GIRDER = ПЕРЕКЛАДИНА (или СОСТАВНАЯ БАЛКА, или РИГЕЛЬ, или СПЛОШНАЯ БАЛКА, или ПРОГОН, или СЛЕГА, или БАЛКА ПЕРЕКРЫТИЯ) – Girder is a large or principle beam used to support concentrated loads at isolated points along its length. Girder is a beam of wood or steel used as the principal support of concentrated loads at points along its span. A Girder is a support beam used in construction. Girders often have an I-beam cross section for strength, but may also have a box shape, Z shape or other forms. Girder is the term used to denote the main horizontal support of a structure which supports smaller beams. A girder is commonly used many times in the building of bridges, and planes. In traditional timber framing a girder is called a Girt. The Warren type girder combines strength with economy of materials and can therefore be relatively light. Patented in 1848 by its designers James Warren (1803–1870) and Willoughby Theobald Monzani (1805–1854), its structure consists of longitudinal members joined only by angled cross-members, forming alternately inverted equilateral triangle-shaped spaces along its length, ensuring that no individual strut, beam, or tie is subject to bending or torsional straining forces, but only to tension or compression. It is an improvement over the Neville truss which uses a spacing configuration of isosceles triangles. Girder is a beam, as of steel, wood, or reinforced concrete, used as a main horizontal support in a building or bridge. Girder is a principal beam of wood, steel, etc., supporting the ends of joists. / Дьжеймз Ворэн (James Warren) и Вилоби Сиобалд Монзани (Willoughby Theobald Monzani). скрепляющим или скручивающим . Крупная или основная балка, используемая для поддержки сосредоточенных нагрузок на отдельные точки по её длине. Под Слегой понимается толстая жердь, брус. Под Прогоном понимается конструктивный элемент покрытия здания, укладываемый по основным несущим конструкциям (балкам, фермам и тому подобному). Предназначается главным образом для восприятия нагрузок от кровли. Под Ригелем, от Немецкого слова Riegel, означающее Засов или Поперечина, понимается линейный несущий элемент (сплошной или решётчатый) в конструкциях зданий и сооружений. Соединяет стойки, колонны (ригель рамы); служит опорой прогонов, плит (ригель перекрытия или ригель покрытия). Выполняется из дерева, железобетона, стали. Под Балкой, от Голландского слова Balk, понимается конструктивный элемент, обычно в виде бруса, работающего главным образом на изгиб. Балки широко применяют в строительстве и машиностроении:- в конструкциях зданий, мостов, эстакад, транспортных средств, машин, станков и так далее. Изготовляют балки в основном из железобетона, металла и дерева. В зависимости от числа опор и характера опорных закреплений различают балки однопролётные, многопролётные, консольные, с заделанными концами, разрезные, неразрезные; в зависимости от формы поперечного сечения – прямоугольные, тавровые, двутавровые, коробчатые и другие. Расчёт балки обычно производят на прочность, жёсткость и устойчивость по законам сопротивления материалов. Прогон – балка, служащая опорой для плит покрытия и передающая нагрузки на основные несущие элементы (ригели, фермы и тому подобное). Обычно покрытия с прогонами применяют при устройстве асбестоцементных, алюминиевых и стальных настилов в легкосбрасываемых покрытиях над взрывоопасными помещениями. Материал прогона – металл (двутавровые или швеллерные прокатные профили), железобетон (как правило, балка прямоугольного профиля) и дерево. Ригель – горизонтальная или наклонная балка (сплошная или решётчатая), связывающая между собой колонны зданий, стойки рам и тому подобное. Служит опорой для прогонов, плит перекрытий и покрытий.

GIRDER TRUSS = БАЛОЧНАЯ ФЕРМА – Girder Truss is a truss designed and engineered to carry heavy loads transmitted from other structural members bearing upon it. Often a multiple ply Truss. / Под Фермой, от Французского слова Ferme, от Латинского слова Firmus, означающее Крепкий или Прочный, понимается стержневая несущая конструкция покрытия здания, пролётного строения моста, гидротехнического сооружения и так далее. Фермы изготовляются из металла, железобетона, дерева и комбинированных (из нескольких) материалов. В расчётной схеме ферма соединение стержней в узлах обычно условно принимается шарнирным, а нагрузка – передающейся через узлы. Поэтому при расчёте полагают, что в стержнях фермы возникают только продольные (растягивающие или сжимающие) усилия. Основные составные части фермы – пояса (прямолинейные и полигональные) и решётка (простая, сложная и составная). Ферма с прямоугольной решёткой и жёстким соединением стержней, работающих на изгиб, называется безраскосной. Пояса и решётка стальных ферм покрытий обычно изготовляются из двух уголковых профилей, соединённых прокладками.

GIRDLE = XX (или ПОЯС, или КУШАК) – Girdle is an article of dress encircling the body usually at the waist; a woman's close-fitting undergarment often boned and usually elasticized that extends from the waist to below the hips.

GIRDLING = КОЛЬЦЕВАНИЕ (или ОПОЯСЫВАНИЕ) – Girdling:- encircling. An infection that girdles a stem or root is one that completely encircles the stem or root. / Окольцовывание/Опоясывание. Инфекция, которая опоясывает стебель или корень, причём полностью окольцовывает стебель или корень.

GIRO TRANSFER = ЖИРО ПЕРЕВОД (или БЕЗНАЛИЧНЫЙ ПЕРЕВОД) – (1) Giro Transfer is the cashless transfer of payments. / Осуществление платежей в безналичном порядке.

(2) Giro Transfer is a transfer by endorsement of an order instrument, e.g., bill of exchange. See also Endorsement. / Перевод посредством индоссамента (передаточной надписи) ордерного инструмента, например, векселя. Термин Жиро, от Итальянского слова Giro, означающее Оборот или Обращение, подразумевает передаточную надпись на векселе, чеке и тому подобном. Смотрите также Индоссамент (Endorsement).

GIRTH = ОБХВАТ (или XX, или ОБВЯЗКА, или ШИРОКИЙ ТКАНЫЙ РЕМЕНЬ, или СВЯЗЬ) – Girth is a band or strap that encircles the body of an animal to fasten something, as a saddle, on its back.

GIS = GEOGRAPHIC INFORMATION SYSTEM

GISH = GENOME IN SITU HYBRIDIZATION

GIT = GOODS IN TRANSIT

GIVE UP = ПЕРЕДАЧА (или ПЕРЕУСТУПКА) – Give Up:- a contract executed by one broker for the client of another broker that the client orders to be turned over to the second broker. The broker accepting the order from the customer collects a wire toll from the carrying broker for the use of the facilities. Often used to consolidate many small orders or to disperse large ones. Also known as Passout. Give Up:- a member of the exchange on the floor may act for a second member by executing an order for him with a third member. The first member tells the third member that he is acting on behalf of the second member and 'gives up' the second member's name rather than his own. A contract executed by one broker for the client of another broker that the client orders to be turned over to the second broker. The broker accepting the order from the customer collects a fee from the carrying broker for the use of the facilities. Often used to consolidate many small orders or to disperse large ones. / Контракт, исполненный одним брокером для заказчика другого брокера, по которому распоряжения заказчика должны быть переданы второму брокеру. Известен также как Отказ или Передача (Passout). Отказаться или Действовать Через или 'Подставлять' (Give Up):- (1) термин, используемый по отношению к сделке с ценными бумагами, в которой участвуют три стороны. Брокер А – брокер, работающий в торговом зале биржи (floor broker), – осуществляет приказ на покупку для Брокера В – другого брокера фирмы – члена биржи, который слишком занят в тот момент для того, чтобы осуществить этот приказ самому. Брокер, с которым Брокер А заключает сделку (брокер продающей стороны), – Брокер С. Брокер А 'подставляет' в договор имя Брокера В, чтобы сделка была заключена между Брокером В и Брокером С, хотя фактически сделка была осуществлена между Брокером А и Брокером С. (2) Другое применение термина:- клиент брокерской компании ABC уезжает из города и, не найдя в другом районе филиала компании ABC, размещает приказ через компанию DEF, заявив, что он имеет счёт в компании ABC. После подтверждения факта наличия счёта компания DEF заключает сделку с компанией GHI, уведомляя GHI о том, что DEF действует от имени ABC ('подставляет' название компании ABC). ABC затем осуществляет детальный клиринг с компанией GHF. Или компания DEF может просто направить приказ клиента напрямую в компанию ABC для исполнения. Несмотря на то, какой будет использован подход, клиент платит комиссионные один раз.

(2) Give Up:- an order that, at the request of the customer, is credited to a brokerage house that has not performed the execution service. / Распоряжение, которое по требованию заказчика, приписано брокерскому дому, который не привёл услугу в исполнение.

GIZA COTTON = ХЛОПЧАТНИК ГИЗА – Giza Cottons:- Egyptian Cotton is well known all over the world, when we mention to the Egyptian Cotton we mean comfort and feel. However people nowadays still don't know or have no idea where Egyptian Cotton originated or even know how it has become a staple of the textile industry. Egyptian Cotton derived from a large family of different types of Cotton. There is Cotton which comes from Asia and Cotton which comes from the West Indies. Also, there are Hybrid types of Cotton, Like American-Egyptian Cotton from which Pima Cotton is derived. the length of the Cotton fibers is one of the major advantages; the longer the fibers are, the softer the Cotton is. Egyptian Cotton has a very soft, almost silky, texture. Because it is quite long fibers. Egyptian Cotton is not like other types of Cotton because it is usually handled by farmers and not by machines. No pesticides are used, no chemicals are used to clean up the Cotton, and there are no machines used to pick the Cotton. So, the Cotton remains soft As the fibers are not disturbed during harvest. However, Egyptian Cotton has existed in Egypt since ancient, almost even prehistoric, times. Native Cotton in Egypt was actually not of a very good quality. So, when an Ethiopian Cotton was sent to Egypt, the founder of modern Egypt was advised to buy some so that he could grow just a small plot. After the first harvest was exported, he began to grow and grow more of the cotton. Cotton trade was most especially busy in a square in Alexandria, where the first trading began in 1865. One of the very important part of Egyptian Cotton's history is the Nile. In the absence of the Nile, cotton and other crops would not have survived for very long. Egypt's moderate climate also played an integral role in developing the popularity and long-standing characteristic of Cotton as Egypt's cash crop. the crops began to improve in quality because of improvements to Egypt's irrigation systems increased Cotton's wealth-producing power. Today, Cotton is still grown heavily in Egypt, both in the northern and in the southern parts. However, the lesser quality Cotton is marked for domestic use while the better grades and qualities are marked for export worldwide. The price of Egyptian Cotton is increasing and it consider higher than its counterparts because of the way in which it is processed and because of its unique fiber structure. Therefore, Today Egyptian Cotton remains as special as it was hundreds of years ago. Xxxxx. Giza Cottons:- there are 6 different variations on the Giza grade fibers, they are broken into 2 different groups:- (i) Long Staple Fibers:- this includes Giza 86, Giza 89 and Giza 90. This first family is when the fiber is longer than 33 mm and has a fiber diameter of 4.3 to 4.9. It is very high quality Cotton, which is slightly better than the well-known American brand of Supima Cotton. (ii) Extra-Long Staple (ELS) Fibers:- the second group includes:- Giza 87, Giza 88, Giza 45. To be graded as one of these 3 premium Giza qualities the fibers must be fine yarn diameter with high uniformity index. The Giza 45 is the best among its Giza counterparts and is rated at 2.95 micronaire (uniformity index). Giza 45 is the most highly graded cotton fiber of the Egyptian Cottons. It is the longest, thinnest, strongest and most has the best uniformity index of 88.5 of the 'Giza' grade Cottons. Meaning the irregularities are minimal, therefore producing a very smooth and silky look and feel when woven into fabric. Giza 45 is undeniably the best cotton in the world. It has to do with a number of factors that ultimately combine to produce the finest Cotton products. As previously mentioned Giza 45 falls into extra-long category with a superior fiber. In addition to this and equally important, is the fineness (2.95 micronaire) and unmatched uniformity. These 3 properties alone are outstanding when combined to create a very fine and smooth hand feel, and also allow a naturally high thread count without the use of plied yarns. Strength:- adding to the superior properties is a very high breaking resistance, measured at an average of 44.3 g/tex. This means despite it's fineness the yarn is likely to produce one of the strongest fabrics when woven. Cleanliness:- due to the special attention the Giza 45 is cultivated with it is generally a much cleaner cotton when harvested from the plants. Natural cleanliness has two benefits. The first is that there will be less brushing of the fibers, therefore keeping the natural structure of the fibers intact, creating less 'ends'. The second benefiting factor is that less chemicals (similar to bleach) will be used to make the Cotton 'white'. These bleaching chemicals tends to break down the strength of the Cotton, therefore leaving Cotton weakened and damaged. Hand Harvesting:- the Giza 45 is such a unique grade of Cotton that it is exclusively harvested by hand, for the best chance at preserving the Cotton. It's obvious why, as you can imagine the damage the blades of the machinery would do to Cotton as its being picked. This laborious and time consuming process adds to the cost of the raw Cotton, but ensures the highest quality product. Maturity:- the maturity of the Cotton is carefully selected while being hand harvested. It is another reason the Egyptians prefer to harvest by hand, so they can visually analyse the maturity of the Cotton before picking it. A more mature Cotton produces the longer staple fibers with the greatest strength. Hand Combing:- the elimination of irregular and inferior particles is all done by hand. Piece by piece the Cotton is sifted through in what is known to the Egyptians as the 'Farfara' Method. After the sifting and excluding the irregularities, it takes careful and skilful techniques to really make the most of the extra-long staple fibers. Specialty spinners are employed to create the world's best yarn. Giza 45 is grown in Egypt, the home of the real Egyptian Cotton. The specific area is on the Nile Delta is the most fertile area of Egypt where rain, sun, humidity and soil combine to produce a climatic perfection. These perfect conditions result in Giza 45, the best cotton in the world. The region in which the Giza 45 is grown is ideal proximity to the Nile, which acts as a natural irrigation system to the Cotton plantation. It is nestled in a triangle in a fork in the Nile itself and is a contrastingly lush area of Egypt (this can be seen in the satellite image, taken from orbit above Egypt). This ensures the harvest will never be short of hydration, and keeps the soil's moisture content at a consistent level. As well as this the average rainfall is 190 mm in

the six months from October to April, this is a supply of clean fresh water that hydrates the crops from above in a few short bursts of torrential rain. Additionally, the humidity is constant at approximately 60–70% throughout the growing season. The geographical position, which is close by the sea means the average temperature doesn't vary much from one day to the other due to the sea winds cooling down the dessert air. Why Is Giza 45 so expensive? Because the Giza 45 is grown in such a small region, only a certain yield can be produced each year. Meaning the Cotton is rare. Giza 45 has a high demand and sometimes all orders cannot be fulfilled. And when the demand exceeds the supply the price is pushed up. As well as being rare, the extra manual processes and methods quickly add to the cost of the raw Giza 45 Cotton. On average, the raw cotton is 5 times the cost of regular Egyptian Cotton. And that's before it is even woven! Xxxxx. Egypt is the historical and current world leader in the production of long and extra long staple Cotton. Long staple cotton includes Giza 86, Giza 89, and Giza 90. The good quality of these counts is similar to American Supima Cotton:- fiber length around 33 mm and from 4.3 to 4.9 micronaire. With these characteristics yarns can be produced up to Ne 50/1 and 70/1. The famous extra long staple cottons, which are longer than 33 mm and of even higher quality, include Giza 45, Giza 70, Giza 87 and Giza 88. These varieties are capable of generating yarns with very fine counts yet are also very strong. The quality of 100% Egyptian cotton is sought out by Filmar at its true origins, in the cotton farms Giza 45 and Giza 70, acquired directly by the company in Egypt. 'Egypt is the gift of the Nile', wrote Herodotus, referring to the great river as a source of inexhaustible fertility of the Earth. In the hot, dry desert of the Sahara, the Nile has created an oasis that enjoys extraordinary weather conditions, ideal for producing the best cotton in the world. In the delta of the river, the climate has regular variations, with minimum winter rains. On average 190 mm of rain fall from October to April and are concentrated in a few days of very heavy rainfall. The relative humidity is quite high (60–70%), due to the humid breezes from the Mediterranean and brackish waters. The daily and annual temperatures ranges are low and even in winter there are no sudden temperature changes, thanks to the gentle winds from the sea. Cotton is planted in late March when the weather is slightly cooler and is conducive to the growth of the lower branches on young plants, where the cotton bolls can grow in the shade of overhanging foliage, protected from the direct heat of the sun. In July and August, when the weather is warm to mild, the cotton fibers are more uniform and regular. In September the Cotton is harvested by hand in five stages, in each of which the bolls have matured just to the right point. The way the crops are looked after and the fact that they are harvested by hand means that the defoliants and other chemicals normally used in mechanical harvesting can be avoided. Raw materials such as these are very precious and unfortunately the cotton bolls can become polluted with other fibers. It is thus the skills and expertise of the spinner, along with the technologies used throughout the processing cycle, that mean residual contaminants can be removed thus making the qualitative difference in the yarn spun. This is how Filmar for over 50 years has succeeded in their quest and passion in finishing this ancient and extraordinary basic raw material. Giza 45 and Giza 70:- Extra Long Staple (ELS) – similar in quality to Giza 70, Giza 45 is the best Extra Long Staple cotton, the 'Queen' of Egyptian Cottons. In 1820, Mohammed Ali Pasha, the founder of modern Egypt, planted for the first time in Egypt, Sea Island Cotton and Brazilian seeds – he was enthusiastic about the fabrics produced from these varieties of fibers. The finest Cotton in the world was born in Egypt, from the marriage of the world's best seeds with the unparalleled climate of this country. Giza 45 plants are cultivated only in a small area east of the delta of the Nile, representing 0.4% of the total annual production of Egyptian Cotton. Its long fibers (over 36 mm) are also extremely fine (2.95 micronaire) with a high degree of uniformity in the section (88.5%). Despite its fineness, Giza 45 is particularly strong:- an average of 44.30 grams/tex. Its high level of resistance, its cleanness and regularity make Giza 45 uniquely excellent. It is an ideal Cotton for the production of yarn and fine and hardy fabrics, with amazingly soft and silky weaves. Karnak Menoufi:- Superior Quality Egyptian Cotton:- this antique Eyptian Cotton, which is extraordinarily beautiful and rare, originates from the coastal zone in between lakes Burullus and Manzala. This dark Cotton, which seems almost mud-like and imbued with the amazing essence of lime, comes right from the Nile delta, the emblem of fertility. This is not a recurring gift of nature, on the contrary it is an exceptional harvest and an event that only happens when there is a favorable agro-climatic union, in soil that has particular bio-chemical characteristics and exposed to doses of sun and saltwater breezes from the lakes and sea nearby. For ten years no cotton producer had been able to cultivate this essence. What used to be considered as a lost botanical treasure and the greatest expression of a bygone age of spinning, has now found new life. Filmar has been lucky to find a small quantity of real Karnak-Menoufi. But maybe it was really nature's reward for so much dedication and passion shown over the years to this primary material and to its ancient land of origin, Egypt. Today Filmar proudly presents this extraordinary product, with its uniquely spun characteristics, not found in any other place on the planet. This naturally cream colored Cotton is a long staple, which means it can be spun in ultrasoft count ranges. Worked with experience, it produces unparalleled resistance of the yarns, soft weaves and absolute pliability. The mercerization shows off its natural shine, with pearly and iridescent reflections. The excellence of the workmanship and subsequent manufacture lead to unique and unrepeatable items of clothing, for those who can really appreciate the quality of the material. / Хлопчатник Гиза (Giza Cotton). Хлопчатник Пима (Pima Cotton). Хлопчатник Супима (Supima Cotton). Филма (Filmar). В 1820 Мохаммэд Али Паша (Mohammed Ali Pasha), основатель современного Египта, впервые в Египте посеял семена так называемого Хлопчатника с Морских Островов (Sea Island Cotton seeds) и Бразильского Хлопчатника; он с энтузиазмом полагал то, что из волокна этих разновидностей Хлопчатника будут выработаны высококачественные ткани. Канэк Мэнуфай (Karnak Menoufi).

GJ = GIGAJOULE

GL = GEAR LUBRICANT

GL = GENERALIZED LEONTIEF

GL = GENERAL LICENSE

GL = GREENLAND

GLABERRIMA RICE = РИС ГЛАБЭРРИМА – Glaberrima Rice is a Species of Rice cultivated in Africa. Oryza Glaberrima, commonly known as African Rice, is one of the two domesticated Rice Species. It was first domesticated and grown in West Africa, and was brought to the Americas by enslaved West African Rice farmers. It is now largely a subsistence crop, rarely sold in markets even in West Africa. While it has been partly replaced by higher-yielding Asian Rice, and the number of Varieties grown is declining, it persists, making up an estimated 20% of Rice grown in West Africa. By comparison to Asian Rice, it is hardy, pest-resistant, low-labor, suited to a variety of African conditions, filling, and has a distinct nutty flavour. It is also grown for cultural reasons; for instance, it is sacred to awasena followers among the Jola people, and is a heritage variety in the United States. Crossbreeding between African and Asian Rice is difficult, but there exist some crosses. History:- humans have independently domesticated two different Rice Species. African Rice was domesticated from wild African Rice, Oryza Barthii, while Asian Rice (Oryza Sativa), was domesticated from wild Asian Rice, Oryza Rufipogon. Oryza Barthii still grows wild in Africa, in a wide variety of open habitats. The Sahara was formerly wetter, with massive paleolakes in what is now the Western Sahara. As the climate dried, the wild Rice retreated and probably became increasingly domesticated as it relied on humans for irrigation. Rice growing in deeper, more permanent water became floating Rice. It is believed to have been domesticated 2 000–3 000 years ago in the inland delta of the Upper Niger River, in what is now Mali. It then spread through West Africa. It has also been recorded off the East coast of Africa, in the Zanzibar Archipelago. Wild Rice seedheads shatter,

scattering the Rice grains to seed the next generation. Domestic Rice does not shatter, making the grains easy for humans to gather. A mutation that caused Rice not to shatter would probably have been the beginning of domestication. Ibn Baṭṭūṭa recorded Rice couscous in the area of present-day Mali in 1350. In the late XV and XVI centuries, the Portuguese sailed to the Southern Rivers area in West Africa and wrote that the land was rich in Rice. 'They said they found the country covered by vast crops, with many Cotton trees and large fields planted in Rice … the country looked to them as having the aspect of a pond (i.e. a marais)'. The Portuguese accounts speak of the Falupo Jola, Landuma, Biafada, and Bainik growing Rice. André Álvares de Almada wrote about the dike systems used for Rice cultivation, from which modern West African Rice dike systems are descended. African Rice was brought to the Americas with the transatlantic slave trade, arriving in Brazil probably by the 1550s and in the United States in 1784. The seed was carried as provisions on slave ships, and the technology and skills needed to grow it were brought by enslaved Rice farmers. Newly imported African slaves were marketed (and sometimes even trained) for their Rice-growing skills, as the high price of Rice made it a major cash crop. The tolerance of African Rice for brackish water meant it could be grown on coastal deltas, as it was in West Africa. There are numerous stories about how the Rice came to North America, including a slave smuggling grains in her hair and a ship driven in to trade by a storm. African Rice is a rare crop in Brazil, Guyana, El Salvador and Panama, but it is still occasionally grown there. There are also native South American Rices, which makes it hard to recognize the arrival of African Rice in histories. Asian Rice came to West Africa in the late 1800s, and by the late XX century had substantially supplanted native African rice. However, African Rice was still used in specific, often marginal habitats, and preferred for its taste. Farmers may grow African Rice to eat and Asian Rice to sell, as African rice is not exported. The 2007 food price shocks drove efforts to raise Rice production. Rice-going regions of Africa are generally net rice importers (partly due to a lack of good local rice-processing capacity) so price increases hurt. Among the efforts to increase yield was the adoption of Nerica cultivars, crossbred to specifications from local farmers using African Rice varieties provided by local farmers. These were bred during the 1990s and released in the early XXI century. Results so far have been mixed; the Nerica varieties are less hardy and more labor-intensive, and effects on real-world yields vary. Subsidies of Nerica seeds have also been criticized for encouraging the loss of native varieties and reducing the independence of farmers. Use:- multiple varieties of African Rice are often grown so that the harvest is staggered. In this way, the harvest can be eaten fresh. Freshly harvested Rice is moist, and can be puffed in fire, and eaten. Fried Rice have browny color when fried this is because of the husk that is green in color when heated turns brown. African Rice can be prepared in much the same way as Asian Rice, but has a distinct nutty flavour, for which it is favoured in West Africa. African Rice grains are often reddish in color; some varieties are strongly aromatic, other, like Carolina Gold, are not at all aromatic. African Rice is also used medicinally. / Ибн Баттута (Ibn Baṭṭūṭa). Фалупо Жола (Falupo Jola), Ландума (Landuma), Биафада (Biafada), и Байник (Bainik). Андрэ Алварис дэ Адмада (André Álvares de Almada).

GLABROUS = ОГОЛЁННОЕ (или НЕОПУШЁННОЕ, или ГЛАДКОЕ, или БЕЗВОЛОСОЕ) – Glabrous:- having a smooth even surface, hairless condition. Hairs are scarce or absent on the hull and/or the leaf blade. In a glabrous strain, few hairs may be found on the margins of the blade. Glabrous:- smooth, without hairs or protrusions.

GLACÉ = ГЛЯСЕ (или ГЛЯНЦЕВОЕ, или ПОЛИРОВАННОЕ, или САТИНИРОВАННОЕ) – Glacé is a lustrous, glossy effect imparted to fabrics by finishing. / Под Глясе, от Французского слова Glacé, означающее Глянцевитое или Замороженное или Застывшее или Ледяное или Лощёное или Обледеневшее или Стекловидное, понимается .

GLAD = XX (или ПРАЗДНИЧНОЕ, или РАДОСТНОЕ) – Glad:- rags dressy clothes.

GLAND = ЖЕЛЕЗА (или ЖЕЛЕЗИСТЫЙ ВОЛОСОК, или ЛИМФАТИЧЕСКИЙ УЗЕЛ, или САЛЬНИК, или НЕКТАРНИК) – Gland is a multi-cellular secretory structure producing oil, resin or other liquid, usually as a protruberance or appendage, but sometimes as part of a surface. / Под Железами понимаются органы животных и человека, вырабатывающие и выделяющие специфические вещества, обычно участвующие в физиологических отправлениях организма. Одни железы, выделяющие свои продукты на поверхность тела или слизистых оболочек через выводные протоки, называются Железами Внешней Секреции, или Экзокринными Железами; их продукты называются Секретами. Другие Железы – Эндокринные (Инкреторные), или Железы Внутренней Секреции, – не имеют выводных протоков; вырабатываемые ими продукты (Инкреты, или Гормоны) выделяются в кровь или лимфу и разносятся с ними по организму. Некоторые железы избирательно поглощают из крови находящиеся в ней конечные продукты диссимиляции, концентрируют их и выделяют наружу, предотвращая отравление ими организма. К таким концентрирующим железам относятся почки, потовые железы, отчасти слёзные железы, выделяемые ими вещества принято называть Экскретами. Образование и выделение продуцируемых веществ протекают в основном одинаково во всех железах и поэтому термином 'Секрет' часто обозначают все секретируемые вещества – секреты, инкреты и экскреты, независимо от их физиологического значения. Секреты большинства желез (например, околоушной, поджелудочной) по своей химической природе относятся к белкам; растворяясь в воде, они выделяются в виде серозных жидкостей. Такие железы часто называют Белковыми, или Серозными Железами. Другую группу составляют Слизистые Железы (например, железы пищевода или матки), продуцирующие муцины и мукоиды (вещества из группы гликопротеидов). Некоторые железы, так называемые гетерокринные, вырабатывают одновременно и белковый, и слизистый секреты. Секреты других желез (сальных, отчасти молочной) имеют липоидную природу и в воде не растворяются. Экзокринные железы и большинство эндокринных желез развиваются как производные эпителиальных (пограничных) тканей; некоторые эндокринные железы могут происходить из других тканей. Так, интерстициальные клетки половых желез (участвующие в выработке половых гормонов) возникают из мезенхимы. Хромаффинные клетки (составляющие мозговую часть надпочечников и так называемые параганглии), продуцирующие катехоламины, являются видоизменёнными нервными (симпатическими) клетками. К ним близки нейросекреторные клетки, которые, будучи нервными по своей природе, способны вырабатывать и выделять в кровь секреторные продукты (смотрите Нейросекреция); у позвоночных животных и человека такие клетки сосредоточены в гипоталамусе. В построении некоторых эндокринных желез (эпифиз, задняя доля гипофиза) участвует нейроглия. Основная функция эпителия – обмен веществ между организмом и средой, в том числе выделение продуктов, вырабатываемых клетками эпителия. В некоторых эпителиальных клетках последняя функция становится доминирующей, и они превращаются в железистые клетки, или одноклеточные железы, например, бокаловидные клетки. Иногда все клетки определённого участка эпителиального пласта дифференцируются в железистые и начинают выделять секрет – возникает железистое поле, например, эпителий слизистой оболочки желудка. В результате увеличения числа железистых клеток в данном участке эпителиального пласта образуется внедряющаяся в подлежащую соединительную ткань железистая ямка, которая в ходе дальнейшего углубления принимает вид трубочки, обособляющейся от эпителиального пласта. Выработка секрета сосредоточивается в дистальной части этого зачатка, которая дифференцируется в концевой (секреторный) отдел, или аденомер, формирующейся железы. Проксимальная же часть железистой трубки становится выводным протоком, клетки которого остаются малодифференцированными (в связи с чем выводные протоки сохраняют способность к пролиферации и во многих случаях оказываются источником роста и регенерации Железы. По форме аденомеров (удлинённой или округлой) железы делят на трубчатые и альвеолярные (шаровидные аденомеры, нередко называемые Ацинусами). Железы, состоящие из одного аденомера (в том числе и разветвлённого) и неветвящегося выводного протока, называемые простыми (трубчатыми

или альвеолярными), например, фундальные и пилорические железы желудка, железы матки. Железы, состоящие из множества аденомеров, секрет которых по многочисленным ответвлениям сливается в общий выводной проток, называются Сложными Железами. По форме аденомеров сложные железы могут быть трубчатыми, например, слюнная подъязычная железа и альвеолярными, например, поджелудочная железа, околоушная железа. Иногда в одной и той же сложной железе одни аденомеры имеют трубчатую форму, другие – альвеолярную (сложная трубчато-альвеолярная железа), например, слюнная подчелюстная. В редких случаях трубчатые аденомеры, разветвляясь, соединяются между собой в рыхлую сеть, и железа становится сложной сетчатой, например, печень, передняя доля гипофиза. В простых железах с разветвлёнными аденомерами и в сложных железах, имеющих много аденомеров, промежутки между ними заполнены соединительной тканью, в которой проходят кровеносные сосуды и нервы. Таким образом, в крупных многоклеточных железах различают паренхиму эпителиального происхождения (аденомеры и выводные протоки) и соединительнотканную строму, поддерживающую и питающую паренхиму. Длительное ослабление функциональной деятельности железы приводит к атрофии паренхимы, тогда как строма в данных обстоятельствах начинает гиперплазироваться и замещать атрофирующуюся паренхиму (склероз или цирроз железы. Смотрите также Секреция. К Нектарникам относятся желёзки растений, выделяющие нектар. Обычно они расположены в цветке, редко – на листьях и стеблях.

GLASS = СМОТРОВОЕ СТЕКЛО – Glass is a maritime term used by mariners for a barometer.

GLASS = СТЕКЛЯННОЕ – Glass is inorganic fiber, in textile form, obtained by drawing molten glass. Alphabetic code – GF; and relevant commercial allowance – 2/3.00.

GLASS CLOTH = СТЕКЛЯННОЕ ПОЛОТНО (или СТЕКЛОТКАНЬ) – Glass Cloth is a towel used to dry drinking glasses, glass plates, and silver. It is made from linen. Glass towels are often checked red and white and may have the word ‘Glass’ woven into the fabric.

GLASS FIBER = СТЕКЛЯННОЕ ВОЛОКНО (или СТЕКЛОВОЛОКНО) – Glass Fiber is a manufactured fiber in which the fiber-forming substance is glass. In the continuous filament process, glass marbles are melted in an electric furnace and the liquid flows in fine streams through small orifices at the bottom of the melting chamber. The resultant filaments are caught and drawn by a high-speed drawwinding mechanism. In the staple fiber process, the streams of molten glass are attenuated into fibers by jets of high-pressure steam or air. These fibers are gathered on a revolving drum and them wound on tubes to form staple fiber sliver or bands that can be drafted, twisted, and plied. Characteristics:- glass fiber is incombustible and will tolerate heat up to 1 000 °F without material damage. Potential strength is not realized in woven fabrics or even in yarns, because the fiber is brittle and fracture points may develop, but nevertheless, very high tensile strength is obtained in woven fabrics, and is retained at elevated temperatures. The fiber originally was difficult to color but methods have been developed to accomplish this. Moisture absorption is low. Electrical and insulation resistance is high. End uses:- glass fiber is used for heat and electrical insulation, filter cloth in the chemical and dye industries, reinforcing belts in tires, novelty fabrics, tablecloths, and fireproof draperies. Because of its brittleness, it is not used in wearing apparel or in household fabrics that have to withstand frequent flexing. Glass Fiber is an inorganic fiber which is very strong, but has poor flexibility and poor abrasion resistance. Glass will not burn and will not conduct electricity. It is impervious to insects, mildew, and sunlight. Today, the primary use of glass fiber is in such industrial applications as insulation or reinforcement of composite structures. There are several different types of Glass Fiber – the one we usually use is called E-Glass – a description going to back to the early days when glass was used primarily for E-electrical insulation. This is not the strongest glass available, that is given by a S-Glass not so common here but you may see it advertised for sale in the States. A-Glass is a third type of glass, the lowest strength/quality often used in chopped strand matt for simple filling. Since the fibers are not woven and therefore have no coherent direction, chopped strand adds only a little strength to resin matrixes. Even so it is still a useful material for filling although a little heavy. In fact, glass is the heaviest of reinforcement materials with a density (S.G. (specific gravity) if you prefer) of ~2.5 g/cm^3. See also Fiberglass. Design Considerations For Glass Fabric Selection:- there are five basic design variables to consider when choosing fabric for industrial use:- (i) Thickness:- glass fabrics are available in thicknesses ranging from ~0.001 0” to ~0.060”; (ii) Weight:- the weight range begins at less than 1 ounce per square yard to over 50 ounces per square yard; (iii) Yarn Size:- yarn size determines the weight and thickness of the fabric. For specific applications, one yarn may be selected over another to the advantage of the fabric’s physical and mechnical performance characteristics. (iv) Construction:- this is determined by the number of warp yarns (machine direction) and fill yarns (cross-machine direction) per inch of the fabric and by the weave pattern. (v) Finish:- most industrial applications require that fabric be used with a coating material. For compatibility with resins coatings, an organic finish or after treatment is often applied to the fabric. Weave Patterns:- the matching of yarn, weave and finish for a particular requirement is an exacting science. Because fiberglass fabrics are highly engineered, the right combination of fabric weight, thickness and construction is essential in selecting the proper fabric for a particular application. Selecting the right reinforcement fabric for any requirement can simplified by calling our technicians, design engineers and technical representatives. Their specialized experience can aid in selecting a reinforcement fabric suited to your requirements. The weaving of reinforcement fabrics is a highly complex function that combines the latest in modern machine technology with the art of weaving, which is as old as civilization. All standard fabric weaves can be produced with fiberglass, aramid, Astroquartz®, polymer yarns. Fiberglass Fabric Applications:- fiberglass fabrics are used in a wide range of industrial applications. The high strength, dimensional stability, design flexibility, and electrical properties are some of the characteristics that ensure optimal performance and economy with this highly engineered material. (1) Coated and Lamination Fabrics:- fiberglass fabrics can be found in window shades, vapor barriers, movie screens, packaging tapes, awnings, protective clothing, gaskets, conveyor belts and countless other products that improve our lives daily. (2) Construction:- in architectural applications fiberglass fabrics provide strength and sustainability to the exterior facades of commercial buildings, and reinforcement for commercial roofing systems. (3) Electrical:- fiberglass fabrics can be found in printed circuit boards, antennas, high voltage generators, transformers, switches, cables and many other electrical applications. (4) Structural Applications:- fiberglass fabrics are used as reinforcements in highly engineered composite materials in many of the worlds leading aircraft, automobiles, buildings, bridges, roadways and sporting goods. (5) Thermal Insulation:- the US Navy, commercial shipyards, the automotive and aerospace industries all use fiberglass almost exclusively for pipe lagging, thermal pad cover, and thermal protection and insulation applications. Fiberglass fabrics are available with a variety of finishes and treatments. Glass Fiber is a very fine flexible fiber made from glass. It. is used extensively for curtains and draperies. Glass fiber fabrics are very strong and wash well, but care should be taken to avoid getting small splinters of the glass yarns in the hands. Glass fiber is stiff and has poor resistance to wear and abrasion. It is also fireproof. See also Fireproof. Glass Fiber Textile:- glass, with its glossy shine, attracts many. It has been put into many uses from being made into utensils, mirrors, windows, doors to furniture and artworks. Textile Industry too could not resist itself from the fatal attraction of glass. Although, hard and rigid by nature, glass can very well be made into fine, shiny and translucent fibers which more or less look and feel like silk fibers. These glass fibers are commonly known as Fiberglass. Prerequisite for Glass Fibers:- although there are two methods for making glass yarns but certain processes have to be done before going on to any of the manufacturing methods. Batches of silica, sand, limestone, soda ash, borax and any other ingredient required for specific purpose have to be made. All these contents are in requisite proportion. These batches are formulated

in an electric furnace from where the molten glass at a temperature of approximately 2 500 °F flows to marble forming machines that produce tiny glass marbles of about 15 mm in diameter. Visual inspection of these marbles are carried on so as to eliminate any of the impurities. The marbles are then again melted in small electric furnaces and extruded through spinnerets. In yet another method, the molten glass is directly extruded from the furnace through spinnerets without converting it into marbles. Glass Fiber Manufacturing Processes:- after the initial process of melting glass and passing it through spinnerets, continuous filaments or staple fibers of glass are manufactured by two different methods. Continuous Filament Process:- in this process, continuous filaments of indefinite length is produced. The molten glass passes through spinnerets having hundreds of small openings. These strands of multiple filaments are carried to winder revolving at very high speed of more than 2 miles per km. This process draws out the fibers in parallel filaments of the diameter of the openings. A sizing or a binder is applied to facilitate the twisting and winding process and to prevent breakage during yarn formation. After winding, filaments are further twisted and plied to make yarns by methods similar to those for making other continuous filament yarns. The sizing is removed through volatizing in an oven. These yarns are used for making such items as curtains and drapes. Staple Fiber Process:- fibers with long-staple qualities are manufactured through staple fiber process. There are many methods for producing such fibers. In one of such methods, the molten glass flows through the small holes of bushing, where jets of compressed air shake the thin streams of molten glass into fine fibers. These fibers vary in length ranging from 8 to 15 inches. The fibers fall through a spray of lubricant and a drying flame onto e revolving drum where they form into a thin web. These fibers in the form of web are gathered from the drum into a sliver. Yarn is then made from this sliver by similar methods that are adopted for making Cotton or wool yarns. These yarns are used for fabrics for industrial purposes where insulation is required. In yet another method, the ends of the glass rods are melted from which drops of glass fall away drawing off glass filaments after them onto a speedily revolving cylinder where they are wound parallel to each other. A web of sliver is formed if the cylinder moves sideways. Sometimes, the staple may be thrown off the cylinder onto a stationary sieve where it forms a sliver. In either conditions, the sliver is then converted into spun yarn. The staple fiber, if subjected to oven, is compressed to the desired thickness and the binder which was earlier applied, is cured. This permanently binds the fibers. Uses of Glass Yarns:- glass fiber is manufactured in a wide range of fine diameters. Some of them are so fine that they can be seen only through a microscope. This quality of fineness contributes greatly to the flexibility of glass fibers. Various manufacturers produce different types of glass fibers for different end uses. Glass fibers them are used for various purpose:- (i) for making home furnishings fabrics; (ii) for making apparels and garments; and (iii) for the purpose tires and reinforced plastics. There are certain glass fibers that can resist heat upto 7 200 °C and can withstand forces having speed of 15 000 miles per hour. These types of glass fibers are used as:- (i) filament windings around rocket cases; (ii) nose cones; (iii) exhaust nozzles; and (iv) heat shields for aeronautical equipment. Some other types of glass fibers are embedded into various plastics for strength. These are used in:- (i) boat hulls and seats; (ii) fishing rods; and (iii) wall paneling. Some other types of glass fibers are used for reinforcing electrical insulation. Yet other types are used as batting for heat insulation in refrigerators and stoves. Glass Fiber is a manufactured fiber in which the fiber-forming substance is glass. These fibers are incombustible and will tolerate heat up to 1 000 °F. However, the resulting fabric is brittle and fracture points may develop. / Эстроквотц® (или Астрокварц®; Astroquartz®). сопротивление истиранию. Под Стеклянным Волокном или Стекловолокном понимается волокно круглого или профильного сечения, получаемое (формуемое) из расплавленного стекла. Изготовляется двух видов:- (i) непрерывное – диметром 3–100 мкм и длиной ≥ 20 км; и (ii) штапельное – диаметром 0.1–20 мкм и длиной 1–50 см. Обладает высокой теплостойкостью (например, для кварцевого, кремнезёмного, каолинового стеклянного волокна – выше 1 000 °C), превосходными диэлектрическими свойствами (удельное электрическое сопротивление кварцевого, бесщелочного, алюмоборосиликатного, магнийалюмосиликатного стеклянного волокна – не ниже 10^{14} Ом·м), модулем упругости, высокой прочностью при растяжении (3–5 ГПа), химической стойкостью, низкой теплопроводностью (0.035–0.09 Вт/(м·К)). Применяется в виде жгутов (ровингов), кручёных нитей, лент, тканей, нетканых материалов (например, стеклохолста) как армирующий наполнитель композиционных материалов (например, стеклопластиков), а также для фильтрования, теплозащиты, производства нагревостойкой изоляции, в волоконной оптике и так далее. Стеклянное Волокно – волокно, пригодное для текстиля, полученное вытягиванием расплавленного стекла с последующим охлаждением расплава. В некоторых Европейских странах этот продукт в виде непрерывных волокон называют ‘Силиони’, в виде резаных волокон – ‘Веранн’. Стекловолокно и нити занимают особое место среди текстильных волокон. Они широко применяются в технике для электро-, тепло-, звуко- и других видов изоляции, в виде фильтровальных материалов, несгораемых изделий, в производстве стеклопластиков и другого.

GLASSINE ENVELOPE or BAG = ГЛАСИН ОБОЛОЧКА или МЕШОК – Glassine Envelope or Bag is a material used in covering the panicle of the female parent after emasculation or pollination.

GLASS REINFORCED THERMOSETTING PLASTICS = УСИЛЕННЫЙ ТЕРМОРЕАКТИВНЫЙ СТЕКЛОПЛАСТИК – Glass Reinforced Thermosetting Plastics (GRP) generally based on polyester resin. Can be used for cab body work, but usually in the construction of trailer walls. / на сложном полиэфире. Реактопласты или Термореактивные Пластмассы – пластические массы, переработка которых в изделия сопровождается необратимой химической реакцией, приводящей к образованию неплавкого и нерастворимого материала. Наиболее распространены реактопласты на основе феноло-формальдегидных смол, полиэфирных смол, эпоксидных смол, мочевино-формальдегидных смол. Содержат обычно большие количества наполнителя – стекловолокна, технического углерода, мела и тому подобного.

GLASS TRANSITION TEMPERATURE = ТЕМПЕРАТУРА СТЕКЛОВАНИЯ – Glass Transition Temperature is the temperature above which a material changes from a brittle, ‘glassy’ nature to a rubbery nature; on cooling, the material changes back to glassy. Synthetic fibers, such as polyester and nylon show this change of physical character. The rate of dye uptake increases dramatically when the fiber is near or above the glass transition temperature. If the glass transition temperature is above the boiling point of water, as it is with polyester, the dyeing rate is extremely slow even at the boil. See also Second-Order Transition Temperature. / Найлан (Nylon). стеклянное или стекловидное или стеклообразное (glassy). Смотрите также Температура (Фазового) Перехода Второго Порядка (Second-Order Transition Temperature).

GLAUBER’S SALT = ГЛЯУБАРОВА СОЛЬ (или ГЛАУБЕРОВА СОЛЬ) – Glauber’s Salt:- in the dye industry, some use ‘sodium sulfate’ to refer to the anhydrous form, and ‘Glauber’s Salt’ only to refer to the decahydrate form ($Na_2(SO_4)\cdot 10H_2O$). Glauber’s Salt is a sodium sulfate. An acid used in dyeing to help the protein fibers to take colors evenly (leveling). Used in acid dyeing. / безводное (anhydrous). сульфат натрия. Глаубэрова соль или Сернокислый Натрий. относится к форме десятиводного гидрата (decahydrate form) $Na_2(SO_4)\cdot 10H_2O$. Гляубарова Соль или Глауберова Соль, минерал класса сульфатов, то же, что Мирабилит. Названа по имени Немецкого химика и врача Йохана Рудольфа Гляуба (Johann Rudolf Glauber; 1604–70), получившего её в 1648. Бесцветные или белые солеобразные массы. Твёрдость 1.5–2, плотность 1.5 г/см^3. По происхождению осадочная (в озёрах и заливах). На территории бывшего Союза Советских Социалистических Республик (СССР) в Туркменистане – месторождения Кара-Богаз-Гол, в Соединённых Штатах Америки (США) – Солёное Озеро, и другие.

GLAUCESCENCE = СИЗОСТЬ (или ГОЛУБОВАТО–ЗЕЛЁНОЕ) – Glaucescence is a fine bloom, blush or coating of whitish or bluish-white substances, usually microscopic particles of wax, easily rubbed off the surface. / тонкий налёт (bloom), .

GLAUCOUS = СИЗОЕ – Glaucous:- bluish gray or bluish green often as a result of a wax-like bloom. Glaucous:- of a pale yellow-green color; of a light bluish gray or bluish white color. / Сизое:- синевато-серое или синевато-зелёное, часто как результат воскового налёта.

GLAZING = ГЛАЗУРОВАНИЕ (или ГЛЯНЦЕВАНИЕ, или АППРЕТИРОВАНИЕ, или ЛОЩЕНИЕ, или ЛАКИРОВАНИЕ, или ПОЛИРОВКА, или ПОЛИРОВАНИЕ) – Glazing is:- (1) a finishing process that produces a smooth, highly polished, or lustrous surface on a fabric such as chintz. The fabric is treated with starch, glue, paraffin, or shellac, then friction calendered. Synthetic resins are used for a more permanent finish. (2) A shiny fabric appearance produced unintentionally, e.g., by pressing at excessive temperature. Glazing is a finishing process consisting of treating the fabric with glue, starch, paraffin, shellac, or resin, then moving it through hot friction rollers. / или шеллак (shellac), . Под Аппретированием, от Французского слова Apprêter, означающее Окончательно Отделывать, понимается пропитка текстильных материалов или нанесение на них при отделке различных веществ – аппретов (крахмал, клей, синтетические смолы и другие), придающих материалам жёсткость, несминаемость, безусадочность, огнестойкость и другие свойства. Аппретированная ткань используется при производстве шлифовальной шкурки. Аппретирование, в текстильной промышленности, одна из основных операций заключительной отделки материалов (тканей, трикотажа), в результате которой они приобретают ряд ценных свойств:- повышенную износоустойчивость, безусадочность, несминаемость, гидрофобность, противогнилостность, негорючесть и другие. В отдельных случаях аппретируют пряжу, когда она выпускается в виде товарной продукции (ниточные изделия). Хлопчатобумажная и особенно льняные ткани обрабатывают крахмальным аппретом. Это повышает износоустойчивость, улучшает внешний вид ткани, её наполненность, облегчает раскрой при пошиве изделий. В состав крахмальных аппретов, кроме крахмала и продукта его гидролиза (декстрина), входят смягчающие вещества (жиры, масла, мыла), гигроскопические вещества (глицерин, поваренная соль), вещества, сообщающие тканям блеск (воск, парафин и так далее), антисептики (формалин, салициловая кислота, соли меди) и другие. При отделке шерстяных и шёлковых тканей вместо крахмала применяют мездровый клей, желатину, Аравийскую камедь и другие. Однако крахмал и другие клеящие вещества удерживаются на ткани очень непрочно и смываются при первой же стирке. Кроме того, крахмал – пищевой продукт, и его применение для аппретирования нежелательно. В зарубежной практике в качестве несмываемых аппретов используют различные эфиры целлюлозы, в частности оксиэтиловый эфир. Однако технологический процесс сравнительно сложен. В бывшем Союзе Советских Социалистических Республик (СССР) были широко распространены латексы поливинилхлорида, полиметил-метакрилата, полистирола и другие. Такая обработка повышает прочность ткани на разрыв и истирание и улучшает внешний вид ткани. Для придания хлопчатобумажным, льняным и вискозно-штапельным тканям несминаемости применяют продукты начальной конденсации ряда синтетических смол. Пользуясь синтетическими смолами и специальными каландрами, можно получить на тканях эффекты тиснения, которые делают их похожими на ткани жаккардового переплетения, а также лощения, муаровый эффект и другое. Важной задачей при выработке некоторых тканей, например плащевых, является придание им водоотталкивающих свойств. Для этого поверхность ткани подвергают гидрофобизации. Первоначально она осуществлялась с помощью парафиново-стеариновых эмульсий с закреплением их на ткани уксуснокислым алюминием. Однако гидрофобные свойства тканей при носке постепенно утрачиваются. Более совершенны способы, основанные на применении новых синтетических материалов:- хромолана, велана, препарата 246, силиконов и других. Многие из этих препаратов прочно химически связываются с волокном, благодаря чему эффект водоотталкивания становится устойчивым к различным факторам воздействия в процессе эксплуатации изделий. Большинство текстильных материалов, прежде всего целлюлозные волокна, подвержено разрушению микроорганизмами – Бактериями и Плесневыми Грибками. Для продления срока службы изделий, особенно подвергающихся длительному воздействию тепла и влаги, их обрабатывают антисептиками (противогнилостная обработка). Наиболее распространённый способ противогнилостной пропитки заключается в закреплении на тканях дубильных экстрактов солями меди и хрома. Существуют и другие методы защиты волокон от действия микроорганизмов, в частности весьма эффективными противогнилостными препаратами являются салициланилид (шерлан), диоксидихлордифенилметан (превентоль) и другие. Для придания тканям негорючести их подвергают огнезащитным пропиткам. Раньше ткань обрабатывали растворами фосфорных солей, смесью буры и борной кислоты и другого. Однако после промывки огнестойкость полностью теряется. Более эффективно нанесение на ткань солей сурьмы, титана, олова с последующим переведением их в нерастворимые соединения, а также хлорированных углеводородов, например хлорнафталина. Одним из новых эффективных способов огнезащитной обработки ткани является образование эфиров целлюлозы при воздействии на неё фосфорной кислоты в присутствии дициандиамида, а также препаратом ТНРС. Для защиты, шерстяных тканей от моли их обрабатывают растворами фтористых солей, а также различными органическими препаратами, содержащими одновременно атомы хлора, гидроксильные и сульфогруппы (эйланы), а также сульфамидные группы и атомы хлора. Аппретирование тканей:- подкрахмаливание, пожалуй, самый старый способ такой обработки тканей, при которой ткань приобретает новые свойства (в частности, большую жёсткость, несминаемость). Общее название всех подобных операций – аппретирование. Существуют такие виды аппретирования, которые позволяют придать ткани водоотталкивающие свойства и даже маслогрязеотталкивающие, сделать обычно мнущуюся ткань малосминаемой, так фиксировать заглаженные складки, что они долго не будут ‘расходиться’, и так далее. Аппретирование – довольно сложный процесс, состоящий из двух стадий:- ткань сначала надо обработать соответствующим жидким препаратом, а затем дать образоваться на поверхности достаточно твёрдой пленке. Пленка может ‘образоваться сама’ в результате испарения растворителя или воздействия кислорода воздуха, но чаще приходится как-то ‘помогать’ её образованию:- проводить ещё одну химическую обработку, вводить катализатор или действовать теплом (вспомните – глажение после подкрахмаливания). Всё это удобнее делать не дома, а на фабрике, где чаще всего и проводят аппретирование. Однако химики разрабатывают средства для аппретирования тканей и одежды в быту. Так, для придания водоотталкивающих свойств палаткам, спецодежде, плащам и другим вещам в магазинах можно приобрести препарат ‘Гидрофоб-1’ (кремнийорганическая жидкость ГКЖ и специальный катализатор). Эмульсия ГКЖ продаётся в стеклянной бутылке (400 г), в пробке которой находится пробирка с катализатором. Эмульсию смешивают с катализатором непосредственно перед употреблением. Содержимое пробирки растворяют в 6.5 л воды и тщательно размешивают. Туда же выливают содержимое флакона (эмульсию). Раствор вновь тщательно перемешивают и погружают в него выстиранную и прополосканную вещь. Её выдерживают в растворе 30 мин, слегка отжимают, подсушивают и гладят влажной. Пересушивать изделие не следует – увлажнить его вновь перед глажением будет трудно. В аэрозольной упаковке выпускаются средства ‘Гидрофоб-74’ и ‘Пропитка Палаточная’. ‘Гидрофоб-74’ предназначен для защиты от намокания текстиля, замши, велюра, искусственного меха. ‘Пропитка Палаточная’ служит для придания водоотталкивающих свойств палаткам, тентам, рюкзакам и зонтам. В продажу поступает средство ‘Стрела’ для фиксации складок на одежде из шерстяных и полушерстяных тканей. Перед применением его надо хорошо взболтать и, разбрызгивая содержимое флакона, смочить места заглаживания складки. После этого складку заглаживают с обеих сторон через марлю до тех пор, пока изделие не станет сухим. Перед обработкой светлых и цветных тканей следует предварительно проверить, выбрав незаметное место с изнанки, не меняет ли ткань свой цвет. Аппретирование хлопчатобумажных тканей производится с целью сообщить им те свойства, которые обычно предъявляются потребителем к готовому товару в

отношении удобства хранения, раскроя при пошиве изделия, а также при дальнейшем практическом использовании. После аппретирования ткань высушивается, затем подвергается увлажнению, ширению, правке утка, каландрированию. Крахмальные аппреты обычно готовят непосредственно на фабриках, аппреты более сложного состава поступают на отделочные фабрики с химических заводов. Крахмальный аппрет варят в открытых чанах вместимостью 600–1 000 литров (л), снабжённых механическими мешалками и подводкой воды, а для нагревания аппретурной массы – подводкой пара. Нагревание острым и глухим паром производят через змеевик. Иногда аппреты варят в автоклавах (под небольшим давлением). При варке под давлением происходит частичный переход крахмала в растворимое состояние. Для простых аппретов, состоящих, например, из разваренного крахмала, мыла и ультрамарина, крахмал разваривают отдельно с расщепителем. В качестве расщепителей крахмала применяют биолазу, хлорамин, гипохлорит, серную кислоту. Перед использованием в аппрет добавляют ПАВ, ультрамарин, другие вещества и хорошо перемешивают. Ниже приводятся некоторые рецепты и режимы приготовления аппретов. (i) Аппрет с биолазой:- в 750 л холодной воды при перемешивании малыми порциями всыпают 125 кг картофельной муки, добавляют 25 г биолазы, затем при перемешивании нагревают до 60–65 °С и поддерживают эту температуру в течение 40 минут, пока клейстер не сделается прозрачным. После этого аппрет нагревают по возможности быстро до кипения или добавляют 0.5 л 80%-ной уксусной кислоты, чтобы прекратить дальнейшее действие биолазы. По окончании кипячения вводят остальные составные части аппрета и водой доводят общий объем до 1 000 л. (ii) Аппрет с серной кислотой:- в 750 л воды при перемешивании всыпают 125 кг маисового крахмала, добавляют 0.5 кг 70%-ной серной кислоты и разваривают в течение 30 мин при температуре 90 °С. Затем аппрет нейтрализуют 0.45 кг (до слабощелочной реакции) кальцинированной соды. По окончании варки объём аппрета водой доводят до 1 000 л. (iii) Аппрет с окислителем:- в 750 л воды при перемешивании всыпают 125 кг картофельной муки и добавляют 0.25 кг хлорамина, при постоянном перемешивании разваривают в течение 30 мин при температуре 85–90 °С, затем аппрет нагревают по возможности быстро до кипячения, чтобы прекратить дальнейшее действие хлорамина. Общий объем аппрета доводят водой до 1 000 л. В состав крахмальных аппретов могут входить различные мягчители:- стеарокс, полиэтиленовая эмульсия, алкамон ОС-2, препарат АМ и другие. Ориентировочный состав аппрета для глянцевой отделки тканей (кг на 600 кг аппрета) таков:- крахмала картофельного – ‘4, крахмала пшеничного – 14, крахмала маисового – 14, синтетических жирных кислот (С17-21) – 0.8, глицерина – 3.6, силиката натрия – 4.0, мыла (60%-ного) – 3.6, траганта – 0.4, ультрамарина – 0.5. Способы нанесения аппрета:- аппрет наносят на ткани на плюсовках с двумя или тремя валами. Существует несколько способов нанесения аппрета. При нанесении аппрета способом в окунку ткань через направляющий ролик сначала поступает в ванну с аппретом, а затем проходит между отжимными валами. При этом способе достигается полное пропитывание ткани аппретом. При нанесении аппрета способом в жало ткань поступает непосредственно между валами плюсовки. При такой заправке нижний вал, вращаясь в ванне, захватывает аппрет и наносит его на одну сторону ткани (обычно на изнаночную). Прижим верхнего вала в этом случае должен быть отрегулирован так, чтобы аппрет по возможности не продавливался сквозь ткань. Однако незначительное количество аппрета все-таки попадает на лицевую сторону, в особенности при аппретировании тонких и редких тканей. Применяют также способ, при котором ткань пропускают в жало между двумя валами, причем нижний вал гравирован пико и снабжен раклей. Если необходимо, чтобы крахмальная масса совсем не проникала на лицевую сторону ткани, применяют этот способ. Аппрет наносят в меньшем количестве, но более концентрированный. Следует указать, что гидрофобные вещества, находящиеся в аппрете, попадая на вал, мешают его смачиванию. В этих местах аппрет не захватывается валом, в результате чего отделка получается неравномерной. При аппретировании тканей с плохой капиллярностью пропитывание ведут на трёхвальной плюсовке с двумя погружениями в ванну. Совмещение процессов аппретирования и крашения:- известно, что поливиниловый спирт в щелочной среде в присутствии электролита образует с дихлортриазиновымн активными красителями нерастворимые плёнки, что свидетельствует об образовании сетчатой структуры. Этот факт и лёг в основу комбинированного процесса аппретирования поливиниловым спиртом и крашения активными дихлортриазииовыми красителями. В этом случае дихлортриазиновые красители реагируют по трём схемам, образуя соединения сетчатой структуры с двумя макромолекулами поливинилового спирта, с двумя макромолекулами целлюлозы, с одной макромолекулой целлюлозы и одной макромолекулой поливинилового спирта одновременно. Степень химической фиксации активных красителей при проведении совместного аппретирования и крашения не ниже, чем при крашении без аппретирования. Кроме дихлортриазиновых красителей могут быть использованы и другие бифункциональные активные красители. Большой интерес приобретают совмещённые способы крашения активными красителями с малосминаемой отделкой тканей из целлюлозы. По одному из таких способов ткань обрабатывают раствором красителя, содержащим щелочной агент, сушат, пропитывают раствором или суспензией предконденсата синтетической смолы, снова сушат, а затем проводят термообработку и промывают. При крашении по двухстадийному способу большая часть красителя реагирует с волокном, меньшая – со смолой. Преимуществом этого способа является возможность использования предконденсатов любых синтетических смол. Фиксация активного красителя на целлюлозе в кислой среде происходит за счёт взаимодействия с предконденсатом смолы в процессе сушки и термофиксации. Применяемые для малосминаемой отделки смолы на базе дизвинилсульфонов реагируют с целлюлозой в щелочной среде, поэтому в данном случае фиксацию смолы и красителя на волокне можно проводить в щелочной среде. По однованному варианту процесса ‘процион – смола’ ткань плюсуют с высоким отжимом, сушат с шириением, прогревают в течение 2–3 мин при температуре 140–160 °С и мылуют в течение 30–60 с при температуре 95–100 °С в растворе соды (3 г/л) и моющего средства (1 г/л). Степень фиксации активных красителей даже в тёмных оттенках составляет выше 90%. Для тканей из вискозных штапельных волокон с учётом того, что для их отделки обычно применяют менее стойкие мочевино-формальдегидные смолы, а также в связи с некоторыми отличиями в свойствах этих волокон предлагается двухванный способ обработки. Ткани плюсуют раствором красителя, в накатанном на ролик состоянии выдерживают в течение 1–2 ч, сушат, плюсуют предконденсатом смолы, содержащим кислый катализатор моноаммоний фосфат и фиксанол PN, сушат и обрабатывают в течение 3 мин при температуре 130 °С. Заключительная мыловка в данном случае необязательна – её применяют в некоторых случаях только при крашении в тёмные тона. Для крашения по описанным выше режимам желательно пользоваться дихлоргриазиновыми активными красителями. Совмещение отделки целлюлозных изделий термореактивными смолами с крашением активными красителями позволяет повысить степень фиксации активных красителей за счёт взаимодействия части активных красителей со смолой. При этом используют два типа катализаторов:- кислый в виде азотнокислого цинка [Zn(N03b] концентрацией 8 г/л и щелочной в виде соды (Na_2CO_3) концентрацией 10 г/л. После пропитывания целлюлозное волокно сушат при температуре 70 °С, затем подвергают термообработке при температуре 140–180 °С продолжительностью от 30 с до 10 мин. Активные красители в случае использования кислого катализатора реагируют со смолой и через неё фиксируются целлюлозным волокном. При использовании щелочного катализатора активные красители реагируют со смолой и с целлюлозным волокном. Показатели прочности окрасок несколько ниже (в особенности к действию мыла при температуре 100 °С), чем у целлюлозного волокна, окрашенного активными красителями без смолы. Потеря прочности целлюлозного волокна в случае использования обоих типов катализаторов одинакова. Малосминаемая отделка на основе эпоксидных смол также может быть совмещена с крашением хлортриазиновыми красителями. Наилучшие результаты по уменьшению сминаемости и прочности окраски

достигаются при использовании смеси эпоксидной смолы ДЭГ-1 (75 г/л) и карбамола ЦЭМ (150 г/л). На Ленинградской ситценабивной фабрике имени Веры Слуцкой подтверждена возможность совмещения крашения активными красителями с малосминаемой отделкой хлопчатобумажного мерсеризованного поплина по этому способу. Угол раскрытия ткани увеличивается с 110 до 230°, а после 20 стирок угол раскрытия составляет 222°, то есть уменьшается всего на 8°. Испытания показали высокую прочность окраски к мокрым обработкам. Лощение кож, технологическая операция, применяемая при отделке поверхности кож хромового дубления, казеинового покрытия и юфти. Лощение выполняют на лощильной машине приглаживанием лицевой стороны воздушно-сухой кожи (влажностью 15–19%) гладким полированным роликом из стекла, стали, агата, яшмы, перемещающимся по замкнутой кривой. При Лощение плёнка покрывной краски распределяется на коже более равномерно, что придаёт ей зеркальную поверхность и блеск. Давление ролика уплотняет кожу, толщина её уменьшается на 8–16%, понижается воздухопроницаемость, предел прочности при растяжении увеличивается, площадь кожи остаётся почти неизменной. В связи с уменьшением производства кож казеинового покрытия Лощение заменяют прессованием. Лощение применяется для сглаживания поверхности и придания ей матового глянца после операции мастичения восковыми пастами или грунтования чистой олифой. Операция лощение может быть конечной в случае отделки изделий без применения лаков и политур. Работа обычно по лощению выполняется вручную при помощи суконки, луба или другого подходящего материала. Гладкость и матовый блеск достигаются энергичным натиранием поверхности вдоль волокон. Лучшие результаты лощения получаются при обработке свежеподсохших поверхностей (спустя 30–40 минут после вощения). Поверхности, обработанные олифой, лощат после 12–24-часовой выдержки. Ремонт и реставрация мебели:- требования к выполненной работе:- Лощёная поверхность должна быть гладкой, равномерно матового блеска. Текстура после лощения должна хорошо выделяться. Для выполнения лощения требуются:- сукно шинельное или морская трава, луб, тонкая стружка и тому подобное. Норма расхода материалов на 1 м^2:- морской травы 2–3 г, стружки 10–15 г.

GLEN CHECK = ЛОЩИННАЯ КЛЕТКА (или ПЁСТРОТКАНАЯ ШОТЛАНДКА) – Glen Check patterns usually consist of checks in varying colors with overlines or overchecks of other colors. Glen checks and glen plaids are the same.

GLENGARRY = ГЛЭНГАРИ (или ШОТЛАНДСКАЯ ШАПКА С ЛЕНТАМИ СЗАДИ) – Glengarry is a woolen cap of Scottish origin.

GLEN PLAID = ГЛЭН ПЛЭД (или XX) – Glen Plaid is a fabric woven in a twill pattern of broken checks. Also called Glen Check.

GLEY = ГЛЕЙ (или ГЛЕЕВАЯ (ПОЧВА)) – Gley:- pertaining to grayish, greenish, and bluish soil colors resulting from waterlogging and reduction of the soil material. / Под Глеем понимается горизонт почвенного профиля зелёной или голубой (часто с ржавыми пятнами) окраски, бесструктурный. Характерен для заболоченных и болотных почв.

GLH = GREEN LEAFHOPPER

GLITTER = СВЕРКАНИЕ (или БЛЕСК, или XX) – (1) Glitter is the name, sometimes used in place of lame, for any fabric woven or knitted with all metallic yarns or with a combination of metallic and other fiber yarns. Today, most glitter is made from one of the nontarnishable metallic fibers, a great improvement over lame of the past that tended to darken with age.

(2) Glitter is the specialty ink providing brilliant, sparkling looks.

GLOBAL CERTIFICATE = ГЛОБАЛЬНОЕ СВИДЕТЕЛЬСТВО (или ГЛОБАЛЬНЫЙ СЕРТИФИКАТ) – Global Certificate is a collective instrument for securities, in particular for bond issues and shares, which – with the exception of a small number of physically held securities certificates – represents the holdings of all shareholders and bond creditors in equity and bonds of a company's specific issuance. Global certificates serve to simplify securities safekeeping and administration. In the case of new issues, global certificates are often submitted to enable trading to start even before individual certificates have been delivered to Clearstream.

GLOBAL CUSTODIAN = ГЛОБАЛЬНЫЙ ДОВЕРИТЕЛЬНЫЙ УПРАВЛЯЮЩИЙ (или ГЛОБАЛЬНЫЙ РАСПОРЯДИТЕЛЬ) – Global Custodian is an institution that provides its customers with safekeeping services and that administers securities that trade and settle throughout the world. / Институт, который обеспечивает своих заказчиков услугами ответственного хранения и который осуществляет администрирование ценных бумаг, торгуемых и рассчитываемых по всему миру.

GLOBAL DEPOSITORY RECEIPT = ГЛОБАЛЬНАЯ ДЕПОЗИТАРНАЯ РАСПИСКА – Global Depositary Receipt (GDR):- to raise money in more than one market, some corporations use global depositary receipts (GDRs) to sell their stock on markets in countries other than the one where they have their headquarters. The GDRs are issued in the currency of the country where the stock is trading. For example, a Mexican company might offer GDRs priced in pounds in London and in yen in Tokyo. Individual investors in the countries where the GDRs are issued buy them to diversify into international markets. GDRs let you do this without having to deal with currency conversion and other complications of overseas investing. However, since GDRs are frequently offered by newer or less-known companies, the prices are often volatile and the stocks may be thinly traded. That makes buying GDRs riskier than buying domestic stocks. See also Depositary Receipt. Global Depository Receipts (GDRs) are the same as American Depository Receipt (ADR) but typically not registered with the US Securities and Exchange Commission (SEC) on Form F-6, and are therefore generally restricted in terms of resales. Global Depositary Receipts (GDRs) are negotiable certificates issued by depositary banks which represent ownership of a given number of a company's shares which can be listed and traded independently from the underlying shares. These instruments are typically used by companies from emerging markets and marketed to professional investors only. GDRs can be listed on either the Main Market via a Standard Listing or on the Professional Securities Market. A GDR will be used to access two or more markets, usually London and the US. They are often launched for capital raising purposes, so the US element is generally either a Rule 144(a) ADR or a Level III ADR, depending on whether the issuer aims to tap the private placement or public US markets. These securities are generally traded in US Dollars on the Exchange's Electronic Trading Service the International Order Book (IOB). Associated dividends are paid to investors in US Dollars. GDRs are settled in either DTC or Euroclear Bank enhancing their cross border liquidity. The more liquid IOB securities have central counterparty clearing ensuring pre and post trade anonymity as well as mitigation of counterparty risk. Global Depository Receipt (GDR) is a negotiable certificate issued by one country's bank against a certain number of shares held in its custody but traded on the stock exchange of another country. GDRs entitle the shareholders to all associated dividends and capital gains, and can be bought and sold like other securities. Thus they allow investors in any country to buy shares of any other country without losing the income or trading flexibility. Also called European Depository Receipt (EDR) or International Depository Receipt (IDR). Global Depository Receipt (GDR) is:- (1) a bank certificate issued in more than one country for shares in a foreign company. The shares are held by a foreign branch of an international bank. The shares trade as domestic shares, but are offered for sale globally through the various bank branches. A GDR is very similar to an American Depositary Receipt. (2) A financial instrument used by private markets to raise capital denominated in either US Dollars or Euros. These instruments are called EDRs when private markets are attempting to obtain Euros. / Юроклыэ Бэньк (Euroclear Bank). Глобальная Депозитарная Расписка (ГДР) – расписка, подтверждающая право на акции иностранной компании, которые имеют хождение во всех странах мира. Если Американская Депозитарная Расписка (АДР; American Depositary Receipt (ADR)) даёт право иностранным компаниям продавать акции гражданам США, то Глобальная Депозитарная Расписка даёт право компаниям из Европы, Азии, США и

Латинской Америки продавать акции на многих мировых рынках. Преимущество ГДР эмитента состоит в том, что компания-эмитент может привлекать капитал не только на отечественном, но и на многих рынках мира. Удобство ГДР для местных инвесторов заключается в том, что они не должны покупать акции на бирже страны-эмитента, что может быть трудно осуществимо и дорого. Кроме того, курс акций и все дивиденды переводятся в валюту страны – держателя акции. Многие ГДР выпускаются компаниями с развивающихся рынков, таких, как Китай, Индия, Бразилия и Южная Корея, а продаются на ведущих фондовых рынка, в частности через электронную систему информации о ценах на Лондонской Фондовой Бирже (London SEAQ International Trading System). Поскольку компании, выпускающие ГДР, известны недостаточно хорошо и пользуются принципами учёта, отличными от принципов учёта, применяемых Западными фирмами, их акции считаются менее устойчивыми и менее ликвидными.

GLOBAL ECONOMY = ГЛОБАЛЬНАЯ ЭКОНОМИКА – Global Economy is the international economic activity which includes the world-wide integration of markets for goods, services, labor, and capital. / Под Глобальной Экономикой понимается внешнеэкономическая деятельность (или международная экономическая деятельность), включающая в себя повсеместную мировую интеграцию рынков товаров, услуг, труда и капитала.

GLOBAL EXPORT MANAGER = УПРАВЛЯЮЩИЙ ГЛОБАЛЬНЫМ ВЫВОЗОМ (или УПРАВЛЯЮЩИЙ ГЛОБАЛЬНЫМ ЭКСПОРТОМ) – In the United States, the Global Export Manager (GEM) is an electronic system for collecting and disseminating trade leads and business opportunities. GEM is maintained by the National Association of State Development Agencies (NASDA). / В Соединённых Штатах Америки под Управляющим Глобальным Экспортом (УГЭ) подразумевается электронная система обработки поступающей информации о торговых инициативах и деловых возможностях. УГЭ поддерживается Национальной Ассоциацией Агентств по Развитию Штата (НААРШ; (the National Association of State Development Agencies (NASDA))).

GLOBAL INDUSTRY CLASSIFICATION STANDARD = ГЛОБАЛЬНЫЙ СТАНДАРТ ПРОМЫШЛЕННОЙ КЛАССИФИКАЦИИ – The Global Industry Classification Standard (GICS) was developed in response to the global financial community's need for one complete, consistent set of global sector and industry definitions that reflects today's economy and is flexible enough to change as the investment world changes. The industry groups under the GICS system are:- Consumer Discretionary, Consumer Staples, Energy, Financials, Financials excluding Property Trusts, Health Care, Industrials, Information Technology, Materials, Property Trusts, Telecommunication Services, and Utilities. / , Службы Дальней Связи, и . коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо).

GLOBALIZATION = ГЛОБАЛИЗАЦИЯ – Globalization is the tendency of investment funds and businesses to move beyond domestic and national markets to other markets around the globe, thereby increasing the interconnectedness of different markets. Globalization has had the effect of markedly increasing not only international trade, but also cultural exchange. The advantages and disadvantages of globalization have been heavily scrutinized and debated in recent years. Proponents of globalization say that it helps developing nations 'catch up' to industrialized nations much faster through increased employment and technological advances. Critics of globalization say that it weakens national sovereignty and allows rich nations to ship domestic jobs overseas where labor is much cheaper. Globalization is far-reaching structural changes, also affecting banking business. A visible sign of the far-reaching transformation is the increasing use of a large number of innovative financial instruments, and the steady integration of national financial markets into international ones. This latter development, in particular, has led to a sharp increase in cross-border money and capital transactions, which is widely known as the Internationalization Of Financial Markets or the Globalization Of Banking. Globalization is a favourite catchphrase of journalists and politicians. It has also become a key idea for business theory and practice, and entered academic debates. But what people mean by 'globalization' is often confused and confusing. Here we examine some key themes in the theory and experience of globalization. Globalization is commonly used as a shorthand way of describing the spread and connectedness of production, communication and technologies across the world. That spread has involved the interlacing of economic and cultural activity. Rather confusingly, 'globalization' is also used by some to refer to the efforts of the International Monetary Fund (IMF), the World Bank and others to create a global free market for goods and services. This political project, while being significant – and potentially damaging for a lot of poorer nations – is really a means to exploit the larger process. Globalization in the sense of connectivity in economic and cultural life across the world, has been growing for centuries. However, many believe the current situation is of a fundamentally different order to what has gone before. The speed of communication and exchange, the complexity and size of the networks involved, and the sheer volume of trade, interaction and risk give what we now label as 'globalization' a peculiar force. With increased economic interconnection has come deep-seated political changes – poorer, 'peripheral', countries have become even more dependent on activities in 'central' economies such as the USA where capital and technical expertise tend to be located. There has also been a shift in power away from the nation state and toward, some argue, multinational corporations. We have also witnessed the rise and globalization of the 'brand'. It isn't just that large corporations operate across many different countries – they have also developed and marketed products that could be just as well sold in Peking as in Washington. Brands like Coca Cola, Nike, Sony, and a host of others have become part of the fabric of vast numbers of people's lives. Globalization involves the diffusion of ideas, practices and technologies. It is something more than internationalization and universalization. It isn't simply modernization or westernization. It is certainly isn't just the liberalization of markets. Anthony Giddens (1990:- 64) has described globalization as 'the intensification of worldwide social relations which link distant localities in such a way that local happenings are shaped by events occurring many miles away and vice versa'. This involves a change in the way we understand geography and experience localness. As well as offering opportunity it brings with considerable risks linked, for example, to technological change. Globalization, thus, has powerful economic, political, cultural and social dimensions. Here we want to focus on four themes that appear with some regularity in the literature:- (i) de-localization and supraterritoriality; (ii) the speed and power of technological innovation and the associated growth of risk; (iii) the rise of multinational corporations; and (iv) the extent to which the moves towards the creation of (global) free markets to leads to instability and division. Globalization:- delocalization and supraterritoriality:- Manuel Castells (1996) has argued persuasively that in the last twenty years or so of the XX century, a new economy emerged around the world. He characterizes it as a new brand of capitalism that has three fundamental features:- productivity and competitiveness are, by and large, a function of knowledge generation and information processing; firms and territories are organized in networks of production, management and distribution; the core economic activities are global – that is, they have the capacity to work as a unit in real time, or chosen time, on a planetary scale. (Castells 2001:- 52). This last idea runs through a lot of the discussion of globalization. Globalization and de-localization. Many of the activities that previously involved face-to-face interaction, or that were local, are now conducted across great distances. There has been a significant de-localization in social and economic exchanges. Activities and relationships have been uprooted from local origins and cultures (Gray 1999:- 57). One important element in this has been the separation of work from the home (and the classic move to the suburbs – see Putnam's discussion of the impact on this on local social relations). But de-localization goes well beyond this. Increasingly people have to deal with distant systems in order that they may live their lives. Banking and retailing, for example, have adopted new technologies that involve people in less face-to-face interaction. Your contact at the bank is in a call centre many miles away; when you buy goods on the internet the only person you might speak to is the delivery driver. In this last example we move beyond simple notions of

distance and territory into a new realm (and this is what Scholte is especially concerned with when he talks of globalization). When we buy books from an internet supplier like Amazon our communications pass through a large number of computers and routers and may well travel thousands of miles; the computers taking our orders can be on a different continent; and the books can be located anywhere in the world. The 'spaces' we inhabit when using the internet to buy things or to communicate (via things like chatrooms and bulletin boards) can allow us to develop a rather different sense of place and of the community to which we belong. Not everything is global, of course. Most employment, for example, is local or regional – but 'strategically crucial activities and economic factors are networked around a globalized system of inputs and outputs' (Castells 2001:- 52). What happens in local neighbourhoods is increasingly influenced by the activities of people and systems operating many miles away. For example, movements in the world commodity and money markets can have a very significant impact upon people's lives across the globe. People and systems are increasingly interdependent. The starting point for understanding the world today is not the size of its GDP or the destructive power of its weapons systems, but the fact that it is so much more joined together than before. It may look like it is made up of separate and sovereign individuals, firms, nations or cities, but the deeper reality is one of multiple connections. (Mulgan 1998:- 3). Businesses are classic example of this. As Castells (2001) noted they are organized around networks of production, management and distribution. Those that are successful have to be able to respond quickly to change – both in the market and in production. Sophisticated information systems are essential in such globalization. Globalization and the decline in power of national governments. It isn't just individuals and neighbourhood institutions that have felt the impact of de-localization. A major causality of this process has been a decline in the power of national governments to direct and influence their economies (especially with regard to macroeconomic management). Shifts in economic activity in say, Japan or the United States, are felt in countries all over the globe. The internationalization of financial markets, of technology and of some manufacturing and services bring with them a new set of limitations upon the freedom of action of nation states. In addition, the emergence of institutions such as the World Bank, the European Union and the European Central Bank, involve new constraints and imperatives. Yet while the influence of nation states may have shrunk as part of the process of globalization it has not disappeared. Indeed, they remain, in Hirst and Thompson's (1996:- 170) words, 'pivotal' institutions, 'especially in terms of creating the conditions for effective international governance'. However, we need to examine the way in which national governments frame their thinking about policy. There is a strong argument that the impact of globalization is most felt through the extent to which politics everywhere are now essentially market-driven. 'It is not just that governments can no longer 'manage' their national economies', Colin Leys (2001:- 1) comments, 'to survive in office they must increasingly 'manage' national politics in such a ways as to adapt them to the pressures of trans-national market forces'. The initiation, or acceleration, of the commodification of public services was ... a logical result of government's increasingly deferential attitude towards market forces in the era of the globalized economy .... A good deal of what was needed [for the conversion of non-market spheres into profitable fields for investment] was accomplished by market forces themselves, with only periodic interventions by the state, which then appeared as rational responses to previous changes. (Leys 2001:- 214). In other words, the impact of globalization is less about the direct way in which specific policy choices are made, as the shaping and reshaping of social relations within all countries. Risk, technological innovation and globalization:- as we have already noted, a particular feature of 'globalization' is the momentum and power of the change involved. 'It is the interaction of extraordinary technological innovation combined with world-wide reach that gives today's change its particular complexion' (Hutton and Giddens 2001:- vii). Developments in the life sciences, and in digital technology and the like, have opened up vast, new possibilities for production and exchange. Innovations like the internet have made it possible to access information and resources across the world – and to coordinate activities in real time. Globalization and the knowledge economy. Earlier we saw Castells making the point that productivity and competitiveness are, by and large, a function of knowledge generation and information processing. This has involved a major shift – and entails a different way of thinking about economies. For countries in the vanguard of the world economy, the balance between knowledge and resources has shifted so far towards the former that knowledge has become perhaps the most important factor determining the standard of living – more than land, than tools, than labor. Today's most technologically advanced economies are truly knowledge-based. (World Bank 1998). The rise of the so-called 'Knowledge Economy' has meant that economists have been challenged to look beyond labor and capital as the central factors of production. Paul Romer and others have argued that technology (and the knowledge on which it is based) has to be viewed as a third factor in leading economies. (Romer, 1986; 1990). Global finance, thus, becomes just one force driving economies. Knowledge capitalism:- 'the drive to generate new ideas and turn them into commercial products and services which consumers want' is now just as pervasive and powerful (Leadbeater 2000:- 8). Inevitably this leads onto questions around the generation and exploitation of knowledge. There is already a gaping divide between rich and poor nations – and this appears to be accelerating under 'knowledge capitalism'. There is also a growing gap within societies (and this is one of the driving forces behind the English government's Connexions strategy). Commentators like Charles Leadbeater have argued for the need to 'innovate and include' and for a recognition that successful knowledge economies have to take a democratic approach to the spread of knowledge:- 'We must breed an open, inquisitive, challenging and ambitious society' (Leadbeater 2000:- 235, 237). However, there are powerful counter-forces to this ideal. In recent years we have witnessed a significant growth in attempts by large corporations to claim intellectual rights over new discoveries, for example in relation to genetic research, and to reap large profits from licensing use of this 'knowledge' to others. There are also significant doubts as to whether 'modern economies' are, indeed, 'knowledge economies'. It doesn't follow, for example, that only those nations committed to lifelong learning and to creating a learning society will thrive (see Wolf 2002:- 13-55). Globalization and Risk:- as well as opening up considerable possibility, the employment of new technologies, when combined with the desire for profit and this 'world-wide' reach, brings with it particular risks. Indeed, writers like Ulrich Beck (1992:- 13) have argued that the gain in power from the 'techno-economic progress' is quickly being overshadowed by the production of risks. (Risks in this sense can be viewed as the probability of harm arising from technological and economic change). Hazards linked to industrial production, for example, can quickly spread beyond the immediate context in which they are generated. In other words, risks become globalized. Modernization Risks possess an inherent tendency towards globalization. A universalization of hazards accompanies industrial production, independent of the place where they are produced:- food chains connect practically everyone on earth to everyone else. They dip under borders. (Beck 1992:- 39). As Beck (1992:- 37) has argued there is a boomerang effect in globalization of this kind. Risks can catch up with those who profit or produce from them. The basic insight lying behind all this is as simple as possible:- everything which threatens life on this Earth also threatens the property and commercial interests of those who live from the commodification of life and its requisites. In this way a genuine and systematically intensifying contradiction arises between the profit and property interests that advance the industrialization process and its frequently threatening consequences, which endanger and expropriate possessions and profits (not to mention the possession and profit of life) (Beck 1992:- 39). Here we have one of the central paradoxes of what Beck has termed 'the risk society'. As knowledge has grown, so has risk. Indeed, it could be argued that the social relationships, institutions and dynamics within which knowledge is produced have accentuated the risks involved. Risk has been globalized. Globalization and the rise of multinational corporations and branding:- a further, crucial aspect of globalization is the nature and power of multinational corporations. Such companies now account for over 33 per cent of world output, and 66 per cent of world trade (Gray 1999:- 62). Significantly, something like a quarter of world trade occurs within multinational corporations (op. cit). This last point is well illustrated by the operations of car manufacturers who typically source their components from plants situated in different countries. However, it is

important not to run away with the idea that the sort of globalization we have been discussing involves multinationals turning, on any large scale, to transnationals:- international businesses are still largely confined to their home territory in terms of their overall business activity; they remain heavily 'nationally embedded' and continue to be multinational, rather than transnational, corporations. (Hirst and Thompson 1996:- 98). While full globalization in this organizational sense may not have occurred on a large scale, these large multinational corporations still have considerable economic and cultural power. Globalization and the impact of multinationals on local communities. Multinationals can impact upon communities in very diverse places. First, they look to establish or contract operations (production, service and sales) in countries and regions where they can exploit cheaper labor and resources. While this can mean additional wealth flowing into those communities, this form of 'globalization' entails significant inequalities. It can also mean large scale unemployment in those communities where those industries were previously located. The wages paid in the new settings can be minimal, and worker's rights and conditions poor. For example, a 1998 survey of special economic zones in China showed that manufacturers for companies like Ralph Lauren, Adidas and Nike were paying as little as 13 cents per hour (a 'living wage' in that area is around 87 cents per hour). In the United States workers doing similar jobs might expect USD10 per hour (Klein 2001:- 212). Second, multinationals constantly seek out new or under-exploited markets. They look to increase sales – often by trying to create new needs among different target groups. One example here has been the activities of tobacco companies in southern countries. Another has been the development of the markets predominantly populated by children and young people. In fact the child and youth market has grown into one the most profitable and influential sectors. 'The young are not only prized not only for the influence they have over adult spending, but also for their own burgeoning spending power' (Kenway and Bullen 2001:- 90). There is increasing evidence that this is having a deep effect; that our view of childhood (especially in northern and 'developed' countries) is increasingly the product of 'consumer-media' culture. Furthermore, that culture:- ... is underpinned in the sweated work of the 'othered' children of the so-called 'Third World'. With the aid of various media, the commodity form has increasingly become central to the life of the young of the West, constructing their identities and relationships, their emotional and social worlds .... Adults and schools have been negatively positioned in this matrix to the extent that youthful power and pleasure are constructed as that which happens elsewhere – away from adults and schools and mainly with the aid of commodities. (Kenway and Bullen 2001:- 187). Of course such commodification of everyday life is hardly new. Writers like Erich Fromm were commenting on the phenomenon in the early 1950s. However, there has been a significant acceleration and intensification (and globalization) with the rise of the brand (see below) and a heavier focus on seeking to condition children and young people to construct their identities around brands. Third, and linked to the above, we have seen the erosion of pubic space by corporate activities. Significant areas of leisure, for example, have moved from more associational forms like clubs to privatized, commercialized activity. Giroux (2000:- 10), for example, charts this with respect to young people. Young people are increasingly excluded from public spaces outside of schools that once offered them the opportunity to hang out with relative security, work with mentors, and develop their own talents and sense of self-worth. Like the concept of citizenship itself, recreational space is now privatized as commercial profit-making venture. Gone are the youth centers, city public parks, outdoor basketball courts or empty lots where kids call play stick ball. Play areas are now rented out to the highest bidder .... This movement has been well documented in the USA (particularly by Robert Putnam with respect to a decline in social capital and civic community – but did not examine in any depth the role corporations have taken). It has profound implications for the quality of life within communities and the sense of well-being that people experience. Fourth, multinational companies can also have significant influence with regard to policy formation in many national governments and in transnational bodies such as the European Union and the World Bank (key actors within the glboalization process). They have also profited from privatization and the opening up of services. As George Monbiot has argued with respect to Britain, for example:- the provision of hospitals, roads and prisons ... has been deliberately tailored to meet corporate demands rather than public need' (2001:- 4). He continues:- ... biotechnology companies have sought to turn the food chain into a controllable commodity and there is an extraordinary web of influence linking them to government ministers and government agencies .... Corporations have come to govern key decision-making processes within the European Union and, with the British government's blessing, begun to develop a transatlantic single market, controlled and run by corporate chief executives. (Monbiot 2001:- 5). While with globalization the power of national governments over macro-economic forces may have been limited in recent years, the services and support they provide for their citizens have been seen as a considerable opportunity for corporations. In addition, national governments still have considerable influence in international organizations – and have therefore become the target of multinationals for action in this arena. Branding and Globalization:- the growth of multinationals and the globalization of their impact is wrapped up with the rise of the brand. The astronomical growth in the wealth and cultural influence of multi-national corporations over the last fifteen years can arguably be traced back to a single, seemingly innocuous idea developed by management theorists in the mid-1980s:- that successful corporations must primarily produce brands, as opposed to products. (Klein 2001:- 3). As Naomi Klein (2001:- 196) has suggested, 'brand builders are the new primary producers in our so-called Knowledge Economy'. One of the key elements that keeps companies as multinationals rather than transnationals is the extent to which they look to 'outsource' products, components and services. The logic underlying this runs something like the following:- ... corporations should not expend their finite resources on factories that will demand physical upkeep, on machines that will corrode or on employees who will certainly age and die. Instead, they should concentrate those resources in the virtual brick and mortar used to build their brands. Nike, Levi, Coca Cola and other major companies spend huge sums of money in promoting and sustaining their brands. One strategy is to try and establish particular brands as an integral part of the way people understand, or would like to see, themselves. As we have already seen with respect the operation of multinationals this has had a particular impact on children and young people (and education). There is an attempt 'to get them young'. Significantly, the focus on brand rather than the inherent qualities of the product as well as advantaging multinationals in terms of market development also has an Achilles heel. Damage to the brand can do disproportionate harm to sales and profitability. If a brand becomes associated with failure or disgrace (for example where a sports star they use to advertise their brand is exposed as a drug-taker; or where the brand becomes associated in the public's mind with the exploitation of children – as for example has happened with some of the main trainer makers) then it can face major problems in the marketplace. Globalization and the multinationals. While there is no doubting the growth in scale and scope of multinational corporations – the degree of control they have over the central dynamics of globalization remains limited. In reality, they are often weak and amorphous organizations. They display the loss of authority and erosion of common values that afflicts practically all late modern social institutions. The global market is not spawning corporations which assume the past functions of sovereign states. Rather, it has weakened and hollowed out both institutions. (Gray 1999:- 63). While multinationals have played a very significant role in the growth of globalization, it is important not to overplay the degree of control they have had over the central dynamics. Capitalism, Free Markets, Instability and Division:- Amartya Sen (2002) has argued that 'the market economy does not work by itself in global relations – indeed, it cannot operate alone even within a given country'. Yet, for some proponents of globalization the aim is to expand market relations, push back state and interstate interference, and create a global free market. This political project can be seen at work in the activities of transnational organizations like the World Trade Organization (WTO), the International Monetary Fund (IMF), and the Organization for Economic Cooperation and Development (OECD), and has been a significant objective of United States intervention. Part of the impetus for this project was the limited success of corporate/state structures in planning and organizing economies. However, even more significant was the growth in influence of neo-liberal ideologies and their promotion by powerful politicians like Reagan in the USA and Thatcher in the UK. A new

orthodoxy became ascendant. In the USA a Democrat President renounced 'big government'; in Britain, the Labour Party abandoned its commitment to social ownership. The 'markets were in command' (Frank 2002:- xv). The basic formula ran something like the following:- Privatization + Deregulation + Globalization = Turbo-capitalism = Prosperity (Luttwak quoted by Frank 2002:- 17). As various commentators have pointed out, the push toward deregulation and 'setting markets free' that so dominated political rhetoric in many northern countries during the 1980s and 1990s was deeply flawed. For example, the central tenet of free market economics – that unregulated markets 'will of their own accord find unimprovable results for all participants' has, according to Will Hutton (1995:- 237), 'now proved to be a nonsense. It does not hold in theory. It is not true'. Historically, free markets have been dependent upon state power. For markets to function over time they require a reasonable degree of political stability, a solid legal framework and a significant amount of social capital. The push to engineer free markets has contained within it the seeds of its own destruction. The central paradox of our time can be stated thus:- economic globalization does not strengthen the current regime of global laissez-faire. It works to undermine it. There is nothing in today's global market that buffers it against the social strains arising from high uneven economic development within and between the world's diverse societies. The swift waxing and waning of industries and livelihoods, the sudden shifts of production and capital, the casino of currency speculation – these conditions trigger political counter-movements that challenge the very ground rules of the global free market. (Gray 1999:- 7). Capitalism is essentially disruptive and ever-changing – and takes very different forms across the world. While it produces wealth for significant numbers of people, many others have suffered. The gap between rich and poor has widened as global capitalism has expanded. For example, David Landes (1999:- xx) has calculated that the difference in income per head between the richest nation (he cited Switzerland) and the poorest non-industrial country, Mozambique, is now about 400 to 1. 'Two hundred and fifty years ago, the gap between richest and poorest was perhaps 5 to 1, and the difference between Europe and, say, East or South Asia (China or India) was around 1.5 or 2 to 1' (op. cit.). The development of markets, the expansion of economic activity, and the extent to which growing prosperity is experienced by populations as a whole has been, and remains, deeply influenced by public policies around, for example, education, land reform and the legal framework for activity. Economists like Amartya Sen have argued that 'public action that can radically alter the outcome of local and global economic relations'. For him the:- ... central issue of contention is not globalization itself, nor is it the use of the market as an institution, but the inequity in the overall balance of institutional arrangements – which produces very unequal sharing of the benefits of globalization. The question is not just whether the poor, too, gain something from globalization, but whether they get a fair share and a fair opportunity. (Sen 2002). Strong markets require significant state and transnational intervention. To be sustained across time they also require stable social relationships and an environment of trust. Moreover, they can be organized and framed so that people throughout different societies can benefit. Conclusion:- one commentator has argued that there is a very serious case not against 'globalization', ... but against the particular version of it imposed by the world's financial elites. The brand currently ascendant needlessly widens gaps of wealth and poverty, erodes democracy, seeds instability, and fails even its own test of maximizing sustainable economic growth. (Kuttner 2002). The gap between rich and poor countries has widened considerably. However, as Sen (2002) has commented, to 'see globalization as merely Western imperialism of ideas and beliefs (as the rhetoric often suggests) would be a serious and costly error'. He continues:- of course, there are issues related to globalization that do connect with imperialism (the history of conquests, colonialism, and alien rule remains relevant today in many ways), and a postcolonial understanding of the world has its merits. But it would be a great mistake to see globalization primarily as a feature of imperialism. It is much bigger – much greater – than that. For example, while the reach and power of multinationals appears to have grown significantly, neither they, nor individual national governments, have the control over macro-economic forces that they would like. Ecological and technological risks have multiplied. Globalization in the sense of connectivity in economic and cultural life across the world, is of a different order to what has gone before. As we said at the start, the speed of communication and exchange, the complexity and size of the networks involved, and the sheer volume of trade, interaction and risk give what we now label as 'globalization' a peculiar force. All this raises particular questions for educators. Has the process of globalization eroded the autonomy of national education systems? How has it impacted on the forms that education now takes? What is the effect of an increased corporate presence and branding in education? What response should educators make? We examine these and other issues in globalization and the incorporation of education. / Кока Кола (Coca Cola), Найки (или Найк в Великобритании; Nike), Сони (Sony), . THE GLOBAL MOBILE COMMERCE INTEROPERABILITY GROUP = ГРУППА ВЗАИМОДЕЙСТВИЯ ПО ГЛОБАЛЬНОЙ МОБИЛЬНОЙ КОММЕРЦИИ – The Global Mobile Commerce Interoperability Group (GMCIG) was formed in June 2000, as an evolution of MasterCard's and Europay's leadership in the area of wireless payment models. The GMCIG offers participants a global and open organization to develop and promote secure wireless payment standards. The organization seeks contributions from all players in the marketplace including network operators, device manufacturers, mobile technology and content providers, financial institutions, and other global payment associations. / Группа Взаимодействия по Глобальной Мобильной Коммерции (ГВГМК) была сформирована в Июне 2000, в качестве эволюции господствующего положения МэстчёКард и Юропэй в области моделей беспроводных платежей. ГВГМК предлагает участникам глобальную и открытую организацию для развития и продвижения стандартов безопасности беспроводных платежей. Организация спрашивает контрибуции со всех игроков данной рыночной площадки, включая операторов сети, изготовителей устройств, поставщиков мобильной технологии и программного обеспечения, финансовых учреждений, и прочих глобальных платёжных ассоциаций.

GLOBAL QUOTA = ГЛОБАЛЬНАЯ КВОТА – A Global Quota is a quota on the total imports of a product from all countries. / Глобальная Квота – это квота на весь объём привоза (или импорта) определённого продукта из всех стран.

GLOBAL RADIATION = ГЛОБАЛЬНАЯ РАДИАЦИЯ (или ГЛОБАЛЬНОЕ ИЗЛУЧЕНИЕ) – Global Radiation is the wavelength distribution of sunlight under a given environment, e.g., under windowpane glass.

GLOBAL REGISTERED SHARES = ГЛОБАЛЬНЫЕ ИМЕННЫЕ АКЦИИ (или ГЛОБАЛЬНЫЕ ЗАРЕГИСТРИРОВАННЫЕ АКЦИИ) – Global Registered Shares are the actual (ordinary) shares of a non-US company, which trade both in the home market and

the United States. The same share certificate is used in both the US and home market. Separate registrars in the US and home country are maintained. In most cases, purchases occurring on a US exchange would be reflected on the US Registrar. Global Registered Shares may also be eligible to list on exchanges in addition to the US and home country. Global Registered Shares are issued pursuant to the company's charter and generally require a charter amendment to create or modify. In the home market, material modifications to local trading settlement practices, ownership transfer procedures and certain other procedures may be necessary. Due to legal and practical considerations, a Global Registered Share structure may only be appropriate in certain jurisdictions and for a limited number of companies with unique goals.

GLOBAL STANDARDS ONE = ГЛОБАЛЬНЫЕ СТАНДАРТЫ ОДИН – Global Standards One (GS1) is a not-for-profit organization that develops and maintains global standards for business communication. The best known of these standards is the barcode, a symbol printed on products that can be scanned electronically. GS1 barcodes are scanned more than six billion times every day. GS1 has 112 local member organizations and 1.5 million user companies. GS1 standards are designed to improve the efficiency, safety and visibility of supply chains across physical and digital channels in 25 sectors. They form a business language that identifies, captures and shares key information about products, locations, assets and more. History:- in 1969, the retail industry in the US was searching for a way to speed up the check-out process in shops. The Ad Hoc Committee for a Uniform Grocery Product Identification Code was established to find a solution. In 1973, the Universal Product Code (UPC) was selected by this group as the first single standard for unique product identification, and in 1974, the Uniform Code Council (UCC) was founded to administer the standard. On 26 June 1974, a pack of Wrigley's chewing gum became the first ever product with a barcode to be scanned in a shop. In 1976, the original 12-digit code was expanded to 13 digits, which opened the doors for the identification system to be used outside the United States. In 1977, the European Article Numbering Association (EAN) was established in Brussels and with founding members from 12 countries. In 1990, EAN and UCC signed a global cooperation agreement and expanded overall presence to 45 countries. In 1999, EAN and UCC launched the Auto-ID Centre to develop Electronic Product Code (EPC) enabling GS1 standards to be used for RFID (short for the Radio-Frequency Identification). In 2004, EAN and UCC launched the Global Data Synchronisation Network (GDSN), a global, internet-based initiative that enables trading partners to efficiently exchange product master data. By 2005, the organization was present in over 90 countries started to use the name GS1 on a worldwide basis. Barcodes:- Barcodes defined by GS1 standards are very common. They encode a product identification number that can be scanned electronically, making it easier for products to be tracked, processed, and stored. Barcodes allow for greater safety, reliability, speed and efficiency of supply chains. They have a crucial role in the retail industry, moving beyond just faster checkout to improved inventory and delivery management and the opportunity to sell online on a global scale. In the United Kingdom alone, the introduction of the barcode in the retail industry has resulted in savings of 10.5 billion Pounds per year. Some of the barcodes that GS1 manages are:- EAN/UPC (used mainly on consumer goods), GS1 Data Matrix (used mainly on healthcare products), GS1-128, GS1 DataBar, and GS1 QR Code. Standards:- the most important GS1 standard is the GTIN. It identifies products uniquely around the world and forms the base of the GS1 system. Main GS1 standards are as follows:- ALE; CBV; EAN/UPC barcodes; EPC/RFID tags; EPCIS; GDSN; GDTI; GEPIR; GIAI; GINC; GLN; GPC; GRAI; GS1 DataBar; GS1 Datamatrix; GS1 EANCOM; GS1 EDI; GS1 SmartSearch; GS1 XML; GSIN; GSRN; GTIN; HF Air Interface; LLRP; SSCC; TDS; TDT; Traceability; UHF Gen2 Air Interface. Many GS1 standards are also ISO standards. For example, GTIN, GLN, SSCC. GS1 also acts as the secretariat for ISO's Automatic identification and data capture techniques technical committee (ISO/IEC JTC 1/SC 31). GS1 standards are developed and maintained through the GS1 Global Standards Management Process (GSMP), a community-based forum that brings together representatives from different industries and businesses. Together they find and implement standards-based solutions to address common supply chain challenges. Industries:- (1) Retail:- retail was the first industry that GS1 began working with and has remained their primary focus. Today, GS1 operates in four retail sub-sectors on a global level:- Apparel, Fresh Foods, CPG/Grocery and General Merchandise. Key focus areas in retail include sustainability, data quality, compliance with regulatory requirements, traceability of products from their origin through delivery, and upstream integration between manufacturers and suppliers. As consumers continue to switch between in-store and e-commerce shopping channels, a consistent shopping experience, efficiency, safety and speed are expected. GS1 has developed standards that uniquely identify products for the benefit of consumers and for search engines, providing accurate and complete product information digitally. Major e-commerce companies such as eBay, Amazon and Google Shopping require companies to use a GS1 number to sell on their websites. (2) Healthcare:- GS1 operates also since many years in Healthcare with the primary objective to increase patient safety and drive supply chain efficiency. Usage of GS1 standards in Healthcare support traceability of products from the manufacturer to the patient, contribute to detect counterfeit products, help to prevent medication errors, enable effective recalls and supports clinical processes. Regulatory bodies across the world are mandating the implementation of GS1 standards for the above reasons as well for medicines as medical devices. (3) Other Industries:- GS1 operates in four other key industries globally:- Transport & Logistics, Foodservice, Technical Industries and Humanitarian Logistics. GS1's Member Organisations in over 100 countries around the world collectively focus on over 25 industry sectors. Membership:- GS1 has over 1.5 million members worldwide. Companies can become members by joining a local GS1 Member Organisation. Governance And Structure:- GS1's governance has three levels:- First Level – GS1 General Assembly, composed of representatives of all Member Organisations. Second Level – GS1 Management Board responsible for global strategic direction (composed of key leaders from multinational businesses and GS1 Member Organisations). Local GS1 Boards responsible for local strategic directions (composed of key leaders from national companies). GS1's management board members are individuals with senior positions in the following companies:- Abudawood; Amazon; Alibaba Group; B. Braun Melsungen; Beijing Hualian Group; Campbell Soup Company; Carrefour; Crossmark; Deutsche Post DHL; eBay; Future Retail; Google; Independent Grocers Association; Johnson & Johnson; LF Logistics; Mattel; Mondelez; Nestlé; Procter & Gamble; Smuckers; Target; Walgreens; Walmart; Wegmans; and GS1 Argentina, GS1 Australia, GS1 Canada, GS1 China, GS1 Germany, GS1 India, GS1 Malta, GS1 UK, GS1 US. Third Level – GS1 Global Office and the Local GS1 Member Organisations. The GS1 Global Office leads the development and maintenance of new standards. Local MO's focus on local services and standards implementation. There are also two other boards at global level:- (i) the GS1 Data Excellence Board (responsible for GS1's data strategy); and (ii) GS1 Innovation Board (responsible for GS1 innovation and R&D activities). Financing:- GS1 Member Organisations around the world are funded by their local members through annual membership fees and sales of services. Partners:- GS1 partners with other international organizations. Some of GS1's partners are:- Consumer Goods Forum; International Standards Organisation (ISO); NATO; United Nations; UN Refugee Agency (UNHCR); World Customs Organisation (WCO); International Society for Quality in Health Care (ISQua); Joint Initiative Council (JIC). Founded 26 April 1974. GS1 has more than 112 offices worldwide. Headquartered in Brussels, Belgium. How we got here:- over the last 40 years, we've opened offices in over 100 countries and amassed more than a million members using supply chain standards that make business easier. Learn about key dates in our history. 1973:- the barcode standard is agreed. Industry leaders in the US select a single standard for product identification. Still used today, it's known as the GS1 barcode. 1974:- the first barcode is scanned. On 26 April, a packet of chewing gum becomes the first barcoded product to be scanned in a supermarket. 1977:- the GS1 system is launched. The European Article Numbering (EAN) Association – later called GS1 – opens an office in Brussels. Its founding members launch an identification system to improve supply chain efficiency. 1983:- barcodes are used on wholesale multi-packs. As barcodes have proved their reliability and usefulness in real-world environments, they are extended and used on product outer cases. 1989:- GS1 moves beyond

barcodes. With wide area networks making an impact on supply chains, we create our first international standard for electronic data interchange. 1990:- responsibilities grow. The US and international arms of GS1 come together formally, creating a single organisation with a presence in 45 countries. 1995:- first healthcare standards created. We expand our work into the healthcare sector, working closely with healthcare bodies and providers. 1999:- the GS1 DataBar arrives. After significant research and design, the GS1 DataBar is created. This holds more information than a barcode, yet is significantly smaller. 2000:- 90th local office opens. In just ten years, we double the number of countries in which we have a local presence. 2002:- global standards forum launched. Our Global Standards Management Process is launched. This global forum gives GS1 members one place to discuss standards. 2004:- the first standard for RFID is created. With Radio Frequency Identification (RFID) Chips becoming more common, we create a standard for their implementation and use. 2007:- GS1 enters the business-to-consumer world. As ecommerce grows, we begin to create open standards that give consumers direct access to key product information. 2013:- a 40-year celebration. With a presence in over 100 countries and more than a million members, we celebrate 40 years of the global language of business. / Рыглиз (Wrigley's). GLOBAL STRAIGHT THROUGH PROCESSING ASSOCIATION = ГЛОБАЛЬНАЯ АССОЦИАЦИЯ ПО НЕПОСРЕДСТВЕННОЙ ОБРАБОТКЕ (или СКВОЗНОЙ ОБРАБОТКЕ) ТРАНЗАКЦИЙ – Global Straight Through Processing Association (GSTPA) is an industry association of investment managers, broker/dealers, and global custodians involved in the processing of cross-border trades. The primary objectives of the GSTPA are to accelerate the flow of cross-border trade information, to reduce the number of failed cross-border trades, and to reduce the risks and the costs of cross-border trade settlements. According to the Global Straight Through Processing Association (GSTPA), cross-border volumes have increased dramatically and are forecasted to reach 600 000 securities trades per day (150 million annually) in 2002 compared with 200 000 trades per day (50 million per annum) in 1998. Domestically, the US equities markets, accounting for 35% of total global market capitalization, had a daily aggregate volume on the NYSE®, NASDAQ® and AMEX® of 0.5 billion shares in 1998. That volume is projected to grow to 3.5 billion in 2002. The GSTPA is an industry association comprised of worldwide representatives from investment management, global custodian, and broker/dealer firms. The GSTPA's stated goal is 'organizing and promoting the efficient electronic flow of cross-border trade information on trade date'. To that end, the group has developed a model for future cross-border trading. Axion4, a consortium of vendors chosen by the GSTPA, is in the process of finalizing specifications and identifying firms to participate in a pilot test to begin this fall. A group called the Global Straight Through Processing Association (GSTPA), which is made up of 40 firms, plans to build a global network to promote the more efficient flow of information to brokerages, custodians, and other firms involved in cross-border trade processing. Streamlining the information flows will reduce the number of failed cross-border trades by opening up connectivity among participants involved in post-trade, pre-settlement securities processing. According to GSTPA, a reduction in processing time would reduce USD280 billion daily from being exposed to operational risks in the US Achieving the goals of the more specific STP (short for the Straight Through Processing) initiatives will be one of the top trends in investment-management technology for a few years to come. The Global Straight Through Processing Association, an industry utility conceived, funded, and developed during the boom times of the late 1990s, says its shareholders have voted to suspend operations and dissolve the business. The GSTPA went live September 09, 2002, but weak commitment from investment mangers, combined with an unwillingness on the part of shareholders to kick in more funding, left the utility with little chance of survival, CEO Jurgen Marziniak says:- 'There was a floor in terms of the number of allocations that were necessary, and that floor wasn't reached'. GSTP AG was formed in 1997 by banks, brokers and fund managers to develop a solution to be used by the entire securities industry to help match and settle millions of transactions executed every day. In 2000, the group outsourced the development of the project to a consortium called Axion 4, which comprises SIS-SegaIntersettle Swift, the bank-owned telecommunications network and Teknosoft-Tata Data Consultancy, a software firm. GSTP AG has said that it will now assume direct responsibility for the operation of the utility, migrating from Axion 4. A spokesperson said:- 'We will enter into direct relationships with existing and new service providers, providing the most cost-effective solution for the industry and ensuring continuity of the services and investments made. Swift will continue to be the exclusive provider of messaging services to GSTP AG'. The association has already terminated its relationship with SIS-SegaIntersettle. The Global Straight Through Processing Association's Swiss-based operating company (GSTP AG), Omgeo, TradingLinks and other entities that will undoubtedly emerge over time all have a role to play. However, each should pursue the industry's goal of open-ended, multilateral interconnectivity that permits 95% STP from the traders' desks to the settlement end-points, regardless of the utilities or vendors that particular firms choose to use. In 1998, 90 institutions create the GSTPA (Global Straight – Through Processing Association). This launches the project of 'transaction flow management', which will play the role of an engine of reconciliation ensuring the link between brokers, portfolio managers and banks custodians. In addition to these corporate initiatives, private companies develop solutions, and including Omgeo. This joint venture of Thomson Financial and DTCC (Depositary Trust & Clearing Corporation), which has many thousands of clients, claims world leadership in the electronic confirmation of international transactions, these representing 90 of the volume handled by Oasys Global service. This experience Omgeo now focuses on the 'post-trade pre-settlement' operations, in other words between the response of the negotiator ('broker') and sent to the depositary and the advocates. So, it faces competition the GSTPA which, paradoxically, members are customers. In addition, Omgeo to rely on its Alert base. 'It identifies 4.6 million of internal accounts of brokers around the world and information delivery – for more than 150 000 companies of management portfolios', said Henri Giacobbi. Reuters (with Capco), Bloomberg, Sungard ... are also present in this area. Ройтас (Reuters) с Кэпкоу (Capco), Блумбёг (Bloomberg), Сангад (Sungard) . Глобальная Ассоциация по Созданию Системы Сквозной Обработки Транзакций – ассоциация участников рынков ценных бумаг (инвестиционных управляющих, брокеров/дилеров, глобальных кастодианов), осуществляющих обработку трансграничных сделок. Ассоциация была создана в 1997 с целью разработки и внедрения системы сквозной обработки транзакций (straight-through processing (STP)) на международных рынках. В результате была создана автоматическая система обработки сделок – Transaction Flow Manager (TFM), начавшая работать в Сентябре 2002. Ассоциация прекратила своё существование по решению участников в Ноябре 2002.

GLOBAL SYSTEM OF MOBILE COMMUNICATIONS = ГЛОБАЛЬНАЯ СИСТЕМА МОБИЛЬНЫХ КОММУНИКАЦИЙ (или ГЛОБАЛЬНАЯ СИСТЕМА МОБИЛЬНОЙ ЭЛЕКТРОСВЯЗИ) – Global System Of Mobile Communications (GSM) is 2nd generation mobile network standard. / Глобальная Система Мобильных Коммуникаций (ГСМ) является вторым поколением стандарта на мобильную сеть. коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо).

GLOBEX® = ГЛОБЭКС® – Globex®:- the most advanced and reliable electronic derivatives trading platform in the world, CME Globex®, offers access to energy futures and options with the speed and flexibility to support the most complex and demanding trading. Millisecond response time, price transparency, anonymity, reliability, market integrity and top-of-book, real-time market data translate to unmatched functionality and capacity that is enhanced by unparalleled customer support. Today the CME Globex® trading system operates at the heart of CME®. It was introduced in 1992 as the first global electronic trading platform for futures contracts. This fully electronic trading system allows market participants to trade from booths at the exchange or while sitting in a home or office thousands of miles away. On 2004-October-19, the one billionth (1 000 000 000) transaction was recorded. Since launching on CME Globex® in mid 2006, CME Group energy contracts have more than tripled in volume. That's because CME Globex® reaches a global trading audience, defines the cutting edge of financial trading technology and receives continual enhancements to meet customers' evolving needs. The platform is an open access marketplace that allows customers to participate directly in the trading process, view the book of orders and prices and enter their own orders. Leading the industry in stability, CME Group has achieved near 100 percent uptime. Customers worldwide have access to the platform virtually 24 hours a day through more than 1 100 direct connections in more than 86 countries and foreign territories, with new connections being added all the time. Telecommunication hubs in Singapore, London, Amsterdam, Dublin, Milan and Paris help reduce connectivity costs, increase accessibility and deliver faster, more efficient trading. CME Group is constantly working to reduce processing time – the platform continues to handle significantly more volume at a significantly faster pace, handling more than six billion trades per month with an average 11-millisecond response time. Trades on CME Globex® are executed in less than the blink of an eye and confirmations are immediately sent to the customer anywhere in the world. CME Group is constantly working to reduce processing time, and our focus on speed and reliability has had very positive results. The platform continues to handle significantly more volume, significantly faster. If CME Globex® is open, the Globex® Control Center (GCC) is open. The GCC provides customer support and problem management, 24 hours a day (from 14:00 Sunday through 16:45 Friday, US Central Time (GMT –6 hours)) to members, clearing members and customers designated by clearing members from around the world. A system for global after hours electronic trading in futures and options developed by Reuters Holdings PLC for CME® and CBOT® for use in conjunction with various exchanges around the world. A global after-hours electronic trading system. An international electronic trading system for futures and options that allows participating exchanges to list their products for trading after the close of the exchanges' open outcry trading hours. Developed by Reuters Holdings Plc for use by the Chicago Mercantile Exchange® (CME®), Globex® was launched on 1992-June-25, for certain CME® contracts. Various MATIF (Marche a Terme International de France) contracts began trading on the system on 1993-March-15. From 2006-August-03 NYMEX® powered by CME Globex®. GLOBEX® is an international automated order-matching system for use before and after regular business hours. It will extend the business day of financial futures and options to a virtual 24-hour capability. It will act as a communications system bringing buyers and sellers together to participate in a competitive market. The system will facilitate competitive prices, a centralized marketplace, access and a continuous flow of price information to the public. All orders will be transmitted through the facilities of exchange members to the GLOBEX® electronic book and will have an equal opportunity to compete based upon price and time of entry. GLOBEX® quotations and price information will be available to all investors throughout the world through the CME's quotation vendor networks. In the early days of PCs and minicomputers, money managers didn't like to admit they used computers for stock screening, or to take the drudgery out of investment analysis. Quantitative money managers such as Batterymarch, led by indexing-pioneer Dean LeBaron, were among the first to embrace a highly computerized investment process. By the mid-1980s, the die was cast for the major role that computers would play. Within a few years, sell-side firms were zapping baskets of stocks or so-called program-trades straight to the New York Stock Exchange's SuperDOT system. Big Wall Street houses like Morgan Stanley and Goldman Sachs were putting DOT boxes on buy-side-trading desks so that institutional customers could shoot their orders directly to the NYSE® – a precursor to firms supplying FIX connections to their best institutional customers. FIX or Financial Information Exchange is a financial industry standard communication protocol. As international-futures exchanges sprang across Europe and Asia, the US share of financial-futures-trading volume slipped from 100 percent in 1980 to 50 percent by 1992. While Chicago's two dominant future's exchanges – the Chicago Mercantile Exchange and the Chicago Board Of Trade (CBOT®) still had the lion's share, debate raged over whether or not open outcry pits would prevail over electronic-trading platforms being launched by foreign futures exchanges. Even though the CME® launched GLOBEX® on 1992-June-25, with Reuters Holdings PLC and the CBOT® as its joint-venture partner, the international after-hours platform struggled, though GLOBEX® volumes picked up when the MATIF joined in 1993. By 1994, both Reuters and the CBOT® had dropped out and the CBOT® had developed Project A. When pressures to cut the costs of building proprietary-trading engines heated up during the late 1990s, the CME® swapped Clearing 21 for NSC, a trading engine developed by Euronext – the conglomerate that owns MATIF. In August 1999, CBOT® teamed up with Eurex® – the all-electronic German and Swiss futures exchange turned technology supplier. Proposed initially by CME® Chairman Emeritus Leo Melamed in 1987, GLOBEX® was introduced in 1992. On 1987-September-02, in a far-reaching joint undertaking, the Chicago Mercantile Exchange® (CME®) and Reuters Holdings PLC entered into a long-range agreement to create GLOBEX®, a global electronic automated transaction system for the trading of futures and futures-options. It was introduced on 1992-June-25 as the first global electronic trading platform for futures contracts. In its first launch, GLOBEX® used Reuters' technology and network. September 1998 saw the launch of the second generation of GLOBEX® using a modified version of the NSC trading system, developed by Paris Bourse for the MATIF (Marché A Terme d'Instruments Financiers, and now Euronext). In 1988 MATIF also added commodity contracts to its range of products by taking charge of the activities of the former Commodities Exchange. The Marché A Terme d'Instruments Financiers (French futures market for financial instruments), thus became MATIF the Marché A Terme International de France (French international futures and options exchange). On 2000-September-22 Amsterdam Exchanges (AEX) Brussels Exchanges (BXS) and Paris Bourse merged to form the first European exchange EURONEXT NV. This is the first time world wide that three exchanges from three different countries have merged to create a single company. / Глобэкс® (Globex®) наиболее продвинутая и ответственная . GLOBOSE = ШАРООБРАЗНОЕ (или ГЛОБОИДНАЯ, или ГЛОБОИДАЛЬНОЕ, или ШАРОВИДНОЕ, или ШАРИКОВИДНОЕ) – Globose:- spherical or spheroidal or rounded. / Шарообразное:- сферическое или сфероидальное или округлённое. Под Глобоидной или Глобоидальной, от Латинского слова Globus, означающее Шар, и Греческого слова Éidos, означающее Вид, понимается сферическое или сфероидальное.

GLOBULAR = ГЛОБУЛЯРНОЕ (или ШАРООБРАЗНОЕ, или ШАРИКОВИДНОЕ) – Globular:- nearly spherical. / Глобулярное (от Латинского слова Globulus, означающее Шарик):- близкое к сферическому.

GLOCHIDS = ГЛОХИДИИ (или КРЮЧОЧКИ, или УСИКИ) – Glochids are spines or hairs, usually small, brittle and barbed. Occurring in tufts and characteristic of Opuntioideae. / колючки или волоски, обычно маленькие, . Глохидии:- крошечные колючки или щетинки, обычно собранные в пучки на ареолах у некоторых Кактусов. Они легко проникают в кожу и часто вызывают раздражение, не позволяя взять Кактусы рукой. Их можно удалить из кожи, приклеив хирургический пластырь, а затем удалив его. Глохидий, от Греческого слова Glochis, означающее Наконечник Стрелы или Шип, паразитическая личинка пресноводных донных пластинчатожаберных моллюсков Семейства Unionidae. Имеет двустворчатую треугольную раковину, замыкающуюся с помощью одного мускула – замыкателя. На конце каждой створки обычно имеется по зазубренному шипу. Нога недоразвита, снабжена длинной клейкой (биссусной) нитью – арканчиком. Кишечник редуцирован. Начальные стадии развития Глохидия протекают в жабрах материнской особи, куда откладываются яйца. Весной Глохидии с помощью арканчиков и шипов прикрепляются к жабрам и коже рыб и таким образом распространяются по водоёмам и против течения рек. После метаморфоза моллюск падает на дно. Заметного вреда рыбам Глохидии не приносят.

GLOMERELLA GOSSYPII = ГЛОМЭРЭЛЛА ГОССИПИИ – Glomerella Gossypii:- Identity:- (i) Name:- Glomerella Gossypii Edgerton; (ii) Anamorph:- Colletotrichum Gossypii Southworth; (iii) Taxonomic Position:- Fungi:- Ascomycetes:- Phyllachorales; (iv) Common Names:- Anthracnose, Pink Boll Rot or Seedling Blight of Cotton (English), Anthracnose du Cotonnier (French), Anthraknose (German), and Antracnosis del Algodonero (Spanish). Hosts:- The only host is cotton. Gossypium Barbadense and Gossypium Hirsutum cultivars are mostly susceptible, while Gossypium Arboreum, Gossypium Herbaceum and Gossypium Thurberi Cultivars show some resistance. In the EPPO (short for the European and Mediterranean Plant Protect Organization; headquartered in Paris, France) region, Cotton is grown in Mediterranean and Eastern European countries. Geographical Distribution:- Glomerella Gossypii, which is probably indigenous to America, now occurs in most Cotton-growing areas throughout the world but tends to be localized in the higher rainfall areas. EPPO region:- Locally established in Bulgaria and Romania; reported from but not established in Italy (Sicily), Spain, Tunisia. Asia:- Afghanistan, Armenia, Azerbaijan, Bangladesh, Cambodia, China (widespread), Georgia, India (Bihar, Madhya Pradesh, Maharashtra), Indonesia, Japan (Honshu), Korea Democratic People's Republic, Korea Republic, Myanmar, Pakistan, Philippines, Taiwan, Thailand. Mostly absent from the Near East. Africa:- Central African Republic, Côte d'Ivoire, Ethiopia, Ghana, Kenya, Madagascar, Mali, Malawi, Mozambique, Nigeria, Sudan, Senegal, Somalia, Tunisia, Uganda, South Africa, Zaire, Zimbabwe. Probably present in most sub-Saharan countries. North America:- Bermuda, Mexico, USA (Alabama, Arkansas, Florida, Georgia, Louisiana, Mississippi, North Carolina, Oklahoma, South Carolina, Texas; also Hawaii, Kentucky, Missouri, Tennessee). Central America and Caribbean:- Barbados, Costa Rica, Cuba, Dominican Republic (unconfirmed), Guatemala, Honduras, Haiti, Jamaica, Nicaragua, Puerto Rico, El Salvador, Trinidad and Tobago. South America:- Argentina, Brazil (Bahia, Ceara, Espirito Santo, Sa\tilde\o Paulo), Colombia, Ecuador, Guyana, Paraguay, Uruguay, Venezuela. Colletotrichum Gossypii var. Cephalosporioides reported at least from Brazil and Paraguay. Oceania:- Australia (Western Australia; an earlier record in Queensland was mistaken), Guam. EU:- Present (reported but not established). Biology:- Glomerella Gossypii is transmitted through seed, and may also overwinter in infected cotton plant debris. Perithecia usually develop in old, dead tissues, and release ascospores which are the primary inoculum source. Usually, only the conidial spore stage is seen on the cotton plant. Secondary spread by conidia occurs in rain and wind and, in Côte d'Ivoire, a Hemipteran Insect, Dysdercus Sp., is thought to be an important vector. Two strains of Glomerella Gossypii are reported to exist in Côte d'Ivoire:- strain 1 attacking both Gossypium Hirsutum and Gossypium Barbadense and strain 2 being pathogenic only to Gossypium Barbadense. Colletotrichum Gossypii var. Cephalosporioides differs from Colletotrichum Gossypii var. Gossypii in virulence, aggressiveness, morphology, growth on various media and ability to develop at less than 30 °C. For symptoms to develop, an RH of about 100% and a temperature of 25 °C are needed for 8–10 h. Detection And Identification:- Symptoms:- The disease caused by Glomerella Gossypii is most serious on seedlings and bolls, but lesions also occur on the stems and leaves of plants, sometimes producing a scald-like effect. Seedlings from infected seeds wilt and die. Infected bolls develop small, round, water-soaked spots which rapidly enlarge, become sunken and finally develop reddish borders with pink centers. In dry weather, diseased areas may be greyish in colour. Badly diseased bolls become mummified (darkened and hardened) and never open. In partially affected bolls, the fungus grows through and infects the seed. Lint from diseased bolls is frequently tinted pink and of inferior quality. For more information, see also Cauquil (1960) and Cognee (1963). A form of the anamorph known as Colletotrichum Gossypii var. Cephalosporioides causes a serious disease, known as Ramulose, Escobilla or Witches' Broom. Symptoms observed in the field include excessive branching, stem twisting, leaf curl, and necrotic lesions on leaves, bolls and stems. Morphology:- Glomerella Gossypii in general resembles the widely distributed Glomerella Cingulata in its perithecia and conidia and could practically be regarded as a cotton-specific form of that Fungus, which is not reported as attacking Cotton. Perithecia are formed embedded in the plant tissue, with beaks extending through the epidermis. They do not collect around a mycelial nodule or form in a stroma, but are distinct and separate. Conidia are formed in mucilaginous acervuli, appearing as pink spore masses in infected bolls. Seed infection is not detectable visually. Detection and Inspection Methods:- A seed testing method, by germination, developed by Halfon-Meiri & Volcani (1977) has been incorporated into an EPPO quarantine procedure (OEPP/EPPO, 1992). Means Of Movement And Dispersal:- Natural spore dispersal will only move the Fungus locally. Over longer distances and in international trade, movement is only in infected Cotton seeds. Theoretically, cotton plants could also transport the pathogen, but there is no such movement in practice. Pest Significance:- Economic Impact:- Cotton anthracnose has become less important as a seedling disease since the general practice of seed treatment with fungicides. However, it is still prevalent on seedlings and bolls in the more humid parts of Eastern USA, possibly as a result of cultural methods to increase vegetative growth. In North-West Côte d'Ivoire (Boundiali sector), Glomerella Gossypii has been shown, either alone or in combination with insect larvae, to reduce boll production by about 25%, with 15–18% of bolls being mummified. In Senegal in 1970/71, rot caused by Fungi, including Glomerella Gossypii, affected only 2.7% of bolls, although, in severe cases, 40–60% losses on bolls have been reported. In India, anthracnose became serious in 1953 and, by 1959, was the limiting factor in Cotton production. Control:- The disease is relatively easy to control by producing seeds from healthy bolls, treating seeds with fungicides or acid treatment. Cultivars may show some resistance and this is being actively sought against the more aggressive var. Cephalosporioides. Phytosanitary Risk:- Glomerella Gossypii is listed by EPPO as an A2 quarantine pest (OEPP/EPPO, 1982). The disease is of minor economic importance in the EPPO countries where it now occurs, for in general cotton is not grown in high-rainfall areas within the EPPO region and these are the conditions which most favour the disease. It is reported still absent from several cotton-producing countries (Maghreb countries, Greece, Israel, Turkey) and from the Central Asian Republics of the former USSR. Var. Cephalosporioides from South America presents a further risk (especially if it is also seed-borne). Phytosanitary Measures:- EPPO recommends (OEPP/EPPO, 1990) that Cotton-growing countries should offer a choice between three alternative phytosanitary

measures:- growing-season inspection of the seed crop, seed testing and acid delinting. / Европейская и Средиземноморская Организация по Защите Растений (ЕОЗР). разработанный Хялфэн-Мири Энд Волкэни (Halfon-Meiri & Volcani) (Элайза Хялфэн-Мири (Aliza Halfon-Meiri) из Волкэни Центра (Volcani Center; Bet Dagan, Israel)) в 1977, был . Glomerella Gossypii (South) Edgerton или Антракноз Хлопчатника:- Распространение:- Регион ЕОКЗР:- проявлялся локально в Азербайджане, Армении, Грузии, Болгарии и Румынии; были сообщения из Испании, Италии (Сицилия) и Туниса, но патоген в этих странах не обосновался. Азия:- Афганистан, Бангладеш, Индия, Индонезия, Камбоджа, Китай (широко распространён), КНДР, Республика Корея, Мьянма, Пакистан, Тайвань, Таиланд, Филиппины, Япония (Хонсю). Африка:- Бенин, Гана, Демократическая республика Конго, Зимбабве, Заир, Кения, Кот д'Ивуар, Мадагаскар, Малави, Мали, Мозамбик, Нигерия, Сенегал, Сомали, Судан, Тунис, Уганда, Центрально-Африканская Республика, Эфиопия, Южная Африка. Северная Америка:- Бермуды, Мексика, США. Центральная Америка и Карибы:- Барбадос, Гаити, Гватемала. Гондурас, Доминиканская Республика (не подтверждено), Коста-Рика, Куба, Никарагуа, Пуэрто-Рико, Сальвадор, Тринидад и Тобаго, Ямайка. Южная Америка:- Аргентина, Бразилия, Венесуэла, Гвиана, Колумбия, Парагвай, Уругвай, Эквадор. Океания:- Австралия (Западная Австралия), Гуам. Поражаемые Растения:- семена и растения Хлопчатника (Gossypium). Сорта Видов Хлопчатника Gossypium Hirsutum и Gossypium Barbadense восприимчивы к возбудителю, в то время как Виды Gossypium Arboreum, Gossypium Herbaceum и Gossypium Thurberi отличаются относительной устойчивостью к патогену. Симптомы Поражений:- Поражаются коробочки, плодоножки, стебель и листья Хлопчатника. На корневой шейке, стебельке и семядолях всходов появляются бурые пятна. Пятна разрастаются, ткань загнивает, погибает. При заболевании взрослых растений на листьях и стеблях образуются бурые пятна. При заражении в период формирования коробочек на створках образуются красно-бурые или тёмно-бурые пятна с красным ободком. При раннем поражении коробочки не раскрываются, волокно и семена в них склеиваются и загнивают. При поражении плодоножек коробочки опадают. Развитию болезни способствуют умеренно теплая погода и высокая влажность. За летний период Гриб даёт несколько генераций конидиального спороношения. Спороношение Гриба:- Glomerella Gossypii имеет вид круглых или продолговатых подушечек с немногочисленными щетинками, которые у основания тёмно-коричневые, у вершины бесцветные, прямые или изогнутые, с перегородками. Конидии продолговатоовальные, обычно со светлой каплей в центре, бесцветные, в массе розовые, размером 11–20 x 2.4–5.5 мкм. Пути Распространения:- В ходе международной торговли возбудитель болезни переносится с заражёнными семенами и растениями Хлопчатника. В естественных условиях патоген распространяется воздушнокапельным путём. Методы выявления и идентификации:- визуальный осмотр, метод влажной камеры, метод выделения на питательную среду, микроскопирование и морфометрирование.

GLORY HOLE = ВЕЛИКОЛЕПНАЯ ДЫРА – Glory Hole (maritime term):- steward's quarters. / каюты стюарда.

GLOSS = БЛЕСК (или ГЛЯНЕЦ) – Gloss is the degree of reflection of a coating film. Paints, varnishes, and lacquers having a lot of reflection are said to be glossy, while those having a low level of reflection are said to be flat. / Степень отражаемости покрывающей плёнки. О красках, олифах, и лаках, имеющих повышенную отражаемость, говорят, что они глянцевые (glossy), а о имеющих низкий уровень отражаемости, говорят, что они матовые (flat).

GLOSS = ГЛЯНЕЦ (или ЛОСК, или ОТБЛЕСК) – Gloss:- angular selectivity of reflectance, involving surface-reflected light, responsible for the degree to which reflected highlights or images of objects may be seen as superimposed on a surface.

GLOSS METER = ИЗМЕРИТЕЛЬ ОТБЛЕСКА (или БЛЕСКОМЕР) – Gloss Meter is an instrument that measures surface-reflected light at defined angles, i.e. 60°, 85°. / Блескомер – прибор для измерения блеска путём направления светового луча постоянной мощности под углом к тестируемой поверхности и контроля отражённого света. Блескомер производит рабочие замеры при углах наблюдения-освещения 85°/85° целенаправленного потока света. Используется в работе с лакокрасочными, эмалированными и другими покрытиями, имеющими матовость или блеск. Блескомеры определённого типа используют для измерения блеска при определённых углах наблюдения ('60°/60°', '20°/20°', и '85°/85°').

GLOSSY = ЛОСНЯЩЕЕСЯ – Glossy:- leaf blades have a glossy surface to which water easily adheres in large droplets.

GLOVE = ПЕРЧАТКА – Glove is a covering for the hand having separate sections for each of the fingers and the thumb and often extending part way up the arm; gauntlet. / Перчатка – покрытие для руки, имеющее отдельные секции для каждого из .

GLOVE SILK = ПЕРЧАТОЧНЫЙ ШЁЛК – Glove Silk:- silk, rayon, synthetics. Knit – two bar doubleknit tricot. Made on a warp knitted frame. Very finely knit but very strong. Now called Nylon™ Simplex. Similar to chamoisette (cotton). / Найлан[T3] (Nylon™).

GLR = GENERAL LICENSE RETURN (REPLACEMENT)

GLUCOSINOLATES = ГЛЮКОСИНОЛАТЫ – Glucosinolates are natural components of canola, rapeseed, and mustard seed. These compounds are responsible for the pungent odor and sharp flavour of cabbage, brussels sprouts, radishes, broccoli and cauliflower. They are natural toxicants, associated with goitre and liver damage when consumed in large quantities. Glucosinolates may be desirable in mustard seed destined for condiment use. However, high levels in rapeseed restricted the use of this seed for feed. Breeding programs to reduce the level of glucosinolates in rapeseed produced canola. Content of glucosinolates in canola is determined according to procedures prescribed in the US Federal Grain Inspection Service (FGIS) instructions. / , ответственные за жгучий запах и острый привкус капусты, Брюссельской капусты, редьки, брокколи и цветной капусты. Они являются натуральными токсикантами, связанными с . Содержание глюкозинолатов в кэнолэ (canola) определяется в соответствии с процедурами, описанными в инструкциях Федеральной Службы США по Инспекции Зерна (ФСИЗ; US Federal Grain Inspection Service (FGIS)).

GLULAM = КЛЕЁНАЯ ДРЕВЕСИНА – Glulam is a structural wood product made by bonding together laminations of dimension lumber. / Строительный древесный продукт, изготовленный посредством скрепления в одно целое слоёв мерного пиломатериала.

GLULAM RIVET = ЗАКЛЁПКА ДЛЯ КЛЕЁНОЙ ДРЕВЕСИНЫ – Glulam Rivet is a nail-like oval shaped fastener used in combination with predrilled steel plates to connect glulam members (approved for use in Canada and the United States). / Под Заклёпкой понимается крепёжная деталь, состоящая из стержня и закладной головки. В заклёпочном соединении конец стержня расклёпывают для образования замыкающей головки. Материал заклёпки обычно выбирают однородным с материалом соединяемых деталей во избежание электрохимической коррозии (у металлов) и температурного напряжения в соединении.

GLUME = КОЛОСКОВАЯ ЧЕШУЯ – Glume:- the two chaffy structures in the inflorescence of grasses. It is made up of the lemma and palea which usually cover the floret before blooming and often remain attached to the ripened 'fruit' or grain of some Cereals, such as Rice.

GLUME DISCOLORATION = ИЗМЕНЕНИЕ ЦВЕТА КОЛОСКОВОЙ ЧЕШУИ (или ОБОЛОЧКИ (ЗЕРНА)) – Glume Discoloration:- synonymous with grain discoloration. Rice grains maybe infected with various organisms causing discoloration ranging from black dots to brown or blackish blotches which may cover the entire glume.

GLUTEN = ГЛУТЭН (или ГЛЮТЕН, или КЛЕЙКОВИНА) – Gluten (from Latin Gluten 'Glue') is a protein composite that appears in foods processed from Wheat and related species, including Barley and Rye. It gives elasticity to dough, helping it to rise and to keep its shape, and often giving the final product a chewy texture. As cases of known gluten sensitivity increase, many foods in the western world are now labeled to clarify whether they contain gluten. Gluten is the composite of a prolamin and a glutelin, which exist, conjoined with starch, in the endosperm of various grass-related grains. Gliadin, a water-soluble, and glutenin, a water-insoluble, (the prolamin and glutelin from Wheat) compose about 80% of the protein contained in Wheat seed. Being insoluble in water, they can be purified by washing away the associated starch. Worldwide, gluten is a source of protein, both in foods prepared directly from sources containing it, and as an additive to foods otherwise low in protein. The seeds of most flowering plants have endosperms with stored protein to nourish embryonic plants during germination. True gluten, with gliadin and glutenin, is limited to certain members of the grass family. The stored proteins of Maize and Rice are sometimes called Glutens, but their proteins differ from Wheat gluten by lacking gliadin. Gluten is extracted from flour by washing out the starch:- starch is water soluble while gluten is not, and gluten binds together strongly, while starch dissolved in cold water is mobile. If a saline solution is used instead of water, a purer protein is obtained, with certain harmless impurities going into solution with the starch. However, on an industrial scale, starch is the prime product, making cold water the favored solvent. In home or restaurant cooking, a ball of Wheat flour dough good is kneaded under water until the starch dissolves out. In industrial production, a slurry of Wheat flour is kneaded vigorously by machinery until the starch dissolves and the gluten condenses into a mass. This mass is collected by centrifugation, then transported through several stages integrated in a continuous process. Approximately 65% of the water in the wet gluten is removed by means of a screw press; the remainder is sprayed through an atomizer nozzle into a drying chamber, where it remains at an elevated temperature a short time to evaporate the water without denaturing the gluten. The process yields a flour-like powder with a 7% moisture content, which is air cooled and pneumatically transported to a receiving vessel. In the final step, the collected gluten is sifted and milled to produce a uniform product. Gluten forms as glutenin molecules cross-link to form a sub-microscopic network attached to gliadin, which contributes viscosity (thickness) and extensibility to the mix. If this dough is leavened with yeast, sugar fermentation produces bubbles of carbon dioxide which, trapped by the gluten network, cause the dough to rise. Baking coagulates the gluten, which, along with starch, stabilizes the shape of the final product. Gluten content has been implicated as a factor in the staling of bread, possibly because it binds water through hydration. The development of gluten (i.e. enhancing its elasticity) affects the texture of the baked goods. Gluten's attainable elasticity is proportional to its content of glutenins with low molecular weights as this portion contains the preponderance of the sulfur atoms responsible for the cross-linking in the network. More refining (of the gluten) leads to chewier products such as pizza and bagels, while less refining yields tender baked goods such as pastry products. Generally, bread flours are high in gluten; cake flours have a lower gluten content. Kneading promotes the formation of gluten strands and cross-links, creating baked product that is chewier in proportion to the length of kneading. An increased moisture content in the dough enhances gluten development. Shortening inhibits formation of cross-links and is used, along with diminished water and less kneading, when a tender and flaky product, such as a pie crust, is desired. The strength and elasticity of gluten in flour is measured in the baking industry using a farinograph. This gives the baker a measurement of quality for different varieties of flours in developing recipes for various baked goods. Gluten, when dried and milled to a powder and added to ordinary flour dough, improves a dough's ability to rise and increases the bread's structural stability and chewiness. Gluten-added dough must be worked vigorously to induce it to rise to its full capacity; an automatic bread machine or food processor may be required for kneading. The added gluten provides supplemental protein to products with low or nonexistent protein levels. Gluten, especially Wheat gluten, is the basis for imitation meats resembling chicken, duck (mock duck), fish, pork and beef. When cooked in broth, gluten absorbs some of the surrounding liquid (including the taste) and becomes firm to the bite, so is widely used in vegetarian and vegan foods as a meat substitute. The 'Codex Alimentarius' set of international standards for food labeling has a standard relating to the labelling of products as 'gluten free', but this standard does not apply to 'foods which in their normal form do not contain gluten'. Gluten is used as a stabilizing agent in products like ice cream and ketchup, where it may be unexpected. Foods of this kind present a problem because the hidden gluten constitutes a hazard for people with celiac disease:- In the United States, at least, gluten might not be listed on the labels of such foods because the US, Food and Drug Administration has classified gluten as GRAS (generally recognized as safe). Requirements for proper labeling are being formulated by the USDA. In the United Kingdom, only cereals currently need to be labelled, while labeling of other products is voluntary. The protein content of some pet foods may also be enhanced by adding gluten. Between 0.5 and 1.0 percent of people in the United States are sensitive to gluten due to celiac disease. Celiac disease constitutes an abnormal immune reaction to partially digested gliadin. It probably occurs with comparable frequencies among all wheat-eating populations in the world. Certain allergies and neuropathies are also caused by gluten consumption and inhalation. Note that Wheat allergy and celiac disease are different disorders. Xxxxx. Gluten is a special type of protein that is commonly found in Rye, Wheat, and Barley. Therefore, it is found in most types of cereals and in many types of bread. Not all foods from the grain family, however, contain gluten. Examples of grains that do not have gluten include wild Rice, Corn, Buckwheat, Millet, Amaranth, Quinoa, Teff, Oats, Soybeans, and Sunflower seeds. Gluten can be removed from wheat flour, producing wheat starch. All of the gluten in Wheat flour, however, cannot be removed. Still, according the the Food and Drug Administration (FDA), if a certain amount of the gluten is removed, the food product can be labeled 'gluten-free'. This is somewhat similar to food products that can be labeled as 0 Calories even though a serving contains 4 or less Calories. Gluten helps make bread elastic, providing it with that chewy texture it has when eaten. For this reason, flour that has had most of its gluten removed, produces a sticky dough that feels much like chewing gum. Gluten provides many additional important qualities to bread. For example, gluten keeps the gases that are released during fermentation in the dough, so the bread is able to rise before it is baked. In addition, gluten firms up when it is cooked and, with the help of starch, helps ensure the bread maintains its proper shape. Gluten also has an absorbent quality, which is why bread is capable of soaking up broth. Because of this feature, gluten is often used by those on a vegetarian diet as an imitation meat. On the downside, gluten is believed to be partly responsible for causing bread to become stale. Some people suffer from a disease called Celiac Disease, which impedes the digestion of gluten. Individuals with celiac disease must eat foods that do not contain gluten in order to prevent illness. If improperly treated, celiac disease can be fatal. In addition, care must be taken when eating grains that do not contain gluten, particularly oats and teff, as they are commonly grown near foods with gluten or processed in the same bins. Catholic sufferers of celiac disease must also exercise precaution, as Wheat, which contains gluten, is a required ingredient in the wafers used for certain religious ceremonies. / пузырь (bubble). Под Клейковиной понимается белковая часть пшеничной муки, остающаяся в виде эластичного сгустка после вымывания крахмала из теста водой. Составляющие клейковину запасные белки – глиадин и глутенин содержатся в эндосперме зерна пшеницы; от их содержания и свойств зависят хлебопекарные качества пшеничной муки. Глютен – смесь двух белков – глиадина (gliadin) и глютенина (glutenin). Глютен содержится в пшенице и ржи, придавая им важное свойство:- когда они смешиваются с водой, то становятся клейкими, начинают захватывать воздух, и из них можно приготовить тесто. Повышенная чувствительность к глютену приводит к развитию чревной болезни у детей. Глютен в питании может быть причиной постоянных головных болей. Если у вас периодические головные боли, плохая координация или

непереносимость глютена, то стоит задуматься о том, сколько пшеницы вы потребляете. Исследователи обнаружили, что если исключить глютен – протеин, который присутствует в пшенице и других зерновых – из диеты, то эти симптомы резко снизятся у людей среднего возраста. Результаты исследования были опубликованы в последнем выпуске Неврологии, научного журнала Американской Академии Неврологии. У 10 пациетнов наблюдалась повышенная чувствительность к глютену и магнитно-резонансная томограмма показывала воспаление центральной нервной системы. Все они время от времени испытывали головные боли, а некоторые из них страдали от нестабильности и отказов мускульной координации. После того, как глютен был исключён из питания, у девяти из десяти пациентов уменьшились или совсем пропали эти симптомы. Один пациент просто не следовал диете. В одном из случаев 50-летний мужчина страдал от головных болей и тошноты, которые сопровождались беспокойством и возбуждением. Он испытывал эпизодические головные боли в течение четырёх лет, затем приступы участились и стали более выраженными. После того, как он исключил глютен из питания, головные боли полностью исчезли. После прекращения этой диеты его периодические головные боли снова вернулись. Устранение инициирующего фактора, в данном случае глютена, может стать терапевтическим методом лечения непереносимости глютена и головных болей. Диагноз непереносимость глютена и связанная с глютеном неврологическая дисфункция объясняется присутствием антител. Кроме того, определённые гены у некоторых людей делают их более предрасположенными к непереносимости. До недавнего времени считалось, что целиакия – непереносимость глютена в зерновых продуктах – довольно редкая в США болезнь. Но положение меняется. Недавние исследования (в 2002) в Клинике Майо (Mayo Clinic, Scottsdale, AZ, the United States) показали резкое увеличение случаев этого недуга. Наиболее подвержены этому заболеванию женщины после 40, 50 и 60 лет. В Январском выпуске 2003 публикации Майо Клиник (Mayo Clinic Women's HealthSource) были опубликованы подробные данные, в соответствии с которыми симптомами целиакии являются спорадическая диарея, боли в брюшной полости, вздутие живота, сероватый стул. Очень часто люди испытывали симптомы целиакии задолго до того, как им был поставлен диагноз. Ведь раньше считалось, что эта болезнь редкая. К тому же симптомы очень многочисленны. Диагноз целиакии ставится с помощью теста крови и подтверждается образцами ткани из тонкой кишки. Если был поставлен такой диагноз, то важно исключить глютен из пищи, то есть избегать употребление хлеба, макаронных изделий, выпечки и всего, что содержит пшеницу, ячмень или рожь. Обычно через несколько недель после такой диеты наступает улучшение здоровья.

GLUTINOUS AROMATIC RICE = ГЛЮТИНОЗНЫЙ АРОМАТИЧНЫЙ РИС – Glutinous Aromatic Rice means white glutinous aromatic Rice, brown glutinous aromatic Rice and paddy glutinous aromatic Rice which their characteristics on white glutinous Rice provides opaque appearance. After being steam cooked, the grain turns to glutinous and sticks together. / Под Глютинозным Ароматичным Рисом понимается белый, бурый и нешелушеный глютинозный ароматичный рис, обеспечивает наличие непрозрачности.

GLUTINOUS BROWN RICE FOR PROCESSING = ГЛЮТИНОЗНЫЙ БУРЫЙ РИС ДЛЯ ПЕРЕРАБОТКИ – In the Rice industry of the United States, Glutinous Brown Rice For Processing shall be special varieties of Rice (Oryza Sativa L. Glutinosa) which contain more than 50 percent chalky kernels. Grade US No. 1 shall contain not more than 1.0 percent of nonchalky kernels, grade US No. 2 not more than 2.0 percent of nonchalky kernels, grade US No. 3 not more than 4.0 percent of nonchalky kernels, grade US No. 4 not more than 6.0 percent of nonchalky kernels, and grade US No. 5 not more than 10.0 percent of nonchalky kernels. The maximum limits for 'Chalky kernels' in §868.261 are not applicable to the special grade 'Glutinous Brown Rice For Processing'. / В индустрии риса в Соединённых Штатах Америки под Глютинозным Рисом подразумеваются особые глютинозные Виды Посевного Риса (Oryza Sativa L. Glutinosa), которые содержат более 50 процентов меловой зерновки (меловых ядер).

GLUTINOUS MILLED RICE = ГЛЮТИНОЗНЫЙ ОБРУШЕННЫЙ РИС – In the United States, Glutinous Milled Rice shall be special varieties of Rice (Oryza Sativa L. Glutinosa) which contain more than 50 percent chalky kernels. For long grain, medium grain, and short grain milled rice, grade US No. 1 shall contain not more than 1.0 percent of nonchalky kernels, grade US No. 2 not more than 2.0 percent of nonchalky kernels, grade US No. 3 not more than 4.0 percent of nonchalky kernels, grade US No. 4 not more than 6.0 percent of nonchalky kernels, grade US No. 5 not more than 10.0 percent of nonchalky kernels, and grade US No. 6 not more than 15.0 percent of nonchalky kernels. For second head milled Rice, grade US No. 1 shall contain not more than 4.0 percent of nonchalky kernels, grade US No. 2 not more than 6.0 percent of nonchalky kernels, grade US No. 3 not more than 10.0 percent of nonchalky kernels, grade US No. 4 not more than 15.0 percent of nonchalky kernels, and grade US No. 5 not more than 20.0 percent of nonchalky kernels. For screenings milled rice, there are no grade limits for percent of nonchalky kernels. For brewers milled rice, the special grade 'Glutinous Milled Rice' is not applicable. / Для высевок (screenings). В индустрии Риса в Соединённых Штатах Америки под Глютинозным Обрушенным Рисом подразумеваются особые Глютинозные Виды Посевного Риса (Oryza Sativa L. Glutinosa), которые содержат более 50 процентов меловой зерновки (меловых ядер).

GLUTINOUS RICE = ГЛЮТИНОЗНЫЙ РИС (или ЛИПКИЙ РИС) – Glutinous Rice also called Sticky Rice or Sweet Rice, consists of amylose and amylopectin starch. With a chalky white texture. The standards for white glutinous Rice are specified as follows:- (i) white glutinous Rice 10%, (ii) Short Grain, and (iii) Long Grain. Glutinous Rice:- refers to waxy Rice with only 0–2% amylose or mainly amylopectin in its endosperm and pollen starch. Raw glutinous endosperm is opaque and becomes moist, sticky, and glossy when cooked. / Глютинозный Рис, именуемый также Клейким Рисом или Сладким Рисом, состоит из амилозы и амилопектинового крахмала. С меловидной белой текстурой. Стандарты на белый глютинозный Рис специфицируются как:- (i) белый глютинозный Рис 10% (white glutinous rice 10%); (ii) Короткозёрный (Short Grain); и (iii) Длиннозёрный (Long Grain). В России, к Глютинозным относят зёрна Риса однородные по цвету, плотного строения, консистенции молочного стекла, в разрезе стеаринообразные без мучнистого или стекловидного вкрапления. Глютинозный Рис:- обработанные зёрна Риса особых глютинозных сортов. От обыкновенного Риса они отличаются тем, что при варке образуют сплошную клейкую массу. Поэтому могут негативно повлиять на качество блюда, особенно если есть желание приготовить Рис рассыпчатым. Глютинозные зёрна плотные, на разрезе с консистенцией молочного стекла, стеаринообразные, однородные по цвету, без мучнистых или стекловидных вкраплений.

GLUTINOUS ROUGH RICE = ГЛЮТИНОЗНЫЙ РИС–СЫРЕЦ – In the Rice industry of the United States, Glutinous Rough Rice shall be special varieties of Rice (Oryza Sativa L. Glutinosa) which contain more than 50 percent chalky kernels. Grade US No. 1 shall contain not more than 1.0 percent of nonchalky kernels, grade US No. 2 not more than 2.0 percent of nonchalky kernels, grade US No. 3 not more than 4.0 percent of nonchalky kernels, grade US No. 4 not more than 6.0 percent of nonchalky kernels, grade US No. 5 not more than 10.0 percent of nonchalky kernels, and grade US No. 6 not more than 15.0 percent of nonchalky kernels. / В индустрии Риса в Соединённых Штатах Америки под Глютинозным Рисом-Сырцом подразумеваются особые Глютинозные Виды Посевного Риса (Oryza Sativa L. Glutinosa), которые содержат более 50 процентов меловой зерновки (меловых ядер). В соответствии в утверждённой в США градацией Сорт № 1 должен содержать не более 1.0 процента немеловой зерновки (немеловых ядер), Сорт № 2 – не более 2.0 процентов немеловой зерновки (немеловых ядер), Сорт № 3 – не более 4.0 процентов немеловой зерновки (немеловых ядер), Сорт № 4 – не более 6.0 процентов немеловой зерновки (немеловых ядер),

Сорт № 5 – не более 10.0 процентов немеловой зерновки (немеловых ядер) и Сорт № 6 – не более 15.0 процентов немеловой зерновки (немеловых ядер).

GLV = GENERAL LICENSE SHIPMENTS OF LIMITED VALUE

GLYCOPHYTES = ГЛИКОФИТЫ (или ГЛЮКОФИТЫ) – Glycophytes are Nonhalophytic Plants or Plants that do not grow well when the osmotic pressure of the soil solution rises above two bars. / Под Гликофитами, от Греческих слов Glykýs, означающее Сладкий, и Phytón, означающее Растение, понимаются Растения незасолённых почв и пресных водоёмов. К ним относится большинство Растений, в том числе почти все культурные. Гликофиты или Глюкофиты, от Греческих слов Glykýs, означающее Сладкий, и Phytón, означающее Растение, Растения незаселённых почв и пресных водоёмов. К Гликофитам относятся Мезофиты, Гигро- и Гидрофиты, некоторые Ксерофиты. Почти все культурные Растения являются Гликофитами. Некоторые из них способны приспосабливаться к засолению почвы. Однако засоление всегда снижает продуктивность Гликофитов. Устойчивость Гликофитов к солям можно увеличить предпосевным солевым закаливанием (смотрите Солестойкость Растений). Сравните с Галофитами.

GLYCOPROTEIN = ГЛИКОПРОТЕИН – Glycoprotein is a diverse group of proteins which are modified by addition of short chains of typically 8–10 sugar residues covalently linked to their polypeptide structure. / Под Гликопротеидами или Мукопротеидами, от Греческого слова Glykýs, означающее Сладкий, и Протеин, понимаются сложные белки, содержащие углеводные компоненты. К гликопротеидам относятся многие белки плазмы крови (иммуноглобулины, трансферрины и другие), некоторые ферменты, гормоны (например, тиреотропин) и другие. Гликопротеиды, сложные белки, содержащие углеводы. Молярная масса от нескольких десятков тысяч до нескольких миллионов. Присутствуют почти во всех тканях и жидкостях животных (включая человека), в тканях растений и в микроорганизмах. К гликопротеидам относятся муцины (встречаются в секретах всех слизистых желёз – в слюне, желудочном соке, в спинномозговой и семенной жидкостях) и мукоиды (входят в состав опорных тканей – костей, хряща, связок, стекловидного тела глаза, яичного белка). К гликопротеидам относятся многие белки плазмы крови (церулоплазмин, орозомукоид, трансферин, протромбин), групповые вещества крови, иммуноглобулины, некоторые ферменты (панкреатическая рибонуклеаза Б, така-амилаза), гормоны (тиреотропин и фолликулостимулирующий гормон). Содержание углеводов в гликопротеидах варьирует от долей процента до 80%; их полисахаридная часть может содержать глюкозамин, галактозамин, галактозу, маннозу и другие углеводы. По аминокислотному составу все известные гликопротеиды делят на две группы:- (1) содержащие обычный набор аминокислот и небольшое количество углеводов (3–40%); и (2) имеющие специфический набор аминокислот с преобладанием серина и треонина и высокое содержание углеводов (60–80%).

GLYCOSIDE = ГЛИКОЗИД – Glycoside is any of a large class of natural or synthetic compounds such as anthocyanin that are acetal derivatives of sugars and that on hydrolysis yield one or more molecules of a sugar, often a noncarbohydrate. / Под Гликозидами понимаются органические вещества, молекулы которых состоят из углевода и неуглеводного компонента (агликона), соединённых так называемой гликозидной связью. Широко распространены в растениях, где могут быть формой переноса и хранения различных веществ. Сердечные гликозиды Наперстянки применяют в медицине. Гликозиды, продукты соединения (посредством легко гидролизуемых гликозидных связей) циклических 5- и 6-членных сахаров с веществами типа спиртов или фенолов. Гликозидные связи образуются между ацетальным гидроксилом сахара и спиртовой группой неуглеводного компонента, так называемого Агликона (при отщеплении молекулы воды). В зависимости от участия атомов S, O или N в образовании гликозидной связи различают S^-, O^- или N^- гликозиды. Две последние группы гликозидов наиболее распространены в тканях растений и животных, a- и b-гликозиды различаются пространственным положением агликона по отношению к плоскости кольца углеводного компонента; их гидролиз протекает при участии ферментов a и b-гликозидаз. Классификацию гликозидов затрудняет разнообразие веществ, выступающих в роли агликона, определяющего специфическое биологическое действие гликозидов. Содержащие глюкозу гликозиды называются Глюкозидами. К гликозидам, содержащим дисахаридные остатки, относятся кроцин (содержащий генциобиозу) и ксанторамнин (рамнозу). Полисахариды, также образуемые гликозидными связями, часто относят к гликозидам, а ферменты, их расщепляющие (например, амилазу), – к гликозидазам. Многие гликозиды – красящие вещества. Ряд гликозидов обладает значительной биологической активностью и применяется в медицине и биологии. Так называемые сердечные гликозиды, содержащиеся в растениях Наперстянке, Ландыше, Строфанте и другие, вызывают изменения сердечной деятельности; их применяют при заболеваниях сердца, они повышают сократительную способность сердечной мышцы, усиливают и укорачивают систолу, удлиняют диастолу, что ведёт к улучшению кровоснабжения сердца и устраняет застойные явления. В эксперименте гликозид флоридзин используют для вызывания гликозурии; гликозид сапонин вызывает гемолиз эритроцитов. Важную роль в организме играют гликозиды, образуемые при соединении сахаров рибозы и дезоксирибозы с азотистыми основаниями, – так называемые Нуклеозиды. Их фосфорные производные – нуклеотиды – участвуют в построении нуклеиновых кислот, а также являются коферментами.

GLYPHOSATE = ГЛИФОСАТ – Glyphosate (or RoundUp as it is commonly sold) is in the spotlight following claims it may cause cancer. AustralianFarmers (AustralianFarmers was initiated in 2016 by the National Farmers' Federation) busts the myths and explains why the science doesn't support this claim. What Is Glyphosate? Glyphosate is the active ingredient in the popular weed killer RoundUp, and about 500 other herbicide products. It's widely used by farmers, gardeners and other land managers. When applied, glyphosate prevents weeds from making the proteins they need to grow. Why Is Glyphosate Important? Glyphosate allows farmers to control weeds from above the ground – doing away with the need to plough or till the soil. Reducing tillage maintains soil nutrients and improves water use efficiency. Healthier soils mean higher yielding crops – a win for farmers and the environment. Glyphosate is also used to control aggressive, noxious weeds such as serrated tussock and African lovegrass. If not controlled, these weeds can rapidly take over a landscape – at the expense of native pastures and biodiversity. Why Is Glyphosate Under Pressure? In September (2018), a Californian jury found in favour of a plaintiff who alleged exposure to RoundUp, manufactured by Monsanto, had resulted in terminal non-Hodgkinson Lymphoma. The jury drew on a study by the International Agency for Research on Cancer (IARC), which identified exposure to glyphosate, as well as activities such as drinking hot drinks, frying food, and hairdressing, as 'probable carcinogenic' activities. In 2016, the Australian Pesticides and Veterinary Medicines Authority (APVMA) evaluated the IARC report and other contemporary scientific assessments as part of an established chemical review nomination process. The APVMA concluded that glyphosate did not pose a carcinogenic risk to humans and that there were no grounds to place it under formal reconsideration. The APVMA is a globally recognised, science-based regulator. What Does The Science Say? No other agricultural chemical has been tested to the extent that glyphosate has. The scientific evidence supporting glyphosate's safety is clear and overwhelming. In the past three years alone, regulatory authorities in the European Union, South Korea, Japan, Australia, New Zealand, Canada and the United States have publicly reaffirmed that exposure to glyphosate does not cause cancer. More than 800 scientific studies and reviews, including numerous independent regulatory safety assessments, have informed and confirmed these regulators' stance. A recent longitudinal study by the United States' National Institute of Agriculture followed 57 000 farmers and registered applicators of glyphosate for more than 20 years. The study found no connection between cancer and glyphosate. Farmers Take These Issues Seriously:- Australian farmers are renowned across the world for producing high quality, safe, sustainable produce. It is a role they take

very seriously. Farmers put their faith in the regulator (the Australian Pesticides And Veterinary Medicines Authority (APVMA)) to only approve for use products that are are safe for the environment and human health. Farmers care about their own health and that of their families, farm workers, communities and consumers. Busting The Myths On Glyphosate:- (1) Myth – Glyphosate Causes Cancer:- In the past 3 years alone regulatory authorities in the European Union, South Korea, Japan, Australia, New Zealand, Canada and the United States have publicly reaffirmed that glyphosate does not cause cancer. A longitudinal study followed 57 000 registered users of glyphosate over 20 years and found no connection between cancer and glyphosate. The findings of a study by the World Health Organisation's International Agency for Research on Cancer, identified exposure to glyphosate, drinking hot drinks, frying food, and hairdressing, as 'probable carcinogenic' activities. In 2016, the APVMA evaluated the IARC report and other contemporary scientific assessments as part of an established chemical review nomination process. The APVMA concluded that glyphosate did not pose a carcinogenic risk to humans and that there were no grounds to place it under formal reconsideration. (2) Fact – Food Grown In Farming Systems Where Glyphosate Is Used, Is Safe To Eat:- Glyphosate is typically not applied directly to food crops. Nevertheless, as with all other agricultural chemicals, farmers must adhere to maximum residue levels (MRLs) for glyphosate. In May 2016, the Joint World Health Organisation (WHO)/Food & Agricultural Organisation (FAO) Meeting on Pesticide Residues concluded that 'glyphosate is unlikely to pose a carcinogenic risk to humans from exposure through diet'. (3) Fact – Glyphosate Is Good For The Environment:- Glyphosate allows farmers to control weeds from above the ground, doing away with the need to plough or till fallow paddocks in preparation for the sowing of a crop. This practice minimises soil disruption and maximises soil health and water use efficiency. Less tillage, means less machinery operation and therefore less emissions generation. Glyphosate is also used by farmers to control aggressive, noxious weeds such as serrated tussock and African lovegrass. Left unmanaged, these weeds will spread rapidly, to the detriment of native grasses and biodiversity. (4) Fact – Products Containing Glyphosate Should Be Used According To The Directions On The Label:- In the same way it is recommended users observe the directions for use on the labels of household products, users of glyphosate products should always follow directions for use. It is important to note that there is no level of exposure to glyphosate that has been deemed to be dangerous to human health. (5) Myth – Australian Farmers Could Produce The Food And Fiber They Do Today, Without Using Glyphosate:- Through better weed control, improved soil health and water use efficiency, the addition of glyphosate has allowed farmers, in particular cotton, cereal, oilseed and pulse growers, to greatly improve their productivity per hectare. Today, on average, each Australian farmer grows enough food to feed 300 Australians and 600 global citizens each year. Australian farmers are trusted across the world for producing safe sustainable food and fiber – glyphosate plays an important role in making this possible. (6) Myth – Australian Farmers Could Use An Alternate Herbicide:- Currently, there is no product approved for use in Australia that is as safe or as effective as glyphosate for weed control. / РаундАп (RoundUp), изготавливаемый компанией Мансэнто (Monsanto), не-Хадьжкинсэнская Лимфома (terminal non-Hodgkinson Lymphoma).

GM = GALL MIDGE

GM = GAMBIA

GM = GENERAL MANAGER

GM = GENERAL MEETING

GM = GENETICALLY MODIFIED

GM = GREEN MANURE

GMBH = GESELLSCHAFT MIT BESCHRÄNKTER HAFTUNG

GMC = GUARANTEED MORTGAGE CERTIFICATE

GMCIG = THE GLOBAL MOBILE COMMERCE INTEROPERABILITY GROUP

GMD = GEOMETRIC MEAN DIAMETER

GMDB = GUARANTEED MINIMUM DEATH BENEFIT

GMDSS = GLOBAL MARITIME DISTRESS AND SAFETY SYSTEM

GMM = GENERAL MERCHANDISING MANAGER

GM PLANTS = GENETICALLY MODIFIED PLANTS

GMPP PLANTS = GENETICALLY MODIFIED PEST–PROTECTED PLANTS

GMROI = GROSS MARGIN RETURN ON INVENTORY

GMT = GREENWICH MEAN TIME

GN = GUINEA

GNMA = THE GOVERNMENT NATIONAL MORTGAGE ASSOCIATION

G–NNR = GENERAL LICENSE NON–NAVAL RESERVE

GNP = GROSS NATIONAL PRODUCT

GNSO = GENERIC NAMES SUPPORTING ORGANIZATION

GO = GENERAL OBLIGATION

GO = GENERAL ORDER

GO ADRIFT = ДРЕЙФОВАТЬ – Go Adrift (maritime term):- break loose.

GOC = GENERAL OPERATING COSTS

GODET ROLL = XX (или ВАЛИК ГАЛЕТА) – Godet Roll is a roll used for transporting and controlling the movement of bundles of fibers and yarns in the processing of these materials. / Godet Wheel = прядильный диск – для отвода пучка искусственных волокон из ванны и для подачи на бобину или в кружку.

GODETS = ГОДЭ (или РАСТИРАЮЩИЕСЯ СКЛАДКИ) – Godets are seam insertions that have triangular shaped panels which are added to the hems seams and this creates a flaring effect in clothes. The shape of the cutting of godets and the insertions depends on how you want the design to look. You can add piping to the godets seams or use a contrast color to make a decorative finish. You can use any fabric to sew godets. / .

GODFRA = GOLD DEPOSIT FORWARD RATE AGREEMENT

GO–DOWN = СКЛАДСКАЯ (или ОТКРЫТАЯ) ПЛОЩАДКА – In the Far East, Go-Down is a warehouse or cargo shed where goods are stored and delivered.

GOFO = GOLD FORWARD OFFERED RATE

GOFRA = GOLD FORWARD RATE AGREEMENT

GO–GO FUND = АКТИВНЫЙ (или ПОСПЕШНЫЙ) ВЫСОКОРИСКОВАННЫЙ ФОНД – Go-Go Fund is the investment fund promising investors exceptionally high earnings achieved by frequently shifting portfolio weightings (trading) and through speculative exposure. / Инвестиционный фонд, обещающий инвесторам исключительно высокие заработки, достигаемые часто переоцененными возможностями портфеля (при торговле) и посредством подверженности спекуляциям.

GOH = GARMENT–ON–HANGER

GOING–CONCERN VALUE = СТОИМОСТЬ ДЕЙСТВУЮЩЕГО КОНЦЕРНА (или СТОИМОСТЬ ДЕЙСТВУЮЩЕГО ПРЕДПРИЯТИЯ) – Going-Concern Value is the value that a firm has as an entity, as opposed to the sum of the values of each of its parts taken separately; particularly important in determining a reasonable railroad rate.

GOING PRIVATE = ПРИВАТИЗАЦИЯ (или ПРИВАТИЗИРОВАНИЕ, или ПРЕОБРАЗОВАНИЕ ПУБЛИЧНОЙ КОМПАНИИ В ЧАСТНУЮ) – Going Private:- removing a company from stock exchange listing, a process achieved by the company purchasing its own shares. Going private is usually the result of a decision by the principal shareholders that they require more direct control of the company. Its primary purpose is to reduce interference by outside investors and to render the company considerably less vulnerable to take-over bids. / Выход компании из котировочного списка фондовой биржи и процесс, осуществляемый за счёт приобретения компанией её собственных акций. Приватизация обычно является результатом решения основных акционеров, в котором они требуют более непосредственного контроля над компанией. Главной целью приватизации является снижение вмешательства сторонних инвесторов и перевод компании в значительно менее беззащитное состояние в отношении предложений о поглощении. Приватизация – преобразование публичной акционерной компании в частную либо путём выкупа компанией своих акций, либо путём покупки акций внешним инвестором. Такое преобразование обычно происходит в том случае, если рыночная цена её акций значительно ниже их балансовой стоимости (book value) и, таким образом, существует возможность приобретения активов по низким ценам. Ещё одним мотивом может быть желание сохранить существующего управляющего, что делает компанию непривлекательной в качестве объекта поглощения.

GOING PUBLIC = АКЦИОНИРОВАНИЕ (или ПРЕОБРАЗОВАНИЕ ЧАСТНОЙ КОМПАНИИ В ПУБЛИЧНУЮ, или ПУБЛИЧНОЕ РАЗМЕЩЕНИЕ, или ОТКРЫТАЯ ПОДПИСКА) – Going Public is the process by which a corporation first sells its shares to the public. When a company sells shares of itself to the public to raise capital. The initial listing of a company's shares on the stock exchange, also known as an Initial Public Offering (IPO). Together with the primary advantage of giving companies access to the capital market as a source of finance, publicity and image building effects as well as fiscal considerations also influence a company's decision to 'go public'. To offer shares of a company to financial institutions and the general public, and thereby receive a listing on the stock exchange. / Акционирование – преобразование частной компании в публичную. Термин используется в том случае, когда частная компания впервые предлагает свои акции к открытой продаже. Право владения компанией, таким образом, переходит из рук нескольких частных акционеров к фонду, который включает акционеров, приобретших акции в открытой продаже. В момент преобразования компании в акционерное общество открытого типа она осуществляет первоначальное публичное предложение (initial public offering) своих акций. Начиная с этого момента или до того, как компания вновь будет преобразована в частную, её акции будут иметь рыночную стоимость (market value).

GOLD = ЗОЛОТО – Gold is a chemical element, a dense, lustrous, yellow precious metal of Group Ib, Period 6, of the periodic table. Gold has several qualities that have made it exceptionally valuable throughout history. It is attractive in colour and brightness, durable to the point of virtual indestructibility, highly malleable, and usually found in nature in a comparatively pure form. The history of gold is unequaled by that of any other metal because of its value in the minds of men from earliest times. Properties, Occurrences, And Uses:- Gold is one of the heaviest of all metals. It is a good conductor of heat and electricity. It is also soft and the most malleable and ductile of metals; an ounce (28 g) can be beaten out to 187 square feet (about 17 square meters) in extremely thin sheets called Gold Leaf. Because gold is visually pleasing and workable and does not tarnish or corrode, it was one of the first metals to attract human attention. Examples of elaborate gold workmanship, many in nearly perfect condition, survive from ancient Egyptian, Minoan, Assyrian, and Etruscan artisans, and gold has continued to be a highly favoured material out of which to craft jewelry and other decorative objects. Owing to its unique qualities, gold has been the one material that is universally accepted in exchange for goods and services. In the form of coins or bullion, gold has occasionally played a major role as a high-denomination currency, although silver has generally been the standard medium of payments in the world's trading systems. Gold began to serve as backing for paper-currency systems when they became widespread in the XIX century, and from the 1870s until World War I the gold standard was the basis for the world's currencies. Although gold's official role in the international monetary system had come to an end by the 1970s, the metal remains a highly regarded reserve asset, and approximately 45 percent of all the world's gold is held by governments and central banks for this purpose. Gold is still accepted by all nations as a medium of international payment. Gold is widespread in low concentrations in all igneous rocks. Its abundance in the Earth's crust is estimated at about 0.005 parts per million. It occurs mostly in the native state, remaining chemically uncombined except with tellurium, selenium, and possibly bismuth. The element's only naturally occurring isotope is gold-197. Gold often occurs in association with copper and lead deposits, and, though the quantity present is often extremely small, it is readily recovered as a by-product in the refining of those base metals. Large masses of gold-bearing rock rich enough to be called Ores are unusual. Two types of deposits containing significant amounts of gold are known:- hydrothermal veins, where it is associated with quartz and pyrite (fool's gold); and placer deposits, both consolidated and unconsolidated, that are derived from the weathering of gold-bearing rocks. The origin of enriched veins is not fully known, but it is believed that the gold was carried up from great depths with other minerals, at least in partial solid solution, and later precipitated. The gold in rocks usually occurs as invisible disseminated grains, more rarely as flakes large enough to be seen, and even more rarely as masses or veinlets. Crystals about 2.5 cm (1 inch) or more across have been found in California. Masses, some on the order of 90 kg (200 pounds), have been reported from Australia. Alluvial deposits of gold found in or along streams were the principal sources of the metal for ancient Egypt and Mesopotamia. Other deposits were found in Lydia (now in Turkey) and the lands of the Aegean and in Persia (now Iran), India, China, and other lands. During the Middle Ages the chief sources of gold in Europe were the mines of Saxony and Austria. The era of gold production that followed the Spanish discovery of the Americas in the 1490s was probably the greatest the world had witnessed to that time. The exploitation of mines by slave labour and the looting of Indian palaces, temples, and graves in Central and South America resulted in an unprecedented influx of gold that literally unbalanced the economic structure of Europe. From Christopher Columbus' discovery of the New World in 1492 to 1600, more than 225 000 kg (8 000 000 ounces) of gold, or 35 percent of world production, came from South

America. The New World's mines – especially those in Colombia – continued into the XVII and XVIII centuries to account for 61 and 80 percent, respectively, of world production; 1 350 000 kg (48 000 000 ounces) were mined in the XVIII century. Russia became the world's leading producer of gold in 1823, and for 14 years it contributed the bulk of the world supply. During the second era of expanding production (1850–75), more gold was produced in the world than in all the years since 1492, primarily because of discoveries in California and Australia. A third marked increase (1890–1915) stemmed from discoveries in Alaska, Yukon Territory, and South Africa. A major factor in the increase of the world's supply of gold was the introduction in 1890 of the cyanide process for the recovery of gold from low-grade ores and ores containing minute, particle-sized gold. Gold production continued to rise throughout the XX century, partly because of the improvement in recovery methods and partly because of the continual growth and expansion of South Africa's gold-mining operations. In the late XX century four countries – South Africa, Russia, the United States, and Australia – accounted for two-thirds of the gold produced annually throughout the world. South Africa alone, with its vast Witwatersrand mines, produces about one-third of the world's gold. Because pure gold is too soft to resist prolonged handling, it is usually alloyed with other metals to increase its hardness for use in jewelry, goldware, or coinage. Most gold used in jewelry is alloyed with silver, copper, and a little zinc to produce various shades of yellow gold or with nickel, copper, and zinc to produce white gold. The color of these gold alloys goes from yellow to white as the proportion of silver in them increases; more than 70 percent silver results in alloys that are white. Alloys of gold with silver or copper are used to make gold coins and goldware, and alloys with platinum or palladium are also used in jewelry. The content of gold alloys is expressed in 24^{ths}, called Karats; a 12-karat gold alloy is 50 percent gold, and 24-karat gold is pure. Because of its high electrical conductivity (71 percent that of copper) and inertness, the largest industrial use of gold is in the electric and electronics industry for plating contacts, terminals, printed circuits, and semiconductor systems. Thin films of gold that reflect up to 98 percent of incident infrared radiation have been employed on satellites to control temperature and on space-suit visors to afford protection. Used in a similar way on the windows of large office buildings, gold reduces the air-conditioning requirement and adds to the beauty. Gold has also long been used for fillings and other repairs to teeth. Compounds:- The characteristic oxidation states of gold are +1 (aurous compounds) and +3 (auric compounds). Gold is more easily displaced from solution by reduction than any other metal; even platinum will reduce Au^{3+} ions to metallic gold. Among the relatively few gold compounds of practical importance are gold (I) chloride, AuCl; gold (III) chloride, or gold trichloride, $AuCl_3$; and chlorauric acid, $HAuCl_4$. All three are involved in the electrolytic refining of gold. Potassium cyanoaurate, $K[Au(CN)_2]$, is the basis for most gold-plating baths (the solution employed when gold is plated). The soluble salt sodium aurichloride, $NaAuCl_4 \cdot 2H_2O$, is used in the treatment of rheumatoid arthritis. Several organic compounds of gold have industrial applications. For example, gold mercaptides, which are obtained from sulfurized terpenes, are dissolved in certain organic solutions and used for decorating china and glass articles. Atomic number:- 79; atomic weight:- 196.967; melting point:- 1 063 °C (1 945 °F); boiling point:- 2 966 °C (3 371 °F); specific gravity:- 19.3 (20 °C); valence:- 1, 3; electronic config.:- 2-8-18-32-18-1. Gold is a metallic element with a characteristic yellow color, but can also be black or ruby when finely divided, while colloidal solutions are intensely colored and often purple. These colors are the result of gold's plasmon frequency lying in the visible range, which causes red and green light to be reflected, and blue light to be absorbed. Gold is a chemical element with the symbol Au (in Latin, Aurum) and atomic number 79. It is a highly sought-after precious metal which, for many centuries, has been used as money, a store of value and in jewelery. The metal occurs as nuggets or grains in rocks, underground 'veins' and in alluvial deposits. It is one of the coinage metals. It is a dense, soft, shiny, yellow metal, and is the most malleable and ductile of the known metals. Gold forms the basis for a monetary standard used by the International Monetary Fund (IMF) and the Bank for International Settlements (BIS). Its ISO currency code is XAU. Modern industrial uses include dentistry and electronics, where gold has traditionally found use because of its good resistance to oxidative corrosion. Chemically, gold is a trivalent and univalent transition metal. Gold does not react with most chemicals, but is attacked by chlorine, fluorine, aqua regia and cyanide. Gold dissolves in mercury, forming amalgam alloys. In particular, gold is insoluble in nitric acid, which will dissolve most other metals. Nitric acid has long been used to confirm the presence of gold in items, and this is the origin of the colloquial term 'Acid Test', referring to a gold standard test for genuine value. Precious metal used for a number of monetary purposes. Buying gold has been recognized for centuries as one of the best ways to preserve one's wealth and purchasing power. Gold bullion is a unique investment. From the time of ancient Egyptians, Greeks and Romans to more modern times, man has had an affinity for gold bullion. In all ages, man has been fascinated with the beauty and magic of gold, and with its power to change men's lives. Today, the beauty of a gold bar lies in its proven ability to diversify investments, protect wealth and preserve one's purchasing power. Gold investing objectives may be 'buy-and-hold' and/or trading. How much to invest in gold is subject to your specific situation and objectives. Gold Bullion, available in .995 fine bullion bars (10 ounce units), the standard industry form. Each bar is hallmarked to certify weight and purity. Delivery of gold bullion can also be taken in the form of 32.15 ounce 'kilobars'. Gold coins have a proven ability to protect wealth and preserve one's purchasing power, and gold coins offer divisible size and are universally acceptable in a recognizable form. This makes the purchase of gold coins and the selling of gold coin convenient through reputable coin dealers. Whether it be for investing in pure 24k (k – carats) gold Vienna Philharmonic, American Buffalo, or Canadian Maple Leaf coins, or other monetary bullion coins like the Krugerrand or the US American Eagle, buying gold coins is a convenient method for wealth protection and profit potential. Coins:- (i) Gold Vienna Philharmonics, available in units of 10 one-ounce coins. Pure 24 karat gold. Each coin is .999 fine gold, legal tender, with a face value of 100 Euro/2 000 Austrian Schillings. Vienna Philharmonics are also available for personal delivery only in fractional sizes of ounce, ounce and 1/10 ounce, in units of 20 coins each. (ii) Canadian Gold Maple Leafs, available in units of 10 one-ounce coins. Pure 24 karat gold. Each coin is .999 fine gold with a face value of 50 Canadian Dollars. Legal tender coin in Canada. (iii) US Gold American Buffalos, available in units of 10 one-ounce coins for personal delivery only. First minted in 2006, American Buffalo gold bullion coins are the first .9999 fine 24-karat gold coins ever struck by the United States Mint. Legal tender coin in the USA with a USD50.00 face value. (iv) US Gold American Eagles, available in units of 10 one-ounce coins for personal delivery only. .9167 fine gold. Legal tender coin in the USA with a USD50.00 face value. Also available for personal delivery only in fractional sizes of ounce, ounce and 1/10 ounce, in units of 20 coins each. (v) South African Gold Krugerrands, available in units of 10 one-ounce coins for personal delivery only. .916 fine gold. First introduced in 1967. Legal tender coin has variable monetary value. Recognized and honored around the world. Latin name Aurum. Chemical symbol Au. Its specific gravity is 19.32 and melting point is 1 063 °C. In the United Kingdom, the System of National Accounts (SNA) and the International Monetary Fund (IMF) (in the 5^{th} Edition of its Balance of Payments Manual) recognise three types of gold:- (i) monetary gold, treated as a financial asset; (ii) gold held as a store of value, to be included in valuables; and (iii) gold as an industrial material, to be included in intermediate consumption or inventories. This is a significant change from previous UK practice and presents problems such that the United Kingdom has received from the European Union a derogation from applying this fully until the year 2005. The present treatment is as follows:- (i) In the accounts a distinction is drawn between gold held as a financial asset (financial gold) and gold held like any other commodity (commodity gold). Commodity gold in the form of finished manufactures together with net domestic and overseas transactions in gold moving into or out of finished manufactured form, i.e. for jewellery, dentistry, electronic goods, medals and proof – but not bullion – coins, is recorded in exports and imports of goods; and (ii) All other transactions in gold, i.e. those involving semi-manufactures such as rods, wire, etc, or bullion, bullion coins or banking-type assets and liabilities denominated in gold, including official reserve assets, are treated as financial gold transactions and included in the financial account of the Balance of Payments. The United Kingdom has adopted different treatment to avoid distortion of its trade in goods account by the substantial transactions of the

London bullion market. For many centuries gold has been much coveted for making jewelry, but above all in 'uncertain' times it is also prized as a capital investment – though it bears no interest. In most cases, buyers are not interested in short-term price gains, but seek to preserve value in the longer term. Over the last few decades, however, gold has been subject to strong price fluctuations. Gold bars or coins can be purchased for investment purposes. The value of gold is based primarily on its use as a currency standard or monetary reserve. In international payment business gold used to play an important part in settling international trade balances, but since 1976 it has largely lost this monetary policy role. Gold Futures (GC) are hedging tools for commercial producers and users of gold. They also provide global gold price discovery and opportunities for portfolio diversification. In addition, they:- (i) offer ongoing trading opportunities, since gold prices respond quickly to political and economic events; and (ii) serve as an alternative to investing in gold bullion, coins, and mining stocks. Things to know about the contracts:- (i) physically delivered; (ii) block-trade eligible; (iii) American-style options; and (iv) can be traded off-exchange for clearing only through CME ClearPort. Diversification:- trading new asset classes such as futures can help traders reduce portfolio volatility, especially during times of financial unrest. Leverage:- leverage is built into each futures contract allowing investors control at a fraction of its total value. Physical Delivery:- gold futures provide a mechanism for taking physical delivery in accordance with details of the contract from licensed depositories. Inflationary Hedge:- historically, the price of Gold has generally moved with inflation, making it a potential hedge against inflationary concerns. Market Liquidity:- liquidity in Gold futures averages a daily volume of over 200 000 trades and over 20 million ounces of Gold. Safe Haven Investment:- gold has historically maintained its value during times of economic or political uncertainty. Many people view it as a safe haven investment. The CME Group Gold futures contract is 100 oz. of Gold:- (1) Product Symbol:- GC. (2) Venue:- CME Globex, CME ClearPort, and Open Outcry (New York). (3) Hours (ET) CME Globex, Hours (ET) CME ClearPort, and Hours (ET) Open Outrcy:- Sunday – Friday 06:00 pm – 05:15 pm (05:00 pm – 04:15 pm Chicago Time/CT) with a 45-minute break each day beginning at 05:15 pm (04:15 pm CT). (4) Contract Size:- 100 Troy ounces. (5) Price Quotation:- US Dollars and Cents per Troy ounce. (6) Minumum Fluctuation:- USD0.10 per Troy ounce. (7) Termination of Trading:- trading terminates on the third last business day of the delivery month. (8) Listed Contracts:- trading is conducted for delivery during the current calendar month; the next two calendar months; any February, April, August, and October falling within a 23-month period; and any June and December falling within a 72-month period beginning with the current month. (9) Settlement Type:- physical. (10) Delivery Period:- delivery may take place on any business day beginning on the first business day of the delivery month or any subsequent business day of the delivery month, but not later than the last business day of the current delivery month. (11) Trading at Settlement (TAS):- Trading at Settlement is allowed in the active contract month. The active contract months will be February, April, June, August and December. On any given date, TAS transactions will be allowed only in a single contract month. TAS transactions may be executed at the current day's settlement price or at any valid price increment ten ticks higher or lower than the settlement price. (12) Grade and Quality Specs:- gold delivered under this contract shall assay to a minimum of 995 fineness. (13) Position Limits:- NYMEX® Position Limits. (14) Rulebook Chapter:- 113. (15) Exchange Rule:- these contracts are listed with, and subject to, the rules and regulations of COMEX. Gold futures offer a unique alternative to trading Gold with three distinct contract sizes (10, 50, and 100 Troy ounces) – one that's right for you. CME Group provides traders of all levels many benefits with Gold futures that other asset classes can't such as opportunity for diversification, greater leverage, deeper market liquidity, the option to take physical delivery and more. Now CME Group has made Gold futures even more accessible with the recent introduction of the 10 oz. E-micro Gold (MGC) futures contract. Like other precious metals, Gold is measured by Troy weight and by grams. When it is alloyed with other metals the term Carat or Karat is used to indicate the amount of gold present, with 24 karats being pure gold and lower ratings proportionally less. The purity of a gold bar can also be expressed as a decimal figure ranging from 0 to 1, known as the Millesimal Fineness, such as 0.995 being very pure. The price of gold is determined on the open market, but a procedure known as the Gold Fixing in London, originating in September 1919, provides a daily benchmark figure to the industry. The afternoon fixing appeared in 1968 to fix a price when US markets are open. Historically gold was used to back currency; in an economic system known as the Gold Standard, a certain weight of gold was given the name of a unit of currency. For a long period, the United States government set the value of the US Dollar so that one Troy ounce was equal to USD20.67 (USD664.56/kg), but in 1934 the Dollar was revalued to USD35.00 per Troy ounce (USD1 125.27/kg). By 1961 it was becoming hard to maintain this price, and a pool of US and European banks agreed to manipulate the market to prevent further currency devaluation against increased gold demand. On 1968-March-17, economic circumstances caused the collapse of the gold pool, and a two-tiered pricing scheme was established whereby gold was still used to settle international accounts at the old USD35.00 per Troy ounce (USD1.13/g) but the price of gold on the private market was allowed to fluctuate; this two-tiered pricing system was abandoned in 1975 when the price of gold was left to find its free-market level. Central banks still hold historical gold reserves as a store of value although the level has generally been declining. The largest gold depository in the world is that of the US Federal Reserve Bank in New York, which holds about 3% of the gold ever mined, as does the similarly-laden US Bullion Depository at Fort Knox. Since 1968 the price of gold on the open market has ranged widely, with a record high of USD850.00/oz (USD27 300.00/kg) on 1980-January-21, to a low of USD252.90/oz (USD8 131.00/kg) on 1999-June-21 (London Fixing). On 2006-May-11 the London gold fixing was USD715.50/oz (USD23 006.00/kg). After dropping along with everything else in 2008, gold embarked on a huge rally based in large part on fear that government stimulus would lead to high inflation. The inflation did not hit and gold took a tumble in 2013. While many take issue with official government inflation numbers, the chart shows that inflation had gotten pretty high prior to the credit crisis but the core (ex food and energy) did not rise above its 2% target. The inflation many saw coming due to quantitative easing has not arrived and gold bulls grew impatient by 2013. Metals in all forms are a pretty strong barometer of global economic health. However there does not appear to be a clear picture of what comes next as the US and global economy attempt to move from this period of extraordinary stimulus to more normal conditions. Metals aren't simply another commodity sector, they say a whole lot about where the global economy is going. Metals are the foundation of economic growth, and precious metals, gold in particular, can be a window to our souls. Besides being used as a currency and store of value when inflation fears rise, gold is the original fear gauge, in high demand when the world seems uncertain and at risk. 'Gold for 5 000 years keeps its value', says George Gero (in April 2014), vice-president of Global Futures RBC Capital Markets and long-time gold trader. You can't trust many currencies so people like to have some gold because it is portable, liquid, holds no allegiances and is instantly convertible to other currencies'. Gold is the most followed and globally traded commodity. That is if it were a commodity. Some call it a precious metal – and it is a lonely one, perhaps the last precious metal – others see it as a currency, the only one that maintains its value – and until we find a real life Rumpelstiltskin able to spin straw into gold like the fairy tale as easily as central bankers can print money, it will remain in demand. However that demand waned in 2013 (see 'Where's the inflation?' right). This came about as the huge increase in inflation expected by so many analysts (based on the massive global stimulus programs from central banks in response to the 2008 credit crisis) did not materialize (see 'Where did the stimulus go?' right). And Gero says traders are abandoning gold positions, which is evident from lower open interest. They keep on buying out-of-the-money calls. Years ago the mining company used to sell forward and buy out-of-the-money calls, but now the minors are selling calls and using the proceeds to but puts, according to Gero. 'We have 1.5 million in open interest in options and only 303 000 in open interest in futures. That is showing me a lack of interest in gold'. Patricia Mohr, vice-president, economics and commodity market specialist at Scotiabank, says gold prices bottomed at its June 2013 low of USD1 180 per oz but that Federal Reserve tapering will limit any move higher. 'Gold was driven up to its all-time record high in 2011 by quantitative easing and the idea that it would be inflationary – to date we haven't seen inflation', Mohr says. 'Talking about reducing QE

is what really unnerved gold. Every time (the Fed) reduces the asset purchase program it will check gold prices, but I do think it has bottomed'. Phillip Streible, senior market strategist at RJO Futures, says, 'I don't think we are going to see USD1 500 plus in gold for a very long time because the US economy is getting better, the global economy is slowly getting better and the Federal Reserve is acknowledging it by continuing to taper. They will stick to that timeline'. Gero agrees. 'There is a need for gold and a use for gold but sometimes it is overused. For the moment it is not bearish; it is not bullish but it is what I call benign neglect', he says. Mohr, adds, 'I don't expect gold to move dramatically higher in the next 12 to 18 months because we expect the Fed will gradually normalize monetary policy in the United States, and I expect monetary policy to be tightened by 2015'. The wild card for gold is geopolitics and there are some signs central banks are hedging their bets. Many sovereign nations have reportedly built up gold reserves. 'It is a form of diversification', says Stephen Platt senior futures strategist for Archer Financial Services. 'Not being totally beholden on the Dollar. It is one of the easiest currencies to diversify, gold and Dollars', he says. 'So if you want to diversify your reserves, central banks have been buyers on the breaks', Platt says. Gero adds, 'In China, traditional investors and government see gold as a store of (value) and because the US Dollar is expected to perform well – they see gold as a US Dollar asset. They will continue to collect gold reserves'. Xxxxx. History of the International Gold Market:- Gold was first used as a form of currency around 1091 BC and has been intimately tied to the financial markets for centuries. Many European countries implemented gold standards in the latter half of the 1800s. In 1900, Congress passed the Gold Standard Act, which officially placed the United States on the gold standard and committed the United States to maintain a fixed exchange rate in relation to other countries on the gold standard. From the late 1800s to World War I, world trade increased from less than USD8 billion to more than USD18 billion. During the same period global gold reserves also increased almost 350% as gold was discovered and utilized as part of the new system of international trade. Following World War II, the world's major industrial states including the United States, Great Britain, France, Germany, Japan, Italy and Spain adopted the Bretton Woods system. The chief feature of the Bretton Woods system was an obligation that each country adopt a monetary policy that maintained foreign exchange rates by tying currencies to the United States Dollar (USD), which was in turn pegged to gold. From 1945 to 1971, United States Dollars could be converted to gold by foreign countries and foreigners for USD35 per troy ounce. Thus, the United States was committed to backing every Dollar overseas with physical gold during this period. In its early years, the Bretton Woods system worked well. However, following World War II, Europe and Japan recovered, the United States' share of the world's economic output began to drop, and the Dollar became overvalued as many more people began to hold their assets in Dollars. Thus, the United States did not have sufficient gold reserves to back all of its currency. In an effort to maintain the fixed price of gold, in 1961 the United States, the United Kingdom and six other European countries entered into the London Gold Pool. The London Gold Pool was the pooling of gold reserves to help maintain the Bretton Woods system of fixed-rate convertible currencies and defend the gold price of USD35 per troy ounce by interventions in the London gold market. From 1961 to 1967, the central banks of these eight countries helped balance spikes in the market price of gold as determined by the London fix while also buying gold on price weaknesses. The London Gold Pool was successful in stabilizing the price of gold until 1968 when France withdrew from the pool and runs on gold, the British pound, and the United States Dollar occurred. The London Gold Pool collapsed in March 1968. From 1968 to 1971, the major industrial countries of the world undertook various efforts to suppress the price of gold, but the writing was on the wall. By 1971, the United States' gold reserves were low and foreign banks held many more Dollars than the United States held in gold, leaving the United States vulnerable to a run on its gold. In 1971, President Richard Nixon issued Executive Order 11615, which ended convertibility between United States Dollars and gold (the 'Nixon Shock'). Following the Nixon Shock, the dollar floated freely on the international market and Bretton Woods was abandoned. The events of 1971 meant that the price of gold was no longer artificially tied to the dollar and ignited the onset of a gold bull market culminating at a price of USD850 per troy ounce in January 1980 – an increase of more than 2300% in less than a decade. On December 31, 1974, gold ownership by Americans was again legalized (from 1933 to 1974 such ownership was generally not legal), and gold futures trading commenced within a few years. / Кристофё Каламбэс (Christopher Columbus). Дьжодьж Гароу (George Gero (в Апреле 2014)). Пэтчриша Мор (Patricia Mohr, Вице-Президент, экономист и специалист по рынку сырья в (Scotiabank)). Филып Стчрэйбл (Phillip Streible). Стивэн Плат (Stephen Platt) старший стратег по фьючерсам в Ачё Файнэншэл Сёвисиз (Archer Financial Services). Сродство (Affinity). двухъярусное (two-tier). В Соединённом Королевстве, Система Национальных Счетов (СНС) и . Амэрикэн (American). Крюгаранд (Krugerrand) . Золото, наряду с серебром, платиной и металлами платиновой группы, составляет благородные металлы. Руководство (Manual). Брэтчэн Вудзская система (Bretton Woods system). Президент США Ричод Никсэн (Richard Nixon). Золото, на Латинском языке Аурум (Aurum); обозначение:- Au, является химическим элементом I группы Периодической Системы Менделеева, атомный номер 79, атомная масса 196.966 5. Благородный металл красивого жёлтого цвета, тяжёлый, ковкий (мягкий и очень пластичный); имеет плотность 19 320 кг/м^3, $t_{пл}$ 1 064.43 °C. Химически золото, как и другие благородные металлы, весьма инертно, на воздухе не изменяется даже при нагревании. Первый из открытых человеком металлов. В природе встречается главным образом самородное золото (коренные и россыпные месторождения). При извлечении золота важное значение имеют процессы амальгамации и цианирования. В технике золото обычно используется в виде сплавов с другими металлами. При сохранении основных свойств золотые сплавы обладают большой твёрдостью и прочностью и позволяют его экономить. Из сплавов золота с платиной делают химически стойкую аппаратуру; из сплава с платиной и серебром – электрические контакты для приборов ответственного назначения. Золото и его сплавы используют также для золочения, изготовления ювелирных изделий и зубных протезов. Содержание золота в ювелирных изделиях, монетах, медалях, полуфабрикатах зубопротезного производства выражают пробой; обычно добавкой служит медь. Коллоидное золото применяют в диагностике почечных и лёгочных заболеваний. С экономической точки зрения золото является специфическим товаром, естественные свойства которого – однородность, делимость, сохраняемость, портативность (большая стоимость при небольшом объёме и массе) – сделали его наиболее подходящим для роли всеобщего эквивалента, то есть денег. Товар, потребительская стоимость которого – способность выражать и измерять стоимость всех других товаров. Золото обращается в форме слитков и монет. Золото (на Латинском – Аурум (Aurum)), Au, химический элемент 1 группы Периодической Системы Менделеева; атомный номер 79, атомная масса 196.966 5; тяжёлый металл жёлтого цвета. Состоит из одного устойчивого изотопа ^{197}Au. Историческая Справка:- золото было первым металлом, известным человеку. Изделия из золота найдены в культурных слоях эпохи неолита (5–4-е тысячелетия до Нашей Эры). В древних государствах – Египте, Месопотамии, Индии, Китае добыча золота, изготовление украшений и других предметов из него существовали за 3–2 тысячи лет до Нашей Эры. Золото часто упоминается в Библии, 'Илиаде', 'Одиссее' и других памятниках древней литературы. Алхимики называли золото 'царём металлов' и обозначали его символом Солнца; открытие способов превращения неблагородных металлов в золото было главной целью алхимии. Распространённость В Природе:- среднее содержание золота в литосфере составляет $4.3 \cdot 10^{-7}$% по массе. В магме и магматических породах золото рассеяно, но из горячих вод в земной коре образуются гидротермальные месторождения золота, имеющие важное промышленное значение (кварцевые золотоносные жилы и другие). В рудах золота в основном находится в свободном (самородном) состоянии и лишь очень редко образует минералы с селеном, теллуром, сурьмой, висмутом. Пирит и другие сульфиды часто содержат примесь золота, которое извлекают при переработке медных, полиметаллических и других руд. В биосфере золото мигрирует в комплексе с органическими соединениями и механическим путём в речных взвесях. 1 литр (л) морской и речной воды содержит около $4 \cdot 10^{-9}$ г золота. На участках золоторудных

месторождений подземные воды содержат золота приблизительно 10^{-6} г/л. Оно мигрирует в почвах и оттуда попадает в растения; некоторые из них концентрируют золото, например, Хвощи, Кукуруза. Разрушение эндогенных месторождений золота приводит к образованию россыпей золота, имеющих промышленное значение. Золото добывается в 41 стране; его основные запасы сосредоточены в бывшем СССР, ЮАР и Канаде. Физические и Химические Свойства:- золото – мягкий, очень пластичный, тягучий металл (может быть проковано в листки толщиной до $8 \cdot 10^{-5}$ мм, протянуто в проволоку, 2 км которой весят 1 г), хорошо проводит тепло и электричество, весьма стойко против химических воздействий. Кристаллическая решётка золота гранецентрированная кубическая, a = 4.704 Å. Атомный радиус 1.44 Å, ионный радиус Au^{1+} 1.37 Å. Плотность (при 20 °C) 19.32 г/см^3, $t_{пл}$ 1 064.43 °C, $t_{кип}$ 2 947 °C; термический коэффициент линейного расширения $14.2 \cdot 10^{-6}$ (при 0–100 °C); удельная теплопроводность 311.48 Вт/(м·К) (0.744 кал/см·сек·°C); удельная теплоёмкость 132.3 Дж/(кг·К) (0.031 6 кал/г·°C) (при 0–100 °C); удельное электросопротивление $2.25 \cdot 10^{-8}$ Ом·м ($2.25 \cdot 10^{-6}$ Ом·см) (при 20 °C); температурный коэффициент электросопротивления 0.003 96 (при 0–100 °C). Модуль упругости $79 \cdot 10^3$ МН/м^2 ($79 \cdot 10^2$ кгс/мм^2), для отожжённого золота предел прочности при растяжении 100–140 МН/м^2 (10–14 кгс/мм^2), относительное удлинение 30–50%, сужение площади поперечного сечения 90%. После пластической деформации на холоду предел прочности повышается до 270–340 МН/м^2 (27–34 кгс/мм^2). Твёрдость по Бринеллю 180 МН/м^2 (18 кгс/мм^2) (для отожжённого золота около 400 °C). Конфигурация внешних электронов атома золота $5d^{10}\ 6s^1$. В соединениях золото имеет валентности 1 и 3 (известны комплексные соединения, в которых золото 2-валентно). С неметаллами (кроме галогенов) золото не взаимодействует. С галогенами золото образует галогениды, например $2Au + 3Cl_2 = 2AuCl_3$. В смеси соляной и азотной кислот золото растворяется, образуя золотохлористоводородную кислоту H $[AuCl_4]$. В растворах цианида натрия NaCN (или калия KCN) при одновременном доступе кислорода золото превращается в цианоаурат (I) натрия $2Na\ [Au\ (CN)_2]$. Эта реакция, открытая в 1843 Петром Романовичем Багратионом (1818–1876), получила практическое применение только в конце XIX века. Для золота характерна лёгкая восстановимость его из соединений до металла и способность к комплексообразованию. Существование закиси золота, то есть оксида золота (I) Au_2O, сомнительно. Хлорид золота (I) AuCl получается при нагревании хлорида золота (III):- $AuCl_3 = AuCl + Cl_2$. Хлорид золота (III) $AuCl_3$ получается действием хлора на порошок или тонкие листочки золота при 200 °C. Красные иглы $AuCl_3$ дают с водой коричнево-красный раствор комплексной кислоты:- $AuCl_3 + H_2O = H_2[AuOCl_3]$. При осаждении раствора $AuCl_3$ едкой щёлочью выпадает амфотерная жёлто-коричневая гидроокись золота(III) $Au(OH)_3$ с преобладанием кислотных свойств; поэтому её называют Золотой Кислотой, а её соли – Ауратами (III). При нагревании гидроокись золота (III) превращается в окись золота Au_2O_3, которая выше 220° разлагается по реакции:- $2Au_2O_3 = 4Au + 3O_2$. При восстановлении солей золота хлоридом олова (II):- $2AuCl_3 + 3SnCl_2 = 3SnCl_4 + 2Au$; образуется весьма стойкий пурпуровый коллоидный раствор золота (Кассиев Пурпур); это используется в анализе для обнаружения золота. Количественное определение золота основано на его осаждении из водных растворов восстановителями ($FeSO_4$, H_2SO_3, $H_2C_2O_4$ и другими) или на применении пробирного анализа. Получение Золота И Его Аффинаж:- из россыпных месторождений золота можно извлечь отмучиванием, основанным на большой разности плотностей золота и пустой породы. Этот способ, применявшийся уже в глубокой древности, сопряжён с большими потерями. Он уступил место Амальгамации (известной уже в I веке до Нашей Эры и применявшейся в Америке начиная с XVI века) и Цианированию, получившему широкое распространение в Америке, Африке и Австралии в 1890-х. В конце XIX – начале XX веков основным источником золота стали коренные месторождения. Золотоносную породу сначала подвергают дроблению и обогащению. Из полученного концентрата извлекают золото раствором цианида калия или натрия. Из раствора комплексного цианида осаждают золото цинком; при этом выпадают и примеси. Для Очистки (Аффинажа) золота электролизом (способ Э. Вольвилла, 1896) аноды, отлитые из нечистого золота, подвешивают в ванне, содержащей солянокислый раствор $AuCl_3$, катодом служит лист чистого золота. При прохождении тока примеси выпадают в осадок (анодный ил, шлам), а на катоде отлагается золото чистотой не менее 99.99%. Применение:- золото в условиях товарного производства выполняет функцию денег. В технике золото применяют в виде сплавов с другими металлами, что повышает прочность и твёрдость золота и позволяет экономить его. Содержание золота в сплавах, применяемых для изготовления ювелирных изделий, монет, медалей, полуфабрикатов зубопротезного производства и так далее, выражают пробой; обычно добавкой служит медь (так называемая Лигатура). В сплаве с платиной золото используется в производстве химически стойкой аппаратуры, в сплаве с платиной и серебром – в электротехнике. Соединения золота используют в фотографии (тонирование). Золото В Искусстве:- золото применяется с древнейших времён в ювелирном искусстве (украшения, культовая и дворцовая утварь и так далее), а также для золочения. Благодаря своей мягкости, ковкости, способности тянуться золото поддаётся особо тонкой обработке чеканкой, литьём, гравировкой. Золото используют для создания разнообразных декоративных эффектов (от глади жёлтой полированной поверхности с плавными переливами световых бликов до сложных фактурных сопоставлений с богатой светотеневой игрой), а также для выполнения тончайшей филиграни. Золото, часто окрашенное примесями других металлов в различные цвета, применяется в сочетании с драгоценными и поделочными камнями, жемчугом, эмалью, чернью. В медицине препараты золота используют в виде взвеси в масле (отечественный препарат кризанил, зарубежный – миокризин) или водорастворимых препаратов (зарубежные – санкризин и солганал) для инъекций при лечении хронических ревматических артритов, эритематозной красной волчанки, часто в сочетании с гормональными и другими препаратами. Препараты золота нередко вызывают побочные явления (повышение температуры тела, раздражение кишечника, почек и другие). Противопоказания к применению препаратов золота:- тяжёлые формы туберкулёза, сахарный диабет, заболевания сердечно-сосудистой системы, печени, почек, крови. Радиоактивное золото (чаще ^{198}Au) вводят в ткани в виде штифтов, гранул и тому подобного – для гамма-терапии и в виде коллоидных растворов – для бета-терапии. Его применяют при лечении опухолей, обычно в сочетании с хирургическим и медикаментозным лечением, а также с диагностическими целями – в виде коллоидных растворов при исследовании ретикуло-эндотелиальной системы, печени, селезёнки и других органов. Экономическое Значение:- золото в условиях товарного производства выполняет функцию всеобщего эквивалента. ‘Первая функция золота состоит в том, чтобы доставить товарному миру материал для выражения стоимости, то есть для того, чтобы выразить стоимости товаров как одноимённые величины, качественно одинаковые и количественно сравнимые’ (Карл Маркс (1818–1883), в книге:- Карл Маркс и Фридрих Энгельс, Сочинения, 2 Издание, Том 23, с. 104). Выражая стоимость всех других товаров, золото в качестве всеобщего эквивалента приобретает особую потребительную стоимость, становится деньгами. ‘Золото и серебро по природе своей не деньги, но деньги по своей природе – золото и серебро’ (Карл Маркс, там же, Том 13, с. 137). Товарный мир выделил золото в качестве денег потому, что оно обладает наилучшими для денежного товара физическими и химическими свойствами:- однородностью, делимостью, сохраняемостью, портативностью (большой стоимостью при небольших объёме и весе), легко поддаётся обработке. Значительное количество золота применяется для изготовления монет или в форме слитков хранится в качестве золотого запаса центральных банков (государства). Золото широко используется для промышленного потребления (в радиоэлектронике, приборостроении и других прогрессивных отраслях), а также как материал для изготовления ювелирных изделий. Первоначально золото употреблялось исключительно для выделки украшений, затем оно стало служить средством сбережения и накопления богатств, а также обмена (сначала в форме слитков). В качестве денег золото использовалось ещё за 1500 лет до Нашей Эры в Китае, Индии, Египте и государствах Месопотамии, а в Древней Греции – в VIII–VII веках до

Нашей Эры. В Лидии, богатой месторождениями золота, в VII веке до Нашей Эры началась чеканка первых в истории монет. Имя Лидийского Царя Креза (правил около 560–546 до Нашей Эры) стало синонимом несметного богатства. На территории бывшего СССР (в Армении) монеты из золота чеканились в I веке до Нашей Эры. Но в древности и в средние века золото не являлось основным валютным металлом. Наряду с ним функции денег выполняли медь и серебро. Погоня за золотом, страсть к обогащению были причинами многочисленных колониальных и торговых войн, в эпоху Великих географических открытий толкали на поиски новых земель. Поток драгоценных металлов в Европу после открытия Америки явился одним из источников первоначального накопления капитала. До середины XVI века из Нового Света в Европу ввозилось преимущественно золото (97–100% ввозимого металла), а со 2-й трети XVI века, после открытия богатейших месторождений серебра в Мексике и Перу – преимущественно серебро (85–99%). В России в начале XIX века стали разрабатываться новые месторождения золота на Урале и в Сибири, и в течение трёх десятилетий страна занимала первое место в мире по его добыче. В середине XIX века были открыты богатые месторождения золота в США (Калифорния) и Австралии, в 1880-х – в Трансваале (Южная Африка). Развитие капитализма, расширение межконтинентальной торговли усилили спрос на денежные металлы, и, хотя добыча золота возросла, во всех странах наряду с золотом в качестве денег ещё продолжало широко использоваться серебро. В конце XIX века произошло резкое снижение стоимости серебра вследствие совершенствования способов его добычи из полиметаллических руд. Рост мировой добычи золота и особенно прилив его в Европу и США из Австралии и Африки ускорили вытеснение обесценившегося серебра и создали условия для перехода большинства стран к монометаллизму (золотому) в его классической форме золотомонетного стандарта (смотрите Золотой Стандарт). Первой к золотому монометаллизму перешла в конце XVIII века Великобритания. К началу XX века золотая валюта утвердилась в большинстве стран мира. Отражая отношения людей в условиях стихийного товарного производства, власть золота выступает на поверхности явлений как отношение вещей, кажется натуральным внутренним свойством золота и порождает золотой и денежный фетишизм. Страсть к накоплению золотых богатств растёт безгранично, толкает на чудовищные преступления. Особенно возрастает власть золота при капитализме, когда товаром становится рабочая сила. Образование при капитализме мирового рынка расширило сферу обращения золота и сделало его мировыми деньгами. В период общего кризиса капитализма подрывается золотой стандарт. Во внутреннем обращении капиталистических стран господствующими становятся бумажные деньги и неразменные на золото банкноты. Ограничиваются или вовсе запрещаются вывоз золота и его купля-продажа. В связи с этим золото перестаёт выполнять функции средства обращения и средства платежа, но, выступая идеально как мера стоимости, а также сохраняя значение средства образования сокровищ и мировых денег, остаётся базой денежных систем и главным средством окончательного урегулирования взаимных денежных требований и обязательств капиталистических стран. Размеры запасов золота – важный показатель устойчивости капиталистических валют и экономического потенциала отдельных стран (смотрите также Золотовалютные Резервы). Купля-продажа золота для промышленного потребления, а также и для частной тезаврации (накопления) осуществляется на специальных рынках золота. Выпадение золота из свободного межгосударственного рыночного оборота вызвало сокращение его доли в валютной системе капиталистического мира и, прежде всего, в валютных резервах капиталистических стран (с 89% в 1913 до 71% в 1928, 69% в 1958 и 55% в 1969). Всё более значительная часть вновь добываемого золота поступает для тезаврации и промышленного использования (в современной химической промышленности, для ракетостроения, космической техники). Так, за 1960–70 частная тезаврация золота возросла в 3.3 раза, его промышленное и ювелирное использование почти в 2.3 раза, золотые запасы капиталистических стран сохранились практически на одном уровне (41 миллиардов Долларов США). В условиях социалистической экономики золото также являлось всеобщим эквивалентом, выступая мерой стоимости и масштабом цен. С 01 Января 1961 золотое содержание Советского Рубля было установлено в 0.987 412 г чистого золота. Это же количество золота было положено в основу Переводного Рубля – международной социалистической валюты стран-членов СЭВ. На мировом социалистическом рынке золото выполняло функцию мировых денег. Золотодобывающая Промышленность – отрасль горной промышленности, занятая добычей золота из коренных и россыпных месторождений. Добыча золота известна с глубокой древности. В Нашу Эру добыча золота производилась в разных странах, где были открыты богатые месторождения:- в Гане (1471), Мексике (1500), Перу, Чили (1532), Бразилии (1577), России (Урал, 1745), Канаде (Квебек, 1823), США (Калифорния, 1848; Колорадо, 1858; Невада, 1859; Аляска, 1890), Австралии (1851), ЮАР (1884). Открытие этих и многих других золотоносных районов с крупнейшими коренными и россыпными месторождениями и общее развитие техники в конце XIX – начале XX веков предопределили большой рост золотодобычи, которая составила:- в XVI веке – 763 тонн (т), в XVII веке – 914 т, в XVIII веке – 1 890 т, в XIX веке – 11 616 т, в XX веке (по 1970, без социалистических стран) – 54 714 т. Месторождения Аляски привлекли десятки тысяч человек, многие из них стали жертвами ‘золотой лихорадки’, погибли от болезней и тяжёлых условий жизни и труда. На территории бывшего СССР золото периодически (с длительными перерывами) добывалось на протяжении всей истории на Кавказе, в Карпатах, на Урале, в Средней Азии, Казахстане, на Дальнем Востоке. Но официально началом создания золотодобывающей промышленности в России принято считать 1745, когда на Урале было открыто Берёзовское золоторудное месторождение. Значительное развитие золотодобывающая промышленность получила после 1814, когда началась эксплуатация многочисленных россыпных месторождений на Урале и несколько позднее – в разных районах Сибири. В царской России добыча золота в основном производилась из россыпных месторождений. До 1917 в эксплуатации находилось не более 10 относительно крупных коренных месторождений. Золотодобывающая промышленность носила полукустарный характер; разрабатывались только богатые руды и россыпи. Добыча золота базировалась главным образом на применении ручного труда, механизированные способы стали появляться в конце XIX – начале XX веков. Развитие золотодобывающей промышленности в дореволюционной России способствовало освоению новых территорий, в том числе Восточной Сибири, где возникали новые поселения. С 1900 в золотодобывающую промышленность России интенсивно проникал иностранный капитал. В 1914 доля последнего составляла 55%. После так называемой Октябрьской Революции 1917 Советское правительство в первую очередь обратило внимание на наиболее крупные районы золотодобычи – Ленский и Уральский. В Декрете СНК РСФСР от 31 Октября 1921 ‘О Золотой И Платиновой Промышленности’ указывалось на особо важное государственное значение золотодобывающей промышленности. В 1926 состоялся съезд работников золотодобывающей промышленности, который разработал развёрнутые мероприятия по восстановлению и механизации золотодобывающих предприятий. Богатые золотоносные россыпи были открыты в 1923 в Алданском районе, в 1930 там же – коренные месторождения, в 1928 – Балейское месторождение и положено начало открытию многочисленных крупных россыпей в бассейне Реки Колымы. В 1933 открыты Джугджурский и Индигирский золотоносные районы, в 1950-х – Чукотский район, в 1960-х – Куларский район. В старых золотоносных районах Урала, Ленской тайги, Приамурья, Приморья, Енисейского кряжа были открыты многочисленные россыпи и получен существенный прирост запасов на крупных коренных месторождениях. В 1960-е открыты крупные коренные месторождения в Средней Азии, Казахстане, на Кавказе и Дальнем Востоке. Золотодобывающая промышленность была превращена в СССР в технически оснащенную отрасль промышленности. Известное значение в развитии золотодобывающей промышленности имела старательская добыча. Разработка россыпей производится преимущественно открытым способом с применением современной высокоэффективной техники (мощных бульдозеров, экскаваторов и другой), дражным и гидравлическими способами. Коренные месторождения

разрабатываются открытым и подземным способами. Переработка руд осуществляется на фабриках с законченным циклом обработки. Созданы высококвалифицированные кадры золотодобывающей промышленности, приисковые и рудничные города и посёлки стали благоустроенными и культурными центрами. Разведанные запасы и перспективы их наращивания обеспечивают дальнейшее увеличение добычи золота из коренных месторождений и сохранение длительной стабильной добычи из россыпей. Золотодобывающая Промышленность В Капиталистических Странах:- к 1940-ым в капиталистических странах добывалось около 1 140 т золота в год, Вторая Мировая Война 1939–45 вызвала снижение золотодобычи до 659 т в 1945. В дальнейшем увеличение добычи происходило за счёт золотосодержащих конгломератов Витватерсранда (ЮАР) при последовательном снижении её в других странах капиталистических мира. Россыпные месторождения в капиталистических странах почти полностью отработаны, из них добывают ежегодно около 30 т. Около 65 т в год извлекается попутно при разработке медных, свинцово-цинковых и других комплексных месторождений. Смотрите также Благородные Металлы. Самородное Золото – минерал класса самородных элементов. Примеси серебра (свыше 25% – электрум), меди, висмута, родия, иридия и других. Цвет ярко-жёлтый, с примесями – бледно-жёлтый, красно-жёлтый, зеленоватый. Твёрдость по минералогической шкале 2–3; плотность 15 600–18 300 кг/м^3. Различают:- тонкодисперсное (до 1–5 микрометров (мкм)), пылевидное (5–50 мкм), мелкое (0.05–2 мм) и крупное (свыше 2 мм, в том числе самородки). Главный минерал золотых руд. Добывается золото как из коренных месторождений, где встречается в виде вкраплённостей в породе, так и из россыпей. Самородное Золото – минерал, являющийся природным твёрдым раствором серебра (следы, до 43%) в золоте; обычны примеси (следы, до 0.9%) меди, железа, свинца, реже – висмута, ртути, платины, марганца и других. Известны разновидности с повышенным содержанием меди – до 20% (медистое золото, купроаурит), висмута – до 4% (висмутистое золото, висмутаурит), платиноидов (платинистое и иридистое золото; порпецит – Au, Pd, родит – Au, Rh), природные амальгамы (Au, Hg). Кристаллизуется в кубической системе, в виде октаэдров, ромбических додекаэдров, кубов и более сложных по форме кристаллов; нередко они искажены, сильно вытянуты, образуя ‘проволочки’, ‘волоски’, или уплощены параллельно грани октаэдра. Для самородного золота, особенно низкопробного, характерны формы дендритов и другого. Широко распространены прожилковидные и неправильные комковидные, ‘крючковатые’ выделения самородного золота; на их поверхности нередко сохраняются отпечатки кристаллов других минералов, агрегаты которых включали скопления самородного золота. Травление выявляет кристаллически-зернистое строение золотых частиц. Самородное золото – ярко-жёлтое, в зависимости от примесей – бледно-жёлтое, красноватое, зеленоватое; без спайности; мягкое (чертится иглой); твёрдость по минералогической шкале – 2.5; плотность 1 970–1 560 кг/м^3. По размерам частиц различают:- Тонкодисперсное Самородное Золото (менее 1–5 мк), Пылевидное Самородное Золото (5–50 мк), Мелкое Самородное Золото (0.05–2 мм) и Крупное Самородное Золото (более 2 мм). Резко выделяющиеся по крупности скопления самородного золота массой более 5 г относят к самородкам. Крупнейшие из обнаруженных самородков не сохранились; переплавлены найденные в Австралии самородки ‘Плита Холтермана’ (285 кг вместе с остатками породы) и ‘Желанный Незнакомец’ (71 кг). В бывшем СССР самородками были богаты Восточные (Урал, Лена) и другие районы (самый крупный самородок, найденный на Урале, весил 36.2 кг). Ценные самородки сохраняются государствами. Самородное золото – главная форма нахождения золота в природе; концентрируется в гидротермальных месторождениях, неравномерно распределяясь в трещиноватом жильном кварце и в сульфидах – пирите, арсенопирите, пирротине и других. В существенно сульфидных рудах самородное золото тонкодисперсное. При окислении руд на земной поверхности мелкое самородное золото частично растворяется и переотлагается; в ряде случаев оно обогащает верхние части рудных тел. Процессы их разрушения приводят к освобождению частиц самородного золота и их накоплению в россыпях; перемещаясь водными потоками вместе с другим кластическим материалом, частицы окатываются, округляются, деформируются, частично перекристаллизовываются; в результате электрохимической коррозии на них образуется тонкая оболочка высокопробного золота, что приводит к общему повышению пробы самородного золота в россыпях. Золотые Руды и россыпи, природные минеральные образования, содержание и общее количество золота в которых достаточны для экономически выгодной добычи этого металла. Золото находится в рудах главным образом в самородном виде. Оно не является химически чистым, а представляет собой твёрдый раствор с другими металлами, преимущественно с серебром. Кроме того, золото в рудах присутствует в виде теллуридов (калаверит $AuTe_2$ и другие), но они не имеют большого промышленного значения. Месторождения золота делятся на коренные и россыпные. Коренные месторождения представлены жилами, системами жил, залежами и зонами прожилково-вкраплённых руд различных размеров и форм. Рудные тела приурочены к трещинам, зонам дробления и рассланцевания горных пород. Мощность их от 0.05 до десятков метров (м), длина десятки и тысячи м. Наиболее крупными зонами являются:- жильная зона Колар в Индии (длина 20 километров (км), разрабатываемая до глубины 3.2 км, при средней мощности жил 1.2 м), система жил Мазер-Лод в США (длина 200 км); некоторые жильные зоны Енисейского Кряжа, минерализованные зоны месторождения Мурунтау в Средней Азии. Золотые месторождения известны в складчатых поясах, на платформах и в областях тектонической активизации. Месторождения золотых руд формировались в разные геологические эпохи (от докембрийской до кайнозойской), на разных глубинах (от десятков метров до 4–5 км от земной поверхности), обычно в связи с крупными разломами земной коры, образуя так называемые Золотоносные Пояса. Их происхождение связано в основном с деятельностью гидротерм. Минеральный состав золотых руд разнообразен:- преобладают кварц и сульфиды железа (пирит, марказит), реже – мышьяка (арсенопирит); присутствуют сульфиды и сульфосоли меди, свинца, цинка, висмута, сурьмы, серебра, окислы, карбонаты. По составу и условиям формирования выделяются следующие формации:- (i) золото-сульфидно-кварцевые, представленные кварцевыми жилами и прожилками, содержащими от 0.5 до 30% сульфидов; золото мелкое и крупное (встречаются также самородки), распределено неравномерно, содержание его колеблется от 10–50 до 1 000 г/т (бывший СССР, Канада, США, Бразилия, Индия, Австралийский Союз, Гана, Южная Родезия); и (ii) существенно-сульфидные, представленные залежами, зонами прожилков и вкраплённой минерализации; золото тонкодисперсное, содержание его редко превышает 1–2 г/т, извлекается попутно с другими металлами – медью, цинком, свинцом, никелем (Танзания, Намибия, Канада, Мексика, Австралийский Союз). Зоны окисления руд (Железные Шляпы) некоторых медно-колчеданных и полиметаллических месторождений обогащены переотложенным из коренных руд золотом и являются самостоятельными объектами добычи последнего. Большая часть таких месторождений находится в бывшем СССР (на Урале и в Казахстане). Россыпи золота представляют собой золотоносные рыхлые (реже сцементированные) отложения обломочного материала, образованные в результате разрушения коренных месторождений и золотосодержащих горных пород. По условиям формирования выделяются следующие основные типы россыпей:- (i) элювиальные, (ii) делювиальные, (iii) аллювиальные, (iv) прибрежные, (v) морские и (vi) озёрные. Наибольшую промышленную ценность представляют аллювиальные россыпи, в том числе современные русловые, долинные и террасовые, а также древние погребённые. Длина россыпей от 1–3 до 25 км, редко до 50 и 100 км, при ширине от 1 м до 200–300 м, иногда до 1 км и более; мощность 1–3 м. Содержание золота от десятых долей г/м^3 до десятков кг/м^3. Золотые россыпи образовывались в разные геологические эпохи. Древние россыпи нередко погребены под более молодыми осадками и залегают на глубине до 100–150 м от поверхности земли. Богатейшие золотоносные россыпи за рубежом известны – в Канаде (бассейн рек Юкон и Клондайк), США (Аляска, Калифорния), Колумбии, Австралийском Союзе, Новой Зеландии, Новой Гвинее, Филиппинах; в бывшем СССР

(бассейны рек Енисея, Лены, Бодайбо, Витима, Алдана, Колымы, Яны и Индигирки). Особый тип месторождений золота – Метаморфизованные Россыпи (золотоносные конгломераты, реже гравелиты). К этому типу относится крупнейшее в мире месторождение золота Витватерсранд в ЮАР. Золотые Сплавы – сплавы, важнейшим компонентом которых является золото (Au). Сплавление Au с другими металлами (Лигатурами) имеет целью повышение прочности и твёрдости, а также экономию золота. Наиболее подробно изучены двойные золотые сплавы. Сплавы Au с Ag представляют собой непрерывные твёрдые растворы. При 20–40% Ag эти сплавы имеют зеленовато-жёлтый цвет, при 50% Ag – бледно-жёлтый; все они мягки и ковки; температура их плавления возрастает с увеличением содержания золота. Сплавы Au с Cu (также непрерывные твёрдые растворы) имеют красновато-жёлтый цвет; они менее ковки, но более тверды и упруги, чем чистое золото. Отжиг (ниже 425–450 °C) придаёт сплавам, близким по составу к CuAu, твёрдость и хрупкость, закалка – мягкость и пластичность. Известны сплавы Au с Pt, Pd и другими элементами. Со многими металлами золото даёт интерметаллические соединения – ауриды. Небольшие примеси Sb, Bi и Pb делают золото хрупким. Сплав Au с Hg (Амальгама) применяется при золочении металлических изделий. Из золотых сплавов изготовляют монеты, ювелирные изделия, зубные протезы (сплавы Au с Cu), электрические контакты для приборов ответственного назначения (сплавы Au с Pt и Ag). Содержание золота в золотых сплавах выражают пробой (смотрите также Проба). Золото:- в начале нового тысячелетия суверенные долги многих государств и дефициты торговых балансов стали настолько огромными, что единственным выходом из сложившейся ситуации является синхронизированная девальвация всех основных валют мира для обеспечения экономического роста. Руководители некоторых организаций (например, Международного Валютного Фонда) и компаний даже заговорили на этом фоне об угрозах валютной войны. Но так или иначе, а по мнению некоторых известных аналитиков корреляция между парой USD/EUR и золотом составляет порядка 75%, то есть при ослаблении Доллара США золото растёт в цене и наоборот. Причём изменение стоимости золота происходит с задержкой в 2–3 секунды вслед за изменением значения пары USD/EUR. Эту тенденцию нарушают лишь какие-то существенные фундаментальные факторы, отраслевая статистика с несбывшимся прогнозом, геополитические и форс-мажорные обстоятельства, связанные с Американским рынком золота. В моменты финансовой неразберихи золото всегда считалось безопасным альтернативным активом. Многие инвесторы и торговцы думают, что этот благородный металл не связан с так называемыми экономическими циклами как большинство промышленных родов сырья (например, медь и нефть) и поэтому закупают его, когда опасаются за экономику, фондовый или валютный рынки. Кроме того, так уже сложилось, что покупка золота является инструментом хэдьжирования против растущих потребительских цен, даже невзирая на ‘приручённую’ инфляцию в США. Правительства многих развитых стран в попытке оживления глобальной экономики раздувают рынок государственных обязательств или казначеек (treasuries), направляют банкам через заимствование триллионы Долларов и снижают до рекордных минимумов процентные ставки по кредитам. В этой связи золото вновь стало подменять Доллар США, считавшийся к этому времени всемирной резервной валютой. Национальные центральные банки и в первую очередь Федеральный Резерв в попытке противостоять финансовым и экономическим кризисам и для придания стартового импульса вялому восстановлению экономики ‘тушат костёр бензином’ – они включают печатный станок и выпускают громадное количество ничем не обеспеченных денег, называя свои действия монетарным смягчением (monetary easing) или количественным смягчением (quantitative easing (QE)). Всё это провоцирует ослабление валюты (в частности Доллара США) и вынуждает инвесторов и торговцев повышать спрос на безопасные активы, что и толкает цену золота вверх. Но растянутая резинка имеет свойство стягиваться обратно (когда речь идёт об экстремальных пиках максимумов и минимумов цены). Так что будьте внимательны, особенно когда речь монетарных властей заходит о повышении процентных ставок, которые способны сбить растущую цену золота.

GOLD = ЗОЛОТОЙ – Gold:- a variable color averaging a deep yellow.

GOLD ACCUMULATION PLANS = ПЛАНЫ НАКОПЛЕНИЯ ЗОЛОТА – Gold Accumulation Plans (GAPs):- gold investment accounts whereby the investor agrees to invest a certain sum of currency in gold each month. Gold accumulated in the account can later be sold back or withdrawn as physical metal in a variety of forms, including bars, coins or jewellery.

GOLD BACKING = ПОДКРЕПЛЕНИЕ ЗОЛОТОМ (или ЗОЛОТОЕ ОБЕСПЕЧЕНИЕ) – Gold Backing:- now abandoned concept whereby the volume of money in circulation had to be underpinned by a corresponding amount of gold held by the government or banks; alternatively, the perception that coins had to be made of gold (gold Dollars, gold Marks). See also Gold Coverage. / Золотое Обеспечение – резервный фонд золота, предназначенный для обеспечения банкнотной эмиссии, а в некоторых странах и других обязательств центрального эмиссионного банка, подлежащих оплате по предъявлению. В период Золотого Стандарта золотое обеспечение служило гарантией устойчивости валюты. Золотое обеспечение денежной эмиссии и других обязательств центрального банка в условиях современных бумажно-денежных систем в подавляющем большинстве стран, в том числе крупнейших, отменено. Лишь в некоторых странах (Швейцария, Бельгия и другие) Закон о Золотом Обеспечении сохраняется в силе по традиции. Например, Швейцарский национальный банк по закону должен иметь золотое обеспечение в сумме не менее 40% выпущенных в обращение банкнот. Фактически золотое обеспечение Швейцарских банкнот составляет около 90%.

GOLD BULLION STANDARD = ЗОЛОТОСЛИТКОВЫЙ СТАНДАРТ – Gold Bullion Standard:- variation of the gold standard in which money in circulation consists of bank notes that are convertible into gold bullion. In this system, gold disappears from the money supply in order to save the precious metal. Central banks do not give gold coins to the public (as in the gold specie standard); instead, they issue bank notes that are convertible into gold ingots with a high unit value, so as to conserve the maximum amount of gold for use as foreign reserves. See also Gold Exchange Standard, Gold Specie Standard, and Gold Standard. / Золотослитковый Стандарт. Смотрите также Золотой Стандарт (Gold Standard), и Золотомонетный Стандарт (Gold Specie Standard).

GOLD CERTIFICATE = СВИДЕТЕЛЬСТВО НА ЗОЛОТО (или ЗОЛОТОЙ СЕРТИФИКАТ) – Gold Certificates are a method of holding gold without taking delivery. Issued by individual banks they confirm an individual’s ownership while the bank holds the metal on the client’s behalf. The client thus saves on storage and personal security issues, and gains liquidity in terms of being able to sell portions of the holdings (if need be) by simply telephoning the custodian. A certificate attesting to a person’s ownership of a specific amount of gold bullion. / Сертификат на Золото или Золотой Сертификат – документ, удостоверяющий право собственности на золото, депонированное в банке. Инвестор, из соображений безопасности не желающий держать золото дома, может предпочесть держать его в банке и иметь на него сертификат. Золото, на которое выдаётся сертификат, хранится в центральном банке. Владельцы сертификатов ежегодно вносят небольшую плату за хранение золота в банке.

GOLD CLAUSE = ЗОЛОТАЯ ОГОВОРКА (или ОГОВОРКА О ЗОЛОТЕ) – Gold Clause:- agreement that the amount of certain payments must be linked to the value of fine gold or of specified gold coins (gold value clause). Term in an agreement that certain payments must be effected in gold or gold coins. Contract provision calling for payment in a stipulated quantity of gold or a stipulated quantity of US Dollars, at the option of the party to be paid. In the United States, gold clauses have not been binding since 1933. /

Положение в соглашении, согласно которому определённые платежи должны быть выполнены золотом или золотыми монетами.

GOLD COINS = ЗОЛОТЫЕ МОНЕТЫ – Gold Coins are the modern coins made from gold are usually held only by collectors and investors. They can be bought and sold, at prices that rise and fall with the market price of gold. Coins minted from gold or gold alloys. Some gold coins are still valid as legal tender. In practice, however, all gold coins are traded at their market value, which is subject to continual fluctuations. / Современные монеты, выполненные в золоте обычно удерживаются коллекционерами и инвесторами. Они могут быть куплены и проданы по ценам, которые растут или снижаются в соответствии с рыночной ценой самого золота. Монеты, отчеканенные из золота или золотых сплавов. Некоторые золотые монеты до сих пор являются законным средством платежа. Однако на практике, все золотые монеты торгуются по их рыночной стоимости, которая подвержена постоянным колебаниям. Золотые Монеты чеканятся правительственными монетными дворами и продаются по цене, определяемой на основе содержания золота в них. Наиболее известные золотые монеты – Американский Орёл, Канадский Кленовый Лист, Мексиканское Песо, Австралийский Кенгуру и Южноафриканский Крюгерранд. Коллекционные монеты (numismatic coins) чеканятся в ограниченном количестве, их цена зависит не от веса содержащегося в них золота, а от их эстетической ценности и ценности как раритета. Цена коллекционных монет гораздо выше цены содержащегося в них золота и поэтому не оказывает такого сильного влияния на цену золота, как другие золотые монеты. Золотой Рубль – условная денежная единица в России, содержавшая в соответствии с законом Царского Правительства от 03 Января 1897 О Введении Золотого Монометаллизма 17.424 доли (1 доля = 0.044 435 грамма (г)) чистого золота (0.774 235 г). Золотые монеты чеканились и выпускались в обращение достоинством в 5 и 10, а также в 15 Рублей (Империалы) и 7 Рублей 50 Копеек (Полуимпериалы). Золотой Рубль был устойчивой денежной единицей как внутри страны, так и за её пределами. Эмиссия банкнот почти полностью покрывалась золотым запасом Госбанка. Курс его в отношении иностранных валют колебался в узких пределах золотых точек (смотрите также Золотые Точки). Размен кредитных билетов Госбанка России на золото был прекращен с началом Первой Мировой Войны в 1914, кредитные билеты в Рублях превратились в бумажные деньги. В 1921–22 в связи с тем, что Советские денежные знаки быстро обесценивались, а товарооборот нуждался в устойчивой денежной единице, было допущено применение дореволюционного золотого рубля в качестве счётной единицы. Курс для пересчёта золотого рубля в Советские знаки устанавливался с 15 Декабря 1921 Народным Комиссариатом Финансов (Наркомфином), с 01 Апреля 1922 Госбанком Российской Советской Федеративной Социалистической Республики (РСФСР), а с 25 Августа 1922 Специальной Котировальной Комиссией, в состав которой входили представители Наркомфина, Госбанка и Наркомвнешторга. Необходимость в применении счётного золотого рубля отпала после выпуска в обращение на основании Декрета Совета Народных Комиссаров Союза Советских Социалистических Республик (СНК СССР) от 11 Октября 1922 банкнот Госбанка в червонцах.

GOLD COVERAGE = ПОКРЫТИЕ ЗОЛОТОМ (или ЗОЛОТОЕ ОБЕСПЕЧЕНИЕ, или ОБЕСПЕЧЕНИЕ ЗОЛОТОМ) – Gold Coverage is a coverage of a country's bank notes in circulation (the rate may be more than 100 percent) by the official gold reserves. For example, according to Article 19 of the National Bank Law (situation in 1998) the gold cover in Switzerland must be at least 40% of the bank notes in circulation. See also Gold Backing. / Обеспечение банкнот страны, находящихся в обращении (ставка может превосходить 100 процентов), официальными резервами золота. В Швейцарии, например, в соответствии со Статьёй 19 Закона о Национальном Банке обеспечение золотом находящихся в обращении банкнот должно составлять не менее 40%.

GOLD DEPOSIT = ВКЛАД ЗОЛОТОМ (или ДЕПОЗИТ ЗОЛОТОМ) – In banks' accounting, Gold Deposits comprise sight and fixed-term deposits of gold from central banks. Gold is considered by the bank to be a financial instrument. Gold deposits are included in the balance sheet on a trade date basis at their weight in gold (translated at the gold market price and USD exchange rate into SDR) plus accrued interest. Interest on gold deposits is included in interest expense on an effective interest rate basis. Gold Deposits placed with the bank originate entirely from central banks. They are all designated as financial liabilities measured at amortised cost. The bank also takes gold deposits that are repayable on the maturity date either in gold or at a fixed amount of currency at the option of the bank (gold dual currency deposits). The embedded gold currency option is included in the balance sheet as a derivative financial instrument and is accounted for at fair value.

GOLD DEPOSIT FORWARD RATE AGREEMENT = СОГЛАШЕНИЕ О ФОРВАРДНОЙ СТАВКЕ НА ВКЛАД ЗОЛОТОМ – The Gold Deposit Forward Rate Agreement (GODFRA) is tailored particularly to central bank activities.

GOLDEN = ЗОЛОТИСТОЕ – Golden:- being or having the color gold or the color of gold; blond.

GOLDEN PARACHUTE = ЗОЛОТОЙ ПАРАШЮТ – Golden Parachute:- substantial benefits given to a top executive (or top executives) in the event that the company is taken over by another firm and the executive is terminated as a result of the merger or takeover. Golden parachutes are contracts given to key executives and can be used as a type of antitakeover measure taken by a firm to discourage an unwanted takeover attempt. Benefits include items such as stock options, cash bonuses, generous severance pay or any combination of these benefits. Also known as Change-In-Control Benefits. Golden parachute clauses can be used to define the lucrative benefits that an employee would receive in the event he or she is terminated; however, the term often relates to terminations that result from a takeover or merger. The use of golden parachutes is controversial. Supporters believe that golden parachutes make it easier to hire and retain top executives, particularly in merger-prone industries. In addition, proponents believe that these lucrative benefits packages allow executives to remain objective if the company is involved in a takeover or merger, and that they can discourage takeovers because of the costs associated with the golden parachute contracts. Opponents of golden parachutes argue that executives are already well-compensated and should not be rewarded for being terminated. Opponents may further argue that executives have an inherent fiduciary responsibility to act in the best interest of the company, and, therefore, should not need additional financial incentive to remain objective and to act in the manner that best benefits the company. In addition, many people who disagree with golden parachutes cite that the associated costs are miniscule when compared to the takeover costs and, as a result, can have little to no impact on the outcome of the takeover attempt. Golden Parachute is a term in a contract of employment whereby the employer is bound to pay the employee a substantial sum of money in the event of dismissal or redundancy. For example, agreements between the company and its directors or senior managers providing for unusually generous payments to be made in the event they resign from their position. Golden Parachute is a clause in an executive's employment contract specifying that he/she will receive large benefits in the event that the company is acquired and the executive's employment is terminated. These benefits can take the form of severance pay, a bonus, stock options, or a combination thereof. / Термин в контракте найма (трудовом договоре), посредством которого наниматель (работодатель) непременно выплатит нанимаемому (работнику) существенную денежную сумму в случае увольнения или сокращения. Например, соглашения между компанией и её директорами или старшими управляющими, предусматривающие осуществление выплат необычайно солидных вознаграждений в случае их отставки от занимаемой должности. Отступные. Золотой Парашют – чрезвычайно выгодный контракт, предлагаемый руководящему работнику фирмы и предусматривающий предоставление огромной компенсации в случае, если его компания будет

поглощена другой фирмой, в результате чего он потеряет свою работу. Золотой Парашют может включать высокую компенсацию в связи с увольнением, опционы на покупку акций или денежную премию. Акт о Налоговой Реформе от 1984 (Tax Reform Act of 1984) устранил возможность вычета из налогооблагаемого дохода 'избыточно высокой компенсации' и ввёл на такие компенсации акцизный налог. Акт о Налоговой Реформе от 1986 (Tax Reform Act of 1986) уточнил некоторые связанные с этим вопросы.

GOLDEN RULE OF BANKING = ЗОЛОТОЕ ПРАВИЛО БАНКОВСКОГО ОБСЛУЖИВАНИЯ – Golden Rule Of Banking is a principle which states that the maturities of the loans granted by a bank should be congruent with, or match, the maturities of the deposits used to finance such loans. / Принцип, который гласит, что погашение ссуд, предоставленных банком, должно быть конгруэнтным, или равнозначным, с погашениями депозитов, используемых для финансирования таких ссуд.

GOLDEN SHARE = ЗОЛОТАЯ АКЦИЯ – In some countries, Golden Share is a share of stock held by a government conveying extraordinary shareholder power for a specified period. Single share of a company that has special voting rights such that it can outvote all other shares in certain circumstances. / экстраординарные .

GOLDEN SLIPPERS = ЗОЛОТИСТЫЕ БАШМАКИ – Golden Slippers (maritime term):- tan work shoes issued to US Maritime Service trainees.

GOLD EXCHANGE STANDARD = ЗОЛОТОДЕВИЗНЫЙ СТАНДАРТ (или СТАНДАРТ ОБМЕНА ЗОЛОТА) – Gold Exchange Standard is a form of gold standard where a country using it has neither a gold currency in circulation nor reserves held in gold for external transactions, but instead keeps its reserves mostly in the currency and securities of another country which is on the gold standard. Both Sterling and US Dollars have been reserve currencies. See also Gold Bullion Standard, Gold Specie Standard, and Gold Standard. International monetary exchange system based on gold. It is a variation of the gold standard. Under the gold-exchange standard, a central bank's reserves are held in the form of both gold and reserve currencies which are convertible into gold. The gold-exchange standard was adopted by all free-market economies at the Bretton Woods conference (see also International Monetary Fund). The system was abandoned in 1971 when the United States abolished the convertibility of the US Dollar into gold, and foreign exchange rates were no longer pegged to the Dollar. The Gold-Exchange Standard is the monetary system under which a nation's currency may be converted into bills of exchange drawn on a country whose currency is convertible into gold at a stable rate of exchange. A nation on the gold-exchange standard is thus able to keep its currency at parity with gold without having to maintain as large a gold reserve as is required under the gold standard. The gold-exchange standard came into prominence after World War I because of an inadequate supply of gold for reserve purposes. British Sterling and the US Dollar have been the most widely recognized reserve currencies. The requirement of a fixed rate of exchange for the reserve currency has the effect of limiting the freedom of the reserve-currency country's monetary policy to solve domestic economic problems. The use of gold reserves is now limited almost exclusively to the settlement of international transactions, on rare occasions. Gold Exchange Standard is a variant form of the gold standard under which a country pegged the value of its currency to the value of the currency of a 'major' country, e.g., Sterling or Dollars, which was itself on a gold standard. The international monetary regime in force between 1958 and 1970 is frequently described as a 'gold exchange standard' system because of the wide use of the Dollar, itself pegged to gold, as a reserve currency and as an accepted medium of exchange internationally. / Брэтчэн Вудзская конференция (Bretton Woods conference). Золотодевизный Стандарт, смотрите также Золотой Стандарт. Золотой Стандарт, монометаллическая денежная система, существовавшая во многих странах на определённом этапе развития капитализма, при которой только золото выступало всеобщим эквивалентом и непосредственной основой денежного обращения. Наиболее совершенной, классической формой золотого стандарта был золотомонетный стандарт, при котором денежная единица страны имела определённое, установленное законом и неизменное золотое содержание (золотой паритет), а 'цена' золота в денежных знаках соответствовала этому паритету. Золотые монеты находились в обращении и имели неограниченную силу законного платёжного средства. Центральные эмиссионные банки были обязаны обменивать банкноты и другие денежные знаки (бумажные деньги, монеты из неполноценных металлов) на золото по номиналу. Допускалась свободная чеканка монет из золота, принадлежащего частным лицам, за небольшую плату или безвозмездно, а также переплавка золотых монет в слитки. Был разрешён свободный вывоз и ввоз золота в любом виде и не существовало никаких валютных ограничений. Золотой стандарт впервые был введён в Великобритании (юридически в конце XVIII века, фактически с 1821). Во Франции, Германии, России, Италии, Японии, США и в других капиталистических странах введение золотого стандарта было завершено в последней четверти XIX века. Денежные системы отдельных стран превратились в единую относительно устойчивую мировую валютную систему. Это в значительной мере содействовало развитию капиталистического мирового хозяйства, росту промышленного производства, внутреннего товарооборота и международной торговли, расширению и укреплению кредитной системы. Золотомонетный стандарт потерпел крах с началом общего кризиса капитализма, когда вспыхнула 1-я Мировая Война 1914–18. Он был заменён бумажноденежным обращением. После 1-й Мировой Войны, в 1924–28 была сделана попытка восстановления золотого стандарта, но не в прежнем виде, а в форме золотослиткового и золотодевизного стандарта. Обращение золотых монет не могло быть восстановлено из-за недостатка золотых резервов и неравномерного их распределения между странами. Крупные суммы банкнот обменивались на золотые слитки массой в 12–14 килограммов (кг) (в Великобритании, Франции) или на иностранную валюту, обмениваемую, в свою очередь, на золотые слитки (в Германии, Бельгии и других). Золото было полностью вытеснено из внутреннего обращения во всех странах, кроме Соединённых Штатов Америки (США), где оно продержалось до 1933. Обмен банкнот на слитки производился, как правило, только в случае необходимости погашения дефицита платёжного баланса путём вывоза золота. Однако и эти видоизменённые формы золотого стандарта продержались недолго. Полный крах их был вызван мировым экономическим кризисом 1929–33, в результате которого во всех капиталистических странах, в том числе и в США, установилось бумажноденежное обращение с присущими ему явлениями инфляции, ростом товарных цен, резкими колебаниями валютных курсов и тому подобным. В 1931 был отменен золотой стандарт в Великобритании и Японии, в 1933 – в США, в 1935 – в Бельгии и Италии, в 1936 – во Франции, Швейцарии и Нидерландах. Международную валютную систему, возникшую после 2-й Мировой Войны 1939–45, иногда также называют Золотодевизным Стандартом, потому что, согласно требованиям этой системы, оформившейся на Бреттонвудской Международной Финансовой Конференции 1944, страны должны иметь резервы в золоте и девизах (в основном в Долларах США) для покрытия дефицитов платёжных балансов. Однако между довоенной и современной формами золотодевизного стандарта имеется существенное различие:- после 2-й Мировой Войны внутреннее обращение в капиталистических странах остаётся полностью на бумажноденежной основе, а предоставленное иностранным держателям национальной валюты право обмена её на Доллары и через Доллары на золотые слитки стало практически неосуществимым после того, как США в связи со снижением их золотого запаса фактически воздерживались от обмена бумажных Долларов на золото даже правительствам и центральным банкам других стран, а с 15 Августа 1971 официально прекратили такой обмен.

GOLD FIX = ФИКСАЦИЯ ЦЕНЫ ЗОЛОТА (или УСТАНОВЛЕНИЕ ЦЕНЫ ЗОЛОТА) – Gold Fix:- the setting of the price of gold by dealers (especially in a twice-daily London meeting at the central bank); the fix is the fundamental worldwide price for setting price of

gold bullion and gold-related contracts and products. See also Gold Fixing, and London Gold Market. The London Gold Fixing (see at http://www.goldfixing.com) takes place twice daily over the telephone. The current four members of the fix 'meet' at 10:30 am and 03:00 pm London time and commence the fix with a trying price. Once Rothschild's seat has been sold, there will once again be five fixing members. The fixing members' representatives relay the price down to their dealing rooms, who are in contact with as many bullion dealers as are interested (or who have interested clients) and these market members then declare how much metal, on a net basis, that they require to buy or sell at that level. The dealers are themselves in contact with their clients, who may change their order, or add or cancel an order, at any time. The position declared by the dealers is the net position outstanding between all their clients, i.e. if one bank has clients wanting to buy a total of two tons, and other clients wanting to sell a total of one ton, then he declares himself as a buyer of one ton. Each fixing member then nets off the position and declares himself, as the representative of all those interested parties, as a net buyer or seller (and of how much), or to be in balance. If the market is out of balance with more gold required than offered, then the price will be adjusted upwards (and vice versa) until balance is achieved (because some clients will pull out if the price does not suit them). At this point the price is fixed. On very rare occasions the price will be fixed when there is an imbalance, at the discretion of the chairman of the fix. The fix is thus entirely open and any market user may participate through his bank. / Как только место Ротшильда (Rothschild) было продано . http://www.goldfixing.com; данный сайт принадлежит компании Зэ Ландэн Голд Макит Фиксинь Эл.ти.ди. (The London Gold Market Fixing Ltd (C/O ScotiaMocatta, 6th Floor, 201 Bishopsgate, London, EC2M 3NS, the United Kingdom)). Среди участников фиксации цены на золото – полномочные представители Лондонских офисов следующих банков:- Баклис Кэпитэл Пи.Эл.Си. (Barclays Capital PLC; штабквартира расположена в Лондоне, Соединённое Королевство), Дойчэ Банк А.Ге. (Deutsche Bank AG; штабквартира расположена во Франкфурте на Майне, Германия), Эйч.Эс.Би.Си. Холдиньгз Пи.Эл.Си. (HSBC Holdings PLC; штабквартира расположена в Лондоне, Соединённое Королевство), Скоша Макэтэ (Scotia Mocatta; член Зэ Бэньк оф Новэ Скоша (The Bank of Nova Scotia); штабквартира расположена в Торонто, Канада) и Сосьетэ Жэнераль Копрэт Энд Инвэстмэнт Бэнькин (Société Générale Corporate & Investment Banking; штабквартира расположена в Париже, Франция). , то есть .

GOLD FIXING = ФИКСИРОВАНИЕ ЦЕНЫ ЗОЛОТА (или УСТАНОВЛЕНИЕ ЦЕНЫ ЗОЛОТА) – On the 12th September 1919 at 11:00 am the first Gold Fixing took place. The original five founding members were:- Nathan Mayer Rothschild & Sons; Mocatta & Goldsmid; Samuel Montagu & Co.; Pixley & Abell; and Sharps & Wilkins. For over 80 years we have been fixing the price of gold providing market users with the opportunity to buy and sell gold at a single quoted price. It also provides a published benchmark price that is widely used as a pricing medium by producers, consumers, investors and central banks. The fix is carried out twice a day by the 5 members via a dedicated conference call facility. At the start of each fixing, the Chairman announces an opening price to the other 4 members who relay this price to their customers, and based on orders received from them, instruct their representatives to declare themselves as buyers or sellers at that price. Provided there are both buyers and sellers at that price, members are then asked to state the number of bars they wish to trade. If at the opening price there are only buyers or only sellers, or if the numbers of bars to be bought or sold does not balance, the price is moved and the same procedure is followed until a balance is achieved. The Chairman then announces that the price is fixed. It should be noted that the Fix is said to balance if the buy amount and the sell amount are within 50 bars of each other. The Fixing will last as long as it is necessary to establish a price that satisfies both buyers and sellers. Customers may leave orders in advance of the Fixings. Alternatively, they may choose to be kept advised of price changes throughout the Fixing and may alter their orders accordingly at any time until the price is fixed. To ensure that the price is not fixed before the member has had an opportunity to communicate any changes each member has a verbal flag. As long as any flag is raised, the Chairman may not declare the price fixed. The setting of the gold price at 10:30 am (first fixing) and 03:00 pm (second fixing) in London by representatives of the London Gold Market. See also Gold Fix, and London Gold Market. Benefits are:- (i) international benchmark; (ii) published price; (iii) narrow dealing spread; (iv) any quantity may be dealt; and (v) anonmity. Members are:- Barclays Capital PLC (headquarters are in London, the United Kingdom), Deutsche Bank AG (headquarters are in Frankfurt am Main, Germany), HSBC Holdings PLC (headquarters are in London, the United Kingdom), Scotia Mocatta (member of The Bank of Nova Scotia; headquarters are in Toronto, ON, Canada); and Société Générale Corporate & Investment Banking (headquarters are in Paris, France). London's deserved reputation as the world's leading international bullion trading centre has its basis in history. The origins of the emergence of London as a gold trading centre can be traced back to around 1671 when the young Moses Mocatta crossed the North Sea from Amsterdam (where he had been trading in sugar and diamonds) to set up business as a merchant, opening an account with Alderman Edward Backwell. Initially his main business was in diamonds, but records from the East India Company in February 1676 show 'By cash of Moses Mocatta for freight on 75 ounces of gold on their ships 'Nathaniel' and 'Society' – £6'. This gold was used to pay for diamonds, and shipments of gold and silver into London soon became regular events. When Napoleon escaped from Elba in 1815 and returned to France to raise his army, the price of gold in the London market jumped overnight from £4.6.6d an ounce to £5.7.0d. Nathan Mayer Rothschild had been ordered by the British Treasury to buy gold to fund the Duke of Wellington's troops in the Battle of Waterloo. At the end of the Napoleonic wars, Britain adopted a formal gold standard (although an unofficial gold standard had been operating since 1717). The rest of Europe remained on the silver standard until increasing supplies of gold, first from Brazil in the XVIII century, then from Russia, California, Australia and South Africa in the XIX century, made it possible for the rest of Europe to switch to the gold standard. The threat of WWI resulted in most countries suspending gold payments, except for urgent settlements, and the gold standard collapsed as central banks started keeping reserves in currencies that could be exchanged for gold. As the war ended, a crucial step was to restore London as the market place for gold. Initially the Bank of England had an agreement with South African mining finance houses for them to ship their gold to London for refining, after which it would be sold through Nathan Mayer Rothschild 'at best price obtainable, giving the London market and the Bullion Brokers an opportunity to bid'. Post WWI:- thus on 12th September 1919 at 11:00 am, the first gold fixing took place, when the price of gold was fixed at £4.18s.9d. per fine ounce. The higher price that day reflected the Sterling/Dollar exchange rate in New York. The New York gold price was USD20.67 per ounce. The bids were made by telephone for the first few days, but it was then decided to hold a formal meeting at the Rothschild offices in New Court, St Swithin's Lane. Although the London fix continued to be in sterling for almost another 50 years, what really counted was the Dollar price of gold, as the Dollar gradually replaced sterling as the world's favorite reserve currency. Britain made a partial return to the gold standard in 1925, however, on 1931-September-21, the gold standard was suspended. Over 200 years of a stable gold price, save for short interludes in the Napoleonic Wars and WWI, had ended. In addition, the reputation of sterling, backed by gold as the international currency was over, sterling was devalued. The US remained on the gold standard, with the price fixed at USD20.67 until 1933, when Roosevelt not only banned the export of gold and halted convertibility of Dollars into gold, but also ordered US citizens to hand in all the gold they possessed (the prohibition on gold lasted until 31 December 1974). Roosevelt, who was trying to boost the US economy, was concerned that the accompanying inflation would weaken the Dollar and lead to an outflow of gold. Roosevelt took to deciding the gold price himself. On the 31st January 1934, the gold price was raised to USD35 an ounce (a total devaluation of the Dollar of almost 40%) and the US resumed the gold standard. The fixing thrived until the outbreak of WWII on 1939-September-03, when the London gold market closed. No fixings were held for almost 15 years, until 22nd March 1954, when the London market was permitted to resume the fixing. The final fixing before World War II had been at a price of £8.1s.0d an ounce, almost double that of 1931. On the 1954-March-22 gold fixed at £12.8s.6d, the increase from the last pre-war fix was due to the devaluation of sterling. Although the fix was still in sterling,

the main concern of the BoE was to keep it in line with the equivalent of USD35. The task of keeping the sterling price in line with USD35 became increasingly difficult, as the private market for gold grew. As early as 1961, the BoE found it had to sell occasionally from reserves on the fix to hold the price at USD35. This lead to the creation of the gold pool – an alliance between central banks around the world to maintain the USD35 level. The pool worked well until 1965, when private buying of gold begun to exceed mine supply, forcing central banks to sell gold reserves into the market to hold the price steady. In 1968, when the Tet offensive in Vietnam touched off a tidal wave of buying, the pool lost 3 000 tons trying to hold the price down. Post 1968:- on the 15th March 1968, the authorities closed the London gold market for two weeks, following an unprecedented three-day speculative surge of gold buying. When the London gold market re-opened on the 1st of April 1968, it fixed the price in Dollars not Sterling, with the gold price no longer set, but free to float and with prices set twice a day, both in the morning and afternoon. Over the course of more than 80 years of the gold fixing, the highest fix was USD850 per ounce on the 21st of January 1980, amid the political crisis in the Middle East, high oil prices and inflation. The longest fixing lasted for 2 hours and fifteen minutes when the stock markets crashed on Black Monday in late October 1987. The highest turnover occurred in March 1968 just before the gold pool collapsed – 14,180 400 oz London Good Delivery bars were traded. Fixing prices for gold and silver are published immediately by the various news agencies. Historical data for Gold and Silver Fixings may be found on the LBMA website (http://www.lbma.org.uk). The Gold Fixing:- there are five members of the Gold Fixing – all of whom are Market Making Members of the London Bullion Market Association (LBMA). The Fixing is conducted by telephone twice each London business day at 10:30 am and 03:00 pm. Clients place orders with the dealing rooms of Fixing members, who net all orders before communicating the net interest to their representative at the Fixing. The gold price is then adjusted up and down until sell and buy orders are matched, at which point the price is declared 'fixed' and all orders are executed on the basis of that price. Transparency at the Fixing is served by the fact that customers may be kept advised of price changes, together with the level of interest, while the Fixing is in progress and may cancel, increase or decrease their interest dependent upon this information. The chairmanship of the Fixing rotates annually among the member firms. As at June 2008, the Fixing members are The Bank of Nova Scotia – ScotiaMocatta, Barclays Capital, Deutsche Bank AG London, HSBC Bank USA NA London Branch and Societe Generale. Xxxxx. 2015-March-18:- A key part of the gold market will see a major shift Friday (2015-March-20). San Francisco (MarketWatch):- on Friday, for the first time in close to a century, the gold market price fix is about to change. It is a move that could potentially provide a better view of China's insatiable demand for the precious metal. The London Bullion Market Association said the LBMA Gold Price will launch on Friday, with the ICE Benchmark Administration operating the auction process. That will replace the so-called London Gold Fix, a widely-used pricing medium that has been around since 1919 and is administered by London Gold Market Fixing Ltd. twice daily. 'The changes taking place with the new gold fix could be a game changer for gold trading as we know it', said Kevin Kerr, president of Kerr Trading International. Here's why:- The London Gold Fix, which will be discontinued after Thursday, is determined by just four participants. The nearly 100-year-old, medium has also been the target of decades of manipulation allegations. But the LBMA has said the electronic auction process for setting the gold price is designed to be transparent and to allow as many participants as possible. 'The new method for fixing the gold price daily will be more reflective of that day's collective price of gold on the world market', said Jim Wyckoff, senior analyst at Kitco.com, adding that he believes the previous London fix 'was not greatly askew on that determination'. China is expected to participate directly in setting the new price fix, which, in theory, would make inflows and outflows out of the world's second largest economy, and one of the largest gold buyers, more apparent. 'This opens up the playing field for gold trading, and adds an entirely new spectrum of possibilities and participants, mainly the Chinese, on the world stage', Kerr said. 'It may lift the very secretive veil' of China's gold consumption Kerr noted. For it is part, LBMA said it won't reveal the participants for the new pricing medium until the day of the launch. But if the Chinese banks are directly involved in the fixing of the gold price, 'they can arbitrage price differences between Shanghai and London (and smooth) out the market … making it an international, 24-hour market', said Julian Phillips, founder of and contributor to GoldForecaster.com. The new fix isn't expected to affect gold prices GCJ5, +1.35% in the near term. Xxxxx. 2015-March-17 The New London Gold Fixing:- The Heart of the Gold Price – The 'Fix'. The London Gold Fixing, the twice daily gold pricing mechanism at which the bulk of physical gold transactions take place is changing dramatically. In the past five London Based gold bullion banks on a direct telephone link to their clients established a price at which these transactions took place. This was an efficient way to establish an accurate price for gold deals done outside of the contracts used to supply the bulk of gold deals. It is in this market that physical gold traders and speculators (we view the COMEX market as a financial market as around only 5% of its deals involve the movement of physical gold) also participated. By trading the marginal supplies of gold (outside of contracted sales of the bulk of gold supplies) a much smaller total, the influence of traders and speculators has had a disproportionate impact on the moment-to-moment gold prices. While the developed world received 80% of global cash flow (up to the year 2000) it also held power over the global gold market. London – the Heart of the Gold Market:- For centuries London has been the global hub of the gold market particularly during the Gold Standard, when London was importing South Africa's over 1 000 tons of newly mined gold a year. London has been able to maintain its position as the world's leading financial market and in particular its gold market. The high standards of gold and people involved in that market allow it to still dominate the physical gold market. In the last few years there have been charges that the 'Gold Fixing' system was outdated and the gold price manipulated by the gold bullion banks, often with government influence. While this had a large element of truth in it, it was not true of the overall London gold market's individual professional operators. The main gold price manipulation in the past came from 1933 (when the dollar was devalued against gold) and after 1985, when central banks encouraged the acceleration of gold production to swamp the gold market, while implying that they were willing to sell of their over 30 000 tons of gold into the gold market. Such manipulation came to a halt in 2009. Since then individual traders have manipulated prices not only in the gold market but interest rate markets and remain under investigation for other incidents of manipulation in financial markets. But the perception has been that the gold market has been operated by professional, capable men and women, in general. The main bullion banks that operated the gold markets have also been responsible for shipping gold bought there, to the global markets. As we have seen in the recent past, the banks can enjoy larger incomes from the inefficiencies of the distribution chains, which invite the establishment of premiums in markets such as Shanghai and India. These premiums accrued to the banks, so did not encourage an improvement in the distribution system or the lowering of such premiums. The Rise Of The Emerging World:- by 2020, at the latest the emerging world will enjoy 65% of global cash flow and the developed world 35% of it. The shift of wealth and power eastwards has led to a very different global gold market. In the developed world the dollar based currency system has sought to wean the developed world off gold and onto national currencies and has succeeded to date. The gold market appears to therefore have less relevance to financial life than it has had throughout history. With the development of markets trading in gold shares or other gold derivatives (futures and options) the bulk of the demand for actual gold has shrunk to very low levels in the west. This has made it far easier to influence gold prices more directly as new supplies have hit the ceiling they have now. The result has been that the dominance of the major western banks over the gold markets and participants is almost complete. The sheer power of the volumes of money they can wield over all financial markets has allowed them and their traders to 'make' prices. But as emerging markets have risen in wealth and power and gold production, the ability to 'make' prices should have moved away from the developed world eastwards reflecting the percentage of global gold demand China and India represent, alongside the Middle East, if markets had been efficient. But they haven't as the institutions that operated the gold markets retained their power over distribution and markets. Add demand from the Middle East to China and India and their demand represents

around 75% of global gold demand. On top of that China at an annual production level or around 430 tons is now the largest gold producer on the planet. So why doesn't the gold market reflect the fundamental changes in supply and demand? It's all about presence in the global gold market and the products on offer and the ease that they move across the different markets. China's gold market is still developing on the pricing front. It has developed strongly in terms of gold used in its financial system and continues to expand its distribution system westwards in China, but has a long way to go to reach all corners of China. More importantly, its absence from the London gold market, in terms of participating directly in it, has prevented its gold market presence being felt. The same applies in India, where western banks continue to dominate distribution to the country. It is apparent that China is no longer content to use London's banks as its only source of foreign supplied gold. To that end it welcomes the redesign of the London Gold Fixing process and wants to join in. On March 20, the London Gold Fix changes to a new mechanism involving global banks as well as the London Bullion Market banks that operate the Gold Fixing now. It is hoped that the new electronic mechanism will, hopefully, operate more efficiently and smooth out global prices as well as lower the influence of the current London banks on the gold price. At the moment there is a USD5 premium over and above the London gold price in Chinese gold markets. With the following Chinese banks:- Bank of China Ltd, China Construction Bank Corp. and ICBC now set to join in the London Fixing, the pricing power of the Chinese gold market will hopefully, directly impact the gold price thereafter. If we see the premium over the gold price, in China, disappear, this will have happened. Bear in mind that Industrial and Commercial Bank of China Ltd. has become the world's largest gold retail bank already and will bring to bear their significant number of clients in China. Not only do we expect these banks to operate in a way that they will try to remove the gold price premium in China (which at the moment increases the profitability of the selling (mainly foreign) banks in China) but make the gold market more globally efficient. With the Chinese gold market being a one-way street (no export of gold is permitted) we expect the Chinese banks to create a 'pool of liquidity' where selling orders from China can take place in London without Chinese gold leaving China. We note that sales of gold in China are extremely small anyway. Nevertheless, that 'pool' of gold liquidity in London that we expect to see, will facilitate arbitrage operations that smooth out global prices and make the Chinese gold market the two-way street it needs to be to reflect global demand and supply. In turn we will see a 24-hour gold market. The swing to 1 kg bars from the 400 ounce 'good delivery' bars in London we are now seeing from the vast tonnages of gold being re-refined in Switzerland and elsewhere, will hopefully increase the fluidity of market products, globally. The presence of Chinese banks in London may well speed that process up. Yuan Gold Fix this Year:- The Chinese have announced that they will set up a Gold Fix in the Yuan in Shanghai, later this year. We believe that, alongside the developments we described above, such a Fix will be taken to heart by the global gold market both in the developed emerging and developed world. The fact that the price will only be in Yuan, will ensure that the gold world will get used to the Chinese currency and be in a position to trade in the Yuan without having to go through the Dollar, the Euro and the Pound Sterling, which carry separate risks. With the Chinese government encouraging the international use of the Yuan in global trade and financing, it will be a small step for foreign entities, including central banks, to hold Yuan in their reserves in the future. But this will not affect the gold market, simply the global currency markets. After all, gold is considered an alternative to all currencies. / Розэвэлт (Roosevelt). Установление цены золота в Лондоне в 10:30 (10:30 дп; первое фиксирование) и 15:00 (03:00 пп; второе фиксирование) по местному времени представителями Лондонского Рынка Золота (London Gold Market). Фиксирование Цены Золота – ежедневное определение цены золота независимыми специалистами по золоту и управляющими работниками банка в Лондоне, Париже и Цюрихе. Цена фиксируется в 10:30 и 15:30 по Лондонскому времени каждый рабочий день согласно соотношению спроса и предложения на рынке. Рынки Золота, особые центры в капиталистических и развивающихся странах, где ведётся регулярная купля-продажа золота. В организационном отношении они обычно представляют собой консорциумы местных банков и специализированных фирм, которые наряду с торговлей золотом производят очистку металла (аффинаж) и изготовляют слитки разной величины. Продавцами выступают в основном золотодобывающие страны, а также владельцы запасов, преимущественно частных; покупателями – частные фирмы и лица – ювелиры, промышленники, инвесторы, тезавраторы (смотрите Тезаврация (Тезаврирование) Золота) и спекулянты, в некоторых случаях – центральные банки. Рынки золота существуют во всех капиталистических и развивающихся странах, как правило, на легальной основе. Там, где государство запрещает гражданам совершать сделки с золотом, функционируют нелегальные, 'чёрные' рынки золота. Большинство рынков золота обслуживает спрос промышленников и тезавраторов в пределах своей страны, деятельность ряда рынков золота носит международный характер. Через последние реализуется основная масса золота; ввоз и вывоз его на этих рынках свободный. С XIX века и до 1960-х XX века центром мировой торговли золотом выступал Лондон. Через него шла реализация добытого золота большинства стран мира, в первую очередь Южно-Африканская Республика (ЮАР), на долю которой приходится более 75% всей мировой добычи золота капиталистических стран. В конце 1960-х Лондон, Соединённое Королевство, был оттеснён на второе место Цюрихом, Швейцария, так как ЮАР, установив прямые отношения с Швейцарскими крупными банками, стала продавать до 80% своей добычи через Цюрих. Два главных международных рынка золота – Цюрих и Лондон, тесно связанные между собой, направляют золото от производителей к конечным потребителям через региональные международные рынки золота, имеющиеся в разных частях света, и непосредственно через крупные внутренние рынки золота некоторых стран. Основные региональные международные рынки золота на Ближнем Востоке – Дубай, Бейрут и Эль-Кувейт; на Дальнем Востоке – Сингапур и Сян Ган (Гон Конг). Они снабжают внутренние рынки золота близлежащих стран Азии и Африки, куда золото завозится главным образом контрабандой. В Западном полушарии основными региональными международными рынками золота до начала 1970-х выступали Торонто и Виннипег, где продаётся золото местной, Канадской, добычи. Эти рынки обслуживали Соединённые Штаты Америки (США) и страны Латинской Америки. С 01 Января 1975 открылся новый международный рынок золота в США (Нью Йорк и Чикаго) в связи с тем, что гражданам США (после запрещения в 1933) было вновь предоставлено право владеть и торговать слитковым золотом. Крупнейший внутренний рынок золота – Париж. Ввоз золота во Францию запрещён, и оно завозится контрабандой главным образом из Швейцарии. Крупными внутренними рынками золота выступают в Европе Милан и Франкфурт-на-Майне, в Азии – Токио, Бомбей ('чёрный рынок'), Дакка, Карачи, в

Африке – Касабланка, Александрия, Каир, в Латинской Америке – Буэнос-Айрес, Рио де Жанейро, Монтевидео. На рынках золота металл продаётся в различных формах. На международных рынках золота в основном в стандартных слитках в 12.5 килограммов (кг), содержащих 995 или 999 частей чистого золота на 1 000 частей сплава, и с клеймами аффинажных заводов и монетных дворов, а также в монете старой и новой чеканки. На внутренних рынках золота металл продаётся в слитках от 1 кг до слитков-малюток в 5–10 граммов (г), в листах, пластинках, дисках, песке и в монете. Для Восточных внутренних рынков золота изготавливаются мелкие слитки особого веса и чистоты. Цена золота, устанавливаемая в Цюрихе и Лондоне, почти совпадает и считается его мировой ценой. Она исчисляется в Долларах США за Тройскую унцию (31.1 г) чистого золота. На региональных международных рынках золота цена золота также определяется в Долларах США за унцию, а на внутренних – в местной валюте за местную меру массы (например, в Европе – кг, в Индии – тола = 11.7 г). Поскольку в ценах региональных международных, а также внутренних рынках золота учитывается стоимость доставки золота из Лондона или Цюриха, плата за страхование, риск, а также ряд других элементов, цены на этих рынках, как правило, выше (на внутренних значительно выше), чем на Лондонском или Цюрихском рынках золота. Цена золота устанавливается в соответствии со спросом и предложением. Попытка её регулирования, предпринятая в 1961, когда по инициативе США для этой цели был создан ‘Золотой Пул’, потерпела провал. ‘Золотой Пул’ в Марте 1968 был ликвидирован. На основании Вашингтонского Соглашения от 17 Марта 1968, заключённого между центральными банками стран-членов ‘Золотого Пула’ (к соглашению присоединилось большинство других капиталистических и развивающихся стран), единый рынок золота, обслуживавший потребности как центральных банков, так и частных фирм и лиц, был разделён на два изолированных рынка:- официальный – для взаимных операций центральных банков по официальной цене 35 Долларов за унцию (по этой цене Казначейство США с 1934 покупало золото у любого продавца, а продавало его только иностранным центральным банкам и валютным органам); и свободный – для всех прочих операций по цене, складывающейся в соответствии со спросом и предложением. За центральными банками, присоединившимися к Вашингтонскому Соглашению и тем самым обязавшимися не продавать и не покупать золото на свободном рынке, в том числе непосредственно у стран-производителей, сохранялось формальное право покупать золото по официальной цене у США. Из золотодобывающих стран только ЮАР разрешалось с 1970 продавать ограниченное количество золота Международному Валютному Фонду (МВФ) по официальной цене, когда рыночная цена не превышала 35 Долларов за унцию. Это гарантировало ЮАР низшую продажную цену (08 Декабря 1974 соглашение ЮАР с Международным Валютным Фондом (МВФ) было отменено). С 15 Августа 1971 США официально прекратили продажу золота за Доллары иностранным центральным банкам по официальной цене и официальный рынок золота фактически прекратил своё существование. 13 Ноября 1973 Вашингтонское Соглашение о ‘двухъярусном рынке’ было отменено. Однако до конца 1975 ни один из крупных центральных банков не проводил операций с золотом на рынке, кроме Казначейства США, которое в Январе 1975 продало около 20 тонн (т) золота из государственных запасов, чтобы сдержать рост цены золота, ожидавшийся в связи с возможным увеличением спроса со стороны отдельных граждан США, получивших право владеть и торговать золотом, и в Июне 1975 продало ещё 15 т золота с целью уменьшить ввоз золота в страну для промышленных нужд. После двукратной девальвации Доллара США (в Декабре 1971 и в Феврале 1973) официальная цена золота стала равна 42.22 Доллара за унцию, тогда как рыночная цена в 1974 и Январе–Октябре 1975 была в 3–4 раза выше. В Августе 1975 Временный Комитет МВФ вынес рекомендацию о продаже 1/6 золотого запаса фонда и об отмене официальной цены золота.

GOLD FORWARD OFFERED RATE = ПРЕДЛАГАЕМАЯ ФОРВАРДНАЯ СТАВКА ЗА ЗОЛОТО – Gold Forward Offered Rate (GOFO):- How are gold lease rates quoted? Back in Get paid to borrow gold and silver?, we mentioned that:- But for a certain class of gold owners, they do earn interests on gold. Right now, instead of receiving interest for lending out gold, they are paying people to borrow gold. Who are these gold owners? They are the central banks. The ‘interest rates’ on gold is the gold lease rates… One of our readers alerted us to this forum discussion, Anybody like to explain the negative lease rates:- Many people, even those that seem to understand the gold market seem to get confused on how the gold least rate is quoted …. It is the LIBOR rate minus the gold lending rate for the duration quoted. Normally gold is loaned at less than LIBOR and that results in a positive figure for the lease rate (designated as GOFO by the London Bullion Market Association (LBMA)). Actually, that explanation from the forum is not accurate too. So, what are the gold lease rates all about and how are they quoted? We did some digging and found this commentary. To explain lease rates, we will start off with the definitions:- GOFO- according to the London Bullion Metal Association, the GOFO is the Gold Forward Offered Rate. These are rates at which contributors are prepared to lend gold on a swap against US Dollars. Quotes are made for 1-, 2-, 3-, 6- and 12-month periods. GOFO is basically the interest rate for borrowing money using gold as collateral. For example, a central bank will enter a swap position with a bank by swapping its gold for US Dollars with the bank. At the end of the period, the swap has to be reversed with the central bank paying an additional certain percentage above the original amount of US Dollars. That ‘certain percentage’ is the GOFO rate. The GOFO rate is related to the gold futures price. This is because if the GOFO rate is too much higher than the gold futures price, then the central bank will be better off selling the gold in the spot market and simultaneously buy gold futures. LIBOR – this is the London inter-banking lending rate. Derived Lease Rate (DLR) – this is the lease rate that you see quoted at Kitco.com. The DLR is defined as LIBOR – GOFO. Now, this is where it is getting complicated. So, we’ll use an example. Let us suppose, this is the current situation:- LIBOR – 5%; GOFO – 1%; DLR – (5 – 1 = 4%); and Gold price - USD1 000/oz. Let’s say Bank A has 100 oz of gold. It then enters a swap with Bank B. So, Bank A will end up with USD100 000 and Bank B has 100 oz of gold. At the end of the period, Bank A has to pay USD101 000 to get back its gold. Now Bank A invests the USD100 000 in the market markets and receives LIBOR interests. At the end of the period, it will have USD105 000. Then it pays USD101 000 to Bank B to get back its gold. The net ‘profit’ in this transaction is USD4 000, which is 4% of the original total gold purchase price. The net effect of these transactions is this:- Bank A lend gold at 4% lease rate. To end it all, the lease rate, as explained in Kitco.com is:- The lease rate is the cost of borrowing gold. In much the same way that individuals borrow Dollars, pay an interest charge, and then return Dollars to the lendor, gold bullion participants will borrow ozs of gold, pay a borrowing cost, and return the ozs of gold to the lendor. The debt is measured in terms of ozs as opposed to Dollars. The value of the metal when it is being borrowed or returned is not a factor. The Gold Offered Forward Rate (GOFO), which is the rate at which dealers will lend gold against US Dollars. GOFO is the interest we need to pay if we swap gold for USD, i.e. if we lend our gold and borrow currency, in this case USD, for the same fixed period. The LBMA publishes daily GOFO quotes for each of the periods of 1, 2, 3, 6 and 12 months. Whenever GOFO turns sharply lower or even negative, this indicates stress in the London gold market, i.e. that some of the participants are desperate to get their hands on gold on short notice and are prepared to pay a premium for borrowing gold against USD collateral. GOFO is the (upside down) fever chart of the London gold market. As Figure 1 shows, the London gold market came down with a serious flu on several occasions:- January 1993, November 1995, September 1999, May 2001, and November 2008. It caught a milder form of cold in September 1997, November 1997, March 1998 and September 1998. In this article, we compile various pieces of information, including historical facts, articles in newspapers and market rumours in order to put the evolution of GOFO shown in Figure 1 into a broader context. We focus on November 1997, March 1998, September 1998, September 1999, May 2001, and October 2008. The article will appear in several parts. This is Part I. The Gold Forward Offered Rate (GOFO) is the interest paid if we lend gold and borrow USD for the same period. If we split this swap into its two components, borrowing USD and lending gold, we see that GOFO is approximately LIBOR minus the Gold Lease Rate (GLR). This assumes that the two pieces of counter-party risk compensate each other, namely the risk that the gold is not returned and

the risk that the currency principal is not paid back. LIBOR is the London Inter Bank Offered Rate, the interest on an unsecured USD loan, and GLR the Gold Lease Rate, the interest on an unsecured gold loan. Under normal market conditions, GOFO is positive, i.e. the interest on USD loans is higher than the GLR. This means that we need to pay interest if we lend gold and borrow USD. The gold basically serves as the collateral for borrowing USD at a lower interest rate than we would have to pay for an unsecured loan. Note that the transactions at the LBMA may be in unallocated accounts, i.e. they do not involve the delivery of physical gold, but rather credit or debit in an unallocated account. Swapping (unallocated) gold for USD has the following analogue in the purely physcial world of the commodities exchanges, for example at the New York Commodities Exchange (COMEX®). The swap is (almost) equivalent to the following transaction in the spot and futures markets. We can synthesize the swap by selling physical gold for USD in the spot market, i.e. for immediate delivery, and at the same time purchase a futures contract in order to buy back the same amount of gold at a future date. In the meantime, we can use (most of) the USD proceeds of the gold sale as we please (while we need to post only a small amount of margin in order to hold the futures contract). Under normal market conditions, GOFO is positive and the price of gold for delivery in the future is higher than the spot price. In the terminology of commodities trading, the gold market is in contango. In the following, we are interested in the situations in which GOFO turned negative and in which the gold market therefore was in backwardation, i.e. the gold for future delivery trades at a discount to the spot price. Stress in the Gold Market:- the following interpretation of gold backwardation rests on a few assumptions:- (i) The participants in the London bullion market act like banks. They borrow and lend both USD paper currency and gold, but they are not primarily long or short gold versus USD. They do not primarily speculate and do not engage in proprietary trading. This is why they are called Bullion Banks. They are institutions that lend and borrow gold and silver. Some of them have a commercial banking license, but some do not. (ii) Their physical gold is fractionally reserved, i.e. they lend a certain multiple of the actual physical reserve by creating ledger entries for gold. These are the unallocated gold accounts. (iii) Because of the fractional reserve lending, the participants in the bullion market are prone to a classic run on the bank, i.e. a run on the physical bullion reserve. This happens when the depositors who hold gold in unallocated accounts wish to take possession of the physical bullion and request allocation, while the bank cannot recall their gold loans quickly enough in order to get hold of the physical bullion they have lent to somebody else. A previous article contains some sample balance sheets in order to illustrate how this works. In the case of such a run on the bank, the bullion bank needs to borrow physical gold in the market for the period between the day on which the customer withdraws physical gold and the day on which an outstanding gold loan is repaid in physical gold. One way of borrowing gold from the market is to swap USD for gold, i.e. borrow gold and lend USD, in the LBMA forward market (In this swap, the borrower at first receives the gold as a credit to their unallocated account, but they can immediately request allocation, take possession of the physcial and deliver it to the customer who wanted to withdraw physical gold). The interest received for such a swap is GOFO. If, however, the bullion banks need to obtain large volumes of such swaps under pressure, this will drive down GOFO, possibly rendering it negative so that the bullion banks have to pay interest in order to borrow gold against a USD collateral. This is a plausible explanation for the downward spikes in GOFO seen in Figure 1 above, some of which have sent the gold forward market into backwardation. Another option is to borrow gold for USD using the spot and futures markets by purchasing gold in the spot market and at the same time selling a futures contract, for example at the New York Commodities Exchange (COMEX®). The signature of bullion banks borrowing gold from the market is then buying pressure in the market for physical gold plus an increasing short position in the futures market, possibly causing backwardation at the COMEX®. Gold bugs often interpret this as outright market manipulation, but it may just be some bullion bank borrowing physical gold from the market for a fixed period of time. Gold Forward Offered Rate (GOFO) is the gold equivalent to LIBOR. The rates at which dealers will lend gold on swap against US Dollars. The Gold Offered Forward Rate (GOFO) is the rate at which dealers will lend gold against US Dollars. Since July 1989, 12 market makers of the London Bullion Market Association (LBMA) have contributed to the GOFO page on Reuters their rates for lending gold against US Dollars; and at 10:00 am every business day, a mean is calculated automatically giving the market, in effect, a gold LIBOR (London Interbank Offered Rate). The gold lease rate is LIBOR minus the GOFO rate. In 1997, a second GOFO page was added that provides logical data, which allows the user to apply the rates to other applications, such as spreadsheets and charts. Reuters LBMA 07 gives a full list of contributor codes. Gold trades in the most opaque of all markets. Gold traders live in a precarious arena of incomplete and unreliable information, more than in the treacherous market pits for other commodities. Most official data about gold held by national accounts offer only incomplete information, if not outright disinformation. In response, a Gold Anti-Trust Action Committee (GATA) was organized in January 1999 in the US to advocate and undertake litigation against illegal collusion among central banks to control the price and supply of gold and related financial securities. GATA underwrote an anti-trust lawsuit filed by its consultant, Reginald H Howe, in Howe vs Bank for International Settlements et al, in the US District Court in Boston from 2000 to 2002. While the Howe suit was dismissed on a jurisdictional technicality, it became the model for the anti-trust lawsuit by New Orleans-based Blanchard Coin and Bullion, one of the oldest and most respected gold bullion and numismatics dealers in the US, against Barrick Gold Corp. and JPMorgan Chase & Co.. That suit was filed in US District Court in New Orleans in 2002 and caused Barrick Gold to agree to stop selling gold in advance as a hedge for 10 years. By 2001, Barrick, working with JPMorgan Chase, had amassed off-balance-sheet assets that were worth more than the market capitalization of the next five biggest gold-mining companies in the world combined. Barrick made USD2.3 billion on its short sales of gold and made a profit on those short sales for 62 consecutive quarters. Over a period of five years, JPMorgan Chase lent gold to Barrick at approximately 1.5%; sold the gold into the market and invested the dollar proceeds at approximately 6.5%; then paid both the proceeds from the sales and the 5% interest differential to Barrick whenever it repaid any of the borrowed gold. During a period when the price of gold dropped by more than 25%, Barrick's annual operating cash flow increased by more than 400%. Blanchard's class-action lawsuit charged that JPMorgan Chase provided Barrick with so much borrowed gold – presumably obtained from central banks – on such favorable terms that Barrick could overwhelm the market and move prices up or down at will and not have to repay the borrowed gold for many years, if at all. Blanchard maintained that in some years, Barrick was able to supply to the market more gold than was supplied by all the bullion banks combined. According to the World Gold Council, bullion banks are investment banks that function as wholesale suppliers dealing in large quantities of gold. All bullion banks are members of the London Bullion Market Association. Through a combination of apparent market manipulation and a 1992 transaction that Interior secretary Manuel Lujan Jr described as 'the biggest gold heist since the days of Butch Cassidy', Barrick amassed off-balance sheet assets that were worth more than the combined market capitalizations of the next five biggest gold mining companies in the world. Barrick submitted a motion arguing that in borrowing gold and selling it into the market, the company was acting as the agent of central banks and carrying out their policies in the gold market and thus should share their immunity from lawsuits. US District Judge Helen Berrigan rejected the Barrick motion and sent the case on for discovery and trial. Soon after that ruling, in November 2005, Barrick settled the Blanchard lawsuit out of court. While the settlement was sealed, Barrick simultaneously announced that it would stop hedging gold. In the market, a steady rise in the price of gold ensued. On January 20, 2006, Barrick acquired a majority share of Placer Dome. The production of the combined organization moved Barrick to its current position as the largest gold producer, ahead of Newmont Mining Corp. In 2008, it produced 7.7 million ounces of gold at a cash cost of USD443 per ounce. As of 2008-December-31, its proven and probable gold mineral reserves stood at 138.5 million ounces. In 2009, Barrick produced 7.42 million ounces of gold at total cash costs of USD466 per ounce, or net cash costs of USD363 per ounce, and 393 million pounds of copper at total cash costs of USD1.17 per pound. Today, Barrick is the largest pure gold mining company in the world, with

its headquarters in Toronto, Ontario, Canada; and four regional business units (RBU's) in Australia, Africa, North America and South America. It is undertaking mining and exploration projects in Papua New Guinea, the United States, Canada, Dominican Republic, Australia, Peru, Chile, Russia, South Africa, Pakistan, Colombia, Argentina and Tanzania. The corporation has 25 operating mines and a pipeline of large, long-life projects in addition to large land positions on some of the most prolific mineral districts. Barrick offers investors exceptional leverage to higher gold prices with the industry's largest production profile and the largest reserves of gold, in addition to 6.1 billion pounds of copper reserves and 1.06 billion ounces of contained silver within gold reserves as at 2009-December-31. The Gold Offered Forward Rate (GOFO):- the rates at which dealers will lend gold on swap against US Dollars. GOFO:- this is the Gold Forward Offered Rate, which is provided on Reuters page GOFO for the periods of 1, 2, 3, 6 and 12 months. The numbers represent rates at which the Market Making Members will lend gold on swap against US Dollars. The GOFO mean provides an international benchmark for gold swap rates. It is the gold equivalent of LIBOR, the London Interbank Offered Rate for currencies and is calculated each business day at 11:00 am and published immediately thereafter. In order for the mean to be valid, rates from at least six Market Makers must be available on the GOFO page at 11:00 am. The mean is then determined by discarding the highest and lowest quotations and calculating the average of the remaining rates. The GOFO mean provides the benchmark for long-term finance and loan agreements as well as for the settlement of gold Interest Rate Swaps and Forward Rate Agreements. / Ройтас (Reuters). (более известная в Англоязычном звучании как ЛАЙБО или ЛИБО (LIBOR)). КиткоДатКам (Kitco.com). КОМЭКС® (COMEX®). Барык Голд Корп. (Barrick Gold Corp.) и Дьжей.Пи.Моргэн Чэйс Энд Ко. (JPMorgan Chase & Co.). Блошар (Blanchard). Мануэль Люхан Младший (Manuel Lujan Jr) описал как 'самое крупное ограбление по золоту со времён Буча Касиди (Butch Cassidy')). Окружной Судья из США Хэлэн Бэригэн (US District Judge Helen Berrigan). Пласе Дом (Placer Dome).

GOLD FORWARD RATE AGREEMENT = СОГЛАШЕНИЕ О ФОРВАРДНОЙ СТАВКЕ НА ЗОЛОТО – Gold Forward Rate Agreements (GOFRAs):- a transaction where cash flows are exchanged monthly, by two parties, during the term of the transaction. One party to the transaction is a payer of a fixed gold interest rate, the other, the payer of a floating gold interest rate (referenced to the London Bullion Market Association (LBMA) 'GOFO' rate). Gold Forward Rate Agreement (GOFRA). An 'off balance sheet' instrument used to minimize forward gold interest rate exposure. It hedges the combined effect of moves in both US Dollar and gold interest rates with settlement in Dollars. Gold Forward Rate Agreement (GOFRA) is an hedging instrument used by producers who, having drawn down gold loans, can lock in forward gold interest rate exposure. The GOFRA hedges against the combined effect of moves in both the US Dollar and gold interest rates with settlement in Dollars. The GOLFRA (Gold Lease Forward Rate Agreement) restricts itself to gold interest rates with settlement in gold. Various gold-related agreements are used in the trade. The Gold Forward Rate Agreement (GOFRA) is a hedging instrument used by producers who, having drawn down gold loans, can lock in forward gold interest rate exposure to both US Dollars and gold borrowing rates with settlement in Dollars. GOFRA hedges against the combined effect of market moves in both US Dollars and gold leasing rates with settlement in Dollars. / Соглашение о Форвардной Ставке по Золоту – производители используют данный хэдьжирующий инструмент, когда они 'выбирают' золотые займы и одновременно хотят зафиксировать с помощью срочной сделки определённый уровень риска потенциальных убытков. Расчёт производится в Долларах США.

GOLD HULL = ЗОЛОТИСТАЯ ШЕЛУХА (или ЗОЛОТИСТАЯ ОБОЛОЧКА (ЗЕРНА)) – Gold Hull (GH):- the hulls show a golden yellow color at maturity.

GOLD KEY SERVICE = СЛУЖБА ЗОЛОТОГО КЛЮЧИКА – In the United States, the Gold Key Service is an International Trade Administration service that provides customized information for US firms visiting a country – market orientation briefings, market research, introductions to potential business partners, an interpreter for meetings, assistance in developing a market strategy, and help in putting together a follow-up plan. Trade Specialists design an agenda of meetings, screen and select the right companies, arrange meetings with key people, and go with US representatives to ensure that no unforeseen difficulties occur.

GOLD LEASE FORWARD RATE AGREEMENT = СОГЛАШЕНИЕ О ФОРВАРДНОЙ СТАВКЕ НА ЛИЗИНГ ЗОЛОТА – Gold Lease Forward Rate Agreement (GOLFRA):- similar to a Gold Forward Rate Agreement (GOFRA) but is restricted solely to gold interest rates hedging with settlement in gold. A hedging product that is popular with those who have gold borrowing or deposit requirements. GOLFRAs are generally settled against the benchmark of US Dollar LIBOR minus the Gold Forward Offered Rate (GOFO) mean on the observation date. The Gold Leasing Forward Rate Agreement (GOLFRA) restricts itself to gold leasing rates with settlement in gold, as expressed by the gold spot rate in dollars. The increased activity of central banks in lending gold to the market means that central banks also have exposure to gold spot rate volatility. / (более известная в Англоязычном звучании как ЛАЙБО или ЛИБО (LIBOR)).

GOLD LOAN = ЗОЛОТОЙ ЗАЁМ (или ССУДА ЗОЛОТОМ) – Gold Loan is a financing mechanism whereby gold is borrowed from a bullion bank (which has usually borrowed it from a central bank or banks), and sold into the market to raise cash, usually to finance a gold mining operation. The metal is then repaid over an agreed period of time. The interest on the loan is usually paid either in Dollars or in gold subject to the agreement between the counter-parties. Gold Loan is the provision of finance in gold for a gold-related project or business, typically in mining or jewellery inventory finance, which provides a combination of generally inexpensive funding together with built-in hedging. In a banks' accounting, Gold Loans comprise fixed-term gold loans to commercial banks. Gold is considered by the bank to be a financial instrument. Gold loans are included in the balance sheet on a trade date basis at their weight in gold (translated at the gold market price and USD exchange rate into SDR) plus accrued interest. Interest on gold loans is included in interest income on an effective interest rate basis.

GOLD OPTION = ОПЦИОН НА ЗОЛОТО – Gold Option is the right to buy or sell a specified amount of gold bullion at a stipulated price on the option expiration day. / Опцион На Золото – право купить или продать определённое количество слитков золота по обусловленной цене в день прекращения признания опциона.

GOLD PARITY = ЗОЛОТОЙ ПАРИТЕТ – Gold Parity:- legally stipulated amount of gold which is equivalent to one currency unit in Switzerland. The power to set the gold parity of the Swiss Franc is exercised by the Federal Council on the basis of the Federal Law on the Coinage dated 1970-December-18. This power was invoked on 1971-May-09, when the fine gold content of the Franc was raised by 7% from 0.203 22 grams to 0.217 59 grams. Owing to the transaction to floating exchange rates and the waiving of the National Bank's obligation to pay gold for bank notes and coins, the gold parity of the Franc has lost most of its significance. Gold Parity is a legally fixed quantity of gold to which a monetary unit is pegged. The value of one currency unit in grammes of fine gold, established by a national government. Under this system, the value of gold determines the (external) value of a currency. Since gold currencies no longer exist, gold parities were artificially fixed by the International Monetary Fund (IMF). In 1971, this was replaced by IMF special drawing rights (SDRs). / К Золотому Паритету относятся:- (i) зафиксированное законом содержание чистого золота в национальных денежных единицах; и (ii) соотношение двух денежных единиц, исчисленное на основе их золотого содержания. Под Золотым Паритетом, от Латинского слова Paritas, означающее Равенство или Равноценность, понимается:- (1) зафиксированное законом страны весовое содержание чистого золота в национальной денежной единице. При золотом

обращении и неограниченном размене бумажных денег на золото цена золота в национальных денежных единицах соответствовала весовому золотому содержанию этой единицы. Например, если золотое содержание Доллара США по закону 1934 составляло 0.888 671 г чистого золота, то цена одной Тройской унции (31.103 5 г) чистого золота равнялась 35 Долларов США. Эта цена являлась официальной на мировом капиталистическом рынке и в обесцененных бумажных Долларах США (с 1972 = 38 Долларов). Другие капиталистические страны устанавливали золотое содержание своих денежных единиц, исходя из зафиксированного законом и согласованного с Международным Валютным Фондом (МВФ) официального курса своей денежной единицы по отношению к Доллару США. (2) Соотношение двух денежных единиц, исчисленное на основе их золотого содержания, зафиксированного законом. В этом значении Золотой Паритет обычно заменяет термин Паритетный Курс, который показывает количество денежных единиц другой страны, имеющих такое же весовое содержание чистого золота, какое по закону имеет денежная единица данной страны. Например, Фунт Стерлингов содержал 2.132 81 г чистого золота, а Французский Франк – 0.160 г, то есть в Фунте Стерлингов в 13.33 раза больше чистого золота, чем во Франке. Поэтому паритетный курс между Фунтом Стерлингов и Франком составлял:- 1 Фунт Стерлингов = 13.33 Французских Франков. При золотом стандарте курсы валют колебались вокруг паритета в пределах золотых точек. В валютной системе капитализма, созданной после Второй Мировой Войны 1939–45 и регулируемой уставом МВФ, курсы валют могли отклоняться от паритета не более чем на 1% в ту или другую сторону. С начала 1972 МВФ расширил пределы отклонения курсов от паритетов до 2.25% в ту или другую сторону. Поддержание курсов валют в этих пределах осуществляется центральными банками капиталистических стран. В бывшем Союзе Советских Социалистических Республик (СССР) Золотой Паритет устанавливался государством в плановом порядке и служил базой для котировки Госбанком СССР иностранных валют.

GOLD POINTS = ЗОЛОТЫЕ ТОЧКИ (или ЗОЛОТЫЕ ПУНКТЫ) – Gold Points:- under an international gold standard, exchange rate at which it is advantageous to make or receive payments for imports or exports in gold. The gold importing point is the exchange rate below which it is advantageous to receive payments in the form of gold, and the gold exporting point is the exchange rate above which it is advantageous to make payments for foreign purchases in gold. / В соответствии с международным золотым стандартом, . Золотые Точки – верхний и нижний пределы отклонений курсов валют от их монетного паритета в условиях золотого обращения и свободного движения золота между странами. Золотые точки определялись расходами, связанными с перемещением золота между странами (транспорт, страхование). Курс любой валюты в условиях золотого обращения и свободы ввоза и вывоза золота не мог превысить верхней золотой точки. В противном случае плательщикам было выгоднее, даже с учётом расходов по упаковке, пересылке, страхованию и другому, отправить золото в страну кредитора и обменять его там по паритету на национальную валюту, в которой должен был производиться платёж, то есть произошёл бы приток золота в страну данной валюты. Падение же курса национальной валюты за пределы нижней золотой точки не могло иметь места, так как при достижении этого предела становилось более выгодным вывозить золото из страны, то есть начался бы его усиленный отлив. Предельный нижний курс валюты называется иначе Экспортной Золотой Точкой, а предельный высший курс – Импортной Золотой Точкой. С отменой золотого стандарта (смотрите Золотой Стандарт) и введением валютных ограничений золотые точки потеряли практическое значение.

GOLD POOL = ЗОЛОТОЙ ПУЛ – The Gold Pool was an alliance between the central banks of Britain, Belgium, France, Italy, the Netherlands, Switzerland, the United States and West Germany from 1961 to 1968 which endeavoured to maintain the gold price at USD35 Dollars per Troy ounce. Name of the gold trading organization set up by Switzerland's big banks in March 1968 after a two-tier gold market had been created (Zurich Gold Pool). / Название торгующей золотом организации, сформированной крупными Швейцарскими банками в Марте 1968 вслед за созданием двухъярусного рынка золота (Цюрихский Золотой Пул (Zurich Gold Pool)). Под Золотым Пулом подразумевалось международное объединение центральных банков Бельгии, Великобритании, Германии (Федеративной Республики), Италии, Нидерландов, Франции, Щвейцарии и Федерального Резервного Банка Нью Йорка (1961–68). Это объединение безуспешно пыталось стабилизировать цену золота на Лондонском рынке золота на уровне, близком к официальной цене (35 Долларов США за Тройскую унцию), регулируя через Банк Англии куплю-продажу золота с помощью государственных золотых запасов. Золотой Пул – международное объединение центральных банков ряда Западных стран. Участниками его были Федеральный Резервный Банк Нью Йорка, а также центральные банки семи Западно-Европейских стран – Великобритании, ФРГ, Франции, Италии, Бельгии, Нидерландов, Швейцарии. 'Золотой Пул' действовал с осени 1961 по Март 1968. Имел целью добиться стабилизации рыночной цены золота на Лондонском рынке (являющемся основным рынком золота) на уровне, близком к официальной цене – 35 Долларов за Тройскую унцию (31.103 5 г) чистого золота. Для этого странами золотого пула был организован совместный консорциум по продаже золота в Лондоне. Английскому банку предоставлялось право продавать золото за счёт золотого пула. Остальные участники обязывались возместить израсходованное золото в пределах заранее согласованных квот. Первоначальные квоты стран были определены (в %):- США – 50, Великобритания, Италия, Франция – по 9, Бельгия, Нидерланды, Швейцария – по 4. В начале 1962 участники золотого пула договорились о совместных покупках золота в Лондоне. Приобретённое золото распределялось между ними пропорционально квотам. Деятельность золотого пула протекала следующим образом:- в течение календарного месяца Английский банк производил операции по купле-продаже золота на Лондонском рынке за счёт собственных ресурсов. В конце месяца выводился чистый итог операций. Дефицит возмещался Английскому банку (каждый центральный банк страны-участницы золотого пула передавал ему золото пропорционально своей доле в сумме согласованных квот). При активном сальдо Английский банк, наоборот, распределял купленный металл между участниками также пропорционально квотам. Сведения об операциях золотого пула строго засекречивались, однако из неофициальных источников известно, что с осени 1961 и до конца 1962 количество золота, проданного через золотой пул, было примерно равно его обратным закупкам. В 1963–64 золотой пул в основном скупал золото, однако в дальнейшем в связи с ослаблением позиций Доллара США и обострением спроса на золото золотому пулу пришлось продать значительное количество металла за счёт государственных запасов участников, чтобы не допустить чрезмерного повышения рыночной цены на золото. После девальвации Фунта Стерлингов в Ноябре 1967 золотые биржи охватила паника. По некоторым оценкам, ущерб, причинённый государственным золотым запасам Западных стран массовыми закупками золота, превысил 3 миллиарда Долларов США. В середине 1967 от участия в операциях золотого пула отказалась Франция. В Марте 1968 остальные участники золотого пула на экстренном совещании в Вашингтоне, США приняли решение прекратить операции на Лондонском рынке золота. Фактически это означало конец золотого пула. Рыночная цена золота стала определяться только соотношением спроса и предложения. В 1970–71, например, она превышала официальную цену на 15–25%. Золотой Блок – группа Европейских стран (Франция, Бельгия, Люксембург, Нидерланды, Италия, Польша, Швейцария), сохранивших золотой стандарт и неизменные паритеты валют в период мирового экономического кризиса 1929–33. На Международной Экономической Конференции в Лондоне (1933) эти страны опубликовали декларацию, в которой обязались оказывать взаимную помощь в поддержании курсов валют. Золотой блок не смог обеспечить стабилизацию валют. Углубление валютного кризиса привело к его распаду. После девальвации Доллара США (1934) и обесценения Фунта Стерлингов странам золотого блока стал невыгоден вывоз (или экспорт) товаров, создались условия для отлива капиталов за границу. В 1934 усилила валютные ограничения Италия. В 1935 Бельгия и

Люксембург отошли от золотого стандарта и девальвировали свои валюты, Польша ввела жёсткий валютный контроль и запретила вывоз золота. В Сентябре 1936 Франция, а за ней Нидерланды и Швейцария отменили золотой стандарт, в Октябре 1936 Франция и Италия девальвировали свои валюты.

GOLD PRICE RISK = РИСК ИЗМЕНЕНИЯ ЦЕНЫ ЗОЛОТА – Gold Price Risk is the potential impact on the fair value of assets and liabilities from changes in the SDR (short for the special drawing rights) price of gold. The bank is exposed to gold price risk principally through its holdings of gold investment assets. This is held in custody or placed on deposit with commercial banks. The bank can also have small exposures to gold price risk through its banking activities with central and commercial banks. Gold price risk is measured within the bank's aggregate market risk economic capital framework.

GOLD RESERVE = ЗОЛОТОЙ РЕЗЕРВ (или ЗОЛОТОЙ ЗАПАС) – Gold Reserve:- a fund of gold bullion or coin held by a government or bank, as distinguished from a private hoard of gold held by an individual or nonfinancial institution. In the past, reserves were accumulated by rulers and governments primarily to meet the costs of waging war, and in most eras governmental policy greatly emphasized the acquiring and holding of 'treasure'. Banks accumulated gold reserves to redeem their promises to pay their depositors in gold. During the XIX century, banks supplanted governments as the principal holders of gold reserves. Commercial banks received deposits subject to repayment in gold on demand and issued notes (paper money) that were redeemable in gold on demand; hence each bank had to hold a reserve of gold coins to meet redemption demands. In the course of time, however, the preponderant portion of the gold reserves shifted to central banks. Because the notes of commercial banks were wholly or largely replaced by notes of the central bank, the commercial banks needed little or no gold for note redemption. The commercial banks also came to depend upon the central bank for gold needed to meet the demands of their depositors. In the 1930s many governments required their central banks to turn over to the national treasuries all or most of their gold holdings. For example, in the United States, the Gold Reserve Act of 1934 stipulated that the US Treasury should take title to all gold coin, gold bullion, and gold certificates held by the central Federal Reserve banks, giving gold certificates of a new type and gold credits on its books in exchange. The US Treasury placed most of its gold reserve at Fort Knox, KY (State of Kentucky). But not all governments 'nationalized' gold, with the result that the status of gold reserves varies from country to country. In some countries, monetary gold reserves are held exclusively by the national government; in others they are held largely by the central bank; and in still others they are held partly by the government and partly by the central bank. Regardless of the holder, however, the use of gold reserves is now limited almost exclusively to the settlement of international transactions – and, even then, only rarely. / Золотой Запас – централизованный резерв золота в слитках и монетах, сосредоточенный в центральном эмиссионном банке или казначействе страны. При свободном золотом обращении до начала общего кризиса капитализма золотой запас имел троякое назначение:- (i) резервного фонда для международных платежей (резервный фонд мировых денег), (ii) резервного фонда для внутреннего металлического обращения, и (iii) резервного фонда для платежей по вкладам и для размена банкнот. В 1913 в централизованных резервах было сосредоточено 59% всего мирового запаса монетарного золота, а 41% золота находился в обращении. С заменой металлического обращения бумажным и прекращением размена банкнот на золото сфера функционирования золота сузилась. Создались возможности для более полной концентрации золотых ресурсов в централизованных фондах. Золото стало направляться на обслуживание операций только внешнеэкономического порядка, то есть сохранило значение резервного фонда для международных платежей. В условиях обострения валютного кризиса после Второй Мировой Войны 1939–45 эта роль золотого запаса значительно возросла, так как увеличилась потребность в золоте, вызванная расстройством платёжных балансов, инфляцией и обесценением валют. Возросла также роль золотого запаса как военно-финансового резерва. Постепенно во всех капиталистических странах было осуществлено огосударствление золотого запаса путём сосредоточения подавляющей массы золотых ресурсов в центральных банках и казначействах. Мировые ресурсы золота распределяются между странами крайне неравномерно. Перед Первой Мировой Войной 1914–18 золотые запасы Европейских стран почти вдвое превосходили золотой запас США. К началу Второй Мировой Войны 1939–45 удельный вес золотого запаса США составлял 56% мировых, к 1949 повысился до 70%. Доля капиталистических стран Европы соответственно уменьшилась с 37 до 15%. К 1969 доля США снизилась до 29%, а доля Европейских стран возросла до 54%. Сокращение мирового золотого запаса к 1969 явилось результатом паники на золотых биржах после девальвации Фунта Стерлингов в Ноябре 1967 и резко возросшей продажи золота частным лицам из государственного золотого запаса США и других стран-участниц Золотого Пула (смотрите также Золотой Пул). После ликвидации в Марте 1968 Золотого Пула и создания двухъярусного рынка золота – официального и свободного – мировые золотые запасы были фактически заморожены. Резкое обострение валютного кризиса в 1971 привело к дальнейшему сокращению в них доли США до 25% (Сентябрь 1971); доля капиталистических стран Европы возросла до 57%. В бывших социалистических странах централизованный золотой запас служил в основном в качестве резерва для международных расчётов, связанных с внешними экономическими отношениями.

GOLD/SILVER RATIO = СООТНОШЕНИЕ ЗОЛОТО/СЕРЕБРО – Gold/Silver Ratio is the number of ounces of silver required to buy one ounce of gold at current spot prices. Gold/Silver Ratio is the number of ounces of silver that can be bought with one ounce of gold. / Количество унций серебра, необходимое для покупки одной унции золота по текущим ценам на наличном рынке.

GOLD SPECIE STANDARD = ЗОЛОТОМОНЕТНЫЙ СТАНДАРТ (или ЗОЛОТОДЕВИЗНЫЙ СТАНДАРТ) – Gold Specie Standard is a gold standard in which money in circulation consists of gold coins and bank notes that are convertible into gold. See also Gold Bullion Standard, Gold Exchange Standard, and Gold Standard. / Золотой стандарт, по которому денежная масса, находящаяся в обращении состоит из золотых монет и банкнот, которые являются обратимыми в золото. Смотрите также Золотой Стандарт (Gold Standard), и Золотослитковый Стандарт (Gold Bullion Standard). Международную валютную систему, возникшую после Второй Мировой Войны 1939–45, иногда также называют Золотодевизным Стандартом, потому что, согласно требованиям этой системы, оформившейся на Брэтчэн Вудзской Международной Финансовой Конференции 1944, страны должны иметь резервы в золоте и девизах (в основном в Долларах США) для покрытия дефицитов платёжных балансов. Однако между довоенной и современной формами золотодевизного стандарта имеется существенное различие:- после Второй Мировой Войны внутреннее обращение в капиталистических странах остаётся полностью на бумажноденежной основе, а предоставленное иностранным держателям национальной валюты право обмена её на Доллары и через Доллары на золотые слитки стало практически неосуществимым после того, как США в связи со снижением их золотого запаса фактически воздерживались от обмена бумажных Долларов на золото даже правительствам и центральным банкам других стран, а с 15 Августа 1971 официально прекратили такой обмен..

GOLD STANDARD = ЗОЛОТОЙ СТАНДАРТ – The Gold Standard:- the great gold discoveries in California and Australia in the 1840s and '50s produced a temporary decline in the value of gold in terms of silver. This price change, plus the dominance of Britain in international finance, led to a widespread shift from a silver standard to a gold standard. Germany adopted gold in 1871–73, the Latin Monetary Union (France, Italy, Belgium, Switzerland) in 1873–74, the Scandinavian Union (Denmark, Norway, and Sweden) and The Netherlands in 1875–76. By the final decades of the century, silver remained dominant only in the Far East (China, in particular). Elsewhere the gold standard reigned. The early XX century was the great era of the international gold standard. Gold coins circulated

in most of the world; paper money, whether issued by private banks or by government, was convertible on demand into gold coins or gold bullion at an official price (with perhaps the addition of a small fee); and bank deposits were convertible into either gold coin or paper currency that was itself convertible into gold. In a few countries, a minor variant prevailed – the so-called Gold-Exchange Standard, under which the currency was converted at a fixed price into the currency of another country (usually the British pound sterling) that was itself convertible into gold. There was, in effect, a single world money called by different names in different countries. A US Dollar, for example, was defined as 23.22 grains of pure gold (25.8 grains of gold 0.9000 fineness). A British Pound Sterling was defined as 113.00 grains of pure gold (123.274 grains of gold $11/12^{th}$ fine). Accordingly, one British Pound equalled 4.8665 US Dollars (113.00/23.22) at the official parity. The actual exchange rate could deviate from this only by an amount that corresponded to the cost of shipping gold. If the price of the pound sterling in terms of dollars rose to a considerably higher value than this in the foreign exchange market, someone in New York City who had a debt to pay in London might find that, rather than buy the needed pounds on the market, it was cheaper to get gold for Dollars at a bank or at the US subtreasury, ship the gold to London, and get pounds for the gold from the Bank of England. This set an upper limit to the exchange rate. Similarly, the cost of shipping gold from Britain to the United States set a lower limit. These limits were known as the Gold Points. Under such an international gold standard, the quantity of money in each country was determined by the specie-flow adjustment mechanism analyzed by XIX-century economists. If, for whatever reason, the quantity of money in a country rose unduly, this would tend to raise prices in that country relative to prices in other countries; the rise in prices would have the effect of discouraging exports and encouraging imports. The decreased supply of foreign currency from the sale of exports plus the increased demand for foreign currency to pay for imports would tend to raise the price of foreign currency in terms of domestic currency. As soon as this price hit the upper gold point, gold would be shipped out of the country to other countries. The decline in the amount of gold would produce in turn a reduction in the total amount of money – because banks and government institutions, seeing their gold reserves decline, would want to protect themselves against further demands by reducing the claims against gold that were outstanding. This would tend to lower prices at home. The influx of gold abroad would have the opposite effect, increasing the quantity of money there and raising prices. These adjustments would continue until the gold flow ceased or was reversed. This is precisely the mechanism that operates within a unified currency area, the mechanism that determines how much money there is in Illinois compared to how much there is in other states or how much there is in Wales compared to how much there is in other parts of the United Kingdom. In the early XX century, most of the world was a unified currency area, so the gold standard functioned throughout the world. Its great advantage was that – if permitted to operate – it would greatly limit the power of any national government to engage in irresponsible monetary expansion. This was also its great disadvantage. In an era of big government and of full-employment policies, a real gold standard would tie the hands of governments in one of the most important areas of policy. The Decline Of Gold:- World War I ended the real international gold standard. Most belligerents suspended the free convertibility of gold. The United States, even after its entry into the war, maintained convertibility but embargoed gold exports. For a few years after the end of the war, most nations had inconvertible national paper standards – inconvertible in that paper money was not convertible into gold or silver. The exchange rate between any two currencies was a market rate that fluctuated from time to time. During this period this was regarded as a temporary phenomenon, like the British suspension of gold payments during the Napoleonic era, and the US suspension during the Civil War greenback period. The great aim was a restoration of the prewar gold standard. This aim dominated monetary developments during the 1920s. Britain, still a major financial power, returned to gold in 1925. Winston Churchill, then chancellor of the Exchequer, decided to follow prevailing financial opinion and adopt the prewar parity (i.e. to define a pound sterling once again as equal to 123.274 grains of gold $11/12^{th}$ fine). This produced exchange rates that, at the existing prices in sterling, overvalued the pound and so tended to produce gold outflows, especially after France returned to gold in 1928 at a parity that undervalued the franc. By 1929 the important currencies of the world, and most of the less important ones, were again linked to gold. The gold standard that was restored, however, was a far cry from the prewar gold standard. The establishment of the Federal Reserve System in the United States introduced an additional link in the international specie-flow mechanism. That mechanism no longer operated automatically. It operated only if the Federal Reserve chose to let it do so, and the Federal Reserve did not so choose; it took certain measures that prevented gold inflows from producing a corresponding expansion in the money supply. The United Kingdom had recurring difficulties in retaining its gold. It followed a restrictive monetary policy, but, because of rigidities in prices and particularly in wages, the result was unemployment rather than a lowering of prices. Unemployment reduced imports and stimulated exports, thus preventing gold losses. But this was not a tenable long-term position, as a lower price level might have been. Most other countries adopted a gold-exchange standard. Everywhere, central banks took scattered measures to loosen the connection between changes in the money supply and inflows or outflows of gold. If the Great Depression had not occurred, this system might have grown and matured and improved. But the Depression brought the managed gold standards to a quick end. It originated in the United States, spread to all the countries linked by the gold exchange standard, and then reverberated back to the United States. Britain was the first major country to cut the link, leaving the gold standard in 1931. The United States followed in March 1933, restoring a fixed – but higher – Dollar price for gold in January 1934, at USD35 an ounce. The Dollar Standard:- The world's monetary system operated on a Dollar Standard from the end of World War II until 1971, when, in an attempt to control inflation, the United States unilaterally severed the connection between the dollar and gold. Under the dollar standard, the dollar was widely used in international trade, even in trade between countries other than the United States. It was the unit in terms of which the exchange rates of other currencies were expressed. Other countries maintained their 'official' exchange rates by buying and selling US Dollars and held Dollars as their primary reserve currency for that purpose. The existence of a dollar standard did not mean that other countries could not change their exchange rates – as Germany and France did in 1969 – just as the gold standard did not mean that they could not 'devalue' or 'appreciate' in terms of gold. What it did mean was that the United States could not determine its own exchange rate or its balance of payments position. It also meant that US monetary policy had a major effect on the world economy. Since 1971 the world's monetary system has consisted of a collection of national fiat currencies linked by 'floating' exchange rates set in the market. Frequent government interventions to affect exchange rates have been effective at most only temporarily. None of the numerous proposals to reform the system has come close to acceptance. Gold Standard is a monetary system with a fixed price for gold, and with gold coin either forming the whole circulation of currency within a country or with notes representing and redeemable in gold. The Gold Standard:- some economists believe that the Federal Reserve allowed or caused the huge declines in the American money supply partly to preserve the gold standard. Under the gold standard, each country set the value of its currency in terms of gold and took monetary actions to defend the fixed price. It is possible that had the Federal Reserve expanded greatly in response to the banking panics, foreigners could have lost confidence in the United States' commitment to the gold standard. This could have led to large gold outflows, and the United States could have been forced to devalue. Likewise, had the Federal Reserve not tightened in the fall of 1931, it is possible that there would have been a speculative attack on the dollar and the United States would have been forced to abandon the gold standard along with Great Britain. While there is debate about the role the gold standard played in limiting US monetary policy, there is no question that it was a key factor in the transmission of America's economic decline to the rest of the world. Under the gold standard, imbalances in trade or asset flows gave rise to international gold flows. For example, in the mid-1920s intense international demand for American assets such as stocks and bonds brought large inflows of gold to the United States. Likewise, a decision by France after World War I to return to the gold standard with an undervalued Franc led to trade surpluses and substantial gold inflows. Britain chose to return to the gold

standard after World War I at the prewar parity. Wartime inflation, however, implied that the Pound was overvalued, and this overvaluation led to trade deficits and substantial gold outflows after 1925. To stem the gold outflow, the Bank of England raised interest rates substantially. High interest rates depressed British spending and led to high unemployment in Great Britain throughout the second half of the 1920s. Once the US economy began to contract severely, the tendency for gold to flow out of other countries and toward the United States intensified. This took place because deflation in the United States made American goods particularly desirable to foreigners, while low income reduced American demand for foreign products. To counteract the resulting tendency toward an American trade surplus and foreign gold outflows, central banks throughout the world raised interest rates. Maintaining the international gold standard, in essence, required a massive monetary contraction throughout the world to match the one occurring in the United States. The result was a decline in output and prices in countries throughout the world that also nearly matched the downturn in the United States. Financial crises and banking panics occurred in a number of countries besides the United States. In May 1931 payment difficulties at the Creditanstalt, Austria's largest bank, set off a string of financial crises that enveloped much of Europe and were a key factor forcing Britain to abandon the gold standard. Among the countries hardest hit by bank failures and volatile financial markets were Austria, Germany, and Hungary. These widespread banking crises could have been the result of poor regulation and other local factors, or simple contagion from one country to another. In addition, the gold standard, by forcing countries to deflate along with the United States, reduced the value of banks' collateral and made them more vulnerable to runs. As in the United States, banking panics and other financial market disruptions further depressed output and prices in a number of countries. See also Balance of Trade. Monetary system in which money is freely convertible into gold at a specified rate, and vice versa, with no restrictions on quantities or on the international shipment of gold. Gold Standard is a system whereby notes issued are backed by gold. In place in the United Kingdom from 1821–1914. The system has the advantage that it gives an automatic check on inflation, and the drawback that the total of world trade must always be limited by the total output of gold in the world. Three conditions must be satisfied for a gold standard to work:- (i) there must be free mintage of gold into the standard legal coins, (ii) gold must be freely importable into or exportable from the country, and (iii) the legal paper money of the country must be convertible by the central bank into gold on request. See also Gold Bullion Standard, Gold Exchange Standard, and Gold Specie Standard. Gold Standard is a monetary system in which currencies are defined in terms of a given weight of gold. Gold Standard is the monetary system in which the standard unit of currency is a fixed quantity of gold or is kept at the value of a fixed quantity of gold. The currency is freely convertible at home or abroad into a fixed amount of gold per unit of currency. In an international gold-standard system, gold or a currency that is convertible into gold at a fixed price is used as a medium of international payments. Under such a system, exchange rates between countries are fixed; if exchange rates rise above or fall below the fixed mint rate by more than the cost of shipping gold from one country to another, large gold inflows or outflows occur until the rates return to the official level. These 'trigger' prices are known as Gold Points. The gold standard was first put into operation in Great Britain in 1821. Prior to this time silver had been the principal world monetary metal; gold had long been used intermittently for coinage in one or another country, but never as the single reference metal, or standard, to which all other forms of money were coordinated or adjusted. For the next 50 years a bimetallic regime of gold and silver was used outside Great Britain, but in the 1870s a monometallic gold standard was adopted by Germany, France, and the United States, with many other countries following suit. This shift occurred because recent gold discoveries in western North America had made gold more plentiful. In the full gold standard that thus prevailed until 1914, gold could be bought or sold in unlimited quantities at a fixed price in convertible paper money per unit weight of the metal. The reign of the full gold standard was short, lasting only from the 1870s to the outbreak of World War I. That war saw recourse to inconvertible paper money or to restrictions on gold export in nearly every country. By 1928, however, the gold standard had been virtually reestablished, although, because of the relative scarcity of gold, most nations adopted a gold-exchange standard, in which they supplemented their central-bank gold reserves with currencies (US Dollars and British Pounds) that were convertible into gold at a stable rate of exchange. The gold-exchange standard collapsed again during the Great Depression of the 1930s, however, and by 1937 not a single country remained on the full gold standard. The United States, however, set a new minimum dollar price for gold to be used for purchases and sales by foreign central banks. This action, known as 'Pegging' the price of gold, provided the basis for the restoration of an international gold standard after World War II; in this postwar system most exchange rates were pegged either to the US Dollar or to gold. In 1958 a type of gold standard was reestablished in which the major European countries provided for the free convertibility of their currencies into gold and Dollars for international payments. But in 1971 dwindling gold reserves and a mounting deficit in its balance of payments led the United States to suspend the free convertibility of Dollars into gold at fixed rates of exchange for use in international payments. The international monetary system was henceforth based on the Dollar and other paper currencies, and gold's official role in world exchange was at an end. The advantages of the gold standard are that (1) it limits the power of governments or banks to cause price inflation by excessive issue of paper currency, although there is evidence that even before World War I monetary authorities did not contract the supply of money when the country incurred a gold outflow; and (2) it creates certainty in international trade by providing a fixed pattern of exchange rates. The disadvantages are that (1) it may not provide sufficient flexibility in the supply of money, because the supply of newly mined gold is not closely related to the growing needs of the world economy for a commensurate supply of money; (2) a country may not be able to isolate its economy from depression or inflation in the rest of the world; and (3) the process of adjustment for a country with a payments deficit can be long and painful whenever an increase in unemployment or a decline in the rate of economic expansion occurs. / выработка (output). Винстэн Чочил (Winston Churchill). Под Золотым Стандартом понималась система золотого монометаллизма, установленная сначала в Великобритании в конце XVIII века, а затем, в конце XIX века, в большинстве ведущих мировых держав. Для золотого стандарта характерны свободная чеканка и обращение золотых монет, размен банкнот на золото (в слитках и монетах). В связи с неустойчивостью мировой экономики был практически отменён в большинстве стран в годы мирового экономического кризиса 1929–33 и после него. Смотрите также Золотомонетный Стандарт (Gold Specie Standard), и Золотослитковый Стандарт (Gold Bullion Standard). Золотой Стандарт – монометаллическая денежная система, существовавшая во многих странах на определённом этапе развития капитализма, при которой только золото выступало всеобщим эквивалентом и непосредственной основой денежного обращения. Наиболее совершенной, классической формой золотого стандарта был Золотомонетный Стандарт, при котором денежная единица страны имела определённое, установленное законом и неизменное золотое содержание (Золотой Паритет), а 'цена' золота в денежных знаках соответствовала этому паритету. Золотые монеты находились в обращении и имели неограниченную силу законного платёжного средства. Центральные эмиссионные банки были обязаны обменивать банкноты и другие денежные знаки (бумажные деньги, монеты из неполноценных металлов) на золото по номиналу. Допускалась свободная чеканка монет из золота, принадлежащего частным лицам, за небольшую плату или безвозмездно, а также переплавка золотых монет в слитки. Был разрешён свободный вывоз и ввоз золота в любом виде и не существовало никаких валютных ограничений. Золотой стандарт впервые был введён в Великобритании (юридически в конце XVIII века, фактически с 1821). Во Франции, Германии, России, Италии, Японии, США и в других капиталистических странах введение золотого стандарта было завершено в последней четверти XIX века. Денежные системы отдельных стран превратились в единую относительно устойчивую мировую валютную систему. Это в значительной мере содействовало развитию капиталистического мирового хозяйства, росту промышленного производства, внутреннего товарооборота и международной торговли, расширению и укреплению кредитной системы. Золотомонетный стандарт

потерпел крах с началом общего кризиса капитализма, когда вспыхнула Первая Мировая Война 1914–18. Он был заменён бумажноденежным обращением. После Первой Мировой Войны, в 1924–28 была сделана попытка восстановления золотого стандарта, но не в прежнем виде, а в форме Золотослиткового Стандарта и Золотодевизного Стандарта. Обращение золотых монет не могло быть восстановлено из-за недостатка золотых резервов и неравномерного их распределения между странами. Крупные суммы банкнот обменивались на золотые слитки массой в 12–14 кг (в Великобритании, Франции) или на иностранную валюту, обмениваемую, в свою очередь, на золотые слитки (в Германии, Бельгии и других). Золото было полностью вытеснено из внутреннего обращения во всех странах, кроме США, где оно продержалось до 1933. Обмен банкнот на слитки производился, как правило, только в случае необходимости погашения дефицита платёжного баланса путём вывоза золота. Однако и эти видоизменённые формы золотого стандарта продержались недолго. Полный крах их был вызван мировым экономическим кризисом 1929–33, в результате которого во всех капиталистических странах, в том числе и в США, установилось бумажноденежное обращение с присущими ему явлениями инфляции, ростом товарных цен, резкими колебаниями валютных курсов и тому подобным. В 1931 был отменен золотой стандарт в Великобритании и Японии, в 1933 – в США, в 1935 – в Бельгии и Италии, в 1936 – во Франции, Швейцарии и Нидерландах. Международную валютную систему, возникшую после Второй Мировой Войны 1939–45, иногда также называют Золотодевизным Стандартом, потому что, согласно требованиям этой системы, оформившейся на Брэтчэн Вудзской Международной Финансовой Конференции 1944, страны должны иметь резервы в золоте и девизах (в основном в Долларах США) для покрытия дефицитов платёжных балансов. Однако между довоенной и современной формами золотодевизного стандарта имеется существенное различие:- после Второй Мировой Войны внутреннее обращение в капиталистических странах остаётся полностью на бумажноденежной основе, а предоставленное иностранным держателям национальной валюты право обмена её на Доллары и через Доллары на золотые слитки стало практически неосуществимым после того, как США в связи со снижением их золотого запаса фактически воздерживались от обмена бумажных Долларов на золото даже правительствам и центральным банкам других стран, а с 15 Августа 1971 официально прекратили такой обмен. Золотой Стандарт – валютно-денежная система, при которой валютные единицы конвертировались в фиксированное количество золота. Подобные системы считаются антиинфляционными. США в прошлом использовали золотой стандарт, но он был отменён в 1971.

GOLD WARRANT = ВАРРАНТ НА ЗОЛОТО – (1) Gold Warrant is a warrant giving the buyer the right to buy gold at a specific price on a specified value date, for which the buyer pays a premium. While similar in structure to options, warrants are securitized instruments.

(2) Gold Warrant is a certificate often issued by exchanges indicating ownership of physical metal.

GOLF = ГОЛФ – Golf (pronunciation:- GOLF) or G is international nautical signal flag meaning:- I require a pilot. When flown by a fishing vessel:- 'I am hauling nets'. With 4 or 5 numerals, longitude (last two numerals indicate minutes). NATO:- guide of formation.

GOLFRA = GOLD LEASE FORWARD RATE AGREEMENT

GOM = GULF OF MIXICO

GONDOLA = ГОНДОЛА – Gondola is a railcar with a flat platform and sides three to five feet high, used for top loading long, heavy items. / Железнодорожный полувагон, состоящий из платформы и бортов, достигающих в высоту от трёх до пяти футов, используемый для погрузки сверху длинных, тяжёлых изделий. Под Гондолой, от Итальянского слова Gondola, саморазгружающийся железнодорожный полувагон с плоским горизонтальным полом.

GONIOSPECTROPHOTOMETER = ГОНИОСПЕКТРОФОТОМЕТР – Goniospectrophotometer is the spectrophotometer having the capability of measuring with a variety of illuminating and viewing angles using bidirectional geometry; also known as Multi-Angle Spectrophotometer. Usually used to measure colored samples with great directionality. / Под Гониоспектрометром, от Греческих слов Gonía, означающее Угол, и Métron, означающее Мера, или Metréo, означающее Измеряю, и Латинского слова Spectrum, означающее Образ или Представление, понимается спектрофотометр, имеющий способность измерения разновидности .

GOOD BANK/BAD BANK = НАДЁЖНЫЙ БАНК/НЕНАДЁЖНЫЙ БАНК – In the United States, Good Bank/Bad Bank is a structuring technique designed to segregate troubled assets of a bank into a separate pool or liquidating vehicle, whether or not the separate pool or liquidating vehicle is technically a bank. It is often combined with an arrangement whereby a government entity assumes the risk of loss on all or some portion of the bad assets. Free of all or some of the risk of its bad assets, the transferring bank becomes the 'good bank' that can now attract capital and carry out its business as a normal going concern.

GOOD CONDITION = ХОРОШЕЕ СОСТОЯНИЕ – Good Condition means a bale of cotton that, by comparison with the photographic standards of 'A Guide for Cotton Bale Standards' of the Joint Cotton Industry Bale Packaging Committee, is determined to be a Grade A or Grade B bale.

GOOD DELIVERY = ДОЛЖНАЯ ПОСТАВКА (или ПОДОБАЮЩАЯ ПОСТАВКА) – Good Delivery:- designation in purchase or sales contracts that the precious metals, securities or merchandise delivered meet the general delivery conditions of the market. Certain basic qualifications must be met before a security sold on the exchange may be delivered. The security must be in proper form to comply with the contract of sale and to transfer title to the purchaser. Good Delivery:- historically, the members of the London bullion market compiled lists of accredited melters and assayers whose gold and silver bars they would accept without question in settlement against transactions conducted between each other and with other acceptable counterparts. Such bars earned the distinction of London Good Delivery status. The London Bullion Market Association (LBMA) Good Delivery List is now widely recognised as representing the de facto standard for the quality of gold and silver bars, in large part thanks to the stringent criteria for assaying standards and bar quality that an applicant must satisfy in order to be listed. The assaying capabilities of refiners on the Good Delivery List are periodically checked under the LBMA's Proactive Monitoring programme. The main requirements to be considered for listing are normally that a refiner must:- (i) have an established track record of at least three years of producing the refined metal for which the listing is being sought; (ii) produce a minimum quantity of refined metal per year – 10 tons of gold and 30 tons of silver; (iii) have a tangible net worth of at least £15 million equivalent; (iv) furnish evidence of their ownership structure and directors; and (v) provide, if required, a suitable letter of endorsement, e.g., from the central bank or an acceptable commercial bank in their country of operation. Approved metals brands acceptable for delivery against the metals contracts. Good Delivery:- the specification which a gold or silver bar or a platinum or palladium ingot or plate must meet in order to be acceptable for delivery in a particular terminal market or futures exchange. / Должная Поставка – термин, относящийся к ценным бумагам и означающий, что сертификат имеет необходимые передаточные надписи и удовлетворяет всем остальным требованиям (гарантийная подпись, должная деноминация и иные требования), так что право владения может быть передано путём поставки сертификата покупающему брокеру, который обязан принять его. Не удовлетворяющие этому условию сертификаты обозначаются термином Bad Delivery.

GOOD DELIVERY BARS = МЕРНЫЕ СЛИТКИ ДЛЯ ДОЛЖНОЙ ПОСТАВКИ (или МЕРНЫЕ СЛИТКИ ДЛЯ ПОДОБАЮЩЕЙ ПОСТАВКИ) – Good Delivery Bars:- also referred to as Large Bars, the ingots that conform to London Good Delivery standard.

GOOD DELIVERY STANDARD = СТАНДАРТ НА ДОЛЖНУЮ ПОСТАВКУ (или СТАНДАРТ НА ПОДОБАЮЩУЮ ПОСТАВКУ) – Good Delivery Standard:- the specification to which a gold bar must conform in order to be acceptable on a certain market or exchange. Good delivery for the London Bullion Market is the internationally accredited good delivery standard. A good delivery bar for London should weigh between 350 and 430 ounces (gold content), of minimum purity 99.5% (two nines five). Further specifications can be obtained from the London Bullion Market Association. Good Delivery Standard:- the specification to which a gold bar must conform in order to be acceptable on a certain market or exchange. Good delivery for the London Bullion Market is the internationally accredited good delivery standard.

GOOD FAITH = ЧЕСТНЫЕ НАМЕРЕНИЯ (или ДОБРОСОВЕСТНОСТЬ) – Good Faith is a basic principle of insurance. The Assured and his broker must disclose and truly represent every material circumstance to the underwriter before acceptance of the risk. A breach of good faith entitles the underwriter to avoid the contract. Proposed changes in law may affect this definition. See also Bona Fide. / заслуживающий доверия или действительный (bona fide).

GOOD FOR THE DAY = ДЕЙСТВИТЕЛЬНОЕ НА ЭТОТ ДЕНЬ – Good For The Day is an order that will expire if it is not executed on the same date as it is placed. / Распоряжение, срок действия которого, в случае его неисполнения, истекает в тот же день, в который и было получено.

GOODNESS OF FIT = ВНЯТНОСТЬ ПРИГОДНОСТИ – Goodness Of Fit is a measure of how well observed data conform to a specified, expected, or theoretical probability distribution.

GOODS = ТОВАРЫ (или ГРУЗЫ, или ВЕЩИ) – (1) Goods is a common term indicating movable property, merchandise, or wares. A term Goods includes any container, pallet or similar article of transport or packaging, if supplied by the consignor. / Обобщающий термин означающий движимое имущество, товары или изделия.

(2) Goods:- all materials which are used to satisfy demands. / Все материалы, которые используются для удовлетворения различного спроса.

(3) Goods:- whole or part of the cargo received from the shipper, including any equipment supplied by the shipper. / Весь или часть груза, полученные от отправителя, в том числе любое оборудование, поставленное отправителем.

GOODS AND SERVICES = ТОВАРЫ И УСЛУГИ – (1) Goods And Services:- products of economic activity, and components of production. Material or intangible things that are capable of satisfying a human want. A good may serve to fill a demand for consumption (consumer goods, intermediate goods), or it may be used in production (capital goods). In economics, no distinction is made between physical goods and services.

(2) Goods And Services:- goods are products. In the context of service marks, a service (1) must be a real activity; (2) must be performed to the order of, or for the benefit of, someone other than the applicant; and (3) the activity performed must be qualitatively different from anything necessarily done in connection with the sale of the applicant's goods or the performance of another service.

GOODS CONTROL CERTIFICATE = СЕРТИФИКАТ КОНТРОЛЯ ТОВАРОВ (или СВИДЕТЕЛЬСТВО КОНТРОЛЯ ТОВАРОВ) – Goods Control Certificate is a document issued by a competent body evidencing the quality of goods described therein, in accordance with national or international standards, or conforming to legislation in the importing country, or as specified in the contract.

GOODS IN TRANSIT = ТОВАРЫ В ТРАНЗИТЕ (или ТОВАРЫ В ПУТИ, или ГРУЗЫ В ПУТИ) – Goods In Transit are the goods which have departed from the initial loading point and not yet arrived at the final unloading point. / Товары, которые покинули первоначальный пункт погрузки, но не прибывшие ещё в конечный пункт выгрузки.

GOODS RECEIPT = ГРУЗОВАЯ КВИТАНЦИЯ (или КВИТАНЦИЯ О ПРИЁМЕ ТОВАРОВ, или КВИТАНЦИЯ НА ТОВАРЫ) – Goods Receipt is a document issued by a port, warehouse, shed, or terminal operator acknowledging receipt of goods specified therein on conditions stated or referred to in the document. / Грузовая Квитанция выдаётся отправителю в удостоверение приёма груза к перевозке.

GOOD THIS WEEK ORDER = РАСПОРЯЖЕНИЕ, ДЕЙСТВИТЕЛЬНОЕ В ТЕЧЕНИЕ ЭТОЙ НЕДЕЛИ (или ПОРУЧЕНИЕ, ДЕЙСТВИТЕЛЬНОЕ В ТЕЧЕНИЕ ЭТОЙ НЕДЕЛИ) – Good This Week Order is an order which is valid only for the week in which it is placed. / Распоряжение, которое остаётся в силе только в течение той недели, в которую оно было размещено.

GOOD 'TILL CANCELED = ДЕЙСТВИТЕЛЬНОЕ ДО ОТМЕНЫ – Good 'Till Canceled is an order which is valid at any time until it is cancelled by the customer. Also known as Open Order. An order to be held by a broker until it can be filled or until canceled. An order placed by a trader that is good until canceled by the trader. This type of order is sometimes used to make purchases on breakouts from price channels or other chart patterns in which the order price is above the current price of the asset. An order to a broker to buy or sell at a specific price until the customer cancels the order. The order holds until executed or canceled. Good-Till-Cancelled Order is an order to buy or sell securities, which remains in the trading system either until executed or cancelled by the client. Good-Till-Canceled is an order that will remain open for execution at any time in the future until the customer cancels it. Good 'Til Cancelled (GTC):- applicable to market orders, it signifies that the order will be open and carried forward indefinitely until it is either filled or cancelled by the client. / Действительное До Отмены:- распоряжение брокеру купить или продать по указанной фиксированной цене, если только заказчик не отменит его. Распоряжение остаётся в силе пока не будет исполнено или отменено.

GOOD–TILL–DATE ORDER = РАСПОРЯЖЕНИЕ, ДЕЙСТВИТЕЛЬНОЕ ДО ДАТЫ (или ПОРУЧЕНИЕ, ДЕЙСТВИТЕЛЬНОЕ ДО ДАТЫ) – Good-Till-Date Order is an order to sell or to purchase a security which is only valid until the indicated date.

GOOD UTILITY PRACTICE = ПРАКТИКА ХОРОШЕГО ПРЕДПРИЯТИЯ – Good Utility Practice is any of the practices, methods, and acts engaged in or approved by a significant portion of the electric utility industry during the relevant time period, or any of the practices, methods, and acts which, in the exercise of reasonable judgment in light of the facts known at the time the decision was made, could have been expected to accomplish the desired result of the lowest reasonable cost consistent with good business practices, reliability, safety and expedition. Good Utility Practice is not intended to be limited to the optimum practice, method, or act to the exclusion of all others, but rather to be acceptable practices, methods, or acts generally accepted in the region and consistently adhered to by the Transmission Provider.

GOODWILL = ДЕЛОВАЯ РЕПУТАЦИЯ (или БЛАГОНАДЁЖНОСТЬ, или ГУДВИЛ) – (1) In Canada, Goodwill:- this is a balance sheet item found under assets. It is the 'intangible' value of an asset (for example, a business that is acquired, intellectual property, etc). For example, a patent may be acquired for CAD1 million but has no intrinsic hard value. In this case, it may show up as goodwill

on the balance sheet. A prudent company will avoid showing too much goodwill by writing down the value of such items. Investors take note – goodwill may make a balance sheet look much rosier than it really is. Goodwill is a value of a business over and above the book value of its identifiable or physical assets. Or it is the amount paid on acquisition of a business over its current stock market valuation. The future benefits from unidentifiable assets which are carried as intangible assets of an entity. Goodwill reflect the entity's ability to earn more than a normal rate of return on its physical assets. Goodwill can arise from a number of causes. It is usually recognised in the accounts only when it is acquired through specific purchase. In this situation, it is calculated as the excess of cost of the acquired entity over the current or fair market value of the net tangible assets acquired. Value in excess of the tangible assets of a business entity, arising from the entity's reputation, its good relations with customers and suppliers, its location, etc. In the United States, goodwill is not listed as an asset on the balance sheet unless a specific sum is actually paid for it. When a business depreciates the value of its fixed assets, it enters a corresponding accounting entry as a depreciation expense on the income statement. Purchased technology and goodwill represents the value of other firms and technology acquired by company. When a firm acquires the assets of another firm, it may pay more than the stated book value of its assets. Accountants use goodwill to account for this excess of the acquisition price over the book value. Goodwill may relate to acquired assets that have real value to firms, such as brand names, customer lists, experience, and relationships, but that cannot be directly valued. Goodwill also can reflect the difference between a firm's book value and its market value at the time of acquisition. Goodwill is a premium paid in the acquisition of an entity over the fair value of its identifiable tangible and intangible assets less liabilities assumed. Goodwill will only occur in exceptional circumstances when the company has bought another company at above its asset value. Goodwill represents the difference between the price paid for the company and the assets bought. It is normally written off as soon as possible. The difference between the value of a business as a whole and the value of its separate net assets. Goodwill:- the established good relationship between two or more parties, generally that of a business enterprise and its customers. The dollar value of this relationship, established prior to a sale, is added to what the property would otherwise be worth. Goodwill is an asset representing the future economic benefits arising from the other assets acquired in a business combination that are not individually identified and separately recognized. / Под Репутацией, от Французского слова Réputation, понимается создавшееся общее мнение о качествах, достоинствах и недостатках кого-либо, чего-либо.

(2) Goodwill can refer, e.g., to the literal good will of the established customers of a retail business (shop or restaurant) whose benevolent habit (or custom) of using it cannot be shown in the accounts.

GOODWILL IMPAIRMENT = ОБЕСЦЕНЕНИЕ РЕПУТАЦИИ – Goodwill Impairment:- an asset reported mainly as goodwill on the balance sheet may be worth much less than the value reported. In this case the good will is impaired and the company will likely have to take a write-down on this asset. This often happens when intellectual property such as software is acquired and a premium price is paid for it. Subsequently, if the software is not commercialized, the goodwill associated with it must be reduced – often to zero.

GOOGLE = ГУГЛ – Google is a popular Internet search engine. To 'google' means to look up on the web using the Google (TM) search engine. / Гугл – популярный поисковый движок в Интернете. Гуглить означает искать что-то в сети, используя поисковый движок Гугл[ТЗ] (Google[TM]).

GOOSENECK = ГУСИНАЯ ШЕЙКА (или ГИБКАЯ МУФТА) – Gooseneck shaped front end of a trailer or chassis. The front rails of the chassis that raise above the plane of the chassis and engage in the tunnel of a container leading to the connection to tractor. / Под Муфтой, от Немецкого слова Muffe или Голландского слова Mouwtje, понимается устройство для соединения валов, тяг, труб, канатов, кабелей и тому подобного. Различают соединительные муфты, муфты приводов.

GOR = GAS–OIL RATIO

GORGE = ВЫРЕЗ (или СРЕЗ) – Gorge:- the break between the collar and the lapel. / Вырез воротника; срез горловины или спинки. между воротничком и лацканом или отворотом.

GORGET = ГОРЖЭ (или ЖОРЖЕТКА, или РУБАНОК–ПАЗОВИК) – Gorget:- a piece of armor protecting the throat; an ornamental collar; part of a wimple covering throat and shoulders. / .

GORR = GROSS OVERRIDING ROYALTY

GOSSAMER = ГАЗ (или ГАСЭМЁ, или ТОНКАЯ ТКАНЬ) – Gossamer:- any sheer, fine fabric may be given the name Gossamer, although the term was traditionally used to describe silk fabrics. Gossamer commonly refers to:- (1) Gossamer (spider silk), very fine spider silk used for ballooning or kiting by various species of spiders; and (2) Gossamer (fabric), very light, sheer, gauze-like fabric. / Gossamer = Тонкая Лёгкая Материя или Лёгкая Шёлковая Шляпа или Очень Лёгкий Плащ. Газ – ткань из шёлка или тонко скрученного хлопка (толщина нити не ниже 120-го номера пряжи). Особенность газового переплетения заключается в том, что при пересечении нитей утка и основы они не уплотняются специальными приспособлениями и между ними остаётся некоторое пространство. В классическом газовом переплетении две нити основы переплетаются с одной нитью утка. Ткани такой выработки получались особенно лёгкими, полупрозрачными. Газ вырабатывался узорным, гладким и даже не только полотняного, но и диагонального переплетения, при котором точки соприкосновения нитей утка и основы давали ощущение косых полос на поверхности тканей. Выделение сортов газовых тканей связано с особенностями обработки исходного сырья. Газ-марабу ткали из шёлка-сырца, но нити предварительно скручивались. Поэтому марабу – газовая ткань золотистого цвета и более жёсткая, чем другие газовые ткани. Газ-рис, напротив, ткался из сырцовых же, но не скрученных нитей, поэтому отличался особой мягкостью. Газ-иллюзион ткался из настолько тонкой пряжи, что был практически прозрачен. После появления особой вращающейся машины для производства кружевного и тюлевого полотна механизировался и процесс ткачества газовых тканей. Это значительно увеличило количество тканей и разнообразило их сорта. В периодических изданиях середины XIX века стали упоминать газ-кристалл. Для его производства использовались разноцветные нити утка и основы – такая ткань отличалась радужным блеском, переливчатостью драгоценного камня. Появление газа-кристалла четко датируется 1852 годом.

GOSSYPIUM = ГОССИПИУМ (или ХЛОПЧАТНИК) – Gossypium is the generic scientific botanical term for Cotton. There are four types:- Arboreum, Barbadense, Herbaceum, and Hirsutum. / Под Госсипиумом понимается обобщённый научный ботанический термин на Латинском языке для обозначения Рода (Genus) Растения Хлопчатник. Существуют четыре Вида (Species или Spp.) этого Рода:- (i) Госсипиум Арборэум (Gossypium Arboreum) или Древовидный; (ii) Госсипиум Барбадэнсэ (Gossypium Barbadense) или Хлопчатник Барбадосский; (iii) Госсипиум Хэрбасэум (Gossypium Herbaceum) или Хлопчатник Травянистый или Хлопчатник Настоящий; и (iv) Госсипиум Хирсутум (Gossypium Hirsutum) или Хлопчатник Обыкновенный.

GOSSYPIUM ARBOREUM = ГОССИПИУМ АРБОРЭУМ (или ХЛОПЧАТНИК ДРЕВОВИДНЫЙ) – Gossypium Arboreum is the perrenial tree found in Arabia, China, Egypt, and India which attains a height of 15 to 20 feet, and products good cotton. A third botanical group. Indian and Eastern Asian short staple coarse cotton varies in length from 1/2 to 1 inch, and usually of high micronaire.

/ Третья ботаническая группа Хлопчатника, к которой относятся некоторые Виды Индийского и Восточно-Азиатского Хлопчатника, из которых получается хлопковое волокно с короткой штапельной длиной, варьирующейся от половины до одного дюйма, и имеющее обычно высокие показатели майкронэйр. Госсипиум Арборэум (Gossypium Arboreum) или Хлопчатник Древовидный или, как называют его некоторые, Хлопчатник Индокитайский – Многолетнее Дерево, встречающееся в Аравийском регионе, Египте, Индии, Китае, и достигающее от 457.2 до 609.6 сантиметров (от 15 до 20 футов) в высоту. Волокно у данного Вида Хлопчатника – короткое, штапельная длина от 12.70 до 25.40 миллиметров (от 1/2 до 1 дюйма), с высоким показателем майкронэйр (micronaire).

GOSSYPIUM BARBADENSE = ГОССИПИУМ БАРБАДЭНСЭ (или ХЛОПЧАТНИК БАРБАДОССКИЙ, или ХЛОПЧАТНИК ПЕРУАНСКИЙ, или ХЛОПЧАТНИК ЕГИПЕТСКИЙ) – Gossypium Barbadense:- native to the West Indies, the original home of the famed Sea Island cotton in the United States before the Civil War, this fiber of romance is no longer produced in this country, but is still raised in the Barbados and Central America. The plant is from 6 to 15 feet in height. A second botanical group. Pima or extra long staple cotton varies in length from 1-1/4 to 1-9/16 inches. Major producing countries are Egypt, the United States of America, Israel, Peru and the some Central Asian states of the former Soviet Union (like Tajikistan, Turkmenistan and Uzbekistan). / Госсипиум Барбадэнсэ (Gossypium Barbadense) или Хлопчатник Барбадосский или, как называют его некоторые, Хлопчатник Египетский или Хлопчатник Перуанский – Растение, родиной которого считаются острова Вэст Индии (West Indies). Чуть позже он оказался на островах Соединённых Штатов Америки, за что получил среди международных торговцев хлопком название Островной или Приморский Хлопок (Sea Island Cotton). Это было перед Гражданской Войной (1861–65) в Соединённых Штатах Америки (США) между так называемыми Севером и Югом. Именно этот Сорт Хлопчатника со временем перестали возделывать в США, но он до сих пор возделывается в Барбадосе и странах Центральной Америки. В США сейчас возделывается одна из его Разновидностей, известная под названием Пима (Pima). Кроме того, он возделывается сейчас в Египте под названием Гиза (Giza), Израиле, Перу и некоторых странах Средней Азии (в Таджикистане, Туркменистане и Узбекистане). Растение достигает высоту от 182.9 до 457.2 сантиметров (от 6 до 15 футов). Волокно у данного Вида Хлопчатника – сверхдлинное, штапельная длина от 31.75 до 39.69 миллиметров (от 1-1/4 до 1-9/16 дюйма).

GOSSYPIUM HERBACEUM = ГОССИПИУМ ХЭРБАСЭУМ (или ХЛОПЧАТНИК ТРАВЯНИСТЫЙ, или ХЛОПЧАТНИК НАСТОЯЩИЙ) – Gossypium Herbaceum is a 4- to 6-foot plant native to China, Egypt, India, and Asia Minor. The famed Egyptian cotton belongs in this grouping. A third botanical group. Indian and Eastern Asian short staple coarse cotton varies in length from 1/2 to 1 inch, and usually of high micronaire. The Cotton plant species Gossypium Herbaceum, commonly known as Levant or Arabian Cotton, is native to southern Africa and the Arabian Peninsula. Since it is considered an ancestor of the more modern varieties, Levant cotton has a long history of cultivation. The evergreen shrub, which was brought over to North America along African trade routes during colonial times, quickly found popularity among the southern regions of the United States. In fact, it is thought to have been one of the first cotton varieties grown in the state of Virginia. The plant was mainly grown for its fibers, which were used to make clothing and similar products. However, Gossypium Herbaceum has been widely used in the production of food and medicine as well. Cotton is not only a valuable source of vitamins but an excellent pain reliever. Gossypin, an active compound found in the cotton plant, has both analgesic and anti-inflammatory benefits. Cottonseeds were once commonly eaten, especially in Egyptian cuisine. The leaves, which are a good source of vitamin E, were cooked and eaten as well. Gossypium Herbaceum seed extract was often used in cooking as a substitute for sesame oil. Cottonseed oil is still used today in cooking oil, salad oil, and shortening. In addition, cottonseed oil can be found in many soap products, as it helps with producing thicker, longer-lasting soap suds. The root bark and cottonseeds of Gossypium Herbaceum were popular for herbal remedies too. Cotton root bark was taken as liquid extract, tea, or a tincture. The remedy was commonly prescribed to help stimulate irregular menstrual cycles, ease childbirth by strengthening contractions, and induce miscarriages when necessary. It was also used to treat symptoms of menopause, such as hot flashes. Additionally, the plant was thought to aid with sexual function by stimulating the reproductive organs. People from India also used the root bark to treat urinary disorders. A decoction made from the leaves of the plant could be used for treating headaches and fever as well. In addition, the seed oil and leaves were helpful when applied to snake bites; stings; and skin conditions, like poison ivy and warts. As with most herbal remedies, Gossypium Herbaceum should not be taken without consulting a qualified health practitioner, especially when pregnant. Although the plant is generally considered safe, both the root bark and seed oil have been known to cause sterility in men. / в этой совокупности. Госсипиум Хэрбасэум (Gossypium Herbaceum) или Хлопчатник Травянистый или Хлопчатник Настоящий или, как называют его некоторые, Хлопчатник Африкано-Азиатский или Хлопчатник Левантийский (Levant Cotton) или Хлопчатник Аравийский (Arabian Cotton) – Растение, произрастающее в Египте, Индии, Китае и в странах Малой Азии (Asia Minor), и достигающее от 121.9 до 182.9 сантиметров (от 4 до 6 футов) в высоту. Известный всем ранее Египетский Хлопчатник также принадлежит к этому виду. Волокно у данного Вида Хлопчатника грубоватое и короткое, штапельная длина от 12.70 до 25.40 миллиметров (от 1/2 до 1 дюйма), и, как правило, с высоким показателем майкронэйр (micronaire).

GOSSYPIUM HIRSUTUM = ГОССИПИУМ ХИРСУТУМ (или ХЛОПЧАТНИК МОХНАТЫЙ, или ХЛОПЧАТНИК ОБЫКНОВЕННЫЙ) – Gossypium Hirsutum:- this 6-foot plant is found in the southern and southwestern parts of the United States and is the basis for American cottons today. A first botanical group. Typically known as Upland Cotton of medium staple length from about 7/8 to 1-5/16 inches. It is the major species of cotton grown worldwide, accounting for about 90 percent of planted acreage. / Это 6-футовое растение встречается в Южной и Юго-Западной частях Соединённых Штатов Америки и служит в настоящее время основой всего Американского хлопкоробства. Виды (Species). Госсипиум Хирсутум (Gossypium Hirsutum) или Хлопчатник Мохнатый или Хлопчатник Обыкновенный или так называемый Нагорный Хлопчатник (Upland Cotton) или, как называют его некоторые, Хлопчатник Мексиканский – ныне широко (до 90% от общего количества всех Видов Хлопчатника) распространённое Растение, произрастающее в странах Северной, Центральной и Южной Америк, Африки, в Южных странах Европы, в странах Ближнего Востока, Средней Азии, в Австралии, Индии, Китае, Пакистане и в ряде других стран Юго-Восточной Азии, достигающее 182.9 сантиметров (6 футов) в высоту. Волокно у данного Вида Хлопчатника имеет среднюю штапельную длину от 22.23 до 33.34 миллиметров (от 7/8 до 1-5/16 дюйма).

GOSSYPOL = ГОССИПОЛ – Gossypol:- the seed embryo contains innumerable glands filled with a yellow pigment called Gossypol. McDonald et al. (553) state that cotton seeds may contain from 0.3–20 g/kg DM (short for Dry Matter) of gossypol, and concentrations of 4–17 g/kg DM have been quoted for the kernels. Gossypol is a polyphenolic aldehyde which is an antioxidant and polymerisation inhibitor and is toxic to monogastric animals:- pigs and rabbits are the most sensitive, whereas poultry are more tolerant. The general symptoms of gossypol toxicity are constipation, depressed appetite and loss of weight; death usually results from circulatory failure. Although acute toxicity is low, ingestion of a small amounts over a prolonged period can be lethal. It is important to distinguish between free (soluble in 70–30 v/v aqueous acetone) and bound gossypol since only the former is considered to be physiologically active. The free gossypol content of cottonseed meal decreases during processing and varies according to the methods used. In new seed, free gossypol accounts for 0.4–1.4% of the weight of the kernel. Screw pressed materials have 200–500 mg free gossypol/kg, pre-pressed solvent extracted meals 200–700 and solvent extracted 1 000–5 000 mg/kg. Processing conditions have to be carefully controlled to

prevent loss of protein quality owing to binding of gossypol to lysine at high temperatures. Fortunately the shearing effect of the screw press in the expeller process is an efficient gossypol inactivator at temperatures which do not reduce protein quality. It is generally considered that pig and poultry diets should not contain more than 100 mg free gossypol/kg and that inclusions of cottonseed meal should be between 50–100 kg/t of feed. Particular care is required with laying hens since comparatively low levels of the meal may cause an olive green discoloration of the yolk in storage. An associated pink discoloration of the albumen is now considered to be due to cyclopropenoids and not gossypol as was once thought. Treatment with ferrous sulphate can ameliorate the biological effects of gossypol; the amount of iron to be added is largely empirical. To reduce the effects of gossypol on growth, the following proportions of iron to free gossypol have been used:- for cattle 1:1, for broilers 2:1, for layers 4:1 and for pigs 1:1. A substance poisonous to some Animals and Insects, produced in small glands by most Cotton Varieties. / МэкДанэлд (McDonald et al. (553)). Фенольное (Phenolic). СС (сухой субстанции; DM (Dry Matter)). лизин (lysine). Субстанция, ядовитая для некоторых животных и насекомых, производимая маленькими железами у большинства селекционных типов Хлопчатника. изменение цвета . Под Госсиполом погимается гликозиподобное соединение, содержащееся в семенах Хлопчатника (0.02–1.6%). Клеточный, сосудистый и нервно-паралитический яд кумулятивного действия. Отравления животных госсиполом чаще возникает при кормлении их жмыхом и шротом из Хлопчатника. Возможно отравление госсиполом подсосного молодняка через молоко. У животных наблюдают угнетение, сонливость, расстройства функций органов пищеварения, мочевыделения и дыхания (отёк лёгких), венозный застой. При отравлении госсиполом промывают желудок, внутрь дают слабительные, адсорбирующие вещества. Для профилактики отравления госсиполом хлопчатниковые жмыхи, шроты и комбикорма скармливают строго по нормам, с перерывами, исключают из рациона молодняка, кормящих и беременных животных. Госсипол, содержащийся в хлопчатниковых кормах, инактивируется пропариванием, добавлением сульфата железа, сульфата цинка, мела. Максимально допустимый уровень (МДУ) госсипола в кормах 0.02%. Госсипол – природный полифенол, жёлтый пигмент, получаемый из Хлопчатника, ингибитор ряда ферментов-дегидрогеназ. Подавляет сперматогенез и испытывался в Китае в качестве орального контрацептива для мужчин. Формула:- $C_{30}H_{28}O_9$ или $C_{30}H_{30}O_9$. Температура кипения:- 707 °C. Молярная масса:- 518.563 г/моль. Госсипол, находящийся преимущественно в семенах (больше зрелых) растения; в меньших количествах госсипол содержится и в других частях Хлопчатника. Госсипол откладывается в особых железах. Количество госсипола в семенах Хлопчатника (а отсюда и в получаемых из них жмыхах) зависит от сорта, мест культивирования растения, а в одной и той же местности – от почвы, метеорологических условий и прочего. Содержание госсипола в некоторых Среднеазиатских и Закавказских сортах Хлопчатника колеблется от О.15 до 1.59%; в хлопковых жмыхах, полученных из Азербайджанских сортов Хлопчатника, – от 0.04 до 0.05%; в Среднеазиатских доходит до 0.12%. Госсипол обладает сильным местным действием; в зависимости от концентрации раствора и длительности соприкосновения с тканью он вызывает воспаление и даже некроз её. Принятый внутрь поражает слизистую оболочку пищеварительного тракта; более интенсивно (вплоть до геморрагического воспаления) это действие проявляется в тонком отделе кишечника. При всасывании вызывает возбуждение нервной системы, сменяющееся депрессией, явления сердечной недостаточности, нарушение мочеотделения (частое болезненное отделение мочи), деятельности печени, кровообращения (кровоизлияния), отёк лёгких. Считают, что изменения, наблюдаемые при отравлениях Хлопчатником, возникают как следствие гемолитического действия госсипола. Госсипол может накапливаться в организме, а затем медленно выделяться. Явления отравления поэтому возникают не сразу, а после некоторого бессимптомного периода; в некоторых случаях отравления могут проявляться после прекращения скармливания содержащего госсипол корма. В одном случае падёж свиней продолжался после полного прекращения кормления жмыхом в течение 10–15 дней. Госсипол, по-видимому, может выделяться с молоком, которое имеет токсические свойства. Токсикологическое Значение:- отравления госсиполом возникают чаще в результате неумеренного, продолжительного кормления хлопковыми жмыхами, реже после разового поедания большого количества (случайно) жмыха. Они часты в хлопководческих районах страны. В 1942 в одном из крупных хозяйств Туркменской ССР при недостатке других кормов свиньи были переведены на рацион почти из одних жмыхов. Через месяц появились признаки заболевания; в результате пало и было вынужденно прирезано около 250 свиней. Много случаев отравления наблюдалось и среди крупного рогатого скота. В одном хозяйстве Западно-Казахстанской Области заболело 115 голов крупного рогатого скота при кормлении хлопковым жмыхом; из них 16 голов было прирезано (в 1959). Количество жмыхов, способных вызывать отравление, может изменяться в зависимости от содержания госсипола в семенах, от способа обработки семян при получении из них масла, от длительности кормления ими. В двух случаях естественных отравлений крупного рогатого скота токсические количества жмыхов на голову в сутки при длительном кормлении были равны от 1.75 до 3 кг и от 3 до 5 кг. Анализ этих случаев показал, что срок наступления отравлений (от начала кормления жмыхами), токсическое количество жмыхов, интенсивность клинической картины отравлений зависели от характера сопутствующего кормления животных. В одном из случаев при кормлении животных плохим таёжным сеном и яровой (овсяной) соломой отравления начали проявляться через 16–28 дней, общее количество скормленных жмыхов до появления отравлений равнялось 45–60 кг на одно животное; из 17 заболевших животных шесть были убиты в тяжёлом состоянии; во втором случае при обильном кормлении сеном, яровой соломой, силосом, свёклой в течение шести месяцев и даче жмыхов резких симптомов отравления, кроме отдельных случаев атоний, слюнотечения и абортов, отмечено не было. Отравления протекают более умеренно при наличии в рационе свиней мучнистых кормов; в стаде свиней, получавших жмых вместе с мучнистыми кормами (в течение всей зимы), заболевания начали появляться только после того, как из рациона были исключены мучнистые корма. Для молодняка свиней (в возрасте от 2 до 6 месяцев) токсическими оказываются от 300 до 600 г жмыхов на одного поросёнка в сутки; у подсвинков (весом до 60 кг) заболевания возникали через 1 1/2–2 месяца при скармливании хлопкового жмыха в количестве 0.5 кг в сутки одному животному. Кормление жмыхом в дозе от 0.5 до 1 кг на животное через 3 месяца вызвало тяжёлую интоксикацию с большим процентом отхода значительной части стада (4–10-месячных поросят). Дача овце около 800 г жмыха (ежедневно) приводит к появлению интоксикации через 2–2 1/2 месяца. В практическом отношении важно отметить, что новорождённые телята часто заболевают после кормления молоком матерей, получавших продолжительное время до отёла хлопковый жмых. После 3–4 кормлений у телят появляется профузный понос; при явлениях прогрессирующей общей слабости, нарастающей сердечной недостаточности и исхудания телята погибают на 2–3-й день болезни. При вскрытии отмечают изменения, обнаруживаемые при госсипольных отравлениях у взрослых животных. Токсичность молока подтверждена экспериментально. Клиническая Картина:- отравления хлопковыми жмыхами протекают при нарастающих нервных явлениях и сильном поражении желудочно-кишечного тракта, почек, лёгких. Отмечаются отказ от корма, отсутствие жвачки, ослабление перистальтики рубца (у крупного рогатого скота) и кишечника, болезненность при пальпации брюшной стенки, запор, выделение плотного, тёмно окрашенного кала, покрытого плёнками слизи, часто с примесью крови; гастроинтестинальные явления часто носят геморрагический характер с явлениями кровавых поносов. Иногда обращают на себя внимание симптомы поражения почек и мочевого пузыря:- частое болезненное выделение мочи, красное окрашивание её (гемоглобинурия), непроизвольное выделение, наличие в ней большого количества белка, пигментов крови. Поражение лёгких выступает в более поздних стадиях болезни и протекает при симптомах отёка (учащение и усиление дыхания, брюшной тип дыхания, пенистое истечение из носа, иногда с примесью крови, притупление и хрипы в лёгких). Как общие явления вначале возникают возбуждение и беспокойство, позже – прогрессирующая депрессия и сильная

мышечная слабость. Животные лежат, вытянув шею или запрокинув её на бок при полной невозможности подняться. При тяжёлых формах болезни можно наблюдать судороги, фибриллярные подергивания мышц. Иногда поражается (изъязвляется) роговица, что ведёт к слепоте; появляются желтуха, отёки на шее и груди. Возможны аборты. Течение отравлений часто очень острое, с летальным исходом уже в первый день. Обычно болезнь при тяжёлых отравлениях Хлопчатником длится 2–3 дня и больше. Смерть наступает при явлениях асфиксии. У свиней остропротекающие отравления характеризуются тяжёлыми нарушениями дыхания с явлениями отёка лёгких (учащение дыхания, прогрессивно развивающаяся одышка, выделение пенистой жидкости из носа и рта, синюшность слизистых оболочек, беспокойство, стремление найти позу, облегчающую дыхание:- свиньи дышат, широко раскрыв рот, стоят, широко расставив ноги, принимают позу сидящей собаки, подняв голову вверх). Нарушается сердечная деятельность; после периода возбуждения наступают постепенное ослабление её и аритмия. Возбудимость больных повышена. Физическое напряжение ухудшает состояние животных. Смерть может наступить быстро при явлениях асфиксии. При более длительном течении отравления отмечают отсутствие аппетита, состояние тошноты, рвоту, угнетение, поносы – иногда с кровью, последующее развитие запоров, тимпаниты, возможны аборты и гибель молодняка. Выздоравливают больные животные медленно. При длительном скармливании небольших количеств жмыха возможно развитие хронических отравлений, выражающихся в продолжительных поносах, заболеваниях дыхательных путей, прогрессирующей слабости и исхудании. Патологоанатомические Изменения:- при вскрытии животных, павших от остро протекавших отравлений госсиполом, находят серозные инфильтраты подкожной клетчатки в области подчелюстного пространства, шеи и подгрудка; выпоты (иногда кровянистые) в полостях тела; резкие изменения по ходу пищеварительного тракта:- гиперемию и отёчность слизистой оболочки рубца, книжки и сычуга, наличие в них сухих слежавшихся кормовых масс, признаки катарального, иногда катарально-геморрагического воспаления тонкого и толстого отделов кишечника, наличие в них окрашенного (красновато-шоколадного) содержимого; увеличение печени, застойные явления и мускатный рисунок на поверхности её разреза, переполнение желчью желчного пузыря и отёчность его стенки; множественные кровоизлияния под капсулой почек, изменения паренхимы почек, гиперемию и опухание слизистой оболочки мочевого пузыря, наличие в нём красно-окрашенной мочи; серозно-геморрагический отёк лёгких; кровоизлияния на эпи- и эндокарде; дегенеративные изменения мышцы сердца; увеличение и гиперемию лимфатических узлов; ярко-красное, карминное окрашивание поверхности разреза скелетной мышцы и печени после некоторого нахождения их на воздухе. В качестве непостоянных изменений отмечают выпячивание глазных яблок, покраснение и набухание с наличием кровоизлияний и эрозий слизистой оболочки прямой кишки. Патологоанатомические изменения при хронических отравлениях характеризуются общим исхуданием, признаками хронического гастроэнтерита и нефрита и общими гидремическими явлениями – скоплением серозных выпотов в грудной и брюшной полостях. У буйволят обнаруживают закупорку уретры жироподобной массой и переполнение мочой почечной лоханки, мочеточников и мочевого пузыря. Диагноз:- для диагноза основное значение могут иметь анамнестические данные о кормлении заболевших (павших) животных хлопковыми жмыхами. Определение госсипола в корме основано на его свойстве давать красное окрашивание с концентрированной серной кислотой, которое позволяет подсчитать количество желёзок госсипола в навеске жмыха. Техника определения сводится к следующему:- среднюю навеску тонко измельчённого жмыха (20 мг) распределяют на 8–10 предметных стеклах; перед микроскопированием препарат смешивают с кислотой (две-три капли), покрывают покровным стеклом. Подсчитывают количество окрашенных точек (желёзок) в каждом препарате (стекле); цифры суммируют, делением определяют среднее количество желёзок в 1 мг; частное умножают на установленный опытным путём коэффициент 0.085. Произведение будет соответствовать процентному содержанию госсипола в жмыхе. Считают, что наличие железа (гемосидерина) в осадке мочи, обнаруживаемое по синему окрашиванию (образование берлинской лазури) при добавлении к осадку солянокислого раствора жёлтой кровяной соли, может являться дополнительным диагностическим приёмом при отравлении животных госсиполом. Солянокислый раствор жёлтой кровяной соли готовится смешиванием 2%-ного раствора железосинеродистого калия (1 часть) с 1%-ным раствором соляной кислоты (1.5 части). Реакция образования Берлинской лазури (синее окрашивание) может быть также использована в качестве метода посмертного диагноза при отравлении госсиполом. В этом случае реактив наносится на вырезанные кусочки печени или коркового слоя почек, наиболее богатых гемосидерином при данном отравлении. Терапия:- лечение, по-видимому, может быть только симптоматическим, так как отравления обычно возникают спустя некоторое время после кормления жмыхом. Необходимо дать слабительное, лучше касторовое масло, а затем средства, защищающие слизистую оболочку:- слизистые, вяжущие; при общем сильном угнетении и слабости сердца – возбуждающие и сердечные средства; при явлениях отёка лёгких применяются кровопускания; при атонии рубца – массаж 2–3 раза в день. Совершенно необходимо устранить жмыхи из рациона при первом же заболевании животных; в кормовой рацион больных ввести мягкое сено, болтушки из отрубей и муки, отвар из ячменя, корнеплоды, лучше морковь. Из мер обезвреживания хлопкового жмыха, доступных в условиях хозяйства, рекомендуют прогревание корма до 80–85 °С в течение 6–8 часов (прогревание в течение 2 часов при температуре 75 °С оказывается малоэффективным); выдерживание корма в течение суток в растворах щёлочей (2%-ная взвесь гашеной извести) с последующим промыванием водой, заквашивание (силосование). В качестве эффективного способа обезвреживания хлопкового жмыха указывают одночасовое кипячение его в воде с добавлением 10% (к весу жмыха) ячменной муки; в этом случае госсипол входит в соединение с содержащимися в муке натуральными белками и инактивируется. Хороший результат обезвреживания был получен также при кипячении жмыхов с пшеничными отрубями. Полноценное кормление является одной из общих мер предупреждения заболеваний при кормлении животных хлопковым жмыхом. Недостаток в последних витаминов и солей необходимо компенсировать витаминной (зелёный корм, хорошее сено) и минеральной подкормкой. Токсическое действие хлопковых жмыхов снижается, если их скармливают не в чистом виде, а в смеси с другими кормами. Ввиду опасности кормления животных хлопковым жмыхом не рекомендуют давать его молодняку и животным в последний период беременности. Во избежание накопления в организме токсических количеств яда рекомендуют кормить жмыхом с интервалами через каждые 15–20 дней. При введении в кормовой рацион хлопкового жмыха необходимо выполнение существующих официальных указаний. Госсипол является естественным фенолом, полученным из Растения Хлопчатника (Род Gossypium). Госсипол является фенольным альдегидом, который действует как ингибитор для нескольких ферментов дегидрогеназы. Это жёлтый пигмент. История Исследования:- в 1929 исследования в Китайской Провинции Цзянси показали зависимость между низким уровнем рождаемости у мужчин и использованием сырого хлопкового масла для приготовления пищи. Соединение вызывающее контрацептивный эффект было определено как госсипол. В 1970 Китайское правительство начало исследовать использование госсипола в качестве противозачаточного средства. Их исследования задействовали более 10 000 испытуемых, и продолжались более десяти лет. Они пришли к выводу, что госсипол в виде таблеток даёт эффект надёжной контрацепции, и не нарушает баланс мужских гормонов. Госсипол также имел серьезные недостатки. Исследования обнаружили аномально высокие темпы развития гипокалиемии среди испытуемых. (Гипокалиемия – низкий уровень калия в крови – вызывает симптомы усталости, мышечной слабости, в тяжёлых случаях – паралич.) Кроме того, около 7% испытуемых сообщили о влиянии на их пищеварительную систему, и около 12% на повышенную утомляемость. Большинство испытуемых восстановились после прекращения приёма госсипола и принятия калия. Более позднее исследование показало, что приём препаратов калия совместно с госсиполом не помешал развитию гипокалиемии у

приматов. В 1986 Китайские исследования были прекращены по причине побочных эффектов. В середине 1990-х, Бразильская фармацевтическая компания Хеврон объявила о планах выпустить на рынок препарат с низкими дозами госсипола под названием Nofertil. Его выпуск было отложен на неопределённый срок в связи с недопустимо высоким уровнем постоянных бесплодий. Около 25% мужчин страдали азооспермией по прошествии года после прекращения лечения. Исследователи предположили, что госсипол мог бы стать хорошей неинвазивной альтернативой хирургической вазэктомии. В 1998 исследовательская группа Всемирной Организации Здравоохранения (ВОЗ) по методам регулирования мужской фертильности рекомендовала отказаться от исследований госсипола. В дополнение к другим побочным эффектам, исследователи ВОЗ были обеспокоены токсическим действием на приматов при дозе в 10 раз меньшей, чем применяемая ранее при контрацепции. Этим докладом фактически закончились дальнейшие исследования госсипола в качестве временной контрацепции. Исследования использовании в качестве альтернативы вазэктомии продолжается в Австрии, Бразилии, Чили, Китае, Доминиканской Республике и Нигерии.

GOUT = ЗАТКАННЫЙ ПУХ – Gout:- hardened fluff, as well as foreign matter such as piece of leather accessories or wood chips, woven into the texture of the fabric. Gouts:- about the same as neps, except that they are larger and give more trouble to burlers and inspectors, they include foreign matter, wastes or matted fibers found in woven goods. Gout is a foreign matter that is accidentally woven into a fabric. It is usually fly or waste that drops into the loom during weaving or that catches in yarns during spinning. Gout is a foreign matter accidently woven into the fabric. Causes:- (i) improper loom cleaning; and (ii) unclean environment. Mending:- the extra foreign matter can be pulled out with a plucker. Combing in both direction rectifies the resultant patch. Gout is a lumpy, asymmetrical yarn of a fabric. Gouts:- similar in appearance to 'neps', but generally confined to somewhat larger bunches of foreign matter or of waste woven into the fabric. Gout is a foreign matter trapped in a fabric by accident, usually lint or waste. See also Slug. Gout:- it is the foreign matter usually lint or accidentally waste into the fabric. Hardened fluff as well as foreign matter such as pieces of feather accessories or wood chips, woven into the texture of the fabric is known as Gout. Gout is a foreign matter usually lint or waste accidentally woven into the fabric. Weaving Defect. Defect Name:- Gouts. Defect Type:- weft lines, horizontal lines. Fabric Type:- Shirting and Dress Goods – Plain Weave. Description:- Gouts:- This defect is the result of masses of accumulated short fiber (fly) being drawn undrafted into the filling yarn during the spinning process. Gouts differ from slubs in that they are characterized by a lumpy appearance while slubs generally are symmetrical. Severity:- Major. / Затканный Пух – порок ткани в виде шишки. Затканный Пух В Виде Шишки (gout):- порок пряжи в тканых полотнах в виде наличия на поверхности полотна коротких утолщений пряжи в результате скопления волокон или элементарных нитей. Примечание:- этот порок вызван скоплением отходов волокна в пряже во время прядения.

GOVERNANCE = ПРАВЛЕНИЕ – Governance:- as in board governance – refers to the practice of overseeing a company on behalf of its stakeholders. The board of directors of a company or organization is its governing body – the soul and conscience of the enterprise. Many regulators now prescribe certain governance practices to try to prevent fraudulent practices and malfeasance.

GOVERNING COUNCIL = РУКОВОДЯЩИЙ СОВЕТ – The Governing Council of the ECB is the main decision-making body of the ECB. It consists of:- (i) the six members of the Executive Board, plus (ii) the governors of the national central banks of the 17 Euro area countries. Responsibilities:- (i) to adopt the guidelines and take the decisions necessary to ensure the performance of the tasks entrusted to the Eurosystem; and (ii) to formulate monetary policy for the Euro area. This includes decisions relating to monetary objectives, key interest rates, the supply of reserves in the Eurosystem, and the establishment of guidelines for the implementation of those decisions. Meetings and decisions:- the Governing Council usually meets twice a month at the Eurotower in Frankfurt am Main, Germany. At its first meeting each month, the Governing Council assesses economic and monetary developments and takes its monthly monetary policy decision. At its second meeting, the Council discusses mainly issues related to other tasks and responsibilities of the ECB and the Eurosystem. While the minutes of the meetings are not published, the monetary policy decision is explained in detail at a press conference held shortly after the first meeting each month. The President, assisted by the Vice-President, chairs the press conference. See also General Council. Governing Council is the supreme decision-making body of the European Central Bank (ECB). It comprises the six members of the ECB's Executive Board and the governors of the national central banks of the EU Member States which have adopted the Euro. The Governing Council of the European Central Bank (ECB) takes its monetary policy decision for the Euro area. Shortly after the meeting, the President of the ECB explains the decision in an introductory statement. This is followed by a question-and-answer session with media representatives. A few hours later the transcript of the press conference is published on the ECB website. Governing Council is the supreme decision-making body of the ECB. It comprises all the members of the Executive Board of the ECB and the governors of the NCBs of the countries that have adopted the Euro. / Руководящий Совет является высшим органом Европейского Центрального Банка (ЕЦБ), принимающим решения. Он состоит из шести членов Исполнительного Совета (Executive Board) ЕЦБ и управляющих национальных центральных банков государств членов ЕС, которые адоптировали в своей стране использование Евро в качестве национальной валюты. Смотрите также Генеральный Совет (General Council).

GOVERNING LAW = РЕГУЛИРУЮЩЕЕ ЗАКОНОДАТЕЛЬСТВО – Governing Law:- the jurisdiction whose law will be applied in the event of a dispute relating to an agreement. / Регулирующее Законодательство:- юрисдикция, чьё законодательство будет применяться в случае возникновения спора, связанного с соглашением.

GOVERNMENTAL ADVISORY COMMITTEE = ПРАВИТЕЛЬСТВЕННЫЙ СОВЕЩАТЕЛЬНЫЙ КОМИТЕТ – The Governmental Advisory Committee (GAC) is an advisory committee comprising appointed representatives of national governments, multi-national governmental organizations and treaty organizations, and distinct economies. Its function is to advise the Internet Corporation for Assigned Names and Numbers (ICANN) Board on matters of concern to governments. The GAC will operate as a forum for the discussion of government interests and concerns, including consumer interests. As an advisory committee, the GAC has no legal authority to act for ICANN, but will report its findings and recommendations to the ICANN Board. The Chairman of the GAC is Heather Dryden of Canada. / Правительственный Совещательный Комитет (ПСК) – совещательный комитет, состоящий из назначенных представителей национальных правительств, многонациональных правительственных организаций, межправительственных организаций и обособленных экономических регионов. Его функция заключается в консультировании Правления Корпорации Интернета по Распределению Имён и Номеров (КИРИН) по вопросам, относящимся к деятельности правительств. ПКК будет работать в качестве форума для обсуждения правительственных интересов и проблем, включая интересы потребителей. Как и любой другой консультативный комитет, ПКК не уполномочен действовать от лица КИРИН, но сможет докладывать о своих результатах и давать рекомендации Правлению КИРИН. Председатель ПКК – Хитер Драйден (Heather Dryden) из Канады.

GOVERNMENT APPROVAL = ОДОБРЕНИЕ (или САНКЦИОНИРОВАНИЕ) ПРАВИТЕЛЬСТВОМ (или ОДОБРЕНИЕ СО СТОРОНЫ ГОСУДАРСТВА, или ПРАВИТЕЛЬСТВЕННЫЙ ДОПУСК) – Government Approval:- mandatory procedure to secure government authorization to do something. The procedure applies to several areas where certain conditions must be met before an action may be performed. For example, by securing government approval, the potential purchaser of a parcel of land can be assured of

its ability to secure a permit to erect its proposed building on the site. The concept of approval implies that the government has discretionary power to authorize the action or transaction contemplated by the approval-seeker.

GOVERNMENT BILL OF LADING = ПРАВИТЕЛЬСТВЕННЫЙ КОНОСАМЕНТ – A Government Bill Of Lading (GBL) is a bill of lading issued by the US Government. See also Military Bill Of Lading. / Правительственный Коносамент (ПК; Government Bill of Lading (GBL)) это коносамент, выдаваемый Правительством США. (Military Bill Of Lading).

GOVERNMENT BOND = ГОСУДАРСТВЕННАЯ ОБЛИГАЦИЯ (или ПРАВИТЕЛЬСТВЕННАЯ ОБЛИГАЦИЯ) – Government Bond is a debt security issued by the government. Interest is usually paid twice yearly at a fixed rate for the life of the bond, usually 10 years. A bond issued by the US Federal Government. / Государственная Облигация представляет собой долговую ценную бумагу, выпущенную правительством страны, как правило казначейством. Процент по такой бумаге выплачивается обычно дважды в год, при этом используется зафиксированная ставка, а срок жизни такой облигации обычно равен 10 годам. Облигация, выпущенная Федеральным Правительством США.

GOVERNMENT CLASS = ПРАВИТЕЛЬСТВЕННЫЙ КЛАСС (или ГОСУДАРСТВЕННЫЙ КЛАСС) – In the US Cotton industry, Government Class is the classification by grade, leaf and staple as determined by the USDA Classing Office, on the basis of the official Cotton standards of the United States in effect at the time of such classification.

GOVERNMENT–CONTROLLED STOCKS = ЗАПАСЫ, КОНТРОЛИРУЕМЫЕ ГОСУДАРСТВОМ (или ЗАПАСЫ, КОНТРОЛИРУЕМЫЕ ПРАВИТЕЛЬСТВОМ) – Government-Controlled Stocks are the primary stocks, exclusively for emergency purposes, owned by governments and organizations that have been established to hold stocks (stock-holding organizations).

GOVERNMENT IMPELLED = ОТПУСКАЕМЫЙ ПО РАСПОРЯЖЕНИЮ ПРАВИТЕЛЬСТВА – Government Impelled:- a cargo owned by or subsidized by the US Federal Government.

GOVERNMENT INSTRUMENT MARKET = РЫНОК ПРАВИТЕЛЬСТВЕННЫХ ИНСТРУМЕНТОВ (или РЫНОК ГОСУДАРСТВЕННЫХ ИНСТРУМЕНТОВ) – Government Instrument Market:- all futures contracts listed by the Chicago Board of Trade in the government instrument market category. / Все фьючерсные контракты, находящиеся в котировочном списке Чикагской Палаты Торговли (Чикагского Табло Торговли, если быть более точными) в рыночной категории 'государственные инструменты' или 'правительственные инструменты'.

GOVERNMENT NATIONAL MORTGAGE ASSOCIATION = ПРАВИТЕЛЬСТВЕННАЯ НАЦИОНАЛЬНАЯ АССОЦИАЦИЯ ПО ЗАКЛАДНЫМ – Government National Mortgage Association (GNMA or Ginnie Mae®):- in 1934, during the depths of the Depression, the US Congress passed the National Housing Act to strengthen a deeply troubled housing market. An important element of this legislation was to make mortgage funds available to more Americans by protecting lenders from the risk of default. In 1938, the US Congress amended the act to create the Federal National Mortgage Association – an entity designed to help mortgage lenders gain access to capital for mortgage loans. The provisions of the act changed gradually over the years until, in 1968, Congress established the Government National Mortgage Association (GNMA) as a government-owned corporation within the US Department of Housing and Urban Development (HUD). The GNMA guaranty allows mortgage lenders to obtain a better price for their mortgage loans in the secondary market. The lenders can then use the proceeds to make new mortgage loans available. The GNMA does not buy or sell loans or issue mortgage-backed securities (MBS). Therefore, GNMA's balance sheet doesn't use derivatives to hedge or carry long-term debt. What GNMA does is guarantee investors the timely payment of principal and interest on MBS backed by federally insured or guaranteed loans – mainly loans insured by the Federal Housing Administration (FHA) or guaranteed by the Department of Veterans Affairs (VA). Other guarantors or issuers of loans eligible as collateral for GNMA MBS include the Department of Agriculture's Rural Housing Service (RHS) and the Department of Housing and Urban Development's Office of Public and Indian Housing (PIH). The GNMA securities are the only MBS to carry the full faith and credit guaranty of the United States government, which means that even in difficult times an investment in GNMA MBS is one of the safest an investor can make. Also known as Ginnie Mae®. At Ginnie Mae®, we help make affordable housing a reality for millions of low- and moderate-income households across America by channeling global capital into the nation's housing markets. Specifically, the Ginnie Mae® guaranty allows mortgage lenders to obtain a better price for their mortgage loans in the secondary market. The lenders can then use the proceeds to make new mortgage loans available. Ginnie Mae® does not buy or sell loans or issue Mortgage-Backed Securities (MBS). Therefore, Ginnie Mae's balance sheet doesn't use derivatives to hedge or carry long term debt. What Ginnie Mae® does is guarantee investors the timely payment of principal and interest on MBS backed by federally insured or guaranteed loans – mainly loans insured by the Federal Housing Administration (FHA) or guaranteed by the Department of Veterans Affairs (VA). Other guarantors or issuers of loans eligible as collateral for Ginnie Mae® MBS include the Department of Agriculture's Rural Housing Service (RHS) and the Department of Housing and Urban Development's Office of Public and Indian Housing (PIH). Ginnie Mae® securities are the only MBS to carry the full faith and credit guaranty of the United States government, which means that even in difficult times an investment in Ginnie Mae® MBS is one of the safest an investor can make. / Известна также как Дьжи.Эн.Эм.Эй. (GNMA) или Дьжини Мэй® (Ginnie Mae®). Государственная Национальная Ипотечная Ассоциация (Government National Mortgage Association (GNMA)) – государственная корпорация, неформально называемая Дьжини Мэй® (Ginnie Mae®), которая является агентством Департамента Жилья и Городского Развития США (US Department of Housing and Urban Development). Дьжини Мэй гарантирует всеми доходами и возможными заимствованиями Правительства США полную и своевременную выплату всех ежемесячных платежей по основной сумме и процентов по обеспеченным ипотеками ценным бумагам Дьжини Мэй® (pass-through securities). Ценные бумаги, которые выпускаются частными компаниями, например, ипотечными банкирами (mortgage bankers) и сберегательными институтами, и, как правило, реализуются через брокеров-дилеров, представляют собой пулы ипотек, застрахованных или гарантированных Федеральным Управлением по Жилищным Вопросам (Federal Housing Administration (FHA)), Фермерской Жилищной Администрацией (Farmer's Home Administration (FmHA)) или Администрацией по Делам Ветеранов (Veteran's Administration (VA)). Смотрите также (Federal Home Loan Mortgage Corporation); (Federal National Mortgage Association); и Дьжини Мэй® (Ginnie Mae® Hass-Through).

GOVERNMENT NOTE = ПРАВИТЕЛЬСТВЕННЫЙ БИЛЕТ (или ГОСУДАРСТВЕННАЯ НОТА) – In Germany, these Government Notes ('Finanzierungsschätze') are issued regularly by the German federal government with terms of approximately 12 and 24 months. They are issued as discount notes, i.e. they are sold at an interest discount (original issue discount security) and repaid at face value. They are available for purchase to all market participants with the exception of banks. The investment amount is limited to €250 000.00 per person and business day. The smallest denomination is €500.00. Thy are not traded on the stock exchange and cannot be redeemed prior to maturity. / В Германии, эти Государственные Ноты или Правительственные Ноты (Финанцирунгсшатьцэ ('Finanzierungsschätze')) регулярно выпускаются Германским федеральным правительством со сроками .

GOVERNMENT–OWNED ENTERPRISES = ГОСУДАРСТВЕННЫЕ ПРЕДПРИЯТИЯ (или ПРЕДПРИЯТИЯ, ПРИНАДЛЕЖАЩИЕ ПРАВИТЕЛЬСТВУ) – Government-Owned Enterprises are the organizations operating under the supervision or authority of the

government, and which are wholly or partially owned by the government. They generally engage in the production of goods and services that are sold at a minimum price that covers at least the cost of production.

GOVERNMENT PROCUREMENT POLICIES AND PRACTICES = ПОЛИТИКА И ПРАКТИКА ГОСУДАРСТВЕННЫХ ЗАКУПОК – Government Procurement Policies And Practices is the term refers to a nontariff barrier to trade involving the discriminatory purchase by official government agencies of goods and services from domestic suppliers, despite their higher prices or inferior quality as compared with competitive goods that could be imported.

GOVERNMENT SECTOR = ГОСУДАРСТВЕННЫЙ СЕКТОР (или ПРАВИТЕЛЬСТВЕННЫЙ СЕКТОР) – In national accounting, Government Sector is one of the sector accounts showing the value added to the economy by government agencies and other publicly owned entities, consisting primarily of services performed by government employees. Also known as Public Sector. / В национальном бюджетном процессе, .

GOVERNMENT SECURITIES = ПРАВИТЕЛЬСТВЕННЫЕ ЦЕННЫЕ БУМАГИ (или ГОСУДАРСТВЕННЫЕ ЦЕННЫЕ БУМАГИ) – Government Securities are the securities issued by the Treasury or government agencies. / К Правительственным или Государственным Ценным Бумагам относятся ценные бумаги, выпущенные казначейством страны или правительственными агентствами. Правительственные Ценные Бумаги (Government Securities) – ценные бумаги, выпускаемые агентствами Правительства США, такими, как Финансовая Корпорация для Урегулирования (Resolution Funding Corporation (REFCORP)) или Федеральный Земельный Банк (Federal Land Bank). Называются также Ценными Бумагами Агентств (Agency Securities). Хотя эти ценные бумаги имеют высокий кредитный рэйтиньг, они не считаются обязательствами государства (government obligations) и, следовательно, не обеспечиваются всеми доходами и возможными заимствованиями (fullfaith and credit) правительства как Казначейки (treasuries).

GOVERNMENT SECURITIES DIVISION OF THE FIXED INCOME CLEARING CORPORATION = УПРАВЛЕНИЕ ПО ПРАВИТЕЛЬСТВЕННЫМ ЦЕННЫМ БУМАГАМ КЛИРИНГОВОЙ КОРПОРАЦИИ ФИКСИРОВАННЫХ ДОХОДОВ – The Government Securities Division (GSD) of the Fixed Income Clearing Corporation (FICC) or FICC/GSD is a systemically important system for settling transactions in US Government Treasury and Agency securities (the FICC/GSD also clears and settles transactions in certain eligible mortgage-backed securities in its General Collateral Finance Repo (GCF Repo®) service) and therefore has assessed itself against the CCP Recommendations. Overall, the FICC/GSD either fully or broadly observes each of the CCP Recommendations as more fully described herein. (Currently, FICC acts as a central counterparties (CCP) through its Government Securities Division only. FICC has submitted a rule filing to the Securities and Exchange Commission to make its Mortgage-Backed Securities Division act as a trade guarantor and CCP. Upon approval of this proposal, this self-assessment will be expanded to include the Mortgage-Backed Securities Division's self-assessment against the CCP Recommendations.) The United States Congress requires clearing agencies, such as FICC, to be registered with the US Securities and Exchange Commission (SEC) and subject to the SEC's comprehensive oversight. The standards that the FICC/GSD is required to adhere to as a registered clearing agency mirror a number of the CCP Recommendations. Specifically, FICC's corporate governance structure is designed to fulfill the public interest requirements of the Securities Exchange Act of 1934, as amended (the Exchange Act) and provides for fair representation of users. The FICC/GSD has a well-founded and transparent legal framework that is based upon the laws and regulations governing the settlement of securities transactions and the conduct of securities clearing agencies in the United States. The FICC/GSD's rules (the Rules) are clear and enable its Members to understand the financial risks associated with participation in the FICC/GSD. (The FICC/GSD's 'netting members' are the participants that use the FICC/GSD's CCP services. The FICC/GSD also offers a comparison-only service, which is a trade matching service. Participants in the comparison-only service do not participate in the netting/CCP service. For ease of description when summarizing the FICC Rules in this assessment, the term 'Member' is used throughout to refer to a netting member.) The FICC/GSD measures and manages credit and market risk exposure through its assessment of daily Clearing Fund (margin) requirements on its Members, ongoing monitoring of their financial condition and by taking other actions permitted under its rules. Finally, FICC provides its Members with safe and secure operations while maintaining cost-effectiveness. Background:- FICC is a wholly-owned subsidiary of The Depository Trust & Clearing Corporation. (FICC resulted from the merger of the Government Securities Clearing Corporation and the MBS Clearing Corporation on January 01, 2003.) FICC operates under two Divisions, the FICC/GSD and the Mortgage-Backed Securities Division. Each Division has its own rules and members. The predecessor to the FICC/GSD was established in 1986 (the FICC/GSD was previously known as the Government Securities Clearing Corporation) to provide automated comparison and settlement services, risk management benefits and operational efficiencies to the US Government securities markets. Today the FICC/GSD is the leading provider of trade comparison, netting, risk management and settlement for the US Government securities marketplace. In 2008, the FICC/GSD processed transactions in US Government securities with a value of USD1 040 000 000 000 000.00. The FICC/GSD's Members include the nation's major brokers and dealers, as well as a wide range of entities that trade US Government securities. The FICC/GSD's inter-dealer broker members play an integral role in this market. Other market participants, such as dealers, often rely on the inter-dealer brokers to trade in the US Government securities market. The inter-dealer brokers provide market participants with screens that indicate best bids and offers available from other dealers. The system is anonymous (i.e. 'blind'). The FICC/GSD accepts buy-sell transactions, repurchase and reverse repurchase agreement transactions ('repos'), and Treasury auction purchases in eligible securities. The US Government securities market is predominantly an over-the-counter market. Most transactions in the US Government securities market are settled on a T+1 basis. The FICC/GSD's comparison and netting systems form the core of all of its services. These systems are used to compare transactions in eligible Treasury bills, notes, bonds and zero-coupon securities, as well as book-entry Fedwire-eligible non-mortgage-backed Federal Agency securities (e.g., Tennessee Valley Authority). The transactions are then netted into one position per CUSIP (short for the Committee on Uniform Securities Identification Procedures), where the FICC/GSD becomes the counterparty for settlement purposes for each net settlement position. These services are discussed in more detail below. Trade Comparison/Real-Time Trade Matching (RTTM®):- the crux of the FICC/GSD's comparison system is its RTTM service. This is an interactive tool that enables members to automate the processing of their securities trades throughout the trading day. Using standardized international message formats, RTTM provides a common platform for collecting and matching trade data, enabling the parties to a securities trade to monitor and manage the status of their trades in real time. The result is an immediate confirmation for trade executions that is legal and binding. RTTM creates a more streamlined and operationally efficient processing environment. It maximizes the volume of trades that match on trade date, and it reduces the risk of mismatched securities trades by allowing trading parties to note and fix errors or potential problems in execution or processing as close as possible to trade execution. Because real-time trade information is recorded immediately, RTTM further safeguards Members in the event of an interruption of business at a member firm level or all across the industry. Netting and Settlement:- through netting, the FICC/GSD establishes a single net long or short position for each Member's daily trading activity in a given security. The Member's net position is the difference between all purchases (long) and all sales (short) in a given security. The FICC/GSD replaces each net position with a settlement obligation for the scheduled settlement date whereby the Member settles with the FICC/GSD as CCP. The FICC/GSD's netting system typically reduces the costs associated with securities transfers by reducing the

number of securities movements required to settle transactions. Because FICC is not a depository institution, it is not given direct access to Fedwire and therefore employs the services of its two clearing banks, the Bank of New York Mellon Corporation (BNY) and JPMorgan Chase Bank (JPM), for this purpose. FICC/GSD Rule 12 (Securities Settlement) provides that the FICC/GSD shall notify each Member (prior to the entity activating its membership) of the clearing bank or banks that the FICC/GSD will use to deliver eligible securities to Members and to receive eligible securities from Members, and by product, the types of securities that each such clearing bank will so deliver and receive. In turn, each Member (prior to activating its membership) must notify the FICC/GSD of the clearing bank or banks that the Member has designated to act on its behalf in the delivery of securities to the FICC/GSD and in the receipt of securities from the FICC/GSD. On each business day, the FICC/GSD makes available to each Member output (i.e. a report) that provides information (for example, type of obligation (deliver or receive), name and reference number of the clearing bank, and CUSIP number, settlement date, par value, final dollar value and other information descriptive of an eligible netting security) that the FICC/GSD deems sufficient to enable such Member to be able to settle its net settlement positions on that business day. Each Member, based on the information provided by the FICC/GSD, then provides appropriate instructions to its clearing bank to deliver to the FICC/GSD, and/or to receive from the FICC/GSD, on behalf of the Member, eligible netting securities against payment or receipt at the appropriate settlement value. Obligations may be settled within a clearing bank, i.e. on the books of a clearing bank when the deliver and attendant receive obligation are at the same clearing bank. Otherwise, obligations are settled using Fedwire. All deliveries are made against full payment. Auction Takedown Service:- the FICC/GSD's Auction Takedown service enables Members to have their Treasury auction awards netted and guaranteed with the rest of their trading activity in the secondary markets thereby reducing settlement risk and costs for participants' auction purchases. All auction awards are submitted to the FICC/GSD by the Federal Reserve Banks on a locked-in basis, meaning that the FICC/GSD automatically generates trade confirmations based on information supplied by the Federal Reserve Banks. Repurchase Agreement Services:- repos are financial instruments that enable firms to sell securities to obtain immediate funds for their own accounts, or for the benefit of their clients, and to simultaneously agree to repurchase the same (or similar) securities after a specified time at a given price, including interest calculated using a rate agreed upon at the time of execution. Repos can be executed directly between dealers, or on a blind-brokered basis through inter-dealer brokers. In dealer-to-dealer processing, dealers trade directly with one another. In blind brokering, repos are executed using inter-dealer brokers to ensure dealer anonymity. Over the past several years, the FICC/GSD has provided automated matching, netting, settlement and risk management of repo transactions. The FICC/GSD also provides a service known as the GCF Repo® service, which enables dealers to trade general collateral repos (a general collateral repo is a repo in which the underlying securities collateral is nonspecific, general collateral whose identification is at the option of the seller. This is in contrast to a specific collateral repo), based on rate, term and underlying product, throughout the day with inter-dealer broker netting members ('brokers') on a blind basis. The service helps foster a highly liquid market for short-term financing. Brokers (who are also members of the FICC/GSD) are required to enter data on GCF Repo transactions for submission to the FICC/GSD shortly after trade execution. Because the specific collateral is not known at the point of trade, brokers submit all GCF Repos to the FICC/GSD using generic general collateral CUSIPs (Standardized generic CUSIP numbers established for GCF Repo processing are used to specify the acceptable type of underlying eligible collateral. For example, there is a GCF Repo CUSIP for Treasuries with a remaining maturity of ten years or less) that denote the underlying product. GCF Repo participants can trade in generic CUSIP numbers all day and then, after the netting process at the end of the day, allocate specific securities (the generic general collateral CUSIP defines the appropriate collateral that a dealer may use to satisfy the net settlement obligation in that CUSIP) to their net settlement obligations. The FICC/GSD becomes the CCP for settlement purposes to each dealer party to a GCF Repo transaction and guarantees settlement of GCF Repos upon receipt of trade data. GCF Repo transactions are settled on a tri-party basis (a tri-party repo is one where a custodian bank acts as an intermediary between the two parties to the repo), which requires dealer Members to have an account with either one or both of the participating clearing banks, BNY and JPM. Dealer Members of the GCF Repo service are permitted to engage in GCF Repo trading on an inter-clearing bank basis, meaning that dealers using different clearing banks (i.e. one dealer clears at BNY and the other dealer clears at JPM) are able to enter into GCF Repo transactions (on a blind basis). Because the net GCF Repo settlement obligations are established after the close of the securities Fedwire, FICC and its two clearing banks have established a tri-party like settlement mechanism to permit a movement of the securities after the securities Fedwire has closed. Specifically, the two clearing banks have agreed to allow the securities to be held under a subcustodial relationship (where FICC is the subcustodian) in lieu of receiving the securities via Fedwire. (The movement of the funds to the clearing bank with the net funds borrowers does not raise the same need because the funds Fedwire stays open later.) In the morning, the GCF pledges are unwound. This means that the securities are returned to the net funds borrowers and the funds are returned to the net funds lenders. The clearing bank (assume it is BNY for illustrative purposes) that is returning the funds to the net funds lenders permits FICC to run a debit in the FICC account at BNY. The net funds borrowers pledge their net free equity (a dealer's net free equity consists of the dealer's balances at the clearing bank and it encompasses the methodology that the clearing banks use to determine whether an account holder, such as a dealer, has sufficient collateral to enter a specific transaction. The net free equity methodology allows a clearing bank to place a limit on its customers' activity by calculating a value on the customers' balances at the bank.) at JPM to FICC; FICC, in turn, pledges this interest to BNY (the clearing bank that has permitted the debit). The debit in the FICC account at the BNY gets satisfied during the end of day GCF settlement process. Specifically, that day's new activity will yield a new interbank funds amount that will move at end of day – this amount is netted with the amount that would have been due in the morning. The holds against the dealers' net free equity accounts are released when the interbank funds movement is made at end of day. Risk Management:- risk management is the foundation for the FICC/GSD's ability to guarantee settlement, as well as the means by which the FICC/GSD protects itself and its Members from the risk inherent in the settlement process. Procedures are in place to ensure that participants comply with the FICC/GSD's rules. The FICC/GSD maintains strict membership standards, including minimum financial requirements, and also collects Clearing Fund to minimize exposure to Members. The Clearing Fund consists of collateral deposits posted by Members in the form of cash and eligible securities. The FICC/GSD also collects mark-to-market payments in the form of margin as part of its funds-only settlement process. Every business day, each Member must pay (or is entitled to collect) an aggregate funds-only settlement amount across all CUSIPs. The main components of this amount include, among other payments, a mark-to-market amount for every net settlement position, a mark-to-market amount for every forward net settlement position, fail marks for obligations that were scheduled to settle and have not yet settled, coupon payments and other adjustments. The FICC/GSD's rules also contain a loss allocation procedure, which would be invoked if a defaulting Member's Clearing Fund deposit is not sufficient to cover losses incurred in the liquidation of the Member's positions. If a Member were to become insolvent, the FICC/GSD would first use that Member's Clearing Fund to cover a loss incurred on the liquidation of the Member's positions (and any funds available from any applicable collateral sharing arrangements with other clearing corporations). If such an extraordinary event occurred where those deposits were insufficient to cover the liquidation of all positions, the FICC/GSD's loss allocation procedure would be used. The procedure allocates any remaining liabilities pro rata among Members who most recently traded with the failed firm, with certain caps and limitations applied to certain trading activity. If losses still remained, the loss allocation provisions provide for loss mutualization among all Members (The FICC/GSD has submitted a rule filing to the SEC to expand its netting membership types to include buy-side entities. Certain types of these firms, such as SEC-registered investment companies, are not permitted by regulation to mutualize loss.

The rule filing proposes to amend the loss allocation structure of the FICC/GSD to exempt these specific entities from loss mutualization, meaning that they would not be assessed for a loss that arose from the default of a Member with whom they had never traded. Other buyside entities would participate in loss allocation.), which in certain instances, may be preceded by the utilization of a certain percent of FICC/GSD's retained earnings. To date, including through a recent well-publicized broker-dealer closeout, the FICC/GSD has never invoked its loss allocation procedure. / Дьжи.Си.Эф. Рипо® (GCF Repo®). Зэ Дипазитори Тчраст Энд Клыринь Корпорэйшэн (The Depository Trust & Clearing Corporation). (Эф.Ай.Си.Си. образовалась 01 Января 2003 в результате слияния Правительственной Корпорации по Клирингу Ценных Бумаг (Government Securities Clearing Corporation) и Корпорации по Клирингу Эм.Би.Эс. GOVERNMENT–SPONSORED ENTERPRISE = СПОНСИРУЕМОЕ ПРАВИТЕЛЬСТВОМ ПРЕДПРИЯТИЕ – Government-Sponsored Enterprises (GSEs) are a group of financial services corporations created by the United States Congress, whose function is to enhance the flow of credit to targeted sectors of the economy. Fannie Mae and Freddie Mac are GSEs.

GOVERNOR = УПРАВЛЯЮЩИЙ – In the United States, Governor is an official appointed to govern; the manager or administrative head of an organization, business or institution.

GO WAREHOUSE = GENERAL ORDER WAREHOUSE

GOWN = МАНТИЯ (или СВОБОДНАЯ ШИРОКАЯ ОДЕЖДА, или НАРЯДНОЕ ВЕЧЕРНЕЕ ПЛАТЬЕ, или ХАЛАТ) – Gown:- a loose flowing outer garment formerly worn by men; a distinctive robe worn by a professional or academic person; a woman's dress; dressing gown; nightgown, wedding-gown; a coverall worn in an operating room.

GP = GENERAL PURPOSE

GP = GERMINATION PERCENTAGE

GP = GUADELOUPE

GPM = GALLONS PER MINUTE

GPM = GRADUATED PAYMENT MORTGAGE

GPM = GROSS PROCESSING MARGIN

GPRA = GOVERNMENT PERFORMANCE AND RESULTS ACT

GPS = GLOBAL POSITIONING SYSTEM

GPWUI = GROSS PRODUCTION WATER USE INDEX

GQ = EQUATORIAL GUINEA

GR = GREECE

GRAB STRENGTH TEST = ТЕСТ НА КРЕПОСТЬ ПОЛОСКИ ТКАНИ – Grab Strength Test is a method for measuring the breaking strength of a fabric sample by mounting the sample in the tensile tester so that only a part of the width of the specimen is gripped in the clamps. Breaking Strength and Elongation of Textile Fabrics – Grab Test (ASTM D5034):- a grab test is used for woven and nonwoven textile fabrics, while a modified grab test is mainly for woven textile fabrics. The grab test is a tensile test where the central part of the specimen's width is tested in the grips. It uses 100 x 150 mm (at least) long specimens with a line drawn parallel to the long direction and located in from the edge of one side of the specimen. The modified grab test is similar with lateral slits cut into the sides of each specimen, except for the center 25 mm (specifications are different for testing of wet fabrics). In all tests, the specimen is pulled to break at 300 mm/min (12 in/min). Test results are the breaking strength (maximum load) and elongation. While manual action grips with smooth flat faces or rubber faces will work, many of our customers prefer the pneumatic action grips for ease of use, productivity, and better repeatability. Pneumatic action grips allow the user to set a clamping pressure, while manually operated grips depend on the operator's strength (which may not be so repeatable). Grab tests specify 25 x 25 mm (or 50 mm sizes) faces (while suggesting larger faces for the lower grip) while modified grab tests require one set of 25 x 50 mm and 50 x 50 mm faces. We find that gripping pressure and specimen alignment are very important in these tests. Too much gripping pressure can produce premature breaks, while not enough gripping pressure can lead to specimen slippage or breaks at or near the jaws. Software will help tremendously in these tests since it can correct for preload or pretension once the grips close, or for slack if the specimen is held too loosely in the grips at the start of the test. American Society for Testing and Materials (ASTM). / Американское Общество по Испытаниям и Материалам (АОИМ). Grab Test = Определение разрывной нагрузки полоски ткани методом зажима её в тиски не по всей ширине, а только на один дюйм.

GRACE PERIOD = ЛЬГОТНЫЙ ПЕРИОД – Grace Period is a short period during which cover under an annual policy may be extended beyond its expiry date to allow for the payment of a renewal premium. The privilege will be lost if the insured rejects the proposed renewal terms, by his actions or words. There are no grace periods in motor or marine insurance. / Льготный Период:- в общем значении:- период времени, предоставляемый в большинстве контрактов и страховых полисов, в течение которого контракт не отменяется и не считается нарушенным даже в случае просрочки платежа. В отношении кредитных карт:- количество дней между моментом использования кредитной карты и платежом по ней, когда проценты не взимаются. Большинство банков предоставляет владельцам кредитных карт льготный период длительностью 25 дней, но другие банки могут предоставлять льготный период иной продолжительности. В страховании:- условие некоторых долгосрочных кредитов, как правило, синдицированных кредитов в Евровалюте (Eurocurrency), предоставляемых зарубежным правительствам и мультинациональным корпорациям группой банков, в соответствии с которым в течение определённого периода погашение основной суммы кредита не производится. Льготный период, который может составлять до пяти лет, является важным моментом в ходе переговоров между заёмщиком и кредитором; заёмщики иногда соглашаются на более высокую ставку процента для того, чтобы увеличить продолжительность льготного периода.

GRACILIS = СТРОЙНОЕ (или ТОНКОЕ, или НЕЖНОЕ, или ХУДОЕ, или ТОЩЕЕ, или СКУДНОЕ) – Gracilis:- slender. / – тонкое.

GRADE = СОРТ – (1) In Cotton industry, Grade is the official US classification system given to the Cotton lint to describe its quality in terms of color and leaf content. See also Color Grade, Leaf Grade, and Universal Cotton Standards. Grade:- the quality of raw Cotton judged on the basis of its color, dirt, content and preparation. / В хлопковой индустрии, официальная Американская система классификации, предназначенная для описания хлопкового волокна по его качественным характеристикам, включая цвет и

засорённость. Смотрите также Сорт По Цвету (Color Grade), Сорт По Засорённости (Leaf Grade), и Универсальные Стандарты на Хлопок (Universal Cotton Standards). Сорт – градация продукции по свойствам или признакам, которая охватывает различные наборы потребностей в продукции или услугах, предназначенных для одного и того же функционального применения.

(2) Grade is a classification of lumber or other wood products based on criteria of quality such as natural characteristics and strength. / Классификация пиломатериалов или иных продуктов из древесины, основанная на критерии качества, таком как естественные характеристики и прочность. Условные показатели, устанавливаемые обычно по основной эксплуатационной характеристике или по комплексу главных свойств материала.

(3) Grade is a measurement used in knitted garments that reflects the size of the needles used to knit the garment. The larger the gauge, the smaller the needle the finer the knit.

(4) Grade, as relates to Potatoes, the tuber quality as relates to compliance with specific tolerances for tuber sizes, defects, diseases and other factors outlined in the US No. 1 Seed Potato Grade.

(5) Grade (Silk) is a classification of raw silk on the basis of tests carried out according to standard methods in silk conditioning houses. The qualities taken into consideration are winding, size, tenacity, elongation, evenness, cleanness, neatness, and cohesion.

GRADE = СОРТ (или СОДЕРЖАНИЕ ЦЕННОГО КОМПОНЕНТА В РУДЕ) – Grade is the mass of desired metal(s) in a given mass of ore.

GRADE = СОРТИРОВАТЬ – Grade:- to separate milled grain according to size and quality – whole grain, broken grain, short grain, or long grain.

GRADE CERTIFICATE = СЕРТИФИКАТ СОРТНОСТИ – A Grade Certificate attests to the quality of a commodity graded by official inspectors, testers and graders. It is another name for Inspection Certificate. / Сертификат Сортности свидетельствует качество сырья, отсортированного официальными инспекторами, испытателями и сортировщиками. Он является ещё одним названием для Сертификата Осмотра или Сертификата Инспекции (Inspection Certificate).

GRADE CODE = СОРТОВОЙ КОД – A Grade Code is a four-digit code used throughout the grain industry to identify each grade of each class of grain. See also Grain Code. / Сортовой Код представляет собой код, состоящий из четырёх цифр и используемый в отрасли производства зерновых для идентификации каждого сорта каждого класса зерна. Смотрите также Код Зерновой Культуры (Grain Code).

GRADED COMMODITIES = СОРТИРОВАННЫЕ РОДА СЫРЬЯ – Each official certificate for Graded Commodities shall show:- (i) the class, grade, or any other quality designation according to the official grade standards; (ii) all factor information requested by the applicant; and (iii) all grade determining factors for commodities graded below the highest quality grade. / Под Сортаментом или Сортиментом, искажённым от Французского слова Assortiment от Assortir, означающее Подбирать или Сортировать, понимается состав продукции по маркам, размерам, профилям. Термин ‘Сортамент’ применяется в металлургической промышленности преимущественно к металлопрокату, отражая данные о форме, размерах и материале различных видов однородных изделий; а ‘Сортимент’ – в лесозаготовительном и лесопильном производстве для характеристики назначения лесоматериала, например, пиловочное бревно.

GRADE NOT CONFORMING TO SPECIFICATION MEASUREMENTS = СОРТ, НЕ УДОВЛЕТВОРЯЮЩИЙ ЗНАЧЕНИЯМ ИЗ СПЕЦИФИКАЦИИ – Grade Not Conforming to Specification Measurements:- finished product not measuring to specified dimensions and component parts not fitting in relationship to notches, openings and seams such as armholes, sleeve heads, neck bands, neck openings, side seams, inseams, waist measurements etc. Cutting Room Defects, and namely – Pattern Grading Defects. / Порок или дефект раскроя.

GRADES = СОРТА – Grades are the various qualities of a commodity. / Разновидности по качеству сырья. Под Сортами, от Французского слова Sorte, понимаются рода товара (сырья или готовой продукции), обладающие определёнными качественными признаками. В переносном плане – качество, разряд. Условные показатели, устанавливаемые обычно по основной эксплуатационной характеристике или по комплексу главных свойств материала.

GRADES OF CHEMICALS = СОРТА ХИМИКАЛИЙ (или СОРТА ХИМИКАТОВ) – Grades Of Chemicals:- chemicals are graded according to purity and appropriateness for end use. Common grades include ‘reagent’ or ‘analytical’ (very pure, for laboratory work, very expensive, often in small packages), ‘USP’ or ‘BP’ (United States Pharmacopeia or British Pharmacopeia, usually for use in or as drugs, quite high purity, medium price, small to very large packages), ‘food grade’ and ‘technical grade’. Dyes for textile use are rarely graded, and are often quite crude and impure, compared with other chemicals. / Фамэкопиа (Pharmacopeia). Под Химикалиями или Химикатами понимаются химические препараты, продукты.

GRADE STAMP = ШТАМП ПО СОРТАМ (или СОРТОВОЙ ШТЕМПЕЛЬ, или СОРТОВОЕ КЛЕЙМО) – Grade Stamp is a stamp placed on lumber to denote its grade. / Штамп, размещённый на пиломатериале для обозначения его сорта.

GRADING = ГРАДАЦИЯ (или СОРТИРОВКА, или СОРТНОСТЬ) – In textile industry, Grading is a classification of the unopened or untied fleeces according to fineness, staple length, character, soundness, etc. Grading is the determining, by touch, the fineness of the diameters of individual fibers. Wool tops are graded in this fashion. Efforts are now being made to grade wool in the grease by this method.

GRADING CERTIFICATE = СЕРТИФИКАТ СОРТНОСТИ – Grading Certificate is a formal document setting forth the quality of a commodity as determined by authorized inspectors or grades. A paper setting forth the quality of a commodity as determined by authorized inspectors or graders. / Документ, устанавливающий качество товара, определённое уполномоченными инспекторами или классификаторами.

GRADING FACTOR = СОРТОВОЙ ПРИЗНАК (или ПРИЗНАК СОРТА) – A Grading Factor is a physical condition of grain, the result of growing conditions, handling procedures or storage practices. It is a visual characteristic that indicates a reduction in quality; for example, frost damage, sprouted kernels, or heated kernels. Only relevant grading factors are shown as reasons for a grade. If a sample of Wheat grades No. 3 for one particular reason, there is no need to list other factors that might be acceptable in a higher grade. If the sample is No. 3 for a combination of reasons, the combination must be shown in order of importance. / проросшая зерновка, или .

GRADING SYSTEM = СИСТЕМА СОРТИРОВКИ (или СИСТЕМА СОРТИРОВАНИЯ) – Grading Systems:- there are two fabric grading systems viz. 4-point and 10-point system. (1) 4-Point System:- Four point system also called as American Approval

Manufacturers Association (AAMA) a giant grading system for determining fabric quality is widely used by department of Defense in US and endorsed by AAMA and ASQ as in Table I. Total defect points per 100 square meters are calculated using the equation:- DPPHSY = (TPSIR x 3 600) / (F_W x TYI); (II.1). Where, DPPHSY is Defect points per 100 square yards, TPSIR is total points scored in the roll and F_W is Fabric width and TYI is Total Yards Inspected Acceptance criteria are 18/24 points per 100 square meters for shirting/suiting material. If one meter of cloth is having more than 10 points is not acceptable. Disadvantages of 4-point system:- It does not have provision for the probability of minor defects causing the fabric to be classified as seconds or minor defects falling out of cutting table during garmenting. There is no standard viewing condition for inspecting the fabric. Manual method has limitation of human error. Table II.B:- (i) Length of defect in fabrics – Points Allotted; (ii) Upto 7.5 cm – 1; (iii) Over 7.5 cm up to 15 cm – 2; (iv) Over 15 cm up to 22.5 cm – 3; (v) Over 22.5 cm – 4; (vi) Holes & opening (largest dimension):- (a) 2.5 cm or less – 2, (b) Over 2.5 cm – 4. (2) 10-Point System:- In 1955, the Ten-Point System for piece goods evaluation was approved and adopted by the Textile Distributor's Institute and National Federation of Textiles. This system assigns penalty points to each defect, depending on its length. The Ten-Point System is somewhat complicated because points-per-length vary for warp and filling defects. Table II.b shows a breakdown of the points:- Under the Ten-Point System, a piece is graded a 'first' if the total penalty points do not exceed the total yardage of the piece. A piece is graded a 'second' if the total penalty points exceed the total yardage of the piece. Table II. C:- (i) Length of defect – Points allotted; (ii) Warp defects:- (a) Up to 2.5 cm – 1, (b) 2.5 cm to 12.5 cm – 3, (c) 12.5 cm to 25 cm – 5, (d) 26 cm to 90 cm – 10; (iii) Filing defect (weft defect):- (a) Up to 2.5 cm – 1, (b) 2.5 cm to 12.5 cm – 3, (c) 12.5 inch to half-width – 5, (d) Larger than half-width – 10.

GRADUATED PAYMENT = ДИФФЕРЕНЦИРОВАННЫЙ ПЛАТЁЖ – Graduated Payment:- repayment terms calling for gradual increases in the payments on a closed-end obligation. A graduated payment loan usually involves negative amortization. / выплата (repayment) .

GRAFT = ПРИВОЙ (или ТРАНСПЛАНТАТ) – Graft is a shoot, bud or other tissue joined to, and growing on, another compatible plant. / Привой – черенок, почка или иная ткань, . Под Привоем понимается:- (i) черенок или почка (глазок) одного растения, привитые на другое растение – подвой; или (ii) надземная часть растения, например, яблони, развившаяся из привитых черенка или почки. Под Подвоем понимается растение (или часть его), на которое прививают часть (черенок, почку и тому подобное) другого растения – Привоя. Через корневую систему подвоя осуществляется минеральное питание и водоснабжение привитого растения. Привой снабжает подвой продуктами ассимиляции. Полнота срастания привитых компонентов и нормальное развитие полученного растительного организма зависят от физиологической совместимости подвоя и привоя. Подвой влияет на силу роста, урожайность и долговечность привоя, его зимостойкость, устойчивость к болезням и вредителям. Привой, в свою очередь, может влиять на зимостойкость подвоя, на развитие его корневой системы. В плодоводстве в зависимости от производственных задач для одной и той же культуры применяют разные подвои. Например, Яблоню прививают на Юге и в центральных районах бывшего СССР на сеянцах культурных сортов и лесной Яблони, в более Северных районах – на сливолистной Яблоне (Китайке), а на Востоке и Севере – на Сибирской Яблоне. В питомниках бывшего СССР для выращивания привитых саженцев плодовых культур использовали около 40 видов подвоев, различающихся происхождением (дикорастущие и культурные), силой роста и способом размножения (семенные и вегетативные).

GRAFT COPOLYMER = ПРИВИТОЙ СОПОЛИМЕР (или ГРАФТ СОПОЛИМЕР) – Graft Copolymers belong to the general class of segmented copolymers and generally consist of a linear backbone of one composition and randomly distributed branches of a different composition. They have been prepared for many decades and have been used as impact resistant materials, thermoplastic elastomers, compatibilizers or emulsifiers for the preparation of stable blends or alloys. The number of potential applications has now expanded with the development of CRP (short for the conventional radical polymerization). Well-defined graft copolymers are most frequently prepared by either:- (a) a 'grafting through', or (b) a 'grafting from' controlled polymerization process. However the development of 'click' chemistry has led to a third approach, (c) based on site specific 'grafting to' chemistry. (a) Grafting Through:- the 'grafting through' method (or macromonomer method) is one of the simplest ways to synthesize graft copolymers with well defined side chains. Typically a low molecular weight monomer is radically copolymerized with a (meth)acrylate functionalized macromonomer. This method permits incorporation of macromonomers that have prepared by other controlled polymerization processes into a backbone prepared by a CRP. Macromonomers such as polyethylene, poly(ethylene oxide), polysiloxanes, poly(lactic acid), polycaprolactone have been incorporated into a polystyrene or poly(meth)acrylate backbone. Moreover, it is possible to design well-defined graft copolymers by combining the CRP 'grafting through' macromonomers procedure where the macromonomers had been prepared by any controlled polymerization process. This combination of controlled polymerization processes allows control of polydispersity, functionality, copolymer composition, backbone length, branch length and branch spacing by consideration of mole-ratio of the Methacryloyl-terminated macromonomers (MM) in the feed and reactivity ratio of both the monomer and macromonomer. Branches can be distributed homogeneously or heterogeneously based on the reactivity ratio of the terminal functional group on the macromonomer and the low molecular weight monomer; and, as shown in the properties section, this has a significant effect on the physical properties of the materials. A series of segmented poly(alkyl methacrylate)-g-poly(D-lactide)/poly(dimethylsiloxane) terpolymers, with different topologies were prepared by employing a combination of the 'grafting through' technique and CRP. Two synthetic pathways were used. The first was a single-step approach in which a methacrylate monomer (methyl methacrylate or butyl methacrylate) was copolymerized with a mixture of a poly(lactic acid) (PLA) macromonomer and a 1,1-diphenylethylene-functionalized polydimethylsiloxane (PDMS) macromonomer. The second strategy was a two-step approach in which a graft copolymer containing one macromonomer was chain-extended by a copolymerization of the second macromonomer and the low-molecular weight methacrylate monomer. The molecular structure of the terpolymers was investigated by 2D GPC which indicated that well-defined terpolymers with controlled branch distribution were prepared via both pathways. The topologies of the graft terpolymers prepared by different combinations of the two step approach are displayed in the following schematic diagrams. While properties have yet to be fully explored, it is likely that phase separation is modified by polymer topology and hence the properties of the material will differ even though compositions were held constant. A spontaneous gradient graft copolymer was prepared by grafting through two different PEO macromonomers. Selection of a PEO methacrylate with a methyl end-group (PEOMeMA, DP of the PEO = 23) and a PEO acrylate end-capped by a phenyl ring (PEOPhA, DP of the PEO = 4) for the copolymerization led to a spontaneous gradient of PEO grafts along the copolymer backbone. A gradient copolymer was formed because of the significant difference in the reactivity of the two PEO macromonomers. The resulting copolymer has a high fraction of PEOMeMA grafts at one end of the polymer chain, gradually changing through hetero-sequences to predominately PEOPhA at the other chain end. An increase in the initial feed ratio of PEO acrylate reduced the rate of change in the shape of the gradient. (b) Grafting From:- the primary requirement for a successful 'grafting from' reaction is a preformed macromolecule with distributed initiating functionality. Grafting from reactions have been conducted from polyethylene, polyvinylchloride, and polyisobutylene. The only requirement for a multifunctional ATRP (short for the Atom Transfer Radical Polymerization) grafting from macroinitiator is distributed radically transferable atoms along the polymer backbone. The initiating sites can be incorporated by copolymerization, be an inherent part of the first polymer, or incorporated in a post-polymerization reaction. Indeed a pre-functionalized isobutylene rubber is commercially available from Exxon, (EXXPRO 3035) and has been employed in a

grafting from ATRP of MMA forming a spectrum of materials ranging from elastomers to impact resistant poly(MMA). Densely grafted copolymers are also prepared by a 'grafting from' polymerization and are discussed in the section on bottle-brush macromolecules and on the 'nanocomposites' page. (c) Grafting To:- grafting to has become a more efficient method for the preparation of graft copolymers with the rise of various 'click' chemistries. This approach has been used for the preparation of well defined star molecules, loosely grafted copolymers and as noted in the following section densely grafted structures. A well-defined copolymers of glycidyl methacrylate (< 40 mol %) and Me methacrylate prepared by ATRP. The glycidyl butyrate monomer unit that had been incorporated into the copolymer was efficiently opened with sodium azide in the presence of ammonium chloride in DMF at 50 °C to prepare a copolymer suitable for 'grafting to' using click linking chemistry. This click-type reaction led to the formation of a copolymer with distributed units of the corresponding 1-hydroxy-2-azido functional group in high yields. These azide-cont aining copolymers were further functionalized in a second click reaction conducted at room temp. CuBr/N,N,N',N",N"-pentamethyldiethylenetriamine-catalyzed 1,3-dipolar cyclo-addition of poly(ethylene oxide) methyl ether pentynoate yielded loosely grafted polymeric brushes with hydrophilic PEO side chains. Another 'high yield' chemical reaction, familiar to all interested in CRP, was exploited in a simple one-pot synthesis of heterograft copolymers via 'grafting onto' by atom transfer nitroxide radical coupling chemistry. The main chain was prepared by anionic ring-opening copolymerization of ethylene oxide (EO) and 4-glycidyloxy-2,2,6,6-tetramethylpiperidine-1-oxyl (GTEMPO) then polystyrene and poly(tert-Bu acrylate) with bromine end (PS-Br, PtBA-Br) were prepared by ATRP. When the three polymers were mixed in the presence of CuBr/N,N,N',N",N"-pentamethyldiethylenetriamine (PMDETA) at 90 °C, the formed secondary carbon radicals at the PS and PtBA chain ends were quickly trapped by nitroxide radicals on poly(GTEMPO-co-EO). It was found that the density of GTEMPO groups on the main chain of the poly(GTEMPO-co-EO), the MW of PS/PtBA side chains, and the structure of macroradicals significantly affected the efficiency of the grafting to reaction. Heterograft copolymers poly(4-glycidyloxy-2,2,6,6-tetramethylpiperidine-1-oxyl-co- ethylene oxide)-graft-polystyrene and poly(tert-Bu acrylate) (poly(GTEMPO-co-EO)-g-PS/PtBA) were synthesized in one-pot by atom transfer nitroxide radical coupling (ATNRC) reaction via 'graft onto'. Graft Copolymer is a copolymer having branches of varying length made up of different monomer units on a common 'backbone' chain. Graft Copolymers are a special type of branched copolymer in which the side chains are structurally distinct from the main chain. The illustration depicts a special case where the main chain and side chains are composed of distinct homopolymers. However, the individual chains of a graft copolymer may be homopolymers or copolymers. Note that different copolymer sequencing is sufficient to define a structural difference, thus an A-B diblock copolymer with A-B alternating copolymer side chains is properly called a Graft Copolymer. For example, suppose we perform a free-radical polymerization of styrene in the presence of polybutadiene, a synthetic rubber, which retains one reactive C=C double bond per residue. We get polystyrene chains growing out in either direction from some of the places where there were double bonds, with a one-carbon rearrangement. Or to look at it the other way around, the result is a polystyrene backbone with polybutadiene chains growing out of it in both directions. This is an interesting copolymer variant in that one of the ingredients was a polymer to begin with. As with block copolymers, the quasi-composite product has properties of both 'components'. In the example cited, the rubbery chains absorb energy when the substance is hit, so it is much less brittle than ordinary polystyrene. The product is called High-Impact Polystyrene, or HIPS. / ЭКСАН (Эксан Мобл Корпорэйшэн; EXXON (Exxon Mobil Corporation)). боковые цепи или побочные цепи или ответвления (side chains). Кополимер – порошкообразная смола, которая полностью растворяется в ацетоне, образуя вязкие концентрированные прядильные растворы.

GRAIN = ГРАН – Grain is one of the earliest units of weight for gold, one grain being the equivalent of one grain of Wheat taken from the middle of the ear. 1 grain = 0.064 8 grams or 0.002 083 Troy ounces. 15.43 grains = 1 gram; 480.6 grains = 1 Troy ounce; 24 grains = 1 pennyweight. See also Granules. Grain is one of the earliest units of weight for gold. 1 grain = 0.064 8 grams or 0.002 083 Troy ounces. 15.43 grains = 1 gram; 480.6 grains = 1 Troy ounce; 24 grains = 1 pennyweight. Grain (gr) is:- (1) a traditional unit of weight. The grain, equal to 1/480 troy ounce (see also Pound (2)), or exactly 64.798 91 milligrams, was the legal foundation of traditional English weight systems, with various pounds being defined as a specified number of grains:- 5 760 grains in a troy pound and 7 000 grains in an avoirdupois pound, for example. In the version of the troy system used by jewelers, there are 24 grains in a pennyweight and 20 pennyweight in an ounce. In the version used by apothecaries, there are 20 grains in a scruple, 3 scruples in a dram, and 8 drams in an ounce. Originally the grain was defined in England as the weight of a barleycorn. This made the English grain larger than the corresponding grain units of France and other nations of the Continent, because those units were based on the weight of the smaller Wheat grain. Grain is a unit of weight in the US Customary System, an avoirdupois unit equal to 0.002 285 ounce (0.064 798 91 grams). One of the earliest weight units used for measuring gold. One grain is equivalent to 0.064 798 91 grams. Abbreviation:- gr. Grain:- as a unit of mass (weight), approximately 64.8 milligrams. / Обычной Системе Мер США. Одна из самых ранних единиц веса, используемых для измерения золота. Один гран равен 0.064 798 91 граммам. Обозначение:- гр. Под Граном, от Латинского слова Granum, означающее Зерно или Крупинка, понимается единица массы. В Британской Империальной Системе для взвешивания драгоценных камней и металлов использовались аптекарский, торговый и Тройский гран. 1 гран = 64.798 91·10^{-6} килограмма (кг) = 64.798 91 миллиграммам (мг). В России гран использовался в аптекарской практике до введения Метрической Системы Мер и был равен 62.209 миллиграммам (мг).

(2) Grain (gr) is a unit of weight formerly used by jewelers in measuring diamonds and other precious stones. The jeweler's grain is exactly 1/4 carat. Now that the carat has been standardized at 200 milligrams, the jeweler's grain is exactly 50 milligrams, or approximately 0.771 6 Troy grain. This unit is widely used for measuring pearls, so it is sometimes called the Pearl Grain.

(3) Grain (gr) is a traditional French unit of weight equal to 53.115 milligrams.

GRAIN = ЗЕРНО – In Rice industry, Grain (syn. Rough Rice, Paddy, Padi, Caryopsis, Seed) is:- (1) a fruit in which the pericarp is fused with the seed. (2) The ripened ovary and its associated structures such as the lemma, palea, rachilla, sterile lemmas, and the awn if present. Grain is a commodity class for seeds intended for processing or consumption and not for planting. See also Seeds. Grain (Rice):- (syn. Rough Rice, Paddy, Caryopsis, and Seed). The ripened ovary and its associated structures such as the lemma, palea, rachilla, sterile lemmas, and the awn if present. Sterile or under-developed ovaries enveloped by a well-developed lemma and palea should be termed empty or under-developed spikelets. A Grain is any seed named in the Canada Grain Act or designated by the Canada Grain Regulations as a grain. / Под Зерном понимается:- (i) плод хлебных злаков (зерновка) и семя зернобобовых культур; и (ii) продукт зернового производства или сырьё для крахмало-паточной, комбикормовой, крупяной, мукомольной, пивоваренной промышленности. Зерно, (1) плод хлебных злаков и семя зерновых бобовых культур. (2) Продукт зернового производства. Зерно является одним из основных продуктов питания человека, сырьём для мукомольной, крупяной, пивоваренной, крахмало-паточной, спиртовой, комбикормовой промышленности, концентрированным кормом для сельскохозяйственных животных. Продукты переработки зерна используют в хлебопекарной, макаронной, кондитерской промышленности. Зерно – наиболее важная часть государственных продовольственных резервов и предмет экспорта. Зерно хлебных злаков (смотрите Зерновые Культуры) – сухой односемянный плод (зерновка), голый у Пшеницы, Ржи, Кукурузы, голозёрных форм Ячменя и Овса и плёнчатый (покрыт цветковыми плёнками) у Овса, Ячменя, Риса, Проса и других. Основную массу зерна составляет эндосперм, из которого при помоле получают наиболее ценную часть муки. Клетки

большей части его массы заполнены крахмалом и белковыми веществами. Краевой слой эндосперма – алейроновый – богат белками и жиром. Наибольшее содержание белков – в слое, прилегающем к алейроновому. При сортовых помолах алейроновый слой отделяют в отруби, так как он плохо усваивается организмом человека. В зависимости от размеров, формы и расположения крахмальных зёрен, свойств и распределения белков зерно может быть стекловидным, полустекловидным и мучнистым. В нижней части зерна расположен зародыш-зачаток будущего растения. В нём много белка, жира, сахаров, витаминов, ферментов. При сортовых помолах зародыш удаляют, так как он с трудом измельчается, а содержащийся в нём жир легко прогоркает, вызывая порчу муки при хранении. Снаружи зерно покрыто плодовой и семенной оболочками, которые также при сортовом помоле в основном попадают в отруби. Весовое соотношение частей зерна Пшеницы (в %):- эндосперм 81.1–84.2; алейроновый слой 6.8–8.6; зародыш 1.4–3.2; оболочки 3.1–5.6; у Овса соответственно – 51–61; 4–6; 3–4; 2–4 и, кроме того, цветковые плёнки 20–40. Зрелое зерно зерновых бобовых культур лишено эндосперма. Оно покрыто семенной оболочкой (кожурой), под которой расположен зародыш, состоящий из мясистых семядолей, зародышевых стебля, корня и почечки. Весовое соотношение основных частей зерно наиболее распространённых зернобобовых культур (в %):- оболочка 6.4–11; семядоли 87.2–92.5; корень, стебель и почечка 1.1–2.5. Средний химический состав зерна (при влажности 14%) включает белки, жиры, углеводы (кроме клетчатки), клетчатка и зола. Основная часть углеводов зерна составляет крахмал, гидролиз которого имеет большое значение при приготовлении теста. Клетчатка и гемицеллюлоза входят в состав клеточных оболочек. Из сахаров содержатся мальтоза, глюкоза и фруктоза. Белки зерна хлебных злаков относятся главным образом к проламинам и глютелинам. Основные белки Пшеницы глиадин и глютенин образуют клейковину, от количества и качества которой зависят упругость теста, пористость и объём хлеба. Клейковина Ржи (выделяется в особых условиях) и Ячменя (содержится не во всех Сортах) обладает худшими физическими свойствами. Белки зернобобовых культур состоят главным образом из глобулинов и небольшого количества альбуминов. Они более полноценны, чем белки хлебных Злаков. Жиры, в которые входят в основном ненасыщенные жирные кислоты, содержатся в наибольшем количестве в зародыше, а у Арахиса и Сои – в семядолях. В составе золы зерна – фосфор, калий, магний, кальций, кремний и другие элементы (в виде окислов). Ферменты главным образом сосредоточены в зародыше, из них наибольшее значение имеют a-амилаза, b-амилаза, a-глюкозидаза (мальтаза), b-фруктофуранозидаза (сахараза), липазы, протеазы, каталаза и другие. В зерне содержатся (наибольшее количество – в зародыше и периферических слоях) витамины:- тиамин (B_1), рибофлавин (B_2), пиридоксин (B_6), никотинамид (PP), аскорбиновая кислота (C); только в проросшем зерне – пантотеновая кислота, а также пигмент каротин – источник витамина ретинола (A). Качество зерна оценивают по следующим показателям:- свежесть, цвет, запах, вкус, кислотность, засорённость, заражённость хлебных запасов Вредителями и болезнями, влажность, натура (масса 1 литра (л)), масса 1 000 зёрен и другие. При технологической оценке (мукомольной и хлебопекарной) часто определяют стекловидность, зольность, содержание белка, проводят опытные выпечки хлеба из полученной муки и последующую оценку его (объёмный выход хлеба из 100 граммов (г) муки, формоустойчивость подового хлеба и другие). Качество зерна в бывшем Союзе Советских Социалистических Республик (СССР) нормировалось Государственными Стандартами (ГОСТ). Были установлены кондиции на перерабатываемое зерно. Качество экспортного зерна нормировалось Техническими Условиями (ТУ). К Зерновым Культурам относятся растения, возделываемые для получения зерна. В сухом веществе зерна Кукурузы, Овса, Пшеницы, Ржи, Риса и других 7–18% белков, 2–5% жира, 60–80% углеводов, а также витамины и ферменты. Зерно Бобовых зерновых культур (зернобобовых культур) богато белком. Стерня или Жнивьё, нижняя часть стеблей зерновых культур, оставшаяся на корню после уборки урожая.

GRAIN = РАСПОЛОЖЕНИЕ ВОЛОКОН – (1) Grain:- the direction, size, arrangement, appearance or quality of the fiber in wood or veneer. When speaking of wood, the term grain is used, in several ways, as in the alignment of the wood in the tree. Basic grain descriptions include straight grain, spiral and interlocked. Straight grain runs in a single direction, parallel to the axis of the tree; spiral grain spirals around the axis of the tree and interlocked grain spirals around the axis of the tree, but reverses its direction regularly, alternating, interlocking. Most species grown in temperate climates produce visible annual growth rings (grain) that show the difference in density and color between wood formed early and that formed late in the growing season. The inner part of the growth ring, formed first, is called ‘Spring Wood’; the outer part, formed later in the season, is called ‘Summer Wood’. Spring wood is characterized by cells having relatively large cavities and thin. Summer wood cells have smaller cavities and thicker walls, and consequently are denser than those in spring wood. The growth rings, when exposed by conventional sawing methods, provide the grain or characteristic pattern of the wood. The distinguishing features among the various species results in part from differences in growth-ring formation. And within species, natural variations in growth ensure the unique character and beauty of each piece of wood. Strictly speaking, grain is not the same as the ‘figure’ of wood. In wood, figure refers to the appearance of wood. The figure of a particular piece of wood may be due to the cut, or to innate properties of the wood, however informally ‘Figure’ is often referred to as Grain. Figure is the combination of wood color as well as grain. Types of figure include bear scratches, bird’s eye, blister, burl, curl, dimple, fiddleback, flame, ghost, quilted, and spalted. Special grain alignments and their rarity promote the value of both the raw material and the finished work it becomes a part of. In a wider sense, the term grain may also be applied to the orientation of the cut; the way a given piece of wood has been sawn, as in flat-grain (flat-sawn or plain sawn) or edge grain (quarter-sawn or rift-sawn or straight-grained). An understanding of grain as applied to woodworking techniques is of the utmost importance. In describing the application of a woodworking technique to a given piece of wood, the direction of the technique may be:- (i) with the grain (easy; giving a clean result), (ii) against the grain (heavy going; giving a poor result), and (iii) across the grain (at right angles to the grain). Grain usually runs from somewhere within (or through) a piece of wood to the surface. If that high point encounters the cutter first, the ends of the grain bundles can be snagged, or lifted. The result is often chipping or separated ends. With the ends of the grain angling away from the cutter, the ends are more likely to slice cleanly, leaving a smooth surface. When the angle of grain is relatively steep, determining direction is easy. However, when this angle is more subtle, or appears to run parallel to the long axis of a piece of wood, it can be difficult to identify the correct direction of feed. Grain patterns on the face of boards can be deceiving. When growth rings are dissected during the sawing process, they can show a feathered-appearing edge that might appear to indicate the wrong feed direction. Looking at the edge of the board is often a better way to determine if the grain is rising or falling. To demonstrate the interaction between grain and cutters, hold a common paint brush at an angle, sliding your hand across the bristles in both directions. Notice how easily the bristles slip over your hand when their ends are pointed in approximately the same direction your hand is moving. Then, notice how the bristles catch when their ends face the direction of your hand. Though exaggerated, this is essentially what happens when feeding wood through the various cutters in our shops. And as Mother Nature is not inclined to make things easier for woodworkers, it is necessary to learn techniques to obtain the best results from this ever-changing medium. The time it takes to successfully read the grain orientation in a piece of wood offsets potential loss of wood, and your time, should the piece fracture. Also known as Flair. / Виды (Species). тангенциально распиленное (flat-sawn) или радиально распиленное (edge grain; радиально распиленное (quarter-sawn)).

(2) Grain is the direction in which the yarns run in weaving. The straight grain is the direction of the warp yarns.

GRAIN ASPIRATOR = ЗЕРНОАСПИРАТОР – Grain Aspirator is designed to effectively separate light trash from good cereals and grain. / Зерноаспиратор, воздушный сепаратор, машина для очистки зерна от пыли и примесей, для выделения оболочек

из продуктов переработки крупяных культур, а также для контроля качества крупы, относов и лузги. Зерноаспираторы делятся на две группы. В зерноаспираторах первой группы, работающих при переменном количестве воздуха, подача зерна производится питающим валиком и регулируется клапанами с противовесами. Отклонение клапана устанавливается винтами. В аспирационных каналах частицы, обладающие большей парусностью, уносятся и оседают в камере, откуда выпадают по мере накопления. В зерноаспираторах второй группы, работающих при постоянном количестве воздуха, зерно через трубу рабочей камеры и клапан равномерным слоем падает на подвижный отражательный щиток, а с него в выходной канал, подвергаясь в пути двухкратному продуванию. Захваченные воздушным потоком примеси направляются по аспирационному каналу в осадочную камеру, откуда удаляются шнеком. Воздух поступает во всасывающее отверстие вентилятора, который подаёт его в отверстие рабочей камеры для повторного продувания.

GRAIN BANK = БАНК ЗЕРНА – Grain Bank:- accepting grain on deposit from a livestock producer for redelivery to him/her as a feed product at a future date.

GRAIN CHARACTERISTICS = ХАРАКТЕРИСТИКИ ЗЕРНА – Grain Characteristics is the different character and dimensions of the rice grain, e.g., length and shape and cooking qualities. / свойство (character) .

GRAIN CHEMICAL QUALITY = ХИМИЧЕСКОЕ КАЧЕСТВО ЗЕРНА – Grain Chemical Quality is the chemical analysis of the grain's content or nutritional value.

GRAIN CODE = КОД ЗЕРНА – A Grain Code is a two-digit code used throughout the industry for each class of grain. See also Grade Code. / Код Зерна представляет собой код, состоящий из двух цифр и используемый в отрасли для идентификации каждого класса зерна. Смотрите также Сортовой Код (Grade Code).

GRAIN DORMANCY = ПОКОЙ ЗЕРНА – Grain Dormancy:- physiologically, the inactive growth phase of the grain. / Покой Зерна:- это состояние жизнеспособных семян, при котором они не прорастают в обычных условиях, прорастают замедленно или прорастают только при специальных условиях. Различают покой вынужденный, вызванный внешними условиями – отсутствием влаги, необходимой температуры, и органический (или глубокий) – задержка прорастания, связанная с внутренними свойствами семян многих Растений. Причины и продолжительность органического покоя, а также условия его нарушения у различных Видов Растений неодинаковы. В состоянии покоя жизненные процессы в зерне не прекращаются. Происходит медленный обмен веществ, поддерживающий жизнь зародышевой ткани. Покой представляет собой очень Важное приспособительное свойство Растений, предохраняющее семена от несвоевременного прорастания и позволяющее им длительное время сохранять жизнеспособность. Свежеубранные семена многих Злаковых и других культур находятся в неглубоком физиологическом покое, который во времени обычно совпадает с периодом послеуборочного дозревания.

GRAIN FUTURES ACT = АКТ О ФЬЮЧЕРСАХ НА ЗЕРНО – 1922-September-21 – The Grain Futures Act, predecessor to the Commodity Exchange Act, is enacted. The provisions of the Grain Futures Act, including the requirements for designation as a contract market, are similar to those of the Future Trading Act. Unlike the Future Trading Act, the Grain Futures Act is based on the interstate commerce clause and bans off-contract-market futures trading rather than taxing it. The Grain Futures Administration is formed as an agency of the US Department of Agriculture (USDA) to administer the Grain Futures Act. The Grain Futures Act also creates the Grain Futures Commission, which consists of the Secretary of Agriculture, the Secretary of Commerce, and the Attorney General. The authority to suspend or revoke a contract market designation is vested in the Grain Futures Commission. 1936-June-15 – The Commodity Exchange Act is enacted. The Commodity Exchange Act replaces the Grain Futures Act and extends Federal regulation to a list of enumerated commodities that includes Cotton, Rice, mill feeds, butter, eggs, and Irish Potatoes, as well as grains. All references to 'grains' in the Grain Futures Act are changed to 'commodities'. The Grain Futures Commission becomes the Commodity Exchange Commission and continues to consist of the Secretary of Agriculture, the Secretary of Commerce, and the Attorney General. The Commodity Exchange Act grants the Commodity Exchange Commission the authority to establish Federal speculative position limits, but not the authority to require exchanges to set their own speculative position limits. The Commodity Exchange Act, among other things, also requires futures commission merchants to segregate customer funds that are deposited for purposes of margin, prohibits fictitious and fraudulent transactions such as wash sales and accommodation trades, and bans all commodity option trading. The option ban remains in effect until 1981. The US Federal statute that provided for the regulation of trading in grain futures, effective 1923-June-22; administered by the US Department of Agriculture; amended in 1936 by the Commodity Exchange Act.

GRAIN HARDNESS = ТВЁРДОСТЬ ЗЕРНА (или ТВЕРДОЗЁРНОСТЬ, или СТЕКЛОВИДНОСТЬ ЗЕРНА) – Grain Hardness is a key variety trait for milling. Hard and soft Wheats have different processing requirements and end-uses. The hard Wheats used for breadmaking must absorb sufficient water during dough making. Soft Wheats are preferred for biscuits as much added liquid is baked out to produce a crisp product. By crushing individual grains within a Single Kernel Characterisation System (SKCS) instrument, the miller can check grain hardness and identify mixtures of hard and soft varieties. Near infrared calibrations, based on SKCS, can rapidly separate hard and soft Wheat samples. / твёрдость (hardness) .

GRAIN INSPECTION, PACKERS AND STOCKYARDS ADMINISTRATION = АДМИНИСТРАЦИЯ ПО ИНСПЕКЦИИ ЗЕРНА, УПАКОВЩИКОВ (или ЗАГОТОВИТЕЛЕЙ) И СКОТНЫХ ДВОРОВ – The Grain Inspection, Packers and Stockyards Administration (GIPSA) is the US Department of Agriculture's (USDA) agency that facilitates the marketing of livestock, poultry, meat, cereals, oilseeds, and related agricultural products, and promotes fair and competitive trading practices for the overall benefit of consumers and American agriculture. GIPSA is part of USDA's Marketing and Regulatory Programs, which are working to ensure a productive and competitive global marketplace for US agricultural products. The Agency's Packers and Stockyards Program (P&SP) promotes fair business practices and competitive environments to market livestock, meat, and poultry. Through its oversight activities, including monitoring programs, reviews, and investigations, P&SP fosters fair competition, provides payment protection, and guards against deceptive and fraudulent trade practices that affect the movement and price of meat animals and their products. P&SP's work protects consumers and members of the livestock, meat, and poultry industries. The Agency's Federal Grain Inspection Service (FGIS) facilitates the marketing of US grain and related agricultural products by establishing standards for quality assessments, regulating handling practices, and managing a network of Federal, State, and private laboratories that provide impartial, user fee funded official inspection and weighing services. Headquartered in Washington, DC, the United States. Mission Statement:- to facilitate the marketing of livestock, poultry, meat, cereals, oilseeds, and related agricultural products, and promote fair and competitive trading practices for the overall benefit of consumers and American agriculture. GIPSA's vision is to be a dynamic organization that responds effectively to the changing conditions of American agriculture. As an organization GIPSA values:- (i) integrity and professionalism; (ii) innovation among individuals and teams; (iii) diversity in the workforce; (iv) employees and customers; and (v) fiscal responsibility. Strategic Plan (in 2012):- ensuring fair and transparent markets free from deceptive and fraudulent practices, combined with recognized and reliable descriptors of crop quality and value, promote economic health and prosperity in American agriculture. US farmers produce a wide variety of agricultural products and the vast American infrastructure permits these products to be processed and distributed throughout the United States and international markets effectively and efficiently. The markets serviced by GIPSA represent a total economic value

of approximately USD170 billion annually with exports contributing over USD28.7 billion to the US economy. History:- the Grain Inspection, Packers and Stockyards Administration (GIPSA) was established in 1994 as part of the reorganization of the US Department of Agriculture. The formation of the agency resulted from the joining of two previously independent agencies:- the Federal Grain Inspection Service and the Packers and Stockyards Administration. Today, GIPSA is part of USDA's Marketing and Regulatory Programs, which are working to ensure a productive and competitive global marketplace for US agricultural products. The Federal Grain Inspection Service (FGIS) was established by Congress in 1976 to manage the national grain inspection system, which initially was established in 1916, and to institute a national grain weighing program. The goal of creating a single Federal grain inspection entity was to ensure development and maintenance of uniform US standards, to develop inspection and weighing procedures for grain in domestic and export trade, and to facilitate grain marketing. Today's (in 2012) Packers and Stockyards Program (P&S) is the progeny of the Packers and Stockyards Administration, which was established in 1921 under the Packers and Stockyards Act. The organization was instituted to regulate livestock marketing activities at public stockyards and the operations of meat packers and live poultry dealers. Grain Inspection, Packers and Stockyards Administration (GIPSA) is a federal agency that facilitates the marketing of livestock, poultry, meat, cereals, oilseeds, and related agricultural commodities, and promotes fair and competitive trading practices for the overall benefit of consumers and American agriculture.

GRAIN LENGTH = ДЛИНА ЗЕРНА – Grain Length is the distance from the base of the sterile lemma to the tip or spiculus of the lemma or palea.

GRAIN MILLING QUALITY = МУКОМОЛЬНОЕ КАЧЕСТВО ЗЕРНА – Grain Milling Quality:- physical and chemical characteristics of the grain after milling.

GRAIN NUMBER = ЧИСЛО ЗЁРЕН – Grain Number is the number of grains per panicle. This varies with the different Varieties.

GRAIN SHAPE = ФОРМА ЗЕРНА – Grain Shape is the physical shape of the rice grain – round or slender, etc.

GRAIN SIZE = РАЗМЕР ЗЕРНА (или ВЕЛИЧИНА ЗЕРНА, или КРУПНОСТЬ ЗЕРНА) – Grain Size is the dimensions and weight of the grain.

GRAIN SMUT = ГОЛОВНЯ ЗЕРНА – Grain Smut is a disease of the Rice grain caused by Ustilaginoidea virens. The grain becomes yellow-greenish or greenish-black velvety spore balls. Also called False Smut. / споровые шарики. Под Головнёй понимается болезнь Растений, вызываемая Головнёвыми Грибами. Несколько видов:- пузырчатая, пыльная, стеблевая, твёрдая. Наиболее вредоносна для Злаков (Кукуруза, Пшеница, Рожь и другие). Колосья, метёлки, початки, стебли и листья превращаются в тёмную споровую массу.

GRAIN–STRAW RATIO = СООТНОШЕНИЕ ЗЕРНО–СОЛОМА – Grain-Straw Ratio is a ratio of grain weight to the remaining aboveground dry weight or straw weight at harvest.

GRAIN TERMINAL = ЗЕРНОХРАНИЛИЩЕ (или ЗЕРНОВОЙ ТЕРМИНАЛ) – Grain Terminal is a large grain elevator facility with the capacity to ship grain by rail and/or barge to domestic or foreign markets. / Под Зернохранилищем понимается сооружение для хранения зерна. Различают закромные, напольные и силосные зернохранилища. Они оборудуются зерноочистительными машинами, зерносушилками, вентиляторами. Зернохранилище, здание или сооружение для хранения зерна. Зернохранилища должны надёжно сохранять зерно, защищать его от атмосферных осадков, грунтовых и поверхностных вод, Грызунов и Птиц, быть удобными для загрузки и выгрузки зерна и контроля за его состоянием. В царской России крестьяне хранили зерно в амбарах, где приём, очистка, сушка зерна и уход за ним осуществлялись главным образом вручную. Товарное зерно, скупавшееся торговцами, хранилось в так называемых лабазах, отличавшихся от амбаров большей величиной. Во второй половине XX века в бывшем Союзе Советских Социалистических Республик (СССР) строили разнообразные зернохранилища – от простейших навесов до высокомеханизированных элеваторов. Зернохранилища бывают напольные, закромные и силосные. В Напольных Зернохранилищах (Зерноскладах) хранят большие массы однородного зерна непосредственно на полу. В бывшем СССР такие зернохранилища ёмкостью от 250 до 5 500 тонн (т) строили в совхозах, колхозах, на хлебоприёмных пунктах. Это одноэтажные здания, чаще всего прямоугольные в плане, в ряде случаев с верхней и нижней галереями, в которых были установлены механизмы для загрузки и выгрузки зерна, со скатной или сводчатой кровлей, горизонтальными или наклонными заглублёнными и полузаглублёнными полами. В Закромных (Бункерных) Зернохранилищах хранили мелкие партии зерна разных культур и сортов. Эти зернохранилища представляли собой напольные склады, разделённые перегородками на отдельные отсеки – закрома, или склады с бункерами, которые имели наклонные или конусные днища. Силосные Зернохранилища – высокие силосы (ёмкости), круглые или прямоугольные в плане, с днищами в виде конусов. Наиболее совершенные из них зерновые элеваторы. Напольные и закромные (бункерные) зернохранилища со скатной кровлей обычно каркасные. Каркас выполняют из сборного железобетона, дерева или металла, стены – из сборного железобетона, кирпича и других материалов, кровлю – чаще всего из волнистых асбестоцементных листов. Сводчатые зернохранилища строят из сборного железобетона. За рубежом распространены напольные зернохранилища цилиндрической формы (Канада, Соединённые Штаты Америки (США)), многоэтажные (Западная Европа), а также зернохранилища с покрытиями из вантовых конструкций. В напольных и закромных зернохранилищах небольшой ёмкости зерно загружают и выгружают передвижными механизмами – транспортёрами, самоподавателями и другими. В крупных зернохранилищах применяют стационарные механизмы, обеспечивающие наименьшие затраты труда. Зерно загружают ленточным транспортёром, размещаемым в верхней галерее. Для приёма зерна и подачи его на верхний транспортёр в торце склада сооружают вышку с нориями, приёмным ковшом и автомобилеподъёмником. Выгружают зерно транспортёром, размещаемым в нижней подземной галерее. Большая часть зерна попадает на транспортёр самотёком, а остальная подгребается передвижными механизмами. В силосных зернохранилищах и напольных с наклонными полами всё зерно разгружается на транспортёры самотёком. Для механизированного приёма зерна, очистки, сушки, подачи в зернохранилище и выгрузки его на хлебоприёмных пунктах и в крупных хозяйствах строят сушильно-очистительные башни с приёмно-отпускными устройствами (СОБ), размещая их в торцах зернохранилищ. Склады связаны с СОБ верхними и нижними транспортёрами. Для хранения больших количеств зерна строят несколько зернохранилищ торцами вплотную один к другому, разделяя их противопожарными стенами. Для лучшего сохранения зерна в зернохранилищах, помимо естественной вентиляции через окно и ворота, а также через шахты с задвижками, устанавливаемые вдоль конька здания, или горизонтального жёлоба внутри закромов, предусматривают активное вентилирование. Температуру зерна в зернохранилищах контролируют электротермометрами, показания которых наблюдают на пульте.

GRAIN TRANSLUCENCY = ПРОСВЕЧИВАЕМОСТЬ (или ПОЛУПРОЗРАЧНОСТЬ) ЗЕРНА – Grain Translucency refers to the ability of light to pass through the endosperm, after milling.

GRAIN WEIGHT = ВЕС ЗЕРНА – Grain Weight is the weight of the grain often recorded as grams per 1 000 grains.

GRAIN WIDTH = ШИРИНА ЗЕРНА – Grain Width is the measurement of the grain across the broadest section.

GRAIN YIELD = УРОЖАЙНОСТЬ ЗЕРНА (или ВЫХОД ЗЕРНА, или УМОЛОТ ЗЕРНА, или УРОЖАЙ ЗЕРНА) – Grain Yield is a weight of harvested grain expressed as tons/ha with a moisture content of 14%.

GRAM = ГРАММ – Gram (g) is the unit of mass in the metric system. The name comes from the Greek Gramma, a small weight identified in later Roman and Byzantine times with the Latin Scripulum or Scruple (the English Scruple is equal to about 1.3 grams). The gram was originally defined to be the mass of one cubic centimeter of pure water, but to provide precise standards it was necessary to construct physical objects of specified mass. One gram is now defined to be 1/1 000 of the mass of the standard kilogram, a platinum-iridium bar carefully guarded by the International Bureau of Weights and Measures in Paris for more than a century. (The kilogram, rather than the gram, is considered the base unit of mass in the SI.) The gram is a small mass, equal to about 15.432 grains or 0.035 273 966 ounce. The original French spelling Gramme is sometimes used. Note:- The only correct symbol for the gram is g. The abbreviations 'gm' and (worse) 'gr' should never be used. / Под Граммом, от Французского слова Gramme, от Латинского и Греческого слова Gramma, означающее Мелкая Мера Массы, понимается основная единица массы в СГС системе единиц и дольная единица (0.001 кг) массы в СИ. Обозначение:- г (g). 1 г с точностью до 0.2% равен массе 1 $см^3$ химически чистой воды при температуре её наибольшей плотности (около 4 °C). 1 г = 10^{-3} кг.

GRAM BREAK FACTOR = ФАКТОР ОБРЫВНОСТИ В ГРАММАХ – Gram Break Factor:- xxxxx. See also Break Factor.

GRAMINEOUS = ТРАВЯНИСТОЕ (или ЗЛАКОВОЕ) – Gramineous:- belonging to the grass family.

GRAMM–LEACH–BLILEY ACT = АКТ ГРЭМА–ЛЫЧА–БЛАЙЛИ – The Gramm-Leach-Bliley Act (GLB), also known as the Financial Services Modernization Act of 1999, (Pub.L. 106-102, 113 Stat. 1338, enacted November 12, 1999) is an act of the 106th United States Congress (1999–2001). It was signed into law by President Bill Clinton and it repealed part of the Glass-Steagall Act of 1933, opening up the market among banking companies, securities companies and insurance companies. The Glass-Steagall Act prohibited any one institution from acting as any combination of an investment bank, a commercial bank, and an insurance company. The Gramm-Leach-Bliley Act allowed commercial banks, investment banks, securities firms, and insurance companies to consolidate. For example, Citicorp (a commercial bank holding company) merged with Travelers Group (an insurance company) in 1998 to form the conglomerate Citigroup Inc., a corporation combining banking, securities and insurance services under a house of brands that included Citibank, Smith Barney, Primerica, and Travelers. This combination, announced in 1998, would have violated the Glass-Steagall Act and the Bank Holding Company Act of 1956 by combining securities, insurance, and banking, if not for a temporary waiver process. The law was passed to legalize these mergers on a permanent basis. Historically, the combined industry has been known as the 'Financial Services Industry'. Many of the largest banks, brokerages, and insurance companies desired the Act at the time. The justification was that individuals usually put more money into investments when the economy is doing well, but they put most of their money into savings accounts when the economy turns bad. With the new Act, they would be able to do both 'savings' and 'investment' at the same financial institution, which would be able to do well in both good and bad economic times. Prior to the Act, most financial services companies were already offering both saving and investment opportunities to their customers. On the retail/consumer side, a bank called Norwest which would later merge with Wells Fargo Bank led the charge in offering all types of financial services products in 1986. American Express attempted to own almost every field of financial business (although there was little synergy among them). Things culminated in 1998 when Citibank merged with Travelers Insurance creating Citigroup Inc.. The merger violated the Bank Holding Company Act (BHCA), but Citibank was given a two-year forbearance that was based on an assumption that they would be able to force a change in the law. The Gramm-Leach-Bliley Act passed in November 1999, repealing portions of the BHCA and the Glass-Steagall Act, allowing banks, brokerages, and insurance companies to merge, thus making the CitiCorp/Travelers Group merger legal. Also prior to the passage of the Act, there were many relaxations to the Glass-Steagall Act. For example, a few years earlier, commercial Banks were allowed to pursue investment banking, and before that banks were also allowed to begin stock and insurance brokerage. Insurance underwriting was the only main operation they weren't allowed to do, something rarely done by banks even after the passage of the Act. Much consolidation occurred in the financial services industry since, but not at the scale some had expected. Retail banks, for example, do not tend to buy insurance underwriters, as they seek to engage in a more profitable business of insurance brokerage by selling products of other insurance companies. Other retail banks were slow to market investments and insurance products and package those products in a convincing way. Brokerage companies had a hard time getting into banking, because they do not have a large branch and backshop footprint. Banks have recently tended to buy other banks, such as the 2004 Bank of America and Fleet Boston merger, yet they have had less success integrating with investment and insurance companies. Many banks have expanded into investment banking, but have found it hard to package it with their banking services, without resorting to questionable tie-ins which caused scandals at Smith Barney. In the United States, Gramm-Leach-Bliley Act is the Federal legislation that allowed affiliations among banks, securities firms, and insurance companies under a financial holding company structure. The act reaffirmed the Federal Reserve's role as 'umbrella supervisor' over organizations that control banks, while also requiring that bank regulators and functional regulators supervise subsidiaries within a financial holding company. Sen. Phil Gramm (R, Texas), Rep. Jim Leach (R, Iowa), and Rep. Thomas J. Bliley, Jr. (R, Virginia), the co-sponsors of the Gramm-Leach-Bliley Act. (Sen.:- The US Senate; Rep:- the US House of Representatives; R:- Republican Party). / Президент Бил Клынтчэн (Bill Clinton) Акт Глэса-Стигэла от 1933 (Glass-Steagall Act of 1933). Например, Сытикоп (Citicorp; коммерческая банковская холдиньговая компания) слилась с Тчрэвэлёрз Груп (Travelers Group; страховая компания) в 1998, образовав конгломерат Сытигруп Инк. (Citigroup Inc.), Сытибэньк (Citibank), Смис Бани (Smith Barney), Праймэрика (Primerica), и Тчрэвэлёрз (Travelers). Бэньк оф Амэрика (Bank of America). , от Латинского слова Affirmo, означающее Утверждаю, . Сенатор Фил Грэм (Sen. Phil Gramm (R, Texas)), Республиканец Дьжим Лыч (Rep. Jim Leach (R, Iowa)), и Республиканец Томэс Дьжей. Блайли, Младший (Rep. Thomas J. Bliley, Jr. (R, Virginia)), соспонсоры Акта Грэма-Лича-Блайли (Gramm-Leach-Bliley Act)). Амэрикэн Экспрэс (American Express).

GRANDFATHER CLAUSE = ДЕДОВСКАЯ ОГОВОРКА (или ОГОВОРКА О НЕРАСПРОСТРАНЕНИИ ДЕЙСТВИЯ НА РАНЕЕ ИМЕВШИЕСЯ ОБСТОЯТЕЛЬСТВА) – Grandfather Clause is a provision that enabled motor carriers engaged in lawful trucking operations before the passage of the Motor Carrier Act of 1935 to secure common carrier authority w/o proving public convenience and necessity; a similar provision exists for other modes. The General Agreement on Tariffs and Trade (GATT) provision that allows the original contracting parties to exempt from general GATT obligations mandatory domestic legislation which is inconsistent with GATT provisions, but which existed before the GATT was signed. Newer members may also 'grandfather' domestic legislation if that is agreed to in negotiating the terms of accession. US legislation also provides for 'grandfather clauses'. / Генерального Соглашения о Тарифах и Торговле (ГСТТ или ГЯТ (GATT)). Дедовская Оговорка – положение, не относящееся к ранее начавшейся деятельности. Положение, включаемое в новое правило (или закон), о том, что лица или коммерческие предприятия, уже занимающиеся деятельностью, которой касаются новые правила, являются исключением из действия этих правил. Например, решение Совета по Стандартам Финансового Учёта (Financial Accounting Standards Board), вступающее в силу в 1998, требует,

чтобы коммерческие предприятия амортизировали (списывали) оценку репутации. Однако решение содержит положение о ранее начавшейся деятельности, которое исключает репутацию, приобретённую до 1998, из активов, подлежащих списанию.

GRANDFATHERED ACTIVITIES = АТАВИСТИЧЕСКИЕ ВИДЫ ДЕЯТЕЛЬНОСТИ (или УСТАРЕВШИЕ ВИДЫ ДЕЯТЕЛЬНОСТИ) – Grandfathered Activities are the nonbank activities, some of which would normally not be permissible for bank holding companies and foreign banks in the United States, but which were acquired or engaged in before a particular date. Such activities may be continued under the 'grandfather' clauses of the Bank Holding Company Act and the International Banking Act.

GRANNY DRESS = БАБУЛЬКИНО ПЛАТЬЕ – Granny Dress is a long loose-fitting dress usually with high neck and long sleeves.

GRANT = ДАР (или ГРАНТ) – Grant:- (1) agree to give or allow (something requested) to, e.g., 'they were granted a meeting'; (2) agree or admit to (someone) that (something) is true, e.g., 'he hasn't made much progress, I'll grant you that'. Grant is:- an amount of money given especially by the government to a person or organization for a special purpose:- (i) student/research grant; or (ii) local authority/government grant. Grant is a bounty, contribution, gift, or subsidy (in cash or kind) bestowed by a government or other organization (called the grantor) for specified purposes to an eligible recipient (called the grantee). Grants are usually conditional upon certain qualifications as to the use, maintenance of specified standards, or a proportional contribution by the grantee or other grantor(s). Grant is a sum of money given by a government or other organization for a particular purpose, e.g., 'a research grant'. Grant (1975-Fenruary; USA):- The term Grant means money or property provided in lieu of money paid or furnished by the Federal Government to recipients under programs that provide financial assistance and support for basic research. The term does not include technical assistance programs which provide services instead of money or other assistance in the form of general revenue sharing, loans, loan guarantees, or insurance. Also the term does not apply to direct payments or direct loans to individuals. (b) The term Recipient includes the following types of organizations which are receiving Federal funds:- (i) Public and private institutions of higher education, (ii) Public and private hospitals, and (iii) Other public and private nonprofit organizations, such as (but not limited to) community action agencies, Head Start agencies, research institutes, educational associations, and health centers. The term does not include foreign or international organizations (such as agencies of the United Nations and Government-owned facilities (GOCO) or research centers providing continuing support for mission-oriented, large scale programs which are (usually) Government-owned or controlled, or are designed as federally-funded research and development centers. (c) The term Agreement means a cooperative agreement, grant, contract or other types of instruments used to reflect a relationship between the Federal Government and the recipient but does not include procurements for goods and services which are normally conducted through solicited competitive bidding or provide for a payment of a fee or profit to the recipient.

GRANTEE = ОДАРЯЕМЫЙ (или ПОЛУЧАТЕЛЬ ПРАВОВОГО ТИТУЛА) – (1) In real estate, a Grantee is a person who receives property after a sale or other transfer of title. In business, a Grantee could be a person who receives a stock option grant. The idea is that the grantee receives something from another person, often called the Grantor. Grantees receive title and claim to assets of all kinds:- stock options, real estate, or the legal use of some sort of asset. See also Grant. In the legal world, a Grantee is a person who receives something. Grantee is one to whom a grant is made; specifically:- one to whom a grant by deed is made.

(2) Grantee is the buyer of real estate. See also Deed. Grantee is the party who receives title to real property (buyer, recipient, donee) from the seller (grantor) by a document called a Grant Deed or Quit Claim Deed. Grantee is a person to whom a grant or conveyance is made. In contracts and other agreements, it is important to understand who exactly the grantee is. Grantee:- in a case involving the sale of land, the buyer is commonly known as the Grantee.

GRANT–IN–AID = ЦЕЛЕВАЯ ДОТАЦИЯ (или ДАР В ПОМОЩЬ, или ГРАНТ В ПОМОЩЬ) – Grant-In-Aid is money coming from central government for a specific project. This kind of funding is usually used when the government and parliament have decided that the recipient should be publicly funded but operate with reasonable independence from the state. In the United Kingdom, most bodies in receipt of grants-in-aid are non-departmental public bodies. A grant-in-aid is funds allocated by one level of government to another level of government to be used for specific purposes. Such funds are usually accompanied by requirements and standards set by the governing body for how they are to be spent. An example of this would be how the United States Congress required states to raise the drinking age for alcohol from 18 to 21 in order for the individual states to continue to qualify for federal funds for interstate highways located within each state. See also Subsidy. / Смотрите также Субсидия (Subsidy).

GRANTOR = ДАРИТЕЛЬ (или ПРЕДОСТАВИВШИЙ) – (1) Grantor is the party who transfers title in real property (seller, giver) to another (buyer, recipient, donee) by grant deed or quit claim deed. See also Grant. Grantor is a person or institution that makes a grant or conveyance. Grantor is an individual who conveys or transfers ownership of property. In real property law, an individual who sells land is known as the Grantor. / Даритель – лицо или учреждение, которое делает дар или передачу.

(2) The term Grantor can refer to the creator of a trust – the individual whose assets are put into the trust – regardless of whether the grantor also functions as the trustee. Grantor is the person or organization that creates a Trust for the benefit of another person or organization. Grantor is eligible bestower of an easement, grant, or right, such as the one who establishes a trust and transfers his or her property to it. Also called Settlor. / Предоставивиший или Даритель или Доверитель или Лицо, Передающее Право (Grantor):- в законодательстве:- лицо, совершающее акт передачи права владения собственностью или оформляющее доверенность. Называется также (Settlor).

(3) A Grantor, or Writer, is the seller of either call or put options who collects the premiums for which the options are sold. Options are sold through exchanges to option holders who are responsible for the payment of the premium. Synonymous with 'Option Writer', a grantor creates contracts for selling options for an underlying interest or asset. For example, say a grantor has sold a call option or assumed a short position in a call option. If the call option is exercised, then the grantor has to sell the underlying stock at the strike price. Conversely, if the grantor sells a put option, the grantor is said to be long and must purchase the underlying stock at the strike price. Serving the function of an option writer is relatively risky, especially on a naked position when the writer does not actually have possession of the asset involved in the contract. The issuer, maker, or writer of an option contract who, in return for the premium paid for the option, stands ready to purchase the underlying commodity (or futures contract) in the case of a put option or to sell the underlying commodity (or futures contract) in the case of a call option. In option trading, Grantor is the floor broker who grants (sells) any exchange option on the floor of the exchange (either as agent or principal), until the time such option is accepted by the clearing organization. Thereafter, the term means the clearing member that cleared such option for the customer who granted it. See also Seller or Writer. Writer or Seller or Grantor is an individual who sells an option, establishing a short position. / В торговле опционами, брокер на полу, который предоставляет (продаёт) любой биржевой опцион на полу биржи (выступая при этом в качестве агента или принципала) до момента, когда такой опцион будет акцептован клиринговой организацией. После этого, данный термин обозначает клирингового члена, который осуществил расчёт по такому опциону для клиента, который предоставил данный опцион. Смотрите также Продавец (Seller) и Выписавший (Writer). Предоставивиший или Даритель или Доверитель или Лицо, Передающее Право (Grantor):- в торговле опционами:- торговец, ведущий операции с опционами, продающий опцион на

покупку (call option) или опцион на продажу (put option) и получающий доход в виде премии (premium income). Даритель продаёт право на покупку ценных бумаг по определённой цене в случае продажи опциона на покупку и право на продажу ценных бумаг по определённой цене в случае продажи опциона на продажу.

(4) Grantor:- in a sale of realty, the Grantor is the seller.

GRANTS = ГРАНТЫ (или ДОТАЦИИ) – Grants are the voluntary transfer payments. They may be current or capital in nature. Grants from government or the European Union to producers are subsidies.

GRANULAR = ГРАНУЛЯРНЫЙ (или ГРАНУЛИРОВАННЫЙ) – Granular:- small grains or pellets. An aggregate similar in size to a crumb but more dense.

GRANULATED BREWERS MILLED RICE = ГРАНУЛИРОВАННЫЙ ОБРУШЕННЫЙ РИС ДЛЯ ПИВОВАРЕНИЯ – In the Rice industry of the United States, Granulated Brewers Milled Rice shall be milled Rice which has been crushed or granulated so that 95.0 percent or more will pass through a 5 sieve, 70.0 percent or more will pass through a 4 sieve, and not more than 15.0 percent will pass through a 21/2 sieve.

GRANULES = ГРАНУЛЫ (или ВКЛЮЧЕНИЯ) – (1) Granules are chemical formulations in small pellets, formed from various inert clays or sand impregnated with pesticide or fertilizer. / Под Гранулами, от Латинского слова Granulum, означающее Зёрнышко, понимаются .

(2) Granules:- bullion, including its various alloys presented for sale in granulated form, often referred to as Grain. / Под Гранулами, от Латинского слова Granulum, означающее Зёрнышко, понимаются мельчайшие частицы сплавов определённого химического состава.

GRAPEVINE = ВИНОГРАДНАЯ ЛОЗА – Grapevines are vines, cuttings, grafts, scions, buds, rootstock and other plants and plant products of grapevine for vegetative propagation. / Виноградные Лозы – лозы, черенки, привои, побеги, почки, корневище и иные растения и продукты растений виноградной лозы для вегетативного размножения.

GRAPHITE = ГРАФИТ – Graphite is a crystalline form of carbon having a laminar structure, which is used as a lubricant. It may be of natural or synthetic origin. Graphite is the crystalline allotrophic form of carbon. / Под Графитом, от Немецкого слова Graphit, от Греческого слова Gráphō, означающее Пишу, понимается минерал, наиболее устойчивая кристаллическая полиморфная модификация самородного углерода. Цвет от чёрного до тёмного стально-серого. Твёрдость по минералогической шкале 1; плотность 2 200–2 300 килограммов на кубический метр (кг/м^3). Огнеупорен, обладает электрической проводимостью. Графит получают искусственно нагреванием антрацита без доступа воздуха. Используется в литейном деле, станкостроительной промышленности, производстве плавильных тиглей, электродов, смазок, карандашей, типографской краски и так далее, а также в атомных реакторах. Графит – минерал, гексагональная кристаллическая модификация чистого углерода, наиболее устойчивая в условиях земной коры. Хорошо образованные кристаллы редки, форма их обычно пластинчатая. Чаще природный графит представлен листочками без кристаллографических очертаний и их агрегатами. Кристаллическая решётка графита – слоистого типа. В слоях атомы C расположены в узлах гексагональных ячеек слоя. Каждый атом C окружён тремя соседними с расстоянием 1.42Å. Слои располагаются параллельно на расстоянии 3.55Å, с симметрической повторяемостью через один, так как они взаимно смещены. Связь между атомами C в одном слое прочная, ковалентного типа; между слоями – слабая, остаточно-металлического типа. Особенности структуры графита и наличие разного типа связей обусловливают анизотропию ряда физических свойств. Так, остаточно-металлическая связь даёт непрозрачность, металлический блеск и высокую электропроводность. От слабой связи между атомными слоями зависит также характерная для графита спайность по одному направлению. Плотность 2 230 килограммов на кубический метр (кг/м^3). Твёрдость благодаря лёгкости разрыва между сетками, перпендикулярными плоскости (0001), равна 1 по минералогической шкале; в самом слое твёрдость высокая – 5.5 и выше. Большой прочностью связи между атомами самой сетки объясняется высокая температура плавления графита (3 850 ±50 °C). Графит хорошо проводит электричество (электрическое сопротивление кристаллов $0.42 \cdot 10^{-4}$ Ом на метр (Ом/м)). Графитовые порошки и блоки имеют значительно большее сопротивление и тем большее, чем выше их дисперсность (до 8–$20 \cdot 10^{-4}$ Ом/см). Графит – магнитноанизотропен, кислотоупорен, окисляется только при высоких температурах, но растворяется в расплавленном железе и сгорает в расплавленной селитре. Графит обладает низким сечением захвата тепловых нейтронов, легко обрабатывается. Свойства графита значительно изменяются при облучении нейтронами:- увеличиваются электросопротивление, модуль упругости и твёрдости; теплопроводность уменьшается приблизительно в 20 раз. Различают месторождения кристаллического графита, связанного с магматическими горными породами или кристаллическими сланцами, и месторождения скрытокристаллического графита, образовавшегося при метаморфизме углей. В магматических горных породах графит кристаллизуется из расплава и отмечается в виде отдельных чешуек и скоплений (гнёзда и штоки) разной величины и разного содержания (например, Ботогольское Месторождение в бывшей Бурятской Автономной Советской Социалистической Республике (АССР), где разрабатывали участки чистого графита без обогащения). Графит добывают в основном из кристаллических сланцев, образовавшихся в результате глубокого метаморфизма глин, содержащих битуминозные вещества. Содержание графита в кристаллических сланцах достигает 3–10–20% и более. Графитовую чешуйку из руды извлекают флотацией. В бывшем Союзе Советских Социалистических Республик (СССР) графит добывался в Украине; за рубежом – в Чехословакии, Австрии, Федеративной Республике Германии (ФРГ), Финляндии, Малагасийской Республике, и в Шри Ланке (бывшем Цейлоне). Скрытокристаллический графит образуется при изменении пластов угля под воздействием магматических пород. В месторождениях этого типа содержание углерода 60–85:; руды используются без обогащения. Крупные месторождения такого графита были известны в СССР на Урале и в Красноярском Крае; за рубежом – в Мексике, в Южной Корее и других. Наряду с природными графитами к кристаллической разновидности принадлежат также Искусственные (Доменный и Карбидный Графиты). Доменный Графит выделяется при медленном охлаждении больших масс чугуна, Карбидный Графит – при термическом разложении карбидов. К скрытокристаллической разновидности относится графит, получаемый в электрических печах путём нагревания углей до температуры более 2 200 °C. Благодаря совокупности ценных физико-химических свойств графит применяют во многих областях современной промышленности. Высокая жаропрочность обусловливает использование графита в производстве огнеупорных материалов и изделий:- литейных форм, плавильных тиглей, керамики, противопригарных красок в литейном деле и прочем. Искусственный кусковой графит применяют как эрозионностойкие покрытия для сопел ракетных двигателей, камер сгорания, носовых конусов и для изготовления некоторых деталей ракет. Вследствие высокой электропроводности его широко используют для изготовления электротехнических изделий и материалов:- гальванических элементов, щелочных аккумуляторов, электроизделий, скользящих контактов, нагревателей, проводящих покрытий и прочего. Благодаря химической стойкости графит применяют в химическом машиностроении в качестве конструкционных материалов (производство плит для футеровки, труб, теплообменников и прочего). Малый коэффициент трения графита позволяет использовать его для изготовления смазочных и антифрикционных изделий. Блоки из очень чистого искусственного графита используют в ядерной

технике как замедлители нейтронов. Тонкоизмельчённый скрытокристаллический графит в виде суспензии применяется для предупреждения образования накипи на стенках паровых котлов. Графит также применяют для производства карандашей и красок. Все перечисленные области применения графита предъявляют очень разнообразные требования к его качеству (чистоте, величине кристаллов, форме частиц и тому подобному), поэтому графиты разных типов не всегда могут быть взаимозаменяемыми. Среди бывших социалистических стран по размерам добычи графита выделялись СССР и Чехословакия. В капиталистическом мире наибольшие количества графита давали Южная Корея, Мексика, Австрия, ФРГ. Лучшие сорта крупнокристаллического графита (в небольших количества) добывали Цейлон и Малагасийская Республика.

GRAPHITE FIBER = ГРАФИТОВОЕ ВОЛОКНО – Graphite Fiber:- although the terms carbon and graphite are used interchangeably to describe these fibers, graphite fibers are more accurately defined as fibers that are 99+% carbonized while the term carbon is used for any fiber carbonized to 93 to 95% or more. Graphite Fiber is a fiber made from a precursor by an oxidation, carbonization, and graphitization process. See also Carbon Fiber. Graphite Composite Material Design Guide (light weight, high performance products):- the purpose of this design guide is to provide general information and specifications on graphite (carbon fiber) composite materials and some guidelines for designing lightweight high performance products with graphite composites. If you have more specific questions, please contact our engineers at Performance Composites, and they will gladly assist you. Graphite composites have exceptional mechanical properties which are unequaled by other materials. The material is strong, stiff, and lightweight. Graphite composite is the material of choice for applications where lightweight and superior performance is paramount, such as components for spacecrafts, fighter aircrafts, and racecars. Composite materials are made by combining reinforcement (fiber) with matrix (resin), and this combination of the fiber and matrix provide characteristics superior to either of the materials alone. In a composite material, the fiber carry majority of the load, and is the major contributor in the material properties. The resin helps to transfer load between fibers, prevents the fibers from buckling, and binds the materials together. Graphite Fibers (sometimes called Carbon Fibers) are made from organic polymer such as polyacrylonitrile. The material is drawn into fibers and kept under tension while it is heated under high temperature (> 1 000 °C). 2 dimensional carbon-carbon crystals (graphite) are formed when the hydrogen is driven out. The carbon-carbon chain has extremely strong molecular bonds (diamond is a 3 dimensional carbon-carbon crystal), and that is what gives the fibers its superior mechanical properties. Historically, graphite composites have been very expensive, which limited its use to only special applications. However, over the past fifteen years, as the volume of graphite fiber consumption has increased and the manufacturing processes have improved, the price of graphite composites has steadily declined. Today graphite composites are economically viable in many applications such as sporting goods, performance boats, performance vehicles, and high performance industrial machinery. Applications of Graphite Composite Materials:- composite materials are extremely versatile. The engineer can choose from a wide variety of fibers and resins to obtain the desired material properties. Also the material thickness and fiber orientations can be optimized for each application. The advantages of graphite composites are:- (i) high specific stiffness (stiffness divided by density); (ii) high specific strength (strength divided by density); (iii) extremely low coefficient of thermal expansion (CTE); and (iv) X-ray transparent (due to its low molecular weight). Examples are:- spacecraft structure; aircraft structure; drive shaft for trucks and high performance vehicles; machinery rollers; sail boat mast and boom; bicycle frame; and machinery components that experience high acceleration and require stiffness and precision. Applications for High Specific Strengths:- graphite composites are widely used for lightweight structures that need to carry extremely high loads. Examples are:- motorcycle components (skid plates, rock guards); fishing pole; golf club shaft; aircraft structure; satellite antenna structures; and racecar chassis. Applications for Low CTE:- graphite fiber has a negative coefficient of thermal expansion, which means when it is heated it will shrink. When the graphite fibers are put into a resin matrix (positive CTE), the composite can be tailored to have almost zero CTE. Graphite composites are used for high precision and thermally stable applications. Examples are:- high precision antennas; scanning and imaging machines; precision optical devices; and metrology equipment. Manufacturing Process:- graphite composite components are manufactured utilizing a molding process. The graphite fibers can be woven into cloth, braided into tubes, or made into unidirectional tapes. The fibers are next coated with resin. This fiber and resin mix can be partially cured then frozen to create a pre-preg, or the fiber and resin mix can be used wet. The graphite fiber and resin mix is then placed into a mold in layers. The number of layers and the orientation of the layers will depend on the mechanical properties desired. The layers of graphite is then compacted and consolidated in the mold by pressure from a press or from a vacuum bag. Depending on the resin system, the part can be cured at room temperature or elevated temperature. Once the part is cured, the part is removed from the mold, and it is ready for finishing operations such as trimming and drilling. Design Information:- graphite composites are considered designer's material, because the parts can be tailored to have strength and or stiffness in the directions and locations that are necessary by strategically placing materials and orienting fiber direction. Also the design and manufacturing flexibility that graphite composites offers provide opportunities to consolidate parts and to incorporate many features into the part to further reduce the total part price. Tooling:- molds are used to define the shape of the composite parts. The graphite composite part will pick up all shapes and features of the molds; therefore the quality of the part is heavily influenced by the quality of the mold. The molds can be either male or female. The female molds are the most common and they will produce a part with a smooth exterior surface while a male mold will produce a smooth interior surface. A matched mold (male and female) is required if the part is consolidated using a press. The molds can be made with composite materials, metal filled epoxy, or machined from aluminum or steel. The type of mold and materials used depends on the type of part and the production quantity.

GRAPNEL = ДРЕК (или КОШКА) – Grapnel (maritime term):- a small anchor with several arms used for dragging purposes.

GRASS CLOTH = ПОЛОТНО ИЗ ТРАВ (или ТРАВНОЕ ПОЛОТНО) – Grass Cloth is a plain-weave, loosely woven fabric made from such fibers as hemp, ramie, and even nettle. Today, true grass cloth is relatively rare, but the appearance of grass cloth is copied in wallpaper and fabrics of man-made fibers. Grass Cloth:- a lustrous plain textile of usually loosely woven fibers.

GRASSES = ТРАВЫ – Grasses are the Plants of the Family Gramineae (Poaceae) which range from small, twisted, erect, or creeping annuals to perennials. Stems are called Culms with well-defined nodes and internodes. Leaves arise alternately in two rows from the nodes. The leaf is composed of two parts, the leaf sheath which clasps the stem, the margins overlapping to form the tube, and the leaf blade which is usually thin, narrow, and linear with parallel venation; a large member among the monocotyledonous plants (monocots).

GRASS–GREEN KERNELS = ЗЕЛЁНАЯ ЗЕРНОВКА (или ЗЕЛЁНЫЕ ЯДРА) – Grass-Green Kernels are kernels of Wheat that are distinctly green because of immaturity. / К Зелёной Зерновке (Зелёным Ядрам) относится зерновка (ядра) Пшеницы, имеющая чётко выраженный зелёный цвет вследствие своей незрелости.

GRASSHOPPER AND ARMYWORM DAMAGE = ПОВРЕЖДЕНИЕ САРАНЧОЙ И ПОХОДНЫМИ ЧЕРВЯМИ – Grasshoppers and Armyworms chew out sections of kernels, particularly the ends and sides. At an early stage, armyworms may chew tunnels through the kernels. This destroys the endosperm, and leaves the exposed chewed areas susceptible to fungal and bacterial infections. Heavy discolorations and moulds may result. / эндосперм (endosperm) . Значительные изменения цвета и . Повреждение – одно из понятий теории надёжности; событие, заключающееся в нарушении исправности изделия. Повреждение может быть

существенным и являться причиной нарушения работоспособности (отказа) и несущественным, при котором работоспособность изделия сохраняется.

GRASSY = ТРАВЯНИСТОЕ – Grassy:- resembling grass especially in color.

GRASSY STUNT = ТРАВЯНАЯ КАРЛИКОВОСТЬ – Grassy Stunt is a viral disease caused by rice grassy stunt virus (RGSV). The disease is transmitted by the brown planthopper Nilaparvata lugens. Grassy stunt is widely distributed in South and Southeast Asia and is characterized by pronounced stunting, proliferation of tillers, and short and narrow pale green to yellow leaves.

GRATING = РЕШЕТЧАТЫЙ НАСТИЛ – Grating is a floor of a refrigerated hold/container which is designed so that air can flow along the floor and into the space where the floor is not covered by a load. T-bar gratings comprising aluminum tee profiles are used in refrigerated containers. Hole gratings (braced boards with holes) are normally used on refrigerated cargo ships. Grating (maritime term):- a wooden lattice-work covering a hatch or the bottom boards of a boat; similarly designed gratings of metal are frequently found on shipboard. / Grating – Пропускание или Просеивание.

GRATIS = ГРАТИС (или БЕСПЛАТНО) – Gratis:- without charge or recompense, e.g., the food was supplied gratis. Gratis comes from the Latin word for 'Favor'; so in English a party favor is a small item given gratis to everyone attending a party. Gratis is used as both an adjective ('The drinks were gratis') and an adverb ('Drinks were served gratis'). But however it's used, it means 'Free'. Middle English, from Latin Gratiis, Gratis, from ablative plural of Gratia Favor – more at Grace. Middle English, from Latin Grātīs, Without Charge, Out of Kindness, Free. Complimentary:- costing nothing; 'complimentary tickets'; 'free admission'. Without Payment; I'll give you this gratis. / В переводе с Латинского языка, Безвозмездно, Бесплатно, или Даром.

GRAVESTONE DOJI = НАДГРОБНЫЙ КАМЕНЬ ДОДЗИ (или СТЕЛА ДОДЗИ) – Gravestone Doji:- in a visual analysis, a Doji line that develops when the Doji is at, or very near, the Low of the day. / В визуальном анализе, Надгробный Камень Додзи или Стела Додзи – это линия Додзи, которая вырисовывается тогда, когда Додзи на или очень близко к минимуму торговой сессии конкретного дня биржевой торговли.

GRAVEYARD = МЕСТО ЗАХОРОНЕНИЯ – Graveyard Watch (maritime term):- the middle watch.

GRAVID = БЕРЕМЕННОЕ – Gravid:- an Insect containing fertilized eggs.

GRAVIMETRIC ANALYSIS = ГРАВИМЕТРИЧЕСКИЙ АНАЛИЗ – Gravimetric Analysis is a method of analysis whereby the dry weight of contaminant per unit volume of fluid can be measured showing the degree of contamination in terms of milligrams of contaminant per liter of fluid. / Под Гравиметрическим Анализом, от Латинского слова Gravis, означающее Тяжёлый, и Греческого слова Metréō, означающее Измеряю, понимается весовой анализ, один из важных методов количественного химического анализа, основанный на точном измерении массы вещества. Определяемое вещество обычно выделяют из анализируемой пробы в виде малорастворимого соединения известного постоянного химического состава, так как выделение вещества в химически чистом виде связано с большими трудностями, а иногда и невозможно. Гравиметрический анализ начинается с взятия точной навески анализируемой пробы и перевода её в раствор. Затем, прибавляя соответствующий реактив, получают малорастворимый осадок соединения, содержащего определяемое вещество. Осадок отделяют от раствора фильтрованием, промывают и сушат или прокаливают до постоянного значения массы. Зная навеску анализируемой пробы a, массу осадка b и его состав, вычисляют содержание определяемого вещества X (обычно, в % по массе):- $X = a \cdot F \cdot 100/b$, где F – фактор пересчёта, представляющий собой отношение атомной массы определяемого вещества (или величины, кратной атомной массе) к молекулярной массе соединения в осадке. Например, при определении содержания железа (атомной масса 55.85), выделенного в виде его окиси Fe_2O_3 (молярная масса 159.70), $F = (2 \cdot 55.85) / 159.70 = 0.699\ 4$. Наиболее ответственная операция гравиметрического анализа – получение легко фильтрующегося (по возможности крупнокристаллического) малорастворимого осадка (потеря вещества вследствие его растворимости не должна превышать 0.1 миллиграмма (мг)), свободного от примесей посторонних веществ, не удаляющихся при сушке или прокаливании. Гравиметрический анализ отличается большой точностью:- относительная ошибка опыта не превышает 0.1%, а при особо тщательной работе может быть доведена до 0.02–0.03%. Недостатки гравиметрического анализа – длительность выполнения и необходимость применения сравнительно больших количеств анализируемой пробы (~0.5 г). Последний недостаток устраняется при использовании микро- и ультрамикрометодов гравиметрического анализа (подробнее смотрите Микрохимический Анализ). Гравиметрический анализ применяют для определения химического состава горных пород, минералов, сплавов, для контроля качества сырья и готовой продукции в ряде отраслей промышленности. К разновидностям гравиметрического анализа относятся Пробирный Анализ и Электрогравиметрический Анализ. Смотрите также Аналитическая Химия, и Количественный Анализ.

GRAVITY = ТЯЖЕСТЬ (или ТЯГОТЕНИЕ, или ВЕС, или ПЛОТНОСТЬ) – (1) Gravity is a force which tries to pull two objects toward each other. Anything which has mass also has a gravitational pull. The more massive an object is, the stronger its gravitational pull is. Earth's gravity is what keeps you on the ground and what causes objects to fall. Gravity is what holds the planets in orbit around the Sun and what keeps the Moon in orbit around Earth. The closer you are to an object, the stronger its gravitational pull is. Gravity is what gives you weight. It is the force that pulls on all of the mass in your body. Gravity is the force of attraction by which terrestrial bodies tend to fall toward the center of the earth. / Под Силой Тяжести понимается равнодействующая силы тяготения тела (материальной точки) к Земле и центробежной силы инерции, обусловленная вращением Земли. Центробежная сила достигает максимального значения на земном экваторе, но и здесь она составляет 1/288 долю силы тяжести, то есть сила тяжести мало отличается от силы тяготения тела к Земле. Сила тяжести тела $P = mg$, где m – масса тела, g – ускорение свободного падения, которое в первом приближении зависит от географической широты места и его высоты над уровнем моря. Направление силы тяжести определяет вертикаль данного места. Под Тяготением или Гравитацией понимается взаимодействие (притяжение), существующее между любыми двумя частицами или телами и определяемое их массами; самое слабое из всех известных типов взаимодействия (например, для двух электронов оно в 10^{42} раз слабее их электромагнитного взаимодействия). В Ньютоновской Теории тяготение для двух материальных точек с массами m_1 и m_2, находящихся на расстоянии R одна от другой, справедлив Закон Всемирного Тяготения Ньютона:- $F = (Gm_1m_2) / R^2$, где G – гравитационная постоянная. Этот закон является фундаментальным для всей небесной механики. Он определяет орбиты движения небесных тел, фигуры равновесия небесных тел, объясняет приливные явления и так далее. Точное измерение поля тяготения Земли (Гравиметрия) даёт сведения о распределении масс в Земле и используется в геологической разведке. Современной теорией тяготения является так называемая Общая Теория Относительности. Тяготение или Гравитация или Гравитационное Взаимодействие – универсальное взаимодействие между любыми видами материи. Если это взаимодействие относительно слабое и тела движутся медленно (по сравнению со скоростью света), то справедлив закон всемирного тяготения Ньютона. В общем случае тяготение описывается созданной физиком-теоретиком Немецкого происхождения Альбертом Айнштайном (или Эйнштейном; (Albert Einstein; 1879–1955) общей теорией относительности. Эта теория

описывает тяготение как воздействие материи на свойства пространства и времени; в свою очередь, эти свойства пространства-времени влияют на движение тел и другие физические процессы. Таким образом, современная теория тяготения резко отличается от теории других видов взаимодействия – электромагнитного, сильного и слабого. Теория Тяготения Ньютона:- Первые высказывания о тяготении как всеобщем свойстве тел относятся к античности. Так, древнегреческий писатель, историк и философ-моралист, общественный деятель Плутарх (Plutarchos; около 46–около 127) писал:- 'Луна упала бы на Землю как камень, чуть только уничтожилась бы сила её полёта'. В XVI и XVII веках в Европе возродились попытки доказательства существования взаимного тяготения тел. Основатель теоретической астрономии Немец Йоханэс Кэпля (или Кеплер; Johannes Kepler; 1571–1630) говорил, что 'тяжесть есть взаимное стремление всех тел'. Итальянский физик Дьжованни Альфонсо Борэлли (или Борелли; Giovanni Alfonso Borelli; 1608–1679) пытался при помощи тяготения объяснить движение спутников Юпитера вокруг планеты. Однако научное доказательство существования всемирного тяготения и математическая формулировка описывающего его закона стали возможны только на основе открытых Английским физиком, математиком, механиком и астрономом Сэром Айзэком Ньютчэнэм (или Исааком Ньютоном; Sir Isaac Newton; 1642–1727) законов механики. Окончательная формулировка закона всемирного тяготения была сделана Ньютоном в вышедшем в 1687 главном его труде 'Математические Начала Натуральной Философии'. Закон тяготения Ньютона гласит, что две любые материальные частицы с массами m_A и m_B притягиваются по направлению друг к другу с силой F, прямо пропорциональной произведению масс и обратно пропорциональной квадрату расстояния r между ними:- $F = G\cdot((m_A m_B) / r^2)$ (1) (под материальными частицами здесь понимаются любые тела при условии, что их линейные размеры много меньше расстояния между ними; смотрите Материальная Точка). Коэффициент пропорциональности G называется Постоянной Тяготения Ньютона, или Гравитационной Постоянной. Численное значение G было определено впервые Британским физиком и химиком Хэнри Кэвэндишем (Henry Cavendish; 1731–1810) (1798), измерившим в лаборатории силы притяжения между двумя шарами. По современным данным, $G = (6.673 \pm 0.003)\cdot 10^{-8}$ см^3/г·сек^2. Следует подчеркнуть, что сама форма закона тяготения (1) (пропорциональность силы массам и обратная пропорциональность квадрату расстояния) проверена с гораздо большей точностью, чем точность определения коэффициента G. Согласно закону (1), сила тяготения зависит только от положения частиц в данный момент времени, то есть гравитационное взаимодействие распространяется мгновенно. Другой важной особенностью закона тяготения Ньютона является тот факт, что сила тяготения, с которой данное тело A притягивает другое тело B, пропорциональна массе тела B. Но так как ускорение, которое получает тело B, согласно второму закону механики, обратно пропорционально его массе, то ускорение, испытываемое телом B под влиянием притяжения тела A, не зависит от массы тела B. Это ускорение носит название Ускорения Свободного Падения. (Более подробно значение этого факта обсуждается ниже.) Для того чтобы вычислить силу тяготения, действующую на данную частицу со стороны многих других частиц (или от непрерывного распределения вещества в некоторой области пространства), надо векторно сложить силы, действующие со стороны каждой частицы (проинтегрировать в случае непрерывного распределения вещества). Таким образом, в Ньютоновской теории тяготения справедлив принцип суперпозиции. Ньютон теоретически доказал, что сила тяготения между двумя шарами конечных размеров со сферически симметричным распределением вещества выражается также формулой (1), где m_A и m_B – полные массы шаров, а r – расстояние между их центрами. При произвольном распределении вещества сила тяготения, действующая в данной точке на пробную частицу, может быть выражена как произведение массы этой частицы на вектор g, называемый Напряжённостью Поля Тяготения В Данной Точке. Чем больше величина (модуль) вектора g, тем сильнее поле тяготения. Из закона Ньютона следует, что поле тяготения – потенциальное поле, то есть его напряжённость g может быть выражена как градиент некоторой скалярной величины j, называемым Гравитационным Потенциалом:- $g = -\mathrm{grad}\ j$ (2). Так, потенциал поля тяготения частицы массы m может быть записан в виде:- $\varphi = -(Gm / r)$ (3). Если задано произвольное распределение плотности вещества в пространстве, r = r(r), то теория потенциала позволяет вычислить гравитационный потенциал j этого распределения, а следовательно, и напряжённость гравитационного поля g во всём пространстве. Потенциал j определяется как решение Уравнения Пуассона (Poisson's Equation; Француз Симеу Дёни Пуассо (или Пуассон; (Siméon Denis Poisson); 1781–1840). $Dj = 4\pi Gr$, (4), где D – Оператор Лапласа (Laplace Operator; Француз Пьер-Симу, маркий дё Ляпляс (Pierre-Simon, marquis de Laplace); 1749–1827). Гравитационный потенциал какого-либо тела или системы тел может быть записан в виде суммы потенциалов частичек, слагающих тело или систему (принцип суперпозиции), то есть в виде интеграла от выражений (3):- $\varphi = -\int(Gdm / r)$ (4a). Интегрирование производится по всей массе тела (или системы тел), r – расстояние элемента массы dm от точки, в которой вычисляется потенциал. Выражение (4a) является решением Уравнения Пуассона (4). Потенциал изолированного тела или системы тел определяется, вообще говоря, неоднозначно. Так, например, к потенциалу можно прибавлять произвольную константу. Если потребовать, чтобы вдали от тела или системы, на бесконечности, потенциал равнялся нулю, то потенциал определяется решением Уравнения Пуассона однозначно в виде (4a). Ньютоновская теория тяготения и Ньютоновская механика явились величайшим достижением естествознания. Они позволяют описать с большой точностью обширный круг явлений, в том числе движение естественных и искусственных тел в Солнечной системе, движения в других системах небесных тел:- в двойных звёздах, в звёздных скоплениях, в галактиках. На основе теории тяготения Ньютона было предсказано существование неизвестной ранее планеты Нептун и спутника Сириуса и сделаны многие другие предсказания, впоследствии блестяще подтвердившиеся. В современной астрономии закон тяготения Ньютона является фундаментом, на основе которого вычисляются движения и строение небесных тел, их эволюция, определяются массы небесных тел. Точное определение гравитационного поля Земли позволяет установить распределение масс под её поверхностью (гравиметрическая разведка) и, следовательно, непосредственно решать важные прикладные задачи. Однако в некоторых случаях, когда поля тяготения становятся достаточно сильными, а скорости движения тел в этих полях не малы по сравнению со скоростью света, тяготение уже не может быть описано законом Ньютона. Необходимость Обобщения Закона Тяготения Ньютона:- теория Ньютона предполагает мгновенное распространение тяготения и уже поэтому не может быть согласована со специальной теорией относительности (смотрите Теория Относительности), утверждающей, что никакое взаимодействие не может распространяться со скоростью, превышающей скорость света в вакууме. Нетрудно найти условия, ограничивающие применимость Ньютоновской теории тяготение. Так как эта теория не согласуется со специальной теорией относительности, то её нельзя применять в тех случаях, когда гравитационные поля настолько сильны, что разгоняют движущиеся в них тела до скорости порядка скорости света c. Скорость, до которой разгоняется тело, свободно падающее из бесконечности (предполагается, что там оно имело пренебрежимо малую скорость) до некоторой точки, равна по порядку величины корню квадратному из модуля гравитационного потенциала j в этой точке (на бесконечности j считается равным нулю). Таком образом, теорию Ньютона можно применять только в том случае, если $|j| << c^2$ (5). В полях тяготения обычных небесных тел это условие выполняется:- так, на поверхности Солнца $|j|/c^2 >> 4\cdot 10^{-6}$, а на поверхности белых карликов – порядка 10^{-3}. Кроме того, Ньютоновская теория неприменима и к расчёту движения частиц даже в слабом поле тяготения, удовлетворяющем условию (5), если частицы, пролетающие вблизи массивных тел, уже вдали от этих тел имели скорость, сравнимую со скоростью света. В частности, теория Ньютона неприменима для расчёта траектории света в поле тяготения. Наконец, теория Ньютона неприменима при расчётах переменного поля тяготения, создаваемого движущимися телами (например, двойными звёздами) на расстояниях r >

$l = ct$, где t – характерное время движения в системе (например, период обращения в системе двойной звезды). Действительно, согласно Ньютоновской теории, поле тяготения на любом расстоянии от системы определяется формулой (4a), то есть положением масс в тот же момент времени, в который определяется поле. Это означает, что при движении тел в системе изменения гравитационного поля, связанные с перемещением тел, мгновенно передаются на любое расстояние r. Но, согласно специальной теории относительности, изменение поля, происходящее за время t, не может распространяться со скоростью, большей c. Обобщение теории тяготения на основе специальной теории относительности было сделано Эйнштейном в 1915–16. Новая теория была названа её творцом Общей Теорией Относительности. Принцип Эквивалентности:- самой важной особенностью поля Тяготение, известной в Ньютоновской теории и положенной Эйнштейном в основу его новой теории, является то, что тяготение совершенно одинаково действует на разные тела, сообщая им одинаковые ускорения независимо от их массы, химического состава и других свойств. Так, на поверхности Земли все тела падают под влиянием её поля тяготения с одинаковым ускорением – ускорением свободного падения. Этот факт был установлен опытным путём ещё Итальянским физиком, механиком, астрономом, математиком и философом Галилео Галилеем (Galileo Galilei; 1564–1642) и может быть сформулирован как принцип строгой пропорциональности гравитационной, или тяжёлой, массы $m_Т$, определяющей взаимодействие тела с полем тяготения и входящей в закон (1), и инертной массы $m_И$, определяющей сопротивление тела действующей на него силе и входящей во второй закон механики Ньютона (смотрите Законы Механики Ньютона). Действительно, уравнение движения тела в поле тяготения записывается в виде:- $m_Иa = F = m_Тg$ (6), где a – ускорение, приобретаемое телом под действием напряжённости гравитационного поля g. Если $m_И$ пропорциональна $m_Т$ и коэффициент пропорциональности одинаков для любых тел, то можно выбрать единицы измерения так, что этот коэффициент станет равен единице, $m_И = m_Т$; тогда они сокращаются в уравнении (6), и ускорение a не зависит от массы и равно напряжённости g поля тяготения, $a = g$, в согласии с законом Галилея. (О современном опытном подтверждении этого фундаментального факта смотрите ниже.) Таким образом, тела разной массы и природы движутся в заданном поле тяготения совершенно одинаково, если их начальные скорости были одинаковыми. Этот факт показывает глубокую аналогию между движением тел в поле тяготения и движением тел в отсутствие тяготения, но относительно ускоренной системы отсчёта. Так, в отсутствие тяготения тела разной массы движутся по инерции прямолинейно и равномерно. Если наблюдать эти тела, например, из кабины космического корабля, который движется вне полей тяготения с постоянным ускорением за счёт работы двигателя, то, естественно, по отношению к кабине все тела будут двигаться с постоянным ускорением, равным по величине и противоположным по направлению ускорению корабля. Движение тел будет таким же, как падение с одинаковым ускорением в постоянном однородном поле тяготения. Силы инерции, действующие в космическом корабле, летящем с ускорением, равным ускорению свободного падения на поверхности Земли, неотличимы от сил гравитации, действующих в истинном поле тяготения в корабле, стоящем на поверхности Земли. Следовательно, силы инерции в ускоренной системе отсчёта (связанной с космическим кораблём) эквивалентны гравитационному полю. Этот факт выражается принципом эквивалентности Эйнштейна. Согласно этому принципу, можно осуществить и процедуру обратную описанной выше имитации поля тяготения ускоренной системой отсчёта, а именно, можно ‘уничтожить’ в данной точке истинное гравитационное поле введением системы отсчёта, движущейся с ускорением свободного падения. Действительно, хорошо известно, что в кабине космического корабля, свободно (с выключенными двигателями) движущегося вокруг Земли в её поле тяготения, наступает состояние невесомости – не проявляются силы тяготения. Эйнштейн предположил, что не только механическое движение, но и вообще все физические процессы в истинном поле тяготения, с одной стороны, и в ускоренной системе в отсутствие тяготения, с другой стороны, протекают по одинаковым законам. Этот принцип получил название ‘Сильного Принципа Эквивалентности’ в отличие от ‘Слабого Принципа Эквивалентности’, относящегося только к законам механики. Основная Идея Теории Тяготения Эйнштейна:- рассмотренная выше система отсчёта (космический корабль с работающим двигателем), движущаяся с постоянным ускорением в отсутствие поля тяготения, имитирует только однородное гравитационное поле, одинаковое по величине и направлению во всём пространстве. Но поля тяготения, создаваемые отдельными телами, не таковы. Для того чтобы имитировать, например, сферическое поле тяготения Земли, нужны ускоренные системы с различным направлением ускорения в различных точках. Наблюдатели в разных системах, установив между собой связь, обнаружат, что они движутся ускоренно друг относительно друга, и тем самым установят отсутствие истинного поля тяготения. Таким образом, истинное поле тяготения не сводится просто к введению ускоренной системы отсчёта в обычном пространстве, или, говоря точнее, в пространстве-времени специальной теории относительности. Однако Эйнштейн показал, что если, исходя из принципа эквивалентности, потребовать, чтобы истинное гравитационное поле было эквивалентно локальным соответствующим образом ускоренным в каждой точке системам отсчёта, то в любой конечной области пространство-время окажется искривленным – Неевклидовым. Это означает, что в трёхмерном пространстве геометрия, вообще говоря, будет Неевклидовой (сумма углов треугольника не равна p, отношение длины окружности к радиусу не равно 2p и так далее), а время в разных точках будет течь по-разному. Таким образом, согласно теории тяготения Эйнштейна, истинное гравитационное поле является не чем иным, как проявлением искривления (отличия геометрии от Евклидовой) четырёхмерного пространства-времени. Следует подчеркнуть, что создание теории тяготения Эйнштейна стало возможным только после открытия Неевклидовой геометрии Русским математиком Николаем Ивановичем Лобачевским (1792–1856), Венгерским математиком Яношем Бойайем (János Bolyai; 1802–1860), Немецкими математиками Йоханом Калем Фридрихём Гауссом (Johann Carl Friedrich Gauss; 1777–1855) и Георгом Фридрихём Бернхардом Риманом (Georg Friedrich Bernhard Riemann; 1826–1866). В отсутствие тяготения движение тела по инерции в пространстве-времени специальной теории относительности изображается прямой линией, или, на математическом языке, экстремальной (геодезической) линией. Идея Эйнштейна, основанная на принципе эквивалентности и составляющая основу теории тяготения, заключается в том, что и в поле тяготения все тела движутся по геодезическим линиям в пространстве-времени, которое, однако, искривлено, и, следовательно, геодезические линии уже не прямые. Массы, создающие поле тяготения, искривляют пространство-время. Тела, которые движутся в искривлённом пространстве-времени, и в этом случае движутся по одним и тем же геодезическим линиям независимо от массы или состава тела. Наблюдатель воспринимает это движение как движение по искривлённым траекториям в трёхмерном пространстве с переменной скоростью. Но с самого начала в теории Эйнштейна заложено, что искривление траектории, закон изменения скорости – это свойства пространства-времени, свойства геодезических линий в этом пространстве-времени, а следовательно, ускорение любых различных тел должно быть одинаково и, значит, отношение тяжёлой массы к инертной (от которого зависит ускорение тела в заданном поле тяготения, смотрите формулу (6)) одинаково для всех тел, и эти массы неотличимы. Таким образом, поле тяготения, по Эйнштейну, есть отклонение свойств пространства-времени от свойств плоского (не искривлённого) многообразия специальной теории относительности. Вторая важная идея, лежащая в основе теории Эйнштейна, – утверждение, что тяготение, то есть искривление пространства-времени, определяется не только массой вещества, слагающего тело, но и всеми видами энергии, присутствующими в системе. Эта идея явилась обобщением на случай теории тяготения принципа эквивалентности массы (m) и энергии (E) специальной теории относительности, выражающейся формулой $E = mc^2$. Согласно этой идее, тяготение зависит не только от распределения масс в пространстве, но и от их движения, от давления и натяжений, имеющихся в телах, от

электромагнитного поля и всех других физических полей. Наконец, в теории тяготения Эйнштейна обобщается вывод специальной теории относительности о конечной скорости распространения всех видов взаимодействия. Согласно Эйнштейну, изменения гравитационного поля распространяются в вакууме со скоростью c. Уравнения Тяготения Эйнштейна:- в специальной теории относительности в инерциальной системе отсчёта квадрат четырёхмерного ‘расстояния’ в пространстве-времени (интервала ds) между двумя бесконечно близкими событиями записывается в виде:- $ds^2 = (cdt)^2 – dx^2 – dy^2 – dz^2$ (7), где t – время, x, y, z – прямоугольные декартовы (пространственные) координаты. Эта система координат называется Галилеевой. Выражение (7) имеет вид, аналогичный выражению для квадрата расстояния в Евклидовом трёхмерном пространстве в декартовых координатах (с точностью до числа измерений и знаков перед квадратами дифференциалов в правой части). Такое пространство-время называют плоским, Евклидовым, или, точнее, псевдоевклидовым, подчёркивая особый характер времени:- в выражении (7) перед $(cdt)^2$ стоит знак ‘+’, в отличие от знаков ‘–‘ перед квадратами дифференциалов пространственных координат. Таким образом, специальная теория относительности является теорией физических процессов в плоском пространстве-времени (пространстве-времени Минковского; смотрите Пространство Минковского; Немецкий математик и физик Хэрман Минковски (Hermann Minkowski); 1864–1909). В пространстве-времени Минковского не обязательно пользоваться декартовыми координатами, в которых интервал записывается в виде (7). Можно ввести любые криволинейные координаты. Тогда квадрат интервала ds^2 будет выражаться через эти новые координаты общей квадратичной формой:- $ds^2 = g_{ik}dx^idx^k$ (8) (i, k = 0, 1, 2, 3), где x^1, x^2, x^3 – произвольные пространств, координаты, $x^0 = ct$ – временная координата (здесь и далее по дважды встречающимся индексам производится суммирование). С физической точки зрения переход к произвольным координатам означает и переход от инерциальной системы отсчёта к системе, вообще говоря, движущейся с ускорением (причём в общем случае разным в разных точках), деформирующейся и вращающейся, и использование в этой системе не декартовых пространственных координат. Несмотря на кажущуюся сложность использования таких систем, практически они иногда оказываются удобными. Но в специальной теории относительности всегда можно пользоваться и Галилеевой системой, в которой интервал записывается особенно просто. (В этом случае в формуле (8) $g_{ik} = 0$ при $i^1 k$, $g_{00} = 1$, $g_{ii} = –1$ при i = 1, 2, 3.) В общей теории относительности пространство-время не плоское, а искривлённое. В искривлённом пространстве-времени (в конечных, не малых, областях) уже нельзя ввести декартовы координаты, и использование криволинейных координат становится неизбежным. В конечных областях такого искривлённого пространства-времени ds^2 записывается в криволинейных координатах в общем виде (8). Зная g_{ik} как функции четырёх координат, можно определить все геометрические свойства пространства-времени. Говорят, что величины g_{ik} определяют метрику пространства-времени, а совокупность всех g_{ik} называют Метрическим Тензором. С помощью g_{ik} вычисляются темп течения времени в разных точках системы отсчёта и расстояния между точками в трёхмерном пространстве. Так, формула для вычисления бесконечно малого интервала времени dt по часам, покоящимся в системе отсчёта, имеет вид:- $dt = \sqrt{(g_{oo}dx^0 / c)}$. При наличии поля тяготения величина g_{00} в разных точках разная, следовательно, темп течения времени зависит от поля тяготения. Оказывается, что чем сильнее поле, тем медленнее течёт время по сравнению с течением времени для наблюдателя вне поля. Математическим аппаратом, изучающим неевклидову геометрию (смотрите Геометрия Риманова (Riemannian Geometry)) в произвольных координатах, является тензорное исчисление. Общая теория относительности использует аппарат тензорного исчисления, её законы записываются в произвольных криволинейных координатах (это означает, в частности, запись в произвольных системах отсчёта), как говорят, в ковариантном виде. Основная задача теории тяготения – определение гравитационного поля, что соответствует в теории Эйнштейна нахождению геометрии пространства-времени. Эта последняя задача сводится к нахождению метрического тензора g_{ik}. Уравнения тяготения Эйнштейна связывают величины g_{ik} с величинами, характеризующими материю, создающую поле:- плотностью, потоками импульса и тому подобными. Эти уравнения записываются в виде:- $R_{ik}(1/2)g_{ik}R = (8tG / c^4) T_{ik}$ (9). Здесь R_{ik} – так называемый Тензор Риччи (Ricci Curvature Tensor; Итальянский математик Грэгорио Риччи-Курбастро (Gregorio Ricci-Curbastro); 1853–1925), выражающийся через g_{ik}, его первые и вторые производные по координатам; $R = R_{ik}g^{ik}$ (величины g^{ik} определяются из уравнений $g_{ik}g^{km} = \delta^m_i$, где δ^m_i – Символ Кронекера (Kronecker Delta); Немецкий математик Лиопольд Кронэка (или Кронекер; Leopold Kronecker); 1823–1891); T_{ik} – так называемый Тензор Энергии-Импульса Материи, компоненты которого выражаются через плотность, потоки импульса и другие величины, характеризующие материю и её движение (под Физической Материей подразумеваются обычное вещество, электромагнитное поле, все другие физические поля). Вскоре после создания общей теории относительности Эйнштейн показал (1917), что существует возможность изменения уравнений (9) с сохранением основных принципов новой теории. Это изменение состоит в добавлении к правой части уравнений (9) так называемого ‘Космологического Члена’:- Lg_{ik}. Постоянная L, называется ‘Космологической Постоянной’, имеет размерность $см^{–2}$. Целью этого усложнения теории была попытка Эйнштейна построить модель Вселенной, которая не изменяется со временем (смотрите Космология). Космологический член можно рассматривать как величину, описывающую плотность энергии и давление (или натяжение) вакуума. Однако вскоре (в 1920-х) Советский математик Александр Александрович Фридман (1888–1925) показал, что уравнения Эйнштейна без L-члена приводят к эволюционирующей модели Вселенной, а Американский астроном Эдвэн Павэл Хабл (Edwin Powell Hubble; 1889–1953) открыл (1929) закон так называемого Красного Смещения для галактик, которое было истолковано как подтверждение эволюционной модели Вселенной. Идея Эйнштейна о статической Вселенной оказалась неверной, и хотя уравнения с L-членом тоже допускают нестационарные решения для модели Вселенной, необходимость в L-члене отпала. После этого Эйнштейн пришёл к выводу, что введение L-члена в уравнения тяготения не нужно (то есть что L = 0). Не все физики согласны с этим заключением Эйнштейна. Но следует подчеркнуть, что пока нет никаких серьёзных наблюдательных, экспериментальных или теоретических оснований считать L отличным от нуля. Во всяком случае, если $L \neq 0$, то, согласно астрофизическим наблюдениям, его абсолютная величина чрезвычайно мала:- $|L| < 10^{–55}$ $см^{–2}$. Он может играть роль только в космологии и практически совершенно не сказывается во всех других задачах теории тяготения. Везде в дальнейшем будет положено L = 0. Внешние уравнения (9) подобны уравнению (4) для Ньютоновского потенциала. В обоих случаях слева стоят величины, характеризующие поле, а справа – величины, характеризующие материю, создающую поле. Однако уравнения (9) имеют ряд существенных особенностей. Уравнение (4) линейно и поэтому удовлетворяет принципу суперпозиции. Оно позволяет вычислить гравитационный потенциал j для любого распределения произвольно движущихся масс. Ньютоновское поле тяготения не зависит от движения масс, поэтому уравнение (4) само не определяет непосредственно их движение. Движение масс определяется из второго закона механики Ньютона (6). Иная ситуация в теории Эйнштейна. Уравнения (9) не линейны, не удовлетворяют принципу суперпозиции. В теории Эйнштейна нельзя произвольным образом задать правую часть уравнений (T_{ik}), зависящую от движения материи, а затем вычислить гравитационное поле g_{ik}. Решение уравнений Эйнштейна приводит к совместному определению и движения материи, создающей поле, и к вычислению самого поля. Существенно при этом, что уравнения поля тяготения содержат в себе и уравнения движения масс в поле тяготения. С физической точки зрения это соответствует тому, что в теории Эйнштейна материя создаёт искривление пространства-времени, а это искривление, в свою очередь, влияет на движение материи, создающей искривление. Разумеется, для решения уравнений Эйнштейна необходимо знать характеристики материи, которые не зависят от гравитационных сил. Так, например, в случае идеального газа надо знать уравнение

состояния вещества – связь между давлением и плотностью. В случае слабых гравитационных полей метрика пространства-времени мало отличается от Евклидовой и уравнения Эйнштейна приближённо переходят в уравнения (4) и (6) теории Ньютона (если рассматриваются движения, медленные по сравнению со скоростью света, и расстояния от источника поля много меньше, чем $l = ct$, где t – характерное время изменения положения тел в источнике поля). В этом случае можно ограничиться вычислением малых поправок к уравнениям Ньютона. Эффекты, соответствующие этим поправкам, позволяют экспериментально проверить теорию Эйнштейна (смотрите ниже). Особенно существенны эффекты теории Эйнштейна в сильных гравитационных полях. Некоторые Выводы Теории Тяготения Эйнштейна:- ряд выводов теории Эйнштейна качественно отличается от выводов Ньютоновской теории тяготения. Важнейшие из них связаны с возникновением 'Чёрных Дыр', сингулярностей пространства-времени (мест, где формально, согласно теории, обрывается существование частиц и полей в обычной, известной нам форме) и существованием гравитационных волн. Чёрные Дыры:- согласно теории Эйнштейна, вторая космическая скорость в сферическом поле тяготения в пустоте выражается той же формулой, что и в теории Ньютона:- $v_2 = \sqrt{(2Gm / r)}$ (10). Следовательно, если тело массы m сожмётся до линейных размеров, меньших величины $r = 2\ Gm/c^2$, называемой Гравитационным Радиусом, то поле тяготения становится настолько сильным, что даже свет не может уйти от него на бесконечность, к далёкому наблюдателю; для этого потребовалась бы скорость больше световой. Такие объекты получили название Чёрных Дыр. Внешний наблюдатель никогда не получит никакой информации из области внутри сферы радиуса $r = 2Gm/c^2$. При сжатии вращающегося тела поле Тяготение, согласно теории Эйнштейна, отличается от поля не вращающегося тела, но вывод об образовании чёрной дыры остаётся в силе. В области размером меньше гравитационного радиуса никакие силы не могут удержать тело от дальнейшего сжатия. Процесс сжатия называется Гравитационным Коллапсом. При этом растёт поле тяготения – увеличивается искривлённость пространства-времени. Доказано, что в результате гравитационного коллапса неизбежно возникает сингулярность пространства-времени, связанная, по-видимому, с возникновением его бесконечной искривлённости. (Об ограниченности применимости теории Эйнштейна в таких условиях смотрите следующий раздел.) Теоретическая астрофизика предсказывает возникновение чёрных дыр в конце эволюции массивных звёзд (смотрите Релятивистская Астрофизика); возможно существование во Вселенной чёрных дыр и другого происхождения. Чёрные дыры, по-видимому, открыты в составе некоторых двойных звёздных систем. Гравитационные Волны:- теория Эйнштейна предсказывает, что тела, движущиеся с переменным ускорением, будут излучать гравитационные волны. Гравитационные волны являются распространяющимися со скоростью света переменными полями приливных гравитационных сил. Такая волна, падая, например, на пробные частицы, расположенные перпендикулярно направлению её распространения, вызывает периодические изменения расстояния между частицами. Однако даже в случае гигантских систем небесных тел излучение гравитационных волн и уносимая ими энергия ничтожны. Так, мощность излучения за счёт движения планет Солнечной системы составляет около 10^{11} эрг/сек, что в 10^{22} раз меньше светового излучения Солнца. Столь же слабо гравитационные волны взаимодействуют с обычной материей. Этим объясняется, что гравитационные волны до сих пор не открыты экспериментально. Квантовые Эффекты. Ограничения Применимости Теории Тяготения Эйнштейна:- Теория Эйнштейна – не квантовая теория. В этом отношении она подобна классической электродинамике Дьжеймза Клока Мэксвэла (или Максвелла; James Clerk Maxwell; 1831–1879). Однако наиболее общие рассуждения показывают, что гравитационное поле должно подчиняться квантовым законам точно так же, как и электромагнитное поле. В противном случае возникли бы противоречия с принципом неопределённости для электронов, фотонов и так далее. Применение квантовой теории к гравитации показывает, что гравитационные волны можно рассматривать как поток квантов – 'гравитонов', которые так же реальны, как и кванты электромагнитного поля – фотоны. Гравитоны представляют собой нейтральные частицы с нулевой массой покоя и со спином, равным 2 (в единицах Постоянной Планка η (или h) (Planc's Constant; Макс Каль Эрнст Людвихь Плянк (или Планк; Max Karl Ernst Ludwig Planck); 1858–1947)). В подавляющем большинстве мыслимых процессов во Вселенной и в лабораторных условиях квантовые эффекты гравитации чрезвычайно слабы, и можно пользоваться не квантовой теорией Эйнштейна. Однако квантовые эффекты должны стать весьма существенными вблизи сингулярностей поля тяготения, где искривления пространства-времени очень велики. Теория размерностей указывает, что квантовые эффекты в гравитации становятся определяющими, когда радиус кривизны пространства-времени (расстояние, на котором проявляются существенные отклонения от геометрии древнегреческого математика Евклида (Eukléides; 323–285 до Нашей Эры):- чем меньше этот радиус, тем больше кривизна) становится равным величине $r_{Пл} = \sqrt{(G\eta / c^3)}$. Расстояние $r_{пл}$ называется Планковской Длиной; оно ничтожно мало:- $r_{Пл} = 10^{-33}$ см. В таких условиях теория тяготения Эйнштейна неприменима. Сингулярные состояния возникают в ходе гравитационного коллапса; сингулярность в прошлом была в расширяющейся Вселенной (смотрите Космология). Последовательной квантовой теории тяготения, применимой и в сингулярных состояниях, пока не существует. Квантовые эффекты приводят к рождению частиц в поле тяготения чёрных дыр. Для чёрных дыр, возникающих из звёзд и имеющих массу, сравнимую с Солнечной, эти эффекты пренебрежимо малы. Однако они могут быть важны для чёрных дыр малой массы (меньше 10^{15} г), которые в принципе могли возникать на ранних этапах расширения Вселенной (смотрите 'Чёрная Дыра'). Экспериментальная Проверка Теории Эйнштейна:- в основе теории тяготения Эйнштейна лежит принцип эквивалентности. Его проверка с возможно большей точностью является важнейшей экспериментальной задачей. Согласно принципу эквивалентности, все тела независимо от их состава и массы, все виды материи должны падать в поле тяготения с одним и тем же ускорением. Справедливость этого утверждения, как уже говорилось, была впервые установлена Галилеем. Венгерский физик Лоранд Агустон Отвёш, барон фон Отвёш (Vásárosnaményi báró Eötvös Loránd Ágoston или коротко Eötvös Loránd; 1848–1919) с помощью крутильных весов доказал справедливость принципа эквивалентности с точностью до 10^{-8}; Американский физик Робэт Хэнри Дик (Robert Henry Dicke; 1916–1997) с сотрудниками довёл точность до 10^{-10}, а Советский физик Владимир Борисович Брагинский (1931–2016) с сотрудниками – до 10^{-12}. Другой проверкой принципа эквивалентности является вывод об изменении частоты n света при его распространении в гравитационном поле. Теория предсказывает (смотрите Красное Смещение) изменение частоты Dn при распространении между точками с разностью гравитационных потенциалов $\varphi_1 - \varphi_2$:- $\Delta v / v = (\varphi_1 - \varphi_2) / c^2$ (11). Эксперименты в лаборатории подтвердили эту формулу с точностью по крайней мере до 1% (смотрите Эффект Мёсбаya или Эффект Мёссбауэра (Mössbauer Effect; Немецкий физик Рудольф Людвихь Мёсбаya (Rudolf Ludwig Mössbauer); 1929–2011)). Кроме этих экспериментов по проверке основ теории, существует ряд опытных проверок её xxxxx. Под Весом Тела понимается сила, с которой тело действует вследствие тяготения к Земле на опору (или подвес), удерживающую его от свободного падения. Если тело и опора неподвижны относительно Земли, то вес тела равен его силе тяжести. Единица веса тела в Международной Системе Единиц СИ – Ньютон (Н). Вес – сила, с которой тело, покоящееся в поле сил тяжести, действует на подвес или горизонтальную опору, препятствующую свободному падению тела. Численно вес тела P равен действующей на него силе тяжести, то есть $P = mg$, где m – масса тела, g – ускорение свободного падения (или ускорение силы тяжести). Поскольку масса тела – величина постоянная (в обычных условиях), а значение g изменяется на Земле с широтой и высотой над уровнем моря (соответствующую формулу смотрите в статье Ускорение Свободного Падения), то соответственно при этом изменяется и вес тела. Одновременно значение g, а с ним и вес зависят от ускорения, обусловленного вращением Земли вокруг своей оси; по этой причине вес тела на экваторе на меньше, чем на полюсе. В малой области вблизи земной

поверхности значение g можно считать постоянным и вес тела – пропорциональным его массе, чем пользуются для измерения массы тел путём их взвешивания на рычажных весах; при этом значение g для взвешиваемого тела и гирь считается одним и тем же. Пружинные весы измеряют вес тела; для определения с их помощью массы надо знать ещё величину g в пункте взвешивания. Вес и масса являются разными физическими величинами, которые нельзя отождествлять; они измеряются в разных единицах:- вес – в единицах силы (Ньютон (Н), килограмм силы (кгс), тонна силы (тс) и другие), а масса – в единицах массы (килограмм (кг), грамм (г), тонна (т) и другие). На тело, погруженное в жидкую или газообразную среду, действует, кроме силы тяжести, Архимедова сила (смотрите Закон Архимеда), равная весу вытесненного объёма среды. Поэтому, например, пружинные весы будут показывать в воздухе вес меньший, чем в вакууме; для рычажных весов различие в показаниях будет зависеть от отношения плотностей гирь и взвешиваемого тела. Тело, покоящееся в лифте, который движется вертикально с ускорением w, будет действовать на пол лифта с силой F = m (g ± w) (знак плюс при движении вверх, минус – вниз), что эквивалентно увеличению веса (перегрузка) или его уменьшению. При свободном падении лифта (w = g) наступает невесомость; такое же состояние имеет место для любого тела, движущегося свободно и поступательно в поле тяготения (ракета, спутник и другие).

(2) API Gravity express the gravity or density of crude oil and liquid petroleum products. API is devised jointly by the American Petroleum Institute and the National Institute of Standards and Technology (NIST). The measuring scale is calibrated in terms of degrees API. API Gravity can be calculated as:- API = (141.5 / SG) – 131.5, where:- API = Degrees API Gravity, and SG = Specific Gravity (at 60 °F). Oil with the least specific gravity has the highest API gravity.Gravity is the relative weight of a certain volume of a liquid as compared with an equal volume of water. See also API Gravity, Density, Specific Gravity, and Specific Weight. API stands for the American Petroleum Institute, which is the major United States trade association for the oil and natural gas industry. The API represents about 400 corporations in the petroleum industry and helps to set standards for production, refinement, and distribution of petroleum products. They also advocate on behalf of the industry. One of the most important standards that the API has set is the method used for measuring the density of petroleum. This standard is called the API Gravity. Specific gravity is a ratio of the density of one substance to the density of a reference substance, usually water. The API gravity is nothing more than the standard specific gravity used by the oil industry, which compares the density of oil to that of water through a calculation designed to ensure consistency in measurement. Less dense oil or 'light oil' is preferable to more dense oil as it contains greater quantities of hydrocarbons that can be converted to gasoline. Petroleum is less dense that water and in 1916, the US government instituted the Baumé scale as the standard measure for any liquid less dense than water. This, in most cases, applies to oil. The value used in this scale was 141.5 (see calculation below), but subsequent testing showed that, due to error, the actual value should be 140. The government changed the scale to 140 to correct the issue, but the use of 141.5 had become so entrenched in the oil industry that the API decided to create the API gravity scale using the old value of 141.5. API gravity is calculated using the specific gravity of an oil, which is nothing more than the ratio of its density to that of water (density of the oil/density of water). Specific gravity for API calculations is always determined at 60 degrees Fahrenheit. API gravity is found as follows:- API Gravity = (141.5 / Specific Gravity) – 131.5. Though API values do not have units, they are often referred to as degrees. So the API gravity of West Texas Intermediate is said to be 39.6 degrees. API gravity moves inversely to density, which means the denser an oil is, the lower its API gravity will be. An API of 10 is equivalent to water, which means any oil with an API above 10 will float on water while any with an API below 10 will sink. The API gravity is used to classify oils as light, medium, heavy, or extra heavy. As the 'weight' of an oil is the largest determinant of its market value, API gravity is exceptionally important. The API values for each 'weight' are as follows:- (i) Light – API > 31.1; (ii) Medium – API between 22.3 and 31.1; (iii) Heavy – API < 22.3; and (iv) Extra Heavy – API < 10.0. These are only rough valuations as the exact demarcation in API gravity between light and heavy oil changes depending on the region from which oil came. The fluctuation as to what constitutes light crude in a given region is the result of commodity trading in oil. Because density is a measure of weight per volume, API can be used to calculate how many barrels of crude can be extracted from a metric ton of a given oil. A metric ton of West Texas Intermediate, with an API of 39.6, will produce 7.6 barrels (at 42 gallons each). The calculation is:- Barrels Per Metric Ton = 1 / [(141.5/(API / 131.5) x 0.159]. Gravity (weight per unit volume) of oils. See also API Gravity. API Gravity:- the American petroleum Institute's inverted scale for denoting the 'lightness' or 'heaviness' of crude oils and other liquid hydrocarbons. Calibrated in API degrees (or degrees API), it is used universally to expresses a crude's relative density in an inverse measure lighter the crude, higher the API gravity, and vice versa because lighter the crude higher its market value. Oil with API greater than 30° is termed light; between 22° and 30°, medium; below 22°, heavy; and below 10°, extra heavy. Asphalt on average has an API gravity of 8°, Brent Crude of 35.5°, and gasoline of 50°. Formula:- {(141.5 / relative density of the crude (at 15.5 °C or 60 °F)} – 131.5. API Gravity:- an arbitrary scale expressing the gravity or density of liquid petroleum products. The measuring scale is calibrated in terms of degrees API; it is calculated as follows:- Degrees API = (141.5 / (sp. gr. 60 °F / 60 °F)) – 131.5. The higher the API gravity, the lighter the compound. Light crudes generally exceed 38 degrees API and heavy crudes are commonly labeled as all crudes with an API gravity of 22 degrees or below. Intermediate crudes fall in the range of 22 degrees to 38 degrees API gravity. / Под Плотностью Тела понимается одна из основных физических характеристик тела (вещества), равная отношению массы dm малого элемента вещества объёмом dV к этому объёму:- ρ = dm / dV. Плотность однородного тела одинакова во всех его точках и равна:- ρ = m / V. Плотность неоднородного тела неодинакова в разных его точках; средняя плотность тела ρ_{CP} = m / V. Плотность вещества растёт с увеличением давления и, как правило, убывает с ростом температуры. При переходе вещества из жидкого состояния в газообразное и из твёрдого в жидкое. Плотность скачкообразно уменьшается (исключение представляют вода и чугун, плотность которых при плавлении увеличивается). Единица плотности в Международной Системе Единиц СИ – килограмм на кубический метр (кг/м^3). Плотность (ρ), масса единичного объёма вещества. Величина обратная удельному объёму. Отношение плотности двух веществ называют относительной плотностью. Обычно плотность веществ определяют относительно плотности дистиллированной воды. Под Удельным Весом (Specific Gravity) понимается вес единицы объёма вещества. В отличие от плотности, удельный вес не является физико-химической характеристикой вещества, так как зависит от места измерения. Удельный Вес – величина γ, равная отношению силы тяжести dP малого элемента тела объёмом dV к этому объёму:- γ = dP / dV. Удельный вес связан с плотностью вещества ρ соотношением:- γ = ρg, g – ускорение свободного падения. Единица удельного веса в Международной Системе Единиц СИ – Ньютон на кубический метр (Н/м^3). Плотность (ρ), физическая величина, определяемая для однородного вещества его массой в единице объёма. Плотность неоднородного вещества – предел отношения массы к объёму, когда объём стягивается к точке, в которой определяется плотность. Отношение плотностей двух веществ при определённых стандартных физических условиях называется Относительной Плотностью:- для жидких и твёрдых веществ она обычно определяется по отношению к плотности дистиллированной воды при 4 °С, для газов – по отношению к плотности сухого воздуха или водорода при нормальных условиях. Средняя Плотность Тела определяется отношением массы тела m к его объёму V, то есть ρ = m/V. Единицей плотности в СИ является килограмм на кубический метр (кг/м^3), в СГС Системе Единиц грамм на кубический сантиметр (г/см^3). На практике пользуются также внесистемными единицами плотности:- грамм на литр (г/л), тонна на кубический метр (т/м^3) и другие. Для измерения плотности веществ применяют плотномеры, пикнометры, ареометры, гидростатическое взвешивание (смотрите Весы Мора). Другие методы определения плотности основаны на связи плотности с параметрами состояния вещества или с зависимостью протекающих в веществе процессов от

его плотности. Так, плотность идеального газа может быть вычислена по уравнению состояния ρ = Pm/RT, где P – давление газа, m – его молекулярная масса (мольная масса), R – газовая постоянная, T – абсолютная температура, или определена, например, по скорости распространения ультразвука c = 1 / √βp (здесь β – адиабатическая сжимаемость газа). Диапазон значений плотности природных тел и сред исключительно широк. Так, плотность межзвёздной среды не превышает 10^{-21} кг/м^3, средняя плотность Солнца составляет 1 410 кг/м^3, Земли – 5 520 кг/м^3, наибольшая плотность металлов – 22 500 кг/м^3 (осмий), плотность вещества атомных ядер – 10^{17} кг/м^3, наконец, плотность нейтронных звёзд может, по-видимому, достигать 10^{20} кг/м^3. Значения плотности некоторых широко используемых веществ и материалов приведены в таблице. Смотрите также Газы, и Металлы. Для пористых и сыпучих тел различают Истинную Плотность (её определяют без учёта имеющихся в теле пустот) и Кажущуюся Плотность (отношение массы тела ко всему занимаемому им объёму). Плотность, как правило, уменьшается с ростом температуры (вследствие теплового расширения тел) и увеличивается с повышением давления. Аномально ведут себя, например, вода, чугун, аморфный кварц. Так, у воды плотность имеет максимальное значение при 4 °C и уменьшается как с повышением, так и с понижением температуры. При агрегатных превращениях вещества плотность изменяется скачком (смотрите Агрегатные Состояния), причём при переходе из жидкого состояния в твёрдое плотность обычно растёт, однако у воды, например, она при затвердевании уменьшается.

Degree API	Specific Gravity	Weight	
		lb/US gal	kg/m^3
1	1.068	8.894	1 067
5	1.037	8.633	1 035

GRAVITY CONVEYOR = ГРАВИТАЦИОННЫЙ КОНВЕЙЕР (или ГРАВИТАЦИОННЫЙ ТРАНСПОРТЁР) – Gravity Conveyor is a type of conveyor that uses gravity to move materials. Skatewheel conveyer and roller conveyor are the most common types of gravity conveyor used, however, even a simple steel chute is essentially a gravity conveyor.

GRAVITY SEPARATION = ГРАВИТАЦИОННОЕ РАЗДЕЛЕНИЕ (или СЕПАРАЦИЯ ПОД ДЕЙСТВИЕМ ТЯЖЕСТИ) – Gravity Separation is a method of separating two components from a mixture. Under the influence of gravity, separation of immiscible phases (gas-solid, liquid-solid, liquid-liquid, solid-solid) allows the denser phase to settle out. / Под Сепарацией, от Латинского слова Separatio, означающее Отделение, понимается отделение жидких или твёрдых частиц от газа, твёрдых – от жидкости; разделение на составные части твёрдых или жидких смесей. Применяется в горном деле, в газовой, пищевой и других отраслях промышленности. Сепарация или Сепарирование в технике, процессы разделения смесей разнородных частиц твёрдых материалов, смесей жидкостей разной плотности, эмульсий; взвесей твёрдых частиц или капелек в газе или паре. При сепарации разделяемые компоненты не изменяют своего химического состава. Например, смесь минеральных зёрен при сепарации разделится на продукты, состоящие из тех же минералов в другом количественном соотношении. Сепарация основана на различии в физических или физико-химических свойствах компонентов смеси:- размеры твёрдых частиц, форма, цвет, блеск, коэффициент трения, прочность, упругость, смачиваемость поверхности, магнитная восприимчивость, электропроводность, люминесценция, радиоактивность и другие. В обогащении полезных ископаемых почти все операции разделения (включая грохочение и классификацию) можно отнести к сепарации. Например, воздушная, или пневматическая, сепарация, сепарация в тяжёлых средах, магнитная, пенная (флотация крупных частиц), электрическая сепарация, трибоадгезионная, радиометрическая сепарация, сепарация по трению, сепарация по упругости и другие. В сельском хозяйстве при переработке зерна операция разделения также называется сепарацией; при этом используют различия в размерах зерна, форме, плотности, коэффициент трения, упругости, магнитной восприимчивости и другом. Свойства, которыми должны отличаться продукты сепарации, не всегда совпадают с признаками, по которым можно разделить смесь компонентов. Например, при сепарации угля и породы продукты одинаковой плотности могут иметь разное содержание золы, определяющее качество угля. Для выбора способа сепарации изучают состав разделяемой смеси, свойства компонентов и степень соответствия желаемых признаков возможным свойствам разделения. Сепарация обычно происходит не по одному главному свойству, отличающему компоненты смеси, а по ряду свойств. Поэтому процесс сепарации зависит от условий проведения и аппарата (сепаратора), в котором происходит разделение. Например, при воздушной сепарации по крупности мелкие частицы должны выноситься потоком воздуха и результаты разделения определяются не только размерами частиц, но также плотностью и формой. В сепарации участвует множество отдельных частиц (зёрен), среди которых имеются частицы с промежуточными свойствами по отношению к главному признаку. В результате промышленной сепарации из исходной смеси не получаются чистые фракции разделяемых веществ, а только продукты с преобладающим их содержанием.

GRAY = ГРЭЙ – Gray is unit of absorbed dose of ionizing radiation, defined in the 1980s by the International Commission on Radiation Units and Measurements. The Gray is named after Louis Harold Gray (1905–1965), British radiobiologist. One Gray is equal approximately to the absorbed dose delivered when the energy per unit mass imparted to matter by ionizing radiation is one Joule per kilogram. As a unit of measure, the gray is coherent with the units of measure in the International System of Units (SI). The Gray replaced the rad, which was not coherent with the SI system. One Gray equals 100 rads. Gray (Gy) is the unit of absorbed dose where 1 Gy is equivalent to the absorption of 1 Joule per kilogram (1 Gy = 1 J·kg^{-1}). Gray (Gy) the SI unit of radiation dose. Radiation carries energy, and when it is absorbed by matter the matter receives this energy. The dose is the amount of energy deposited per unit of mass. One Gray is defined to be the dose of one Joule of energy absorbed per kilogram of matter, or 100 rad. The unit is named for the

British physician Louis Harold Gray (1905–1965), an authority on the use of radiation in the treatment of cancer. / Под Грэем понимается единица поглощённой дозы излучения и кермы в СИ. Обозначение:- Гр (Gy). Названа в честь Английского учёного Луиса Хэролда Грэя (Louis Harold Gray; 1905–65). 1 Гр = 1 Дж/кг = 10^4 эрг/г = 100 рад.

GRAY = СЕРОЕ – Gray:- color made up from the mix of black and white. The variations of the color of cement.

GRAY = СЕРОЕ (или СУРОВОЕ, или НЕОТДЕЛАННОЕ) – Gray and Grey are different spellings of the same word, and both are used throughout the English-speaking world. But gray is more common in American English, while grey is more common in all the other main varieties of English. In the United Kingdom, for instance, grey appears about twenty times for every instance of gray. In the United States the ratio is reversed. Gray is an intermediate color between black and white, a neutral or achromatic color, meaning literally a color 'without color'. It is the color of a cloud-covered sky, of ash and of lead. See also Greige, and Grey.

GRAY FABRICS = СУРОВЫЕ ТКАНИ (или НЕОТДЕЛАННЫЕ ТКАНИ, или СУРОВЬЁ) – The woven cloth from the loom, called Greige or Grey, is whitish but has a natural yellow tint. This cloth is further treated by various means to improve its appearance and feel, then either bleached, dyed or printed to produce the fabrics used in various products seen on store shelves. See also Greige, and Greige Fabric. Gray Fabric or Greige Fabric:- woven or knitted goods direct from the loom or knitting machine, before they have been given any kind of finishing treatment. Gray Fabric is an unfinished fabric, just removed from a knitting machine or a loom. Also known as Greige Fabric, Grey Fabrics or Grey Goods in the United Kingdom. The raw woven fabric that is sent to a finishing plant where it is bleached, pre-shrunk, dyed, printed and given a special finish. Also known as Gray Goods in the United States, or Grey Fabrics in the United Kingdom. Unbleached and undyed cotton or linen fabric. / Сотканая из пряжи ткань, не прошедшая заключительной отделки. Неотделанные Ткани, снимаемые с ткацкого станка, называется Суровьём. Суровьё – неотделанное текстильное полотно (тканое, трикотажное, нетканое). Суровье обычно подвергают разбраковке, промериванию или взвешиванию, а в некоторых случаях – чистке и штопке (шерстяные ткани), после чего передают в отделку.

GRAY GOODS = СУРОВЫЕ ТОВАРЫ (или НЕОТДЕЛАННЫЕ ТОВАРЫ, или СУРОВЬЁ) – Gray Goods are the fabrics in the off-loom state, prior to their receiving any desizing, boil-off, or bleaching treatment.

GRAYISH = СЕРОВАТОЕ – Grayish:- somewhat gray.

GRAY MARKET = СЕРЫЙ РЫНОК – Gray Market is:- (1) an unofficial market where new issues of shares are bought and sold before they become officially available for trading on the stock exchange. Trading in gray or 'when-issued' markets can provide a good indication of demand for a new issue. In some parts of the world 'Gray' is spelled 'Grey'. (2) The sale or import of goods by unauthorized dealers. In this case, items that were manufactured abroad and imported into a country without the consent of the trademark holder would be a gray market good. Gray Market is a market for unofficial trading. See also Gray Market Prices. What is Gray Market? Generally, a manufacturer works with a single importer who can sell and support their products in a given region. The importer usually has local dealers and distributors who resell the imported products; this is called a 'Distribution Channel'. Gray Market refers to merchandise that is imported and sold by methods other than these normal channels. For local safety regulations and certifications (FCC (short for the Federal Communications Commission), CE (short for the French Conformité Européenne), UL (short for the Underwriters Laboratories Inc.), etc) and government requirements a manufacturer provides special packaging (manuals in the appropriate language, power cables designed for the local receptacle, etc) and product engineering designed to meet local codes. Manufacturers also have service and support agreements with the authorized importer. Gray Market items are not designed to be sold in a particular market and cannot be supported by the authorized importer because they may not meet mandatory safety and certification codes. Because these items are not designed for a particular market they may not function properly, or the authorized importer may not be equipped to provide service, support or software. With the opening of international borders and the use of the Internet to sell goods, Gray Market equipment has become extremely common in the photographic and consumer electronics markets. Many different types of equipment are brought into North America for sale without the proper documentation and US consumers do not always know what they are purchasing. Because the resellers' cost is less they can sell Gray Market items for less. Unfortunately this price savings is only on the initial purchase; because service and support is more difficult to obtain it may end up costing the consumer more in the long run. Legal market in which goods in short supply can be purchased at a premium over normal trading prices. Any semi-legal market; one that keeps within the letter but not the spirit of the law. The term is most usually applied to the market dealing in any stock or share whose issue has been announced but which has not yet taken place. Traders therefore gamble on the eventual selling price of the issue when it comes onto the market. / Сэ.Ё. (CE (Conformité Européenne); Коформите Ёропеэн), Ю.Эл. (UL (Underwriters Laboratories Inc.); Андэрайтчёрз Лэборэтчориз Инк.). Серый Рынок:- (1) Потребительский рынок:- продажа товаров, как правило, по сниженным ценам дилерами, не имеющими на это разрешения. Потребители, приобретшие товар подпольного изготовления, могут столкнуться с ситуацией, когда производитель отказывается подтвердить гарантию качества этого товара. В некоторых случаях товары подпольного изготовления могут продаваться в стране, где их продажа не предусмотрена. Например, инструкция по применению может быть написана на иностранном языке. (2) Рынок ценных бумаг:- продажа ещё не выпущенных, но разрешённых к выпуску ценных бумаг фирмой, которая не является членом синдиката андеррайтеров. Подобные сделки служат хорошим показателем уровня спроса на предстоящий выпуск акций или облигаций.

GRAY MARKET PRICES = ЦЕНЫ СЕРОГО РЫНКА – Gray Market Prices:- as in the case of stock market trading, asked and bid prices or rates are quoted on the gray market. Gray market prices for forward trading in new Swiss Franc bond issues are regularly published in the Swiss financial press.

GRAY SCALE = ШКАЛА СЕРОГО – Gray Scale is an achromatic scale ranging from black through a series of successively lighter grays to white. Such a series may be made up of steps that appear to be equally distant from one another (such as the Munsell Value Scale) or may be arranged according to some other criteria such as a geometric progression based on lightness. Such scales may be used to describe the relative amount of difference between two similar colors.

GRAY WOOL = СЕРАЯ ШЕРСТЬ – Gray Wool:- fleeces with a few dark fibers, a rather common occurrence in the medium wools produced by down or black-faced breeds.

GRC = GENETIC RESOURCES CENTER

GREASE = ПЛАСТИЧНАЯ СМАЗКА (или КОНСИСТЕНТНАЯ СМАЗКА) – Grease is a lubricant composed of an oil or oils thickened with a soap, soaps or other thickener to a semisolid or solid consistency. / Пластичная Смазка – полутвёрдый или твёрдый продукт, состоящий из смеси минерального или синтетического масла, стабилизированного мылами или другими загустителями с возможным содержанием других компонентов. Примечание:- временно до 01 Января 1993 допускалось наряду с термином Пластичный Смазочный Материал применять дополнительную краткую форму Смазка. Под Консистентной Смазкой, от Латинского слова Consistens (Consistentis), означающее Густеющий или Застывающий или Состоящий, понимается нерекомендуемое название Пластичной Смазки. Пластичные Смазки или Консистентные Смазки – смазочные

материалы, проявляющие в зависимости от нагрузки свойства жидкости или твёрдого тела. При малых нагрузках они сохраняют свою форму, не стекают с вертикальных поверхностей и удерживаются в негерметизированных узлах трения. Пластичные смазки состоят из жидкого масла, твёрдого загустителя, присадок и добавок. Частицы загустителя в составе пластичных смазок, имеющие коллоидные размеры, образуют структурный каркас, в ячейках которого удерживается дисперсионная среда (масло). Благодаря этому пластичные смазки начинают деформироваться подобно аномально-вязкой жидкости только при нагрузках, превышающих предел прочности пластичной смазки (обычно 0.1–2 кН/м^2, или 1–20 гс/см^2). Сразу после прекращения деформирования связи структурного каркаса восстанавливаются, и смазка вновь приобретает свойства твёрдого тела. Это позволяет упростить конструкцию и снизить вес узлов трения, предотвращает загрязнение окружающей среды. Сроки смены пластичных смазок больше, чем смазочных материалов. В современных механизмах пластичные смазки часто не меняют в течение всего срока их службы. Промышленность бывшего СССР в 1974 выпускала около 150 сортов пластичных смазоки. Их мировое производство составляет около 1 миллиона тонн (т) в год (3.5% выпуска всех смазочных материалов). Пластичные смазки получают, вводя в нефтяные, реже синтетические, масла 5–30 (обычно 10–20) % твёрдого загустителя. Процесс производства периодический. В варочных котлах готовят расплав загустителя в масле. При охлаждении загуститель кристаллизуется в виде сетки мелких волокон. Загустители с температурой плавления выше 200–300 °C диспергируют в масле при помощи гомогенизаторов, например, коллоидных мельниц. При изготовлении в состав некоторых пластичных смазок вводят присадки (антиокислительные, антикоррозионные, противозадирные и другие) или твёрдые добавки (антифрикционные, герметизирующие). Пластичные смазки классифицируют по типу загустителя и по области применения. Наиболее распространены мыльные пластичные смазки, загущенные кальциевыми, литиевыми, натриевыми мылами высших жирных кислот. Гидратированные кальциевые пластичные смазки (солидолы) работоспособны до 60–80 °C, натриевые до 110 °C, литиевые и комплексные кальциевые до 120–140 °C. На долю углеводородных пластичных смазок, загущаемых парафином и церезином, приходится 10–15% всего выпуска пластичных смазок. Они имеют низкую температуру плавления (50–65 °C) и используются в основном для консервации металлоизделий. В зависимости от назначения и области применения различают следующие типы пластичных смазок:- (i) Антифрикционные, снижающие трение скольжения и уменьшающие износ. Их применяют в подшипниках качения и скольжения, шарнирах, зубчатых и цепных передачах индустриальных механизмов, приборах, транспортных, сельскохозяйственных и других машин. (ii) Консервационные, предотвращающие коррозию металлоизделий. В отличие от других покрытий (окраска, хромирование) они легко удаляются с трущихся и других поверхностей при расконсервировании механизма. (iii) К уплотнительным пластичным смазкам относятся арматурные (для герметизации прямоточных задвижек, пробковых кранов), резьбовые (для предотвращения заедания тяжелонагруженных или высокотемпературных резьбовых пар), вакуумные (для герметизации подвижных вакуумных соединений). Под Пластичными Смазками понимаются высоковязкие мази, получаемые путём загущения нефтяных или синтетических мысел мылами, твёрдыми углеводородами, органическими пигментами и другими продуктами. Применяются главным образом для смазывания трущихся соединений механизмов, когда непрерывная подача жидкой смазки невозможна. Пластичные смазки используются также для консервации деталей и механизмов при их длительном хранении и транспортировании, а также как уплотнительный материал. Важнейшие свойства:- высокая температура каплепадения, прилипаемость к поверхности трения, стабильность. Наиболее распространены литол, солидол, консталин, железнодорожная, графитная и другие пластичные смазки общего назначения. Существуют также низкотемпературные пластичные смазки, работоспособные при температурах до –60 °C, и высокотемпературные – до 200 °C. Устаревшее название пластичных смазок – Консистентные Смазки. Техническое совершенствование техники и оборудования невозможно без использования современных достижений трибологии и высококачественных смазочных материалов. Важную группу смазочных материалов составляют Пластичные Смазки, отличающиеся от масел наличием второго компонента – загустителя, который формирует структуру, придающую смазкам прочность и другие реологические свойства. Улучшение свойств и разработка новых типов смазок ведётся по следующим направлениям:- (i) подбор и создание новых типов загустителей, в том числе смешанных и комплексных, например, сверхщелочных сульфонатов и алкилсалицилатов; (ii) применение в качестве дисперсионных сред синтетических и растительных масел, с целью создания высокотемпературных и экологических (биоразлагаемых) смазок; (iii) улучшения качества смазок в процессе их производства за счёт оптимизации технологических параметров; и (iv) повышение качества смазок и их функциональных характеристик за счёт использования добавок (присадок и наполнителей). Применение в смазках добавок оказалось очень эффективным направлением, позволяющим целенаправленно улучшать свойства смазок и решать ряд важных практических задач:- (i) улучшать функциональные характеристики и расширять диапазон (температурный, нагрузочный, скоростной и так далее) эксплуатации смазок; (ii) более гибко регулировать структуру и реологические характеристики смазок; и (iii) решать технологические и технические задачи, которые невозможно преодолеть, используя только дисперсионную среду и дисперсную фазу.

GREASE FITTING = НАКОНЕЧНИК ДЛЯ ПЛАСТИЧНОЙ СМАЗКИ (или ФИТИНГ ДЛЯ ПЛАСТИЧНОЙ СМАЗКИ) – Grease Fitting is a small fitting which connects a grease gun and the component to be lubricated. The fitting is installed by a threaded connection, leaving a nipple to which the grease gun attaches. See also Grease. / Наконечник (Нагнетателя) Для Пластичной Смазки.

GREASE GUN = НАГНЕТАТЕЛЬ ДЛЯ ПЛАСТИЧНОЙ СМАЗКИ (или ПИСТОЛЕТ ДЛЯ ПЛАСТИЧНОЙ СМАЗКИ, или ШПРИЦ ДЛЯ КОНСИСТЕНТНОЙ СМАЗКИ, или СОЛИДОЛОНАГНЕТАТЕЛЬ) – Grease Gun is a tool (normally hand-powered) which is used for lubrication tasks. By squeezing the trigger of the gun, grease is applied through an aperture to a specific point. See also Grease.

GREASE WOOL = ЖИРОПОТНАЯ ШЕРСТЬ – Grease Wool is a wool in its natural condition as it comes from the sheep, either shorn or pulled. It contains a mixture of ‘suint’ and wool fats. See also Scouring.

GREATCOAT = ПАЛЬТО (или ШИНЕЛЬ) – Greatcoat is a heavy overcoat.

GREAT LAKES PORTS = ПОРТЫ ВЕЛИКИХ ОЗЁР – Great Lakes Ports are the ports in the lakes of Canada and/or the United States popular for grain shipments. In Canada:- Port Arthur and Fort William on Lake Superior; Hamilton, Kingston, Toronto and Prescott on Lake Ontario. In the United States:- Chicago, Milwaukee on Lake Michigan; Duluth and Superior on Lake Superior and Toledo on Lake Erie. / Под Портами Великих Озёр подразумеваются порты Канады и/или Соединённых Штатов Америки популярные в отрасли перевозок зерновых. В Канаде:- Порт Артур (Port Arthur) и Форт Вилъйэм (Fort William) на Верхнем Озере (Lake Superior); Гамильтон (Hamilton), Кингстон (Kingston), Торонто (Toronto) и Прескотт (Prescott) на Озере Онтарио (Lake Ontario). В Соединённых Штатах Америки:- Чикаго (Chicago), Милуоки (Milwaukee) на Озере Мичиган (Lake Michigan); Дулут (Duluth) и Сьюпириор (Superior) на Верхнем Озере (Lake Superior) и Толедо (Toledo) на Озере Эри (Lake Erie).

GREAT LAKES SHIP = СУДНО ДЛЯ ВЕЛИКИХ ОЗЁР – Great Lakes Ship is a cargo ship developed to carry raw materials and manufactured goods on the Great Lakes. Most carry bulk cargoes of grain, iron ore or coal.

GREAT WHEEL = ВЕЛИКОЕ КОЛЕСО – Great Wheel or Walking Wheel:- (usually) turned by hand, very large (e.g., 50" diameter), used for long draw on things like cotton (high twist). Instead of a flyer and bobbins, this wheel is a wheel-driven spindle. The Illinois State Museum site shows a Great Wheel. Full-size 'generic' facsimile of typical North American Great or Wool Wheel, circa 1770–1830. This is a composite design, not a duplicate of any one wheel. Drive wheel is approximately 40" in diameter, with 2-1/4" wide rim. Much of what we make is constructed of MLH (short for the Mixed Light Hardwoods ... which is to say mostly maple, birch, beech and the like. The woods are not light in weight, just light-colored). All pegs, keys, nuts, etc of appropriate woods. Spindle support post has iron or copper collar; tapered socket for various spindle heads. Drive-cord tension adjustment is by through-post hand screw, locking nuts. Wheel is furnished with our 'bat' or 'palm' spindle head. Wheel bearings are 'cone and box' type (similar to wagon wheels). Knocks down for storage, transport. Furnished with modern oil bottle, extra drive cord material, and a chunk of beeswax. 18 to 24 month wait. / высокая крутка .

GREAVE = ПОНОЖИ (или НАГОЛЕННИК) – Greave:- armor for the leg below the knee.

GREEKS = ГРЕКИ – Greeks:- while many of the terms used to describe buying and selling options are the same terms used to describe other investments, some are unique to options. Mastering the new language may take a little time, but it's essential to understanding options strategies you're considering. It's Greek To Me:- the terms that estimate changes in the prices of options as various market factors – such as stock price and time to expiration – change are named after Greek letters, and are collectively known as the Greeks. Many investors use the Greeks to compare options and find an option that fits a particular strategy. It's important to remember, though, that the Greeks are based on mathematical formulas. While they can be used to assess possible future prices, there's no guarantee that they'll hold true. (1) Greeks On Stocks:- when used to describe stocks, these measurements compare the stock's performance to a benchmark index:- (i) Beta:- a measure of how a stock's volatility changes in relation to the overall market. A Beta may help you determine how closely a stock in your portfolio tracks the movement of an index, if you're considering hedging with index options. A Beta of 1.5 means a stock gains 1.5 points for every point the index gains – and loses 1.5 points for every point the index loses. (ii) Alpha:- a measure of how a stock performs in relation to a benchmark, independent of its Beta. A positive Alpha means that the stock outperformed what the beta predicted, and a negative Alpha means the stock didn't perform as well as predicted. (2) Greeks On Options:- when used to describe options, the Greeks usually compare the movement of an option's theoretical price or volatility as the underlying stock changes in price or volatility, or as expiration nears:- (i) Delta:- a measure of how much an option price changes when the underlying stock price changes. The Delta of an option varies over the life of that option, depending on the underlying stock price and the amount of time left until expiration. Like most of the Greeks, Delta is expressed as a decimal between 0 and +1 or 0 and –1. For example, a call Delta of 0.5 means that for every Dollar increase in the stock price, the call premium increases 50 cents. A Delta between 0 and –1 refers to a put option, since put premiums fall as stock price increases. So a Delta of –0.5 would mean that for every Dollar increase in the stock price, the put premium would be expected to drop by 50 cents. (ii) Theta:- the rate at which premium decays per unit of time as expiration nears. As time decays, options prices can decrease rapidly if they're out-of-the-money. If they're in-the-money near expiration, options price changes tend to mirror those of the underlying stock. (iii) Rho:- an estimate of how much the price of an option – its premium – changes when the interest rate changes. For example, higher interest rates may mean that call prices rise and put prices decline. (iv) Vega:- an estimate of how much an option price changes when the volatility assumption changes. In general, greater volatility means a higher option premium. Vega is also sometimes referred to as Kappa, Omega, or Tau. (3) Greeks On Greeks:- some Greeks work as secondary measurements, showing how a particular Greek changes as the option changes in price or volatility:- (i) Gamma:- a measure of how much the Delta changes when the price of the underlying stock changes. You might think of Gamma as the Delta of an option's Delta.

GREEN = ЗЕЛЁНОЕ – Green:- somewhat less yellow than growing fresh grass.

GREENBACK = ГРИНБАК (или ЗЕЛЁНЫЙ БАК) – Greenback:- the American paper currency first printed during the Civil War. Identified by the green ink used for printing one side of the bill. Popular informal name for the US Dollar. / Популярное неформальное наименование Доллара США. В России в простонародии называются также как Бак и Грин. Бумажная денежная единица в Соединённых Штатах Америки была впервые отпечатана во время Гражданской Войны (1861–65) между буржуазным Севером и рабовладельческим Югом. Идентифицируется зелёными чернилами, используемыми для печати одной стороны денежного билета.

GREEN BOND = ЗЕЛЁНАЯ ОБЛИГАЦИЯ – A Green Bond is a type of fixed-income instrument that is specifically earmarked to raise money for climate and environmental projects. These bonds are typically asset-linked and backed by the issuing entity's balance sheet, so they usually carry the same credit rating as their issuers' other debt obligations. Dating back to the first decade of the XXI century, green bonds are also referred to as Climate Bonds. Key Takeaways:- (i) A green bond is a fixed-income instrument designed specifically to support specific climate-related or environmental projects; (ii) Green bonds typically come with tax incentives to enhance their attractiveness to investors; (iii) The World Bank issued the first official so-labeled green bond for institutional investors in 2009; and (iv) Around USD157 billion worth of green bonds were issued in 2019. Understanding Green Bonds:- Green bonds are designated bonds intended to encourage sustainability and to support climate-related or other types of special environmental projects. More specifically, green bonds finance projects aimed at energy efficiency, pollution prevention, sustainable agriculture, fishery and forestry, the protection of aquatic and terrestrial ecosystems, clean transportation, clean water, and sustainable water management. They also finance the cultivation of environmentally friendly technologies and the mitigation of climate change. Green bonds come with tax incentives such as tax exemption and tax credits, making them a more attractive investment compared to a comparable taxable bond. These tax advantages provide a monetary incentive to tackle prominent social issues such as climate change and a movement to renewable sources of energy. To qualify for green bond status, they are often verified by a third party such as the Climate Bond Standard Board, which certifies that the bond will fund projects that include benefits to the environment. History of Green Bonds:- As recently as 2012, green bond issuance amounted only to USD2.6 billion. But in 2016, green bonds began to sprout. Much of the action was attributable to Chinese borrowers, who accounted for USD32.9 billion of the total, or more than a third of all issuances. But the interest is global, with the European Union and the United States among the leaders too. In 2017, green bond issuance soared to a record high, accounting for USD161 billion worth of investment worldwide, according to the latest report from the rating agency Moody's. Growth slowed a bit in 2018, hitting only USD167 billion, but rebounded the following year. Moody's estimates that global issuances in 2019, when finally tabulated, could top USD250 billion. The Climate Bonds Initiative, an international, investor-focused not-for-profit organization, puts the figure at USD257.5 billion. The 2010s saw the development of green bond funds, broadening the ability of retail investors to participate in these initiatives. Allianz SE, Axa SA, State Street Corporation, TIAA-CREF, Blackrock, ax World Funds, and HSBC are among the investment companies and asset management firms that have sponsored green bond mutual funds or ETFs. Real-World Example of Green Bonds:- The World Bank is a major issuer of green bonds. While it finances projects around the world, the institution has been very active especially in the United States, where its issuances have totaled USD5.3 billion between FY 2014 and FY 2018, and in India, where its issuances total over 2.7 billion Rupees. In the latter country, one of the bank's oldest ventures has been the Rampur Hydropower Project, which aims to provide low-carbon hydroelectric power to northern India's

electricity grid. It produces 1 957 000 MegaWatts annually, saving 1 407 700 tons of carbon dioxide emissions a year. Green Bonds are standard bonds with a bonus 'green' feature. The green 'use of proceeds' bond market has developed around the idea of flat pricing – where the bond price is the same as ordinary bonds. Prices are flat because the credit profile of green bonds is the same as other vanilla bonds from the same issuer. Therefore, green bonds are pari pasu to vanilla issuance. Green Bonds describe fixed-income financial instruments that fund environmental improvements or projects. The Green Bond Principles, a guidance document crafted by a coalition of key stakeholder banks, describes green bonds as:- (i) Green Bonds are often identical in structure, risk, and return to traditional bonds, except that capital raised from a green bond funds clean energy, energy efficiency, low carbon transport, smart grid, agriculture and forestry, natural resource mitigation or similar projects/ initiatives/ programs. (ii) Green Bonds are marketed as 'green' at the time of issuance. Issuers are expected to provide a description of projects to be funded at the time of issuance, ensure segregation of project funds, and provide post-project reporting or verification about how the funds were used. (iii) Green Bonds typically fund large-scale, capital-intensive green infrastructure projects such as energy efficiency projects, transit, or renewable power, among others, that can be repaid from steady, modest, long-term cash flows. Green Bonds are '... instruments in which the proceeds will be exclusively applied (either by specifying Use of Proceeds, Direct Project Exposure, or Securitization) towards new and existing Green Projects – defined here as projects and activities that promote climate or other environmental sustainability purposes'. Why Green Bonds? Climate:- Transitioning communities away from carbon-reliance is a serious challenge; in order to achieve the target of USD53 trillion in clean energy investment needed by 2035 to keep global warming under two degrees, the International Energy Agency suggests using several tools, including Green Bonds. Green Bonds can advance adoption of innovative new technologies, finance projects that provide green jobs, and promote economic and climate resiliency across regions. 'Local governments wield significant influence and authority that can drive environmental sustainability within their jurisdictions'. – The California Sustainability Alliance. Benefits:- (i) Investor Demand and Diversification:- Investors are increasingly demanding socially responsible investment (SRI) opportunities and have expressed a strong appetite for green bonds by repeatedly oversubscribing issuances. While retail investors demand sustainable investments from their brokers and fund managers, institutional investors are using green bonds to address ESG (Environment, Social, Governance) mandates, something that, before Green Bonds, had been a struggle to address with fixed income tools. As a result, green bond issuances have attracted new investors and new types of investors, providing a potential market for future issuances. (ii) Enabling Projects at a Lower Cost of Capital:- Green bonds are an excellent way to secure large amounts of capital to support environmental investments that may not otherwise be available, or that may be uneconomic using more expensive capital. Green bonds are well suited for large-scale sustainability projects such as wind and solar development, which often require capital investment ahead of revenues, and which generate modest revenue over a longer investment horizon. (iii) Leadership:- For the foreseeable future, green bond issuers are leaders in developing this space. They can encourage other municipalities to participate and establish a financially innovative reputation. Early adopters will pave the way for the rest of the nation in financing environmental projects. Government leaders may also participate in working groups and coalitions, which are shaping the market, developing standards, and ensuring lasting success. (iv) Press Coverage & Brand Value:- Green Bonds provide governments with a chance to brand themselves as forward thinking, innovative, and sustainable. The press continues to cover green bond issues favorably. The State of Massachusetts received international coverage by top financial news reporters, resulting in television coverage and interview requests for the treasurer. (v) Green Bonds Over Other Options:- Green Bonds offer an exciting opportunity for both investors and issuers to encourage sustainable growth while leading the investment community. Green bonds provide several advantages over other financing options:- (a) They provide institutional investors with a means of accessing sustainable investments in the fixed income market in a familiar, low-risk vehicle; (b) Issuing this emerging security type sends a strong, pro-active message to stakeholders while attracting a new investor base; and (c) Green Bonds also provide municipalities with an ideal opportunity to develop Public-Private-Partnerships (PPPs) to accelerate the advancement of new technologies and energy efficiency. One example of this is the 'Morris Model', where Morris County issued low cost bonds for solar projects on government buildings, passing along the low cost to a private developer.

GREEN CARD = ЗЕЛЁНАЯ КАРТА – In insurance, the Green Card or International Motor Insurance Certificate is equivalent to the national motor insurance certificates of all of the countries a motorist visits. It is an internationally recognised document, that is accepted by the authorities of all countries in which the Green Card is valid. The Green Card System is managed by the Council of Bureaux in London. The Green Card itself doesn't provide insurance cover but does certify that the holder has at least the minimum compulsory Third Party insurance cover required by law in the countries visited. Insurance against other hazards, such as fire or theft abroad, should be applied for from the insurance company who may demand a supplement if the existing cover is limited to the Member State in which the vehicle is registered. For visits by motorists to countries participating in the Green Card System the Green Card is not a required document since it is substituted by the national vehicle registration plates of those countries. These countries are the Member Countries of the European Union plus Andorra, Croatia, Iceland, Norway and Switzerland. It is still advisable to carry the Green Card when travelling abroad. In Gibraltar, Liechtenstein, Monaco and San Marino, the same situation normally applies but it is advisable to check the cover carefully. The national registration plates of the countries signify to the authorities of the country that your car is insured in respect only for Third Party liabilities for which insurance is compulsory. It is recommended to discuss the following with the insurer:- (i) what, if any, insurance documentation is necessary for the countries to be visited; (ii) the extent of the cover provided by the existing motor insurance policies for the countries to be visited; and (iii) the procedure to be followed in the event of an accident in a visited country. Other countries are party to the Green Card arrangements (you will either need to have a Green Card or purchase insurance at the border). Currently these are:- Albania, Andorra, Belarus, Bosnia and Herzegovina, Bulgaria, Iran, Israel, Macedonia, Moldova, Montenegro, Morocco, Romania, Serbia (Kosovo, while regarded as a part of Serbia, is in effect under the control of the United Nations. Green Cards are not available for Kosovo and border car insurance must be purchased), Tunisia, Turkey, and Ukraine. Having signed an Agreement called the Uniform Agreement, Spain participates in the Green Card System with all foreign Bureaux members, with the exception of Turkey. In the event of an accident abroad, immediately contact the insurer or their representative in the country concerned. The Green Card gives details of the local Green Card Bureau. If the accident was caused by an uninsured or unidentifiable car, the victim is entitled, under Community law, to compensation from the motor vehicle guarantee fund of the Member State in which the accident occurred. This is in accordance with the rules in force in that Member State. New rules have been introduced to ensure that motorists get rapid compensation for accidents regardless of where they are in the EU. This has made procedures easier and settling claims quicker, with fines being charged on late payments. This applies not only to accidents that happen in the EU but also to accidents between two EU parties in a country outside the EU but which belongs to the Green Card System. Green Card, an international motor insurance certificate, part of the International Motor Insurance Card System, used in and around Europe. The Green Card System was introduced on 1953-January-01 under the aegis of the Economic Commission for Europe of the United Nations and is managed by the Council of Bureaux, a body established in London, the United Kingdom in 1949. The Green Card System is primarily a European System. It presently includes most, but not all European Countries, west of the Urals and the Caspian Sea and Countries bordering the Mediterranean Sea. The objectives of the Green Card System are:- (i) to ensure that Third Party victims of road traffic accidents do not suffer from the fact that injuries or damage sustained by them were caused by a visiting motorist rather than a motorist resident in the same country; and (ii) to avoid the need for motorists to obtain insurance cover at

each of the frontiers of the countries which they visit. Through the activities of the Green Card Bureaux established by Law or Regulation in each of the 44 Countries participating in the System. All Green Card Bureaux operate with the recognition and approval of their Governments. Each Green Card Bureau has two functions:- (i) as a 'Bureau of the country of the accident', it has responsibility in accordance with national legal provisions for Compulsory Third Party Motor Insurance for the handling and settlement of claims arising from accidents caused by visiting motorists; and (ii) as a 'Guaranteeing Bureau' it guarantees certificates of Motor Insurance – ('Green Cards') which are issued by its member insurance companies to their policyholders. National bureaux cooperate on the basis of the Internal Regulations signed bilaterally between each of them. The Green Card is equivalent to the national Motor Insurance Certificates of each and all of the Countries which a motorist visits. As such it is accepted without any obstacle or cost by the Authorities of all countries for which the individual Green Card is valid. The Green Card certifies that the visiting motorist has at least the minimum compulsory Third Party insurance cover required by the Laws of the countries visited. Motorists should obtain Green Cards from the Insurer who has issued their motor insurance policy. For visits by motorists to 30 of the 44 Countries participating in the Green Card System the Green Card is not a required document since it is substituted by the national vehicle registration plates of those 30 Countries, which are – the 25/27 Member Countries of the European Union as well as Andorra, Croatia, Iceland, Norway, and Switzerland. The national registration plates of the 30 countries signify to the Authorities of the country that the vehicle concerned is insured in respect only of the Third Party liabilities for which insurance is compulsory. Motorists are therefore urged to find out from their Insurers:- (i) what, if any, insurance documentation is necessary for the countries to be visited; (ii) the extent of the cover provided by their own motor insurance policies for the countries visited; and (iii) the procedure to be followed in the event of an accident in a visited Country. Green Card means the international certificate of motor insurance conforming to any of the models approved by the Council of Bureaux. Council of Bureaux means the body to which all Bureaux must belong and which is responsible for the administration and the operation of the international motor civil liability insurance system (known as the Green Card System). The Green Card is an International Certificate Of Third Party Motor Insurance that is prepared by motorists on a temporary travel to a certain country or countries within the geographical scope of the Green Card System which has to be presented in the event of an accident or at the borders and even, if necessary, within the member countries of the system. What is the Green Card System? The International Motor Insurance Card System (called as the Green Card System) is based upon a recommendation of the Economic Commission for Europe (ECE) of the United Nations, which was adopted in January 1949.The system came into operation on 01 January 1953. To join as a member of The Green Card System:- the basic element for the Green Card System membership is the existing compulsory third party liability law in the participating countries. The Green Card System Members:- there are at present forty-three countries participating in the Green Card System (thirty-eight in Europe and five outside Europe (Iran, Iraq, Tunisia, Morocco, Israel)) and collectively these countries have a total vehicle population of about 220 million vehicles, which travel, within the scope of the Green Card System. Members and Date of Entry:- Albania (1992), Andorra (1996), Austria (1954), Belarus (2003), Belgium (1949), Bosnia and Herzegovina (1996), Bulgaria (1971), Croatia (1992), Cyprus (1996), Czech Republic (1949), Denmark (1949), Estonia (1992), Finland (1949), France (1949), Germany (1951), Greece (1949), Hungary (1960), Iceland (1970), Iran (1976), Ireland (1949), Italy (1953), Latvia (1998), Lithuania (2003), Luxembourg (1949), Macedonia, Former Yugoslav Republic of (1994), Malta (1985), Moldova (1997), Morocco (1969), The Netherlands (1949), Norway (1949), Poland (1958), Portugal (1953), Romania (1965), Russia (2009), Serbia (1954), Slovak Republic (1949), Slovenia (1992), Spain (1953), Sweden (1949), Switzerland (1949), Tunisia (1969), Turkey (1964), Ukraine (1997), and United Kingdom (1949). The Bureaux:- in each participating country, there is a national Green Card Bureau. The national Green Card Bureau is entrusted, in accordance with its national law, with managing, checking and taking responsibility for damage caused by vehicles from countries, which are members of the Green Card System. The national Green Card Bureau acts on behalf of the insurer of the foreign vehicle and it is entrusted with the settlement of claims resulting from accidents caused by the visiting motorists. The national Green Card Bureau supervises on the successful enforcement of the uniform agreement between the bureau (UA). All of the bureaux are a member of Council of Bureaux (COB), which is the Managing Organization of the System. Who does issue the Green Card? Third party motor risk insurers, who are members of the national Green Card Bureau of the member countries, issue the Green Card. A person who is the victim of an accident (caused by a foreign motorist) in the visited country, can request the assistance of the Green Card Bureau in the country of origin. 2007:- Albania, Andorra, Austria, Belarus, Belgium, Bosnia and Herzegovina, Bulgaria, Croatia, Cyprus, Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Iceland, Iran, Ireland, Israel, Italy, Latvia, Lithuania, Luxembourg, Macedonia, Malta, Moldova, Montenegro, Morocco, the Netherlands, Norway, Poland, Portugal, Romania, Serbia, Slovakia, Slovenia, Spain, Sweden, Switzerland, Tunisia, Turkey, Ukraine, and the United Kingdom of Great Britain and Northern Ireland. The cover provided under Green Cards issued for Cyprus is restricted to those geographical parts of Cyprus which are under the control of the Government of the Republic of Cyprus. In regard to:- (i) damage to the insured vehicle, however caused; (ii) personal injuries not covered by the Compulsory Third Party Insurance Law in force in the country of accident; and (iii) renewal of a card the validity of which has expired the national bureau of the country visited should not be approached but notification should be given (unless otherwise instructed by the Insurer) direct to the Insurer. / Страхование Гражданской Ответственности (Third Party insurance) или Страхование Ответственности Перед Третьими Лицами (Third Party Liability insurance).

GREEN COTTON = ЗЕЛЁНЫЙ ХЛОПОК – Green Cotton is a Cotton which has been picked prior to maturity. This damp Cotton is found chiefly at the beginning of the picking season.

GREEN DISCOLORATION = ИЗМЕНЕНИЕ ЦВЕТА В ЗЕЛЁНЫЙ ЦВЕТ (или ПОЗЕЛЕНЕНИЕ) – Green Discoloration:- Garments:- women's sharkskin-twill blouse; Fabric Construction:- (i) Count:- 130 x 68; (ii) Warp:- 101/40 dull acetate rayon; (iii) Filling:- 150/40 dull acetate rayon. Complaint:- a customer claimed that green blotches appeared in new white blouses after they were washed. Analysis:- laboratory scouring tests made on the blouses showed that the green discoloration was removed in 0.5% soap solution at 180 °F in a few minutes. In checking with the finisher, it was found that the gray goods as delivered for finishing contained a green tint, which was supposedly fugitive. However, further tests revealed that this green tint, while apparently removed in normal finishing operations, gradually reappeared on exposure to very slight concentrations of acid. Also, the blouses, after washing, tended to become greenish again in some areas, probably because of exposure to certain normal atmospheric conditions. Investigation disclosed that the original yarn had been delivered with the green tint applied by the yarn manufacturer. It was concluded that the use of this particular dyestuff for identification was an improper choice on the part of the yarn manufacturer, on account of its peculiar characteristics. Therefore, its use was subsequently discontinued. The color was later identified as malachite green, a basic dyestuff. / Уточина:- 150/40 .

GREENHOUSE = ПАРНИК (или ТЕПЛИЦА) – Greenhouse is a large construction, usually made from glass, where plants are grown under controlled environmental conditions. / Под Парником понимается сооружение защищённого грунта для выращивания рассады (Капусты, Огурца, Томата, Цветов и другого), овощных (Огурца, Редиса, Салата и другого) и цветочных культур. Котлован с деревянной, железобетонной обвязкой или короб, укрытый застеклёнными рамами или прозрачной плёнкой. Обогрев солнечный, биотопливом, водяной, электрический. Под Теплицей понимается сооружение защищённого грунта для выращивания рассады, овощных, плодовых и декоративных культур, а также размножения и сохранения тропических и субтропических растений, проведения биологических исследований и тому подобного; помещение с покрытием из стекла или

прозрачных для света плёнки и пластика. Обогрев теплицы – солнечный, биологический (теплом биотоплива), технический (водяной, паровой, электрический). Зимние теплицы в эксплуатации круглый год, весенние – весной, летом и осенью; имеются теплицы почвенные и гидропонные.

GREENHOUSE EFFECT = ПАРНИКОВЫЙ ЭФФЕКТ – Greenhouse Effect:- the trapping of heat from sunlight by atmospheric gases (greenhouse gases), including carbon dioxide, methane and water, which raises planetary temperatures above those expected from a simple model of heat radiation received from the sun and re-radiated into space. The high surface temperature on the planet Venus is caused by an extreme form of greenhouse effect. Greenhouse Effect is the process whereby short-wave radiation passes readily through the earth's atmosphere to surface areas, whereas the longer-wave outgoing radiation is absorbed and reradiated by water vapor, droplets and carbon dioxide, thus retaining heat in the atmosphere. Greenhouse Effect is the effect of trapping heat by the transmission of visible solar energy, and the absorption (or reflection) of infra red heat energy. This can be done by a sheet of glass or a layer of some gases, known as Greenhouse Gases. The greenhouse effect is beneficial to mankind as well as harmful as, without it, the surface of the earth would be around 33 °C cooler than it is. The majority of this is natural, changes very slowly and consequently the earth's ecosystems have evolved to function best with the greenhouse effect at this natural level. Since the industrial revolution, however, and the rapidly increasing use of fossil fuels, atmospheric levels of greenhouse gases, particularly carbon dioxide (CO_2) have increased extremely rapidly to the highest level they have been at for 650 000 years. This is because carbon that was removed from the atmosphere many millions of years ago, and resulted in a reduction of atmospheric CO_2 levels then, is now being extracted as coal, oil and natural gas and returned to the atmosphere. Greenhouse Effect:- the increasing mean global surface temperature of the earth caused by gases in the atmosphere (including carbon dioxide, methane, nitrous oxide, ozone, and chlorofluorocarbon). The greenhouse effect allows solar radiation to penetrate but absorbs the infrared radiation returning to space. / Под Парниковым Эффектом или Оранжерейным Эффектом в атмосферах планет понимается нагрев внутренних слоёв атмосферы (Венеры, Земли и других планет с плотными атмосферами), обусловленный прозрачностью атмосферы для основной части излучения Солнца (в оптическом диапазоне) и поглощением атмосферой основной (ИК) части теплового излучения поверхности планеты, нагретой Солнцем. В атмосфере Земли излучение поглощается молекулами H_2O, CO_2, O_3 и другими. Парниковый эффект повышает среднюю температуру планеты, смягчает различия между дневными и ночными температурами.

GREENHOUSE GAS = ПАРНИКОВЫЙ ГАЗ – Greenhouse Gas (GHG) is any one of a number of gases that trap heat in the earth's atmosphere in a similar way to which the glass traps heat in a greenhouse. They work because they transmit light at the visible wavelengths that form the majority of the sun's energy incident on the surface of the earth. When the surface of the earth absorbs this and warms up it re-radiates heat energy at much longer wavelengths, in the infra red, and this is absorbed by GHG molecules such as carbon dioxide (CO_2), methane (CH_4), nitrous oxide (N_2O), hydrofuorocarbons (HFCs), ozone (O_3) and water vapour (H_2O). Although carbon dioxide is the most widely known about, as it is responsible for the majority of anthropogenic climate change, other GHGs have a much greater greenhouse gas potential per molecule.

GREENHOUSE SCREENING = ПАРНИКОВЫЙ ОТБОР (или ПАРНИКОВАЯ БРАКОВКА) – Greenhouse Screening is the process of evaluating varieties for resistance in the greenhouse, in contrast to field and screenhouse screening. / Процесс вычисления разновидностей .

GREENISH STAINS = ЗЕЛЕНОВАТЫЕ РАЗВОДЫ (или ЗЕЛЕНОВАТЫЕ ПОТЁКИ) – Greenish Stains:- Fabric:- spun-rayon linen-type fabric; Construction:- (i) Count:- 40 x 40; (ii) Warp:- 16/1 65% 2-in. 1%-den. bright viscose rayon; 35% %-in. IMr den. bright viscose rayon; (iii) Filling:- same as warp. Finish:- plain dyed maize. Defect:- greenish stains in both gray and finished goods and tender spots or holes in the finished goods only. Analysis:- analysis showed the stains to be confined to the warp yarns only. By chemical tests it was found that traces of copper were present in the stains, which could not be removed through any normal scouring operation. Laboratory bleaching of cuttings of the boiled-off goods resulted in the production of holes in the stained areas. This defect was due to the contamination of the warp yarn during slashing by verdigris or copper-resist stains, the latter being formed by the reaction between copper from metal in the size tank and the free fatty acid in the warp-sizing mix. The tendering in finishing was the result of the catalytic action of the copper in producing localized overbleaching. / Уточина:- такая же как и основа.

GREEN LEAFHOPPER = ЗЕЛЁНАЯ ЦИКАДКА (или ЗЕЛЁНЫЙ ПОЕДАТЕЛЬ ЛИСТЬЕВ) – Green Leafhopper is a Rice pest, Nephotettix Spp., prevalent in Asia that can cause hopperburn and also pronounced yellowing and stunting, by transmitting the yellow dwarf virus and tungro diseases in Rice. / Наездник (Hopper).

GREEN MANURE = ЗЕЛЁНОЕ (ОРГАНИЧЕСКОЕ) УДОБРЕНИЕ (или СИДЕРАТ) – Green Manure is a plant material incorporated into the soil while green or soon after maturity to improve the soil.

GREEN REVOLUTION = ЗЕЛЁНЫЙ ПЕРЕВОРОТ – Green Revolution is a term used to describe the success in increased crop production throughout Asia, commencing in the 1960s as a result of high-yielding Rice varieties developed by the International Rice Research Institute (IRRI; headquartered in Los Baños, Philippines) and Wheat varieties by the International Maize and Wheat Improvement Center (CIMMYT®; headquartered in México, Mexico).

GREEN SEA = СПЛОШНАЯ ВОЛНА – Green Sea (maritime term):- a large body of water taken aboard (ship a sea). / Сплошная Волна, заливающая палубу не разбиваясь.

GREEN STINK BUG = ЗЕЛЁНЫЙ ВОНЮЧИЙ КЛОП – Green Stink Bug (Acrosternum hilare) is a large green member of the stink bug family (Pentatomidae) that usually undergoes a generation on wild hosts, such as elderberry and wild cherry, before moving into cotton, often during boll formation. Feeding by adults and large nymphs with needle-like stylets, often on bolls of all sizes, causes small, rounded, dark spots on the exterior carpel wall; feeding can transmit hardlock organism, resulting in unharvestable bolls and low-quality lint. This species' life cycle (egg to adult) typically takes 30 to 35 days.

GREEN TACK = НЕВЫСОХШИЙ КЛЕЙ – Green Tack is a term used in fabric bonding for the preliminary bond created in the first stage of curing by the wet adhesive process. At this point, the bond is not fully cured and hence is 'green'.

GREEN (UNSEASONED) = ЗЕЛЁНАЯ (или СВЕЖЕРАСПИЛЕННАЯ, или НЕВЫДЕРЖАННАЯ, или НЕПРОСУШЕННАЯ) – Green (Unseasoned):- freshly sawed lumber, or lumber that has received no intentional drying. Wood that has become completely wet after immersion in water would not be considered green, but may be said to be in the green condition. / после погружения/окунания в воду.

GREENWICH MEAN TIME = ГРИНВИЧСКОЕ СРЕДНЕЕ ВРЕМЯ – Greenwich Mean Time (GMT) is the mean solar time at the meridian of Greenwich, England, formerly used as a basis for standard time throughout the world. Originally, the local time at the Royal Observatory, Greenwich, England was chosen as standard at the 1884 International Meridian Conference, leading to the widespread use of Greenwich Mean Time (GMT) in order to set local clocks. This location was chosen because by 1884 two-thirds of all charts and maps already used it as their Prime Meridian. In 1929, the term Universal Time (UT) was introduced to refer to GMT with the day

starting at midnight. Until the 1950s, broadcast time signals were based on UT, and hence on the rotation of the Earth. Also known as Greenwich Civil Time. See also Coordinated Universal Time. GMT is an abbreviation for Greenwich Mean Time, the standard time of longitude 0°. This meridian of longitude, called the Prime Meridian, was fixed as the longitude of the Royal Greenwich Observatory in London by the International Meridian Conference of 1884. GMT is five hours later than US Eastern Standard Time (EST). The abbreviation UT (Universal Time) has largely replaced GMT. Mean solar time at the village of Greenwich near London which, as decided at the International Meridian Congress of 1884, is assigned 0 degrees longitude (called Prime Meridian). Because it is based on the Earth's rotation (which is irregular) it actually follows a fictitious Mean Sun that moves at a uniform speed along the equator. A XIX century worldwide time standard, it was replaced in 1970 by the Coordinated Universal Time (UTC) for astronomical and navigational use, but is still in common use by airlines and radio and television stations. When expressed in terms of a 24-hour clock, GMT is also called Universal Time (UT) or Z Time and Zulu Time (Z). It is five hours ahead of the US Eastern Standard Time (EST) during standard period, and four hours ahead during daylight-saving period. / Гринвичское Среднее Время (ГСВ). Гринвичский меридиан является начальным (нулевым) меридианом, от которого ведётся счёт долгот по Земле. Он проходит через Гринвич, город в предместье Лондона в Англии, известный расположенной в нём астрономической обсерваторией, через которую условно и проведён нулевой (Гринвичский) меридиан.

GREIGE = СУРОВЬЁ (или НЕОТДЕЛАННОЕ, или СУРОВОЕ) – Greige:- grey-beige; North American equivalent to British Grey. In North America, greige is often used to describe loom state fabric that is unbleached, contains size and lubricants, and may be a bit dirty. Greige goods are made ready for dyeing by singeing, desizing, scouring and usually bleaching. A term used to describe textile products prior to bleaching, dying or finishing. Some greige textiles may, however, contain dyed or finished yarns. Greige is the state of a fabric as it comes from the loom (after it has been constructed) but before it has been colored or finished. / Термин, используемый для описания текстильной продукции перед отбеливанием, крашением или отделкой. Некоторые неотделанные виды текстильной продукции могут, всё же, быть выполнены из крашеной или отделанной пряжи.

GREIGE FABRIC = НЕОТДЕЛАННАЯ ТКАНЬ (или СУРОВАЯ ТКАНЬ, или СУРОВЬЁ) – Greige Fabric is an unfinished fabric just off the loom or knitting machine. Also known as Gray Fabric. See also Fabric, and Greige. / Неотделанные Ткани, снимаемые с ткацкого станка, называется Суровьём.

GREIGE GOODS = НЕОТДЕЛАННЫЕ ТОВАРЫ – Greige Goods:- a material in their raw state; before any process has been applied to any piece of fabric. Greige Goods is a term for fabric that is in its natural state of color. Fabric in its raw state, prior to being dyed or printed. In regard to woven fabric, the term greige goods is used to describe cloth woven on a loom with warp and filling yarns that have not been dyed. Greige goods is an unfished fabric, just removed from a knitting machine or loom. The cloth has typically not received dry or wet finishing. The woven fabric may be dyed later after weaving, as in piece dyed fabrics. Greige Goods:- an unfinished fabric, just removed from a knitting machine or a loom. Also known as Gray Goods, or Grey Goods. / с основной и уточной пряжами, которое не было окрашено.

GRENADINE = ГРЕНАДИН – Grenadine is:- (1) a fine, loosely woven fabric in leno weave made with dyed filling yarns and having a clipped dobby design. (2) A silk cord constructed by twisting together several twisted strands. Grenadine is a tightly twisted ply yarn composed of two or three singles. Grenadine:- a moderate reddish orange. An open-weave fabric of various fibers. / уточные пряжи. Гренадин – лёгкая плательная ткань в тканую полоску или клетку; либо кручёный шёлк типа основы, отличающийся от неё лишь большим числом кручений.

GREX = ГРЭКС – Grex is:- (1) the unit of linear density equal to the weight in grams of 10 kilometers (10 000 meters) of yarn, filament, fiber, or other textile strand. (2) The system of yarn numbering based on the use of grex units. See also Yarn Number. / Унивесальная весовая система нумерации всякой пряжи, шёлка, искусственного и синтетического волокна:- номер определяется числом граммов, которые весят 10 000 метров пряжи. Термин Грэкс составлен из букв, составляющих словосочетание (Gr)ame P(e)r(x) 10 000 meters.

GREY = СЕРОЕ (или СУРОВОЕ) – Grey is a British term equivalent to North American Greige.

GREY CAPITAL MARKET = СЕРЫЙ РЫНОК КАПИТАЛА – Grey Capital Market is inofficial name for the unregulated part of the capital market, not monitored by the state. Its products are not sold by banks and not traded on the stock exchange. The grey capital market is characterised by high risks, at times leading to a complete loss of investor capital in connection with illegal investment fraud or embezzlement schemes. Complex investment schemes often make it virtually impossible to track invested capital. Dubious sales techniques and emotional arguments may be used to create over-optimistic hopes and promise unrealistic returns for investors. However, it is safe to assume that a considerable amount of untaxed income (illegal earnings) are in circulation in this market. See also Gray Market, and Pyramid Scheme.

GREY FABRIC = СУРОВАЯ ТКАНЬ (или СУРОВЬЁ) – Grey Fabric is an unfinished fabric just off the loom or knitting machine. See also Gray Fabric, and Greige Fabric.

GREY HEATHER = СЕРЫЙ ВЕРЕСК – Grey Heather:- a mixed fabric color is achieved by using different colors of fiber and mixing them together (a good example is a grey heather T-shirts). Black and white fiber mixed will combine to give grey heather fiber. Heather is blended fibers combined to create a vari-colored effect. Heather fabric typically contains 3 fibers:- cotton, polyester or rayon. Heather grey fabric is never 100% Cotton. Another fiber must always be added with the cotton in order to achieve the necessary color. It is important to note that depending on the percent of cotton, the fabric can still be legally labeled 100% cotton. You will need to check the most current regulations to determine the percentage of cotton required to label as 100% cotton. You can probably learn that information from the Federal Trade Commission.

GREY LIST = СЕРЫЙ СПИСОК (или ТЕНЕВОЙ СПИСОК) – Grey List is a list of disreputable end users in nations of concern for missile proliferation from the intelligence community. Licensing officials in the Commerce and State use this list as a cross-reference when reviewing export license applications for commodities listed in the Missile Technology Control Regime (MTCR) Equipment and Technology Annex.

GREY–MOLD ROT = СЕРАЯ ПЛЕСНЕВИДНАЯ ГНИЛЬ – Grey-Mold Rot is a storage disease frequently occurring in carrots and tomatoes. / Под Гнилью Растений понимаются болезни, вызываемые Полупаразитными и Сапрофитными Грибами и Бактериями. Подвержены клубнеплоды, корнеплоды, корни, листья, плоды, почки, стволы, цветки многих сельскохозяйственных культур и древесных Растений. Органические вещества клеток больных растений разлагаются и частично минерализуются.

GREY WATER = СЕРАЯ ВОДА – Grey Water is effluent water suitable for use in gardens, from light domestic use for baths, showers, washing clothes or dishes and containing less nitrogen and less likely to be a disease vector than water from toilets.

GRI = GENERAL RATE INCREASE

GRIANDRILLE BAR = XX ПОЛОСКА – Griandrille Bar:- use of wrong component in double yarn. Spinning defect. / Порок или дефект прядения.

GRID = ЭНЕРГЕТИЧЕСКАЯ СИСТЕМА (или ЭНЕРГОСИСТЕМА) – In reference to electricity, electrical utility distribution system or network including the high voltage backbone system of interconnected transmission lines, substations and related facilities. Grid:- the layout of an electrical distribution system. In the electrical arena, Grid is a term used to refer to the electrical utility distribution network. / По отношению к электричеству, распределительная система или сеть энергопредприятий, включающая высоковольтную магистральную систему линий электропередачи, подстанции и соответствующие установки. Под Энергосистемой или Электроэнергетической Системой понимается совокупность энергетических ресурсов всех видов, методов и средств их получения, преобразования, распределения и использования, обеспечивающих снабжение потребителей всеми видами энергии. В энергосистему входят системы электроэнергетическая, нефте- и газоснабжения, угольной промышленности, ядерной энергетики, обычно объединённые в масштабах страны в единую энергетическую систему.

GRID PLATE MARK = ОТМЕТИНА ОТ РЕШЁТЧАТОЙ ПЛИТЫ – Grid Plate Mark:- incorrect selection of grid plate and/or padding. Machinery defects, and namely – Pressing Equipment. / Порок или дефект от машинного оборудования.

GRILL STRUCTURE = РЕШЕТЧАТАЯ СТРУКТУРА (или РЕШЁТКА) – Grill Structure is a lengthwise, widthwise and diagonally crossing main component and rib structure used to form and strengthen decks. See also Pallet. / Решётка (Grill Structure):- продольные, поперечные и диагональные пересекающие основной элемент ребра жёсткости, применяемые для формирования и усиления настилов. Смотрите также Поддон (Pallet).

GRINDING = ТОЧЕНИЕ (или ПРИТИРКА, или ШЛИФОВАНИЕ) – Grinding:- fabricated wear marks on denim; often on the edge fabric of pocket openings, leg openings, or the outer fabric of the fly on a jean; creates a worn-in look that is caused by the wearing through of the edge of fabric (at the hem, for example); grinding is not to be confused with a fray as grinding is somewhat scattered randomly.

GRINNING = НЕРОВНОТА – Grinning is:- (1) a flaw in fabric, especially a ribbed fabric, that occurs when warp threads show through the covering filling threads or when the threads have slipped leaving open spaces on either side. (2) A condition that occurs when the carpet backing shows through the pile. (3) A printing term referring to either poor cover where the background shade shows through the print, or to the ‘two-tone’ appearance of a shade printed with incompatible dyes. / неровнота по цвету. Уточные нити или .

GRIPPER LOOM = ТКАЦКИЙ СТАНОК С ЗАЖИМНЫМИ КОЛОДКАМИ (или ЗАХВАТКАМИ) – Gripper Looms are the shuttleless looms. These looms employ a projectile with a jaw that grips the end of the filling yarn during the insertion of the pick. Looms without shuttles. Gripper Loom is a type of loom without shuttles. Method of inserting weft yarn:- a small metal gripper shuttle grasps the weft yarn and inserts it. Characteristics:- A very versatile loom, but it is noisy and there is a limit to its operation at high speed. Gripper Loom:- a small metal gripper shuttle grasps the weft yarn and inserts it. A very versatile loom, but it is noisy and there is a limit to its operation at high speed. / относятся к разряду бесчелночных ткацких станков.

GRIST = ТОНИНА ПРЯЖИ (или НОМЕР ПРЯЖИ, или ТОЛЩИНА ШВЕЙНОЙ НИТКИ) – Grist:- the yards (or meters) per pound (YPP). So if you had a finished yarn that came up 890 YPP, one pound of yarn would equal 890 yards. The grist (or count) may range from 300 yds/lb to 3 000 000 yd/lb for a single filament of silk (theoretically).

GRIT = GRANTOR RETAINED INCOME TRUST

GRITS = ЗЁРНА ГРУБОГО ПОМОЛА – Grits are coarsely ground grain, from which the bran and germ have been removed, usually screened to uniform particle size.

GRITTY–APPEARING CRÊPE YARNS = XX КРЭП ПРЯЖИ – Gritty-Appearing Crêpe Yarns:- Complaint:- crêpe twisted-rayon yarns were examined before weaving, and certain lots were found to have a rough or ‘gritty’ appearance. It was decided that this condition should be investigated and corrected before the possibility of producing imperfect fabric should be risked. Analysis:- analysis showed that the smooth-appearing yarns were normal production from a twister operating under relatively high tension. The ‘gritty’ yarn was produced by a defective flyer in the twister, the bent arms apparently reducing the tension to a subnormal level. On immersion of the two yarns in water, it was found that the normal yarn was much less active than the ‘gritty’ yarn, being Blower to untwist and open. Also, single-strand tensile-strength tests showed that the normal yarn had about 23?? elongation at the breaking load, whereas the ‘gritty’ yarn had only ls’< elongation at the break. A few yards of fabric were woven with this ‘gritty’ yarn in the filling and, after it had been boiled off and dyed, the fabric was found to present a ‘cracky’, uneven finished appearance. / в уточине и, .

GRIZZLE = ГРИЗЛ (или КАПРИЗНИЧАТЬ, или ХНЫКАТЬ) – Grizzle:- a roan coat pattern or C, or a brownish red.

GRIZZLED = СЕДОЙ (или XX) – Grizzled:- sprinkled or streaked with gray.

GRL = GRAIN LENGTH

GROATS = КРУПЫ – Groats are hulled grains, and refer to the caryopsis of domestic or wild Oats; that is, it is the kernel with the hull removed. Groats are grain from which the hulls have been removed. Groats are the hulled grains of various Cereals, such as Oats, Wheat, Barley, or Rye. Groats are whole grains that include the cereal germ and fiber-rich bran portion of the grain as well as the endosperm (which is the usual product of milling). Groats can also be produced from pseudocereal seeds such as Buckwheat. Groats are nutritious but hard to chew, so they are often soaked before cooking. Groats are used in soups and porridges:- steel-cut oats is simply another name for sliced oats groats. Groats of many cereals are the basis of kasha, a porridge-like staple meal of Eastern Europe and Eurasia. In the United States Kasha or Kashi usually refers to roasted buckwheat groats in particular. Parboiled and cut durum wheat groats, known as Bulgur, are an essential ingredient of many Middle Eastern dishes such as mansaf and tabbouleh. Groats are also used in some sausages such as black puddings. A traditional dish from the Black Country in England is groaty pudding (not to be confused with groats pudding). Groaty pudding is made from soaked groats, leeks, onions, beef, and beef stock, and baked for up to 16 hours; it is a traditional meal on Guy Fawkes Night. Consuming groats has become increasingly popular among the National Football League (NFL) players, who often cite the sustained energy that groats provide. Typically, they consume the groats the night before. Production:- the grain is cleaned, sorted by grain size and peeled (if necessary) before being husked. Additionally, the grains can be sliced on a ‘Groat Cutter’ which can be adjusted to cut fine, medium or coarse groats. Regardless, thereafter the groats are freed from any adhering parts of the shell by a brushing machine. In the case of cut groats their fragments are sorted by size by sieving. / зерновка (ядро) с удалённой плодовой оболочкой. жатка (cutter). Размер Зерна или Величина Зерна (Grain Size). Под Крупой понимается пищевой продукт из цельных или дроблёных зёрен Крупяных (Гречиха, Кукуруза, Просо, Рис), Зерновых (Овёс, Пшеница, Ячмень) и Бобовых (Горох, Чечевица) культур. К крупам относят хлопья (кукурузные, овсяные), вспученные

зёрна (пшеничные, рисовые) и саго. Крупа, продукт питания, состоящий из цельных или дроблёных зёрен различных культур. Наибольшее количество круп производят из зерна Риса, Проса, Гречихи, а также из Овса, Кукурузы, Пшеницы и Гороха; значительно меньше из Сорго, Чумизы, Чечевицы и других (смотрите Крупяные Культуры), однако крупа из зерна этих растений в некоторых странах Африки, Восточной Азии является основным или важнейшим продуктом питания. К крупяным продуктам относят Саго, получаемое из сердцевины ствола некоторых пальм, а также искусственного саго – из крахмала (смотрите Крупяное Производство). В бывшем Союзе Советских Социалистических Республик (СССР) вырабатывали следующие виды круп:- из Гречихи – ядрица пропаренная и непропаренная и продел; из Риса-зерна – Рис шлифованный, полированный, дроблёный; из Овса – крупа недроблёная пропаренная, плющеная и хлопья ‘геркулес’, толокно; из Гороха – Горох лущёный, полированный (цельный и колотый) и крупа типа манной; из Проса – пшено шлифованное; из Ячменя – перловая, ячневая и пенсак; из Пшеницы – манная, получаемая при помолах мягкой Пшеницы, смеси твёрдой (20%) и мягкой, а также одной твёрдой Пшеницы, и шлифованная – Полтавская, Артек из твёрдой Пшеницы; из Кукурузы – крупа шлифованная, крупа для хлопьев и кукурузных палочек. Из зерна Пшеницы, Кукурузы и Риса изготовляют также так называемые Вспученные (Взорванные) Зёрна, не нуждающиеся в кулинарной обработке. Крупы обладают высокой пищевой ценностью. Внутренняя часть зерна освобождена от оболочки, поэтому крупы хорошо усваиваются, питательны, калорийны и вкусны. Все крупы содержат много углеводов. Наиболее ценны крупы из Гречихи, Риса, Бобовых и Овса. Они содержат в составе белков наибольшее количество незаменимых аминокислот. Для повышения пищевой ценности круп их обогащают белками (сухим обратом), витаминами и микроэлементами. По физиологически обоснованным нормам питания рекомендуется употреблять в пищу в среднем на душу населения 14–15 килограммов (кг) в год различных круп. Они особенно необходимы для питания детей и больных. Крупы используют в основном в виде каш, при приготовлении супов, а также в производстве пищевых концентратов. В некоторых странах крупа заменяет печёный хлеб (например, Рис в Индии, Китае, Японии). Крупы:- обработанные посредством лущения, дробления, шлифования зёрна хлебных растений. Для получения крупы зёрна сначала очищаются в сортировках и триерах от песка, пыли и сорных примесей, потом с них при помощи особых жерновов или вальцов слущиваются оболочки и удаляется зародыш. После отсеивания лузги и мучнистой мелочи на сите остаются чистые ободранные зёрна, которые получают название Крупа и идут или прямо в потребление или подвергаются дальнейшей обработке. Эта обработка состоит в сортировании крупы по величине – зерна, в округлении зёрен, в шлифовании их, в дроблении зёрен на 2–3 части и прочее. Смотря по степени очистки и совершенству обработки крупы делят на высшие и низшие сорта, а по величине зёрен – на крупные, средние и мелкие. В бывшем Союзе Советских Социалистических Республик (СССР) наибольшее распространение имели гречневая крупа и пшено, менее широко были распространены крупы, выделываемые из Ячменя, Овса, Пшеницы, Кукурузы, Риса и Саго. В некоторых местностях бывшего СССР можно было встретить крупы, выработанные из Росички, Могара, Плывучего Манника, Гаоляна и других растений, принадлежащих к семейству Злаков. По своему питательному значению крупы близки к хлебу. Питательность круп ‘обусловливается главным образом обильным содержанием углеводов, количество которых в некоторых сортах достигает 84%. Белков и других азот-содержащих веществ находится в крупе от 0.74% до 17.69%, жира – от 0.16% до 6.56%. Витаминами крупы не богаты; чем выше сорт крупы по отделке, тем меньше в ней витаминов. Белый шлифованный рис, манная крупа и саго никаких витаминов не содержат; в прочих крупах находится главным образом витамин В и в очень малом количестве витамин Л. Вкус круп в значительной степени зависит от их свежести. Сырость и плохая вентиляция сильно ускоряют порчу крупы. Нередко крупа подвергается нападению насекомых, истребляющих и загрязняющих её. Из них наибольшую опасность для зернохранилищ представляет Амбарный Долгоносик. На рынке обращаются следующие сорта круп:- (i) Гречневая крупа выделывается из семян Гречихи (Polygonum Fagopyrum). Для удаления шелухи семена подсушиваются и затем обрушиваются на мельницах-крупорушках. Смотря по t° сушки, крупа получается зеленовато-белого, желтоватого, красноватого и бурого цвета. Слишком зелёный цвет указывает на недозрел ость гречневого зерна, а слишком бурый – на излишнее пересушивание зерна или на умышленное поджаривание крупы с целью устранения затхлого вкуса залежавшейся крупы. Имеются два главных сорта гречневой крупы:- ядрица –лущёные цельные зерна гречихи и продельная (мелкая) – лущёные зёрна, расколотые на 2–3 части. Наиболее частая примесь в гречневой крупе – необрушенные зёрна гречихи, так называемые ‘галки’, затем остатки шелухи, разного рода сорные семена, комочки сухой земли и мышиные экскременты. Кондиционные нормы для гречневой крупы-ядрицы следующие:- крупа должна быть очищена, влажностью не более 13.5%, с содержанием необрушенных зёрен не более 1%, мучнистой пыли не более 0.5%, сорных примесей не более 0.5%, битых зёрен допускается не более 5%. (ii) Пшено, или пшенная крупа выделывается из семян Обыкновенного Проса (Panicum Miliaceum) или реже – из семян Итальянского Проса – Томи, или Могара (Panicum Italicum, Setaria Italica). Зёрна Проса очищаются от наружной жёсткой кожуры, внутренней тонкой оболочки и зародышевых частей. Пшено, очищенное только от наружной кожуры, носит торговое название пшено-дранец; если удалены ещё внутренняя оболочка и зародыш, то называется пшеном толчёным (обработанное в толчеях). Пшено-дранец ценится значительно ниже толчёного, так как зёрна, у которых не удалены внутренняя тонкая оболочка и зародыш, имеют горьковатый вкус и труднее разваривaются. Различают три основных сорта пшена:- первый, второй и третий, отличающиеся друг от друга величиной зёрен, степенью очистки и количеством примесей. Кондиционное пшено должно иметь влажность не более 13.5%; необрушенных зёрен в нём допускается не более 1 %, посторонних сорных примесей и мучнистой пыли не более 0.5%. В пшене высоко ценится жёлтый цвет, свойственный лучшим сортам его; поэтому белесоватое пшено нередко подкрашивают, чтобы придать ему вид высокосортного товара. Для подкрашивания применяются разнообразные красящие вещества:- куркума, шафран, ноготки, пикриновая кислота, анилиновые краски, охра, сурик, крон и проч. Подкраска пшена пикриновой кислотой, кроном и суриком может вызвать у потребителя тяжелое отравление. К пшену близки крупы, выделываемые из некоторых сортов Сорго:- в Туркестане – Джугара (Sorghum cernuum), в Маньчжурии – Гаолян. К тому же виду Просовидных Злаков относится Росичка (Panicum sanguineum или Digitaria sanguinalis). Для удаления из пшена краски и мучнистой пыли рекомендуется перед варкой крупы тщательно с трением промывать её несколько раз водой. Пшено не выдерживает продолжительного хранения, утрачивает хороший вкус и горкнет. (iii) Ячменная крупа из Ячменя (Hordeumj вырабатывается до 8 сортов круп, отличающихся по величине зерна, степени его очистки, белизне, засорённости. Простые сорта называют ячной крупой, лучшие – перловой крупой. Лучшие сорта перловой крупы носят название ‘голландка’ и ‘полуголландка’. Ячная крупа идёт на приготовление каши, перловая – для супов и отваров. По калорийности и усвояемости ячменная крупа близка к гречневой. (iv) Овсяная крупа из сомин Овса (Avena sativa) выделывают два сорта (первый и второй) простой крупы и несколько сортов так называемой запарной крупы. Простая овсяная крупа готовится путём обычного обрушивания зёрен овса. Для приготовления запарной крупы крупный сортированный овёс слегка поджаривают на сковородах или во вращающихся барабанах и затем обдирают с него все оболочки; полученную крупу пропаривают паром, высушивают и дробят или расплющивают вальцами. Цель поджаривания и пропаривания заключается в придании крупе приятного аромата и устранении горьковатого привкуса, свойственного Овсу. Сорта овсяной крупы, носящие название ‘Геркулес’, ‘Чемпион’, ‘Силач’, ‘Американские патентованные’ относятся к запарным плющенным крупам. По исследованиям Хлопина каша, приготовленная из простой овсяной крупы на воде с маслом, усвояется не лучше грубых сортов ржаного хлеба. Каша из крупы ‘Геркулес’ усвояется лучше, приближаясь по усвоению белковых веществ к простым сортам пшеничного хлеба. Особенностью

овсяной крупы является богатство хорошо усвояемым жиром. Кестнер и Книппинг (Kestner, Knipping) отмечают, что супы и каши из овсяной крупы и муки полезны при заболеваниях пищеварительных органов вследствие большого содержания в Овсе слизистых веществ, обволакивающих слизистую оболочку желудка и кишок и нтим защищающих её от излишнего раздражения пищей. Из поджаренной запарной овсяной крупы посредством размалывания приготовляют 'толокно' – особый вид муки, которая применяется в пищу в виде болтушки с молоком, заварного теста с маслом, колобков и прочего. (v) Пшеничная крупа выделывается двух сортов:- простая и манная. Простая представляет собой слегка раздробленные зёрна Пшеницы (Triticum); манная готовится из самых внутренних частей пшеничного зерна и имеет вид мелких крупинок желтовато-белого цвета. Простая пшеничная крупа в бывшем СССР была мало распространена; в некоторых районах Поволжья и Закаспийского края она служила заменой гречневой крупе. Из разновидностей Пшеницы для выделки простой крупы часто пользуются так называемой полбой. Манная крупа благодаря высоким вкусовым качествам, нежности и высокой усвояемости получила повсеместное широкое распространение как первоклассный продукт питания детей, больных и стариков. Коэффициент усвояемости каши, сваренной из манной крупы, можно приравнять к коэффициенту усвояемости лучших сортов белого пшеничного хлеба, а именно:- белков – 85%, углеводов – 97%, жиров – 85%. При долгом хранении манная крупа утрачивает нежный вкус, нередко приобретает затхлый привкус и слеживается в комки. (vi) Ржаная крупа из ржи (Secale cereale) специальных сортов крупа не выделывается, и если иногда готовят кашу из Ржи, то в качестве крупы применяются обыкновенные зёрна Ржи, очищенные от сорных примесей. В неурожайные годы в СССР Рожь нередко выдавалась в пищевом пайке вместо гречневой и пшенной круп. Каша из Ржи получается неудовлетворительная по вкусу и по консистенции. (vii) Кукурузная крупа представляет собой раздробленные на части семена Кукурузы или Маиса (Zea mays). Смотря по степени дробления различают крупные и мелкие сорта этой крупы. Самый мелкий и чистый сорт напоминает своим видом манную крупу и иногда служит для её фальсификации. В СССР кукурузная крупа была распространена главным образом в некоторых южных районах. Вкусовые достоинства кукурузной крупы невысоки. Однообразное питание Кукурузой, в особенности залежавшейся и испорченной, вызывает заболевания пеллагрой, иногда принимающие характер обширных эпидемий. (viii) Рис получается из семян однолетнего злака того же наименования (Oryza Sativa). Для выработки крупы зрелые семена Риса очищаются от верхней жесткой оболочки, полируются трением и сортируются. Битые зёрна отбрасываются и идут на выработку рисового крахмала. Чем лучше очищен Рис от оболочек и чем цвет его белее, тем выше он ценится. При полировке Риса нередко прибавляется к нему порошок талька, который облегчает шлифование и придаёт крупе особую белизну. Содержание в Рисе более 0.3% талька считается излишним и не должно допускаться. В последнее время за границей для отбелки Риса и других видов круп нередко практикуется применение сернистой кислоты. Такого рода приём отбелки считается недопустимым с санитарной точки зрения, если имеет целью замаскировать порчу крупы и придать ей вид свежего продукта. Значительное содержание сернистой кислоты может само по себе оказать вредное влияние на здоровье. Иногда Рис подсинивают красками, среди которых могут быть и вредные для здоровья. Для удаления талька и краски Рис перед варкой следует энергично с трением промыть в воде. Лучшим сортом Риса считается Каролинский (Американский); высоко ценятся также вывозные из Персии сорта 'Садри' – с тонким длинным стекловидным зерном и 'Акула' – с крупным белым зерном. Туркестанские и Закавказские сорта Риса по качеству уступают привозным из Персии и Индии. Благодаря прекрасным вкусовым качествам, легкой перевариваемости и высокой усвояемости Рис играет весьма важную роль в диетическом питании. Белый шлифованный Рис совершенно не содержит витаминов, и при однообразном питании им может развиться авитаминозное заболевание бери-бери, зависящее от недостатка в пище витамина B. (ix) Саго:- этот вид крупы выделывается не из зёрен хлебных растений, а приготовляется фабричным или кустарным способом из крахмала. Различают два главных сорта Саго:- 'настоящее' и 'искусственное'. Настоящее Саго вырабатывается из крахмала, добываемого из сердцевины Саговых Пальм, растущих в Ост-Индии и на островах Зондского Архипелага. Саговый крахмал слегка клейстеризуется, скатывается в шарики и высушивается – получается крупа саго. Искусственное Саго подобным же образом приготовляется из картофельного крахмала. Питательное значение Саго ниже других круп, так как оно состоит почти исключительно из одного углевода – крахмала, а белки и жиры встречаются в нём лишь в виде следов; никаких витаминов Саго не содержит. Тапиока представляет собой Бразильское Саго, вырабатываемое из крахмала аррорута, добываемого из Растений Tapioca, Manihot и других. Крупяные Культуры, Растения, дающие зерно, используемое в основном для приготовления крупы. Большинство Крупяных культур – Рис, Просо, Могар, Чумиза, Дагусса, Сорго – представители Семейства Злаков, Гречиха – Семейства Гречишных. Зерно Крупяных культур богато углеводами, белком, витаминами. Его (зерно) перерабатывают также на муку, крахмал, спирт и используют на корм Птицам и Свиньям; солому скармливают скоту. Крупяные культуры выращивают во всех странах:- Рис в основном в Индии, Пакистане, Китае, Японии, Демократической Республике Вьетнам (ДРВ), Просо и Сорго – в Индии, Нигерии, Соединённых Штатах Америки (США), Гречиху – в Польше, Болгарии, Франции, Германской Демократической Республике (ГДР), Федеративной Республике Германия (ФРГ) и других, Чумизу и Могар – в Китае, Дагуссу – в Северной Африке и Индии. Мировая посевная площадь Крупяных культур (Риса, Сорго, Проса, Гречихи) 256.1 миллионов гектаров (га), валовой сбор зерна 408.3 миллиона тонн (т) (в 1971). В бывшем Союзе Советских Социалистических Республик (СССР) Крупяными культурами считают Рис, Просо и Гречиху. В 1971 ими было занято 4.6 миллиона га, валовой сбор зерна 4.65 миллиона т. Более подробно о Крупяных культурах смотрите статьи Гречиха, Просо, Рис, Сорго и другие; о производстве их зерна – Зерновое Хозяйство.

GROGRAM = ФАЙ (или ГРОГРЭМ) – Grogram is a coarse loosely woven fabric of silk, silk and mohair, or silk and wool. Compare Grosgrain. / .

GROSGRAIN = ГРОУГРЭЙН (или ГРОСГРЭЙН, или ГРОГРО) – Grosgrain is a closely woven fabric which has fine, horizontal ribs. It is generally made of silk or rayon, although cheaper alternatives are available in synthetic fabrics such as polyester, and is always black. It is a popular material for decorative ribbons. Grosgrain is a heavy fabric with prominent ribs, grosgrain has a dressy appearance and is used in ribbons, vestments, and ceremonial cloths. Grosgrain is a fairly heavy, closely woven, firm, corded or ribbed fabric, made in silk or rayon warp with cotton cords. The cords are round and firm, heavier than in poplin, rounder than in faille. Grosgrain is often made in narrow widths for use as trimming. The most common use of grosgrain is for ribbons in which the ribs are usually narrow, but it can be made with larger ribs for academic gowns. It is really a bengaline in narrow goods and is used for ribbons, neckties, and lapel facings. Grosgrain is a strong close-woven corded fabric usually of silk or rayon and often with cotton filler. Compare Grogram. / Ткань типа поплина с резко выраженным репсовым эффектом. Лента Гро-Гро. фай (faille). Грогрон – гладкокрашеный шёлк наивысшего качества, добываемый из самых лучших коконов шёлковичного червя, дающих длинную неповреждённую нить. Качество сырья позволяло добиться очень плотного кручения пряжи, но при этом вес её был невелик, то есть штука (так в XIX веке называли рулон ткани) материи из грогрона весила много меньше, чем такой же по метражу кусок шёлка другого сорта. Грогрон был самой дорогой шёлковой тканью XIX века. 'Гро', входящий в состав названия какой-либо ткани, означал, что исходным сырьём был шёлк. Сортов таких тканей было очень много. Магазины и мануфактурные лавки середины XIX века предлагали гроданвер – узкий полосатый шёлк из Анвера, гродеберлен – из Берлина, гродещин – из Китая,

гроденапль – из Неаполя, гродетур – из Тура, гродефлоранс – из Флоренции и так далее. Обычно в сортах худшего качества, чем грогрон, утком служили более короткие нити, называемые ‘Трам’.

GROSS = БРУТТО (или ВАЛОВЫЙ, или ВСЕГО, или В ЦЕЛОМ) – Key economic series can be shown as Gross, i.e. before deduction of the consumption of fixed capital or net, i.e. after deduction. / Под Брутто, от Итальянского слова Brutto, означающее Грубый или Нечистый, понимается масса товара с упаковкой. Сравните с Нетто (Net).

GROSS CLAIMS = ВСЕГО ПО ПРЕТЕНЗИЯМ – At the Corporation of Lloyd’s, Gross Claims are the claims under contracts of insurance underwritten by the members of a syndicate plus internal and external claims settlement expenses less salvage or other recoveries, but before the deduction of reinsurance recoveries. / Корпорэйшэн оф Лойдз.

GROSS CREDIT EXPOSURES = ВАЛОВЫЙ ОБЪЁМ ЗАЯВЛЕННЫХ КРЕДИТОВ – In BIS (short for the Bank for International Setlements) reports:- Gross Credit Exposures take into account legally enforceable bilateral netting agreements. Excluding CDS contracts (short for the credit default swaps) for all countries except the United States. / соглашения о двустороннем взаиморасчёте или сведении.

GROSS DEFICIENCY = ВАЛОВАЯ НЕХВАТКА (или ВАЛОВЫЙ ДЕФИЦИТ) – Gross Deficiency (in electricity):- the sum of all companies’ individual capacity deficiency, or the shortfall of unforced capacity below unforced capacity obligation. The term is also referred to as Accounted-For Deficiency.

GROSS DOMESTIC INCOME = ВАЛОВОЙ ВНУТРЕННИЙ ДОХОД – Gross Domestic Income (GDI) is the sum of incomes earned and costs incurred in the production of Gross Domestic Product (GDP). In national economic accounting, GDP and GDI are conceptually equal. In practice, GDP and GDI differ because they are constructed using largely independent source data.

GROSS DOMESTIC PRODUCT = ВАЛОВОЙ ВНУТРЕННИЙ ПРОДУКТ – Gross Domestic Product (GDP) is the value of the goods and services produced by the nation’s economy less the value of the goods and services used up in production. GDP is also equal to the sum of personal consumption expenditures, gross private domestic investment, net exports of goods and services, and government consumption expenditures and gross investment. Gross Domestic Product (GDP) is the total value of output in the economic territory. It is the balancing item on the production account for the whole economy. Domestic product can be measured gross or net. It is presented in the accounts at market (or purchasers’) prices. In national accounting, aggregate of goods and services produced by an economy over a given period, such as one year, obtained by valuing outputs of goods and services at market prices. Gross Domestic Product (GDP) includes all goods used for final consumption or for investment and changes in inventories. It excludes intermediate goods. GDP differs from Gross National Product in that it does not include income from foreign investments. The value of all final goods and services produced by an economy over a particular time period, normally a year. Gross Domestic Product (GDP) is the total value of goods and services produced by labor and property located in the country. As long as the labor and property are located in the country, the supplier (that is, the workers and, for property, the owners) may be either residents or residents of foreign countries. Gross Domestic Product (GDP) is a measure of economic activity. GDP represents the value of all the goods and services produced by an economy over a specified period. Gross Domestic Product (GDP) is measure of the market value of all goods and services produced within the boundaries of a nation, regardless of asset ownership. Unlike Gross National Product (GNP), GDP excludes receipts from that nation’s business operations in foreign countries, as well as the share of reinvested earning in foreign affiliates of domestic corporations. Gross Domestic Product (GDP) is the total value of goods and services produced by a nation over a given period, usually 1 year. Gross Domestic Product (GDP) is a measure of a country’s overall economic output. It expresses the monetary value of all goods produced and services rendered annually in a country, expressed in a currency unit, e.g., EUR). Gross domestic product less the depreciation it includes gives net domestic income. Gross Domestic Product (GDP) is an estimate of the total money value of all the final goods and services produced in a given one-year period using the factors of production located within a particular country’s borders. Gross Domestic Product (GDP) is a statistical measure which, in essence, tells us what Canada’s domestic output is. Think of it as the aggregate ‘sales’ of all companies operating in the country. Technically speaking, the GNP (Gross National Product) and the GDP differ in the way in which imports and exports are accounted for (i.e. take total Canadian spending, add exports, subtract imports, add change in inventories). Usually the percentage changes are tracked and reported (e.g., in Monday’s Report on Business) to give us some idea as to how our economy is performing overall – relative to our past performance. A common equation for GDP is:- GDP = consumption + investment + government expenditures + exports – imports. It is also useful in comparing our productivity to that of other countries. Check out Major Nations Economic Indicators for some comparisons. What is our GDP? How does our National Deficit (i.e. Canada’s total indebtedness) compare to GDP? What percentage of GDP is paid in taxes? The Province of British Columbia (BC) Government has a good explanation for GDP and other terms on its website at http://www.bcstats.gov.bc.ca/DATA/BUS_STAT/bcea/bcea_faq.htm#Q2. Gross Domestic Product (GDP) is the broadest measure of aggregate economic activity encompassing every measure of the economy, measuring the total value of goods and services produced during a specific period. / выработка (output). В национальном бюджетном процессе, . строка баланса (item). Валовой Внутренний Продукт (ВВП) – это стоимость товаров и услуг, произведённых и оказанных, соответственно, экономикой нации за вычетом товаров и услуг, использовавшихся в производстве. ВВП равен также сумме личных трат на потребление (personal consumption expenditures), валового частного внутреннего инвестирования (gross private domestic investment), чистых вывозов (или экспорта) товаров и услуг (net exports of goods and services), и правительственных трат на потребление и валового инвестирования (government consumption expenditures and gross investment). Валовой Внутренний Продукт (ВВП) является статистическим показателем, отражающим совокупную стоимость конечных товаров и услуг, соответственно произведённых и оказанных на территории данной страны, в рыночных ценах. В отличие от валового национального продукта (ВНП), в состав ВВП не включается сальдо платёжного баланса. Валовой Внутренний Продукт (ВВП) – совокупная стоимость товаров и услуг, произведённых внутри страны. ВВП состоит из потребительских и правительственных доходов, частных инвестиций внутри страны за вычетом стоимости вывозных (или экспортных) товаров и услуг. Данные о величине ВВП в Соединённых Штатах Америки (США) ежеквартально представляются Бюро Экономического Анализа при Департаменте Торговли США (Bureau of Economic Analysis of the US Department of Commerce). Скорректированный на инфляцию, или реальный, ВВП служит для оценки темпов роста экономики США. Ранее ВВП назывался Валовым Национальным Продуктом (Gross National Product).

GROSS ELECTRICITY GENERATION = ВАЛОВАЯ ВЫРАБОТКА ЭЛЕКТРИЧЕСТВА (или СУММАРНАЯ ВЫРАБОТКА ЭЛЕКТРИЧЕСТВА, или СУММАРНАЯ ВЫРАБОТКА ЭЛЕКТРИЧЕСКОЙ ЭНЕРГИИ) – Gross Electricity Generation is the total amount of electric energy produced by generating units and measured at the generating terminal in kiloWatthours (kWh) or MegaWatthours (mWh). See also Net Electricity Generation. / Полное количество электроэнергии, произведённой генерирующими установками, и измеряемое в килоВаттах (кВт) или МегаВаттах (МВт) на генерирующем терминале. Смотрите также Полезная Выработка Электричества (Net Electricity Generation).

GROSS EXCESS = ВАЛОВЫЙ ИЗЛИШЕК (или ВАЛОВЫЙ ПРОФИЦИТ) – Gross Excess:- the sum of all LSE’s (short for the Load Serving Entity) individual excess capacity, or the excess of unforced capacity above unforced capacity obligation. The term is referred

to as Accounted-For Excess in the PJM Accounted-For Obligation Manual (Manual 17). PJM Interconnection LLC (Pennsylvania New Jersey Maryland Interconnection LLC. / Пи.Дьжей.Эм. Интёконэкшэн Эл.Эл.Си. (PJM Interconnection LLC или Пэнсэлвэйниэ Ню Дьжози Мэрилэнд Интёконэкшэн Эл.Эл.Си. (Pennsylvania New Jersey Maryland Interconnection LLC)).

GROSS EXPENDITURES ON RESEARCH AND DEVELOPMENT = ВАЛОВЫЕ ЗАТРАТЫ НА ИССЛЕДОВАНИЕ И РАЗВИТИЕ – Gross Expenditures on Research and Development (GERD) is usually expressed as a percentage of the Gross Domestic Product (GDP). The Research and Development (R&D) Expenditures in Canada for 1997 are estimated at CAD13Bn, 64% of it coming from Business. Universities account for 21% of this and the federal government for 11%. The GERD/GDP ratio for Canada is 1.64% (Our competitors' ratios are:- USA:- 2.54, Germany:- 2.26). As for provinces, the GERD/GDP ratio winner is Quebec at 1.94.

GROSS EXPORT VOLUME = ВАЛОВЫЙ ОБЪЁМ ВЫВОЗА (или ВАЛОВЫЙ ОБЪЁМ ЭКСПОРТА) – Gross Export Volume (energy):- the sum of all export transaction volume (MWh (MegaWatthour)).

GROSS FEDERAL DEBT = ВАЛОВЫЙ ФЕДЕРАЛЬНЫЙ ДОЛГ – Gross Federal Debt:- that's the gross amount of debt issued by the US Treasury. 'Debt Held By The Public' and 'Debt Held By Federal Government Accounts' here are components of Gross Federal Debt. Today's (2013-April-23) Federal Debt is about USD16 860 592 064 000. The amount is the gross federal debt issued by the United States Department of the Treasury since 1790. It doesn't include state and local debt, and it doesn't include the so-called unfunded liabilities of entitlement programs like Social Security and Medicare. Federal Debt per person is about USD51 672. 'Gross Federal Debt' is the total debt owed by the United States federal government. It comprises 'Debt Held By Public', including foreign governments, debt held by federal government accounts such as IOUs owed to the Social Security trust fund, and 'Debt Held By Federal Reserve', debt bought by the Federal Reserve System as part of the monetary base. Federal debt began the XX century at less than 10 percent of GDP. It jerked above 30 percent as a result of World War I and then declined in the 1920s to 16.3 percent by 1929. Federal debt started to increase after the Crash of 1929, and rose above 40 percent in the depths of the Great Depression. Federal debt exploded during World War II to over 120 percent of GDP, and then began a decline that bottomed out at 32 percent of GDP in 1974. Federal debt almost doubled in the 1980s, reaching 60 percent of GDP in 1990 and peaking at 66 percent of GDP in 1996, before declining to 56 percent in 2001. Federal debt started increasing again in the 2000s, reaching 70 percent of GDP in 2008. Then it exploded in the aftermath of the Crash of 2008, reaching 102 percent of GDP in 2011. Federal debt has breached 100 percent of GDP twice since 1900:- during World War II and in the aftermath of the Crash of 2008. The United States federal government began with a substantial debt, the cost of the Revolutionary War. Under Alexander Hamilton's funding system the debt was paid off by 1840. Government debt has typically peaked after wars. It breached 30 percent of GDP after the Revolutionary War, the Civil War, and World War I. It breached 100 percent of GDP in World War II. Government debt also breached 100 percent of GDP in the aftermath of the financial crisis of 2008. The US federal government differentiates between Gross Debt issued by the US Treasury and Net Debt held by the public. The numbers on Gross Debt are published by the US Treasury here. Numbers on various categories of federal debt, including Gross Debt, debt held by federal government accounts, debt held by the public, and debt held by the Federal Reserve System, are published every year by the Office of Management and Budget in the Federal Budget in the Historical Tables as Table 7.1 – Federal Debt at the End of the Year. The table starts in 1940. The chart above shows three categories of federal debt:- (i) monetized debt (blue), i.e. federal debt bought by the Federal Reserve System; (ii) debt held by the federal government (red), e.g., as IOUs for Social Security; and (iii) other debt (green), i.e. debt in public hands, including foreign governments. See also Federal Deficit. / Алыгзэндё (Alexander). Смотрите также Федеральный Дефицит (Federal Deficit).

GROSS FIXED CAPITAL FORMATION = ВАЛОВОЕ ФОРМИРОВАНИЕ ФИКСИРОВАННОГО КАПИТАЛА – In national accounting, Gross Fixed Capital Formation is the creation of capital through savings. In this sense, capital is not money, securities or land, but a productive good such as machinery purchased with the savings. Acquisition less disposals of fixed assets and the improvement of land. / В национальном бюджетном процессе, создание капитала посредством сбережений. В этом смысле капитал не является деньгами, ценными бумагами или землёй, а является производственным товаром, таким как машинное оборудование, приобретённым на эти сбережения.

GROSS FREIGHT = СОВОКУПНЫЙ ФРАХТ – Gross Freight is a freight money collected or to be collected without calculating the expenses relating to the running cost of the ship for the voyage undertaken.

GROSS GENERATION = ВАЛОВАЯ ГЕНЕРАЦИЯ – Gross Generation is the total amount of electric energy produced by the generating units at a generating station or stations, measured at the generator terminals.

GROSS IMPORT VOLUME = ВАЛОВЫЙ ОБЪЁМ ПРИВОЗА (или ВАЛОВЫЙ ОБЪЁМ ИМПОРТА) – Gross Import Volume (energy):- the sum of all import transaction volume (MWh (MegaWatthour)).

GROSS INPUT TO ATMOSPHERIC CRUDE OIL DISTILLATION UNITS = СУММАРНАЯ ЗАГРУЗКА УСТАНОВКИ ПЕРВИЧНОЙ (или АТМОСФЕРНОЙ) ПЕРЕРАБОТКИ СЫРОЙ НЕФТИ – Gross Input To Atmospheric Crude Oil Distillation Units:- total input to atmospheric crude oil distillation units. Includes all crude oil, lease condensate, natural gas plant liquids, refinery feedstock, liquefied refinery gases, stop oils, and other liquid hydrocarbons produced from tar sands and oil shale.

GROSS INTEREST = БРУТТО ПРОЦЕНТ (или ВАЛОВОЙ ПРОЦЕНТ) – Gross Interest is an interest paid before deduction of any taxes at source such as withholding tax, excise tax, etc. The opposite of Net Interest.

GROSS LINE = ОБЩАЯ ВЕЛИЧИНА ГРАНИЦЫ УДЕРЖАНИЯ (или БРУТТО–ДОЛЯ) – Gross Line is the amount of risk that an insurer or reinsurer is carrying before taking account of any applicable reinsurance that reduces that risk.

GROSS MANIFEST = ВАЛОВОЙ МАНИФЕСТ (или БРУТТО МАНИФЕСТ) – Gross Manifest is a manifest containing freight details without any appropriate disbursements. / Манифест, содержащий сведения о фрахте, без каких-либо соответствующих уплат.

GROSS MARKET VALUE = ВАЛОВАЯ РЫНОЧНАЯ СТОИМОСТЬ (или ВАЛОВАЯ РЫНОЧНАЯ ЦЕННОСТЬ) – Gross Market Value is a sum of the absolute values of all outstanding derivatives contracts with either positive or negative replacement values evaluated at market prices prevailing on the reporting date. Thus, the gross positive market value of a dealer's outstanding contracts is the sum of the replacement values of all contracts that are in a current gain position to the reporter at current market prices (and therefore, if they were settled immediately, would represent claims on counterparties). The gross negative market value is the sum of the values of all contracts that have a negative value on the reporting date (ie those that are in a current loss position and therefore, if they were settled immediately, would represent liabilities of the dealer to its counterparties). The term 'Gross' indicates that contracts with positive and negative replacement values with the same counterparty are not netted. Nor are the sums of positive and negative contract values within a market risk category such as foreign exchange contracts, interest rate contracts, equities and commodities set off against one another. Gross market values supply information about the potential scale of market risk in derivatives transactions and of the associated financial risk transfer taking place. Furthermore, gross market value provides a measure of economic significance that is readily comparable across markets and products.

GROSS MARGIN = ВАЛОВАЯ МАРЖА – Gross Margin (GM):- with respect to financial reporting, this term refers to a company's performance with respect to it's profitability before taking into account overhead or operating costs. For example, if a company sells goods for total proceeds of CAD100K and the direct cost of producing (or acquiring) those goods is CAD60K, then the gross margin is CAD40K, usually expressed as a percentage, i.e. 40% GM. After subtracting fixed (i.e. overhead) expenses such as salaries and rent, from the Gross Margin, the result is Net Profit (before tax). Gross Margin is the amount of profit remaining after deducting Cost of Goods Sold from Delivered (or Written) Sales for a specified period of time and for a specified product, category, vendor or entire company. Can be expressed as a Dollar amount or percentage. Also known as Gross Profit. / Валовая Маржа (ВМ):- в отношении финансовой отчётности, термин относится к производительности компании в отношении её прибыльности до .

GROSS MARGIN FOR RESEARCH AND DEVELOPMENT = ВАЛОВАЯ МАРЖА ОТ (НАУЧНЫХ) ИССЛЕДОВАНИЙ И (ОПЫТНО–КОНСТРУКТОРСКИХ) РАЗРАБОТОК – Gross Margin For Research And Development is calculated by subtracting research and development (R&D) expenses from R&D revenues.

GROSS MARKET VALUES = ВАЛОВЫЕ СРЕДСТВА В РЫНКЕ (или ВАЛОВЫЕ РЫНОЧНЫЕ ЦЕННОСТИ) – Gross Market Values:- another measure of the size of derivatives markets is provided by outstandings in terms of Gross Market Values. Gross market values also supply information about the scale of gross transfer of price risks in the derivatives markets. Furthermore, gross market value at current market prices provides a measure of derivatives market size and economic significance that is readily comparable across markets and products. Gross market values are defined as the sums of the absolute values of all open contracts with either positive or negative replacement values calculated at market prices prevailing on the reporting date. Replacement value denotes the price to be received or paid if the instrument were sold in the market at the time of reporting. Market values are therefore the amounts at which a contract could be exchanged in a current transaction between willing parties, other than in a forced or liquidation sale. If a quoted price was available for a contract, the number of trading units was multiplied by that market price. If a quoted market price was not available, the reporting institution provided its best estimate of market value based on the quoted price of a similar contract or on valuation techniques such as discounted cash flows. Gross market value is defined as the value of all open contracts before counterparty or any other netting. Thus, the gross positive market value of a firm's outstanding contracts is the sum of all positive replacement values of a firm's contracts. Similarly, the gross negative market value is the sum of all negative values of a firm's contracts. The term gross is used to indicate that contracts with positive and negative replacement values with the same counterparty should not be netted. Nor should the sums of positive and negative contract values be set off against each other within a risk category. In the case of forwards and swaps, the market (or replacement) value of outstanding contracts to which the reporter is a counterparty is either positive, zero or negative, depending on how underlying prices have moved since the contract's initiation. Unlike forwards or swaps, OTC options have a market value at initiation, which is equal to the premium paid to the writer of the option. Throughout their life option contracts can only have a positive market value for the buyer and a negative market value for the seller. If a quoted market price was available for a contract, the market value for that contract was the product of the number of trading units of the contract multiplied by that market price. If a quoted market price was not available, the market value of an outstanding option contract was determined on the basis of secondary market prices for options with the same strike prices and remaining maturities as the options being valued, or by using option pricing models. In an option pricing model, current quotes of forward prices for the underlying (spot prices for American options) and the implied volatility and market interest rate relevant to the option's maturity would normally be used to calculate the 'market' values. In the case of options, the gross positive market value is the sum of the current market values of all purchased options, and gross negative market value is the sum of the values of sold options. As is the case for other instruments, options sold and purchased with the same counterparty were not netted against each other, nor were offset bought and sold options on the same underlying. Data on gross market values were reported as at end-June (in 2007), in US Dollar equivalents, with non-Dollar amounts converted into US Dollars using end-of-period exchange rates. See also Notional Amounts Outstanding. In BIS (short for the Bank for International Setlements) reports:- Gross Market Values, which measure the cost of replacing all existing contracts, provide a measure of market risk. Gross Market Values are defined as the sums of the absolute values of all open contracts with either positive or negative replacement values evaluated at market prices prevailing on the reporting date. Thus, the gross positive market value of a dealer's outstanding contracts is the sum of the replacement values of all contracts that are in a current gain position to the reporter at current market prices (and therefore, if they were settled immediately, would represent claims on counterparties). The gross negative market value is the sum of the values of all contracts that have a negative value on the reporting date (i.e. those that are in a current loss position and therefore, if they were settled immediately, would represent liabilities of the dealer to its counterparties). The term 'gross' is used to indicate that contracts with positive and negative replacement values with the same counterparty are not netted. Nor are the sums of positive and negative contract values within a market risk category such as foreign exchange contracts, interest rate contracts, equities and commodities set off against one another. As stated above, gross market values supply information about the potential scale of market risk in derivatives transactions. Furthermore, gross market value at current market prices provides a measure of economic significance that is readily comparable across markets and products. / взаиморасчёт или сведение (netting) . Чтобы легче было понимать суть этого термина, следует воспользоваться смысловым разъяснением. Задействованные условные суммы (Notional Amounts Outstanding) представляют собой совокупные суммы общих сумм всех внебиржевых контрактов (свопов и опционов) в том или ином сегменте внеучётного рынка, и она не является суммой реально задействованных в этом рынке денежных средств. Дело в том, что покупатель или продавец свопа, приобретая или продавая его у известного игрока или известному игроку (соответственно) внебиржевого рынка не уплачивает за эту сделку всей суммы контракта (в данном случае свопа), а размещает у этого игрока лишь своего рода страховой депозит в виде залога, который служит гарантией исполнения финансовых обязательств по данному свопу. Таким образом, общая сумма контракта (свопа) может быть, например, 100 000.00 Долларов США, в то время как этот страховой депозит может составлять всего 3 000.00 Долларов США. То есть в данной сделке реальных денег задействовано лишь 3 000.00, а условная сумма контракта равна 100 000.00. Приблизительно такая же ситуация и с внебиржевыми опционами, когда условная сумма опциона может составлять предположим также 100 000.00 Долларов США, а уплачиваемая за его покупку премия – 3 000.00 Долларов США. Только в случае со свопом залоговая сумма вернётся залогодателю, а в случае с опционом – нет. Эту сумму реальных денежных средств в размере 3 000.00 Долларов США в различных отчётах о ситуации на внебиржевых рынках называют Валовыми Средствами В Рынке (Gross Market Values). В зависимости от того, что это за рынок, а также от финансового состояния или кредитной истории участника сделки со свопом или опционом, и общей ситуации на рынке, размер реальных денежных средств, задействованных в данной ситуации может колебаться от 3 до 25%. В конечном итоге валовые средства в рынке измеряют стоимость замены всех существующих внебиржевых контрактов, и в этой связи они лучшим образом отображают и измеряют рыночный риск, нежели задействованные условные суммы. Поскольку с возрастанием риска на рынке начинают увеличиваться страховые залоговые депозиты за свопы и премии за опционы, и, стало быть, увеличиваются валовые средства в рынке.

GROSS MASS = БРУТТО МАССА – Gross Mass is the total mass of a consignment, or of any part of a consignment, including the fiber and the tare. See also Mass.

GROSS NATIONAL DISPOSABLE INCOME = ВАЛОВОЙ НАЦИОНАЛЬНЫЙ РАСПОЛАГАЕМЫЙ ДОХОД – Gross National Disposable Income is the income available to the residents arising from gross domestic product (GDP), and receipts from, less payments to, the rest of the world of employment income, property income and current transfers.

GROSS NATIONAL PRODUCT = ВАЛОВОЙ НАЦИОНАЛЬНЫЙ ПРОДУКТ – Gross National Product (GNP) is an estimate of the total money value of all the final goods and services produced in a given one-year period by the factors of production owned by a particular country's residents. ('Final' goods and services means goods and services sold or otherwise provided to their final consumers – that is, to avoid double counting, the value of steel sold to GM to make a car is not added separately into the GNP or gross domestic product (GDP) totals because its value is already included when we add in the final sales price of the car to the customer.) GNP and GDP are very closely related concepts in theory, and in actual practice the numbers tend to be pretty close to each other for most large industrialized countries. The differences between the two measures arise from the facts that there may be foreign-owned companies engaged in production within the country's borders and there may be companies owned by the country's residents that are engaged in production in some other country but provide income to residents. So, for example, when Americans receive more income from their overseas investments than foreigners receive from their investments in the United States, American GNP will be somewhat larger than GDP in that year. If Americans receive less income from their overseas investments than foreigners receive from their US investments, on the other hand, American GNP will be somewhat smaller than GDP. Equivalent estimates of GNP (or GDP) produced in a given year may theoretically be arrived at through at least three different accounting approaches, depending upon whether the transactions that determine the prices of final goods and services are looked at and tallied up by focussing on the buying or by focussing on the proceeds from selling or by focussing on the nature of the products themselves. Using the expenditure approach, you can estimate total GNP as the sum of estimates of the amounts of money that are spent on final goods and services by households (Consumption), by business firms (Investment), by government (Government Purchases), and by the world outside the country (Net Exports). Using the incomes approach, you can estimate total GNP by summing up estimates of the different kinds of earnings people receive from producing these same final goods and services:- (i) total wages and salaries; (ii) profits of incorporated and unincorporated businesses; (iii) rental incomes; and (iv) interest incomes. (Plus certain adjustments to account for wear and tear on productive assets like plant and machinery – depreciation – and what are called Indirect Business Taxes). Using the product or output approach, you can estimate GNP by summing up the output of all the various organizations producing goods and services in the country, subtracting out the costs of their raw materials to avoid double counting and making suitable adjustments for depreciation and for the value of imports and exports. (In theory, all three approaches should give you the same grand totals – but of course in actual practice there will be discrepancies, and sometimes sizable discrepancies, between the three estimates.) Why does anyone bother to estimate the GNP or GDP? For the same reasons statistical data is also gathered on unemployment rates, consumer price levels, the international trade balance and so on – to facilitate economic policy making by government, to assist in planning by decision-makers in private business, and to test economic theories. If government policy makers include among their goals the promotion of economic growth and material prosperity in the national economy as a whole by means of monetary and fiscal policy, they need to have some reasonably precise way of telling how the economy is doing so as to decide whether they should be pushing on the gas or stepping on the brakes. Businessmen responsible for planning new investments in plant and equipment or the introduction of new products can use macroeconomic data and economic theory to forecast the likely levels of demand for their products and the probable trends in their various costs of production. Finally, a historical record of such statistics provides economists with the necessary data to test and refine their theories about how the economy actually works (and, in the process, perhaps to improve the policy makers' understanding of the likely consequences of their policies). GNP and GDP are among the most comprehensive measures of the overall amount of economic production taking place in a national economy. Nevertheless, the available statistics produced by government agencies are always far from perfect estimates of what they purport to measure. They are measured in money value terms to get around the problem of adding up total output of many different goods and services that are normally expressed in many different kinds of incomparable physical units. Microeconomic theory gives us lots of reasons for believing that the relative prices at which products trade on a free market represent reasonably unbiased estimates of the relative values consumers put upon the various kinds of goods and services traded – at least where there are no large problems with externalities or public goods. But not all the final goods and services produced in a society are traded on the free market, and the relative contributions of these untraded goods and services to the consumers' material living standards are therefore awfully difficult to estimate very well. Most of the services produced by government, to take the largest example, cannot be valued at a free market price because they are not offered for voluntary purchase on a free market – instead, the presumed beneficiaries of these services (the citizenry) are forced to pay for them through taxes, whether they think the benefits are 'worth it' or not. In compiling the national accounts, the government statistical offices simply make the heroic (and self-flattering) assumption that all the goods and services provided by government are 'worth' at least what was spent to produce them, however outrageous the costs might have been and however worthless (or harmful) the output might have been in the eyes of the citizenry. A very large category of privately produced goods and services whose production does not register at all in the official GNP or GDP statistics (because they do not trade for money on the market) consists of householders' home production for their own use – things like backyard vegetable gardening, do-it-yourself home and auto repairs, and the innumerable productive service activities of homemakers in cooking, cleaning, sewing, childcare and so on. Another major omission from the national accounts consists of goods and services that actually are traded for money on markets – black markets – but the transactions are deliberately concealed from government information collectors, either to avoid prosecution for trading in illegal demerit goods (for example, drugs and prostitution) or simply to avoid paying taxes or submitting to costly regulations on otherwise potentially legal business transactions (working off the books, unauthorized import/export trade, 'moonshine' production of liquor, etc). Economists' unofficial estimates of the size of the American 'underground economy' in recent years range from no less than 5% to as much as 30% of official GDP!) If one wants to use GNP (or GDP) to measure changes in overall levels of economic production from one year to the next, then using money prices as a 'common denominator' for adding up all the disparate kinds of goods and services introduces another problem for the accuracy of the estimates – inflation. Using money valuations to measure output at several points in time is a little like using a rubber tape-measure to measure several different distances. Part of the increase in GNP (or GDP) from one year to the next really is the result of increased output, but part is also likely to be due merely to change in the value of the currency unit used to measure it. Government statistical compilers try to deal with this problem by producing estimates of 'real' or 'constant Dollar' GNP (and GDP), dividing their original ('current Dollar') estimates by one or another of many possible 'price indexes' constructed to account for and remove the effects of general price inflation – but the problems of choosing and constructing appropriate price indexes for this purpose are themselves numerous and admit of no single unambiguous 'best' answer to the problem. It is also important to keep in mind that GNP and GDP (even when divided by the size of the population to produce 'per capita GNP') were never intended even theoretically to be good measures of overall economic welfare:- they are at best only measures of recent levels or rates of productive activity. Overall societal welfare is a broader concept than just economic welfare, and GNP (or GDP) is at best only a very incomplete measure even of economic welfare, since levels of current production do not necessarily reflect the levels of accumulated wealth actually at the disposal of the citizenry. Moreover, the greater availability of leisure time made possible by today's higher levels of productivity is pretty clearly an improvement in our economic welfare over the days of the early XIX century 14-hour workday. But this

improvement does not show up at all in our long-term GNP growth rates – except possibly in a backwards way, since our official GNP would no doubt be much higher than it is today if everyone still worked a 14-hour workday using our modern technology instead of 'wasting' all those potential labor hours on 'nonproductive' recreation, relaxation, contemplation and socializing. And of course aggregate GNP and GDP do not give any indication as to who gets to consume how much of the goods and services produced, nor do their compilers exercise any 'judgment' about what these goods and services are or ought to be (as the advocates of the 'equitable distribution' and merit goods and demerit goods concepts would want to insist upon as crucial determinants of societal welfare). Gross National Product (GNP) is equal to GDP plus the net income accruing from foreign sources. Aggregate of goods and services produced by various industries in an economy for a given period, such as one year. The Gross National Product (GNP) is Gross Domestic Product (GDP), plus income earned by domestic residents from foreign investments, less income earned in the domestic market by foreigners abroad. The Gross Domestic Product plus the income accruing to domestic residents as a result of investments abroad less income earned in domestic markets accruing to foreigners abroad. The Gross National Product (GNP) is a measure of the market value of goods and services produced by the labor and property of a nation. Includes receipts from that nation's business operation in foreign countries, as well as the share of reinvested earnings in foreign affiliates of domestic corporations. Gross National Product (GNP) is similar to the Gross Domestic Product (GDP), but it's not only what is produced domestically but also what a countries nationals produce abroad. Hence, it's not the best indicator for what's happening within an economy. / национальные счета. Валовой Национальный Продукт (ВНП) является статистическим показателем, отражающим совокупную стоимость конечных товаров и услуг в рыночных ценах. ВНП включает в себя стоимость потреблённых населением товаров и услуг, государственных закупок, капитальные вложения и сальдо платёжного баланса. Валовой Национальный Продукт (ВНП), экономический показатель, принятый в буржуазной статистике отдельных капиталистических стран, а также международных экономических и статистических организаций, представляющий собой совокупную стоимость конечных товаров и услуг, выраженную в рыночных ценах. Как правило, валовой национальный продукт исчисляется по использованию (а не по производству и распределению) и охватывает стоимость потребления населением товаров и услуг, государственных закупок, капитальные вложения и сальдо платёжного баланса. Оценка в рыночных ценах означает, что в валовой национальный продукт включаются косвенные налоги, входящие в цену, и исключаются государственные субсидии. Валовой национальный продукт существенно отличается по величине и структуре от валового общественного продукта (ВОП) социалистических стран. Так, в величину валового национального продукта не включаются материальные затраты (сырьё, материалы, топливо и так далее), но в то же время входит сумма непроизводственных услуг. По размеру валовой национальный продукт близок к национальному доходу, исчисляемому по концепции буржуазных статистиков:- он превышает национальный доход на величину амортизации основного капитала и косвенных налогов. Вот почему при сопоставлении динамики и структуры экономики капиталистических стран с динамикой и структурой стран социализма требуется значительный пересчёт. Для того чтобы валовой национальный продукт был сопоставим с национальным доходом социалистических стран, из него исключаются амортизация и непроизводственные услуги, что обычно сокращает его величину примерно на 30%.

GROSS PREMIUM = ВАЛОВАЯ СУММА ПРЕМИИ (или БРУТТО СУММА ПРЕМИИ) – Gross Premium is a term normally applied to gross written premiums before deduction of brokerage fees or commission and expenses. Original and additional inward premiums, plus any amount in respect of administration fees or policy expenses remitted with a premium but before the deduction of outward reinsurance premiums.

GROSS PROCESSING MARGIN = ВАЛОВАЯ ПРИБЫЛЬ ОТ ПЕРЕРАБОТКИ – A term Gross Processing Margin refers to the difference between the cost of a commodity and the combined sales income of the finished products that result from processing the commodity. Various industries have formulas to express the relationship of raw material costs to sales income from finished products. See also Crack Spread, Crush Spread, and Spark Spread. The difference between the cost of soybeans and the combined sales income of the processed soybean oil and meal.

GROSS PRODUCT UNIT = ЕДИНИЦА ВАЛОВОГО ПРОДУКТА – Gross Product Unit (GPU):- for all children's sleepwear garments meeting 'flame resistant' requirements, a Gross Product Unit Number (GPU #) must be noted on the care label. Every 500 dozen garments must be tested by an outside testing laboratory for flammability and a GPU number assigned. The supporting 'flame resistant' documents must be shipped with the garments to ensure release through customs. The GPU # can be assigned by the vendor. Position the GPU # beneath the RN # on the care label. The words, 'Flame Resistant' (English), 'Igni' Fugo' (Spanish) must appear on the front of the label, visible to customs. Position beneath size indicator. Important Note:- this definition and requirement of GPU may be changed. Please contact the Federal Trade Commission of the USA government for the most current and accurate information. The above definition is being posted in 2004 and we can not guarantee its accuracy.

GROSS PROFIT = ВАЛОВАЯ ПРИБЫЛЬ – Gross Profit is the difference between revenue and the direct costs involved in producing goods or delivering services. Also known as Gross Margin. / Валовая Прибыль представляет собой часть валового дохода предприятия, которая остаётся у него за вычетом всех расходов.

GROSS PROFIT MARGIN RATIO = СООТНОШЕНИЕ ВАЛОВАЯ ПРИБЫЛЬ МАРЖА – Gross Profit Margin Ratio:- profit margin after cost of goods sold. Fiscal year revenues minus fiscal year cost of goods sold divided by the revenues. Expressed as a percentage.

GROSS REGISTERED TONNAGE = ВАЛОВАЯ РЕГИСТРОВАЯ ВМЕСТИМОСТЬ (или ВАЛОВЫЙ РЕГИСТРОВЫЙ ТОННАЖ) – A term Gross Registered Tonnage refers to the carrying capacity of a vessel in volume as opposed to weight. / Под Регистровой Вместимостью судна понимается объём внутренних помещений судна, измеряемый в регистровых тоннах. 1 рег.т = 100 фут^3 = 2.831 685 м^3. Различают:- (i) валовую регистровую вместимость (все помещения), служащую для расчётов сборов в портах и так далее; и (ii) чистую регистровую вместимость (помещения для груза и пассажиров), характеризующую коммерчески эксплуатируемые помещения.

GROSS REGISTERED TONS = ВАЛОВЫХ РЕГИСТРОВЫХ ТОНН – Gross Registered Tons:- a common measurement of the internal volume of a ship with certain spaces excluded. One ton equals 100 cubic feet; the total of all the enclosed spaces within a ship expressed in tons each of which is equivalent to 100 cubic feet.

GROSS SETTLEMENT SYSTEM = СИСТЕМА ВАЛОВЫХ РАСЧЁТОВ – Gross Settlement System is a transfer system in which funds are settled or securities are transferred instruction by instruction.

GROSS TON = ВАЛОВАЯ ТОННА – Gross Ton (GT):- the name 'gross ton' is used in at least two ways:- (i) as another name for the British Imperial or long ton of 2 240 pounds (see also Ton (1)); and (ii) as another name for the register ton, a unit of volume equal to 100 cubic feet (see also Ton (3)), in describing the entire interior volume of a ship as opposed to the cargo-carrying capacity. To avoid confusion, it is better to use 'long ton' for use (1) and 'gross register ton' for use (2).

GROSS TONNAGE = ВАЛОВЫЙ ТОННАЖ (или ВАЛОВАЯ ВМЕСТИМОСТЬ) – Gross Tonnage is the volume of the interior of the vessel including all spaces which are permanently closed in (but excluding the double bottom). This is calculated not by weight but by space; one ton being represented by 100 cubic feet or, where metric measurement is concerned, 1 000 cubic centimeters per ton. Gross Tonnage (GT) is a volume measure of the overall size of a vessel determined in accordance with the provisions of the international convention on measurement of vessels usually expressed in register ton. Applies to vessels, not to cargo, (0.2 + 0.02 $\log_{10}V$) where V is the volume in cubic meters of all enclosed spaces on the vessel.

GROSS VALUE ADDED = ВАЛОВАЯ ДОБАВЛЕННАЯ СТОИМОСТЬ (или БРУТТО ДОБАВЛЕННАЯ СТОИМОСТЬ) – Gross Value Added:- the value generated by any unit engaged in production, and the contributions of individual sectors or industries to gross domestic product. It is measured at basic prices, excluding taxes less subsidies on products. Gross Value Added is the value of output less the value of intermediate consumption; it is a measure of the contribution to GDP (short for the Gross Domestic Product) made by an individual producer, industry or sector; gross value added is the source from which the primary incomes of the SNA (short for the System of National Accounts) are generated and is therefore carried forward into the primary distribution of income account. Context:- gross value added may be calculated at basic prices, factor cost, producers' prices or at market prices.

GROSS VEHICLE WEIGHT = БРУТТО ВЕС ТРАНСПОРТНОГО СРЕДСТВА – Gross Vehicle Weight is the combined total weight of a vehicle and its container, inclusive of prime mover.

GROSS WEIGHT = БРУТТО ВЕС – Gross Weight is the total weight of a shipment of goods, including their packaging such as crates, pallets etc. Gross Weight is total weight of container, chassis, tractor and payload. The full weight of a shipment, including goods and packaging. Compare Tare Weight. Weight (mass) of cargo including packing, but excluding the carrier's equipment. Entire weight of goods, packaging and freight car or container, ready for shipment. Generally, 80 000 pounds maximum container, cargo and tractor for highway transport. Gross Weight is the total weight without deduction for tare (includes packaging and container). Gross Weight is the weight of the goods including packing, wrappers, or containers, both internal and external. The total weight as shipped. Net Weight is the weight of the goods themselves without the inclusion of any wrapper. Gross Weight is the weight of the goods including packing, wrappers, or containers, internal and external. The total weight as shipped. / Вес товара с упаковкой. Вес Брутто (Gross Weight):- масса товара вместе с упаковкой внутренней (неотделимой от товара до его потребления) и внешней – тарой (ящики, мешки, бочки и тому подобное). В международной практике торговых отношений встречается также термин 'полубрутто', обозначающий Вес Брутто за вычетом массы наружной упаковки.

GROSS WEIGHT OF CONTAINER = БРУТТО ВЕС КОНТЕЙНЕРА – Gross Weight Of Container is total weight of container including cargo. / Под Брутто Весом Контейнера понимается полный вес контейнера, включая вес груза.

GROSS WITHDRAWALS = ВАЛОВАЯ ОТКАЧКА – Gross Withdrawals:- in the natural gas industry, full well-stream volume, including all natural gas plant liquids and all nonhydrocarbon gases, but excluding lease condensate. Also includes amounts delivered as royalty payments or consumed in field operations.

GROSS YIELD = ВАЛОВАЯ ДОХОДНОСТЬ – Gross Yield is the income produced by investments (such as securities, real estate property, etc) before any deductions, charges or taxes. The opposite of Net Yield. / Доход, принесённый инвестициями (такими как ценные бумаги, недвижимость и тому подобное), до каких-либо вычетов, сборов или налогов. В противовес Чистой Доходности (Net Yield).

GROUND = ЗАЗЕМЛЕНИЕ – Ground is a conducting connection between an electrical circuit or device and the earth. A ground may be intentional, such as in the case of a safety ground, or accidental which may result in high overcurrents. / Под Заземлением понимается устройство для электрического соединения с землёй аппаратов, машин, приборов и другого; предназначено для защиты от опасного действия электрического тока, а в ряде случаев для использования земли в качестве проводника тока или одного из плеч несимметричного вибратора (антенны). Состоит из заземлителя (обеспечивающего непосредственный контакт с землёй) и заземляющего проводника. Под Заземлением понимается электрическое соединение элементов электрических машин, аппаратов, приборов и тому подобного с землёй; устройство, обеспечивающее такое соединение. В зависимости от назначения различают защитное заземление, предохраняющее людей от поражения электрическим током (например, заземление корпусов электрических машин и аппаратов), и рабочее заземление (например, заземление радиотехнических антенн). Защитное заземление производится с помощью заземлителя (стальные трубы, полосы и тому подобное), обеспечивающего непосредственный контакт с землёй, и заземляющего проводника.

GROUND COLOR = ЦВЕТ ГРУНТА (или ЦВЕТ ФОНА) – Ground Color is a term describing the plain background color against which a design is created.

GROUND CONVEYOR = НАЗЕМНЫЙ КОНВЕЙЕР (или НАЗЕМНЫЙ ТРАНСПОРТЁР, или ГРУНТОВЫЙ ТРАНСПОРТЁР) – Ground Conveyor is a general term for conveying equipment which runs on wheels along the ground, can be freely steered and is used to convey, pull or push loads, such as forklift trucks or side loaders.

GROUND FIRE = НИЗОВОЙ ОГОНЬ (или НИЗИННЫЙ ПОЖАР) – Ground Fire is a fire that consumes organic material and burns into the underlying soil itself, for example, a peat fire. Applies in some deepwater Rice areas of Southern Vietnam. Ground Fire is a fire that consumes all organic material and burns into the underlying soil itself, as, for example, a peat fire in the marshlands. This applies to some deepwater Rice areas of South Vietnam.

GROUND HOG = ЗЕМНОЙ СУРОК (или ЛЕСНОЙ СУРОК, или ГОРНЫЙ БОБР, или ТРУБКОЗУБ, или ТРОСТНИКОВАЯ КРЫСА) – The Groundhog, or Woodchuck, is one of 14 species of Marmots. These rodents live a feast-or-famine lifestyle and gorge themselves all summer to build up plentiful reserves of fat. After the first frost, they retreat to their underground burrows and snooze until spring, drawing their sustenance from body fat. While hibernating, the animal's heart rate plunges, and its body temperature is not much warmer than the temperature inside its burrow. Groundhog hibernation gave rise to the popular American custom of Groundhog Day, held on the second of February every year. Tradition dictates that if a groundhog sees its shadow that day, there will be six more weeks of winter, though such a prediction seems a sure bet over much of the groundhog's North American range. In the spring, females welcome a litter of perhaps a half dozen newborns, which stay with their mother for several months. Groundhogs are the largest members of the squirrel family. Though they are usually seen on the ground, they can climb trees and are also capable swimmers. These rodents frequent the areas where woodlands meet open spaces, like fields, roads, or streams. Here they eat grasses and plants as well as fruits and tree bark. Groundhogs are the bane of many a gardener. They can decimate a plot while voraciously feeding during the summer and fall seasons. Ground Hog is an animal in West Africa that causes serious damage to Rice crops by chewing the stems. The Groundhog (Marmota monax), also known as a Woodchuck, or in some areas as a land-beaver, is a rodent of the family Sciuridae, belonging to the group of large ground squirrels known as Marmots. Other Marmots, such as the yellow-bellied and hoary Marmots, live in rocky and mountainous areas, but the woodchuck is a lowland creature. It is widely distributed in North

America and common in the North-Eastern and central United States. Groundhogs are found as far north as Alaska, with their habitat extending South-East to Alabama. / Земной Сурок или Лесной Сурок является одним из 14 Видов Сурков. Под Сурками (Marmota) понимается Род Млекопитающих Грызунов Семейства Беличьих. Длина тела до 60 сантиметров, хвоста менее 1/2 длины тела. 13 Видов, в Северном полушарии (исключая пустыни и тундры); в бывшем Союзе Советских Социалистических Республик (СССР) – 6 Видов. Объект промысла (мех, жир, мясо). Могут быть носителями возбудителя чумы. В Красных Книгах Международного Союза Охраны Природы и Природных Ресурсов (МСОП) (2 Вида) и бывшего СССР (1 Вид). Под Трубкозубом понимается Отряд Млекопитающих. 1 Вид. Длина тела до 1.5 метров (м), хвоста до 0.6 м. Голова удлинённая. Зубы состоят из нескольких полых призм. В Африке (исключая северную часть). Объект охоты (мясо, кожа), поэтому численность сокращается.

GROUNDING = ВЫГРУЗКА НА ЗЕМЛЮ – Grounding:- to separate a container physically from a chassis stacking the container on the ground.

GROUNDING = ПОСАДКА НА ГРУНТ (или ПОСАДКА НА МЕЛЬ) – Grounding:- deliberate contact by a ship with the bottom while she is moored or anchored as a result of the water level dropping. It is one type of the casualty. Deliberate contact by a ship with the bottom while she is moored or anchored as a result of the water level dropping. Many salvage operations involve a response to vessel groundings. Some groundings occur in areas of great environmental sensitivity. The salvage team arriving at the scene must make a rapid assessment of the casualty's condition and the potential for refloating without further hull damage and loss of cargo. In some instances, it is necessary to discharge part or all of the cargo, in order to free the ship. Much depends on the nature of the grounding site (sand, mud, rock, coral, etc), the extent to which the hull is aground, the degree of damage and a wide range of other operational factors, especially the weather. A forecast deterioration in the weather can have a major influence on the salvage strategy adopted. Grounding (maritime term):- running ashore (hitting the bottom). / необходимо разгрузить часть груза или весь груз вцелом, .

GROUND RENT = ЗЕМЕЛЬНАЯ РЕНТА – Ground Rent is a rent paid to the owner of land in respect of a ground lease granted to a developer who has the right to develop the land.

GROUND TACKLE = ЯКОРНОЕ УСТРОЙСТВО – Ground Tackle (maritime term):- a term used to cover all of the anchor gear.

GROUNDWATER = ПОДЗЕМНАЯ ВОДА (или ГРУНТОВАЯ ВОДА) – Groundwater is that portion of the water below the surface of the ground whose pressure is greater than atmospheric pressure. / Подземные Воды находятся в толще земной коры в жидком, газообразном и твёрдом состоянии (лёд). Подземные воды заполняют поры, трещины и пустоты в почвах и горных породах. Подземные воды могут быть химически и физически связанными (удерживаются в почвах и породах молекулярными силами, переходя при изменении температуры и давления в парообразное и жидкое состояния) и свободными (образуют постоянные водоносные горизонты). В зависимости от гидравлических свойств подземные воды могут быть Грунтовыми и Напорными (или Артезианскими). Под Грунтовыми Водами понимаются подземные воды первого от поверхности Земли постоянного водоносного горизонта, не имеющего сверху сплошной кровли водонепроницаемых пород (давление воды на поверхности равно атмосферному); не обладают напором и подвержены сезонным колебаниям уровня и дебита. Грунтовые воды участвуют в почвообразовательном процессе, определяют водный режим почв и растений. Оптимальная глубина залегания грунтовых вод обеспечивает благоприятный водный режим почвы и растений; повышение их уровня может вызвать подтопление прилегающих земель. Уровень залегания грунтовых вод учитывают при выборе способов орошения (поливов); при применении некоторых пестицидов и другого. Питание грунтовых вод происходит в основном за счёт впитывания атмосферных осадков и поверхностных вод. Напорные Воды залегают в пластах, перекрытых сверху слабопроницаемым слоем (на его поверхности давление выше атмосферного); в скважинах, вскрывающих этот пласт, уровень воды нередко устанавливается выше поверхности земли и скважины фонтанируют. Запасы (ресурсы) подземных вод оцениваются ёмкостью водоносного горизонта; они являются источником питьевого водоснабжения, используются в орошении (1/3 земель в мире поливается подземными водами), слабоминерализованными. Подземные воды – в водоснабжении промышленности. Подземные воды находятся под постоянным влиянием атмосферных, почвенно-биологических, антропогенных и прочих факторов, поэтому их глубины залегания (напоры), химический состав и температура изменяются во времени (режим подземных вод).

GROUNDWATER RUN–OFF = СТОК ГРУНТОВЫХ ВОД (или СТОК ПОДЗЕМНЫХ ВОД, или ПОДЗЕМНЫЙ СТОК) – Groundwater Run-Off is a water from a catchment area that moves freely under the influence of gravity and enters the soil.

GROUP = ГРУППА – (1) Group:- affiliation of legally independent companies in an economic unit under common management by means of financial participation. This structure is normally chosen to strengthen market positions. Also known as Concern, and Conglomerate. / в хозяйствующем субъекте . Известна также как Конгломерат (Conglomerate), и Концерн (Concern).

(2) SWIFT message types related to one financial function. Particular groups together comprise a category. A group, within a category, is indicated by the second digit of the message type number. / Типы сообщений Сообщества по Всемирной Межбанковской Финансовой Дальней Связи (СВМФДС; The Society for Worldwide Interbank Financial Telecommunication (SWIFT)), относящиеся к одной финансовой функции. Вместе отдельные группы составляют категорию. Группа в пределах категории обозначается второй цифрой номера типа сообщения. коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо).

(3) Group:- also referred to as a Technology Center or TC; a unit of several Group Art Units in the mechanical, electrical, chemical or design area, managed by one or more Group Directors. Groups are more properly referred to as Technology Centers, or TCs.

GROUP ACCOUNTS = ГРУППОВЫЕ СЧЕТА (или СЧЕТА ГРУППЫ) – In the United Kingdom (UK), as a general principle, where one company (or undertaking) controls another company (or undertaking) it is required to prepare Group Accounts to show the combined results and position of both companies. The original UK standard on group accounts, Statement of Standard Accounting Practice No. 14 (SSAP 14 (Statement of Standard Accounting Practice 14)) 'Group Accounts' was issued in September 1978 and was drafted to accord with the relevant provisions of the UK Companies Act of 1985 then in force. At that time the Companies Act did not include detailed rules regarding the preparation of group accounts. The issue of International Accounting Standard No. 3 (IAS 3) 'Consolidated Financial Statements' prompted the UK standard setting board to act. IAS 3 was later replaced by IAS No. 27 'Consolidated financial statements and accounting for investments in subsidiaries' which was recently amended in January 2008. It is normal for group accounts to be in the form of consolidated financial statements, with the terms more or less having the same meaning. The group is effectively treated as though it were a separate single company with only one group of shareholders. The balances and profits shown are only those resulting from transactions with third parties and all balances and transactions within the group are eliminated. Some common adjustments are discussed later. An undertaking is the parent undertaking in relation to another undertaking, the subsidiary, if the subsidiary undertaking is controlled by the parent undertaking. This implies that a group will consist of all undertakings under the control or ownership of the parent. The objective of consolidated financial statements is to present the results of the parent and all the entities over which it has control (i.e. a group) as if they were a single entity. It follows from this that an

entity cannot trade with itself nor make a profit from any transactions within the group. Thus any intra-group transactions need to be eliminated, i.e. cancelled as part of the consolidation process. Such transactions include:- (i) Sales:- if one member of a group sells goods to another, these sales are recorded by the seller in turnover, and by the purchaser in cost of sales at the same amount (the transfer price). Provided the purchaser has sold on the goods to an entity that is not a member of the group, it is a simple matter to eliminate the intra-group sale from turnover and cost of sales (at the same amount) when consolidating the profit and loss accounts. This elimination does not have an effect on the balance sheet. A problem arises when some of the goods from the intra-group sale are still in the inventory (or stocks) of the purchasing company at the year end. As these goods have not left the group, any profit added by the supplying company has not been realized and must therefore be eliminated. Once the amount of the unrealized profit has been determined, it is deducted from gross profit (by increasing cost of sales) and also deducted from the carrying amount of the consolidated inventory on the balance sheet. This deduction reduces the balance sheet value of the inventory to the cost of the group. (ii) Non-current asset transfers:- occasionally, a non-current asset is transferred within the group. The parent may have manufactured the asset as part of its normal production (and therefore included the sale in turnover or revenue, or it may have transferred an asset previously used as part of its own non-current assets. If the transfer is done at cost the required elimination would therefore be to remove the cost of the asset from turnover or revenue and cost of sales. The situation is also complicated if the transfer contains a profit element. At the date of sale /transfer, the profit is unrealized so in the financial statements prepared at this date the profit would be eliminated and also deducted from the carrying amount of the asset. (iii) Loans:- It is quite common for a parent to provide a loan to a subsidiary on which interest will usually be paid and received. The parent will normally show the loan as an investment with any interest received included in its profit and loss account. Conversely, the subsidiary will show the loan as a non-current liability (assuming repayment is due in more than one year's time) and will show any interest paid as a financing cost in its profit and loss account. It is a relatively simple matter to eliminate the asset (investment) against the liability (loan) in the consolidated balance sheet and the interest received against the interest paid in the consolidated profit and loss account. Uniform accounting policies should be used for determining the amounts to be included in the consolidated financial statements, if necessary by adjusting for consolidation the amounts which have been reported by subsidiary undertakings in their individual financial statements. In exceptional cases, different accounting policies may be used but any departures require disclosure of the particulars. The financial statements of subsidiary undertakings to be used in preparing consolidated financial statements should, wherever practicable, be prepared to the same financial year and for the same accounting period as those of the parent undertaking of the group. Where the financial year of the subsidiary undertaking differs from that of the parent, interim financial statements should be prepared to assist in the consolidation. If it is not practicable the subsidiary's last financial statements, providing that the year ended not more than three months before the relevant year end of the parent of the group, should be used for consolidation purposes. Also known as Consolidated Financial Statements in the United States. / МСБУ 3 (сокращение для Международного Стандарта Бухгалтерского Учёта № 3) – . выплата (repayment) .

GROUPAGE = ГРУППИРОВКА – Groupage is a consolidation service, putting small shipments into containers for shipment.

GROUPAGE AGENT = АГЕНТ ПО ГРУППИРОВКЕ – Groupage Agent is one who consolidates LCL (short for the Less Than Container Load) consignments to offer to a carrier as an FCL (short for the Full Container Load).

GROUP A HERBICIDE = ГЕРБИЦИД ГРУППЫ ЭЙ. – Group A Herbicide:- these post-emergence grass herbicides act through inhibiting acetyl-coA caboxylase, leading to membrane disruption in the plant.

GROUP ART UNIT = ГРУППОВАЯ ЕДИНИЦА ПО ИСКУССТВУ – Group Art Unit:- may be abbreviated 'AU', 'GAU' or 'Grp Art Unit' on office (the United States Patent and Trademark Office (USPTO)) correspondence; is a working unit responsible for a cluster of related patent art. Staffed by one supervisory patent examiner (SPE) and a number of patent examiners who determine patentability on applications for a patent. Group Art Units are currently identified by a four digit number, i.e. 1642.

GROUP BALANCE SHEET = ГРУППОВОЙ БАЛАНСОВЫЙ ОТЧЁТ (или БАЛАНСОВЫЙ ОТЧЁТ ГРУППЫ) – Group Balance Sheet is a consolidated balance sheet of a group of companies, showing combined results with the exception of inter-company participations, supplies, receivables and debts, shipments and services (i.e. purchases and sales) and similar items. A group income statement is prepared together with the consolidated balance sheet. / , то есть приобретения и продажи) и аналогичные строки баланса (items).

GROUP B HERBICIDE = ГЕРБИЦИД ГРУППЫ БИ. – Group B Herbicide:- these herbicides inhibit acetolactate synthase.

GROUP B MILL PRICE = ЗАВОДСКАЯ ЦЕНА ГРУППЫ БИ. – In the United States, Group B Mill Price is the price for Cotton delivered to mills in Western North Carolina and South Carolina. These prices, including landing and brokerage costs, are quoted for Cotton of given grades and staples from given regions. The Strict Low Middling (SLM) 1-1/16 inch price is often compared with polyester staple and rayon staple prices to indicate cotton's competitive position in the raw fiber market.

GROUP C HERBICIDE = ГЕРБИЦИД ГРУППЫ СИ. – Group C Herbicide:- these herbicides inhibit photosynthesis at photosystem II.

GROUP D HERBICIDE = ГЕРБИЦИД ГРУППЫ ДИ. – Group D Herbicide:- these herbicides inhibit tubulin formation, effectively inhibiting plant growth.

GROUP E HERBICIDE = ГЕРБИЦИД ГРУППЫ И. – Group E Herbicide:- these herbicides inhibit mitosis.

GROUPEUR = ГРУППИРОВЩИК – Grouper:- xxxxx. Also known as Groupage Agent.

GROUP F HERBICIDE = ГЕРБИЦИД ГРУППЫ ЭФ. – Group F Herbicide:- these herbicides inhibit carotenoid biosynthesis.

GROUP G HERBICIDE = ГЕРБИЦИД ГРУППЫ ДЬЖИ. – Group G Herbicide:- these herbicides inhibit protoporphyrinogen oxidase.

GROUP H HERBICIDE = ГЕРБИЦИД ГРУППЫ ЭЙЧ. – Group H Herbicide:- these herbicides inhibit protein systhesis.

GROUP I HERBICIDE = ГЕРБИЦИД ГРУППЫ АЙ. – Group I Herbicide:- these herbicides disrupt cell growth.

GROUP J HERBICIDE = ГЕРБИЦИД ГРУППЫ ДЬЖЕЙ. – Group J Herbicide:- these herbicides inhibit fat synthesis.

GROUP K HERBICIDE = ГЕРБИЦИД ГРУППЫ КЕЙ. – Group K Herbicide:- these herbicides have multiple modes of action inhibiting growth and root elongation.

GROUP L HERBICIDE = ГЕРБИЦИД ГРУППЫ ЭЛ. – Group L Herbicide:- these herbicides inhibit photoshythesis at photosystem I.

GROUP M HERBICIDE = ГЕРБИЦИД ГРУППЫ ЭМ. – Group M Herbicide:- these herbicides inhibit 5-enolpyruvylshikimate-3-phosphate (EPSP) synthase (also known as 3- phosphoshikimate 1-carboxyvinyltransferase).

GROUP N HERBICIDE = ГЕРБИЦИД ГРУППЫ ЭН. – Group N Herbicide:- these herbicides inhibit glutamine synthetase.

GROUP OF COMPANIES = ГРУППА КОМПАНИЙ – Group Of Companies:- grouping of companies or businesses which are in some way interdependent. Decisions are usually centralized and guided by a dominant company.

GROUP OF EIGHT = ГРУППА ИЗ ВОСЬМИ – (1) Group Of Eight:- the development countries that participated in the Conference on International Economic Cooperation (EC) in 1975, consisting of Australia, Canada, the EC (as one member), Japan, Spain, Sweden, Switzerland and the United States.

(2) Group Of Eight is an international group of the leaders or the finance ministers of the eight leading industrialized democracies created to coordinate economic and monetary policy. The G8 countries are Canada, France, Germany, Italy, Japan, Russia, The United Kingdom and the United States of America. / Международная группа руководителей или финансовых министров восьми ведущих индустриальных демократий, созданная с целью координации экономической и монетарной политики. Повсеместно указывается под сокращением Г8 (G8). В состав стран Г8 (G8) входят:- Германия, Италия, Канада, Россия, Соединённое Королевство, Соединённые Штаты Америки, Франция и Япония.

GROUP OF ELEVEN = ГРУППА ИЗ ОДИННАДЦАТИ – The G11 is a forum for the largest debtor nations in Latin America. Its members include:- Argentina, Bolivia, Brazil, Chile, Columbia, Dominican Republic, Ecuador, Peru, Uruguay, and Venezuela. Also known as Cartagena Group.

GROUP OF FIFTEEN = ГРУППА ИЗ ПЯТНАДЦАТИ – The G15, established in 1990, consists of relatively prosperous or large developing countries. The G15 discusses the benefits of mutual cooperation in improving their international economic positions. Members include:- Algeria, Argentina, Brazil, Egypt, India, Indonesia, Jamaica, Malaysia (a very active member), Mexico, Nigeria, Peru, Senegal, Venezuela. Yugoslavia, and Zimbabwe.

GROUP OF FIVE = ГРУППА ИЗ ПЯТИ – Similar to the Group of Seven (G7), with the exception of Canada and Italy. / В неё входят все те же страны, что и в Группу из Семи, за исключением Канады и Италии.

GROUP OF NINE = ГРУППА ИЗ ДЕВЯТИ – Group Of Nine is an informal group that discusses matters of mutual interest, consisting of Austria, Belgium, Bulgaria, Denmark, Finland, Hungary, Romania, Sweden and the former Yugoslavia.

GROUP OF NINETEEN = ГРУППА ИЗ ДЕВЯТНАДЦАТИ – Group Of Nineteen:- the less-developed countries (LDCs) that participated in the Conference on International Economic Cooperation (CIEC), held in several sessions between 1975 and 1977. Its members include:- Algeria, Argentina, Brazil, Cameroon, Egypt, India, Indonesia, Iraq, Jamaica, Mexico, Nigeria, Pakistan, Peru, Saudi Arabia, Venezuela, Yugoslavia, Zaire, Zambia, and Zimbabwe.

GROUP OF NINETY = ГРУППА ИЗ ДЕВЯНОСТА – Group Of Ninety (G-90) consists of African Group, ACP (short for the African, Caribbean and Pacific Group of States), and least-developed countries. WTO members (65):- Angola, Antigua and Barbuda, Bangladesh, Barbados, Belize, Benin, Botswana, Burkina Faso, Burundi, Côte d'Ivoire, Cambodia, Cameroon, Cape Verde, Central African Republic, Chad, Congo, Cuba, Democratic Republic of the Congo, Djibouti, Dominica, Dominican Republic, Egypt, Fiji, Gabon, Gambia, Ghana, Grenada, Guinea, Guinea-Bissau, Guyana, Haiti, Jamaica, Kenya, Lesotho, Madagascar, Malawi, Maldives, Mali, Mauritania, Mauritius, Morocco, Mozambique, Myanmar, Namibia, Nepal, Niger, Nigeria, Papua New Guinea, Rwanda, Saint Kitts and Nevis, Saint Lucia, Saint Vincent and the Grenadines, Senegal, Sierra Leone, Solomon Islands, South Africa, Suriname, Swaziland, Tanzania, Togo, Trinidad and Tobago, Tunisia, Uganda, Zambia, and Zimbabwe. WTO observers (14):- Afghanistan, Bahamas, Bhutan, Comoros, Equatorial Guinea, Ethiopia, Lao People's Democratic Republic, Liberia, Samoa, Sao Tomé and Principe, Seychelles, Sudan, Vanuatu, and Yemen. Not WTO members or observers (11):- Cook Islands, Eritrea, Kiribati, Marshall Islands, Micronesia, Federated States of, Nauru, Niue, Palau, Somalia, Timor-Leste, and Tuvalu. During the Fifth Ministerial Conference in Cancún, Mexico from 10 to 14 September 2003 and the subsequent WTO meeting in Geneva in July 2004, small developing countries held together as the Group-of-Ninety (G-90). While most countries recognize the benefits of dismantling the remaining barriers to trade, some – notably the least developed countries (LDCs) and some small island economies in Africa, the Caribbean, and the Pacific (ACP) – are apprehensive. To ensure that their concerns are reflected in the final text of the Doha Round, the LDCs and ACP countries have joined forces to form the Group of Ninety (G-90). One of the core issues at stake is that most G-90 countries already enjoy duty-free access for their exports in key markets – such as the European Union (EU) and the United States – in the context of preference schemes aimed at encouraging export growth and economic development in poor countries. This means that they would have little to gain from additional market access at the global level. More important, the multilateral removal of trade barriers would erode the price advantage that trade preferences confer and would expose countries whose exports rely on this advantage to fierce competition from more cost-efficient suppliers. It is not surprising, therefore, that 'preference erosion' has become an obstacle to completing the Doha Round. The G-90 has called for remedies, including compensatory and other mechanisms, such as measures to promote exports; technical and financial assistance for improving infrastructure, productivity, and diversification, and for development of systems to achieve compliance with technical and sanitary standards; and a laxer application of those standards to G-90 exports. It has also called for WTO members not to take measures that would further erode preferences so as to enable preference beneficiaries who trade on a limited number of products to continue to benefit from an 'equitable' share of the world market. Preference erosion can also occur outside the multilateral context – for example, when export partners eliminate preferences, expand the number of preference beneficiaries, or lower most-favored-nation (MFN) tariffs unilaterally without lowering preferential tariffs proportionately. It is in the latter context that ACP countries have opposed recent EU plans to reform its banana and sugar regimes, which are aimed at the gradual dismantling of the high trade barriers for these products.

GROUP OF SEVEN = ГРУППА ИЗ СЕМИ – Group Of Seven:- this term refers to seven major economic powers (Canada, France, Germany, Great Britain, Italy, Japan, and the United States) whose finance ministers seek to promote balanced economic growth and stability among exchange rates. G7 Finance Ministers And Central Bank Governors:- as part of the broader framework of cooperation within the Group of Seven countries (G7; Canada, France, Germany, Italy, Japan, the United Kingdom and the United States form the Group of Seven (G7) and with Russia the Group of Eight (G8). Heads of State or Government and foreign ministers meet in the G8 composition and finance ministers in the G7 composition.), finance ministers and central bank governors meet regularly to discuss key international economic and financial issues. Their meetings are mainly concerned with economic and financial developments and prospects in their respective countries, exchange rate issues and the global economy. In addition, they address issues of common interest related to international monetary and financial policy. These informal exchanges of views may help participants to achieve a greater understanding of the different issues involved, and may also be of use in the discussion and decision-making processes of international organisations such as the IMF, the World Bank or the OECD, providing possible guidance or political impetus for their work. International group made up of seven leading industrial nations – Canada, France, Germany, Italy, Japan, the United Kingdom, and the United States – whose finance ministers and central bank governors meet occasionally to discuss economic policy. The International Economy magazine, now in its twentieth year of publication (Spring 2007), has evolved in step with the G7, it seems. The establishment of the G7 was agreed upon at the Tokyo Summit in 1986, one year after the Plaza Accord (see also Plaza Accord) had

been signed by the G5. The Tokyo declaration states:- '…the Heads of State or Government:- Request the seven Finance Ministers (including those of Italy and Canada) to review their individual economic objectives and forecasts collectively at least once a year, using the indicators specified below, with a particular view to examining their mutual compatibility; As for the G5, in view of the formation of the G7, (the Heads of State or Government) … Reaffirm the undertaking … to cooperate with the International Monetary Fund in strengthening multilateral surveillance, particularly among the countries whose currencies constitute the SDR (Special Drawing Rights), and request that, in conducting such surveillance … their individual economic forecasts should be reviewed, taking into account indicators such as GNP growth rates, inflation rates, interest rates, unemployment rates, fiscal deficit ratios, current account and trade balances, monetary growth rates, reserves, and exchange rates'. In spite of the fact that the Tokyo declaration chose the expression, 'countries whose currencies constitute the SDR' and did not use the 'G5' designation, the G5 meeting was held first for the Louvre Accord in February 1987, and the G7 was treated as a forum for ex post facto authorization. So it seemed at least to the finance minister of Italy, who excused himself midway through the conference and returned home. The upshot was that it proved awkward to hold the G5 meeting thereafter. By 2007, with the passage of twenty years, the G7 has changed its character significantly. First, the process of economic integration in the European Union has advanced and the Euro has been introduced. And second, Russia and China have been invited to G7 meetings for the exchange of views. At the G7's Essen meeting in February 2007, the invitees included Brazil, India, South Africa, and Mexico, in addition to Russia and China. As for the first change, I (Tomomitsu Oba is Chairman of the Japan Center for International Finance and former Vice Finance Minister, Japan) have been musing about the Euro's strength these days. The market cites many reasons for the Euro's strength, such as the economic growth rate of 2.7 percent in the Euro zone, a rate approaching the 3.4 percent growth of the United States, and the narrowing of the interest rate gap between the United States and the Euro zone. Nevertheless, in my assessment, the primary reason lies in the fact that the entire Euro region led by Germany is gathering strength, providing support to the Euro. The strong Euro is a reflection of the strength of the Euro region that is now comparable to that of the Dollar sphere. I think the Euro will become a currency that may threaten the Dollar in good time. I am of the view that the strong Euro is anchored on a strong Euro region and especially on a strong Germany. Some, however, may take issue with this observation and say that political integration has not advanced far enough. That the European constitution was rejected in referendums in France and the Netherlands in 2005, in particular, was a cause for bewilderment for many who had set their hopes on political integration. Nonetheless, the Maastricht, Amsterdam, and Nice Treaties all remain valid. One might argue that the European constitution containing hundreds of pages that even heads of state or cabinet ministers did not bother to look through was justifiably rejected by some Europeans. Suitable further tactical moves will be devised sooner or later. One can say that political integration was not really pushed back. The creation of the Euro itself represents, I think, an important step forward in political integration. German Chancellor Angela Merkel and the finance ministers of Germany and Italy sounded critical about the weak Yen and Dollar shortly before the February G7 meeting. While they should have blamed the appreciating Euro, they obviously shifted the aim of their attack in the interest of bolstering the authority of the European Central Bank. Granted, the yen and the Dollar are growing weaker vis-à-vis the Euro; still the Yen is relatively stable in regard to the Dollar. The two weak currencies stand equably with each other. The increase in Japan's foreign reserves over the last two years was a mere USD50 billion. Only the interest income on investments of the foreign reserves has risen. No intervention in the exchange market has been undertaken by our monetary authorities. Thus, the criticisms regarding yen depreciation by Germans and other Europeans are unfounded. At the February meeting of the G7, the topic of how to define the position of hedge funds and whether to regulate them or not was reportedly on the agenda. The conclusion in favor of enhancing the transparency of hedge funds' trades seems appropriate. It is desirable that the G7 continues exchanging views and consulting with the non-members on a limited range of issues including energy and environments. / Томомицу Оба (Tomomitsu Oba). Этот термин относится к семи крупным экономическим державам (Великобритания, Германия, Италия, Канада, Соединённые Штаты Америки, Франция и Япония), министры финансов которых стремятся продвинуть сбалансированный экономический рост и стабильность обменных курсов своих валют. Международная группа, сформированная семью ведущими промышленными нациями – Германией, Италией, Канадой, Соединёнными Штатами Америки, Соединённым Королевством, Францией и Японией, министры финансов и управляющие центральных банков которых время от времени встречаются для обсуждения вопросов экономической политики.

GROUP OF SEVENTY–SEVEN = ГРУППА ИЗ СЕМИДЕСЯТИ СЕМИ – Goup Of Seventy-Seven:- a grouping of developing countries which had its origins in the early 1960s. This numerical designation persists, although membership had increased to more than 120 countries. The G77 functions as a caucus for the developing countries on economic matters in many forums including the United Nations. Today (in 2011), the G77 has 131 members. Group of developing countries set up in 1964 at the end of the first UNCTAD (originally 77, but now more than 130 countries). Group of 77 (G-77) and China:- a large negotiating alliance of developing countries that focuses on numerous international topics, including climate change. The G-77 was founded in 1967 under the auspices of the United Nations Conference on Trade and Development (UNCTAD). It seeks to harmonize the negotiating positions of its 131 member states. / Группа из Семидесяти Семи (Г77 (G77)) – группировка молодых развивающихся стран, отсчитывающих свою историю с начала 1960-х. Данное цифровое обозначение группы поддерживается несмотря на то, что её текущий состав превышает 120 стран. Основными функциями Г77 по причине того, что она состоит из развивающихся стран, является отстаивание интересов и решение экономических вопросов на различных форумах, в том числе и в Организации Объединённых Наций.

GROUP OF SIX = ГРУППА ИЗ ШЕСТИ – Group Of Six:- not to be confused with the Big Six, this refers to Argentina, Greece, India, Mexico, Sweden, Tanzania, whose aim is to achieve nuclear disarmament. / Термин Группа из Шести относится к Аргентине, Греции, Индии, Мексике, Танзании и Швеции, целями которых являются достижение ядерного разоружения. Не путайте с Большой Шестёркой (Big Six).

GROUP OF TEN = ГРУППА ИЗ ДЕСЯТИ – Group of Ten:- the ten nations who met in Paris in 1961 to arrange the special drawing rights of the International Monetary Fund (IMF); Belgium, Canada, France, Italy, Japan, Netherlands, Sweden, UK, US, and West Germany. Abbreviation:- G10. The work of the Group of Ten (G10; The G10 comprises Belgium, Canada, France, Germany, Italy, Japan, Netherlands, Sweden, the United Kingdom and the United States. Switzerland is an associate member of the G10.) ministers and governors is closely linked to the activities of the IMF. It dates back to the creation of the General Arrangements to Borrow (GAB), which were established in 1962 to complement the IMF's ordinary resources. In recent years, the main focus of the G10 has been on preventing and managing international financial crises. Group Of Ten:- under the International Monetary Fund's General Agreements to Borrow (GAB), established in 1962, 10 of the wealthiest industrial members of the IMF 'stand ready to lend their currencies to the IMF up to specified amounts when supplementary resources are needed'. The finance ministers of these countries comprise the Group of Ten. Group Of Ten (G10):- now eleven industrialized nations that meet on an annual basis to consult each other, debate and cooperate on international financial matters. The member countries are:- France, Germany, Belgium, Italy, Japan, the Netherlands, Sweden, the United Kingdom, the United States and Canada, with Switzerland playing a minor role. The G10 has been criticized for its lack of responsiveness to the needs of developing countries. G10 meetings are politically charged events that often make headlines in the international press for the protests that follow them. G10 governors usually meet every second month at the Bank for International Settlements. Group of ten countries that concluded the General Arrangements to Borrow (1962). International credits are granted in

conjunction with the International Monetary Fund (IMF). G-10:- a coalition of countries lobbying for agriculture to be treated as diverse and special because of non-trade concerns (not to be confused with the Group of Ten Central Bankers). WTO members (9):- Chinese Taipei, Iceland, Israel, Japan, Korea, Republic of, Liechtenstein, Mauritius, Norway, and Switzerland. Also known as Paris Club. Group of Ten (economic) is a group originally of ten, now eleven, industrial nations. The Group of Ten or G-10 refers to the group of countries that have agreed to participate in the General Arrangements to Borrow (GAB). The GAB was established in 1962, when the governments of eight International Monetary Fund (IMF) members – Belgium, Canada, France, Italy, Japan, the Netherlands, the United Kingdom, and the United States – and the central banks of two others, Germany and Sweden, agreed to make resources available to the IMF for drawings by participants, and, under certain circumstances, for drawings by nonparticipants. The GAB was strengthened in 1964 by the association of Switzerland, then a nonmember of the Fund, but the name of the G10 remained the same. The following international organizations are official observers of the activities of the G10:- the Bank for International Settlements (BIS), European Commission, International Monetary Fund, and Organisation for Economic Co-operation and Development. The Group of Ten signed the Smithsonian Agreement in December 1971, replacing the world's fixed exchange rate regime with a floating exchange rate regime. Luxembourg is an associate member. / Г10 или Г-10. Известна также как Парижский Клуб (Paris Club).

GROUP OF THIRTY = ГРУППА ИЗ ТРИДЦАТИ – Group Of Thirty is an informal group of 30 leading international bankers, economists, financial experts and businessmen organized by the former managing director of the International Monetary Fund (IMF) with the purpose of discussing and proposing solutions to the world's economic problems. Group of Thirty (G30) is a private, nonprofit international organization composed of representatives from the public sector and the private sector, including academia. The Group's objectives are to deepen the understanding of international financial and economic issues. In 1989, the G30 made recommendations regarding international clearance and settlement systems. The Group of Thirty:- founded in 1978, this has become the world's leading international financial consultative group, comprised of 30 leading figures from economic and financial arenas. It describes itself as a non political organization that explores issues of business practice and public policy, suggesting measures to improve the functioning of the international financial system … (for bankers and big business etc, rather than the population as a whole?) Members include Mervyn King – Governor of the Bank of England, Stanley Fischer – Deputy Managing Director of the IMF, and the Governors of the Bank of France and the Bank of Japan. The Chairman is Jacob Frenkel who recently took over from former US Federal Reserve boss Paul Volcker. Frenkel is chairman of international merchant bankers Merrill Lynch and a former Governor of the Bank of Israel. In reality, there are many more organisations and many possible links between them. For example, the US funded 'British American Project for the Successor Generation' has been responsible, since the 1980s, for recruiting young up and coming British politicians and media people and taking them on expenses paid trips to the US to educate them in the virtues of the 'American dream'. The message is – stick with us boys and girls and you will go far … And many have done just that, for example Neil Kinnock, Blair, Mandelson, Mo Mowlam, George Robertson plus various Labour party advisers and policy makers, not to mention Radio 4 'Today' programme presenter James Naughty and BBC 2 Newsnight presenter Jeremy Paxman. Of all these secretive private forums you might say, so what – it's essential that top people get together to discuss and plan global affairs – what right has anyone to impugn any improper motives on their part – they are doing the best they can for us all. If that's really the case, why the secrecy? And look at the evidence out there all around us. In a world where more than one billion people live in absolute poverty, let's take a careful look at what the outcome of all this really is. See also The Committee of 300. / Мёвин Кин (Mervyn King) – управляющий Банка Англии (Governor of the Bank of England), Стэнли Фищё (Stanley Fischer) – Помощник Управляющего Директора (Deputy Managing Director) МВФ (IMF), и Управляющие Банка Франции (Bank of France) и Банка Японии (Bank of Japan). Председателем (Chairman) является Якоб Фрэнькэл (Jacob Frenkel) Пол Xxxxx (Paul Volcker). Мёрл Лынч (Merrill Lynch). Нил Кинэк (Neil Kinnock), Блэа (Blair), Мандэлсэн (Mandelson), Мо Молэм (Mo Mowlam), Дьжодьж Робэтсэн (George Robertson) плюс различные советники и создатели политики Лейбористской партии (Labour party advisers and policy makers), Рэйдио фо 'Тчудэй' (Radio 4 'Today') Дьжеймз Ноти (James Naughty) и Би.Би.Си. Тчу Ньюзнайтч ведущий Дьжерэми Паксмэн (BBC 2 Newsnight presenter Jeremy Paxman).

GROUP OF THIRTY–THREE = ГРУППА ИЗ ТРИДЦАТИ ТРЁХ – In WTO, Group Of Thirty-Three or G-33:- also called 'Friends of Special Products' in agriculture. Coalition of developing countries pressing for flexibility for developing countries to undertake limited market opening in agriculture. WTO members (46):- Antigua and Barbuda, Barbados, Belize, Benin, Bolivia, Plurinational State of, Botswana, Côte d'Ivoire, China, Congo, Cuba, Dominica, Dominican Republic, El Salvador, Grenada, Guatemala, Guyana, Haiti, Honduras, India, Indonesia, Jamaica, Kenya, Korea (Republic of), Madagascar, Mauritius, Mongolia, Mozambique, Nicaragua, Nigeria, Pakistan, Panama, Peru, Philippines, Saint Kitts and Nevis, Saint Lucia, Saint Vincent and the Grenadines, Senegal, Sri Lanka, Suriname, Tanzania, Trinidad and Tobago, Turkey, Uganda, Venezuela (Bolivarian Republic of), Zambia, and Zimbabwe. The leading economists from 13 countries with the aim of promoting solutions to international economic problems.

GROUP OF THREE = ГРУППА ИЗ ТРОИХ – Group Of Three:- mechanism for policy coordination that consists of Colombia, Mexico and Venezuela. / Данная группа представляет собой механизм для координации политики и включает в себя в качестве стран-членов Венесуэллу, Колумбию и Мексику.

GROUP OF TWENTY = ГРУППА ИЗ ДВАДЦАТИ – (1) The Group Of Twenty, or G20, is the premier forum for international cooperation on the most important aspects of the international economic and financial agenda. It brings together the world's major advanced and emerging economies. The G20 includes 19 country members and the European Union, that all together represent around 90% of global GDP, 80% of global trade, and two thirds of the world's population. The objective of the G20 is:- (i) policy coordination between its members in order to achieve global economic stability, sustainable growth; (ii) to promote financial regulations that reduce risks and prevent future financial crises; and (iii) to create a new international financial architecture. Membership of the G20, which includes both developed and emerging economies, closely reflects two current trends that are transforming international relations:- the increasing influence of emerging economies on political and economic affairs, and the need to find innovative forms of cooperation to meet new global challenges that require collective responses. The G20 includes 19 countries and The European Union:- Argentina, Australia, Brazil, Canada, China, France, Germany, India, Indonesia, Italy, Japan, Mexico, Korea (Republic of), Russia, Saudi Arabia, South Africa, Turkey, United Kingdom, the United States, and the European Union. The G20 was created in response to both to the financial crises that arose in a number of emerging economies in the 1990s and to a growing recognition that some of these countries were not adequately represented in global economic discussion and governance. In December 1999, the finance ministers and central bank governors of advanced and emerging countries of systemic importance met in Berlin, Germany, for an informal dialogue on key issues for global economic stability. Since then, finance ministers and central bank governors have met annually:- 2000 – in Canada, 2001 – in Canada, 2002 – in India, 2003 – in Mexico, 2004 – in Germany, 2005 – in China, 2006 – in Australia, 2007 – in South Africa, 2008 – in Brazil. In November 2008, during the worst economic crisis since the Great Depression (1929), the US President George Walker Bush convened a meeting of G20 Leaders in Washington, DC, the USA. The magnitude of the crisis was such that it threatened to engulf the entire global economy; it therefore required a highlevel coordinated response. The G20 was the most suitable forum for achieving this task, given it represents advanced and emerging economies from all corners of the world, and its

relatively small membership allows it to reach agreements rapidly. At that meeting, the Leaders discussed the causes of the global economic and financial crisis and agreed to implement an Action Plan around three main objectives:- (i) restoring global growth; (ii) strengthening the international financial system; and (iii) reforming international financial institutions. Since then, the G20 has held six Leaders' Summits to seek agreements on global economic matters. November 2008 – Washington, DC, the USA; April 2009 – London, the United Kingdom; September 2009 – Pittsburgh, the USA; June 2010 – Toronto, Canada; November 2010 – Seoul, Korea (Republis of); and November 2011 – Cannes, France. Mexico has taken part in all the G20 Summits and meetings and hosted the Ministerial G20 Meeting in 1993 and now (2012) chairs the Annual Presidency of the G20. In today's interdependent global economy, Mexico has promoted the group's role as a representative, inclusive and effective forum for making and implementing economic and financial decisions. The G20 is an international forum made up of 19 countries and the European Union, representing the world's major developed and emerging economies. Together, the G20 members represent 85% of global GDP, 75% of international trade, and two-thirds of the world's population. Originally bringing together finance ministers and central bank governors, the G20 has evolved into a forum to address broader global challenges. The Group of 20 (G20; The members of the Group of 20 are the finance ministers and central bank governors of Argentina, Australia, Brazil, Canada, China, France, Germany, India, Indonesia, Italy, Japan, Korea, Mexico, Russia, Saudi Arabia, South Africa, Turkey, the United Kingdom and the United States. Another member is the European Community, represented by the President of the EU Council and the President of the ECB. The managing director of the IMF and the President of the World Bank, plus the chairpersons of the International Monetary and Financial Committee and Development Committee of the IMF and World Bank, also participate in the talks as ex officio members.) is an informal forum of finance ministers and central bank governors set up in 1999 to involve key emerging market countries in the dialogue on international economic and financial policy issues. It aims to facilitate an open exchange of views on those matters and thus promote consensus-building on issues discussed by the relevant decision-making bodies, such as the IMF and the World Bank. / Дьжодьж Вокё Бош (George Walker Bush; 1946–).

(2) In WTO:- G-20 is a coalition of developing countries pressing for ambitious reforms of agriculture in developed countries with some flexibility for developing countries (not to be confused with the G-20 group of finance ministers and central bank governors, and its recent summit meetings). WTO members (23):- Argentina, Bolivia (Plurinational State of), Brazil, Chile, China, Cuba, Ecuador, Egypt, Guatemala, India, Indonesia, Mexico, Nigeria, Pakistan, Paraguay, Peru, Philippines, South Africa, Tanzania, Thailand, Uruguay, Venezuela (Bolivarian Republic of), and Zimbabwe.

GROUP OF TWENTY–FOUR = ГРУППА ИЗ ДВАДЦАТИ ЧЕТЫРЁХ – Group Of 24 (G-24):- twenty-four countries established in 1971 to work together to coordinate the positions of developing countries on international monetary and development finance issues and to ensure that their interests were adequately represented in negotiations on international monetary matters. G-24 is a chapter of the Group of 77 (G-77), the largest intergovernmental group of developing states in the United Nations. Membership is strictly limited to 24 countries, but any member of the G-77 can join discussions. China has been a 'special invitee' since 1981. While it is not an organ of the International Monetary Fund (IMF), the IMF provides secretariat services for the Group. Group Of Twenty-Four:- a grouping of finance ministers from 24 developing country members of the International Monetary Fund (IMF). The Group, representing eight countries from each of the African, Asian, and Latin American country groupings in the Group of 77, was formed in 1971 to counterbalance the influence of the Group of 10.

GROUP OF TWO = ГРУППА ИЗ ДВОИХ – Group Of Two is an informal term that came into being in about 1986 and refers to Japan and the United States. / Неформальный термин, появившийся приблизительно в 1986 и относящийся к двум странам – Соединённым Штатам Америки и Японии.

GROWING BEEF CATTLE IN DRY LOTS = РАСТУЩИЙ КРУПНЫЙ РОГАТЫЙ СКОТ МЯСНОЙ ПОРОДЫ В СУХИХ СТОЙЛАХ – Growing Beef Cattle in Dry Lots (Steers and/or Heifers):- weaned growing beef Cattle (including dairy breeds), that are maintained in a dry lot, receiving the majority of their diet from harvested forage.

GROWING CATTLE ON PASTURE = РАСТУЩИЙ КРУПНЫЙ РОГАТЫЙ СКОТ НА ПАСТБИЩЕ – Growing Cattle on Pasture are stockers, feeders, and slaughters. See also Feeders, Slaughter Cattle, Stockers, and Weaned Cattle.

GROWING DEGREE–DAY = ГРАДУСО–ДЕНЬ РОСТА – Growing Degree-Day:- xxxxx. See also Heat Units.

GROWING MEDIUM = СУБСТРАТ ДЛЯ ВЫРАЩИВАНИЯ (РАСТЕНИЙ) (или СРЕДА ДЛЯ ВЫРАЩИВАНИЯ) – Growing Medium is any material in which plant roots are growing or intended for that purpose.

GROWING PERIOD = ПЕРИОД РОСТА (или ВЕГЕТАЦИОННЫЙ ПЕРИОД) – Growing Period of a Plant Species is a time period of active growth during a growing season.

GROWING POINT = ТОЧКА РОСТА (или КОНУС НАРАСТАНИЯ) – Growing Point is a mass of meristematic tissue at the stem or root tip where growth in length of the stem or root occurs. / на стебле или острие корня, где . Под Конусом Нарастания или Точкой Роста или Апексом понимается верхушка побега и корня растений, состоящая из клеток образовательной ткани (меристемы); обеспечивает формирование первичных тканей и органов и их рост.

GROWING SEASON = СЕЗОН РОСТА (или ВЕГЕТАЦИОННЫЙ СЕЗОН, или СЕЗОН ВЕГЕТАЦИИ) – Growing Season is a period or periods of the year when Plants actively grow in an area, place of production or production site. Growing Season is the period of a year when the environment enables farmers to produce a crop of economic value. / Под Сезоном, от Французского слова Saison, понимается период времени, характеризующийся .

GROWING SEASON INSPECTION = ИНСПЕКЦИЯ В СЕЗОН РОСТА – Growing Season Inspection is an examination of Plants during active growth to verify freedom from specific pests or pathogens. Also may include the growing media or soil.

GROWTH = РОСТ – (1) Growth is:- (1) the change in the size of a plant, resulting in increased volume, increased dry weight, and protein content. (2) The increased population or colony of a culture of microorganisms. Growth is an increase as in, size, number, value, or strength. / В биологии под Ростом понимается увеличение массы и линейных размеров особи за счёт увеличения числа и размеров клеток и неклеточных образований. Характеризуется ритмичностью (суточные, сезонные и другие ритмы). Регулируется главным образом гормонами.

(2) Growth:- in economics, complex process of long-term change, evidenced by an increase in a nation's productivity and transformation of its social structures. Growth is the ultimate goal of all economic systems. The priority given this goal reflects a dual concern:- meeting the growing needs of individuals and communities, i.e. improving the standard of living, and maximizing the nation's advantages in international competition. Growth can only be analyzed over the long term. It is the result of profound changes in all sectors of an economy, after eliminating seasonal or cyclical changes. The basic measure of growth is the gross national products or the gross domestic product. This measure is adjusted for price inflation and expressed in constant terms. Selecting a growth rate is a

fundamental choice in economic planning. This choice, and its effects on major economic, budgetary and monetary equilibria, reflects the basic political choices that are at the root of all planning. / , то есть .

(3) Growth:- in sharemarket, the capital appreciation of a company or trust price rather than the returns from income via dividends.

(4) Growth:- xxxxx. See also Secondary Creep. The void growth occurs primarily under secondary creep conditions. / Смотрите также Вторичная Ползучесть или Вторичная Текучесть (Secondary Creep).

GROWTH ANALYSIS = АНАЛИЗ РОСТА – Growth Analysis is a method of taking samples at defined intervals and determining the development patterns.

GROWTH CURVE = КРИВАЯ РОСТА – Growth Curve is a graph which plots the plant's weight, height, and leaf area against time and age.

GROWTH DURATION = ПРОДОЛЖИТЕЛЬНОСТЬ РОСТА – Growth Duration is a length of time the crop takes to mature (seeding to harvest).

GROWTH FUND = ФОНД РОСТА – Growth Fund:- long-term investment that concentrates on capital growth. Growth-oriented investment fund. Such funds place only marginal emphasis on generating a cash yield. The Growth Funds offer potential for appreciation in share value, while the current income may be low. The fluctuation in share price may also be high. Such funds invest in stocks and have tendency to outperform other funds and other modes of savings over a period of time. / Фонд Роста (Growth Fund) – взаимный фонд, вкладывающий средства в акции роста. Целью фонда является обеспечение долгосрочного роста капитала, вложенного акционерами. Фонды, вкладывающие средства в акции роста, являются менее устойчивыми, чем консервативные доходные или финансовые инвестиционные фонды. Как правило, их доходность растёт быстрее, чем у консервативных фондов в ситуации подъёма на рынке, и снижается более резко в периоды спада. Смотрите также (Growth Stock).

GROWTH HABIT = ГАБИТУС РОСТА (или ФОРМА РОСТА) – Growth Habit is the usual sequences of the vegetative and reproductive phases of the plant. / Под Габитусом, от Латинского слова Habitus, означающее Внешность или Наружность, понимается:- (i) наружный вид, облик растения или животного; (ii) наружный вид, облик кристалла, минерала; (iii) внешний облик человека, его телосложение, конституция, осанка.

GROWTH INHIBITORS = ИНГИБИТОРЫ РОСТА – Growth Inhibitors are the suppressants of plant growth such as hormones or chemicals that inhibit the plant's ability to grow or develop. See also Inhibitor. / Под Ингибиторами, от Латинского слова Inhibeo, означающее Удерживаю, понимаются химические вещества, подавляющие активность ферментов. Например, иодуксусная кислота тормозит ферментативные реакции углеводного обмена. Используют для изучения механизма действия ферментов, для лечения нарушений обмена веществ, а также в качестве пестицидов.

GROWTH OF WORLD TRADE = РОСТ ВСЕМИРНОЙ ТОРГОВЛИ – Growth Of World Trade is calculated as the arithmetic mean of the growth of world import volumes and world export volumes.

GROWTH REGULATORS = РЕГУЛЯТОРЫ РОСТА – Growth Regulators are the chemicals that are used to control the plant's growth.

GROWTH RETARDANTS = РЕТАРДАНТЫ РОСТА (или ЗАМЕДЛИТЕЛИ РОСТА) – Growth Retardants are the chemicals that delay or slow down growth. / Под Ретардацией, от Латинского слова Retardatio, означающее Замедление, понимается задержка развития действия.

GROWTH STAGES = СТАДИИ РОСТА – Growth Stages are the defined periods or cycles of the plant's growth, such as the seedling, tillering, and reproductive stages. / Под Стадией, от Греческого слова Stádion, означающее Стадий (мера длины), понимается определённая ступень, период, этап в развитии чего-либо, имеющие свои качественные особенности.

GROWTH STIMULATORS = СТИМУЛЯТОРЫ РОСТА – Growth Stimulators are chemicals or hormones that are used to accelerate or promote the rate of growth in plants. / Под Стимуляторами Роста растений понимаются природные или синтетические вещества, стимулирующие рост растений путём ускорения деления клеток или их растяжения в длину. К природным стимуляторам роста растений относятся фитогормоны – ауксины, гиббереллины, цитокинины, к синтетическим – их аналоги.

GROWTH STOCK = АКЦИИ РОСТА – Growth Stocks are shares of a company or sector believed by analysts to have above-average long-term growth prospects. Stock of a company with a record of earnings growth at a relatively high rate. Shares of a corporation which have scored faster-than-average earnings gains and are expected to show high levels of profit growth. As a consequence, they justify a higher price/earnings ratio but also constitute riskier investments than average equities. / Акции Роста – акции корпораций, уровень роста доходов которых в течение последних нескольких лет был выше среднего, и которые, как ожидается, и далее будут сохранять высокий темп роста доходов. В долгосрочной перспективе акции роста, как правило, показывают лучшие результаты, чем медленно растущие или стабильные акции. Однако акции роста являются более рискованным видом инвестиций, чем средние акции, поскольку они обычно имеют высокое соотношение цены и доходности и дивиденды по ним выплачиваются незначительные либо не выплачиваются вообще. Смотрите также Price/Earnings Ratio.

GRP = GLASS REINFORCED PLASTICS

GRP = GLASS REINFORCED THERMOSETTING PLASTICS

GRS = GRAIN SHAPE

GRT = GROSS REGISTERED TONNAGE

GS = SOUTH GEORGIA AND THE SOUTH SANDWICH ISLANDS

GS1 = GLOBAL STANDARDS ONE

GSA = GENERAL SERVICES ADMINISTRATION

GSE = GOVERNMENT–SPONSORED ENTERPRISE

GSM = GLOBAL SYSTEM OF MOBILE COMMUNICATIONS

GSM = ГКМ – GSM is a common but non-standard symbol for grams per square meter (g/m^2), the metric unit of density for paper and for fabric. Paper density measured in this unit is often called Grammage.

GSP = GENERALIZED SYSTEM OF PREFERENCES

GSTPA = GLOBAL STRAIGHT THROUGH PROCESSING ASSOCIATION

G–STRING = БЕЧЁВКА ДЬЖИ. (или XX) – G-String is a strip of cloth passed between the legs and supported by a waist cord.

G–SUIT = КОСТЮМ ДЬЖИ. (или XX) – G-Suit is a suit designed to counteract the physiological effects of acceleration on an aviator or astronaut.

GSV = GRASSY STUNT VIRUS

GT = BILLION TONS

GT = GELATINIZATION TEMPERATURE

GT = GUATEMALA

GTC ORDER = GOOD 'TIL CANCELLED ORDER

GTDA = GENERAL LICENSE TECHNICAL DATA

GTDR = GENERAL LICENSE TECHNICAL DATA RESTRICTED

GTL = GAS TO LIQUIDS

gTLD = GENERIC TOP LEVEL DOMAIN

GTM ORDER = GOOD THIS MONTH ORDER

GTW ORDER = GOOD THIS WEEK ORDER

GTZ = DEUTSCHE GESELLSCHAFT FÜR TECHNISCHE ZUSAMMENARBEIT = GERMAN AGENCY FOR TECHNICAL COOPERATION

GU = GUAM

GUANACO = ГУАНАКО – Guanaco is a protein fiber from the Guanaco, a relative of the Llama. See also Llama. Guanaco is a wooly, reddish-brown wild animal of the Llama family. Guanaco Species:- the Guanaco is considered to be a wild species, like the Vicuña. Some scientists think that Lamas and Alpacas are races derived from the Guanaco. Other consider that they are different species. Actually, we can say that both theories are valid. In the natural environment, those animals make up herds of 5 to 10 females, a male and their offspring. The period in which the Guanacos are in heat corresponds to the southern summer, between November and February. The gestation period lasts eleven months. The Guanaco belongs to the South American Camelids and is a little bigger than the Vicuña. / Под Гуанако понимается парнокопытное животное рода Лам. Длина 1.2–1.75 метров. Обитает в высокогорьях Анд (Южная Америка). Объект охоты (мясо, кожа); численность сокращается. Предок домашней Ламы. Под Ламой понимается понимается род парнокопытных животных семейства верблюдовых. Длина 1.2–1.75 м. 2 вида – Гуанако и Викунья, обитают в высокогорьях Анд; оба одомашнены – собственно Лама (одомашненный Гуанако) и Альпака (Гуанако, скрещённый с Викуньей). Лам используют как вьючных животных; очень ценится шерсть.

GUAR = ГУАР (или XX) – Guar is a plant-derived gum. Guar gum is used as a thickener in some printing pastes for acid dyes and in etching paste for cellulose fibers. It is reasonably resistant to acids. Guar is unsuitable for use with reactive dyes since it will itself react with the dye. Modified guar gums are also used.

GUARANTEE = ГАРАНТИЯ – (1) Guarantee is a legal arrangement involving a promise by one person to perform the obligations of a second person to a third person, in the event the second person fails to perform. Agreement whereby one person assumes responsibility for a second person's debt to a vendor if the second person becomes insolvent. Used in international trade, it backs a vendor's claim in the form of a bank guarantee. Credit insurance for exporters. Guarantee is a contract in which a third party (the guarantor) provides an assurance that a desired outcome will be achieved. He also undertakes to pay compensation for damages resulting from a certain entrepreneurial act or course of action. A guarantee is a form of loan collateral, similar to a suretyship. Unlike a suretyship, however, a guarantee is abstract (i.e. not bound to a principal obligation), thereby giving the lender greater security. / В гражданском праве под Гарантией понимается предусмотренное законом или договором обязательство, в силу которого какое-либо физическое или юридическое лицо полностью или частично отвечает перед кредиторами при неисполнении или ненадлежащем исполнении обязательства должником.

(2) Guarantee is a contract by which a guarantor undertakes to be responsible to a creditor for the fulfilment of a debtor's obligation. The legal basis of a guarantee is formed by §§ 785ff German Civil Code (BGB). The contract is a unilateral obligation on the part of the guarantor. The creditor only has rights under the contract. The guarantee presupposes the existence of a principal debt, to which the guarantee is accessory. There are various types of guarantee. Particularly well known are the absolute guarantee, the non-performance or modified non-performance guarantee, and the joint guarantee. Guarantees are also issued as aval guarantees or as aval credit. Assumption of responsibility by one person (the guarantor) for another's debt or obligation to perform an act or duty. The guarantor is liable for performance or payment only in the event of default by the original debtor. In popular usage, a person or business can 'guarantee' its own performance, i.e. by providing assurance that goods offered for sale will last for a given period. Also known as Cosignature, and Guaranty. A contractual engagement to answer for the debt, default or failure of another person. The guarantor is obligated in respect of the obligee of a third party (principal debtor or obligor) to pay the debt if the third party fails to perform. The purpose of a guarantee is to secure a claim, mainly in order to raise credit (guaranteed credit). / , то есть . Гарантия является инструментом обеспечения исполнения обязательств. Даёт сторонам, заключившим контракт, уверенность в том (гарантию того), что заключённый контракт будет исполнен или стороны получат компенсацию при неисполнении другой стороной условий контракта.

(3) Guarantee is a contract feature that contractually constrains the reporting entity's ability to modify the net cash flows under the contract.

(4) Guarantee is a credit granted by a bank through the assumption of a guarantee on the basis of §§ 765 ff. German Civil Code or through the provision of an indemnity. This means that the bank does not provide liquid funds, but its own creditworthiness, its good name, as it were. When it assumes a guarantee, the bank undertakes to fulfil the borrower's obligations towards a third party. It is accessory and therefore tied strictly to the underlying debt. In the case of an indemnity, the bank undertakes towards a third party to ensure a specific future result. It is abstract and therefore not tied to the underlying debt. The two forms are contingent liabilities reported off the balance sheet.

GUARANTEE CREDIT = ГАРАНТИЙНЫЙ КРЕДИТ (или КРЕДИТНАЯ ГАРАНТИЯ) – Guarantee Credit is a bank credit where the bank does not grant funds but incurs liabilities or obligations on behalf of the customer, e.g., bill guarantee, acceptance or surety credit, contingent liability. The opposite of Cash Loan. / , например, . Под Гарантийным Кредитом понимается взаимный кредит предприятия под поручительство (гарантию) банка или государства.

GUARANTEED BENEFITS = ГАРАНТИРУЕМЫЕ ВЫПЛАТЫ – Guaranteed Benefits are the payments or other benefits to which a particular policyholder or investor has an unconditional right that is not subject to the contractual discretion of the issuer. / Платежи или иные выплаты, в отношении которых владелец полиса или инвестор имеет безусловное право, которое не является предметом усмотрения по контракту со стороны эмитента этого полиса.

GUARANTEED BOND = ГАРАНТИРУЕМАЯ ОБЛИГАЦИЯ (или ГАРАНТИРОВАННАЯ ОБЛИГАЦИЯ) – Guaranteed Bond is a debt security that offers a secondary guarantee that interest and principal payment will be made by a third party, should the issuer default due to reasons such as insolvency or bankruptcy. A guaranteed bond can be municipal or corporate, backed by a bond insurer, a fund or group entity, or a government authority. Bonds have an inherent risk of default that could mean a bondholder never gets the principal back upon maturity and loses out on periodic interest payments. A guaranteed bond removes this risk by creating a back-up payer in the event that the issuer is unable to fulfill its obligation. Because of this lowered risk, guaranteed bonds generally have a lower interest rate than non-guaranteed bonds. Guaranteed Bond is a bond issue for which a third party (e.g., parent company) guarantees fulfillment of the terms vis-à-vis the issuer's creditors. Guaranteed Bond is a bond on which payment is guaranteed by a third party such as a government or a bond insurance company. A guaranteed bond is doubly protected because it is payment can come either from the issuer or from the third party in case the issuer defaults. As such, a guaranteed bond is low risk and therefore usually carries a lower coupon rate than an uninsured bond or other bond without a guarantee. A bond guaranteed by the US government is generally thought to be riskless. Guaranteed Bond is a corporate bond whose principal and/or interest payments are guaranteed by a corporation other than the issuer. Guaranteed Bonds are types of bonds that are paid by parties other than those that issued the bonds. A bond is a debt security that represents money the issuer owes the holder. Bonds have individual terms, but in essence, they consist of principal and interest. While principal is the original amount, interest is an additional amount at a fixed rate, which serves as compensation for the borrowed amount. Interest is paid at specific times agreed upon by both the issuer and holder, and when the bond comes to maturity, the full amount of principal plus interest is due. With guaranteed bonds, either the principal, interest or both are paid by a party other than the original issuer, borrower or debtor. Making guaranteed bonds can be a marketing strategy, and it is used by some industrial companies to strengthen credit and to boost their own financial standing. These corporations often target businesses that they have a monetary interest in and offer to make guaranteed bonds for them. These bonds can be risky because they are not necessarily sound investments. A guarantee bond can be difficult to ensure because the guarantor, the one who pledges that the debt will be paid, may default on the payment. A guaranteed bond should be supported with security that ensures the principal and interest can be paid. Guaranteed bonds should always come with written terms that are phrased in a way that requires the guarantor to cover the debtor's payment, no matter what. After guarantee bonds are issued, the terms of guarantee are outlined on the bonds and signed by the guaranteeing company. The best way to look at guaranteed bonds is an obligation of the company that issues them. Bonds that have been guaranteed differ from bonds that have been guaranteed by endorsement. Guaranteed bonds may have been guaranteed after they were issued, and the terms of guarantee are not necessarily explicitly outlined. When bonds are guaranteed by endorsement, each bond lists the fact that it is guaranteed, along with the signature of the cooperating corporation. If the bond issuer goes into default, a guarantee will limit the repercussions for the bondholder. Every country has its own rules for dealing with the defaulting of a bond issuer. In some nations such as Canada, the federal government guarantees the bond. If the issuer defaults, the government is responsible for the total cost of the bond, including principal and interest. Guaranteed Bond is a bond that is issued by one firm and guaranteed as to interest and principal by one or more other firms. Such bonds, often resulting from joint ventures, are particularly common among railroads that lease tracks to and from each another. / виз-а-ви (vis-à-vis). Выпуск облигации, по которому третья сторона (например, материнская компания) гарантирует исполнение положений перед визави кредиторами эмитента. Гарантированная Облигация – облигация корпорации, выплата основной суммы или дивидендов по которой гарантирована компанией, отличной от выпустившей стороны. Подобные облигации практически всегда являются облигациями железнодорожных компаний, выпущенными в результате возникновения ситуации, когда одна железнодорожная компания арендует железнодорожные пути иной компании, и владельцы ценных бумаг арендуемой железной дороги требуют гарантии дохода в обмен на отказ от контроля за собственностью. Гарантированные ценные бумаги, связанные с подобными ситуациями, могут также включать привилегированные или обыкновенные акции, по которым гарантируются дивиденды. И гарантированные акции, и гарантированные облигации, по сути дела, являются долговыми (необеспеченными) обязательствами (debenture) гаранта, хотя при ликвидации (liquidation) статус акций может оказаться ненадёжным. В любом случае если гарант пользуется более устойчивым кредитом, чем железнодорожная компания, ценные бумаги которой он гарантирует, стоимость ценных бумаг растёт. Гарантированные облигации могут также быть результатом взаимоотношений материнской компании и филиала, когда облигации выпускаются филиалом с гарантией материнской компании.

GUARANTEED CREDIT = ГАРАНТИЙНЫЙ КРЕДИТ (или ГАРАНТИРУЕМЫЙ КРЕДИТ, или ГАРАНТИРОВАННЫЙ КРЕДИТ) – Guaranteed Credit is a credit granted without ad rem collateral but secured by one or several guarantees. In some European countries, special guarantee cooperatives have been founded for this purpose, e.g., mortgage guarantee cooperatives. The banks usually require joint and several guarantees before granting guaranteed credit. / , например, . Под Гарантийным Кредитом понимается взаимный кредит предприятия под поручительство (гарантию) банка или государства.

GUARANTEED ELEMENT = ГАРАНТИРУЕМЫЙ ЭЛЕМЕНТ (или ГАРАНТИРОВАННАЯ СОСТАВНАЯ ЧАСТЬ) – Guaranteed Element is an obligation to pay guaranteed benefits, included in a contract that contains a discretionary participation feature. / Обязательство проплатить гарантированные выплаты, включённые в контракт, который содержит пункт об участии по усмотрительности.

GUARANTEED FINAL MATURITY CLASS = КЛАСС ГАРАНТИРОВАННОГО КОНЕЧНОГО ПОГАШЕНИЯ – Guaranteed Final Maturity (GRM) Class, which is a class of Real Estate Mortgage Investment Conduit (REMIC) regular interests that benefit from a minimum prepayment guarantee in that they are subject to mandatory retirement by the issuer on a fixed date that is earlier than the date on which the qualified mortgages held by the REMIC would be fully retired if they were not prepaid to any degree. The date typically is set so that the qualified mortgages are expected to be fully retired on or prior to that date based on a reasonable prepayment assumption.

GUARANTEED FREIGHT = ГАРАНТИРУЕМЫЙ ФРАХТ (или ГАРАНТИРОВАННЫЙ ФРАХТ) – Guaranteed Freight is a freight payable whether the goods are delivered or not, provided the failure to deliver the goods resulted from causes beyond the carrier's control.

GUARANTEED INSURABILITY = ГАРАНТИРУЕМАЯ СТРАХОВАЯ ПРИЕМЛЕМОСТЬ (или ГАРАНТИРОВАННАЯ СТРАХОВАЯ ПРИЕМЛЕМОСТЬ) – Guaranteed Insurability is a right to take insurance for a specific risk at a later time, without a reassessment of the status of that risk.

GUARANTEED INTRODUCING BROKER = ГАРАНТИРУЕМЫЙ ПРЕДСТАВЛЯЮЩИЙ БРОКЕР (или ГАРАНТИРОВАННЫЙ ПРЕДСТАВЛЯЮЩИЙ БРОКЕР) – Guaranteed Introducing Broker is an introducing broker (IB) that has entered into a guarantee agreement with a Futures Commission Merchant (FCM), whereby the FCM agrees to be jointly and severally liable for all of the Introducing Broker's obligations under the US Commodity Exchange Act. By entering into the agreement, the Introducing Broker is relieved from the necessity of raising its own capital to satisfy minimum financial requirements. In contrast, an Independent Introducing Broker must raise its own capital to meet minimum financial requirements. A firm or individual that solicits and accepts commodity futures orders from customers but does not accept money, securities or property from the customer. A Guaranteed Introducing Broker has a written agreement with a Futures Commission Merchant (FCM) that obligates the FCM to assume financial and disciplinary responsibility for the performance of the Guaranteed Introducing Broker in connection with futures and options customers. Therefore, unlike an Independent Introducing Broker, a Guaranteed Introducing Broker must introduce all accounts to its guarantor FCM but is not subject to minimum financial requirements. All Introducing Brokers must be registered with the US Commodity Futures Trading Commission.

GUARANTEED MINIMUM DEATH BENEFIT = ГАРАНТИРУЕМЫЙ МИНИМУМ ПОСМЕРТНЫХ ВЫПЛАТ – Guaranteed Minimum Death Benefit is a feature of variable annuity business. The benefit is a pre-determined minimum amount that the beneficiary will receive upon death.

GUARANTEED MINIMUM RATE = ГАРАНТИРУЕМАЯ МИНИМАЛЬНАЯ СТАВКА – Guaranteed Minimum Rate:- in the United States officially known as 'Guaranteed Minimum Investment Yields', these are relevant only to interest earnings for Series E and EE savings bonds and savings notes that have issue dates prior to 1995-May-01. These yields are applied as rates to produce amounts such bonds are guaranteed to be worth and are specified in offering regulations. Calculations using guaranteed rates never include possible bond redemption values produced by market-based rates. See also Market-based Interest Rate. The 'guaranteed minimum investment yield' is a measure of the minimum overall return from the issue date to any later interest accrual date during the original maturity period. In the case of a bond in extended maturity periods, a measure of the overall return from what the bond was guaranteed to be worth at the start of the extension period the bond is in to any later interest accrual date during that extension period. When comparing guaranteed with market-based returns, the comparison involves comparing the guaranteed return with the market-based return over a bond's entire life from the date of issue, or, if issued before 1982-November-01, from the date a bond first went up in value on or after 1982-November-01. A bond's 'life' ends when the bond stops earning interest.

GUARANTEED RENEWABLE POLICY = ПОЛИС С ГАРАНТИРУЕМЫМ ВОЗОБНОВЛЕНИЕМ – Guaranteed Renewable Policy is a policy which the insured has the right to continue in force by the timely payment of premiums to a specified age, (usually age 50) during which period the insurer has no right to make unilaterally any change in any provision of the policy while the policy is in force but make changes in premium rates for the entire policyholder classification. See also Non-Cancelable Policy.

GUARANTEE FOR WARRANTY OBLIGATIONS = ГАРАНТИЯ ПО ОБЯЗАТЕЛЬСТВАМ РУЧАТЕЛЬСТВА – Guarantee For Warranty Obligations is used in import-export business, but also in domestic commercial business, trade and industry, where it is more often a surety. It has a purpose to secure any claims by the buyer on the seller due to possible defects appearing after delivery. Guarantee amount:- frequently 5% to 20% of the value of the contract. Term depends on business sector, frequently 1 year after delivery or commissioning. In the construction trade, the guarantee for warranty obligation in the form of a simple guarantee or a joint and several guarantee is known as a Building (or Works) Contractor's Guarantee. It can also be used in the export business as a 'retention bond' (substitute for payment retention, often 5% to 10% of the value of the contract).

GUARANTEE FUND = ГАРАНТИЙНЫЙ ФОНД – Guarantee Fund:- these funds ensure the repayment of invested capital, or a certain percentage thereof, at the end of their maturity, thereby minimizing the capital investment risk for investors.

GUARANTEE SECURING A CREDIT LINE = ГАРАНТИЯ, ОБЕСПЕЧИВАЮЩАЯ КРЕДИТНУЮ ЛИНИЮ – Guarantee Securing A Credit Line is used worldwide. It has a purpose to secure any claims by the lender on the borrower due to a credit (loan, etc) not being repaid in accordance with the terms of the contract. Guarantee amount is amount of the credit. Usually includes a margin to cover accrued interest and incidental expenses. Term:- expiry of loan plus, e.g., 15 days. Mainly abstract guarantees in favor of the foreign or domestic lending bank. In international business, 'pay or extend' claims are quite often made under guarantees. This simply extends the validity of the guarantee.

GUARANTOR LIABILITY = ОБЯЗАТЕЛЬСТВО ГАРАНТА – Guarantor Liability is a term for the unlimited liability of the Federal government, the Federal states, cities and communities for all current and future obligations entered into by the banks they support, in particular savings banks and central savings banks. Alongside guarantor liability a maintenance obligation ('Anstaltslast') also used to exist. It prescribed that the public sector had to furnish its companies with the financial means to conduct their business for as long as they existed. On 2001-July-17 the EU Commission and the Federal Republic of Germany agreed to that these two forms of state liability should be discontinued after a transitional phase. Liabilities arising before the start of the transitional phase on 2001-July-18 were covered by guarantor liability. Liabilities entered into during the transitional phase (18.07.2001 to 18.07.2005) and maturing at the latest on 2015-December-31 are also subject to guarantor liability. Liabilities entered into after the transitional phase or during the transitional phase and maturing after 2015-December-31 are no longer covered by guarantor liability. The maintenance obligation was stopped on 2005-July-18. / 'Анштальтсляст' ('Anstaltslast').

GUARD CELL = ЗАМЫКАЮЩАЯ КЛЕТКА – Guard Cell is one of two crescent-shaped cells which surround and control the opening and closing of the aperture of the stoma and thereby regulate passage of gases and water vapor through a plant's epidermis. Guard Cell is one of two crescent-shaped epidermal cells united at the ends whose changes in turgidity determine the opening and closing of the stomata. / Замыкающая Клетка в устьице. и контролирует открытие и закрытие апертуры (отверстия в пыльце) устьица и тем самым регулирует газообмен и испарение .

GUARD HAIR = ОСТЕВОЙ ВОЛОС – Guard Hair:- the long, stiff, usually coarse fiber which projects from the wooly undercoat of a mammal's pelt. Guard Hair is a coarse wiry layer of hair which protects a soft downy undercoat. Most mammals have three distinct kinds of hairs. Guard Hairs protect the rest of the pelage from abrasion and frequently from moisture, and they usually lend a characteristic color pattern. The thicker underfur is primarily insulative and may differ in color from the guard hairs. The third common hair type is the vibrissa, or whisker, a stiff, typically elongate hair that functions in tactile .... Guard Hair is any of the long coarse hairs forming a layer that covers and protects the soft underfur of certain mammals. The pelts of fur-bearing animals are called True Furs when they consist of two elements:- a dense undercoat, called Ground Hair, and longer hairs, extending beyond that layer, called

Guard Hair. The principal function of ground hair is to maintain the animal's body temperature; that of guard hair is to protect the underlying fur and skin and to shed rain or snow. / от истирания и часто от намокания, .

GUARD'S CHECK = КЛЕТОЧКА ГВАРДЕЙЦА (или КЛЕТКА КАК У ОХРАННИКА) – Guard's Check when a 2 and 2 color order is used in both the warp and the weft of a 2/2 twill, a distinctive vertical line effect is produced.

GUAR GUM = ГУАРОВАЯ РЕЗИНА – Guar (derived from word Guaran) is extracted from the seed of the Guar plant which is a leguminous shrub Cyamopsis tetragonoloba. Guar bean Gum is known for its water retention properties. It is an annual leguminous plant harvested at the end of year in semi-arid regions of India and Pakistan. Guar fruit is a pod; its beans have an average radius of approximately 2–3 mm. Guar seed comprise of hull, the albumen or endosperm, which is light cream in color. Seed is made up of two hemispherical segments (splits) which surround the germ. Its major constituent is the polysaccharides and protein rich germ. Gum of guar is an amazingly versatile and efficient high polymer hydrophilic hydrocolloid, economical in use and easy to handle. Its ability to form highly viscous colloidal dispersions at low concentrations, without heating, makes it one of the most interesting of the hydrocolloids. It is few of naturally available water-soluble gums, chemically classified as a galactomannan and possessing a molecular weight reported to be of order 200 000–250 000. It is non-toxic and non-ionic, could be used with other synthetic and natural hydrocolloids. One of the most powerful water binder and viscosity enhancer, superior to practically all known water soluble gums. Guar gum is a galactomannan similar to locust bean gum consisting of a (1-->4)-linked b-D-mannopyranose backbone with branch points from their 6-positions linked to a-D-galactose (i.e. 1-->6-linked-a-D-galactopyranose). There are between 1.5–2 mannose residues for every galactose. Higher Degree of substitution (DS) and Molar Substitution of guar gum gives by carboxyalkyl and hydroxyalkyl groups respectively gives improved solubility, dispersion and emulsification, this is the main reason for popularity of its derivatives in various Industries. Guar Gum powder increase the viscosity of the aqueuos base even at small concentration of approximately 1%. Guar based gels are Non-Newtonian, i.e. their viscosity changes with the change in temperature. It has a Galactose to Mannose ratio of 1:2. Solubility rates of Guar Gum powder could be increased by choosing an appropriate manufacturing process, thus achieving the Quick/Fast Hydrating Guar grades. It is insoluble in organic solvents and soluble in water (hold and cold). Being non-Ionic Guar is not effected by pH, but it is sensitive to high acidic media.The viscosity of guar in water depends on temperature, concentration, pH, shear rate. Guar shows shear-thinning effect, i.e. at high temperature it's solutions are less viscous but viscosity is regained when temperature is lowered. Guar Gum is an industrial gum used to thicken the burn out/devoré, paste during burn out processes. Won't break down under strong acid conditions. Chemically, Guar Gum is a polysaccharide composed of the sugars galactose and mannose. The backbone is a linear chain of β 1,4-linked mannose residues to which galactose residues are 1,6-linked at every second mannose, forming short side-branches. Depending upon the requirement of end product various processing techniques are used. The commercial production of Guar gum is normally undertaken by using process of roasting, differential attrition, sieving and polishing. Food grade guar gum is manufactured in stages. It is very important to select guar split in this process. The split is screened to clean it and then soaked to prehydrate it in a double cone mixer. The prehydrating stage is very important because it determines the rate of hydration of the final product. The soaked splits, which have reasonably high moisture content, are passed through a flaker. The flaked guar split is ground and then dried. The powder is screened through rotary screens to deliver required particle size. Oversize particles are either recycled to main Ultra fine or reground in a separate regrind plant, according to the viscosity requirement. This stage helps to reduce the load at the grinder. The soaked splits are difficult to grind. Direct grinding of those generates more heat in the grinder which is not desired in the process as it reduces the hydration of the product. Through the heating, grinding, and polishing process, the husk is separated from the endosperm halves and the refined Guar Gum split is obtained. Through the further grinding process, the refined Guar split is then treated and converted into powder. The split manufacturing process yields husk and germ called 'Guar Meal', widely sold in the international market as cattle feed. It is high in protein and contains 'Oil and Albuminoids', about 50% in germ and about 25% in husks. The quality of the food grade guar gum powder is defined from its particle size, rate of hydration, and microbial content. E412 guar gum is an important natural food supplement with high nutritional value. Manufacturers define different grades and qualities of guar gum by the particle size, the viscosity generated with a given concentration, and the rate at which that viscosity develops. Coarse-mesh guar gums, will typically, but not always, develop viscosity more slowly. They may achieve a reasonably high viscosity, but will take longer to achieve. On the other hand, they will disperse better than fine-mesh, all conditions being equal. A finer mesh, like a 200 mesh, requires more effort to dissolve. Modified forms of guar gum that are available commercially include enzyme-modified, cationic and hydropropyl guar. Guar Gum, also called Guaran, is a galactomannan. It is primarily the ground endosperm of guar beans. The guar seeds are dehusked, milled and screened to obtain the guar gum. It is typically produced as a free-flowing, pale, off-white-colored, coarse to fine ground powder. The guar bean is principally grown in India and Pakistan, with smaller crops grown in the United States, Australia, China, and Africa. In India, Rajasthan and Haryana are the main producing regions, and Jodhpur in Rajasthan is a major Guar trading market. In Pakistan Sindh is the main area for Production for Guar Beans. The world market of guar is estimated at 150 000 tons annually. According to a Reuters report, India accounts for about 80 percent of the global trade in guar products. India exported 11 billion Rupees worth of guar products in 2007/08 financial year ending March 2008. Pakistan trails India in the global trade. Industrial guar gum is the most sought-after guar product, and accounts for about 45 percent of the total demand. Industrial gum is used as a controlling agent in oil wells to facilitate easy drilling and prevent fluid loss. Guar Gum (Galactomannan) is a high molecular weight carbohydrate polymer derived from the natural seed of guar plant (Cyampopis tetragonolobus). Part of the seed is Hull (14–17%), Endosperm (35–42%), and germ (43–47%). Guar gum is a polysaccharide consisting of a mannose backbone with a galactose side chain. The galactose is randomly placed on the mannose backbone with the average ratio 1:2 of galactose to mannose. Guar gum has a polymeric structure containing numerous hydroxyl groups, which are treated for manufacturing various derivatives used for special applications in various industries. The powder is off white to yellowish in color depending on the quality of the seed. Guar gum is obtained by an automatic mechanical process in which first the seed is split into two halves and the hull and the germ is mechanically scraped off to obtain endosperm. The endosperm thus obtained is further purified and grounded into powder of required granulation and viscosity. Neelkanth Polymers' state-of-the-art plant is capable of producing several grades of guar gum ranging from very low to very high viscosity and from coarse to fine granulation. Guar Gum gives excellent film forming and thickening properties when used for textile sizing, finishing and printing. It reduces warp breakage, reduces dusting while sizing and gives better efficiency in production. / шлифование (grinding). Сильная Кислота (Strong Acid). Devoré:- (1) Дэворе; (2) Пожирать; (3) Съедать. Ройтас (Reuters). Нилкэнт (Neelkanth).

GUAYABERA SHIRT = РУБАШКА ГУАЙАВЭРА – The Guayabera Shirt (gwai-a-Ber-a) is one of the most authentic symbols of Latin Culture. They are made of light fabrics to weather tropical heat. Distinctive for its two vertical pleats, four spacious pockets and embroidery detail in a variety of fashion colors. Usually short-sleeved (but also designed in long sleeve) lightweight sport shirt designed to be worn un-tucked.

GUIDANCE = МЕТОДИЧКА – A term Guidance refers to a public company's comments regarding its up-coming financial results. It forewarns investors about upcoming earnings reports – to avoid surprises, i.e. it is giving some 'guidance' to investors as to what they can expect to see with respect to corporate performance. It is like a preliminary estimate of results.

GUIDE BAR = НАПРАВЛЯЮЩАЯ РЕЙКА (или НАПРАВЛЯЮЩАЯ ГРЕБЁНКА) – Guide Bar is a mechanism on a warp-knitting machine that directs warp threads to the latch needles. Guide Bar is a mechanism on a warp knitting machine which directs warp yarns to the knitting needles, and their movement is controlled so that patterns can be knit.

GUIDES = НАПРАВЛЯЮЩИЕ – Guides are the fittings of various shapes for controlling the path of a threadline.

GUILLOTINE = ГИЛЬОТИНА – Guillotine is a cutting device that consists of a single blade that descends between guides for chopping fibers, plastic strands, etc. / Под Гильотиной, от Французского слова Guillotine, понимается орудие для обезглавливания осуждённых на казнь, введённое во Франции в 1791 во время Французского Государственного Переворота (революции; the French Revolution or in French:- Révolution Française; 1789–99) по предложению Французского врача Доктора Жозэфа-Иньаса Гийота (Joseph-Ignace Guillotin).

GUIMPE = ГИМП (или НАГРУДНИК, или АПОСТОЛЬНИК (у монахинь), или МАНИШКА, или ФИГАРО) – Guimpe is a blouse worn under a jumper or pinafore. / .

GUINEA = ГИНЕЯ – Guinea:- the old British coin system, used until 1971, was a little bit strange for a modern man. The reason was that it wasn't a decimal system, based on the values of 100 subunits yet of different coins with different values compared to each other. So, a pound was equal to 20 shillings, a shilling was 12 pence and each penny was equal to 4 farthing. Therefore, a pound was equal to 20 shillings, 240 pence or 960 farthings. But this wasn't it. A three pence coin was known and had the value of 1/4 shilling. But also a four pence coin, equal to 1/3 shilling was used. The two shilling coin or the florin was first introduced in 1847 and was 1/10 of the pound. The most interesting coin in this difficult money equation was a gold coin, named guinea, introduced in the XVII century and minted until the beginning of the XIX century. This coin was introduced by King Charles 2nd in 1663. The proclamation stated that the new coin will be legal currency starting 27 March 1663. The weight of these coins was established by royal decree and 44 and a half guineas will have the same weight of one troy pound of gold, with a title of 91.66%. The weight was established at around 8.5–8.4 g. The diameter of this coin was established at 25 mm, with slight differences. The coin had the formal value of one pound, being equal to 20 silver shillings. This coin was nicknamed 'guinea' because the gold used for minting it was brought from Guinea in Africa. The area was rich in gold and provided this precious metal in large quantities. The first guinea, minted by Charles 2nd, had on one side the royal portrait, looking right, laured, and the typical legend, and on the other side the four coat of arms, of England, Scotland, Ireland and France, arranged in the form of a cruciform, with scepters. This pattern was used for all the gold coins minted by this king, until 1684. The successor of Charles, Jacob 2nd, used the same patterns for the coins, except that his bust is looking left and not right. It happens to know the name of the designer of the coin, the artist John Roettier. Because gold was a rare metal, soon the guinea was worth more than its value. Officially, it was worth 20 silver shillings, but with the gold in it you can swap it for more silver. So, around 1670 the weight of the coin was lowered to 8.4–8.3 g. Despite this fact, ten years later, the coin was bought from the market with 22 silver shillings. Starting with the reign of William of Orange, the design changed. William hadn't any blood connection with the royal family and he wasn't a direct heir, yet the housband of Mary, the daughter of John 2nd. To legitimate his rule, he used on his coin an unusual image. He and his wife both appeared on the coin, standing on each other side, looking right. This image, stamped on a coin that circulated every day, created the impression that William was the same as another member of the royal family, as his wife, Queen Mary. This led to a useful propaganda in his favor. These coins were minted since 1689 until 1694. Following the death of Mary, in December 1694, the obverse of the guinea changed in 1695, as only William appeared on the face of the coin. In the same manner, the daughter of Jacob and the sister-in-law of William, Queen Anne, appeared on her coins. The Hanovra dynasty, brought in 1714, used at the beginning of the reign the same design for the coins. This suggested that nothing changed in the everyday life. The design was the same. But with the reign of George 2nd, everything changed. During his long reign of 33 years, coins were minted every year (except 1742, 44, 54, 57). The coins minted between 1729 and 1739 sometimes have under the bust the letters EIC, from East India Company, to indicate that the gold was brought from India. In 1745, the letters were LIMA, indicating a South American provenience of the gold. The design of the reverse changed. Instead of the cruciform coat of arms, the new coat of arms was used. Also it must be said that during the reign of George 2nd, the problem of cutting the coins was solved. Following an old habit, people used to cut a small portion of a precious metal coin, keeping that small part. A 0.05–0.1 g is not much and you can hardly feel the difference but when 10 or 20 people do that thing, the coin will be less heavy with 1 g. And a coin that based its value on the content of gold will not be equal to another coin, identical but heavier. Sir Isaac Newton solved this problem. He was the first that introduced the technological procedure of reeding the edges. Every particular intervention will be easy notable from now on. George 3rd also minted a large variety of gold guineas, with the coat of arms similar to the one previously used, or other designs. The most interesting coin is the 1813 'Military guinea', specially minted for the duke of Wellington army. This army stationed in the Pyrenees and needed money to buy provisions from the local people. But the locals only accepted gold so a special issue of 80 000 gold coins was produced. The design is unique, showing the coat of arms, crowned, within a Garter, with the French legend 'Honi Soit Qui Mal Y Pense', and the legend 'Britanniarum Rex Fidei Defensor' on the side. It must also be said that in the same year, one gold guinea worth 27 shillings in paper and 21 in silver. It was the last important guinea mint, as in 1816, the coin was replaced by a new gold coin, worth 20 shillings (one pound) and named sovereign. A subdivision of a guinea was minted. Ever since 1669, the half guinea was used and sometimes the rare third of a guinea (this coin used on the reverse the royal crown and not the coat of arms). In 1718 and 1764 a quarter of a guinea was also minted. Despite the fact that this coin isn't minted and used since 1816, the name still has a great impact in everyday monetary calculation. The term Guinea is still used in modern English, for the value of 1 pound and 5 pence, following the 1971 reform when a shilling was considered equal to 5 new pence. The term guinea is still used in horse races. So used, that modern British coin catalogue considered that it can express the price of that catalogue in guineas and not pounds. Guinea is the British gold coin with a nominal value of £1 first issued in 1663 and named after gold from Guinea in West Africa. It was unofficially revalued at 21 shillings at The Great Recoinage of 1696, a value confirmed in 1717. It has a fineness of 916.6 and a fine gold content of approximately 1/4 Troy ounce. / Эта монета была представлена Королём Чалзом Вторым (King Charles 2nd) в 1663. Дьжон Ротиэ (John Roettier). Вильэм (William of Orange), муж Мэри (Mary), дочери Дьжона Второго (John 2nd). Королева Мэри (Queen Mary). , дочь Дьжейкэба (Jacob) и сводная сестра Вильэма (sister-in-law of William), Королева Энн (Queen Anne), . Династия Хэновра (Hanovra dynasty). Дьжодьж Второй (George 2nd). Сэр Айзэк Ньютчэн (Sir Isaac Newton). Дьжодьж Третий (George 3rd). Вэлинтчэн (Wellington). Гатё (Garter), с надписью (legend) на Французском 'Они Суа Ки Маль И Пас' ('Honi Soit Qui Mal Y Pense'), и надписью 'Британниарум Рэкс Фидэй Дэфэнсор' ('Britanniarum Rex Fidei Defensor'). Под Гинеей понимается золотая монета, которая чеканилась в 1663–1817; с 1717 равнялась 21 Шиллингу. Была заменена золотым Совереном.

GUIPURE = ГИПЮР – Guipure is a heavy large-patterned decorative lace.

GULES = XX (или КРАСНОЕ) – Gules:- the heraldic color red.

GULF COOPERATION COUNCIL = СОВЕТ ПО СОТРУДНИЧЕСТВУ В ЗАЛИВЕ – The Cooperation Council for the Arab States of the Gulf (CCASG), also known as the Gulf Cooperation Council (GCC), is a political and economic union of the Arab states bordering the Persian Gulf and located on or near the Arabian Peninsula, namely Bahrain, Kuwait, Oman, Qatar, Saudi Arabia, and United Arab

Emirates. Jordan and Morocco have been invited to join the council. On 06 March 2012, the six members of the GCC announced that the Gulf Cooperation Council would be evolving from a regional bloc to a confederation, in possible response to Arab democratic unrest and increased Iranian influence in the region. This proposal is strongly backed by Saudi Arabia, but doubts have been raised by the other countries. Established in Abu Dhabi on 25 May 1981, the original Council comprised the 630-million-acre (2 500 000 km^2) Persian Gulf states of the United Arab Emirates, Bahrain, Saudi Arabia, Oman, Qatar and Kuwait. The unified economic agreement between the countries of the Gulf Cooperation Council was signed on 11 November 1981 in Abu Dhabi. These countries are often referred to as the GCC States. Objectives:- among the stated objectives are:- formulating similar regulations in various fields such as religious, finance, trade, customs, tourism, legislation, and administration; fostering scientific and technical progress in industry, mining, agriculture, water and animal resources; establishing scientific research centers; setting up joint ventures; unified military presence (Peninsula Shield Force); encouraging cooperation of the private sector; strengthening ties between their peoples; and establishing a common currency by 2010. However, Oman announced in December 2006 it would not be able to meet the target date. Following the announcement that the central bank for the monetary union would be located in Riyadh and not in the UAE, the UAE announced their withdrawal from the monetary union project in May 2009. The name Khaleeji has been proposed as a name for this currency. If realised, the GCC monetary union would be the second largest supranational monetary union in the world, measured by GDP of the common-currency area. This area has some of the fastest growing economies in the world, mostly due to a boom in oil and natural gas revenues coupled with a building and investment boom backed by decades of saved petroleum revenues. In an effort to build a tax base and economic foundation before the reserves run out, the UAE's investment arms, including Abu Dhabi Investment Authority, retain over USD900 billion in assets. Other regional funds also have several hundreds of billions dollars of assets under management. The region is also an emerging hotspot for events, including the 2006 Asian Games in Doha, Qatar. Doha also submitted an unsuccessful application for the 2016 Summer Olympic Games. Qatar was later chosen to host the 2022 FIFA World Cup. Recently, the leaders of the Council have come under fire for doing too little to combat the economic downturn. While GCC countries were among the first hit – and the first to respond to the crisis – their programs have been prone to disparities. Recovery plans have been criticized for crowding out the private sector, failing to set clear priorities for growth, failing to restore weak consumer and investor confidence, and undermining long-term stability. The Logo of the GCC consists of two concentric circles. On the upper part of the larger circle, the Bismillah phrase is written in Arabic and on the lower part the Council's full name, in Arabic. The inner circle contains an embossed hexagonal shape representing the Council's six member countries. The inside of the hexagon is filled by a map encompassing the Arabian Peninsula, on which the areas of the member countries are shown in brown. Organizations:- (1) Patent Office:- the GCC Patent Office was approved in 1992 and established soon after in Riyadh, Saudi Arabia. Applications are filed and prosecuted in the Arabic language before the GCC Patent Office in Riyadh, Saudi Arabia, which is a separate office from the Saudi Arabian Patent Office. A GCC Patent cannot co-exist with a national application in any of the member states, therefore, a national application must be relinquished within 90 days of filing the GCC Patent Application. (2) Common Market:- a GCC common market was launched on 01 January 2008. The common market grants national treatment to all GCC firms and citizens in any other GCC country, and in doing so removes all barriers to cross country investment and services trade. A customs union was declared in 2003, but practical implementation has lagged behind. Indeed, shortly afterwards, Bahrain concluded a separate Free Trade Agreement with the US, in effect cutting through the GCC's agreement, and causing much friction. (3) Monetary Council:- on 15 December 2009, Bahrain, Kuwait, Qatar and Saudi Arabia announced the creation of a Monetary Council, a step toward establishing a shared currency. The board of the council, which will set a timetable for establishing a joint central bank and choose a currency regime, will meet for the first time on 30 March 2010. Kuwaiti Foreign Minister Sheikh Mohammed Sabah al-Salem al-Sabah said on 08 December 2009 that a single currency may take up to 10 years to establish. The original target was in 2010. Oman and the UAE later announced their withdrawal of the proposed currency until further notice. (4) Peninsula Shield Force:- amidst the 2011 Bahraini protests, Gulf Cooperation Council forces from Saudi Arabia, Kuwait and the UAE were sent to Bahrain in March 2011. There are six member states of the Cooperation Council for the Arab States of the Gulf (CCASG) (Gulf Cooperation Council, GCC):- Bahrain; Kuwait; Oman; Qatar; Saudi Arabia; and United Arab Emirates (UAE). Since the creation of the council in 1981 its membership has not expanded, with all members being Arab monarchies. Iran and Iraq, which also border the Persian Gulf, are not members. The GCC has land borders with Iraq, Jordan and Yemen. The GCC members and Yemen are also members of the Greater Arab Free Trade Area (GAFTA). However, this is unlikely to significantly affect the agenda of the GCC as it has a more aggressive timetable than GAFTA and is seeking greater integration. The six member countries (Bahrain, Kuwait, Oman, Qatar, Saudi Arabia, and the United Arab Emirates) of the Gulf Cooperation Council (GCC) control half the proven oil reserves outside the Soviet Union, and account for about 40 percent of all the oil moving in international trade. The GCC was created in 1981, largely in response to the outbreak of the Iran-Iraq war. In creating the GCC, the members tried to maintain the balance of power in the Gulf by strengthening multilateral cooperation in security and economic matters. As regards trade, the GCC is only a policy-coordinating forum; the Council cannot impose policies on the members. GCC headquarters are in Riyadh, Saudi Arabia. The presidency of the GCC rotates yearly among the rules of the member countries. The Gulf Cooperation Council (GCC) was established in an agreement concluded on 25 May 1981 in Riyadh, Saudi Arabia between: Bahrain, Kuwait, Oman, Qatar, Saudi Arabia and UAE. These countries declared that the GCC is established in view of the special relations between them, their similar political systems based on Islamic beliefs, joint destiny and common objectives. The GCC is a regional common market with a defense planning council as well. The geographic proximity of the these countries and their general adoption of free trade economic policies are factors that encouraged them to establish the GCC. Based on their conviction about the connected nature of their security and that an aggression against any one of them is deemed an aggression against all of them, cooperation in the military field has received the attention of the GCC states. Such conviction stems from the facts of geopolitics and faith in one destiny. Moreover, the security challenges in an unstable regional environment, like the Gulf area, imposes on the GCC States coordination of their policies and mobilization of their capabilities. The Gulf Cooperation Council (GCC) was formed in 1981 to confront their security challenges collectively. The immediate objective was to protect themselves from the threat posed by the Iran-Iraq War and Iranian-inspired activist Islamism (also seen as fundamentalism). In a series of meetings, chiefs of staff and defense ministers of the gulf states developed plans for mutual defense and launched efforts to form a joint command and a joint defense network. Ground and air units of the six member states carried out several multilateral exercises between 1983 and 1987 under the code name of Peninsula Shield. Military assistance, funded mainly by Saudi Arabia and Kuwait, was extended to Bahrain for up-to- date fighter aircraft and a modern air base, and to Oman to improve its defensive capability at the Strait of Hormuz. The GCC planned to integrate naval and ground radar systems and to create a combined air control and warning system based on Saudi AWACS aircraft. Problems of compatibility with different communication and electronic systems, however, delayed the introduction of these programs. In 1984 the GCC defense ministers agreed on the creation of a two-brigade (10 000-man) Peninsula Shield Force. This joint intervention force was based in Saudi Arabia near King Khalid Military City at Hafar al Batin under the command of a Saudi officer. In addition to a headquarters staff, the force consisted of one infantry brigade of about 5 000 men with elements from all GCC states in 1992. Its mission, however, had not been publicly defined. It was not clear, for example, whether the joint force would have authority to intervene in a domestic emergency. The force could be enlarged at a time of threat; it was apparently reinforced prior to the Persian Gulf War in 1991 but did not take part in the war as a distinct unit. Under a 1984 agreement within the GCC, Bahrain and Oman were to receive

USD1.8 billion in aid from richer members of the six-nation group, to build up their armed forces. But some of the states did not keep this commitment. Saudi Arabia was the only country that kept its commitment to this program. After leading Bahrain to sign agreements with the United States and European suppliers, the others then backed out of the commitment because of their own financial problems in the wake of the Gulf War and with the drop in oil prices. In March 1991, after the conclusion of the Persian Gulf War, the six members of the GCC, together with Egypt and Syria, declared their intention to establish a deterrent force to protect Kuwait, with Egypt and Syria to provide the bulk of the troops and the GCC states to provide the financing. The plan subsequently encountered a series of setbacks. At year's end, there appeared little chance that the Arab deterrent force would be installed. In the meantime, Kuwait had succeeded in obtaining security commitments from the United States and Britain and arranged for the prepositioning of United States military equipment. The GCC States seek to build up their defence forces according to a common conception. In this context, they have unified operational procedures, training, and military curricula. They also endeavour to accomplish compatibility of their military systems. Moreover the armed forces of the GCC States carry out joint military exercises with the Peninsula Shield Force, as well as joint air and sea manuvers. Among the important achievements in the military field is the creation of the Peninsula Shield Force in 1982, which incorporates the credibility of the GCC will. Another important achievement was the resolution taken during Kuwait summit in 1997, which entailed to link the GCC Member States with a military communication network for early warning. Bahrain's Supreme Commander in Chief His Majesty King Hamad issued Royal Decree Number 18 for the year 2011 on 15 March 2011 announcing a State of National Safety in accordance with Article 36/b of Bahrain's Constitution of 2002, which will cover all areas of Bahrain as of Tuesday, March 15, 2011 for a period of three months. The commander in Chief of the Bahrain Defense force has been mandated to take the measures and procedures necessary to preserve the safety of the nation and its people; these measures will be implemented by the Bahrain Defense Force, public security forces, National Guard and any other forces if necessay. As protests escalated in March 2011, Bahrain's government, contrary to the advice of the Obama Administration, invited security assistance from other neighboring Gulf Cooperation Council countries. The Bahrain Independent Commission of Inquiry's (BICI) report found that there was a general breakdown and deterioration in the state of safety, security, and law and order during the events in Bahrain in 2011 as elements of the protest movement crossed the threshold from peaceful protest to full blown riots It also found that groups of vandals and gangs of individuals armed with knives, swords, and other weapons were reported in many of Bahrain's cities and villages where specific groups were targeted and were seriously assaulted. Due to the country's vulnerability at that point, the Peninsula Shield Force, part of the mutual agreement signed 10 October 1982 among Gulf Cooperation Countries (GCC), were activated to insure the integrity of Bahrain's territorial borders. Their operations were limited to preparing to assist the Bahrain Defense Force (BDF) against any confrontation by any foreign armed intervention and in protecting and securing vital locations in the country. Peninsula Shield Forces did not participate in any operations involving confrontations with Bahraini civilians or engage in any form of riot control. Furthermore, The Commission did not find any evidence of human rights violations committed by these units deployed in Bahrain starting on 14 March 2011. Regarding reforms, HRH the Crown Prince's initiative for dialogue was extended 3 days after the protest movement started, one that could have led to 'significant constitutional, political and socio- economic reforms and precluded the ensuing negative consequences'. The initiative was rejected by the opposition primarily in their belief that they could achieve greater political gains from the streets. Still, the Government have always maintained and continuously reaffirmed that the door for dialogue is and will remain open for anyone genuinely seeking to move Bahrain forward. New current name is The Cooperation Council for the Arab States of the Gulf. Cooperation Council for the Arab States of the Gulf or Gulf Cooperation Council (GCC) is a political, economic, social, regional organization according to its charter. It is a regional cooperation system between the Arab States of the Gulf created to meet the challenges imposed by surrounding circumstances. The scope of its work includes economy, politics, security, culture, health, information, education, legal affairs, administration, energy, industry, mining, agriculture, fishery and livestock. Member States:- The United Arab Emirates; The Kingdom of Bahrain; The Kingdom of Saudi Arabia; The Sultanate of Oman; The State of Qatar; and The State of Kuwait. Geographical location of GCC:- GCC states are located in the Arabian peninsula southwest of Asia between the latitudes of 15 and 35 north of equator and longitudes of 35 and 60 east of Greenwich, bordered by Iraq and Jordan in the North, Republic of Yemen and the Arabian Sea in the South, Arabian Gulf in the East, and Red Sea in the West. Population:- according to 2000 census, the total population of the six member states is 31 015 200. Area:- the total area of GCC countries is estimated to be 2 667 000 square kilometers. The establishment of the GCC:- the geographical nature of the GCC states and the similarity of their regulations, economic and social conditions, and the nature of contemporary challenges are the factors that helped in the establishment of the GCC. The Foreign Ministers of the six member states met in Riyadh on February 04, 1981 and issued a communique expressing their agreement to establish a Cooperation Council for the Arab States of the Gulf, form a Secretariat General for this purpose, hold periodic summit meetings and ministerial meetings to achieve the objectives set out for the member states and their people. The first summit was held on May 25, 1981 in Abu Dhabi, United Arab Emirates. Summits are held every year. Objectives of the GCC:- the basic objectives of the Cooperation Council are as follows:- (1) to effect coordination, integration, and interconnection among member states in all fields in order to achieve unity among them; (2) to deepen and strengthen relations, links and areas of cooperation now prevailing among their people in various fields; (3) to formulate similar regulations in various fields including the following:- (a) economic and financial affairs, (b) commerce, customs and communications, (c) education and culture, (d) social and health affairs, (e) information and tourism, and (f) legislative and administrative affairs; (4) to stimulate scientific and technological progress in the fields of industry, mining, agriculture, water and animal resources, to establish scientific research, to establish joint ventures and encourage cooperation by the private sector for the good of their people. Organizations of the Cooperation Council:- the Cooperation Council has the following main organizations:- (1) The Supreme Council to which is attached the Commission for Settlement of Dispute; (2) The Ministerial Council; and (3) The Secretariat General. Supreme Council:- the Supreme Council is the highest authority of the Cooperation Council formed of heads of member states. Its presidency is rotatory based on the alphabetical order of the names of the member states. It holds two ordinary and consultative sessions every year. Extraordinary sessions may be convened at the request of any member seconded by another member. It holds its session in the territories of member states. Supreme Council's meeting is considered valid if attended by two-thirds of the member states. The Cooperation Council has a commission called 'The Commission for the Settlement of Dispute' which is attached to the Supreme Council. The Supreme Council establishes the composition of the Commission for every case on an 'ad-hoc' basis in accordance with the nature of dispute. If a dispute arises over interpretation or implementation of the Charter and such a dispute is not resolved within the Ministerial Council or the Supreme Council, the Supreme Council may refer such dispute to the Commission for the Settlement of Dispute. The Commission submits its recommendation or opinions as applicable, to the Supreme Council for such action as the Supreme Council deems appropriate. Ministerial Council:- the Ministerial Council is formed of the Foreign Ministers of the Member States or other delegated ministers. The presidency of the Ministerial Council is for the Member States which presided the last ordinary session of the supreme Council or if necessary, or the states which is next to preside the Supreme Council. The Ministerial Council meets every three months. An extraordinary meeting could also be held whenever needed. The Consultative Commission for the GCC Supreme Council:- based on the resolution of the GCC Supreme Council in its 8th session held in Kuwait in December 1997, to establish an advisory commission for the Supreme Council consisting of 30 members (five from each GCC Member State for three renewable years), the Commission held its first meeting in November, 1998. Secretariat General:- the Secretariat General is composed of a Secretary-General, Assistant

Secretaries-General, and a number of staff as required. Its headquarters is in Riyadh, Saudi Arabia. The Secretariat General is consists of the following sectors:- Secretary-General's Office; Political Affairs; Military Affairs; Economic Affairs; Human and Environment Affairs; Legal Affairs; Finance and Administration Affairs; Information Center; Information Department; The Technical Telecommunication Bureau in Bahrain; and GCC Delegation in Brussels. / Кувейтский Министр Иностранных Дел Шейх Мохаммэд Сабах аль-Салем аль-Сабах (Kuwaiti Foreign Minister Sheikh Mohammed Sabah al-Salem al-Sabah). коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо). , от Латинского слова Affirmo, означающее Утверждаю, .

GULF COAST GASOLINE = БЕНЗИН ИЗ ПОБЕРЕЖЬЯ ЗАЛИВА – Gulf Coast Gasoline (physical) futures are an outright gasoline contract between a buyer and a seller. The contract:- (i) is based on M Grade conventional gasoline; and (ii) offers risk management coverage for gasoline traded on the Gulf Coast, a primary refining center. Things to know:- (i) traded via open outcry, the CME Globex® electronic trading system, and off-exchange for clearing only through CME ClearPort; and (ii) physically delivered. About Gulf Coast Gasoline:- the Gulf Coast gasoline futures contract gives market participants the opportunity to target their risk management coverage for gasoline traded on the Gulf Coast, the primary refining center. This region is essential to gasoline refiners and retailers because the Gulf Coast serves as one of two key trading centers in the cash market; the other being New York. The Gulf Coast gasoline futures contract, coded LR, was launched to provide greater price transparency to the gasoline market. It features physical delivery of M-grade conventional gasoline into the Colonial Pipeline ratably in increments of 25 contracts during each cycle of the delivery month. Delivery takes place following termination of trading. The final settlement price is based on the average-weighted price of trades done in the closing range on termination day. Delivery shall be made FOB the Colonial Pipeline at the injections station selected by the Seller at Pasadena, Texas; Houston, Texas; Hebert, Texas; Port Arthur, Texas; Lake Charles, Louisiana; Krotz Springs, Louisiana; Baton Rouge, Louisiana; Collins, Mississippi; and Moundville, Alabama. Gulf Coast Gasoline is defined as M Grade conventional gasoline traded on the Gulf Coast, the primary refining center and delivered into the Colonial Pipeline. The Gulf Coast is one of two key trading centers in the cash market. The other one is New York. Gulf Coast gasoline futures are traded at the NYMEX® under ticker symbol LR. Contract size is 42 000 gallons (1 000 barrels) quoted in US Dollars and Cents per gallon. Delivery takes place all 12 calendar months. Settlement is by physical delivery. / Си.Эм.И. Глобэкс® (CME Globex®).

GULF COAST HARBOR ULTRA LOW SULFUR DIESEL = ДИЗЕЛЬ ИЗ ПОРТОВ ПОБЕРЕЖЬЯ ЗАЛИВА С УЛЬТРАНИЗКИМ СОДЕРЖАНИЕМ СЕРЫ – Gulf Coast Harbor Ultra Low Sulfur Diesel (ULSD) is the new standard for highway diesel fuel in the United States since December, 2010. Physical delivery is into the Colonial Pipeline at a variety of injection stations:- Texas, Pasadena and Houston being the main locations. Gulf Coast Harbor Ultra Low Sulfur Diesel futures are traded at the NYMEX® under ticker symbol LU. Contract size is 42 000 gallons (1 000 barrels) quoted in US Dollars and Cents per gallon. Delivery takes place all calendar months. Contract settled by physical delivery. / НАЙМЭКС® (NYMEX®).

GULF COAST SOUR CRUDE OIL = КИСЛАЯ (или СЕРНИСТАЯ) НЕФТЬ ИЗ ПОБЕРЕЖЬЯ ЗАЛИВА – Gulf Coast Sour Crude Oil:- Mars-type crude oil of the Louisiana offshore. Gulf Coast Sour Crude Oil futures are traded at the NYMEX® under ticker symbol MB. Contract size is 1 000 barrels with a contract price quoted in US Dollars and Cents per barrel. Delivery dates take place every month of the year. Settlement Price:- Physical delivery will be based on the Final Settlement Price on the last day of trading. The physical delivery obligation is based on MARS-type crude oil at the Louisiana Offshore Oil Port LLC (LOOP) facilities in Clovelly, Louisiana. Alternate delivery of Basrah Light and Russian Urals will be permitted at fixed differentials. The contract will be available for trading as an inter-commodity spread to WTI on CME Globex®, using the MB:CL spread code. Termination of Trading:- Trading in the current delivery month shall cease on the third business day prior to the 25th calendar day of the month preceding the delivery month. If the 25th calendar day of the month is a non-business day, trading shall cease on the third business day prior to the last business day preceding the 25th calendar day. In the event that the official Exchange holiday schedule changes subsequent to the listing of a Crude Oil futures contract, the originally listed expiration date shall remain in effect. Listed Contracts:- 36 consecutive months. Settlement Type:- Physical with delivery at LOOP Facility in Clovelly, LA. Alternate delivery of Basrah Light and Russian Urals will be permitted at fixed differentials. Xxxxx. Physically Delivered Gulf Coast Sour Crude Oil Futures:- Starting on 2009-December-07, the Exchange will re-launch its Gulf Coast Sour Crude Oil futures contract, based on physical delivery of domestically produced Mars crude oil and two foreign sour crude oil streams at the Louisiana Offshore Oil Platform (LOOP) facility in Clovelly, Louisiana. In addition to Mars, the Exchange will allow delivery of two foreign crude oil streams, Basrah Light and Russian Urals. This new futures contract will be listed on CME Globex®, and will feature inter-commodity spread trading with the Light Sweet Crude Oil (WTI) futures contract. Gulf Coast Sour Crude Oil futures will expire on the same day as the WTI futures contract, and will be linked to the powerful liquidity of the WTI futures contract. The US Gulf Coast area of Texas and Louisiana is the key oil production and import hub for supplying most of the US crude oil refining sector. The US Gulf Coast crude oil market has a diverse group of commercial market participants, fluid interaction with other important regional markets, especially the US Mid-continent market, and a strong existing base of market competition. The LOOP is the largest US deepwater port and is the single largest point of entry for crude oil coming into the US market. It receives and stores crude oil from supertankers, and domestic crude oil produced from the deepwater areas in the Gulf of Mexico. The LOOP terminal has upwards of 60 million barrels of storage capacity with pipeline connections to the refineries located in the US Gulf Coast and Midwest areas. Benefits:- (i) Liquidity:- access the deep liquidity of the world's largest and most diverse derivatives marketplace, where an average of more than 1.5 million energy contracts traded or cleared daily. (ii) Flexibility:- trade with unparalleled flexibility on CME Globex®, through CME ClearPort or directly from our New York trading floor. (iii) Security:- take advantage of more than USD8 billion in financial safeguards and a marketplace where in more than 100 years no member firm has failed to meet its performance bond or delivery obligations. / НАЙМЭКС® (NYMEX®). Си.Эм.И. Глобэкс® (CME Globex®). Си.Эм.И. КлыэПорт (CME ClearPort).

GULP = GROUP UNIVERSAL LIFE POLICY

GUM = ГУММИ (или КАМЕДЬ, или РАСТИТЕЛЬНЫЙ КЛЕЙ, или СМОЛА, или ЖИВИЦА, или КЛЕЯЩЕЕ ВЕЩЕСТВО) – Gum is a term covering a wide range of substances. Strictly, gums are carbohydrate high polymers, either soluble or dispersible in water, that are derived from vegetable origins. Loosely, the term gum is used to mean resins, saps, natural rubber, chicle, starch, cellulose derivatives, and many other products. In textile printing, the term refers to print-paste thickeners. Gum is a material resulting from the breakdown of plant cells including their carbohydrates. On exposure to air, gums dry and harden. / Подклеивать камедью. Этот термин относится к сгустителям загустки (print-paste thickeners).

GUM BOOT = РЕЗИНОВЫЙ САПОГ – Gum Boot is a rubber boot.

GUMMIFERA = КАМЕДЕНОСНОЕ – Gummifera:- bearing gum.

GUMMY WOOL = СМОЛИСТАЯ ШЕРСТЬ (или ЛИПКАЯ ШЕРСТЬ) – Gummy Wool is a scoured wool that still has some yolk in it.

GUN MARKS = ОТМЕТИНЫ XX – Gun Marks:- ring or impression of gun when we use during removing of stains. Finishing defect. / развод (или потёк (stain)). Порок или дефект заключительной отделки.

GUNMETAL = ПУШЕЧНЫЙ МЕТАЛЛ (или ПУШЕЧНАЯ БРОНЗА, или ХХ) – Gunmetal:- a bluish gray color.

GUNWALE = ПЛАНШИРЬ (или ПРИВАЛЬНЫЙ БРУС, или ЛИНИЯ ПЕРЕСЕЧЕНИЯ ВЕРХНЕЙ ПАЛУБЫ С БОРТОМ) – The Gunwale, pronounced 'gunnel' to rhyme with 'tunnel', is a nautical term describing the top edge of the side of a boat. Wale is the same word as the skin injury, a weal, which, too, forms a ridge. Originally the gunwale was the 'Gun ridge' on a sailing warship. This represented the strengthening wale or structural band added to the design of the ship, at and above the level of a gun deck. It was designed to accommodate the stresses imposed by the use of artillery. In wooden boats, the gunwale remained, mounted inboard of the sheer strake, regardless of the use of gunnery. In modern boats, it is the top edge of the side where there is usually some form of stiffening. Upper edge of a ship's sides. Gunwale (maritime term):- the upper edge of a vessel or boat's side. / Верхняя кромка борта беспалубного судна. Под Планширем, от Английского слова Plankshеer, понимается:- (i) деревянные или металлические перила поверх судового леерного ограждения или фальшборта; или (ii) продольная связь корпуса шлюпки в виде деревянного бруса с гнёздами для уключин, идущего по бортам и покрывающего верхние концы шпангоутов. Под Привальным Брусом понимается брус, устанавливаемый вдоль борта судна выше ватерлинии, служащий для предохранения его от смятия при ударах во время швартовки к пирсу или другому судну. Бывают деревянными, металлическими, резино-металлическими. Фальшборт, от Немецкого слова Falschbord, лёгкий стальной пояс, выполненный как продолжение бортовой обшивки судна и расположенный выше верхней палубы. Фальшборт служит ограждением открытых частей палубы и уменьшает накат волн на неё.

GUR, JAGGERY, KHANDASARI = ГУР, ДЬЖАГЭРИ, ХАНДАСАРИ – Gur, Jaggery, Khandasari are the semi-processed sugars (plantation whites) extracted from sugarcane in India.

GUTTA = ГУТТА (или ПРОРЕЗИНЕННОЕ, или КАПЛЯ, или КАПЕЛЬКА) – Gutta:- French for 'Resist', which forms a barrier on the fabric to create a pattern. may be water soluble, solvent soluble, or a heat fixable resin. / Под Гуттой, от Латинского слова Gutta, означающее Капля, понимается .

GUTTATION = ГУТТАЦИЯ – Guttation is exudation of liquid water from plants. / Под Гуттацией, от Латинского слова Gutta, означающее Капля, понимается выделение листьями растений капельной жидкости (капель воды) через водяные устьица (гидатоды) на краях и кончиках листьев под воздействием корневого давления. Происходит в том случае, когда поступление воды в растение превышает транспирацию, большей частью ночью, рано утром или в условиях повышенной влажности. Часто наблюдается у молодых проростков, например, Злаков, когда корневая система развивается быстрее, чем листья. Возможно таким образом растение освобождается от избытка солей.

GUTTERED = ЖЕЛОБОЧНОЕ (или С ПАЗАМИ) – Guttered:- of leaf margins folded inward.

GVW = GROSS VEHICLE WEIGHT

GW = GIGAWATT

GW = GRAIN WEIGHT

GW = GUINEA–BISSAU

GW·H = GIGAWATT HOUR

GY = GUYANA

GYMNOSPERM = ГОЛОСЕМЕННОЕ (или ГИМНОСПЕРМ) – Gymnosperm:- with naked or unprotected ovules (seeds), e.g., conifers, cone-bearing Plants such as Welwitschia. Gymnosperms do not produce flowers, but instead release pollen through the air to the female ovule, causing fertilization. / Под Голосеменными Растениями понимается древняя Группа (Отдел) Семенных Растений, у которых имеются семяпочки (в отличие от Папоротников), но отсутствуют плодолистики (в отличие от Цветковых). Произошли в девоне от примитивных Папоротниковидных. Около 600 Видов, Деревья и Кустарники, распространены широко. К Голосеменным относятся Классы Саговниковых, Гинкговых, Хвойных и Гнетовых, а также ископаемые семенные Папоротники и Беннеттиты. Хозяйственное значение имеют Хвойные, особенно Сосновые (Сосна, Лиственница, Ель, Пихта, Кедр), а также представители Семейства Таксодиевых и Кипарисовых.

GYNOECIUM = ГИНЕЦЕЙ – Gynoecium is the female part of the flower consisting collectively of the carpel(s) or pistil(s). / Гинецей – женский орган цветка, состоящий совместно из плодолистика(ов) (или карпели(ей)) или пестика(ов). Под Гинецеем, от Греческих слов Gynē, означающее Женщина, и Oikion, означающее Дом или Жилище, понимается совокупность плодолистиков цветка, образующих один или несколько пестиков – женских органов цветка. Гинецей может состоять только из одного плодолистика или из нескольких не сросшихся между собой плодолистиков (апокарпный), например, у Гороха и других видов Бобовых (одночленный), у Земляники (многочленный), но чаще формируется один пестик из двух или большего числа сросшихся между собой плодолистиков – ценокарпный гинецей, который встречается у большинства семейств и в зависимости от способов срастания плодолистиков представлен различными типами.

GYNOSTEGIUM = ГИНОСТЕГИЙ – Gynostegium is a crown of united stamens and style protecting the gynoecium and typical of milkweeds (Asclepias). / объединённых тычинок (stamens) и столбик, защищающий гинецей, и типичный для Ваточников (Asclepias). Под Гиностегием, от Греческих слов Gynē, означающее Женщина, и , означающее , понимается .

GYRO PILOT = ГИРОРУЛЕВОЙ (или АВТОРУЛЕВОЙ, или АВТОПИЛОТ) – Gyro Pilot is an instrument, which automatically controls and steers a ship very accurately, compared with human navigation. An advanced bearing is set and the gyro pilot will direct to that point.

- H -

H = ЭЙЧ. – H is fifth letter of a NASDAQ® stock symbol specifying that the issue is the second preferred bond of the company. / НЭЗДЭК® (NASDAQ®) .

H = DECLARED OR PAID AFTER STOCK DIVIDEND OR SPLIT–UP

h = HECTO = 10^2

H = HOTEL

H1 = FIRST HALF A YEAR

H1 LUBRICANT = СМАЗКА ЭЙЧ.1 – H1 Lubricant:- food-grade lubricants used in food processing environments where there is some possibility of incidental food contact. Lubricant formulations may only be composed of one or more approved basestocks, additives and thickeners (if grease) listed in Guidelines of Security Code of Federal Regulations (CFR) Title 21, §178.3570. See also Lubricant.

H2 LUBRICANT = СМАЗКА ЭЙЧ.2 – H2 Lubricant:- lubricants used on equipment and machine parts in locations where there is no possibility that the lubricant or lubricated surface contacts food. Because there is not the risk of contacting food, these lubricants do not have a defined list of acceptable ingredients. They cannot, however, contain intentionally heavy metals such as antimony, arsenic, cadmium, lead, mercury or selenium. Also, the ingredients must not include substances that are carcinogens, mutagens, teratogens or mineral acids. See also Lubricant.

H3 LUBRICANT = СМАЗКА ЭЙЧ.3 – H3 Lubricant:- also known as Soluble or Edible Oil. These are used to clean and prevent rust on hooks, trolleys and similar equipment. See also Lubricant.

HA = HECTARE

HA = HUMIC ACID

HAB = HOUSE AIR WAYBILL

HABERGEON = XX – Habergeon is a medieval jacket of mail shorter than a hauberk; hauberk.

HABICK = XX – Habick is an instrument used during the Middles Ages to hold fabric under tension during its final preparation and dressing. It is roughly equivalent to the modern stenter rail.

HABILIMENTS = XX (или ОДЕЯНИЯ) – Habiliments:- the dress characteristic of an occupation or occasion.

HABIT = ХАБИТУС (или ГАБИТУС, или (ВНЕШНИЙ) ОБЛИК) – Habit:- the characteristics of growth and general appearance of a plant. Habit is the general form and growth pattern of a plant. / Под Хабитусом или Габитусом, от Латинского слова Habitus, означающее Внешность или Наружность, понимается:- (i) наружный вид, облик Растения или Животного; (ii) наружный вид, облик кристалла, минерала; (iii) внешний облик человека, его телосложение, конституция, осанка.

HABIT = ТЕЛОСЛОЖЕНИЕ (или ВНЕШНИЙ ОБЛИК) – Habit:- a costume characteristic of a calling, rank, or function; a costume worn for horseback riding.

HABITAT = ХАБИТАТ (или ГАБИТАТ, или ОБИТАЛИЩЕ, или МЕСТООБИТАНИЕ, или МЕСТО ОБИТАНИЯ, или МЕСТО ПРОИЗРАСТАНИЯ, или МЕСТО РАСПРОСТРАНЕНИЯ, или ЕСТЕСТВЕННАЯ СРЕДА) – Habitat is a part of an ecosystem with conditions in which an organism naturally occurs or can establish. Habitat is the place in which a Plant, or other organisms, naturally grows or lives. Habitat is the physical location or type of environment in which a Plant or an organism is found.

HABUTAI = ХАБУТАЙ – Habutai is one of the most basic plain weaves, it is normally a lining silk, but can also be used for T-shirts, lampshades, summer blouses or very light lingerie. It is very lightweight and easy to dye. Habutai is a soft, lightweight silk dress fabric originally woven in the gum on hand looms in Japan. It is sometimes confused with China silk, which is technically lighter in weight. Habutai:- silk. Plain weave. Very light weight and soft. A little heavier than China Silk, but similar. Sold by weight measure known Momme (1 momme = 3.75 g). Made from waste silk that can be twisted. It is piece dyed or printed and sized. Has many defects in the cloth which has a ‘shot-about’ appearance but this does not effect the cloth. Comes from Japan – originnally woven on Japanese hand looms. Lighter than shantung but heavier than silk. / Общее название для многих Японских шёлковых тканей типа Че-су-чи.

HACCP = HAZARD ANALYSIS CRITICAL CONTROL POINT

HACKLES = ЩЕТИ (или ГРЕБНИ, или МЫКАНИЦЫ, или ГРЕБЕННЫЕ ПЛАНКИ, или ПЛАНКИ С ЖЕЛЕЗНЫМИ ЗУБЬЯМИ ДЛЯ ЧЕСАНИЯ ЛЬНА И ПЕНЬКИ) – Hackle is a tool for separating the long flax fibers from the short material. A hackle may also be used with a comb to process wool fibers. Hackles:- the comb for dressing flax or hemp. / Щеть (во множественном числе – Щети).

HACKLING = (МАШИННОЕ) ЧЕСАНИЕ – Hackling is a cleaning the remaining woody particles and separation of the fibers. This is done by drawing the flax fibers through the hackles. Traditionally, there are three sets of hackles that are used to progressively process the fibers. The previous step would be ‘rippling’. Hackling is a combing process that prepares the flax fibers for spinning by removing short lengths of fiber, leaving only longer ones and laying them parallel. It may be done by hand or by machine. / Чесание льна.

HAGBERG FALLING NUMBER = ЧИСЛО ПАДЕНИЯ ХАГБЭРЬЯ – The Hagberg Falling Number (HFN) is a measure of the quality of Wheat and its suitability for certain processes. In practice it is a measure of the viscosity of a broth made from the grain. A sample of the grain is ground, mixed with water and heated. It is put into a narrow tube and the time taken in seconds for a weighted plunger to fall a fixed distance is noted. Low Hagberg indicates high enzyme activity and onset of sprouting. A threshold of 250 seconds is used for breadmaking Wheat and samples with low Hagberg are rejected. Low Hagberg Wheat produces bread with a dark crust color and a weak, sticky crumb that cannot be sliced. The Hagberg test is used worldwide. It measures the time, in seconds, a plunger takes to descend through a heated mixture of ground grain and water. The test provides an indirect estimate of alphaamylase activity. See also Falling Number. 1960:- Sven Hagberg developed a rapid, original method for determining α-amylase activity in sprout-damaged grain. 1961 Sven Hagberg named the method ‘Falling-Number’ (FN) with a simple modification. 1962:- Harald Perten founded Perten Instruments AB (Kungens Kurva, Sweden) and commercialized falling number apparatus. 1968:- International Association of Cereal Science and Technology approved the method as ICC Standard No. 107/1. 1972 The method was implemented as an Official AACC Method 56-81B (AACC is short for the American Association of Cereal Chemists). 1982:- The International Organization for Standardization approved the method as ISO 3093. Pasta/noodle made with low FN flour is fragile, soft and mushy. More starch is lost to cooking water, making the water cloudy. Production problems with low FN flour – uneven extrusion, strand stretching, and irregularities in drying. Traditionally, predicting amylase content for grain trade and the milling and baking industry has relied on a combination of visual inspection and laboratory testing using the conventional Hagberg Falling Number (HFN) test. Developed over 40 years ago, this complicated test requires costly laboratory equipment to estimate alpha-amylase activity in Wheat. Generally, a falling number of 350 seconds or longer indicates a low alpha-amylase enzyme activity and very sound Wheat quality. As the amount of amylase activity or concentration increases, falling number times decrease and Wheat quality is reduced. HFN below 200 seconds indicates high levels of alpha-amylase activity and poor Wheat quality. Wheat Quality:- (i) Good:- Falling Number (Seconds) – 400, and Amylase (ng/ml extract) – 15; (ii) OK:- Falling Number (Seconds) – 300, and Amylase (ng/ml extract) – 100; (iii) Marginal:- Falling Number (Seconds) – 250, and Amylase (ng/ml extract) – 170; and (iv) Poor:- Falling Number (Seconds) – 150, and Amylase (ng/ml extract) – 350. / Смотрите также Число Падения (Falling Number). Свэн Хагбэрьй (Sven Hagberg). Харальд Пэртэн (Harald Perten) Пэртэн Инструмэнтс А.Бе. (Perten Instruments AB) Кунгэнс Курва (Kungens Kurva), Швеция. Экструзия или Выдавливание (Extrusion).

THE HAGUE PROTOCOL = ГААГСКИЙ ПРОТОКОЛ – The Hague Protocol is an amendment of the Warsaw Convention at The Hague, 1955-September-28 (aircargo). Protocol to amend the Convention of the Unification of Certain Rules Concerning International Air Carriage (done at the Hague on 1955-September-28). A text amending the provisions of the Warsaw Convention of 1929 now in force in most countries with the significant exception of the United States. In 1955, the Hague Protocol to the Warsaw Convention increased the per-passenger liability limitation to USD16 600.00, but the United States still regarded this limit as too low and therefore did not ratify the Protocol. The Warsaw Convention of 1929. The Convention on the Unification of Certain Rules Relating to International Carriage by Air, adopted during the early days of aviation, dominated the field of aviation passenger liability for almost half a century. It limits the liability, except in cases of gross negligence on the part of the carrier, to a maximum of 125 000 Poincaré gold Francs (about USD10 000.00). The Hague Protocol of 1955 doubled the existing limits of liability. In 1971, by the Guatemala City Protocol, the rule of the Warsaw Convention based on presumption of fault yielded to strict liability, irrespective of fault. However, it will be some time before the 1971 protocol comes into force because at least 30 states, including five with major air traffic, must ratify it. (As of May 2002, only 7 states had ratified the protocol). An interesting feature of the Guatemala City Protocol is that although it provides for a limit of about USD 100 000.00 per passenger, there is also provision for a domestic supplement if a state that is party to the protocol wishes to have a higher limit. In 1975, an International Conference on Air Law, convened under the auspices of the International Civil Aviation Organization (ICAO), adopted new amendments to the Warsaw Convention, as amended by the Hague Protocol. Under the new provisions, the carrier is responsible for cargo damage, irrespective of fault. Another major change concerns the method of calculating the liability limits by turning from a solely gold monetary basis to a dual system, allowing countries that are members of the International Monetary Fund (IMF) to base passenger, baggage, and cargo liability on Special Drawing Rights (SDR), whereas countries not members of the IMF would declare liability limits in monetary units based on gold. The Guadalajara Convention of 1961. The Guadalajara Convention, supplementary to the Warsaw Convention, contains rules with regard to carriage performed by other than the contracting carrier, that is to say, by a carrier that had not issued the ticket to the passenger, or the air waybill to the consignor. In this case, both the contracting carrier and the actual carrier would be held jointly and severally liable under the Warsaw Convention or that convention as amended by the Hague Protocol. / В перевозках авиационных грузов .

THE HAGUE RULES = ГААГСКИЕ ПРАВИЛА – The Hague Rules means the provision of the International Convention for Unification of Certain Rules Relating to Bills of Lading signed at Brussels, Belgium on 1924-August-25. Rules governing the carriage of goods by sea and identifying the rights and responsibilities of carriers and owners of cargo. These rules were published in 1924 following an international convention and were subsequently given the force of law by many maritime nations. International Agreement setting forth conditions governing the carriage of goods by sea. Article IV, Rule 5, states that liability for the shipowners negligence is limited to USD500.00 per unit. The Hague Rules package limit is Sterling 100.00. US COGSA (short for the US Carriage of Goods by Sea Act of 1936) USD500.00 per package. Hague Visby is 555.67 SDR's. Hamburg Rules 2.50 SDR's per kg or 835.00 SDR's per package. Warsaw Convention USD20.00 per kg. Code of minimum conditions for the carriage of cargo under a bill of lading. International convention for the unification of rules, pertaining to Bills of Lading (1924). These Rules describe the responsibilities of ocean Carriers. A multilateral maritime treaty adopted in 1921 at The Hague, Netherlands. Standardizes liability of an international carrier under the Ocean Bill of Lading. Establishes a legal floor for Bill of Lading. At the moment the international carriage of goods by sea is governed by the Hague Rules (1924), the Hague-Visby Rules (1968), and the Hamburg Rules (1978). See also The Hague-Visby Rules, and The Hamburg Rules. / Гаагские Правила – основные положения, определяющие объём и формы ответственности судовладельца при перевозке груза. Гаагские Правила – международные основные положения, определяющие объём ответственности судовладельцев при перевозке грузов по коносаментам. Гаагские Правила подразумевают под собой положение Международной Конвенции по Унификации Некоторых Правил, Касающихся Коносамента (The International Convention for Unification of Certain Rules Relating to Bills of Lading), подписанное в Брюсселе, Бельгия 25 Августа 1924. Они являются сводом правил, определяющих права и привилегии морских перевозчиков грузов. Основные положения, определяющие объём ответственности судовладельцев при перевозке грузов по коносаментам, были разработаны Международной Ассоциацией Юристов и рассмотрены на Конференции в Гааге в Сентябре 1921. После внесения изменений Гаагские Правила были окончательно приняты и вошли в качестве положения в Международную Конвенцию по Унификации Некоторых Правил, Касающихся Коносамента. Появление этих правил было вызвано необходимостью единообразного толкования условий коносамента, используемого в международных перевозках с участием в них большого числа организаций (судовладельцев, грузоотправителей, банков, страховых компаний), интересы которых не всегда совпадают друг с другом. Согласно Гаагских Правил перевозчик обязан проявить должную заботу, чтобы его судно было мореходным, снаряжённым и снабжённым всем необходимым, он должен также надлежащим образом укомплектовать экипаж судна, обеспечить пригодность грузовых помещений к приёму, перевозке и сохранности груза. Кроме того, эти правила возлагают на перевозчика обязанность надлежащим образом и с проявлением должной заботы загружать, укладывать, перевозить, сохранять, выгружать и обращаться с перевозимым грузом. В данных правилах чётко оговорено, что любой пункт, статья или условие в контракте перевозки (коносаменте), освобождающие перевозчика от ответственности за убытки, возникающие вследствие небрежности, вины или упущений последнего, либо уменьшающие эту ответственность иным образом, чем это предусмотрено Гаагскими Правилами, считаются недействительными и не имеют юридической силы и правовых последствий. Согласно этим правилам перевозчик освобождается от ответственности за потери или убытки, явившиеся результатом действия непреодолимой силы, карантинных ограничений, восстания, гражданских волнений, скрытых пороков груза, небрежности и упущений капитана, лоцмана, членов экипажа судна в судовождении или управлении судном, а также иных причин, если последние не вызваны недостатком должной заботы со стороны перевозчика. Поправки и изменения в Гаагские Правила были внесены 23 Февраля 1968 Брюссельским Протоколом по пересмотру Гаагских Правил для коносаментов (так называемыми Гаагско-Висбайскими Правилами (The Hague-Visby Rules)), а также Гамбургскими Правилами (The Hamburg Rules) Конвенции Организации Ообъединённых Наций по Морской Перевозке Товаров от 1978 (The United National Convention on the Carriage of Goods by Sea of 1978).

THE HAGUE–VISBY RULES = ГААГСКО–ВИСБЮНСКИЕ ПРАВИЛА (или ГААГСКО–ВИСБИНСКИЕ ПРАВИЛА) – New name for the Hague Rules as amended in 1968 at Visby, Sweden. The Hague-Visby Rules means the Hague Rules as amended by the protocol signed at Brussels, Belgium on 1968-February-23. A set of rules, amending the Hague Rules published in 1968 and subsequently given the force of law by many maritime nations. The Hague-Visby Rules means the provisions of The Hague Rules 1924 as amended by the Protocol adopted at Brussels on 1968-February-23, and 1979-December-21 (SDR Protocol) where applicable. Notwithstanding anything to the contrary herein it is expressly agreed that nothing herein shall contractually apply the Hague-Visby Rules to the bill of lading and they shall apply only when compulsorily applicable by the law governing the bill of lading. A set of rules, amending the Hague Rules published in 1968 and subsequently given the force of law by many maritime nations. The Hague-Visby Rules are a set of international rules for the carriage of goods by sea. The official title is 'International Convention for the Unification of Certain Rules of Law relating to Bills of Lading' and was drafted in Brussels in 1924. After being amended by the Brussels Amendments (officially the 'Protocol to Amend the International Convention for the Unification of Certain Rules of Law Relating to Bills

of Lading') in 1968, the Rules became known as the Hague-Visby Rules. A final amendment was made in the SDR Protocol in 1979 (SDR (short for the Special Drawing Rights) as defined by the International Monetary Fund and applied by the SDR Protocol (1979) signed at Brussels on 1979-December-21 to amend the Hague Rules). The premise of the Hague-Visby Rules is that a carrier has far greater bargaining power than the shipper; and that to protect the interests of the shipper/cargo-owner, the law should impose minimum obligations upon the carrier. At the moment the international carriage of goods by sea is governed by the Hague Rules (1924), the Hague-Visby Rules (1968), and the Hamburg Rules (1978). See also The Hague Rules, and The Hamburg Rules. / Новое название для Гаагских Правил, дополненных в 1968 в Висбю (может также произноситься как Висби), Швеция.

HAIK = АЙК (или НАКИДКА) – Haik is a voluminous piece of usually white cloth worn as an outer garment in northern Africa. / женская накидка.

HAIL = ОКЛИК – Hail (maritime term):- to address a vessel, to come from, as to hail from some port (call).

HAIR = ВОЛОС – Hair is a long thin epidermal appendage, either formed from a single elongated cell or consisting of a single row of cells. See also Arachnoid, Barbate, Canescence, Capillaceus, Capillatus, Ciliate, Cephalium, Coma, Felt, Glabrous, Glochids, Hirsute, Lanate, Lasiacantha, Penicillate, Pubescent, Pubispina, Scabrous, Trichome, Villous, Woolly. Hair is a uni- or multi-cellular epidermal outgrowth. / Под Волосами понимаются роговые производные кожи, образующие волосяной покров у млекопитающих животных и человека. Содержат пигменты, определяющие их окраску, защищают тело от механических повреждений и потери тепла. Нижний ярус волосяного покрова у многих млекопитающих образует Подшёрсток. У некоторых животных (Носороги, Слоны) кожа почти лишена волос. С волосами обычно связаны сальные, а иногда и потовые железы. У многих млекопитающих весной и осенью происходит линька. Волосы у человека в среднем 2–4 года. Подшёрсток или Пуховые Волосы, нижний ярус волосяного покрова (шерсти) у большинства млекопитающих. Подшёрсток представлен извитыми тонкими мягкими волосами и выполняет основную теплоизоляционную функцию шёрстного покрова. У некоторых животных (например, у мериносовых Овец) подшёрсток образует весь волосяной покров, у других (например, у Кабарги) он почти отсутствует. Хорошо выражен у животных, приспособленных к холодному климату, а также у водных животных. Подшёрсток – наиболее ценная часть Шерсти.

HAIRCLOTH = ВОЛОСЯНОЕ ПОЛОТНО (или ВОЛОСЯНАЯ БОРТОВКА, или БОРТОВЫЙ ВОЛОС) – Haircloth is a stiff, wiry fabric made from a combination of natural or man-made fibers with animal hair filling, usually mohair (goat) or horsehair. It is used in upholstery and as interfacing and stiffening because of its strength. Haircloth:- any of various stiff wiry fabrics especially of horsehair or camel hair used for upholstery or for stiffening in garments.

HAIRCUT = НАВАР (или СТРИЖКА) – Haircut is the difference between the market value of a security and its value when used as collateral. The haircut is intended to protect a collateral taker from losses due to declines in collateral values. In computing the value of assets for purposes of capital, segregation, or margin requirements, a percentage reduction from the stated value (e.g., book value or market value) to account for possible declines in value that may occur before assets can be liquidated. Haircut is:- (1) in determining whether assets meet capital requirements, a percentage reduction in the stated value of assets. (2) In computing the worth of assets deposited as collateral or margin, a reduction from market value. / Сегрегация или Выделение или Зейгерование или Разделение По Крупности (Segregation). Под Наваром понимается разность между рыночной оценкой ценной бумаги и её оценкой на момент заклада в качестве обеспечения. , например, . Стрижка – термин, использующийся в области операций с ценными бумагами и означающий фактор риска, применяемый для оценки ценных бумаг при расчёте чистого капитала брокера-дилера. Фактор риска варьирует в соответствии с классом ценных бумаг, их рыночным риском и сроком до погашения. Например, государственные ценные бумаги (governments), являющиеся эквивалентами наличных средств, могут иметь фактор риска 0%, ценные бумаги на капитал – 30%, а просроченные инвестиции (ценные бумаги, сроки погашения по которым уже прошли) с невысокой вероятностью выплат могут иметь фактор риска 100%.

HAIRCUTTING = СТРИЖКА – Haircutting:- when securities such as stocks and bonds are used as the investment margin, they are discounted at a percentage to determine their collateral value. Discounting these securities by a certain percentage to determine their margin value is referred to as Haircutting. This is in contrast to cash where the entire amount of the deposit is used for the margin. If for example, a stock is discounted by 30%, only 70% of the particular stock can be used as margin.

HAIR FIBERS = ВОЛОСЯНЫЕ ВОЛОКНА – Hair Fibers are wool-like fibers from animals other than sheep, including the Alpaca, Llama, Vicuna, Cashmere Goat, Angora Goat, Angora Rabbit and Bactrian Camel.

HAIRLINE = ТОНКИЙ КОНТУРНЫЙ РИСУНОК (или ТОНКАЯ ВОЛОСЯНАЯ ЛИНИЯ, или ОЧЕНЬ МЕЛКИЙ РИСУНОК) – Hairline is a fabric with a hairline design, namely a textile design consisting of lengthwise or crosswise lines usually one thread wide.

HAIRPIN LACE = ШПИЛЕЧНОЕ КРУЖЕВО – Hairpin Lace is a delicate, narrow lace worked over a hairpin or a special hairpin-shaped, loom-like tool.

HAIR SHIRT = ВЛАСЯНИЦА (или ВОЛОСЯНАЯ РУБАШКА) – Hair Shirt is a shirt made of rough animal hair worn next to the skin as a penance.

HAIRY = ВОЛОСАТОЕ (или ШЕРСТИСТОЕ, или ОТЩЕПИВШЕЕСЯ) – Hairy is:- (1) a term describing a woven fabric defect characterized by a hairy appearance due to broken fibers or filaments. Principle causes are underslashed warp; rough drop wires, heddles, or reed; fabric slippage on take-up drum; rough shuttles; cut glass, dents, or reeds in warper; and damage in slashing. (2) A term describing a fabric intentionally made with a hairy surface; such fabrics are usually produced from spun yarns. See also Fuzziness, and Fuzzy.

HAIRY CLOTH = ШЕРСТИСТОЕ ПОЛОТНО – Hairy Cloth:- the fibers in the yarn have been roughened before, during or after weaving.

HALF–BLOOD WOOL = ПОЛУКРОВНАЯ ШЕРСТЬ – Half-Blood Wool:- designation of a grade classification immediately below the fine grade. / Бостонский термин мериносовой шерсти, идентичный шерсти Halfbred. Полукровная Шерсть – тонина волокна 20–23.5 микрон.

HALF BOOT = ПОЛУСАПОГ (или ПОЛУБОТИНОК) – Half Boot is a boot with a top reaching above the ankle and ending below the knee.

HALF–HEIGHT = С НЕПОЛНОЙ ВЕРХНЕЙ РАМОЙ – Half-Height:- identical to the open top, but with 4'3" ends and not the standard 8'6". Suitable for the carriage of heavy cargo as the box weight is considerably less. 20' only. / Идентичен открытому сверху контейнеру, за исключением наличия бортов нестандартной высоты 8 футов и 6 дюймов, а 4 фута и 3 дюйма. Применяется

для перевозки тяжёлых грузов, поскольку вес такого контейнера значительно легче стандартного. По своей длине ограничены лишь 20-футовыми контейнерами.

HALF–HEIGHT OPEN TOP CONTAINER = КОНТЕЙНЕР НА БАЗЕ ПЛАТФОРМЫ С НЕПОЛНОЙ ВЕРХНЕЙ РАМОЙ – Half-Height Open Top Container is a half-height container with no roof, which is particularly suitable for heavy and compact cargo. The container can be loaded through the open top using a crane. Due to the reduced height of this container, the rates on container ships can sometimes be more favorable.

HALF–LIFE = ПОЛОВИНА ЖИЗНИ (или ПЕРИОД ПОЛУРАСПАДА, или ПЕРИОД ПОЛУВЫВЕДЕНИЯ, или ПЕРИОД ПОЛУРАЗЛОЖЕНИЯ) – Half-Life is the time taken for a herbicide to be degraded by 50%. Half Life is the time taken for the value of something to reduce to half of that value. Of a radioactive isotope, the time taken for half of the atoms to decay. / Период Полураспада или Период Полувыведения радиоактивного изотопа.

HALF–MAST = ПРИСПУЩЕННОЕ – Half-Mast (maritime term):- the position of a flag when lowered halfway down.

HALF PICK = ХХ ПОПЕРЕЧНАЯ НИТЬ – Half Pick:- in case of rapier looms, if the second rapier does not collect the weft, it shall stop in between, and we get half pick.

HALF SIBS = ПОЛУСИБСЫ (или ПОЛУРОДСТВЕННЫЕ) – Half Sibs are the individuals derived from crosses in which one of the two parents is common. / Под Сибсами понимаются потомки одних родителей, родные братья и сёстры. Термин используется в генетике человека и животных.

HALF–SLIP = ПОЛУКОМБИНАЦИЯ (или НИЖНЯЯ ЮБКА) – Half-Slip:- a topless slip with an elasticized waistband.

HALFTONE = ПОЛУТОН (или АВТОТИПИЯ) – Halftone:- a uniform series of dots that give the appearance of a lighter shade of a solid color. The number of dots-per-inch is called the Line Count or Frequency. The amount of coverage is determined by the percentage of dots.

HALLIARD = ФАЛ (или ГАРДЕЛЬ) – Halliard or Halyard (maritime term):- ropes used for hoisting gaffs and sails, and signal flags.

HALLMARK = ПРОБИРНОЕ КЛЕЙМО – Hallmark is a mark or number of marks made on gold or silver jewellery and other fabricated products to confirm that the quality is of the carat fineness marked on the item. Hallmark is a mark or number of marks made on gold, silver or platinum jewellery and other fabricated products to confirm that the quality is of the fineness marked on the item. See website:- http://www.thegoldsmiths.co.uk. Hallmark is a stamped impression on the surface of a precious metals bar and their alloys that indicates the producer, serial number, weight, and purity of metal content. / Пробирное Клеймо – проштампованный на поверхности слитка благородных металлов и их сплавов оттиск, который отражает производителя, серийный номер, вес и чистоту содержащегося в слитке металла. Клеймо Пробы. Именник – это клеймо производителя. Так, первая цифра показывает год клеймения, следующая за ней буква – шифр Госинспекции, производившей операцию. Ещё две-три буквы – это кодированное имя предприятия-производителя. Ювелиры обязаны ежегодно перерегистрировать именник, меняя первую цифру в связи с наступлением нового года.

HALO = ГАЛО (или СИЯЮЩЕЕ, или ОРЕОЛЬНОЕ) – Halo is the off-shade color fringe effect often seen in direct application dyeing when used mixed-color dyes. It is common for different color dyes of the same family to migrate at different rates when solutions are applied to fabric. For example, a purple made by mixing Red MX-8B (usually called Fuchsia) and Turquoise MX-G tends to produce strong turquoise halos. If a drop of dye solution is applied to soda ash pre-soaked fabric, the red component quickly stops moving outward, but the turquoise continues to migrate outward much longer, resulting in a too-red center with a turquoise halo. This can be very difficult to control, other than by selection of the dyes used for mixtures. Because black dyes are almost always mixtures, haloing often occurs with black. Halo:- an area of light color surrounding a localized thick portion of the fabric after dyeing. Note:- this defect is often caused by migration of dye during drying or by less dye reaching the area around the thkkening (e.g., knot, slub, gout) during pad dyeing. / Туркуаз (в переводе с Французского языка – Бирюза или Бирюзовое) Эм.Экс.-Дьжи. (Turquoise MX-G). Ореол (halo):- порок заключительной отделки ткани; более светлая зона, окружающая большой участок полотна после крашения. Примечание:- этот порок возникает при использовании водорастворимого красителя для плюсования, когда недостаточное количество краски попадает в зону вокруг узла, шишковатости или затканного пуха.

HALOPHYTE = ГАЛОФИТ – Halophyte is a plant adapted to, growing in and tolerating salty environments. / Под Галофитом, от Греческих слов Hál̓s, означающее Соль, и Phytón, означающее Растение, понимается растение, адаптированное к росту и терпению засолённой окружающей среды.

HALTER = НЕДОУЗДОК (или ХХ) – Halter is a woman's blouse that leaves the back, arms, and midriff bare and that is typically held in place by straps around the neck and across the back.

THE HAMBURG RULES = ГАМБУРГСКИЕ ПРАВИЛА – The Hamburg Rules are rules governing the rights and responsibilities of carrier and cargo interests which may be incorporated into a contract for the carriage of goods by sea either by agreement of the parties or statutorily. These rules were adopted by the United National Convention on the Carriage of Goods by Sea in 1978. The Hamburg Rules means the rules set out in Schedule 4 and embodied in the United Nations Convention on the Carriage of Goods by Sea, 1978. During the 1970's pressure mounted from developing countries and major shipper nations for a full re-examination of cargo liability regimes. Many, especially developing countries, took the view that the Hague Rules had been developed by 'colonial maritime nations' in 1924, largely for the benefit of their maritime interests, and that the imbalance between shipowners and shipper interests needed to be redressed. This led to the negotiation in 1978 of the United Nations Convention on the Carriage of Goods by Sea (Hamburg Rules). Rather than just amending the Hague Rules, the Hamburg Rules adopted a new approach to cargo liability. Under the Hamburg Rules the carrier is held responsible for the loss of or damage to goods whilst in their charge, unless they can prove that all reasonable measures to avoid damage or loss were taken. Carrier liability is extended to reflect the different categories of cargo now carried, new technology and loading methods, and other practical problems incurred by shippers such as losses incurred through delays in delivery. The Hamburg Rules were adopted on 1978-March-31 at a diplomatic conference held at Hamburg. The Convention entered into force on 1992-November-01 when the pre-requisite number of countries acceded to the Convention. However, none of the world's major trading nations have acceded to the Hamburg Rules, nor have its provisions been widely incorporated in national legislation, reflecting a general view that the Hamburg Rules have over-compensated in their effort to redress a perceived imbalance in the Hague Rules in favor of shipowners. The Hamburg Rules probably cover less than 5 per cent of world maritime trade. The United Nations Convention on the Carriage of Goods by Sea (The Hamburg Rules) Hamburg, 1978-March-30. Scope of application:- (i) The provisions of this Convention are applicable to all contracts of carriage by sea between two different States, if:- (a) the port of loading as provided for in the contract of carriage by sea is located in a Contracting State, or (b) the port of discharge as provided for in the contract of carriage by sea is located in a Contracting State, or (c) one of the optional ports of discharge provided for in the contract of

carriage by sea is the actual port of discharge and such port is located in a Contracting State, or (d) the bill of lading or other document evidencing the contract of carriage by sea is issued in a Contracting State, or (e) the bill of lading or other document evidencing the contract of carriage by sea provides that the provisions of this Convention or the legislation of any State giving effect to them are to govern the contract. (ii) The provisions of this Convention are applicable without regard to the nationality of the ship, the carrier, the actual carrier, the shipper, the consignee or any other interested person. (iii) The provisions of this Convention are not applicable to charter-parties. However, where a bill of lading is issued pursuant to a charter-party, the provisions of the Convention apply to such a bill of lading if it governs the relation between the carrier and the holder of the bill of lading, not being the charterer. (iv) If a contract provides for future carriage of goods in a series of shipments during an agreed period, the provisions of this Convention apply to each shipment. However, where a shipment is made under a charter-party, the provisions of paragraph 3 of this Article apply. At the moment the international carriage of goods by sea is governed by the Hague Rules (1924), the Hague-Visby Rules (1968), and the Hamburg Rules (1978). See also The Hague Rules, and The Hague-Visby Rules. / Гамбургские Правила – правила, определяющие права и ответственность перевозчика, являются положением Конвенции Организации Объединённых Наций по Морской Перевозке Товаров (The United National Convention on the Carriage of Goods by Sea). Они были адаптированы на дипломатической конференции в Гамбурге, Германия 31 Марта 1978 и вступили в силу 01 Ноября 1992.

HAMMER = МОЛОТ – Hammer is a bullish reversal candlestick pattern when an asset moves significantly lower after the open, but rallies to close well above the intraday Low. The resulting candlestick looks like a square lollipop with a long stick. The opposite of Hanging Man. The Hammer candlestick pattern forms after a prolonged downtrend. It is considered a strong reversal signal. On the day of the hammer candle, there is strong selling as the market opens up. As the day goes on, however, the market recovers and closes near the unchanged mark, or in some cases even higher. American International Group (AIG) provides a good example of the hammer formation. On June 24, AIG formed a hammer pattern after a prolonged downtrend. The stock opened at USD43.01 and made a low of USD41.53 before closing at USD42.30. Although the stock stabbed lower, it recovered and closed near its opening price, indicating that buyers came in at the lower levels. A reasonable entry point for this particular hammer pattern would be at the high of June 23 at USD43.04. On June 25, AIG opened at USD42.85 and once USD43.01 was broken, longs could have been initiated with a stop loss at the June 23 low of USD41.53. AIG in the coming sessions made a high of USD46.83. / В техническом анализе биржевых рынков на свечном графике под Молотом понимается молотообразная бычья свечная модель разворота, когда цена на актив значительно падает после открытия, но к закрытию поднимается немного выше дневного минимума. Отображаемая свеча выглядит как квадратный леденец на длинной палочке. В противоположность Висельнику (Hanging Man).

HAMMOCK = ГАМАЧНАЯ (или ГАМАК) – This cloth, as the name implies, is used in the making of Hammocks. It is made strong and durable to stand the strain and wear that it is subjected to and can be woven on almost any or dinary loom. It is generally made in three grades, viz., best, medium and low. The best grades are generally made on the Jacquard loom, so that very elaborate patterns may be introduced. A 400 tie-up is generally used, but any tie may be used according to the requirements of the design and quality of the cloth. The warp is generally composed of three or four or more colors of yarn, the colors being very bright and contrasting, such colors as green, red gold and black taking a prominent Tart. The design is generally an extensive and elaborate one and in stripe form, but designs of the following character are sometimes employed, with particulars as follows:- design. The warp is woven with an even tension and where a gauze or leno weave is used, two or more beams are necessary and the necessary slackners. When the warp is composed of several colors of yarn, the filling is generally used undyed or in one solid color. Semi-fancies (generally of medium quality) and plain or lower grade cloths may be woven on harness looms (16 to 24 harness being employed). Plain or lower grade cloths are sometimes woven in looms having a cross-weaving or gauze-reed attachment when the weave is a gauze or leno, which is generally the case. These cloths (medium grade) are not made as strong and compact as the first quality; the particulars being as follows:- Warp:- 14 ends per 1 in, % cotton, 7 x 2 dent reed. Filling:- 12 picks per 1 in, % cotton. The weave is generally a semi-fancy one, i.e. plain weave for 2 in or 3 in and then a gauze stripe or gauze stripes at irregular intervals across the warps. The colorings in warp are similar to the first grade coloring, and the design Is less elaborate, sometimes on the following order:- picture. The cheapest qualities are much lighter in weight and more open in texture, the particulars being as follows:- Warp:- 8 ends per 1 in, % cotton, 8 dent reed x 2; mess every other dent Filling:- 7 picks per 1 inch (in), % cotton. The weave is generally a gauze one, one that is largely used, being 3 picks plain and 1 pick gauze. This quality is often made with undyed cotton warp and filling and is dyed in the piece a solid color. It may also be made with colored warp Lhreads, but on account oi the scarcity of warp threads less effective results are obtained than are obtained in the first two grades. A typical sample Is herewith enclosed, but is a little better quality than the particulars given refer to. These cloths are generally made by manufacturers who make up their own cloths into hammocks and sell in this form. They require no finishing, as they are made up into hammocks in the condition as taken from the looms, except in cases where the goods are to i/e dyed. Drapery for Hammocks:- in making hammocks, hangings or draperies are employed and these cloths are closely related to the hammock cloth. They ore made on the same looms as hammock cloths and are of the same texture. The yarn used is the same generally, but the cloth need not be as strong aa the body cloth. The ends and picks per 1 in may be a little lowar. The drapery cloths are made two in a width, there being 12 in or 14 in of the reed empty between the two cloths. The filling is thrown across m tine regular manner, and when the cloth is woven, the filling is cut in the centre of space between the cloths and the ends thus formed constitute the fringe of the hangings, which fringe is knotted in various ways to make the hanging more effective. In order to secure the warp threads at the inside edge of drapery while weaving, the two ends nearest the fringe side are made to cross each other in weaving and make a firm selvage tor the actual cloth. The warp yarn may be either in colored stripe form or solid color, and the filling solid color, or both warp and filling may be in undyed state and dyed in the piece when n-oven. The draperies are made to match tne body, similar colorings and designs being employed. Weaves to Employ:- the best qualities have generally Jacquard effects, and as the texture is not so compact, the plain weave must be used extensively in ground, the figure being either 5 harness satin or 3–1 twill. Low grade cloths are made almost exclusively with the gauze weave, the following being a typical one:- The medium qualities as made on harness looms have weaves of the following character, the plain weave being conspicuous in order to make a firm cloth:- picture. Low grade cloths are made almost exclusively with the gauze weave, the following being a typical one. / Жакяр (Jacquard). Уточина:- .

HAND = МАТРОС (или РАБОЧИЙ) – Hand (maritime term):- a member of the ship's company.

HAND = РУЧНОЙ (МЕТОД) (или НА ОЩУПЬ, или ТУШЕ, или СТРЕЛКА (ПРИБОРА)) – Hand or Handle:- refers to the actual feel of the wool; a good 'handle' has great resilience and softness, fineness, length, strength, and is pleasing to the touch. Hand:- the way the fabric feels when it is touched. Terms like softness, crispness, dryness, silkiness are all terms that describe the hand of the fabric. A good hand refers to shape retention without stiffness. Hand:- a subjective measurement of the reaction obtained from the sense of touch created when handling a fabric, reflecting the many factors which lend individuality and character to a material. The tactile qualities of a fabric, e.g., softness, firmness, elasticity, fineness, resilience, and other qualities perceived by touch. Hand or Handle:- the feel of a fabric. Hand of a fabric is quite subjective, and often difficult to describe. Both chemical and mechanical treatments are frequently used to alter the hand of a fabric. See also Hand-Builder, and Softener. Hand:- the softness of a fabric as judged by feeling it

with your hand. Hand:- the tactile qualities of a fabric, e.g., softness, firmness, elasticity, fineness, resilience, and other qualities perceived by touch.

HANDBAG = РУЧНАЯ СУМОЧКА (или ДАМСКАЯ СУМОЧКА) – Handbag is a bag held in the hand or hung form a shoulder strap and used for carrying small personal articles and money.

HAND–BLOCKED PRINT = НАБИВНАЯ ТКАНЬ РУЧНОЙ НАБИВКИ – Hand-Blocked Print is a fabric that has been printed by hand with wooden or linoleum blocks. See also Printing. Hand-Blocked Print:- fabrics printed by hand with blocks made of wood or linoleum. / Ручная Набойка Деревянными Формами.

HAND–BUILDER = РУЧНОЙ КОМПОНЕНТ – Hand-Builder is a treatment that makes a fabric feel firmer or stiffer. Hand builders are essentially the opposite of fabric softeners. They may be applied to make a fabric easier to manage in sewing, or to make it feel more robust (as for work clothing). Hand builders may be temporary, such as starch, or permanent, such as polymer resins. Hand builders can interfere with dyeing. Some are impossible to remove.

HAND GIRTH = ОБХВАТ КИСТИ – Hand Girth:- to find out your glove size, measure (in inches) around your hand with a tape measure across your palm. You should use your dominant hand, the right if you are right-handed, and the left if you are left-handed. Glove Size Equivalents:- some manufacturers indicate glove sizes by number and others by letters standing for Small, Medium, Large, etc. We always indicate the size of a pair of gloves the same way the manufacturer does. Use the table at the right to translate between 'letter sizes' and 'number sizes'. (A) Measure around the hand at the fullest part (exclude thumb). (B) measure from the tip of the middle finger to the base of the hand. (C) Use the largest of these two measurements for the correct size glove; (D) If you are right handed, take measurements from your right hand; (F) If you are left handed, take measurements from your left hand; (G) The number of inches measured equals the size of the glove, example:- a 7" measurement equals a size 7 glove. Hand Girth or Glove Size is a maximum girth measured over the knuckles (metacarpals) of the open right hand, fingers together and thumb excluded. Measure your dominant hand with a tape measure around the knuckles in inches (your left if you are left handed and your right if you are right handed). The size that you measure in inches, is your glove size, so if you measure 9 inches (for men), you will need a medium (M) glove. Please remember that if the gloves are too tight on your hands they may make your hands feel cold, so if in doubt go up a size! Some manufacturers indicate glove sizes by number and others by letters standing for XXS (Extra Extra Small), XS (Extra Small), S (Small), M (Medium), L (Large), XL (Extra Large), XXL (Extra Extra Large or Double Extra Large), and XXXL (Extra Extra Extra Large); or by years for children – 5 yrs, 6–9 yrs, 10–13 yrs. / Обхват Кисти:- максимальный обхват кисти в сантиметрах в плоскости, проходящей через пястно-фаланговый сустав, пальцы сжаты вместе, за исключением большого пальца. Длина Кисти:- расстояние в сантиметрах от первой складки у основания кисти правой руки до кончика среднего пальца. Измеряют при выпрямленной ладони, сжатых пальцах и вытянутом большом пальце. Люди разных профессий ежедневно используют перчатки для соблюдения правил безопасности и личной защиты. Медицинские работники стараются обезопасить себя при контакте с пациентами от микробов и инфекций. От физических или химических повреждений защищают перчатки работников промышленности, сельского хозяйства, строительной и ремонтной сферы. В пищевой промышленности перчатки надевают, чтобы в еду не попали человеческие микробы. Все люди, пытаясь защитить себя от холода, носят перчатки. Важно знать свой размер перчаток и уметь его определять. Перчатки любого использования следует подбирать по размеру своей руки. В повседневной жизни каждый человек, надевая перчатки, должен чувствовать комфорт и уют, а работники всех сфер – максимально эффективно выполнять свою работу и обеспечивать себе безопасные условия труда. Для распознания размера перчаток из любого материала следует измерить кисть. Кисти у всех людей разные, и существуют перчатки как очень больших, так и очень маленьких размеров. Чтобы определить размер руки для перчаток, нужно взять обычную метровую ленту и наложить на окружность кисти. Мерить окружность нужно в широчайшей части кисти – у основания четырех пальцев. Таким образом, метровая лента показывает число в сантиметрах, которое поможет определить размер подходящих перчаток для любого использования. Интересным фактом является то, что та рука, которая пишет, обычно больше в диаметре, чем вторая. После измерения обхвата кисти и получения какого-то числа можно определить размер перчаток. Стоит учитывать, что размеры мужских перчаток и женских отличаются. Это объясняется тем, что обхват кисти руки у мужчины гораздо больше, чем у женщины. Самый маленький мужской размер перчаток обозначается почти той же цифрой, что и большой размер женских перчаток. Следует обратить внимание, что в мужских перчатках гораздо шире форма пальцев. Женские перчатки намного уже в этом месте. Европейские производители перчаток маркируют размеры цифрами, означающими дюймы. Мужские и женские перчатки по Европейским стандартам имеют одинаковую маркировку. Американский тип маркировки перчаток отличается от Европейского типа тем, что размеры обозначаются буквами. Такой тип маркировки используют для всех видов одежды и аксессуаров во всем мире. Американский тип значительно упрощает выбор перчаток, так как не нужно запоминать цифры, в которых можно запутаться. Достаточно знать всего одну букву.

HAND HELD DEVICE = ПОРТАТИВНОЕ УСТРОЙСТВО (или УПРАВЛЯЕМОЕ ВРУЧНУЮ УСТРОЙСТВО) – Hand Held Device is a wireless device utilized by brokers, and Exchange trading floor personnel.

HAND HELD TERMINAL = ПОРТАТИВНЫЙ ТЕРМИНАЛ (или УПРАВЛЯЕМЫЙ ВРУЧНУЮ ТЕРМИНАЛ) – Hand Held Terminal is a small computer terminal used by floor brokers or floor traders on an exchange to record trade information and transmit that information to the clearing organization.

HANDKERCHIEF = НОСОВОЙ ПЛАТОК – Handkerchief is a small usually square piece of cloth used for various usually personal purposes, as blowing the nose or wiping the eyes, or as an accessory on one's attire.

HANDKERCHIEF LINEN = ЛЬНЯНОЕ ДЛЯ НОСОВЫХ ПЛАТКОВ (или ПЛАТОЧНОЕ ЛЬНЯНОЕ) – Handkerchief Linen is a fine, sheer linen used for handkerchiefs, dresses or blouses, or whenever a lightweight cloth is desired.

HAND–KNOTTED RUG = КОВРИК РУЧНОЙ РАБОТЫ – Hand-Knotted Rug, including Oriental and Persian rugs, is among the most expensive made. Intricate designs are possible. The higher the number of knots to the inch, the finer the rug.

HANDLE = НА ОЩУПЬ – Handle:- the subjective assessment of feel, e.g., roughness, smoothness, pliability and thickness. See also Hand. / На Ощупь:- субъективная оценка испытания качества, например, шершавость, гладкость, гибкость и толщина.

HAND LEAD = РУЧНОЙ ЛОТ – Hand Lead (maritime term):- a lead of from 7 to 14 pounds used with the hand lead line for ascertaining the depth of water in entering or leaving a harbor. Line marked to 20 fathoms.

HAND LENGTH = ДЛИНА КИСТИ – Hand Length is the distance from the center of the most distal wrist crease to the tip of the middle finger. / Длина Кисти:- расстояние в сантиметрах от первой складки у основания кисти правой руки до кончика среднего пальца. Измеряют при выпрямленной ладони, сжатых пальцах и вытянутом большом пальце.

HANDLING = ПЕРЕВАЛКА – Handling is the labor involved in moving product received from the trailer into the warehouse dock and then into the storage location on the 'IN' and moving the product out of the storage location and into a staging location to then be loaded onto a trailer on the 'OUT'. The Warehouse Forklift/Clamp Operator moves product IN and OUT. If additional handling is involved such as opening on days off, pick packing etc, that are not the normal handling as defined in the warehouse contract, these would be defined as additional accessorial charges for handling.

HANDLING = ПЕРЕВАЛКА (или УХОД) – Handling:- a single pick-up, movement and set-down of a loaded or empty pallet.

HANDLING CHARGE = СБОР ЗА ПЕРЕВАЛКУ – Handling Charge is a charge for normal warehouse handling (inbound or outbound, or both) to customer.

HANDLING COSTS = ЗАТРАТЫ ПО ПЕРЕВАЛКЕ – Handling Costs:- the cost involved in transferring, preparing and otherwise contracting inventory. Handling Costs:- cost to warehouse or the third party logistics (3PL) for all handling operations.

HANDLING INSTRUCTIONS = ИНСТРУКЦИИ ПО ПЕРЕВАЛКЕ (или ИНСТРУКЦИИ ПО ОБРАЩЕНИЮ С ГРУЗОМ) – Handling Instructions:- indication how cargo is to be handled. / Указание на то, как следует обращаться с грузом.

HANDLING SERVICE = УСЛУГА ПЕРЕВАЛКИ (или ПЕРЕВАЛОЧНОЕ ОБСЛУЖИВАНИЕ) – Handling Service is a service concerning the physical handling of cargo.

HANDLING SYMBOL = СИМВОЛ ПО УХОДУ (или СИМВОЛ ОБРАЩЕНИЯ С ГРУЗОМ, или СИМВОЛ, УКАЗЫВАЮЩИЙ НА СПОСОБ ОБРАЩЕНИЯ С ГРУЗОМ) – Handling Symbols are an essential part of the marking of packages and ensure greater care is taken during cargo handling.

HAND LOOM = РУЧНОЙ ТКАЦКИЙ СТАНОК – Hand Loom is:- (1) a weaving devise operated manually; (2) a term used to describe a specially woven sample containing yarn dyes for color judging.

HANDPICKING = РУЧНОЙ СБОР – Handpicking is a removing by hand.

HAND RAIL = ЛЕЕР (или ПОРУЧЕНЬ) – Hand Rail (maritime term):- a steadying rail of a ladder (banister).

HAND ROPE = ЛЕЕР – Hand Rope (maritime term):- same as 'Grab Rope' (rope). / то же, что и Бакштов или Леер.

HANDSPUN = РУЧНОГО ПРЯДЕНИЯ (или СПРЯДЕННАЯ ВРУЧНУЮ) – Handspun:- yarns which are spun by hand using a spinning wheel or electric spinner.

HAND TAUT = ТУГО НАТЯНУТОЕ ВРУЧНУЮ – Hand Taut (maritime term):- as tight as can be pulled by hand.

HAND TRACTOR = ОДНООСНЫЙ ТРАКТОР С ВЫНОСНЫМ УПРАВЛЕНИЕМ – Hand Tractor is the walk-behind, two-wheel tractor commonly used for land preparation in wetland rice. Also called Power Tiller.

HAND TRUCK = РУЧНАЯ ТЕЛЕЖКА – Hand Truck is the Western hand truck is a device used to transport goods manually with wheels within the side rails. The Eastern hand-truck is similar except the wheels are outside the side rails.

HAND–WASHED WOOL = ВЫМЫТАЯ ВРУЧНУЮ ШЕРСТЬ – Hand-Washed Wool is a wool washed before it is shorn from the sheep.

HAND WEEDING = РУЧНАЯ ПРОПОЛКА (или РУЧНОЕ УДАЛЕНИЕ СОРНЯКОВ) – Hand Weeding is a practical and efficient method used to manually remove weeds within rows and hills; used in areas where a cultivating implement cannot be used.

HAND (WHEEL) JACK OPENING = ХХ – Hand (Wheel) Jack Opening is a space provided in the bottom deck to allow pallet jack wheels to bear on the floor.

HANDYBILLY = ПЕРЕНОСНОЙ НАСОС – Handybilly (maritime term):- a watch tackle (small, handy block and tackle for general use).

HANDYMAX VESSEL = СРЕДНЕТОННАЖНОЕ СУДНО (или СУДНО ХЭНДИМЭКС) – Handymax is a naval architecture term for a bulk carrier, typically between 35 000 and 60 000 deadweight tonnage (dwt). A handymax ship is typically 150–200 meters (492–656 feet) in length, though certain bulk terminal restrictions, such as those in Japan, mean that many handymax ships are just under 190 meters in overall length. Modern handymax designs are typically 52 000–58 000 dwt in size, have five cargo holds, and four cranes of 30 metric ton lifting capacity. Handymax Vessels:- inexact term, but normally taken to mean a vessel of about 40 000–48 000 dwt. Handymax-Vessels between 30 000 dwt and 60 000 dwt. The Handymax sector operates in a large number of geographically dispersed global trades, mainly carrying grains and minor bulks including steel products, forest products and fertilizers. Vessels less than 60 000 dwt are built with on-board cranes that enable them to load and discharge cargo in countries and ports with limited infrastructure. / 40 000–48 000 грп. Суда грузоподъёмностью менее 60 000 грп со встроенными кранами на борту, которые позволяют им погружать и разгружать груз в странах и портах с ограниченной инфраструктурой.

HANDYSIZE VESSEL = МЕЛКОТОННАЖНОЕ СУДНО (или СУДНО ХЭНДИСАЙЗ) – Handysize Vessels:- inexact term, but normally taken to mean a vessel of about 20 000–35 000 dwt. Although there is no official definition in terms of exact tonnages, Handysize most usually refers to a dry bulk vessel (or, less commonly, to a product tanker) with deadweight of about 15 000–35 000 tons. Above this size are Handymax bulkers (typically 35 000–58 000 tons deadweight); there is no well-defined or widely accepted size sector below 15 000 tons. Handysize is numerically the most common size of bulk carrier, with nearly 2 000 units in service totalling about 43 million tons. Handysize ships are very flexible because their size allows them to enter smaller ports, and in most cases they are 'geared', i.e. fitted with cranes, which means that they can load and discharge cargoes at ports which lack cranes or other cargo handling systems. Compared to larger bulk carriers, handysizes carry a wider variety of cargo types. These include steel products, grain, metal ores, phosphate, cement, logs, woodchips and other types of so-called 'Breakbulk' Cargo. Handysize bulkers are built mainly by shipyards in Japan, Korea, China, the Philippines and India, though a few other countries also have the capacity to build such vessels. The most common industry-standard specification handysize bulker is now about 32 000 mt deadweight on a summer draft of about 10.0 meters, and features 5 cargo holds with hydraulically operated hatch covers, with four 30 metric ton cranes for cargo handling. Some handysizes are also fitted with stanchions to enable logs to be loaded in stacks on deck. Such vessels are often referred to as 'Handy Loggers'. Handysize-Vessels up to 30 000 dwt, which carry exclusively minor bulk cargoes. Historically, the Handysize drybulk carrier sector was seen as the most versatile. Increasingly, however, this has become more of a regional trading, niche sector. The vessels are well suited for small ports with length and draft restrictions and also lacking infrastructure. / могли погружать и разгружать грузы в портах .

HANGER BEAM = ВЕШАЛА (или ВЕШАЛОЧНЫЙ БРУС, или ВЕШАЛОЧНАЯ ПЕРЕКЛАДИНА, или ВЕШАЛОЧНАЯ ШТАНГА) – Hanger Beam is a beam affixed with hanging, looped rope utilised to hang clothing in a hangertainer.

HANGERTAINER = ХЭНГЁТЭЙНЁ (или КОНТЕЙНЕР С ВЕШАЛАМИ) – Hangertainer:- use for all kinds of garment. The containers are specially designed for garment product and related industry. There are some options of using a string or bar system or a combination of both. The containers allow increased flexibility, greater load Internal Capacity and savings on transportation and handling cost. Also known as Garment Container. Hangertainer is a specialized container equipped with hanger beams for the purpose of stowing garments on hangers. / Специальный контейнер, оборудованный вешалами для перевозки швейных изделий на вешалках.

HANG FROM THE YARDS = ХХ – Hang From The Yards (maritime term):- dangle a man from one of the yard arms, sometimes by the neck, if the man was to be killed, and sometimes by the toes, if he was merely to be tortured. A severe punishment used aboard sailing ships long ago. Today, a reprimand.

HANGING MAN = ПОВЕСИВШИЙСЯ (или ВИСЯЩИЙ) ЧЕЛОВЕК (или ВИСЕЛЬНИК) – In technical analysis, Hanging Man is a bearish reversal candlestick pattern when an asset moves significantly lower after the open, but rallies to close well above the intraday Low. The resulting candlestick looks like a square lollipop with a long stick. The opposite of Hammer. The Hanging Man mirrors the hammer. It occurs at a top in the market, signaling a likely price fall. Hanging Man candlestick formations are another reversal pattern. This formation typically happens after a prolonged uptrend when a security moves significantly lower after the open, but rallies to close well above the intraday low. It is important to emphasize that the hanging man pattern is a warning of potential price change, not a signal, in and of itself, to go short. 'Hang 'em high' (right) includes an example found in Alcoa (AA). On February 15 (2013), Alcoa formed a hanging man pattern after a brief uptrend, Alcoa opened at USD9.34 and made a high of USD9.36, a low of USD9.20 and then closed at USD9.32. So after making a low of USD9.20, Alcoa recovered and closed almost near its opening price. A trader might have taken short positions once the February 15 low of USD9.20 was taken out in subsequent trading sessions. This happened on February 19 when Alcoa opened at USD9.31. Once the USD9.20 level was broken, shorts might have been initiated, with a stop loss set at the February 15 high of USD9.36. In later trading sessions, Alcoa reached a low of USD8.30. Although they are relatively reliable, candle patterns are just one tool in a trader's toolbox. Traders should integrate candlestick analysis, moving averages, Bollinger Bands®, price patterns (such as triangles) and indicators (such as stochastic or CCI) to reach trading decisions. Of course, the break of a simple trendline is a powerful message that should not be ignored, particularly when done in the neighborhood of reversal formations. / В техническом анализе биржевых рынков, медвежья свечная модель разворота, когда цена на актив значительно падает после открытия, но к закрытию поднимается намного выше дневного минимума. Отображаемая свеча выглядит как квадратный леденец на длинной палочке. В противоположность Молоту (Hammer). Элкоа (Alcoa). Пограничные Полосы Болындьжёра®, .

HANGING THREADS = ПРОВИСШИЕ (или СВИСАЮЩИЕ) НИТИ – Hanging Threads:- ends loose on the face of the fabric because the short and long ends of the fabric are not removed by the weaver. Weaving defect. / Порок или дефект ткачества.

HANG PICK = ПРОВИСШАЯ ПОПЕРЕЧНАЯ НИТЬ (или ПОДНЫРКА) – Hang Pick is a pick that is caught on a warp yarn knot for a short distance which produces a triangular hole in the fabric. Hang picks usually result from knots that are tied incorrectly, shuttle tension that is too loose, or harness that is timed too early. Hang Pick:- a pick which is out of line for a short distance producing a triangular shaped hole in a fabric. Weaving defect. Defect Name:- Hang Pick or Loopy Filling. Defect Type:- Isolated Defects. Fabric Type:- Denim Bottomweights – Indigo Dyed. Description:- Hang Pick or Loopy Filling:- This defect is the result of the filling hanging on the knot which appears approximately one-half inch above the filling loops in the photograph. During weaving, the filling hangs on the knot for a split second until freed by the stroke of the reed. Severity:- Minor. Hang Pick is a pick, caught on a warp yarn knot for a short distance, producing a triangular-shaped hole in the fabric. Synonym:- Hang Shot. / Подныpка – порок или дефект ткачества. Подныpки не более 5 сантиметров (см). Размер порока – до 1 см. Под Подныpками понимается дефект суровой ткани, когда уточные нити на коротких участках не переплетаются с основными, а выступают в виде скобочек или петель сверху или снизу полотна; причины – нечистый зев, несвоевременный ввод уточной нити в зев, провисание нитей основы, излишне высокое или низкое расположение шпаруток и другое. Провисшая Поперечная Нить (hang pick):- порок ткани; короткие петли уточной пряжи на поверхности ткани. Примечание:- этот порок вызван уточной пряжей, зацепившейся за выступающий узлоуловитель пряжи основы в течение доли секунды во время прибоя уточной нити или пока узел не достигнет опушки ткани.

HANG SENG INDEX = ИНДЕКС ОТ ХЭН СЭН (или ИНДЕКС ОТ ВЕЧНОРАСТУЩЕГО) – The Hang Seng Index (HSI) was launched on 24 November 1969 and is one of the earliest stock market indexes in Hong Kong. Also known as the Hong Kong Blue Chip Index, the HSI measures the performance of largest and most liquid companies listed in Hong Kong. To better reflect the price movements of the major sectors of the market, four sub-indexes were introduced in 1985. The constituent stocks are grouped under Finance, Utilities, Properties, and Commerce and Industry sub-indexes. Constituent stocks of the HSI are selected by a rigorous process of detailed analysis. Only companies with a primary listing on the Main Board of the Stock Exchange of Hong Kong (SEHK) are eligible potential constituents. Mainland China enterprises that have H-share listing in Hong Kong will be eligible for inclusion in the HSI if they meet any one of the following conditions:- (i) the H-share company has 100% of its ordinary share capital in the form of H shares which are listed on the SEHK; (ii) the H-share company has completed the process of Share Reform, with the result that there is no unlisted share capital in the company; or (iii) for new H-share IPOs, the company has no unlisted share capital. To be eligible for selection, a company in the Universe:- (i) must be among those companies that constitute the top 90% of the total market capitalization of all primary listed shares on the SEHK (market capitalization is expressed as an average of the past 12 months); (ii) must be among those companies that constitute the top 90% of the total turnover of all primary listed shares on the SEHK (turnover is aggregated and individually assessed for eight quarterly sub-periods for the past 24 months); and (iii) should normally have a listing history of 24 months on the SEHK or meet the requirements of the below Guidelines for Handling Large-cap Stocks Listed for Less Than 24 Months. From the many eligible candidates, final selections are based on the following:- (i) the market capitalization and turnover ranking of the company; (ii) the representation of the relevant sub-sector within the HSI directly reflecting that of the market; and (iii) the financial performance of the company. The HSI is reviewed quarterly. HSI:- Launch Date:- 24 November 1969. Base Date:- 31 July 1964. Base Value:- 100.00. Currency:- HKD. Number of Constituents:- maximum 50. Dissemination:- every 15 seconds. Review Frequency and Rebalance Frequency:- quarterly. Sub-Indexes ((i) HSI Finance Sub-index (HSF); (ii) HSI Utilities Sub-index (HSU); (iii) HSI Properties Sub-index (HSP); and (iv) HSI Commerce & Industry Sub-index (HSC)):- Launch Date:- 2 January 1985. Base Date:- 13 January 1984. Base Value:- 975.47. Currency:- HKD. Number of Constituents:- maximum 50. Review Frequency and Rebalance Frequency:- quarterly. The Hang Seng Index (HSI) is one of the earliest stock market indexes in Hong Kong. Publicly launched on 1969-November-24, the HSI has become the most widely quoted indicator of the performance of the Hong Kong stock market. There are 45 HSI constituent stocks in total. In the future, the number of constituent stocks will be increased to 50 in order to reflect the changes in the Hong Kong stock market and to maintain the index as the most representative market benchmark. To better reflect the price

movements of the major sectors of the market, HSI constituent stocks are grouped into Finance, Utilities, Properties, and Commerce and Industry Sub-indexes. (On 1985-January-02, four sub-indices were established in order to make the index clearer and to classify constituent stocks into four distinct sectors). The Hang Seng Index adopts freefloat-adjusted market capitalisation weighted methodology with a 15% cap on each constituent weighting. In case of H-share constituents, only the H-share portion is taken into calculation. Only companies with a primary listing on the Main Board of the Stock Exchange of Hong Kong (SEHK) are eligible potential constituents. Mainland China enterprises that have H-share listing in Hong Kong will be eligible for inclusion in the HSI if they meet any one of the following conditions:- (i) the H-share company has 100% of its ordinary share capital in the form of H shares which are listed on the SEHK; (ii) the H-share company has completed the process of Share Reform, with the result that there is no unlisted share capital in the company; or (iii) for new H-share IPOs, the company has no unlisted share capital. To be eligible for selection, a company in the Universe:- (i) must be among those companies that constitute the top 90% of the total market capitalisation of all eligible shares listed on the SEHK (market capitalisation is expressed as an average of the past 12 months); (ii) must be among those companies that constitute the top 90% of the total turnover of all primary listed shares on the SEHK (turnover is aggregated and individually assessed for eight quarterly sub-periods over the past 24 months); and (iii) should normally have a listing history of 24 months on the SEHK or meet the requirements of the following Guidelines:- Guidelines for Handling Large-cap Stocks Listed for Less than 24 Months. From the many eligible candidates, final selections are based on the following:- (i) the market capitalisation and turnover ranking of the company; (ii) the representation of the sub-sectors within the HSI directly reflecting that of the market; and (iii) the financial performance of the company. The HSI is reviewed quarterly. The Hang Seng Index is a free-float capitalization-weighted index of selection of companies from the Stock Exchange of Hong Kong. The components of the index are divided into four subindexes:- Commerce and Industry, Finance, Utilities, and Properties. The index was developed with a base level of 100 as of 1964-July-31. Hang Seng Indexes Company Limited (Hang Seng Indexes), a wholly -owned subsidiary of Hang Seng Bank, was established in 1984 and is Hong Kong's leading index compiler covering Hong Kong and mainland China markets. Hang Seng Indexes calculates and manages the Hang Seng Family of Indexes. Starting in 1969 with the creation of the Hang Seng Index, now widely recognised as the barometer of the Hong Kong stock market, Hang Seng Indexes has been at the forefront of the market, developing numerous market measures to help investors make their investment decisions. Indexes in the Hang Seng Family of Indexes are grouped into four categories:- Flagship Indexes, Benchmark Indexes, Thematic Indexes and Strategy Indexes then classified as Hong Kong-listed, Cross-market or Mainland-listed according to where their constituents are listed. Currently, the Hang Seng Family of Indexes comprises over 250 real-time and daily indexes. Going forward, Hang Seng Indexes will continue to broaden its index series to meet the widening spectrum of investor demand for index investment solutions. The Hang Seng Index (abbreviated:- HSI) is a freefloat-adjusted market capitalization-weighted stock market index in Hong Kong. It is used to record and monitor daily changes of the largest companies of the Hong Kong stock market and is the main indicator of the overall market performance in Hong Kong. These 45 constituent companies represent about 60% of capitalization of the Hong Kong Stock Exchange (HKEX). Starting from 2011-March-07, the HKEX will extend their trading hours. In the first stage, (opening value will be at 09:20) 09.30–12.00 and 13.30–16.00. In the second stage, from 2012-March-05, the afternoon trade will change to 13.00–16.00, that's mark with the mainland trading hours. HSI was started on 1969-November-24, and is currently compiled and maintained by Hang Seng Indexes Company Limited, which is a wholly owned subsidiary of Hang Seng Bank, one of the largest banks registered and listed in Hong Kong in terms of market capitalisation. It is responsible for compiling, publishing and managing the Hang Seng Index and a range of other stock indexes, such as Hang Seng China Enterprises Index, Hang Seng China AH Index Series, Hang Seng China H-Financials Index, Hang Seng Composite Index Series, Hang Seng China A Industry Top Index, Hang Seng Corporate Sustainability Index Series and Hang Seng Total Return Index Series. When the Hang Seng Index was first published, its base of 100 points was set equivalent to the stocks' total value as of the market close on 1964-July-31. Its all-time low is 58.61 points, reached retroactively on 1967-August-31, after the base value was established but before the publication of the index. The Hang Seng passed the 10 000.00 point milestone for the first time in its history on 1993-December-10 and, 13 years later, passed the 20 000.00 point milestone on 2006-December-28. In less than 10 months, it passed the 30 000.00 point milestone on 2007-October-18. Its all-time high, set on 2007-October-30, was 31 958.41 points during trading and 31 638.22 points at closing. From 2007-October-30 through 2008-March-09, the index lost 9 426 points or approximately 30%. On September 5, it fell past the 20 000 mark the first time in almost a year to a low of 19 708.39, later closing at 19 933.28. On 2008-October-08, the index closed at 15 431.73, over 50% less than the all-time high and the lowest closing value in over two years. On 2008-October-27, the index fell to 10 676.29 points, having fallen nearly two-thirds from its all-time peak. But stocks passed the 20 000 point milestone again to 20 063.93 on 2009-July-24. The Hang Seng Composite Index Series was launched on 2001-October-03, targeting on providing a broad standard of the performance of the Hong Kong stock market. It was last revamped on 2010-March-08, and comprises 307 constituents (will become 306 from 2010-August-09. The market capitalisation of these companies accounts for about 95% of the total capitalisation of the stocks in Hong Kong. To ensure the impartiality of its operation, Hang Seng Indexes Company Limited established an Independent Advisory Committee to give advice on issues pertaining to the indexes, including constituent changes and the development of new indexes. HSI constituent stocks are selected with the use of extensive analysis, together with external consultation. To be qualified for selection, a company:- (i) must be among those that comprise top 90% of the total market value of all ordinary shares; (ii) must be among those that comprise top 90% of the total turnover on the Stock Exchange of Hong Kong Limited (SEHK); and (iii) should have a listing history of 24 months or meet the requirements of the following Guidelines:- Guidelines for Handling Large-cap Stocks Listed for Less than 24 Months. Among the eligible candidates, final selections are based on their:- (i) market capitalisation and turnover rankings; (ii) representation of the respective sub-sectors within HSI; and (iii) financial performance. Hang Seng means 'ever-growing' in Chinese. Hang Seng Indexes Company Limited (HSIL; headquartered in Hong Kong) is a wholly-owned subsidiary of Hang Seng Bank Limited (headquartered in Hong Kong) which is a principal member of the HSBC Group, which is among the world's largest financial services organizations and holds a 62.14% equity interest in the Bank. The Hang Seng Index (HSI), the most widely quoted gauge of the Hong Kong stock market, includes the largest and most liquid stocks listed on the Main Board of the Stock Exchange of Hong Kong (SEHK). Features:- (i) the index includes the largest and most liquid stocks listed in Hong Kong; (ii) stocks are freefloat-adjusted for investibility representation; (iii) 15% capping is applied to avoid single stock domination; and (iv) four sector sub-indexes are also available:- Finance; Utilities; Properties; Commerce & Industry. / Хэн Сэн Индэксиз Кампэни Лимитид (Hang Seng Indexes Company Limited) Эйч.Эс.Би.Си. Груп (HSBC Group). Индекс от Хэн Сэн (ИХС; Hang Seng Index (HSI)) – это важнейший биржевой индекс Гон Конга. Индекс от Хэн Сэн вычисляется как среднее взвешенное по капитализации значение стоимости акций 45 крупнейших акционерных компаний Гон Конга. Индекс от Хэн Сэн используется для записи и изучения ежедневных изменений крупнейших компаний Гон Конга на фондовом рынке страны, а также является основным индикатором поведения рынка в целом. Эти 45 компаний составляют 65% от общей капитализации Фондовой Биржи Гон Конга. Расчёт Индекса от Хэн Сэн начался 24 Ноября 1969 компанией HSI Services Limited, которая полностью принадлежит Hang Seng Bank, второму по величине капитализации банку Гон Конга. Компания собирает, публикует и анализирует информацию по индексу от Хэн Сэн и ряда других фондовых индексов, таких как Hang Seng Composite Index, Hang Seng HK MidCap Index и прочие. Индекс от Хэн Сэн (Hang Seng Index) – главный показатель эффективности фондового рынка Гон Конга. Индекс составляется на базе акций 33 компаний и включает индексы акций 4 групп компаний:- финансовых компаний (4), фирм по работе с недвижимостью (9),

компаний коммунального хозяйства (6), торговых и промышленных компаний (14). Индекс исчисляется как среднеарифметическое среднее, взвешенное по величине рыночной капитализации, и в значительной степени зависит от акций институтов с большой капитализацией, таких, как Hong Kong Bank, Hang Seng Bank, Hong Kong Land и Cheung Kong.

HANG SHOT = ПРОВИСШИЙ (или СВИСАЮЩИЙСЯ) УТОК (или ПОДНЫРКА) – Hang Shot is a pick that is caught on a warp yarn knot for a short distance which produces a triangular hole in the fabric. Hang shots usually result from knots that are tied incorrectly, shuttle tension that is too loose, or harness that is timed too early. See also Hang Pick. / Смотрите также Подныркa (Hang Pick). Подныркa не более 5 см. Размер порока – до 1 см. Под Подныркaми понимается дефект суровой ткани, когда уточные нити на коротких участках не переплетаются с основными, а выступают в виде скобочек или петель сверху или снизу полотна; причины – нечистый зев, несвоевременный ввод уточной нити в зев, провисание нитей основы, излишне высокое или низкое расположение шпаруток и другое.

HANG TAGS = СВИСАЮЩИЕ ЯРЛЫКИ – Hang Tags are important point of sale items that can play a valuable role in attracting consumer attention and relaying important information abut the product to which the tags are attached. The tag is utilized to identify the brand name of the product. Hang tags are also utilized to point out important information about a product or the company that supplies the product. In regards to children's clothing, the hang tag occasionally points out safety issues that should be considered when purchasing the product. Hang tag generally hang from garments on a swift tack. This allows the hang tag to hang on the outside of a garment with out falling all over the floor of the retailer. Integrated hang tag is an integration of price ticket information (UPC Price (short for the US Universal Product Code Price), etc) onto a hang tag. This process eliminates the need for having a hang tag plus a price ticket. The integrated hang tag allows you to merge the creative aspect of hang tags with the boring but necessary information from a traditional price ticket. Essentially, this allows for an updated version of an old fashion price ticket.

HANG THREAD = ПРОВИСШАЯ (или СВИСАЮЩАЯСЯ) НИТЬ (или ПОДНЫРКА) – Hang Thread or Long End:- a short light streak, in a dyed fabric, of similar thickness to that of the warp yarns. Note:- this defect is caused by a partially detached warp yarn lying on the fabric surface, which inhibits the penetration of dye into the fabric beneath it. Defect Name:- Hang Thread. Defect Type:- warp lines, vertical lines. Fabric Type:- Bottomweights – Twill Derivatives. Description:- Hang Thread:- This is the result of a weaver failing to clip the excess thread after repairing a broken end and the cloth inspector failing to remove it in the final inspection. The thread on the face of the fabric restricts the penetration of dye into the fabric beneath it resulting in a light streak. Severity:- Major. / Зависающая Нить; Длинный Конец (hang thread; long end):- порок заключительной отделки ткани; короткая светлая полоса в окрашенной ткани той же толщины, что и пряжа основы. Примечание:- этот порок вызван нитью основы, лежащей на поверхности ткани, которая мешает проникновению краски в ткань под ней. Подныркa не более 5 сантиметров (см). Размер порока – до 1 см. Под Подныркaми понимается дефект суровой ткани, когда уточные нити на коротких участках не переплетаются с основными, а выступают в виде скобочек или петель сверху или снизу полотна; причины – нечистый зев, несвоевременный ввод уточной нити в зев, провисание нитей основы, излишне высокое или низкое расположение шпаруток и другое.

HANK = МОТОК (или БУХТА, или ПЕТИНКА, или МОТОЧНАЯ) – (1) Hank:- roving and yarn are spoken of in terms of definite yard lengths per pound for the standard. In cotton, for example, there are 840 yards in one pound of the #1 yarn; worsted is 560 yards; cut wool, 300 yards; run wool, 1 600 yards, etc. A unit of measuring yarn; silk hank being 1 000 yards; worsted hank 560 yards long; cotton hank 840 yards; woolen skein 1 600 yards; jute and linen 3 600 yards. Hank is a package of yarn from a reel, hopefully with the yardage and fiber content noted on a label. This may refer to a specified yardage, as in a hank of worsted yarn contains 560 yards, cotton and silk is 840 yards, and linen is 300 yards. Hank is a standard length of slubbing, roving, or yarn. The length is specified by the yarn numbering system in use, e.g., cotton hanks have a length of 840 yards. In textile manufacture, hank is a unit of measure applied to a length of yarn or to a loose assemblage of fibers forming a single strand, and varying according to the fiber origin. A hank of cotton or of the spun silk made from short lengths of waste silk is 840 yards (770 m) long. A hank of linen is 300 yards (270 m). In worsted yarn, made from combed fiber, there are 560 yards (510 m) to a hank. / упаковка пряжи с мотовила, . Моток хлопчатобумажной пряжи, равный 840 ярдам (768.1 метрам) и состоящий из 7 пасем. Английский Моток льняной пряжи, равный 3 000 ярдов, состоящий из 10 пасем по 300 ярдов (274.2 метров) каждая. Шотландский и Ирландский Моток или Талька льняной пряжи, равный 3 600 ярдам (3 290 метрам) и состоящий из 12 пасем по 300 ярдов (274.2 метров) каждая.

(2) The count, number or size of roving, such as a 1.5 or 2-hank roving. Hank is a term applied to slubbing or roving that indicates the yarn number (count), e.g., a 1.5 hank roving. / Единица длины для определения номера пряжи; Номер продукта в прядильном производстве.

(3) Hank is a skein of reeled yarn. / Моток – пасьма пряжи пасьмовой мотки.

HANKIE = ХЭНКИ (или НОСОВОЙ ПЛАТОК) – Hankie:- handkerchief.

HANK ROVING = БУХТОВАЯ РОВНИЦА (или НОМЕР РОВНИЦЫ) – Hank Roving is a term applied to slubbing or roving that indicates the yarn number (count), e.g., a 1.5 hank roving. See also Hank.

HAP = ПОКРОВ – Hap:- (dialectical) something, as a cloak, that serves as a covering or wrap.

HAPLOID = ГАПЛОИД – Haploid (n) is a cell or an organism with the gametic (n) chromosome number. Haploid:- having a single set of chromosomes. / Под Гаплоидом, от Греческих слов Haplóos, означающее Одиночный или Простой, и Éidos, означающее Вид, понимается клетка или особь с одинарным (гаплоидным) набором непарных хромосом. Гаплоидны половые клетки, некоторые грибы, водоросли. Под Гаплоидом понимается организм, клетки которого имеют один (гаплоидный) набор непарных хромосом. Составляет, как правило, половину хромосомного набора диплоидной материнской особи. Иногда гаплоидами называются также организмы, полученные от полиплоидных видов и имеющие более одного набора непарных хромосом. Гаплоиды встречаются в естественных условиях (у многих эукариотических микроорганизмов, низших и высших растений и очень редко у животных) и могут быть получены искусственно. Развивается гаплоид из гаметы или из функционально-равноценной ей клетки без оплодотворения. У человека и большинства животных гаплоидны только половые клетки. В селекции растений гаплоиды (путём удвоения у них числа хромосом) пользуются для ускоренного получения гомозиготных линий, равноценных самоопылённым линиям при производстве гибридных семян (например, у Кукурузы), а также для перевода селекционного процесса с полиплоидного на диплоидный уровень. Использование моноплоидов Кукурузы сокращает сроки выведения и испытания новых гибридов на 1–3 года. В генетических исследованиях гаплоиды могут быть привлечены для расшифровки геномного состава вида, исследования спектра мутационной изменчивости и так далее.

HAPLOID PLANT = ГАПЛОИДНОЕ РАСТЕНИЕ – Haploid Plant is a Plant regenerated from anther or microspore culture with half the number of chromosomes of the diploid (symbol : n). / из пыльника или микроспоры .

HAPTONASTIC = ГАПТОНАСТИЧЕСКОЕ – Haptonastic is a movement response to a touch stimulus. / Под Гаптонастическим, от Греческих слов Háptō, означающее Прикрепляю, и Nastós, означающее Уплотнённый, понимается движение, .

HARAMI = ХАРАМИ (или БЕРЕМЕННОСТЬ) – In technical analysis, Harami is a two day pattern that has a small body day completely contained within the range of the previous body, and is the opposite color. / В техническом анализе биржевых рынков, под Харами понимается двухдневная модель, содержащая небольшое тело последнего дня полностью умещающееся в диапазоне предыдущего тела, и при этом, противоположного цвета.

HARAMI CROSS = КРЕСТ ХАРАМИ – In technical analysis, Harami Cross is a two day pattern similar to the Harami. The difference is that the last day is a Doji. / В техническом анализе биржевых рынков, под Крестом Харами понимается двухдневная модель аналогичная Харами (Harami) с той лишь разницей, что последний день отображается как Додзи (Doji).

HARBOR = ПОРТ ПРИПИСКИ (или ГАВАНЬ) – A Harbor or Harbour (US spelling Harbor) is a place of security and comfort, a small bay or other sheltered part of an area of water, usually well protected against high waves and strong currents, and deep enough to provide anchorage for ships and other craft. It is also a place where port facilities are provided, e.g., accommodation for ships and cargo handling facilities. The term Port or Seaport normally includes the harbor and the adjacent town or city suitable for loading goods and embarking men. A Haven is a type of harbor used in literature or in names and adds the idea of refuge. Harbor is a place of shelter for vessels. Most of the time used as an indication for the geographical location. / Место убежища для судов. В большинстве случаев используется в качестве указания для географического положения. Под Гаванью, от Голландского слова Haven, понимается естественно или искусственно защищённая от волн, ветра и течений прибрежная часть водного пространства; место стоянки судов. Гаванью называется также прилегающая к причалам часть портовой акватории, где производят грузовые операции (в соответствии со специализацией по роду перерабатываемых грузов или типу обслуживаемых судов – каботажная, лесная, нефтяная, угольная гавани и так далее) или посадку-высадку пассажиров (пассажирская гавань). Различают гавани для стоянки судов специального назначения (например, военная, рыбачья гавани), ремонта судов (ремонтная гавань) или их отстоя в межнавигационный период (зимовочная гавань).

HARBOR DUES = ПОРТОВЫЕ СБОРЫ (или ПОРТОВЫЕ ПОШЛИНЫ) – Assessment by Port Authorities when vessels enter harbor. Harbor Dues:- various local charges against all seagoing vessels entering a harbor, to cover maintenance of channel depths, buoys, lights, etc. All harbors do not necessarily have this charge.

HARBOR MASTER = ГАВАНЬМЕЙСТЕР (или ПОРТОВЫЙ ИНСПЕКТОР, или ХОЗЯИН ПОРТА, или КАПИТАН ПОРТА) – Harbor Master is an officer who attends to the berthing, etc, of ships in a harbor. Harbor Master is a person usually having the experience of a certificated master mariner and having a good knowledge of the characteristics of the port and its whole area. He administers the entire shipping movements that take place in and within reach of the port he is responsible for.

HARD ACTION = ЖЁСТКОЕ ДЕЙСТВИЕ – Hard Action:- in light-weight goods, this may result in stud or socket pulling through the material. The snap fastener manufacturer can be of help in recommending proper tension of stud in socket for weight of garment material. Closure defects, and namely – Snap Fasteners. / Порок или дефект застёжки.

HARD AGROUND = ЖЁСТКАЯ (или ТЯЖЁЛАЯ) ПОСАДКА НА МЕЛЬ (или ПОСАДКА НА ГРУНТ; или ВЫБРОС НА СУШУ или НА МЕЛЬ) – Hard Aground:- a vessel which has gone aground and is incapable of refloating under her own power. A vessel had fetched up hard aground. Before it ran aground on Bligh Reef. Bulker goes hard aground. Well, maybe a better term would be ‘soft aground’. Its been really windy here yesterday and last night with 20 to 30 mph winds out of the west and northwest. Some reports had gusts here in the Stamford area at 50 mph. Combine tge wind.

HARDBOARD = ТВЁРДАЯ ВОЛОКНИСТАЯ ПЛИТА (или ДРЕВЕСНОВОЛОКНИСТАЯ ПЛИТА) – Hardboard is a panel manufactured primarily from interfolded wood fibers consolidated under heat and pressure in a hot press and used, for example, in the manufacture of siding products. This refers to Hardboards, generally around 2–3 cm thick, that are used for load securing and for interlayer dunnage or top dunnage. Since these hardboards only has minimal material strength and, in addition, one side of the board is very smooth, they are not suitable for use as dunnage and cannot be reccommended. The exception is use as lateral load distibution or to protected neighboring cargo from low physical loads. / Это относится к твёрдым древесноволокнистым плитам, обычно в пределах 2–3 см толщиной, которые используются для защищённости груза и для межслойного или поверхностного деннажа. Поскольку эти древесноволокнистые плиты имеют слишком малую прочность материала и, в добавок, одна сторона плиты является весьма шершавой, они не приемлемы для использования в качестве деннажа и не могут быть рекомендованы для использования с этой целью. Исключением служит лишь использование в качестве поперечного распределения груза или для защищённого прилегающего друг к другу груза от низких физических нагрузок. Под Древесноволокнистыми Плитами понимается материал, получаемый измельчением древесины в волокнистую массу с последующим формованием из неё плит. Древесноволокнистые плиты подразделяются на:- изоляционно-отделочные, изоляционные, полутвёрдые, сверхтвёрдые и твёрдые. Такие плиты используются в мебельной промышленности и строительстве. Древесноволокнистые Плиты (ДВП) – древесные материалы, вырабатываемые путём отлива на сетке (аналогично отливу картона) из обычной, а также из рафинёрной, дефибраторной и другой древесной массы. Существуют два способа производства древесноволокнистых плит:- (i) мокрый – в присутствии воды; и (ii) сухой – без воды с добавлением 4–8% синтетической смолы. Для повышения механической прочности, а также стойкости против влаги, огня, действия насекомых и микроорганизмов в состав плит вводят смолы, гидрофобизирующие вещества, антипирены, антисептики и тому подобное. После отлива плиты сушат (мягкие, изоляционные плиты) или прессуют (полутвёрдые, твёрдые и сверхтвёрдые). Размеры плит (мм):- длина 1 200–5 500, ширина 1 000–2 140, толщина 2.5–12. Древесноволокнистые плиты применяют в строительстве для теплоизоляции кровли, стен, перекрытий, для отделки помещений, в производстве мебели и так далее. Древесноволокнистая Плита – листовой материал, изготовленный путём горячего прессования или сушки ковра из древесных волокон с введением при необходимости связующих и специальных добавок. Существуют два способа производства древесноволокнистых плит:- мокрый (без добавки связующего вещества) и сухой (требующий введения в измельчённую древесину синтетической смолы). Различают сверхтвёрдые, твёрдые, полутвёрдые, изоляционно-отделочные и изоляционные древесноволокнистые плиты. При производстве древесноволокнистых изоляционных плит клеи в древесную массу не добавляются. Твёрдая ДВП – прессованная древесноволокнистая плита плотностью более 800 кг/куб.м. Твёрдые плиты производятся из механической древесной массы, получаемой путём размола технологической щепы и опилок. Древесная масса с добавленными в неё скрепляющими клеями подаётся в прессмашины, где прессуется под высоким давлением и температурой. Твёрдые плиты применяются в строительстве как панельный и изоляционный материал, а также используются в мебельном производстве и для изготовления дверей.

HARD COMMODITIES = ТВЁРДЫЕ РОДЫ СЫРЬЯ – Hard Commodities are the ones extracted through mining. Those include precious metals (gold, silver, palladium, platinum), non-ferrous or base metals (aluminum, copper, lead, nickel, zinc), ferrous metals

(iron ore, steel), minor metals (cobalt, molybdenum, magnesium, sylicon, titanium, etc), rare earth metals (cerium, praseodymium, neodymium, promethium, terbium, dysprosium, etc) and uranium.

HARD COPY = ЖЁСТКАЯ КОПИЯ (или РАСПЕЧАТКА, или ЭКЗЕМПЛЯР В ПЕЧАТНОМ ВИДЕ) – Hard Copy:- computer output printed on paper. Text typed or printed on paper of a document that has been written or stored on a computer disk or on microfilm.

HARD CURRENCY = ТВЁРДАЯ ВАЛЮТА – Hard Currency is a currency whose exchange rate tends to go up because demand for it is persistently high relative to the supply. The opposite of Soft Currency. Currency that is expected to remain stable and that is readily convertible into other currencies or into gold. See also Foreign Exchange. Currency that, because of its soundness, is generally accepted in international transactions. Hard Currency is a currency which is sound enough to be accepted internationally and which is usually fully convertible. Hard Currency is a currency, usually from a highly industrialized country, that is widely accepted around the world as a form of payment for goods and services. A hard currency is expected to remain relatively stable through a short period of time, and to be highly liquid in the forex market. Another criterion for a hard currency is that the currency must come from a politically and economically stable country. The US Dollar and the British Pound are good examples of hard currencies.

HARD DOUGH STAGE = СТАДИЯ ТВЁРДОЙ ВОСКОВОЙ СПЕЛОСТИ (или СТАДИЯ ТВЁРДОГО ТЕСТООБРАЗНОГО СОСТОЯНИЯ) – Hard Dough Stage is a stage when the Rice grain is almost fully ripe.

HARDENED–STEEL NAIL = ЗАКАЛЁННЫЙ–СТАЛЬНОЙ ГВОЗДЬ – Hardened-Steel Nail is a heat-treated and tempered steel pallet nail with a Morgan Impact Bend Angle Nail Tester (MIBANT) angle between 8 and 28 degrees. / Моргэн (Morgan).

HARD END = ТВЁРДАЯ (или ЖЁСТКАЯ) ПРОДОЛЬНАЯ НИТЬ (или КРУТОЙ КОНЕЦ, или ПУТАНКА) – Hard End:- xxxxx. See also Tight Twist End. Fabrics defect.

HARDENING = УКРЕПЛЕНИЕ – (1) A term Hardening describes a price which is gradually stabilizing. / Укрепление:- данный термин описывает цену, которая постепенно стабилизируется.

(2) Hardening is a term indicating a slowly advancing market. / Термин, указывающий на сравнительно медленное повышение цен на рынке.

HARD FIBER = ЖЁСТКОЕ ВОЛОКНО (или ТВЁРДОЕ ВОЛОКНО) – Hard Fibers are collected from leaves and fruit parts. Sisal, Banana and Bamboo are some examples of leaf fiber production. Many Species of the Genus Agave are produced around the world. The general appearance of most species is that they lack a stem and that the leaves emerge directly from the roots. However, some species do have a visible stem and uses other than for fiber are also well documented. Agave Americana is the source of the Agave found in Mexico and Southern parts of the United States. The leaves of several other Agave Species also yield fiber and many Agave Species are grown as ornamental plants. Sisal (Agave Sisalana) is a Perennial Plant with an average lifespan of 7 to 12 years. The plant flourishes in dry-hot soil and weather conditions, reaching an average height of 4–6 meters (about one third of a meter height increase each year). About 300 000 tons of sisal are produced every year almost without any insecticides, irrigation water or fertilizer. The leaves that yield the fiber are composed of about 90% water. Leaves grow to a length of 1.0 to 1.5 meters in length and have spikes on the edges, which makes it hard to walk through the fields. The first harvest can be brought in when the plants are about two years old and they remain productive for 10 to 12 years. Each plant produces 180 to 240 leaves in its lifetime and yields 1 to 4 tons of fiber per hectare. The leaves are removed from the plant only when they are ready to be processed. Storage of leaves is not recommended because the quality of the fiber tends to deteriorate. The fibers are extracted through a process known as Decortication wherein the leaves are processed by running them through crushers to free the fibers and get rid of the pulp. After the pulp has been squeezed out, the fibers are washed or brushed to leave them more perfectly clean. In East Africa, decortication is done in factories. The leaves are crushed between rollers and then beaten by a rotating wheel with blunt blades. Then the fibers are washed and dried. The key features of sisal fiber are high resistance to bacterial infestation and to deterioration in saltwater. The flowers produced by the sisal plant are usually sterile and the common way of propagating the next generation is through suckers that grow at the base of the plant or by means of small bulbs produced on the flower peduncle. In the past, 96% of the leaf weight was discarded, but today it is used for fertilizer, cattle feed and as fuel for biogas production. Just over 200 000 tons of sisal fiber are produced worldwide and Brazil, with almost two thirds of global production, is the largest producing country. Banana fibers are extracted from the stem of the Banana Plant (Musa Sapientum). The fiber may be harvested from young shoots or from the mature stem after the fruit has been collected. Unlike many other vegetable/plant fibers, the parts of the plant from which the fiber is extracted – young shoots and/or older stems – have an important impact on the quality of the fiber. Young shoots are comparatively easy to process and produce much finer fibers. Accordingly, their uses are also different. Young shoots are harvested periodically and boiled in lye to prepare fibers for making yarn. Even in young shoots the outer layers of the stem produce much coarser fibers than the inner ones. The mature trunk in its entirety, commonly used in Nepal to obtain banana yarn, produces a vast quantity of coarser fibers. According to the literature, the fibers of the banana plant may be extracted by chemical, mechanical or biological methods. Banana fibers look like bamboo and ramie fibers but have a better spinning performance than the other two. The fibers have poor elongation characteristics, but dry rather faster. Banana fibers are comprised of cellulose, hemicellulose, and lignin. Mukhopadhyay et al. (2008) reported that the botanical composition of banana fiber is about 31% cellulose and some 15% hemicellulose and lignin, the rest being moisture, ash and extractives. The uses of banana fiber vary greatly depending on the fineness, but only a minimal amount goes into the garment industry. Right now, banana fiber is a waste product of banana cultivation and it is utilized inefficiently or only partially. The extraction of fiber from the pseudo stem is not a common practice and much of the stem is not used to produce fiber at all. See also Natural Fibers. Hard Fiber:- stiff, elongated fibers obtained from leaves or stems of plants. Coarse and stiff, they are used in matting and industrial products. Hard Fibers are comparatively stiff, elongated, woody fibers from the leaves or leaf stems of certain perennial plants. These fibers are generally too coarse and stiff to be woven and are used chiefly in twine, netting, and ropes. Examples are Abaca, Henequen, and Sisal. See also Harsh Fiber, and Soft Fibers. / Жёсткие Волокна из листьев растений:- Манильская Пенька (Abaca), Новозеландский Лён (Phormium tenax), Сизаль (Agave) и другие. Сравнительно жёсткие, удлинённые, одеревенелые (древесные) волокна из листьев или стебельков листьев определённых многолетних растений. Эти волокна, как правило, достаточно грубые и жёсткие для того, чтобы использоваться в ткачестве; ранее они использовались, главным образом, для производства бечёвки, верёвки, морских канатов и рыболовных сетей. Примерами служат Абака (Abaca; именуемая также как Манильская Пенька (Manila Hemp) и текстильный банан), Энэкэн (Henequen; именуемое также как Агава Фуркреевидная (Agave Fourcroydes Lem), Энэкин (Henequin) и Эникэн (Heniquen)), и Сисаль (Sisal; именуемая также как Сизаль). Смотрите также Грубое Волокно (Harsh Fiber), и Мягкие Волокна (Soft Fibers). лубяное волокно (bast fiber).

HARD HAT = ТВЁРДАЯ ШЛЯПА – Hard Hat is a protective hat made of rigid material, as metal or fiberglass, and worn especially by construction workers.

HARD MARKET = ЖЁСТКИЙ РЫНОК (или ТВЁРДЫЙ РЫНОК) – A Hard Market is a phase of the property and casualty insurance cycle that is characterized by high demand and low supply. When the growth in demand for insurance increases more rapidly than the

available supply of insurance, the outcome is a hard insurance market. In this type of market, insurance is generally more difficult for buyers to obtain. Buyers are also more likely to experience high insurance premiums and steady rate increases. Given the market dynamics, a hard market is usually considered a seller's market. Insurance companies typically profit during a hard market period. They can command higher insurance premiums from potential buyers because insurance coverage is in demand. Insurance companies are also able to underwrite more restrictive terms and conditions into their insurance policies. During a hard market, buyers lose some of their negotiating power. Based on these factors, insurance companies generally experience few underwriting losses during a hard insurance market phase. A Soft Market is the opposite of a hard market and is often referred to as a Buyer's Market. In a soft market, insurance is usually easier for buyers to obtain. Rates are typically lower because competition among insurance companies increases. In addition, insurance companies tend to adopt more lenient underwriting standards in order to secure prospective buyers and to retain existing clients. As a result, soft markets can mean significant underwriting losses for insurance companies. The property and casualty insurance market is cyclical, and it rotates between soft markets and hard markets. While recurrent periods of hard and soft market conditions exist, the overall cycle is irregular and can be unpredictable. The cycle can be impacted by the occurrence of a major insurable event, such as a hurricane, tsunami or other natural disaster. Although often favorable towards sellers, hard markets can present some challenges for insurance companies. Client retention can be a key concern. When insurance premiums rise, buyers are more likely to start shopping around for a new insurance provider. This can prove challenging for insurance companies who are trying to retain their current book of business. Insurance companies may spend the bulk of their marketing resources and time retaining their existing clients, leaving them with less means to spend on attracting new clients. Hard Market:- one side of the market cycle that is characterized by high rates, low limits, and restricted coverage. See also Soft Market. In the property and liability insurance business, underwriting philosophies fluctuate between periods called the Hard Market and the Soft Market. The hard market is the period during which underwriting standards are very tight and the rates are high. Normally the hard market closely follows a soft market period during which the underwriting standards had been soft and the price or rates are very low, resulting in substantial underwriting losses. The cycle swings back and forth between the two cycles and bounces between soft underwriting with low rates and heavy losses, to the hard market with subsequent tightening of standards and dramatic increases in price. Hard Market:- when the availability of some or all classes of insurance or reinsurances is limited relative to demand for such insurance or reinsurance resulting in increased premiums and coverage restrictions. / Момент, когда доступность некоторых или всех классов страхования или перестрахования ограничена относительно спроса на такое страхование или перестрахование, что проявляется в виде повышенных премий и ограничений покрытия.

HARDNESS = ЖЁСТКОСТЬ (или ТВЁРДОСТЬ) – (1) Hardness is the resistance of a substance to surface abrasion. / сопротивление поверхности к поверхностной абразии. Под Твёрдостью понимается сопротивление материала вдавливанию или царапанию. Твёрдость не является физической постоянной, а представляет собой сложное свойство, зависящее как от прочности и пластичности материала, так и от метода измерения. Подробнее смотрите Твёрдость Металлов, Твёрдость Минералов. Под Жёсткостью понимается способность тела или конструкции сопротивляться образованию деформации; физико-геометрическая характеристика поперечного сечения элемента конструкции. В случаях простых деформаций в пределах Закона Гука (смотрите Закон Гука) жёсткость определяется численно как произведение модуля упругости E (при растяжении сжатии и изгибе) или G (при сдвиге и кручении) на ту или иную геометрическую характеристику поперечного сечения элемента:- EF – при растяжении-сжатии, EI – при изгибе, GF – при сдвиге и так далее, где F – площадь поперечного сечения, I – осевой момент инерции. Понятие Жёсткость широко используется при решении задач сопротивления материалов.

(2) Hardness:- with respect to water, a measure of the content of minerals that impart certain properties. Calcium and magnesium ions are main cause of hardness in tap water. They can interfere with some chemical processes in preparation and dyeing. Soap, for example, forms insoluble compounds when it reacts with hardness minerals. Calcium carbonate or calcium hydroxide, formed when soda ash or sodium hydroxide is added to hard water, are quite insoluble and will precipitate from solution. The precipitate can be deposited on fabric, adversely effecting the hand of the fabric. Sequestrant chemicals can be added to hard water to reduce the effect of the hardness ions. Sodium hexametaphosphate is generally the preferred chemical for this purpose for many dyeing processes. Hardness is:- (1) when used in reference to water, hardness is the total parts per million (ppm) of calcium an $CaCO_3$ plus the magnesium expressed as equivalent $CaCO_3$ (ppm hardness (as $CaCO_3$) = (ppm Ca x 2.497 + ppm Mg x 4.116)). (2) Used in reference to pulp to denote the degree of delignification. / Гексаметафосфат Натрия (Sodium Hexametaphosphate). осадок (precipitate). Под Жёсткостью Воды понимается совокупность свойств, обусловленных содержанием в воде ионов Ca^{2+} и Mg^{2+}. Суммарная концентрация ионов Ca^{2+} (кальциевая жёсткость воды) и Mg^{2+} (магниевая жёсткость воды) называется Общей Жёсткостью Воды. Различают жёсткость воды карбонатную и некарбонатную. Карбонатная жёсткость воды соответствует той части ионов Ca^{2+} и Mg^{2+}, которая эквивалентна содержащимся в воде гидрокарбонат-ионам HCO_3^-. В бывшем Союзе Советских Социалистических Республик (СССР) величину жёсткости природных вод выражают в миллиграмм-эквивалентах на 1 литр (мг-экв/л), а жёсткость вод умягчённых, обессоленных и тому подобных – в микрограмм-эквивалентах на 1 килограмм (мкг-экв/кг). До 1952 в СССР жёсткость воды выражали в градусах жёсткости (1° соответствует 0.357 мкг-экв/л). Жёсткость природных вод колеблется в очень широких пределах – от 0.1–0.2 мг-экв/л в водах рек и озёр, расположенных в зонах тайги и тундры, до 80–100 мг-экв/л в некоторых подземных водах и водах морей и океанов. Повышенная жёсткость воды природных источников обусловлена преимущественно контактом воды с горными породами, содержащими карбонаты и сульфаты Ca и Mg. Использование жёсткой воды недопустимо в теплоэнергетике, производстве искусственного волокна и ряде других отраслей. Жёсткость воды ведёт к усиленному образованию накипи в котлах и отопительных приборах, что ухудшает теплообмен. Жёсткость воды увеличивает расход мыла при стирке, так как часть его образует с ионами Ca^{2+} нерастворимый осадок. В жёсткой воде плохо разваривaются овощи и мясо, так как ионы Ca^{2+} образуют с белками пищевых продуктов нерастворимые соединения; ухудшается вкус чая. Высокая жёсткость воды способствует образованию мочевых камней у человека. Допустимый предел жёсткости воды, используемой для централизованного водоснабжения, – 7 мг-экв/л; в исключительных случаях по согласованию с органами санитарного надзора может быть допущена большая жёсткость воды – до 14 мг-экв/л. При необходимости использования водоисточника с высокой жёсткостью воды применяют специальные методы умягчения воды (смотрите также Водоподготовка).

HARDPAN = ХАРДПЭН (или ПОДПАХОТНЫЙ СЛОЙ) – Hardpan is a physically compacted soil layer restricting root growth and water movement through it. / рост корня и движения воды через него. Хардпэн – сцементированный горизонт почвы.

HARD RED SPRING WHEAT = ТВЁРДАЯ ЯРОВАЯ КРАСНОЗЁРНАЯ ПШЕНИЦА – In the United States, Hard Red Spring Wheat is all varieties of Hard Red Spring Wheat. This class shall be divided into the following three subclasses:- (i) Dark Northern Spring Wheat is Hard Red Spring Wheat with 75 percent or more of dark, hard, and vitreous kernels; (ii) Northern Spring Wheat is Hard Red Spring Wheat with 25 percent or more but less than 75 percent of dark, hard, and vitreous kernels; and (iii) Red Spring Wheat is Hard Red Spring Wheat with less than 25 percent of dark, hard, and vitreous kernels. Hard Red Spring Wheat (HRSW) contains the highest protein content (1 316.5%) making it an excellent bread wheat with superior milling and baking characteristics. Hard red spring Wheat

is grown mostly in Montana, the Dakotas, and Minnesota. This Wheat is seeded in the spring and may have either a hard or a soft endosperm. Subclasses are Dark Northern Spring, Northern Spring, and Red Spring Wheats. Total acreage is about 13.8 million acres. / пшеница с 75 процентами или более тёмной, твёрдой, и стекловидной зерновкой (стекловидными ядрами); .

HARD RED WINTER WHEAT = ТВЁРДАЯ ОЗИМАЯ КРАСНОЗЁРНАЯ ПШЕНИЦА – Hard Red Winter Wheat (HRWW) is a hard, brownish, mellow high-protein Wheat used for bread, hard baked goods and all-purpose flour. It can have either hard or soft endosperm. Hard red winter Wheat is seeded in the fall. It is produced in the Great Plains, between the Rocky Mountains and the Mississippi River, and from Texas to the Dakotas and Montana. It's production accounts for more than 40% of the US Wheat crop and constitutes around half of US Wheat exports. Hard red winter Wheat is traded at eh KCBT under ticker symbol KW. Contract size is 5 000 bushels quoted in US Dollars' Cents and 1/4-cents per bushel. Delivery months include:- March, May, July, September, and December. Contract is settled physically. Deliverable grades include No. 2 at contract price and No. 1 at a 1 1/2-cent premium. Hard Red Winter Wheat is all varieties of Hard Red Winter Wheat. There are no subclasses in this class. Hard Red Winter Wheat is the class of Wheat used mostly for bread and all-purpose flour. This Wheat is fall-seeded, has medium to high protein content (10–13.5%), and can have either hard or soft endosperm. Hard red winter Wheat accounts for more than 40% of the US Wheat crop and half of US Wheat exports. This Wheat is produced in the Great Plains, between the Mississippi River and the Rocky Mountains, and from Texas to the Dakotas and Montana. It has a wide range of protein and good milling and baking qualities. The flour is used to produce bread, rolls, some sweet goods, and all-purpose flour. Total acreage is about 23 million acres.

HARD SHELL = ТВЁРДАЯ ОБОЛОЧКА – Hard Shell:- a high-impact, abrasion-resistant outer fabric, which provides protection from the environment. / , устойчивая к истиранию .

HARD SIZE = СЛИШКОМ ГУСТАЯ ПО КОНСИСТЕНЦИИ ШЛИХТА (или СИЛЬНАЯ ПРОКЛЕЙКА, или ЗАСТОЙ) – Hard Sizing:- this will give a sandpaper effect and feel to a cloth. Caused by the warp being allowed to remain immersed in sizing solution too long, or to dry too hard against a cylinder while out of action. Hard sizing may be prevented by keeping the slasher moving while the yarn is in process; reduce necessary stops to minimum. Hard – Not degummed. Hard Size characterized by uneven and distorted appearance of the fabric, because of hard gummed spots in the warp. Use of cold size or keeping the immersion roller dipped in size during a long machine stop causes such spots. Hard Size:- when the stoppage occurs in the sizing machine then the chemicals becomes hard at the stage of pressing roller, and then we adjust this problem at the stage of weaving. Hard Size is a condition found in areas of fabric where the warp contains an excessive quantity of sizing. Weaving defect. Hard Size:- sections of cloth containing an excessive quantity of sizing. Synonym:- Starch Lump. / Шлихта слишком густой консистенции. Застой – сплошной заклей основных нитей по всей ширине основы – порок шлихтовки.

HARD SPOTS = ТВЁРДЫЕ ПЯТНА (или ТВЁРДЫЕ МЕСТА) – Hard Spots:- Garment:- woman's dress; Fabric Construction:- (i) Count:- 52 x 52; (ii) Warp:- 100/60/50 S bright viscose, plied with 150/40 dull acetate rayon; (iii) Filling:- 150/40/20 dull acetate rayon. Complaint:- hard spots in the mid-portion front of the dress. Analysis:- analysis showed that this defect was due to a partial dissolving and hardening of the acetate yarns in those spots. Although it was impossible to determine by chemical means the particular solvent which might have caused this fault, because it had completely evaporated after the damage was done, it was reasonable to believe that a few drops of nail-polish remover had been accidentally spilled on the front of the dress. Most of the commonly used nail-polish removers (and nail polishes) contain acetone or some other organic solvent which attacks cellulose acetate rayon. Since there is a definite solvent action, with permanent damage to the yarns, it is impossible to restore the fabric to its original condition. In some extreme cases, the solvent action may be great enough to cause complete removal of the acetate component of the fabric, producing holes. / Уточина:- 150/40/20 .

HARD TOP OPEN TOP CONTAINER = ОТКРЫТЫЙ СВЕРХУ КОНТЕЙНЕР СО СЪЁМНОЙ ЖЁСТКОЙ КРЫШЕЙ – Hard Top Open Top Container is a container that opens at the top and can be closed with a solid roof (steel sheet). Like all containers that open at the top, this is suitable for crane loading.

HARD TWIST = ПЕРЕКРУЧЕННАЯ (или СИЛЬНО КРУЧЁНАЯ, или С ПОВЫШЕННОЙ КРУТКОЙ, или ВЫСОКАЯ КРУТКА, или ЖЁСТКАЯ) – Hard Twist or Hard Spun:- adjectives applied to yarn which has excessive twist. Such yarn is often not usable, since it may curl, become recessive, or may even loop. Hard Twist:- a yarn with increased twist.

HARD VITREOUS KERNELS = ТВЁРДАЯ СТЕКЛОВИДНАЯ ЗЕРНОВКА (или ТВЁРДЫЕ СТЕКЛОВИДНЫЕ ЯДРА) – Hard Vitreous Kernels (HVKs):- vitreousness is the natural translucence of a kernel that is a visible sign of kernel hardness. Hard Vitreous Kernels (HVKs) are a grade determinant for the amber durum Wheat class in Canada and the red spring and red winter Wheat classes in western Canada. HVK content is related to protein content and milling quality, which are particularly important in durum Wheat. Non-vitreous kernels are produced under cool maturation conditions, abundant soil moisture and insufficient nitrogen. Flours milled from non-viteous Wheat have reduced protein content and produce poor loaf volumes. Non-vitreous kernels are not as significant in soft Wheats, since low protein is desirable for most soft Wheat end-products. / твёрдость (hardness).

HARDWARE OPERATIONS = ОПЕРАЦИИ МЕХАНИЧЕСКОГО ОБОРУДОВАНИЯ – Hardware Operations is the number of cuts plus turnback operation of lock chamber. Calculated to count each emptying or filling of lock chamber. / . Рассчитывается по каждому опорожнению или наполнению камеры шлюза.

HARD WATER = ТЯЖЁЛАЯ ВОДА – Hard Water contains salts (usually calcium or magnesium) that interfere with formation of a lather from soap. Hard water used for irrigation of plants may leave white marks on foliage and the salts accumulate in the soil. / Под Тяжёлой Водой, D_2O, понимается изотопная разновидность воды, в молекулах которой атомы водорода заменены атомами дейтерия. Плотность 1.104 г/см3 (3.98 °C), $t_{пл}$ 3.813 °C, $t_{кип}$ 101.43 °C. Соотношение в природных водах H_2O с D_2O около 6 800 : 1. На организмы действует угнетающе, в больших дозах вызывает их гибель. Замедлитель нейтронов и теплоноситель в ядерных реакторах, изотопный индикатор, растворитель. Используется для получения дейтерия. Существует также сверхтяжёлая вода T_2O (T – тритий) и тяжелокислородная вода, молекулы которой вместо атомов ^{16}O содержат атомы ^{17}O и ^{18}O.

HARD WHITE WHEAT = ТВЁРДАЯ БЕЛОЗЁРНАЯ ПШЕНИЦА – Hard White Wheat is the newest class of Wheat to be grown in the United States. Hard white Wheat is closely related to red Wheats except for the color genes and has a milder, sweeter flavor, equal fiber, and similar milling and baking qualities. Hard white Wheat is used in yeast breads, hard rolls, bulgur, tortillas, and oriental noodles. This Wheat is used in domestic markets and is exported in limited amounts. There are no subclasses. Total acreage is about 0.3 million acres. Hard White Wheat is all hard endosperm white Wheat varieties. There are no subclasses in this class. / эндосперм (endosperm).

HARDWOOD = ТВЁРДАЯ ДРЕВЕСИНА – Hardwood is a wood from broad-leaved species of trees (not necessarily hard or dense).

HARDWOOD (DECIDUOUS) TREES = ДЕРЕВЬЯ ТВЁРДЫХ (ЛИСТВЕННЫХ) ПОРОД – Hardwood (Deciduous) Trees:- one of the botanical groups of trees that have broad leaves, in contrast to the conifers or softwoods. The term does not necessarily refer to the actual hardness of the wood. Hardwood is strong, dense wood from slow-growing broad leaved trees. Hardwood is a tree species with broad, flat, usually deciduous leaves such as oak, maple, cottonwood, and elm. Wood hardness varies a great deal and may actually be softer than some softwoods. / твёрдость (hardness). виды (species).

HARDY = ВЫНОСЛИВОЕ (или СТОЙКОЕ, или ЗАКАЛЁННОЕ) – Hardy is of a plant able to survive the extremes of climate, often taken to mean resistance to cold and frost. Hardy:- a plant that can withstand and grow under severe adverse climatic conditions. / например, морозоустойчивое.

HAREM PANTS = ГАРЕМНЫЕ ШТАНЫ – Harem Pants are the women's loose trousers that fit closely at the ankle.

HARMFUL SUBSTANCE = ВРЕДНОЕ ВЕЩЕСТВО – Harmful Substances within the context of Oeko-Tex Standard 100 refer to substances which may be present in a textile product or accessory and exceed a maximum amount or which evolve during normal and prescribed use and exceed a maximum amount, and which may have some kind of effect on people during normal and prescribed use and may, according to current scientific knowledge, be injurious to human health. See also Oeko-Tex Standard 100.

HARMLESS CHEMICALS = БЕЗОПАСНЫЕ ХИМИЧЕСКИЕ ВЕЩЕСТВА (или БЕЗВРЕДНЫЕ ХИМИЧЕСКИЕ ВЕЩЕСТВА) – Harmless Chemicals:- a cargo description, which is a contradiction of terms. A chemical is a substance and whether it is harmless or not, depends on the context in which the substance appears or is used. Some shipping lines (e.g., Maersk Line) does not accept harmless chemicals as a valid cargo description on the shipping documents. / , например, Мэрск Лайн (Maersk Line).

HARMONIC = ГАРМОНИКА (или ГАРМОНИЧЕСКОЕ) – Harmonic:- a sine wave which is an integral multiple of a base frequency. For example, the third harmonic on a 60 Hz system is a frequency of 180 Hz. Certain types of electrical equipment generate harmonics which interfere with the proper functioning of other devices connected to the same system. / Под Гармоникой, от Греческого слова Harmonikós, означающее Слаженный или Соразмерный, понимается простейшая периодическая функция вида $f(t) = A\sin(\omega t + \varphi)$. Характеризует гармоническое колебание, являющееся составляющей сложного колебания, с частотой ω, кратной основной частоте (первой гармонике). В акустике и музыке гармоника назвается Обертоном.

HARMONISED INDEX OF CONSUMER PRICES = ГАРМОНИЗИРОВАННЫЙ ИНДЕКС ПО ПОТРЕБИТЕЛЬСКИМ ЦЕНАМ – Harmonised Index of Consumer Prices (HICP) is the measure of prices used by the Governing Council to assess price stability in the Euro area. It is calculated and published by Eurostat, the Statistical Office of the European Communities. The HICPs are economic indicators constructed to measure the changes over time in the prices of consumer goods and services acquired by households. The HICPs give comparable measures of inflation in the Euro-zone, the EU, the European Economic Area and for other countries including accession and candidate countries. They are calculated according to a harmonized approach and a single set of definitions. They provide the official measure of consumer price inflation in the Euro-zone for the purposes of monetary policy in the euro area and assessing inflation convergence as required under the Maastricht criteria. HICP data, including backdata, is revisable under the terms set in Commission Regulation (EC) No 1921/2001. When updated (see release calendar), the database overwrites existing data with the revised data and those changes will only be flagged for a short period, generally until the next update. If you are dealing with indexation you should bear in mind that HICP can be revised at any point in time. Revisions may also affect backdata. To trace revisions, please refer to the monthly HICP publication 'Data in Focus' (pdf). The full set of HICP data is available in the free on-line database (Prices/Harmonized Indices of Consumer Prices). You can customize your data extractions using the interfaces provided. HICP was rebased to 2005 = 100. More details on the practical implications of the rebasing can be found in the News Release 146/2005 of 16 November 2005. Available data (2005 = 100):- (i) Monthly Data:- (a) Index; (b) annual rate of change; (c) monthly rate of change; and (d) 12-month average rate of change; (ii) Annual Data:- average index and rate of change; and (iii) Weights:- (a) Country weights; and (b) Item weights. Weights are revised yearly and released with the January data. Country weights for the current year can also be found in the Annex to the January inflation News release, published in February each year. Over 30 special aggregates have been created for economic analysis. These include, for example indices for goods, services, energy, or excluding some components as energy and unprocessed food. Special aggregates are revised according to the underlying classification's revision and the set aggregates were compiled to meet specific policies needs. Their definitions can be found in Eurostat's classifications server. Data are not seasonally adjusted. Seasonally adjusted data can be found in the European Central Bank's website. Consumer price inflation in the Euro area is measured by the Harmonised Index of Consumer Prices (HICP). The HICP is compiled by Eurostat and the national statistical institutes in accordance with harmonised statistical methods. The ECB aims to maintain annual inflation rates as measured by the HICP below, but close to, 2% over the medium term (see Monetary Policy). The HICP is also used in assessing whether a country is ready to join the euro area. Harmonized Index Of Consumer Prices (HICP):- a list of the final costs paid by European consumers for the items in a basket of common goods. The Harmonized Index of Consumer Prices (HICP) is produced by each European Union member state to help measure inflation and to guide the European Central Bank in formulating monetary policy. The HICP is also used as the basis of the European Index of Consumer Prices, which is weighted toward household expenditures. The prices measured by the HICP come from the prices of representative goods from urban and rural pricing patterns. The index tracks the prices of goods such as Coffee, Tobacco, meat, fruit, household appliances, cars, pharmaceuticals, electricity, clothing and many other widely used products. Owner-occupied housing costs are excluded from the HICP. Harmonised Index of Consumer Prices (HICP) is the index of consumer prices whose statistical methodology has been harmonised across countries.

HARMONIZATION = ГАРМОНИЗАЦИЯ – Harmonization is the establishment, recognition and application by different countries of phytosanitary measures based on common standards. / Под Гармонизацией понимается .

HARMONIZED COMMODITY DESCRIPTION AND CODING SYSTEM = ГАРМОНИЗИРОВАННАЯ СИСТЕМА ОПИСАНИЯ И КОДИРОВАНИЯ ТОВАРОВ – The Harmonized Commodity Description and Coding System, generally referred to as Harmonized System or simply HS, is a multipurpose international product nomenclature developed by the World Customs Organization (WCO). It comprises about 5 000 commodity groups, each identified by a six digit code, arranged in a legal and logical structure and is supported by well-defined rules to achieve uniform classification. The system is used by more than 177 countries and economies as a basis for their Customs tariffs and for the collection of international trade statistics. Over 98% of the merchandise in international trade is classified in terms of the Harmonised System (HS). The HS contributes to the harmonization of Customs and trade procedures, and the non-documentary trade data interchange in connection with such procedures, thus reducing the costs related to international trade. It is also extensively used by governments, international organizations and the private sector for many other purposes such as internal taxes, trade policies, monitoring of controlled goods, rules of origin, freight tariffs, transport statistics, price monitoring, quota controls, compilation of national accounts, and economic research and analysis. The HS is thus a universal economic language and code for goods, and an indispensable tool for international trade. The Harmonized System is governed by The International Convention on the Harmonized Commodity Description and Coding System done at Brussels, Belgium on 1983-June-14 and as amended by the Protocol

of Amendment to the International Convention on the Harmonized Commodity Description and Coding System of 1986-June-24. The maintenance of the HS is a World Customs Organization (WCO) priority. This activity includes measures to secure uniform interpretation of the HS and its periodic updating in light of developments in technology and changes in trade patterns. The WCO manages this process through the Harmonized System Committee (representing the Contracting Parties to the HS Convention), which examines policy matters, takes decisions on classification questions, settles disputes and prepares amendments to the Explanatory Notes. The HS Committee also prepares amendments updating the HS every 4–6 years. Decisions concerning the interpretation and application of the Harmonized System, such as classification decisions and amendments to the Explanatory Notes or to the Compendium of Classification Opinions, become effective two months after the approval by the HS Committee. These are reflected in the amending supplements of the relevant WCO publications. The Harmonized Commodity Description and Coding System (or Harmonized System, HS) is a system for classifying goods in international trade, developed under the auspices of the Customs Cooperation Council. Beginning on 1989-January-01, the new HS numbers replaced previously adhered-to schedules in over 50 countries, including the United States. For the United States, the HS numbers are the numbers that are entered on the actual export and import documents. Any other commodity code classification number (SIC, SITC, end-use, etc) are just rearrangements and transformations of the original HS numbers. An international goods classification system for describing cargo in international trade under a single commodity-coding scheme. Developed under the auspices of the Customs Cooperations Council (CCC), an international Customs organization in Brussels, this code is a hierarchically structured product nomenclature containing approximately 5 000 headings and subheadings. It is organized into 99 chapters arranged in 22 sections. Sections encompass an industry, e.g., Section XI, Textiles and Textile Articles; chapters encompass the various materials and products of the industry, e.g., Chapter 50, Silk; Chapter 55, Manmade Staple Fibers; Chapter 57, Carpets. The basic code contains four-digit headings and six-digit subheadings. Many countries add digits for Customs tariff and statistical purposes. In the United States, duty rates will be the eight-digit level; statistical suffixes will be at the ten-digit level. The Harmonized System (HS) is the current US tariff schedule (TSUSA) for imports and is the basis for the ten-digit Schedule B export code. Also known as Harmonized System, or Harmonized System Of Codes. Xxxxxx. The Harmonized Commodity Description and Coding System or, simply, Harmonized System (HS) is an international product nomenclature based on the Customs Cooperation Council Nomenclature (CCCN) and the Standard International Trade Classification (SITC) Revision 2. The CCCN was the product nomenclature authored by the then Customs Cooperation Council (CCC) now known as World Customs Organization (WCO), while SITC Revision 2, drafted by the United Nation (UN), is used in trade statistics. The HS comprises the following:- (a) General Rules for the interpretation of the System; (b) Section and Chapter Notes, including Subheading Notes; and (c) A list of headings arranged in systematic order (i.e. degree of processing) and, where appropriate, subdivided into subheadings. The General Rules are provided to ensure that a given product is always classified in one and the same heading (and subheading), to the exclusion of any others which might appear to merit consideration. The Section and Chapter Notes (including Subheading Notes) form an integral part of the HS and have the same legal force as the General Rules. The 1 240 headings are arranged in 96 Chapters which are themselves grouped into 21 Sections. The HS comprises a total of 5 108 separate groups of goods by a 6-digit code. The HS is reflected as Sections 103 and 104 in the Tariff and Customs Code, Volume I, which provide the General Rules for the Interpretation of the Harmonized System and the list of headings and the legal Notes, respectively. The HS effects uniformity in the classification of goods and standardizes commercial documents which ultimately enhances customs administration. What are the uses of the HS?:- (a) as a tariff nomenclature; (b) as a statistical nomenclature; (c) as a base for the harmonization of economic classification, e.g., market surveys and data collection; (d) as a multipurpose nomenclature by international unions of shipping and transport organizations; (e) as an international language and code for customs purposes; and (f) as a base for the determination of the Rules of Origin (ROO) for non- preferential trade purposes such as the MFN treatment, anti-dumping and countervailing duties, safeguard measures and origin marking. The HS was implemented in October 1988. / национальные счета , например, .

HARMONIZED EUROPEAN STANDARDS = ГАРМОНИЗИРОВАННЫЕ ЕВРОПЕЙСКИЕ СТАНДАРТЫ – Harmonized European Standards are those drawn up on the basis of a standardization ‘request’ (formerly called a ‘Mandate’) by the European Commission (or the European Free Trade Association (EFTA)). Roughly 19% of all European Standards are ‘harmonized’ standards. These standards give detail to the more general ‘essential safety and health requirements’ laid down in European legislation such as the directives. Lists of harmonized standards are published in the Official Journal of the European Union (OJEU). In each harmonized standard, the relationship between it and the relevant directive is described in an Annex. Compliance with a harmonized European Standard means that it can be assumed that the essential requirements of the respective directive(s) have been met. Although products and services in accordance with harmonized European Standards must be accepted in all EU member countries, the use of such standards remains voluntary. However, manufacturers who do not comply with these standards must provide another form of proof that the essential requirements of the Directive have been met.

HARMONIZED PHYTOSANITARY MEASURES = ГАРМОНИЗИРОВАННЫЕ ФИТОСАНИТАРНЫЕ МЕРЫ – Harmonized Phytosanitary Measures are phytosanitary measures established by contracting parties to the International Plant Protection Convention (IPPC), based on international standards. / К Гармонизированным Фитосанитарным Мерам относятся такие фитосанитарные меры, которые устанавливаются договаривающимися сторонами Международной Конвенции По Защите Растений (МКЗР; International Plant Protection Convention (IPPC)) и основаны на международных стандартах.

HARMONIZED TARIFF SCHEDULE OF THE UNITED STATES = ГАРМОНИЗИРОВАННЫЙ ПЕРЕЧЕНЬ ТАРИФОВ СОЕДИНЁННЫХ ШТАТОВ – Harmonized Tariff Schedule Of The United States (HTSUS):- published by the US International Trade Commission, the HTSUS is used in the classification of imported merchandise for rates of duty and statistical purposes. The Harmonized Tariff Schedule of the United States (HTS) replaced the Tariff Schedules of the United States (TSUS) effective January 01, 1989. Chapters 1 through 97 are based upon the internationally adopted Harmonized Commodity Desaiption and Coding System through the 6-digit level of product description, with additional US product subdivisions at the 8-digit level Chapters 98 and 99 contain special US classification provisions and temporary rate provisions, respectively. Rates of duty in the general subcolumn of HTS column 1 are most-favored-nation (MFN) rates; for the most part, they represent the final concession rate from the Tokyo Round of Multilateral Trade Negotiations. Column 1-general duty rates are applicable to imported goods from all nonembargoed countries except those enumerated in general note 3(b) to the HTS Afghanistan, Azerbaijan, Cuba, Kampuchea, Laos, North Korea, and Vietnam – whose goods are dutiable at the rates set forth in column 2. Goods from Albania, Armenia, Belarus, Bosnia, Bulgaria, the People’s Republic of China, Croatia, the Czech Republic, Estonia, Georgia, Hungary, Kazakhstan, Kyrgyzstan, Latvia, Lithuania, Macedonia, Moldova, Mongolia, Poland, Romania, Russia, Slovakia, Slovenia, Tajikistan, Turkmenistan, Ukraine, and Uzbekistan are now eligible for MFN treatment. Among goods dutiable at column 1-general rates, particular products of enumerated countries may be eligible for reduced rates of duty or for duty-free entry under one or more preferential tariff programs. Such tariff treatment is set forth in the special subcolumn of HTS column 1. Where eligibility for special tariff treatment is not claimed or established, goods are dutiable at column 1-general rates.

HARMONIZED TARIFF SYSTEM = ГАРМОНИЗИРОВАННАЯ СИСТЕМА ТАРИФОВ – Harmonized Tariff System is an international classification system designed to improve the collection of import and export statistics as well as provide a uniform tariff code structure for incorporation into national tariff systems. Promotes a high degree of international uniformity in the presentation of customs tariffs and foreign trade statistics. Consists of approximately 5 000 item descriptions, grouped into 21 sections and 97 chapters. The liability of imported goods to customs duty and the rates of duty to which they are subject depends on their tariff classification, i.e. the particular heading or sub-heading of the tariff under which they fall. Classification is also used to determine liability to a variety of non-tariff measures such as import licensing and import quotas. The classification is made by way of numerical codings which are the subject of an international convention known as the Harmonised Commodity Description and Coding System or HS as it is more commonly known. This Convention was adopted by the European Community (EC) and most of its major trading partners, including the United States and Japan, from 1988-January-01. The HS provides over 5 000 descriptions of goods to which individual numerical codings are allocated. The HS has a pyramidal structure:- goods are grouped into 21 Sections according to their principal characteristics, e.g., Section I comprises live animals, Section II vegetable products, etc. These Sections are sub-dividend into one or more Chapters totaling (currently, July 2008) 97 in all. Each description of goods identified under the HS has a six-digit numerical code, the first four of which are known as the 'Heading Number'. The EC has adopted the HS and expanded its subheadings for a number of purposes:- (i) To establish its Combined Nomenclature (CN), i.e. a combination of tariff and statistical subheadings, for the purpose of more closely identifying goods. It does this by breaking out the HS subheadings into more detailed subheadings. These subheadings are represented by two additional digits. Thus, each CN subheading has an 8 digit code. (ii) To establish the Integrated Tariff of the European Community known as Le TARIC (Le Tarif Intégré de la Communauté, in French), based on the CN. This includes additional Community subdivisions, referred to as 'TARIC' subheadings, to identify goods subject to particular EC tariff measures, e.g., preferential rates of duty, tariff suspensions, anti-dumping duty, and to certain measures under the Common Agricultural Policy (CAP). These subheadings are generally denoted by a further 2 digits. The complete 10 digit number forms the TARIC code number. Exceptionally an additional TARIC code of 4 digits is provided for use where Community measures are not coded or are incompletely coded at the 9th and 10th digit level. (iii) To establish an Export Refund Nomenclature (ERN) for CAP purposes. The ERN code consists of a 12 digit code and determines the rates of export refund applicable to specific products. The Combined Nomenclature (CN), the schedules of duty rates and other charges, e.g., CAP, and certain tariff measures agreed at international level (such as INN, WTO quotas) taken together constitute the Common Customs Tariff (CCT) of the EC. In general, the CN's 8-digit code is used in respect of the internal trade of the EC in Community goods and for exports from the EC. The 10+ digit code is used in respect of imports into the EC from non-EC countries and for exports of CAP products eligible for export refunds. Also known as Harmonized Commodity Description And Coding System. / Известна также как Гармонизированная Система Описания И Кодирования Товаров (Harmonized Commodity Description And Coding System). ИТАРС (Интегрированный Тариф Сообщества) или, как это звучит на Французском языке по месту расположения, Лё ТАРИК (Лё Тариф Этэгрэ дё ля Коммюноте; Le TARIC (Le Tarif Intégré de la Communauté)).

THE HARMONIZED SYSTEM = ГАРМОНИЗИРОВАННАЯ СИСТЕМА – The Harmonized System (HS) is the 'language of international trade'. The Harmonized System or HS is a goods nomenclature that is developed and maintained by the World Customs Organization (WCO), and is governed by the International Convention on the Harmonized Commodity Description and Coding System done at Brussels, Belgium on 1983-June-14 and as amended by the Protocol of Amendment to the International Convention on the Harmonized Commodity Description and Coding System of 1986-June-24. Over 190 countries and economies use the HS as a basis for their customs tariffs and for the collection of international trade statistics. Although there are 'only' 127 contracting parties to the HS Convention (situation in February, 2007), many other countries and territories apply the HS without formally being a contracting party to the HS Convention. Over 98% of the merchandise in international trade is classified in terms of the HS, which can thus truly be labeled the 'language of international trade'. The HS provides a logical structure in which over 1 200 headings are grouped in 96 Chapters, some of which are further divided into sub-Chapters. The Chapters are arranged in 21 Sections. Each heading is identified by a four-digit code, the first two digits indicating the Chapter wherein the heading appears, the latter two indicating the position of the heading in the Chapter. In addition, most of the headings are subdivided into 1-dash subheadings which, where necessary, are further subdivided into 2-dash subheadings, identified by a 6-digit code (HS code). Thus, for instance, HS code 2204.21 refers to the fourth heading (2204.21) of Chapter 22 (2204.21), namely the first two-dash subheading (2204.21) of the second one-dash subheading (2204.21). The full description of subheading 2204.21 is 'Other wine; grape must with fermentation prevented or arrested by addition of alcohol; in containers holding 2 l or less'. The HS Convention requires in particular that HS headings, subheadings and numerical codes be used without addition or modification, and that the General Rules for interpretation are used for its application. Within these limits, textual adaptations are allowed if necessary to give effect to the HS in domestic law, as well as further subdivisions beyond the level of the six-digit HS codes. For instance, it would be allowed to create further subheadings for HS code 2204.21 according to alcoholic strength, but further subdivisions of this subheading may not cover 'sparkling wines in containers holding 2 l or less', as these must stay under subheading 2204.10, or further subdivisions added thereto. The HS is set up as a 'closed system':- it classifies all traded goods, whether or not existing at the time the HS was established. A number of tools are built into the HS system to accomplish this ambition. Also known as Harmonized Commodity Description And Coding System. / Известна также как Гармонизированная Система Описания И Кодирования Товаров (Harmonized Commodity Description And Coding System).

HARNESS = РЕМИЗКА – Harness is a frame holding the heddles in position in the loom during weaving. See also Loom. / ремизной рамы (harness frame). Ремизка (harness) – деталь ткацкого станка, состоящая из двух металлических или деревянных планок, между которыми натянуты галева (heddles) – проволочки, пластинки или кручёные нити с отверстием посредине для продевания через них нитей основы. Ремизки, перемещаясь вверх или вниз, поднимают или опускают нити основы, образуя зев (shed), в который прокладываются нити утка. Набор ремизок на станке называется Ремизом. Каждая ремизка состоит из рамки с надетыми на неё галевами. В большинстве случаев используют рамки с металлическими планками, а на станках старых конструкций – с деревянными планками. С рамками хомутами соединены прутки, на которые надевают галева. Галева бывают металлические и нитяные. Галево имеет глазок, через который продевают нить основы. Размеры и форма глазков зависят от вида вырабатываемой ткани и линейной плотности нити основы. Каждая нить основы проходит через соответствующий ей глазок галева (heddle eye) одной из ремизок (harness), а затем между двумя зубьями бёрда.

HARNESS(ES) = РЕМИЗ(Ы) – Harnesses:- the wooden frames upon which the heddles are placed by means of top-heddle loop and a bottom-heddle loop. The harnesses form the shed in the loom when some of them are raised while others are lowered.

HARNESS BALK = РЕМИЗНЫЙ ХХ – Defect Name:- Harness Balk. Defect Type:- weft lines, horizontal lines. Fabric Type:- Shirting and Dress Goods – Plain Weave. Description:- Harness Balk:- This defect is the result of one harness of this six-harness plain weave failing to move in its prescribed sequence, causing a pick of filling to float over certain warp ends with which it should have interlaced. Severity:- Major.

HARNESS BREAKDOWN = РЕМИЗНЫЙ РАЗРЫВ – Harness Breakdown:- caused by the harness straps breaking on a conventional loom. There will be definite pattern change in the weave. Woven fabric defect. (1) Defect Name:- Harness Breakdown. Defect Type:- warp lines, vertical lines. Fabric Type:- Denim Bottomweights – Piece Dyed. Description:- Harness Breakdown:- This is the result of harness straps breaking on a conventional loom. This view shows the effect of the harness staying down and the warp floats on the back of the fabric. Severity:- Major. (2) Defect Name:- Harness Breakdown. Defect Type:- weft lines, horizontal lines. Fabric Type:- Denim Bottomweights – Piece Dyed. Description:- Harness Breakdown:- This is the result of harness straps breaking on a conventional loom. This view shows the effect of the harness staying up and the warp floats on the face of the fabric. Severity:- Major. / Порок или дефект ткачества.

HARNESS CHAIN = РЕМИЗНАЯ ЦЕПЬ (или ЦЕПЬ РЕМИЗА) – Harness Chain:- an endless, wooden chain with each bar of the chain fitted with lags, according to the motif to be used in the weave in the fabric. The lags in each bar come under the jack-tip on the loom, causing the harnesses thus affected to rise and bring the warp ends drawn through the heddles on the particular harness to rise and form raisers in the cloth. Each bar represents one pick in the goods. The chain is located at the headstock side of the loom where the head motion, dobby, or otherwise is situated. The harness chain is made from the drawing-in draft used to draw-in the warp ends as prescribed by the designer of the material. Another, but serving the same purpose, is the chain built of all metal – the bars, rollers or balls, sinker disks, and cotter pins. Harness Chain is a mechanism used to control the vertical movements of the harness, or shaft, on a loom. See also Loom. / Набор ремизок на станке называется Ремизом.

HARNESS MISDRAW = РЕМИЗНЫЙ ХХ – (1) Defect Name:- Harness Misdraw. Defect Type:- warp lines, vertical lines. Fabric Type:- Denim Bottomweights – Piece Dyed. Description:- Harness Misdraw:- This is the result of two ends being drawn wrong through the harness. Instead of the 1-2-3-4 draw, they are drawn 1-3-2-4. This distorts the weave and breaks the twill line. Severity:- Major.

(2) Defect Name:- Harness Misdraw. Defect Type:- warp lines, vertical lines. Fabric Type:- Bottomweights – Twill Derivatives. Description:- Harness Misdraw:- This is the result of ends being drawn wrong through the harness. This takes place in a plain weave section of the fabric resulting in what is commonly called a ‘Flat’. Severity:- Major.

HARNESS SATIN = РЕМИЗНЫЙ АТЛАС – Harness Satin:- weaving pattern producing a satin appearance. ‘Eight-harness’ means the warp tow crosses over seven fill tows and under the eighth (repeatedly).

HARNESS (WARP) SKIP = РЕМИЗНАЯ (ОСНОВНАЯ) ПРОБОРКА (или ПОДНЫРКА) – Harness (Warp) Skip or Harness Skip:- warp yarns appearing more or less continuously on the surface of the fabric due to non interlacement of weft yarns. Weaving defect. See also Float. / Порок или дефект ткачества. Подныркu не более 5 см. Размер порока – до 1 см. Под Подныркаmи понимается дефект суровой ткани, когда уточные нити на коротких участках не переплетаются с основными, а выступают в виде скобочек или петель сверху или снизу полотна; причины – нечистый зев, несвоевременный ввод уточной нити в зев, провисание нитей основы, излишне высокое или низкое расположение шпаруток и другое.

HARRIS TWEED = ХАРИСОВСКИЙ ТВИД – Harris Tweed is a tweed hand-woven from yarns spun by hand or machine on the islands of the Outer Hebrides off the coast of Scotland. Harris is one of these islands. Harris Tweed:- all are hand woven on the islands off the Northern coast of Scotland (outer Hebrides). There are two types of Harris Tweed:- (i) fabric woven from hand-spun yarn; and (ii) fabric woven from machine-spun yarn. Now very few are woven from hand spun yarns as it takes too much time and labor. It is always stamped to that effect in addition to the label which any Harris Tweed always bears. Much is woven in 27” and 28” widths, but also in 54”. When damp, it smells mossy and smokey. Is now made from Scottish and other wools. Is also power warped and power beamed. / .

HARROW = БОРОНА – Harrow is a cultivating implement usually with spikes or teeth used for secondary tillage to pulverize and smoothen the soil, mulching, covering, or removing weeds, e.g., comb-tooth or spike-tooth harrow and wooden plank. / Под Бороной понимается сельскохозяйственное орудие для боронования почвы. Различают бороны зубовые (лапчатые, ножевидные, вращающиеся и другие) и дисковые (disc harrow). Борона, сельскохозяйственное орудие для неглубокого рыхления почвы и ухода за растениями. Первые сведения о применении бороны относятся к Римскому времени (Италия, I век до Нашей Эры). У Славянских племён борона распространилась не позже конца 1-го тысячелетия Нашей Эры, первое письменное упоминание о бороне содержится в Русской правде (XI–XII века). Древнейшей формой бороны на Руси была ‘Суковатка’ – ствол Ели с обрубленными до длины 50–70 см сучьями. Позднее применяли:- борону-смык из связанных обрубков древесных стволов с сучьями длиной от 35 до 50 см; бороны-плетёнки, состоящие из ряда деревянных брусьев и кольев, связанных лыком; бороны с деревянными рамами и металлическими зубьями, а также с металлическими рамами и металлическими зубьями; дисковые бороны. Все эти бороны перевозились по полю живым тяглом. Современные бороны, как правило, имеют металлическую раму и металлические рабочие органы. Их агрегатируют обычно с тракторами. Современные бороны подразделяют на зубовые и дисковые, а также на бороны общего и специального назначения. (1) Зубовые Бороны применяют для рыхления верхнего слоя почвы после вспашки, разрушения почвенной корки весной на посевах озимых и боронования всходов, заделки семян и минеральных удобрений, выравнивания поверхности поля перед посевом, уничтожения сорняков. Рабочие органы этих борон – стальные зубья (квадратные, круглые, прямоугольные, ножевидные). Зубья крепят жёстко или шарнирно к раме бороны либо к пружинной стойке. Для зубовых борон принята рама зигзагообразной формы, которая обеспечивает симметричное расположение зубьев и меньшую забиваемость орудия. По нагрузке, приходящейся на один зуб, эти бороны разделяют на тяжёлые (16–20 Н), средние (12–16 Н) и лёгкие (5–12 Н) (1 Н » 0.1 кгс). Зубовые бороны бывают следующих типов:- ‘Зигзаг’, шлейф-бороны, сетчатые, пружинные, прополочные, луговые и ножевые вращающиеся и другие. Борона ‘Зигзаг’ состоит из 3 зубовых звеньев. Их выпускают прицепными или навесными. Шлейф-Борона состоит из 2 звеньев. Каждое звено имеет стальной нож (струг), борону с одним рядом зубьев и волокушу из 4 брусьев. Струг срезает гребни и глыбы, зубья крошат их, а брусья волокуши измельчают комки и выравнивают поверхность поля. Сетчатая Борона имеет зубья из круглой стали, соединённые шарнирно и образующие сетку, которая хорошо приспосабливается к рельефу поля. Сетчатые Бороны могут быть прицепными и навесными. Сетчатая Прореживающая Борона (Скребница) предназначена для прореживания всходов сахарной Свёклы и прополки Свёклы и Кукурузы. Борона состоит из 2 секций с фигурно изогнутыми звеньями, оканчивающимися зубьями. Пружинная Борона состоит из 3 брусьев с закреплёнными на них пружинными зубьями. Прополочная Борона имеет пружинные эластичные зубья с заострёнными концами, которыми обрабатывают защитные зоны у растений с одновременным рыхлением междурядий. Луговая Борона снабжена пластинчатыми ножами скребкового типа, которые разбивают комья земли, заравнивают кротовины, вычесывают сгнившие корни трав и другое. Ножевая Вращающаяся Борона предназначена для работы на почвах, засорённых камнями. Её рабочие органы – пластинчатые ножи закреплены на вращающихся валах. Борона хорошо приспосабливается к рельефу поля и преодолевает препятствия (пни, камни) высотой до 35 см. (2) Дисковые Бороны (Disc Harrow) используют в основном для рыхления задернелых пластов и разрушения крупных глыб и комьев почвы. Рабочими органами их являются гладкие или вырезные диски диаметром 450, 510 и 660 мм. Диски собирают в батареи. Расположенные под углом к направлению движения агрегата диски, вращаясь во время работы,

разрезают пласты почвы, рыхлят, перемешивают и отваливают почву в сторону. Дисковые бороны разделяют на болотные, полевые и садовые, навесные, полунавесные и прицепные. Полевые Бороны имеют батареи, снабжённые балластными ящиками, в которые добавляют груз, увеличивающий вес бороны в целях лучшей обработки почвы. Батареи Садовых Борон для обработки почвы в междурядьях и приствольных полосах садов и ягодников расположены несимметрично относительно продольной оси бороны, вследствие чего смещается точка прицепа в сторону, что даёт возможность удалить трактор от плодовых деревьев на 1.5–3.5 м. Кроме того, бороны оборудованы приспособлением для отвода батарей в междурядье при соприкосновении с плодовым деревом.

HARROWING = БОРОНОВАНИЕ – Harrowing is a secondary tillage operation which pulverizes, smoothens and firms the soil in seedbed preparation. It controls weeds or incorporates material spread on the surface into the soil. / Под Боронованием понимается рыхление поверхностного слоя почвы боронами и вращающимися мотыгами. Предохраняет почву от высыхания, выравнивает её поверхность, разрушает почвенную корку, уничтожает сорняки. Боронование, приём мелкой обработки почвы и ухода за сельскохозяйственными растениями. Проводится зубовыми или дисковыми боронами и вращающимися мотыгами. Боронование предохраняет почву от быстрого высыхания, улучшает воздухо- и водопроницаемость, что благоприятствует усилению полезных микробиологических процессов и накоплению в почве усвояемых растениями питательных веществ. В этих целях ранней весной боронуют зябь, чёрный пар, озимые. Боронованием перед посевом яровых выравнивают поверхность пашни, после посева уничтожают проростки сорняков и разрушают почвенную корку до появления всходов и по всходам (лучше вращающимися мотыгами или сетчатыми боронами). На паровых полях и при подготовке почвы под озимые из-под непаровых предшественников боронование применяют для выравнивания поверхности пашни и сбережения почвенной влаги. Вспашку и культивацию обычно проводят одновременно с боронованием. В малоснежных районах (Восточная Сибирь и другие), где гребнистая поверхность пашни, вспаханной на зябь, усиливает иссушение почвы, практикуют осеннее боронование зяби. Качество боронования зависит от влажности обрабатываемого слоя почвы, орудия и техники выполнения. Хорошее крошение обеспечивается при физической спелости почвы, когда она содержит 60–70% влаги от полной влагоёмкости. Боронование пересохшей или переувлажнённой почвы может принести вред. Повышение скорости обработки способствует лучшему рыхлению, но усиливает распыление почвы. Боронование поперёк пахоты или по диагонали по сравнению с продольным обеспечивает лучшее рыхление и выравнивание поверхности. Показателями высокого качества боронования являются:- хорошо разрыхлённый верхний слой почвы и незначительное его распыление, выровненная поверхность пашни и максимальное количество уничтоженных всходов сорняков.

HARSH = ГРУБАЯ – Harsh:- a coarse, rough wool.

HARSH FIBER = ГРУБОЕ ВОЛОКНО – Harsh Fiber is a fiber that is rough or coarse to the touch, but not fused or bonded filaments.

HARSH HAND = ГРУБОЕ НА ОЩУПЬ (или ГРУБОЕ ТУШЕ) – Harsh Hand:- Fabric:- spun-rayon-and-wool suiting; Construction:- (i) Count:- 104 x 74; (ii) Warp:- 20 1 25$ 1%-in. 1%-den. bright viscose rayon 50% 2-in. 3-den. dull viscose rayon 25% 58's wool cut 2 in.; (iii) Filling:- 22/1, same blend as warp; Finish:- plain dyed rose with resin finish. Defect:- customer complained of the harshness of hand of several pieces, as compared with earlier deliveries. Analysis:- preliminary examination indicated that the difference in hand was due to the finish. However, after laboratory removal of the resin from cuttings of both the original and the unsatisfactory pieces, the new goods were still harsh. It was assumed that an error had been made in using a blended yarn with a lower grade of wool, but microscopic analysis showed the quality to be identical. While the yarns were being examined microscopically, it was observed that the wool fibers in the harsher feeling goods were damaged in appearance. Chemical analysis was made and the wool content of the harsh fabric was found to be appreciably lower than the original amount specific' 1. Tests made of the dyestuffs used confirmed the fact that the goods had been vat-dyed and it was decided that the dyer had caused the fiber's degradation through careless use of sodium hydroxide, the damaged wool giving the harsher hand. / Уточина:- .

HARSHNESS OF HAND = ГРУБОСТЬ НА ОЩУПЬ – Harshness Of Hand:- Garments:- laundered bird's-eye diapers; Fabric Construction:- (i) Count:- 64 x 50; (ii) Warp:- 29/1 carded cotton; (iii) Filling:- 13/1 carded cotton. Complaint:- excessive roughing up and harshening of the hand in diapers after several launderings. The customer claimed that the cotton quality was inferior. Analysis:- analysis of the cotton in the laundered diapers, as well as in cuttings of new diaper fabric, showed that the cotton was of standard quality and fiber length. Repeated laundering tests made on new diapers from the same delivery showed no excessive balling up or harshening of the hand. It was concluded that this defect was due to improper laundering. High alkalinity of the scouring bath, along with careless drying and processing in the laundering, is frequently responsible for an undesirable rough and harsh hand. / Уточина:- .

HARTER ACT = АКТ ХАТЁ (или АКТ ХАРТЁРА) – Harter Act is a US statute pertaining to merchandise or property transported from or between ports of the United States and foreign ports. Currently, the Act is partially superseded by the US Carriage of Goods by Sea Act of 1936 (COGSA). However, the Harter Act still applies to carriage of goods not subject to COGSA, including the period before loading and after discharge and carriage between US ports unless the bill of lading expressly makes COGSA applicable to such shipments. Harter Act voids clauses in ocean bills of lading which attempt to relieve the vessel owner of liability for loss or damage to cargo arising from negligence in loading, stowage, care and proper delivery or clauses that attempt to avoid or lessen the vessel owner's obligations to exercise due diligence to provide a seaworthy vessel and crew for the carriage and delivery of cargo. It also relieves a vessel owner of liability for errors in navigation or management of the vessel if the owner exercises due diligence to make the vessel in all respects seaworthy. Act of February 13, 1893 (probably named after Michael Daniel Harter, a US Representative from Ohio; 1846–1896). The Harter Act was designed to protect American shipping companies from liability involving damaged or lost cargo. English companies were allowed to add clauses to the bills of lading that protected them from responsibility in certain events if goods were damaged. The Harter act was designed to give the same protection to American shippers. It only applies to domestic shipping. If applies to international shipping, the Harter act must be mentioned in the bill of lading. So, The Harter Act:- 'If the owner of any vessel transporting merchandise or property to or from any port in the United States of America shall exercise due diligence to make the said vessel in all respects seaworthy and properly manned, equipped, and supplied, neither the vessel, her owner or owners, agent, or charterers, shall become or be held responsible for damage or loss resulting from faults or errors in navigation or in the management of said vessel nor shall the vessel, her owner or owners, charterers, agent, or master be held liable for losses arising from dangers of the sea or other navigable waters, acts of God, or public enemies, or the inherent defect, quality, or vice of the thing carried, or from insufficiency of package, or seizure under legal process, or for loss resulting from any act or omission of the shipper or owner of the goods, his agent or representative, or from saving or attempting to save life or property at sea, or from any deviation in rendering such service'. In essence the law makes the following points in protecting ship owners from liability. The following circumstances are those that the shipper is not liable for if damage or loss occurs to the cargo:- (i) Four circumstances were recognised by everyone before the passage of the act:- (a) acts of God; (b) destruction by pirates or countries at war; (c) inherent vice; and (d) fire (not listed in Harter, rather in the Fire Statute of 1851, but implied in Harter). (ii) The following are specific to the Harter Act only:- (a) errors in navigating or managing the ship; (b) acts of God at sea (storms, whale attacks and I am not kidding, see Moby Dick, etc); (c) bad packaging on the

part of the manufacturer, such as badly built crates; (d) seizure of the cargo by law enforcment or legal authorities; (e) acts or omissions by the shipper; and (f) if damage to the cargo results while attempting to save lives at sea. (iii) The shipper can only enjoy the above ten immunities if he fulfills three requirements:- (a) the cargo must be properly stowed and cared for; (b) the ship must be properly equipped, manned, and provisioned; and (c) the ship must be seaworthy. This US statute refers to merchandise or property transported from or between ports of the United States and foreign ports. Now partially superseded by the US Carriage of Goods by Sea Act of 1936. A law passed by the US Congress in 1893. The Harter Act provides that a vessel owner is not responsible for loss or damage caused by faults or errors in navigation, provided the ship owner has taken proper care to see that his/her ship is in all respects seaworthy and properly manned and equipped. / или хозяин (или капитан). возможно Майкэл Дэниэл Хатё (Michael Daniel Harter; 1846–1896; Американский Конгрессмен от Штата Огайо). Акт Хатё (известный в Русском языке как Акт Хартёра, одобренный Конгрессом США 13 Февраля 1893, который определил ответственность судовладельцев по морским грузовым перевозкам и установил содержание ограничительных оговорок, которые морской перевозчик вправе включить в свой коносамент.

HARVEST = ЖАТВА (или УБОРКА УРОЖАЯ, или СБОР УРОЖАЯ) – Harvest:- to cut and collect by hand or machine the grain or product of the Plant.

HARVESTABLE BOLL = КОРОБОЧКА, ГОТОВАЯ К СБОРУ УРОЖАЯ – Harvestable Boll is a boll that will open before the end of the growing season to permit mechanical harvest. Normally, the capsule will dry and open to expose the fiber in such a way that the seedcotton is ready for mechanical spindle picking. Some immature bolls also open and can be harvested. In contrast, boll development may have been arrested by some factor such as excessively cool weather, which prevents opening of the boll and exposure of the seedcotton. A general sense of which bolls are harvestable is important in order to limit management inputs designed to protect non-harvestable bolls late in the cropping season.

HARVESTER = СБОРЩИК (или УБОРОЧНАЯ МАШИНА) – Harvester is a person or machine that cuts and collects the product of a plant.

HARVEST INDEX = ИНДЕКС ПО УРОЖАЮ – Harvest Index (HI) is the ratio between the economic yield (grain) and the total dry matter produced. The ratio of grain weight to total aboveground plant dry weight.

HARVESTING = ЖАТВА (или УБОРКА УРОЖАЯ, или СБОР УРОЖАЯ) – Harvesting is the process of gathering in a crop; in the case of Rice, the gathering in of mature Rice panicles from the field.

HARVEST INITIATION = ОСНОВАНИЕ ДЛЯ СБОРА УРОЖАЯ (или XX) – Harvest Initiation:- The time when sufficient bolls are open to begin first harvest in a field. Harvest initiation is generally sequenced among fields based on maturity.

HASH FUNCTION = ФУНКЦИЯ ХЭШИРОВАНИЯ (или ХЭШ ФУНКЦИЯ) – Hash Function is a (mathematical) function which maps values from a large (possibly very large) domain into a smaller range. A ‘good’ hash function is such that the results of applying the function to a (large) set of values in the domain will be evenly distributed (and apparently at random) over the range. / Функция Хэширования или Хэш Функция – функция, отображающая строки бит в строки бит фиксированной длины и удовлетворяющая следующим свойствам:- (i) по данному значению функции сложно вычислить исходные данные, отображённые в это значение; (ii) для заданных исходных данных трудно найти другие исходные данные, отображаемые с тем же результатом; и (iii) трудно найти какую-либо пару исходных данных с одинаковым значением хэш-функции. Примечание:- применительно к области электронной цифровой подписи свойство (i) подразумевает, что по известной электронной цифровой подписью невозможно восстановить исходное сообщение; свойство (ii) подразумевает, что для заданного подписанного сообщения трудно подобрать другое (фальсифицированное) сообщение, имеющее ту же электронную цифровую подпись, свойство (iii) подразумевает, что трудно подобрать какую-либо пару сообщений, имеющих одну и ту же подпись.

HASHTAG = ЗАГОЛОВОК (или МЕТКА ПЕРЕД (СИМВОЛОМ) #, или ХЭШТЭГ) – Hashtag is a metadata tag that is prefaced by the hash symbol, #. Hashtags are widely used on microblogging and photo-sharing services such as Twitter and Instagram as a form of user-generated tagging that enables cross-referencing of content sharing a subject or theme. For example, a search within Instagram for the hashtag #bluesky returns all posts that have been tagged with that hashtag. After the initial hash symbol, a hashtag may include letters, digits, and underscores. The use of hashtags was first proposed by Chris Messina in a 2007 tweet, that, although initially decried by Twitter as a ‘thing for nerds’, eventually led to their use rapidly becoming widespread throughout the platform. Messina, who made no attempt to patent the use because he felt ‘they were born of the Internet, and owned by no one’, has subsequently been credited as the godfather of the hashtag. By the end of the decade hashtags could be seen in most emerging as well as established social media platforms including Instagram, Facebook, Reddit, and YouTube – so much so that Instagram had to officially place a ‘30 hashtags’ limit on its posts to prevent people from abusing their use, a limit that Instagrammers eventually circumvented by posting hashtags in the comments section of their posts. As of 2018 more than 85% of the top 50 websites by traffic on the Internet use hashtags and their use is common by millennials, Generation Z (or simply Gen Z, also known as Zoomers), politicians, influencers, and celebrities worldwide. Because of its widespread use, hashtag was added to the Oxford English Dictionary in June 2014. The term Hashtag is sometimes erroneously used to refer to the hash symbol itself when used in the context of a hashtag. Formal taxonomies can be developed from the folk taxonomy rendered machine-readable by the markup that hashtags provide. This process is called Folksonomy. Origin And Uses:- The number sign or hash symbol ‘#’ is often used in information technology to highlight a special meaning. (The symbol is also called an ‘Octothorpe’ or ‘pound sign’ in the US, and ‘hash’ in the UK) In 1970, for example, the number sign was used to denote immediate address mode in the assembly language of the PDP-11 (short for the Programmed Data Processor-11) when placed next to a symbol or a number. In 1978, Brian Kernighan and Dennis Ritchie used # in the C programming language to indicate special keywords that the C preprocessor had to process first. In the 1986 SGML standard (short for the Standard Generalized Markup Language), ISO 8879:1986 (q.v.), # is a reserved name indicator (rni) that precedes keyword syntactic literals, – e.g., the primitive content token #PCDATA, used for parsed character data. The International Telecommunication Union (ITU) approved in November 1988 recommendation E.161 that put the pound sign on the right side of the 0 in the 4 x 3 button arrangement for push buttons on telephones. This same arrangement is still used today in most software phones (see Android dialer for example). The ITU recommendation had 2 design options for the pound sign:- a European version where the hash sign was built with a 90-degree angle and a North-American version with an 80-degree angle. The North-American version seems to have prevailed as most pound signs in Europe now follow the 80-degree inclination. The pound sign was adopted for use within IRC (Internet Relay Chat) networks circa 1988 to label groups and topics. Channels or topics that are available across an entire IRC network are prefixed with a hash symbol # (as opposed to those local to a server, which use an ampersand ‘&’). Internationally, the hashtag became a practice of writing style for Twitter posts during the 2009–2010 Iranian election protests; Twitter users inside and outside Iran used both English- and Persian-language hashtags in communications during the events. The first published use of the term ‘Hash Tag’ was in a blog post by Stowe Boyd, ‘Hash Tags = Twitter Groupings’, on August 26, 2007, according to lexicographer Ben Zimmer Chair of the American Dialect Society’s New Words Committee. Beginning July 02, 2009, Twitter began to hyperlink all hashtags in tweets to Twitter search

results for the hashtagged word (and for the standard spelling of commonly misspelled words). In 2010, Twitter introduced 'Trending Topics' on the Twitter front page, displaying hashtags that are rapidly becoming popular. Twitter has an algorithm to tackle attempts to spam the trending list and ensure that hashtags trend naturally. Although the hashtag started out most popularly on Twitter as the main social media platform for this use, the use has extended to other social media sites including Instagram, Facebook, Flickr, Tumblr, and Google+. Other Uses:- The feature has been added to other, non-short-message-oriented services, such as the user comment systems on YouTube and Gawker Media. In the case of the latter, hashtags for blog comments and directly submitted comments were used to maintain a more constant rate of user activity even when paid employees were not logged into the website. Real-time search aggregators such as the former Google Real-Time Search also support hashtags in syndicated posts, meaning that hashtags inserted into Twitter posts can be hyperlinked to incoming posts falling under that same hashtag; this has further enabled a view of the 'river' of Twitter posts. Style:- A hashtag must begin with a hash character followed by other characters, and is terminated by a space or end of message. It is always safe to precede the '#' with a space, and to include letters without diacritics, digits, and underscores. In many cases, other characters are also allowed, in particular, accented characters used in many languages, but handling may vary from one client to another and from time to time as standards evolve. A discussion of hashtag standards suggests that if #Romeo&Juliet is used, different Twitter clients might link to #Romeo, #Romeo&, or #Romeo&Juliet. Hashtags are not case sensitive:- a search for '#hashtag' finds '#HashTag'. The use of embedded capitals (CamelCase) increases legibility and avoids confusion. On microblogging and social networking sites hashtags can be inserted anywhere within a text, often at the beginning or the end, but also within the text, usually as a word (e.g., 'It is #sunny today'). Languages that do not use word dividers handle hashtags differently. In China, microblogs Sina Weibo and Tencent Weibo use a double-hashtag-delimited #HashName# format, since the lack of spacing between Chinese characters necessitates a closing tag. Twitter uses a different syntax for Chinese characters and orthographies with similar spacing conventions:- the hashtag contains unspaced characters, separated from preceding and following text by spaces (e.g., '我#爱你' instead of '我#爱你') or by zero-width non-joiner characters before and after the hashtagged element, to retain a linguistically natural appearance (displaying as unspaced '我#爱你', but with invisible non-joiners delimiting the hashtag). It is considered acceptable to tag a post once when contributing to a specific conversation. Two hashtags are considered acceptable when adding a location to the conversation. Three hashtags are seen by some as the 'absolute maximum', and any contribution exceeding this risks 'raising the ire of the community'. As well as frustrating other users, the misuse of hashtags can lead to account suspensions. Twitter warns that adding hashtags to unrelated tweets, or repeated use of the same hashtag without adding to a conversation can filter an account from search results, or suspend the account. Jimmy Fallon and Justin Timberlake performed a sketch parodying the often incorrect and misunderstood use of hashtags on Late Night with Jimmy Fallon in September 2013. Function:- Hashtags are mostly used in unmoderated, ad hoc discussion forums; any combination of characters led by a hash symbol is a hashtag, and any hashtag, if promoted by enough individuals, can 'trend' and attract more individual users to discussion. On Twitter, when a hashtag becomes extremely popular, it appears in the 'Trending Topics' area of a user's homepage. The trending topics can be organized by geographic area or by all of Twitter. Hashtags are neither registered nor controlled by any one user or group of users. They cannot be 'retired' from public usage, meaning that any given hashtag can theoretically be used in perpetuity. They do not contain any set definitions, meaning that a single hashtag can be used for any number of purposes, as chosen by the creators of them. Hashtags intended for discussion of a particular event tend to use an obscure wording to avoid being caught up with generic conversations on similar subjects, such as a cake festival using #cakefestival rather than simply #cake. However, this can also make it difficult for topics to become 'trending topics' because people often use different spelling or words to refer to the same topic. For topics to trend, there must be a consensus, whether silent or stated, that the hashtag refers to that specific topic. Hashtags also function as beacons that help users find and 'follow' (subscribe) or 'list' (organize into public contact lists) other users of similar interest. Television broadcasters such as Channel 4 have employed the hashtag during the transmission of programmes such as First Dates and The Undateables. Research has shown that audience numbers go up when individuals can be interactive by tweeting while viewing a programme. Hashtags can be used on the social network Instagram, by posting a picture and hashtagging it with its subject. As an example, a photo of oneself and a friend posted to the social network can be hashtagged #bffl or #friends. Instagram has banned certain hashtags, some because they are too generic, such as #photography #iPhone #iphoneography, and therefore do not fulfill a purpose. They have also blocked hashtags that can be linked to illegal activities, such as drug use. The ban against certain hashtags has a consequential role in the way that particular subaltern communities are built and maintained on Instagram. Despite Instagram's content policies, users are finding creative ways of maintaining their practices and ultimately circumventing censorship. Famous YouTube bloggers often use hashtags to promote their videos to a wide audience. Thus, by leaving various hashtags under the video, they are trying to increase their views and gain as many likes as possible. Usually, hashtags are left under the video itself in a special line. By clicking on the hashtag you go directly to the link to the video, which are similar in topic. Hashtags are also used informally to express context around a given message, with no intent to categorize the message for later searching, sharing, or other reasons. One of the functions of the hashtag is to serve as a reflexive meta-commentary, which contributes to the idea of how written communication in new media can be paralleled to how pragmatic methodology is applied to speech. In addition, the culture of hashtag has developed due to recent Black Lives Matter movement. In this case hashtags has been used to access vital information and news update on the topic. Similarly, hashtags were used for the #MeToo social movement. It was used to spread awareness and empower people to fight for gender equality. The spreadability function of the hashtag was very impactful for the cause because it allowed for people's messages to reach a wider audience. Through the spread of external information regarding the #MeToo movement empowered by the use of hashtags, has caused for an increase in financial investment towards sexual assault reform. This can help express contextual cues or offer more depth to the information or message that appears with the hashtag. 'My arms are getting darker by the minute. #toomuchfaketan'. Another function of the hashtag can be used to express personal feelings and emotions. For example, with 'It's Monday!! #excited #sarcasm' in which the adjectives are directly indicating the emotions of the speaker. It can also be used as a disclaimer of the information that the hashtag accompanies, as in, 'BREAKING NEWS:- US GDP growth is back! #kidding'. In this case, the hashtag provides an essential piece of information in which the meaning of the utterance is changed entirely by the disclaimer hashtag. This may also be conveyed with #sarcasm, as in the previous example. Self-mockery is another informal function of the hashtag used by writers, as in this tweet:- 'Feeling great about myself till I met an old friend who now races at the Master's level. Yup, there's today's #lessoninhumility', where the informality of the hashtag provides commentary on the tweet itself. Hashtags are a combination of keywords or phrases preceded by the # symbol, excluding any spaces or punctuations. For example, if you put the # symbol in front of the words 'social media', it becomes a hashtag #socialmedia. / Крис Мэссина (Chris Messina). Инстэгрэм (Instagram), Фэйсбок (Facebook), Рэдит (Reddit), и ЮТюб (YouTube). В 1978 Брайэн Кёнигэн (Brian Kernighan) и Дэнис Ричи (Dennis Ritchie) использовали. Стоу Бойд (Stowe Boyd) Председатель Бен Зимэ (Ben Zimmer Chair). Твитэ (Twitter) Инстэгрэм (Instagram), Фэйсбок (Facebook), Флыкё (Flickr), Тамблэ (Tumblr), и Гуглплас (Google+). ЮТюб (YouTube) и Гокэ Мидиэ (Gawker Media). #РомиоЭндДьжулиэт (#Romeo&Juliet). В Китае микроблоги Сайна Вэйбо (Sina Weibo) и Тенсэн Вэйбо (Tencent Weibo). Дьжимми Фэлэн (Jimmy Fallon) и Дьжастин Тимбэлэйк (Justin Timberlake).

HASP = МОТОК (или ШПУЛЬКА) – Jute or linen yarn measure, equal to 3 600 yards. Hasp:- jute or linen yarn in a 3 600-yard length. See also Heer. / мера джутовой или льняной пряжи, равная 3 600 ярдам длины. Смотрите также Xxxxx (Heer).

HASTATE = СТРЕЛОВИДНОЕ (или КОПЬЕВИДНОЕ) – Hastate:- arrowhead-shaped.

HASTATE LEAF = СТРЕЛОВИДНЫЙ ЛИСТ – Hastate Leaf:- halberd-shaped; remembering to that old fashioned weapon which was a combination between a spear and a battleax; wider at the base but with lobes ending sharply. Hastate Leaf is a leaf shaped like a spearhead with flaring pointed lobes at the base. / более широкий у основания, но с .

HAT = ШЛЯПА – Hat is a covering for the head usually having a shaped crown and brim. Headwear.

HATCH = ВЫЛУПЛЯТЬСЯ (или ВЫВОДИТЬСЯ, или ВЫВОДОК) – Hatch:- in the nymph or larva of insects, to come out of the egg after the embryo has completed development.

HATCH = ЛЮК – Hatch is an opening, generally rectangular, in a ship's deck affording access into the compartment below. The opening in the deck of a vessel; gives access to the cargo hold. Opening in a ship's deck through which cargo is lowered to or brought up from the holds. Hatch (maritime term):- an opening in a ship's deck for passageway or for handling cargo or stores. / Под Люком, от Голландского слова Luik, понимается отверстие в палубе судна для сообщения с нижерасположенными помещениями (сходный люк, грузовой люк) или доступа света и свежего воздуха (светлый люк). Люки на верхней палубе обычно окаймлены комингсами и снабжены непроницаемыми люковыми закрытиями. Закрытия больших люков (грузовых, светлых) имеют электрический или гидравлический привод. Люки устраивают также в фюзеляже самолёта, космического корабля, в полу и стенах промышленных сооружений, котлах, на колодцах для доступа в водопроводную, газовую, канализационную, телефонную сети и другие.

HATCH COVER = КРЫШКА ЛЮКА – Watertight means of closing the hatchway of a vessel. Hatch Cover is a water-tight covering which goes over the opening in the deck of a vessel giving access to the cargo hold.

HATCH WAY = ШАХТА ЛЮКА – Hatch Way:- opening in the deck of a vessel through which cargo is loaded into, or discharged from the hold and which is closed by means of a hatch cover. / Отверстие в палубе судна, через которое груз погружается в или разгружается из трюма, и которое закрывается с помощью крышки люка.

HAU = HARYANA AGRICULTURAL UNIVERSITY

HAUBERK = КОЛЬЧУГА – Hauberk is a tunic of chain mail worn as defensive armor from the XII to the XIV centuries.

HAULAGE = ДОСТАВКА (или ПОДВОЗКА, или НАЗЕМНЫЙ ПОДВОЗ, или ИЗВОЗ) – Haulage is the inland carriage of cargo or containers between named locations. Haulage is the inland transport service which is offered by the carrier under the terms and conditions of the tariff and of the relative transport document. / порядки и условия .

HAULIER = ДОСТАВЩИК (или ОТКАТЧИК, или СУХОПУТНЫЙ ПОДВОЗЧИК) – Haulier is a person or firm that transports goods by lorry (motor truck); one engaged in road haulage. Road Carrier. Haulier is a company that carries goods in trucks or trains for other companies. / Автомобильный перевозчик.

HAULM = СОЛОМА (или СОЛОМИНА, или БОТВА) – Haulm is the collective stems or tops of crop plants (e.g., Beans, Peas, Potatoes, grains, grasses) after the crop has been gathered, as used for bedding or thatching. Occasionally applied to a single stem. / Солома – коллективные стебли и надземные части возделываемых растений (например, Фасолей, Горохов, Картофелей, зерновых, трав) после того, как были убраны, используемые для подстилки скоту или закрепления почвы. Изредка применимо к одинокому стеблю (Соломина). Под Соломиной понимается цилиндрический, обычно полый в междоузлиях стебель злаков; у современных Сортов Овса, Пшеницы, Ржи и других сельскохозяйственных культур; устойчив к полеганию. Под Ботвой понимается надземная растительная масса овощных, кормовых и технических корнеклубнеплодов. Свежую, высушенную и силосованную ботву скармливают крупно рогатому скоту, в небольших количествах свиньям и овцам. Ботва, надземная растительная масса овощных, кормовых и технических корнеклубнеплодов. Идёт на корм в свежем, высушенном и силосованном виде. Содержит воды 80–85%, сухого вещества 15–20%. Питательность свежей ботвы:- 11.4 (Турнепса) – 15.8 (Свёклы Сахарной) кормовых единиц и 1.8–2 кг переваримого протеина в 100 кг корма; силосованной, соответственно, 12.0–15.9 кормовых единиц и 1.4–2.3 кг переваримого протеина. Скармливают ботву преимущественно крупному рогатому скоту (10–15 кг в сутки) и в небольших количествах свиньям и овцам. При больших дачах для нейтрализации свободных кислот добавляют мел (1 г на 1 кг ботвы). Ботву Картофеля скармливают осторожно из-за содержания в ней вредного для животных вещества солонина; беременным животным и молодняку её не дают. Силосуют ботву в чистом виде и в смеси с соломенной резкой или мякиной (10–15%).

HAURLAN INDEX = ИНДЕКС ОТ ХОАРЛЭНА – Haurlan Index is a technical analysis indicator, developed by Peter N. Haurlan, that is used to detect market breadth. There are three components of the Haurlan index:- (i) Short Term:- a 3-day exponential moving average is taken of the net NYSE advances over declines. (ii) Intermediate Term:- same, using a 20-day exponential moving average. (iii) Long Term:- same, using a 200-day exponential moving average. Breaking Down 'Haurlan Index':- each of the three components is used to detect a different movement, whether it is momentum, breakouts, or resistance. Haurlan Index is an indicator developed by Pete Haurlan to detect market breadth. The Haurlan Index is a technical indicator used to determine overbought and oversold conditions. Developed in the 1960s by Peter N. Haurlan (1923–1978), a rocket scientist and analytical trading enthusiast, the index itself measures market breadth through short-, intermediate- and long-term components. Each component is designed to measure a different aspect of price movements. This index was designed to be applied to the New York Stock Exchange (NYSE®), but analysts can use it for most major exchanges or indexes. Haurlan built this tool around the familiar advance-decline line and combined it with exponential moving averages (EMAs) over three-, 20- and 200-day lines. The short-term EMA is used to watch for breakouts and has a large influence on day-to-day trading. The intermediate-term EMA sets support and resistance levels and was considered by Haurlan to be the most important of the three lines. The long-term EMA does not actually generate any trading signals itself; it is only used to smooth out the signals from the other two lines and help provide a primary trend. Most analysts and traders will use the Haurlan Index in combination with other indicators, especially support and resistance oscillators. The Haurlan Index is mostly a short-term trading tool, even though there is a long-term trend calculation, so tools that help provide long-running support information aren't as useful in confirming Haurlan signals. Since the Haurlan Index is based on advance-decline (A/D) line numbers, it can also be used in a support role as a measurement of trend support. Other momentum indicators that rely on the A/D line are not good confirmation candidates with the Haurlan, as the underlying calculations would be somewhat redundant. / НЙФБ® или Эн.Уай.Эс.И.® (NYSE®). Американец Питё Эн. Хоарлэн (Peter N. Haurlan; 1923–1978).

HAUSTAURIUM = ГАУСТОРИЯ – Haustaurium (pl. haustoria) is a specialized organ through which a parasitic plant absorbs nourishment from its host. / Под Гаусторией, от Латинского слова Haustor, означающее Пьющий или Черпающий, понимается часть гифы паразитического Гриба, находящаяся внутри живой клетки растения-хозяина. Через гаусторию питательные вещества клеток организма-хозяина поступают в таллом Гриба. Имеются у многих фитопатогенных Грибов. Под Гаусториями,

от Латинского слова Haustor, означающее Пьющий или Черпающий, понимаются одноклеточные или многоклеточные образования Растений, служащие для всасывания тех или иных веществ. Гаустории у Паразитных Покрытосеменных Растений (например, у Повилики, Заразихи) – многоклеточные образования, представляющие большей частью видоизменённые корни; они развиваются при соприкосновении паразита с телом растения-хозяина, внедряются в его ткани и поглощают из них питательные вещества. Гаустории эндосперма и других структур зародышевого мешка у некоторых Покрытосеменных Растений – видоизменённые клетки, служащие для усиления притока питательных веществ к зародышу из окружающих тканей. Гаустории у Грибов – выросты клеток Гриба, проникающие в клетки хозяина.

HAUTE COUTURE = ОТ КУТЮР (или ВЕРХ ПОШИВА, или ВЫСОКАЯ МОДА) – Haute Couture:- the term haute couture is a designation protected by law and 'only those companies mentioned on the list drawn up each year by a commission domiciled at the Ministry for Industry are entitled to avail themselves thereof', to quote the Syndical Chamber for Haute Couture. The main criteria, set forth in 1945 and updated in 1992, are as follows:- to employ a minimum of fifteen people at the workshops, to present to the press in Paris each season (spring/summer and autumn/winter) a collection of at least thirty-five runs consisting of models for daytime wear and evening wear. Haute Couture is the business of designing, making, and selling high fashion, custom-made clothing. / Под От Кутюр, от Французского Haute Couture, означающее буквально Высокая Мода, понимается дело, связанное с .

HAVELOCK = ЧЕХОЛ С НАЗАТЫЛЬНИКОМ – Havelock is a covering attached to a cap to protect the neck from the sun or bad weather.

HAVERSACK = РАНЕЦ–РЮКЗАК (или РЮКЗАК ДЛЯ ПРОВИЗИИ) – Haversack is a bag similar to a knapsack but worn over one shoulder.

HAVING = ДОПРОС (или ОБЛАДАНИЕ) – Having:- used when defining the scope of a claim. A transitional phrase that is synonymous with (means the same thing as) 'including', 'containing' or 'characterized by'; is inclusive or open-ended and does not exclude additional, unrecited elements or method steps.

HAWAIIAN SHIRT = ГАВАЙСКАЯ РУБАШКА – Hawaiian Shirt is a usually short-sleeved sport shirt with a colorful pattern.

HAWB = HOUSE AIRWAY BILL

HAWB/MAWB = HOUSE AIRWAYBILL/MASTER AIRWAYBILL

HAWSE BUCKLER = КЛЮЗОВАЯ КРЫШКА – Hawse Buckler (maritime term):- an iron plate covering a hawse hole.

HAWSE–PIPE = ЯКОРНАЯ ТРУБА – Hawse-Pipe (maritime term):- a pipe lead-in for anchor chain through ship's bow.

HAWSER = ТРОС (или ШВАРТОВ, или ФАЛ, или КАНАТ) – Hawser is a large strong rope used for towing purposes and for securing or mooring ships. Hawsers are now mostly made of steel. Hawser (maritime term):- a rope used for towing or, mooring. / Под Тросом, от Голландского слова Tros, подразумевается наименование канатно-верёвочных изделий, изготовляемых из естественных (растительных) и искусственных волокнистых материалов, а также из стальной проволоки. Под Швартовным Устройством судна понимается совокупность приспособлений и механизмов (вьюшки, киповые планки, клюзы, кнехты, лебёдки, утки, швартовные клюзы, швартовные лебёдки или шпили, швартовы и прочие) для удержания судна во время стоянки у причала или у борта другого судна. Управление швартовными механизмами местное или дистанционное. Автоматическое потравливание или выбирание швартового троса при изменении его натяжения (например, при погрузке или разгрузке судна) позволяет избежать тяжёлой ручной работы. Швартов, от Голландского слова Zwaartouw, гибкий трос (стальной, синтетический или из растительного волокна), с помощью которого подтягивают и крепят судно к причалу или другому судну. Под Фалом, от Голландского слова Val, понимается трос, верёвка – одним словом, судовая снасть бегучего (подвижного) такелажа, используемая для подъёма гафелей, парусов, реев, флажных сигналов. Под Канатом понимается гибкое изделие, изготовленное из нитей, пряжи (каболок) из волокон растительного, синтетического или минирального происхождения, а также из стальной проволоки. По способу изготовления канаты подразделяются на кручёные или витые, невитые, плетёные. Стальные канаты изготовляют из проволок диаметром 0.5–2 мм круглого или фасонного сечения. Витые круглые канаты могут иметь одинарную (спиральную), двойную (тросовую), тройную (кабельтовую) свивку. Комбинированные витые канаты изготовляют чаще всего из пеньки и стали. Невитые канаты состоят из плотно уложенных групп стальных проволок или спиральных кабелей, обжатых спиральной обмоткой или зажимами. Плетёные канаты изготовляют из чётного числа (обычно четырёх) переплетённых прядей. Неметаллические канаты свивают из волокон асбеста, капрона (принятое в бывшем Союзе Советских Социалистических Республик (СССР) торговое название поликапроамида и волокон из него), Найлана^{T3} (Nylon^{TM}), пеньки, полипропилена, хлопка и других.

HAWSER–LAID = КАБЕЛЬНОЙ РАБОТЫ (или ТРОСОВОГО СПУСКА) – Hawser-Laid (maritime term):- left-handed rope of nine strands, in the form of three three-stranded, right-handed ropes. / Кабельной Работы (о тросе).

HAWSER TWIST = КАНАТНАЯ КРУТКА (или ТРОСОВАЯ СВИВКА, или ТРОЩЕНИЕ) – Hawser Twist is the construction of cabled yarn, cord, or rope in which the single and first-ply twist are in the same direction and the second-ply twist is in the opposite direction, and S/S/Z or Z/Z/S construction. / Конструкция многокруточной нити, верёвки или каната. Для скручивания готовой пряжи или химических нитей применяются трощение и кручение. Канатная Крутка – крутка одиночной пряжи и крутка первого сложения имеют одинаковое направление, а крутка последующего сложения имеет противоположное направление:- S/S/Z или Z/Z/S. Трощение является подготовительным процессом и заключается в соединении заданного числа одиночных нитей в один продукт, называемый трощёным или строщенным изделием, обладающим большой ровнотой по линейной плотности. При трощении необходимо обеспечить постоянство числа одиночных нитей по длине изделия и равенство натяжений отдельных компонентов. Затем трощёное изделие подвергают кручению, направление которого обозначают так же, как и при производстве однониточной пряжи (S и Z). Трощение – совместное параллельное наматывание (без крутки) нескольких текстильных нитей на одну паковку. Трощение обычно предшествует кручению. Применяется при производстве кручёных нитей, швейных ниток и тому подобного. Выполняется на тростильных машинах.

HAZARD = ОПАСНОСТЬ – Something that causes an exposure to injury, loss or damage. Hazard is a specific situation that increases the probability of the occurrence of loss arising from a peril, or that may influence the extent of the loss. For example, accident, sickness, fire, flood, liability, explosion are perils. Slippery floors, unsanitary conditions, shingled roofs, congested traffic, unguarded premises, and uninspected boilers are Hazards. / Опасность – возможность, угроза чего-нибудь очень плохого, какого-нибудь несчастья.

HAZARD CARGO SURCHARGE = НАДБАВКА ЗА ОПАСНЫЙ ГРУЗ (или ДОПЛАТА ЗА ОПАСНЫЙ ГРУЗ) – Hazard Cargo Surcharge is a surcharge applied to hazard (dangerous) cargoes by shipping lines tariffs. Freight surcharges are no longer updated by conferences. Please refer to shipping line agents or freight forwarders for their values. / надбавка или доплата (surcharge).

HAZARDOUS MATERIALS = (ОСОБО) ОПАСНЫЕ МАТЕРИАЛЫ – HazMat is a short for Hazardous Material. Material is deemed hazardous by the government or a carrier. HazMat may require special handling or special facilities. Not all warehouses or carriers will handle HazMat. Cargo or goods deemed dangerous because of their nature, such as caustic substances, radioactive materials, explosives, combustibles, etc. HAZ MAT is an industry abbreviation for 'Hazardous Material'. Hazardous Materials:- substance or combination of substances which, because of its quantity, concentration, or physical or chemical characteristics, may cause or significantly pose a substantial hazard to human health or the environment when improperly packaged, stored, transported, or otherwise managed. In the United States, material designated as hazardous by 49 CFR (49 CFR is short for the Code of Federal Regulations:- Title 49). A Hazardous Material is a substance or material which has been determined by the Department of Transportation to be capable of posing an unreasonable risk to health, safety and property when transported. A complete listing of hazardous material can be found in 49 CFR 172.101.

HAZARDOUS PURSUITS = ОПАСНЫЕ ЗАНЯТИЯ – Hazardous Pursuits:- certain sports and activities are termed hazardous pursuits and are excluded from travel insurances although it may be possible to have them included on payment of an additional premium. / Определённые виды спорта и другой деятельности определяются как опасные занятия и исключаются из страховок при путешествиях, хотя у многих страховых компаний существует возможность включать их в эти страховки, но при оплате дополнительной премии.

HAZARDOUS SUBSTANCE = ОПАСНОЕ ВЕЩЕСТВО – A Hazardous Substance is defined in the Regulations as any pesticide, herbicide or desiccant. / Предписаниями под Опасным Веществом определяется такое вещество, как гербицид, десикант (обезвоживатель) или любой пестицид.

HAZARDOUS WASTES = (ОСОБО) ОПАСНЫЕ ОТХОДЫ – Hazardous Waste is a waste that because of its quantity, concentration or physical, chemical or infectious characteristics may cause or significantly contribute to an increase in mortality or serious illness, or pose a substantial present or potential hazard to human health or the environment when improperly managed. Solid waste means any garbage, refuse or sludge from a waste treatment plan, water supply treatment plant or air pollution control facility and other discarded material including solid, liquid, semisolid or contained gaseous material resulting from industrial, commercial, mining, agricultural operations and from community activities. A hazardous waste is considered a liquid if it does not pass the Paint Filter Liquids Test as described in EPA Publication No. SW-846 'Test Methods for Evaluating Solid Wastes. Physical/Chemical Methods'. The US Environmental Protection Agency (EPA) has identified four characteristics of hazardous wastes that are:- (i) Corrosivity – D002 – the material is a liquid and can erode materials and human tissue. Examples include alkaline cleaners, some chlorides, fluorides and acids; pH less than or equal to 2 or greater than or equal to 12.5, or corrodes steel at a rate greater than 1/4 inch per year; (ii) Ignitability – D001 – the material is a liquid and is capable of burning or causing fire; examples include acetone, gasoline and industrial alcohols. Flash point less than 140 degrees F. (iii) Reactivity – D003 – the material is capable of reacting with air or water, causing an explosion or a release of poisonous fumes; examples include peroxides, isocynates, cyanides and chlorine; and (iv) Toxicity Characteristic (TC) – D004 – D043 – the material contains compounds that can poison humans. Examples include heavy metals and pesticide wastes. Wastes are determined to be TC wastes if they fail the Toxic Characteristic Leaching Procedure (TCLP) test, which is an analytical method designed to decide how much of a particular contaminant leaches from a material. Forty-three compounds are included; and they are listed in the following table. If a material leaches a compound on this list in amounts greater than the regulatory limit, it is a TC hazardous waste. Hazardous Wastes:- in the United States, any material, whether solid, liquid or containing gaseous material, identified in the Resource & Conservation Recovery Act (RCRA) either by name (listed) or by characteristics. A waste is any solid, liquid, or contained gaseous material that is discarded by being disposed of, burned or incinerated, or recycled. There are some exceptions for recycled materials. It can be the byproduct of a manufacturing process or simply a commercial product that you use in your business – such as a cleaning fluid or battery acid – and that is being disposed of. Even materials that are recyclable or can be reused in some way (such as burning solvents for fuel) might be considered waste. / Щелочное (Alkaline). сохранение (conservation).

HAZE = ДЫМКА (или ЛЁГКИЙ ТУМАН, или МУТНОСТЬ (жидкости)) – Haze:- in reflection, (1) scattering of light at the glossy surface of a specimen responsible for the apparent reduction in contrast of objects viewed by reflection at the surface. (2) Percent of reflected light scattered by a specimen having a glossy surface so that its direction deviates more than a specified angle from the direction of specular reflection. Haze is the scattering of light within or at the surface of a nearly clear specimen, responsible for cloudy appearance seen in transmission. / Атмосферная Дымка, равномерная световая вуаль, заволакивающая далёкие части ландшафта; вызывается рассеянием лучей в слое воздуха, расположенном между наблюдателем и рассматриваемыми предметами. В чистом воздухе лучи сине-фиолетовой части спектра рассеиваются сильнее, чем жёлтые и красные, поэтому атмосферная дымка, а вместе с ней и тёмные далёкие предметы приобретают голубоватую окраску ('синие дали'). Атмосферная дымка сглаживает различия в яркости и цвете удалённых предметов и этим ухудшает их видимость, вплоть до полного её исчезновения (смотрите Атмосферная Видимость). Техника ослабления эффекта атмосферной дымки разработана наиболее полно в аэрофотографии; в её основу положено перенесение съёмки (то есть применение соответствующих аэрофотоплёнок и светофильтров) в жёлтую, красную и ближнюю инфракрасную часть спектра, где яркость атмосферной дымки меньше. Когда атмосферная дымка вызывается рассеянием на крупных частицах пыли, тумана и тому подобного, такие методы не эффективны, так как в этих случаях рассеяние во всех частях спектра одинаково. Под Мутностью понимается способность оптически неоднородной среды рассеивать проходящий сквозь неё свет (смотрите Мутные Среды). Количественной характеристикой мутности служит коэффициент экстинкции (ослабления), определяемый по уравнению:- $t = (1 / l) \ln (I_0 / I)$, где I_0 и I – интенсивности светового луча соответственно до и после прохождения через слой среды толщиной l. Мутность определяют методами нефелометрии и турбидиметрии. Мутность Атмосферы, уменьшение прозрачности воздуха, обусловленное как рассеянием света взвешенными в атмосфере частицами (мельчайшими каплями воды, кристалликами льда, пылинками, частицами дыма и прочим), так и поглощением света водяным паром. С увеличением мутности атмосферы усиливается рассеяние Солнечных лучей и уменьшается интенсивность прямой Солнечной радиации. Количественной характеристикой мутности атмосферы служит фактор мутности.

HAZEL = ОРЕХОВОЕ (или ЛЕЩИНА) – Hazel:- a light brown to strong yellowish brown. / от светло-коричневого до строгого желтовато-бурого.

HAZ MAT = HAZARDOUS MATERIALS

HB = HYBRIDIZATION BLOCK

HBD = HARBOUR DUES

HCES = HONAM CROP EXPERIMENT STATION

HC CONTAINER = HIGH CUBE CONTAINER

HCPV = HYDROCARBON PORE VOLUME

HD = HIGH DENSITY

HDD = HEATING DEGREE–DAYS

HDD/CDD = HEATING DEGREE DAY/COOLING DEGREE DAY

HDI = HIGH DENSITY INDEX

HEAD = ГОЛОВКА – A Head (Capitulum) is a short dense spike in which the flowers are borne directly on a broad, flat peduncle, giving the inflorescence the appearance of a single flower, as in the Dandelion (Taraxacum). / как у Одуванчика (Тараксакум; Dandelion (Taraxacum)). У растений под Головкой (Capitulum) понимается простое соцветие с укороченной, иногда утолщённой (но не плоской, как у корзинки) осью, на верхушке которой на коротких цветоножках сидят цветки. Примеры головок:- соцветия Ворсянки, Клевера и других.

HEAD = ГОЛОВКА (или (ВЕРХНЕЕ) ДНИЩЕ, или ХХ) – Head is an end closure for the filter case or bowl which contains one or more ports.

HEAD = МЕТЁЛКА (или КОЛОС, или ЗОНТИК, или КОРЗИНКА) – Head is:- (1) a dense cluster of sessile or nearly sessile flowers. (2) The inflorescence or panicles of cereals such as Rice and Sorghum. / Корзинка – тип соцветия; метёлка у злаковых; кочан капусты. Под Метёлкой понимается ложное соцветие, многократно ветвящееся и несущее на концах ветвей простые соцветия – кисти (Сирень), колоски (у злаков), корзинки (у сложноцветных). Под Колосом понимается соцветие, в котором на удлинённой главной оси расположены сидячие цветки (простой колос – у Вербены, Подорожника) или колоски (сложный колос – у Пшеницы, Ржи). Под Зонтиком понимается соцветие с укороченной главной осью и цветками, располагающимися на удлинённых цветоножках почти в одной плоскости. Простой зонтик у Вишни, Примулы, сложный – у многих растений семейства Зонтичных. Под Корзинкой понимается тип соцветия, в котором цветки сидят на расширенной оси в виде блюдцевидной или шаровидной площадки (у Подсолнечника, Ромашки и других сложноцветных).

HEAD = ГОЛОВА (или ГАЛЬЮН) – Head (maritime term):- the ship's water closet (toilet or wash-room). The upper edge of a quadrilateral sail. / В Англоязычном морском жаргоне термин .

HEAD AND SHOULDERS = ГОЛОВА И ПЛЕЧИ – Head And Shoulders is a pattern in price trends which chartists consider indicates a price trend reversal. The price has risen for some time, at the peak of the left shoulder, profit taking has caused the price to drop or level. The price then rises steeply again to the head before more profit taking causes the price to drop to around the same level as the shoulder. A further modest rise or level will indicate that a further major fall is imminent. The breach of the neckline is the indication to sell. In technical analysis, a chart formation that resembles a human head and shoulders and is generally considered to be predictive of a price reversal. A head and shoulders top (which is considered predictive of a price decline) consists of a high price, a decline to a support level, a rally to a higher price than the previous high price, a second decline to the support level, and a weaker rally to about the level of the first high price. The reverse (upside-down) formation is called a Head And Shoulders Bottom (which is considered predictive of a price rally). Head And Shoulders is a reversal formation where three relatively similar thrusts in a trend are attempted with the middle (head) price move slightly higher/lower. The two shoulders are typically uniform in size, although the right shoulder may be smaller (withered) as the effects of the trend reversal are already being felt in the market. The trading signal is a breakout below/above the neckline. A reversal pattern characterized by a high, a higher high, a lower high, and a break below the line joining the lows between the highs, the so-called Neck-Line. Head And Shoulders:- This is one of the most popular and reliable chart patterns in technical analysis. Head and shoulders is a reversal chart pattern that when formed, signals that the security is likely to move against the previous trend. As you can see in Figure 1, there are two versions of the head and shoulders chart pattern. Head and shoulders top (shown on the left) is a chart pattern that is formed at the high of an upward movement and signals that the upward trend is about to end. Head and shoulders bottom, also known as Inverse Head And Shoulders (shown on the right) is the lesser known of the two, but is used to signal a reversal in a downtrend. Figure 1:- head and shoulders top is shown on the left. Head and shoulders bottom, or inverse head and shoulders, is on the right. Both of these head and shoulders patterns are similar in that there are four main parts:- two shoulders, a head and a neckline. Also, each individual head and shoulder is comprised of a high and a low. For example, in the head and shoulders top image shown on the left side in Figure 1, the left shoulder is made up of a high followed by a low. In this pattern, the neckline is a level of support or resistance. Remember that an upward trend is a period of successive rising highs and rising lows. The head and shoulders chart pattern, therefore, illustrates a weakening in a trend by showing the deterioration in the successive movements of the highs and lows. In technical analysis, Head And Shoulders is a three-peak pattern resembling the head and shoulders outline of a person, which is used to chart stock and commodity price trends. The pattern indicates the reversal of a trend. As prices move down to the right shoulder, a head and shoulders top is formed, meaning that prices should be falling. A reverse head and shoulders pattern has the head formation at the bottom of the chart and means that prices should be rising. / В техническом анализе биржевых рынков, Голова И Плечи – разворотная фигура, характеризуемая тремя максимальными значениями, из которых первое – максимумом, второе – более высокий, нежели первое, максимум и третье – более низкий, нежели первое, максимум, и падением с пробоем линии, соединяющей минимумы значений первого и третьего максимумов, так называемой линии 'шеи'.

HEAD AND SHOULDERS BOTTOM = ПЕРЕВЁРНУТЫЕ ГОЛОВА И ПЛЕЧИ ВНИЗУ – Head And Shoulders Bottom is a well-known reversal pattern marked by three (or more) prominent troughs with a middle trough (the head) that is lower than the other troughs (the shoulders). When the trendline (neckline) connecting the peaks at the top of the pattern is broken, the pattern is complete. / В техническом анализе биржевых рынков, .

HEAD AND SHOULDERS TOP = ГОЛОВА И ПЛЕЧИ ВВЕРХУ – Head And Shoulders Top is a well-known reversal pattern marked by three (or more) prominent peaks with a middle peak (the head) that is higher than the other peaks (the shoulders). When the trendline (neckline) connecting the troughs at the bottom of the pattern is broken, the pattern is complete. / В техническом анализе биржевых рынков, .

HEADBAND = ГОЛОВНАЯ ПОВЯЗКА – Headband is a band worn on or around the head.

HEADDRESS = ЗАМЫСЛОВАТЫЙ ГОЛОВНОЙ УБОР – Headdress is an often elaborate covering for the head.

HEAD DYE = ХХ КРАСИТЕЛЬ – Head Dye:- xxxxx. See also Illuminating Dye.

HEAD END = ГОЛОВНОЙ КОНЕЦ (или КАЗОВЫЙ КОНЕЦ) – Head End is:- (1) the beginning of a new piece of fabric in the loom that bears appropriate identification. (2) A small sample of fabric that may be submitted to a customer for approval. Head End:- theoretically, the start of a piece of fabric, but more commonly used to describe a small full-width sample of gray or finished goods. /

Головной Конец:- (1) начало куска ткани на ткацком станке; (2) наружный конец куска готовой ткани с фабричными знаками; казовый конец куска ткани; (3) передняя или головная часть шлихтовальной машины.

HEADER = ЗАГОЛОВОК – Header is that part of the SWIFT message envelope which precedes the message text. Its prime purpose is to identify the receiver to SWIFT and the sender to the receiver. The sender and receiver are identified only in the header. The information contained in the header is network dependent. / Под Заголовком понимается та часть оболочки (envelop) сообщения Сообщества по Всемирной Межбанковской Финансовой Дальней Связи (СВМФДС; The Society for Worldwide Interbank Financial Telecommunication (SWIFT)), которая предшествует тексту самого сообщения. Его главной целью является идентификация получателя для СВМФДС и отправителя для получателя. Отправитель и получатель идентифицируются только в заголовке. Информация, содержащаяся в заголовке зависит от рабочей сети. коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо).

HEADER = ФЕРМА – Header is a single member composed of two or more wood members, securely fastened together and used to increase load carrying capability at wall or floor openings. / В строительной механике под Фермой, от Французского слова Ferme от Латинского слова Firmus, означающее Крепкий или Прочный, понимается геометрически неизменяемая стержневая система, у которой все узлы принимаются при расчёте шарнирными. Металлические, железобетонные, деревянные и комбинированные фермы применяют в покрытиях зданий, мостах и другом. Под Фермой, от Французского слова Ferme, от Латинского слова Firmus, означающее Крепкий или Прочный, понимается стержневая несущая конструкция покрытия здания, пролётного строения моста, гидротехнического сооружения и так далее. Фермы изготовляются из металла, железобетона, дерева и комбинированных (из нескольких) материалов. В расчётной схеме ферма соединение стержней в узлах обычно условно принимается шарнирным, а нагрузка – передающейся через узлы. Поэтому при расчёте полагают, что в стержнях фермы возникают только продольные (растягивающие или сжимающие) усилия. Основные составные части фермы – пояса (прямолинейные и полигональные) и решётка (простая, сложная и составная). Ферма с прямоугольной решёткой и жёстким соединением стержней, работающих на изгиб, называется безраскосной. Пояса и решётка стальных ферм покрытий обычно изготовляются из двух уголковых профилей, соединённых прокладками.

HEADER BAR = ГОЛОВНОЙ (или ЦЕНТРАЛЬНЫЙ) СТЕРЖЕНЬ – Header Bar is a bar or beam on rear of container (open top) that can be removed or swung to improve access into container. / Стержень или брус на задней стороне контейнера (открытого сверху), который может быть вынут или вывёрнут с целью обеспечения доступа к контейнер. Контейнер, открытый сверху сходен во всех отношениях с контейнером общего назначения, за исключением того, что у него вместо жёсткой крыши имеется гибкий раздвижной или съёмный чехол, сделанный, например, из брезента или пластика (иногда армированного) и обычно поддерживаемый откидными или съёмными балками. Аналогичные контейнеры выпускают также совсем без крыши. Они могут иметь откидные или съёмные верхние торцовые поперечные элементы над торцовыми дверями. Контейнер общего назначения с открывающейся крышей может использоваться для тех же специальных целей, как и открытый сверху контейнер.

HEADGEAR = ГОЛОВНОЙ УБОР (или ШЛЕМ) – Headgear is a covering or protective device for the head.

HEAD GIRTH = ОБХВАТ ГОЛОВЫ – Head Girth:- using measuring tape, start one inch above your eye brows and go around the widest part of your head. Measure in inches. Depth is typically determined by the distance between your ears and the top of your head. In order for a cap or hat to fit comfortably and without escessive wrinkling, it is important for you to first understand what head shape you have. / Обхват Головы:- максимальный горизонтальный обхват головы, измеренный над ушами в сантиметрах.

HEADING = ВЫМЁТЫВАНИЕ (или ВЫБРАСЫВАНИЕ МЕТЁЛКИ, или ВЫБРАСЫВАНИЕ СУЛТАНА, или КОЛОШЕНИЕ, или ВЫКОЛАШИВАНИЕ) – Heading is a growth stage of the rice plant marked by emergence of the panicle from the boot.

HEADLAND PATTERN = РИСУНОК ЗАЩИТНОЙ ПОЛОСЫ – Headland Pattern is a plowing technique that makes a dead or back furrow plowing pattern. This technique is used in many plowing operations but especially in large operations using large tillage equipment.

HEADLINE EARNINGS = ЗАРАБОТКИ ОТ ОСНОВНОГО ВИДА ДЕЯТЕЛЬНОСТИ – Headline Earnings are the earnings attributable to ordinary shareholders from trading operations, excluding capital profits and losses, amortization of goodwill, revaluations of investment properties and impairment of advances.

HEADLOAD = НАГРУЗКА НА ПЕРЕДНЮЮ ЧАСТЬ – Headload:- a quantity of cargo loaded in the front of a container.

HEADPIECE = ГОЛОВНОЙ УБОР (или ШЛЕМ, или КАСКА) – Headpiece is a protective or defensive head covering; an ornamental, ceremonial, or traditional covering for the head.

HEAD RICE = ОСНОВНОЕ ЗЕРНО РИСА – Head Rice:- the whole grains of milled Rice that can be obtained from a given quantity of clean rough Rice (paddy). It is usually expressed as a percentage of rough Rice. Broken Rice larger than 3/4 of a grain is also considered as Head Rice. Head Rice may vary from as low as 25% to as high as 65%. Head Rice is the portion of total milled Rice consisting of whole kernels. Head Rice or Head Rice Percentage is the weight of head grain or whole kernels in the Rice lot. Head Rice normally includes broken kernels that are 75–80% of the whole kernel. High Head Rice yield is one of the most important criteria for measuring milled Rice quality. Broken grain has normally only half of the value of head Rice. The actual head Rice percentage in a sample of milled Rice will depend on both varietal characteristics (i.e. the potential head Rice yield), production factors, and harvesting, drying and milling process. In general harvesting, drying, and milling can be responsible for some losses and damage to the grain. Head Rice means broken kernels whose lengths are more than those of brokens but have not reached the length of the whole kernel. This includes split kernels that retain the area as from 80% of the whole kernel. / Под Основным Зерном Риса понимается часть полностью обрушенного Риса, состоящая из целиковой зерновки (целых ядер). дроблёнка или сечка (brokens). У Ячменя:- к основному зерну относят зёрна Ячменя, по характеру повреждений не относящиеся к сорной и зерновой примесям, а также мелкие зёрна Ячменя.

HEAD ROOM = МЕЖПАЛУБНОЕ ПРОСТРАНСТВО (или ГАБАРИТНАЯ ВЫСОТА) – Head Room (maritime term):- the height of the decks, below decks.

HEAD–TO–ROW = РЯД, ЗАСЕЯННЫЙ СЕМЕНАМИ ОДНОГО КОЛОСА или ОДНОЙ МЕТЁЛКИ (или МЕТЁЛКА К РЯДУ) – Head-To-Row:- a process of growing seeds of individual plants to determine or maintain seed purity of a variety.

HEALTH CHECK REFORM OF THE COMMON AGRICULTURAL POLICY = РЕФОРМА ПРОВЕРКИ ГОТОВНОСТИ ОБЩЕЙ СЕЛЬСКОХОЗЯЙСТВЕННОЙ ПОЛИТИКИ – Health Check Reform Of The Common Agricultural Policy:- on 20 November 2008 the EU agriculture ministers reached a political agreement on the Health Check of the Common Agricultural Policy. Among a range of measures, the agreement abolishes arable set-aside, increases milk quotas gradually leading up to their abolition in 2015, and

converts market intervention into a genuine safety net. Ministers also agreed to increase modulation, whereby direct payments to farmers are reduced and the money transferred to the Rural Development Fund.

HEALTH INSURANCE = СТРАХОВАНИЕ ЗДОРОВЬЯ – Health Insurance is a generic term applying to all types of insurance indemnifying or reimbursing for losses caused by bodily injury or sickness or for expenses of medical treatment necessitated by sickness or accidental bodily injury. The Health Maintenance Organization (HMO) Health Insurance is a network of doctors, hospitals, health care providers, and pharmacies that offer medical treatment at a reduced cost to members. Each health care provider that is part of the network works together to manage the cost and quality of the health care provided to members. A member of an HMO health insurance plan is responsible for choosing a Primary Care Physician (PCP) from a list of physicians that are a part of the network. These physicians range from general practice, internal medicine, family practice, and pediatrics. The Primary Care Physician is responsible for coordinating the health care needs of the member of the HMO plan. The PCP can provide care or recommend a specialist if needed. There are numerous specialists that are part of the HMO health network. There are several advantages to having an HMO health insurance plan. One of the biggest advantages is that members enjoy low out-of-pocket expenses in comparison to pricey, traditional health insurance plans. A visit to a doctor's office or a hospital is covered after a small co-payment of USD5 or USD10 is paid. An HMO health insurance plan usually includes routine physicals, prescription drugs, lab tests, well baby care, maternity visits, and vision exams. With this type of plan, members are not expected to pay an annual deductible before their medical treatment is covered. / Страхование Здоровья – в широком смысле – страхование, предусматривающее покрытие расходов на медикаменты и медицинское обслуживание, включая Health Maintenance Organizations (HMOs) – программы страхования в выбранной страхователем организации и тому подобное. При страховании предусматривается возмещение убытков, вызванных болезнью или телесным повреждением, несчастным случаем, возмещение потери дохода в результате нетрудоспособности.

HEALTHY TILLER = ЗДОРОВЫЙ ОТРОСТОК – Healthy Tiller is a tiller that is free of pest damage.

HEART = СЕРДЦЕВИНА – Heart (maritime term):- the inside center strand of rope.

HEART ROT = СЕРДЦЕВИННАЯ ГНИЛЬ (или ГНИЛЬ СЕРДЦЕВИНЫ, или ЯДРОВАЯ ГНИЛЬ) – Any rot characteristically confined to the heartwood originating in the living tree. Heart Rot is often defined as decay in living trees. Some define it as decay that develops primarily in the heartwood or inner wood of living trees. It is usually used to refer to decays that primarily develop in the stem rather than in the roots and butt. / гниение в растущих деревьях.

HEART SHAPED = В ФОРМЕ СЕРДЦА (или СЕРДЦЕОБРАЗНОЕ) – Heart Shaped or Butterfly Headress:- this head dress looked like wings had been attached on the sides. A veil was worn over it, and many times a caul would be worn underneath.

HEARTWOOD = СЕРДЦЕВИННАЯ ДРЕВЕСИНА (или СЕРДЦЕВИНА, или ЯДРО) – Nonliving, inner and often dark-colored wood in which no water transport occurs. It is surrounded by sapwood. Has preformed defenses but no active defenses. Heartwood is the wood extending from the true center to the sapwood, and whose cells no longer participate in the life processes of the tree. Heartwood may contain gums, resins, and other materials that usually make it darker and more decay resistant than sapwood. See also Pith. / и большей сопротивляемостью гниению, нежели . Под Сердцевиной понимается узкая центральная часть ствола, состоящая из рыхлой ткани, характеризующаяся бурым или более светлым, чем у окружающей древесины, цветом. На торцах сортимента наблюдается в виде пятна (около 5 мм) различной формы, на радиальных поверхностях – в виде узкой полосы. В ботанике под Сердцевиной понимается центральная часть стебля или корня, занятая рыхлой паренхимной тканью, в которой откладывается дубящие вещества, крахмал, масла. Кнаружи от сердцевины расположена древесина.

HEAT–AWAY™ = ХИТ–ЭВЭЙ™ – Heat-Away™ (thermogaze):- is a special heat-sensitive, woven cotton fabric often referred to as 'Burn-Away' or 'Aetz-Cloth'. It is used in the following situations:- (i) on top of fabrics that cannot be made wet, like corduroy or velvet, to keep stitches from sinking in and getting lost; and (ii) to create 'free-standing' embroidery. Just hoop Heat-Away™ and embroider directly onto it. After removing the Heat-Away™, only the embroidered pattern remains. / Хит-Эвэй™ (Heat-Away™).

HEAT CAPACITY = ТЕПЛОЁМКОСТЬ – Heat Capacity is a physical property of a material indicating its ability to retain heat; measured in kJ/(kg K); typical values:- 4.182 kJ/(kg °C) for water, 2.1 kJ/(kg °C) for ice, 1.6 kJ/(kg °C) for many frozen foodstuffs. / Под Теплоёмкостью понимается количество теплоты, которое необходимо подвести к телу, чтобы повысить его температуру на 1 °C или 1 K, точнее – отношение количества теплоты, полученное телом (веществом) при бесконечно малом изменении его состояния в каком-либо процессе, к вызванному им приращению температуры. Теплоёмкость единицы массы называют Удельной Теплоёмкостью. Теплоёмкость – величина равная отношению количества теплоты δQ, сообщаемого телу (системе) при бесконечно малом изменении его состояния в каком-либо процессе, к соответствующему изменению температуры T этого тела:- C = δQ / dT. Отношение T к массе тела m называют Удельной Теплоёмкостью c = C / m, а отношение T к количеству вещества – Молярной Теплоёмкостью:- C_m = Mc = MC / m, где M – молярная масса вещества. Теплоёмкость зависит от химического состава, условий, в которых оно находится, процесса теплопередачи. Например, в адиабатном процессе C = 0, в изохорическом процессе C = C_v, в изобарическом процессе C = C_p и в изотермическом процессе C = ±∞. Для идеального газа выполняется Уравнение Майера (Немецкий естествоиспытатель, врач Юлиус Робэрт Майэр (Mayer) 1814–78). В общем случае теплоёмкость – функция температуры. Единица теплоёмкости в СИ – Дж/К.

HEAT CONTENT = ТЕПЛОТВОРНАЯ СПОСОБНОСТЬ (или КАЛОРИЙНОСТЬ (устаревшее), или ТЕПЛОСОДЕРЖАНИЕ, или ТЕПЛОТА СГОРАНИЯ, или ТЕПЛОТВОРНОСТЬ, или ЭНТАЛЬПИЯ) – Heat Content:- the amount of heat energy available to be released by the transformation or use of a specified physical unit of an energy form, e.g., a ton of coal, a barrel of oil, a kiloWatthour of electricity, a cubic foot of natural gas, or a pound of steam. The amount of heat energy is commonly expressed in British thermal units (Btus). Heat content of combustible energy forms can be expressed in terms of their gross heat content (higher or upper heating value) or net heat content (lower heating value), depending upon whether or not the available heat energy includes or excludes the energy used to vaporize water (contained in the original energy form or created during the combustion process). The US Energy Information Administration typically uses gross heat content values. / Количество тепловой энергии, доступное к выпуску путём трансформации, или применение специфической физической единицы энергии, например, тонна угля, баррель нефти, килоВаттчас электричества, кубический фут природного газа или фунт пара. Количество тепловой энергии обычно выражается в Британских единицах теплоты (Бет). Теплосодержание, выделяемое в процессах сгорания, может быть выражено либо как валовое содержимое тепла (высшая или полезная величина тепла), либо как чистое содержимое тепла (низшая полезная величина тепла) в зависимости от того, включает ли или нет доступная тепловая энергия энергию, используемую для производства пара из воды (содержавшуюся в первоначальной форме энергии или созданную в процессе сгорания). Администрация США по Информации в Сфере Энергетики обычно использует величины валового содержимого тепла. Под Калорийностью топлива понимается теплота сгорания. Теплосодержание, то же, что Энтальпия. Под Теплотой Сгорания топлива или Теплотой Горения понимается количество теплоты в Джоулях (Дж) или калориях (кал), выделяющейся

при полном сгорании твёрдого, жидкого или газообразного топлива. Различают теплоту сгорания низшую (без учёта теплоты, израсходованной на испарение воды, содержащейся в топливе или образующейся при сгорании) и высшую, а также удельную и объёмную. Под Энтальпией, от Греческого слова Enthálpō, означающее Нагреваю или Согреваю, понимается однозначная функция H состояния термодинамической системы при независимых параметрах энтропии S и давлении p, связана с внутренней энергией U соотношением:- H = U + pV, где V – объём системы. При постоянном p (то есть в изобарическом процессе) изменение энтальпии равно количеству теплоты, подведённой к системе, поэтому энтальпию часто называют тепловой функцией или теплосодержанием. В состоянии термодинамического равновесия (при постоянных p и S) энтальпия системы минимальна. Единица энтальпии в СИ – Джоуль (Дж).

HEAT–DAMAGED KERNELS = ПОВРЕЖДЁННАЯ САМОСОГРЕВАНИЕМ ЗЕРНОВКА (или ПОВРЕЖДЁННЫЕ САМОСОГРЕВАНИЕМ ЯДРА) – (1) Heat-Damaged Kernels are the kernels, pieces of Wheat kernels, and other grains that are materially discolored and damaged by heat which remain in the sample after the removal of dockage and shrunken and broken kernels. / изменили цвет .

(2) Heat-Damaged Kernels:- whole or large broken kernels of Rice which are materially discolored and damaged as a result of heating, and whole or large broken kernels of parboiled rice in nonparboiled Rice which are as dark as, or darker in color than, the interpretive line for heat-damaged kernels. / изменили цвет .

(3) Heat-Damaged Kernels:- Canola and pieces of Canola which, after being crushed, exhibit that they are discolored and damaged by heat. / , которые изменили цвет и .

HEAT DURABILITY = ПРОДОЛЖИТЕЛЬНОСТЬ ПОДДЕРЖИВАНИЯ ТЕПЛА – Heat Durability is the extent to which a material retains its useful properties at ambient air conditions, following its exposure to a specified temperature and environment for a specified time and its return to ambient air conditions.

HEATED CONTAINER = ОТАПЛИВАЕМЫЙ КОНТЕЙНЕР (или ПРОГРЕВАЕМЫЙ КОНТЕЙНЕР) – Heated Container is a thermal container served by a heat producing appliance.

HEATED KERNELS = СОГРЕТАЯ ЗЕРНОВКА (или СОГРЕТЫЕ ЯДРА) – Heated Kernels have the light tan to dark brown color or an odor typical of grain that has heated in storage. The term includes kernels discolored from artificial drying, but not binburnt or fireburnt kernels. / изменившую цвет .

HEATED STORAGE = ХРАНЕНИЕ В ТЁПЛЫХ СКЛАДАХ – Heated Storage:- warehouse specifically heated to protect bottled cargo. / Склад, специально обогреваемый, для сохранности бутилированного груза.

HEAT EXCHANGER = ТЕПЛООБМЕННИК – Heat Exchanger is a device which transfers heat through a conducting wall from one fluid to another. / Теплообменник или Теплообменный Аппарат – устройство, в котором осуществляется теплообмен между двумя или несколькими теплоносителями либо между теплоносителем и поверхностью твёрдого тела. Процесс передачи теплоты от одного теплоносителя к другому – один из наиболее важных и часто используемых в технике процессов, например, получение пара в теплообменниках-котлоагрегатах основано на теплообмене между продуктами сгорания органического топлива и водой. По принципу действия теплообменники подразделяют на рекуператоры, регенераторы и смесительные теплообменники; существуют также теплообменники, в которых нагрев (охлаждение) теплоносителя осуществляется за счёт ‘внутреннего’ источника теплоты (холода). Рекуперативные теплообменники – аппараты, в которых 2 движущихся теплоносителя с различной температурой разделены твёрдой стенкой. Теплообмен происходит путём конвекции в теплоносителях и теплопроводности стенки (смотрите Конвективный Теплообмен), а также лучистого теплообмена, если хотя бы одним из теплоносителей является излучающий газ. К рекуператорам относятся парогенераторы, подогреватели, выпарные аппараты и так далее. На рисунке даны некоторые конструкции рекуперативных теплообменников. В регенеративных теплообменниках одна и та же поверхность нагрева периодически омывается то горячим, то холодным теплоносителем, то есть сперва поверхность отбирает теплоту и нагревается, а затем отдаёт теплоту и охлаждается. Типичный пример регенераторов – воздухонагреватели доменных печей (смотрите Каупер). Так как в рекуперативных и регенеративных теплообменниках теплообмен осуществляется на поверхности твёрдого тела, их называют поверхностными. В смесительных теплообменниках теплообмен идёт при непосредственном соприкосновении теплоносителей. Теплообменник такого типа – градирни, в которых вода охлаждается атмосферным воздухом. В теплообменниках с внутренним источником теплоты (холода) используется только один теплоноситель. К подобным теплообменникам относятся ядерные реакторы, электронагреватели и так далее. Тепловой расчёт теплообменника сводится к совместному решению уравнений теплового баланса и теплопередачи. Различают проектные расчёты, необходимые для определения поверхности теплообмена и выполняемые при конструировании новых теплообменников; и поверочные расчёты теплообменника, цель которых определить количество переданной теплоты и конечные температуры теплоносителей при известной поверхности теплообменника. Теплообменники широко применяются в теплоэнергетике (воздухоподогреватели, конденсаторы, пароперегреватели, экономайзеры), в химической и пищевой промышленности и так далее.

HEAT EXPANSION RUPTURE = РАЗРЫВ ВСЛЕДСТВИЕ ТЕПЛОВОГО УВЕЛИЧЕНИЯ В ОБЪЁМЕ – Heat Expansion Rupture is a damage to a product or its packaging caused by an increase in volume when the temperature rises above a critical point.

HEATH = ВЕРЕЩАТНИК (или ПУСТОШЬ) – Heath is open land covered with low-growing shrubs such as heather. / Верещатник – открытая местность, покрытая низкорастущими кустами, такими как обыкновенный Вереск (heather). Под Верещатниками понимаются заросли кустарников, преимущественно семейства Вересковых (Вереск, Эрика); встречаются Брусника, Лишайники, Мхи, Толокнянка и Черника. Распространены на песчаных и торфянистых почвах в условиях умеренного влажного океанического климата (Западная Европа; на территории бывшего СССР – Прибалтика). Под Пустошью понимается растительность, образованная в основном вечнозелёными кустарничками преимущественно на месте лесов, главным образом после вырубок или пожаров, например, верещатники в приморских районах Западной Европы. Пустошью называются также некоторые сходные типы растительности в Южной Африке и Южной Австралии.

HEATHER = ПЁСТРОЕ – Heather is a yarn that is spun using pre-dyed fibers. These fibers are blended together to give a particular look. For example, black and white may be blended together to create a grey heathered yarn. The term, heather, may also be used to describe the fabric made from heathered yarns.

HEATHER YARN = ПЁСТРАЯ ПРЯЖА – Heather Yarn is a term describing mottled or melange-type yarns.

HEAT–INDUCED BLOWING = ВЗДУТИЕ ВСЛЕДСТВИЕ ВОЗДЕЙСТВИЯ ТЕПЛОМ – Heat-Induced Blowing is a bulging on cans caused by dilation (expansion) of the canned product.

HEATING DEGREE DAY/COOLING DEGREE DAY = ГРАДУСО–ДЕНЬ ОТОПЛЕНИЯ/ГРАДУСО–ДЕНЬ ОХЛАЖДЕНИЯ – Heating Degree Day/Cooling Degree Day (HDD/CDD):- HDD is a measurement designed to reflect the demand for energy needed to heat a building or facility. The heating requirements for a given structure at a specific location are considered to be directly proportional to the number of HDDs at that location. A similar measurement, CDD, reflects the amount of energy used to cool a building. HDDs are defined relative to a base temperature, which is the outside temperature above which a building needs no heating. HDDs can be calculated in several different ways, depending on the accuracy desired, but one of the simplest and most common uses 65° F as a base temperature, and is calculated as follows:- Take the average temperature on any given day, and subtract it from the base temperature. If the value is less than or equal to zero, that day has zero HDDs. But if the value is positive, that number represents the number of HDDs on that day. Other calculation methods improve accuracy by taking into account such things as the type of building and how well it's insulated, any heat-generating occupants or equipment, the time of day when heating is required, or the cumulative effect of residual heat. Why does this matter? Because HDDs are typical indicators of energy consumption for space heating, they can be used to monitor the heating costs for climate-controlled buildings, to forecast heating demand, or for estimating future heating demand costs.

HEATING DEGREE–DAYS = ГРАДУСО–ДНИ ОТОПЛЕНИЯ – Heating Degree Days (HDD) is a measure of how cold a location is over a period of time relative to a base temperature, most commonly specified as 65 degrees Fahrenheit (or 18.3 °C). The measure is computed for each day by subtracting the average of the day's high and low temperatures from the base temperature (65 degrees), with negative values set equal to zero. Each day's heating degree-days are summed to create a heating degree-day measure for a specified reference period. Heating degree-days are used in energy analysis as an indicator of space heating energy requirements or use. Heating degree-days are the number of degrees per day that the daily temperature is below a given temperature. The given temperature is the point below which the consumer is assumed to use fuels for space heating and varies from country to country. See also Cooling Degree-Days, Degree Day, and Degree-Days Normals. Heating Degree Days (HDD) is a measure of how cold a location is over a period of time relative to a base temperature, most commonly specified as 65 degrees Fahrenheit. The measure is computed for each day by subtracting the average of the day's high and low temperatures from the base temperature (65 degrees), with negative values set equal to zero. Each day's heating degree days are summed to create a heating degree-day measure for a specified reference period. Heating degree days are used in energy analysis as an indicator of space heating energy requirements or use. / Измерение того, насколько холодно в данном месте в течение определённого периода по отношению к базовому значению температуры, как правило, составляющему 65 градусов по Фаренгейту (18.3 °C). Значения вычисляются по каждому дню путём вычитания из базовой температуры (65 градусов) среднеарифметических значений макисмальной и минимальной суточной температуры, при этом отрицательные величины приравниваются к нулю. Ежедневные значения градусо-дней отопления суммируются для определения значения градусо-дня отопления для конретно выбранного периода. Градусо-дни отопления используются в анализе ситуации в энергетике в качестве индикатора потребности или фактического потребления энергии, направленной на отопление помещений. Другими словами, градусо-днями отопления называют количество градусов в сутки, на которое среднесуточная температура ниже базовой. Эта температура служит значением, ниже которого потребитель предположительно использует энергию для отопления помещений; и она может быть различной в разных странах. Смотрите также Градусо-Дни Кондиционирования (Cooling Degree-Days), Градусо-День (Degree Day), и Среднестатистические Градусо-Дни (Degree-Days Normals).

HEATING OIL = ТОПЛИВО ПЕЧНОЕ БЫТОВОЕ – Heating Oil is a low-viscosity petroleum product that is derived from crude oil. As a result, heating oil prices are often tied to WTI crude. Generally, 25% of the yield of a barrel of crude is devoted to heating oil, the second most after gasoline. Heating oil is generally used as a fuel for furnaces or boilers to heat homes and businesses. The fuel is especially popular in parts in of Northeastern US where natural gas and propane are either inaccessible or too expensive for these often cold markets. The product is also popular in the British Isles and especially Northern Ireland. Furthermore, contracts of the fuel are a popular choice for those seeking to hedge prices of diesel and jet fuel which do not trade as liquidly as heating oil does but are often a stable premium above NYMEX® heating oil futures contracts. For those looking to invest directly in heating oil, a limited number of options are available. While there are heavily traded futures contracts for the product, there are currently no pure play stocks or equity ETFs that invest in companies that exclusively produce heating oil and do not also refine it themselves from crude oil. With that being said, some smaller firms or even some utilities may be a way to gain some level of exposure to the sector. There are, however, a number of ETPs that offer exposure to the commodity's futures contracts either in a basket or pure-play form. Heating Oil:- No. 2 fuel oil, a distillate fuel oil used either for domestic heating or in moderate capacity commercial-industrial burners. The New York Mercantile Exchange (NYMEX®) launched the heating oil futures contract on 1978-November-14. See also Fuel Oil. / НАЙМЭКС® (NYMEX®). Дословно отопительное масло, печное бытовое топливо № 2 (No. 2 heating oil). Под Котельными Топливами понимаются тяжёлые продукты переработки нефтей, каменных углей, горючих сланцев. Применяются для корабельных, судовых и стационарных котельных установок и в промышленных печах различного назначения.

HEATING SYSTEM = СИСТЕМА ОТОПЛЕНИЯ (или СИСТЕМА ОБОГРЕВА) – Heating System:- Energy Efficiency program promotion aimed at improving the efficiency of the heating delivery system, including replacement, in the residential, commercial, or industrial sectors. / Под Отоплением понимается искусственный обогрев помещений для поддержания температуры, отвечающей условиям теплового комфорта (например, 18–20 °C в жилых помещениях), а иногда и требованиям технологического процесса. Под отоплением понимают также системы, выполняющие эти функции. Основные виды:- водяное, воздушное, лучистое, панельное, печное, электрическое отопление. Под Отоплением понимается искусственный обогрев помещений для возмещения в них тепловых потерь и поддержания на заданном уровне температуры, отвечающей чаще всего условиям теплового комфорта для людей, а иногда требованиям технологического процесса. Наиболее распространено водяное отопление.

HEAT RECOVERY STEAM GENERATOR = XX – Heat Recovery Steam Generator (HRSG) is an air-to-steam heat exchanger installed on combined-cycle generators.

HEAT RESISTANCE = ТЕПЛОСТОЙКОСТЬ (или ЖАРОПРОЧНОСТЬ) – Heat Resistance is a property of certain fibers or yarns whereby they resist degradation at high temperature. Heat resistance may be an inherent property of the fiber-forming polymer or it may be imparted by additives or treatment during manufacture. See also Heat Stabilized. Heat Resistance can be a quality inherent in a yarn, or it may be imparted by additives or treatment of the resulting fabric. Heat Resistance is the extent to which a material retains useful properties as measured during exposure of the material to a specified temperature and environment for a specified time.

HEAT SET FINISH (HEAT SEALING) = ЗАКЛЮЧИТЕЛЬНОЕ ВОЗДЕЙСТВИЕ НА ФОРМУ ТЕПЛОМ (ТЕПЛОВОЕ ЗАПЕЧАТЫВАНИЕ) – Heat Set Finish (Heat Sealing) is a process of heat finishing that will stabilize many manufactured fiber fabrics in order that there will not be any subsequent change in shape or size. Heat setting is used to permanently impart a crease, a pleat, or durability into a fabric or garment – a finish that will remain through repeated washings and dry cleanings.

HEAT SETTING = ТЕРМОУСАДКА (или ОТВЕРДЕНИЕ ПРИ НАГРЕВАНИИ) – Heat-Setting is the process of conferring dimensional stability and often other desirable properties such as wrinkle resistance and improved heat resistance to manufactured fibers, yarns, and fabrics by means of either moist of dry heat. Heat Setting is the process of conferring stability upon fibers, yarns, or fabrics by means of steam or dry heat. Heat Setting:- although practices similar to heat setting are used in the finishing of almost all fabrics, the term heat setting, strictly speaking, refers only to thermoplastic man-made fibers. Because of the thermoplastic nature of most man-made fibers (they change their shape when heat is applied), certain features, such as pleats, can be made permanent by treating them under very high heat. Heat setting usually gives a smooth appearance to a fabric and sets its final measurements. Boarding, a process in the rnanufacture of stockings, is a type of heat setting.

HEAT STABILIZED = СТАБИЛИЗИРОВАННОЕ ТЕПЛОМ (или СТАБИЛИЗИРОВАННОЕ ПРИ НАГРЕВАНИИ, или ТЕРМОСТАБИЛИЗИРОВАННОЕ) – Heat Stabilized is a term to describe fiber or yarn heat-treated to reduce the tendency of the fiber to shrink or elongate under load at elevated temperature. See also Heat Resistance.

HEAT TRANSFER = ТЕПЛОПЕРЕДАЧА – Heat Transfer is a form of printing in which elaborate colors and designs are printed onto a special type of paper. The paper is placed over the fabric and the designs and colors are transferred to the fabric through the application of heat. / Теплопередача, теплообмен между двумя теплоносителями через разделяющую их твёрдую стенку или через поверхность раздела между ними. Теплопередача включает в себя теплоотдачу от более горячей жидкости к стенке, теплопроводность в стенке, теплоотдачу от стенки к более холодной подвижной среде. Интенсивность передачи теплоты при теплопередаче характеризуется Коэффициентом Теплопередачи k, численно равным количеству теплоты, которое передаётся через единицу поверхности стенки в единицу времени при разности температур между жидкостями в 1 К; размерность k – Вт/(м^2·К) [ккал/м^2·°С)]. Величина R, обратная коэффициенту теплопередачи, называется полным термическим сопротивлением теплопередачи. Например, R однослойной стенки:- $R = 1 / k = (1 / \alpha_1) + (\delta / \lambda) + (1 / \alpha_2)$, где α_1 и α_2 – коэффициенты теплоотдачи от горячей жидкости к поверхности стенки и от поверхности стенки к холодной жидкости; d – толщина стенки; l – коэффициент теплопроводности. В большинстве встречающихся на практике случаев коэффициент теплопередачи определяется опытным путём. При этом полученные результаты обрабатываются методами теории подобия. Смотрите также Конвективный Теплообмен.

HEAT TRANSFER PRINTING = ПЕЧАТАНИЕ ТЕПЛОПЕРЕДАЧЕЙ – Heat Transfer Printing:- the popularity of polyester fabrics has led to the development of a completely new form of printing termed heat transfer printing, which prints the pattern on paper with carefully selected dyes. The paper is then applied to the fabric by passing the two together through a type of hot calender, and the pattern is transferred from one to the other. This method opens up new possibilities such as the production of halftone effects. In all textile printing, the nature and, particularly, the viscosity of the print paste are important, and the thickeners employed must be compatible with all the other components. For conventional methods the thickeners are such reagents as starch, gum tragacanth, alginates, methyl cellulose ethers, and sodium carboxymethyl cellulose. Many types of dye can be applied, including direct cotton, vat, mordant, and reactive dyes, as well as pigment colors. Most dyes are fixed by steaming or aging, by a batch or continuous method, and more rapid fixation is effected by flash aging, e.g., allowing a shorter steaming period by employing smaller machines. After steaming, the fabric must be thoroughly washed to remove loose dye and thickener, ensuring fastness to rubbing. Most textile materials can be printed without special pretreatment, but wool cloths are generally chlorinated before printing. Tops (long, parallel wool fibers), printed in stripes, are used for mixed effects, and printed warps produce shadowy effects. Tufted carpets are printed by a process designed to ensure good penetration. Heat Transfer Printing is a method of printing fabric of polyester or other thermoplastic fibers with disperse dyes. The design is transferred from preprinted paper onto the fabric by contact heat which causes the dye to sublime. Having no affinity for paper, the dyes are taken up by the fabric. The method is capable of producing well-defined, clear prints. / Сродство (Affinity). протирание или притирка (rubbing).

HEAT TRANSITION COEFFICIENT = КОЭФФИЦИЕНТ ПЕРЕДАЧИ (или СОПРЯЖЕНИЯ) ТЕПЛА – Heat Transition Coefficient, also known as the K-Value; physical value that specifies the degree of insulation provided by a wall or similar. For containers, heat transition takes account of the heat transfer from the air inside the container to the wall, the heat transmitted by the wall, and the heat transferred to the air outside the container; unit of measurement: W/(m^{2}K); Typical value for refrigerated containers:- 0.3 W/(m^{2}K) (new), 0.4 W/(m^{2}K) (old).

HEAT TREATING = ТЕПЛОВАЯ ОБРАБОТКА (или ТЕРМИЧЕСКАЯ ОБРАБОТКА) – Heat Treating:- the properties of metals can be substantially changed by various heat-treatment processes. Depending on the alloy and its condition, heat treating can harden or soften a metal. (i) Hardening Treatments:- hardening heat treatments invariably involve heating to a sufficiently high temperature to dissolve solute-rich precipitates. The metal is then rapidly cooled to avoid reprecipitation; often this is done by quenching in water or oil. The concentration of solute dissolved in the metal is now much greater than the equilibrium concentration. This produces what is known as Solid-Solution Hardening, but the alloy can usually be hardened appreciably more by aging to allow a very fine precipitate to form. Aging is done at an elevated temperature that is still well below the temperature at which the precipitate will dissolve. If the alloy is heated still further, the precipitate will coarsen; that is, the finest particles will dissolve so that the average particle size will increase. This will reduce the hardness somewhat but increase the ductility. Precipitation hardening is used to produce most high-strength alloys. In products made of soft, ductile metals such as aluminum or copper, the age-hardened alloy is put into service with the finest precipitate (that is, the highest strength) possible. When heated to a high temperature, a few metals, principally iron and titanium alloys, transform to a different crystal structure. Often the high-temperature phase has a higher solubility for the solute, thus aiding the dissolution of the precipitate. If the alloy is slowly cooled, the reverse phase transformation will occur at a high temperature, forming a coarse precipitate and yielding a soft structure. This is the principle behind annealing procedures. However, if the alloy is quenched from the high temperature, the reverse transformation occurs at a much lower temperature, so that a very fine precipitate forms. This is the basis for hardening iron-carbon (steel) alloys. The hardness of the low-temperature-transformation phase (known as Martensite) increases with carbon content, and this can result in some very strong alloys. Other alloying elements such as nickel, chromium, and manganese are added to steel primarily to slow transformation from the high-temperature phase so that thicker pieces, which cool more slowly on quenching, will harden to martensite on cooling. Steel with fresh martensite is still not tough enough for use without first being heated to an elevated temperature. This tempering process reduces residual stresses produced by the phase transformation, reduces hardness by coarsening the carbide precipitate, and increases toughness. Where high strength is the main concern, the tempering temperature is kept low. When toughness is the primary goal and strength secondary, a relatively high tempering temperature is used. (ii) Softening Treatments:- in many situations the purpose of heat treating is to soften the alloy and thereby increase its ductility. This may be necessary if a number of cold-forming operations are required to form a part but the metal is so hardened after the first operation that further cold working will cause it to crack. If the metal is recrystallized by annealing at an elevated temperature, it will become soft enough to allow further forming operations. Another case arises when it is necessary to machine high-carbon tools in order to form a die. If the alloy is quenched from a high temperature to form martensite, it will be hard, brittle, and virtually impossible to machine. But if it is slowly cooled, the carbides will be much coarser, and the steel will be machinable.

Processes:- most furnaces designed for heat treatment use natural gas or electricity to raise the temperature. The atmosphere around the work may be air for low-temperature anneals, but at elevated temperatures some atmosphere other than air must be used in order to avoid oxidation. One common atmosphere is obtained by burning natural gas with less than the stoichiometric amount of air. With more reactive metals, annealing can be done in a vacuum furnace. In some heat treatments only the surface need be heated. With electromagnetic induction or by use of a laser, this can be done so quickly that no special atmosphere is needed to avoid oxidation. Surface heat treating also avoids the distortion that can accompany heating and quenching the entire part. For example, the rear axle of most automobiles is a steel bar roughly 1 meter long and 3 centimeters in diameter (about 3 feet long and 1.25 inches in diameter). The surface can be hardened by passing the bar through an induction coil that quickly heats the surface immediately beneath the coil to red heat, transforming it to austenite. The inside remains cold, however, and, after the coil passes, this cold interior quickly draws heat from the surface, transforming it to martensite. The part is then tempered and put into service. Since most of the cross section of the part is not heated or transformed during this operation, there is no distortion and therefore no need to straighten a hardened part. / как Мартенсит (Martensite). легирование или легирующее (alloying). осадок (precipitate). твёрдость (hardness).

HEAT TREATMENT = ТЕПЛОВАЯ ОБРАБОТКА – (1) Heat Treatment is the process in which a commodity is heated until it reaches a minimum temperature for a minimum period of time according to an official technical specification. / Тепловая Обработка – процесс, при котором сырьё нагревается до достижения минимальной температуры на минимальный период времени в соответствии с официальной технической спецификацией.

(2) Heat Treatment:- high temperature conditions used to sterilize seeds or to break dormancy.

HEAT UNIT = ЕДИНИЦА ТЕПЛОТЫ – Heat Unit is a synonym for Degree-Day or Growing Degree-Day. In the United States, an alternate name, coined by Americans, for the British thermal unit (Btu). / Под Единицей Теплоты в Международной Системе Единиц СИ понимается Джоуль (Дж).

HEAT UNITS = ЕДИНИЦ ТЕПЛОТЫ (или ХХ) – Heat Units:- A concept that utilizes temperature rather than calendar days in describing growth and development of a crop. The concept is based on a developmental temperature threshold (usually 60 °F for Cotton) above which the crop grows and below which little or no development occurs. There is no upper threshold, although there is some evidence that this may be needed. The basic formula for calculating heat units involves adding the maximum and minimum temperatures for each day, dividing by 2, and subtracting the threshold temperature. Calculation of the accumulated heat units, and a knowledge of the heat unit requirement for any particular growth stage, can be used to explain and predict the occurrence of events or the duration of stages in crop development, i.e. as a general physiological time scale of development during the season. The expected range of heat units for any particular growth stage may be influenced by deficiencies of nutrients or water, insect infestations, disease, or physical damage by weather or chemicals. Also known as Growing Degree-Days or DD60's (for a threshold temperature of 60 °F or 15.5 °C). See also Heat Units From NAWF=5.

HEAT UNITS FROM NAWF=5 = ЕДИНИЦ ТЕПЛОТЫ С УВБЦ=5 – Heat Units From NAWF=5:- A method used to assist with end-of-season management decisions based on the development of the last effective boll population sequenced by heat unit accumulation. Research has shown that approximately 850 DD60's or 850 Growing Degree-Days (for a threshold temperature of 60 °F or 15.5 °C) are required for the last effective bolls to mature in the Mississippi River delta. See also Heat Units; and Nodes Above White Flower (NAWF). / В хлопководстве под термином Единиц Теплоты С УВБЦ=5 понимается метод, используемый для помощи в принятии правленческих решений в конце сезона, основанных на развитии последней эффективной популяции коробочек, . Смотрите также Единицы Теплоты (Heat Units); и Узлы Выше Белого Цветка (УВБЦ) (Nodes Above White Flower (NAWF)).

HEAVE = ВЫБИРАТЬ (или ВЫХАЖИВАТЬ, или ПОДАВАТЬ) – Heave (maritime term):- to haul or pull on a line; to throw a heaving line.

HEAVE AROUND = ПОВОРАЧИВАТЬСЯ (или ВЫБИРАТЬ) – Heave Around (maritime term):- to revolve the drum of a capstan, winch or windlass. (Pulling with mechanical deck heaving gear). / Выбирать на шпиль; Выбирать лебёдку.

HEAVE AWAY = ПОШЁЛ ШПИЛЬ (или ПОШЁЛ БРАШПИЛЬ, или ПОШЁЛ ТАЛИ) – Heave Away (maritime term):- an order to haul away or to heave around a capstan (pull).

HEAVE IN = ВЫХАЖИВАТЬ (или ВЫБИРАТЬ, или ПОДНИМАТЬ НА БОРТ) – Heave In (maritime term):- to haul in. / Выхаживать на шпиле; Выбирать снасть; Поднимать на борт.

HEAVE SHORT = ВЫБИРАТЬ ДО ПАНЕРА – Heave Short (maritime term):- to heave in until the vessel is riding nearly over her anchor. / Выбирать якорную цепь до панера.

HEAVE TAUT = ВЫБИРАТЬ ВТУГУЮ (или ВЫБИРАТЬ НАТУГО, или ОБТЯГИВАТЬ) – Heave Taut (maritime term):- to haul in until the line has a strain upon it.

HEAVE THE LEAD = БРОСАТЬ ЛОТ – Heave The Lead (maritime term):- the operation of taking a sounding with the hand lead (to find bottom).

HEAVE TO = ЛОЖИТЬСЯ В ДРЕЙФ – Heave To (maritime term):- to bring vessel on a course on which she rides easily and hold her there by the use of the ship's engines (holding a position). / Ложиться В Дрейф; Лежать В Дрейфе; Останавливаться в открытом море, держась против волны и ветра.

HEAVING LINE = БРОСАТЕЛЬНЫЙ (или БРОСАТЕЛЬНЫЙ КОНЕЦ) – Heaving Line (maritime term):- a small line thrown to an approaching vessel, or a dock as a messenger.

HEAVY = ТЯЖЁЛОЕ – Heavy:- a large number of sell orders hanging over the market without a corresponding number of buy orders.

HEAVY CARGO SURCHARGE = НАДБАВКА ЗА ТЯЖЕЛОВЕСНЫЙ ГРУЗ (или ДОПЛАТА ЗА ТЯЖЕЛОВЕСНЫЙ ГРУЗ) – Heavy Cargo Surcharge is a surcharge applied to heavy cargoes by shipping lines tariffs. Depends on direction. Freight surcharges are no longer updated by conferences. Please refer to shipping line agents or freight forwarders for their values. / надбавка или доплата (surcharge).

HEAVY COLOR = ТЯЖЁЛЫЙ ЦВЕТ – Heavy Color:- excess color smudged in a weftways band. Note:- this defect is often caused by the stopping of a printing machine, allowing more paste than normal to penetrate the fabric. / Тёмная Полоса Из-За Остановки Машины (heavy color):- порок заключительной отделки ткани; полоса густой краски, размазанная по ширине. Примечание:- этот порок часто вызывается остановкой машины набивки, допуская нанесение больше пасты, чем необходимо для обычного проникновения в ткань.

HEAVY CRUDE = ТЯЖЁЛАЯ НЕФТЬ – Heavy Crude is a crude oil with a high specific gravity and a low API (American Petroleum Institute) gravity due to the presence of a high proportion of heavy hydrocarbon fractions. See also Heavy Oil. Has an API gravity of less than 28 degrees. The lower the API gravity, the heavier the oil. / Тяжёлая Нефть – нефть с высоким удельным весом и низкой тяжестью по шкале измерений АИН (Американский Институт Нефти) вследствие наличия высокой пропорции тяжёлых углеводородных фракций. Имеет тяжесть по АИН менее 28 градусов. Чем меньше тяжесть по АИН, тем тяжелее нефть.

HEAVY END = ТЯЖЁЛАЯ ПРОДОЛЬНАЯ НИТЬ (или ПРОДОЛЬНАЯ НИТЬ ЗАНИЖЕННОГО НОМЕРА) – Heavyend:- xxxxx. See also Coarse End, and Coarse Thread. / Основа заниженного номера.

HEAVY ENDS = ТЯЖЁЛЫЕ ПОГОНЫ (или ТЯЖЁЛЫЕ КОНЦЕВЫЕ ФРАКЦИИ, или ТЯЖЁЛЫЕ ХВОСТОВЫЕ ФРАКЦИИ) – Heavy Ends are the portions of a petroleum distillate fraction which are highest boiling, and therefore distill over last if the temperature is raised progressively. Heavyend is the higher boiling fraction in distillation. What is light end, heavy end in distillation column? What are their relationship with initial boiling point (IBP) and final boiling point (FBP)? In general, 'Lighter' materials have lower boiling points so they will evaporate first and condense out last (at the first place they see that is cool enough). 'Heavier' things, in general, have higher boiling points so they will evaporate last and condense first. Not sure about terminology IBP and FBP. IBP is the initial boiling point and reflects the lightest component of a mixture. FBP is the final boiling point and reflects the heaviest component of a mixture. / В нефтехимии к Тяжёлым Фракциям относятся масляные фракции, выкипающие при температуре выше 300 °C при атмосферном давлении.

HEAVY FILLING = ТЯЖЁЛАЯ УТОЧИНА (или УТОЧИНА ЗАНИЖЕННОГО НОМЕРА) – Heavy Filling:- xxxxx. See also Coarse Pick, and Coarse Thread. / Уток заниженного номера.

HEAVY FUEL OIL = МАЗУТ (или ТЯЖЁЛЫЕ ТОПЛИВНЫЕ ФРАКЦИИ) – Heavy Fuel Oil is a blended product based on the residues from various refinery, distillation and cracking processes. It is a viscous liquid with a characteristic odor and it requires heating for storage and combustion. Heavy fuel oil is used in medium to large industrial plants, marine applications and power stations in combustion equipment such as boilers, furnaces and diesel engines. Heavy fuel oil is a general term and other names commonly used to describe this range of products include:- residual fuel oil, bunker fuel, bunker C, fuel oil No. 6, industrial fuel oil, marine fuel oil and black oil. Moreover, terms such as heavy fuel oil, medium fuel oil and light fuel oil are used to describe products for industrial applications to give a general indication of the viscosity and density of the product. Two main categories of fuel oil can be distinguished according to their sulphur content:- (i) low sulphur fuel oil:- sulphur content is lower than 1%; and (ii) high sulphur fuel oil:- sulphur content is 1% or higher. This covers all residual (heavy) fuel oils (including those obtained by blending). Kinematic viscosity is above 10 cSt at 80 °C. The flash point is always above 50 °C and density is always more than 0.90 kg/l. Low sulphur content is a heavy fuel oil with sulphur content lower than 1%. High sulphur content is a heavy fuel oil with sulphur content of 1% or higher. Heavy Fuels are blends of the residues and distillates that are derived from various refinery distillation, cracking and reforming processes. These heavy fuels are complex mixtures which may boil in the range from 121 to 600 °C. They consist of aromatic, aliphatic and naphthenic hydrocarbons, generally having carbon numbers in the range of C7 to C50, together with asphaltenes and smaller amounts of heterocyclic compounds containing sulfur, nitrogen and oxygen. The individual streams in this category may be:- (i) Atmospheric Distillates – distillates from atmospheric distillation of crude oil; (ii) Atmospheric Residues – residues from atmospheric distillation of crude oil; (iii) Vacuum Distillates – distillates from vacuum distillation of atmospheric residue; (iv) Vacuum Residues – residues from vacuum distillation of atmospheric residue; (v) Cracked Distillates – distillates of streams derived from cracking processes; (vi) Cracked Residues – residues of streams derived from cracking processes; and (vii) Reformer Residues – residues of streams derived from distillation of reformer processes. Analytical data on heavy fuel oil streams are scarce, since they are blended into heavy fuels normally because they have no commercial value in any other use and consequently have not been fully characterized. See also Residue. Fuel oil is heavier oils that remain after the distillate fuel oils and lighter hydrocarbons are boiled off in refinery operations. The viscosity is above 115" Redwood 1 at 38 °C. It is used for the production of electric power, space heating, vessel bunkering, and various industrial purposes. Heavy oil that makes up the distillation residue. It comprises all fuels (including those obtained by blending) with a kinematic viscosity above 27.5 cSt at 38 °C. Its flash point is always above 50 °C and its specific gravity is higher than 0.90. It is commonly used by ships and industrial large-scale heating installations as fuel in furnaces or boilers. Heavy Fuel Oil is a waste from refining oil, which includes all heavy products and is generally used in boilers, power plants and navigation. Fuel Oil, under this term, various products can be exported or imported. They include among others:- (i) industrial fuel oil; (ii) marine fuel oil for ships; (iii) heavy fuel oil; and (iv) reduced topping crude oil. / В нефтехимии к Тяжёлым Фракциям относятся масляные фракции, выкипающие при температуре выше 300 °C при атмосферном давлении. Слово Мазут было заимствовано из Тюркского языка. Оно означает густую жидкость тёмно-коричневого цвета, остаток после отгона от нефти бензина, керосина и фракций дизельного топлива. Плотность мазута составляет 0.89–1.00 г/см^3, теплота сгорания 39.4–40.7 МДж/кг. Мазут применяют как жидкое котельное топливо, а также для производства битумов, кокса и моторных топлив. Под Мазутом (происхождение слова из Тюркского языка) понимается остаток после перегонки нефти при атмосферном давлении (отгонки бензина, керосина и дизельного топлива). Мазут – густая тёмная жидкость; плотность 890–1 000 кг/м^3, низшая теплота сгорания около 40 МДж/кг. Применяется как сырьё для крекинга, в качестве котельного топлива, для получения смазочных масел. Остаток после отбора масляных фракций называется гудроном. Марки мазута различаются по вязкости, температуре вспышки, зольности, температуре застывания и прочему.

HEAVY LIFT = ПОДЪЁМ ТЯЖЁЛОВЕСНОГО ГРУЗА – Heavy Lift:- a unit of cargo which cannot be lifted by the normal ship's lifting gear. Single commodities too heavy to be lifted by the ship's regular equipment. Single commodity exceeding the capacity of normal loading equipment and requiring special equipment and rigging methods for handling. Pieces of cargo normally weighing in excess of 8 960 lb.

HEAVY LIFT CHARGE = СБОР ЗА ПОДЪЁМ ТЯЖЁЛОВЕСНОГО ГРУЗА – Heavy Lift Charge is a charge for cargo which is too heavy to be lifted by standard cranes or ship's tackle. A charge made for lifting articles too heavy to be lifted by a ship's normal tackle. Additional tariff charge assessed for use of special heavy-duty machine to handle heavy cargo.

HEAVY–LIFT STEEL CORNERPIECES = ТЯЖЕЛОВЕСНЫЕ СТАЛЬНЫЕ УГОЛЬНИКИ – Heavy-Lift Steel Cornerpieces:- these are angled steel plates attached to the bottom and/or top of cargo items to prevent damage by slinging equipment.

HEAVY LIFT VESSEL = СУДНО ДЛЯ ПЕРЕВОЗКИ ТЯЖЁЛОВЕСНЫХ ГРУЗОВ – Heavy Lift Vessel is a vessel specially designed and equipped for the carriage of heavy cargoes. A vessel specifically designed to be self-sustaining with heavy lift cranes to handle unusually heavy or outsized cargoes.

HEAVY MARKET = СКУЧНЫЙ РЫНОК (или ТЯЖЁЛЫЙ РЫНОК) – Heavy Market is a market for a security characterized by more sell orders than buy orders. Trading in such a market usually involves declining prices because of the downward pressure created by the glut of sell orders. Heavy Market is a market in which prices are demonstrating either an inability to advance or a slight tendency to decline. Heavy Market is a market that is demonstrating difficulty in advancing and is displaying a tendency to decline. A heavy market

may be a manifestation of investor uncertainty about near-term direction, and a sign that the market is topping out. It may also be characterized by a shortage of buyers (many of whom may prefer to stay on the sidelines until the uncertainty abates) and an abundance of sellers. Such a market is sometimes also referred to as a Top-Heavy Market. A heavy market could find itself vulnerable to toppling over if economic conditions and/or uncertainty worsen, as this would exacerbate the imbalance between buyers and sellers of stocks or futures. As such, a heavy market could be interpreted as a signal of, or precursor to, a potential steep decline in the near to medium-term. Heavy Market is a declining market. Heavy Market is a situation in trading that is characterized by a greater amount of sell orders than buy orders. This creates downward pressure on the price of the traded assets. This observable event can occur in any market for any financial instrument, such as stocks, bonds or commodities. / Рынок, на котором цены проявляют либо невозможность повышаться, либо слабую тенденцию к снижению. Тяжёлый Рынок – рынок акций, облигаций или товарно-сырьевой продукции со снижающимися котировками, сложившийся в результате превышения предложения над спросом.

HEAVY METALS = ТЯЖЁЛЫЕ МЕТАЛЛЫ – Heavy Metals are those metals which have densities greater than five. / Под Тяжёлыми Металлами понимаются цветные металлы с плотностью, большей, чем у железа; Висмут (Bi), Кадмий (Cd), Кобальт (Co), Медь (Cu), Никель (Ni), Олово (Sn), Ртуть (Hg), Свинец (Pb), Сурьма (Sb), и Цинк (Zn).

HEAVY OIL = ТЯЖЁЛАЯ НЕФТЬ – Heavy Oil is a type of crude oil which is very viscous, meaning that it does not flow easily. The common characteristic properties of heavy oil are:- high specific gravity, low hydrogen to carbon ratios, high carbon residues, and high contents of asphaltenes, heavy metal, sulphur and nitrogen. Specialized processing is required to produce more useful fractions, such as: naphtha, kerosene, and gas oil. The Husky Energy Lloydminster Upgrader is specially designed to take heavy oil and bitumen feedstock and process it into high quality, low sulfur, synthetic crude oil. The upgrader in 1998 produced an average of 54 000 barrels per day (bpd) of synthetic crude oil (8 585 m^3) and 15 000 bpd (2 385 m^3 per day) of oil equivalent in other products such as:- diluent, petroleum coke, and sulphur. By 2008, the average production had increased to 6 600 bpd of synthetic crude blend, 1 000 tons per day of petroleum coke, 375 tons per day of sulphur (used in fertilizer), 12 000 bpd of diluent (used to reduce the viscosity of heavy oil to facilitate movement in pipelines, for example, and 4 000 bpd of low sulphur diesel fuel. Heavy Oil is a mix of heterogeneous denominations. 4 Classes based mainly on downhole viscosity:- (i) A Class:- Medium Heavy Oil 25° > d° API > 18°; 100 cPo > μ > 10 cPo, mobile at reservoir conditions; (ii) B Class:- Extra Heavy Oil 20° > d° API > 7°; 10 000 cPo > μ > 100 cPo, mobile at reservoir conditions; (iii) C Class:- Tar Sands and Bitumen 12° > d° API > 7°; μ > 10 000 cPo, non mobile at reservoir conditions; and (iv) D Class:- Oil Shales, Reservoir = Source Rock, no permeability, Mining Extraction only. / Тяжёлая Нефть – тип нефти, которая очень вязкая, что значит, что она не льётся легко. Общими характерными свойствами тяжёлой нефти являются:- высокий удельный вес, .

HEAVY OIL = ТЯЖЁЛЫЕ НЕФТЯНЫЕ ФРАКЦИИ – Heavy Oil:- the fuel oils remaining after the lighter oils have been distilled off during the refining process. Except for start-up and flame stabilization, virtually all petroleum used in steam-electric power plants is heavy oil. / Разновидности дизельного топлива, остающегося после отгонки лёгких нефтяных фракций в процессе очистки. Если не принимать в расчёт запуск и стабилизацию пламени, фактически все нефтепродукты, используемые в теплоэлектроцентралях, относятся к тяжёлым нефтяным фракциям. Под Нефтяными Погонами или Нефтяными Дистиллятами понимаются фракции, отбираемые при перегонке нефти, например, бензиновая или керосиновая. С повышением температуры кипения фракции повышается плотность, изменяются свойства и углеводородный состав нефтяных дистиллятов. Аналогичные по температурам кипения фракции разных нефтей могут различаться между собой.

HEAVY PICK = ТЯЖЁЛАЯ ПОПЕРЕЧНАЯ НИТЬ (или ПОПЕРЕЧНАЯ НИТЬ ЗАНИЖЕННОГО НОМЕРА) – Heavy Pick:- xxxxx. See also Coarse Pick, and Coarse Thread. / Уток заниженного номера.

HEAVY PLATE = ТЯЖЁЛАЯ ПЛИТА – Heavy Plate:- hot-rolled thick steel sheets (sometimes several cm), generally further processed or used in the ‘raw’ steel industry (shipbuilding).

HEAVY SOIL = ТЯЖЁЛАЯ ПОЧВА (или ПОЧВА ТЯЖЁЛОГО МЕХАНИЧЕСКОГО (ГРАНУЛОМЕТРИЧЕСКОГО) СОСТАВА) – Heavy Soil is a soil with a high clay content.

HEAVY TIMBER CONSTRUCTION = КОНСТРУКЦИЯ ИЗ КРУПНОЙ СТРОИТЕЛЬНОЙ ПИЛОПРОДУКЦИИ (или ПОЛУОГНЕСТОЙКАЯ ПОСТРОЙКА С ТОЛСТЫМИ ДЕРЕВЯННЫМИ БАЛКАМИ ПЕРЕКРЫТИЙ) – Heavy Timber Construction is a type of combustible construction in which a degree of fire safety is attained by placing limitations on the sizes of wood structural members and on thickness and composition of wood floors and roofs and by the avoidance of concealed spaces under floors and roofs. / .

HEAVY WEIGHT = ТЯЖЁЛЫЙ ВЕС – Heavy Weight:- also called Expedition Weight. Most often use din base layers. Thick and warm, it is usually brushed on the inside for warmth and wicking, and smooth on the outside to protect.

HEAVY WEIGHT CHARGE = СБОР ЗА ТЯЖЁЛЫЙ ВЕС – Heavy Weight Charge is a surcharge for exceeding certain weight. 20ft containers exceeding the weight of 14 000 kg tare (container) are subject to a heavy weight surcharge (HWT). An empty 20ft container weighs approximately 2 300 kg. 40ft containers are not subject to a heavy weight surcharge. Both 20ft and 40ft containers can carry a load of more than 28 000 kg.

HEAVY WOOL = ТЯЖЁЛАЯ ШЕРСТЬ – Heavy Wool is a wool which has a high shrinkage in scouring; consequently, a low-yield fleece. Heavy Wool is a wool that has considerable grease or dirt and will have a high shrinkage in scouring.

HECTIC = ГЕКТИЧЕСКОЕ (или БУРНОЕ, или ЛИХОРАДОЧНОЕ) – Hectic:- red; flushed.

HECTARE = ГЕКТАР – Hectare:- a further complication is that a square hectometer (hm^2) is commonly known by its old metric name hectare (ha), a non-SI unit. A hectare equals a square 100 m·100 m, which is 10 000 m^2. That’s about the area of two football fields. There are 100 ha or 100 hm^2 in a square kilometer (km^2). Hectare (ha) is a metric unit of area equal to 100 Ares (2.471 acres) and equivalent to 10 000 square meters (107 639 square feet). Hectare is a measurement of land area in the metric system equivalent to 10 000 m^2. See also Acre. / Под Гектаром, от Греческого слова Гекто (Hekatón), означающее Сто, и Ар, понимается допускаемая к применению наравне с единицами СИ в сельском и лесном хозяйстве внесистемная единица площади. Обозначение:- га (ha). 1 га = 100 ар = 10 000 $м^2$. Смотрите также Акр (Acre). Гектар, единица площади в Метрической системе мер, применяемая для измерений земельных участков. Сокращённое обозначение:- Русское га, международное ha. 1 га равен площади квадрата со стороной 100 метров (м). Наименование ‘гектары’ образовано добавлением приставки гекто... (от Греческого слова Hekatón, означающее Сто) к наименованию единицы площади ар. 1 га = 100 ар = 10 000 м, 1 десятина = 1.092 54 га. Под Аром, от Латинского слова Area, означающее Площадь, понимается единица площади в Метрической системе мер, равна площади квадрата со стороной в 10 метров (м), то есть 1 ар = 100 квадратных метров ($м^2$). Наиболее употребительная в практике земельная мера гектар (сокращённое обозначение га); 1 га = 100 ар = 10 000 $м^2$.

HEDDLE = ГАЛЕВО – Heddle is a cord, round steel wire, or thin flat steel strip with a loop or eye near the center through which one or more warp threads pass on the loom so that the thread movement may be controlled in weaving. The heddles are held at both ends by the harness frame. They control the weave pattern and shed as the harnesses are raised and lowered during weaving. Heddles:- usually made of fine pressed-steel wire, they have a hole or eye in the center through which the respective warp ends are drawn. / ремизной рамы (harness frame). Галева:- обычно выполненные из тонкой . Каждая ремизка состоит из рамки с надетыми на неё галевами. В большинстве случаев используют рамки с металлическими планками, а на станках старых конструкций – с деревянными планками. С рамками хомутами соединены прутки, на которые надевают галева. Галева бывают металлические и нитяные. Галево имеет глазок, через который продевают нить основы. Размеры и форма глазков зависят от вида вырабатываемой ткани и линейной плотности нити основы. Каждая нить основы проходит через соответствующий ей глазок галева (heddle eye) одной из ремизок (harness), а затем между двумя зубьями бёрда.

HEDGE = ОГРАЖДЕНИЕ – Hedge or Hedgerow is a border, fence or boundary formed by a row of closely planted shrubs or bushes often trimmed to a formal shape. The number of Species forming a hedge tends to increase in proportion to its age. / Виды (Species).

HEDGE = ХЭДЬЖ (или ОГРАЖДЕНИЕ (ОТ ЦЕНОВОГО РИСКА)) – Hedge is a form of risk compensation. Countertrade or covering transaction designed to offset an existing or potential risk position by eliminating or diminishing the element of risk, in particular price, interest rate or exchange rate risk. Risk compensation is achieved by incurring a similar yet countercurrent risk to that entailed by the position to be hedged. Future transactions are classic examples of hedging instruments. Securities portfolios can be hedged with financial derivatives. Also known as Hedging. A financial transaction to mitigate risk. For example, taking an equal and opposite position on the futures market to that held in physicals to reduce price exposure in physicals. Hedge is the initiation of a position in a futures or options market that is intended as a temporary substitute for the sale or purchase of the actual commodity. The sale of futures contracts in anticipation of future sales of cash commodities as a protection against possible price declines, or the purchase of futures contracts in anticipation of future purchases of cash commodities as a protection against the possibility of increasing costs. The purchase or sale of a futures contract as a temporary substitute for a cash market transaction to be made at a later date. Usually it involves opposite positions in the cash market and futures market at the same time. Hedge involves taking a position in the futures market that is equal and opposite to the position one expects to take in the cash market, thus providing protection against adverse price movements. Hedge is a transaction entered into in order to offset the impact of adverse price movements of an asset. / Хэдьж – своего рода страхование от возможного изменения цен. Стратегия, используемая для ограничения инвестиционного риска. Идеальным является хэдьж, исключающий возможность получения прибыли или убытков. Например, акционер, беспокоящийся о том, что курсы акций падают, может застраховать свои вложения, приобретя опцион на продажу (put option) на акции, или путём продажи опциона на покупку (call option). Некто, имеющий 100 акций компании XYZ, продающихся по 70 Долларов за акцию, может застраховать свою позицию, приобретя опцион на продажу, дающий ему право продать 100 акций по 70 Долларов в любой момент времени в течение нескольких месяцев. Этот инвестор может заплатить определённую сумму, называемую премией (premium), за это право. Если акции компании XYZ в течение этого периода падают, инвестор может реализовать свой опцион, то есть продать акции по 70 Долларов, сохранив, таким образом, стоимость в 70 Долларов своих вложений в акции XYZ. Тот же владелец акций компании XYZ может хэдьжировать свою позицию путём продажи опциона на покупку. В подобной сделке он продаёт право на покупку акций компании XYZ по 70 Долларов за акцию в течение нескольких месяцев, в обмен он получает премию. Если акции компании XYZ падают в цене, то доход от полученной премии сможет компенсировать до некоторой степени спад курса на акции. Продажа в короткую (selling short) является ещё одним широко распространённым методом хэдьжирования. Инвесторы часто пытаются застраховаться от инфляции, приобретая активы, которые растут в цене быстрее инфляции, такие, как золото, недвижимость или другие реальные активы. Крупные коммерческие фирмы, стремящиеся гарантировать цену, которую они получат или заплатят за товарно-сырьевую продукцию, хэдьжируют свои позиции путём соответствующих одновременных покупок и продаж на фьючерсных рынках (futures market). Например, компания Hershey может застраховать поставки какао на фьючерсном рынке для того, чтобы ограничить риск роста цен на какао. Управляющие крупных денежных фондов, таких, как пенсионный и взаимный фонды, могут хэдьжировать валютный риск либо риск процентных ставок с помощью покупки или продажи фьючерсных и опционных контрактов. Например, управляющий глобального взаимного фонда (global mutual fund), имеющий большой пакет Японских акций и считающий, что курс Японской Иены понизится относительно курса Доллара, может купить фьючерс или опцион на Японскую Иену для уменьшения убытков.

HEDGE EFFECTIVENESS = ЭФФЕКТИВНОСТЬ ХЭДЬЖА (или ЭФФЕКТИВНОСТЬ ОГРАЖДЕНИЯ) – Hedge Effectiveness is the degree to which changes in the fair value of cash flows of the hedged item that are attributable to a hedged risk are offset by changes in the fair value or cash flows of the hedging instrument.

HEDGE EXEMPTION = ОСВОБОЖДЕНИЕ ДЛЯ ХЭДЬЖА – Hedge Exemption is an exemption from speculative position limits for bona fide hedgers and certain other persons who meet the requirements of exchange and the US Commodity Futures Trading Commission rules. / заслуживающий доверия или действительный (bona fide).

HEDGE FUND = ХЭДЬЖ ФОНД – A Hedge Fund is a collective investment scheme (CIS) commonly recognised as an alternative investment product because of the management style employed and the types of risks adopted within the investment strategy. Generally hedge funds are flexible in their investment strategy – they can take long and short positions, use derivatives for speculative purposes and use leverage to gear assets. In addition to buying assets in the hope that their value will rise, hedge funds may use short-selling strategies that rely on an asset decreasing in value. Hedge funds may also borrow money to leverage their assets and gear their positions. These factors make the investment strategies of hedge funds more complicated than those of traditional CIS. Hedge funds usually adopt an active investment style. Therefore the skill of the hedge fund manager is highly important to the performance of the fund. Hedge funds often charge performance-based fees as a result. A private investment fund or pool that trades and invests in various assets such as securities, commodities, currency, and derivatives on behalf of its clients, typically wealthy individuals. Some Commodity Pool Operators operate hedge funds. The term Hedge Fund generally is used to refer to an entity that holds a pool of securities, and perhaps other assets, whose interests are not sold in a registered public offering and which is not registered as an investment company. One of the first hedge funds invested in equities and used leverage and short selling to 'hedge' the portfolio's exposure to movements of the corporate equity markets. Over time, hedge funds have diversified their portfolios to include other financial instruments and engage in a wider variety of investment strategies. In addition to trading in equities, hedge funds may trade fixed income securities, convertible securities, currencies, exchange-traded futures, over-the-counter derivatives, futures contracts, commodity options and other non-securities investments. Hedge funds may or may not utilize hedging and arbitrage strategies and may engage in relatively traditional, long-only equity strategies. Hedge Funds operate with funds of pension funds, insurance companies, investment and private banks, and rich individuals. They trade actively, bet heavily and have large sums of money at their disposal. Hedge funds may employ a variety of techniques to enhance returns, such as both buying and selling assets according to a valuation model. Among the current hedging strategies and techniques are the following:- convertible arbitrage, event-

driven, merger arbitrage, and market-neutral. Individual hedge funds are very different in what they do and the risk they take on and they are difficult to understand. Also known as Fund of Funds. Hedge Funds are part of so-called Alternative Investments. Unlike equity or fixed-income funds they are not distinguished by type of investment. Hedge funds managers are to a limited extent subject to any strict regulatory requirements and as such can make use of a wide range of investment instruments and strategies. Hedge funds' asset allocation and investment risks may be totally different. The number of possible hedge fund strategies a fund manager may choose from within the limits imposed on a fund at its launch can be divided into 5 main categories:- (i) Relative value strategies benefit from market arbitrage. In case of fixed income arbitrage (interest arbitrage) the hedge fund speculates with and attempts to exploit price inefficiencies on the fixed-income, futures and derivatives markets for bonds. Such funds will customarily purchase an undervalued security (long position) and simultaneously sell a synthetic version of the instrument. Since price inefficiencies are generally not very large, borrowed funds are used extensively in order to increase the share of third-party funds (leverage), thereby raising the return on equity. (ii) Managers of event-driven hedge funds target specific events in a company's life cycle, such a takeovers, mergers or reorganizations not yet anticipated by the market. Here, investment performance depends not on overall market developments but on the manager's ability to analyze and exploit event-driven situations. (iii) Global macro-strategies attempt to profit from worldwide developments on the equity, foreign exchange, interest, commodity and other markets, usually based on a macroeconomic analysis. They try to predict and anticipate changing trends on the markets. (iv) Long/short strategies (equity hedged) were the original basis for the development of hedge funds. Shares classified as undervalued are bought and overvalued shares sold short at the same time. With this approach, a positive return can be achieved both in rising and falling markets. The focus is not on expected movements in the overall stock market, but rather the assessment of individual shares and their relationship to one another. (v) Managed futures strategies involve professional, active and often global portfolio management of various asset classes using exchange-traded futures and derivates on financial assets and commodities. The idea is that price movements follow certain, analytically predictable trends. Hedge funds offer good chances of achieving high returns, but also entail equally high risks of incurring substantial losses. Hedge Funds:- these are high return, relatively high risk funds in which the risks are hedged through diversification or offsetting investments. Hedge funds attempt to preserve capital while achieving high returns for their investors. The name comes from the fact that they may be used as a 'hedge' (i.e. safeguard) against risk. These funds can take long or short positions, invest in commodities, futures, bonds or stocks, buy and sell options, invest in private companies – almost anything where impressive gains could be realized. For example, to protect against a downturn in the market, a fund that holds a basket of stocks could short S&P 500 futures contracts. To hedge against other risks, for example weather-dependent crop shortfalls, a fund could sell Orange Juice futures as a hedge against inclement weather. Hedge Fund is the unregulated investment fund and various types of money managers, including commodity trading advisers (CTAs), which share (a combination of) the following characteristics:- they often follow a relatively broad range of investment strategies that are not subject to borrowing and leverage restrictions, with many of them using high levels of leverage; they often have a different regulatory mandate than 'Institutional Investors' and typically cater to sophisticated investors such as high net worth individuals or institutions; and they often hold long and short positions in various markets, asset classes and instruments, with frequent use of derivatives for speculative purposes. / Хэдьж Фонды оперируют крупными капиталами пенсионных фондов, страховых компаний, частных банков и богачей. Они активно торгуют, делают крупные ставки и имеют в своём распоряжении солидные денежные суммы. Хэдьж фонды берут на вооружение множество различных технологий для получения доходов, таких как покупка и продажа активов в соответствии с избранной моделью оценки. Среди современных стратегий и техник хэдьжирования встречаются такие, как обратимое арбитражирование (конвертируемое арбитражирование), действие по важным обстоятельствам (исходя из выгоды сделки), арбитражирование на поглощении и стратегия нейтральности рынка. Между различными хэдьж фондами имеются серьёзные различия в плане выбираемых стратегий и соответствующих им рисков, принимаемых на себя хэдьж фондами; а сами эти стратегии достаточно сложны для понимания. Известен также как Фонд Фондов (Fund of Funds). Хэдьж Фонд – частный взаимный инвестиционный фонд (для инвесторов в США) или офшорный взаимный фонд (для инвесторов за пределами США или освобождённых от налогов инвесторов), в которых главному партнёру принадлежит основная сумма вклада и регистрационные документы которых предусматривают возможность занятия как коротких, так и длинных позиций на рынке ценных бумаг, использование финансового рычага и производных финансовых инструментов и осуществление инвестиций на многих рынках. Хэдьж фонды часто берут на себя большой риск, применяя спекулятивные стратегии, такие, как программная торговля (program trading), короткие продажи (selling short), свопы (swaps), арбитраж (arbitrage). Фонду нет необходимости применять все эти стратегии, но он должен иметь возможность их применения. Поскольку фонд не ограничен в приобретении ценных бумаг, он может быть потенциально прибыльным в любых рыночных условиях, включая и ситуацию резкого падения цен. Поскольку хэдьж фонды имеют возможность быстро перемещать огромные суммы денег между рынками, они могут оказывать значительное влияние на ежедневную ситуацию на рынках акций, облигаций и фьючерсов. Хэдьж фонды предоставляют главному партнёру право на поощрительные дополнительные выплаты, величина которых зависит от показателя дохода – чем больше доход, тем выше выплаты. По условиям хэдьж фонда 65% инвесторов должны быть аккредитованными инвесторами, то есть суммарные активы индивидуального инвестора или семейной пары должны составлять не менее 1 миллиона Долларов, или же доход индивидуального инвестора за последний год должен быть не менее 200 000 Долларов, семейной пары – не менее 300 000 Долларов. Хотя в действительности инвестору нужно гораздо больше средств. Кроме того, хэдьж фонды устанавливают минимальный размер инвестиций, который значителен даже для аккредитованных инвесторов. Минимальный размер взноса варьируется от 250 000 до 10 миллионов Долларов. В хэдьж фонды инвестор отдаёт ликвидные средства. Только что вступивший инвестор, как правило, не может изъять эти средства в течение одного года. Хэдьж Фонды представляют собой частные инвестиционные пулы, основная задача которых заключается в получении максимальной прибыли, в том числе, за счёт использования рискованных спекулятивных инвестиционных стратегий и производных финансовых инструментов. В отличие от взаимных фондов, действующих в жёстких регуляторных рамках и не имеющих права совершать операции с высокой степенью риска, хэдьж фонды обладают необычайной гибкостью в выборе стратегий и инструментов инвестирования. Минимальный объём инвестиций в эти фонды, как правило, составляет один миллион Долларов США. Согласно Американскому законодательству (National Securities Markets Improvement Act of 1996), услуги хэдьж фондов доступны лишь индивидуальным инвесторам с капиталом свыше 5 миллионов Долларов США. Подобные законодательные нормы были разработаны для того, чтобы допустить к участию в операциях хэдьж фондов только наиболее опытных индивидуальных инвесторов. На сегодняшний день хэдьж фонды работают преимущественно с институциональными инвесторами.

HEDGER = ХЭДЬЖЕР – Commodity Hedgers are the sellers or buyers of the actual physical commodity (e.g., farmers, oil companies, millers, etc) who engage in hedging strategies by selling or buying commodity futures contracts to protect themselves from the adverse effects of commodity price volatility. Hedgers transfer price risk to speculators who assume higher risk for a higher profit potential. Hedgers reduce the adverse effects of changing prices, but face the adverse effect of a changing basis. Hedger is a trader who enters the market with the specific intent of protecting an existing or anticipated physical market exposure from unexpected or adverse price fluctuations. Hedger is an individual or company owning or planning to own a cash commodity Corn, Cotton, Soybeans, Wheat, US Treasury bills, bonds or notes, etc and concerned that the cost of the commodity may change before either buying or selling it in the

cash market. A hedger achieves protection against changing cash prices by purchasing (selling) futures contracts of the same or similar commodity and later offsetting that position by selling (purchasing) futures contracts of the same quantity and type as the initial transaction. / Хэдьжерами сырья являются продавцы или покупатели фактического материального сырья (например, фермеры, мельники, нефтяные компании и так далее), которые вовлечены в стратегии хэдьжирования посредством продажи или покупки фьючерсных контрактов на сырьё с целью своей защиты от неблагоприятных эффектов лихорадочности цен на сырьё. флуктуации (колебания) цены. Хэдьжеры переводят ценовой риск на спекулянтов, которые принимают на себя повышенный риск за более высокий потенциал прибыли. Хэдьжеры уменьшают неблагоприятные эффекты от меняющихся цен, но сталкиваются при этом с неблагоприятным эффектом изменяющегося базиса.

HEDGE RATIO = СООТНОШЕНИЕ С ХЭДЬЖЕМ (или СООТНОШЕНИЕ С ОГРАЖДЕНИЕМ) – (1) Hedge Ratio is a ratio of the value of futures contracts purchased or sold to the value of the cash commodity being hedged, a computation necessary to minimize basis risk. The number of futures contracts needed to hedge a cash market position. In the field of options and futures trading, the hedge ratio indicates how many such options or futures must be bought or sold to fully offset any price changes in the underlying asset. / Показатель, отражающий использование биржевого механизма уменьшения риска. Рассчитывается как отношение числа открытых контрактов или неликвидных обязательств хэдьжеров к величине того капитала по сырью, который подвержен риску изменения стоимости.

(2) Hedge Ratio is the ratio, determined by an option's Delta, of futures to options required to establish a riskless position. For example, if a USD1.00/barrel change in the underlying futures price leads to a USD0.25/barrel change in the options premium, the hedge ratio is four (four options for each futures contract).

HEDGE–TO–ARRIVE CONTRACT = КОНТРАКТ С ХЭДЬЖЕМ–К–ПРИБЫТИЮ – Hedge-To-Arrive (HTA) Contracts came into use (in the United States) in the Corn Belt in the early 1990s. There are two main types of futures-based HTAs, ranging from a non-roll HTA contract with a relatively simple two-decision version to a slightly more complex intra-year rolling HTA contract that is limited to the typical crop marketing year annually (September 01 through August 31). Thus, September 01 is the start of the new crop marketing year. Since harvest in the Corn Belt typically does not start until late September or early October, farmers using HTA contracts for harvest delivery prices typically utilize December Corn and November Soybean futures contracts, respectively. Non-roll HTAs remove price-level risk but involve exposure to basis risk – the risk that the difference between local cash prices and the nearby futures price will move in an adverse direction and lower the producer's net price received. Basis risk is typically relatively small but can be sizable in times of extreme weather problems, inadequate storage space, transportation problems, and demand shocks. Spread risk (differences in various futures price delivery months) is not involved with these contracts. Intra-year HTAs involve exposure to both basis risk and intra-year spread risk. Intra-year spreads (differences in various futures prices delivery months) are more typical in years when supplies are incredibly tight. Inter-year spreads can be extremely volatile and involve significant exposure to futures prices and spread risk. These contracts are no longer offered by the grain industry. Non-Roll HTAs:- These contracts originally were offered as an alternative to basis contracts, in which the basis is set at the start of the contract. Still, the producer is given an extended time to choose his or her price level, as reflected by the futures market. In contrast, non-roll HTAs set the futures price at the start of the contract but leave the basis to be set later. Non-roll HTAs are quite like cash forward contracts, except that the basis is established at a time the producer chooses, but usually before the delivery of the actual grain. The elevator or processor that initiates the contract covers the position by selling futures contracts and is exposed to margin calls if futures prices move in an adverse direction. The producer, rather than the elevator or processor, carries the basis risk. The main difference between non-roll HTAs and forward cash contracts is basis change with its potential for a higher, or lower final cash price received reflecting the final basis accepted. Non-roll HTAs require a specific quantity and quality of grain to be delivered at a predetermined date and place that cannot be changed. The only decision that's remaining after the contract is signed when to set the basis. Non-roll HTA contracts for corn and soybeans can be for delivery in the current crop year or delivery of the next two years of crops. Delivery in later crop years is possible because the Chicago Mercantile Exchange has simultaneous trading of harvest-delivery futures contracts for three different crop years. Hence, an elevator or processer could simultaneously offer non-roll Corn HTAs for fall 2020 delivery based on December 2020 Corn futures contracts. Also, both 2021 and 2022 Corn non-roll HTAs are based on December 2021 and 2022 Corn futures contract prices. Basis risk is the leading market risk for the producer using non-roll HTA contracts. Basis risk is typically much smaller than price-level risk. Like a forward cash contract, non-roll HTAs prevent the producer from benefiting if futures prices rise but protect against declining futures prices. If the basis strengthens from the start of the contract to the time the producer sets the basis, the net price will increase from what was available when the contract was initiated. If the basis weakens, the net price to the producer will decline. To effectively use these contracts, the producer must have a good understanding of the local basis and factors affecting it. He or she also must monitor the basis and be able to decide when the basis will be set. Intra-Year Rolling HTAs:- These contracts are like non-roll HTAs except that the delivery date can be changed to another time within the same crop marketing year (September to August). This flexibility in delivery dates creates exposure to intra-year spread risk, which is usually small. However, caution should be used when rolling old-crop contracts to new crop contract months. Typically, September corn and September soybean futures contracts are the start of a new crop marketing year. With this type of contract, potential price gains come only from basis improvement or rolling the price up a few cents to a later-delivery old-crop futures month. Neither of these sources of higher prices is guaranteed. Both involve risk, and both can result in lower net cash prices. These contracts lock in a level of futures prices and prevent gaining from a rising futures market. Intra-year rolling HTAs are more complex than non-roll HTAs because the producer must decide when to set the basis and when to roll the contract. Risk exposure is typically greater because the intra-year rolling HTA contracts include both basis risk and intra-year spread risk. In spring 1996, the Commodity Futures Trading Commission (CFTC), the regulatory agency for commodity futures markets, issued guidelines discouraging the use of HTAs that allow inter-year rolling. Regulatory review and pending litigation altered the future use of these inter-roll and multi-year inter-roll HTAs. The grain industry no longer provides this type of inter-year roll HTA contracts. In short, considerable risk exposure was involved with inter-year rolling HTA contracts and created a stigma that lasted for decades. Conclusions:- There are two main types of futures-based HTA grain contracts offered by most elevators and processors throughout the Corn Belt. One is a non-roll HTA contract with a relatively simple two-decision process initiating the futures price first and then later fixing the basis. The other is an intra-year rolling HTA contract, which has both basis risk as well as intra-year spread risk. This particular contract is typically limited by the time frame of a crop marketing year that runs annually from September 01 through August 31. Hedge-To-Arrive Contract is an agreement where a producer chooses a future contract month and establishes the futures price for grain he/she intends to sell. The basis is established later at the discretion of the producer. The producer's price is the futures price less the basis. Hedge-to-arrive contracts can often be rolled forward to another futures contract month. The elevator performs the hedging transaction. See also Basis Contract; Delayed Payment Contract; Elevator Cash Contract; Forward Contract; Minimum Price Contract; Offer Contract; and Price-Later (Delayed Price) Contract.

HEDGIE = HEDGE FUND

HEDGING = ХЭДЬЖИРОВАНИЕ (или ОГОРАЖИВАНИЕ (ОТ ЦЕНОВОГО РИСКА), или ОГРАЖДЕНИЕ (ОТ ЦЕНОВОГО РИСКА)) – Hedging is a means of protection against extensive loss due to adverse price fluctuations. In the futures market, to purchase or sell for future delivery as a temporary substitute for a merchandising transaction to be made later. Hedging is the practice of buying or selling futures contracts to offset an existing position in the cash or spot market, thus reducing the risks of unforeseen major price changes. Hedging is a taking a position in a futures or options market offsetting a position held in the cash market to minimize the risk of financial loss from an adverse price change. The major function of a futures market is to provide facilities where commercial companies can hedge their price risks. The price to the public is reduced, because hedging enables processors to reduce operating costs. The ability to reduce risk by hedging makes the cost of financing lower. Basic hedging with futures contracts is achieved when a position in the futures market is approximately equal and opposite to the position held by the hedger in the cash or physical market. There is often a strong relationship between futures and cash markets. The quotation for each unit is expressed in the same way in both the cash and futures markets. The fact that traders know that deliveries can be made is the principal reason why futures prices preserve a continuing relationship with cash market prices. Since futures market prices typically move in tandem with the cash market over the course of time, tending to converge as contracts mature, a gain in the futures market will offset a loss in the cash market, or vice versa. The balancing of operations in spot cotton, or related products, with offsetting operations in cotton futures, to reduce the risk of loss through price change during the period of merchandising or manufacturing. Hedging is the financial technique to offset the risk of loss from price, exchange rate or interest rate fluctuations, usually by means of futures contracts, options and interest rate swaps. The purchase or sale of a derivative security (such as options or futures) in order to reduce or neutralize all or some portion of the risk of holding another security. Hedging is the practice of offsetting the price risk inherent in any cash market position by taking an equal but opposite position in the futures market. Hedgers use the futures markets to protect their business from adverse price changes. A long hedge involves buying futures contracts to protect against possible increasing prices of commodities. A short hedge involves selling futures contracts to protect against possible declining prices of commodities. See also Long Hedge, Purchasing Hedge, Selling Hedge, and Short Hedge. Hedging is the taking a position in a futures market opposite to a position held in the cash market to minimize the risk of financial loss from an adverse price change; or a purchase or sale of futures as a temporary substitute for a cash transaction that will occur later. Hedging is the use of financial instruments such as futures contracts to mitigate risk in a commodity market, e.g., if a company expects to receive a large payment in USD 6 months in the future, it can buy CAD (Canadian Dollar) contracts in the futures market to offset a potential decrease in CAD value when the USD are received and converted into CAD. One can hedge either a long cash market position (e.g., one owns the cash commodity) or a short cash market position (e.g., one plans on buying the cash commodity in the future). Hedging is a safeguarding an investment against risks such as price or currency risks by concluding a countertrade. This may be an options or futures deal, for instance, of a type and volume capable of offsetting the risks of the underlying transaction. Hedging:- actions taken to reduce risk, i.e. to secure a subsequent price or rate (e.g., interest rate, exchange rate) on a transaction. Such actions include (but not limited to) acquisition of a derivative financial contract such as options, forwards, futures or swaps. Hedging is an action taken to protect the value of a portfolio against a change in market prices. Hedging involves holding offsetting long and short positions in the assets. The values of the long and short positions are expected to respond identically to market changes. Hedging is a buying or a selling of futures contracts as substitutes for later cash transactions to insure against price change. See also Long Hedge; and Short Hedge. / Открытие позиции на фьючерсном рынке, противоположной удерживаемой позиции на рынке реального актива с целью снижения риска финансового убытка при неблагоприятном развороте цены; или приобретение или продажа фьючерсов в качестве временного замещения сделки с наличным активом, которая состоится позже. , например, . флуктуации (колебания) процентной ставки. Хэдьжирование:- заключение сделки, которая уменьшает риск существующей операции или торговли на определённом рынке. Например:- Дьжон, импортёр, должен 20 Ноября заплатить USD1 000 000 за привозную (или импортную) операцию. Сегодня, 03 Октября, в соответствии с текущим курсом Доллара, на его счёте достаточно денег, чтобы это сделать. Тем не менее, невозможно знать заранее, каким будет обменный курс Доллара на 20 Ноября. Чтобы подстраховаться, импортёр Дьжон может заключить форвардную сделку по покупке USD1 000 000, что и будет выполнено 20 Ноября по цене, эквивалентной сегодняшнему курсу Доллара (03 Октября). Таким образом, Дьжон страхует (хэдьжирует) сам себя и исключает риск ситуации, когда у него может не оказаться достаточной суммы в Долларах, чтобы заплатить за привозимые (или импортируемые) товары.

HEDGING TRANSACTION = ТРАНЗАКЦИЯ ХЭДЬЖИРОВАНИЯ (или ОПЕРАЦИЯ ХЭДЬЖИРОВАНИЯ) – Hedging Transaction:- (a) in general, for purposes of this section, the term Hedging Transaction means any transaction entered into by the taxpayer in the normal course of the taxpayer's trade or business primarily:- (i) to manage risk of price changes or currency fluctuations with respect to ordinary property which is held or to be held by the taxpayer; (ii) to manage risk of interest rate or price changes or currency fluctuations with respect to borrowings made or to be made, or ordinary obligations incurred or to be incurred, by the taxpayer; or (iii) to manage such other risks as the Secretary may prescribe in regulations. (B) Treatment of nonidentification or improper identification of hedging transactions:- notwithstanding subsection (a)(7), the Secretary shall prescribe regulations to properly characterize any income, gain, expense, or loss arising from a transaction:- (i) which is a hedging transaction but which was not identified as such in accordance with subsection (a)(7); or (ii) which was so identified but is not a hedging transaction.

HEEL = ОПОРНЫЙ УЗЕЛ (или ОПОРНЫЙ КАБЛУЧОК, или ОПОРНАЯ ПЯТА) – Heel is a point on truss at which the top and bottom chords intersect. / Точка фермы, в которой пересекаются верхний и нижний пояса.

HEEL = ПЯТКА – Heel is a small portion of the previous year's growth at the base of a cutting. / Пятка или нижняя часть черенка, например, винограда.

HEELING = КРЕН (или НАКРЕНЕНИЕ, или ВАЛКОСТЬ) – Heel or Heel Angle:- temporary inclination of a ship to one side along its fore-and-aft axis brought about by external forces working on the ship. Heeling can be caused by a rough seas, winds or the rudder position. The heel angle describes the inclination of the ship. The heel angle is the deviation from the perpendicular. / Крен или Угол Крена:- временное наклонение судна в одну сторону . Под Креном понимается отклонение вертикальной плоскости симметрии судна, летательного аппарата от вертикали к земной поверхности. Креном летательного аппарата называется также движение, при котором происходит изменение угла крена. Движение креном характеризуется скоростью крена и используется, например, при выполнении фигур пилотажа, при заходе на посадку для парирования смещения траектории летательного аппарата относительно оси взлётнопосадочной полосы (ВПП). Под Креном, от Голландского слова Krengen, означающее Класть Судно На Бок, понимается поворот судна или летательного аппарата относительно продольной оси. Под Тангажем, от Французского слова Tangage, понимается угловое движение судна или летательного аппарата, например, самолёта, относительно главной поперечной (горизонтальной) оси инерции. Угол тангажа – угол между продольной осью летательного аппарата и горизонтальной плоскостью. Под Валкостью судна понимается свойство судна крениться под действием небольших усилий (ветра, перемещения груза и тому подобного). Валкость присуща судам с малой начальной остойчивостью. Кренование – искусственное создание крена судна для проверки положения по высоте его центра тяжести и начальной метацентрической высоты. В процессе кренования определяют кренящий момент, углы крена и период свободных колебаний.

Кренование производят после постройки или ремонта судна. Кренование применяют также для обнажения борта судна на плаву. Креномeтр или Креномер – прибор для измерения угла крена судна; состоит из подставки со шкалой в виде кругового сектора с градусными делениями и маятника с указательной стрелкой, подвешенной в геометрическом центре сектора; устанавливается обычно в ходовой рубке.

HEER = МОТОК – Heer is the unit of measure for jute and linen yarn, equal to 600 yards or $1/24^{th}$ of a spindle. A full spindle would have 14 400 yards. See also Hasp. / Моток – единица измерения джутовой и льняной пряжи, равная 600 ярдам (или 548.6 метрам) или . (1) Моток льняной пряжи, а также моток пряжи из аппаратной шерсти, равный 600 ярдам (или 548.6 метрам); (2) Две пасьмы льняной пряжи по 300 ярдов каждая.

HEIFER = ТЁЛКА (или НЕТЕЛЬ) – Domestic (in the United Kingdom) cows are one of the most common farm Animals around the world, and the English language has several words to describe these Animals at various ages. A baby cow is called a Calf. A female calf is sometimes called a Heifer Calf and a male a Bull Calf. A Heifer is a female that has not had any offspring. The term usually refers to immature females; after giving birth to her first calf, however, a heifer becomes a cow. An adult male is known as a Bull. Many male cattle are castrated to reduce their aggressive tendencies and make them more tractable. Young neutered males, which are primarily raised for beef, are called Steers or Bullocks, whereas adult neutered males, which are usually used for draft purposes, are known as Oxen. A group of cows, cattle, or Kine (an archaic term for more than one cow) constitutes a herd. English lacks a gender-neutral singular form, and so 'Cow' is used for both female individuals and all domestic bovines. Heifer (in farming) is a cow that has not borne a calf, or has borne only one calf. / Тёлка (heifer):- молодая нестельная самка крупного рогатого скота. Нетель (springer heifer):- тёлка, у которой при визуальном осмотре или ректальном исследовании обнаружены признаки стельности.

HEIGHT = ВЫСОТА – Height (h) is a overall dimension vertical to the deck plane. See also Pallet. / Высота h (Height):- габаритный размер поддона перпендикулярный к горизонтальной плоскости, определённой осями длины и ширины. Смотрите также Поддон (Pallet).

HEIGHT = РОСТ – Height:- vertical distance between the crown of the head and the soles of the feet, measured with the subject standing erect without shoes and with the feet together (for infants not yet able to stand upright:- length of the body measured in a straight line from the crown of the head to the soles of the feet). Human Height or Stature is the distance from the bottom of the feet to the top of the head in a human body, standing erect. It is measured using a stadiometer, usually in centimetres when using the metric system, or feet and inches when using the imperial system. / Рост:- вертикальное расстояние в сантиметрах от макушки головы до подошв ступней. При измерении человек стоит прямо, без обуви, ступни ног вместе. Рост (детей, не умеющих стоять):- длина тела, измеренная по прямой линии от макушки до подошв ступней.

HEIGHT–TO–NODE RATIO = СООТНОШЕНИЕ ВЫСОТЫ К УЗЛУ – Height-To-Node Ratio:- The total plant height in inches divided by the total number of main-stem nodes. Plant height is measured from the cotyledonary node to the uppermost main-stem node with an unfurled leaf. Number of main-stem nodes is determined by counting the main-stem node immediately above the cotyledonary node to the highest main-stem node with an unfurled leaf. The height-to-node ratio is used as an index of plant vigor. Height-to-node ratio is very sensitive to temperature early in the year, such that before 10 main-stem nodes the ratio is generally more indicative of spring temperatures than any management decisions. Research in California has shown that prior to 7 nodes, a low height-to-node ratio will not limit yield potential because the leaves that support bolls have not yet developed. After node 7, changes in the ratio become very important and determine stature and potential carrying capacity of the plant, e.g., 70% of the yield comes from branches on nodes 7 to 16. In Arkansas, average height-to-node ratio is 2.0 for adapted Cultivars. Below this value indicates slow height development and stressed conditions, while higher values indicate excessive vegetative growth. The developing fruit load reduces the height-to-node ratio.

HEL = HOME EQUITY LOAN

HELD COVERED = УДЕРЖИВАЕМЫЙ ПОКРЫТЫМ – Held Covered:- a provisional acceptance of risk, subject to confirmation at a later date that the agreed cover is needed. Where applicable to an existing insurance, cover is conditional, in practice, on prompt advice to the underwriter as soon as the assured is aware of the circumstances to be held covered coming into effect, and a reasonable additional premium is payable if the risk held covered comes into effect. An agreement by underwriters to provide cover in certain circumstances. Where this is a policy provision, cover is subject to prompt advice to the underwriters that the circumstances have taken place and payment of an additional premium, if required. The held covered provision may allow underwriters to amend the policy conditions. A 'held covered' provision in broker's slip is not legally binding on the subscribing underwriters until it is embodied in a legally valid policy, but underwriters should still ensure that they understand what is intended when initialing such slip agreements. Where it is agreed in the London market to hold covered a renewal, pending receipt of confirmation from the assured, such agreement is valid for no more than 14 days unless agreed otherwise.

HELD TO MATURITY INVESTMENTS = ИНВЕСТИЦИИ, УДЕРЖИВАЕМЫЕ ДО ПОГАШЕНИЯ – Held To Maturity Investments:- a non-derivative financial asset with fixed payments and fixed maturity that an entity has intention to hold to maturity other than those designated as fair value through profit and loss; available for sale; and meet the definition of loans and receivables.

HELICAL GEAR = ГЕЛИКОИДАЛЬНАЯ ПЕРЕДАЧА (или ГЕЛИКОИДАЛЬНАЯ ЗУБЧАТАЯ ПЕРЕДАЧА, или ВИНТОВАЯ ЗУБЧАТАЯ ПЕРЕДАЧА, или КОСОЗУБОЕ КОЛЕСО) – Helical Gears:- helical gears operate more smoothly and quietly compared to spur gears due to the way the teeth interact. The teeth on a helical gear cut at an angle to the face of the gear. When two of the teeth start to engage, the contact is gradual-starting at one end of the tooth and maintaining contact as the gear rotates into full engagement. The typical range of the helix angle is about 15 to 30 deg. The thrust load varies directly with the magnitude of tangent of helix angle. Helical is the most commonly used gear in transmissions. They also generate large amounts of thrust and use bearings to help support the thrust load. Helical gears can be used to adjust the rotation angle by 90 deg. when mounted on perpendicular shafts. Its normal gear ratio range is 3:2 to 10:1. Helical Gear is a cylindrical gear wheel which has slanted teeth that follow the pitch surface in a helical manner. See also Gear. Helical Gears are one type of cylindrical gears with slanted tooth trace. Compared to spur gears, they have the larger contact ratio and excel in quietness and less vibration and able to transmit large force. A pair of helical gears has the same helix angle but the helix hand is opposite. When the reference section of the gear is in the normal plane, by tilting the hobbing tool, the spur gear hobbing machine and hobbing tool can be used to produce helical gears. Because of the twist of teeth, their manufacturing has the disadvantage of more difficult production. The helical gears made by KHK (brand of Japanese gears) can be classified into two groups by the reference section of the gears being in the rotating plane (transverse module) and normal plane (normal module). If the reference section is in the rotating plane, the center distance is identical to spur gears as long as they are the same module and number of teeth. This allows for easy swapping with spur gears. However, in this case, they require special hobbing cutters and grinding stones, leading to higher production cost. On the other hand, if the reference section is in the normal plane, it is possible to use spur gear hobbing tools and grinding stones. However, the same module and number of teeth in spur gears no longer

match the center distance of helical gears, and swapping becomes very difficult. In addition, the center distance is usually not an integer. While spur gears do not generate axial thrust forces, because of the twist in the tooth trace, helical gears produce axial thrust force. Therefore, it is desirable to use thrust bearings to absorb this force. However, combining right hand and left hand helical gears making double helical gears will eliminate the thrust force. Helical gears are often used in automotive transmissions by replacing spur gears. / часто используются в автотракторных трансмиссиях, заменяя цилиндрические прямозубые передачи (или колёса) (spur gears). Под Геликоидом, от Греческих слов Hélix, родительный подеж Hélikos, означающее Спираль, и Éidos, означающее Вид, понимается один из видов винтовой поверхности. Винтовая Зубчатая Передача – цилиндрическая зубчатая передача винтовыми колёсами между перекрещивающимися валами. В основном применяются винтовая зубчатая передача с межосевым углом 90°. Перекрещивание валов позволяет выводить оба вала передачи за её пределы в разных направлениях, что даёт возможность передавать вращение от одного вала к нескольким другим. В связи с точечным контактом зубьев и большим скольжением в зацеплении винтовые зубчатые передачи склонны к быстрому износу и заеданию даже при небольших нагрузках, поэтому их применяют главным образом в кинематических цепях приборов.

HELICALLY THREADED NAIL = XX (или ВЫПУКЛЫЙ ГВОЗДЬ) – Helically Threaded Nail is a screw nailthreaded nail on which the threaded portion has a medium lead angle and rolling expansion approximately equal to the depression. See also Pallet. / Выпуклый Гвоздь (Helically Threaded Nail):- гвоздь, имеющий выпуклую нарезку со средним углом профиля, при этом выпуклая (расширяющаяся) часть приблизительно равна нижней. Смотрите также Поддон (Pallet).

HELICAL NAIL = ВИТОЙ ГВОЗДЬ (или СПИРАЛЬНЫЙ ГВОЗДЬ) – Helical Nail is a helically (continuous spiral) threaded pallet nail. See also Drive Screw Nail.

HELICAL WINDING = ВИНТОВАЯ НАМОТКА (или СПИРАЛЬНАЯ НАМОТКА, или ПЕРЕКРЁСТНАЯ НАМОТКА) – Helical Winding:- in filament wound items, a winding in which a filament band advances along a helical path, not necessarily at a constant angle except in the case of a cylinder.

HELICOVERPA ARMIGERA = ХЭЛИКОВЭРПА АРМИГЭРА (или АФРИКАНСКАЯ ХЛОПКОВАЯ СОВКА, или ХЛОПКОВАЯ СОВКА) – Moths Helicoverpa Armigera (Hübner, 1808):- homotypic synonym – Heliothis (Helicoverpa) Armiger or Heliothis Armigera. Embankk common name:- Cotton Bollworm. Other names:- African Bollworm, Corn Ear Worm, Scarce Bordered Straw, Tobacco Budworm. The Corn Earworm Helicoverpa Zea (Boddie) and the old world Bollworm Helicoverpa Armigera (Hübner) (Lepidoptera:- Noctuidae) are allopatric Species and occur in important agricultural crops. In Maize, both Species tend to infest the ear. The introduction of Helicoverpa Armigera in Brazil has created a new scenario, where these Helicoverpa Species might cohabit and interact with one another, affecting the prevalence of each Species in the agroecosystem, integrated pest management, and Insect resistance management. In this study, larval occurrence and proportion of these Species in Maize was assessed in three regions of Brazil during three crop seasons. Interaction between the Species was evaluated in interspecific and intraspecific scenarios under laboratory and field conditions. Helicoverpa Zea was predominant in Rio Grande do Sul and the Planaltina, DF (central Brazil). In Western Bahia, Helicoverpa Zea was predominant in the first collection, but approximately equal in number to Helicoverpa Armigera in the second crop season. Both Species exhibit high cannibalism/predation rates, and larval size was the primary factor for larval survival in the interaction studies. Larva of Helicoverpa Zea had higher survival when interacting with Helicoverpa Armigera, indicating that Helicoverpa Zea has an advantage in intraguild interactions with Helicoverpa Armigera in Maize. Overall, the results from this study indicate that Maize might play a role as a source of infestation or a sink of insecticide or Bt protein unselected Helicoverpa Armigera populations, depending on the Helicoverpa Zea:- Helicoverpa Armigera intraguild competition and adult movement in the landscape. The Heliothinae (Lepidoptera:- Noctuidae) is a cosmopolitan Subfamily of Noctuid Moths that comprises more than 400 Species. A review involving the Corn Earworm complex proposed the Genera Helicoverpa. One of the significant contributions of this review was to propose the Species differentiation between Helicoverpa Zea (Boddie) and Helicoverpa Armigera (Hübner) based on male and female genitalia. Helicoverpa Zea and Helicoverpa Armigera are allopatric Species that have a preference to feed on Plant reproductive tissues, often causing economic damage. Helicoverpa Zea is only present in the American continents, and so is named the new old world Bollworm. Helicoverpa Armigera, the old world Bollworm, was reported present in Asia, Africa, Europe and Australia. However, a new scenario of Helicoverpa Zea and Helicoverpa Armigera cohabiting in an American continent was reported with the detection of Helicoverpa Armigera in Brazil during the crop season of 2012/13. Indeed, Helicoverpa Armigera was present in Brazil at least since 2008, and the potential for it to spread throughout North and South America has been confirmed by reports of its occurrence in other countries, such as Argentina, and in the United States on 17 June 2015, where three Helicoverpa Armigera moths were collected in Florida. Several concerns have been raised about the impact of the interaction between these two former allopatric Species, with relevance to integrated pest management and Insect resistance management. Maize is the major host of Helicoverpa Zea, and moths usually oviposit on silks, where the neonates feed, and then move to kernels after entering the tip of the husk. When larvae reach the third instar, they become cannibalistic and frequently only one larva survives per Maize ear. This Species presents management challenges because of its biological and behavioral characteristics and rapid adaptation to chemical control (e.g., resistance to organophosphate and pyrethroid insecticides). One alternative to insecticide control has been the use of transgenic hybrids expressing active proteins of the bacterium Bacillus Thuringiensis (Bt). However, cases of resistance of Helicoverpa Zea have already been reported on Bt Maize expressing the proteins Cry1Ab. Helicoverpa Armigera is a polyphagous Pest and prefers Cotton and Sorghum. However, injury in Maize is reported, and similarly to Helicoverpa Zea, Helicoverpa Armigera moths tend to oviposit on Maize silks and larvae feed on kernels. Considering this preference for reproductive tissues (silks and early ear development stages), Maize supports one generation of Helicoverpa Armigera, and economic impact has been reported. In addition, insecticide resistance of Helicoverpa Armigera has been reported to organophosphate, carbamate, and pyrethroid insecticides. In Brazil, besides Maize, there is the possibility that these two Species could cohabit in other economically important crops such as Soybean, Cotton, Tomatoes, Dry Beans, among others. However, Maize represents a model crop to study the interaction between these two Pests. The Maize ear is the same feeding site for both Species, where larvae are naturally confined with less possibility of movement to other reproductive tissues on the same plant. Larval movement to other feeding sites is more likely in Cotton or Soybean. Thus, Maize represents an appropriate arena for intraguild interaction studies. In addition, larvae of both Species have cannibalistic behavior, which might intensify the intraguild competition. African Bollworm Caterpillar (3–4 cm long) is initially pale green, sometimes with black dots, and a pattern of thin dark lines running along the body, the lines being darker around the second and third segments. In later instars, the dark lines become less conspicuous, and the black spots develop red areas around them. There is a good deal of variation in colour in this Species. Lighter and darker forms of both caterpillars and moths are known, for example, having white instead of black spots on the caterpillars. The caterpillar postures when disturbed characteristic of a number of Species in this. Scientific Name:- Helicoverpa Armigera (Synonym:- Heliothis Armigera). Order/Family:- Lepidoptera:- Noctuidae. Common Names:- African Bollworm, Fruitworm, Podborer, Corn Earworm, Tomato Grub, Tobacco Budworm. Type of Pest:- Insect. Host Plants:- Beans, Cotton, Cowpea, Green Gram, Maize, Okra, Peas, Peppers, Sorghum, Tomato. Other Crops:- Sunflower. Helicoverpa Species:- two Species of Helicoverpa are serious Pests of field crops (particularly grain legumes, summer grains and Cotton) in the Northern grains region of Australia.

Helicoverpa Armigera is generally regarded as the more serious pest because of its greater capacity to develop resistance to insecticides, broader host range, and persistence in cropping areas from year to year. Helicoverpa Punctigera numbers in cropping regions fluctuate based on conditions in inland breeding areas. Scientific Name:- Helicoverpa Armigera (Cotton Bollworm or Corn Earworm) and Helicoverpa Punctigera (Native Budworm). Identification:- eggs are 0.5 mm in diameter and change from white to brown to a black head stage before hatching. Newly hatched larvae are light in colour with tiny dark spots and dark heads. As larvae develop they become darker and the darker spots become more obvious. Both Species look the same at the egg and small larvae stages. Medium larvae develop lines and bands running the length of the body and are variable in color. Helicoverpa Armigera have a saddle of darker pigment on the fourth segment and at the back of the head and dark-colored legs. Helicoverpa Punctigera have no saddle and light-colored legs. Large larvae of Helicoverpa Armigera have white hairs around the head; Helicoverpa Punctigera have black hairs around the head. Pupae are found in soil underneath the crop. Healthy pupae wriggle violently when touched. Helicoverpa Armigera pupal tail spines are more widely spaced than those of Helicoverpa Punctigera. Moths are a dull light brown with dark markings and are 35 mm long. Helicoverpa Armigera has a small light or pale patch in the dark section of the hindwing while the dark section is uniform in Helicoverpa Punctigera. Forewings are brown in the female and cream in the male. Similar Species:- commonly confused Species include Armyworms and Loopers. Helicoverpa larvae have a group of four pairs of 'legs' in the back half of the body while loopers can have a group of two, three or four pairs of legs at the rear and loop when walking. Armyworm also have 4 pairs of prolegs, but are smoother and fatter, with more colored bands than Helicoverpa. Life Cycle:- Helicoverpa Armigera and Helicoverpa Punctigera take about 4–6 weeks to deveop from egg to adult in summer, and 8–12 weeks in spring or autumn. Moths live for around 10 days during which females lay 1 000 eggs. Crops Attacked:- the two Helicoverpa Species prefer different hosts:- (i) Helicoverpa Punctigera attacks broadleaf Species, e.g., Cotton, Chickpea, Sunflower, Soybean, Mungbean, Navy Bean, Lucerne, Canola, Peanut, Faba Bean, Safflower, Linseed and Azuki Bean. It is not found on grass or Cereal crops, such as Wheat, Barley, Sorghum or Maize. (ii) Helicoverpa Armigera will attack all field crops, but is less common in Wheat and Barley. Larvae feed on leaves but are most damaging when feeding on growing terminals, buds or squares, flowers, pods, seed and/or fruit. This includes direct losses through shedding and reduced quality. Monitoring:- Helicoverpa can be present in crops from the vegetative stage onwards. Very susceptible crops (e.g., Cotton) need to be closely monitored from emergence to maturity for eggs and larvae, however, most field crops only need to be monitored closely from budding/flowering through to maturity. Eggs are most commonly laid on the top third of the Plant and growing points. Management:- to manage Helicoverpa Armigera and Helicoverpa Punctigera well, it is important to understand the basic differences between the two Species. Integrated Pest Management (IPM) strategies incorporating chemical, cultural and biological methods aim to restrict populations to below damaging levels. Helicoverpa Armigera has developed resistance to a wide range of insecticides, however a number of products are now registered for both Species that have reduced impacts on natural enemies in the crop. Larvae are best targeted when smaller than 7 mm. Natural Enemies:- all stages of the Helicoverpa lifecycle are attacked by a wide range of predators, parasitoids and pathgens, and conserving these in the crop through the avoidance of broad-spectrum insecticides can help prevent/minimize the need for insecticide treatments. / Хэликовэрпа Армигэра или Хлопковая Совка (Helicoverpa Armigera или Heliothis Armigera), бабочка Семейства Совок. Передние крылья серовато-жёлтые, задние более светлые; размах крыльев 30–40 миллиметров (мм). Распространена в хлопкосеющих странах; в бывшем Союзе Советских Социалистических Республик (СССР) – на Юге Европейской части и на Кавказе. Из зимующих в почве куколок бабочки вылетают весной при температуре верхнего слоя почвы 17–20 °C, откладывают яйца (около 500 штук) на верхние части растения. Гусеницы повреждают более 120 Видов культурных и дикорастущих Растений; наиболее часто Хлопчатник, Кукурузу, Нут, Томат, Кенаф, Табак, Сою. Сначала скелетируют листья, затем повреждают бутоны, цветки, завязи, вызывая их опадение, в дальнейшем выедают семена в коробочках (отсюда название 'Коробочный Червь' Хлопчатника). На Кукурузе гусеницы питаются зерном в початках, на Табаке, Томате – семенами. Меры борьбы:- зяблевая вспашка, уничтожение цветущих Сорных Растений весной; обработка в Мае посевов Кукурузы, Табака, Нута, Томата и других культур, на которых обнаружены яйца Вредителя, инсектицидами (обработку прекращают за 25–30 суток (сут) до сбора урожая); обработка Хлопчатника во время бутонизации инсектицидами; раннее скашивание Кукурузы на силос; уничтожение яиц и гусениц Хлопковой Совки при чеканке Хлопчатника; удаление с поля послеуборочных остатков.

HELIOTHIS = ХЭЛИОТИС (или ГЕЛИОТИС, или СОВКА) – Heliothis or Genus Heliothis (synonym) is a Genus of Noctuidae. Heliothis used as a noun is very rare. A Heliothis virus. Heliothis:- an evaluation of protein, amino nitrogen, and trehalose levels in the hemolymph of parasitized Heliothis indicates that each parasitoid Species exerts a different effect on Heliothis. A number of parasitoid Genera still remain to be evaluated relative to their effects on host growth before a relationship can be established between parasitoid taxon and effects of their parasitism on hosts. Parasitoids of Heliothis Spp. (Lepidoptera:- Noctuidae). Heliothis is a Genus of Moths, whose larvae are agricultural pests on crop Species such as Tobacco, Cotton, Soybean and Pigeon Pea. Several of the Species formerly placed in this Genus are now in the Genus Helicoverpa. Heliothis Armigera has been a growing problem for many years. The Cotton industry has had a voluntary chemical usage strategy for many years, however, due to many of the same chemicals being used on other crops, chemicals are failing because of the continuous exposure of Heliothis to the same chemical in different crops, e.g., Carbamates on Chickpeas, Cotton and Mung Beans. / Виды (Species). Хэлиотис или Гелиотис или Совка (Heliothis), или Семейство Совок (Ночниц) (синоним) является Семейством Чешуекрылых Вредителей (или Бабочек (Lepidoptera)) Ноктуидэ или Совок (Noctuidae). гусеница и бабочка.

HELIOTHIS ARMIGERA = ХЭЛИОТИС АРМИГЭРА (или ХЛОПКОВАЯ СОВКА, или ХЛОПКОВАЯ НОЧНИЦА) – Heliothis Armigera is other name for Helicoverpa Armigera (Cotton Bollworm). See also Helicoverpa Armigera.

HELIOTROPE = ЛИЛОВОЕ (или ГЕЛИОТРОП или ГЕЛИОТРОПНОЕ) – Heliotrope:- a variable color averaging a moderate to reddish purple.

HELIX ANGLE = УГОЛ СПИРАЛИ (или УГОЛ ЗМЕЕВИКА) – Helix Angle is:- (1) the angle formed by the path of a ply and the major axis in a yarn or tire cord. (2) The angle between the tangent to a yarn and the minor axis of the package on which it is wound. Also called Wind Angle.

THE HELLENIC REAL–TIME MONEY TRANSFER EXPRESS SYSTEM = ГРЕЧЕСКАЯ ЭКСПРЕСС СИСТЕМА ДЕНЕЖНЫХ ПЕРЕВОДОВ В РЕЖИМЕ РЕАЛЬНОГО ВРЕМЕНИ – The Hellenic Real-Time Money Transfer Express System (HERMES) is the Greek RTGS system, and is owned and managed by the Bank of Greece. HERMES commenced operations in March 2000, and is used for credit transfers among the Bank of Greece and the credit institutions. The aim of HERMES is to provide the infrastructure to ensure the smooth flow of funds in the domestic market and, through TARGET, to all EU countries, thus facilitating the implementation of monetary policy and minimizing the systemic risks related to the settlement of payments. HERMES provides real-time settlement of customer and interbank payment orders, subject to the availability of funds in the settlement account of the sending participant held with the Bank of Greece. The settlement account can be overdrawn only against collateralized assets. The settlement of balances of other payment and securities settlement systems in Greece is also carried out via HERMES. The Hellenic Real-time Money Transfer Express System (HERMES) is the Greek Real-Time Gross Settlement (RTGS) system. An RTGS system for large-value payments,

HERMES, was set up to enable real-time transfers between the accounts held by credit institutions with the Bank of Greece. At the same time DIAS (ΔΙΑΤΡΑΠΕΖΙΚΑ ΣΥΣΤΗΜΑΤΑ ΑΕ (DIAS AE), http://www.dias.com.gr, INTERBANKING SYSTEMS (DIAS) SA) was established in Maroussi, Greece on 1989-June-28 on the initiative of the Hellenic Bank Association. The Company's shareholders are only credit institutions, specialized credit institutions and the Central Bank, the Bank of Greece), a net settlement system for retail payments, has developed several subsystems for the clearing of different payment instruments (cheques and credit transfers) as well as for ATM interoperability, while further developments are under way (direct debits). The statutory and legal framework authorizes the Bank of Greece to operate and manage clearing and settlement systems, while its other responsibilities include the oversight of payment systems and the supervision of credit institutions and other financial organizations. The Bank of Greece plays a pivotal role in the Greek payment system. It developed and manages the RTGS system, HERMES, the securities settlement system, BOGS (The Bank of Greece's SSS (The Securities Settlement Systems)), and the Electronic Secondary Securities Market (ESSM; HDAT is the acronym in Greek) system. The Bank of Greece has developed an electronic market (HDAT) and a settlement system (BOGS) for trading and settling Greek government securities in book-entry form. The Bank of Greece acts as manager and operator of these systems. HERMES is available for processing both interbank and customer payments, irrespective of their value. Its primary goal is to attract all large-value payments in order to reduce systemic risks effectively, but small-value payments represent a significant proportion of HERMES activity. Certain payments are settled exclusively via HERMES. These are the payments related to:- (i) single monetary policy operations; (ii) the settlement of the Euro leg of foreign exchange operations involving the Eurosystem; and (iii) fund transfers in which the Bank of Greece is involved either as a receiving or a sending party. In addition, the balances of the existing clearing systems operating in Greece settle through HERMES. Large-value netting systems in Euro are settled through HERMES. ATM networks have spread throughout the country and are all interlinked through DIAS SA, which performs the switching of all ATM transactions. The DIAS SA system provides the capacity for bank customers to withdraw cash from ATMs belonging to any bank connected to the system. DIAS is a clearing system for retail payments. The name DIAS SA stands for 'Interbanking systems', and the company was formed in 1989 on the initiative of the Hellenic Bank Association (HBA). Currently (June 2001), 36 banks cover the company's share capital in proportion to their share of the banking market. The largest shareholder is the Bank of Greece. Participation is restricted to DIAS shareholders. DIAS has developed and operates five subsystems, each one focusing on a different area, and a sixth is under development, but due to be operational soon. DIAS performs the clearing and then proceeds to consolidate the clearing balances of all the sub-systems. / (HERMES). ДИАС (DIAS). Греческая система Валовых Расчётов в Режиме Реального Времени (ВРРРВ). ТАСВРРУП (Трансевропейская Автоматизированная Система Валовых Расчётов в Режиме Реального Времени по Ускоренным Переводам) или ТАСВРРЭП (Трансевропейская Автоматизированная Система Валовых Расчётов в Режиме Реального Времени по Экспресс Переводам). взаиморасчёт или сведение (netting) .

HELM = КАСКА (или ШЛЕМ) – Helm:- helmet. A Helm is a wheel or tiller by which a ship is steered. A Helmet is a form of protective head covering worn by soldiers, firefighters, divers, cyclists, etc.

HELM = ШТУРВАЛ (или РУЛЬ) – Helm is a tiller or a wheel generally installed on the bridge or wheelhouse of a ship to turn the rudder during maneuvering and navigation. It is in fact the steering wheel of the ship. / Румпель или колесо. Под Штурвалом, от Голландского слова Stuurwiel от Stuur, означающее Руль, и Wiel, означающее Колесо, понимается орган или устройство в системе управления (обычно в виде колеса) автомобилем, заслонками в трубопроводах, комбайном (ведущими колёсами), самолётом (элеронами и рулями высоты), судном (перекладкой руля) и так далее. На многих судах ручной или машинный штурвал заменены кнопочным устройством. Под судовым Рулём, от Голландского слова Roer, понимается устройство для удержания судна на курсе, а также для поворота на ходу. Обычно – пластина, поворачивающаяся вокруг вертикальной оси. Под Рулём судна понимается средство управления судном. Руль состоит из пера и баллера, вокруг оси которого поворачивается руль. По форме профиля пера рули делятся на плоские и обтекаемые; по способу соединения баллера с корпусом – на простые (многоопорные), полуподвесные и подвесные; по положению оси баллера относительно пера руля – на небалансирные, полубалансирные и балансирные. На подводных кораблях, кроме вертикального руля для управления в надводном плавании, имеются также носовые и кормовые горизонтальные рули для управления под водой. У судов с гребными винтами в поворотных направляющих насадках рулями служат насадки. Под Румпелем, от Голландского слова Roerpen от Roer, означающее Весло или Руль, и Pen, означающее Шпенёк, понимается рычаг на верхней части оси руля. Служит для перекладывания (поворота) руля на малых судах. Под Румпелем понимается рычаг, жёстко соединённый с головной частью баллера руля и предназначенный для его поворота – перекладки руля. Румпель бывает в виде одноплечего рычага (продольный), двуплечего рычага (поперечный), сектора с тросовым или зубчатым приводом (секторный).

HELMET = ШЛЕМ (или КАСКА) – Helmet:- a covering or enclosing headpiece of ancient or medieval armor; any of various protective head coverings usually made of a hard material to resist impact. A Helmet is a form of protective gear worn to protect the head from injuries. Ceremonial or symbolic helmets (e.g., UK policeman's helmet) without protective function are sometimes used. The oldest known use of helmets was by Assyrian soldiers in 900 BC, who wore thick leather or bronze helmets to protect the head from blunt object and sword blows and arrow strikes in combat. Soldiers still wear helmets, now often made from lightweight plastic materials. In civilian life, helmets are used for recreational activities and sports (e.g., jockeys in horse racing, American football, ice hockey, cricket, baseball, and rock climbing); dangerous work activities (e.g., construction, mining, riot police); and transportation (e.g., Motorcycle helmets and bicycle helmets). Since the 1990s, most helmets are made from resin or plastic, which may be reinforced with fibers such as aramids. The word Helmet is diminutive from Helm, Medieval word for combat protective headgear. The Medieval great helm covers the whole head and often is accompanied with camail protecting throat and neck as well. Originally a helmet was a helm which covered the head only partly.

HEM = ОКОЙМА (или РУБЕЦ, или ОБШИВКА, или ПОДРУБЛЕННЫЙ ШОВ, или ПОДРУБОЧНЫЙ ШОВ, или КРАЙ, или КАЙМА, или ПОДОГНУТОЕ) – (1) Hem (clean):- the double fold of fabric secured with a row of stitching with the raw edge of the fabric buried within the fold. / втачивание (stitching).

(2) Hem is a fold which may be used as a finish or as a decoration on a garment. A hem may be straight or curved. Curved hems must be narrow, whereas straight hems may be any width, the only requirement being good proportion for the placing. The first fold of a hem depends upon the width of the hem and the firmness of the fabric. Hem (raw):- a single fold of fabric secured with a row of stitching, leaving the raw edge of the fabric exposed. Hem is the edge of a piece of cloth, such as the bottom edge of a skirt or dress, which is folded over and sewn so that it does not develop loose threads. / втачивание (stitching).

HEMICELLULOSE = ГЕМИЦЕЛЛЮЛОЗА (или ПОЛУЦЕЛЛЮЛОЗА) – Hemicellulose is heterogeneous mixture of polysaccharides resembling cellulose, but of lower molecular weight and less complex. Hemicellulose is insoluble in hot water or with chelating agents, but can be extracted with dilute aqueous alkali. Present in allmost all plant cell walls where hemicellulose binds with pectin to cellulose to form a network of crosslinked fibers, but found especially in woody tisues. Includes xylan, glucuronoxylan, arabinoxylan, arabinogalactan II, glucomannan, xyloglucan and galactomannan. Hemicelluloses are the principal noncellulosic polysaccharides in

wood. Wood contains 28 to 35% hemicelluloses, the balance being cellulose and lignin. / Под Гемицеллюлозой, от Греческого слова Hēmi, означающее Полу (Половина или Наполовину), и от Французского слова Cellulose, от Латинского слова Cellula, означающее буквально Комнатка, а здесь – Клетка, понимается . Щёлочь (Alkali). хелатообразователь (chelating agent). Включает ксилан, глюкуроноксилан, арабиноксилан, . Гемицеллюлозы, высокомолекулярные (молярная масса 1 000–12 000) гетерополисахариды (смотрите Полисахариды). Встречаются в значительном количестве (от 6 до 27%) в одревесневших частях растений (соломе, семенах, орехах, древесине) вместе с целлюлозой; в отличие от неё, гемицеллюлозы легко гидролизуются разбавленными минеральными кислотами с образованием галактозы, ксилозы, арабинозы и уроновых кислот. Из растений извлекаются разбавленными щёлочами.

HEMIMETABOLIC = ГЕМИМЕТАБОЛИЧЕСКОЕ (или ПОЛУМЕТАБОЛИЧЕСКОЕ) – Hemimetabolic:- having incomplete metamorphosis especially in insects with aquatic larvae in which the young does not resemble the old. / С неполным превращением. Под Гемиметаболическим, от Греческих слов Hēmi, означающее Полу (Половина или Наполовину), и Metabolē, означающее Перемена или Превращение, понимается . Под Гемиметаболией, от Греческих слов Hemi-, означающее Полу-, и Metabole, означающее Превращение, понимается неполное превращение, тип постэмбрионального развития насекомых ряда систематических групп (Стрекозы, Подёнки, Веснянки, Прямокрылые, Клопы и другие), при котором из яйца выходит личинка (нимфа), внешне сходная со взрослым насекомым:- имеет фасеточные глаза, расчленённые лапки, такие же, как у взрослого, ротовые органы. У насекомых из разных Отрядов постэмбриональное развитие включает от 3 до 30 нимфальных возрастов. Превращение нимфы во взрослое насекомое происходит без стадии куколки. Иногда термин Гемиметаболия применяется только к развитию Стрекоз, Подёнок и Веснянок, имеющих в нимфальной стадии провизорные, или временные, органы (жабры, маска); развитие других насекомых с неполным превращением, при котором у личинки нет провизорных органов, называется Паурометаболией. Сравните с Голометаболия.

HEMMING STITCH = ПОДРУБОЧНАЯ СТРОЧКА – Hemming Stitch is a stitch used to finish the raw edge of a fabric, usually by turning up and catching the edge to another point on the fabric. The needle is inserted in a slanted direction into the edge being hemmed, then into the fabric which is to be caught. Many other types of stitches can also be used for hemming. See also Stitch.

HEMP = КОНОПЛЯ – Hemp:- this is found in India, Italy, the Philippines, Poland, Russia, and Spain. Russia produces more than all other nations combined. The best quality comes from Italy. Hemp is grown in this country in the states of California, Illinois, Indiana, Kentucky and Missouri. In recent years Wisconsin has begun raising the fiber, and excellent results have been obtained due to the mineral matter in the soil. The fiber is difficult to bleach, a serious drawback to its progress. Like Jute, the fiber comes from just inside the outer bark of the plant which grows from six to ten feet high. Hemp is stronger than jute and withstands water better than any other natural textile fiber. Uses of hemp are ropes, twines, cables, and rugs. Hemp is the fiber from the plant Cannabis Sativa. Hemp is a coarse, durable bast fiber obtained from the inner bark of the hemp plant. Used primarily in twines and cordages, and most recently apparel. Hemp is a coarse, durable bast fiber of Cannabis sativa found all over the world. Used primarily for twines, cordage, halyards, and tarred riggings. Hemp (Cannabis sativa) is a bast fiber that was probably used first in Asia. The fiber is dark tan or brown and is difficult to bleach, but it can be dyed bright and dark colors. The Hemp fibers vary widely in length, depending upon their ultimate use. Industrial fibers may be several inches long, while fibers used for domestic textiles are about 3/4 inch to 1 inch (1.9 to 2.54 cm) long. The elongation (1 to 6 percent) is low and its elasticity poor. The thermal reactions of hemp and the effect of sunlight are the same as for cotton. Hemp is moth resistant, but it is not impervious to mildew. Coarse Hemp fibers and yarns are woven into cordage, rope, sacking and heavy-duty tarpaulins. In Italy, fine Hemp fibers are used for interior design and apparel fabrics. Hemp is a plant grown in nearly all the temperate countries of the world. It furnishes a bast fiber, obtained by a retting process, which is used for rope and textiles. Some of the fiber enters the paper industry as waste material. The term Hemp has also come to be used in a generic sense as fiber and then preceded by an adjective, for example, Manila Hemp (see also Abaca), Sisal Hemp (see also Sisal). Hemp is a plant grown in the Philippines, Mexico, Central America, the West Indies, and India. Outer fibers are used for cordage, inner fibers for cables and canvas. Hemp:- The Plant:- Hemp fiber is obtained from the bast of the Plant Cannabis Sativa L. It grows easily – to a height of 4 meters – without agrochemicals and captures large quantities of carbon. Production of hemp is restricted in some countries, where the plant is confused with marijuana. Optimum yield of hemp fiber is more than 2 tons per ha, while average yields are around 650 kg. Hemp:- easy to grow without agrochemicals, hemp is used increasingly in agrotextiles, car panels and fibreboard, and ‘cottonized’ for clothing. The Fiber:- Long, strong and durable, Hemp fibers are about 70% cellulose and contain low levels of lignin (around 8–10%). The fiber diameter ranges from 16 to 50 microns. Hemp fiber conducts heat, dyes well, resists mildew, blocks ultraviolet light and has natural anti-bacterial properties. Shorter, woody core fibers (‘tow’) contain higher levels of lignin. Uses Of Hemp:- Hemp has been used for centuries to make rope, canvas and paper. Long Hemp fibers can be spun and woven to make crisp, linen-like fabric used in clothing, home furnishing textiles and floor coverings. In China, Hemp is de-gummed for processing on flax or cotton machinery. Blending with cotton, linen, silk and wool gives Hemp a softer feel, while adding resistance and durability to the product. In Europe, Hemp fibers are used mainly in the special paper industry – thanks to lower lignin content, it can be pulped using fewer chemicals than wood. Hemp fibers are also used to reinforce moulded thermoplastics in the automobile industry. The short core fibers go into insulation products, fibreboard and erosion control mats, while the fibrous core can be blended with lime to make strong, lightweight concrete. Producers:- The world’s leading producer of Hemp is China, with smaller production in Europe, Chile and the Democratic People’s Republic of Korea. In the European Union Hemp is grown on around 15 000 ha of land. Major producers are France, Germany and the United Kingdom. Production And Trade:- Between 2000 and 2006, world production of Hemp fiber grew from 50 000 tons to almost 90 000 tons, almost half of it produced in China. Production in the EU was 23 000 tons. China is the largest exporter of Hemp textiles, mainly to Europe and North America, where the market for hemp clothing is growing rapidly. China also exports Hemp-based fibreboard. Hemp’s Future In Chinese Fabrics:- The key is ‘cottonization’ to produce fine, soft textile fibres suitable for blending with cotton, wool and synthetics. Zhang Jianchun, Director General of China’s Hemp Research Centre in Beijing has a dream:- to see lush green plantations of Cannabis Sativa growing across 1.3 million hectares (ha) of the country’s farmland. That would be sufficient, Zhang calculates, to produce up to 10 million tons of Hemp plants a year and, with it, around two million tonnes of hemp fiber. Expanded production of Hemp, he says, offers enormous benefits for China. First, it would provide a major new source of fiber for the textile industry, reduce dependency on Cotton and, in the process, free large areas of Cotton-growing land for food production. In addition, Hemp cultivation would generate extra income for millions of small-scale farmers in some of the country’s poorest rural areas. China currently cultivates industrial hemp over an area of around 20 000 ha. That is just a fraction of the 5.6 million ha dedicated to cotton (China is the world’s biggest cotton grower, with a harvest of some 6.6 million tons in 2006). Among natural fibers processed for use in Chinese textiles, Hemp output ranks far behind that of wool and silk and of other bast sources such as Flax, Jute, Kenaf and Ramie. ‘Performance Properties’:- The Hemp Research Centre is working to change that – and restore Hemp to its once important place in Chinese agriculture and textiles. Zhang points out that China is the birthplace of industrial Hemp:- archaeological evidence shows that the plant was grown for fiber some 4 000 years ago, and it was not overtaken by cotton in clothing until early last century. Today, a small quantity of pure Hemp fashion fabric is produced in China for high-value niche markets. But, Zhang says, the fiber’s future lies in its integration into the production of cotton, wool, cashmere and silk textiles, and blending with

synthetic fibers. ‘The inherent and special performance properties of Hemp are very important in the market because they are attractive to consumers’, he says. ‘Compared with cotton, Hemp fiber has greater heat resistance and better moisture absorption and dispersion, while its high rate of absorption of toxic gases makes it excellent for use in household textiles’. The key to hemp’s future in fabrics is ‘cottonization’:- removing the lignin that binds the Hemp fibers (and gives stalks their rigidity), but prevents them from being spun and finished on slightly modified cotton or wool processing equipment. Using specially developed machines and an array of de-gumming technologies, Chinese scientists say they have successfully reduced the lignin content in Hemp fibers from 8–10% to as little as 0.2%. Result:- ‘We can now cottonize Hemp fiber into quite fine, soft and workable textile fibers for cotton and wool systems and for blending with man-made fibers’, says Zhang. ‘One kilogram of textile fibers can be produced from 2 kgs of Hemp bark’. Technologies developed by the center are now being used in China’s first commercial-scale Hemp processing mill, in Xishuangbana,Yunnan Province, which has the capacity to process 50 000 tons of Hemp fibers a year, mainly for use in Cotton-Hemp blends. Not Only Fibers ...:- China’s Hemp Research Centre says most parts of the Hemp plant can be used in a variety of applications. The seed is an excellent source of edible oil also suitable for cosmetics and lotions, while the leaves and flowers are used in medicine. The Centre has also made viscose from Hemp hurd, the fibrous core of the Hemp stalk which, because of its short length and low density, is usually treated as waste. Hemp hurd was used in the wood/plastic composite outdoor flooring of the Beijing Olympic Park. Food Security:- Zhang says hemp agriculture could play an important role in guaranteeing China’s food security, protecting the environment and contributing to farmers’ incomes. ‘Hemp production is best suited to hilly areas and uplands, as well as semi-arid regions and areas with poor soils’, he says. ‘It can also be grown with little need for pesticides, unlike Cotton. If 1.3 million ha of Hemp were grown, China could reduce its Cotton area by the same amount and use it for growing food crops’. The centre has identified large areas in northern and northwest China and in Yunnan Province suitable for hemp. ‘In these regions, Hemp will not displace food crop production’, says Zhang Jianchun. ‘In some cases, they are not major food growing areas. In others, such as the Northern plains, Hemp would be ideal as a rotation crop with Soybean and Wheat, allowing farmers to make better use of their land and generate extra income’. For the large-scale Soybean farms of Northern China, the centre recommends its newly developed ‘combine harvester + decorticator’ for Hemp operations. / лубяное волокно (bast fiber). Конопля – растение, Пенька – волокно. Конопля (Cannabis) является Родом Однолетних Травянистых Растений Семейства Коноплёвых, лубоволокнистая прядильная и масличная культура. Имеется три близких Вида Конопли (иногда их объединяют в один Вид), преимущественно в Азии. Возделывают с 1-го тысячелетия до Нашей Эры в Средней Азии, на территории бывшего Союза Советских Социалистических Республик (СССР) с IX века Нашей Эры, в Европейских странах распространилась в XVI веке, родина – Средняя Азия) культурную Посевную Коноплю (Cannabis Sativa; в сухих стеблях до 25% волокна (пеньки), а в семенах до 35% конопляного жирного масла) и Индийскую Коноплю – наркотическое растение. Наркотик, получаемый из верхних частей Индийской Конопли называется Марихуана. Сорная Конопля (Cannabis Ruderalis) – Сорняк яровых культур в бывшем СССР (Западная Сибирь, Поволжье, Средняя Азия). Посевная Конопля – относительно теплолюбивое (молодые растения переносят заморозки до –5 °С) растение, требовательно к почвенной влаге, особенно в период бутонизации и цветения; в это же время потребляет наибольшее количество питательных веществ. Вегетационный период 65–160 суток (в зависимости от принадлежности сорта к раннеспелой, среднеспелой и позднеспелой группе). Растение двудомное (мужские особи – Посконь, или Замашка, женские – Матёрка). Посконь в отличие от Матёрки является менее облиственным растением, раньше созревает (что создаёт неудобства при уборке), содержит больше волокна. Опыляется перекрёстно (ветром). Лучшие почвы – чернозёмы и осушенные торфяники. Из Поскони и Зеленца (Матёрка, убранная в период технической спелости) получают волокно (пеньку), из которой изготавливают ткани. Из более грубого волокна Матёрки, убранной на семена, делают канаты, верёвки, парусину. Выход волокна из сухих стеблей Поскони 20–25%, Зеленца 12–20%. Семена Конопли содержат 30–35% жирного пищевого масла, используемого также для технических целей. Жмых скармливают скоту. Основные коноплесеющие районы в бывшем СССР:- Центральночернозёмные области России, Поволжье, Северный Кавказ, лесостепная и Южная Украина, Белоруссия. Распространённые сорта:- двудомной Конопли – Южная Созревающая 6, Краснодарская 35, Кубань, Днепровская 4; однодомной Конопли – Днепровская Однодомная 6, Южносозревающая Однодомная 14, Золотлношская 13 и другие. Ведётся работа по выведению сортов с одновременно созревающей Посконью и Матёркой. Средняя урожайность волокна 8–9 ц/га, высокая – 12–15 ц/га. Коноплю выращивают в севооборотах с короткой ротацией (4–5 польные), которые обычно размещают на пойменных землях и осушенных торфяниках. Предшественники – многолетние травы, Картофель, Сахарная Свёкла. Под вспашку вносят навоз или компост (40–60 т/га). Минеральные удобрения (30–120 кг/га N, 30–100 кг/га P_2O_5 и 45–120 кг/га K_2O) применяют под вспашку, при посеве в рядки и в подкормку. Сеют Коноплю при прогревании верхнего слоя почвы до 8–10 °С, обычным рядовым (междурядья 15 см) способом, норма посева семян на Зеленец 90–120 кг/га, для двустороннего использования однодомной Конопли 70–80 кг/га, двудомной – 90–100 кг/га, глубина посева 3–4 см. Для получения с посевов волокна и семян во время массового цветения выдёргивают Посконь, а затем при созревании семян убирают Матёрку коноплежаткой (с последующим обмолотом коноплемолотилкой) или коноплеуборочным комбайном. При зеленцовой культуре (только на волокно) Посконь и Матёрку убирают одновременно в начале отцветания Поскони. После обмолота стебли мочат в водоёмах, затем тресту сушат и перерабатывают на волокно. Разработаны и осваиваются интенсивные технологии возделывания и уборки Конопли, основанные на механизации всех операций, строгом соблюдении технологической дисциплины (сроков и параметров агротехнических приёмов), применении поточного метода уборки с формированием крупных тюков соломы и тресты и механизированной погрузки их в транспортные средства. Вредители – Конопляная Блошка и Листовёртка, Стеблевой Мотылёк. Болезни – фузариоз. Из Сорняков очень вредоносна Заразиха. Садовую форму Посевной Конопли (var. sinensis) с красивой светлой зеленью выращивают как декоративное Растение. Пенька – грубое лубяное волокно, получаемое из стеблей однолетнего травянистого растения – Конопли. Применяется для выработки грубых тканей бытового и технического назначения. Из пеньки производят также кручёные изделия – верёвки, канаты, шпагат и тому подобное. Пенька – грубое лубяное волокно, полученное из стеблей Конопли. На заводах и пунктах первичной обработки в результате мятья и трепания тресты (вымоченных стеблей Конопли) получают пеньку (длиной более 700 мм) и отходы (короткое пеньковое волокно). Выделяют пеньку пенькотрёпальными машинами. Пенька – сырьё для изготовления канатов, хозяйственной верёвки, сноповязального и упаковочного шпагата, брезента, парусины, пожарных рукавов и тому подобного. Изделия из пеньки устойчивы к гниению. Пенькой называют также лубяные волокна, извлекаемые из растений других ботанических видов, например, Манильская Пенька или Абака (из листьев прядильного Банана), Бомбейская Пенька (из стеблей Кроталярии).

HEMP = ПЕНЬКОВЫЙ ТРОС – Hemp (maritime term):- rope made of the fibers of the Hemp Plant and used for small stuff or less than 24 thread (1.75 inch circumference). Rope is measured by circumference, wire by diameter.

HENLEY = ХЭНЛИ (или XX) – Henley is a type of shirt. They can be long sleeve or short sleeve. A Henley shirt is a collarless shirt that is generally for casualwear. Characterized by a 4–6” long slit beneath the round neckline, usually having 2–5 buttons. It essentially resembles a collarless polo shirt. A Henley shirt is a collarless men’s pullover shirt, characterized by a 10-centimeter-long (4 in) placket beneath the round neckline, usually having 2–5 buttons. It essentially resembles a collarless polo shirt. The sleeves may be either short or long, and it can be made in almost any fabric, although cotton, cotton-polyester blends, and thermals are by far the most popular.

Henley shirts are generally regarded as menswear, but women's versions have appeared as well. They were so named because this particular style of shirt was the traditional uniform of rowers in the English town of Henley-on-Thames. Some crews still use this style as part of their uniform. Originally quite popular in the early 1970s, Henley shirts have recently made a fashion comeback, especially in Western countries such as the United Kingdom, United States, Canada, and Australia, but also in some East Asian countries such as Japan and Korea. In his biography of Ralph Lauren, the journalist Michael Gross quotes a New York merchant who recalled showing a vintage shirt to a Ralph Lauren buyer:- 'I showed this fellow underwear – a three-button long-sleeve shirt by Johnstown Knitting Mills. He said, 'This is a new shirt'. That's where he got the idea for the Henley shirt'. / Ралф Лорэн (Ralph Lauren), журналист Майкэл Грос (Michael Gross). Дьжонстаун Нитинь Милз (Johnstown Knitting Mills). Рубашка без воротника, с короткими рукавами, с небольшим разрезом на груди у шеи на пуговицах.

HENRY = ХЭНРИ (или ГЕНРИ) – Henry (H) is the SI unit of electric inductance. A changing magnetic field induces an electric current in a loop of wire (or in a coil of many loops) located in the field. Although the induced voltage depends only on the rate at which the magnetic flux changes, measured in Webers per second, the amount of the current depends also on the physical properties of the coil. A coil with an inductance of one Henry requires a flux of one Weber for each Ampere of induced current. If, on the other hand, it is the current which changes, then the induced field will generate a potential difference within the coil:- if the inductance is one Henry a current change of one Ampere per second generates a potential difference of one Volt. The Henry is a large unit; inductances in practical circuits are measured in milliHenrys (mH) or microHenrys (μH). The unit is named for the American physicist Joseph Henry (1797–1878), one of several scientists who discovered independently how magnetic fields can be used to generate alternating currents. The plural is sometimes spelled Henrys, but in English it is correct to spell it Henries. Henry is the practical unit of inductance. One Henry is equal to the inductance in which the change of one Ampere per second results in an induced voltage of one Volt. Abbreviated H. Named for the American physicist Joseph Henry 1878. / Генри, по имени Американского физика Дьжосэфа Хэнри (Joseph Henry; 1797–1878), единица продуктивности и взаимной индуктивности в СИ. Обозначение:- Гн (Н). 1 Генри (Гн) равен индуктивности электрической цепи, с которой при силе постоянного тока в ней 1 Ампер (А) сцепляется магнитный поток 1 Вебер (Вб). 1 Гн = 1 В·с / А = 1 Вб / А = 10^9 см (единица СГСМ) = $1.11 \cdot 10^{-12}$ единицы СГСЭ.

HENRY HUB = УНИВЕРСАЛЬНЫЙ ТЕХНОЛОГИЧЕСКИЙ УЗЕЛ ХЭНРИ – Henry Hub is the pricing point for natural gas futures contracts traded on the New York Mercantile Exchange (NYMEX®). It is a point on the natural gas pipeline system in Erath, State of Louisiana. It is owned by Sabine Pipe Line LLC. It interconnects with nine interstate and four intrastate pipelines:- Acadian, Bridgeline, Columbia Gulf Transmission, Gulf South Pipeline, Jefferson Island, NGPL, Sabine, Sea Robin, Southern Natural Pipeline, Texas Gas Transmission, Transcontinental Pipeline, and Trunkline Pipeline. The two compressor stations can compress 520 000 decatherm/day or 6.3 GigaWatts (GW). The transportation capacity (in 2000) is 1.8 billion cubic feet per day (bcf/d) or 590 cubic meters per second (m^3/s) or 20.4 GigaWatts (GW). Spot and future prices set at Henry Hub are denominated in US Dollars per million of British Thermal Units (MMBTUs) and are generally seen to be the primary price set for the North American natural gas market. North American unregulated wellhead and burnertip natural gas prices are closely correlated to those set at Henry Hub. See also National Balancing Point, and Title Transfer Facility. The Henry Hub is a natural gas pipeline hub in Louisiana, USA that serves as the delivery point for New York Mercantile Exchange natural gas futures contracts and often serves as a benchmark for wholesale natural gas prices across the United States. Henry Hub is a major gas collection and interconnection facility in Southern Louisiana, US. Henry Hub is owned and operated by Sabine Pipeline LLC, which is a wholly owned subsidiary of Chevron Texaco. The Henry Hub is physically located at Sabine's Henry Gas Processing Plant in Louisiana. The Henry Hub interconnects nine interstate and four intrastate pipelines Collectively these pipelines in the North East, South East and Mid-West states. Henry Hub accommodates 1.8 bcfd (billion cubic feet per day). The US market is perhaps the world's best example of open market pricing at work. Gas wholesale prices are referenced to Henry Hub, the interconnection point for thirteen 13 major US inter and intrastate pipelines. Since 1990, the New York Mercantile Exchange (NYMEX®) has adopted Henry Hub as the benchmark point for gas trading. Marketers and traders therefore purchase wholesale supplies, for immediate or future delivery, on the basis of on line Henry Hub prices quoted on NYMEX®. Wellhead prices are usually lower than Henry Hub, reflecting the cost of transportation to the Hub. The price paid by the final customers in the US market varies across states and sectors, reflecting differential cost of service to get the gas to the customers' plant gate. This includes costs of transportation and storage both of which are tightly regulated by Federal Energy Regulatory Commission (FERC). For example, customer in Boston could be paying as much as USD5.00 per MMbtu when the wholesale price at Henry Hub is USD4.00 per MMBtu (million British thermal unit). Short term volatility in gas prices over time reflect the changes in supply and demand factors including weather conditions, the level of storage, production rates, import capacity, and the cost of competing fuels. The Henry Hub in Erath, Louisiana, USA is a distribution hub connecting nine interstate and four intrastate pipelines, which lends its name to the pricing point for natural gas futures contracts traded on the New York Mercantile Exchange (NYMEX®). Spot and future prices set at the Henry Hub are denominated in USD/mmBtu (millions of British thermal units) and are the benchmark prices in the North American natural gas market. The Henry Hub is the largest centralized point for natural gas spot and futures trading in the United States. The New York Mercantile Exchange (NYMEX®) uses the Henry Hub as the point of delivery for its natural gas futures contract. The NYMEX® gas futures contract began trading on April 3, 1990 and is currently traded 72 months into the future. NYMEX® deliveries at the Henry Hub are treated in the same way as cash-market transactions. Many natural gas marketers also use the Henry Hub as their physical contract delivery point or their price benchmark for spot trades of natural gas. Because Henry Hub spot and futures prices have become the surrogate for 'real-time' wellhead natural gas prices, EIA frequently has been asked about the relationship between these two prices series. This analysis examines the relationship by comparing US wellhead gas prices with Henry Hub spot prices. The Henry Hub is owned and operated by Sabine Pipe Line, LLC, which is a wholly owned subsidiary of ChevronTexaco. The Sabine Pipe Line starts in eastern Texas near Port Arthur, runs through south Louisiana, not far from the Gulf of Mexico, and ends in Vermillion Parish, Louisiana, at the Henry Hub near the town of Erath. The Henry Hub is physically situated at Sabine's Henry Gas Processing Plant. The Henry Hub interconnects nine interstate and four intrastate pipelines, including:- Acadian, Columbia Gulf, Dow, Equitable (Jefferson Island), Koch Gateway, LRC, Natural Gas Pipe Line, Sea Robin, Southern Natural, Texas Gas, Transco, Trunkline, and Sabine's mainline. Collectively, these pipelines provide access to markets in the Midwest, Northeast, Southeast, and Gulf Coast regions of the United States. Sabine currently has the ability to transport 1.8 billion cubic feet per day across the Henry Hub. Relative to the total US lower 48 average daily gas consumption of 60.6 billion cubic feet per day in 2000, the Henry Hub can handle up to 3.0 percent of average daily gas consumption. Approximately 49 percent of the US wellhead production either occurs near the Henry Hub or passes close to the Henry Hub as it moves to downstream consumption markets. This is based on 2000 production levels reported for the Gulf of Mexico and the onshore Louisiana and Texas regions encircling the Gulf of Mexico. / Собин Пайп Лайн Эл.Эл.Си. (Sabine Pipe Line LLC) Шеврон Тэксэкоу (Chevron Texaco). Универсальный газопроводный технологический узел в Луизиане, США, используемый в качестве пункта поставки по фьючерсным контрактам Нью Йоркской Товарной Биржи (или НАЙМЭКС® (NYMEX®)) на природный газ, и часто служащий в качестве ориентира для цен оптовой продажи природного газа внутри Соединённых Штатов.

HENRY HUB NATURAL GAS = ПРИРОДНЫЙ ГАЗ ИЗ УНИВЕРСАЛЬНОГО ТЕХНОЛОГИЧЕСКОГО УЗЛА ХЭНРИ – The Henry Hub is a distribution hub on the natural gas pipeline system in Erath, Louisiana, owned by Sabine Pipe Line LLC. Due to its importance,

it lends its name to the pricing point for natural gas futures contracts traded on the New York Mercantile Exchange (NYMEX®) and the OTC swaps traded on IntercontinentalExchange (ICE). It interconnects with nine interstate and four intrastate pipelines:- Acadian, Columbia Gulf Transmission, Gulf South Pipeline, Bridgeline, NGPL, Sea Robin, Southern Natural Pipeline, Texas Gas Transmission, Transcontinental Pipeline, Trunkline Pipeline, Jefferson Island, and Sabine. The two compressor stations can compress 520 000 decatherm/d (6.3 GW). The transportation capacity is 1.8 billion ft^3/d (bcf) (590 m^3/s) (20.4 GW) (Sabine Pipe Line, LLC, 2000). Spot and future prices set at Henry Hub are denominated in USD/mmbtu (millions of British thermal units) and are generally seen to be the primary price set for the North American natural gas market. North American unregulated wellhead and burnertip natural gas prices are closely correlated to those set at Henry Hub. The area surrounding the Henry Hub was affected by the flooding and storm surge from Hurricanes Ike and Rita, but the facility suffered minimal damage. In 2011, the Henry Hub was the site of a land dispute, in which Sabine, a subsidiary of Chevron, sued to condemn land near the site of the hub, and expropriate it from the Broussard family, who had owned it for generations, arguing that it was acting in the national interest. Henry Hub Natural Gas:- Henry Hub is the pricing point for natural gas futures contracts traded on the NYMEX®. It is a point on the natural gas pipeline system in Erath, Louisiana. Spot and future prices set at Henry Hub are generally seen to be the primary price set for the North American natural gas market. The US Wellhead and Henry Hub Spot Natural Gas Prices:- the US wellhead price, as reported in EIA's Natural Gas Monthly, is the price received by natural gas producers for marketed gas, as reported on Form EIA-895 by the States and the MMS. The wellhead price is reported in EIA publications in dollars per thousand cubic feet. Henry Hub 'spot gas', as defined by the data series used in this analysis, represents natural gas sales contracted for next day delivery and title transfer at the Henry Hub. This analysis uses the monthly Henry Hub spot price collected and reported by Natural Gas Week (NGW). The NGW Henry Hub price data begin in January 1995. The NGW monthly price represents a volume-weighted average price of spot transactions, collected by NGW staff on a daily basis from natural gas marketers. Henry Hub spot prices are reported in dollars per million Btu. The Henry Hub spot price and the wellhead price reflect the supply and demand conditions for two distinct facets of the natural gas market. The Henry Hub spot price pertains to transactions for next-day delivery occurring at the Henry Gas Processing Plant and is measured downstream of the wellhead, after the natural gas liquids have been removed and after a transportation cost has been incurred. In contrast, the wellhead price includes the value of natural gas liquids and pertains to all transactions occurring in the United States, thereby encompassing purchase commitments of all durations. For the period spanning all of 2001 through early 2002, the average monthly wellhead gas price currently reported by EIA is an estimated number. Because these wellhead prices are estimated rather than measured quantities, the prices for 2001 and 2002 were excluded from consideration. The actual difference equals the Henry Hub spot price minus the wellhead price (expressed in 2000 Dollars) and is shown in Figure 2 for the period August 1996 through December 2000. The table below lists descriptive statistics for the actual difference. The mean (arithmetic average) price difference is 31.6 cents per thousand cubic feet, and the median value is 23.6 cents per thousand cubic feet. Both values are consistent with the notion that the Henry Hub, being a downstream location, incurs a transportation cost for moving the natural gas from the wellhead. The spread of 8 cents per thousand cubic feet between the mean and median values in the table above indicates that the distribution of observations is not symmetric around the mean. Moreover, the standard deviation of 38.5 cents per thousand cubic feet indicates a relatively wide distribution of observations around the mean value of 31.6 cents per thousand cubic feet. Given the large difference between the mean and median values and the relatively large standard deviation, the price difference is not a particularly precise expression of the relationship between the two prices. Because of the nonsymmetric nature of the observations, the median value might be more representative of the central tendency of the data than is the mean value. The Henry Hub Natural Gas spot price standard. In late 1989, Sabine was selected by the New York Mercantile Exchange (NYMEX®) as the official delivery mechanism for the world's first natural gas futures contract. The 'spot price' is the Henry Hub price at that moment in time – not associated with a future contract. Natural gas is priced in units of one million British thermal units (MMBtu). If Natural gas is trading for in dollars is referring to the Henry Hub price for the current month's contract. The standard NYMEX® NGAS Contract is for 10 000 million British thermal units. The Henry Hub uses the average of the natural gas prices from 13 interconnected pipelines. / Собин Пайп Лайн Эл.Эл.Си. (Sabine Pipe Line LLC). Нью Йоркской Товарной Биржей (или НАЙМЭКС® (NYMEX®)). Шеврон Корпорэйшэн (Chevron Corporation).

HERB = ТРАВА (или ГЕРБА) – Herb is a vascular plant lacking a woody structure. / , от Латинского слова Эрба (Herba), означающее Трава или Растение, .

HERBACEOUS = ТРАВЯНИСТОЕ (или ТРАВЯНОЕ) – Herbaceous:- dying to the ground periodically or lacking a definite woody structure. Herbaceous:- non-woody plants. / , от Латинского слова Herba, означающее Трава, .

HERBICIDE = ГЕРБИЦИД – Herbicide is any substance, or mixture of substances, intended to prevent the growth of or to destroy terrestrial or aquatic Weeds. Weeds are any woody or non-woody undesirable vegetation. Herbicide is an agent, usually chemical, for killing or inhibiting the growth of unwanted Plants, i.e. Weeds. In the past, sea salt, by-products of chemical industries, and various oils were used as Weed killers. Late in the XIX century the selective control of broad-leaved Weeds among cereal crops came into practice. The central development in modern Weed control was the introduction in 1945 of so-called Organic Herbicides; they were revolutionary in that their high toxicity allowed for effective Weed control at very low dosages – about 1–2 percent of the dosage rates of such earlier Weed killers as carbon disulfide, borax, and arsenic trioxide. Modern weed killers are put in two categories:- selective (affecting specific Plant Species) and nonselective (affecting Plants generally). These, in turn, are classified as foliage-applied and soil herbicides. Contact herbicides (e.g., sulfuric acid, diquat, paraquat) kill only the plant organs with which they are in contact. Translocated herbicides (e.g., amitrole; picloram; 2,4-D) are effective against roots or other organs to which they are transported from aboveground treated surfaces (i.e. soil). With respect to planting time, herbicides are also classified as preplant, preemergence, or postemergence Weed killers. Preplant herbicides may be applied to the soil or to weeds before crop planting. Certain herbicides (e.g., sodium arsenite) are sometimes applied by the jar method, whereby the tops of weeds are bent over and immersed in jars of poisonous solution. The herbicide is drawn into the rest of the plant and into connecting plants, gradually killing the entire system. Wild morning glory, poison oak, and camel thorn are sometimes treated in this manner. Chlorinated benzene and certain aromatic solvents are used to control aquatic Weeds by adding them directly to the watery medium. See also Defoliant. Herbicide is a chemical substance or cultured biological organism designed to interfere with specific chemical processes in Plants. Herbicide is a material used to kill Weeds. In Cotton the material usually is characterized by (1) timing:- PPI (prior to planting and incorporated), Pre (prior to plant emergence from soil), and Post (after plant emergence); or by (2) application type:- Broadcast (applied evenly over an area), Banded (applied over a portion of the total area), or Directed (targeted at a specific area), usually toward the base of the Cotton Plant. Algicide kills algae. Herbicide is a chemical used for killing or inhibiting the growth of certain Plants or Weeds. / Виды (Species). Гербициды сплошного действия и гербициды избирательного (селективного) действия, которые подразделяются на контактные и системные гербициды. Под Гербицидами, от Латинских слов Хэрба (Herba), означающее Трава, и Сэдо (Caedo), означающее Убиваю, понимаются химические вещества, применяемые для уничтожения растительности. По характеру действия на растения делятся на:- (i) Гербициды Сплошного Действия, убивающие все Виды Растений; и (ii) Гербициды Избирательного (Селективного) Действия, поражающие одни Виды Растений и не повреждающие других. Первые применяют для уничтожения растительности вокруг промышленных объектов, на лесных вырубках, аэродромах, железных и шоссейных дорогах, под

линиями высоковольтных электропередач, в дренажных каналах, прудах и озёрах; вторые – для защиты культурных растений от Сорняков (химическая прополка). Такое деление условно, так как в большинстве случаев одно и то же вещество в зависимости от концентрации, норм расхода и условий применения может проявлять себя как гербициды сплошного или избирательного действия. Например, монурон и диурон в дозах 1.2–1.6 килограмма (кг) действующего вещества на 1 гектар (га) уничтожают однолетние Сорняки в посевах Хлопчатника, в более высоких дозах – всю растительность. Избирательность действия гербицида определяется химическим составом, формой и дозами препарата, методом и сроками обработки посевов, фазами роста растений, их анатомическим и морфологическим строением, почвенно-климатическими условиями и так далее. Различают биохимическую и топографическую избирательность гербицидов. При Биохимической Избирательности действие гербицидов основано на вмешательстве его в обмен веществ растений. Биохимическая Избирательность в большинстве случаев проявляется в неодинаковом превращении гербицидов:- в устойчивых растениях гербицид блокируется компонентами клетки и разлагается до нетоксичных соединений или до токсичных, с последующей их инактивацией; в чувствительных – гербицид или угнетает растения (ингибирующее действие) или под влиянием компонентов клетки разрушается до токсических соединений, убивающих Растения. Например, симазин и атразин в устойчивой к ним Кукурузе разлагаются до нетоксических соединений, в чувствительных (корневищевых многолетних Сорняках) – не разлагаются. Топографическая Избирательность гербицида связана с различиями в анатомо-морфологическом строении Растений и способе внесения гербицида. На избирательности этого типа основано использование 2М–4Х в посевах Льна. Лён, в отличие от многих двудольных Сорняков, мало чувствителен к 2М–4Х при крупнокапельном опрыскивании его этим гербицидом в фазу ‘ёлочки’, так как капли раствора стекают с узких листьев Льна, покрытых восковым налётом и расположенных под острым углом к стеблю. Более устойчивы к гербицидам сильно опушённые растения, плохо смачивающиеся ими, растения с толстой, мало проницаемой кутикулой и небольшим количеством устьиц. Топографической избирательностью объясняется, например, различная чувствительность к гербицидам Растений даже одного и того же Вида:- Растения, произрастающие в тени, на влажной, богатой питательными веществами и особенно азотом почве, вырастают более изнеженными и более чувствительными к гербицидам. Гербициды могут быть с широкой и узкой избирательностью. Широкой избирательностью обладает, например, 2,4–Д, уничтожающий все двудольные Растения, узкой – пропанид, уничтожающий Просянки в посевах Риса, и другие. Гербициды сплошного и избирательного действия в зависимости от способности перемещаться в растении делят на контактные и системные. Контактные Гербициды (ДНОК, пропанид, грамоксон, пентахлорфенолят натрия и другие), попав на растение, вызывают местное отравление участков ткани, которые быстро увядают, буреют и засыхают. Системные Гербициды (2,4–Д, 2М–4Х, симазин, атразин, монурон и другие) способны передвигаться по сосудистой системе растений вместе с питательными веществами и продуктами обмена веществ, вызывая общее отравление (деформацию стебля и листьев Растений, постепенное угнетение роста, хлоротичность, хрупкость листьев и стеблей, стерильность и так далее), что особенно ценно для борьбы с многолетними и имеющими мощную корневую систему Сорняками. Контактные и системные гербициды наносят на листовую поверхность Растений (Листовые Гербициды) и на почву (Почвенные, или Корневые, Гербициды). Многие гербициды могут быть использованы как для обработки надземных частей Сорняков, так и для внесения в почву. Современные гербициды – органические соединения, делящиеся на несколько больших групп:- замещённые фенолы (ДНОК, пентахлорфенолят натрия); бензонитрилы (иоксинил и другие); четвертичные соединения аммония (реглон, грамоксон); производные хлорфеноксиалкилкарбоновых кислот (2,4–Д; 2,4–ДМ; 2,4–ДП; 2М–4Х; 2М–4ХМ; 2М–4ХП; 2,4,5–Т); бензойные кислоты (2,3,6–ТБК; банвел-Д); галоидозамещённые алифатические кислоты (ТХА, далапон); карбаматы (хлор-ИФК; ИФК, карбин); тиокарбаматы (диаллат, энтам, тиллам, триаллат, ялан); амиды (солан, пропанид, дифенамид); производные мочевины (дихлоральмочевина, фенурон, монурон, диурон, которан, линурон, метурин, монолинурон); производные урацила (ленацил), триазины (симазин, атразин, пропазин, прометрин, десметрин); гербициды других групп (дактал, пиклорам, трефлан и другие). В качестве гербицидов в ограниченных масштабах применяют и некоторые неорганические вещества:- сульфамат аммония, цианат калия, хлораты натрия, магния, кальция, нитрат натрия и другие. Известно свыше 1 000 соединений с гербицидными свойствами. Для борьбы с сорняками используют около 140. Гербициды изготовляют главным образом в виде растворов, растворимых в воде порошков, паст, смачивающихся порошков, концентратов эмульсии. Основной способ применения гербицидов – опрыскивание с помощью наземных опрыскивателей и с самолётов водными растворами, водными эмульсиями и водными суспензиями. Используются гранулированные гербициды, но их применение пока незначительно. Гербициды вносят до или после зяблевой вспашки, в различное время до посева сельскохозяйственной культуры, в период от посева до появления всходов и после появления всходов культурных растений в различные фазы их развития. Доза гербицида зависит от степени засорения полей, сортовых особенностей сельскохозяйственной культуры, почвенно-климатических условий и агротехнических приёмов. При низких дозах избирательное действие гербицида проявляется сильнее, при очень высоких полностью исчезает. При одних и тех же дозах гербициды (кроме триазинов) с понижением температуры (ниже 8–12°С) действуют слабее, с повышением – сильнее. Контактные гербициды лучше действуют в ясную погоду при температуре 18–22 °С. На лёгких почвах дозы гербицида обычно меньше, чем на тяжёлых, богатых гумусом, сильнее удерживающих гербицид. Против однолетних сорняков Бобовых культур вносят (в кг на 1 га действующего вещества) прометрин (1.5–2.5), линурон (2–3), ДНОК (3–4), пентахлорфенолят натрия (6–8) одновременно с посевом или в течение 3–4 дней после него; Сои – трефлан (1–2) до её посева; Картофеля – аминные соли (1–1.5) и эфиры (0.8–1) 2,4–Д, 2М–4Х (1–1.5), метурин (2–3), монолинурон (2–3) и другие не позднее чем за 5–6 дней до появления всходов, против Пырея ползучего под зяблевую вспашку вносят ТХА (20–30). Против двудольных однолетних сорняков Клевера используют 2М–4ХМ (2–3), Люцерны – 2,4–ДМ (1.5–2.5) в фазе развития у неё 1-го тройчатого листа; против повилик стерню многолетних трав через 1–3 дня после 1-го укоса опрыскивают ДНОК (1,5), пентахлорфенолятом натрия (16–20), реглоном (1–1.5). В садах, виноградниках и ягодниках наибольшее применение нашли симазин, атразин, ТХА, далапон и реглон, на сенокосах и пастбищах – амиинные соли и эфиры 2,4-Д и так далее. Химические методы борьбы с сорняками обычно применяют в сочетании с агротехническими. Использование гербицидов в сельском хозяйстве помогает совершенствовать приёмы агротехники. Например, химическая прополка позволила перейти на частогнездовой посев Кукурузы и Хлопчатника, гребневую посадку Картофеля, сократить количество междурядных обработок и так далее. Использование гербицидов очень рентабельно и обеспечивает повышение в среднем урожая (в ц с 1 га) зерновых на 2,5 (2,4-Д), Риса на 4–7 (пропанид), Кукурузы на зелёную массу на 50 и зерно на 7 (симазин и атразин) и так далее. Кроме того, применение гербицидов ведёт к значительной экономии ручного труда. Большинство гербицидов средне- и малоядовито для человека и теплокровных животных и только некоторые (ДНОК, пентахлорфенолят натрия) – высокоядовитые вещества. Большинство гербицидов сохраняется в неизменном виде в почве максимум несколько недель, и только некоторые производные триазинов, мочевины, трихлорбензойной кислоты, внесённые в больших дозах, могут сохраняться в течение ряда лет. Чтобы предупредить неблагоприятное действие гербицида (попадание в водоёмы, накопление в растительных кормах или в животных продуктах и тому подобное), необходимо строго соблюдать правила, предусмотренные инструкциями по их применению; если имеются эффективные биологические методы борьбы с сорными растениями, то отдавать предпочтение этим методам. Работают с гербицидами в резиновых перчатках, спецодежде, респираторах, очках, чтобы

исключить попадание препаратов на открытые части тела, в рот, нос, глаза, соблюдая правила личной гигиены. Под термином Гербициды понимаются химические препараты из группы пестицидов для уничтожения нежелательной, главным образом сорной, растительности. В состав гербицидов входят:- (i) арборициды, уничтожающие нежелательную древесно-кустарниковую растительность, например, кустарники на пастбище; и (ii) альгициды (algicides), уничтожающие водные растения (водоросли) в водохранилищах, каналах и тому подобном. Кроме того, по характеру действия гербициды различают на:- (i) гербициды сплошного действия, поражающие все виды растений, используемые вокруг промышленных объектов, на аэродромах, под линиями электропередач и в других местах; и (ii) гербициды избирательного действия, уничтожающие лишь определённые виды растений, например, сорняки, и не повреждающие культурные растения, благодаря чему пригодны для химической прополки сельскохозяйственных культур. Гербициды широко применяют в сельском хозяйстве для химической прополки на полях, в садах, виноградниках и тому подобных местах. В качестве гербицидов применяют, например, карбаматы и тиокарбаматы, производные бензойной кислоты, многие гетероциклические соединения, цианамид кальция. Избирательность и эффективность действия гербицидов повышаются при их применении в смесях с так называемыми гербицидными антидотами. В зависимости от формы их вносят в почву, ими проводят опыливание и опрыскивание. Во многих странах мира использование гербицидов регламентируется в законодательном порядке. Неправильное применение гербицидов может привести к загрязнению почвы и водоёмов, гибели растений и животных, и нарушению биологической связи в биогеоценозах. Уничтожение гербицидами сорняков в посевах и посадках культурных растений называется Химической Прополкой. Улучшает условия жизнедеятельности возделываемых растений, повышает урожайность. Гербициды – вещества, уничтожающие нежелательные Растения (гербициды, применяемые для уничтожения Деревьев и Кустарников, называются также арборицидами, вещества, служащие для борьбы с Водорослями, – альгицидами). Главная область применения гербицидов – уничтожение сорняков в посевах сельскохозяйственных культур (Химическая Прополка), особенно Кукурузы, Сои, Хлопчатника, Пшеницы, Риса и Сахарной Свеклы. Товарные формы гербицидов – растворы, концентраты эмульсий, смачивающиеся порошки (реже гранулы), содержащие, помимо действующего вещества, разбавители и вспомогательные добавки; от состава этих препаратов и их физико-химических свойств существенно зависит эффективность гербицидов. Для расширения спектра действия и повышения активности гербицидов часто используют их смеси, выпускаемые промышленностью или приготовляемые на месте применения. Различают гербициды избирательного и сплошного действия; первые уничтожают лишь некоторые растения, вторые – всякую растительность. Это деление в известной мере условно, так как многие гербициды с повышением их дозы (или концентрации в препарате) свою избирательность утрачивают. Различают также гербициды контактного действия, поражающие растение в местах контакта с ним, и системные, способные передвигаться по сосудистой системе растения от места поглощения к месту действия. По условиям применения гербициды делят на почвенные, или довсходовые (их вносят в почву или наносят на неё до посева либо до появления всходов), и листовые, или послевсходовые. Почвенные гербициды поглощаются семенами, корнями, проростками, листовые – надземными частями растений в различные периоды вегетации. Гербицидная активность веществ обусловлена их способностью проникать в те или иные части растения, перемещаться в нём, влиять на процессы жизнедеятельности растения, а также подвергаться метаболизму под действием ферментов или других веществ, содержащихся в растении и почве, с образованием менее (или более) токсичных продуктов. Для почвенных гербицидов важны их адсорбция и десорбция, перемещение в почве и вымывание из неё, разложение под действием влаги, света и почвенной микрофлоры, способность длительно сохраняться в почве (так называемая персистентность). Избирательность гербицидов в наибольшей мере обусловлена биохимическими факторами, в частности неодинаковой способностью различных растений разлагать гербициды или связывать его с образованием нетоксичных веществ. Однако иногда она может быть обусловлена физическими или морфологическими причинами, например, тем, что на листья злаков, которые имеют меньшую поверхность и хуже смачиваются, чем листья двудольных растений, попадает при обработке (например, опрыскивании) меньше гербицидов. Эффект, который достигается в результате применения гербицидов, зависит также от видового состава обрабатываемых растений и условий окружающей среды (температура, влажность, состав почвы и другие). В соответствии с природой и механизмом действия выделяют следующие основные группы гербицидов:- (i) Ингибиторы Фотосинтеза – эти гербициды проникают в хлоропласты растений; некоторые из них (например, соли дипиридилия) препятствуют захвату электронов ферредоксином и нарушают процесс восстановления кофермента никотинамидадениндинуклеотидфосфата (НАДФ) в так называемой фотосистеме I, другие (из групп арилмочевин, сим-триазинов, 1,2,4-триазинонов, урацилов, гидроксибензонитрилов, пиридазинонов) препятствуют переносу электронов к пластохинону в так называемой фотосистеме II. (ii) Гербициды, влияющие на дыхание растений, в частности разобщающие цепь окислительного фосфорилирования и подавляющие образование АТФ (например, соединения из групп динитрофенолов и галогенфенолов). (iii) Ингибиторы клеточного деления (митоза), например, N-арилкарбаматы и динитроанилины; вносят их, как правило, в почву, где гербициды подавляют прорастание семян и рост корней. (iv) Гербициды, регулирующие рост растений, или ‘Синтетические Ауксины’, аналогичные по свойствам 3-индолилуксусной кислоте (ге-тероауксину) – природному гормону роста (при его избытке непомерно ускоряется рост растения, что приводит к истощению и гибели); ауксиноподобными свойствами обладают соединения из групп арилоксиалканкарбоновых и арилкарбоновых кислот, производные пиколиновой кислоты. Активность гербицидов может быть связана также с подавлением таких процессов, как синтез нуклеиновых кислот, каротиноидов, белков, липидов, или с блокированием биосинтеза и транспорта природных регуляторов, катализирующих эти процессы. Механизм действия многих гербицидов пока не выяснен. Наиболее важные гербициды (рассматриваемые ниже гербициды относятся к разным классам органических соединений (при описании гербицидов, кроме условного международного названия, присваиваемого обычно пестицидным веществам, в скобках указаны фирменные названия торговых препаратов на их основе; показатели $ЛД_{50}$ приведены для крыс при введении перорально):- (i) Кетоны:- к этой группе гербицидов относятся метоксифенон (Каяфенон) и Na-соль замещённого 1,3-циклогександиона-аллоксидим-натрий (Кусагард, II; $ЛД_{50}$ 2 200 мг/кг). Соединения I используют для обработки Риса, II-для обработки Сахарной Свёклы, Сои и других (норма расхода 0.75–1.1 кг/га). Ещё более активным, чем II, является довсходовый гербицид Сетоксидим (Па). (ii) Нитро- и галогенфенолы. Несмотря на высокую токсичность этих соединений, в качестве гербицидов применяют ряд производных:- 4,6-динитро-о-крезол (ДНОК, R = H, Y = CH_3; $ЛД_{50}$ 40–85 мг/кг), используемый для послевсходовой обработки многолетних злаковых трав (1.2–4.8 кг/га); диносеб (R = H, Y = втор-C_4H_9), динотерб (R = H, Y = трет-C_4H_9), диносеб- и динотерб-ацетаты (R = = $COCH_3$). Все эти соединения – типичные контактные гербициды; к их действию устойчивы лишь те растения, которые имеют плотную восковую кутикулу и плохо смачиваются. К контактным гербицидам относятся и галогенфенолы:- пентахлорфенол, его Na-соль и наиболее важный из этой группы-иоксинил (IV, X = 1; ЛД50 150 мг/кг), используемый (в том числе в виде октаноата) против сорняков, устойчивых к 2,4-дихлорфеноксиуксусной кислоте. Для обработки зерновых культур применяют также бромоксинил (IV, X = Br) и менее токсичный бромфеноксим (фанерой, V; ЛД50 1217 мг/кг). (iii) Нитродифениловые Эфиры: из гербицидов этой группы наиболее широко применяют соединения:- нитро-фен (нитрохлор, R = C1, R' = H; $ЛД_{50}$ 3 630 мг/кг), бифенокс (Модаун, R = Cl, R’ = $COOCH_3$), хлометок-синил (R = Cl, R’ = OCH_3; $ЛД_{50}$ 10 000 мг/кг) и ацифлуорфен (Блазер, R = CF_3, R’ = $COOCH_3$). Нитродифениловые эфиры менее токсичны для людей и животных, чем нитро- и галогенфенолы; используют их для до- и

послевсходовой обработки Риса, Сои, овощных культур и других. Действие этих гербицидов основано главным образом на подавлении фотосинтеза и лучше всего проявляется при хорошем солнечном освещении. (iv) Динитроанилины:- большое экономическое значение приобрели ингибиторы митоза-гербициды из группы 2,6-динитроанилинов; главный из них – трифлуралин (Трефлан, Нитран, X = CF_3, R = R' = н-C_3H_7, Y = H; $ЛД_{50}$ 3 300 мг/кг), применяемый в больших масштабах для обработки Хлопчатника, Сои, Подсолнечника, Капусты, Томатов и других (1–2.5 кг/га). Гербицидной активностью обладают также аналоги трифлуралина-нитралин (X = CH_3SO_2), оризалин (X = NH_2SO_2), изопропалин (X = изо-C_3H_7). Из других динитроанилинов важен пендиметалин (Стомп, Проул, VII, X = = Y = CH_3, R = 1-этилпропил, R' = H; $ЛД_{50}$ 1 050 мг/кг), используемый в посевах Хлопчатника (1–2 кг/га). (v) Галогеналифатические и Аралифатические Кислоты:- среди галогеналифатических кислот наибольшее значение имеют доступные трихлоруксусная и 2,2-дихлопропионовая кислоты. Применяют их в виде Na-солей, главным образом для уничтожения однодольных сорняков. $Cl_3CCOONa$ (ТХАН; $ЛД_{50}$ 3 320 мг/кг) поглощается корнями растений, CH_3CCl_2COONa (Далапон) – как корнями, так и листьями. Оба препарата часто используют для осенней подготовки почвы (4–50 кг/га, ТХАН-до 100 кг/га). Некоторое применение находит также CHF_2CF_2COONa. Из арилалифатических кислот и их производных важны:- хлорфен-проп-метил (Бидизин) 4-$ClC_6H_4CH_2CH(Cl)COOCH_3$-гербицид для борьбы с Овсюгом; 2,3,6-$Cl_3C_6H_2CH_2COOH$ (Фенак); беназолин (VIII; $ЛД_{50}$ 3 000 мг/кг) – гербицид ауксиноподобного действия, применяемый обычно в смеси с 2,4-дихлорфеноксиуксусной кислотой. (vi) Арилоксиалканкарбоновые Кислоты:- в эту весьма важную группу входит ряд системных гербицидов ауксиноподобного действия; применяют их как до, так и после появления всходов в форме солей или эфиров (первые лучше поглощаются корнями, вторые – надземными частями растений). Главные гербициды среди соединений:- 2,4-дихлорфеноксиуксусная кислота, или 2,4-Д (X = Cl, Y = = H, и = 1), и 2М-4Х (X = CH_3, Y = H, и=1), в больших масштабах используемые для уничтожения двудольных сорняков в посевах зерновых культур (0.2–2 кг/га). Для этих же целей служат аналоги 2,4-Д и 2М-4Х с п = 3 (соответственно 2,4-ДМ и 2М-4ХМ). Эффективный гербицид 2,4,5-Т (X = = Y = Cl, n = 1) в бывшем СССР и ряде других стран не разрешён, так как при его синтезе возможно образование примеси ядовитого тетрахлордибензо-и-диоксина. Соединения, где n-чётное число, гербицидной активностью не обладают. (vii) Гербициды из Группы а-феноксипропионовых Кислот:- 2,4-ДП (X, R = x = Cl, Y = Z = H) и 2М-4ХП (X, R = Cl, X = CH_3, Y = = Z = H), а также весьма избирательные дихлофоп-метил (Иллоксан, X, R = 2,4-$Cl_2C_6H_3O$, X = Y = H, Z = CH_3) и флуазифоп-бутил, уничтожающие Овсюг и другие злаковые сорняки в посевах злаковых культур (0.12–1 кг/га). Против злаковых сорняков в посевах широколиственных культур эффективен до- и послевсходовый гербицид хинофоп-этил при норме расхода 0.05–0.5 кг/га. Действие соединений связано с блокированием транспорта ауксинов. Высокоактивен также гетероциклический арборицид трихлопир (Гарлон; $ЛД_{50}$ 713 мг/кг), уничтожающий лиственные деревья в культуре хвойных (1–2 кг/га). (viii) Ароматические и Гетероциклические Кислоты:- среди ароматических кислот чаще всего активны соединения, содержащие в ядре атомы галогена; из них наиболее известен послевсходовый гербицид дикамба (Банвел Д, X = = OCH_3, Y = Cl; $ЛД_{50}$ 1 200 мг/кг), применяемый, как и полидим (Трисбен, X = Y = Cl), для борьбы с многолетними сорняками. Используются также производные 2,6-дихлорбензойной кислоты – нитрил 2,6-$Cl_2C_6H_3CN$ (дихлобенил) и тиоамид 2,6-$Cl_2C_6H_3CSNH_2$ (Хлортиамид, Префикс). Для обработки Томатов и Сои применяют амибен (X = Cl, Y = NH_2), для обработки овощных культур-хлортал-диметил (Дактал). (ix) Высокой гербицидной активностью обладают Производные Пиколиновой кислоты – лонтрел и пиклорам (Тордон; $ЛД_{50}$ 1 500 мг/кг). Лонтрел при послевсходовом применении (50–150 г/га) уничтожает сорняки в посевах Пшеницы, Ячменя и Кукурузы, малоизбирательный пиклорам служит для борьбы с глубокоукореняющимися сорняками и древесной растительностью. (x) Производные Аминокислот:- производные аланина – флампроп-изопропил (Суффикс BW, X = F, R = изо-C_3H_7; $ЛД_{50}$ 3 000 мг/кг) и бензоилпроп-этил (Суффикс; X = Cl, R = C_2H_5) применяют как послевсходовые гербициды для борьбы с Овсюгом в посевах злаков; активность этих соединений, более высокая у (–)-изомеров, обусловлена гидролизом до свободных кислот, избирательность – различием в скоростях гидролиза в сорняках и культурных растениях. (xi) Амиды Карбоновых Кислот:- наиболее распространённые гербициды этой группы – анилиды и замещённые амиды монохлоруксусной кислоты. Среди первых особенно важен пропанид (R = C_2H_5; $ЛД_{50}$ 1 300 мг/кг), применяемый для обработки Риса (3–9 кг/га), среди вторых – пропахлор (Рамрод, R = C_6H_5, R'= н-C_3H_7; $ЛД_{50}$ 1 300 мг/кг), используемый в посевах овощных культур и Кукурузы, и аллидохлор (Рандокс, R = R' = $CH_2CH=CH_2$). По механизму действия амиды обычно отличаются от гербицидных кислот:- соединения первых – контактные послевсходовые гербициды, ингибирующие фотосинтез, соединения вторых и третьих – довсходовые гербициды, ингибирующие, по-видимому, биосинтез гиббереллинов. Гербицидной активностью обладает также ряд 2,6-диалкиланили-дов, особенно алахлор (Лассо, R = CH_3, $ЛД_{50}$ 1 040 мг/кг), бутахлор (Мачете, R = н-C_4H_9) и актион (Антор, R = $CH_2COOC_2H_5$). Довсходовыми гербицидами служат дифенамид $(C_6H_5)_2CHCON(CH_3)_2$, напропамид (Девринол, Дэпра) и пропизамид. (xii) Карбаматы и Тиокарбаматы:- известно несколько гербицидов из числа N-алкилкарбаматов, однако чаще гербицидную активность проявляют N-арилкарбаматы, в том числе замещённые в положениях 3 и 4 фенильного ядра. Среди этих соединений, помимо применяемых в ограниченных масштабах ИФК (X = Y = H, R = изо-C_3H_7) и хлор-ИФК (X = C1, Y = H, R = изо-C_3H_7), эффективных главным образом против однодольных сорняков, известен барбан (Карбин, X = C1, Y = H, R = $CH_2C=CCH_2Cl$) – послевсходовый гербицид для борьбы с Овсюгом в посевах зерновых (0.4–0.6 кг/га). бис-Карбамат фенмедифам (Бетанал; $ЛД_{50}$ 750 мг/кг) часто применяют для послевсходовой обработки свеклы (1–1.5 кг/га); в посевах этой культуры иногда используют также проксимфам $C_6H_5NHCOOM=C(CH_3)_2$ и асулам 4-$NH_2C_6H_4SO_2NHCOOCH_3$. При послевсходовом применении N-арилкарбаматы действуют как ингибиторы фотосинтеза, при довсходовом – как ингибиторы митоза. Широкое и разнообразное применение нашли почвенные гербициды из группы тиокарбаматов, особенно ЭПТК (Эптам, R = R' = C_3H_7, X = C_2H_5; $ЛД_{50}$ 1 660 мг/кг) и бутилат (Сутан, R = R'= изо-C_4H_9, X = C_2H_5; $ЛД_{50}$ >4 000 мг/кг); при обработке Кукурузы их обычно используют в виде препаратов Эрадикан и Сутан-Плюс, содержащих добавку антидота. В посевах Риса применяют молинат (Ялан, R = R' = $(CH_2)_6$, X = = C_2H_5), Сои – вернолат (Вернам, R = R' = X = C_3H_7), Сахарной Свёклы – циклоат (Ронит, R = X = C_2H_5, R'= = циклогексил), для борьбы со злаковыми сорняками в посевах зерновых и других культур – триаллат (R = R'= = изо-C_3H_7, X = $CH_2CCl=CCl_2$; $ЛД_{50}$ 1 470 мг/кг; норма расхода 0.8–1.6 кг/га). (xiii) Производные Мочевины:- среди соединений этой весьма важной группы гербицидов активность чаще всего проявляют трёхзамещённые производные. Их избирательность и спектр действия существенно зависят от характера заместителей в фенильном ядре. Трёхзамещённое производное мочевины линурон – один из важнейших гербицидов для обработки Сои, Кукурузы, Картофеля (1–3 кг/га). Гербицидной активностью обладают также многочисленные соединения аналоги, содержащие вместо одной CH_3-группы другой алкильный радикал или вместо фенила – другой карбо- или гетероциклический остаток (например, циклооктил, 5-трет-бутил-2-изоксазолил). Так, метабензтиа-зурон (Трибунил, XXVII, R = CH_3) – используется для до- или послевсходовой обработки зерновых; тиадиазолилмочевины (R = трет-C_4H_9, CF_3, $C_2H_5SO_2$ и другие) – высокоактивные гербициды сплошного действия. Четырёхзамещённые производные мочевины проявляют активность лишь в том случае, когда один из заместителей легко отщепляется. Среди двузамещённых мочевин известен ряд гербицидов:- дихлоральмочевина $[CCl_3CH(OH)NH]_2CO$ – старейший легкодоступный гербицид, используемый в посевах Свеклы; более эффективный для этой культуры бензтиазурон (Мерпелан, R = H); Димурон, применяемый в посевах Риса. Хлорсульфурон (Глин), содержащий триазиновую группировку, – новый и пока самый высокоактивный из всех известных гербицидов. Его доза при обработке зерновых культур в полевых условиях составляет всего 5–60 г/га (обычно 10–20 г/га), то

есть он примерно в 100 раз более активен, чем 2,4-Д. Хлорсульфурон ингибирует деление и рост клеток чувствительных к нему растений и не влияет на фотосинтез и дыхание растений. При замене атома Cl на $COOCH_3$ – группу получен гербицид метсульфуронметил, активный даже в дозе 4–8 г/га; при замене триазинового цикла на пиримидиновый также получаются высокоактивные гербициды. (xiv) Пятичленные Гетероциклические Соединения:- среди большого числа этих соединений (1,3-оксазолидиндионов, замещённых пиразолов, имидазолов, бензотиадиазолов и других), обладающих гербицидной активностью, число веществ, применяемых на практике, сравнительно невелико. Так, оксадиазон (Ронстар; ЛД50 > 8 000 мг/кг) используют для обработки Сои, Риса (0.75–1 кг/га) и других; Метазол – для довсходовой обработки Хлопчатника и Картофеля; Этофумезат (Нортрон; $ЛД_{50}$ > 6 000 мг/кг) – в посевах Свёклы. Дифензокват-метилсульфат (Авендж) – послевсходовый гербицид для борьбы с Овсюгом в посевах зерновых (0.8–1.5 кг/га), проявляющий также фунгицидное действие. (xv) Шестичленные Гетероциклические Соединения:- среди этих соединений с одним гетероатомом (помимо упоминавшихся выше Трихлопира, Лонтрела и Пиклорама) широко известны соли 2,2'-и 4,4'-дипиридилия- быстродействующие контактные гербициды. Дикват-дибромид (Реглон; $ЛД_{50}$ 282 мг/кг) эффективен главным образом против двудольных растений и нередко применяется также, как десикант; паракват-дихлорид (Грамоксон; $ЛД_{50}$ 150 мг/кг) – гербицид сплошного действия; в почве он быстро разлагается, не мешая развитию культур, высеваемых после обработки. Поэтому паракват (а отчасти и дикват) пригоден для так называемого беспахотного земледелия в районах, где почва подвержена ветровой эрозии. В бывшем СССР паракват не был разрешён из-за его токсичности. Важнейшие гербициды среди шестичленных гетероциклов с двумя гетероатомами-производные пиридазинов и пиримидинов. Из пиридазинов наиболее известен хлоридазон (Феназон, Пирамин; $ЛД_{50}$ > 2 000 мг/кг), используемый для довсходовой обработки Свёклы. Этот гербицид – ингибитор фотосинтеза; в растениях Свёклы он дезактивируется, образуя N-гликозиды. Близкий к нему по структуре норфлуразон (Зориал) находит применение в хлопководстве. Кредазин – гербицид для обработки Томатов и Земляники, Пиридат – послевсходовый контактный гербицид для обработки зерновых. Из многочисленных производных пиримидина, обладающих гербицидной активностью, практическое применение нашли лишь соединения из группы пиримидиндионов (Урацилов), в частности ленацил (Гексилур; $ЛД_{50}$ > 11 000 мг/кг) – довсходовый гербицид для обработки Свёклы (0.8–1.6 кг/га), а также соединения:- бромацил (X = Br, R = втор-C_4H_9) и тербацил (X = Cl, R = трет-C_4H_9), используемые как гербициды сплошного действия. Из шестичленных гетероциклических соединений с тремя гетероатомами (помимо триазинов, рассматриваемых ниже) важен бентазон (Базагран; $ЛД_{50}$ 1 100 мг/кг), применяемый в виде водорастворимой Na-соли для послевсходовой обработки зерновых (1–2 кг/га). (xvi) Триазины:- сим-1,3,5-Триазины – крупнейшая группа гербицидов по масштабам мирового производства. Гербицидной активностью обладают соединения, содержащие алкиламиногруппы в положениях 4 и 6 и галоген, метилтио- или метокси-группы-в положении 2. Из соединений, в к-рых X = Hal, наиболее важны атразин (R = C_2H_5, R' = = изо-C_3H_7) и симазин (R = R' = C_2H_5; $ЛД_{50}$ 1 390 мг/кг), используемые для довсходовой обработки Кукурузы (1.5–4 кг/га) и других культур, а также цианазин (Бладекс, R = = C_2H_5, K' = $C(CH_3)_2CN$) – до- и послевсходовый гербицид для Кукурузы, бобовых и зерновых культур. 2-Метилтиопроизводные сим-триазинов (X = = SCH_3) выгодно отличаются от других гербицидов этой группы более широким спектром действия, большей избирательностью и не слишком большой персистентностью в почве. Наибольшее распространение получил прометрин (R = R' = изо-C3H7; $ЛД_{50}$ > 3 000 мг/кг), применяемый в культурах Хлопчатника, Подсолнечника, Картофеля, Моркови и других (1.5–2.5 кг/га). В посадках Капусты часто применяют десметрин (Семерон, R = CH_3, R' = изо-C_3H_7), а также его аналог – 2-метилтио-4-азидо-6-изопропиламино-1,3,5-триазин (Азипротрин). Важное значение в хлопководстве приобрел дипропетрин (Котофор, X = SC_2H_5; R = R' = изо-C_3H_7). Некоторое применение находят и 2-метокситриазины (X = OCH_3), избирательность которых меньше, чем у других смм-триазинов. Гербицидная активность производных смм-триазинов обусловлена главным образом ингибированием фотосинтеза; дезактивация этих гербицидов в почве и растениях связана обычно с гидролизом до неактивных 2-гидроксипроизводных (X-OH). Активностью обладают также и некоторые тетрагидро-сим-триазины, в частности гексазинон (Велпар) – гербицид сплошного действия, применяемый на незасеваемых площадях (2–13 кг/га) и в лесном хозяйстве. Известен ряд избирательных гербицидов и среди производных 1,2,4-триазина, важнейшие из которых:- метрибузин (Зенкор, R = = трет-C_4H_9, R' = SCH_3; $ЛД_{50}$ > 1 100 мг/кг), применяемый для довсходовой обработки Картофеля (1–1.5 кг/га) и послевсходовой обработки Томатов, Сои, а также метамитрон (Голтикс, R = C_6H_5, R' = CH_3) – до- и послевсходовый гербицид для Свёклы (3–5 кг/га). (xvii) Органические Соединения Фосфора и Мышьяка:- среди фосфорорганических соединений наиболее важным является глифосат $(HO)_2P(O)CH_2NHCH_2COOH$ (Раундап; $ЛД_{50}$ 4 320 мг/кг) – системный гербицид сплошного действия, быстро разлагающийся в почве и применяемый в виде изопропиламмониевой соли для борьбы с глубокоукореняющимися и многолетними сорняками (1–1.5 кг/га) в период вегетации; используются также бутамифос (Кремарт), R = 5-CH_3, R'= C_2H_5, R" = втор-C_4H_9) и амипрофос-метил (Токунол, R = 4-CH3, R' = CH_3, R" = изо-C_3H_7); кренайт – арборицид, эффективный в дозе 2.5–5 кг/га; бенсулид (изо-$C_3H_7O)_2P(S)SCH_2CH_2SO_2C_6H_5$ (Префар), применяемый для обработки овощных и бахчевых культур; пиперофос – гербицид для до- и послевсходовой обработки Риса. Наряду с глифосатом применение нашёл контактный гербицид сплошного действия – глуфосинат аммония (L)-норма расхода 0.15–1.2 кг/га. К мышъякорганическим гербицидам относятся, например, метиларсонаты натрия и аммония, Na-солъ какодиловой кислоты. В бывшем СССР и Западной Европе эти гербициды не применяют из-за их высокой токсичности. Уничтожение растений с помощью химических средств известно с XIX века, когда при прокладке дорог и расчистке промышленных площадок в качестве гербицидов сплошного действия использовали в больших дозах дешёвые неорганические соли, серную кислоту, отходы нефтяной, коксохимической и горнорудной промышленности. В начале XX века у некоторых веществ (например, медного купороса, серной кислоты и особенно 4,6-динитро-о-крезола) была отмечена избирательность действия. Широкое и быстрое распространение гербициды получили после открытия в 1942–45 свойств 2,4-дихлорфенок-сиуксусной кислоты, не утратившей своего значения. Использование гербицидов в сельском хозяйстве, особенно в промышленно развитых странах, оказало огромное влияние на агротехнику возделывания многих культур в условиях нехватки рабочей силы. Мировое производство гербицидов постоянно расширяется, например, в США в 1980 оно превысило 300 000 тонн (в расчёте на действующее вещество). Мировой ассортимент гербицидов насчитывает свыше 200 действующих веществ (без учёта их смесей), около 100 веществ было разрешено к применению в бывшем СССР на 1982–85. Продажа и применение гербицидов во всех странах допускаются лишь с разрешения компетентных государственных органов на основании данных, подтверждающих эффективность гербицида, его безопасность для людей, животных и объектов окружающей среды. При этом регламентируются правила транспортировки, хранения и применения гербицида. Допустимые остатки гербицидов в продуктах питания и фураже строго нормируются и контролируются органами Госсанинспекции. Неправильное применение гербицидов может загрязнить почву и водоёмы, вызвать гибель растений и животных, нарушить биологические связи в биогеоценозах.

HERBICIDE DAMAGE = ПОВРЕЖДЕНИЕ ГЕРБИЦИДАМИ – Herbicides applied at planting can be washed into the root zone by rain, especially with dry loose seed beds, planting slots that open with drying, or depressions along the top of the bed. Fluometuron causes interveinal bleaching of leaves that can persist until the end of the season, sometimes with a grey crusty surface. Fluometuron in combination with prometryn can damage or kill seedlings. High rates of trifluralin may cause swelling at the base of cotton stems and rootpruning. New roots attempting growth from the base of the stem may also 'burn' back. Residual herbicides used on other crops and

in fallows can damage cotton. Metsulfuron may cause yellowing and stunting in seedlings. Glyphosate drift causes stunting and reddening of petioles and cotyledons fold down. Patterns of damage reflect the direction of drift. Higher levels of exposure kill seedlings. 'Safe' herbicides can damage cotton if applied under adverse conditions. In very cold weather pyrithiobac-sodium may cause puckering and yellowing of seedling leaves. Xxxxx. Herbicide Damage is most prevalent during the early stages of growth and symptoms vary considerably according to the type and rate of herbicide used. Symptoms may include yellowing between the veins on cotyledons and lower leaves, stunting and slow growth, root pruning and poor root development, death and defoliation of leaves and cotyledons, seedling death, declining plant stand, etc. Assuming that the rates of application are correct and appropriate for the soil type and assuming the spray equipment is well maintained and calibrated correctly, then, problems are most likely to occur when pre-plant herbicides are incorporated too deeply or when herbicides applied at planting are washed into the root zone by rain that falls after planting. Damage may be accentuated if the press-wheel on the planter has left a depression along the planting line on top of the bed or if the beds are poorly prepared and loose or have dried considerably prior to the rainfall after planting. / черешков листа (petioles) и семядолей (cotyledons). сеялка точного высева (planter). Повреждение – одно из понятий теории надёжности; событие, заключающееся в нарушении исправности изделия. Повреждение может быть существенным и являться причиной нарушения работоспособности (отказа) и несущественным, при котором работоспособность изделия сохраняется.

HERBICIDE DRIFT = ДРЕЙФ ГЕРБИЦИДА (или СНОС ГЕРБИЦИДА) – Herbicide Drift is the drift of a herbicide off-target, or from where it was applied. / Снос гербицида от запланированного места или с места применения.

HERBICIDE REGISTRATION = РЕГИСТРАЦИЯ ГЕРБИЦИДА – Herbicide Registration:- before herbicides can be sold, supplied, distributed or used in Australia, they must be registered by the National Registration Authority (NRA). The registration process is governed by Commonwealth legislation and undertaken according to accepted scientific principles and through rigorous independent analysis by several government agencies and the NRA.

HERBIVORE = ТРАВОЯДНОЕ – Herbivore is an animal that eats only plants. / , от Латинского слова Herba, означающее Трава, .

HEREDITY = НАСЛЕДСТВЕННОСТЬ (или НАСЛЕДОВАНИЕ) – Heredity is the genetic transmission of characteristics from parents to their offspring. / Под Наследственностью понимается свойство организма повторять в ряду поколений сходные типы обмена веществ и индивидуального развития в целом. Обеспечивается самовоспроизведением материальных единиц наследственности – генов, локализованных в специфических структурах ядра клетки (хромосомах) и цитоплазмы. Вместе с изменчивостью наследственность обеспечивает постоянство и многообразие форм жизни и лежит в основе эволюции живой природы.

HERFINDAHL–HIRSCHMAN INDEX = ИНДЕКС ОТ ХЁФИНДАЛА–ХЁЩМЭНА – Herfindahl-Hirschman Index (HHI) is calculated as the sum of the squares of the market share percentages of all firms in a market. Also known as Herfindahl Index. / в честь Американского сельскохозяйственного экономиста, Профессора Ориса Клэмэнта Хёфиндала (Orris Clement Herfindahl; 1918–1972). Американский экономист, Профессор Албёт Ото Хёщмэн (Albert Otto Hirschman; 1915–2012).

HERFINDAHL INDEX = ИНДЕКС ОТ ХЁФИНДАЛА – The Herfindahl Index is a measure of concentration of the production in an industry calculated as the sum of the squares of market shares for each firm. This is one method of summarizing the degree to which an industry is oligopolistic and the concentration of market control held by the largest firms in the industry. Two other measures of industry concentration are the four-firm concentration ratio and the eight-firm concentration ratio. The Herfindahl index is a measure of industry concentration. It was developed to provide an alternative measure of the relative market control of the largest firms to that found with the four-firm and eight-firm concentration ratios. The Herfindahl index is named after Professor Orris Clement Herfindahl, the economist first credited with using it to analyze industry concentration. However, upon further review, another economist, Albert Otto Hirschman, was found to have used this index earlier. As such, it is often termed the Herfindahl-Hirschman Index (HHI). The Herfindahl index is considered an improvement over concentration ratios because it uses information about each firm in the industry. Should the market shares of the first and second firms in an industry change, then the Herfindahl index also changes. This is not true for concentration ratios. Suppose, for example, that sales of OmniCola increase from USD460 million to USD560 million, which causing an increase in market share to 28 percent. At the same time sales of Juice-Up decrease from USD350 million to USD250 million, which causes a decrease in market share to 12.5 percent. In this case, the Herfindahl index increases from 1 177 to 1 282. However, these changes in sales and market shares have no affect on four-firm and eight-firm concentration ratios. The top four firms in the Shady Valley soft drink market account for 61.25 percent of industry sales before and after the change. The top eight firms also account for 78.5 percent of total industry sales before and after. Yet, the increase in sales of OmniCola and market share, at the expense of Juice-Up, gives OmniCola more market control. This change in market control is reflected by the Herfindahl index, but not by either concentration ratio. This index, developed by Orris Clement Herfindahl and Albert Otto Hirschmann in the 1960s, is an exponential function of the 'market share' of each participant in an industry or economy. 'Herfindahl Scores' are standardized, ranging only from zero to one. A score of zero suggests a complete lack of concentration while a score of one indicates complete dominance by one entity. The Herfindahl Index (HI), also known as the Concentration Index, measures industry concentration by summing the squared market shares of the firms in the industry. It is commonly used to support antitrust claims. The index can be large or small, but decreases are indicative of a loss in pricing power and/or increased competition while increases suggest the opposite. Most mergers must pass the scrutiny of the Herfindahl Index before being approved by the US Department of Justice. Interpret the results:- the Herfindahl index for the medical-supplies industry is 0.245 (for example). In general, a Herfindahl index below 0.1 signifies low concentration, while an index above 0.18 signifies high concentration. If all companies in an industry have equal market share, the reciprocal of the index is is equal to the number of companies in the industry. In BIS (short for the Bank for International Setlements) reports:- the Herfindahl Index (HI) represents a measure of market concentration and is defined as the sum of the squares of the market shares of each individual institution. It ranges from 0 to 10 000. The more concentrated the market, the higher the measure becomes. If the market is fully concentrated (only one institution) the measure will have the (maximum) value of 10 000. The Herfindahl Index (HI), also known as Herfindahl-Hirschman Index or HHI, is a measure of the size of firms in relation to the industry and an indicator of the amount of competition among them. Named after economists Orris Clement Herfindahl (1918–1972) and Albert Otto Hirschman (1915–2012), it is an economic concept widely applied in competition law, antitrust and also technology management. It is defined as the sum of the squares of the market shares of the 50 largest firms (or summed over all the firms if there are fewer than 50) within the industry, where the market shares are expressed as fractions. The result is proportional to the average market share, weighted by market share. As such, it can range from 0 to 1.0, moving from a huge number of very small firms to a single monopolistic producer. Increases in the Herfindahl index generally indicate a decrease in competition and an increase of market power, whereas decreases indicate the opposite. The major benefit of the Herfindahl index in relationship to such measures as the concentration ratio is that it gives more weight to larger firms. The measure is essentially equivalent to the Simpson Diversity Index used in ecology. The United States Federal anti-trust authorities such as the Department of Justice and the Federal Trade Commission use the Herfindahl index as a screening tool to determine whether a proposed merger is likely to raise antitrust concerns (increases of over 0.0100 points

generally provoke scrutiny, although this varies from case to case. The Antitrust Division of the Department of Justice considers Herfindahl indices between 0.1000 and 0.1800 to be moderately concentrated and indices above 0.1800 to be concentrated. As the market concentration increases, competition and efficiency decrease and the chances of collusion and monopoly increase. Herfindahl-Hirschman Index (HHI) is an index of market concentration the US Department of Justice uses to determine whether a monopoly is forming. The scale goes from zero to 10 000, with 10 000 indicating that a single company controls 100% of the market share in a given industry. An HHI of less than 1 000 indicates a market with little concentration, which the Justice Department prefers. Any merger or acquisition leading to an increase of more than 100 when the HHI was previously greater than 1 800 may lead to antitrust action against the company involved. / в честь Американского сельскохозяйственного экономиста, Профессора Ориса Клэмэнта Хёфиндала (Orris Clement Herfindahl; 1918–1972). Американский экономист, Профессор Албёт Ото Хёщмэн (Albert Otto Hirschman; 1915–2012). Симпсэн (Simpson). ОмниКола (OmniCola).

HERITABILITY = НАСЛЕДУЕМОСТЬ – Heritability:- in the broad sense, the proportion of the total phenotypic variance which is inherited, the remainder being due to environmental effects. In the narrow sense, the proportion of variance due to additive effects of genes.

HERITABLE = НАСЛЕДУЕМОЕ (или НАСЛЕДСТВЕННОЕ) – Heritable:- the characteristics of parents transmitted to their progeny.

HERMAPHRODITE = ГЕРМАФРОДИТ (или ОБОЕПОЛОЕ) – Hermaphrodite:- with both male and female reproductive parts usually in the same flower. Hermaphrodite is a flower which possesses both male and female organs; bisexual. / ; двуполое. В Греческой мифологии под Гермафродитом подразумевался сын Гермеса и Афродиты, юноша необычайной красоты. По просьбе нимфы Салмакиды, страстно и безответно влюблённой в Гермафродита, боги слили её с ним в одно двуполое существо. Гермафродитизм подразумевает наличие у одного организма мужских и женских половых органов. Различают естественный гермафродитизм, свойственный главным образом беспозвоночным, и аномальный (порок развития), встречающийся и у человека.

HERMES = THE HELLENIC REAL–TIME MONEY TRANSFER EXPRESS SYSTEM

HERRINGBONE = В ЁЛОЧКУ (или ЁЛОЧКОЙ, или ЁЛКОЙ) – The term Herringbone is used to refer to a distinctive pattern which appears in masonry, clothing design, and parquetry. The pattern has been used for hundreds of years, especially in Europe. It can be difficult to make the elements of a herringbone pattern line up. As a result, creating things with a herringbone pattern is usually limited to skilled craftsmen if the pattern has to be created entirely by hand. The advent of modular systems for things like brickwork and flooring has made herringbone easier, and therefore more common. The pattern consists of very short rows of slanted parallel lines. The rows are oriented in opposition to each other, causing the slanted lines to form a dense pattern of chevrons, with each slant meeting up at the end with a slant going in the opposite direction. The pattern is named for the herring fish, which is famous for being rather densely bony. Depending on personal taste, a herringbone pattern may be made with different colors or textures to make the lines stand out, or it may be left subtle and simple. Clothing produced with a herringbone pattern is usually intended for use as an outer layer. Tweed, a fabric well known in England, is often produced with a herringbone pattern. Tweed is a coarse woolen cloth which is worn as an outer layer. The wool makes tweed highly insulating, and also resists water so that the garment can be worn outdoors for activities like hunting and shooting. Twill fabric is also produced with a herringbone pattern, in which the alternating lines are often ribbed, creating a raised pattern. In parquetry, more casually known as Flooring, herringbone patterns can be accomplished in wood, brick, and tile. Subtle alternating colors may be used to create a distinctive floor pattern, or the materials used may be the same, causing the floor to look uniform from a distance. Laying a herringbone floor is very challenging, since the multitude of small rows must be made to line up smoothly, which can be difficult in a room which is not perfectly plumb. Small mistakes in a herringbone floor can be rather glaring because of the way the pattern lines up, so care must be taken. Masonry also utilizes herringbone, often as an accent pattern on the sides of buildings and other structures. A floor or outdoor walkway made from stone or brick may be made entirely from herringbone, or herringbone stripes may be integrated into other patterns. Just like with flooring, the rows must be carefully aligned to maintain the integrity of the pattern. Herringbone:- a variation on the twill weave construction in which the twill is reversed, or broken, at regular intervals, producing a zig-zag effect. Herringbone is a distinctive V-shaped weaving pattern usually found in twill fabric. The pattern is named so because it looks like the skeleton of a herring fish. Herringbone-patterned fabric is usually wool, and is often used for suits and outerwear. Tweed cloth is often woven with a herringbone pattern. Herringbone is a broken twill weave characterized by a balanced zigzag effect produced by having the rib run first to the right and then to the left for an equal number of threads. Herringbone is a fabric in which the pattern of weave resembles the skeletal structure of the herring. It is a twill weave in which the wale runs in one direction for a few rows and then re verses, forming a ‘V’ pattern. It is made with a broken twill weave that produces a balanced, zigzag effect and is used for sportswear, suits, and coats. Herringbone is a twilled fabric with a herringbone pattern, namely a pattern made up of rows of parallel lines which in any two adjacent rows slope in opposite directions. A suit made of herringbone, namely a twilled fabric with a herringbone pattern, namely rows of parallel lines which in any two adjacent rows slope in opposite directions.

HERRINGBONE TWILL = ОБРАТНАЯ САРЖА (или САРЖЕВОЕ В ЁЛОЧКУ, или САРЖА ЁЛКОЙ, или ГРИНСБОН) – Herringbone Twill is a broken twill weave composed of vertical sections which are alternately right hand and left hand in direction. The twill changes direction perfectly where the weave breaks, balancing the overall pattern of the fabric.

HERSTATT RISK = РИСК ХЭРШТАТТА – Herstatt Risk, also known as Cross-Currency Settlement Risk or Foreign Exchange Risk is the risk that a party to a trade fails to make payment even though it has been paid by its counterparty. It is named after the German bank Herstatt whose license was withdrawn by regulators on 1974-June-26 due to its inability to cover its liabilities. This forced the bank into liquidation and it ceased operating. Because of time zone differences this meant that Herstatt was unable to pay some New York banks for foreign exchange it had received before it ceased operating. The risk that when dealing with an overseas client a bank may not be able to recover its funds if the counter party defaults on its payment obligation. Named for the failed German bank Bankhaus Herstatt on 1974-June-26. Also known as Cross-Currency Settlement Risk. Herstatt Bank was a privately owned bank in the German city of Cologne. It went bankrupt on 1974-June-26 in a famous incident illustrating settlement risk in international finance. On 1974-June-26, German regulators forced the troubled Bank Herstatt into liquidation. That day, a number of banks had released payment of DEM to Herstatt in Frankfurt in exchange for USD that was to be delivered in New York. Because of time-zone differences, Herstatt ceased operations between the times of the respective payments. The counterparty banks did not receive their USD payments. Responding to the cross-jurisdictional implications of the Herstatt debacle, the G-10 countries (the G-10 is actually eleven countries:- Belgium, Canada, France, Germany, Italy, Japan, the Netherlands, Sweden, Switzerland, the United Kingdom and the United States) and Luxembourg formed a standing committee under the auspices of the Bank for International Settlements (BIS). Called the Basel Committee on Banking Supervision, the committee comprises representatives from central banks and regulatory authorities. This type of settlement risk, in which one party in a foreign exchange trade pays out the currency it sold but does not receive the currency it bought, is sometimes called Herstatt Risk. The failure of Bank Herstatt was one factor that led to the creation of the continuous linked settlement platform (CLS), which launched almost 30 years later in 2002. This payment versus payment (PVP)

process enables member banks to trade foreign currencies without assuming the settlement risk associated with the process, whereby a counterparty could fail before delivering their leg of the transaction. / Банкхаус Хэрштат (Bankhaus Herstatt).

HERTZ = ГЕРЦ – Hertz is a unit of frequency. The number of Hertz (abbreviated Hz) equals the number of cycles per second. The frequency of any phenomenon with regular periodic variations can be expressed in Hertz, but the term is used most frequently in connection with alternating electric currents, electromagnetic waves (light, radar, etc), and sound. It is part of the International System of Units (SI), which is based on the metric system. The term Hertz was proposed in the early 1920s by German scientists to honour the XIX-century German physicist Heinrich (Rudolf) Hertz (born 1857-February-22, in Hamburg, Germany, died 1894-January-01, in Bonn, Germany). The unit was adopted in October 1933 by a committee of the International Electrotechnical Commission and is in widespread use today, although it has not entirely replaced the expression 'cycles per second'. A rarely used multiple of the Hertz is the Fresnel, which is equal to 10^{12} Hertz. The Fresnel was named for the XVIII–XIX-century French scientist Augustin Jean Fresnel, one of the pioneers of the science of optics. Hertz is the unit of frequency. One Hertz equals one complete cycle per second of an ac source. Abbreviated Hz. Named after the German physicist Heinrich R. Hertz 1894. This unit replaces the former 'cycles-per-second'. Hertz (Hz) is the SI unit of frequency, equal to one cycle per second. The Hertz is used to measure the rates of events that happen periodically in a fixed and definite cycle; the becquerel, also equal to one 'event' per second, is used to measure the rates of things which happen randomly or unpredictably. Multiples of the Hertz are common:- the frequencies of radio and television waves are measured in kiloHertz (kHz), MegaHertz (MHz), or even GigaHertz (GHz), and the frequencies of light waves in TeraHertz (THz). The unit is named for the German physicist Heinrich Rudolf Hertz (1857–94), who proved in 1887 that energy is transmitted through a vacuum by electromagnetic waves. Herz (Hz):- electricity system frequency is measured in Herz. / Огюста Жо Фрэнэль (Augustin Jean Fresnel). Герц, единица частоты периодического процесса в системах единиц СИ и СГС. Названа по имени Немецкого физика Хайнрихя Рудольфа Херца (или Генриха Рудольфа Герца; Heinrich Rudolf Hertz, родившегося 22 Февраля 1857 в Гамбурге, Германия и скончавшегося 01 Января 1894 в Бонне, Германия). Обозначение:- Гц (Hz). 1 Гц равен частоте периодического процесса, при которой за время 1 с происходит один цикл процесса. В технике широко используются кратные единицы от Гц:- килоГерц (1 кГц = 10^3 Гц), МегаГерц (1 МГц = 10^6 Гц), ГигаГерц (1 ГГц = 10^9 Гц). В честь Французского учёного Огюста Жо Фрэнэля (Augustin Jean Fresnel), одного из пионеров в науке оптика. Герц – единица частоты. Названа в честь Генриха Герца. Сокращённое обозначение:- Русское Гц, международное Hz. 1 Герц – частота периодического процесса, при которой за время в 1 секунду (сек) происходит один цикл процесса. Широко применяются кратные единицы от Герца – килоГерц (10^3 Гц), МегаГерц (10^6 Гц) и другие.

HESSIAN = ДЖУТОВОЕ ПОЛОТНО (или ГЕССЕНСКОЕ) – Hessian is a name for burlap used in the United Kingdom, India, and parts or Europe. See also Burlap. / Смотрите также Мешочная Ткань (Burlap).

HESSIAN BOOT = ГЕССЕНСКИЙ САПОГ (или БОТФОРТ, или ВЫСОКИЙ САПОГ) – Hessian Boot:- a high boot that extends to just below the knee and is commonly ornamented with a tassel and that was introduced into England by the Hessians early in the XIX century. / сапог с высоким голенищем; тяжёлый военный сапог с кисточкой для украшения. Гессенский – из города Гессен, Германия.

HETEROBELTIOSIS = ГЕТЕРОБЕЛТИОЗ (или ГЕТЕРОБЕЛТИОЗИС) – Heterobeltiosis refers to the phenomenon in which the FI hybrid obtained by crossing two genetically dissimilar parents shows superiority over the better parent in one or a combination of characters. / свойства (characters). / , от Греческого слова Héteros, означающее Другой, .

HETEROCARYOPSIS = ГЕТЕРОКАРИОПСИС (или ГЕТЕРОЗЕРНОВКА) – Heterocaryopsis:- the condition in which there are two or more genetically different nuclei in a single cell of a fungal mycelium. / , от Греческого слова Héteros, означающее Другой, .

HETEROCHROMATIN = ГЕТЕРОХРОМАТИН – Heterochromatin is a portion of genomic DNA which is highly stained because of high condensation. The heterochromatin is transcriptionally inactive and often contains large amounts of highly repeated DNA (satellite DNA). / повторяющейся ДНК (сателлитной ДНК). Под Гетерохроматином понимается вещество хромосом, сохраняющее компактную (спирализованную) структуру на всех стадиях клеточного цикла. Функция гетерохроматина не совсем ясна. Под Гетерохроматином, от от Греческих слов Héteros, означающее Другой, и Chroma, означающее Цвет, понимаются участки хромосом, остающиеся в промежутке между делениями клетки, то есть в интерфазе, уплотнёнными (в отличие от других участков – эухроматина). Гетерохроматин иногда тесно связан с ядрышком, образуя вокруг него подобие кольца или оболочки. Во время митоза гетерохроматин окрашивается сильнее или слабее, чем эухроматин (явление положительного или отрицательного гетеропикноза). Гетерохроматин особенно характерен для половых хромосом многих видов животных. Гетеропикнотические участки удаётся получить в эксперименте, например, при действии низкой температуры. Полагают, что гетерохроматин не содержит генов, контролирующих развитие организма.

HETEROCYST = ГЕТЕРОЦИСТА – Heterocyst is a thick-walled, usually translucent cell of some blue-green algae known to be the site of nitrogen fixation. / Под Гетероцистой, от Греческих слов Héteros, означающее Другой, и Kýstis, означающее Пузырь, у водорослей понимаются крупные жёлтые клетки, лишённые живого содержимого. Характерны для Синезелёных Водорослей. По гетероцисте обычно происходит разрыв нити Водорослей.

HETEROFILAMENT = ГЕТЕРОЭЛЕМЕНТАРНАЯ НИТЬ (или НЕОДНОРОДНЫЙ ФИЛАМЕНТ, или ГЕТЕРОФИЛАМЕНТ) – Heterofilament is a filament made up of more than one polymer. Also known as Heterofil. See also Bicomponent Fibers.

HETEROGENEOUS = ГЕТЕРОГЕННОЕ (или РАЗНОРОДНОЕ, или НЕОДНОРОДНОЕ) – Heterogeneous:- having different genotypes in a population. / Под Гетерогенным, от Греческого слова Heterogenes, означающее Разнородный, .

HETEROLOGOUS GENE TRANSFER = ГЕТЕРОЛОГИЧЕСКАЯ ПЕРЕДАЧА ГЕНА (или ГЕТЕРОЛОГИЧНАЯ ПЕРЕДАЧА ГЕНА) – Heterologous Gene Transfer is a type of alien gene transfer where there is a transfer of traits from species possessing different genome(s). / от Греческого слова Héteros, означающее Другой, .

HETEROMORPHUS = ГЕТЕРОМОРФНОЕ – Heteromorphus:- with an irregular or unusual shape or structure. / Под Гетероморфным, от Греческих слов Héteros, означающее Другой, и Morphē, означающее Форма, понимается .

HETEROSIS = ГЕТЕРОЗИС (или ГИБРИДНАЯ СИЛА) – Heterosis (standard) refers to the phenomenon in which the FI hybrid obtained by the crossing of two genetically dissimilar parents shows superiority over the best standard check prevailing at that time in one or a combination of characters. / свойства (characters). Под Гетерозисом, от Греческого слова Heteróiōsis, означающее Изменение или Превращение, понимается свойство гибридов первого поколения превосходить по жизнестойкости, плодовитости и другим признакам лучшую из родительских форм. Во втором и последующих поколениях гетерозис обычно затухает. Гетерозис Растений и Животных используют как важный приём повышения урожайности и продуктивности. Гетерозис или 'Гибридная Сила', ускорение роста и увеличение размеров, повышение жизнестойкости и плодовитости гибридов первого поколения при различных скрещиваниях как животных, так и растений. Во втором и последующих

поколениях гетерозис обычно затухает. Различают Истинный Гетерозис – способность гибридов оставлять большое число плодовитых потомков, и Гигантизм – увеличение всего гибридного организма или отдельных его частей. Гетерозис обнаружен у разнообразных многоклеточных Животных и Растений (в том числе и самоопылителей). Сходные с гетерозисом явления наблюдаются при половом процессе и у некоторых одноклеточных. У сельскохозяйственных Животных и возделываемых Растений гетерозис нередко приводит к значительному повышению продуктивности и урожайности (смотрите ниже – Гетерозис В Сельском Хозяйстве). Гетерозис и обратная ему инбредная депрессия (смотрите Инбридинг) были известны уже древним Грекам, в частности Аристотелю (Aristotle; 384–322 до Нашей Эры). Первые научные исследования гетерозиса у растений проведены Немецким ботаником Йозэфом Готлибом Коэльройта (Joseph Gottlieb Koelreuter; 1733–1806) в 1760. Английский натуралист, геолог и биолог Чалз Давин (или Дарвин; Charles Darwin; 1809–1882) обобщил наблюдения о пользе скрещиваний в 1876, оказав тем самым большое влияние на работы Русского селекционера Ивана Владимировича Мичурина (1855–1935) и многих других селекционеров. Термин Гетерозис предложил Американский генетик Дьжодьж Хэрэсэн Щал (George Harrison Shull; 1874–1954) (в 1914); он первый получил ‘двойные’ межлинейные гибриды Кукурузы. Основы метода промышленного выращивания этих гибридов разработал Американский учёный Данэлд Форща Дьжонз (Donald Forsha Jones; 1890–1963) в 1917. Применение гибридизации в сельском хозяйстве расширяется из года в год, что стимулирует и теоретические исследования гетерозиса. Особи с сильно выраженным гетерозисом имеют преимущества при естественном отборе, и потому проявления гетерозиса усиливаются, что способствует увеличению генетической изменчивости. Нередко возникают устойчивые генетические системы, обеспечивающие преимущественное выживание гетерозигот по многим генам. Исследование гетерозиса, помимо обычного изучения морфологических признаков, требует применения физиологических и биохимических методик, позволяющих обнаружить тонкие различия между гибридами и исходными формами. Начато изучение гетерозиса и на молекулярном уровне:- в частности, у многих гибридов исследуется строение специфических белковых молекул – ферментов, антигенов и других. По Дарвину, гетерозис обусловлен объединением в оплодотворённой яйцеклетке разнородных наследственных задатков. На этой основе возникли две главные гипотезы о механизме гетерозиса:- Гипотеза Гетерозиготности (‘сверхдоминирования’, ‘одногенного’ гетерозиса) была выдвинута Американскими исследователями Эдводом Мориэм Истом (Edward Murray East; 1879–1938) и Дьжодьжем Хэрэсэном Щалом в 1908. Два состояния (два аллеля) одного и того же гена при их совмещении в гетерозиготе дополняют друг друга в своём действии на организм. Каждый ген управляет синтезом определённого полипептида. У гетерозиготы синтезируются несколько различных белковых цепочек вместо одной и нередко образуются гетерополимеры – ‘гибридные’ молекулы (смотрите Комплементарность); это может дать ей преимущество. Гипотезу доминантности (суммирования доминантных генов) сформулировали Американские биологи Эй.Би. Брюс (A.B. Bruce) в 1910, Данэлд Форща Дьжонз в 1917 и другие. Мутации (изменения) генов в общей массе вредны. Защитой от них служит увеличение доминантности ‘нормальных’ для популяции генов (эволюция доминантности). Совмещение у гибрида благоприятных доминантных генов двух родителей приводит к гетерозису. Обе гипотезы гетерозиса могут быть объединены концепцией генетического баланса (Американский учёный Дьжей. Лонё (J Lerner), Английский Сэр Кэнес Мэйзё (Sir Kenneth Mather; 1911–1990), Русский генетик Николай Васильевич Турбин (1912–1998)). В основе гетерозиса, по-видимому, лежит взаимодействие как аллельных, так и неаллельных генов; однако во всех случаях гетерозис связан с повышенной гетерозиготностью гибрида и его биохимическим обогащением, что и обусловливает усиление обмена веществ. Особый практический и теоретический интерес представляет проблема закрепления гетерозиса. Она может быть решена путём удвоения хромосомных наборов (смотрите Полиплоидия), создания устойчивых гетерозиготных структур и использования всех форм апомиксиса, а также вегетативного размножения гибридов. Эффект гетерозиса может быть закреплён и при удвоении отдельных генов или небольших участков хромосом. Роль таких дупликаций в эволюции очень велика; поэтому гетерозис следует рассматривать как важный этап на пути эволюционного прогресса. Гетерозис В Сельском Хозяйстве:- Использование гетерозиса в растениеводстве – важный приём повышения продуктивности растений. Урожай гетерозисных гибридов на 10–30% выше, чем у обычных сортов. Для использования гетерозиса в производстве разработаны экономически рентабельные способы получения гибридных семян Кукурузы, Томатов, Баклажанов, Перца, Лука, Огурцов, Арбузов, Тыквы, Сахарной Свёклы, Сорго, Ржи, Люцерны и других сельскохозяйственных Растений. Особое положение занимает Группа вегетативно размножаемых Растений, у которых возможно закрепление гетерозиса в потомстве, например, Сорта Картофеля и плодово-ягодных культур, выведенные из гибридных семян. Для использования гетерозиса с практической целью применяются межсортовые скрещивания гомозиготных Сортов самоопыляющихся Растений, межсортовые (межпопуляционные) скрещивания самоопылённых линий перекрёстноопыляющихся Растений (парные, трёхлинейные, двойные – четырёхлинейные, множественные) и сортолинейные скрещивания. Преимущество определённых типов скрещивания для каждой сельскохозяйственной культуры устанавливается на основе экономической оценки. Устранению трудностей в получении гибридных семян может способствовать использование цитоплазматической мужской стерильности (ЦМС), свойства несовместимости у некоторых перекрестноопыляющихся Растений и других наследственных особенностей в структуре цветка и соцветия, исключающих большие затраты на кастрацию. При выборе родительских форм для получения гетерозисных гибридов оценивают их комбинационную способность. Первоначально селекция в этом направлении сводилась к выделению лучших по комбинационной ценности генотипов из популяций свободноопыляющихся Сортов на основе инбридинга в форме принудительного самоопыления. Разработаны методы оценки и повышения комбинационной способности линий и других групп растений, используемых для скрещиваний. Наибольший эффект в использовании гетерозиса достигнут на Кукурузе. Создание и внедрение в производство гибридов Кукурузы позволило повысить на 20–30% валовые сборы зерна на огромных площадях, занимаемых этой культурой в разных странах мира. Созданы гибриды Кукурузы, совмещающие в себе высокую урожайность с хорошим качеством семян, засухоустойчивостью и иммунитетом к различным болезням. Районированы гетерозисные гибриды Сорго (Гибрид Ранний 1, Гибрид Восход), гетерозисные межсортовые гибриды Сахарной Свёклы, из которых наибольшее распространение получил Ялтушковский гибрид. Для получения гетерозисных форм все шире используются линии Сахарной Свёклы со стерильной пыльцой. Явления гетерозиса установлены также у многих овощных и масличных культур. Получены первые результаты в изучении гетерозиса у гибридов Пшеницы первого поколения, созданы стерильные аналоги и восстановители фертильности (плодовитости), выявлены источники ЦМС у Пшеницы. В животноводстве явления гетерозиса наблюдаются при гибридизации, межпородном и внутрипородном (межлинейном) скрещивании и обеспечивают заметное повышение продуктивности сельскохозяйственных животных. Наибольшее распространение получило использование гетерозис при промышленном скрещивании. В птицеводстве при скрещивании яйценоских пород кур, например, Леггорнов с Австралорпами, Родайландами и другими, яйценоскость помесей первого поколения возрастает на 20–25 яиц в год; скрещивание мясных пород кур с мясо-яичными обусловливает повышение мясных качеств (смотрите Бройлер); гетерозис по комплексу признаков получают при скрещивании близкородственных линий кур одной породы или при межпородных скрещиваниях. В свиноводстве, овцеводстве и скотоводстве промышленным скрещиванием пользуются для получения гетерозиса по мясной продуктивности, что выражается в повышении скороспелости и живого веса животных, увеличении убойного выхода, улучшении качества туши. Свиней мясо-сальных (комбинированных) пород скрещивают с хряками мясных пород. Мелких малопродуктивных овец

местных пород скрещивают с баранами мясо-шёрстных пород, тонкорунных маток – с баранами скороспелых мясных или полутонкорунных пород. Для повышения мясной продуктивности коров молочных, молочно-мясных и местных мясных пород скрещивают с быками специализированных мясных пород.

HETEROSIS BREEDING = ГЕТЕРОЗИСНОЕ РАЗВЕДЕНИЕ (или ГЕТЕРОЗИСНАЯ СЕЛЕКЦИЯ) – Heterosis Breeding is a method of breeding to develop FI hybrids which exploit the phenomenon of hybrid vigor to increase yield potential and yield stability. / от Греческого слова Héteros, означающее Другой, . Под Разведением сельскохозяйственных животных понимается наука о размножении сельскохозяйственных животных и улучшении их наследственных качеств, совершенствовании существующих и выведении новых пород; раздел зоотехнии; производственная деятельность по осуществлению этих задач. Разрабатывает теорию и практические приёмы племенной работы применительно ко всем видам сельскохозяйственных животных. Важнейшие методы разведения сельскохозяйственных животных – чистопородное разведение, скрещивание и гибридизация при тщательном отборе и подборе животных. Тесно связано с генетикой. Под Селекцией, от Латинского слова Selectio, означающее Выбор или Отбор, понимается:- (1) раздел агрономии и зоотехнии, изучающий методы создания сортов и гибридов сельскохозяйственных растений и пород животных с нужными человеку признаками. (2) Отрасль сельскохозяйственного производства, занимающаяся выведением сортов и гибридов сельскохозяйственных культур, пород животных. Основные направления селекции:- (i) растений на урожайность или животных на продуктивность; (ii) на качество продукции; (iii) растений – на зимостойкость, засухоустойчивость, устойчивость к болезням и вредителям, приспособленность к высоким дозам удобрений и другого; (iv) животных – на плодовитость и другое. Методы селекции:- отбор, гибридизация, мутагенез.

HETEROTROPH = ГЕТЕРОТРОФ (или ГЕТЕРОТРОФНЫЙ ОРГАНИЗМ) – Heterotroph is an organism that can not make its own food and consumes other organisms to survive. / Под Гетеротрофом или Гетеротрофным Организмом, от Греческих слов Héteros, означающее Другой, и Trophē, означающее Пища, понимается организмы, использующие для своего питания готовые органические вещества. К Гетеротрофам относятся Человек, все Животные, некоторые Растения, большинство Бактерий, Грибы. Гетеротрофные Организмы или Гетеротрофы, организмы, использующие для своего питания готовые органические соединения (в отличие от автотрофных организмов, способных первично синтезировать необходимые им органические вещества из неорганических соединений углерода, азота, серы и других). К гетеротрофным организмам относятся все Животные и Человек, а также некоторые Растения (Грибы, многие паразиты и сапрофиты Покрытосеменных Растений) и микроорганизмы. Однако разделение растений и микроорганизмов на гетеротрофные и автотрофные, несмотря на принципиальное различие в типе их обмена веществ, довольно условно. Даже типичные автотрофы – фотосинтезирующие зелёные Растения – могут усваивать некоторое количество органических веществ из почвы через корни, но их рост и развитие лучше протекают на минеральных источниках азота. Некоторые зелёные Растения, обладая способностью к фотосинтезу, являются в то же время насекомоядными (Росянка, Пузырчатка и другие), то есть используют в основном органический азот, а их углеродное питание осуществляется фотосинтетически. Некоторые автотрофы нуждаются в присутствии в среде витаминоподобных веществ, необходимых для автотрофного синтеза, и так далее. В 1921 Русский учёный Александр Фёдорович Лебедев (1882–1936) показал, а в 1933 с помощью изотопного метода Американские учёные Харлэнд Гаф Вуд (Harland Goff Wood; 1907–1991) и Чэстёр Хэмлын Вокмэн (Chester Hamlin Werkman; 1893–1962) подтвердили, что даже ярко выраженные гетеротрофные организмы (некоторые Бактерии, Грибы и другие) способны усваивать углерод CO_2. Гетеротрофный синтез обеспечивает незначительное накопление органического вещества (до 10% всего углерода организма). Возможность усвоения CO_2 клеткой, не содержащей зелёного (или иного) пигмента, имеет принципиальное значение для понимания эволюции хемосинтеза и фотосинтеза, Выявлена способность и животных тканей использовать CO_2. В связи с этим возникла тенденция к дифференциации организмов на автотрофы и гетеротрофы не по типу углеродного питания, а по характеру источника жизненно необходимой энергии. В соответствии с этим к гетеротрофным организмам относят организмы, для которых источником углерода служит окисление сложных органических соединений – углеводородов жиров, белков; к фотоавтотрофам – организмы, осуществляющие фотохимические реакции; к хемоавтотрофам – организмы, для которых источником энергии являются реакции окисления неорганических веществ Строго гетеротрофные организмы – Животные и Человек, использующие органические соединения для покрытия энергетического расхода построения и возобновления тканей тела и регуляции жизненных функций. Такие гетеротрофные организмы различают по потребности в тех или иных органических соединениях (что зависит от степени их участия в обмене веществ организмов), а также по возможности синтезирования этих соединений самими организмами. К числу необходимых, но несинтезируемых гетеротрофными организмами веществ относятся так называемые незаменимые аминокислоты, витамины и близкие к ним соединения Осуществляя разложение и минерализацию сложных органических веществ, гетеротрофные организмы играют важную роль в круговороте веществ в природе.

HETEROTROPHIC = ГЕТЕРОТРОФИЧЕСКОЕ (или ГЕТЕРОТРОФНОЕ) – Heterotrophic is the obtaining nourishment from outside sources, specifically requiring complex organic compounds of nitrogen and carbon for metabolic synthesis. / от Греческого слова Héteros, означающее Другой, .

HETEROTROPHIC NITRIFICATION = ГЕТЕРОТРОФИЧЕСКАЯ НИТРИФИКАЦИЯ (или ГЕТЕРОТРОФНАЯ НИТРИФИКАЦИЯ) – Heterotrophic Nitrification is the biochemical oxidation of reduced forms of nitrogen to nitrate by heterotrophic microorganisms. / от Греческого слова Héteros, означающее Другой, . Под Нитрификацией, от Греческого слова Nitron, означающее первоначально – Природная Сода, затем – Селитра, и Латинского слова Facio, означающее Делаю, понимается превращение так называемыми нитрифицирующими Бактериями аммонийных солей почвы и водоёмов в нитраты, усваиваемые растениями. Играет первостепенную роль в круговороте азота в биосфере. Свидетельствует о завершении процесса минерализации в экосистеме. Обработка почвы, улучшающая её аэрацию, усиливает нитрификацию. Чрезмерное накопление нитратов в почве нежелательно, так как они легко вымываются и загрязняют воду.

HETEROZYGOTE = ГЕТЕРОЗИГОТА – Heterozygote is an individual having different alleles for any gene pair and producing two kinds of gametes. Heterozygote:- with unlike genes on any particular pair of chromosomes. / Под Гетерозиготой, от Греческих слов Héteros, означающее Другой или Иной, и Zygōtós, означающее Соединённый Вместе, понимается клетка или организм, в наследственном наборе (генотипе) которого гомологичные хромосомы несут разные формы (аллели) того или иного гена. Гетерозигота, клетка или организм, имеющие в наследственном наборе (генотипе) разные формы (аллели) того или иного гена. Гетерозигота получается при слиянии разнокачественных по генному составу гамет, каждая из которых приносит в зиготу свои аллели. Например, гомозиготные формы АА и аа образуют гаметы соответственно А и а. Полученная при скрещивании АА x аа гетерозигота всегда образует разнокачественные гаметы:- А и а. Скрещивание такой формы внутри себя или с рецессивной родительской формой аа даёт потомков двух видов – фенотипически А и фенотипически а (смотрите Рецессивность, Фенотип). Расщепление гетерозиготы происходит по определённому правилу (смотрите Законы Менделя). Сохранение гетерозиготы имеет значение для сельскохозяйственной практики, так как расщепление часто ведёт к утрате

ценных качеств. Почти все плодовые деревья гетерозиготны. Чтобы предупредить у них расщепление признаков и утерю ценных свойств, прибегают к вегетативному размножению или апомиксису. Для сохранения гетерозиготного состояния могут применяться также гиногенез и партеногенез. Сравните с Гомозигота.

HETEROZYGOUS = ГЕТЕРОЗИГОТНОЕ – Heterozygous is a hybrid for any gene pair, with different alleles for the gene being considered, usually one dominant or recessive.

HEURISTIC = ЭВРИСТИКА (или ЭВРИСТИЧЕСКИЙ) – Heuristic:- the process of solving problems by evaluating each step in the progress, searching for satisfactory solutions rather than optimal solutions. It comprises a form of problem solving where the results are determined by experience or intuition instead of by optimization. / Эвристик или Эвристический (от Греческого слова Heurisko, означающее Открываю или Отыскиваю) анализатор – компонент антивирусной программы, который позволяет обнаруживать новые и неизвестные ранее вирусы. Эвристик анализирует как файлы, так и загрузочные сектора дисков. При эвристическом анализе осуществляется проверка исполняемого кода в исследуемом объекте и делается попытка выявить присутствие характерных для вирусов функций. Если эвристик находит подозрительный код, пользователю выдаётся сообщение о возможном инфицировании объекта неизвестным вирусом с указанием категории, к которой этот код относится. Во многих антивирусных программах выделяются следующие категории подозрительных объектов, определяемых эвристиком:- COM, EXE, WIN.EXE, TSR, MACRO, BOOT, CRYPT, SCRIPT, BATCH, IRC, WORM. В случае, если в процессе работы сканера антивирусной программы или резидентного монитора (специальной функции защиты во время работы компьютера) выдаётся сообщение о возможном инфицировании того или иного объекта одной из вышеуказанных категорий вирусов, разработчики антивирусных программ рекомендуют отправить подозрительный файл для изучения в их службу поддержки пользователей с помощью специальной формы.

HEX = HELSINKI EXCHANGE

HEXAGONAL GROUP = ШЕСТИСТОРОННЯЯ ГРУППА (или ШЕСТИГРАННАЯ ГРУППА) – Hexagonal Group is the old Pentagonal Group plus one, with the goal of forming an economic and political cooperation group for the region between the Adriatic and the Baltic Seas. Its members were Austria, Czechoslovakia, Hungary, Italy, Poland and the former Yugoslavia. / Шестисторонняя Группа образовалась в результате присоединения к старой Пятисторонней или Пятигранной Группе (Pentagonal Group) ещё одного члена с целью создания группы по экономическому и политическому сотрудничеству в регионе, расположенном между Адриатическим и Балтийским Морями. Её членами являлись Австрия, Венгрия, Италия, Польша, и бывшие Чехословакия и Югославия.

HEXAMETHYLENEDIAMINE = ГЕКСАМЕТИЛЕНДИАМИН – Hexamethylenediamine:- 1,6-diaminohexane, ($H_2N(CH_2)_6NH_2$). It is used in the polymerization reaction to form nylon 66. / Гексаметилендиамин, $NH_2(CH_2)_6NH_2$, . Найлан^{T3} (Nylon^{TM}).

HEXAPLOID = ГЕКСАПЛОИД (или ГЕКСАПЛОИДНОЕ) – Hexaploid is a plant that has six sets of chromosomes. / Под Гексаплоидом, от Греческих слов Héxplóos, означающее Шестой, и Éidos, означающее Вид, понимается .

HF = HELD FOR

HFCS = HIGH FRUCTOSE CORN SYRUP

HFR = HOLD FOR RELEASE

HG = HEXAGONAL GROUP

HHD = HAND HELD DEVICE

HHI = HERFINDAHL–HIRSCHMAN INDEX

HHP = HIGHLY HAZARDOUS PESTICIDE

HH SAVINGS BONDS = СБЕРЕГАТЕЛЬНЫЕ ОБЛИГАЦИИ СЕРИИ ЭЙЧ.ЭЙЧ. – In the United States, a Series HH US Savings Bond is a current income savings bond issued after 1979 that is a contract between the owner or co-owners and the United States. Under the contract, the owner or co-owners lend money to the United States, and the US must both repay that money when the bond is redeemed at 6 months after issue or later. The US must also pay interest to the owner or co-owners starting at six months after issue and every six months thereafter until the bond stops bearing interest 20 years after issue. The interest rate is subject to change after Series HH bonds are 10 years old. Regulations for these securities are in Title 31 Code of Federal Regulations Parts 352 and 353, also published as Department of the Treasury Circulars, Public Debt Series Nos. 2-80 and 3-80.

HI = HARVEST INDEX

HIBERNATION = ГИБЕРНАЦИЯ (или ЗИМОВАНИЕ, или ЗИМНЯЯ СПЯЧКА) – Hibernation:- spending the winter months in a resting or dormant state. Hibernation is the inactive or dormant state of insects during winter. / Под Гибернацией, от Латинского слова Hibernatio, означающее Зимняя Спячка, понимается .

HIBOR = HONG KONG INTERBANK OFFERED RATE

HICP = HARMONISED INDEX OF CONSUMER PRICES

HIDDEN ECONOMY = ТЕНЕВАЯ ЭКОНОМИКА – Hidden Economy:- certain activities may be productive and also legal but are concealed from the authorities for various reasons – for example to evade taxes or regulation. In principle these, as well as economic production that is illegal, are to be included in the accounts but they are by their nature difficult to measure.

HIDE = ШКУРА – Hide, the pelt taken from a cow, steer, or bull of the bovine species, from the pelt of a horse, or from the integument of some other large adult animal. The pelts of smaller animals are commonly called Skins – namely, sheepskins, goatskins, calfskins, etc. For the preservation and tanning of hides. See also Leather, Pelt, and Skin.

HIDING POWER = КРОЮЩАЯ СПОСОБНОСТЬ (или ЭНЕРГИЯ (или МОЩНОСТЬ, или СИЛА) ПРЯТАНИЯ (или СКРЫВАНИЯ, или СОКРЫТИЯ, или УТАИВАНИЯ)) – Hiding Power is:- (1) the ability of a coating material to hide the surface coated by producing a specified opacity at a given film thickness. The greater the amount of scattering pigments, the greater the hide. (2) The area over which a specified volume of paint can be spread to produce a specified contrast between areas where the substrate is black and where it is white.

HIGH = МАКСИМУМ – High is the highest price an asset trades in a particular period of time, usually a day. The daily High is the highest price received during the trading day for a particular asset. It normally reflects the highest price that occurred during all trading sessions for the day. The bar's or candle's high is the highest price received during each time interval. / Дневной Максимум – это

самая высокая цена сделки, состоявшейся в течение дня торговли по конкретному активу. Обычно он отражает самую высокую цену, имевшую место в течение всех торговых сессий одного дня торговли. Штриховой или свечной максимум – это самая высокая цена, имевшая место в течение каждого временного интервала.

HIGH–BULK YARN = ВЫСОКООБЪЁМНАЯ ПРЯЖА – High-Bulk Yarn is the yarn from spinnable fibers which is of lighter weight than the material it is taken from. The yarn bulk is given a special finish – a boarding which provides ready-made products (knitted upper garments, underwear) with qualities of high utility, e.g., porosity and an aesthetic appearance, and makes them full and soft to the touch. See also Textured Yarn. Although the term High-Bulk Yarn is definitely a technical one, it is used occasionally in advertising. Highbulk yarns are processed so that, through a form of shrinkage in the processing, they are thicker and bulkier than they would be otherwise. High-Bulk Yarn is produced by combining a low-shrink fiber with chemical staple fibers (primarily polyacrylonitrile) having a shrinkage of 20–30 percent. Heat treatment of such yarn in a free state shortens the high-shrink fibers but leaves the low-shrink fiber virtually unchanged in length. The low-shrink fiber is bonded to the high-shrink fibers by friction, and the fibers are bent, which gives the yarn a fluffy appearance. / пористость или рыхлость (porosity). Высокообъёмная Пряжа – пряжа, дополнительная объёмность которой получена путём химической и/или тепловой обработки.

HIGH BULK YARN QUALITATIVE = КАЧЕСТВЕННАЯ ВЫСОКООБЪЁМНАЯ ПРЯЖА – High Bulk Yarn Qualitative is a term to describe a textured yarn. A bulked yarn develops more bulk than stretch in the finished fabric.

HIGH CUBE CONTAINER = КОНТЕЙНЕР ПОВЫШЕННОЙ ВМЕСТИМОСТИ (или КОНТЕЙНЕР ПОВЫШЕННОГО ОБЪЁМА) – A High Cube Container is a container with above average cubic capacity. High Cube (HC) Container is a container which exceeds 8’6” in height. With high cube containers, you gain an extra foot in height compared with general-purpose containers. Ideal for light, voluminous cargo or bulky cargo. These extra volume containers come in steel and aluminium. Large volume container (many cubic meters), as it is 9-1/2 feet high (as opposed to 8 ft or 8-1/2 ft). Any container exceeding 102 inches in height. Container 40’ in length 9’6” height. High Cube Dry Containers ensure that you gain an extra foot in height compared with dry containers. The high cube dry containers are ideal for light, voluminous or bulky cargo. These extra volume containers are made in 40’ and 45’ sizes in steel and aluminium. Specific dimensions and capacity of high cube dry containers may vary depending on the container manufacturer, the age of the container and the container owner. Container which exceeds 8-feet-6-inches (102 inches) (2.56 meters) in height. Identical to the GP (General Purpose) container, but with 9’6” sides and not the standard 8’6”. 40 ft and 45 ft only.

HIGH CUBE PREMIUM = ПРЕМИЯ ЗА ПОВЫШЕННУЮ ВМЕСТИМОСТЬ – High Cube Premium is a surcharge for High Cube container equipment. Freight surcharges are no longer updated by conferences. Please refer to shipping line agents or freight forwarders for their values. / надбавка или доплата (surcharge) за .

HIGH DENSITY = ВЫСОКАЯ ПЛОТНОСТЬ – (1) High Density is a term to describe a material with heavier than normal weight per unit volume. See also Density.

(2) In the Cotton industry, High Density is the compression of a flat, modified flat, or gin standard bale of Cotton to high density of about 32 pounds per cubic foot. In the United States, previously used for most exported Cotton, but currently replaced by universal density compression of about 28 pounds per cubic foot.

HIGH DENSITY GRAIN = ЗЕРНО ВЫСОКОЙ ПЛОТНОСТИ – High Density Grain:- grains having specific gravity greater than 1.20. The specific gravity of a grain indicates the degree to which the cavity of the hull is filled and the density of carbohydrate deposition in the grain. Hence, high density grains are filled to their potential size and weight.

HIGH–END = ВЫСШЕГО ПОТРЕБЛЕНИЯ – High-End is a term normally describing goods that are produced for the top of the market and are consequently very expensive.

HIGH FLYERS = ПОДАЮЩИЕ БОЛЬШИЕ НАДЕЖДЫ (или ПТИЦЫ ВЫСОКОГО ПОЛЁТА, или ВЫСШИЙ ЭШЕЛОН) – High Flyers:- is an expression used for shares showing extreme increases in their market price and mostly above-average price/earnings ratios.

HIGH FRUCTOSE CORN SYRUP = КУКУРУЗНЫЙ СИРОП С ВЫСОКИМ СОДЕРЖАНИЕМ ФРУКТОЗЫ – High Fructose Corn Syrup (HFCS) is the isoglucose sweetener extracted from Maize.

HIGH GRADE = ВЫСОКИЙ СОРТ (или ВЫСОКОСОРТНОЕ, или ВЫСОКОЕ СОДЕРЖАНИЕ ЦЕННОГО КОМПОНЕНТА В РУДЕ) – High Grade:- the best or richest ore in a deposit.

HIGH–GRADE FUND = ВЫСОКОПРОФИЛЬНЫЙ (или ВЫСОКОКАЧЕСТВЕННЫЙ) ФОНД (или ФОНД, СПЕЦИАЛИЗИРУЮЩИЙСЯ НА ВЫСОКОКАЧЕСТВЕННЫХ АКТИВАХ, или ФОНД КАПИТАЛОВЛОЖЕНИЙ В ВЫСОКОКАЧЕСТВЕННЫЕ АКТИВЫ) – High-Grade Fund is an investment fund investing solely in first-class assets. / Инвестиционный фонд, инвестирующий исключительно в первоклассные активы.

HIGH HEELS = ВЫСОКИЕ КАБЛУКИ – High Heels are the shoes with high heels. / heel = каблук или пятка.

HIGH INCIDENCE OF WARP BREAKS = ЧАСТОЕ ПРОЯВЛЕНИЕ ОБРЫВОВ ОСНОВЫ – High Incidence of Warp Breaks:- excessive warp tension, blunt or loose shuttle tip, rough shuttles, too small or too big shed formation, bottom shed line beating down on slay race, jerky movement of healds, too early or too late shedding, race board badly worn out, healds catching each other, sharp or rigid reed wires, warp size accumulation on reed, pirns projecting above or below shuttle, improper sizing, improper humidity in the loom shed, a weaker warp yarn, a higher speed of loom, more number of ends per inch for the count being used, less air space in reed are the main causes for excessive warp breaks.

HIGH LEVEL LANGUAGES VIRUSES = ВИРУСЫ ЯЗЫКОВ ВЫСОКОГО УРОВНЯ – High Level Languages Viruses (HLL Viruses):- prior to the launch of Microsoft Windows 95, most computer viruses were compact programs written in assembly language. Computer viruses written in Ada, BASIC, C, C++. Delphi, FORTH, Visual BASIC and other programming languages were called HLL (High Level Languages) Viruses. Viruses written in high level programming languages were larger than those written in assembly language and tended to function more simply. However, their larger size often made them more complicated to analyze and innocent programs written in the same language as the HLL computer virus were sometimes incorrectly flagged as malicious (a ‘false positive’). / Майкрософт Виндоуз 95 (Microsoft Windows 95). Эйда (Ada), БЭЙСИК (BASIC), Си. (C), Си. ++ (C++). Дэлфай (или Дэлфи; Delphi), ФОРС (FORTH), Вижюол БЭЙСИК (Visual BASIC).

HIGH LOFT = ВЫСОКОЛЕТУЧЕЕ (или ВЫСКОУПРУГОЕ) – Highloft is a general term for a fiber structure containing more air than fiber. Specifically, a lofty, low-density nonwoven structure that is used for applications such as fiberfill, insulation, health care, personal protection and cleaning material. High Loft is a term given to a fiber structure that contains more air then fiber. It is a lofty, low-density material that is used in such applications as fiberfill, insulation, etc.

HIGH, LOW = МАКСИМУМ, МИНИМУМ – High, Low:- the highest and lowest prices the stock sold for that day.

HIGH–LOW PILE = ВЫСОКИЙ–НИЗКИЙ ВОРС – High-Low Pile is a pile construction characterized by the presence of two or more pile heights. High-low pile carpets sometimes combine looped and cut surface yarns.

HIGHLY EFFECTIVE HEDGE = ВЫСОКО ЭФФЕКТИВНЫЙ ХЭДЬЖ – Highly Effective Hedge:- for hedge accounting to occur IAS 39 (short for the International Accounting Standard 39) requires that the hedge is highly effective. In managing offsetting changes in fair value or cash flows, changes (in value of hedge and underlying instrument) must almost fully offset each other and actual results must be within a range of 80% to 125%. / МСБУ 39 (сокращение для Международного Стандарта Бухгалтерского Учёта № 39) – .

HIGHLY PERISHABLE FOODSTUFFS = ВЕСЬМА (или ОЧЕНЬ) СКОРОПОРТЯЩИЕСЯ ПИЩЕВЫЕ ПРОДУКТЫ – Highly Perishable Foodstuffs are foodstuffs that are at risk of rapid quality degredation.

HIGH MODULUS = ВЫСОКОМОДУЛЬНОЕ (или ВЫСОКИЙ МОДУЛЬ) – High Modulus is a term that refers to a material with a higher than normal resistance to deformation. See also Modulus.

HIGH PERFORMANCE FIBERS AND FABRICS = ВОЛОКНА И ТКАНИ ВЫСОКИХ ХАРАКТЕРИСТИК – Basic weaving concepts are utilized in the manufacture of high performance fibers and fabrics, such as glass and aramid. The technology, however, is advanced to incorporate specialized precision equipment to meet the exacting demands of modern applications. For composite applications there are sixbasic fabric patterns:- Plain, Basket, Leno, Four Harness Satin, Eight Harness Satin, and Twill. Physical Properties of Selected Advanced Performance Fibers:- Ultra High Molecular Weight Polyethylene (UHMWPE) – Spectra® (is a registered trademark of Honeywell International Corp., Morristown, State of New Jersey (NJ), the United States). (1) High Strength:- UHMWPE has a density of 0.97 g/cc making it one of the lightest high performance fibers, with a high strength to weight ratio. This fiber can be up to fifteen times as strong as steel. (2) Chemical Resistance:- UHMWPE has excellent resistance to water, acetic acid, hydrochloric acid, nitric acid, ammonium hydroxide, kerosene, toluene, trichloromethane and microorganisms. This fiber is slightly affected by strong base. (3) Thermal Stability:- the melting point of UHMWPE is 150 °C. The tenacity and modulus decrease at higher temperatures but increase in sub-zero temperatures. They show essentially no embrittlement at temperatures as low as –150 °C. Advanced Materials Applications:- (1) Ballistics and Protection Products:- JPS Industries Inc. (is the world's leading manufacturer of high strength fiberglass, Astroquartz®, and aramid fabrics and reinforcements; headquartered in Anderson, State of South Carolina (SC), the United States) manufactures high performance fabrics for use in ballistic resistant applications. High performance fabrics are used extensively in bullet, fragment, and stab resistant body armor for militaries, federal agencies, police, and correctional departments. They are also used in the manufacture of helmets for both military and civilian agencies. (2) Marine, Tooling, and Recreational Products:- JPS Industries Inc. high performance fabrics, exhibiting the properties of high strength and durability, are used in a variety of applications ranging from boating to skiing. Applications are driven by strength, weight durability, clarity, and cost. Applications include kayaks, boats, hydroplanes, safety equipment, and other sporting goods. Advanced Materials Fiber Nomenclature:- high performance fibers are typically designated by denier, tex, or decitex (dtex). Each is described below:- (i) Denier:- the denier system is used internationally to measure the size of silk and synthetic filaments and yarns. Denier number indicates the weight in grams of 9 000 meters of filament or filament yarn. For example, if 9 000 meters weighs 100 grams, it is a 100-denier yarn. The smaller the denier number, the finer the yarn. Denier = dtex x 0.9. (ii) Tex and Decitex:- the tex system is also applicable to the measurement of filament yarns. It is based on the weight in grams of one kilometer (3 300 feet) of yarn. Decitex (dtex) is defined as ten times tex. Tex = dtex / 10. For example, 840 denier yarn may also be designated as 933 dtex or 93.3 Tex. / Хонивэл Интёнэшэнэл Корп. (Honeywell International Corp.). Дьжей.Пи.Эс. Индэстриз Инк. (JPS Industries Inc.) Эстроквотц® (или Астрокварц®; Astroquartz®).

HIGH pH FINISH = АППРЕТ С ВЫСОКИМ ВОДОРОДНЫМ ПОКАЗАТЕЛЕМ – High pH Finish is a finish, basic in nature rather than acid or neutral, that is applied to yarn or fiber.

HIGH PRESSURE SIDE = УЧАСТОК ВЫСОКОГО ДАВЛЕНИЯ – High Pressure Side is the portion of the process preceding the gin stand (including unloading, drying, extracting, cleaning, and overflow handling systems) in which material is conveyed by a higher pressure air, and exhausts are typically controlled by cyclones.

HIGH–PRICED SHARES = ВЫСОКО ОЦЕНИВАЕМЫЕ АКЦИИ – High-Priced Shares are the shares with a market price which far exceeds the average. They are therefore generally acquired only by large investors.

HIGH SEAS = ОТКРЫТЫЕ МОРЯ – High Seas, in maritime law, all parts of the mass of saltwater surrounding the globe that are not part of the territorial sea or internal waters of a state. For several centuries beginning in the European Middle Ages, a number of maritime states asserted sovereignty over large portions of the high seas. Well-known examples were the claims of Genoa in the Mediterranean and of Great Britain in the North Sea and elsewhere. The doctrine that the high seas in time of peace are open to all nations and may not be subjected to national sovereignty (freedom of the seas) was proposed by the Dutch jurist Hugo Grotius as early as 1609. It did not become an accepted principle of international law, however, until the XIX century. Freedom of the seas was ideologically connected with other XIX-century freedoms, particularly laissez-faire economic theory, and was vigorously pressed by the great maritime and commercial powers, especially Great Britain. Freedom of the high seas is now recognized to include freedom of navigation, fishing, the laying of submarine cables and pipelines, and overflight of aircraft. By the second half of the XX century, demands by some coastal states for increased security and customs zones, for exclusive offshore-fishing rights, for conservation of maritime resources, and for exploitation of resources, especially oil, found in continental shelves caused serious conflicts. The first United Nations Conference on the Law of the Sea, meeting at Geneva, Switzerland in 1958, sought to codify the law of the high seas but was unable to resolve many issues, notably the maximum permissible breadth of the territorial sea subject to national sovereignty. A second conference (Geneva 1960) also failed to resolve this point; and a third conference began in Caracas, Venezuela in 1973, later convening in Geneva and New York City. In the United States, maritime areas that are outside the jurisdiction of any state. Oceans, seas, and waters outside of national jurisdiction are referred to as the High Seas or, in Latin, Mare Liberum (meaning Free Seas). Ships sailing the high seas are generally under the jurisdiction of the flag state; (if there is one) however, when a ship is involved in certain criminal acts, such as piracy, any nation can exercise jurisdiction under the doctrine of universal jurisdiction. / сохранение (conservation). от Латинского словосочетания Марэ Либэрум (Mare Liberum), означающее Свободное Море, . Laissez-Faire = Представьте Делу Идти Своим Порядком; Позиция Невмешательства или Недоговорённости (на Французском).

HIGH–SHRINK STAPLE = ВЫСОКОУСАДОЧНЫЙ ШТАПЕЛЬ – High-Shrink Staple is a staple with a higher degree of potential shrinkage than regular staple of the same generic fiber. When blended with regular staple and treated (in yarn or fabric form) to induce shrinkage, it produces a high degree of bulk in the product.

HIGH–TEMPERATURE DYEING = ВЫСОКОТЕМПЕРАТУРНОЕ КРАШЕНИЕ (или КРАШЕНИЕ ПРИ ВЫСОКОЙ ТЕМПЕРАТУРЕ) – High-Temperature Dyeing is a new method for the high-temperature dyeing of acrylic fibers. A new method of

dyeing polyacrylonitrile fibers at high temperatures, in the presence of hydroxyl-amine sulphate, is described in detail. The hydroxylamine salt seems to modify the nitrile groups into new functions containing amino groups, which confer on the fiber affinity for soluble and insoluble dyes of different classes – acid, direct, metal-complex, phthalocyanine, etc. See also Dyeing. High-Temperature Dyeing is a dyeing operation in which the aqueous dyebaths are maintained at temperatures greater than 100 °C by use of pressurized equipment. Used for many manufactured fibers.

HIGH TEMPERATURE HIGH SHEAR VISCOSITY = ВЯЗКОСТЬ ПРИ ВЫСОКОЙ СКОРОСТИ СДВИГА И ВЫСОКОЙ ТЕМПЕРАТУРЕ (или ВЫСОКОТЕМПЕРАТУРНАЯ ВЯЗКОСТЬ ПРИ ВЫСОКОЙ СКОРОСТИ СДВИГА) – High Temperature High Shear (HTHS) Viscosity is a measure of a fluid's resistance to flow under conditions resembling highly-loaded journal bearings in fired internal combustion engines, typically 1 million per second @ 150 °C. See also Viscosity. ASTM D4741-21 Standard Test Method for Measuring Viscosity at High Temperature and High Shear Rate by Tapered-Plug Viscometer. Viscosity measured under the conditions of this test method is considered to be representative of that at the temperatures and shear rates but not the pressures in the journal bearings of internal combustion engines under operating conditions. The high temperature high shear (HTHS) viscosity at this shear rate can be measured at other temperatures using this apparatus. This is achieved by the use of a different range of Newtonian calibration fluids. The precision has not been studied for any temperature or viscosity range not noted in the precision section. Scope:- This test method covers the laboratory determination of the viscosity of oils at 150 °C and $1 \cdot 10^6$ s^{-1} and at 100 °C and $1 \cdot 10^6$ s^{-1}, using high shear rate tapered-plug viscometer models BE/C or BS/C. Newtonian calibration oils are used to adjust the working gap and for calibration of the apparatus. These calibration oils cover a range from approximately 1.4 mPa·s to 5.9 mPa·s (cP) at 150 °C and 4.2 mPa·s to 18.9 mPa·s (cP) at 100 °C. This test method should not be used for extrapolation to higher viscosities than those of the Newtonian calibration oils used for calibration of the apparatus. If it is so used, the precision statement will no longer apply. The precision has only been determined for the viscosity range 1.48 mPa·s to 5.07 mPa·s at 150 °C and from 4.9 mPa·s to 11.8 mPa·s at 100 °C for the materials listed in the precision section. A non-Newtonian reference oil is used to check that the working conditions are correct. The exact viscosity appropriate to each batch of this oil is established by testing on a number of instruments in different laboratories. The agreed value for this reference oil may be obtained from the chairman of the Coordinating European Council (CEC) Surveillance Group for CEC L-36-90, or from the distributor. Applicability to products other than engine oils has not been determined in preparing this test method. The values stated in SI units are to be regarded as standard. No other units of measurement are included in this standard except those noted below. Exception:- This test method uses the SI unit millipascal-second (mPa·s) as the unit of viscosity. (1 cP = 1 mPa·s.) This standard does not purport to address all of the safety concerns, if any, associated with its use. It is the responsibility of the user of this standard to establish appropriate safety, health, and environmental practices and determine the applicability of regulatory limitations prior to use. This international standard was developed in accordance with internationally recognized principles on standardization established in the Decision on Principles for the Development of International Standards, Guides and Recommendations issued by the World Trade Organization Technical Barriers to Trade (TBT) Committee. ASTM International, 100 Barr Harbor Drive, PO Box C700, West Conshohocken, PA 19428-2959, The United States of America (at www.astm.org). / При высоких температурах вязкость моторного масла снижается, масляная плёнка становится тоньше. Параметр HTHS – это высокотемпературная вязкость при высокой скорости сдвига, определяемая при 150 °C и скорости сдвига 10^6 c^{-1}. В последнее время при введении все более строгих норм на токсичность отработанных газов и выбросов CO_2 автомобилями, намечается тенденция к снижению HTHS, особенно у Японских и Корейских автопроизводителей, и применение масел вязкостей SAE 0W-20, SAE 5W-20 – это мера, которая даёт возможность автомобилестроителям дополнительно понизить вредность выбросов в атмосферу и снизить расход топлива. Использование таких масел экономически и экологически оправдано для автомобилестроителей. Масла с низким HTHS дают большую экономию топлива по сравнению с обычными маслами более высокой вязкости. Меньшая вязкость масла приводит к меньшему сопротивлению деталям двигателя, что приводит к увеличению мощности двигателя, меньшему износу в некоторых узлах двигателя. Применение таких масел так же положительно влияет на экологию. Выброс CO_2 в атмосферу на низковязких маслах ниже, чем на маслах более высокой вязкости. Стоит обратить внимание что Европейские изготовители автомобилей (за исключением Европейского подразделения Фод Мото Кампэни (Ford Motor Company)) не придерживаются этого направления. Так, например, последние лицензии моторных масел с допусками BMW LL-04, MB 229.51, VW 504 00/507 00, Renault 0710/0720 чётко стандартизируют параметр HTHS более 3.5 мПа·с (mPa·s). В моторах, спроектированных для использования в них масла с пониженным HTHS, имеется ряд существенных отличий:- (1) расстояние между трущимися поверхностями уменьшено, более высокая точность сборки и подгонки деталей друг к другу (минимальные зазоры между деталями); (2) применение масло-насосов более высокой производительности для создания требуемого давления при использовании более жидких масел; и (3) применение широко-поверхностных подшипников, в которых масло высокой вязкости поступает медленнее. специальное нанесение микропрофиля поверхности на деталях – на подобие хона в цилиндрах, для удерживания на деталях низковязких масел. Если двигатель не спроектирован под низковязкие масла, использование таких масел в нём недопустимо! Именно для этого в руководствах по эксплуатации использование моторных масел чётко регламентировано, например, соответствованием требованиям ACEA или требованиям изготовителя автомобиля с чётким указанием необходимого допуска у масла. Возможные Негативные Последствия Использования Масел С Низким HTHS В Неподготовленных Двигателях. Применение масла с пониженным HTHS в не предназначенных для этого двигателях может привести к их ускоренному износу. Особенно при эксплуатации в условиях повышенных температур, постоянной езды в городских пробках, а также на высоких скоростях. (1) Высокие Скорости, Нагруженность Автомобиля, Высокие Температуры Окружающего Воздуха:- Наряду с плюсами низковязких масел – экономия топлива, экология, более высокий КПД, есть и минусы! Дело в том, что слишком тонкая плёнка на высокой скорости и при сопутствующих факторах (например, пониженное давление в системе смазки, что то же может быть следствием сниженной вязкости) может недостаточно защищать пары трения от износа. (2) Абразивные Отложения В Двигателе:- Ещё одна проблема при использовании низковязких масел – абразивные отложения в двигателе. Например, частицы пыли, сажа, частицы естественного износа, в двигателе негативно влияют на слишком тонкую масляную пленку, разрывая её – что неминуемо приводит к ещё большему износу. В тяжёлых условиях эксплуатации такие отложения совсем не редкость, а скорее даже закономерность. Низкокачественное топливо, при сгорании которого образовалась зола, некачественный воздушный фильтр или подсос воздуха приводит к попаданию пыли в двигатель и масло. (3) Попадание Топлива В Моторное Масло:- Приводит к дополнительному разжижению. При низкотемпературном запуске двигателя, а также неполное сгорание топлива на холостых оборотах и коротких поездках или при неисправностях электроники двигателя, очень часто не воспламенившееся топливо попадает в моторное масло и дополнительно разжижает его. Низковязкое масло, при попадании в него топлива становится ещё более жидким! Топливо, конечно же, испаряется со временем, но масло не полностью восстанавливает свои первоначальные характеристики. Согласно исследованиям, проведённым в 1997 институтом Toyota R&D, на четырёх цилиндровых двигателях 1.6 DOHC наблюдается увеличение износа при снижении HTHS при температуре 130 °C, чего не наблюдалось при температуре масла 90 °C – при которой вязкости масел практически не отличаются. Если Есть Необходимость Использования Одного Масла В Автомобилях С Различными Требованиями По Вязкости HTHS:- Стоит учитывать, что негативные последствия от

использования масла с низким HTHS (< 3.5 мПа·с) могут превысить все плюсы от использования таковых. Можно поступиться некоторой экономией топлива (около 2–4%), которую можно даже не заметить при разных водителях, разной дорожной обстановке и других меняющихся условий. Для длительной, бесперебойной работы следует использовать более универсальный продукт с HTHS > 3.5 мПа·с, соответствующий спецификациям ACEA A3/B3/B4, например, масел вязкостью SAE 5W-30 или SAE 5W-40.

HIGH TENACITY = ВЫСОКОПРОЧНОЕ (или ВЫСОКАЯ (УДЕЛЬНАЯ) ПРОЧНОСТЬ, или ТЯГУЧЕСТЬ, или ВЫСОКАЯ ПРОЧНОСТЬ НА РАЗРЫВ) – High Tenacity is a term to describe a material with a higher than normal tensile strength. See also Tenacity. High Tenacity:- high strength of modified rayon and acetate fibers as a result of chemical treatment while the fibers are in the plastic state.

HIGH TENACITY YARN = ВЫСОКОПРОЧНАЯ ПРЯЖА (или ПРЯЖА ВЫСОКОЙ (УДЕЛЬНОЙ) ПРОЧНОСТИ (или ТЯГУЧЕСТИ, или ВЯЗКОСТИ)) – High Tenacity Yarn is the yarn with a significantly higher breaking tenacity than others of the same generic category, generally used because of that main characteristic. Note:- currently the following lower limits are used for high tenacity yarns. Limits for high tenacity filament yarns (generic category of fiber – lower limit of tenacity, in cN/tex):- Aramid – 180; Polyamide/Nylon – 53; Polyester – 53; and Viscose – 28. Kayavlon Impex Pvt Ltd (India) is a leading exporter of High Tenacity Yarns in India and has been exporting world class quality high tenacity yarn to various countries across the globe creating its demand for quality products in Europe, Asia, Africa and America. A yarn containing filaments made from synthetic polymers has a cross-section having at least 5 vertices, a titer of 1 to 7 dtex and a tenacity of at least 60 cN/tex. The filaments of the high tenacity yarn preferably have a cross-section having 5 to 8 vertices, possibly with indentations between the vertices. The cross-section of the filaments is preferably star-shaped. The high tenacity yarn preferably has a tenacity of 60 to 85 cN/tex, an elongation at break of 15% to 35%, a hot-air shrinkage of 4% to 10% and a stretch recovery of 250 to 400 cN/tex. High Tenacity yarn is also available in different variant like normal shrinkage, low shrinkage and super low shrinkage depending upon the suitable end-use. The high tenacity yarn is excellently suited for use in the manufacture of industrial fabrics, particularly airbag fabrics. High tenacity yarns have been used in the manufacture of textiles, carpets and tarpaulin. In the manufacture of textile fabrics such as wovens, knitted and crocheted fabrics and nonwovens from yarns containing synthetic polymer filaments. The most important consideration in the manufacture of these fabrics is the use of yarns with filaments having high tenacity and guaranteeing good foldability. The high tenacity yarns have high durability, toughness and chemical resistance, and withstands extremely hot environments that can stress conventional multi-filaments to their performance limits. For example:- 55D (D = Denier) 24F (F = No. of Filament) BR (Bright Luster) or 4 000D 576F. / Найлан^{T3} (Nylon^{TM}). Каявлон Импэкс Пи.ви.ти. Эл.ти.ди. (Kayavlon Impex Pvt Ltd). филаментная (комплексная) пряжа (filament yarn).

HIGH–TENSILE YARN = СИЛЬНО НАТЯНУТАЯ (или РАСТЯНУТАЯ) ПРЯЖА – High-Tensile Yarn is called Elastik in the USSR; abroad, the trade name ‘Helanca’ is usually used. It is produced by the twisting of compound synthetic fibers (polyamide, polyester, and other fibers) up to 2 500–5 000 twists per meter, heat setting of the twisted yarn, and untwisting of the set yarn. The yarn assumes a spiral shape and acquires high stretchability (up to 400 percent) and fluffiness. See also Low-Tensile Yarns, and Textured Yarns. / Хэлэнка (или Хэлянка (Helanca)).

HIGH VISABILITY FABRICS = ТКАНИ ВЫСОКОЙ ВЫРАЖАЕМОСТИ – High Visability Fabrics are the fabrics that contain fluorescent materials in order to make the wearer visible in dim and dark lights. These fabrics have the ability to reflect on-coming lights, which cause them to glow in the dark.

HIGH VISCOSITY INDEX = ВЫСОКИЙ ИНДЕКС ВЯЗКОСТИ – High Viscosity Index (HVI):- typically from 80 to 110 VI units. See also Viscosity Index.

HIGH VOLUME INSTRUMENT = ВЫСОКОПРОИЗВОДИТЕЛЬНЫЙ ИНСТРУМЕНТ (или ВЫСОКОПРОИЗВОДИТЕЛЬНЫЙ ПРИБОР) – High Volume Instrument (HVI) testing. Systems (test lines) by which high speed bale by bale testing can be attained. Cotton bales are tested for micronaire, length, uniformity, strength, elongation, color and trash content. High Volume Instrument (HVI):- The testing of fibers was always of importance to the spinner. It is done by the HVI machine. High volume instrument systems are based on the fiber bundle strength testing, i.e. many fibers are checked at the same time and their average values determined. Traditional testing using micronaire, pressley, stelometre, and fibro graph are designed to determine average value for a large number of fibers, the so called fiber bundle tests. In HVI, the bundle testing method is automated. Here, the time for testing is less and so the number of samples that could be processed is increased, quite considerably. The influence of operator is reduced. The HVI testing is attractive due to the classing of Cotton and the laying down of a mix in the spinning mill. This HVI testing is suitable for the extensive quality control of all the bales processed in a spinning mill. The mill is in a position to determine its own quality level within a certain operating range. The time for testing per sample is 0.3 minutes. It is best applied to instituting optimum condition for raw material. About 180 samples per hour can be tested and that too with only 2 operators. Historical Development of HVI:- Conventionally measurement of the fiber properties was mainly carried out using manual method and it included the maximum chance of getting errors involved in it due to manual errors and was also a time consuming job. Thus there was a need for development of an instrument capable of measuring all properties in minimum time for better Cotton classification. The US PCCA (Plains Cotton Cooperative Association) played a key role in the development of High Volume Instrument (HVI) testing to determine the fiber properties of Cotton which revolutionized the Cotton and textile industries. As its name implies, HVI determines the fiber properties of a bale of Cotton more quickly and more accurately than the previous method of evaluating some of those properties by hand classing. The HVI system provides more information about a bale of cotton than the subjective hand classing method. In 1960, PCCA and Motion Control, Inc., an instrument manufacturer in Dallas, Texas, began pioneering the development of a system to eliminate the potential for human error that existed with hand classing and expand the number of fiber properties that could rapidly be determined for each bale of cotton. The goal was to be able to provide seven fiber quality characteristics for every bale produced by PCCA’s farmer-owners. Laboratory instruments were available for determining most of the fiber properties, but they required up to 15 minutes or longer to determine each of the properties. The PCCA theory was based on economics:- the faster cotton could be classed, the faster it could be marketed; and, the more accurate measurements of quality could result in a more adequate supply of cotton with fiber properties to meet the specific needs of textile mills. By the mid-1960s, the United States Department of Agricultural (USDA) and the Cotton Producers Institute (now called Cotton, Incorporated) also became involved in the research required to bring this concept to the marketplace. In 1968 three of the first five HVI lines were in operation in Lubbock, Texas. One line was at Texas Tech University’s International Textile Center and two at PCCA. These lines were the very earliest versions to have all seven-fiber properties combined into a single testing line and measure them in less than 20 seconds per test. In 1980, USDA built a new classing office in Lamesa, Texas, (about 60 miles south of Lubbock) specifically designed only for instrument testing all of the Cotton samples received at that office using the latest version of the HVI equipment. This was a daring step but was based on data collected and analysed and improvements made in the HVI system during the previous 20 years. Although met with scepticism in the initial years by many in the cotton and textile industries, the HVI system prevailed, and USDA continued to install the instrument testing lines in all government Cotton classing offices. In 1991, USDA

used the HVI system on all the cotton provided to the department for classing. Today, HVI class data is accepted throughout the world and is the foundation on which cotton is traded. Manufacturers of HVI:- In total, there are five companies manufacturing rapid instrument testing machines in the world:- (1) Uster Technologies, Inc., (2) Premier Evolvics Pvt. Ltd., (3) Lintronics (China, Mainland), (4) Changing Technologies (China, Mainland), and (5) Statex Engineering (India). High volume instrument (HVI) is the most common rapid instrument testing machine made by Uster Technologies, Inc.. The only other company that has over 100 machines installed in the world, mostly in Asia, is Premier Evolvics Pvt. Ltd. based in India. It is estimated that close to 2 000 rapid instruments testing machines have already been stalled in the world, mostly from Uster Technologies, Inc.. Not only do the machines from each company differ, but various models from each company also differ among themselves. The full fledge models of both the manufacturers are capable of measuring measure micronaire, length, length uniformity, strength, color, trash, maturity, sugar content etc. Various HVI Models Available In Market In Present Date Are:- (1) USTER® HVI 1000, Available Options:- (i) Barcode Reader (M700), (ii) UPS (Uninterrupted Power Supply) device; (iii) UV Module, and (iv) NEP Module; and (2) ART 2-high volume fiber tester premier. Principle Of HVI:- High volume instrument systems are based on the fiber bundle testing, i.e. many fibers are checked at the same time and their average values determined. Traditional testing using micronaire, pressley, stelometre, and fibro graph are designed to determine average value for a large number of fibers, the so called fiber bundle tests. In HVI, the bundle testing method is automated. HVI Used In Bale Management System:- This is based on the categorising of Cotton bales according to their fiber quality characteristics. It includes the measurement of the fiber characteristics with reference to each individual bale, separation of bales into classes and lying down of balanced bale mixes based on these classes. The reason for undertaking this work lies in the fact that there is sometimes a considerable variation in the fiber characteristics from one bale to another, even within the same delivery. This variation will result in the yarn quality variation if the bales are mixed in an uncontrolled manner. The bale management software, normally embedded with an HVI, helps in selection of bales for a particular mix from the available stock. Once the data are received from HVI in the software, classification of bales in groups are done with user defined criteria:- (i) Manual calculation errors and the tedious task of day to day manual planning of mix are avoided; (ii) The storage of large number of data enables for tracking long period records or results thereby helping in clear analysis; (iii) More cost effective mix can be made since cost factor is also included; it also helps in planning for further requirements or purchase; (iv) Additional details such as party name, weighment details, and rejection details can be printed along with the test results which will be useful for the mill personnel for better analysis; (v) Separate range criteria shall be selected for basic samples, lot samples and mixing; (vi) Flexible intervals in grouping of bales with reference to the selected category; and (vii) Basic sample results and results checked after lot arrival shall be compared graphically or numerically for easy decision making of approval or rejection. Information:- The instruments are calibrated to read in staple length. Length measurements obtained from the instrument are considerably more repeatable than the staple length determination by the classer. In one experiment the instrument repeated the same staple length determination 44% of the time while the classer repeated this determination only 29% of the time. Similarly, the instrument repeated to 1/32” on 76% of the samples, while the classer agreed on 71% of the samples to within 1/31”. The precision of the HVI length measurement has been improved over the last few years. If we take the same bale of Cotton used in the earlier example and repeatedly measure length with an HVI system, over two-thirds of measurements will be in a range of only about 1/32nd of an inch:- 95% of the individual readings will be within 1/32nd of an inch of the bale average. In the 77 000 bales tested, the length readings were repeated within 0.02” on 71% of the bales between laboratories. / Высокопроизводительный Инструмент (ВПИ; High Volume Instrument (HVI). Моушэн Кэнтчрол, Инк. (Motion Control, Inc.). Катэн, Инкорпорэйтид (Cotton, Incorporated). (1) Уштэр Тчэкнолодьжиз, Инк. (Uster Technologies, Inc.; США), (2) Прэмиэ Ивалвикс Пи.ви.ти. Эл.ти.ди. (Premier Evolvics Pvt. Ltd.; Индия), (3) Лынтчроникс (Lintronics; Китай), (4) Чэйндьжинь Тчэкнолодьжиз (Changing Technologies; Китай), и (5) Статэкс Эндьжиниэринь (Statex Engineering; Индия). Испытания на Высокопроизводительном Инструменте. Системы (измерительные линии), посредством которых могут быть произведены быстрые измерения различных качественных характеристик хлопкового волокна кипы за кипой. Кипы хлопка испытываются на майкронейр, длину, однородность, крепость, растяжение, цвет и содержание сорных примесей.

HIGH VOLUME INSTRUMENT TESTING = ИСПЫТАНИЕ НА ВЫСОКОПРОИЗВОДИТЕЛЬНОМ ИНСТРУМЕНТЕ (или ИСПЫТАНИЕ НА ВЫСОКОПРОИЗВОДИТЕЛЬНОМ ПРИБОРЕ) – In the Cotton industry, High Volume Instrument (HVI) Testing is a process for determining cotton quality that utilizes instruments rather than sight and touch methods to determine quality characteristics. / Высокопроизводительный Инструмент (ВПИ; High Volume Instrument (HVI).

HIGH WET MODULUS RAYON = ВЫСОКОМОДУЛЬНЫЙ ВО ВЛАЖНОМ СОСТОЯНИИ РЭЙОН (или ВЫСОКОМОДУЛЬНАЯ ВО ВЛАЖНОМ СОСТОЯНИИ ГИДРАТЦЕЛЛЮЛОЗА) – High Wet Modulus Rayon is a rayon made by a modified viscose process. The resulting rayon is rnuch stronger when wet than ordinary rayon. Zantrel and Avril are examples of high wet modulus rayon. See also Viscose Rayon.

HIGH, WIDE AND HANDSOME = ВЫСОКИЙ, ШИРОКИЙ И САМОСТОЯТЕЛЬНЫЙ (или СЧАСТЛИВЧИК) – High, Wide And Handsome (maritime term):- sailing ship with a favorable wind, sailing dry and easily. A person riding the crest of good fortune.

HIGH–YIELD BONDS = ВЫСОКОДОХОДНЫЕ ОБЛИГАЦИИ – High-Yield Bonds are fixed-income securities which leading rating agencies classify as BB+ (Standard & Poor’s), Ba1 (Moody’s) or poorer, or unrated bonds corresponding to those ratings. Owing to their inferior credit quality, high-yield bonds offer a higher return than investment-grade securities but also entail greater risks. Bonds of this type are issued primarily by corporates and emerging markets. / Высокодоходные Облигации – ценные бумаги с фиксированным доходом, которые ведущие рэйтиньговые агентства классифицируют как BB+ (Стэндод Энд Поз (Standard & Poor’s)), Ba1 (Мудиз Инвэстоз Сёвис Лимитид (Moody’s Investors Service Ltd)) или более слабые, или как облигации, на которые не распространяется рэйтиньг, данных агентств. Из-за низшего кредитного качества, высокодоходные облигации предлагают более высокую отдачу, нежели ценные бумаги инвестиционного сорта, а также сопряжены с более высокими рисками. Облигации этого типа выпускаются главным образом от имени корпораций или развивающихся рынков.

HIGH–YIELDING VARIETIES = ВЫСОКОУРОЖАЙНЫЕ РАЗНОВИДНОСТИ (или ВЫСОКОПРОДУКТИВНЫЕ РАЗНОВИДНОСТИ) – High-Yielding Varieties (HYVs) are Rice Varieties developed through a breeding program that possess desirable agronomic characteristics, resistance to Insects and diseases, and tolerance for environmental stresses like soil problems, temperature, and drought; nearly all HYVs are short-statured or semidwarf.

HIGH YIELD INSTALMENTS = ВЫСОКОДОХОДНЫЕ ВЫПУСКИ – High Yield Instalments or Hot Instalments are instalments containing a higher gearing level (usually between 70% to 110%) when issued compared to regular ones.

HIJAB = ХИЖЭБ (или ХИДЖЯБ) – Hijab is the modern word for the practice of dressing modestly, which all practicing Muslims past the age of puberty are instructed to do in their holy book, the Qur’an. No precise dress code for men or women is set out in the Qur’an (the most specific part being 33:59 mentioning that believers ‘draw their cloaks close round them (when they go out)’), and various Islamic scholars have interpreted the meaning of hijab in different ways. The basic requirements are that when in the presence of someone of the opposite sex other than a ‘close family member’ (Mahram), a woman should cover her body, and walk and dress in a

way which does not draw sexual attention to her, and that a man should be covered from at least the navel to the knees, and similarly not wear figure-hugging clothes that draw sexual attention to him.

HIJACKER = ПОХИТИТЕЛЬ – Hijacker is the System Modification Software deployed without adequate notice, consent, or control to the user. Hijackers often unexpectedly alter browser settings, redirect Web searches and/or network requests to unintended sites, or replace Web content. Hijackers may also frustrate users' attempts to undo these changes, by restoring hijacked settings upon each system start.

HILL = КУЧА – Hill is a group of Rice Plants directly adjacent to each other because the seeds or seedlings were planted together. A hill may also consist of only one plant.

HILL RICE = ГОРНЫЙ РИС (или РИС С ХОЛМОВ, или РИС С ВОЗВЫШЕННОСТЕЙ) – Hill Riceis a Rice grown in the uplands on the steep slopes of hills usually with high rainfall.

HI–LO = ВЫСОКО–НИЗКО (или ВВЕРХ–ВНИЗ, или ХХ) – Hi-Lo:- also known as Forklift. References the ability of the truck to lift and put down freight.

HILUM = ХИЛУМ (или (СЕМЕННОЙ) РУБЧИК) – Hilum is the small scar on a seed coat where it was attached to the seed pod by the funicle. Hilum is the scar at the point of attachment of the seed of the plant. Hilum is a scar on the caryopsis indicating the point of attachment to the palea. / Рубчик – маленький шов на семени, место прикрепления семяножки. Шов на семени в месте прикрепления семяножки. Под Семенным Рубчиком понимается место отделения зрелого семени от семяножки. Хилум:- (1) Рубчик или место прикрепления семени в плоде. (2) Апертура у пыльцевого зерна. (3) Центр крахмального зерна, вокруг которого откладываются слои крахмала.

HIMATION = ГИМАТИЙ (или ПЛАЩ) – Himation is a rectangular cloth draped over the left shoulder and about the body and worn as a garment in ancient Greece. / .

HINDRANCE = ПРЕПЯТСТВИЕ (или ПОМЕХА) – In transport by sea, Hindrance means any real or apprehended hindrance, risk, delay, difficulty or disadvantage of whatsoever kind to the carriage, the carrier, sub-contractor(s), the vessel, or the goods or any property including without limitation the existence or apprehension of:- (i) acts of God; (ii) war, hostilities, civil commotions, acts of public enemies, or terrorism; (iii) governmental restraints on commerce, shipping or trading (including voluntary import or export quotas arising from the threat of governmental restraints); (iv) quarantine, sanitary or other similar regulations or restrictions; (v) epidemics or diseases; (vi) work stoppages, strikes, or lockouts, whether or not conducted by employees of the carrier or sub-contractor(s); (vii) accidents, casualties, fire, or transportation disasters; (viii) congestion of, closure of, obstacle in or danger to any canal, strait, waterway, port, wharf, sea terminal, or any other place; or (ix) bad weather, shallow water, ice, earthquake, landslip or other obstacles in the carriage.

HINTERLAND = ТЕРРИТОРИЯ ПОРТА – Hinterland is an inland area served by a particular port. Etymology:- borrowing from German Hinterland, from Hinter = Behind + Land = Land, cognate to English Hind = Back or Rear + Land. First used in English in 1888 by George Chisholm in his work Handbook of Commercial Geography originally as hinderland, but current spelling (following German) became more popular. The term is characteristic of thalassocratic analysis of space (from the point of view of nation, such as XIX century Britain, with maritime supremacy). / Наземная часть, обслуживаемая конкретным портом.

HIP GIRTH = ОБХВАТ БЁДЕР – Hip Girth:- when standing, measure around the widest part of the hip. Hip Girth or Hips (for women):- standing with heels together, measure around the fullest part of your hips and bottom. Hip Girth (for women):- stand with heels together, and measure around the fullest part of your hips (about 8 inches from your waist). Hip Girth (for men):- measure around the widest part of the seat. Have the tape moderately tight. Hip Girth or Hips:- measure around the fullest part of your seat. Please do not convert underbust measurement into US bra size, i.e. underbust measurement 32" into US bra size 32, use the manufacturers' charts instead. Hips:- measured across the widest part of the thigh. Hips:- measure across the widest part of your hips, just below your hips. / Обхват Бёдер:- горизонтальный обхват, измеренный в сантиметрах по наиболее выступающим точкам ягодиц. Обхват Бёдер – сантиметровая лента проходит по наиболее выступающим точкам ягодиц. Обхват Бёдер – расстояние на уровне выступающих точек ягодиц. Обхват Бёдер (для женщин) – это третья цифра на маркировке. Однако если речь идёт о поясных изделиях (например, трусиках), то на ярлыке стоит единственная цифра – обхват бёдер. Межразмерная разница в обхвате бёдер составляет ±2 см. По обхвату бёдер можно судить, к какой полнотной группе относится Ваша фигура. Согласно стандартам выделяют 4-е полнотные группы. Чтобы определить, к какой группе относитесь Вы, нужно вычесть из обхвата бёдер (с учётом выступа живота) обхват груди. Число, которое получилось и есть Ваша группа. Разница между обхватом бёдер и обхватом груди составляет:- (i) первая полнотная группа: -4 см; (ii) вторая полнотная группа: -8 см; (iii) третья полнотная группа: -12 см; и (iv) четвёртая полнотная группа: -16 см.

HIP BOOT = САПОГ С ВЫСОКИМ ГОЛЕНИЩЕМ – Hip Boot is a waterproof boot reaching to the hips. / доходящие до бёдер.

HIPS = HOST INTRUSION PREVENTION SYSTEMS

HIRSUTE = КОСМАТОЕ (или ВОЛОСАТОЕ, или ЩЕТИНИСТОЕ) – Hirsute:- pubescent, with coarse, stiff hairs. Hirsute:- with rough or coarse hairs.

HIRSUTUS = ШЕРШАВОЕ (или ЖЁСТКОВОЛОСИСТОЕ)

HISPA = ЩИТОВКА – Hispa is a common name for insects of the species Dicladispa (Hispa) Armigera. / Под Щитовками понимается группа Семейств Насекомых Подотряда Кокцидовых. На теле плотный щиток (отсюда название). Для самок 0.8–2 миллиметра (самцы мельче). Свыше 2 000 Видов. Распространены широко; в бывшем Союзе Советских Социалистических Республик (СССР) около 250 Видов. Многие повреждают культурные Растения (Яблони и другие).

HISPIDULOUS YARN = КОЛЮЧАЯ ПРЯЖА – Hispidulous Yarn is the yarn which has a 'hairy' surface. Generally intended for yarn-yarn interlocking when fabricating composite preforms. Hispidulous:- covered with stiff, short hairs.

HISTORICAL VOLATILITY = ИСТОРИЧЕСКАЯ ЛИХОРАДОЧНОСТЬ – Historical Volatility is a statistical measure of the volatility of a futures contract, security, or other instrument over a specified number of past trading days. The annualized standard deviation of percent changes in futures prices over a specific period. It is an indication of past volatility in the marketplace. Historical Volatility indicates how much prices have changed in the past and is derived by using daily settlement prices for futures. Historical Volatility is the degree to which a particular price has fluctuated in the past. Historic Volatility:- mathematically derived from price fluctuations of the underlying asset over a past specified period of time. / Историческая Лихорадочность:- показатель колебания определённой цены в прошлом. Уровень, до которого определённая цена колебалась в прошлом.

HISTORIC VOLATILITY RATIO = СООТНОШЕНИЕ С ИСТОРИЧЕСКОЙ ЛИХОРАДОЧНОСТЬЮ – Historic Volatility Ratio:- a comparison of recent, short tem volatility to the longer-term average. Short-term volatility much below the longer-term average is another indicator for breakout mode.

HISTOSOL = ГИСТОСОЛЬ – Histosol:- soils that have organic materials in more than half of the upper 80 cm. / Гистосоль – органогенная почва с волокнистой структурой. Под Гисто, от Греческого слова Histós или Histion, означающее Ткань, и . Гистосоль:- почва с мощным органогенным горизонтом, формирующаяся при обилии влаги и богатых остатков растительности, наиболее типична на болотах.

HITCH = СЦЕПКА (или НАВЕСНОЕ УСТРОЙСТВО, или ПРИЦЕПНОЕ УСТРОЙСТВО, или СЦЕПНОЕ УСТРОЙСТВО) – Hitch is an attachment on a tractor or machinery used for connecting it to another piece of machinery or equipment.

HITCH–BACK = ОТТАЛКИВАТЬ (или ОТТЯГИВАТЬ, или ОТЦЕПЛЯТЬ, или ОТКРЕПЛЯТЬ) – Hitch-Back:- xxxxx. Fabrics defect. See also Draw-Back, and Sticker, 1. / hitch = зацепка.

HITCHHIKER PEST = ВРЕДИТЕЛЬ ХИТЧХАЙКЁ (или ХХ ВРЕДИТЕЛЬ) – Hitchhiker Pest:- when traveling, the last souvenir that you want to bring home would be bed bug bites or even worse, bed Bugs themselves. Bed Bugs are great Hitchhikers. Therefore, its really important to keep your eye open for them. Whether youre staying in a one-star motel or a five-star resort, or anywhere where people come and go. Getting rid of bed Bugs, once youve got them at home, can be very difficult. See also Contaminating Pest. The best way to deal with bed bugs is to seek out a bed bug exterminator, as this invasive pest can be very difficult to get rid of without proper treatments. Bed Bugs present unique challenges to the bug extermination industry because Bed Bugs are great 'hitchhikers'; they can hide in luggage, purses, clothing and even a wallet. They are very small in their young stages and difficult to find. In Austin (the US; and beyond!) Bed Bugs can be transferred by individuals or live on possessions in homes, hotels, college dorms, apartments, and shelters. Once Bed Bugs have been introduced into a structure, they find numerous areas to harbor and continue to increase in population. Typically, they hide out in cracks and crevices during the day, coming out at night in search of a meal. Bed Bugs also lay eggs frequently – usually four to five every day and tend to move away from the initial point of entry into other parts of a room or even between rooms in a home or building. Developing a Bed Bug problem in your home can me worrisome, but it is not your fault! Bed Bugs can be prevalent in clean homes just as easily as unkempt ones. Bed Bug activity is independent of sanitation and economic status – they are equal opportunity pests. / Постельный Клоп (bed Bug).

HITCHMENT = СБОР (или УВЯЗКА, или ПОДБОР) – Hitchment is the marrying of two or more portions of one shipment that originate at different locations, moving under one bill of lading, from one shipper to one consignee. Authority for this service must be granted by tariff publication. See also Bill Of Lading.

HITCHMENT BILL OF LADING = СБОРНЫЙ КОНОСАМЕНТ – Hitchment Bill Of Lading (B/L) is a bill covering parts of a shipment which are loaded at more than one location. Hitchment B/L usually consists of two parts, hitchment and hitchment memo. The hitchment portion usually covers the majority of a divided shipment and carries the entire revenue. / Сборный Коносамент – коносамент на несколько грузов, предназначенных для различных грузополучателей.

HITCHMENT CARGO = СБОРНЫЙ ГРУЗ – Hitchment Cargo:- an amount of goods which is added to an original consignment as the owner and the destination are the same as those of the original consignment. / Количество товаров, которые добавляются к первоначальной консигнации, поскольку и владелец и место назначения новой части товаров являются теми же самыми, что и у первоначальной консигнации.

HIT THE MARKET = ОЖИВИТЬ РЫНОК (или ЗАВОЕВАТЬ РЫНОК) – Hit The Market:- (i) be launched into the market; or (ii) have an impact on the market. See also Hit The Ring. / Смотрите также Оживить Ринг (Hit The Ring).

HIT THE RING = ОЖИВИТЬ РИНГ – Hit The Ring:- sounds more like a descriptive phrase. It is just slang for orders arriving in the ring (the physical location where traders gather). As orders to buy or sell the asset are sent to the ring, you might say they hit the ring, especially if they act to move prices. Also known as Hit The Market.

HK = HONG KONG

HKD = HONG KONG DOLLAR

HKFE = HONG KONG FUTURES EXCHANGE

H/L = HEAVY LIFT

HL = HECTOLITER

HLA = HIGH LEVEL ARCHITECTURE

HLL VIRUSES = HIGH LEVEL LANGUAGES VIRUSES

HLT = HIGHLY LEVERAGED TRANSACTION

HM = HAZARDOUS MATERIALS

HM = HEARD ISLAND AND MCDONALD ISLANDS

HMPE = HIGH MODULUS POLYETHYLENE

HMT = HARBOR MAINTENANCE TAX

HN = HONDURAS

HNL = HONDURAN LEMPIRA

HOARDING = НАКОПЛЕНИЕ (или ТЕЗАВРАЦИЯ) – To collect or amass precious metals, cash or other supplies for security reasons. Hoarding is an accumulation of idle goods or money by an economic unit. Money or objects of value are ordinarily saved in the form of income-producing investments, thus returning the funds to the normal stream of circulation. In economic theory, any money that is saved but not invested is said to be hoarded. When money is hoarded, the funds are removed from the normal stream of circulation, reducing total income and slowing down the velocity of money. / товаров и денежных средств хозяйствующим субъектом. Под Тезаврацией, от Греческого слова Thesauros, означающее Сокровище, понимается:- (i) изъятие драгоценных металлов, монет и банкнот из обращения с целью накопления, а не получения доходов, в ожидании роста их стоимости или получения прибыли в будущем; (ii) накопление драгоценных металлов (в виде слитков, монет, ювелирных изделий) частными владельцами в виде сокровища или страховых фондов. В современных условиях тезаврация обусловлена, в первую очередь,

стремлением застраховать капиталы и сбережения от инфляционного обесценения; и (iii) создание золотого запаса государства. Тезаврация или Тезаврирование золота, от Греческого слова Thesaurós, означающее Сокровище, понимается накопление золота как сокровища частными лицами в докапиталистических формациях и при капитализме. Накопление государством золотых запасов для международных расчётов, образования стратегических резервов, укрепления денежного обращения и тому подобного тезаврацией не является. На протяжении многих веков (вплоть до 2-й Мировой Войны 1939–45) тезаврация золота для бытовых и обрядовых надобностей была характерна для стран Востока – Индии, Китая, Египта и других. В развитых капиталистических странах тезаврация золота развивается главным образом в периоды войн и послевоенных хозяйственных неурядиц, экономических кризисов, инфляции и так далее с целью предохранить денежные капиталы и сбережения от обесценения бумажных денег. По данным Лиги Наций и ряда зарубежных источников, тезаврация золота поглотила за 20 лет (1914–33) свыше 5 тысяч тонн (т) золота. Во время 2-й Мировой Войны и в первые послевоенные годы тезаврация золота не приняла широких размеров, так как в большинстве воюющих стран был введён жёсткий валютный контроль, добыча золота в основных добывающих странах (в сфере влияния Великобритании и в Соединённых Штатах Америки (США)) резко сокращена, весь добываемый металл сдавался государству; частная торговля золотом была фактически запрещена. После восстановления свободной торговли золотом в 1950-х в связи с углублением валютного кризиса объём тезаврации золота быстро возрастал. За 1956–66 было тезаврировано 4.8 тысяч т золота, по данным Международного Валютного Фонда (6.5 тысяч т золота, по данным Банка Международных Расчётов). (Разница в оценках связана с тем, что первая учитывает золото, тезаврированное в форме слитков и монет, а вторая включает также примитивные ювелирные изделия из золота.) Наиболее крупные частные накопления золота сосредоточены во Франции и Индии. По оценкам Американского агентства Ф. Пика, из общего количества золота, добытого в мире со времени открытия Америки (1492) до 1975, оцениваемого приблизительно в 77 тысяч т (исключая добычу в бывшем Союзе Советских Социалистических Республик (СССР) после 1917 и в других социалистических странах после 2-й Мировой Войны 1939–45), тезаврация золота поглотила 24 тысяч т. Запасы Французских тезавраторов к конце 1974 достигли 4.6 тысяч т, из 5 тысяч т золота, тезаврированного в странах Азии, большая часть приходилась на Индию.

HOARY = СЕДОЕ (или ДРЯХЛОЕ) – Hoary:- gray or white with or as if with age.

HOAX = НАДУВАТЕЛЬСТВО – Hoax:- there are many hoaxes sent as chain letters via email and social media, spreading because people are tricked into forwarding them, rather than through malicious code. The only way to defend from hoaxes is heightened caution. Hoaxes often claim to be quoting trustworthy companies ('Microsoft warns…', 'CNN announced…', etc) and often consist of warnings about catastrophic consequences. For example, devastating new viruses that will cause a computer to catch on fire and explode, or serial killers hiding in the back seats of cars. 'Sympathy Hoaxes' claim that forwarding the message will somehow benefit children with cancer, or help find a missing person. Others claim that forwarding the hoax will benefit the person forwarding by earning them money or free goods. What these messages have in common is an appeal to forward them immediately to others. This is how hoaxes are spread.

HOBBLE SKIRT = НЕУКЛЮЖАЯ ЮБКА (или НЕСКЛАДНАЯ ЮБКА, или УГЛОВАТАЯ ЮБКА) – Hobble Skirt is a skirt constricted at the bottom.

HOEING = ОКАПЫВАНИЕ (или МОТЫЖЕНИЕ, или РЫХЛЕНИЕ) – Hoeing is a technique used with a hoe to loosen the soil, to remove weeds between the rows of Rice or other Plants. A hoe is an ancient and versatile agricultural tool used to move small amounts of soil. Common goals include Weed control by agitating the surface of the soil around Plants, piling soil around the base of Plants (hilling), creating narrow furrows (drills) and shallow trenches for planting seeds and bulbs, to chop Weeds, roots and crop residues, and even to dig or move soil, such as when harvesting root crops like Potatoes. / Прополка от сорняков.

HOG–CORN RATIO = СООТНОШЕНИЕ БОРОВ–КУКУРУЗА – Hog-Corn Ratio is the relationship of feeding costs to the Dollar value of hogs. It is measured by dividing the price of hogs (hundredweight) by the price of Corn (bushel). When corn prices are high relative to pork prices, fewer units of Corn equal the Dollar value of 100 pounds of pork. Conversely, when Corn prices are low in relation to pork prices, more units of Corn are required to equal the value of 100 pounds of pork. See also Corn-Hog Ration, Feed Ratio, and Steer-Corn Ratio. Hog-Corn Ratio is the number of bushels of Corn that are equal (in value) to one hundred pounds of live hogs; that is, the price of hogs per hundredweight divided by the price of Corn per bushel. A favorable (high) ratio is usually followed by an increase in hog production; an unfavorable (low) ratio, by a decrease. Also known as Corn-Hog Ratio. / Смотрите также Соотношение Кукуруза-Боров (Corn-Hog Ration), и Соотношение С Кормом (Feed Ratio).

HOGGED = С ПЕРЕГИБОМ – A Hogged ship is one that is held amidships with both ends sagging lower than the center. Loading condition of a vessel in such a way that the center of the vessel is slightly raised (arch-wise in the center).

HOGGET WOOL = ШЕРСТЬ ЯРКИ (или ШЕРСТЬ ГОДОВАЛОГО БАРАШКА) – Hogget Wool comes from sheep twelve to fourteen months old that have not been previously shorn. The fiber is fine, soft resilient, and mature, and has tapered ends. Hogget wool is a very desirable grade of wool and, because of its strength, is used primarily for the warp yarns of fabrics.

HOIST = ПОДЪЁМНИК – The term Hoist shall mean a power-driven apparatus for raising or lowering a load by the application of a pulling force. Also known as High-Lift Truck. The term High-Lift Truck shall mean a power-driven industrial type of truck used for lateral transportation that is equipped with a power-operated lifting device usually in the form of a fork or platform capable of tiering loaded pallets. The term shall not mean low-lift trucks or low-lift platform trucks that are designed for the transportation of but not the tiering of material. Hoist is applied principally to the lifting of heavy objects, often by mechanical means:- hoist a sunken ship. Heavy forklift machine used for lifting and stacking containers and cargo. Also known as Fork Hoist. / Погрузчик или Погрузочная Машина, самоходная машина, предназначенная для выполнения операций захвата, подъёма, транспортирования и укладки грузов в транспортные средства, штабели или отвалы. Погрузчики периодического действия производят захват, транспортирование и выдачу груза поочерёдно; погрузчики непрерывного действия – непрерывно. Различают погрузчики общего назначения (универсальные), выполняющие работы в различных отраслях народного хозяйства с грузами широкой номенклатуры, снабжаемые сменным рабочим оборудованием (до 40 видов), и специальные, предназначенные для работ с грузами ограниченной номенклатуры или в особых условиях (например, в шахтах – смотрите Погрузочная Машина Горная). Оборудование погрузчика монтируют на специально конструируемых шасси или используют шасси тракторов, колёсных тягачей, автомобилей. Наиболее распространённые погрузчики периодического действия – электропогрузчики и автопогрузчики. Рабочее оборудование погрузчика периодического действия имеет обычно объёмный гидропривод. В механизмах передвижения применяют механические, электрические, гидродинамические (с гидротрансформатором) трансмиссии или мотор-колёса. Электро- и автопогрузчики снабжены однотипным рабочим оборудованием – грузоподъёмником с набором съёмных грузозахватных приспособлений. Одноковшовые погрузчики, кроме погрузки и перевозки сыпучих, кусковых, штучных грузов, могут выполнять земляные, дорожные, карьерные работы, корчевать пни, срезать кустарники. Их основное рабочее оборудование – закреплённый шарнирно на конце подъёмной стрелы ковш,

наполняемый под действием напорного усилия ходовой части или при заторможенной ходовой части при помощи гидроцилиндров. В зависимости от средней плотности перегружаемых материалов используют ковши нормальной, увеличенной и уменьшенной ёмкостей. Кроме ковшей, предусматривают использование других рабочих органов, например, вил, челюстных захватов, крановых крюков и тому подобного. Ёмкость ковшей – 0.1–30 кубических метров (м3) при мощности двигателей 10 – 700 килоВатт (кВт) и высоте разгрузки 2.5 – 4 м, транспортные скорости достигают 12 километров в час (км/ч) (гусеничные погрузчики) и 50 км/ч (колёсные погрузчики). Погрузчики непрерывного действия – самоходные конвейеры с самозагрузкой, предназначенные для погрузки и транспортирования сыпучих и мелкокусковых грузов из штабелей и отвалов, имеют по сравнению с одноковшовыми погрузчиками большую производительность (30 – 400 м3/ч), меньшую энерго- и металлоёмкость. Их рабочее оборудование:- питатель нагребающего или зачерпывающего типа, транспортирующий орган, то есть основной конвейер (ковшового, ленточного, скребкового и других типов), и отвальный орган, состоящий обычно из вспомогательного ленточного конвейера или поворотного лотка. В ряде конструкций основной конвейер дополнительно выполняет функции отсутствующего грузозахватного или отвального органа. Погрузчик непрерывного действия имеет механический, реже – электромеханический или электрогидравлический привод рабочего органа; в механизмах передвижения для получения малых рабочих скоростей ставят ходоуменьшители с приводом от гидродвигателя. На некоторых типах машин применяется гидростатическая трансмиссия. Подъёмник, грузоподъёмная машина прерывного (циклического) или непрерывного действия для подъёма груза и людей в специальных грузонесущих устройствах, движущихся по жёстким вертикальным (иногда наклонным) направляющим или рельсовому пути. По способу передачи воздействия от привода к грузонесущим устройствам различают канатные, цепные, реечные, винтовые и плунжерные подъёмники. Преимущественное распространение получили канатные подъёмники, в которых грузонесущие устройства подвешиваются на стальных канатах, огибающих канатоведущие шкивы или навиваемых на барабаны подъёмных лебёдок. В подъёмниках с канатоведущими шкивами, передающими тяговое усилие трением, грузонесущие устройства (кабина, клеть, скип, платформа, тележка или вагон) уравновешиваются другими такими же устройствами или противовесом, также движущимися по направляющим. В барабанных подъёмниках уравновешивание уменьшает нагрузки на привод. При применении дополнительных грузоподъёмных средств для уравновешивания производительность подъёмника увеличивается. Подъёмники имеют, как правило, электрический или реже гидравлический привод. Подъёмники охватывают широкую сферу применения, чем обусловлено разнообразие их конструктивных форм и типов. В жилых, общественных, административных и промышленных зданиях получили распространение лифты, эскалаторы, реже патерностеры. Для подъёма людей в вагонах по рельсовому наклонному пути на горы, крутые берега и другие естественные возвышения служат фуникулёры – пассажирские канатные подъёмники циклического действия. Для выдачи на поверхность полезных ископаемых и пустых пород в шахтах, рудниках и карьерах, для загрузки доменных печей применяют скиповые подъёмники (смотрите Скип); при подземной разработке полезных ископаемых для подъёма (спуска) людей, оборудования, материалов устраивают клетьевые подъёмники (смотрите Шахтный Подъём). Сооружение зданий ведут с помощью строительных подъёмников – мачтовых, канатных, шахтных; монтаж напорных трубопроводов при строительстве высокогорных ГЭС осуществляют специальными тележечными подъёмниками. Различные типы подъёмников используются на ремонтных заводах (например, для подъёма автомобилей и тому подобного), при обслуживании и мелком ремонте зданий, газгольдеров и других высоких сооружений (например, подъёмники на автомобилях-вышках). Подъёмниками называют также устройства для подъёма судов при движении их по каналам с разными уровнями воды (смотрите Судоподъёмник). Под Подъёмником понимается грузоподъёмная машина для вертикального или наклонного перемещения грузов или людей с одного уровня на другой в кабинах, клетях, ковшах или на платформах, подвешенных к канатам или цепям и перемещающихся по направляющим. Различают скиповые, строительные, шахтные подъёмники, лифты, фуникулёры и прочие. Подъёмно-Транспортные Машины предназначены для подъёма и перемещения грузов, в том числе людей, на небольшие расстояния в пределах заводов, портов, складов, строительных площадок и тому подобного. Различают подъёмно-транспортные машины непрерывного действия (конвейеры, элеваторы, эскалаторы), периодического действия (грузоподъёмные машины), устройства наземного и подвесного транспорта (канатные дороги, фуникулёры), которые могут быть циклического и непрерывного действия. Грузоподъёмная Машина, устройство для подъёма груза и людей в вертикальной или близкой к ней наклонной плоскости (лифты – грузовые и пассажирские, подъёмники – шахтные, скиповые, строительные и прочие). Термин Грузоподъёмная Машина объединяет различные по конструкции и кинематическим схемам машины. К грузоподъёмным машинам относятся и такие простейшие устройства, как домкраты, тали, вороты, полиспасты, и такие сложные, как самоходный стреловой полноповоротный кран, или автопогрузчик. Грузоподъёмная машина в зависимости от назначения может быть стационарной, самоходной или передвижной, прерывного или непрерывного действия, с электроприводом, с приводом от двигателя внутреннего сгорания или с каким-либо другим. Грузоподъёмность машин колеблется от нескольких килограммов (кг) до нескольких сотен тонн (т). Многие грузоподъёмные машины обеспечивают не только подъём, опускание груза и удержание его на заданной высоте, но и перемещение в горизонтальной плоскости (различного рода краны). При одновременном включении механизмов подъёма и горизонтального перемещения груз можно передвигать в пространстве по любой траектории. Основные части грузоподъёмной машины:- остов, механизм подъёма, грузонесущий (грузозахватный) орган. Самоходные грузоподъёмные машины снабжаются также механизмом передвижения, а поворотные – механизмом поворота. Грузозахватные приспособления грузоподъёмной машины, как и конструкция самой машины, зависят от размеров, веса и свойств перемещаемого груза, а также от технологии производственного процесса. Для подъёма и опускания людей используют клети и кабины, для штучных грузов – различные крючья и специальные захваты, а для сыпучих грузов – бадьи, ковши, грейдеры и прочее. Под Грузоподъёмной Машиной понимается устройство для перемещения груза или людей в вертикальном или близкой к ней наклонной плоскости (грузовые и пассажирские лифты, краны, шахтные, строительные и другие подъёмники). Под термином Грузоподъёмная Машина понимают различные по конструкции и кинематическим схемам машины:- простейшие устройства – вороты, домкраты, полиспасты, тали; сложные – самоходный стреловой полноповоротный кран или автопогрузчик и тому подобное. В зависимости от назначения грузоподъёмная машина может быть стационарной или передвижной, прерывного или непрерывного действия, с электроприводом, с приводом от двигателя внутреннего сгорания или с каким-либо другим приводом. Под Грузозахватным Приспособлением понимается устройство или механизм грузоподъёмной машины для захвата, перемещения и разгрузки различных грузов. Грузозахватные приспособления навешиваются на рабочий орган грузоподъёмной машины. Различают грузозахватные приспособления для штучных грузов – чалочные стропы, скобы, траверсы, клещи; для насыпных – грейферы, ковши, кюбели; для наливных – бадьи, специальные ёмкости. Разновидность грузозахватных приспособлений – подъёмные электромагниты, вакуумные грузозахваты и тому подобные. К грузозахватным приспособлениям относят также автостропы, обеспечивающие захват и освобождение штучных грузов при погрузочно-разгрузочных, строительных и монтажных работах без участия стропальщика. Операции строповки и отстроповки могут выполняться, например, с помощью электромагнита, установленного на автостропе и управляемого из кабины крановщиком.

HOIST AWAY = ВЫБИРАЙ (или ПОШЁЛ ТАЛИ) – Hoist Away (maritime term):- an order to haul up.

HOISTING ROPE = ПОДЪЁМНЫЙ ТРОС – Hoisting Rope is a special flexible wire rope for lifting purposes, generally being of six strands with 19 wires in each strand and in most cases having a hemp rope at the center.

HOIST OPERATION = ОПЕРАЦИЯ ПОДЪЁМНИКА – Hoist Operation is an operation with lifting gear (cranes etc).

HOJA BLANCA = БЕЛОЛИСТНОСТЬ (или БЕЛЫЙ ЛИСТ, или ОХА БЛАНКА) – Hoja Blanca is a viral disease caused by Rice hoja blanca virus transmitted by the Planthopper Sogatodes Oryzicola and the Leafhopper Hortensia Similis. The disease is known to occur only in the Western Hemisphere and common only in Central and South America, and the Caribbean. The disease is characterized by stunting; leaves may have yellowish stripes or are mottled; the panicle may be incompletely exserted, and flowers are sterile or absent. / .

HOLD = ТРЮМ – Hold is a general name for the spaces below the main deck designated for stowage of general cargo. A hold on a tanker is usually just forward of No. 1 cargo tank. Some newer tankers have no hold. See also Bays. Compartment below deck used solely for carrying cargo. Hold is the space below the deck of a vessel used to carry cargo. Section of vessel in which containers are stored. Hold (maritime term):- the space below decks utilized for the stowage of cargo and stores. / Под Трюмом, от Голландского слова 'Truim, понимается помещение в корпусе судна под нижней палубой, то есть между нижней палубой и днищем или вторым дном. В трюмах размещают грузы (грузовые трюмы), судовые механизмы (машинные трюмы), запасы и так далее.

HOLDDOWN CLAMP = НИЖНЯЯ СКОБА (или НИЖНЕЕ КРЕПЛЕНИЕ, или НИЖНИЙ ЗАЖИМ) – Holddown Clamp is a locking device to hold container on chassis during transit. / запирающее устройство для удерживания контейнера на шасси во время транзита.

HOLDER = ВЛАДЕЛЕЦ (или ДЕРЖАТЕЛЬ) – (1) A Holder is the person who has possession of, and a property right in, a bill of lading. 49 USC §80101(4) (2005; 49 USC is short for the United States Code:- Title 49). Someone who owns something or owns rights in something, such as bills, bonds, credit cards, or shares. Holder is a person who is the ultimate or beneficial owner of the American Depository Receipt (ADR) or American Depository Share (ADS).

(2) In option trading, Holder is the purchaser of either a call or put option. Option buyers receive the right, but not the obligation, to assume a futures position. Also known as Buyer. The opposite of Grantor. Holder is the buyer of an option, more commonly referred to as the Taker. Holder is the option buyer that pays a premium in return for the right to exercise the option. / В противовес Предоставившему (Grantor).

HOLDER IN DUE COURSE = ВЛАДЕЛЕЦ В ПОРЯДКЕ ЗАКОННОГО ПРАВОПРЕЕМСТВА – Any entity whose endorsement appears on a negotiable instrument. Holder In Due Course is a person who has taken up a bill for value before payment is due, and who has no good reason to suspect the title of the previous holder.

HOLD HARMLESS AGREEMENT = СОГЛАШЕНИЕ ОБ УДЕРЖАНИИ И ПЕРЕДАЧЕ ОТВЕТСТВЕННОСТИ ЗА ВОЗМЕЩЕНИЕ УЩЕРБА – Hold Harmless Agreement is a contractual arrangement whereby one party assumes the liability inherent in a situation, thereby relieving the other party of responsibility. Such agreements are typically found in contracts like leases. A typical lease may provide that the lessee must hold harmless' the lessor for any liability from accidents arising out of the premises.

HOLDING COMPANY = КОНТРОЛИРУЮЩАЯ КОМПАНИЯ (или ХОЛДИНЬГОВАЯ КОМПАНИЯ, или ДЕРЖАТЕЛЬСКАЯ КОМПАНИЯ) – Holding Company is a company whose primary purpose is to control corporations through ownership or control of their voting stock. Like those of an investment company, most of the assets of a holding company are financial in nature (stocks, bonds), but the two differ in purpose. A holding company may also be an industrial company, such as AT&T. See also Company, Conglomerate, Domination, and Merger. A corporation that owns the securities of another, in most cases with voting control. Holding Company is a company that exists to own shares in other companies, that are (depending on the level of shareholding) its subsidiaries. An immediate holding company is one that holds a controlling interest in another company, but in turn, the immediate holding company itself may be owned by a holding company. Holding Company is a company with permanent holdings in other companies for the purpose of control or financing. In Switzerland, the Federal Government and most cantons grant tax relief to holding companies (known as the Holding Privilege). A Holding Company is a company or firm that owns other companies' outstanding stock. The term usually refers to a company which does not produce goods or services itself; rather, its purpose is to own shares of other companies. Holding companies allow the reduction of risk for the owners and can allow the ownership and control of a number of different companies. In the United States, 80% or more of stock, in voting and value, must be owned before tax consolidation benefits such as tax-free dividends can be claimed. Sometimes a company intended to be a pure holding company identifies itself as such by adding 'Holdings' or '(Holdings)' to its name, as in Sears Holdings Corporation. In the United States, Berkshire Hathaway is the largest publicly traded holding company; it owns numerous insurance companies, manufacturing businesses, retailers, and other companies. Two other large notable holding companies are United Continental Holdings and AMR Corporation, whose primary purposes are to wholly own United Airlines and American Airlines, respectively. In some instances, holding companies have held capital for pending investments. In US broadcasting, many major media conglomerates have purchased smaller broadcasters outright, but have not changed the broadcast licenses to reflect this, resulting in stations that are (for example) still licensed to Jacor and Citicasters, effectively making them such as subsidiary companies of their owner Clear Channel Communications. This is sometimes done on a per-market basis; for example in Atlanta both WNNX and later WWWQ are licensed to 'WNNX LiCo, Inc.' (LiCo meaning 'license company'), both owned by Susquehanna Radio (which was later sold to Cumulus Media). In determining caps to prevent excessive concentration of media ownership, all of these are attributed to the parent company, as are leased stations, as a matter of broadcast regulation. In the United States, a personal holding company is defined in section 542 of the Internal Revenue Code. A corporation is a personal holding company if both of the following requirements are met:- (i) Gross Income Test:- at least 60% of the corporation's adjusted ordinary gross income is from dividends, interest, rent, and royalties; and (ii) Stock Ownership Test:- more than 50% in value of the corporation's outstanding stock is owned by five or fewer individuals. A Parent Company is a company that owns enough voting stock in another firm (subsidiary) to control management and operations by influencing or electing its board of directors. A parent company could simply be a company that wholly owns another company. This would be known as a 'Wholly Owned Subsidiary'. Holding Company is a parent corporation that owns enough voting stock in another corporation to control its board of directors (and, therefore, controls its policies and management). A holding company must own at least 80% of voting stock to get tax consolidation benefits, such as tax-free dividends. / ДаблЮ.Эн.Эн.Экс. ЛыКо, Инк. (WNNX LiCo, Inc.), Сасквэхэна Рэйдиоу (Susquehanna Radio) (которая в последстие была продана Кьюмюлас Мидиа (Cumulus Media)). коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо). Под так называемой Холдинь Кампэни, от Английского слов Holding Company, от Holding, означающее Владеющий (акциями), понимается Холдинь или Холдиньговая Компания или Держательская Компания, владеющая контрольными пакетами акций других компаний с целью контроля и управления их деятельностью. Имеется 2 типа Холдинь Кампэни:- (i) Чистый, выполняющий только указанные функции; и (ii) Смешанный, занимающийся также определённой предпринимательской деятельностью – промышленной, торговой, транспортной, кредитно-финансовой и тому

подобной. Холдинь Кампэни представляет собой неотъемлемое звено так называемой Системы Участия. Во всех капиталистических странах во главе трестов или концернов находятся Холдинь Кампэни, а некоторые, главным образом многонациональные монополии, возглавляет целая система Холдинь Кампэни. Так, например, Англо-Голландская нефтяная монополия Ройэл Дач Шэл возглавляется двумя холдиньгами – Английским Шэл Тчрэнспот и Голландским Рохал Дутч Петролеум, которые держат акции ещё двух Холдинь Кампэни – Шэл Пэтчролиэм Ко. Лтд в Великобритании и Шэл Петролеум Эн.Ви. в Нидерландах; последние две компании непосредственно и через свои дочерние общества владеют или участвуют в капитале более чем 500 компаний. Такая же сложная структура и у Англо-Голландского пищевкусового и мыловаренно-парфюмерного треста Юниливё (Uniliver). Холдинь Кампэни, в составе которой одновременно находятся промышленные предприятия, коммерческие банки, страховые и другие компании, являются одной из форм организации финансовой олигархии. Примером могут служить банки ФРГ – Немецкий и Дрезденский и Бельгийский банк Сосьете Женераль де Бельжик, возглавляющие одноимённые финансовые группы. Эти банки владеют акциями и контролируют деятельность в среднем 150 компаний каждый, включая кредитно-финансовые, инвестиционные, страховые, торговые, промышленные и транспортные общества и предприятия сферы услуг. Тресты и концерны широко используют Холдинь Кампэни и в своей внутренней организационной структуре с целью контроля и руководства группами дочерних фирм, выделенными по какому-либо определённому признаку:- географическому, отраслевому, товарному и так далее. Например, крупнейшая нефтяная монополия капиталистического мира ЭКСАН (Эксан Мобл Корпорэйшэн; EXXON (Exxon Mobil Corporation)) имеет в своём составе около 10 таких холдиньгов, возглавляющих дочерние фирмы, которые действуют в Африке, на Ближнем Востоке и так далее. Стремясь увеличить прибыли, монополии часто создают такие Холдинь Кампэни в странах с более низким налогообложением. Развитие Холдинь Кампэни означает усиление процесса концентрации производства и капитала, способствуя подчинению крупным компаниям мелких и средних фирм. Холдиньговая Компания – корпорация, владеющая количеством акций с правом голоса иной корпорации, достаточным для того, чтобы оказывать влияние на её правление и, следовательно, контролировать управление и политику. Холдиньговая компания не обязательно должна владеть большинством акций в своих филиалах или вести такую же деятельность. Однако для того, чтобы воспользоваться возможностью объединить налоги, включая не облагаемые налогом дивиденды, выплачиваемые материнской компании, и возможностью разделить убытки в результате деятельности, холдиньговая компания должна владеть 80% или более акций филиала с правом голоса. Преимуществами холдиньговой компании по сравнению с таким подходом к расширению, как объединение компаний (merger), являются;- способность контролировать значительную сферу деятельности компании при неполном участии во владении и сравнительно небольших инвестициях; некоторая теоретическая возможность принимать риск через филиалы с ответственностью, ограниченной участием в филиале; возможность расширения путём негласного приобретения акций, в противоположность необходимости получения одобрения акционеров другой компании. Недостатками холдиньговой компании являются:- многократное налогообложение, в том случае если в собственности находится менее 80% филиала, а кроме того, взимание иных специальных налогов и налогов штата; риск вынужденного роспуска (divestiture) (легче добиться вынужденного роспуска холдиньговой компании, чем разделения действующего объединения); риск негативных последствий широкого использования заёмных средств, выражающийся в избыточном расширении бизнеса (pyramiding). Следующие типы холдиньговых компаний определяются особым образом и подчиняются особому законодательству:- холдиньговые компании, предоставляющие общественные коммунальные услуги (Public Utility Holding Company), банковские холдиньговые компании (bank holding company), железнодорожные и воздушно-транспортные холдиньговые компании.

HOLDING COMPANY DEPOSITORY RECEIPTS = ДЕПОЗИТАРНЫЕ РАСПИСКИ КОНТРОЛИРУЮЩЕЙ КОМПАНИИ (или ДЕПОЗИТАРНЫЕ РАСПИСКИ ХОЛДИНЬГОВОЙ КОМПАНИИ) – Holding Company Depository Receipt (HOLDR) is a financial product created by Merrill Lynch and traded daily on the American Stock Exchange that allows investors to buy and sell a basket of stocks in a particular sector, industry or other classification in a single transaction. There is a wide range of HOLDRs, covering various segments of the market such as biotech, internet and Europe 2001. Each HOLDR represents individual ownership in the stocks underlying the HOLDR. The value of the HOLDR fluctuates with the change in value of the underlying stocks. The benefit of this instrument is that it enables an investor to gain exposure to a segment of the market and diversify within that sector. To gain the same level of diversification without this vehicle, the investor would need to purchase each company individually, thus increasing the amount of commissions. The Holding Company Depository Receipts (HOLDRs), launched by Merrill Lynch, trade just like stocks on the American Stock Exchange® (AMEX®). Each HOLDR is a basket of stocks designed to track the performance of a particular industry segment. For example, the Regional Bank HOLDRs (RKH) consist of stock from about 20 regional banks. Holding Company Depositary Receipts (HOLDRs):- Looking for the benefits of a diversified portfolio but don't want to pay the fees associated with it? Maybe you want a more direct and focused approach, something that most mutual funds cannot offer. Your wait is over. Merrill Lynch has invented a new type of investment that solves these problems and more. They're called HOLDRs (which is short for Holding Company Depositary Receipts). The composition of HOLDRs:- HOLDRs are essentially a bundle of stocks traded as one security. In the past, investors that wanted to invest in a certain industry or sector were forced to buy shares of dozens of companies, paying a brokerage commission on each purchase and sale. These transaction expenses significantly lowered his investment returns over time. Now, that same investor can call his broker and place an order for HOLDRs. He will pay only one commission and receive shares in dozens of companies in exchange. Investing in HOLDRs:- HOLDRs must be purchased in lots (units of 100 or more). A single regional bank HOLDRs (symbol:- RKH), for example, currently trades at USD127.55; meaning an investor would have to purchase USD12 755 worth (USD127.55 x 100 units). Example of underlying securities in HOLDRs:- an investor that purchased one lot of telecom HOLDRs would beneficially own the following:- (i) 27 shares SBC Communications; (ii) 25 shares AT&T Corp.; (iii) 22 shares MCI WorldCom; (iv) 12 shares Bell Atlantic; (v) 15 shares Bell South; (vi) 8 shares GTE Corp.; (vii) 5 shares BCE Inc.; (viii) 6 shares Sprint FON; (ix) 3 shares Sprint PCS; (x) 6 shares Global Crossing; (xi) 3 shares Nextel; (xii) 4 shares US West; (xiii) 6 shares Qwest Communications; (xiv) 3 shares Level 3 Communications; (xv) 2 shares Alltell; (xvi) 1 share Telephone & Data Systems; (xvii) 1 share NTL Inc.; (xviii) 2 shares Broadwing; (xix) 1 share McLeod USA; (xx) 1 share Century Telephone Enterprises. At any time, the investor could pay a USD10 per-lot cancellation fee and take possession of the underlying shares of stock, e.g., if you owned one lot of telecom HOLDRs, you would be able to exchange it into the specific number of shares of the companies listed above. Even better, exchanging HOLDRs for the underlying securities is a non-taxable event, ensuring your money will stay invested and not go to Uncle Sam. Types of HOLDRs:- there are currently seventeen types of HOLDRs in which you can invest. They are:- (i) Biotech HOLDRS; (ii) Broadband HOLDRS; (iii) B2B Internet HOLDRS; (iv) Europe 2001 HOLDRS; (v) Internet HOLDRS; (vi) Internet Architecture HOLDRS; (vii) Internet Infrastructure HOLDRS; (viii) Market 2000+ HOLDRS; (ix) Oil Services HOLDRS; (x) Pharmaceutical HOLDRS; (xi) Regional Bank HOLDRS; (xii) Retail HOLDRS; (xiii) Semiconductor HOLDRS; (xiv) Software HOLDRS; (xv) Telecom HOLDRS; (xvi) Utilities HOLDRS; and (xvii) Wireless HOLDRS. The benefits of direct investment vs. HOLDRs:- one of the best things about HOLDRs is that you are eligible for all of the services and benefits provided to those who purchase shares of stock outright; dividends, annual reports, and shareholder perks are still provided quarterly or annually where applicable. HOLDRs vs. mutual funds:- mutual funds are pools of assets invested by a professional money manager. HOLDRs, on the other hand, are a type of basket investing. They are merely a way to acquire shares in dozens of companies by only purchasing one security. Although both mutual funds and HOLDRs offer certain

diversification benefits, they are drastically different creatures. Holding Company Depository Receipts (HOLDERs):- shares in several publicly-traded companies packaged together and traded as if they were one stock. HOLDRs are printed on one stock certificate. HOLDRs are put together in situations where some stocks pay higher dividends, while others have the higher potential for appreciation. They were created and are administered by Merrill Lynch, and trade on the American Stock Exchange. HOLDRs exist in many different industries. Holding Company Depository Receipts (HOLDRs), pronounced 'Holders', are defined as trust-issued receipts that represent the investor's beneficial ownership of a specified group of stocks. HOLDRs allow the investor to benefit from the ownership of a specified group of stocks. They automatically provide diversified exposure to an industry, a sector, or a group of stocks in a single investment HOLDRs also allow the investor to tax losses in any stocks that decline, and to defer gains indefinitely on the best-performing stocks. Shareholders retain the voting and dividend rights on the underlying stocks. / Мёрл Лынч (Merrill Lynch). АФБ® или АМЭКС® (AMEX®) . коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо). (i) 27 акций Эс.Би.Си. Камъюникэйшэнз (SBC Communications); (ii) 25 акций Эй.Ти.ЭндТи. Корп. (AT&T Corp.); (iii) 22 акции Эм.Си.Ай. ВорлдКам (MCI WorldCom); (iv) 12 акций Бэл Этлэнтик (Bell Atlantic); (v) 15 акций Бэл Саус (Bell South); (vi) 8 акций Дьжи.Ти.И. Корп. (GTE Corp.); (vii) 5 акций Би.Си.И. Инк. (BCE Inc.); (viii) 6 акций Спрынт Эф.Оу.Эн. (Sprint FON); (ix) 3 акции Спрынт Пи.Си.Эс. (Sprint PCS); (x) 6 акций Глоубэл Красынь (Global Crossing); (xi) 3 акции Нэкстэл (Nextel); (xii) 4 акции Ю.Эс. Вэст (US West); (xiii) 6 акций Квэст Камъюникэйшэнз (Qwest Communications); (xiv) 3 акции Лэвэл Сри Камъюникэйшэнз (Level 3 Communications); (xv) 2 акции Алтчэл (Alltell); (xvi) 1 акция Тчэлэфон Энд Дэйтча Систэмз (Telephone & Data Systems); (xvii) 1 акция Эн.Ти.Эл. Инк. (NTL Inc.); (xviii) 2 акции Бродвинг (Broadwing); (xix) 1 акция МэКлауд Ю.Эс.Эй. (McLeod USA); (xx) 1 акция Сэнтчури Тчэлэфон Энтёпрайзиз (Century Telephone Enterprises).

HOLDING GAINS OR LOSSES = ПРИБЫЛИ ИЛИ УБЫТКИ ОТ УДЕРЖИВАНИЯ (или ЗАРАБОТКИ ИЛИ ПОТЕРИ ОТ УДЕРЖИВАНИЯ) – holding Gains Or Losses:- profit or loss obtained by virtue of the changing price of assets being held. Holding gains or losses may arise from either physical and financial assets.

HOLDING LOCK = УДЕРЖИВАЮЩИЙ ЗАМОК – A Holding Lock is a facility that prevents securities from being deducted from, or entered into, a Holding pursuant to a Transfer or Conversion.

HOLD METEOROLOGY STUDY GROUP = XX ГРУППА ИЗУЧЕНИЯ МЕТЕОРОЛОГИИ – Hold Meteorology Study Group:- the objective of the container meteorology study group at the Warnemünde-Wustrow University of Seafaring, established by Professor Ulrich Scharnow (1926–1999) in 1970, who has headed the group since that time, was to investigate the complex thermodynamic processes occurring in containers. The investigations were carried out on two standard containers, each of which was equipped with an air lock to prevent disturbing the cryptoclimate when monitoring and making measurements and a weather station. The results of the investigations were able to provide information to both container manufacturers and consignors, particularly to consignors of hygroscopic goods, about the potential for climatological stress to which the goods stored in containers are subjected under specific climatological conditions, particularly in ambient conditions exposed to radiation. / Университет Ванэмюндэ-Вустро (Warnemünde-Wustrow University of Seafaring), основанный Профессором Ульрихём Шарнофом (Ulrich Scharnow; 1926–1999) в 1970.

HOLDRS = HOLDING COMPANY DEPOSITARY RECEIPTS

HOLE = ДЫРА (или ПРОБОИНА, или ОТВЕРСТИЕ) – (1) Hole is formed due to accidental cutting or tear. Rough Mechanical parts of the looms can cause this. Minor Defect Classification:- Not reckoned. Major Defect Classification:- Up to 0.6 cm. (1) Defect Name:- Hole. Defect Type:- Finishing Defects. Fabric Type:- Single Knit Fabrics. Description:- Hole:- This is where the fabric has been pulverized during compaction. This is the back of the fabric. Severity:- Major. (2) Defect Name:- Hole. Defect Type:- Isolated Defects. Fabric Type:- Double Knit Fabrics. Description:- Hole:- This is the result of a lint ball interfering with the normal interloping of the yarn. Severity:- Major. Hole:- in fabric, an imperfection where one or more yarns are sufficiently damaged to create an aperture. Hole:- a breakdown in the fabric where one or more adjacent loops are severed. Note:- this defect can be due to very many causes, amongst which are:- careless handling of the fabric, defective machine elements, chemical damage, insect darnage or darnage during finishing such as lack of control during singeing, shearing, etc. Hole:- a break in the fabric involving more than two yarns. Holes:- all defects that break the fabric, regardless of size, shall be penalized a maximum of four points. A hole consists of two or more broken yarns. Holes:- if there is any small holes present in the fabric and then it is a major fabric defect. Fabric Hole:- includes holes in the fabric and needle holes. All fabric holes should be considered defective. Hole:- caused by broken needle. A large Hole or a press off is the result of a broken yarn at a specific needle feed so that knitting cannot occur. Knitted fabric defect, and namely:- stitch defect. Hole:- caused by broken needle. Holes:- Fabric:- cotton dress goods; Construction:- (i) Count:- 92 x 92; (ii) Warp:- 30/1 combed cotton; (iii) Filling:- 40/1 combed cotton; Finish:- plain dyed navy. Defect:- small holes near one selvage and extending in for about 4 inches from the edge. Analysis:- examination of the sample submitted showed that both warp and filling threads were punctured throughout the entire piece. The series of small holes was attributed to damage by the coarse or dull pins on a wooden temple roll used on the loom. In recent years this type of temple roll has been replaced by rolls covered with rubber or other surfaces, which grip the fabric without the danger of cutting by the metal pins, particularly after they tend to become dull. Holes by defective machine elements. Holes:- Fabric:- cotton sheeting; Construction:- (i) Count:- 80 x 92; (ii) Warp:- 28/1 carded cotton; (iii) Filling:- 36/1 carded cotton; Finish:- desized and singed. Defect:- small holes across width of piece at irregular intervals. Analysis:- examination showed that, wherever the small holes were present, there were thin places in the fabric resulting from set marks, or loom starting-up places, where the pickage was much less than the normal. When goods containing this kind of imperfection are singed in the finishing plant by passing them over open gas flames, there is the danger of the flame's shooting through the more open places and burning small holes in the cloth. It was noted that there were brownish scorched areas around the holes, which confirmed the fact that the damage was produced by burning. / Уточина:- 40/1 гребенная хлопковая; . основные и уточные нити. Порок или дефект. Ткацкая Дыра (пробоины, просечки) – отверстия различных размеров, возникающие при повреждении ткани частями ткацкого станка. Под Дырой понимается местный порок, при котором разрушена целостность полотна. Прорез (hole):- порок ткани; нарушение ткани, где две или более смежных нити разъединены. Примечание:- этот порок может произойти из-за очень многих причин, среди которых:- небрежная обработка ткани, дефектные элементы машины (такие как ролики натяжного механизма или шаблоны), химическое повреждение, повреждение насекомыми или повреждение во время обработки, таких как нехватка контроля во время стрижки и так далее.

(2) Hole:- damage caused by faulty machine or related equipment. Sewing Room Defects. / Порок или дефект швейного производства.

(3) Holes:- resulting from greige goods weaving, finishing, or needle cuts such as would occur in the sewing operation. Interlining defects. / Порок или дефект. , или игольных прорубок таких, какие могли бы возникнуть в процессе операции шитья.

HOLE AND WEAK SPOT = ДЫРА И СЛАБОЕ ПЯТНО (или МЕСТО) – Hole And Weak Spot:- Garment:- one pair of khaki cotton trousers; Fabric Construction:- (i) Count:- 106 x 56; (ii) Warp:- 36/2 combed cotton; (iii) Filling:- same as warp. Complaint:- the trousers were returned by the customer to the retailer because of a small hole and a single weak spot in the left trouser leg, adjacent to the seam. Analysis:- laboratory tests revealed the presence of a small amount of sulphuric acid in the tender and slightly discolored area

around the hole. Since the stained section was confined to one side of the trouser seam, it was evident that the acid must have come into contact with the fabric before it had been made up into trousers. Although it was impossible to determine whether the acid contamination had taken place before or after the material was received by the customer, it was assumed that this type of damage was more likely to occur at the finishing plant or in transit than in the plant of the garment manufacturer. It is not unusual for the garments of gas station attendants to show damage from the spattering of automobile battery acid. In those cases, however, the stains or holes are more than likely to show on both sides of seams, in sewing thread, or even through two layers of the fabric. / Уточина:- такая же как и основа. развод (или потёк (stain)).

HOLE, CUT OR TEAR = ДЫРА, ПОРЕЗ (или ПРОРЕЗЬ) ИЛИ РАЗРЫВ (или РАЗДИР) – Hole, Cut or Tear:- this is self explanatory. Causes:- (i) sharp edges on cloth roll; (ii) hard substance between layers of fabric in cloth roll; (iii) course temples used for fine fabric; and (iv) during removal of hard particles like, iron particles woven in the cloth. Mending:- non mendable. Hole, Cut or Tear:- the occurrence of hole, cut or tear which is self explanatory. Weaving Defect.

HOLES = ДЫРЫ (или ПРОБОИНЫ) – Holes in interlocked fabric. Possible Cause:- weak place in yarn which could have resulted in breakage. This is usually a minor defect. Holes in interlocked fabric don't have the tendency to open up. Depending on the size and color of fabric they can even be mended by sewing and hidden to a considerable degree. Spinning defect. Hole:- fabric fall off. Possible Cause:- one reason for a hole of this type can be the needle latch getting stuck in flat bed machines. This is a major defect. The fabric will continue opening up whenever such a defect occurs. It must be mended immediately to prevent further damage. Knitting defect. Hole in sulfur dyed fabric due to tendering. Possible Cause:- this hole appeared in the levis denim article soon after it was purchased. The hole appeared on washing the garment. This is a major defect. Consumers want their purchase to retain the characteristics they bought, unless stated otherwise. Dyeing defect. Holes:- Fabric:- novelty dress goods; Construction:- (i) Count:- 90 x 64; (ii) Warp:- One end of 100/60 viscose rayon, alternating with one end of 100/40 bright acetate rayon; (iii) Filling:- 30/1 1%-in. 1%-den. bright viscose rayon; Finish:- cross-dyed red (viscose) and white (acetate). Defect:- small holes throughout. Analysis:- inspection under a low-power pick glass showed that the holes were due to breaks in the white acetate warp yarns. There was also evidence of a slight fusing or dissolving of the tips of the broken ends. Although the original construction specified the use of bright acetate warp yarn, microscopic examination revealed that these yarns were not pigmented but were dulled through the use of some chemical agent. It was subsequently determined that, prior to dyeing the goods, the finisher had used a phenolic compound as a delusterant. Through lack of proper control of chemical concentration and temperature, the acetate was not only delustered but was also partly dissolved in those areas where the holes appeared. The delustering of bright acetate rayon by the finisher is seldom practiced in this country today. Holes:- Fabric:- spun-rayon broadcloth; Construction:- (i) Count:- 128 x 68; (ii) Warp:- 30/1 1%-in. 1%-den. bright viscose rayon; (iii) Filling:- same as warp; Finish:- plain dyed green. Defect:- numerous small breaks in the filling. Analysis:- the finished goods showed numerous places where single filling yarns were broken. Careful examination of a number of pieces of the gray goods revealed the presence of several kinked filling yarns which protruded slightly above the cloth surface. By checking with the finisher, it was learned that the gray goods were singed before processing. It was evident that this operation was causing a burning of the protruding loop, with the subsequent production of filling breaks and holes. Holes:- Fabric:- rayon lining twill; Construction:- (i) Count:- 112 x 68; (ii) Warp:- 150/40 bright viscose rayon; (iii) Filling:- same as warp; Finish:- plain dyed gray. Defect:- small holes throughout the finished goods. Analysis:- examination showed that a large proportion of the holes were appearing at intervals of about 1 yard. There being no evidence of any finishing operation which would produce this type of damage, the investigation was continued by inspecting a large number of bales of gray goods. Eventually several bales were found which showed what resembled a mechanical chafing or bruising along the edges of several of the flat-folded pieces. When the additional goods being held at the finishing plant were checked, it was learned that similar damage had been found in the same type of fabric from two gray mills, located many miles apart. Microscopic analysis showed positive evidence of insect damage, in many cases only the warp yarns (containing sizing) being attacked. Traces of insect excrement were found around the damaged areas, and it was concluded that the defect was caused by silverfish at the finishing plant. Most of the damage occurred at approximately 1-yard intervals, because the gray goods were baled in flat, folded condition, and the folded edges, about 1 yard apart, were most readily accessible to attack. Holes (tow):- in tow opening processes, partial or complete filament breakage within a confined spread of tow, usually circular or oval in shape. Not to be confused with splitting or partial crimp deregistration, which are linear. Holes:- Complaint:- a number of bellows from folding-type cameras were returned to the finishing plant by a customer who was engaged in the business of rubberizing black-dyed cotton fabric for this use. It was reported that pinholes had developed in the finished bellows, which were consequently rejected by camera manufacturers because of light leakage. Analysis:- the rubberizer claimed that the fabric, as delivered, showed no damage, but that the pinholes developed after the rubber had been applied. Tracing the records of the finisher who had dyed the fabric revealed that due warning had been given of the proposed end use 4 of this material. Since traces of copper act as a catalyst in causing rubber deterioration, special care had been exercised in selecting copper-free sulphur black dyes. Further investigation revealed that, through some error, the dyed fabric had been dried on copper dry cans, which contaminated it with sufficient metal to produce the damage. Although it might have been possible to treat the dyed fabric with cyanide solutions to remove the traces of copper which caused the trouble, the hazards involved in using such poisonous chemicals in the dyehouse were considered too great to warrant running the risk for the sake of avoiding the monetary loss which the dyer was forced to assume. / Уточина:- такая же как и основа.

HOLES AND CUTS = ДЫРЫ И ПОРЕЗЫ (или ПРОРЕЗИ) – (1) Holes And Cuts:- easily discernible and seriousness depends on size and location. Holes and cuts on the inner stitch line or between the inner stitch line and the teeth are serious. Those beyond the inner stitch line are minor in importance except as they may affect the appearance of the finished garment. Closure defects, and namely – Metal Zippers and Nylon Spiral Zippers:- Tare and Cord Defects. / на линии внутреннего стежка или между . Порок или дефект застёжки. Найлан^{T3} (Nylon^{TM}).

(2) Same as for metal zippers. Holes And Cuts:- easily discernible and seriousness depends on size and location. Holes and cuts on the inner stitch line or between the inner stitch line and the teeth are serious. Those beyond the inner stitch line are minor in importance except as they may affect the appearance of the finished garment. Closure defects, and namely – Nylon Spiral Zipper:- Tape and Cord Detects. / Порок или дефект застёжки. Найлан^{T3} (Nylon^{TM}).

HOLES IN SHIRT = ДЫРЫ В РУБАШКЕ – Holes In Shirt:- Garment:- man's rayon sport shirt; Fabric Construction:- (i) Count:- 120 x 68; (ii) Warp:- 120/40 dull acetate rayon; (iii) Filling:- 15/1 50% 1/4 -in. 1%-den. bright viscose rayon 50% 1%-in. 3-den. dull acetate rayon. Complaint:- holes developed after very few wearings and launderings. Analysis:- inspection disclosed that the holes appeared chiefly in those areas where the fabric was doubled or in several layers, such as at the collar points, cuffs, and seams. In other sections the fabric surface had a smooth, glazed appearance. Analysis showed evidence of fusing of the acetate in those places, as if by a hot iron. It was concluded that the damage was caused by the use of excessive heat in ironing, a condition for which neither the mill nor the manufacturer could assume responsibility, because this is a characteristic of cellulose acetate fibers and yarns which is commonly known. In this particular case, too, the garment bore a label cautioning the user to 'iron with a cool iron only'. Many attempts have been made to overcome the danger of fusing fabrics made of cellulose acetate rayon when they are ironed at high temperatures by means of

saponification of the fabric surface. In general, this technique has not been very successful, probably because the saponification process weakens the fibers, reduces the denier, tends to cause yarn slippage, and alters the dyeing characteristics. / Уточина:- .

HOLES IN TABLECLOTH = ДЫРЫ В СКАТЕРТИ – Holes In Tablecloth:- Article:- white cotton striped damask tablecloth; Fabric Construction:- (i) Count:- 78 x 46; (ii) Warp:- 18/1 cotton; (iii) Filling:- 17/1 cotton. Complaint:- holes appeared in cloth after it was laundered once. Analysis:- physical tests confirmed the fact that the fabric was excessively weak in certain areas. Chemical tests for oxycellulose were positive, indicating that the tendering was produced by some corrosive chemical agent. When the history of the fabric was traced, it was learned that these goods were given a so-called 'Permanent' Finish, involving the use of an alkaline viscose (cellulose) solution, which was applied and then precipitated in the fabric by treatment with a mineral acid. Under the circumstances, it was assumed that the finisher, rather than the consumer or the laundry, was more likely to have been responsible for this condition. Apparently some pieces of fabric had been finished without having been adequately neutralized or rinsed after the acid treatment. This assumption was evidently a correct one, because at a later date several more complaints developed on similar tablecloths made from the same lot of finished goods. / Уточина:- .

HOLES OR CRACK = ДЫРЫ ИЛИ НЕДОСЕКИ – Holes or Crack:- local holes obtained when yarn breaks during loop formation. Causes:- (i) relation between cylinder and dial loop not correct; (ii) weak places in yarn, which breaks during loop formation; (iii) knots; and (iv) yarn running tension is too high. Can be avoided by:- (i) use of flat knots; (ii) accurate yarn guide setting; (iii) use of fabric fault detector; and (iv) use of yarn having lower hariness. Knitted fabric defect.

HOLES OR MARKS = ДЫРЫ ИЛИ ОТМЕТИНЫ – Holes Or Marks:- caused by drag on garment while being transported. Machinery defects, and namely – Work Handling Equipment. / Порок или дефект от машинного оборудования.

HOLIDAY = НЕОБРАБОТАННОЕ МЕСТО – Holiday (maritime term):- an imperfection, spots left unfinished in cleaning or painting. / Необработанное по недосмотру при окраске или очистке поверхности место.

HOLISTIC = ХОЛИСТИЧНОЕ – Holistic:- of, concerned with, or dealing with whole or integrated systems rather than with their parts. / , от Греческого слова Hólos, означающее Весь или Целый, .

HOLLAND = ГОЛЛАНДСКАЯ – Holland is a plain weave fabric similar to sheeting with a stiff sometimes glazed finish. Often of linen or cotton. Frequently used for shades. See also Shadecloth. Holland is a plain-weave fabric used in the home primarily for window shades. Holland Shade Cloth is a plain woven linen, finished with a sizing of oil and starch which renders it opaque. Most shade cloth now made of fine cotton and finished to look like linen. Uses:- window shades, lamp shades. Holland is a cotton or linen fabric in plain weave usually heavily sized or glazed and used for window shades, bookbinding, and clothing. / Голландская – такнь полотняного переплетения, похожая на бязь с . Смотрите также Экранное Полотно или Экранная Ткань (Shadecloth).

HOLLAND FINISH = ГОЛЛАНДСКАЯ ОТДЕЛКА (или ГОЛЛАНДСКИЙ АППРЕТ) – Holland Finish is a glazed or unglazed finish containing oil and a filling material. The finish is applied to cotton fabrics to make them opaque or semiopaque. The resultant fabric resembles a beetled linen fabric called Holland Fabric.

HOLLOW CONJUGATE POLYESTER FIBER = ПОЛОЕ ВЫСОКОИЗВИТОЕ (СЛОЖНОЕ) ПОЛИЭФИРНОЕ ВОЛОКНО – Hollow Conjugate (silicone, non-silicone) Polyester Fiber, produced by bicomponent hollow spinning technology of heterogeneous polyester, will be able to meet your anticipation about high quality non-woven and stuffing use with its superior bulky property, high resilience and light weight which is generated through three dimensional helical structured and permanent crimp. Advantages:- (i) superior bulkiness; (ii) permanent bulkiness; (iii) excellent resilience; and (iv) light and soft. Usage:- (i) Stuffing:- toy, sofa, bedding series, etc; (ii) Industires:- padding, mattress, cushion, filter, needing punch, furniture, etc; and (iii) Others. Specification:- (i) Type:- Silicone / Non-silicone / Flame Retardant etc; (ii) Denier:- 3/ 6/ 7/ 9/ 12/ 15/ 20/ 23D etc; and (iii) Length:- 32 / 51 / 64 / 76 /102 mm. Notes:- (i) Virgin:- polymer directly spinning; and (ii) Recycle:- made from Chip and PET Flakes.

HOLLOW FIBER = ПОЛОЕ ВОЛОКНО (или ПУСТОТЕЛОЕ ВОЛОКНО) – Hollow Fiber is a manufactured fiber made with a hollow center. / Полое Волокно – изготавливаемое волокно, сделанное с полым центром.

HOLLOW FILAMENT FIBERS = ПОЛЫЕ НИТЕВИДНЫЕ ВОЛОКНА (или ВОЛОКНА В ВИДЕ ПОЛЫХ НИТЕЙ) – Hollow Filament Fibers are manufactured, continuous filament fibers, having voids created by introduction of air or other gas in the polymer solution or by melt spinning through specially designed spinnerets. Hollow Filament Fibers are manufactured, continuous filament fibers that have a center void, which has been created through the introduction of air or other gas in the polymer solution, or by melt spinning through specially designed spinnerets during production.

HOLLOW CONJUGATED SILICONIZED POLYESTER FIBER = ПОЛОЕ ВЫСОКОИЗВИТОЕ СИЛИКОНИЗИРОВАННОЕ (СЛОЖНОЕ) ПОЛИЭФИРНОЕ ВОЛОКНО – Hollow Conjugated Siliconized (HCS) Polyester Fiber:- at times, customers ask me what we mean by describing our pillow forms as made with 'hollow, siliconized, conjugate, virgin polyester fiber'. As much as it sounds like a bunch of jargon, here is a brief explanation of what it all means:- (i) Hollow:- this means that it traps the airl; in other words this is what gives the pillow forms their loft and shape; (ii) Siliconized:- the polyester fibers are coated with silicon. In cheaper fibers, the silicon coating is not used and this causes the fibers to stick together. Silicon coating allows the fibers to slide over each other; (iii) Conjugated:- conjugate polyester fibers are twisted, giving it extra resiliency and bounce, allowing it to last long and fill pillows up with a strong loft factor (fill power); and (iv) Virgin:- this means that the fiber is made from all new, non-recycled polyester fibers only.

HOLOTYPE = ГОЛОТИП – Holotype is the type specimen of a taxon as designated in the author's description. / Голотип – типовой экземпляр таксономической единицы (таксона) в качестве назначенного в описании автора. Под Голотипом, от Греческих слов Hólos, означающее Весь, и Týpos, означающее Образец или Отпечаток или Форма, понимается .

HOLY STONE = СВЯЩЕННЫЙ КАМЕНЬ – Holy Stone (maritime term):- the soft sandstone block sailors use to scrub the deck, so-called, because seamen were on their knees to use it. / Камень для драйки палубы.

HOMBURG = ХОМБУРГ (или ХОМБЁГ, или ХОМБУРГСКАЯ) – Homburg is a man's felt hat with a stiff curled brim and a high crown creased lengthwise. / Элегантная фетровая шляпа с лентой вокруг тульи. По названию курорта, на котором будущий Английский Король Эдуард впервые появился в такой шляпе.

HOME BANKING = БАНКОВСКОЕ ОБСЛУЖИВАНИЕ НА ДОМУ – Home Banking is the practice of conducting banking transactions from home rather than at branch locations. Home banking generally refers to either banking over the telephone or on the internet. The first experiments with internet banking started in the early 1980s, but it did not become popular until the mid 1990s when home internet access was widespread. Today, a variety of internet banks exist which maintain few, if any, physical branches. The increasing popularity of home banking has fundamentally changed the character of the banking industry. Many people are able to arrange their affairs so that they seldom have need of a physical branch. Online-only banks have profited from this shift in the industry.

The absence of brick and mortar locations allows online banks to offer favorable interest rates, lower fees and many other incentives for those willing to bank online. Home Banking is the execution of banking transactions by customers from their homes using a computer and modem connected to the bank's computer. See also Telebanking. / Осуществление клиентами своих банковских операций непосредственно из дома, используя при этом компьютер и модем, соединяемые с компьютером банка. Смотрите также Дистанционное Банковское Обслуживание или Банковское Обслуживание На Отдалении (Telebanking). Банковское Обслуживание на Дому – вид банковских услуг, позволяющий клиентам и мелким предпринимателям проводить многие банковские операции, не выходя из дома, используя компьютеры, телефоны и кабельное телевидение, что создаёт для них ряд удобств. Клиенты банка, кроме получения прочих услуг, могут переводить средства с одного счёта на другой, обратиться за займом и производить выплаты по кредитам, оплачивать счета, проверять остатки, покупать или продавать ценные бумаги. Поскольку получение банковских услуг на дому стало более лёгким и удобным, всё большее количество клиентов желают ими пользоваться. Преимущества этих услуг состоят в конфиденциальности, быстроте и точности исполнения, возможности проведения операций в любое время. Большинство банков взимает дополнительную плату за предоставление таких услуг. Однако услуги на дому не распространяются на такой вид операций, как получение наличных денег, за которыми клиент должен приходить в банк и получать их у кассира, или пользование пластиковыми карточками.

HOME COPY = ДОМАШНЯЯ КОПИЯ (или ДОМАШНИЙ ЭКЗЕМПЛЯР, или ХХ) – Home Copy is a copy of an international application filed under the Patent Cooperation Treaty maintained by the receiving office (the United States Patent and Trademark Office (USPTO)) where the international application was filed. / копия для получающего ведомства – копия международной заявки, которая остаётся в получающем ведомстве.

HOME EQUITY LINE OF CREDIT = КРЕДИТНАЯ ЛИНИЯ ПОД ЗАЛОГ ДОМА – In the United States, a Home Equity Line Of Credit is a form of revolving credit in which your home serves as collateral. Because a home often is a consumer's most valuable asset, many homeowners use home equity credit lines only for major items, such as education, home improvements, or medical bills, and choose not to use them for day-to-day expenses. With a home equity line, you will be approved for a specific amount of credit. Many lenders set the credit limit on a home equity line by taking a percentage (say, 75%) of the home's appraised value and subtracting from that the balance owed on the existing mortgage. In determining your actual credit limit, the lender will also consider your ability to repay the loan (principal and interest) by looking at your income, debts, and other financial obligations as well as your credit history. Many home equity plans set a fixed period during which you can borrow money, such as 10 years. At the end of this 'draw period', you may be allowed to renew the credit line. If your plan does not allow renewals, you will not be able to borrow additional money once the period has ended. Some plans may call for payment in full of any outstanding balance at the end of the period. Others may allow repayment over a fixed period (the 'repayment period'), for example, 10 years. Once approved for a home equity line of credit, you will most likely be able to borrow up to your credit limit whenever you want. Typically, you will use special checks to draw on your line. Under some plans, borrowers can use a credit card or other means to draw on the line. There may be other limitations on how you use the line. Some plans may require you to borrow a minimum amount each time you draw on the line (for example, USD300.00) or keep a minimum amount outstanding. Some plans may also require that you take an initial advance when the line is set up. / выплата (repayment) .

HOME OFFICE = ДОМАШНЯЯ КОНТОРА (или ДОМАШНИЙ ОФИС) – Generally, Home Office is the corporate headquarters of insurers and the location where the chief officers of the organization are housed. / Так обычно между собой страховщики называют свою корпоративную штабквартиру, в которой размещено руководство их организации.

HOMEOTHERMIC PESTS = ГОМЕОТЕРМИЧЕСКИЕ ВРЕДИТЕЛИ – Homeothermic Pests:- (Greek:- homoios – identical; thermos – heat) Warm-blooded Pests. / Теплокровные Вредители.

HOMESPUN = ПРИМИТИВНОЕ (или КУСТАРНОЕ, или СПРЯДЕННОЕ ДОМА, или ДОМАШНЕГО ПРЯДЕНИЯ) – Homespun, in theory, this refers to rough, coarse, tweed-like fabric made with thick, uneven yarns and a plain weave. Obviously, not defined by a person who spends much time with good handspinners. Homespun:- a loosely woven usually woolen or linen fabric originally made from homespun yarn. Coarse, rugged yarn is used. Originally an un dyed woolen cloth spun into yarn and woven in the home, by peasants and country folk the world over. Has substantial appearance and serviceable qualities. Made with irregular, slightly twisted uneven yarns. Has a spongy feel with a hand-loomed tweedy appearance. Genuine homespun is produced in a very limited quantity and much powerloom cloth is sold as genuine homespun. Many qualities are made, the best is an ideal rough-and-ready type of cloth. Homespun:- coarse plain-weave fabric of uneven yarns that have a handspun appearance. Homespun:- originally, fabrics made from yarns spun by hand. Today, homespun is used for fabrics that imitate this look. It is a very coarse, rough, plain-weave fabric, loosely woven with irregular, tightly twisted, and nubby, unevenly spun yarns. It is made from linen, wool, cotton, or man-made fiber, or blends in varied colors and is used for coats, suits, sportswear, draperies, upholstery, and slipcovers. / Ткань типа твида из грубой шерстяной меланжевой пряжи.

HOMOGENEOUS = ГОМОГЕННОЕ (или ОДНОРОДНОЕ) – Homogeneous:- uniform in appearance and similar in genetic composition due to descent from a common ancestor.

HOMOLOGOUS = ГОМОЛОГИЧНОЕ (или ГОМОЛОГИЧЕСКОЕ) – Homologous:- pertaining to DNA molecules that have identical or nearly identical base sequences.

HOMOLOGOUS CHROMOSOMES = ГОМОЛОГИЧНЫЕ ХРОМОСОМЫ – Homologous Chromosomes is a pair of essentially identical chromosomes.

HOMOLOGOUS GENE TRANSFER = ПЕРЕДАЧА (или ПЕРЕНОС) ГОМОЛОГИЧНЫХ ГЕНОВ – Homologous Gene Transfer is a type of alien gene transfer where there is a transfer of traits from species having the same genome.

HOMOLOGY = ГОМОЛОГИЯ (или СООТВЕТСТВИЕ) – Homology:- having the same phylogenetic origin, but not necessarily identical form or function. / , от Греческого слова Homólogos, означающее Подобный или Соответственный, .

HOMONYM = ГОМОНИМ – Homonym is a name that already exists for another Plant. The newest name is illegitimate and must be changed. / Гомоним – одинаковое название разных ботанических Видов. Под Гомонимом, от Греческого слова Homós, означающее Одинаковый или Равный, .

HOMOPLASY = ГОМОПЛАЗИЯ – Homoplasy:- of different species with similar characters that have evolved separately and are not from a common phylogenetic origin. / Гомоплазия:- о различных видах с аналогичными характеристиками, которые и не являются из общего филогенетического происхождения. Под Гомоплазией, от Греческих слов Homós, означающее Одинаковый или Равный, и Plasis, означающее Образование, понимается .

HOMOPOLYMER = ГОМОПОЛИМЕР – Homopolymer is a polymer composed of one substance or one type of molecule. / Гомополимер – полимер, макромолекулы которого состоят из одинаковых по составу и строению повторяющихся структурных единиц (мономерных звеньев). Они имеют такой же химический состав (эмпирическую формулу), что и молекулы исходного мономера, только для полимеров, полученных полимеризацией ненасыщенного или циклического мономера. Если же при получении макромолекул в ходе реакции выделяется низкомолекулярное соединение, например, при проведении поликонденсации, то повторяющееся звено отличается по составу от молекул мономера.

HOMOZYGOSIS = ГОМОЗИГОТНОСТЬ – Homozygosis is the union of gametes identical for one or more pairs of genes. / Под Гомозиготностью, от Греческих слов Homós, означающее Взаимный или Общий или Одинаковый или Равный, и Zygōtós, означающее Соединённый Вместе, понимается состояние организма, при котором гомологичные хромосомы несут одну и ту же аллель того или иного гена. Самооплодотворяющиеся организмы практически гомозиготны. В генетике гомозиготные формы (линии) используют для решения ряда теоретических вопросов наследственности и изменчивости (доминантность, кроссинговер, мутации и другое). В сельскохозяйственном производстве гомозиготность широко применяют для использования эффекта Гетерозиса.

HOMOZYGOTE = ГОМОЗИГОТА – Homozygote is a zygote derived from the union of genetically identical gametes. An individual with both alleles alike for any given gene; these are therefore pure for any given trait. Homozygote:- with identical genes on any particular pair of chromosomes. / Под Гомозиготой, от Греческих слов Homós, означающее Взаимный или Общий или Одинаковый или Равный, и Zygōtós, означающее Соединённый Вместе, понимается клетка или организм, в наследственном наборе (генотипе) которого гомологичные хромосомы несут одну и ту же форму данного гена. Сравните с Гетерозиготой.

HOMOZYGOUS = ГОМОЗИГОТНОЕ – Homozygous:- having one type of allele in both chromosomes for a given gene or genes. Having the same members of the allelic gene pair, either dominant or recessive on both chromosomes, and producing only one kind of gamete.

HONAN = ХОНЭНСКОЕ (или ХОНАНЬСКОЕ) – Honan is a heavy silk, pongee-type, but a finer weave, originally the product of wild silkworms of Honan, China. A fabric of the best grade of Chinese silk, it is sometimes woven with blue edges. It is now made to resemble a heavy pongee, with slub yarns in both warp and filling. Honan is manufactured from silk or from man-made fibers. It is used for women's dresses. See also Pongee, Silk, and Wild Silk. Honan is a pongee-type fabric of the very best Chinese wild silk. Honan is sometimes woven with blue edges. Honan:- silk, also from man-made synthetics. Plain weave. The best grade of wild silk. Very similar to 'pongee' but finer. Made from wild silkworms raised in the Honan area of China. The only wild type that gives even dyeing results. Do not fit too tightly. / Хонэн (Honan). основа и уточина. Китайская шёлковая ткань типа Че-су-чи.

HONAN SILK = ХОНЭНСКИЙ ШЁЛК – Honan Silk is a silk similar to pongee. See also Pongee.

HONEYCOMB = ВАФЕЛЬНОЕ – (1) Honeycomb is a weave that results in fabrics that have diamonds or other geometric shapes resembling a honeycomb. Waffle weaves are identical to honeycomb weaves, and many weaves called Thermal are honeycomb weaves.

(2) Honey Comb is a fabric in which the warp and weft threads float to form a diamond shape with ridges and hollows to produce a cellular cloth. Brighton and Grecian weaves are adaptations of the honeycomb principle. / ткань, в которой нити основы и утка .

HONEYCOMB = МЕДОВАЯ СОТА (или СОТОВИДНАЯ СЕРЕДИНКА, или ОПОРНЫЕ КЛЕТКИ, или СВИЩ, или РАКОВИНА) – Honeycomb:- a cellular separation in the interior of a wood piece, usually along the wood grain, a result of internal stress. It normally occurs during kiln drying, particularly in white or red oak, when too much heat is applied too rapidly. / Источенная древесина.

HONEYCOMBING = ОБРАЗОВАНИЕ СОТОВЫХ ПУСТОТ – Honeycombing is the situation that occurs when a lot (see also Lot) is partially depleted and the remaining space is wasted because it cannot be utilized.

HONEYDEW = МЕДОВАЯ РОСА (или МЕДВЯНАЯ РОСА, или ПАДЬ) – Honeydew:- liquid excretions of Homoptera, consisting largely of sugars and amino acids. Honeydew causes a scorching of leaves, the photosynthetic activity of which is reduced by the presence of sooty moulds. Honeydew is a sugary liquid excretion of plant-sucking Hoppers which consists of a mixture of undigested plant material and excretory products. The Cotton Aphid (Aphid Gossypii), also known as the Melon Aphid, infests the Cotton seedlings. Cotton Aphids are among the most injuring insects found in Cotton. They suck sap from leaves and secrete honeydew on the undersides of leaves. Honeydew secretions may burn the leaves and interfere with photosynthesis. In addition, Aphid is a vector of viruses and a carrier of other Insects. In Africa, Aphid infestations are among the most injuring insect pests in terms of economic yield lost. An excretion of plant sap sucking Insects such as Aphids and Whiteflies high in sugars. Honeydew contaminated Cotton lint can accrue large discounts. Sticky Cotton is a term used to refer to Cotton fiber that has thereon sticky sugar deposits which have been excreted by certain (Homopteran) Insects (mainly the Sweet Potato Whitefly (Bemisia Tabaci) and the Cotton Aphid (Aphis Gossyppi) which feed on Cotton leaves above open bolls. Sticky cotton causes severe problems during the milling of cotton. It is a problem faced by Cotton growers all over the world. The sticky substance on the cotton fibers of sticky cotton is called Honeydew. Honeydew is a complex mixture of mono-, di-, trisaccharides and small amounts of protein and organic acids (1,2). A typical composition of the honeydew produced by white flies is 29.5% oligosaccharides (including melezitose), 10.1% sucrose, 5.3% glucose, 11.7% fructose, and 43.1% trehalulose (3). Honeydew on cotton makes it difficult to process the cotton in gins and textile mills. Furthermore, the presence of such honeydew enhances the microbial fermentation of fiber staining Fungi which greatly deleteriously effects the fiber quality of the cotton. In gins, sticky cotton interferes with trash removal and requires gin blades to be cleaned more frequently, slowing the ginning operation. This can significantly reduce productivity. In textile mills, honeydew interferes with the major processing steps including carding, drawing, roving and spinning operations. Because of the adaptation of high speed technology, sticky cotton is a major threat to cotton production in many countries and plays an important quality consideration in the textile industry. There seems to be limited work reported in reducing the stickiness of infected cotton. Heating the sticky cotton to 130–140 °C for a short time was reported to caramelize the sugars in honeydew to avoid stickiness during spinning (4). The application of a hydrocarbon and surfactant additive to the cotton was reported to eliminate the sticking problem in yarn manufacturing (5). Another approach which has been reported is to spray contaminated cotton bales with dilute solutions of ammonium hydroxide or ammonium nitrate to enhance microbial breakdown of the sugars in honeydew (2). Others have indicated the use of insecticides to control cotton stickiness (6,7). The use of a material called Tempanil®, reported to contain glucose oxidase, applied to contaminated cotton was found to significantly decrease soluble sugars (8). The change in stickiness of the treated cotton was not mentioned. Tempanil® consists of two parts:- a powdered preparation of glucose oxidase and catalase; and, a liquid mixture of non-ionic and anionic wetting agents. / Тчэмпэнил® (Tempanil®). Богатое сахаром выделение Насекомых, высасывающих сок Растений, среди которых Тли и Белокрылки (Хлопковые Совки). На хлопковое волокно, поражённое медовой росой, полагается большая скидка. Сахаристые выделения Хлопковой Тли на волокне Хлопчатника.

HONITON = ОНИТОН – Honiton Lace was made from the XVII century but this is the lace made in the XIX century that made Honiton famous. It was the favourite of Queen Victoria, whose coronation gown was made of Honiton. The queen was so impressed by the quality of the works that she commissioned a second piece as the christening robe of her eldest son, later to be King Edward VII. There is no proof of any lace making at Honiton as lace was made by individual workers who lived in the surrounding villages. The most famous one were Branscombe, Axminster, Beer, Ottery, St Mary, Seaton and Sidmouth. Each area developed a distinctive style. Honiton Bobbin lace may be divided into three branches, Honiton, Honiton Appliqué, and raised Honiton. Raised Honiton:- the lace obtains its name from the raised cord bordering parts of the design, this cord being unlike any other, as it is made on the pillow by the worker as she proceeds, and thereby serves a double purpose:- enriching the lace and making the work easier. The worker can by means of this cord proceed from one part of the design to another where she would otherwise be obliged to cut off the bobbins and restart. People interested by Honiton lace schould visit the Alhalows Museum in Honiton. / Королева Виктчориа (Queen Victoria). Король Эдвод VII (King Edward VII). Онитон Аплике (Honiton Appliqué). Appliqué = Прилепленный.

HONOR = ОПЛАЧИВАТЬ В СРОК (или ИСПОЛНИТЬ ФИНАНСОВОЕ ОБЯЗАТЕЛЬСТВО) – (1) Honor or Honour is a term introduced in the UCP 600 to clarify the obligations of an issuing or confirming bank and remove ambiguity. Honour means:- (i) to pay at sight if the credit is available by sight payment; (ii) to incur a deferred payment undertaking and pay at maturity if the credit is available by deferred payment; and (iii) to accept a bill of exchange (draft) drawn by the beneficiary and pay at maturity if the credit is available by acceptance. To pay at sight if the credit is available by sight payment. / Оплатить по предъявлению, если предоставленный кредит был выдан на условии оплаты по предъявлению.

(2) Honor:- to incur a deferred payment undertaking and pay at maturity if the credit is available by deferred payment.

(3) Honor:- to accept a bill of exchange or draft drawn by the beneficiary and pay at maturity if the credit is available by acceptance.

HOOD = КАПЮШОН (или КАПОР, или ЧЕПЕЦ, или ЧЕПЧИК, или КЛОБУК) – Hood:- a flexible covering for the head and neck; a protective covering for the head and face; an ornamental scarf worn over an academic gown that indicates by its color the wearer's college or university.

HOOK = КРЮК (или КРЮЧОК) – Hook is the device used to pull the lead through the wheel's orifice.

HOOKED = КРЮЧКОВАТОЕ – Hooked:- with a straight basal portion and a tip curved into an arc.

HOOKED BOW = КРЮЧКОВАТЫЙ (или КРЮЧКОВИДНЫЙ) ПЕРЕКОС – Hooked Bow is a fabric condition in which the filling or course yarns are in the proper position for most of the fabric width but are pulled out of alignment at one side of the fabric. See also Double Hooked Bow. Fabrics defect. / уточина или .

HOOKED RUG = СВЯЗАННЫЙ КРЮЧКОМ КОВРИК – Hooked Rug is a rug made by hand or machine using a hook to pull loops of yarn or fabric through a coarse backing or canvas to form a pile.

HOOK REED = БЁРДО С КРЮЧКАМИ (или КРЮЧКОВАТОЕ БЁРДО) – Hook Reed:- this type of reeds is used for beaming and sizing machines. It is the most popular reed on the market for obtaining an end to end or single end lease for your loom beams from a section beam creel. The threading is easy as the cap on the top is removable and the oval rod is provided for laying in the ends. The middle portion of the drawing shows the exclusive dent spacing effect supplied on every hook reed. This ensures a stiff reed while running and an evenly spaced comb when laying in. The hooks are precision formed and highly polished to handle the finest yarn. All parts are rust-proofed. Mind that all hooks must always face the take-up beam. It is recommended to use the single hook reed in all operations with an even number of beams. The double hook reed has a similar construction, but the hook arrangement is changed to allow leasing of odd numbers of section beams. When ordering a double hook type, be sure the thread arrangement illustrated is applicable to your work. Other parameters for hook reeds include:- (i) quantity; (ii) density (dents/m); (iii) total number of dents; (iv) useful length (mm); and (iv) total length (mm). See also Reed. / Смотрите также Бёрдо (Reed).

HOOK REVERSAL = КРЮКООБРАЗНЫЙ РАЗВОРОТ – In visual analysis, Hook Reversal is a single bar reversal pattern (normally on a daily chart) where a new high/low for a trend is accomplished early in the session and then followed by a lower/higher close.

HOOK TO HOOK = ГАК К ГАКУ (или КРЮК К КРЮКУ, или ПРИХВАТ К ПРИХВАТУ) – Liner Term Hook/Hook (LTHH):- given that this is a notional point in chartering terms, this is best described as the Shipper/Receiver arranging for delivery/receival of cargo to/from directly under ships hook and the ship paying for the labor to stow the cargo in the vessels cargo holds, as well as on-board lashing and securing and provision of dunnage materials, and to discharge again over the ship's side. Shore based stevedoring aspects remain the responsibility of the shipper/receiver, however, there are some owners that may incorporate these costs into their LTHH rate. Once again, ask owners to clearly define this aspect. Wharfage charges/dues/taxes can be a contentious issue but are usually considered to be for the Shippers/Receivers account and there may also be many other statutory levies on cargo or freight that may apply. Many Shippers/Receivers are unaware of these additional costs and do not include them into their costing and consequently may be left with an unexpected considerable expense at the completion of a project. Hook To Hook:- describe the period from the time the cargo comes within reach of a vessel's tackle until the cargo leaves it at the discharging port. Hook is the high-capacity J-shaped equipment used to hang various other equipment, particularly the swivel and kelly, the elevator bails or topdrive units. The hook is attached to the bottom of the traveling block and provides a way to pick up heavy loads with the traveling block. The hook is either locked (the normal condition) or free to rotate, so that it may be mated or decoupled with items positioned around the rig floor, not limited to a single direction. / , и разгружать .

HOOPSKIRT = НИЖНЯЯ ЮБКА С ФИЖМАМИ (или ЮБКА С ОБОДАМИ, или ОБВЯЗЫВАЕМАЯ ЮБКА, или КРИНОЛИН) – Hoopskirt is a skirt stiffened with as if with hoops.

HOOT = ЛЕПОТА (или ЛАФА, или БАЛДЁЖ, или ПЕРЕКУР) – Hoot is a maritime slang for a longshore shift between 02:00/03:00 hours and 08:00 hours. / Термин 'Лепота/Лафа/Балдёж/Перекур' относится к разряду морского жаргона и означает период времени ночной портовой смены в промежутке между 02:00/03:00 и 08:00 часами.

HOPPER = ХОППЕР (или ХОПЁ) – Hopper:- funnel-like cargo handling equipment used to measure and direct bulk cargoes such as Wheat or fertilizer into a truck's or ship's hold. May be self-propelled or require towing to manoeuvre into place. / Под Хоппером понимается саморазгружающийся грузовой железнодорожный вагон с кузовом в виде бункера (воронки) для перевозки главным образом сыпучих грузов. Загружается хоппер сверху, разгружается снизу через люки со специальными разгрузочными приспособлениями. В России создано и внедрено в эксплуатацию семейство специальных хопперов для перевозки горячих грузов (агломерата, кокса, окатышей), зерна, технического углерода, цемента. Хоппер (Hopper):- разновидность полувагона. Используется для массовых перевозок сыпучих грузов. Для перевозок цемента, зерна и других сыпучих грузов, требующих защиты от атмосферных осадков, применяются крытые хопперы с загрузочными люками на крыше.

HOPPER BARGE = ГРУНТООТВОЗНАЯ ШАЛАНДА (или ГРУНТООТВОЗНАЯ БАРЖА) – Hopper Barge is a barge which loads material dumped into it by a dredger and discharges the cargo through the bottom. / Баржа, загружаемая донными отложениями, поднимаемыми на борт драгой (агрегатом с многочерпаковым рабочим органом для подводной разработки), и разгружаемыми затем через специальные отверстия в собственном днище. Под Шаландой, от Французского слова Chaland, понимается небольшая баржа для погрузки и разгрузки крупнотоннажных судов на рейде, перевозки земли и тому подобного.

HOPPERBURN = ОЖОГ (или ВЫГОРАНИЕ, или ВЫЖИГАНИЕ) ПРЫГАЮЩИМИ НАСЕКОМЫМИ – Hopperburn is the complete drying up of Rice Plants caused by the extensive feeding by large number of Planthoppers which suck plant sap, e.g., brown Planthoppers Nilaparvata Lugens. / Наездник (Hopper).

HOPPER CAR = ВАГОН–ХОППЕР (или ВАГОН БУНКЕРНОГО ТИПА) – Hopper Car is a railcar that permits top loading and bottom unloading of bulk commodities; some hopper cars have permanent tops with hatches to provide protection against the elements. See also Hopper. / и разгрузку через днище . Смотрите также Хоппер (Hopper).

HOPSACKING = РОГОЖКА (или ТКАНЬ ШАШЕЧНОГО ПЕРЕПЛЕТЕНИЯ, или ТКАНЬ РОГОЖНО–КЛЕТЧАТОГО ПЕРЕПЛЕТЕНИЯ) – Hopsacking is a coarse, open, basket-weave fabric that gets its name from the plain-weave fabric of jute or hemp used for sacking in which hops are gathered. Hopsack or Hopsacking is a rough-surfaced loosely woven clothing fabric. Cotton, wool, linen, rayon, silk, hemp, jute. Basket weave. Made with coarse yarn. Has a rather rough texture and quite durable. Often quite bulky but various weights.

HORIZON = ГОРИЗОНТ (или НЕБОСКЛОН) – Horizon:- a type of light source used in a commercial light box to simulate early morning sunrise, or late afternoon sunset conditions. The correct technical definition for Horizon light is as follows:- a simulated horizon sunlight source providing a color temperature of 2 300 ±200 Kelvin (K) at a minimum illumination of 80 ft/candles.

HORIZONTAL AND DIRECTIONAL DRILLING = ГОРИЗОНТАЛЬНОЕ И НАПРАВЛЕННОЕ БУРЕНИЕ – Horizontal And Directional Drilling:- following a conventional vertical drilling, it is possible to change direction and drill horizontally or directionally. The approach is particularly useful in increasing the yield from thin layers of oil deposits without needing to drill additional bore holes. / Под Наклонно-Направленным Бурением понимается бурение скважины с отклонением от вертикали (до нескольких километров). Применяется для вскрытия и эксплуатации залежей нефти, находящихся под участками, недоступными для установки буровых вышек (заболоченные места, реки, крутые овраги, бурение с берега под дно моря и другие), а также для глушения нефтяных и газовых фонтанов. Его применяют также для проходки взрывных скважин.

HORIZONTAL ARCH = ГОРИЗОНТАЛЬНЫЙ СВОД (или ГОРИЗОНТАЛЬНАЯ ДУГА) – The Horizontal Arch is measured from the beginning of the bone under the armpit, through the nipple and until the end of the bone between the breasts (Note:- measurements are not rounded). The horizontal arch should be measured in a underwire soft bra (push up bra does not fit).

HORIZONTAL BAND OF DIFFERENT COLOR = ГОРИЗОНТАЛЬНАЯ ПОЛОСА ОТЛИЧАЮЩЕГОСЯ ЦВЕТА – Horizontal Band Of Different Color on bottom of T-shirt. Possible Cause:- this happens due to a change of bobbin in the knitting machine. Different lots of yarn can have slight shade variations which can produced shade differences in fabric. Technically a major defect should not make its way to a garment. This variation was not visible when the article was bought. However, was very apparent when the shirt was worn in sunlight. Knitting defect.

HORIZONTAL EXPORT TRADING COMPANY = ГОРИЗОНТАЛЬНО ИНТЕГРИРОВАННАЯ ВЫВОЗНАЯ ТОРГОВАЯ КОМПАНИЯ (или ГОРИЗОНТАЛЬНО ИНТЕГРИРОВАННАЯ ЭКСПОРТНАЯ ТОРГОВАЯ КОМПАНИЯ) – Horizontal Export Trading Company is an export trading company which exports a range of similar or identical products supplied by a number of manufacturers or other producers. Webb-Pomerene Organizations, trade-grouped organized export trading companies, and an export trading company formed by an association of agricultural cooperatives are the prime examples of horizontally organized export trading companies. See also Webb-Pomerene Act Of 1918. / Вэб-Помэринские Организации (Webb-Pomerene Organizations). Смотрите также Акт Вэба-Помэрина От 1918 (Webb-Pomerene Act Of 1918).

HORIZONTAL FLAME TEST = ИСПЫТАНИЕ НА ГОРИЗОНТАЛЬНУЮ ВОСПЛАМЕНЯЕМОСТЬ (или ТЕСТ ПО ГОРИЗОНТАЛЬНОМУ ОКРАШИВАНИЮ ПЛАМЕНИ) – Horizontal Flame Test is a test for flame resistance in which a specimen is mounted in a horizontal holder and exposed to an open flame for a specific time to measure burning rate and char-hole diameter. Horizontal Flame Test measures the burning rate of automotive interior materials when subjected to a 1.5" flame. Burning rate is calculated. This is mandatory for all automotive fabrics. See also Flammability Tests.

HORIZONTAL LINE = ГОРИЗОНТАЛЬНАЯ ЛИНИЯ – Horizontal Line is any line lying in a horizontal plane. See also Ring. Horizontal Line is:- (1) a narrow band around hosiery appearing different from the rest of the hose. Principal causes:- variations in yarn size, dye, absorption, or luster. (2) The device that carries the traveler up and down the package in ring spinning. Also see Ring Spinning.

HORIZONTAL LIP = ГОРИЗОНТАЛЬНАЯ КРОМКА – Horizontal Lip is a horizontal projection of the top deck beyond the stringers or blocks intended for load-retention purposes (e.g., shrink or stretch wrap), which is not intended to be used for lifting. See also Pallet. / Горизонтальная Кромка:- горизонтальный выступ верхнего настила, предназначенный для крепления ограждающих приспособлений, поддерживающих груз, но не предназначенный для подъёма груза. Смотрите также Поддон (Pallet).

HORIZONTAL OPTION SPREAD = ГОРИЗОНТАЛЬНАЯ КУРСОВАЯ РАЗНИЦА ОПЦИОНОВ (или ГОРИЗОНТАЛЬНЫЙ СПРЭД ОПЦИОНОВ) – Horizontal Option Spread:- the options vary with respect to maturity but not strike price. Also called a Calendar Spread.

HORIZONTAL RESISTANCE = ГОРИЗОНТАЛЬНАЯ РЕЗИСТЕНТНОСТЬ (или ГОРИЗОНТАЛЬНАЯ СОПРОТИВЛЯЕМОСТЬ, или ГОРИЗОНТАЛЬНАЯ УСТОЙЧИВОСТЬ) – Horizontal Resistance is a resistance governed by many genes of minor effects which provide resistance (usually moderate) to any (or all) diseases or insect biotype of a given species, but can be easily affected by the environment, e.g., a variety may be susceptible in the greenhouse but may be resistant in the field or vice versa. A type of resistance expressed equally against all biotypes of a pest species. It does not involve a gene-for-gene relationship.

HORIZONTAL SPREAD = ГОРИЗОНТАЛЬНАЯ КУРСОВАЯ РАЗНИЦА (или ГОРИЗОНТАЛЬНЫЙ СПРЭД) – Horizontal Spread is an option spread involving the simultaneous purchase and sale of options of the same class and strike prices but different expiration dates. The purchase of either a call or put option and the simultaneous sale of the same type of option with typically the same strike price but with a different expiration month. Also known as Calendar Spread and Time Spread. Horizontal Spread is an options strategy involving the simultaneous purchase and sale of two options of the same type, having the same strike price, but different expiration dates. An example of this would be the purchase of a December 20 call and the sale of a June 20 call. This strategy is used to profit from a change in the price difference as the securities move closer to maturity. Also referred to as Calendar Spread, or Time Spread. See also Diagonal Spread, and Vertical Spread. The Horizontal Spread refers to a family of spreads involving options of the same

underlying stock, same strike prices, but different expiration month. They can be created with either all calls or all puts. Horizontal Spread is the options strategy that involves buying and selling the same number of options contracts with the same exercise price, but with different maturity dates; also called a Calendar Spread. For instance, an investor might buy ten XYZ call options with a striking price of USD70 and a maturity date of October. At the same time, he would sell ten XYZ call options with the same striking price of USD70 but a maturity date of July. The investor hopes to profit by moves in XYZ stock by this means. Horizontal Spreads have two options with the same strike price but different expirations. This type of spread, also known as a Calendar Spread, is neither bearish or bullish, it will profit as a result of the time premium on the short leg eroding faster then the time premium on the long leg. / Горизонтальная Курсовая Разница или Горизонтальный Спрэд – опционная стратегия, заключающаяся в покупке и продаже одного и того же количества опционных контрактов с одной и той же ценой исполнения, но с различными сроками исполнения; называется также Календарным Спрэдом (Calendar Spread). Например, инвестор может приобрести 10 опционов на покупку акций компании XYZ со сходной ценой в 70 Долларов и сроком исполнения в Октябре. В то же время он продаёт 10 опционов на покупку акций компании XYZ с такой же ценой исполнения в 70 Долларов, но со сроком исполнения в Июле. Таким образом, инвестор надеется получить прибыль от изменения цены акций компании XYZ.

HORIZONTAL STRIPES = ГОРИЗОНТАЛЬНЫЕ ПОЛОСКИ – Horizontal Stripes are caused by unevenness in the courses. They traverse horizontally and repeat themselves regularly or irregularly. Causes:- (i) yarn feeder set badly; (ii) differences in the yarn running-in tension; and (iii) jerky impulse from fabric take up. Mending:- non mendable. Knitted fabric defect.

HORIZONTHALONIUS = ХОРИЗОНТАЛОНИУС (или ГОРИЗОНТАЛЬНОЕ) – Horizonthalonius:- with a flat, level disc.

HORMONE = ГОРМОН – Hormone is a chemical substance produced in a plant tissue, capable of diffusing or transport to other parts where it's presence or gradients regulates specific functions such as abscission, differentiation, flowering, growth and tropisms. Hormone is the regulatory substance that controls metabolism and development, acts at low concentrations (e.g., less than one ppm, micromolar) and at a distance from its site of synthesis. / , рост и тропизмы. Под Гормонами, от Греческого слова Hormáō, означающее Возбуждаю или Привожу В Движение, понимаются биологически активные вещества, вырабатываемые в организме специализированными клетками или органами (железами внутренней секреции) и оказывающие целенаправленное влияние на деятельность других органов и тканей. Позвоночные животные и человек имеют развитую систему таких желёз (гипофиз, надпочечники, половые, щитовидная и другие), которые посредством гормон, выделяемых в кровь, участвуют в регуляции всех жизненно важных процессов – роста, развития, размножения, обмена веществ. Развитые эндокринные железы есть и у высокоорганизованных беспозвоночных – Головоногих Моллюсков, Насекомых, Ракообразных. Секретируемые ими гормоны контролируют рост, линьку, метаморфоз, половое размножение и другое. Каждый из гормон влияет на организм в сложном взаимодействии с другими гормонами; в целом гормональная система совместно с нервной системой обеспечивает деятельность организма как единого целого. Химическая природа гормон различна – белки, пептиды, производные аминокислот, стероиды. Гормоны, используемые в медицине, получают химическим синтезом или выделяют из соответствующих органов животных. О гормонах растений смотрите Фитогормоны.

HORMUZ = ОРМУЗСКИЙ (или ХОРМУЗСКИЙ) – The narrow Strait of Hormuz is considered one of the most, if not the most strategic strait of water on the planet. Through its waters, in giant ocean-going tankers, passes much of the oil from Bahrain, Iran, Iraq, Kuwait, Qatar, Saudi Arabia and the United Arab Emirates. Bordered by Iran, Oman's Musandam Peninsula and the United Arab Emirates, this stretch of water is of obvious military significance, and subsequently, the US Navy and others patrol its waters. According to historians, the name 'Hormuz' is derived from a variation of the Persian God named Hormoz, or from the Persian word Hurmogh – meaning date Palm Tree. In 1988, just a few miles to the South of Qeshm Island, the United States Navy cruiser, USS Vincennes (accidentally?) shot down an Iranian Air Bus passenger jet with 290 people aboard, and to this day that controversial action has yet to fully explained to the satisfaction of all parties. The Strait of Hormuz is the sea-passage out of the Persian Gulf between Iran on the Eastern shore and the United Arab Emirates (UAE) and Oman on the West. The Strait of Hormuz forms a strategic link between the oil fields of the Persian Gulf, which is a maritime dead end, the Gulf of Oman and the Indian Ocean. It has a width between 48 and 80 km, but navigation is limited to two 3 km wide channels, each exclusively used for inbound or outbound traffic. Circulation in and out of the Persian Gulf is thus highly constrained, namely because the sizable amount of tanker and container ship traffic makes navigation difficult along the narrow channels. In addition, islands that ensure the control of the strait are contested by Iran and the United Arab Emirates. The security of the strait has been often compromised and its commercial usage has been the object of contentions. Between 1984 and 1987 a 'Tanker War' took place between Iran and Iraq, during the Iran-Iraq War (1980–88), where each belligerent began firing on tankers, even neutrals, bound for their respective ports. Shipping in the Persian Gulf dropped by 25 percent, forcing the intervention of the United States to secure the oil shipping lanes. About 88 percent of all the petroleum exported from the Persian Gulf transits through the Strait of Hormuz, bound for Asia, Western Europe and the United States. Its importance for global oil circulation cannot be overstated. For instance, 75 percent of all Japanese oil imports transit through the strait. There are thus very few alternative outlets to oil exports if the traffic of about 14 Mb/d going through Hormuz were compromised. In addition to geopolitics, the geography of the Middle East creates challenges for petroleum distribution. The first is the concentration of reserves around the Persian Gulf (Saudi Arabia, Kuwait, Iraq, Iran and the United Arab Emirates) leaving the Strait of Hormuz as one of the only viable outlets to export oil using large oil tankers. The second is the constrained access to the main European markets through the Suez Canal, whereby a fully laden VLCC cannot transit through the canal and must round Africa. While the Persian Gulf has conventionally been centered on oil production and distribution, the growth of container shipping has also expanded its commercial importance. For instance, Dubai ranked in 2010 as the world's ninth largest container port with traffic above 11.6 million TEU but it can only be accessed through the Strait of Hormuz. It has become a major transshipment hub linking the main Asian, Middle Eastern and East African trade routes. Consequently, compromising circulation through the Strait of Hormuz would impair global oil trade as well as commercial trade along Europe/Asia routes. / Ормузский или Хормузский Пролив (Strait of Hormuz) – морской путь из Персидского Залива (Persian Gulf) между Ираном с восточной стороны и Объединёнными Арабскими Эмиратами (ОАЭ) и Оманом с западной. Ормузский или Хормузский Пролив между Аравийским Полуостровом и материковой частью Азии, соединяет Персидский и Оманский заливы. Длина Ормузского Пролива составляет 195 километров, наименьшая ширина – 54 километра. Глубина на фарватере составляет 27.5 метров. Основной порт – Бендер Аббас (Bandar-e Abbas), столица Остана Хормозган (Ostan-e Hormozgān), Иран; с 22 Июля 2008 название этого порта было изменено на новое – Порт Специальная Экономическая Зона имени Шахида Раджи (Shahid Rajaee Special Economic Zone или Shahid Rajaee SEZ).

HORORATA TARTAN© = ХОРОРАТЧАВСКАЯ КЛЕТКА© – The Hororata Tartan© incorporates specially selected colors which represent the area of Hororata villiage in New Zealand, including red to represent the native Rata Tree after which Hororata was named and yellow and black to symbolize the local sports teams and school. Wilton xxx one of the world xxx leading tartan designers xxx offered to design Hororata xxx very own tartan to help raise money after an earthquake. The fabric would be woven in Scotland and gifted to the local community. Xxxxx. The Hororata Tartan© was designed and gifted to the people of Hororata. This Tartan is designed with six colors, each color chosen to symbolise what it means to be from the Hororata region:- (i) red represents our native

Rata tree's flower of which HoroRATA was named; (ii) white represents the snow that blankets our mountains each winter; (iii) blue represents the rivers and waterways that bring life and enjoyment; (iv) green represents the grass and pounamu; (v) our region has three primary schools, and their colors are all represented:- black and yellow for Hororata School, green and white for Windwhistle School and blue and black for Glentunnel School. You can join Clan Hororata by purchasing your own Hororata Tartan© Kilt. Personally tailored for you by the New Zealand Kilt Company (Hororata, New Zealand). Also available in the Hororata Tartan© we have ties and scarves. By purchasing a Hororata Tartan© garment, you will a contributing to the Hororata Community Trust thus become an honorary member of Clan Hororata. The Hororata Tartan© was modelled by Miss Scotland Jennifer Reoch (2011) with renowned Glasgow based photographer Neil Macmillan taking the stunning photographs on the grounds of Cameron House, Loch Lomond. This is a vibrant Tartan which will bring any garment to life. / Хороратча Тартэн© (Hororata Tartan©). Вилтчэн (Wilton). Мисс Шотландия 2011 Дьженифё Риок (Miss Scotland Jennifer Reoch (2011)) фотографом Нилом Мэкмилэн (Neil Macmillan) Камёрэн Хаус, Лох Ломэнд (Cameron House, Loch Lomond).

HORSEHAIR = КОНСКИЙ ВОЛОС – Horsehair:- fibers that are hair from the mane and tail, for the most part, of Canadian and Argentine horses. It is occasionally used for upholstery, but is more commonly used in interfacings for stiffening and strength. It is always combined with other fibers. True horsehair is rare and fabrics loosely called horsehair are often made from other hairs (such as goat) or man-made fibers. Horsehair:- cloth made from horsehair.

HORSE LATITUDES = КОНСКИЕ ШИРОТЫ (или ЛОШАДИНЫЕ ШИРОТЫ, или ШТИЛЕВЫЕ ЗОНЫ) – Horse Latitudes (maritime term):- the latitudes on the outer margins of the trades where the prevailing winds are light and variable.

HORSEPOWER = ЛОШАДИНАЯ СИЛА – Horsepower (hp or HP or Hp) is the name of several non-SI units of power. It was originally defined to allow the output of steam engines to be measured and compared with the power output of draft horses. The horsepower was widely adopted to measure the output of piston engines, turbines, electric motors and other machinery. Different regions adopted different definitions of the unit. Most countries now use the SI unit 'Watt' for measurement of power. The definition of a horsepower unit is different in different applications; application outside of the context of a particular definition will be inaccurate:- (i) One Mechanical Horsepower of 550 foot-pounds per second is equivalent to 745.7 Watts. (ii) A Metric Horsepower of 75 kgf·m per second is equivalent to 735.499 Watts. (iii) A Boiler Horsepower is used for rating steam boilers and is equivalent to 34.5 pounds of water evaporated per hour at 212 degrees Fahrenheit, or 9 809.5 Watts. (iv) One Horsepower for rating electric motors is equal to 746 Watts. (v) A Pferdestärke is a name for a group of similar power measurements used in Germany around the end of the XIX century, all of about one metric horsepower in size. Metric horsepower began in Germany in the XIX century and became popular across Europe and Asia. The various units used to indicate this definition (PS, CV, pk, and ch) all translate to 'horse power' in English, so it is common to see these values referred to as 'horsepower' or 'hp' in the press releases or media coverage of the German, French, Italian, and Japanese automobile companies. British manufacturers often intermix metric horsepower and mechanical horsepower depending on the origin of the engine in question. Metric horsepower, as a rule, is defined as 0.735 498 75 kW, or roughly 98.6% of mechanical horsepower. This was a minor issue in the days when measurement systems varied widely and engines produced less power, but has become a major sticking point today. Exotic cars from Europe like the McLaren F1 and Bugatti Veyron are often quoted using the wrong definition, and their power output is sometimes even converted twice because of confusion over whether the original 'horsepower' number was Metric or mechanical. The Dutch 'Paardenkracht' (pk), the Swedish 'Hästkraft' (hk), the Finnish 'Hevosvoima' (hv), the Norwegian and Danish 'Hestekraft' (hk), the Hungarian 'Lóerő' (LE), the Czech-Slovak 'Koňská Síla' (k or ks), the Serbo-Croatian 'Konjska Snaga' (k or ks) and the Polish 'Koń Mechaniczny' (KM) all equal the German 'Pferdestärke' (PS). In Italian ('Cavalli'), Spanish ('Caballos'), and Portuguese ('Cavalos'), 'CV' is the equivalent to the German 'PS'. It is also used as the French term for the Pferdestärke, but in French, this should be written in lowercase letters as 'cv'. See also Chevaux, Chevaux Vapeur, Pferdestärke, and Watt. Horsepower is the unit of power equal to 745.7 Watts. / Мэкларэн Эф.Уан. (McLaren F1) и Бугати Вэйрон (Bugatti Veyron). Нидерландское Пардэнкрахт (Пэй.Ка.; paardenkracht (pk)); Шведское хэсткрафт (Хо.Ко.; hästkraft (hk)), Финское хэвосвойма (Хо.Вэ.; hevosvoima (hv)), Норвежское и Датское хэстэкрафт (Хо.Ко.; hestekraft (hk)), Венгерское луэрль (Эль.Э.; lóerő (LE)), Чехо-Словацкое коньска сила (К. или К.С.; koňská síla (k или ks)), Сербо-Хорватское коньска снага (Кё. Или Кё.Со.; konjska snaga (k или ks)) и Польское Конь Мэханичны (Ка.Эм.; koń mechaniczny (KM) или лошадиная сила (лс)) всё это равноценно Немецкому Фиэдэштакэ (Пэ.Эс.; Pferdestärke (PS)). Лошадей по-Итальянски Кавалли (Cavalli), по-Испански Кавайос (Caballos) и по-Португальски Кавалюс (Cavalos), . Смотрите также Фиэдэштакэ или Лошадиная Сила (Pferdestärke), Шво или Лошадей (Chevaux), и Шво Вапёр или Лошадиный Пар (Chevaux Vapeur). Лошадиная Сила, устаревшая внесистемная единица мощности; была введена в XVIII веке, продолжает применяться в ряде отраслей техники (главным образом в автомобилестроении и тракторостроении). Обозначается л.с., PS (Pferdestärke, Немецкий), CV (cheval-vapeur, Французский), HP или hp (horsepower, Английский). В бывшем Союзе Советских Социалистических Республик (СССР) и некоторых других странах 1 л.с. (1 PS, 1 CV) = 75 кгс·м/сек = 736 Вт. В США, Великобритании и других странах 1 hp = 550 фут·фунт/сек = 746 Вт. Лошадиная Сила относится к устаревшей, не подлежащей применению, но время от времени используемой внесистемной единицей мощности. Обозначение:- л.с.. 1 лс (метрическая) = 75 кгс·м/с = 735.499 Вт. В Великобритании и Соединённых Штатах Америки применяют лошадиную силу, которая обозначается hp и равна 745.7 Вт.

HORSETAIL LINING CLOTH = ПОДКЛАДОЧНОЕ ПОЛОТНО ИЗ ЛОШАДИНОГО ХВОСТА – Horsetail Lining Cloth:- the natural horsetail is a kind of materials with high elasticity, softness but sturdiness. So the horsetail lining cloth made of horsetail is the necessary accessories for western suits. It is a kind of plain cloth made of cotton yarn or T/C yarn as warp and whole good spring natural horsetail hair as weft. High elasticity, wrinklefree, softness but sturdiness is their most outstanding feature. It is really the ideal material for the lining cloth. Core-spun horsetail cloth is a kind of never-ending yarn spun by three-cord cotton thread with the horsetail. The core-spun horsetail lining cloth takes the cotton yarn as warp, and core-spun horsetail cloth as weft. Compared with horsetail lining cloth, it is wider, thicker, more elastic. So it is better to act as material of shoulder pads, wind coats, over coats, full dress, military suits, etc and it could be used together with horsetail lining cloth. Hair Interlining adopts wool and camel hair as the raw materials and is processed with special finishing. It can also be made with horse hair core-spun yarns and chemical filament fiber. Due to its particular structures and the adoption of sizing and resin finishing of base cloth, the finished interlining boasts anisotropic features. It bears excellent drapability warp-wise and distinguished elasticity weft-wise. Besides, the interlining is characteristic of a soft handle and excellent shape retention. The shrinkage after dry wash and water wash is both unnoticeable, compared to that of pure wool or blended fabrics. The hair interlining can be adopted as the front interlining, bias strip and cuff interlining of top-grade business suits, ceremonial dresses and suits.

HORT = ПЛОДОВОДСТВЕННОЕ (или САДОВОЕ) – Hort:- as part of a species name means 'associated with gardens', 'of garden or horticultural origin'. Usually applied to a selected form or cultivar or hybridized so that the true origin is obscure. / 'ассоциируемое с садами', 'о садовом или плодоводственном происхождении'.

HORTICULTURE = ПЛОДОВОДСТВО (или САДОВОДСТВО) – Horticulture is the science of growing plants for decorative effect or for consumption as food. / Под Плодоводством понимается отрасль растениеводства. Направления:- собственно Плодоводство (получение плодов Абрикоса, Вишни, Груши, Инжира, Персика, Сливы, Хурмы, Черешни, Яблони и других), ягодоводство (выращивание Земляники, Клубники, Крыжовника, Малины, Смородины и других), питомниководство (выращивание посадочного материала плодовых культур в питомниках). В бывшем Союзе Советских Социалистических Республик (СССР) в 1960 плодовых садов и ягодников 2.92 миллиона га, валовой сбор продукции 3.07 миллиона тонн (т); в 1984 соответственно 3.1 миллиона га, 10.0 миллионов т. Наибольшие площади в России, Украине, Узбекистане, Грузии. Выращивали более 1 500 сортов 34 культур. За рубежом плодоводство развито в Аргентине, Болгарии, Индии, Италии, Соединённых Штатах Америки (США), бывшей Югославии и других странах. Под Садоводством понимается отрасль растениеводства; выращивание плодовых культур, декоративных (декоративное садоводство), в том числе комнатных (комнатное садоводство) растений.

HOSE = ЧУЛКИ (или РУКАВ, или ВЯЗАНОЕ ИЗДЕЛИЕ В ФОРМЕ РУКАВА) – Hose:- a cloth leg covering that sometimes covers the foot; stocking, sock; a close-fitting garment covering the legs and waist that is usually attached to a doublet by points; short breeches reaching to the knee.

HOSIERY HOSE = ТРИКОТАЖНЫЕ ЧУЛКИ (или ТРИКОТАЖНЫЙ РУКАВ) – Hosiery Hose:- knitwear (chiefly British).

HOST = ХОЗЯИН (или НОСИТЕЛЬ) – Host is the organism on or in which a parasite lives and from which it derives its nourishment. Sometimes also used for the plant on which an epiphyte lives. Host is the organism on which a parasite lives or the plant on which a pest feeds. / Носитель, например, вируса. Под Хозяином понимается организм на или в котором живёт паразит и от которого он добывает своё питание.

HOST EVASION = УКЛОНЕНИЕ ХОЗЯИНА (или УСКОЛЬЗАНИЕ ХОЗЯИНА) – Host Evasion is a type of pseudoresistance where the Plant evades Insect injury by passing through the susceptible stage quickly or when insect numbers are low. An example is an early-maturing variety which is harvested before the Insects reach damaging levels.

HOSTILE TAKEOVER = НЕПРИЯЗНЕННОЕ ПОГЛОЩЕНИЕ (или ВРАЖДЕБНОЕ ПОГЛОЩЕНИЕ) – Hostile Takeover is a corporate takeover attempt that is strongly resisted by the target firm. This often leads to low morale among employees. Usually such an attempt is made by a competitor that thinks he can acquire a company at a bargain price and/or to eliminate competition. This often happens when market conditions are poor and valuation multiples are lower making acquisition targets more appealing. Hostile Takeover is a takeover that occurs without the approval of the target corporation's board of directors. Hostile Takeover is the acquisition of one company (called the Target Company) by another (called the Acquirer) that is accomplished not by coming to an agreement with the target company's management, but by going directly to the company's shareholders or fighting to replace management in order to get the acquisition approved. A hostile takeover can be accomplished through either a tender offer or a proxy fight. The key characteristic of a hostile takeover is that the target company's management does not want the deal to go through. Sometimes a company's management will defend against unwanted hostile takeovers by using several controversial strategies including the poison pill, crown-jewel defense, golden parachute, pac-man defense, and others. Hostile Takeover:- disapproval of, or open resistance from, its board of directors. The acquirer ('raider') usually takes the takeover offer direct to the target firm's stockholders (shareholders) or seeks their approval to remove the obstructing board members. Mergers and Acquisitions (M&A):- these two words represent how companies buy, sell and recombine businesses. They're also the reason why today's corporate landscape is a maze of conglomerations. Insurance companies own breakfast cereal makers, shopping mall outlets are part of military manufacturing groups, and movie studios own airlines, all because of mergers and acquisitions. Not all M&As are peaceful, however. Sometimes, a company can take over another one against its will – a hostile takeover. Hostile Takeover is a takeover of a company (usually made by an open tender offer to shareholders) against the wishes of the current management and the Board of Directors by an acquiring company or raider. Hostile Takeover is the acquisition of one company by another without the consent of the target company's board of directors. Generally speaking, a hostile takeover involves the acquiring company buying stock directly from shareholders, sometimes by offering a particularly high price. The acquiring company may buy up to 5% of the target company without registering the move with the US Securities and Exchange Commission (SEC). See also Corporate Raider, and Friendly Takeover. / Враждебное Поглощение – поглощение компании против воли её руководства и совета директоров. Такое поглощение может быть предпринято другой компанией или захватчиком (raider), получившим хорошую финансовую поддержку. Если цена предложения достаточно высока, акционеры могут согласиться на предложение о поглощении, даже если руководство компании будет возражать и утверждать, что компания на самом деле стоит гораздо больше. Если поглотитель предложит достаточно высокую цену, руководство компании может изменить своё отношение к сделке, представляя враждебное поглощение дружественным. В распоряжении руководства компании имеется много способов противостояния поглощению, среди прочих 'зелёный шантаж' (greenmail), 'ядовитые пилюли' (poison pills), 'выжженная земля' (scorched earth), 'пилюли самоубийства' (suicide pills). Также называется недружественным поглощением (unfriendly takeover). Смотрите также Takeover.

HOST INTRUSION PREVENTION SYSTEMS = СИСТЕМЫ ПРЕДОТВРАЩЕНИЯ ВТОРЖЕНИЯ В ХОЗЯИНА – Host Intrusion Prevention Systems (HIPS) protect your system from malware and unwanted activity likely to interfere with the running of your computer. A HIPS generally works on a different principle to an anti-virus scanner – it monitors entry points into the system (and specific system activities, such as process creation, driver loading, etc) and blocks suspected intrusion attempts (or prompts the user to allow or reject a suspicious activity).

HOSTLER = КОНЮХ – Hostler is a driver who moves container within the same facility or between two facilities in the same general area.

HOST NAME = НАИМЕНОВАНИЕ ХОЗЯИНА – Host Name is the unique name used to identify a computer on a network. / Уникальное наименование, используемое для идентификации компьютера в сети.

HOST PEST LIST = СПИСОК ВРЕДИТЕЛЕЙ ХОЗЯЕВ – Host Pest List is a list of Pests that infest a Plant Species, globally or in an area.

HOST PLANT = РАСТЕНИЕ ХОЗЯИН – Host Plant is a plant that provides nourishment and protection to a parasitic organism, living Plant, or Animal.

HOST PLANT RESISTANCE = СОПРОТИВЛЯЕМОСТЬ РАСТЕНИЯ ХОЗЯИНА – Host Plant Resistance is the relative genetic ability of a cultivar to produce a larger or higher quality crop compared with other cultivars exposed to the same infestation level.

HOST RANGE = КРУГ ХОЗЯЕВ (или ДИАПАЗОН ХОЗЯЕВ) – Host Range:- species capable, under natural conditions, of sustaining a specific pest or other organism. Host Range:- the various kinds of plants that may be attacked by a pathogen or insect.

HOST RESISTANCE = СОПРОТИВЛЯЕМОСТЬ ХОЗЯИНА – Host Resistance is a plant that is resistant to or tolerant of attacks of parasites or pathogens by evolving morphological or physiological modifications.

HOST–SPECIFICITY TESTING = ТЕСТИРОВАНИЕ НА СПЕЦИФИЧНОСТЬ В ОТНОШЕННИИ ХОЗЯЕВ – Host-Specificity Testing is a process by which the range of plants at risk from attack by a biological control agent in the field is determined.

HOT AIR EMASCULATION = ЭМАСКУЛЯЦИЯ ГОРЯЧИМ ВОЗДУХОМ (или КАСТРАЦИЯ ГОРЯЧИМ ВОЗДУХОМ) – Hot Air Emasculation is the use of hot air to open and force the floret to remove or kill the anther. / пыльник (anther). Эмаскуляция – удаление несозревших пестиков у цветков. Под Кастрацией, от Латинского слова Castratio, означающее Оскопление, понимается:- (1) у человека – удаление половых желёз (яичек, яичников) хирургическим путём или подавлением их функции другими методами (гормоны, облучение) преимущественно при опухолях. (2) У животных – удаление половых желёз у самцов и самок с хозяйственными и реже лечебными целями. Кастрированные сельскохозяйственные животные более спокойны, лучше откармливаются, их мясо вкуснее, питательнее.

HOT–AIR SHRINKAGE = УСАДКА ПОД ГОРЯЧИМ ВОЗДУХОМ – Hot Air Shrinkage is the yarn length reduction caused by hot air treatment, expressed as a percentage of the initial yarn length. We distinguish between free shrinkage and shrinkage under pretension. (1) Free Shrinkage:- after the measurement of the yarn length (L1) under 1cN/Tex pretension, the sample is submitted free of tension to a defined temperature (usually between 100 °C and 200 °C; for Nexis Fibers:- 180 °C) for 15 minutes. After a cooling time of 1 hour under standard atmospheric conditions, the shrunk yarn is measured again under 1 cN/Tex pretension to define its shrunk length (L2). The residual shrinkage is defined as:- ((L1 – L2) x 100) / L1. (2) Shrinkage Under Pretension:- the yarn sample is introduced under a pretension of 0.1 cN/Tex into a heated channel. The induced yarn shrinkage, in percentage of the initially introduced yarn length, is read directly from a scale. The test conditions are:- (i) 15 minutes at 180 °C for Polyamide 6 yarns; (ii) 10 minutes at 180 °C for Polyamide 6.6 yarns < 940 dtex; and (iii) 15 minutes at 180 °C for Polyamide 6.6 yarns ≥ 940 dtex. Generally, Hot-Air Shrinkage is the reduction in the dimensions of a fabric, yarn, or fiber induced by exposure to dry heat. Specifically, a fundamental property of fibers.

HOT AIR SHRINKAGE, AFTER TREATMENT = УСАДКА ОТ ГОРЯЧЕГО ВОЗДУХА, ПОСЛЕ ОБРАБОТКИ – Hot Air Shrinkage, After Treatment is the decrease in length of a test specimen caused by a treatment in hot air under specified temperature and time, expressed as a percentage of the length of the untreated test specimen. The lengths are measured before and after treatment under a specified pretension. See also Shrinkage.

HOT AIR SHRINKAGE, DURING TREATMENT = УСАДКА ОТ ГОРЯЧЕГО ВОЗДУХА, В ТЕЧЕНИЕ ОБРАБОТКИ – Hot Air Shrinkage, During Treatment is the decrease in length of a test specimen caused by a treatment in hot air under specified temperature and time, expressed as a percentage of the length of the untreated test specimen. The lengths are measured before (under a specified pretension) and during treatment (under a specified measuring tension). See also Shrinkage.

HOT AIR SHRINKAGE FORCE = СИЛА УСАДКИ ПОД ГОРЯЧИМ ВОЗДУХОМ – Hot Air Shrinkage Force is the shrinkage force in cN resulting from the hot air treatment at 180 °C, under a pretension of 0.1 cN/Tex.

HOTEL = ХОТЭЛ – Hotel (pronunciation:- hoh-TELL) or H is international nautical signal flag meaning:- I have a pilot on board.

HOTEL FINANCING = ФИНАНСИРОВАНИЕ ГОСТИНИЦ (или ФИНАНСИРОВАНИЕ ГОСТИНИЧНОГО БИЗНЕСА) – Hotel Financing is a financing especially adapted to the needs and practices of the hotel industry. For banking institutions, hotel financing is an important facet of the commercial lending business in tourist regions. / Финансирование, специально адаптированное под нужды и хозяйственную деятельность гостиничного сектора экономики. Для банковских учреждений финансирование гостиничного бизнеса является важным аспектом коммерческого ссудного бизнеса в туристических регионах.

HOT–HEAD PRESS = ГОРЯЧЕНАПОРНЫЙ ПРЕСС – Hot-Head Press is a pressing machine capable of generating high temperatures and pressures. Used for pressing and processing permanent-press fabrics.

HOT INSTALMENTS = ГОРЯЧИЕ САМОСТОЯТЕЛЬНЫЕ ВЫПУСКИ – Hot Instalments:- if you have a strong positive view about a share and an appetite for risk, consider Macquarie Hot Instalments. They give you the potential for highly leveraged returns on more than 40 leading Australian shares. You pay 5–30% of the price upfront and enjoy the dividend and franking creditabenefits of share ownership. Also known as High Yield Installments.

HOT ISSUES = ГОРЯЧИЕ ЭМИССИИ (или ГОРЯЧИЕ ВЫПУСКИ) – Hot Issue:- newly issued stock that is in great public demand. Hot issue stocks usually shoot up in price at their initial offering, since there is more demand than there are shares available. Special National Association of Securities Dealers rules apply to the distribution of hot issues by the selling investment banking syndicate. Newly issued securities strongly oversubscribed in the primary market and often traded at higher-than-issue prices in the secondary market. Hot Issue:- newly issued stock that is in great public demand. Hot issue stocks usually shoot up in price at their initial offering since there is more demand than there are shares available. Also known as Hot New Issue. / Вновь эмитируемые ценные бумаги, серьёзно перевыписанные на первичном рынке, и часто торгуемые на вторичном рынке по ценам выше цен на момент выпуска. Горячий Выпуск – новые акции, пользующиеся высоким спросом. Акции горячего выпуска обычно резко вырастают в цене при их первоначальном предложении, поскольку спрос сильно превышает предложение имеющихся акций. При размещении горячих выпусков через банковские синдикаты, продающие ценные бумаги, применяются специальные правила Национальной Ассоциации Дилеров по Ценным Бумагам (Special National Association of Securities Dealers rules).

HOT–MELT ADHESIVE = ТЕРМОПЛАВКИЙ КЛЕЙ (или ТЕРМОПЛАВКИЙ АДГЕЗИВ) – Hot-Melt Adhesive is a solid material that melts quickly upon heating, then sets to a firm bond upon cooling. Use of this type adhesive provides almost instantaneous bonding. Hot-Melt Adhesive is an adhesive that is applied in a molten state and forms a bond on cooling to a solid state. / Термоплавкий Клей – адгезив, который наносится в расплавленном состоянии и формирует сцепление при охлаждении до твёрдого состояния.

HOT MONEY = ГОРЯЧИЕ ДЕНЬГИ – (1) Hot Money is:- (1) a money that flows regularly between financial markets as investors attempt to ensure they get the highest short-term interest rates possible. Hot money will flow from low interest rate yielding countries into higher interest rates countries by investors looking to make the highest return. These financial transfers could affect the exchange rate if the sum is high enough and can therefore impact the balance of payments. Banks usually attract 'hot money' by offering relatively short-term certificates of deposit that have above-average interest rates. As soon as the institution reduces interest rates or another institution offers higher rates, investors with 'hot money' withdraw their funds and move them to another institution with higher rates. (2) Stolen money that is marked so as as to be traceable. Hot money might have been involved in a robbery and tracked through dye marks on each bill or through recorded serial numbers. Hot Money is another expression for flight capital, i.e. money transferred by the owner into another country in violation of capital export restrictions or exchange controls, usually to take advantage of more favorable rates of return in the country of destination. Hot Money is the money that is moved by its owner quickly from one form of investment to another, as to take advantage of changing international exchange rates or gain high short-term returns on investments.

Hot Money is a capital transferred from one financial centre to another seeking the highest interest rates or the best opportunity for short-term gain, esp from changes in exchange rates. Hot Money:- funds transferred frequently or hastily from one country to another chiefly to avoid depreciation in value or to take advantage of higher interest rates. / Ещё одно выражение для обозначения беглого капитала, то есть денежных средств, переводимых их владельцем в другую страну в нарушение ограничений по вывозу капитала или валютного контроля, осуществляемое обычно для того, чтобы воспользоваться преимуществом более благоприятных ставок отдачи в той стране назначения. Горячие Деньги – инвестиционные средства, которые вкладываются избирательно для получения высоких краткосрочных доходов. Заёмщики, привлекающие горячие деньги, такие, как банки, выпускающие высокодоходные депозитные сертификаты (certificates of deposit), должны быть готовы к тому, что они могут потерять эти деньги, если другой заёмщик предложит более высокую процентную ставку.

(2) Hot Money:- short-term speculative international capital movements motivated by interest rate differentials or expectations of revaluation or devaluation during a period of economic crisis. / Краткосрочные спекулятивные подвижки международного капитала, мотивированные разницами в процентной ставке или ожиданиями ревальвации или девальвации в течение периода экономического кризиса.

HOT ROLLED STEELS = ГОРЯЧЕКАТАНЫЕ СТАЛИ – Hot Rolled Steels are just that:- they are heated up red-hot and pushed through rollers that squeeze the metal, literally squishing it into a particular profile, depending on the shape of the rollers. The process takes a long time, and because the steel is so hot for so long in the open air of the steel mill, the surface of the metal has has a long time to oxidize, producing a thick, tough oxide scale with the characteristic blue grey finish of the final product. The chemical coloring of metals relies on the action of the chemicals with the metal itself. The only surface exposed on a Hot Rolled Steel product is the blue oxide scale, which is virtually inert. In order to color the metal, either the grey of the base metal must be exposed by grinding and then can be colored, or pigmented lacquers or paints must be used on the surface. Because the surface is rough, it takes paints and lacquers very well. Hot Rolled Steel products are not a consistent blueish color. This is particularly true with hot rolled sheet, over the surface of which the color varies dramatically, more blue at the edges, more grey in the center of the sheet. The blue scale finish on hot rolled products is incidental to the process of producing the product, and so, is not controlled in any way. This gives rise to fairly strong inconsistencies in the finish, particularly in sheet and plate. Again, the blue scale on the metal prevents any chemical coloring on the surface ot the metal unless the scale is removed, exposing the bare metal beneath. Most hot rolled products are very soft and bendable. This is really only noticable in the smaller bar sizes, but it can affect the final product if you are relying on the product to take a lot of strain. If you are looking for a stiffer product, use Cold Finished Steel. The shapes available in hot rolled steels are availble in 12 ft, 20 ft, and sometimes 40 ft lengths, so check with your supplier. Hot rolled plate is a very rough product, and should be treated as such. All hot rolled products weld, bend, drill, and form very easily, and as well are the least expensive of the steels, giving rise to the least expensive finished product of any of the steels. Nearly all metalwork involves welding or soldering the metal. How those welds are addressed is often the difference between a hack job and good craftsmanship. If hot rolled steel is welded, either the un-dressed welds are left as a part of the aesthetic, or they will have to be ground down by hand. Grinding and dressing the welds, of course, removes the blue scale at the weld zone while leaving the blue scale on the rest of the material. This aesthetic difference must be addressed at every weld. It is possible to return the color, but not the texture, of the blue scale at the ground weld joint where the metal has been exposed by heating up the joint red hot and allowing to cool. A reminder:- (i) pipe is specified by the inside diameter, and (ii) tubing is specified by the outside diameter. Hot rolled steel stock products mostly have a rounded appearance at the corners and edges and relatively inexact dimensions, whereas cold finished steels are much smoother and more precise. / шлифование (grinding).

HOT ROLLED (WIDE) STRIP = ГОРЯЧЕКАТАНЫЙ (ШИРОКИЙ) ШТРИП – The Hot Rolled (Wide) Strip is a hot rolled steel product with a rectangular cross-section of at least 600 mm in width. It is immediately wound into coils after rolling with the edges aligned as closely as possible (like a watch spring). It is subsequently used to produce thin steel sheet and heavy plate as well as cold rolled strip/cold rolled wide strip. / прокатка (rolling). Под Штрипсами, от Английского слова Strip, означающее Лента или Полоса, понимаются стальные полосы, используемые в качестве заготовки для производства сварных труб.

HOT SPOT = ГОРЯЧАЯ ТОЧКА (или ПРИРОДНЫЙ ОЧАГ) – Hot Spot is a site where the natural field infestation of a particular Insect or disease is high, providing sufficient pressure for reliable results in varietal resistance tests.

HOT START = ЖАРКОЕ НАЧАЛО – Hot Start:- Polymerase Chain Reaction (PCR) modification with the reaction tube kept at 95 °C prior to addition of primer and polymerase.

HOT WATER EMASCULATION = ЭМАСКУЛЯЦИЯ ГОРЯЧЕЙ ВОДОЙ (или КАСТРАЦИЯ ГОРЯЧЕЙ ВОДОЙ) – Hot Water Emasculation is the use of hot water to open and force the floret to remove the anther. Emerging the panicle in hot water to kill the pollen grains. / пыльник (anther). Эмаскуляция – удаление несозревших пестиков у цветков. Под Кастрацией, от Латинского слова Castratio, означающее Оскопление, понимается:- (1) у человека – удаление половых желёз (яичек, яичников) хирургическим путём или подавлением их функции другими методами (гормоны, облучение) преимущественно при опухолях. (2) У животных – удаление половых желёз у самцов и самок с хозяйственными и реже лечебными целями. Кастрированные сельскохозяйственные животные более спокойны, лучше откармливаются, их мясо вкуснее, питательнее.

HOT WATER SHRINKAGE = УСАДКА ОТ ГОРЯЧЕЙ ВОДЫ – Hot Water Shrinkage (95 °C) is the industrial multifilament yarn length reduction caused by hot water treatment, expressed as a percentage of the initial yarn length, defined according to the following method:- (1) on a standard reel of 1m circumference, skeins are prepared for a 5 000 dtex equivalent. The length of the skeins are measured under 1 cN/Tex pretension in order to define L1; (2) The skeins are then boiled free of tension during 15 minutes in hot water (95 °C), then dried and conditioned at standar d conditions; and (3) The shrunk skeins are measured again under 1 cN/Tex pretension in order to define L2. The hot water shrinkage is expressed in percent as:- ((L1 – L2) x 100) / L1. Hot Water Shrinkage is the decrease in length of a test specimen caused by a treatment in hot water under a specified temperature and time, expressed as a percentage of the length of the untreated test specimen. The lengths are measured before and after treatment under a specified pretension. The water temperature to be applied is specified between buyer and seller. See also Shrinkage. / филаментная (комплексная) пряжа (filament yarn).

HOT WATER TREATMENT = ОБРАБОТКА ГОРЯЧЕЙ ВОДОЙ – Hot Water Treatment is a water treatment at high temperature applied to seed samples to make them aseptic, used particularly for international shipments.

HOUNDSTOOTH = СОБАЧИЙ ЗУБЕЦ – Houndstooth:- one of the most easily identifiable checks is the houndstooth or dogstooth check. This weave is produced in a pattern of four light and four dark yarns in both warp and weft. The gun club check is a variation of the houndstooth but using a different color sequence traditionally on a light colored ground. Houndstooth is a term describing a medium-sized broken-check effect; the check is actually a four pointed star. Houndstooth is a duotone textile pattern characterized by broken checks or abstract four-pointed shapes. The traditional colors are black and white, although sometimes different colors are substituted for black. / клетчатый рисунок на ткани, причём эти клетки с зазубринами.

HOUNDSTOOTH CHECK = XX КЛЕТКА – Houndstooth Check:- a variation on the twill weave construction in which a broken check effect is produced by a variation in the pattern of interlacing yarns, utilizing at least two different colored yarns.

HOURLY CHART = ПОЧАСОВОЙ ГРАФИК – Hourly Chart is a graphical representation of price where the time interval is 60 minutes of a trading session with the possible exception of the last bar of the day. / В биржевом деле под Почасовым Графиком понимается графическое отображение ситуации с изменением цены, в котором временной интервал торговли соответствует 60 минутам торговой сессии с возможным исключением для самого последнего штриха этого графика, который может отражать неполный текущий временной интервал торговли, например, 20 или 45 минут и так далее.

HOURLY NON–FIRM TRANSMISSION SERVICE = ПОЧАСОВАЯ УСЛУГА НЕОБЕСПЕЧЕННОЙ (или НЕТВЁРДОЙ) ПЕРЕДАЧИ – Hourly Non-Firm Transmission Service:- point-to-point transmission that is scheduled and paid for on an as-available basis and is subject to interruption.

HOUSE = РУБКА (или ПОМЕЩАТЬ) – House (maritime term):- to stow or secure in a safe place. A top-mast is housed by lowering it and securing it to a lowermast.

HOUSE ACCOUNT = СЧЁТ ДОМА – House Account is an account designated for the brokers own transactions.

HOUSE AIR WAYBILL = АВИАГРУЗОВАЯ НАКЛАДНАЯ ПУНКТА СБОРА – House Air Waybill is a bill of lading issued by a forwarder to a shipper as a receipt for goods that the forwarder will consolidate with cargo from other shippers for transport. Contains all the information of an air waybill but is not a financial document. This is a contract between the shipper and freight forwarder. All the shipments covered by the individual house air waybills are consolidated and a single air waybill is issued to cover the consolidated shipment.

HOUSE BILL OF LADING = ДОМАШНИЙ КОНОСАМЕНТ (или ВНУТРЕННИЙ КОНОСАМЕНТ, или СБОРНЫЙ КОНОСАМЕНТ, или КОНОСАМЕНТ ПУНКТА СБОРА) – House Bill Of Lading:- a freight forwarder can act as agent for a group of exporters of smaller consignments. The small shipments are 'Less than Containerload' (LCL). When the freight forwarder 'consolidates' the consignments, he is called a 'Consolidator' or 'Groupage Contractor' and may issue to each customer a cerificate of receipt that may contain the terms of the contract of carriage between him and the customer. Such a document is known as a 'House Bill Of Lading'. It can also be known as a 'Groupage Certificate'. The freight forwarder will then enter into separate contracts of carriage with the actual carrier or carriers for a 'Full Containerload' (FCL) and as far as they are concerned, the freight forwarder is the 'shipper'. He will obtain from them a bill of lading. The document that he issues to his customers may not really be a 'bill of lading'. Therefore it may not possess the characteristic of a document of title and may be rejected by banks unless the credit precisely permits their acceptance for payment. Indeed, Art. 26(c)(iv) of the UCP 1983 states:- 'Unless otherwise stipulated in the credit, banks will reject a document which:- is issued by a freight forwarder, unless it indicates that it is issued by such freight forwarder acting as a carrier, or as the agent of a named carrier'. If the freight forwarder is acting as a 'Non-Vessel Owning Carrier' (NVOC) or even as a NVOCC ('Non-Vessel Owning Common Carrier'), depending on the circumstance of carriage and jurisdiction in which disputes may be brought, the document issued as a 'bill of lading' may be accepted by banks as a document of title. The carriage will be by combined transport, and the document may be a 'combined transport document' as referred to in the publication UCP 1983, Arts. 25 and 26(b)(i), and which is acceptable to banks. However, para. (d) of the Articles provides that:- 'Unless otherwise stipulated in the credit, banks will reject a transport document issued by a freight forwarder unless it is a FIATA (short for the International Federation of Freight Forwarders Associations) Combined Transport Bill of Lading approved by the International Chamber of Commerce or otherwise indicates that it is issued by a freight forwarder acting as a carrier or agent of a named carrier'. The phrase 'House To House Bill Of Lading' is different from a 'House Bill Of Lading'. The former covers carriage from door-to-door, i.e. in combined transport for the entire journey. The issuer is likely to be the 'carrier' for the complete transport and therefore likely to carry the full burden of liability for loss or damage or delay. The latter is a document (or 'receipt') issued by a freight forwarder to his customer whose goods are consolidated with other customers' goods for onward carriage by another 'carrier'. The 'House Bill Of Lading' may contain terms and conditions but may also be subject to 'standard trading conditions' of the freight forwarder or the Association he may belong to. House Bill Of Lading is a bill of lading issued by a freight forwarder or consolidator covering a single shipment containing the names, addresses and specific description of the goods shipped. What is the difference between House Bill of Lading, Master Bill of Lading? House Bill of Lading (HBL) is issued by the NVOCC/Freight Forwarder to the actual customer. (NVOCC is short for the Non-Vessel Operating Common Carrier). Master Bill of Lading (MBL) is issued by the Shipping Line (Carrier) to the NVOCC/Freight Forwarder – also known as Ocean Bill of Lading. House Bill of Lading will be an exact replica of the Master Bill of Lading issued by the actual Shipping line in respect of cargo details. The only difference will be that the shipper, consignee and notify party details will be different in the HBL and MBL. In the HBL:- (i) the Shipper will usually be the actual shipper/exporter of the cargo (or as dictated by the L/C); (ii) the Consignee will usually be the actual receiver/importer of the cargo (or as dictated by the L/C); and (iii) the Notify could be the same as Consignee or any other party as dictated by the L/C). In the MBL:- (i) the Shipper will usually be the NVOCC operator or their agent or the Freight Forwarder; (ii) the Consignee will usually be the destination agent or counterpart or office of the NVOCC operator or the Freight Forwarder; and (iii) the Notify could be the same as Consignee or any other party. The rest of the details like vessel/voyage information, cargo description, number of containers, seal numbers, weight, measurements etc will all remain the same. Unless required otherwise by the L/C, the HBL can also be used as a negotiable document and can be considered the title of goods and receipt of cargo same as an MBL. In the interest of the NVOCC operator and their insurance coverage/exposure, it is recommended that all the details except the shipper, consignee and notify details on the HBL remain the same on the MBL. The House Bill of Lading also known as the Forwarder's Bill of Lading has to do with carriers and freight. The actual term House Bill of Lading is commonly used to describe the various transport documents issued by forwarders. A House Bill of Lading (HBL) is a document created by an Ocean Transport Intermediary (OTI) such as a freight forwarder or non-vessel operating company (NVOCC). The document is an acknowledgment of the receipt of goods that are to be shipped. It is issued to the supplier once the cargo has been received and may be used in lieu Letter of Credit in lieu of a Master Bill of Lading (MBL). HBL includes the name and address of the supplier, who delivers the shipment to the freight forwarder, and the consignee, who the freight forwarder delivers the shipment to. The document also includes specific information about the items shipped and the value of the shipping contract. / Хозяйский (или Капитанский) Коносамент. Коносамент, выдаваемый грузовым экспедитором или комплектовщиком (консолидатором), покрывающий единую грузовую отправку и содержащий в себе наименования, адреса и специфическое описание отгруженных товаров. Домашний Коносамент (House Bill of Lading (HBL)) – это коносамент, выпускаемый экспедитором (NVOCC), нередко – в дополнение к линейному (linear), или мастер-коносаменту (Master Bill of Lading (MBL)). Домашний и линейный (мастер) Коносаменты часто рассматривают как альтернативы друг другу, разницы в товарораспорядительных свойствах между ними нет. Первый – подтверждает договор между отправителем и транспортной или экспедиционной компанией, оператором смешанной перевозки, но не линии; второй – между отправителем и морской линией. Домашний Коносамент выпускается самим экспедитором или уполномоченной организацией FIATA (если экспедитор является её членом). Линейный Коносамент выпускается одновременно с домашним, но в электронном виде,

хранится в электронной системе перевозчика. Мастер-Коносамент в этом случае не содержит реальных данных отправителя и получателя, а сам Коносамент грузовладелец, скорее всего, никогда не увидит. Агент отправителя по распоряжению отправителя выписывает телекс-релиз у агента судоходной линии в порту отправления, чтобы покупатель мог получить контейнер в порту назначения. В телекс-релизе (его ещё называют экспресс-релизом, потому что виден в электронной системе перевозчика в течение суток с момента выпуска) есть ссылка на электронную версию линейного коносамента. В релизе указывается, что получить контейнер возможно без предоставления 3 оригиналов коносамента. Для Чего Нужен Домашний Коносамент? Домашний Коносамент выпускается экспедитором в дополнении к мастер-коносаменту, когда это требуется условиями аккредитива или банковскими условиями. Например, банк может выставить такие условия сделки, которые для линии (морского перевозчика) будут неприемлемыми. Тогда экспедитор в дополнении к Линейному Коносаменту (Linear B/L), который будет выпущен в любом случае, выпускает Домашний Коносамент (House B/L). Документ нужен и в том случае, когда продавец передал груз на хранение перевозчику (экспедитору), а тот ещё не погрузил его на судно. В этом случае поставщик использует Домашний Коносамент для представления его в банк в качестве подтверждения отгрузки груза и получения причитающегося по условиям договора купли-продажи платежа. Банки могут перестраховываться, выставляя условие наличия пометки ‘clean on board’, при котором перевозчик не сможет высказать претензии к состоянию груза после его погрузки на борт. Не всякая судоходная линия согласится на подобные условия, что и порождает потребность в House Bill of Lading. То есть преимущество, которое даёт Домашний Коносамент клиенту перед Линейным Коносаментом сводится к возможности выполнения всех банковских условий. Отличия Домашнего От Мастер Коносамента:- Главное отличие между двумя этими видами коносаментов в том, кто выпускает документы и кто фактически владеет грузом. В MBL при наличии HBL отправителем и получателем груза является экспедитор. По Домашнему Коносаменту линия не обязана выдавать груз никому, в том числе реальному владельцу, так как для перевозчика имеет силу только MBL, где указан получателем экспедитор. Домашний Коносамент даёт экспедитору широкие возможности по манипулированию клиентом – нередко требуются депозиты за использование контейнера, может взиматься плата за возврат порожнего контейнера в сток морской линии. Наконец, недобросовестный экспедитор имеет возможность вообще забрать груз и увезти его в неизвестном направлении. Решение подобной ситуации возможно будет только по суду. Также нужно понимать, что существует множество видов Домашних Коносаментов. С практической точки зрения важно обратить внимание на организацию, выдающую Домашний Коносамент. Например, Maersk не предоставит никаких документов, пока не получит письма от NVOCC-оператора (например, Kuehne+Nagel), что контейнер нужно выдать именно указанному получателю. К крупным NVOCC можно отнести Kuehne+Nagel, Panalpina, Schenker, Militzer&Munch и других. Они имеют филиалы в странах отправления, зарегистрированы в местных торгово-промышленных палатах (ТПП), в FIATA. Они имеют право на выпуск Домашних Коносаментов, признаваемых банками для Letter of Credit. Такие Домашние Коносаменты могут использоваться даже для таможенного оформления (признаются некоторыми таможнями). В Новороссийске, впрочем, HBL тяжело признается таможней даже в связке с MBL (инспекторы часто требуют копии договоров между поименованными в документах получателем и отправителем груза, например, Kuehne+Nagel China и Kuehne+Nagel Russia). Риски С Домашними Коносаментами:- Когда Домашний Коносамент выписывается случайным экспедитором возможны различные варианты развития событий:- (i) груз будет отправлен в другой порт (например, вместо СПб – в Новороссийск); (ii) перевозка будет осуществляться иной, чем указано в HBL, морской линией (указанной же вполне возможно не существует вообще); (iii) возникают дополнительные платежи (на выгрузку груза, оформление документов, портовые сборы, ...), при отказе получателем от которых груз будет удерживаться в порту. Не застрахованы грузополучатели и в том случае, если HBL выпускается проверенным компаниями – в этом случае риски возникают, например, когда груз уже в пути, а отправитель хочет поменять получателя. Основная цель выпуска Домашнего Коносамента – минимизация участия грузоотправителя в процессе организации перевозки. Задачи по местному обслуживанию и размещению бронирования в морской линии берёт на себя NVOCC оператор. Он же и выпускает HBL для грузоотправителя. Домашний коносамент является дополнительным и второстепенным по отношению к линейному, который будет оформлен перевозчиком (морской линией) для NVOCC оператора.

HOUSECOAT = КАПОТ (или (ДОМАШНИЙ) ХАЛАТ) – Housecoat:- a woman’s often long-skirted informal garment for wear around the house. See examples in the Flannel Housecoats section.

HOUSEDRESS = ДОМАШНЕЕ ПЛАТЬЕ – Housedress is a dress with simple lines that is suitable for housework and is made usually of a washable fabric.

HOUSE FLAG = ФЛАГ ПАРОХОДСТВА (или ФЛАГ СУДОХОДНОЙ КОМПАНИИ) – House Flag (maritime term):- distinguishing flag of a merchant marine company flown from the mainmast of merchant ships.

HOUSEHOLDER = ДОМОВЛАДЕЛЕЦ – Householder:- in the United States, the data on relationship to householder were derived from the question, ‘How is this person related to Person 1’, which was asked of Persons 2 and higher in housing units. One person in each household is designated as the householder (Person 1). In most cases, the householder is the person, or one of the people, in whose name the home is owned, being bought, or rented. If there is no such person in the household, any adult household member 15 years old and over could be designated as the householder (i.e. Person 1). Households are classified by type according to the sex of the householder and the presence of relatives. Two types of householders are distinguished:- family householders and nonfamily householders. A family householder is a householder living with one or more individuals related to him or her by birth, marriage, or adoption. The householder and all of the people in the household related to him or her are family members. A nonfamily householder is a householder living alone or with nonrelatives only.

HOUSEHOLDS = ДОМОВЛАДЕНИЯ – Household:- composed of the farmer and his family. Considered both the production and consumption unit of the social organization. The household can be managed by one person or operated collectively, as family members live, sleep, eat, share the same place, and divide household duties and general farm management and work. Individuals or small groups of individuals as consumers and in some cases as entrepreneurs producing goods and market services, where such activities cannot be hived off and treated as those of a quasi corporation. In the United States, a Household includes all of the people who occupy a housing unit. People not living in households are classified as living in group quarters. A housing unit is a house, an apartment, a mobile home, a group of rooms, or a single room occupied (or if vacant, intended for occupancy) as separate living quarters. Separate living quarters are those in which the occupants live separately from any other people in the building and that have direct access from the outside of the building or through a common hall. The occupants may be a single family, one person living alone, two or more families living together, or any other group of related or unrelated people who share living quarters.

HOUSEKEEPING = ПОДДЕРЖАНИЕ ЧИСТОТЫ И ПОРЯДКА – Housekeeping is a keeping the warehouse presentable, organized, and safe for all parties.

HOUSE–TO–HOUSE = ОТ ПРЕДПРИЯТИЯ ДО ПРЕДПРИЯТИЯ (или ОТ ДОМА ДО ДОМА) – House-To-House:- shipment is containerised at the shipper’s factory or warehouse, and then transported to the consignee’s premises, where the cargo is unloaded. /

Партия груза, загруженная в контейнер на фабрике или складе отправителя, и в дальнейшем перевозимая в помещения консигнатора (грузополучателя), в которых данный груз выгружается из контейнера.

HOUSE TO PIER = ОТ ПРЕДПРИЯТИЯ ДО ПИРСА (или ОТ ДОМА ДО ПИРСА) – House To Pier:- shipment is containerised at the shipper's factory or warehouse. It is then destuffed at the discharge pier prior to final delivery. Shipper loaded container that will be de-consolidated at destination terminal for distribution. Cargo loaded into a container by the shipper under shipper's supervision. When the cargo is exported, it is unloaded at the foreign pier destination. / на пирсе разгрузки .

HOUSING = КОЖУХ (или КОРПУС) – Housing:- a ported enclosure which directs the flow of fluid through the filter element. / направляет поток жидкости через фильтрующий элемент.

HOVERCRAFT = СКЕГОВОЕ СУДНО (или СУДНО НА ВОЗДУШНОЙ ПОДУШКЕ, или ПОЛЗОЛЁТ) – Hovercraft:- in the early 1950s, engineers in the United Kingdom, the United States, and Switzerland were seeking solutions to Sir John Thornycroft's 80-year-old problem. Christopher Cockerell of the United Kingdom is now acknowledged to have been the father of the Hovercraft, as the air-cushion vehicle is popularly known. During World War II he had been closely connected with the development of radar and other radio aids and had retired into peacetime life as a boatbuilder. Soon he began to concern himself with Thornycroft's problem of reducing the hydrodynamic drag on the hull of a boat with some kind of air lubrication. Cockerell (later knighted) bypassed Thornycroft's plenum chamber (in effect, an empty box with an open bottom) principle, in which air is pumped directly into a cavity beneath the vessel, because of the difficulty in containing the cushion. He theorized that, if air were instead pumped under the vessel through a narrow slot running entirely around the circumference, the air would flow toward the centre of the vessel, forming an external curtain that would effectively contain the cushion. This system is known as a Peripheral Jet. Once air has built up below the craft to a pressure equaling the craft weight, incoming air has nowhere to go but outward and experiences a sharp change of velocity on striking the surface. The momentum of the peripheral jet air keeps the cushion pressure and the ground clearance higher than it would be if air were pumped directly into a plenum chamber. To test his theory, Cockerell set up an apparatus consisting of a blower that fed air into an inverted coffee tin through a hole in the base. The tin was suspended over the weighing pan of a pair of kitchen scales, and air blown into the tin forced the pan down against the mass of a number of weights. In this way the forces involved were roughly measured. By securing a second tin within the first and directing air down through the space between, Cockerell was able to demonstrate that more than three times the number of weights could be raised by this means, compared with the plenum chamber effect of the single can. Cockerell's first patent was filed on 1955-December-12, and in the following year he formed a company known as Hovercraft Ltd. His early memoranda and reports show a prescient grasp of the problems involved in translating the theory into practice. Such problems still concerned designers of Hovercraft years later, and some of Cockerell's ideas have yet to be fully explored. He forecast, for example, that some kind of secondary suspension would be required in addition to the air cushion itself. Another of his ideas still to be developed deals with the recirculation of air in the peripheral jet so that part of it is used over and over, improving efficiency and reducing the power required. Realizing that his discovery would not only make boats go faster but also would allow the development of amphibious craft, Cockerell approached the Ministry of Supply, the British government's defense-equipment procurement authority. The air-cushion vehicle was classified 'secret' in November 1956, and a development contract was placed with a British aircraft and seaplane manufacturer. In 1959 the world's first practical air-cushion vehicle (ACV) was launched. It was called the SR.N1. Originally the SR.N1 had a total weight of four tons and could carry three men at a maximum speed of 25 knots (1 knot = 1.15 miles or 1.85 kilometers per hour) over very calm water. Instead of having a completely solid structure to contain the cushion and peripheral jet, it incorporated a 6-inch- (15-centimeter-) deep skirt of rubberized fabric. This development provided a means whereby the air cushion could easily be contained despite unevenness of the ground or water. It was soon found that the skirt made it possible to revert once again to the plenum chamber as a cushion producer. Use of the skirt brought the problem of making skirts durable enough to withstand the friction wear produced at high speeds through water. It was necessary to develop the design and manufacturing skills that would allow skirts to be made in the optimum shape for aerodynamic efficiency. Skirts of rubber and plastic mixtures, 4 feet (1.2 meters) deep, had been developed by early 1963, and the performance of the SR.N1 had been increased by using them (and incorporating gas-turbine power) to a payload of seven tons and a maximum speed of 50 knots. The first crossing of the English Channel by the SR.N1 was in 1959, symbolically on the 50th anniversary of Louis Blériot's first flight across the same water. Manufacturers and operators in many parts of the world became interested. Manufacture began in the United States, Japan, Sweden, and France; and in Britain additional British companies were building craft in the early 1960s. The years 1962–64 were a peak period for worldwide interest in Hovercraft, but by the early 1970s only the British had produced what could truly be called a range of craft, and this against considerable odds. There were signs, however, that US, Soviet, and French manufacturers were seriously contemplating reentry into the field and that Australia and Japan also were becoming ACV-minded. The stagnation of the intervening seven years can be explained by the failure of air-cushion vehicles to live up to what many people thought was their original promise. Cockerell and others had foreseen many of the difficulties, but some second-generation designers, builders, and, particularly, operators thought that the simple Hovercraft would be the answer to a variety of problems that at that stage of development were considerably beyond the scope of the craft available. In the first place, amphibious craft generally needed to be air-propelled. Directional control was imprecise, precluding their use on highways. As already mentioned, the design of and materials used in flexible skirts had to be developed from the first, and not until 1965 was an efficient and economic flexible-skirt arrangement evolved, and even then the materials were still being developed. Another major problem arose when aircraft gas-turbine engines were used in a marine environment. Although such engines, suitably modified, had been installed in ships with some success, their transition into Hovercraft brought out their extreme vulnerability to saltwater corrosion. By its very nature the air-cushion vehicle generates a great deal of spray when it is hovering over water, and the spray is drawn into the intakes of gas turbines in amounts not envisaged by the engine designer. Even after considerable filtering, the moisture and salt content is high enough to corrode large modern gas-turbine engines to such an extent that they need a daily wash with pure water and even then have a considerably reduced life span between overhauls. The costs of engine overhauls and skirt maintenance and repairs have probably been the main factors retarding the advancement of air-cushion vehicles. Skirt development proceeded extremely rapidly in the first decade after SR.N1. Jet-engine corrosion may be solved by new materials or possibly by intake design to limit spray ingestion. In the meantime, some manufacturers are bypassing the gas-turbine difficulty by using high-speed marine diesel engines in multiple units. These are cheaper, more economical to run, and relatively free from corrosion problems but for a given power output are considerably heavier than their gas-turbine counterparts. The history of the air-cushion vehicle principle also includes the use of air-cushion support in other applications, both for transportation and for support as such. These include air-cushion transporters, trains, and even beds. Also known as Air-Cushion Machine. A vessel used for the transportation of passengers and cargo riding on a cushion of air formed under it. It is very maneuverable and is also amphibious. An air-cushion machine, such as the British Hovercraft, is not considered an amphibious vehicle. / проблема 80-летнего Сэра Дьжона Соникрофта (Sir John Thornycroft). Кристофё Кокёрэл (Christopher Cockerell) из Соединённого Королевства. Хавёкрэфт Эл.ти.ди. (Hovercraft Ltd.). 50-Летие первого полёта Люи Блеръё (Louis Blériot) . Под Судном на Воздушной Подушке (СВП) понимается транспортное средство, сила поддержания которого формируется слоем сжатого воздуха, создаваемого под корпусом судна или под его несущими поверхностями с помощью специальных нагнетателей. Существуют СВП с полным отрывом от поверхности (амфибийное судно) и с неполным

отрывом от поверхности (скеговое судно). Отрыв корпуса судна от поверхности позволяет снизить сопротивление движению и добиться увеличения скорости. Скеговое Судно на воздушной подушке – транспортное средство с жёстким бортовым ограждением (скегами) и гибким или жёстким ограждением воздушной подушки в оконечностях. Скеговые суда вследствие неполного отрыва их от воды из-за погружения бортовых ограждений воздушной подушки в воду не являются амфибийными.

hp = HP = HORSEPOWER

H/P = HOUSE TO PIER

HPE STANDARDS = СТАНДАРТЫ ХА.ПЭ.Э. – HPE Standards:- packaging guidelines for boxes, crates, wooden supports, etc. HPE is the abbreviation for the:- Bundesverband Holzpackmittel Paletten Exportverpackung e.V. (German Federal Association for Wooden Packaging, Export and Palets). / Бундэсфабанд Хольцпакмитэль Палетэн Экспотфапакун Э.Фау. (Bundesverband Holzpackmittel Paletten Exportverpackung e.V.).

H–SHARES = АКЦИИ ЭЙЧ. – H-Shares means shares of a company incorporated in the Chinese mainland that are listed on the Stock Exchange of Hong Kong (SEHK) or other foreign exchange. H-shares are still regulated by Chinese law, but they are denominated in Hong Kong Dollars and trade the same as other equities on the Honk Kong exchange. H-shares on the exchange are automatically included in the Hang Seng China Enterprise Index, provided that they maintain the Hong Kong exchange regulatory requirements. H-shares are available for more than 90 Chinese companies, giving investors at least some access to most of the major economic sectors such as financials, industrials and utilities. In 2007, the Chinese government decided to allow mainland investors to invest in the Hong Kong exchange, which greatly increased the demand for H-shares, as mainland investors were previously forbidden from investing in the exchange. China still offers A-shares in many of the same companies, but only mainland residents can invest in them. H-Shares are shares in Chinese companies that trade on the Hong Kong Stock Exchange. H-shares are denominated in Hong Kong Dollars and allow companies incorporated in the People's Republic of China to have access to capital from Hong Kong. H-Shares are subject to Chinese regulations and are included on the Hang Seng index. H Shares are shares in Chinese companies issued in China under Chinese law. They are listed on the Hong Kong Stock Exchange and subject to its stringent listing and disclosure requirements. The shares are denominated in Hong Kong Dollar and trade like any other shares listed on the Hong Kong Exchange. There are now (in 2006) 91 companies offering H shares giving exposure to more than a dozen sectors including Telecommunications, Insurance, Real Estate, Airlines, Logistics as well as Infrastructure such as roads and electricity, Oil, Mining and Basic Materials such as steel, cement, aluminum and petrochemicals. They are required to meet the same standard of disclosure required of all companies listed on the SEHK. H Shares (also known as Hang Seng China Enterprises Index) refers to the shares of companies incorporated in mainland China that are traded on the Stock Exchange of Hong Kong (SEHK). Many companies float their shares simultaneously on the Hong Kong market and one of the two mainland Chinese stock exchanges. Huge price discrepancies between the H shares and the A share counterparts of the same company are not uncommon. A shares generally trade at a premium to H shares as the People's Republic of China government restricts mainland Chinese people from investing abroad, and foreigners from investing in the A-share markets in mainland China. / коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо).

HU = (CENTRIFUGAL) HULLER

HU = HUNGARY

HUARACHE = УАРАЧЭ (или ГУАРАЧЕ) – Huarache:- a low-heeled sandal having an upper made of interwoven leather strips. / Huaracho = плетёная кожаная сандалия; Мексиканская сандалия. heel = каблук или пятка. Уарачэ или Гуараче – появившиеся в Мексике комфортные и удобные в носке сандалии на плоской подошве с верхом из переплетённых между собой кожаных ремешков из сыромятной кожи.

HUB = РАЗВЯЗКА (или РАЗВЯЗОЧНЫЙ УЗЕЛ, или (УНИВЕРСАЛЬНЫЙ ТЕХНОЛОГИЧЕСКИЙ) УЗЕЛ) – Hub is a central location to which traffic from many cities is directed and from which traffic is fed to other areas. Hub is a transfer site or system where several pipelines interconnect and where shippers may obtain services to manage and facilitate their routing of supplies from production areas to markets. Transshipment point in a service network, which serves points beyond that of a particular service by means of feeder vessels. Hub is the central transhipment point in a transport structure, serving a number of consignees and/or consignors by means of spokes. The stretches between hubs mutually are referred to as Trunks. For example, Zeebrugge, Belgium is the main trading hub for natural gas in Western Europe. / Развязочный сайт или система, где между собой соединяются несколько трубопроводов и где отправители могут воспользоваться услугами управления и содействия их рутинным поставкам из регионов добычи и производства на конкретные рынки. Например, Зээбрюгэ, Бельгия (Zeebrugge, Belgium) является главным торговым узлом для природного газа в Западной Европе.

HUB PORT/SERVICE = РАЗВЯЗОЧНЫЙ ПОРТ/СЛУЖБА (или УЗЛОВОЙ ПОРТ/СЛУЖБА) – A term Hub Port/Service refers to the practice where shipping lines call at one port in a country or region, rather than at several ports. / Этот термин относится к практике судоходных линий, которые предпочитают работать с одним каким-то крупным портом или регионом, нежели распылять свои усилия не несколько портов.

HUBRIS = НАДМЕННОСТЬ (или ВЫСОКОМЕРНОСТЬ, или ГОРДЫНЯ, или СПЕСЬ) – Hubris:- though not a financial or business term per se, it's included here because it is often used in reference to a characteristic displayed by some entrepreneurs. It's a noun meaning exaggerated pride or self-confidence. The opposite of Humble.

HUCK = МЕЛКОУЗОРЧАТАЯ (или ХАК, или ПОЛОТЕНЕЧНАЯ ТКАНЬ С МЕЛКОУЗОРЧАТЫМ ПЕРЕПЛЕТЕНИЕМ, или БЕДРО, или РЯДИТЬСЯ, или СУРОВОЕ ПОЛОТЕНЦЕ) – Huck is a type of toweling fabric with a honeycombed surface made by using heavy filling yarns in a dobby weave. It has excellent absorbent qualities. It is woven with a pattern, most often with a dobby attachment on the loom and may have Jacquard borders. Huck is traditionally made of cotton, linen, or rayon, or a mixture of these, although today, other fibers may be used. In a mixture it is called a Union Fabric. Face or hand towels are made in white or colors and are used for drying dishes, glasses, and kitchen utensils. Huck is also called Huckaback. Embroidery enthusiasts often use huck as a ground for their work. See also Dobby. / тяжёлые уточные пряжи в . Жакяр (Jacquard). тип полотенечной ткани с усеянной поверхностью, выработанной с использованием тяжёлой уточной пряжи в кареточном переплетении. Она имеет отличные абсорбирующие свойства.

HUCKABACK = МЕЛКОУЗОРЧАТОЕ ПОЛОТНО (или КАМЧАТОЕ ПОЛОТНО) – Huckaback:- a heavy, serviceable toweling made with slackly twisted filling yarns to aid absorption. The cloth has a honeycomb effect. Huckaback is an absorbent durable fabric of cotton, linen, or both used chiefly for towels. It is strong. Has variation in weaves but most have small squares on the surface that stand out from the background. Comes in white, colors, or colored borders. Also stripes. The motif is made from a series of floats, some of them rather long, which gives a loose effect in certain areas. This, if well spaced, acts as a good absorbing agency. / кручёные уточные пряжи .

HUCKEPACK CARRIAGE = ПЕРЕВОЗКА НА ЗАКОРКАХ (или КОМБИНИРОВАННАЯ ПЕРЕВОЗКА) – Huckepack Carriage is the carriage of road vehicles and trailers on railway wagons. The name of this transport technology originated from the German words:- Huckepack Tragen = Carrying on the Back. The analogous term is Piggyback in English and Kangourou in the French-speaking area. It describes in fact the carriage of road vehicles together with their load on the railway cars. See also Piggyback. Special low-height wagons for piggyback (huckepack) carriage of unaccompanied semitrailers with recessed pockets to accommodate the trailer road-wheels, or spine wagons. In the last thirty years the West European area has noted a permanent economic growth that has been reflected also on the growth of the overall transport operations. The transport sector in the European Union has recorded an estimated 4 per cent gross national product of the Union and employed more than 6 million people. Road transport of goods is constantly increasing and occupies mainly the dominant position in cargo transport. At the same time the share of railways has been reduced over the last thirty years. Therefore, there is an increasing need for the data on intermodal transport. The rail/road system combines the advantages of both rail and road and can make a considerable contribution towards resolving intra-European traffic problems. The success of huckepack transport must be based on consistent policies with respect to standards for both loading units and the vehicles carrying them. The carriage of goods, especially in international transport requires co-operation between several carriers from all the traffic branches. One carrier cannot deal with the whole transport task due to the diversity of transport routes. Depending on the organization and the technical and technological co-ordination and co-operation of the participating transport branches, by simultaneous usage of transport and manipulation means in various combinations of transport, different forms have developed, that is, different techniques of rationalization in the exploitation of the intermodal transport. This work will be based on the road and railway traffic and the problems concerning that most of the combined transport is 'unaccompanied', i.e. the loading unit is not accompanied by a driver, equal conditions of competition between various modes of transport, situation regarding border controls, interoperability, problems of bottlenecks and impact of new technologies in combined transport as the basis for the development of advanced transport technologies. The road and railway combination is a logical step towards maintaining flexibility and reducing external costs. Commercial intermodal road-rail transport started comparatively late in Germany although lorries and tanks were moved by rail during World War II. Soon, Germany became the leading European country for developing intermodal transport. On a Europe-wide scale, intermodal transport has been used commercially since the late 1960's. Road transportation is currently very competitive within the European Union (EU). Prices are down, service levels are up and deregulation is ahead of rail transportation. The EU Directive 91/440 on competition and revitalization of railways forces them to be profitable in business economic terms. Current bad profitability keeps new actors away from entering the industry on a large scale. The decline in the quality of combined transport started in 1997 and continued in 1998. The problems included the lack of engines, usage of non-standardised engines, insufficient number of engine drivers, delays, etc. / Кагуру (Kangourou). Перевозка на Закорках или Комбинированная Перевозка (Huckepack Tragen).

HUD = THE UNITED STATES DEPARTMENT OF HOUSING AND URBAN DEVELOPMENT

HUE = ТОН (или ОТТЕНОК, или ПРЕОБЛАДАЮЩИЙ ЦВЕТ, или ЦВЕТОВОЙ ТОН, или ОКРАС, или ТОН ОКРАСКИ, или РАСЦВЕТКА) – Hue is the attribute of color perception by means of which an object is judged to be red, yellow, green, blue or purple. Hue is the pure spectrum colors commonly referred to by the 'color names' – red, orange, yellow, blue, green violet. Hue:- the attribute of color by means of which a color is perceived to be red, yellow, green, blue, purple, etc. Pure white, black, and grays possess no hue. / Тон цветовой, одна из основных характеристик цвета (наряду с его светлотой и насыщенностью), определяющая его оттенок и выражающаяся словами 'красный, синий, сиреневый' и так далее; различия в названиях красок указывают в первую очередь

на цветовой тон (например, ‘изумрудная зелень’, ‘лимонная’, ‘жёлтая’ и так далее). В живописи тоном называют также основной оттенок, обобщающий и подчиняющий себе все цвета произведения и сообщающий колориту цельность. Краски в тональной живописи подбираются с расчётом на объединение цветов общим тоном. В зависимости от преобладания тех или иных цветов и различия в их сочетаниях тон в картине может быть серебристым, золотистым, тёплым или холодным и так далее. Термином Тон в живописи определяют также светлоту цвета. Оттенок – цвет, получаемый из чистого цвета добавлением белого или чёрного, а также – в небольших количествах других цветов.

HUF = HUNGARIAN FORINT

HUG = ДЕРЖАТЬСЯ БЛИЖЕ – Hug (maritime term):- to keep close. / Держаться Ближе к ветру или берегу.

HUG–ME–TIGHT = ОБНИМИ МЕНЯ КРЕПКО – Hug-Me-Tight:- a woman’s short usually knitted sleeveless close-fitting jacket.

HULK = БЛОКШИВ (или ПЛАШКОУТ, или КИЛЕКТОР) – Hulk (maritime term):- a worn out vessel.

HULL = КОРПУС – Hull is a shell or body of a ship. Outer shell of a vessel, usually made of steel plates. Hull is the outer shell of a vessel, made of steel plates or other suitable material to keep water outside the vessel. / Под Корпусом судна, от Латинского слова Corpus, означающее Единое Целое, Сущность или Тело, понимается основная часть судна, состоящая из каркаса (балок различного направления – набора) и оболочки (наружной обшивки и настила верхней палубы). Внутри корпус судна может быть разделён вертикальными или наклонными поперечными и продольными переборками, а по высоте – промежуточными палубами и платформами; на крупных судах устраивают двойное дно. К корпусу судна крепят фундаменты судовых механизмов и оборудования. Корпуса судов военных кораблей имеют броню и элементы обшивки, создающие их невидимыми для радаров. Обычно корпус судна изготовляют из стали, используются также дерево, железобетон, алюминиевые сплавы и пластмассы.

HULL = ШЕЛУХА (или КОЖИЦА, или КОЖУРА, или СКОРЛУПА, или СЕМЕННАЯ ОБОЛОЧКА) – Hull is the outermost covering of the Rice grain which provides protection to the Rice caryopsis composed of lemma and palea. It ranges from 17 to 24% of the rough Rice content. The outer covering of anything, particularly of a nut or of grain; the outer skin of a kernel. Also known as Husk. Hull (syn. Husk, and Chaff) includes the lemma and palea. Structures such as the rachilla, sterile lemmas, the awn if present, and broken segment of the pedicel are usually associated with the hull, if they survive the threshing process. Hull is the outer covering of a seed or fruit, as the husk of grain, pod of a pea, shell of a nut, etc. Hull is the outer hard shell of Cotton seeds. / Плёнка Зерна (Hull). состоящая из нижней цветковой чешуи (lemma) и верхней цветковой чешуи (palea).

HULL COLORS = ЦВЕТА ШЕЛУХИ (или ЦВЕТА КОЖИЦЫ) – Hull Colors (Hm, Hi, Hg, Hf):- non-anthocyanin colors which appear on the lemma and palea only when the straw hull gene, Gh, is present.

HULL DOWN = КОРПУС ВНИЗУ (или КОРПУС СКРЫТ ЗА ГОРИЗОНТОМ) – Hull Down (maritime term):- said of a vessel when, due to its distance on the horizon, only the masts are visible.

HULLED KERNELS = ЛУЩЁНАЯ ЗЕРНОВКА (или ШЕЛУШЕНАЯ ЗЕРНОВКА, или ЛУЩЁНЫЕ ЯДРА, или ШЕЛУШЕНЫЕ ЯДРА, или ОТШЕЛУШЕННАЯ ЗЕРНОВКА) – Hulled Kernels have the hulls removed, e.g., oat groats, peeled barley and hulled sunflower seeds.

HULLESS KERNELS = ГОЛАЯ ЗЕРНОВКА (или ГОЛЫЕ ЯДРА) – Hulless Kernels have naturally loose hulls or no hulls, e.g., Wheat, hulless Oats and Barley. / Голая Зерновка (Голые Ядра), которая естественным образом потеряла кожуру или не имела её вовсе, например, голозёрного Овса, ядра Пшеницы и Ячменя.

HULLING = ШЕЛУШЕНИЕ (или ЛУЩЕНИЕ, или ОБРУШИВАНИЕ, или ОБДИРКА, или ОТШЕЛУШИВАНИЕ) – Hulling is the removal of the husks or hulls from the Rice grain; converting rough Rice or paddy into milled Rice. / Отшелушивание цветочной оболочки, производимое Марьянским Рисозаводом, Россия.

HULL INSURANCE = СТРАХОВАНИЕ КОРПУСА СУДНА – Hull Insurance is boat insurance that covers damage to a boat, its machinery and its equipment. According to United Marine Underwriters, it is the closest maritime equivalent to comprehensive and collision automobile insurance. Like other products in the insurance market, coverage and deductibles vary by company, so read and compare insurance contracts before you buy. Hull insurance is a term sometimes used for aircraft. Hull Insurance is an insurance on the ship, its machinery and equipment. Marine Hull insurance covers nearly everything that floats and moves, starting with rowing boat to huge ocean going tankers. Besides that, hull underwriters will not hesitate to insure non-propelled objects, which may occassionaly move such as floating docks, buoys, transshipment barges and even floating hotels. Furthermore we can say that vessels under conversion or construction are also dealt with by marine hull underwriters. In fact, there are many uniform conditions around the world and many alternatives how to insure your beloved ship, but let us outline the most widely known insurance covers, which your fellow shipowners are considering to have:- (1) Hull & Machinery (H&M):- this is very basic of marine hull. Sceleton, if we may say so. This policy will cover your vessel, including hull, machinery, gear and equipment against loss or damage. Normaly you would be also entitled to claim for your ship’s proportion of salvage, salvage charges, general average as well as wages and maintenance under your H&M policy, but you need to check your wording first. (2) Disbursements, Freight, Increased Value (IV):- underwriters would normaly say that there is a big deal of difference between these insurances, but all in all, these are basicaly the same as you would be entitled to claim certain amount of money (which you have agreed beforehand with you underwriter friend) in excess of insured value of your vessel in case she will be a total loss, whatever actual or constructive. (3) Loss of Hire (LOH):- it goes without saying that you need some money to run your ship and you would expect some profit from her operation as well. Ok, but you would naturaly be left without income once your ship is not working, so that’s why here is LOH insurance. This policy will compensate daily amount stated in your policy (again you have to agree it before) whilst your ship is under repairs following an accident covered under H&M insurance. Underwriters would normaly allow 14 days deductible before they open their wallets, but this still is nothing in case of reasonably serious damage. (4) Mortgagees’ Interest Insurance (MII):- this policy would normaly be demanded by bankers (or, as we say, mortgagees). It protects the mortgagees’ interest in the insured vessel in case H&M underwriters would refuse to settle a claim due to breach of warranty stated in H&M policy, e.g., H&M is allowing vessel to sail only within Baltic sea, but your vessel end up in collision in English channel – you hardly can expect you H&M underwriter to pay for it, but MII policy will protect mortgagees’ interest anyway. (5) Builders’ Risks:- this is insurance for the vessel under construction. Cover is normaly against all risks of loss or damage to vessel whilt under construction or conversion and during trials and would include certain liability risks as well. This insurance is normaly taken by ship builders. Hull Insurance covers more than the hull. Sails, motors and masts may also be included. Hull Insurance:- the basic Marine Policy is used to cover either the shipowner or the shipper (or buyer) of goods. When coverage is for goods it is termed a Cargo Policy; when the ship is covered, it is termed Hull Insurance. The shipowner is provided legal liability protection to others, for instance in the event of a collision. The Hull Policy can be written for each voyage of a ship, or for a specified time period, typically one year. When written on a time period basis, an implied warranty of seaworthiness is applied to the vessel. This warranty does not adhere to

the time basis coverage; it is deemed to present a potential hardship to the shipowner, since the ship may be at sea or at a port where suitable repairs might not be available, when coverage begins. / Страховка по судну, его машинной части и оборудования. Страхование Корпуса Судна, Механизмов и Оборудования:- полис, покрывающий страхование корпуса, механизмов и оборудования является основой морского страхования. При этом страхуется ущерб, наносимый корпусу, механизмам и оборудованию, находящимся на судне. Основная цель страхования корпуса, механизмов и оборудования – это обеспечение уверенности судовладельца в том, что эксплуатационные возможности судна в период его эксплуатации останутся без изменений. Поскольку судовладелец понимает, что страховой случай может наступить в каждом рейсе, то он страхует корпус, машины и оборудование на случай ущерба, который может понести судно и его оборудование в период эксплуатации. Получаемый в данном случае полис предусматривает компенсацию за физические повреждения или ущерб в результате действия морских стихий, и включает в себя затраты по спасательной операции и всем прочим действиям, связанным с утратой судна или его повреждением в море. Такой полис адаптирован к требованиям и типам судов конкретного судовладельца, и учитывает состояние судна, его стоимость, страховые премии, а также оговаривает тип предоставляемого страхового покрытия – 'страхование от всех рисков', 'ограниченное страхование' или 'страхование на случай полной утраты судна'. Чаще всего при страховании корпуса и механизмов используются три варианта общепризнанных страховых условий:- (i) План Норвежского Морского Страхования от 1996, в редакции 2010 (The Norwegian Marine Insurance Plan of 1996, Version 2010); (ii) Стандартные Английские Условия Срочного Страхования Корпуса и Механизмов (the Institute Time Clauses – Hulls (ITCH)); и (iii) Стандартные Американские Условия Страхования Корпуса и Механизмов от 02 Июня 1977 (the American Institute Hull Clauses June 02, 1977). Были изданы также более новые редакции Английских условий, которые не нашли широкого применения, однако, их последняя версия, известная как Международные условия страхования корпуса и механизмов от 11 Января 2003 (International Hull Clauses (IHC) of 2003-January-11), нашла некоторую поддержку и может применяться в будущем вместо Стандартных Английских условий страхования корпуса и механизмов. Полис предусматривает страхование судов от гибели или ущерба в результате:- (i) воздействий стихии на море, реках, озёрах и всех прочих судоходных водах; (ii) неблагоприятных погодных условий; (iii) столкновения с другим судном; (iv) контакта с плавающими или подводными объектами; (v) контакта с закреплёнными объектами; (vi) посадки на грунт; (vii) посадки на мель; (viii) пожара, взрыва, удара молнии; (ix) хищения, совершённого лицами, не являющимися членами экипажа судна; (x) контакта с сухопутными средствами, причальным или портовым оборудованием или сооружениями; (xi) землетрясения, извержения вулкана; (xii) несчастного случая при погрузке, выгрузке или перемещении груза или бункера; (xiii) контакта с самолётами, вертолётами или подобными объектами, а также объектами, падающими с них; (xiv) взрыва котлов и любого скрытого дефекта гребного вала, коленчатого вала, кулачкового вала или любой части или частей главного двигателя или любых вспомогательных машин, или корпуса; (xv) халатности ремонтных рабочих; (xvi) ошибки капитана, лиц командного состава, команды или лоцмана в период нахождения на вахте, заключающейся в несоответствующем исполнении действий, требующихся согласно любым правилам, положениям или хорошей морской практики, или преобладающим окружающим условиям; и (xvii) законных действий любых органов власти, направленных на предотвращение или смягчение опасности загрязнения или ущерба окружающей среде, или угрозы загрязнения или ущерба, возникающих непосредственно в результате повреждения застрахованного судна. Страхуемые Риски:- (i) полная утрата судна (фактическая или конструктивная); (ii) повреждение корпуса, механизмов, оборудования и всех относящихся к ним устройств; (iii) общая авария; (iv) спасательные работы, вознаграждение за спасение; (v) затраты, понесённые в разумных пределах с целью избежания гибели или минимизации ущерба (судебные издержки и оплата рабочей силы); (vi) затраты по предотвращению столкновения или нападения; и (vii) затраты по постановке судна в сухой док для осмотра подводной части корпуса после посадки на грунт или мель, в том числе, если повреждения обнаружены не были.

HULL SPOT = ПЯТНИСТОСТЬ ШЕЛУХИ (или ПЯТНИСТОСТЬ КОЖИЦЫ) – Hull Spot (HSP):- small tissue areas on the lemma and palea which are thin and transparent and appear discolored.

HUMAN CAPITAL = ЧЕЛОВЕЧЕСКИЙ КАПИТАЛ – Human Capital:- a loose catch-all term for the practical knowledge, acquired skills and learned abilities of an individual that make him or her potentially productive and thus equip him or her to earn income in exchange for labor. The figurative use of the term capital in connection with what would perhaps better be called the 'Quality Of Labor' is somewhat confusing. In the strictest sense of the term, human capital is not really capital at all. The term was coined so as to make a useful illustrative analogy between investing resources to increase the stock of ordinary physical capital (tools, machines, buildings, etc) in order to increase the productivity of labor and 'investing' in the education or training of the labor force as an alternative means of accomplishing the same general objective of higher productivity. In both sorts of 'investment', costs are incurred by investors in the present in the expectation of deriving extra benefits over a long period of time in the future. As in the case of ordinary investments in physical capital, investments in human capital make economic sense to the extent that the value of the additional future benefits to be expected (greater productivity and thus more income for the worker and his employer) exceed the extra costs that have to be incurred in the present to obtain them (costs of schooling or training programs, production and income foregone while the individual is in training, the loss of leisure and perhaps the experience of mental anguish undergone by the individual in having to learn new things, etc). Varying levels of past investment in human capital provides one of the main explanation for the size of wage and salary differentials among individuals:- payment for an individual's labor in reality includes not just payment for the employee's leisure time foregone but also a premium that represents the going rate of return on his past investment in human capital. The analogy between human capital and real capital breaks down in one important respect, however. Property rights over ordinary inanimate capital are normally readily transferable by sale from one owner to another, and consequently markets for capital goods can function easily and smoothly to reallocate such resources from one project to another with minimal complications and transactions costs. The value of resources that have been invested in physical capital by an investor can often be readily recovered later (at least in good part) through resale, with the proceeds being easily redeployed into purchases for consumption or reinvestment in other types of capital goods as the investor may choose. However, human capital is by definition inseparably embedded in the nervous system of a specific individual and it thus cannot be separately owned apart from the individual's living body itself. Except in societies that legalize slavery (or at least enforce very long term transferable indentured labor contracts), human capital itself cannot be directly bought and sold on the market – only its temporary services as reflected in the labor productivity of the one individual who alone can own it. If an employee chooses to quit his or her job (perhaps because of an offer of much higher pay by a competing firm in the same industry), then any past investment the employer may have made to upgrade the employee's job skills is lost to the firm from the minute the former employee walks out the door for the last time. The only person who can invest in human capital with full confidence that he will not be arbitrarily deprived of its fruits in the future without compensation is the individual in whom the investment is made, so other firms or individuals therefore have much less incentive to invest resources in him or her in this way, even if this might be the cheapest way to increase productivity. Even the individual in whom the human capital is to be embedded may be somewhat deterred from investing by the fact that such an investment is necessarily very illiquid – that he cannot later recoup any part of the value of his own investment in human capital by selling it off if he should desire to go into some other line of endeavor where the skills involved are not useful.

HUMECTANT = УВЛАЖНИТЕЛЬ (или СМАЧИВАТЕЛЬ) – Humectant is a chemical that helps retain moisture. In some dyeing techniques, such as direct application, it is necessary to prevent the dye solution applied to the fabric from drying out before the dye has time to fix to the fibers. A humectant, often urea or occasionally glycerine, may be used for this purpose. Humectants may be unnecessary if it is possible to wrap the fabric in plastic sheeting or put it in a closed plastic container to keep it from drying out. / Увлажнитель:- устройство для повышения влажности воздуха в комнате. Иногда используют поднос с испаряющейся водой, но более сложные увлажнители работают на электричестве.

HUMERAL VEIL = ХЬЮМЁРЭЛ ВЭЙЛ (или УМЕРАЛЬ ВЭЙ, или ВУАЛЬ НА ПЛЕЧИ, или НАПЛЕЧНАЯ ВУАЛЬ) – Humeral Veil:- an oblong vestment worn around the shoulders and over the hands by a priest holding a sacred vessel. / Humeral = Плечевой.

HUMIDITY = ВЛАЖНОСТЬ (или СЫРОСТЬ) – In the Cotton industry, the actual Humidity content of a Cotton. Such content, stated as a percentage of the absolute dry weight of the sample after duly dried at the ventilated oven, is the hygrometric grade or 'regain' of such sample. Unless otherwise stated, the standard 'regain' is 8.5% on dry weight. This value is the basis for the calculation of the commercial weight or corrected invoice weight of a lot of Cotton. The 'regain' of a lot is the average of the values obtained from samples submitted to a test. When the weight of the Cotton completely dried out increased by 8.5% shows a weight in excess of the original weight, there is a 'humidity loss'; when being below, there is a 'humidity gain'. The loss or gain is expressed in percentage of the original net weight. On calculating the commercial weight, the 'humidity loss' 'increases' the net delivered weight. The 'humidity gain' 'decreases' the net delivered weight. Humidity is a dampness, the amount of water or water vapor in the air. / Стандартом предусмотрены нормы влажности хлопкового волокна в пределах 5.0–8.5%. Влажность – содержание влаги в .

HUMIDITY MOTOR = МОТОР ВЛАЖНОСТИ (или ДВИГАТЕЛЬ ВЛАЖНОСТИ) – Humidity Motor:- circulation produced when the temperature gradient between the cargo and the container wall is too steep. This increases the transport of humidity to the surfaces of the container.

HUMPING = СЦЕПКА ПРИ СПУСКЕ С ГОРКИ – Humping is the process of connecting a moving railcar with a motionless railcar which results in a force of great magnitude and shock. Humping is the process of connecting a moving rail car with a motionless rail car within a rail classification yard in order to make up a train. The cars move by gravity from an incline or hump onto the appropriate track.

HUMPY CHAIN = ВЫГНУТАЯ ЦЕПОЧКА – Humpy Chain:- readily noticeable by its waviness. Causes difficulty at sewing operation and distorts finished garment's appearance. See also Curved Or Crooked Chain. Closure defects, and namely – Zippers:- Chain or Teeth Defects. / Порок или дефект застёжки.

HUMUS = ГУМУС (или ПЕРЕГНОЙ) – Humus is the organic component of soil, composed of partially or completely decayed plant and animal remains that provides nutrients for plants and increases the ability of soil to retain water. / Под Гумусом или Перегноем, от Латинского слова Humus, означающее Земля или Почва, понимаются высокомолекулярные тёмноокрашенные органические вещества почвы. Состоит из гуминовых кислот, фульвокислот, гумина и ульмина. Образуется в результате гумификации продуктов разложения органических остатков. Содержит элементы питания растений, которые после разложения гумуса переходят в доступную для них форму. Почвы, богатые гумусом, плодородны.

HUNDREDWEIGHT = ХАНДРЭДВЭЙТ (или ХАНДРЕДВЕЙТ, или ЦЕНТНЕР, или ЦЕНТАЛ) – The Hundredweight or Centum Weight (abbreviated cwt) is a unit of mass defined in terms of the pound (lb). Its British definition is not the same as that used in North America. The two are distinguished by speaking of the long hundredweight and the short hundredweight:- (i) In Imperial units, a (long) hundredweight is defined as 112 lb, which is equal to 50.802 345 kg; (ii) In United States (US) customary units, a (short) hundredweight is defined as 100 lb, which is equal to 45.359 237 kg. This is also the usual hundredweight in Canada. The short hundredweight is also called a Cental, especially in places which normally use the long hundredweight. Under both conventions, twenty hundredweights are in a ton:- the long ton of 2 240 lb and the short ton of 2 000 lb. The long ton is approximately equal to the metric tonne of 1 000 kg (2 205 lb). The long and short hundredweight are both descended from the French avoirdupois weight system, which became established in England in Late Medieval times. For some history on how the British and American units diverged from each other, or why the British unit is 112 lbs, see also Avoirdupois. In brief, British custom came to widely use the Stone weight, which is 14 pounds, and wished for the hundredweight unit to be in whole integers of Stones – and 100 divided by 14 is not an integer. The Stone was not one of the avoirdupois units in Medieval France, and never became customary in the British American colonies or the United States of America. In 1824 in the United Kingdom (UK), new weights and measures legislation made it illegal for merchants to use the word hundredweight in the sense of a hundred pounds. A merchant could be sued for fraud for doing so. In 1879, the hundred pound weight was re-legalized for trade in the UK under the name 'cental', in response to legislative pressure from UK merchants who were importing corn and tobacco from the US. The short hundredweight is commonly used in US in the sale of livestock and some cereal grains and oilseeds and concrete additives and on futures exchanges. The long hundredweight is now little used in any country, and its usage is decreasing, since the English-speaking countries other than the US adopted the metric system. A few decades ago, commodities weighted in terms of long hundredweights included cattle, cattle fodder, fertilizers, coal, some industrial chemicals, other industrial materials, large church bells, and so on. Before the XV century in England, a hundredweight was a different unit equal to 108 lb. In Canada, a Hundredweight (abbreviation:- cwt) is equal to 100 pounds of potatoes. The hundredweight replaced the bushelas the commonly accepted measurement in agriculture. In Canada, the bushel was replaced by the hundredweightas the commonly accepted unit of measurement in agriculture. In the United Kingdom, Hundredweight is the Imperial measurement equal to one hundred and twelve pounds, or eight stones; 50.8 kilograms. Hundredweight is a measure of weight containing 100 pounds (45.5 kg) in the United States or 112 pounds (50.802 3 kg) in the United Kingdom. Short ton hundredweight = 100 pounds. Long ton hundredweight = 112 pounds. Hundredweight:- also referred to as Centum Weight, the hundredweight (cwt) is a unit of mass expressed in terms of pounds. In commodity trading the (short) hundredweight is used as unit for rough rice (RR) future contracts traded at the CBOT®. Imperial system:- 1 (long) hundredweight = 112 lb = 50.802 345 kg; 20 hundredweight = 1 (long) ton = 2 240 lb ≈ 1 metric ton (2 205 lb = 1 000 kg). US customary system:- 1 (short) hundredweight = 100 lb = 45.359 237 kg; 20 hundredweight = 1 (short) ton = 2 000 lb. The pricing unit used in transportation; a hundredweight is equal to 100 pounds. / Короткий Центнер = 100 фунтов = 45.359 237 килограмм; в США известен как Квинтал. Длинный Центнер = 112 фунтов = 50.802 345 килограмм; в Соединённом Королевстве. СИБАТ® (CBOT®).

HUNGRY FINE = ТОНКОЕ ОТ ГОЛОДА – Hungry Fine is a term used to describe a fine wool caused by poor nourishment as opposed to careful breeding.

HUNTER COLOR DIFFERENCE = ЦВЕТОВОЕ РАЗЛИЧИЕ ПО ХАНТЁРУ – Hunter Color Difference is the color difference calculated by the use of the Hunter equations, based on the opponent-color coordinates, L, a, b, applied to CIE 1931 tristimulus values for CIE standard illuminant C, and by extension to the CIE 1964 standard observer and other CIE standard illuminants. Commission Internationale de l'Eclairage (CIE) is the French title of the International Commission on Illumination. HunterLab Inc., Reston, State of

Virginia, the United States. / Комисьо Этэрнасьёналь дё л'Эклераж (Сэ.И.Е.; Commission Internationale de l'Eclairage (CIE)). ХантёЛэб Инк. (HunterLab Inc.).

HUNTER GREEN = ЗЕЛЁНО–ОХОТНИЧЬЕ (или ОХОТНИЧЬЯ ЗЕЛЕНЬ) – Hunter Green:- a dark yellowish green.

HUNTER LAB SCALE = ШКАЛА ХАНТЁ ЛЭБ – Hunter Lab Scale is a uniform color scale devised by Hunter in 1958 for use in a color difference meter. It is based on Hering's opponent-colors theory of vision. HunterLab Inc., Reston, State of Virginia, the United States. / ХантёЛэб Инк. (HunterLab Inc.).

HURDLE RATE = ПОРОГОВАЯ СТАВКА (или БАРЬЕРНАЯ СТАВКА) – Hurdle Rate is the minimum rate of investment that is acceptable to an investor. It is also used in the context of achieving a certain rate before other events can take place. For example, a fund manager has to achieve a certain hurdle rate for his investors before he is paid a bonus.

HURRICANE = УРАГАН – The ingredients for a Hurricane include a pre-existing weather disturbance, warm tropical oceans, moisture, and relatively light winds aloft. If the right conditions persist long enough, they can combine to produce the violent winds, incredible waves, torrential rains, and floods we associate with this phenomenon. Each year, an average of eleven tropical storms develop over the Atlantic Ocean, Caribbean Sea, and Gulf of Mexico. Many of these remain over the ocean and never impact the US coastline. Six of these storms become hurricanes each year. In an average 3-year period, roughly five hurricanes strike the US coastline, killing approximately 50 to 100 people anywhere from Texas to Maine. Of these, two are typically 'major' or 'intense' hurricanes (a category 3 or higher storm on the Saffir-Simpson Hurricane Scale). A hurricane is a type of tropical cyclone, which is a generic term for a low pressure system that generally forms in the tropics. The cyclone is accompanied by thunderstorms and, in the Northern Hemisphere, a counterclockwise circulation of winds near the earth's surface. Tropical cyclones are classified as follows:- (i) Tropical Depression – an organized system of clouds and thunderstorms with a defined surface circulation and maximum sustained winds of 38 mph (33 kt) or less; (ii) Tropical Storm – an organized system of strong thunderstorms with a defined surface circulation and maximum sustained winds of 39–73 mph (34–63 kt); and (iii) Hurricane – an intense tropical weather system of strong thunderstorms with a well-defined surface circulation and maximum sustained winds of 74 mph (64 kt) or higher. Sustained winds – a 1-minute average wind measured at about 33 ft (10 meters) above the surface. 1 knot = 1 nautical mile per hour or 1.15 statute miles per hour. Abbreviated as 'kt'. Hurricanes are categorized according to the strength of their winds using the Saffir-Simpson Hurricane Scale. A Category 1 storm has the lowest wind speeds, while a Category 5 hurricane has the strongest. These are relative terms, because lower category storms can sometimes inflict greater damage than higher category storms, depending on where they strike and the particular hazards they bring. In fact, tropical storms can also produce significant damage and loss of life, mainly due to flooding. When the the winds from these storms reach 39 mph (34 kts), the cyclones are given names. Years ago, an international committee developed names for Atlantic cyclones (The History of Naming Hurricanes). In 1979 a six year rotating list of Atlantic storm names was adopted – alternating between male and female hurricane names. Storm names are used to facilitate geographic referencing, for warning services, for legal issues, and to reduce confusion when two or more tropical cyclones occur at the same time. Through a vote of the World Meteorological Organization Region IV Subcommittee, Atlantic cyclone names are retired usually when hurricanes result in substantial damage or death or for other special circumstances. See also The Saffir-Simpson Hurricane Scale. Hurricane (maritime term):- force of wind over 65 knots. / (i) Тропическая Депрессия (Tropical Depression); (ii) Тропический Шторм (Tropical Storm); (iii) Ураган (Hurricane). Смотрите также Шкала Сафира-Симпсона По Мощи Ураганов (The Saffir-Simpson Hurricane Scale). штормовой нагон воды . 1 узел (knot) = 1 морской миле в час (nautical mile per hour) или 1.15 уставных (или статутных, или законных) милей в час (statute miles per hour).

HUSBANDING = АККУРАТНОЕ ОТНОШЕНИЕ (или БЕРЕЖЛИВОЕ ОТНОШЕНИЕ, или ОТНОШЕНИЕ ДОЛЖНЫМ ОБРАЗОМ) – Taking care of a vessel's non cargo related operations as instructed the by the master or owner of the vessel. Husbanding is a term used by steamship lines, agents, or port captains who are appointed to handle all matters in assisting the master of the vessel while in port to obtain such services as bunkering, fresh water, food and supplies, payroll for the crew, doctors appointments, and ship repair. / хозяином (или капитаном) или .

HUSK = СКОРЛУПА (или ШЕЛУХА, или ЛУЗГА, или ПЛОДОВАЯ ОБОЛОЧКА, или МЯКИННАЯ ОБОЛОЧКА, или КОЖИЦА, или ПЛЁНКА) – (1) Husk is the dry outer covering of various fruits or seeds, as of an ear of corn. Husk (in botany) is the outer shell or coating of a seed. Also known as Hull. Rice shell, Husk or Hull:- encloses the brown Rice consists mainly of embryo and endosperm. Husk is:- (i) a usually dry or membranous outer covering (such as a pod or one composed of bracts) of various seeds and fruits (such as Barley and Corn); and also one of the constituent parts; (ii) an outer layer; an emptied shell. Husk is a synonymous with Hull. / Лущильные Лущилкой (Husked). Рисовая оболочка, Кожица или Семенная Шелуха:- покрывает семя бурого Риса, которое состоит, главным образом, из зародыша и эндосперма. Лузга Подсолнечниковая, оболочки семян Подсолнечника, отход маслоэкстракционного производства. Содержит много клетчатки (52–58%), безазотистые экстрактивные вещества (38–39%), протеин (3.7–4.5%), жир (1.3–1.6%). В 1 кг подсолнечниковой лузги около 0.2 кормовых единиц. Используют в кормлении крупного рогатого скота. Скармливают в смеси с концентратами (в виде муки и гранул). Лузга – субстрат для выращивания дрожжей кормовых.

(2) Husk is the inner portion of a cocoon; too fine to reel and know as Silk Waste. / Внутренняя составляющая кокона, слишком тонкая для разматывания и известная как Отходы Шёлка (Silk Waste).

HUSTLER = ПЕРЕГРУЗОЧНОЕ СРЕДСТВО (или ПЕРЕВОЗЧИК КОНТЕЙНЕРОВ, или ТРАНСПОРТЁР КОНТЕЙНЕРОВ) – Hustler is a tractor that pulls containers around the pier for positioning. Also known as Yard Hustler.

HVI = HIGHT VISCOSITY INDEX

HVI = HIGH VOLUME INSTRUMENT

HVK = HARD VITREOUS KERNELS

HW = HAND WEEDING

HWR = HULL WEIGHT RATIO

HWT = HOT WATER TREATMENT

HYALINE = ГИАЛИН (или ГИАЛИНОВОЕ, или СТЕКЛОВИДНОЕ) – Hyaline:- translucent or transparent. / Прозрачное. Гиалиновое – просвечиваемое. Под Гиалиновым, от Греческого слова Hyálinos, понимается стекловидный, прозрачный, например, гиалиновый хрящ.

HYBRID = ГИБРИД – Hybrid, for the Convention on International Trade in Endangered Species of Wild Fauna and Flora (CITES) purposes, hybrid is the offspring of two genetically dissimilar taxa where at least one parent is listed in a CITES Appendix. This would include the offspring of parents belonging to different species, different genera, and crosses made between a species and a hybrid.

Offspring from parents of the same species (i.e. intra-specific crosses) are regulated as species and are not considered hybrids. Hybrid:- progeny from an inter-specific (or inter-generic) fertilization, often of intermediate appearance to the parents. Hybrid:- seed or plants produced as the result of controlled pollination as opposed to seed produced as the result of natural pollination. Hybrid is the product of a cross between genetically dissimilar parents. / Под Гибридом, от Латинского слова Hibrida, понимается организм, полученный в результате скрещивания генетически различающихся родительских форм (видов, пород, линий и других).

HYBRID ADJUSTABLE–RATE MORTGAGE = ГИБРИДНАЯ ЗАКЛАДНАЯ С ПЕРЕОЦЕНИВАЕМОЙ СТАВКОЙ – Hybrid Adjustable-Rate Mortgage:- in the United States, these adjustable-rate mortgages (ARMs) are a mix – or a hybrid – of a fixed-rate period and an adjustable-rate period. The interest rate is fixed for the first several years of the loan; after that, the rate could adjust annually. For example, hybrid ARMs can be advertised as 3/1 or 5/1 – the first number tells you how long the fixed interest-rate period will be and the second number tells you how often the rate will adjust after the initial period. / Гибридная Закладная С Переоцениваемой Ставкой:- в Соединённых Штатах Америки закладные с переоцениваемой ставкой (ЗПС; adjustable-rate mortgage (ARM)) являются смесью – или гибридом – периода с фиксированной ставкой (fixed-rate period) и периода с переоцениваемой ставкой (adjustable-rate period). Процентная ставка зафиксирована для нескольких первых лет займа; после чего, ставка может ежегодно переоцениваться. Например, гибридные ЗПС могут подаваться в прессе как 3/1 или 5/1 – первая цифра указывает на то, как долго или сколько лет будет продолжаться период с фиксированной ставкой процентов, а вторая цифра указывает на то, как часто ставка будет переоцениваться, спустя первоначальный период.

HYBRID BEARING = ГИБРИДНЫЙ ПОДШИПНИК (или ГИДРОСТАТОДИНАМИЧЕСКИЙ ПОДШИПНИК) – Hybrid Bearing is a bearing that consists of metal rings and ceramic balls. See also Bearing. / По виду смазки Гибридный Подшипник или Гидростатодинамический Подшипник – подшипник скольжения, предназначенный для работы как при гидродинамической, так и при гидростатической смазке.

HYBRID COMPOSITE = ГИБРИДНЫЙ КОМПОЗИЦИОННЫЙ МАТЕРИАЛ (или ГИБРИДНЫЙ КОМПОЗИТ) – Hybrid Composite is the advanced composite with a combination of different high-strength continuous filaments in the matrix. Also, composite in which continuous and staple fibers are used in the same matrix.

HYBRID EXCHANGE TRADED FUND = ГИБРИДНЫЙ ФОНД, ТОРГУЕМЫЙ НА БИРЖЕ – An Exchange Traded Fund (ETF) that can either be based on an index or be 'actively managed' by the fund manager selecting the securities that he or she favors.

HYBRID FABRIC = ГИБРИДНАЯ ТКАНЬ (или РАЗНОРОДНАЯ ТКАНЬ) – Hybrid Fabric is a fabric for composite manufacture in which two or more different yarns are used in the fabric construction. This provides design flexibility to meet performance requirements and controls cost by permitting some lower priced fibers to be used.

HYBRID INSTRUMENTS = ГИБРИДНЫЕ ИНСТРУМЕНТЫ – Hybrid Instruments are the financial instruments that possess, in varying combinations, characteristics of forward contracts, futures contracts, option contracts, debt instruments, bank depository interests, and other interests. Certain hybrid instruments are exempt from the US Commodity Futures Trading Commission (CFTC) regulation.

HYBRIDIZATION = ГИБРИДИЗАЦИЯ – Hybridization is a breeding method in which two varieties are crossed to generate new variability and to produce desired recombinants. The hybrids are allowed to self-pollinate and the segregating populations are handled by an appropriate method. / метод разведения, в котором скрещены две разновидности для . Под Гибридизацией, от Латинского слова Hibrida, означающее Помесь, понимается скрещивание разнородных в наследственном отношении организмов. Один из важнейших факторов эволюции биологических форм в природе. Применяют для получения хозяйственных ценных форм животных и растений. Скрещивание особей одного и того же вида (различных подвидов, сортов, пород или линий) называется внутривидовой гибридизацией, а различных видов или родов – отдалённой гибридизацией. Гибридизация как высокочувствительный метод выявления специфических последовательностей нуклеотидов. Если водный раствор ДНК нагреть до 100 °C и повысить pH до 13, то ДНК диссоциирует на 2 цепи (денатурирует), так как комплементарные связи между основаниями разрушаются. В 1961 было обнаружено, что этот процесс обратим:- выдерживание ДНК при температуре 65 °C вело к восстановлению структуры двойной спирали. Этот процесс называется Ренатурация или Гибридизация. Процессы гибридизации происходят между любыми одинарными цепями, если они комплементарны:- ДНК – ДНК, РНК – РНК, ДНК – РНК. Для теста необходимо иметь чистый одноцепочечный фрагмент ДНК, комплементарный той последовательности, которую хотим обнаружить. Этот фрагмент получают либо клонированием, либо путём химического синтеза. Одноцепочечная ДНК, используемая в качестве индикатора, называется ДНК-Зонд. Она может содержать от 15 до 1 000 нуклеотидов. ДНК-зонды применяются в различных целях. Гибридизация ДНК-зонда с РНК, выделенной из анализируемой клетки, может выявить наличие или отсутствие экспрессии гена. Если гибридизации не происходит, значит ген молчит, не работает. ДНК-зонды также позволяют проводить диагностику наследственных болезней. В большинстве случаев мутации, ведущие к наследственным болезням, рецессивны, то есть болезнь развивается, если человек получает дефектные гены от обоих родителей. Аномальные эмбрионы лучше выявлять до рождения. Например, для серповидноклеточной анемии в мутантном гене, кодирующем бэта-цепь гемоглобина, последовательность ГАГ заменена на ГТГ. В этом случае синтезируют олигонуклеотид длиной около 20 оснований, метят радиоактивной меткой. Из эмбриональных клеток, содержащихся в амниотической жидкости, выделяют ДНК и используют её для гибридизации. Если эмбрион дефектен, то тест будет положительным. Анализ проводят по следующей схеме (Блоттинг ДНК по Саузерну):- исследуемую ДНК гидролизуют рестриктазами, фракционируют электрофорезом, переносят разделённые фрагменты на нитроцеллюлозный фильтр и проводят реакцию гибридизации с мечеными олигонуклеотидами. Этот метод был разработан Саузерном в 1975. В отечественной литературе его принято называть Южный Блотинг. Блотинг – в переводе с Английского означает Промокашка, Саузер – Южный, в данном случае игра слов:- фамилия учёного переводится как географическое направление. Молекулы ДНК разгоняют в агарозном геле электрофорезом. ДНК в геле денатурируют щёлочью. Щёлочь нейтрализуют и пластину геля покрывают листом нитроцеллюлозы. Сверху на нитроцеллюлозу помещают стопку листов фильтровальной бумаги, обеспечивая медленный ток буферного раствора через гель в направлении, перпендикулярном направлению электрофореза. ДНК диффундирует из геля и связывается с нитроцеллюлозным фильтром. После прогревания фильтра при 80 °C в вакууме ДНК необратимо связывается с нитроцеллюлозой. Расположение полос иммобилизованной ДНК точно соответствует их расположению в геле. ДНК, связанную с нитроцеллюлозным фильтром, можно гибридизовать с радиоактивно меченой ДНК. Блотинг по Саузерну является исключительно полезным также и для локализации изучаемых генов в определённых фрагментах, полученных в результате гидролиза различными рестриктазами гибридных молекул ДНК, хромосомной ДНК и т. д. Аналогичным методом на нитроцеллюлозу переносят молекулы РНК (Северный Блоттинг) и белка (Западный Блоттинг). Из частей света осталась свободной только Западная, хотя вакантными остались 2 класса макромолекул – углеводы и липиды. Одним из наиболее точных и современных методов анализа является использование чипов. Они представляют собой пластинки с иммобилизованными меченными ДНК-зондами. Каждая такая пластинка может содержать несколько десятков

тысяч зондов, расположенных в определённой последовательности. Метка проявляется только в спаренных двухцепочечных фрагментах. Если в исследуемом образце есть последовательности, комплементарные последовательностям зонда, то гибридизацию можно определить визуально или с помощью специальных приборов. Как правило, детекторы соединены с компьютером, то есть процедура считывания и обработки информации автоматизирована. Такие ДНК-чипы можно применять для комплексной диагностики инфекционных заболеваний, наследственных дефектов, установления экспрессии тех или иных генов (в этом случае идёт гибридизация с мРНК), то есть отслеживания нарушений обмена веществ. Они дёшевы, очень надёжны, просты в обращении и могут многократно использоваться. Недостаток – дорогая аппаратура для детекции.

HYBRIDIZATION BLOCK = БЛОК ГИБРИДИЗАЦИИ – Hybridization Block is a specific piece of land set aside for research in making specific crosses in breeding particular varieties of Rice.

HYBRID RICE = ГИБРИДНЫЙ РИС – Hybrid Rice is the F_1 seed used as commercial variety. Major determinants of Rice grain quality are:- (i) hull and pericarp color; (ii) grain size, shape, weight uniformity and general appearance; (iii) milling and head rice recovery; (iv) kernel chalkiness, translucency and color; and (v) cooking, eating, and processing characteristics. Some rice grain tissues are of maternal origin and others result from fertilization and union of genetically diverse gametes. Seeds borne on F_1 Rice hybrids are F_2 seeds. These would not show genetic segregation for traits of maternal tissues viz., lemma and palea of the Rice hull, seed size and shape, and pericarp color. However, traits of endosperm (viz., endosperm translucency, chalkiness, amylose content, gelatinization temperature, gel consistency, etc) are bound to show genetic segregation because endosperm is formed by fertilization and union of the 2n gamete of the female parent and the n gamete from the male parent. / Размер Зерна или Величина Зерна (Grain Size). Сегрегация или Выделение или Зейгерование или Разделение По Крупности (Segregation).

HYBRID VARIETY = ГИБРИДНАЯ РАЗНОВИДНОСТЬ – Hybrid Variety:- (1) a variety of Rice developed from crossing and selection to gain higher yields. (2) F_1 offspring of two genetically dissimilar parents.

HYBRID VIGOR = ГИБРИДНАЯ СИЛА (или ГИБРИДНАЯ МОЩНОСТЬ) – Hybrid Vigor:- the increase in vigor of hybrids over their parental inbred types. Also known as Heterosis. / Известна также как Гетерозис (Heterosis).

HYBRID YARN = ГИБРИДНАЯ ПРЯЖА (или РАЗНОРОДНАЯ ПРЯЖА) – In aerospace textiles, Hybrid Yarn is a yarn having more than one component. See also Commingled Yarn.

HYDATHODE = ГИДАТОД (или ГИДАТОДА) – Hydathode is a specialized gland or pore on the surface or leaf margin of higher plants that exudes water from the plant tissues. Hydathode is a water-excreting gland or pore occurring on the edges or tips of the leaves of many plants. / Под Гидатодами, от Греческих слов Hýdōr, родительный падеж Hýdatos, означающее Вода, и Hodós, означающее Путь, понимаются желёзки в эпидермисе листа, обеспечивающие гуттацию.

HYDRATION = ГИДРАТИРОВАНИЕ (или ГИДРАТАЦИЯ) – Hydration is the process where a compound combines with water in a definite ratio. / Под Гидратацией понимается присоединение воды к веществу. Может протекать с разрушением молекул воды, например, при синтезе этанола гидратация этилена, или без их разрушения, например, при образовании кристаллогидратов. Обусловливает растворимость веществ в воде, электролитическую диссоциацию ионных соединений.

HYDRATION NUMBER = ЧИСЛО ГИДРАТАЦИИ – Hydration Number is a value indicating how many water molecules are associated with each molecule of some other compound in a crystal of that compound. Many chemicals have one or more water molecules associated with each chemical molecule in the commercially-sold form of that chemical. For example, sodium carbonate (soda ash) may be sold as anhydrous (containing no water molecules), monohydrate (one water molecule per sodium carbonate molecule, written as $Na_2CO_3 \cdot H_2O$) or decahydrate (ten water molecules per sodium carbonate molecule – $Na_2CO_3 \cdot 10H_2O$). This water is not visibly present as water – it does not cause dampness, though it may change the appearance of the dry chemical. The hydration state must be considered when measuring the chemical by weight. For example, 1 gram of sodium carbonate decahydrate contains about 0.37 grams of sodium carbonate, and 0.63 grams of water. If chemicals are exposed to air for long periods, the hydration may either increase or decrease depending on conditions. See also Hygroscopic. / безводное (anhydrous). десятиводный гидрат (decahydrate).

HYDRAULIC ENTANGLEMENT = ГИДРАВЛИЧЕСКАЯ ПОДПЛЕТИНА (или ГИДРАВЛИЧЕСКОЕ ПУТАНЬЕ, или ГИДРАВЛИЧЕСКОЕ ПЕРЕПЛЕТЕНИЕ, или ГИДРАВЛИЧЕСКОЕ СПЛЕТЕНИЕ) – Hydraulic Entanglement is the process of entangling individual fibers with each other by using water jets with varyubg degrees of water pressure. The higher water pressure, the greater is the degree of entanglement. Depending on the backing substrate used during the entangling process, one can get a product that has a uniform surface or one that is aperture. Most coating substrate end uses require a uniformly surfaced product. In a sense, one can consider hydraulic entangling to be a hydraulic needlepunching process. While hydraulic entanglement produces a material that is flatter and thinner than a needlepunched one, the bond formed has a lot in common with that produced by needlepunching. It is more like an anchor point than a rigid bond point, and the fabrics made – like some needlepunched fabrics – tends to have low elastic recovery. Hydraulic Entanglement:- the basic hydraulic entangling process entails impinging high energy water onto a substrate while the substrate is in contact with an impaction surface, thereby changing the structure and the properties of the substrate. What may seem like a very simple process is in fact extremely complex, although reproducibility from lot to lot is excellent. See also Hydroentangling.

HYDRAULIC FLUID = ГИДРАВЛИЧЕСКАЯ ЖИДКОСТЬ – Hydraulic Fluid is a fluid serving as the power transmission medium in a hydraulic system. The most commonly used fluids are petroleum oils, synthetic lubricants, oil-water emulsions, and water-glycol mixtures. The principal requirements of a premium hydraulic fluid are proper viscosity, high viscosity index, anti-wear protection (if needed), good oxidation stability, adequate pour point, good demulsibility, rust inhibition, resistance to foaming, and compatibility with seal materials. Anti-wear oils are frequently used in compact, high-pressure, and capacity pumps that require extra lubrication protection. / противоизносная защита . точка потери текучести (pour point). Гидравлические Жидкости – жидкости, применяемые в машинах и механизмах для передачи усилий (смотрите Гидравлическая Передача, Гидравлический Двигатель, Гидродинамическая Передача и Объёмная Гидропередача). Гидравлические жидкости должны обладать высокой стабильностью против окисления, малой вспениваемостью, инертностью к материалам деталей гидросистемы, пологой кривой вязкости, низкой температурой застывания и высокой температурой вспышки. Нефтехимическая промышленность выпускает более 20 сортов минеральных масел, используемых в гидравлических системах. В ряде случаев в качестве гидравлических жидкостей применяют некоторые индустриальные и моторные масла. Большинство гидравлических жидкостей содержит антиокислительные, антипенные и другие присадки.

HYDRAULIC FRACTURING = ГИДРАВЛИЧЕСКИЙ РАЗРЫВ – Hydraulic Fracturing produces fractures in the rock formation that stimulate the flow of natural gas or oil, increasing the volumes that can be recovered. Wells may be drilled vertically hundreds to thousands of feet below the land surface and may include horizontal or directional sections extending thousands of feet. Fractures are

created by pumping large quantities of fluids at high pressure down a wellbore and into the target rock formation. Hydraulic fracturing fluid commonly consists of water, proppant and chemical additives that open and enlarge fractures within the rock formation. These fractures can extend several hundred feet away from the wellbore. The proppants – sand, ceramic pellets or other small incompressible particles – hold open the newly created fractures. Once the injection process is completed, the internal pressure of the rock formation causes fluid to return to the surface through the wellbore. This fluid is known as both 'Flowback' and 'Produced Water' and may contain the injected chemicals plus naturally occurring materials such as brines, metals, radionuclides, and hydrocarbons. The flowback and produced water is typically stored on site in tanks or pits before treatment, disposal or recycling. In many cases, it is injected underground for disposal. In areas where that is not an option, it may be treated and reused or processed by a wastewater treatment facility and then discharged to surface water. Hydraulic fracturing is a technique used in 'unconventional' gas production. 'Unconventional' reservoirs can cost-effectively produce gas only by using a special stimulation technique, like hydraulic fracturing, or other special recovery process and technology. This is often because the gas is highly dispersed in the rock, rather than occurring in a concentrated underground location. Extracting unconventional gas is relatively new. Coalbed methane production began in the 1980s; shale gas extraction is even more recent. The main enabling technologies, hydraulic fracturing and horizontal drilling, have opened up new areas for oil and gas development, with particular focus on natural gas reservoirs such as shale, coalbed and tight sands. Hydraulic Fracturing (or Fracking) is a process used in nine out of 10 natural gas wells in the United States, where millions of gallons of water, sand and chemicals are pumped underground to break apart the rock and release the gas. Scientists are worried that the chemicals used in fracturing may pose a threat either underground or when waste fluids are handled and sometimes spilled on the surface. Hydraulic Fracturing involves the injection of more than a million gallons of water, sand and chemicals at high pressure down and across into horizontally drilled wells as far as 10 000 feet below the surface. The pressured mixture causes the rock layer, in this case th Marcellus Shale, to crack. These fissures are held open by the sand particles so that natural gas from the shale can flow up the well. Hydraulic Fracturing:- geologic formations may contain large quantities of oil or gas, but have a poor flow rate due to low permeability, or from damage or clogging of the formation during drilling. This is particularly true for tight sands, shales and coalbed methane formations. Hydraulic Fracturing (aka Fracking, which rhymes with cracking) stimulates wells drilled into these formations, making profitable otherwise prohibitively expensive extraction. Within the past decade, the combination of hydraulic fracturing with horizontal drilling has opened up shale deposits across the country and brought large-scale natural gas drilling to new regions. The fracking process occurs after a well has been drilled and steel pipe (casing) has been inserted in the well bore. The casing is perforated within the target zones that contain oil or gas, so that when the fracturing fluid is injected into the well it flows through the perforations into the target zones. Eventually, the target formation will not be able to absorb the fluid as quickly as it is being injected. At this point, the pressure created causes the formation to crack or fracture. Once the fractures have been created, injection ceases and the fracturing fluids begin to flow back to the surface. Materials called Proppants (e.g., usually sand or ceramic beads), which were injected as part of the frac fluid mixture, remain in the target formation to hold open the fractures. Typically, a mixture of water, proppants and chemicals is pumped into the rock or coal formation. There are, however, other ways to fracture wells. Sometimes fractures are created by injecting gases such as propane or nitrogen, and sometimes acidizing occurs simultaneously with fracturing. Acidizing involves pumping acid (usually hydrochloric acid), into the formation to dissolve some of the rock material to clean out pores and enable gas and fluid to flows more readily into the well. Some studies have shown that more than 90% of fracking fluids may remain underground. Used fracturing fluids that return to the surface are often referred to as Flowback, and these wastes are typically stored in open pits or tanks at the well site prior to disposal.

HYDRAULIC MOTOR = ГИДРАВЛИЧЕСКИЙ МОТОР (или ГИДРОМОТОР) – Hydraulic Motor is a device which converts hydraulic fluid power into mechanical force and motion by transfer of flow under pressure. It usually provided rotary mechanical motion.

HYDRAULIC OIL = ГИДРАВЛИЧЕСКОЕ МАСЛО (или МАСЛО ДЛЯ ГИДРАВЛИЧЕСКИХ СИСТЕМ) – Hydraulic Oil is an oil specially suited for use as either the specific gravity or the American Petroleum Institute (API) gravity of a liquid. / Гидравлические Масла:- гидравлические устройства используются во многих отраслях промышленности – горнодобывающей, металлургической, автомобильной, транспортной и так далее. Рабочим веществом в гидравлическом оборудовании является жидкость. От её вида и качества зависит надёжность, срок службы и безотказная работа всей системы. В зависимости от конструкции и условий эксплуатации применяются разные гидравлические жидкости, называемые также рабочими жидкостями или маслами. По химическому составу гидравлические жидкости можно разделить на следующие группы:- (i) минеральные масла; (ii) синтетические гидравлические масла; (iii) трудновоспламеняемые гидравлические жидкости; и (iv) биоразлагаемые гидравлические масла. Гидравлические минеральные масла – это, как правило, специально подобранные минеральные основы, в которые добавлены присадки, обеспечивающие соответствующие свойства масла. Они характеризуются хорошей термоокислительной стабильностью, стойкостью к коррозии и другими физико-химическими и эксплуатационными свойствами в зависимости от своего состава. Синтетические Гидравлические Масла – это, как правило, углеводородные масла на основе полиальфаолефинов (ПАО), синтетических сложных эфиров или полигликолей. Трудновоспламеняемые гидравлические жидкости, как правило, производятся для горной и литейной промышленностей, а также для всех областей, в которых присутствует пожарная опасность и не находят применения традиционные минеральные масла. Чаще всего встречающимися трудновоспламеняемыми гидравлическими жидкостями являются микроэмульсии категорий HFA (Hydraulic Fire-resistant fluid group A), HFB (Hydraulic Fire-resistant fluid group B) и синтетические водные растворы полимеров категории HFC (Hydraulic Fire-resistant fluid group C). Биоразлагаемые Гидравлические Масла – это масла, в которых масляной основой являются синтетические сложные эфиры, белые масла или масла растительного происхождения с определённым набором присадок. Производятся также гидравлические жидкости специального назначения. Это масла для пищевой промышленности, гидравлические трансмиссионные жидкости, универсальные моторно-трансмиссионно-гидравлические масла, гидравлические жидкости с высоким индексом вязкости и низкой температурой текучести, применяемые в авиации. Функции Гидравлических Масел:- гидравлическая жидкость передаёт энергию от гидравлического привода, которым обычно является насос, к приёмникам энергии, например, гидродвигателям. Задача насоса заключается в обеспечении гидросистемы достаточно большим количеством масла/рабочей жидкости под соответствующим давлением, что приводит в движение элементы гидростистемы и вызывает выделение тепла. Гидравлическая жидкость должна осуществлять следующие функции:- (i) переносить силу; (ii) переносить давление и уплотнять; (iii) смазывать и уменьшать изнашивание; и (iv) отводить тепло. Гидравлическая жидкость при эксплуатации должна обладать следующими параметрами:- (i) стойкость к окислению и гидролизу; (ii) стойкость к пенообразованию; (iii) склонность к выделению воздуха; (iv) деэмульгирующие свойства; (v) ограниченная воспламеняемость; и (vi) биоразлагаемость. Основные Параметры Гидравлических Масел:- Вязкость И Индекс Вязкости:- самым важным параметром, характеризующим свойства гидравлических (и прочих) масел, является вязкость и её изменение в зависимости от условий работы системы (давления, температуры). С ростом давления вязкость масла возрастает, а повышение температуры, напротив, приводит к уменьшению вязкости. От вязкости зависит степень уплотнения подвижных систем и качество смазки подвижных узлов – она должна быть подобрана таким образом, чтобы при нагревании системы до рабочей температуры в подвижных узлах исполнительных механизмов возникало жидкостное трение. Устройства,

работающие в широком диапазоне температур, нуждаются в жидкости с высоким индексом вязкости (ИВ), то есть в меньших изменениях вязкости масла в зависимости от температуры, и обладающей необходимой прокачиваемостью при самой низкой рабочей температуре. Индекс вязкости является параметром, который зависит от группового состава содержащихся в масле углеводородов. Правильный выбор вязкости имеет значение при отводе тепла от узлов трения. В случае применения масла с меньшей вязкостью отвод тепла больше, однако вязкость должна обеспечивать требуемое смазывание. Принято считать, что для масляных гидравлических систем минимальная допустимая вязкость составляет 5 мм^2/с. Очень важным параметром является влияние давления на вязкость, поскольку при повышении давления вязкость тоже растёт. Вследствие продолжительного влияния давления масло в системе может утратить свои свойства и будет подвергаться деформации сдвига под действием механических сил. Выделение Воздуха:- при необходимости ограничить присутствие воздуха в гидросистеме очень важна способность масла к быстрому выделению воздуха. Растворимость воздуха в гидравлическом масле является функцией давления в гидросистеме. В районах скачкообразного понижения давления происходит резкое выделение пузырьков воздуха. Пена, образующаяся в зонах с большой скоростью циркуляции, может вызвать кавитационное повреждение поверхности клапанов и насосов. Гидравлическую систему необходимо конструировать и эксплуатировать таким образом, чтобы избежать попадания в неё воздуха. Образование пены в гидросистеме приводит к опасности утечки гидравлической жидкости и всасывания избыточного воздуха, а в результате – к сбоям в работе системы. В связи с этим гидравлические жидкости должны обладать хорошими противопенными свойствами. Смазочные Свойства:- гидравлические масла применяются во все более форсируемых системах, работающих в условиях высокой нагрузки, поэтому они должны характеризоваться хорошими противоизносными свойствами и защищать взаимодействующие детали от чрезмерного износа. В состав гидравлических масел необходимо включать противозадирные и противоизносные присадки. Органические или металлоорганические присадки позволяют придать гидравлической жидкости требуемые противоизносные свойства даже при очень большом давлении. Они образуют на металлической поверхности слой масляной плёнки, уменьшающей вероятность появления микрозадиров. Стойкость К Эмульгированию:- гидравлическое масло должно характеризоваться высокой степенью стабильности в присутствии воды, от которой оно должно отделяться быстро и полностью. Вода способствует коррозии, вызывает гидролиз присадок, образует с маслом эмульсию, благоприятствуя появлению осадков и блокированию фильтров, что может привести к изнашиванию деталей – а в результате к сбоям в работе всей гидросистемы. Масло должно обладать стойкостью к эмульгированию и легко выделять воду, которая подверглась дисперсии, а также содержать присадки с высокой гидролитической стойкостью. Термическая Стабильность:- при работе гидравлической системы температура масла начинает повышаться. Повышение температуры, даже краткосрочное, может приводить к ухудшению качества гидравлической жидкости в результате её окисления и термического разложения. Продукты разложения оказывают коррозионное действие на металлы, образуют осадки и шламы. В экстремальных условиях применяются маслоохладители, обеспечивающие работу в стабильных температурных условиях. Действие На Уплотнения И Провода:- гидравлические масла не должны оказывать разрушительного действия на материалыуплотнений и проводов гидросистемы, такие как резина, тефлон и другие пластические массы. Недопустимо применение в гидросистемах элементов, которые под действием масел будут набухать, затвердевать или растворять провода и уплотнения, приводя к остановке или поломке гидравлической системы. Рецептуры гидравлических масел составляются таким образом, чтобы их компоненты не вступали в реакции с деталями гидросистемы. Фильтруемость:- в современных гидравлических системах, оснащённых фильтрами тщательной очистки, должны применяться масла, обладающие соответствующей фильтруемостью, то есть способностью к непрерывной циркуляции. Присутствие некоторых функциональных добавок может приводить к уменьшению фильтруемости. Эта способность может уменьшаться также из-за присутствия в гидравлическом масле воды и продуктов окисления. Наиболее распространённым методом определения фильтруемости является метод Denison TP-02/100, применяемый для оценки фильтруемости свежих гидравлических жидкостей. Чистота Гидравлических Жидкостей:- растущие ожидания, связанные с качеством гидравлических масел в гидросистемах, приводят к необходимости применять жидкости с высокой степенью чистоты. Для этого требуется доставить конечному пользователю масло определённого класса чистоты, залить в гидросистему чистое масло, контролировать чистоту масла и обеспечить правильный уход за гидросистемой, в том числе следить за исправностью системы фильтрации. Класс чистоты гидравлических масел определяется в зависимости от содержания в них твёрдых частиц по двум стандартам:- NAS 1638 (все твёрдые частицы, содержащиеся в пробе объёмом 100 мл, подсчитываются и делятся на группы в зависимости от размера) и ISO 4406:99 – степень загрязнённости гидравлического масла описывается тремя числами (например, ISO 18/16/13), информирующими о количестве твёрдых частиц размером более 4, 6 и 14 мкм в 100 мл исследуемой жидкости. Однако чаще всего результат описывается с помощью двух чисел (ISO */16/13). Класс чистоты всегда связан с системой, в которой находится данное масло, а значит, он может измениться, если перелить масло в другой резервуар. Чтобы получить нужный класс чистоты, необходимо ещё раз профильтровать масло после того, как оно залито в систему. Следует помнить, что всегда после замены масла необходима надлежащая очистка системы перед повторной заливкой. Спецификации Производителей:- требования к качеству гидравлических масел установлены двумя стандартами:- ISO 6746/4 и DIN 51524 ч. 1–3. Кроме этих двух стандартов производители гидравлического оборудования (Denison HF-0, HF-1, HF-2; Eaton Vickers M-2950-S, I-286-S; Cincinnati Milacron P-68, P-69, P-70) разработали собственные фирменные спецификации. По сравнению со стандартом DIN 51524 данные спецификации используют новые методы исследований, расширяют диапазон определяемых свойств масел. Общая черта этих спецификаций – введение требования испытаний масла на стенде с гидравлическим насосом, моделирующим работу гидросистемы. Стандарт DIN 51524 и спецификация Denison HF-0 (только для вязкости VG 32-68) охватывают широкий диапазон свойств, существенных для испытаний гидравлических масел. Значимые с точки зрения производителей свойства охватывают спецификации M-2950-S и P-70. Уход И Надлежащие Условия Работы:- срок службы гидравлического масла зависит от многих факторов, в частности, от конструкции гидросистемы, свойств материала, из которого она сделана, рабочей температуры, условий окружающей среды, нагрузок на установку, химического состава масла и добросовестности обслуживания. Гидравлическое масло следует беречь от загрязнения внешними материалами (такими как пыль, песок, ржавчина, вода и других твёрдых загрязнителей) во время его переливания, транспортировки к оборудованию и работы в гидросистеме. По мере возможности следует обеспечить мониторинг основных параметров, от которых зависит работа системы, таких как вязкость, содержание воды, чистота, кислотное число. Эти исследования можно проводить в месте эксплуатации гидравлического масла. После обнаружения нарушений часть из них можно быстро устранить на месте, что позволит избежать простоев в работе машин.

HYDRAULIC PUMP = ГИДРАВЛИЧЕСКИЙ НАСОС – Hydraulic Pump is a device which converts mechanical force and motion into hydraulic fluid power by means of producing flow. See also Pump.

HYDRAULICS = ГИДРАВЛИКА – Hydraulics is the engineering science pertaining to liquid pressure and flow. / Гидравлика – инженерная наука, . Под Гидравликой, от Греческого слова Hydraulikós, означающее Водяной, от Hýdōr, означающее Вода, и Aulos, означающее Трубка, понимается наука о законах движения и равновесия жидкостей и способах приложения этих законов к решению задач инженерной практики. В отличие от гидромеханики, гидравлика характеризуется особым подходом к

изучению явлений течения жидкостей; она устанавливает приближённые зависимости, ограничиваясь во многих случаях рассмотрением одноразмерного движения, широко используя при этом эксперимент, как в лабораторных, так и в натурных условиях. Наряду с этим намечается всё большее сближение между гидромеханикой и гидравликой:- с одной стороны, гидромеханика всё чаще обращается к эксперименту, с другой – методы гидравлического анализа становятся более строгими. Гидравлика изучает капельные жидкости, считая их обычно несжимаемыми. Однако выводы гидравлики применимы и к газам в тех случаях, когда давление в них, а вместе с тем и плотность, почти постоянны. Течения газов с большими скоростями исследуются в газовой динамике. Рассматривая главным образом так называемую внутреннюю задачу, то есть движение жидкости в твёрдых границах, гидравлика почти не касается вопроса о распределении силового воздействия на поверхность обтекаемых тел, которому уделяется много внимания в аэродинамике. Гидравлика обычно подразделяется на две части:- теоретические основы гидравлики, где излагаются важнейшие положения учения о равновесии и движении жидкостей; и практическую гидравлику, применяющую эти положения к решению частных вопросов инженерной практики. Основные разделы практической гидравлики:- течение по трубам (гидравлика трубопроводов), течение в каналах и реках (гидравлика открытых русел), истечение жидкости из отверстия и через водосливы, движение в пористых средах (фильтрация), взаимодействие потока и твёрдого преграждения (гидравлика сооружений). Во всех указанных разделах движение жидкости рассматривается как установившееся, так и неустановившееся (нестационарное). Изучая равновесие жидкостей, гидравлика исследует общие законы гидростатики, а также частные вопросы:- давление жидкости на стенки различных сосудов, труб, на плотины, быки и устои мостов и прочее, давление на погруженные в жидкость тела (смотрите Закон Архимеда), условия равновесия плавающих тел (смотрите Плавание Тел). Рассматривая движения жидкости, гидравлика пользуется основными уравнениями гидродинамики, при этом главнейшими соотношениями являются:- Уравнение Бернулли для реальной жидкости (смотрите Уравнение Бернулли), определяющее общую связь между давлением, высотой, скоростью течения жидкости и потерями напора, и уравнение неразрывности (смотрите Уравнение Неразрывности) в гидравлической форме. Гидравлика подробно рассматривает вопрос о гидравлических сопротивлениях, возникающих при различных режимах течения жидкости (смотрите Ламинарное Течение, Турбулентное Течение), а также условия перехода из одного режима в другой (смотрите Число Рэйнолдза или Число Рейнольдса). Гидравлика Трубопроводов указывает способы определения размеров труб, необходимых для пропуска заданного расхода жидкости при заданных условиях и для решения ряда вопросов, возникающих при проектировании и строительстве трубопроводов различного назначения (водопроводные сети, напорные трубопроводы гидроэлектростанций, нефтепроводы и прочие). Здесь же рассматривается вопрос о распределении скоростей в трубах, что имеет большое значение для расчётов теплопередачи, устройств пневматического и гидравлического транспорта, при измерении расходов и так далее. Теория неустановившегося движения в трубах исследует явление гидравлического удара. Гидравлика Открытых Русел изучает течение воды в каналах и реках. Здесь даются способы определения глубины воды в каналах при заданном расходе и уклоне дна, широко применяемые при проектировании судоходных, оросительных, осушительных и гидроэнергетических каналов, канализационных труб, при выправительных работах на реках и прочем. Гидравлика открытых русел исследует также вопрос о распределении скоростей по сечению потока, что весьма существенно для гидрометрии, расчёта движения наносов и прочего. Теория неравномерного движения в открытых руслах даёт возможность определять кривые свободной поверхности воды, а теория неустановившегося движения важна при учёте явлений, связанных с маневрированием затворами плотин, суточным регулированием гидроэлектростанций, попуском воды из водохранилищ и прочим. В разделах гидравлики, посвящённых истечению жидкости из отверстий и через водосливы, приводятся расчётные зависимости для определения необходимых размеров отверстий в различных резервуарах, шлюзах, плотинах, водопропускных трубах и так далее, а также для выявления скоростей истечения жидкостей и времени опорожнения резервуаров. Гидравлическая теория фильтрации даёт методы расчёта дебита и скорости течения воды в различных условиях безнапорного и напорного потоков (фильтрация воды через плотины, фильтрация нефти, газа и воды в пластовых условиях, фильтрация из каналов, приток к грунтовым колодцам и прочее). В гидравлике рассматриваются также движение наносов в открытых потоках и пульпы в трубах, методы гидравлических измерений, моделирование гидравлических явлений и некоторые другие вопросы. Существенно важные для расчёта гидротехнических сооружений вопросы гидравлики – неравномерное и неустановившееся движение в открытых руслах и трубах, течение с переменным расходом, фильтрация и другие – иногда объединяют под общим названием Инженерная Гидравлика или Гидравлика Сооружений. Таким образом, круг вопросов, охватываемых гидравликой, весьма обширен и законы гидравлики в той или иной мере находят применение практически во всех областях инженерной деятельности, а особенно в гидротехнике, мелиорации, водоснабжении, канализации, теплогазоснабжении, гидромеханизации, гидроэнергетике, водном транспорте и другом. Некоторые принципы гидростатики были установлены ещё древнегреческим математиком и физиком Архимедом (Archimedes; 287–212 до Нашей Эры), возникновение гидродинамики также относится к античному периоду, однако формирование гидравлики как науки начинается с середины XV века, когда Итальяно-Французский учёный и художник Леонардо ди сэр Пьеро да Винчи (Leonardo di ser Piero da Vinci; 1452–1519) лабораторными опытами положил начало экспериментальному методу в гидравлике. В XVI–XVII веках Нидерландский математик, механик и инженер Симон Стэфин (Simon Stevin; 1548–1620), Итальянский физик, механик, астроном, философ и математик Галилео Галилей (Galileo Galilei; 1564–1642) и Французский Католический теолог, писатель, математик и физик Блез Паскаль (Blaise Pascal; 1623–1662) разработали основы гидростатики как науки, а Итальянский математик и физик Эванджелиста Торричелли (Evangelista Torricelli; 1608–1647) дал известную формулу для скорости жидкости, вытекающей из отверстия. В дальнейшем Сэр Айзэк Ньютчэн (или Исаак Ньютон (Sir Isaac Newton; 1643–1727) высказал основные положения о внутреннем трении в жидкостях. В XVIII веке Швейцарский физик-универсал, механик и математик Даниэл Бэрнулли (Daniel Bernoulli; 1700–1782) и Швейцарско-Немецко-Российский математик и механик Лионхард Ойля (или Леонард Эйлер; Leonhard Euler; 1707–1783) разработали общие уравнения движения идеальной жидкости, послужившие основой для дальнейшего развития гидромеханики и гидравлики. Однако применение этих уравнений (так же как и предложенных несколько позже уравнений движения вязкой жидкости) для решения практических задач привело к удовлетворительным результатам лишь в немногих случаях. В связи с этим с конца XVIII века многие учёные и инженеры (Французы Отуан дё Шэзи (Antoine de Chézy; 1718–1798), Ори Филибэр Гяспар Дарси (Henry Philibert Gaspard Darcy; 1803–1858), и Ори-Эмиль База (Henri-Émile Bazin; 1829–1917), и Немец Юлиус Людвихь Вайсбах (Julius Ludwig Weisbach; 1806–1871) и другие) опытным путём изучали движение воды в различных частных случаях, в результате чего гидравлика обогатилась значительным числом эмпирических формул. Создававшаяся таким образом практическая гидравлика всё более отдалялась от теоретической гидродинамики. Сближение между ними наметалось лишь к концу XIX века в результате формирования новых взглядов на движение жидкости, основанных на исследовании структуры потока. Особо заслуживают упоминания работы Английского физика и инженера Озбона Рэйнолдза (или Осборна Рейнольдса; Osborne Reynolds; 1842–1912), позволившие глубже проникнуть в сложный процесс течения реальной жидкости и в физическую природу гидравлических сопротивлений и положившие начало учению о турбулентном движении. Впоследствии это учение, благодаря исследованиям Немецкого учёного Людвихя Прандтля (Ludwig Prandtl; 1875–1953) и Венгерско-Американского учёного Тодора Кармана (Tódor Kármán; 1881–1963), завершилось созданием полуэмпирических теорий турбулентности, получивших широкое

практическое применение. К этому же периоду относятся исследования Николая Егоровича Жуковского (1847–1921), из которых для гидравлики наибольшее значение имели работы о гидравлическом ударе и о движении грунтовых вод. В XX веке быстрый рост гидротехники, теплоэнергетики, гидромашиностроения, а также авиационной техники привёл к интенсивному развитию гидравлики, которое характеризуется синтезом теоретических и экспериментальных методов. Большой вклад в развитие гидравлики был сделан Советскими учёными (работы Николая Николаевича Павловского (1884–1937), Леонида Самуиловича Лейбензона (1879–1951), Михаила Андреевича Великанова (1879–1964) и других). Практическое значение гидравлики возросло в связи с потребностями современной техники в решении вопросов транспортирования жидкостей и газов различного назначения и использования их для разнообразных целей. Если ранее в гидравлике изучалась лишь одна жидкость – вода, то в современных условиях всё большее внимание уделяется изучению закономерностей движения вязких жидкостей (нефти и её продуктов), газов, неоднородных и так называемых Неньютоновских Жидкостей. Меняются и методы исследования и решения гидравлических задач. Сравнительно недавно в гидравлике основное место отводилось чисто эмпирическим зависимостям, справедливым только для воды и часто лишь в узких пределах изменения скоростей, температур, геометрических параметров потока; теперь всё большее значение приобретают закономерности общего порядка, действительные для всех жидкостей, отвечающие требованиям теории подобия и прочее. При этом отдельные случаи могут рассматриваться как следствие обобщённых закономерностей. Гидравлика постепенно превращается в один из прикладных разделов общей науки о движении жидкостей – механики жидкости. Исследования в области гидравлики координируются Международной Ассоциацией Гидравлических Исследований (МАГИ). Её орган – Journal of the International Association for Hydraulic Research (Delft, с 1937). Периодические издания в области гидравлики:- журналы Гидротехническое Строительство (с 1930) и Гидротехника И Мелиорация (с 1949), Известия Всесоюзного Научно-Исследовательского Института Гидротехники имени Бориса Евгеньевича Веденеева (с 1931), Труды Координационных Совещаний По Гидротехнике (с 1961), сборники Гидравлика И Гидротехника (с 1961), Houille Blanche (Grenoble, с 1946), Journal of the Hydraulics Division. American Society of Civil Engineers (New York, с 1956), L'Energia Elettrica (Milano, с 1924).

HYDRAULIC SYSTEM = ГИДРАВЛИЧЕСКАЯ СИСТЕМА (или ГИДРОСИСТЕМА) – Hydraulic System is a system designed to transmit power through a liquid medium, permitting multiplication of force in accordance with Pascal's Law, which stated that 'a pressure exerted on a confined liquid is transmitted undiminished in all directions and acts with equal force on all equal areas'. Hydraulic systems have six basic components:- (1) a reservoir to hold the fluid supply; (2) a fluid to transmit the power; (3) a pump to move the fluid; (4) a valve to regulate pressure; (5) a directional valve to control the flow, and (6) a working component – such as a cylinder and piston or a shaft rotated by pressurized fluid – to turn hydraulic power into mechanical motion. Hydraulic systems offer several advantages over mechanical systems:- They eliminate complicated mechanisms such as cams, gears, and levers; are less subject to wear; are usually more easily adjusted for control of speed and force; are easily adaptable to both rotary and liner transmission of power; and can transmit power over long distances and in any direction with small losses. / износ; .

HYDRO = ГИДРО – Hydro or Hydros (in Britain) is a dyehouse term for sodium hydrosulfite.

HYDROCARBONS = УГЛЕВОДОРОДЫ – Hydrocarbons are the compounds containing only carbon and hydrogen. Petroleum consists chiefly of hydrocarbons. Hydrocarbons are the organic chemical compounds containing hydrogen and carbon atoms. They form the basis of all petroleum products. Hydrocarbons:- an organic chemical compound of hydrogen and carbon in the gaseous, liquid, or solid phase. The molecular structure of hydrocarbon compounds varies from the simplest (methane, the primary constituent of natural gas) to very heavy and very complex. / Под Углеводородами понимаются органические соединения, молекулы которых построены только из атомов углерода и водорода. Атомы углерода образуют в углеводороде 'открытые' линейные или разветвлённые цепи (например, нормальный пентан и изопентаны), а также циклы (например, циклогексан, бензол). Различают:- (i) ациклические или алифатические углеводороды, в молекулах которых атомы углерода образуют линейные или разветвлённые 'открытые' цепи, например, изобутилен или этан; и (ii) карбоциклические углеводороды, молекулы которых представляют собой циклы (кольца) из трёх или более атомов углерода. Эти углеводороды подразделяют на алициклические, например, циклогексан, и ароматические, например, бензол. Углеводороды являются важнейшими компонентами нефти, природного газа, каменного угля и продуктов их переработки, широко используемыми в качестве сырья для получения многочисленных химических продуктов, топлива и другого. Углеводороды – класс органических соединений, молекулы которых состоят только из атомов углерода и водорода. В зависимости от строения различают ациклические, или алифатические, углеводороды, в молекулах которых атомы углерода связаны друг с другом в линейные или разветвлённые цепи; и изоциклические, или карбоциклические, углеводороды, молекулы которых представляют собой кольца (циклы) из 3 и более атомов углерода. Эту группу углеводородов делят на алициклические углеводороды и ароматические углеводороды (смотрите также Ароматические Соединения). Ациклические углеводороды подразделяют на насыщенные углеводороды, содержащие только простые связи (родоначальник ряда – метан), и ненасыщенные углеводороды, в молекулах которых могут содержаться кратные связи – двойные и тройные, например, одна двойная связь (смотрите Олефины), две двойные связи (смотрите Диеновые Углеводороды), одна тройная связь (как, например, в ацетилене). Алициклические углеводороды также могут быть насыщенными (смотрите Циклоалканы) и ненасыщенными. Углеводороды образуют гомологические ряды, характеризующиеся закономерным изменением физических и химических свойств (смотрите также Органическая Химия).

HYDROCHLORIC ACID = ХЛОРИСТОВОДОРОДНАЯ КИСЛОТА (или СОЛЯНАЯ КИСЛОТА) – Hydrochloric Acid is a strong inorganic acid; solution of HCl in water, typically about 37%; often called Muriatic Acid. Hydrochloric acid is not much used in dyeing, but is used in some processes to strip certain finishes from fabric. It can cause skin burns, and the fumes are very noxious. Handle and store it with great care. It is a strong acid. / Сильная Кислота (Strong Acid).

HYDROCRACKING = ГИДРОКРЕКИНГ – Hydrocracking is a catalytic cracking by application of medium and high pressure gas with hydrogen content. Choice of catalysts and technical parameters makes it possible to obtain high-quality components for most petroleum products (liquefied gas, gasoline and diesel, oil components, etc) from virtually any raw hydrocarbons by hydrocracking. While thermal and catalytic cracking produce shorter hydrocarbon molecules largely by disposing of the excess carbon atoms, hydrocracking inserts hydrogen atoms to achieve the same effect. Hydrocracking is a refining process that uses catalysts and hydrogen at high pressures for converting heavy oils (fuel oil components) to lighter and more valuable products (notably naphtha and middle distillate components). The process can handle high sulphur feedstock without prior desulphurisation, yielding low sulphur blending components. / , от Греческих слов Hýdōr, означающее Вода, и . В процессе термического и каталитического крекинга более короткие углеводородные молекулы образуются в основном за счёт высвобождения атомов углерода; при гидрокрекинге тот же эффект достигается за счёт встраивания дополнительных атомов водорода. Гидрокрекинг это процесс каталитического крекинга с применением водородсодержащего газа под средним и высоким давлением, позволяющий путём подбора катализаторов и технических параметров получать практически из любого углеводородного сырья высококачественные компоненты основных нефтепродуктов (сжиженный газ, бензин, дизельное топливо, компоненты масел и так далее). Процесс переработки, использующий катализаторы и водород под высоким давлением для переработки тяжёлых

нефтяных фракций (компонентов топочного топлива) в лёгкие и более дорогостоящие продукты (особенно прямогонный бензин и компоненты средних дистиллятов). Этот процесс может позволяет перерабатывать высоко сернистое сырьё без предварительной десульфурации (обессеривания) и получать низкосернистые смешанные компоненты. Гидрокрекинг, каталитический процесс переработки низкосортных топлив. Смотрите также Деструктивная Гидрогенизация. Под Гидрокрекингом понимается переработка высококипящих нефтяных фракций, мазута или гудрона для получения бензина, дизельного и реактивного топлив, смазочных масел и другого. Проводят действием водорода при 330–450 °C и давлении 5–30 МПа в присутствии цеолитсодержащих катализаторов. Десульфурация (обессеривание).

HYDRODYNAMIC LUBRICATION = ГИДРОДИНАМИЧЕСКОЕ СМАЗЫВАНИЕ – Hydrodynamic Lubrication is a system of lubrication in which the shape and relative motion of the sliding surfaces causes the formation of a fluid film having sufficient pressure to separate the surfaces. See also Lubrication.

HYDROELECTRIC PLANT = ГИДРОЭЛЕКТРИЧЕСКАЯ СТАНЦИЯ (или ГИДРОЭЛЕКТРОСТАНЦИЯ) – Hydroelectric Plant:- the first electrical generation facility in Fall Creek gorge was built in the early 1880's. That plant was powered by water from a dam just above the present dam, with a water wheel just above the present plant with a cable to a generator located near the Foundry. In 1904, the present plant was built. Construction was preceded by replacing Triphammer Dam slightly west of it original location in 1896. Water is supplied to the plant from Beebe Lake by a five-foot diameter underground penstock, 1 700 feet long. The existing intake dates to 1953 and was upgraded in 1981. The original plant capacity was 300 kW with 2 Pelton Wheel turbines and 2 30kW DC exciters. This was increased in 1913 by adding a 360 kW Francis turbine. The facility was overhauled in 1935 after being completely flooded. In 1957, No. 2 generator was replaced with a 175 kW unit. The plant capacity then stood at 850 kW @2 400 Volts. In this configuration, the plant last operated in 1970. It was vandalized in 1972. In 1981, the plant was completely renovated and all the original machinery removed except for one of the DC exciters. Two Ossberger crossflow turbines were installed with a total rated capacity of 1 950 kW. The plant, however, is limited to about 1 100 kW output because of the size of the penstock. This hydroelectric plant is 'run of river', which means that no water is stored. At all times, 10 cfs must continue to pass over the dam. The average production for this plant is 4.5M KWh to 5.5KWh. Hydroelectric Plant is a plant in which the turbine generators are driven by falling water. Hydroelectric energy is made by moving water. Hydro comes from the Greek word for water. Hydroelectric energy has been in use for thousands of years. Ancient Romans built turbines, which are wheels turned by flowing water. Roman turbines were not used for electricity, but for grinding grains to make flour and breads. Water mills provide another source of hydroelectric energy. Water mills, which were common until the Industrial Revolution, are large wheels usually located on the banks of moderately flowing rivers. Water mills generate energy that powers such diverse activities as grinding grain, cutting lumber, or creating hot fires to create steel. The first US hydroelectric power plant was built on the Fox River in 1882 in Appleton, Wisconsin. This plant powered two paper mills and one home. Harnessing Hydroelectricity:- to harness energy from flowing water, the water must be controlled. A large reservoir is created, usually by damming a river to create an artificial lake, or reservoir. Water is channeled through tunnels in the dam. The energy of water flowing through the dam's tunnels causes turbines to turn. The turbines make generators move. Generators are machines that produce electricity. Engineers control the amount of water let through the dam. The process used to control this flow of water is called the intake system. When a lot of energy is needed, most of the tunnels to the turbines are open, and millions of gallons of water flow through them. When less energy is needed, engineers slow down the intake system by closing some of the tunnels. During floods, the intake system is helped by a spillway. A spillway is a structure that allows water to flow directly into the river or other body of water below the dam, bypassing all tunnels, turbines, and generators. Spillways prevent the dam and the community from being damaged. Spillways, which look like long ramps, are empty and dry most of the time. From Water Currents to Electrical Currents:- large, fast-flowing rivers produce the most hydroelectricity. The Columbia River, which forms part of the border between the US states of Washington and Oregon, is a big river that produces massive amounts of hydroelectric energy. The Bonneville Dam, one of many dams on the Columbia River, has 20 turbines and generates more than a million watts of power every year. Thats enough energy to power hundreds of thousands of homes and businesses. Hydroelectric power plants near waterfalls can create huge amounts of energy, too. Water crashing over the fall line is full of energy. A famous example of this is the hydroelectric plant at Niagara Falls, which spans the border between the United States and Canada. Hydroelectric energy generated by Niagara Falls is split between the US state of New York and the Canadian province of Ontario. Engineers at Niagara Falls cannot turn the falls off, but they can severely limit the intake and control the amount of water rushing over the waterfall. The largest hydroelectric power plant in the world is the enormous Three Gorges Dam, which spans the Yangtze River in China. It is 185 meters (607 feet) tall and 115 meters (377 feet) thick at its base. It has 26 turbines and will be able to generate more than a billion watts of power. The Three Gorges Dam is operating, but engineers are still working on the system. They are adding even more turbines and generators to the project. Hydroelectric Energy and the Environment:- hydroelectricity relies on water, which is a clean, renewable energy source. A renewable source of energy is one that will not run out. Renewable energy comes from natural sources, like wind, sunlight, rain, tides, and geothermal energy (the heat produced inside the Earth). Non-renewable energy sources include coal, oil, and natural gas. Water is renewable because the water cycle is continually recycling itself. Water evaporates, forms clouds, and then rains down on the Earth, starting the cycle again. Reservoirs created by dams can provide large, safe recreational space for a community. Boaters and water skiers can enjoy the lake. Many reservoirs are also stocked with fish. The area around a reservoir is often a protected natural space, allowing campers and hikers to enjoy the natural environment. Using water as a source of energy is generally a safe environmental choice. Its not perfect, though. Hydroelectric power plants require a dam and a reservoir. These man-made structures may be obstacles for fish trying to swim upstream. Some dams, including the Bonneville Dam, have installed fish ladders to help fish migrate. Fish ladders are a series of wide steps built on the side of the river and dam. The ladder allows fish to slowly swim upstream instead of being totally blocked by the dam. Dams flood river banks, destroying wetland habitat for thousands of organisms. Aquatic birds such as cranes and ducks are often at risk, as well as plants that depend on the marshy habitat of a river bank. Operating the power plant may also raise the temperature of the water in the reservoir. Plants and animals near the dam have to adjust to this change or migrate elsewhere. The OShaughnessy Dam on the Tuolumne River in the US state of California was one of the first hydroelectric energy projects to draw widespread criticism for its impact on the environment. The dam, constructed in 1913, flooded a region called Hetch Hetchy Valley, part of Yosemite National Park. The lake created by the OShaughnessy Dam is called the Hetch Hetchy Reservoir. Environmental coalitions opposed the dam, citing the destruction of the environment and the habitats it provided. However, the power plant provided affordable hydroelectric energy to the booming urban area around San Francisco. The Hetch Hetchy Reservoir is still a controversial project. Many people believe the OShaughnessy Dam should be destroyed and the valley returned to its native habitat. Others contend that destroying a source of energy for such a major urban area would reduce the quality of life for residents of the Bay Area. There are limits to the amount of hydroelectric energy a dam can provide. The most limiting factor is silt that builds up on the reservoirs bed. This silt is carried by the flowing river, but prevented from reaching its normal destination in a delta or river mouth by the dam. Hundreds of meters of silt build up on the bottom of the reservoir, reducing the amount of water in the facility. Less water means less powerful energy to flow through the systems turbines. Most dams must spend a considerable amount of money to avoid silt build-up, a process called Siltation. Some power plants can only provide electricity for 20 or 30 years because of siltation. Hydroelectric Energy and People:- billions of people

depend on hydroelectricity every day. It powers homes, offices, factories, hospitals, and schools. Hydroelectric energy is usually one of the first methods a developing country uses to bring affordable electricity to rural areas. Hydroelectricity helps improve the hygiene, education, and employment opportunities available to a community. China and India, for instance, have built dozens of dams over the past decade, as their development has quickly grown. The United States depended on hydroelectric energy to bring electricity to many rural or poor areas. Most of this construction took place during the 1930s. Dams were a huge part of the New Deal, a series of government programs that put people to work and brought electricity to millions of Americans during the Great Depression. The Bonneville Dam on the Columbia River, the Shasta Dam on the Sacramento River, and the Hoover Dam on the Colorado River are some dams constructed as part of the New Deal. The most famous hydroelectric power project of the New Deal is probably the Tennessee Valley Authority (TVA). The TVA constructed a series of dams along the Tennessee River and its tributaries. Today, the TVA is the largest public power company in the United States, providing affordable electricity for residents in the states of Alabama, Georgia, Kentucky, Mississippi, North Carolina, Tennessee, and Virginia. However, hydroelectricity often comes at a human cost. The huge dams required for hydroelectric energy projects create reservoirs that flood entire valleys. Homes, communities, and towns may be relocated as dam construction begins. Egypt began construction of the Aswan Dam complex on the Nile River in 1960. Engineers realized that ancient temples of Abu Simbel were going to be flooded by the reservoir, called Lake Nasser. These monuments were built directly into cliffs several stories tall. The Abu Simbel temples are a part of Egypts cultural heritage and a major tourist destination. Rather than have the monuments flooded, the government of Egypt relocated the entire mountainside to an artificial hill nearby. Today, Abu Simbel sits above the Aswan Dam. Chinas massive Three Gorges Dam project will bring safe, affordable electricity to millions of people. It will allow hospitals, schools, and factories to work longer, more reliable hours. It will also allow people to maintain healthier lifestyles by providing clean water. Construction of the dam directly benefited workers, too. More than a quarter of a million people have found work with the project. However, the project has forced more than a million people to relocate. Lifestyles were disrupted. Many families were relocated from rural towns on the banks of the Yangtze River to Chongqing, a major urban area with 31 million residents. Other people were relocated out of the province entirely. Hydroelectric Plant is a place where electricity is produced by the energy of rapidly moving water. / Под Гидроэлектрической Станцией или Гидроэлектростанцией (ГЭС) понимается электростанция, вырабатывающая электрическую энергию в результате преобразования энергии водного потока. ГЭС состоит из гидротехнических сооружений, обеспечивающих необходимую концентрацию потока воды и создание напора, и энергетического оборудования, преобразующего энергию движущейся по напором воды в электрическую энергию. Основное энергетическое оборудование размещают в здании ГЭС:- в машинном зале – гидроагрегаты, вспомогательное оборудование, устройства автоматического управления и контроля; на центральном посту управления – пульт оператора-диспетчера или автооператор ГЭС. Повышающие трансформаторы, как правило, располагаются у продольной стены здания ГЭС на открытом воздухе, распределительные устройства высшего напряжения – на специальных открытых площадках. По напору ГЭС делятся на высоконапорные (более 60 м), средненапорные (от 60 до 25 м) и низконапорные (до 25 м). На высоконапорных ГЭС устанавливают ковшовые и радиально-осевые турбины с металлическими спиральными камерами; на средненапорных – поворотно-лопастные и радиально-осевые турбины с железобетонными и металлическими спиральными камерами; на низконапорных – поворотно-лопастные турбины в бетонных и железобетонных спиральных камерах, иногда горизонтальные турбины в капсулах или в открытых камерах. Существуют основные схемы ГЭС:- Плотинная (с искусственным подпором уровня реки за счёт плотины) и Деривационная (с отводом воды из русла реки по специальному выводу к месту с большой разностью уровней). В зависимости от особенностей выполнения гидротехнических сооружений различают Русловые ГЭС (здание станции входит в состав водоподпорных сооружений), Приплотинные ГЭС (здание станции располагается за плотиной), Деривационные ГЭС. Широкое распространение получили Совмещённые ГЭС, у которых здание станции одновременно выполняет функцию водосбросного сооружения. Особое место среди ГЭС занимают Гидроаккумулирующие Электростанции и Приливные Электростанции. Отдельные ГЭС или каскады ГЭС, как правило, работают в энергосистеме совместно с Конденсационными Электростанциями, Теплоэлектроцентралями, Атомными Электростанциями, Газотурбинными Электростанциями; в зависимости от характера участия в покрытии графика нагрузки ГЭС могут быть Базисными, Полупиковыми и Пиковыми. Наиболее крупные гидроэлектростанции в бывшем Союзе Советских Социалистических Республик (СССР):- Волжская ГЭС имени Владимира Ильича Ленина мощностью 2.3 ГВт, Волжская ГЭС имени XXII Съезда КПСС – 2.53 ГВт, Нурекская ГЭС (на Реке Вахше) – 2.7 ГВт, Усть-Илимская ГЭС (на Реке Ангаре) – 4.32 ГВт, Братская ГЭС имени 50-летия Великого Октября (на Реке Ангаре) – 4.5 ГВт, Красноярская ГЭС имени 50-Летия СССР (на Реке Енисее) – 6 ГВт, Саяно-Шушенская ГЭС (на Реке Енисее) – 6.4 ГВт.

HYDRO–ENTANGLEMENT = ГИДРО–СПЛЕТЕНИЕ (или ГИДРО–ПЕРЕПЛЕТЕНИЕ) – Hydro-Entanglement:- It is a bonding process for wet or dry fibrous webs made by either carding, airlaying or wet-laying, the resulting bonded fabric being a nonwoven. It uses fine, high pressure jets of water which penetrate the web, hit the conveyor belt and bounce back causing the fibers to entangle. Hydroentanglement is sometimes known as Spunlacing, because the early nonwovens were entangled on conveyors with a patterned weave which gave the nonwovens a lacy appearance.

HYDROENTANGLING = ГИДРОПОДПЛЕТИНА (или ГИДРОСПЛЕТЕНИЕ, или ГИДРОПЕРЕПЛЕТЕНИЕ) – Hydroentangling is a process for forming a fabric by mechanically wrapping and knotting fibers in a web through the use of high-velocity jets or curtains of water. See also Spunlaces Fabric.

HYDROEXTRACTOR = ГИДРОЭКСТРАКТОР (или ОТЖИМАЛКА) – Hydroextractors are the machines which are used in textile processing industry. These are mainly centrifuges. The wet material is placed in the extractor, which has a wall of perforated metal, generally stainless steel. the internal drum rotates at high speed thus throwing out the water contained in it. The use of hydroextractor significantly reduces the energy required to dry any material. See also Centrifuge. Centrifugal Hydro Extractor machine applies to separation of the crystallization of particles larger than 0.1 mm, amorphous materials, as well as fibrous materials, such as sugar paste, slurry, ammonium bicarbonate, salt, viscose fiber, plastic particles. Types of Centrifugal Hydro Extractor:- (i) Hydro Extractor Machine; (ii) Bag Lifting Centrifuge; (iii) Four Point Suspension CGMP Centrifuge; and (iv) Centrifuge Hydro Extractors. / Смотрите также Центрифуга (Centrifuge).

HYDROFINISHING = ГИДРОФАЙНИНГ (или ГИДРООЧИСТКА) – Hydrofinishing is a process for treating raw extracted base stocks with hydrogen to saturate them for improved stability. Hydrofinishing:- hydrogen treatment of crude oil in order to saturate the molecules and increase stability. / Процесс каталитической сероочистки в присутствии водорода. Гидроочистка – процесс селективного гидрирования содержащихся в моторных топливах (бензин, керосин, дизельное топливо), маслах и других нефтепродуктах (например, в сырье для каталитического риформинга) органических сернистых, азотистых и кислородных соединений, которые, присоединяя водород, образуют соответственно сероводород, аммиак и воду и в таком виде удаляются из очищаемого продукта. Гидроочистку ведут в присутствии гидрирующего катализатора, например, алюмомолибдата кобальта, при 260–430 °C и давлении водородсодержащего газа 1–10 МН/м^2 (10–100 кгс/см^2). При гидроочистке расходуется значительное количество водорода (чтобы снизить на 1% содержание серы, необходимо затратить его 9–18 м^3 на 1 м^3 сырья),

поэтому установки гидроочистки обычно совмещают с установками каталитического риформинга, дающими избыточный водород. Образующийся при гидроочистке сероводород улавливают и используют для получения серы и серной кислоты. В результате гидроочистки повышается качество нефтепродуктов, снижается коррозия оборудования, уменьшается загрязнение атмосферы. Гидроочистка смазочных масел, применяемая вместо контактной очистки глинами, улучшает цвет и запах, понижает кислотность и коксуемость масел. Процесс гидроочистки приобрёл очень большое значение в связи с вовлечением в переработку больших количеств сернистых и высокосернистых (более 1.9% серы) нефтей.

HYDROFOIL = СУДНО НА ПОДВОДНЫХ КРЫЛЬЯХ – Hydrofoil is a craft more or less similar to the hovercraft insofar as it flies over water and thus eliminates friction between the water and the hull. Under acceleration it rises above water but remains in contact with the surface through supporting legs. Hydrofoil:- underwater fin with a flat or curved winglike surface that is designed to lift a moving boat or ship by means of the reaction upon its surface from the water through which it moves. Ships that use hydrofoils, or foils, are themselves called Hydrofoils. Hydrofoils can lift a boat's hull clear of the water as speed increases, and the resultant reduction in drag yields higher speeds without expending more horsepower. The two main foil systems now in use are the surface-piercing and submerged types. Surface-piercing foils just break the surface of the water and are usually arranged in a V-shape. Foils that stay fully submerged project down into the water vertically. When at rest or steaming slowly, a hydrofoil ship supports its weight by its own buoyance, but as speed is increased, the foils carry progressively more weight until the ship's hull is raised clear of the water. Hydrofoil ships are faster than ships of conventional design but are limited to moderate sizes. The first efficient manned hydrofoil ship was built in Italy about 1900 by an Italian engineer, inventor and aeronautical pioneer Enrico Forlanini (1848–1930). Hydrofoils were not widely used until the 1950s, when military and commercial models were built. By the 1970s hydrofoil craft were in operation in many places, and speeds of up to 80 knots (nautical miles per hour) had been achieved. / Итальянским инженером, изобретателем и пионером аэронавтики Энрико Форлянини (Enrico Forlanini; 1848–1930). Аппарат, более-менее похожий на судно на воздушной подушке, поскольку он парит над водой и следовательно исключает трение между водой и корпусом. При ускорении он приподнимается над водной поверхностью, но остаётся в контакте с ней посредством подводных крыльев, размещённых в нижней части стоек. Судно на Подводных Крыльях (СПК), судно, корпус которого при движении поднимается над водой под действием подъёмной силы, создаваемой погружёнными в воду крыльями. Патент на судно на подводных крыльях был выдан в России в 1891. Применяются с середины XX века для перевозки пассажиров (до 300 человек) и небольших срочных грузов, в военно-морском флоте. Скорость 80–100 км/ч. Судно на Подводных Крыльях (СПК), судно с крыльями под днищем, на которых при движении возникает подъёмная сила, вызывающая всплытие корпуса над водой. В СПК сопротивление воды движению резко уменьшено, что позволяет достигать высоких скоростей хода без больших затрат энергии. Скорость пассажирских СПК достигает 60–100 км/ч.

HYDROGENATION = ГИДРОГЕНАЦИЯ (или ГИДРИРОВАНИЕ, или ГИДРОГЕНИЗАЦИЯ, или НАВОДОРОЖИВАНИЕ) – Hydrogenation:- in refining, the chemical addition of hydrogen to a hydrocarbon in the presence of a catalyst; a severe form of hydrogen treating. Hydrogenation may be either destructive or non-destructive. In the former case, hydrocarbon chains are ruptured (cracked) and hydrogen is added where the breaks have occurred. In the latter, hydrogen is added to a molecule that is unsaturated with respect ot hydrogen. In either case, the resulting products are highly stable. Temperatures and pressures in the hydrogenation process are usually greater than in hydrofining. Hydrogenation is the process of passing hydrogen into an unsaturated chemical in the presence of a catalyst to convert the material to a more saturated state, i.e. containing more combined hydrogen. / Под Гидрогенизацией (от Латинского слова Hydrogenium, означающее Водород) или Гидрированием понимается каталитическая реакция присоединения водорода к простым веществам (элементам) или химическим соединениям. Обратная реакция – отщепление водорода от химических соединений – называется Дегидрогенизацией (или Дегидрированием). Гидрогенизация и Дегидрогенизация – важные методы каталитического синтеза различных органических веществ, основанные на реакциях окислительно-восстановительного типа, связанных подвижным равновесием (смотрите Химическое Равновесие). Примером может служить обратимое каталитическое превращение этилового спирта в ацетальдегид:- $C_2H_5OH \leftrightarrow CH_3CHO + H_2$. Повышение температуры и понижение давления H_2 способствуют образованию ацетальдегида, а понижение температуры и повышение давления H_2 – образованию этилового спирта; такое влияние условий типично для всех реакций гидрогенизации и дегидрогенизации. Катализаторами гидрогенизации и дегидрогенизации являются многие металлы (Fe, Ni, Co, Pt, Pd, Os и другие), окислы (NiO, CoO, Cr_2O_3, MoO_2 и другие), а также сульфиды (WS_2, MoS_2, Cr_nS_m). Гидрогенизация и дегидрогенизация широко используются в промышленности. Например, синтез такого важного продукта, как метиловый спирт, служащий сырьём для многих химических производств и растворителем, осуществляют гидрогенизацией окиси углерода ($CO + 2H_2 = CH_3OH$) на окисных цинк-хромовых катализаторах при 300–400 °C и давлении водорода 20–30 МН/м^2 (200–300 кгс/см^2). При другом составе катализаторов этим методом можно получать и высшие спирты. Гидрогенизация жиров лежит в основе производства маргарина (смотрите Гидрогенизация Жиров). В связи с возникновением производства таких материалов, как капрон, Найлан^{T3} (Nylon^{TM}) и прочих (смотрите Полиамидные Волокна), метод гидрогенизации стал широко применяться для получения промежуточных продуктов – циклогексанола из фенола, циклогексана из бензола, гексаметилендиамина из динитрила адипиновой кислоты (на никелевых катализаторах) и циклогексиламина из анилина (на кобальтсодержащих катализаторах). Для облагораживания топлив, получаемых из сернистых нефтей, большое значение имеет гидроочистка (смотрите Очистка Нефти) – гидрогенизация на алюмо-кобальт-молибденовом или вольфрамо-никелевом катализаторах, приводящая к разрушению органических сернистых соединений и удалению серы в виде H_2S. Другой процесс облагораживания нефтепродуктов – гидрогенизация деструктивная (на вольфрамсульфидных и некоторых других катализаторах) – приводит к увеличению выхода светлых и лёгких продуктов при переработке нефти. При гидрогенизации CO на различных катализаторах можно получать бензин, твёрдые парафины или кислородсодержащие органические соединения. Синтез неорганического вещества аммиака взаимодействием азота и водорода под высоким давлением также относится к гидрогенизации и является примером гидрогенизации простого вещества. Один из простейших примеров дегидрогенизации – дегидрирование спиртов. Значительное количество ацетальдегида производится дегидрогенизацией гидролизного (получаемого из древесины) этилового спирта. Дегидрогенизация углеводородов является одной из основных реакций, протекающих на смешанных катализаторах в сложном процессе риформинга, который приводит к существенному улучшению качеств моторных топлив; эта реакция позволяет получать также различные ароматические углеводороды из нафтеновых и парафиновых (смотрите также Ароматизация Нефтепродуктов). Широкое применение дегидрогенизация нашла в производстве мономеров для синтеза каучуков и смол. Так, парафиновые углеводороды бутан и изопентан дегидрируются при 500–600 °C на катализаторах, содержащих окись хрома, соответственно в бутилены и изопентен (изоамилен), которые, в свою очередь, дегидрируются на сложных катализаторах в диолефины – бутадиен и изопрен. В производстве полимеров стирола и его производных большое значение приобрела дегидрогенизация алкилароматических углеводородов – этилбензола в стирол, изопропилбензола в метилстирол и тому подобное. Начало широкого изучения гидрогенизации было положено в 1897–1900 научными школами Поля Сабатье (Paul Sabatier; 1854–1941) во Франции и Николая Дмитриевича Зелинского (1861–1953) в России. Основные закономерности гидрогенизации смесей органических соединений установил Сергей

Васильевич Лебедев (1874–1934). В области практического применения гидрогенизации крупные успехи были достигнуты уже в 1-й четверти XX века Немецким химиком Фрицем Хаба (Fritz Haber; 1868–1934) (синтез аммиака), Немецким химиком-технологом Фридрихём Карлом Рудольфом Бэргиусом (Friedrich Karl Rudolf Bergius; 1884–1949) (гидрогенизация угля) и Французским учёным Жоржем Эмилем Лео Патаром (Georges Emile Léon Patart; 1869–1944; синтез метанола). Дегидрогенизацию спиртов открыл в 1886 Французский химик и общественный деятель Пьер Ожэн Марсэля Бертэлю (Pierre Eugène Marcellin Berthelot; 1827–1907). В 1901 Сабатье наблюдал наряду с другими превращениями углеводородов и их дегидрогенизацию. В чистом виде дегидрогенизацию углеводородов впервые удалось осуществить Николаю Дмитриевичу Зелинскому, разработавшему ряд избирательно действующих катализаторов. Большой вклад в развитие теории и практики гидрогенизации и дегидрогенизации внесли Советские химики, академики Борис Александрович Казанский (1891–1943), Алексей Александрович Баландин (1898–1967) и их научные школы. Гидрогенизация – восстановление ненасыщенного соединения с присоединением атомов водорода по кратной связи. Гидрогенация (присоединение H_2 по двойной связи) на никелевом катализаторе:- из непредельного жидкого масла триолеина получаем предельный твёрдый жир тристеарин.

HYDROGEN BOND = ВОДОРОДНАЯ СВЯЗЬ – Hydrogen Bond is a chemical bond in which hydrogen that is already covalently bonded to one atom is electrically attracted to a lone pair of electrons on another atom. Some atoms such as oxygen are said to be very electronegative, which means that they strongly draw bonding electrons toward themselves. If hydrogen is bonded to such an atom, the hydrogen 'appears' to have some positive charge. Lone pairs (that is, not involved in bonding to other atoms) of electronegative atoms tend to attract hydrogen from other molecules, but a new compound is not formed. Hydrogen bonds are weak to moderate in strength, but there can be very large numbers of hydrogen bonds between molecules of compounds like cellulose. It is hydrogen bonds between cellulose molecules that keep the molecules together as fibers (and it is because they are easily broken and re-formed that cotton wrinkles). Hydrogen bonds play a role in dyeing with direct dyes, and may be present as 'temporary' bonds with other dye types.

HYDROGEN ION CONCENTRATION = КОНЦЕНТРАЦИЯ ВОДОРОДНЫХ ИОНОВ (или КИСЛОТНОСТЬ) – Hydrogen Ion Concentration is:- (1) a measure of acidity/alkalinity of a solution. (2) Mathematically is equal to the negative logarithm of the molar concentration of hydrogen ion; measurement of acidity/alkalinity of a solution; pH less than 7 = acidic; above 7 = basic. / Щёлочность (Alkalinity).

HYDROGEN PEROXIDE = ПЕРОКСИД ВОДОРОДА (или ПЕРЕКИСЬ ВОДОРОДА) – Hydrogen Peroxide, H_2O_2, normally as a solution in water. Hydrogen peroxide is extensively used in commercial bleaching of textiles, especially cellulose fibers and wool. It is effective and non-polluting. The hydrogen peroxide sold in drug and grocery stores is about a 3% solution. Industrial strength hydrogen peroxide may be 35%, 50% or 70%. At these strengths it is quite dangerous to handle, and spills can cause fires. Hydrogen peroxide can behave as either an oxidizing agent or a reducing agent. It is sometimes used as an antichlor. Sodium percarbonate and potassium monopersulfate are dry chemicals derived from hydrogen peroxide. / перкарбонат натрия (sodium percarbonate). моноперсульфат калия (potassium monopersulfate).

HYDROGRAPH = ГИДРОГРАФ – Hydrograph is a flooding pattern shown as a continuous curve of water depth based on daily depth values. / Под Гидрографом, от Греческих слов Hýdōr, означающее Вода, и Gráphō, означающее Пишу, понимается график изменения во времени расхода воды в створе реки (канала). Отражает характер распределения водного стока в течение года, сезона, половодья (паводка), межени.

HYDROGRAPHIC SURVEY = ГИДРОГРАФИЧЕСКОЕ ИЗЫСКАНИЕ (или ГИДРОГРАФИЧЕСКОЕ ОБСЛЕДОВАНИЕ, или ГИДРОГРАФИЧЕСКИЙ ПРОМЕР) – Hydrographic Survey is the scientific mapping of the sea bed for navigation. / , от Греческих слов Hýdōr, означающее Вода, и Gráphō, означающее Пишу, понимается . Научное картографирование морского дна, проводимое для определения возможности навигации в данном месте. Используемое для этих целей гидрографическое судно осуществляет промеры глубин, съёмку береговой полосы и тому подобное на морях, озёрах и реках.

HYDROLOGY = ГИДРОЛОГИЯ – Hydrology is the science dealing with the distribution and movement of water. / Под Гидрологией, от Греческих слов Hýdōr, означающее Вода, и Lógos, означающее Слово или Учение, понимается наука, изучающая природные воды, явления и процессы, в них протекающие. Предмет изучения геологии – водные объекты, снежный покров, ледники, почвенные и подземные воды. Гидрология разделяется на гидрологию моря, гидрологию суши, гидрогеологию, гляциологию. Гидрология исследует круговорот воды в природе, влияние на него деятельности человека и управление режимом водных объектов и водным режимом отдельных территорий; проводит анализ гидрологических элементов для отдельных территорий и Земли в целом. Гидрология даёт оценку и прогноз состояния и рационального использования вод, ресурсов. Современная гидрология пользуется методами, применяемыми в географии, физике и других науках.

HYDROLYSIS = ГИДРОЛИЗ – Hydrolysis is a breakdown process that occurs in anhydrous hydraulic fluids as a result of heat, water, and metal catalysts (iron, steel, copper, etc). In general, Hydrolysis is the decomposition of a chemical by reaction with water. Some chemicals, such as MX dyes, are effectively destroyed by hydrolysis. Others, such as soda ash, are made useful because of hydrolysis. Hydrolysis will occur when susceptible compounds are in aqueous solution, but can also occur because of water absorbed from moist air, without the compound ever appearing wet or damp. This is why many dry chemicals must be kept in sealed containers. See also Hygroscopic. Hydrolysis is the decomposition or alteration of a chemical substance by water. Hydrolysis is a double decomposition reaction involving the addition of the elements of water and the formation of an acid and a base, an acid and an alcohol, or an acid and phenol. / Под Гидролизом, от Греческих слов Hýdōr, означающее Вода, и Lýsis, означающее Разложение или Распад или Растворение, понимается обменная реакция между веществом и водой, например, $AlCl_3 + 3H_2O \rightarrow Al(OH)_3 + 3HCl$. Основа многих технологических и природных процессов. Гидролиз – реакция ионного обмена между различными веществами и водой. Равновесие в процессе гидролиза солей подчиняется Закону Действующих Масс. Если в результате гидролиза образуется нерастворимое или легколетучее вещество, гидролиз идёт практически до полного разложения исходной соли. В остальных случаях гидролиз солей проходит тем полнее, чем слабее соответствующая соли кислота или основание. Если гидролизу подвергается соль, образованная слабой кислотой и сильным основанием, например, KCN, раствор имеет щелочную реакцию; это объясняется тем, что анион слабой кислоты частично связывает образовавшиеся при диссоциации воды ионы H^+ и в растворе остаётся избыток ионов OH^-. Раствор соли сильной кислоты и слабого основания, например, NH_4Cl, – кислый. Если заряд катиона (или аниона) соли больше единицы, то гидролиз часто приводит к образованию кислых (или основных) солей в качестве продуктов первой ступени процесса. Количественной характеристикой гидролиза солей может служить степень гидролиза (a), определяемая отношением концентрации гидролизованной части молекул к общей концентрации данной соли в растворе; в большинстве случаев она невелика. Так, в 0.1 молярных растворах ацетата натрия CH_3COONa или хлорида аммония NH_4Cl при 25 °C a = 0.01%, а для ацетата аммония CH_3COONH_4 a = 0.5%. С повышением температуры и разбавлением раствора степень гидролиза увеличивается. Гидролиз солей лежит в основе многих важных процессов в химической промышленности и лабораторной практике. Частичный гидролиз трёхкальциевого силиката является

причиной выделения свободной извести при взаимодействии портландцемента с водой (смотрите Цемент). Благодаря гидролизу возможно существование буферных систем, способных поддерживать постоянную кислотность среды. Такие растворы имеют и очень важное физиологическое значение – постоянная концентрация ионов H^+ необходима для нормальной жизнедеятельности организма. С гидролизом солей связан ряд геологических изменений земной коры и образование минералов, формирование природных вод и почв. Гидролиз органических соединений – расщепление органического соединения водой с образованием двух или более веществ. Обычно гидролиз осуществляется в присутствии кислот (кислотный гидролиз) или щёлочей (щелочной гидролиз). Гидролитическому расщеплению чаще всего подвергаются связи атома углерода с другими атомами (галогенами, кислородом, азотом и другими). Так, щелочной гидролиз галогенидов служит методом получения (в том числе и промышленного) спиртов и фенолов. В зависимости от строения углеводородного радикала (R) и от условий реакции гидролиз галогенпроизводных может осуществляться как мономолекулярный (S_N1) или бимолекулярный (S_N2) процесс. В случае мономолекулярной реакции вначале происходит ионизация связи углерод-галоген, а затем образующийся ион карбония реагирует с водой; щёлочь, если она добавлена, не влияет на скорость гидролиза и служит только для нейтрализации выделяющейся галогеноводородной кислоты и смещения равновесия. В случае бимолекулярной реакции скорость гидролиза прямо пропорциональна концентрации щёлочи. Исключительно важен гидролиз сложных эфиров (реакция, обратная этерификации). Кислотный гидролиз сложных эфиров является обратимым процессом. Щелочной гидролиз сложных эфиров необратим, поскольку он приводит к образованию спирта и соли кислоты. Этот процесс широко применяется в промышленности для получения спиртов и кислот, например, при омылении жиров с целью получения глицерина и солей высших алифатических кислот (мыла). Аналогично сложным эфирам гидролизуются амиды кислот. Случаи гидролиза углерод-углеродной связи сравнительно редки. К ним относятся, в частности, кетонное (действием кислот и разбавленных щёлочей) и кислотное (действием концентрированной щёлочи) расщепление 1,3-дикарбонильных соединений, например, ацетоуксусного эфира. Термин Гидролиз обычно применяется в органической химии также по отношению к некоторым процессам, которые более правильно было бы называть Гидратацией; примером может служить превращение нитрилов кислот в амиды. Гидролиз сложноэфирных, гликозидных (в углеводах) и амидных (в белках) связей играет огромную роль в жизнедеятельности любых организмов, например, в таких процессах, как усвоение пищи, передача нервных импульсов и тому подобных. Гидролиз в живом организме катализируется ферментами Гидролазами. Смотрите также Гидролиз Растительных Материалов.

HYDROLYTIC CLASS = ГИДРОЛИТИЧЕСКИЙ КЛАСС – Hydrolytic Class is the degree of water resistance for glass products.

HYDROLYTIC/ENZYMATIC FAT CLEAVAGE = ГИДРОЛИТИЧЕСКОЕ/ЭНЗИМАТИЧЕСКОЕ (или ФЕРМЕНТАТИВНОЕ) РАСЩЕПЛЕНИЕ ЖИРА – Hydrolytic/Enzymatic Fat Cleavage:- (Greek:- hydro – water; lysis – solution; enzymos – fermented) Fat cleavage due to moisture and fat-cleaving enzymes (lipases).

HYDROLYTIC STABILITY = ГИДРОЛИТИЧЕСКАЯ СТАБИЛЬНОСТЬ (или ГИДРОЛИТИЧЕСКАЯ УСТОЙЧИВОСТЬ) – Hydrolytic Stability is an ability of additives and certain synthetic lubricants to resist chemical decomposition (hydrolysis) in the presence of water. / устойчивость к гидролизу.

HYDROMETALLURGY = ГИДРОМЕТАЛЛУРГИЯ – Hydrometallurgy is concerned with the selective leaching of metallic compounds to form a solution from which the metals can be precipitated and recovered. Leaching processes are used when it is the simplest method or when the ore is of too low a grade for more expensive extractive procedures. (i) Conversion:- because not all ores and concentrates are found naturally in a form that is satisfactory for leaching, they must often be subjected to preliminary operations. For example, sulfide ores, which are relatively insoluble in sulfuric acid, can be converted to quite soluble forms by oxidizing or sulfatizing roasts. On the other hand, oxide ores and concentrates can be given a controlled reducing roast in order to produce a calcine containing a reduced metal that will dissolve easily in the leaching solution. These treatments are described in more detail above. A second popular treatment for converting sulfides is pressure oxidation, in which the sulfides are oxidized to a porous structure that provides good access for the leaching solution. This treatment was developed for the recovery of gold from sulfide ores, which are not suitable for cyanide leaching without first being oxidized. A finely ground concentrate slurry is preheated to 175 °C (350 °F) and pumped into a four- or five-compartment autoclave, each compartment containing an agitator. Gaseous oxygen is added to each compartment, and retention time in the autoclave is two hours in order to achieve the desired oxidation. (ii) Leaching:- oxides are leached with a sulfuric acid or sodium carbonate solvent, while sulfates can be leached with water or sulfuric acid. Ammonium hydroxide is used for native ores, carbonates, and sulfides, and sodium hydroxide is used for oxides. Cyanide solutions are a solvent for the precious metals, while a sodium chloride solution dissolves some chlorides. In all cases the leach solvent should be cheap and available, strong, and preferably selective for the values present. Leaching is carried out by two main methods: simple leaching at ambient temperature and atmospheric pressure; and pressure leaching, in which pressure and temperature are increased in order to accelerate the operation. The method chosen depends on the grade of the feed material, with richer feed accommodating a costlier, more extensive treatment. Leaching in-place, or in situ leaching, is practiced on ores that are too far underground and of too low a grade for surface treatment. A leach solution is circulated down through a fractured ore body to dissolve the values and is then pumped to the surface, where the values are precipitated. Heap leaching is done on ores of semilow grade – that is, high enough to be brought to the surface for treatment. This method is increasing in popularity as larger tonnages of semilow-grade ore are mined. The ore is piled in heaps on pads and sprayed with leach solution, which trickles down through the heaps while dissolving the values. The pregnant solution is drained away and taken to precipitation tanks. Higher-grade ores are treated by tank leaching, which is carried out in two ways. One method is of very large scale, with several thousand tons of ore treated at a time in large concrete tanks with a circulating solution. In the second method, small amounts of finely ground high-grade ore are agitated in tanks by air or by mechanical impellers. Both solutions pass to precipitation after leaching is completed. Pressure leaching shortens the treatment time by improving the solubility of solids that dissolve only very slowly at atmospheric pressure. For this process autoclaves are used, in both vertical and horizontal styles. After leaching, the pregnant solution is separated from the insoluble residue and sent to precipitation. (iii) Recovery:- pregnant solution from leaching operations is treated in a variety of ways to precipitate the dissolved metal values and recover them in solid form. These include electrolytic deposition, transfer of metal ions, chemical precipitation, solvent extraction in combination with electrolytic and chemical methods, and carbon adsorption combined with electrolytic treatment. Electrolytic deposition, also called Electrowinning, gives a pure product and is a preferred method. However, it is expensive, owing to the cost of electricity, and must have a solution of high metal content. Insoluble anodes, and cathodes made of either a strippable inert material or a thin sheet of the deposited metal, are inserted into a tank containing leach solution. As current is passed, the solution dissociates, and metal ions deposit at the cathode. This common method is used for copper, zinc, nickel, and cobalt. Solvent extraction combined with electrolytic deposition takes dilute, low-value metal solutions and concentrates them into small volumes and high metal contents, rendering them satisfactory for electrolytic treatment. Low-grade copper ores are processed in this manner. First, a large volume of a low-value copper leach solution (2.5 grams per liter, or 0.33 ounces per gallon) is contacted with a small volume of water-immiscible organic solvent in kerosene. The metal values pass from the leach solution into the extraction solution, the two phases are separated, and the extraction

solution goes on to the stripping circuit. Here another fluid is added that has a still greater affinity for the metal values, picking them out of the extraction solution. The two solutions are separated, with the small volume of stripping solution having a metal content high enough (50 grams per liter, or 6.6 ounces per gallon) to be suitable for electrolytic precipitation. An adsorption circuit is used to strip pregnant solutions of gold cyanide with activated carbon. The carbon is in turn stripped of the metal by a solution, which then goes to an electrolytic cell where the gold content is deposited at the cathode. Chemical precipitation can be accomplished in a number of ways. In one method, a displacement reaction takes place in which a more active metal replaces a less active metal in solution. For example, in copper cementation iron replaces copper ions in solution, solid particles of copper precipitating while iron goes into solution. This is an inexpensive method commonly applied to weak, dilute leach solutions. Another displacement reaction uses gas, with hydrogen sulfide, for example, added to a solution containing nickel sulfate and precipitating nickel sulfide. Finally, changing the acidity of a solution is a common method of precipitation. Yellow cake, a common name for sodium diuranate, is precipitated from a concentrated uranium leach solution by adding sodium hydroxide to raise the pH to 7. / Восстановительный Обжиг (Reducing Roast). Сульфатизирующие Обжиги (Sulfatizing Roasts). осадок (precipitate). Под Гидрометаллургией, от слов Гидро... и Металлургия, понимается извлечение металлов из руд, концентратов и отходов различных производств водными растворами химических реагентов с последующим выделением металлов из растворов. На возможность применения гидрометаллургических процессов для извлечения металлов из руд указывал ещё в 1763 Русский учёный Михаил Васильевич Ломоносов (1711–1765). Значительный вклад в развитие гидрометаллургии внёс Русский учёный Пётр Романович Багратион (1818–1876), создавший теорию цианирования золота (в 1843). В начале XX века промышленное значение приобрела гидрометаллургия меди. Позднее были разработаны гидрометаллургические способы получения многих других металлов. Гидрометаллургия включает ряд основных технологических операций, выполняемых в определённой последовательности. Механическая обработка руды – дробление и измельчение с целью полного или частичного раскрытия зёрен минералов, содержащих извлекаемый металл. Изменение химического состава руды или концентрата для подготовки их к выщелачиванию – хлорирующий, окислительный, сульфатизирующий или восстановительный обжиг, спекание. Цель – разложение химических соединений извлекаемого металла и перевод их в растворимую форму. Выщелачивание – перевод извлекаемого металла в водный раствор. Эта операция иногда осуществляется попутно в процессе мокрого измельчения (в мельницах, классификаторах) или в специальной аппаратуре (чаны для выщелачивания, автоклавы). Отделение металлосодержащего раствора от измельчённого материала обезвоживанием и промывкой в сгустителях, на фильтрах. Подготовка растворов к выделению из них соединений или металлов отделением взвешенных частиц (осветление) или химическим осаждением сопутствующих металлов и примесей. Осаждение металлов или их соединений из растворов электролизом (медь, цинк и другие), восстановлением более электроотрицательным металлом – цементацией (медь, серебро, золото и другие), сорбцией ионообменными смолами или углем, жидкостной экстракцией соединений металла органическими растворителями с последующей реэкстракцией в водный раствор и осаждением из него чистого металла или химического соединения. Переработка осадка с целью дальнейшей очистки выделенного соединения или чернового металла или непосредственное получение готового товарного металла может осуществляться:- перекристаллизацией, возгонкой, прокаливанием, переплавкой, электролизом из водных или расплавленных сред. При химическом взаимодействии металла с растворителем нейтральный атом металла переходит в ионное состояние, образуя растворимое соединение. Растворение происходит легко в случае выщелачивания руд или концентратов, в которых металл присутствует в окисленной (ионной) форме. Примером могут служить окисленные медные и урановые руды, обожжённые цинковые концентраты, продукты хлорирующего обжига. В некоторых случаях для извлечения металла растворителем необходимо предварительное окисление кислородом или другим окислителем (например, при содовом выщелачивании руд, содержащих 4-валентный уран, для перевода последнего в 6-валентный). При растворении металлов (самородных или восстановленных) неизбежно окисление их для перехода в ионное состояние. Окисление металла с одновременной ионизацией окислителя (например, растворённого в воде молекулярного кислорода) в случае более благородных металлов термодинамически возможно лишь при затрате энергии, которая, например, может быть получена при образовании комплексного иона (цианирование золота и серебра, аммиачное выщелачивание металлической меди, никеля). Растворение минералов с различными видами химической связи в кристаллической решётке (ковалентная, металлическая, ионная) характерно для выщелачивания сульфидов, арсенидов, селенидов, теллуридов. Растворение этих минералов, если предварительно не проведён окислительный обжиг, в большинстве случаев также требует окисления в пульпе, например, при аммиачном выщелачивании медно-никелевых сульфидных руд в автоклаве под давлением кислорода или воздуха. Перенос растворителя и удаление продуктов реакции происходит в объёме раствора конвекцией (турбулентной диффузией), а в слое на границе с минералом – молекулярной (тепловой) диффузией. Обычно реакция, происходящая при гидрометаллургическом извлечении, находится в диффузионной области; определяющим фактором является скорость диффузии вещества, лимитирующая течение реакции. Возрастание скорости растворения минерала происходит при увеличении его относительной поверхности (то есть степени измельчения), при ускорении перемешивания и при повышении температуры. Форма поверхности и размер частиц растворяемого минерала определяют функциональную зависимость количества растворившегося металла от времени контакта с раствором; поэтому они влияют на степень извлечения и на объём аппаратов для выщелачивания. Растворителями для выщелачивания соединений является преимущественно серная кислота (ванадий, медь, цинк), сода (ванадий в карбонатных рудах, молибден, вольфрам), едкий натр (глинозём, вольфрам), аммиак (медь, никель), цианистые соли (золото, серебро), сернистый натрий (сурьма, ртуть), растворы хлора и хлоридов (благородные металлы, свинец, редкие металлы), тиосульфаты (золото, серебро). Для жидкостной экстракции применяют различные соединения (например, раствор трибутилфосфата и ди-2-этилгексилфосфата в керосине и другие). После экстракции очищенное соединение металла извлекается из органического растворителя водным раствором, часто с добавкой кислоты или другого реагента. Из раствора металлы осаждаются методом цементации или углем, или водородом под давлением. Применяются также аниониты или катиониты. После сорбции соединение металла снимается растворителем с ионита и последний подвергается регенерации. При больших масштабах гидрометаллургического производства (например, при выщелачивании меди из окисленных крупнокусковых руд) обработка иногда осуществляется орошением штабелей руды слабыми растворами серной кислоты. Медьсодержащие растворы дренируются в сборные резервуары, а затем в цементаторы. Для дроблёных и рассортированных песковых фракций руд (например, золотых) применяется просачивание раствора в чанах через слой хорошо фильтрующей загрузки. Для интенсификации этого процесса раствор иногда предварительно насыщают воздухом, создают вакуум под фильтрующим днищем. Для выщелачивания тонкоизмельчённого материала применяют чаны для перемешивания (механической, пневматической и пневмомеханической) пульпы. Для непрерывного выщелачивания обычно их соединяют последовательно. Иногда возможны комбинированные схемы выщелачивания:- зернистого классифицированного материала – просачиванием, отделённого мелкого материала (шлама) – перемешиванием. В отдельных случаях возможно и другое аппаратурное оформление выщелачивания, например, в автоклавах непрерывного и периодического действия. Выщелачивание кислыми растворами производится в стальной гуммированной, керамической или другой кислотоупорной аппаратуре; для щелочных растворов пригодна стальная, иногда деревянная аппаратура. Методы жидкостной экстракции или дополняют выщелачивание, или применяются для

непосредственного извлечения соединений металлов из руд. Экстракция производится по принципу противотока в экстракционных колонках (экстракт и отходящий раствор непрерывно удаляют в разных направлениях). Обезвоживание и промывка производятся в сгустителях (гребковые с центральным и периферическим приводом, многоярусные) и фильтрах (вакуум-фильтры и фильтр-прессы непрерывного и периодического действия). Осаждение из растворов производится в аппаратах, конструкция которых зависит от осадителя. Для химических (растворимых) осадителей применяют реакторы и фильтры. Порошкообразные осадители (цинковая, алюминиевая пыль) вводятся в смесители с раствором, осаждение затем может продолжаться внутри перекачивающего насоса, в трубопроводе и через слой осадителя на фильтре. Можно осаждать металл или его соединения в самой пульпе (например, погружением в пульпу сетчатых корзин с ионитом). Порошковые осадители после контакта с раствором можно выделять флотацией. Осаждение кусковыми осадителями (железо для меди, цинковая стружка или уголь для золота) производят в желобах или ящиках с перегородками для зигзагообразного движения раствора вверх и вниз через слой осадителя. Возможно выделение примесей (например, железа) гидролизом из очищенного раствора с последующим получением основного металла (например, цинка) осаждением на катоде электролизом с нерастворимыми анодами. Смотрите также Благородные Металлы.

HYDROMETER = ГИДРОМЕТР (или АРЕОМЕТР) – Hydrometer is an instrument for determining either the specific gravity of a liquid or the American Petroleum Institute (API) gravity. Hydrometer is measuring equipment used to determine the density of liquids, also Areometer. / Под Гидрометром, от Греческих слов Hýdōr, означающее Вода, и Metréo, означающее Измеряю, понимается . Под Ареометром, от Греческих слов Araiys, означающее Слабый, а здесь – Жидкий, и Metréo, означающее Измеряю, понимается прибор для измерений плотности жидкостей и твёрдых тел. Устройство ареометра основано на Законе Архимеда (смотрите Закон Архимеда), из которого следует, что вес жидкости, вытесненной плавающим телом (в данном случае ареометром), равен его весу. По глубине погружения ареометра (объёму вытесненной им жидкости) и весу ареометра можно определить плотность исследуемой жидкости. На практике применяют ареометры двух типов:- ареометры постоянного веса (более распространённые) и ареометры постоянного объёма. К ареометрам постоянного веса относятся Денсиметры, шкалы которых градуируются в единицах плотности (ранее распространённые ареометры со шкалами, градуированными в условных единицах – градусах Бомё, Брикса, Траллеса и другие, теперь не допускаются к применению); и ареометры для измерений концентрации растворов, шкалы которых градуируются в % по объёму или по массе. Многие ареометры, предназначенные для измерений концентрации веществ в определённых жидких смесях и растворах, имеют специальные названия:- лактоденсиметры, которыми определяют жирность молока, спиртомеры – содержание спирта в воде, сахаромеры – содержание сахара в сиропах (по массе, в %), и так далее. Плотность у денсиметров отсчитывается непосредственно по шкале. Цена деления шкалы эталонных денсиметров составляет 0.000 1, 0.000 2 и 0.000 5 г/см^3, у рабочих (в зависимости от пределов измерений) – от 0.000 5 до 0.02 г/см^3, у ареометров для измерений концентрации – от 0.1 до 2%. При измерениях плотности у ареометра постоянного объёма остаётся неизменным объём погруженной части прибора, что достигается изменением веса ареометра. Плотность определяется по массе гирь, снятых или добавленных для того, чтобы ареометр погрузился до метки, указывающей объём вытесненной жидкости. Плотность твёрдых тел измеряют ареометром постоянного объёма с дополнительной тарелкой, присоединённой к корпусу ареометра снизу (ареометрические весы) (смотрите Гидростатическое Взвешивание).

HYDROMORPHIC = ГИДРОМОРФНОЕ – Hydromorphic:- (1) pertaining to a soil showing characteristics associated with permanent or periodic excess water, e.g., gley phenomena. (2) Derived from hydro (water) and morph (form). Descriptive of soil developed in the presence of permanent or periodic excess of moisture.

HYDROMORPHIC RICE = ГИДРОМОРФНЫЙ РИС – Hydromorphic Rice is a Rice that is grown where the water table is very close to the surface.

HYDROPHILIC = ГИДРОФИЛЬНОЕ (или ВЛАГОЛЮБИВОЕ) – Hydrophilic:- having strong affinity for or the ability to absorb water. Hydrophilic:- water-loving. Hydrophilic:- compounds with an affinity for water. / Под Гидрофильным, от Греческих слов Hýdōr, означающее Вода, и Philia, означающее Любовь, понимается влаголюбивое.

HYDROPHILIC FIBERS = ГИДРОФИЛЬНЫЕ ВОЛОКНА – Hydrophilic Fibers are the fibers that absorb water easily, take longer to dry, and require more ironing. These fibers denote a finish that improves wearing comfort. / Под Гидрофильными Волокнами, от Греческих слов Hýdōr, означающее Вода, и Philia, означающее Любовь, понимается .

HYDROPHOBIC = ГИДРОФОБНОЕ – Hydrophobic:- compounds that repel water. Hydrophobic:- lacking affinity for or the ability to absorb water. / Под Гидрофобным, от Греческих слов Hýdōr, означающее Вода, и Phóbos, означающее Боязнь или Страх, понимается .

HYDROPHOBIC FIBERS = ГИДРОФОБНЫЕ ВОЛОКНА – Hydrophobic Fibers are the fibers that lack the ability to absorb water. These fibers denote a finish normally applied to create water-repellent products. / Под Гидрофобными Волокнами, от Греческих слов Hýdōr, означающее Вода, и Phóbos, означающее Боязнь или Страх, понимаются волокна, которые .

HYDROPONICS = ГИДРОПОНИКА – Hydroponics is the growing of plants in nutrient solutions with or without an inert medium to provide mechanical support. / Под Гидропоникой, от Греческих слов Hýdōr, означающее Вода, и Pónos, означающее Работа, понимается выращивание растений (овощных, цветочных, ягодных и других) без почвы. Корни укрепляются в гравии, мхе, песке и другом твёрдом субстрате (куда подаётся вода с растворёнными в ней элементами питания), погружаются в питательный раствор или, находясь в воздушной среде, периодически этим раствором опрыскиваются.

HYDROSCOPIC = ГИДРОСКОПИЧНОЕ (или ГИГРОСКОПИЧЕСКОЕ) – Hydroscopic:- having the ability to absorb moisture from the atmosphere. All fibers have this property in varying degrees. See also Hygroscopic. / Под Гигроскопическим, от Греческих слов Hygrós, означающее Влажный, и Skopeo, означающее Наблюдаю, понимается прилагательное от свойства материалов поглощать (сорбировать) влагу из воздуха.

HYDROSTATIC LUBRICATION = ГИДРОСТАТИЧЕСКОЕ СМАЗЫВАНИЕ – Hydrostatic Lubrication is a system of lubrication in which the lubricant is supplied under sufficient external pressure to separate the opposing surfaces by a fluid film. See also Lubrication.

HYDRO TILLER = ГИДРО ПОЧВОФРЕЗА (или ГИДРО КУЛЬТИВАТОР) – Hydro Tiller is the engine-powered, rotary, walk-behind tiller or puddler of the floating type. A Hydraulic Tiller is a piece of machinery often used in conjunction with a towing vehicle such as a tractor or all-terrain vehicle (ATV) that tills soil, turning it for aeration and weed or rock removal. This machine is used in preparation for planting, usually in gardens or areas that are being prepared to be landscaped. A hydraulic tiller will feature rotating teeth or blades that are propelled by a hydraulic system that uses fluids to provide driving force. Such a design cuts down on noise as well as friction that can be damaging to various components. Some hydraulic tiller models can be used by walking behind the unit rather than towing it on a tractor or ATV. These units offer more portability and versatility in tight spots where a tractor or ATV cannot fit. The handlebars for

such designs will feature hand brakes that can slow or stop wheels mounted on either side of the machine, and the brakes can be used to help steer the unit. Pulling the brake handle on the left side, for example, will slow the left wheel, thereby turning the entire hydraulic tiller to the left. Depressing the right brake will have a similar effect in the opposite direction. Some models that are mounted to tractors can take advantage of the power take-off system (PTO) often built into the tractor. This system can power a variety of components, and a hydraulic tiller may be mounted to the power take-off to operate the tines. The unit itself can then be raised and lowered using a hydraulic arm; this allows the user to adjust the depth to which the tines will cut into the soil, or to raise the unit entirely off the ground so the driver can drive over areas that do not need tilling. PTO systems may or may not accommodate hydraulically driven tillers; this depends on the type of tractor as well as its compatibility with the tiller. The fluid used in hydraulic systems is usually a type of oil. The thickness or viscosity of this oil can vary depending on its application; when the oil is forced through hydraulic hoses and into actuator cylinders, the tines of the tiller can be rotated to cut into the soil. When the fluid is retracted, the tines will stop rotating. This motion is usually controlled by some sort of master cylinder that may or may not be adjustable, depending on the type of system included with the particular tiller model.

HYDROTREATING = ГИДРООЧИСТКА – Hydrotreating is a refining process for treating petroleum fractions from atmospheric or vacuum distillation units (e.g., heavy gasoil, middle distillates, naphtha, reformer feeds, and residual fuel oil) and other petroleum streams (e.g., cat-cracked naphtha, coker naphtha, gasoil, etc) in the presence of catalysts and substantial quantities of hydrogen. Hydrotreating results in desulphurisation, removal of substances that deactivate catalysts (e.g., nitrogen compounds) and conversion of olefins to paraffins to reduce gum formation in gasoline. Hydrotreating is a process for reducing sulfur and nitrogen elements in petroleum products using a catalyst under pressure from a gas containing hydrogen. / , от Греческих слов Hýdōr, означающее Вода, и . прямогонный бензин, сырьё для риформинга и) и другие нефтяные потоки. олефинов в парафины для снижения содержания смолы в бензине. , например, . Гидроочистка это процесс снижения содержания сернистых и азотистых соединений в нефтепродуктах на катализаторе под давлением водородсодержащего газа. Под Гидроочисткой понимается очистка моторных топлив, масел и других нефтепродуктов от примесей органических производных серы, кислорода и азота. Данный процесс осуществляется каталитической гидрогенизацией продукта при 250–425 °C и давлении 1–15 МПа. Во время этого процесса примеси превращаются в предельные углеводороды и легкоудаляемые H_2S, H_2O и NH_3. Десульфурация (обессеривание). Гидроочистка, процесс селективного гидрирования содержащихся в моторных топливах (бензин, керосин, дизельное топливо), маслах и других нефтепродуктах (например, в сырье для каталитического риформинга) органических сернистых, азотистых и кислородных соединений, которые, присоединяя водород, образуют соответственно сероводород, аммиак и воду и в таком виде удаляются из очищаемого продукта. Гидроочистку ведут в присутствии гидрирующего катализатора, например, алюмомолибдата кобальта, при 260–430 °C и давлении водородсодержащего газа 1–10 МегаНьютонов на один квадратный метр (МН/м^2) (10–100 килограмм силы на квадратный сантиметр (кгс/см^2)). При гидроочистке расходуется значительное количество водорода (чтобы снизить на 1% содержание серы, необходимо затратить его 9–18 кубических метров (м^3) на 1 м^3 сырья), поэтому установки гидроочистки обычно совмещают с установками каталитического риформинга, дающими избыточный водород. Образующийся при гидроочистке сероводород улавливают и используют для получения серы и серной кислоты. В результате гидроочистки повышается качество нефтепродуктов, снижается коррозия оборудования, уменьшается загрязнение атмосферы. Гидроочистка смазочных масел, применяемая вместо контактной очистки глинами, улучшает цвет и запах, понижает кислотность и коксуемость масел. Процесс гидроочистки приобрёл очень большое значение в связи с вовлечением в переработку больших количеств сернистых и высокосернистых (более 1.9% серы) нефтей.

HYDROTROPISM = ГИДРОТРОПИЗМ – Hydrotropism:- bending, growth or movement of a part in response to a water source. See also Tropism. / Смотрите также Тропизм (Tropism). Под Гидротропизмом, от Греческих слов Hýdōr, означающее Вода, и . Под Тропизмом, от Греческого слова Trópos, означающее Направление или Поворот, понимается ростовое движение органов растений (корня, стебля, листьев), обусловленное направленным действием какого-либо раздражителя – света (фоторопизм), силы земного тяготения (геотропизм), температуры (термотропизм), прикосновения (гаптотропизм), воды (гидротропизм), кислорода (аэротропизм) и других химических веществ (хемотропизм). В основе тропизма лежит неравномерный рост, вызываемый перераспределением в растении фитогормонов.

HYDRO TURBINE = ГИДРОТУРБИНА (или ГИДРАВЛИЧЕСКАЯ ТУРБИНА, или ВОДЯНАЯ ТУРБИНА) – Hydro Turbine is a rotary engine whose energy is generated from moving water. / Гидротурбина – роторный двигатель, энергия которого генерируется из движущейся воды. Гидротурбина или Гидравлическая Турбина или Водяная Турбина – ротационный двигатель, преобразующий механическую энергию воды (её энергию положения, давления и скоростную) в энергию вращающегося вала. По принципу действия гидротурбины делятся на активные и реактивные. Основным рабочим органом гидротурбины, в котором происходит преобразование энергии, является рабочее колесо. Вода подводится к рабочему колесу в активных гидротурбинах через сопла, в реактивных – через направляющий аппарат. В активной гидротурбине вода перед рабочим колесом и за ним имеет давление, равное атмосферному. В реактивной гидротурбине давление, воды перед рабочим колесом больше атмосферного, а за ним может быть как больше, так и меньше атмосферного давления. Первая реактивная гидротурбина была изобретена в 1827 Французским инженером Бэнуа Фурнэйро (Benoît Fourneyron; 1802–1867); эта гидротурбина имела на рабочем колесе мощность 6 л.с., но из-за плохих энергетических свойств подобные гидротурбины уже не применяются. В 1855 Британо-Американский инженер Дьжеймз Байкино Фрэнсис (James Bicheno Francis; 1815–1892) изобрёл радиально-осевое рабочее колесо гидротурбины с неповоротными лопастями, а в 1887 Немецкий инженер, Профессор Финк (Fink) предложил направляющий аппарат с поворотными лопатками (смотрите Радиально-Осевая Гидротурбина). В 1889 Американский инженер Лэстё Алэн Пэлтэн (Lester Allen Pelton; 1829–1908) запатентовал активную – ковшовую гидротурбину, в 1920 Австрийский инженер и изобретатель Викто Каплян (Viktor Kaplan; 1876–1934) получил патент на поворотнолопастную гидротурбину. Радиально-осевые, поворотнолопастные и ковшовые гидротурбины широко применяются для выработки электрической энергии (смотрите Гидроэнергетика). Для расчёта профиля лопасти рабочего колеса гидротурбины, вращающегося с постоянной угловой скоростью, используется уравнение:- $H \cdot \eta_Г = (U_1 \cdot V_1 \cdot \cos\alpha 1 - U_2 \cdot V_2 \cdot \cos\alpha_2) / g$, где H – рабочий напор гидротурбины, то есть запас энергии 1 кг воды (разность отметок горизонтов воды перед входом в сооружения гидравлической силовой установки и по выходе из них за вычетом потерь на сопротивление во всех сооружениях, но без вычета потерь в самой гидротурбине); U_1 и U_2 – окружные скорости лопастей на входе воды в рабочее колесо и на выходе из него, м/сек; V_1 и V_2 – абсолютные скорости воды на входе и выходе, м/сек; (α_1 и α_2 – углы между направлениями окружных и абсолютных скоростей в точках, соответствующих осереднённой по энергии поверхности тока, град; g – ускорение свободного падения, м/сек^2. В левую часть уравнения вводится множитель $\eta_Г$, являющийся гидравлическим коэффициентом полезного действия (кпд) гидротурбины. Часть мощности, полученная колесом, расходуется на преодоление механических сопротивлений, эти потери учитываются механический кпд гидротурбин η_0. Утечка воды в обход рабочего колеса учитывается объёмным кпд гидротурбины. Полный кпд гидротурбины $\eta = \eta_Г \cdot \eta_M \cdot \eta_0$ – отношение полезной мощности, отдаваемой турбинным валом, к мощности пропускаемой через гидротурбину воды. В современной гидротурбине

полный кпд равен 0.85–0.92; при благоприятных условиях работы лучших образцов гидротурбин он достигает 0.94–0.95. Геометрические размеры гидротурбин характеризуются номинальным диаметром Д, рабочего колеса. Гидротурбины разных размеров образуют турбинную серию, если обладают однотипными рабочими колёсами и геометрическими подобными элементами проточной части. Определив необходимые параметры одной из гидротурбин данной серии, можно подсчитать, пользуясь формулами подобия, те же параметры для любой гидравлической турбины этой серии (смотрите Гидродинамическое И Аэродинамическое Моделирование). Каждую турбинную серию характеризует коэффициент быстроходности, численно равный частоте вращения вала гидротурбины, развивающей при напоре 1 м мощность 0.735 5 кВт (1 л.с.). Чем больше этот коэффициент, тем больше частота вращения вала при заданных напоре и мощности. Гидротурбина и электрический генератор обходятся дешевле при увеличении частоты их вращения, поэтому стремятся строить гидротурбины с возможно большим коэффициентом быстроходности. Однако в реактивных гидротурбинах этому препятствует явление кавитации, вызывающее вибрацию агрегата, снижение кпд и разрушение материала гидротурбины. Графики, выражающие зависимости величин, характеризующих гидротурбину, называются Турбинными Характеристиками. На Рисунке представлены характеристики гидротурбины при постоянном напоре и частоте вращения колеса, но при различных нагрузках и расходе воды. В реальных условиях гидротурбины работают при меняющемся напоре; их поведение в этом случае изображается универсальными характеристиками для модели и эксплуатационными характеристиками – для натурной гидротурбины. Универсальные характеристики строятся на основании лабораторных исследований модели, проточная часть которой геометрически подобна натурной. На универсальных характеристиках, исходя из условий моделирования, в координатах приведённых величин расхода Q'_1 л/сек и частоты вращения h'_1 об/мин (характерных для гидротурбин данной серии диаметром рабочего колеса 1 м, работающих при напоре 1 м) наносятся изолинии равных кпд η%, коэффициент кавитации s и открытия направляющего аппарата α_0. Эксплуатационные характеристики строятся на основании универсальных и показывают зависимость кпд натурной турбины η% от нагрузки N Мвм и напора Нм при номинальной частоте вращения турбины n = const. Здесь же обычно наносят линию ограничения мощности, выражающую зависимость гарантированной мощности от напора. На этих же характеристиках изображают линии равных допустимых высот отсасывания H_S м, показывающих заглубление рабочего колеса гидротурбины под уровень воды в нижнем бьефе (разность отметок расположения рабочего колеса и уровня нижнего бьефа). Проточная часть реактивных гидротурбин состоит из следующих основных элементов:- спиральной камеры гидротурбины; направляющего аппарата, регулирующего расход воды; рабочего колеса и отсасывающей трубы, отводящей воду от гидротурбины. Реактивные гидротурбины по направлению потока в рабочем колесе делятся на осевые и радиально-осевые. По способу регулирования мощности реактивные гидротурбины бывают одинарного и двойного регулирования. К гидротурбинам одинарного регулирования относятся гидротурбины, содержащие направляющий аппарат с поворотными лопатками, через который вода подводится к рабочему колесу (регулирование в этих гидротурбинах производится изменением угла поворота лопаток направляющего аппарата), и лопастнорегулируемые гидротурбина, у которых лопасти рабочего колеса могут поворачиваться вокруг своих осей (регулирование в этих гидротурбинах производится изменением угла поворота лопастей рабочего колеса). Гидротурбины двойного регулирования содержат направляющий аппарат с поворотными лопатками и рабочее колесо с поворотными лопастями. Поворотнолопастные гидротурбины, применяемые на напоры до 150 м, могут быть осевыми и диагональными гидротурбинами. Разновидностью осевых являются двухперовые, в которых на каждом фланце размещаются по две лопасти вместо одной. Радиально-осевые гидротурбины одиночного регулирования применяют на напоры до 500–600 м. Активные гидротурбины строят преимущественно в виде ковшовых гидротурбин и применяют на напоры выше 500–600 м; их делят на парциальные и непарциальные. В парциальных гидротурбинах вода к рабочему колесу подводится в виде струй через одно или несколько сопел и поэтому одновременно работает одна или несколько лопастей рабочего колеса. В непарциальных гидротурбинах вода подводится одной кольцевой струёй и поэтому одновременно работают все лопасти рабочего колеса. В активных гидротурбинах отсасывающие трубы и спиральные камеры отсутствуют, роль регулятора расхода выполняют сопловые устройства с иглами, перемещающимися внутри сопел и изменяющими площадь выходного сечения. Крупные гидротурбины снабжаются автоматическими регуляторами скорости. По расположению вала рабочего колеса гидротурбины делятся на вертикальные, горизонтальные и наклонные. Сочетание гидротурбины с гидрогенератором называют Гидроагрегатом. Горизонтальные гидроагрегаты с поворотно-лопастными или пропеллерными гидротурбинами могут выполняться в виде капсульного гидроагрегата. Широкое распространение получили обратимые гидроагрегаты для гидроаккумулирующих и приливных электростанций, состоящие из насосо-турбины (гидромашины, способной работать как в насосном, так и в турбинном режимах) и двигателя-генератора (электромашины, работающей как в двигательном, так и в генераторном режимах). В обратимых гидроагрегатах применяются только реактивные гидротурбины. Для приливных электростанций используются капсульные гидроагрегаты. В 1962 в бывшем СССР была разработана номенклатура поворотнолопастных и радиально-осевых гидротурбин, в которой давались система типов и размеров гидротурбин и их основные гидравлические и конструктивные характеристики. Эта номенклатура была основана на закономерном изменении зависимостей геометрических и гидравлических параметров рабочих колёс от напора. Основными тенденциями в развитии гидротурбин являются:- увеличение единичной мощности, продвижение каждого типа гидротурбин в область повышенных напоров, совершенствование и создание новых типов гидротурбин, улучшение качества, повышение надёжности и долговечности оборудования. В бывшем СССР были созданы и успешно работали гидротурбины радиально-осевого типа мощностью 508 МВт на расчётный напор 93 м с диаметром рабочего колеса 7.5 м для Красноярской ГЭС, разрабатывались гидротурбины такого же типа для Саянской ГЭС (единичная мощность 650 МВт, расчётный напор 194 м, диаметр рабочего колеса 6.5 м). Больших успехов в создании гидротурбин достигли фирмы:- Японские Хитачи (Hitachi), Мицубищи (Mitsubishi), Тощиба (Toshiba), Шведская НОХАБ (NOHAB (Nydqvist & Holm AB)), Французская Нэрпи (Neirpik), Британская Инглыш Илэктчрик (English Electric), Немецкая Фот (Voith) и другие. Например, Японской фирмой Тосиба проектировалась гидротурбина для ГЭС Гранд-Кули-III единичной мощностью 600 МВт на напор 87 м с диаметром рабочего колеса 9.7 м.

HYDROXYL END GROUP = ГИДРОКСИЛЬНАЯ КОНЦЕВАЯ ГРУППА (или ГИДРОКСИЛЬНАЯ ГОЛОВНАЯ ГРУППА) – Hydroxyl End Group is a polymer chain-terminating (–OH) group.

HYGROPHILIC MICROORGANISMS = ГИГРОФИЛЬНЫЕ МИКРООРГАНИЗМЫ (или ВЛАГОЛЮБИВЫЕ МИКРООРГАНИЗМЫ) – Hygrophilic Microorganisms:- (Greek:- hygros – moist, philos – love) microorganisms that require a relative humidity of > 90%.

HYGROSCOPIC = ГИГРОСКОПИЧНОЕ – Hygroscopic:- having a tendency to absorb water (usually meaning absorbing it from air). Some of the commonly used chemicals in dyeing are hygroscopic. If they are left exposed to moist air, they will absorb water from the air. This may lead to caking, and increases the ratio of weight to volume of the chemical. For many chemicals, there are no visual signs that water has been absorbed. For others (such as copper sulfate), the color will change. Some, such as sodium hydroxide are deliquescent – they will absorb so much water from air that a liquid solution will form. Hygroscopic chemicals should be stored in tightly sealed, moisture proof containers. See also Hydroscopic.

HYGROSCOPICITY = ГИГРОСКОПИЧНОСТЬ – Hygroscopicity:- (Greek:- hygros – moist) a property of products that react to the air humidity. Hygroscopicity is the ability to readily take up and retain moisture. / Под Гигроскопичностью, от Греческих слов Hygrós, означающее Влажный, и Skopéō, означающее Наблюдаю, понимается способность материалов или веществ поглощать влагу из окружающей среды (обычно пары воды из воздуха). Гигроскопичны различные осушающие вещества, например, прокалённый хлорид кальция. Под Гигроскопичностью, от Греческих слов Hygrós, означающее Влажный, и Skopéō, означающее Наблюдаю, понимается свойство материалов поглощать (сорбировать) влагу из воздуха. Гигроскопичностью обладают:- смачиваемые водой (гидрофильные) материалы капиллярно-пористой структуры (древесина, зерно и другие), в тонких капиллярах которых происходит конденсация влаги (смотрите Капиллярная Конденсация); хорошо растворимые в воде вещества (пищевая соль, сахар, концентрированная серная кислота и другие), особенно химические соединения, образующие с водой кристаллогидраты. Количество поглощённой пористым материалом влаги (гигроскопическая влажность, $W_{гиг.}$) возрастает с увеличением влагосодержания воздуха, достигая максимума при относительной влажности воздуха 100%. Для древесины максимальная $W_{гиг.}$ ~30% (по массе), для Пшеницы ~36%. Знание гигроскопичности материала важно для расчёта процессов сушки и увлажнения:- гигроскопичность учитывается при длительном хранении и перевозке материалов, особенно морем. Гигроскопичностью объясняется отсыревание и даже расплывание ряда солей при хранении на воздухе. Некоторые гигроскопические вещества (например, концентрированную серную кислоту) применяют для осушения воздуха.

HYPANTHIUM = ГИПАНТИЙ – Hypanthium is a cup-like, ring-like or tubular base of a flower carrying on its rim the calyx, sepals, petals, and stamens and often superior to the ovary. / Гипантий – основание цветка типа чашечки, кольца или трубчатое, несущее на своём ободке чашечку (calyx), чашелистики (sepals), лепестки (petals), и тычинки (stamens) и часто превосходящее до завязи. Под Гипантием, от Греческих слов Hypo, означающее Внизу или Снизу, и Anthos, означающее Цветок, понимается расширенное цветоложе, с которым обычно срастаются основания листочков околоцветника и тычинок. Встречается у цветков со средней завязью (например, у Шиповника, Земляники).

HYPANTHODIUM = ГИПАНТОДИЙ – Hypanthodium is an inflorescence composed of an aggregate of flowers on the inner fleshy wall of a concave capitulum, e.g., Ficus or the characteristic flat 'shield flowers' of Dorstenia. / Гипантодий – соцветие состоящее из совокупности цветков на внутренней мясистой (fleshy) стенке головки (capitulum) подбарабанья (concave), например, Фикуса (Ficus) или характерных плоских 'щитковых цветков' Дорстэнии (Dorstenia).

HYPERINFLATION = ГИПЕРИНФЛЯЦИЯ – Hyperinflation is the extremely rapid or out of control inflation. There is no precise numerical definition to hyperinflation. Hyperinflation is a situation where the price increases are so out of control that the concept of inflation is meaningless. When associated with depressions, hyperinflation often occurs when there is a large increase in the money supply not supported by gross domestic product (GDP) growth, resulting in an imbalance in the supply and demand for the money. Left unchecked this causes prices to increase, as the currency loses its value. When associated with wars, hyperinflation often occurs when there is a loss of confidence in a currency's ability to maintain its value in the aftermath. Because of this, sellers demand a risk premium to accept the currency, and they do this by raising their prices. One of the most famous examples of hyperinflation occurred in Germany between January 1922 and November 1923. By some estimates, the average price level increased by a factor of 20 billion, doubling every 28 hours. See also Deflation, Inflation, and Price Stability. Hyperinflation is an extremely rapid period of inflation, usually caused by a rapid increase in the money supply. Usually due to unrestrained printing of fiat currency. Unfortunately, there is no exact percentage where inflation turns from 'Ordinary Inflation' to 'Hyperinflation'. So you can't say for instance that 9.9% inflation is ordinary but 10% inflation is hyperinflation. Typically in hyperinflation it just gets progressively worse. Every month the inflation rate just gets higher and higher until the curve goes hyperbolic. Classic Hyperinflation:- Classic examples are the Hyperinflation of Weimar Germany and the more recent Zimbabwean Hyperinflation which reached 2.2 Million Percent. For instance in Germany prices doubled in only 5 years between 1914 and 1919, but then things got really bad .... So the doubling in 5 years was only the beginning and if it had ended there might not have even been considered hyperinflation. But as it went on, things got worse, dentists and doctors stopped asking for currency, seeking payment in butter or eggs instead. Prices rose not just by the day, but by the hour – or even the minute. If you had your morning coffee in a café, and you preferred drinking two cups rather than one, it was cheaper to order both cups at the same time. The flight from currency that had begun with the buying of diamonds, gold, country houses, and antiques now extended to minor and almost useless items – bric-a-brac, soap, hairpins. During times of Hyperinflation people know the money will be worth less tomorrow so they exchange any cash they have for any physical good they can get their hands on (whether they need it or not). After all, a bar of soap will still be a bar of soap tomorrow but it may take twice as many Dollars to buy it. This has the effect of further stoking the fires of inflation by increasing the Velocity of money. In Zimbabwe, by 2008 the (hyper)inflation rate had reached 2.2 million percent. Eggs sold for a million dollars each. And things were just physically extremely difficult because of the lack of a stable medium of exchange. Hyperinflation Leads to Lawlessness:- In most cases of hyperinflation the lack of a reliable system of exchange leads to a breakdown in society and a 'wild-west' sort of atmosphere. In Germany:- The law-abiding country crumbled into petty thievery. Copper pipes and brass armatures weren't safe. Gasoline was siphoned from cars. People bought things they didn't need and used them to barter – a pair of shoes for a shirt, some crockery for Coffee. Berlin had a 'witches' Sabbath' atmosphere. Prostitutes of both sexes roamed the streets. Cocaine was the fashionable drug. In Zimbabwe:- Inflation is making it impossible for families to afford basic commodities they need to live day by day. A Chivhu resident who asked to be identified only as Innocent, said inflation is obliging many Zimbabweans to make a living by means that are sometimes 'less than reputable'. Hyperinflation is not as uncommon as you think. Egypt 276 AD – 334 AD 1 million percent inflation in 58 years. A measure of wheat which sold for 200 Drachmae in 276 AD increased to more than 2 000 000 Drachmae in 334 AD. France 1789–1803:- Assignats were created as notes by the French Government based on the value of confiscated church property. But they were printed with no relation to the underlying value and eventually became totally worthless (no exchange value). United States 1779:- 47% inflation per month. United States 1861–65:- Total hyperinflation of 1 200 to 1. Confederate Civil War Inflation Rates. Austria 1914–23:- Inflation in one year (1922) reached 1 426% and overall the consumer price index rose by a factor of 11 836. Germany 1914–23:- Total hyperinflation 1 000 000 000 000 to 1. Hyperinflation in Weimar Germany. Hungary 1919–24:- Inflation reached 98% per month in 1922. Poland 1918–24:- Hyperinflation 800 000 to 1. Philippines 1942–44:- Conquering Japanese army issued fiat currency which rapidly became worthless. Greece 1942–53:- Total hyperinflation 50 000 000 000 000 to 1. Hungary 1945–46:- Total hyperinflation 400 000 000 000 000 000 000 000 000 000 to 1. Some historians believe this hyperinflation was actually an act of war as Russian Marxists tried to destroy the Hungarian middle and upper classes. China 1947–49:- Total hyperinflation 15 000 000 000 000 000 000 to 1. Brazil 1967–94:- Total hyperinflation of 2 750 000 000 000 000 000 to 1. Mexico 1982–93:- Total hyperinflation of 10 000%. Bolivia 1984–87:- New currency replaced the old currency at a rate of 1 Million to one. Iraq 1987–95:- Total hyperinflation of 10 000 to 1. Nicaragua 1988–91:- Total hyperinflation of 50 000 000 000 to 1. Argentina 1975–93:- By the end the hyperinflation currency exchanged at 100 Billion to one. Peru 1986–91:- Total hyperinflation of 1 000 000 000 to 1. Yugoslavia 1989–94:- By the end the hyperinflation currency exchanged at 10^{27} to one. Poland 1989–94:- By the end the hyperinflation currency exchanged at 10 000 to one. Zaire 1989–96:- By the end the hyperinflation currency exchanged at 300 000 000 000 to one. Angola 1991–99:- By the end the hyperinflation currency exchanged at 1 Billion to one. Bosnia and Herzegovina 1992–93:- Hyperinflation at the rate of 100 000 to 1. Belarus 1994–2002:- By the end the hyperinflation currency exchanged at 1 Million to one.

Zimbabwe 1998–2008:- The overall impact of hyperinflation was 1 = 10^{25}. The final result was a total elimination of the currency and only foreign currencies traded. North Korea:- December 2009 to mid-January 2011. Hyperinflation is extremely rapid or 'run-away' inflation. The precise boundary line between 'ordinary' inflation and hyperinflation is somewhat arbitrary, but contemporary economists generally reserve the term hyperinflation for situations in which the general price level is increasing at rates in excess of 50% per month. Hyperinflation isn't just an increase in the money supply; after all the central bank increases the money supply all the time, a phenomenon we know as simple inflation and which we come to expect as a constant. Hyperinflation, however, happens when uncertainty in the future worth of the currency causes people to start trading it for things of actual utility and more reliable stores of value as soon as they can. The velocity of paper money through the system increases as people seek to get rid of it. So hyperinflation isn't just the expansion of the monetary base, though the expansion is at the root. The expansion is fuel, but the conflagration doesn't start till the herd panics. Citizens generally know that the paper currencies they are forced by law to use aren't quite as good as gold. There is an oily, slippery quality to the paper. That its value will go down gradually over time is a given, but most folks deluded themselves into believing it's for the best and that the government has it all in hand. But eventually a nation has to face the inevitable outcome of government trying to manage an economy; centralized planning leads to misinvestments on a colossal – even global – scale. These are paid for by the stealthy tax of inflation … and eventually the whole thing collapses. Hyperinflation:- How does it happen? The government borrows money into existence (from the central bank) and then spends it into the economy. Governments and central banks technically are separate entities, but they collude with each other like this all the time. When citizens and foreigners won't lend (buy bonds) and raising taxes isn't enough, the central bank is always there willing to play ball. The central bank can increase the monetary base as much as it wants…because it's the entity that issues the currency. It then uses that currency to buy bonds from the government, which is just a convoluted way of saying it loans this money to the government so that the government can continue to spend money. Of course if anyone else tries this sort of legerdemain, it would be called Counterfeiting. When the government and central bank does it, it's considered economic stimulus. Then the government can spend this new money into the economy by its usual favorite venues: wars, welfare and – in times when stimulus is called for – an alphabet soup of make-work programs. Hyperinflation takes off when the entire population gets wise. The money supply might have been growing in fits and spurts for decades, but the hyperinflationary storm happens when that money really starts to move around as people try to get rid of it. The prices of useful goods get bid up to embarrassing levels. The process accelerates when governments try to stabilize markets … often by adding more paper … because honestly, what else can a government do? Mismanagement and fraud are the only things governments really get right consistently. So for the government a problem that's caused by the theft of inflation can only be solved by … more mismanagement and fraud. The entire process is self-reinforcing and results in the hyperinflationary death spiral to which all currency is heir. Hyperinflation:- A brief history:- before paper money, rulers would just debase the coins – that is remove the quantity of precious metals in each and increase the number in circulation. Each coin had less gold or silver in it, though the rulers who issued the currency would insist – on pain of death – that everyone pretends that the coins were worth just as much. This sort thing led to Sir Thomas Gresham's pithy maxim:- 'bad money drives good money out of circulation'. That is to say that people generally aren't fooled by a debased currency and will hold on to the unadulterated forms of money while they use the debased stuff for their transactions. They use the debased stuff for day-to-day transactions, but put the good stuff under their mattresses. Inflation and declining value have been features of fiat currencies since their inception in China about a millennium ago. Hyperinflation is a new mutated version of this ancient terror, born in the XX century. The most famous example worked its horrors during the Weimar Republic period in Germany. In 1921 a dollar was worth about 50 German Marks; by the end of 1923 the exchange rate was 4.2 trillion Marks for a Dollar. Onerous demands by the British for war reparations forced the German government essentially to pay with the futures of its citizens. Hyperinflation:- Why does this matter now? This matters now because the new administration is going to 'monetize the debt'. They are going to create new money in order to bail out various banks and businesses and even mortgage debtors. But again, governments may be able to create money, but they cannot create purchasing power. It's a swindle. The money they create dilutes the value of that already in existence. It is a way to siphon purchasing power from those trusting souls who have saved in the currency. It's an indirect and subtle tax. This is wrong in principle and disastrous in practice. This sort of thing can't happen when the money is just a stand-in for gold. Then the money supply is fairly fixed. But that sort of thing ties government's hands. When you want a strictly limited constitutional government, that's a good thing. Of course, if you want centralized planning, market interventions and wars, gold standards are horribly restricting. That's why governments get rid of them as quickly as they can. Then there is absolutely no need to be fiscally responsible. Then governments can use all the usual means to grow in scope and reach:- the wars, welfare and market intervention previously mentioned. Hyperinflation:- Myths? When speaking of the collapse of a currency, people often trot out the adage 'you can't eat gold'. By this they mean that in a true currency crisis and attendant collapse, only fuel and food and the arms to protect them will have any value. Gold, despite being branded a barbarous relic by Keynes, is actually a symbol of civilization and trade. Therefore it won't perform its monetary function when civilization and trade break down. In a true collapse, there may be no trade at all or what little trade there is could be limited to barter. As long as there is any exchange being done, people will find something to use as money; the guy with the cows and the milk you want is not always going to want the furs you have to trade. If trade goes on at all, even if barter is a large part of it, precious metals will have a place. They've been used as money for thousands of years because they perform the function of money so well. On the other hand, a common assumption is that gold is absolutely the best thing to hold during hyperinflation. Not necessarily true. It will do a lot better than the failing currency … but a hyperinflationary scenario means that just about everything is doing better than the failing currency … the currency is the one thing that no one wants to hold. Depending on where things are at the start, however, it may not do the best. Real estate is traditionally a good hedge against currency failure, but in recent history real estate prices were extremely overblown all over the western world by access to credit in the form of the leveraging instrument known as the 30-year mortgage (100-years in Japan during its bubble) and exotic permutations thereof. So gold in this particular situation has a bit of head start on real estate which itself has a further to fall. And speaking of real estate and other falling asset prices …. Hyperinflation:- What about deflation? Isn't that what we're experiencing now? Don't count on deflation in any real sense. Under a fiat currency, deflation can only ever be a short-term phenomena, and it generally only occurs when available credit contracts. Also keep in mind that credit is something that banks can over-issue far above actual reserves thanks to those pernicious fractional lending laws. Credit is like an appendix to the actual supply of money; some folks count it in the measure of the overall monetary base, while some don't. It's a fact that it can deflate and the effect on the economy is indeed very deflationary as prices bid up by credit collapse (housing is a very obvious example, but luxury items and even needed commodities are affected by availability of credit) and activity dependent on credit ceases, and the jobs attached to those activities disappear. Credit distorts prices. It's how the banks – under direction from the central bank – gets the disaster rolling. Fractional reserve lending laws allow banks to make loans far beyond what they actually have on reserve (a fraction of those reserves, hence the name). Assets get bid up with credit and bad business ideas get funded. People get all sorts of false signals because of the availability of credit and bad decisions get made. Debts grow on all sorts of unproductive purchases and ventures. This can't go on forever – borrowing from the future and on reserves that aren't really there. When it stops working, those debts have to be worked out somehow. The temptingly easy way to do this is to devalue the debts and make them easier to pay. A little inflationary easing thus seems like a really good idea. That's how governments make inflation palatable to their subjects. It makes the weight of bad financial decisions easier to bear. The government labels this sort

of thing as ‘economic stimulus’ or ‘quantitative easing’, though a more honest description would be ‘defrauding the minority of savers’ and ‘prolonging the inevitable painful outcome of propping up misinvestments’. A term Hyperinflation refers to very rapid, out-of-control inflation. There is no exact definition of what constitutes hyperinflation. In 1922 this occurred in Germany when the country printed banknotes so liberally that consumers had to take bags full of currency to make purchases. Inflation has been over 100% for many countries at various times in their history. Since inflation for stable economies is in the low single-digits, it is generally understood that inflation above 10% would constitute hyperinflation. A situation in which the rate of inflation is very high and/or rises constantly and eventually becomes out of control is called Hyperinflation. Socially, hyperinflation is a very destructive phenomenon which has far-reaching consequences for individuals and society as a whole. Although there is no generally accepted definition of hyperinflation, most economists would agree that a situation where the monthly inflation rate exceeds 50% can be described as hyperinflation. Hyperinflation and periods of very high inflation occurred several times during the XX century. Below are some examples of countries that experienced such high annual rates of inflation and the respective figures for the years indicated:- (i) 1922 – Germany 5 000%; (ii) 1985 – Bolivia more than 10 000%; (iii) 1989 – Argentina 3 100%; (iv) 1990 – Peru 7 500%; (v) 1993 – Brazil 2 100%; (vi) 1993 – Ukraine 5 000%; and (vii) 2020 – Zimbabwe above 500% annually. Let us briefly illustrate the consequences of such a phenomenon. An inflation rate of 50% per month implies an increase of more than 100-fold in the price level over a year and an increase of more than two million-fold over three years. There is no doubt that such rates of inflation place a heavy burden on society. In fact, in Germany, the hyperinflation that followed World War I and peaked in 1923 had devastating economic, social and – as is widely agreed – political consequences. As many people lost their savings, this led to a substantial loss in wealth for broad segments of the population. The realisation that price levels were constantly rising sparked a vicious circle. People naturally asked for higher wages, anticipating higher price levels in the future. These expectations became a reality, since higher wages translated into higher costs of production, which again meant higher prices. In the same vein, people started to pass on their money – which lost its value – by spending faster and faster. The Government reacted to the decline in the value of money by adding more and more zeros to the paper currency, but over time it became impossible to keep up with the exploding price level. Eventually these hyperinflation costs became intolerable. Over time money completely lost its role as a store of value, unit of account and medium of exchange. Barter became more common and unofficial monies, such as cigarettes, which did not lose their value due to inflation, started to replace official paper money. / Сэр Томэс Грэшэм (Sir Thomas Gresham). пузырь (bubble). Гиперинфляция – исключительно быстрый рост цен, ведущий к резкому обесценению денежной единицы, расстройству платёжного оборота и к экономическому кризису в стране. Принято считать, что гиперинфляция наступает при росте цен более чем на 50% в месяц. Однако отдельные специалисты оспаривают такой критерий, полагая, что гиперинфляция не может иметь какого-либо количественного измерителя. Разрушение денежно-кредитной системы, массовое ‘бегство’ от денег есть признак её наступления. Причины этого явления следующие:- обвальное падение производства; разрыв хозяйственных связей; потеря управляемости; чрезмерный дефицит государственного бюджета. Последствия гиперинфляции чрезвычайно губительны: обесценение результатов труда; рост безработицы; снижение инвестиционное активности и другое. Наиболее радикальный способ борьбы с гиперинфляцией – восстановление производства, рост его эффективности. Гиперинфляция – инфляция с высокими темпами. В разных источниках указываются разные критерии. Это может быть рост цен свыше 10 раз (+900%) в год; более 50% в месяц (то есть в 129.7 раз год); свыше 100% за 3 года (то есть свыше 2% в месяц в течение 3 лет). Гиперинфляцию выделяют в отдельный вид, поскольку она ведёт к развалу товарно-денежного обращения и финансовой системы страны из-за потери доверия к деньгам. Деньги утрачивают свою естественную роль в экономике как меры стоимости, средства обращения, средства накопления и средства платежа. Период гиперинфляции обозначает кризис в государстве. Гиперинфляцию могут сопровождать дифолт по долгам государства, массовые банкротства, максимальное увеличение бартера и отказ от использования денег, обнищание населения из-за невозможности делать накопления. В ходе гиперинфляции, как, например, во время Гражданской войны в России, или Германии начала 1920-х, денежное обращение часто уступает место натуральному обмену. Эквивалентами начинают выступать ликвидные товары, внутренняя стоимость которых не зависит от государственной политики:- свободно конвертируемая валюта, благородные металлы, некоторые товары (водка, сигареты, сахар). Следствием может стать Долларизация экономики, когда иностранная валюта (чаще всего в XX веке и до кризиса 2008 это был Доллар США) широко применяется для операций внутри страны или отдельных отраслей, вплоть до полного вытеснения национальной валюты. Одним из способов сохранения сбережений во времена гиперинфляции может стать покупка (как в Турции) стройматериалов для медленного возведения каких-либо построек. Такой ‘долгострой’ позволяет вкладывать денежные излишки в товар – кирпич, цемент и прочее без необходимости последующей их продажи – их всегда можно использовать для строительства по мере накопления. Но обычно люди вынуждены тратить свои деньги на закупку чего-либо, не обращая внимания на реальную необходимость, что ещё более увеличивает спрос и поднимает цену. Деградация денежной системы, обесценивание сбережений и долговых облигаций ведёт к экономическому спаду, в результате которого производство товаров резко падает, что приводит к новому росту цен из-за снижения предложения на рынке. Виновниками гиперинфляции считаются правительства, которые пытаются покрывать государственные расходы за счёт эмиссии (выпуска) новых необеспеченных денег, подрывая этим доверие населения к своей валюте. Банкноты утрачивают свою стоимость и население старается избавиться от них как можно быстрее. Поскольку соотношение объёма товаров с объёмом денег связано не напрямую, а через скорость оборота денежной массы в экономике (требуется меньший объём денежной массы при увеличении скорости её оборота), то при увеличении скорости оборота денег при неизменной товарной массе должны увеличиться цены – стоимость денег падает. На уровень инфляции существенное влияние оказывает и объём денежной массы, выведенной из обращения путём замораживания вкладов в банках. Для этого могут применять как административные механизмы (запреты), так и увеличение ставки рефинансирования. Однако на практике при гиперинфляции нет экономической привлекательности в долгосрочных вкладах. Несмотря на пагубность такой эмиссии, многие правительства (особенно во время войн) прибегали к ней в попытке предотвратить ещё более пагубные для них альтернативы – немедленный экономический коллапс, военное поражение. Зачастую доверие к национальной валюте возвращают в результате денежной реформы, в том числе с заменой названия валюты. Рекордным примером гиперинфляции может служить инфляция в Зимбабве 2000-х. После экспроприации земель белых фермеров в Октябре 2008 инфляция составляла 231 миллион процентов в год (по официальным данным). По неофициальным данным – инфляция составляла около $6.5 \cdot 10^{108}$ процентов. Цены удваивались всреднем примерно за каждые 1.5 часа.

HYPERPLASIA = ГИПЕРПЛАЗИЯ – Hyperplasia is an excessive multiplication of cells. / Под Гиперплазией, от Греческих слов Hypér, означающее Над или Сверх, и Plásis, означающее Образование или Создание, понимается увеличение числа структурных элементов тканей (клеток, волокон) вследствие избыточного их образования, например, при усилении функции органа, воспалении, предраке, при образовании галлов у Растений. Под Гиперплазией, от Греческих слов Hypér, означающее Над или Сверх, и Plásis, означающее Образование или Создание, понимается увеличение числа структурных элементов тканей и органов. У Человека и Животных в основе гиперплазии лежат усиленное размножение клеток и образование новых структур. Гиперплазия наблюдается при разнообразных патологических разрастаниях тканей (хроническое продуктивное воспаление, опухоль), при регенерации и гипертрофии. Часто гиперплазия носит компенсаторный характер. Гиперплазия у

Растений – местное разрастание тканей в результате митотического или амитотического деления клеток; возникает при поражении Вредителями, возбудителями болезней, при травмах, воздействии стимуляторов роста, ядохимикатов и других препаратов. Результат гиперплазии – образование галлов, каллюсов, капов и тому подобного.

HYPERSENSITIVITY = ГИПЕРЧУВСТВИТЕЛЬНОСТЬ (или КРАЙНЯЯ ЧУВСТВИТЕЛЬНОСТЬ) – Hypersensitivity is the extreme sensitivity.

HYPERTROPHY = ГИПЕРТРОФИЯ – Hypertrophy is an abnormal increase in size of cells. / Под Гипертрофией, от Греческих слов Hypér, означающее Над или Сверх, и Trophē, означающее Питание или Пища, понимается увеличение объёма органа или части тела. Различают гипертрофию физиологическую (например, гипертрофия мышц у атлетов, гипертрофия матки при беременности) и патологическую (например, гипертрофия миокарда при пороках сердца). Под Гипертрофией понимается увеличение объёма органа тела или отдельной его части. Гипертрофия у Человека (или Животного) может происходить либо в результате увеличения объёма отдельных составных элементов органа (клеток и тканей), либо вследствие увеличения их количества (гиперплазия). Различают истинную и ложную гипертрофии. К истинной гипертрофии относится увеличение объёма или массы специфических элементов в результате усиленной функциональной нагрузки (так называемая рабочая, или компенсаторная, гипертрофия) или при нарушении регулирующих влияний со стороны нервной и эндокринной систем. Рабочая гипертрофия может возникать в здоровом организме у лиц, занятых физическим трудом, спортсменов (‘физиологическая гипертрофия’ мышц), а также при поражении части какого-либо органа, например сердца при его пороке (компенсаторная гипертрофия) или при гибели парного органа, например, почки (викарная гипертрофия). Во всех случаях рабочей гипертрофии происходит компенсация нарушенных функций. Примерами гипертрофии, наступающей в результате нарушения нейро-эндокринных влияний, являются акромегалия, гинекомастия; в этих случаях гипертрофия не имеет компенсаторного значения, а сопровождается значительными расстройствами функций. Ложной гипертрофией называют увеличение органа в результате избыточного разрастания межуточной, чаще всего жировой, ткани при атрофии паренхимы (функциональной ткани); функция органа при этом обычно бывает снижена. Гипертрофия органов у Растений осуществляется на основе увеличения объёма их клеток. Она может быть результатом усиления синтеза веществ клеточных оболочек, цитоплазмы, отложения запасных соединений, возникновения многоядерности, полиплоидии и тому подобного. Причины гипертрофии – нарушение синтеза и обмена фенольных соединений, аминокислот, белков, углеводов и жиров, дефицит микроэлементов и тому подобное. Гипертрофию могут вызывать Вирусы, Бактерии, Грибы, Беспозвоночные и Растения-Паразиты; она может сопровождать многие мутации, прививки, воздействие на Растения ионизирующими излучениями, ультразвуком и другим. Гипертрофия обычно взаимосвязана с гиперплазией и нарушениями дифференциации тканей в органах. Во многих случаях, например, при возникновении опухолей и галлов, гипертрофия возникает вслед за клеточным делением; при механических повреждениях, физических и химических воздействиях она нередко первична. Гипертрофия наблюдается как у Высших, так и у Низших Растений.

HYPERVIRULENT = ГИПЕРВИРУЛЕНТНЫЙ – Hupervirulent:- more virulent than all previously identified races or strains. The hypervirulent races of the bacterial blight pathogen are able to overcome a combination of several resistance genes in the plant whereas all previously identified races are only able to overcome single resistance genes.

HYPHA = ГИФА – Hypha is one of the individual threads that make up the mycelium of a Fungus; hyphae increase by lateral branching. / Под Гифами, от Греческого слова Hyphē, означающее Паутина или Ткань, понимаются микроскопически тонкие, простые или ветвящиеся нити, из которых формируются вегетативное тело (грибница, или мицелий) и плодовые тела Грибов.

HYPO = ГИПО – Hypo is a British textile industry term for hypochlorite bleach (see Bleach,Chlorine). Don’t confuse this use of ‘hypo’ with the use in photographic processing where it means something very different – sodium hyposulfate (more commonly called Sodium Thiosulfate).

HYPO–ALLERGETIC = ГИПОАЛЛЕРГЕТИК – Hypo-Allergetic:- a fiber or material is deemed hypo-allergenic if it has undergone a process that makes it less apt to cause an allergic reaction.

HYPOCHLOROUS ACID = ГИПОХЛОРИСТАЯ КИСЛОТА (или ХЛОРНОВАТИСТАЯ КИСЛОТА) – Hypochlorous Acid, HClO, is produced by hydrolysis of sodium hypochlorite under pH neutral to slightly acid conditions. Hypochlorous acid, though effective at bleaching, is also believed to be very damaging to cellulose. For this reason, chlorine bleach baths are maintained at pH between about 9 and 11. / хлорный отбеливатель (chlorine bleach).

HYPOCOTYL = ГИПОКОТИЛЬ (или ПОДСЕМЯДОЛЬНОЕ КОЛЕНО) – Hypocotyl is the main axis of the seed embryo just below the cotyledons and continuing into the developing primary root of the seedling. Hypocotyl is the part of the stem of a seedling or embryo below the cotyledons. / Под Гипокотилем или Подсемядольным Коленом (Hypocotyle) понимается участок стебля у зародыша и у проростков растений от корневой шейки до места отхождения (прикрепления) семядолей. У одних проростков, например, Редиса, Тыквы, гипокотиль вытягивается и выносит на свет ассимилирующие семядоли (так называемый надземный тип прорастания), у других (например, Горох, Дуб) он остаётся под землёй, и семядоли не воносятся на поверхность почвы (подземный тип прорастания). На гипокотиле могут возникать придаточные корни и побеги. У некоторых растений гипокотиль становится вместилищем запасных веществ (например, корнеплод у Редиса); у Моркови, Редьки, Свёклы гипокотиль – составная часть корнеплода, находящаяся между головкой (стеблевой частью) и собственно корнем.

HYPODERMIS = ГИПОДЕРМА – Hypodermis is the tissue immediately beneath the epidermis of a plant especially when lignified, suberized, or otherwise modified to serve as a supporting and protecting layer. Hypodermis is a layer of cells below the epidermis. / Гиподерма – слой клеток, расположенный под эпидермисом. Под Гиподермой, от Греческих слов Hypó, означающее Внизу или Под, и Dérma, означающее Кожа, понимается:- (i) у Беспозвоночных Животных – тонкий слой эпителия, лежащий под кутикулой и вырабатывающий её; (ii) у Растений – один или несколько слоёв клеток, расположенных под эпидермисом (кожицей) стеблей, листьев, семян и плодов или под эпиблемой (волосконосным слоем) корней.

HYPOGEAL = ПОДЗЕМНОЕ – Hypogeal:- happening, living or remaining below ground. Of the emergence of cotyledons below the surface of the ground or within the seed coat. / Подземное:- появляющийся, живущий или остающийся ниже земли. Возникновение котиледонов (семядолей) ниже поверхности земли или внутри семенной оболочки. , от Греческих слов Hypó, означающее Внизу или Под, и .

HYPOGEOUS = ГИПОГЕННОЕ (или ЭНДОГЕННОЕ, или ГЛУБИННОЕ) – Hypogeous:- below ground. / :- ниже земли. Под Гипогенным или Эндогенным, от Греческих слов Hypó, означающее Внизу или Под, и , означающее , понимается расположенные в глуби или под поверхностью.

HYPOID AXLE = ГИПОИДНАЯ ОСЬ – Hypoid Axle:- Hypoid is an abbreviation for hypocycloidal and relates to the geometry of the crown wheel and pinion arrangement usually on rear wheel drive cars. The pinion is usually highly offset to reduce propshaft intrusion into the passenger compartment.

HYPOID GEAR = ГИПОИДНАЯ ПЕРЕДАЧА (или ГИПОИДНАЯ ЗУБЧАТАЯ ПЕРЕДАЧА, или КОНИЧЕСКАЯ ЗУБЧАТАЯ ПЕРЕДАЧА, или ГИПОИДНОЕ ЗУБЧАТОЕ КОЛЕСО) – Hypoid Gears are the gears in which the pinion axis intersects the plane of the ring gear at a point below the ring-gear axle and above the outer edge of the ring gear, or above the ring-gear axle and below the outer edge of the ring gear. See also Gear. / Смотрите также (Зубчатая) Передача (Gear). Гипоидная Передача (сокращённое от гиперболоидная), особый вид винтовой зубчатой передачи, осуществляемой коническими колёсами со скрещивающимися осями. В гипоидной передаче ось малого зубчатого колеса (шестерни) смещена относительно оси большого зубчатого колеса. При передаточном числе i = 1–2.5 смещение E ≤ (0.33–0.23) $D_к$, где $D_к$ – диаметр колеса, при i > 2.5 смещение E ≤ 0.20 $D_к$. Колёса гипоидной передачи могут иметь косые, или криволинейные, зубья; угол скрещивания осей обычно равен 90°. Передаточное число большинства гипоидных передач не превышает 10, однако в некоторых случаях достигает 30 и более. Нагрузочная способность гипоидной передачи по сравнению с другими передачами со скрещивающимися осями выше благодаря линейному контакту зубьев и увеличению числа пар зубьев, находящихся в зацеплении. В гипоидной передаче обеспечивается хорошее притирание сопряжённых поверхностей; этим объясняется плавная и бесшумная работа передачи. При тех же $D_к$ и i шестерня гипоидной передачи имеет больший размер, чем обычная коническая; это позволяет увеличить диаметр вала шестерни и таким образом сделать его более жёстким, применить подшипники большего размера, то есть повысить их долговечность. Недостатком гипоидной передачи является повышенная опасность заедания, обусловленная скольжением вдоль линий контакта зубьев. Это явление сопровождается снижением несущей способности масляного клина. Опасность заедания устраняется применением противозадирной смазки (гипоидного масла) и термической обработкой зубьев, обеспечивающей высокую твёрдость их поверхности. Гипоидные передачи применяют в приводах ведущих колёс автомобилей и тракторов, в тепловозах, в текстильных машинах для передачи вращения от одного вала многим десяткам веретён, в станках для обеспечения высокой точности при большом передаточном числе, в прецизионных станках вместо червячных передач.

HYPOID GEAR LUBRICANT = СМАЗКА ДЛЯ ГИПОИДНЫХ ПЕРЕДАЧ – Hypoid Gear Lubricant is a gear lubricant having extreme pressure characteristics for use with a hypoid type of gear as in the differential of an automobile. See also Gear, and Lubricant. / Смазка Для Гипоидных Передач – смазка для (зубчатых) передач, имеющая характеристики для сверхвысокого давления для использования с .

HYPOSTATIC = ГИПОСТАТИЧНОЕ (или ГИПОСТАТИЧЕСКОЕ) – Hypostatic:- in a gene, one that is suppressed by a nonallelic dominant gene.

HYPOTHECATION = ЗАКЛАДЫВАНИЕ – (1) Hypothecation is the established practice of a borrower pledging an asset as collateral for a loan, while retaining ownership of the assets and enjoying the benefits therefrom. With hypothecation, the lender has the right to seize the asset if the borrower cannot service the loan as stipulated by the terms in the loan agreement. Hypothecation also refers to securities in a margin account that an investor uses as collateral to borrow funds from a brokerage. Since the practice of hypothecation provides security to the lender because of the collateral pledged by the borrower, the lender generally offers the loan at a lower rate of interest than on an unsecured loan. Mortgages and margin loans are the most common examples of hypothecation. While it enables the borrower to obtain loans on more favorable terms than unsecured loans, the borrower risks losing the asset if prices plunge precipitously and the loan cannot be serviced. For example, a record number of the US homeowners lost their homes to foreclosure in the wake of the 2006–08 housing collapse and financial crisis, as home prices plunged and interest rates on mortgages rose. In the United States, Hypothecation is the pledging of securities as collateral, for example, to secure the debit balance in a margin account. Hypothecation is the practice where a borrower pledges collateral to secure a debt or a borrower, as a condition precedent to a loan, has a third party (usually an affiliate) pledge collateral for the borrower. The borrower retains ownership of the collateral, but it is ‘hypothetically’ controlled by the creditor in that he has the right to seize possession if the borrower defaults. A common example occurs when a consumer enters into a mortgage agreement, in which the consumer’s house becomes collateral until the mortgage loan is paid off. The detailed practice and rules regulating hypothecation vary depending on context and on the jurisdiction where it takes place. In the United States, the legal right for the creditor to take ownership of the collateral if the debtor defaults is classified as a lien. Rehypothecation is a practice that occurs principally in the financial markets, where a bank or other broker-dealer reuses the collateral pledged by its clients as collateral for its own borrowing. Hypothecation is a common feature of consumer contracts involving mortgages – the borrower legally owns the house, but until the mortgage is paid off, the creditor has the right to take possession in the hypothetical case that the borrower fails to keep up with repayments. If a consumer takes out an additional loan secured against the value of his mortgage (approximately the current value of the house minus outstanding repayments) the consumer is then hypothecating the mortgage itself – the creditor can still seize the house but in this case the creditor then becomes responsible for the outstanding mortgage debt. Sometimes consumer goods and business equipment can be bought on credit agreements involving hypothecation – the goods are legally owned by the borrower, but once again the creditor can seize them if required. Hypothecation in the investment markets:- when an investor asks a broker to purchase securities on margin, hypothecation can occur in two senses. The purchased assets can be hypothecated, so that if the investor fails to keep up credit repayments the broker can sell some of the securities. The broker can also sell the securities if they drop in value and the investor fails to respond to a margin call. The second sense is that the original deposit the investor puts down for the margin account can itself be in the form of securities rather than a cash deposit, and again the securities belong to the investor but can be sold by the creditor in the case of a default. In both cases, unlike with consumer or business finance, the borrower does not typically have possession of the securities as they will be in accounts controlled by the broker, however the borrower does still retain legal ownership. Rehypothecation:- re-hypothecation occurs when banks or broker-dealers re-use the collateral posted by clients such as hedge funds to back the broker’s own trades and borrowing. In the United Kingdom, there is no limit on the amount of a clients assets that can be rehypothecated, except if the client has negotiated an agreement with their broker that includes a limit or prohibition. In the United States, re-hypothecation is capped at 140% of a client’s debit balance. In 2007, rehypothecation accounted for half the activity in the shadow banking system. Because the collateral is not cash it does not show up on conventional balance sheet accounting. Before the Lehman collapse, the International Monetary Fund (IMF) calculated that US banks were receiving over USD4 trillion worth of funding by rehypothecation, much of it sourced from the UK where there are no statutory limits governing the reuse of a client’s collateral. It is estimated that only USD1 trillion of original collateral was being used, meaning that collateral was being rehypothecated several times over, with an estimated churn factor of 4. Following the Lehman collapse, large hedge funds in particular became more wary of allowing their collateral to be rehypothecated, and even in the UK they would insist on contracts that limit the amount of their assets that can be reposted, or even prohibit rehypothecation completely. In 2009 the IMF estimated that the funds available to US banks due to rehypothecation had declined by more than half to USD2.1 trillion – due to both less original collateral being available for rehypothecation in the first place and a lower churn factor. The

possible role of rehypothecation in the financial crisis of 2007–10 and in the shadow banking system was largely overlooked by the mainstream financial press, until Dr. Gillian Tett of the Financial Times drew attention in August 2010 to a paper from Manmohan Singh and James Aitken of the International Monetary Fund which examined the issue. Rehypothecation in repo agreements:- rehypothecation can be involved in repurchase agreements, commonly called Repos. In a two-party repurchase agreement, one party sells to the other a security at a price with a commitment to buy the security back at a later date for another price. Overnight repurchase agreements, the most commonly used form of this arrangement, comprise a sale which takes place the first day and a repurchase that reverses the transaction the next day. Term repurchase agreements, less commonly used, extend for a fixed period of time that may be as long as three months. Open-ended term repurchase agreements are also possible. A so-called Reverse Repo is not actually different than a repo; it merely describes the opposite side of the transaction. The seller of the security who later repurchases it is entering into a repurchase agreement; the purchaser who later resells the security enters into a reverse repurchase agreement. Notwithstanding its nominal form as a sale and subsequent repurchase of a security, the economic effect of a repurchase agreement is that of a secured loan. Hypothecation is the collateralizing arrangement in which neither the possession nor the title but only the right to sell an asset or property passes on to the creditor or lender (called a Grantee). Arrangement where the grantee has the possession and right to sell, but not the title, is called Pledging. See also Mortgage. Hypothecation is the act of pledging a mortgage or lien as collateral against a loan. It refers to the right a lender has to liquidate an asset if necessary to pay a debt. A borrower is said to hypothecate the mortgage. / Доктор Дьжилиэн Тэт (Dr. Gillian Tett) из Файнэншэл Таймз (Financial Times) Маньмогхэн Синь (Manmohan Singh) и Дьжеймз Эйткин (James Aitken). В Соединённых Штатах Америки закладывание ценных бумаг в качестве обеспечения, например, для гарантирования дебетового сальдо на маржинальном счёте. Под Ипотекой, от Греческого слова Hypothēkē, означающее Заклад или Залог, понимается залог недвидимого имущества, главным образом земли, с целью получения ссуды, так называемого Ипотечного Кредита. Ипотекой называют также Закладную (Mortgage) на заложенное имущество и долг по ипотечному кредиту. С точки зрения распределения дохода, созданного в сельском хозяйстве, ипотека означает продажу в ей земельной ренты или части её в виде процентов по ипотечному кредиту. В этом состоит экономическая сущность залога земли и вообще всякой недвижимости, приносящей ренту, например, залог жилых домов, сдаваемых их собственниками внаём. Ипотека широко распространена в экономике современного капитализма, особенно в сельском хозяйстве, что связано с высокоразвитым кредитным делом. В наибольшей степени ипотека развита в США, Канаде, Великобритании, Франции, Швеции. Благодаря ипотеке банковский, государственный и частный капитал устанавливает свой контроль над значительной частью земельного фонда. В то же время ипотека является одним из основных каналов поступления капиталовложений в сельскохозяйственное производство и другие отрасли экономики. Она позволяет предпринимателю увеличивать долю производительно используемого свободного капитала, землевладельцам – финансировать покупку дополнительных крупных участков земли при высоком уровне цен на неё. Значение ипотеки особенно возрастает в связи с техническим прогрессом в сельском хозяйстве, требующим увеличения капитальных затрат на возведение современных производственных построек и сооружений, покупку дорогостоящего оборудования и так далее. Кредит по ипотеке – самый долгосрочный. Ипотечные ссуды выдаются на 15–40 и более лет, что обусловливает сравнительно низкие годовые проценты (1–5%). Они имеют целевой характер (на покупку земли, оборудования, на строительство, мелиорацию и так далее) и предоставляются с рассрочкой платежей разной периодичности (ежегодной, квартальной, ежемесячной) при фиксированном проценте за непогашенную часть задолженности. В США в конце 1960-х задолженность по ипотеке составляла свыше половины, а в Великобритании до 1/4 общей стоимости построек, сооружений, машин и оборудования в сельскохозяйстенных предприятиях. Большая часть ипотечных ссуд достаётся крупным земельным собственникам, мелкие землевладельцы прибегают к ипотеке гораздо реже. Так, в США кредитом под залог земли в конце 1960-х пользовалось примерно 3/4 крупных фермеров-землевладельцев и только 1/4 мелких. Во многих Западно-Европейских странах государственные и частные ипотечные банки вообще не кредитуют мелких фермеров и крестьян (как и других владельцев недвижимости). Они устанавливают минимальный размер владения, необходимый для получения ипотечной ссуды. Поэтому мелкие крестьяне-землевладельцы могут прибегать лишь к частной ипотеке за высокие проценты, которая, как правило, не спасает мелкие хозяйства от разорения. В социалистических странах земля не являлась объектом купли, продажи и залога, поэтому ипотека в них не существовала. Термин Ипотека впервые появился в Греции в начале VI века до Нашей Эры. Он был связан с обеспечением ответственности должника перед кредитором определёнными земельными владениями (первоначально в Афинах залоговым обеспечением служила личность должника, которому в случае невыполнения обязательства грозило рабство). Для этого оформлялись обязательства, а на границе принадлежащей заёмщику земельной территории ставился столб с надписью о том, что указанная собственность служит обеспечением претензии кредитора в указанной сумме. На таком столбе, получившем название Ипотека (от Греческого слова Hypotheka, означающее Подпорка или Подставка), отмечались все долги собственника земли. Новое развитие институт ипотеки получил в Римской Империи. В I веке Нашей Эры. создавались ипотечные учреждения, которые выдавали кредиты под залог имущества частным лицам. В период правления Императора Антония Пия (II век Нашей Эры) было разработано особое законодательство для ипотечных банков, которые существовали наряду с другими специализированными банками, а также иными кредитными учреждениями – прообразами сберкасс и сберегательных ассоциаций. Государство часто оказывало большую поддержку ипотечному кредитованию. Так, при Императоре Траяне были созданы специальные фонды для поддержки вдов и сирот, которые предоставляли ипотечные кредиты под 5% годовых. Аналогичные финансовые системы были образованы в России в XIX веке, правда, поддержка в основном адресовалась представителям дворянского сословия. Ипотека – залог недвижимого имущества на основании договора между залогодателем и залогодержателем. Ипотека может быть установлена в обеспечение обязательства по кредитному договору, по договору займа или иного обязательства, в том числе обязательства, основанного на купле-продаже, аренде, подряде, другом договоре, причинении вреда, если иное не предусмотрено законом. Закладывание (Hypothecation) – банковские операции:- передача собственности в залог с целью обеспечения займа. Право владения собственностью при залоге не предоставляется, но даётся право на продажу заложенной собственности в случае невыплаты ссуды. Ценные бумаги:- передача в залог ценных бумаг в качестве обеспечения займов, предоставляемых с целью приобретения ценных бумаг или покрытия ‘коротких’ продаж, называемых займами с гарантийным взносом. Когда то же самое обеспечение вносится в залог банку брокером в качестве обеспечения по брокерскому займу, этот процесс называется Перезакладыванием (Rehypothecation).

(2) Hypothecation:- a firm of shippers may borrow money from a bank using cargo it is currently shipping as security. In this case, the bank takes out a lien on the cargo and this is conveyed in a letter of hypothecation. / Фирма грузоотправителей может занять деньги у банка, используя груз, который в текущий момент отгружается, в качестве гарантии исполнения обязательств перед банком. В этом случае банк оставляет за собой право на удержание груза и этот факт излагается в направляемом письме о закладывании (letter of hypothecation).

HYPOTHESIS = ГИПОТЕЗА – Hypothesis:- an assumption, supposition, or postulate drawn before all the facts have been discovered or investigated and adopted for the time being as a guide for further investigation. Something not yet proven or assumed to be true for

the sake of testing its soundness or in order to bring out new evidence. / Под Гипотезой, от Греческого слова Hypóthesis, означающее Основание или Предположение, понимается предположительное суждение о закономерной (причинной) связи явлений; форма развития науки.

HYSTERESIS = ГИСТЕРЕЗИС – Hysteresis:- (1) in tire cord, a measurement of work lost through heat during dynamic operation. (2) In tensile testing, loss of linear recovery following repeated loading and relaxation. / Под Гистерезисом, от Греческого слова Hysteresis, означающее Запаздывание или Отставание, понимается явление, которое состоит в том, что физическая величина, характеризующая состояние тела (например, намагниченность), неоднозначно зависит от физической величины, характеризующей внешние условия (например, магнитного поля). Гистерезис наблюдается в тех случаях, когда состояние тела в данный момент времени определяется внешними условиями не только в тот же, но и в предшествующие моменты времени. Неоднозначная зависимость величин наблюдается в любых процессах, так как для изменения состояния тела всегда требуется определённое время (время релаксации) и реакция тела отстаёт от вызывающих её причин. Такое отставание тем меньше, чем медленнее изменяются внешние условия Однако для некоторых процессов отставание при замедлении изменения внешних условий не уменьшается. В этих случаях неоднозначную зависимость величин называют гистерезисной, а само явление – гистерезисом. Гистерезис наблюдается в различных веществах и при разных физических процессах. Наибольший интерес представляют:- магнитный гистерезис, диэлектрический гистерезис и упругий гистерезис. Магнитный гистерезис наблюдается в магнитных материалах, например, в ферромагнетиках. Основной особенностью ферромагнетиков является наличие спонтанной (самопроизвольной) намагниченности. Обычно ферромагнетик намагничен не однородно, а разбит на домены – области однородной спонтанной намагниченности, у которых величина намагниченности (магнитного момента единицы объёма) одинакова, а направления различны. Под действием внешнего магнитного поля число и размеры доменов, намагниченных по полю, увеличиваются за счёт других доменов. Кроме того, магнитные моменты отдельных доменов могут поворачиваться по полю. В результате магнитный момент образца увеличивается. На Рисунке 1 изображена зависимость магнитного момента M ферромагнитного образца от напряжённости H внешнего магнитного поля (кривая намагничивания). В достаточно сильном магнитном поле образец намагничивается до насыщения (при дальнейшем увеличении поля значение M практически не изменяется, точка A). При этом образец состоит из одного домена с магнитным моментом насыщения M_s, направленным по полю. При уменьшении напряжённости внешнего магнитного поля H магнитный момент образца M будет уменьшаться по кривой I преимущественно за счёт возникновения и роста доменов с магнитным моментом, направленным против поля. Рост доменов обусловлен движением доменных стенок. Это движение затруднено из-за наличия в образце различных дефектов (примесей, неоднородностей и тому подобного), которые закрепляют доменные стенки в некоторых положениях; требуются достаточно сильные магнитные поля для того, чтобы их сдвинуть. Поэтому при уменьшении поля H до нуля у образца сохраняется так называемый остаточный магнитный момент M_r (точка B). Образец полностью размагничивается лишь в достаточно сильном поле противоположного направления, называемом Коэрцитивным Полем (коэрцитивной силой) H_c (точка C). При дальнейшем увеличении магнитного поля обратного направления образец вновь намагничивается вдоль поля до насыщения (точка D). Перемагничивание образца (из точки D в точку A) происходит по кривой II. Таким образом, при циклическом изменении поля кривая, характеризующая изменение магнитного момента образца, образует петлю магнитного гистерезиса. Если поле H циклически изменять в таких пределах, что намагниченность насыщения не достигается, то получается непредельная петля магнитного гистерезиса (кривая III). Уменьшая амплитуду изменения поля H до нуля, можно образец полностью размагнитить (прийти в точку O). Намагничивание образца из точки O происходит по кривой IV. При магнитном гистерезисе одному и тому же значению напряжённости внешнего магнитного поля H соответствуют разные значения магнитного момента M. Эта неоднозначность обусловлена влиянием состояний образца, предшествующих данному (то есть магнитной предысторией образца). Вид и размеры петли магнитного гистерезиса, величина H_c в различных ферромагнетиках могут меняться в широких пределах. Например, в чистом железе H_c = 1 э, в сплаве магнико H_c = 580 э. На петлю магнитного гистерезиса сильно влияет обработка материала, при которой изменяется число дефектов (Рисунок 2). Площадь петли магнитного гистерезиса равна энергии, теряемой в образце за один цикл изменения поля. Эта энергия идёт, в конечном счёте, на нагревание образца. Такие потери энергии называются гистерезисными. В тех случаях, когда потери на гистерезис нежелательны (например, в сердечниках трансформаторов, в статорах и роторах электрических машин), применяют магнитномягкие материалы, обладающие малым H_c и малой площадью петли гистерезиса Для изготовления постоянных магнитов, напротив, требуются магнитножёсткие материалы с большим H_c. С ростом частоты переменного магнитного поля (числа циклов перемагничивания в единицу времени) к гистерезисным потерям добавляются другие потери, связанные с вихревыми токами и магнитной вязкостью. Соответственно площадь петли гистерезиса при высоких частотах увеличивается. Такую петлю иногда называют Динамической Петлёй, в отличие от описанной выше статической петли. От магнитного момента зависят многие другие свойства ферромагнетика, например, электрическое сопротивление, механическая деформация. Изменение магнитного момента вызывает изменение и этих свойств. Соответственно наблюдается, например, гальваномагнитный гистерезис, магнитострикционный гистерезис. Диэлектрический гистерезис наблюдается обычно в сегнетоэлектриках, например, титанате бария. Зависимость поляризации P от напряжённости электрического поля E в сегнетоэлектриках (Рисунок 3) подобна зависимости M от H в ферромагнетиках и объясняется наличием спонтанной электрической поляризации, электрических доменов и трудностью перестройки доменной структуры. Гистерезисные потери составляют большую часть диэлектрических потерь в сегнетоэлектриках. Поскольку с поляризацией связаны другие характеристики сегнетоэлектриков, например, деформация, то с диэлектрическим гистерезисом связаны другие виды гистерезиса, например, пьезоэлектрический гистерезис (Рисунок 4), гистерезис электрооптического эффекта. В некоторых случаях наблюдаются двойные петли диэлектрического гистерезиса (Рисунок 5). Это объясняется тем, что под влиянием электрического поля в образце происходит фазовый переход с перестройкой кристаллической структуры. Такого рода диэлектрический гистерезис тесно связан с гистерезисом при фазовых переходах. Упругий гистерезис, то есть гистерезисная зависимость деформации и от механического напряжения s, наблюдается в любых реальных материалах при достаточно больших напряжениях (Рисунок 6). Упругий гистерезис возникает всякий раз, когда имеет место пластическая (неупругая) деформация (смотрите Пластичность). Пластическая деформация обусловлена перемещением дефектов, например, дислокаций, всегда присутствующих в реальных материалах. Примеси, включения и другие дефекты, а также сама кристаллическая решётка стремятся удержать дислокацию в определённых положениях в кристалле. Поэтому требуются напряжения достаточной величины, чтобы сдвинуть дислокацию. Механическая обработка и введение примесей приводят к закреплению дислокаций, в результате чего происходит упрочнение материала, пластическая деформация и упругий гистерезис наблюдаются при больших напряжениях. Энергия, теряемая в образце за один цикл, идёт в конечном счёте на нагревание образца. Потери на упругий гистерезис дают вклад во внутреннее трение. В случае упругих деформаций, помимо гистерезисных, есть и другие потери, например, обусловленные вязкостью. Величина этих потерь, в отличие от гистерезисных, зависит от частоты изменения s (или и). Иногда понятие ‘Упругий Гистерезис’ употребляется шире – говорят о динамической петле упругого гистерезиса, включающей все потери на данной частоте.

IATA = INTERNATIONAL AIR TRANSPORT ASSOCIATION

IATA TRAVEL PASS = ПРОПУСК ДЛЯ ПУТЕШЕСТВИЙ МАВТ – IATA Travel Pass (on 2021-February-16):- IATA (short for the International Air Transport Association) Travel Pass is a mobile application that helps travellers to store and manage their verified certifications for COVID-19 tests or COVID-19 vaccines. This will be important for governments that are likely to require either verified testing or vaccination proof as a condition of international travel during and after the COVID-19 pandemic. The IATA Travel Pass will be more secure and efficient than current paper processes used to manage health requirements (the International Certificate of Vaccination or Prophylaxis, for example). This will be important given the potentially enormous scale of testing or vaccine verifications that will need to be securely managed. How does IATA Travel Pass work? IATA Travel Pass will help people to travel with ease while meeting any government requirements for COVID-19 tests or vaccines. The IATA Travel Pass has four open and interoperable modules which together create the end-to-end solution. IATA Travel Pass incorporates:- (1) Global registry of health requirements – enables passengers to find accurate information on travel, testing and eventually vaccine requirements for their journey. (2) Global

registry of testing/vaccination centers – enables passengers to find testing centers and labs at their departure location which meet the standards for testing and vaccination requirements of their destination. (3) Lab App – enables authorized labs and test centers to securely share test and vaccination certificates with passengers. (4) Contactless Travel App – enables passengers to (1) create a 'digital passport', (2) receive test and vaccination certificates and verify that they are sufficient for their itinerary, and (3) share testing or vaccination certificates with airlines and authorities to facilitate travel. This app can also be used by travelers to manage travel documentation digitally and seamlessly throughout their journey, improving travel experience. Why did IATA decide to develop IATA Travel Pass? IATA Travel Pass modernizes an existing system. For decades we have had a paper documentation system for providing proof of vaccination. The most well-known is the requirement of many governments for a yellowfever vaccination depending on your travel history and travel destination. Under the International Health Regulations, this is managed by the 'yellow book' or International Certificate of Vaccination and Prophylaxis. The IATA Travel Pass moves this to a digital platform and joins it with up-to-date information on entry requirements. This makes the process more convenient for travelers and helps avoid fraudulent documentation. This modernization will be crucial as government entry requirements are expected to evolve with the epidemiological situation. An electronic process will be better able to manage the volumes of data that are likely to be needed and it will help passengers to adapt to any changes more easily in government requirements. Importantly, there will be paper-based alternatives for people who do not have mobile phones, albeit less convenient ones. IATA is already managing health requirements through its Timatic solution, so IATA Travel Pass is a natural evolution to support the industry during the pandemic. How will IATA Travel Pass help the reopening of international travel? IATA Travel Pass will help provide governments with the confidence to reopen borders without quarantine. To reopen borders without quarantine, governments need to be confident that they are mitigating the risk of importing COVID-19. Testing or proof of vaccine is the solution. IATA Travel Pass will manage and verify the secure flow of necessary testing or vaccine information among governments, airlines, laboratories, and travellers giving governments confidence in a passenger COVID-19 status. It appears that each traveler must have a smartphone, so how do you handle families who may not have a smartphone each, or people who just do not have a smartphone? There will be paper-based alternatives for people who do not have mobile phones. And for families, we have formed an industry working group to explore how we can make the process as seamless and efficient as possible. Is IATA mandating that passengers have a COVID-19 vaccine to travel? No. Governments decide the requirements to travel; airlines and passengers need to comply. In normal times there are visa and vaccination requirements in many countries. Due to the COVID-19 pandemic governments have imposed additional restrictions: quarantine measures, testing requirements and eventually vaccination requirements. IATA Travel Pass is a tool for use by governments, travelers, airlines, and test centers/vaccination providers to get verified information to those who need it in a safe and secure manner. Questions On Timelines And Trials:- When will IATA launch IATA Travel Pass? The first-cross border pilots started end of 2020 and the iOS and Android launch is slated for the end of March 2021. To be ready for when governments re-open borders, we are working as fast as we can with our member airlines to bring this to market. To deliver immediate assistance to the industry, the Timatic enhancements for the global registry of health requirements were completed at the end of January 2021. How many airlines are expected to take part? We expect the IATA Travel Pass to be popular with airlines because it is being built with deep knowledge of their operational requirements and the needs of their customers in mind. There are other solution providers in the market. The IATA Travel pass is being built with four modules (entry requirement registry, test center registry, certification holder, and digital identity). They can be used together as a whole solution or in combination with other solutions. We want it to be as flexible as possible. Who is IATA planning to run trials with? Since kicking off the development of IATA Travel Pass in December, we are fast approaching the roll out of the first full pilot with Singapore Airlines at the end of March. This will be followed by a pilot with IAG and trials with Qatar Airways, Emirates, Etihad Airways, and Copa Airlines along with another 15 airlines. We have also received public endorsement for IATA Travel Pass from the government of Panama and discussions are ongoing with other governments. Questions On Privacy:- How will IATA ensure the integrity of personal data? Travelers always remain in control of their data with their privacy protected. The IATA Travel Pass does not store any data centrally. It simply links entities that need verification (airlines and governments) with the test or vaccination data when travelers permit. This last point is key. No verification will go to an airline or a government without the authorization of the traveler. How will the various stakeholders needing access to the testing vaccine data be able to access it, i.e. airlines, immigration, airports, etc? Verified certificates for COVID-19 tests or vaccinations will be stored on the traveller's phone. When needed, the traveller will be prompted to release their certificates to authorities and other stakeholders. If the passenger chooses to do so the data is sent by them from their phones directly to the other entity. Travelers always remain in control of their data with their privacy protected. Questions On Other Providers:- How does IATA Travel Pass differ from other solutions? There are several solutions that are at various stages of readiness. We cannot speak for them. But we are building IATA Travel Pass in modules using open standards so that it can work with other solutions that are being developed. We are building the IATA Travel Pass this way because we believe that a competitive market is important. IATA also brings unique experience to this endeavor in four key areas:- (i) Managing Entry Requirements:- IATA has long been the trusted source for entry requirements. The Travel Pass will use the expertise of Timatic, which helped airlines to ensure that the travel documentation of 700 million travelers met government entry requirements in 2019. (ii) Digital Identity:- IATA has been working on digital identification technologies for some time. The Contactless Travel App already exists for this purpose. With a few modifications it is well-suited to help travelers manage digital test or vaccination certificates. (iii) Accreditation:- IATA has accredited travel and cargo agents worldwide for decades as part of its trusted global financial settlement capabilities. This experience will prove valuable in accrediting labs and test centers. (iv) Standard Setting:- Standards are developed and adopted under the IATA Conference structure. Through its advocacy and standard activities, IATA has earned trust as a partner for governments, industry, and international institutions, which lends credibility to the IATA Travel Pass endeavor and any other competing apps that use the same trusted IATA standards. Is IATA Travel Pass in direct competition with other solutions? We believe that there should be competitive market for solutions to manage health credentials. We are building a product that can stand on its own. But it is being built in modules, so that other solutions can use parts of the IATA Travel Pass in their offering. Our aim is for airlines and their passengers to have choice. Questions On Costs:- Do passengers need to pay for IATA Travel Pass? No, IATA Travel Pass will be free for passengers to download and use. How much will airlines have to pay to use IATA Travel Pass? We aim to make this solution as low cost for airlines as possible while ensuring that the solution is robust. Final pricing has yet to be determined. How much has IATA Travel Pass cost to develop? This is still a work in progress. There are some cost-efficiencies as the IATA Travel Pass relies on some existing IATA solutions like the IATA Contactless Travel App and Timatic. We do not, however, intend to disclose the development cost. Does IATA Support initiatives such as the Good Health Pass Initiative? We welcome the effort of technology providers to develop open standards like Verifiable Credentials and Decentralized Identifiers that offer an opportunity to meet the many challenges of today's digital world. However, we believe the optimal approach is to work with the institutions who develop these standards directly such as ICAO, which is responsible for developing global standards for aviation and WHO which is responsible for health accreditation standards, such as vaccine certificates. Questions On Lab Verification:- How will IATA approve the labs which will provide the testing? Governments will need to decide the criteria for labs and test centers. IATA will not approve labs. Our job is to accurately register them. IATA will leverage the expertise we have in travel agency and cargo provider approval. There is a vast number of labs across the globe. We are working with partners who can help us with their expertise and reach to help us ensure that, through the IATA Travel Pass, travelers will have the most accurate and up-to-date information on accredited

labs as possible. How many labs may have to be verified? This is likely to be a considerable number. We are working with airlines and partners who can help us with their expertise and reach to help us ensure that, through the IATA Travel Pass, travelers will have the most accurate and up-to-date information on accredited labs as possible. How do we verify that a test result or vaccination is not fraudulent? IATA does not verify the test or vaccine results. We provide the means for registered labs to send test results and vaccine details with travelers in a secured manner whereby the details can be verified to guarantee authenticity of origin and integrity of the content. The IATA Travel Pass ensures that this transaction is secure and matches the identity of the traveler with the identity of the person taking the test/vaccination. COVID-19 test results and vaccination details are sent from the registered laboratory to the passenger's phone as a verifiable credential. As such it is not possible for the passenger to tamper with this data. There are also checks put in place to ensure the passengers identity to avoid transferring test results to a new person. By when are we expecting the Lab Registry to be available? Discussions are progressing to identify key partners and to on-board them. The plan is to gradually build up the lab network by first addressing the requirements for the pilots and before building a wider base. How will customers be able to find out which Labs are relevant for them? A search feature will be made available on the Contactless Travel App. In addition, airlines and other customers may have this search feature on their digital channels as well. We are investigating if this capability can be included in the IATA Travel Centre Questions On Digital Identity:- How does the IATA Contactless Travel App module work? The IATA Contactless Travel App is a module of the IATA Travel Pass. It enables passengers to (1) create a 'digital passport', (2) receive test and vaccination certificates and verify that they are sufficient for their itinerary, and (3) share testing or vaccination certificates with airlines and authorities to facilitate travel. This app can also be used by travelers to manage travel documentation digitally and seamlessly throughout their journey, improving travel experience. How do passengers create a 'digital version of their passport' using the Contactless Travel App? To create a digital identity a passenger will need to follow the steps below:- (1) Download the free IATA Travel Pass to their Smart phone. (2) Log in. (3) Take a selfie with their Smart phone. (4) Complete a liveness test as instructed by the phone, i.e. move their head, close their eyes in front of the camera as instructed. (5) Take a scan of the data on the two lines at the bottom of the passport photo page with their Smart phones. (6) Scan the data-chip on the passport as prompted by the phone. (7) The IATA Travel Pass then verifies that:- (i) the passport belongs to the person in front of the phone, and (ii) that the passport is genuine and has not been tampered with. (8) The verified digital credential is then stored on the passenger's phone and can be used as their 'digital passport'. How are my passport details used? The IATA Contactless Travel App will enable passengers to create a digital version of their passport on the phone. The passenger can then choose to securely send their passport details to airlines, airports and border control. This will ensure that document and identity verification can be performed off airport, and facial recognition can be used to swiftly process them at key touch points at the airport without the need to physically exchange passports and boarding passes. Is contactless travel possible with the Contactless Travel App? Yes, the Contactless Travel App will allow passengers to:- (1) Create a digital identity by scanning their passports with their smart phones. The scan is then stored on their phone and can be used as their 'digital passport'. (2) Choose to share their digital identity including their digital photo directly with airline, airport, and border control partners. (3) Experience contactless travel at the airport by using facial recognition to link them to their digital passport. Their face becomes their passport and boarding passport. Can IATA Contactless Travel App element be used for contactless travel only? Yes, each module of the IATA Travel Pass can be used individually or as a full end-to-end solution. Questions On Vaccinations:- Will those not vaccinated (for whatever reason) be banned from traveling? Governments, not airlines and not IATA, make the rules on entry requirements for travelers. Airlines and passengers need to comply. Governments will also decide if vaccinations will be mandatory or voluntary for their populations. If governments make vaccinations a requirement for travel, airlines will comply, and the IATA Travel Pass will help them. Is IATA mandating that passengers have a COVID-19 vaccine to travel? No, governments decide the requirements to travel; airlines and passengers need to comply. In some cases, individual airlines, in coordination with their regulators may also develop company policies in this respect. Why is IATA planning to force additional restrictions on passengers when at the same time you declare on your homepage that there is an extremely low risk of viral transmission inflight? The risk of transmission on-board is low. Government requirements for vaccinations or tests are expected to be implemented as a border control measure (international and in some cases also across domestic borders). This is to control the spread or importation of COVID-19 by the movement of travelers. For this, governments may require verified evidence that the person has been tested or vaccinated. IATA Travel Pass enables that verification. There are many other types of communicable diseases, such as measles, mumps, Ebola, HIV etc. How many of the above will be included? Timatic is updated with health requirements for many diseases including some of the above when there is a regulatory requirement. When the Ebola crisis surfaced Timatic played a critical role in some parts of the world. The current scope of IATA Travel Pass is limited to COVID-19 as this is only disease which governments limit access to their country apart from Yellow Fever. It could be expanded if the situation requires it. Fraud:- Are fake COVID-19 tests of concern to IATA? Fake COVID-19 test/vaccine results are of concern and an area that we are keeping an eye on. In addition to Afghanistan we are aware of counterfeit test results having cropped up in other countries around the world including Brazil, Bangladesh and France. Paper test results come not only in different formats and languages, but they can also be easily manipulated. Check-in agents need to follow extensive entry requirement guidance and try to determine the authenticity of multiple non-standard test documents passengers present to them. This leads to health check inefficiencies, errors and fraud – an increasing problem around the world. The existing system of paper test and vaccine certificates needs to be modernized through digitalization. IATA is developing a solution called IATA Travel Pass, a mobile app to help passengers easily and securely manage their travel in line with government requirements for COVID-19 tests or vaccines. The IATA Travel Pass moves existing paper processes to a digital platform. / Международной Ассоциации Воздушного Транспорта.

ICE CLAUSE = ЛЕДОВАЯ ОГОВОРКА – An Ice Clause is a standard clause in the chartering of ocean vessels. It dictates the course a vessel master may take if the ship is prevented from entering the loading or discharge port because of ice, or if the vessel is threatened by ice while in the port. The clause establishes rights and obligations of both vessel owner and charterer if these events occur. / Ледовая Оговорка – стандартная оговорка при . от захода в порт погрузки или разгрузки . хозяин (или капитан) судна .

ICE CLEAR US, INC. = АЙ.СИ.И. КЛЫЭ Ю.ЭС., ИНК. – ICE Clear US, Inc. is the designated clearing house for ICE Futures US, Inc. ICE Clear US℠, Inc. was originally organized in 1915 as the New York Cotton Exchange Clearing Association and later became the Commodity Clearing Corporation. Although an ICE Futures US® subsidiary, ICE Clear US℠ has its own membership, Board of Directors, elected officers and operating staff. ICE Clear US℠ provides clearing services and financial stability for its clearing members. ICE Clear US℠ performs two major functions:- (i) reconciliation and clearing of all futures and options transactions made on ICE Futures US®; and (ii) assuring the financial integrity of such transactions. Through its system of financial safeguards and transaction guarantees, ICE Clear US℠ protects the interests of the trading public, members of ICE Futures US® and its clearing members. ICE Clear US, Inc. is the derivatives clearing organization for ICE Futures US, a commodity exchange regulated by the Commodity Futures Trading Commission (CFTC). Although ICE Clear US℠ is a wholly-owned subsidiary of ICE Futures US, it maintains its own membership, Board of Directors, officers and operating staff. ICE Clear US℠ provides an integral service that

enhances the stability and integrity of ICE Futures US® through a comprehensive set of procedures that includes enforcement of stringent membership standards; management of risk through real-time oversight of clearing member positions; twice daily margin settlements with its clearing members; limits on the size of positions that may be carried in relation to a clearing member's capital; and substantial default resources, including a Guaranty Fund. ICE Clear US℠ provides the financial backing for all ICE Futures US® market participants and ICE Clear US℠ clearing members. The ICE Clearing Systems encompass a number of integrated systems, most importantly the Post-Trade Management System, or PTMS, Allocation and Claim Transaction System, or ACT, and the Extensible Clearing System, or ECS. PTMS provides real-time trade processing services enabling clearing members to offer real-time risk management services. ACT provides for straight through processing of trade executions given up to other clearing members. ECS supports open and delivery position management, real-time trade and post-trade accounting, risk management (daily and intra-day cash, marked-to-market/option premium and original margin using the CME SPAN® algorithm), collateral management, daily settlement and banking. Each of the parts of ICE Clear US℠ risk management process is explained more fully below. The Role Of The Clearing House:- Through its system of financial safeguards, ICE Clear US, Inc. (Clearing House) performs two major functions:- (1) reconciling and clearing all futures and options transactions executed on ICE Futures US®; and (2) assuring the financial integrity of each transaction and resulting position. When a trade has been matched and cleared, ICE Clear US℠ is substituted as the central counterparty to the trade, thereby guaranteeing financial performance of the contract to the clearing member on the opposite side. In its role as counterparty for all cleared contracts, ICE Clear US℠ deals exclusively with Clearing Members. Each Clearing Member is financially responsible for the contracts it has submitted to ICE Clear US℠, and the Clearinghouse is responsible to each Clearing Member for the net settlement from all contracts it clears. In support of its role as the central counterparty for all cleared contracts, ICE Clear US℠ has instituted a series of financial safeguards and procedures designed to manage the risks it assumes and protect the integrity of the Clearinghouse, as described below. Clearing Membership Financial Requirements:- Only firms that have adequate capital are eligible to become members of ICE Clear US℠. Once admitted, Clearing Members must adhere to stringent financial and operational requirements. Clearing Members must have at least USD5 000 000 in adjusted net capital, and any Clearing Member regulated by the CFTC must also satisfy applicable CFTC capital requirements and segregate and account for all customer funds and property separate and apart from the Clearing Member's own property. All clearing members must also be member firms of ICE Futures US® (See section entitled Applying for ICE Clear US Membership for a guide to becoming a member firm of ICE Futures US®). Additionally, Clearing Members must institute risk management controls and demonstrate the operational capability to handle customer business. All clearing members must establish banking arrangements with approved banks to facilitate payments to and from ICE Clear US℠. Customer Protection:- The contracts cleared by ICE Clear US℠ are maintained in its records within two accounts or 'origins'. These accounts isolate the clearing activity related to a Clearing Member's proprietary business in the 'house' origin account and the clearing activity of clients into the 'customer segregated' origin account for each Clearing Member. The ICE Clear US℠ rules and Clearing Member Agreement clearly define the exclusive relationship between ICE Clear US℠ and its members. Controlling Risk Through The Collection Of Margin:- Unique to the clearing of commodity futures contracts, two margin methods are used by ICE Clear US℠ to secure performance by its clearing members. One method is the collection of variation margin based on the twice-daily mark-to-market of open contracts. Following this procedure, ICE Clear US typically collects from member firms the vast majority of its financial exposure from open positions before the end of the trading day. The second margin method is the collection of original margin, which is a good-faith deposit designed to serve as security for the payment of the Clearing Member's variation margin obligations to the Clearing House. These two kinds of margin are described below. Variation Margin:- variation margin covers the previous day's open positions and the new positions resulting from the current day's trading activity of the clearing member. Variation margin for futures contracts can be paid to, and must be collected from, clearing members twice each day. The intra-day variation calculation uses a prevailing market price whereas the end of day calculation uses the daily settlement price for each futures contract. In addition to the scheduled intra-day variation calculation, the Clearinghouse may initiate additional intra-day variation calls, for example, in times of great volatility. These intra-day variation payments constitute advance payments against the end-of- day variation calculation. Calls for intra-day variation payments by clearing members are required to be satisfied within 60 minutes of request by ICE Clear US℠. Clearing members must pay the variation margin calculated at the end of each day by the morning of the following business day. The end-of-day variation margin includes any remaining variation margin not paid or received from the prior day's intra-day variation margin calls resulting from price changes, new trading activity and option premiums. Original Margin:- original margin is sometimes referred to as a Performance Bond and is calculated using the historical price volatility of the contract being margined. It is collected to ensure Clearing Members can meet their variation margin obligations for the next day, should the market move significantly against the positions they are carrying. ICE Clear US℠ calculates original margin requirements using a system that determines the largest theoretical loss a Clearing Member could incur in one day based on historical market prices and volatility. The Risk Department at ICE Clear US℠ uses a variety of analytical tools and procedures to establish and validate the margin requirement. The Risk Department's targeted minimum confidence interval covers the greater of 97th percentile or 99th confidence interval of one day price moves during the preceding 10, 30, and 60 days. The Clearinghouse adjusts the margin requirement for each commodity up or down as market volatility changes. If a clearing member's original margin requirement increases and ICE Clear US℠ is not holding sufficient excess cash or collateral from the firm to cover the increase, ICE Clear US℠ will call that Clearing Member for additional original margin to meet the deficiency. This calculation is made daily on the basis of each firm's end-of-day positions. The clearing house is required to collect gross margins for customer segregated positions from its clearing members. As such, clearing members are required to submit customer positions by account to the clearing house on a daily basis. The positions reported by the clearing member are reconciled against the customer segregated positions in clearing. Those positions that cannot be reconciled comprise a balancing account which is margined on an outright basis. Monitoring Risk Intra-Day:- throughout the trading day, ICE Clear US℠ monitors the position and market exposure of each clearing member to ensure that there are enough funds on deposit as original margin to cover their risk. This is done by calculating real time profit and loss using up-to-date position and pricing information and by calculating potential losses using pricing information based on simulated adverse market conditions. ICE Clear US℠ risk management staff is automatically notified when clearing members have breached pre-defined thresholds allowing them to take immediate action to resolve any risk issues. Position Limits:- ICE Clear US℠ establishes for each clearing member a limit that restricts the size of the total positions it may carry with the Clearinghouse. These limits are based on the adjusted net capital of the firm. If a Clearing Member exceeds its position limits, a margin surcharge is added to its original margin requirement. ICE Clear US℠ may also reduce the position limits of a clearing member when circumstances warrant. (See section 5.6, Position Risk, of ICE Clear US Bylaws: https://www.theice.com/publicdocs/rulebooks/clear/ICE_Clear_Bylaws.pdf). The Guaranty Fund:- Covering Unmargined Risk:- the margin procedures and establishment of position limits by the Clearinghouse have proven, over time, to be a sound risk management technique. It is possible, however, that extreme market conditions or special circumstances relating to a particular clearing member may result in a default by a clearing member. ICE Clear US℠ further protects itself from such an event by maintaining a Guaranty Fund into which each clearing member must make a specified contribution based on the percentage of the overall margins held by the Clearing House and of the trading volume cleared by the Clearing House it represents. The minimum contribution by each clearing member to the Guaranty Fund currently is USD2 000 000. The Guaranty Fund provides ICE Clear US℠ with additional resources to

cover a default where the losses of a clearing member are greater than the amount of the original margin held by the Clearinghouse from that firm. In such a case, ICE Clear US[SM] can apply the clearing member's Guaranty Fund contribution and, if any deficiency still remains, may apply all or any part of the Guaranty Fund contributions of all other clearing members, in addition to utilizing other sources of funds described below. The size of the guaranty fund is designed to cover the greatest potential loss at any one clearing member given the largest historical price move in any one commodity. (See Section 5.4 Guaranty Fund of ICE Clear US[SM] Bylaws:- https://www.theice.com/publicdocs/rulebooks/clear/ICE_Clear_Bylaws.pdf). It is important to note that while ICE Clear US[SM] has established the Guaranty Fund as a resource, the need to draw upon it has never arisen. Financial Stress:- the US Bankruptcy Code contains provisions that allow the Clearinghouse to take actions to minimize its exposure to loss from an insolvent clearing member. In addition, CFTC Regulations establish a regime governing the distribution of the assets of a bankrupt commodity broker. In the event of a clearing member's financial default, ICE Clear US[M] will suspend the clearing member and attempt to transfer all open positions of its non-defaulting customers to one or more other clearing members who are in good standing. Any positions not transferred can be liquidated by the Clearinghouse in the market or by book entry in certain cases. The Bylaws authorize ICE Clear US to use the following additional sources of funds in the event that the original margin deposits held by the Clearinghouse from a defaulting firm, along with that firm's Guaranty Fund deposit, is not sufficient to cover its obligation to ICE Clear US[SM]:- (i) the portion of the surplus capital of ICE Clear US that the Clearinghouse's Board of Directors determines is available to cover the default; (ii) a loan, which may be secured by the Guaranty Fund; (iii) the Guaranty Fund (for the most recent information regarding the size of Guaranty Fund, please see IntercontinentalExchange, Inc.'s most recent 10-K or 10-Q SEC filing:- http://ir.theice.com/sec.cfm?DocType=Annual&Year=&FormatFilter=; (iv) insurance proceeds, if any, received by the Corporation in connection with the default; and (v) assessments levied by the Clearinghouse upon all of the non-defaulting clearing members. In addition, IntercontinentalExchange, Inc. has reserved USD50 000 000 of a committed line of credit for the use of ICE Clear US[SM] should it be needed to provide short-term liquidity in the event of a clearing member default. Clearing Notices:- one of the primary ways ICE Clear US[SM] communicates with its clearing member community is by way of Clearing Notices. The Clearing Notices regularly report margin changes, changes of rules and by-laws, system notices and calendars. One of the Clearing Notices published each month is a calendar of events that includes holidays, new contracts and relevant delivery and expiration dates for that month. The calendar is published at the end of each month for the next month's events. Every clearing member should subscribe to the Clearing Notices distribution. Any number of your company's staff members may subscribe to Clearing Notices by visiting:- https://www.theice.com/Subscription.shtml, submitting an e-mail address, and choosing the ICE Clear US[SM] Feed. Within the ICE Clear US[SM] Feed, you may subscribe to Expiration Notices, General Information, and Margin notices; you may assign different e-mail addresses to receive these notices, but someone at your firm should be receiving each kind of notice. The ICE Clear US monthly calendar is included in the General Information notices. In addition to the items in the ICE Clear US[SM] Feed, for clearing and delivery considerations you should consider subscribing to these items:- (i) from the ICE System Alert Feed, to the ICE Clear US[SM] Alerts, which are time sensitive alerts sent by e-mail; (ii) from the Market Notices Feed, to the notices labeled 'ICE Futures US[®]' – in particular to the ICE Futures US[®] Exchange Notices; and (iii) from the General Information Feed, the ICE News Releases. ICE[®] Community:- all clearing members are encouraged to sign up for access to ICE Community, an online network for clearing member firms that serves as a resource for information on technical system specifications, commonly used forms required by ICE Clear US[SM], clearing member contact lists and recaps of the clearing member working group meetings. Users are also able to post documents and start discussions about ongoing ICE[®] projects or generic industry topics with others in the community. When ICE Clear US[SM] is planning a major system initiative, a separate space is be dedicated in ICE Community for system specifications, FAQs and manuals. Some documents are only available online at ICE[®] Community. To ensure that information is shared only with the community of ICE Clear US[SM] members and service vendors, the application for admission to ICE[®] Community is password protected. Access to ICE[®] Community can by requested at:- https://community.theice.com. Once access is approved and users are logged in, users will note that there are several Communities (column on the left) from which to select, ICE Clear being one among several. The space is also shared with other ICE[®] clearing houses. Users should also take note of the Notifications Heading on the lower right side of the page. ICE[®] Community users receive email notifications when new or updated information is posted to the Community. In conjunction with its January 2007 acquisition of the New York Board of Trade (NYBOT[®]), ICE[®] acquired the New York Clearing Corporation (NYCC[®]). NYCC[®] was renamed ICE Clear US[SM] effective 2007-June-01 and continues to operate as a registered Derivatives Clearing Organization under the oversight of the US Commodity Futures Trading Commission (CFTC). On 2007-July-18, IntercontinentalExchange, Inc., a Delaware corporation (ICE[®]), and ICE Futures, ICE's United Kingdom regulated futures subsidiary, notified LCH.Clearnet Group Ltd (LCH; headquartered in London, UK) that ICE[®] and ICE Futures were terminating the Amendment and Restatement Agreement dated 2003-October-09 between ICE[®] and LCH and terminating the Clearing Services Agreement dated 2003-October-09 between ICE Futures and LCH. Under these agreements, LCH provides clearing services to ICE[®] and ICE Futures for all energy contracts traded on the ICE[®] platform. The notices of termination from ICE[®] and ICE Futures provide LCH one year's written notice of termination and specify that the termination date will be a date agreed to between the parties, or, in the event that no agreement is reached between the parties regarding a termination date, will be the date that is twelve (12) months from the date of the notice. ICE and ICE Futures provided LCH with the notices of termination in connection with ICE's previously announced plans to form a wholly-owned European clearing house. The European clearing house will be based in London and is part of ICE's strategic plan to offer clearing services through wholly-owned clearing businesses in the United States and the United Kingdom. The European clearing house will be known as ICE Clear Europe[SM]. ICE Clear Europe is preparing an application to the Uinted Kingdom's Financial Services Authority (FSA) to become a Recognised Clearing House. In conjunction with ICE's January 2007 acquisition of the New York Board of Trade (NYBOT[®]), ICE acquired the New York Clearing Corporation (NYCC[®]). NYCC[®] has been renamed 'ICE Clear US[SM]' and will operate as the ICE clearing house in the United States. ICE Clear US continues to operate as a registered Derivatives Clearing Organization under the oversight of the United States Commodity Futures Trading Commission (CFTC). In January 2007, Intercontinental Exchange, Inc. merged with and acquired both NYBOT[®] and its clearing organization, NYCC[®], a wholly-owned subsidiary of NYBOT[®]. Previously, in 1999, NYCC[®] had taken over clearing functions of the Commodity Clearing Corporation and the Commodity Futures Clearing Corporation of New York that formerly cleared for the New York Cotton Exchange and Coffee, Sugar & Cocoa Exchange, Inc., respectively. On 2007-June-01, the name of NYCC[®] changed to ICE Clear US, Inc.. IntercontinentalExchange, Inc. (ICE[®]), an electronic energy marketplace and soft commodity exchange, has plans to build on its existing United States clearing operations with the formation of a wholly-owned European clearing house. The clearing house will be based in London and is part of ICE's strategic plan to offer clearing services through wholly-owned clearing businesses in the United States and the United Kingdom. These clearing houses will complement ICE's diverse futures and over-the-counter (OTC) execution business while meeting the risk management and regulatory requirements of a global marketplace. The European clearing house, to be known as ICE Clear Europe[SM], will partner with ICE's United States clearing house to serve ICE's global customer base across the commodities and financial products marketplace, including futures and over-the-counter (OTC) markets. ICE Clear Europe is preparing an application to the United Kingdom's Financial Services Authority (FSA) to become a Recognised Clearing House. The final application is expected to be submitted by July 2007. Assuming that the information provided is satisfactory and the timeline is met, regulatory approval is anticipated in early 2008. In

conjunction with its January 2007 acquisition of the New York Board of Trade (NYBOT®), ICE® acquired the New York Clearing Corporation (NYCC®). NYCC® will be renamed 'ICE Clear US℠' effective 2007-June-01 and will continue to operate as a registered Derivatives Clearing Organization under the oversight of the United States Commodity Futures Trading Commission (CFTC). ICE expects to transition its energy futures and OTC derivatives business to its own clearing operations at the end of the second quarter of 2008, through the transfer of positions to ICE Clear Europe. Currently, ICE's energy futures and OTC derivatives businesses are cleared through LCH.Clearnet Ltd (headquartered in London, UK). The ICE Clear group will leverage a common technology and development team from the outset. The Extensible Clearing System (ECS), a highly flexible platform originally based on the OnExchange system, will serve as the cornerstone of the expanded clearing technology platform. For the benefit of European firms presently clearing ICE® energy markets and to minimize their technological and operational changes, ECS will be linked to the Trade Registration System (TRS) for ICE Clear Europe. This is the post-trade technology platform currently used for ICE's cleared energy markets and is provided by AEMS (Atos Euronext Market Solutions). In April, ICE announced an investment in TRS technology capacity. Beginning in January 2007, ICE® and NYBOT® engineers began a second phase of development around all NYCC® clearing systems to significantly expand functionality, processing capacity and electronic trading interfaces. Prior to NYBOT® offering electronic trading in early February, ICE® and NYCC® quickly and successfully integrated their respective trading and clearing platforms, with the initial development efforts resulting in a ten-fold expansion of clearing capacity. Currently, ICE's technology and clearing team is developing a new state-of-the-art clearing platform employing new technologies such as Java J2EE, Oracle and IBM AIX. Design and development on the enterprise solution is ongoing, with the next phase of clearing enhancements supporting a new Post Trade Management System (PTMS) slated for completion in June 2007. 'We believe that through collaboration with futures and OTC market participants, we are uniquely positioned to execute on a best-in-class clearing solution, and one that addresses the risk management requirements of ICE's diverse and global business', said Jeffrey C. Sprecher, ICE® Chairman and CEO. 'Earlier this year, we began actively planning and executing on our strategy with a team of technology and clearing experts assembled from both inside and outside our organization in the United States and Europe. Our highest priority as we expand our clearing platform is to ensure the integrity of the financial framework that underlies these vital operations'. Sprecher continued, 'At the same time, we believe continued innovation and competition in clearing will offer meaningful benefits to the broader trading community. Gaining greater control over this core capability will allow us to introduce more services to the OTC markets for brokers and dealers. And finally, this flexibility will allow us to increase our speed-to-market for new cleared products and to expand our products further into the physical commodity markets'. With regard to expectations for clearing revenues and expenses, ICE has provided the following estimates and information. ICE® expects to provide further information on ICE Clear as details and timelines are available:- (i) In 2006, ICE estimates that its customers generated approximately USD50 million in clearing fees payable to LCH.Clearnet Ltd relating to ICE's futures, options and OTC contracts cleared through LCH.Clearnet Ltd. (ii) ICE expects to begin clearing its energy futures and OTC contracts as of July 2008 following the migration of this business from LCH.Clearnet Ltd. (iii) As a result, ICE® estimates in 2008 it will realize incremental clearing revenues beginning in July of approximately USD25 million to USD30 million, with annual incremental clearing revenues in 2009 in excess of USD60 million. ICE does not provide revenue or growth forecasts. (iv) Annual incremental clearing expenses for ICE's clearing operations are expected to be in the range of USD9 million to USD14 million. (v) ICE® expects to incur USD7 million to USD9 million in start-up costs over the combined period of 2007–08 in connection with the development of ICE Clear, with some portion of these expenses to be capitalized relating to technology and software development costs. (vi) Capital expenditures related to clearing over the combined period of 2007–08 are projected in the range of USD7 million to USD10 million. The portion of capital expenditures relating to the current year was included in ICE's earlier estimates of USD25 million to USD30 million for 2007. ICE Clear US, Inc. is the designated clearinghouse for ICE Futures US®. ICE Clear US, Inc. is a subsidiary of ICE Futures US, Inc. and serves as the clearing house for products traded on the exchange. ICE Futures US® is the successor organization to the New York Board of Trade (NYBOT®) and its affiliated clearing house, the New York Clearing Corporation. ICE Futures US® and ICE Clear US℠, which are relatively new participants in the US derivatives markets, benefit from the long and rich history of some the first established futures markets in the US. The New York Board of Trade, prior to the acquisition by the IntercontinentalExchange, grew from the merger of several of the original futures exchanges in New York. The oldest of these exchanges was the New York Cotton Exchange that was established in 1870. Individual futures markets for coffee, sugar, cocoa and orange juice followed and eventually merged into the New York Board of Trade. The New York futures markets for these 'soft' commodities have had a long and storied role in the economic history of New York and US popular culture. In 2007, the New York Board of Trade was acquired by IntercontinentalExchange, Inc. As part of that acquisition, the futures exchange was re-named ICE Futures US® and its clearing subsidiary became ICE Clear US℠. The clearing services offered by ICE Clear US℠ provide a key role in the success of the markets of ICE Futures US®. By serving as the central counterparty to each matched trade, trading participants do not need to evaluate the credit potential of counterparties on each executed transaction or limit their execution to a select group of counterparties. In addition, the risk management procedures and policies of ICE Clear US℠ which include; intraday mark-to-market, the continuous margining of trading activity and positions, and a rigorous membership process are designed to mitigate risk exposure to the clearing house and ensure the continued integrity of the marketplace. This discipline and counterparty risk intermediation is the critical feature of ICE Clear US℠ that supports the availability of efficient and liquid markets of ICE Futures US®. IntercontinentalExchange, Inc. (ICE®) is a leading operator of regulated futures exchanges and over-the-counter markets. ICE® is also a leading operator of central clearing services for the futures and over-the-counter markets, with five regulated clearing houses across North America and Europe. ICE® serves customers in more than 70 countries. ICE Clear US is the primary derivatives clearing organization for ICE Futures US®. Although ICE Clear US is a wholly-owned subsidiary of ICE Futures US®, it maintains its own membership, Board of Directors, management team and operating staff. ICE Clear US adheres to CFTC rules designed to meet the international standards set forth in the PFMIs, and accordingly retains its status as a Qualified Central Counterparty (QCCP). ICE Clear US provides an integral service that enhances the stability and integrity of ICE Futures US® through a comprehensive set of procedures that includes enforcement of stringent membership standards; management of risk through real-time oversight of clearing member positions; twice daily margin settlements with its clearing members; limits on the size of positions that may be carried in relation to a clearing member's capital; and substantial default resources, including a guaranty fund. The ICE Clearing Systems encompass a number of integrated systems, most importantly the Post-Trade Management System, or PTMS, Allocation and Claim Transaction System, or ACT, and the Extensible Clearing System, or ECS. PTMS provides real-time trade processing services enabling clearing members to offer real-time risk management services. ACT provides for straight through processing of trade executions given up to other clearing members. ECS supports open position and delivery position management, real-time trade and post-trade accounting, risk management (daily and intra-day cash, marked-to-market/option premium and original margin using the CME SPAN® algorithm), collateral management, daily settlement and banking. The Role Of The Clearing House:- Through its system of financial safeguards, ICE Clear US performs two major functions:- (1) reconciling and clearing all futures and options transactions executed on ICE Futures US®; and (2) guaranteeing the 4 financial integrity of each transaction and resulting position. When a trade has been matched and cleared, ICE Clear US is substituted as the central counterparty to the trade, thereby guaranteeing financial performance of the contract to the clearing member on the opposite side. In its role as counterparty for all cleared contracts, ICE Clear US deals exclusively with clearing members. Each clearing member is financially responsible for the

contracts it has submitted to ICE Clear US, and the clearing house is responsible to each clearing member for the net settlement from all contracts it clears. In support of its role as the central counterparty for all cleared contracts, ICE Clear US has instituted a series of financial safeguards and procedures designed to manage the risks it assumes and protect the integrity of the clearing house, as described below. Clearing Membership Financial Requirements:- Only firms that have adequate capital are eligible to become members of ICE Clear US. Once admitted, Clearing Members must adhere to stringent financial and operational requirements. Clearing members must have at least USD5 000 000 in adjusted net capital, and any clearing member regulated by the CFTC must also satisfy applicable CFTC capital requirements and segregate and account for all customer funds and property separate and apart from the clearing member's own property. All clearing members must also be member firms of ICE Futures US® (See Applying for ICE Clear US Membership for a guide to becoming a member firm of ICE Futures US®). Additionally, clearing member must institute risk management controls and demonstrate the operational capability to handle customer business. All clearing member must establish banking arrangements with approved banks to facilitate payments to and from ICE Clear US. Customer Protection:- The contracts cleared by ICE Clear US are maintained in its records within two accounts or 'origins'. These accounts isolate the clearing activity related to a clearing member's proprietary business in the house' origin account and the clearing activity of clients into the 'customer segregated' origin account for each clearing member. The ICE Clear US rules and Clearing Member Agreement clearly define the exclusive relationship between ICE Clear US and its members. Risk Management At ICE Clear US:- Unique to the clearing of futures contracts, two margin methods are used by ICE Clear US to secure performance by its clearing members. One method is the collection of variation margin based on the twice-daily mark-to-market of open contracts. Following this procedure, ICE Clear US typically collects from clearing members the vast majority of its financial exposure from open positions before the end of the trading day. The second margin method is the collection of original margin, which is a good-faith deposit designed to serve as security for the payment of the clearing member's variation margin obligations to the clearing house. These two kinds of margin are described below. Variation Margin:- Variation margin covers the previous day's open positions and the new positions resulting from the current day's trading activity of the clearing member. Variation margin for futures contracts can be paid to, and must be collected from, clearing members twice each day. The intra-day variation calculation uses a prevailing market price whereas the end of day calculation uses the daily settlement price for each futures contract. In addition to the scheduled intra-day variation calculation, the clearing house may initiate additional intraday variation calls, for example, in times of great volatility or market stress events. These intra-day variation payments constitute advance payments against the end-of-day variation calculation. Calls for intra-day variation payments by clearing members are required to be satisfied within 60 minutes of request by ICE Clear US. Clearing members must pay the variation margin calculated at the end of each day by the settlement deadline on the following business day. The end-of-day variation margin includes any remaining variation margin not paid or received from the prior day's intra-day variation margin calls resulting from price changes, new trading activity and option premiums. Original Margin:- Original margin is sometimes referred to as a Performance Bond and is calculated using the historical price volatility of the contract being margined. It is collected to ensure clearing members can meet their payment obligations to the clearing house. ICE Clear US calculates original margin requirements using a system that determines the largest theoretical loss a clearing member could incur in one day based on historical market prices and volatility. The Risk Department at ICE Clear US uses a variety of analytical tools and procedures to establish and validate the original margin requirement. The targeted minimum confidence interval covers 99% of one day price moves during the preceding 10, 30, and 60 days. The clearing house adjusts the margin requirement for each commodity up or down as market volatility changes. If a clearing member's original margin requirement increases and ICE Clear US is not holding sufficient excess cash or collateral from the firm to cover the increase, ICE Clear US will call that clearing member for additional original margin to meet the deficiency. This calculation is made daily on the basis of each firm's end-of-day positions. The clearing house is required to collect gross margins for customer segregated positions from its clearing members. As such, clearing members are required to submit customer positions by account to the clearing house on a daily basis. The positions reported by the clearing member are reconciled against the customer segregated positions in clearing. Those positions that cannot be reconciled comprise a balancing account which is margined on an outright basis. Clearing members must pay any original margin deficits to the clearing house by the settlement deadline on the following business day. Monitoring Risk Intra-Day:- Throughout the trading day, ICE Clear US monitors the position and market exposure of each clearing member to ensure that there are enough funds on deposit as original margin to cover their risk. This is done by calculating real time profit and loss using up-to-date position and pricing information and by calculating potential losses using pricing information based on simulated adverse market conditions. ICE Clear US risk management staff is automatically notified when clearing members have breached predefined thresholds allowing them to take immediate action to resolve any risk issues. Position Limits:- ICE Clear US establishes for each clearing member a limit that restricts the size of the total positions it may carry with the clearing house. These limits are based on the adjusted net capital of the firm. If a clearing member exceeds its position limits, a margin surcharge is added to its original margin requirement. ICE Clear US may also reduce the position limits of a clearing member when circumstances warrant. See Section 5.6, Position Risk, of ICE Clear US Bylaws Pursuant to CFTC regulations, ICE Futures US® applies position limit and position accountability regimes to the commodity contracts. These limits and accountability regimes area based on numerous factors including the size of the underlying commercial market and the demonstrated liquidity of the commodity contracts themselves. The Guaranty Fund:- Covering Unmargined Risk:- The margin procedures and establishment of position limits by the clearing house have proven, over time, to be a sound risk management technique. It is possible however that extreme market conditions or special circumstances relating to a particular clearing member may result in a default by a clearing 6 member. ICE Clear US further protects itself from such an event by maintaining a guaranty fund into which each clearing member must make a specified contribution based on the percentage of the overall margins held by the clearing house and of the trading volume cleared by the clearing house it represents. The minimum contribution by each clearing member to the guaranty fund currently is USD2 000 000. The guaranty fund provides ICE Clear US with additional resources to cover a default where the losses of a clearing member are greater than the amount of the original margin held by the clearing house from that firm. In such a case, ICE Clear US can apply the clearing member's guaranty fund contribution and, if any deficiency still remains, may apply all or any part of the guaranty fund contributions of all other clearing members, in addition to utilizing other sources of funds described below. The size of the guaranty fund is designed to enable ICE Clear US to meet its financial obligations to its clearing members notwithstanding a default by the two clearing members creating the largest combined loss to ICE Clear US in extreme but plausible market conditions. See Section 5.4 Guaranty Fund of ICE Clear US Bylaws. It is important to note that while ICE Clear US has established the guaranty fund as a resource, the need to draw upon it has not arisen during past defaults. For the most recent information regarding the size of the ICE Clear US guaranty fund, please see:- ICE Clear US Financial Resources. Financial Resources:- The US Bankruptcy Code contains provisions that allow the clearing house to take actions to minimize its exposure to loss from an insolvent clearing member. In addition, CFTC regulations establish a regime governing the distribution of the assets of a bankrupt commodity broker. In the event of a clearing member's financial default, ICE Clear US will suspend the clearing member and attempt to transfer all open positions of its non-defaulting customers to one or more other clearing members who are in good standing. Any positions not transferred can be liquidated by the clearing house in the market or by book entry in certain cases. The bylaws authorize ICE Clear US to use the following additional sources of funds in the event that the original margin deposits held by the clearing house from a defaulting firm, along with that firm's guaranty fund deposit, is not sufficient to cover its obligation to ICE Clear US:- (i) USD25 000 000 ICE Clear US

priority contribution; (ii) Non-defaulting members' contributions to the guaranty fund and ICE Clear US pro rata contribution of USD25 000 000; (iii) Assessments levied by the clearing house upon all of the non-defaulting clearing members subject to certain caps. In addition, Intercontinental Exchange, Inc. has reserved USD50 000 000 of a committed line of credit for the use of ICE Clear US which can be used to provide short-term liquidity in the event of a clearing member default. The ICE Clear US℠ is the successor clearing organization of the New York Clearing Corporation and clears the trades of the ICE Futures US, Inc.. ICE Clear US, Inc. was originally organized in 1915 as the New York Cotton Exchange Clearing Association and later became the Commodity Clearing Corporation. Although an ICE Futures US® subsidiary, ICE Clear US℠ has its own separate membership, Board of Directors, elected officers and operating staff. ICE Clear US℠ provides clearing services and financial stability for its clearing members. ICE Clear US℠ performs two major functions:- (i) reconciliation and clearing of all futures and options transactions made on ICE Futures US®; and (ii) assuring the financial integrity of such transactions. Through its system of financial safeguards and transaction guarantees, ICE Clear US℠ protects the interests of the trading public, members of the Exchange and the clearing members of the Clearing Corporation. / Ай.Си.И. ICE–CREAM = ЛЕДЯНОЙ КРЕМ (или МОРОЖЕНОЕ) – Ice-Cream:- of a color similar to that of vanilla ice cream.

ICE FUTURES ABU DHABI HOLDINGS LIMITED = АЙ.СИ.И. ФЬЮЧЕЗ АБУ ДАБИ ХОЛДИНЬГЗ ЛИТИТИД – Ice Futures Abu Dhabi Holdings Limited is a Private Limited Company that was established in 2019 in Abu Dhabi, United Arab Emirates. The organisation operates in the Holding Companies sector. Ownership of the organisation is held by British, Chinese, Japanese, Korean, Singaporean, and Swiss based enterprises. In November 2019, Abu Dhabi's Supreme Petroleum Council (SPC) announced that Abu Dhabi National Oil Company's (ADNOC's) flagship onshore crude oil, Murban, would move to market-driven, forward-based pricing, using a new futures contract as its price marker. (Note:- ADNOC is one of the world's leading diversified energy and petrochemicals groups with a daily output of about 3 million barrels of oil and 10.5 billion cubic feet of natural gas. With 14 specialist subsidiary and joint venture companies, ADNOC is a primary catalyst for the UAE's growth and diversification.) The SPC also authorized ADNOC to remove destination restrictions on Murban crude sales. This was followed by an announcement from Intercontinental Exchange Inc. (ICE®) that it will launch a new exchange, ICE Futures Abu Dhabi (IFAD), to host the world's first futures contract based on ADNOC's Murban crude oil. ICE Futures Abu Dhabi and trading in Murban Futures plans to launch on March 29, 2021, subject to the completion of regulatory approvals. Nine of the world's largest energy traders will join ICE® and ADNOC as founding partners in ICE Futures Abu Dhabi (IFAD). Those partners are BP, GS Caltex, INPEX, JXTG, PetroChina, PTT, Shell, Total and Vitol. In November 2019, ICE announced its plans to launch ICE Futures Abu Dhabi (IFAD), with the Abu Dhabi National Oil Company (ADNOC) and nine of the world's largest energy traders partnering with ICE® on the launch. IFAD will be home to the world's first Murban Crude futures contract, offering transparent pricing in this global crude for the first time. By establishing a secondary market and offering inter-commodity spreads, participants will have more options to manage risk and clear trades. ICE® Murban Futures will be complemented with a range of cash settled derivatives which IFAD plan to launch for day one of trading. Contracts traded at IFAD will be cleared at ICE Clear Europe, a leading energy clearing house, and will clear alongside global oil benchmarks – ICE® Brent, ICE® WTI, ICE® (Platts) Dubai and ICE® Low Sulphur Gasoil – allowing customers to benefit from associated margin offsets and delivering capital efficiencies. ICE Futures Abu Dhabi Recognized as an Overseas Investment Exchange by UK's Financial Conduct Authority:- Abu Dhabi, United Arab Emirates – (Business Wire) – March 26, 2021 – Intercontinental Exchange, Inc. (NYSE:ICE), a leading operator of global exchanges and clearing houses and provider of mortgage technology, data and listings services, today announced that ICE Futures Abu Dhabi (IFAD), ICE's new exchange in Abu Dhabi, has been recognized as an overseas investment exchange by the UK's Financial Conduct Authority. This recognition ensures that UK-based traders can access IFAD markets and trading in ICE® Murban Crude Oil Futures and 18 related cash settled derivatives and inter-commodity spreads launching on March 29, 2021. Alongside the UK, investors from jurisdictions including Abu Dhabi Global Market, the United States, Singapore, Switzerland, the Netherlands, France, Norway, Australia, Japan and South Korea, are able to trade on IFAD. ICE Futures Abu Dhabi has published a list of the jurisdictions where it has obtained advice regarding permitting access to IFAD markets. Contracts traded on IFAD will be cleared at ICE Clear Europe. The 26 approved Exchange Members, of which 19 are approved Clearing Members, are listed in full on IFAD's Membership page. Clearing members will stand behind all trades made through IFAD and cleared by ICE Clear Europe, whether it is for the account of a customer, member, or their own account. ICE® is launching IFAD with the Abu Dhabi National Oil Company (ADNOC) and nine of the world's largest energy traders including BP, ENEOS, GS Caltex, INPEX, PetroChina, PTT, Shell, TOTSA (Total) and Vitol. ICE® Murban Futures will be a physically delivered contract with delivery at Fujairah in the United Arab Emirates on a free on board (FOB) basis. Murban Crude is a light sweet crude produced by ADNOC. ADNOC produces roughly three million barrels of oil per day, of which approximately 1.7 million barrels per day is Murban crude.

ICE FUTURES CANADA, INC. = АЙ.СИ.И. ФЬЮЧЕЗ КЭНЭДА, ИНК. – ICE Futures Canada, Inc. was established in 1887 and has been facilitating futures contract trading since 1904. A wholly-owned subsidiary of ICE® since 2007, ICE Futures Canada® is Canada's leading agricultural exchange and was the first fully-electronic exchange in North America. ICE Futures Canada® offers futures and options contracts on canola and barley, along with trading and risk management services. ICE Futures Canada® contracts are cleared through ICE Clear Canada. ICE Futures Canada, Inc. is registered as a commodity futures exchange and a self-regulatory organization under The Commodity Futures Act, 1996, S.M. c73. The Manitoba Securities Commission (MSC) is the primary regulator. ICE Futures Canada® has been granted No-Action relief by staff of the US Commodities Futures Trading Commission (CFTC), permitting it to make its electronic trading system available to US-based participants. See also IntercontinentalExchange, Inc. ICE Futures Canada®, the former Winnipeg Commodity Exchange (WCE) is Canada's largest agricultural derivatives platform and lists the world's most heavily-traded canola contract, as well as futures and options on Barley and Wheat. It also owns the Canadian Climate Exchange. The WCE demutualized in 2001, and its WCE Holdings parent was acquired for CAD50 million in August 2007 by the IntercontinentalExchange® (ICE®) on 2007-August-28. All trading on the exchange transitioned to the ICE® electronic platform on 2007-December-10. The business was renamed ICE Futures Canada®, effective 2008-January-01. ICE Futures Canada® is Canada's leading agricultural futures and options exchange and hosts the world's leading Canola futures contract. Headquartered in Winnipeg, Manitoba (MB), Canada. The Winnipeg Commodity Exchange (WCE) was founded as the Winnipeg Grain & Produce Exchange in 1887 as an unincorporated association providing a cash market in Wheat, Oats and Barley. Futures in Wheat, Oats and flaxseed were added in 1904. It changed its name to the Winnipeg Grain Exchange in 1908, and to the Winnipeg Commodity Exchange in 1972. The WCE Clearing Corporation was established in 1998, and the Manitoba Securities Commission became its regulatory authority in 2000. In May 2004, members agreed to end open-outcry trading and transfer listings to the Chicago Board of Trade's electronic e-CBOT® platform, and became the first North American commodities exchange to end all floor-based trading with the last session on 2004-December-17. The member-owned exchange demutualized in November 2001 and, on 2007-April-26, announced it had retained Deutsche Bank AG to explore strategic alternatives, including a possible sale. On 2007-June-22, the company accepted an offer from

the ICE®, but announced in August 2007 that it had received a superior offer, which traders said came from the New York Mercantile Exchange. WCE accepted an amended offer from the ICE® on 2007-August-22, and the transaction closed on August-28. The ICE® paid CAD77.59 per common share, or CAD50 million in aggregate. WCE products were transferred to the ICE® trading platform on 2007-December-10. The exchange offers futures and options in canola (rapeseed), domestic feed Wheat and western Barley, with canola futures dominating volume, which reached record levels in November 2007. Canola futures were launched in 1963, and accounted for 95 percent of trades in November 2007, with Wheat futures accounting for 4.2 percent. At the end of November 2007, total open interest stood at 169 188 contracts. Ice Futures Canada, Inc. is a private company categorized under Commodity Contract Exchanges and located in Winnipeg, MB, Canada. Current (on 2010) estimates show this company has an annual revenue of CAD7 797 120 and employs a staff of approximately 18. IntercontinentalExchange, Inc. (ICE®) is a leading operator of regulated futures exchanges and over-the-counter markets. ICE® is also a leading operator of central clearing services for the futures and over-the-counter markets, with five regulated clearing houses across North America and Europe. ICE® serves customers in more than 70 countries. / Ай.Си.И. Фьючез Кэнэда, Инк. (ICE Futures Canada, Inc.). Дойчэ Банк А.Ге. (Deutsche Bank AG). СИБАТ® (СВОТ®).

ICE FUTURES EUROPE® = АЙ.СИ.И. ФЬЮЧЕЗ ЮРЭП® – ICE Futures Europe® is ICE's London-based, regulated futures exchange for global energy markets. As the leading fully-electronic energy futures exchange, ICE Futures Europe® lists the leading global crude oil benchmarks and sees half of the trade in the world's crude oil and refined product futures in its markets. ICE® also offers the leading European emissions futures market. Participants in more than 70 countries have access to a range of futures and options contracts to manage risk around-the-clock, in a transparent and liquid marketplace. Powered by a widely distributed, sophisticated technology platform, ICE Futures Europe® brings the world's energy markets together. ICE Futures Europe® contracts are cleared through ICE Clear Europe Limited. See also IntercontinentalExchange, Inc. ICE Futures Europe® is the leading electronic, regulated futures and options exchange for global energy markets, including the world's leading crude oil benchmarks – Brent and WTI crude oil. Headquartered in London, the United Kingdom. ICE® will suffice for ICE Futures Europe®, formerly called The International Petroleum Exchange of London (IPE). A chip off the old ICE® block, ICE Futures Europe® is a subsidiary of US-based IntercontinentalExchange® (ICE®) and is an electronic exchange market for regulated energy futures and options in Europe. Products traded include derivative contracts based on energy commodities such as crude oil, refined oil (including heating oil and jet fuel), and natural gas and electric power. The exchange has transitioned from pit trading to electronic trade operations and no longer has an open-outcry platform. Its contracts are cleared through ICE Clear Europe Limited, its London-based clearing house. Introduced in 1988, the ICE® Brent Crude futures contract is the leading benchmark for pricing the world's crude oil, including grades in Africa, the Middle East and Asia. ICE Futures Europe® has also listed the North American benchmark West Texas Intermediate (WTI) crude futures contract since 2006. WTI has also established a daily volume record in 2011. ICE Futures Europe® is the UK-regulated, London-based subsidiary through which IntercontinentalExchange® conducts its energy futures markets. Previously, the exchange was named the International Petroleum Exchange before being acquired by ICE®. ICE Futures Europe® offers the trading in oil benchmarks and trades nearly half of the world's global crude futures in its markets. Clearing for ICE Futures Europe® and ICE's OTC energy products are done through LCH.Clearnet Ltd (headquartered in London, UK). Clearing was expected to move to ICE's wholly owned European clearing house ICE Clear Europe Limited in September of 2008, but was deferred due to the financial market turmoil of early September. Also in July of 2008, ICE Futures Europe® Chairman Bob Reid said at a British parliamentary panel on oil market speculation that the exchange was willing to adopt US trading limits for its contract in US crude oil. The Commodity Futures Trading Commission (CFTC) had indicated it wished to extend its trading limits to the US crude oil futures contract traded on the ICE®. As debate about speculative trade has increased, some US politicians have asserted that US traders take advantage of a lack of position limits at ICE Futures Europe® to build large, and potentially price-changing, positions. Trading in ICE® West Texas Intermediate Light Sweet Crude Oil contract on ICE® represents 15 percent of the open interest in the global WTI market. ICE Futures Europe® was founded in 1980 as the International Petroleum Exchange (IPE). In June 2001 IntercontinentalExchange® (ICE®) acquired the IPE, which was subsequently renamed ICE Futures Europe® in 2006. On November 29, exchange-wide volume at ICE Futures Europe® reached a record 875 375 contracts, surpassing the 2007-November-13 record of 858 604 contracts. ICE® offers participants access to Brent and West Texas Intermediate (WTI) global crude oil benchmark futures contracts, Gas Oil, Natural Gas, Electricity, Coal, and ECX carbon financial instruments. On 2008-February-21, the European Climate Exchange Ltd (ECX) and ICE® Futures Europe announced the imminent launch of futures contracts on Certified Emission Reductions (CERs), noting ECX had reached an agreement with LCH.Clearnet regarding the launch of the contracts. It was anticipated the exact date for the launch was to be announced shortly. This put to rest speculation of what may occur with the contracts. On 2010-March-15, ICE Futures Europe® introduced the ICE® TTF Natural Gas futures contract. The first trade was executed by Total Gas and Power and Credit Suisse Group AG. The contract is based on the Title Transfer Facility (TTF) in the Netherlands and trades alongside ICE's UK. NBP Natural Gas futures contract, the leading benchmark for UK natural gas. On 2011-March-14, the ICE Futures Europe® announced the introduction of the first Brent Crude cracks to US-refined products on ICE Futures Europe®. The new contracts, available for trading today, are:- (i) ICE® Heating Oil vs ICE® Brent Futures Crack Spread; and (ii) ICE® RBOB Gasoline vs ICE® Brent Futures Crack Spread. ICE Futures Europe® is launching these ICE® Brent-based cracks to US-refined products in response to requests from US-based market participants who require a tradable crack relationship to the global Brent Crude benchmark. Brent is the most widely used contract for pricing global crude, including grades in Africa, the Middle East and Asia. Product cracks expressed against Brent for hedging and trading physical crude are widely used outside North America. The two new Brent-based cracks make it possible to effectively align US-refined product pricing with the benchmark that best represents the global price of crude oil for refiners, traders and hedgers. IntercontinentalExchange, Inc. (ICE®) is a leading operator of regulated futures exchanges and over-the-counter markets. ICE® is also a leading operator of central clearing services for the futures and over-the-counter markets, with five regulated clearing houses across North America and Europe. ICE® serves customers in more than 70 countries. / Ай.Си.И. Фьючез Юрэп® (ICE Futures Europe®). Крэди Свиссэ Груп А.Ге. (Credit Suisse Group AG).

ICE FUTURES SINGAPORE PTE. LTD. = АЙ.СИ.И. ФЬЮЧЕЗ СИНАПО ПИ.ТИ.И. ЭЛ.ТИ.ДИ. – ICE Futures Singapore℠ offers secure, regulated futures trading and clearing services to market participants within this key region. All members must check that ICE Futures Singapore℠ has the relevant regulatory status in each jurisdiction from which they wish to trade ICE Futures Singapore℠ products on the ICE Platform.

ICE FUTURES US, INC. = АЙ.СИ.И. ФЬЮЧЕЗ Ю.ЭС., ИНК. – ICE Futures US, Inc. was founded in 2007 through merger and is based in New York and is a leading global soft commodity futures and options exchange, with markets for sugar, cotton, coffee, cocoa and orange juice. ICE® is also the exclusive venue for trading Russell 1000® and Russell 2000® index futures and options contracts as well as contracts based on the ICE® US Dollar Index. ICE Futures US® offers a range of trading and risk management services across soft commodities, equity indexes and foreign exchange (FX), and its state-of-the-art electronic trading platform brings market access and transparency to participants around the world. ICE Futures US® markets are cleared by ICE Clear US. See also IntercontinentalExchange, Inc., and New York Board Of Trade. ICE Futures US® is a leading global futures and options exchange that lists futures and options for agricultural commodities and precious metals, as well as futures and options contracts for equity and credit indexes, currencies and North American natural gas and power products. ICE Futures US® and its predecessor companies have offered trading in contracts based on agricultural commodities for over 130 years and maintain a strong franchise in these products. The contracts are designed to provide effective pricing and hedging tools to industry users worldwide, as well as strategic trading opportunities for investors. The prices for agricultural contracts serve as global benchmarks for the physical commodity markets, including Sugar No. 11® (world raw sugar), Coffee 'C'® (Arabica Coffee), Cotton No. 2®, Frozen Concentrated Orange Juice and Cocoa. In 2012, ICE Futures US® broadened its commodity product suite to include financially-settled futures on US grains and oilseeds and options on those futures. ICE Futures US® offers financial products in equity index, currency and credit markets. The exchange lists futures and options contracts on Russell indices, including the US small cap equity benchmark Russell 2000® index, as well as the Russell 1000® and related style indices. Additionally, the exchange began offering mini MSCI futures on June 30, 2014. These benchmark futures, including the mini MSCI Emerging Markets and mini MSCI EAFE futures were previously listed on NYSE Liffe US and cleared by the Options Clearing Corporation. ICE Futures US also provides futures and options markets for nearly 60 currency pair contracts including euro-based, US Dollar-based, yen-based, sterling-based and other cross-rates, as well as the benchmark US Dollar Index® futures contract. The US Dollar Index futures contract is based on the ICE US Dollar Index, the most well-known and widely quoted measure of the performance of the United States Dollar. ICE Futures US® recently began offering a full suite of precious metals futures and options on precious metals futures, including full sized and mini gold contracts and full sized and mini sized silver contracts. These products were previously listed on NYSE Liffe US and cleared by the Options Clearing Corporation until their transition to ICE Futures US® on June 30, 2014. ICE Futures US® also offers futures and options contracts on an array of US power, natural gas and emissions markets. These energy contracts trade on ICE Futures US® and are cleared by ICE Clear Europe. The US Commodity Exchange Act generally requires that futures trading in the United States be conducted on a commodity exchange registered as a designated contract market by the Commodity Futures Trading Commission, or CFTC. ICE Futures US® operates as a designated contract market and is regulated by the CFTC. ICE Futures US® is responsible for carrying out self-regulatory functions and has its own governance, compliance, surveillance functions, as well as a framework for disciplining members and other market participants that do not comply with exchange rules and policies. ICE Futures US® is periodically reviewed by the CFTC to ensure that it is complying with its self-regulatory obligations. Market Participants:- ICE Futures US's participants include representatives from segments of the underlying industries served by its agricultural, precious metals, and financial markets, including the sugar, coffee, cotton and cocoa industries. Traders in these futures markets include hedgers, speculators and investors. Investors and speculators typically place orders through futures commission merchants (FCMs) or through introducing brokers (IBs) who have clearing relationships with FCMs. Investors may also pool their funds with other investors in collective investment vehicles known as Commodity Pools, which are managed by commodity pool operators and commodity trading advisors (CTAs). Trading Technology:- Trading of all ICE Futures US® listed products takes place electronically. (In 2008, futures contracts at ICE Futures US® transitioned to exclusive electronic trading. In October 2012, options contracts at ICE Futures US® transitioned to exclusive electronic trading. Some transactions, such as EFPs and blocks, are transacted privately rather than on the electronic trading platform and submitted electronically for clearing using ICE Block). The exchange uses the ICE® electronic trading platform for it futures and options contracts. For futures-related products, the platform supports several order types, matching algorithms, price reasonability checks, inter-commodity spread pricing and real-time risk management. ICE® has also developed an implied matching engine that automatically discovers best bid and offer prices throughout the forward curve. The ICE® platform delivers sub-millisecond average round trip transaction times in its futures markets (transaction time is measured round trip performance end-to-end within the ICE® data center and through the ICE® matching engine). ICE's platform has proven to be extremely consistent, with more than 99.5% of transactions being completed in less than twenty milliseconds during peak trading periods. Along with speed and consistency, the ICE® trading platform is reliable, typically offering greater than 99.99% availability. Connectivity:- ICE® offers access to its electronic markets through a broad range of interfaces, including dedicated lines, server co-location data centers, telecommunications hubs in the United States, Europe and Asia, and directly via the Internet. The ICE® global network consists of high speed dedicated data lines connecting data hubs in New York, Atlanta, Chicago, London and Singapore with the exchange's and clearing house's primary and disaster recovery data centers. ICE's state-of-the-art hosting center is in Illinois, outside Chicago, and its disaster recovery site for its technology systems is in Georgia. ICE® offers server co-location space at its data centers to all its customers. This service allows customers to deploy their trading servers and applications onsite, virtually eliminating data transmission latency between the customer and the exchange. Available via an internet browser, WebICE is feature-rich trading interface offering a single point of access to all ICE Futures markets. ICE's web-based front-end, WebICE, is a feature-rich trading interface offering a single point of access to all ICE Futures markets. The ICE trading platform is also available through multiple independent software vendors (ISVs) and application program interfaces (APIs) for order routing, market data and trade capture. ICE also has introduced ICE® mobile for iPhone®, iPod Touch® and iPad®, and Android® and Blackberry enabled devices. ICE mobile allows WebICE users the ability to view and manage their WebICE orders from mobile devices as well as the option to enter orders and trade from certain mobile devices (These devices include the iPhone, iPad and Android devices). ICE® also offers the industry's most intuitive instant messaging platform for traders and brokers in the commodity and equity derivatives market, ICE® Chat. And WhenTech is an advanced option pricing and risk management platform for options analysis and pricing tools that allow users to quickly price nearly all options/futures spreads via an intuitive point-andclick interface. ICE Futures US® is the leading global futures and options exchange for trading an array of futures and options contracts for agricultural and financial commodities, including the benchmark Sugar and Russell 2000® contracts. Headquartered in New York, State of New York (NY), the United States. IntercontinentalExchange® conducts global futures and options markets in soft commodity, foreign exchange, interest rates, currencies and equity index markets through its US futures exchange, ICE Futures US, Inc., formerly the New York Board of Trade (NYBOT®). The NYBOT® was acquired by ICE® in January 2007. Clearing services for ICE Futures US® are provided through ICE Clear US, Inc.. In early 2007, the US Internal Revenue Service gave ICE Futures contracts, which are regulated in the United Kingdom, the same tax treatment as contracts traded on US futures exchanges. The ruling applied to contracts traded from April 01. The ruling meant that US market participants would receive a 60/40 tax treatment. Many believed the change in tax treatment served to put ICE® on more level ground with the New York Mercantile Exchange (NYMEX®). The ICE® and NYBOT® announced their merger agreement on 2006-September-14, and the deal was completed on 2007-January-12. The transaction consideration comprised 10.297 million shares of ICE® common stock and USD400 million in cash. The number of shares of ICE common stock issued pursuant to the merger agreement represented approximately 15 percent of the issued and outstanding share capital of ICE®. Computershare Shareholder

Services, Inc, as exchange agent delivered the applicable merger consideration to each NYBOT® member by late January 2007. Side-by-side (electronic and open outcry) trading of the NYBOT's benchmark agricultural commodities on ICE's electronic trading platform began the evening of January 25 for the trade date January 26. On 2007-October-22, The Wall Street Journal posted a report that NYBOT® is planning to officially shut down its futures pits in the next six months as electronic commodities trading takes over. (Note that the WSJ cited sources 'familiar with the matter'.) It could also eventually lead the downtown exchange to abandon its headquarters at the World Financial Center, according to the report. On 2008-February-25, ICE Futures US® said that effective with the start of trading on 2008-April-01, the exchange would implement amendments to its open outcry trading hours for the following options contracts (all times are New York times):- (i) ICE® Sugar No. 11 options 08:10 am to 01:30 pm; (ii) ICE® Coffee 'C' options 08:00 am to 01:30 pm; (iii) ICE® Cocoa options 08:00 am to 01:00 pm; and (iv) ICE® USDX and Euro Index options 08:00 am to 03:00 pm. For all other products, options floor trading hours would be unchanged and remain as follows:- (i) ICE® Cotton No. 2 options 10:30 am to 02:15 pm; (ii) ICE® FCOJ-A options 10:00 am to 1:30 pm; (iii) ICE® RJ-CRB options and CI Indexes options 10:00 am to 02:30 pm; and (iv) ICE® Russell options and NYSE® Stock Index options 09:30 am to 04:15 pm. ICE Futures US® offers trading in futures and options on sugar, Cotton, Coffee, Cocoa, and Orange juice, in addition to interest rates, currency, and indexes. In October 2007, ICE Futures US® announced that it would begin offering 11 electronically traded foreign exchange futures 22 hours/day, beginning on 2007-November-09, with the listing to occur in phases. These include:- British Pound/Japanese Yen; British Pounds; British Pound/Swiss Franc; British Pound/US Dollar; Euro/British Pound; Euro/Japanese Yen; Euro/Swiss Franc; Euro/US Dollar; Swiss Franc/Japanese Yen; US Dollar/Japanese Yen; and US Dollar/Swiss Franc. On 2008-September-22, ICE® announced the successful transition of the US Russell Index complex to ICE Futures US®. ICE® signed an exclusive license agreement with Russell Investments in June 2007 that gave ICE® the exclusive right to trade futures and options based on Russell's US equity indexes. These include the Russell 1000 Index and Russell 2000 Index, as well as the related value and growth indexes Russell offers. In October of 2008, it was announced that ICE Futures US® would launch a suite of million-currency-unit foreign exchange (FX) futures contracts on 2008-November-06. The new futures contracts, known as ICE® Millions and first announced on September 24, combine the benefits of futures and OTC products, bringing additional transactional efficiencies and risk management tools to the FX marketplace. ICE® Millions are 10 times the notional value of the existing suite of ICE® FX futures and options contracts. ICE Futures US® also lists the ICE® US Dollar Index futures, which would remain the existing notional size of USD1 000 times the index value. IntercontinentalExchange, Inc. (ICE®) is a leading operator of regulated futures exchanges and over-the-counter markets. ICE® is also a leading operator of central clearing services for the futures and over-the-counter markets, with five regulated clearing houses across North America and Europe. ICE® serves customers in more than 70 countries. ICE Futures US, Inc. (IFUS) is a leading regulated commodity futures exchange for the trading of agricultural commodities. IFUS and its predecessor companies have offered trading in contracts based on agricultural commodities for over 130 years and IFUS maintains a strong franchise in these products. The contracts are designed to provide effective pricing and hedging tools to industry users worldwide, as well as strategic trading opportunities for investors. The prices for IFUS agricultural contracts serve as global benchmarks for the physical commodity markets, including Sugar No. 11 (world raw sugar), Coffee 'C' (Arabica Coffee), Cotton No. 2℠ (Cotton), Frozen Concentrated Orange Juice and Cocoa. In 2012, IFUS broadened its commodity product suite to include financially-settled futures on US grains and oilseeds and options on those futures. IFUS offers financial products in equity index, currency and commodity index markets. The exchange lists futures and options contracts on Russell indexes, including the US small cap equity benchmark Russell 2000® index, as well as the Russell 1000® and related style indexes. ICE® entered into a licensing agreement with Russell for the use of its indexes as the basis for equity index futures and options and ICE® has exclusive rights through the remainder of the licensing agreement, which extends through June 2017. IFUS also provides futures and options markets for over 60 currency pair contracts including Euro-based, US Dollar-based, Yen-based, Sterling-based and other cross-rates, as well as the benchmark US Dollar Index® futures contract. The US Dollar Index futures contract is based on the ICE US Dollar Index, the most well-known and widely quoted measure of the performance of the US Dollar. The exchange also offers futures contracts based on the Continuous Commodity Index, or CCI, and the Reuters Jefferies CRB Futures Price Index. The US Commodity Exchange Act generally requires that futures trading in the US be conducted on a commodity exchange registered as a designated contract market by the Commodity Futures Trading Commission, or CFTC. ICE Futures US® operates as a designated contract market and is regulated by the CFTC. ICE Futures US® is responsible for carrying out self-regulatory functions and has its own governance, compliance, surveillance functions, as well as a framework for disciplining members and other market participants that do not comply with exchange rules and policies. IFUS is periodically reviewed by the CFTC to insure that it is complying with its self-regulatory obligations. Market Participants:- ICE Futures US's participants include representatives from segments of the underlying industries served by its agricultural and financial markets, including the sugar, coffee,cotton and cocoa industries. Traders in these futures markets include hedgers, speculators and investors. Investors and speculators typically place orders through futures commission merchants (FCMs) or through introducing brokers (IBs) who have clearing relationships with FCMs. Investors may also pool their funds with other investors in collective investment vehicles known as Commodity Pools, which are managed by commodity pool operators and commodity trading advisors (CTAs). Trading Technology:- Trading of all ICE Futures US® listed products takes place electronically. In 2008, futures contracts at ICE Futures US® transitioned to exclusive electronic trading. In October 2012, open outcry trading of options came to an end. Some transactions, such as EFPs and blocks, are transacted privately rather than on the electronic trading platform and submitted electronically for clearing using ICEBlock. IFUS offers its screens for electronic trading in 30 jurisdictions. IFUS uses the ICE® electronic trading platform for it futures and options contracts. For futures-related products, the platform supports several order types, matching algorithms, price reasonability checks, inter-commodity spread pricing and real-time risk management. ICE® has also developed an implied matching engine that automatically discovers best bid and offer prices throughout the forward curve. The ICE® platform delivers average round trip transaction times of approximately 700 microseconds in its futures markets (transaction time is measured round trip performance end-to-end within the ICE® data center and through the ICE® matching engine). ICE's platform has proven to be extremely consistent, with more than 99.5% of transactions being completed in less than twenty milliseconds during peak trading periods. Along with speed and consistency, the ICE trading platform is reliable, typically offering greater than 99.99% availability. Connectivity:- ICE® offers access to its electronic markets through a broad range of interfaces, including dedicated lines, server co-location data centers, telecommunications hubs in the US, Europe and Asia, and directly via the Internet. The ICE® global network consists of high speed dedicated data lines connecting data hubs in New York, Atlanta, Chicago, London and Singapore with the exchange's and clearing house's primary and disaster recovery data centers. ICE's state-of-the-art hosting center is in Illinois, outside Chicago, and its disaster recovery site for its technology systems is in Georgia. ICE® offers server co-location space at its data centers to all its customers. This service allows customers to deploy their trading servers and applications onsite, virtually eliminating data transmission latency between the customer and the exchange. ICE's web-based front-end is called WebICE, and connectivity to the ICE trading platform is available through WebICE as well as multiple independent software vendors (ISVs; ICE® has approved a number of ISVs based on their technology offering and commitment to customer service; a list of the approved ISVs is available on the ICE website) and application program interfaces (APIs) for order routing, market data and trade capture. Generally, ICE® has over 10 000 connections to its platform daily via WebICE and over 4 000 connections to its platform through multiple ISVs, co-location centers, dedicated lines and global telecommunications hubs. ICE also has introduced ICE mobile

for iPhone®, iPod Touch® and iPad®, and Android® and Blackberry enabled devices. ICE® mobile allows WebICE users the ability to view and manage their WebICE orders from mobile devices as well as the option to enter orders and trade from certain mobile devices. These devices include the iPhone®, iPad® and Android® devices. / Ай.Си.И. Фьючез Ю.Эс., Инк. (ICE Futures US, Inc.) Расэл (Russell). Ай.Си.И. Клыэ Ю.Эс. (ICE Clear US). Эн.Уай.Эс.И. Лайф Ю.Эс. (NYSE Liffe US). Для айФон (iPhone®), айПад Тач (iPod Touch®) и айПад (iPad®), и Эндройд (Android®) и Блакбэри (Blackberry). НАЙБЭТ® (NYBOT®). НАЙМЭКС® (NYMEX®). Зэ Вол Стрит Дьжонэл (The Wall Street Journal). Ройтас Дьжефёриз (Reuters Jefferies). НЙФБ® или Эн.Уай.Эс.И.® (NYSE®).

ICE SKATE = КОНЁК – Ice Skate:- a shoe with a metal runner attached for ice-skating.

ICFP = INSTITUTE OF CERTIFIED FINANCIAL PLANNERS

ICFTU = INTERNATIONAL CONFEDERATION OF FREE TRADE UNIONS

ICGEB = INTERNATIONAL CENTER FOR GENETIC ENGINEERING AND BIOTECHNOLOGY

ICHCA = INTERNATIONAL CARGO HANDLING COORDINATING ASSOCIATION

ICID = INTERNATIONAL COMMISSION ON IRRIGATION AND DRAINAGE

ICIMOD = INTERNATIONAL CENTRE FOR INTEGRATED MOUNTAIN DEVELOPMENT

ICIPE = INTERNATIONAL CENTRE OF INSECT PHYSIOLOGY AND ECOLOGY

ICLARM = INTERNATIONAL CENTER FOR LIVING AQUATIC RESOURCES MANAGEMENT

ICM = INTERNATIONAL CAPITAL MARKETS ADVISORY COMMITTEE

ICMA = INSTITUTE OF COST AND MANAGEMENT ACCOUNTANTS

ICO = INITIAL COIN OFFERING

ICO = INTERNATIONAL COFFEE ORGANIZATION

ICP = INTERCOUNTRY PROGRAM ON INTEGRATED PEST CONTROL

ICPM = INTERIM COMMISSION ON PHYTOSANITARY MEASURES

ICRAF = INTERNATIONAL CENTRE FOR RESEARCH IN AGROFORESTRY

ICRC = INTERNATIONAL COMMITTEE OF RED CROSS

ICRISAT = INTERNATIONAL CROPS RESEARCH INSTITUTE FOR THE SEMI–ARID TROPICS

ICS = INTERNAL CONTROL SYSTEM

ICS = INTERNATIONAL CHAMBER OF SHIPPING

ICS = INVESTMENT CLIMATE STATEMENT

ICSD = INTERNATIONAL CENTRAL SECURITIES DEPOSITORY

ICSID = INTERNATIONAL CENTRE FOR SETTLEMENT OF INVESTMENT DISPUTES

ICSU = INTERNATIONAL COUNCIL OF SCIENTIFIC UNIONS

ICTA = INSTITUTO DE CIENCIA Y TECHNOLOGIA AGRICOLAS = INSTITUTE OF AGRICULTURAL SCIENCE AND TECHNOLOGY

ICTF = INTERMEDIATE CONTAINER TRANSFER FACILITY

ICWG–GR = INTER–CENTER WORKING GROUP ON GENETIC RESOURCES

ID = IBID

ID = INDONESIA

ID = INSIDE DIAMETER

ID = И.ДЭ. – ID is short for ‘Ibid’ (an abbreviation of ‘Ibidem’), meaning literally In The Same Place or Same As Previously Cited. / , от Латинского слова Ибид (Ibid), сокращение от Ибидэм (Ibidem), означающее В Том Же Месте, . ID = Idem = Тот Же.

IDA = INDIVIDUAL DEVELOPMENT ACCOUNT

IDA = INTERNATIONAL DEVELOPMENT ASSOCIATION

IDB = INDUSTRIAL DEVELOPMENT BOND

IDB = ISLAMIC DEVELOPMENT BANK

IDC = INITIAL DATA CAPTURE

IDCA = INTERNATIONAL DEVELOPMENT COOPERATION AGENCY

IDE = INTEGRATED DEVELOPMENT ENVIRONMENT

IDENTIFICATION OF GOODS AND/OR SERVICES = ИДЕНТИФИКАЦИЯ ТОВАРОВ И/ИЛИ УСЛУГ (или ОТОЖДЕСТВЛЕНИЕ ТОВАРОВ И/ИЛИ УСЛУГ) – In the US patent law, Identification Of Goods And/Or Services is a written statement of the goods and/or services included in an application. Every application must include an identification of goods and/or services. If you fail to list any recognizable goods or services, the United States Patent and Trademark Office (USPTO) will return the application and refund the fee. When specifying the goods and/or services, applicants should use clear, concise terms, i.e. common commercial names and language that the general public easily understands. Please note that the terms in the class headings or short titles of the classes in the ‘International Classification of Classes of Goods and Services’ are generally too broad and should not be used alone as an identification. Also, an international class number alone is never an acceptable listing. For a listing of acceptable wording for goods and services.

IDENTIFICATION TEST = ИСПЫТАНИЕ НА ИДЕНТИФИКАЦИЮ (или ТЕСТ НА ОТОЖДЕСТВЛЕНИЕ, или ТЕСТ НА ОПОЗНАВАНИЕ) – Identification Test is any procedure for determining kinds of fibers, yarn construction, fabric construction, or finish and coloring of textiles. Physical, chemical, microscopic and other methods may be used. / Под Идентификацией, от Латинского слова Identificare, означающее Отождествлять, понимается установление на основании определённых признаков тождества различных объектов.

IDENTITY–PRESERVED = РАЗДЕЛЬНО КОНСЕРВИРУЕМОЕ (или ХРАНИМОЕ ОТДЕЛЬНО) – In a primary elevator, Identity-Preserved or special bin grain is held in a separate bin at the request of the owner. / В заготовительном (первичном) элеваторе раздельно консервируемое (или хранимое отдельно) или специальное бункерное зерно, которое хранится в отдельном бункере по требованию владельца.

I/D ENTRE = IMMEDIATE DELIVERY ENTRY

IDEOTYPE = ИДЕОТИП – Ideotype is an ideal plant type used as a model for selective breeding to develop specific plant characteristics desired or required in particular ecosystems. / Под Идеотипом, от Греческих слов Idéa, означающее Идея или Образ, и Тýpos, означающее Образец или Отпечаток или Форма, понимается .

IDESSA = INSTITUT DES SAVANES

IDH = ISOCITRIC DEHYDROGENASE

IDIAP = INSTITUTO DE INVESTIGACIÓN AGROPECUARIA DE PANAMÁ

IDIOBLAST = ИДИОБЛАСТ – Idioblast is a special cell in a tissue which differs markedly in form, size or contents from other cells in the same tissue. / особая клетка в ткани, которая . Под Идиобластом, от Греческого слова Idios, означающее Особый или Своеобразный или Свой, и Blastos, означающее Росток, понимается . Растительная клетка, отличающаяся по форме, структуре или содержимому от остальных клеток той же ткани.

IDLE TIME = ПРОСТОЙ (или ВРЕМЯ ПРОСТОЯ) – Idle Time is the amount of ineffective time whereby the available resources are not used, e.g., a container in a yard. / Количество неэффективного времени, в течение которого доступные ресурсы не используются, например, контейнер в контейнерном дворе.

IIT = INDIAN INSTITUTE OF TECHNOLOGY

IITA = INTERNATIONAL INSTITUTE OF TROPICAL AGRICULTURE

I/J = INDICA/JAPONICA

I–JOIST = ДВУТАВРОВАЯ ВТОРОСТЕПЕННАЯ БАЛКА – I-Joist is an engineered wood joist, more commonly known as an I-Joist is a product designed to eliminate many of the problems that occur with using conventional wood joists. Invented in 1969, the I-joist is a man made engineered wood product which has incredible strength in relation to its size and weight. The biggest notable difference, other than their look, compared to dimensional lumber is that the I-joist is designed to carry heavy loads over long distances while using less lumber than a dimensional solid wood joist of a size necessary to do the same task. As of 2005, approximately 50% of all wood light framed floors were framed using I-joists. The wood I-Joist is very efficient at utilizing wood fiber. The flanges (the top and bottom of the assembled member) are designed to resist bending forces and provide stiffness to the product. The web section, typically plywood or OSB, is designed to resist the shear forces in the joist. The connection between the two typically occurs in a rout in the flange where adhesive has been applied. The efficiencies obtained through the use of an 'I' cross section require additional considerations relative to solid rectangular sections. The intent of this document is to familiarize the user with the special requirements of designing and installing I-Joist systems. Wood I-Joists are well accepted throughout the construction industry. I-joists are a high strength, cost efficient alternative to conventional framing. They are exceptionally stiff, lightweight and capable of long spans. Holes may be easily cut in the web according to manufacturer's recommendations, allowing ducts and utilities to be run through the joist. I-joists are dimensionally stable and uniform in size, with no crown. This keeps floors quieter, reduces field modifications, and eliminates rejects in the field. I-joists may be field cut to proper length using conventional methods and tools. Manufacturing of I-joists utilizes the geometry of the cross-section and high strength components to maximize the strength and stiffness of the wood fiber. Flanges are manufactured from solid sawn lumber or structural composite lumber, while webs typically consist of plywood or oriented strand board. The efficient utilization of raw materials, along with high quality exterior adhesives and state of the art quality control procedures, result in an extremely consistent product that maximizes environmental benefits as well. Wood I-joists are produced as proprietary products which are covered by code acceptance reports by one or all of the model building codes. Acceptance reports and product literature should be consulted for current design information. Prefabricated wood I-joists are used throughout the world. They are widely used as a framing material for housing in North America. I-joists are made in different grades and with various processes and can be utilized in various applications. Proper design is required to optimize performance and economics. In addition to use in housing, I-joists find increasing use in commercial and industrial construction. The high strength, stiffness, wide availability and cost saving attributes make them a viable alternative in most low-rise construction projects. Prefabricated wood I-joists are typically used as floor and roof joists in conventional construction. In addition, I-joists are used as studs where long lengths and high strengths are required. I-joists are widely regarded as a premium construction material and are available throughout the United States. To efficiently specify I-joists for individual construction projects, consideration should be given to the size and the required strength of the I-joist. Sizes vary with each individual product. The best source of this information is your local lumber supplier, distribution center or I-joist manufacturer. Proper design is facilitated through the use of manufacturer's literature and specification software available from I-joist manufacturers. / древесная балка (wood joist). , тогда как раскосы/решётки . Под Балкой, от Голландского слова Balk, понимается конструктивный элемент, обычно в виде бруса, работающего главным образом на изгиб. Балки широко применяют в строительстве и машиностроении:- в конструкциях зданий, мостов, эстакад, транспортных средств, машин, станков и так далее. Изготовляют балки в основном из железобетона, металла и дерева. В зависимости от числа опор и характера опорных закреплений различают балки однопролётные, многопролётные, консольные, с заделанными концами, разрезные, неразрезные; в зависимости от формы поперечного сечения – прямоугольные, тавровые, двутавровые, коробчатые и другие. Расчёт балки обычно производят на прочность, жёсткость и устойчивость по законам сопротивления материалов.

IKAT = ИКАТ – Ikat is a fabric in which the yarns have been tie-dyed before weaving. / Икат – Малайская ткань из предварительно окрашенных нитей.

IL = INTERLINKING SYSTEM

IL = ISRAEL

ILA = INTERNATIONAL LONGSHOREMEN'S ASSOCIATION

ILC = INTERLINKING COMPONENT

ILCA = INTERNATIONAL LIVESTOCK CENTRE FOR AFRICA

ILGWU = INTERNATIONAL LADIES' GARMENT WORKERS' UNION

ILL = INTERLIBRARY LENDING

ILLIQUIDITY = НЕЛИКВИДНОСТЬ – (1) Illiquidity is a situation in which an asset is not easily converted into cash, or in which a person is unable to raise cash quickly and/or easily. / Ситуация, при которой актив не является свободно обратимым в денежные средства, или при которой лицо не в состоянии быстро и/или легко раздобыть денежные средства.

(2) Illiquidity is a lack of liquid and easily marketable assets resulting in payment liabilities and obligations not being met on time. See also Insolvency. / Неликвидность – нехватка ликвидных и легко обращаемых на рынке активов вследствие оплаты пассивов и обязательств, которые не были удовлетворены в срок. Смотрите также Неплатёжеспособность (Insolvency).

ILLITE = ИЛЛИТ – Illite is a 2:1 layered clay in which a negative charge caused by ion substitution is neutralized by potassium ions.

ILLIMINANT = ОСВЕТИТЕЛЬНОЕ СРЕДСТВО (или ИСТОЧНИК СВЕТА, или ИЛЛЮМИНАНТ) – Illuminant:- mathematical description of the relative spectral power distribution of a real or imaginary light source, that is, the relative energy emitted by a source at each wavelength in its emission spectrum (the data entered into a color computer, used to predict the effect of different light sources on the perceived color). Illuminant is a table of spectral distribution as close as possible to that of the natural light source, usually daylight, to be duplicated.

ILLUMINANT A = ИЛЛЮМИНАНТ ЭЙ. – Illuminant A (CIE):- incandescent illumination, yellow orange in color, with a correlated color temperature of 2 856 K. It is defined in the wavelength range of 380–770 nm. Commission Internationale de l'Eclairage (CIE) is the French title of the International Commission on Illumination. / Комисьо Этэрнасьёналь дё л'Эклераж (Сэ.И.Е.; Commission Internationale de l'Eclairage (CIE)).

ILLUMINANTS D = ИЛЛЮМИНАНТЫ ДИ. – Illuminants D:- daylight illuminants, defined from 300–830 nm, the UV portion 300–380 nm being necessary to describe correctly colors which contain fluorescent dyes or pigments. They are designated as D with a subscript to describe the correlated color temperature:- D65 having a correlated color temperature of 6 504 K, close to that of Illuminant C, is the most commonly used. They are based on actual measurements of the spectral distribution of daylight.

ILLUMINATING DYE = СВЕТИЛЬНЫЙ КРАСИТЕЛЬ (или ИЛЛЮМИНИРУЮЩИЙ КРАСИТЕЛЬ, или ОСВЕТИТЕЛЬНЫЙ КРАСИТЕЛЬ) – Illuminating Dye is a dye mixed with discharge paste in printing techniques; also called Head Dye. In some discharge

printing techniques, dye is mixed with the discharge paste, so that the discharged area is given a new color. Illuminating dyes must be selected carefully, since they must resist the effects of the discharge chemicals.

ILLUMINATOR = ИЛЛЮМИНАТОР (или ОСВЕТИТЕЛЬ, или СВЕТИЛЬНИК, или ОСВЕТИТЕЛЬНЫЙ ПРИБОР) – Illuminator:- the portion of a radiometric or photometric instrument that provides the illuminating beam on the specimen, including the source, occasionally the monochromator or spectral filters, a diffuser such as an integrating sphere, if used, and associated optics. / Под Иллюминатором, от Латинского слова Illuminator, означающее Осветитель, от Illumino, означающее Освещаю, понимается застеклённое окно в корпусе или надстройке судна для освещения и вентиляции внутренних помещений. Судовые иллюминаторы бывают круглые (бортовые и рубочные) и прямоугольные (рубочные), глухие и открывающиеся, часто с водонепроницаемыми крышками. Выбор типа иллюминатора определяется местом его установки и расстоянием до ватерлинии. Иллюминаторами называются также круглые окна подводного исследовательского аппарата, самолёта, вертолёта, космического корабля и других.

ILLUSION = ИЛЛЮЗИЯ (или ОБМАН, или ОБМАНКА) – Illusion is a very fine net or mesh fabrics such as those used in bridal veils. Illusion usually is made of either silk or nylon. Illusion:- a very fine, all-silk tulle which originated in France. It has a cobweb appearance. Hexagonal open mesh. Made in 52 inch and 72 inch widths. Used in veils, particularly for weddings, trimmings. / Найлан^{T3} (Nylon^{TM}). Под Иллюзиями, от Латинского слова Illusio, от Illudo, означающее Насмехаюсь или Обманываю или Разыгрываю, понимаются:- (1) неадекватное представление о воспринимаемом объекте, выходящее за границы обычных ошибок восприятия. Иллюзии представляют собой по преимуществу неосознанное и не поддающееся произвольной коррекции явление. (2) Ложные, несбыточные надежды, мечты.

ILMA = INDEPENDENT LUBRICANT MANUFACTURERS ASSOCIATION

ILO = INTERNATIONAL LABOR ORGANIZATION

ILRAD = INTERNATIONAL LABORATORY FOR RESEARCH ON ANIMAL DISEASES

ILRI = INTERNATIONAL INSTITUTE FOR LAND RECLAMATION AND IMPROVEMENT

ILRI = INTERNATIONAL LIVESTOCK RESEARCH INSTITUTE

ILS = ISRAELI SHEKEL

ILSAC = INTERNATIONAL LUBRICANT STANDARDIZATION AND APPROVAL COMMITTEE

ILU = INSTITUTE OF LONDON UNDERWRITERS

ILV = INTEGRATED LLOYD'S VEHICLE

IMAGE ANALYZER = АНАЛИЗАТОР ИЗОБРАЖЕНИЯ – Image Analyzer is a sophisticated microscopic system involving a microscope, a television camera, a dedicated computer, and a viewing monitor similar to a television screen.

IMAGE FILE WRAPPER = ХХ ФАЙЛА ИЗОБРАЖЕНИЯ – In the US patent paw, Image File Wrapper (IFW) is an electronic version of a patent application, including image and/or text versions of the bibliographic information, all papers as filed, and all office (the United States Patent and Trademark Office (USPTO)) actions and correspondence related to that application.

IMAGE PRESENTMENT = ПРЕДСТАВЛЕНИЕ ИЗОБРАЖЕНИЯ (или ПРЕДСТАВЛЕНИЕ КОПИИ) – In the United States, Image Presentment means electronic check presentment when an image of the check and the magnetic ink character recognition (MICR) line are included in the data sent to the paying bank. Under image presentment, the delivery of paper checks to the paying bank is not necessary for legal presentment.

IMAGO = ИМАГО (или ВЗРОСЛАЯ СТАДИЯ) – Imago is the last (adult) stage of development of an insect, after the last ecdysis (moulting) of an incomplete metamorphosis, or after emergence from the pupae where the metamorphosis is complete. As this is the only stage that is sexually mature and has functional wings in winged species, the imago is often referred to as the Adult Stage. The Latin plural of imago is imagines, and this is the term generally used by entomologists. However, imagos is also acceptable. Imago (plural:- Imagoes):- fully developed insects. / Полностью развившиеся насекомые. Взрослая стадия в метаморфозе насекомого. Термин Имаго, от Латинского слова Imago, означающее Вид или Образ, относится к окончательной (дефинитивной) стадии индивидуального развития животных, взрослому животному. Этот термин обычно употребляется по отношению к насекомым.

IMBALANCE ENERGY = ДИСБАЛАНС ЭЛЕКТРОЭНЕРГИИ – Imbalance Energy:- the real-time change in generation output or demand requested by the Independent System Operator (ISO) to maintain reliability of the ISO-controlled grid. Sources of imbalance energy include regulation, spinning and non-spinning reserves, replacement reserve, and energy from other generating units that are able to respond to the ISO's request for more or less energy. Discrepancy between the amount that a seller contracted to deliver and the actual volume of power delivered. Imbalances are resolved through monetary payment. / выработка (output). Расхождение в количестве между законтрактованным продавцом объёмом поставки электроэнергии и реально поставленным объёмом. Эти несоответствия разрешаются через денежные взаиморасчёты.

IMBIBITION = ВПИТЫВАНИЕ (или ВСАСЫВАНИЕ, или ПОГЛОЩЕНИЕ, или НАБУХАНИЕ, или НАСЫЩЕНИЕ ВЛАГОЙ) – (1) Imbibition is the process of absorbing or taking in water as in drinking.

(2) Imbibition is a measure of the liquid or water-holding capacity of a textile material. / .

IMBIBITION = НАБУХАНИЕ (или НАСЫЩЕНИЕ ВЛАГОЙ) – Imbibitions are a physical process mainly concerned with adsorption of water. If a living (e.g., seed) or a dead plant (e.g., dry wood) material is kept in water, it absorbs water and swells, up considerably leading to increase in volume. These substances (seeds, dry wood etc) are called Imbibants. The liquid (water) which is absorbed is termed as Imbibed Substance and the phenomenon is referred to as Imbibitions. Imbibitions may be defined as a physical process in which living or dead plant materials take up water or liquid mainly by adsorption due to the presence of hydrophilic or lyophilic colloids inside them through the submicroscopic capillaries present on their general surface of the body. In plants imbibitions of water takes place by the constituents of cell wall and protoplasm such as carbohydrates, proteins etc. Conditions necessary for imbibitions:- (i) the existence of a diffusion pressure gradient between the imbibant and the substance imbibed; and (ii) the existence of certain affinity between components of the imbibant and the imbibed substance. Dry plant materials and seeds posses too much negative water potential. As a result water moves into them, when the plant materials arc placed in water. The movement of water into plant materials continues till a dynamic equilibrium is attained. An imbibing does not necessarily imbibe all kinds of liquids. For example, dry plant materials immersed in ether do not swell appreciably. However, rubber, a plant product does imbibe ether and swell appreciably if submerged in it. On the other hand rubber will not imbibe water. This shows there exists some affinity or attractive force between the

imbibant (rubber) and the liquid ether a considerable amount of materials such as proteins, carbohydrates etc occur as hydrophilic colloids inside the cells. They have a strong affinity for water. Imbibitions Pressure:- it represents the pressure that an imbibant develops when submerged in water. This pressure can be of tremendous magnitude. This fact becomes clear from the splitting of rock brought about by inserting dry wooden stakes in the crcuiccs of rock and soaking them with water. Why does rock split because too much imbibitions pressure develops due to imbibitions. The imbibitional pressure also helps in breaking soil profiles by germinating seeds. Factors affecting the rate of imbibitions:- (i) Temperature:- the rate of imbibitions increases with the increase in temperature. (ii) Concentration of the Solute:- the presence of solutes in water affects the rate of imbibitions the rate L more in pure water than in a solution. Increase in concentration of the solute decreases imbibitions. Imbibitions totally ceases at a very high concentration of solutes in external solution. Biological importance of imbibitions:- (i) imbibitions play a key role in the initial stage of water absorption by the roots; (ii) imbibitions initiate seed germination; (iii) the imbibitions force is useful in adhering water to the walls of xylem elements; (iv) it helps fruits to retain water; and (v) it also plays a major role in young and actively growing tissues. See also Water Imbibition. / Под Набуханием понимается увеличение объёма твёрдого тела вследствие поглощения им из окружающей среды жидкости или пара. Набухание характерно для полимеров и некоторых минералов со слоистой кристаллической решёткой. Набухание – важный процесс в текстильной технологии, кожевенном производстве, хлебопекарной промышленности.

IMBRICATE = ЧЕРЕПИТЧАТО–РАСПОЛОЖЕННОЕ (или ЧЕРЕПИЦЕОБРАЗНОЕ, или НАБЕГАЮЩЕЕ) – Imbricate:- with overlapping edges. / – с заходящими друг на друга краями.

IMC = INDEX OF MARKET CONNECTION

IMC = INTERMODAL MARKETING COMPANY

IMCO = INTERNATIONAL MARITIME CONSULTATIVE ORGANIZATION

IMDG CODE = INTERNATIONAL MARITIME DANGEROUS GOODS CODE

IMF = INTERNATIONAL MONETARY FUND

IMI = INTERNATIONAL MARKET INSIGHTS

IMM = INTERNATIONAL MONETARY MARKET

IMMATURE = НЕДОЗРЕЛЫЕ – Immature damaged Soybeans are characterized by a green exterior appearance in conjunction with green discoloration penetrating the cotyledon. Examination of the cotyledons is determined by cutting the Soybeans in cross section. For grading purposes, immature damaged Soybeans are considered as part of the Total Damage grade specification. Soybeans that are green in appearance and have no discoloration of the cotyledon or just a halo of green around the outside of the cotyledon are to be assessed against the overall color of the sample. / Недозрелые повреждённые Соевые Бобы характеризуются наличием зелёной окраски снаружи совместно с проникающим изменением в зелёный цвет семядоли (cotyledon). Проверка семядолей осуществляется с помощью поперечного среза Соевых Бобов. В отношении определения сорта недозрелые повреждённые соевые бобы рассматриваются как часть Полного Повреждения в сортовой спецификации. Соевые Бобы зелёной наружности, не имеющие изменения цвета семядоли или просто с ореолом зелёного цвета вокруг наружной поверхности семядоли, должны оцениваться против всеобщего цвета пробы.

IMMATURE COTTON = НЕДОЗРЕЛЫЙ ХЛОПЧАТНИК (или НЕЗРЕЛЫЙ ХЛОПОК) – Immature Cotton is a Cotton that has been picked and baled before the fiber has reached a normal state of maturity, resulting in a weakened staple of inferior value.

IMMATURE COTTON FIBER = НЕДОЗРЕЛОЕ ХЛОПКОВОЕ ВОЛОКНО – Immature Cotton Fiber is the fiber which, upon swelling, either assumes a spiral form or lies flat, thinly outlined and almost transparent. It has a wall thickness of less than one-fourth of the maximum fiber width. Immature Cotton has a different cross-section from mature Cotton, and the permeability test helps identify this important parameter. Immature Cotton fibers also have dyeing characteristics that differ from those of mature fibers. Thus it is often important to determine if the fiber being used is mature or not.

IMMATURE GRAINS = НЕДОЗРЕЛЫЕ ЗЁРНА (или НЕЗРЕЛЫЕ ЗЁРНА) – Immature Grains are the grains with still greenish caryopsis or brown Rice.

IMMATURE KERNELS = НЕДОЗРЕЛАЯ ЗЕРНОВКА (или НЕДОЗРЕЛЫЕ ЯДРА) – Immature Kernels mean Rice kernels which are light green and smaller than normal grains. Immature kernels mean Rice kernels that are light green, obtained from immature paddy. / Под Недозрелой Зерновкой понимается зерновка риса, имеющая светло-зеленоватый оттенок вследствие недозрелости собранного риса и характеризующаяся меньшими размерами нежели нормальные зёрна.

IMMATURE SEED COTTON = НЕДОЗРЕЛЫЙ ХЛОПОК–СЫРЕЦ – Immature Seed Cotton:- immature seeds are motes:- can be either fuzzy (immature seeds on which fiber development ceased at an early stage) or bearded (a piece of seed coat with long fibers attached). Both are often termed seed coat neps. Immature seeds covered with fuzz fibers and sometimes also with very short lint. Immature seeds on which fiber development ceased at an early stage. Cotton which has been picked and baled before actual maturity; causes inferior staple. / Хлопок-сырец с нераспушёнными слежавшимися дольками из-за раннего прекращения отложения клетчатки в волокне и, в следствии этого, с полным отсутствием в нём извитости, упругости и прочности волокна.

IMMEDIATE DELIVERY ENTRY = ВВОЗ ДЛЯ НЕПОСРЕДСТВЕННОЙ ПОСТАВКИ – In the United States, the Immediate Delivery Entry (I/D Entry) used to expedite clearance of cargo. It allows for up to ten days for the payment of estimated duty and processing of the consumption entry. In addition, it permits the delivery of the cargo prior to payment of the estimated duty and then allows subsequent filing of the consumption entry and duty. Procedure allowing cargo to be delivered up to ten days prior to the payment of estimated duties. Includes merchandise such as fresh fruits and vegetables for human consumption from Mexico and Canada.

IMMEDIATE ELASTIC DEFORMATION = МГНОВЕННАЯ ЭЛАСТИЧЕСКАЯ ДЕФОРМАЦИЯ (МГНОВЕННАЯ УПРУГАЯ ДЕФОРМАЦИЯ, или МГНОВЕННАЯ ОБРАТИМАЯ ДЕФОРМАЦИЯ) – Immediate Elastic Deformation is the recoverable deformation that is essentially independent of time, i.e. occurring in (a time approaching) zero time and recoverable in (a time approaching) zero time after removal of the applied load.

IMMEDIATE EXIT = НЕПОСРЕДСТВЕННЫЙ ВЫПУСК (или НЕМЕДЛЕННЫЙ ВЫПУСК) – In the United States, Customs Immediate Exit (IE) Form is used when goods are brought into the US and are to be immediately re-exported without being transported within the US.

IMMEDIATE EXPORTATION = НЕПОСРЕДСТВЕННЫЙ ВЫВОЗ (или НЕМЕДЛЕННОЕ ЭКСПОРТИРОВАНИЕ) – Immediate Exportation is an entry that allows foreign merchandise arriving at one port to be exported from the same port without the payment of

duty. / вывоз (exportation). Ввоз, который позволяет иностранному товару, прибывающему в какой-либо порт, быть вывезенным (или экспортированным) из этого же порта без оплаты пошлины.

IMMEDIATE OR CANCEL ORDER = РАСПОРЯЖЕНИЕ НА НЕМЕДЛЕННОЕ ИСПОЛНЕНИЕ ИЛИ ОТМЕНУ – Immediate-Or-Cancel Order is a type of order in the Xetra® electronic trading system requiring that all or part of the order be executed immediately after it has been brought to the market. Any portions not executed immediately are automatically cancelled. An order which must be filled immediately or be canceled. Immediate Or Cancel (IOC) orders need not be filled in their entirety. / Ксэтра® (Xetra®). Распоряжение, которое должно быть исполнено немедленно, в противном случае отменено. Распоряжения на Немедленное Исполнение Или Отмену (НИО) вовсе не нуждаются в исполнении в полном объёме.

IMMEDIATE TRANSPORTATION ENTRY = ВВОЗ ДЛЯ НЕПОСРЕДСТВЕННОЙ ТРАНСПОРТИРОВКИ – Immediate Transportation Entry:- refers to an I/T Entry (US Customs). Allows the cargo to move beyond the vessel entry point in bond for customs clearance at the destination named in the I/T movement from one customs district to another, e.g., cargo entering the United States at Los Angeles destined for Chicago can move to Chicago before having a customs inspection. Cargo must clear Customs at the inland destination point. Immediate Transportation Entry (I/T Entry) allows the cargo to be moved from the pier to an inland destination via a bonded carrier without the payment of duties or finalization of the entry at the port of arrival. Immediate Transportation Entry permits shipment to be moved, by a bonded domestic carrier, from the port-of-entry to an inland destination without payment of duty or finalization of entry at port-of-entry.

IMMISCIBLE = НЕСМЕШИВАЕМОЕ (или НЕСМЕШИВАЮЩЕЕСЯ) – Immiscible:- incapable of being mixed without separation of phases. Water and petroleum oil are immiscible under most conditions, although they can be made miscible with the addition of an emulsifier.

IMMOBILIZATION = ИММОБИЛИЗАЦИЯ (или ОБЕЗДВИЖИВАНИЕ) – (1) Immobilization is a placement of certificated securities and financial instruments in a central securities depository to facilitate book-entry transfers. / Размещение сертифицированных ценных бумаг и финансовых инструментов в центральном депозитарии ценных бумаг для облегчения бездокументарной передачи.

(2) Immobilization is the conversion of an element from inorganic form to organic form in microbial tissues so that the element is not readily available to plants.

IMMUNE = ИММУННОЕ – Immune:- completely resistant to infection by a plant pathogen. Immunity is normal as most plants are immune to most pathogens. Immune:- completely resistant to pest or disease of the plant.

IMO = INTERNATIONAL MARITIME ORGANIZATION

IMPACT = INTERNATIONAL MODEL FOR POLICY ANALYSIS OF AGRICULTURAL COMMODITIES AND TRADE

IMPACT DAY = УДАРНЫЙ ДЕНЬ (или ДЕНЬ ДЕЙСТВИЙ) – Impact Day is the day on which the availability of the prospectus is advertised, and the flotation is officially announced, along with the pricing of the shares.

IMPACT RESISTANCE = УДАРОСТОЙКОСТЬ (или УДАРНАЯ СТОЙКОСТЬ, или УДАРНАЯ ВЯЗКОСТЬ, или СОПРОТИВЛЕНИЕ УДАРУ) – Impact Resistance is:- (1) the resistance of a material to fracture by a blow, expressed in terms of the amount of energy absorbed before fracture. (2) In yarn or cord, the ability to withstand instantaneous or rapid rate of loading.

IMPACT STRENGTH = УДАРОПРОЧНОСТЬ (или УДАРНАЯ ПРОЧНОСТЬ, или ПРОЧНОСТЬ ПРИ УДАРЕ, или КРЕПОСТЬ ПРИ УДАРЕ) – Impact Strength is the ability of a material to absorb mechanical energy in the process of deformation and fracture under impact loading. The term Impact Strength, as well as the term Impact Energy, is also applied to the amount of energy absorbed before fracture. To determine impact strength, a bending impact test is commonly used. The specimen in this case has a prismatic bar shape, and a transverse notch is cut in one side of the specimen. The impact strength is regarded as the work required for the fracture of the specimen. In the former USSR the work is generally referred to the cross-sectional area of the specimen at the base of the notch and is expressed in Joules per square meter, Newton-meters per square meter, or kilogram-force-meters per square centimeter. Impact strength is one of the most important strength characteristics of a metal. When the test temperature is lowered over a series of tests, a sharp drop in impact strength indicates the brittle temperature of the material. Reliable performance of the material is possible only at temperatures above the brittle temperature. In another type of bending impact test that is sometimes used, a small fatigue crack is produced in advance at the base of the notch; the crack is 1.5 mm in length. In this case a measurement is made of the specific work required for fracture of the specimen. Compared with the impact strength as measured in the first type of test described, the impact strength measured in this way provides a more sensitive characterization of the brittleness of high-strength materials. See also Impact Resistance. Impact Strength, is the capability of the material to withstand a suddenly applied load and is expressed in terms of energy. Often measured with the Izod impact strength test or Charpy impact test (French scientist Georges Charpy (full name Georges Augustin Albert Charpy (01 September 1865 – 25 November 1945) proposed the Charpy impact test in 1901), both of which measure the impact energy required to fracture a sample. Volume, modulus of elasticity, distribution of forces, and yield strength affect the impact strength of a material. In order for a material or object to have a higher impact strength the stresses must be distributed evenly throughout the object. It also must have a large volume with a low modulus of elasticity and a high material yield strength. American Society for Testing and Materials (ASTM). / Американское Общество по Испытаниям и Материалам (АОИМ). Ударный Тест по Шарпи ИСО 179 (АОИМ Ди.256 (ASTM D256)):- основным отличием методов Шарпи и Изода является способ установки испытуемого образца. При испытании по методу Шарпи образец не зажимают, а свободно устанавливают на опору в горизонтальном положении. (полное имя Жорж Огюста Альбэр Шарпи (Georges Augustin Albert Charpy)).

IMPAIRMENT = ОБЕСЦЕНЕНИЕ (или СНИЖЕНИЕ СТОИМОСТИ) – (1) Impairment is the act of making something futile and useless (as by routine). See also Write Down. / Смотрите также Уценка (Write Down).

(2) Impairment is a reduction in a company's stated capital. This is usually reduced because of poorly estimated losses or gains. Impairment is a reduction in a firm's capital as a result of distributions or losses. Impairment is a reduction in a company's working capital as a result of a loss on an investment or a distribution (such as a coupon or dividend) to investors. Impairment is the occurrence of a change for the worse (as in strength, value, or quality).

(3) The total capital that is less than the par value of the company's capital stock. Impairment can be used in many contexts. Whatever the situation, impairment is bad for the company.

IMPAIRMENT CHARGE = СПИСАНИЕ ВСЛЕДСТВИЕ ОБЕСЦЕНЕНИЯ (или ЗАПИСЬ ВСЛЕДСТВИЕ СНИЖЕНИЯ СТОИМОСТИ) – Impairment Charge is a specific reduction on a company's balance sheet that adjusts the value of a company's goodwill. Due to accounting rules, a company must monitor and test the value of its goodwill, to determine if it is overvalued. If it is, the

company must issue an impairment charge on its balance sheet, to take into account the reduced value of the goodwill. Adjustment in the accounting value of an asset. Impairment Charge is the new term for writing off worthless goodwill. These charges started making headlines in 2002 as companies adopted new accounting rules and disclosed huge goodwill write-offs (for example, AOL – USD54 billion, SBC – USD1.8 billion, and McDonald's – USD99 million). While impairment charges have since then gone relatively unnoticed, they will get more attention as the weak economy and faltering stock market force more goodwill charge-offs and increase concerns about corporate balance sheets. This article will define the impairment charge and look at its good, bad and ugly effects. Impairment Defined:- as with most generally accepted accounting principles, the definition of 'impairment' is in the eye of the beholder. The regulations are complex, but the fundamentals are relatively easy to understand. Under the new rules, all goodwill is to be assigned to the company's reporting units that are expected to benefit from that goodwill. Then the goodwill must be tested (at least annually) to determine if the recorded value of the goodwill is greater than the fair value. If the fair value is less than the carrying value, the goodwill is deemed 'impaired' and must be charged off. This charge reduces the value of goodwill to the fair market value and represents a 'mark-to-market' charge. The Good:- if done correctly, this will provide investors with more valuable information. Balance sheets are bloated with goodwill that resulted from acquisitions during the bubble years, when companies overpaid for assets by using overpriced stock. Over-inflated financial statements distort not only the analysis of a company but also what investors should pay for that stock. The new rules force companies to revalue these bad investments, much like what the stock market has done to individual stocks. The impairment charge also provides investors with a way to evaluate corporate management and its decision-making track record. Companies that have to write off billions of Dollars due to impairment have not made good investment decisions. Managements that bite the bullet and take an honest all-encompassing charge should be viewed more favorably than those who slowly bleed a company to death by deciding to take a series of recurring impairment charges, thereby manipulating reality. The Bad:- the accounting rules (FAS 141 and FAS 142) allow companies a great deal of discretion in allocating goodwill and determining its value. Determining fair value has always been as much an art as a science and different experts can arrive honestly at different valuations. In addition, it is possible for the allocation process to be manipulated for the purpose of avoiding flunking the impairment test. As managements attempt to avoid these charge-offs, more accounting shenanigans will undoubtedly result. It's doubtful that very many corporate managements will face reality and take their medicine. Compensation packages will incite managers to delay the inevitable as they hope for a stock market rebound that will boost fair value. A delay, however, could backfire and adversely impact EPS in 2003. According to the rules, impairment charges that occur within the first year of adopting the new accounting rules (calendar 2002 for most corporations) are accounted for as a charge to equity. After the first year, impairment charges hit the income statement. Consequently, postponing may help results in 2002 but could reduce EPS in 2003. The other bad thing is that investors will have a hard time evaluating how management is handling this issue. The process of allocating goodwill to business units and the valuation process will be hidden from investors, which will provide ample opportunity for manipulation. Companies are also not required to disclose what is determined to be the fair value of goodwill, even though this information would help investors make a more informed investment decision. The Ugly:- things could get ugly if increased impairment charges reduce equity to levels that trigger technical loan defaults. Most lenders require companies who have borrowed money to promise to maintain certain operating ratios. If a company does not meet these obligations (also called Loan Covenants), it can be deemed in default of the loan agreement. This could have a detrimental effect on the company's ability to refinance its debt, especially if it has a large amount of debt and in need of more financing. An Example:- assume that NetcoDOA (a pretend company) has equity of USD3.45 billion, intangibles of USD3.17 billion and total debt of USD3.96 billion. This means that NetcoDOA's tangible net worth is USD28 million (USD3.45 billion of equity less debt of USD3.17 billion). Let's also assume that NetcoDOA took out a bank loan in late 2000 that will mature in 2005. The loan requires that NetcoDOA maintain a capitalization ratio no greater than 70%. A typical capitalization ratio is defined as debt represented as a percent of capital (debt plus equity). This means that NetcoDOA's capitalization ratio is 53.4%:- debt of USD3.96 billion divided by capital of USD7.41 billion (equity of USD3.45 billion plus debt of USD3.96 billion). Now assume that NetcoDOA is faced with an impairment charge that will wipe out half of its goodwill (USD1.725 billion), which will also reduce equity by the same amount. This will cause the capitalization ratio to rise to 70%, which is the limit established by the bank. Also assume that, in the most recent quarter, the company posted an operating loss that further reduced equity and caused the capitalization ratio to exceed the maximum 70%. In this situation, NetcoDOA is in technical default of its loan. The bank has the right to either demand it be repaid immediately (by declaring that NetcoDOA is in default) or, more likely, require NetcoDOA to renegotiate the loan. The bank holds all the cards and can require a higher interest rate or ask NetcoDOA to find another lender. In the current economic climate, this is not an easy thing to do. Note:- The numbers used above are based upon real data. They represent the average values for the 61 stocks in Baseline's integrated telco industry list. Conclusion:- new accounting regulations that require companies to mark their goodwill to market will be a painful way to resolve the misallocation of assets that occurred during the dotcom bubble (1995–2000). In several ways, it will help investors by providing more relevant financial information, but it also gives companies a way to manipulate reality and postpone the inevitable. If the economy and stock markets remain weak, many companies could face loan defaults. Individuals need to be aware of these risks and factor them into their investing decision-making process. There are no easy ways to evaluate impairment risk, but there are a few generalizations that should serve as red flags indicating which companies are at risk:- (i) company made large acquisitions in the late 1990s (notably the telco and AOL); (ii) company has high (greater than 70%) leverage ratios and negative operating cash flows; and (iii) company's stock price has declined significantly since 2000. Unfortunately, the above can be said about most companies. / Переоценка учётной ценности актива. пузырь (bubble).

IMPAIRMENT LOSS = УБЫТОК ВСЛЕДСТВИЕ ОБЕСЦЕНЕНИЯ (или УБЫТОК ВСЛЕДСТВИЕ СНИЖЕНИЯ СТОИМОСТИ) – Impairment Loss is a special, nonrecurring charge taken to write down an asset with an overstated book value. Generally an asset is considered to be value-impaired when its book value exceeds the future net cash flows expected to be received from its use. An impairment write-down reduces an overstated book value to fair value. An impairment loss is measured as the amount by which the asset's carrying amount exceeds the higher of the value in use and the net selling price of that asset. The Impairment Loss is reported as a separate line item on the income statement, and new adjusted value of goodwill is reported in the balance sheet. The amount by which the carrying amount of an asset exceeds its recoverable amount. / Сумма, на которую текущая сумма актива превышает её покрываемую сумму.

IMPAIRMENT OF ASSETS = ОБЕСЦЕНЕНИЕ АКТИВОВ (или СНИЖЕНИЕ СТОИМОСТИ АКТИВОВ) – IAS 36 (short for International Accounting Standard No. 36) Impairment of Assets – The objective of this Standard is to prescribe the procedures that an entity applies to ensure that its assets are carried at no more than their recoverable amount. An asset is carried at more than its recoverable amount if its carrying amount exceeds the amount to be recovered through use or sale of the asset. If this is the case, the asset is described as impaired and the Standard requires the entity to recognise an impairment loss. The Standard also specifies when an entity should reverse an impairment loss and prescribes disclosures. Identifying an asset that may be impaired:- An entity shall assess at each reporting date whether there is any indication that an asset may be impaired. If any such indication exists, the entity shall estimate the recoverable amount of the asset. Irrespective of whether there is any indication of impairment, an entity shall also:- (a) test an intangible asset with an indefinite useful life or an intangible asset not yet available for use for impairment annually by

comparing its carrying amount with its recoverable amount. This impairment test may be performed at any time during an annual period, provided it is performed at the same time every year. Different intangible assets may be tested for impairment at different times. However, if such an intangible asset was initially recognised during the current annual period, that intangible asset shall be tested for impairment before the end of the current annual period. (b) test goodwill acquired in a business combination for impairment annually in accordance with paragraphs 80–99. If there is any indication that an asset may be impaired, recoverable amount shall be estimated for the individual asset. If it is not possible to estimate the recoverable amount of the individual asset, an entity shall determine the recoverable amount of the cash-generating unit to which the asset belongs (the asset's cash-generating unit). A 'cash-generating unit' is the smallest identifiable group of assets that generates cash inflows that are largely independent of the cash inflows from other assets or groups of assets. Measuring recoverable amount:- The 'recoverable amount' of an asset or a cash-generating unit is the higher of its fair value less costs to sell and its value in use. It is not always necessary to determine both an asset's fair value less costs to sell and its value in use. If either of these amounts exceeds the asset's carrying amount, the asset is not impaired and it is not necessary to estimate the other amount. 'Fair value less costs to sell' is the amount obtainable from the sale of an asset or cash-generating unit in an arm's length transaction between knowledgeable, willing parties, less the costs of disposal. 'Value in use' is the present value of the future cash flows expected to be derived from an asset or cash-generating unit. The following elements shall be reflected in the calculation of an asset's value in use:- (a) an estimate of the future cash flows the entity expects to derive from the asset; (b) expectations about possible variations in the amount or timing of those future cash flows; (c) the time value of money, represented by the current market risk-free rate of interest; (d) the price for bearing the uncertainty inherent in the asset; and (e) other factors, such as illiquidity, that market participants would reflect in pricing the future cash flows the entity expects to derive from the asset. Estimates of future cash flows shall include:- (a) projections of cash inflows from the continuing use of the asset; (b) projections of cash outflows that are necessarily incurred to generate the cash inflows from continuing use of the asset (including cash outflows to prepare the asset for use) and can be directly attributed, or allocated on a reasonable and consistent basis, to the asset; and (c) net cash flows, if any, to be received (or paid) for the disposal of the asset at the end of its useful life. Future cash flows shall be estimated for the asset in its current condition. Estimates of future cash flows shall not include estimated future cash inflows or outflows that are expected to arise from:- (a) a future restructuring to which an entity is not yet committed; or (b) improving or enhancing the asset's performance. Estimates of future cash flows shall not include:- (a) cash inflows or outflows from financing activities; or (b) income tax receipts or payments. Recognising and measuring an impairment loss:- If, and only if, the recoverable amount of an asset is less than its carrying amount, the carrying amount of the asset shall be reduced to its recoverable amount. That reduction is an impairment loss. An impairment loss shall be recognised immediately in profit or loss, unless the asset is carried at revalued amount in accordance with another Standard (for example, in accordance with the revaluation model in IAS 16 Property, Plant and Equipment). Any impairment loss of a revalued asset shall be treated as a revaluation decrease in accordance with that other Standard. An impairment loss shall be recognised for a cash-generating unit (the smallest group of cash-generating units to which goodwill or a corporate asset has been allocated) if, and only if, the recoverable amount of the unit (group of units) is less than the carrying amount of the unit (group of units). The impairment loss shall be allocated to reduce the carrying amount of the assets of the unit (group of units) in the following order:- (a) first, to reduce the carrying amount of any goodwill allocated to the cash-generating unit (group of units); and (b) then, to the other assets of the unit (group of units) pro rata on the basis of the carrying amount of each asset in the unit (group of units). However, an entity shall not reduce the carrying amount of an asset below the highest of:- (a) its fair value less costs to sell (if determinable); (b) its value in use (if determinable); and (c) zero. The amount of the impairment loss that would otherwise have been allocated to the asset shall be allocated pro rata to the other assets of the unit (group of units). Goodwill:- For the purpose of impairment testing, goodwill acquired in a business combination shall, from the acquisition date, be allocated to each of the acquirer's cash-generating units, or groups of cash-generating units, that is expected to benefit from the synergies of the combination, irrespective of whether other assets or liabilities of the acquiree are assigned to those units or groups of units. The annual impairment test for a cash-generating unit to which goodwill has been allocated may be performed at any time during an annual period, provided the test is performed at the same time every year. Different cash-generating units may be tested for impairment at different times. However, if some or all of the goodwill allocated to a cash-generating unit was acquired in a business combination during the current annual period, that unit shall be tested for impairment before the end of the current annual period. The Standard permits the most recent detailed calculation made in a preceding period of the recoverable amount of a cash-generating unit (group of units) to which goodwill has been allocated to be used in the impairment test for that unit (group of units) in the current period, provided specified criteria are met. Reversing an impairment loss:- An entity shall assess at each reporting date whether there is any indication that an impairment loss recognised in prior periods for an asset other than goodwill may no longer exist or may have decreased. If any such indication exists, the entity shall estimate the recoverable amount of that asset. An impairment loss recognised in prior periods for an asset other than goodwill shall be reversed if, and only if, there has been a change in the estimates used to determine the asset's recoverable amount since the last impairment loss was recognised. A reversal of an impairment loss for a cash-generating unit shall be allocated to the assets of the unit, except for goodwill, pro rata with the carrying amounts of those assets. The increased carrying amount of an asset other than goodwill attributable to a reversal of an impairment loss shall not exceed the carrying amount that would have been determined (net of amortisation or depreciation) had no impairment loss been recognised for the asset in prior years. A reversal of an impairment loss for an asset other than goodwill shall be recognised immediately in profit or loss, unless the asset is carried at revalued amount in accordance with another Standard (for example, the revaluation model in IAS 16 Property, Plant and Equipment). Any reversal of an impairment loss of a revalued asset shall be treated as a revaluation increase in accordance with that other Standard. An impairment loss recognised for goodwill shall not be reversed in a subsequent period. / МСБУ 36 (сокращение для Международного Стандарта Бухгалтерского Учёта № 36) – .

IMPAIRMENTS OF ADVANCES = ОБЕСЦЕНЕНИЯ АВАНСОВ (или СНИЖЕНИЕ СТОИМОСТИ АВАНСОВ) – Impairments Of Advances:- advances are impaired (provided for) where the present value of the future cash flows on advances is less than the current carrying value in the records.

IMPAIRMENT TEST = ИСПЫТАНИЕ НА ОБЕСЦЕНЕНИЕ (или ТЕСТ НА СНИЖЕНИЕ СТОИМОСТИ) – Impairment Test is the process of testing that an impairment loss exists for an asset or group of assets.

IMPEDANCE = ИМПЕДАНС – In electricity, Impedance is a measure in Ohms of the degree to which an electric circuit resists the flow of electric current when a voltage is impressed across its terminals. Impedance:- the total effects of a circuit that oppose the flow of an ac current consisting of inductance, capacitance, and resistance. It can be quantified in the units of Ohms. / Под Импеданс, От Латинского слова Impedio, означающее Препятствую, понимается:- (1) В акустике – комплексное сопротивление, вводимое при рассмотрении колебаний акустических систем (по аналогии с электротехникой). Понятием импеданс пользуются при рассмотрении распространения звука в трубах переменного сечения, рупорах, фундаментах и опорах и тому подобном, при изучении акустических свойств излучателей и приёмников звука. (2) В электротехнике – устаревшее название Полного Сопротивления электрической цепи. Полное Сопротивление, величина, характеризующая сопротивление электрической цепи

току. Полное сопротивление синусоидальному току выражается отношением действующего напряжения U к действующему току I в этой цепи:- $Z = U/I = \sqrt{(r^2 + x^2)}$, где r и x – активное и реактивное сопротивления. Измеряется в Омах.

IMPERFECT = НЕСОВЕРШЕННОЕ (или ИМПЕРФЕКТ, или НЕПОЛНОЕ, или НЕЗАКОНЧЕННОЕ) – Imperfect:- flowers lacking either pistils or stamens. / либо тычинок (stamens). Под Имперфектом, от Латинского слова Imperfectus, означающее Незавершённый, понимается .

IMPERFECT FLOWER = НЕСОВЕРШЕННЫЙ ЦВЕТОК – Imperfect Flower:- lacking a pistil or stamen. / и тычинка (stamen).

IMPERFECT SELVAGE = НЕСОВЕРШЕННАЯ КРОМКА (или НЕЗАКОНЧЕННАЯ КРОМКА) – Imperfect Selvage:- a selvage serves a double purpose:- (i) as a binding point for the filling when weaving; and (ii) as an aid for maintaining the proper width when dyeing and finishing a fabric. To be imperfect a selvage may be:- loose, narrow, thick or thin, tight, and uneven (with respect to its own width). Selvage must be matched to the fabric it is supporting. This is done by trial and error or by the use of previous experience. Weaving imperfections directly due to faulty selvages are broken picks, bowed filling, over-beating, loom stoppage, loose selvage, shiners. The troubles of the dyer are multiplied by poor edges. Tight edges cause bowing; loose edges give a scalloped appearance; thin or narrow selvages slip through the tender clips; thick edges 'build-up' at the edges, causing dye streakiness, especially in jig-dyeing. Imperfect selvages are caused by the incorrect diameter of the yarn, poor slashing or warping, and the use of a selvage yarn that has a different coefficient of contraction from that of the body yarn. / уточина.

IMPERIAL UNITS = ИМПЕРИАЛЬНЫЕ ЕДИНИЦЫ (или ИМПЕРИЧЕСКИЕ ЕДИНИЦЫ) – Imperial Units are the units of the British Imperial system, adopted by Parliament in 1824. The basic units of the system are the foot, the avoirdupois pound, and the Imperial pint. The Weights and Measures Acts of 1963 and 1985 have redefined the Imperial units in term of the SI units. The Imperial units remain in varying degrees of use in Britain, Canada, Australia, and other areas of British heritage despite the introduction of metric units there. Americans should note that the Imperial foot and pound are essentially the same as the units used in the United States, but the Imperial pint is significantly larger than the US liquid and dry pints. See also British Imperial System.

IMPERVIOUS = НЕПРОНИЦАЕМОЕ (или НЕПРОХОДИМОЕ, или НЕДОСТУПНОЕ) – Impervious:- incapable of being penetrated. Resistant to penetration by fluids or by roots. / или корнями.

IMPLIED REPO RATE = ПОДРАЗУМЕВАЕМАЯ СТАВКА ПО РИПО – Implied Repo Rate is the rate of return that can be obtained from selling a debt instrument futures contract and simultaneously buying a bond or note deliverable against that futures contract with borrowed funds. The bond or note with the highest implied repo rate is cheapest to deliver. The return earned by buying a cheapest-to-deliver bond for a bond futures contract and selling it forward via the futures contract.

IMPLIED VOLATILITY = ПОДРАЗУМЕВАЕМАЯ ЛИХОРАДОЧНОСТЬ (или ПОДРАЗУМЕВАЕМОЕ ШАРАХАНЬЕ) – Implied Volatility (IV):- a key variable in most option pricing models, including the famous Black-Scholes Option Pricing Model. Other variables usually include:- security price, strike price, risk-free rate of return and days to expiration. If all other variables are equal, the security with the highest volatility will have the highest option prices. Many NASDAQ® and tech stocks (CSCO (Cisco Systems, Inc.) and AMGN (Amgen Inc.)) have higher volatilities than New York Stock Exchange (NYSE®) and non-tech stocks (G (Gillette®) and MRK (Merck & Co., Inc.)), and their options are also prices accordingly. One method of measuring volatility is by finding the standard deviation of the underlying security. However, the standard deviation cannot always explain the volatility that is implied by an option's price. Many times the price of an option will reflect more volatility than that measured by the standard deviation. This led to the notion of implied volatility, which is based on option prices. If the option price is known, then plugging in all variables and solving for volatility will yield the implied volatility. The volatility of a futures contract, security, or other instrument as implied by the prices of an option on that instrument, calculated using an options pricing model. A measurement of the market's expected price range of the underlying commodity futures based on market-traded options premiums. Implied Volatility measures how much the market thinks prices will change in the future, and is obtained from daily settlement prices for options. Implied Volatility (IV) reflects expectations regarding the underlying asset's future volatility, used to determine an option price. Implied volatility is computed iteratively from the Black-Scholes formula, provided all other parameters (such as option price, maturity, interest rate) are known. With everything else being equal, i.e. the same share, comparable basis, maturity and subscription ratio, the option which has the lowest implied volatility is the 'least expensive'. The volatility level at which the theoretical value calculated by model would be the same as current option price. The value of volatility embedded in an option price. All things being equal, higher implied volatility will lead to higher vanilla option prices and vice versa. The effect of changes in volatility on an option's price is known as Vega. If an option's premium is known, its implied volatility can be derived by inputting all the known factors into an option pricing model (the current price of the underlying, interest rates, the time to maturity and the strike price). The model will then calculate the volatility assumed in the option price, which will be the market's best estimate of the future volatility of the underlying. Implied Volatility is a volatility as calculated by determining the variable in the Black-Scholes option price formula from market option prices. The element of the formula that identifies the degree of supply and demand for options. / Уровень лихорадочности или шараханья, при котором теоретическое значение, рассчитанное по модели, могло бы быть таким же, как и у текущей цены опциона. Модель Блэка-Сколза (Black-Scholes Model). НЙФБ® или Эн.Уай.Эс.И.® (NYSE®). НЭЗДЭК® (NASDAQ®) Си.Эс.Си.Оу. (Сыско Сыстэмз, Инк.; CSCO (Cisco Systems, Inc.)) и Эй.Эм.Дьжи.Эн. (Эмдьжен Инк.; AMGN (Amgen Inc.)) Дьжи. (Дьжилэт®; G (Gillette®)) и Эм.Ар.Кей. (Мёк Энд Ко., Инк.; MRK (Merck & Co., Inc.)).

IMPLIED WARRANTY = ПОДРАЗУМЕВАЕМОЕ РУЧАТЕЛЬСТВО – Implied Warranty is a warranty that is not expressed in a policy, but which is implied to be therein by law, e.g., warranty of seaworthiness in a voyage policy, warranty of legality in all policies. A warranty is a representation by the policyholder that certain conditions exist or will be met. Even if the warranty is not in writing, it may exist as an 'implied' warranty, e.g., that a building is not on fire when insured, or that a vessel is seaworthy. Implied Warranty:- fundamental conditions implied in a contract of marine insurance are seaworthiness of the vessel and the legality of the venture. / , например, .

IMPORT = ПРИВОЗ (или ИМПОРТ) – To bring foreign goods and services into a country. To receive goods from a foreign country. Imports are merchandise brought into one place or country from another. Collectively, imports and exports are referred to as Trade. Trade may be denominated in volume, financial value, or both. Good or service purchased from a foreign country. Goods or services purchased from another country and brought into one's own country. / Товар или услуга, приобретённая у иностранного государства. Термин Импорт, от Латинского слова Importo, означающее Ввожу, относится к ввозу товаров в страну из-за границы.

IMPORTANCE FACTOR = ПОКАЗАТЕЛЬ ВАЖНОСТИ – Importance Factor is a factor applied to factored loads, other than dead load, to take into account the consequence of collapse as related to the use and occupancy of the structure, as in Limit States Design. / в Расчёте Предельных Состояний.

IMPORT BAN = ЗАПРЕТ НА ПРИВОЗ (или ЗАПРЕТ НА ИМПОРТ) – Import Ban is a ban of specified imports, often for political rather than economical observe. Prohibition on the import of a good or service. / Запрет на привоз (или импорт) товаров или услуг.

IMPORT BARRIERS = ПРИВОЗНЫЕ БАРЬЕРЫ (или ИМПОРТНЫЕ БАРЬЕРЫ) – Import Barriers are the quotas, tariffs, and embargoes used by a country to restrict the quantity or value of a commodity that may enter that country. See also Competitive Imports; Import Quota; Imports; and Import Substitution.

IMPORT CERTIFICATE = СВИДЕТЕЛЬСТВО НА ПРИВОЗ (или СЕРТИФИКАТ НА ИМПОРТ) – The Import Certificate is a means by which the government of the country of ultimate destination exercises legal control over the internal channeling of the commodities covered by the import certificate.

IMPORTER OF RECORD = ИМПОРТЁР СОГЛАСНО ДОКУМЕНТОВ (или ПРИВОЗЯЩИЙ ПО ЗАПИСИ) – US Customs Service defines the Importer of Record as the owner or purchaser of the goods; or, when designated by the owner, purchaser, or consignee, a licensed Customs broker.

IMPORT LICENSE = ЛИЦЕНЗИЯ НА ПРИВОЗ (или СПЕЦИАЛЬНОЕ РАЗРЕШЕНИЕ НА ПРИВОЗ, или ИМПОРТНАЯ ЛИЦЕНЗИЯ, или ЛИЦЕНЗИЯ НА ИМПОРТ) – Import License is a document required and issued by some national governments authorizing the importation of goods. Government-issued permit to import an item under specified conditions. / привоз (importation).

IMPORT PERMIT = РАЗРЕШЕНИЕ НА ПРИВОЗ (или ИМПОРТНОЕ РАЗРЕШЕНИЕ) – (1) Import Permit:- some countries use this term interchangeably with import license. Permits are usually required for items which might affect the public health morals, or animal life/vegetation, etc, in other words, foodstuffs, feedstuffs, pharmaceuticals (human and veterinary), medical equipment, seeds, plants, various written materials (including tapes, cassettes, movies, TV tapes or TV movies). Import Permit is a document allowing a person to order and receive a thing from another country. Used in seed exchange.

(2) Import Permit is an official document authorizing importation of a commodity in accordance with specified phytosanitary import requirements. / привоз (importation).

(3) Import Permit (of a biological control agent) is an official document authorizing importation (of a biological control agent) in accordance with specified requirements. / привоз (importation).

IMPORT QUOTA = КВОТА НА ПРИВОЗ (или ИМПОРТНАЯ КВОТА, или КВОТА НА ИМПОРТ) – Import Quota is the maximum quantity or value of a commodity allowed to enter a country during a specific period of time. See also Competitive Imports; Import Barriers; Imports; and Import Substitution. Import Quota is a means of restricting imports by the issuance of licenses to importers, assigning each a quota, after determination of the total amount of any commodity which is to be imported during a period. Import licenses may also specify the country from which the importer must purchase the goods. Import Quota:- the maximum quantity or value of a commodity allowed to enter a country during a specified time period. Import Quota is the maximum amount of a commodity that can be imported in a specified time period. In the cotton industry, for example, United States imposes an annual import quota on raw cotton totaling 14.5 million pounds (about 30 000 bales) of short staple cotton having a length of less than 1-1/8 inches and a quota of 45.7 million pounds (about 95 000 bales) of long staple cotton having a length of 1-1/8 or more inches. / Импортная Квота – экономический количественный показатель, характеризующий значимость привоза (или импорта) для национального хозяйства, для отдельных отраслей и производства, по различным видам продукции. Импортная квота в исчисляется в ценностном или натуральном выражении за определённый период в виде отношения объёма привоза (или импорта) к объёму внутреннего потребления. Нетарифное количественное ограничение ввоза определённых видов товаров в страну, устанавливаемое правительством в целях ограждения собственной экономики, защиты внутреннего рынка. Импортная Квота – нетарифное, то есть не связанное с ценами и налогами, количественное ограничение ввоза определённых видов товаров в страну, устанавливаемое правительством в целях ограждения собственной экономики, защиты внутреннего рынка.

IMPORT QUOTA AUCTIONING = ПРОВЕДЕНИЕ АУКЦИОНА ПО ПРИВОЗНЫМ КВОТАМ (или ПРОВЕДЕНИЕ АУКЦИОНА ПО ИМПОРТНЫМ КВОТАМ) – Import Quota Auctioning is the process of auctioning the right to import specified quantities of quota-restricted goods. / Процесс заполучения права в ходе проводимого аукциона на ввоз определённых количеств ограничиваемых квотами товаров.

IMPORT RESTRICTION = ОГРАНИЧЕНИЕ ПРИВОЗА (или ОГРАНИЧЕНИЕ ИМПОРТА) – Import Restriction, applied by a country with an adverse trade balance (or for other reasons), reflect a desire to control the volume of goods coming into the country from other countries may include the imposition of tariffs or import quotas, restrictions on the amount of foreign currency available to cover imports, a requirement for import deposits, the imposition of import surcharges, or the prohibition of various categories of imports. / надбавок или доплат (surcharges) при импорте или .

IMPORTS = ПРИВОЗЫ (или ИМПОРТ) – Imports are the quantity or value of commodities legally entering a country. See also Competitive Imports; Import Barriers; Import Quota; and Import Substitution. Imports:- goods and services which one country's residents purchase and transport from another country into their own country. Imports of merchandise include commodities of foreign origin as well as goods of domestic origin returned to the United States with no change in condition or after having been processed and/or assembled in other countries. For statistical purposes, imports are classified by type of transaction:- (i) merchandise entered for immediate consumption ('duty free' merchandise and merchandise on which duty is paid on arrival); (ii) merchandise withdrawn for consumption from Customs bonded warehouses, and US Foreign Trade Zones; and (iii) merchandise entered into Customs bonded warehouses and US Foreign Trade Zones from foreign countries. / Привозы или Импорт:- товары и услуги, которые резиденты одной страны приобрели и перевезли из другой страны в свою собственную страну.

IMPORTS FOR CONSUMPTION = ПРИВОЗЫ ДЛЯ ПОТРЕБЛЕНИЯ (или ИМПОРТ ДЛЯ ПОТРЕБЛЕНИЯ) – Imports For Consumption measure the total of merchandise that has physically cleared through US Customs either entering consumption channels immediately or entering after withdrawal for consumption from bonded warehouses under Customs custody or from Foreign Trade Zones. Many countries use the term 'special imports' to designate statistics compiled on this basis.

IMPORT SUBSTITUTION = СУБСТИТУЦИЯ ПРИВОЗА (или ЗАМЕЩЕНИЕ ИМПОРТА, или ИМПОРТОЗАМЕЩЕНИЕ) – Import Substitution is the economic policy adopted in most developing countries from the 1930s to the 1980s to promote industrialization by protecting domestic producers from the competition of imports. Protection – in the form of high tariffs or the restriction of imports through quotas – was applied indiscriminately, often to inherently high-cost industries that had no hope of ever becoming internationally competitive. After the early stages of import substitution, protected new industries tended to be very intensive in the use of capital and especially of imported capital goods, i.e. tangible items such as buildings, machinery, and equipment produced and used in the production of other goods and .... Import Substitution is a government strategy that emphasizes replacement of some agricultural or industrial imports to encourage local production for local consumption, rather than producing for export markets. Import substitutes are

meant to generate employment, reduce foreign exchange demand, stimulate innovation, and make the country self-reliant in critical areas such as food, defense, and advanced technology. A policy of Import Substitution was intended to promote industrialization by protecting domestic producers from the competition of imports. Protection, in the form of high tariffs or the restriction of imports through quotas, was applied indiscriminately, often to inherently high-cost industries that had no hope of ever becoming internationally competitive. Also, after the early stages of import substitution, protected new industries tended to be very intensive in the use of capital and especially of imported capital goods. The import-substitution approach defined 'industrialization' rather narrowly as the expansion of the modern manufacturing sector based on capital-intensive technology. Capital was therefore identified with durable capital equipment in the form of complex machinery and other inputs that the underdeveloped countries were not able to produce domestically. Thus, foreign-exchange requirements were calculated on the basis of the fixed technical input-output coefficients of the manufacturing sector. With high levels of protection for domestic industry, and with exchange rates that were often maintained at unrealistic levels (usually in an effort to make imported capital goods 'cheap'), the experience of most developing countries was that export earnings grew relatively slowly. The simultaneously sharp increase in demand for imported capital goods (and for raw materials and replacement parts as well) resulted in unexpectedly large increases in imports. Most developing countries found themselves with critical foreign-exchange shortages and were forced to reduce imports in order to cut their current-account deficits to manageable proportions. The cutbacks in imports usually resulted in reduced growth rates, if not recessions. This result led to the view that economic stagnation was caused primarily by a shortage of foreign exchange with which to buy essential industrial inputs. But over the longer term the growth rates of countries that continued to protect their domestic industries heavily not only stagnated but declined sharply. Contrasting the experience of countries that persisted in policies of import substitution with those that followed alternative policies (see below) subsequently demonstrated that foreign-exchange shortage was a barrier to growth only within the context of the protectionist policies adopted and was not inherently a barrier to the development process itself. Import Substitution is a strategy which emphasizes the replacement of imports with domestically produced goods, rather than the production of goods for export, to encourage the development of domestic industry. See also Competitive Imports; Import Barriers; Import Quota; and Imports. / Замещение Привоза (или Импорта) – политика замещения привезённых (или импортных) товаров отечественной продукцией под покровительством квот и тарифов. Замещение Импорта – снижение доли привезённых (или импортных) товаров в общем ассортименте товаров на отечественном рынке. Замещение привоза (или импорта) способствует стимулированию национальной экономики, особенно промышленности. Замещение импорта осуществляется ограничением привоза (увеличением таможенных пошлин, введением лимитов и валютных ограничений), а также инвестированием средств в национальную промышленность, налоговыми льготами для отечественных производителей и тому подобным. Замещение Привоза (или Импорта) – уменьшение или прекращение привоза (или импорта) определённого товара посредством производства в стране такого же или аналогичного товара (импортозамещающего товара). Импортозамещение.

IMPRACTICABLE = НЕОСУЩЕСТВИМОЕ (или НЕВЫПОЛНИМОЕ) – Impracticable:- when an entity cannot apply a requirement after making every reasonable effort to do so. For a particular prior period, it is impracticable to apply a change in an accounting policy retrospectively or to make a retrospective restatement to correct an error if:- (i) the effects of the retrospective application or retrospective restatement are not determinable; (ii) the retrospective application or retrospective restatement requires assumptions about what management's intent would have been in that period; or (iii) the retrospective application or retrospective restatement requires significant estimates of amounts and it is impossible to distinguish objectively information about those estimates that:- (a) provides evidence of circumstances that existed on the date(s) as at which those amounts are to be recognized, measured or disclosed; and (b) would have been available when the financial statements for that prior period were authorized for issue from other information.

IMPREGNATED FABRIC = ПРОПИТАННАЯ ТКАНЬ – Impregnated Fabric is a fabric in which the interstices between the yarns are completely filled, as compared to sized or coated material where the interstices are not completely filled. Not included in the definition is a woven fabric constructed from impregnated yarns, rather than one impregnated after weaving.

IMPROPER ALIGNMENT = НЕНАДЛЕЖАЩЕЕ ВЫРАВНИВАНИЕ – Improper Alignment:- gauges are available for attaching equipment to assure proper alignment in positioning. This is a necessity if garment is to have a properly tailored look, if the top of the zipper is extended into the waistband of the trouser, then the hook and eye should be offset to prevent it from hitting the zipper material. Closure defects, and namely – Hooks and Eyes. / Порок или дефект застёжки.

IMPROPER CUTTING = НЕНАДЛЕЖАЩИЙ РАСКРОЙ – Improper Cutting:- not following marker lines, resulting in distorted parts. Letting knife lean, causing top and bottom plys to be of different sizes. Cutting Room Defects, and namely – Cutting Defects. / Порок или дефект раскроя.

IMPROPER DIMENSIONS = НЕНАДЛЕЖАЩИЕ РАЗМЕРНОСТИ – Improper Dimensions:- not always apparent unless slider works with great difficulty or operates too easily. Zipper may give initial satisfactory operation but fail after only moderate use and especially after laundering or dry cleaning. Closure defects, and namely – Zippers:- Chain or Teeth Defects. / Порок или дефект застёжки.

IMPROPER DIMENSIONS OF TOP OR BOTTOM STOP = НЕНАДЛЕЖАЩИЕ РАЗМЕРНОСТИ ВЕРХНЕГО ИЛИ НИЖНЕГО СТОПОРА – Improper Dimensions of Top or Bottom Stop:- not readily apparent. Results in stop pulling away from fabric and may cause slider to jam. May not be evident until the garment is in use. Closure defects, and namely – Zippers and Nylon Spiral Zipper:- Top or Bottom Stop Defects. / Порок или дефект застёжки. Найлан[T3] (Nylon[TM]).

IMPROPER FINISHES = НЕНАДЛЕЖАЩИЕ ЗАКЛЮЧИТЕЛЬНЫЕ ОТДЕЛКИ – Improper Finishes:- finishes which are weak, brittle, have long selvages, hard to cut or hard to sew. Interlining defects. / Порок или дефект.

IMPROPER KNIFE SHARPENING = НЕНАДЛЕЖАЩАЯ ОСТРОТА (или ЗАТОЧКА) НОЖА – Improper Knife Sharpening:- causing ragged, frayed or fused edges on bundles. Cutting Room Defects, and namely – Cutting Defects. / Порок или дефект раскроя.

IMPROPERLY APPLIED = ПРИЛОЖЕННОЕ НЕНАДЛЕЖАЩИМ ОБРАЗОМ – Improperly Applied:- this is usually caused by a careless operator or improperly adjusted attaching equipment, and corrections are usually simple when apparent. Closure defects, and namely – Hooks and Eyes. / Порок или дефект застёжки.

IMPROPERLY ATTACHED = ПРИКРЕПЛЁННОЕ НЕНАДЛЕЖАЩИМ ОБРАЗОМ – Improperly Attached:- this may be due to lack of sufficient reinforcement at point of attachment, material at point of attachment too thin or too thick, or material at point of attachment not even, i.e. several thicknesses under part of closure and less than that under other part, or improper attaching machine adjustment. Closure defects, and namely – Metal Buttons, Snap Fasteners, Rivets and Burrs. / Порок или дефект застёжки.

IMPROPERLY LOCATED STOP = ОСТАНОВ, ПРЕДПРИНЯТЫЙ В НЕНАДЛЕЖАЩЕМ РАСПОЛОЖЕНИИ – Improperly Located Stop:- if top stop or bottom stop does not contain the end of the coil, it will permit coil to loosen from fabric, interfering with slider

operation. Closure defects, and namely – Nylon Spiral Zipper:- Top or Bottom Stop Defects. / Порок или дефект застёжки. Найлан^{T3} (Nylon^{TM}).

IMPROPER MATCHING OF FACE OF MATERIAL = НЕНАДЛЕЖАЩАЯ ПОДГОНКА ЛИЦА МАТЕРИАЛА – Improper Matching of Face of Material:- not spread face down, face up or face to face as required. Cutting Room Defects, and namely – Spreading Defects. / Порок или дефект раскроя.

IMPROPER PRESSING OVER ZIPPERS or OTHER CLOSURES = ХХ или ИНЫЕ ЗАСТЁЖКИ – Improper Pressing Over Zippers or Other Closures:- often produces a tear or unsightly impression on the face of the garment. Finishing department defects, and namely – Pressing Defects. / Порок или дефект заключительной обработки.

IMPROPER TENSION = НЕНАДЛЕЖАЩЕЕ НАТЯЖЕНИЕ – Improper Tension:- cloth spread too tight or too loose, causing parts not to fit in sewing or distorting dimensions of garments. Cutting Room Defects, and namely – Spreading Defects. / Порок или дефект раскроя.

IMPROPER WEFT THREADING = НЕНАДЛЕЖАЩАЯ ЗАПРАВКА (или ЗАВОДКА, или ВДЕВАНИЕ) УТКА – Improper Weft Threading (Single Moti) is the defect is characterized by a loose and uneven selvedge consisting of weft and warp protroduing loosly beyong the true selvedge line. Weaving defect. / Порок или дефект ткачества.

IMPROVED CULTIVAR = УСОВЕРШЕНСТВОВАННЫЙ КУЛЬТИВАР – Improved Cultivar is a Rice Variety that has been bred to increase production.

IMPROVED PLANT TYPE = УСОВЕРШЕНСТВОВАННЫЙ ТИП РАСТЕНИЯ – Improved Plant Type:- specific morphological and physiological features of the Rice plant that make it more efficient and higher yielding.

IMPURITY = ПРИМЕСЬ (или СОР) – Impurity is any undesirable extraneous material present in a fleece or textile product.

IMPUTATION = ВМЕНЕНИЕ (или ПРИПИСЫВАНИЕ) – Imputation is the process of inventing a transaction where, although no money has changed hands, there has been a flow of goods or services. It is confined to a very small number of cases where a reasonably satisfactory basis for the assumed valuation is available.

IMPUTATION CREDIT = ВМЕНЁННЫЙ КРЕДИТ – Imputation Credit;- the tax credits passed on to a shareholder who receives a franked dividend. Under provisions of the Income Tax Assessment Act, imputation credits entitle investors to a rebate for tax already paid by an Australian company. See Dividend Imputation. An Imputation Credit is a credit to a person owning shares for the tax that has already been paid by the issuing company on their dividends. These are also known as Franking Credits.

IMRO = INVESTMENT MANAGEMENT REGULATORY ORGANISATION

IN = INDIA

INACTIVATION = ИНАКТИВАЦИЯ – Inactivation is a rendering micro-organisms incapable of development.

INADEQUATE PRESSING = НЕАДЕКВАТНОЕ ПРЕССОВАНИЕ – Inadequate Pressing:- excessive heat or pressure resulting in poor pleating, fullness or twisting of a seam or garment surface. Finishing department defects, and namely – Pressing Defects. / Порок или дефект заключительной обработки.

INADVERTENT ENERGY = НЕЗАЯВЛЕННАЯ (или НЕНАМЕРЕННАЯ, или НЕУМЫШЛЕННАЯ, или НЕПРЕДНАМЕРЕННАЯ) ЭЛЕКТРОЭНЕРГИЯ – Inadvertent Energy:- the imbalance of energy flows back and forth that are on-going and routine between a generator of power and the centers of demand. These imbalances are typically settled through exchanges of physical commodity exchange. / Дисбаланс энергии, которая протекает туда и обратно между генератором энергии и центрами потребления, является типичным процессом. Эти дисбалансы обычно устраняются посредством обмена физического сырья.

INBOARD = ВНУТРЕННЕЕ – Inboard (maritime term):- towards the center line of a ship (towards the center).

IN BOND = ПОД ОБЯЗАТЕЛЬСТВОМ (или ПОД ТАМОЖЕННЫМ КОНТРОЛЕМ) – In Bond:- cargo moving under Customs control where duty has not yet been paid. The transportation of a shipment to an inland point for Customs clearance rather than filing an entry to clear the goods at the port of arrival.

IN–BOND SYSTEM = СИСТЕМА ТАМОЖЕННОГО КОНТРОЛЯ (или СЛЕЖЕНИЯ) – In the United States, the In-Bond System, a part of Customs' Automated Comercial System, controls merchandise from the point of unloading at the port of entry or exportation. The system works with the input of departures (from the port of unloading), arrivals, and closures (accountability of arrivals). The US Customs and Border Protection (CBP) must strive to balance its competing goals of facilitating trade, providing port security, and collecting trade revenues. CBP's in-bond system, which allows goods to transit the United States without formally entering US commerce, must also balance these goals. In response to concerns that previously identified weaknesses in the in-bond system have not been remedied, the US Government Accountability Office (GAO) examined (1) the purpose of the in-bond system and the extent of its use (2) CBP efforts to ensure that revenues are collected and trade concerns are minimized, and (3) CBP efforts to ensure that security-related inspections are properly targeted. GAO examined audit reports and agency documents, interviewed officials at CBP headquarters and at 10 CBP port offices. GAO also discussed the in-bond system with trade groups impacted by the in-bond system. The In-Bond System is designed to facilitate the flow of trade; however, CBP does not know the extent of the in-bond system's use as a result of lax oversight. The system allows cargo to be transported from the arrival port, without appraisal or payment of duties, to another US port for official entry into US commerce or for exportation. Although the in-bond system is estimated to be widely used, CBP cannot assess the extent of program use because it collects little information on in-bond shipments and performs limited analysis of data that it does collect. Despite numerous program reviews and audits that identified problems in CBP's management of the in-bond system, weaknesses persist and continue to impede CBP's ability to ensure proper collection of trade revenue and management of trade risks. The major weakness is that CBP does not adequately monitor and track in-bond goods. In particular, it does not consistently reconcile in-bond documents issued at the arrival port with documents at the destination port to ensure that the cargo is either officially entered with appropriate duties or quotas applied, or is in fact exported. CBP records show that many in-bond cargo shipments remained unreconciled, or 'open', with one port reporting that 77 percent of its in-bond transactions were open. Also, in-bond regulations provide unusual flexibility for the trade community, but create challenges for CBP in tracking movements. Finally, some CBP ports do not consistently perform in-bond compliance reviews which could identify weaknesses and possible solutions. The limited information available on in-bond cargo also impedes CBP efforts to manage security risks and ensure proper targeting of inspections. In-bond goods transit the United States with a security score based on manifest information and do not use more accurate and detailed entry type information to re-score until and unless the cargo enters US commerce. As a result, some higher risk cargo may not be identified for inspection, and scarce inspection resources may be used for some lower risk cargo. / вывоз (exportation).

INBOUND = ВВОЗИМОЕ – Inbound:- import shipment.

INBRED = ИНБРЕДНОЕ (или ИНЦУХТИРОВАННОЕ) – Inbred:- an individual resulting from the mating of closely related parents or selfing.

INBRED LINE = ИНБРЕДНАЯ ЛИНИЯ (или ИНЦУХТИРОВАННАЯ ЛИНИЯ, или САМООПЫЛЁННАЯ ЛИНИЯ) – Inbred Line is a nearly homozygous breeding line produced by continued self-fertilization.

INBREEDING = ИНБРИДИНГ (или ИНЦУХТ, или БЛИЗКОРОДСТВЕННОЕ СКРЕЩИВАНИЕ) – Inbreeding is the interbreeding of closely related individuals occurring naturally (as in a closed population), or as a deliberately chosen system of breeding and serving especially to preserve and fix desirable characters of and to eliminate unfavorable characters from a suitably selected stock but tending to effect an unwanted decline (as in size, vigor, or fertility) through the fixation of undesirable and often recessive characters when the initial stock is any way defective. / свойства (characters) . Под Инбридингом или Инцухтом, от Английского Слова Inbreeding, от In, означающее В или Внутри, и Breeding, означающее Разведение, или от Немецкого слова Inzucht, понимается скрещивание близкородственных организмов. У самоопыляющихся растений (Пшеница, Цитрусовые, Ячмень и другие). Инбридинг – нормальное явление. У животных и перекрёстноопыляемых растений при длительном инбридинге возможны возникновения уродств, снижение продуктивности, жизнеспособности или гибель особей. При скрещивании инбредных линий у гибридов первого поколения часто проявляется гетерозис. Под Инбридингом понимается разведение ‘в себе’, скрещивание близкородственных форм в пределах одной популяции организмов. (1) В применении к растениям в том же значении часто пользуются термином Инцухт (от Немецкого слова Inzucht). У растений крайнее выражение естественного инбридинга – автогамия у самоопылителей. У перекрёстно опыляющихся растений инбридинг – принудительное самоопыление, повторяющееся в большем или меньшем числе последовательных поколений, ведёт к возрастанию гомозиготности и к инбредной депрессии, то есть снижению продуктивности и жизнеспособности особей. Причина инбредной депрессии – переход рецессивных летальных генов, а также генов, снижающих жизнеспособность организма, в гомозиготное состояние. Например, при самоопылении Капусты Кочанной, Картофеля, Кукурузы наблюдаются снижение интенсивности роста, плодовитости, возникновению аномалий и уродств. Депрессия, связанная с инбридингом, наиболее заметно проявляется в первых поколениях, а затем, дойдя до определённого уровня (инбредного минимума), не развивается. Так как инбредные особи становятся гомозиготными и по нормальным генам, в том числе и обусловливающим ценные в хозяйственном отношении признаки, они устойчиво передают ценные свойства потомству. Скрещивание двух или нескольких инбредных линий часто приводит к гетерозису в первом гибридном поколении. Тетрагибриды Кукурузы – продукт скрещивания четырёх инбредных линий – дают повышение урожайности на 30–60% по сравнению с обычными сортами. Инбридинг у самоопыляющихся растений в природе часто чередуется с перекрёстным опылением:- первый обеспечивает наследственную устойчивость потомства, второе – гетерозис и наследственную дифференциацию. (2) Инбридинг в животноводстве – спаривание животных, находящихся в кровном родстве. Форма однородного подбора в животноводстве. Применяется при углублённой племенной работе для усиления в потомстве свойств родоначальника и получения ценных племенных животных. Использовался при выведении многих культурных пород сельскохозяйственных животных. В зависимости от близости родства с родоначальником, на которого ведётся инбридинг, различают несколько степеней инбридинга:- I – II (мать х сын), II – I (дочь х отец), I – III (бабка х внук), III – I (внучка х дед), II – II (сестра х брат) – кровосмешение, III – II, II – III, I – IV, IV – I, III – III – близкородственное, IV – III, III – IV, I – V, V – I, IV – IV – умереннородственное, IV – V, V – IV, V – V и более отдалённородственное. Половые клетки самца и самки при родственном спаривании генетически более сходны, поэтому у инбредных животных автоматически возрастает гомозиготность. Длительное применение близкородственных спариваний в животноводстве обычно вызывает снижение жизнеспособности животных, ослабление конституции и сопротивляемости организма, снижение продуктивности и ухудшение качества продукции, уменьшение плодовитости (иногда полное бесплодие), появление уродливого и мертворождённого приплода и другое. Вредные последствия инбридинга объясняются переходом в гомозиготное состояние многих вредных рецессивных генов и нарушением эволюционно сложившихся закономерностей онтогенеза. Осторожное применение инбридинга тесных степеней на выдающихся предков, а также комплексный инбридинг на двух или нескольких высокоценных животных, особенно помесного происхождения, предварительно уже испытанных в родственных спариваниях, дают хорошие результаты. Тесный Инбридинг необходим при существенной качественной переделке породы, а также на начальных этапах создания новых пород. Инбридинг применяют и для выведения высокогомозиготных линий животных с целью последующего использования кроссов этих линий для получения высокопродуктивного потомства с признаками гетерозиса. Для получения гетерозисных животных применяют:- (i) Инкроссинг – кросс двух инбредных линий, выведенных в пределах одной породы; (ii) Инкроссбридинг – кросс инбредных линий разных пород; (iii) Топкроссинг – спаривание инбредных производителей с неинбредными и неродственными производителю матками. Близкородственное спаривание как острый и рискованный приём разведения животных применяли в Союзе Советских Социалистических Республик (СССР) в племенных хозяйствах при углублённой племенной работе, умереннородственное – в племенных хозяйствах для репродукции племенного материала. В пользовательном животноводстве инбридинг недопустим. Инбридинг, родственное скрещивание, разведение при помощи родственных скрещиваний, разведение ‘в себе’, ‘внутрибрачие’. Инбридинг в широком смысле называется родственное скрещивание вообще; в узком смысле (обычно с прибавлением слов:- строгий, тесный Инбридинг – close inbreeding, strenge Inzucht) – и размножение при помощи самооплодотворения или путём скрещивания брата с сестрой в каждом поколении. Значение Инбридинга в лаборатории, селекции и природе. Тесный Инбридинг встречается в качестве нормального явления в природе, например у самоопыляющихся растений. Тесный Инбридинг является очень плодотворным методом разведения в генетике и селекции:- при его помощи выводятся чистые и чистокровные линии и культуры растений и животных, а также производится экспериментальный анализ наследственных признаков. В морфологии и физиологии, при экспериментальном изучении варьирующих признаков и реакций организма на определённые внешние воздействия, также приходится прибегать к Инбридингу для получения по возможности ‘чистого’, наследственно-однородного материала, чем устраняется ‘затемняющее’ опыт влияние наследственной изменчивости данного признака или реакции. Инбридинг в широком смысле слова, в виде более или менее отдалённых или близких родственных скрещиваний, встречается в природе в небольших изолированных популяциях; в этих случаях, ускоряя проявление запаса рецессивных генов данной популяции, инбридинг принимает участие в механизме эволюционного процесса. Вопрос о ‘вырождении’ в результате Инбридинга. В медицине, животноводстве и растениеводстве вопрос об Инбридинге ставится кроме того и в совершенно иной плоскости. С давних пор утвердилось мнение, что родственное скрещивание, особенно – близкое и повторное, ведёт к ‘вырождению’ соответствующей семьи, породы, культуры или линии, к появлению в ней уродств и ослаблению её ‘жизнеспособности’ и плодовитости. В конце XIX века в связи с изучением вопроса о потенциальном бессмертии протистов (одноклеточных), теорией пола и Вейсмановской теорией амфимиксиса это мнение получает как-будто подтверждение со стороны общей биологии. В настоящее время с развитием экспериментальной генетики вопрос о ‘вырождении в результате родственного скрещивания’ можно считать разъяснённым. Несомненно, что инбридинг как таковой никакого вредного действия на потомство не оказывает. Это

показывают и случаи природных, естественных Инбридингов (например, у Самоопыляющихся Растений) и целый ряд точных лабораторных опытов (например, Мухy Drosophila можно в течение сотни поколений разводить в тесном Инбридинге без того, чтобы появились признаки 'вырождения'). Общебиологические предпосылки в пользу старого мнения также отпали:- оказалось, что у протистов амфимиксис может заменяться аутомиксисом и что 'омолаживающее' действие на организм одноклеточных и некоторых многоклеточных, помимо амфимиксиса, может оказывать и повторная регенерация после искусственных поранений. Значение и действие Инбридинга сводится таким образом к следующему:- если в гетерогенной среде (популяции), содержащей ряд генов в гетерозиготном состоянии, наступает инбридинг, то для ряда рецессивных генов создаётся возможность проявиться, перейдя в гомозиготное состояние; в результате этого в потомстве появляется ряд рецессивных наследственных признаков, бывших до того в 'скрытом', гетерозиготном состоянии; среди них наряду с нейтральными и положительными проявятся и патологические, отрицательные признаки (уродства, наследственные болезни, гены, вызывающие частичное или полное бесплодие, и так далее), а эти последние, особенно бросаясь в глаза, и создают представление о вредном действии Инбридинга. Повышая гомозиготность (наследственную гомогенность) в потомстве, и тем самым сокращает нереализованную 'наследственную потенцию' (данной породы, семьи, линии) и может создать при участии отбора односторонность и специализацию породы (например, породы и сорта культурных растений и животных).

INBREEDING DEPRESSION = ИНБРЕДНАЯ ДЕПРЕССИЯ – Inbreeding Depression is a continuous breeding of genetically related individuals resulting in decrease in reproductive capacity.

IN BULK = НАВАЛОМ – A term 'In Bulk' refers to seed when loose either in vehicles of transportation or in storage, and not to seed in bags or other containers.

INC. = INCORPORATED

INCA = INSTITUTO NACIONAL DE CIENCIAS AGRICOLAS

INCARNADINE = БЛЕДНО–АЛОЕ (или СВЕТЛО–КРАСНОЕ, или РОЗОВОЕ, или АЛОЕ, или БАГРЯНОЕ, или КРОВАВО–КРАСНОЕ) – Incarnadine:- having the pinkish color of flesh; red, especially bloodred.

INCENTIVE = СТИМУЛИРОВАНИЕ (или ПООЩРЕНИЕ) – Incentive:- positive motive, sometimes artificially generated, for performing some task. Means of encouraging certain economic behavior by consumers or producers. Incentive:- something that provides a motive for a person to choose a particular course of action. Organized cooperative activities in a social setting – such as cooperation for the purpose of economic production – depends upon each of the participants having some sort of incentive to behave in the required cooperative fashion. Different societies (and even different organizations within the same society) vary considerably in the nature of the incentive systems upon which they characteristically rely to organize their common projects. Incentives may be classified according to a number of different schemes, but one of the more useful classifications subdivides incentives into three general types:- moral incentives, coercive incentives and remunerative incentives. (i) A person has a moral incentive to behave in a particular way when he has been taught to believe that it is the 'right' or 'proper' or 'admirable' thing to do. If he behaves as others expect him to, he may expect the approval or even the admiration of the other members of the collectivity and enjoy an enhanced sense of acceptance or self-esteem. If he behaves improperly, he may expect verbal expressions of condemnation, scorn, ridicule or even ostracism from the collectivity, and he may experience unpleasant feelings of guilt, shame or self-condemnation. (ii) A person has a coercive incentive to behave in a particular way when it has been made known to him that failure to do so will result in some form of physical aggression being directed at him by other members of the collectivity in the form of inflicting pain or physical harm on him or his loved ones, depriving him of his freedom of movement, or perhaps confiscating or destroying his treasured possessions. (iii) A person has a remunerative incentive to behave in a particular way if it has been made known to him that doing so will result in some form of material reward he will not otherwise receive. If he behaves as desired, he will receive some specified amount of a valuable good or service (or money with which he can purchase whatever he wishes) in exchange. All known societies employ all three sorts of incentives to at least some degree in order to evoke from its members the necessary degree of cooperation for the society to survive and flourish. However, different societies differ radically in the relative proportions of these different kinds of incentives used within their characteristic mix of incentives. 'Primitive' or 'traditional' cultures such as those of hunter-gatherers tend to rely very heavily on moral incentives and make relatively little use of coercive and remunerative incentives to sustain social cooperation. More 'advanced' or 'modern' societies built around a much more specialized and complex division of labor tend to make much greater use of both coercive and remunerative incentives in organizing social activities, while still relying in very important ways upon moral or normative incentives. Among the more 'advanced' societies, liberal societies try to rely as much as possible on remunerative and moral incentives in preference to the use of coercive incentives, while authoritarian and totalitarian societies display much less reluctance to resort to coercive incentives in securing social cooperation. / Означает поощрение определённого экономического поведения потребителями или производителями.

INCENTIVE RATE = СТИМУЛИРУЮЩАЯ СТАВКА – Incentive Rate is a lower-than-usual tariff rate assessed because a shipper offers a greater volume than specified in the tariff. The incentive rate is assessed for that portion exceeding the normal volume.

INCEPTION DATE = НАЧАЛЬНАЯ ДАТА (или ДАТА НАСТУПЛЕНИЯ) – In reference to insurance, an Inception Date is the date from which, under the terms of a policy, an insurer is deemed to be at risk.

INCH = ДЮЙМ – Inch is a unit of British Imperial and United States Customary measure equal to 1/36 of a yard. The unit derives from the Old English Ince, or Ynce, which in turn came from the Latin unit Uncia, which was 'one-twelfth' of a Roman foot, or pes. The Latin word Uncia was the source of the name of another English unit, the Ounce. The old English ynce was defined by King David I of Scotland about 1150 as the breadth of a man's thumb at the base of the nail. To help maintain consistency of the unit, the measure was usually achieved by adding the thumb breadth of three men – one small, one medium, and one large – and then dividing the figure by three. During the reign of King Edward II, in the early XIV century, the inch was defined as 'three grains of barley, dry and round, placed end to end lengthwise'. At various times the inch has also been defined as the combined lengths of 12 poppyseeds. Since 1959 the inch has been defined officially as 2.54 cm. / Данная единица измерения возникла от старого Английского термина Инс (Ince или Ynce), которые, в свою очередь, пришли из Латинского языка от единицы измерения Унсиа (Uncia). Королём Дэйвидом I (King David I). Короля Эдвода II (King Edward II). Под Дюймом, от Голландского слова Duim, означающее Большой Палец, понимается Британская Имперальная единица длины равная 1/12 фута или 25.4 мм. Применяют дольные от дюйма – микродюйм, равный 10^{-6} дюйма или 25.4 нм, и мил, равный 10^{-3} дюйма или 25.4 микрометров (мкм).

INCHMAREE CLAUSE = ОГОВОРКА ИНЧМАРИ – Inchmaree Clause is a standard clause in maritime insurance contracts covering risk of events not directly linked to perils at sea such as, but not necessarily limited to, loading accidents. Named after a ship called the Inchmaree which suffered damage as a result of the breakdown of a pump. A British Court, in 1884, held that such an accident was not a peril of the sea and so not covered by the standard wording of insurance contracts of the time. Since then, maritime insurance contracts specifically address that by including a comprehensive clause on such risks that, while not directly linked to perils of the sea,

nonetheless relate directly to shipping; called an Inchmaree Clause. So-called for a famous legal decision involving a vessel of that name. Covers losses resulting from a latent defect in the vessel's hull or machinery and losses resulting from errors in navigation or management of the vessel by the master or crew. Inchmaree Clause – provides coverage for loss or damage to cargo from bursting of boilers, breakage of shafts or through any latent defect in the hull or machinery of the vessel or from errors in the navigation or management of the vessel by the master, mates, engineers, or pilots. / и убытки, возникающие вследствие навигационной ошибки или ошибки в управлении судном хозяином (или капитаном) или экипажем (или командой). Оговорка Инчмари – оговорка о возмещении страховщиком убытков, вызванных скрытыми дефектами в корпусе или машине судна.

INCH QUALITY = КАЧЕСТВО ДЮЙМА – Inch Quality is a measure of quality of warp knit fabric, the number of inches of fabric per rack. See also Rack. / мера качества основовязаной трикотажной ткани, число дюймов ткани на . Смотрите также (Rack).

INCHWORM = ДЮЙМОВЫЙ ЧЕРВЯК – Inchworm is a perjorative term used to describe tense spinners who 'inch' their way through their fibers; often too close to the wheel oriface. Relax. This is supposed to be fun. Inch Worm is a short draw drafting technique where both hands work the fiber. One hand controls the twist while the other hand pulls and feeds fiber to be spun.

INCIDENCE = ЗАБОЛЕВАЕМОСТЬ – Incidence:- the proportion (%) of plants or bolls that are affected by a particular disease as opposed to disease severity which is a measure of the mean intensity or extent of the symptoms on each plant or boll.

INCIPIENT DECAY = ЗАРОЖДАЮЩЕЕСЯ ГНИЕНИЕ (или ЗАРОЖДАЮЩЕЕСЯ ЗАГНИВАНИЕ, или ЗАРОЖДАЮЩЕЕСЯ РАЗЛОЖЕНИЕ, или ЗАРОЖДАЮЩИЙСЯ РАСПАД) – Incipient Decay:- the early stage of decay that has not proceeded far enough to soften or otherwise apparently impair the hardness of the wood. It is usually accompanied by a slight discoloration or bleaching of wood. / лёгким изменением цвета или . твёрдость (hardness).

INCOME = ДОХОД (или ПРИХОД) – (1) Income is an amount received by an individual or group in payment for labor or from a factor of production. Real income is the purchasing power of income, determined by adjusting money income to current price levels. Income:- money, goods or services received from any activity. Income may be either a return on one of the factors of production:- an interest, profit, rent, or salary, or a transfer payment made for some other reason, such as unemployment benefit. The definition includes non-monetary income such as the benefit derived from the possession of assets.

(2) Income:- the maximum value that could be withdrawn by the owners of an entity during a period without reducing their equity in the entity below the level at the beginning of the period. Calculated in accounting as the excess of revenues and gains over expenses and losses for a period, or as the increase in owners' equity, excluding capital contributions or withdrawals, between two dates. Also referred to as Net Income, Net Profit, and Profit. Income is inflow of revenue during a period of time. Also known as Profit in the United Kingdom. In the United States, in accounting, excess of revenues over expenses and losses for an accounting period. See also Net Income, and Operation Profit. / Доходами признаётся приращение экономических выгод в течение отчётного периода, происходящее в форме притока или увеличения активов или уменьшения обязательств, что выражается в увеличении капитала, не связанного с вкладами участников акционерного капитала. Доходы включают как выручку, так и прочие доходы. Выручка возникает в процессе обычной деятельности компании и может называться по-разному:- продажи, вознаграждения, проценты, роялти, дивиденды, арендная плата.
