TISSUE TAFFETA = ТКАНЕВАЯ ТАФТА – Tissue Taffeta is a crisp, lightweight taffeta. See also Paper Taffeta. Tissue Taffeta:- plain weave, very light weight and transparent. / Тафта – ткань полотняного переплетения. Тканевая Тафта – ворсистая, лёгкая тафта. Смотрите также Бумажная Тафта (Paper Taffeta).

TISTR = THAILAND INSTITUTE FOR SCIENTIFIC AND TECHNOLOGICAL RESEARCH

TITAL = TRANSACTION INSURED TRADE ACCEPTANCE LOCATOR

TITANIUM DIOXIDE = ДИОКСИД ТИТАНА (или ДВУОКИСЬ ТИТАНА) – Titanium Dioxide is a compound (TiO_2) that occurs naturally in three different forms (rutile, anatase, and brookite). It is used chiefly as a pigment or delusterant in paint or fiber. / Чистый Диоксид Титана (TiO_2) – это бесцветное твёрдое кристаллическое вещество. Несмотря на бесцветность, в больших количествах диоксид титана чрезвычайно эффективный белый пигмент, если он хорошо очищен. В тонкораздробленном состоянии диоксид титана – белый порошок. TiO_2 практически не растворяется в воде и минеральных кислотах, кроме плавиковой и концентрированной серной. TiO_2 практически не поглощает никакого падающего света в видимой области спектра. Свет или передаётся, или преломляется через кристалл или же отражается на поверхностях. TiO_2 – это стабильное (самый стабильное из всех известных белых пигментов), нелетучее, нерастворимое в кислотах, щелочах и растворах при нормальных условиях вещество. Двуокись титана отличается высокой реакционной устойчивостью к различным соединениям, в том числе и к токсичным, содержащимся в воздушной среде. Из-за своей инертности, диоксид титана не токсичен и, в общем, считается очень безопасным веществом. Он может контактировать с продуктами в упаковке, а в определённых концентрациях его можно использовать и как пищевой краситель. Двуокись титана совместима с любыми другими пигментами пленкообразующими веществами и наполнителями. Диоксид титана не растворим в воде, не образует мыла с жирными кислотами связующего, незначительно растворяется в щелочах, органических и минеральных кислотах, полностью растворяется при длительном кипячении в смеси концентрированной серной кислоты с сульфатом аммония; обладает высокой фотохимической активностью, вследствие выделения и обратного поглощения малых количеств кислорода. Вследствие очень высокой белизны тонкодисперсного диоксида титана он нашёл широкое применение в качестве белого пигмента в лакокрасочной промышленности. Тонкое измельчение, поверхностная обработка (гидратом окиси алюминия, кремневой кислотой, фосфатом алюминия, органическими активными веществами) значительно повышают все пигментные свойства диоксида титана. Поверхностная обработка особенно улучшает атмосферостойкость. Диоксид титана (главным образом, в рутильной форме) очень широко используют для приготовления всех видов красок и эмалей. Отличительные особенности двуокиси титана:- (i) обладает отличными красящими способностями, то есть по сравнению с другими веществами требуется меньше двуокиси титана для окрашивания в белый цвет; (ii) двуокись титана практически нетоксична; (iii) двуокись титана негорюча; (iv) соединения титана широко распространены в природе; (v) существуют довольно удобные технологические возможности для получения очень тонкодисперсной двуокиси титана, например, путём гидролиза солей титана и последующим прокаливанием гидроксида титана; (vi) двуокись титана имеет отличную атмосферостойкость; (vii) диоксид титана имеет высокие оптические характеристики (способность к рассеиванию света); кроме того (viii) двуокись титана химически инертна. Температура плавления для рутила:- 1 870 °C. Температура кипения для рутила:- 2 500 °C. Плотность при 20 °C для рутила:- 4.235 г/см^3. Диоксид титана существует в виде нескольких кристаллических модификаций. В природе можно встретить следующие модификации:- кубическая сингония (рутил), тетрагональная сингония (анатаз) и реже – ромбическая сингония (брукит). Следует отметить, что брукит промышленно почти не производится и в природе встречается редко. Анатазная форма также существенно уступает по производству рутильной, так как хуже рассеивает свет и менее атмосферостойка. В мире производится 85–90% диоксида титана рутильной модификации и 10–15% – анатазной. Рутильный диоксид отличается большей атмосферостойкостью, его укрывистая способность выше на 30%. Рутил гораздо лучше, чем анатаз защищает полимер от ультрафиолетового излучения, предотвращая деструкцию, фотокатализ и выцветание последнего. Таким образом, именно применение диоксида титана в форме рутила является безальтернативным для производства дорожных разметочных составов. Примеры применения:- более 50% всего объёма диоксида титана идёт на изготовление товаров лакокрасочной отрасли (титановые белила), поскольку диоксид обладает отличными красящими свойствами. Это:- краски (глянцевые, матовые и полуматовые, силикатные, кремнийорганические, порошковые, эмульсионные и с наполнителями для разнообразных строительных, ремонтных и промышленных работ, печати), лаки и эмали, смеси и растворы для грунтования, шпаклёвки, штукатурки, цементирования, а также полиуретановые и эпоксидные покрытия, в том числе и для древесины. Диоксид, как и металл, белого цвета, поэтому используется он в качестве пигмента. Покрытия приобретают высокую стойкость к воздействиям ультрафиолета, не желтеют и практически не стареют. Более 20% объёма производства двуокиси титана потребляется для изготовления пластических масс и изделий на их основе с высокими термическими свойствами (к примеру, оконный пластик, различная мебель, предметы быта, детали автомобилей, машин и техники), а также каучука, линолеума и резины. Здесь он выступает в роли наполнителя, обеспечивая атмосферостойкость изделий и поверхностей, сопротивление при смене среды, защиту от агрессивных факторов. Около 14% используется при производстве бумаги (белой, цветной, пропитанной), картона, обоев. Диоксид титана играет важную роль при пигментовании. Для придания бумаге гладкости, белизны и высоких свойств при печати на поверхность наносят диоксид или его смеси с другими пигментами. Диоксид титана химической чистоты 99.999 8% применяется при производстве оптоволоконных изделий, медицинского оборудования, в радиоэлектронной промышленности. При изготовлении сверхчистых стекол диоксид служит эталоном чистоты. Также он незаменим при выработке термостойкого и оптического стекла, как огнеупорное защитное покрытие при сварочных работах. При производстве керамики диоксид используется для придания максимальной белизны и черепку либо же эмали (ангобам). Известно применение оксида титана в косметической отрасли, в частности для усиления

свойств солнцезащитных средств, отбеливающих возможностей различных кремов и прочего. Упаковочные материалы с использованием диоксида титана играют важную роль при транспортировке и хранении нестойких к солнечному свету продуктов. В пищевой промышленности диоксид используют для отбеливания таких продуктов, как рыбные фарши и полуфабрикаты, белое мясо (кальмар, курица), сахар-рафинад, жевательные резинки, драже и так далее. При этом, конечно же, регламентируется максимальная концентрация диоксида в массе продукта. Также соединение может использоваться как катализатор в химическом и фармацевтическом производстве для получения специфических промежуточных продуктов. В целом, для каждого производства нормируется чистота диоксида, количество и характер примесей, допустимые массовые концентрации и другие показатели. Производство и потребление диоксида титана на сегодня является одним из показателей развития экономики. Чаще всего исходным материалом для получения диоксида титана сульфатным методом служит ильменит – природная смесь различных оксидов, в основном четырёхвалентного титана и трёхвалентного ферума. При хлоридном методе исходным сырьём является хлоридная соль четырёхвалентного металлического титана. Эти два метода позволяют добывать пигмент диоксид титана обеих модификаций. Хлоридный метод проще сульфатного. Существуют три разновидности хлоридного метода получения диоксида:- (i) соль титана гидролизируют в воде, а затем нерастворимый осадок гидроксида титана подвергают термическому воздействию для получения оксида титана. (ii) Можно проводить реакцию гидролиза при помощи водного пара и пара тетрахлоридной соли титана при температуре не ниже 1 000 градусов, при этом диоксид приобретает свойства пигмента. (iii) Третий способ состоит в сжигании хлорида титана в кислородной атмосфере. При сжигании необходимо поддерживать температуру на постоянном уровне с целью получения частиц одинакового размера, а также регулировать период времени, на протяжении которого образовавшиеся частицы пребывают под термическим воздействием. Именно условия сгорания и определяют структурную модификацию получаемого диоксида титана. Часто таким методом получают продукт, непригодный для производства лакокрасочных товаров, поскольку он содержит больше, чем 0.5% хлора. Недостатком производства пигментов диоксида титана является невозможность повторно использовать отделяющуюся при гидролизе титановой соли хлоридную кислоту, которая отделяется при гидролизе титановой соли. Сульфатный метод представляет собой длинную цепь последовательных операций. На первой стадии породу размалывают и сушат, затем проводят реакцию с концентрированной сульфатной кислотой, после чего полученный титанилсульфат восстанавливают и осветляют. Таким образом, трёхвалентный ферум восстанавливается до двухвалентного. После этого полученный раствор подвергают фильтрации, центрифугированию и кристаллизации в вакууме, затем выпаривают лишнюю влагу до необходимой концентрации титанилсульфатного раствора. При помощи центрифугирования от раствора отделяют железный купорос. Далее следует гидролиз, то есть реакция с водой, в ходе которой получается гидрат двуокиси титана. В ходе последующей двухэтапной фильтрации отделяют различные примеси и посторонние вещества. Далее следует отбелка смеси, обработка солями с последующим прокаливанием для удаления влаги. После прокаливания вещество несколько раз размалывают, проводят обработку поверхности, затем сушат и мелко измельчают полученный пигмент. Двуокись Титана пигментная – синтетический неорганический пигмент белого цвета, анатазной и рутильной форм, получаемый гидролизом растворов сернокислого титана с последующим прокаливанием гидратированной двуокиси титана. В зависимости от кристаллической структуры выпускают две формы двуокиси титана:- Р – рутильная и А – анатазная. При наличии поверхностной обработки в условной обозначение марки добавляется индекс ‘0’. В зависимости от области применения двуокись титана изготовляют следующих марок:- Р-1, Р-02, Р-03, Р-04, Р-05; А-1, А-2, А-01, А-02. Двуокись титана пигментная марки Р-02 предназначается для производства лакокрасочных материалов, в том числе вододисперсионных, с хорошей атмосферостойкостью; пластмасс; искусственных кож; плёночных материалов. Двуокись титана пигментная пожаро- и взрывобезопасна, по степени воздействия на организм относится к веществам 4-го класса опасности. Двуокись титана пигментную упаковывают в стальные фляги; стальные, картонно-навивные, фанерные, фанерные с полиэтиленовым вкладышем барабаны; деревянные, деревянные с полиэтиленовым вкладышем, полиэтиленовые, бумажные, из прорезиненной ткани бочки. Допускается упаковывать пигментную двуокись титана в мягкие специализированные контейнеры разового использования. Двуокись титана пигментную транспортируют всеми видами транспорта в крытых транспортных средствах. Допускается транспортирование продукции, упакованной в мягкие специализированные контейнеры, в открытых транспортных средствах. Двуокись титана пигментную хранят в закрытых складских помещениях при температуре окружающей среды от минус 40 до плюс 400 °С. Допускается хранение продукции, упакованной в мягкие специализированные контейнеры, на открытых площадках. Тару укладывают в штабели высотой не более 3 м на подкладки или деревянные поддоны. В настоящее время Диоксид Титана производится двумя способами:- сульфатным и хлорным. Первый вариант, внедрённый ещё в 1936, предусматривает получение TiO_2 из ильменитового концентрата, обрабатываемого серной кислотой; второй метод, разработанный компанией ДюПо (DuPont) в 1950, подразумевает получение конечного продукта из тетрахлорида титана. Работы над новыми методами выработки диоксида титана продолжаются, поскольку существующие технологии имеют определённые недостатки. Например, сульфатная технология энергозатратна и довольно негативно сказывается на экологии; хлорный метод, превосходящий сульфатный по экономическим показателям, в большинстве случаев неприемлем, поскольку получаемый пигмент содержит адсорбированный хлор и из-за физико-химических показателей не может использоваться для изготовления лакокрасочной продукции. Прокаливание диоксида титана, полученного хлорным методом, до 900 °С отчасти снимает данное ограничение, но существенно увеличивает технологические затраты. Как и цена любого другого продукта, стоимость Диоксида Титана в немалой степени определяется спросом. Согласно экспертным данным, в 2010 объём мирового производства TiO_2 составил около 5 миллионов тонн, что практически покрыло спрос. Однако стоит учитывать следующее:- 2011 год можно назвать годом экономической рецессии – в ближайшие годы основные потребители диоксида титана будут наращивать производство, в результате чего спрос вновь превысит предложение. Это подтверждается выводами экспертов, прогнозирующих увеличение объёмов потребления TiO_2 на 3–4% в год. Крупнейшими мировыми производителями TiO_2 остаются крупнейшие корпорации:- Кристал Глоубэл (Cristal Global) (Саудовская Аравия), ДюПо^{T3} (DuPont^{TM}) или И.Ай. дю По дё Номур энд Кампэни (E.I. du Pont de Nemours and Company) (Соединённые Штаты Америки), Хантсмэн Интёнэшэнэл Эл.Эл.Си. (Huntsman International LLC) (Соединённые Штаты Америки). Аналитики данных компаний в один голос заявляют о том, что объёмы потребления диоксида титана к 2015 составят около 7 миллионов тонн. Учитывая стремительный выход из рецессии нуждающихся в диоксиде титана предприятий, данный показатель можно назвать скорее заниженным, чем завышенным. Таким образом, разрыв между спросом и предложением будет увеличиваться, что, несомненно, также послужит причиной роста стоимости диоксида титана. Анализируя показатели прошлых лет, можно наблюдать стабильный рост:- начиная с 2009, среднегодовые цены на TiO_2 возросли на 15%. Если верить аналитикам, в 2011 цены на диоксид титана возрастут примерно на 20%, но уже в следующем году рост замедлится до 10% в год.

TITFER = ТИТФЁ (или ШЛЯПА, или ШАПКА) – Titfer:- (British) hat. Origin:- 1930s, abbreviation of rhyming slang Tit For Tat. / на жаргоне – Шляпа.

TITIAN = ЗОЛОТИСТО–КАШТАНОВОЕ (или ХХ) – Titian:- of a brownish orange color.

TITLE XI = ТИТУЛ XI (или РАЗДЕЛ XI) – Title XI:- a ship financing guarantee program.

TITLE TRANSFER = ПЕРЕДАЧА ТИТУЛА (или ПЕРЕХОД ПРАВА СОБСТВЕННОСТИ) – Title Transfer is conveyance of the ownership interest in property from one counterparty to another. Title transfer is used as one of the methods for collateralisation. The title transfer method employs an outright transfer of the ownership interest in property serving as collateral, i.e. the collateral provider transfers title or ownership interest to the assets given as collateral against an agreement that the collateral taker will return the equivalent assets in accordance with the terms of their agreement. / неотложный перевод доли владения в собственности, . Под Титулом, от Латинского слова Titulus, означающее Заглавие или Надпись или Почётное Звание, в буржуазном праве понимается основание какого-либо права, например, титул купли-продажи, дарения, мены и так далее.

TITLE TRANSFER FACILITY = ПУНКТ ПЕРЕДАЧИ ТИТУЛА (или ПУНКТ ПЕРЕХОДА ПРАВА СОБСТВЕННОСТИ) – The Title Transfer Facility, more commonly known as TTF, is a virtual trading point for natural gas in the Netherlands. Set up by Gasunie in 2003, it is almost identical to the National Balancing Point (NBP) in the United Kingdom and allows gas to be traded within the Dutch network. Gas at TTF usually trades in Euros per MegaWatt hour. See also Henry Hub, and National Balancing Point.

TITRE = ТИТР (или НОМЕР, или СОРТ, или ПРОБА, или НАДПИСЬ, или ЗАГОЛОВОК, или НАЗВАНИЕ) – (1) Titre is a deprecated term. See also Linear Density. / Под Титром, от Французского слова Titre, означающее Качество или Характеристика, понимается внесистемная единица линейной плотности волокон или нитей, характеризующая толщину материалов. В титре за единицу массы принимали денье (0.05 грамма), а за единицу длины – 450 метров. Был заменён тексом (tex). Смотрите также Линейная Плотность (Linear Density). Титр в текстильной промышленности, служит для оценки толщины волокон и нитей (в основном шёлковых). Выражается произведением площади поперечного сечения волокна или нити на плотность их вещества (или отношением массы волокна или нити к их длине). Титр стали применять в XVIII веке; с 1900 используют так называемый Легальный Титр, численно равный массе нити (в граммах (г)) длиной 9 километров (км). В бывшем Союзе Советских Социалистических Республик (СССР) с 1956 вместо титра был принят текс.

(2) Titre:- xxxxx. / Титр, в аналитической химии концентрация раствора, выраженная количеством (в граммах (г)) растворённого вещества в 1 миллилитре (мл) раствора или количеством какого-либо вещества, реагирующего с 1 мл данного раствора. Соответственно различают Титр По Растворённому Веществу (например, Титр раствора соляной кислоты – T_{HCl}) или Титр По Определяемому Веществу (например, Титр раствора соляной кислоты по едкому натру – $T_{HCl/NaOH}$). Титр рассчитывается по формуле:- T = P/V, где T – титр раствора в г/мл, P – масса навески в г, V – объём мерной колбы в мл. Растворы с известным титром - стандартные растворы – используются в титриметрическом анализе.

(3) Titre:- xxxxx. / Титр в иммунохимическом анализе, максимальное или оптимальное разведение антигенов, антител или комплемента, при котором возможны регистрация положительной реакции между антигенами и антителами или стандартизация реакции по одному или обоим компонентам. В отдельных случаях (например, в реакции связывания комплемента) за титр антигена принимают наибольшую его концентрацию, при которой ещё возможна регистрация лизиса сенсибилизированных эритроцитов. Определение титра позволяет быстро оценить активность иммунных сывороток. В иммунохимическом анализе применяют три вида титрования. Макротитрование проводят с помощью пипеток, добавляя к одинаковым объёмам растворителя различные количества титруемого материала, или путём последовательного переноса смеси материала и растворителя в пробирки с одинаковым количеством растворителя. В последнем случае обычно берут равные объёмы материала, растворителя и переносимой смеси, получая двукратные разведения. Микротитрование проводят аналогично, но с помощью капилляров, а объёмы измеряют по количеству капель. При автоматическом титровании используют фигурные петли, способные удерживать строго стандартные объёмы жидкости.

(4) Titre:- xxxxx. / Титр Бактерий, максимальное разведение водной взвеси бактерий, при посеве которой наблюдается их рост. Чтобы установить титр Бактерий, определённое количество исследуемого материала (почва, вода, пищевые продукты) вносят в пробирку со стерильной водой и тщательно размешивают. Затем 1 миллилитр (мл) из первой пробирки разводят в 10 раз в следующей пробирке. Повторяя эту операцию многократно, получают дальнейшие разведения. Высевая пробы с различным разведением на элективные или дифференциально-диагностические питательные среды, предназначенные для роста определённой физиологической группы Бактерий, можно получить данные о количестве в исследуемом материале гнилостных, нитрифицирующих, денитрифицирующих, целлюлозных, анаэробных и других Бактерий. При санитарно-гигиенической оценке воды и пищевых продуктов большое значение имеет титр кишечной палочки – так называемый Коли-Индекс.

(5) Titre:- xxxxx. / Титр в кино, надпись в фильме; бывают заглавные, или вступительные, промежуточные и заключительные титры, а также внутрикадровые надписи – субтитры, использующиеся при демонстрации кинокартин на иностранных языках, выпускаемых без дублирования. В ‘немом’ кино титры передавали содержание диалога, сообщали об изменении времени и места действия, помогали раскрытию авторского замысла. В звуковом кино сохранили значение преимущественно заглавные титры.

'TO ARRIVE' CONTRACT = КОНТРАКТ ПО ПРИБЫТИИ – 'To Arrive' Contract:- a transaction providing for subsequent delivery within a stipulated time limit of a specific grade of a commodity. The 'to arrive' sales contract was the forerunner of the present-day futures contract. / Операция, обеспечивающая последующую поставку сырья спецификационного сорта в пределах обусловленного времени. Контракт купли-продажи 'по прибытии' был предшественником нынешнего фьючерсного контракта.

TOBA = TERMS OF BUSINESS AGREEMENT

TOBACCO BUDWORM = ТАБАЧНЫЙ ПОЧЕЧНЫЙ ЧЕРВЬ (или ТАБАЧНЫЙ ПОЧКОЕД, или ГУСЕНИЦА ТАБАЧНОЙ СОВКИ) – Tobacco Budworm (for Cotton crop):- Scientific Name:- Heliothis Virescens. Description Of The Pest:- The Budworm is an important Pest of Cotton only in the desert valleys. Budworm moths are about 0.75 inch long, with a wing span of 1 to 1.5 inches. Eggs are spherical, flattened, with 10 to 15 perpendicular rows of toothed ribs. Newly hatched larvae have several rows of dark tubercles along the back, each bearing one or two bristles. Larvae range from olive green to dark reddish brown in color and can be best distinguished from most other caterpillars by the tiny spines, visible under a hand lens, that cover most of the body surface. To distinguish the Budworm from Bollworm larvae, they must be at least in the third instar. The Budworm has a toothlike structure on the inner surface of the mandibles that is lacking in the Bollworm, and it has the tiny spines of the skin extending onto the tubercles on top of the eighth abdominal segment; in the Bollworm, these tubercles lack spines. Damage:- Heliothis larvae damage bolls and squares. Larvae chew holes into the base of bolls and may hollow out locks. Moist frass usually accumulates around the base of the boll. Larvae may also chew shallow gouges in the boll surface, which can become infected with rot organisms. Bracts of young squares flare outward and the squares become yellow and abort from the plant. Older squares may remain but usually have a round hole and frass near the base. Fifth-instar larvae are the most destructive; they not only damage more fruit than do earlier instars, but they damage

larger fruit that are harder for the plant to replace. Management:- The impact of a Budworm infestation depends on the number of larvae present, the age of the larvae, and the timing of damage relative to the crop's fruiting cycle. Although large larvae do most of the damage, it is not possible to kill a significant proportion of them once they are older than the third instar. Monitoring and control must therefore be aimed at the eggs and small larvae. Natural enemies are very important in managing populations of Budworms. Damaging populations usually do not appear until late in the season, after treatments for other Pests have disrupted natural controls. Insecticides are needed only if the population exceeds the treatment threshold while the crop has a significant number of squares or green bolls that will have time to develop into mature bolls by season's end. There is no need to treat once bolls begin cracking, because most bolls are too mature by that time to be susceptible and squares still present will not have time to mature. In the low desert valleys, there are two periods when injury can occur – one in each fruiting cycle. Biological Control:- Many predators and parasites combine to substantially maintain Heliothis populations at low levels. Insecticide sprays for other Pests will disrupt this natural control. Cultural Control:- Heliothis are attracted to succulent, rank-growing Cotton Plants; keep water, fertilizer, and plant density at recommended levels to avoid rank growth. Because populations seldom reach damaging levels before late summer, manage the crop for early maturing and plan to defoliate by late September (in California). The use of Bt Cotton will help prevent damage by this pest. The use of transgenic Cotton, Bollguard II, offers suppression of Cotton Bollworm, along with Beet Armyworms, Pink Bollworm, and Tobacco Budworm. Organically Acceptable Methods:- Biological controls, cultural practices that promote early harvest, and sprays of Bacillus Thuringiensis are acceptable for use on organically grown Cotton. Monitoring And Treatment Decisions:- In desert valleys, start sampling in mid-July, about 1 to 2 weeks after peak squaring. Continue sampling until most bolls have matured. In crops with a second fruiting cycle, continue until top crop bolls have matured. For standard sampling, check for larvae on the terminal growth of at least 100 plants chosen at random. Divide fields of up to 80 acres into quarters and check 25 plants in each quarter. Divide larger fields into more areas and check 25 plants in each area. The treatment threshold is 10 to 12 small Budworm or Bollworm larvae per 100 plants. In fields that have been treated previously, treat when you find 8 small Bollworms per 100 plants. Later instar larvae are the most destructive but are very resistant to insecticides; therefore, aim treatments at first or second instars. Tobacco Budworm (Heliothis Virescens), a caterpillar Pest of primarily squares and bolls; a close relative of the Corn Earworm. It undergoes three to four generations annually and often is the predominant Species of the Bollworm/Budworm complex in June in the Carolinas. Mid South populations of Tobacco Budworms have developed resistance to all major classes of insecticides. Cotton Bollworms and Tobacco Budworms are fruit feeders, and their effects on production are generally more critical after first bloom. Natural control can usually suppress populations early in the growing season, but damage can occur at any stage of crop development. Thresholds for Bollworm/Budworm in US Cotton range from 4–20% of plants infested with larvae to 5–25% square (preflowering fruit) damage. Most recommendations emphasize the preservation of natural control agents, and thresholds are lowered after the first insecticide application has been made. / Виды (Species). Табачная Совка:- бабочка, передние крылья коричневато-сероватые с волнистыми полосками и тремя тёмными пятнами, задние – светлые с тёмной каймой (у самцов каймы нет). Гусеницы оливково-серого цвета, зимуют в земле и окукливаются весною. Вредит Табакам, объедая наружные части растений. Меры борьбы:- отравленные приманки (на 100 килограммов (кг) отрубей 4 литра (л) патоки и 1–2 кг Парижской зелени или мышьяковистокислого натра; смесь разбавляется водой до получения тестообразной массы).

TOBACCO CLOTH = ТАБАЧНОЕ ПОЛОТНО – Tobacco Cloth is a thin, lightweight, open cloth used to shade and protect Tobacco Plants.

TOBIN'S Q = КЬЮ. ТОБИНА – Tobin's Q (also known as Q Ratio and Kaldor's V) is the ratio between a physical asset's market value and its replacement value. It was first introduced by an Hungarian-English economist Nicholas Kaldor (born Káldor Miklós; 1908–1986) in 1966 in his article 'Marginal Productivity and the Macro-Economic Theories of Distribution:- Comment on Samuelson and Modigliani' (American economist Professor Paul Anthony Samuelson (1915–2009) and an Italian-American economist Professor Franco Modigliani (1918–2003)). It was popularised a decade later, however, by an American economist James Tobin (1918–2002), who describes its two quantities (1977):- One, the numerator, is the market valuation: the going price in the market for exchanging existing assets. The other, the denominator, is the replacement or reproduction cost:- the price in the market for newly produced commodities. We believe that this ratio has considerable macroeconomic significance and usefulness, as the nexus between financial markets and markets for goods and services. Xxxxx. Tobin's Q is the ratio of market value of a company's assets to the replacement value of those assets. The market value of assets can be estimated as the sum of market value of the company's equity and book values of its debt and the replacement value can be considered as equal to the book value of total assets. Tobin's Q measures the wealth generated by a company for its shareholders. It compares how much more a company is worth when compared to the book value of its assets. Any excess of market value of assets over their book value results from intangible assets, goodwill, future growth potential, competitive position, etc. A high q ratio is generally considered good because it indicates that the company is worth more than the sum of its assets. But since it is based on historical data, it is not a good predictor of future returns on the company's equity. In valuation context, a high q ratio might indicate that the company's stock is overvalued. The Tobin's q ratio can also be utilized as an indicator of overall stock market valuation. A very high ratio relative to historical trend might indicate that the stock market is overvalued and vice versa. Formula:- Tobin's Q can be calculated using the following equation:- Tobin's Q = Market Value of Assets / Replacement Value of Assets. Market value of assets equals the market value of equity and market value of debt. The actual replacement value of assets is hard to determine so it is assumed to be equal to the book value of total assets:- Tobin's Q = $(E_{MV} + D_{MV}) / A_{BV}$. However, many companies do not have marketable debt, so it is assumed that the market value of debt equals its book value. So Tobin's q simplifies to:- Tobin's Q = $(E_{MV} + D_{BV}) / A_{BV}$. Where E_{MV} is the market value of equity (i.e. stock price multiplied by total number of shares outstanding), D_{BV} stands for book value of debt and A_{BV} is the book value of total assets. / Венгерско-Английский экономист Никалэс Калдор (Nicholas Kaldor) (урождённый Кальдор Миклош (Káldor Miklós); 1908–1986) в 1966 в своей статье ('Marginal Productivity and the Macro-Economic Theories of Distribution:- Comment on Samuelson and Modigliani') (Американский экономист Профессор Пол Энсэни Сэмьюлсэн (Paul Anthony Samuelson; 1915–2009) и Итало-Американский экономист Профессор Франко Модильяни (Franco Modigliani; 1918–2003)). Он был популяризован спустя десятилетие, однако, Американский экономист Дьжеймз Тобин (James Tobin; 1918–2002).

TOBOGGAN = ТЧОБАГЭН (или ТОБОГГАН, или ШАПКА, или ХХ) – Toboggan:- a knit hat worn to keep the head warm in cold temperatures. (Not to be mistaken for a long sled.) In Southern American English, Appalachian English, and Yooper dialect, toboggan refers to a type of hat. This is sometimes shortened to boggan or lengthened to boggan cap. This type of hat is also referred to by other names:- knit hat or knit cap, sock cap or stocking cap, watch cap, tuque, skull cap or sometimes as a ski cap.

TOC = TRANSPORTATION OPERATING COMMAND

TOCMC = TEXAS ORGANIC COTTON MARKETING COOPERATIVE

TOCOM = THE TOKYO COMMODITY EXCHANGE

TOD = TRANSFER ON DEATH

TODA = TAKEOFF DISTANCE AVAILABLE

TOE = TONS OF OIL EQUIVALENT

TOE CLOSING = ЗАКРЫТИЕ (или СШИВКА, или СБОРКА, или МЫСОК (ЧУЛКА)) НОСКА – Toe Closing:- in knitting hosiery, this term refers to closing the toe opening. It may be knit closed, or in tube hosiery, sewn closed. / в вязаных чулочно-носочных изделиях этот термин относится к ..

TOEHOLD PURCHASE = ПРИОБРЕТЕНИЕ, НЕ ТРЕБУЮЩЕЕ РАЗЪЯСНЕНИЙ (О НАМЕРЕНИЯХ) (или ПРИОБРЕТЕНИЕ ТОЧКИ ОПОРЫ) – A Toehold Purchase is accumulation of less than 5% of a target company's outstanding stock by another company or investor with a particular goal in mind. If the toehold purchase is made by another company, it may be a precursor to a takeover bid or tender offer. If a large investor is making the toehold purchase, it usually is accompanied by demands that the target company take a number of steps to increase shareholder value of the firm. A toehold purchase by a company may be a signal that it is interested in eventually acquiring the company. This potential acquirer can quietly amass up to 5% for its toehold as it considers its strategic options. But if it crosses the 5% threshold, it must file a Schedule 13D with the US Securities and Exchange Commission (SEC) and explain to the target firm in writing the reason for the purchase of 5% or more of its stock. Filing a Schedule 13D additionally notifies the public of what the company is intending to do with its toehold purchase. A toehold purchase by an investor normally means that it intends to shake up the target firm in certain ways in an attempt to boost the market value. This activist investor would announce to the Board of Directors of a company in a public letter that it has built up a material stake, outline its reasons for its investment, and suggest (or demand) specific actions to increase shareholder value. This notification to the public can, and often does, take place before the 5% mark is reached. Activist's Toehold Success Example:- A prominent activist investor, Paul Singer of Elliott Capital Management, has had much success with the strategy of making toehold purchases, agitating for changes at his targeted investment, and then eventually cashing out at substantial profits if his recommendations or demands are implemented effectively. In November 2016, Singer disclosed a 4% holding in Cognizant Technology Solutions along with his ideas for lifting profitability and returning cash to shareholders. He also insisted on change at the Board level. The results were swift – in February 2017, Cognizant agreed to replacing three new independent directors and committed to plans to expand profit margins and return capital to shareholders. First acquisition of up to 5% of a target company's shares in an attempted takeover bid. Toehold Purchase is the concept of acquisition of only a 5% or lesser stake in a company by buying stocks. It is a very small percentage of stake in the company but it still gives the shareholder an option of being a decision maker in the acquired company. Since it is a very limited and small share, it appears like having a 'hold of the toe' in the acquired company and hence the term. Explanation:- The companies are absolutely free for purchasing up to lower than 5% of any incorporation. But once an incorporation purchases 5% or greater of target company, the acquirer should file a 13D form with the SEC and provide explanation to the target firm in writing, the reasons for purchasing 5% or more of the stock. By filing a 13D form, moreover notifies to the public, what the companies' intentions are to do with its toehold purchase, and might be a precursor to a takeover. By filing a 13D form, moreover notifies to the public, what the companies' intentions are to do with its toehold purchase, and might be a precursor to a takeover. In the case of a decision making among the shareholders, the perspective of a toehold shareholders is also considered, thus making them important to the acquired company. Hence, this concludes the definition of Toehold Purchase along with its overview. Toehold Purchase:- often used in risk arbitrage. Accumulation by an acquirer of less than 5% of the shares of a target company. Once 5% is acquired, the acquirer must file with the SEC and other agencies to explain its intentions and notify the acquiree. See also Rule 13d. A Toehold Purchase is one in which an individual investor or investment firm caps holdings in a potential target company at less than 5% of the company's outstanding stock. Presumably that's because once an investor has acquired 5% or more of the stock, the investor must notify the company, the market where the company is listed, and the Securities and Exchange Commission (SEC). That notification must explain the next steps the investor intends to take, such as a possible takeover bid. Toehold Purchase is the purchase of less than 5% of the outstanding common shares of a target company before establishing a much larger stake. A toehold purchase allows a party to buy stock in a company without filing a notice with the SEC and with the target company. Toehold Purchase:- the acquisition of less than five percent of the shares of a company that is a target for a takeover. Once the five percent level is reached, the acquirer has to file Schedule 13D with the Securities and Exchange Commission to outline its plans and intentions under the requirements of the Williams Act. Toehold Purchase is the act of buying less than 5% of a company's outstanding stock as a possible precursor to a subsequent larger purchase. When 5% or more is accumulated, the Securities and Exchange Commission (SEC) and the target must be notified. / Комиссия по Ценным Бумагам и Биржам (The Securities and Exchange Commission; сокращённо – КЦББ или СЭК (SEC), в Англоязычном произношении). Пол Синё (Paul Singer) из Элыэт Кэпитэл Манэдьжмент (Elliott Capital Management). Кагнизэнт Тэкнолодьжи Солушэнз (Cognizant Technology Solutions). Приобретение Точки Опоры (Toehold Purchase):- накопление инвестором менее 5% акций компании, являющейся целью перекупки (target company). Как только приобретается 5% акций, покупатель должен представить информацию в Комиссию по Ценным Бумагам и Биржам, на соответствующую биржу и в компанию, являющуюся целью перекупки. Он должен объяснить свои действия, а также сообщить, что может ожидать от него компания. Смотрите также (Schedule 13D); и Акт Вилъйэма (William's Act).

TOFC = TRAILER ON FLAT CAR

TÒGA = ТОГА – Tòga is the loose outer garment worn in public by citizens of ancient Rome; also, a similar loose wrap or a professional, official, or academic gown. / .

TOGGLE = БАНКАБРОШ (или КОЛЕНЧАТЫЙ РЫЧАГ) – Toggle is a bar-shaped button fastened to a garment with a loop.

TOGGLE = КОЛЕНО (или КОЛЕНЧАТЫЙ РЫЧАГ, или ШАРНИРНЫЙ РЫЧАГ, или КОСТЫЛЁК, или КЛЕВАНТ, или КОФЕЛЬ–НАГЕЛЬ) – Toggle (maritime term):- a small piece of wood or bar of iron inserted in a knot to render it more secure, or to make it more readily unfastened or slipped.

TOILE = ТУАЛЬ (или ПОЛОТНО, или ХОЛСТ, или ХОЛСТИНА, или ВУАЛЬ) – Toile is the French word for Cloth. Toile is also a woven fabric that has been printed, usually in one color only, with a scenic design. This is occasionally called Turle de Jouy. It is most commonly found in home furnishings fabrics. Toile is also used in the field of expensive designer clothing where the word is used to describe a fabric pattern for a garment. Etymology:- Middle English Toile, from French Toile ('Cloth'), from Old French Teile, from Latin Tela, ('Web'), from Proto-Indo-European *(s)teg ('to cover'). Toile is the name of a fabric that entered the English language around the XVI century from a French word meaning 'Linen Cloth' or 'Canvas' – particularly cloth or canvas for painting on. The word Toile can refer to the fabric itself, a test garment (generally) sewn from the same material, or a type of surface decoration (traditionally) printed on the same fabric. In Australian and British terminology, a toile is a version of a garment made by a fashion designer or dressmaker to test a pattern. They are usually made in cheap material, as multiple toiles may be made in the process of perfecting a design. Toiles are commonly called 'Muslins' in the United States, named for the cheap, unbleached cotton fabric available in different weights. Toile de Jouy, sometimes abbreviated to simply 'Toile', is a type of decorating pattern consisting of a usually white or off-white background on which a repeated pattern depicting a fairly complex scene, generally of a pastoral theme such as a couple having a picnic by a lake or an arrangement of flowers. The pattern portion consists of a single color, most often black, dark red, or blue. Greens, browns, and

magenta toile patterns are less common, but not unheard of. Toile is most associated with fabrics (curtains and upholstery in particular, especially chintz), though toile wallpaper is also popular. Toile can also be used on teapots, beddings, clothing, etc. In upper-class (primarily American, but also northern European) society, toile is often seen on dresses or aprons used at such events as country-themed garden parties or tea parties. Toiles were originally produced in Ireland in the mid-XVIII century and quickly became popular in Britain and France. The term, Toile de Jouy, originated in France in the late XVIII century. In the French language, the phrase literally means 'cloth from Jouy-en-Josas', a town of north-central France. Although it has been continuously produced since then, it experienced a marked upsurge in popularity around the year 2000. Previously only a decorating design, designers have been recently experimenting with toile-patterned apparel as well, although toile-patterned shirts were widely worn in the 1970s. Toiles were very popular during the Colonial Era in the United States and are highly associated with preservationist towns and historical areas, such as Colonial Williamsburg. When Williamsburg saw a repopularization in the 1930s, so did toiles, as they did again in the 1970s in celebration of the United States Bicentennial. Toile is:- (1) a broad term describing many simple plain weave twill fabrics, especially those made from linen. (2) Sheer cotton and linen fabrics. Toile is a version of a garment made by a fashion designer or dressmaker to test a pattern, or a single-color design that looks like pen and ink drawings. Most depict allegorical or pastoral scenes, but some may just be of flowers, etc. Toile:- any of many plain or simple twill weave fabrics especially linen. / Тюрль дё Жуи (Turle de Jouy). Туаль (Toile), от Французского слова Туаль (Toile), от Старофранцузского слова Тэйль (Teile), означающее Кострика или Луб, от Латинского слова Тэла (Tela). Туаль дё Жуи (Toile de Jouy). Жуи-ан-Жоза (Jouy-en-Josas).

TOILE DE JOUY = ТУАЛЬ ДЁ ЖУИ (или ТУАЛЬ ИЗ ЖУИ, или ПОЛОТНО, или ХОЛСТ, или ХОЛСТИНА, или ПАРУСИНА, или БЕЛЬЕВАЯ ТКАНЬ, или ВУАЛЬ) – Toile de Jouy is a cotton fabric printed in pictorial designs. The original toile was printed by Oberkampf in 1759 at Jouy, France. It is used for draperies and bedspreads. See also Toile. Toile De Jouy is a fabric printed in toile de Jouy, namely an XVIII century French scenic pattern usually printed on cotton, linen, or silk in one color on a light ground.

TOKEN = ЖЕТОН – Token is a stamped piece of metal issued as a limited means of exchange, but not guaranteed by the government, e.g., a bus token. / Штампованный кусок металла, используемый в качестве ограниченного средства обмена, но не гарантированного правительством, например, автобусный жетон. Под Жетоном понимается металлический кружок, заменяющий монету, например, в торговых аппаратах.

THE TOKYO COMMODITY EXCHANGE, INC. = ТОКИЙСКАЯ СЫРЬЕВАЯ БИРЖА, ИНК. – The Tokyo Commodity Exchange, Inc. (TOCOM) was established on 1984-November-01 as an amalgamation of the Tokyo Textile Exchange (established 1951), the Tokyo Rubber Exchange (1952) and the Tokyo Gold Exchange (1982). Since its inception, TOCOM has experiences a remarkable expansion in its market size. TOCOM's trading volume soared from 4 million contracts in 1985 to 87 million contracts in 2003, more than a twenty-fold increase during a nineteen year period. TOCOM created Japan's first petroleum futures market with gasoline and kerosene listed in July 1999, followed by crude oil in September 2001 and gas oil in September 2003. Although trading volume declined in 2004, the growth in trading value in US Dollar terms gives a strong signal of continued growth going forward. The Tokyo Commodity Exchange, Inc. (TOCOM) is a futures exchange that offers a comprehensive array of industry-oriented commodities, such as precious metals (gold, silver, platinum and palladium), oil (crude oil, gasoline and kerosene), rubber and aluminum futures as well as gold options on futures. TOCOM, Japan's largest and one of the preeminent futures exchanges in Asia, enhances the functionality of commodity derivatives markets as one of the industry's infrastructure, which is to provide a risk hedge tool for price fluctuation, as well as a tool for asset management. The Tokyo Commodity Exchange, Inc. was established on 1984-November-01, as a merger of the Tokyo Textile Exchange (established 1951), the Tokyo Rubber Exchange (1952) and the Tokyo Gold Exchange (1982). TOCOM, acting as a pioneer among exchanges, introduced an electronic trading platform in 1991. Following the addition of an aluminum market in 1997 and an oil market in 1999, TOCOM offers a full range of futures on essential industrial commodities, which are highly correlated to physical market trends, and has grown into a truly international futures exchange. In 2005, clearing operations were moved from an in-house clearing house to the Japan Commodity Clearing House (JCCH), an independent clearing house, whose efficient financial operations enhanced our trading environment. The annual volume in 2005 reached about sixty-two million contracts, which, in the span of those twenty years, represents over fifteen times the four million contracts traded during the first year of operations. The Tokyo market is the first one to open in the world, followed by the London and New York markets. TOCOM, as a center for benchmark price formation in the Asian time zone, strives for fair and transparent market operations. All of the TOCOM products are traded continuously on an electronic platform. TOCOM properly responds to the needs of investors from all over the world through its highly reliable and efficient system, which rapidly and accurately handles a large number of orders. Since its launch in 1991, TOCOM has relentlessly upgraded and increased the capacity of its electronic platform to pro-actively adjust to the ever-changing futures markets. To ensure safe and rapid handling of orders at all times, we pay the utmost attention to system continuity and performance, and we are confident that our platform constitutes a very robust and secure trading environment. In November 2003, TOCOM started to connect to Independent Software Vendors (ISVs) to facilitate the placement of orders from overseas. In fact, most of the access to our market from overseas is done through ISVs and ISV connections significantly contribute to increase market liquidity. You can trade through TOCOM broker members from wherever you are. If the broker member works with an ISV, seamless trading operations can be achieved. Naturally, you may also choose to trade with an FCM in your country who can then place orders through TOCOM broker members. Commercial players in one of our listed commodities can also become associate members and place orders through our broker members. Associate members can trade with lower margins rates than the ones applicable to general customers, since their required margins are equivalent to members' margins, therefore achieving highly efficient fund operations. Another way to participate in the TOCOM market is to obtain TOCOM membership by going through our financial and qualification screening process. TOCOM was established on 01 November 1984 as a merger of the Tokyo Textile Exchange, the Tokyo Rubber Exchange and the Tokyo Gold Exchange. Website:- http://www.tocom.or.jp. Some history facts:- In April 1991, TOCOM started electronic trading. In August 1992, listed palladium futures. In April 1997, listed aluminum futures. In July 1999, opened oil market, listed gasoline and kerosene futures. In September 2001, listed Middle East crude oil futures. In September 2003, listed gas oil futures (currently trading is suspended). In May 2004, listed options on gold futures. In January 2005, rubber market was fully computerized. In the past, TOCOM used to handle clearing operations through an in-house clearing house. Following the implementation of the revised Commodity Exchange Law (CEL), the Japan Commodity Clearing House (JCCH), an independent clearing house that integrates the clearing operations of all Japanese commodity exchanges including TOCOM, was established in May 2005 and is the sole counterparty for all settlements. / флуктуации (колебания) цены . Токийская Сырьевая Биржа, Инк., известная также под названием ТЧОКОМ (TOCOM), была создана 01 Ноября 1984 в результате поглощения Токийской Биржи Текстиля (Tokyo Textile Exchange; основанной в 1951), Токийской Биржи Каучука (Tokyo Rubber Exchange; основанной в 1952) и Токийской Биржи Золота (Tokyo Gold Exchange; основанной в 1982). Сетевой сайт:- http://www.tocom.or.jp. Некоторые факты из истории биржи:- в Апреле 1991 биржа выступила первопроходцем среди всех других бирж мира впервые проведя электронные торги. В Августе 1992 ТЧОКОМ ввела в обращение фьючерсы на палладиум (palladium futures), а в Апреле 1997 – фьючерсы на алюминий (aluminum futures). С запуском в обращение в Июле 1999 фьючерсов на бензин и керосин (gasoline and kerosene futures) было положено открытие нового рынка – рынка нефти и нефтепродуктов. В Сентябре 2001 были введены фьючерсы на Ближневосточную нефть (Middle East crude oil futures). В

Сентябре 2003 ТЧОКОМ ввела в обращение фьючерсы на газойль (gas oil futures), однако, спустя какое-то время, торговля ими была временно приостановлена. В Мае 2004 стартовали торги опционами на фьючерсы на золото (options on gold futures). В Январе 2005 рынок каучука был полностью компьютеризирован. Токийский рынок открывается самым первым в мире, за ним идут открытия Шанхайского рынка, Лондонского рынка и, в конце концов, Нью Йоркского рынка. ТЧОКОМ-овские котировки служат ориентиром для всей Азиатской временной зоны биржевой торговли. Биржа всегда стремилась и стремится к проведению честных и прозрачных операций по формированию цен на всех своих рынках. Первоначально биржа проводила все расчёты среди брокеров через свою собственную клиринговую палату. Однако, выполняя требования пересмотренного Закона о Сырьевой Бирже (Commodity Exchange Law), ТЧОКОМ стала осуществлять эти расчёты через созданную в Мае 2005 Японскую Сырьевую Клиринговую Палату (ЯСКП; Japan Commodity Clearing House (JCCH)). ЯСКП является независимой клиринговой палатой, которая объединила в единое целое расчёты (клиринговые операции) всех Японских сырьевых бирж, став при этом единственной встречной стороной по всем таким расчётам. Крупнейшая Японская сырьевая биржа ТЧОКОМ (TOCOM) производит операции с фьючерсами на драгметаллы, такие как:- палладий, платина, серебро и золото, алюминий, каучук, керосин, бензин и газойль. А также производит физические торговые операции с сырой нефтью. Она относится к товарным торговым биржам универсального типа. Теперь (19 Июня 2012) она начинает торговлю контрактами на сельскохозяйственную продукцию Токийской Биржи Зерна (TGE). Это решение было принято на Майском (2012) заседании совета директоров. ТЧОКОМ начнёт расширение фьючерсной торговли сельскохозяйственными продуктами, при помощи привлечения широкого и разнообразного круга участвующих в торгах и прикладывая усилия к повышению надёжности рынка контрактов на различную сельскохозяйственную продукцию и улучшение комфорта для постоянных участников. Планируется, что торги будут проводиться с Января 2013 на поставку таких сельскохозяйственных продуктов, как:- Соя, Фасоль (Адзуки), Кукуруза, а также на контрактную поставку сыра и сахара. Эту новость прокомментировал Тадащи Эзаки, Исполнительный Директор Токийской Сырьевой Биржи, в том плане, что ТЧОКОМ убеждена в рентабельности и выгодности торгов контрактами на поставку сельскохозяйственной продукции. Рынок сельского хозяйства в Японии один из основных в Японии, поэтому он играет важную роль в экономике страны. 2013-Апрель-01:- Япония намерена создать рынок фьючерсов по торговле сжиженным газом – это первый шаг к созданию мирового рынка сжиженного природного газа (СПГ). Рынок, вероятно, будет быстро развиваться в ближайшие годы, ведь США активно готовятся к вывозу (или экспорту) топлива. Пока Япония платит за сжиженный газ в 4.5 раза больше, чем Америка. Сейчас единого рынка газа в мире нет, цены на ресурс сильно различаются в зависимости от региона, пишет Зэ Вол Стрит Дьжонэл (The Wall Street Journal). Япония стала самым крупным в мире импортёром СПГ. Сегодня страна платит USD18 за один миллион Британских тепловых единиц сжиженного газа против обычного природного газа по цене в USD4 в США. Цены на газ, который завозит Япония, привязаны к ценам на нефть. Однако резкий рост добычи газа в США ослабил связь между рынком газа и нефти. Если будет создан рынок фьючерсов, то цены на газ можно будет полностью отвязать от цен на нефть. Различные Японские компании, в том числе электростанции, торговые дома и другие договорились о запуске нового инструмента:- фьючерсов на газ, номинированных в Долларах США. Они появятся на Токийской Сырьевой Бирже к Марту 2015. Токийская Сырьевая Биржа (ТЧОКОМ) производит операции с фьючерсами на золото, серебро, платину, палладий, каучук и хлопковую и шерстяную пряжу. Контракты на металлы продаются с 09:00 до 11:00 и с 13:00 до 15:30; на каучук – с 09:45 до 15:30 и пряжу – с 08:50 до 15:10.

THE TOKYO ROUND = ТОКИЙСКИЙ РАУНД – The Tokyo Round called for consideration to be given ‘to improvements in the international framework for the conduct of world trade’. Four separate agreements make up what is known as the ‘Framework Agreement’. They concern:- (i) differential and more favorable treatment for, and reciprocity and fuller participation by, developing countries in the international framework for trade; (ii) trade measures taken for balance of payments purposes; (iii) safeguard actions for development purposes; and (iv) an understanding on notification, consultation, dispute settlement and surveillance in the GATT (short for the General Agreement on Tariffs and Trade). 1973–79 – The seventh round, launched in Tokyo, Japan, sees Gatt reach agreement to start reducing not only tariffs but trade barriers as well, such as subsidies and import licensing. Tariff reductions worth more than USD300 billion achieved. The Tokyo Round:- a first try to reform the system:- The Tokyo Round lasted from 1973 to 1979, with 102 countries participating. It continued GATT’s efforts to progressively reduce tariffs. The results included an average one-third cut in customs duties in the world’s nine major industrial markets, bringing the average tariff on industrial products down to 4.7%. The tariff reductions, phased in over a period of eight years, involved an element of ‘harmonization’ – the higher the tariff, the larger the cut, proportionally. In other issues, the Tokyo Round had mixed results. It failed to come to grips with the fundamental problems affecting farm trade and also stopped short of providing a modified agreement on ‘safeguards’ (emergency import measures). Nevertheless, a series of agreements on non-tariff barriers did emerge from the negotiations, in some cases interpreting existing GATT rules, in others breaking entirely new ground. In most cases, only a relatively small number of (mainly industrialized) GATT members subscribed to these agreements and arrangements. Because they were not accepted by the full GATT membership, they were often informally called ‘Codes’. They were not multilateral, but they were a beginning. Several codes were eventually amended in the Uruguay Round and turned into multilateral commitments accepted by all WTO members. Only four remained ‘plurilateral’ – those on government procurement, bovine meat, civil aircraft and dairy products. In 1997 WTO members agreed to terminate the bovine meat and dairy agreements, leaving only two. Did GATT succeed? GATT was provisional with a limited field of action, but its success over 47 years in promoting and securing the liberalization of much of world trade is incontestable. Continual reductions in tariffs alone helped spur very high rates of world trade growth during the 1950s and 1960s – around 8% a year on average. And the momentum of trade liberalization helped ensure that trade growth consistently out-paced production growth throughout the GATT era, a measure of countries’ increasing ability to trade with each other and to reap the benefits of trade. The rush of new members during the Uruguay Round demonstrated that the multilateral trading system was recognized as an anchor for development and an instrument of economic and trade reform. But all was not well. As time passed new problems arose. The Tokyo Round in the 1970s was an attempt to tackle some of these but its achievements were limited. This was a sign of difficult times to come. GATT’s success in reducing tariffs to such a low level, combined with a series of economic recessions in the 1970s and early 1980s, drove governments to devise other forms of protection for sectors facing increased foreign competition. High rates of unemployment and constant factory closures led governments in Western Europe and North America to seek bilateral market-sharing arrangements with competitors and to embark on a subsidies race to maintain their holds on agricultural trade. Both these changes undermined GATT’s credibility and effectiveness. The problem was not just a deteriorating trade policy environment. By the early 1980s the General Agreement was clearly no longer as relevant to the realities of world trade as it had been in the 1940s. For a start, world trade had become far more complex and important than 40 years before: the globalization of the world economy was underway, trade in services – not covered by GATT rules – was of major interest to more and more countries, and international investment had expanded. The expansion of services trade was also closely tied to further increases in world merchandise trade. In other respects, GATT had been found wanting. For instance, in agriculture, loopholes in the multilateral system were heavily exploited, and efforts at liberalizing agricultural trade met with little success. In the textiles and clothing sector, an exception to GATT’s normal disciplines was negotiated in the 1960s and early 1970s, leading to the Multifibre Arrangement. Even GATT’s institutional structure and its dispute settlement system were causing concern. These and other factors convinced GATT members that a new effort to reinforce and extend the multilateral system should be attempted. That effort resulted in the Uruguay

Round, the Marrakesh Declaration, and the creation of the WTO. The seventh round of GATT took place in Tokyo from 1973 until 1979. The talks managed to reduce several trade barriers in addition to USD300 billion in tariffs. Negotiations covered a range of topics including government procurement, customs valuation, subsidies, countervailing measures, antidumping, standards and import licensing. / Токийский Раунд Генерального Соглашения о Тарифах и Торговле (ГСТТ или ГЯТ (GATT)) стал седьмым раундом по счёту. Старт ему положила встреча и переговоры представителей стран-участниц в Токио, Япония в 1973 и продлился до 1979. Его основной задачей и целью было достижение соглашения между 102 странами-участницами этих переговоров о начале снижения не только тарифов, но и торговых барьеров в виде субсидий и лицензирования привоза (или импорта). В результате всех состоявшихся встреч и переговоров Токийского Раунда была достигнута договорённость о снижении тарифов в размере USD300 миллиардов (Долларов США).

THE TOKYO STOCK EXCHANGE, INC. = ТОКИЙСКАЯ ФОНДОВАЯ БИРЖА, ИНК. – The Tokyo Stock Exchange, Inc was established on 1878-May-15, as the Tokyo Kabushiki Torihikijo under the direction of then-Finance Minister Okuma Shigenobu and capitalist advocate Shibusawa Eiichi. Trading began on 1878-June-01. In 1943, the exchange was combined with ten other stock exchanges in major Japanese cities to form a single Japan Securities Exchange (Nippon Shōken Torihikisho). The combined exchange was shut down and reorganized shortly after the bombing of Nagasaki. The Tokyo Stock Exchange, Inc. was established on 1949-April-01 and reopened under its current Japanese name on 1949-May-16, pursuant to the new Securities Exchange Act. The TSE runup from 1983 to 1990 was unprecedented, in 1990 it accounted for over 60% of the world's stock market capitalization (by far the world's largest) before falling precipitously in value and rankings today, but still remains one of the 3 largest exchanges in the world by market capitalization of listed shares. The trading floor of the TSE was closed on 1999-April-30, and the exchange switched to electronic trading for all transactions. A new facility, called TSE Arrows (Tōshō Arrows), opened on 2000-May-09. In 2001, the TSE restructured itself as a corporation. Before this time, it was a membership organization. The Tokyo Stock Exchange (TSE) or in Japanese, Tōkyō Shōken Torihikisho, is the second largest stock exchange market in the world by monetary volume located in Tokyo, Japan, second only to the New York Stock Exchange. It currently lists 2 271 domestic companies and 31 foreign companies, with a total market capitalization of over USD4 trillion. Stocks listed on the TSE are separated into the First Section (for large companies), the Second Section (for mid-sized companies), and the 'Mothers' section (for high-growth startup companies). As of March 2006, there are 1 721 First Section companies, 489 Second Section companies and 156 Mothers companies. The main indices tracking the TSE are the Nikkei 225 index of companies selected by the Nihon Keizai Shimbun, Inc. (NIKKEI; Japan's largest business newspaper), the TOPIX index based on the share prices of First Section companies, and the J30 index of large industrial companies maintained by Japan's major broadsheet newspapers. Tokyo Stock Exchange Group, Inc was established on 2007-August-01. On April 16, 2007, Tokyo Stock Exchange, Inc. (TSE) became the first major exchange in the world and the first exchange in the country to acquire the certifications for 'ISO/IEC 27001:2005 / JIS Q 27001:2006', which are global standards for Information Security Management System (ISMS). The TSE previously acquired ISMS certifications according to the global standards 'BS7799-2:2002' and 'ISMS Conformity Assessment Ver. 2.0' in April 2006, and this time has completed the transition to certifications for the successive global standards 'ISO/IEC 27001:2005 / JIS Q 27001:2006'. The certifications were given in recognition of the TSE's series of information security activities functioning systematically and conforming to global standards. The TSE will continue conducting operations as an enterprise that provides exchange services with a high public value while being fully conscious of further enhancement of information security management in the future as well. ISO27001 certification is a certification scheme under which an assessment and certification body certifies conformity to 'ISO/IEC 27001:2005 / JIS Q 27001:2006', which are global standards for Information Security Management System (ISMS). 'ISO/IEC 27001:2005 / JIS Q 27001:2006' are assessment standards for ISMS. The accreditation bodies are ANAB (The American National Standards Institute (ANSI) – American Society for Quality (ASQ) National Accreditation Board) and JIPDEC (Japan Information Processing Development Corporation). The assessment standards have been revised along with the issuance of the global standard 'ISO/IEC 27001', adding new requirements such as 'Supervising/Measuring Effectiveness of Management Tactics'. The stock trading floor has attracted attention as a symbol of the securities and financial markets of our country for more than 120 years since floor trading began at the former Tokyo Stock Exchange, the predecessor of the current Tokyo Stock Exchange, on 1878-June-01. However, the stock trading floor was closed on 1999-April-30 in an effort to accelerate the speed and reduce the cost of transactions by member securities companies, and seek further efficiency in the Tokyo market. At the site of the stock trading floor, 'TSE arrows' was opened on 2000-May-09 as a new symbol of the Tokyo market. In the 1870's, a securities system was introduced in Japan and public bond negotiation began. This resulted in the request for a public trading institution; and, the 'Stock Exchange Ordinance' was enacted in May 1878. Based on this ordinance, the 'Tokyo Stock Exchange Co., Ltd.' was established on May 15, 1878; and trading began on June 1st. In March 1943, the 'Japan Securities Exchange Law' was enacted to reorganize the Stock Exchange as a war-time controlled institution. On June 30, 1943, 11 stock exchanges throughout Japan were unified and a quasi-public corporation, the 'Japan Securities Exchange', was established (dissolved in April, 1947). With worsening war conditions and air-raids on the main island of Japan, the securities market was forced to suspend trading sessions on all securities markets from August 10, 1945. It was difficult to re-open the Stock Exchange by a Memorandum of Supreme Commander of Allied Powers (SCAP) in September 1945; however, trading was restarted by unofficial group transactions in December of 1945. The Securities and Exchange Law was enacted in March of 1947, and entirely revised in April of 1948. On April 01, 1949, three stock exchanges were established in Tokyo, Osaka and Nagoya. Trading on these exchanges began on May 16. In July of that same year, five additional stock exchanges were established in Kyoto (merged into Osaka Securities Exchange in March 2001), Kobe (dissolved in October 1967), Hiroshima (merged into Tokyo Stock Exchange in March 2000), Fukuoka, and Niigata (merged with Tokyo Stock Exchange in March 2000). In addition, the Sapporo Securities Exchange was established in April 1950. Consequently, Japan now has five stock exchanges. TSE maintains regional representative offices in each of the 3 main financial regions:- (i) in North America:- New York, State of New York (NY), the United States; (ii) in Europe:- London, the United Kingdom; and (iii) in Asia:- Beijing, China, and Singapore, Singapore. Some historic facts:- May 15, 1878 – Tokyo Stock Exchange Co., Ltd. Established; June 30, 1943 – Japan Securities Exchange, a quasi-governmental organization, created by a merger of all existing stock exchanges in Japan; April 16, 1947 – Japan Securities Exchange dissolved; April 01, 1949 – Tokyo Stock Exchange in the present form founded (opened on May 16); June 01, 1951 – margin transactions introduced; April 02, 1956 - bond trading started; October 02, 1961 - Second Section for stocks opened; October 01, 1966 – Government bonds listed for the first time after World War II; October 02, 1967 – new auction process put into practice with abolition of 'Baikai' trades (off-exchange trades by members reported as TSE contracts); April 01, 1968 – licensing system for securities companies introduced in place of registration system; July 01, 1969 – TOPIX (Tokyo Stock Price Index) inaugurated (January 04, 1968 = 100); May 11, 1970 – trading in convertible bonds started; October 15, 1970 – TSE joined the International Federation of Stock Exchanges (FIBV); July 19, 1971 – Book Entry Clearing System for stocks introduced; April 2, 1973 – Yen-based foreign bonds listed for the first time; December 18, 1973 – Foreign Stock Section opened; September 24, 1974 – Market Information System (MIS) put into operation; April 01, 1977 – ad valorem brokerage commission system introduced; January 23, 1982 – Computer-assisted Order Routing & Execution System (CORES) introduced; May 13, 1985 – trading started in new market building; October 19, 1985 – trading in 10-year Japanese government bond futures started; February 01, 1986 – 10 securities companies including first 6 foreign companies joined the TSE membership; May 23, 1988 – 22 securities companies including 16 foreign companies joined the TSE membership;

September 03, 1988 – trading in TOPIX futures started; October 20, 1989 – trading in TOPIX options started; December 01, 1989 – trading in US T-Bond futures started; May 11, 1990 – trading in options on Japanese government bond futures started; November 19, 1990 – 10 securities companies including 3 foreign companies joined the TSE membership; November 26, 1990 – Floor Order Routing and Execution System (FORES) introduced; October 09, 1991 – Central Depository & Clearing System began its operation; April 01, 1994 – partial (over 1 billion Yen) deregulation of brokerage commission was effected; May 29, 1995 – Investment Trust Beneficiary Certificate linked to 'Nikkei 300 Stock Index Listed Fund' listed; February 16, 1996 – trading in 5-year Japanese Government bond futures started; July 18, 1997 – trading in equity options started; January 23, 1998 – trading in sector-stock price index futures started; April 01, 1998 – partial (over 50 million Yen) deregulation of brokerage commission was effected; April 02, 1998 – calculation of new stock price index series started; June 29, 1998 – ToSTNeT introduced; July 01, 1998 – TDnet (Timely Disclosure Network) system introduced; December 01, 1998 – abolition of restriction on off-exchange trading for listed securities; April 02, 1999 – 50th Anniversary Ceremony was held; April 30, 1999 – stock trading floor was closed; June 01, 1999 – Target (TSE wide area network) introduced; October 01, 1999 – liberalization of brokerage commission; October 01, 1999 – abolition of the fixed number of members was effected; November 11, 1999 – The MOTHERS market for high-growth and emerging companies established; March 01, 2000 – Hiroshima and Niigata stock exchanges merge into TSE; May 09, 2000 – opening of TSE ARROWS; November 01, 2001 – Tokyo Stock Exchange, Inc. established after demutualization of TSE; January 14, 2003 – commencement of operations at Japan Securities Clearing Corporation; August 01, 2007 – Tokyo Stock Exchange Group, Inc. established; October 17, 2007 – establishment of Tokyo Stock Exchange Regulation; November 01, 2007 – commencement of operations at Tokyo Stock Exchange Regulation. The stock trading floor has attracted attention as a symbol of the securities and financial markets of our country for more than 120 years since floor trading began at the former Tokyo Stock Exchange, the predecessor of the current Tokyo Stock Exchange, on June 01, 1878. However, the stock trading floor was closed on April 30, 1999 in an effort to accelerate the speed and reduce the cost of transactions by member securities companies, and seek further efficiency in the Tokyo market. At the site of the stock trading floor, 'TSE arrows' was opened on May 09, 2000 as a new symbol of the Tokyo market. In the early Meiji era (in the 1880s), floor clerks worked in kimono. In the middle of the Meiji era (in the 1890s), the stock trading floor was renewed as the scale of the market expanded. The most actively traded stock was the former Tokyo Stock Exchange's stock. In the early Showa era (in the 1930s), a great deal of government bonds were issued during wartime. Floor trading was suspended in August 1945 with aggravation of the war situation. After the war ended, the stock trading floor was occupied by the General Headquarters (GHQ) until January 1948. The Japan Securities Exchange was dissolved in 1947 while a large number of shares were reallocated to public investors due to a breakup of Japanese 'Zaibatsu' conglomerates. Possessing stocks immediately became popular with securities privatization and promotions. Trading at the Tokyo Stock Exchange resumed in May, 1949. 12 U-shaped trading posts were placed at the time of opening of Tokyo Stock Exchange (May 1949). 1959 to the end of the former stock trading floor. Black Boards at the stock trading floor:- prices of transactions were written on the black board with chalk. In the 1960s, the securities industry suffered from the heaviest blow in the postwar era due to the slumping economy and sluggish stock and investment trust trading. In January 1968, the regulatory frameworks of securities companies were shifted to a licensing system. Floor trading when the market price information system began operations:- the prices of stocks were displayed on the electronic signboard when the market information system began operating at the stock trading floor (September, 1974). GEKITAKU (clappers which were beaten when transactions were executed):- GEKITAKU trading, group competitive call auction trading started in the middle of the era where stocks issued by Tokyo Stock Exchange were traded in December 1900, and continued until December 1982. A boom in stocks started around 1985 when the new stock trading floor was opened. Floor trading at the new stock trading floor:- introduction of a system to streamline operations at stock trading floor (November, 1990). TSE computerized relevant operations at the stock trading floor, such as placing and matching orders, which had been done manually. With the computerization of the operations, placing orders on-line became possible also for stocks traded in the stock trading floor if the order was a small lot (less than specific volume), which resulted in accelerating computerization of relevant operations at the stock trading floor. Floor trading at the new stock trading floor (mid-1990s):- accelerating the computerization gradually reduced the number of clerks on the stock trading floor. / Токио Кабущики Торихкизё (Tokyo Kabushiki Torihikijo) по указанию тогдашнего Министра Финансов Японии Окума Щигэнобу (Okuma Shigenobu) и капиталиста адвоката Щибусава Эйци (Shibusawa Eiichi). Ниппон Щёкэн Торихкизё (Nippon Shōken Torihikisho). Тощё (Tōshō). Мейзи (Meiji). Щёва (Showa). Японские Заибацу (Zaibatsu). индекс по 225 от Никкэй (Nikkei 225 index) по компаниям, выбранным Нихон Кейзай Щимбун, Инк. (Nihon Keizai Shimbun, Inc.) . Токийская Фондовая Биржа Ко., Лтд (Tokyo Stock Exchange Co., Ltd; Японское название – Токио Кабущики Торихкизё (Tokyo Kabushiki Torihikijo)) была образована 15 Мая 1878 по указанию тогдашнего Министра Финансов Японии Окума Щигэнобу (Okuma Shigenobu) и капиталиста адвоката Щибусава Эйци (Shibusawa Eiichi). Первые торги на бирже состоялись 01 Июня 1878. В те времена торговцы акциями, собиравшиеся на бирже, надевали исключительно национальную одежду – кимоно. 30 Июня 1943 в ходе объединения с ещё десятью другими фондовыми биржами крупнейших городов Японии была создана единая Японская Биржа Ценных Бумаг (Japan Securities Exchange; Японское название – Ниппон Щёкэн Торихкизё (Nippon Shōken Torihikisho)). Однако просуществовала она недолго и в конце II Мировой Войны после атомных бомбардировок Нагасаки и Хиросимы с 10 Августа 1945 торги на бирже были остановлены, а 16 Апреля 1947 она была закрыта. В здании биржи расположились Американские военные. До Января 1948 в нём находился Генеральный Штаб оккупационных войск, которые управляли страной вплоть до момента возвращения всей власти Японскому правительству в начале 1950-х. Всё это время торговля ценными бумагами в стране продолжалась, правда, все сделки заключались не публично, а частным образом между конкретными инвесторами и владельцами акций и облигаций. В соответствии с новым пересмотренным в Апреле 1948 Актом о Фондовой Бирже (Securities Exchange Act) Токийская Фондовая Биржа, Инк. (Tokyo Stock Exchange, Inc.) была образована вновь 01 Апреля 1949, а 16 Мая 1949 состоялось её повторное официальное открытие под своим текущим Японским названием – Токио Щёкэн Торихкизё (Tōkyō Shōken Torihikisho). Токийская Фондовая Биржевая Группа, Инк. (Tokyo Stock Exchange Group, Inc.) была образована 01 Августа 2007. Токийская Фондовая Биржа по рыночной капитализации уступает только Нью Йоркской Фондовой Бирже. Сейчас на ней торгуется около 2 300 ценных бумаг Японских компаний и свыше 30 бумаг зарубежных эмитентов. Среди крупнейших компаний, разместивших свои акции на Токийской бирже, можно встретить множество транснациональных гигантов из разных отраслей:- автомобильных концернов Хонда (Honda), Мацда (Mazda), Мицубищи (Mitsubishi), Тойота (Toyota), производителей высокотехнологичных устройств Коника Миноlта (Konica Minolta), Никон (Nikon), Олимпас (Olympus), Касио (Casio), Сони (Sony), крупнейших Японских банков и других финансовых организаций. На долю Токийской биржи приходится свыше 80% биржевого оборота страны. Основными продавцами и покупателями являются институциональные владельцы ценных бумаг. В Японии индивидуальные владельцы имеют лишь 20% обращающихся на бирже акций, а 80% принадлежит финансовым учреждениям, страховым компаниям и корпорациям. Владельцы акций рассчитывают не на дивиденды (в начале 1990 они были в 70 раз меньше рыночной стоимости акций), а на повышение курса акций и получение дохода в результате продажи акций по более высокому курсу (среднегодовой доход на проданную акцию выпуска 1980–1994 составил 34.7%). Основной метод торговли – открытый двойной аукцион, торговля с голоса в биржевой толпе 'зараба'. До 80% всех обращающихся в стране акций продаётся и покупается на Токийской Фондовой Бирже. Из 1.3–1.5 миллионов зарегистрированных в Японии акционерных фирм здесь зарегистрировано 1 517, но на них

приходится более 25% всех производимых товаров и услуг. В 2005 Токийская Фондовая Биржа заняла почётное второе место в мировой классификации крупнейших фондовых рынков мира. В её состав вошли 2 500 компаний, приносящих ежегодно более 3 000 триллионов дохода в Долларах США. Послевоенное Азиатское чудо – быстрый рост экономических и финансовых систем крупнейших стран региона – естественно, затронул и Японию. Страна стала выходить в лидеры мировой экономики за счёт своих технологических разработок и прогрессивных инноваций. И хотя на самой бирже до 1974 года не существовало даже электронных табло и цены на все бумаги писались обычным мелом на чёрной доске, стоимость акций Японских компаний с 1968 постоянно росла. Именно в это время правительством Японии были введены необходимые ограничения на деятельность брокеров и некоторые новые правила проведения биржевых операций. Особенно заметным рост ценных бумаг стал в период с 1983 по 1990 – за эти семь лет Токийская Фондовая Биржа стала первой в мире по рыночной капитализации размещённых здесь компаний (60% объёма мирового фондового рынка было сосредоточено именно в столице Японии). Успешная стратегия конкурентов из Нью Йорка вскоре изменила ситуацию, однако второе место прочно закрепилось за Токийской биржей. Электронная Эра:- 30 Апреля 1999 на крупнейшей фондовой бирже Японии закончилась эпоха ‘живых’ торгов – площадки, на которых находились брокеры, проводившие сделки, были закрыты. Вся торговля перешла в электронный рынок. Несколько раз использование электронных систем приводило к серьёзным сбоям в торговых процессах. Так, 01 Ноября 2005 биржа смогла проработать только полтора часа. Через 90 минут после открытия торгов отказала установленная накануне компьютерная система торгов, разработанная компанией Фуджитцу (Fujitsu). Работа фондовой площадки остановилась на четыре с половиной часа, что стало рекордным простоем в новейшей истории Токийской биржи. Другой неприятный случай произошёл из-за того, что во время проведения IPO компании Дьжей.-Ком (J-Com) 08 Декабря 2005 сотрудник фирмы Мизухо Сэкьюрэтиз (Mizuho Securities), осуществлявшей техническую поддержку размещения акций, ввёл при выставлении ценных бумаг на продажу ошибочные данные. Вместо того, чтобы назначить цену одной акции в 610 000 Иен, он выставил 610 000 акций за 1 Иену. В первые же секунды торгов наиболее находчивые и быстрые брокеры начали скупать за бесценок акции Дьжей.-Ком. Администраторы биржи поняли ошибку и постарались отменить совершённые операции. Однако несмотря на приложенные усилия потери Дьжей.-Ком составили 347 миллионов Долларов США – эту сумму эмитенту поровну возместили Токийская Фондовая Биржа и Мизухо Сэкьюрэтиз. Последний крупный сбой произошёл на бирже в Январе 2006, когда количество сделок, проведённых на ней, превысило 4.5 миллиона и торги остановились на 20 минут. Правительство Японии обязало владельцев биржи подготовить программу совершенствования компьютерной системы, которая позволила бы предотвращать такие сбои в будущем. Сейчас компании, акции которых торгуются на Токийской бирже, делятся на три большие группы:- (i) первая секция (компании с крупной капитализацией); (ii) вторая секция (средние компании); и (iii) секция Mothers (этим Английским словом (Мамочки) на Токийской бирже называют наиболее быстро растущие компании и отрасли рынка – термин появился из неточной аббревиатуры для соответствующего понятия Market of the High-Growth and Emerging Stocks). Примерно 65% эмитентов входят в первую секцию, меньше всего компаний попадают в ‘материнский’ список. Стоимость всех ценных бумаг, торгующихся на Токийской Фондовой Бирже, превышает 5 триллионов Долларов США. Основными показателями состояния дел на Токийской Фондовой Бирже являются два главных индекса:- 225 от Никкэй (Nikkei 225) и ТОПИКС (TOPIX). Из них самым востребованным у инвесторов и брокеров стал, конечно, Никкэй, который рассчитывается как среднее взвешенное значение цен акций 225 наиболее активно торгующихся компаний Токийской Фондовой Биржи. 07 Сентября 1950 этот индекс впервые был опубликован под названием TSE Adjusted Stock Price Average, а с 1970 он вычисляется Японской газетой Nihon Keizai Shimbun. От сокращенного названия газеты и произошло новое название индекса – Никкэй. Индекс TOPIX рассчитывается самой Токийской Фондовой Биржей как среднее взвешенное значение цен акций всех компаний первой секции биржи, находящихся в свободном обращении. Этот индекс впервые был опубликован 01 Июля 1969 со значением 100 пунктов. Сегодня TOPIX рассчитывается каждые 15 секунд. Фондовые индексы Токийской биржи:- TOPIX или ТОПИКС (Tokyo Stock Price Index) – биржевой индекс Токийской Фондовой Биржи, рассчитываемый как среднее взвешенное по рыночной капитализации значение цен акций, находящиеся в свободном обращении, компаний, принадлежащих к первому сегменту Токийской Фондовой Биржи, то есть компании с высокой капитализацией. Индекс был перенесён из торговой системы, где учитывались общее число выпущенных акций, в систему с учётом только тех акций, которые находятся в свободном обращении. Перенос происходил в три этапа с Октября 2005 по Июнь 2006. Хотя изменения были только технические, но они оказали огромный эффект на индекс, поскольку у многих Японских компаний большое количество акций, просто удерживаются у руках деловых партнеров, как часть сложного альянса, такие акции ещё долго не будут включены в расчёты средневзвешенного индекса компаний. Впервые ТОПИКС (TOPIX) был опубликован 01 Июля 1969 с базовым значением 100 пунктов. Список компаний, охваченных биржевым индексом, пересматривается два раза в год – в Январе компании могут быть добавлены или удалены из списка, в Июле – только добавлены. 225 от НИККЭЙ (NIKKEI 225 Stock Average) – один из важнейших фондовых индексов Японии. Значение индекса вычисляется как простое среднее арифметическое цен акций 225 наиболее активно торгуемых компаний первой, которую часто называют элитной, секции Токийской Фондовой Биржи. Впервые индекс был опубликован 07 Сентября 1950 под названием TSE Adjusted Stock Price Average. С 1970 индекс вычисляется Японской экономической газетой Нихон Кейзай Щимбун (Nihon Keizai Shimbun). Новое название индекса произошло от сокращённого названия самой газеты – Никкэй. Список компаний, охваченных Индексом Никкэй (Nikkei), пересматривается как минимум раз в год, в Октябре. Японское чудо:- с 1983 по 1990-е Токийская Фондовая Биржа пережила головокружительный взлёт, сосредоточив в себе более 60% капитализации глобального рынка ценных бумаг. Этот этап, названный впоследствии периодом ‘экономики мыльного пузыря’, можно считать бурным финалом ‘японского чуда’. Страна увлеклась повальной спекуляцией акциями компаний, торгующих землей и недвижимостью. Цены на них росли, как на дрожжах. Банки раздавали щедрые кредиты направо и налево. А кончилось всё тем, что пузырь лопнул. Цены обвалились, по стране прокатилась волна банкротств, кредиты остались невозвращёнными, и ‘чудо’ сменилось самым продолжительным в послевоенной истории экономическим спадом. Он длился все 1990-е, а окончательное восстановление рынка акций произошло только в прошлом году. Отдельные потрясения происходят и по сей день, но они носят преимущественно технический характер. Так, к примеру, 01 Ноября 2005 после установки нового компьютерного оборудования на бирже произошёл самый серьёзный в истории системный сбой. Зависшая операционная система компании Фуджитцу (Fujitsu) парализовала торги Токийской бирже на четыре с половиной часа. Вторая беда случилась через месяц и привела к полной смене высшего руководства биржи. 08 Декабря 2005 на Токийской Фондовой Бирже дебютировала рекрутинговая компания Дьжей.-Ком (J-Com) с весьма дорогими акциями стоимостью 610 000 Иен (более 7 000 Долларов США). Однако вместо того, чтобы предложить одну акцию фирмы за указанную сумму, сотрудник брокерской компании неверным нажатием клавиши выставил 610 000 акций по 1 Иене (0.84 цента) за каждую. Они были мгновенно раскуплены, причём число проданных акций в 42 раза превосходило их реальное количество (14 500). Ошибка была замечена не сразу, но и после того, как она была обнаружена, возникли технические сложности с отменой операции. В результате пришлось выкупать весь пакет за его настоящую стоимость. Досадная опечатка обошлась компании в 347 миллионов Долларов США. История умалчивает, что стало с несчастным неловким брокером, но, чтобы восстановить доверие инвесторов, Президенту Токийской Фондовой Биржи и ещё троим управляющим высшего звена пришлось уйти в отставку, взяв на себя ответственность за несовершенство

компьютерной системы. Токийская Фондовая Биржа – самая большая фондовая биржа в Японии. Токийская Фондовая Биржа – одна из самых крупных, самых важных и самых активных фондовых рынков в мире. Среднее Значение Фондового индекса Никкэй (Nikkei Stock Average) известно как 225 от Никкэй и 500 от Никкэй – главные индексы, которые рассчитываются по формуле, аналогичной промышленному индексу Дау Дьжонз. Индекс Токийской Фондовой Биржи (TOPIX, Tokyo Stock Price Index) – составной индекс всех акций в первой секции биржи. Операции производятся дважды в день с 09:00 до 11:00 и с 13:00 до 15:00. Расчёт – поставка на третий рабочий день после подписания контракта.

TOLA = ТОЛА – (1) Tola is a traditional unit of weight in India and South Asia. Like the seer and the maund, the tola varied considerably from one area to another. The official size in British India was 180 grains, which is about 0.411 4 ounce (avoirdupois) or 11.664 grams. There are 80 tolas in a seer, 3 200 in a maund. / Как Сир (Seer) или (Maund). Под Толой понимается традиционная единица веса в Индии и Юго-Восточной Азии.

(2) Tola is the traditional Indian unit of weight for gold. 1 tola = 0.374 878 Troy ounces = 11.663 8 grams. The most popular sized bar is 10 tola = 3.748 78 Troy ounces. Weights are for 999.9 gold purity. / В Индии под Толой понимается традиционная единица веса для золота. Самым распространённым размером слитка золота 999.9-й пробы является вес в 10 тол, равный 3.748 78 Тройским унциям.

TOLERANCE = ДОПУСК – (1) Tolerance is any variation in trait's readings mutually agreed between the parties of the contract as acceptable beyond the Control Limit. / Допуск – любое изменение показателей характеристики качества, превышающее Контрольный Лимит, приемлемое в соответствии со взаимной договоренностью контрактных сторон. Под Допуском понимается разность между наибольшим и наименьшим предельными значениями (размерами) какого-либо параметра.

(2) Tolerance is the maximum permissible positive or negative deviation between the value of a quantity as determined according to BISFA (short for the Bureau International pour la Standardisation des Fibres Artificielles or The International Bureau for the Standardization of Man-made Fibres; headquartered in Brussels, Belgium) methods and the value quoted for the consignment. Normally, the tolerance is a percentage of the quoted value. / Допуск – максимально допустимое положительное или отрицательное отклонение между величиной количества, которая определена в соответствии с методами Бюро Этэрнасьёналь пур ля Стандардизасьён дэ Фибру Артифисиэл (Bureau International pour la Standardisation des Fibres Artificielles) – Международного Бюро по Стандартизации Искусственных Волокон, и величиной, расцениваемой для партии товара.

(3) Tolerance is the range of color difference that is acceptable to say that the color is a commercial match. Most usually an agreement is made between buyer and seller concerning color acceptability. / Допуск – диапазон .

TOLERANCE = ТОЛЕРАНТНОСТЬ (или ВЫНОСЛИВОСТЬ, или УСТОЙЧИВОСТЬ) – Tolerance is an ability to continue normal growth or function when exposed to a potentially harmful agent. Plant growth and/or productivity relatively unaffected by the presence of disease. Tolerance is an ability of a plant to withstand stress without yield reduction or injury. / Под Толерантностью, от Латинского слова Tolerantia, означающее Терпение, понимается:- (i) иммунологическое состояние организма, при котором он неспособен синтезировать антитела в ответ на введение определённого антигена при сохранении иммунной реактивности к другим антигенам; проблема такой толерантности имеет значение при пересадке органов и тканей; (ii) способность организма переносить неблагоприятное влияние того или иного фактора среды; или (iii) терпимость к чужим верованиям, мнениям и поведению.

TOLERANCE OF COMMERCIAL MASS = ДОПУСК ПО КОММЕРЧЕСКОЙ МАССЕ (или ДОПУСКАЕМОЕ ОТКЛОНЕНИЕ ПО КОММЕРЧЕСКОЙ МАССЕ) – Tolerance Of Commercial Mass:- xxxxx. See also Mass. Tolerance is the permissible deviation from a standard (measurement). Weight Allowance or Tolerance is an allowance made for differences in weights due to variations in scales or inherent nature of goods. In natural fibers, Commercial Weight is the dry weight of fibers or yarns plus the commercial moisture regain.

TOLERANCE OF INVOICE MASS = ДОПУСК ПО МАССЕ В СЧЁТЕ–ФАКТУРЕ (или ДОПУСКАЕМОЕ ОТКЛОНЕНИЕ ПО МАССЕ В СЧЁТЕ–ФАКТУРЕ) – Tolerance Of Invoice Mass is the maximum permitted deviation between the value of the commercial mass as determined according to BISFA (short for the Bureau International pour la Standardisation des Fibres Artificielles or The International Bureau for the Standardization of Man-made Fibres; headquartered in Brussels, Belgium) methods and the invoice mass as indicated on the documents of sale of the consignment, expressed as a percentage of the invoice mass. See also Mass. / Бюро Этэрнасьёналь пур ля Стандардизасьён дэ Фибру Артифисиэл (Bureau International pour la Standardisation des Fibres Artificielles).

TOLLING = ПЕРЕРАБОТКА ПО ДАВАЛЬЧЕСКОЙ СХЕМЕ – Tolling:- under a tolling agreement a power marketer or commercial electricity customer provides the fuel, say natural gas, to produce electricity for the marketer or customer at an agreed spark spread, and receives the rights to electricity output. In reference to electricity, an arrangement whereby a party moves fuel to a power generator and receives kiloWatt hours (kWh) in return for a preestablished fee. / выработка (output). По отношению к электричеству, договорённость, в соответствии с которой одна сторона завозит топливо генерирующей энергоустановке, являющейся второй стороной, и получает от неё килоВатт-часы (кВт) электроэнергии в обмен на выплату предварительно оговорённого вознаграждения.

TOLLING CHARGES = СБОРЫ ЗА ПЕРЕРАБОТКУ (или РАСХОДЫ НА ПЕРЕРАБОТКУ ПО ДАВАЛЬЧЕСКОЙ СХЕМЕ) – In mining industry, Tolling Charges are the charges or margins for converting concentrate into finished metal. These include treatment charges and refining charges (TC/RCs), price participation and price sharing for copper concentrate and roasting charges for molybdenum concentrate. / В горной (горнодобывающей) промышленности, . Они включают расходы по обработке и расходы по рафинированию (РО/PP), .

TOLUENE DIISOCYANATE = ТОЛУОЛ ДИИЗОЦИАНАТ – Toluene Diisocyanate (TDI) is a starting material for the production of polyurethane. It is used primarily in the automotive industry (for example, in seat cushions and interiors) and the furniture industry (for example, for flexible foams for mattresses or cushioning, or in wood coating). / Толуол Диизоцианат (Toluene Diisocyanate).

TOMBSTONE KERNEL = ПОРАЖЁННАЯ ГНИЛЬЮ ЗЕРНОВКА (или ПОРАЖЁННОЕ ГНИЛЬЮ ЯДРО, или ФУЗАРИОЗНОЕ ЗЕРНО) – Tombstone Kernel is an obsolete term for a fusarium-damaged kernel.

TOMENTUM = ВОЙЛОК (или НАБИВКА) – Tomentum is a layer of matted woolly threads on the surface of a plant. Often the hairs are white, giving the surface a silvery appearance. Latin = Cushion Stuffing. Tomentose:- of a surface covered with tomentum. Tomentous:- of a surface covered with tomentum. Tomentosum:- epiphet of a plant covered with tomentum. / Войлок на листьях и стебле.

TOMMING OFF = ЗАКЛИНИВАНИЕ – Tomming Off:- using wedges between cargo and the ship's side or a bulkhead to prevent movement of the goods during transit. / Использование клиньев или клинышков между грузом и бортом корабля или переборки (перегородки) для предотвращения смещения товаров в процессе транзита.

TOM NEXT = TOMORROW NEXT

TOMORROW NEXT = РАСЧЁТАМИ СЛЕДУЮЩЕГО УТРА (или РАСЧЁТАМИ ЗАВТРА И НА СЛЕДУЮЩИЙ ДЕНЬ) – Tomorrow Next:- simultaneous buying of a currency for delivery the following day and selling for the spot day or vice versa. Foreign exchange and money market trades executed tomorrow for delivery on the next business day. TOM/NEXT refers to the time period commencing one business day forward from the present and ending one business day later (usually spot). In precious metals, generally refers to the swap rate for borrowing or lending metal vs USD for this time period, which is typically used to manage short-term liquidity flows.

TON = ТОННА – (1) Ton is a metric unit of mass, equal to 1 000 kilograms (kg), or approximately 2 204.623 pounds avoirdupois. This metric ton is a bit smaller than the British long ton. The metric ton is now known officially as the Tonne. Unit of weight measurement:- 1 000 kilograms (metric ton) or 2 240 lb (long ton). 1 ton of natural gas liquids (NGLs) equals 1.9 standard cubic meters of oil equivalent. 1 ton equals 7.33 barrels of oil (average API gravity). Barrels per ton vary from origin to origin. / 2 204.623. Под Тонной, от Французского слова Tonne, от средневекового Латинского слова Tunna, означающее Бочка, понимается основная метрическая единица массы в Системе Единиц МТС, то есть внесистемная единица, допускаемая к применению наравне с единицей СИ килограммом (кг). Одна метрическая тонна равна 1 000 килограммам. Обозначение:- т. В Соединённом Королевстве в Британской Империальной Системе применяется длинная тонна, равная 2 240 Британским торговым фунтам или 1 016.047 килограммам, а в Соединённых Штатах Америки – короткая тонна, равная 2 000 Британским торговым фунтам или 907.185 килограммам. В Соединённом Королевстве пробирная тонна равна 32.666 7 граммам (г), а в Соединённых Штатах Америки пробирная тонна равна 29.166 7 граммам (г).

(2) Unit of weight or measurement used as a basis for the calculation of freights (Freight Ton (FT)). Ton is a traditional unit of volume used for measuring the cargo of a ship, truck, train, or other freight carrier. This freight ton is exactly 40 cubic feet, or approximately 1.132 6 cubic meters. However, the term Freight Ton is also being used to mean a metric ton of freight, volume not specified. Perhaps because of this confusion, the 40 cubic foot unit is often called the Measurement Ton (MTON). But the confusion seems impossible to dispel; some shippers are now using Measurement Ton to mean a metric ton of freight. To further complicate the situation, the freight ton is also called the US Shipping Ton; the British shipping ton is 5% larger at 42 cubic feet (1.189 3 cubic meters).

(3) Ton is the unit of volume used traditionally to measure the 'displacement' of ships, especially warships. One way to describe the size of a ship is to state the volume of sea water it displaces when it is afloat: in other words, the volume of that part of the ship below the waterline. The actual weight of sea water varies somewhat according to its temperature and how salty it is, but for this purpose it has been agreed that a long ton of sea water occupies about 35 cubic feet. Accordingly the displacement ton is defined to be exactly 35 cubic feet, or approximately 0.991 1 cubic meter. Since this is a much smaller unit than the register ton, warships have a much higher 'tonnage' than merchant ships of approximately the same dimensions. The symbol DT is recommended for this unit.

(4) Ton is the unit used traditionally to measure the cargo capacity of a merchant ship. During the Middle Ages, merchant ships were rated by the number of tuns of wine they could carry. Today the merchant marine ton is defined to be exactly 100 cubic feet, or approximately 2.831 68 cubic meters. This unit is often called the Register Ton, since it is recorded in official registers of ships. The symbol RT seems to be in wide use for this unit, but it is also used for the refrigeration ton. / Регистровая тонна – единица объёма (вместимости), равная 2.831 68 кубическим метрам ($м^3$).

(5) Ton is the traditional unit of weight equal to 20 hundredweight. In the United States and Canada, there are 100 pounds in the hundredweight and exactly 2 000 pounds (907.185 kilograms) in the ton. In Britain, there are 112 pounds in the hundredweight and 2 240 pounds (1 016.047 kilograms) in the ton. To distinguish between the two units, the British ton is called the Long Ton and the American one is the short ton. In old England, a 'tun' was a large cask used to store wine. Because these tuns were of standard size, more or less, the tun came to represent both a volume unit, indicating the capacity of a cask, and also a weight unit, indicating the weight of a cask when it was full. The best symbol to use for this unit is tn. In the US mining industry, T is used to distinguish the traditional ton from the metric ton, but T is the International System of Units (Le Système International d'Unités (SI)) symbol for the tesla. The symbol t, traditionally used for the long or short ton, is now reserved for the metric ton. / Лё Систэм Этэрнасьёналь д'Юните (Эс.И. или, как её уже устоялось называть в России, СИ).

TONGUE TEAR STRENGTH = КРЕПОСТЬ НА РАЗРЫВ ЯЗЫЧКОВ – Tearing Strength of Textile Fabrics by Tongue (Single Rip) Procedure (ASTM D2261):- a large variety of tests are used throughout the textile industry to evaluate the performance and quality of fabrics. ASTM D2261 test method uses the tongue (single rip) procedure to measure the tearing strength of fabrics. In this test method, a cut is made in a rectangular specimen, which starts a tear. By cutting the material, two 'tongues' are formed. A reference line is drawn to indicate the point to tear. One tongue is placed in the upper jaw and one tongue is placed in the lower jaw. As the test is run, the jaw move apart and the fabric tears along the precut segment. The resulting data reflects the strength of the yarns, fiber bonds, and fiber interlocks, as well as their resistance to tearing. When testing to this standard, it is important to consider data rate. To consistently and accurately measure the tear strength of your material, it's important to remember that the data sampling rate has to be high enough that the test peaks and troughs are captured. We recommend using either a 3300 or 5900 universal testing machine fitted with pneumatic side action grips. The type of jaw faces varies depending on your material; however we typically recommend rubber or wave profile faces. Tongue Tear Strength is the average force required to tear a rectangular sample with a cut in the edge at the center of the shorter side. The two tongues are gripped in a tensile tester and the force required to continue and tear is measured. Tongue Tear Test is a simple tearing test where the tearing takes place alon the weakest region of the leather specimen. A 5 mm dia. Hole is punched into the leather at a point one-third of the length of the specimen, 75 x 25 mm. From one end on the central line of the specimen. The leather specimen is then cut into two tongues at right angles to the grain surface for two-third of its length. The ends of the two tongues formed are clamped to the two jaws of the tensile tester. The load required for continuing the tear is noted. The tearing strength actually indicates about the strength of the fibers and their cohesive force. American Society for Testing and Materials (ASTM). / Американское Общество по Испытаниям и Материалам (АОИМ). Метод определения прочности ткани на раздирание:- у каждой полоски делается продольный надрез по её средней линии для получения двух 'язычков'.

TON MILE = ТОННО·МИЛЯ – Ton Mile is a measurement used in the economics of transportation to designate one ton being moved one mile. This is useful to the shipper because it includes the distance to move a commodity in the calculation. / Грузонапряжённость железнодорожных линий, показатель интенсивности использования железнодорожной сети; величина грузонапряжённость (или густоты перевозок) измеряется количеством тонно·километров (т·км), приходящихся на 1 км эксплуатационной длины железных дорог (эксплуатационная длина железных дорог бывшего Союза Советских Социалистических Республик (СССР) не включает протяжения вторых и третьих главных, а также станционных путей). Мощность грузопотока может быть измерена

также количеством тонн груза, провезённых через определённое сечение (пункт) железнодорожной сети за определённый период времени. Средняя грузонапряжённость сети железных дорог бывшего СССР за послевоенные годы возросла более чем в 4 раза:- с 4.3 миллионов т·км/км в 1940 до 18.5 миллионов т·км/км в 1970; на отдельных направлениях железнодорожные сети средняя грузонапряжённость колебалась от 1 до 70 миллионов т·км/км и более. Средняя грузонапряжённость железнодорожной сети Соединённых Штатов Америки (США) составляла 3.5 миллиона т·км/км в 1968; в Федеративной Республике Германия (ФРГ) – 2.0 и Франции – 1.7 миллиона т·км/км, то есть в 5–10 раз ниже, чем в СССР. Показатель грузонапряжённости применяется также и к другим наземным, а также водным путям сообщения. Грузооборот, основной условно-натуральный экономический показатель продукции транспорта как особой отрасли материального производства. Представляет собой произведение количества перевезённого груза (в тоннах (т)) и расстояния перевозки (в километрах (км)). Измеряется тонно·километрами (т·км) нетто (на морском транспорте – тонно-милями, где миля = 1.852 км), то есть без веса подвижного состава, в котором груз перемещается. Следовательно, грузооборот транспорта зависит от массы перевозимого груза и дальности перевозки. Масса груза, в свою очередь, обусловлена объёмом и структурой производства различной продукции, а также зависит от коэффициента перевозимости или коэффициента повторности перевозок (смотрите Грузовые Перевозки). На дальность перевозки грузов влияют:- размер территории и размещение природных богатств, предприятий по отношению к источникам сырья, топлива и районам потребления продукции, степень развитости самой транспортной сети (наличие кратчайших или только кружных линий) и так далее. В свою очередь, на дальность перевозок (и на связанные с нею размеры грузооборота) оказывают воздействие:- общественный способ производства материальных благ, особенности процесса обращения продукции и товаров (стихийного – в капиталистических странах, планомерного – в бывшем Союзе Советских Социалистических Республик (СССР) и в других странах социализма). Стихийность капиталистического обращения товаров вызывает огромное количество встречных, излишне дальних, излишне повторных и других нерациональных перевозок и, соответственно, искусственно увеличенный излишний грузооборот. Этому способствуют неравномерность размещения производительных сил в капиталистическом мире, отрыв большой части обрабатывающей промышленности от источников сырья и рынков сбыта продукции. Известно, что небольшое число индустриально развитых государств (Соединённые Штаты Америки (США), Великобритания, Федеративная Республика Германия (ФРГ), Франция, Япония, Италия, Бельгия и другие) сосредоточили в своих руках почти всю обрабатывающую промышленность капиталистического мира, нередко получая нужное сырьё издалека. В то же время бывшие колониальные и экономически отсталые страны завозят из индустриально развитых государств (подчас за тысячи километров) продукцию обрабатывающей промышленности, хотя многие виды этой продукции могли бы производить у себя. Увеличению грузооборота способствует и узкая специализация экономически отсталых стран на производстве одного или нескольких видов продукции, например, Бразилии на производстве Кофе, Венесуэлы – нефти, Чили – медной руды и селитры, Цейлона – чая и так далее. Этим объясняется быстрый рост грузопотоков в межконтинентальных сообщениях, осуществляемых в основном морским транспортом (удельный его вес в общем грузообороте мирового транспорта – свыше 2/3). Социалистическое плановое хозяйство, в отличие от капиталистического, располагает большими возможностями для всесторонней рационализации экономических связей и перевозок, особенно в сфере обращения, и на этой основе – возможностями относительно сократить грузооборот и связанные с ним затраты народного хозяйства на транспорт. Упорядочению и устранению излишнего грузооборота, в частности, содействуют:- рационализация размещения производительных сил с тем, чтобы стоимость продукции у потребителя была минимальной по сумме затрат на её производство и транспортировку; построение оптимальных планов снабжения, сбыта и перевозок (недопущение излишне дальних, встречных и других нерациональных перевозок). Значительный опыт СССР показывает, что построенные на основе применения точных математических методов и электронно-вычислительных машин (ЭВМ) общесоюзные (общесетевые) оптимальные планы перевозок массовых грузов позволяют значительно сократить объём грузооборота (в т·км). На экономически слаборазвитые и развивающиеся страны приходится лишь около 20% всего грузооборота (включая перевозки и в международном сообщении) и менее 8% грузооборота во внутреннем сообщении, в то время как они занимают почти половину территории земного шара, на которой проживает около 45% населения. Неравномерно развивается грузооборот и по видам транспорта. Так, грузооборот всех видов транспорта за 1950–67 возрос в среднем на 219% (в том числе во внутренних сообщениях на 146%). За тот же период грузооборот железных дорог увеличился лишь на 113%, автотранспорта – на 249%, внутреннего водного транспорта – на 93%, морского – на 277% , трубопроводного – на 382%, а газопроводного – на 518%. Около 70% всего грузооборота развивающихся стран составляют морские перевозки флота Либерии, формально являющегося самым крупным в мире, а также Панамы и некоторых других стран. Фактически этим флотом владеют крупные монополии США и ряда стран Западной Европы. Суда этих монополий лишь фиктивно приписаны к портам малых стран с целью уклониться от уплаты больших налогов. Именно этой причиной объясняется сравнительно малый грузооборот морского флота США несмотря на большие размеры флота. По ориентировочным расчётам, действующая мировая статистика примерно втрое преувеличивает долю развивающихся стран в мировом грузообороте (с 6 до 19%) и соответственно преуменьшает долю развитых капиталистических стран. На долю морского транспорта приходится около 2/3 всего грузооборота, главным образом за счёт огромной дальности перевозки грузов, особенно в международных сообщениях (свыше 6 000 километров (км)). Грузооборот транспорта общего пользования СССР и его динамика отражают особенно быстрый темп развития народного хозяйства страны и его огромные масштабы. Суммарный грузооборот всех видов транспорта СССР в 1969 составлял около 15% мирового и около 30% внутренних грузооборотов всех стран мира. На долю железных дорог СССР приходится почти половина мирового грузооборота железных дорог, около 65% всего грузооборота СССР и свыше 80% внутренних грузооборотов, что связано с размерами территории СССР, своеобразием размещения природных богатств и производительных сил в стране и рядом других важных факторов, определяющих ведущую роль железных дорог в транспортной системе СССР.

TONNAGE = ТОННАЖ (или ВМЕСТИМОСТЬ) – Tonnage:- deadweight, gross, net, displacement; a quantity of cargo normally expressed as a number of tons. Generally refers to freight handled. Total weight or amount of cargo expressed in tons. / Под Тоннажем судна, от Французского слова Tonnage, понимается регистровая вместимость судна. Тоннаж выражают в регистровых тоннах. Неправильно называть тоннаж судна водоизмещением или грузоподъёмностью.

TONNAGE DECK = ОБМЕРНАЯ ПАЛУБА (или ТОННАЖНАЯ ПАЛУБА) – The uppermost continuous deck in ships having less than three decks, or the second continuous deck from below. / Самая верхняя непрерывная палуба на корабле, имеющем не менее трёх палуб, или вторая непрерывная палуба с низу.

TONNAGE KTONS = ТЫС.ТОНН ТОННАЖА (или КТОНН ТОННАЖА) – Tonnage Ktons is the combined total tonnage from all loaded barges which passed through the lock chamber. Tonnage is reported in kilotons (1 ton is equal to 2 000 lbs). / Ктонн Тоннажа или Килотонн Тоннажа – комбинированный итоговый тоннаж всех загруженных барж, которые проходят через шлюзовую камеру. Тоннаж просчитывается в килотоннах (1 тонна равна 2 000 фунтов).

TONNE = (МЕТРИЧЕСКАЯ) ТОННА – Tonne (t) is a Metric unit of mass equal to 1 000 kilograms or approximately 2 204.623 pounds avoirdupois. The SI (The International System is called the SI, using the first two initials of its French name Système International d'Unités) uses this French spelling for the Metric ton (see also Ton (2) above) to distinguish it clearly from the long and short tons of customary English usage. Large masses are often stated as multiples of the tonne, although technically the SI requires that masses be stated as multiples of the gram. Thus a mass of 10^3 tonnes = 10^6 kg = 10^9 g is often called 1 kilotonne (kt) instead of 1 Gigagram (Gg). In the United States, the Department of Commerce recommends that the tonne be called the Metric Ton. The spelling Tonne denotes the metric ton of 1 000 kilograms (approximately 2 204.623 pounds). Also known as Ton. See also Long Ton, and Short Ton. / Под Тонной, от Французского слова Тонн (Tonne), от средневекового Латинского слова Tunna, означающее Бочка, понимается основная метрическая единица массы в Системе Единиц МТС, то есть внесистемная единица, допускаемая к применению наравне с единицей СИ килограммом (кг). Одна Метрическая тонна равна 1 000 килограммам. Обозначение:- т. В Соединённом Королевстве в Британской Империальной Системе применяется длинная тонна, равная 2 240 Британским торговым фунтам или 1 016.047 килограммам, а в США – короткая тонна, равная 2 000 Британским торговым фунтам или 907.185 килограммам.

TONS OF OIL EQUIVALENT = ТОНН НЕФТЯНОГО ЭКВИВАЛЕНТА (или ТОНН В НЕФТЯНОМ ЭКВИВАЛЕНТЕ) – Tons of Oil Equivalent (TOE) is a measure of energy used to relate different fuels to the equivalent oil requirement based on an energy value for oil of 42 MJ/kg.

TON WEIGHT = ТОННАЖНЫЙ ВЕС – Ton Weight is a Metric measure equals 1 000 kilograms. A short ton is 2 000 pounds and a long ton is 2 240 pounds.

TOO BIAS = СЛИШКОМ ОТКЛОНЯЮЩЕЕСЯ – Too Bias:- cutting of the part has been cut on too bias an angle and therefore does not sew in properly. Interlining defects. / Порок или дефект.

TOO–BIG–TO–FAIL = СЛИШКОМ КРУПНЫЙ ЧТОБЫ ЛОПНУЛ – In the United States, Too-Big-To-Fail is the government practices that protect large banking organizations from the normal discipline of the marketplace because of concerns that such institutions are so important to markets and their positions so intertwined with those of other banks that their failure would be unacceptably disruptive, financially and economically.

TOOLING RESIN = ИНСТРУМЕНТНАЯ (или ИНСТРУМЕНТАЛЬНАЯ) СМОЛА (или СМОЛА ДЛЯ ОСНАСТКИ) – Tooling Resin:- resins that have applications as tooling aids, coreboxes, prototypes, hammer forms, stretch forms, foundry patterns, and so forth. Epoxy and silicon are common examples.

TOO LONG IN STORAGE = СЛИШКОМ ДОЛГО НА ХРАНЕНИИ – Too Long In Storage:- thread left too long in storage tends to dry out. This is partly dependent upon storage conditions. Thread defects, and namely – Storage. / Порок или дефект ниток.

TOOL SIDE = СО СТОРОНЫ ИНСТРУМЕНТА – Tool Side is a side of the part that is cured against the tool (mold or mandrel).

(TO) ORDER BILL OF LADING = ОРДЕРНЫЙ КОНОСАМЕНТ (или КОНОСАМЕНТ ПРИКАЗУ, или КОНОСАМЕНТ ПО РАСПОРЯЖЕНИЮ) – An Order Bill of Lading (BL or B/L) is one in which the goods are consigned to the order of a named party. This distinction is important in determining whether a bill of lading is negotiable (capable of transferring title to the goods covered under it by its delivery or endorsement). If its terms provide that the freight is to be delivered to the bearer (or possessor) of the bill, to the order of a named party, or, as recognized in overseas trade, to a named person or assigns, a bill, as a document of title, is negotiable. In contrast, a straight bill is not negotiable. See also Bill Of Lading. Negotiable bill of lading that can be negotiated like any other Negotiable Instrument, so that the shipper can sell it to anyone, not just the intended recipient of the goods. The bill requires the carrier to release the goods only when the bill of lading is given him by the recipient. This bill uses express words to make the bill negotiable, e.g., it states that delivery is to be made to the further order of the consignee using words such as 'delivery to ABC Ltd or to order or assigns'. Consequently, it can be endorsed by ABC Ltd or the right to take delivery can be transferred by physical delivery of the bill accompanied by adequate evidence of ABC Ltd's intention to transfer. Also known as Negotiable Bill Of Lading. / К Ордерным Коносаментам относятся коносаменты, по которым товары подлежат передаче в соответствии с распоряжением указываемой стороны. Эта особенность является важной при определении того, является ли коносамент оборотным/оборачиваемым, то есть способным передавать титул на товары указанные в нём, посредством его (коносамента) поставки или индоссамента, или нет. Если положения коносамента предусматривают то, что груз должен быть поставлен предъявителю (или распорядителю) данного коносамента по распоряжению указываемой стороны или, как принято во внешней торговле, поименованному лицу или когда коносамент отчуждается как документ о титуле, такой коносамент признаётся оборотным/оборачиваемым. В отличие от именного коносамента (straight bill of lading или просто straight bill), который не является оборачиваемым. Оборотным или Оборачиваемым Коносаментом признаётся такой коносамент, который может быть обращаемым как любой другой Оборотный или Оборачиваемый Инструмент (Negotiable Instrument), посредством чего грузоотправитель может продать его кому угодно, а не только лишь предполагаемому получателю данных товаров. Такой коносамент требует от перевозчика отпустить данные товары только лишь тогда, когда данный коносамент будет предоставлен ему каким-то получателем. Этот коносамент использует прописанные слова, с помощью которых он становится обращаемым/оборотным/оборачиваемым, например, он указывает на то, что поставка должна быть произведена по дальнейшему распоряжению данного грузополучателя при наличии в коносаменте таких слов или выражений как:- 'поставка (компании) ABC Ltd' (delivery to ABC Ltd) или 'по распоряжению' (to order) или 'отчуждает' (assigns). Следовательно, он может быть индоссирован компанией ABC Ltd или право принять поставку может быть передано посредством физической поставки коносамента, сопровождаемого соответствующим свидетельством компании ABC Ltd о намерении передачи. Известен также как Оборотный/Оборачиваемый/Обращаемый Коносамент (Negotiable Bill Of Lading).

TO ORDER OF SHIPPER = ПО РАСПОРЯЖЕНИЮ ОТПРАВИТЕЛЯ – To Order Of Shipper:- the shipper, by way of endorsement and passing of the document, allows a transfer of the rights to take delivery of the goods in the document, e.g., a bill of lading (B/L).

TOP = TAKE–OR–PAY

TOP = TARGET OPTION PAYMENTS

TOP = TONGAN PA'ANGA

TOP = ВЕРХНЕЕ (или ТОП, или ХХ) – Top is a garment worn on the upper body. / швейное изделие, одеваемое на верхнюю часть тела.

TOP = ВЕРШИНА (или МАКСИМАЛЬНАЯ, или ВЕРХНЯЯ) – Top is the highest price on a chart for a significant amount of time looking back and forward of the high date. This normally represents the end to a bull market phase and the beginning of better price slide.

TOP = ВЫСШИЙ РАНГ – TOP is the Netherlands' RTGS (Real-Time Gross Settlement) system operated by DNB (De Nederlandsche Bank). TOP, the real-time gross settlement system of the Netherlands Bank, has been designed for processing and settling large-value payments in Euros. TOP is not an acronym. Rather, the system is named after the market sector in which it operates:- the 'top', i.e. the sector handling the largest-value payments in the Netherlands. / является Нидерландской системой ВРРРВ (Валовых Расчётов в Режиме Реального Времени) оперируемая банком Дэ Нэйдёлансэ Банк (Дэ.Эн.Бэ.; De Nederlandsche Bank (DNB)).

TOP = МЫЧКА (или ЛЕНТА ГРЕБЕННОГО ПРОЧЁСА) – Top is:- (1) a wool sliver that has been combed to straighten the fibers and to remove short fiber; an intermediate stage in the production of worsted yarn. (2) A similar untwisted strand of manufactured staple delivered by the comb or made directly from tow. Top is a continuous untwisted strand of wool fibers of predetermined length from which the short fibers (noil) have been removed in the combing process. Usually produced by carding, gilling and combing wool or fibers of similar length. See also Slubbing. Top is a synonym for Sliver. Also a form of package in which sliver can be delivered, e.g., ball top or bump top. / Мычка в шерстопроизводстве. Мычка (устаревший термин) – пучок льна для прядения.

TO PAY AS CARGO = ПЛАТИТЬ КАК ЗА ГРУЗ – To Pay As Cargo:- a provision in a marine policy effected to supplement a cargo policy, as where a buyer wishes to cover himself for a higher value than that fixed in the seller's policy. When issuing the supplementary policy the insurers agree that where a loss is shown to be recoverable under the original policy they will not contest the higher value.

TOP BOOT = САПОГ С ОТВОРОТОМ (или САПОГ С РАСТРУБОМ) – Top Boot is a high boot often with light-colored leather bands around the upper part.

TOP CAP = ВЕРХНЯЯ КРЫШКА – Top Cap:- panel to be placed on top of a unit load to allow for tight strapping without damaging the unit load. / без повреждения пакета.

TOP CHORD = ВЕРХНИЙ ПОЯС – Top Chord is inclined or horizontal member that established the upper edge of a truss. A chord member is defined as the entire member which may consist of shorter spliced pieces. An inclined or horizontal member that establishes the upper edge of a truss, usually carrying combined compression and bending stresses. / Наклонный или горизонтальный элемент, который формирует верхнюю грань фермы, .

TOPCOAT = ПАЛЬТО (или ЛЁГКОЕ ПАЛЬТО, или ПЛАЩ, или НАКИДКА) – Topcoat is a lightweight overcoat.

TOP COLORS = ВЕРХНИЕ ЦВЕТА – Top Colors are the colors used on the ground color to form a design.

TOPCROSS = ТОПКРОСС – Topcross is a cross between a selection, line, or clone, and a common pollen parent which may be a variety, inbred line, or a single cross. The common pollen parent is called the Topcross or Tester Parent. / (1) Топкросс – скрещивание инцухтлиний с производственной популяцией (сортом) при селекции на гетерозис. (2) Топкросс – скрещивание аутбредных самок с инбредным производителем. Под Топкроссом понимается:- (1) в растениеводстве – метод скрещивания для определения комбинационной способности инцухтлиний или сортов в селекции на гетерозис. (2) В животноводстве – спаривание специальных отселекционированных инбредных производителей с неродственными им аутбредными матками.

TOP DECK = ВЕРХНИЙ НАСТИЛ – Top Deck is a flat, horizontal payload-carrying surface of a pallet. Note:- the top deck can be slatted, close boarded, ribbed, mesh or solid. See also Pallet. / Верхний Настил:- горизонтальная поверхность, образующая площадку для размещения груза. Примечание:- площадка может быть решетчатая, покрытая досками настила, сетчатая или сплошная. Смотрите также Поддон (Pallet).

TOP–DECK OF THE PALLET = ВЕРХНИЙ НАСТИЛ ПОДДОНА – Top-Deck Of The Pallet:- the assembly of deckboards comprising the upper load-carrying surface of the pallet. See also Pallet.

TOP DECK SUB–ASSEMBLY = ХХ ВЕРХНЕГО НАСТИЛА – Top Deck Sub-Assembly or Top Deck Mat is an assembly of top deckboards and stringerboards. See also Pallet. / Фактически только лишь верхний настил в сборе, подбитый снизу тремя досками по краям и в центре. Верхний Настил С Нижними Деталями (Top Deck Sub-Assembly):- верхний настил поддона, состоящий из поперечных досок настила и продольных брусьев.

TOP–DOWN APPROACH = ПОДХОД СВЕРХУ–ВНИЗ (или ПОДХОД ОТ ГЛАВНОГО К ВТОРОСТЕПЕННОМУ) – Top-Down Approach is an approach to market analysis used by both fundamental and technical analysts. It often begins with a more 'macro' analysis of the overall market through major indices (Dow, NYSE®, S&P 500®, etc) before concentrating on the market at a more 'micro' level. Strong and weak sectors of the market are analyzed before focusing on individual stocks within select groups. Top-Down Approach is an analysis technique that begins with a broader (macro) perspective and applies trends and conclusions to more specific situations. Top-Down Approach is an approach, based on an assessment of the overall economic development and the respective sector, to predict the development of an individual company and its share price. Opposite:- Bottom-Up Approach. / (Дау (Dow), НЙФБ® или Эн.Уай.Эс.И.® (NYSE®), Эс.ЭндПи. 500® (S&P 500®)).

TOPDRESSING = (НЕКОРНЕВАЯ) ПОДКОРМКА – Topdressing is the application of fertilizer materials after seeding or transplanting or after the crop has been established. / Под Подкормкой растений понимается внесение органических и минеральных удобрений под сельскохозяйственные культуры в период их роста и развития.

TOP DYEING = КРАШЕНИЕ В МЫЧКЕ (или КРАШЕНИЕ В ЛЕНТЕ) – Top Dyeing is:- (1) the process of covering with an additional dye, not necessarily of the same color or class, to obtain the desired shade. (2) Fiber in top form is placed in cans and dyed in a batch-dye vessel with reverse cycling capability. An expensive process that is used primarily for fancy yarns. Top Dyeing:- top is the combed wool. In this method, the fiber is dyed in the stage just before the appearance of finished yarn. Top Dyeing is dyeing worsted wool fibers after they have been combed to straighten and remove the short fibers. The wool fiber at this stage is known as Top. Top dyeing is preferred for worsted wools as the dye does not have to be wasted on the short fibers that are removed during the combing process. Top Dyeing:- top is the combed wool sliver. It is wound on perforated spools and the dye solution is circulated through it. This method results in very even dyeing.

TOPEE = ТРОПИЧЕСКИЙ ШЛЕМ (или ТОПИ) – Topee is a lightweight helmet-shaped hat made of pith or cork. / пробковый или из люфы тропический шлем.

TOP HANDLERS = ТРАВЕРСЫ С ВЕРХНИМ ПОДХВАТОМ (или МАНИПУЛЯТОРЫ С ВЕРХНИМ ПОДХВАТОМ, или МАНИПУЛЯТОРЫ С ЗАХВАТОМ СВЕРХУ) – Top Handlers:- an equipment that loads/unloads containers at container yard. / Оборудование, которое осуществляет погрузку/выгрузку контейнеров в контейнерном дворе. Под Манипулятором, от Французского слова Manipulateur, от Латинских слов Manipulus, означающее Горсть или Пригоршня, и Manus, означающее Рука, понимается управляемое устройство, оснащённое рабочим органом, служащим для выполнения двигательных функций, аналогичных движениям руки человека при перемещении в пространстве объекта (вещества, заготовки, изделия) при его

обработке, изменении положения и тому подобному. Манипулятор входит в состав многих машин, механизмов (например, прокатный манипулятор, ковочный манипулятор, манипулятор бурильной установки), автоматических линий в автоматизированных производствах, является частью промышленных роботов. Подвесы в виде траверсы с поворотными замковыми устройствами.

TOP HAT = XX ШЛЯПА (или ШЛЯПА ИЗ ВЫСШЕГО СВЕТА) – Top Hat is a tall-crowned hat usually of beaver or silk. However, they are also made of other fabrics.

TOP–HEAVY = С ВЫСОКИМ ПОЛОЖЕНИЕМ ЦЕНТРА ТЯЖЕСТИ – Top-Heavy (maritime term):- too heavy aloft.

TOPIX = TOKYO STOCK PRICE INDEX

TOPIX = ТОПИКС – TOPIX is the stock price indices are statistical indicators of trends in the financial market. TOPIX and Nikkei 225 are commonly used indices in Japan. As important economic indicators, precision and continuity are vital to their calculation. TOPIX (Tokyo Stock Price Index):- provider:- Tokyo Stock Exchange, Inc. (TSE); issue composition:- all companies listed on the TSE First Section; No. of constituents:- about 1 700 (TOPIX has no constituent review because it is based on all domestic common stocks listed on the First Section of TSE. The number of constituents will change according to new listings and delistings); methodology:- free-float adjusted market capitalization weighted (TOPIX expresses fluctuations in the market capitalization of all domestic stocks listed on the TSE First Section, with the market value on 1968-January-04 (base market value) set at 100 points. TOPIX is most affected by issues with high aggregate market value); and unit:- point. Sub-indices:- TSE calculates and publishes TOPIX (Tokyo Stock Price Index) as well as other indices such as Size, Sector, and Style Indices. By offering indices calculated from various constituencies, TSE provides for a wide variety of investor needs. Television, newspapers and financial information vendors use indices as stock market indicators. The Japanese government uses TOPIX as their leading economic indicator. Indices have an important usage as assets benchmark. As a benchmark, indices are used for the evaluation standard of asset management. Institutional investors including pension fund and investment fund managers use TOPIX as a benchmark to evaluate their Japanese market portfolios. Indices are used for diversified investments for pension funds or the investment trusts because of their indications of comprehensive stocks movements. TOPIX-ETF (an Exchange-traded fund which holds a portfolio representing all stocks in the Tokyo Price Index (TOPIX)), the largest ETF in Japan, is traded on TSE. Global investors can hedge Japanese stock portfolios using TOPIX futures and options. See also Nikkei 225. Xxxxx. ‘Today, the TOPIX closed at xxx.xx points...’ You may have seen this type of a report on the TV news or other media. TOPIX is the acronym for the ‘TOkyo stock Price IndeX’ – a barometer measuring trends in the stock market as a whole, used as a valuable indicator by people who actively invest in stocks. The TOPIX is calculated using 100 points as the value for 1968-January-04, and as this graph illustrates, the index reflects movements in the Japanese economy. Established after World War II in 1949, the Tokyo Stock Exchange is the nerve center of the secondary market for securities. The TSE has laid the foundation of the market necessary for the exchange of negotiable securities, and has played a pivotal role in ensuring the formation of fair prices and smooth circulation. In order to respond to increasingly active trading in the future, we at the TSE are continuously working to improve market confidence and usability. The TOPIX, also known as the Tokyo Stock Price Index, is a capitalization weighted index of all companies listed on the First Section of the Tokyo Stock Exchange. The index is supplemented by the subindices of the 33 industry sectors. The index calculation excludes temporary issues and preferred stocks, and has a base value of 100 as of 1968-January-04. Tokyo stock Price IndeX, commonly known as TOPIX, along with Nikkei 225, is an important stock market index for the Tokyo Stock Exchange (TSE) in Japan, tracking all domestic companies of the exchange’s First Section. It is calculated and published by the TSE. As of 2011-February-01, there are 1 669 companies listed on the First Section of the TSE. The market value for the index on the same date, is 197 401 Billion Yen. The index transitioned from a system where a company’s weighting is based on the total number of shares outstanding (commonly called the Float) to a weighting based on the number of shares available for trading (called the Free Float). This transition took place in three phases starting in October 2005 and being completed in June 2006. Although the change is a technicality, it had a significant effect on the weighting of many companies in the index because many companies in Japan have significant holds of shares of their business partners as a part of intricate business alliances, and such shares will no longer be included in calculating the weight of companies in the index. TSE currently calculates and distributes TOPIX every second and further plans to launch a new High-Speed Index dissemination service provided at the millisecond level starting from 2011-February-28. On 1969-July-01 TSE to begin calculating and publishing ‘TOPIX’ and ‘TOPIX Sector Indices’. TOPIX New Index Series:- (i) TOPIX 1000:- component stocks in the TOPIX 500 and highly market capitalized stocks of the TOPIX small; (ii) TOPIX 500:- component stocks in the TOPIX Core 30, the TOPIX Large 70 and the TOPIX Mid 400; (iii) TOPIX Small:- outside the component stocks in the TOPIX 500 and non-eligible stocks (new companies which have not been listed on the TSE for 6 months or more, out of the companies listed on the 1st section of the TSE) in the TOPIX; (iv) TOPIX 100:- component stocks in the TOPIX Core 30 and the TOPIX Large 70; (v) TOPIX Mid 400:- excluding TOPIX 100 stocks, these are the remaining stocks in the TOPIX 500; (vi) TOPIX Core 30:- the 30 most liquid and highly market capitalized stocks; and (vii) TOPIX Large 70:- after the Core 30, the 70 most liquid and highly market capitalized stocks. / 225 от Никкэй (Nikkei 225). Индекс по Токийским Фондовым Ценам (Tokyo Stock Price Index), известный под сокращением ТОПИКС (TOPIX), является важным фондовым индексом Японии. Он рассчитывается Токийской Фондовой Биржей (ТФБ) как среднее арифметическое значение, взвешенное по рыночной капитализации цен акций компаний, принадлежащих к первому сегменту Токийской Фондовой Биржи (компании с большой капитализацией). При вычислении капитализации учитываются акции, находящиеся в свободном обращении. Впервые TOPIX был опубликован 01 Июля 1969 с базовым значением 100 пунктов. Список компаний, охваченных индексом, пересматривается два раза в год – в Январе компании могут быть добавлены или удалены из списка, и в Июле – только добавлены. Индекс вычисляется каждые 15 секунд в рабочие дни биржи. Наряду с основным индексом Токийская Фондовая Биржа вычисляет также серию подиндексов:- (i) TOPIX Core 30 – акции 30 самых крупных и ликвидных Японских компаний, зарегистрированных на ТФБ; (ii) TOPIX Large 70 – акции 70 Японских компаний, следующих после компаний из TOPIX Core 30 по величине и ликвидности; (iii) TOPIX Mid 400 – акции 400 Японских компаний, следующих после компаний из TOPIX Large 70 по величине и ликвидности; (iv) TOPIX Small – акции Японских компаний, не попавших в TOPIX Mid 400; (v) TOPIX 100 – компании из TOPIX Core 30 и TOPIX Large 70; (vi) TOPIX 500 – компании из TOPIX 100 и TOPIX Mid 400; (vii) TOPIX 1000 – компании из TOPIX 500 и первые 500 компаний из TOPIX Small; и (viii) 33 подиндекса для различных отраслей экономики.

TOPKNOT = ЧУБ (или ХОХОЛОК, или ПУЧОК ПЕРЬЕВ, или XX) – Topknot is an ornament, as a knot of ribbons or a pompom, forming a headdress or worn as part of a coiffure; a crest of feathers or tuft of hair on the top of the head.

TOP–LEVEL DOMAINS = ДОМЕНЫ ВЕРХНЕГО УРОВНЯ – Top-Level Domains (TLDs) are the names at the top of the DNS naming hierarchy. They appear in domain names as the string of letters following the last (rightmost) ‘.’, such as ‘net’ in ‘www.example.net’. The administrator for a TLD controls what second-level names are recognized in that TLD. The administrators of the ‘root domain’ or ‘root zone’ control what TLDs are recognized by the DNS. Commonly used TLDs include .com, .net, .edu, .jp, .de, etc. See also DNS. / Домены Верхнего Уровня (ДВУ) – это имена верхнего уровня в иерархии имён СДИ. Они отображаются в

доменных именах в качестве буквенной строки, которая следует за последней точкой, например, ‘net’ в ‘www.example.net’. Администратор ДВУ контролирует, какие имена второго уровня распознаются в этом ДВУ. Администратор ‘корневого домена’ или ‘корневой зоны’ контролирует, какие ДВУ распознаются системой СДИ. К наиболее используемым ДВУ относятся .com, .net, .edu, .jp, .de и другие.

TOP–OFF = ДОЗАГРУЗИТЬ ДО УПОРА – Top-Off:- to fill a ship which is already partly loaded with cargo. / Заполнить судно, которое уже частично загружено грузом.

TOPOSEQUENCE = ТОПОПОСЛЕДОВАТЕЛЬНОСТЬ – Toposequence is a sequence of soils in the landscape, from the crest to the valley bottom.

TOPP = TOBACCO PAYMENT PROGRAM

TOPPER = ЦИЛИНДР (или ШЛЯПА, или КЕПКА, или ШИРОКОЕ ДАМСКОЕ ПАЛЬТО) – Topper is a silk hat; opera hat; a woman’s usually short and loose-fitting lightweight outer coat.

TOPPING = УДАЛЕНИЕ ВЕРХУШКИ (или ПИНЦИРОВКА, или ЧЕКАНКА) – Topping is the removal of the terminal bud of the main stem. Pruning is the removal of apical points of vegetative and fruiting branches. For Pima S2 Cotton Cultivar:- The results indicated that topping plants at 120 cm height increased number of retended bolls, fruiting sites, days to first open boll, open boll, unopen bolls and seed cotton yield. Side branch pruning at 120 cm height increased final plant height, monopodia, main stem internodes, sympodia, earliness percentage and boll weight. Topping + pruning at 100 cm height only decreased number of aborted sites. Topping + pruning at 120 cm height increased additional fruiting branch bolls, percentage of bolls on vegetative branches, boll weight and seed cotton yield. Topping at 120 cm height and 40 cm hill spacing resulted in the highest number of retended bolls and seed cotton yield. See also Pruning. / Чеканка Хлопчатника – прищипка верхушек главного стебля и моноподиальных ветвей, – которая приостанавливает ростовые процессы и имеющиеся запасы питательных веществ у растений направляет на усиление питания плодовых органов. Чеканка также способствует лучшему освещению Растений. Чеканку начинают:- на высокоплодородных участках с мощным развитием растений при образовании 16–18 плодовых ветвей с 15–20 Июля; на участках со средним развитием растений при 15–16 плодовых ветвях с 20–25 Июля; на участках со слабым развитием Растений чеканку проводят в период с 01 по 10 Августа при образовании 13–14 плодовых ветвей. Эти сроки могут изменяться в зависимости от состояния Хлопчатника и климатических условий года. Чеканка Растений – удаление верхушек побегов или верхних побегов у сельскохозяйственных Растений для прекращения их роста. Агротехнический приём, улучшает плодообразование и ускоряет созревания урожая. Чеканка обеспечивает усиленный приток питательных веществ к завязям за счёт прекращения роста побегов. Это уменьшает опадение завязей и создаёт лучшие условия для развития плодов. Чеканка Хлопчатника уменьшает полегание растений, ускоряет созревание волокна и раскрытие коробочек. Чеканку проводят после развития на кустах 14–16 плодовых ветвей. При чеканке боковые побеги обрезают на 2–3 см, главный стебель – на 4–6 см. Хлопчатник чеканят одновременно с рыхлением междурядий или нарезкой борозд для полива, применяя для этого приспособление к культиватору или специальные машины. Под Обрезкой (Trim) Растений понимается удаление ветвей или их укорачивание. Обрезают плодовые и декоративные растения для формирования кроны, регулирования сроков прохождения фаз развития растений, омолаживания. Под Пинцировкой (Topping), от Немецкого слова Pinzieren, означающее Удалять Конец, или Прищипкой понимается удаление верхушки молодого побега растения. Применяется при формировании кроны Персика, Яблони, некоторых декоративных Растений, для ускорения созревания урожая Огурца (в теплицах), Табака и другого. Под Чеканкой Растений понимается удаление верхушек побегов (topping) или верхних побегов в основном у Винограда и Хлопчатника для прекращения их роста. Уменьшает опадение завязей, создаёт лучшие условия для развития плодов.

TOPPING = УПИРАНИЕ В ПОТОЛОК – Topping is a period where the stock or market is ‘catching its breath’ after an advance, characterized by a flat trading range without any noticeable trend. It is common to see a topping period after a lengthy increase of the stock price. Topping may be sign of Distribution.

TOP–SIDER = ТОП–САЙДЁР – Top-Sider is a trademark:- used for a low casual shoe having a rubber sole.

TOPSOIL = ВЕРХНИЙ СЛОЙ ПОЧВЫ – Topsoil (surface soil) is the uppermost part of the soil ordinarily moved in tillage, or its equivalent in uncultivated soils. Topsoil ranges from 8–10 cm to 20–25 cm in depth. It is frequently designated as the plow layer. / Верхний Слой Почвы (Поверхностный Слой Почвы) .

TOPSTITCHING = ОТДЕЛОЧНАЯ СТРОЧКА – Topstitching is a decorative stitch that reinforces seams, pocket edges, or collars. It is often done in a color that contrasts with the background fabric.

TOQUE = ТОК (или ШАПОЧКА, или ШЛЯПКА) – Toque is a woman’s small hat without a brim made in any of various soft close-fitting shapes. / .

TORA = TAKE–OFF RUN AVAILABLE

TORCHON = ТОРШОН (или ГРУБОЕ КРУЖЕВО) – Torchon is a coarse bobbin or machine-made lace made with fan-shaped designs forming a scalloped edge. / сорт плетёного кружева.

TORN PATCHES = РВАНЫЕ ЛЯПКИ (или РВАНЫЕ ПЯТНА) – Torn Patches in denim. Possible Cause:- over application of enzyme. This is a major defect as it has clearly damaged the fabric. Finishing defect.

TORN SHIRT COLLARS = РАСПОРОТЫЕ (или РВАНЫЕ, или ПОРВАННЫЕ, или РАЗОДРАННЫЕ) ВОРОТНИЧКИ – Torn Shirt Collars:- Garments:- white cotton-broadcloth shirt collars; Fabric Construction:- (i) Count:- 144 x 76; (ii) Warp:- 80/2 combed cotton; (iii) Filling:- same as warp. Complaint:- a shirt manufacturer returned a number of finished fused collars, claiming that the broadcloth was weak. The collars were made of two layers of white cotton broadcloth, laminated or fused with an inner lining of the type composed of cotton and regularly spaced ends of a cellulose acetate yarn, which acts as the bonding agent when the layers are subjected to a solvent for the cellulose acetate, along with heat and pressure. After the collars were made up, it was found that they tore apart very easily between the neckband and collar sections. Analysis:- tensile-strength tests made on cuttings of the white broadcloth from which these collars had been made indicated that they were normal and up to standard. Several of the collars were softened by the application of a solvent and the stitches were carefully removed at the seams where the tearing took place. It was found that both warp and filling yarns were cut excessively, in some places most of the filling yarns having been completely severed. Also, stitch length showed extreme variation, running from 12 to 22 per inch. In collars in which there were only 12 stitches per inch, the cutting was correspondingly less pronounced and the tear resistance was comparatively high. This defect was attributed to faulty sewing operations, resulting from the use of improper or dull needles. / Уточина:- такая же как основа.

TORONTO STOCK EXCHANGE INDEX = ИНДЕКС ОТ ТОРОНТСКОЙ ФОНДОВОЙ БИРЖИ – Toronto Stock Exchange Index TSE 300 is the stock price index representing a market capitalization average price on the Toronto Stock Exchange. This index was replace in May 2002 by the S&P/TSX Composite Index. / Эс.ЭндПи./Ти.Эс.Экс. .

TORQUE = ВРАЩАЮЩИЙ МОМЕНТ – Torque is a force or a combination of forces that produces or tends to produce a twisting or rotating motion. In reference to yarn, torque refers to the yarn's tendency to turn on itself, or kink, as a result of twisting. / Под Вращающим Моментом понимается мера внешнего воздействия, изменяющего угловую скорость вращающегося тела. Вращающий момент $M_{вр}$ равен сумме моментов всех действующих на тело сил относительно оси вращения и связан с угловым ускорением тела ε равенством Мвр = I·ε, где I – момент инерции тела относительно оси вращения.

TORQUE YARN = ВРАЩАЮЩАЯСЯ ПРЯЖА – Torque Yarn:- when a torque yarn is permitted to hang freely, it rotates or kinks to relieve the torque introduced into the yarn during texturing. See also Textured Yarn.

TORSION TEXTURED YARN = СКРУЧЕННАЯ (или СВИТАЯ) ТЕКСТУРИРОВАННАЯ ПРЯЖА – Torsion Textured Yarn is a textured filament yarn obtained by heat setting of a twisted filament yarn and subsequently untwisting it. See also False Twist Yarn. / филаментная (комплексная) пряжа (filament yarn). Torsion (in French) = Крутка.

TORT = ДЕЛИКТ – Tort is a legal term. A wrongful or injurious act (other than breaking a contract) for which a civil suit may be brought in court by private persons. If the suit is successful, the court may award the victims cash compensation for damages, 'punitive' damages above the actual cost of the injury in order to punish the defendent, and/or a court order banning any future repetitions of the kind of behavior giving rise to the suit. For example, a householder might sue the owners of a nearby factory for creating excessive noise or pollution that interferes unreasonably with the householder's health or the peaceful enjoyment of his property. Tort law procedures are thus one of the principal mechanisms for defining and protecting property rights short of evoking criminal law and is an important governmental mechanism for trying to overcome the problem of negative externalities. In the United States, Tort is a term for one of many civil wrongs, other than breach of contract, for which a court of law will afford a remedy in the form of damages. For a court to find a tort, the court must find three elements:- (i) a duty; (ii) a breach of that duty; and (iii) harm resulting from that breach of duty. / Под Деликтом, от Латинского слова Delictum, понимается незаконное действие, правонарушение или проступок, вызвавший нанесение ущерба и влекущий за собой обязанность его возмещения.

TORTUOUS = ИЗВИЛИСТОЕ (или ИЗВИВАЮЩЕЕСЯ) – Tortuous:- twisted.

TOS = TERMS OF SALE

TOTAL ACID NUMBER = ОБЩАЯ КИСЛОТНОСТЬ (или ОБЩЕЕ КИСЛОТНОЕ ЧИСЛО) – Total Acid Number (TAN):- the quantity of base, expressed in milligrams of potassium hydroxide, that is required to neutralize all acidic constituents present in 1 gram of sample. (ASTM Designation D 974). See also Acid Number. American Society for Testing and Materials (ASTM). Total Acid Number (TAN):- the required amount of potassium hydroxide (KOH) to partially or fully neutralize the petroleum product's acidity. Technically, the Total Acid Number (TAN) of the oil indicates the deteriorating condition of the lubricating oil. Higher the TAN, more acidic is the lubricant, and further are its chances of getting more deteriorated. TAN also indicates the potential of the oil to cause corrosion problems, leading to component failure. The TAN should not be more than 2 for marine lubricating oils. / Американское Общество по Испытаниям и Материалам (АОИМ). Общее Кислотное Число $К_1$ (суммарное кислотное число сильных и слабых кислот) – количество щёлочи, выраженное в миллиграммах гидроокиси калия (КОН) на 1 грамм (г) образца, необходимое для потенциометрического титрования испытуемой массы в определённом растворителе от начального показания измерительного прибора до показания свежеприготовленного щелочного неводного буферного раствора или чёткой точки перегиба, как указано в стандарте.

TOTAL ASSETS = ВСЕГО АКТИВОВ (или СОВОКУПНЫЕ АКТИВЫ, или ИТОГОВЫЕ АКТИВЫ) – Total Assets:- the sum of assets reported by a company in its balance sheet. As off-balance-sheet operations become increasingly significant, this indicator only reflects part of the overall business of a company. In a balance sheet (IFRS), Total Assets consist of:- Long-Term Assets and Short-Term Assets. Total Assets is the sum of fixed and current assets. / Тотальный – всеобщий, всеобъемлющий, всеохватывающий, полный.

TOTAL AVERAGE INVENTORY = ИТОГОВОЕ СРЕДНЕЕ ЗНАЧЕНИЕ ИНВЕНТАРЯ – (1) Total Average Inventory:- the sum of average order quantity (one half of order quantity) plus safety stock. Safety stock is the amount on hand after the arrival of the order. / Тотальный – всеобщий, всеобъемлющий, всеохватывающий, полный.

(2) Total Average Inventory:- the average normal use stock plus the average lead stock plus safety stock.

TOTAL BASE NUMBER = ОБЩАЯ ЩЁЛОЧНОСТЬ (или ОБЩЕЕ ЩЕЛОЧНОЕ ЧИСЛО) – Total Base Number (TBN):- the quantity of acid, expressed in terms of the equivalent number of milligrams of potassium hydroxide that is required to neutralize all basic constituents present in 1 gram of sample. (ASTM Designation D 974). See also Base Number. American Society for Testing and Materials (ASTM). Total Base Number (TBN) is the amount of acid required to neutralize the lubricant's basicity expressed in potassium hydroxide (KOH) equivalent. Total Base Number (TBN) can be defined as the measure of reserve alkaline additives that are put into the lubricating oil to neutralize the acids. It determines how effectively the acids formed during the combustion process can be controlled. Higher the TBN better is the capability to fight oxidisation and corrosion, and to improve viscosity characteristics. It also allows longer operating period between lubricant changes under harsh operating conditions. Diesel engines burning low grades of fuel show high rate of liner wear as low grade fuel have higher sulphur content. This high sulphur content leads to corrosive wear to the liner surface. Thus, alkaline lubricating oil is used to protect the liner surface against corrosive attack by neutralizing the sulphur derivative compounds. The TBN is generally between 8–10 for marine lubricating oils. / Американское Общество по Испытаниям и Материалам (АОИМ). износа . коррозионный износ . Общее Щелочное Число $Щ_1$ – количество щёлочи, выраженное в миллиграммах гидроокиси калия (КОН) на 1 грамм (г) образца, необходимое для потенциометрического титрования испытуемой массы в определённом растворителе от начального показания измерительного прибора до показания свежеприготовленного кислого неводного буферного раствора или чёткой точки перегиба, как указано в стандарте.

TOTAL CAPITAL = ИТОГОВЫЙ КАПИТАЛ – Total Capital is defined as the sum of core capital and total allowance for loan losses and reserve for guaranty losses, less the specific loss allowance (that is, the allowance required on individually-impaired loans). Total Capital = Shareholders' Funds + Net Debt. / Тотальный – всеобщий, всеобъемлющий, всеохватывающий, полный.

TOTAL COST OF DISTRIBUTION = ВСЕГО ЗАТРАТ ПО ДИСТРИБУЦИИ (или ИТОГО РАСХОДОВ ПО РЕАЛИЗАЦИИ) – Total Cost Of Distribution is the sum of purchasing, transportation and storage costs in the movement of finished products through the post production channel. / Тотальный – всеобщий, всеобъемлющий, всеохватывающий, полный.

TOTAL DEBT = ИТОГОВАЯ ЗАДОЛЖЕННОСТЬ (или СОВОКУПНАЯ ЗАДОЛЖЕННОСТЬ, или ВСЕГО ДОЛГОВ, или ОБЩИЙ ДОЛГ) – Total Debt contains short term and long term loans, notes and bonds. Total Debt is comprised of the current portion of debt, current capital lease obligations, long-term debt and long-term capital lease obligations; net debt is the difference between the total debt and cash and cash equivalents and short-term investments. / Общий Долг включает текущую часть задолженности (долговых обязательств), текущие обязательства по финансовому лизингу, долгосрочный долг и долгосрочные обязательства по финансовому лизингу; чистый долг/задолженность рассчитывается как разность между общим долгом и денежными средствами и их эквивалентами и краткосрочными инвестициями. Тотальный – всеобщий, всеобъемлющий, всеохватывающий, полный.

TOTAL DELAY TIME TOWS = ИТОГОВОЕ ВРЕМЯ ЗАДЕРЖКИ БУКСИРУЕМЫХ СУДОВ – Total Delay Time Tows is the total hours of accumulated delay time experienced by tows waiting to pass through a lock chamber.

TOTAL DENIER = ИТОГОВОЕ ДЕНЬЕ – Total Denier is the denier of a tow before it is crimped. It is the product of the denier per filament and the number of filaments in the tow. The total denier after crimping (called Crimped Total Denier) is higher because of the resultant increase in weight per unit length.

TOTAL DENIER (OF TOW) = ИТОГОВОЕ ДЕНЬЕ (ЖГУТА) – Total Denier (Of Tow):- the product of the denier per filament times the number of filaments in a tow. / число элементарных нитей в жгуте.

TOTAL DSM COST = ИТОГОВАЯ ЗАТРАТА НА УПРАВЛЕНИЕ СО СТОРОНЫ ПОТРЕБЛЕНИЯ (или СПРОСА) – A term Total DSM Cost refers to the sum of total utility cost and nonutility cost. Demand-Side Management (DSM).

TOTAL DSM PROGRAMS = ИТОГОВЫЕ ПРОГРАММЫ УПРАВЛЕНИЯ СО СТОРОНЫ ПОТРЕБЛЕНИЯ (или СПРОСА) – A term Total DSM Programs refers to the total net effects of all the utility's DSM (short for the Demand-Side Management) programs. For the purpose of this survey, it is the sum of the effects for Energy Efficiency, Direct Load Control, Interruptible Load, Other Load Management, Other Demand-Side Management (DSM) Programs, and Load Building. Net growth in energy or load effects should be reported as a negative number, shown with a minus sign.

TOTAL EQUITY = ИТОГОВЫЕ (или СОВОКУПНЫЕ) СОБСТВЕННЫЕ СРЕДСТВА – Total Equity:- this term means, with respect to any account, the open trade equity, if any, in the account, the amount of money, if any, in the account, and the value of any securities or other property, if any, in the account, valued in accordance with the rules of the exchange. / Тотальный – всеобщий, всеобъемлющий, всеохватывающий, полный.

TOTAL EQUITY AND LIABILITIES = ИТОГО СОБСТВЕННЫХ СРЕДСТВ И ОБЯЗАТЕЛЬСТВ – In a balance sheet (IFRS), Total Equity And Liabilities consist of:- Equity; Long-Term Liabilities; Short-Term Liabilities.

TOTAL FACTOR PRODUCTIVITY = ИТОГО ФАКТОРНОЙ ПРОДУКТИВНОСТИ (или ИТОГО ФАКТОРНОЙ ПРОИЗВОДИТЕЛЬНОСТИ) – Total Factor Productivity (TFP) is the portion of output not explained by the amount of inputs used in production. The following definition describes the measurement and importance of TFP for growth, fluctuations and development as well as likely future directions of research. Total Factor Productivity (TFP) is the portion of output not explained by the amount of inputs used in production. As such, its level is determined by how efficiently and intensely the inputs are utilized in production. TFP growth is usually measured by the Solow residual. Let g_Y denote the growth rate of aggregate output, g_K the growth rate of aggregate capital, g_L the growth rate of aggregate labor and alpha the capital share. The Solow residual is then defined as $g_Y - \alpha \times g_K - (1 - \alpha) \times g_L$. The Solow residual accurately measures TFP growth if (i) the production function is neoclassical, (ii) there is perfect competition in factor markets, and (iii) the growth rates of the inputs are measured accurately. TFP plays a critical role on economic fluctuations, economic growth and cross-country per capita income differences. At business cycle frequencies, TFP is strongly correlated with output and hours worked. Based on this observation, Kydland and Prescott (1982) initiated the real business cycle (RBC) literature. In the standard business cycle model, shocks to TFP are propagated by pro-cyclical labor supply and investment, thereby generating fluctuations in output and labor productivity at business cycle frequencies with an amplitude that resembles the US data. Subsequent work has introduced pro-cyclical fluctuations in measured TFP by incorporating unmeasured labor hoarding and/or capacity utilization in the standard framework (e.g., Burnside et al. (1995) and King and Rebelo, 1999). As shown in the landmark article by Robert Solow (1956), long-run growth in income per capita in an economy with an aggregate neoclassical production function must be driven by growth in TFP. For over 30 years, the conceptual difficulty when trying to endogenize. TFP growth was how to pay for the fixed costs of innovation in a perfectly competitive economy with constant returns to scale in capital and labor. In this context, all output is exhausted by paying capital and labor their marginal products, and therefore, no resources are left to pay for the innovation costs. Romer (1990) and Aghion and Howitt (1992) solved this problem by granting the innovator monopolistic rights over his innovation, which are sustainable through the patent system. In this way, innovators can recoup the initial fixed costs of innovation through the profit margin they make from commercializing their patent. By linking the TFP growth rate to innovation, endogenous growth models shed light on the determinants of TFP growth. R&D subsidies and an abundance of skilled labor reduce the marginal cost of conducting R&D and increase the rate of innovation development and therefore, the TFP growth rate. Increases in the size of markets increase the innovators' revenues, leading to more innovation and higher TFP growth. Solow (1956) also demonstrated that cross-country differences in technology may generate important cross-country differences in income per capita. Klenow and Rodriguez-Clare (1997) and Hall and Jones (1999) have confirmed that a majority of the gap in income per capita between rich and poor countries is associated to large cross-country differences in TFP. Cross-country differences in TFP can be due to differences in the physical technology used by countries or in the efficiency with which technologies are used. To explore the relative importance of these factors, it is necessary to have data on direct measures of technology. Comin, Hobijn and Rovito (2006) put together direct measures of technology adoption for approximately 75 different technologies and show that the cross-country differences in technology are approximately four times larger than cross-country differences in income per capita. Further, technology is positively correlated to income per capita. Thus, cross-country variation in TFP is, to a large extent, determined by the cross-country variation in physical technology. Total Factor Productivity is the productivity of all inputs taken together. In economics, Total-Factor Productivity (TFP), also called Multi-Factor Productivity, is a variable which accounts for effects in total output not caused by traditionally measured inputs. If all inputs are accounted for, then total factor productivity (TFP) can be taken as a measure of an economy's long-term technological change or technological dynamism. TFP cannot be measured directly. Instead it is a residual, often called the Solow Residual, which accounts for effects in total output not caused by inputs. The equation below (in Cobb-Douglas form) represents total output (Y) as a function of total-factor productivity (A), capital input (K), labor input (L), and the two inputs' respective shares of output (α and β are the capital input share of contribution for K and L respectively). An increase in either A, K or L will lead to an increase in output. While capital and labor input are tangible, total-factor productivity appears to be more intangible as it can range from technology to knowledge of worker (human capital). $Y = A \times K^{\alpha} \times L^{\beta}$. Technology Growth and Efficiency are regarded as two of the biggest sub-sections of Total Factor Productivity, the former possessing 'special' inherent features such as positive externalities and non-rivalness which enhance its position as a driver of economic growth. Total Factor Productivity is often seen as the real driver of growth within an economy and

studies reveal that whilst labor and investment are important contributors, Total Factor Productivity may account for up to 60% of growth within economies. It has been shown that there is a historical correlation between TFP and energy conversion efficiency. / Xxxxx (Kydland) и Прэскот (Prescott). Киньг (King) и Ребелу (Rebelo). Агион (Aghion) и Хавит (Howitt). Робэт Солов (Robert Solow). Xxxxx (Klenow) и Родригэз–Клэар (Rodriguez-Clare). Хол (Hall) и Дьжонз (Jones). Комин (Comin), (Hobijn) и Ровито (Rovito). Коб-Даглэс (Cobb-Douglas).

TOTAL FIXED ASSETS = ИТОГО НЕДВИЖИМЫХ АКТИВОВ (или ИТОГО ОСНОВНЫХ СРЕДСТВ) – Total Fixed Assets is the sum of the values of land and buildings, plant and machinery (NBV = Net Book Value) and other fixed assets.

TOTAL FLEECE WEIGHT = ИТОГОВЫЙ ВЕС РУНА – Total Fleece Weight is the weight of the entire raw fleece.

TOTAL INVENTORY = ИТОГО ИНВЕНТАРЯ – In the official statistics of US Census Bureau, Total Inventories represent the value of the end-of-month stocks regardless of stage of fabrication (whether in the form of purchased materials and supplies, work in process, or finished goods). These inventories are valued at cost using any valuation method other than LIFO (short for the Last In, First Out). Inventories associated with the non-manufacturing activities of your company are excluded. Total Inventories is the sum of raw materials, work-in-progress and finished inventories.

TOTALITARIANISM = ТОТАЛИТАРНОСТЬ – Totalitarianism is a domination by a single, like-minded governing elite of all (or virtually all) organized political, economic, social and cultural activities in a country by means of a single-party monopoly of power, police repression not only of all forms of dissent and opposition but also of all forms of independent private organizations as such, rigorous censorship of the mass media, centralized state planning and administration of the economy, and pervasive propaganda to inculcate the principles of the obligatory official ideology. Totalitarian states differ from traditional dictatorships or despotisms primarily with respect to the broader ('total') scope of human behavior that the authorities seek to regulate in detail and with respect to their much more effective control mechanisms made possible by exploiting XX century breakthroughs in rapid communication and transportation, scientific psychology, pervasive mass media, surveillance technology, electronic information retrieval, and so on. The term is commonly applied both to fascist regimes and communist regimes, and occasionally by extension to other exotic cults, movements or regimes with ambitions for total control such as those led by various sorts of religious fanatics like the Reverend (Rev.) Jim Jones and others. / Дьжим Дьжонз (Jim Jones). коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо). Тоталитаризм, от позднелатинского слова Totalis, означающее Весь или Полный или Целый, одна из форм авторитарного буржуазного государства (тоталитарное государство), характеризующаяся его полным (тотальным) контролем над всеми сферами жизни общества. Также направление буржуазной политической мысли, оправдывающее авторитаризм, этатизм. С 1920-х тоталитаризм стал официальной идеологией фашистских Германии и Италии. Вместе с тем понятие Тоталитаризм употреблялось буржуазно-либеральными идеологами для критической оценки фашистской диктатуры. Начиная с периода 'холодной войны' активно использовалось антикоммунистической пропагандой по отношению к социалистическим государствам, которые отождествлялись с тоталитарными режимами и противопоставлялись демократическому, свободному обществу.

TOTAL LIABILITIES = ВСЕГО ОБЯЗАТЕЛЬСТВ (или СОВОКУПНЫЕ ПАССИВЫ, или ИТОГОВЫЕ ПАССИВЫ) – Total Liabilities:- the sum of liabilities reported by a company in its balance sheet. As off-balance-sheet operations become increasingly significant, this indicator only reflects part of the overall business of a company. / Сумма обязательств, заявленных компанией в своём балансовом отчёте. Поскольку забалансовые операции стали весьма значимыми, только этот индикатор отражает часть всеобъемлемой деловой активности компании. Тотальный – всеобщий, всеобъемлющий, всеохватывающий, полный.

TOTAL LOSS = ПОЛНОЕ ИСТРЕБЛЕНИЕ (или ПОЛНАЯ ГИБЕЛЬ) – Total Loss is:- (i) a loss of the subject-matter of insurance such that it is totally lost, destroyed or damaged beyond economic repair; (ii) a loss that gives rise to payment of the full sum insured. This can be actual total loss or constructive total loss. According to the Lisbon Rules, Total Loss means an actual total loss of the vessel or such damage to the vessel that the cost of saving and repairing her would exceed her market value at the time of the collision. Where the subject matter of an insurance is lost, destroyed or damaged beyond repair. / Тотальный – всеобщий, всеобъемлющий, всеохватывающий, полный.

TOTAL MILLED RICE = ПОЛНОСТЬЮ ОБРУШЕННЫЙ РИС – Total Milled Rice:- Quantity of whole plus broken grains of milled Rice that can be obtained from a given quantity of clean rough Rice. Total Milled Rice is the bulk of the starch endosperm consisting of head Rice, second heads, screenings, and brewers' Rice. Also known as Polished Rice. / эндосперм (endosperm). основное зерно Риса (head Rice), высевки (screenings), . Известен также как Полированный Рис или Шлифованный Рис (Polished Rice).

TOTAL NONUTILITY COSTS = ИТОГОВЫЕ ЗАТРАТЫ НЕ САМОГО ПРЕДПРИЯТИЯ – A term Total Nonutility Costs refers to total cash expenditures incurred by consumers and trade allies that are associated with participation in a Demand-Side Management (DSM) program, but that are not reimbursed by the utility. The nonutility expenditures should include only those additional costs necessary to purchase or install an efficient measure relative to a less efficient one. Costs are to be reported in nominal dollars in the year in which they are incurred, regardless of when the actual effects occur. To the extent possible, respondents are asked to provide the best estimate of non-utility costs if actual costs are unavailable.

TOTAL PURCHASE PRICE = ИТОГОВАЯ ЦЕНА ПРИОБРЕТЕНИЯ – The Total Purchase Price of a security is the amount of money that must be paid, including all ancillary costs, to buy a securities position.

TOTAL QUALITY MANAGEMENT = ВСЕОБЪЕМЛЕМОЕ УПРАВЛЕНИЕ КАЧЕСТВОМ – Total Quality Management is an approach to business management that focuses on quality and typically has:- a strong customer orientation, total involvement, measurement systems, systematic support and continuous improvement. / Тотальный – всеобщий, всеобъемлющий, всеохватывающий, полный.

TOTAL RETURN = ИТОГОВОЕ ПОСТУПЛЕНИЕ (или ИТОГОВАЯ ОТДАЧА) – In index trading, Total Return provides investors with a price-plus-gross cash dividend return. Gross cash dividends are applied on the ex-date of the dividend. For Australia's S&P/ASX total return indices, otherwise known as Accumulation Indices, Standard & Poor's use the net dividend as quoted by the company. This quoted dividend is net of any franking credits. 'Grossed-up' total return values for the S&P/ASX indices, incorporating franking credits, can by calculated independently via Standard & Poor's (S&P) Custom Indices. See also Net Total Return. Total Return, when measuring performance, is the actual rate of return of an investment or a pool of investments over a given evaluation period. Total return includes interest, capital gains, dividends and distributions realized over a given period of time. Total return accounts for two categories of return:- income including interest paid by fixed-income investments, distributions or dividends and capital appreciation, representing the change in the market price of an asset. Total return is the amount of value an investor earns from a security over a specific period, typically one year, when all distributions are reinvested. Total return is expressed as a percentage of the amount invested. For example, a total return of 20% means the security increased by 20% of its original value due to a price increase, distribution of dividends (if a stock), coupons (if a bond) or capital gains (if a fund). Total return is a strong measure of an investment's

overall performance. Example of Total Return:- an investor buys 100 shares of Stock A at USD20 per share for an initial value of USD2 000. Stock A pays a 5% dividend the investor reinvests, buying five additional shares. After one year, the share price rises to USD22. To calculate the investment's total return, the investor divides the total investment gains (105 shares x USD22 per share = USD2 310 current value – USD2 000 initial value = USD310 total gains) by the initial value of the investment (USD2 000) and multiplies by 100 to convert the answer to a percentage (USD310/USD2 000 x 100 = 15.5%). The investor's total return is 15.5%. Importance of Total Return:- some of the best dividend stocks have small growth potential and produce small capital gains. Basing an investment's return on capital gains alone does not take into consideration price increases or other methods of growing the stock's value. For example, an investor buys shares of Company B, and the share price increases 24.5% in one year. The investor gains 24.5% from the price change alone. Since Company B also paid a dividend during the year, adding in the stock's yield of 4.1% to the price change, the combined return is 28.6%. Total return determines an investment's true growth over time. It is important to evaluate the big picture and not just one return metric when determining an increase in value. Total return is used when analyzing a company's historical performance. Calculating expected future return puts reasonable expectations on an investor's investments and helps plan for retirement or other needs. / Тотальный – всеобщий, всеобъемлющий, всеохватывающий, полный. Стэндод энд Поз (Standard & Poor's). Итоговое Поступление или Совокупный Доход или Суммарный Годовой Доход (Total Return):- годовой доход по инвестициям, включая прирост капитала и дивиденды или проценты по облигациям, которые сохраняются до срока погашения. Совокупный доход равен доходу до срока погашения (yield to maturity). Для акций будущий рост капитала прогнозируется с использованием соотношения цены и доходности (price/earnings ratio). В торговле опционами совокупная прибыль означает дивиденды плюс прибыль на капитал плюс доход по премиям.

TOTAL RETURN SWAP = СВОП НА ИТОГОВОЕ ПОСТУПЛЕНИЕ (или СВОП НА ИТОГОВУЮ ОТДАЧУ, или СВОП НА СОВОКУПНОЕ ПОСТУПЛЕНИЕ) – A Total Return Swap is an agreement in which one party (total return payer) transfers the total economic performance of a reference obligation to the other party (total return receiver). Total economic performance includes income from interest and fees, gains and losses from market movements, and credit losses. The total return receiver assumes the entire economic exposure – that is, both market and credit exposure – to the reference asset. The total return payer – often the owner of the reference obligation – gives up economic exposure to the performance of the reference asset and in return takes on counterparty credit exposure to the total return receiver in the event of a default or fall in value of the reference asset. A type of credit derivative in which one counterparty receives the total return (interest payments and any capital gains or losses) from a specified reference asset and the other counterparty receives a specified fixed or floating cash flow that is not related to the creditworthiness of the reference asset. Also known as Total Rate Of Return Swap, or TR Swap. Total Return Swap is a transaction in which one party pays either a single amount or periodic amounts based on the total return on one or more loans, debt securities or other financial instruments (each a 'Reference Obligation') issued, guaranteed or otherwise entered into by a third party (the 'Reference Entity'), calculated by reference to interest, dividend and fee payments and any appreciation in the market value of each Reference Obligation, and the other party pays either a single amount or periodic amounts determined by reference to a specified notional amount and any depreciation in the market value of each Reference Obligation. A total return swap may (but need not) provide for acceleration of its termination date upon the occurrence of one or more specified events with respect to a Reference Entity or a Reference Obligation with a termination payment made by one party to the other calculated by reference to the value of the Reference Obligation. / Тотальный – всеобщий, всеобъемлющий, всеохватывающий, полный.

TOTAL REVENUES = ИТОГО ВЫРУЧКА (или ВСЕГО ВЫРУЧКИ, или СОВОКУПНАЯ ВЫРУЧКА, или ИТОГОВАЯ ВЫРУЧКА) – Total Revenues:- fiscal year-to-date cumulative revenues, i.e. data taken from the 10Q reports. / В Соединённых Штатах Америки, то есть данные, взятые из отчётов по форме 10Кью. (10Q reports). Тотальный – всеобщий, всеобъемлющий, всеохватывающий, полный.

TOTAL STOCKHOLDER RETURN = СОВОКУПНАЯ ОТДАЧА АКЦИОНЕРАМ – Total Stockholder Return is the return to stockholders as measured by stock price appreciation and reinvested dividends for a period of time.

TOTAL UTILITY COSTS = ИТОГОВЫЕ ЗАТРАТЫ КОММУНАЛЬНОГО ПРЕДПРИЯТИЯ – A term 'Total Utility Costs' refers to the sum of the total Direct and Indirect Utility Costs for the year. Utility costs should reflect the total cash expenditures for the year, reported in nominal Dollars, that flowed out to support Demand-Side Management (DSM) programs. They should be reported in the year they are incurred, regardless of when the actual effects occur.

TOTE = ТОУТ (или ТЧУТ, или НОСИТЬ, или НЕСТИ) – (1) Tote is a sturdy rectangular bag with an open top and two strap handles. A Tote Bag, a carry bag that is often used to carry items too large for a purse; sometimes also sold as a reusable shopping bag.

(2) Tote:- to carry a heavy weight or load.

TO THE ORDER OF … = ПО РАСПОРЯЖЕНИЮ … – The notation 'To The Order Of' after the name of the beneficiary makes it possible to transfer securities by endorsement. The clause turns the security into an instrument to order (bill of lading). In the case of legal instruments made out to order (e.g., bill of exchange, check, registered share) the notation is not essential because these securities are already deemed to be endorsed. / (например, .

TOTIPOTENCY = ТОТИПОТЕНТНОСТЬ – Totipotency is a potential of cells or tissues to form all cell types and/or to regenerate a plant. / Тотипотентность (от Латинских слов Totus, означающее Весь или Совокупный или Целый, и Potentia, означающее Возможность или Мощь или Сила) – способность клетки путём деления дать начало любому клеточному типу организма. Понятие Тотипотентности, Мультипотентности и Плюрипотентности тесно связано с понятиями Потенция К Развитию и Детерминация. Оплодотворённые яйцеклетки животных являются тотипотентными. В течение развития потомки зиготы утрачивают тотипотентность. У большинства животных бластомеры сохраняют тотипотентность в течение определённого количества делений дробления. У животных с детерминированным развитием (например, у круглых червей) первые потомки зиготы уже утрачивают тотипотентность. У некоторых организмов клетки могут дедифференцироваться и обретать тотипотентность. Срезанные части растений и каллус могут быть использованы для выращивания целого растения.

TOUCH = ЧУТОЧКА (или ХХ) – Touch:- the narrowest spread amongst the market makers between buying and selling prices. A narrow touch indicates good marketability.

TOUGH = СРЕДНЕЙ СУХОСТИ (или МЯГКОЕ) – Grain is identified as Tough if the moisture content exceeds the straight range established for that class of grain but is not damp. With increasing moisture content, grain is graded straight, tough, damp, moist, and wet. / Зерно идентифицируется как средней сухости или вязкое, если содержание влаги в нём превосходит уровень влаги для сухого зерна, установленный для такого класса зерна, но не превышает уровня влаги для влажного зерна. В случае увеличения содержания влаги зерно будет последовательно отсортировано как сухое или твёрдое (straight), средней сухости или мягкое (tough), влажное или вязкое (damp), сырое (moist) и мокрое (wet).

TOUGHNESS = ТЯГУЧЕСТЬ (или ЖЁСТКОСТЬ, или ПРОЧНОСТЬ, или УДАРНАЯ ВЯЗКОСТЬ, или ВЫНОСЛИВОСТЬ, или КРЕПОСТЬ) – Toughness is a quality of wood which permits the material to absorb a relatively large amount of energy, to withstand repeated shocks, and to undergo considerable deformation before breaking. Toughness is a term with a wide variety of meanings, no single precise mechanical definition being generally recognized, but tensile strength with pact resistance are indicator of toughness. Also, it is the measure of the ability of a sample to absorb mechanical energy without breaking, usually defined as the area underneath a stress-strain curve (Shah V (1998) Handbook of plastics testing technology. Wiley, New York). Toughness generally implies a lack of brittleness; having very substantial elongation to break accompanied by high tensile strength. One proposed definition for toughness is the energy ... . Toughness is the ability to resist shock or impact and to absorb energy before fracture. Toughness is that property of a material by virtue of which it can absorb energy, generally implying lack of brittleness and relatively high elongation to break. Note:- toughness is often evaluated as the energy required to break a material, proportional to the area under the stress-strain curve. Toughness, in materials science and metallurgy, is the resistance to fracture of a material when stressed. It is defined as the amount of energy per volume that a material can absorb before rupturing. Toughness is the ability of a metal to deform plastically and to absorb energy in the process before fracture is termed toughness. The emphasis of this definition should be placed on the ability to absorb energy before fracture. Recall that ductility is a measure of how much something deforms plastically before fracture, but just because a material is ductile does not make it tough. The key to toughness is a good combination of strength and ductility. A material with high strength and high ductility will have more toughness than a material with low strength and high ductility. Therefore, one way to measure toughness is by calculating the area under the stress strain curve from a tensile test. This value is simply called ‘Material Toughness’ and it has units of energy per volume. Material toughness equates to a slow absorption of energy by the material. There are several variables that have a profound influence on the toughness of a material. These variables are:- (i) strain rate (rate of loading); (ii) temperature; and (iii) notch effect. A metal may possess satisfactory toughness under static loads but may fail under dynamic loads or impact. As a rule ductility and, therefore, toughness decrease as the rate of loading increases. Temperature is the second variable to have a major influence on its toughness. As temperature is lowered, the ductility and toughness also decrease. The third variable is termed notch effect, has to due with the distribution of stress. A material might display good toughness when the applied stress is uniaxial; but when a multiaxial stress state is produced due to the presence of a notch, the material might not withstand the simultaneous elastic and plastic deformation in the various directions. There are several standard types of toughness test that generate data for specific loading conditions and/or component design approaches. Three of the toughness properties that will be discussed in more detail are (i) impact toughness, (ii) notch toughness and (iii) fracture toughness. Toughness is:- (1) an ability of a material to endure large deformations without rupture. (2) The actual work per unit mass required to rupture a fiber or a yarn. Toughness describes how much total energy has to be used before a material breaks. If the material takes a lot of energy (it may change shape) before breaking, then it is a tough material. If only a little energy is needed to break the material it is weak or brittle (depending on wether the material yielded or not). / Сжимаемость или Объёмная Упругость – способность твёрдых, жидких и газообразных тел под действием всестороннего внешнего давления изменять свой объём обратимым образом, то есть так, чтобы после прекращения действия внешнего давления восстанавливался первоначальный объём тела. Характеристиками сжимаемости служат:- модуль объёмной упругости K = V(dp / dV) и коэффициент сжимаемости k = –(1 / V)(dV / dp) = 1/K, где V – объём тела, p – внешнее давление. Под Упругостью понимается свойство тел восстанавливать свою форму и объём (твёрдые тела) или только объём (газы и жидкости) после прекращения действия внешних сил или других причин, например, нагревания, вызвавших деформацию тела. Тело, обладающее этим свойством, называют упругим. Жидкое тело обладает упругостью формы только по отношению к переменным внешним воздействиям достаточно высокой частоты. Количественная характеристика упругих свойств материалов – модули упругости. Упругость обусловлена взаимодействием между атомами и молекулами и их тепловым движением. В области упругих деформаций тел справедлив Закон Гука. Вязкость или Внутреннее Трение, свойство газов и жидкостей, характеризующее сопротивление действию внешних сил, вызывающих их течение. Под Жёсткостью понимается способность тела или конструкции сопротивляться образованию деформации. У абсолютно твёрдого тела (предельный случай, не встречающийся в действительности) жёсткость бесконечно велика (сколь угодно большие нагрузки не вызывают деформаций); у резин жёсткость очень мала (малая нагрузка приводит к большим деформациям). Большинство реальных материалов по жёсткости занимает промежуточное положение между абсолютно твёрдым телом и резиной. При простых деформациях в пределах Закона Гука жёсткость определяется как произведение модуля упругости на ту или иную геометрическую характеристику поперечного сечения элемента (площадь сечения при растяжении-сжатии и сдвиге, осевой момент инерции при изгибе и так далее). Величина, обратная жёсткости, назвается Податливостью. В авиационной и ракетной технике часто оценивают удельную жёсткость – отношение жёсткости к плотности материала. Под Жёсткостью понимается характеристика элемента конструкции, определяющая его способность сопротивляться деформации (изгибу, кручению, растяжению и так далее). Она зависит от геометрических характеристик сечения и физических свойств материала (модулей упругости). Под Прочностью понимается способность материала сопротивляться разрушению, а также необратимому изменению формы (пластической деформации) при действии внешних нагрузок; в узком смысле слова – только сопротивление разрушению. Прочность твёрдых тел обусловлена в конечном счёте силами взаимодействия между атомами и ионами, составляющими тело. Прочность зависит не только от самого материала, но и от вида напряжённого состояния (изгиб, растяжение, сжатие и другие), от условий эксплуатации (воздействие окружающей среды, длительность и число циклов нагружения, скорость нагружения, температура и так далее). В зависимости от всех этих факторов в технике приняты различные меры прочности:- предел прочности, предел текучести, предел усталости и другие. Повышение прочности материалов – важнейшая задача современной техники, она решается термической и механической обработкой, введением легирующих добавок в сплавы, радиоактивным облучением, применением армировальных и композиционных материалов. Под Прочностью понимается свойство материалов в определённых условиях и пределах, на разрушаясь, воспринимать те или иные воздействия (нагрузки, неравномерные температурные, магнитные, электрические и другие поля, неравномерные высыхание или набухание, неравномерное протекание физико-химических процессов в разных частях тела и другие). Критериями прочности для различных случаев являются:- предел ползучести, предел пропорциональности, предел прочности, предел текучести и другие.

TOUGHNESS AT BREAK = ТЯГУЧЕСТЬ (или ЖЁСТКОСТЬ, или ПРОЧНОСТЬ, или УДАРНАЯ ВЯЗКОСТЬ, или ВЫНОСЛИВОСТЬ) ПРИ РАЗРЫВЕ – Toughness At Break:- xxxxx. See aslo Breaking Toughness.

TOVALOP = TANKER OWNERS’ VOLUNTARY AGREEMENT CONCERNING LIABILITY FOR OIL POLLUTION

TOW = БУКСИРОВАТЬ (или БУКСИРУЕМОЕ) – Tow:- when one or more vessels are being towed; when a tug is towing one or more floating objects; to pull an object in the water by means of a rope. Tow is a ship being towed. Tow (maritime term):- to pull through water; vessels towed. Tow is a towboat with a barge or barges. / Корабль, подвергаемый вождению (буксировке).

TOW = ЖГУТ (или ПАКЛЯ, или БУКСИРНЫЙ КАНАТ, или КУДЕЛЬ, или ОЧЁСКИ, или КОРОТКОВОЛОКНИСТЫЙ ЛЁН) – Tow is a large bundle of manufactured filament fiber as they are extruded from the spinerette, and before they have been cut into

staple fibers. Tow is a large number of filaments, assembled without substantial twist usually intended to be cut or stretch-broken for use in staple fiber or top form. Tow is a large strand of continuous manufactured fiber filaments without definite twist, collected in loose, rope-like form, usually held together by crimp. Tow is the form that most manufactured fiber reaches before being cut into staple. It is often processed on tow-conversion machinery into tops, sliver, or yarn, or on tow-opening equipment to make webs for various uses. Tow is the shorter flax fibers removed by hackling. Tow is a large strand of continuous manufactured fiber filaments without definite twist, collected in a loose, rope-like form, usually held together by crimp. Tow is the form most manufactured fiber reaches before being cut into staple. Tow is a large number of filaments, assembled without substantial twist usually intended to be cut or stretch-broken for use in staple fiber or top form. Tow:- short flax fibers, separated by hackling (combing) from the longer fibers. Also, the poorly hackled, uneven linen yarn made from these short fibers. It may also refer to a continuous loose rope of man made filaments drawn together without twist to be cut in lengths for spun yarn. See also Line. Tow:- short, coarse and broken strands of hemp or flax. It results from the hackling process. Tow is the yarn or cloth made of tow, namely a short or broken fiber (as of flax, hemp, or synthetic material) that is used especially for yarn, twine, or stuffing. / Жгут волокон в виде ленты. Текстильный Жгут (Tow (for man-made fibers)) – совокупность большого числа продольно сложенных элементарных нитей, предназначенных для резки или разрыва в производстве штапельного волокна или топса. Под Паклей понимаются волокнистые отходы первичной обработки льна, пеньки и других лубяных культур, непригодные для выработки пряжи. Используется как изоляционный, набивочный, обтирочный, прокладочный и тому подобный материал. Кудель – короткое спутанное льняное волокно.

TOWAGE = БУКСИРОВКА (или ВОЖДЕНИЕ) – (1) Where a tug tows or manoeuvres a vessel into or out of a berth. The act of towing another vessel. Towage is the act of towing a ship or other objects from one place to another. / Когда буксир буксирует или осуществляет маневры с другим судном по его заводу или выводу из места стоянки. Действие по буксировке иного судна. Под Буксировкой понимается передвижение судна, не имеющего достаточной способности к самостоятельному передвижению, с помощью другого судна. Буксирование осуществляется:- (i) для выполнения маневра, например, разворачивание или перетяжка судна; (ii) на определённом расстоянии; и (iii) на определённый период времени, например, при ледоходе.

(2) Charges for the services of tugs assisting a ship or other vessels in ports or other locations. The charge made for towing a vessel. / Сбор, взимаемый за буксировку судна.

TOWAGE BILL = СЧЁТ ЗА БУКСИРОВКУ – Towage Bill is an account rendered for towage expenses. / Счёт за Буксировку – это счёт, выставленный за расходы по буксировке.

TOWEL = ПОЛОТЕНЦЕ – Towel is a rectangular piece of fabric used for drying (people, glasses, dishes).

TOWELING = ПОЛОТЕНЕЧНАЯ ТКАНЬ (или ПОЛОТЕНЕЧНОЕ ПОЛОТНО) – Toweling is a cotton or linen fabric often used for making towels. / хлопковая или льняная ткань, часто используемая для изготовления полотенец.

TOWER'S LIABILITY = ОТВЕТСТВЕННОСТЬ БУКСИРОВЩИКА – Tower's Liability is a liability incurred by any ship or vessel when she is towing another ship, vessel or other object. / Ответственность, принимаемая на себя любым кораблём или судном, когда оно буксирует другой корабль, судно или иной объект.

TOWER UNITS = БАШЕННЫЕ ЗВЕНЬЯ – Tower Units:- cooling equipment for supplying of cool air to porthole containers in terminals.

TOWING SAFETY ADVISORY COMMITTEE = СОВЕЩАТЕЛЬНЫЙ КОМИТЕТ ПО БЕЗОПАСНОСТИ БУКСИРОВКИ (или КОНСУЛЬТАТИВНЫЙ КОМИТЕТ ПО БЕЗОПАСНОСТИ БУКСИРОВКИ) – Towing Safety Advisory Committee (TSAC) is an industry advisory body to the US Coast Guard.

TOW LINEN = КУДЕЛЬ (или ОЧЕСКОВЫЙ ЛЁН, или ПАКЛЕВЫЙ ЛЁН) – Tow Linen:- these are the shorter, less desirable flax fibers separated from bast line fibers in hackling. Tow linen is usually carded and spun into a woolen-style yarn. A wonderful use for tow linen is to knit bath mitts – a situation where you want all of the rough, scratch nature of this yarn. Tow Linen is a fabric made of uneven, irregular yarns composed of the every short fibers.

TOWS ALL = ВСЕГО БУКСИРУЕМЫХ СУДОВ – Tows All is the total number of tows with their barges passing through a lock chamber.

TOXIC = ТОКСИЧНОЕ – Toxic:- of, relating to, or caused by a poison or toxin, poisonous, causes illness, reduces plant growth. Toxic:- (Greek:- Toxikón = Poison) Poisonous. / Ядовитое.

TOXICITY = ТОКСИЧНОСТЬ – Toxicity is the characteristic of being poisonous or harmful to plant or animal life; the relative degree of severity of this characteristic. The quality or potential of a substance to cause injury, illness, or other undesirable effects. Toxicity:- (Greek:- Toxikón = Poison) the degree to which a substance is poisonous. Toxicity is the quality of being poisonous. / Степень ядовитости вещества. Качество или потенциал вещества наносить вред здоровью, вызывать заболевание или иные нежелательные последствия. Под Токсичностью, от Греческого слова Toxikón, означающее Яд, понимается способность некоторых химических соединений и веществ биологической природы оказывать вредное действие на организм животных, растений и человека.

TOXIN = ТОКСИН – Toxin is any of the various poisonous substances produced by certain plants and animal cells including bacterial toxins, phytotoxins, and zootoxins. / Под Токсинами понимаются соединения (часто белковой природы) бактериального, растительного или животного происхождения, способные при попадании в организм животных или человека вызывать заболевание или их гибель. Содержатся в ядах змей, пауков, скорпионов. Бактериальные токсины вызывают столбняк, ботулизм и другие болезни. Токсины применяют для получения анатоксинов.

TOY = БЕЗДЕЛУШКА (или ХХ) – Toy is (Scottish) a linen or wool headdress depending to the shoulders once worn by old women of the lower classes. / льняной или шерстяной головной убор .

TOYO STRAW = ТОЁВСКАЯ СОЛОМА (или СОЛОМА ТОЁ, или ТОЁВСКАЯ СОЛОМКА) – Toyo Straw is a shiny smooth straw made chiefly in Japan from shellacked Rice paper and used especially for hats. See also Straw. Toyo Straw Fedora Hat (Tan). Toyo is a town and province in Japan. / шеллак (shellac). Тоё (Toyo) – город и провинция в Японии.

TP = EAST TIMOR

TP = TELECOMMUNICATIONS PROCESSOR

TP = TIRE PRESSURE

TP = TOTAL PARTICULATE MATTER

TP = TRAILER POINT

TPA = TAMPA INTERNATIONAL AIRPORT

TPA = TEREPHTHALIC ACID

TPAC = TRADEMARK PUBLIC ADVISORY COMMITTEE

TPE = THEORETICAL PRODUCTION ECOLOGY

TPER = TOTAL PRIMARY ENERGY REQUIREMENT

TPE–WAU = THEORETICAL PRODUCTION ECOLOGY–WAGENINGEN AGRICULTURAL UNIVERSITY

TPF = TICKER PLANT FRANKFURT

TPI = TURNS PER INCH

TPOSTAL = TRADEMARK POSTAL SYSTEM

TPP = TRANS PACIFIC PARTNERSHIP

TPR = TRANSPLANTED RICE

TPRB = TRADE POLICY REVIEW BODY

TPRI = TROPICAL PESTICIDES RESEARCH INSTITUTE

TPRM = TRADE POLICY REVIEW MECHANISM

TPS = TRANSPORTATION PROTECTIVE SERVICE

TPSIS = TRANSPORTATION PLANNING SUPPORT INFORMATION SYSTEM

TPT = TREADLE PADDY THRESHER

TQM = TOTAL QUALITY MANAGEMENT

TR = TRANSPLANTER

TR = TRANSPORTATION REQUEST

TR = TURKEY

TR4 = RICE TRANSPLANTER (6 ROWS MANUAL)

TR5 = RICE TRANSPLANTER (8 ROWS MANUAL)

TRAC = TOLERANCE REASSESSMENT ADVISORY COMMITTEE

TRACEABILITY = ОТСЛЕЖИВАЕМОСТЬ (или ПРОСЛЕЖИВАЕМОСТЬ) – Traceability is an ability to track a shipment from the time it leaves the warehouse until the time it arrives at the consignee.

TRACER = ЗАПРОС НА ПРОСЛЕЖИВАНИЕ – (1) Tracer is a request upon a transportation line to establish the whereabouts of a shipment for the purpose of expediting its movement or establishing delivery. Tracer is a request on a transportation line to trace a shipment for the purpose of expediting its movement or establishing delivery. Common usage of this term has been simplified to mean any request for status of a shipment. / Запрос в транспортную линию для установки местонахождения партии груза с целью экспедирования её перемещения или установления поставки. Запрос в транспортную линию для прослеживания партии груза с целью экспедирования её перемещения или установления поставки. Общепринятое использование этого термина упрощено до обозначения любого запроса о состоянии/статусе грузовой партии.

(2) Tracer is a request for an answer to a communication or for advice concerning the status of a subject. / Запрос с целью получения ответа в связи или извещения, касающегося состояния/статуса субъекта. коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо).

TRACHEARY = ТРАХЕАЛЬНОЕ – Tracheary:- of conducting tissues containing tracheids and vessels. / о проводящих тканях, содержащих трахеиды (сосудовидные клетки) и сосуды. Трахеальное (Trachealis).

TRACHEID = ТРАХЕИДА – Tracheid is a basic primitive unit of the xylem (fluid-conducting tissue), consisting of a single elongated cell with pointed ends and a thick, pitted secondary cell wall composed of cellulose thickened with lignin. The mature tracheid is dead and empty of cytoplasm. Tracheids are found in all vascular plants and are the only conducting elements in gymnosperms and ferns. / Трахеиды (сосудовидные клетки). цитоплазмы (cytoplasm). и папоротников. У растений под Трахеидами, от Греческих слов Trachéia, означающее Дыхательное Горло, и Éidos, означающее Вид, понимаются основные проводящие элементы ксилемы в виде длинных мёртвых клеток. В эволюции дали начало сосудам, либриформу и прочему. Трахеиды, мёртвые одревеснevшие клетки растений, которые служат для проведения воды. Встречаются в ксилеме (древесине) всех высших растений, за исключением некоторых Покрытосеменных (например, Злаков, Осок), у которых водопроводящую функцию выполняют сосуды, или трахеи. В поперечном сечении трахеиды обычно многоугольные, стенки их с кольчатыми, спиральными, лестничными утолщениями или окаймленными порами. Длина варьирует от долей миллиметра (мм) до 3–5 мм (Сосна, Лиственница) и даже 10 мм (Агава). В процессе эволюции из трахеид образовались сосуды, волокнистые трахеиды с ограниченной водопроводящей способностью и специализированные механические элементы – либриформ.

TRACING = ПРОСЛЕЖИВАНИЕ – Tracing is the action of retrieving information concerning the whereabouts of cargo and equipment. / Действие, направленное на получение информации, касающейся местонахождения груза и оборудования.

TRACING CLOTH = ОТПЕЧАТЫВАЮЩЕЕ (или КОПИРУЮЩЕЕ) ПОЛОТНО (или ЧЕРТЁЖНАЯ КАЛЬКА) – Tracing Cloth is a nonwoven, transparent fabric used for tracing designs and especially patterns. Since tracing cloth is fabric, it can be marked and altered more easily than paper used for the same purpose.

TRACK = ПУТЬ (или ДОРОЖКА) – Track (maritime term):- the path of the vessel. / Путь судна.

TRACKABLE = ПРОСЛЕЖИВАЕМОЕ – Trackable:- total quantity of weight, space, and pallets.

(2) Trackable:- commodities loaded in railroad cars on tracks. / Товары, загруженные в железнодорожные вагоны на путях.

TRACKER = ОРИЕНТАТОР (или СОПРОВОДИТЕЛЬ) – Tracker is a fiber, tow, or yarn added to a prepeg for verifying fiber alignment, and in the case of woven materials, for distinguishing warp fibers from fill fibers.

TRACKER FUND = ФОНД ХХ – Tracker Fund is a fund that invests in such a way that its price performance tracks that of a specified index.

TRACKING = СЛЕЖЕНИЕ (или ОТСЛЕЖИВАНИЕ) – Tracking:- the function of maintaining status information, including current location of cargo, cargo items, consignments or containers either full or empty. Determining a shipment's location during the course of a move. Tracking is the information given to monitor progress of a particular shipment to its destination. Leading courier services, such as UPS, FedEx, etc and most freight companies will assign a number to your shipment. This number will show various details of your delivery such as the date to expect arrival. Most of the time you will have the ability to insert the tracking number into the freight carriers website for detailed information. / Функция поддерживающией информации о статусе, включающая текущее место нахождения груза, грузовых изделий, партий товара или контейнеров, будь-то заполненных или опорожнённых. Определение места нахождения грузовой отправки в течение всего хода перевозки.

TRACKING COOKIES = ОТСЛЕЖИВАЮЩИЕ КУКИ (или КУКИ ДЛЯ СЛЕЖЕНИЯ, или ОПРЕДЕЛЕНИЕ МЕСТОНАХОЖДЕНИЯ) – A Tracking Cookie is any Cookie used for tracking users' surfing habits. Tracking Cookies are a form of Tracking Technology. They are typically used by advertisers wishing to analyze and manage advertising data, but they may be used to profile and track user activity more closely. However, tracking cookies are simply a text file, and a record of visits or activity with a single website or its affiliated sites. See also Cookie.

TRACKSUIT = ТРЕНИРОВОЧНЫЙ КОСТЮМ – Tracksuit is a suit of clothing consisting usually of a jacket and pants that is often worn by athletes when working out/exercising.

TRACON = TERMINAL RADAR APPROACH CONTROL

TRACTOR = ТРАКТОР – Tractor is an engineering vehicle specifically designed to deliver at a high tractive effort (or torque) at slow speeds, for the purposes of hauling a trailer or machinery used in agriculture or construction. Most commonly, the term is used to describe a farm vehicle that provides the power and traction to mechanize agricultural tasks, especially (and originally) tillage, but nowadays a great variety of tasks. Agricultural implements may be towed behind or mounted on the tractor, and the tractor may also provide a source of power if the implement is mechanised. The word Tractor was taken from Latin, being the agent noun of trahere 'To Pull'. The first recorded use of the word meaning 'an engine or vehicle for pulling wagons or ploughs' occurred in 1896, from the earlier term 'Traction Engine' (1859). National Variations:- in the United Kingdom (UK), the Republic of Ireland, Australia, India, Spain, Argentina, Slovenia, Serbia, Croatia, and Germany, the word 'Tractor' usually means 'Farm Tractor', and the use of the word 'Tractor' to mean other types of vehicles is familiar to the vehicle trade, but unfamiliar to much of the general public. In Canada and the United States (US), the word may also refer to the road tractor portion of a tractor trailer truck, but also usually refers to the piece of farm equipment. History:- (1) Traction Engines:- The first powered farm implements in the early 19th century were portable engines – steam engines on wheels that could be used to drive mechanical farm machinery by way of a flexible belt. British inventor and mining engineer Richard Trevithick (1771–1833) designed the first 'semi-portable' stationary steam engine for agricultural use, known as a 'Barn Engine' in 1812, and it was used to drive a corn threshing machine. The truly portable engine was invented in 1839 by William Tuxford (1806–1883) of Boston, Lincolnshire, England who started manufacture of an engine built around a locomotive-style boiler with horizontal smoke tubes. A large flywheel was mounted on the crankshaft, and a stout leather belt was used to transfer the drive to the equipment being driven. In the 1850s, English agricultural engineer John Fowler (1826–1864) used a Clayton & Shuttleworth (an engineering company located at Stamp End Works, Lincoln, Lincolnshire, England) portable engine to drive apparatus in the first public demonstrations of the application of cable haulage to cultivation. In parallel with the early portable engine development, many engineers attempted to make them self-propelled – the fore-runners of the traction engine. In most cases this was achieved by fitting a sprocket on the end of the crankshaft, and running a chain from this to a larger sprocket on the rear axle. These experiments met with mixed success. The first proper traction engine, in the form recognisable today, was developed in 1859 when British engineer Thomas Aveling (1824–1882) modified a Clayton & Shuttleworth portable engine, which had to be hauled from job to job by horses, into a self-propelled one. The alteration was made by fitting a long driving chain between the crankshaft and the rear axle. The first half of the 1860s was a period of great experimentation but by the end of the decade the standard form of the traction engine had evolved and would change little over the next sixty years. It was widely adopted for agricultural use. The first tractors were steam-powered plowing engines. They were used in pairs, placed on either side of a field to haul a plow back and forth between them using a wire cable. In Britain Mann's (full name of company is Mann's Patent Steam Cart and Wagon Company; Leeds, England) and Garrett (full name of company is Richard Garett & Sons; Leiston, Suffolk, England) developed steam tractors for direct ploughing, but the heavy, wet soil of England meant that these designs were less economical than a team of horses. In the United States, where soil conditions permitted, steam tractors were used to direct-haul plows. Steam-powered agricultural engines remained in use well into the 20th century until reliable internal combustion engines had been developed. (2) Gasoline-Powered Tractor:- In 1892, American inventor John Froelich (1849–1933) invented and built the first gasoline/petrol-powered tractor in Clayton County, Iowa, US. A Van Duzen single-cylinder gasoline engine was mounted on a Robinson engine chassis, which could be controlled and propelled by Froelich's gear box. After receiving a patent, Froelich started up the Waterloo Gasoline Engine Company (Waterloo, Iowa) and invested all of his assets. However, the venture was very unsuccessful, and by 1895 all was lost and he went out of business. Richard Hornsby & Sons (an engine and machinery manufacturer in Lincolnshire, England) are credited with producing and selling the first oil-engined tractor in Britain invented by Herbert Akroyd-Stuart (1864–1927). The Hornsby-Akroyd Patent Safety Oil Traction Engine was made in 1896 with a 20 hp engine. In 1897, it was bought by Mr. Locke-King, and this is the first recorded sale of a tractor in Britain. Also in that year, the tractor won a Silver Medal of the Royal Agricultural Society of England. That tractor would later be returned to the factory and fitted with a caterpillar track. The first commercially successful light-weight petrol-powered general purpose tractor was built by Dan Albone (1860–1906), a British inventor in 1901. He filed for a patent on 15 February 1902 for his tractor design and then formed Ivel Agricultural Motors Limited. The other directors were Selwyn Edge, Charles Jarrott, John Hewitt and Lord Willoughby de Eresby (Gilbert Heathcote-Drummond-Willoughby, 2nd Earl of Ancaster; 1867–1951). He called his machine the Ivel Agricultural Motor; the word 'Tractor' did not come into common use until later. The Ivel Agricultural Motor was light, powerful and compact. It had one front wheel, with solid rubber tyre, and two large rear wheels like a modern tractor. The engine used water cooling, by evaporation. It had one forward and one reverse gear. A pulley wheel on the left hand side allowed it to be used as a stationary engine, driving a wide range of agricultural machinery. The 1903 sale price was £300. His tractor won a medal at the Royal Agricultural Show, in 1903 and 1904. About 500 were built, and many were exported all over the world. The original engine was made by Payne & Co. of Coventry, England. After 1906, French Aster (full name of company is Ateliers de Construction Mecanique l'Aster; Saint-Denis, France) engines were used. The first successful American tractor was built by Charles Walter Hart (1872–1937) and Charles Henry Parr (1868–1941). They developed a two-cylinder gasoline engine and set up their business in Charles City, Iowa. In 1903, the firm built 15 'Tractors', a

term with Latin roots coined by Hart and Parr, and a combination of the words Traction and Power. Their 14 000-pound #3 is the oldest surviving internal combustion engine tractor in the United States, and is on display at the Smithsonian National Museum of American History in Washington, DC. The two-cylinder engine has a unique hit-and-miss firing cycle that produced 30 horsepower at the belt and 18 at the drawbar. In 1908, the Saunderson Tractor and Implement Co. of Elstow, Bedford, England introduced a four-wheel design, and went on to become the largest tractor manufacturer in Britain at the time. While the earlier, heavier tractors were initially very successful, it became increasingly apparent at this time that the weight of a large supporting frame was less-efficient than lighter designs. Henry Ford introduced a light-weight, mass-produced design which largely displaced the heavier designs. Some companies halfheartedly followed suit with mediocre designs, as if to disprove the concept, but they were largely unsuccessful in that endeavor. While unpopular at first, these gasoline-powered machines began to catch on in the 1910s, when they became smaller and more affordable. American captain of industry and a business magnate Henry Ford (1863–1947) introduced the Fordson, a wildly popular mass-produced tractor, in 1917. They were built in the US, Ireland, England and Russia, and by 1923, Fordson had 77% of the US market. The Fordson dispensed with a frame, using the strength of the engine block to hold the machine together. By the 1920s, tractors with gasoline-powered internal combustion engines had become the norm. Irish-born British engineer Henry George 'Harry' Ferguson (1884–1960) applied for a British patent for his three-point hitch in 1926, a three-point attachment of the implement to the tractor and the simplest and the only statically determinate way of joining two bodies in engineering. The Ferguson-Brown Company produced the Model A Ferguson-Brown tractor with a Ferguson-designed hydraulic hitch. In 1938 Ferguson entered into a collaboration with Henry Ford to produce the Ford-Ferguson 9N tractor. The three-point hitch soon became the favorite hitch attachment system among farmers around the world. This tractor model also included a rear Power Take Off (PTO) shaft that could be used to power three point hitch mounted implements such as sickle-bar mowers. This PTO location set the standard for future tractor developments. Farm Tractor Design, Power And Transmission:- Tractor Configurations:- Tractors can be generally classified by number of axles or wheels, with main categories of two-wheel tractors (single-axle tractors) and four-wheel tractors (two-axle tractors); more axles are possible but uncommon. Among four-wheel tractors (two-axle tractors), most are two-wheel drive (usually at the rear); but many are two-wheel drive with front wheel assist, four-wheel drive (often with articulated steering), or track tractors (with steel or rubber tracks). The classic farm tractor is a simple open vehicle, with two very large driving wheels on an axle below and slightly behind a single seat (the seat and steering wheel consequently are in the center), and the engine in front of the driver, with two steerable wheels below the engine compartment. This basic design has remained unchanged for a number of years, but enclosed cabs are fitted on almost all modern models, for reasons of operator safety and comfort. In some localities with heavy or wet soils, notably in the Central Valley of California, the 'Caterpillar' or 'Crawler' type of tracked tractor became popular in the 1930s, due to superior traction and flotation. These were usually maneuvered through the use of turning brake pedals and separate track clutches operated by levers rather than a steering wheel. Four-wheel drive tractors began to appear in the 1960s. Some four-wheel drive tractors have the standard 'two large, two small' configuration typical of smaller tractors, while some have four large, powered wheels. The larger tractors are typically an articulated, center-hinged design steered by hydraulic cylinders that move the forward power unit while the trailing unit is not steered separately. In the early XXI century, articulated or non-articulated, steerable multitrack tractors have largely supplanted the Caterpillar type for farm use. Larger types of modern farm tractors include articulated four-wheel or eight-wheel drive units with one or two power units which are hinged in the middle and steered by hydraulic clutches or pumps. A relatively recent development is the replacement of wheels or steel crawler-type tracks with flexible, steel-reinforced rubber tracks, usually powered by hydrostatic or completely hydraulic driving mechanisms. The configuration of these tractors bears little resemblance to the classic farm tractor design. Engine And Fuels:- the predecessors of modern tractors, traction engines, used steam engines for power. Gasoline And Kerosine:- since the turn of the XX century, internal combustion engines have been the power source of choice. Between 1900 and 1960, gasoline was the predominant fuel, with kerosene (the Rumely Oil Pull (a line of farm tractors developed by Advance-Rumely Company; La Porte, Indiana, US) was the most notable of this kind) and ethanol being common alternatives. Generally, one engine could burn any of those, although cold starting was easiest on gasoline. Often, a small auxiliary fuel tank was available to hold gasoline for cold starting and warm-up, while the main fuel tank held whatever fuel was most convenient or least expensive for the particular farmer. In the United Kingdom, a gasoline-kerosene engine is known as a petrol-paraffin engine. Diesel:- Dieselisation gained momentum starting in the 1960s, and modern farm tractors usually employ diesel engines, which range in power output from 18 to 575 horsepower (15 to 480 kW). Size and output are dependent on application, with smaller tractors used for lawn mowing, landscaping, orchard work, and truck farming, and larger tractors for vast fields of wheat, maize, soy, and other bulk crops. Liquified Petroleum Gas:- liquified petroleum gas (LPG) or propane also have been used as tractor fuels, but require special pressurized fuel tanks and filling equipment, so are less prevalent in most markets. Biodiesel:- in some countries such as Germany, biodiesel is often used. Some other biofuels such as straight vegetable oil are also being used by some farmers. Transmission:- most older farm tractors use a manual transmission with several gear ratios, typically three to six, sometimes multiplied into two or three ranges. This arrangement provides a set of discrete ratios that, combined with the varying of the throttle, allow final-drive speeds from less than one up to about 25 miles per hour (40 km/h), with the lower speeds used for working the land and the highest speed used on the road. Slow, controllable speeds are necessary for most of the operations performed with a tractor. They help give the farmer a larger degree of control in certain situations, such as field work. However, when travelling on public roads, the slow operating speeds can cause problems, such as long queues or tailbacks, which can delay or annoy motorists in cars and trucks. These motorists are responsible for being duly careful around farm tractors and sharing the road with them, but many shirk this responsibility, so various ways to minimize the interaction or minimize the speed differential are employed where feasible. Some countries (for example the Netherlands) employ a road sign on some roads that means 'no farm tractors'. Some modern tractors, such as the JCB (short for the J.C. Bamford Excavators Limited; an English multinational corporation headquartered in Rocester, Staffordshire, UK) Fastrac, are now capable of much higher road speeds of around 50 mph (80 km/h). Older tractors usually have unsynchronized transmission designs, which often require the operator stop the tractor to shift between gears. This mode of use is inherently unsuited to some of the work tractors do, and has been circumvented in various ways over the years. For existing unsynchronized tractors, the methods of circumvention are double clutching or power-shifting, both of which require the operator to rely on skill to speed-match the gears while shifting, and are undesirable from a risk-mitigation standpoint because of what can go wrong if the operator makes a mistake – transmission damage is possible, and loss of vehicle control can occur if the tractor is towing a heavy load either uphill or downhill – something that tractors often do. Therefore, operator's manuals for most of these tractors state one must always stop the tractor before shifting, and they do not even mention the alternatives. As already said, that mode of use is inherently unsuited to some of the work tractors do, so better options were pursued for newer tractor designs. In these, unsynchronized transmission designs were replaced with synchronization or with continuously variable transmissions (CVTs). Either a synchronized manual transmission with enough available gear ratios (often achieved with dual ranges, high and low) or a CVT allow the engine speed to be matched to the desired final-drive speed, while keeping engine speed within the appropriate speed (as measured in rotations per minute or rpm) range for power generation (the working range) (whereas throttling back to achieve the desired final-drive speed is a trade-off that leaves the working range). The problems, solutions, and developments described here also describe the history of transmission evolution in semi-trailer trucks. The biggest difference is fleet turnover; whereas most of the old road tractors have long since been scrapped, many of the old farm tractors are still in use. Therefore, old transmission design and

operation is primarily just of historical interest in trucking, whereas in farming it still often affects daily life. Hitches And Power Applications:- the power produced by the engine must be transmitted to the implement or equipment to do the actual work intended for the equipment. This may be accomplished via a drawbar or hitch system if the implement is to be towed or otherwise pulled through the tractive power of the engine, or via a pulley or power takeoff system if the implement is stationary, or a combination of the two. Drawbars:- until the 1940s, plows and other tillage equipment usually were connected to the tractor via a drawbar. The classic drawbar is simply a steel bar attached to the tractor (or in some cases, as in the early Fordsons, cast as part of the rear transmission housing) to which the hitch of the implement was attached with a pin or by a loop and clevis. The implement could be readily attached and removed, allowing the tractor to be used for other purposes on a daily basis. If the tractor was equipped with a swinging drawbar, then it could be set at the center or offset from center to allow the tractor to run outside the path of the implement. The drawbar system necessitated the implement having its own running gear (usually wheels) and in the case of a plow, chisel cultivator or harrow, some sort of lift mechanism to raise it out of the ground at turns or for transport. Drawbars necessarily posed a rollover risk depending on how the tractive torque was applied. The Fordson tractors (of which more units were produced and placed in service than any other farm tractor) was extremely prone to roll over backwards due to an excessively short wheelbase. The linkage between the implement and the tractor usually had some slack which could lead to jerky starts and greater wear and tear on the tractor and the equipment. Drawbars were appropriate to the dawn of mechanization, because they were very simple in concept and because as the tractor replaced the horse, existing horse-drawn implements usually already had running gear. As the history of mechanization progressed, however, the advantages of other hitching systems became apparent, leading to new developments (see below). Depending on the function for which a tractor is used, though, the drawbar is still one of the usual means of attaching an implement to a tractor. Fixed Mounts:- Some tractor manufacturers produced matching equipment that could be directly mounted on the tractor. Examples included front-end loaders, belly mowers, row crop cultivators, corn pickers and corn planters. In most cases, these fixed mounts were proprietary and unique to each make of tractor, so an implement produced by John Deere (the brand name of Deere & Company; Moline, Illinois, US), for example, could not be attached to a Minneapolis Moline tractor. Another disadvantage was mounting usually required some time and labor, resulting in the implement being semi-permanently attached with bolts or other mounting hardware. Usually, it was impractical to remove the implement and reinstall it on a day-to-day basis. As a result, the tractor was unavailable for other uses and dedicated to a single use for an appreciable period of time. An implement generally would be mounted at the beginning of its season of use (such as tillage, planting or harvesting) and removed only when the likely use season had ended. Three-Point Hitches And Quick Hitches:- the drawbar system was virtually the exclusive method of attaching implements (other than direct attachment to the tractor) before Harry Ferguson developed the three-point hitch. Equipment attached to the three-point hitch can be raised or lowered hydraulically with a control lever. The equipment attached to the three-point hitch is usually completely supported by the tractor. Another way to attach an implement is via a quick hitch, which is attached to the three-point hitch. This enables a single person to attach an implement quicker and put the person in less danger when attaching the implement. The three-point hitch revolutionized farm tractors and their implements. While the Ferguson system was still under patent, other manufacturers developed new hitching systems to try to fend off some of Ferguson's competitive advantage. For example, International Harvestor Company's (IHC and later IH; American company; Rock Island, Illinois, US) Farmall tractors gained a two-point 'Fast Hitch', and John Deere had a power lift that was similar to, but not as flexible as, the Ferguson invention. Once the patent protection expired on the three-point hitch, it became an industry standard. Almost every tractor today features Ferguson's three-point linkage or a derivative of it. This hitch allows for easy attachment and detachment of implements while allowing the implement to function as a part of the tractor, almost as if it were attached by a fixed mount. Previously, when the implement hit an obstacle, the towing link would break or the tractor could flip over. Ferguson's genius was to combine a connection via two lower and one upper lift arms that were connected to a hydraulic lifting ram. The ram was, in turn, connected to the upper of the three links so the increased drag (as when a plough hits a rock) caused the hydraulics to lift the implement until the obstacle was passed. Recently, Bobcat's (Bobcat Company is an American-based manufacturer; West Fargo, North Dakota, US) patent on its front loader connection (inspired by these earlier systems) has expired, and compact tractors are now being outfitted with quick-connect attachments for their front-end loaders. Power Take-Off Systems And Hydraulics:- in addition to towing an implement or supplying tractive power through the wheels, most tractors have a means to transfer power to another machine such as a baler, swather, or mower. Unless it functions solely by pulling it through or over the ground, a towed implement needs its own power source (such as a baler or combine with a separate engine) or else a means of transmitting power from the tractor to the mechanical operations of the equipment. Early tractors used belts or cables wrapped around the flywheel or a separate belt pulley to power stationary equipment, such as a threshing machine, buzz saw, silage blower, or stationary baler. In most cases, it was not practical for the tractor and equipment to move with a flexible belt or cable between them, so this system required the tractor to remain in one location, with the work brought to the equipment, or the tractor to be relocated at each turn and the power set-up reapplied (as in cable-drawn plowing systems used in early steam tractor operations). Modern tractors use a power take-off (PTO) shaft to provide rotary power to machinery that may be stationary or pulled. The PTO shaft generally is at the rear of the tractor, and can be connected to an implement that is either towed by a drawbar or a three-point hitch. This eliminates the need for a separate, implement-mounted power source, which is almost never seen in modern farm equipment. Virtually all modern tractors can also provide external hydraulic fluid and electrical power to the equipment they are towing, either by hoses or wires. Operation:- Modern tractors have many electrical switches and levers in the cab for controlling the multitude of different functions available on the tractor. Pedals:- modern farm tractors usually have four or five foot-pedals for the operator on the floor of the tractor. The pedal on the left is the clutch. The operator presses on this pedal to disengage the transmission for either shifting gears or stopping the tractor. Some modern tractors have (or as optional equipment) a button on the gear stick for controlling the clutch, in addition to the standard pedal. Two of the pedals on the right are the brakes. The left brake pedal stops the left rear wheel and the right brake pedal does the same with the right side. This independent left and right wheel-braking augments the steering of the tractor when only the two rear wheels are driven. This is usually done when it is necessary to make a sharp turn. The split brake pedal is also used in mud or soft soil to control a tire spinning due to loss of traction. The operator presses both pedals together to stop the tractor. Usually a swinging or sliding bolt is provided to lock the two together when desired. The pedal furthest to the right is the foot throttle. Unlike in automobiles, it can also be controlled from a hand-operated lever ('hand throttle'). This helps provide a constant speed in field work. It also helps provide continuous power for stationary tractors that are operating an implement by shaft or belt. The foot throttle gives the operator more automobile-like control over the speed of the tractor for road work. This is a feature of more recent tractors; older tractors often did not have it. In the UK, foot pedal use to control engine speed while travelling on the road is mandatory. Some tractors, especially those designed for row-crop work, have a 'de-accelerator' pedal, which operates in the reverse fashion to an automobile throttle, in that the pedal is pushed down to slow the engine. This allows fine control over the speed of the tractor when maneuvering at the end of crop rows in fields- the operating speed of the engine is set using the hand throttle, and to slow the tractor to turn, the operator simply has to press the pedal, and turn and release it once the turn is completed, rather than having to alter the setting of the hand throttle twice during the maneuver. A fifth pedal is traditionally included just in front of the driver's seat (often pressed with the operator's heel) to operate the rear differential lock (diff-lock), which prevents wheel slip. The differential normally allows the outside wheel to travel faster than the inside wheel during a turn. However, in low-traction conditions on a soft surface, the

same mechanism could allow one wheel to slip, further reducing traction. The diff-lock overrides this, forcing both wheels to turn at the same speed, reducing wheel slip and improving traction. Care must be taken to unlock the differential before turning, usually by hitting the pedal a second time, since the tractor with good traction cannot perform a turn with the diff-lock engaged. In modern tractors, this pedal is replaced with an electrical switch. Levers And Switches:- many functions once controlled with levers have been replaced with some model of electrical switch with the rise of indirect computer controlling of functions in modern tractors. Until the beginning of the 1960s, tractors had a single register of gears, hence one gear stick, often with three to five forward gears and 1 reverse. Then, group gears were introduced, and another gear stick was added. Later, control of the forward-reverse direction was moved to a special stick attached at the side of the steering wheel, which allowed forward or reverse travel in any gear. Nowadays, with CVTs (continuously variable transmissions) or other clutch-free gear types, fewer sticks control the transmission, and some are replaced with electrical switches or are totally computer-controlled. The three-point hitch was controlled with a lever for adjusting the position, or as with the earliest ones, just the function for raising or lowering the hitch. With modern electrical systems, it is often replaced with a potentiometer for the lower bound position and another one for the upper bound, and a switch allowing automatic adjustment of the hitch between these settings. The external hydraulics also originally had levers, but now are often replaced with some form of electrical switch; the same is true for the power take-off shaft. Safety:- agriculture in the United States is one of the most hazardous industries, only surpassed by mining and construction. No other farm machine is so identified with the hazards of production agriculture as the tractor. Tractor-related injuries account for approximately 32% of the fatalities and 6% of the nonfatal injuries in agriculture. Over 50% is attributed to tractor overturns. The roll-over protection structure (ROPS) and seat belt, when worn, are the most important safety devices to protect operators from death during tractor overturns. Modern tractors have a ROPS to prevent an operator from being crushed if the tractor turns over. The ROPS does not prevent tractor overturns; rather, it prevents the operator from being crushed during an overturn. This is especially important in open-air tractors, where the ROPS is a steel beam that extends above the operator's seat. For tractors with operator cabs, the ROPS is part of the frame of the cab. A ROPS with enclosed cab further reduces the likelihood of serious injury because the operator is protected by the sides and windows of the cab. These structures were first required by legislation in Sweden in 1959. Before they were required, some farmers died when their tractors rolled on top of them. Row-crop tractors, before ROPS, were particularly dangerous because of their 'tricycle' design with the two front wheels spaced close together and angled inward toward the ground. Some farmers were killed by rollovers while operating tractors along steep slopes. Others have been killed while attempting to tow or pull an excessive load from above axle height, or when cold weather caused the tires to freeze to the ground, in both cases causing the tractor to pivot around the rear axle. ROPS were first required in the United States in 1986, but this requirement did not retroactively apply to tractors produced before this year; therefore, adoption of ROPS has been incomplete in the farming community. To combat this problem, CROPS (cost-effective roll-over protection structures) have been developed to encourage farmers to retrofit older tractors. For the ROPS to work as designed, the operator must stay within its protective frame. This means the operator must wear the seat belt; not wearing it may defeat the primary purpose of the ROPS. Applications And Variations:- Farm Tractor Applications:- the most common use of the term 'Tractor' is for the vehicles used on farms. The farm tractor is used for pulling or pushing agricultural machinery or trailers, for plowing, tilling, disking, harrowing, planting, and similar tasks. A variety of specialty farm tractors have been developed for particular uses. These include 'row crop' tractors with adjustable tread width to allow the tractor to pass down rows of corn, tomatoes or other crops without crushing the plants, 'wheatland' or 'standard' tractors with fixed wheels and a lower center of gravity for plowing and other heavy field work for broadcast crops, and 'high crop' tractors with adjustable tread and increased ground clearance, often used in the cultivation of cotton and other high-growing row crop plant operations, and 'utility tractors', typically smaller tractors with a low center of gravity and short turning radius, used for general purposes around the farmstead. Many utility tractors are used for nonfarm grading, landscape maintenance and excavation purposes, particularly with loaders, backhoes, pallet forks and similar devices. Small garden or lawn tractors designed for suburban and semirural gardening and landscape maintenance also exist in a variety of configurations. Some farm-type tractors are found elsewhere than on farms: with large universities' gardening departments, in public parks, or for highway workman use with blowtorch cylinders strapped to the sides and a pneumatic drill air compressor permanently fastened over the power take-off. These are often fitted with grass (turf) tyres which are less damaging to soft surfaces than agricultural tires. Precision Agriculture:- space technology has been incorporated into agriculture in the form of GPS (short for the Global Positioning System; American satellite navigation system) devices, and robust on-board computers installed as optional features on farm tractors. These technologies are used in modern, precision farming techniques. The spin-offs from the space race have actually facilitated automation in plowing and the use of autosteer systems (drone on tractors that are manned but only steered at the end of a row), the idea being to neither overlap and use more fuel nor leave streaks when performing jobs such as cultivating. Several tractor companies have also been working on producing a driverless tractor. Engineering Tractors:- the durability and engine power of tractors made them very suitable for engineering tasks. Tractors can be fitted with engineering tools such as dozer blades, buckets, hoes, rippers, etc. The most common attachments for the front of a tractor are dozer blades or buckets. When attached to engineering tools, the tractor is called an Engineering Vehicle. A Bulldozer is a track-type tractor with a blade attached in the front and a rope-winch behind. Bulldozers are very powerful tractors and have excellent ground-hold, as their main tasks are to push or drag. Bulldozers have been further modified over time to evolve into new machines which are capable of working in ways that the original bulldozer can not. One example is that loader tractors were created by removing the blade and substituting a large volume bucket and hydraulic arms which can raise and lower the bucket, thus making it useful for scooping up earth, rock and similar loose material to load it into trucks. A front-loader or loader is a tractor with an engineering tool which consists of two hydraulic powered arms on either side of the front engine compartment and a tilting implement. This is usually a wide-open box called a bucket, but other common attachments are a pallet fork and a bale grappler. Other modifications to the original bulldozer include making the machine smaller to let it operate in small work areas where movement is limited. Also, tiny wheeled loaders, officially called Skid-Steer Loaders, but nicknamed 'Bobcat' after the original manufacturer, are particularly suited for small excavation projects in confined areas. Backhoe Loader:- the most common variation of the classic farm tractor is the Hoe, also called a Hoe-Loader. As the name implies, it has a loader assembly on the front and a backhoe on the back. Backhoes attach to a three-point hitch on farm or industrial tractors. Industrial tractors are often heavier in construction, particularly with regards to the use of steel grill for protection from rocks and the use of construction tires. When the backhoe is permanently attached, the machine usually has a seat that can swivel to the rear to face the hoe controls. Removable backhoe attachments almost always have a separate seat on the attachment. Backhoe-loaders are very common and can be used for a wide variety of tasks:- construction, small demolitions, light transportation of building materials, powering building equipment, digging holes, loading trucks, breaking asphalt and paving roads. Some buckets have retractable bottoms, enabling them to empty their loads more quickly and efficiently. Buckets with retractable bottoms are also often used for grading and scratching off sand. The front assembly may be a removable attachment or permanently mounted. Often the bucket can be replaced with other devices or tools. Their relatively small frames and precise controls make backhoe-loaders very useful and common in urban engineering projects, such as construction and repairs in areas too small for larger equipment. Their versatility and compact size makes them one of the most popular urban construction vehicles. In the UK, the word 'JCB' is sometimes used colloquially as a genericized trademark for any such type of engineering vehicle. The term JCB now appears in the Oxford English Dictionary, although it is still legally a trademark of J.C. Bamford Ltd. The term 'Digger' is also commonly used.

Compact Utility Tractor:- a compact utility tractor (CUT) is a smaller version of an agricultural tractor, but designed primarily for landscaping and estate management tasks rather than for planting and harvesting on a commercial scale. Typical CUTs range from 20 to 50 horsepower (15–37 kW) with available power take-off (PTO) horsepower ranging from 15 to 45 hp (11–34 kW). CUTs are often equipped with both a mid-mounted and a standard rear PTO, especially those below 40 horsepower (30 kW). The mid-mount PTO shaft typically rotates at/near 2000 rpm and is typically used to power mid-mount finish mowers, front-mounted snow blowers or front-mounted rotary brooms. The rear PTO is standardized at 540 rpms for the North American markets, but in some parts of the world, a dual 540/1000 rpm PTO is standard, and implements are available for either standard in those markets. One of the most common attachment for a CUT is the front-end loader or FEL. Like the larger agricultural tractors, a CUT will have an adjustable, hydraulically controlled three-point hitch. Typically, a CUT will have four-wheel drive, or more correctly four-wheel assist. Modern CUTs often feature hydrostatic transmissions, but many variants of gear-drive transmissions are also offered from low priced, simple gear transmissions to synchronized transmissions to advanced glide-shift transmissions. All modern CUTs feature government-mandated roll over protection structures just like agricultural tractors. The most well-known brands in North America include Kubota, John Deere Tractor, New Holland Ag, Case-Farmall and Massey-Ferguson. Although less common, compact backhoes are often attached to compact utility tractors. Compact utility tractors require special, smaller implements than full-sized agricultural tractors. Very common implements include the box blade, the grader blade, the landscape rake, the post hole digger (or post hole auger), the rotary cutter (slasher or a brush hog), a mid- or rear-mount finish mower, a broadcast seeder, a subsoiler and the rototiller (rotary tiller). In northern climates, a rear-mounted snow blower is very common; some smaller CUT models are available with front-mounted snow blowers powered by mid-PTO shafts. Implement brands outnumbere tractor brands, so CUT owners have a wide selection of implements. For small-scale farming or large-scale gardening, some planting and harvesting implements are sized for CUTs. One- and two-row planting units are commonly available, as are cultivators, sprayers and different types of seeders (slit, rotary and drop). One of the first CUTs offered for small farms of three to 30 acres and for small jobs on larger farms was a three-wheeled unit, with the rear wheel being the drive wheel, offered by Sears & Roebuck in 1954 and priced at USD598 for the basic. Standard Tractor:- the earliest tractors were called ‘Standard’ Tractors, and were intended almost solely for plowing and harrowing before planting, which were difficult tasks for humans and draft animals. They were characterized by a low, rearward seating position, fixed-width tread, and low ground clearance. These early tractors were cumbersome, and were not well-suited to getting into a field of already-planted row crops to do weed control. The ‘Standard’ Tractor definition is no longer in current use. Row-Crop Tractor:- a general-purpose or row-crop tractor is tailored specifically to the growing of crops grown in rows, and most especially to cultivating these crops. These tractors are universal machines, capable of both primary tillage and cultivation of a crop. The ‘Row-Crop’ or ‘General-Purpose’ designation is no longer in current use. Row-Crop Tractor History:- the row-crop tractor category evolved rather than appearing overnight, but the International Harvester (IH) Farmall is often considered the ‘first’ tractor of the category. Some earlier tractors of the 1910s and 1920s approached the form factor from the heavier side, as did motorized cultivators from the lighter side, but the Farmall brought all of the salient features together into one package, with a capable distribution network to ensure its commercial success. In the new form factor that the Farmall popularized, the cultivator was mounted in the front so it was easily visible. Additionally, the tractor had a narrow front end; the front tires were spaced very closely and angled in towards the bottom. The back wheels straddled two rows, and the unit could cultivate four rows at once. From 1924 until 1963, Farmalls were the largest selling row-crop tractors. To compete, John Deere designed the Model C, which had a wide front and could cultivate three rows at once. Only 112 prototypes were made, as Deere realized sales would be lost to Farmall if their model did less. In 1928, Deere released the Model C anyway, only as the Model GP (General Purpose) to avoid confusion with the Model D when ordered over the then unclear telephone. Oliver refined its ‘Row Crop’ model early in 1930. Until 1935, the 18–27 was Oliver–Hart-Parr’s only row-crop tractor. Many Oliver row-crop models are referred to as ‘Oliver Row Crop 77’, ‘Oliver Row Crop 88’, etc. Row-Crop Tractor Safety:- many early row-crop tractors had a tricycle design with two closely spaced front tires, and some even had a single front tire. This made it dangerous to operate on the side of a steep hill; as a result, many farmers died from tractor rollovers. Also, early row-crop tractors had no rollover protection system (ROPS), meaning if the tractor flipped back, the operator could be crushed. Sweden was the first country which passed legislation requiring ROPS, in 1959. Over 50% of tractor related injuries and deaths are attributed to tractor rollover. Modern Row-Crop Tractors:- Canadian agricultural equipment manufacturer Versatile (full name of company is Buhler Versatile Incorporated; Winnipeg, Manitoba, Canada) makes row-crop tractors that are 250 and 280 horsepower (190 and 210 kW); powered by an 8.3 liter Cummins (full name of company is Cummins, Inc.; Columbus, Indiana, US) Diesel engine. Modern row crop tractors have rollover protection systems in the form of a reinforced cab or a roll bar. Garden Tractors:- garden tractors (mini tractors) are small, light tractors designed for use in domestic gardens and small estates. Garden tractors are designed for cutting grass, snow removal, and small property cultivation. In the US, the term Riding Lawn Mower today often is used to refer to mid- or rear-engined machines. Front-engined tractor layout machines designed primarily for cutting grass and light towing are called Lawn Tractors; heavier-duty tractors of similar size are garden tractors. Garden tractors are capable of mounting a wider array of attachments than lawn tractors. Unlike lawn tractors and rear-engined riding mowers, garden tractors are powered by horizontal-crankshaft engines with a belt-drive to transaxle-type transmissions (usually of four- or five-speeds, although some may also have two-speed reduction gearboxes, drive-shafts, or hydrostatic or hydraulic drives). Garden tractors from Wheel Horse Company (South Bend, Indiana, US), Cub Cadet (Cleveland, Ohio, US), Economy (Power King), John Deere, Massey Ferguson Limited (Duluth, Georgia, US) and Case Ingersoll are built in this manner. The engines are generally a one- or two-cylinder petrol (gasoline) engines, although diesel engine models are also available, especially in Europe. Typically, diesel-powered garden tractors are larger and heavier-duty than gasoline-powered units and compare more similarly to compact utility tractors. Visually, the distinction between a garden tractor and a lawn tractor is often hard to make – generally, garden tractors are more sturdily built, with stronger frames, 12-inch or larger wheels mounted with multiple lugs (most lawn tractors have a single bolt or clip on the hub), heavier transaxles, and ability to accommodate a wide range of front, belly, and rear mounted attachments. Two-Wheel Tractors:- although most people think first of four-wheel vehicles when they think of tractors, a tractor may have one or more axles. The key benefit is the power itself, which only takes one axle to provide. Single-axle tractors, more often called Two-Wheel Tractors or Walk-Behind Tractors, have had many users since the beginning of internal combustion engine tractors. They tend to be small and affordable. This was especially true before the 1960s, when a walk-behind tractor could often be more affordable than a two-axle tractor of comparable power. Today’s compact utility tractors and advanced garden tractors may negate most of that market advantage, but two-wheel tractors still enjoy a loyal following, especially where an already-paid-for two-wheel tractor is financially superior to a compact or garden tractor that would have to be purchased. Countries where two-wheel tractors are especially prevalent today include, Thailand, China, Bangladesh, India, and other Southeast Asia countries. Orchard Tractors:- tractors tailored to use in fruit orchards typically have features suited to passing under tree branches with impunity. These include a lower overall profile; reduced tree-branch-snagging risk (via underslung exhaust pipes rather than smoke-stack-style exhaust, and large sheetmetal cowlings and fairings that allow branches to deflect and slide off rather than catch); spark arrestors on the exhaust tips; and often wire cages to protect the operator from snags. Automobile-Conversion Tractors And Other Homemade Versions:- the ingenuity of farm mechanics, coupled in some cases with OEM (short for the Original Equipment Manufacturer) or aftermarket assistance, has often resulted in the conversion of automobiles for use as farm tractors. In the United States, this trend was especially strong from the 1910s through 1950s. It began early in the development

of vehicles powered by internal combustion engines, with blacksmiths and amateur mechanics tinkering in their shops. Especially during the interwar period, dozens of manufacturers (Montgomery Ward among them) marketed aftermarket kits for converting Ford Model Ts for use as tractors. (These were sometimes called 'Hoover Wagons' during the Great Depression, although this term was usually reserved for automobiles converted to horse-drawn buggy use when gasoline was unavailable or unaffordable. During the same period, another common name was 'Doodlebug'). Ford even considered producing an 'official' optional kit. Many Model A Fords also were converted for this purpose. In later years, some farm mechanics have been known to convert more modern trucks or cars for use as tractors, more often as curiosities or for recreational purposes (rather than out of the earlier motives of pure necessity or frugality). During World War II, a shortage of tractors in Sweden led to the development of the so-called 'EPA' tractor (EPA was a chain of discount stores and it was often used to signify something lacking in quality). An EPA tractor was simply an automobile, truck or lorry, with the passenger space cut off behind the front seats, equipped with two gearboxes in a row. When done to an older car with a ladder frame, the result was not dissimilar to a tractor and could be used as one. After the war it remained popular, now not as a farm vehicle, but as a way for young people without a driver's license to own something similar to a car. Since it was legally seen as a tractor, it could be driven from 16 years of age and only required a tractor license. Eventually, the legal loophole was closed and no new EPA tractors were allowed to be made, but the remaining ones were still legal, which led to inflated prices and many protests from people who preferred EPA tractors to ordinary cars. The German occupation of Italy during World War II resulted in a severe shortage of mechanized farm equipment. The destruction of tractors was a sort of scorched-earth strategy used to reduce the independence of the conquered. The shortage of tractors in that area of Europe was the origin of Lamborghini (full name of company is Automobili Lamborghini S.p.A.; Sant'Agata Bolognese, Italy). The war was also the inspiration for dual-purpose vehicles such as the Land Rover (former British company Land Rover Ltd. (1978–2012); now a car brand). Based on the Jeep, the company made a vehicle that combined PTO, tillage, and transportation. In March 1975, a similar type of vehicle was introduced in Sweden, the A Tractor (from Arbetstraktor (Work Tractor)); the main difference is an A tractor has a top speed of 30 km/h. This is usually done by fitting two gearboxes in a row and not using one of them. The Volvo Duett (Sweden) was, for a long time, the primary choice for conversion to an EPA or A tractor, but since supplies have dried up, other cars have been used, in most cases another Volvo. Another type of homemade tractors are ones that are fabricated from scratch. The 'from scratch' description is relative, as often individual components will be repurposed from earlier vehicles or machinery (e.g., engines, gearboxes, axle housings), but the tractor's overall chassis is essentially designed and built by the owner (e.g., a frame is welded from bar stock – channel stock, angle stock, flat stock, etc). As with automobile conversions, the heyday of this type of tractor, at least in developed economies, lies in the past, when there were large populations of blue-collar workers for whom metalworking and farming were prevalent parts of their lives. (For example, many XIX- and XX-century New England and Midwestern machinists and factory workers had grown up on farms.) Backyard fabrication was a natural activity to them (whereas it might seem daunting to most people today). Alternative Machine Types Called Tractors:- the term 'Tractor' (US and Canada) or 'Tractor Unit' (UK) is also applied to:- (i) Road Tractors, Tractor Units or Traction Heads, familiar as the front end of an articulated lorry/semi-trailer truck. They are heavy-duty vehicles with large engines and several axles. (ii) The majority of these tractors are designed to pull long semi-trailers, most often to transport freight over a significant distance, and is connected to the trailer with a fifth wheel coupling. In England, this type of 'Tractor' is often called an 'Artic Cab' (short for 'Articulated' Cab). (iii) A minority is the ballast tractor, whose load is hauled from a drawbar. (iv) Pushback Tractors are used on airports to move aircraft on the ground, most commonly pushing aircraft away from their parking stands. (v) Locomotive Tractors (engines) or Rail Car Movers – the amalgamation of machines, electrical generators, controls and devices that comprise the traction component of railway vehicles. (vi) Artillery Tractors – vehicles used to tow artillery pieces of varying weights. (vii) NASA (short for the National Aeronautics and Space Administration) and other space agencies use very large tractors to move large launch vehicles and space shuttles between their hangars and launch pads. (viii) A Pipe-Tractor is a device used for conveying advanced instruments into pipes for measurement and data logging, and the purging of well holes, sewer pipes and other inaccessible tubes. / Ричод Тчрэвизик (Richard Trevithick). Под Трактором, от новолатинского слова Tractor от Латинского слова Traho, означающее Тащу или Тяну, понимается самоходная машина на гусеничном или колёсном ходу для перемещения и приведения в действие прицеплённых к ней или установленных на ней машин-орудий (дорожных, сельскохозяйственных, строительных и тому подобных), для привода стационарных машин, а также для буксирования повозок (прицепов). Основные достоинства гусеничных тракторов – высокие тяговые показатели, хорошее сцепление с почвой и высокая проходимость; недостатки – большие масса и первоначальная стоимость, низкая износостойкость гусеничного движителя. Колёсные тракторы имеют малую массу, просты в устройстве и эксплуатации, хорошо приспособлены к работе с навесными машинами. На тракторы устанавливают в основном дизели или (реже) карбюраторные двигатели внутреннего сгорания, используются механические и гидромеханические передачи. Трактор, самодвижущаяся (гусеничная или колёсная) машина, выполняющая сельскохозяйственные, дорожно-

строительные, землеройные, транспортные и другие работы в агрегате с прицепными, навесными или стационарными машинами (орудиями). (Смотрите также Машинно-Тракторный Агрегат). Историческая Справка:- Первые колёсные тракторы с паровыми машинами появились в Великобритании и Франции в 1830 и применялись на транспорте и в военном деле; с 1850 паровые тракторы используются в сельском хозяйстве этих стран, а с 1890 – в сельском хозяйстве США. Ценные изобретения по гусеничному ходу были сделаны в России Дмитрием Андреевичем Загряжским (1807–1860) в 1837 и Александром Петровичем Костиковым-Алмазовым около 1889. В 1888 Русский механик Фёдор Абрамович Блинов (1831–1902) построил и испытал гусеничный трактор с двумя паровыми машинами. В 1893–95 Русский изобретатель-самоучка Яков Васильевич Мамин (1873–1955) создал самоходную колёсную тележку с двигателем внутреннего сгорания. С 1901 фирма Харт-Па Кампэни (Hart-Parr Company) в США выпустила первые колёсные тракторы с двигателями внутреннего сгорания. Начиная с 1912 в США фирмой Холт Мэньюфактчэринь Кампэни (Holt Manufacturing Company), а позднее в Германии фирмой Вандэра-Дона (Wanderer-Dorner) и в других странах производятся тракторы на гусеничном ходу. Первые тракторы в бывшем Союзе Советских Социалистических Республик (СССР) выпущены в 1923 (Фордзон-Путиловец). С 1930 в СССР налажено массовое производство тракторов, что дало возможность в 1932 отказаться от их привоза (или импорта) (смотрите Тракторостроение). Классификация Тракторов:- По назначению тракторы разделяют на сельскохозяйственные и промышленные. Сельскохозяйственные тракторы общего назначения в агрегате с соответствующими машинами (орудиями) осуществляют пахоту, культивацию, посев, уборку и другие работы. Наиболее мощные сельскохозяйственные тракторы используются при освоении целинных и залежных земель для корчевания пней, удаления и запашки кустарников и других работ. Пропашные тракторы позволяют механизировать междурядную обработку – культивацию, рыхление, окучивание, опыливание, уборку пропашных культур (Кукурузы, Сахарной Свёклы, Хлопчатника и других). Особенности пропашных тракторов – приспособленность к работе с навесными машинами (орудиями) и хорошая проходимость в междурядьях пропашных культур, значительный (обычно регулируемый) размер колеи, большой дорожный просвет, узкие колёса (гусеницы). Базовые модели промышленных тракторов характеризуются большими, чем у сельскохозяйственных тракторов, тяговыми усилиями. Они выполняют землеройные, дорожно-строительные, мелиоративные и другие работы в агрегате с разнообразными навесными (бульдозерная лопата, снегоочиститель, экскаваторный ковш и тому подобными) и прицепными (скрепер, грейдер и тому подобными) машинами (орудиями). В зависимости от условий работы трактора используются различные модификации базовых моделей (например, для сельскохозяйственных тракторов – виноградниковый, болотоходный, крутосклонный, садовый; для промышленных тракторов – мелиоративный, лесосплавный, трелёвочный). По типу движителя тракторы разделяют на колёсные и гусеничные. Механизмы И Оборудование Тракторов:- Силовая установка состоит из двигателя и обеспечивающих его работу устройств (смотрите Тракторный Двигатель). В силовую передачу входят сцепление, соединительная муфта, коробка передач, центральная и конечная передачи (смотрите Силовая Передача). Наиболее распространены фрикционные муфты сцепления, иногда применяются гидродинамические и электрические (смотрите Муфты). Механические ступенчатые коробки передач сельскохозяйственных тракторов имеют 6, 8, 15 и более передач, а промышленных – 3–6. Всё большее распространение получают коробки передач с зубчатыми колёсами постоянного зацепления или с планетарным редуктором (установлены на некоторых зарубежных и Советских тракторах, например Т-150, Т-150К, К-701). Через центральную передачу (обычно конический редуктор) вращающий момент подводится к ведущим колёсам гусеничных тракторов; у колёсных тракторов используется дифференциальный механизм. Конечные передачи (обычно цилиндрические редукторы) располагаются у ведущих колёс и служат для увеличения общего передаточного числа трансмиссий и создания необходимого дорожного просвета. В некоторых экспериментальных образцах тракторов применяются гидрообъёмные (гидронасос и гидромоторы) и гидромеханический (гидротрансформатор и механическая коробка передач) трансмиссии (смотрите Гидродинамическая Передача, Объёмная Гидропередача). Для получения особо низких скоростей движения трактора трансмиссии оборудуются дополнительными передачами – ходоуменьшителями. Ходовая система колёсных тракторов состоит из подвески, осей (мостов) и колёс (направляющих и ведущих) с пневматическими шинами низкого давления. Иногда для повышения проходимости применяются полугусеничный ход, уширительные решётчатые колёса и накидные почвозацепы. Ходовая система гусеничных тракторов состоит из подвески, гусеничных цепей, ведущих колёс, опорных катков, поддерживающих роликов и направляющих колёс (смотрите Гусеничный Ход). Остов трактора обычно выполняется в виде рам различных конструкций. Механизмы управления трактора состоят из рулевого управления и тормозов (ленточных или дисковых). Изменение направления движения колёсных тракторов обычно осуществляется передними (направляющими) колёсами. Иногда для улучшения манёвренности в конструкциях тракторов предусматривается поворот всех 4 колёс, регулирование вращающих моментов на ведущих колёсах, относительно вращение передней и задней частей трактора при схеме с шарнирной рамой. Поворот гусеничных тракторов производится изменением частоты вращения ведущих колёс правой или левой гусениц муфтами и тормозами; иногда применяется одноступенчатый планетарный механизм с двумя парами тормозов. Кабины устанавливаются на всех Советских и большинстве зарубежных тракторов и служат для создания комфортных условий работы тракториста. Электрооборудование трактора состоит из источников электрического тока (аккумуляторной батареи и установленного на двигателе генератора), приборов для пуска двигателя, освещения пути и рабочих машин (орудий), вентиляции кабины, подачи звуковых и световых сигналов. Эксплуатационные Показатели:- Основные эксплуатационные показатели тракторов подразделяют на технико-экономические, технические и агротехнические. К технико-экономическим показателям относятся производительность в агрегате, тяговые качества, трудоёмкость обслуживания и ухода, металлоёмкость и другие; к техническим – устойчивость трактора (продольная и поперечная), лёгкость управления, удобство работы персонала (наличие кабины, контрольных приборов; число мест для сидения); к агротехническим – удельное давление на почву, проходимость в междурядьях (дорожный просвет, абрис, защитные зоны), манёвренность в агрегате, плавность хода, точность следования по заданному направлению. Типаж Тракторов:- Число моделей тракторов, выпускавшихся в бывшем СССР, а также их показатели были определены типажом – системой машин, построенной по заранее разработанному техническому плану, основанное на рациональном сочетании тяговых показателей разных типов тракторов при минимальном числе базовых моделей (смотрите Типизация). Класс в типаже – совокупность моделей (конкретных конструкций) тракторов, имеющих одинаковые классификационные параметры. В бывшем СССР по данным на 1975 существовала следующая градация на классы:- 0.2 тс; 0.6 тс; 0.9 тс; 1.4 тс; 2 тс; 3 тс; 4 тс; 5 тс; 6 тс и 15 тс. Базовая модель – наиболее распространённый вид трактора в данном классе. Модификация – модель, относящаяся к тому же классу, что и базовая, но имеющая иную компоновку или оснащённая дополнительными механизмами. За основной классификационный параметр в бывшем СССР и бывших странах-членах СЭВ (Совета Экономической Взаимопомощи) принято наибольшее тяговое усилие, при ограниченном буксовании, развиваемое трактором. 1-й типаж был предложен в 1923, а разработан и реализован в 1946. В 1956 был создан 2-й типаж трактора на 1961–65. Предусматривалось увеличение рабочих скоростей до 5–6 километров в час (км/ч), повышение срока службы двигателей до 2 500–3 000 часов (ч), трансмиссий – до 5 000–6 000 ч. Были подготовлены к выпуску модели тракторов, соответствующие мировому уровню техники:- колёсные – Т-40, МТЗ-50, Т-16, ДТ-14, К-700; гусеничные – Т-74, ДТ-75, ДЭТ-250 и другие. 3-й типаж трактора на 1965–70 состоял из 13 базовых моделей с тяговыми усилиями от 6 до 250 килоНьютонов (кн) (0.6 – 25 тоннсилы (тс)) и ряда

модификаций. Для дальнейшего улучшения эксплуатационных показателей был разработан 4-й типаж трактора на 1971–80. В 4-м типаже повышаются рабочие скорости до 35 км/ч, срок службы до капитального ремонта, снижается трудоёмкость обслуживания. В связи с повышением скоростей движения трактора в подвеску вводятся дополнительные упругие элементы; кабина снабжается рессорами, герметизируется, оснащается вентиляционными и отопительными устройствами, кондиционерами. Внедряется широкая унификация узлов и деталей внутри класса и между различными классами тракторов. Разрабатываются тракторы с электрическим и гидравлическим приводом. Входят в практику устройства для автоматизации тракторных работ (загрузочных режимов, вождения машинно-тракторного агрегата на рабочем гоне), защиты от аварийных ситуаций и тому подобного.

TRACTOR = ТЯГАЧ – Tractor is a vehicle designed and used primarily for drawing other vehicles and not so constructed as to carry a load other than a part of the weight of the vehicle and load so drawn. Unit of highway motive power used to pull one or more trailers/containers. In the United States, an articulated lorry consisting of a towing engine. Also known as Prime Mover in Australia, and Truck in New Zealand and the united Kingdom. Tractor is the truck that pulls a trailer. Tractor (or Truck Tractor) is the noncargo carrying power unit that operates in combination with a semitrailer or trailer, except that a truck tractor and semitrailer engaged in the transportation of automobiles may transport motor vehicles on part of the power unit. Tractor is a vehicle designed for pulling loads greater than the weight actually applied to the vehicle. The trailer on which the load is carried is connected to the tractor via the fifth wheel. / Тягач – машина для буксировки прицепов, полуприцепов, для установки навесного (сельскохозяйственного, дорожно-строительного и другого) оборудования. Имеет сцепное устройство, вывод тормозного привода к прицепу и полуприцепу и розетку для подключения их систем электропитания. По сравнению с обычными тракторами, автомобилями тягачи часто имеют повышенную мощность двигателя и передаточные отношения в силовой передаче, укороченную базу. Различают тягачи буксирные с тягово-сцепным механизмом и седельные, имеющие вместо грузовой платформы опорно-сцепной механизм для полуприцепов. Для транспортирования неделимых и тяжеловесных грузов применяются балластные тягачи. Тягач, колёсная или гусеничная самодвижущаяся машина (на базе трактора или грузового автомобиля) для транспортировки прицепных повозок и систем (например, прицепов, прицепных сельскохозяйственных машин, дорожных машин). Имеет тягово-сцепное (буксирные тягачи) или опорно-сцепное (седельные тягачи) устройство. У буксирных тягачей необходимое для получения высокого тягового усилия давление гусениц или колёс на грунт (сцепной вес) обеспечивается массой самого тягача. У седельных тягачей дополнительный сцепной вес создаётся давлением одноосного прицепа (полуприцепа), передаваемым через так называемое седло на раму тягача, либо балластом в кузове. Для повышения тягового усилия иногда в трансмиссии тягача предусматривается несколько (обычно 1–2) дополнительных передач с увеличенным передаточным отношением.

TRACTOR–TRAILER = ТЯГАЧ С ПРИЦЕПОМ – Tractor-Trailer (in the United States):- an articulated truck. Also known as Semi-Trailer Truck in the United Kingdom. Tractor Trailer is a large truck with a long trailer attached to the back of it. Tractor-Trailer is a large truck in two parts, one in the front for the driver and one behind where goods are carried. The connection between the two parts can bend in order to help the vehicle turn corners. A Tractor-Trailer is a large truck that is made in two separate sections, a tractor and a trailer, which are joined together by metal bars. Tractor-Trailer is a powerful vehicle for moving heavy loads, esp. over long distances, consisting of a separate part at the front for the driver attached to a large rectangular container on wheels. Tractor-Trailer is a combination of a tractor (sense 2) and a trailer or semitrailer, used in trucking. / Известен также в Соединённом Королевстве как Тягач с Полуприцепом (Semi-Trailer Truck).

TRADABLES = TRADING INSTRUMENTS

TRADE = ТОРГОВЛЯ (или КУПЛЯ–ПРОДАЖА) – (1) Trade is a business of buying and selling in general. / В общем смысле это дело покупки или продажи чего-либо. В гражданском праве Купля-Продажа является одним из наиболее распространённых типов контрактов (договоров), согласно которому продавец обязуется передать имущество в собственность (оперативное управление) покупателю, а покупатель – принять его и уплатить установленную цену. Торговля или Купля-Продажа:- в общем значении:- (1) покупка или продажа товаров и услуг среди компаний, штатов или стран, называемая коммерческой деятельностью (commerce). Количество привозимых (или импортируемых) товаров и услуг за вычетом вывоза (или экспорта) составляет торговый баланс страны (balance of trade). Смотрите также Тариф (Tariff), и Торговый Дефицит (Trade Deficit). (2) Лица, занимающиеся коммерческой деятельностью, которая состоит в продаже товаров. Такие люди называются участниками торговли (members of the trade). Они получают скидки (discounts) с цены, которую должны платить покупатели, совершающие покупки в открытой продаже. (3) Группа производителей (компаний), конкурирующих на одном и том же рынке. Эти компании создают торговые ассоциации и публикуют торговые журналы. (4) Коммерческие компании, которые ведут бизнес друг с другом. Например, кредиторская задолженность (accounts payable) поставщикам называется ожидаемыми платежами (trade accounts payable); термин Торговый Кредит (trade credit) используется, когда кредиторская задолженность является источником финансирования рабочего (оборотного) капитала (working capital). Компании, без задержек оплачивающие свои счета, получают торговые скидки (trade discounts). (5) Синоним – бартер (barter) – обмен товарами и услугами без использования денег. Для ценных бумаг:- осуществлять сделку по покупке или продаже акций, облигаций или товарно-сырьевого фьючерсного контракта. Сделка заключается, когда покупатель и продавец договариваются о цене, по которой будет совершена сделка. Торговец (trader), часто покупающий или продающий ценные бумаги за свой счёт в целях получения краткосрочных прибылей; отличается от инвестора, который держит свои ставки в надежде на долгосрочную прибыль.

(2) In the United States, a Trade may also be another term for a Bargain or Deal. Any stock market order concluded. The Trade is a transaction effected between members either on-exchange or over-the-counter. The term Trade means any purchase or sale of any asset made in accordance with the rules of an exchange. See also Transaction. / Термин Купля-Продажа означает любое приобретение или продажу любого актива в соответствии с правилами биржи. Смотрите также Операция (Transaction).

TRADE = ПАССАТ – Trades are the practically steady winds blowing toward the equator, North-East in the Northern and South-East in the Southern hemisphere. / Под Пассатами, от Немецкого слова Passat, понимаются устойчивые на протяжении года воздушные течения в тропических широтах над океанами. В Северном полушарии направление пассатов преимущественно Северо-Восточное, в Южном – Юго-Восточное. Между пассатами Северного и Южного полушарий – внутритропическая зона конвергенции; над пассатами в противоположном пассатам направлении дуют антипассаты.

TRADE AT SETTLEMENT = ТОРГОВЛЯ ПРИ РАСЧЁТЕ – ICE Futures US, Inc. (IFUS) allows Trade At Settlement (TAS) trades for certain futures contracts traded on the ICE electronic trading platform. This document is meant to provide information concerning TAS orders and TAS trading. What Is TAS? TAS is a capability that allows a trader to enter an order to buy or sell an eligible futures contract during the course of the trading day at a price equal to the settlement price for that contract, or at a price up to five ticks (minimum price fluctuations) above or below the settlement price. (Note that there is an exception for Henry Hub futures only, for which the permitted TAS bid/offer and trading range is up to and including 100 ticks above and below the settlement price.) Examples:- For

Cotton No. 2® futures, the minimum price fluctuation is .01 cents per pound. A cotton trader may enter a TAS order at a price of 0, which means the trader wants to trade at the settlement price, or at +.01,+.02 or up to as much as +.05 above the settlement price, or at -.01, -.02, or down to as much as -.05 below the settlement price. For Frozen Concentrate Orange Juice (FCOJ) futures the minimum price fluctuation is .05 cents per pound. A trader may enter an order for a TAS trade at a price of 0 (which would mean the trader wanted to trade at the settlement price), or at +.05, +.10, or up to as much as +.25 above the settlement price, or at -.05, -.10, or down to as much as -.25 below the settlement price. TAS buy and sell orders are matched on a first-in, first-out basis. After a TAS trade is matched, each TAS transaction receives a trade price equal to, or up to five ticks above or below, the Exchange's daily settlement price for the respective futures contract month. When Are Confirmations Received For TAS Trades? TAS trades are confirmed when TAS bids and offers match. A confirmation of a TAS trade indicates that a trade has been executed at the settlement price (0), or at the agreed tick interval above or below the settlement price. When Can TAS Orders Be Entered? TAS buy and sell orders may be entered from the start of the pre-open period for the respective product through the end of the futures contract settlement window each day. Are There Any Restrictions On Who Is Eligible To Execute A TAS Trade? No, any market participant is eligible to enter a TAS order and to execute a TAS trade. What Contracts Are Eligible For TAS Trading? (1) Agricultural Contracts:- Cocoa (CC); Coffee 'C'® (KC); Cotton No. 2™ (CT); Frozen Concentrated Orange Juice (OJ); Sugar No. 11® (SB); and Canola (RS). (2) Stock Index Contracts:- NYSE FANG+™ Index Futures (FNG); MSCI EAFE Index Futures (MFS); and MSCI Emerging Markets Index Futures (MME). (3) Currency Index and Currency Pair Contracts:- US Dollar Index® (USDX®); Australian Dollar/US Dollar (KAU); Brazil Real/US Dollar (KBX); British Pound/US Dollar (MP); Euro/British Pound (KGB); Euro/Japanese Yen (KEJ); Euro/Norwegian Krone (KOL); Euro/Swedish Krona (KRK); Euro/Swiss Franc (KRZ); Euro/US Dollar (KEO); and Indian Rupee/US Dollar (KIU). (4) Metals Contracts:- 100 oz. Gold Futures (ZG); Mini Gold Futures (YG); 5 000 oz. Silver Futures (ZI); and Mini Silver Futures (YI). (5) Energy Contracts:- Henry LD1 Fixed Price Future (H). What Contract Months Are Eligible For TAS Trading? For each TAS-eligible contract there is a pre-set number of contract months that are eligible for TAS trading on any day. Those numbers are:- (i) for Cocoa, Coffee 'C', Frozen Concentrated Orange Juice and US Dollar Index futures, the first three listed contract months; (ii) for Cotton No. 2 futures, the first five contract months; (iii) for Sugar No. 11 and NYSE FANG+ futures, the first four contract months; (iv) for 100 oz. and Mini Gold futures, the first three contract months in the February, April, June, August, October and December contracts only; (v) for 5 000 oz. and Mini Silver futures, the first three contract months in the January, March, May, July, September and December contracts; (vi) for currency pair, MSCI EAFE Index and MSCI Emerging Markets Index futures, the front two listed contract months; and (vii) for Henry Hub futures, the first ten listed contract months. Note that for the agricultural contracts and metals contracts shown above, once a futures contract month has gone into its Notice Period the contract is no longer eligible to be traded via TAS (outright or as a spread). For the currency, energy, and MSCI stock index contracts shown above, the front contract month remains eligible to be traded via TAS (outright and spread) through and including its last trading day. For the NYSE FANG+ stock index contracts, the front contract month remains eligible to be traded via TAS (outright and spread) through and including the business day prior to the last trading day of the futures contract month. What About TAS Spread Trades? TAS spread trading is enabled for all contracts for which TAS trading is offered. What Spread Pairs Are Eligible For TAS Trading? TAS spread trading is enabled for all spread pairs in which outright TAS trading is offered, with the following exceptions:- For USDX futures contracts, TAS spread trading is enabled for two calendar spread pairs:- the front month vs. the second month and the second month vs. the third month. At What Prices Can TAS Spreads Be Traded? TAS spread trades can be executed at the spread differential between the daily settlement prices for the respective futures contract months, or up to five ticks above and below that spread differential. The sole exception to this is Henry Hub futures, for which the maximum spread differential is 100 ticks above and below the respective spread differential. What Is The Spread Convention For TAS Spreads? The spread convention for TAS spreads is identical to the regular calendar spread convention for the particular product. That is, if the calendar spread convention for a product on the platform means that the spread buyer is buying the front month/selling the back month, this same convention will apply to TAS spreads for the product. For ICE Futures US products, two different calendar spread conventions are followed. For the Agricultural Contracts, Metal Contracts and Henry Hub Contracts, buying the spread means buying the front month/selling the back month. For the Currency Index and Currency Pair Contracts and Stock Index Contracts, buying the spread means buying the back month/selling the front month. How Are TAS Spread Legs Priced? Like TAS outright trades, the prices of TAS spread legs are set after the daily settlement prices for the respective contracts are determined after the end of the settlement window for the respective product. For TAS spreads done at a price of zero ('at the settlement difference'), each leg of the TAS is priced at the settlement price of the respective futures contract in the spread. For TAS Spreads done at one or two or up to five ticks above/below the settlement, the leg prices are set as follows:- (i) Front Month – price is set at the settlement price for the respective contract; (ii) Back Month – price is set at the settlement price for the respective contract plus the TAS spread trade price (which can be a positive number or a negative number). Note:- For Cotton No. 2 futures contracts only, on a day on which either or both legs of the TAS spread settles at the contract's daily trading limit up or down, the leg price of the back month of the TAS spread is determined by the Exchange using the prices of trades done for that Calendar Spread during the settlement period, rather than using the settlement price of that contract month. What Is The Policy Regarding TAS Trades In Limit Up/Down Markets? IFUS allows TAS trading in several futures contracts that are subject to daily trading limits:- Cotton No. 2, Canola and FCOJ-A futures. During the course of the TAS trading day for these products, TAS trades may be matched at a range of TAS +5 ticks to TAS –5 ticks, and the specific contract month may settle at limit up or limit down. In such instances, the matched TAS trades stand, notwithstanding the fact that this futures contract month settles at its limit up or down price. For example, suppose on Day 1 the May 2018 Cotton No. 2 futures contract has settled at a price of 93.00, and that on Day 2 TAS trades have been matched in the platform at a price of +.05, or five minimum ticks above the settlement price. If on Day 2 the May contract settles at a limit up price of 97.00, the TAS trades at a price of +.05 stands, despite fact that the clearing price of 97.05 exceeds the limit up price of 97.00 on that trading day. The information herein has been compiled by ICE Futures US, Inc. for general purposes only and is not intended to serve as investment advice. While every effort has been made to ensure accuracy, ICE Futures US, Inc. does not guarantee its accuracy or completeness or that any particular trading result can be achieved. ICE Futures US, Inc. assumes no responsibility and cannot be liable for any errors or omissions. Futures and options trading involves risk and is not suitable for everyone. Trading on ICE Futures US, Inc. is governed by specific rules set forth by the Exchange and is the authoritative source on all current contract specifications. These rules are subject to change.

TRADE BALANCE = ТОРГОВОЕ САЛЬДО (или ТОРГОВЫЙ БАЛАНС, или САЛЬДО ТОРГОВЛИ) – Trade Balance:- measures the difference between exports and imports of both tangible goods and services. The level of the international trade balance, as well as changes in exports and imports, indicate trends in foreign trade. The difference between a nation's imports and exports of merchandise. Also known as Balance Of Trade. See also Balance Of Payments.

TRADE BARRIERS = ТОРГОВЫЕ БАРЬЕРЫ – Trade Barriers:- something that restricts or discourages trade. For example, the United States Trade Representative classifies trade barriers into eight general categories:- (i) import policies (tariff and other import charges, quantitative restrictions, import licensing, and customs barriers); (ii) standards, testing, labeling and certification; (iii) government procurement; (iv) export subsidies; (v) lack of intellectual property protection; (vi) service barriers; (vii) investment barriers;

and (viii) other barriers, e.g., barriers encompassing more than one category or barriers affecting a single sector. A term Trade Barriers means of preventing or slowing the import or export of commodities by imposing restrictions that reduce their flow. / , например, .

TRADE BILL = ТОРГОВЫЙ ВЕКСЕЛЬ – Trade Bill is a bill of exchange between traders. The value and acceptability of a trade bills depends upon the standing of the accepting trader. Bill of exchange drafted in connection with a commodity transaction. The opposite of Finance Bill. / Вексель, выпущенный в связи со сделкой по сырью. В противоположность Финансовому Векселю (Finance Bill).

TRADE CONCORDANCE = ТОРГОВЫЙ УКАЗАТЕЛЬ – Trade Concordance refers to the matching of Harmonized System (HS) codes to larger statistical definitions, such as the Standard Industrial Classification (SIC) code and the Standard International Trade Classification (SITC) system. The US Bureau of the Census, the United Nations, as well as individual US Federal and private organizations, maintain trade concordances for the purpose of relating trade and production data.

TRADE CREDITORS = ТОРГОВЫЕ КРЕДИТОРЫ – Trade Creditors is the money currently owed by the company to the suppliers of raw materials and component parts.

TRADE CREDITORS TO INVENTORY = ТОРГОВЫЕ КРЕДИТОРЫ К ИНВЕНТАРЮ – Trade Creditors to Inventory is the value of trade creditors expressed as a proportion of the value of stock. Therefore it is a measure of the extent to which the creditors fund inventories.

TRADE DATE = ДАТА СДЕЛКИ (или ДАТА ТОРГОВЛИ) – Trade Date is the date on which a securities transaction is executed. The Trade Date is the date on which parties agree to the terms of a contract. See also Effective Date. The date that the purchase or sale of securities is made. / Дата Сделки:- день, когда реально происходит сделка с ценными бумагами или товарно-сырьевыми фьючерсами. Расчётная дата (settlement date) обычно наступает через пять рабочих дней, но может варьироваться в зависимости от характера сделки и метода поставки. Смотрите также (Delayed Delivery), (Delivery Date), (Regular-Way Delivery (And Settlement)), и (Seller's Option).

TRADE DEFICIT = ДЕФИЦИТ ТОРГОВОГО БАЛАНСА – Trade Deficit is the amount by which merchandise imports exceed merchandise exports. / Дефицит торгового баланса есть не что иное, как разница на которую стоимость всех ввезённых в страну товаров превышает стоимость всех вывезенных из страны товаров. Торговый Дефицит или Активное (Положительное) Сальдо:- превышение привоза (или импорта) над вывозом (или экспортом) (торговый дефицит (trade deficit)); или вывоза (или экспорта) над привозом (или импортом) (положительное сальдо (trade surplus)), в результате чего возникает положительный или отрицательный торговый баланс (balance of trade). В торговый баланс включаются сделки с товарами и движимым имуществом, текущие счета (current account), в которых отражаются услуги и туризм, транспорт, и иные невидимые статьи (invisible items), например, проценты и прибыли, полученные за рубежом. Торговый баланс представляет собой часть совокупного платёжного баланса (balance of payments). Факторы, влияющие на торговый баланс страны, включают положение (место) её валюты по отношению к валютам стран, с которыми она ведёт торговлю (сильный Доллар США, например, делает товары, произведённые в иных странах, относительно дешёвыми для Американцев), производственные преимущества в ключевых отраслях (Японские автомобили, например) или состояние экономики торгующей страны, где производство может удовлетворять или не удовлетворять спрос.

TRADE DRESS = ТОРГОВЫЙ НАРЯД – In the patent law, a Trade Dress is a product's design, product packaging, color, or other distinguishing nonfunctional element of appearance. Trade Dress is a legal term of art that generally refers to characteristics of the visual appearance of a product or its packaging (or even the design of a building) that signify the source of the product to consumers. Trade dress is a form of intellectual property. In the United States, like trademarks, a product's Trade Dress is legally protected by the Lanham Act, the federal statute which regulates trademarks and trade dress. Trade dress protection is intended to protect consumers from packaging or appearance of products that are designed to imitate other products; to prevent a consumer from buying one product under the belief that it is another. For example, the shape, color, and arrangement of the materials of a children's line of clothing can be protectable trade dress (though, the design of the garments themselves is not protected), as can the design of a magazine cover, the appearance and décor of a chain of Mexican-style restaurants, and a method of displaying wine bottles in a wine shop. Under section 43(a) of the Lanham Act, a product's trade dress can be protected without formal registration with the United States Patent and Trademark Office (USPTO). In relevant part, section 43(a) states the following:- 'Any person who, on or in connection with any goods or services, or any container for goods, uses in commerce any word, term, name, symbol, or device, or any combination thereof, or any false designation of origin, false or misleading description of fact, or false or misleading representation of fact, which:- (A) is likely to cause confusion, or to cause mistake, or to deceive (...) as to the origin, sponsorship, or approval of his or her goods, services, or commercial activities by another person, or (B) in commercial advertising or promotion, misrepresents the nature, characteristics, qualities, or geographic origin of his or her or another person's goods, services, or commercial activities, shall be liable in a civil action by any person who believes that he or she is likely to be damaged by such an act'. This statute allows the owner of a particular trade dress ('container for goods') to sue an infringer (a person or entity who illegally copies that trade dress) for violating section 43(a) without registering that trade dress with any formal agency or system (unlike the registration and application requirements for enforcing other forms of intellectual property, such as patents). It is commonly seen as providing 'federal common law' protection for trade dress (and trademarks). Formal Registration:- Trade Dress may be registered with the United States Patent and Trademark Office (USPTO) in either the Principal Register or the Supplemental Register. Although registration is not required for legal protection, registration offers several advantages. In the Principal Register, a registrant gains nationwide constructive use and constructive notice, which prevent others from using or registering that registrant's trade dress (without contesting the registration). Further, a registrant in the Principal Register gains incontestable status after five years, which eliminates many of the ways for another party to challenge the registration. Registration under the Supplemental Register allows the registrant to protect its trade dress in foreign countries, although the protections are much more limited than protections under the Principal Register in the United States.

TRADE EVENT = ТОРГОВОЕ СОБЫТИЕ (или СОБЫТИЕ В МИРЕ ТОРГОВЛИ) – A Trade Event is a promotional activity that may include a demonstration of products or services and brings together in one viewing area the principals in the purchase and sale of the products or services. As a generic term, trade events may include trade fairs, trade missions, trade shows, catalog shows, matchmaker events, foreign buyer missions and similar functions.

TRADE FAIR = ТОРГОВАЯ ЯРМАРКА – A Trade Fair is a stage-setting event in which firms of several nationalities present their products or services to prospective customers in a preformatted setting (usually a booth of a certain size which is located adjacent to other potential suppliers). A distinguishing factor between trade fairs and trade shows is size. A trade fair is generally viewed as having a larger number of participants than other trade events, or as an event bringing together related industries.

TRADE GAP = ДЕФИЦИТ ТОРГОВОГО БАЛАНСА – Trade Gap is a difference between the larger amount of imports of merchandise and the lesser amount of exports of merchandise over a given period of time. / Разница между превышающим

большим объёмом привоза (или импорта) товаров и меньшим объёмом вывоза (или экспорта) товаров за данный период времени.

TRADE HOUSE = ТОРГОВЫЙ ДОМ – Trade House is a firm which deals in the physical commodity. / Фирма, которая заключает и исполняет сделки по поставкам фактического сырья.

TRADE IMBALANCE = ТОРГОВЫЙ ДИСБАЛАНС (или ДИСБАЛАНС ТОРГОВЛИ, или ДИСБАЛАНС В ТОРГОВЛЕ) – Trade Imbalance is a discrepancy between the amount a country imports and the amount it exports.

TRADE LIMIT MONITORING SYSTEM = СИСТЕМА КОНТРОЛЯ ЛИМИТА СДЕЛОК – Trade Limit Monitoring System is the system through which clearing members set and monitor limits on their customers' New York Mercantile Exchange (NYMEX) ACCESS® accounts, including maximum order size, maximum position size per session, session trading volume, and session trading losses.

TRADE LOSS = УБЫЛЬ ОТ ТОРГОВЛИ (или КОММЕРЧЕСКАЯ УБЫЛЬ) – Trade Loss is a loss, usually small in amount, specific to certain kinds of cargo and which, because it is expected, is uninsurable. For example, seepage or evaporation of liquid from wooden casks. / Убыль, обычно весьма малая в количественном отношении, присущая определённым видам грузов и которая, в силу своей ожидаемости, не является страхуемой. Например, просачивание или испарение жидкости из деревянных бочек или бочонков (wooden casks). Естественная убыль вследствие сыпучести или усыхания.

TRADE MARGINS = МАРЖИ ДЛЯ ТОРГОВЛИ – Trade Margins or Lower Hedge Margins are available only to commodity hedgers and not to speculators. Hedgers face lower risks than speculators because they have opposite positions in cash and futures. Price movement opposite to the held position benefits the other.

TRADE MARK = ТОВАРНЫЙ ЗНАК (или ТОРГОВАЯ МАРКА) – A Trademark is a distinctive sign which identifies certain goods or services as those produced or provided by a specific person or enterprise. Its origin dates back to ancient times, when craftsmen reproduced their signatures, or 'Marks' on their artistic or utilitarian products. Over the years these marks evolved into today's system of trademark registration and protection. The system helps consumers identify and purchase a product or service because its nature and quality, indicated by its unique trademark, meets their needs. A trademark provides protection to the owner of the mark by ensuring the exclusive right to use it to identify goods or services, or to authorize another to use it in return for payment. The period of protection varies, but a trademark can be renewed indefinitely beyond the time limit on payment of additional fees. Trademark protection is enforced by the courts, which in most systems have the authority to block trademark infringement. In a larger sense, trademarks promote initiative and enterprise worldwide by rewarding the owners of trademarks with recognition and financial profit. Trademark protection also hinders the efforts of unfair competitors, such as counterfeiters, to use similar distinctive signs to market inferior or different products or services. The system enables people with skill and enterprise to produce and market goods and services in the fairest possible conditions, thereby facilitating international trade. What kinds of trademarks can be registered? The possibilities are almost limitless. Trademarks may be one or a combination of words, letters, and numerals. They may consist of drawings, symbols, three-dimensional signs such as the shape and packaging of goods, audible signs such as music or vocal sounds, fragrances, or colors used as distinguishing features. In addition to trademarks identifying the commercial source of goods or services, several other categories of marks exist. Collective marks are owned by an association whose members use them to identify themselves with a level of quality and other requirements set by the association. Examples of such associations would be those representing accountants, engineers, or architects. Certification marks are given for compliance with defined standards, but are not confined to any membership. They may be granted to anyone who can certify that the products involved meet certain established standards. The internationally accepted 'ISO 9000' quality standards are an example of such widely-recognized certifications. How is a trademark registered? First, an application for registration of a trademark must be filed with the appropriate national or regional trademark office. The application must contain a clear reproduction of the sign filed for registration, including any colors, forms, or three-dimensional features. The application must also contain a list of goods or services to which the sign would apply. The sign must fulfill certain conditions in order to be protected as a trademark or other type of mark. It must be distinctive, so that consumers can distinguish it as identifying a particular product, as well as from other trademarks identifying other products. It must neither mislead nor deceive customers or violate public order or morality. Finally, the rights applied for cannot be the same as, or similar to, rights already granted to another trademark owner. This may be determined through search and examination by the national office, or by the opposition of third parties who claim similar or identical rights. How extensive is trademark protection? Almost all countries in the world register and protect trademarks. Each national or regional office maintains a Register of Trademarks which contains full application information on all registrations and renewals, facilitating examination, search, and potential opposition by third parties. The effects of such a registration are, however, limited to the country (or, in the case of a regional registration, countries) concerned. In order to avoid the need to register separately with each national or regional office, WIPO administers a system of international registration of marks. This system is governed by two treaties, the Madrid Agreement Concerning the International Registration of Marks and the Madrid Protocol. A person who has a link (through nationality, domicile or establishment) with a country party to one or both of these treaties may, on the basis of a registration or application with the trademark office of that country, obtain an international registration having effect in some or all of the other countries of the Madrid Union. Trademark is a word or mark that distinctly indicates the ownership of a product or service, and that is legally reserved for the exclusive use of that owner. Trademarks and service marks are primarily intended to indicate the source of goods and services and to distinguish those goods and services from those of others. They also symbolize the quality of the goods or services with which they are used. Most trademarks and service marks (called Marks) are words, but they can be almost anything that can distinguish one product or service from another, such as symbols, logos, sounds, designs or even distinctive nonfunctional product configurations. While virtually all countries recognize and offer protection for trademarks, many but not all countries recognize and protect service marks. In some countries, protection for a mark is acquired by using the mark on goods or services. In other countries, the owner must register the mark with the national trademark office before protection in that country is granted. The duration of protection afforded a mark varies greatly from country to country. Registrations are issued for finite periods of time. However, because of the fundamental purposes of these marks, namely avoiding public confusion, encouraging competition and protecting the owners' goodwill, registrations may be renewed and thus extend indefinitely as long as the marks are used. The owner of a mark may preclude others from using a similar mark if such use is likely to cause confusion in the minds of purchasers. Determining whether two marks are so similar as to be confusing usually involves a multi-factor analysis that compares the parties' marks, their goods or services, their advertising and trade channels, the defendant's intent in choosing its mark, and the presence or absence of actual confusion. As with all intellectual property, trademark and service mark laws are national in origin. Some countries grant rights to the first person to use the mark in the course of business, while other countries grant rights to the first person to obtain a registration in that country. In 'first-to-use' countries, rights may subsist without registering the mark with the national trademark office. However, registration is still desirable because it is presumptive evidence of the validity of the mark and the owner's right to use the mark. It also appears on the national register of marks providing notice to the world of the owner's use and claim of ownership. Some countries require that the mark be used in commerce prior to the issuance of a registration, while other countries permit registration based on the intent of the

applicant to use the mark in the future. Following the use or registration of a trademark, the owner must use the mark or it may become subject to attack by others on the ground that the owner has abandoned it. At a minimum, most countries require that a mark be distinctive, i.e. capable of distinguishing the goods or services of the owner of the mark from the goods or services of others. To determine whether a mark meets this test, one must determine the 'strength' of the mark. A mark's strength is usually measured across a spectrum. This spectrum includes, from weakest to strongest, terms that are generic, descriptive, suggestive, arbitrary and fanciful. At the weakest end of the spectrum lie words, symbols or devices that are not capable of distinguishing goods because they are common terms used to identify the goods themselves, e.g., book, table, chair. Such terms are called Generic Terms and are not protectable as trademarks. The next category is comprised of descriptive terms. A mark is descriptive if it describes the intended purpose, function, physical characteristic, laudatory quality or end use of the product. Examples of descriptive marks include SAVMOTOR for an engine oil additive intended to prolong the life of an automobile engine, MICRO for wheel weights that are very small, and SUPREME for wine allegedly of superior quality. Because they are not inherently distinctive, a desriptive term cannot be protectable as a mark until, through extensive sales and advertising, the term has come to identify the source of the goods bearing the mark. In the United States, when a descriptive mark achieves this level of distinctiveness, it is said to have acquired a 'secondary meaning'. In contrast to descriptive marks, suggestive marks do not immediately describe the goods with which the mark is used, but rather require thought, imagination or perception to reach a conclusion about the nature of the goods. Suggestive marks are considered inherently distinctive and protectable without first acquiring secondary meaning. Examples of suggestive marks may include HERO for hire extinguishers or GREYHOUND for bus transportation services. Arbitrary marks are words, symbols, and devices that are in common use but, when used on the goods of the trademark owner, neither describe nor suggest the quality of those goods. Examples of arbitrary marks include ARROW for liqueurs, APPLE for computers, and CAMEL for cigarettes. Like suggestive marks, arbitrary marks are inherently distinctive and secondary meaning need not be proven. The most distinctive marks are fanciful marks. A fanciful mark is a 'coined' word or symbol invented or selected for the sole purpose of functioning as a mark. Examples of fanciful marks include EXXON for gasoline, KODAK for photographic supplies, XEROX for photocopying equipment, and CLOROX for bleach. Fanciful marks are traditionally afforded the greatest scope of protection. See also Service Mark. Relates to any work, name or symbol which is used in trade to distinguish a product from other similar goods. A Trademark is a word, symbol or picture, or combination of these, used to distinguish goods or services of one person or organization from the goods or services of others in the marketplace. A trademark is registered for a period of 15 years from the date of registration. Trademarks may be renewed every 15 years without limitation. The person who is first to use the trademark or make it, or who previously registered and used the mark in a Paris Union country, or who intends to use the mark, is entitled to registration. In the latter instance, the applicant must use the mark before it will be registered. A mark not used for three consecutive years can be canceled. After five years, a valid trademark registration generally becomes incontestable on the grounds of prior use unless it can be shown that the registrant adopted his or her mark with knowledge of the other party's first use. There are 'registered use' provisions. Trademark protect words, names, symbols, sounds, or colors that distinguish goods and services from those manufactured or sold by others and to indicate the source of the goods. Trademarks, unlike patents, can be renewed forever as long as they are being used in commerce. A Trademark is a sign, or a combination of signs, which distinguishes the goods or services of one enterprise from those of another. Such signs may use words, letters, numerals, pictures, shapes and colors, as well as any combination of the above. An increasing number of countries also allow for the registration of less traditional forms of trademark, such as three-dimensional signs (like the Coca-Cola bottle or Toblerone chocolate bar), audible signs (sounds, such as the roar of the lion that precedes films produced by MGM), or olfactory signs (smells, such as perfumes). But many countries have set limits as to what may be registered as a trademark, generally allowing only signs that are visually perceptible or can be represented graphically. A trademark is a sign used on goods or in connection with the marketing of goods. The trademark may appear not only on the goods themselves but also on the container or wrapper in which the goods are sold. When used in connection with the marketing of the goods the sign may appear in advertisements, for example in newspapers or on television, or in the windows of the shops in which the goods are sold. In addition to trademarks identifying the commercial source of goods or services, several other categories of marks exist. Collective marks are owned by an association, such as an association representing accountants or engineers, whose members use the mark to identify themselves with a level of quality and other requirements set by the association. Certification marks, such as the Woolmark, are given for compliance with defined standards, but are not confined to any membership. A trademark used in connection with services is called a Service Mark. Service marks are used for example by hotels, restaurants, airlines, tourist agencies, car-rental agencies, laundries and cleaners. All that has been said about trademarks applies also to service marks. Broadly speaking, a trademark performs the following four main functions. These relate to the distinguishing of marked goods or services, their commercial origin, their quality and their promotion in the market place:- (i) To distinguish the products or services of one enterprise from those of other enterprises. Trademarks facilitate the choice to be made by the consumer when buying certain products or using certain services. The trademark helps the consumer to identify a product or service which was already known to him or which was advertised. The distinctive character of a mark has to be evaluated in relation to the goods or services to which the mark is applied. For example, the word 'Apple' or the image of an apple cannot distinguish apples, but it is distinctive for computers. Trademarks do not only distinguish products or services as such, they distinguish them in their relationship to an enterprise from which the products or services originate. (ii) To refer to a particular enterprise, not necessarily known to the consumer, which offers the products or services on the market. Thus trademarks distinguish products or services from one source, from identical or similar products or services from other sources. This function is important in defining the scope of protection of trademarks. (iii) To refer to a particular quality of the product or service for which it is used, so that consumers can rely on the consistent quality of the goods offered under a mark. This function is commonly referred to as the guarantee function of trademarks. A trademark is not always used by only one enterprise, since the trademark owner may grant licenses to use the trademark to other enterprises. It is accordingly essential that licensees respect the quality standards of the trademark owner. Moreover, trading enterprises often use trademarks for products that they acquire from various sources. In such cases, the trademark owner is not responsible for producing the products but rather (and this may be equally important) for selecting those that meet his quality standards and requirements. This argument is supported by the fact that even where the trademark owner is the manufacturer of a particular product, he may frequently use parts which have not been produced by him, but which have been selected by him. (iv) To promote the marketing and sale of products, and the marketing and rendering of services. Trademarks are not only used to distinguish or to refer to a particular enterprise or a particular quality, but also to stimulate sales. A trademark that is to fulfill that function must be carefully selected. It must appeal to the consumer, create interest and inspire a feeling of confidence. That is why this function sometimes is called the Appeal Function. The owner of a registered trademark has an exclusive right in respect of his mark. It gives him the right to use the mark and to prevent unauthorized third parties from using the mark, or a confusingly similar mark, so as to prevent consumers and the public in general from being misled. The period of protection varies, but a trademark can be renewed indefinitely on payment of corresponding fees. Trademark protection is enforced by the courts, which in most systems have the authority to block trademark infringement. Distinctive Mark or symbol that identifies a product, service or company, and that is protected by registration with the patent and trademark office. Trademarks are intangible assets. See also Brand. / чертёж (drawing). (SAVMOTOR), МАЙКРО (MICRO), СУПРИМ (SUPREME). ХИРО (HERO) ГРЭЙХАУНД (GREYHOUND). ЭРОУ (ARROW), ЭПЛ (APPLE), КЭМЭЛ (CAMEL). ЭКСАН (Эксан Мобл Корпорэйшэн; EXXON (Exxon Mobil

Corporation)), КОДАК (KODAK), ЗИРОКС (XEROX), КЛОРОКС (CLOROX). (как бутылка Кокэ-Кола (Coca-Cola) или плитка шоколада Тоблероне (Toblerone)). Знаки Обслуживания используются, например, гостиницами, ресторанами, авиалиниями, туристическими агентствами, агенствами по аренде автомобилей, химчистками и чистильщиками. Товарный Знак – это отличительное обозначение, которое идентифицирует определённые товары или услуги как произведённые или предоставленные конкретным лицом или предприятием. Он возник ещё в те давние времена, когда мастера ставили на своих художественных произведениях или утилитарных изделиях свою подпись, или 'знак'. Впоследствии все эти знаки трансформировались в современную систему регистрации и охраны товарных знаков. Эта система помогает потребителям идентифицировать и покупать те продукты или услуги, характер и качество которых, подтверждаемые их уникальным товарным знаком, отвечают их потребностям. Какова функция товарного знака? Товарный знак предоставляет владельцу знака охрану в виде исключительного права на пользование знаком для идентификации его товаров и услуг среди прочих или на предоставление такого права другому лицу в обмен на вознаграждение. Срок охраны может варьироваться, однако после истечения первоначально установленного срока охраны при условии уплаты дополнительных пошлин срок охраны товарного знака может продлеваться на неопределённый период. Защиту охраняемых товарных знаков осуществляют суды, и в большинстве стран они правомочны принимать меры по пресечению нарушений прав на товарные знаки. В более широком смысле, использование товарных знаков способствует развитию инициативы и предпринимательства во всем мире, принося их владельцам признание и материальную выгоду. Охрана товарных знаков также препятствует попыткам осуществлять недобросовестную конкуренцию, в частности, использованию сходных до степени смешения или поддельных товарных знаков с целью сбыта товаров и услуг более низкого качества или не соответствующих оригинальному знаку по другим показателям. Система позволяет предприимчивым и талантливым людям производить и сбывать товары и услуги на наиболее справедливых условиях, что способствует развитию международной торговли. Какие товарные знаки можно регистрировать? Возможности в этом плане практически неисчерпаемы. Товарный знак может состоять из одного слова, буквы или цифры, либо любого их сочетания. Он может состоять из рисунков, символов, трёхмерных обозначений, реализуемых, например, в форме и упаковке изделий, слышимых звуковых сигналов, таких как музыка или звуки человеческого голоса, запахов или цвета, используемых в качестве отличительных признаков. Кроме знаков, идентифицирующих коммерческое происхождение изделия или услуги, существует несколько дополнительных категорий товарных знаков. Владельцами коллективных знаков могут быть ассоциации, члены которых путём их использования ставят знак равенства между собой и установленными ассоциацией требованиями качества и другими требованиями. Примером таких ассоциаций являются ассоциации бухгалтеров, инженеров или архитекторов. Сертификационные знаки присваиваются за соответствие установленным стандартам, однако сфера их применения не ограничена тем или иным профессиональным обществом. Они могут присваиваться любому лицу, способному доказать, что его изделия соответствуют определённым установленным стандартам. В качестве примера сертификационных знаков, получивших международное признание, можно упомянуть стандарты качества ISO 9000. Каков порядок регистрации товарных знаков? Вначале в соответствующее национальное или региональное ведомство подаётся заявка на регистрацию товарного знака. Заявка должна содержать чёткое изображение знака, регистрация которого испрашивается, включая чёткое воспроизведение цвета, формы или трёхмерных элементов. В заявке также необходимо указать перечень товаров или услуг, для которых испрашивается охрана знака. Для получения охраны в качестве товарного или иного знака сам знак должен удовлетворять определённым условиям. Он должен обладать различительной функцией, с тем чтобы потребители могли узнавать его как присущий определённой продукции и одновременно не спутать его с другими товарными знаками, идентифицирующими другие продукты. Товарный знак не должен нести ложной или вводящей в заблуждение информации, он также не должен противоречить общественному порядку или морали. Кроме того, испрашиваемые права не могут полностью или частично совпадать с правами, уже предоставленными владельцу другого товарного знака. Это устанавливается путём поиска и экспертизы, проводимых национальным ведомством, либо путём рассмотрения возражения третьих лиц, претендующих на такие же или аналогичные права. На какой территории действует охрана товарных знаков? Почти все страны мира проводят регистрацию и предоставляют охрану на товарные знаки. В каждом национальном или региональном ведомстве имеется реестр товарных знаков, в котором содержится исчерпывающая информация о заявках на все регистрации и продления, что облегчает проведение экспертизы и поиска, а также действия третьих лиц в плане возможных возражений. Однако, действие такой регистрации ограничивается территорией страны, в которой она осуществлена (а в случае региональной регистрации – территориями соответствующих стран). Для того, чтобы избежать необходимости регистрации в каждом национальном либо региональном ведомстве, ВОИС выполняет административные функции системы международной регистрации знаков. Эта система регулируется двумя договорами:- Мадридским Соглашением о международной регистрации знаков и Мадридским Протоколом. Лицо, имеющее связь (то есть гражданство, место постоянного проживания или действительное и нефиктивное коммерческое предприятие) с одной из стран – участниц одного или обоих упомянутых договоров, на основании подачи заявки либо регистрации в национальном ведомстве этой страны может получить международную регистрацию, признаваемую действительной в некоторых или во всех других странах Мадридского Союза. В настоящее время участниками одного или обоих соглашений являются более 60 стран. Товарный Знак предназначен, главным образом, для указания источника и качества товаров, а также их отличия от аналогичных товаров иных компаний. Обычно под товарным знаком предполагается какое-то слово, но кроме этого также могут быть использованы символы, логотип (logo), дизайны, звуки и тому подобное. Словесные ТЗ (сочетание отдельных букв, цифр, фамилия), изобразительные ТЗ (рисунки, графические символы, сочетания цветов), объёмные ТЗ (форма изделий или упаковки). , то есть . , например, . Заводская Марка или Фабричная Марка это графический знак (рисунок, надпись) на изделиях или их упаковке. Под Товарным Знаком понимается оригинально оформленное графическое изображение, оригинальное название, особое сочетание цифр, букв или слов и тому подобного, которым предприятие снабжает свои изделия. Один из объектов промышленной собственности. Под Товарным Знаком (ТЗ) понимается символ или надпись, применяемые предприятием для обозначения продукции определённой модели или вида и помещаемые на самой продукции, её упаковке (таре), товаросопроводительной документации. Товарный Знак может быть словесным (сочетание отдельных букв, цифр, фамилия), изобразительным (рисунок, графический символ). Товарный Знак (ТЗ) или Торговая Марка (ТМ):- отличительное название или символ, служащие для идентификации товара, услуги или компании. В США права на торговую марку – право запрещать конкурентам использовать аналогичные символы при продажах или рекламе – возникают на основании использования; то есть регистрация не обязательна для получения юридического права на торговую марку. Торговая марка, регистрируемая в Бюро по Патентам и Торговым Маркам США, действует в течение 20 лет и обновляется по мере использования. Продукция может быть запатентована и защищена торговой маркой. Здесь преимущество заключается в том, что, когда патент истекает, эксклюзивное владение маркой может быть обеспечено на бесконечный срок с помощью торговой марки. Торговая марка указывается в балансовой ведомости (balance sheet) в качестве нематериального актива (intangible asset). Хотя, так же как и права на землю, торговые марки могут действовать в течение неограниченного периода времени и формально не могут амортизироваться, на практике бухгалтеры амортизируют торговые марки в течение срока их прогнозируемого действия, который не превышает обычно 40 лет.

TRADEMARK ACT = АКТ О ТОВАРНЫХ ЗНАКАХ – In the United States, the Trademark Act of 1946, as Amended (Public Law 79-489, Chapter 540, approved July 05, 1946; 60 STAT. 427) – currently contained in Chapter 22 of Title 15 of the United States Code (USC); the major body of US law that governs federal registration of trademarks. The Trademark Act of 1946 (Lanham Act) amended by the Trademark Revision Act of 1988. The Trade-Mark Act of 1905 superseded the Trade-Mark Act of March 03, 1881, ch. 138, 21 Stat. 502, entitled 'An Act to authorize the registration of trade-marks and protect the same', and also act August 05, 1882, ch. 393, 22 Stat. 298, entitled 'An Act relating to the registration of trade marks'. Former section 109 of this title repealed all inconsistent acts and parts of acts, except so far as they might apply to certificates of registration issued under the Trade-Mark Act of March 03, 1881, ch. 138, and act August 05, 1882, ch. 393. Act July 05, 1946, ch. 540, 60 Stat. 427, which is classified to this chapter, is popularly known as the 'Lanham Act' and also as the 'Trademark Act of 1946'.

TRADEMARK APPLICATION = ЗАЯВКА НА ТОВАРНЫЙ ЗНАК (или ЗАЯВКА НА РЕГИСТРАЦИЮ ТОВАРНОГО ЗНАКА) – Trademark Application is a document by which a person requests a federal trademark registration. To receive a filing date, an application must include (i) the applicant's name, (ii) a name and address for correspondence, (iii) a clear drawing of the mark sought to be registered, (iv) a list of the goods or services, and (v) the application filing fee. / чертёж (drawing).

TRADEMARK APPLICATION AND REGISTRATION RETRIEVAL = ВОССТАНОВЛЕНИЕ ЗАЯВКИ И РЕГИСТРАЦИИ ТОВАРНОГО ЗНАКА – In the United States, the Trademark Application and Registration Retrieval (TARR) system:- USPTO's (short for the United States Patent and Trademark Office) online database for monitoring federal trademark applications and registrations. Using TARR, applicants, trademark owners and the public may check the status of pending trademark applications and registrations. To access information about a specific mark, users must provide the associated serial number or registration number of the record they seek.

TRADEMARK DOCUMENT RETRIEVAL = ВОССТАНОВЛЕНИЕ ДОКУМЕНТОВ НА ТОВАРНЫЙ ЗНАК – In the United States, a Trademark Document Retrieval (TDR) system:- online retrieval of documents from the electronic case file for federal trademark applications and registrations. To access information about a specific mark, users must provide the associated serial number, registration number, reference number, or international registration number of the record they seek.

TRADEMARK ELECTRONIC APPLICATION SYSTEM = ЭЛЕКТРОННАЯ СИСТЕМА ПОДАЧИ ЗАЯВОК НА РЕГИСТРАЦИЮ ТОВАРНОГО ЗНАКА – Trademark Electronic Application System (TEAS) is the USPTO's (short for the United States Patent and Trademark Office) electronic filing system. It may be used to file a variety of documents with the USPTO, including new trademark applications, amendments to allege use, statements of use, responses to Office actions, and changes of address, just to name a few.

TRADEMARK ELECTRONIC SEARCH SYSTEM = ЭЛЕКТРОННАЯ ПОИСКОВАЯ СИСТЕМА ТОВАРНЫХ ЗНАКОВ – Trademark Electronic Search System (TESS):- USPTO's online database for searching pending, registered and dead federal trademarks. TESS is free and intended for use by the general public. Due to limitations of equipment and bandwidth, TESS is not intended to be a source for bulk downloads of USPTO (short for the United States Patent and Trademark Office) data. Bulk data may be purchased from USPTO at cost (see the USPTO Products and Services Catalog). Individuals, companies, IP addresses, or blocks of IP addresses who, in effect, deny service to the general public by generating unusually high numbers of daily TESS accesses (searches, pages, or hits), whether generated manually or in an automated fashion, may be denied access to these servers without notice.

TRADEMARK IMAGE CAPTURE AND RETRIEVAL SYSTEM = СИСТЕМА ЗАХВАТА И ВОССТАНОВЛЕНИЯ ИЗОБРАЖЕНИЯ ТОВАРНОГО ЗНАКА – In the United States, the Trademark Image Capture and Retrieval System (TICRS) is a system used within the United States Patent and Trademark Office (USPTO) to scan, store and provide access to images of papers associated with trademark registrations.

TRADEMARK MANUAL OF EXAMINING PROCEDURE = ПОСОБИЕ ПО ПРОЦЕДУРЕ ЭКЗАМЕНАЦИИ ТОВАРНОГО ЗНАКА – Trademark Manual of Examining Procedure (TMEP) is a reference work on the practices and procedures relative to prosecution of applications to register marks in the United States Patent and Trademark Office (USPTO). It contains guidelines for USPTO examining attorneys, trademark applicants and owners, and attorneys and representatives for trademark applicants and owners. The TMEP contains information about the trademark examination process, and outlines the procedures which examining attorneys are required or authorized to follow in the examination of trademark applications.

TRADEMARK POSTAL SYSTEM = ПОЧТОВАЯ СИСТЕМА ПО ТОВАРНЫМ ЗНАКАМ – In the United States, a Trademark Postal System (TPostal):- The Department of Commerce's United States Patent and Trademark Office (USPTO) recently (November 2002) implemented a new electronic bulk mailing system in cooperation with the US Postal Service. The Trademark Postal System, or TPostal, uses the Postal Service's NetPost Mailing Online service to process trademark bulk mail. The USPTO is the first federal agency to take advantage of the faster, more efficient electronic service. The economic importance of trademarks is more important today than ever before. Information regarding the status of a registration must be provided to the owner accurately and quickly. Working in cooperation with the Postal Service, the USPTO was able to develop a faster, less expensive fully automated system to generate and send bulk mail to its trademark customers. Information is sent to the Postal Service Web site at http://www.usps.com for printing, stamping, and mailing within 24 hours of receipt. By using standard postcards rather than windowed letters, the labor, materials and postage costs are reduced significantly.

TRADEMARK REPORTING AND MONITORING = ОТЧЁТНОСТЬ И НАБЛЮДЕНИЕ ЗА ТОВАРНЫМИ ЗНАКАМИ – Trademark Reporting And Monitoring (TRAM) is a system used by trademark examiners within the United States Patent and Trademark Office (USPTO).

TRADEMARK TRIAL AND APPEAL BOARD = ПАЛАТА ПО СУДЕБНЫМ РАЗБИРАТЕЛЬСТВАМ И АПЕЛЛЯЦИЯМ В ОТНОШЕНИИ ТОВАРНЫХ ЗНАКОВ – Trademark Trial and Appeal Board (TTAB) is an administrative tribunal at the United States Patent and Trademark Office (USPTO). It has jurisdiction over appeals from decisions of the Trademark Office, as well as opposition proceedings and cancellation proceedings.

TRADEMARK WORK–AT–HOME = НАДОМНАЯ РАБОТА ПО ОБСЛУЖИВАНИЮ ТОВАРНЫХ ЗНАКОВ – Trademark Work-at-Home (TW@H) is a telecommuting work alternative for Trademark employees.

TRADE MISSION = ТОРГОВАЯ МИССИЯ – Generically, a Trade Mission is composed of individuals who are taken as a group to meet with prospective customers overseas. Missions visit specific individuals or places with no specific stage setting other than appointments. Appointments are made with government and/or commercial customers, or with individuals who may be a stepping stone to customers. Official trade missions are scheduled in selected countries to help participants find local agents, representatives, and distributors, to make direct sales, or to conduct market assessments. Some missions include technical seminars to support sales of sophisticated products and technology in specific markets. Trade missions include planning and publicity, appointments with

qualified contacts and with government officials, market briefings and background information on contacts, as well as logistical support and interpreter service. Trade missions also are frequently organized by other Federal, State or local agencies.

TRADE NAME = ТОРГОВОЕ НАЗВАНИЕ – Trade Names:- another category of industrial property covers commercial names and designations. A commercial or trade name is the name or designation that identifies an enterprise. In most countries, trade names may be registered with a government authority. However, under Article 8 of the Paris Convention for the Protection of Industrial Property a trade name must be protected without the obligation of filing or registration, whether or not it forms part of a trademark. Protection generally means that the trade name of one enterprise may not be used by another enterprise either as a trade name or as a trade or service mark; and that a name or designation similar to the trade name, if likely to mislead the public, may not be used by another enterprise. Trade Name is a trademark or other designation by which a commercial product is identified.

TRADE–OFF = ПОСТУПИТЬСЯ (или ВЗАИМОУВЯЗКА, или УСТУПКА, или РАСПРОДАЖА) – Trade-Off:- when choices are made (collectively or by an individual) to accept having less of one thing in order to get more of something else, the results are called Trade-Offs. For example, when one is allocating (limited) funds, the trade-off usually involves reduced spending for some purposes in order to be able to spend more for other more urgent purposes. However, the concept does not apply only (or even primarily) to decisions involving money. A student faced with the choice of spending Saturday studying for a Political Economy exam or shopping at The Mall makes a trade-off of shopping time for study time in deciding how many hours to study and how many to spend shopping. Society also makes trade-offs – such as, for example, between its need for a more plentiful supply of energy and its need to prevent excessive deterioration of the environment caused by energy production technologies. Evaluating trade-offs, when done carefully and systematically, involves comparing the costs and benefits of each of the available alternatives with each other. Most choices (and thus most trade-offs) are not all-or-nothing decisions; rather they typically involve small changes at the margin – a little more of this at the cost of a little less of that. Consumers continuously practice marginalism and make trade-offs as they consider whether to buy one more unit or one unit less of a good or service in their efforts to obtain a mix of goods and services that afford them the greatest satisfaction for their available buying power. Producers must constantly be deciding (and reevaluating) their trade-offs in choosing whether to produce somewhat more or somewhat less of a particular product, whether to add a few more workers or lay a few off, whether to invest in more plant and equipment or whether to close down some of existing capacity, and so on – in their efforts to maximize profits. Xxxxx. A Trade-Off (or Tradeoff) is a situation that involves losing one quality or aspect of something in return for gaining another quality or aspect. It implies a decision to be made with full comprehension of both the upside and downside of a particular choice. In economics the term is expressed as opportunity cost, referring to the most preferred alternative given up. A trade-off, then, involves a sacrifice that must be made to obtain a certain product, rather than other products that can be made using the same required resources. For a person going to a basketball game, its opportunity cost is the money and time expended, say that would have been spent watching a particular television program. Trade-offs are important in engineering. For example, in electrical engineering, negative feedback is used in amplifiers to trade gain for other desirable properties, such as improved bandwidth, stability of the gain and/or bias point, noise immunity, and reduction of nonlinear distortion. The Golden Gate Bridge (The Golden Gate Bridge is a suspension bridge spanning the Golden Gate, the opening of the San Francisco Bay into the Pacific Ocean) is a prime rare example where few engineering and aesthetic trade-offs had to be made. / Мост Золотые Врата.

TRADE OPTION = ТОРГОВЫЙ ОПЦИОН (или ТОРГОВАТЬ ОПЦИОНОМ) – Trade Option:- a commodity option transaction in which the taker is reasonably believed by the writer to be engaged in business involving use of that commodity or a related commodity. / Операция с опционом на сырьё, в которой взявший (покупатель), резонно полагает, что выписывающий (продавец) занимается делом, вовлечённым с использованием того сырья или связанного с ним сырья.

TRADER = ТОРГОВЕЦ – (1) Trader is a merchant involved in cash commodities. / Торговец – коммерсант, вовлечённый в торговлю реальными родами сырья. Торговец:- в общем значении, любое лицо, покупающее и продающее товары или услуги для получения прибыли; дилер (dealer) или коммерсант (merchant). Смотрите также (Barter), и (Trade). В инвестиционной деятельности:- (1) лицо, занимающееся покупкой и продажей ценных бумаг – акций (stocks), облигаций (bonds), опционов (options), или товарно-сырьевой продукции, например, Пшеницы, золота, или иностранной валюты (foreign exchange), по своему счёту, то есть в качестве дилера или принципала (principal), а не в качестве брокера (broker) или агента (agent). (2) Частное лицо, занимающееся покупкой и продажей ценных бумаг или товарно-сырьевой продукции по своему счёту с целью получения краткосрочной прибыли; спекулянт (speculator). Смотрите также (Day Trade), (Competitive Trader), (Floor Trader), (Registered Competitive Market Maker), (Registered Competitive Trader), и (Speculation).

(2) Trader is a professional speculator who trades for his own account and who typically holds exchange trading privileges. Individuals who buy and sell for their own accounts for short-term profit. Also, an employee of a broker/dealer or financial institution who specializes in handling purchases and sales of securities for the firm and/or its clients. See also Investor and Speculator.

TRADE–RELATED ASPECTS OF INTELLECTUAL PROPERTY RIGHTS = АСПЕКТЫ ПРАВ НА ИНТЕЛЛЕКТУАЛЬНУЮ СОБСТВЕННОСТЬ, СВЯЗАННЫЕ С ТОРГОВЛЕЙ – The Uruguay Round of international trade negotiations, launched under the auspices of the General Agreement on Tariffs and Trade (GATT) in Punta del Este, Uruguay, in September 1986, came to a conclusion seven years later on 1993-December-15. The results of the negotiations was a comprehensive set of agreements, including one on Trade-Related Aspects of Intellectual Property Rights (TRIPS). The TRIPS agreement is considered to be among the most important parts of the world trade pact. In essence, the agreement requires member countries to adopt a certain minimum standard of international property protection. For example, in the area of trademarks, the agreement defines which types of marks are eligible for protection, and states that internationally well-known marks shall enjoy additional protection. Under the TRIPS agreement, member countries are obliged to rewrite national laws to make them conform to internationally agreed norms for the protection of patents, trademarks, copyrights, industrial designs, trade secrets, and integrated circuits (semiconductor chip mask works). It also broadens the areas of protection to include technological areas, such as pharmaceutical products, computer software, and inventions and works arising from new technologies, that are not currently protected in many countries. The TRIPS agreement also attempts to prevent any use of geographical terms that may mislead consumers as to the origin of goods. Some aspects of the agreement relating to the use of such geographical terms have not been completely resolved, but the TRIPS agreement does provide for future negotiations on unresolved issues. For example, during the GATT/TRIPS negotiations the United States and others argued that the term ‘champagne’ had become a generic term for a certain type of beverage; the European Union argued the contrary view. Ultimately, the United States passed GATT legislation requiring the Patent and Trademark Office to treat all false geographical indications for wines and spirits, e.g., BORDEAUX wine originating from anywhere other than the Bordeaux region of France, as unregisterable. In the area of copyrights, the agreement requires compliance with the latest (1971) rules of the Berne Convention. Under the TRIPS agreement, countries will amend their national legislation and practices to conform with the agreement’s provisions according to the following timetable:- developed countries over one year; former Soviet bloc and developing countries over five years; and less developed countries over 11 years. The TRIPS accord includes enforcement provisions which provide for the use of improved international dispute settlement

procedures under the World Trade Organization (WTO) for disputes between countries. The accord also permits cross-sectoral retaliation for a violation of TRIPS obligations; if a country fails to protect patents, for example, it could face retaliation in an unrelated sector. See also The Berne Convention, The European Patent Convention, The Madrid Agreement, The Madrid Protocol, The Paris Convention, and The Patent Cooperation Treaty. / Пунта дэль Эстэ (Punta del Este). , например, . интегральные микросхемы . Генерального Соглашения о Тарифах и Торговле (ГСТТ или ГЯТ (GATT)) . Бордо (BORDEAUX).

TRADER WORKSTATION = РАБОЧАЯ СТАНЦИЯ ТОРГОВЦА – Trader Workstation is a New York Mercantile Exchange (NYMEX®) ACCESS® workstation through which NYMEX ACCESS® orders are placed. / НАЙМЭКС АКСЭС® (NYMEX ACCESS®).

TRADES = TREASURY/RESERVE AUTOMATED DEBT ENTRY SYSTEM

TRADE SECRET = ТОРГОВЫЙ СЕКРЕТ (или КОММЕРЧЕСКАЯ ТАЙНА) – A Trade Secret is information that is secret or not generally known in the relevant industry and that gives its owner an advantage over competitors. Trade secret protection exists as long as the information is kept secret or confidential by its owner and is not lawfully and independently obtained by others. Examples of trade secrets include formulas, patterns, methods, programs, techniques, processes or compilations of information that provide one's business with a competitive advantage. The owner of a trade secret may recover damages resulting from the improper disclosure or use of its trade secret by another. Trade secrets are not registered like other forms of intellectual property, and are not creatures of statutes. Instead, the judicial systems of each country determine the requirements for obtaining trade secret protection. Some of the factors commonly considered include:- (i) the extent to which the information is known outside of the business; (ii) the extent to which the information is known by employees and others involved in the trade secret owner's business; (iii) the extent of the measures taken to guard the trade secrets; (iv) the value of the information to the owner and his competitors; (v) the amount of money or effort expended by the trade secret owner in developing the secret; and (vi) the effort required by others to acquire or duplicate (through reverse engineering) the information. The 'secrecy' of an alleged trade secret is the most important factor to be considered. If the information claimed to be a trade secret is available through any legitimate means and is obtained in this way, then the information is no longer 'secret' and may become ineligible for protection. However, if the owner has taken reasonable steps to protect the information, but the trade 'secret' information nonetheless is publicly disclosed, the courts in many countries may still grant protection. Such 'reasonable' steps may include requiring those persons who encounter the information as the result of normal business ventures to sign confidentiality and nondisclosure agreements. Trade Secret is an information that companies keep secret to give them an advantage over their competitors. / К Торговому Секрету относится информация, являющаяся секретом или неизвестная в целом в соответствующей отрасли, и которая даёт её владельцу преимущество над конкурентами. Примеры торговых секретов включают формулы, рисунки, методы, программы, технические приёмы, процессы или подборка информации, обеспечивающая только одному данному предприятию выгоды в конкуренции с другими.

TRADE SHOW = КОММЕРЧЕСКИЙ ПОКАЗ (или ТОРГОВАЯ ВЫСТАВКА) – A Trade Show is a stage-setting event in which firms present their products or services to prospective customers in a preformatted setting, usually a booth of a certain size which is located adjacent to other potential suppliers. The firms are generally in the same industry but not necessarily of the same nationality since trade fairs are international. A distinguishing factor between trade fairs and trade shows is size. A trade show is generally viewed as a smaller assembly of participants.

TRADE ULLAGE = КОММЕРЧЕСКИЙ НЕЗАПОЛНЕННЫЙ ОБЪЁМ (или КОММЕРЧЕСКАЯ НЕЗАПОЛНЕННАЯ ЁМКОСТЬ) – Trade Ullage is an allowance for natural loss to cargo, e.g., evaporation. / Допуск для естественной убыли груза, например, вследствие испарения.

TRADE–WEIGHTED VALUE OF THE DOLLAR = УРАВНОВЕШЕННАЯ ТОРГОВЛЕЙ СТОИМОСТЬ ДОЛЛАРА – In the United States, the Trade-Weighted Value Of The Dollar is the value of the Dollar pegged to, or expressed relative to, a market basket of selected foreign currencies. The Federal Reserve calculates a trade-weighted value of the Dollar based on the weighted-average exchange value of the Dollar against the currencies of 10 industrial countries.

TRADING = ТОРГОВЛЯ – Trading is an activity of a trader in all its meanings (buying and selling, etc). The process of opening a position in a market with the expectation of realizing a profit. Trading is a rapid buying and selling of securities aimed at capitalizing on short-term price fluctuations. / Процесс открытия позиции на рынке в надежде получения прибыли.

TRADING AHEAD = УПРЕЖДАЮЩАЯ ТОРГОВЛЯ (или ТОРГОВЛЯ С УПРЕЖДЕНИЕМ) – Trading Ahead:- when a specialist trades securities for his or her own firm's account when there are unexecuted customer orders to buy or sell such securities, which could have been executed at the same price. Trading ahead is specifically prohibited by NYSE® rules, since it places the customers at a disadvantage when trading. As well, by taking undue advantage of his or her privileged position, the specialist is damaging the integrity of the market. Trading ahead was initially prohibited by NYSE® Rule 92. Subsequently, in order to reduce regulatory duplication and streamline compliance, the NYSE® and AMEX® replaced Rule 92 with FINRA Rule 5320 with effect from September 12, 2011. FINRA Rule 5320 prohibits a member firm that accepts a customer order for a security, but does not execute it, from trading the security for the firm's proprietary account at a price that would have satisfied the customer order. However, the firm can redeem the situation by immediately thereafter executing the customer order at a price that is at least the same, if not better, than the price it obtained for its own account. Otherwise it would be a violation of Rule 5320. There are certain exceptions to Rule 5320, including exceptions for large orders and institutional orders, a 'no-knowledge' exception and an odd lot and bona fide error transaction exception. See also Front Running. / НЙФБ® или Эн.Уай.Эс.И.® (NYSE®). АМЭКС® (AMEX®). заслуживающий доверия или действительный (bona fide). Смотрите также Упреждение (Front Running).

TRADING ARCADE = ТОРГОВАЯ АРКАДА – Trading Arcade is a facility, often operated by a clearing member that clears trades for locals, where e-locals who trade for their own account can gather to trade on an electronic trading facility (especially if the exchange is all-electronic and there is no pit or ring).

TRADING CHANNEL = ТОРГОВЫЙ КОРИДОР – When charting the price of an asset, this is the space on the chart between an asset's support and resistance levels. The price of the asset will stay within the support and resistance levels until a breakout occurs. Range traders will buy an asset when its price is near the bottom of the trading channel and sell it when the price gets close to the top of the trading channel, making a profit on the price spread. Trading channels may be flat, ascending or descending. / В техническом анализе биржевых рынков, Торговый Коридор это своего рода коридор, построенный на графике изменения цен посредством проведения линий по характерным максимальным и минимальным значениям цен для продолжительного временного интервала. В целом, рынки большую часть времени проводят в торговых коридорах. Однако в них очень сложно вести прибыльную торговлю. Торговые коридоры легко увидеть в прошлом, но их почти невозможно прогнозировать. Пробой за пределы торгового коридора предполагает грядущее изменение цен в направлении пробоя.

TRADING DAY = ТОРГОВЫЙ ДЕНЬ – Most securities, indexes, futures contract and commodities trade for a single session, lasting several hours each day, while others are traded during multiple sessions lasting many hours. Exchange trading systems, such as GLOBEX® from the Chicago Mercantile Exchange, offer around-the-clock trading for an increasing number of contracts. These trading systems, and the longer trading hours they offer, make the trading day difficult to distinguish. Most vendors of electronic trading systems attempt to display the trading day for each market, beginning with the morning opening in each market's primary trading location or beginning with the Exchange's established opening time. For selected contracts traded through the GLOBEX® system, the CME® has established an opening time coinciding with the opening of the Far Eastern markets. For example:- the CME® has established that the opening time for Eurodollars is 14:45 CT (02:45 pm CT). Therefore, the vendors' daily chart for Eurodollars contains data from 14:45 to 13:59 (the close of the primary session) the following day. / Большинство ценных бумаг, индексов, фьючерсных контрактов и товарно-сырьевых позиций торгуются на биржевых площадках в течение одной сессии, длящейся несколько часов каждый день, в то время как оставшиеся торгуются в течение многоразовых сессий, длящихся часами. Биржевые торговые системы, такие как ГЛОБЭКС® (GLOBEX®) от Чикагской Товарной Биржи, предлагают круглосуточную торговлю по всё более увеличивающемуся количеству контрактов. Эти торговые системы и всё более увеличивающиеся часы торговли, предлагаемые ими, делают трудно различимым понятие торгового дня. Большинство разработчиков электронных торговых систем пытаются отражать торговый день по каждому рынку, начиная с утреннего открытия первичной торговой сессии для этого рынка или начиная со времени открытия, утверждаемого той или иной Биржей. Для ряда контрактов, торгуемых в системе ГЛОБЭКС®, ЧТБ утвердила часы открытия торгов, совпадающие с открытием торгов по этим рынкам на биржах Юго-Восточной Азии. Например, ЧТБ утвердила время открытия торгов по Евродолларам в 14:45 по времени Центральной Временной Зоны в США (или в 02:45 после полудня по времени Центральной Временной Зоны в США). В этой связи графики дневных торгов по Евродолларам, выстраиваемые с помощью программ различных разработчиков, содержат данные начиная с 14:45 до 13:59 (закрытие первичной торговой сессии) следующего дня.

TRADING DESK = ТОРГУЮЩАЯ КОНТОРА – In the United States, the group at the Federal Reserve Bank of New York that conducts open market operations for the Federal Reserve System and intervenes in foreign currency markets for the Federal Reserve and Treasury. Also known as The Desk.

TRADING DIVIDENDS = ТОРГОВЛЯ ДИВИДЕНДАМИ – When a stock pays a dividend the amount of the dividend is subtracted from the price of the stock. For example, if XYZ stock is trading at USD100.00, it will trade at USD99.00 after paying a USD1.00 dividend. Empirical evidence shows that when a stock goes ex-dividend, the stock usually trades above it's ex-dividend price. A USD100.00 stock that pays a USD1.00 dividend will trade above USD99.00 at the open most of the time. Profiting from this requires that the stock is purchased at the close of trading the day before a stock goes ex-dividend. The stock must be sold the following day, the ex-dividend day, immediately at the open. Just how much can be made by trading dividends depends on how much the stock trades above the ex-dividend on the open. Statistically, stocks paying more than 3% annualized lose only 72% of their dividend value when the market opens on the ex-dividend date. Consider USD100 000.00 worth of stock paying a quarterly dividend with a 4% annual yield. A quarterly dividend payment would equal USD1 000.00. Theoretically, the value of this stock would drop to USD99 000.00. If this stock loses only 72% of it's dividend value, the value of the stock would drop to USD99 280.00. The holder of the stock would incur a capital loss of USD720.00, then receive USD1 000.00 on the dividend pay date, for a net profit of USD280.00. The cost of the round trip trade must be deducted from the transaction, and that would diminish the overall return. A significant benefit of trading dividends is the potential tax benefit. Dividend income is taxed at 15%, while the capital loss incurred can be deducted at the marginal tax rate. This rate varies depending on your tax bracket. A taxpayer subject to a 33% marginal tax rate would have the added benefit of paying a tax rate reduced by 18% on the USD1 000.00 dividend. In the above example trade, the immediate benefit would be USD280.00 less commissions, and the deferred benefit would be 18% of USD720.00. Although this return on investment may appear small, the benefit can be realized frequently, and the aggregate of these trades can be significant. Disadvantages of trading dividends are:- (i) A lot of capital must be put at risk for a relatively small return. There are strategies to reduce or eliminate this risk using options. The idea of being subject to overnight risk can be unacceptable to most experienced traders. (ii) The dividend distribution is unavailable during the period between the ex-dividend date and the pay date. (iii) Implementing this strategy requires tracking dividend payments. (iv) Trades must be made at the close of trading and again at the open each time a dividend play is made, requiring the trader be available to trade at frequent intervals. The advantages are:- (i) the net capital loss is usually less than the dividend payout; (ii) reduced tax liability, since dividends are taxed at a lower rate than than capital gains; and (iii) deferred tax liability, if the pay date is in the calendar year following the ex-dividend date. There are guidelines for trading dividends:- (i) set the minimum yield that will result in a profit. This number is relative to the capital at risk. (ii) Buy the dividend bearing security as near to the market close the day before ex-dividend date as possible. (iii) Always trade with a market order. (iv) Get out at the open on the ex-dividend date with a market order. (v) Do not place a market order before the open. Trading Dividends is a technique of buying and selling stocks in other firms by a corporation in order to maximize the number of dividend it can collect. This action is advantageous, because 80% of the dividend income it receives from the stocks of other companies is not taxed, according to Internal Revenue Service regulations. / Торговля Дивидендами:- метод покупки и продажи компанией акций других компаний с тем, чтобы максимизировать получаемые дивиденды. Подобная практика является выгодной, поскольку 80% дохода от дивидендов, который компания получает по акциям других компаний, не подвергается налогообложению согласно предписаниям Службы Внутренних Доходов (СВД). Смотрите также (Dividend Exclusion).

TRADING FACILITY = ТОРГОВАЯ ПЛОЩАДКА (или ПЛОЩАДКА ДЛЯ ТОРГОВЛИ) – Trading Facility is a person or group of person that provides a physical or electronic facility or system in which multiple participants have the ability to execute or trade agreements, contracts, or transactions by accepting bids and offers made by other participants in the facility or system. See also Many-To-Many.

TRADING FLOOR = ТОРГОВЫЙ ПОЛ – In the stock exchange, physical area where stock traders buy and sell stocks and bonds listed on the exchange. Also known as Ring. A physical trading facility where traders make bids and offers via open outcry or the specialist system. Trading Floor is a traditional type of exchange where market participants are physically present at specific hours in one place (trading room) to personally conduct proprietary trading or customers' orders (open outcry trading). Open outcry trading is continually losing its importance in comparison to computerized trading. Electronic trading systems, such as Xetra®, are crowding out traditional open outcry trading. More than 90 precent of the trading in German shares is carried out using Xetra®. Trading Floor and surrounding booths and facilities which are governed by the exchange. See also Floor. / Ксэтра® (Xetra®). Торговый Пол – место на бирже опционов, где осуществляются сделки купли/продажи контрактов.

TRADING FLOOR SYSTEM = СИСТЕМА ТОРГОВОГО ПОЛА – Trading Floor System is a traditional exchange trading in which lead brokers, independent brokers and traders are physically present on the trading floor during the exchange's business hours. A characteristic feature of a trading floor system is the personal communication between market participants. Floor trading is increasingly being replaced by computerized exchanges using electronic trading systems, e.g., Xetra® and Eurex® (fully electronic trading). The

Frankfurt Stock Exchange is the most important trading floor system in Germany. / Ксэтра® (Xetra®) и Ойрэкс® или Юрэкс® (Eurex®). коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо).

TRADING FOR OWN ACCOUNT = ТОРГОВЛЯ ЗА СОБСТВЕННЫЙ СЧЁТ – Trading For Own Account:- a commission agent, broker, forwarding agent or trustee instructed to execute a transaction for a client can act as contracting party (§§ 400pp. German Commercial Code). For example, brokers typically trade for own account for which they must comply with rules on insider trading.

TRADING INDEX = ИНДЕКС ПО ТОРГОВЛЕ – The purpose of the Trading Index or TRIN (also called the ARMS Index after its inventor, Richard Arms) is to express the relationship of volume in advancing issues to volume in declining issues. When the market is rising we want to see more volume going into advancing issues than declining issues. When this doesn't happen, negative divergences occur. The opposite is true in declining markets. A chart of the index will display points where the market is oversold and overbought as well as divergences between the market and the TRIN. Trading Index:- this index measures the relative strength of volume associated with advancing stocks against the strength of volume associated with declining stocks. When used as a short term indicator, readings below 1.0 are considered bullish while readings above 1.0 are considered bearish. An extreme bearish reading would be 1.5 or higher; an extreme bullish reading would be .5 and lower. Readings of 2.0 or .3 would be considered 'climactic'. A calculation which takes the number of advancing stock and divides it by the number of declining stocks. A result of less than 1 is considered bullish, greater than 1 bearish. Also known as Arms Index, or TRIN. / В техническом анализе биржевых рынков, . Индекс от Амза (Arms Index) или ТРИН (TRIN). Ричод Амз (Richard Arms). Индекс По Торговле (или ТРИН):- мера силы фондового рынка, которая связывает соотношение подъёмов и спадов (advance-decline) – число выпусков, выросших в цене, делённое на число выпусков, цена на которые упала, – и соотношение подъёма и спада объёмов торгов – общее число акций, выросших в цене, делённое на число акций, цена на которые упала. Считается, что ТРИН меньше 1.0 отражает тенденцию к повышению, в то время как ТРИН выше 1.0 отражает тенденцию к понижению. Рассчитанный выше ТРИН, равный 0.8, считается признаком тенденции к повышению. ТРИН, основанный на котировках закрытия, называется ТРИНом Закрытия (Closing TRIN). Смотрите также (Closing Tick).

TRADING LIMIT = ЛИМИТ ТОРГОВЛИ (или ПРЕДЕЛ ТОРГОВЛИ) – Trading Limit is the number of commodity contracts that a person may trade during a single day. The limit is established by the Commodity Futures Trading Commission or by the exchange on which the particular contract is traded. Compare Position Limit. Trading Limit is the exchange-imposed maximum daliy price change that a futures contract or futures option contract can undergo. See also Position Limit. Daily Trading Limit is the maximum gain or loss on a derivative contract, such as options and futures contracts, that is allowed in any one trading session. The limits are imposed by the exchanges in order to protect against extreme volatility or manipulation within the markets. When daily trading limits have been reached, it is said to be a 'locked market', and trading will halt for any trades that break the threshold or trading will close for that particular security. Daily trading limits can also be in place for currency trading, such as China's daily trading limit of 0.5% for the Chinese Renminbi against the US Dollar. When a particular commodity or contract has reached the daily trading limit, it may be considered 'limit up' or 'limit down', depending on the direction of the day's move. Trading limits are much more important for derivatives than for stocks or bonds, for example, because so many investors use massive amounts of leverage to trade commodities, currencies and futures contracts. / Смотрите также Лимит Позиции (Position Limit).

TRADING ORDER = РАСПОРЯЖЕНИЕ НА ТОРГОВЛЮ (или ПОРУЧЕНИЕ НА ТОРГОВЛЮ) – Trading Order is an order to buy or sell a futures contract.

TRADING PERIOD = ПЕРИОД ТОРГОВЛИ – Trading Period is the period (usually a year) covered by the accounts in question.

TRADING POSTS = ТОРГОВЫЕ ПОСТЫ (или ТОРГУЮЩИЕ КАБИНКИ, или ТОРГУЮЩИЕ СТОЙКИ) – Trading Posts:- the 17 horseshoe-shaped counters manned by clerks and specialists on the trading floor of the New York Stock Exchange (NYSE®) are like stores where individual stocks are bought and sold. Each trading post is responsible for over 100 stocks. The actual buying and selling takes place around each post. / Торговый Пост:- место проведения операций с данными ценными бумагами в торговом зале биржи. Именно здесь биржевой брокер (specialist) по данным ценным бумагам выполняет функции создателя рынка, собирается публика (crowd), то есть брокеры торгового зала биржи с приказами по данным ценным бумагам. В Нью Йоркской Фондовой Бирже (НЙФБ® или Эн.Уай.Эс.И.® (NYSE®)), где продаются и покупаются акции, например, имеется 22 торговых поста, на каждом из них ведутся операции со 100 акциями. Смотрите также (Floor Broker), (Floor Trader), и (Make A Market).

TRADING PRICE = ЦЕНА СДЕЛКИ – Trading Price is the price at which a stock exchange transaction is effected. Each trading price on the exchange is registered and published (provided a round lot has been traded). By contrast, an Asked Price is the lowest price offered by the seller and a Bid Price is the highest price a buyer is prepared to offer. The first price paid for a listed security on a given day is called the Opening Price, the last paid price being the Closing Price.

TRADING RANGE = ТОРГОВЫЙ ДИАПАЗОН – Trading Range:- a congestion area on the chart where no discernable directional bias is evident. Generally part of a consolidation pattern prior to a breakout and a trend formation. / Торговый Диапазон:- для фьючерсов на сырьё, торговый лимит, устанавливаемый биржей, где проводятся операции с сырьевыми фьючерсами на определённые роды сырья. Цена на сырьевой фьючерсный контракт не может подниматься выше или падать ниже этого предела в конкретный торговый день. Смотрите также (Limit Up), (Limit Down). Для ценных бумаг, разница между высшей и низшей ценами, по которым велись операции по данным ценным бумагам или операции на рынке. Торговая разница на ценные бумаги корпорации XYZ, например, может составлять от 40 до 60 Долларов за последние два года. Если ценные бумаги или рынок кажутся замкнутыми в рамках узкого спектра цен, аналитики говорят, что существует рынок в рамках данной торговой разницы, за которым последует значительное изменение – в направлении повышения или понижения. Смотрите также (Flag), (Pennant), (Triangle), и (Wedge).

TRADING RESULT = РЕЗУЛЬТАТ ТОРГОВЛИ – Trading Result is a balance of revenue and losses, established on the basis of a bank's profit and loss account, from trading in securities, derivatives, foreign exchange, precious metals and other trading business.

TRADING SYSTEM = ТОРГОВАЯ СИСТЕМА – A Trading System is a collection of rules, indicators and formulas which uses price and volume data to generate buy and sell orders. / Торговая система это свод правил, индикаторов и формул, которые используют данные о ценах и объёмах сделок для генерации распоряжений на покупку и продажу.

TRADITIONAL CULTIVARS = ТРАДИЦИОННЫЕ КУЛЬТИВАРЫ – Traditional Cultivars:- tall, weak-stemmed, long-duration, low-yielding cultivars grown by farmers for many years.

TRAFFIC PAN (HANDPAN) = УПЛОТНЁННЫЙ СЛОЙ ПО ПРОГОНУ МАШИН (или РУЧНОЙ СЛОЙ) – Traffic Pan (Handpan) is a 5- to 10-cm thick compacted subsurface horizon between the 10- to 40-cm depths; common in paddies. / подпахотный слой .

TRAILER = КОНЦОВКА – That part of a SWIFT message envelope which follows the message text. It provides the receiver with additional information about the message. The information contained in the header is network dependent. / Та часть электронного сообщения, передаваемого по каналам связи СВМФДС (Сообщество по Всемирной Межбанковской Финансовой Дальней Связи; SWIFT (The Society for Worldwide Interbank Financial Telecommunication)), которая следует за текстом самого сообщения. Она обеспечивает получателя дополнительной информацией об этом сообщении. Информация, содержащаяся в заголовке, зависит от сети. коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо).

TRAILER = ПРИЦЕП (или ТРЕЙЛЕР) – Trailer is an enclosed vehicle, towed by a truck, which is used for transporting product. There are a few different types of trailers. These include tractor trailers, semi-trailers, flat beds and reefers (refrigerated trailers). Most trailers are 45', 48', or 53' long. Trailer is a vehicle without motive power designed to be drawn by another vehicle. Trailer is a vehicle designed to carry cargo while being hauled by a tractor or other self-propelled motor vehicle on public roads. Examples of trailers included in this definition are:- (i) trailers, semi-trailers, automobile racks, flatbeds, lowboys and tankers; (ii) dollies that convert semi-trailers to trailers; and (iii) shipping containers for containerized cargo that can be attached to and transported by trailers. The truck unit into which freight is loaded as in tractor trailer combination. See also Container. A vehicle without propulsion, designed for the carriage of cargo to be towed by a truckhead. Container and chassis as one unit. / Под Трейлером, от Английского слова Trailer от Trail, означающее Тащить, понимается прицеп, предназначенный для перевозки тяжеловесных (до 100 тонн) неделимых грузов. Трейлеры имеют низкую ступенчатую раму, обеспечивающую малую погрузочную высоту. Для того чтобы уменьшить удельную нагрузку на дорогу, трейлеры выполняют многоосными с большим числом колёс малого диаметра на одной оси (6–8). Грузоподъёмность трейлеров 20–60 тонн, но для перевозки некоторых видов энергетического оборудования (части мощных генераторов, турбин и тому подобного) создаются трейлеры грузоподъёмностью 100 тонн и выше. Платформа трейлера имеет металлический настил и бортовой брус, оборудуется откидными трапами, а иногда снабжается механизмами для погрузки и разгрузки. Прицеп, повозка, буксируемая тягачом (автомобиль, трактор), для перевозки грузов либо для нетранспортных работ, например, прицепы-лавки, прицепы-мастерские. Прицеп – одно-, двух- или многоосная безмоторная повозка, буксируемая автомобилем-тягачом или трактором. Предназначается для перевозки грузов и пассажиров (транспортный прицеп) либо для выполнения нетранспортных работ (специальный прицеп), производимых при помощи установленных на прицепе машин, аппаратов или оборудования (прицепы-мастерские, автолавки, дачи и другие).

TRAILER INTERCHANGE AND RECEIPT = ВЗАИМООБМЕН И ПРИЁМ ПРИЦЕПОВ – Trailer Interchange and Receipt is a contract used to interchange equipment between one carrier and other carriers. / Взаимообмен И Приём Прицепов – это контракт, используемый для взаимообмена оборудованием между одним отдельно взятым перевозчиком и всеми другими перевозчиками, также заключившими такой контракт.

TRAILER ON FLAT CAR = ПРИЦЕП НА ПЛАТФОРМЕ – Trailer On Flat Car:- carriage of piggyback highway trailers on specially equipped railway wagons. Trailer On Flat Car (TOFC) is a service in which a container is loaded on a rail car with chassis, bogies or wheels. Probably the most common and best-known form of piggyback. Highway truck trailers are either lifted on and off in side transfer, or else end loaded and unloaded from a fixed ramp. When containers move in this type of service, they are first mounted on a chassis or bogie, prior to loading on the piggyback rail car. The movement of cargo on a railroad flatcar. Carriage of intermodal containers when the container is still attached to the chassis, and both chassis and container are loaded on a rail flat car.

TRAILING PICKS = ПОЛЗУЩИЕ (или ПРИПОДНИМАЮЩИЕСЯ) ПОПЕРЕЧНЫЕ НИТИ – Trailing Picks:- these are extra tuck in length more than 15 mm which interlace in the fabric body not pulled properly and cut during mending repair work. Mending defect. / Порок или дефект штопки (mending defect).

TRAILING STOP = ПОЛЗУЩИЙ УРОВЕНЬ ФИКСАЦИИ – Trailing Stop:- a stop loss level set above or below the current price that adjusts as the price fluctuates. For a long position, a trailing stop would be set below the current price and would rise as the price advances. Should the price decline and reach the trailing stop, then a stop loss would be triggered and the position closed. As long as the price remains above the trailing stop, the position is held. Indicators such as Moving Averages or Parabolic SAR can be used to set trailing stops. A stop loss order that moves with the trend of the market. As the asset price rises the trailing stop price also moves higher. / флуктуации (колебания) цены. Распоряжение на фиксацию убытка с уровнем фиксации, движущимся вслед за тенденцией на рынке. Пока стоимость актива возрастает, ценовой уровень фиксации также продолжает возрастать, следуя за движением цены актива.

TRAIN CREW = ЭКИПАЖ ПОЕЗДА – In the United States, the Train Crew or Yard Crew is one or more railroad employees assigned a controlling locomotive, under the charge and control of one crew member; called to perform service covered by Section 2 of the Hours of Service Act; involved with the train or yard movement of railroad rolling equipment they are to work with as an operating crew; reporting and working together as a unit that remains in close contact if more than one employee; and subject to the railroad operating rules and program of operational tests and inspections required in 49 CFR 217.9 and 217.11 (49 CFR is short for the Code of Federal Regulations:- Title 49).

TRAIT = ПРИЗНАК (или ОСОБЕННОСТЬ, или ЧЕРТА) – Trait is a distinguishing quality or character of a plant. / отличающее качество или свойство растения.

TRAM = TRADEMARK REPORTING AND MONITORING

TRAMMAGE = ЗАКРУЧИВАНИЕ – Trammage:- in woven crêpes, a puckered area in which a filling yarn has twist running in the same direction for several picks instead of alternating S and Z twist. Fabrics defect. Trammage is the term generally used to describe hands of uneven shrinkage in the filling of a fabric, particularly – but not always – crêpes, and starting at shuttle changes. The fabric asumes a fillingwise pucker or plissé appearance. / в которой уточная пряжа . плиссе или складчатое (plissé).

TRAMP LINE = ТРАМПОВАЯ ЛИНИЯ – Tramp Line:- an ocean carrier company operating vessels not on regular runs or schedules. They call at any port where cargo may be available. / Компания океанского перевозчика, эксплуатирующая суда не по регулярным рейсам или расписаниям. Судно такой компании, как правило, заходит в любые порты, где можно взять груз на борт для его последующей перевозки.

TRAMP SERVICE = ТРАМПОВОЕ ОБСЛУЖИВАНИЕ – Tramp Service:- vessels operating without a fixed itinerary or schedule or charter contract. / Трамповые Перевозки грузов судовыми партиями без заранее фиксированных расписаний работы судов.

TRAMP VESSEL = ТРАМПОВОЕ СУДНО (или ТРАМП) – Tramp Vessel is a vessel not operating under a regular schedule. / Судно, не работающее по регулярному расписанию. Судно, перевозящее грузы, которое не закреплено на определённых линиях судоходства, и которое выполняет разовые, а не регулярные, перевозки грузов по договору – чартеру.

TRAM SILK = КРУЧЁНЫЙ ШЁЛК – Tram Silk is a low-twist, ply silk yarn formed by combining two or three single strands.

TRANCHE = ТРАНШ – (1) In general, Tranche is one of a series of payments which when put together add up to the total agreed.

(2) Tranche is a part of a securities issue if the issue is not carried out in one stage but in several partial amounts with different maturities, in different currencies and, if applicable, at different interest rates. Part of a uniform capital issue (bond) which is offered for subscription in several installments. The individual tranches usually have different maturities and offer different rates of interest, and therefore have different issuing and market prices. / Транш:- (1) Класс (разряд) риска, связанный со сроком погашения, или иные классы (разряды), на которые подразделяются ценные бумаги, которые имеют много классов, например, ипотечные облигации с дополнительным обеспечением (collateralized mortgage obligation (CMO)) или инвестиционные вложения, обеспеченные недвижимостью (REMIC). Например, типичные ипотечные облигации с дополнительным обеспечением (CMO) бывают классов A, B, C и Z, которые представляют облигации с кратким сроком оплаты, со средним сроком оплаты и с длительным сроком оплаты, а также бескупонные выпуски (классы), по которым поступают наличные средства, остающиеся после выплат по остальным классам. Более сложные варианты CMO имеют многочисленные классы, типа zh класс Y, включающий план выплат из резервного фонда. (2) В Великобритании выпуски ценных бумаг с фиксированной ставкой часто предварительно планируются государственными или местными полномочными органами или корпорациями, а затем размещаются частями, называемыми Траншами. Таким образом, можно говорить о новых траншах уже существующих ценных бумаг. Вариант этого термина – Траншет (Tranchettes) – относится к мелким траншам ценных бумаг с золотым обрезом (государственным облигациям), продаваемым Правительством Банку Англии, который затем перепродаёт их на рынке. (3) Доли крупных (10–30 миллионов Долларов США) депозитных сертификатов в Евродолларах, которые размещаются между мелкими инвесторами деноминациями в 10 000 Долларов США. Эти доли представлены сертификатами и имеют одни и те же процентные ставки, дату выпуска, дату выплаты процентов, а также срок погашения первичных документов, которые называются Разделёнными Депозитными Сертификатами (Tranch CD).

TRANSACTION = ТРАНЗАКЦИЯ (или ОПЕРАЦИЯ) – (1) Transaction is a separate action in support of a specific business activity. Act of carrying out a business deal. Any action by which an economic unit participates in economic life. / Любое действие, посредством которого хозяйствующий субъект участвует в экономическом процессе. Под Транзакцией, от Латинского слова Транзакцио (Transactio), означающее Договор или Полюбовная Сделка или Совершение, понимается:- (1) финансовая банковская операция, перевод денежных средств; (2) соглашение политического или юридического характера, сопровождаемое взаимными уступками.

(2) Transaction:- the buying or selling of securities resulting from the execution of an order. The entry or liquidation of a trade. The term Transaction means any purchase or sale of any asset made in accordance with the rules of an exchange. Any action by which an economic unit participates in economic life. / Термин Сделка означает любое приобретение или продажу любого актива в соответствии с правилами биржи. Смотрите также Купле-Продажа (Trade). Транзакция или Операция:- в бухгалтерском учёте, событие или условие, признаваемое путём внесения записей в книги бухгалтерского учёта. В индустрии ценных бумаг, исполнение приказа на покупку или продажу ценных бумаг или товарно-сырьевого фьючерсного контракта. После того как покупатель и продавец договариваются о цене, продавец обязан поставить соответствующие ценные бумаги или товарно-сырьевую продукцию и покупатель обязан принять поставку.

TRANSACTION ACCOUNT = ОПЕРАЦИОННЫЙ СЧЁТ – In the United States, the Transaction Account is a checking or similar account from which transfers can be made to third parties. Demand-deposit accounts, negotiable order of withdrawal (NOW) accounts, automatic transfer service (ATS) accounts, and credit union share draft accounts are examples of transaction accounts at banks and other depository institutions. A checking account or similar deposit account from which transfers of funds can be made. Demand deposit accounts, NOW (negotiable order of withdrawal) accounts, and credit union share draft accounts are examples of transaction accounts. Transaction Account means an account, such as demand deposit, NOW account, share draft account, or other checkable deposit account, that can be used to make fund transfers or withdrawals using paper or electronic payment instruments, such as a check or debit card. A transaction account does not include a savings account, which is limited to six transfers or withdrawals per month, as defined in the Federal Reserve Board's Regulation D.

TRANSACTION AMOUNT = СУММА ТРАНЗАКЦИИ (или СУММА ОПЕРАЦИИ) – In banking, Transaction Amount is the amount of a transaction as it crosses the border.

TRANSACTION CODE = КОД ТРАНЗАКЦИИ (или КОД ОПЕРАЦИИ) – Transaction Code:- in banking, in addition to the bank operation code, the Transaction Code contains other relevant information:- type of underlying agreement between creditor and debtor, rejection/revocation conditions, etc.

TRANSACTION COSTS = ОПЕРАЦИОННЫЕ РАСХОДЫ (или ОПЕРАЦИОННЫЕ ЗАТРАТЫ) – Transaction Costs are the costs other than the money price that are incurred in trading goods or services. Before a particular mutually beneficial trade can take place, at least one party must figure out that there may be someone with which such a trade is potentially possible, search out one or more such possible trade partners, inform him/them of the opportunity, and negotiate the terms of the exchange. All of these activities involve opportunity costs in terms of time, energy and money. If the terms of the trade are to be more complicated than simple 'cash on the barrelhead' (for example, if the agreement involves such complications as payment in installments, prepayment for future delivery, warranties or guarantees for quality, provision for future maintenance and service, options for additional future purchases at a guaranteed price, etc), negotiations for such a detailed contract may itself be prolonged and very costly in terms of time, travel expenses, lawyers' fees, and so on. After a trade has been agreed upon, there may also be significant costs involved in monitoring or policing the other party to make sure he is honoring the terms of the agreement (and, if he is not, to take appropriate legal or other actions to make him do so). These are the main sorts of transaction costs, then:- search and information costs, bargaining and decision costs, policing and enforcement costs. Elementary versions of economic theorizing often make the simplifying assumption that information and other transaction costs are zero (and, indeed, in a generally law-abiding society with a stable money system, cheap transportation and cheap communications, they are often pretty negligible). But realism nevertheless demands that we keep in mind the fact that the benefits to the participants in an exchange have to be high enough to cover their transaction costs if the trade is to take place at all. Indeed, many otherwise mutually advantageous trades do not take place because of the very high transaction costs that would be involved. High transaction costs are very often at the root of the problems discussed under the heading of externalities, especially in those situations where the external costs or benefits accrue to very large numbers of third parties and therefore a contractual agreement to internalize the externality is extremely costly to negotiate. Transactions Costs are the costs of using the market (buying and selling) such as the cost of organizing and transacting exchanges. Incremental costs directly attributable to the acquisition or disposal of a financial asset or financial liability. An incremental cost is one that would not have been incurred if the entity had not been incurred if the entity had not acquired, issued or disposed of the financial instrument. They include fees and commissions paid to agents (including employees acting as selling agents), advisers, brokers and dealers, levies by regulatory agencies and securities exchanges, and transfer taxes and duties. They do not include debt premiums or discounts, financing costs or internal

administrative or holding costs. / коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо). Операционные Расходы:- расходы на продажу или покупку ценных бумаг, которые включают главным образом брокерские комиссионные (brokerage commission), дилерские скидки (markdown) или наценки и дополнительную плату, например, взимаемую банком или брокером-дилером за совершение сделки с Казначейскими Облигациями. Эти расходы также включают прямые налоги, например, плату, взимаемую Комиссией по Ценным Бумагам и Биржам (SEC fee), штатовские налоги на продажу ценных бумаг (transfer taxes) или другие прямые налоги.

TRANSACTION DETAILS = СВЕДЕНИЯ О ТРАНЗАКЦИИ (или СВЕДЕНИЯ ОБ ОПЕРАЦИИ) – In banking, Transaction Details are a set of data elements specifying all relevant details of an European Electronic Purse (EEP) transaction.

TRANSACTION NUMBER = НОМЕР ТРАНЗАКЦИИ (или НОМЕР ОПЕРАЦИИ) – Transaction Number:- customers participating in online banking offerings receive, usually by mail, a list of transaction numbers (TANs). In addition to the PIN, a TAN must be entered for each transaction. If the bank receives an order with the correct PIN and TAN, it will assume that the order was sent by the customer. The bank interprets the TAN as a quasi-signature. Used TANs expire. This serves to undertake payments per online banking.

TRANSACTION REFERENCE = ОПЕРАЦИОННАЯ ССЫЛКА – In banking, Transaction Reference is a sender's unique reference for a transaction.

TRANSACTION REFERENCE BY CREDITOR = ОПЕРАЦИОННАЯ ССЫЛКА КРЕДИТОРА – In banking, Transaction Reference By Creditor is a transaction identification initiated by creditor, and can be part of creditor's own accounting/invoicing system.

TRANSACTION REFERENCE NUMBER = НОМЕР ОПЕРАЦИОННОЙ ССЫЛКИ – Transaction Reference Number is a field name (Field Tag:- 20) in all SWIFT messages:- the Sender's unambiguous identification of the transaction. Details of its form and content are at the discretion of the Sender. / Название поля (Поле номер 20) во всех сообщениях Сообщества по Всемирной Межбанковской Финансовой Дальней Связи (СВМФДС; The Society for Worldwide Interbank Financial Telecommunication (SWIFT)). Недвусмысленная идентификация операции отправителем. Сведения о её форме и содержимом остаются на усмотрение самого отправителя. коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо).

TRANSACTION SET = КОМПЛЕКТ ДАННЫХ ПО СДЕЛКЕ – Transaction Set is a group of data elements that represent the information on a business document, like a shipment order, and which are transmitted through the electronic data interchange (EDI).

TRANSACTION TYPE CODE = КОД ТИПА ТРАНЗАКЦИИ (или КОД ТИПА ОПЕРАЦИИ) – In banking, Transaction Type Code is a code that identifies the nature, purpose and/or reason of an individual transaction, primarily used for regulatory reporting requirements. / В банковском обслуживании под Кодом Типа Операции подразумевается код, индентифицирующий суть, цель и/или причину индивидуальной операции. Он используется главным образом с целью удовлетворения установленных требований отчётности.

TRANSCAD = TRANSPORTATION COMPUTER ASSISTED DESIGN

TRANSCOM = TRANSPORTATION OPERATIONS COORDINATING COMMITTEE

TRANSCOM = (UNITED STATES) TRANSPORTATION COMMAND

TRANSCRIPTION = ТРАНСКРИПЦИЯ – Transcription is:- (1) copying of a gene into RNA. Also, copying of a viral RNA into a cRNA. (2) The process by which DNA is copied into RNA. As the nucleic acid 'language' stays the same (see Genetic Code), the process is called Transcription. / Считывание генетического кода. В генетике под Транскрипцией, от Латинского слова Transcriptio, означающее Переписывание, понимается биосинтез молекул РНК на соответствующих участках ДНК; первый этап реализации генетической информации в клетке, в процессе которого последовательность нуклеотидов ДНК 'переписывается' в нуклеотидную последовательность РНК. Возможна также обратная транскрипция.

TRANSDUCTION = ТРАНСДУКЦИЯ – Transduction is a transfer of genetic material from one bacteria to another by means of a bacteriophage. / Трансдукция – передача генетического вещества от одной хромосомы к другой. Под Трансдукцией, от Латинского слова Transductio, означающее Перемещение, понимается перенос бактериофагом генетического материала (участка ДНК) из одной бактериальной клетки в другую, что приводит к изменению наследственных свойств клетки. Перенесённый генетический материал может остаться в составе ДНК фага или включаться в ДНК бактерии.

TRANSECT = ТРАНСЕКТА (или ПОПЕРЕЧНЫЙ РАЗРЕЗ) – Transect:- an identified or fixed path across a field allowing representative sampling or assessment that may be repeated over time.

TRANSESTERIFICATION = ПЕРЕЭСТЕРИФИКАЦИЯ (или ТРАНСЭСТЕРИФИКАЦИЯ) – Transesterification:- in the production of polyester from dimethyl terephthalate and ethylene glycol, the process of exchanging ethylene glycol for the methyl groups to obtain bis-β- hydroxyethyl terephthalate. The methanol generated in the reaction is removed as it is formed to drive the reaction to completion. / Переэстерификация – превращение одних сложных эфиров в другие.

THE TRANS–EUROPEAN AUTOMATED REAL–TIME GROSS SETTLEMENT EXPRESS TRANSFER SYSTEM = ТРАНСЕВРОПЕЙСКАЯ АВТОМАТИЗИРОВАННАЯ СИСТЕМА ВАЛОВЫХ РАСЧЁТОВ В РЕЖИМЕ РЕАЛЬНОГО ВРЕМЕНИ ПО УСКОРЕННЫМ ПЕРЕВОДАМ (или ТРАНСЕВРОПЕЙСКАЯ АВТОМАТИЗИРОВАННАЯ СИСТЕМА ВАЛОВЫХ РАСЧЁТОВ В РЕЖИМЕ РЕАЛЬНОГО ВРЕМЕНИ ПО ЭКСПРЕСС ПЕРЕВОДАМ) – TARGET, which stands for the Trans-European Automated Real-time Gross settlement Express Transfer system, is the real-time gross settlement system for the Euro, which commenced operation on 1999-January-04. TARGET is more than simply a payment infrastructure; it offers a premium payment service which overcomes national borders between payment systems in the European Union (EU). TARGET has a decentralized structure which consists of 15 national real-time gross settlement (RTGS) systems and the ECB payment mechanism (EPM), which are interlinked so as to provide a uniform platform for the processing of cross-border payments in Euro. TARGET is a real-time system:- under normal circumstances payments reach their destination within a couple of minutes, if not only a few seconds, of being debited from the sending participant's account. All cross-border payments receive the same treatment, regardless of their value. TARGET is a gross settlement system in which each payment is handled individually. Acknowledgement of the successful execution of each individual payment order is sent to the sending national central bank in real time. TARGET provides intraday finality:- settlement is final once the funds have been credited. The money received is central bank money. It is possible to re-use these funds several times a day. TARGET is accessible to a large number of participants. Hence, most credit institutions are able to use TARGET to make payments on their own behalf, independently of other participants. Even indirect participants can be addressed directly. TARGET is very easy to use. To initiate a cross-border payment via TARGET, participants simply send their payment orders to the Euro RTGS system in which they participate. TARGET was developed to meet three main objectives:- (i) to provide a safe and reliable mechanism for the settlement of

Euro cross-border payments on an RTGS basis; (ii) to increase the efficiency of cross-border payments within the Euro area; and, most importantly, (iii) to serve the needs of the monetary policy of the ECB. TARGET was developed by all the EU national central banks, most of which have a long and proven track record in building and running RTGS systems. SWIFT, which has more than 25 years' experience in financial messaging services, was chosen as the network service provider for TARGET. Special agreements have been concluded with SWIFT with a view to providing the best possible support in terms of speed, capacity, availability and security. The security policy for TARGET is based on an agreed security strategy and methodology and is implemented using a life-cycle approach. Since the beginning of 1997 several TARGET Risk Analyses have been conducted on a regular basis. A TARGET Risk Analysis focuses in particular on the IT infrastructure, software, operational procedures and business continuity plans and contingency arrangements in place to ensure the continuity of TARGET operations. In October 2000 a common information tool – the TARGET information system (TIS) – was implemented. The TIS allows all TARGET participants to gain simultaneous access to standardized information on the status of the TARGET system via the information providers Reuters, Telerate/Bridge and Bloomberg. The TIS does not replace the communication channels already existing at the domestic level. A payment system consisting of one real-time gross settlement (RTGS) system in each of the Member States participating in the Euro area at the start of Stage Three of Economic and Monetary Union. The national RTGS systems are interconnected via the Interlinking mechanism so as to enable same-day cross-border transfers throughout the Euro area. RTGS systems of non-Euro area EU Member States may also be connected to TARGET, provided that they are able to process Euro. TARGET (Trans-European Automated Real-time Gross settlement Express Transfer system):- the Eurosystem has developed TARGET to process large-value payments in Euro in real time throughout the Euro area. TARGET provides a level playing field for market participants and a tool through which the monetary policy-related transactions between the NCBs of the Eurosystem and credit institutions can be carried out in a timely and secure manner. It is the only payment system carrying out cross-border payments in Euro which is directly accessible to all monetary policy counterparties. It thus enables the Euro money market to function as a single market and makes a single monetary policy possible. The Current System:- TARGET began live operations on 04 January 1999 and has a decentralized structure. It currently comprises and interlinks 16 national RTGS systems and the ECB payment mechanism (EPM). The 16 national RTGS systems are the systems of the 12 Euro area countries plus Denmark, Sweden, the United Kingdom and, since March 2005, Poland. Slovenia is set to join in 2007. The ECB Guideline on TARGET (Guideline ECB/2001/3 of 26 April 2001 on a Trans-European Automated Real-time Gross settlement Express Transfer system (TARGET), as last amended by Guideline ECB/2003/6 of 04 April 2003) lays down the rules governing the operation of the system, including its national components. It also contains provisions on a number of minimum common features (e.g., access criteria, currency unit, pricing rules, time of operation, payment rules, irrevocability, finality and intraday credit) with which each national RTGS system participating in TARGET must comply. A multilateral agreement that mirrors the TARGET Guideline has been concluded between the Eurosystem and the non-Euro area NCBs. TARGET must be used for all payments directly resulting from or made in connection with:- (i) the Eurosystem's monetary policy operations; (ii) the settlement of the Euro leg of foreign exchange operations involving the Eurosystem; (iii) the settlement operations of large-value systems handling Euro transfers. For other payments, such as interbank and commercial payments in Euro, market participants are free to use TARGET or another payment system. In 2005, 89% of the total turnover of large-value payments in euro were carried out via TARGET. At the end of 2004, there were more than 10 000 participants; overall, some 50 000 institutions can be addressed through TARGET. TARGET2:- the current structure of TARGET was decided on in 1994 and was based on the principles of minimum harmonisation and interconnection of existing infrastructures. This was the best way of ensuring that the system would be operational from the very start of Stage Three of EMU. However, in view of increasing financial integration within the Euro area and the fact that the business needs of TARGET users are becoming even more similar, preparations for a new enhanced system (TARGET2) started in October 2002. These preparations are aimed at TARGET2 starting operations in 2007. The second generation of TARGET (i) will better meet customers' needs by providing an extensively harmonised service level, (ii) will help to ensure cost efficiency and (iii) will be prepared for swift adaptation to future developments, including the enlargement of the EU and the Eurosystem. At the same time, the NCBs will remain responsible for the accounts of, and business relations with, the credit institutions. TARGET2 will provide for a single shared platform (SSP) for those central banks that decide to join it and give up their national RTGS platforms. All Eurosystem central banks will participate in TARGET2. Danmarks Nationalbank has confirmed its participation, whereas Sveriges Riksbank and the Bank of England will not connect to TARGET2. Central banks of some of the new EU Member States will only participate when they adopt the Euro. Settlement Agent For Private Systems:- the Eurosystem also acts as settlement agent for payment systems that it does not operate itself. For example, the ECB is the settlement agent for the EURO1 system operated by the Euro Banking Association (EBA), and some NCBs settle for privately operated retail payment systems and securities settlement systems. The function performed by the ECB and some NCBs as settlement agents ensures that these payment systems settle in central bank money to minimise the risk of failures with critical systemic consequences for the financial system. The Continuous Linked Settlement System:- The Continuous Linked Settlement (CLS) system has been operating since 2002 to settle foreign exchange transactions between member banks on a payment versus payment basis in the books of the CLS Bank, which is based in New York. The US Federal Reserve is the main overseer of the system. The ECB provides account facilities for the CLS system and is the overseer for the Euro which is the second most important currency in the CLS system. Retail Payment Systems:- The Eurosystem's involvement in retail payment systems is diverse. Several Euro area NCBs, for example the Banca d'Italia, the Nationale Bank van België/Banque Nationale de Belgique and the Deutsche Bundesbank, have a long tradition of operating in retail payment systems. They offer neutral and open networks in which banks can participate, irrespective of the size of their business. The degree of Eurosystem involvement in retail payment systems will largely depend on the efforts of the banking sector to provide an efficient retail payments infrastructure for the Euro in the future. The Correspondent Central Banking Model:- in the absence of adequate market facilities for the cross-border mobilization of assets throughout the Euro area, the Eurosystem has set up a correspondent central banking model (CCBM) for its own operations. This system ensures that all payment system participants and monetary counterparties are able to provide collateral for Eurosystem credit operations, irrespective of where the collateral is located. To this end, each NCB acts as a custodian for the other NCBs. The CCBM was developed as an interim solution, until such time as the market developed alternatives, and was not intended to compete with market initiatives to provide cross-border services for market operations. Central Securities Depository Activities:- Eurosystem NCBs have traditionally played an operational role in the settlement of securities. Although various tasks have now been transferred to private entities, some of the NCBs still act as a central securities depository (CSD) or registrar for some government and other securities. Oversight Of Payment And Securities Settlement Systems:- payment systems oversight sets standards for the security of payment systems and ensures that they are applied correctly. Based on a combination of moral suasion and regulatory pressure, the main purpose of oversight is to protect the functioning of the payment systems. Oversight is therefore different from banking supervision. Banking supervision involves monitoring individual banks or financial institutions with a view to ensuring their financial stability and, primarily, to protect depositors and bank customers. Since 1999 payment systems oversight has been a shared responsibility between the ECB and the Euro area NCBs. The ECB is the overseer of European wide large-value payment systems (including TARGET) whereas the NCBs oversee the respective domestic systems. Oversight is performed in line with the safety and efficiency standards which have been set by the ECB for payment systems operating in Euro. In February 2001 the ECB took over the 'Core Principles for Systemically Important Payment Systems'

(CPSS Publications No 43, Core Principles for Systemically Important Payment Systems, published by the BIS in January 2001), which had been drawn up in January 2001 by the G10 Committee on Payment and Settlement Systems (CPSS). (The CPSS is a standing committee which was established by the G10 central bank governors and which is hosted by the BIS.) These now form part of the set of standards that the ECB and the Eurosystem NCBs use for monitoring large-value Euro payment systems. As far as the oversight of securities clearing and settlement systems is concerned, the powers of the Eurosystem are less explicit and exclusive. However, since 2001, the ESCB and the Committee of European Securities Regulators (CESR) cooperate closely on securities clearing and settlement systems. A joint working group, composed of a representative of each central bank of the ESCB and from each securities regulator from the CESR, has developed European standards for clearing and settlement, based on the recommendations of the CPSS and the International Organization of Securities Commissions (IOSCO). These ESCBCESR standards aim at increasing the safety, soundness and efficiency of securities clearing and settlement systems in the European Union and also take into account the need to remove the barriers to efficient cross-border clearing and settlement processes within this area. The Eurosystem also encourages the market to think about future challenges and devise possible solutions. The Eurosystem provides a forum for discussion with market participants – through bilateral or multilateral meetings, presentations, speeches and publications – with a view to paving the way for further enhancements to payment systems and new infrastructure developments. In the field of securities settlement systems, the ECB closely monitors the consolidation process, pursuing a policy line that fosters efficiency, particularly in cross-border transfers of securities throughout the Euro area. Inter-European Monetary Union (EMU) payment system consisting of a network of realtime clearing systems (one per member country). Trans-European Automated Real-Time Gross Express Transfer (TARGET) system is configured to be linked to compatible systems in non-EMU countries. The TARGET2 (Trans-European Automated Real-time Gross settlement Express Transfer) system is now replacing the first-generation TARGET system, which has been in operation since January 1999, when the Euro was launched. By the summer of 2008, the new system will be available for all transactions in euro between and within the Euro area countries as well as several other EU countries. Like its predecessor, TARGET2 is used for the settlement of central bank operations, large-value Euro interbank transfers as well as other Euro payments. It provides real-time processing, settlement in central bank money and immediate finality. However, unlike its predecessor, in which all payments were processed decentrally by the national central banks, the new system uses a single shared platform with no intervention by the central banks. This platform makes the provision of an enhanced and harmonized ser vice possible and, via economies of scale, permits lower fees and better cost-efficiency. There is no upper or lower value limit for TARGET2 payments. By using TARGET2 for all large-value payments, in particular those related to interbank operations, market participants receive a premium ser vice and make a substantial contribution to reducing systemic risk throughout the European Union, i.e. the risk of 'contagion' to other areas due to the high number and value of interactions between banks. Another development in this context is the launch in 2008 of the Single Euro Payments Area (SEPA), in which all non-cash Euro payments are treated as domestic payments; the difference between national and cross-border transactions is disappearing. TARGET2 together with SEPA will transform the payments market in the Euro area, making it more dynamic and cost-efficient. A payment system that interlinks all of the national real-time gross settlement systems in the EU member states. TARGET is located at the European Central Bank. TARGET2:- Trans-European Automated Real-time Gross settlement Express Transfer system for the Euro, which is used for the settlement of central bank operations, large-value Euro interbank transfers and other Euro payments. TARGET2 provides settlement in central bank money and immediate finality. It is available for all transactions in Euro between and within the Euro area countries as well as several other EU countries. TARGET2 is now replacing the first-generation TARGET system, which has been in operation since January 1999, when the Euro was launched. Trans-European Automated Real-Time Gross Express Transfer (TARGET) system is the European payment transfer system for cross-border payments. The national systems were linked together in order to create a standardized platform for cross-border Euro payments. Trans-European Automated Real-time Gross settlement Express Transfer system (TARGET) is an interbank transfer system linking national real-time gross settlement systems in Europe. TARGET was developed by European central banks primarily to implement the European Central Bank's monetary policy. The advantage of TARGET is its ability to process payments quickly; 98% of payments are executed within five minutes. Trans-European Automated Real-time Gross settlement Express Transfer (TARGET) System is the RTGS system for the Euro. It is a decentralised system consisting of 15 national real-time gross settlement (RTGS) systems, the ECB payment mechanism (EPM) and the interlinking mechanism. / Нашьёналэ Банк фон Болхие (Эн.Бе.Бе.; Nationale Bank van België (NBB). Ройтас (Reuters), Тэлэрэйт/Бридьж (Telerate/Bridge), и Блумбёг (Bloomberg). коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо). ТАСВРРУП (Трансевропейская Автоматизированная Система Валовых Расчётов в Режиме Реального Времени по Ускоренным Переводам) или ТАСВРРЭП (Трансевропейская Автоматизированная Система Валовых Расчётов в Режиме Реального Времени по Экспресс Переводам). система Валовых Расчётов в Режиме Реального Времени (ВРРРВ). Сообщество по Всемирной Межбанковской Финансовой Дальней Связи (СВМФДС; The Society for Worldwide Interbank Financial Telecommunication (SWIFT)). коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо).

TRANSFER = ТРАНСФЕРТ (или ПЕРЕВОД) – Transfer of a sum of money from one account to another on the basis of a corresponding instruction by the payer (remitter) to his bank (agency agreement). The most important form of cashless payment besides cheques and direct debits, as well as bank and credit cards. Unrequited payments made by one unit to another. They may be current transfers or capital transfers. The most important types of transfers are taxes, social contributions and benefits. A term Transfer means, depending on the context, the process for a producer or an authorized agent of the producer to:- (1) Physically relocate cotton loan collateral from one CCC-approved warehouse to another CCC-approved warehouse (CCC is the short for Commodity Credit Corporation of the US Department of Agriculture); (2) Exchange an electronic warehouse receipt for a receipt certificated by a warehouse for delivery under a futures contract without physically relocating the cotton; or (3) Do both of the above. / Под Трансфертом, от Французского слова Transfert от Латинского слова Transfero, означающее Перемещаю или Переношу, понимается перевод иностранной валюты или золота из одной страны в другую. В банковском деле Трансферт или Перевод подразумевает перемещение средств с одного счёта на другой, например, со счёта со сберкнижкой – на чековой счёт.

TRANSFER = ТРАНСФЕРТ (или ПЕРЕДАЧА) – To convey or shift from one person or place to another. Transfer:- legal movements of something, e.g., property, shares, etc, from one owner to another. The conveyance of right, title or interest in property from one person to another. Transfer:- this term may refer to two different operations:- (i) the delivery of a stock certificate from the seller's broker to the buyer's broker and legal change of ownership, normally accomplished within a few days; (ii) to record the change of ownership on the books of the corporation by the transfer agent. When the purchaser's name is recorded, dividends, notices of meetings, proxies, financial reports and all pertinent literature sent by the issuer to its securities holders are mailed direct to the new owner. See also Registrar, and Street Name. / Под Трансфертом, от Французского слова Transfert от Латинского слова Transfero, означающее Перемещаю или Переношу, понимается передача права владения именными ценными бумагами. Трансферт или Передача:- обмен правом собственности между сторонами. Например, участок недвижимости может быть передан от продавца покупателю путём исполнения контракта на продажу. Ценные бумаги и взаимные фонды обычно передаются через трансфертного агента, который электронным путём переводит право собственности на ценные бумаги.

TRANSFERABLE CONTRACT = ПЕРЕВОДИМЫЙ КОНТРАКТ (или КОНТРАКТ, ДОПУСКАЮЩИЙ ЗАМЕНУ) – Transferable Contract means each contract to be transferred by seller to buyer as a purchased asset pursuant to Section 2.1(b). See also Transferable Option. In an option market, the term Transferable Option refers to a contract that permits a position in the option market to be offset by a transaction on the opposite side of the market in the same contract. The following is an example of a case law referring to transferable option:- the fact that the stock option was able to be passed on the death of the holder did not make the option a transferable option. / Смотрите также Переводимый Опцион (Transferable Option).

TRANSFERABLE LETTER OF CREDIT = ПЕРЕВОДИМЫЙ АККРЕДИТИВ (или ТРАНСФЕРАБЕЛЬНЫЙ АККРЕДИТИВ) – A Transferable Credit is a documentary credit under which the Beneficiary (First Beneficiary) may request the bank specifically authorised to pay, incur a deferred payment undertaking, accept or negotiate (the Transferring Bank), or in the case of a freely negotiable Credit, the bank specifically authorised in the Credit as a Transferring Bank, to make the Credit available in whole or in part to one or more other Beneficiary(ies) (Second Beneficiary(ies)). See also Non-Transferable Letter Of Credit. Documentary credit under the terms of which the beneficiary may instruct the expressly authorized bank to make all or part of the credit available to one or more other beneficiaries (second beneficiaries). Transferable Credit is a type of letter of credit that names a middleman as beneficiary and allows him to give another party, the actual supplier, certain rights to present documents and receive payment under the letter of credit. Transfer must be effected by a bank authorized to do so by the issuing bank and involves notifying the transferee (called the Second Beneficiary) of what documents he must present. The documents must be the same as those required in the letter of credit itself but the price of the goods may be reduced and the middleman's name may be required to be listed in the transferee's invoices as the buyer, thereby allowing the middleman to substitute invoices at a higher price and receive the difference without disclosing the name of the actual end-buyer. The transferring bank is not obligated to pay documents presented under the transfer 3/4 such obligation remains with the issuing bank. A Transferable Letter of Credit (LC) is a documentary credit under which the Beneficiary (first Beneficiary) may request the bank specifically authorised in the credit to transfer the credit, available in whole or part, to one or more secondary Beneficiary(ies). / Трансферабельный Аккредитив представляет собой аккредитив, по которому бенефициар может передать право использования аккредитива, то есть проведения отгрузки и получения выручки, одному или нескольким другим лицам (второму(ым) бенефициару(ам)). Аккредитив может быть Переводимым (или Трансферабельным). Переводимым называется аккредитив, в соответствии с которым бенефициар (первый бенефициар) может просить банк, уполномоченный произвести платёж, принять обязательство платежа с рассрочкой, произвести акцепт или негоциацию (переводящий банк) или, в случае аккредитива со свободной негоциацией, – банк, специально указанный в аккредитиве как переводящий банк, – предоставить возможность использовать аккредитив полностью или частично одному или нескольким бенефициарам (второму(ым) бенефициару(ам)). Если иное не предусмотрено в аккредитиве, переводный аккредитив может быть переведён только один раз. Аккредитив может быть переведён, только если он чётко определён банком эмитентом как 'Переводимый'. Термины 'Делимый', 'Дробный', 'Переуступаемый', 'Передаваемый' и подобные не дают права рассматривать аккредитив в качестве переводимого. Переводящий банк не обязан осуществлять перевод аккредитива иначе как в пределах и порядке, на которые он однозначно выразил своё согласие.

TRANSFERABLE OPTION = ПЕРЕВОДИМЫЙ ОПЦИОН (или ОПЦИОН, ДОПУСКАЮЩИЙ ЗАМЕНУ) – Transferable Option is an option contract that permits a position in the option market to be offset by a transaction on the opposite side of the market in the same contract. Also known as Transferable Contract. / Опционный контракт, который разрешает позиции на рынке данных опционов быть зачтённой операцией с противоположной стороны данного рынка (продавца или покупателя соответственно) по такому же контракту. Известен также как Переводимый Контракт или Контракт, Допускающий Замену (Transferable Contract).

TRANSFER AGENT = АГЕНТ ПО ПЕРЕДАЧЕ (или АГЕНТ ПО ВЕДЕНИЮ РЕЕСТРА, или ТРАНСФЕРТНЫЙ АГЕНТ) – A Transfer Agent is appointed by a company to maintain records of its stock and bond holders, to cancel and issue certificates and resolve problems arising from lost, stolen or destroyed certificates. A transfer agent is often a commercial bank or trust company, although some large corporations act as their own agent. A Transfer Agent keeps a record of the name of each registered shareowner, his or her address, the number of shares owned, and sees that certificates presented for transfer are properly cancelled and new certificates issued in the name of the new owner. See also Registrar. / В США регистраторов обычно именуют Трансферт Агентами, тогда как в России трансферт-агентам отводится роль помощников регистраторов. Трансферт Агент – юридическое лицо, профессиональный участник рынка ценных бумаг, который по договору с регистратором принимает от зарегистрированных лиц или их уполномоченных представителей и передаёт регистратору информацию и документы, необходимые для проведения операций в реестре, а также принимает от регистратора и передаёт зарегистрированным лицам или их уполномоченным представителям информацию и документы, полученные от регистратора. Трансфертный Агент:- агент, в качестве которого обычно выступает коммерческий банк, назначаемый корпорацией для ведения документации владельцев акций и облигаций, отмены и выдачи сертификатов и для разрешения проблем, возникающих в результате потери, порчи или кражи сертификатов. Предупреждение выпуска чрезмерно большого числа акций (overissue) является функцией регистрационного подразделения (registrar). Корпорация также может выступать в качестве собственного трансфертного агента.

TRANSFER COATING = ПОКРЫТИЕ ПЕРЕНОСОМ (или ПЕРЕНОСИМОЕ ПОКРЫТИЕ) – Transfer Coating:- this method involves applying the coating to a temporary substrate and then adding an adhesive coating (tie coat) to allow transfer by roller of the coating to the desired substrate.

TRANSFEREE = ПОЛУЧАТЕЛЬ – Transferee is a person that becomes entitled to receive structured settlement payment rights as a result of a transfer agreement.

TRANSFER ELEVATOR = ПЕРЕВАЛОЧНЫЙ ЭЛЕВАТОР – A Transfer Elevator normally receives grain that has been officially graded and weighed at a terminal elevator and stores that grain before it is loaded to vessels for export. / Перевалочный элеватор обычно получает зерно, которое было официально отсортировано и взвешено на терминальном элеваторе, и хранит данное зерно до момента его погрузки на судно для вывоза из страны.

TRANSFER NOTICE = УВЕДОМЛЕНИЕ О ПЕРЕДАЧЕ – Transfer Notice is a term used on some exchanges to describe a notice of delivery. See also Retender.

TRANSFER OF ELECTRONIC PAYMENT INITIATOR = ПЕРЕВОД ИНИЦИАТОРА ЭЛЕКТРОННОГО ПЛАТЕЖА – In banking, Transfer of the Electronic Payment Initiator (e-Payment Initiator or ePI) via electronic means from or on behalf of the beneficiary to the ordering customer.

TRANSFER OF EPI = TRANSFER OF ELECTRONIC PAYMENT INITIATOR

TRANSFER OF FUNDS = ТРАНСФЕРТ ФОНДОВ (или ПЕРЕВОД ДЕНЕЖНЫХ СРЕДСТВ) – Transfer Of Funds:- in banking, processing and payment execution. / В банковском обслуживании, осуществление процесса получения и обработки и последующее исполнение платежа.

TRANSFER OF IBAN = TRANSFER OF INTERNATIONAL BANK ACCOUNT NUMBER

TRANSFER OF INTERNATIONAL BANK ACCOUNT NUMBER = ПЕРЕДАЧА СВЕДЕНИЙ О МЕЖДУНАРОДНОМ НОМЕРЕ БАНКОВСКОГО СЧЁТА – In banking, Transfer Of International Bank Account Number is a transport of the International Bank Account Number (IBAN) in an operational message.

TRANSFER OF PAYMENT ORDER = ПЕРЕДАЧА ПЛАТЁЖНОГО ПОРУЧЕНИЯ (или ТРАНСФЕРТ ПЛАТЁЖНОГО ПОРУЧЕНИЯ) – In banking, Transfer Of Payment Order is a sending the completed payment order from the ordering customer to the Ordering Customer's Financial Institution (OFI).

TRANSFER ORDER = ПОРУЧЕНИЕ НА ТРАНСФЕРТ – Transfer Order shall mean any instruction by a participant to place at the disposal of a recipient an amount of money by means of a book entry on the accounts of a bank, a central bank or a settlement agent, or any instruction which results in the assumption or discharge of a payment obligation as defined by the rules of the system.

TRANSFER PAYMENTS = ТРАНСФЕРТНЫЕ ПЛАТЕЖИ (или ПЕРЕДАТОЧНЫЕ ПЛАТЕЖИ) – Transfer Payment is a payment of money by the government to an individual that does not form part of an exchange but rather represents a gift without anything being received or required in return. Examples of transfer payments would include student scholarship grants, welfare checks, and social security benefits. Establishing programs providing for transfer payments from the budget to particular favored categories of the population represent one of the most direct ways in which a government may pursue policies of income redistribution. In national accounting, Transfer Payments are the payments that represent a redistribution of national wealth, such as state pensions, social security and unemployment compensation, rather than compensation for goods or services. / В национальном бюджетном процессе платежи, которые представляют перераспределение . Трансфертные Платежи:- средства, передаваемые населению правительством. Многие льготные выплаты по правительственным программам считаются трансфертными платежами, в их число входят пособия, выплачиваемые по системе социального страхования, пособия по нетрудоспособности, кормпенсация по безработице, благотворительные выплаты и пособия ветеранам. Большая часть годового бюджета федерального правительства идёт на трансфертные платежи.

TRANSFER PRICE = ТРАНСФЕРТНАЯ ЦЕНА (или ВНУТРИФИРМЕННАЯ ЦЕНА) – Transfer Price:- literally this only refers to the price charged on goods and services that are traded between subsidiaries of a multinational corporation. However, the term usually connotes the setting of such prices high or low so as to minimize the total taxes paid to different governments, in response to differences in corporate tax rates. Transfer Price is the price at which divisions of a company transact with each other. Transactions may include the trade of supplies or labor between departments. Transfer prices are used when individual entities of a larger multi-entity firm are treated and measured as separately run entities. In managerial accounting, when different divisions of a multi-entity company are in charge of their own profits, they are also responsible for their own 'Return on Invested Capital'. Therefore, when divisions are required to transact with each other, a transfer price is used to determine costs. Transfer prices tend not to differ much from the price in the market because one of the entities in such a transaction will lose out:- they will either be buying for more than the prevailing market price or selling below the market price, and this will affect their performance. Also known as Transfer Cost. / Трансфертная Цена:- цена, взимаемая одним отделом комплексной организации сделок между отделами этой организации; также называется Трансфертными Расходами (Transfer Costs). Трансфертная цена возникает, когда каждое подразделение управляется центром, несущим ответственность за получение доходов (profit center), то есть за доход на инвестированный капитал (return on invested capital), и должно, следовательно, так строить отношения с другими подразделениями той же организации на условно-рыночной основе. Смотрите также (Arm's Length Transaction).

TRANSFERRING BANK = ПЕРЕВОДЯЩИЙ БАНК – A transferable Credit is a Credit under which the Beneficiary (First Beneficiary) may request the bank authorized to pay, incur a deferred payment undertaking, accept or negotiate (the Transferring Bank), or in the case of a freely negotiable Credit, the bank specifically authorized in the Credit as a Transferring Bank, to make the Credit available in whole or in part to one or more other Beneficiary(ies) (Second Beneficiary(ies)). The Transferring Bank shall be under no obligation to effect such transfer except to the extent and in the manner expressly consented to by such bank. At the time of making a request for transfer and prior to transfer of the Credit, the First Beneficiary must irrevocably instruct the Transferring Bank whether or not he retains the right to refuse to allow the Transferring Bank to advise amendments to the Second Beneficiary(ies). If the Transferring Bank consents to the transfer under these conditions, it must, at the time of transfer, advise the Second Beneficiary(ies) of the First Beneficiary's instructions regarding amendments. Transferring Bank charges in respect of transfers including commissions, fees, costs or expenses are payable by the First Beneficiary, unless otherwise agreed. If the Transferring Bank agrees to transfer the Credit it shall be under no obligation to effect the transfer until such charges are paid. If the Transferring Bank has provided an undertaking to pay the beneficiary at maturity, it has presumably added its confirmation to the credit or made some other arrangement with the beneficiary. The Transferring Bank refused to transfer the L/C stating the following reasons:- 'the certificate as required, has to be issued by the first beneficiary and not by the second beneficiary. If this certificate is issued by the second beneficiary it will be considered as discrepant, as not issued by the nominated party in the L/C. For the declaration, the second beneficiary will hand over to the master his own invoices which will be different from those which will be presented to the issuing bank, as their invoices will be replaced by those of the first beneficiary'.

TRANSFER RISK = ПЕРЕВОДНЫЙ РИСК (или РИСК ОТСУТСТВИЯ ВОЗМОЖНОСТИ ПЕРЕВОДА (ДЕНЕЖНЫХ СРЕДСТВ)) – Transfer Risk is the risk that a counterparty is unable to meet its foreign currency obligations due to restricted access to foreign currency. The bank calculates and sets limits for transfer risk on a per country basis. Risk incurred by the seller of goods that, due to the fact that his country has a negative balance of payments, no foreign exchange (US Dollars or other hard currency) may be available to the buyer when he is ready to pay for the goods. The risk that a transfer covered by a contract cannot be effected between one currency area and another, or that such transfers are restricted as a result of state intervention. / Под Переводным Риском понимается риск, связанный с переводом средств за границу, а если более подробно, то вероятность введения суверенным правительством мер валютного контроля, которые ограничат возможности должников по получению и использованию иностранной валюты, необходимой для своевременного исполнения обязательств, выраженных в иностранной валюте. Текущее заключение Стэндод энд Поз (Standard & Poor's) относительно риска, связанного с переводом средств, присущего обязательству, выраженному в иностранной валюте, как правило, эквивалентно рэйтиньгу платёжеспособности суверенного правительства страны местонахождения заёмщика в иностранной валюте. В отношении отдельных обязательств, выраженных в иностранной валюте, риск, связанный с переводом средств, может оказаться ниже, нежели тот, что был определён при рэйтиньге платёжеспособности государства в иностранной валюте; сюда относятся такие обязательства, для исполнения которых имеется неограниченный доступ к адекватным оффшорным источникам иностранной валюты (например,

внешние гарантии, поддержка оффшорных материнских компаний или юридическая структура, сводящая к минимуму риск, связанный с переводом средств, в отношении конкретного обязательства), или такие, исполнению которых способствует тот факт, что заёмщик находится в стране, экономика которой в значительной степени долларизована. Риск, связанный с переводом средств, учитывается во всех рэйтиньгах в иностранной валюте, и не учитывается в рэйтиньгах в местной валюте.

TRANSFER RNA = ТРАНСПОРТНАЯ РНК (или ТРАНСФЕРНАЯ РНК, или ПЕРЕДАВАЕМАЯ РНК) – Transfer RNA (tRNA) is the RNA that becomes attached to an amino acid and guides it to the correct position on the ribosome for protein synthesis; there is at least one tRNA molecule for each amino acid.

TRANSFER STANDARD = ПЕРЕДАТОЧНЫЙ СТАНДАРТ (или СТАНДАРТ ПЕРЕДАЧИ) – Transfer Standard is a physical standard used to transfer a calibration from one instrument to another, usually from a reference instrument in a standards laboratory to an instrument in the field.

TRANSFER TAIL = ХВОСТИК ПЕРЕДАЧИ – Transfer Tail is a long end of yarn wound at the base of a package that permits increased warping or transfer efficiency by providing an easily accessible connecting point for the succeeding package. / длинный конец пряжи, намотанный у основания паковки, который .

TRANSFER TRADES = ТРАНСФЕРТНЫЕ СДЕЛКИ – Transfer Trades:- entries made upon the books of Futures Commission Merchants for the purpose of:- (i) transferring existing trades from one account to another within the same office where no change in ownership is involved; (ii) transferring existing trades from the books of one commission merchant to the books of another commission merchant where no change in ownership is involved. Also known as Ex-Pit Transactions.

TRANSFERTS BANQUE DE FRANCE = ТРАНСФЭР БАНК ДЁ ФРАНС (или БАНКОВСКИЕ ПЕРЕВОДЫ ФРАНЦИИ) – Transferts Banque de France (TBF) is the French Real-Time Gross Settlement (RTGS) system in central bank money, with real-time execution and immediate finality for both cross-border and domestic High Value Payments in Euro. TBF provides end-of-day or intraday settlement to all payment and settlement systems operating in France. TBF (Transferts Banque de France) started operating in French Francs on line on 1997-October-27 and switched to the Euro at the launching of TARGET on 1999-January-04. Connected to participants through the Centrale des Règlements Interbancaires (CRI) platform, the system is managed by the Banque de France. Interconnected with the other RTGS systems, TBF is the French component of TARGET. / Банковские Переводы Франции или Трансфэр Банк дё Франс (Тэ.Бэ.Эф.) (Transferts Banque de France (TBF)) является системой Валовых Расчётов в Режиме Реального Времени (ВРРРВ). через платформу Центра Межбанковских Расчётов или Сантраль дэ Рэглёман Интэрбанкэр (Сэ.Эр.И.) (Centrale des Règlements Interbancaires (CRI)). ТАСВРРУП (Трансевропейская Автоматизированная Система Валовых Расчётов в Режиме Реального Времени по Ускоренным Переводам) или ТАСВРРЭП (Трансевропейская Автоматизированная Система Валовых Расчётов в Режиме Реального Времени по Экспресс Переводам).

TRANSFORMANT = ТРАНСФОРМАНТ – Transformant is a bacterial cell that has undergone transformation.

TRANSFORMATION = ТРАНСФОРМАЦИЯ – Transformation is the genetic modification induced by the incorporation of 'foreign' DNA into a cell. / чужеродной ДНК в клетку. В генетике под Трансформацией, от позднелатинского слова Transformatio, означающее Превращение, понимается изменение наследственных свойств бактериальной клетки в результате проникновения в неё чужеродной ДНК. С открытием и изучением трансформации (1944) выяснилось, что ДНК – материальный носитель наследственности. Трансформация возможна и у клеток высших организмов.

TRANSFORMED BYPASS UNIT = ТРАНСФОРМИРОВАННЫЙ ПЕРЕПУСКНОЙ БЛОК (или УСТАНОВКА, или ЕДИНИЦА) – Transformer Bypass Unit (TBU):- component of a remote refrigerated container monitoring system with data transfer via the power cable. A TBU allows a transformer to be bridged, that would otherwise not let the data signal pass.

TRANSFORMER = ТРАНСФОРМАТОР – Transformer is a device that converts one ac voltage and current to a different voltage and current. Constructed using two or more coils of wire around a common magnetic core. The energy is transferred from one coil, usually considered the primary winding, to the other coil, the secondary winding by means of mutual induction in the magnetic core. Transformers are an efficient and economical means of transferring large amounts of ac electric power at high voltages. This is the primary advantage of ac systems over dc systems. Transformer is an electrical device for changing the voltage of alternating current. / Под Трансформатором, от Латинского слова Transformo, означающее Преобразую, понимается устройство для преобразования, превращения, изменения каких-либо существующих свойств энергии (например, электрический трансформатор, гидротрансформатор) или объектов (например, фототрансформатор). Важнейшими видами трансформаторов являются электрические трансформаторы и гидротрансформаторы. Под электрическим Трансформатором понимается статическое (не имеющее подвижных частей) устройство, преобразующее переменный ток одного напряжения в переменный ток другого напряжения (при неизменной частоте). В основе действия электрического трансформатора лежит явление электромагнитной индукции. Состоит из магнитопровода, набранного из листовой стали, и одной или нескольких изолированных обмоток, охватываемых общим магнитным потоком. В соответствии с видом преобразуемого тока различают одно- и трёхфазные электрические трансформаторы. Основные типы электрических трансформаторов:- (i) высоковольтные испытательные трансформаторы; (ii) измерительные трансформаторы; (iii) импульсные трансформаторы малой мощности, применяемые в электронной технике; (iv) силовые трансформаторы – для передачи и распределения электроэнергии; и (v) силовые трансформаторы специального назначения (печные, электросварочные, для выпрямительных установок и так далее). Мощность – от долей В·А до сотен МВ·А; преобразуемые напряжения – от долей В до сотен кВ.

TRANSGENIC = ТРАНСГЕННОЕ – Transgenic:- descriptive of an organism that contains some genetic material that has been experimentally transferred into it from some other source.

TRANSGENIC COTTON = ТРАНСГЕННЫЙ ХЛОПЧАТНИК – Transgenic Cotton is a Cotton Variety genetically altered by the addition of foreign genetic material (DNA) from another Variety. Examples include Cotton that is resistant to certain Insects or herbicides. In 2008, 94.6 percent of the US upland crop was planted in transgenic Varieties – genetically engineered Varieties resistant to worms, herbicides, or both. A Cotton Variety genetically altered by the addition of genetic material (Deoxyribonucleic Acid – DNA) from another variety. Cotton that has been genetically altered by recombinant DNA techniques to express tolerance to either herbicides, e.g., Roundup Ready, BXN, or Insect Pests, e.g., Bollgard® against Tobacco Budworms. / (Дезоксирибонуклеиновая Кислота – ДНК). Рандап Рэди (Roundup Ready), Би.Экс.Эн. (BXN), (Bollgard®).

TRANSGENIC PLANT = ТРАНСГЕННОЕ РАСТЕНИЕ – Transgenic Plant is a plant in which one or more genes or genetic constructs or traits have been introduced using recombinant DNA techniques, (also known as Genetic Engineering) which could be considered to include the insertion of genetic material from the same or different species.

TRANSGENIC VARIETIES = ТРАНСГЕННЫЕ РАЗНОВИДНОСТИ (или ТРАНСГЕННЫЕ СЕЛЕКЦИОННЫЕ СОРТА) – Transgenic Varieties are the varieties, e.g., of Cotton that have been genetically modified, in this case, herbicide tolerant varieties of Cotton that have been genetically modified to enhance their tolerance of specific herbicides, e.g., Roundup Ready Cotton. / , например, .

TRANSGRESSIVE SEGREGATION = ТРАНСГРЕССИВНАЯ СЕГРЕГАЦИЯ – Transgressive Segregation is a segregation pattern in which the segregants exceed the limits of the parents. / Сегрегация или Выделение или Зейгерование или Разделение По Крупности (Segregation).

TRANSHIPMENT = ПЕРЕГРУЗКА (или ПЕРЕВАЛКА) – Transhipment is the Customs procedure under which goods are transferred under Customs control from the importing means of transport to the exporting means of transport within the area of one Customs office which is the office of both importation and exportation. Transhipment is the process whereby a cargo is transferred to a different ship to continue its journey. Transshipment refers to the act of sending an exported product through an intermediate country before routing it to the country intended to be its final destination. (1) A shipment under one Bill of Lading, whereby sea (ocean) transport is 'broken' into two or more parts. The port where the sea (ocean) transport is 'broken' is the transhipment port. (2) Transfer of cargo from one means of transport to another for oncarriage during the course of one transport operation. (3) Customs:- Customs procedure under which goods are transferred under customs control from the importing means of transport to the exporting means of transport within the area of one customs office which is the office of both importation and exportation. Transfer; A shipment under one Bill of Lading, whereby the ocean transport consists of two or more parts, and where the shipment is transferred from one vessel to another. Cargo landed at a terminal and shipped out again on another vessel without leaving the port area. Can be international (a container arrives from one country and is trans-shipped to another) or domestic (a container arrives from overseas and is trans-shipped to another domestic port by a coastal service). See also Transshipment. / привоз (importation) и вывоз (exportation).

TRANSHIPMENT NOTE = ПЕРЕГРУЗОЧНАЯ ВЕДОМОСТЬ (или ПЕРЕВАЛОЧНАЯ НОТА) – Transhipment Note is a legally binding document accompanying certain goods in transit, comprising a detailed declaration of those goods and the obligation by the responsible party, countersigned by a joint and several guarantor, to pay all duties associated with the goods within the time specified, under penalty of law. Also known as Bond Note. / Юридически обязывающий документ, сопровождающий некоторые товары в момент их транзита, несущий в себе подробную декларацию об этих товарах и обязательстве, принятом на себя ответственной стороной, соподписавшейся как совместный и самостоятельный гарант, оплатить все пошлины, связанные с данными товарами, в течение указанного срока, под угрозой наложения штрафа в случае отказа от оплаты. Известна также как Нота Обязательства (Bond Note).

TRANSIENCE = ЗАЛЁТ – Transience is a presence of a pest that is not expected to lead to establishment.

TRANSIENT EXPRESSION = ПРОХОДЯЩАЯ (или НЕУСТОЙЧИВАЯ) ЭКСПРЕССИЯ (или ПЕРЕХОДЯЩЕЕ ПРОЯВЛЕНИЕ) – Transient Expression is an expression of a transforming gene by recipient cells over a relatively brief time span; does not necessarily indicate integration of the gene into the plant chromosome.

TRANSIRE = ТРАНСИРЭ (или ТРЭНЗАЙЭРИ) – Transire is a Customs document used when a vessel is coasting, giving full cargo details. It serves as clearance from the port of issue. / Таможенный документ, используемый на судах для прибрежного плавания, предоставляющий полные сведения о грузе. Он служит в качестве подтверждения таможенной очистки в порту выдачи этого документа. Под Транзирэ, от Латинского слова Transire, означающее Провоз или Прохождение, понимается . Фактически, это разрешение таможни на провоз грузов на судне каботажного плавания.

TRANSIT = ТРАНЗИТ (или ПРОХОЖДЕНИЕ) – Transit is the shipment or transport of covered property by the named insured:- (i) It begins where the named insured accepts the covered property for transportation to a specific destination. (ii) It continues and includes normal stops, interruptions, delays and transfers incidental to the route and the method of shipment, such as rest stops, food stops and temporary storage in transit. (iii) It ends when the consignee or another authorized party accepts the shipped goods at the specific destination. In customs, Goods In Transit are goods that are moving between two ports of entry within a given country which are not subject to tariffs and inspection procedures. By extension, customs regulations that apply to such goods. See also Consignment In Transit. / Под Транзитом, от Латинского слова Transitus, означающее Переход или Прохождение, понимаются перевозки пассажиров и грузов из одного пункта в другой через промежуточные пункты. На железнодорожном транспорте понятие Транзит применяется не только к перевозкам, но также к поездам и отдельным вагонам. Транзитный груз перевозится обычно маршрутными поездами, проходящими сортировочные и участковые станции без переработки. На речном транспорте понятие Транзит применяют к перевозкам, совершаемым в границах двух или нескольких смежных пароходств (Прямой Транзит), а также между портами-пристанями одного пароходства (Внутренний Транзит). Транзитные перевозки осуществляются также в смешанных сообщениях, в которых участвуют железные дороги и пароходства (речные или морские). Транзит имеет место в сообщениях как внутри страны, так и между отдельными странами (провоз пассажиров и грузов одной страны через территорию другой в третью страну). Установление транзитных международных сообщений обеспечивает удобства для вывозных (или экспортных) и привозных (или импортных) организаций, освобождает их от перегрузки и переотправки грузов, дополнительных оформления документов и расчётов за перевозки в пограничных пунктах и портах. Перевозки грузов между различными странами осуществляются на основании соглашений между этими странами.

TRANSIT ACCOMPANYING DOCUMENT = ДОКУМЕНТ, СОПРОВОЖДАЮЩИЙ ТРАНЗИТ – In the European Union, the Transit Accompanying Document (TAD) accompanies the goods where a transit declaration is processed at an office of departure by the new computerised transit system (NCTS). Copies A and B of the TAD replace copies No 4 and No 5 of the SAD. The TAD corresponds to the specimen and notes in Appendix III, Annexes D3 and D4 Convention/Annex 45a IPC.

TRANSIT CLAUSE = ОГОВОРКА О ТРАНЗИТЕ (или ТРАНЗИТНАЯ ОГОВОРКА) – Transit Clause is a clause in marine and aviation cargo policies providing that the cover attaches from the departure from the place of storage at a place named in the policy until the cargo arrives at a place of storage at a named destination or at some alternative place. A clause in the Institute Cargo Clauses, specifying the attachment and termination of cover.

TRANSIT DAMAGE = ТРАНЗИТНОЕ ПОВРЕЖДЕНИЕ (или ПОВРЕЖДЕНИЕ В ТРАНЗИТЕ) – Transit Damage:- resulting in broken spools, crushed cones, dirt, cuts, etc. Thread defects, and namely – Transit. / Порок или дефект ниток.

TRANSIT DOCUMENTS = ТРАНЗИТНЫЕ ДОКУМЕНТЫ – Transit Documents:- shall mean any Customs transit document (international or national) under cover of which a transport of goods is carried out from Customs office(s) of departure to Customs office(s) of destination. Such documents serve as bonds vis-a-vis the Customs authorities of the countries of departure, in transit and of destination for the goods carried. Such international transit documents may be TIR carnets, T-documents (Common Transit). National transit documents may be used on the territory of countries, which are not contracting parties to any international transit agreements or

regional agreements are in use or in which such international agreements are under suspension or not applicable. There may be cases where two or more transit documents are in use for one transit operation. / Данный термин относится к любым таможенным транзитным документам (международным или национальным), под прикрытием которых производится перевозка товаров от таможенного управления места отправления до таможенного управления места назначения. Такие документы служат в качестве гарантии визави таможенных органов стран отправления, транзита и места назначения для перевозимых товаров. К таким международным транзитным документам могут относиться:- Тэ.И.Эр. Карнэ или Книжки МДП (TIR carnets), документы Т (Обычный Транзит; T-documents (Common Transit)). Национальные транзитные документы могут быть использованы при перевозках грузов по территории стран, не являющихся договаривающимися сторонами в любых международных соглашениях о транзите или региональных соглашениях, находящихся в использовании или в которых такие международные соглашения временно приостановлены или не применяются. Могут также встречаться случаи, когда два или более транзитных документов используются для одной транзитной операции. Транзитная Декларация (ТД 3) на территории бывшего СССР.

TRANSITIONAL PHRASE = ПЕРЕХОДНАЯ ФРАЗА – In patent law, Transitional Phrase is a word or phrase that serves to link or create a relationship between one idea or concept and another. In the following example, 'consisting of' is the transitional phrase between 'an item' and 'one or more parts'. Example:- an item consisting of one or more parts.

TRANSITION TEMPERATURE = ТЕМПЕРАТУРА ПЕРЕХОДА – Transition Temperature is a temperature at which some radical change, usually a phase change, in the appearance or structure of a substance occurs. Examples of transition temperatures are melting point, boiling point, and second-order transition temperature. / Температура (фазового) перехода.

TRANSITORY YELLOWING = ПЕРЕХОДЯЩИЙ ХЛОРОЗ (или МИМОЛЁТНЫЙ ЖЁЛТЫЙ БАКТЕРИОЗ) – Transitory Yellowing is a virus disease of Rice transmitted by Green Leafhoppers (Nephotettix Nigropictus, Nephotettix Cincticeps, and Nephotettix Virescens). The characteristic symptoms are yellowing of leaves, reduced tillering, and stunting. The disease is similar to tungro since it is transmitted by the same insect.

TRANSIT TIME = ТРАНЗИТНОЕ ВРЕМЯ (или ВРЕМЯ ПРОХОЖДЕНИЯ) – Transit Time is the total time that elapses between a shipment's delivery and its pickup. Transit Time is a time that vessel takes moving from one port to another. / Полное время, которое было затрачено с момента поставки грузовой партии до её передачи грузополучателю. Время, которое затрачивается судном при переходе из одного порта в другой.

TRANSIT ZONE = ТРАНЗИТНАЯ ЗОНА (или ЗОНА ТРАНЗИТА) – Transit Zone:- a port of entry in a coastal country that is established as a storage and distribution center for the convenience of a neighboring country lacking adequate port facilities or access to the sea. A zone is administered so that goods in transit to and from the neighboring country are not subject to the customs duties, import controls or many of the entry and exit formalities of the host country. A transit zone is a more limited facility then a free trade zone or a free port.

TRANSLATION = ТРАНСЛЯЦИЯ – Translation (genetic) is the process by which the genetic information of RNA is used to specify and direct the synthesis of proteins. Occurs in ribosomes. / (Генетическая) Трансляция – синтез полипептидной цепи белковой молекулы. В биологии под Трансляцией, от Латинского слова Translatio, означающее Передача, понимается биосинтез белков в живой клетке на рибосомах; второй этап реализации генетической информации, в процессе которого последовательность нуклеотидов информационной РНК 'переводится' в аминокислотную последовательность синтезирующегося белка. Протекает с участием транспортной РНК и соответствующих ферментов.

TRANSLOADING = ПЕРЕГРУЗКА – Transloading:- taking cargo from one vessel and loading it into another for further on-carriage. Transfer of containers from one vessel to another vessel. Synonymous with Transshipment. / Взятие груза из одного судна и погрузка его в другое судно для последующей доставки. Передача контейнеров из одного судна другому судну. Синоним другому Англоязычному термину Перегрузка (Transshipment).

TRANSLOCATED HERBICIDE = ПЕРЕМЕЩАЮЩИЙСЯ ГЕРБИЦИД – Translocated Herbicide is a herbicide that is moved within the plant. Translocated herbicides may be either phloem mobile or xylem mobile.

TRANSLOCATION = ТРАНСЛОКАЦИЯ (или ПЕРЕМЕЩЕНИЕ, или ПЕРЕДВИЖЕНИЕ) – Translocation:- (1) Genetic:- change in position of a segment of a chromosome to another location in the same or a different chromosome. (2) Physiological:- the movement of assimilates (carbohydrates or nutrients) from one plant organ to another in response to stress or ontogeny. (3) Breakage and reunion of chromatid at a different point of the chromosome. The process whereby a chemical is absorbed into the plant, via the leaves or roots, and is then moved to other parts of the plant. / Процесс, посредством которого химические вещества абсорбируются растением через листья и корни, а затем доставляются к другим частям растения. Транслокация – перемещение участка хромосомы. Передвижение веществ в растениях. Под Транслокацией, от Латинских слов Trans, означающее За или Сквозь или Через, и Locatio, означающее Размещение, понимается обмен между двух или более хромосом, а также перенос участка хромосомы в другое место той же хромосомы. Тип хромосомных перестроек (мутаций).

TRANSLUCENCY = ПРОСВЕЧИВАНИЕ (или ПРОСВЕЧИВАЕМОСТЬ) – (1) Translucency is the property of a specimen by which it transmits light diffusely without permitting a clear view of objects beyond the specimen and not in contact with it.

(2) Translucency:- the opposite of Chalkiness; measured with a Riken-Sanno Rice Meter which measures transmitted light through a fixed volume of Rice grains, one model for brown Rice, another for milled Rice. / (Riken-Sanno Rice Meter).

TRANSLUCENT = ПРОСВЕЧИВАЮЩЕЕ (или ПОЛУПРОЗРАЧНОЕ) – Translucent:- transmitting light but causing sufficient diffusion to eliminate perception of distinct images; intermediate between clear and opaque. Translucent:- transmitting light diffusely, but not permitting a clear view of objects beyond the specimen and not in contact with it.

TRANSMISSION = ПЕРЕДАЧА (или ТРАНСМИССИЯ) – Transmission is the movement or transfer of electric energy over an interconnected group of lines and associated equipment between points of supply and points at which it is transformed for delivery to consumers, or is delivered to other electric systems. Transmission is considered to end when the energy is transformed for distribution to the consumer. In reference to electricity, the Transmission system carries the electricity from generating plants to the load. It can operate at low voltage, high voltage, or extra-high voltage. The available transmission capacity varies through time, based on the number and size of the physical transactions. / По отношению к электричеству под Передачей или Трансмиссией, от Латинского слова Transmissio, означающее Передача или Переход, понимается система передачи, которая подаёт электричество от генерирующей установки к токоприёмнику. Она может осуществляться посредством передачи низкого, высокого и сверх-высокого напряжения. Доступная мощность передачи изменяется во времени в зависимости от количества и объёмов фактических действий нагрузки. Электропередача, совокупность электрических установок и устройств, обеспечивающих передачу электрической энергии на расстояние. В состав электропередачи входят понижающие и повышающие

трансформаторы, воздушные и (или) кабельные линии электропередачи (ЛЭП), высоковольтные выключатели, аппаратура защиты и противоаварийной автоматики. Возможность передачи значительных количеств электроэнергии на расстояние определяется пропускной способностью электропередачи, которая зависит от напряжения и протяжённости ЛЭП, обеспечения устойчивости её режима, условий эксплуатации, величины допустимых потерь и так далее. Повышение пропускной способности электропередачи связано, главным образом, с увеличением напряжения ЛЭП. Смотрите также Передача Электроэнергии и Техника Высоких Напряжений. Передача Электроэнергии от электростанции к потребителям – одна из важнейших задач энергетики. Электроэнергия передаётся преимущественно по воздушным линиям электропередачи (ЛЭП) переменного тока, хотя наблюдается тенденция ко все более широкому применению кабельных линий и линий постоянного тока. Необходимость передачи электроэнергии на расстояние обусловлена тем, что электроэнергия вырабатывается крупными электростанциями с мощными агрегатами, а потребляется сравнительно маломощными электроприёмниками, распределёнными на значительной территории. Тенденция к концентрации мощностей объясняется тем, что с их ростом снижаются относительные затраты на сооружение электростанций и уменьшается стоимость вырабатываемой электроэнергии. Размещение мощных электростанций производится с учётом целого ряда факторов, таких, например, как наличие энергоресурсов, их вид, запасы и возможности транспортировки, природные условия, возможность работы в составе единой энергосистемы и тому подобное. Часто такие электростанции оказываются существенно удалёнными от основных центров потребления электроэнергии. От эффективности передачи электроэнергии на расстояние зависит работа единых электроэнергетических систем, охватывающих обширные территории. Одной из основных характеристик электропередачи является её пропускная способность, то есть та наибольшая мощность, которую можно передать по ЛЭП с учётом ограничивающих факторов:- предельной мощности по условиям устойчивости, потерь на корону, нагрева проводников и так далее. Мощность, передаваемая по ЛЭП переменного тока, связана с её протяжённостью и напряжениями зависимостью:- $P = ((U_1 \cdot U_2)/Z_c \cdot \sin(\alpha \cdot l)) \cdot \sin \delta$, где U_1 и U_2 – напряжения в начале и в конце ЛЭП, Z_c – волновое сопротивление ЛЭП, α – коэффициент изменения фазы, характеризующий поворот вектора напряжения вдоль линии на единицу её длины (обусловленный волновым характером распространения электромагнитного поля), l – протяжённость ЛЭП, δ – угол между векторами напряжения в начале и в конце линии, характеризующий режим электропередачи и её устойчивость. Предельная передаваемая мощность достигается при $\delta = 90°$, когда $\sin \delta = 1$. Для воздушных ЛЭП переменного тока можно приближённо считать, что максимальная передаваемая мощность примерно пропорциональна квадрату напряжения, а стоимость сооружения ЛЭП пропорциональна напряжению. Поэтому в развитии электропередач наблюдается тенденция к увеличению напряжения как к главному средству повышения пропускной способности ЛЭП. Предельные значения напряжении ЛЭП, связанные с возможными перенапряжениями, ограничиваются изоляцией ЛЭП и электрической прочностью воздуха. Повышение пропускной способности ЛЭП переменного тока возможно и путём усовершенствования конструкции линии, а также посредством включения различных компенсирующих устройств. Так, например, на ЛЭП напряжением 330 кВ и выше используется ‘расщепление’ проводов в каждой фазе на несколько электрически связанных между собой проводников; при этом индуктивное сопротивление линии уменьшается, а ёмкостная проводимость увеличивается, что ведёт к снижению Z_c и уменьшению a. Одним из способов повышения пропускной способности ЛЭП является сооружение ‘разомкнутых’ линий, у которых на опорах подвешиваются провода двух цепей таким образом, что провода разных фаз оказываются сближенными между собой. В электропередачах постоянного тока отсутствуют многие факторы, свойственные электропередачам переменного тока и ограничивающие их пропускную способность. Предельная мощность, передаваемая по ЛЭП постоянного тока, имеет большие значения, чем у аналогичных ЛЭП переменного тока:- $P_{пр} = E_B^2 / (2 \cdot R_\Sigma)$, где E_B – напряжение на выходе выпрямителя, R_Σ – сумммарное активное сопротивление электропередачи, в которое, кроме сопротивления проводов ЛЭП, входят сопротивления выпрямителя и инвертора. Ограниченность применения электропередач постоянного тока связана главным образом с техническими трудностями создания эффективных недорогих устройств для преобразования переменного тока в постоянный (в начале линии) и постоянного тока в переменный (в конце линии). Электропередачи постоянного тока перспективны для объединения крупных удалённых друг от друга энергосистем. В этом случае отпадает необходимость в обеспечении устойчивости работы этих систем. Качество электроэнергии определяется надёжной и устойчивой работой электропередачи, что обеспечивается, в частности, применением компенсирующих устройств и систем автоматического регулирования и управления. Первая в мире электропередача, рассчитанная на длительную эксплуатацию, была построена в Петербурге, Россия в 1876 Павлом Николаевичем Яблочковым для электрического освещения улиц. Дмитрий Александрович Лачинов и Марсель Депре в 1880 теоретически обосновали возможность повышения напряжения для увеличения мощности и дальности передачи. Однако широкое использование электрической энергии в промышленности, теснейшим образом связанное с передачей электроэнергии на расстояние, началось лишь после изобретения Михаилом Осиповичем Доливо-Добровольским экономичного и относительно простого способа передачи электрической энергии трёхфазным переменным током. Со времени создания первых электропередач трёхфазного тока их напряжение возрастало в 1.5–2 раза примерно каждые 10–15 лет. Повышение напряжения давало возможность увеличивать расстояния и передаваемые мощности. В 1920-х электроэнергия передавалась максимально на расстояния порядка 100 км, к 1930-м протяжённость ЛЭП увеличилась до 400 км, а к 1970-м годам длина ЛЭП достигла 1 000–1 200 км. Наряду с развитием электропередач переменного тока совершенствовалась техника передачи электроэнергии постоянным током. В 1950 в бывшем СССР впервые в мире была введена в действие опытная кабельная линия постоянного тока Каширская ГРЭС – Москва напряжением 200 кВ с пропускной способностью 30 МВт. Накопленный опыт позволил в 1962–65 ввести в эксплуатацию межсистемную электропередачу постоянного тока (с воздушной ЛЭП напряжением 800 кВ) Волгоград – Донбасс пропускной способностью 750 МВт. К 1974 в разных странах работало уже более 20 электропередач постоянного тока. В СССР в 1975–85 намечалось строительство ЛЭП постоянного тока напряжением ±750 кВ протяжённостью 2 500–3 000 км и в дальнейшем – электропередачи ±1 200 кВ. С 1960-х большое внимание уделялось разработке качественно новых электропередач. Таковы, например, ‘закрытые’ электропередачи, выполняемые в виде замкнутых конструкций, заполненных электроизолирующим газом (например, SF_6), внутри которых располагаются провода высокого напряжения. Перспективны также криогенные (в дальнейшем, возможно, сверхпроводящие) ЛЭП. ‘Закрытые’ и криогенные электропередачи особенно удобны для энергоснабжения потребителей в густонаселённых районах, например на территориях крупных городов. Кроме того, изучается возможность передачи энергии электромагнитными волнами высокой частоты по волноводам. В энергоснабжении потребителей альтернативой передаче электроэнергии на расстояние является перевозка топлива. Сравнительный анализ показывает, что не всегда передача электроэнергии – наилучший способ энергоснабжения:- например, при высокой калорийности угля (более 17–19 МДж/кг) более целесообразно перевозить его по железной дороге (при условии, что железная дорога уже построена); в ряде случаев оказывается предпочтительнее сооружать трубопроводы для подачи природного газа или нефти. Анализ энергосистем ряда стран позволяет выделить две основные тенденции их развития:- приближение электростанций к центрам потребления в тех случаях, когда на территории, охватываемой объединённой энергосистемой, нет дешёвых источников энергии или когда ресурсы этих источников уже исчерпаны; сооружение электростанций вблизи дешёвых источников энергии и передачи

электроэнергии на расстояние, к центрам её потребления. Системы электро-, нефте- и газоснабжения должны сооружаться и эксплуатироваться в определённой координации между собой и образовывать единую энергетическую систему страны.

TRANSMISSION = ТРАНСМИССИЯ (или ПЕРЕДАЧА, или ПРОПУСКАНИЕ, или ПРОХОЖДЕНИЕ) – Transmission of radiant energy is the process whereby radiant energy passes through a material or object.

TRANSMISSION COMPANY = ПЕРЕКАЧИВАЮЩАЯ КОМПАНИЯ (или КОМПАНИЯ, ОСУЩЕСТВЛЯЮЩАЯ ПРОКАЧКУ) – Transmission Company is a company that transports gas for resale on its own behalf or transports gas for other. Also known as Pipeline Company. / Компания, осуществляющая прокачку газа для его последующей перепродажи от своего собственного имени или прокачку газа на платной основе для других компаний. Известна также как Трубопроводная Компания (Pipeline Company).

TRANSMISSION CONNECTION ASSETS = СОЕДИНИТЕЛЬНЫЕ ПЕРЕДАЮЩИЕ УСТРОЙСТВА – In reference to electricity, Transmission Connection Assets (TCA) are those assets that are put in primarily to connect customer to the grid and used for purposes of transmission connection services for the conveyance of electricity. / По отношению к электричеству, Соединительные Передающие Устройства (СПУ) – те устройства, которые используются для подключения потребителя к энергосистеме с целью оказания услуг по подаче электроэнергии.

TRANSMISSION CONNECTION SERVICES = УСЛУГИ ПО ПОДКЛЮЧЕНИЮ И ПЕРЕДАЧЕ – In reference to electricity the following services:- (a) the provision of capability at a connection point to deliver electricity to or take electricity from the connection point; (b) the conveyance of electricity:- (i) from the user system or equipment of a customer to the connection point, or (ii) from the connection point to the user system or equipment of a customer; (c) the planning, installation, maintenance, augmentation, testing and operation of transmission connection assets; and (d) the provision of services that support any of the services referred to in paragraphs (a) to (c). See also Regulated Transmission Services. / По отношению к электричеству услуги, состоящие в следующем:- (a) обеспечение возможности подачи или приёма электричества в/от точки подключения; (b) передача электроэнергии:- (i) от системы или оборудования потребителя к точке подключения, или (ii) от точки подключения к системе или оборудованию потребителя; (c) планирование, установка, обслуживание, расширение, тестирование и поддержание в рабочем состоянии соединительных передающих устройств; и (d) предоставление услуг, которые обеспечивают выполнение любой из услуг, перечисленных в пунктах с (a) до (c). Смотрите также Подконтрольная Подача Электроэнергии (Regulated Transmission Services).

TRANSMISSION MECHANISM = МЕХАНИЗМ ТРАНСМИССИИ (или МЕХАНИЗМ ПЕРЕДАЧИ) – Transmission Mechanism is the process in which changes in interest rates through various channels influence the behavior of economic agents, economic activity and ultimately the general price level. / Под Трансмиссией, от Латинского слова Transmissio, означающее Передача или Переход, понимается устройство или система для передачи вращения от двигателя к рабочим машинам (станкам, мельницам, дробилкам и другому). Трансмиссией называют также всю совокупность передач в тракторах, автомобилях и других самоходных машинах.

TRANSMISSION SERVICE AGREEMENT = СОГЛАШЕНИЕ ОБ ОКАЗАНИИ УСЛУГ ПО ПЕРЕДАЧЕ (ЭЛЕКТРИЧЕСКОЙ ЭНЕРГИИ) (или СОГЛАШЕНИЕ ОБ УСЛУГАХ ПО ПЕРЕДАЧЕ) – Transmission Service Agreement means the initial agreement and any amendments or supplements thereto entered into by the transmission customer and transmission provider for service under Commonwealth Edison's Federal Energy Regulatory Commission (FERC) tariff. / Соглашение об Оказании Услуг Поставки (электроэнергии) – это изначальное соглашение и любые изменения или приложения к нему, подписанные потребителем и поставщиком электроэнергии согласно тарифу Федеральной Комиссии по Надзору в Сфере Энергетики (ФКНСЭ) Сообщества Эдэсэна.

TRANSMISSION SYSTEM = СИСТЕМА ПЕРЕДАЧИ – Transmission System (electric) is an interconnected group of electric transmission lines and associated equipment for moving or transferring electric energy in bulk between points of supply and points at which it is transformed for delivery over the distribution system lines to consumers, or is delivered to other electric systems. / Под Электропередачей или Передачей Электроэнергии понимается:- (i) передача электрической энергии на расстояние; (ii) комплекс устройств, осуществляющих такую передачу (ЛЭП, электрические подстанции и другие).

TRANSMITTAL LETTER = СОПРОВОДИТЕЛЬНОЕ ПИСЬМО (или ПЕРЕДАТОЧНОЕ ПИСЬМО) – Transmittal Letter contains a list of the particulars of the shipment, a record of the documents being transmitted, and instructions for disposition of these documents. Any special instructions are also included. / Сопроводительное Письмо содержит перечень подробностей в отношении грузовой отправки, запись о документах, которые были переданы, и инструкции по распоряжению этими документами. В него включаются также любые специальные инструкции. Передаточное Письмо (Transmittal Letter):- письмо, которое отправляется вместе с документом или ценными бумагами. Оно содержит описание и цели сделки.

TRANSMITTED NUTRIENTS = ПЕРЕНОСИМЫЕ ПИТАТЕЛЬНЫЕ ВЕЩЕСТВА – Transmitted Nutrients are nutrients moved to growing points during seed germination.

TRANSOVARIAL PASSAGE = ТРАНСОВАРИАЛЬНЫЙ ПАСАЖ (или ТРАНСОВАРИАЛЬНЫЙ ПЕРЕНОС) – Transovarial Passage is a transmission of virus in the insect from one generation to the next through the egg. / Трансовариальный – передающийся через яйца.

TRANSPARENCY = ПРОЗРАЧНОСТЬ – (1) Transparency is the degree of regular transmission, thus the property of a material by which objects may be seen clearly through a sheet of it.

(2) Transparency is the principle of making available, at the international level, phytosanitary measures and their rationale; based on the World Trade Organization Agreement on the Application of Sanitary and Phytosanitary Measures. The extent to which laws, regulations, agreements, and practices affecting international trade are open, clear, measurable and verifiable.

TRANSPARENT = ПРОЗРАЧНОЕ – Transparent:- adjective to describe a material that transmits light without diffusion or scattering.

TRANSPARENT VELVET = ПРОЗРАЧНЫЙ БАРХАТ – Transparent Velvet is a sheer-cut pile velvet usually all rayon or with rayon pile, suitable for evening dresses, wraps, and millinery. Transparent Velvet (Chiffon Velvet) is a lightweight, very soft, draping velvet made with a silk or rayon back and a rayon pile.

TRANS–PECOS = ТРЭНС–ПЭКОССКОЕ (или ЗАПЭКОССКОЕ) – Trans-Pecos:- of territory in Texas west of the Pecos River.

TRANSPIRATION = ТРАНСПИРАЦИЯ (или ИСПАРИНА) – Transpiration is loss of water vapor through the plant's stomata. C4-metabolic adaptations in the Cactaceae and other succulents allow transpiration to be minimized. The evaporation of water vapor from plants, mainly through the stomata. Transpiration is the process by which plants release water vapor to the atmosphere through

surface pores (stomatal openings) in the plant foliage in response to atmospheric demand. The water of transpiration usually reaches a maximum value in the afternoon and a minimum value just before sunrise. Soil moisture content and plant characters, such as location and distribution of stomata, reduction of transpiration surface (leaf rolling), and plant age, affect transpiration rate. / Под Транспирацией, от Латинских слов Trans, означающее За или Сквозь или Через, и Spiro, означающее Выдыхаю или Дышу, понимается испарение воды из растений через пар, главным образом из устьиц. Основным органом транспирации растения служит лист. Благодаря процессу транспирации в растениях возникает ток воды и растворённых в ней минеральных солей от корней к листьям. Транспирация предохраняет растения от перегрева. Расход воды растением на транспирацию огромен, например, за вегетационный период с одного гектара (га) посева пшеницы испаряется приблизительно 2 000 тонн воды, капусты – 8 000 тонн воды.

TRANSPIRATION LOSSES = ТРАНСПИРАЦИОННЫЕ ПОТЕРИ – Transpiration Losses are evaporation losses in vegetable products as a result of respiration (transpiration). / В отношении овощной продукции потери на испарение вследствие респирации (транспирации).

TRANSPLANT = ПЕРЕСАЖИВАТЬ – Transplant:- to remove seedlings from the nursery (seedbed) and plant them in the field either by hand or machine. / либо вручную, либо машиной.

TRANSPONDER = ТРАНСПОНДЕР (или ИМПУЛЬСНЫЙ ПОВТОРИТЕЛЬ, или ПРИЁМООТВЕТЧИК) – Transponder is a device (chip) used for identification, which automatically transmits certain coded data when actuated by a special signal from an interrogator. / Транспондер – это электронный прибор, использующийся в телекоммуникациях. Представляет собой приёмопередающее устройство, а называется так от частей двух Английских слов – transmitter и responder.

TRANSPORTATION AND EXPORTATION ENTRY = ВВОЗ ДЛЯ (ПОСЛЕДУЮЩЕЙ) ТРАНСПОРТИРОВКИ И ВЫВОЗА – Transportation and Exportation Entry (T/E Entry or T&E Entry) allows goods coming from or going to a third country (such as Canada or Mexico) to enter the United States for the purpose of trans-shipments. Allows goods to be entered into the United States for re-export to a third country. / вывоз (exportation). Данный режим ввоза позволяет товарам быть ввезёнными в Соединённые Штаты Америки для обратного вывоза (или реэкспорта) в третью страну.

TRANSPORTATION MANAGEMENT SYSTEM = СИСТЕМА УПРАВЛЕНИЯ ТРАНСПОРТИРОВКОЙ – Transportation Management System (TMS) is a system used by the transportation department which aids in such tasks as manifesting shipments, finding rate quotes, and managing carriers.

TRANSPORTATION SECTOR = ТРАНСПОРТНЫЙ СЕКТОР (или СЕКТОР ТРАНСПОРТИРОВКА) – In some US energy reports, Transportation Sector is an energy-consuming sector that consists of all vehicles whose primary purpose is transporting people and/or goods from one physical location to another. Included are aircraft, automobiles, barges, buses, motorcycles, ships, subways, trains, trucks, and other rail and waterborne vehicles. Vehicles whose primary purpose is not transportation, e.g., construction cranes and bulldozers, farming vehicles, and warehouse tractors and forklifts, are classified in the sector of their primary use. / В некоторых отчётах США по энергетике, энергопотребляющий сектор, состоящий из всех транспортных средств, основной целью которых является транспортировка людей или товаров из одного места в другое. Сюда включаются самолёты, автомобили, баржи, автобусы, мотоциклы, суда, метро, поезда, грузовики и другие железнодорожные и водные транспортные средства. Транспортные средства, основным предназначением которых не является транспортировка, например, строительные краны и бульдозеры, сельскохозяйственные транспортные средства, а также складские тракторы и погрузчики, приписываются к сектору по их прямому назначению.

TRANSPORTATION TARIFF = ТАРИФ НА ТРАНСПОРТИРОВКУ – Transportation Tariff is a document published by a carrier that describes charges for transportation between 2 or more points, and contains other terms and conditions governing the transportation activity.

TRANSPORT DOCUMENT = ТРАНСПОРТНЫЙ ДОКУМЕНТ (или ДОКУМЕНТ НА ПЕРЕВОЗКУ) – Transport Document is a document evidencing a contract of carriage between a shipowner and a consignor, such as a sea waybill, a bill of lading or a multimodal transport document. / Транспортные Документы:- коносамент, накладная или иные документы, подтверждающие наличие и содержание договора перевозки товаров и сопровождающие товары и транспортные средства при международных перевозках.

TRANSPORT EQUIPMENT = ТРАНСПОРТНОЕ ОБОРУДОВАНИЕ (или ПЕРЕВОЗОЧНОЕ ОБОРУДОВАНИЕ) – Transport Equipment includes vehicles, tanks, tank-containers, portable tanks, demountable tanks, tank swap bodies, tube trailers, bulk containers, intermediate bulk containers, containers, packaging, packages, receptacles and aerosols, and any other item used or intended for use in the carriage of dangerous goods by road.

TRANSPORT FAN = ПНЕВМОТРАНСПОРТНАЯ УСТАНОВКА – Transport Fan:- a graduated range of material transport fans are available suitable for all instances within the opening line, the fan geometry is optimised for a material-protecting throughput of fibers. Depending on the application, the fans operate at a constant speed or are controlled by invertorsm, the necessary motor power is individually calculated for each fan resulting in minimal power usage. New modern material transport fans use only high-grade aluminium impellers to ensure efficient operation with much reduced chance of spark generation. In spinning process, a graduated range of material transport fans are available suitable for all instances within the opening line, the fan geometry is optimised for a material-protecting throughput of fibers. Fill Depending on the application, the fans operate at a constant speed or are controlled by invertorsm, the necessary motor power is individually calculated for each fan resulting in minimal power usage. All Crosrol Material Transport Fans use only high-grade aluminium impellers to ensure efficient operation with much reduced chance of spark generation. Inverter Transport Fan is used to transport raw material from the front different single machine to the next one. Those motors are driven by frequency inverter, so it can control the pressure and volume of the air in the duct accurately. It adopts straight-blade aluminum-alloy impeller which has a smooth oxygenated surface and features of no sparkle, no block and no adhesion of fiber. Its surface is painted with plastics and it have a good antirust performance. One of two revolving directions, clockwise or anti-clockwise can be adopted. Fan's outlet angle can be 0°, 90° and 180°. The way of transmission is that the impeller and motor connect directly. Inverter Transport Fan is used to transport cotton, man-made fibers material from the last blowroom maxhine to the chute feed of card. The speed is regulated by frequency inverter. The fan has a good adaptability and a compact construction. The fan can be clockwise or anti-clockwise revolving directions. The fan consists of impeller and cover. The impeller consists of eight radial leaf blades which are welded on the hub and the support plate, and it connects the output shaft of motor directly. The cover is fixed on the seat of the fan, there are three installation positions. / В прядильном производстве. outlet = припуск сверх шва.

TRANSPORT INFORMATION SERVICE = СЛУЖБА ИНФОРМАЦИИ О ПЕРЕВОЗКАХ – The Transport Information Service (TIS; http://www.tis-gdv.de) from the German Insurance Association (Gesamtverband der Deutschen Versicherungswirtschaft e.V. (GDV

e.V.)) provides users with specialist information from German marine underwriters on various aspects of the transport sector. TIS covers the following subject areas:- (i) cargo Information for a total of 190 products; (ii) technical information about containers; (iii) technical information about fit-for-purpose packaging; (iv) articles dealing with load securing; (v) photo of the Month; and (vi) risk factors in cargo insurance. Headquartered in Berlin, Germany. / Гезамтфэрбанд дэр Дойчэн Вэрсихерунгсвиртшафт и.Фау. (Ге.Дэ.Фау. и.Фау.; Gesamtverband der Deutschen Versicherungswirtschaft e.V. (GDV e.V.)).

TRANSPORT–RELATED ACCELERATION FORCES = СИЛЫ УСКОРЕНИЯ, СВЯЗАННЫЕ С ПЕРЕВОЗКОЙ – Transport-Related Acceleration Forces:- negative and positive accelerations are dynamic, mechanical stresses which occur in two main types during the transportation of goods:- (i) regular acceleration forces; and (ii) irregular acceleration forces. Regular acceleration forces primarily occur in maritime transport. Acceleration of up to one g (g = 9.81 [m/s^2]) and, in extreme cases, even more, may occur due to rolling and pitching in rough seas. Such regular acceleration forces have an impact on the effort involved in load securing. Irregular acceleration forces occur during cornering or when a train passes over switches, during braking, starting up, hoisting and lowering. Such acceleration forces are not generally repeated, but they may occur several times at varying intensities during transport. These are the typical stresses of land transport and transport, handling and storage operations.

TRANSPORT–RELATED PROPERTIES OF PRODUCTS = СВЯЗАННЫЕ С ПЕРЕВОЗКОЙ СВОЙСТВА ПРОДУКТОВ – Transport-Related Properties of Products are product properties required for transport, handling and storage processes.

TRANSPORTS INTERNATIONAUX ROUTIERS = ТРАНСПОР ЭТЭРНАСЬЁНО РУТЭР (или МЕЖДУНАРОДНЫЕ ДОРОЖНЫЕ ПЕРЕВОЗКИ) – Transports Internationaux Routiers (TIR) is the European carnet system to facilitate international movement of goods. TIR Carnet means the entry document reproduced as Annex 1 to the Customs Convention on the International Transport of Goods under Cover of TIR Carnets. The TIR Carnet may be accepted at any port of entry for the transport of merchandise in road vehicles or in containers, even if the containers, without being loaded on road vehicles, are carried by other means of transport for part of the journey between the customs offices of departure and destination. The TIR Carnet may also be accepted for the transport of 'heavy or bulky goods' as defined in Article 1 of the TIR Convention. The TIR Carnet covers the transportation of merchandise for customs purposes only. Road vehicles transporting merchandise under cover of a TIR Carnet must also comply with all other applicable requirements of governmental agencies concerned with the regulations of such vehicles and their personnel.

TRANSPORTS INTERNATIONAUX ROUTIERS CARNET = ТРАНСПОР ЭТЭРНАСЬЁНО РУТЭР КАРНЭ (или КНИЖКА МЕЖДУНАРОДНОЙ ДОРОЖНОЙ ПЕРЕВОЗКИ) – International Customs document allowing passage of goods from origin to destination over several international borders without en route Customs inspection of goods. A document which can be issued to ease border crossings in Europe. Customs at a European location places a seal on a container and issues the TIR Carnet. The document and seal allow the container to cross borders without inspection to the consignee's door, where destination customs will then inspect the cargo. Is a Customs transit document permitting facilitation of international trade and international road transport, under cover of which transport of goods from (a) Customs office(s) of departure to (a) Customs office(s) of destination is carried out under the procedure called 'TIR Procedure' laid down in the TIR Convention. The TIR Carnet (short for the Transports Internationaux Routiers Carnet) is a Customs transit document used for an international transit operation of goods. It may be issued either in the country of departure or in the country in which the holder is established or resident. The TIR carnet is printed in French, except for page 1 of the cover where the items are also printed in English. Carnets used for TIR operations within a regional guarantee chain may be printed in any other official language of the United Nations except for page 1 of the cover where items are also printed in English or French. Each TIR carnet has a unique reference number. A TIR carnet may have 4, 6, 14, or 20 vouchers, as one pair of vouchers is used per country; the number of vouchers indicates the number of countries that can be transited, including the countries of departures and destinations, under cover of this type of carnet, e.g., a 14-voucher carnet may be used for a TIR transport through up to 7 countries. Each individual TIR carnet can be used for one TIR transport. Once the TIR operation has been terminated at the Customs office of destination of the goods, the driver is handed back the TIR carnet duly endorsed by the Customs authorities of destination and may proceed with the goods' delivery. The TIR carnet is returned to the IRU for control and archiving. To obtain a TIR carnet you must be a member of a TIR carnet issuing and guaranteeing association in the country where you are domiciled and be admitted to the TIR system in accordance with the provisions of the TIR Convention. How many countries can I transit under cover of a TIR Carnet? Answer:- From 2 to 10 countries. For a transit operation between two countries you would use a 4-voucher TIR carnet. There are also TIR carnets with 6, 14 or 20 vouchers, enabling you to transit up to 3, 7 or 10 countries, respectively. All goods in the same sealed load compartment that is covered by a TIR carnet are covered by the guarantee of the TIR carnet, whether or not enumerated in the TIR carnet. Goods can be loaded and unloaded in several places (partial loading or unloading), provided that the total number of Customs offices of loading and unloading does not exceed 4. Also known as Carnet TIR. See also Admission Temporaire – Temporary Admission Carnet, and Carnet De Passages En Douane. / , например, . Отрывные листки (volets, vouchers или sheets). Известна также как Книжка МДП или Тэ.И.Эр. Карнэ (TIR Carnet). Смотрите также Адмисьён Тэмпорэр – Тэмпорэри Эдмишэн Карнэ или Книжка Временного Допуска (Admission Temporaire – Temporary Admission Carnet), и Карнэ Дё Пассаж Ан Дуан или Книжка Допусков В Таможне (Carnet De Passages En Douane). Книжка Международной Дорожной Перевозки или Книжка МДП – это документ таможенного транзита, используемый для подтверждения существования международной гарантии уплаты таможенных пошлин и налогов на товары, перевозимые по процедуре МДП, в пределах сумм, установленных договаривающимися сторонами, и на условиях, предусмотренных Конвенцией МДП. Каждая книжка МДП имеет уникальный идентификационный номер. Книжка МДП может содержать 4, 6, 14 или 20 отрывных листков. Так как в каждой стране используется комплект из двух отрывных листков, то количество листков в книжке указывает число стран, через которые можно проехать транзитом по данному типу книжки, включая страну отправления и назначения. Например, 20-страничные книжки могут быть использованы для перевозки МДП через максимум 10 стран. Каждая отдельная книжка МДП может быть использована только для одной перевозки МДП. По завершению перевозки МДП в таможне назначения, книжка МДП возвращается водителю, заверенная надлежащим образом таможенными органами назначения. Таможенные органы должны немедленно подтвердить в электронном виде прекращение перевозки МДП через SafeTIR. Книжка МДП возвращается в ассоциацию и отправляется затем в Международный Автотранспортный Союз (МАС) (или Международный Союз Автомобильного Транспорта (МСАТ); International Road Transport Union (IRU)) для окончательного контроля и архивирования.

TRANSPORTS INTERNATIONAUX ROUTIERS CONVENTION = ТРАНСПОР ЭТЭРНАСЬЁНО РУТЭР КОНВЭНСЬЁН (или КОНВЕНЦИЯ О МЕЖДУНАРОДНЫХ ДОРОЖНЫХ ПЕРЕВОЗКАХ) – A Review Conference convened on 1975-November-14 under the auspices of the United Nations Economic Commission for Europe (UNECE) produced the TIR Convention of 1975 that came into force in 1978. Since that time the TIR Convention (short for the Transports Internationaux Routiers Convention) has proved that it is one of the most successful international transport conventions and is in fact so far the only universal Customs transit system in existence. The idea behind the TIR Convention and its transit regime has formed the basis for many regional transit systems and has thus, directly and indirectly, contributed to the facilitation of international transport, especially international road transport, not only in Europe and the Middle East, but also in other parts of the world, such as Africa and Latin America. Anyone who has ever travelled on

European roads will recognize the familiar blue and white TIR plate borne by thousands of lorries and semi-trailers using the TIR Customs transit system. For the driver, the transport operator and the shipper, this plate stands for fast and efficient international transportation by road. Work on the TIR transit system started soon after the Second World War under the auspices of the United Nations Economic Commission for Europe (UNECE). The first TIR Agreement was concluded in 1949 between a small number of European countries. The success of this limited scheme led to the negotiation of a TIR Convention which was adopted in 1959 by the UNECE Inland Transport Committee and entered into force in 1960. This first TIR Convention was revised in 1975 to take account of practical experience in operating the system and to give effect to technical advances and changing Customs and transportation requirements. The experience gained in the first 10 to 15 years of operating the system was thus used to make the TIR system more efficient, less complex and at the same time more Customs secure. Another reason why the original TIR system had to be modified was that in the early 1960's a new transport technique emerged: the maritime container. That was followed a little later by the inland container used by the European railways and by the swap-body introduced for improving the efficiency of road/rail transport. These new combined or multimodal transport techniques necessitated the acceptance of the container, under certain conditions, as a Customs secure loading unit. It meant also that the TIR regime no longer only covered road transport, but was extended to rail, inland waterways and even maritime transport, although at least one part of the total transport operation still has to be made by road. Upon its entry into force the new Convention terminated and replaced the old Convention of 1959. However, the former Convention is still in force for various reasons, one of which is that one of the Contracting Parties to the old Convention (Japan) has not yet acceded to the TIR Convention of 1975. The TIR Convention has proved to be one of the most effective international instruments prepared under the auspices of the United Nations Economic Commission for Europe (UNECE). To date, it has 66 Contracting Parties, including the European Community. It covers the whole of Europe and reaches out to North Africa and the Near and Middle East. Countries in Asia have been informed about the facilities of this global Customs transit system and their interest has shown that they may well join the TIR Convention in the not too distant future. Already today, the United States of America and Canada are Contracting Parties as well as Chile and Uruguay in South America. The success of the TIR system may also be judged by the number of TIR Carnets distributed and issued every year. Whilst in 1952 only a little over 3 000 TIR Carnets were issued, this number increased steadily reaching 100 000 in 1960, then 800 000 in 1970. During the seventies and eighties the demand for TIR Carnets floated between around 500 000 and 900 000. This can be explained by the enlargement of the European Community which utilizes its own Community Transit System within its territory. Thus, TIR Carnets cannot be used for Customs transit operations within its member countries. As a result of the expanding East-West European trade, particularly since 1989, and the corresponding tremendous increase in international road transport, the number of TIR Carnets issued, exceeded one million in 1992 and has now reached almost 3.6 million (2006) which represents the start of nearly 10 000 TIR transports every day in more than 50 countries and well over 50 000 TIR border crossing procedures daily. The number of transport companies authorized by national Customs authorities to utilize TIR Carnets amounts to more than 40 000. The accession of a number of Central European countries to the European Community in 2004 has, so far, not led to a decrease in the number of TIR transport operations in this part of Europe. At the same time it can be expected that the number of TIR transport operations in and to the countries of the Middle East and Asia will continue to increase in the future. In substance, the tremendous increase in the use of the TIR Customs transit system can be explained by the special features of the TIR regime which offer transport operators and Customs authorities a simple, flexible, cost-effective and secure Customs regime for the international transport of goods across frontiers. Customs transit systems are devised to facilitate to the greatest possible extent the movement of goods under Customs seals in international trade and to provide the required Customs security and guarantees. For such a system to function satisfactorily, it is essential that any formalities involved are neither too burdensome for the Customs officials nor too complex for the transport operators and their agents. Therefore, a balance needs to be struck between the requirements of the Customs authorities on the one hand and those of the transport operators on the other. Traditionally when goods crossed the territory of one or more States in the course of an international transport of goods by road, the Customs authorities in each State applied national controls and procedures. These varied from State to State, but frequently involved the inspection of the load at each national frontier and the imposition of national security requirements (guarantee, bond, deposit of duty, etc) to cover the potential duties and taxes at risk while the goods were in transit through each territory. These measures, applied in each country of transit, led to considerable expenses, delays and interferences with international transport. In an attempt to reduce these difficulties experienced by transport operators and, at the same time, to offer Customs administrations an international system of control replacing traditional national procedures, whilst effectively protecting the revenue of each State through which goods were carried, the TIR system was devised. (a) Advantages for Customs administrations:- as regards Customs control measures at frontiers, the TIR system clearly has advantages for Customs administrations as it reduces the normal requirements of national transit procedures. At the same time the system avoids the need – expensive in manpower and facilities – for physical inspection in countries of transit other than checking seals and the external conditions of the load compartment or container. It also dispenses with the need to operate national guarantees and national systems of documentation. In addition, advantages arise from the fact that the international transit operation is covered by a single transit document, the TIR Carnet, which reduces the risk of presenting inaccurate information to Customs administrations. In case of doubt, Customs authorities have the right to inspect the goods under Customs seal at any time and, if necessary, to interrupt the TIR transport and/or to take adequate measures in accordance with national legislation. In view of the strict provisions of the TIR Convention and the interest of all Customs authorities and transport operators to apply these provisions, such interventions should remain exceptional. Customs authorities can therefore reduce routine administrative Customs procedures to a minimum and devote their limited resources to specific control measures based on risk assessment and intelligence information. The TIR Executive Board (TIRExB), as an inter-governmental organ, ensures that each of the actors in the TIR procedure adequately applies the provisions of the Convention. In case of difficulties in the application of the TIR Convention at the international level, Customs authorities may wish to address the TIRExB for guidance and support. The TIRExB is also at the disposal of all Contracting Parties to coordinate and foster the exchange of intelligence and other information. (b) Advantages for the transport industry:- The advantages of the TIR Convention to commerce and to transport interests are also obvious. Goods may travel across national frontiers with a minimum of interference by Customs administrations. By easing traditional impediments to the international movement of goods, the TIR system encourages the development of international trade. By reducing delays in transit, it enables significant economies to be made in transport costs. The TIR Convention also provides, through its international guarantee chain, relatively simple access to the required guarantees which are a sine qua non for the transport and trade industry to benefit from the facilities of Customs transit systems. Finally, in reducing the impediments to international traffic by road caused by Customs controls, it enables exporters and importers to select more easily the form of transport most suitable for their needs. Future Development of the TIR System:- (a) World-wide application of the TIR System:- The TIR system is promoted under the auspices of the United Nations to make it as widely available as possible for all countries wishing to make use of it. In 1984, the Economic and Social Council of the United Nations (ECOSOC) adopted a Resolution (1984/79) which recommends that countries world-wide examine the possibility of acceding to the Convention and introducing the TIR system. Furthermore, it recommends that international, intergovernmental and non-governmental organizations, and in particular the Regional Commissions of the United Nations, promote the introduction of the TIR system as a universal Customs transit system. In accordance with this ECOSOC Resolution, activities have been undertaken to promote the application of the TIR Convention beyond the present

66 Contracting Parties. Several regional and sub-regional seminars and workshops have already been organized in Europe, Asia and the Middle East to familiarize Governments, trade and the transport industry with the facilities of the Convention. Currently work is under way to extend the scope of the TIR system to Asia and to the Middle East. This work is undertaken in particular by the secretariats of the UNECE and the United Nations Economic and Social Commissions for Asia and the Pacific (UN ESCAP) and Western Asia (ESCWA) which promote the TIR system as one of the cornerstones for efficient international land transport in Asia and the Middle East. These efforts are supported by various international bodies and banks, such as the European Commission and the World Bank which see the TIR system as an important element in facilitating road transport along the historic Silk route or in the Greater Mekong sub-region in Far-East Asia. (b) The TIR System and electronic data processing:- World-wide, the replacement of paper documents by electronic data processing is an ongoing process which will continue to gain further importance, also for Customs administrations and transport operators. This trend will increasingly affect Customs procedures and the documents used by Customs authorities. The reasons are that Customs administrations are confronted with an enormous dilemma. On the one hand they are governed by laws which oblige them to collect and account for revenues in an effective and efficient manner and to prevent fraud and smuggling of contraband. On the other hand they are increasingly criticized by trading parties (importers, exporters, transport operators, freight forwarders) for not facilitating the speedy throughput of cargo. Taking into account the limitations of Customs manpower and the increasingly sophisticated methods of Customs fraud and smuggling, there seems to be no other way than to increase productivity and Customs control by adapting national and international administrative procedures, making use of the latest technologies and electronic data processing. The Contracting Parties to the TIR Convention have included the computerization of the TIR procedure into Phase III of the TIR revision process. They recognized that computerization of the TIR procedure was inevitable in the light of:- (i) today's extremely rapid technological developments, based on Internet and Smart Card technologies, particularly affecting international transport and trade; (ii) the ever increasing need for improved efficiency of Customs procedures and trade practices; and (iii) the fight against fraudulent activities which must be conducted with the most appropriate and effective means. Given the large number and the diversified administrative structure of the more than 60 Contracting Parties to the TIR Convention, any computerized system must be able to function in a very decentralized and flexible manner on the basis of only a few internationally accepted standard features, such as the establishment of an international centralized database under Customs control and the management by Customs of data on guarantees. This is a difficult, but challenging task which will have to be realized with an appropriate level of connectivity with the existing TIR related IT systems. But there can be no doubt: The TIR system must be kept in line with the latest developments in electronic data processing techniques which have already and increasingly will change all related Customs, transport and trade activities. If not, the TIR system, particularly the paper-based TIR Carnet, will become an obstacle to efficient international transport and trade and will jeopardize effective national Customs procedures and controls. This challenge will have to be met by all Contracting Parties to the TIR Convention, by national and international organizations as well as by the transport industry involved. Conclusion:- the TIR system, created more than 50 years ago and the TIR Convention, have proved to be a very effective international Customs transit system and have played an important role in facilitating international trade and transport, primarily within Europe, but more recently also between Europe and neighbouring areas. With the rapid increase of East-West European traffic and with the emergence of many newly independent countries in Central and Eastern Europe, the TIR system is today faced with new and, to this extent, unprecedented challenges. At the same time Customs authorities are faced with an unparalleled amount of Customs fraud and smuggling as a result of changing political, economic and social situations in many countries in the region and due to often heavily increasing Customs duties and taxes. Furthermore, the management and the control of the TIR system pose problems for national Customs authorities which, mainly in newly independent countries, sometimes still have to acquire the necessary experience and often do not have sufficient and adequately trained personnel. To counter some of these unwanted developments, Governments and other actors in the TIR system sometimes impose unilateral measures, such as the requirement of additional guarantees for TIR transit operations or the exclusion of certain categories of goods which are not in line with the provisions and the spirit of the TIR Convention. While such measures may provide some temporary relief, they will induce in the long run not only other countries to introduce similar measures, but they will also make international trade and transport more expensive and, eventually, may lead to a total collapse of the TIR transit system – with no viable alternative in sight. The TIR Convention itself provides already a number of measures to safeguard the legitimate interests of Customs authorities, such as the requirement for escort services, prescription of transit routes and reduced transit times. Other measures may be prepared if Contracting Parties to the TIR Convention so wish. Stable and long-term solutions can only be found in joint and concerted action by all concerned Contracting Parties to the TIR Convention. The TIR Executive Board (TIRExB) as well as the UNECE and its Working Party on Customs Questions affecting Transport (WP.30) provide a forum for such cooperation and coordination. Experience has shown that solutions to many recently emerged problems in the application of the TIR Convention have been found within the organs and bodies established in the framework of the TIR Convention and the UNECE. It is the aim of the UNECE and the TIR secretariat to continue to work in this direction and to provide a well-functioning international machinery to further improve cooperation and coordination among Contracting Parties to the TIR Convention and the transport industry. It is essential to continuously improve the legal framework within which the TIR transit system operates and to streamline its operation so that the TIR transit system is always in line with the requirements of the transport industry and of the Customs authorities. The United Nations, as a universal organization, is the depositary of the TIR Convention and provides the framework and the services to administer and, where necessary, adapt the TIR Convention to changing requirements. Past experience has shown that the TIR Convention, as part of the transport facilitation work undertaken within the UNECE, has served the interests of all concerned, Customs authorities and transport operators alike, and there is every reason to believe that it will continue to do so in the future. The UNECE (United Nations Economic Commission for Europe with headquarters in Geneva, Switzerland) Customs Convention on the International Transport of Goods under Cover of TIR Carnets (TIR Convention, 1975-November-14). Entry into force:- 1978-March-20, in accordance with article 53(1). The TIR Convention, has been revised 28 times since November of 1975. The latest amendments came into force on 2009-January-01. Also known as TIR Convention. / Таможенная Конвенция ЕЭКООН (Европейская Экономическая Комиссия Организации Объединённых Наций со штабквартирой в Женеве, Швейцария) о Международной Перевозке Грузов с применением Книжки МДП (Конвенция МДП, 1975-Ноябрь-14). Вступила в силу 20 Марта 1978 в соответствии со статьёй 53(1) самой конвенции. С Ноября 1975 Конвенция МДП пересматривалась 28 раз. Последние поправки вступили в силу 01 Января 2009. Известна также как Конвенция МДП или Тэ.И.Эр. Конвэнсьён (TIR Convention).

TRANSPORT TEMPERATURES = ТЕМПЕРАТУРЫ ПЕРЕВОЗКИ – Transport Temperatures:- loading, travel and pulp temperatures, e.g., for sweet oils. / , например, для оливковых сладких масел (sweet oils).

TRANSPORT UNIT = ТРАНСПОРТНАЯ ЕДИНИЦА (или ТРАНСПОРТНЫЙ ПАКЕТ) – Transport Unit is any means of transporting goods suitable for use in a Customs transit operation or under Customs seal. The term transport-unit means:- (i) containers having an internal volume of one cubic meter or more, (ii) road vehicles, including trailers and semi-trailers, (iii) railway wagons, and (iv) lighters, barges and similar vessels. Approval of transport-units for transport of goods under Customs seal is dealt with in various international

instruments, for example, the Kyoto Convention (Annex E.1.), the Customs Convention on Containers, 1972, and the Customs Convention on the international transport of goods under cover of TIR carnets (TIR Convention), 1975.

TRANSPOSON = ТРАНСПОЗОН – Transposon is a transposable element in either prokaryote or eukaryote. May contain its own transposase enzyme gene. Usually is flanked by direct or indirect repeat sequences. / Транспозон или ТП Элемент или Перемещающийся Элемент – участок генома с непостоянной локализацией.

TRANSSHIP = ПЕРЕГРУЖАТЬ – Transship:- to transfer goods from one transportation line to another or to transfer goods from one vessel to another.

TRANSSHIPMENT = ПЕРЕГРУЗКА – Transshipment:- transfer of a shipment from one carrier, or more commonly, from one vessel to another whereas in transit. Transshipments are usually made (1) where there is no direct air, land, or sea link between the consignor's and consignee's countries, (2) where the intended port of entry is blocked, or (3) to hide the identity of the port or country of origin. Because transshipment exposes the shipment to a higher probability of damage or loss, some purchase orders or letters of credit specifically prohibit it. Also spelled as transhipment. A system under which cargo is transferred from one transportation line to another. Transshipment is the act of shipping goods to an intermediate destination prior to reaching their ultimate end-use. Transshipment is a common practice with logistic benefits, but can be used to illegitimately to disguise country of origin or intent of the goods. Transshipment is commonly used by smugglers and terrorists seeking to disguise the point of origin of their goods from Customs officials. Certain countries like Libya, North Korea, and Syria are considered higher risk for security threats while countries like China and Taiwan are likely sources for counterfeit goods. Importers can transship goods both intentionally and accidentally. Intentional transshipments are done to avoid higher duty rates levied on certain countries, avoid import restrictions like visa and quota restrictions, or make use of a special trade program to drastically lower duty rates. Accidental transshipments are usually caused by miscommunication between foreign vendors or US buyers. Too often, US importers do not recognize the need for properly declaring country of origin and see reduced duty rates as smart business. Foreign vendors typically do not have the in-depth knowledge of US Customs regulations to advise against the practice. Penalties:- in addition to the loss of import privileges and seizure of imported merchandise, importers practicing transshipment may also be subject to an array of civil penalties under 19 USC 1592. Maximum penalties for transshipment are:- (i) Fraud:- an amount not exceeding the domestic value of the merchandise; (ii) Gross Negligence:- the lesser of (a) the domestic value of the merchandise, or (b) four times the lawful duties, taxes, and fees, or (c) if the violation did not affect the assessment of duties, 40 percent of the dutiable value of the merchandise; (iii) Negligence:- the lesser of (a) the domestic value of the merchandise, or (b) two times the lawful duties, taxes, and fees, or (c) if the violation did not affect the assessment of duties, 20 percent of the dutiable value of the merchandise. The act of transferring goods from one vessel to another or from one conveyance to another, including periods at transshipping ports or places. Transshipment or Transhipment is the shipment of goods or containers to an intermediate destination, then to yet another destination. One possible reason is to change the means of transport during the journey (for example from ship transport to road transport), known as Transloading. Another reason is to combine small shipments into a large shipment (consolidation), dividing the large shipment at the other end (deconsolidation). Transshipment usually takes place in transport hubs. Much international transshipment also takes place in designated customs areas, thus avoiding the need for customs checks or duties, otherwise a major hindrance for efficient transport. Note that transshipment is generally considered as a legal term. An item handled (from the shipper's point of view) as a single movement is not generally considered transshipped even if it may in reality change from one transport to another at several points. Previously, it was often not distinguished from transloading, since each leg of such a trip was typically handled by a different shipper. Transshipment is normally fully legitimate and an everyday part of the world's trade. However, it can also be a method used to disguise intent, as is the case with illegal logging, smuggling or grey market goods. The transhipment of containers at a container port or terminal can be defined as the number (or proportion) of containers, possibly expressed in twenty-foot equivalent units (TEUs), of the total container flow that is handled at the port or terminal and, after temporary storage in the stack, transferred to another ship to reach their destinations. The exact definition of transhipment may differ between ports, mostly depending on the inclusion of inland water transport (barges operating on canals and rivers to the hinterland). The definition of transhipment may:- (i) include only seaborne transfers (a change to another international deep-sea container ship); and (ii) include both seaborne and inland waterway ship transfers (sometimes indicated as water-to-water transhipment). Most coastal container ports in China have a large proportion of riverside 'transhipment' to the hinterland. In both cases, a single, unique, transhipped container is counted twice in the port performance, since it is handled twice by the waterside cranes (separate unloading from arriving ship A, waiting in the stack, and loading onto departing ship B). At a break-of-gauge cargo is transloaded from boxcars or covered goods wagons on one track, to wagons on another track of a different rail gauge, or containers are transloaded from flatcars on one track to flatcars on another track of a different gauge. Variable gauge axles can eliminate this inconvenience. Transshipment is a transfer, in a convenient port from one ship to another when the first carrying vessel does not call at the port of destination. / коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо).

TRANSSHIPMENT PORT = ПОРТ ПЕРЕГРУЗКИ – Transshipment Port is a place where cargo is transferred to another carrier.

TRANSTAINER = ТРАНСТЕЙНЕР (или ТРАНСПОРТНОЕ СРЕДСТВО ДЛЯ ОБРАБОТКИ КОНТЕЙНЕРОВ) – Transtainer is a powered mobile portal frame with four wheel steering. Capable of lifting, stacking and transferring containers. Also known as Rubber Tyred Gantry (RTG) Crane. / Увеличение пропускной способности контейнерного терминала возможно как за счёт расширения территории складирования, так и за счёт увеличения его ярусности. В этой связи, использование тыловых трансте йнерных перегружателей, позволяющих штабелировать контейнеры в пять ярусов, может стать следующим шагом на пути дальнейшего развития контейнерного терминала. Применение трансте йнерной технологии складирования в три раза повышает эффективность использования складских площадей и позволяет более экономично их эксплуатировать. Кроме того, по расчётам специалистов, в полтора раза увеличивается скорость обработки судов:- трансте йнер – машина очень скоростная, оборудованная системой Smart Rail. На сегодняшний день это наиболее передовая, но и одновременно более сложная технология (представьте, как доставать контейнер находящийся внизу пятиярусного штабеля), поэтому без существующей автоматизированной информационной системы управления, без планирования размещения контейнеров на складских площадях внедрение данной технологии было бы практически невозможно.

TRANSVERSE = НАИСКОСЬ (или ИСКОСА, или СБОКУ, или ПОПЕРЕЧНО) – Transverse:- across or at right angles to the vertical. Transverse:- across the long axis. / поперёк длинной оси.

TRANSVERSE = ПОПЕРЕЧНОЕ (или ТРАВЕРЗ) – (1) Transverse:- across a ship at right angles to a line drawn from bow to stern. / Поперёк судна под прямым углом по отношению к линии, мысленно проведённой от носа к корме. Под Шпангоутом, от Голландского слова Spanthout, понимается:- (i) поперечный элемент конструкции корпуса (каркаса) в виде поперечного ребра жёсткости бортовой обшивки судна (между днищем и палубой) или фюзеляжа летательного аппарата; или (ii) изображение поперечного сечения судна на чертеже. Под Траверсой или Траверзой понимается горизонтальная балка, опирающаяся на

вертикальные стойки; часть конструкций (обычно в виде поперечной балки) различных машин и сооружений. Подвижная траверса подвешивается к канатам (цепям) грузоподъёмных машин. Под Траверсой понимается горизонтальная балка, являющаяся частью различных конструкций и машин (главным образом станин). Подвижные траверсы станков называются поперечинами, например в гидравлическом прессе, продольно-строгальном станке.

(2) Термин Траверз возник от Французского слова Traverse, от Латинского слова Transversus, обозначающее Поперечный. В морском судоходстве он используется для обозначения направления, перпендикулярного курсу судна или продольной оси судна. Выражение 'Быть на Траверзе' какого-либо предмета означает находиться на линии, направленной на этот предмет и составляющей прямой угол с курсом судна. По названию борта различают левый и правый траверз.

TRAP = ЛОВУШКА (или УЛОВИТЕЛЬ) – Trap is a structure designed to catch and detain animal prey. / Под Ловушками понимаются:- (1) орудия и приспособления для ловли диких зверей и птиц, то есть для охоты. Автоматические ловушки (самоловы) – капканы, кулемы, ловчие ямы, пасти, петли, плашки, садки и другие и действующие при участии человека – сети. (2) Приспособления для ловли вредителей сельскохозяйственных растений, например, ночных бабочек (световые ловушки), других насекомых (ловчие пояса, канавки и каналы), грызунов (капканы).

TRAP CROP = ПРИМАНОЧНАЯ КУЛЬТУРА – Trap Crop is a crop planted alongside cotton designed to lure heliothis into them, where they are then destroyed. Soybean, chickpea, maize, pigeon peas, sorghum, etc, may be used as trap crops. Efficiency of the trap crop depends on the season. A crop, or portion of a crop intended to attract pests so they can be destroyed by treatning a relatively small area or by destroying the trap crop and pests together. Trap Crop is a crop that is planted specifically to attract pests, rodents, or birds away from the main crop. / Сельскохозяйственная культура или её порция, предназначенная для привлечения внимания табачных совок с тем, чтобы они могли бы быть уничтожены обработкой относительно небольшой площади или совместным уничтожением самой приманки и этих вредителей.

TRAPEZOID TEAR TESTER = ТЕСТЕР ДЛЯ ОТРЫВА ТРАПЕЦОИДА – Trapezoid Tear Tester:- the Trapezoid tear test values increase with hardness, with a large increase for 95A urethane. In the Trapezoid test, mainly used to test rubber coated fabrics, the entire stress is placed at the initiation of tear, in a direction perpendicular to the direction of tear. This eliminates the 'doubling back' and shear effects associated with split tears and the tensile effects found in Graves and Winkelmann tests. The Trapezoid test is a useful complement to the other tear tests, but it cannot be used for hard compounds because it is difficult to fold the sample properly. See also Elmendorf Tear Tester. / твёрдость (hardness). в тестах Грэйвза (Graves) и Винкэльмана (Winkelmann). Эльмэндорф (Elmendorf).

TRAPPED END = СХАЧЕННАЯ (или ЗАСТРЯВШАЯ) ПРОДОЛЬНАЯ НИТЬ – Trapped End is an end that is unable to unwrap or unwind from the beam. Trapping of an end may be prolonged or intermittent depending upon the cause of trapping, e.g., rolled ends at the selvage, short ends, or mechanical difficulties.

TRAPPED SHUTTLE = XX – Defect Name:- Trapped Shuttle. Defect Type:- weft lines, horizontal lines. Fabric Type:- Bottomweights – Twill Derivatives. Description:- Trapped Shuttle:- This defect is caused by the loom stopping abruptly, trapping the shuttle in the shed. The effect created is that of distorting the fabric and stretching the yarn. The slackness is then woven into the fabric upon start-up of the loom. Severity:- Major.

TRAPUNTO = ТРАПУНТО (или СТЁГАНОЕ ОДЕЯЛО, или СТЁГАНОЕ, или ВЫШИВКА, или ВЫШИТОЕ, или ПРОШИВКА, или ПРОШИТОЕ, или ЖАККАРДОВО ПИКЕ) – Trapunto is a form of quilting in which fabric is quilted only in certain areas. The design to be quilted, a monogram for example, is first worked through two layers of fabric. Then, the back ing fabric is slit so that the yuilted areas can be padded with yarn, cord, or a filling such as fiberfill. See also Fiberfill. Trapunto, from the Italian for To Embroider, is a method of quilting that is also called Stuffed Technique. A puffy, decorative feature, trapunto utilizes at least two layers, the underside of which is slit and padded, producing a raised surface on the quilt. The style originated in Italy before the XIV century. Trapunto is often confused with the relatively similar techniques used in making traditional whole cloth Provençal quilts that were developed from the XVII century onwards in France. One of the earliest surviving examples of trapunto quilting is the Tristan Quilt in the Victoria and Albert Museum, a linen quilt representing scenes from the story of Tristan and Isolde which was made in Sicily during the second half of the XIII century. Another piece of the Tristan Quilt, thought to be from a pair to the V&A's example, is in the Bargello, an art museum in Florence. / в Барджэлло, музее искусства во Флоренции. Под Трапунто, от Итальянского слова Trapunto, означающее Стёганое Одеяло или Стёганое, Вышивка или Вышитое, Прошивка или Прошитое, понимается . Торговое название.

TRASH = ЗАСОРЁННОСТЬ – Trash:- bits of leaves and stems, insect excrement, whole or broken seeds, seed hull fragments, etc. While some, such as bits of leaves and stems, are relatively easy to remove, it is difficult to eliminate seed hulls, as they themselves are covered in fiber. This trash thus stays in the fiber as far as the spinning mill, where it causes production losses. bits of leaves and stems, insect excrement, whole or broken seeds, seed hull fragments, etc. While some, such as bits of leaves and stems, are relatively easy to remove, it is difficult to eliminate seed hulls, as they themselves are covered in fiber. This trash thus stays in the fiber as far as the spinning mill, where it causes production losses. Trash:- in Cotton, undeveloped seed, motes, small bits of seed coat, or particles of leaf appearing as specks. Synonym:- Mote Trash. In the Cotton industry, Trash is a measure of the amount of non-lint materials in the Cotton, such as leaf and bark from the Cotton plant. The surface of the Cotton sample is scanned by a video camera and the percentage of the surface area occupied by trash particles is calculated. Although the trash determination and classer's leaf grade are not the same, there is a correlation between the two as shown in the table below. / В хлопковой отрасли Засорённость – это показатель содержания в хлопке не волокнистых материалов, таких как листья и кора самого Хлопчатника. Поверхность образца хлопка сначала сканируется видеокамерой, а затем подсчитывается процент поверхности, содержащей частицы сора. И хотя параметры засорённости и сорта засорённости по классёрской оценке не одно и тоже, между ними существует взаимосвязь, отражённая в приводимой таблице.

Relationship of trash measurement to classer's leaf grade / Соотношение показателей засорённости с классёрской оценкой сорта засорённости							
Classer's Leaf Grade / Сорт Засорённости по оценке Классёра	1	2	3	4	5	6	7
Trash Measurement (4-yr. Avg.), % area / Показатель Засорённости (4-летнее усреднение), % поверхности	0.12	0.20	0.33	0.50	0.68	0.92	1.21

TRAUMOTROPISM = ТРАВМАТРОПИЗМ – Traumotropism:- bending, growth or movement of a part as a response to wounding. See also Tropism. / Смотрите также Тропизм (Tropism). Под Травматропизмом, от Греческих слов Tráuma, означающее Рана, и . Под Тропизмом, от Греческого слова Tróрos, означающее Направление или Поворот, понимается ростовое движение органов

растений (корня, стебля, листьев), обусловленное направленным действием какого-либо раздражителя – света (фоторопизм), силы земного тяготения (геотропизм), температуры (термотропизм), прикосновения (гаптотропизм), воды (гидротропизм), кислорода (аэротропизм) и других химических веществ (хемотропизм). В основе тропизма лежит неравномерный рост, вызываемый перераспределением в растении фитогормонов.

TRAVELER = БЕГУНОК – Traveler is a C-shaped, metal clip that revolves around the ring on a ring spinning frame. It guides the yarn onto the bobbin as twist is inserted into the yarn. / Бегунок – деталь (в виде скобы), обеспечивающая совмещённый процесс кручения и намотки нити на кольцепрядильных и кольцекрутильных машинах.

TRAVELER = ПУТЕШЕСТВЕННИК – Traveler is any person who temporarily enters the territory of a country in which he or she does not normally reside ('non-resident'), and any person who returns to the territory of the country in which he or she normally resides after having been abroad temporarily ('returning resident'). Customs facilities applicable to travellers are dealt with in Annex F.3. to the Kyoto Convention and in Annex B.6. to the Istanbul Convention. A Traveler is a person who stays for a period of less than 1 year in a country of which he or she is not a resident. Military and other government personnel and their dependents stationed outside their country or residence are not considered travelers, regardless of the length of their stay abroad; they are considered to have remained within the economy of their home country. The definition of travelers also excludes owners or employees of business enterprises who temporarily work abroad in order to further the enterprise's business, but intend to return to their country of residence within a reasonable period of time.

TRAVEL INSURANCE = СТРАХОВАНИЕ ПУТЕШЕСТВИЯ – The Social Security Medicare Program does not provide coverage for hospital or medical costs outside the United States of America. Why should I be concerned about medical coverage abroad?:- (i) The Social Security Medicare Program does not provide coverage for hospital or air ambulance medical costs outside the United States of America. (ii) Many health insurance plans do not provide coverage overseas. Those that provide 'customary and reasonable' hospital costs abroad may not pay for your medical evacuation back to the United States which can easily cost USD10 000.00 and up depending on your location and medical condition. (iii) Many foreign doctors and hospitals require payment in cash prior to providing service. (iv) Uninsured patients may be refused service. (v) Countries with socialized medicine may not provide full services to non-residents. (vi) Payment of hospital and other expenses abroad is the responsibility of the traveler. (vii) Some countries require tourists to carry accident or travel insurance. For detailed information on country specific information, please visit Country Information Sheet. What questions should I ask my health insurance company?:- (i) Does this insurance policy cover emergency expenses abroad such as returning me to the United States for treatment if I am seriously ill? (ii) Does this insurance cover high-risk activities such as parasailing, mountain climbing, scuba diving and off-roading? (iii) Does this policy cover pre-existing conditions? (iv) Does the insurance company require pre-authorizations or second opinions before emergency treatment can begin? (v) Does the insurance company guarantee medical payments abroad? (vi) Will the insurance company pay foreign hospitals and foreign doctors directly? (vii) Does the insurance company have a 24-hour physician-backed support center? (viii) Senior citizens may wish to contact the American Association of Retired Persons for information about foreign medical care coverage with Medicare supplement plans. Can the US government assist me if I become disabled overseas?:- (i) If an American becomes ill or is seriously injured abroad, a US consular officer can assist in locating appropriate medical services and informing family or friends. (ii) If necessary a consular officer can also assist in the transfer of funds from the United States. (iii) Payment of hospital and other expenses is the responsibility of the traveler. Where do I find a list of physicians in the country I plan to visit? For detailed information on physicians abroad, the authoritative reference is The Official ABMS Directory of Board Certified Medical Specialists, published for the American Board of Medical Specialists and its certifying member boards. US embassies and consulates abroad maintain lists of hospitals and physicians, many of which are posted on the embassy or consulate web site. What's the difference between Travel Insurance and Travel Medical Insurance? Travel Insurance insures your financial investment up to the amount of your policy limits. Travel Medical Insurance insures you should you become ill and need medical attention while living or traveling abroad. What insurance information should I carry with me abroad? Carry both your insurance policy identity card as proof of your insurance and a claim form. / Страхование Путешествия – совокупность видов страхования, обеспечивающая страховую защиту граждан во время их пребывания в путешествии, гостинице, походе и так далее. Может включать как ответственность за утрату или повреждение имущества, так и страхование их жизни и здоровья. Специфическим видом такого страхования является страхование на случай плохой погоды во время нахождения застрахованных лиц на отдыхе. При страховании имущества туристов застрахованными считаются имущество и предметы личного пользования, которые страхователь и члены его семьи (застрахованные лица) имеют при себе или перевозят на средствах транспорта, включая нахождение их в транспортных предприятиях и местах хранения. Объём страховой ответственности может включать в себя пожары, аварии, стихийные бедствия, хищения, грабёж, преднамеренные и злоумышленные действия третьих лиц и так далее. Страхование самих туристов предусматривает выплату определённых денежных сумм при расстройстве здоровья застрахованных лиц или их смерти во время путешествия вследствие несчастных случаев и других оговорённых в контракте событий. По страхованию на случай плохой погоды страховщик несёт ответственность, если во время нахождения застрахованных лиц на отдыхе в течение установленного контрактом времени имели место оговорённые неблагоприятные погодные условия (осадки, отсутствие солнца, волнение моря, неудовлетворительная температура воздуха и так далее). Действие контракта страхования путешествия начинается, как правило, с момента выезда застрахованных лиц или выноса их имущества из постоянного места жительства (но не ранее установленного в контракте срока) и заканчивается в момент их возвращения обратно (но не позже установленного срока окончания страхования). Иногда по условиям контракта страхования может быть предусмотрен так называемый Ассистанс, то есть оказание услуг или оплаты этих услуг, необходимость в которых возникает в результате наступления страхового случая. Ассистанс обеспечивает страховую защиту при поездке за рубеж (в случае болезни, несчастного случая, репатриации и так далее). В связи с развитием индустрии туризма, в том числе и международного, страхование путешествия развивается.

TRAVELLERS CHEQUES = ЧЕКИ ПУТЕШЕСТВЕННИКОВ – Travellers Cheques:- travel currency designed to guard against or prevent misuse of foreign currency. Travellers cheques are denominated in specific amounts in EUR, USD or other foreign currency and are issued by individual banks. Travellers cheques are signed by the holder at the time of purchase. They can be cashed at some banks at home and abroad or used to make direct purchases at stores that accept them. Travellers cheques must be signed a second time when they are cashed. If a holder's travellers cheques are lost or stolen before they have been cashed, they will be replaced upon presentation of the sales receipt if the conditions for reimbursement specified in the Terms of Sale are met. However, due to the global acceptance of debit and credit cards and the increased availability of ATMs, travellers cheques are becoming increasingly less important. The number of locations that sell or accept travellers cheques is steadily declining. / Чек Путешественника или Дорожный Чек:- чек, выданный финансовым институтом, например, Амэрикэн Экспрэс (American Express), Виза (Visa) или МэстчёКард (MasterCard), который позволяет совершающим поездки возить свои средства в более удобном виде, чем наличные. Путешественник покупает чеки, часто по номинальной стоимости, платя наличными, кредитной карточкой или обычным чеком в банк или бюро обслуживания, а затем подписывает каждый дорожный чек. Затем этот чек может быть использован

практически во всех уголках мира, как только на нём будет поставлена подпись. Преимущества таких чеков состоят в том, что ими не может воспользоваться никто другой, даже если они украдены или потеряны. Их можно обменять почти в любой стране. Дорожные чеки могут быть выданы во многих валютах, это позволяет путешественнику ориентироваться на какой-то определённый обменный курс ещё до начала поездки. Многие учреждения, оформляющие дорожные чеки, предлагают тип чека, который даёт возможность двум лицам пользоваться одними и теми же средствами. Первым таким учреждением был Амэрикэн Экспрэс. Выпускающие дорожные чеки организации получают выгоду от флоута (float), зарабатывая проценты на средствах с того момента, когда чеки покупаются, до момента их использования.

TRAVEL or TRANSPORT TEMPERATURE = ТЕМПЕРАТУРА ПУТЕШЕСТВИЯ или ПЕРЕВОЗКИ – Travel or Transport Temperature is optimum storage temperature of a product.

TRAVERSE LENGTH = ДЛИНА ПОПЕРЕЧИНЫ (или НИТЕВОДА, или ТРАВЕРСЫ) – Traverse Length is the lateral distance between the points of reversal of the wind on a yarn package.

TRAVERSE RATIO = СООТНОШЕНИЕ ПЕРЕСЕЧЕНИЕ (или ПОПЕРЕЧИНА, или ТРАВЕРС, или МАНЁВР ЗИГЗАГ) – Traverse Ratio (TR) is the number of coils of yarn wound on per complete traverse cycle. The traverse ratio is twice the wind. The Wind is the number of coils of yarn wound on per single traverse from one end of the package to the other. See also Wind Ratio. The ratio of spindle revolutions to strokes of the traverse is known as the Wind Ratio. Traverse Ratio is one of the important parameters in determining filtering efficiency of a filter cartridge. Set of gears were designed to wind packages with different traverse rations. Polypropylene yarns of 0.4 hank and 0.6 hank were used for winding. During winding packages with different traverse ratios, the variation in coil angle ranges between 20° and 32°.

TRAY = ЛОТОК (или КОРЫТО, или ПРОТИВЕНЬ) – Trays are preformed containers made from plastic to take individual fruits that are particularly sensitive to pressure.

TRB = TECHNICAL REVIEW BOARD

TRB = TRANSPORTATION RESEARCH BOARD

TRC = TERMINAL RECEIVING CHARGE

TREADLE = ПЕДАЛЬ (или ПОДНОЖКА, или ЖУРАВЛЬ, или ПРОСТУПНОЙ РЫЧАГ, или РАБОТАТЬ ПЕДАЛЬЮ) – Treadle:- flat bit under foot.

TREASURIES = КАЗНАЧЕЙКИ – A United States Treasury security is government debt issued by the United States Department of the Treasury through the Bureau of the Public Debt. Treasury securities are the debt financing instruments of the United States Federal government, and they are often referred to simply as Treasuries. There are four types of marketable treasury securities:- Treasury Bills, Treasury Notes, Treasury Bonds, and Treasury Inflation Protected Securities (TIPS). There are several types of non-marketable treasury securities including State and Local Government Series (SLGS), Government Account Series debt issued to government-managed trust funds, and savings bonds. All of the marketable Treasury securities are very liquid and are heavily traded on the secondary market. The non-marketable securities (such as savings bonds) are issued to subscribers and cannot be transferred through market sales. Debt obligations of the government. Treasuries are among the safest investments, since they are secured by the full faith and credit of the government. The interest of treasuries is exempt from state and local taxes but is subject to federal income tax. There are three types of treasuries:- Treasury Bills, with maturities of one year or less; Treasury Bonds, long-term instruments with maturities of 10 years or more; and Treasury Notes, with maturities ranging from one to 10 years. / Казначейки – ценные бумаги Казначейства (министерства финансов) США. Подлежащие продаже или передаче (negotiable) долговые обязательства Правительства США, обеспеченные всеми доходами и заимствованиями (fullfaith and credit). Эти ценные бумаги выпускаются с различными сроками исполнения. Доход от казначейских ценных бумаг не облагается местными штатовскими налогами, но облагается федеральными налогами. (1) Казначейские краткосрочные векселя (Treasury bills) – краткосрочные ценные бумаги со сроком исполнения менее года, выпускаемые со скидкой против нарицательной стоимости (face value). Аукционы по продаже 91-дневных и 182-дневных векселей (bills) проводятся еженедельно, а приносимый ими доход внимательно отслеживается финансовым рынком в качестве показателя возможных тенденций динамики процентных ставок. Процентные ставки по многим займам с плавающей процентной ставкой и ипотечные займы с плавающим процентом привязаны к этим векселям. Раз в четыре недели Казначейство проводит аукционы по продаже 52-недельных векселей. Иногда оно также выпускает краткосрочные векселя под будущие налоги (tax anticipation bills), а также Казначейские долговые обязательства. Казначейские векселя выпускаются минимальным достоинством в USD10 000, с дополнениями в USD5 000 сверх USD10 000 (за исключением векселей по вложению наличности, которые продаются минимальными пакетами на 10 миллионов Долларов). Индивидуальные инвесторы, не участвующие в аукционных торгах (competitive bid), могут приобрести векселя по средней цене выигравших конкурентных предложений. Казначейские векселя являются основным видом ценных бумаг, выпускаемых Федеральным Резервом в целях регулирования денежной массы (money supply) через операции на открытом рынке (open market operations). Смотрите также (Dutch Auction), (Repurchase Agreement). (2) Казначейские облигации (Treasury bonds) – это долгосрочные долговые обязательства со сроком исполнения более 10 лет, выпускаемые минимальным достоинством в USD1 000. (3) Долгосрочные казначейские векселя (Treasury notes) – это ценные бумаги промежуточного характера со сроком исполнения от 1 года до 10 дет. Достоинство их варьируется от USD1 000 до USD1 000 000 и более. Долгосрочные векселя продаются по наличной подписке, в обмен на неоплаченные или подлежащие оплате выпуски государственных ценных бумаг или через аукцион.

TREASURY = КАЗНАЧЕЙСТВО – (1) In the United States, mission:- maintain a strong economy and create economic and job opportunities by promoting the conditions that enable economic growth and stability at home and abroad, strengthen national security by combating threats and protecting the integrity of the financial system, and manage the US Government's finances and resources effectively. The Treasury Department is the executive agency responsible for promoting economic prosperity and ensuring the financial security of the United States. The Department is responsible for a wide range of activities such as advising the President on economic and financial issues, encouraging sustainable economic growth, and fostering improved governance in financial institutions. The Department of the Treasury operates and maintains systems that are critical to the nation's financial infrastructure, such as the production of coin and currency, the disbursement of payments to the American public, revenue collection, and the borrowing of funds necessary to run the federal government. The Department works with other federal agencies, foreign governments, and international financial institutions to encourage global economic growth, raise standards of living, and to the extent possible, predict and prevent economic and financial crises. The Treasury Department also performs a critical and far-reaching role in enhancing national security by implementing economic sanctions against foreign threats to the United States, identifying and targeting the financial support networks of national security threats, and improving the safeguards of our financial systems. The Treasury Department and the Treasury building have a rich history. From the 1789 Act of Congress (approved:- 1789-September-02) that established the department to the

construction of its first Washington building, this section will give you a valuable insight into Treasury's development and history. Headquartered in Washington, DC, the United States. Treasury is the executive department of a government in charge of the collection, management, and expenditure of the public revenue. Government ministry or department that manages a nation's finances. In the United States, the Treasury Department's main functions are to formulate and recommend fiscal, tax, and financial policies, to serve as the government's financial agent, and to manufacture coins and currency. It includes the US Bureau of Engraving and Printing, the Customs Service, the Internal Revenue Service and other agencies. / Казначейство – правительственное министерство или департамент, который управляет финансами нации. В Соединённых Штатах основными функциями Казначейского Департамента являются формулировать и рекомендовать фискальную, налоговую и финансовую политики, оказывать услуги в качестве финансового агента правительства, чеканить монеты и печатать банкноты. Оно состоит из Бюро США по Гравировке и Печати (US Bureau of Engraving and Printing), Таможенной Службы (Customs Service), Службы Внутренних Доходов (Internal Revenue Service) и прочих агентств. Под Казначейством понимается государственный финансовый орган, ведающий кассовым исполнением бюджета. Казначейство также организует взимание налогов, сборов, выпускает казначейские билеты (бумажные деньги).

(2) Treasury is the department of a company that oversees the management and investment of existing and accruing funds as well as the management of financial risks. This includes all aspects of liquidity, interest rate and currency management, as well as a comprehensive capital structure management in order to minimize the cost of capital and optimize the allocation of capital. At the government level, the Treasury is the economics and finance ministry in the United Kingdom, the US Department of the Treasury the US finance ministry.

TREASURY BILL = КАЗНАЧЕЙСКИЙ ВЕКСЕЛЬ (или ВЕКСЕЛЬ КАЗНАЧЕЙСТВА) – In the US, at the moment there are the following Treasury Bills:- 4-Week, 13-Week and 26-Week Bills. Treasury Bills (or T-Bills) mature in one year or less. Like zero-coupon bonds, they do not pay interest prior to maturity; instead they are sold at a discount of the par value to create a positive yield to maturity. Many regard Treasury Bills as the least risky investment available to US investors. Regular weekly T-Bills are commonly issued with maturity dates of 28 days (or 4 weeks, about a month), 91 days (or 13 weeks, about 3 months), 182 days (or 26 weeks, about 6 months), and 364 days (or 52 weeks, about 1 year). Treasury bills are sold by single price auctions held weekly. Offering amounts for 13-week and 26-week bills are announced each Thursday for auction, usually at 11:30 am, on the following Monday and settlement, or issuance, on Thursday. Offering amounts for 4-week bills are announced on Monday for auction the next day, Tuesday, usually at 11:30 am, and issuance on Thursday. Offering amounts for 52-week bills are announced every fourth Thursday for auction the next Tuesday, usually at 11:30 am, and issuance on Thursday. Purchase orders at TreasuryDirect must be entered before 11:00 on the Monday of the auction. The minimum purchase, effective 2008-April-07, is USD100.00. This amount formerly had been USD1 000.00. Mature T-Bills are also redeemed on each Thursday. Banks and financial institutions, especially primary dealers, are the largest purchasers of T-Bills. Like other securities, individual issues of T-Bills are identified with a unique CUSIP number. The 13-week bill issued three months after a 26-week bill is considered a re-opening of the 26-week bill and is given the same CUSIP number. The 4-week bill issued two months after that and maturing on the same day is also considered a re-opening of the 26-week bill and shares the same CUSIP (short for the Committee on Uniform Security Identification Procedures) number. For example, the 26-week bill issued on 2007-March-22, and maturing on 2007-September-20, has the same CUSIP number (912795A27) as the 13-week bill issued on 2007-June-21, and maturing on 2007-September-20, and as the 4-week bill issued on 2007-August-23 that matures on 2007-September-20. During periods when Treasury cash balances are particularly low, the Treasury may sell cash management bills (or CMBs). These are sold at a discount and by auction just like weekly Treasury Bills. They differ in that they are irregular in amount, term (often less than 21 days), and day of the week for auction, issuance, and maturity. When CMBs mature on the same day as a regular weekly bill, usually Thursday, they are said to be on-cycle. The CMB is considered another reopening of the bill and has the same CUSIP. When CMBs mature on any other day, they are off-cycle and have a different CUSIP number. Treasury bills are quoted for purchase and sale in the secondary market on an annualized discount percentage, or basis. With the advent of TreasuryDirect, individuals can now purchase T-Bills online and have funds withdrawn from and deposited directly to their personal bank account and earn higher interest rates on their savings. General calculation for the discount yield for Treasury Bills is:- Discount Yield (%) = ((Face Value – Purchase Price) / Face Value) x (360 / Days Till Maturity) x 100%. Treasury Bills are short-term government securities with maturities ranging from a few days to 52 weeks. Bills are sold at a discount from their face value. Treasury Bills, or T-Bills, are sold in terms ranging from a few days to 52 weeks. Bills are typically sold at a discount from the par amount (also called Face Value). For instance, you might pay USD990.00 for a USD1 000.00 bill. When the bill matures, you would be paid USD1 000.00. The difference between the purchase price and face value is interest. It is possible for a bill auction to result in a price equal to par, which means that Treasury will issue and redeem the securities at par value. In the United States, Treasury Bill (T-Bill) is the short-term US Treasury security having a maturity of up to one year and issued in denominations of USD10 000.00 to USD1 million. T-bills are sold at a discount:- Investors purchase a bill at a price lower than the face value, for example, the investor might buy a USD10 000.00 bill for USD9 700.00; the return is the difference between the price paid and the amount received when the bill is sold or it matures (if held to maturity, the return on the T-Bill in the example would be USD300.00). T-Bills are the type of security most frequently used in Federal Reserve open market operations. Treasury Bills:- short-term securities or promissory notes which are issued by government in return for funding from the money market. In the United Kingdom every week the Bank of England invites tenders for sterling Treasury Bills from the financial institutions operating in the market. Euro-denominated bills are issued by tender each month. Treasury Bills are an important form of shortterm borrowing for the government, generally being issued for periods of 3 or 6 months. Short-term obligation of a national government maturing in less than one year from the date of issue. Treasury Bills bear no interest and are sold at a discount. Treasury Bills:- Short-term zero coupon US government obligations, generally issued with various maturities of up to one year, and maturities typically run 13, 26 and 52 weeks. Trading in the secondary market, the price of Treasury Bills (T-Bills) rises when interest rates fall and vice versa. A short-term government debt instrument with an original maturity of one year or less. Treasure bills are sold at a discount from par with the interest earned being the difference between the face value received at maturity and the price paid. Treasury Bills:- they are sold at something less than their value at maturity, the difference thereby being the yield. For example, a one-year US Treasury Bill worth USD10 000.00 at maturity may sell at USD9 600.00. The USD400.00 difference would be the yield, which is 4.17% (400/USD9 600.00). A good barometer of interest rates. Treasury Bill is a Government bill. Usually issued with a term of 91 or 182 days. / Краткосрочный государственный долговой инструмент с первоначальным погашением в один год или менее. Казначейские векселя продаются с дисконтом к лицевой стоимости с процентом, заработанным на разнице между лицевой стоимостью, полученной при погашении, и уплаченной ценой. Они продаются по цене немного дешевле их номинала при окончании срока действия, и эта разница составляет их доходность. Например, одногодичный Вексель Казначейства США стоит USD10 000.00 по истечении срока действия может продаваться по USD9 600.00. Разница USD400.00 и есть такая доходность, которая может быть выражена также и как 4.17% (400/USD9 600.00). Хороший показатель процентных ставок.

TREASURY BOND = КАЗНАЧЕЙСКАЯ ОБЛИГАЦИЯ (или ОБЛИГАЦИЯ КАЗНАЧЕЙСТВА) – In the US, at the moment there are the following Treasury Bonds:- 30-Year Bonds. Treasury Bonds pay a fixed rate of interest every six months until they mature. They are

issued in a term of 30 years. Treasury Bonds pay interest every six months and mature in 30 years. In the United States, the Treasury Bond is a long-term security having a maturity of 10 years or longer issued in denominations of USD1 000.00 or more. A 30-year bond is sometimes referred to as a Long Bond. Bonds pay interest semiannually, and the principal is payable at maturity. A long-term debt security issued by the US Government. Maturities are usually between 20 and 30 years, typically running 20 and 30 years. The 10-year Treasury Note is the benchmark security for US debt. Trading in the secondary market, the price of the Treasury Bonds rises when interest rates fall and declines when interest rates rise. Long-term (more than ten years) obligations of the US government that pay interest semiannually until they mature, at which time the principal and the final interest payment is paid to the investor. Government debt security with a coupon and original maturity of more than 10 years. Interest is paid semiannually. Treasury Bonds (T-Bonds, or the long bond) have the longest maturity, from twenty years to thirty years. They have a coupon payment every six months like T-Notes, and are commonly issued with maturity of thirty years. The secondary market is highly liquid, so the yield on the most recent T-Bond offering was commonly used as a proxy for long-term interest rates in general. This role has largely been taken over by the 10-year note, as the size and frequency of long-term bond issues declined significantly in the 1990s and early 2000s. The US Federal Government suspended issuing the well-known 30-year Treasury bonds (often called Long-Bonds) for a four and a half year period starting 2001-October-31 and concluding February 2006. As the US Government used its budget surpluses to pay down the Federal debt in the late 1990s, the 10-year Treasury note began to replace the 30-year Treasury bond as the general, most-followed metric of the US bond market. However, because of demand from pension funds and large, long-term institutional investors, along with a need to diversify the Treasury's liabilities – and also because the flatter yield curve meant that the opportunity cost of selling long-dated debt had dropped – the 30-year Treasury bond was re-introduced in February 2006 and is now issued quarterly. This brought the US in line with Japan and European governments issuing longer-dated maturities amid growing global demand from pension funds. / Государственная долговая ценная бумага с купоном и первоначальным погашением не менее, чем через 10 лет. Проценты выплачиваются раз в полгода.

TREASURY DISCOUNT PAPER = ДИСКОНТНАЯ БУМАГА КАЗНАЧЕЙСТВА – Treasury Discount Papers are discount notes, i.e. without interest coupon, issued by the German federal government with terms of up to two years. Interest is paid upon repayment and is calculated from the difference between the face value (repayment amount) and the lower purchase price. Treasury discount paper is targeted mainly at institutional investors, although anyone is entitled to purchase these securities. They are issued as one-off issues in the auction procedure and have minimum denominations of 1 million Euros. Treasury discount paper is not exchange traded.

TREASURY INFLATION–PROTECTED SECURITIES = КАЗНАЧЕЙСКИЕ ЦЕННЫЕ БУМАГИ, ЗАЩИЩЁННЫЕ ОТ ИНФЛЯЦИИ – The US government's inflation-fighting securities are called Treasury Inflation-Protected Securities (TIPS). Since their introduction in 1997, the US Treasury inflation bond market has grown to more than USD400 billion. TIPS base their inflation component on the monthly Consumer Price Index for Urban Consumers (CPI-U), which measures the changing prices of goods and services. For new issues, the real rate over the CPI is set at periodic auctions held by the government. In an inflationary environment, demand will almost certainly drive up TIPS prices, which then usually causes interest rates paid by new issues to drop. Both of these factors will tend to boost the value of current portfolios and make it more expensive for investors to jump in. Treasury Inflation-Protected Security (TIPS) is a security which is identical to a Treasury bond except that principal and coupon payments are adjusted to eliminate the effects of inflation. Treasury Inflation-Protected Securities, or TIPS, provide protection against inflation. The principal of a TIPS increases with inflation and decreases with deflation, as measured by the Consumer Price Index. When a TIPS matures, you are paid the adjusted principal or original principal, whichever is greater. TIPS pay interest twice a year, at a fixed rate. The rate is applied to the adjusted principal; so, like the principal, interest payments rise with inflation and fall with deflation. Note:- one maturity of TIPS, the 30-year TIPS, isn't offered in Legacy Treasury Direct. TIPS are marketable securities whose principal is adjusted by changes in the Consumer Price Index. TIPS pay interest every six months and are issued with maturities of 5, 10, and 30 years. Treasury Inflation-Protected Securities (or TIPS) are the inflation-indexed bonds issued by the US Treasury. The principal is adjusted to the Consumer Price Index, the commonly used measure of inflation. The coupon rate is constant, but generates a different amount of interest when multiplied by the inflation-adjusted principal, thus protecting the holder against inflation. TIPS are currently offered in 5-year, 10-year and 30-year maturities. In the United States, at the moment there are the following TIPS:- 5-Year, 10-Year and 30-Year TIPS. / Казначейские Ценные Бумаги, Защищённые От Инфляции (Treasury Inflation-Protected Securities; сокращённо – или ТИПС (TIPS)) – ценные бумаги, идентичные Казначейским облигациям, за исключением того, что платежи по принципалу и купону переоцениваются с тем, чтобы устранить эффекты инфляции.

TREASURY INVESTMENT GROWTH RECEIPT = КАЗНАЧЕЙСКАЯ РАСПИСКА О РОСТЕ ИНВЕСТИЦИЙ – Treasury Investment Growth Receipts (TIGRs) are stripped Treasury securities offered at a significant discount to face value and backed by the US government. TIGRs were introduced by Merrill Lynch and were originally issued between 1982 and 1986. TIGR bonds were discontinued when the US government began issuing public STRIPS in 1986. TIGRs are one of a small class of bonds known as 'Feline' Securities, due to their catlike acronyms. Created before the more popular Treasury STRIPS, this form of investment vehicle is progressively deteriorating. TIGRs are generally traded on secondary markets to individuals wishing to ensure future cash flows or profit from interest rate volatility. Treasury Investment Growth Receipts (TIGRs, pronounced Tigers), introduced by Merrill Lynch, are stripped treasury securities offered at a significant discount to face value and backed by the US Government. Treasury Investors Growth Receipt (TIGER or TIGR) is a form of zero coupon security. TIGERs are US Government backed bonds that have been stripped of their coupons. Both the Corpus (principal) of the bonds and the individual coupons are sold separately at a deep discount from their face values. Investors receive face value for the TIGERs when the bonds mature, but do not receive periodic interest payments. Treasury Investors Growth Receipts (TIGERs) are the US government-backed bonds without coupons, meaning that the bondholders do not receive the periodic interest payments. The principal of the bond and the individual coupons are sold separately. Treasury Investment Growth Receipt is a Treasury security whose coupons have been stripped by Merrill Lynch. TIGRs therefore pay no interest. They are sold at a significant discount from par and mature at par. TIGRs fluctuate in price, sometimes dramatically, because changes in interest rates have made them more or less desirable. TIGRs can be invested IRAs and other pension accounts; they are also exempt from state and local taxes. They were originally issued between 1982 and 1986, becoming more-or-less obsolete when the US Treasury began issuing its own stripped bonds. They still exist, but are fairly uncommon investments. See also STRIPS, and Zero-Coupon Bonds. / , известных как Ценные Бумаги Филайн (Feline Securities). Мёрл Лынч (Merrill Lynch). Казначейская Расписка о Росте Инвесторов (ТИГРы; Treasury Investors Growth Receipt (TIGER)):- разновидность ценных бумаг с нулевыми купонами на основе Казначейских ценных бумаг, Казначейские расписки инвестиционного роста. Казначейская Расписка о Росте Инвесторов (ТИГР; Treasury Investors Growth Receipt (TIGER)):- Казначейский инвестиционный сертификат на прирост капитала – вид бесупонной ценной бумаги (zero-coupon security), впервые введённый брокерской фирмой Мёрл Лынч, Пирс, Фэна Энд Смис (Merrill Lynch, Pierce, Fenner & Smith). ТИГРы – это обеспеченные правительством США ценные бумаги, от которых были отделены купоны (coupons). Основная часть облигаций (corpus) и купоны продаются отдельно со значительной скидкой против их нарицательной цены. Инвесторы получают за ТИГРов их нарицательную стоимость (face value) по наступлении срока погашения облигаций, но не получают периодических процентных выплат. В соответствии с правилами

Службы Внутренних Доходов (налогового управления) США владельцы ценных бумаг ТИГРы должны выплачивать подоходный налог на условные проценты, которые они получили бы, если бы эти облигации были облигациями с полным купоном (full coupon bond). Для того чтобы избежать уплаты налогов, не получая дохода, с которого они взимаются, большинство инвесторов хранят ТИГРов на индивидуальных пенсионных счетах (IRA), или счетах Кио (Keogh accounts) или на счетах иных сберегательных планов, позволяющих отсрочить уплату налогов (tax deferred plans).

TREASURY NOTE = КАЗНАЧЕЙСКИЙ БИЛЕТ (или БИЛЕТ КАЗНАЧЕЙСТВА, или КАЗНАЧЕЙСКАЯ НОТА, или НОТА КАЗНАЧЕЙСТВА, или КАЗНАЧЕЙСКАЯ АССИГНАЦИЯ) – Treasury Notes are short and medium-term bonds issued by the German federal government, the federal states and/or special assets of the federal government. Treasury discount paper is sold at a discount on the face value. Fixed-income bonds are also referred to as Public Notes. Treasury Notes, sometimes called T-Notes, earn a fixed rate of interest every six months until maturity. Notes are issued in terms of 2, 3, 5, 7, and 10 years. Treasury Notes (or T-Notes) mature in one to ten years. They have a coupon payment every six months, and are commonly issued with maturities dates between 1 to 10 years, with denominations of USD1 000.00. T-Notes and T-Bonds are quoted on the secondary market at percentage of par in thirty-seconds of a point. Thus, for example, a quote of 95:07 on a note indicates that it is trading at a discount:- USD952.19 (i.e. 95 + 7/32%) for a USD1 000.00 bond. Several different notations may be used for bond price quotes. The example of 95 and 7/32 points may be written as 95:07, or 95-07, or 95'07, or decimalized as 95.21875. Other notation includes a +, which indicates 1/64 points and a third digit may be specified to represent 1/256 points. Examples include 95:07+ which equates to (95 + 7/32 + 1/64) and 95:073 which equates to (95 + 7/32 + 3/256). Notation such as 95:073+ is unusual and not typically used. The 10-year Treasury note has become the security most frequently quoted when discussing the performance of the US Government bond market and is used to convey the market's take on longer-term macroeconomic expectations. Treasury Notes are government securities that are issued with maturities of 2, 3, 5, 7, and 10 years and pay interest every six months. In the United States, the Treasury Note is an intermediate-term security having a maturity of one to 10 years and issued in denominations of USD1 000.00 or more. Notes pay interest semiannually, and the principal is payable at maturity. Same as Treasury Bonds except that Treasury Notes are medium-term and not callable. Intermediate-term, interest-bearing obligation of a national government maturing in one to five years from the date of issue. Same as Treasury Bond except that treasury notes are medium-term (more than one year but not more than ten years). Medium-term debt security issued by the US Government. Maturities are usually between 2 and 10 years, typically running 2, 5, and 10 years. The yield of the 10-year Treasury Note is commonly used as the benchmark interest rate. Trading in the secondary market, the price of the Treasury Notes rises when interest rates fall and declines when interest rates rise. Government debt security with a coupon and original maturity of one to 10 years. In the United States, at the moment there are the following Treasury Notes:- 2-Year, 3-Year, 5-Year, 7-Year and 10-Year Notes. / Государственная долговая ценная бумага с купоном и первоначальным погашением от одного года до 10 лет.

TREASURY SECURITIES = КАЗНАЧЕЙСКИЕ ЦЕННЫЕ БУМАГИ (или ЦЕННЫЕ БУМАГИ КАЗНАЧЕЙСТВА) – In the United States, the Treasury Securities are the interest-bearing obligations of the US government issued by the Treasury as a means of borrowing money to meet government expenditures not covered by tax revenues. Marketable Treasury securities fall into three categories:- bills, bonds, and notes. Marketable Treasury obligations are currently issued in book-entry form only; that is, the purchaser receives a statement, rather than an engraved certificate. Obligations of the US government issued by the US Department of the Treasury as a means of borrowing money to meet government expenditures not covered by tax revenues. All marketable Treasury securities have a minimum purchase amount of USD1 000.00 and are issued in USD1 000.00 increments. There are three types of marketable Treasury securities:- bills, notes, and bonds. The Treasury Department also issues several types of nonmarketable securities, including savings bonds.

TREASURY SHARES = АКЦИИ У КАЗНАЧЕЙСТВА (или СОБСТВЕННЫЕ АКЦИИ, или ВЫКУПЛЕННЫЕ СОБСТВЕННЫЕ АКЦИИ) – Treasury Shares are the shares of a corporation, issued and later re-acquired by the corporation, held as an asset of the corporation. Treasury Shares:- stock that has been bought back by the issuing corporation and is available for retirement or resale; it is issued but not outstanding; it cannot vote and pays no dividends. Treasury Shares are shares held by the company that issued them. A company acquires treasury shares by buying them in the market. In the United Kingdom (UK), Treasury shares can be cancelled, sold, or used in employee share (or share option) schemes. Companies are required to disclose their holding of treasury shares and any sales, cancellations or transfers. The commonest use of treasury share among UK listed companies seems to be to hold shares for employee share schemes. Treasury shares do not receive dividends or rights and they cannot be used to vote at or attend company meetings. They are shown on the balance sheet, but they are deducted from share capital. Treasury shares are disregarded in calculating undiluted earnings per share (EPS). / Акции корпорации, выпущенные и чуть позже выкупленные самой корпорацией, и удерживаемые в качестве актива данной корпорации. Счёт 'Собственные Акции (Доли)' предназначен для обобщения информации о наличии и движении собственных акций, выкупленных акционерным обществом у акционеров для их последующей перепродажи или аннулирования. Иные хозяйственные общества и товарищества используют этот счёт для учёта доли участника, приобретённой самим обществом или товариществом для передачи другим участникам или третьим лицам. При выкупе акционерным или иным обществом (товариществом) у акционера (участника) принадлежащих ему акций (доли) в бухгалтерском учёте на сумму фактических затрат делается запись по дебету счёта 'Собственные Акции (Доли)' и кредиту счетов учёта денежных средств. Аннулирование выкупленных акционерным обществом собственных акций проводится по кредиту счёта 'Собственные Акции (Доли)' и дебету счёта 'Уставный Капитал' после выполнения этим обществом всех предусмотренных процедур. Возникающая при этом на счёте 'Собственные Акции (Доли)' разница между фактическими затратами на выкуп акций (долей) и номинальной стоимостью их относится на счёт 'Прочие Доходы и Расходы'.

TREASURY STOCK = ДОЛЯ У КАЗНАЧЕЙСТВА (или СРЕДСТВА КАЗНЫ, или СОБСТВЕННЫЕ ДОЛИ, или СОБСТВЕННЫЙ КАПИТАЛ, или КАЗЁННАЯ АКЦИЯ) – Treasury Stock is a stock issued by a company but later reacquired. It may be held in the company's treasury indefinitely, reissued to the public, or retired. Treasury stock receives no dividend and has no vote while held by the company. Treasury Stock represents the company's common or preferred stock currently owned by the company it self, as a result of stock repurchase in the past. The amount of treasury stock is subtracted from stockholders' equity. The amount of treasury stock is determined by either cost method or par value method. Treasury Stock is a company's own stock that has been reacquired after having been issued and fully paid. In order for stock to be classified as treasury stock, it must remain uncanceled in the corporate treasury. Thus, treasury stock is considered to be issued but not outstanding. Treasury Stock is an equity purchased by the company for the purpose of reissuing or retiring in the future. Reasons for buying treasury stock:- (i) facilitate stock option programs; (ii) defend against takeover bids; (iii) utilize a cash surplus; (iv) increase the market value of the outstanding common stock; and (v) provide a substitute for dividends (tax free). / Собственные Выкупленные Акции В Портфеле Корпорации (Treasury Stock):- акции какой-либо корпорации, выкупленные ею самой, которые могут быть погашены (retirement) или перепроданы. Эти акции считаются выпущенными, но они не находятся на руках акционеров. Они не могут участвовать в голосовании, и по ним не выплачиваются (и не накапливаются) дивиденды. Они не включаются в соотношения, определяющие стоимость

обыкновенных акций. Среди причин, по которым в портфеле корпорации могут появиться собственные акции:- (i) намерение предложить альтернативы – вместо выплаты облагаемых налогом дивидендов, поскольку уменьшение числа находящихся на руках акционеров акций увеличивает стоимость одной акции и часто – её рыночную цену; (ii) гарантия исполнения опционов на акции и варрантов, а также конвертации конвертируемых ценных бумаг; (iii) использование как средства борьбы с тендерным предложением (tender offer) потенциального покупателя компании; (iv) возможность изменить соотношение задолженностей к собственному капиталу (debt-to-equity ratio) путём выпуска облигаций с целью финансирования обратного выкупа акций; (v) результат стабилизации (stabilization) рыночных цен в период распространения нового выпуска (new issue). Называются также Выкупленными Ценными Бумагами (Reacquired Stock) или Собственными Акциями (Treasury Shares). Смотрите также (Issued And Outstanding), и (Unissued Stock).

TREASURY STRIPS = КАЗНАЧЕЙСКИЕ XX – Treasury STRIPS is an acronym for 'Separate Trading of Registered Interest and Principal Securities'. Treasury STRIPS are fixed-income securities sold at a significant discount to face value and offer no interest payments because they mature at par. Backed by the US government, STRIPS, which were first introduced in 1985, offer minimal risk and some tax benefits in certain states, replacing TIGRs and CATS as the dominant zero-coupon US security. Although you receive no tangible income, you typically still have to pay federal income tax on the bond's accretion for the year. See also CATS, STRIPS, and TIGRs.

TREASURY TAX AND LOAN RATE OF INTEREST = ПРОЦЕНТНАЯ СТАВКА КАЗНАЧЕЙСТВА В ОТНОШЕНИИ НАЛОГОВ И ЗАЙМОВ – The Treasury Tax and Loan (TT&L) program encompasses two separate components – a depositary component through which the Treasury collects Federal tax deposits and payments from business taxpayers for employee withholding and other types of taxes, and an investment component through which the Treasury invests short-term operating balances not needed for immediate cash outlays. Through the TT&L depositary component, which comprises nearly 10 500 commercial financial institutions and Federal Reserve Banks (FRBs), the Treasury collected almost USD1.4 trillion in Fiscal Year 1998, representing approximately 80 percent of the total Federal annual receipts, from approximately 5 million business taxpayers. More than 1 500 of the TT&L depositaries borrow excess short-term Treasury operating funds by participating in the investment component of the TT&L program. Through agreements executed under this Part, participating depositaries borrow Treasury funds in the form of a note secured with collateral pledged to Treasury and pay interest to the Treasury on these balances. In Fiscal Year 1998, the Treasury earned USD1.2 billion in interest income through the TT&L investment component. The interest rate that the Treasury charges on a TT&L depositary's note balance is the Federal funds rate (computed on a weighted average effective basis by the Federal Reserve Bank of New York (FRBNY)) less 25 basis points (25 hundredths of one percentage point). The Federal funds rate is the interest rate at which financial institutions exchange balances in their accounts at the Federal Reserve with each other on an overnight, unsecured basis. The current formula was put into place in 1978. At that time, the overnight repurchase agreement market was not mature and a published rate was not available. Thus, the TT&L rate of interest was set as an approximation of an overnight repurchase agreement rate. When the current formula was put into place in 1978, it was generally believed that the Federal funds rate averaged 25 basis points above the volume-weighted average interest rate from overnight repurchase agreements secured by Treasury securities and select Agency securities executed by the FRBNY for its monetary operations. An overnight repurchase agreement is the economic equivalent of an overnight loan collateralized by securities. Treasury is proposing to change the TT&L rate of interest to an explicit overnight repurchase agreement rate. This change will allow Treasury to receive the actual interest rate, rather than a proxy rate, on an economically similar transaction. Specifically, Treasury is proposing that FRBNY, as fiscal agent for the US Treasury, compile and publish a volume-weighted average overnight repurchase agreement rate. We propose that the FRBNY compile this rate from data it would obtain from its domestic open market counter parties ('the primary dealers') regarding the volumeweighted average overnight rate the primary dealers paid to finance general collateral securities. The Treasury requests comments on this proposed methodology. Replacing the formula or proxy rate with an explicit overnight repurchase agreement rate will provide depositaries with an easily understandable rate which will be publicly available. Historically, these two rates generally have moved broadly in tandem. From the inception of the investment program in 1978 through May 1999 the Federal funds rate averaged approximately 29 basis points (29 hundredths of one percentage point) over the overnight repurchase agreement rate. Since 1990, however, the average difference between the two rates has been only approximately 2 basis points (2 hundredths of one percentage point). It is important that the TT&L rate of interest be readily available to the public. The Treasury proposes to request that the Federal Reserve publish an overnight repurchase agreement rate on a basis similar to that used to publish the Federal funds rate. Thus, financial institutions that elect to maintain a TT&L note balance will have a readily accessible indicator on which to estimate the cost of funds. Treasury proposes to change the definition of the 'Treasury Tax and Loan (TT&L) rate of interest' from the Federal funds rate less 25 basis points to a volume-weighted average overnight repurchase agreement rate. Treasury also proposes to add a definition of 'Overnight Repurchase Agreement Rate'. This new term is used in the redefined 'Treasury Tax and Loan (TT&L) Rate Of Interest'. As a result of this new definition, this section will be renumbered. In the United States, a Treasury tax and loan (TT&L) rate of interest means the overnight repurchase agreement rate. See also Overnight Repurchase Agreement Rate. Under the Treasury Tax and Loan (TT&L) program, tax payments by individuals and businesses go into accounts at depository institutions, rather than directly to the Treasury's accounts at the Federal Reserve. TT&L accounts help to stabilize the supply of reserves in the banking system, increasing the stability of financial markets and simplifying the implementation of monetary polic. Over 80 percent of the TT&L institutions are collectors that transfer funds to the Treasury's accounts at the Federal reserve the same day, or after, they receive them. The remainder are 'note option' depositories, which hold the tax funds longer. Treasury Tax and Loan (TT&L) accounts consist of federal tax payments made directly by business firms, and other federal payments that are deposited in TT&L accounts indirectly. The TT&L program aids in maintaining the stability of financial markets by reducing uncertainty about the supply of reserves in the banking system and simplifying the Fed's implementation of monetary policy. This is accomplished by having tax payments deposited into TT&L accounts at depository institutions, rather than in the Treasury's accounts at the Federal Reserve, thereby allowing the tax payments to remain in the banking system. In the absence of TT&L accounts, tax payments would generate abrupt changes in depository reserves. / Смотрите также Ставка По Однодневным Соглашениям Об Откупе или Ставка Прямого Рипо На День (Overnight Repurchase Agreement Rate).

TREASURY YIELD = ДОХОДНОСТЬ ПО КАЗНАЧЕЙКАМ – Treasury Yield is the interest rate that the US Treasury pays to borrow money.

TREATED SEED = ПРОТРАВЛЕННОЕ СЕМЯ (или ОБРАБОТАННОЕ СЕМЯ) – Treated Seed is grain that has been coated with an agricultural chemical for agronomic purposes. These include protection of the germinating seed from insects and pathogens, and increasing the availability of nutrients to the seed when planted. Seed treatment dressings may contain one or more insecticides or fungicides, and seed inoculants usually contain either a fungus or bacteria. Both types of seed dressings contain a dye to render the treated seed visually conspicuous. The color of the dye varies depending upon the type of treatment and the type of grain. The current Canadian color standards for pesticide seed treatments are:- cereals- pink or red, canola – baby blue or green. Seed treated with an

inoculant may have a green stain. The coatings or stains may appear greasy or powdery and surface area distribution ranges from tiny flecks to complete coverage. / развод (или потёк (stain)).

TREATED WHEAT = ОБРАБОТАННАЯ ПШЕНИЦА – Treated Wheat is a Wheat that has been scoured, limed, washed, sulfured, or treated in such a manner that the true quality is not reflected by either the numerical grades or the US Sample grade designation alone. / Пшеница, которая подверглась шелушению (scoured), известкованию (limed), промывке водой (washed), окуриванию или обработке серой (sulfured), или. В случае Обработанной Пшеницы в официальных сертификатах указывается подвергалась ли Пшеница шелушению, известкованию, промывке водой, обработке серой или была обработана другим способом.

TREATIES OF ROME = РИМСКИЕ ТРАКТАТЫ – Treaties of Rome:- (i) The Treaty establishing the European Economic Community (EEC) and (ii) the Treaty establishing the European Atomic Energy Community (Euratom). The Treaties entered into force on 1958-January-01. The two new Communities were added to the European Coal and Steel Community (ECSC), which had been established in 1952 for a period of 50 years. / Юрэтм (Euratom).

TREATING = ОБРАБОТКА – Treating:- refining processes whereby intermediate products obtained by distillation and conversion are refined by physical or chemical means to remove substances that impair their color, odor, performance, or stability.

TREATMENT = ОБРАБОТКА – Treatment is the official procedure for the killing, inactivation or removal of pests, or for rendering pests infertile or for devitalization. The act of eliminating possible cotton pest infestation(s) by means of cleaning, spraying or fumigation to eliminate the infestation. Treatment is a general term denoting different effects which are to be compared or the effects or factors that are to be measured. (e.g., variety, fertilizer rates) or procedures (e.g., method of nitrogen application). / Под Обработкой понимается официально утверждённая процедура по уничтожению, инактивации или удалению вредителей, или по приданию вредителям бесплодия или по лишению их жизнеспособности.

TREATMENT CHARGES AND REFINING CHARGES = РАСХОДЫ ПО ОБРАБОТКЕ И РАСХОДЫ ПО РАФИНИРОВАНИЮ (или РАСХОДЫ НА ОБРАБОТКУ И РАСХОДЫ НА РАФИНИРОВАНИЕ) – The fee paid by a miner to the smelter/refiner which upgrades the mine's concentrate output. Abbreviated to TC/RCs on second reference. Smelting/refining contracts also typically include escalators, which adjust the charges up or down in line with fluctuations in the market price of the metal in question. In mining industry, Treatment Charges And Refining Charges (TC/RC) being terms used to set the smelting and refining cost. / выработка (output). Плавка или Выплавка или Плавление (Smelting). В горной (горнодобывающей) промышленности, расходы по обработке и расходы по рафинированию (PO/PP), существующие термины, используемые для составления стоимости плавки и рафинирования. Вознаграждение, уплачиваемое добывающим предприятием плавильному/обогатительному заводу за повышение концентрации металла в руде, добытой этим предприятием. При последующих упоминаниях в тексте допускается сокращение PO/PP. Контракты на плавку/рафинирование, обычно также, включают пересчётные коэффициенты, которые переоценивают повышение или снижение расходов в зависимости от колебаний рыночной цены на соответствующий металл.

TREATMENT THRESHOLD = ПОРОГ ПРИМЕНЕНИЯ – Treatment Threshold is the level of pest population at which a pesticide or other control measure is needed to prevent eventual economic injury to the crop. / Уровень популяции вредителей, при котором становится необходимым воздействие пестицидами или другие методы сдерживания для предотвращения возможного вреда соответствующей сельскохозяйственной культуре.

TREATY = ТРАКТАТ – (1) In the European Union a term Treaty refers to the Treaty establishing the European Community (EC Treaty). The original Treaty was signed in Rome on 1957-March-25 (therefore often referred to as the Treaty of Rome) and entered into force on 1958-January-01. It established the European Economic Community (EEC), which is now the European Community (EC). The Treaty on European Union (EU Treaty), which is often referred to as the Maastricht Treaty, amended the EEC Treaty with a view to establishing the European Community (EC). A term Treaty refers to the Treaty establishing the European Community. The Treaty was signed in Rome on 25 March 1957 and entered into force on 01 January 1958. It established the European Economic Community (EEC), which is now the European Community (EC), and is often referred to as the 'Treaty of Rome'. The Treaty on European Union (which is often referred to as the 'Maastricht Treaty') was signed on 07 February 1992 and entered into force on 01 November 1993. The Treaty on European Union amended the Treaty establishing the European Community and established the European Union. The 'Treaty of Amsterdam', which was signed in Amsterdam on 02 October 1997 and entered into force on 01 May 1999, amended both the Treaty establishing the European Community and the Treaty on European Union. Equally, the 'Treaty of Nice', which concluded the 2000 Intergovernmental Conference and was signed on 26 February 2001 and entered into force on 01 February 2003, amended both the Treaty establishing the European Community and the Treaty on European Union.

(2) Treaty is a general reinsurance agreement which is obligatory between the ceding company and the reinsurer containing the contractual terms applying to the reinsurance of some class or classes of business, in contrast to a reinsurance agreement covering an individual risk. A reinsurance contract under which the reassured agrees to offer and the reinsurer agrees to accept all risks of certain size within a defined class. / Контракт перестрахования или договор перестрахования, в соответствии с которым .

TREATY OF AMSTERDAM = АМСТЕРДАМСКИЙ ТРАКТАТ – The Treaty of Amsterdam was approved by the European Council held in Amsterdam on 16–17 June 1997 and signed on 02 October 1997 by the Foreign Ministers of the fifteen member countries of the European Union. On 01 May 1999, it came into force having been ratified by all the member States, following their own constitutional rules. As a legal document, the Treaty of Amsterdam has as main objective to modify certain regulations of the Treaty of the European Union, the constituent treaties of the European Communities (Paris and Rome) and of some acts related to them. It does not substitute the previous treaties, but rather it is added. The Treaty of Amsterdam attracted widespread criticism. These are some of the main critical remarks:- (i) It did not solve one of the greatest pending problems of the Union:- the adaptation of the institutions to a increasingly wider Community. Some institutions were thought for an inferior number of member States and are not efficient for the Europe of the Fifteen, not to mention for the future Union that will arise from the future accession of Central and Eastern Europe countries. (ii) For the more pro-Europe point of view, the Treaty was not a step courageous enough towards political Union. Community competences in spheres as common foreign and security policy (CFSP) or police and judicial cooperation were not enhanced. (iii) No advance was done to work out the so known democratic deficit of the Union. The negotiations that precede the Treaty continued being based on give and take between governments and States, with neither public participation, nor transparent and sufficient information. The European Parliament, the sole community elected institution, role has not been sufficiently boosted. The text of the treaty went on being quite complicated – it consists of three parts, one annex and thirteen protocols – and is not easily intelligible neither to citizens, nor, even, to legal, economic and political agents that should act according to its regulations. In spite of all those insufficiencies, the Treaty of Amsterdam meant an advancement in the road towards the European Union. Let's have a glance at four main aspects of the Treaty. Freedom, security and justice:- the Treaty states unequivocally that the Union is founded on the principles of liberty, democracy, respect for human rights and fundamental freedoms, and the rule of law, principles which are common to the member States. In 1998, the European Council held in Cologne, decided to begin drafting a Charter of Fundamental Rights. The treaty

considered that the fundamental rights applicable at Union level should be strengthened in a Charter in order to raise awareness of them among citizens. The Charter was to be based on the Community Treaties, international conventions such as the 1950 European Convention on Human Rights and the 1989 European Social Charter, constitutional traditions common to the member States and various European Parliament declarations. The Article 6 of the treaty affirms:- '1. The Union is founded on the principles of liberty, democracy, respect for human rights and fundamental freedoms, and the rule of law, principles which are common to the Member States. 2. The Union shall respect fundamental rights, as guaranteed by the European Convention for the Protection of Human Rights and Fundamental Freedoms signed in Rome on 04 November 1950 and as they result from the constitutional traditions common to the Member States, as general principles of Community law (...)'. (Treaty of Amsterdam, 1997). Regarding to social rights, the great change is the signing of the new British government, presided over by Tony Blair, of the Social Charter annexed to the Treaty of Maastricht. This Charter of the Fundamental Social Rights of Workers, commonly known as the Social Charter, was included in the Treaty of Amsterdam. It is a political instrument that contains moral obligations to guarantee the respect of certain social rights. They are related to labor market, vocational training, equal opportunities and the working environment. It was adopted that the Council, after complying with different conditions, might determine the existence of a serious and persistent breach of principles included in Article 6 by a member State. In that case, the Council, by a qualified majority, might agree to suspend certain of the rights derived from the Amsterdam Treaty to that member State, including the voting rights of the representative of that government in the Council. The sanctions adopted by the EU against Austria in February 2000 because of the access of Jörg Haider's far right party to Vienna government, shows a general attitude of defence of fundamental rights and of prevention against political views that attempt against these rights. Under the Treaty of Amsterdam a new Article 13 has been written into the EC Treaty to reinforce the guarantee of non-discrimination laid down in the Treaties and extend it to the other cases cited above. The Union committed to establish a common area of freedom, security and justice. All affairs related to free movement of persons; controls on external borders; asylum, immigration and safeguarding of the rights of third-country nationals; and judicial cooperation in civil matters were 'communitised' by the Treaty of Amsterdam, that is to say, they were brought under the legal framework of the first pillar. To this effect, the Schengen Agreement and Convention were included in the Treaty. United Kingdom, Ireland and Denmark voluntarily stayed out and, therefore, kept the right of exercising controls on people in their frontiers. Denmark joined Schengen in 1996. As the free movement of persons makes necessary to create information systems in an European scale, the guarantees of protection of personal data were reinforced as well. On 28 July 2000, four important EU countries, Spain, Italy, Germany and France, agreed to eliminate the obligation of obtaining a residence permission to the rest of UE citizens. Police and judicial cooperation in criminal matters (fight against racism and xenophobia, terrorism, drugs traffic, fraud, and international organised crime and money-laundering) continued included in the third pillar and, accordingly, are matters of intergovernmental cooperation. The objectives of making easier the judicial collaboration, facilitating the extradition procedures among member States and fomenting police collaboration, were settled on. In this way, a gradual program of development of the Europol (European Police Office) activities was agreed. The Union and the citizen:- as well as developing the concept of Citizenship of the Union, the Treaty included different measures trying to set the common citizen in the centre of the Union concerns:- (i) Measures to foster the EU intervention to fight against unemployment; to preserve, protect and improve the quality of the environment; and to improve consumer protection. (ii) European citizens have the right to access all documents of EU institutions and to communicate with them using in whatever official language of the Union (Spanish, Portuguese, French, Italian, English, Irish Gaelic, Dutch, German, Danish, Swedish, Finnish and Greek). Common foreign policy:- the dramatic break-up of Yugoslavia and the coming back of the war to our continent evidenced how badly was needed an Union able to act and prevent, and not only to react after events come up. The former Yugoslavia crisis made again evident the weakness of the European States when reacting by their own in the presence of an international crisis. A major problem of the EU common foreign and security policy from its start with the Treaty of Maastricht (signed on 07 February 1992) has been the conspicuous imbalance between its ambitious objectives and the meagre means the Union counts on to accomplish them. The main change introduced by the Treaty of Amsterdam is the establishment of a new post, labelled by the journalists as Mr. CFSP. Javier Solana, former Spanish cabinet minister and secretary general of NATO, was appointed in October 1999, Secretary General of the Council of the European Union and High representative for the Common foreign and security policy. This same year was elected Secretary General of Western European Union (WEU). The Treaty also provides the Union with a common security policy that covers all matters relating to its security, including the gradual formulation of a common defence policy. The main role of Mr. Solana is personifying the still weak and new common European foreign and security policy. The CFSP should elaborate a progressive framing of a common defence policy, which might lead to common defence. The reform of the EU institutions:- taking into account the future enlargement and in the perspective of a necessary overhaul of the EU institutions, the treaty of Amsterdam introduced some reforms in the functions and competences of the main institutions. The competences of the European Parliament were enhanced, as well as the functions of the Court of Auditors, Economic and Social Committee and Committee of the Regions. Some reforms were also established in the functioning of the Commission and the Council of the European Union. After the Amsterdam Treaty came into force, the concept of closer cooperation was introduced in the Treaty of the European Union. The aim of such cooperation is to enable a limited number of Member States that are willing and able to advance further, to deepen European integration within the single institutional framework of the Union. This closer cooperation will prevent the most eurosceptics countries from setting a slow pace to the integration process. Journalists have used different ways to convey the idea of an Europe 'à la carte', 'Multi-speed' Europe, or an 'Variable-geometry' Europe. General awareness of the insufficiency of the agreed institutional reforms caused that the very treaty had a clause calling an Intergovernmental Conference (IGC) to overhaul the Union institutions before a new enlargement took place. Treaty of Amsterdam, which was signed in Amsterdam on 1997-October-02 and entered into force on 1999-May-01, and the Treaty of Nice, which was signed on 2001-February-26 and entered into force on 2003-February-01, amended both the Treaty establishing the European Community and the Treaty on European Union. / , от Латинского слова Affirmo, означающее Утверждаю, . Тони Блэр (Tony Blair). Ёрг Хайдэр (Jörg Haider). Хавьэр Солана (Javier Solana). а ля кярт (à la carte).

TREATY OF LISBON = ЛИССАБОНСКИЙ ТРАКТАТ – Treaty of Lisbon was signed on 2007-December-13, but will only enter into force once it has been ratified by all Member States. It amends both the Treaty establishing the European Community and the Treaty on European Union. These two Treaties will continue to be the basis on which the EU functions. The Treaty of Lisbon simplifies the structure of the EU, which currently consists of three 'pillars':- the Community, the common foreign and security policy, and justice and home affairs. In the new Treaty, the pillars cease to exist and the Community is replaced by the Union, which will have legal personality. The Treaty establishing the European Community is renamed the Treaty on the Functioning of the Union. / которая в настоящее время зиждется на трёх столпах:- .

TREATY OF VERSAILLES = ВЕРСАЛЬСКИЙ ТРАКТАТ – Treaty of Versailles is a peace document signed at the end of World War I by the Allied and Associated Powers and by Germany in the Hall of Mirrors in the Palace of Versailles, France, on June 28, 1919; it took force on January 10, 1920. When the German government asked US President Woodrow Wilson to arrange a general armistice in October 1918, it declared that it accepted the Fourteen Points he had formulated as the basis for a just peace. However, the Allies demanded 'compensation by Germany for all damage done to the civilian population of the Allies and their property by the aggression

of Germany by land, by sea and from the air'. Further, the nine points covering new territorial consignments were complicated by the secret treaties that England, France, and Italy had made with Greece, Romania, and each other during the last years of the war. The treaty was drafted during the Paris Peace Conference in the spring of 1919, which was dominated by the national leaders known as the 'Big Four', David Lloyd George of Britain, Georges Clemenceau of France, Woodrow Wilson of the United States, and Vittorio Orlando of Italy. The first three in particular made the important decisions. None of the defeated nations had any say in shaping the treaty, and even the associated Allied powers played only a minor role. The German delegation was presented with a fait accompli; it was shocked at the severity of the terms and protested the contradictions between the assurances made when the armistice was negotiated and the actual treaty. Accepting the 'war guilt' clause and the reparation terms were especially odious to them. The population and territory of Germany was reduced by about 10 percent by the treaty. On the west Alsace and Lorraine were returned to France, and the Saarland was placed under the supervision of the League of Nations until 1935. In the north three small areas were given to Belgium; and, after a plebiscite in Schleswig, northern Schleswig was returned to Denmark. In the east, Poland was resurrected, given most of formerly German West Prussia and Poznán (Posen), given a 'corridor' to the Baltic Sea (which separated East Prussia from the rest of Germany), and given part of Upper Silesia after a plebiscite. Danzig (Gdansk) was declared a free city. All Germany's overseas colonies in China, in the Pacific, and in Africa were taken over by Britain, France, Japan, and other Allied nations (see Mandate). The 'War Guilt Clause' of the treaty deemed Germany the aggressor in the war and consequently made Germany responsible for making reparations to the Allied nations in payment for the losses and damage they had sustained in the war. It was impossible to compute the exact sum to be paid as reparations for the damage caused by the Germans, especially in France and Belgium, at the time the treaty was being drafted, but a commission that assessed the losses incurred by the civilian population set an amount of USD33 000 000 000 in 1921. Although economists at the time declared that such a huge sum could never be collected without upsetting international finances, the Allies insisted that Germany be made to pay, and the treaty permitted them to take punitive actions if Germany fell behind in its payments. The Big Four, especially Clemenceau, wanted to make sure that Germany would never again pose a military threat to the rest of Europe, and the treaty contained a number of stipulations to guarantee this aim. The German army was restricted to 100 000 men; the general staff was eliminated; the manufacture of armoured cars, tanks, submarines, airplanes, and poison gas was forbidden; and only a small number of specified factories could make weapons or munitions. All of Germany west of the Rhine and up to 30 miles (50 km) east of it was to be a demilitarized zone. The forced disarmament of Germany, it was hoped, would be accompanied by voluntary disarmament in other nations. The treaty included the Covenant of the League of Nations, in which members guaranteed each other's independence and territorial integrity. Economic sanctions would be applied against any member who resorted to war. The league was to supervise mandated territories, the occupied Saar Basin, and Danzig and to formulate plans for reducing armaments. The treaty also established the Permanent Court of International Justice and the International Labour Organisation. The Treaty of Versailles was bitterly criticized by the Germans, who complained that it had been 'dictated' to them, that it violated the spirit of the Fourteen Points, and that it demanded intolerable sacrifices that would wreck their economy. In the years after it was ratified the Treaty of Versailles was revised and altered, mostly in Germany's favor. Numerous concessions were made to Germany before the rise of Adolf Hitler, and by 1938 only the territorial settlement articles remained. Many historians claim that the combination of a harsh treaty and subsequent lax enforcement of its provisions paved the way for the upsurge of German militarism in the 1930s. The huge German reparations and the war guilt clause fostered deep resentment of the settlement in Germany, and when Hitler remilitarized the Rhineland in 1936 (a violation of the treaty), the Allies did nothing to stop him, thus encouraging future German aggression. / Президент США Томэс Вудроу Вилсэн (Thomas Woodrow Wilson; 1856–1924). Большая Четвёрка ('Big Four'), Дэйвид Лойд Дьжодьж (David Lloyd George; 1863–1945) от Британии, Жорж Бажама Клемосу (Georges Benjamin Clémenceau; 1841–1929) от Франции, Томэс Вудроу Вилсэн (Thomas Woodrow Wilson; 1856–1924) от Соединённых Штатов Америки, и Витторио Имануэле Орландо (Vittorio Emanuele Orlando; 1860–1952) от Италии. Адольф Хитля (Adolf Hitler; 1889–1945). Версальский Трактат или Версальский Мирный Договор 1919, договор, официально завершивший Первую Мировую Войну 1914–18, подписан 28 Июня 1919 в Версале (Франция) Соединёнными Штатами Америки (США), Британской Империей, Францией, Италией и Японией, а также Бельгией, Боливией, Бразилией, Кубой, Экуадором, Грецией, Гватемалой, Гаити, Хиджазом, Гондурасом, Либерией, Никарагуа, Панамой, Перу, Польшей, Португалией, Румынией, Сербо-Хорвато-Словенским государством, Сиамом, Чехословакией и Уругваем, с одной стороны, и капитулировавшей Германией – с другой. Условия договора были выработаны (после длительных секретных совещаний) на Парижской Мирной Конференции 1919–20. Договор вступил в силу 10 Января 1920, после ратификации его Германией и четырьмя главными союзными державами – Великобританией, Францией, Италией и Японией. Из подписавших Версальский Мирный Договор 1919 государств США, Хиджаз и Экуадор отказались его ратифицировать. Сенат США отказался ратифицировать Версальский Мирный Договор 1919 из-за нежелания США связывать себя участием в Лиге Наций (где преобладало влияние Великобритании и Франции), устав которой был составной частью Версальского Мирного Договора 1919. Взамен Версальского Мирного Договора 1919 США заключили с Германией в Августе 1921 особый договор, почти идентичный Версальскому Мирному Договору 1919, но не содержавший статей о Лиге Наций. Российский революционер, организатор и лидер так называемой Октябрьской Революции 1917, крупнейший теоретик Марксизма Владимир Ильич Ленин (1870–1924) указывал, что Версальский Договор – '... договор хищников и разбойников', '... неслыханный, грабительский мир, который десятки миллионов людей, и в том цивилизованных, ставит в положение рабов' (Полн. Собр. Соч., 5 Изд., Т. 41, С. 352, 353). Версальский Мирный Договор 1919 имел целью закрепление передела капиталистического мира в пользу держав-победительниц. По Версальскому Мирному Договору 1919 Германия возвращала Франции Эльзас-Лотарингию (в границах 1870); Бельгии – округа Мальмеди и Эйпен, а также так называемую нейтральную и Прусскую части Морене; Польше – Познань, части Поморья и другие территории Западной Пруссии; город Данциг (Гданьск) и его округ был объявлен 'вольным городом'; город Мемель (Клайпеда) передан в ведение держав-победительниц (в Феврале 1923 присоединён к Литве). Вопрос о государственной принадлежности Шлезвига, Южной части Восточной Пруссии и Верхней Силезии должен был быть решён плебисцитом (в результате часть Шлезвига перешла в 1920 к Дании, часть Верхней Силезии в 1921 – к Польше, Южная часть Восточной Пруссии осталась у Германии); к Чехословакии отошёл небольшой участок Силезской территории. Исконные Польские земли – на правом берегу Одера, Нижняя Силезия, большая часть Верхней Силезии и другие – остались у Германии. Саар переходил на 15 лет под управление Лиги Наций, а по истечении 15 лет судьба Саара должна была решиться путём плебисцита. Угольные шахты Саара были переданы в собственность Франции. По Версальскому Мирному Договору 1919 Германия признавала и обязывалась строго соблюдать независимость Австрии, а также признавала полную независимость Польши и Чехословакии. Вся Германская часть левобережья Рейна и полоса правого берега шириной в 50 километров (км) подлежали демилитаризации. Германия лишалась всех своих колоний, которые позднее были поделены между главными державами-победительницами на основе системы мандатов Лиги Наций. Передел Германских колоний был осуществлён следующим образом. В Африке Танганьика стала подмандатной территорией Великобритании, район Руанда-Урунди – подмандатной территорией Бельгии, 'Треугольник Кионга' (Юго-Восточная Африка) был передан Португалии (названные территории ранее составляли Германскую Восточную Африку), Великобритания и Франция разделили Того и Камерун; ЮАС получил мандат на Юго-Западную Африку. На Тихом Океане в качестве подмандатных территорий к Японии отошли принадлежавшие Германии острова севернее экватора, к

Австралийскому Союзу – Германская Новая Гвинея, к Новой Зеландии – острова Самоа. Германия по Версальскому Мирному Договору 1919 отказывалась от всех концессий и привилегий в Китае, от прав консульской юрисдикции и от всякой собственности в Сиаме, от всех договоров и соглашений с Либерией, признавала протекторат Франции над Марокко и Великобритании над Египтом. Права Германии в отношении Цзяочжоу и всей Шаньдунской Провинции Китая отходили к Японии (вследствие этого Версальский Мирный Договор 1919 не был подписан Китаем). По договору вооружённые силы Германии должны были быть ограничены 100 000-й сухопутной армией; обязательная военная служба отменялась, основная часть сохранившегося военно-морского флота подлежала передаче победителям. Германия обязывалась возместить в форме репараций убытки, понесённые правительствами и отдельными гражданами стран Антанты в результате военных действий (определение размеров репараций возлагалось на особую Репарационную Комиссию). Согласно Статье 116, Германия признавала '... независимость всех территорий, входивших в состав бывшей Российской Империи к 1-му Августа 1914 года', а также отмену Брестского Мира 1918 и всех других договоров, заключённых ею с Советским Правительством. Статья 117 Версальского Мирного Договора 1919, раскрывавшая планы его авторов, рассчитанные на разгром Советской власти и расчленение территории бывшей Российской Империи, обязывала Германию признать все договоры и соглашения союзных и объединившихся держав с государствами, которые '... образовались или образуются на всей или на части территорий бывшей Российской Империи'. Версальский Мирный Договор 1919 – важнейший в числе договоров, составивших основу Версальско-Вашингтонской системы, направленной не только против побеждённых государств, но и против Советского государства, революционного движения в капиталистических государствах и национально-освободительного движения в колониальных и зависимых странах. Версальский Мирный Договор 1919 сохранил в Германии господство реакционных империалистических сил и поставил Немецких трудящихся под двойной гнёт своих и иностранных империалистов. Недовольство Немецкого населения Версальским Мирным Договором 1919 было использовано Гитлеровцами в целях создания массовой базы для своей партии. Размер и условия репарационных платежей неоднократно пересматривались; Германским монополиям империалистическими кругами США и некоторых других стран были предоставлены огромные займы (смотрите План Дауэса, 1924; План Юнга, 1929). В 1931 Германии был предоставлен мораторий, после чего выплата репарационных платежей была прекращена. Правящие круги Западных держав рассматривали Германию как ударную силу для борьбы с Советским государством. Союз Советских Социалистических Республик (СССР) был противником Версальского Мирного Договора 1919, неизменно разоблачал его империалистический грабительский характер, но в то же время решительно боролся против проводившейся Гитлеровцами под видом борьбы с Версальским Мирным Договором 1919 политики развязывания 2-й Мировой Войны. Готовясь к войне за установление мирового господства, Гитлеровская Германия ввела в Марте 1935 всеобщую воинскую повинность, односторонним актом нарушив военные статьи Версальского Мирного Договора 1919. Правительства стран-победительниц попустительствовали нарушению Германией Версальского Мирного Договора 1919. В Июне 1935 было заключено морское соглашение между Германией и Великобританией, явившееся уже двусторонним нарушением Версальского Мирного Договора 1919. Захват Германией Австрии (в 1938), Чехословакии (в 1938–39), Клайпеды (в 1939) и её нападение на Польшу (01 Сентября 1939) означали фактически окончательную ликвидацию Версальского Мирного Договора 1919 фашистской Германией, ставшей на путь империалистической агрессии и войны.

TREATY ON EUROPEAN UNION = ТРАКТАТ О ЕВРОПЕЙСКОМ СОЮЗЕ – The Treaty On European Union:- in June 1988 the European Council confirmed the objective of the progressive realisation of economic and monetary union and instructed a committee chaired by Jacques Delors, President of the European Commission, to propose 'concrete stages' leading to EMU. The committee was composed of the governors of the Community national central banks; Alexandre Lamfalussy, General Manager of the Bank for International Settlements (BIS); Niels Thygesen, Professor of Economics, Copenhagen; Miguel Boyer, President of the Banco Exterior de España; and Frans Andriessen, Member of the European Commission. The resulting 'Delors Report' of 17 April 1989 (Committee for the study of economic and monetary union (1989), Report on economic and monetary union in the European Community, 1989) recommended that economic and monetary union be achieved in three 'discrete but evolutionary steps'. Stage One was to focus on completing the internal market, reducing disparities between Member States' economic policies, removing all obstacles to financial integration and intensifying monetary cooperation. Stage Two would serve as a period of transition to the final stage, setting up the basic organs and organisational structure of EMU and strengthening economic convergence. In Stage Three exchange rates would be locked irrevocably and the various Community institutions and bodies would be assigned their full monetary and economic responsibilities. Although Stage One was established within the existing institutional framework of the Community, changes to the institutional structure were needed for Stages Two and Three. It was necessary therefore to revise the Treaty establishing the European Economic Community. To this end, an Intergovernmental Conference (IGC) on EMU was convened, which opened in November 1990 in parallel with the IGC on European Political Union. At the European Council's invitation, the EMU IGC was prepared by the Council of Ministers, the European Commission, the Monetary Committee and the Committee of Governors, all within their respective fields of competence. The outcome of the IGC negotiations was the Treaty on European Union (the EU Treaty, commonly known as the 'Maastricht Treaty'), which was signed in Maastricht on 07 February 1992. The EU Treaty established the European Union and amended the founding treaties of the European Communities. The amendments to the EEC Treaty added, among others, a new chapter on economic and monetary policy. This new chapter laid down the foundations of EMU and set out a method and timetable for its realisation. Reflecting the Community's increasing powers and scope, the EEC was renamed the European Community. The Statute of the European System of Central Banks and of the European Central Bank (Statute of the ESCB) and the Statute of the European Monetary Institute (EMI Statute) were attached as Protocols to the EC Treaty. Denmark and the United Kingdom were given a special status that did not oblige them to participate in Stage Three of EMU. The EU Treaty had been scheduled to enter into force on 01 January 1993. However, owing to delays in the ratification process in Denmark and Germany, it did not actually come into force until 01 November 1993. The Treaty on European Union (TEU or Maastricht Treaty) with the Statute of the European System of Central Banks (ESCB) and of the European Central Bank (ECB), signed on 1992-February-07. By this Treaty, the High Contracting Parties establish among themselves a European Union, hereinafter called 'the Union'. This Treaty marks a new stage in the process of creating an ever closer union among the peoples of Europe, in which decisions are taken as closely as possible to the citizen. The Union shall be founded on the European Communities, supplemented by the policies and forms of cooperation established by this Treaty. Its task shall be to organize, in a manner demonstrating consistency and solidarity, relations between the Member States and between their peoples. Treaty on European Union (which is often referred to as the Maastricht Treaty) was signed at Maastricht on 1992-February-07 and entered into force on 1993-November-01.The Treaty on European Union amended the Treaty establishing the European Community and established the European Union. His Majesty The King of the Belgians, Her Majesty The Queen of Denmark, The President of The Federal Republic of Germany, The President of The Hellenic Republic, His Majesty The King of Spain, The President of the French Republic, The President of Ireland, The President of The Italian Republic, His Royal Highness The Grand Duke of Luxembourg, Her Majesty The Queen of The Netherlands, The President of The Portuguese Republic, Her Majesty The Queen of The United Kingdom of Great Britain and Northern Ireland. Resolved to mark a new stage in the process of European integration undertaken with the establishment of the European Communities. Recalling the historic importance of the ending of the division of the European continent and the need to create firm bases for the construction of the future Europe. Confirming their

attachment to the principles of liberty, democracy and respect for human rights and fundamental freedoms and of the rule of law. Desiring to deepen the solidarity between their peoples while respecting their history, their culture and their traditions. Desiring to enhance further the democratic and efficient functioning of the institutions so as to enable them better to carry out, within a single institutional framework, the tasks entrusted to them. Resolved to achieve the strengthening and the convergence of their economies and to establish an economic and monetary union including, in accordance with the provisions of this Treaty, a single and stable currency. Determined to promote economic and social progress for their peoples, within the context of the accomplishment of the internal market and of reinforced cohesion and environmental protection, and to implement policies ensuring that advances in economic integration are accompanied by parallel progress in other fields. Resolved to establish a citizenship common to nationals of their countries. Resolved to implement a common foreign and security policy including the eventual framing of a common defence policy, which might in time lead to a common defence, thereby reinforcing the European identity and its independence in order to promote peace, security and progress in Europe and in the world. Reaffirming their objective to facilitate the free movement of persons, while ensuring the safety and security of their peoples, by including provisions on justice and home affairs in this Treaty. Resolved to continue the process of creating an ever closer union among the peoples of Europe, in which decisions are taken as closely as possible to the citizen in accordance with the principle of subsidiarity. In view of further steps to be taken in order to advance European integration. Have Decided to establish a European Union. / Александрэ Лёмфалюси (Alexandre Lamfalussy). , от Латинского слова Affirmo, означающее Утверждаю, . 07 Февраля 1992 – в Маастрихт, Нидерланды был подписан Трактат о Европейском Союзе, и таким образом был основан Европейский Союз.

TREE = ДЕРЕВО – Tree is a plant with a single distinct trunk between the ground and first branch. / Под Деревом понимается Многолетнее Растение с одревеснevшим главным стеблем (стволом), сохраняющимся в течение всей его жизни и ветвями, образующими крону. Высотой от 2 до 100 метров, изредка больше. Отдельные Виды, например, Остистая Сосна живут до 3 000–5 000 лет. Деревья принадлежат главным образом к Хвойным (из Голосеменных (Gymnosperm)) и Двудольным (из Покрытосеменных (Angiosperm)) Растениям. К ним относятся многие плодовые культуры. Деревья (выделяют деревья первой, второй и третьей величины), к которым относятся большинство древесных Растений от 5 до 35 метров и образующие основные ярусы древостоев.

TREE BARK = ДРЕВЕСНАЯ КОРА – Tree Bark is a term describing the rippled or wavy effect sometimes seen when a bonded fabric is stretched in the horizontal (widthwise) direction. This defect is caused by bias tensions present when two distorted or skewed fabrics are bonded.

TRENCH = ШИНЕЛЬ – Trench:- trench coat.

TRENCH COAT = ШИНЕЛЬ (или ОКОПНЫЙ КИТЕЛЬ) – Trench Coat is a waterproof overcoat with a removable lining; a double-breasted raincoat with deep pockets, wide belt, and straps on the shoulders.

TREND = ТЕНДЕНЦИЯ – In technical analysis, Trend is defined as a directional move over a period of time. There are three types – up, down and sideways. See also Resistance, and Support. The general tendency of a market to move in a certain direction. General pattern or long-term tendency. A trend involves long-term economic phenomena that can be observed and measured independently of occasional short-term fluctuations. The general direction of a moving market, as shown by acceding to descending peaks and bottoms of price movements. A term Trend refers to the direction of prices. Rising peaks and troughs constitute an uptrend; falling peaks and troughs constitute a downtrend. A trading range is characterized by horizontal peaks and troughs. Trends are generally classified into:- (i) Intermediate Trend (one to six months), (ii) Major Trend (longer than a year), and (iii) Minor Trend (less than a month). The general direction, either upward or downward, in which prices have been moving. A succession of higher highs and higher lows, or lower lows and lower highs, over time that can be readily identified on a chart. The general tendency of a market go move in a certain direction over a period of time. The Trend is your friend. A trend at its most basic consists of a situation in which prices move more in one direction than another. Many technical measures attempt to discern when a price is moving in a trend, punctuated by minor corrections, and when it is simply trendless. Trend is a general direction of a stock or market when it is in either an upward or a declining move over a period of time. / краткосрочные флуктуации (колебания). Общая Тенденция рынка к движению в каком-то определённом направлении в течение какого-то периода времени. В том случае, когда каждый относительный максимум выше предыдущего максимума, а каждый относительный минимум – выше предыдущего минимума, наблюдается тенденция к росту или тенденция на повышение или восходящая тенденция (Uptrend). И она будет продолжать считаться таковой, пока не будет пробит предыдущий относительный минимум. Нарушение этого условия служит предупреждением о том, что тенденция, возможно, закончилась. Аналогичным образом, тенденция к падению или нисходящая тенденция может быть определена как последовательность более низких минимумов и более низких максимумов и рассматривается таковой, пока не пробит предыдущий относительный максимум. Тенденция – твоя подруга (таков смысл поговорки в переводе с Английского языка). Тенденция в самом общем понимании представляет собой тенденцию движения цен в определённом направлении. Многие методы технического анализа направлены на выявление наличия, определяемого при минимальных корректировках, или отсутствия тенденции в динамике цен. Под Тенденцией, от позднелатинского слова Tendentia, означающее Направленность, понимается направление развития какого-либо идеи, мысли, явления и тому подобного. Тенденция:- в общем значении:- любое общее движение. Например:- ‘Существует тенденция к подъёму (спаду, сохранению существующего уровня) при продаже акций XYZ’ или ‘Существует тенденция к увеличению использования компьютеров во время совершения сделок на Вол Стрит’. Ценные бумаги:- долгосрочные изменения цен или объёмов торгов в направлении повышения, понижения или вверх и вниз, характерные для определённых рынков, товарно-сырьевой продукции или ценных бумаг. Также может относиться к процентным ставкам и доходам.

TREND BIAS = ПРЕОБЛАДАНИЕ ТЕНДЕНЦИИ (или ПРЕДУБЕЖДЕНИЕ В ОТНОШЕНИИ ТЕНДЕНЦИИ) – Trend Bias is the tendency of technical setups to resolve in favor of the trend. The stronger the trend, the stronger the Trend Bias. This is a new term, and an enhancement of an old concept:- The trend is your friend. One of the problems we face as technicians is that technical situations don’t always turn out the way ‘the book’ says they should. While the term certainly applies to standard chart formations, such as head and shoulders, double top, support and resistance, etc, we most often encounter it with simple overbought and oversold conditions detected by oscillators. For example, during a bull market, technical indicators can become quite overbought, but prices, instead of correcting as we normally expect, often keep moving higher or simply consolidate. There are certainly many examples of this during the rally from the March 2003 market lows, and during that period, technicians who had become proficient in picking overbought tops during the 2000–03 Bear Market were suddenly getting their heads handed to them as their favorite indicators began to betray them time after time. Yes, there were some corrections, but they were small, resulting in a series of higher lows. During the same period, oversold conditions proved to be quite reliable bottom identifiers, although I should emphasize that oversold conditions tend to be fairly reliable regardless of Trend Bias. Nevertheless, during down trends reactions from oversold conditions will usually precipitate

some kind of bounce, and deeply oversold conditions always occur near a tradable bottom. Conversely, extreme overbought conditions are very often the sign of a rally initiation, not a top. / осадок (precipitate).

TREND CHANNEL = КАНАЛ ТЕНДЕНЦИИ (или КОРИДОР ТЕНДЕНЦИИ) – Trend Channel – a parallel probable price range centered about the most likely price line. Historically, this term has been used to denote the area between the base trendline and the reaction trendline defined by price moves against the prevailing trend. Trend Channel:- a channel is defined as the price path drawn by two parallel trend lines. The lines serve as an upward, downward or straight corridor for the price. The area between two parallel trendlines, the upper trendline connecting most of the important price peaks or closes and the lower trendline connecting the important lows or closes. Ascending Trend Channel – a channel formed using two parallel, upward trendlines as the borders. The upper trendline connects chart highs, the lower trendline connects the chart lows. A channel is defined as the area between two parallel trendlines and is often taken as a measure of a trading range. In charting, a price channel contains prices throughout a trend. There are three basic ways to draw channels: parallel, rounded and channels that connect lows (bear trend) or highs (bull trend). / Коридор или диапазон тенденции находится внутри двух ограничительных линий проходящих по относительным минимумам и максимумам.

TREND FOLLOWING = СЛЕДОВАНИЕ ТЕНДЕНЦИИ – Trend Following is a method of trading in which an investor attempts to capture moves as long as the asset continues to move in that same direction. / Метод торговли, предусматривающий попытку ухватить движение цены актива и удерживать занятую при этом позицию до тех пор, пока движение цен в этом направлении будет продолжаться.

TREND LINES = ЛИНИИ ТЕНДЕНЦИИ – Trendline is a line constructed by connecting a series of descending peaks or ascending troughs. The more times a trendline has been touched increases the significance of a break in the trendline. A trendline can act as either a support line or a resistance line. In charting, a line drawn across the bottom or top of a price chart indicating the direction or trend of price movement. If up, the trendline is called Bullish; if down, it is called Bearish. Trend Lines are constructed by connecting a line across the highs of a stock to form a line that extends into the future called Resistance. They are also drawn by connecting the lows of a stock and extended into the future called Support. The longer the time period of the line and the more times price actually touches the line, the stronger the line is deemed to be. A line drawn from pivot points tops or bottoms as an aid in identifying a trend as well as locating support or resistance for a break in the trend. In technical analysis, a Trend Line is a straight line that connects two or more price points, extending it into the future to act as a support or resistance. Trend lines are important in that they identify and confirm trends. See also Resistance, and Support. Lines drawn on a price chart linking subsequent lows in a downtrend and subsequent highs in a uptrend. Straight lines drawn on a chart below reaction lows (in an uptrend) or above rally peaks (in a downtrend) that determine the steepness of the current trend. The breaking of a trendline usually signals a trend reversal. / Линии на графике цен, соединяющие ряды последовательных минимальных значений в понижательный тренд, и ряды последовательных максимальных значений – в повышательный тренд. В техническом анализе биржевых рынков, . Тенденции к росту или к падению на графиках часто выделяют прямыми линиями. Линия тенденции к росту соединяет последовательность относительных минимумов, когда каждый последующий относительный минимум выше предыдущего. Линия тенденции к падению соединяет последовательность относительных максимумов, когда каждый последующий относительный максимум ниже предыдущего. Линия Тенденции:- график, используемый техническими аналитиками для отслеживания имевшего место в прошлом направления динамики ценных бумаг или товарно-сырьевых фьючерсов для прогноза будущих колебаний цен. Линия тенденции формируется путём соединения высших или низших котировок, до которых поднялись или упали ценные бумаги в рамках данного периода. Угол результирующей линии отражает, куда – вверх или вниз – направлена основная тенденция котировок ценных бумаг или товарно-сырьевой продукции. Если котировки вырастают выше направленной вниз линии тенденции или падают ниже направленной вверх линии тенденции, то технические аналитики говорят, что может появиться новое направление. Смотрите также Технический Анализ (Technical Analysis), (trading pattern).

TREND MODEL = МОДЕЛЬ ТЕНДЕНЦИИ – The Trend Model is an uncomplicated moving-average crossover system that is designed to catch medium- and long-term trend changes relatively early in the move. We use a 20-, 50-, and 200-EMA (exponential moving average) to execute this model, however, another combination of moving averages could be used to design a model more suited to your own preferences. Primary medium-term signals are generated by 20/50-EMA crossovers. A buy signal is generated when the 20-EMA crosses up through the slower 50-EMA. When the 20-EMA crosses down through the 50-EMA, a sell signal is generated. Long-term buy/sell signals are generated by 50/200-EMA crossovers. A long position may be opened each time a 20/50-EMA crossover buy signal is generated; however, the long-term 50/200-EMA crossover status must be consulted before opening short positions on a 20/50-EMA crossover sell signal. Short positions should only be taken when the long-term 50/200-EMA is on a sell signal at the time a 20/50-EMA sell signal is generated. Otherwise, move to cash (neutral). This is a conservative approach to playing the short side of the market. It is designed to avoid the frequent whipsaws that will occur during bull market corrections, and it limits exposure on the short side to down legs in bear markets. This model should not be used to manage a portfolio with 100% of the portfolio invested in a single position. Indeed, no timing model should be used in that manner. Always use good money management techniques. / В техническом анализе биржевых рынков, .

TREWS = КЛЕТЧАТЫЕ ШТАНЫ (или ТЧРЮЗ) – Trews:- (chiefly British) pant, especially tight-fitting trousers usually of tartan; close-cut tartan shorts worn under the kilt in Highland dress. / клетчатые штаны Шотландских горцев.

THE TREYNOR RATIO = СООТНОШЕНИЕ ТРЭЙНОРА (или ТРЭЙНОРСКОЕ СООТНОШЕНИЕ) – The Treynor Ratio:- another popular measure of risk-adjusted performance is the Treynor ratio. Unlike the Sharpe ratio, this ratio uses beta as the measure of risk in the denominator rather than standard deviation. The Treynor ratio may be interpreted as the risk premium that the investment earns per unit of beta. The Treynor ratio depends on the unit of time used to express returns. Generally, the beta of an asset, the denominator of the ratio, would be expected to be quite similar, regardless of the unit of time used to express returns. However, ignoring compounding, the quarterly returns would be expected to be one-quarter the magnitude of annual returns, and monthly expected returns to be one-twelfth the magnitude of annual returns. Thus the numerator is proportional to the time unit, and the denominator is roughly independent of the time unit, meaning that the ratio is proportional to the unit of time. The Treynor ratio is easily intuitively interpreted as excess return earned by bearing systematic risk. Unlike the Sharpe ratio, the Treynor ratio should not be used on a stand-alone basis. Beta is a measure of only one type of risk, systematic risk. Therefore, selecting a stand-alone investment on the basis of the Treynor ratio might tend to maximize excess return per unit of systematic risk but not maximize excess return per unit of total risk unless each investment were well-diversified. Beta does serve as an appropriate measure of the marginal risk of adding an investment to a well-diversified portfolio. Therefore, the Treynor ratio is designed to compare well-diversified investments and to compare investments that are to be added to a well-diversified portfolio. But the Treynor ratio should not be used to compare poorly diversified investments on a stand-alone basis. It is less frequently applied in alternative investments, because beta is not an appropriate risk measure for many alternative investment strategies. The Treynor Ratio is a measure of risk-adjusted performance for

investments; risk premium that the investment earns per unit of beta. Formula:- TR = [E(R_p) − R_f] / p, where:- TR is the Treynor ratio for portfolio p; E(R_p) is the expected return, or mean return, for portfolio p; R_f is the riskless rate; and p is the beta of the returns of portfolio p. Example:- a portfolio that earns 10% per year and has a beta with respect to the market portfolio of 1.5 when the risk-free rate is 3%. The Treynor ratio is (10% – 3%) / 1.5 or 0.046 7 (4.67%). / соотношение Шарпа (Sharpe ratio).

TRIACETATE FIBER = ТРИАЦЕТАТНОЕ ВОЛОКНО – Triacetate Fiber is a manufactured fiber produced from cellulose triacetate in the forms of filament yarn, staple, and tow. Cellulose triacetate fiber differs from acetate fiber in that during its manufacture the cellulose is completely acetylated whereas acetate, which is diacetate, is only partially acetylated. The US Federal Trade Commission (FTC) notes that a fiber may be called Triacetate when not less than 92% of the hydroxyl groups are acetylated. Fabrics of triacetate have higher heat resistance than acetate fabrics and can be safely ironed at higher temperatures. Triacetate fabrics that have been properly heat-set (usually after dyeing) have improved ease-of-care characteristics because of a change in the crystalline structure of the fiber. See also Acetate Fiber. Triacetate is cellulose acetate fiber in which at least 92% of the hydroxyl groups are acetylated. Alphabetic code – CTA; and relevant commercial allowance – 7.00. Triacetate is a manufactured fiber, which like acetate, is made by modifying cellulose. However, even more acetate groups have been added to create this fiber. Triacetate is less absorbent and less sensitive to high temperatures than acetate. It can be hand or machine washed and tumble dried, with relatively good wrinkle recovery. Examples of chemical formulae:- cellulose triacetate $–(–C_6H_7O_2–(OX)_3–)_n–$; where X = H or CH_3CO and the degree of esterification is between 2.76 and 3. Triacetate is a thermoplastic fiber classified under the generic name of acetate, although it is a modification of acetate. Triacetate fabrics resist shrinkage, wrinkles, and fading. They do not dissolve in acetone, can be washed at higher temperatures than those made of acetate, and can be ironed with the heat set for linen. See also Acetate. Triacetate is a man-made fiber produced from cellulose triacetate in the forms of filament yarn, staple and tow. Cellulose triacetate fiber differs from acetate fiber in that during its manufacture the cellulose is completely acetylated where as regular acetate, which is diacetate, is only partially acetylated. / филаментная (комплексная) пряжа (filament yarn). ацетат целлюлозы или ацетилцеллюлоза (cellulose acetate). Триацетатное Волокно – один из видов ацетатного волокна. Триацетатное волокно выпускается в виде штапельного волокна. Смотрите также Ацетатное Волокно (Acetate Fiber). Триацетатные Волокна получают аналогично ацетатным. Для прядильного раствора триацетат целлюлозы растворяют в смеси метиленхлорида и спирта. Формуют волокна сухим или мокрым способом. Прочность триацетатных волокон в сухом состоянии 13–16 кгс/мм^2, в мокром – уменьшается на 30–40%. Это волокно отличается высокой упругостью, благодаря чему изделия из него не требуют глажения, а также сохраняют плиссе и гофре даже после стирки. Волокна термостойки, выдерживают нагревание до 150–160 °С. Триацетатные волокна окрашиваются лучше, чем ацетатные, устойчивы к действию света, не разрушаются микроорганизмами. Недостатками этого волокна являются малая гигроскопичность (3.5–4.5%), высокая электризуемость, низкая устойчивость к действию щёлочей, ацетона и других органических растворителей. Триацетатное Волокно – один из видов ацетатных волокон. Смотрите также Ацетатные Волокна.

TRIACETIN = ТРИАЦЕТИН – Triacetin is a glycerol triacetate. A type of plasticizer for acetate fibers. It is widely used to add firmness to cigarette filter rods.

TRIAL = ОПЫТ (или ИСПЫТАНИЕ) – Trial is an experiment to determine or test the quality or performance of a specific variety, system, or crop rotation and its usefulness in increasing farmers' production. / Под Опытом понимается основанное на практике чувственно-эмпирическое познание объективной действительности; единство знаний и умений, навыков. Опыт выступает и как процесс практического воздействия человека на внешний мир, и как результат этого воздействия в виде знаний и умений. Под Испытанием понимается понятие теории вероятностей. Испытание может иметь один (и только один) из n исходов. Каждый исход испытания рассматривается как случайное событие, имеющее определённую вероятность.

TRIAL BALANCE = ПРОБНЫЙ БАЛАНС (или ПРЕДВАРИТЕЛЬНЫЙ БАЛАНС) – Trial Balance:- in accounting, test that the books of account are accurate, by extracting a balance and checking that the debits equal the credits. This may take place monthly, but must be carried out at least annually, during an audit. In accounting, list of accounts with balances in the ledger to verify the equality of the debit and credit sides of the ledger. A trial balance does not verify the correctness of accounts. / главная книга (ledger).

TRIANGLE = ТРЕУГОЛЬНИК – In visual analysis, sideways price patterns in which prices fluctuate with converging trendlines. The three types of triangles are:- (i) the Ascending Triangles, (ii) the Descending Triangles, and (iii) the Symmetrical Triangles. A chScott pattern of a number of bars with generally higher lows and lowers highs, i.e. a period of market contraction. As the market reaches the point of the triangle, a breakout and multiday trending move often occurs. Triangles are some of the most well-known chart patterns used in technical analysis. The three types of triangles, which vary in construct and implication, are the symmetrical triangle, ascending and descending triangle. These chart patterns are considered to last anywhere from a couple of weeks to several months. The symmetrical triangle in Figure 4 is a pattern in which two trendlines converge toward each other. This pattern is neutral in that a breakout to the upside or downside is a confirmation of a trend in that direction. In an ascending triangle, the upper trendline is flat, while the bottom trendline is upward sloping. This is generally thought of as a bullish pattern in which chartists look for an upside breakout. In a descending triangle, the lower trendline is flat and the upper trendline is descending. This is generally seen as a bearish pattern where chartists look for a downside breakout. / , то есть . В техническом анализе биржевых рынков, . (а) Восходящие Треугольники (Ascending Triangles), (б) Нисходящие Треугольники (Descending Triangles), и (в) Симметричные Треугольники (Symmetrical Triangles). Треугольники относятся к Фигурам Продолжения (Continuation Patterns) и Фигурам Разворота (Reversal Patterns), и делятся на восходящие, нисходящие и симметричные треугольники. Симметричный Треугольник обычно заканчивается продолжением той тенденции, которая ему предшествовала. Традиционное понимание графиков предполагает, что несимметричные треугольники будут уступать место тенденции в направлении наклона гипотенузы. Однако направление пробоя треугольной формации является более важным, чем её тип, например, вслед за восходящим треугольником произошёл пробой вниз, и за ним последовало резкое снижение цен. Треугольник – модель, отражаемая на техническом графике. Имеет две базисные точки и вершину, формируемую путём соединения изменений котировок акций с помощью линии. В типичной модели треугольника вершина находится справа, хотя в 'перевёрнутом' треугольнике она находится слева. В типичном треугольнике существует два или более подъёма, и цена падает по мере того, как каждый последующий локальный пик опускается ниже предшествующего пика, а каждый локальный минимум – выше предшествующего локального минимума. Нисходящая линия справа от вершины треугольника часто указывает в направлении прорыва. Технические аналитики считают, что если котировки ценных бумаг нарушают треугольную модель, то обычно это означает, что котировки ценных бумаг продолжат движение в том же направлении.

TRIANGULAR FLAGS = ТРЕУГОЛЬНЫЕ ФЛАГИ – In visual analysis, chart patterns of the price movement of a commodity when the market consolidates sideways. The price patterns are used by technical analysts to try to recognize changes in a price trend. / В техническом анализе биржевых рынков, .

TRIANGULAR HULL = ТРЕУГОЛЬНАЯ ПЛЁНКА ЗЕРНА – Triangular Hull (tri) is the spikelet appears triangular because the lemma is so shaped.

TRIANGULAR MERGER = ТРОЙСТВЕННОЕ (или ТРОЙНОЕ, или ТРИАНГУЛЯРНОЕ, или ТРЕУГОЛЬНОЕ) СЛИЯНИЕ – In a Triangular Merger, the target company merges into a subsidiary of the acquiring company with the target shareholders receiving as merger consideration shares in the acquiring company. A (forward) triangular merger would theoretically be possible under the new Merger Act if in a squeeze-out merger the consideration consisted of shares in the surviving entity's parent company. However, as the super-majority requirement for shareholders' resolutions approving a squeeze-out merger is 90 per cent of all the voting rights of the transferring company, triangular mergers will be rare in practice. / Реорганизация компании в форме присоединия. Стороны реорганизации:- присоединяющее лицо и присоединённое лицо.

TRIANGULATION = ТРИАНГУЛЯЦИЯ – Triangulation is the term used to describe a chain of intra-European Community supplies of goods involving three parties. But, instead of the goods physically passing from one to the other, they are delivered directly from the first to the last party in the chain.

TRIAXIAL BRAID = ТРИАКСИАЛЬНЫЙ ШНУР – Triaxial Braid is a braided fabric structure which includes axial yarns running in the longitudinal direction. The axial yarns are entrapped within a braid intersection. The maximum number of axial yarns which may be included in the fabric is one half the number of braiding yarns. See also Biaxial Braid, and Braid.

TRIAXIAL FABRICS = ТРЁХОСНЫЕ ТКАНИ – Triaxial Fabrics are the completely isotropic fabrics made in a weaving process employing three yarns at 60° angles to each other. These fabrics have no stretch or distortion in any direction. With equal sizes and number of yarns in all three directions, the fabric approaches equal strength and stiffness in all directions.

TRIAXIAL WEAVE = ТРЁХОСНОЕ ПЕРЕПЛЕТЕНИЕ – Triaxial Weave is a type of woven fabric which is formed through the placement of three distinct yarn orientations. There are two types of triaxial weaves, those with one warp and two wefts, and a new generation of machines which uses two warps and one weft.

TRI–AXLE = ТРЁХОСНОЕ – Tri-Axle:- a third axle used for supporting additional weight. / Третья ось используется для поддержки дополнительного веса.

TRIBE = ТРИБА (или КОЛЕНО) – Tribe or Tribus is a taxonomic category between a Genus and a Subfamily. See also Class, Division, Family, Genus, Kingdom, Order, Phylum, Specie, and Type. / Смотрите также Вид (Specie), Класс (Class), Отдел (Division), Отряд (Phylum), Порядок (Order), Род (Genus), Семейство (Family), Тип (Type), Триба или Колено (Tribe), и Царство (Kingdom). Триба (Tribe или Tribus) или Колено, таксономическая (систематическая) категория в систематике Растений и Животных, занимающая промежуточное положение между Подсемейством и Родом. Применяется для объединения близких Родов (например, Пырей, Житняк, Пшеница, Рожь, Ячмень и другие родственные им Роды Злаков составляют Трибу Пшеничных (Tribus или Tribe:- Triticeae). Для Латинских названий Трибы в ботанике принято окончание – eae (Белоусовые (Nardeae), Рисовые (Oryzeae) и тому подобные), в зоологии – ini (Браконидовые (Braconini)). Большие Трибы иногда делят на Подтрибы (Subtribus).

TRIBOLOGY = ТРИБОЛОГИЯ – Tribology is the science and technology of interacting surfaces in relative motion, including the study of lubrication, friction and wear. Tribological wear is wear that occurs as a result of relative motion at the surface. Tribology is a science branch dealing with friction, wear and lubrication. / Под Трибологией, от Греческих слов Tribos, означающее Трение, и Lógos, означающее Слово или Учение, понимается наука и технология . изучение смазывания, трения и износа.

TRIBUNAL = ТРИБУНАЛ – Tribunal is a special court or group of people who are officially chosen, especially by the government, to examine (legal) problems of a particular type:- a war crimes tribunal. Tribunal is a special court chosen, esp by a government or governments, to examine a particular problem:- An international tribunal of judges was established to investigate alleged war crimes. / Под Трибуналом, от Латинского слова Tribunal, означающее Судилище, (основное значение:- возвышение, на котором в Древнем Риме восседали важнейшие должностные лица – консулы, преторы – при исполнении служебных обязанностей), понимается особый суд. (1) Во Франции – революционный чрезвычайный суд периода Великой Французской Революции. (2) В бывшем Союзе Советских Социалистических Республик (СССР) – суды, учреждённые Декретом Совета Народных Комиссаров О Суде от 22 Ноября (05 Декабря) 1917 для борьбы с контрреволюцией и наиболее опасными преступлениями (см отрите Революционные Трибуналы), а также суды, рассматривающие дела о воинских и иных преступлениях, отнесённых законом к их ведению (смотрите Военные Трибуналы). (3) Международный судебный орган по преследованию и наказанию главных военных преступников 2-й Мировой Войны 1939–45 (смотрите Международный Военный Трибунал). (4) В судебных системах некоторых буржуазных стран (например, Франции, Италии) суд первой инстанции и апелляционная инстанция для дел, рассмотренных мировыми судьями.

TRICE = БРАТЬ НА ГИТОВЫ (или ПОДТЯГИВАТЬ, или ПОДНИМАТЬ) – Trice (maritime term):- to lash up.

TRICHINOSIS = ТРИХИНОЗ (или ТРИХИНЕЛЛЁЗ) – Trichinosis is a human disease caused by Triciniellae (Trichinella Spiralis). Household pets, for example may be secondary hosts. Meat inspections are statutory preventive measures. / Под Трихинеллёзом понимается инвазионная болезнь (гельминтоз из группы нематодозов) человека и животных (грызуны, жвачные, кошки, свиньи, собаки и другие), вызываемая Трихиной. Симптомы:- лихорадка, мышечные боли, отёки век, расстройства функции центральной нервной системы. Заражение при употреблении инвазированного мяса.

TRICHOME = ТРИХОМ – Trichome is a hair-like structure growing at one end from the plant's epidermis. Trichomes have numerous forms including branched or unbranched hairs, scales and glands. / имеют различные формы, включающие ветвящиеся или неветвящиеся волоски, чешуйки (scales) и железы (или железистые волоски; glands). Под Трихомами, от Греческого слова Trichōma, означающее Волосы, понимаются выросты эпидермиса у растений в виде волосков (hairs), чешуек (scales), щетинок и тому подобного.

TRICING LINE = ОТТЯЖКА (или СЛАБ–ГОРДЕНЬ, или СЛАБЛИНЬ, или ГИТОВ) – Tricing Line (maritime term) is a line used for suspending articles.

TRICK = ВАХТА – Trick (maritime term) is the period of time during which the wheelsman remains at the wheel. / Вахта рулевого.

TRICOLETTE = ТРИКОЛЕТ – Tricolette is a usually silk or rayon knitted fabric used especially for women's clothing. / .

TRICORNE = ТРЕУГОЛКА (или ТРИКОРН) – Tricorne is a cocked hat.

TRICOT = ТРИКО (или ВЯЗАНЬЕ) – Tricot is a generic term for the most common type of warp-knit fabric. It has fine wales on the face and coursewise ribs on the back. It can be made in a plain Jersey construction or in meshes, stripes, and many other designs.

Tricot is usually made of triacetate, acetate, polyester, nylon, or rayon. See also Jersey, and Knitting. Tricot is a special case of warp knitting, in which the yarn zigzags vertically, following a single column ('wale') of knitting, rather than a single row ('course'), as is customary. Tricot and its relatives are very resistant to runs, and are commonly used in lingerie. Tricot is a plain, warp-knit fabric that can be created with an array of fibers and fiber blends. It is not unusual for various types of tricot to be manufactured with the use of cotton, wool, silk, rayon or nylon, or any combination of fibers. Because the pattern for tricot fabric is a close-knit design with fibers running lengthwise while employing an interlooped yarn pattern, the texture of tricot is a little different from some other types of material. One side will feature fine ribs running in a lengthwise pattern, while the other side will feature ribs that run in a crosswise direction. The finished look of tricot is that of a sturdy, yet soft, material that can be ideal for a number of applications such as the lining for luggage or jewelry boxes. Tricot is a type of warp knitting in which spring bearded needles are normally used to make fine fabrics with usually one to three warps are used. Tricot is a term originating from the French Tricoter, meaning To Knit. It is a fabric made by a warp-knitting (tricot) machine, a machine in which parallel yarns run lengthwise and are locked into a series of loops. Warp knits have a good deal of crosswise stretch. See also Two-Bar Tricot. Tricot is a generic term for the most common type of warp-knit fabric. It has fine wales on the face and coursewise ribs on the back. It can be made in a plain Jersey construction or in many other designs. Tricot is a plain warp-knitted fabric (as of nylon, wool, rayon, silk, or cotton) with a close inelastic knit and used especially in clothing (as underwear); a twilled clothing fabric of wool with fine warp ribs or of wool and cotton with fine weft ribs. Vertical wales on surface and more or less crosswise ribs on the back. Has a thin texture, made from very fine or single yarns. Glove silk is a double bar tricot (very run-resistant). Used for underwear, sportswear, bathing suits, gloves. / Найлан^{Т3} (Nylon^{ТМ}). Под Трико понимаются:- (1) плотные шерстяные, полушерстяные, хлопчатобумажные ткани с ясно выраженным рисунком переплетения (рубчики, продольные полоски, клетки и тому подобное). Из трико шьют костюмы, платья и тому подобное. В переплетении Трико петли располагаются поочерёдно в двух соседних петельных столбиках. Трико, как и цепочка, состоит из закрытых или открытых петель или сочетания тех и других, повторяющихся по рядам. Под Трико, от Французского слова Tricot, от Tricoter (Трикотэ), означающее Вязать, понимается:- (1) плотная костюмная ткань из шерстяной, полушерстяной, хлопчатобумажной пряж с примесью химических волокон. Вырабатывается саржевым или мелкоузорчатым переплетением нитей; имеет чётко выраженный рисунок в виде рубчиков, полосок, клеток и так далее. (2) Одно из главных основовязаных трикотажных переплетений. (3) Спортивная, театральная одежда из трикотажа, плотно облегающая тело. Под Трикотажем, от Французского слова Tricot, означающее Трико (вязаная ткань) или Вязанье, понимаются вязаные изделия или вязанье. Под Трикотажем, от Французского слова Tricotage, от Tricoter, означающее Вязать, понимается вязаное полотно или готовое изделие, полученное из одной или многих нитей образованием петель и их взаимным переплетением на трикотажной машине. В отличие от других текстильных изделий, трикотаж обладает растяжимостью по всем направлениям из-за возможности петель изменять форму и размеры. Рыхлая петельная структура придаёт трикотажу мягкость и несминаемость. Трикотаж используется для изготовления предметов одежды, а также в производстве искусственного меха, кружев, рыболовных сетей, технических и медицинских изделий и тому подобного. Классификация:- Трикотаж подразделяют по волокнистому составу, структуре, отделке и назначению. Для его изготовления в основном используют хлопчатобумажную и шерстяные нити, химические волокна (искусственные и синтетические, в том числе текстурированные нити). Пористость и лёгкая проницаемость трикотажа для воздуха, влаги способствуют более широкому, чем в тканях, использованию в нём синтетического сырья. Изготавливается однородным (из волокон одного вида), смешанным (из нитей, полученных из смеси различных волокон) и неоднородным (из нитей различных видов). Трикотаж из пряжи, полученной из смеси хлопка и небольшого количества шерстяных отходов, называется Вигоневым Трикотажем. По структуре различают трикотаж поперечновязаный (кулирный) и основовязаный, одинарный – однофонтурный и двойной – двухфонтурный (смотрите Трикотажное Переплетение). По сравнению с одинарным двойной трикотаж более плотный и тяжёлый, не закручивается с краёв и применяется преимущественно для изготовления верхних (иногда бельевых) изделий. По способу отделки различают суровый (неотделанный), отбелённый (смотрите Отбеливание), гладкокрашеный (окрашенный в один цвет) и пёстровязаный трикотаж. Для отделки используется красильно-отделочное оборудование, приспособленное к обработке трикотажа. Помимо гладкой поверхности, трикотаж может иметь пушистый слой (ворс), который образуется расчёсыванием нитей на поверхности трикотажа с помощью игольчатых лент и шишек, закреплённых на валах ворсовальных машин. По назначению различают бельевой, верхний, чулочно-носочный, перчаточный, платочно-шарфовый и другой трикотаж. Бельевые и верхние изделия в основном шьют из трикотажного полотна, остальные изделия, как правило, получают готовыми на машине. Бельевой трикотаж обладает гигроскопичностью, мягкостью, эластичностью, имеет высокую воздухо- и паропроницаемость и тому подобное. Для его изготовления в основном используются полотна из хлопко-полиэфирной (хлопко-лавсановой) пряжи, а также так называемые Платированные Полотна, у которых лицевая сторона выработана из шёлковых нитей, а изнаночная – из хлопка. Трикотажные полотна для верхних изделий имеют, как правило, большую, чем бельевые, толщину, характеризуются формоустойчивостью, хорошими теплозащитными свойствами. Основные Характеристики И Свойства Трикотажа:- Строение трикотажа обусловливается переплетением петель и их геометрическими параметрами (длина нити в петле, модуль петли – отношение длины нити в петле к её толщине, высота петельного ряда и другое); линейной плотностью нити (масса 1 километра (км) нити в граммах (г)), толщиной и числом сложений нити, структурой поверхности (гладкая, ворсовая) и тому подобным. Качество трикотажа определяется поверхностной плотностью, числом петель на единицу длины в направлении по петельному столбику (плотность по вертикали) и по петельному ряду (плотность по горизонтали), а также механическими и физическими свойствами. Поверхностная плотность характеризует материалоёмкость и косвенно толщину трикотажа; для верхних изделий составляет 300–600 граммов на квадратный метр (г/м^2), для бельевых 115–240 г/м^2. Для оценки механических свойств трикотажа определяют растяжимость, упругость, эластичность, прочность на разрыв, истирание, распускаемость, закручиваемость с краёв и тому подобное. Растяжимость трикотажа зависит от вида переплетения и строения петель; наибольшее увеличение размеров имеет поперечновязаный трикотаж (например, для чулочных изделий до 400%), наименьшее – основовязаный. Во всех случаях удлинение трикотажа в поперечном направлении больше, чем в продольном. Малорастяжимый трикотаж не требует специальной обработки при изготовлении одежды; пошив изделий выполняют на швейных машинах цепного стежка. Уменьшение растяжимости трикотажа, предназначен для изготовления верхних изделий, достигается применением комбинированных переплетений, в которых иногда используют уточные нити. Нити могут прокладываться вдоль петельных рядов (поперечный уток) и вдоль столбиков (продольный уток). Растяжимость трикотажа при этом снижается до 5–10%. Упругость (способность мгновенно восстанавливать первоначальную форму после снятия нагрузки) и эластичность трикотажа (способность восстанавливать форму через некоторое время после снятия нагрузки) в основном зависят от вида сырья и переплетения. Наибольшей упругостью обладает трикотаж из текстурированных нитей, а также трикотаж из шерстяной пряжи, выработанный переплетением 'ластик'. Упругость и эластичность способствуют сохранению формы изделия в процессе носки, значительно повышают стойкость одежды к истиранию и многократным растяжениям. Прочность трикотажа на разрыв составляет обычно 50–70% от суммарной прочности нитей, входящих в поперечное сечение полотна. Устойчивость трикотажа к истиранию зависит от поверхности волокна, крутки нитей, вида переплетения, отделки. Наибольшей устойчивостью к истиранию обладает трикотаж из синтетических нитей, наименьшей –

шерстяной трикотаж и трикотаж с ворсовой поверхностью. Разрушение нити в петлях в результате истирания или повреждения вызывает распускание (или сбегание) петли. Интенсивность сбегания зависит от вида переплетения и гладкости нити. Основовязаный трикотаж, в котором в состав каждой петли входят две нити, практически нераспускаем; трикотаж кулирных переплетений, как правило, легко распускается. Исключение составляют ажурные, прессовые и перевитые переплетения. Закручиваемость трикотажа с краёв характерна для всех переплетений, выработанных на машинах с одной игольницей (однофонтурных). Вызывается стремлением нити, изогнутой в петлю, распрямиться. Величина закручивания зависит от упругости и линейной плотности нити, внешних условий, вида отделки. Это свойство трикотажа затрудняет швейную обработку изделий:- временно может быть устранено влажно-тепловым воздействием на каландрах или прессах. Преждевременный износ трикотажных изделий иногда возникает в результате недостаточной стабильности размеров и формы изделия в носке и стирке, свойственной петельным структурам с высоким модулем петли. Признаком формоустойчивости трикотажа служит его способность к растяжению. Переплетения, имеющие малоподвижные петли или высокую плотность, а также химически стабилизированные в вытянутом состоянии, характеризуются большой стабильностью размеров. При оценке гигиеничности трикотажа обычно определяют его физические свойства:- способность поглощать влагу из окружающей среды (гигроскопичность), воздухо-, водо- и паропроницаемость, электризуемость и другие. Гигроскопичность зависит от вида волокон; наилучшими свойствами обладает хлопчатобумажный трикотаж, почти не поглощают влаги изделия из синтетических волокон. Трикотаж благодаря рыхлой петельной структуре имеет воздухо-, водо- и паропроницаемость значительно выше, чем ткани. Изменяя плотность вязания или применяя нити, отличающиеся по структуре (пушистости), получают различную проницаемость трикотажа. Электризуемость трикотажа (способность накапливать электростатические заряды до размеров, ощутимых человеком) зависит от волокнистого состава трикотажа. Гидрофобные волокна (большинство синтетических волокон) создают в трикотаже высокую электризуемость; для уменьшения её применяется обработка трикотажа химическими препаратами – антистатиками. Смешанный трикотаж, в котором значительна доля гидрофильных волокон, не обладает высокой электризуемостью. Смотрите также Трикотажная Промышленность.

TRICOT BEAM = НАВОЙ ДЛЯ ТРИКО – Tricot Beam is a metal flanged beam, commonly 42 inches in width, on which yarn is wound for use as a supply for the tricot machine.

TRICOT FABRIC YIELD = ВЫХОД ТКАНИ ТРИКО – Tricot Fabric Yield is the number of square yards per pound of greige or finished tricot fabric.

TRICOTINE = ТРИКОТИН (или КОСТЮМНОЕ ТРИКО) – Tricotine is a sturdy suiting woven of tightly twisted yarns in a double twill. Has a double twill rib on the face of the cloth. Has a very clear finish. It drapes well, and tailors easily. Medium in weight. Has exceptional wearing qualities. Very much like cavalry twill, but finer. In the same family as whipcords, coverts, and gabardines. 63 twill, left to right (double). Worsted, wool, rayon, blends with synthetics. / .

TRICOT KNIT = ТРИКОТАЖ ТРИКО – Tricot Knit is a warp knit fabric in which the fabric is formed by interlooping adjacent parallel yarns. The warp beam holds thousands of yards of yarns in a parallel arrangement, and these yarns are fed into the knitting area simultaneously. Sufficient yarns to produce the final fabric width and length are on the beam. Tricot knits are frequently used in women's lingerie items such as slips, bras, panties, and nightgowns. A warp knit fabric in which the fabric is formed by interlooping adjacent parallel yarns. The warp beam holds thousands of yards of yarns in a parallel arrangement, and these yarns are fed into the knitting area simultaneously. Sufficient yarns to produce the final fabric width and length are on the beam. Tricot knits are frequently used in underwear. Tricot Knits are made almost exclusively from filament yarns because uniform diameter and high quality are essential yarn characteristics for use with the very high speed tricot knitting machines. Fabrics constructed by the tricot knitting machine are usually plain or have a simple geometric designs. The front surface of the fabric has clearly defined vertical wales, and the back surface has crosswise courses. General characteristics of tricot knits include softness, good drapability, crease resistance, non-raveling, and elasticity. The wide range of textile products made from tricot knits include lingerie, sleepwear, robes, men's shirts, blouses, dresses, waitresses' and nurses' uniforms, backing for bonded fabrics, and automobile upholstery. Tricot knits are made predominantly from nylon, acetate, and polyester fibers. / Найлан^{T3} (Nylon^{TM}). основовязаная ткань, в которой сама ткань формируется . В переплетении Трико петли располагаются поочерёдно в двух соседних петельных столбиках. Трико, как и цепочка, состоит из закрытых или открытых петель или сочетания тех и других, повторяющихся по рядам. Под Трикотажем, от Французского слова Tricot, означающее Трико (вязаная ткань) или Вязанье, понимаются вязаные изделия или вязанье. Трикотажное Переплетение, строение петельной структуры трикотажа; определяет внешний вид трикотажа и его свойства (упругость, крепость, воздухопроницаемость и другие). Трикотажное переплетение отличаются друг от друга составом элементов петельной структуры (петля, набросок, протяжка) и их взаимным расположением. В зависимости от числа нитей, участвующих в процессе образования петельного ряда, различают поперечновязаные (кулирные) и основовязаные трикотажные переплетения. При поперечновязаном трикотажном переплетении горизонтальный петельный ряд образуется последовательным изгибанием одной нити. В основовязаном трикотажном переплетении горизонтальный петельный ряд составляется системой нитей (основой), отдельные нити образуют последовательно по 1 (редко по 2) петле в каждом ряду. Трикотажные переплетения бывают одинарные и двойные. У одинарного трикотажа одна сторона состоит из лицевых петель, у двойного, который вырабатывается на трикотажных машинах с 2 игольницами, обе стороны лицевые. Из многочисленных видов трикотажных переплетений обычно выделяют простейшие (главные), производные, комбинированные и сложные переплетения. В главных трикотажных переплетениях каждый ряд состоит из самого простого сочетания только одного основного элемента – петель. В группу главных поперечновязаных трикотажных переплетений входят:- гладь кулирная (одинарное однолицевое трикотажное переплетение) и ластик (двойное, двухлицевое трикотажное переплетение). Группа главных основовязаных трикотажных переплетений включает цепочку, трико и атлас, которые могут быть и одинарными, и двойными. Трикотажное переплетение цепочка не представляет собой трикотаж в обычном понимании этого слова. Цепочка состоит из петель одной нити, нанизанных друг на друга. Цепочки не имеют поперечной связи между собой; используются для получения более сложных основовязаных трикотажных переплетений, например, трико и атласа. Производные трикотажные переплетения (производная гладь, производный ластик и другие) представляют собой сочетание петельных столбиков из разных видов простейших трикотажных переплетений. В группу комбинированных трикотажных переплетений (например, прессовых, жаккардовых и других) входят переплетения, у которых в горизонтальных петельных рядах сочетаются различные элементы петельной структуры и чередование рядов более сложное по сравнению с простейшими трикотажными переплетениями. Сложные трикотажные переплетения (ажурные, зигзагообразные и другие) получают путём дополнительных операций при петлеобразовании, например, перенесением петель, переплетением с фиксированным расположением 2 нитей в петле.

TRICOT KNITTING = ВЯЗАНИЕ ТРИКО – Tricot Knitting is a run-resistant type of warp knitting in which either single or double sets of yarn are used. See also Knitting, and Tricot. Tricot Knitting is a run-resistant type of warp knitting in which either single or double sets

of yarn are used. Tricot Knitting is usually done with machines, and is used for track clothing, and bike shorts. This form of knitting is found in vintage knitting patterns, but is not much in favor for hand knitting.

TRICOT SECTION = СЕКЦИЯ (или ДЕТАЛЬ) ТРИКО – Tricot Section:- xxxxxx. See also Tricot Beam.

TRIDENTATE = ТРЕЗУБЧАТОЕ (или ТРЕЗУБОЕ, или ТРИДЕНТСКОЕ) – Tridentate:- forked into three points. Tridentum (Tri Dentum, meaning 'Three Teeth'). / Под Тридентским, от Латинского слова Tridentum, .

TRIER = ТРИЕР (или ПРОБООТБОРНИК) – A Trier is a hollow cone-shaped device used to obtain samples manually from bagged grain. / Пробоотборник это полое конусообразное устройство для отбора проб вручную из партии упакованного в мешки зерна. Под Триером, от Французского слова Trier, означающее Отбирать или Сортировать, понимается сельскохозяйственная машина для очистки от примесей семян зерновых культур и трав по длине частиц. Триер выделяет из семян очищаемой культуры длинные и короткие примеси. Триеры бывают цилиндрические и дисковые. В бывшем Союзе Советских Социалистических Республик (СССР) применяли цилиндрические триеры, рабочим органом которых являлись ячеистые цилиндры. В цилиндрах с мелкими ячейками (кукольных) выделяются короткие зёрна и примеси, а в цилиндрах с ячейками большого диаметра (овсюжных) – длинные зёрна и примеси. При вращении цилиндра короткие зёрна и примеси попадают в ячейки, поднимаются вверх и выпадают из ячеек в лоток. Длинные зёрна и примеси идут сходом по ячеистой поверхности. Производительность триеров от 5 (БТ-5 (блок триерный 5)) до 20 (БТ-20) тонн в час.

TRIFOLIATE = ТРЁХЛИСТОЧКОВОЕ – Trifoliate:- having three leaflets. Trifoliate is a compound leaf with three leaflets. / трёхсложный или тройчатосложный лист Птелеи Трёхлисточковой (Ptelea Trifoliata). Под Трифолиатой (понцирус) понимается род вечнозелёных деревьев Семейства Рутовых. 1 Вид, в тропических и субтропических странах. Подвой для цитрусовых культур. Декоративное растение.

TRIGGER HAIR = ЛОВЧИЙ ВОЛОСОК (или НАСТОРОЖКА) – Trigger Hair is a specialized structure found in the traps of certain carniverous plants which causes the trap to activate in response to stimulation. See also Entomophagous. / Смотрите также Энтомофаги или Насекомоядное (Entomophagous).

TRIGGER LINE = ТРИГГЕРНАЯ ЛИНИЯ (или ЛИНИЯ СРАБАТЫВАНИЯ) – Trigger Line is a moving-average line found in the moving average convergence divergence (MACD) theory, which is used to signal buy or sell points for a security. The trigger line interacts with the two moving averages that form the MACD line and attempts to predict upcoming trends. The trigger line provides traders with technical insight on when to long or short a stock. A common use of the trigger line is found in crossovers. When the trigger line crosses above the MACD line, a buy signal is sent, indicating that a trader should purchase the stock. Inversely, the trigger falling below the MACD represents a bearish trend, where the trader should short the stock. Also known as Signal Line. / В техническом анализе биржевых рынков, под Триггерной Линией или Линией Срабатывания понимается линия . Известна также как Сигнальная Линия (Signal Line).

TRIGONOUS = ТРИГОНАЛЬНОЕ (или ТРЁХПЕСТИЧНОЕ, или ТРЕУГОЛЬНОЕ, или ТРЁХЧЛЕННОЕ) – Trigonous:- with a three-cornered, triangular cross section. Trigonous:- three-angled. / Цветок Трёхчленного типа.

TRIHYBRID = ТРИГИБРИД – Trihybrid is a hybrid Rice from a cross between parents differing in three specific genes. / Тригибрид – гибрид, гетерозиготный по трём парам аллелей.

TRILBY = ТРИЛБИ (или ХХ) – Trilby is a soft felt hat with indented crown. A Trilby Hat (commonly called a Trilby) is a narrow-brimmed type of hat. The trilby was once viewed as the rich man's favored hat; it is sometimes called the 'Brown Trilby' in England and is much seen at the horse races. It is also sometimes described as a 'Crumpled' Fedora. The London hat company Lock and Co. describes the trilby as having a 'shorter (viz., narrower) brim which is angled down (snapped down) at the front and slightly turned up at the back' versus the fedora's 'wider brim which is more level (flatter)'. The trilby also has a slightly shorter crown than a typical fedora design. The hat's name derives from the stage adaptation of George du Maurier's 1894 novel Trilby; a hat of this style was worn in the first London production of the play, and promptly came to be called 'a Trilby Hat'. Traditionally it is made from rabbit hair felt, but is usually made from other materials, such as tweed, straw, wool and wool/nylon blends. The hat reached its zenith of common popularity in the 1960s; the lower head clearance in American automobiles made it impractical to wear a hat with a tall crown while driving. It faded from popularity in the 1970s when any type of men's headwear went out of fashion, and men's fashion instead began focusing on highly maintained hairstyles. The hat saw a resurgence in popularity in the early 1980s, when it was marketed to both men and women in an attempt to capitalize on a retro fashion trend. In shape it resembles the Tyrolean hat. / Найлан^{T3} (Nylon^{TM}). Жорж дю Морье (George du Maurier). мягкая фетровая шляпа с . Трилби – героиня одноимённого романа Английской писательницы Дафны дю Морье (Daphne du Maurier).

TRILLION = ТРИЛЛИОН – Trillion is one thousand billion or 10^{12}. See also Billion. / Триллион – одна тысяча миллиардов или 10^{12}. Смотрите также Биллион или Миллиард (Billion). Под Триллионом, от Французского слова Trillion, понимается тысяча миллиардов, число, изображаемое единицей с 12 нулями, то есть число 10^{12}. В некоторых странах триллионом называют число 10^{18}.

TRILOBAL = ТРИЛОБАЛ (или ТРЁХЛОПАСТНОЕ) – Trilobal polyester is a multiple filament, twisted, high-sheen continuous fiber thread. It has the bright appearance of rayon or silk. Triangular shaped fibers reflect more light and give an attractive sparkle to textiles. Trilobal polyesters are often compared to rayon threads in sheen but they have very different characteristics. Because we cannot take the chance of our thread fading or running or bleeding, we do not use, sell, or recommend rayon thread. The better choice is trilobal polyester. Trilobal poly has the same high sheen as rayon but is stronger and is colorfast. It costs more than rayon, but the quality and peace of mind are well worth it. Trilobal is a fiber with a modified cross section having three lobes. What is Trilobal polyester? Recent advances in fiber technology have resulted in a new type of polyester. In the past, due to its dull appearance, polyester lost out to other fibers, especially rayon. However, with the development of Trilobal polyester, rayon thread may become a thread of the past. In manufacturing Trilobal polyester, the Trilobal cross section of the fibers creates excellent light reflection, resulting in high sheen. If the desired effect is durability, softness, and brightness, Trilobal poly is perfect for the job. Following are characteristics of Trilobal poly:- (i) Brightness:- high sheen for attractive quilting and embroidery designs; (ii) Strength:- stronger than rayon, which means fewer thread breaks. Polyester can be used at higher machine speeds than weaker threads, including rayon. (iii) Colorfastness:- withstands chlorine. Durable to cleaning and laundering. More resistant to UV exposure than rayon. (iv) Controlled Elongation (stretch):- outperforms rayon and other polyester threads (such as spun poly); (v) Excellent Wet Strength:- does not weaken in washings; (vi) Abrasion Resistant:- higher abrasion resistance than rayon means it does not wear out as fast; (vii) More Stitch Volume:- has a slight 3D effect with less need for underlay or cord. Perfect for satin stitches. (viii) More Resistant To Chemical Damage than rayon. Ideal for industrial work-wear garments. (ix) More forgiving of poor adjustments or mechanical conditions of the machine; and (x) virtually lint free. / Трилобал из сложного полиэфира (polyester):- особенностью этой ткани является перламутровый блеск. Используется в основном для

пошива детской одежды. Изделия из ткани Трилобал можно стирать как ручным, так и машинным способом при температуре 40 °C. Материал быстро сохнет. Глаженье ткани при максимальной температуре подошвы утюга 150 °C. Не рекомендуется сушка в барабане и использование отбеливающих, хлорсодержащих порошков. Трилобал (Trilobal) – это материал семейства полиамидов, имеющий высокую устойчивость к износу. По своей структуре он похож на лучи, расходящиеся в стороны на 120 градусов. За счёт такой струкуры плотность ткани очень высока, а на вид поверхность красиво блестит. Благодаря такой структуре, материалы из трилобала крепче держатся на клею. Применение трилобала:- из трилобала делают флок, при помощи которого производится флокирование изделий для декоративной отделки. Во флокировании трилобал применяют для увеличения поверхности флока, но его мало для самостоятельного флокирования, поскольку большой плотности забивки им трудно достичь. Поэтому трилобал смешивают в другие виды флока. Трилобал также используют в качестве внешнего покрытия валиков для покраски, их основа – плотный поролон. Такие валики помогают добиться максимально равномерного распределения краски. Трилобал применяется и для производства верхней одежды.

TRIM = ДИФФЕРЕНТ – Trim is the difference between the forward and after draughts. A ship floating at equal draught all along is said to be on an even keel, or to have zero trim. If the fraughts are not the same from bow to stern, the ship is floting with a trim. Deeper draughts aft than forward result in trim by the stern. If the draught forward exceeds the draught aft, the condition is called trim by the head or bu the bow. The measure of the amount of trim is simply the difference between the after and forward draughts. Trim is the relationship between a ship's draughts forward and aft. Trim (maritime term):- the angle to the horizontal at which a vessel rides. / Под Дифферентом судна, от Латинского слова Differens (Differentis), означающее Разница, понимается наклон судна в продольной плоскости. Дифферент определяет посадку судна и измеряется разностью между осадками кормы и носа. Если разность равна нулю, говорят, что 'судно сидит на ровном киле'; если разность положительна – 'судно с дифферентом на корму'; при отрицательной разности – 'с дифферентом на нос'. Дифферент устраняют перераспределением грузов по длине (в частности, водяного балласта) или перекладкой горизонтальных рулей (на подводных лодках).

TRIM = ПОДРЕЗКА (или ОБРЕЗКА, или ПИНЦИРОВКА, или ЧЕКАНКА) – Trim:- thin out – make sparse; 'thin out the young plants'. See also Clip Leaves. / Под Обрезкой Растений понимается удаление ветвей или их укорачивание. Обрезают плодовые и декоративные растения для формирования кроны, регулирования сроков прохождения фаз развития растений, омолаживания. Под Пинцировкой (Topping), от Немецкого слова Pinzieren, означающее Удалять Конец, или Прищипкой понимается удаление верхушки молодого побега растения. Применяется при формировании кроны Персика, Яблони, некоторых декоративных Растений, для ускорения созревания урожая Огурца (в теплицах), Табака и другого. Под Чеканкой Растений понимается удаление верхушек побегов (topping) или верхних побегов в основном у Винограда и Хлопчатника для прекращения их роста. Уменьшает опадение завязей, создаёт лучшие условия для развития плодов.

TRIM–CUT = ОБРЕЗКА – Trim-Cut:- tapered and tailored, or a form-fitting garment. / :- подшитое и сшитое, или облегающее форму швейное изделие.

TRIMER = ТРИМЕР – Trimer is a polymer consisting of three monomer units. See also Cyclic Trimer.

TRIMMER = ПОДБАЛОЧНИК – Trimmer is a conventionally framed wall member usually consisting of fastened multiple studs in a framed wall opening, used to carry header load reaction. The trimmer is the shorter member of the fabricated unit.

TRIMMING = ОТДЕЛОЧНЫЙ МАТЕРИАЛ – Trimming is anything used to decorate clothing or home furnishings. / Кружево, бордюр, басон.

TRIN = TRADING INDEX

TRINITARIO COCOA BEAN = БОБ КАКАО ТРИНИТАРИО – Trinitario, from the island of Trinidad off the coast of Venezuela, is a cross between Criollo and Forastero. The two varieties were first crossed in the XVIII century when the island's Criollo plantations were almost wiped out by an environmental disaster. Trinitario trees are now grown wherever Criollo is found, and also in Trinidad and other islands of the Lesser Antilles, as well as in Java, Papua-New-Guinea and Sri Lanka, in the Indian Ocean. Cameroon also produces large quantities of Trinitario. Trinitario Characteristics:- Trinitario is halfway between the two other categories in every respect in terms of organoleptic qualities; it is well known for its strong aromatic power. The Trinitario Cocoa Bean is hybrid of the Criollo and Forastero varieties. Trinitario was created in Trinidad after the Forastero Variety was introduced and crossed with the local Criollo Variety in the XVIII century as a consequence of the Criollo Variety almost being wiped out on the island. The Trinitario Cocoa bean is grown in Trinidad, islands of the Lesser Antilles, Java, Papua-New-Guinea and Sri Lanka. It is also grown in large quantities in Cameroon. Its production accounts for 10–15% of the total Cocoa world ouput. It is a very aromatic Variety. Its other characteristics are in between the Criollo and Forastero Varieties.

TRIP = ОСВОБОЖДАТЬ (или РАСЦЕПЛЯТЬ) – Trip (maritime term):- to let go.

TRIP = ОТКЛЮЧКА – Trip:- slang in energy industries. To 'Trip' a switch or a Circuit Breaker means to switch-off the flow of electricity through a section of an electric circuit. A 'trip' can disconnect electricity in a small circuit like a certain area of a house. It can also be more widespread, disconnecting a generating station from the larger electric power grid. A circuit may be 'tripped' on purpose, in order to safely do electrical work. Sometimes a circuit gets 'tripped' unintentionally, causing a power outage.

TRIP = ХОДКА (или ПРОБЕГ) – Trip consists of four to six handlings of a pallet. / состоит из от четырёх до шести перевозок поддона.

TRI–PARTY REPO = ТРЁХСТОРОННЕЕ РИПО – Tri-Party Repo is a repurchase agreement in which bonds and cash are delivered by the trading counterparty to an independent custodian bank, clearing house, or securities depository that is responsible for ensuring that the collateral's value remains adequate during the life of the transaction. / Соглашение об откупе, по которому облигации и наличные доставляются торгующей стороной в независимый доверительный управляющий банк (банк распорядитель), клиринговую палату или депозитарий ценных бумаг, который несёт ответственность за гарантирование того, что размер обеспечения (залога) будет оставаться соответствующим в течение всего срока проводимой операции.

TRIPLE–BEAM BALANCE = ТРОЙНЫЕ РЫЧАЖНЫЕ ВЕСЫ (или ТРОЙНЫЕ КОРОМЫСЛОВЫЕ ВЕСЫ) – Triple-Beam Balance is a weighing device. This term refers a laboratory-type balance scale. 'Triple-beam' simply refers to the fact that there are three bars on which weights slide to counterbalance the item on the pan. Typically, one bar has a weight for tenths or hundredths of a gram, one has a weight for grams, and one has a weight for tens of grams. Often additional weights can be hung from pins to increase the total capacity. Triple-beam balances are moderately priced and quite useful in dyeing. A type with a single pan where the mechanism is below the pan (as opposed to a hanging pan type) with a resolution of a tenth of a gram is a good choice for general dyeing use. There are now many electronic scales available that are very easy to use, but typically a good deal more expensive for comparable capacity and resolution.

TRIPLE CROSSING = ТРОЙСТВЕННОЕ СКРЕЩИВАНИЕ (или ТРЁХПОРОДНОЕ СКРЕЩИВАНИЕ, или ТРЁХЛИНЕЙНОЕ СКРЕЩИВАНИЕ) – Triple Crossing is a sequential crossing of three cultivars, e.g., for A, B and C, A x B, AB x C, ABC x A, ABCA x B, and so on.

TRIPLE SHEERS = ТРОЙНЫЕ БОРТА (или ХХ) – Triple Sheers are the heavier and flatter than sheers. Almost opaque. Many are made from 'Bemberg', which wears, drapes, and washes well. Sheers are used extensively for after 5 wear, as well as afternoon dresses in heavier weights, and some coats, lingerie, curtains, trims, etc. / Бэмберг (Bemberg).

TRIPLE TOP = ТРОЙНАЯ ВЕРШИНА – In visual analysis, Triple Top is a price pattern with three prominent peaks, similar to the head and shoulders top, except that all three peaks occur at about the same level. The Triple Bottom is the mirror image of the Triple Top. / В техническом анализе биржевых рынков, .

TRIPLE TOP/BOTTOM = ТРОЙНАЯ ВЕРШИНА/ВПАДИНА – In visual analysis, Triple Top/Bottom is a potential reversal pattern where three price spikes of similar magnitude are turned back lower/higher. The general perception by many chartists is that triple tops and bottoms fail more often than they work and thus are viewed in a contrarian manner. / В техническом анализе биржевых рынков, .

TRIPLE WITCHING HOUR = ЧАС ТРОЙСТВЕННОГО ЧАРОДЕЙСТВА – Triple Witching Hour is the last trading hour on the third Friday of March, June, September and December when options and futures on stock indexes at the New York Stock Exchange expire concurrently. Triple Witching is an event that occurs when the contracts for stock index futures, stock index options and stock options all expire on the same day. Triple witching days happen four times a year on the third Friday of March, June, September and December. This phenomenon is sometimes referred to as 'Freaky Friday'. The final trading hour for that Friday is the hour known as Triple Witching. The markets are quite volatile in this final hour, as traders quickly offset their option/futures orders before the closing bell. If you are a long-term investor, triple witching will have a minimal impact on you. / Последний час торговли в третью Пятницу Марта, Июня, Сентября и Декабря, когда на Нью Йоркской Фондовой Бирже у опционов и фьючерсов на фондовые индексы одновременно прекращается признание.

TRIPLEX = ТРИПЛЕКС – (1) Triplex is a polyploid recessive at all loci except three with respect to a particular gene. / Триплекс – тетраплоид, имеющий три доминантных аллели данного гена.

(2) Triplex:- xxxxx. / Под Триплексом, от Латинского слова Triplex, означающее Тройной, понимается материал, состоящий из трёх слоёв:- двух пластин силикатного или органического стекла и склеивающего соединительного слоя (обычно из поливинилбутираля). При ударе не разлетается на осколки, так как отдельные куски пластин удерживаются соединительным слоем. Применяется для остекления средств транспорта, скафандров.

TRIPLOID = ТРИПЛОИД (или ТРИПЛОИДНОЕ) – Triploid is an organism with three basic (n) sets of chromosomes. / Триплоид – клетка с тремя гаплоидными наборами хромосом. Под Триплоидом, от Греческих слов Triplóos, означающее Тройной, и Éidos, означающее Вид, понимается организм с тремя основными (гаплоидными) наборами хромосом в соматических клетках (3n). Как несбалансированные полиплоиды триплоида характеризуются полной или приближающейся к полной стерильностью. Иногда триплоидия – оптимальный уровень плоидности. Классический пример комбинированного эффекта триплоидии и гетерозиса – триплоидная Сахарная Свёкла. Триплоидные гибриды (3n = 27) Сахарной Свёклы получают путём колхицирования (обработка семян и почек раствором колхицина) диплоидных сортов (2n = 18) этой культуры с последующим скрещиванием образовавшихся тетраплоидных форм (2n = 36) с обычными диплоидными сортами. Триплоиды Сахарной Свёклы отличаются повышенной продуктивностью и сахаристостью. Путём пересева не размножаются; их получают ежегодно по определённой программе скрещивания.

TRIPPING LINE = ОТТЯЖКА (или КОНЕЦ ДЛЯ ВЫКЛАДЫВАНИЯ ГАКА) – Tripping Line (maritime term) is a line used for capsizing the sea anchor and hauling it in.

TRIPS = TRADE–RELATED ASPECTS OF INTELLECTUAL PROPERTY RIGHTS

TRIPS = TRANSPORTATION INTELLIGENT PLANNING SYSTEM

TRIS = TRANSPORTATION RESEARCH INFORMATION SERVICE

TRISKELION CROSS SECTION = СЕЧЕНИЕ ТРИСКЭЛИЁН – Triskelion Cross Section is a trilobal cross section in which the radiating arms are curved or bent. See also Cross Section. / Трискэлиён – три бегущие ноги, выходящие из одной точки. сечение трилобал или трёхлопастное сечение.

TRISODIUM PHOSPHATE = ТРЁХНАТРИЕВЫЙ ФОСФАТ – Trisodium Phosphate (TSP or T.S.P.), Na_3PO_4, also called 'Sodium Phosphate, Tribasic'. TSP is sometimes used to produce pH in the range of about 12 for dyeing processes. It may be used in scouring. Strong solutions can be very irritating to skin, so handle it with care.

TRISOMIC = ТРИСОМИК – Trisomic is an organism diploid except for one kind of chromosome which is present in triplicate, hence, having 2n + 1 chromosomes. / Трисомик – клетка с двумя нормальными наборами хромосом.

TRISTIMULUS = ТРИСТИМУЛ (или ТРЁХЦВЕТНОЕ, или ТРЁХКООРДИНАТНАЯ СИСТЕМА) – Tristimulus:- of, or consisting of, three stimuli:- generally used to describe components of additive mixture required to evoke a particular color sensation. Commission Internationale de l'Eclairage (CIE) is the French title of the International Commission on Illumination. / Комисьо Этэрнасьёналь дё л'Эклераж (Сэ.И.Е.; Commission Internationale de l'Eclairage (CIE)). Тристимул (Tristimulus) – координата цветового пространства, любой из трёх компонентов количественной характеристики цвета. Примеры цветовых пространств, образованных тристимулами:- RGB, CIE XYZ, CIE LAB. Смотрите также МКО (CIE). Tristimulus – буквально означает Трёхцветный, относится к процессу цветообразования из трёх цветовых раздражителей (возбудителей, или стимулов), известных как колбочки L, M, S ('красные' (L), 'зелёные' (M) и 'синие' (S)). Слово Stimulus в отечественной физиологии всегда переводится как Раздражитель (тот же свет, который попадает на клетчатку, на те же колбочки и возбуждает их), вот многочисленные определения слова 'раздражитель'.

TRISTIMULUS VALUES = ТРЁХСТИМУЛЬНЫЕ ЗНАЧЕНИЯ (или ТРЁХЦВЕТНЫЕ ЗНАЧЕНИЯ) – Tristimulus Values:- in shade matching during dyeing, these values represent the amount of each of the three primary colors that, when mixed additively, will generate the desired shade. Tristimulus Values:- amounts (in percent) of the three components necessary in a three-color additive mixture required for matching a color; in the CIE System (Comission Internationale de l'Eclairage System or International Commission on Illumination System), they are designated as X, Y and Z. The illuminant and standard observer color matching functions used must be designated; if they are not, the assumption is made that the values are for the 1931 observer (2° field) and Illuminant C. The values obtained depend on the method of integration used and on the relationship of the nature of the sample and on the instrument design

used to measure the reflectance or transmittance. Tristimulus values are not, therefore, absolute values characteristic of a sample, but relative values dependent on the method used to obtain them. Approximations of CIE tristimulus values may be obtained from measurements made on a tristimulus colorimeter, giving measurements generally normalized to 100, which must then be normalized to equivalent CIE values. The filter measurements should be properly designated as R, G, and B instead of X, Y, and Z. / Комисьо Этэрнасьёналь дё л'Эклераж (Сэ.И.Е.; Commission Internationale de l'Eclairage (CIE)).

TRI–WAY SWING–PADDLE VALVE = ТРОЙНИК (или ТРЁХХОДОВОЙ ХХ–СТВОРЧАТЫЙ КЛАПАН) – 3-Way Swing-Paddle Valve is erected in cotton transporting pipe line for blowing-carding production line. 3-way swing paddle valve is use in 'one system two material' production line. Modified model 3-way swing paddle valve is used together with metal detector or spark detector for excluding the trash moving. The time opening or closing of 3-way swing paddle valve is controlled by programmable controller. When 3-way swing paddle valve receives signal from metal detector or spark detector, it automatically closes cotton transporting pipe and open trash excluding channel. After trash is excluded, valve automatically reset. The Crosrol range of two and three way pneumatically operated distribution valves are used primarily for distributing the material flow from a singie source into multiple opening lines. These types of valves operate automatically (programmed) in conjunction with up-stream and down-stream opening machines without the need for operator intervention offering a simple yet effective solution to material handling. / Или как его ещё называют рабочие прядильного производства на своём жаргоне – 'Штаны'.

TRIX = ТРИКС – In technical analysis, TRIX (short for the Triple Exponential Average) is a momentum indicator showing the percent rate of change of a triple exponentially smoothed moving averages. Like other oscillators, TRIX oscillates around a zero line. Its triple exponential smoothing makes it an excellent filter of market noise and it functions well as a leading indicator of market trends. TRIX Indicator was designed for trading trends. TRIX uses a triple-smoothed moving average to eliminate cycles shorter than the indicator period. What Is TRIX? The Triple Exponential Average (TRIX) indicator is an oscillator used to identify oversold and overbought markets, and it can also be used as a momentum indicator. Like many oscillators, TRIX oscillates around a zero line. When it is used as an oscillator, a positive value indicates an overbought market while a negative value indicates an oversold market. When TRIX is used as a momentum indicator, a positive value suggests momentum is increasing while a negative value suggests momentum is decreasing. Many analysts believe that when the TRIX crosses above the zero line it gives a buy signal, and when it closes below the zero line, it gives a sell signal. Also, divergences between price and TRIX can indicate significant turning points in the market. TRIX calculates a triple exponential moving average of the log of the price input over the period of time specified by the length input for the current bar. The current bar's value is subtracted by the previous bar's value. This prevents cycles that are shorter than the period defined by length input from being considered by the indicator. Advantages of TRIX:- two main advantages of TRIX over other trend-following indicators are its excellent filtration of market noise and its tendency to be a leading than lagging indicator. It filters out market noise using the triple exponential average calculation, thus eliminating minor short-term cycles that indicate a change in market direction. It has the ability to lead a market because it measures the difference between each bar's 'smoothed' version of the price information. When interpreted as a leading indicator, TRIX is best used in conjunction with another market-timing indicator – this minimizes false indications. TRIX is one of the best trend reversal and momentum indicators we have in our daily arsenal. TRIX is a momentum indicator that displays the percent rate-of-change of a triple exponentially smoothed moving average of a security's closing price. It was developed in the early 1980s by Jack Hutson, an editor for Technical Analysis of Stocks and Commodities magazine. Oscillating around a zero line, TRIX is designed to filter out stock movements that are insignificant to the larger trend of the stock. The user selects a number of periods (such as 15) with which to create the moving average, and those cycles that are shorter than that period are filtered out. / В техническом анализе биржевых рынков индикатор момента, . сглаженные. Дьжяк Хатсан (Jack Hutson).

TRL = TURKISH LIRA

TRM = TECHNICAL REFERENCE MODEL

TRN = TRANSACTION REFERENCE NUMBER

TRO = TEMPORARY RESTRAINING ORDER

TRO = TRIP REDUCTION ORDINANCE

TROGODERMA GRANARIUM (EVERTS) = ТРОГОДЭРМА ГРАНАРИУМ (ЭВЭРТС) – Trogoderma Granarium:- commodities fumigated with methyl bromide include durable food commodities (such as Cocoa and Coffee beans, Grains, dried fruit, nuts), perishable food commodities (mainly fruits and vegetables), and non-food commodities (forestry products, cut flowers, cotton, tobacco, packaging, animal feed stuffs, artifacts, and other commodities). In special extermination problems, such as that of the khapra-beetle (Trogoderma Granarium Ev.) larvae in the transport of bulk-loaded expeller (pressed remains from oil and fat seeds that are used for making cattle feed), methyl bromide is used in combination with hydrogen phosphide. Khapra Beetle – a dermestid Beetle (Trogoderma Granarium) that is native to the Indian subcontinent and is now a serious pest of stored grain in most parts of the world. Trogoderma Granarium is a most serious pest of stored commodities and every effort is extended to prevent its spread in international trade. In many countries, imported consignments found to contain J. Granarium are segregated and immediately fumigated with methyl bromide (at a dosage of 80 9/cu³ m for 48 hours). Lately, Prostephanus truncates originating from Central America has become a pest of international quarantine importance. They are also to be found in packaging material (barrels, cases, fabric wrappings). It should also be pointed out that storage pests can go without food for extended periods. The Khapra Beetle (Trogoderma Granarium), for instance, can manage for around a year without food. / Капровый Жук на Латинском языке.

TROJAN = ТРОЯНЕЦ – Trojan is a program that appears to do one thing but actually does another. Also known as (a.k.a.) Trojan Horse. A Trojan or Trojan Horse is a broad term for malicious software used for various nefarious purposes, often either destructive or for purposes of data theft. The determinative difference between a trojan and a virus or worm, is that it is not able to replicate or infect files on its own. Therefore it must rely on other means to get onto victims' computer systems – for example, Internet drive-by-downloads, by exploiting software vulnerabilities or by social engineering, being downloaded by another type of malware (e.g., a worm, virus, or trojan-downloader), and so on. Its name, derived from the story of the conquest of Troy by smuggling soldiers into the city inside a massive wooden horse, suggests that it disguises its true function, often employing social engineering to achieve being executed. Trojans are currently the most common malware type, used to open backdoors, exfiltrate user data (send it to a remote attacker), download other (malicious) software onto the infected system, and so on. See also Malware, and Virus. / Троянец – вирусная программа, содержащая скрытый модуль, осуществляющий несанкционированные пользователем действия в компьютере. Эти действия не обязательно будут разрушительными, но всегда направлены во вред пользователю. Троянские программы-вандалы подменяют какую-либо из часто запускаемых программ, выполняют её функции или имитируют такое исполнение, производя, вместе с тем, какие-либо вредоносные действия (стирают файлы, разрушают каталоги, форматируют диски, отсылают пароли или другую конфиденциальную информацию, хранящуюся на ПК пользователя). Значительное

распространение Троянские программы получили с возникновением разновидности .BBS. Некоторые Троянские программы содержат механизм обновления своих компонент из сети Интернет. Известен также как Троянский Конь (Trojan Horse).

TROLLEY = (ГРУЗОВАЯ) ТЕЛЕЖКА (или ТАЛЬ) – Trolley is a movable carriage adapted to shift a load laterally by moving along a track or other guiding means and which supports or guides a member from which the load is suspended. See also Crane. / Под Грузовой Тележкой или Талью, от Голландского слова Talie, понимается подвесное грузоподъёмное устройство с пневматическим, ручным или электрическим приводом. Пневматические тали грузоподъёмностью до 0.1 тонны (т) применяют в тех случаях, когда наличие электрического тока недопустимо по условиям производства. Длина путей передвижения пневматической тали ограничивается возможностями подачи сжатого воздуха. Ручные тали грузоподъёмностью 0.1–10 т бывают стационарные или передвижные. Электрические тали обычно имеют грузоподъёмность 0.25–10 т, высоту подъёма груза 4–30 метров (м), скорость подъёма 8–20 м/мин и скорость передвижения 20–30 м/мин. Подвесные пути для передвижения электроталей могут иметь один или два рельса, стрелки, закругления и небольшие уклоны.

TROPICAL PRODUCTS = ТРОПИЧЕСКИЕ ПРОДУКТЫ – Tropical Products:- traditionally, agricultural goods of export interest to developing countries in the tropical zones of Africa, East Asia and Latin America, e.g., Bananas, Coffee, spices, tea and tropical hardwoods. In WTO, Tropical Products:- a coalition of developing countries seeking greater market access for tropical products. WTO members (8):- Bolivia, Plurinational State of, Colombia, Costa Rica, Ecuador, Guatemala, Nicaragua, Panama, and Peru. / Традиционно, сельскохозяйственные товары вывозной (или экспортной) направленности в развивающиеся страны в тропических зонах Африки, Восточной Азии и Латинской Америки, например, бананы, кофе, специи, чай и различные виды тропической твёрдой древесины.

TROPICAL RUST = ТРОПИЧЕСКАЯ РЖАВЧИНА – Tropical Rust is common on feral Cotton and tree Cotton in parts of Northern Australia. Numerous small spots develop on older leaves. Spots are purple with a red/brown center on the upper side of the leaf and brown, powdery underneath. More severe during the dry season. Tropical Rust, caused by Phakopsora Gossypii, has been recorded on wild Cotton and tree Cotton in the Northern Territory and North Queensland. Under favorable conditions numerous small (1–2 mm) pustules develop on the undersurface of the leaf. Each pustule is a mass of powdery spores that may be effectively dispersed by wind over long distances. The disease has not been recorded on cultivated Cotton in Australia but has previously caused significant losses in parts of North and South America. / Под Ржавчиной растений понимается болезнь, вызываемая ржавчинными Грибами. Поражает многие декоративные, лесные и сельскохозяйственные культуры. На надземных органах пустулы, из которых при растрескивании высыпается ржавый порошок – споры Гриба. Урожайность резко снижается.

TROPICAL WORSTEDS = ТРОПИЧЕСКИЙ ГАРУС (или ХХ) – Tropical Worsteds:- 100% worsted. If just called tropical, it can be made up in any fiber or blends of wool and a synthetic. The yarns are very tightly twisted and woven to permit a free circulation of air. It is lightweight and is ideal for summer and tropical wear. It has a clear finish. Wears and tailors very well. Both men's and women's suits and coats. Weave:- plain and rather open weaves.

TROPISM = ТРОПИЗМ – Tropism – Tropic – of a movement by a fixed part of a fixed plant towards or away from a stimulus such as gravity, heat or light, the direction of movement being determined by the direction from which the stimulus originates. A tropism is caused by a positive or negative growth response on the side of the organ nearest to the stimulus relative to the side furthest from the stimulus, and the whole organ then bends away or towards the stumulus respectively. See also Chemotropism, Galvanotropism, Geotropism, Hydrotropism, Phototropism, Rheotropism, Thermotropism, Thigmotropism, and Traumotropism. / Под Тропизмом, от Греческого слова Tróрos, означающее Направление или Поворот, понимается ростовое движение органов растений (корня, стебля, листьев), обусловленное направленным действием какого-либо раздражителя – света (фоторопизм), силы земного тяготения (геотропизм), температуры (термотропизм), прикосновения (гаптотропизм), воды (гидротропизм), кислорода (аэротропизм) и других химических веществ (хемотропизм). В основе тропизма лежит неравномерный рост, вызываемый перераспределением в растении фитогормонов.

TROUBLED ASSET = ПРОБЛЕМАТИЧНЫЙ АКТИВ – In the United States, Troubled Assets under EESA (short for the the Emergency Economic Stabilization Act of 2008 was signed into law on 2008-October-03. The Act authorized the Treasury to spend up to USD700 billion to purchase troubled assets and make capital injections) fall into two broad categories. The first category includes residential or commercial mortgages and any securities, obligations, or other instruments that are based on or related to such mortgages, that in each case were originated or issued on or before 2008-March-14, the purchase of which the Secretary determines promotes financial market stability. The second category gives Treasury the power to declare any other financial instrument to be a troubled asset if the purchase of the instrument is 'necessary' to promote financial market stability.

TROUGH = КОРЫТО (или КОРМУШКА) – Trough is a container for animal feed or water.

TROUSER = БРЮКИ (или ШТАНИНА) – Trouser is the pant (usually used in plural). / брюки ().

TROY OUNCE = ТРОЙСКАЯ УНЦИЯ – The Troy Ounce, traditionally used in pharmacy and jewelry, is 1/12 Troy pound, 480 grains, or about 31.103 476 8 grams. Thus the Troy ounce equals 192/175 = 1.097 14 avoirdupois ounces. This unit is the traditional measure for gold and other precious metals; in particular, the prices of gold and silver quoted in financial markets are the prices per Troy ounce. The Troy ounce is divided into 20 pennyweight or into 8 Troy drams. The Troy ounce is sometimes abbreviated oz t or toz to distinguish it from the more common avoirdupois ounce; in traditional pharmacy it was abbreviated oz ap. See also Ounce. The Troy ounce have been used since the Middle Ages to weigh gold, silver, and other precious metals and stones. The name supposedly derives from the city of Troyes in France, site of one of the major medieval fairs. Also known as Apothecaries' Ounce. Troy weights is a traditional English weight system of great antiquity, apparently in use since long before the Norman conquest of 1066. The system is believed to be named for the French market town of Troyes, where English merchants traded at least as early as the time of Charlemagne (early IX century). he origin of the Troy system is not clear, but a number of scholars believe the dram corresponds to the denarius, a Roman coin that weighed about 60 English grains and (when used as a weight) was also divided into 3 scruples. The Troy system was always the theoretical basis of the traditional English monetary system, in which there were 12 pence (pennies) to the shilling and 20 shillings to the pound. However, in medieval England pennies did not actually weigh a Troy pennyweight, because they were made using the tower weight system (see above) and thus weighed 22.5 grains instead of 24. In 1527, Henry VIII abolished the tower pound and made the Troy system official for coinage; thereafter silver shillings weighed exactly 0.6 Troy ounce. The smaller Troy weights continued in common use in pharmacy and monetary affairs into the early XX century, but the Troy pound was abolished in 1878 to avoid any commercial confusion with the avoirdupois pound. The Troy system is nearly obsolete today, but the prices of precious metals are still quoted by the Troy ounce. The standard weight in which gold is quoted in the international market, weighing 31.103 476 8 g. Named after the old French city of Troyes, where there was an annual trading fair in mediaeval days and where this was a unit of weight. A unit weight, equal to about 1.1 avoirdupois ounce. The Troy ounce is the traditional unit weight for precious metals, believed to be named after a weight used as the annual fair at Troyes in France in the Middle Ages. 1 ounce Troy (oz t) = 480 grains (gr) = 31.103 476 8

grams (g); 1 Metric ton = 32 150.746 6 Troy ounces. The Troy Ounce (ozt) is a unit of mass (imperial system) used to gauge the weight and therefore the price of precious metals (gold, silver, platinum and palladium) and gemstones. 1 Troy ounce = 1.097 142 86 ounces = 31.103 476 8 grams = 0.068 571 428 6 pounds. 1 pound = 14.583 333 3 Troy ounce. Troy Ounce is the traditional unit of weight used for precious metals. The term derives from the French town of Troyes, where this unit was first used in the Middle Ages. One Troy ounce is equal to 1.097 142 86 ounces avoirdupois. In the bullion market, all references to ounces mean Troy ounces. Troy Ounce is the traditional unit of weight used for precious metals, which was attributed to a weight used in Troyes, France, in medieval times. / В Британской Империальной Системе Тройская унция служит мерой массы благородных металлов. 1 Тройская унция = 31.103 5 грамм. Известна также как Аптекарская Унция (Apothecaries' Ounce).

TRQ = TARIFF RATE QUOTA

TRRL = TRANSPORT AND ROAD RESEARCH LABORATORY

TRSA = TERMINAL RADAR SERVICE AREA

TRUCK = КЛОТ (или КЛОТИК) – Truck (maritime term) is the flat circular piece secured on the top of the mast.

TRUCK = ГРУЗОВОЙ АВТОМОБИЛЬ (или ТЯГАЧ, или ГРУЗОВИК) – In the United States 'Truck' is usually reserved for commercial vehicles larger than normal cars, and for pickups and other vehicles having an open load bed. In the United Kingdom and the Republic of Ireland, Lorry is used as well as 'Truck', but only used for the medium and heavy types (see below); i.e. a van, a pickup or an off-road four-wheel drive vehicle such as a Jeep would never be regarded as a lorry in these countries, unlike in the United States. The same applies to the initials 'HGV' (short for Heavy Goods Vehicle) which is basically synonymous with 'Lorry'. The word Truck is also accepted in these countries, and can apply to large vans as well as to lorries (i.e. its scope is slightly wider). The word 'Lorry' is also used in Cambodia, although here it can refer to a train. In Australia and New Zealand, a pickup truck (a relatively small, usually car- or van-derived vehicle, with an open back body) is called a Ute (short for 'Utility') and the word 'Truck' is reserved for larger vehicles. Other languages have loanwords based on these terms, such as the Malay language and the Spanish language in northern Mexico. A commonly understood term for truck across many European countries is camion. Additionally, from the German language the initials 'PKW' (short for Personen Kraft Wagen or Passenger Carrying Vehicle) for a car/van or small truck) and 'LKW' (short for Last Kraft Wagen or cargo/load/freight carrying vehicle) for larger trucks are understood. In US English the word 'Truck' is used in the names of particular types of truck, such as a 'Fire Truck' or 'Tanker Truck'. Note that in British English these would be a 'Fire Engine' and 'Tanker' respectively. Class of automotive vehicles of various sizes and designs for transporting goods. In New Zealand and the United Kingdom, an articulated lorry consisting of a towing engine. Also known as Prime Mover in Australia, and Tractor in the United States. / Тягач – машина для буксировки прицепов, полуприцепов, для установки навесного (сельскохозяйственного, дорожно-строительного и другого) оборудования. Имеет сцепное устройство, вывод тормозного привода к прицепу и полуприцепу и розетку для подключения их систем электропитания. По сравнению с обычными тракторами, автомобилями тягачи часто имеют повышенную мощность двигателя и передаточные отношения в силовой передаче, укороченную базу. Различают тягачи буксирные с тягово-сцепным механизмом и седельные, имеющие вместо грузовой платформы опорно-сцепной механизм для полуприцепов. Для транспортирования неделимых и тяжеловесных грузов применяются балластные тягачи.

TRUCK AND TRAILER = ТЯГАЧ С ПРИЦЕПОМ – In the United Kingdom, Truck And Trailer is a semi-trailer truck. / Грузовой автомобиль характеризуется конструктивной схемой, грузоподъёмностью, видом перевозок, колёсной формулой и компоновкой (расположением кабины по отношению к передней оси). По конструктивной схеме различают одиночные грузовые автомобили и автопоезда (тягач с прицепом, седельный тягач с полуприцепом). По грузоподъёмности грузовые автомобили делят на следующие классы:- особо малой грузоподъёмности (до 0.5 тонн), малой грузоподъёмности (0.5–2 тонн), средней грузоподъёмности (2–5 тонн), большой грузоподъёмности (5–15 тонн), особо большой грузоподъёмности (свыше 15 тонн – так называемый внедорожный автомобиль). По виду перевозок различают универсальные и специализированные (контейнеровозы, самосвалы, фургоны, цистерны и прочие) грузовые автомобили. Наиболее распространённые компоновочные схемы грузовых автомобилей – 'кабина за двигателем' и 'кабина над двигателем'; последняя получает всё большее распространение на грузовых автомобилях большой грузоподъёмности.

TRUCK COUNTRY STATION = ГОСУДАРСТВЕННАЯ ПУТЕЙНАЯ СТАНЦИЯ (или ГОСУДАРСТВЕННАЯ ЖЕЛЕЗНОДОРОЖНАЯ СТАНЦИЯ) – (1) Truck Country Station:- a type of deferred delivery in which the price is set FOB seller's location, and the buyer agrees to pay freight costs to his destination. / Тип отсроченной поставки, в которой цена установлена на условиях ФОБ (FOB) месторасположение продавца, а покупатель соглашается оплатить затраты по фрахту до его пункта назначения.

TRUCK DOOR = ДВЕРЬ (или ПРОЁМ) ДЛЯ ГРУЗОВИКОВ – Truck Door:- an area in the warehouse that is used to accommodate the loading and unloading of trailers.

TRUCKER'S DEPOT = ДЕПО ДАЛЬНОБОЙЩИКА (или ГРУЗОВОЕ ДЕПО) – Trucker's Depot:- where trucks load/unload cargo.

TRUCK FLIGHT = РЕЙС ГРУЗОВИКОМ (или ХХ) – Truck Flight:- cargo that is transported by surface, usually by a dedicated truck, on an airway bill. Carriage between origin and destination may be exclusively by surface or also may feed into airport-to-airport or surface transportation. Also known as Road Feeder Service (RFS).

TRUCK LOAD = ТЕХНИЧЕСКАЯ НОРМА ЗАГРУЗКИ ГРУЗОВИКА – Truck Load is the quantity of freight required to fill a trailer; usually more than 10 000 pounds. / Техническая Норма Загрузки – это согласованное с грузоотправителем количество груза, которое может быть загружено в данный грузовик при наилучшем использовании его грузоподъёмности и вместимости.

TRUE AND FAIR = ИСТИННОЕ И СПРАВЕДЛИВОЕ – True And Fair:- requirements under EU 4th Directive that accounts should present a 'true and fair view' of the state of affairs of a company – for many years has been overriding requirement of UK accounting.

TRUE HIGHS = ИСТИННЫЕ МАКСИМУМЫ – True Highs are defined as the maximum of either the current bar's high or the previous bar's close. / В техническом анализе биржевых рынков, истинные максимумы – это наибольшие из значений либо максимума цены штриха текущего дня, либо цены закрытия штриха предыдущего дня.

TRUE LEAF = НАСТОЯЩИЙ ЛИСТ – True Leaf is any leaf produced after the cotyledons. / Любой лист, пробившийся из семядолей.

TRUE LOWS = ИСТИННЫЕ МИНИМУМЫ – True Lows are defined as the minimum of either the current bar's low or the previous bar's close. / В техническом анализе биржевых рынков, истинные минимумы – это наименьшие из значений либо минимума цены штриха текущего дня, либо цены закрытия штриха предыдущего дня.

TRUE RANGE = ИСТИННЫЙ ДИАПАЗОН – The True Range is the greatest distance of current high to current low, previous close to current high or previous close to current low. / В техническом анализе биржевых рынков, истинный диапазон – это наибольший ценовой интервал между текущим максимумом и текущим минимумом, предыдущим закрытием и текущим максимумом или предыдущим закрытием и текущим минимумом.

TRUE TENSILE STRENGTH = ИСТИННАЯ ПРОЧНОСТЬ НА РАСТЯЖЕНИЕ – True Tensile Strength is the maximum tensile stress expressed in force per unit area of the specimen at the time of rupture. See also Tensile Strength.

TRUE–TO–TYPE WOOL = ВЕРНО (или НАСТОЯЩАЯ)–ДО–ТИПОВОЙ ШЕРСТИ – True-To-Type Wool:- a fleece showing strong breed-specific characteristics.

TRUNCATE = УПРОСТИТЬ (ПРОЦЕДУРУ ИНКАССИРОВАНИЯ) – The term 'Truncate' means to remove an original paper check from the check collection or return process and send to a recipient, in lieu of such original paper check, a substitute check or, by agreement, information relating to the original check (including data taken from the Magnetic Ink Character Recognition (MICR) line of the original check or an electronic image of the original check), whether with or without subsequent delivery of the original paper check.

TRUNCATE = УСЕЧЁННОЕ – Truncate:- ending suddenly as if cut cleanly off.

TRUNCATE = УСЕЧЬ (или УСЕЧЕНИЕ, или УСЕКНОВЕНИЕ, или УРЕЗАНИЕ, или СОКРАЩЕНИЕ, или УКОРОТИТЬ) – Truncate:- cut-off somewhat squarely at the end.

TRUNCATION = УПРОЩЁННАЯ ПРОЦЕДУРА ИНКАССИРОВАНИЯ – Truncation:- shortening of check processing cycle by safekeeping the paid checks instead of returning them to their respective writers (drawers). In the banking, Truncation is a procedure in which the physical movement of paper payment instruments, e.g., paid cheques or credit transfers, within a bank, between banks, or between a bank and its customer is curtailed or eliminated, being replaced, in whole or in part, by electronic records of their content for further processing and transmission. Truncation is a special type of credit processing whereby the original documentation stays at the institute where it was originally presented. In contrast with the traditional processes neither the original document nor a copy is transferred but only the data of the coding line. The information transmitted corresponds to all the requirements of data processing. / Упрощённая процедура инкассирования это особый тип начисления. Упрощённая Процедура или Сокращение:- ускорение процедуры обработки документов; отбрасывание цифр после запятой, без округления. Сокращение этапов обработки документов с целью уменьшения бумажной работы и текущих расходов. Например, сокращение обработки чеков или сохранение (safekeeping) чеков, когда банк сохраняет чеки на микрофильмах в определённой папке.

TRUNK = МАГИСТРАЛЬ – Trunk is a communications channel between two points. Main line – primary line of transport. / коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо). Канал связи между двумя пунктами. Главная линия – первичная линия перевозки. Под Магистралью, от Латинского слова Magistralis, означающее Главный или Руководящий, понимается основная, главная линия в системе какой-нибудь сети, например, водной, железнодорожной, электрической и тому подобной. Магистраль:- (1) Главное направление, основная линия в путях сообщения (водная магистраль, железнодорожная магистраль). (2) Широкая улица большого города с интенсивным транспортным движением. (3) Главный кабель в телеграфной и телефонной связи, ЛЭП магистральной сети. (4) Главная труба в водопроводной, канализационной сети или сети теплоснабжения.

TRUNK = СТВОЛ – Trunk is the main woody stem of a tree supported and directly attached at the lower end to the roots and at the upper end supporting the branches. / непосредственно прикреплённый к низшем концу к корням, а к высшему концу поддерживающий ветви. Под Стволом понимается наиболее мощно развитый (по сравнению с ветвями) многолетний стебель деревьев.

TRUNK = ТОРС (или ХХ) – Trunk:- hose short full breeches reaching halfway down the thigh worn chiefly in the late XVI and early XVII centuries.

TRUNK = ТРУСЫ – Trunk:- (plural) men's shorts worn chiefly for sports. / Трусы:- мужские шорты, одеваемые, главным образом, при занятиях спортом.

TRUNK = ЯЩИК (или КОРОБКА в трепальных машинах, или ТОРС) – Trunk:- double the length of a coverall, from the center of the neckhole at the back to the point of the leg separation on the seat seam. / на слоночном шве.

TRUNKING = ПОДВОЗ КОНТЕЙНЕРА – Trunking is a movement of containers between terminal and carrier's inland facilities. / Перемещение контейнеров между терминалом и наземными сооружениями перевозчика.

TRUNK LINES = МАГИСТРАЛЬНЫЕ ЛИНИИ (или МАГИСТРАЛЬНЫЕ ТРУБОПРОВОДЫ) – Trunk Lines are large-diameter pipelines that transport crude oil, natural gas liquids and refined petroleum products to refineries and petrochemical plants; some trunk lines also transport refined products to consuming areas. Oil pipelines used for the long-distance movements of crude oil, refined oil, or other liquid products Oil pipelines used for the long-distance movements of crude oil, refined oil, or other liquid products. / Под Магистральным Нефтепроводом понимается комплекс сооружений для перекачки сырой нефти на большие расстояния (сотни и тысячи километров) из районов её добычи к местам переработки. Нефтепровод состоит из трубопровода, перекачивающих станций, средств связи и вспомогательных сооружений. Трубопровод для продуктов переработки нефти (бензина, керосина и другого) называют продуктопроводом. Длина отдельных нефтепроводов достигает нескольких тысяч километров (например, нефтепровод Дружба имеет длину свыше 5 000 километров), внутренний диаметр от 200 до 1 220 миллиметров.

TRUSS = (СКВОЗНАЯ) ФЕРМА – Truss is an assembly of members combined to form a rigid framework. All members are interconnected to form triangles. Light frame trusses are made from dimension lumber restrained by toothed plates. Heavy trusses are made for large members restrained by bolts and connectors or glulam rivets. Truss is engineered, pre-fabricated structural component, assembled from wood members and metal connector plates, and designed to carry superimposed dead and live loads. The truss members form a rigid, plane, structural component and are usually assembled such that the members form triangles. Truss is an engineered pre-built component, designed to carry its own weight and added superimposed design loads, that most often functions as a structural support member. A Truss, most often made of wood, employs one or more triangles in its construction. Made from dimension lumber of various sizes, the chords and webs are most often connected together by the use of toothed connector plates which transfer the tensile and shear forces. Metal connector plates are stamped from galvanized steel sheet metal of varying grades and gauge thicknesses to provide different grip values. / болтами или соединителями или клееными заклёпками. В строительной механике под Фермой, от Французского слова Ferme от Латинского слова Firmus, означающее Крепкий или Прочный, понимается геометрически неизменяемая стержневая система, у которой все узлы принимаются при расчёте шарнирными. Металлические, железобетонные, деревянные и комбинированные фермы применяют в покрытиях зданий, мостах и другом. Под Фермой, от Французского слова Ferme, от Латинского слова Firmus, означающее Крепкий или Прочный, понимается

стержневая несущая конструкция покрытия здания, пролётного строения моста, гидротехнического сооружения и так далее. Фермы изготовляются из металла, железобетона, дерева и комбинированных (из нескольких) материалов. В расчётной схеме ферма соединение стержней в узлах обычно условно принимается шарнирным, а нагрузка – передающейся через узлы. Поэтому при расчёте полагают, что в стержнях фермы возникают только продольные (растягивающие или сжимающие) усилия. Основные составные части фермы – пояса (прямолинейные и полигональные) и решётка (простая, сложная и составная). Ферма с прямоугольной решёткой и жёстким соединением стержней, работающих на изгиб, называется безраскосной. Пояса и решётка стальных ферм покрытий обычно изготовляются из двух уголковых профилей, соединённых прокладками. В строительных конструкциях под Связями понимаются соединительные элементы каркаса здания (сооружения), обеспечивающие устойчивость основных (несущих) конструкций каркаса и пространственную жёсткость сооружения в целом. Связи обеспечивают также перераспределение нагрузок, приложенных к отдельным конструкциям, на соседние конструкции или на всё сооружение. Система связей обычно состоит из стержневых конструкций (порталов, ферм) и отдельных стержней (раскосов и других). Под Прогоном понимается конструктивный элемент покрытия здания, укладываемый по основным несущим конструкциям (балкам, фермам и тому подобному). Предназначается главным образом для восприятия нагрузок от кровли.

TRUSS CLIP = XX – Truss Clip is a metal component designed to provide the structural connection of roof or floor trusses to wall plates in order to facilitate resistance to wind uplift forces.

TRUSS FRAME = XX – Truss Frame or Truss-Frame is the product of the structural connection of an upper truss to a lower truss by its integral wall members.

TRUSS LAYOUT = XX – Truss Layout is a technical drawing, produced by the truss engineer, illustrating the precise inter-relation of truss components and their final placement location on the final structural assembly.

TRUSS PLATE = ПЛАСТИНА ФЕРМЫ (или ПЛИТА ФЕРМЫ) – Truss Plate is a light steel plate fastening, intended for use in structural lumber assemblies, that may have integral teeth of various shapes and configurations. / Металлические Зубчатые Пластины (МЗП), используемые в стропильных фермах, обеспечивают чрезвычайно надёжную структурную стойкость. Основой системы является Металлическая Зубчатая Пластина (МЗП), используемая в мире с середины 1950-х. Одобренная в 1964 Протоколом Института Строительной Техники в Берлине (IfBT), МЗП ознаменовала новую эпоху в конструкциях деревянных сооружений. Появление стыковых пластин, с последующем внедрением мощных средств сложнейшего компьютерного проектирования, позволило качественно изменить тысячелетнее использование древесины в строительстве, сделав его максимально технологичным, и сведя извечный перерасход древесины и трудозатрат до минимума. Стандартная МЗП изготавливается из двухсторонней оцинкованной листовой стали со слоем цинка 275 г/м^2, в которой выпрессованы шипы, соединяющие отдельные заготовки. Для запрессовки МЗП в узлах конструкций требуется специальное технологическое оборудование.

TRUSS SYSTEM = СИСТЕМА ФЕРМ – Truss System is an assemblage of floor and/or roof trusses, and/or truss frame components and truss girders, together with all bracing, connections, and other structural elements and all spatial and locational criteria, that, in combination, function to support the dead, live and wind loads applicable to the roof of a structure, with respect to a truss system for the roof, and/or the floor of a structure with respect to a truss system for the floor. A truss system does not include foundations, or any other structural support system.

TRUST = ТРЕСТ – Trust is a group of companies that join forces to create a cartel, or in some cases a monopoly. In the latter sense it is more often used in the United States, e.g., in the term anti-trust law. Combination of several companies to form a single economic unit. In business, Trust is large corporation or group of corporations with a monopoly or near-monopoly on the production or distribution of a particular good or service. The name comes from transferring all or most of the voting stock of a group of corporations to a board of trustees, which would use the voting rights on behalf of the entire group. Such trusts are illegal in the United States. / Комбинация нескольких компаний для формирования единого хозяйствующего субъекта. Под Трестом, от Английского слова Trust, означающее буквально Доверие, понимаются:- (1) форма капиталистических монополий, при которой все объединяющиеся предприятия теряют свою коммерческую и производственную самостоятельность и подчиняются единому управлению. Тресты возникли в Соединённых Штатах Америки (США) в последней трети XIX века и получили там наибольшее распространение. Первым трестом считается объединение, созданное Дьжоном Дэйвисэном Рокэфэлёром (John Davison Rockefeller; 1839–1937) в 1879 под названием Стэндод Оил (Standard Oil) и охватившее подавляющую часть нефтяной промышленности США. Юридически образование треста означает передачу контроля над ранее независимыми предприятиями (в форме контрольного пакета акций или особого доверительного сертификата) группе крупных капиталистов-создателей треста, объединённых в так называемый Доверительный Совет (Board of Trustees). Таким способом осуществляется огромная централизация капитала, позволяющая проводить в рамках объединённых в трест предприятий единую техническую и экономическую политику и одновременно извлекать монопольную прибыль. Путём трестирования в США были созданы многочисленные монополии в важнейших отраслях промышленности:- металлургии, нефтепереработке, сельскохозяйственном машиностроении, сахарной промышленности и так далее. После 1-й Мировой Войны 1914–18 трестирование промышленности получило большое развитие и в капиталистических странах Европы. В это время были созданы:- в Германии – стальной трест Фаайнихтэ Штальвэркэ (Vereinigte Stahlwerke) (в 1926), химический трест И.Ге. Фарбэниндустри (I.G. Farbenindustrie) (в 1925); в Великобритании – химический трест Импириэл Кэмикэл Индэстриз (Imperial Chemical Industries) (в 1926) и другие. В трестах незавершённость процесса централизации капитала выражается в том, что общая прибыль распределяется в соответствии с долевым участием отдельных ранее независимых предприятий, что препятствует созданию общего фонда капиталовложений. В этом отношении трест является предшественником более тесных форм монополистических объединений, таких, как холдиньговая компания, концерн. В развитых странах капитализма для ограничения некоторых видов деятельности трестов и других форм монополий было введено так называемое антитрестовское законодательство. Оно направлено прежде всего против рыночных форм монополизации, особенно против единых отраслевых трестов и картелей. Однако с середины XX века наиболее характерными формами монополизации экономики стали многоотраслевые объединения, в борьбе с которыми антитрестовское законодательство оказывается бессильным. (2) В бывшем Союзе Советских Социалистических Республик (СССР) образование трестов было связано с задачами и целями новой экономической политики (НЭП). Они создавались как хозрасчётные объединения предприятий одной отрасли и основывались на общественной собственности на средства производства. К середине 1923 в системе Высшего Совета Народного Хозяйства (ВСНХ) насчитывалось 477 трестов. Декретом Всероссийского Центрального Исполнительного Комитета (ВЦИК) и Совета Народных Комиссаров (СНК) от 10 Апреля 1923 Трест определялся как ‘государственное промышленное предприятие, которому предоставлена самостоятельность в производстве своих операций согласно утверждённому для них уставу и который действует на началах коммерческого расчёта с целью извлечения прибыли’. С завершением восстановления

народного хозяйства и началом индустриализации менялось положение трестов в системе управления промышленностью. Это отразилось в ‘Положении О Государственных Промышленных Трестах’ от 29 Июня 1927, которое расширяло хозяйственную самостоятельность трестов. Однако в начале 1-й пятилетки (1929–1932) в связи с широким капитальным строительством появились новые крупные промышленные предприятия, с расширением масштабов производства, повысилась роль предприятия в структуре хозяйственного аппарата. В результате изменения системы управления промышленностью в 1929 функции трестов были ограничены. Превратившись в промежуточное, административное звено, они в середине 1-й пятилетки были ликвидированы. (3) В СССР в строительстве трест – основная организационно-производственная единица, например, строительные, монтажные и другие тресты. Под Трестом понимается одна из форм монополистических объединений, в рамках которых участники теряют производственную, коммерческую, а часто и юридическую самостоятельность. Реальная власть в тресте сосредотачивается в руках правления или головной компании. Преимущественное развитие получили в отраслях, производящих однородную продукцию. В современный период тресты встречаются редко. Трест:- в бизнесе, тип корпоративного объединения, связанного с монополией и ограничением торговли, который мог свободно функционировать до введения антитрестовских законов (antitrust laws) в конце XIX – начале XX веков. Название произошло от доверительного голосования (voting trusf), когда небольшое число доверенных лиц голосует большинством акций. Доверительное голосование до сих пор используется как средство облегчения реорганизации испытывающих затруднения компаний. Смотрите также (Investment Company), (Voting Trust Certificate).

TRUST = ТРЕСТ (или ДОВЕРИТЕЛЬНАЯ СОБСТВЕННОСТЬ, или ТРАСТ) – (1) Trust is a property, real or personal, held by one person for the benefit of another. Property right held by one person for the benefit of another. Trust is ancient legal practice where one person (the grantor) transfers the legal title to an asset, called the Principle or Corpus, to another person (the trustee), with specific instructions about how the corpus is to be managed and disposed. It is a sum of money or property placed into the care of a group of trustees, to be managed, although not necessarily invested, for the benefit of an individual or organization such as a charity. In the United States, Trust (Charitable Trust):- a trust a business arrangement in which property (real estate or personal property) is given by one person (the settlor) to be held by another (the trustee) for the purpose of benefiting a specific class of persons or the general public (the charitable purpose). A charitable trust may take the form of a trust, corporation, or unincorporated association, IRC 507. A sum of money or property held and administered by trustees on behalf of a third party. Under UK and US law, both the trustees and the beneficiaries are regarded as being the owners of the assets or property. In law, transfer of property from one person (the Settlor or Donor) to another person (the Trustee), who is to hold the property for the benefit or use of a third person (the Beneficiary). / В законодательстве, передача собственности от одного лица (Учредителя Треста или Донора) другому лицу (Распорядителю или Доверительному Собственнику), которое должно удерживать эту собственность в пользу или для использования третьим лицом (Выгодоприобретателем или Бенефициаром). Под Трестом или Доверительной Собственностью в современном Англо-Американском праве понимается один из наиболее распространённых институтов. Сущность треста заключается в том, что одно лицо – доверительный собственник (trustee) управляет имуществом, переданным ему другим лицом – учредителем треста (settlor). Доверительный собственник выступает перед третьими лицами в качестве собственника имущества и отвечает за управление им перед лицом (лицами), в интересах которого трест учреждён. Трест сложился в праве справедливости, когда чрезмерный формализм общего права затруднял передачу права собственности. В дальнейшем трест стал использоваться в самых различных случаях. Так, в качестве доверительных собственников рассматриваются органы юридические лица, опекун, распоряжающийся имуществом подопечного, администратор наследственного имущества; отношения треста признаются при конкурсном управлении имуществом несостоятельного должника и так далее. В некоторых случаях трест возникает на основании закона, например, в Великобритании в связи со сложностью и длительностью оформления продажи недвижимой собственности продавец с момента заключения договора до окончания оформления считается доверительным собственником. Доверительное Управление Имуществом как вид гражданско-правовых отношений регулируется главой 53 Гражданского Кодекса Российской Федерации (ГК РФ). Согласно Статье 1012 ГК РФ по Договору Доверительного Управления Имуществом одна сторона (Учредитель Управления) передаёт другой стороне (Доверительному Управляющему) на определённый срок имущество в доверительное управление, а другая сторона обязуется осуществлять управление этим имуществом в интересах учредителя управления или указанного им лица (выгодоприобретателя). Передача имущества в доверительное управление не влечёт перехода права собственности на него к доверительному управляющему (Пункт 1 Статьи 1012 ГК РФ). Доверительный управляющий в пределах, установленных договором, осуществляет правомочия собственника и вправе совершать с переданным ему имуществом любые юридические и фактические действия в интересах выгодоприобретателя с обязательным указанием своих полномочий (после наименования доверительного управляющего должна быть проставлена пометка ДУ). Деятельность доверительного управляющего подобна оказанию услуг по управлению. Однако его ответственность за причинение убытков является повышенной по сравнению с иными договорными формами – он обязан компенсировать любые убытки, если не докажет, что они произошли вследствие непреодолимой силы, либо действий учредителя управления или выгодоприобретателя (Ст. 1022 ГК РФ). Ограничена и возможность управляющего извлекать выгоды из договора. Закон закрепляет за ним право на предусмотренное договором вознаграждение, а также на возмещение необходимых расходов, произведенных им при доверительном управлении имуществом, но только за счёт доходов от использования этого имущества (Ст. 1023 ГК РФ). Не может доверительный управляющий и быть выгодоприобретателем по договору (П. 3 Ст. 1015 ГК РФ). Имущество, переданное в доверительное управление, обособляется от другого имущества учредителя управления, а также от имущества доверительного управляющего. Это имущество отражается у доверительного управляющего на отдельном балансе, и по нему ведётся самостоятельный учёт (П. 1 Ст. 1018 ГК РФ). Опека, форма охраны личных и имущественных интересов недееспособных граждан. В бывшем Союзе Советских Социалистических Республик (СССР) устанавливалась законом над детьми до 15 лет, лишившимися родительского попечения, над лицами, которых суд признал недееспособными вследствие душевной болезни или слабоумия. Опека может быть установлена над имуществом подопечных, а также безвестно отсутствующих, в ряде случаев – над наследственным имуществом. Международная Опека, система управления, осуществляемая от имени и под руководством ООН. В бывшем СССР Попечительство, правовая форма защиты личных и имущественных прав и интересов граждан. Устанавливается:- над несовершеннолетними в возрасте от 15 до 18 лет, оставшимися без родительского попечения; над совершеннолетними, которые по состоянию здоровья не могут самостоятельно осуществлять свои права и выполнять свои обязанности; над лицами, ограниченными судом в дееспособности вследствие злоупотребления спиртными напитками или наркотическими веществами. Подопечный. Траст или Доверительная Собственность:- в законодательстве, отношение с доверенным лицом (fiduciary), в рамках которого некоторое лицо, называемое доверенным лицом или попечителем (trustee), получает право на распоряжение собственностью в интересах другого лица, называемого бенефициаром (beneficiary). Лицо, заключающее договор о доверительных отношениях, то есть создающее траст, называется доверителем (creator, settlor, grantor) или донором (donor). Доверительная собственность обозначается термином corpus, trust res, trust fund или trust estate. Она отделяется от любого приносимого ей дохода. Если доверительные отношения заключаются при жизни доверителя, то она называется доверенностью при жизни доверителя (living trust) или inter vivos trust (между живыми). Доверительные отношения, создаваемые в результате

завещания, обозначаются термином завещательный траст (testamentary trust). Доверенное лицо обязано эффективно инвестировать доверенную собственность, и, если особо не установлено каких-либо ограничений, оно имеет право продавать, закладывать или сдавать внаём доверенную собственность по своему усмотрению. Смотрите также (Charitable Remainder Trust), (Clifford Trust), (Investment Trust); (Revisionary Trust), Трастовая Компания (Trust Company), (Trustee In Bankruptcy), и (Trust Indenture Act Of 1939).

(2) In the securities industry of the United Kingdom, a Trust is an investment operation that is managed by a group of trustees on behalf of other people, such as a unit trust. / В индустрии ценных бумаг Соединённого Королевства под Трастом понимается инвестиционная операция, которая управляется группой распорядителей от имени других людей, например, такая как паевой фонд (unit trust).

TRUST ACCOUNT = ТРЕСТОВСКИЙ СЧЁТ (или ТРАСТОВЫЙ СЧЁТ) – Trust Accounts are the accounts on which assets are credited of which the account holder is not the beneficial owner. He manages the account in his name but for the account of a third party. So-called Escrow Accounts are of special significance due to the fact that these accounts can only be opened for certain professional groups, e.g., notaries.

TRUST COMPANY = ТРЕСТОВСКАЯ КОМПАНИЯ (или ТРАСТОВАЯ КОМПАНИЯ) – Trust Company is the financial organization acting as a trustee, fiduciary or agent for individuals or firms and as a custodian for property held in trust, for the execution of wills, administration of trust funds, etc. / Трастовая Компания:- организация, которая, обычно совместно с коммерческим банком, действует в качестве доверенного лица, фидуциара (fiduciary) или агента (agent) – частного лица или коммерческого предприятия для управления доверенным имуществом, наследством, собственностью, находящейся под опекой, при передаче и регистрации акций и для оказания других соответствующих услуг. Трастовые компании также занимаются управлением (инвестированием) завещанных средств (фидуциарные функции) и планированием завещаний. Их деятельность регулируется штатовскими законами.

TRUST DEED = АКТ УЧРЕЖДЕНИЯ ТРЕСТА (или ДОКУМЕНТ О ДОВЕРЕННОЙ СОБСТВЕННОСТИ) – Trust Deed is a legal document that transfers property into the hands of trustees and sets out the terms of the trust. / Юридический документ, который передаёт имущество в руки доверительных собственников и устанавливает положения данной доверительной собственности (траста).

TRUSTED THIRD PARTY = ДОВЕРЕННАЯ ТРЕТЬЯ СТОРОНА – Trusted Third Party (TTP) is an organization, which delivers services to increase the reliability of electronic exchange of information. Such services may include archiving of certificates, time stamping, attribute certification. A Certification Authority (CA) must have the status, credentials and qualifications of a TTP. / Управление по Сертификации (УС; Certification Authority (CA)). Доверенная Третья Сторона – это организация, предоставляющая участникам взаимодействия гарантии своевременности и точности сообщений, обеспечение целостности, подлинности и авторства. В случае возникновения споров доверенная третья сторона предоставляет необходимые факты, подтверждающие совершение действия и ход событий.

TRUSTEE = ДОВЕРИТЕЛЬНЫЙ СОБСТВЕННИК (или ДОВЕРИТЕЛЬНЫЙ УПРАВЛЯЮЩИЙ, или РАСПОРЯДИТЕЛЬ, или ПОПЕЧИТЕЛЬ) – (1) Trustee is a person managing a trust. Person who holds a sum of money or property on trust for a third party. See also Bankruptcy Trustee. In the United States, a Trustee is the person appointed to administer or manage a trust estate. / Лицо, управляющее доверительной собственностью (трастом). Лицо, которое удерживает денежную сумму или имущество по доверительной собственности для третьей стороны. Смотрите также Доверительный Управляющий Конкурсной Массой или Попечитель по Банкротству (Bankruptcy Trustee).

(2) Trustee is a person named by the drawer of a bill of exchange, or by an endorser, who agrees to honor a debt when it comes due. / Лицо, указанное трассантом векселя, или индоссантом, которое согласно удовлетворить обязательство в при наступлении срока.

TRUSTEESHIP COUNCIL = СОВЕТ ПО ОПЕКЕ (или СОВЕТ ПО КУРАЦИИ) – The Trusteeship Council was designed to supervise the government of trust territories and to lead them to self-government or independence. The trusteeship system, like the mandate system under the League of Nations, was established on the premise that colonial territories taken from countries defeated in war should not be annexed by the victorious powers but should be administered by a trust country under international supervision until their future status was determined. Unlike the mandate system, the trusteeship system invited petitions from trust territories on their independence and required periodic international missions to the territories. In 1945 only 12 League of Nations mandates remained:- Nauru, New Guinea, Ruanda-Urundi, Togoland and Cameroon (French administered), Togoland and Cameroon (British administered), the Pacific Islands (Carolines, Marshalls, and Marianas), Western Samoa, South West Africa, Tanganyika, and Palestine. All these mandates became trust territories except South West Africa (now Namibia), which South Africa refused to enter into the trusteeship system. The Trusteeship Council, which met once each year, consisted of states administering trust territories, permanent members of the Security Council that did not administer trust territories, and other UN members elected by the General Assembly. Each member had one vote, and decisions were taken by a simple majority of those present. With the independence of Palau, the last remaining trust territory, in 1994, the council terminated its operations. No longer required to meet annually, the council may meet on the decision of its president or on a request by a majority of its members, by the General Assembly, or by the Security Council. Since 1994 new roles for the council have been proposed, including administering the global commons (e.g., the seabed and outer space) and serving as a forum for minority and indigenous peoples. / Совет по Опеке является одним из главных органов ООН, который контролирует осуществление международной опеки. Несмотря на устранение в двадцатом веке из названий некоторых стран такого слова как ‘колония’, всё равно оставались территории находившиеся под контролем бывших метрополий, но уже в закамуфлированном виде, например под вывеской департаментов и тому подобных. Организация Объединённых Наций (ООН) создаёт под своим руководством международную систему опеки для управления теми территориями, которые могут быть включены в неё последующими индивидуальными соглашениями, и для наблюдения за этими территориями. Эти территории именуются в качестве ‘территорий под опекой’ или ‘подопечных территорий’ (‘trust territories’). Система опеки ООН распространяется на такие территории из нижеперечисленных категорий, которые могут быть включены в неё соответствующими соглашениями об опеке:- (i) территории, ныне находящиеся под мандатом; (ii) территории, которые могут быть отторгнуты от вражеских государств в результате Второй Мировой Войны; и (iii) территории, добровольно включённые в систему опеки государствами, ответственными за их управление. К основным задачам системы опеки, в соответствии с целями ООН, относятся:- (i) укрепление международного мира и безопасности; (ii) способствование политическому, экономическому и социальному прогрессу населения территории под опекой, его прогрессу в области образования и его прогрессивному развитию в направлении к самоуправлению или независимости, как это может оказаться подходящим для специфических условий каждой территории и её народов и имея в виду свободно выраженное желание этих народов, и как это может быть предусмотрено условиями каждого соглашения об опеке; (iii) поощрение уважения прав человека и основных

свобод для всех, без различия расы, пола, языка и религии, и поощрение признания взаимозависимости народов мира; и (iv) обеспечение равного отношения к членам ООН и их гражданам в области социальной, экономической и торговой, а также равного отношения к ним в отправлении правосудия без ущерба для достижения вышеизложенных задач и при условии соблюдения положений Статьи 80 Устава ООН. Для осуществления поставленных целей в Организации Объединённых Наций создан Совет по Опеке. Он является одним из главных органов ООН. Совет по Опеке состоит из следующих членов ООН:- (i) тех членов ООН, которые управляют территориями под опекой; (ii) тех членов ООН из состава 15 постоянных и непостоянных членов Совета Безопасности, которые не управляют территориями под опекой; и (iii) такого числа других членов ООН, избранных Генеральной Ассамблеей (the General Assembly) на трёхгодичный срок, какое может оказаться необходимым для обеспечения того, чтобы общее число членов Совета по Опеке распределялось поровну между членами ООН, управляющими и не управляющими территориями под опекой. Каждый член Совета по Опеке назначает одно особо квалифицированное лицо, которое будет его представителем в Совете по Опеке. Каждый член Совета по Опеке имеет один голос. Решения Совета по Опеке принимаются большинством голосов присутствующих и участвующих в голосовании членов Совета. Заседания Совета по Опеке созываются по мере надобности в соответствии с его собственными Правилами процедуры, которые должны предусматривать созыв заседаний по требованию большинства членов. Генеральная Ассамблея ООН и находящийся под её руководством Совет по Опеке, при выполнении своих функций, уполномочиваются:- (i) рассматривать отчёты, представляемые управляющей властью; (ii) принимать петиции и рассматривать их, консультируясь с управляющей властью; (iii) устраивать периодические посещения соответствующих территорий под опекой в согласованные с управляющей властью сроки; и (iv) предпринимать упомянутые и другие действия в соответствии с условиями соглашений об опеке. Совет по Опеке разрабатывает анкету относительно политического, экономического и социального прогресса населения каждой территории под опекой, а также его прогресса в области образования, а управляющая власть каждой территории под опекой, входящей в компетенцию Генеральной Ассамблеи, представляет последней ежегодные доклады на основе этой анкеты. Совет по Опеке пользуется в соответствующих случаях помощью Экономического и Социального Совета (Economic and Social Council) ООН и специализированных учреждений в отношении вопросов, в которых они соответственно заинтересованы.

TRUSTER = УЧРЕДИТЕЛЬ ТРЕСТА – Truster is a person who creates a trust. A convenient term used in the laws of Scotland. / Учредитель Треста – лицо, которое учреждает трест. Подходящий термин, используемый в законодательстве Шотландии.

TRUST LETTER = ПИСЬМО О ТРЕСТЕ (или ПИСЬМО О ДОВЕРЕННОЙ СОБСТВЕННОСТИ) – Trust Letter is a document that a bank requires when somebody uses goods as security for a loan. / Письмо О Тресте – документ, требуемый банком когда кто-либо использует товары в качестве обеспечения займа.

TRUSTOR = УЧРЕДИТЕЛЬ ТРЕСТА – Trustor is an individual who establishes a trust by giving property to a trustee for the benefit of another. One who deeds his property to a trustee. In the United States, a Trustor is the individual (in some instances, an institution or organization) who creates a trust. The Trustor may also be called the Donor, Grantor, Maker, or Settler. A person who establishes the trust. / Имущество.

TRUST RECEIPT = ТРЕСТОВСКАЯ РАСПИСКА (или ТРАСТОВАЯ РАСПИСКА) – Trust Receipt:- release of merchandise by a bank to a buyer while the bank retains title to the merchandise. The goods are usually obtained for manufacturing or sales purposes. The buyer is obligated to maintain the goods (or the proceeds from their sales) distinct from the remainder of the assets and to hold them ready for repossession by the bank.

TRUTH IN LENDING DISCLOSURES = ДОСТОВЕРНОСТЬ ПРИ РАСКРЫТИИ СУЩНОСТИ ЗАИМСТВОВАНИЯ – In the United States, a Truth In Lending Disclosures is an information sent to customers at periodic intervals regarding finance charges, service charges, minimum payment schedule, customer obligations, and Fair Credit Billing Act requirements for items in dispute.

TRYPTOPHAN = ТРИПТОФАН – Tryptophan:- Chemical Names:- L-tryptophan, Tryptophan, (S)-Tryptophan, L-Tryptophane, 73-22-3, Tryptophane. Molecular Formula:- $C_{11}H_{12}N_2O_2$. Molecular Weight:- 204.22518 g/mol. L-tryptophan is an essential amino acid that is necessary for normal growth in infants and for Nitrogen balance in adults. It is a precursor of Indole Alkaloids in plants. It is a precursor of Serotonin (hence its use as an antidepressant and sleep aid). It can be a precursor to Niacin, albeit inefficiently, in mammals. Tryptophan is the least plentiful of all 22 amino acids and an essential amino acid in humans (provided by food), Tryptophan is found in most proteins and a precursor of serotonin.Tryptophan is converted to 5-hydroxy-tryptophan (5-HTP), converted in turn to serotonin, a neurotransmitter essential in regulating appetite, sleep, mood, and pain. Tryptophan is a natural sedative and present in dairy products, meats, brown rice, fish, and soybeans. L-tryptophan is a white powder with a flat taste. An essential amino acid; occurs in isomeric forms. Tryptophan is a precursor of serotonin. Because CNS depletion of serotonin is considered to be involved in depression, tryptophan has been used in its treatment. Although it has been given alone, evidence of effectiveness is scant andtryptophan has generally been used as adjunctive therapy in depression. It has sometimes been given with pyridoxine and ascorbic acid, which are involved in its metabolism to serotonin. (L)-Tryptophan decreases sleep latency and slightly increases sleeping time without altering qualitative characteristics of polygraphic patterns during sleep in normal subjects. In insomniac patients, it increases sleeping time and decreases both sleep latency and number of awakenings. Beneficial effects were observed when L-tryptophan was administered to 2 patients with myoclonus. In each case suspension of methylcellulose and water containing 1 g of (L)-tryptophan/15 mL was prepared and administered orally at a level of 10 g daily in 5 divided doses. Some patients with rheumatoid arthritis given tryptophan as an antidepressant had reduced rheumatic symptoms, with recurrence when tryptophan was withdrawn. Tryptophan is critical for the production of the body's proteins, enzymes and muscle tissue. It is also essential for the production of niacin, the synthesis of the neurotransmitter serotonin and melatonin. Tryptophan supplements can be used as natural relaxants to help relieve insomnia. Tryptophan can also reduce anxiety and depression and has been shown to reduce the intensity of migraine headaches. Other promising indications include the relief of chronic pain, reduction of impulsivity or mania and the treatment of obsessive or compulsive disorders. Tryptophan also appears to help the immune system and can reduce the risk of cardiac spasms. Tryptophan deficiencies may lead to coronary artery spasms. Tryptophanis used as an essential nutrient in infant formulas and intravenous feeding. Tryptophan is marketed as a prescription drug (Tryptan) for those who do not seem to respond well to conventional antidepressants. It may also be used to treat those afflicted with seasonal affective disorder (a winter-onset depression). Tryptopan serves as the precursor for the synthesis of serotonin (5-hydroxytryptamine, 5-HT) and melatonin (N-acetyl-5-methoxytryptamine). Tryptophan is an amino acid needed for normal growth in infants and for nitrogen balance in adults. It is an essential amino acid, which means your body cannot produce it – you must get it from your diet. Function:- the body uses tryptophan to help make niacin and serotonin. Serotonin is thought to produce healthy sleep and a stable mood. In order for tryptophan in the diet to be changed into niacin, the body needs to have enough:- (i) Iron; (ii) Riboflavin; and (iii) Vitamin B6. Tryptophan can be found in:- Cheese, Chicken, Eggs, Fish, Milk, Nuts, Peanut butter, Peanuts, Pumpkin seeds, Sesame seeds, Soy, Tofu, and Turkey. See also Protein. / В осенне-зимний период радуйте себя природными антидепрессантами, продуктами, содержащими триптофан, углеводы. Содержание триптофана в продуктах питания (в миллиграммах (мг) на 100 граммов (г) продукта:- (1) в мясных продуктах:- баранина 210, говядина 220, индейка 330,

кролик 330, курица I категории 290, курица II категории 330, печень говяжья 240, свинина 190, телятина 250, яйца куриные 200; (2) в рыбе и морепродуктах:- икра красная 960, икра чёрная 910, кальмары 320, карп 180, лосось 220, минтай 210, окунь морской 170, палтус 180, сельдь Атлантическая 250, скумбрия 160, ставрида 300, судак 180, треска 210; (3) в молочных продуктах:- кефир 40, молоко 40, сыр Голландский 790, сыр плавленый 500, творог жирный 210, творог нежирный 180; (4) в орехах и семечках:- арахис 750, кешью 600, миндаль 630, орехи кедровые 420, семечки подсолнечника 300, фисташки 300; (5) в крупах и бобовых:- бобы соевые 600, горох 260, греча 180, крупа овсяная 160, крупа перловая 100, крупа ячневая 120, пшено 170, фасоль 260; а также грибы 130, курага 150, макаронные изделия 130, хлеб пшеничный 100, шоколад 200. Смотрите также Протеин или Белок (Protein). Триптофан – незаменимая аминокислота, значит, для его пополнения есть единственный источник – пища. Триптофан в организме человека непосредственно преобразуется в серотонин – соединение, которое вызывает умственное расслабление и создаёт ощущение эмоционального благополучия. Серотонин, в свою очередь, является предшественником мелатонина, регулирующего биологические часы. У людей, находящихся в состоянии депрессии, в крови мало как серотонина, так и триптофана. Их низкое содержание в организме вызывает депрессию, тревожность, бессонницу, расстройства внимания, гиперактивность, мигрень, головные боли, напряжение. Страшно представить, что бы произошло, если бы в нашем организме не было триптофана. Тогда мы бы, наверно, страдали бесконечной бессонницей, чрезмерно толстели или, наоборот, худели до неузнаваемости, были бы раздражительными, агрессивными и беспокойными… Но, к счастью, это всего лишь страшные мысли. На самом же деле в нашем организме есть триптофан, который является незаменимым помощником. Только нельзя забывать, что он постоянно должен поступать с пищей. Если Вы постоянно устаёте, чувствуете себя раздражённым или даже несчастным, если у Вас есть нарушения сна, то вполне вероятно, что в Вашем организме не хватает триптофана. Триптофан действует как натуральный антидепрессант, помогает естественным путём вызвать сон, уменьшить беспокойство и напряжение. Секрет действия триптофана заключается в том, что он воздействует на химию мозга. Попадая из крови в мозг, триптофан даёт команду выработки серотонина. Как было сказано выше, серотонин ответственен за хорошее настроение, оказывает расслабляющее и успокаивающее действие, повышает работоспособность. Врачи давно признали, что биологические добавки, содержащие триптофан, гораздо лучше справляются с депрессией и бессонницей, чем лекарственные препараты. Многие знают, что если на ночь выпить молока, то спится намного лучше. Это происходит оттого, что в молоке содержится триптофан. Триптофан также помогает и против других эмоциональных нарушений, например, предменструальной тревоги. Вредные привычки это, конечно, плохо, но если уж так случилось, что Вы курите или употребляете алкоголь, Вам на помощь придёт триптофан. Он нейтрализует действие никотина, содержащегося в сигаретном дыме, помогает организму справиться с его пагубным воздействием на организм. Триптофан уменьшает некоторые симптомы биохимических изменений в организме, вызванных алкоголем. Кроме того, триптофан препятствует развитию алкоголизма. Удивительно, но маленькая аминокислота способна защищать огромный человеческий организм. Что контролирует аппетит человека и, следовательно, его вес? Конечно, триптофан. Он снижает тягу к пище, особенно углеводной, способствует снижению массы тела, нормализует аппетит при булимии и анорексии. Триптофан снимает депрессивное состояние и устраняет поверхностный сон, часто сопутствующий диетам. Он помогает быстрее возникнуть чувству насыщения, что ведёт к потреблению меньшего количества калорий и помогает снизить вес. Триптофан является предшественником витамина B3 (ниацина), способного сдерживать первичное образование триглицеридов (компонентов жира), что препятствует развитию ожирения. Для поддержания хорошей формы или корректировки веса очень важно, что триптофан снижает аппетит. Это происходит под воздействием серотонина, образующегося из триптофана, в результате чего улучшается настроение, усиливается мотивация для продолжения диеты. Одним словом, триптофан рождает у нас желание поддерживать хорошую форму и употреблять пищу в правильных количествах. Триптофан, кроме перечисленных выше свойств, способен уменьшать болевую чувствительность, стимулирует выработку гормона роста, который необходим для увеличения мышечной массы и уменьшения массы жира. Триптофан играет определённую роль в лечении различных расстройств питания, алкогольной зависимости, синдрома Дауна, агрессивного поведения, синдрома гиперактивности/дефицита внимания, шизофрении, участвует в выработке ниацина (витамина B3). Вам необходим триптофан, если у Вас:- Депрессия; Постоянно плохое настроение; Сезонные функциональные расстройства; Состояние тревоги и другие эмоциональные нарушения (в том числе при синдроме предменструального напряжения); Невроз навязчивых состояний; Расстройства приема пищи (в том числе булимия, переедание, некоторые формы ожирения); Повышенная раздражительность и агрессивность; Мигрень и головные боли других типов; Повышенная чувствительность к боли; Алкогольная зависимость; Расстройства сна; и Синдром хронической усталости. Как ни странно это звучит, чтобы в мозг попало больше триптофана, нужно есть то, что почти целиком состоит из углеводов,- такие, например, продукты, содержащие сложные углеводы, как хлеб, рис, паста или чистые углеводы:- столовый сахар или фруктозу. При использовании для расслабления нужно принимать в течение дня между приёмами пищи и запивать соком или водой, но не с молоком или другими продуктами, содержащими белок. Лучше всего принимать триптофан с витаминами группы B. Всегда принимайте добавки перед едой, поскольку, чтобы проявить свое действие, триптофан должен соединиться с системой транспорта аминокислот, которая доставит его в мозг. Триптофан хорошо адсорбируется в желудочно-кишечном тракте. Для того чтобы заместить израсходованную при метаболизме белка аминокислоту, здоровому взрослому требуется 3.5 мг на кг веса. Из всех незаменимых аминокислот триптофан меньше всего представлен в пище – из-за того, что уровень триптофана в пище слабо соотносится с другими аминокислотами. Разовые дозы свыше 2 г не рекомендуются, хотя успешные тесты Исследовательского Центра по Психиатрии в Мэриленде показали, что нет опасности привыкания к триптофану или его передозировки (благодаря тому, что триптофан является естественной частью нашего тела, организму, чтобы использовать его, не нужно изменять никаких функций, как это бывает с лекарствами). Побочные действия при приёме Триптофана не выявлены. Больным астмой, по всей вероятности, следует избегать триптофана, поскольку любой предшественник серотонина может усиливать затруднения дыхания, а высокие дозы способны вызывать заметное чувство утомления после упражнений. Применение при беременности и в период лактации (грудного вскармливания) не рекомендуется. Лекарственное взаимодействие триптофана с другими лекарственными средствами не выявлено. Приём аминокислот без включения триптофана у женщин вызывает усиление симптомов, связанных с менструацией (ПМС), а у мужчин в 30% случаев усиливает раздражительность и агрессивность. Лучшими натуральными источниками триптофана являются продукты, содержащие большое количество белков. Их содержат, в частности, грибы, овёс, бананы, сушёные финики, кунжут, кедровый орех, молоко, йогурт, творог. Триптофан присутствует в большинстве растительных белков, особенно им богаты соевые бобы. Очень малое количество содержится в кукурузе. Одним из лучших источников триптофана является арахис, причём как цельные орехи, так и арахисовое масло. Мясо и рыба содержат триптофан, однако неравномерно:- белки соединительной ткани (коллаген, эластин, желатин) не содержат триптофан. Триптофан в изобилии содержится во всех видах мяса, особенно, в свинине, утке и дичи. Однако, добавки являются гораздо более эффективным источником этой аминокислоты, чем пища.

T–SHIRT = Т–ОБРАЗНАЯ СОРОЧКА (или ФУТБОЛКА, или ТЕННИСКА) – T-Shirt is a knitted cotton undershirt with short sleeves that may be worn for sports or work without an outer garment. T-Shirt is a collarless short-sleeved or sleeveless usually cotton undershirt; also, an outer shirt of similar design. A T-Shirt (T Shirt or Tee) is a style of shirt. A T-shirt's defining characteristic is the T shape made with the body and sleeves. It is normally associated with short sleeves, a round neck line, and no collar. However, it may also include long sleeves, buttons, collars, or v-necks. T-shirts are typically made of cotton fibers (sometimes others), knitted together in a Jersey stitch that gives a T-shirt its distinctive soft texture. The majority of modern T-shirts have a body that is made from a continuously woven tube, so the torso has no side seams. This is accomplished with special weaving machines called Circular Looms, which produce seamless fabric for tube tops, stockings, and the like. Conventional stitching is used for the waist band, neck band, sleeves and to close the shoulders. The manufacture of T-shirts has become highly automated, and may include fabric cutting by laser or water jet. T-shirt fashions include many styles for both men and women, and for all age groups, including baby, youth, teen, adult and elderly sizes. The T-shirt evolved from undergarments used in the XIX century, through cutting the one-piece 'union suit' underwear into separate top and bottom garments, with the top long enough to tuck under the waistband of the bottoms. T-shirts, with and without buttons, were adopted by miners and stevedores during the late XIX century as a convenient covering for hot environments. T-shirts, as a slip-on garment without buttons, originally became popular in the United States when they were issued by the US Navy during or following the Spanish American War. These were a crew-necked, short-sleeved, white cotton undershirt to be worn under a uniform. It became common for sailors and Marines in work parties, the early submarines, and tropical climates to remove their uniform 'jacket', wearing (and soiling) only the undershirt. US Merchant Marine sailor in 1944. Named the T-shirt due to the shape of the garment's outline, it soon became popular as a bottom layer of clothing for workers in various industries, including agriculture. The T-shirt was easily fitted, easily cleaned, and inexpensive, and for this reason it became the shirt of choice for young boys. Boys' shirts were made in various colors and patterns. By the Great Depression, the T-shirt was often the default garment to be worn when doing farm or ranch chores, as well as other times when modesty called for a torso covering but conditions called for lightweight fabrics. T-shirts were originally worn as undershirts. Now T-shirts are worn frequently as the only piece of clothing on the top half of the body, other than possibly a bra or an undershirt (vest). T-shirts have also become a medium for self-expression and advertising, with any imaginable combination of words, art and photographs on display. A T-shirt typically extends to the waist. Variants of the T-shirt, like the tank top, crew neck, A-shirt (with the nickname 'Wife Beater'), muscle shirt, scoop neck, and V-neck have been developed. Hip hop fashion calls for 'tall-T' T-shirts which may extend down to the knees. A 1990s trend in women's clothing involved tight-fitting 'cropped' T-shirts short enough to reveal the midriff. Another popular trend is wearing a short-sleeved T-shirt of a contrasting color over a long-sleeved T-shirt. This is known as 'Layering'. T-shirts that are tight to the body are called fitted, tailored or 'baby doll' t-shirts.

T–TEST = ТЕСТ ТИ. – T-Test is a statistical test criterion in comparing two samples of data believed to be normally distributed. A T-Test is any statistical hypothesis test in which the test statistic follows a Student's t distribution if the null hypothesis is supported. It is most commonly applied when the test statistic would follow a normal distribution if the value of a scaling term in the test statistic were known. When the scaling term is unknown and is replaced by an estimate based on the data, the test statistic (under certain conditions) follows a Student's t distribution. The t-statistic was introduced in 1908 by William Sealy Gosset, a chemist working for the Guinness brewery in Dublin, Ireland ('Student' was his pen name). Gosset had been hired due to Claude Guinness's policy of recruiting the best graduates from Oxford and Cambridge to apply biochemistry and statistics to Guinness's industrial processes. Gosset devised the t-test as a cheap way to monitor the quality of stout. He published the test in Biometrika in 1908, but was forced to use a pen name by his employer, who regarded the fact that they were using statistics as a trade secret. In fact, Gosset's identity was known to fellow statisticians. / Вильэм Сили Госсэт (William Sealy Gosset). Клёд Гинэс (Claude Guinness).

TUB = БАРКА (или ВАННА, или ЧАН) – In textile processing, Tub is a large container used for holding liquids. See also Beck.

TUBE = ВАЛИК (или КОПС, или ПАТРОН, или ПОЧАТОК) – Tube is a cylindrical yarn package formed for winding on a tube. / Паковка пряжи цилиндрической формы, формируемая посредством наматывания пряжи на патрон. Под Початком понимается паковка с пряжей или кручёной нитью, намотанной на патрон или шпулю и имеющей форму цилиндра, верхние и нижние основания которого представляют усечённый конус, что позволяет производить сматывание нити с неподвижного початка вдоль его оси.

TUBE = ПАТРОН (или ТУБА) – Tubes for cross-wound packages in winding and twisting. A cylindrical holder or bobbin used as a core for a cylindrical yarn package. Tube is another name for a bobbin, cylindrical in shape and used as base of core about which filaments or yarn are wound either snugly and compactly, or loosely as the occasion demands. / Одно из названий бобины цилиндрической формы, которая используется в качестве основы для сердцевины, на которую либо клубочком и компактно, либо со слабым натяжением в зависимости от того, как это требуется, наматываются нити или пряжа.

TUBE = ТРУБА (или ХХ) – Tube is an article of clothing shaped like a tube, as tube top or tube socks.

TUBE = ТРУБКА (или ТРУБОЧКА) – Tube is a narrow flower structure formed by fusion of the tepals. / узкая структура цветка, формируемая слиянием листочков околоцветника. Например, пыльниковая трубка у цветков.

TUBER = КЛУБЕНЬ – Tuber is a thick, fleshy underground modified root or stem section used for storage of food or water, as in a potato. Tuber is a short thickened underground stem. Tubers:- as relates to seed potatoes, potatoes produced under field conditions. / Клубень – толстый, мясистый (fleshy) подземный модифицированный корень или секция стебля, используемая для хранения пищи или воды, как у картофеля. Под Клубнем понимается видоизменённый побег растения с утолщённым стеблем и недоразвитыми листьями. Надземные клубни у кольраби, некоторых орхидей, подземные – у земляной груши, картофеля. В клубне отлагаются главным образом крахмал и другие углеводы. Может служить для вегетативного размножения. Под Клубнеплодами понимается группа растений (батат, картофель, топинамбур и другие), у которых на подземных стеблях или боковых корнях образуются клубни, используемые в пищу человеком, на корм скоту, для переработки. Клубень:- вздутый подземный стебель или корень, место хранения питательных веществ во время периода покоя.

TUBERCLE = БУГОРОК (или ТУБЕРКУЛ, или КЛУБЕНЁК) – Tubercle is small, rounded prominence or knob-like protusion from the surface. In Cactaceae a roughly pyrimidal protrusion from the stem surface, with an areole at or near its summit. Hence:- Adj. tuberculate. Tubercles are small tubers produced in leaf axils of leaf bud cuttings. Tubercle:- any small, rounded projection. / У Кактусовых (Cactaceae) . в пазухах листьев . Клубенёк (Латинское слово Tuberculum, означающее Бугорок); возникающий под влиянием клубеньковых бактерий.

TUBERCULATE = БУГОРЧАТОЕ (или КЛУБЕНЬКОВОЕ) – Tuberculate:- having tubercles. / Клубеньковое (Латинский – Nodularis).

TUBEROUS = КЛУБНЕВОЕ – Tuberous:- bearing a tuber. / клубень (tuber).

TUBEROUS ROOT = КЛУБНЕВИДНЫЙ КОРЕНЬ (или КЛУБНЕВОЙ КОРЕНЬ) – Tuberous Root is a generally undistended fibrous root system with thickened fleshy sections scattered along its length. Not a taproot or caudex. / Клубневидный или Клубневой Корень – мясистый (fleshy). Не главный корень (taproot) или каудекс.

TUBING = РУКАВ (или ТРУБА, или ИЗДЕЛИЕ РУКАВНОЙ ФОРМЫ) – Tubing is a woven, knit, or braided fabric of cylindrical form, having a width of over 4 inches.

TUBULAR = ТРУБЧАТОЕ (или ТУБУЛЯРНОЕ) – Tubular:- in the form of a hollow cylinder. / в форме полого цилиндра. Дудчатый Лист (на Латинском языке – Folium Fistulosum).

TUBULAR FABRIC = ТРУБЧАТАЯ ТКАНЬ (или РУКАВНАЯ ТКАНЬ, или МЕШКОВАЯ ТКАНЬ, или КРУГЛОЕ ТРИКОТАЖНОЕ ПОЛОТНО) – Tubular Fabric is a fabric woven or knit in a tube form with no seams, such as seamless pillowcases, some knit underwear fabrics, and seamless hosiery. See also Circular-Knit Fabric. / и бесшовные чулочно-носочные изделия (seamless hosiery). Смотрите также Плосковязаная Ткань (Circular-Knit Fabric).

TUCKED–IN SELVEDGES = ЗАКЛАДНЫЕ КРОМКИ – Tucked-In Selvedges:- a special hooked needle driven by a cam produces, after cutting, the insertion of the protruding thread end into the subsequent shed, thus forming a stronger edge. Tucked-in selvedge can be formed by two different methods. With most common method the projecting weft tail is tucked in the form of a hairpin to a predetermined length (10–15 mm) into the next weave shed. This gives a firm and neat selvedge. A 2/1 or 3/1 rib with two ends per heald and 2 fold yarns with about 20% finer than the body yarn number give excellent results. Sulzer Bros. were the pioneer to introduce this type of tucked-in selvedge on their projectile machines but now-a-days it is also used on rapier and air-jet weaving machines. This system is generally used for light to middle weight fabrics, when weave and fabric density permit. There are also available tuck-in selvedge motions which are entirely controlled by pneumatic or mixed pneumatic and mechanical devices. See also Fused Selvedges, Leno Selvedges, Melt Selvedges, and Selvedge. / Закладная Кромка:- проложенная в зев нить утка обрезается, а её конец закладывается кромкообразователем в следующий зев.

TUCKING = ЗАВЁРТЫВАНИЕ (или ЗАСТРАЧИВАНИЕ) – Tucking:- this is the result of an unintentional tucking in the knitted fabric. This is also called the Bird's Eye Defect. Knitted fabric defect, and namely:- stitch defect. Defect Name:- Tucking (Unwanted). Defect Type:- warp lines, vertical lines. Fabric Type:- Single Knit Fabrics. Description:- Tucking (unwanted):- This is the result of malfunctioning needle. Tucking occurs when a needle retains one loop and takes on one or more additional loops, and then casts all of them together. It becomes a defect when it is unintentional. Severity:- Major.

TUCKING DEFECT = ДЕФЕКТ ЗАВЁРТЫВАНИЯ (или ПОРОК ЗАСТРАЧИВАНИЯ) – Tucking Defect:- in knitted fabrics, one or more unwanted tuck loops. / в вязаных тканях, одна или более нежелательных хх петель.

TUCK LOOP = ЗАПРЕССОВАННАЯ ПЕТЛЯ (или ДВОЙНАЯ ПЕТЛЯ, или ПЕТЛЯ ВСКЛАДКУ, или ПЕТЛЯ ВСБОРКУ) – Tuck Loop is a knitted stitch when a needle receives a new yarn without losing its old loop.

TUCKS = СКЛАДКИ (или СБОРКИ) – Cotton Wash Fabric:- a Tuck fabric is a single cloth and is made by using two or more warps, is generally composed of all cotton, cotton and silk, and all silk, and can be made on any loom having either a dobby or a Jacquard attachment, and single or double box, double box looms, of course, giving great scope for filling patterns. A tuck effect in a cloth is a perfect pleat running across the cloth from one selvage to the other and was used extensively a few years ago in making fancy bosoms for men's outing or neglige shirts and ladies' waisting, very elaborate effects being produced by weaving ground cloth in colors either harmonizing with or contrasting to that of the tuck. Two different numbers of filling are used in this fabric, namely, a fine one for the plain ground or flat part of the cloth, and a coarse number for the tuck as the tuck is a filling effect, and the coarse filling causing it to stand out more prominently from the ground fabric than would be the case if fine numbers of filling were used to form the whole fabric. In making a common tuck effect two beams are necessary, also 10 harness or heddle shafts. The top beam containing the tuck warp is drawn in on the 2, 4, 6, 8^{th} harnesses, and the bottom beam, containing ground warp, is drawn on 1, 3, 5, 7^{th} harnesses, the other two harnesses to work independently for selvage, plain weave being used all the time. The harness or head chain Is pegged to work all the harnesses plain weave at the same time for whatever length of plain ground is desired in the cloth being woven. 'For example, if you want 40 picks plain ground cloth before weaving' the tuck, simply peg the chain plain weave on all harnesses for 40 picks. Then to form the tuck peg the chain so as to work only tuck harnesses for plain weave, for number picks necessary to give length of tuck desired, the ground harnesses being at rest. While the tuck harnesses are working, the take-up motion is temporarily dispensed with by coupling the take-up finger to a jack in the head motion by running a strap over the top of the loom and down the side. After having woven the desired number of picks to form the tuck, as the loom turns over, all the harnesses are set working plain weave, and as the first pick of the chain operates the head motion, the take-up finger drops, the take-up motion is again in gear, and the reed beats in, the pick binding the turn and throwing it out from the ground fabric. This fabric is generally made to finish from 2% to 3% ounces and 27 inches wide. / Два различных числа уточин . Жакяр (Jacquard).

TUCK STITCH = СТЕЖОК ВСКЛАДКУ (или СТЕЖОК ВСБОРКУ) – Tuck Stitch is a variation of a basic stitch in weft knitting to make a knobby, bumpy, knitted texture. Unknitted loops are slipped from one needle to another. On the following row, the unknitted loops are knitted as regular stitches. Tuck Stitch is a knitting stitch made when a needle receives a new yarn without losing its old loop.

TUDO = THIOUREA DIOXIDE

TUFT = ПУЧОК (или БОРОДКА, или КЛОК) – Tuft is:- (1) a cluster of soft yarns drawn through a fabric and projecting from the surface in the form of cut yarns or loops. (2) The portion of pile-like material that comprises a tufted fabric or carpet. See also Tufted Carpet, and Tufted Fabric. Tuft is a bunch of yarns or threads forced through a quilt, mattress, or upholstery to secure the stuffing. See also Quilt.

TUFTED = ПЛОТНОКУСТОВОЕ (или ПУЧКОВАТОЕ) – Tufted:- having many short, crowded branches all arising from about the same point.

TUFTED CARPET = СТЁГАНЫЙ КОВЁР – Tufted Carpet is a carpet produced by a tufting machine instead of a loom. It is an outgrowth of hand-tufted bedspreads. Today, broadloom tufting machines produce over 90% of all domestic carpeting. Tufting machines are essentially multineedle sewing machines that push the pile yarns through a primary backing fabric and hold them in place to form loops as the needles are withdrawn. The loops are then either released for loop-pile carpets or cut for cut-pile carpets. The pile yarns may be either predyed or uncolored, in which case, the greige carpet is then piece-dyed or printed. In either case, a latex or other binding agent is applied to the backstitch to lock the tufts in place and to secure the secondary backing fabric. Formerly, all carpets were woven, either by hand or machine. The significantly greater productivity of tufting has revolutionized the carpet industry and made soft floor coverings available to the mass market. Tufted Carpet is a carpet made by needling pile yarns into a previously woven backing of Jute or Cotton. / Стёганые Ковры представляют собой ворс, пристёганный к основе.

TUFTED FABRIC = СТЁГАНАЯ ТКАНЬ – Tufted Fabric is the cotton sheeting, lightweight duck, or other fabric decorated with fluffy tufts of multiple-ply, soft-twist cotton yarns or manufactured fiber yarns closely arranged in continuous lines or spaced at intervals to produce the type of fabric called Candlewick. The tufts are inserted and cut by machine in previously woven fabric or are woven in by the loom and afterwards cut to form the tufts. They have a chenille-like softness and bulk and are erroneously called Chenille. Patterns vary from simple straight lines and elaborate designs to completely covered materials resembling long pile fabrics. The may be white, solid colored, or multicolored. Tufted fabrics are used for bedspreads, bath mats, and robes, etc. Tufted Fabric is a fabric ornamented with soft, fluffy, slackly twisted ply yarns (usually cotton). Most tufts are inserted by needles into a woven fabric, such as unbleached muslin, textured cotton, and rayon plain-weave cloth. When tufts are spaced (as coin dots), a bedspread is called Candlewick. / пучок или клок или ворсовый узелок (tuft). Свечной Фитиль (Candlewick).

TUFTING = ВОРСОВЫЙ УЗЕЛОК (или ПУЧОК, или КЛОК) – Tufting is a brush-like button of clipped cotton yarn that appears at regular intervals on mattresses. Also, the most common method for making rugs. Groups of yarns are forced through a backing fabric. The yarns are held in place permanently when the underside of the rug is coated, often with liquid latex.

TUG = БУКСИР (или БУКСИРНОЕ СУДНО) – Tug:- ocean-going ships cannot reach port basins, which are sometimes narrow and winding, without the help of tugs to assist them in turning, reversing and docking and casting off manoeuvres. The tugs each have an engine output of approximately 1 600 kW (2 400 PS) and a bollard pull of 30 to 45 tons. In the port of Hamburg, Germany, for example, harbour tugs are no longer driven by conventional propellers at the stern but instead are equipped with a drive system located in the aft section and controlled either by rotors (Voith-Schneider system) or 360 degree rotatable propellers. This allows surges in all directions. Tug is a vessel which tows another vessel, the other vessel being termed the 'Tow'. Tug is a small vessel designed to tow or push large ships or barges. Tugs have powerful diesel engines and are essential to docks and ports to maneuver large ships into their berths. In the United States, pusher tugs are also used to push enormous trains of barges on the rivers and inland waterways of the US Oceangoing salvage tugs provide assistance to ships in distress and engage in such work as towing drilling rigs and oil production platforms. See also Towboat. / Океанские суда самостоятельно не могут заходить в портовые бассейны, которые бывают иногда узкими и извилистыми. Им требуется поддержка буксиров для оказания помощи при разворотах, движении задним ходом и доковании (постановки в док) и выполнении манёвров. Каждый буксир оснащается двигателем, имеющим мощность приблизительно 1 600 кВт (2 400 лс (лошадиных сил)) и силу тяги от 30 до 45 тонн. В порту Гамбурга, Германия, например, портовые (рейдовые) буксиры больше не оснащаются общепризнанными винтами сзади, а вместо этого они оборудуются системой привода, располагаемой в кормовой части и действующей либо с помощью турбин (в системах Фойт-Шнайдэра (Voith-Schneider system)), либо винтами, способными поворачиваться на 360 градусов. Это нововведение позволяет постепенно продвигаться во всех направлениях. Судно, которое буксирует другое судно, называемое буксируемым судном (tow). Небольшое судно, предназначенное для буксировки или толкания крупных судов или барж. Буксиры оснащаются мощными дизельными двигателями и они востребованы доками и портами для осуществления маневрирования крупных судов при постановке в отводимые им места стоянки. В Соединённых Штатах Америки буксиры толкачи используются также для буксировки методом толкания огромных составов барж при движении по рекам и внутренним водным путям морских спасательных буксиров США с целью обеспечения помощи судам, терпящим бедствие и привлечения к такой работе как буксировка буровых установок и нефтедобывающих платформ. В судоходстве под Буксиром, от Голландского слова Boegseren, означающее Тянуть, понимается самоходное судно для вождения (буксировки) несамоходных судов, плотов и других плавающих сооружений. По району плавания различают морские, озёрные, рейдовые и речные буксирные суда. По назначению буксирные суда подразделяют на:- (i) буксировщики, осуществляющие вождение судов на буксирном тросе; (ii) кантовщики, оказывающие помощь судам при швартовке к причалам порта; (iii) спасатели – для оказания помощи аварийным судам в открытом море и их буксировки в порт-убежище; и (iv) толкачи – для вождения судов толканием. Толкач или Буксир-Толкач – буксирное судно, приспособленное для вождения несамоходных судов впереди себя (толканием). С буксируемым судном или группой судов толкач скрепляется носовым сцепным устройством. Толкание более эффективно, чем буксировка на тросе за кормой (если нет волнения), так как буксируемые суда не тормозятся струёй от винта буксирного судна. Для улучшения видимости толкачи имеют в носовой части высокую рулевую рубку.

TUG BOAT = БУКСИРНЫЙ КАТЕР (или БУКСИР, или БУКСИРНОЕ СУДНО) – Tug Boat (maritime term) is a small vessel fitted for towing. Tug Boats are boats used to guide and tow vessels in/out of port. / Катера, используемые для направления (ориентирования) и буксировки судов в/из акватории порта.

TUILLE = БЕДРЕННАЯ ПЛАСТИНА – Tuille is one of the hinged plates before the thigh in plate armor. / часть доспехов древнего воина.

TUL = TULSA INTERNATIONAL AIRPORT

TULLE = ТЮЛЬ – Tulle is a soft, fine, transparent silk net. Formerly made only of silk, tulle is now made of nylon or rayon, and is a favorite for evening dresses and bridal veils. See also Net. Tulle:- a sheer often stiffened silk, rayon, cotton or nylon net used chiefly for veils or ballet costumes. Derived name from Tulle, France. First made by machine in 1768. Has a hexagonal mesh and is stiff. Guaze, knotted, leno, made on a lace machine. It is difficult to launder. Comes is white and colors, and is very cool, dressy, and delicate. It is a stately type of fabric when used for formal wear, and weddings. It is also used for ballet costumes and wedding veils. Tulle is a lightweight, extremely fine, machine-made netting, usually with a hexagon shaped mesh effect. End-uses include dance or ballet costumes and veils. Tulle and Netting is a lightweight, very fine netting, which is often starched. It can be made of various fibers, including silk, nylon and rayon. Tulle is most commonly used for veils, gowns (particularly wedding gowns) and ballet tutus. / Найлан[ТЗ] (Nylon[TM]). Сетка (Netting). Под Тюлем, от Французского слова Tulle, понимается очень тонкая шёлковая сетка для вуалеток и отделки. Тюль – ткань или прозрачное плетение из тонких ниток в виде равномерных мелких круглых ячеек. Сочетание ячеек, заполненных плетением и незаполненных, образует узор, чаще всего геометрический или растительный орнамент. Тюль был наиболее модным в эпоху ампир и использовался для пошива лёгких платьев-туник.

TUNGRO = ТУНГРО – Tungro is a viral disease transmitted by Green (Nephotettix Spp.) and Zigzag Leafhoppers (Recilia Dorsalis). The diseased plants are characterized by stunting and reduced tillering. The leaf color ranges from light yellow to orange-yellow. Yellowing usually starts from the tips of the leaves. The panicles are often not fully exserted. The grains are usually covered with dark brown blotches.

TUNIC = ТУНИКА (или МУНДИР, или КИТЕЛЬ) – Tunic is a blouse-like garment that falls to the hips or below and often is gathered at the waist or belted. Tunic is a simple slip-on garment made with or without sleeves and usually knee-length or longer, belted at the waist and worn as an under or outer garment by men and women of ancient Greece and Rome; surcoat; a long usually plain close-fitting jacket with high collar worn especially as part of a uniform; tunicle; a short overskirt; a hip-length or longer blouse or jacket.

TUNICLE = ТЮНИКЛ (или ХХ) – Tunicle is a short vestment worn by a subdeacon over the alb during mass and by a bishop under the dalmatic at pontifical ceremonies.

TUNNELING = ПРОХОДКА ТУННЕЛЯ – Tunneling is a making a passage through plant material by the feeding of larvae.

TUNNEL TEST = ТУННЕЛЬНОЕ ИСПЫТАНИЕ – Tunnel Test is a test for the flammability of floor coverings in which a sample is placed on the ceiling of a tunnel of specific dimensions and ignited under controlled conditions to determine the extent to which it will burn. Also called Steiner Tunnel Test. See also Flammability Tests. / Туннельный метод испытания на горение. Смотрите также Тесты На Воспламеняемость (Flammability Tests).

TUQUE = ТЮК (или ВЯЗАНАЯ ШАПОЧКА) – Tuque is a warm knitted usually pointed stocking cap. / .

TURBAN = ТЮРБАН (или ЧАЛМА) – Turban is a fabric that is twisted and draped around the head to form a hat. It is an adaptation of an oriental headdress. Turban is a headdress worn chiefly in countries of the eastern Mediterranean and southern Asia especially by Muslims and made of a cap around which is wound a long cloth; a headdress resembling a Muslim turban, specifically a woman's close-fitting hat without a brim. / Тюрбан (на Персидском языке) – Чалма; мужской и женский головной убор в виде куска ткани, обмотанного вокруг головы, распространённый среди ряда народов Северной Африки, Аравийского полуострова, Индии и Азии. Тюрбан обычно наматывается на тюбетейку, феску или шапку. Для его изготовления обычно требуется 6–8 метров ткани, но на некоторые виды тюрбанов уходит до 20 метров материи.

TURBIDITY = МУТНОСТЬ (или ПОМУТНЕНИЕ) – Turbidity is a reduction of transparency of a specimen due to the presence of particulate matter. Turbidity is the degree of opacity of a fluid. Turbidity is the decrease in optical transparency of a solution because of the presence of particulate matter. / Под Мутностью понимается способность оптически неоднородной среды рассеивать проходящий сквозь неё свет (смотрите Мутные Среды). Количественной характеристикой мутности служит Коэффициент Экстинкции (Ослабления), определяемый по уравнению:- $t = (1 / l) \ln (I_0 / I)$, где I_0 и I – интенсивности светового луча соответственно до и после прохождения через слой среды толщиной l. Мутность определяют методами нефелометрии и турбидиметрии.

TURBINATE = ИМЕЮЩЕЕ ФОРМУ ПЕРЕВЁРНУТОГО КОНУСА (или КУБАРЕВИДНОЕ) – Turbinate:- shaped like an inverted cone or top. / Кубаревидное о раковине.

TURBINE = ТУРБИНА – Turbine is a machine for generating rotary mechanical power from the energy of a stream of fluid (such as water, steam, or hot gas). Turbines convert the kinetic energy of fluids to mechanical energy through the principles of impulse and reaction, or a mixture of the two. / Под Турбиной, от Французского Turbine, от Латинского слова Turbo, родительный падеж Turbinis, означающее Вихрь или Вращение С Большой Скоростью), понимается первичный двигатель с чисто вращательным движением рабочего органа – ротора и непрерывным рабочим процессом, преобразующий в механическую работу кинетическую энергию подводимого рабочего тела – пара, газа или воды. Стационарные Паровые и Газовые Турбины применяют для привода генераторов электрического тока (Турбогенераторы), центробежных компрессоров и воздуходувок (Турбокомпрессоры, Турбовоздуходувки), питательных, топливных и масляных насосов (Турбонасосы). Транспортные паровые и газовые турбины используют в качестве главных судовых двигателей. Газовые Турбины используются также в качестве Авиационных Двигателей (Турбовинтовые и Турбореактивные Двигатели) и в отдельных случаях – на локомотивах (Газотурбовозы) и специальных автомобилях, требующих особо мощных двигателей. Гидравлические Турбины строят только в стационарном исполнении для привода тихоходных генераторов электрического тока (Гидрогенераторы) на гидроэлектрических станциях. К 1976 мощность паровых турбин достигла 1 300 МегаВатт (МВт), газовых – 100 МВт, гидравлических – более 600 МВт в агрегате. Благодаря хорошей экономичности, компактности, надёжности и возможности осуществить большую единичную мощность турбины практически вытеснили поршневые паровые машины из современной мировой энергетики. Смотрите также Газовая Турбина, Гидротурбина, и Паровая Турбина. Под Турбиной, от Французского слова Turbine, от Латинского слова Turbo, означающее Вихрь или Вращение с Большой Скоростью, понимается первичный двигатель с вращательным движением рабочего органа – ротора и непрерывным рабочим процессом, преобразующий в механическую работу кинетическую энергию подводимого рабочего тела – газа или жидкости (например, воды), пара; лопаточная машина. Рабочее тело поступает через направляющие аппараты на лопастную решётку и приводит ротор во вращение. Стационарные паровые турбины и газовые турбины широко применяют для привода генераторов электрического тока (турбогенераторы), центробежных компрессоров и воздуходувок (турбокомпрессоры, турбовоздуходувки), питательных топливных и масляных насосов (турбонасосы). Транспортные паровые и газовые турбины используют в качестве судовых двигателей, соединяя их с гребенными валами через понижающую зубчатую передачу – редуктор (турбозубчатые агрегаты) для получения оптимальной частоты вращения гребных винтов. Газовые турбины широко используются также в авиационных двигателях (турбовинтовые двигатели и турбореактивные двигатели) и в отдельных случаях – на локомотивах (газотурбовозы) и специальных автомобилях, требующих особо мощных двигателей. Гидравлические турбины строят в стационарном исполнении для привода тихоходных генераторов электрического тока (гидрогенераторы) на гидроэлектрических станциях. Благодаря хорошей экономичности, компактности, надёжности и возможности получать большую единичную мощность. Турбины практически вытеснили поршневые паровые машины из современной мировой энергетики. В Турбине, струя рабочего тела воздействует на лопатки, закреплённые по окружности ротора, и приводит ротор в движение. По принципу действия различают:- Активные и Реактивные Турбины, по конструкции – Одно- и Многоступенчатые Турбины. Паровые и газовые турбины подразделяются на:- Стационарные (для привода генераторов электрического тока, компрессоров и так далее) и Транспортные Турбины. Гидравлические турбины строят только стационарными и используют на ГЭС для привода гидрогенераторов. Мощность паровых турбин достигает 1 300 МВт, газовых – 100 МВт, гидравлических – более 600 МВт.

TURBINE OIL = ТУРБИННОЕ МАСЛО – Turbine Oil is a top-quality rust- and oxidation-inhibited (R&O) oil that meets the rigid requirements traditionally imposed on steam-turbine lubrication. Quality turbine oils are also distinguished by good demulsibility, a requisite of effective oil-water separation. Turbine oils are widely used in other exacting applications for which long service life and dependable lubrication are mandatory. Such compressors, hydraulic systems, gear drives, and other equipment. Turbine oils can also

be used as heat transfer fluids in open systems, where oxidation stability is of primary importance. / Под Турбинными Маслами понимается группа смазочных масел, используемых для смазки подшипников и вспомогательных механизмов паровых и водяных турбин, турбонасосов, турбокомпрессорных машин (воздушных, газовых и холодильных), а также в качестве смазывающей и рабочей жидкости в различных промышленных механизмах с циркуляционными системами. Турбинные масла – глубокоочищенные дистиллятные нефтяные масла из малосернистых беспарафиновых или сернистых парафиновых нефтей с добавками, состоящими из комплекса антиокислительных, антикоррозионных, деэмульгирующих, антипенных, в отдельных случаях антиизносных присадок. Характеризуются высокой устойчивостью против окисления, хорошими антикоррозийными и деэмульгирующими свойствами, малой вспениваемостью. Турбинные масла с вязкостью при 50 °C $20–23·10^{-6}$ $м^2$/сек (20–23 сантиСтокс (сСт)) применяются в быстроходных турбоагрегатах (3 000 оборотов в минуту (об/мин) и выше), а с вязкостью $28–48·10^{-6}$ $м^2$/сек (28–48 сСт) и более – в тихоходных и мощных, в том числе судовых, турбоагрегатах (турборедукторных установках). Для систем регулирования мощных паровых турбин находят применение синтетические турбинные масла на основе триксиленилфосфата. Их преимущество – высокая огнестойкость. Однако они дороги и обладают некоторой токсичностью.

TURBO FUEL = ТУРБИННОЕ ТОПЛИВО – Turbo Fuel is kerosene with a special degree of refining, with a freezing point below that of common kerosene. It is used in reaction motors and turbo propellers. See also Kerosene. / Турбинное Топливо – это керосин со особой степенью очистки, имеющий температуру замерзания ниже, чем у обычного керосина. Он используется реакционными двигателями и турбинными движителями или турбовинтами. Смотрите также Керосин (Kerosene).

TURBULENT FLOW = ТУРБУЛЕНТНОЕ ТЕЧЕНИЕ (или ТУРБУЛЕНТНЫЙ ПОТОК) – Turbulent Flow is a flow situation in which the fluid particles move in a random manner. Turbulent Flow is a flow in which the velocity at any point varies on an erratic basic. It occurs when flow velocity exceeds a limiting value or when tube configuration irregularities preclude laminar flow. See also Laminar Flow. / Под Турбулентным Течением, от Латинского слова Turbulentus, означающее Беспорядочный или Бурный), понимается форма течения жидкости или газа, при которой их элементы совершают неупорядоченные, неустановившиеся движения по сложным траекториям, что приводит к интенсивному перемешиванию между слоями движущихся жидкости или газа (смотрите Турбулентность). Наиболее детально изучены турбулентные течения в трубах, каналах, пограничных слоях около обтекаемых жидкостью или газом твёрдых тел, а также так называемые Свободные Турбулентные Течения – струи, следы за движущимися относительно жидкости или газа твёрдыми телами и зоны перемешивания между потоками разной скорости, не разделёнными какими-либо твёрдыми стенками. Турбулентные течения отличаются от соответствующих Ламинарных Течений как своей сложной внутренней структурой, так и распределением осреднённой скорости по сечению потока и интегральными характеристиками – зависимостью средней по сечению или максимальной скорости, расхода, а также коэффициента сопротивления от Числа Рейнольдса Re. Профиль осреднённой скорости турбулентного течения в трубах или каналах отличается от параболического профиля соответствующего ламинарного течения более быстрым возрастанием скорости у стенок и меньшей кривизной в центральной части течения. За исключением тонкого слоя около стенки профиль скорости описывается логарифмическим законом (то есть скорость линейно зависит от логарифма расстояния до стенки). Коэффициент сопротивления $\lambda = 8\tau_w / \rho v^2_{cp}$ (где τ_w – напряжение трения на стенке, ρ – плотность жидкости, v_{cp} – её скорость, средняя по сечению потока) связан с Re соотношением:- $\lambda^{-1/2} = (1 / x \sqrt{8})\ln(\lambda^{1/2} Re) + B$, где x и B – числовые постоянные. В отличие от Ламинарных Пограничных Слоёв, Турбулентный Пограничный Слой обычно имеет отчётливую границу, беспорядочно колеблющуюся со временем (в пределах 0.4 δ–1.2 δ, где δ – расстояние от стенки, на котором осреднённая скорость равна 0.99 v, а v – скорость вне пограничного слоя). Профиль осреднённой скорости в пристенной части турбулентного пограничного слоя описывается логарифмическим законом, а во внешней части скорость растёт с удалением от стенки быстрее, чем по логарифмическому закону. Зависимость λ от Re здесь имеет вид, аналогичный указанному выше. Струи, следы и зоны перемешивания обладают приблизительно автомодельностью:- в каждом сечении x = const любого из этих турбулентных течений на не слишком малых расстояниях x от начального сечения можно ввести такие масштабы длины и скорости L(x) и v(x), что безразмерные статистические характеристики гидродинамических полей (в частности, профили осреднённой скорости), полученные при применении этих масштабов, будут одинаковыми во всех сечениях. В случае свободных турбулентных течений область пространства, занятая завихренным турбулентным течением, в каждый момент времени имеет чёткую, но очень неправильную форму границ, вне которых течение потенциально. Зона перемежающейся турбулентности оказывается здесь значительно более широкой, чем в пограничных слоях.

TURBULENT FLOW SAMPLER = ПРОБООТБОРНИК ТУРБУЛЕНТНОГО ТЕЧЕНИЯ – Turbulent Flow Sampler is a sampler that contains a flow path in which turbulence is induced in the main stream by abruptly changing the direction of the fluid.

TURGID = ТУРГЕСЦЕНТНОЕ (или НАБУХШЕЕ, или РАЗДУТОЕ, или РАЗБУХШЕЕ) – Turgid:- swollen by some internal force, usually by fluid uptake.

TURGOR = ТУРГОР – Turgor:- (Latin:- turgescere – to swell) Inner pressure, distension of cells. / Под Тургором, от позднелатинского слова Turgor, означающее Вздутие или Наполнение, понимается внутреннее гидростатическое давление в живой клетке, вызывающее напряжение клеточной оболочки. У животных тургор клеток обычно невысок, у растительных клеток тургорное давление поддерживает листья и стебли (у травянистых растений) в вертикальном положении, придаёт растениям прочность и устойчивость. Тургор – показатель оводнённости и состояния водного режима растений. Снижением тургора сопровождаются процессы автолиза, увядания и старения клеток.

TURGOR PRESSURE = ТУРГОРНОЕ ДАВЛЕНИЕ – Turgor Pressure:- outward force exerted on a cell wall by water taken up into the cell by osmosis. See also Wall Pressure. / Под Тургором, от позднелатинского слова Turgor, означающее Вздутие или Наполнение, понимается внутреннее гидростатическое давление в живой клетке, вызывающее напряжение клеточной оболочки. У животных тургор клеток обычно невысок, у растительных клеток тургорное давление поддерживает листья и стебли (у травянистых растений) в вертикальном положении, придаёт растениям прочность и устойчивость. Тургор – показатель оводнённости и состояния водного режима растений. Снижением тургора сопровождаются процессы автолиза, увядания и старения клеток.

TURN = ОБОРОТ – Turn is the distance parallel to the axis of a yarn or rope in which a strand makes one complete spiral. See also Twist.

TURNAROUND = ПЛАНОВОЕ ЗАКРЫТИЕ – A Turnaround is a planned, periodic shut down (total or partial) of a refinery process unit or plant to perform maintenance, overhaul and repair operations and to inspect, test and replace process materials and equipment. Here are some key facts:- (i) turnarounds allow for necessary maintenance and upkeep of operating units and are needed to maintain safe and efficient operations; (ii) turnarounds are scheduled at least 1–2 years in advance and do not necessarily focus on the same operating units; (iii) in assessing whether to delay a turnaround, a refiner has to include the opportunity cost of a possible unplanned shutdown resulting from the decision to delay the turnaround; (iv) depending on the process unit and the amount of maintenance

needed, the length of the turnaround can vary from 1 week to 4 weeks or more; (v) a major turnaround usually will involve the crude unit or the catalytic cracking unit and will result in a more significant decrease in the utilization rate than a minor turnaround that may involve units such as the alkylation unit, isomerization unit or sulfur plant; (vi) not every unit is impacted during every turnaround. For example, the industry average is about 4 years between turnarounds catalytic cracking units; (vii) a turnaround is not necessary to enable a refinery to shift from gasoline mode to distillate mode. However, if a turnaround is planned, it is possible to take steps, such as catalyst upgrades, that could improve the distillate yields; and (viii) in general, the less often units are started up and taken down, the better (safer) it is since refinery incidents are more likely to occur during these occasions. A refinery or petrochemical plant is said to be 'in turnaround' when it is taken out of service of maintenance, usually planned. A refinery Turnaround is a major maintenance and inspection event during which large sections of the plant are systematically shut down and equipment is opened, cleaned, and inspected for integrity. A turnaround focuses on checking and repairing equipment that can't be worked on while the plant is operating. The temporary shut down also provides an opportunity to integrate new or upgraded equipment into the existing system – a task that cannot be accomplished at any other time. For example, at Ergon's (Ergon Refining, Inc) West Virginia, Arkansas, and Mississippi refineries, a turnaround is scheduled every one to four years. This massive overhaul demands two to six weeks of concentrated effort. A turnaround can involve anywhere from 200 to 2 000 people working in 12 to 16 hour shifts; work is conducted 24 hours a day, seven days a week, until the process is complete. Personnel inspect every area of the refinery, from operators running robotic video cameras through sewer lines 20 feet underground to reliability engineers inspecting the tip of a 220-foot flare stack from a basket suspended from a crane. 'To an outsider, a turnaround looks like an ant mound', said Meeks. 'In reality, a turnaround is a well-planned, carefully orchestrated event that demands the highest level of organization and performance from every area of the plant'. / Эргон Рифайнин, Инк. (Ergon Refining, Inc.). (Meeks). О 'плановом закрытии' нефтеперегонного или нефтехимического завода говорят, когда завод закрывается на техническое обслуживание, как правило, в соответствии с определённым графиком.

TURNAROUND = РАЗВОРОТ – (1) In water transportation, Turn-Around is the time it takes between the arrival of a vessel and its departure.

(2) In trucking, Turn-Around is the time it takes a trucker to enter and exit a terminal.

(3) Turnaround is a situation where a company, or its stock, shows a significant trend reversal. / Разворот:- благоприятный поворот в деятельности компании, на рынке или в экономике в целом. Инвесторы, вкладывающие средства на фондовом рынке, считают, что компания, показывающая невысокие результаты, может значительно увеличить свои доходы и получить значительную прибыль от благоприятного поворота событий.

TURNAROUND TIME = ВРЕМЯ НА ОБОРОТ – Turnaround Time is the time interval between harvesting of the existing crop and planting of the next crop in a cropping sequence.

TURNAROUND TIME = ВРЕМЯ НА ОБОРОТ (В ПОРТУ) – In water transportation, Turnaround Time is the time it takes between the arrival of a vessel and its departure. Time taken for a vessel to arrive in port, unload, reload and depart. Also refers to the time taken for a truck to arrive in port and deliver or receive cargo. / В перевозке груза водным транспортом, срок, составляющий временной диапазон между прибытием судна и его отбытием. Время, затрачиваемое судном на прибытие в порт, выгрузку, перезагрузку и отбытие. Также относится к времени, отводимому грузовику для прибытия в порт и поставки или получения груза.

TURNBUCKLE = СТЯЖНАЯ МУФТА (или СТЯЖНАЯ ГАЙКА) – Turnbuckle:- tightening elements made up of two threaded rods, a threaded barrel and a lever, usually in the form of a ratchet. Turnbuckles are the preferred tensioning method when securing loads with chains.

TURN–BUCKLE = ТАЛРЕП – Turn-Buckle (maritime term):- a metal appliance consisting of a thread and screw capable of being set up or slacked back and used for setting up on rigging.

TURNED–OVER EDGE = СВЁРНУТАЯ ОКРАЙКА – Turned-Over Edge is a curled selvage. See also Curled Selvage.

TURNER = ДОШЕДШЕЕ (или ОБОРАЧИВАТЕЛЬ, или ВОРОШИТЕЛЬ) – Turner:- banana that is becoming ripe to eat.

TURN IN ALL STANDING = ЛОЖИТЬСЯ СПАТЬ НЕ РАЗДЕВАЯСЬ – Turn In All Standing (maritime term):- go to bed without undressing.

TURNING = УКЛАДКА (или ОБОРОТ, или ПОВОРОТ, или ВЫВОРАЧИВАНИЕ, или ПЕРЕЛИЦОВКА) – Turning is the reversing of two or more pieces of material that are seamed together for pressing or topstitching.

TURNING BASIN = БАССЕЙН ДЛЯ РАЗВОРОТА – Turning Basin is a basin found in deepwater ports for turning vessels for operational purposes for berth-side work, or to send the vessel back out to open sea. With vessels measuring as large as 900 ft, the Port of Savannah's largest turning basin measures 1 500 ft x 1 700 ft. The Port of Brunswick's turning basin is 1 200 ft in diameter.

TURNKEY = ПОД КЛЮЧ – Turnkey:- a method of construction whereby the contractor assumes total responsibility from design through completion of the project. Situation, especially in the computer and construction industries, in which a supplier provides a complete customized package to a customer. / Под Ключ:- любой проект, который строится или производится компанией, которая в итоге передаёт его в полностью завершённом виде заказчику. Пользователю остаётся, так сказать, лишь 'повернуть ключ' и начать работу. Этот термин используется по отношению к проектам на строительство жилья, которые после завершения строительства передаются управляющим этой собственности. Существуют также компьютерные системы, сдаваемые под ключ. В этом случае пользователь не должен обладать специальными знаниями в области компьютеров и может немедленно начинать ими пользоваться после установки.

TURNOVER = ОБОРОТ – In the United Kingdom, gross value of all sales made by a company during the accounting period. Also known as Revenues in the United States. Turnover:- money earned by your business before deducting any business expenses. It includes receipts in cask or in kind for goods sold or work done, commission, fees receivable, tips, insurance proceeds for loss of stock and profits, and so on. It does not include Business StartUp Allowance (or Enterprise Allowance). Also, do not include amounts received from the sale of capital items, that is assets which are of lasting use to the business, such as business premises, plant, machinery and vehicles. Turnover should be included in your accounts when it is earned, even if you do not receive the money until later. / Оборот (капитала):- В финансовой сфере:- (1) указывает, сколько раз данные активы могли окупиться в течение отчётного периода, обычно одного года. Смотрите также (Accounts Receivable Turnover), и (Inventory Takeover). (2) Отношение годового объёма продаж компании к её чистой стоимости или собственным средствам (net worth). Показывает темп роста компании без дополнительных инвестиций за определённый период времени. Смотрите также (Capital Turnover). Оборот (капитала):- В Великобритании:- годовой объём продаж. В промышленности:- совокупный объём безработицы, делённый на число работников, заменённых в течение данного периода времени. В индустрии ценных бумаг:- объём акций, с которыми совершались операции, выраженный как процент (доля) от совокупного объёма (стоимости) акций, котирующихся на бирже в

течение данного периода времени, обычно один день или один год. То же самое отношение можно рассчитывать и по отдельным ценным бумагам и портфелям вложений частных лиц и организаций инвесторов.

TURNOVER RATE = СТАВКА ОБОРАЧИВАЕМОСТИ (или УРОВЕНЬ ОБОРАЧИВАЕМОСТИ) – Turnover Rate is the volume of shares traded in a year as a percentage of total shares listed on an exchange, outstanding for an individual issue or held in an institutional portfolio.

TURNOVER TAX = НАЛОГ С ОБОРОТА – A Turnover Tax is similar to VAT (short for the value-added tax), with the difference that it taxes intermediate and possibly capital goods. It is an indirect tax, typically on an ad valorem basis, applicable to a production process or stage. For example, when manufacturing activity is completed, a tax may be charged on some companies. Sales tax occurs when merchandise has been sold. By Country:- In South Africa, the turnover tax is a simple tax on the gross income of small businesses. Businesses that elect to pay the turnover tax are exempt from VAT. Turnover tax is at a very low rate compared to most taxes but is without any deductions. In the Republic of Ireland, turnover tax was introduced in 1963 and followed by wholesale tax in 1966. Both were replaced in 1972 by VAT, in preparation for Ireland's accession to the European Communities, which prohibited both taxes. Turnover Tax:- treated like the Ad valorem except for one major difference – this tax is computed on major products and services at the end of the manufacturing process. In South Africa, Turnover Tax is a simplified system aimed at making it easier for micro business to meet their tax obligations. The turnover tax system replaces Income Tax, VAT, Provisional Tax, Capital Gains Tax and Dividends Tax for micro businesses with a qualifying annual turnover of R 1 million or less. A micro business that is registered for turnover tax can, however, elect to remain in the VAT system (from 01 March 2012). Turnover tax is worked out by applying a tax rate to the taxable turnover of a micro business. The rates are applicable for any year of assessment ending during the period of 12 months ending on 28 February 2018:- (i) Turnover (R) – 0–335 000, Rate Of Tax (R) – 0%; (ii) Turnover (R) – 335 001–500 000, Rate Of Tax (R) – 1% of each R1 above 335 000; (iii) Turnover (R) – 500 001–750 000, Rate Of Tax (R) – 1 650 +2% of the amount above 500 000; and (iv) Turnover (R) – 750 001 and above, Rate Of Tax (R) – 6 650 + 3% of the amount above 750 000. Table 1:- Turnover Tax Rates for any year of assessment ending during the period of 12 months ending on 28 February 2018. Who Is It For? Micro businesses with an annual turnover of R 1 million or less. The following taxpayers may qualify:- (i) Individuals (sole proprietors); (ii) Partnerships; (iii) Close corporations; (iv) Companies; and (v) Co-operatives. How To Register? To register for Turnover Tax:- (i) Do a quick test to see if you quality for turnover tax; and (ii) For more information on how to register. How To Pay? There are three payment dates:- (i) 1st payment is in the middle of the tax year on the last business day of August, i.e. 29 August 2014 on the TT02 – Payment Advice for Turnover Tax; (ii) 2nd payment is at the end of the tax year on the last business day of February, i.e. 27 February 2015 on the TT02 – Payment Advice for Turnover Tax; and (iii) Final payment is after the annual TT03 – Turnover Tax Return is submitted and processed. The submission of TT03 turnover tax returns is in line with the submission of the annual income tax returns, between 01 July and 31 January of the following year. What Records Should Be Kept? A big advantage of turnover tax is the reduced record-keeping requirements. The following records must be kept:- (i) Records of all amounts received; (ii) Records of dividends declared; and (iii) A list of each asset with a cost price of more than R10 000 at the end of the year of assessment as well as of liabilities exceeding R10 000. To take account of the typical expenses incurred by a micro business and to eliminate the need for detailed recordkeeping of deductible tax expenses, the turnover tax rates are significantly lower than the tax rates under the standard tax system. In the United Kingdom, Turnover Tax is a tax on total transactions or gross sales usually applicable to all sales of commodities by manufacturers, wholesalers, and retailers. / Налог С Оборота, форма мобилизации доходов в государственный бюджет. При капитализме налог с оборота является основной формой косвенного обложения, выступает как надбавка к цене товара:- в Великобритании, Франции и Федеральной Республике Германия (ФРГ) – это налог на добавленную стоимость, в Соединённых Штатах Америки (США) – налог с продаж. В бывшем Союзе Советских Социалистических Республик (СССР) и других социалистических странах налог с оборота – часть денежных накоплений (чистого дохода) социалистических предприятий (объединений), непосредственно обращаемая в доход государства. Через налог с оборота государство мобилизует значительные денежные ресурсы на цели расширенного социалистического воспроизводства и удовлетворение других общегосударственных потребностей. Налог с оборота используется также как важный экономический инструмент регулирования рентабельности продукции в интересах укрепления хозрасчёта и основной источник сбалансирования республиканских и местных бюджетов. По своему экономическому содержанию налог с оборота не является налогом, так как не служит надбавкой к цене товара и не представляет собой вычета из заработной платы рабочих и служащих и других доходов трудящихся. Ему присущи лишь внешние признаки налогового платежа (обязательность платежа, фиксированный размер, уплата в установленные сроки). Разграничение денежных накоплений предприятий на прибыль и налог с оборота и принципы их взимания в бюджет были установлены налоговой реформой 1930. Налог с оборота уплачивают хозрасчётные государственные и кооперативные (кроме колхозов) предприятия и организации, а также предприятия общественных организаций. Основная часть налога с оборота реализуется в отраслях лёгкой и пищевой промышленности. Высокая доля поступлений налога с оборота в этих отраслях обусловлена тем, что наряду со стоимостью прибавочного продукта, созданного здесь, таким образом реализуется часть стоимости прибавочного продукта, произведённого и в других отраслях материального производства:- тяжёлой промышленности, строительстве и сельском хозяйстве. По многим товарам народного потребления налог с оборота не уплачивается (печёный хлеб и хлебобулочные изделия, мясо и изделия из мяса, колбасные изделия, сыры, молоко, молочнокислые продукты, сливочное масло, консервы, овощи, фрукты, медикаменты, книжная продукция и многие другие товары). В тяжёлой промышленности налог с оборота взимается в нефтяной и газовой отраслях, в электроэнергетике и по отдельным видам продукции машиностроения. Налог с оборота взимается:- в виде разницы между розничными и оптовыми ценами предприятия за вычетом торговых скидок; по твёрдым ставкам (в Рублях) с единицы объёма продукции (с 1 тонны (т) нефтепродуктов, хлебопродуктов и ферментированного табака, с 1 тысячи кубических метров (тыс. $м^3$) природного и попутного газа и другого); в процентах к обороту (по всем товарам, на которые не установлены оптовые цены предприятий). Поступления налога с оборота в виде разницы в ценах занимают основное место, их удельный вес повысился с 74% в 1964 до 80% в 1972, а доля налога с оборота, взимаемого по ставкам в процентах к выручке, снизилась за этот период с 12 до 5.8%. Налог с оборота играет важную роль в обеспечении государственного бюджета устойчивыми, равномерно поступающими платежами. Абсолютные размеры его поступления в государственый бюджет систематически возрастают:- в 1960 – 31.3 миллиардов Рублей, в 1965 – 38.7 миллиардов Рублей, в 1972 – 55.6 миллиардов Рублей, хотя удельный вес в общей сумме денежных накоплений предприятий и в доходах государственного бюджета падает соответственно (в %):- 48.0, 46.5, 37.8 и 40.7, 37.8, 31.7. Снижение удельного веса налога с оборота обусловлено повышением роли прибыли как главной формы денежных накоплений и основного источника, формирования доходов государственного бюджета. В целях стимулирования роста производства товаров народного потребления, расширения их ассортимента и улучшения качества предприятиям-изготовителям предоставляются льготы, некоторые из этих предприятий полностью освобождаются от налога с оборота по реализуемым товарам.

TURN RATE = СТАВКА ОБОРАЧИВАЕМОСТИ (или ТЕМП ОБОРАЧИВАЕМОСТИ) – Turn Rate is the amount of times inventory will be replenished in entirety during any specified period (generally one year). This is a relative measurement based on a snapshot as most products will not be completely depleted and replenished but, rather perpetually restocked.

TURNROW = РАЗВОРОТНЫЙ РЯД (или ПРОХОДНОЙ РЯД) – Turnrow is the unplanted space that allows machinery to be turned at each end of a field. / Разворотный Ряд представляет собой незасеянное пространство, позволяющее технике разворачиваться в каждом конце поля.

TURNROW (TURN STRIP, HEAD LAND) = РАЗВОРОТНЫЙ РЯД (или ПРОХОДНОЙ РЯД) (ПОВОРОТНАЯ ПОЛОСА, ГОЛОВНАЯ (или НАПРАВЛЯЕМАЯ) ЗЕМЛЯ) – Turnrow (turn strip, head land) is the land at the margin of a field on which the plow or other equipment may be turned. / Разворотный Ряд (Turnrow) (поворотная полоса (turn strip), головная (или направляемая) земля (head land)):- земля на краю поля, на которой могут развернуться плуг или иное оборудование. Поворотная Полоса:- для выполнения поворота агрегата по концам гона проводят контрольные линии, проезжая которые тракторист должен начать манёвр (поворот), а также включить и выключить рабочие органы машин-орудий, входящих в состав агрегата. Размер поворотной полосы E зависит от состава агрегата, а также расстояния, на которое нужно продвинуть агрегат от контрольной линии, чтобы начать поворот без огрехов, порчи растений и выбранной схемы поворота. Размер поворотной полосы проще всего определить экспериментальным путём, совершив тренировочный поворот на свободном участке поля. В тех случаях, когда участок обрабатывают в двух направлениях, поворотные полосы должны быть выделены со всех четырёх сторон участка и обработаны круговым движением.

TURNS PER INCH = КРУЧЕНИЙ НА ДЮЙМ – Twists Per Inch or Turns Per Inch (TPI) is a term used in the textile industry. It measures how much twist a yarn has, and can be calculated by counting the number of twists in an inch of yarn. The number of twists per inch can, in plied yarns, be determined by counting the number of bumps in one inch, and divide by the number of singles (the strands plied together to make the yarn). If the picture to the right, for example, was of an inch of 2 ply yarn, then the number of twists per inch would be 6 divided by 2, or three, as there are six bumps, and it is a two ply. While this method works very well with plied yarns, singles don't have bumps to count. One way to determine the tpi for a single is to add a contrasting color fiber when spinning it, and then count the number of times the contrasting fiber has wrapped around the yarn. Another method is to measure an inch of yarn, and untwist it, counting how many full revolutions it takes until there is no twist left. This can be done by inserting two paper-clips into the yarn, at an inch apart, thus making it easier to count a full revolution. A less precise method is to allow the single to ply against itself:- the resulting two ply yarn is about half the number of twists per inch of the single. Thus one can roughly find the number of twists per inch for the single, or one can use the doubled back yarn as a measure. With yarn that is both thick and thin, than it is best to count over several inches and average them. This is because the number of twists per inch will tend to vary from the thin and thick sections. See also Twist.

TURN TO = ПРИВОДИТЬСЯ К ВЕТРУ (или ПОВОРАЧИВАТЬ, или НАЧАТЬ РАБОТЫ) – Turn To (maritime term):- an order to commence ship's work.

TURN TURTLE = ОПРОКИДЫВАТЬСЯ (или ПЕРЕВОРАЧИВАТЬ ЧЕРЕПАХУ) – Turn Turtle (maritime term):- to capsize.

TURQUOISE = БИРЮЗОВОЕ – Turquoise:- a variable color averaging a light greenish blue.

TURQUOISE BLUE = БИРЮЗОВО–ГОЛУБОЕ – Turquoise Blue:- a light greenish blue that is paler and slightly bluer than average turquoise.

TURQUOISE GREEN = БИРЮЗОВО–ЗЕЛЁНОЕ – Turquoise Green:- a light bluish green.

TURRET TRUCK = ГРУЗОВИК С ПОВОРОТНЫМ ПОДЪЁМНЫМ УСТРОЙСТВОМ – Turret Truck is a type of man-up lift truck with a rotating fork that can turn 90 degrees in either direction.

TURTLENECK COLLAR = ВОРОТНИК ЧЕРЕПАШЬЯ ШЕЯ – Turtleneck Collar is a high, close-fitting collar rolled or turned down on itself. Turtleneck is a high close-fitting turnover collar used especially for sweaters; a sweater with a turtleneck. / Водолазка – это атрибут 'бесполого' гардероба, вещь в стиле унисекс, то есть 'для него и для неё'. Она используется в качестве как праздничной одежды, так и одежды для отдыха, повседневной. С середины XX века за водолазкой закрепился статус 'анти-галстука' для мужчин, пренебрегающих официальным стилем в моде, и 'умной' формы одежды для всех. Ив Сен-Лоран однажды сказал:- 'Узкая чёрная юбка и чёрная тонкая водолазка из джерси – вот мой образ деловой женщины'. В 2008 журнал Elle назвал водолазку вещью, которая должна иметься в гардеробе каждого интеллигентного человека, не безразличного к своему имиджу. Водолазки и по сей день очень актуальны. И даже более, чем актуальны. Опрос, проведённый журналом Men's Health, показал, что 685 женщин из каждой тысячи его участниц считают, что ничто не делает мужчину столь сексуальным, как чёрный свитер типа водолазки, и отвели ей первое место в иерархии предметов мужской одежды. Американцы называют водолазку Turtle Neck ('черепашья шея', 'черепашья горловина'), Англичане – Polo Neck (шея, горловина в стиле 'поло'), Немцы – Rollkragepullover (пуловер с закрученным воротом). После выхода на экраны в 1959 фильма Фэдэрико Фэллини (Federico Fellini) 'Сладкая Жизнь' (La Dolce Vita), в котором Марчэлло Мастрояни (Marcello Mastroianni) сыграл роль обласканного богемой журналиста по имени Марчэлло, любящего облачаться в элегантные чёрные водолазки, в Итальянском языке за ними закрепилось соответствующее название – Dolcevita ('Сладкая Жизнь'). Начиная с 1890, водолазки были незаменимым предметом спортивной (их носили игроки в гольф, автогонщики, футболисты и хоккеисты) и некоторой профессиональной одежды (водолазное дело, авиация). Первоначально они появились в Британии, а потом в них начало одеваться всё человечество. Водолазки всегда были удобны в ношении:- они шились из мягких тканей, плотно облегали тело, согревали его. Со временем лётная и спортивная братия начала носить эти свитерки и в повседневной жизни – под пиджаками, рубашками. Идея всем очень понравилась. Где-то так и началась славная история водолазки. И ставить точку в этой истории пока ещё рано. В 1960-х водолазка была одинакова популярна как в студенческой среде, ассоциируясь с образом опрятного, ухоженного студента-интроверта, так и на подиумах. Дизайнер Пьер Карда (Pierre Cardin) в 1959 представил публике свою первую коллекцию прэт-а-портэ (prêt-à-porter), состоящую из лаконичных базовых вещей. Трикотажная водолазка, связанная 'лапшой', была в этом показе ключевым элементом. За это смелое решение модельера исключили из Синдиката Высокой моды. В 1967 Карда в свою коллекцию летней одежды ввёл белые мужские водолазки в сочетании с мотоциклетными куртками на молнии. Белым водолазкам отдавал предпочтение знаменитый исследователь Мирового океана Жак-Ив Кусто (Jacques-Yves Cousteau), красным – Французский эколог Роне Дюмо (Renée Dumont). Основная же масса интеллектуалов – учёных, философов, художников – рядилась в чёрные водолазки. Они стали символом утончённости, меланхоличности, недосказанности, привлекали нестандартных, плохо вписывающихся в каноны общества людей. Их носили битники, околачивающиеся в районах потрёпанных кафешек, элегантные мафиози в полосатых костюмах, все великие барды во главе с Сэржем Гэнзбуром (Serge Gainsbourg). Пик популярности водолазок совпал с популярностью группы Битлз – молодые музыканты сделали этот свитерок эталоном элегантности и безупречного вкуса. Особенно

потрясающе водолазки смотрелись (и сейчас смотрятся) на тоненьких фигурках девочек-подростков. Британская модель Твигги ввела в моду новый тип привлекательности – тип худой городской девочки в клетчатой юбке, туфлях с квадратными каблуками и водолазке. В таком наряде она красовалась на обложках всех модных журналов. В гардеробе у Элвиса Пресли (Elvis Presley), Сальвадора Дали (Salvador Dali) и Эрнеста Миллёра Хэмингвэя (Ernest Miller Hemingway) имелись водолазки оригинальных фасонов. Знаменитый миллионер и модник Вулф Барнато (Woolf Barnato) тоже любил свитера 'под горло'. Садясь за руль, он всегда менял дорогой смокинг на водолазку из шерсти. Одри Хэпбён (Audrey Hepburn) в фильме 'Забавная Мордашка' танцевала в чёрной водолазке. Образ дополняли короткие чёрные штаны, такого же цвета туфли и белые носки. Пианист Владимир Давидович Ашкенази (Vladimir Ashkenasi), певец Барри Манилов (Barry Manilow), основатель Эпл (Apple) Стив Дьжобз (Steve Jobs) – тоже среди тех, кто видел в водолазках не только особый прок, но и особую прелесть. В водолазках любил щеголять Андреас Папандреу (Andreas Papandreou), сегодня их носят такие политики, как Владимир Путин и Николя Саркози (Nicolas Sarkozy). В некоторых странах водолазки являются составной частью профессиональной униформы отдельных категорий служащих. Например, белые водолазки – у бортпроводниц Скандинавских авиалиний (SAS). Или чёрные – у полицейских функционеров и публичных (государственных) служащих в Бельгии (объявлены таковыми Королевским указом от 22 Июня 2006). В 2010 в Канаде разработана модель водолазки для кормящих матерей.

TUS = TUCSON INTERNATIONAL AIRPORT

TUSCAN STRAW = ТОСКАНСКАЯ СОЛОМА (или ТОСКАНСКАЯ СОЛОМКА) – Tuscan Straw:- the straw must have a certain length of 'pipe' between the knots, must possess a clear delicate golden color, and must not be brittle. The most valuable straw for plaits is grown in Tuscany, and from it the well-known Tuscan plaits and Leghorn hats are made. The straw of Tuscany, specially grown for plaiting, is distinguished into three qualities, Fontederas Semone being the finest, Mazzuolo the second quality, from which the bulk of the plaits are made, while from the third quality, Santa Fioro, only 'Tuscan pedals' and braids are plaited. The wheat-seed for these straws is sown very thickly on comparatively elevated and arid land, and it sends up long attenuated stalks. See also Straw. Tuscany is a region in Italy having an area of about 23 000 square kilometers and a population of about 3.8 million inhabitants. The regional capital is Florence. Tuscany (Italian:- Toscana) is a region in Italy. The Tuscan language (lingua Toscana) or Tuscan dialect (dialetto Toscano) is an Italo-Dalmatian language spoken in Tuscany, Italy. Standard Italian is based on Tuscan, specifically on its Florentine variety.

TUSSAH = ТУССА – Tussah is a silk fabric woven from silk made by wild, uncultivated silkworms. Tussah is strong, but coarse and uneven. It is naturally tau in color, cannot be bleached, and has a rougher texture than cultivated silk. It is used in shantung and pongee. Wild silkworms eat leaves other than mulberry leaves eaten exclusively by silkworms. The difference in diet accounts for the different fiber and fabric characteristics. Tussah is also used to describe fabrics designed to imitate this kind of silk. See also Wild Silk. Tussah is the silk or silk fabric from the brownish fiber produced by larvae of some saturnid moths (as Antheraea paphia). Usually plain but also in twill. Made from wild or uncultivated silkworms. It is coarse, strong, and uneven. Dull lustre and rather stiff. Has a rough texture with many slubs, knots, and bumps. It is ecru or tan in color and it is difficult to bleach. It usually doesn't take an even dye color. Wears well and becomes more rough looking with wear. It wrinkles a little, but not as much as some. Various weights. Appears in filament and staple form. In lighter weights, dresses. In heavier weights, coats and suits and ensembles. / Тусса – шёлк диких шёлкопрядов.

TUSSAH SILK = ШЁЛК ТУССА (или ШЁЛК ДИКИХ ШЕЛКОПРЯДОВ, или ДИКИЙ ШЁЛК) – Tussah (also called Tussar, Tasar, Tussore):- a medium to heavy weight silk made from free-range (Woo Hoo) wild silkworms of the Antheraea Mylitta or Antheraca Proylei Species. The warp and weft yarns of this plain weave silk fabric are very different, giving tussah the look of woven grasses. Tussah is relatively uneven, has small lumps and is less lustrous than cultivated silk. It does however tend to be stronger, perhaps because it is a somewhat thicker fiber. Because of tannin-rich diet, Tussah is almost always a natural brown color. But it does dye well, and is good for suits, jackets, and home decoration. Sews easily but may unravel, so finished seams are advisable. The name Tussah is also associated with the Antheraea silk producing caterpillar. This caterpillar is raised in the forested regions of China, Korea and India, and has a different diet from its Bombyx mori cousin – relying mostly on Arjun Tree (Terminalia Arjun), Asan (Terminalia Tomentosa), and Oak (Querus). Tussah silkworms are protected and harvested in jungles and forests by indigenous peoples in Asia. These silkworms seem to have rejected all attempts at total domestication. Tussah fibers are derived from cocoons collected after the moth has emerged naturally in the field, and are a little coarser than the cultivated Bombyx mori. Whether they are reared in the tropics or temperate climate, the leaves they eat contain tannin, the ingredient in tea that leaves a stain in your cup. The natural color of tussah silk is, therefore, warm honey beige. Tussah Silk is the wild silk of India and China where the silk worms are fed Oak leaves. This causes a goldish color. Tussah Silk is a silk fabric woven from silk made by wild, uncultivated silkworms. Tussah is strong, but coarse and uneven. It is naturally tau in color, cannot be bleached, and has a rougher texture than cultivated silk. It is used in shantung and pongee. Wild silkworms eat leaves other than mulberry leaves eaten exclusively by silkworms. The difference in diet accounts for the different fiber and fabric characteristics. Tussah is also used to describe fabrics designed to imitate this kind of silk. See also Wild Silk. / , от Французского слова Тусса (Tussah) или Tissau, . развод (или потёк (stain)).

TUSSORE = ТУССОР – Tussore is a coarse silk from the larvae of the tussore moth and related species. Tussore is another term for Tussah. Tussore (also Tussah or Tussur) is the silk woven from the cocoons of wild silkworms feeding on some mountain shrub. The undyed silk is a tan or light brown color. There are various types of tussore, each named after the shrub that the cocoons were collected from. The diet of the silkworms has a great effect on the quality of the silk. Collectively, they can be called Wild Silkworm Cloth. / Туссор – шёлк типа Чесучи.

TUTU = ТЮТЮ (или БАЛЕТНАЯ ПАЧКА, или БАЛЕТНАЯ ЮБКА) – Tutu:- a short projecting skirt worn by a ballerina. / .

TUXEDO = ТАКСИДО (или СМОКИНГ) – Tuxedo is a single-breasted or double-breasted usually black or blackish blue jacket; formal evening clothes for men.

TUXEDO COLLAR = ВОРОТНИК ТАКСИДО (или ВОРОТНИК КАК У СМОКИНГА) – Tuxedo Collar is a shawl collar cut in one width and which extends the full length of the front edge of a jacket. A Tuxedo (American English) or Dinner Suit or Dinner Jacket (British English) is a semi-formal evening suit distinguished primarily by satin or grosgrain facings on the jacket's lapels and buttons and a similar stripe along the outseam of the trousers. The suit is typically black (though may be midnight blue) and commonly worn with a formal shirt, shoes and other accessories, most traditionally in the form prescribed by the black tie dress code. Although many etiquette and sartorial experts have insisted for a century that tuxedo is less correct than dinner jacket, the first written reference to tuxedo predates dinner jacket by two years:- tuxedo first appeared in 1889 while dinner jacket is dated only to 1891. Contrarily, the Prince of Wales had apparently ordered a 'tailless dinner jacket' from his tailors in 1885. Today, the terms are variously used in different parts of the world. Tuxedo (or, colloquially, tux) is used most often in North America; it was associated with Tuxedo Park, a planned resort community developed as a hunting club in the Ramapo Mountains near New York City. In Britain 'Tuxedo' is sometimes used to refer to the white version of the suit jacket. Conversely, in North American, the white jacket is generally known as a Dinner

Jacket. In French, Italian, Portuguese, German, Spanish, Polish, Russian and also other European languages, the jacket is called a Smoking. In French the shawl-collared version is le smoking Deauville, while the peaked-lapel version is le smoking Capri. In many places, it is often nicknamed a 'Penguin Suit', given its black and white colors. In the United States, it is also referred to as a 'Monkey Suit' in slang. Street musicians with pet monkeys dressed them in miniature tuxes for entertainment. / лё смокинь Довильле (le smoking Deauville), лё смокинь Кяпри (le smoking Capri).

TWARON® = ТВЭРЭН® – Twaron® is the brandname of Teijin Aramid for a para-aramid. It is a heat-resistant and strong synthetic fiber developed in the early 1970s by the Dutch company Akzo, division Enka, later Akzo Industrial Fibers. The research name of the para-aramid fiber was originally Fiber X, but it was soon called Arenka. Although the Dutch para-aramid fiber was developed only a little later than DuPont's Kevlar®, introduction of Twaron as a commercial product came much later than Kevlar® due to financial problems at the Akzo company in the 1970s. Twaron® is an aramid fiber produced in Europe. Twaron® Fiber:- Twaron® is a very strong, light para-aramid fiber (poly-paraphyenylene terephthalamide). It has a high modulus, and is thermally stable, and highly impact and chemical resistant. Twaron is 5 times stronger than steel and has little loss of strength during repeated abrasion, flexing and stretching. Twaron is an outstanding material for ropes that need to meet specific demanding requirements. Twaron fiber can be twisted or braided into a number of rope constructions. Twaron® Fiber Properties:- (i) very high tenacity; (ii) high modulus of elasticity; (iii) low creep; (iv) resistance to high temperatures; (v) good fatigue resistance; (vi) cut resistant; (vii) chemical resistance; and (viii) good dielectric behavior. Twaron® Fiber Applications:- (i) high performance light weight substitute for steel rope; (ii) Industrial Rope applications; (iii) Military Applications; and (iv) sport and extreme sport applications. Twaron® is a so-called Para-Aramid Fiber similar to Kevlar. It is available in different grades, dependat of the application. Twaron® is used in roughly the same applications as Kevlar and Technora. EuroFibers supplies the grades T1012 and T2300. / Тэйджин Арамид (Teijin Aramid). Датской компанией Аксо (AKZO), подразделением Энка (Enka), . Аринка (Arenka). Кэвла® или Кевлар® (Kevlar®).

TWEED = ТВИД – Tweed is a medium to heavy weight, fluffy, woolen, twill weave fabric containing colored slubbed yarns. Common end-uses include coats and suits. Tweed:- tweed clothing, specifically, a tweed suit, where tweed is a rough woolen fabric made usually in twill weaves and used especially for suits and coats. A rough woolen fabric made usually in twill weaves and used especially for suits and coats. It is the Scotch name for twill and originated along the banks of the Tweed river, which separates England from Scotland. Sometimes known as 'Tweel'. Sistercloth of homespun cheviot and shetland. They are the same in texture, yarn, weight, feel, and use. Originally only made from different colored stock-dyed fibers, producing various color effects. There are a wide range of rough surfaced, sturdy fabrics. There are also some closely woven smoother, softer yarn fabrics, and many monotone tweeds. May also be plaid, checked, striped, or other patterns. Does not hold a crease very well. Wool, also cotton, rayon, silk, linen, and synthetics. Twill weave. Tweed is a fabric made from woollen-spun yarn in a variety of color and weave effects. Tweed is a type of fabric made from rough, woven wool. It may or may not use a twill, or diagonal, weave. Herringbone, a twill pattern in which the diagonal slant of the weave alternates, is popular in tweed. Many tweed fabrics also make use of threads of different colors to create an attractive 'heather' effect. Tweed originated in Scotland, and its name may derive from association with the Tweed River that runs through the Scottish Borders, once a textile center. The name tweed is also related to twill – or tweel in Scots – so the exact history of the term is unclear. Tweed was traditionally hand dyed using local natural dyes and hand woven. Dyes for traditional luxury tweeds may come from such plant life as moss, lichens, and blackberries. Tweed has a fairly loose weave, making it flexible and comfortable. It is popular for informal outerwear, as it is durable and weather-resistant. Recent decades have seen tweed luggage and even tennis shoes in addition to the more traditional jackets. Harris Tweed, perhaps the best known variety, is still hand woven in the home, though the yarn is spun and dyed by machine. Harris Tweed is made in the Outer Hebrides islands in Scotland. Magee of Donegal, an Irish clothing manufacturer and retailer, makes a line of hand woven Donegal Tweed garments, though many of their products are woven by machine. Though the great majority of tweed garments are made of wool, silk tweed also exists. It resembles the woolen variety not only in the type of weave, but also in the roughness of the yarn and the combination of varied colors. Silk tweed is more lightweight than wool tweed and can be used for warm weather jackets and sweaters. It is more commonly used in women's fashion than in menswear. Some summer tweeds use a blend of wool and silk. Tweed is an irregular, soft, flexible, unfinished, shaggy wool or wool-blend fabric made with a 2/2 twill weave. Tweeds are used in all types of coat fabrics and suitings. Tweed is a rough, unfinished, woolen fabric, of a soft, open, flexible texture that resembles cheviot or homespun, but more closely woven. It is made in either plain or twill weave and may have a check or herringbone pattern. Subdued, interesting color effects (heather mixtures) are obtained by twisting together differently colored woolen strands into a two- or three-ply yarn. Tweeds are desirable for informal outerwear, being moisture-resistant and very durable. / Шэвьё (Cheviot) или . Под Твидом понимается пёстротканая шерстяная или вигоневая ткань с диагональным переплетением нитей. Твид (Tweed), река в Великобритании. Длина 163 километра (км), площадь бассейна около 5 000 квадратных километров (км^2). Берёт начало на Южно-Шотландской Возвышенности, течёт преимущественно на Востоке (или возвышенности), по горно-холмистой местности, в низовьях – по равнине. Средний расход воды в нижнем течении (у города Норем) – 83 кубических метров в секунду (м^3/сек). Впадает в Северное Море; близ устья судоходна во время приливов. В устье – город Берик. Твид – шерстяная, напоминающая домотканую ткань. Идеальный материал для костюмов и пальто делового и спортивного характера, хотя из лёгкого твида шьют и платья.

TWEED–TEXTURED = ТЕКСТУРИРОВАННОЕ ПОД ТВИД – Tweed-Textured is an exaggerated chevron or tweed-like structural design with accentuated nubs.

TWEEN DECK = ТВИНДЕК – Cargo carrying surface below the main deck dividing a hold horizontally in an upper and a lower compartment. Tween Deck is a deck below the main deck. / Несущая груз поверхность ниже главной палубы, разделяющая трюм в горизонтальном плане на верхний и нижний отсек. Палуба, расположенная ниже главной палубы. Под Твиндеком понимается межпалубное пространство на судне. В твиндеках располагают грузовые помещения, пассажирские каюты и так далее. Твиндек (tween-deck, от Английских слов Between, означающее Между, и Deck, означающее Палуба), межпалубное пространство на судне. На однопалубных судах могут размещаться в удлинённых надстройках (баке, юте) или между главной палубой и платформами, делящими некоторые из трюмов по высоте. На многопалубных судах – несколько ярусов твиндеков. В твиндеке располагают грузовые помещения, пассажирские каюты и так далее. Доступ в грузовые твиндеки – через люки, бортовые порты либо по продольным проездам с кормы или носа.

TWEEN DECKER = МНОГОПАЛУБНИК (или МНОГОПАЛУБНОЕ СУДНО) – Tween Decker is any ship having one or more decks below the main deck. / Любое судно, имеющее одну или более палуб ниже главной палубы.

TWENTY–FOOT EQUIVALENT UNIT = ЭКВИВАЛЕНТНОЕ ДВАДЦАТИФУТОВОМУ КОНТЕЙНЕРУ ТРАНСПОРТНОЕ СРЕДСТВО (или ЕДИНИЦА, ЭКВИВАЛЕНТНАЯ ДВАДЦАТИФУТОВИКУ) – Twenty Foot Equivalent Unit (TEU) is a measurement unit cost of the work and the container rolling stock and depots; and is a unit of measurement of the goods, equal to the volume of 1 x 20-foot container; 1 x 40-foot container = 2TEU. Twenty-foot Equivalent Unit (TEU) is a measure of container capacity still used by some institutions. 1 FEU (Forty-Foot Equivalent Unit) or 1 FFE (Forty-Foot Equivalent) = 2 TEU. Twenty Foot Equivalent Unit is a measurement of cargo-carrying capacity on a containership, referring to a common container size of 20 ft in length. Twenty-foot Equivalent Unit (TEU):- corresponds to a 20 foot container, where the container height (8 ft, 8½ ft oder 9½ ft) is not taken into account; unit for counting containers. TEU is a measure of a ship's cargo-carrying capacity. One TEU measures twenty feet by eight feet by eight feet – the dimensions of a standard twenty-foot container. Unit of measurement equivalent to one twenty foot container. Twenty Foot Equivalent Unit (TEU) is a unit of measure representing a standard, usually seaborne, shipping container approximately 20 feet long and 8 feet wide. Often transferred between modes of transportation. Twenty-foot Equivalent Unit (TEU) is the international standard measure of containers. Used when differentiating between container lengths and numbers. Twenty-Foot Equivalent Unit (TEU) is a standard unit based on an ISO container of 20 feet length (6.10 m), used as a statistical measure of traffic flows or capacities. One standard 40 feet ISO Series 1 container equals 2 TEUs. / Эквивалентное Двадцатифутовому Контейнеру Транспортное Средство (ЭДКТС).

TWH = TERAWATT–HOUR

TWILL = САРЖА – Twill, cotton fabric with an oblique weft (like denim). Twill is a fabric characterized by its diagonal weave. This weave may be evident in tweed variants of twill, where several colors are used. It is less evident when used with a single colored thread like cotton, for use in cotton twill, sometimes also called Chino. Twill tends to be a light fabric, yet tweed, especially when woven with wool, can produce a nice fabric for cool, but not cold temperatures. One example of this type of twill is the Harris Tweed, invented and still used in Scotland. One of the most inventive uses of the Harris Tweed in recent years is the Harris Tweed tennis shoe, made for Nike. It has enjoyed great success as a variant on the traditional tennis shoe. Other forms of twill that usually benefit from two colors of yarn are the herringbone, and houndstooth twill, often used in men's and women's suits. Though there is only a slight differentiation in color, it is still enough to produce a different look than cloth of a single thread, and many enjoy the patterns. Cotton twill is a frequent fabric choice for men's casual pants in particular. Brands like Dockers have long made use of twill to produce popular men's chinos, which tend to be both light and comfortable, offering a dressier, but still comfortable change from denim. Because of the weave method, twill tends to give more than other weaves, so twill pants can be a nice choice for a day of picnicking, walking, or camping. Twill pants are also preferable because the weave tends to resist staining. Stains show up less, because they have a more difficult time adhering to the multiple thread use. Twill fabrics are often used for upholstery for this purpose, usually with mixed thread, as they are naturally more stain resistant than a flat weave. The most basic twill weave is two threads in one direction, crossed over by a single thread in the opposite direction. This gives the weave its characteristic design, although the weave can be far more complex depending upon the degree to which the weaver wants a design in the twill to show. In general the best twills for use are those with the highest thread count, as this will increase the durability of the fabric. Both cotton and wool twill are preferable over polyester or rayon twill, as they will be more durable. Higher thread counts also produce thicker twill, which not only resists staining but damage from water, and protection from chilly breezes when the twill is used for clothing. See also Serge. Twill is a fabric woven by alternatively passing weft threads over one or more and under two or more warp threads to produce diagonal lines or ribs. Twill is a type of fabric woven with a pattern of diagonal parallel ribs. It is made by passing the weft thread over one or more warp threads and then under two or more warp threads and so on, with a 'step' or offset between rows to create the characteristic diagonal pattern. Because of this structure, twills generally drape well. Examples of twill fabric are chino, drill, denim, gabardine, tweed and serge. Standard construction of the gray fabric in Japan:- 65% polyester/35% cotton, 34's/2, 170 threads per inch, 47"; in Pakistan:- 100% cotton (1) 3/1, 20's x 20's, 108 x 58 threads per inch, 47.5" or 63"; (2) 3/1, 20's x 16's, 128 x 60 threads per inch, 47.5" or 63"; (3) 3/1, 20's x 10's, 118 x 52 threads per inch, 63"; (4) 3/1, 16's x 12's, 96 x 48 threads per inch, 63"; and (5) 3/1, 16's x 12's, 108 x 56 threads per inch, 47.5"; in Indonesia:- 100% cotton, CM40 x CM40, 133 x 72 threads per inch, 48"; in Taiwan:- (1) 3/1, 20's x 20's, 108 x 58 threads per inch, 58/60", solid dyed; (2) 2/1. 30's x 30's, 136 x 72 threads per inch, 58/60", solid dyed; (3) 2/1, 40's x 40's, 120 x 100 threads per inch, 58/60", solid dyed; (4) Denim, 3/1, 14.5 oz/yd, 58/60", indigo dyed; and (5) Denim, 3/1, 13.75 oz/yd, 58/60", indigo dyed. Twill is a fabric with a twill weave, namely a textile weave in which the filling threads pass over one and under two or more warp threads to give an appearance of diagonal lines. / развод (или потёк (stain)). текстильное переплетение, в котором уточные нити . Саржа – ткань, характеризуемая своим диагональным переплетением. Это переплетение может быть хорошо заметно в твидовых вариантах саржи, в которых используются несколько цветов. Оно менее заметно в случае использования нитей типа хлопковых, окрашенных в один цвет, для использования в хлопчатобумажной сарже, иногда называемой также . Под Саржей, от Латинского слова Sericus, означающее Шёлковый, понимается хлопчатобумажная или из химического волокна ткань с наклонными рубчиками на лицевой поверхности. Саржу употребляют для подкладок и тому подобного. Под Саржей, от Итальянского слова Sargia, Французского слова Serge, от Латинского слова Sericus, означающее Шёлковый, понимается:- (1) ткань саржевого переплетения нитей из натуральных или химических волокон; вырабатывается в основном гладкокрашеной и набивной. Используется как подкладочная, платьевая, техническая и тому подобная ткань. (2) Сокращённое название саржевого переплетения. Саржа, от Итальянского слова Sargia, от Французского слова Serge, от Латинского слова Sericus, означающее Шёлковый, понимается ткань саржевого переплетения нитей из натуральных или химических волокон; вырабатывается в основном гладкокрашеной и набивной. Используется как подкладочная, платьевая, техническая и тому подобная ткань.

TWILL TAPE = САРЖЕВАЯ ТЕСЬМА – Twill Tape is a narrow, twill-weave ribbon, fairly heavy in weight. It is stitched into garment areas such as collar lapels, shoulders, and facing edges for strength and to prevent stretching. It is also used in the seams of slip covers and other home furnishing items for added strength. Twill tape is usually available only in white and black. See also Twill, and Weaving. Twill is a narrow ribbon, fairly heavy in weight. It is stitched into garment areas such as collar lapels, shoulders, and facing edges for strength and to prevent stretching. It is also used in the seams of slipcovers and other home furnishings items for added strength. Twill tape usually is available only in white or black. / Саржа – узкая лента, .

TWILL WEAVE = САРЖЕВОЕ ПЕРЕПЛЕТЕНИЕ – Twill Weave is characterized by the effect of parallel diagonal ribs formed left-to-right or right-to-left. It is created by the interlacing of 2 or 3 warp threads over 1 or 2 filling thread in an alternate rows (2/1 twill or 3/2 twill accordingly). The resulting fabric is more pliable and drapeable than the plain or basket weave but less pliable than satin. Twill weave which has more warps than the wefts floating on the face of the fabric is called Warp Faced and those with wefts predominating is known as Weft Faced. Characteristics of Twill Weave:- (i) it has fewer interlacing than plain weave; (ii) it is durable and heavier; (iii) it is wrinkle resistant; (iv) it is resistant to showing soil and soiling; (v) the twill direction is defined as left or right hand or variation; (vi) it is more raveling than plain weave; and (vii) it is more pliable drape and hand than plain weave. Twill Weave is a basic weave in which the fabrics are constructed by interlacing warp and filling yarns in a progressive alternation which creates a diagonal effect on the face, or right side, of the fabric. In some twill weave fabrics, the diagonal effect may also be seen clearly on the back side of the fabric. Twill Weave is a fundamental weave characterized by diagonal lines produced by a series of floats staggered in the warp direction. The floats are normally formed by filling (filling-faced twill). A warp-face twill is a weave in which the warp yarns produce the diagonal effect. See also Plain Weave, Sateen Weave, Satin Weave, and Weave. Warp faced twill:- in which quantity of warp is more on the face of the fabric, e.g., 2/1 twill and 1/2 will show on on the reverse. Twill Weave is distinguished by diagonal lines. The simplest twill is that created by the weft crossing over two warp yarns, then under one, the sequence being repeated in each succeeding shot (pick), but stepped over, one warp either to the left or right. Twills with more warps than wefts floating on the fabric's face are called Warp Faced; those with wefts predominating, weft faced. The angle of the twill can also vary. Twills can be varied by changing the relative number of warps and wefts in each repeat (2:1, 2:3, 3:1, 6:2, etc); by stepping the repeat in one direction; by breaking the direction of the diagonals formed by the twill at regular intervals; by reversing the direction of the diagonal at regular intervals to form chevrons or lozenges; or by combining several twills or modifying them to create a pattern. Twills drape better than plain weaves with the same yarn count because twills have fewer interlacings. Twill weaves have been used throughout history in many weights and textures, from wool serges mentioned in medieval French manuscripts to English diapered (diamond patterned) table linens, patterned bed coverlets, and Indian shawls. Twill Weave is a weave with a diagonal rib (twill line) that runs from the upper left to the lower right, or from upper right to lower left. In a twill weave, each filling thread passes over or under at least two warp threads, with the point where the filling thread goes under moving up and over at least one thread in each row. Herringbone weave is a broken twill weave which forms Vs in the weave pattern. Twill Weave is similar to a satin weave in the sense that the loom is floating the warp or weft yarns over yarns of the opposite direction, but with a twill the yarn is only passing over two of the opposite yarns. A twill is distinctive by the diagonal lines that appear in the fabric. A twill weave, like a satin weave, usually results in a softer fabric than a plain weave. It is excellent for brushed or napped cotton, and is superior for a feather pillow ticking because of its strength. / 3 основные нити 2 уточные нити . Характерной особенностью Саржевого Переплетения, или простой саржи, являются наклонные линии – диагонали, которые образуются в результате расположения основных перекрытий, идущих на лицевой стороне ткани чаще всего снизу вверх слева направо, со сдвигом S = 1. При одинаковой плотности и толщине основы и утка диагонали располагаются под углом 45° к длине ткани. При соотношении плотностей P_o / P_y = 2/1 диагоналевый рубчик будет направлен под углом около 63°. По внешнему виду поверхность ткани будет напоминать габардин, а не саржу. При выработке ткани с соотношением P_o/ P_y = 1/2 на ткани будут видны диагонали, идущие под углом около 27°. В отличие от полотняного переплетения, у которого один неизменный раппорт, у саржевого переплетения много раппортов. Наименьший раппорт саржевого переплетения равен 3, а максимальный раппорт определяется величиной настилов, длина которых при средней линейной плотности пряжи не должна превышать 3–4 мм. Раппорт саржи условно обозначается простой дробью, у которой числитель обозначает число основных перекрытий на одной уточине, а знаменатель – число уточных перекрытий на той же уточине. Сумма числителя и знаменателя показывает число нитей в раппорте переплетения. Различают уточную и основную саржи. В уточной сарже на лицевой стороне преобладают уточные перекрытия, в основной сарже – основные. Саржу вырабатывают рядовой проборкой, исключение составляет заправка очень плотных по основе тканей, для которых требуется удвоенное количество ремизок и применяется рассыпная проборка. Для уменьшения напряженности выработки ткани основные саржи заправляют на станке лицом вниз. В этом случае уменьшается количество поднимаемых в цикле зевообразования ремизок и, соответственно, уменьшается натяжение основы. Число нитей, пробираемых в зуб бёрда, берётся равным либо половине числа нитей в раппорте, либо числу нитей в раппорте. При такой проборке получается наиболее чёткий рисунок диагонали на поверхности ткани. Чёткость диагоналей зависит так же от следующих факторов:- (i) направления крутки нитей основы и утка (при разном направлении крутки диагонали будут более рельефные; направление крутки нитей должно быть обратным направлению диагонали саржи), (ii) линейной плотности нитей (чем меньше линейная плотность нитей, тем больше блеск диагоналей), (iii) натяжения нитей основы (с увеличением натяжения нитей основы диагонали на ткани, выполненной основной саржей, будут менее заметны, а на ткани уточной саржи – более рельефными, и наоборот). Для кромки лучше всего использовать репсовое переплетение, в отдельных случаях можно вырабатывать их тем же переплетением, что и фон, но с обратным расположением диагоналей. В хлопчатобумажном ткачестве саржевым переплетением вырабатывают кашемир, далембу, саржу, тик-саржу. Кашемир и саржу выпускают гладкокрашеными и набивными, далембу – в гладком крашении, тик-саржу отбеленной и гладкокрашеной. Используются эти ткани как плательные и подкладочные, а тик-саржа главным образом в обувном производстве. Кашемир вырабатывают саржей 1/4, а саржу, далембу и тик-саржу – саржей 3/1. В льняном производстве саржевым переплетением вырабатывается пёстротканый тик с продольными цветными полосами. Он используется для пошивки чехлов, обивки матрацев и так далее. Смотрите также Переплетение Нитей.

TWILO PROCESS = ПРОЦЕСС ТВИЛО – Twilo Process is a spinning process in which yarn is made by binding fibers with an adhesive, then removing the adhesive after the yarn is made into fabric. Total exploitation of the inherent strength of the fibers can be achieved only by using adhesives, as was done, for example, in the Twilo process. The adhesive effect can be produced by means of adhesive substances or adhesive fibers (polyvinyl-alcohol fibers). Since this process can be used only for a small market segment, twisting of the fiber strand remains the sole possibility for imparting strength, even for the future.

TWINE = ШПАГАТ (или БЕЧЁВКА, или ШНУРОК, или КРУЧЁНАЯ НИТЬ) – Twine is:- (1) a plied yarn made form medium-twist single yarns with ply twist in the opposite direction. (2) A single-strand yarn, usually 3 or 4 millimeters in diameter, made of hard fibers, such as henequen, sisal, abaca, or phormium, and sufficiently stiff to perform satisfactorily on a mechanical grain binder.

TWIN–LIFT SPREADER = СПРЭДЕР ДЛЯ ПОДЪЁМА ПАРОЙ (или КЛЕЩЕВОЙ ЗАХВАТ ДЛЯ ПОДЪЁМА ПАРОЙ) – Twin-Lift Spreader is a spreader able to pick up either, two 20 ft ISO containers at the same time, or one 40 ft container. / Спрэдер, способный одновременно поднимать либо два 20-футовых контейнера по классификации МОС (ISO), либо один 40-футовый контейнер.

TWIN SCREW = ДВУХМОСТОВОЙ – A Twin Screw is a tractor with three axles in which the two drive axles are in a tandem setting. / Тягач с тремя осями, две из которых спарены друг с другом.

TWINSET = КОСТЮМ (или ХХ) – Twinset is a combination of a matching pullover and cardigan worn together.

TWIN SHARES = АКЦИИ БЛИЗНЕЦЫ (или АКЦИИ БЛИЗНЕЦОВ) – Twin Shares are the shares of two legally independent companies, whose shareholders must be identical and which were joined together as the result of a merger and are inseparably linked. / Акции двух юридически независимых компаний, акционерами которых являются одни и те же лица, и которые были объеденены в одно целое в результате слияния, и которые неразрывно связаны между собой.

TWIST = КРУЧЕНИЕ (или КРУТКА, или ЧИСЛО КРУЧЕНИЙ) – Twist is the helical disposition of the components of a single, folded or cabled yarn or roving. Twist is in the S (or Z) direction when the spirals of the yarn or roving held vertically slope in the same direction as the middle part of the letter S (or Z). Note:- if the S/Z notation cannot be used (for example in numerical fields of databanks) S should be designated as (–) and Z as (+). In steel cord the twist is called Direction of Lay. In spinning, this refers to the turns inserted into a yarn to bind its fibers together and thereby add more strength. It is usually indicated as turns per inch or tpi. Greater twist would be caused by additional revolutions of the flyer on a set amount of fiber. In yarn and rope production, process that binds fibers or yarns together in a continuous strand, accomplished in spinning or playing operations. The direction of the twist may be to the right, described as Z twist, or to the left, described as S twist. Single yarn is formed by twisting fibers or filaments in one direction. Ply yarn is made by twisting two or more single yarns together, usually by combining singles twisted in one direction with a ply twist in the opposite direction. Twine, cord, or rope can be made with a cable twist, each twist in the opposite direction of the preceding twist (S/Z/S or Z/S/Z), or with a hawser twist, the single yarns and the first ply twist in one direction and the second ply twist in the opposite direction (S/S/Z or Z/Z/S). The number of turns per unit of length in a yarn affects the appearance and durability of fabric made from that yarn. Yarns used for soft-surfaced fabrics have less twist than those used for smooth-surfaced fabrics. Yarns made into crêpe fabrics have maximum twist. Twist is the number of turns about its axis per unit of length of a yarn or other textile strand. Twist is expressed as turns per inch (tpi), turns per meter (tpm), or turns per centimeter (tpcm). Twist is the number of turns per unit length of the fiber, strand, roving, or yarn. In the United States, twist is measured in terms of the number of turns per inch (tpi). The number of turns about its axis, per unit of length, noted in a fiber, yarn, cord, etc. It is expressed in turns per inch (tpi), turns per meter (tpm), or by the helix angle in a structure of known diameter. See also S-Twist, and Z-Twist. Twist is a term that applies to the number of turns and the direction that two yarns are turned during the manufacturing process. The yarn twist brings the fibers close together and makes them compact. It helps the fibers adhere to one another, increasing yarn strength. The direction and amount of yarn twist helps determine appearance, performance, durability of both yarns and the subsequent fabric or textile product. Single yarns may be twisted to the right (S Twist) or to the left (Z Twist). Generally, woolen and worsted yarns are S-Twist, while cotton and flax yarns are typically Z-Twist. Twist is generally expressed as turns per inch (tpi), turns per meter (tpm), or turns per centimeter (tpcm). Twist is the number of turns about its axis per unit of length, noted in a yarn. It is expressed in turns per inch, turns per meter or by the helix angle in a structure of known diameter. Twist is a technical term referring to the way in which yam is turned during the course of its manufacture. It is the number of times (turns) one inch of yarn is twisted. In carpeting, twist is a corkserew-like, uncut pile. Yarns of different colors may be twisted together to form pile loops causing a pebbly appearance. It resists footmarks and is good for high traffic areas. Twist is the number of turns about its axis per unit of length of a yarn or other textile strand. / Количество кручений вокруг своей оси на единицу длины, указываемое для пряжи. Оно выражается в количестве кручений на дюйм, количестве кручений на метр или углом спирали в структуре известного диаметра. Число Кручений на единицу длины волокна, . Сущность кручения заключается в том, что волокна пряжи или каждая одиночная нить, располагаясь примерно по винтовым линиям, растягивается и под действием сил упругости волокон продукт (кручёное изделие) уплотняется, увеличиваются давление и силы трения между волокнами или нитями, вследствие чего разрывная нагрузка кручёного продукта (пряжи) повышается. Цель кручения – образование из сравнительно коротких волокон пряжи, обладающей округлой формой поперечного сечения и соответствующей прочностью, растяжимостью и упругостью. Скручивание пряжи позволяет улучшить физико-механические и други свойства текстильных нитей:- (i) разрывная нагрузка кручёной пряжи по сравнению с однониточной увеличивается вдвое; (ii) в зависимости от соотношения и направлений крутки жёсткость нити на кручение и изгиб изменяется как в сторону уменьшения, так и в сторону увеличения; (iii) неровнота по линейной плотности, разрывной нагрузке и удлинению снижается; (iv) плотность нити, стойкость к истиранию увеличиваются; (v) возможно получение различных внешних эффектов, в том числе формирование фасонной пряжи и другие. В настоящее время известно несколько способов кручения – формирования пряжи. В частности однозонное кручение, совмещённое с наматыванием. Этот способ используется на кольцевых и центрифугальных прядильных машинах. Однозонное кручение, не совмещённое с наматыванием. Этот способ используется во всех безверетённых способах прядения и осуществляется на пневмомеханических (камерных, роторных, одно- и двухконденсорных дрэф-машинах), воздушно-вихревых, аэродинамических, воздушно-вихремеханических (аэромеханических), электропневмомеханических и других прядильных машинах. Кручение на пневмомеханических машинах осуществляется в формирующее-крутильном устройстве – прядильной камере. Общее число кручений, которое получает пряжа, слагается, во-первых, из числа кручений, сообщаемых непосредственно вращающейся прядильной камерой; во-вторых, из числа кручений, возникающих при съёме волокнистой ленточки с желоба, так как за время облегания пунктом съёма по периметру камеры ленточка получает одно кручение; в-третьих, из числа кручений, возникающих от крутки волокнистой ленточки, за счёт чего происходит дополнительный её съём с желоба. Под Кручением или Скручиванием текстильных материалов понимается технологический процесс, при котором деформация кручения сообщается волокнам и нитям (пряже). Скрученность получаемого продукта характеризуется круткой, то есть числом витков на 1 метр его длины, углом наклона наружных волокон или нитей к продольной оси продукта и направлением крутки.

TWIST = ВИНТОВОЕ КОРОБЛЕНИЕ (или ВИНТОВАЯ ПОКОРОБЛЕННОСТЬ, или КРЫЛОВАТОСТЬ) – Twist is a warping in which one corner of a piece twists out of the plane of the other three. / В древесине, покоробленность, при которой один угол изделия выкручивает пласть трёх других. Под Короблением Древесины понимается изменение формы пиломатериалов, заготовок и деталей при их высыхании (разбухании). Различают:- винтовое коробление, поперечное коробление и продольное коробление. Винтовое коробление древесины образуется при наличии тангенциального наклона волокон. Основная причина поперечного коробления древесины – различие в усушке (разбухании) в радиальном и тангенциальном направлениях. Продольное коробление древесины вызывается разницей усушки вдоль волокон отдельных зон доски, например, при наличии такого порока древесины, как крень. Временное коробление древесины может наблюдаться при неравномерных увлажнении или сушке пиломатериалов. Коробление древесины происходит также при механической обработке пиломатериалов или заготовок, имеющих значительные остаточные напряжения, сохранившиеся после камерной сушки. Крень – порок древесины

хвойных пород, который образуется в сжатой зоне изогнутых стволов, когда годичные слои уширяются за счёт развития реактивной древесины, тёмным цветом напоминающий позднюю древесину. Различают сплошную и местную крень. Порок увеличивает усушку древесины вдоль волокон, способствует короблению, ухудшает и ряд других её свойств.

TWIST BLEED = НАЛЁЖКА КРУТКИ – Twist Bleed:- a short section of real twist in false-twist yarn that prevents crimp development and hence causes a pinhole effect in fabric. See also Twit.

TWIST (DIRECTION) = НАПРАВЛЕНИЕ КРУТКИ – Twist (Direction) is the direction of twist in yarns and other textile strands, as indicated by the capital letters S and Z, in reference to whether the twist direction conforms to the middle-section slope of the particular letter.

TWISTED LEGS = ЗАКРУЧЕННЫЕ ШТАНИНЫ – Twisted Legs is where the sideseam twists around to the front of the pant and distorts the appearance of the jeans. Recommended Solutions for twisted legs:- (1) usually caused by poor operator handling. Instruct the sewing operator to match the front and back properly so they come out the same length. Sometimes notches are used to insure proper alignment. They should not trim off the front or back with scissors to make them come out the same length. (2) Make sure the cut parts are of equal length coming to the assembly operation. (3) Check fabric quality and cutting for proper skew. (4) Make sure the sewing machine is adjusted properly for uniform feeding of the top and bottom plies. Fabrics defect. / закручивания бокового шва.

TWISTED NAIL = XX (или КРУЧЕННЫЙ ГВОЗДЬ) – Twisted Nail is a nail made from square-section wire with helical flutes for the full length of the shank. See also Pallet. / Крученный Гвоздь (Twisted Nail):- гвоздь, имеющий проволочные квадратные секции с винтовой рифлей (выемкой) по всей длине стержня. Смотрите также Поддон (Pallet).

TWISTED SEAM = ЗАКРУЧЕННЫЙ ШОВ – (1) Twisted Seam:- uneven feeding caused by improper selection and adjustment of fittings. Machinery defects, and namely – Sewing Machines and Attachments. / Порок или дефект от машинного обрудования.

(2) Twisted Seam:- caused by improper alignment of fabric pieces, uneven tension or pull on plies being stitched. Sewing Room Defects. / Порок или дефект швейного производства.

TWIST FACTOR = ФАКТОР КРУТКИ (или КОЭФФИЦИЕНТ КРУТКИ) – Twist Factor is the value obtained when the twist is multiplied by the square root of the linear density of the yarn. Note 1:- $TF = t \cdot \sqrt{(LD / 1000)}$; where:- TF – twist factor, t – twist in turns per meter, and LD – linear density in tex. Note 2:- in order to be able to make effective comparison of different fiber generic categories in certain applications, e.g., tyre cords, it is necessary to take into account the density of the fibers. $TF_c = t \cdot \sqrt{(LD / \rho)}$; where:- TF_c – twist factor corrected, t – twist in turns per meter, LD – linear density in tex, and ρ – density in kg/m^3.

TWISTING = КРУЧЕНИЕ (или СКРУЧИВАНИЕ) – Twisting is:- (1) the process of combining filaments into yarn by twisting them together or combining two or more parallel singles yarns (spun or filament) into plied yarns or cords. Cables are made by twisting plied yarns or cords. Twisting is also employed to increase strength, smoothness, and uniformity, or to obtain novelty effects in yarn. / Кручение или Скручивание текстильных материалов – технологический процесс, при котором деформация кручения сообщается волокнам и нитям (пряже). Скрученность полученного продукта характеризуется круткой, то есть числом витков на 1 м его длины, углом наклона волокон или нитей к продольной оси продукта и направлением крутки.

(2) Twisting:- a very high level of twist is added to single or plied yarns to make crêpe yarns. This operation generally is called Creping or Throwing.

(3) Twisting is the process of combining filaments into yarn by twisting them together or combining two or more parallel single yarn (spun or frilament) into piled yarns or cords. Cables are made by twisting piled yarns or cords. Twisting is the process of adding twist to a filament yarn to hold the filaments together for ease in subsequent textile processing, etc. Twisting/Plying:- this process serves to control the yarn strength, diameter, weight, and flexibility. Filaments are twisted to a predetermined specification, and the twisted threads are then combined or plied to balance and avoid any stresses in the yarn that may cause processing difficulties. Many glass fabrics are woven from single yarns as received from the yarn producers. / филаментная (комплексная) пряжа (filament yarn).

TWISTING–IN = ПРИВЯЗЫВАНИЕ (или ПРИВЯЗКА, или ПРИСУЧИВАНИЕ, или ВКРУЧИВАНИЕ) – Twisting-In is the process of joining the single ends of a new warp with those of an old one. / Привязывание или Присучивание Основ. Привязывание Основы – соединение узлами концов нити доработанной основы с концами нитей вновь подготовленной основы. Этот вариант применяется в том случае, если на станке должна вырабатываться ткань такая же, как вырабатывалась ранее, то после доработки старой основы нити новой основы привязывают к нитям старой основы протаскивая их затем через ламели, ремизки, бёрдо. Аналогом привязки является процессы присучивания и склеивания нитей. В процессе привязки пряжи образуются пороки и отходы. (1) Пороки Привязки:- (i) Обрывы Нитей – из-за чрезмерного натяжения в зажимах; (ii) Парочки – нити связываются парами, когда не верно выбраны иглы отборного механизма; (iii) Слабо Завязанные Узлы – появляются при разладе узловязателя узловязальной головки; (iv) Пропуск Нитей – несвязанные нити, появляются при разладе узловязателя. (2) Отходы Проборки и Привязки зависят от пряжи на навое и от аккуратности работы привязчицы и подавальщицы. Обычно отходы проборного отдела составляют 0.05–0.15% от массы перерабатываемых основ. При проборке длина угаров 0.3–0.5 метров; при привязке 1–2 метра по всей ширине основы. Присучивание Основы – соединение концов нитей прикручиванием иногда с последующим склеиванием. Привязывание основы осуществляется с помощью узловязальных машин или вручную. Узловязальные машины классифицируют по следующим признакам:- (1) по способу применения:- стационарные машины, передвижные, универсальные; и (2) по способу отбора нитей:- с игольным отбором, с ценовым отбором, с пневматическим отбором.

TWIST LEVEL = УРОВЕНЬ КРУТКИ – Twist Level is the number of turns per unit length of a twisted yarn.

TWIST LIVELINESS = ЖИЗНЕННОСТЬ КРУТКИ – Twist Liveliness is the tendency for a twisted yarn to untwist or for a torsion textured yarn to resume its twisted shape. / или для скрученной текстурированной пряжи .

TWISTLOCK = ПОВОРОТНЫЙ ЗАМОК – Twist Lock is a mechanical device which is part of the spreader bar which extends from the spreader bar into the top corner castings of the container to perform the locking function. A securing mechanism for securing containers in a vertical direction; twist locks are placed between the containers and fastened in the oblong holes on the container corners. Twistlock:- a set of four twistable bayonet type shear keys used as part of a spreader to pick up a container or as part of a chassis to secure the containers. Device which has to be inserted into the corner fittings of a shipping container and is turned or twisted, thus locking the container for the purpose of securing or lifting. / в верхние угловые отливки контейнера для .

TWIST MULTIPLIER = МНОЖИТЕЛЬ КРУТКИ (или КОЭФФИЦИЕНТ КРУТКИ) – Twist Multiplier is the ratio of turns per inch (tpi) to the square root of the yarn count.

TWISTS = ЖГУТИКИ – Twists:- twisted bundles are a common motif found in naturally occurring structures of self-assembled fibers, such as collagen and fibrin. By understanding the general principles governing such organizations, new synthetic materials – from the nano to the macroscale – may also be realized. Recently, continuum elasticity theory has been applied to describe generic twisted fiber bundles. This has revealed a relation between a bundle's twist and the presence of topological defects in the cross-sectional packing of the fibers. Here we employ numerical simulations to examine this interdependence. We model a bundle's cross-section as beads confined to a plane. The interactions between beads is governed by a modified Lennard-Jones potential that accounts for the effects of twist. We observe configurations that range from perfect hexagonal packing for cases of no twist, to defect populated structures above a critical amount of twist. For small bundles of less than ~100 beads, there exists a discrete spectrum of energy ground states corresponding to integer numbers of five-fold disclinations. For larger bundles, we hope to uncover what types of defect arrangements effectively screen the stresses caused by twist, and compare these to current predictions of the internal organization of collagen fibrils. See also Naps. To form into a thread from many fine filaments; as, to twist wool or cotton. Twist is a yarn term describing the number of turns per unit length and direction of twist of either the singles or plies around their axes. Twist direction is either called Z- or S-Twist. Twist is expressed as turns per inch (tpi), turns per meter (tpm), or turns per centimeter (tpcm). The Twist of a yarn is characterized by the direction of twist of the finished yarn and by the number of turns per meter. Twist:- to produce (thread, cord, etc) by winding 2 or more threads or strands around one another. Naps:- fuzzy or hairy substance or fibers projecting on some materials, giving downy appearance, forming soft surface and lying smoothly in one direction. Not to be confused with pile. Applied to flannel of all kinds, cricket cloth, blanketing, baby clothes, silence cloth, molleton, some lining fabrics, overcoating, knitted fabrics, etc. / Смотрите также Жгутики (Naps).

TWIST SETTING = ФИКСАЦИЯ КРУТКИ (или УСТАНОВКА КРУТКИ) – Twist Setting is a process for fixing twist in yarns to deaden torque and eliminate kinking during further processing. This process usually involves using steam. There are several methods that use steam to condition the packages of yarns.

TWIST VARIATION = ВАРИАЦИЯ ПО КРУТКЕ – Twist Variation:- less twist or more than normal twist. Spinning defect. Twist Variation:- twist less or more than normal twist. (1) Loose/Soft Twist – due to lower spindle speed cause are:- (i) speed not proper of each spindle; (ii) bearings; (iii) break shoe conditions; (iv) pressure of tension roller; (v) bolster; and (vi) yarn lapping over spindle. (2) Hard Twist – due to low take-up speed:- (i) bobbin holder adopter; (ii) cradle setting and its pressure; (iii) friction ring; (iv) winding tension; (v) yarn lapping over feed roller; (vi) winding roller; and (vii) faulty and damaged bobbins should be discarded. General reasons:- (i) lapping on disc; (ii) spindle and capsule working; (iii) overfeed variation; (iv) dial and overfeed tensions varies; (v) trolley knocks over breaks so placed rails at bottom on floor; and (vi) scratches on drum. / Порок или дефект прядения.

TWIT = ПЕРЕСЛЕЖИСТОСТЬ – Twit is a short section of real twist in false-twist yarn that prevents crimp development and hence causes a pinhole effect in fabric. Also called Twist Bleed or Tight Spot. / Пятно.

TWITT(Y) = ПЕРЕСЛЕЖИСТОСТЬ (или ПЕРЕСЛЕЖИСТАЯ, или РУЧЬИСТАЯ) – Twitt:- a term applied to yarn which is irregular, that is thick and thin, the thin places being below the count required and thick places above. The defect is caused by material being drafted at an irregular rate. / Порок или дефект прядения. Переслежистость (Twitty) – порок пряжи, а пряжа – переслежистая.

TWO–BAR TRICOT = ДВУХФОНТУРНОЕ ТРИКО (или ПРОСТОЕ ТРИКО) – Two-Bar (Double-Bar) Tricot is a warp knit in which two sets of yarns are required, one knitted in one direction and the othcr in the opposite direction. A ribbed surface results. It is synonymous with doublewarp tricot knit.

TWO BLOCKS = ДВЕ ТАЛИ (или ДВА БЛОКА) – Two Blocks (maritime term):- when the two blocks of a tackle have been drawn as close together as possible.

TWOEY FILLING = ДВУЛИЧНАЯ УТОЧИНА – 'Twoey' Filling:- some condition which gives a repeat-pattern appearance at regular intervals of every two picks.

TWO–FOR–ONE TWISTER = ХХ КРУТИЛЬЩИК (или КРУТИЛЬНАЯ МАШИНА) – Two-For-One Twister is a twister that inserts twist at a rate of twice the spindle speed. For example, at a spindle speed of 2 000 rpm, 4 000 turns per minute are inserted in the yarn.

TWO–LINE BREEDING = ДВУХЛИНЕЙНОЕ РАЗВЕДЕНИЕ – Two-Line Breeding is a hybrid Rice breeding methodology where only two lines, a male sterile (either photosensitive, thermosensitive, or chemically induced) and a pollen parent are used for the production of F_1 hybrids. / В генетике под Линией, от Латинского слова Linea, понимаются размножающиеся половым путём родственные организмы, которые происходят, как правило, от одного предка или одной пары общих предков и воспроизводят в ряду поколений одни и те же наследственно устойчивые признаки. Линия – основа для получения высокопродуктивных гибридов в растениеводстве и животноводстве.

TWO–PIECE = ДВУХПРЕДМЕТНОЕ – Two-Piece:- a garment, as a bathing suit, that is two-piece.

TWO–TONE EFFECT = ДВУХТОНОВЫЙ ЭФФЕКТ – Two-Tone Effect:- Fabric:- spun-rayon dress goods; Construction:- (i) Count:- 96 x 92; (ii) Warp:- 17/1 75% 2-in. 3-den. dull viscose rayon; 25% 2-in. 4-den. bright Bemberg rayon; (iii) Filling:- same as warp; Finish:- plain dyed rose. Defect:- mottled or 'two-tone' effect, which the dyer claimed he was unable to eliminate. Analysis:- it will be noted from the fabric construction (which was confirmed by laboratory analysis of the sample submitted) that it was made of a blend of dull viscose and bright Bemberg rayon staple. Since all cuprammonium rayon dyes appreciably darker than most viscose-process yarns in the same bath, the two-tone effect is unavoidable. In this case it was decided that the blend was not a suitable one. It might have been possible, by selecting a viscose rayon which was exceptionally dark-dyeing, to obtain a combination that would show a minimum of the cross-dye effect. Also, the use of a bright-luster viscose staple would probably be of some help in minimizing the contrast, since dull fiber of the same make and denier always appears lighter in shade, though dyed in the same bath. / Уточина:- такая же как основа. Бэмберг (Bemberg).

TWO–WAY ENTRY PALLET = ДВУХЗАХОДНЫЙ ПОДДОН – Two-Way Entry Pallet is a pallet with un-notched solid stringers allowing entry only from the ends. Two-Way Entry Pallet or Two-Way Pallet is a flat pallet permitting the entry of the fork arms of forklift trucks and pallet trucks from two opposite directions only.

TWO–WAY PALLET = ДВУХЗАХОДНЫЙ ПОДДОН – Two-Way Pallet is a pallet so designed that the forks of a fork lift truck can be inserted from two sides only. Two-Way Pallet permits equipment handling from two sides. / Поддон, разработанный таким образом, чтобы вилы вильчатого подъёмника могли вставляться в него только с двух сторон. Двухзаходный Поддон:- плоский поддон, конструкция которого обеспечивает возможность ввода вилочного захвата с двух противоположных сторон.

TWU = TRANSPORT WORKERS UNION

TYCOON = НУВОРИШ – Tycoon is a someone who has amassed a large fortune and a great deal of personal and professional power through business or inheritance. / Под Нуворишем, от Французского словосочетания Нуво Риш (Nouveau Riche), означающее Новый Богач, понимается человек, разбогатевший на спекуляциях и пробившийся в высшие слои общества, а также богач выскочка. В современной России нувориша часто называют олигархом, хотя олигархи зарабатывают свои состояния в течение длительного периода времени и в большинстве случаев честными путями.

TYING = СВЯЗЫВАНИЕ (или ПЕРЕВЯЗЫВАНИЕ, или СВЯЗКА, или ПОДВЯЗЬ, или ОБВЯЗКА) – Tying:- traditionally, after a fleece is short, it is rolled into a bundle and tied off with a paper cord (so that it could be removed during the carbonization process). I believe that the paper cords are no longer being made.

TYPE = ТИП – (1) Type is a group of Varieties so nearly similar that the individual Varieties cannot be clearly differentiated except under special conditions. Type is the permanently preserved specimen or specimens on which the Species or Sub-Species description is based. See also Class, Division, Family, Genus, Kingdom, Order, Phylum, Specie, and Tribe. / Смотрите также Вид (Specie), Класс (Class), Отдел (Division), Отряд (Phylum), Порядок (Order), Род (Genus), Семейство (Family), Триба или Колено (Tribe), и Царство (Kingdom). Под Типом, от Греческого слова Ту́pos, означающее Образец или Отпечаток или Форма, понимается таксономическая категория (ранг) в систематике животных. В Тип (иногда сначала в Подтип) объединяют близкие по происхождению Классы. Все представители одного Типа имеют единый план строения. Типы отражают основные ветви филогенетического древа животных. Всех животных обычно относят к 16 Типам (по мнению разных учёных, Типов от 13 до 33). Все Типы животных объединяются в Царство Животных. В систематике растений Типу соответствует Отдел (Division). Под Типом в биологии (Typus) понимается высшая таксономическая категория в систематике животных, объединяющая родственные Классы. Термин Тип был предложен в 1825 Французским зоологом Ори Мари Дюкотэ дё Блявиль (Henri Marie Ducrotay de Blainville; 1777-Сентябрь-12–1850-Май-01), назвавшим так четыре ‘ветви’ животных, выделенные в 1812 Французским учёным Жо Леопольд Николя Фредерик Кювье (Jean Léopold Nicolas Frédéric Cuvier, известный как Жорж Кювье (Georges Cuvier); 1769-Август-23–1832-Май-13). Объём разных Типов неодинаков:- в Типе Губок около 5 000 Видов, в Типе Погонофор – всего около 100. Типы нередко подразделяют на Подтипы; так, например, Тип Хордовых включает четыре Подтипа:- Головохордовые, Личиночнохордовые (или Оболочники), Бесчерепные и Черепные (или Позвоночные). Все организмы одного Типа характеризуются единым планом строения. Хотя число и объём Типов различны у разных систематиков (от 10 до 33), однако эти расхождения не меняют принципиального значения Типа как категории, отражающей основные (главные) ветви филогенетического древа животных (смотрите также Систематика). В систематике растений, разрабатываемой независимо от систематики животных, таксономическая категория (ранг таксона), соответствующая Типу называется Отделом. Под Отделом понимается таксонометрическая категория (ранг) в систематике растений. В Отдел (иногда сначала в Подотдел) объединяют близкие по происхождению Классы. Например, Классы Двудольных и Однодольных образуют Отдел Цветковых. Всего в систематике растений выделяют от 14 до 20 Отделов.

(2) Type:- when used with a Variety name means seed of the Variety named which may be mixed with seed of other Varieties of the same kind and of similar character, the manner of and the circumstances connected with the use of the designation to be governed by rules and regulations.

(3) Type:- as applied to Cotton, this is a means of designating all the various characteristics desired in a Cotton by a single sample.

(4) Type is a wool class sharing set characteristics. These are based on:- breed, condition, length, spinning quality, soundness, style, and color.

TYPE LOCALITY = МЕСТОНАХОЖДЕНИЕ ТИПА (или МЕСТООБИТАНИЕ ТИПА) – Type Locality is the place where the type specimen was collected.

TYPICAL PRICE = ТИПИЧНАЯ ЦЕНА – The Typical Price is the average of the High, Low and Close. The price is calculated with the following formula:- Typical Price = (High + Low + Close) / 3. / Типичная Цена определяется как среднеарифметическое значение от Максимума, Минимума и Цены Закрытия. Эта цена рассчитывается по следующей формуле:- Типичная Цена = (Максимум + Минимум + Цена Закрытия) / 3.

TYRANNO = ТЧИРАНО – Tyranno is a Si_3N_4 based fiber produced by Nippon. A multi-filament yarn with fiber diameters in the range of 10–20 µm. / Ниппон (Nippon).

TYRE CORD FABRIC = ТКАНЬ ДЛЯ ШИННОГО КОРДА – Tyre Cord Fabric is a structure used in tyre manufacture, comprising a sheet of warp cords or yarns bound together by widely spaced weft yarns which are usually of cotton and have a distinctly lower linear density than the warp cords or yarns.

TYRE YARN = ШИННАЯ ПРЯЖА (или ПРЯЖА ДЛЯ ШИННОГО КОРДА, или ПРЯЖА ДЛЯ ШИННОЙ ПРОМЫШЛЕННОСТИ) – Yarn that is used in the manufacture of the textile carcase of rubber tyres.

TYROLEAN HAT = ТИРОЛЬСКАЯ ШЛЯПА – Tyrolean Hat is a head covering marked by soft often green felt, a narrow brim and pointed crown, and an ornamental feather. / В Австрии, Тирольская Шляпа .

TYS = MCGHEE TYSON AIRPORT

TYVEK® = ТАЙВЭК® – Tyvek® is a somewhat paper-like material made from polyethylene fibers; manufactured by DuPont. Tyvek® is a very strong non-woven material that is often used for high-strength mailing envelopes. It is good for labels for items to be dyed, because of its toughness and resistance to dyeing. Use a permanent-ink felt-tipped marker to write on it. Be careful ironing items with Tyvek® labels – it melts easily. / ДюПонт или ДюПо (DuPont).

TZ = TETRAZOLIUM TEST

TZ = UNITED REPUBLIC OF TANZANIA

TZS = TANZANIAN SHILLING

- U -

U = Ю. – (1) U is the SI symbol for the unified atomic mass unit, as defined in 1960 and accepted by both chemists and physicists.

(2) U is a commercial unit of thermal conductance (heat flow). The U factor, as it is also called, is the conductance through an insulator as measured in Btu's of energy conducted times inches of thickness per hour of time per square foot of area per °F of temperature difference between the two sides of the material. The U factor is numerically equal to 1 divided by the R value.

(3) U is a unit of distance used to measure the height of the standard racks in which audio, video, or computer components are mounted. 1U is equal to 1.75 inches (44.45 millimeters), so that, for example, a 2U component is 3.5 inches high, and a 22U rack houses a stack of components 38.5 inches high.

(4) U is the usual symbol for the enzyme unit.

(5) U is the German symbol for a turn or revolution (Umdrehung), usually seen in combinations such as U/min, the German equivalent of the English symbol rpm for revolutions per minute (rpm). / Умдреун (Umdrehung).

U = UNIFORM

UA = UKRAINE

U/A = UNDERWRITING ACCOUNT

U/A = UNDERWRITING AGENT

UA = UNITS OF ACCOUNT

UA = URBAN AGRICULTURE

UA = URBANIZED AREA

UAF = UNIVERSITY OF AGRICULTURE AND FORESTRY

UAH = UKRAINIAN HRYVNIA

UAS = UNIVERSITY OF AGRICULTURAL SCIENCES

UAS = UREA–AMMONIUM SULFATE

UAV = UNMANNED AERIAL VEHICLE

UAW = UNITED AUTOMOBILE WORKERS

UBERRIMAE FIDES = УБЭРРИМАЭ ФИДЭС (или САМЫМ ЧЕСТНЫМ ОБРАЗОМ) – Uberrima Fides (sometimes seen in its genitive form Uberrimae Fidei) is a Latin phrase meaning Utmost Good Faith (literally, Most Abundant Faith). It is the name of a legal doctrine which governs insurance contracts. This means that all parties to an insurance contract must deal in good faith, making a full declaration of all material facts in the insurance proposal. This contrasts with the legal doctrine of caveat emptor (let the buyer beware). The Latin term Uberrima Fides means, in a UK legal context:- Good Faith. Uberrima Fides:- 'utmost good faith'; a contract of insurance is a contract based on the principles of utmost good faith. It requires proposers to give all relevant information to the insurer and requires insurers to deal openly and honestly with policyholders. Uberrima Fides:- in Latin:- Utmost Good Faith; the basis of all insurance contracts. See also Utmost Good Faith. Uberrima Fides:- a condition of certain types of contract, for instance, the provision of insurance cover. The benefiting party is required to disclose all material facts that may affect the value of the contract, whether requested to or not. Failure to supply such information or the provision of false information may nullify the ... / Крайняя Добросовестность (на Латинском языке) (Uberrima Fides):- основа всех страховых договоров. Смотрите также Наивысшая Добросовестность (Utmost Good Faith). Латинское словосочетание Убэрримаэ Фидэс (Uberrima Fides) наивысшая добросовестность или наивысшая степень доверия. Фидэс (Fides), означающее Вера. Наивысшая Добросовестность (Utmost Good Faith или на Латинском Uberrima Fides):- фундаментальный принцип страхового дела, предполагающий, что лицо, желающее оформить страховой полис, должно предоставить страховщику всю необходимую для правильного расчёта страховой премии за страхуемый риск информацию. От страховщиков ничего нельзя утаивать даже в тех случаях, когда они специально не требуют какой-либо информации. Принцип имеет очень большое значение, так как страховщик обычно не располагает всеми фактами, связанными со страхованием риска; единственным источником информации для него может служить сам страхователь. Если обнаружится, что страхователь утаил информацию или дал ложные сведения, страховщик имеет право рассматривать полис как недействительный, и суд подержит его отказ платить страховую сумму. Смотрите также Наивысшая Добросовестность или Наивысшая Степень Доверия (Utmost Good Faith).

UBIQUINONE = УБИХИНОН – Ubiquinone:- Ubiquinones are a class of fat-soluble benzoquinones that are involved in the body's mitochondrial electron transport. They are found in most organisms, from Bacteria to mammals, hence the name 'Ubiquinone' ('Ubiquitous or Widespread Quinone'). Generic Name:- Ubiquinone (Coenzyme Q-10); Brand Names:- Coenzyme Q10, CoQ10, elppa CoQ10, LiQsorb, Q-Sorb Co Q-10, QuinZyme, Co-Q10, NutraDrops, Liquid Co-Q10, Co Q-10, CoEnzyme Q10. Ubiquinone is a vitamin-like substance that is made naturally in the body. Ubiquinone is also known as Coenzima, Ubidcarenone, Ubidécarénone, and Ubiquinol. The first ubiquinone was isolated in 1957. Since that time, ubiquinones have been extensively studied in Japan, Russia, and Europe with research in the US beginning more recently. Popular press accounts claim that roughly 12 million Japanese use ubiquinones as the medication of choice for management of cardiovascular diseases, with more than 250 commercially available preparations. Ubiquinone is touted as an effective treatment of congestive heart failure (CHF), heart rhythm irregularities, high blood pressure, and in reducing injury to the heart muscle caused by lack of oxygen. Other claims include increasing exercise tolerance, stimulating the immune system, and counteracting the aging process. Ubiquinone has not been approved for therapeutic use in the US, but it is available as a food supplement. Ubiquinone is likely effective in alternative medicine as an aid in treating coenzyme Q-10 deficiency, or reducing the symptoms of mitochondrial disorders (conditions that affect energy-production in the cells of the body). Ubiquinone is also possibly effective in preventing migraine headaches, lowering blood pressure, preventing a second heart attack, or slowing the progression of early Parkinson's disease. Ubiquinone is also possibly effective in improving symptoms in people with congestive heart failure, nerve problems caused by diabetes, Huntington's disease, muscular dystrophy, or macular degeneration (age-related vision loss). Ubiquinone has also been used to treat Alzheimer's disease, high cholesterol, or amyotrophic lateral sclerosis (Lou Gehrig's disease). However, research has shown that ubiquinone may not be effective in treating these conditions. Research also has shown that ubiquinone is not likely to be effective in increasing athletic performance. Other uses not proven with research have included treating asthma, COPD, cancer, diabetes, certain heart problems, fibromyalgia, hepatitis C, kidney problems, high blood pressure during pregnancy, muscle problems caused by taking 'statin' cholesterol medicine, and other conditions. Ubiquinone is often sold as an herbal supplement. There are no regulated manufacturing standards in place for many herbal compounds and some marketed supplements have been found to be contaminated with toxic metals or other drugs. Herbal/health supplements should be purchased from a reliable source to minimize the risk of contamination. Important information:- Follow all directions on the product label

and package. Tell each of your healthcare providers about all your medical conditions, allergies, and all medicines you use. Before Taking This Medicine:- Ask a doctor, pharmacist, or other healthcare provider if it is safe for you to use this product if you have ever had:- (i) high or low blood pressure; (ii) if you are receiving chemotherapy; or (iii) if you smoke. Ubiquinone is considered possibly safe to use during pregnancy. However, do not use this product without medical advice if you are pregnant. It is not known whether ubiquinone passes into breast milk or if it could harm a nursing baby. Do not use this product without medical advice if you are breast-feeding a baby. Do not give any herbal/health supplement to a child without a doctor's advice. How Should I Take Ubiquinone? When considering the use of herbal supplements, seek the advice of your doctor. You may also consider consulting a practitioner who is trained in the use of herbal/health supplements. If you choose to use ubiquinone, use it as directed on the package or as directed by your doctor, pharmacist, or other healthcare provider. Do not use more of this product than is recommended on the label. Measure liquid ubiquinone carefully. Use the dosing syringe provided, or use a medicine dose-measuring device (not a kitchen spoon). To take the disintegrating tablet, use dry hands to remove the tablet from the package, and place it in your mouth. It will begin to dissolve right away. Do not swallow the tablet whole. Allow it to dissolve in your mouth without chewing. Do not use different forms of ubiquinone at the same time without medical advice. Using different formulations together increases the risk of an overdose. Your blood pressure may need to be checked while you are taking ubiquinone. If you need surgery, stop taking ubiquinone at least 2 weeks ahead of time. Store ubiquinone at room temperature, away from light, heat, and moisture. Keep the medicine bottle closed when not in use. What Happens If I Miss A Dose? Skip the missed dose if it is almost time for your next scheduled dose. Do not use extra medicine to make up the missed dose. What Happens If I Overdose? Seek emergency medical attention or call the Poison Help line at +1-800-2221222. What Should I Avoid While Taking Ubiquinone? Avoid using ubiquinone together with other herbal/health supplements that can also lower blood pressure. This includes andrographis, casein peptides, cat's claw, fish oil, L-arginine, lycium, stinging nettle, or theanine. Ubiquinone Side Effects:- Get emergency medical help if you have signs of an allergic reaction:- hives; difficult breathing; swelling of your face, lips, tongue, or throat. Although not all side effects are known, ubiquinone is thought to be likely safe for most adults when used as directed. Stop using ubiquinone and call your healthcare provider at once if you have:- very low blood pressure – dizziness, severe weakness, feeling like you might pass out. Common side effects may include:- (i) upset stomach, nausea, vomiting, loss of appetite; (ii) diarrhea; (iii) skin rash; or(iv) low blood pressure. This is not a complete list of side effects and others may occur. Call your doctor for medical advice about side effects. You may report side effects to FDA at 1-800-FDA-1088. Also called Coenzyme Q. Ubiquinone, any of several members of a series of organic compounds belonging to a class called Quinones. Widely distributed in plants, animals, and microorganisms, ubiquinones function in conjunction with enzymes in cellular respiration (i.e. oxidation-reduction processes). The naturally occurring ubiquinones differ from each other only slightly in chemical structure, depending on the source, the structures resembling those of the fat-soluble vitamin K and certain derivatives of vitamin E. Also known as Coenzyme Q. / болезнь Ханиньтчэна (Huntington's disease). болезнь Лу Гэрига (Lou Gehrig's disease). Под Убихинонами, от Латинского слова Ubique, означающее Везде или Повсюду, и хинон), бензохиноны, коферменты Q, KoQ, производные 5-метил-2,3-диметоксихинона, у которых к 6-му атому углерода присоединена полиизопреновая цепь; различаются числом (от 6 до 10) изопреновых звеньев (C_5H_8). Принимают участие в реакциях, обеспечивающих живые клетки энергией. Обозначаются:- $УХ_n$ или KoQ_n; в первом случае n – число углеродных атомов, во втором – число изопреновых звеньев (то есть, например, $УХ_{30}$ соответствует KoQ_6). Бесцветные кристаллические вещества, с максимумом поглощения при 270 мкм, нерастворимы в воде, растворимы в органических растворителях. Присутствуют во всех организмах:- у Млекопитающих преобладает $УХ_{50}$, у Грибов – $УХ_{30–50}$, у Бактерий – $УХ_{40}$, у Простейших – $УХ_{40–50}$, у Насекомых – $УХ_{45–50}$. В небольших количествах $УХ_{40–50}$ встречаются в митохондриях Растений; в хлоропластах Растений содержатся близкие к убихинонам пластохиноны, у некоторых Бактерий – различные нафтохиноны. Биологическое действие убихинонов основано на их способности к обратимым окислительно-восстановительным превращениям. Убихиноны локализованы в цитоплазматических мембранах (у Бактерий) или внутренних мембранах митохондрий и участвуют в переносе электронов и водорода по дыхательной цепи на участке между флавопротеидом и цитохромом b (смотрите Окислительное Фосфорилирование).

UBIQUITIN = УБИКВИТИН (или УБИХИТИН) – Ubiquitin is a small protein present in all eucaryotic cells (i.e. it is ubiquitous) which plays an important role in 'tagging' other protein molecules (e.g., old ones which are degraded/mis-folded, or no longer needed) so they are destined (marked) for destruction (via proteolytic cleavage). Such proteins are then broken-down in cell's proteasomes and their constituents recycled; because they are damaged or no longer needed by the body. The ubiquitin molecules are then available for reuse. That tagging/marking-for-destruction occurs via fusion of the ubiquitin to the relevant protein molecules, and those 'tagged' protein molecules are said to have been ubiquitinated. The overall ubiquitination process was discovered/delineated during the 1970s and 1980s by Irwin Rose, Aaron Ciechanover, and Avram Hershko. / Американский биолог Овин Элэн Роуз (Irwin Allan Rose; 1926–2015), Израильский биолог Ахарон Чэхановэр (Aaron Ciechanover; 1947–), и родившийся в Венгрии Израильский биохимик Аврам Хэршко (Avram Hershko). , от Латинского слова Ubique, означающее Везде или Повсюду, и . Убиквитин – небольшой белок, состоящий из 76 аминокислотных остатков, который встречается во всех эукариотических клетках. Модификация убиквитином различных белков-мишеней определяет его роль во многих внутриклеточных процессах, таких как регуляция экспрессии генов, клеточного цикла и деления, ответ на стресс, элиминация повреждённых белков, репарация ДНК, импорт белков в митохондрии, сборка рибосом, апоптоз и другие. Нарушения убиквитинирования белков и их последующей деградации в протеасомах играют важную роль в развитии нейродегенеративных заболеваний, включая болезнь Паркинсона. Хотя митохондрии мозга Крыс обладают собственной убиквитин-конъюгирующей системой, роль убиквитина в обмене митохондриальных белков, конкретные белки-мишени убиквитинирования в норме и особенно при нейродегенеративных заболеваниях, изучены недостаточно. Обнаружено накопление убиквитин-белковых агрегатов в митохондриях мозга при ряде биологических моделей нейродегенеративных заболеваний, однако значение убиквитин-конъюгирующей системы митохондрий и тем более белки-субстраты практически неизвестны. Убиквитин – один из самых распространённых белков в природе. Он синтезируется во всех эукариотических клетках – от дрожжей до человека, а у человека – от клеток кожи до нейронов. Пика известности этот белок достиг в 1980-х, когда обнаружилось, что убиквитинилирование является 'поцелуем смерти' для белков. Действительно, одна из форм убиквитина является маркёром деградации выполнивших свою функцию или 'поломанных' белков. Потом было обнаружено и второе, противоположное, его свойство – убиквитинилирование белков ряда сигнальных путей регулирует их активность и, в результате, опосредует передачу сигнала в ядро. Наконец, недавно было открыто, что функции убиквитина распространяются и на регулирование аппарата ядра:- показана его роль в регулировании транскрипции генов путём модификации РНК-полимеразного комплекса.

UDBATTA DISEASE = БОЛЕЗНЬ УДБАТТА – Udbatta Disease:- Ephelis Oryzae by Sydow (Sexual Stage:- Balansia Oryzae-Sativae). Period of occurrence:- panicle emergence stage. Collateral Hosts:- Grasses, Isachne, Elegans, Cynadon Dactylon, Pennisetum Sp. and Eragrostis Tenuifolia. Damage symptoms:- (i) stunted growth of affected seedlings; (ii) the panicle emerges from the leaf sheath, as a straight, dirty colored, hard, cylindrical spike, considerably reduced in size, much resembling an agarbatti or udbatta; and (iii) no grains are formed on the infected ear instead white mycelium and conidia form narrow stripes on the flag leaf along the veins before the panicle emerge. Management:- (i) use disease free seeds for sowing; (ii) hot water treatment of seeds at 52 °C for 10 min; and (iii) removal and destruction of diseased panicles in field. Udbatta Disease is a Rice disease caused by Balansia Oryzae-Sativae (Ephelis Pallida Pat). The panicles emerge as small cylinders covered with white mycelium. Udbatta Disease or False Ergot of Rice:- Balansia Oryzae-Sativae is an ascomycete related to the ergot Fungi that is pathogenic on a number of Grasses but is of particular concern when it occurs on Rice. Infection of the plant is systemic and results in the loss of most or total yield. Although the wider range of hosts among both wild Species and cultivated forage Grasses can provide a source of inoculum, the pathogen is also shown to be seed-borne in Rice. A recent introduction of the pathogen or a very closely related Fungus to the USA on an ornamental Grass suggests an alternative means of introduction. The pathogen is reported primarily from Southern and Eastern Asia and a few West African and Pacific island countries. There is evidence for ecologically limitations on its spread and, where it is already endemic, occurrence is sporadic. Stromata on mummified spikelets, hemispherical, capitate, gregarious, 0.67–1.2 µm diam with a black, coarsely papillate surface, yellowish-brown to white interior, arising from a mummified spikelet upon which the conidiamata developed. Ascomata with perithecia embedded in periphery stromatal head, perithecia rounded, ovoid to pyriform, 125–200 · 85–100 µm diam. Asci cylindrical, 92–120 · 6 µm with a rounded, thickened apex, an attenuated base, eight-spored. Ascospores filiform, non-septate, straight or curved, 12–27 · ca. 1 µm in width. Acervuli on surface of mummified inflorescence emerging from leaf sheath; when wet, appearing gelatinous, cupulate or convex fructification, 1–1.5 mm diam bearing a palisade of conidiophores. Conidiophores terminating in narrow conidiogenous cells that proliferate percurrently to form a mass of filiform to acicular, hyaline conidia, 13–35 · 1–2 µm. Similarities To Other Species/Conditions Tsukiboshi et al. (2008) observed no differences in morphology between isolates of two molecularly distinguishable groups of Ephelis Japonica; these groups were related to those which Tanaka et al. (2001) linked to two different Species of Balansia, the Asian Balansia Andropogonis and the American Balansia Discoidea. Some identifications of Ephelis Oryzae on Grasses have been based primarily on conidium size and thus may be erroneous. Ephelis Oryzae and Balansia Andropogonis share hosts in several Grass Genera:- Chrysopogon, Cynodon, Digitaria, Echinochloa, Microstegium, Panicum, Paspalum and Pennisetum. Therefore, although Balansia Andropogonis may produce the teleomorph on infected heads, distinguishing between the species in the absence of the teleomorph is not easy. Notes On Taxonomy/Nomenclature:- The Fungus causing Udbatta disease was described from India in its anamorphic (spermatial) stage as Ephelis Oryzae by Sydow (1914). Narasimhan and Thirumalachar (1943) incubated infected Rice grains on sand to obtain immature teleomorphic stromata. They referred to the Fungus as Balansia Oryzae, but did not formally describe the sexual stage. Hashioka (1971) described the teleomorph from herbarium specimens under the name Balansia Oryzae-Sativae. Deighton (1937) reported a similar disease from Sierra Leone and referred to the causal organism as Ephelis Pallida Pat. distinguished from Ephelis Oryzae by its smaller spores. Deighton (1956) also found the Balansia state on Rice and several wild Grasses. Hashioka (1971) considered the Fungus from Sierra Leone to be Ephelis Oryzae (Ou, 1985). Phylogenetic studies (Kuldau et al.,1997; White., 2000; Bischoff et al., 2004) have placed the group of Fungi with an Ephelis anamorph as a discrete Group within the Family Clavicipitaceae, which includes the ergot Fungi. Tanaka et al. (2001) found two subgroups within the clade of Ephelis-producing Fungi, one including Balansia Andropogonis and some Ephelis isolates from Asia and another comprised of isolates identified as Ephelis Japonica Henn. from Grasses in Asia, the one available isolate of Ephelis Oryzae from India, and isolates from the American Species Balansia Discoidea (=Balansia Strangulans forma Discoidea). Because isolates from some host plants occurred in both groups, and only one Ephelis Oryzae isolate was available for sequencing, it could not be concluded that all of the Ephelis reported from Rice and other Grasses in India necessarily belonged to the second Subgroup (Tanaka et al., 2001), that is, some of what was reported as ‘udbatta’ might have been caused by isolates related to Balansia Andropogonis. According to Tai and Siang (1948), Ephelis Oryzae has conidiomata that are cupulate or convex; Balansia Andropogonis is another Species in the Ephelis-producing clade that has cupulate conidiomata (Reddy et al.,1998). Because Tanaka et al. (2001) noted that the name Ephelis Japonica predated Ephelis Oryzae, some subsequent work has applied the earlier name to the udbatta pathogen (Zhou et al., 2003; Tsukiboshi et al., 2008), synonymizing that disease with ‘black choke’ of Grasses. Examining twenty isolates from Grasses in Japan, Tsukuboshi et al. (2008) found two RFLP patterns of DNA among them, although the conidia could not be distinguished and the observed isolate morphology fit the descriptions of both Ephelis Japonica and Ephelis Oryzae. The more widespread type A RFLP subgroup was identified with the Balansia Discoidea/Ephelis Japonica Subgroup of Tanaka et al (2001); the type A RFLP Subgroup, found only in Okinawa, the southernmost part of Japan, was identified with the Balansia Andropogonis Subgroup. The lack of distinguishing morphology in the anamorph and the greater distribution of the isolates corresponding to Ephelis Oryzae, the udbatta pathogen, indicate even further that accurate identification of Ephelis Species on Grasses in Southern Asia, at least, and probably worldwide, will require examination by molecular techniques. Distribution:- As Balansia Oryzae-Sativae, with the anamorph Ephelis Oryzae or Ephelis Pallida, this pathogen is reported primarily from Southern and Eastern Asia and a few West African and Pacific island countries. If the suggested identity with Ephelis Japonica (Tanaka et al., 2001) is accepted, then the Fungus occurs in the Western Hemisphere as well, having been reported from Puerto Rico and the Virgin Islands (USDA/SMML, 2010). There is one record from Rice in Louisiana, USA (Anon., 1960). Risk Of Introduction:- Historically, ‘udbatta’ disease has caused significant yield losses in areas where it is endemic, but its occurrence has generally been sporadic and of minor importance (Lee and Gunnell, 1992). Use of resistant Varieties and improved cultural practices eventually reduced the incidence to a very low level in both India and China (Tanaka

et al., 2001). Therefore, the risk of an introduction to a Rice-growing area depends on the existing level of resistance in the predominant Varieties grown and the cultural practices, including seed treatment, that are already in use. Some effect of the local environment was also considered to be involved with incidence of the disease (Tai and Siang, 1948; Mohanty, 1964) but the particular factors involved were not determined. Detection And Inspection Methods:- While still within the sheaths, the panicles of infected Rice plants become matted together by the mycelium of the Fungus. They emerge as single, small, cylindrical rods, covered by white mycelium. In time, they become hard and sclerotium-like, bearing the conidiomata which appear as small black masses. Infected plants are usually stunted and occasionally, the white mycelium and conidia form narrow stripes along the veins on the flag leaves prior to panicle emergence. The flag leaf and sheath of infected tillers are sometimes slightly distorted and the upper leaves (including the flag leaf) may appear silvery (Booth, 1979). Diagnostic Method:- The symptoms described for this disease make it readily recognizable in mature Rice plants. A means to diagnose seedlings or stunted immature plants or to test asymptomatic seed rapidly and accurately is needed. No DNA sequences for Balansia Oryzae-Sativae or Ephelis Oryzae are available in GenBank for use in molecular assays, but a few sequences for several DNA regions of Ephelis Japonica have been deposited (NCBI, 2010). Zhou et al. (2003) report a sensitive nested-PCR technique, based on sequences in the ITS regions, for detection of Fungi in either of the Ephelis Japonica Subgroups of Tanaka et al. (2001). Species-specific primers enabled detection in asymptomatic plant tissue of Grasses. Notes On Crops/Other Plants Affected:- The Fungus has many Grass Hosts including Isachne Elegans, Arthraxon Ciliaris var. Coloratus, Sacciolepis Indica, Cynodon Dactylon, Secale Cereale and Oryza Brachyantha (Rao et al., 1959; Venkatarayan, 1937; Deighton, 1956). Other hosts include Sehima Nervosum (Hiremath et al., 1991) and Sorghum Vulgare (Gowda et al., 1981; Hiremath et al., 1982). Paspalum Orbiculare, Eragrostis Nigra and Alloteropsis Cimicina were reported as newly observed weed hosts by Indrasenan and Mammen (1983). Cotton Grass, Imperata Cylindrica, was found infected in the vicinity of Rice fields in Mysore, Maharashtra, India (Govindu, 1969). A Fungus found on Microstegium Nudum and Leptochloa Chinensis was tentatively assigned to Ephelis Oryzae by Mohanty (1975b). Infection occurred on Pennisetum Typhoideum (= Pennisetum Glaucum, Pearl Millet) growing next to a crop of Setaria Italica (Foxtail Millet). The florets in the lower half of the affected head were greyish, stuck together and pressed towards the rachis (Reddy and Channamma, 1976). Ephelis Species, recorded as Ephelis Oryzae, Ephelis Japonica or Ephelis Pallida, have also been observed on, or isolated from, Grass Species in many additional Genera, including Acroceras, Andropogon, Brachiaria, Chloris, Chrysopogon, Digitaria, Echinochloa, Eragrostis, Eriochloa, Eulalia, and Panicum (Venkatakrishniah, 1952; Deighton, 1956; Tanaka et al., Eragrostis, Eriochloa, Eulalia, and Panicum (Venkatakrishniah, 1952; Deighton, 1956; Tanaka et al., 2001; Tsukuboshi et al., 2008; SMML/USDA, 2010). In the USA, the pathogen was discovered on an imported ornamental Grass, Pennisetum Purpureum (Roberts and White, 2006). Symptoms:- Infection is systemic and most or all of the tillers are involved. Infected plants are usually stunted and, occasionally, white mycelium and conidia form narrow stripes along the veins on the flag leaves prior to panicle emergence (Tai and Siang, 1948). The flag leaf and sheath of infected tillers are sometimes slightly distorted and the upper leaves (including the flag leaf) may appear silvery (Mohanty, 1971; Booth, 1979). Occasionally the head may fail to emerge (Narasimhan and Thirumalachar, 1943). Infected plants often produce fewer heads (Mohanty, 1976; Shivandanappa and Govindu, 1976). Symptoms become most characteristic at the time of panicle emergence. While still within the sheaths, panicles become matted together by the mycelium of the Fungus. They emerge as single, small, cylindrical rods, covered with white mycelium. Spikes infected by Ephelis Oryzae are somewhat dry and mummified with partially formed buds and, become darker in color and more stromatic as conidial acervuli, appearing as small black masses, develop on the surface. When wet, these conidial acervuli appear gelatinous; they consist of a saucer-shaped fructification bearing a palisade of conidiophores and a mass of conidia (Booth, 1979). Biology And Ecology:- The systemic infection, results in the emergence of an erect, greyish-white, cylindrical axis from the leaf sheath instead of a normal inflorescence (Booth, 1979). The primary source of inoculum is considered to be infected seeds. There is no evidence that the pathogen is soilborne (Mohanty, 1964). Inoculation of heads before flowering resulted in a significant increase in infection in the succeeding crop (Mohanty, 1964). Inoculation of dry seeds with a spore suspension of Ephelis Oryzae, or treating dry or pre-soaked seeds with spore dust, induced the disease more effectively than inoculation of germinated seeds. Seedling infection appears to be the principal mode of infection; inoculation of plants with spore suspensions at various growth stages, including flowering, failed to produce the disease (Mohanty, 1977). Mycelium and conidia were observed in and on the leaf blades and sheathes of infected tillers (Mohanty, 1979). The disease is prevalent at higher elevations in India, indicating that the eco-climatic conditions prevailing in these areas are more favorable to the completion of the life cycle of the fungus than those on the plains (Mohanty, 1964). An average soil temperature of 28 °C and abundant soil moisture in the nursery beds during the first week after sowing, followed by average soil temperatures of 28–38 °C and adequate soil moisture in the subsequent period of growth up to flowering, is conducive to the development of the disease. Air temperature appears to have no direct effect, but may indirectly influence the soil temperature. Consequently, disease development is greater during seasons of higher air temperature (about 25 °C) in the first week after sowing (Mohanty, 1976). Conidia of Ephelis Oryzae germinate at temperatures between 18 and 30 °C, with an optimum of 26 °C. Cultures grow slowly, but produce abundant conidia on most common laboratory media. They are resistant to drying; about one-third of spores which were air-dried on glass slides at 26 °C for 162 days were still capable of germinating in water. Approximately the same proportion of spores survived for five months on infected rice panicles exposed to winter air temperature and humidity in Yunnan, China (Tai and Siang, 1948). The life cycle of the Fungus is not well known (Lee and Gunnell, 1992). Tai and Siang (1948) suggest that initial inoculum may come from overwintering infected heads or from surviving stools of harvested plants left in damp parts of the field. That inoculation of Rice heads in one season could result in infection of plants growing from the seed the next year was demonstrated by Mohanty (1964), but natural plant-to-plant inoculation has not been observed or demonstrated in the field. Inoculum for infection of Rice might also come from infected wild Grasses (Padwick, 1950). The role of the sexual stage is not known; it was not observed to occur in areas of India where the pathogen was endemic (Narusimhan and Thirumalachar, 1943; Mohanty, 1964, 1979). Physiology And Phenology:- Tsukiboshi et al. (2008) observed Subgroups among Ephelis Japonica (considered to include Ephelis Oryzae) isolates in Japan that appeared to correspond to either Balansia Discoidea or Balansia Andropogonis. Both of these Species were described as ‘epibiotic’ by Reddy et al. (1998) rather than as ‘endophytic’. Nevertheless, the Fungus does exist systemically within the plant until heading, after infecting the seed or seedling (Mohanty, 1964). Further evidence for the systemic nature of infection exists in the observation of Mohanty (1979) that approximately the same number of tillers were infected in the ‘ratoon’ regrowth of diseased plants whose stems were cut back after the harvest. Movement And Dispersal:- Natural Dispersal:- Conidia produced on the diseased heads or on the leaf blades (Mohanty, 1964, 1975a) are the only propagules known for this Fungus in most of its range. These are likely to be wind-disseminated between plants, although plant-to-plant infection has not been demonstrated or observed. Wild Grasses probably serve as a source of inoculum for Rice (Padwick, 1950); the inoculum would have to be transported into the field, and wind is the likely carrier for dry spores. Vector Transmission:- Not reported. Accidental Introduction:- The pathogen can be carried on or in seed (Mohanty, 1964; Misra et al., 1994b). Seedborne Aspects Of Disease Incidence:- There is no information available on incidence of natural seed infection. Mew and Gonzales (2002) do not address Ephelis Oryzae as a seedborne pathogen. Effect on Seed Quality:- Infected heads are a 100% loss (Mohanty, 1971). Seeds infected by the Fungus appear discolored, abnormally small, deformed and contain whitish masses of conidia (Misra et al., 1994b). As the disease develops, the entire endosperm is destroyed, leaving a black hyphal mass covered by persistent glumes (Narasimhan and Thirumalachar, 1943). Mohanty (1964) did not report symptoms on seeds of artificially inoculated heads; damaged seed would,

however, generate a poor host for systemic infection the following season. Pathogen Transmission Mohanty (1964) demonstrated that inoculation of Rice heads before flowering causes a significant increase in the infection of the succeeding crop. Inoculation of dry seeds with a spore suspension of Ephelis Oryzae, or soaking seeds with spore dust, induced the disease more effectively than inoculating germinated seeds (Mohanty, 1977). Seedling infection appears to be the principal mode of infection; inoculation of plants with sprays of spore suspensions at various other growth stages, including flowering failed to produce the disease in the plants (Mohanty, 1977). The primary source of inoculum is therefore considered to be infected seeds. There is no evidence that the pathogen is soilborne (Mohanty, 1964). Seed Treatment:- The Fungus is seedborne and can be controlled by treatment of presoaked seeds with hot water at 54 °C for 10 minutes (Mohanty, 1979). Other methods include 'solar treatment' – the exposure of presoaked seeds to sunlight on a hot paved surface – and the use of ethylmercury chloride, carboxin or oxycarboxin, or thiabendazole (Mohanty, 1971). In tests of infested seed, more infection developed in untreated unsprouted seed than in untreated sprouted seed, possibly due to the faster growth of the plant. Carbendazim performed best in reducing disease incidence and increasing yields, followed by mancozeb and iprobenfos, (Sannegowda and Pandurangegowda, 1986). Gowda (1980) reported that a hot-water seed treatment of 54 °C for 20 minutes was highly effective in controlling the disease; this is a departure from the 10 minute period suggested by other researchers. For further information on physico-chemical methods of seed treatment for control of this disease, see Mohanty (1975b). Seed Health Tests:- Blotter method (Misra et al., 1994a) (1) Place two or three layers of good-quality white or colored blotting paper, moistened with distilled water, into Petri dishes (9.5 cm) of Pyrex glass or clear plastic (to allow the penetration of NUV light). (2) Distribute seeds from the sample to be tested (with or without pretreatment) evenly on the blotting paper at 25 seeds/plate. (3) Incubate the seeds at 22 °C under a 12-h light and 12-h dark cycle with NUV light for 6–8 days. (4) Express the number of infected seed as a percentage of the total number of seeds. Washing Test Method (Misra et al., 1994a):- (1) Place the seed sample to be tested in a beaker or flask and add water, with or without a wetting agent or alcohol. (2) Shake the container vigorously to remove any organisms adhering to the seed surface. (3) Transfer the washings into centrifuge tubes and centrifuge for about 5 minutes at 3 000–5 000 rpm. (4) Decant excess liquid from each tube and examine the extracted material under a compound microscope for fungal spores, hyphae and nematodes. (5) Stain with lactophenol blue to color the fungal spores and hyphae. (6) Count the number of fungal spores using a haemocytometer. Impacts:- Economic impact:- Udbatta disease, caused by Ephelis Oryzae, infected 9–11% of Rice panicles in Bombay, India, and 5-20% in Yunnan, China (Ou, 1985). The disease was considered important in some areas of Bangalore, India, causing direct and indirect losses of between 1.75 and 3.69% for different Rice Cultivars (Shivandanappa and Govindu, 1976). Govindu (1969) reported 10% infection on the Rice Cultivar IR-8. Levels of earhead infection are usually 2–3%, but in years when the disease is severe, losses of up to 11% are common in susceptible Varieties (Mohanty, 1964) Kamat and Patel (1951) reported that between 9 and 11% of the plants in Northern areas of Kanara District, Bombay State, were infected. Tai and Siang (1948) recorded 5–30% earhead infection in damp fields in the Kunming Lake area of China. Preliminary disease surveys conducted in the mangrove swamp Rice fields of Northern Sierra Leone during the 1977 cropping season indicated that this wass a potentially major disease (Fomba and Raymundo, 1978). Overall, Udbatta disease causes significant yield losses in areas where it is endemic, but its occurrence is generally sporadic and of minor importance (Gowda and Janardhan, 1980; Lee and Gunnell, 1992). Use of resistant Varieties and improved cultural practices eventually reduced the incidence to a very low level in both India and China (Tanaka et al., 2001). Management:- SPS measures:- Because seed and seedling infection is apparently symptomless, uncertified Rice seed, and seed and immature plants of warm-season Grasses, may need to be quarantined before entry to Rice or millet-growing countries while testing, either by slower cultural methods or a rapid and sensitive molecular technique (Zhou et al., 2003) is done. Cultural Control And Sanitary Measures:- Sowing either very early (last week in May) or very late (first or second week of July) rather than at the usual time (second or third week of June) reduced the incidence of Udbatta disease in Rice Variety J1 in Jeypore, Orissa, India (Mohanty, 1964). Chemical Control:- In field plots containing inoculated plants, carbendazim reduced disease intensity the most on Rice cv. IET 1444, followed by aureofungin (a fungicidal antibiotic), iprobenfos and mancozeb. Aureofungin and benomyl increased grain yield of Rice cv. Kalinga, and benomyl, more than carbendazim and aureofungin, increased that of Cultivar IET 1444 (Indrasenan et al., 1981). For further information on chemical control of Udbatta disease, see Mohanty (1971) and Pandurangegowda et al. (1986). Soil treatments with carbendazim + thiram with and without seed treatment with the same material or an organic mercurial provided the best disease control and increase in yield. Under conditions of natural infection in Orissa, India. Soil treatment with carbendazim + thiram or with quintozene, without any seed treatment, was better than seed treatment alone, without any soil treatment (Padhi and Mohanty, 1984). Host resistance Some resistance to Ubdbatta disease was found in pathology experiments and screening trials for multiple Rice diseases in India (Mohanty, 1964; Sanne-Gowda et al., 1973; Shivandanappa and Govindu, 1976; Indrasenan et al., 1982; Gangopadhyay andPadmanabhan, 1987). According to Tanaka et al. (2001), improved Cultivars of Rice has contributed to the near-elimination of the disease in India and China. Gaps In Knowledge/Research Needs:- The relationship of this Species to Balansia Andropogonis should be clarified, and the true host ranges of both investigated. If both Species occur on the same host Species of other Grasses, perhaps both can infect Rice or Sorghum. When the Species distinction is clear, then the true distribution should be determined, particularly whether the Ephelis Japonica reported from the Americas is identical, or closely related, to the rice pathogen in Asia. The biology of this Species requires more investigation. How does seed of Rice become infected in the field – by plant-to-plant dispersal of conidia from other Rice plants or from Grasses, or as the result of infected and clean seeds and heads being harvested together? The pathogen has been shown to persist in the bases of Rice plants and infect the 'ratoon' crop. Does it persist in a similar manner in perennial Grasses? The teleomorph was observed in Sierra Leone – does it also occur in Asia, and what role, if any, does it have in the cycle of the Rice pathogen? A PCR technique should be tested for the detection of seed infection by Ephelis Oryzae. Symptoms:- a white mycelial mat ties panicle branches together so that they emerge as single, small, cylindrical rods.

UDEAC = UNION DOUANIÈRE ET ÉCONOMIQUE DE L'AFRIQUE CENTRALE = CUSTOMS AND ECONOMIC UNION OF CENTRAL AFRICA

UDIA = UNITED DAIRY INDUSTRY ASSOCIATION

UDIC = УДИЧЕСКОЕ – The Udic (Latin Udus = Humid) moisture regime is one in which the soil moisture control section is not dry in any part for as long as 90 cumulative days in normal years. If the mean annual soil temperature is lower than 22 °C and if the mean winter and mean summer soil temperatures at a depth of 50 cm from the soil surface differ by 6 °C or more, the soil moisture control section, in normal years, is dry in all parts for less than 45 consecutive days in the 4 months following the summer solstice. In addition, the udic moisture regime requires, except for short periods, a three-phase system, solid-liquid-gas, in part or all of the soil moisture control section when the soil temperature is above 5 °C. The udic moisture regime is common to the soils of humid climates that have well distributed rainfall; have enough rain in summer so that the amount of stored moisture plus rainfall is approximately equal to, or exceeds, the amount of evapotranspiration; or have adequate winter rains to recharge the soils and cool, foggy summers, as in coastal areas. Water moves downward through the soils at some time in normal years. In climates where precipitation exceeds evapotranspiration in all months of normal years, the moisture tension rarely reaches 100 kPa in the soil moisture control section, although there are occasional brief periods when some stored moisture is used. The water moves through the soil in all months when it is not frozen. Such an extremely wet moisture regime is called Perudic (Latin Per = Throughout In Time, and Latin Udus = Humid). In

the names of most taxa, the formative element ‘ud’ is used to indicate either a udic or a perudic regime; the formative element ‘per’ is used in selected taxa. Udic:- pertaining to a soil moisture regime where the soil is not dry for as long as 90 cumulative days. The udic moisture regime is common to soils of humid climates which have well-distributed rainfall, or which have enough rain in summer so that the amount of stored moisture plus rainfall is approximately equal to, or exceeds, the amount of evapotranspiration. Water moves down through the soil at some time in most years. Some soil suborders, like udalf (alfisol) and udept (inceptisol), have a udic moisture regime. / , от Латинского слова Udus, означающее Влажный или Мокрый, . Удический режим увлажнения почв, который характеризуется тем, что почва не высыхает полностью в течение 90 последовательных дней или в течение 60 последовательных дней в 90-дневный период, следующий за летним солнцестоянием, когда температура почвы на глубине 50 сантиметров выше 5 °C.

UDRP = UNIFORM DISPUTE RESOLUTION POLICY

UDRP = UNIFORM DOMAIN NAME DISPUTE RESOLUTION POLICY

UEA = UNITED EGG ASSOCIATION

UEA = USPTO ENTERPRISE ARCHITECTURE

UEAPME = UNION EUROPÉENNE D’ARTISANAT ET DES PETITES ET MOYENNES ENTREPRISES = EUROPEAN ASSOCIATION OF CRAFT AND SMALL AND MEDIUM–SIZED ENTERPRISES

UEP = UNITED EGG PRODUCERS

UEPR = UNEARNED PREMIUM RESERVE

UIT = UNIT INVESTMENT TRUST

UITP = INTERNATIONAL UNION OF PUBLIC TRANSPORT

UK = THE UNITED KINGDOM

UK BALANCE OF PAYMENTS = САЛЬДО ПЛАТЕЖЕЙ СК (или ПЛАТЁЖНЫЙ БАЛАНС СК) – UK Balance Of Payments:- an annual publication of the Office for National Statistics. It is often known as the Pink Book and is now available online as well as in printed form. See also Balance Of Payments. / Платёжный Баланс СК (UK Balance Of Payments):- ежегодная публикация Управления по Национальной Статистике. Её часто называют Розовой Книгой (Pink Book).

UKC = UNITED KINGDOM–CONTINENT

UKLA = UNITED KINGDOM LISTING AUTHORITY

UKMO = UNITED KINGDOM METEOROLOGICAL OFFICE

UK NATIONAL ACCOUNTS = НАЦИОНАЛЬНЫЕ СЧЕТА СК – UK National Accounts:- an annual publication of the UK Office for National Statistics. It is often known as the Blue Book and is now available online as well as in printed form. It provides figures for the gross domestic product and separate accounts of production, income, and expenditure. / Национальные Счета СК (UK National Accounts):- ежемесячное издание Управления по Национальной Статистике. Его часто называют Голубой Книгой (Blue Book). Содержит показатели Валового Внутреннего Продукта (Gross Domestic Product) и отдельные счета производства, доходов и расходов.

UK PREMIUM = ПРЕМИЯ СК – UK Premium is a surcharge applied to United Kingdom (UK) ports. / Под Премией СК понимается надбавка или доплата (surcharge), применяемая в отношении портов Соединённого Королевства (СК).

UKRAINIAN HRYVNIA = УКРАИНСКАЯ ГРИВНА (или УКРАИНСКАЯ ГРЫВНЯ) – Ukrainian Hryvnia:- UAH is the three-letter currency ISO code representing the currency of Ukraine which is commonly known as the Hryvnia.

UKTI = UK TRADE AND INVESTMENT = UNITED KINGDOM TRADE AND INVESTMENT

UK TRADE AND INVESTMENT = ТОРГОВЛЯ И ИНВЕСТИЦИЯ СК – UK Trade And Investment (UKTI) is an organisation responsible for promoting the development of United Kingdom (UK) exports and encouraging foreign companies to invest in the UK.

UK TRANSIT = ТРАНЗИТ ПО СК – UK Transit is a procedure for moving goods under Customs control when import or export formalities are carried out away from the place of importation or exportation, and the movement does not involve another European Union member state. Also know as National Transit.

U/L = UNDERLYING

UL = UNDERWRITER'S LABORATORIES

ULAE = UNALLOCATED LOSS ADJUSTMENT EXPENSES

ULB = UNLIGHTED BUOY

ULC = UNDERWRITER'S LABORATORIES OF CANADA

ULCC = ULTRA LARGE CRUDE CARRIER

ULD = UNIT LOAD DEVICE

UL DOWN = ULTRA LIGHT DOWN

ULEV = ULTRA LOW EMISSIONS VEHICLE

ULEXITE = УЛЕКСИТ (или БОРОНАТРОКАЛЬЦИТ) – Ulexite, borate mineral that consists of hydrated sodium and calcium borate ($NaCaB_5O_9 \cdot 8H_2O$). Individual crystals are colorless and have a vitreous lustre, whereas the more common nodular, rounded, or lenslike crystal aggregates (often resembling cotton balls) are white and have a silky or satiny lustre. Ulexite is found in arid regions, where it may be derived from boron leached from sediments and pyroclastic rocks by circulating waters. Typical occurrences are in saline playas (dry lakes) and marshes, as in Esmeralda County, Nevada; in Death Valley and the Kramer District, California; in the nitrate region of Chile, where it is widespread; and in Canada's Maritime provinces. / Улексит (от имени Немецкого химика Геока Людвихя Улекса (Georg Ludwig Ulex; 1811–1883)) или Боронатрокальцит, минерал подкласса водных боратов, $NaCa[B_5O_9] \cdot 8H_2O$. Кристаллизуется в моноклинной системе. Образует тонковолокнистые сплошные массы или радиально-лучистые агрегаты белого цвета. Твёрдость по минералогической шкале 1, плотность 1 650 килограммов на кубический сантиметр (кг/см^3). Встречается как гипергенный минерал в отложениях озёр; продукт замещения в глинистых гипсоносных породах соляных куполов. Руда бора. Месторождения:- Индерское (СССР), Невада (США).

ULI = UNDERWRITER'S LABORATORIES, INC.

ULLAGE = НЕЗАПОЛНЕННЫЙ ОБЪЁМ (или НЕЗАПОЛНЕННАЯ ЁМКОСТЬ) – Ullage is a free space above a liquid contained in a tank, drum or tank-container, expressed as a percentage of the total capacity. Ullage is often used to leave room for possible expansion of the liquid. See also Outage, and Trade Ullage. Ullage:- (1) the amount of wine or other liquor which has leaked from a cask, rendering the remainder of little worth and fit only to be thrown away. Damaged goods, particularly in relation to victuals, are commonly known on board ship as Ullaged. (2) A lazy or cack-handed sailor who is of little use in a ... Ullage is the space not filled with liquid in a drum or tank. A term Ullage has its roots in Anglo-Norman and Latin and in the XV century when the word meant the volume by which a container is under-filled – that is, the space above the beer. This remains the common usage in the United States, where the headspace in a keg, a cask, or a bottle (for the latter, when beer or wine has leaked or been evaporated out) is referred to as the Ullage. It can also describe the lost liquid itself, especially in cases of leakage or evaporation through corks. The definition is somewhat different in the UK, where 'Ullage' is used to describe ... Ullage:- the empty volume at the top of a container partially filled by liquid ... Ullage:- which derives from the French Ouillage, has had a variety of meanings and uses in the English-speaking wine trade. It can mean the process of evaporation of wine held in wooden containers such as a barrel. The head space left in the container is also called the Ullage, or 'Ullage Space', and the wine in that state is said to be 'on ullage'. The word Ullage is also used for any space in a stoppered wine bottle not occupied by wine (see Fill Level). And ullage is also used as a verb so that a bottle or barrel not entirely full is said to be ... Ullage:- (1) the volume of empty space above a liquid in a container. (2) The volume of lost liquid from a container due to evaporation or ... Ullage:- (1) the amount by which the full capacity of a barrel or similar container exceeds the volume of the contents, as a result of evaporation or leakage. (2) As defined by HM Revenue and Customs, the actual contents of a barrel or similar container at the time of importation into the UK. The difference between this volume and the full capacity is called the Vacuity. / Незаполненный Объём; и Утечка или Недостача (Ullage):- (1) Величина, на которую полный объём бочонка или другой подобной ёмкости превышает объём содержимого в результате происшедших испарений или утечки. (2) По определению Её Королевского Величества Департамента Налогов И Сборов, фактический объём содержимого бочонка или другой подобной ёмкости в момент его ввоза в Великобританию. Разница между этим объёмом и полной вместимостью ёмкости называется Пустотой (Vacuity). Пространство в барабане, цистерне или баке, не заполненное жидкостью. Пустое пространство над жидкостью, содержащейся в цистерне или баке, барабане или контейнере-цистерне, выраженное в процентном соотношении к полной вместимости. В связи с возможным расширением самой жидкости незаполненный объём часто используется для отбрасывания сомнений по этому поводу. Смотрите также Коммерческий Незаполненный Объём или Коммерческая Незаполненная Ёмкость (Trade Ullage). Незаполненный Объём:- расстояние между верхней точкой груза и люками.

ULR = ULTIMATE LOSS RATIO

ULSD = ULTRA LOW SULFUR DIESEL

ULSTER = ОЛСТЁРСКАЯ – Ulster:- originally, the name for a friezé overcoating fabric made in Ulster, Ireland. Today, the word is usually used as a synonym for overcoat. See also Frieze. Ulster is a long loose overcoat of Irish origin made of heavy material, as frieze. / Смотрите также Фризе или Бобрик или Байка (Friezé).

ULTIMATE BENEFICIAL OWNER = НЕПОСРЕДСТВЕННЫЙ БЕНЕФИЦИАРНЫЙ СОБСТВЕННИК – The Ultimate Beneficial Owner (UBO) of a US affiliate is that person, proceeding up the affiliate's ownership chain beginning with and including the foreign parent, that is not owned more than 50 percent by another person. The UBO consists of only the ultimate owner, other affiliated persons are excluded. If the foreign parent is not owned more than 50 percent by another person, the foreign parent and the UBO are the same. A UBO, unlike a foreign parent, may be a US person.

ULTIMATE CONSIGNEE = НЕПОСРЕДСТВЕННЫЙ КОНСИГНАТОР (или НЕПОСРЕДСТВЕННЫЙ ГРУЗОПОЛУЧАТЕЛЬ) – Ultimate Consignee:- the principal party in interest located abroad who receives the exported or reexported items. The ultimate consignee is not a forwarding agent or other intermediary, but may be the end-user. The Ultimate Consignee is the person located abroad who is the true party in interest, receiving the export for the designated end-use. / Конечным Грузополучателем является лицо, находящееся за рубежом, которое является подлинной стороной в интересе, и которое получает вывозную (или

экспортированную) продукцию для конечного использования по назначению. Грузополучатель – лицо, управомоченное на получение груза в месте назначения и несущее соответствующие обязанности, связанные с получением груза.

ULTIMATE NET LOSS = ОКОНЧАТЕЛЬНЫЙ ЧИСТЫЙ УБЫТОК – In reinsurance, Ultimate Net Loss is the term usually means the total sum which the assured, or any company as his insurer, or both, become obligated to pay either through adjudication or compromise, and usually includes hospital, medical and funeral charges and all sums paid as salaries, wages, compensation, fees, charges and law costs, premiums on attachment or appeal bonds, interest, expenses for doctors, lawyers, nurses, and investigators and other persons, and for litigation, settlement, adjustment and investigation of claims and suits which are paid as a consequence of the insured loss, excluding only the salaries of the assured's or of any underlying insurer's permanent employees.

ULTIMATE OSCILLATOR = НЕПОСРЕДСТВЕННЫЙ ОСЦИЛЛЯТОР (или КОНЕЧНЫЙ ОСЦИЛЛЯТОР, или ОКОНЧАТЕЛЬНЫЙ ОСЦИЛЛЯТОР) – Ultimate Oscillator is an oscillator that attempts to combine information for several different time periods into one number. Three different time periods are used, typically a 7-day period, a 14-day period, and a 28-day period. The resulting oscillator is bounded in that it moves between 0 and 100 with 50 as the center line. 70 and 30 are used as overbought/oversold levels. / В техническом анализе биржевых рынков, .

ULTIMATE PURCHASER = НЕПОСРЕДСТВЕННЫЙ ПРИОБРЕТАТЕЛЬ (или КОНЕЧНЫЙ ПРИОБРЕТАТЕЛЬ) – (1) Ultimate Purchaser is generally the last person in the United States who will receive the article in the form in which it was imported; however, for a good of a NAFTA (short for the North American Free Trade Agreement entered into by the United States, Canada and Mexico on August 13, 1992) country (A good of a NAFTA country is an article for which the country of origin is Canada, Mexico or the United States as determined under the NAFTA Marking Rules), the 'Ultimate Purchaser' is the last person in the United States who purchases the good in the form in which it was imported. It is not feasible to state who will be the 'Ultimate Purchaser' in every circumstance. The following examples may be helpful:- (1) If an imported article will be used in manufacture, the manufacturer may be the 'Ultimate Purchaser' if he subjects the imported article to a process which results in a substantial transformation of the article, even though the process may not result in a new or different article, or for a good of a NAFTA country, a process which results in one of the changes prescribed in the NAFTA Marking Rules as effecting a change in the article's country of origin. (2) If the manufacturing process is merely a minor one which leaves the identity of the imported article intact, the consumer or user of the article, who obtains the article after the processing, will be regarded as the 'Ultimate Purchaser'. With respect to a good of a NAFTA country, if the manufacturing process does not result in one of the changes prescribed in the NAFTA Marking Rules as effecting a change in the article's country of origin, the consumer who purchases the article after processing will be regarded as the ultimate purchaser. (3) If an article is to be sold at retail in its imported form, the purchaser at retail is the 'Ultimate Purchaser'. (4) If the imported article is distributed as a gift the recipient is the 'Ultimate Purchaser', unless the good is a good of a NAFTA country. In that case, the purchaser of the gift is the ultimate purchaser. / Непосредственный Приобретатель или Конечный Приобретатель:- как его определяют таможенные служащие – последнее лицо, которое получит привозной (или импортный) товар в том виде, в каком он был привезён (или импортирован).

(2) A term Ultimate Purchaser means, with respect to any new vehicle, the first person who in good faith purchases such new vehicle for purposes other than resale. The term Ultimate Purchaser means with respect to any new automobile, the first person, other than a dealer purchasing in his capacity as a dealer, who in good faith purchases such new automobile for purposes other than resale.

ULTIMATE RECEIVER = НЕПОСРЕДСТВЕННЫЙ ПОЛУЧАТЕЛЬ – Ultimate Receiver:- in Cotton futures trading, a stopper of a Delivery Notice who does not retender the contract during the same deliver period in which he stopped the notice. The Ultimate Receiver takes possession and assumes ownership of the duplicate samples. / Непосредственный Получатель:- в торговле фьючерсами на Хлопок останавливающий (stopper) Уведомление о Поставке (Delivery Notice), который не намерен участвовать в повторном конкурсе по данному контракту в тот же самый период поставки, в течение которого он остановил данное уведомление. Непосредственный получатель берёт в распоряжение и принимает на себя владение образцами дубликатов.

ULTIMATE TENSILE STRENGTH = ОКОНЧАТЕЛЬНАЯ ПРОЧНОСТЬ НА РАСТЯЖЕНИЕ (или ПРЕДЕЛ ПРОЧНОСТИ НА РАСТЯЖЕНИЕ) – Ultimate Tensile Strength (UTS), often shortened to tensile strength (TS) or ultimate strength, is the maximum stress that a material can withstand while being stretched or pulled before necking, which is when the specimen's cross-section starts to significantly stretch. Tensile strength is the opposite of compressive strength and the values can be quite different. The UTS is usually found by performing a tensile test and recording the stress versus strain; the highest point of the stress-strain curve is the UTS. It is an intensive property; therefore its value does not depend on the size of the test specimen. However, it is dependent on other factors, such as the preparation of the specimen, the presence or otherwise of surface defects, and the temperature of the test environment and material. Tensile strengths are rarely used in the design of ductile members, but they are important in brittle members. They are tabulated for common materials such as alloys, composite materials, ceramics, plastics, and wood. Tensile strength is defined as a stress, which is measured as force per unit area. For some non-homogeneous materials (or for assembled components) it can be reported just as a force or as a force per unit width. In the SI system, the unit is the Pascal (Pa) (or a multiple thereof, often MegaPascals (MPa), using the Mega- prefix); or, equivalently to Pascals, Newtons per square meter (N/m^2). The customary unit is pounds-force per square inch (lbf/in^2 or psi), or kilo-pounds per square inch (ksi, or sometimes kpsi), which is equal to 1 000 psi; kilo-pounds per square inch are commonly used for convenience when measuring tensile strengths. See also Tensil Strength.

ULTIMO = УЛЬТИМО (или ПРОШЛОГО МЕСЯЦА) – Ultimo:- also abbreviated as Ult. Formerly, but now rarely, used in commercial letters, meaning 'of last month' (your letter of the 12th ult.). Latin Ultimō mense 'In The Last Month'. See also Instant. Ultimo:- the end of the month or end of the year. / Ультимо или Прошлого Месяца (Ultimo):- . Смотрите также Немедленный/Текущего Месяца (Instant).

ULTISOL = УЛЬТИСОЛ (или УЛЬТИЗОЛЬ) – Ultisol is one of the 12 soil orders in the US Soil Taxonomy. Ultisols are reddish, clay-rich, acidic soils that support a mixed forest vegetation prior to cultivation. They are naturally suitable for forestry, can be made agriculturally productive with the application of lime and fertilizers, and are stable materials for construction projects. Occupying just over 8 percent of the nonpolar continental land area on Earth, they are found in humid temperate or tropical regions, including the South-Eastern United States and China, and in the humid tropics in South America and Africa. Ultisols are found in geologically old landscape settings. They are characterized by a humus-rich surface horizon (the uppermost layer), by a layer of clay that has migrated below the surface horizon, and by a nutrient content low in available calcium, magnesium, potassium, and sodium. The well-developed, extensively leached soil horizons are enriched in kaolin-group clay minerals and in metal oxides and appear as red or bleached layers. Ultisols differ from Alfisols by their few mineral nutrients and high content of aluminum. They differ from Oxisols by the lack – or sometimes deep displacement – of a horizon enriched in aluminum and iron oxides and in kaolin clay minerals.

ULTRACENTRIFUGE = УЛЬТРАЦЕНТРИФУГА – Ultracentrifuge is a high-speed centrifuge that can attain revolving speeds up to 85 000 rpm and centrifugal fields up to 500 000 times gravity. The machine is used to sediment (i.e. cause to settle out) and hence separate macromolecules (i.e. large molecules) and macromolecular structures in a mixture/solution. In general, a centrifuge is a machine that whirls test tubes around rapidly, like a merry-go-round, to force the heavier suspended materials (in the solutions in the test tubes) to the bottoms of those test tubes before the lighter material. / Под Ультрацентрифугой, от Латинских слов Ultra, означающее За Пределами или По Ту Сторону или Сверх, Centrum, от Греческого слова Kéntron, означающее Срединная Точка или Средоточие или Центр, и Fugo, означающее Бег или Бегство, понимается прибор для разделения частиц менее 100 нм (коллоидов, субклеточных частиц, макромолекул белков, нуклеиновых кислот, липидов, полисахаридов, синтетических полимеров и прочих), взвешенных или растворённых в жидкости; это достигается вращением ротора, создающего центробежное поле с ускорением, на много порядков превышающим ускорение силы тяжести. По назначению и конструкции ультрацентрифуги подразделяются на препаративные, аналитические и препаративно-аналитические. Препаративные ультрацентрифуги снабжены угловыми роторами с гнёздами для цилиндрических пробирок, стаканов или бутылок, наклоненных под углом 20–40° к вертикальной оси ротора, либо так называемыми Бакетными Роторами со стаканами, поворачивающимися на 90° при вращении. Существуют также зональные и проточные роторы с одной большой внутренней полостью для фракционируемой жидкости. Препаративные ультрацентрифуги используются для выделения отдельных компонентов из сложных смесей. Аналитические ультрацентрифуги снабжены роторами со сквозными цилиндрическими гнёздами, в которые помещены специальные прозрачные кюветы для исследуемых растворов или суспензий. Процесс перераспределения частиц в них можно наблюдать непосредственно при вращении ротора с помощью специальных оптических систем (рефрактометрических, абсорбционных). Существуют модели аналитических ультрацентрифуг, соединённые с ЭВМ (Электронными Вычислительными Машинами), производящими автоматическую обработку экспериментальных данных. Первая ультрацентрифуга, предназначенная для изучения движения частиц, невидимых в световой микроскоп, создана Шведским физико-химиком Тиодором Сведбарием (Theodor Svedberg; 1884–1971) в 1923 (публикация в 1924). В этой ультрацентрифуге достигались центробежные ускорения всего до 5 000 g. Она имела абсорбционную оптическую систему и использовалась для изучения движения частиц золота диаметром около 5 нм. В 1926 Сведбари сконструировал первую высокоскоростную ультрацентрифугу (41 000 оборотов в минуту (об/мин), ускорения – до 10^5 g), с помощью которой проводились аналитические исследования белков в растворах (в частности, гемоглобина). В 1939 Сведбарием создана аналитическая ультрацентрифуга со стальным ротором (65 000 об/мин). Подавляющее большинство современных лабораторных ультрацентрифуг снабжено электрическими приводами и алюминиевыми или титановыми роторами. В бывшем Союзе Советских Социалистических Республик (СССР) и за рубежом выпускается много видов ультрацентрифуг, в которых создаются центробежные ускорения вплоть до 500 000 g, а разделение частиц и молекул осуществляется в объёмах, измеряемых десятками и сотнями миллилитров (мл). Смотрите также Ультрацентрифугирование.

ULTRACLEAN = УЛЬТРАЧИСТОЕ – Ultraclean:- 1 particle >10 micron per milliliter. See also Superclean. / Ультра, от Латинского слова Ultra, означающее За Пределами или По Ту Сторону или Сверх, .

ULTRAFILTRATION = УЛЬТРАФИЛЬТРАЦИЯ – Ultrafiltration is a (mixture) separation methodology that uses the ability of synthetic semipermeable membranes (possessing appropriate physical and chemical natures) to discriminate between molecules in the mixture, primarily on the basis of the molecules' size/shape. Invented and developed by Dr. Roy J. Taylor in the 1950s and 1960s, ultrafiltration is typically utilized for the separation of relatively high-molecular-weight solutes (e.g. proteins, gums, polymers and other complex organic molecules) and colloidally dispersed substances (e.g., minerals, microorganisms, etc) from their solvents (e.g., water). / Доктор Рой Дьжей. Тэйло (Dr. Roy J. Taylor). Под Ультрафильтрацией, от Латинского слова Ultra, означающее За Пределами или По Ту Сторону или Сверх, и фильтрация, понимается продавливание жидкости через полупроницаемую мембрану – проницаемую для малых молекул и ионов, но непроницаемую для макромолекул и коллоидных частиц. Ультрафильтрация растворов, содержащих молекулы высокомолекулярных соединений, в отличие от ультрафильтрации золей, иногда называют молекулярной фильтрацией. Ультрафильтрацию можно рассматривать как диализ под давлением или как обратный осмос, если мембрана пропускает только молекулы растворителя. В последнем случае процесс часто называют Гиперфильтрацией; при его осуществлении внешнее давление должно превышать осмотическое давление раствора. Мембраны для ультрафильтров, обычно в виде пластин (листов) или цилиндрических патронов ('свечей'), изготавливают из микропористых неорганических материалов, продуктов животного происхождения, но чаще из искусственных и синтетических полимеров (эфиров целлюлозы, полиамидов и других). Максимальный размер проходящих через мембрану частиц (молекул) лежит в пределах от нескольких мкм до сотых долей мкм. Разделяющая способность (селективность) мембран зависит от их структуры и физико-химических свойств, а также от давления, температуры, состава фильтруемой жидкости и прочих внешних факторов. Ультрафильтрация как метод концентрирования, очистки и фракционирования высокодисперсных систем и многокомпонентных растворов широко применяется в лабораторной практике, медицине, промышленности. Так, посредством ультрафильтрации очищают от ионных и не ионных примесей воду, органические растворители, жидкие топлива и масла; разделяют сложные смеси белков, алкалоидов и других веществ; выделяют ферменты, витамины, вирусы; стерилизуют жидкости медицинского и фармацевтического назначения. Ультрафильтрацию используют в дисперсионном анализе, микробиологическом анализе, при анализе загрязнений воздушных бассейнов и природных водоёмов промышленными и бытовыми отходами.

ULTRAHIGH FREQUENCY = УЛЬТРАВЫСОКАЯ ЧАСТОТА – Ultrahigh Frequency (UHF), conventionally defined portion of the electromagnetic spectrum, encompassing radiations having a wavelength between 0.1 and 1 m and a frequency between 3 000 and 300 MegaHertz. UHF signals are used extensively in televison broadcasting. UHF waves typically carry televison signals on channels 14 through 83. UHF waves are very weakly reflected by the ionized layers of the upper atmosphere. Therefore, unlike longer waves, they bend very little around the curvature of the Earth and are easily obstructed by tall buildings and mountains. They can, however, be concentrated into narrow, highly directional signal beams. These characteristics make UHF suitable for line-of-sight applications that require high accuracy. Besides their use in television broadcasting, UHF waves are utilized in ship and aircraft navigation systems and for certain types of police communications. In some instances, radio communications between spacecraft and Earth-based tracking stations are carried via UHF signals. See also VHF.

ULTRA LARGE CRUDE CARRIER = УЛЬТРАКРУПНЫЙ НЕФТЕПЕРЕВОЗЧИК – Ultra Large Crude Carriers (ULCC) are tankers larger than 300 000 dwt. Ultra Large Crude Carriers (ULCC) are the tanker ships from 300 000 to 550 000 dwt in size. Used for carrying crude oil on long haul routes from the Persian Gulf to Europe, America, and East Asia, via the Cape of Good Hope or the Strait of Malacca. The enormous size of these vessels requires custom built terminals. A vessel designed for the carriage of liquid bulk cargo with a loading capacity ranging from 250 000 to 500 000 DWT. A tanker with a capacity exceeding 320 000 deadweight tons. It must unload petroleum products at special deep-water petroleum terminals, e.g., such as Louisiana Offshore Oil Port (LOOP). Such tankers are further divided by whether they are providing Clean or Dirty service. See also Clean Tankers, Dirty Tankers, Supertanker, and Very

Large Crude Carrier. / от 250 000 до 500 000 грп. , например, такие как Прибрежный Нефтяной Порт Луизианы (ПНПЛ; Louisiana Offshore Oil Port (LOOP)).

ULTRA LIGHT DOWN = УЛЬТРА ЛЁГКИЙ НИЗ (или ПУШОК, или ПУХ) – Ultra Light Down (UL Down) is used in women's and men's jackets. the concept is to make the lightest and warmest insulation layer available. UL Down jackets weigh less than a tee-shirt, blocks more wind, is warmer than even the heaviest fleece jackets, and compress to the size of a water bottle. This outerwear can be used when warmth is critical, minimal weight is paramount, and space is at a premium.

ULTRA–LIGHT WEIGHT = УЛЬТРАЛЁГКИЙ ВЕС – Ultra-Light Weight is a term used to describe a fabric used in outerwear, which allows for a minimum pack volume and weight. Lightweight packable garments offer the most versatile weather protection. Some of these fabrics have a protective layer on the membrane, which provides durability. This means that the garments made from extra lightweight fabrics need no separate lining.

ULTRA LOW SULFUR DIESEL = ДИЗЕЛЬ С УЛЬТРАНИЗКИМ СОДЕРЖАНИЕМ СЕРЫ – Ultra Low Sulfur Diesel (ULSD) is defined as diesel fuel with 15 parts per million (ppm) or lower sulfur content. As of December, 2006, almost all of the petroleum-based diesel fuel available in Europe and North America is of a ULSD type replacing LSD diesel. Lower sulfur content is expected to substantially lower emissions from diesel engines. Petroleum-based ULSD is not considered an alternative fuel under the Energy Policy Act of 1992 (EPAct), but most ULSD fuels produced from non-petroleum and renewable sources are considered EPAct alternative fuels. Changes in heating oil sulfur specifications in the US Northeast will likely increase ultra-low sulfur diesel demand this winter:- reductions in the maximum sulfur content of heating fuels in five northeastern states will likely result in higher demand for ultra-low sulfur diesel (ULSD). On July 1st, New Jersey, Massachusetts, Connecticut, Vermont, and Rhode Island reduced the maximum allowable content of sulfur in heating oil to 500 parts per million (ppm) from 20 000–3 000 ppm. It is expected that heating oil meeting the 500 ppm specification will be blended from higher-sulfur heating oil and ultra-low sulfur diesel (ULSD), which has a maximum sulfur content of 15 ppm. The 500 ppm sulfur limit for heating fuel is an interim step in most Northeast states' plans to reduce the acceptable maximum sulfur level to 15 ppm by mid-2016 (New Jersey) or during 2018. US home heating oil consumption is highly concentrated in the Northeast. Four-fifths of all homes in the United States that use heating oil are located in the Northeast (source:- US Census Bureau, 2012 American Community Survey). Moreover, 25% of homes in the Northeast, or 5.3 million homes, use oil as their main heating fuel. The five Northeastern states adopting lower sulfur limits this year have used an average of 139 000 barrels per day (bbl/d) of No. 2 heating oil during the past five winters (October–March). Massachusetts and Connecticut, the largest consumers among the five states, averaged 42 000 bbl/d and 40 000 bbl/d, respectively over the past five winters. Demand typically peaks in January, with the January average demand for all five states combined over the past 5 years averaging 195 000 bbl/d. However, demand in the region has been declining, as existing homes that use heating oil for space heating convert to natural gas and as fewer new homes are built to use heating oil. US refineries, as well as refineries in the Atlantic Basin that supply distillate to the Northeast United States, do not typically produce substantial volumes of 500 ppm sulfur specification distillate. In 2013, US refineries produced 146 000 bbl/d of distillate with sulfur content greater than 15 ppm but less than 500 ppm, almost of all of which was produced in the Gulf Coast region. The East Coast (PADD 1) produced only 3 000 bbl/d. ULSD was 90% of total US refinery net production of distillate in 2013. As a result of this shortfall in refinery production of 500 ppm distillate, heating oil market participants in the Northeast will likely pursue one of several strategies. One option is to supply ULSD, which, as noted, has a maximum sulfur content of 15 ppm and which is used primarily as transportation fuel, to meet heating oil demand. US refineries produce substantial volumes of ULSD and the product is readily available in the New York Harbor area because the sulfur specification for heating oil in New York was reduced to 15 ppm in 2012. Additionally the New York Mercantile Exchange (NYMEX®) converted the standard heating oil futures contract to 15 ppm in May, 2013. Thus, the Northeast has access to a fungible distillate product that can supply both home heating demand as well as transportation demand and that does not require separate storage and handling facilities for the different fuels. However, because ULSD typically costs more that higher-sulfur heating oil, homeowners could face higher prices to heat their homes. A second option is to blend higher-sulfur distillate with ULSD to produce 500 ppm heating oil. This option requires separate storage and handling facilities for the two fuels, but allows the blender to capture the price difference between the higher-priced ULSD and the lower-priced higher-sulfur distillate. Based on a blend of 80% ULSD to 20% No. 2 heating oil, to meet the 500 ppm sulfur limit, blending the two fuels would yield a 2-cent-per-gallon average margin based on August spot prices in New York harbor. As winter approaches, inventories take on greater importance. With the change in the sulfur specification on the horizon, the sulfur level of distillate fuel in inventory in the converting states has changed. Before 2013, the percentage of distillate inventory in the converting states that was 500 ppm sulfur content or greater averaged over 70%. Ahead of July 2013, when the NYMEX® distillate specification changed to ULSD, the quality of distillate held in inventory began to shift. Many of the bulk terminals qualified to deliver against the NYMEX® are located in New Jersey, and as a result much of the distillate inventory in New Jersey was converted to a lower-sulfur specification in advance of the May 2013 contract deadline. As the July 01, 2014 specification change approached, the share of distillate inventories the converting states with sulfur content under 15 ppm increased further. The latest state-level inventory data (June) show that low-sulfur distillate now makes up 64% of total distillate inventories in the converting states, while distillate with a sulfur content greater than 500 ppm now only makes up 35%. That higher-sulfur distillate inventories have not dropped further is an indication that inventory holders in some states intend to blend. However, as a 15 ppm sulfur limit is planned for these states in 2016 and 2018, the share of distillate inventories with a sulfur content of less than 15 ppm is expected to continue to grow in the future. Only 1% of total distillate inventories in the converting states are of a distillate with sulfur content greater than 15 ppm but less than 500 ppm. While the change in Northeast heating oil specifications likely will increase demand for ULSD, the increased low-sulfur demand should easily be met through a combination of domestic refinery production and imports from the actively traded Atlantic Basin market. / НАЙМЭКС® (NYMEX®).

ULTRAMARINE = УЛЬТРАМАРИН – Ultramarine, pigment in the gem lapis lazuli, used by painters as early as the European Middle Ages. Ore containing the color was ground, and the powdered lapis lazuli was separated from the other mineral matter. The pigment was first produced artificially in the late 1820s in France and Germany, being made from about equal amounts of China clay, sulfur, and sodium carbonate, with lesser amounts of silica and rosin or pitch. The mixture is fired slowly to 750 °C (1 380 °F) and cooled in a sealed furnace. Depending on the proportion of the ingredients, the shade varies from greenish to reddish blue. Ultramarine is used in paints, lacquers, and decorating materials. It has a particularly brilliant blue color and is very lightfast, but it is not suitable for use outdoors because it weathers to a dull-blue powder.

ULTRAMICROSCOPE = УЛЬТРАМИКРОСКОП – Ultramicroscope is a microscope arrangement used to study colloidal-size particles that are too small to be visible in an ordinary light microscope. The particles, usually suspended in a liquid, are illuminated with a strong light beam perpendicular to the optical axis of the microscope. These particles scatter light, and their movements are seen only as flashes against a dark background; their structure is not resolved.

ULTRA–SHORT–TERM BOND FUND = ФОНД СВЕРХКРАТКОСРОЧНЫХ ОБЛИГАЦИЙ – Ultra-Short-Term Bond Funds, which typically invest in bonds with a duration of less than one year, are a subcategory of short-term bond funds, which hold bonds with a

duration of one to three years. Return rates for ultrashort-term bond funds are usually higher than money market funds but lower than conventional short-term bond funds. Conservative investors tend to like ultrashort-term bond funds because they have less interest-rate sensitivity than short-term bond funds but will typically have higher yields than money market funds. However, ultrashort-term bond funds have lower relative average returns over the long run than short-term bond funds and much lower returns than intermediate-term bond funds and long-term bond funds. Best Time To Buy Ultrashort-Term Bond Funds:- As the name implies, ultrashort-term bond funds are not designed for long-term investing and performance. For example, a total bond market index fund would be expected to average a return of around 5% over a 10-year period, whereas an ultrashort-term bond fund would do well to average 2%. However, bond mutual funds have principal risk, which means that an investor may potentially sell a bond fund for a lower value than they bought it. And when interest rates are rising, this risk is increased by a market risk type called Interest Rate Risk. So if, in a low-interest-rate environment, an investor wants to get a yield higher than money market funds but interest rates are expected to rise in the near future, ultrashort-term bond funds can be a good idea. Other than the potential for error in predicting the movement of interest rates, ultrashort-term bond funds are best suited for investing over a relatively short period of time, such as three to six months. Tip:- The best time to invest in ultrashort-term bond funds is when interest rates are expected to rise. For investors looking for an appropriate objective for investing in ultrashort-term bond funds, an appropriate time frame is less than one year. Conversely, if interest rates are currently high or expected to fall, a short-term bond is not as smart of an investment as something with a longer maturity. Long-term bonds are less subject to adverse effects from near-term interest fluctuations. Best Ultrashort-Term Bond Funds:- Assuming an investor wants to use ultrashort-term bond funds as designed and invest for a relatively short period of time, the best ultrashort-term bond funds will have no load and will have a low expense ratio. One of the best ultrashort-term bond funds to buy is Vanguard Ultrashort-Term Bond (VUBFX), which has a low expense ratio of 0.2% and performance that usually tops most funds with similar holdings. The Bloomberg Barclays 1–3 month T-Bill ETF (T-Bill = US Treasury Bill; and ETF = Exchange Traded Fund) is another great option, with its expense ratio of under 0.14%. To find similar funds, investors can research and find the best ultrashort-term bond funds on one of the many websites for researching mutual funds. Just be sure to look for low expense ratios and good historical performance records. The Bottom Line:- Put simply, ultrashort-term bond funds are best for investment objectives with less than a one-year time horizon. This is because the yields for ultrashort-term bond funds are much lower on average than short-, intermediate-, and long-term bond funds. Because of their low sensitivity to interest rates, some investors like to use ultrashort-term bond funds when interest rates are rising. They may not be a smart investment when interest rates are high and at risk of falling, however. As with any investment, market conditions at the time of investing should play a significant role in determining your strategy. Xxxxx. Ultra-Short Bond Funds are mutual funds that generally invest in fixed income securities with extremely short maturities, or time periods in which they become due for payment. Like other bond mutual funds, ultra-short bond funds may invest in a wide range of securities, including corporate debt, government securities, mortgage-backed securities, and other asset-backed securities. Some investors don't realize that there are material differences between ultra-short bond funds and other investments with relatively low risks, such as money market funds and certificates of deposit. Specifically, ultra-short bond funds tend to have higher risks than money market funds and certificates of deposit (CDs). Money market funds can only invest in certain high-quality, short-term investments issued by US government, US corporations, and state and local governments. Ultra-short bond funds, like other bond mutual funds, are not subject to these requirements and typically pursue strategies aimed at producing higher yields by investing in securities with higher risks. In addition, the net asset value (NAV) of an ultra-short bond fund will fluctuate, while a money market fund tries to keep its NAV at a stable USD1.00 per share. Money market funds are also subject to strict diversification and maturity standards that don't apply to ultra-short bond funds. Ultra-short bond funds are not guaranteed or insured by the Federal Deposit Insurance Corporation (FDIC) or any other government agency. A CD, on the other hand, features federal deposit insurance up to USD250 000.00. A CD, which promises a return of principal and a specified rate of interest, is a special type of deposit account with a bank or thrift institution that typically offers a higher rate of interest than a regular savings account. If you are considering investing in an ultra-short bond fund, keep in mind that ultra-short bond funds can vary significantly in their risks and rewards. In fact, some ultra-short bond funds may lose money despite their investment objective of preserving capital. The level of risk associated with a particular ultra-short bond fund may depend on a variety of factors, including:- (i) Credit Quality Of The Fund's Investments:- It's important to know the types of securities a fund invests in because ultra-short bond funds may experience losses due to credit downgrades or defaults of their portfolio securities. Credit risk is less of a factor for ultra-short bond funds that principally invest in government securities. By contrast, if you invest in an ultra-short bond fund that invests in bonds of companies with lower credit ratings, derivative securities, or private label mortgage-backed securities, you'll generally be subject to a higher level of risk. (ii) Maturity Dates Of The Fund's Investments:- The maturity date of a security is the date that it becomes due for payment. An ultra-short bond fund that holds securities with longer average maturity dates will be riskier than a fund with shorter average maturity dates – assuming the funds are otherwise similar. (iii) Sensitivity To Interest Rate Changes:- Generally, when interest rates go up, the value of debt securities will go down. Because of this, you can lose money investing in any bond fund, including an ultra-short bond fund. In a high interest rate environment, certain ultra-short bond funds may be especially vulnerable to losses. Before you invest in any ultra-short bond fund, be sure to read about a fund's 'duration', which measures how sensitive the fund's portfolio may be to changes in interest rates. As always, be skeptical of any investment that promises you a greater potential for return at no additional risk. Investors can learn more about an ultra-short bond fund by reading all of the fund's available information, including its prospectus. Investors should understand how mutual funds work, what factors to consider, and how they can avoid common problems, before they invest in an ultra-short bond fund or any mutual fund. Investors seeking to learn more about mutual fund investing should read the Securities and Exchange Commission's (SEC's) 'Invest Wisely: An Introduction to Mutual Funds'. For more information about investing wisely and avoiding fraud, please check out Investor.gov and the Investor Information section of our website at www.sec.gov/investor.shtml. / Блумбёг Барклэйз (Bloomberg Barclays) Фонд Сверхкраткосрочных Облигаций (Ultra-Short-Term Bond Fund):- взаимный фонд, покупающий облигации со сроком погашения один год и менее. Такие фонды обычно выплачивают более высокие дивиденды, чем взаимные фонды денежных рынков, но более низкие, чем фонд краткосрочных облигаций (short-term bond funds). Преимущество этих фондов для инвесторов состоит в том, что их цены более стабильны, чем цены фонда обычных краткосрочных облигаций, а дивиденды превосходят те, что предлагают фонды денежных рынков. Однако стоимость чистых активов (net asset value) в расчёте на одну облигацию фонда сверхкраткосрочных облигаций постоянно меняется – в отличие от стоимости чистых активов во взаимных фондах денежных рынков, которая установилась на уровне 1 Доллара США на акцию. Поэтому на облигации с фонда сверхкраткосрочных облигаций можно получить как прирост капитала, так и понести убытки.

ULTRASONIC QUILTING = УЛЬТРАЗВУКОВАЯ СТЁЖКА (или СТЁЖКА УЛЬТРАЗВУКОМ) – Ultrasonic Quilting:- using the principle of ultrasonic to sew the products without needle and suture, with various types of chemical fiber fabric, nonwoven, spray cotton, artificial leather and other fabrics laminated adhesive, reflective material composite, embossing and leather gilding function. This pattern is clear and beautiful; the material is not deformed, bonded firmly and without pinprick, high efficiency. According to the demand to change stick, can press different patterns, it is the ideal equipment for bed sheets, quilt cover, bedspread, sofa covers, clothing, decoration and leather bronzing, embossing reflective material. The design concept of this equipment is advanced, technology is at the international leading level. See also Pinsonic® Thermal Joining Machine. Ultrasonic Embossing:- using high-frequency

vibration wave propagation to be welded two or more surfaces, In the case of pressure, make the material surface to frication from each other and urge the fusion between the molecular layer, it ‘s advantage is high speed, energy conservation, high fusion, good conductivity, no spark, close to the cold processing. / сохранение (conservation). распространение или продвижение (propagation). Пинсоник® (Pinsonic®).

ULTRASONICS = УЛЬТРАЗВУКИ – Ultrasonics, vibrations of frequencies greater than the upper limit of the audible range for humans – that is, greater than about 20 kiloHertz. The term Sonic is applied to ultrasound waves of very high amplitudes. Hypersound, sometimes called Praetersound or Microsound, is sound waves of frequencies greater than 10^{13} Hertz. At such high frequencies it is very difficult for a sound wave to propagate efficiently; indeed, above a frequency of about $1.25 \cdot 10^{13}$ Hertz, it is impossible for longitudinal waves to propagate at all, even in a liquid or a solid, because the molecules of the material in which the waves are traveling cannot pass the vibration along rapidly enough. Many animals have the ability to hear sounds in the human ultrasonic frequency range. Some ranges of hearing for mammals and insects are compared with those of humans in the Table. A presumed sensitivity of roaches and rodents to frequencies in the 40 kiloHertz region has led to the manufacture of ‘pest controllers’ that emit loud sounds in that frequency range to drive the pests away, but they do not appear to work as advertised. Transducers:- An ultrasonic transducer is a device used to convert some other type of energy into an ultrasonic vibration. There are several basic types, classified by the energy source and by the medium into which the waves are being generated. Mechanical devices include gas-driven, or pneumatic, transducers such as whistles as well as liquid-driven transducers such as hydrodynamic oscillators and vibrating blades. These devices, limited to low ultrasonic frequencies, have a number of industrial applications, including drying, ultrasonic cleaning, and injection of fuel oil into burners. Electromechanical transducers are far more versatile and include piezoelectric and magnetostrictive devices. A magnetostrictive transducer makes use of a type of magnetic material in which an applied oscillating magnetic field squeezes the atoms of the material together, creating a periodic change in the length of the material and thus producing a high-frequency mechanical vibration. Magnetostrictive transducers are used primarily in the lower frequency ranges and are common in ultrasonic cleaners and ultrasonic machining applications. By far the most popular and versatile type of ultrasonic transducer is the piezoelectric crystal, which converts an oscillating electric field applied to the crystal into a mechanical vibration. Piezoelectric crystals include quartz, Rochelle salt, and certain types of ceramic. Piezoelectric transducers are readily employed over the entire frequency range and at all output levels. Particular shapes can be chosen for particular applications. For example, a disc shape provides a plane ultrasonic wave, while curving the radiating surface in a slightly concave or bowl shape creates an ultrasonic wave that will focus at a specific point. Piezoelectric and magnetostrictive transducers also are employed as ultrasonic receivers, picking up an ultrasonic vibration and converting it into an electrical oscillation. Applications In Research:- One of the important areas of scientific study in which ultrasonics has had an enormous impact is cavitation. When water is boiled, bubbles form at the bottom of the container, rise in the water, and then collapse, leading to the sound of the boiling water. The boiling process and the resulting sounds have intrigued people since they were first observed, and they were the object of considerable research and calculation by the British physicists Osborne Reynolds and Lord Rayleigh, who applied the term cavitation to the process of formation of bubbles. Because an ultrasonic wave can be used carefully to control cavitation, ultrasound has been a useful tool in the investigation of the process. The study of cavitation has also provided important information on intermolecular forces. Research is being carried out on aspects of the cavitation process and its applications. A contemporary subject of research involves emission of light as the cavity produced by a high-intensity ultrasonic wave collapses. This effect, called Sonoluminescence, is believed to create instantaneous temperatures hotter than the surface of the Sun. The speed of propagation of an ultrasonic wave is strongly dependent on the viscosity of the medium. This property can be a useful tool in investigating the viscosity of materials. Because the various parts of a living cell are distinguished by differing viscosities, acoustical microscopy can make use of this property of cells to ‘see’ into living cells, as will be discussed below in Medical applications. Ranging And Navigating:- Sonar (sound navigation and ranging) has extensive marine applications. By sending out pulses of sound or ultrasound and measuring the time required for the pulses to reflect off a distant object and return to the source, the location of that object can be ascertained and its motion tracked. This technique is used extensively to locate and track submarines at sea and to locate explosive mines below the surface of the water. Two boats at known locations can also use triangulation to locate and track a third boat or submarine. The distance over which these techniques can be used is limited by temperature gradients in the water, which bend the beam away from the surface and create shadow regions. One of the advantages of ultrasonic waves over sound waves in underwater applications is that, because of their higher frequencies (or shorter wavelengths), the former will travel greater distances with less diffraction. Ranging has also been used to map the bottom of the ocean, providing depth charts that are commonly used in navigation, particularly near coasts and in shallow waterways. Even small boats are now equipped with sonic ranging devices that determine and display the depth of the water so that the navigator can keep the boat from beaching on submerged sandbars or other shallow points. Modern fishing boats use ultrasonic ranging devices to locate schools of fish, substantially increasing their efficiency. Even in the absence of visible light, bats can guide their flight and even locate flying insects (which they consume in flight) through the use of sonic ranging. Ultrasonic echolocation has also been used in traffic control applications and in counting and sorting items on an assembly line. Ultrasonic ranging provides the basis of the eye and vision systems for robots, and it has a number of important medical applications (see below). The Doppler Effect:- If an ultrasonic wave is reflected off a moving obstacle, the frequency of the resulting wave will be changed, or Doppler-shifted. More specifically, if the obstacle is moving toward the source, the frequency of the reflected wave will be increased; and if the obstacle is moving away from the source, the frequency of the reflected wave will be decreased. The amount of the frequency shift can be used to determine the velocity of the moving obstacle. Just as the Doppler shift for radar, an electromagnetic wave, can be used to determine the speed of a moving car, so can the speed of a moving submarine be determined by the Doppler shift of a sonar beam. An important industrial application is the ultrasonic flow meter, in which reflecting ultrasound off a flowing liquid leads to a Doppler shift that is calibrated to provide the flow rate of the liquid. This technique also has been applied to blood flow in arteries. Many burglar alarms, both for home use and for use in commercial buildings, employ the ultrasonic Doppler shift principle. Such alarms cannot be used where pets or moving curtains might activate them. Materials Testing:- Nondestructive testing involves the use of ultrasonic echolocation to gather information on the integrity of mechanical structures. Since changes in the material present an impedance mismatch from which an ultrasonic wave is reflected, ultrasonic testing can be used to identify faults, holes, cracks, or corrosion in materials, to inspect welds, to determine the quality of poured concrete, and to monitor metal fatigue. Owing to the mechanism by which sound waves propagate in metals, ultrasound can be used to probe more deeply than any other form of radiation. Ultrasonic procedures are used to perform in-service inspection of structures in nuclear reactors. Structural flaws in materials can also be studied by subjecting the materials to stress and looking for acoustic emissions as the materials are stressed. Acoustic emission, the general name for this type of nondestructive study, has developed as a distinct field of acoustics. High-Intensity Applications:- High-intensity ultrasound has achieved a variety of important applications. Perhaps the most ubiquitous is ultrasonic cleaning, in which ultrasonic vibrations are set up in small liquid tanks in which objects are placed for cleaning. Cavitation of the liquid by the ultrasound, as well as the vibration, create turbulence in the liquid and result in the cleaning action. Ultrasonic cleaning is very popular for jewelry and has also been used with such items as dentures, surgical instruments, and small machinery. Degreasing is often enhanced by ultrasonic cleaning. Large-scale ultrasonic cleaners have also been developed for use in assembly lines. Ultrasonic machining employs the high-intensity vibrations of a transducer to move a machine tool. If necessary, a slurry containing carborundum

grit may be used; diamond tools can also be used. A variation of this technique is ultrasonic drilling, which makes use of pneumatic vibrations at ultrasonic frequencies in place of the standard rotary drill bit. Holes of virtually any shape can be drilled in hard or brittle materials such as glass, germanium, or ceramic. Ultrasonic soldering has become important, especially for soldering unusual or difficult materials and for very clean applications. The ultrasonic vibrations perform the function of cleaning the surface, even removing the oxide layer on aluminum so that the material can be soldered. Because the surfaces can be made extremely clean and free from the normal thin oxide layer, soldering flux becomes unnecessary. Chemical And Electrical Uses:- The chemical effects of ultrasound arise from an electrical discharge that accompanies the cavitation process. This forms a basis for ultrasound's acting as a catalyst in certain chemical reactions, including oxidation, reduction, hydrolysis, polymerization and depolymerization, and molecular rearrangement. With ultrasound, some chemical processes can be carried out more rapidly, at lower temperatures, or more efficiently. The ultrasonic delay line is a thin layer of piezoelectric material used to produce a short, precise delay in an electrical signal. The electrical signal creates a mechanical vibration in the piezoelectric crystal that passes through the crystal and is converted back to an electrical signal. A very precise time delay can be achieved by constructing a crystal with the proper thickness. These devices are employed in fast electronic timing circuits. Medical Applications:- Although ultrasound competes with other forms of medical imaging, such as X-ray techniques and magnetic resonance imaging, it has certain desirable features – for example, Doppler motion study – that the other techniques cannot provide. In addition, among the various modern techniques for the imaging of internal organs, ultrasonic devices are by far the least expensive. Ultrasound is also used for treating joint pains and for treating certain types of tumours for which it is desirable to produce localized heating. A very effective use of ultrasound deriving from its nature as a mechanical vibration is the elimination of kidney and bladder stones. Diagnosis:- Much medical diagnostic imaging is carried out with X rays. Because of the high photon energies of the X ray, this type of radiation is highly ionizing – that is, X rays are readily capable of destroying molecular bonds in the body tissue through which they pass. This destruction can lead to changes in the function of the tissue involved or, in extreme cases, its annihilation. One of the important advantages of ultrasound is that it is a mechanical vibration and is therefore a nonionizing form of energy. Thus, it is usable in many sensitive circumstances where X rays might be damaging. Also, the resolution of X rays is limited owing to their great penetrating ability and the slight differences between soft tissues. Ultrasound, on the other hand, gives good contrast between various types of soft tissue. Ultrasonic scanning in medical diagnosis uses the same principle as sonar. Pulses of high-frequency ultrasound, generally above one MegaHertz, are created by a piezoelectric transducer and directed into the body. As the ultrasound traverses various internal organs, it encounters changes in acoustic impedance, which cause reflections. The amount and time delay of the various reflections can be analyzed to obtain information regarding the internal organs. In the B-scan mode, a linear array of transducers is used to scan a plane in the body, and the resultant data is displayed on a television screen as a two-dimensional plot. The A-scan technique uses a single transducer to scan along a line in the body, and the echoes are plotted as a function of time. This technique is used for measuring the distances or sizes of internal organs. The M-scan mode is used to record the motion of internal organs, as in the study of heart dysfunction. Greater resolution is obtained in ultrasonic imaging by using higher frequencies, i.e. shorter wavelengths. A limitation of this property of waves is that higher frequencies tend to be much more strongly absorbed. Because it is nonionizing, ultrasound has become one of the staples of obstetric diagnosis. During the process of drawing amniotic fluid in testing for birth defects, ultrasonic imaging is used to guide the needle and thus avoid damage to the fetus or surrounding tissue. Ultrasonic imaging of the fetus can be used to determine the date of conception, to identify multiple births, and to diagnose abnormalities in the development of the fetus. Ultrasonic Doppler techniques have become very important in diagnosing problems in blood flow. In one technique, a three-MegaHertz ultrasonic beam is reflected off typical oncoming arterial blood with a Doppler shift of a few kiloHertz – a frequency difference that can be heard directly by a physician. Using this technique, it is possible to monitor the heartbeat of a fetus long before a stethoscope can pick up the sound. Arterial diseases such as arteriosclerosis can also be diagnosed, and the healing of arteries can be monitored following surgery. A combination of B-scan imaging and Doppler imaging, known as Duplex Scanning, can identify arteries and immediately measure their blood flow; this has been extensively used to diagnose heart valve defects. Using ultrasound with frequencies up to 2 000 MegaHertz, which has a wavelength of 0.75 micrometer in soft tissues (as compared with a wavelength of about 0.55 micrometer for light), ultrasonic microscopes have been developed that rival light microscopes in their resolution. The distinct advantage of ultrasonic microscopes lies in their ability to distinguish various parts of a cell by their viscosity. Also, because they require no artificial contrast mediums, which kill the cells, acoustic microscopy can study actual living cells. Therapy And Surgery:- Because ultrasound is a mechanical vibration and can be well focused at high frequencies, it can be used to create internal heating of localized tissue without harmful effects on nearby tissue. This technique can be employed to relieve pains in joints, particularly in the back and shoulder. Also, research is now being carried out in the treatment of certain types of cancer by local heating, since focusing intense ultrasonic waves can heat the area of a tumour while not significantly affecting surrounding tissue. Trackless surgery – that is, surgery that does not require an incision or track from the skin to the affected area – has been developed for several conditions. Focused ultrasound has been used for the treatment of Parkinson's disease by creating brain lesions in areas that are inaccessible to traditional surgery. A common application of this technique is the destruction of kidney stones with shock waves formed by bursts of focused ultrasound. In some cases, a device called an ultrasonic lithotripter focuses the ultrasound with the help of X-ray guidance, but a more common technique for destruction of kidney stones, known as Endoscopic Ultrasonic Disintegration, uses a small metal rod inserted through the skin to deliver ultrasound in the 22- to 30-kiloHertz frequency region. Infrasonics:- The term Infrasonics refers to waves of a frequency below the range of human hearing, i.e. below about 20 Hertz. Such waves occur in nature in earthquakes, waterfalls, ocean waves, volcanoes, and a variety of atmospheric phenomena such as wind, thunder, and weather patterns. Calculating the motion of these waves and predicting the weather using these calculations, among other information, is one of the great challenges for modern high-speed computers. Aircraft, automobiles, or other rapidly moving objects, as well as air handlers and blowers in buildings, also produce substantial amounts of infrasonic radiation. Studies have shown that many people experience adverse reactions to large intensities of infrasonic frequencies, developing headaches, nausea, blurred vision, and dizziness. On the other hand, a number of animals are sensitive to infrasonic frequencies, as indicated in the Table. It is believed by many zoologists that this sensitivity in animals such as elephants may be helpful in providing them with early warning of earthquakes and weather disturbances. It has been suggested that the sensitivity of birds to infrasound aids their navigation and even affects their migration. One of the most important examples of infrasonic waves in nature is in earthquakes. Three principal types of earthquake wave exist:- the S-wave, a transverse body wave; the P-wave, a longitudinal body wave; and the L-wave, which propagates along the boundary of stratified mediums. L-waves, which are of great importance in earthquake engineering, propagate in a similar way to water waves, at low velocities that are dependent on frequency. S-waves are transverse body waves and thus can only be propagated within solid bodies such as rocks. P-waves are longitudinal waves similar to sound waves; they propagate at the speed of sound and have large ranges. When P-waves propagating from the epicenter of an earthquake reach the surface of the Earth, they are converted into L-waves, which may then damage surface structures. The great range of P-waves makes them useful in identifying earthquakes from observation points a great distance from the epicentre. In many cases, the most severe shock from an earthquake is preceded by smaller shocks, which provide advance warning of the greater shock to come. Underground nuclear explosions also produce P-waves, allowing them to be monitored from any point in the world if they are of sufficient intensity. The reflection of man-made seismic shocks has helped to identify possible locations of oil and natural-gas sources. Distinctive rock formations in which these

minerals are likely to be found can be identified by sonic ranging, primarily at infrasonic frequencies. Environmental Noise:- Many forms of noise in the urban environment, including traffic and airplane noise, industrial noise, and noise from electronically amplified music performed at high audio levels in confined rooms, may contribute to hearing damage. Even when the noise level in a working environment may not be dangerous, it can be distracting for those who work in that environment and therefore lead to reduced work production. In addition to the sound level, the character of the noise may be important. Identifiable noises, such as talking or music, may be more distracting for many people than noise produced by air handlers, small motors, or traffic. Low levels of noise may be overcome using additional absorbing material, such as heavy drapery or sound-absorbent tiles in enclosed rooms. Where low levels of identifiable noise may be distracting, or where privacy of conversations in adjacent offices and reception areas may be important, the undesirable sounds may be masked. A small white-noise source such as static or rushing air, placed in the room, can mask the sounds of conversation from adjacent rooms without being offensive or dangerous to the ears of people working nearby. This type of device is often used in offices of doctors and other professionals. Another technique for reducing personal noise level is through the use of hearing protectors, which are held over the ears in the same manner as an earmuff. By using commercially available earmuff-type hearing protectors, a decrease in sound level can be attained ranging typically from about 10 deciBels (dB) at 100 Hertz to over 30 deciBels for frequencies above 1 000 Hertz. Environmental and industrial noise is regulated in the United States under the Occupational Safety and Health Act of 1970 and the Noise Control Act of 1972. Under these acts, the Occupational Safety and Health Administration has set up industrial noise criteria in order to provide limits on the intensity of sound exposure and on the time duration for which that intensity may be allowed. Maximum daily exposure to noise at various levels is given in the Table. If an individual is exposed to various levels of noise for different time intervals during the day, the total exposure or dose (D) of noise is obtained from the relation:- $D = (C_1/T_1) + (C_2/T_2) + (C_3/T_3) + ..., (41)) + ..., (41)$, where C is the actual time of exposure and T is the allowable time of exposure at any level in the Table. Using this formula, the maximum allowable daily noise dose will be 1, and any daily exposure over 1 is unacceptable. Criteria for indoor noise are summarized in three sets of specifications that have been derived by collecting subjective judgments from a large sampling of people in a variety of specific situations. These have developed into the noise criteria (NC) and preferred noise criteria (PNC) curves, which provide limits on the level of noise introduced into the environment. The NC curves, developed in 1957, aim to provide a comfortable working or living environment by specifying the maximum allowable level of noise in octave bands over the entire audio spectrum. The complete set of 11 curves specifies noise criteria for a broad range of situations. The PNC curves, developed in 1971, add limits on low-frequency rumble and high-frequency hiss; hence, they are preferred over the older NC standard. Summarized in the curves shown in Figure 1, these criteria provide design goals for noise levels for a variety of different purposes. Part of the specification of a work or living environment is the appropriate PNC curve; in the event that the sound level exceeds PNC limits, sound-absorptive materials can be introduced into the environment as necessary to meet the appropriate standards. Outdoor noise limits are also important for human comfort. Standard house construction will provide some shielding from external sounds if the house meets minimum standards of construction and if the outside noise level falls within acceptable limits. These limits are generally specified for particular periods of the day – for example, during daylight hours, during evening hours, and at night during sleeping hours. Because of refraction in the atmosphere owing to the nighttime temperature inversion, relatively loud sounds can be introduced into an area from a rather distant highway, airport, or railroad. One interesting technique for control of highway noise is the erection of noise barriers alongside the highway, separating the highway from adjacent residential areas. The effectiveness of such barriers is limited by the diffraction of sound, which is greater at the lower frequencies that often predominate in road noise, especially from large vehicles. In order to be effective, they must be as close as possible to either the source or the observer of the noise (preferably to the source), thus maximizing the diffraction that would be necessary for the sound to reach the observer. Another requirement for this type of barrier is that it must also limit the amount of transmitted sound in order to bring about significant noise reduction. / соль Рошэль (Rochelle salt). Британские физики Озбон Рэнэлдз (Osborne Reynolds; 1842–1912) и Лорд Рэйли (Lord Rayleigh; полное имя Дьжон Вилъйэм Стчрат, Третий Барон Рэйли (John Wiliam Strutt, Third Baron Rayleigh); 1842–1919). Эффект Допля (The Doppler Effect; по имени Австрийского математика и физика Крыстиана Допля (Christian Doppler); 1803–1853). болезнь Паркинсэна (Parkinson's disease).

ULTRASOUND = УЛЬТРАЗВУК – Ultrasound:- in medicine, the use of high-frequency sound (ultrasonic) waves to produce images of structures within the human body. Ultrasonic waves are sound waves that are above the range of sound audible to humans. The ultrasonic waves are produced by the electrical stimulation of a piezoelectric crystal and can be aimed at a specific area of the body. As the waves travel through bodily tissues, they are reflected back at any point where there is a change in tissue density, as, for instance, in the border between two different organs of the body. The reflected echoes are received by an electronic apparatus that determines the intensity level of the echoes and the position of the tissue giving rise to the echoes. The images thus formed can be displayed in static form, or, through the use of rapid multiple sound scans, they can in effect provide a moving picture of the inside of the body. Part of ultrasound's usefulness derives from the fact that the sound waves are less potentially harmful to human tissues than are X rays or other ionizing radiations. Because it is an invasive procedure, theoretical risks to the tissues do exist; however, there are no known examples of tissue damage from conventional ultrasound imaging. Ultrasound is most commonly used to examine fetuses in utero in order to ascertain size, position, or abnormalities. Ultrasound is also used to provide images of the heart, liver, kidneys, gallbladder, breast, eye, and major blood vessels. Also known as Ultrasonography.

ULTRA–SUÈDE = УЛЬТРАЗАМША – Ultra-Suède is a synthetic fabric that feels like natural suède but it is resistant to stains and discoloration; it can be washed in a washing machine. It is a woven fabric, but resists pulling or fraying because it is combined with a polyurethane foam in a nonwoven structure. The fabric is multifunctional:- it is used in fashion, interior decorating, automotive and other vehicle upholstery, and industrial applications, such as protective fabric for electronic equipment. It is also a very popular fabric in the manufacture of footbags (also known as Hacky Sacks). Ultrasuede is a fabric so unique, it's a category all its own. The product of exclusive Toray Group technologies that are as capital-intensive as they are impossible to duplicate, Ultrasuede delivers unparalleled luxury, appeal, performance and ease of care. The magic of Ultrasuede begins with ultra-microfibers so fine they cannot be seen by the human eye, ultra-microfibers so microscopically minute a single pound of them could be stretched from the earth to the moon and back. Ultrasuede begins with polymer ultra-microfibers spun so light and fine, a strand measuring more than 50 miles long would weigh less than a gram. These ultra-microfibers are extruded through protective spinnerets, creating what we call the 'Islands in the Sea' configuration, with ultra-microfiber filaments 'afloat' in each strand. These strands are then transformed via a complex process that includes ironing, curling, cutting and needle-punching into a soft felt-like material which is then impregnated with a special adhesive binder. Once the material is formed, the protective polymer coating is dissolved with a solvent and the material is further processed to create a fabric that is, almost paradoxically, as soft and supple as it is strong and durable. Magnified thousands of times, this cross-section reveals the densely complex yet mono-layer structure of Ultrasuede. The end result:- ultrasuede, a richly complex non-woven fabric offering an unparalleled combination of luxury, appeal, performance and ease of care for an extraordinary array of applications. / Японская Торе Груп (Toray Group). развод (или потёк (stain)). Замша Тканая – ткань, вырабатываемая атласным переплетением с плотным уточным застилом на лицевой поверхности и подвергаемая в отделке ворсованию и

аппретированию, благодаря чему по внешнему виду и на ощупь она напоминает натуральную замшу. Замша тканая употребляется для изготовления спортивных костюмов, курток и тому подобного.

ULTRAVIOLET = УЛЬТРАФИОЛЕТ – Ultraviolet (UV):- light that is just beyond the visible portion of the light spectrum at the blue end. It is primarily ultraviolet light that is responsible for fading of colors, and that makes fluorescent compounds glow. Longwave ultraviolet, 'blacklight', with a wavelength of around 365 nanometers, is the preferred source for exposing many photosensitive materials, such as silkscreen emulsions. It is also useful for inspecting fabrics to detect optical brighteners. Longwave UV sources can be found in the form or fluorescent tubes. Tubes that appear white when off also emit considerable visible light and are best as exposure sources. Tubes that appear very dark purple don't produce much visible light and are best for inspection sources. The dark purple type can often be purchased at novelty shops. 'Germicidal' lamps are shortwave UV emitters. This wavelength, typically about 254 nanometers, can cause eye damage. In one classification system, the ultraviolet spectrum is referred to by three wavelength classes:- UV-A (315–400 nm), UV-B (280–315 nm) and UV-R (280–400 nm). Ordinary glass is fairly transparent to longwave UV, but nearly completely opaque to shortwave UV. Ultraviolet:- referring to radiant flux having wavelengths shorter than the visible wavelengths, about 10 nm to 380 nm. / невидимое излучение ('blacklight'). Оптический Блескообразователь или Оптический Отбеливатель (Optical Brightener). (УФ). Под Ультрафиолетовым Излучением (УФ-Излучение), от Латинского слова Ультра (Ultra), означающее За Пределами или По Ту Сторону или Сверх, и фиолетовый, понимаются ультрафиолетовые лучи, УФ-Излучение, не видимое глазом электромагнитное излучение, занимающее спектральную область между видимым и Рентгеновским излучениями в пределах длин волн l 400–10 нм. Вся область ультрафиолетового излучения условно делится на ближнюю (400–200 нм) и далёкую, или вакуумную (200–10 нм); последнее название обусловлено тем, что ультрафиолетовое излучение этого участка сильно поглощается воздухом и его исследование производят с помощью вакуумных спектральных приборов. Ближнее ультрафиолетовое излучение открыто в 1801 Немецким учёным Йоханом Вильхэльмом Рита (Johann Wilhelm Ritter; 1776–1810) и Английским учёным Вильэмом Хайдом Волэстэном (William Hyde Wollaston; 1766–1828) по фотохимическому действию этого излучения на хлористое серебро. Вакуумное ультрафиолетовое излучение обнаружено Немецким учёным Викто Шуманом (Victor Schumann; 1841–1913) при помощи построенного им вакуумного спектрографа с флюоритовой призмой (1885–1903) и безжелатиновых фотопластинок. Он получил возможность регистрировать коротковолновое излучение до 130 нм. Английский учёный Сиодор Лаймэн (Theodore Lyman; 1874–1954), впервые построив вакуумный спектрограф с вогнутой дифракционной решёткой, регистрировал ультрафиолетовое излучение с длиной волны до 25 нм (1924). К 1927 был изучен весь промежуток между вакуумным ультрафиолетовым излучением и Рентгеновским излучением. Спектр ультрафиолетового излучения может быть линейчатым, непрерывным или состоять из полос в зависимости от природы источника ультрафиолетового излучения (смотрите Оптические Спектры). Линейчатым спектром обладает УФ-излучение атомов, ионов или лёгких молекул (например, H_2). Для спектров тяжёлых молекул характерны полосы, обусловленные электронно-колебательно-вращательными переходами молекул (смотрите Молекулярные Спектры). Непрерывный спектр возникает при торможении и рекомбинации электронов (смотрите Тормозное Излучение). Оптические свойства веществ в ультрафиолетовой области спектра значительно отличаются от их оптических свойств в видимой области. Характерной чертой является уменьшение прозрачности (увеличение коэффициента поглощения) большинства тел, прозрачных в видимой области. Например, обычное стекло непрозрачно при l < 320 нм; в более коротковолновой области прозрачны лишь увиолевое стекло, сапфир, фтористый магний, кварц, флюорит, фтористый литий и некоторые другие материалы. Наиболее далёкую границу прозрачности (105 нм) имеет фтористый литий. Для l < 105 нм прозрачных материалов практически нет. Из газообразных веществ наибольшую прозрачность имеют инертные газы, граница прозрачности которых определяется величиной их ионизационного потенциала. Самую коротковолновую границу прозрачности имеет гелий – 50.4 нм. Воздух непрозрачен практически при l < 185 нм из-за поглощения кислородом. Коэффициент отражения всех материалов (в том числе металлов) уменьшается с уменьшением длины волны излучения. Например, коэффициент отражения свеженапылённого алюминия, одного из лучших материалов для отражающих покрытий в видимой области спектра, резко уменьшается при l < 90 нм. Отражение алюминия значительно уменьшается также вследствие окисления поверхности. Для защиты поверхности алюминия от окисления применяются покрытия из фтористого лития или фтористого магния. В области l < 80 нм некоторые материалы имеют коэффициент отражения 10–30% (золото, платина, радий, вольфрам и другие), однако при l < 40 нм и их коэффициент отражения снижается до 1% и меньше. Источники Ультрафиолетового Излучения:- Излучение накалённых до 3 000 К твёрдых тел содержит заметную долю ультрафиолетового излучения непрерывного спектра, интенсивность которого растёт с увеличением температуры. Более мощное ультрафиолетовое излучение испускает плазма газового разряда. При этом в зависимости от разрядных условий и рабочего вещества может испускаться как непрерывный, так и линейчатый спектр. Для различных применений ультрафиолетового излучения промышленность выпускает ртутные, водородные, ксеноновые и другие газоразрядные лампы, окна которых (либо целиком колбы) изготовляют из прозрачных для ультрафиолетового излучения материалов (чаще из кварца). Любая высокотемпературная плазма (плазма электрических искр и дуг, плазма, образующаяся при фокусировке мощного лазерного излучения в газах или на поверхности твёрдых тел, и так далее) является мощным источником ультрафиолетового излучения. Интенсивное ультрафиолетовое излучение непрерывного спектра испускают электроны, ускоренные в синхротроне (синхротронное излучение). Для ультрафиолетовой области спектра разработаны также оптические квантовые генераторы (лазеры). Наименьшую длину волны имеет водородный лазер (109.8 нм). Естественные источники ультрафиолетового излучения – Солнце, звёзды, туманности и другие космические объекты. Однако лишь длинноволновая часть ультрафиолетового излучения (l > 290 нм) достигает земной поверхности. Более коротковолновое ультрафиолетовое излучение поглощается озоном, кислородом и другими компонентами атмосферы на высоте 30–200 километров (км) от поверхности Земли, что играет большую роль в атмосферных процессах. Ультрафиолетовое излучение звёзд и других космических тел, кроме поглощения в земной атмосфере, в интервале 91.2–20 нм практически полностью поглощается межзвёздным водородом. Приёмники Ультрафиолетового Излучения:- Для регистрации ультрафиолетового излучения при l > 230 нм используются обычные фотоматериалы. В более коротковолновой области к нему чувствительны специальные маложелатиновые фотослои. Применяются фотоэлектрические приёмники, использующие способность ультрафиолетового излучения вызывать ионизацию и фотоэффект:- фотодиоды, ионизационные камеры, счётчики фотонов, фотоумножители и другие. Разработан также особый вид фотоумножителей – каналовые электронные умножители, позволяющие создавать микроканаловые пластины. В таких пластинах каждая ячейка является каналовым электронным умножителем размером до 10 мкм. Микроканаловые пластины позволяют получать фотоэлектрические изображения в ультрафиолетовом излучении и объединяют преимущества фотографических и фотоэлектрических методов регистрации излучения. При исследовании ультрафиолетового излучения также используют различные люминесцирующие вещества, преобразующие ультрафиолетовое излучение в видимое. На этой основе созданы приборы для визуализации изображений в ультрафиолетовом излучении. Применение Ультрафиолетового Излучения:- Изучение спектров испускания, поглощения и отражения в УФ-области позволяет определять электронную структуру атомов, ионов, молекул, а также твёрдых тел. УФ-спектры Солнца, звёзд и другого несут информацию о физических процессах, происходящих в горячих областях этих космических объектов (смотрите

Ультрафиолетовая Спектроскопия, Вакуумная Спектроскопия). На фотоэффекте, вызываемом ультрафиолетовым излучением, основана фотоэлектронная спектроскопия. Ультрафиолетовое излучение может нарушать химические связи в молекулах, в результате чего могут происходить различные химические реакции (окисление, восстановление, разложение, полимеризация и так далее, смотрите Фотохимия). Люминесценция под действием ультрафиолетового излучения используется при создании люминесцентных ламп, светящихся красок, в люминесцентном анализе и люминесцентной дефектоскопии. Ультрафиолетовое излучение применяется в криминалистике для установления идентичности красителей, подлинности документов и тому подобного. В искусствоведении ультрафиолетовое излучение позволяет обнаружить на картинах не видимые глазом следы реставраций. Способность многих веществ к избирательному поглощению ультрафиолетового излучения используется для обнаружения в атмосфере вредных примесей, а также в ультрафиолетовой микроскопии. Биологическое Действие Ультрафиолетового Излучения:- При действии на живые организмы ультрафиолетовое излучение поглощается верхними слоями тканей растений или кожи человека и животных. В основе биологического действия ультрафиолетового излучения лежат химические изменения молекул биополимеров. Эти изменения вызываются как непосредственным поглощением ими квантов излучения, так и (в меньшей степени) образующимися при облучении радикалами воды и других низкомолекулярных соединений. На человека и животных малые дозы ультрафиолетового излучения оказывают благотворное действие – способствуют образованию витаминов группы D (смотрите Кальциферолы), улучшают иммунобиологические свойства организма. Характерной реакцией кожи на ультрафиолетовое излучение является специфическое покраснение – эритема (максимальным эритемным действием обладает ультрафиолетовое излучение с l = 296.7 нм и l = 253.7 нм), которая обычно переходит в защитную пигментацию (загар). Большие дозы ультрафиолетового излучения могут вызывать повреждения глаз (фотоофтальмию) и ожог кожи. Частые и чрезмерные дозы ультрафиолетового излучения в некоторых случаях могут оказывать канцерогенное действие на кожу. В Растениях ультрафиолетовое излучение изменяет активность ферментов и гормонов, влияет на синтез пигментов, интенсивность фотосинтеза и фотопериодической реакции. Не установлено, полезны ли и тем более необходимы ли для прорастания семян, развития проростков и нормальной жизнедеятельности Высших Растений малые дозы ультрафиолетового излучения. Большие дозы ультрафиолетового излучения, несомненно, неблагоприятны для растений, о чём свидетельствуют и существующие у них защитные приспособления (например, накопление определённых пигментов, клеточные механизмы восстановления от повреждений). На микроорганизмы и культивируемые клетки высших животных и растений ультрафиолетовое излучение оказывает губительное и мутагенное действие (наиболее эффективно ультрафиолетовое излучение с l в пределах 280–240 нм). Обычно спектр летального и мутагенного действия ультрафиолетового излучения примерно совпадает со спектром поглощения нуклеиновых кислот – ДНК и РНК, в некоторых случаях спектр биологического действия близок к спектру поглощения белков. Основная роль в действии ультрафиолетового излучения на клетки принадлежит, по-видимому, химическим изменениям ДНК:- входящие в её состав пиримидиновые основания (главным образом тимин) при поглощении квантов ультрафиолетового излучения образуют димеры, которые препятствуют нормальному удвоению (репликации) ДНК при подготовке клетки к делению. Это может приводить к гибели клеток или изменению их наследственных свойств (мутациям). Определённое значение в летальном действии ультрафиолетового излучения на клетки имеют также повреждение биолеских мембран и нарушение синтеза различных компонентов мембран и клеточной оболочки. Большинство живых клеток может восстанавливаться от вызываемых ультрафиолетовым излучением повреждений благодаря наличию у них систем репарации. Способность восстанавливаться от повреждений, вызываемых ультрафиолетовым излучением, возникла, вероятно, на ранних этапах эволюции и играла важную роль в выживании первичных организмов, подвергавшихся интенсивному Солнечному ультрафиолетовому облучению. По чувствительности к ультрафиолетовому излучению биологические объекты различаются очень сильно. Например, доза ультрафиолетового излучения, вызывающая гибель 90% клеток, для разных штаммов кишечной палочки равна 10, 100 и 800 эрг/мм^2, а для Бактерий Micrococcus Radiodurans – 7 000 эрг/мм^2. Чувствительность клеток к ультрафиолетовому излучению в большой степени зависит также от их физиологического состояния и условий культивирования до и после облучения (температура, состав питательной среды и другие). Сильно влияют на чувствительность клеток к ультрафиолетовому излучению мутации некоторых генов. У Бактерий и Дрожжей известно около 20 генов, мутации которых повышают чувствительность к ультрафиолетовому излучению. В ряде случаев такие гены ответственны за восстановление клеток от лучевых повреждений. Мутации других генов нарушают синтез белка и строение клеточных мембран, тем самым повышая радиочувствительность негенетических компонентов клетки. Мутации, повышающие чувствительность к ультрафиолетовому излучению, известны и у высших организмов, в том числе у человека. Так, наследственное заболевание – пигментная ксеродерма обусловлено мутациями генов, контролирующих темновую репарацию. Генетические последствия облучения ультрафиолетовым излучением пыльцы высших растений, клеток растений и животных, а также микроорганизмов выражаются в повышении частот мутирования генов, хромосом и плазмид. Частота мутирования отдельных генов, при действии высоких доз ультрафиолетового излучения, может повышаться в тысячи раз по сравнению с естественным уровнем и достигает нескольких процентов. В отличие от генетического действия ионизирующих излучений, мутации генов под влиянием ультрафиолетового излучения возникают относительно чаще, чем мутации хромосом. Благодаря сильному мутагенному эффекту ультрафиолетовое излучение широко используют как в генетических исследованиях, так и в селекции растений и промышленных микроорганизмов, являющихся продуцентами антибиотиков, аминокислот, витаминов и белковой биомассы. Генетическое действие ультрафиолетового излучения могло играть существенную роль в эволюции живых организмов. О применении ультрафиолетового излучения в медицине смотрите Светолечение.

ULTRAVIOLET DEGRADATION = ДЕГРАДАЦИЯ ОТ УЛЬТРАФИОЛЕТА – Ultraviolet Degradation is a weakening or deterioration caused by exposure to ultraviolet rays of sunlight or artificial light.

ULTRAVIOLET PROTECTION FACTOR = ФАКТОР ЗАЩИТЫ ОТ УЛЬТРАФИОЛЕТА – Ultraviolet Protection Factor (UPF):- the UPF rating indicates how effective a fabric is at blocking out solar ultraviolet radiation from reaching the skin. UPF ratings range from 15 to 50 with higher ratings indicating more effective blocking and therefore better protection for the wearer of a garment. Fabrics that test higher than UPF 50 are rated as UPF50+. UPF testing involves exposing a fabric to ultraviolet radiation (UVR) and measuring how much is transmitted through the sample. Different wave-lengths of radiation in the UVR spectrum have different effects on human skin and this is taken into consideration when calculating the UPF rating. Factors that contribute to the UPF rating of a fabric are:- (i) composition of the yarns (cotton, polyester, etc); (ii) tightness of the weave or the knit (tighter improves the rating); (iii) color (darkest colors are generally better); (iv) stretch (more stretch lowers the rating); (v) moisture (many fabrics have lower ratings when wet); (vi) condition (worn and faded garments may have reduced ratings); and (vii) finishing (some fabrics are treated with UV absorbing chemicals).

ULTRAVIOLET RADIATION = УЛЬТРАФИОЛЕТОВАЯ РАДИАЦИЯ – Ultraviolet Radiation, that portion of the electromagnetic spectrum extending from the violet, or short-wavelength, end of the visible light range to the X-ray region. Ultraviolet (UV) radiation is undetectable by the human eye, although when it falls on certain materials it may cause them to fluoresce, i.e. emit electromagnetic

radiation of lower energy, such as visible light. Many insects, however, are able to see ultraviolet radiation. Ultraviolet radiation lies between wavelengths of about 400 nanometers (1 nanometer (nm) is 10^{-9} meter, or 10 angstrom units) on the visible-light side and about 100 nm on the X-ray side, though some authorities extend the short-wavelength limit to 4 nm. In physics, ultraviolet radiation is traditionally divided into four regions:- near (400–300 nm), middle (300–200 nm), far (200–100 nm), and extreme (below 100 nm). In biology three conventional divisions have been observed:- near (400–315 nm), which is absorbed relatively poorly by organisms; actinic (315–200 nm), which is absorbed most readily by organic matter and thus has the greatest effects on organisms; and vacuum (less than 200 nm), which is absorbed by most substances, including nitrogen in the air, and so is of little use in biological experimentation. Based on the interaction of wavelengths of ultraviolet radiation with biological materials, three divisions have been designated:- UVA (400–315 nm), also called black light; UVB (315–280 nm), responsible for the radiation's best-known effects on organisms; and UVC (280–100 nm), which does not reach the Earth's surface. Ultraviolet radiation is produced by high-temperature surfaces, such as the Sun, in a continuous spectrum and by atomic excitation in a gaseous discharge tube as a discrete spectrum of wavelengths. Most of the ultraviolet radiation in sunlight is absorbed by oxygen in the Earth's atmosphere, which forms the ozone layer of the lower stratosphere. Of the ultraviolet that does reach the Earth's surface, almost 99 percent is UVA radiation. When the ozone layer becomes thin, more UVB radiation reaches the Earth's surface and may have hazardous effects on organisms. Unlike X rays, ultraviolet radiation has a low power of penetration, hence its direct effects on the human body are limited to the surface skin. The direct effects include reddening of the skin (sunburn), pigmentation development (suntan), aging, and carcinogenic changes. Ultraviolet sunburns can be mild, causing only redness and tenderness, or they can be so severe as to produce blisters, swelling, seepage of fluid, and sloughing of the outer skin. The blood capillaries (minute vessels) in the skin dilate with aggregations of red and white blood cells to produce the red coloration. Tanning is a natural body defense relying on melanin to help protect the skin from further injury. Melanin is a chemical pigment in the skin that absorbs ultraviolet radiation and limits its penetration into tissues. A suntan occurs when melanin pigments in cells in the deeper tissue portion of the skin are activated by ultraviolet radiation, and the cells migrate to the surface of the skin. When these cells die, the pigmentation disappears. Persons of light complexion have less melanin pigment and so experience the harmful effects of ultraviolet radiation to a greater degree. The application of sunscreen to the skin can help to block absorption of ultraviolet radiation in such persons. Constant exposure to the Sun's ultraviolet radiation induces most of the skin changes commonly associated with aging, such as wrinkling, thickening, and changes in pigmentation. There is also a much higher frequency of skin cancer, particularly in persons with fair skin. The three basic skin cancers, basal- and squamous-cell carcinoma and melanoma, have been linked to long-term exposure to ultraviolet radiation and probably result from changes generated in the DNA of skin cells by ultraviolet rays. Ultraviolet radiation also has positive effects on the human body, however. It stimulates the production of vitamin D in the skin and can be used as a therapeutic agent for such diseases as psoriasis. Because of its bactericidal capabilities at wavelengths of 260–280 nm, ultraviolet radiation is useful as both a research tool and a sterilizing technique. Fluorescent lighting, which exploits the ability of ultraviolet radiation to interact with materials known as phosphors and cause the emission of visible light, is a highly efficient form of artificial lighting. See also Ultraviolet.

ULTRAVIOLET RESISTANCE = СОПРОТИВЛЕНИЕ УЛЬТРАФИОЛЕТУ (или СТОЙКОСТЬ К УЛЬТРАФИОЛЕТУ, или УСТОЙЧИВОСТЬ К УЛЬТРАФИОЛЕТУ) – Ultraviolet Resistance is an ability to retain strength and resist deterioration on exposure to sunlight.

ULTRA VIRES = УЛЬТРА ВИРЭС (или С ПРЕВЫШЕНИЕМ ПРАВОМОЧИЙ, или СВЕРХ ВОЗМОЖНОСТИ) – Law Latin, from Latin prep. Ultra = Beyond + Vires, pl. of. vis = Strength. Beyond The Powers; Transcending Authority; – a phrase used frequently in relation to acts or enactments by corporations in excess of their chartered or statutory rights. Latin for 'Beyond Powers'. It refers to conduct by a corporation or its officers that exceeds the powers granted by law. Ultra Vires (Latin, Ultra, Beyond + Vires, Powers):- an act or decision beyond the legal power of the person or institution making it, and thus invalid. Delegated legislation that contains provisions not authorised by the enabling power or that fails to comply with procedural requirements regulating its exercise of the power is ultra vires. Subdelegated legislation may also be invalid if the enabling power did not include the power to subdelegate (delegatus non potest delegare). Administrative actions and decisions may be ultra vires through ... Ultra Vires:- it is used as a legal term in a number of common law contexts. Ultra Vires has two meanings:- (1) substantive ultra vires where a decision has been reached outside the powers conferred on the decision taker; and (2) procedural ultra vires where the prescribed procedures have not been properly complied with. The doctrine of ultra vires gives courts considerable powers of oversight over decision-making. The range and variety of bodies amenable to the doctrine is large. Ministers, or any public body with statutory powers, may be included. The doctrine also applies to companies ... / Ультра, от Латинского слова Ultra, означающее За Пределами или По Ту Сторону или Сверх. Вне Компетенции или С Превышением Полномочий (Ultra Vires):- обозначение действия должностного лица или корпорации, на совершение которого у них нет полномочий. Полномочия должностных лиц, выполняющих свои административные обязанности, и компаний ограничены теми документами, в которых эти полномочия определены. Если должностные лица в своих действиях превышают полномочия, такие действия могут повлечь за собой разбирательство в суде. Полномочия компании ограничены пунктом о целях Меморандума об Ассоциации (Memorandum of Association). Не входящее в круг указанных целей соглашение, заключаемое компанией, зачастую не имеет юридической силы, хотя третья сторона может, по Закону О Компаниях 1985, рассчитывать на судебную защиту своих прав, если она вступила в сделку с компанией добросовестно (либо существуют другие равнозначные способы защиты своих прав). Ультра Вирэс:- в переводе с Латинского, Вне Полномочий; Вне Компетенции; Власть, Превышающая Свои Полномочия (Трансцендентальная Власть). Ультра Вирэс или Превышая Полномочия:- действия компании, не разрешённые уставом, и которые, следовательно, могут привести к судебным претензиям со стороны акционеров или третьих лиц. Смотрите также (Articles Of Incorporation).

ULTRA VIRES ACTIVITIES = ВИДЫ ДЕЯТЕЛЬНОСТИ УЛЬТРА ВИРЭС – Ultra Vires Activities are the corporate actions and operations that are not sanctioned by corporate charter, sometimes leading to shareholder lawsuits.

UM = THE UNITED STATES MINOR OUTLYING ISLANDS

UMANGITE = УМАНГИТ – Umangite, a copper selenide (Cu_3Se_2) occurring only in small grains or fine granular aggregates with other copper minerals of the sulfide group. The mineral is bluish black with a reddish tint. Deposits of the mineral are found in the Sierra de Umango (for which it is named) in Argentina; in the Harz Mountains of Germany; and at Skrickerum, Sweden. Umangite alters to malachite. / Сиэрра дэ Уманго (Sierra de Umango); Харц (Harz Mountains); Скрикерум (Skrickerum).

UMBEL = ЗОНТИК – Umbel is a flat-topped or rounded inflorescence in the shape of an umbrella with individual pedicels arising close together. Umbel is an inflorescence in which a number of divergent flowers arises from the same point. / Зонтик – с плоской верхушкой или округлённое соцветие в форме зонтика с индивидуальными цветоножками, стоящими близка друг к другу. Под Зонтиком понимается тип соцветия с укороченной главной осью и цветками, располагающимися на удлинённых цветоножках почти в одной плоскости. Простой зонтик у Вишни, Примулы, сложный – у многих растений Семейства Зонтичных. Зонтик (Umbella), соцветие растений, в котором цветоножки всех цветков одинаковой длины и выходят как бы из верхушки

укороченной главной оси. Цветки поэтому располагаются почти на одном уровне (например, у Вишни, Первоцвета, Астранции). В зонтике начинают распускаться сначала периферические цветки, затем внутренние. У растений чаще бывают сложные зонтики, в которых на длинных осях, выходящих из верхушки главной оси, располагаются не цветки, а мелкие зонтики с короткими цветоножками. Такие мелкие зонтики называют зонтичками, а оси, на которых они сидят, – лучами. Сложные зонтики присущи почти всем растениям из Семейства Зонтичных (Морковь, Укроп, Дудник и другие).

UMBER = УМБРА (или УМБРОВОВОЕ, или БУРОЕ, или ТЁМНО–КОРИЧНЕВОЕ) – Umber:- moderate to dark yellowish brown; a moderate brown.

UMBILICUS = ПУПОК (или РУБЧИК, или ПУП, или ПУПОВИНА, или СЕРЕДИНА, или СРЕДОТОЧИЕ, или ШИШКА, или МАЛЕНЬКИЙ ЦЕНТРАЛЬНЫЙ ВЫСТУП, или КРУЖОЧЕК) – Umbilicus is a scar or depression on the summit of a fruit after the floral parts are shed.

UMBRA = УМБРА (или ТЕНЬ) – Umbra is that part of a shadow area over which all light from a given source is excluded. The shadow from a point source of illumination is essentially all umbra, but that from a source of some size (as from the Sun) consists of a small umbra and a much larger partial shadow called the Penumbra. Thus, in an eclipse of the Sun, the regions of umbra are those experiencing total eclipse and those of penumbra, partial eclipse. The term is also used for the darkest inner portion of a sunspot.

UMBRELLA = КОЛПАК (или ЗОНТИК) – Umbrella (maritime term):- the cone-shaped shield at the top of the smokestack. / Колпак:- защита конусной формы на вершине дымовой трубы.

UMBRELLA CLOTH = ЗОНТИЧНОЕ ПОЛОТНО – Umbrella Cloth:- The name given to these fabrics indicates the use to which they are subjected. It stands for cloths of widely different qualities, materials and weaves. The weaves, with the exception of those used for umbrella ginghams, are of small repeating types, as plain, three-end twill, and five and six end twills of four interlacings in a repeat. Being subjected to extremes of weather, the constructions of the cloths are necessarily good. All-cotton umbrella cloths are usually woven white, then piece dyed in solid colors. For cotton warp and worsted filling goods the warp yarn is usually dyed before being woven. This is especially the case in colors other than black. It is much harder to get a fast color, one of the essential features of a good umbrella cloth, on union piece-dyed goods than on yarn-dyed goods. Black is the principal color used. In The Better Grades of umbrella cloths it is common to find silk or wool in combination with cotton. These materials are sometimes combined in the same yarn, being mixed before spun. In other cases the yarns on a beam are all of one material, and yarns of different materials, from separate beams, are used in one fabric. The analysis of a good grade of umbrella cloth shows it to have been made of silk and cotton, the selvages being of silk and the body of the warp arranged two ends of cotton and one end of silk alternately. The filling is cotton. This is a so-called Silk Umbrella Cloth. A good cotton umbrella fabric with a twill weave is constructed as follows:- Ends per inch, 84; picks per inch, 112; width in reed, 28-3/4 inches; width of cloth, 27 inches; ends in warp, 2,312; reed, 2 ends per dent; warp 60s combed American Cotton filling, 40s combed Egyptian Cotton; weave, (1 1)/(2 1) twill. Plain selvages. The cloth was woven on 12 harnesses, 2 for selvages and 10 for ground. One of the most essential features of a good umbrella cloth is a good selvage, as upon such depends not only the appearance of the cloth, but its utility. A cloth between two ribs of an umbrella would be worthless if it contained a broken selvage. We will consider a plain weave umbrella cloth, containing a good selvage, where 2 picks work as one and 2 picks are inserted in each shed. The ground is reeded 2 ends in each dent and the selvages 4 ends per dent. The construction of this fabric is 96 ends per inch of 60s warp yarn:- 104 picks per inch of 56s filling; American warp and Egyptian filling, combed stock. An ordinary single box dobby loom is generally used when making these goods, the large number of ends per inch necessitating a greater number of harnesses than are usually run on cam looms. Care has to be exercised, when weaving, to make the goods as near perfect as possible, because defects made in the loom have to be remedied afterward, or the goods have to be sold as seconds. Finishing:- On account of the combinations of materials found in mixed umbrella fabrics, the finishing and dyeing processes are of great importance and have to be done with care in order that each material will look the same when finished and retain its color under severe usage. Especial care has to be taken with silk selvage goods, because, if the selvages are damaged, the goods have to be sold for other purposes, with a consequent loss in price. Cotton umbrella cloths are singed or sheared, crabbed and steamed. If they contain silk selvages, the latter are moistened slightly just before they reach the singe plates or flames. When the goods are required to be sheared, they are first thoroughly burled, all knots and other uneven imperfections being removed so that the cloth will present an even surface, free from holes, after shearing. When steaming and drying the goods, it is necessary to have them started and kept straight, so that the warp yarns may be straight and the width uniform throughout the piece. Carding And Spinning Particulars:- The goods considered in this article are made in the same kind of mill and from the same grade of yarns as ondule fabrics, which were dealt with in the previous article. The carding and spinning data of the one will therefore apply equally well to the other, and need not be repeated here. Dyeing Particulars:- (1) Fast Black:- Dyed on the jig machine. First bath, 100 gallons; 8 pounds immedial black NN.; 10 pounds sodium sulphide; 3 pounds soda ash; 25 pounds common salt; run the pieces through for one hour, take off to a washing machine, and give a good rinsing with water; after-treat with 3 per cent chrome; 3 per cent acetic acid for 30 minutes at 180 degrees Fahrenheit (degrees F. or °F); soap with 10 pounds soap; 2 pounds olive oil; 4 pounds sal soda; 50 gallons water at 180 degrees F., and rinse. Boil the soap, olive oil and sal soda together for one hour before using. For subsequent lots 2 per cent soda ash, 7 per cent immedial black NN.; 8 per cent sodium sulphide, 6 per cent common salt will be sufficient for the dyeing process. (2) A Sulphur Black:- is the fastest to light, washing and general wear. Another black can be dyed with sulphur black topped with logwood:- six per cent immedial black NG.; 10 per cent sulphide soda; 2 per cent soda ash; 20 per cent salt; rinse well, and after-treat with 2 per cent chrome; rinse and dye with 5 per cent extract logwood; rinse and soap at 150 degrees F.; 1/2 ounce soap to 1 gallon water. And again a good black can be dyed with a one-dip black fixed with chrome which is very fast to light and washing, but not so fast as sulphur black. (3) A One-Dip Black:- ten per cent diamine fast black F.; 2 per cent sal soda; 30 per cent Glauber's salt; dye at the boil for one hour; rinse and after-treat with 2 per cent chrome; 2 per cent sulphate copper at 175 degrees F.; 3 per cent acetic acid; rinse well and soap with weak soap solution at 150 degrees F.. / Уточина.

UMBRELLA FUND = ЗОНТИЧНЫЙ ФОНД (или ФОНД ЗОНТИК) – Umbrella Fund is a fund construction comprising several subfunds. Since the subfunds together form a single legal entity (umbrella), it is only necessary to apply to have the umbrella fund listed. Once the umbrella is listed, further subfunds may be created. Investors may switch out of one subfund into another commission-free. See also Investment Fund. Umbrella Fund:- an offshore fund consisting of a fund of funds that invests in other offshore funds. / Фонд Зонтик (Umbrella Fund):- офшорный фонд (offshore fund), состоящий из фонда фондов (fund of funds), инвестированных в другие офшорные фонды.

UMBRELLA PERSONAL LIABILITY POLICY = ЗОНТИЧНЫЙ ПОЛИС ЛИЧНОЙ ОТВЕТСТВЕННОСТИ – Umbrella Personal Liability Policy:- xxxxx. / Зонтичный Полис Личной Ответственности (Umbrella Personal Liability Policy):- полис страхования задолженности, предоставляющий покрытие сверх того, что обеспечивают обычные полисы страхования ответственности. Например, типичные полисы владельца дома предлагают покрытие в размере 300 000 Долларов США против судебных исков и других претензий. Зонтичный полис может предложить покрытие задолженности на сумму в 1 миллион Долларов США,

причём претензии начнут оплачивать только после того, как будет исчерпано покрытие, лежащее в основе полиса. Население обычно приобретает зонтичные полисы, чтобы защитить себя от возможного решения суда присяжных в случае судебного разбирательства. Зонтичный полис также даёт защиту в ситуациях, которые не предусмотрены стандартным полисом страхования задолженности при страховании жилища и автомобиля, как, например, оговор и клевета. Зонтичный полис объединяет полисы, что позволяет преодолеть ограничения лежащих в его основе полисов и предложить более выгодное соотношение затрат и выгод.

UMBRELLA PLANT = ЗОНТИЧНОЕ РАСТЕНИЕ (или РАСТЕНИЕ СЫТЬ) – Umbrella Plant, any of several unrelated but similarly leaved Plants. Cyperus Alternifolius (Family Cyperaceae), also called Umbrella Palm and Umbrella Sedge, is widely cultivated in water gardens and as a potted Plant. It grows up to 1 m (3 feet) high. Native to Madagascar, Réunion, and Mauritius, it is widely naturalized in the tropics and subtropics. Eriogonum Alenii, native to the Western United States, is a white woolly member of the buckwheat Family (Polygonaceae). It grows to 50 cm (20 inches). Another Umbrella Plant, in the Family Saxifragaceae, is Peltiphyllum Peltatum; its leaves are about 25 cm (10 inches) across, with 10–15 lobes. It grows well in wet places, reaching about 2 m (6 feet) in height.

UMBRELLA SWIFT = ЗОНТИЧНАЯ МОТОВИЛО (или РОГУЛЬКА, или ФИГУРКА) – Umbrella Swift is a swift that opens up with a mechanism rather like an umbrella's.

UMBRISOL = УМБРИЗОЛ (или ХХ) – Umbrisol is one of the 30 soil groups in the classification system of the Food and Agriculture Organization (FAO). Umbrisols are characterized by a surface layer that is rich in humus but not in calcium available to plants, owing to high rainfall and extensive leaching that lead to acidic conditions. They are found under forest cover in high-rainfall regions of western Europe, the Pacific Coast of North America north of California, the South-Western coast of South America, and the Himalayas. Umbrisols occupy about 0.8 percent of the total continental land area on Earth and are related to soils of the Inceptisol order of the US Soil Taxonomy that form under coniferous forest vegetation. They are the forestland counterpart of Chernozems, Kastanozems, and Phaeozems in exhibiting a humus-rich surface layer.

UMG = UNDERWRITING MANAGEMENT GROUP

UMIAK = УМИЯК (или УМИАК) – Umiak is boat used by the Greenland and later by the Alaskan Eskimos for transport. It was called the woman's boat, as opposed to the Kayak, the men's hunting and fishing boat. Like the kayak, the umiak was made of seal or other animal skins stretched over a driftwood or whalebone frame and was paddled. Unlike the kayak, it was an open boat, either round in shape or elongated much like the birchbark canoe. The umiak was used by women for transporting themselves, children, the elderly, and possessions; the umiak was also used by the men for whaling. In the XX century the umiak was first furnished with an outboard motor and finally displaced by conventional motorboats, as was the kayak, except for recreation or sporting. / Умиак, грузовая Эскимосская лодка больших размеров (длина 8–9 метров (м), ширина 1.5 м, глубина до 70 сантиметров (см)) с открытым верхом. Имеет пару вёсел и парус, деревянный каркас обтянут тюленьими кожами. Умиак называют также женской лодкой (в отличие от Каяка), так как гребцами всегда бывают женщины, а мужчина обычно сидит на руле, которым служит лопатообразное весло.

UML = UNIFIED MODELING LANGUAGE

UMLER = UNIFORM MACHINE LANGUAGE EQUIPMENT REGISTER

UMMB = UREA–MOLASSES MINIMAL BLOCK

UMPIRE = ТРЕТЕЙСКИЙ СУДЬЯ (или РЕФЕРИ) – Umpire:- one who decides between disputants or arbitrators. See also Arbitration. / Третейский Судья или Референ (Umpire):- . Смотрите также Арбитраж (Arbitration).

UMTA = URBAN MASS TRANSPORTATION ADMINISTRATION

UMTRI = UNIVERSITY OF MICHIGAN TRANSPORTATION RESEARCH INSTITUTE

UMTRIS = URBAN MASS TRANSPORTATION RESEARCH INFORMATION SERVICE

UMW = UNITED MINE WORKERS

UN = THE UNITED NATIONS

UNABSORBED COST = НЕАБСОРБИРОВАННЫЙ РАСХОД (или НЕПОГЛОЩЁННЫЙ РАСХОД, или НЕПОГЛОЩЁННАЯ ИЗДЕРЖКА) – Unabsorbed Cost:- the part of the overhead costs of a production process that are not covered by its revenue when the output falls below a specified level. Overheads are sometimes added to the direct costs of a process and divided by the output to give a unit cost. The output for this calculation is often set at such a level that the whole of the overheads are absorbed by the unit cost. If, in fact, the output falls below this level, the whole of the overheads will not be absorbed, the deficit being the unabsorbed cost. See also Cost. / Непоглощённый Расход или Непоглощённая Издержка (Unabsorbed Cost):- часть накладных расходов производственного процесса, которая не возмещается из выручки, если объём производства падает ниже определённого уровня. Накладные расходы иногда добавляются к прямым издержкам (direct costs) производства и распределяются на все единицы выпускаемой продукции, с тем чтобы рассчитать себестоимость единицы (unit cost) продукции. Объём выпуска при такоц калькуляции обычно устанавливается на уровне, достаточном для того, чтобы все накладные расходы оказались поглощёнными в себестоимости единицы продукции. Если фактический объём производства падает ниже этого уровня, накладные расходы полностью не поглощаются, и непогашенная часть называется Непоглощёнными Издержками.

UNACASTD = UNITED NATIONS ADVISORY COMMITTEE ON THE APPLICATION OF SCIENCE AND TECHNOLOGY TO DEVELOPMENT

UNACCOUNTED–FOR CRUDE OIL = НЕУЧТЁННАЯ НЕФТЬ – In some US energy reports, Unaccounted-For Crude Oil represents the arithmetic difference between the calculated supply and the calculated disposition of crude oil. The calculated supply is the sum of crude oil production plus imports minus changes in crude oil stocks. The calculated disposition of crude oil is the sum of crude oil input to refineries, crude oil exports, crude oil burned as fuel, and crude oil losses.

UNACCOUNTED–FOR GAS = НЕУЧТЁННЫЙ ГАЗ – Unaccounted-For Gas is a gas lost through leakage or errors in measurement.

UNADJUSTED TRIAL BALANCE = ПЕРЕОЦЕНЕННЫЙ ПРОБНЫЙ БАЛАНС (или НЕСКОРРЕКТИРОВАННЫЙ ПРОБНЫЙ БАЛАНС) – Unadjusted Trial Balance is an internal accounting report that is prepared prior to recording the adjusting entries. Its purpose is to verify that the total amount of debit balances in the general ledger accounts is equal to the total amount of credit balances. The Unadjusted Trial Balance is the listing of general ledger account balances at the end of a reporting period, before any adjusting entries are made to the balances to create financial statements. The unadjusted trial balance is used as the starting point for

analyzing account balances and making adjusting entries. This report is a standard one that can be issued by many accounting software packages. It can also be manually compiled. If a company creates financial statements on a monthly basis, the accountant would print an unadjusted trial balance at the end of each month to initiate the process of creating financial statements. Alternatively, if the company only creates financial statements once a quarter, one would print the unadjusted trial balance on a quarterly basis. In a computerized accounting system, it may not even be apparent that an unadjusted trial balance is available; instead, the accountant may simply work from the general ledger report, and adjust it as necessary to create financial statements. An unadjusted trial balance is only used in double entry bookkeeping, where all account entries must balance. If a single entry system is used, it is not possible to create a trial balance where the sum of all debits equals the sum of all credits. What is the difference between an unadjusted trial balance and an adjusted trial balance? The differences between an unadjusted trial balance and an adjusted trial balance are the amounts recorded as part of the adjusting entries. Adjusting entries include the accrual of revenues that were earned but were not yet recorded, and the accrual of expenses that were incurred but were not yet recorded. Accrued expenses and the related liabilities often involve wages, utilities, repairs and maintenance, commissions, interest, and more. Adjusting entries also include depreciation and the deferral of or an adjustment of prepayments including prepaid insurance, unearned revenues, customer deposits, and more. / Нескорректированный Пробный Баланс:- пробный баланс, составленный до отражения и переноса на счета главной книги корректирующих записей. Смотрите также Пробный Баланс (Trial Balance).

UNALLOCATED ACCOUNT = ОБЕЗЛИЧЕННЫЙ СЧЁТ – Unallocated Accounts:- this is an account where specific bars are not set aside and the customer has a general entitlement to the metal. It is the most convenient, cheapest and most commonly used method of holding metal. The units of these accounts are one fine ounce of gold and one ounce of silver based upon a 995 LGD (London Good Delivery) gold bar and a 999 fine LGD silver bar respectively. Transactions may be settled by credits or debits to the account while the balance represents the indebtedness between the two parties. Credit balances on the account do not entitle the creditor to specific bars of gold or silver, but are backed by the general stock of the bullion dealer with whom the account is held. The client is an unsecured creditor. Should the client wish to receive actual metal, this is done by 'allocating' specific bars or equivalent bullion product, the fine gold content of which is then debited from the allocated account. Unallocated Account is an account in which the client's bars are not specifically ring-fenced, and which is cheaper than an allocated account in that storage charges are obviated. The client carries higher counterparty risk, however, as he is an unsecured creditor. See also Allocated Account, Bullion Account, and Metal Account. Unallocated Accounts:- these represent the most straightforward and hence most popular way of trading, settling and holding gold, silver, platinum and palladium and are the cornerstone of the loco London mechanism for bullion and the loco London/Zurich mechanism for platinum and palladium. The units of these accounts are one fine Troy ounce of gold and one Troy ounce of silver, platinum or palladium based upon a 995 fine LGD gold bar, a 999 fine LGD silver bar or a 999.5 GD platinum or palladium plate or ingot. The simplicity of this arrangement is reflected in the fact that transactions may be settled by credits or debits to the account while the balance represents the indebtedness between the two parties. Credit balances on the account do not entitle the creditor to specific bars of gold or silver or plates or ingots of platinum or palladium but are backed by the general stock of the precious metal dealer with whom the account is held:- the client in this scenario is an unsecured creditor. Alternatively, a negative balance will represent the precious metal indebtedness of the client to the dealer in the case where the client has a precious metal overdraft facility. Should the client wish to receive actual metal, this is done by 'allocating' specific bars, plates or ingots or equivalent precious metal product, the metal content of which is then debited from the unallocated account. For clients, market convention is that precious metal may be allocated on the day on which it is called for, with physical metal generally available for collection within two days. This time frame can be shortened or lengthened by mutual agreement depending upon amount and prevailing market conditions. To take the analogy of simple currency bank accounts, precious metal bars, of any form, may be drawn down, or allocated, from an unallocated account in just the same way that bank notes with specific unique numbers may be drawn out of a bank checking account. Unallocated Account is an account where specific bars are not set aside and the customer has a general entitlement to the metal. This is the most convenient, cheapest and most commonly used method of holding metal. The holder is an unsecured creditor. See also Allocated Account; and Metal Account. / Смотрите также Счёт Ответственного Хранения (Allocated Account); и Металлический Счёт (Metal Account).

UNAMORTIZED BOND DISCOUNT = НЕАМОРТИЗИРОВАННЫЙ ДИСКОНТ ПО ОБЯЗАТЕЛЬСТВАМ – Unamortized Bond Discount:- par value of a bond less the proceeds received from the sale of the bond, less whatever portion has been amortized. / Неамортизированная Облигационная Скидка – часть скидки от номинала облигации, которую предстоит амортизировать в будущие годы. Неамортизированная Облигационная Скидка (Unamortized Bond Discount):- разница между лицевой стоимостью (face value) облигации и поступлениями от продажи облигаций компанией-эмитентом минус часть, подлежащая списанию, то есть отнесённая к расходам, которые периодически отражаются в отчёте о прибылях и убытках (profit and loss statement). Во время эмиссии у компании имеются две альтернативы:- (1) она может немедленно поглотить как расход сумму скидки плюс затраты на эмиссию, такие, как правовое оформление, тиражирование облигаций, регистрация (registration) и другие аналогичные расходы, либо (2) она может захотеть рассматривать всю скидку и расходы как отсроченные расходы (deferred charge), зарегистрировать их как актив (asset), который будет списываться на протяжении всей жизни облигаций или по какой-то другой схеме, которую предпочтёт компания. Сумма, которую предстоит истратить в какой-то момент, будет неамортизированной облигационной скидкой.

UNAMORTIZED PREMIUMS ON INVESTMENTS = НЕАМОРТИЗИРОВАННЫЕ ПРЕМИИ ПО ИНВЕСТИЦИЯМ – Unamortized Premiums On Investments:- the unexpensed portion of the difference between the price paid for a security and its par value. / Неамортизированные Премии По Инвестициям (Unamortized Premiums On Investments):- не списанные части сумм, на которые цена, уплаченная за ценные бумаги, превышает их номинальную (par) стоимость (облигации (bond) или привилегированной акции (preferred stock)) или рыночную стоимость (market value) – для обыкновенной акции. Премия (premium) уплачивается при приобретении ценных бумаг, является по сути нематериальным активом (intangible asset) и согласно консервативным методам бухгалтерского учёта должна списываться как расходы по прошествии определённого периода времени. Смотрите также Going-Concern Value.

UNAPPROPRIATED PROFIT = НЕВЫДЕЛЕННАЯ ПРИБЫЛЬ (или НЕРАСПРЕДЕЛЁННАЯ ПРИБЫЛЬ) – Unappropriated Profit:- the part of an organization's profit that is neither allocated to a specific purpose nor paid out in dividends. See also Appropriation; and Profit. / Нераспределённая Прибыль (Unappropriated Profit):- часть прибыли организации, которая не была израсходована в каких-либо определённых целях и не была выплачена в виде дивидендов (dividends).

UNATTENDED TERMINAL = ТЕРМИНАЛ БЕЗ ОБСЛУЖИВАНИЯ (или АВТОНОМНЫЙ ТЕРМИНАЛ) – In banking, Unattended Terminal is a terminal designed to be used by the cardholder in self-service mode. The Unattended Payment Terminal (UPT) is a cardholder-operated payment terminal that reads, captures and transmits card information in conjunction with an unattended self-service device, including, but not limited to, the following:- (i) Automated Fuel Dispenser; (ii) Ticketing Machine; and (iii) Vending Machine. The scope of these requirements does not include UPTs that are not cardholder PIN acceptance devices; nor does it include ATMs, which are separately defined. / В банковском обслуживании, терминал, предназначенный для использования

владельцами карт в режиме самообслуживания. В России такие терминалы называют Терминалами Самообслуживания. Они позволяют значительно сократить время для посещения банка и упростить процедуру оплаты услуг. Терминалы самообслуживания – это устройства, позволяющие клиентам:- (i) самостоятельно проводить платежи; (ii) так же просто пользоваться им, как и банкоматом; (iii) производить оплату с использованием банковской карты или наличных денежных средств; (iv) выполнять все действия путём нажатия клавиши напротив соответствующей надписи на экране терминала, при этом выполнение всех операций сопровождается подробными инструкциями, также выводимыми на экран терминала; (v) легко найти соответствующую функцию терминала, поскольку все услуги собраны в основные группы по видам платежей; (vi) вводить данные с цифровой клавиатуры или с использованием считывателя штрих кода; и (vii) проверить и получить подтверждение выполнения каждой совершённой пользователем операции за счёт выдаваемого терминалом чека, являющегося официальным банковским документом, подтверждающим совершённый платёж. Платежи через терминалы могут совершаться по тем же тарифам, как если бы они совершались через кассиров банка, и без взимания дополнительных комиссий. Банки постоянно расширяют перечень доступных платежей внутри групп. В России с помощью терминалов самообслуживания могут быть оплачены коммунальные платежи, услуги связи, дошкольных и учебных заведений, налоги, штрафы и пени, гаситься выданные банком кредиты, оформлены длительные поручения, заявки на получение кредита, подключение к услуге 'Мобильный Банк' и прочее.

UNAUTHORIZED USER = НЕУПОЛНОМОЧЕННЫЙ ПОЛЬЗОВАТЕЛЬ (или НЕАВТОРИЗОВАННЫЙ ПОЛЬЗОВАТЕЛЬ) – Unauthorized User is a person designated in the Licensing Agreement as not having permission to access or otherwise use the digital information that is the subject matter of the agreement or, more often, any person who is not an Authorized User, as that term is defined.

UNBALANCED GROWTH = НЕСБАЛАНСИРОВАННЫЙ РОСТ – Unbalanced Growth is a situation in which economic growth is significantly faster in some segments of the economy than in others. Unbalanced Growth is situation in which economic growth is significantly higher in some sectors than others. For example, banking may be growing rapidly while manufacturing may be growing more slowly or even declining. / Несбалансированный Рост:- капиталовложения, обеспечивающие различные уровни доходности в разных сферах экономики.

UNBALANCED PLAID = НЕОТБАЛАНСИРОВАННЫЙ ПЛЕД (или НЕОТРЕГУЛИРОВАННАЯ ШОТЛАНДКА) – An Unbalanced Plaid is one in which the arrangement of the stripes is different on the crosswise and lengthwise grain of the fabric. In constructing a garment of this type special care must be taken in matching the plaid design.

UNBALANCED SEAL = НЕУРАВНОВЕШЕННОЕ УПЛОТНЕНИЕ – Unbalanced Seal is a mechanical seal arrangement wherein the full hydraulic pressure of the seal chamber acts to close the seal faces. See also Seal.

UNBALANCED TRAFFIC = НЕСБАЛАНСИРОВАННОЕ ДВИЖЕНИЕ – Unbalanced Traffic:- xxxxx. / Несбалансированное Движение:- ситуация, когда движение в одном направлении более интенсивное, чем в обратном.

UNBALANCED YARN = НЕОТБАЛАНСИРОВАННАЯ (или НЕОТРЕГУЛИРОВАННАЯ) ПРЯЖА – Unbalanced Yarn is a yarn in which there is sufficient twist to set up a torque effect, so that the yarn will untwist and retwist in the opposite direction.

UNBEND = ОТВЯЗЫВАТЬ (или ОТКРЕПЛЯТЬ, или ОТДАВАТЬ) – Unbend (maritime term):- to untie.

UNBIASED EXPECTATIONS HYPOTHESIS = ГИПОТЕЗА НЕСМЕЩЁННЫХ ОЖИДАНИЙ (или ГИПОТЕЗА НЕПРЕДВЗЯТЫХ ОЖИДАНИЙ) – Unbiased Expectations Hypothesis is a theory that forward exchange rates are unbiased predictors of future spot rates. See also Forward Parity.

UNBIASED PREDICTOR = НЕСМЕЩЁННЫЙ ПРЕДСКАЗАТЕЛЬ – Unbiased Predictor:- a theory that spot prices at some future date will be equal to today's forward rates.

UNBLEACHED MUSLIN = НЕОТБЕЛЕННЫЙ МУСЛИН (или НЕБЕЛЁНАЯ КИСЕЯ) – Unbleached Muslin is a cotton plain-weave printcloth fabric in grey goods and lightweight sheetings, used for ironing board covers, dust covers, and dust cloths. / Кисея – очень тонкая редко тканая полупрозрачная хлопчатобумажная ткань полотняного переплетения, цветная, узорчатая или с вышитым орнаментом. В первое десятилетие XIX века самой модной была белая кисея, как подражание античным традициям. По техническим и художественным качествам близка к муслину.

UNBUNDLE = РАЗБИВКА (или В ОТДЕЛЬНОСТИ, или РАЗДЕЛЬНО, или РАЗМЕЖОВЫВАТЬ) – Unbundle:- account for the components of a contract as if they were separate contracts. To price separately. Unbundle:- to pick apart formerly composite services or risks so that the components can be considered separately. Derivatives enable the risks associated with financial transactions to be unbundled, e.g., one derivative can be used to manage currency risk and another to manage the interest-rate risk of the one transaction. Also, the services of a bank, broker or financial institution are described as unbundled when no single service is priced so cheaply that it is subsidised by another. Each service is marketed and priced on its own merit, to be independently viable. To give separate prices for equipment and supporting services.

UNBUNDLING = РАЗМЕЖЕВАНИЕ (или РАЗДЕЛЕНИЕ) – (1) Unbundling is the separating of the various components of electricity production, supply and service, in order to introduce greater elements of competition to these segments of the industry. 'Functional Unbundling' would require monopolistic utilities to provide access to their transmission and distribution network in exchange for an access fee. 'Structural Unbundling' would require complete vertical disaggregation, so that monopolistic utilities would be required to divest either their generation assets or their transmission/distribution assets.

(2) Unbundling is a separation of a multinational firm's transfers of funds into discrete flows for specific purposes. See also Bundling.

(3) Unbundling:- the separation of a business into its constituent parts, generally by selling off certain subsidiaries or business lines. Unbundling:- the sale of peripheral parts of a business to concentrate on its core activities. This may be because it is believed that the outlying parts of a business empire could operate more profitably if they became independent or joined different groupings, or to raise money for paying off debt. / Разделение (Unbundling):- поглощение крупного конгломерата с целью сохранить в рамках действующего концерна только ключевое производство и продать некоторые или все другие филиалы, чтобы профинансировать поглощение.

(4) Unbundling is the selling off of separate parts of a security, for example its coupon.

(5) Unbundling is the process of breaking a product into separate components and selling each component separately. For example, discount airlines sell a ticket for a flight then charge separately for baggage, food, choice of seat, etc.

UNCALLED CAPITAL = НЕВОСТРЕБОВАННЫЙ КАПИТАЛ – Uncalled Capital:- shares can be issued but only partly paid and the difference between the face value and the amount paid is known as Uncalled Capital. The total amount of capital that as yet has not been called up by the directors on the shares which are currently issued. Money owing to a company on partly-paid shares. Uncalled capital exists as a reserve to be called upon at any time by the directors of a company. Uncalled Capital is a capital that a company has in the form of shares that have not been completely paid for by shareholders. Uncalled Capital:- stocks or shares that a company is allowed to issue, but has not. Can sometimes mean the unpaid portion of partly paid stocks. Also known as Reserve Capital. See also Authorized Capital; and Reserve Capital. Uncalled Capital:- occasionally part of a company's issued share capital is held in reserve and is only called up if the company is wound up. / Невостребованный Капитал (Uncalled Capital):- капитал, который компания имеет в форме акций, которые не были полностью оплачены держателями акций (или акционерами). Смотрите также Резервный Капитал (Reserve Capital). Невостребованный Капитал – это часть выпущенного акционерного капитала компании, которая остаётся невостребованной.

UNCDF = UNITED NATIONS CAPITAL DEVELOPMENT FUND

UNCED = UNITED NATIONS CONFERENCE ON ENVIRONMENT AND DEVELOPMENT

UN/CEFACT = UNITED NATIONS CENTRE FOR TRADE FACILITATION AND ELECTRONIC BUSINESS

UNCERTIFICATED UNITS = НЕСЕРТИФИЦИРОВАННЫЕ ПАИ – Uncertificated Units:- a small number of units purchased for an investor in a unit trust by reinvestment of dividends. If the number of units is too small to warrant the issue of a certificate they are held on account for the investor and added to the total when the holding is sold. / Несертифицированные Паи (Uncertificated Units):- небольшое количество паёв, приобретённых паевым трестом (unit trust) для инвестора за счёт реинвестирования дивидендов. Если количество паёв недостаточно велико, чтобы требовать выдачу сертификата, эти паи хранятся на счёте инвестора и добавляются к общему количеству его паёв, когда он захочет продать их.

UNCINATE = КРЮЧКОВАТОЕ – Uncinate – uncate – terminated by a sharply curved hook. Hence uncinatus – with hooked spines.

UNCITRAL = UNITED NATIONS COMMISSION ON INTERNATIONAL TRADE LAW

UNCLAIMED FREIGHT = НЕЗАЯВЛЕННЫЙ ФРАХТ (или НЕВОСТРЕБОВАННЫЙ ГРУЗ, или НЕВОСТРЕБОВАННЫЙ ФРАХТ) – Unclaimed Freight is a freight that has not been called for or picked up by the consignee or owner. / Невостребованный Груз или Невостребованный Фрахт:- груз, который не был востребован ни грузополучателем, ни владельцем.

UNCLASSED WHEAT = НЕКЛАССИФИЦИРОВАННАЯ ПШЕНИЦА – In the United States, Unclassed Wheat is any Variety of Wheat that is not classifiable under other criteria provided in the Wheat standards. There are no subclasses in this class. This class includes any Wheat which is other than red or white in color.

UNCLEAN BILL OF LADING = НЕЧИСТЫЙ КОНОСАМЕНТ (или КОНОСАМЕНТ С ПОМЕТКАМИ, или КОНОСАМЕНТ С ЗАМЕЧАНИЯМИ, или КОНОСАМЕНТ С ОГОВОРКАМИ) – Unclean Bill Of Lading is a bill of lading which has exceptions to the receipt of merchandise noted on it. Also known as Foul Bill Of Lading. Unclean Bill Of Lading is a document showing the details of the products sent from a seller to a buyer that states that either the products or their containers are damaged. An unclean bill of lading is issued when it is determined that the packages are not in their original condition. A bill of lading that has been claused by the carrier to show that the goods were not in sound condition when received. Unclean Bill Of Lading:- under the UCP 1983, a 'clean transport document is one which bears no superimposed clause or notation which expressly declares a defective condition of the goods and/or the packaging'. Accordingly, if a bill of lading, as a transport document, does bear such a clause, it will be 'unclean'. The clause should refer to the condition of the goods and/or the packaging when the goods are shipped. Banks will normally reject transport documents with such clauses. It may be pointed out that the defective nature of the goods and/or the packaging should refer to the condition of the objects themselves. A clause simply stating that the goods are shipped in 'second-hand cases' does not imply that the packaging is defective although this may be a 'superimposed clause or notation' and may lead the exporter into difficulties because banks are very conservative and cautious. / Коносамент, который имеет исключения в расписке в получении товаров, указанных в нём. Известен также как Грязный Коносамент или Коносамент С Пометками (Foul Bill Of Lading). Коносамент, который был помечен перевозчиком с целью показать, что товары находились в ненадлежащем состоянии в момент их получения.

UNCLE POINT = ТОЧКА ИЗДЫХАНИЯ (или ХХ) – The Uncle Point is a place where a trader has had enough pain or draw-down and decides that the trade is no longer working and throws in the towel, i.e. the trader flattens his/her position. This includes the point of emotional stress as well as financial analysis of the losses being suffered. The uncle point is usually the point where you know something is truly going wrong with your system and you take action and get out. The exact origin of 'say uncle' or 'cry uncle', first appearing in written English around 1918 is unclear but there are some interesting theories. One theory posits that 'Uncle' is actually a mangled form of the Irish word 'Anacol', meaning 'protection' or 'safety', making a demand from an aggressor to 'cry uncle' equivalent to the thug demanding that his victim 'cry for help' as a signal of surrender. There's no real evidence to support this theory, but there certainly was no lack of recent Irish immigrants in the United States around the turn of the century, so it's not entirely implausible. The other popular theory about 'cry uncle' suggests that the phrase may actually be thousands of years old, and that its origins go all the way back to the Roman Empire. According to this theory, Roman children, when beset by a bully, would be forced to say 'Patrue, mi Patruissimo', or 'Uncle, my best Uncle', in order to surrender and be freed. As to precisely why Ancient Roman bullies forced their victims to 'cry uncle', opinions vary. It may be that the ritual was simply a way of making the victim call out for help from a grownup, thus proving his or her helplessness. Alternatively, it may have started as a way of forcing the victim to grant the bully a title of respect – in Roman times, your father's brother was accorded nearly the same power and status as your father. The form of 'Uncle' used in the Latin phrase ('Patrue') tends to support this theory, inasmuch as it specifically denoted your paternal uncle, as opposed to the brother of your mother ('Avunculus'), who occupied a somewhat lower rung in patrilineal Roman society'.

UNCLE SAM = ДЯДЯ СЭМ – Uncle Sam is a popular US symbol usually associated with a cartoon figure having long white hair and chin whiskers and dressed in a swallow-tailed coat, vest, tall hat, and striped trousers. His appearance is derived from two earlier symbolic figures in American folklore – Brother Jonathan and Yankee Doodle. The origin of the term Uncle Sam, though disputed, is usually associated with a businessman from Troy, N.Y., Samuel Wilson, known affectionately as 'Uncle Sam' Wilson. The barrels of beef that he supplied the army during the War of 1812 were stamped 'U.S.' to indicate government property. This identification is said to have led to the widespread use of the nickname Uncle Sam for the United States; and a resolution passed by Congress in 1961 recognized Wilson as the namesake of the national symbol. Uncle Sam and his predecessor Brother Jonathan were used interchangeably to represent the United States by US cartoonists from the early 1830s to 1861. Cartoonists of the British humour magazine Punch helped evolve the modern figure by their drawings of both Brother Jonathan and Uncle Sam as lean, whiskered gentlemen wearing top hats and striped pants. Probably the first US political cartoonist to crystallize the figure of Uncle Sam was Thomas Nast, beginning in the early 1870s. One of the most familiar treatments in the XX century was shown in James Montgomery

Flagg's World War I recruiting poster, also used in World War II, for which the caption read, 'I Want You'. / Братец Дьжонэсэн (Brother Jonathan) и Яньки Дудэл (Yankee Doodle). Сэмьюэл Вилсэн (Samuel Wilson), 'Дядя Сэм' Вилсэн ('Uncle Sam' Wilson). Британский юмористический журнал Панч (Punch). Томэс Нэст (Thomas Nast). Дьжеймз Мантгэмэри Флэг (James Montgomery Flagg).

UNCOLLECTED FUNDS = НЕИНКАССИРОВАННЫЕ ФОНДЫ – Uncollected Funds:- the amount of bank deposits in the form of checks that have not yet been paid by the banks on which the checks are drawn. / Неинкассированные Фонды (Uncollected Funds):- часть депонированной суммы, которая ещё не была востребована банком, в который были вложены средства, то есть неоплаченные банком чеки. Банк обычно не разрешает вкладчику снимать деньги под неинкассированные средства. Смотрите также Xxxxx (Float).

UNCOLLECTIBLE ACCOUNT = НЕИНКАССИРОВАННЫЙ СЧЁТ (или НЕВЗЫСКИВАЕМЫЙ СЧЁТ, или НЕСОБИРАЕМЫЙ СЧЁТ, или СЧЁТ БЕЗНАДЁЖНОЙ ЗАДОЛЖЕННОСТИ, или СОМНИТЕЛЬНЫЙ СЧЁТ) – Uncollectible Account is an account which cannot be collected by a company because the customer is not able to pay or is unwilling to pay. / Сомнительные Счета (Uncollectible Accounts) (Задолженность):- дебиторская задолженность покупателей (заказчиков), которые не могут или не будут оплачивать счета; для целей финансового учёта требуется расчёт поправки на сомнительную задолженность, которая уменьшает величину дебиторской задолженности, отражаемой в балансе. Неинкассированный Счёт (Uncollectible Account):- счёт клиента, который не может быть инкассирован из-за нежелания или неспособности клиента платить. Обычно после нескольких попыток инкассирования такую дебиторскую задолженность списывают.

UNCOMPENSATED DEMAND FUNCTION = ФУНКЦИЯ НЕСКОМПЕНСИРОВАННОГО СПРОСА – Uncompensated Demand Function:- In microeconomics, a consumer's Marshallian Demand Function (named after an English economist Alfred Marshall; 1842–1924) specifies what the consumer would buy in each price and income or wealth situation, assuming it perfectly solves the utility maximization problem. Marshallian Demand is sometimes called Walrasian Demand (named after a French mathematical economist Marie-Esprit-Léon Walras; 1834–1910) or Uncompensated Demand Function instead, because the original Marshallian analysis refused wealth effects. See also Marshallian Demand Function. Uncompensated Demand (or Marshallian Demand) is the standard demand function we're all used to. It gives the various quantities of a good that will be demanded at different prices due to consumers solving a maximisation problem, maximising utility at a given price and income level. For compensated demand, incomes are assumed to be at the level which solves the consumers expenditure minimisation problem at a fixed level of utility. Alfred Marshall was the first economist to draw supply and demand curves. The 'Marshallian cross' is the staple tool of blackboard economics. Marshallian demand curves are simply conventional market or individual demand curves. / Эдфрид Машэл (Alfred Marshall; 1842–1924). Мари-Эспри-Леу Вальрас (Marie-Esprit-Léon Walras; 1834–1910). Функция Нескомпенсированного Спроса (Uncompensated Demand Function):- . Смотрите также Функция Маршэловского Спроса (Marshallian Demand Function).

UNCONDITIONAL BID = БЕЗУСЛОВНОЕ ПРЕДЛОЖЕНИЕ НА ПОКУПКУ – Unconditional Bid:- an offer by one company to buy another without particular conditions. The expected profit from a conditional tender offer is generally higher than the expected profit from an unconditional bid. See also Takeover Bid. Unconditional Bid is a takeover bid to buy a company at a particular price, without any conditions. / Безусловное Предложение На Покупку (Unconditional Bid):- . Предложение О Поглощении (Takeover Bid).

UNCONDITIONAL CALL MONEY = ДЕНЬГИ ДО БЕЗУСЛОВНОГО ВОСРЕБОВАНИЯ – Unconditional Call Money:- in Japan, unconditional loans are made for two days, after which they can be called or ... / Деньги До Безусловного Востребования:- Японский термин, означающий ссуды, выданные первоначально на два дня, которые затем могут быть востребованы с уведомлением в один день.

UNCONFINED RELEASE = НЕОГРАНИЧЕННЫЙ ВЫПУСК (или СВОБОДНЫЙ ВЫПУСК) – Unconfined Release is a release of plants that are not isolated either reproductively or physically from managed or un-managed environments, but may be subject to other restrictions.

UNCONFIRMED LETTER OF CREDIT = НЕПОДТВЕРЖДЁННЫЙ АККРЕДИТИВ – Unconfirmed Letter of Credit is a documentary letter of credit where the advising bank makes no commitment to pay, accept or negotiate. See also Letter Of Credit; and Silent Confirmation. Unconfirmed Letter Of Credit is a letter of credit that has not been confirmed. See also Confirmed Letter Of Credit. Unconfirmed Letter of Credit is a letter of credit which has not been guaranteed or confirmed by any bank other than the bank that opened it. The advising bank merely informs the beneficiary of the letter of credit terms and conditions. / Неподтверждённый Аккредитив – аккредитив, который не был подтверждён. Смотрите также Подтверждённый Аккредитив (Confirmed Letter Of Credit).

UNCONSCIONABLE BARGAIN = ОТЪЯВЛЕННАЯ СДЕЛКА (или НЕЗАКОННАЯ СДЕЛКА) – Unconscionable Bargain:- a contract on very unfair terms. An example is the sale of a future interest in property at a gross undervalue, made by someone with expectations to succeed to the property who is in immediate need of money. Such a contract may be set aside or modified by a court of equitable jurisdiction ... See also Catching Bargain. Unconscionable Bargains:- i.e. those in which the terms are very unfair. / Незаконная Сделка (Unconscionable Bargain):- . Смотрите также Ловкая Сделка (Catching Bargain).

UNCONVENTIONAL NATURAL GAS = НЕТРАДИЦИОННЫЙ ПРИРОДНЫЙ ГАЗ (или ГАЗ НЕТРАДИЦИОННОГО ПРОИСХОЖДЕНИЯ) – Unconventional Natural Gas:- in the case of natural gas from coal, natural gas from tight sands and shale gas, conventional gas found in unconventional reservoirs or reservoirs requiring special production methods or technologies; in the case of gas hydrates, conventional methane in an unconventional form occurring in a conventional reservoir.

UNCONVENTIONAL OIL AND GAS RESOURCES = РЕСУРСЫ НЕТРАДИЦИОННЫХ НЕФТИ И ГАЗА – Unconventional Oil And Gas Resources:- hydrocarbons contained in formations over very large areas with extremely low permeability that are not influenced by buoyancy. In contrast, conventional resources are contained within geologic structures/stratigraphy and float buoyantly over water. Unconventional resources include shale gas, coalbed methane, crude oil and natural gas from tight rock formations, tar sands, kerogen from oil shale, and gas hydrates that cannot commercially flow without well stimulation.

UNCOVERED CALL = НЕОБЕСПЕЧЕННЫЙ ОПЦИОН НА ПОКУПКУ – Uncovered Call is a short call option position in which the writer does not own shares of underlying stock represented by the option contracts. Uncovered calls are much riskier for the writer than a covered call, where the writer of the uncovered call owns the underlying stock. If the buyer of a call exercises the option to call, the writer would be forced to buy the asset at the current market price. Also called a 'Naked' Asset.

UNCOVERED CALL WRITING = ВЫПИСЫВАНИЕ НЕОБЕСПЕЧЕННОГО ОПЦИОНА НА ПОКУПКУ – Uncovered Call Writing:- a short call option position in which the writer does not own an equivalent position in the underlying security represented by his option contracts.

UNCOVERED INTEREST ARBITRAGE = НЕПОКРЫТЫЙ ПРОЦЕНТНЫЙ АРБИТРАЖ – Uncovered Interest Arbitrage:- a process of borrowing a currency and converting it to a second currency where it is invested. The arbitrageur aims to earn profit from the relative interest rates received and paid. Unlike covered interest arbitrage, the currency in which the arbitrageur invests is not sold forward; instead the arbitrageur waits until the maturity of the investment and then sells the second currency spot for the original currency. Also, unlike covered interest arbitrage, the uncovered version is risky. Uncovered Interest Arbitrage is a form of arbitrage where funds are transferred abroad to take advantage of higher interest in foreign monetary centers. It involves the conversion of the domestic currency to the foreign currency to make investment; and subsequent re-conversion of the fund from the foreign currency to the domestic currency at the time of maturity. A foreign exchange risk is involved due to the possible depreciation of the foreign currency during the period of the investment. / Непокрытый Процентный Арбитраж:- ситуация, когда инвестиция произведена в актив в иностранной валюте с целью воспользоваться более выгодной процентной ставкой, без того чтобы одновременно осуществить форвардную обменную сделку для защиты инвестора от риска изменения валютных курсов.

UNCOVERED OPTION = НЕПОКРЫТЫЙ ОПЦИОН – Uncovered Option is a short call or put option position which is not covered by the purchase or sale of the underlying futures contract or physical commodity. Also known as Naked Option. / Позиция продажи (короткая позиция) опциона на покупку или продажу, которая не покрыта приобретением или продажей соответствующего фьючерсного контракта или физического сырья. Смотрите также Необеспеченный Опцион (Naked Option). Непокрытый Опцион или Необеспеченный Опцион:- короткая опционная позиция, под которую владелец не имеет соответствующего покрытия (если потребуется произвести по нему поставку). Смотрите также Покрытый Опцион (Covered Option), и (Covered Writer).

UNCOVERED POSITION = НЕПОКРЫТАЯ ПОЗИЦИЯ (или НЕЗАКРЫТАЯ ПОЗИЦИЯ) – (1) Uncovered Position:- shortage of units due to an excessive number of short sales. Where a long market player has bought more of a commodity than he has agreed to sell, or where a short market player has sold more of a commodity than he has to deliver. The seller of an uncovered position is still under obligation to deliver underlying asset. / Непокрытая Позиция:- нехватка единиц вследствие чрезмерного числа продаж в короткую. Ситуация, в которой участник рынка, имеющий длинную позицию, купил больше сырья, чем он обязался продать, либо в которой участник рынка, имеющий короткую позицию, продал сырья больше, чем он должен был поставить. Продавец непокрытой позиции продолжает оставаться обязанным поставить соответствующий актив.

(2) Uncovered Position:- when the grantor of an options position has no cover in the underlying futures market against a price swing in the holder's favor. Uncovered Position:- shortage of units due to an excessive number of short sales. / Ситуация, в которой предоставивший опцион не располагает на рынке базовых фьючерсов средствами нейтрализации риска отклонения цены в пользу владельца опциона.

(3) Uncovered Position:- an uncovered amount under a Lombard loan. / Непокрытая Позиция:- необеспеченная сумма по Ломбардному займу.

UNCOVERED PUT = НЕПОКРЫТЫЙ ОПЦИОН НА ПРОДАЖУ (или НЕОБЕСПЕЧЕННЫЙ ОПЦИОН НА ПРОДАЖУ) – Uncovered Put is a short put option position in which the writer does not have a corresponding short stock position or has not deposited, in a cash account, cash or cash equivalents equal to the exercise value of the put. The writer has pledged to buy the asset at a certain price if the buyer of the option chooses to exercise it. Uncovered put options limit the writer's risk to the value of the stock (adjusted for premium received.) Also called 'Naked' Puts.

UNCOVERED PUT WRITING = ВЫПИСЫВАНИЕ НЕПОКРЫТОГО ОПЦИОНА НА ПРОДАЖУ (или ВЫПИСЫВАНИЕ НЕОБЕСПЕЧЕННОГО ОПЦИОНА НА ПРОДАЖУ) – Uncovered Put Writing:- short put option position in which the writer does not have a corresponding short position in the underlying security or has not deposited, in a cash account.

UNCRD = UNITED NATIONS CENTRE FOR REGIONAL DEVELOPMENT

UNCRIMPING ENERGY = ЭНЕРГИЯ НА ВЫПРАВЛЕНИЕ (или РАЗГОФРИРОВАНИЕ) – Uncrimping Energy is an important quality index to measure the crimping effect of cellulose acetate fibers, which is determined by both crimp cap force and crimp roller force. It is found by analyzing that uncrimping energy can be determined directly by the vibration magnitude of crimp cap. In order to evaluate the stability of uncrimping energy, a real-time signal monitoring system was developed to detect vibration signals of crimping machine. The electric eddy current sensor was used to measure the swing of crimp cap. The uncrimping energy was then calculated in terms of the functional combination of root-mean-square value, peak to peak value and average value of the vibration signal. In the on-line application, the results indicate that the uncrimping energy data, measured by monitoring system, are stable and can rapidly reflect the force changes of crimp cap and roller. See also Crimp Energy. / ацетат целлюлозы или ацетилцеллюлоза (cellulose acetate).

UNCTAD = UNITED NATIONS CONFERENCE ON TRADE AND DEVELOPMENT

UNCUT BUTTONHOLE = НЕПРОРЕЗАННАЯ ПЕТЛЯ (или НЕПРОРЕЗАННАЯ ПЕТЛИЦА) – Uncut Buttonhole:- where knife failed to cut buttonhole. Sewing Room Defects. / Порок или дефект швейного производства.

UNCUT PILE = НЕУКОРОЧЕННЫЙ ВОРС (или НЕРАЗРЕЗНОЙ ВОРС, или ПЕТЛИСТЫЙ ВОРС) – Uncut Pile, also known as Loop Pile or Rounded Loops, is a finish of the fabric without cutting the yarns. The Fabrics with uncut pile is very strong because the loops of the yarn run continuously from face of the carpet through its back. Added backing helps to strengthen it further. The regularity or irregularity of the loops, the height and texture of the yarn is determined by the surface and texture of the uncut pile. The strongest carpet is made with uncut pile weave. Uncut pile has clear detail in design. It is soft, beautiful and hugs the floor better. It has more longevity than other carpet weaves. Hand towels, bath towels, extra large and beach towels are uncut piles for greater wear of the fabric. See also Cut Pile, and Weave. / Вытяной Ворс или Булавчатый Ворс (Loop Pile).

UNCUT VELVET = НЕРАЗРЕЗНОЙ БАРХАТ (или БУЛАВЧАТЫЙ БАРХАТ) – Uncut Velvet is a type of velvet in which the pile is left in loop form. For production, the wire method is used. Occasionally called Terry Velvet.

UNDATED SECURITY = НЕДАТИРОВАННАЯ ЦЕННАЯ БУМАГА – Undated Security:- a security with no set redemption date. With such a security the borrower has only the obligation to pay interest as agreed, and need not redeem it. An undated security may be irredeemable, in which case the borrower has no right to redeem it, or it may be redeemable at the borrower's discretion, as in the case of UK 'Consols' (Consolidated Fund Annuities), where the government has the right but no obligation to redeem them at par at any time. See also Consols; and Security. Undated Security is a fixed-interest security that has no redemption date. / Недатированная Ценная Бумага (Undated Security):- ценная бумага с фиксированным процентом (fixed-interest security), не имеющая даты погашения (redemption date). Смотрите также Консоли (Consols).

UNDCP = UNITED NATIONS DRUG CENTRAL PROGRAM

UNDECILLION = УНДЕЦИЛЛИОН – Undecillion is a unit of quantity equal to 10^{36} (1 followed by 36 zeros).

UNDERAPPLIED OR OVERAPPLIED FACTORY OVERHEAD = НЕДОСПИСАННЫЕ ИЛИ ИЗЛИШНЕ СПИСАННЫЕ ФАБРИЧНЫЕ НАКЛАДНЫЕ РАСХОДЫ – Underapplied Or Overapplied Factory Overhead:- Since the predetermined overhead rateis established before a period begins and is based entirely on estimated data, the overhead cost applied to work in process (WIP) will generally differ from the amount of overhead cost actually incurred during a period.The difference between the overhead cost applied to work in process (WIP) and the actual overhead costs of a period is termed as either underapplied overhead or overapplied overhead. For example if a company calculates its predetermined overhead rate USD6 per machine hour. 15 000 machine hours are actually worked and overhead applied to production is therefore USD90 000 (15 000 hours x USD6). If actual factory overhead is USD95 000 then underapplied overhead is USD5 000 (USD95 000 – USD90 000). If the situation is reverse and the company applies USD95 000 and actual overhead is USD90 000 the overapplied overhead would be USD5 000. Causes/Reasons Of Under Applied Or Over Applied Overhead:- The causes/reasons of under or over-applied overhead can be complex. Nevertheless the basic problem is that the method of applying overhead to jobs using a predetermined overhead rate assumes that actual overhead costs will be proportional to the actual amount of the allocation base incurred during the period. If, for example, the predetermined overhead rate is USD6 per machine hour, then it is assumed that actual overhead cost incurred will be USD6 for every machine hour that is actually worked. There are actually two reasons why this may not be true. First, much of the overhead often consists of fixed coststhat do not grow as the number ofmachine hoursincurred increases. Second, spending on overhead items may or may not be under control. If individuals who are responsible for overhead costs do a good job, those costs should be less than were expected at the beginning of the period. If they do a poor job, those costs will be more than expected. Xxxxx. Difference Between Overapplied & Underapplied Overhead:- For a company engaged in manufacturing, determining the value of inventory can be complicated. The company must account for the raw materials used in making its products, the direct labor required and any manufacturing overhead. When preliminary estimates of overhead expenses differ from the company's actual expenses, the result is either overapplied overhead or underapplied overhead, depending on whether the estimate exceeded actual expenses or fell short of them. Manufacturing Overhead:- When manufacturers account for the cost of the goods they make and sell, that cost must include manufacturing overhead, or 'factory overhead'. These are production costs separate from materials and direct labor, including setup costs for equipment, utility costs to run machinery and the wages of factory personnel not directly involved in production, such as maintenance workers. Depending on their production process, companies may express these costs as a rate per hour of machine time, a rate per hour of worker time or a per-unit cost, for example. Preliminary Overhead:- Because accountants have to charge expenses as they're incurred, manufacturers don't have the luxury of waiting until the end of an accounting period to determine their exact manufacturing overhead costs. Instead, they start with estimates based on past experience and their expectations for the future. A company might estimate that for the coming year, it will have manufacturing overhead of USD250 000 and it will run its machines for a total of 13 000 hours. Estimated manufacturing overhead, then, will be about USD19.23 per machine hour. Applying Overhead:- As the company goes about its business making products, its accountants will charge manufacturing overhead expenses to inventory based on the number of machine hours used in production and the estimated rate. Say that over the course of the year, the company winds up running its machines for a total of 15 000 hours. At USD19.23 an hour, that comes to USD288 450. That figure is the company's 'applied' overhead, the amount assigned to items in inventory. Overapplied and Underapplied:- At the end of the year, with the full benefit of hindsight, the company knows what its actual factory overhead expenses have been. Say that amount comes out to USD300 000. Since the company charged off only USD288 450, it has 'underapplied overhead' of USD11 550. If the actual overhead had come to USD270 000, the company would have charged off more than was necessary, and it would have 'overapplied overhead' of USD18 450. Note that the preliminary estimate of overhead costs, USD250 000, doesn't factor in here. It was just used to set the estimated hourly rate. The Effects of Underapplied Overhead:- Expenses refer to the sums that a business spends in order to run its operations. Expenses are distinguished from capital expenditures by the fact that expenses produce benefits for the business in only one single time period rather than multiple. Overhead is expense spent in order to run the business's operations but cannot be attributed to specific products or services. It can refer to either manufacturing overhead or operating expenses, but in the context of underapplied overhead, the term 'Overhead' refers to manufacturing overhead. Cost of Goods Sold and Operating Expenses:- Cost of goods sold and operating expenses constitute the two main categories of expenses. Cost of goods sold includes all expenses spent in order to acquire the goods and services the business has sold in one specific time period. Operating expenses include all expenses spent in order to run the operations that sell those products and keep the business running. Although overhead can refer to all operating expenses, manufacturing overhead falls under cost of goods sold. Manufacturing Overhead:- Manufacturing overhead incorporates all cost of goods sold expenses that cannot be attributed to a specific product or service being produced, meaning that it includes disparate items such as utilities and other costs of running the production processes. Overapplied and underapplied manufacturing overhead arises when the budgeted manufacturing overhead does not match actual manufacturing overhead. Underapplied Overhead:- Underapplied overhead occurs when the budgeted manufacturing overhead is less than the actual manufacturing overhead spent on production. For example, if a business budgets USD70 000 to be spent on manufacturing overhead and then spends USD80 000 on its actual manufacturing overhead, that business has underapplied overhead of USD10 000. Underapplied overhead is recorded as a prepaid expense on the balance sheet and then corrected through increasing cost of goods sold at the end of the time period. Underapplied Overhead on the Financial Statements:- Prepaid expenses are counted as being assets on the balance sheet. For example, a business that has USD10 000 in underapplied overhead records that sum as a prepaid expense on the accounting ledger. At the end of the time period, the business then records a portion of underapplied overhead as being cost of goods sold, thus increasing expenses on the income statement and decreasing that period's net income. Whether the business chooses to record the entire sum or a portion of the sum depends on whether the business chooses to allocate all of the underapplied overhead to cost of goods sold or to cost of goods sold, work-in-progress, and finished goods. In either case, the impact of underapplied overhead on the financial statements does not change, only the degree of that impact in the current time period. Factory Overhead:- also referred to as Manufacturing Overhead, Indirect Manufacturing Costs, Factory Burden, and Manufacturing Support Costs. / Недосписанные Или Излишне Списанные Фабричные Накладные Расходы:- разница, которая возникает, когда сумма фабричных накладных расходов, списанная на производство в отчётном периоде по нормативному коэффициенту, соответственно меньше или больше суммы фактически понесённых за этот период фабричных накладных расходов. В случае, если нет значительных остатков незавершённого производства и вся произведённая продукция практически продана, разницу списывают на себестоимость реализованной продукции, в противном случае она распределяется на счета Незавершённое Производство, Запасы Готовой Продукции и Себестоимость Реализованной Продукции пропорционально остаткам на этих счетах.

UNDERBANKED = НЕДОБРАНО (или XX) – Underbanked:- when an originating investment banker cannot find enough firms to underwrite a new issue. / Недобранный (Underbanked):- новый выпуск без гарантийного синдиката. Так говорят о распространении нового выпуска ценных бумаг (new issue), когда осуществляющий первичное размещение инвестиционный банкир (investment banker) испытывает трудности в привлечении других компаний в расписывающую группу (underwriting group) или синдикат андеррайтеров. Смотрите также Underwrite.

UNDER BASIS = XX – Under Basis is a condition that exists when the local cash price is lower than the futures prices. Also called Negative Basis. See also Over Basis.

UNDER BELOW = БЕРЕГИСЬ (или ПОЛУНДРА, или XX) – Under Below (maritime term):- a warning from aloft (heads up).

UNDER BOND = ПОД ОБЯЗАТЕЛЬСТВОМ (или XX) – Under Bond:- xxxxx. See also US Customs Bonded Warehouse.

UNDERBOOKED = НЕДОБРОНИРОВАНО (или XX) – Underbooked:- describes limited interest by prospective buyers in a new issue of a security during the preoffering registration period. / Недобронированный или Неполностью Заказанный (Underbooked):- говорится о новом выпуске (new issue) ценных бумаг, когда брокеры в течение предшествующего предложения регистрационного периода (registration) проверяют списки потенциальных покупателей и обнаруживают ограниченный интерес (indications of interest) к ним. Противоположностью неполностью заказанному выпуску является выпуск, покупатели которого полностью определены (fully circled). Смотрите также Xxxxx (Circle).

UNDER BUST GIRTH = ОБХВАТ ПОД ГРУДЬЮ – Under Bust Girth or Under Bust:- measure around the chest, under the bust where the bra elastic is. Under Bust:- measure under the very breast. Under Bust Girth:- a girth under the breast; tape is located horizontally directly under the breast. You need to stand straight, and during the measurement, be sure to exhale and completely relax. Underbust:- measure around ribcage where your bra band sits. / Обхват Под Грудью (для женщин):- горизонтальный обхват тела в сантиметрах под грудью. Человек стоит прямо, измерительная лента прохоит под основанием грудных желез.

UNDERCAPITALIZATION = НЕДОКАПИТАЛИЗАЦИЯ (или НЕДОСТАТОЧНАЯ КАПИТАЛИЗАЦИЯ) – Undercapitalization:- xxxxx. / Недокапитализация или Недостаточная Капитализация (Undercapitalization):- ситуация, при которой коммерческое предприятие не имеет достаточного капитала для выполнения своих нормальных коммерческих функций. Смотрите также Capitalization; и Working Capital.

UNDERCAPITALIZED = НЕДОКАПИТАЛИЗИРОВАНО (или XX) – Undercapitalized:- a business has insufficient capital to carry out its normal functions.

UNDERCARRIER = ПЕРЕВОЗЧИК С НЕВЫБРАННЫМИ КВОТАМИ НА ПЕРЕВОЗКУ – Undercarrier is a carrier in a conference or consortium who carries less cargo than the allotment distributed to him. Undercarrier is a carrier which has been subcontracted to carry out part of the transport operation. This term is most commonly used with non-vessel operating common carriers, which contract for carriage with the shipper and subcontract for the actual transportation with a ship line. In this situation, the ship line is the undercarrier. / Перевозчик, являющийся участником конференции или консорциума, который перевозит меньше грузов, нежели это предусмотрено для него по распределению.

UNDERCHARGE = НЕДОБОР (или НЕДОСБОР) – Undercharge:- to charge less than the proper amount. / Недобор:- взимание платы меньше правильной суммы.

UNDERCLOTHES = НИЖНЕЕ БЕЛЬЁ (или НАТЕЛЬНЫЕ ОДЕЖДЫ) – Underclothes:- underwear.

UNDERCLOTHING = НАТЕЛЬНОЕ БЕЛЬЁ (или НАТЕЛЬНАЯ ОДЕЖДА) – Underclothing:- underwear.

UNDERCOAT = XX (или ОДЕЖДА, НОСИМАЯ ПОД ДРУГОЙ) – Undercoat is a coat or jacket worn under another.

UNDERCONSUMPTION = НЕДОПОТРЕБЛЕНИЕ – Underconsumption:- level of consumption that is below the potential offered by supply. Underconsumption is defined in relation to supply and not in relation to an objective level of need. It may effect one, several or even most of the goods and services used to achieve a certain lifestyle. / Недопотребление – это недостаточное или неполное потребление чего-либо.

UNDERCURE = XX – Undercure:- not apparent without testing in laboratory. Causes lack of compressive strength and poor resistance to washing and ironing. Closure defects, and namely – Plastic Buttons. / Порок или дефект застёжки.

UNDERDECK = НИЖНЯЯ ПАЛУБА (или ПОДПАЛУБНОЕ) – Underdeck is a storage space below the vessel's deck where cargo is stowed in the holds; carriers are responsible for cargo shipped under deck, whilst they reject all liability for cargo shipped on deck. See also Deck.

UNDERDECK STOWAGE = ПОДПАЛУБНАЯ УКЛАДКА (или ПОДПАЛУБНОЕ РАЗМЕЩЕНИЕ, или ПОДПАЛУБНАЯ ШТИВКА) – Underdeck Stowage:- cargo/container which is stowed below the main deck. / Подпалубное Размещение:- груз/контейнер, который размещён ниже главной палубы.

UNDER DECK TONNAGE = ПОДПАЛУБНЫЙ ТОННАЖ (или ПОДПАЛУБНАЯ ВМЕСТИМОСТЬ) – Under Deck Tonnage is the capacity of the ship below the tonnage deck calculated in cubic tons. / Вместимость судна ниже обмерной палубы, исчисляемая в кубических тоннах. Подпалубная Вместимость – это объём всех помещений до верхней непрерывной палубы (у однопалубных и двухпалубных судов) или до второй палубы снизу (на судах, имеющих более двух непрерывных палуб).

UNDERDEVELOPED COUNTRIES = НЕДОРАЗВИТЫЕ СТРАНЫ (или СЛАБОРАЗВИТЫЕ СТРАНЫ) – Underdeveloped Country is a country characterized by low levels of Gross National Product (GNP) and Income Per Head. Such countries are typically dominated by a large primary sector that produces a limited range of agricultural and mineral products and in which the majority of the population exists at or near subsistence levels, producing barely enough for their immediate needs, thus being unable to release the resources required to support a large urbanized industrial population. The term 'Developing' indicates that, as seen by most such countries, the way to improve their economic fortunes is to diversify the industrial base of the economy by, in particular, establishing new manufacturing industries and by adopting the price system. To facilitate an increase in urban population necessary for industrialization, a nation may either import the necessary commodities from abroad with the foreign exchange earned from the export of the (predominantly) primary goods, or it can attempt to improve its own agriculture. With appropriate economic aid from industrialized countries and the ability and willingness on the part of a developing country, the transition into a newly industrialized country could be made. Certain problems do exist, however. For instance, increases in real income that are achieved need to be maintained, which means keeping population numbers in check. Illiteracy and social customs for large families tend to work against governmental efforts to increase the standard of living of its citizens. Also, most of the foreign exchange earned by such countries is by exporting, mainly commodities (see International Trade). See also Demographic Transition, Economic Development, International Commodity Agreements, International Debt, Population Trap, Structure Of Industry, United Nations Conference On Trade And Development. Underdeveloped Countries:- a country that is less developed economically than most others, with little industry and little money spent on education, health care, etc. For example, the money is earmarked for shares of companies in underdeveloped countries. Underdeveloped Countries are at the very bottom of the global economy, with widespread extreme poverty and dire living conditions. They usually have little or no infrastructure or reliable health care and other social services. Many have experienced long-term political

unrest in the form of civil war or armed conflict with other nations, or have been subject to unstable governments, dictatorships, and/or corruption. In addition, they may frequently suffer environmental events and natural disasters that cause famine, destruction, and displacement of large segments of their populations. Underdeveloped Countries:- a country characterised by (i) mass poverty which is chronic and not the result of temporary misfortune and (ii) obsolete methods of production and social organization, which means that the poverty is not due to poor natural resources and hence could presumably be lessened by methods already proved in other countries. / Недоразвитые Страны или Слаборазвитые Страны:- страны, где среднедушевой реальный доход ниже аналогичного показателя в странах с процветающей промышленностью. Смотрите также Less Developed Countries, и Third World.

UNDERDRAWERS = КАЛЬСОНЫ (или ПАНТАЛОНЫ, или ХХ) – Underdrawers:- an article of underwear for the lower body.

UNDERFUNDED PENSION PLAN = НЕДОФИНАНСИРОВАННЫЙ ПЕНСИОННЫЙ ПЛАН – Underfunded Pension Plan is a pension plan that has a negative surplus, i.e. liabilities exceed assets.

UNDERGARMENT = НИЖНЕЕ БЕЛЬЁ (или НИЖНЕЕ ПЛАТЬЕ, или ПРЕДМЕТ НАТЕЛЬНОГО БЕЛЬЯ, или ПОДДЁВКА) – Undergarment is a garment to be worn under another.

UNDER GLASS = ПОД СТЕКЛОМ – Under Glass:- grown in the greenhouse or, in the case of a cutting, with a jar or cloche placed over it. / Под Стеклом:- выращенное в парнике или, в случае .

UNDERGROUND ECONOMY = ПОДПОЛЬНАЯ ЭКОНОМИКА – A term Underground Economy refers to illegal economic activity. Transactions in the underground economy are illegal either because the good or service being traded is illegal or because an otherwise licit transaction does not comply with government reporting requirements. Underground Economy, also called Shadow Economy, transaction of goods or services not reported to the government and therefore beyond the reach of tax collectors and regulators. / Подпольная Экономика:- часть национального дохода, которая остаётся неполностью учтённой или неучтённой официальной статистикой.

UNDERINSURANCE = НЕПОЛНОЕ СТРАХОВАНИЕ (или НЕДОСТРАХОВАНИЕ) – Underinsurance or Under-Insurance or Under Insurance occur when the amount for which the property is insured, is less than the value of such property. Insuring for less than the amount at risk. Where the sum insured does not represent the true value of the property insured. See average for an explanation of the consequences of under insurance. / Неполное Страхование или Недострахование – это страхование интереса ниже его действительной стоимости. Если страховой полис выдан на сумму, которая ниже действительной стоимости интереса, находящегося на риске, риск считается недострахованным. В этом случае сумма разницы между страховой суммой и суммой по полису, в которую интерес должен быть застрахован, исходя из его действительной стоимости, лежит на ответственности страхователя. Недострахование:- ситуация, когда страховая сумма по договору страхования оказывается недостаточной для восстановления застрахованного имущества в случае его полной конструктивной гибели.

UNDERINVESTMENT PROBLEM = ПРОБЛЕМА НЕДОИНВЕСТИРОВАНИЯ – Underinvestment Problem:- the mirror image of the asset substitution problem, in that stockholders refuse to invest in low-risk assets to avoid shifting wealth from themselves to debtholders.

UNDERLAP = ДОСРОЧНЫЙ ВОЗВРАТ (или ХХ) – (1) Underlap:- xxxxx. / Досрочный Возврат (в практике фрахтования):- период времени досрочного возврата судна владельцу (до оговорённой даты).

(2) Underlap is a thing which projects beneath something else. Underlap is a section of a garment extending beneath another especially. The front edge of a coat or dress that is closed by placing one side of the front under the other.

UNDERLAY = ПОДКЛАДКА (или ПОДСТИЛКА, или ПОДКЛАДЫВАТЬ, или ПОДПИРАТЬ) – Underlay is a synonym for Padding or Rug Cushion. It usually describes the layer of fabric of sponge rubber or hair placed underneath a carpet or rug to provide it with longer life, to give it a more luxurious appearance and feeling, to prevent the rug from slipping, and to make the rug softer and more cushiony. Carpet padding is made of cattle hair, rubberized hair, rubber, and combinations of jute and cattle hair, as well as some man-made fibers. See also Carpet, Padding, Rug, and Rug Cushion.

UNDERLYING = СООТВЕТСТВУЮЩЕЕ – Underlying (asset):- in futures and options transactions, such as options, warrants or futures, the term ‘Underlying’ is used to refer to the asset (e.g., share, bond, index or currency) on which the transaction is based. A market factor that affects the value of a contract or component of a contract and causes it to be a derivative or an embedded derivative, respectively. Underlying is an instrument on which futures and options contracts are based, such as equities, bonds, indices, currencies or commodities. Underlying:- the variable on which a futures, option or other derivative contract is based. Underlying:- what supports the security or instrument that parties agree to exchange in a derivative contract. Underlying is the security, i.e. an equity or a bond, underlying an option or futures contract. See also Financial Futures. / Под Соответствующим понимается инструмент, на котором базируется фьючерс или опцион. К таковому могут относиться:- акции, паи, доли, облигации, индексы, валюты и сырьё. Соответствующее:- ценная бумага, лежащая в основе опциона и на которую имеется право купли-продажи в соответствии с условиями опционного контракта.

UNDERLYING ASSET = СООТВЕТСТВУЮЩИЙ АКТИВ – Underlying Asset:- the specific cash index, commodity, futures contract, or stock against which the futures or options contract is valued. The specific stock, futures or other contract to be delivered, when, and if, the option is exercised. Underlying Asset:- in futures and options transactions, such as options, warrants or futures, the term ‘Underlying’ is used to refer to the asset (e.g., share, bond, index or currency) on which the transaction is based. Underlying Asset:- the security or property or loan agreement that an option gives the option holder the right to buy or to sell. / Соответствующая ценная бумага, фьючерсный или иной контракт, которые должны быть поставлены или исполнены в случае исполнения опциона. Соответствующий Актив – актив (финансовые инструменты, сырьё или товар), лежащий в основе производного инструмента (деривата).

UNDERLYING COMMODITY = СООТВЕТСТВУЮЩЕЕ СЫРЬЁ – Underlying Commodity:- the cash commodity underlying a futures contract. Also, the commodity or futures contract on which a commodity option is based, and which must be accepted or delivered if the option is exercised. Underlying Commodity is the commodity or futures contract on which a commodity option is based, and which must be accepted or delivered if the option is exercised. / Соответствующее Сырьё – сырьё или фьючерсный контракт, на котором основан опцион на сырьё, и которое должно быть принято или поставлено, в случае исполнения данного опциона.

UNDERLYING CONTRACT TYPE = СООТВЕТСТВУЮЩИЙ ТИП КОНТРАКТА (или ТИП СООТВЕТСТВУЮЩЕГО КОНТРАКТА) – Underlying Contract Type is the type of instrument covered by the option. Currently three types of options are available. These are equity, currency, and futures. / Тип инструмента, предлагаемого опционом. В настоящее время о биржевом обороте находятся три типа опционов, среди которых:- опцион на акцию, опцион на валюту и опцион на фьючерс.

UNDERLYING DEBT = СООТВЕТСТВУЮЩИЙ ДОЛГ – Underlying Debt:- municipal bonds issued by government entities but under the control of larger government entities and for which the larger entity shares the credit responsibility. / Соответствующий Долг (Underlying Debt):- задолженность более низкого уровня, задолженность в основе, то есть в основе лежит требование, которое имеет приоритет перед требованием других кредиторов. Термин используется по отношению к муниципальным облигациям (municipal bond) и относится к задолженностям государственных органов, находящихся в юрисдикции вышестоящих государственных органов, по которым эти государственные органы несут частичную кредитную ответственность. Например, районный орган может разделять ответственность по общим обязательствам деревни, находящейся в рамках данного района, причём задолженность деревни является задолженностью более низкого уровня с точки зрения районных органов. Термин Перекрывающаяся Задолженность (Overlapping Debt) также используется по отношению к задолженностям более низкого уровня, но перекрывающиеся задолженности могут также существовать в органах одного уровня, когда, например, школьный район находится на территории двух или более различных территориальных округов.

UNDERLYING FUTURES CONTRACT = СООТВЕТСТВУЮЩИЙ ФЬЮЧЕРСНЫЙ КОНТРАКТ – Underlying Futures Contract:- the specific futures contract that is bought (in case of a call) or sold (in case of a put) by exercising an option. Underlying Futures Contract is the specific futures contract that may be bought or sold by exercising an option. Underlying Futures Contract is a futures contract that supports an option on that future, which is executed if the option is exercised. / Определённый фьючерсный контракт, который будет куплен (в случае опциона на покупку) или продан (в случае опциона на продажу) при исполнении опциона. Соответствующий Фьючерсный Контракт – фьючерсный контракт, лежащий в основе опциона. Соответствующий Фьючерсный Контракт – фьючерсный контракт, лежащий в основе опциона на этот фьючерсный контракт. Например, Чикагская Палата Торговли (Chicago Board of Trade) предлагает опцион на фьючерсные контракты на казначейские облигации. Лежащими в основе фьючерсными контрактами являются фьючерсные контракты на казначейские облигации, продающиеся на бирже; если опционный контракт исполняется, то поставка осуществляется фьючерсными контрактами, лежащими в его основе.

UNDERLYING PRICE = СООТВЕТСТВУЮЩАЯ ЦЕНА – Underlying Price is the price of the instrument which could be delivered upon exercise. / Соответствующая Цена – цена инструмента, который мог бы быть поставлен по его исполнении.

UNDERLYING SECURITY = СООТВЕТСТВУЮЩАЯ ЦЕННАЯ БУМАГА – Underlying Security:- for options, the security that is subject to purchase or sold upon exercise of an option contract. For example, IBM stock is the underlying security for IBM options. For depository receipts, the class, series, and number of the foreign shares represented by the depository receipt. Underlying Security:- when trading derivatives, the underlying security is the stock, commodity, future, or currency that underlies the derivative. A derivative is a traded instrument such as an option or future. The underlying security is what needs to be delivered to the buyer of the derivative when the derivative is exercised or expires. The buyer receives the underlying security and the seller delivers it. In reality, most derivatives that are traded are closed out before expiration and delivery of the underlying security does not take place. / Ай.Би.Эм. (IBM). Соответствующая Ценная Бумага (Underlying Security):- (1) В опционах:- ценные бумаги, которые должны быть поставлены в случае исполнения опционного контракта на продажу (put option) или покупку (call option). Однако расчёты по опционам на индекс (index options) и фьючерсам на фондовый индекс (stock index futures) производятся наличными, поскольку весь фондовый индекс поставить невозможно. (2) В ценных бумагах:- обыкновенные акции, лежащие в основе определённых типов ценных бумаг, выпускаемых корпорациями. Эти акции должны поставляться, если исполняется подписной варрант (subscription warrant) или право на подписку (subscription right) и если конвертируемые (convertible) облигации или привилегированные акции (preferred stock) конвертируются в обыкновенные акции, или если исполняется поощрительный опцион на акции (incentive stock option).

UNDERMANNED = НЕУКОМПЛЕКТОВАННОЕ – Undermanned (maritime term):- insufficient number of crew; shorthanded.

UNDERMARGINED ACCOUNT = СЧЁТ С НЕДОСТАТОЧНОЙ МАРЖЁЙ – Undermargined Account is a margin account that no longer meets minimum maintenance requirements, requiring a margin call on the investor. / Счёт С Недостаточной Маржёй (Undermargined Account):- счёт с маржей (margin account), по которому не удовлетворяются требования о минимально необходимом залоге (margin requirements) или сумме, минимально необходимой для поддержания счёта (mimimum maintenance). В результате, брокер должен предъявить клиенту требование о внесении дополнительного обеспечения (margin call).

UNDERMILLED KERNELS = НЕДООБРУШЕННАЯ ЗЕРНОВКА (или НЕДООБРУШЕННЫЕ ЯДРА, или НЕДОРУШЕННЫЕ ЯДРА, или НЕДОСТАТОЧНО ОБРУШЕННАЯ ЗЕРНОВКА, или НЕДОРУШ, или НЕДОДИР) – Undermilled Kernels mean milled Rice kernels that have the milling degree below that specified for each grade of Rice. / Недорушенной Зерновкой (Недорушенными Ядрами) считаются обрушенные ядра Риса, которые имеют степень рушения ниже той, которая специфицирована для каждого сорта Риса.

UNDERMILLED MILLED RICE = НЕДООБРУШЕННЫЙ ОБРУШЕННЫЙ РИС (или НЕДОСТАТОЧНО ОБРУШЕННЫЙ РИС, НЕДОРУШЕННЫЙ ОБРУШЕННЫЙ РИС, или НЕДОРУШ, или НЕДОДИР) – In the Rice industry of the United States, Undermilled Milled Rice shall be milled Rice which is not equal to the milling requirements for ‘hard milled’, ‘well milled’, and ‘reasonably well milled’ Rice. Grades US No. 1 and US No. 2 shall contain not more than 2.0 percent, grades US No. 3 and US No. 4 not more than 5.0 percent, grade US No. 5 not more than 10.0 percent, and grade US No. 6 not more than 15.0 percent of well-milled kernels. Grade US No. 5 shall contain not more than 10.0 percent of red Rice and damaged kernels (singly or combined) and in no case more than 6.0 percent of damaged kernels. / 6.0 процентов повреждённой зерновки (повреждённых ядер).

UNDERPANTS = ТРУСЫ (или КАЛЬСОНЫ, или ПОДШТАННИКИ, или ХХ) – Underpants are the short or long pants worn under an outer garment; drawers.

UNDERPERFORM = НЕДОВЫПОЛНИТЬ – Underperform:- In general, this means to do worse than some particular benchmark. Mutual Fund XYZ is said to underperform the S&P 500 if its return falls short of the S&P 500 return. However, this language does not take risk into account. That is, one might have a lower return than the benchmark in a particular year because of lower risk exposure. Underperform is also a term used by analysts to describe the prospects of a particular company. Usually, this means that the company will do worse than its industry average. Related Outperform.

UNDER–PRESS = НЕДОГЛАЖЕННОЕ (или ПОД ПРЕССОМ) – Under-Press:- to press the underside of a garment section during manufacturing to open the seams and give it shape.

UNDERPRICING = НЕДООЦЕНКА – Underpricing:- issuing securities at less than their market value.

UNDER–RAISED = НЕДОВОРСОВАННОЕ (или НЕДОНАЧЁСАННОЕ) – Under-Raised:- insufficient coverage of the ground structure of a raised fabric. Note:- this defect is caused by the incorrect setting of the raising machine or an insufficient number of passes of the fabric through the raising machine. / Недостаточное Ворсование (under-raised):- порок ткани; недостаточный застил

фактуры ворсованной ткани. Примечание:- этот порок вызван неправильным регулированием ворсовальной машины или недостаточным числом проходов ткани через ворсовальную машину.

UNDERSEA CABLE = ПОДВОДНЫЙ КАБЕЛЬ (или КАБЕЛЬ ПОД МОРЕМ) – Undersea Cable:- assembly of conductors enclosed by an insulating sheath and laid on the ocean floor for the transmission of messages. Undersea cables for transmitting telegraph signals antedated the invention of the telephone; the first undersea telegraph cable was laid in 1850 between England and France. The Atlantic was spanned in 1858 between Ireland and Newfoundland, but the cable's insulation failed and it had to be abandoned. The first permanently successful transatlantic cable was laid in 1866, and in the same year another cable, partially laid in 1865, was also completed. The American financier Cyrus W. Field and the British scientist Lord Kelvin were closely associated with the two enterprises. Use of long undersea cables suitable for telephony followed the development in the 1950s of telephone repeaters with sufficiently long life to make the operation economically practical. The development of vacuum-tube repeaters that could operate continuously and flawlessly with no attention for at least 20 years, at depths up to 2 000 fathoms (12 000 feet (3 660 m)), made possible the first transatlantic telephone cable, from Scotland to Newfoundland (1956). The system provided 36 telephone circuits. Similar undersea systems between Port Angeles, Wash., and Ketchikan, Alaska, and between California and Hawaii were later put into service. A 5 300-nautical-mile (9 816-kilometer) cable between Hawaii and Japan (1964) provided 128 voice circuits; the same number of circuits were provided in 1965 by a cable linking the United States and France. Newer cables use transistorized repeaters and provide even more voice circuits; some are capable of transmitting television programs. Also known as Marine Cable. / Американский деловой человек и финансист Сайрэс Вэст Филд (Cyrus West Field; 1819–1892) и Британский учёный Лорд Келвин (Lord Kelvin; полное имя Вильэм Томзэн, 1-й Барон Келвин (William Thomson, 1st Baron Kelvin); 1824–1907).

UNDERSELLING = ПРОДАЖА ПО ЗАНИЖЕННОЙ ЦЕНЕ – Underselling is a selling something at a lower price than (a competitor), e.g., a big supermarket can usually undersell a small local store. / Продажа По Заниженной Цене:- (1) продажа по более низкой цене, чем у конкурентов; (2) предложение привозных (или импортных) товаров для продажи в США по ценам ниже сопоставимых отечественных товаров.

UNDERSHIRT = НИЖНЯЯ РУБАШКА (или НАТЕЛЬНАЯ РУБАШКА, или ХХ) – Undershirt is a collarless undergarment with or without sleeves.

UNDERSKIRT = НИЖНЯЯ ЮБКА (или ПОДЪЮБОЧНИК, или ПОДЪЮБНИК) – Underskirt is a skirt worn under an outer skirt, especially a petticoat.

UNDERSHOT = ХХ (или НЕДОБОЙ) – Defect Name:- Undershot. Defect Type:- weft lines, horizontal lines. Fabric Type:- Denim Bottomweights – Indigo Dyed. Description:- Undershot:- This is the same defect as the overshot except that the shuttle exits to the back of the fabric. On the face, this gives the appearance of a broken pick or burl mark. An examination of the back of the fabric will generally reveal the tell-tale filling floats. Severity:- Major. / уточина.

UNDERSTANDABILITY = ПОНИМАЕМОСТЬ (или ПОНЯТНОСТЬ) – Understandability is the concept that financial information should be presented so that a reader can easily comprehend it. This concept assumes a reasonable knowledge of business by the reader, but does not require advanced business knowledge to gain a high level of comprehension. Adherence to a reasonable level of understandability would prevent an organization from deliberately obfuscating financial information in order to mislead users of its financial statements. In order to be understandable, information should be presented using the following guidelines:- (i) Complete:- The text presented should not be missing any key information. For example, a table of future lease payments should include all future periods for which lease payments will be made, so that a reader can understand the entire scope of future obligations. (ii) Concise:- Do not bury the users of financial information with an excessive amount of detail. This means presenting a sufficient amount of information that is easily scanned for highlights. Also, do not replicate disclosures throughout the financial statements; instead, set forth information in one place, and then insert references to it elsewhere in the financial statements, as needed. (iii) Clear:- Use a presentation methodology that is easy for the reader to scan. This typically means that charts and tables take the place of text, or are at least the preferred form of presentation. (iv) Organized:- The reader should be able to easily locate cross-referenced information within the financial statements. This means that all supporting schedules should be identified with a footnote number or letter, with this identifier listed in the main financial statements. The preceding concepts do not mean that complex information should be excluded from the financial statements. For example, the concepts related to pensions and derivatives are not easy to understand. In these situations, apply the understandability concept as much as possible, but still present the required information. / Понятность:- качественная характеристика бухгалтерской информации, требующая, чтобы информация в финансовой отчётности была понятна пользователям, обладающим умеренным знанием хозяйственной деятельности и бухгалтерского учёта, а также желающим изучать информацию с разумной тщательностью.

UNDERSUBSCRIPTION = НЕДОПОДПИСКА – Undersubscription:- failure of applications for shares in a new issue to match the number on offer. This means that some shares will be unsold, or bought by underwriters, which makes it probable that when the market opens the newly issued shares will sell at a discount relative to the issue price. See also Over-Subscription; and Underwriting. / Недоподписка (Undersubscription):- . Смотрите также Избыточная Подписка или Переподписка (Over-Subscription).

UNDERTAKING = ОБЯЗАТЕЛЬСТВО (или ХХ) – Undertaking is a formal pledge or promise to do something. For example, I give an undertaking that we shall proceed with the legislation. See also Multinational Disclosure Rules, and Rules Of Competition. Undertaking is a task that is taken on; an enterprise, e.g., a mammoth undertaking that involved digging into the side of a cliff face.

UNDERTAKINGS FOR COLLECTIVE INVESTMENTS IN TRANSFERABLE SECURITIES = ОБЯЗАТЕЛЬСТВА ДЛЯ КОЛЛЕКТИВНЫХ ИНВЕСТИЦИЙ В ПЕРЕВОДИМЫЕ ЦЕННЫЕ БУМАГИ – Undertakings for Collective Investments in Transferable Securities (UCITS) are the investment funds established under Luxembourg law. Undertakings for Collective Investments in Transferable Securities (UCITS):- a European Union (EU) Directive adopted in 1985. The objective of UCITS was to allow collective investments to operate throughout the EU with a single authorization from one member state, allowing funds authorized in one member state to be sold to the public in other member states. In practice, UCITS was not successful as many EU nations have imposed additional regulatory requirements in order to protect local asset managers. UCITS II Directive was drafted in early 1990s to amend the 1985 Directives to more successfully harmonize laws throughout Europe. However, Council of Ministers could not reach a common position and UCITS II was abandoned. A set of Directives adopted in December 2001 which amended UCITS I. UCITS III consists of two directives, a 'Product Directive' and a 'Management Directive'. (1) Product Directive removes barriers to the cross border marketing of units of collective investment funds by allowing funds to invest in a wider range of financial instruments including derivatives. (2) Management Directive gives management companies a 'European Passport' to operate throughout the EU, which widens the range of activities management companies are allowed to take and also assists the cross-border marketing. UCITS III is currently in force. The proposal of UCITS IV was approved by the European Parliament on January 13, 2009 and also by the Council of European Union, to be implemented in 2011. UCITS IV will bring further uniformity in collective investments throughout European Union.

UNDER THE BELT = ПОД ПОЯСОМ (или ХХ) – Under The Belt:- long position in a stock. / позиция покупки (или длинная позиция) по акции.

UNDERTOW = ХХ (или ДОННОЕ ПРОТИВОТЕЧЕНИЕ, или ОТЛИВ, или ОТКАТ) – Undertow (maritime term):- a subsurface current in a surf. Undertow is a strong seaward bottom current returning the water of broken waves back out to sea. There is in fact no such current in a gross sense, for the overall flow of surface water toward the shore in a surf zone is very small. The water actually thrown up on the shore by breaking waves does flow back, however, and under certain circumstances this return flow may be experienced by swimmers as a strong current. Returning water may, for example, be channelized by the presence or form of obstacles on the bottom into rip currents of significant velocity but quite narrow lateral dimension. Also, since the volume of returning water varies with the size of the waves, the swimmer who waits for a low-water trough or a cycle of low waves before standing up to walk to shore may encounter the return flow from large waves just gone by and again experience a seemingly strong current.

UNDERVALUED = НЕДООЦЕНЕННОЕ – Undervalued:- a stock price perceived to be too low or cheap, as indicated by a particular valuation model. For instance, some might consider a particular company's stock price cheap if the company's price-earnings ratio is much lower than the industry average. To refer to undervaluation or overvaluation implicitly assumes some model of valuation. It is always possible that the security is valued correctly and that model applied is wrong. / Недооцененное (Undervalued):- акции, с заниженной стоимостью. Ценные бумаги, продающиеся по цене ниже цены ликвидации (liquidation) или рыночной стоимости (market value), которую, по мнению аналитиков, они заслуживают. Акции компании могут быть недооценены, поскольку продукция отрасли промышленности не пользуется спросом, поскольку компания широко не известна или имеет неустойчивую историю доходов, или по другим причинам. Аналитики, занимающиеся анализом фундаментальных факторов, пытаются выделить недооцененные компании, чтобы их клиенты могли приобрести акции прежде, чем они будут оценены в полной мере (fully valued). Компании, акции которых недооцениваются, часто становятся целью попыток поглощения (takeover), поскольку таким образом покупатели могут приобрести активы дешевле. Смотрите также Фундаментальный Анализ (Fundamental Analysis).

UNDERVALUED CURRENCY = НЕДООЦЕНЕННАЯ ВАЛЮТА – Undervalued Currency:- if a nation's currency is 'Undervalued', it means the rate at which it can be exchanged for other world currencies is too low. But you don't have to be aforeign exchange trader to feel the effects of anundervalued currency. Undervalued Currency:- the situation of a currency whose value on the exchange market is lower than is believed to be sustainable. This may be due to a pegged or managed rate that is below the market-clearing rate, or, under afloating rate, it may be due to speculative capital outflows. Contrasts with Over-Valued Currency. Undervalued Currency is a currency with an exchange rate lower than it ought to be. A currency may be undervalued, for example, when its purchasing power, supply and demand are all strong, but its price is still comparatively low. Some governments keep their currencies undervalued deliberately because it makes their exports less expensive, but this is usually an unsustainable policy. See also Weakening Of A Currency. / Недооцененная Валюта:- (1) валюта, которой было продано слишком много в результате действия эмоциональных факторов; (2) валюта, стоимость которой правительство пытается удержать ниже рыночной с целью удешевления и повышения конкурентоспособности вывозной (или экспортной) продукции. В противовес Overvalued Currency.

UNDERVALUED SECURITY = НЕДООЦЕНЕННАЯ ЦЕННАЯ БУМАГА – Undervalued Security is a security selling below its market value or liquidation value.

UNDERWATER = ПОДВОДНЫЙ – Underwater:- when used in options trading the term underwater refers to an option that is out-of-the-money. For example, a call option that has a strike price higher than the current market price or a put option with a strike price lower than the current market price would be options that are underwater. Underwater in real estate investing refers to an owner who has negative equity in their home. This will happen when the price of their house falls below what they owe on the home and creates what is referred to as a negative equity trap. See also Underwater Option.

UNDERWATER DIVING = ПОДВОДНОЕ ПЛАВАНИЕ – Underwater Diving:- swimming done underwater either with a minimum of equipment, as in skin diving (free diving) or with a SCUBA (abbreviation of Self-Contained Underwater-Breathing Apparatus) or an Aqua-Lung. Competitive underwater diving sports include spearfishing and underwater hockey, sometimes called 'Octopush'. Underwater swimming and diving is as old as swimming and has been perpetuated into the present by pearl divers and sponge divers. Skin diving requires only a face mask or goggles, a short breathing tube (protruding from the mouth and kept above water), and flippers, or foot fins. A wet suit, a dry suit, or the latter over the former may be used in cold water. Skin diving was first popularized in the 1920s and 1930s in the Mediterranean and off the California coast, notably by the American diver John Guy Gilpatric, whose The Compleat Goggler (1938) gave great impetus to the sport and aroused the interest of the French naval engineer and diver Jacques-Yves Cousteau. The goggles, flippers, snorkel (the name given the air tube from the German submarine air exhaust and intake device that allowed submerged operation), and face mask were all developed into their basic forms in the 1930s. Attempts to construct diving apparatus go back to the XIX century, but the sport of scuba, or Aqua-Lung, diving dates from 1943, when Cousteau and the French engineer Émile Gagnan developed the first fully automatic compressed-air Aqua-Lung. Cousteau also did important work on the development of underwater cameras and photography and popularized the sport in Le Monde du Silence (1952; The Silent World), written with Frédéric Dumas, and in other writings and television and film productions. Clubs formed after 1943 as fast as scuba equipment became available; national associations were formed in France, Italy, Great Britain, Canada, and the United States; and in 1959 Cousteau formed, with 15 national organizations (later more than 50), the Confédération Mondiale des Activités Subaquatique (CMAS; World Underwater Federation). The fish hunted for food and the coral hunted for ornament by primitive divers are still sought by contemporary skin divers and scuba divers. An improved spear gun devised in the 1930s is used for food hunting, and special underwater cameras are widely used for recreational and scientific purposes. In addition, scuba diving has been useful scientifically in oceanography, in the study of fish and other marine organisms, and in the study of water pollution, as well as in the exploration of ships on the ocean floor and for salvage work, in which the earlier diving helmet with air line from on shipboard has been largely replaced. Also known as Underwater Swimming. / Американский водолаз Дьжон Гай Гилпэтчрик (John Guy Gilpatric; 1896–1950). Французский морской инженер и водолаз Жакь-Ивэ Кусто (Jacques-Yves Cousteau; 1910–1997). (дыхательная) трубка (или снокэл (snorkel)). Французский инженер Эмиль Гяньо (Émile Gagnan; 1900–1979). Фрэдэрикь Дюма (Frédéric Dumas; 1913–1991). Конфэдэрасьён Мондиаль дэ Активитэ Сюбакватикь (Сэ.Эм.А.Эс.; Confédération Mondiale des Activités Subaquatique (CMAS)).

UNDERWATER OPTION = ПОДВОДНЫЙ ОПЦИОН – Underwater Option means each company option with a per share exercise price equal to or greater than the sum of (i) the cash consideration plus (ii) the product of (1) the stock consideration times (2) the volume-weighted average price for a share of parent common stock, rounded to the nearest one-tenth of a cent, as reported on the Nasdaq Global Select Market for the trading day immediately prior to the day on which the effective time occurs. Underwater Option is an out-of-the-money stock option. That is, it describes an option in which the underlying asset is a stock that is currently trading for less than the strike price of the option. For example, an executive at a publicly-traded company may have stock options in which he/she

may buy the stock of his/her own company for USD80 per share. If the stock is currently trading at USD60 per share, the options are worthless. Underwater Option is the term used to describe a share option (granted under any share option scheme) which has an exercise price per share greater than the current actual market value of a share. This means that should such an underwater option be exercised and the shares immediately sold, the option holder would make a loss. For obvious reasons, an option holder is unlikely to exercise an underwater option and therefore in many cases alternative ways to reward and incentivise underwater option holders have to be found. It should be noted that underwater options outside of exit or leaver scenarios (i.e. where they do not lapse in the event of an imminent exit or the imminent cessation of employment of the option holder) may still hold a 'hope value' based on the possibility of an economic recovery and a subsequent increase in the share price which may result in the market value of a share rising above the exercise price of the share option. Underwater options are most common in economic downturns and therefore underwater options are a cyclical issue for companies. A share option most commonly results in becoming underwater when it is originally granted with an exercise price equal to or in excess of the market value of a share at the date of grant (market value share option). / Подводный Опцион (Underwater Option) или Опцион Без Денег (out-of-the money). 'Без денег' означает, что опцион не имеет внутренней стоимости; вся его стоимость состоит из временной стоимости. Опцион на покупку бывает 'без денег', если его цена исполнения выше, чем текущая цена лежащего в основе контракта. Опцион на продажу бывает 'без денег', если его цена исполнения ниже текущей цены лежащего в основе контракта.

UNDERWAY = НА ХОДУ – Underway:- said of a vessel when not at anchor, nor made fast to the shore, or aground.

UNDERWEAR = НАТЕЛЬНОЕ БЕЛЬЁ (или НИЖНЕЕ БЕЛЬЁ, или ИСПОДНЕЕ) – Underwear is a clothing or an article of clothing worn next to the skin and under other clothing. Boxer shorts, briefs, thongs, bikini, boxer briefs, panties etc.

UNDERWEIGHT = НЕДОВЕС – A term Underweight usually refers to recommendation that leads an investor to reduce their investment in a particular security or asset class. The reduction is usually with respect to a benchmark. Suppose that United States (US) equities compose 40% of the benchmark portfolio. If one thinks the US will underperform, the investor may reduce the exposure to US equity to less than 40%.

UNDERWITHHOLDING = НЕДОУДЕРЖИВАНИЕ – Underwithholding:- when a taxpayer has withheld too little tax from salary and will therefore owe tax when filing a return. / Недоудерживание или Недовычет (Underwithholding):- ситуация, когда у налогоплательщиков вычитают из заработной платы слишком мало федеральных, штатных или местных подоходных налогов. По этому случаю налогоплательщики могут задолжать большие суммы подоходного налога, когда они будут заполнять налоговую декларацию. Если недовычет велик, то налогоплательщик, возможно, заплатит ещё и проценты, и штраф. Чтобы исправить положение, налогоплательщик должен заполнить новую форму W-4 у своего работодателя и уменьшить число иждивенцев, которые были упомянуты. Смотрите также Overwithholding.

UNDER WOUND = НЕДОМОТАННОЕ – Under Wound:- thread wound over or under itself. This causes thread to pull off cones or spool unevenly resulting in breakage. Thread defects, and namely – Winding. / Порок или дефект ниток.

UNDERWRITE = РАСПИСАТЬ (или РАСПИСЫВАТЬ) – (1) Underwrite:- this term may refer to:- (i) the process of evaluating, defining and pricing insurance and reinsurance risks including where appropriate the rejection of such risks; and (ii) the acceptance of the obligation to pay or indemnify the insured or reassured under a contract of insurance or reinsurance. / Расписывать:- В страховании:- принимать на себя риск в обмен на уплату страховых взносов или премий (premium).

(2) Underwrite:- to guarantee, as to guarantee the issuer of securities a specified price by entering into a purchase and sale agreement. To bring securities to market. / Расписывать:- в инвестировании:- брать на реализацию (размещение) ценные бумаги, принимать на себя обязательства по размещению ценных бумаг. Принимать на себя риск при покупке нового выпуска (new issue) ценных бумаг у выпустившей их корпорации или у государственного органа и перепродавать эти бумаги в открытой продаже напрямую или через дилеров. Расписчик или Андеррайтер (underwriter) получает прибыль на разнице между ценой, уплаченной организации, выпустившей ценные бумаги, и ценой предложения в открытой продаже (public offering price), называемую спрэдом андеррайтера, или гарантийным спрэдом (underwriting spread). Замещением ценных бумаг обычно занимаются инвестиционные банкиры, которые формируют группу андеррайтеров (underwriting group), также называемую группой приобретения (purchase group), для распределения риска и обеспечения успешного размещения выпуска ценных бумаг. Синдикат действует в рамках соглашения между андеррайтерами (agreement among underwriters), также называемого синдикатным договором (syndicate contract) или договором группы приобретения (purchase group contract). Группа андеррайтеров назначает управляющего андеррайтера (managing underwriter), которого также называют ведущим андеррайтером (leading underwriter) или синдикатным управляющим (syndicate manager), или просто управляющим (manager). Так, андеррайтером обычно выступает инвестиционный банк, начавший работать с потенциальным эмитентом на стадии рыночного планирования проекта (originating investment banker). В США компания начинает работать с организацией, выпускающей ценные бумаги, за несколько месяцев до того, как план деталей выпуска ценных бумаг и подготовки регистрационных материалов (registration materials) подаётся в Комиссию по Ценным Бумагам и Биржам (Securities and Exchange Commission). Управляющий андеррайтер, действующий в качестве агента всей группы, подписывает соглашение о размещении или приобретении выпуска ценных бумаг (underwriting agreement или purchase contract) с организацией, выпустившей ценные бумаги. В этом соглашении фиксируются условия, сроки договорённости и обязанности синдиката андеррайтеров и организации, выпустившей ценные бумаги. В течение периода первоначального предложения ценных бумаг на рынке в обязанности управляющего андеррайтера входит обеспечение стабильной рыночной цены (market price). Он организует котировки акций на открытом рынке и привязывает цены к определённому ориентиру. Этот процесс называется искусственной поддержкой цены (pegging). Управляющий также назначает продающую группу (selling group), которая состоит из дилеров и андеррайтеров, чтобы содействовать размещению (distribution) акций выпуска. Строго говоря, андеррайтер (underwrite), принимая на себя обязательства по размещению ценных бумаг, действует согласно твёрдому обязательству о размещении ценных бумаг (firm commitment), также известному как купленная сделка (bought deal), когда весь выпуск ценных бумаг приобретается непосредственно у выпустившей их организации. Остальные инвестиционные обязательства банка, по отношению к которым иногда некорректно используется термин (underwrite), представляют собой обязательства на условиях сделать всё возможное (best effort), всё или ничего (all or none), приобрести нераспроданные ценые бумаги (standby commitment). В каждом из этих случаев риск делится между организацией, выпустившей ценные бумаги, и инвестиционным банкиром (investment banker). Этот термин также иногда используется в связи с зарегистрированным вторичным предложением (registered secondary offering) крупной партии ценных бумаг, которое включает в основном тот же процесс, что и новый выпуск ценных бумаг, однако прибыль в этом случае получает продающий инвестор, а не организация, выпустившая ценные бумаги. В отношении этих договорённостей правильнее было бы использовать термин вторичное предложение (secondary offering) или вторичное размещение (secondary distribution) большой партии ценных бумаг (обычно по фиксированной цене) через биржу, а не покупка ценных бумаг для последующей перепродажи (underwriting), который следует

использовать только по отношению к размещению новых выпусков, то есть к первичному распространению. Существует два основных метода, с помощью которых организации, выпустившие ценные бумаги, осуществляют выбор андеррайтеров и определяют размер прибыли:- на основе договорной гарантии (negotiated underwritings) и на основе конкурентных заявок (competitive bid underwritings). Как правило, договорный андеррайтинг используется для размещения выпусков ценных (акций) и долговых обязательств (облигаций) корпораций, в то время как конкурентные заявки используются для гарантированного размещения муниципальных ценных бумаг и акций государственных предприятий коммунального хозяйства. Смотрите также (Allotment), (Blowout), (Floating An Issue), (Flotation Cost), Горячий Выпуск (Hot Issue), (Initial Public Offering), Предварительно Проданный Выпуск (Presold Issue), Первичный Рынок (Primary Market), Публичное Предложение (Public Offering), Резервный Расписчик (Standby Underwriter).

UNDERWRITER = РАСПИСЧИК (или РАСПИСЫВАЮЩИЙ, или АНДЕРРАЙТЕР) – (1) Underwriter:- depending on the context this term may refer to:- (i) the individual who is responsible for underwriting a particular insurance or reinsurance contract and who is either an employee of a managing agent, an insurance company or reinsurance company or an employee of a coverholder or any similar underwriting agent; and (ii) an individual member or company that insures or reinsures a risk. Underwriter is a person who accepts business on behalf of an insurer. Underwriter is a technician trained in evaluating risks and determining rates and coverages for them. The term derives from the practice at Lloyd's of each person willing to accept a portion of the riskwriting his or her name under the description of the risk. A person trained in evaluating risks and determining the rates and coverages that will be used for them. Underwriter is a person who examines a risk, decides whether or not it can be insured, and, if it can, works out the premium to be charged, usually on the basis of the frequency of past claims for similar risks. Underwriters are either employed by insurance companies or are members of Lloyd's. The name arises from the early days of marine insurance, when a merchant would, as a sideline, write his name under the amount and details of the risk he had agreed to cover on a slip of paper. Underwriter is a member of an insurance company or a Lloyd's syndicate who decides whether or not to accept a particular risk for a specified premium. In general, the public only deal with underwriters through a broker. Underwriter:- an insurer of ships and cargoes from loss and damage, the name coming from the insurer writing his name under the policy of insurance. The request for insurance is termed the offering of a 'risk', and in marine insurance the word risk is equivalent to the liability of the underwriter. Each underwriter of a marine insurance puts opposite his name the percentage of the total risk for which he accepts liability. Underwriter is a member of an insurance company or syndicate to whom a broker offers a risk, and who quotes on covering that risk at a specified premium (see Broker's Placing Slip). An Underwriter is a person or firm who assumes financial risks on behalf of another; the term is used in a number of industries; it can refer to an insurance company, an investment bank, or an individual sponsor of an event. / Расписчик или Андеррайтер (Underwriter):- лицо, которое определяет риск, выносит решение о целесообразности и возможности его страхования и, если может, рассчитывает величину требуемой страховой премии на основе частоты предъявления требований выплаты страховых сумм по аналогичным рискам в прошлом. Андеррайтеры либо работают в страховых компаниях, либо являются членами Лойдз (Lloyd's) (Смотрите также Синдикат (Syndicate)). Название Андеррайтер восходит к временам первых шагов развития морского страхования, когда купец в качестве третьей стороны ставил (write) свою подпись под (under) суммой и слагаемыми рисками, который он согласен покрыть. Смотрите также Институт Лондонских Андеррайтеров (Institute of London Underwriters). Подготовленный сотрудник страховой компании, который оценивает риски, назначает ставку и страхует то, что будет определено в этой связи. Андеррайтер:- в страховании – юридическое лицо, являющееся ответственным за заключение страховых (перестраховочных) контрактов и формирование портфеля страховых обязательств:- осуществляет подписку страхового полиса или принимает на себя страховой риск. Расписчик или Андеррайтер:- тот, кто принимает на себя страховой риск. В страховании:- компания, принимающая на себя расходы по риску в случае смерти, пожара, кражи, болезни и так далее, в обмен на получение платежей, называемых страховыми взносами или премиями (premiums). Смотрите также (Underwrite). Андеррайтер:- физическое лицо или организация, которые берут на себя риск за определённую комиссию.

(2) Underwriter:- when doing an Initial Public Offering (IPO), an underwriter, i.e. a stockbroker firm, handles the distribution of shares to the public. Effectively, the brokerage firm subscribes (underwrites) for the shares and then sells them to its clients (investors). Either a stockbroker or an institution that contracts to buy any shares from an issue which fail to sell to investors. Underwriter is a person or institution that agrees to take up a proportion of the risk of something. For example, an underwriter may take up the shares of an issue that are not taken up by the public, in return for a commission (known as an Underwriting Commission). For the issuer, the underwriter represents the guarantee that the whole issue will be subscribed. An underwriter guarantees to the company that the funds sought will be raised and any shortfall will be taken up by the underwriter and the funds will be available at a specific time. An Underwriter buys all the public shares of a company presenting an Initial Public Offering (IPO) at a set price and resells them to the public (on an exchange or over-the-counter (OTC)), hopefully at a profit. Association of commercial banks or investment banks that purchases a new offering of securities, generally for resale to investors through a public offering. Underwriter:- in the United States and United Kingdom, the underwriters of issues of bonds and equities (foreign or domestic) are themselves obliged to purchase any unsubscribed securities from these issues. Together with the lead manager and the co-managers, the members of an issue syndicate jointly guarantee to place the entire amount of the envisaged issue. In contrast to the syndicate members, the banks in the selling group and the broker are invited by the lead manager to take part in the placement of the issue in return for a remuneration, but are not called upon to guarantee placement. See also Investment Banker. Underwriter is a firm, usually an investment bank, that buys an issue of securities from a company and resells it to investors. In general, a party that guarantees the proceeds to the firm from a security sale, thereby in effect taking ownership of the securities. Underwriter is a company that purchases shares of a corporation and arranges for their sale to the general public. Underwriter:- generally, a member of a new issue syndicate who is invited to sub-underwrite the issue but does not participate as a manager (see Primary Underwriter). In the euronote and certificate of deposit markets, applied to those banks and institutions that undertake to buy such instruments throughout the life of the facility. Underwriters receive a fee, irrespective of whether they are required to buy securities, and if they do take securities it is usually at a discounted price. This is said to be needed in order to ensure an ... Underwriter:- an individual, finance company, or issuing house who undertakes for a commission to acquire a specified number of shares in a company if those shares are not taken up by the public during a flotation. In both cases the underwriter may relieve himself of part of his liability by effecting similar arrangements with sub-underwriters ... Underwriter:- in finance, a company or other legal entity that administers the issue and distribution of financial securities by a corporation or other issuing body. The underwriter determines the price at which the securities are offered, buys the shares from the issuer, and then sells them to investors. The underwriters receive a fee from the clients and usually earn additional profit from selling the underwritten securities. However, if the issue price is too high the underwriter will be left with unsold securities which must either be held or sold at a ... Underwriter a risk-spreading service provider (individual, finance company or stockbroker) who charges publicly listed companies a commission to cover part or all of the risk of unsold shares when they make a public offering of a large tranche of shares or other rights; similarly for an unlisted company being floated on the stock market:- see float. The underwriter .... / Расписчик или Андеррайтер (Underwriter):- финансовый институт, как правило эмиссионный дом (issuing house) или торговый банк (merchant bank), который гарантирует приобретение части непроданных акций при публичном размещении нового выпуска (new issue). Гаранты, как правило,

работают за комиссию (обычно 2%) и могут объединяться для покупки всех непроданных акций при условии, что минимальная часть объявленного в проспекте (prospectus) выпуска будет реализована широкой публике по подписке. Лицо, выступающее гарантом размещения ценных бумаг. Расписчик или Андеррайтер:- в индустрии ценных бумаг:- инвестиционный банкир (investment banker), который самостоятельно или в качестве члена расписывающей группы (underwriting group) или синдиката обязуется приобрести новый выпуск ценных бумаг (new issue) у организации, выпустившей ценные бумаги, и размещать их среди инвесторов, получая прибыль на расписывающей курсовой разнице (или гарантийном спрэде (underwriting spread)). Смотрите также (Underwrite). Андеррайтер:- (1) маклер по операциям с ценными бумагами; (2) в банковской деятельности, на рынке ценных бумаг – физическое или юридическое лицо, гарантирующее эмитенту (акций или других ценных бумаг) их размещение на рынке на согласованных условиях за специальное вознаграждение. Андеррайтер:- лицо или организация, которые выступают гарантами размещения ценных бумаг.

UNDERWRITER'S DISCOUNT = ДИСКОНТ РАСПИСЧИКА (или ДИСКОНТ АНДЕРРАЙТЕРА) – Underwriter's Discount is is the differential between the price paid to the issuer for the new issue and the prices at which the securities are initially offered to the investing public. It is the fee an underwriter charges when purchasing bonds or certificates of participation (COPs) for resale to the public. The underwriter assumes the risk of ownership until the bonds are sold. See also Gross Spread.

UNDERWRITERS LABORATORIES = ЛАБОРАТОРИИ РАСПИСЧИКОВ (или ЛАБОРАТОРИИ АНДЕРРАЙТЕРОВ) – Underwriters Laboratories:- a non-profit organization that was established by the insurance industry to test electrical devices for safety.

UNDERWRITING = РАСПИСЫВАНИЕ (или АНДЕРРАЙТИНГ) – (1) Underwriting is the process of examining, accepting, or rejecting insurance risks, and classifying those selected in order to charge the proper premium for each. / Процесс обследования, акцепта или отказа страховых рисков и классификация тех выбранных рисков с целью определения точной комиссии по каждому.

(2) Underwriting:- agreeing, in return for a fee, to take up by way of subscription in a new company or new issue a certain number of shares if and so far as they are not applied for by the public. Underwriting of an issue is usually undertaken by a financial institution. Underwriting is an acting as the underwriter in the issue of new securities for a firm. Underwriting:- in investment, underwriting is where an institution gives a guarantee to a company issuing new shares or bonds that it will buy any remaining shares or bonds that are not bought by other investors. / Расписывание или Андеррайтинг – размещение инвестиционной компанией за определённую комиссию ценных бумаг заказчика без принятия обязательств по выкупу недоразмещённой их части. Андеррайтинг – покупка и продажа инвестиционными компаниями, банками и крупными брокерскими фирмами ценных бумаг новых выпусков на первичном рынке, распространённый метод размещения ценных бумаг (акций и облигаций); также называется и сам договор на размещение ценных бумаг между гарантом и эмитентом. Возможны условия андеррайтинга:- (i) инвестиционная компания выкупает у эмитента весь выпуск ценных бумаг по фиксированной цене и перепродаёт его другим инвесторам; (ii) инвестиционная компания обязуется выкупить у эмитента недоразмещённую часть выпуска ценных бумаг; (iii) инвестиционная компания обязуется приложить максимум усилий по размещению ценных бумаг без принятия обязательств по выкупу недоразмещённой их части.

UNDERWRITING AGENCY = РАСПИСЫВАЮЩЕЕ АГЕНТСТВО (или АНДЕРРАЙТИНГОВОЕ АГЕНТСТВО) – In the United Kingdom, Underwriting Agency is an organization which is approved by the Council of Lloyd's to represent the interests of underwriting members at Lloyd's. The agency embraces the activities of both a members' agent and a managing agent. The members' agent looks after the financial and other relevant matters on behalf of the names in syndicates; but takes no part in the underwriting side of the business. The managing agent deals with all matters connected with the acceptance of business and appoints an active underwriter to whom is delegated the power to act as the syndicate's underwriting agent in concluding insurance contracts, through the medium of a Lloyd's broker, between the syndicate names and the assured. / Лойдз (Lloyd's).

UNDERWRITING AGENT = РАСПИСЫВАЮЩИЙ АГЕНТ (или АНДЕРРАЙТИНГОВЫЙ АГЕНТ) – At the Corporation of Lloyd's, a managing agent or a members' agent. Underwriting Agent:- one who is appointed by an insurance company to accept business on behalf of his principal; within the terms of the agency contract. An insurance broker's principal is the assured, but an underwriting agent's principal is the insurer. An underwriting agent is not, normally, a salaried employee of the company; his services, customarily, being rewarded by commission based on the amount of business he produces for the company. / Корпорэйшэн оф Лойдз (Corporation of Lloyd's).

UNDERWRITING AGREEMENT = СОГЛАШЕНИЕ О РАСПИСЫВАНИИ (или СОГЛАШЕНИЕ О РАЗМЕЩЕНИИ) – An Underwriting Agreement is a contract between a group of investment bankers who form an underwriting group or syndicate, and the issuing corporation of a new securities issue. The underwriting agreement contains the details of the transaction, including the underwriting group's commitment to purchase the new securities issue, the agreed-upon price and the initial resale price. The underwriting agreement can be considered the contract between a corporation issuing a new securities issue and the underwriting group that has agreed to purchase and then resell the issue for a profit. The purpose of the underwriting agreement is to ensure that all of the players understand their responsibility in the process, thus minimizing potential conflict. Types of Underwriting Agreements:- (i) Firm Commitment Agreement:- in a firm commitment underwriting, the underwriter guarantees to purchase all of the securities being offered for sale by the issuer regardless of whether they can sell them to investors. A firm commitment underwriting agreement is the most desirable for the issuer because it guarantees them all of their money right away. The more in demand the offering is, the more likely it is that it will be done on a firm commitment basis. In a firm commitment, the underwriter puts their own money at risk if they can't sell the securities to investors. Underwriting a securities offering on a firm commitment basis exposes the underwriter to substantial amount of risk. As such, underwriters often insist on including a market out clause in the underwriting agreement. A market out clause frees the underwriter from their obligation to purchase all of the securities in case of a development that impairs the quality of the securities or that adversely affects the issuer. However, poor market conditions is not a qualifying condition. One example of when a market out clause could be invoked is if the issuer was a bio tech company and the FDA just denied approval of the company's new drug. (ii) Best Efforts Agreement:- in a best efforts underwriting agreement, underwriters do their best to sell all of the securities offered by the issuer, but the underwriter isn't obligated to purchase the securities for their own account. The lower the demand for an issue, the greater likelihood that it will be done on a best efforts basis. Any shares or bonds in a best efforts underwriting that have not been sold will be returned to the issuer. (iii) Mini-Maxi Agreement:- a mini-maxi agreement is a type of best efforts underwriting that does not become effective until a minimum amount of the securities have been sold. Once the minimum has been met, the underwriter may then sell the securities up to the maximum amount specified under the terms of the offering. All funds collected from investors will be held in escrow until the underwriting is completed. If the minimum amount of securities specified by the offering cannot be reached, the offering will be canceled and the investors' funds that were collected will be returned to them. (iv) All or None Agreement:- with an all or none underwriting, the issuer has determined that it must receive the proceeds from the sale of all of the securities. Investors' funds are held in escrow until all of the securities are sold. If all of the securities are sold, the proceeds will be

released to the issuer. If all of the securities are not sold, the issue is canceled and the investors' funds will be returned to them. (v) Standby Underwriting Agreement:- a standby underwriting agreement is used in conjunction with a preemptive rights offering. All standby underwritings are done on a firm commitment basis. The standby underwriter agrees to purchase any shares that current shareholders do not purchase. The standby underwriter will then resell the securities to the public. Underwriting Agreement is an agreement concluded between the issuer and underwriting syndicate concerning the direct underwriting of the new securities issue, e.g., bond issue. Underwriting Agreement is a securities-purchase contract between an underwriter or underwriting syndicate and an issuer of bonds or shares. Among other terms, it specifies the price at which the security will be offered to the public (public offering price), underwriter's profit margin (underwriting spread), and the date by which the payments must be settled (settlement date). Underwriting Agreement is the contract between a corporation issuing new publicly offered securities and the managing underwriter as agent for the underwriting group. Compare to Agreement Among Underwriters. Underwriting Agreement is also known as a UA. In a registered offering, the agreement between the company and the underwriters concerning the offering of the securities. The underwriting agreement contains an agreement by the underwriter(s) to purchase the offered securities from the issuer or other seller and to resell them to the public, the underwriting discount, representations and warranties of the parties, certain covenants, expense allocation and indemnification provisions. / Соглашение, заключённое между эмитентом и расписывающим синдикатом, касающееся прямой расписки новой эмиссии ценных бумаг, например, эмиссии облигаций. Соглашение о Расписывании или Соглашение о Размещении – соглашение между корпорацией, выпускающей новые ценные бумаги для предложения в открытой продаже, и управляющим андеррайтером (managing underwriter), действующим в качестве агента группы андеррайтеров (underwriting group). Называется также Соглашением о Приобретении (purchase agreement) или Контрактом на Приобретение (purchase contract) ценных бумаг. Это соглашение представляет собой обязательство андеррайтеров приобрести ценные бумаги, в нём указываются цена предложения в открытой продаже (public offering price), гарантийный спрэд (underwriting spread), включая все скидки и комиссионные, чистая прибыль, получаемая организацией, выпускающей новые ценные бумаги, а также дата завершения соглашения (settlement date). Организация, выпускающая ценные бумаги, обязуется оплатить все расходы, понесённые при выпуске или перепродаже ценных бумаг, включая расходы на регистрацию (registration) в Комиссии по Ценным Бумагам и Биржам (Securities and Exchange Commission (SEC)), а также на выпуск проспектов (prospectus), и обязуется представить управляющему андеррайтеру достаточное число экземпляров предварительных проспектов (preliminary prospectus – на жаргоне часто называется Красной Селёдкой – Red Herring) и окончательных, утверждённых проспектов. Организация, выпускающая ценные бумаги, обязуется:- (1) составить все необходимые для подачи в SEC бумаги и полностью выполнить все требования Акта о Ценных Бумагах от 1933 (Securities Act of 1933); (2) взять на себя всю ответственность за полноту, точность и необходимую сертификацию всей информации, содержащейся в регистрационном заявлении и проспекте; (3) привести информацию обо всех судебных процессах; (4) использовать поступления в указанных целях; (5) обеспечить соответствие требованиям штатовских законов о ценных бумагах; (6) фиксировать все согласованные изменения; (7) гарантировать андеррайтеров от ответственности в случае упущений или неверной интерпретации информации, ответственность за которую несёт организация, выпустившая ценные бумаги. Андеррайтеры обязуются начать предложение ценных бумаг немедленно по завершении прохождения регистрации через SEC или по наступлении определённой даты после неё. Андеррайтеры имеют право продавать ценные бумаги членам продающей группы (selling group). Гарантийное соглашение о продаже и размещении выпуска ценных бумаг не следует путать с соглашением между андеррайтерами (agreement among underwriters). Смотрите также (Best Effort), (Firm Commitment), (Standby Commitment), (Underwrite).

UNDERWRITING CAPACITY = ПОТЕНЦИАЛ РАСПИСЫВАНИЯ (или ЁМКОСТЬ РАСПИСЫВАНИЯ) – Underwriting Capacity:- at the Corporation of Lloyd's, depending on the context this term may refer to:- (i) a member's allocated capacity; (ii) syndicate allocated capacity, with or without the addition of cover from qualifying quota share reinsurance; (iii) the total underwriting capacity of all syndicates combined, with or without the addition of cover from qualifying quota share reinsurance; or (iv) the underwriting capacity of an insurance company or a reinsurance company. / Корпорэйшэн оф Лойдз (Corporation of Lloyd's).

UNDERWRITING COMMISSION = КОМИССИЯ ЗА РАСПИСЫВАНИЕ (или КОМИССИЯ ЗА АНДЕРРАЙТИНГ) – Underwriting Commission is the fee investment bankers charge for underwriting a security issue.

UNDERWRITING FEE = ВОЗНАГРАЖДЕНИЕ ЗА РАСПИСЫВАНИЕ (или ВОЗНАГРАЖДЕНИЕ ЗА АНДЕРРАЙТИНГ) – Underwriting Fee is the portion of the gross underwriting spread that compensates the securities firms that underwrite a public offering for their services.

UNDERWRITING GROUP = РАСПИСЫВАЮЩАЯ ГРУППА (или ГРУППА АНДЕРРАЙТИНГА) – Underwriting Group:- xxxxx. / Расписывающая Группа или Группа Андеррайтинга (Underwriting Group):- временная ассоциация инвестиционных банков, организованная лидирующим инвестиционным банком (investment banker) для размещения нового выпуска (new issue) ценных бумаг. Действуя в рамках соглашения между андеррайтерами (agreement among underwriters), группа (синдикат) обязуется приобрести ценные бумаги у выпустившей их корпорации по согласованной цене и перепродать их затем по цене предложения в открытой продаже (public offering price), разница между которыми представляет собой курсовую разницу по расписыванию или спрэд по андеррайтингу (underwriting spread). Цель создания расписывающего синдиката заключается в распределении риска и обеспечении успешной реализации предлагаемых ценных бумаг. Большинство групп андеррайтеров действует в рамках так называемых контрактов о разделении синдиката (divided syndicate contract), означающих, что ответственность каждого члена ограничивается объёмом индивидуального участия. Также называется Распределяющим Синдикатом (Distributing Syndicate), Приобретающей Группой (Purchase Group), Инвестиционной Банковской Группой (Investment Banking Group) или Синдикатом (Syndicate). Смотрите также Firm Commitment; Underwrite; и Underwriting Agreement.

UNDERWRITING INCOME = ДОХОД ЗА РАСПИСЫВАНИЕ (или ДОХОД ЗА АНДЕРРАЙТИНГ) – Underwriting Income:- for an insurance company, the difference between the premiums earned and the costs of settling claims.

UNDERWRITING SPREAD = КУРСОВАЯ РАЗНИЦА ПО РАСПИСЫВАНИЮ (или СПРЭД ПО АНДЕРРАЙТИНГУ) – Underwriting Spread is the income that is generated by the underwriting syndicate and the selling group, which is essentially the difference between the amount paid to the issuer of securities in a primary distribution and the public offering price. / Курсовая Разница по Расписыванию или Спрэд по Андеррайтингу (Underwriting Spread):- разница между суммой, уплаченной организации, выпустившей ценные бумаги в процессе их первичного распределения (primary distribution), и ценой предложения в открытой продаже (public offering price). Размер разницы называется курсовой разницей или спрэдом (spread) и варьирует широко. Она зависит от объёма выпуска ценных бумаг, финансового положения организации, выпустившей ценные бумаги, типа участвующих в выпуске ценных бумаг (акции, облигации, права), статуса ценных бумаг (старшие, младшие, обеспеченные, необеспеченные) и типа обязательства, взятого на себя инвестиционными банками. Курсовая разница может составлять от

доли процента для выпусков облигаций большой компании коммунального хозяйства до 25% от первоначальной цены предложения в открытой продаже (initial public offering) для небольшой компании. Курсовая разница по расписыванию распределяется между управляющим андеррайтером (managing underwriter), продающей группой (selling group) и участвующими в размещении ценных бумаг андеррайтерами. Пропорции этого распределения также варьируют, но при разнице в два пункта управляющий андеррайтер обычно получает 0.25%, продающая группа – 1%, а андеррайтеры – 0.75%. Однако андеррайтеры часто также являются и членами продающей группы, получая, таким образом, 1.75% разницы, а управляющий андеррайтер, входящий во все три категории, получит полные 2%. Смотрите также Competitive Bid; Flotation Cost; Gross Spread; Negotiated Underwriting; Selling Concession; и Underwrite.

UNDERWRITING STAMP = ШТАМП О РАСПИСЫВАНИИ – Underwriting Stamp:- the stamp that is applied to a slip by an underwriter to signify his acceptance of a risk. It shows the number and pseudonym of the syndicate or the name of the (re)insurance company for whom the underwriter acts and has a space for his underwriting reference to be inserted. The underwriter will insert his line on a slip next to his underwriting stamp.

UNDERWRITING SYNDICATE = РАСПИСЫВАЮЩИЙ СИНДИКАТ (или АНДЕРРАЙТИНГОВЫЙ СИНДИКАТ) – Underwriting Syndicate:- in banking business this refers to a consortium of two or more banks, formed for a limited time, for the purpose of placing securities. The members sign a syndicate agreement which specifies the tasks to be performed by each member. A temporary association (consortium) of two or more investment banks for the joint underwriting of a securities issue. Underwriting Syndicate is a group of investment banks that work together to sell new security offerings to investors. The underwriting syndicate is led by the lead underwriter. See also Lead Underwriter.

UNDERWRITTEN OFFERING = РАСПИСАННОЕ ПРЕДЛОЖЕНИЕ (или РАСПИСАННОЕ РАЗМЕЩЕНИЕ) – Underwritten Offering is a purchase and sale securities.

UNDEVELOPED COUNTRIES = НЕРАЗВИТЫЕ СТРАНЫ – Undeveloped Countries:- an undeveloped country or region does not have modern industries and usually has a low standard of living. See also Third World, and Underdeveloped Countries. / Неразвитые Страны:- .

UNDEVELOPED KERNELS = НЕДОРАЗВИТАЯ ЗЕРНОВКА (или НЕДОРАЗВИТЫЕ ЯДРА) – Undeveloped Kernels mean kernels that do not develop normally as should be, and are flat without starch. / В индустрии Риса под Недоразвитой Зерновкой (или Недоразвитыми Ядрами) понимается зерновка, которая не развита нормально, как должна, и которая .

UNDEVELOPED RESERVES = НЕДОБЫТЫЕ РЕЗЕРВЫ – Undeveloped Reserves: Undeveloped reserves are expected to be recovered: (1) from new wells on undrilled acreage, (2) from deepening existing wells to a different reservoir, or (3) where a relatively large expenditure is required to (a) recomplete an existing well or (b) install production or transportation facilities for primary or improved recovery projects. See also Reserves.

UNDIES = ИСПОДНЕЕ (или НИЖНЕЕ БЕЛЬЁ) – Undies is another word for underwear. More of a slang word used in the English language. / Исподнее – нательное бельё, например, выбежал в исподнем.

UNDIFFERENTIATED MARKETING = НЕДИФФЕРЕНЦИРОВАННЫЙ МАРКЕТИНГ – Undifferentiated Marketing is the marketing of a product aimed at the widest possible market. An early example was the Model T Ford, which was mass-produced, aimed at a very wide market, and only available in black. Ford now produce a wide range of models, with different engine capacities, colors, and prices aimed at attracting a wide variety of tastes and requirements. Compare Differentiated Marketing. See also Marketing. / Недифференцированный Маркетинг (Undifferentiated Marketing):- маркетинг продукта на максимально широком рынке. К ранним примерам такого маркетинга относится автомобиль Форда Модели Ти., которая производилась в массовом масштабе, предназначалась для очень широкого рынка и выпускалась только чёрного цвета. В настоящее время (1990) компания Форд выпускает большое число моделей самых разнообразных цветов, оснащённых двигателями разной мощности и продаваемых по разным ценам, чтобы охватить всё многообразие вкусов и предъявляемых покупателями требований.

UNDIGESTED SECURITIES = НЕОСВОЕННЫЕ ЦЕННЫЕ БУМАГИ – Undigested Securities are newly issued securities that are not purchased because of lack of demand during the initial public offering (IPO). / Неосвоенные Ценные Бумаги (Undigested Securities):- акции или облигации новых выпусков, которые остаются неразмещёнными, поскольку отсутствует достаточный спрос на них в открытой продаже по цене предложения (offering price). Смотрите также Underwrite.

UNDISCHARGED BANKRUPT = НЕ ВОССТАНОВЛЕННЫЙ В ПРАВАХ БАНКРОТ – Undischarged Bankrupt is a person who has been made bankrupt and who has not yet received an order of discharge from the court. Such a person is disqualified from holding certain offices, which include justice of the peace, councillor, and Member of Parliament. An undischarged bankrupt must not obtain credit of £500 or more either alone or jointly with any other person without disclosing his bankruptcy. He must not carry on business (directly or indirectly) in a different name from that in which he was made bankrupt, without telling all those with whom he does ... Undischarged Bankrupt is a person whose bankruptcy has not been discharged. Such persons may not obtain credit (above £500) without first informing the creditor that they are undischarged bankrupts, and may not carry on a business without disclosing the name under which they become bankrupt. Undischarged bankrupts may not hold office as a JP, MP, mayor, or ... Undischarged Bankrupt is a person who has been made bankrupt and who has not yet received an order of discharge from the court. Such a person is disqualified from holding certain offices, which include justice of the peace, councillor, and Member of Parliament. He must not obtain credit for more than £500 without informing the creditor that he is an undischarged bankrupt, and he must not carry on a business without disclosing the name under which he was made bankrupt to those who deal with him. See also Bankruptcy Law. / Не Восстановленный В Правах Банкрот (Undischarged Bankrupt):- в Соединённом Королевстве лицо, не освобождённое от состояния банкротства (bankruptcy). Такое лицо не имеет права брать кредит на сумму более 250 Фунтов Стерлингов, не поставив в известность кредитора, что оно является не восстановленным в правах банкротом, занимать должность директора компании либо заниматься бизнесом под другим именем. Кроме того, не восстановленный в правах банкрот не может занимать должности мирового судьи, члена Парламента, мэра или члена Совета. Если он является пэром, то лишается возможности заседать в Палате Лордов.

UNDISCLOSED ASSIGNMENT = НЕРАСКРЫТАЯ ПЕРЕДАЧА (или НЕРАСКРЫТОЕ (ПРЕД)НАЗНАЧЕНИЕ) – Undisclosed Assignment is an assignment under which the new creditor dispenses with notifying the third party that title or interest has ben transferred.

UNDISCLOSED FACTORING = НЕРАСКРЫТЫЙ ФАКТОРИНГ – Undisclosed Factoring is a form of factoring in which the seller of goods does not wish to disclose that a factor is being used. In these circumstances, the factor buys the goods that have been sold (rather than the debt their sale incurred) and, as an undisclosed principal, appoints the original seller to act as an agent to recover the debt. The factor assumes responsibility in the case of non-payment so that from the point of view of the seller, the factor offers the

same service as in normal factoring. See also Factoring. / Нераскрытый Факторинг (Undisclosed Factoring):- форма факторинга, при которой продавец товаров не хочет раскрывать причин, заставивших его использовать фактора. При таких обстоятельствах фактор (factor) покупает уже проданные товары (но не долг, который возник в результате их продажи) и, действуя в качестве нераскрытого принципала (undisclosed principal), назначает подлинного (оригинального) продавца своим агентом, уполномочивая его взыскать долг. Фактор принимает на себя ответственность за неполучение платежа, поэтому, с точки зрения продавца, фактор оказывает ему ту же услугу, что и при нормальном факторинге. Смотрите также Факторинг (Factoring).

UNDISCLOSED PRINCIPAL = НЕРАСКРЫТЫЙ ПРИНЦИПАЛ – Undisclosed Principal is a person who buys or sells through an agent or broker and remains anonymous. The agent or broker must disclose when dealing on behalf of an undisclosed principal; failure to do so may result in the agent being treated in law as the principal and in some circumstances the contract may be made void. See also Principal. Undisclosed Principal is a principal whose existence is not disclosed by its agent to a contracting third party. The rule ('doctrine of the undisclosed principal') is well established:- where a contract is made in an agent's own name on behalf of an undisclosed principal, either the principal or the agent may sue upon it. The third party, upon discovering the existence of the principal, may opt to sue either the agent or the principal. There are some exceptions to this rule (e.g., if a third party has made it clear that it does not want to contract with a ...). / Нераскрытый Принципал (Undisclosed Principal):- лицо, которое покупает или продаёт товары при посредничестве агента или брокера и сохраняет свою анонимность. Агент или брокер обязан сообщить, что он заключает сделку от мени нераскрытого принципала; если он этого не сделает, то, по закону, сам будет рассматриваться принципалом, и при определённых условиях контракт может стать недействительным. Смотрите также Принципал (Principal).

UNDISCLOSED RESERVES = НЕРАСКРЫТЫЕ РЕЗЕРВЫ (или СКРЫТЫЕ РЕЗЕРВЫ) – Undisclosed Reserves are reserves not shown in the balance sheet of a company; for example, if the market value of an asset is higher than its book value. Other forms:- replacement reserves (maintenance of real-asset values and equity capital) and other undisclosed reserves. Undisclosed reserves enhance a company's creditworthiness. The opposite of Disclosed Reserves, or Open Reserves.

UNDISTRIBUTABLE RESERVES = НЕРАСПРЕДЕЛЯЕМЫЕ РЕЗЕРВЫ – Undistributable Reserves:- in the United Kingdom accounting, reserves that are not legally available for distribution to stockholders as dividends according to the Companies Act 1985. They include share capital, share premium account, capital redemption reserve, certain unrealized profits, or any other reserve. Also known as Restricted Surplus in the United States. The Undistributable Reserves are defined as:- (i) share premium account; (ii) capital redemption reserve; (iii) aggregate accumulated unrealized profits less aggregate accumulated unrealized losses; (iv) any reserve whose distribution is prohibited by law (other than the UK Companies Act of 1985); and (v) any reserve whose distribution is prohibited by the Memorandum or Articles of the company itself. Undistributable Reserves include the capital redemption reserve, share premium account, and revaluation reserve. Undistributable reserves include:- (i) share premium account; (ii) capital redemption reserve; (iii) excess of unrealised profits over unrealised losses; or (iv) any other reserve which it is prohibited to distribute by law, or by the company's constitution. Negative distributable reserves therefore occur if accumulated undistributed realised profits are less than accumulated realised losses not previously written off. See also Capital Reserve. Undistributable Reserves are the reserves that may not be distributed according to the Companies Act. They include share capital, share premium account, capital redemption reserve, certain unrealized profits, or any other reserve that the company may not distribute according to some other Act or its own constitutional documents. In the USA such reserves are known as Restricted Surplus. Compare Distributable Profits. / Нераспределяемые Резервы (Undistributable Reserves):- . Смотрите также Капитальные Резервы (Capital Reserves).

UNDISTRIBUTED PROFITS = НЕРАСПРЕДЕЛЁННЫЕ ПРИБЫЛИ – Undistributed Profits are the amount of a publicly-traded company's post-tax earnings that are not paid in dividends. Most earnings retained are re-invested into the company's operations. Year-on-year tracking of the ratio of undistributed profits to dividends is important to fundamental analysis to investigate whether a company is increasing or decreasing its rate of re-investment. Undistributed profits form part of a company's equity, and are owned by shareholders. They are also called Retained Earnings, Accumulated Profits, Undivided Profits, and Earned Surplus. Undistributed Profit is a profit which has not been distributed as dividends to shareholders. See also Retained Earnings. Undistributed Profit is a profit earned by an organization but not distributed to its shareholders by way of dividends. Such sums are available for later distribution but are frequently used by companies to finance their activities. See also Retained Earnings. / Нераспределённая Прибыль (Undistributed Profit):- прибыль, полученная организацией, но не распределённая между акционерами в виде дивидендов. Такие прибыли могут распределяться в будущем, однако чаще компании используют их для финансирования своей деятельности.

UNDISTRIBUTED REALIZED EARNINGS = НЕРАСПРЕДЕЛЁННЫЕ РЕАЛИЗОВАННЫЕ ЗАРАБОТКИ – Undistributed Realized Earnings are the cumulative balance of periodic net investment income (loss) and realized gain (loss) on investments, less dividends or distributions (at times, an Small Business Investment Company (SBIC) may need to make an adjustment which is not reflected in this general formula). To accommodate regulatory requirements, two components of Undistributed Realized Earnings are presented separately in the financial statements:- (i) Non-cash Gains/Income; and (ii) Undistributed Net Realized Earnings.

UNDIVERSIFIABLE RISK = НЕДИВЕРСИФИЦИРУЕМЫЙ РИСК – Undiversifiable Risk:- related Systematic Risk. Systematic risk is the risk inherent to the entire market or market segment. Systematic risk, also known as Undiversifiable Risk, Volatility, or Market Risk, affects the overall market, not just a particular stock or industry. This type of risk is both unpredictable and impossible to completely avoid. It cannot be mitigated through diversification, only through hedging or by using the correct asset allocation strategy.

UNDIVIDED PROFITS = НЕРАЗДЕЛЁННЫЕ ПРИБЫЛИ – Undivided Profits:- xxxxx. / Неразделённые Прибыли (Undivided Profits):- сумма, указываемая в бухгалтерском балансе (balance sheet). Это прибыли, которые не были выплачены в виде дивидендов (dividends), или были удержаны для создания активного сальдо (избытка) (surplus) на счёте. Текущие доходы засчитываются на счёт неразделённых прибылей и затем либо выплачиваются в виде дивидендов, либо сохраняются для увеличения совокупного собственного капитала (equity). По мере роста сумм на счёте, круглые суммы могут периодически переноситься на счёт доходов.

UNDO = АННУЛИРОВАТЬ (или ХХ) – Undo:- (1) unfasten, untie, or loosen (something), e.g., 'the knot was difficult to undo'; (2) cancel or reverse the effects or results of (a previous action or measure), e.g., 'there wasn't any way Evelyn could undo the damage'. / Эвэлэн (Evelyn). Аннулировать:- отказаться от сделки.

UNDP = UNITED NATIONS DEVELOPMENT PROGRAMME

UNDP/WB = UNITED NATIONS DEVELOPMENT PROGRAMME/THE WORLD BANK

UNDRAWN TOW = НЕТЯНУТЫЙ ЖГУТ (или НЕТЯНУТАЯ ПАКЛЯ) – Undrawn Tow:- Plastic bottles are collected from the public using bottle banks or kerbside collection schemes. The collected bottles are delivered to sorting centers, often termed Materials

Reclamation Facilities (MRFs) where they are separated into three different plastic types (polymers). The three types are High Density Polyethylene (HDPE), Polyvinyl Chloride (PVC) and Polyethylene Terephthalate (PET). It is the PET bottles that are mainly used to produce fiber products. These bottles are typically used to produce fizzy or soft drinks bottles. They are transparent and have a small 'dot' in the base of the bottle. The sorted bottles are compressed into dense bales and shipped to a reprocessing plant. Each shipment typically comprises of around 300 000 bottles. At the reprocessing plant the bales are loaded into a de-baling machine which loosens the squashed bottles. These are loaded onto a conveyor, which carries the bottles through inspection equipment that removes any remaining non-PET bottles from the stream. The plastic bottles are then chopped into small flakes whilst in a water bath. This 'wet granulation' process helps clean the bottles and removes the label. Floatation equipment is used to separate the PET from another plastic material used to produce the bottle caps. The flakes of PET are finally drained of water and dried. An air blower system transports the flakes into storage containers, and helps blow out any remaining dust or small pieces of label. To produce the fiber, this flake material is melted and squeezed through spinnerets. These are flat plates with many tiny holes. As the molten plastic emerges from the spinneret it solidifies. The melt spinning produces many long strands of individual fibers, known as an 'Undrawn Tow'. The undrawn tow is then brought together in a single thick tow. This collection of fibers is then drawn. The drawing process stretches the fibers to several times their original length. The fibers, now stretched, are crimped to introduce a 'wave' into the fiber. The wave is set in the fiber by heating. Finally, the fiber is cut into specific lengths. The final use of the fiber is one factor in determining the choice of length of fiber. To make fleece clothing the fibers are spun into a yarn. The yarn is then woven to produce rolls of fleece material. This material is cut to shape and sewn to make a new garment. See also Drawn Tow. Sample:- fleece jacket made from recycled PET bottles. Polyester Fiber manufacturing process:- today over 70 to 75% of polyester is produced by CP (continuous polymerisation) process using PTA (short for the Purified Terephthalic Acid) and MEG (short for the Mono Ethylene Glycol). The old process is called Batch Process using DMT (Dimethyl Terephthalate) and MEG. Catalysts like Sb_3O_3 (Antimony trioxide) are used to start and control the reaction. TiO_2 (Titanium dioxide) is added to make the polyester fiber / filament dull. Spin finishes are added at melt spinning and draw machine to provide static protection and have cohesion and certain frictional properties to enable fiber get processed through textile spinning machinery without any problem. PTA which is a white powder is fed by a screw conveyor into hot MEG to dissolve it. Then catalysts and TiO_2 are added. After that Esterification takes place at high temperature. Then monomer is formed. Polymerisation is carried out at high temperature (290 to 300 degree centigrade) and in almost total vacuum. Monomer gets polymerised into the final product, PET (Polyethylene Terephthalate). This is in the form of thick viscous liquid. This liquid is them pumped to melt spinning machines. These machines may be single sided or double sided and can have 36/48/64 spinning positions. At each position, the polymer is pumped by a metering pump-which discharges an accurate quantity of polymer per revolution (to control the denier of the fiber) through a pack which has sand or stainless steel particles as filter media and a spinnerette which could be circular or rectangular and will have a specific number of holes depending on the technology used and the final denier being produced. Polymer comes out of each hole of the spinnerette and is instantly solidified by the flow of cool dry air. This process is called Quenching. The filaments from each spinnerette are collected together to form a small ribbon, passed over a wheel which rotates in a bath of spin finish:- and this ribbon is then mixed with ribbon coming from other spinning positions, this combined ribbon is a tow and is coiled in cans. The material is called Undrawn Tow and has no textile properties. At the next machine (the draw machine), undrawn tows from severl cans are collected in the form of a sheet and passed through a trough of hot water to raise the temperature of polymer to 70 degrees C which is the glass transition temperature of this polymer so that the polymer can be drawn. In the next two zones, the polymer is drawn approximately 4 times and the actual draw or the pull takes place either in a steam chamber or in a hot water trough. After the drawing is complete, each filament has the required denier, and has all its sub microscopic chains aligned parallel to the fiber axis, thereby improving the crystallinity of the fiber structure and imparting certain strength. Next step is to set the strength by annealing the filaments by passing them under tension on several steam heated cylinders at temperatures 180 to 220 degrees C. Also the filaments may be shrunk on the first zone of annealer by over feeding and imparting higher strength by stretching 2% or so on the final zone of the annealer. Next the fiber is quenched in a hot water bath, then passed through a steam chest to again heat up the tow to 100 degree C so that the crimping process which takes place in the stuffer box proceeds smoothly and the crimps have a good stability. Textile spin finish is applied either before crimping by kiss roll technique or after crimping by a bank of hollow cone sprays mounted on both sides of the tow. The next step is to set the crimps and dry the tow fully which is carried out by laying the tow on a lattice which passes through a hot air chamber at 85 degree C or so. The two is guided to a cutter and the cut fibers are baled for despatch. The cutter is a reel having slots at intervals equal to the cut length desired 32 or 38 or 44 or 51 mm. Each slot has a sharp stainless steel or tungsten carbide blade placed in it. The tow is wound on a cutter reel, at one side of the reel is a presser wheel which presses the tow on to the blades and the tow is cut. The cut fiber falls down by gravity and is usually partially opened by several air jets and finally the fiber is baled. Some, balers have a preweighting arrangement which enables the baler to produce all bales of a pre determined weight. The bale is transported to a ware house where it is 'matured' for a minimum of 8/10 days before it is permitted to be despatched to the spinning mill. / Кудель – короткое спутанное льняное волокно.

UNDRAWN YARN = НЕТЯНУТАЯ ПРЯЖА – Undrawn Yarn is extruded yarn (filaments), the component molecules of which are substantially unoriented. Undrawn yarn exhibits predominantly plastic flow in the initial stages of stretching and represents an intermediate stage in the production of a manufactured yarn. Undrawn Yarn is the extruded filament yarn (or tow), the component macromolecules of which have a low degree of orientation. Note:- Undrawn yarn and tow represent intermediate stages in the production of some synthetic yams and staple fibers respectively. / филаментная (комплексная) пряжа (filament yarn).

UNDUE INFLUENCE = НЕНАДЛЕЖАЩЕЕ ВЛИЯНИЕ (или НЕДОЛЖНОЕ ВЛИЯНИЕ) – Undue Influence:- use by a stronger party of an imbalance of power, or a particular vulnerability of the weaker party, to dominate the weaker party and cause them to enter a contract against their own interests. Undue influence may occur where there is a special relationship between the parties, or where there is no special relationship. Undue influence is a vitiating factor (see Vitiate) rendering a contract voidable. Where there is a special relationship (e.g., a fiduciary relationship, parent and child, doctor and patient), the presumption is that ... Undue Influence is the unfair pressure exerted on a person to sign a contract that is not a true expression of that person's aims or requirements at the time, but is to the advantage of another party (either a party to the contract or a third party). Such a contract may be set aside by a court. Undue Influence is the influence that prevents someone from exercising an independent judgment with respect to any transaction. A contract or gift procured by the exercise of undue influence is liable to be set aside by the courts. A will may likewise be held to be invalid if it is shown that the testator made it under conditions of undue influence (see also Testamentary Intention). The exercise of undue influence must normally be proved affirmatively – it must be shown that there is a dealing or transaction in which an unfair advantage has been taken of another ... Undue Influence is a form of wrongdoing which concentrates upon the manner in which the intention to enter a contract is produced. It arises in circumstances where there is some form of superiority which has induced the victim to enter a transaction which that person otherwise would not freely and knowingly enter. The law will not permit such a transaction to stand. Courts have tended to divide undue influence into two categories:- 'actual' and 'presumed'. Establishing actual undue influence requires proof that the wrongdoer actually exerted undue ... Undue Influence is the influence that prevents someone from exercising an independent judgment with respect to any transaction. A contract or gift procured by the exercise of undue influence is liable to be

set aside by the courts. A will may likewise be held to be invalid if it is shown that the testator made it under conditions of undue influence. The exercise of undue influence must normally be proved affirmatively – it must be shown that there is a dealing or transaction in which an unfair advantage has been taken of another person. In the case of certain ... / Недолжное Влияние (Undue Influence):- незаконное давление, оказываемое на какое-либо лицо, чтобы заставить его подписать контракт, который в данное время не отвечает его целям и потребностям, однако является выгодным для другой стороны (либо стороны, которая фигурирует в контракте как третья сторона). Такой контракт может быть аннулирован судом.

UNDULATE = ВОЛНИСТОЕ (или СТРУЙЧАТОЕ, или АНДЮЛЭЙТ) – Undulate:- wavy with alternately concave and convex regions. Hence undatus, undulatus – with wavy margins, undulated. Undulate:- with a wavy surface. / с поочерёдно .

UNDULATE RACHIS = ВОЛНИСТЫЙ СТЕРЖЕНЬ (или СТРУЙЧАТАЯ ОСЬ СОЦВЕТИЯ) – Undulate Rachis (UR) is the primary panicle branches, especially the lower ones, have undulating secondary axes. This condition is caused by mechanical compression exerted on the branches owing to the premature extension of the axes while they are inside the flag leaf sheath.

UNDYED CREASE = НЕПРОКРАШЕННЫЙ ЗАЛОМ – Undyed Crease:- in a printed fabric, a well defined lengthways streak from which the color is missing. Note:- this defect is caused by passing a creased fabric through the printing machine. / Под Заломом понимается местный порок в виде неустранимых следов складок. Размер порока – по всему куску. Неокрашенные Складки (undyed crease):- порок заключительной отделки ткани; чётко определяемые неокрашенные продольные полосы в набивном полотне. Примечание:- этот порок возникает при прохождении смятого полотна через набивную машину.

UNEARNED DISCOUNT = НЕЗАРАБОТАННЫЙ ДИСКОНТ (или НЕЗАРАБОТАННАЯ СКИДКА, или ХХ) – Unearned Discount:- xxxxx. / Незаработанная Скидка (Unearned Discount):- сумма, вносимая в учётные книги организации-кредитора, из которой заранее вычитается процент, который будет внесён в качестве дохода в течение срока займа. В соответствии с принципами бухгалтерского учёта, подобные проценты первоначально учитываются как обязательства (liability). Затем по прошествии месяцев и по мере постепенного начисления процентов они учитываются в качестве дохода, таким образом увеличивая прибыли кредитора и уменьшая соответствующие обязательства. Смотрите также Unearned Income.

UNEARNED INCOME = НЕЗАРАБОТАННЫЙ ДОХОД (или НЕОТРАБОТАННЫЙ ДОХОД) – Unearned Income is an income received from investments, and not from the provision of goods or services, including dividends and interest payments. Also known as Deferred Income. Unearned Income describes any personal income that comes from investments and other sources unrelated to employment services. Examples of unearned income include interest from a savings account, bond interest, alimony and dividends from stock. This type of income differs from traditionally earned income, which is the income earned from active work or business activity. Unearned income is a type of income denoted by the US Internal Revenue Service (IRS) derived from means other than personal efforts. To the IRS, 'personal efforts' includes wages, salaries, tips, other taxable employee pay and self-employment income. Any income source that falls outside of these efforts is considered unearned income. This type of income is commonly denoted as 'passive sources of income' and is generated without having to work. Most unearned income sources are not subject to payroll taxes, and all unearned income sources are not subject to employment taxes, such as Social Security and Medicare. It is therefore extremely important for individuals making unearned income to understand where that income is coming from and how each source is taxed. Types of Unearned Income:- the most common type of unearned income is the income that comes from interest and dividends. Most people participate in some sort of investing, either debt or equity. If, for example, a person invests in a dividend-paying company such as Disney, he most likely receives a dividend payment every quarter. This means each stock the investor owns receives a percentage of the company's profits each quarter, known as the Dividend Yield. The total sum of the dividend yield is taxed at the current dividend tax rate. The money earned in this capacity is considered unearned income, and the tax paid is considered unearned income tax. Retirement benefits are also a common type of unearned income. When a person retires, he most likely lives off of the distributions from a 401(k), pension or similar retirement account. Specifically in the case of a 401(k) distribution, where taxes are realized when the money is withdrawn, the IRS considers the withdrawn money to be unearned income. The retiree is taxed at his income tax rate in this scenario. Less common forms of unearned income include gifts, prizes, inheritances and other unearned income. Any time someone gifts money to another person, wins prize money in a contest or lottery, inherits money from a deceased relative or receives alimony or workers comp, it is considered unearned income. This is because the money was generated without the involvement of active work or business activity. Each of these situations has unique unearned income tax rates. Unearned Income:- (1) in accounting:- income received before a good is sold or a service is provided. Unearned income is classified as a current liability on the balance sheet until it is recognized as earned income during the accounting cycle. (2) In taxation:- income derived from means other than the provision of personal efforts, such as that derived as dividends, interest, or rent. Pensions and royalties, however, are not considered unearned income. Unearned Income or unearned revenue occurs when a company receives money before the money is earned. This is also referred to as Deferred Revenues or Customer Deposits. The unearned amount is recorded in a liability account such as Unearned Revenues, Deferred Revenues, or Customer Deposits. After the amount has been earned, the liability account is reduced and a revenue account is increased. Example 1:- a lawn service company offers customers a special package of five applications of fertilizers and weed treatments for USD200 if the customer prepays in March. The service will be provided in April, May, June, July, and September. When the company receives USD200 in March, it will debit the asset Cash for USD200 and will credit the liability account Unearned Revenues. Since these are balance sheet accounts (and since no work has yet been performed), no revenue is reported in March. In April when the first service is provided, the company will debit the liability account Unearned Revenues for USD40 and will credit the income statement account Service Revenues for USD40. At the end of April, the balance sheet will report the company's remaining liability of USD160. The income statement for April will report that USD40 was earned. The USD40 entry is referred to as an adjusting entry and the same entry will be recorded in May, June, July, and September. Example 2:- a company informs a customer that a USD5 000 deposit is required before it will begin work on the customer's special order. The customer gives the company USD5 000 on December 28 and the company will begin work on the special order on January 03. On December 28 the company will debit Cash for USD5 000 and will credit a liability account, such as Customer Deposits (or Unearned Revenues or Deferred Revenues) for USD5 000. No revenue is reported in December for this special order since the company did not perform any work. When the special order is completed in January the company will debit the liability account for USD5 000 and will credit a revenue account. Unearned Income (revenue) is an income received in advance of the time at which it is earned, such as prepaid rent. Unearned Income is an income not derived from trades, professions, or vocations, or from the emoluments of office. In the United Kingdom (UK), it was formerly taxed more heavily than earned income through the imposition of an investment-income surcharge. Earned and unearned income are now taxed at essentially the same rates (with minor differences in the treatment of income from savings and company ... See also Income. Unearned Income is the personal income derived from sources other than work. It thus consists of rent, dividends, interest, and transfer payments. See also Property Income. / Незаработанный Доход (Unearned Income):- доход, не являющийся торговой прибылью, доходом от занятий профессиональной деятельностью, заработной платой или жалованьем. До 1984 в Великобритании считалось, что доход от инвестиций, поскольку он более постоянный, нежели заработанный доход, и не зависит от труда налогоплательщика, должен облагаться налогом по более высокой ставке, чем доход, заработанный, что и

делалось путём дополнительного налогообложения дохода от инвестиций, ставка которого на 15% превышала нормальную ставку подоходного налога. В настоящее время (1990) заработанный и незаработанный доходы облагаются в Великобритании налогом по единой ставке. Доход, полученный от инвестиций, а не от реализации товаров или оказания услуг, и включайщий в себя дивиденды и процентные платежи (или платежи процентов). Известен также как Доходы Будущих Периодов (Deferred Income). Незаработанный Доход (Поступления) (Unearned Income (Revenue)):- (1) В бухгалтерском учёте:- доход, полученный, но ещё не заработанный, как, например, арендная плата, внесённая авансом, или иной аванс, полученный от клиентов. Незаработанный доход в балансовой ведомости (balance sheet) компании обычно рассматривается как текущие обязательства (current liability) и предполагается, что он будет впоследствии отнесён на счёт доходов в течение соответствующего отчётного периода. Смотрите также (Deferred Charge). (2) В подоходном налоге:- доход из источников, отличных от заработной платы, жалованья, чаевых и иной компенсации, получаемой работником, например, дивиденды (dividends), проценты (interest), арендная плата.

UNEARNED INTEREST = НЕЗАРАБОТАННЫЙ ПРОЦЕНТ – Unearned Interest is an interest that has been received on a loan, but that cannot be treated as a part of earnings yet, because the principal of the loan has not been outstanding long enough. / Незаработанный Процент (Unearned Interest):- проценты по займу, которые были уже взысканы финансовой организацией, но которые не могут считаться частью доходов, поскольку основная сумма займа не просуществовала в качестве таковой в течение достаточно длительного срока. Также называется Дисконтом (Discount) или Незаработанным Дисконтом (Unearned Discount).

UNEARNED PREMIUM = НЕЗАРАБОТАННАЯ ПРЕМИЯ (или НЕОТРАБОТАННАЯ ПРЕМИЯ) – In insurance's accounting, written premiums are recognised as earned according to the risk profile of the policy. Unearned premiums represent the proportion of premiums written in the year that relate to unexpired terms of policies in force at the balance sheet date, calculated on the basis of established earnings patterns or time apportioned as appropriate. The proportion of premium that relates to the unused period of cover. In reinsurance, Unearned Premium is that portion of the original premium that applies to the unexpired portion of risk. A fire or casualty insurer or reinsurer must carry a reserve against all unearned premiums as a liability in its financial statement, for if the policy should be canceled, the company would have to pay back the unearned part of the original premium. Premium already paid to an underwriter which is in respect of a period when he was not at risk. Unearned Premium is the proportion of a premium which relates to the portion of a risk which has not yet expired. / Незаработанная Страховая Премия – это премия, остающаяся после вычитания суммы заработанной страховой премии из суммы премии по принятым страхованиям; доля страховой премии, приходящаяся на неоконченную часть периода ответственности по действующим страховым полисам или договорам страховщика или перестраховщика, отражённая в их отчётности на определённый момент времени. Так как страховая защита ещё не применялась по отношению к неоконченному периоду времени, страховщик ещё не заработал данную часть страховой премии. Другими словами, незаработанная премия – это часть страховой премии по принятым страхованиям, относящаяся к периоду страхования, который ещё не истёк или не был использован, но страховая премия за этот период была оплачена. Таким образом, в случае годовой суммы страховой премии в конце первого месяца полисного периода 1/12 от суммы премии являются незаработанной частью премии.

UNEARNED PREMIUM RESERVE = РЕЗЕРВ НЕЗАРАБОТАННОЙ ПРЕМИИ (или РЕЗЕРВ НЕОТРАБОТАННОЙ ПРЕМИИ) – In insurance, Unearned Premium Reserve:- the fund set aside as at the end of the financial year by a non-life insurer out of premiums in respect of risks to be borne by the company after the end of that year under contracts of insurance entered into before the end of that year.

UNEARNED REVENUE = НЕЗАРАБОТАННАЯ ВЫРУЧКА (или НЕЗАРАБОТАННЫЙ ДОХОД) – Unearned Revenue is money received by an individual or company for a service or product that has yet to be fulfilled. Unearned revenue can be thought of as a 'prepayment' for goods or services that a person or company is expected to produce for the purchaser. As a result of this prepayment, the seller has a liability equal to the revenue earned until delivery of the good or service. Unearned revenue is simply money that has not been earned but has been received before the fulfillment of a service. The early cash flow to the firm is advantageous for any number of activities, such as paying interest on debt and purchasing more inventory. However, by accepting unearned revenue, the firm has then entered a legal obligation to deliver on the terms of the payment. For example, with a prepayment on a lease contract to a real estate company, the revenue is a liability until it is earned. Criteria to Recognize Revenue:- There are several criteria established by the US Securities and Exchange Commission (SEC) that a public company must meet to recognize revenue. If these are not met, revenue recognition is deferred. According to the SEC, there must be collection probability, or the ability to make a reasonable estimate of an amount for the allowance for doubtful accounts; completed delivery, or ownership shifted to the buyer; persuasive evidence of an arrangement; and a determined price. Unearned Revenue In Practice:- If a publishing company accepts USD1 200 for a one-year subscription, the amount is recorded as an increase in cash and an increase in unearned revenue. Both are balance sheet accounts, so the transaction does not immediately affect the income statement. If it is a monthly publication, as each periodical is delivered, the liability or unearned revenue is reduced by USD100 (USD1 200 divided by 12 months) while revenue is increased by the same amount. Example of Unearned Revenue:- Morningstar, Inc. offers a line of products and services for the financial industry, including financial advisors and asset managers. Many of its products are sold through subscriptions. Under this arrangement, many subscribers pay up front, and receive the product over time. This creates a situation in which the amount is recorded as unearned revenue or, as Morningstar calls it, deferred revenue. At the end of the first quarter of 2018, Morningstar had USD205.8 million in unearned revenue. This is up from USD187.9 million from the year-ago period. The company classifies the revenue as a short-term liability, meaning it expects the amount to be paid over one year. Although unearned revenue can provide clues into future revenue, investors should note the balance change could be due to a change in the business. Morningstar increased quarterly and monthly invoices, and is less reliant on up-front payments from annual invoices, meaning the balance has been growing more slowly than in the past. Unearned Revenues:- a liability account that reports amounts received in advance of providing goods or services. When the goods or services are provided, this account balance is decreased and a revenue account is increased. Unearned Revenue is prepaid revenue. In essence, the customer pays in advance for services that have not yet been performed by the recipient of the payment. This is advantageous from a cash flow perspective for the seller, who now has the cash to perform the required services. Is Unearned Revenue an Asset or a Liability? Unearned revenue is a liability for the recipient of the payment, so the initial entry is a debit to the cash account and a credit to the unearned revenue account. Accounting for Unearned Revenue:- As a company earns the revenue, it reduces the balance in the unearned revenue account (with a debit) and increases the balance in the revenue account (with a credit). The unearned revenue account is usually classified as a current liability on the balance sheet. If a company were not to deal with unearned revenue in this manner, and instead recognize it all at once, revenues and profits would initially be overstated, and then understated for the additional periods during which the revenues and profits should have been recognized. This is also a violation of the matching principle, since revenues are being recognized at once, while related expenses are not being recognized until later periods. Examples of Unearned Revenue:- Examples of unearned revenue are:- (i) a rent payment made in advance; (ii) a services

contract paid in advance; (iii) a legal retainer paid in advance; and (iv) prepaid insurance. Also known as Prepaid Revenue. Xxxxx. Unearned Revenue (also known as Deferred Revenue or Deferred Income) represents revenue already collected but not yet earned. Hence, they are also called Advances From Customers. Following the accrual concept of accounting, unearned revenues are considered as liabilities. It is to be noted that under the accrual concept, income is recognized when earned regardless of when collected. And so, unearned revenue should not be included as income yet; rather, it is recorded as a liability. This liability represents an obligation of the company to render services or deliver goods in the future. It will be recognized as income only when the goods or services have been delivered or rendered. At the end of the period, unearned revenues must be checked and adjusted if necessary. The adjusting entry for unearned revenue depends upon the journal entry made when it was initially recorded. There are two ways of recording unearned revenue:- (i) the liability method; and (ii) the income method. Xxxxx. Unearned Revenue, also called Deferred Revenue, is the liability or amount of money owed for payment of goods or services by a customer before the goods or services have been delivered to that customer. In other words, if a customer pays for a good or service before the company delivers it, the company has to recognize that it owes the customer for that good or service. What Does Unearned Revenue Mean? What is the definition of unearned revenue? GAAP requires businesses to use the accrual basis of accounting. This means that all revenues are recorded when earned regardless of when the cash is actually received. In other words, a customer who buys a shirt on December 31 and pays for in on January 01 is considered to have bought the shirt on December 31. The retailer records a December sale. This concept also applies for customers who put down deposits on sales. Since the good or service hasn't been delivered or performed yet, the company hasn't actually earned the revenue. It records a liability until the company delivers the purchased product. Let's take a look at an example. Example:- A good example of deferred revenue is a magazine subscription. Usually you pay for a 12-month magazine subscription upfront, but you don't actually receive all of the magazines right away. You receive one magazine a month until the end of the year. This is considered unearned income to the company until it delivers all 12 months of magazines. Instead of recording revenue when the magazine subscription is purchased, the company records unearned revenue in a liability account. When the magazines are delivered and the subscription is fulfilled, the deferral account is zeroed out to the revenues account. Define Unearned Revenue:- Unearned Revenue is a customer payment that a business recognizes as a liability because it is received before the goods or services are delivered to the customer. Xxxxx. Unearned Revenue is the same thing as deferred revenue. In accounting, unearned revenue is a liability. It is a liability because even though a company has received payment from the customer, the money is potentially refundable and thus not yet recognized as revenue. Unearned Revenue Basics:- Unearned revenue occurs when a company sells a good or service in advance of the customer receiving it. Customers often receive discounts for paying in advance for goods or services. Unearned revenue is an important concept in accounting because the company cannot recognize the revenue until it provides the good or service to the customer who paid for it. The line item 'Unearned Revenue' or 'Deferred Income' gives the company a place to recognize that the cash payment has come in but the company has deferred the revenue recognition until a later date. Examples of Unearned Revenue:- An example of unearned revenue might be a publishing company that sells a two-year subscription to a magazine. The liability arises from the fact that the company has collected money for the subscription but has not yet delivered the magazines. Another example of unearned revenue is rent that a landlord collects in advance. Accounting for Unearned Revenue:- When the transaction occurs, such as a publishing company selling a magazine subscription, the journal entry includes a debit to cash and a credit to unearned revenue. The income statement, or statement of earnings, does not reflect that the company has made a sale until it has earned the income by delivering the magazines to the customer. Yet, the balance sheet, or statement of financial position, would show that the company increased its cash asset at the same time it incurred a liability for the transaction, as it still has to deliver the magazines to the customer. Unearned Revenue vs. Earned Revenue:- Once the company performs the service the customer has paid for, the company enters another journal entry to recognize the revenue. For example, as a publishing company delivers the magazines a customer with a two-year subscription has paid for, the journal entry shows a credit to revenue and a debit to unearned revenue. In this way, the company converts the unearned revenue to 'real' or 'earned' revenue. / Американская корпорация Мониньстар, Инк. (Morningstar, Inc.), занимающаяся исследованиями в сфере международных инвестиций и управления инвестициями. Незаработанные Доходы (Unearned Revenues):- доходы, полученные авансом; полученные средства за товары, ещё не поставленные покупателю, и услуги, ещё не оказанные, в течение отчётного периода; является счётом обязательств. Называются также Отсроченными Выручками (Deferred Revenues), и Авансы От Потребителей (Advances From Customers).

UNECE = UNITED NATIONS ECONOMIC COMMISSION FOR EUROPE

UN/EDIFACT = UNITED NATIONS/ELECTRONIC DATA INTERCHANGE FOR ADMINISTRATION, COMMERCE AND TRANSPORT

UNEMPLOYED or UNEMPLOYMENT = БЕЗРАБОТНЫЕ или БЕЗРАБОТИЦА – Unemployed or Unemployment:- xxxxx. / Безработные или Безработица (Unemployed or Unemployment):- состояние пребывания без работы не по своей воле. Система страхования безработицы на уровне федерации – штата выплачивает пособия уволенным рабочим наличными деньгами. Большинство штатов выплачивает пособия максимум 26 недель. Есть штаты, где платят немного дольше. В периоды особенно высокой безработицы в некоторых штатах пособия должны выплачиваться на протяжении ещё 13 недель. Эти 'продлённые' пособия выплачиваются совместно – примерно половина поступает из фондов штата и половина – из федеральных источников. Для получения права на пособие, необходимо, чтобы человек ранее имел работу и активно искал новую. Безработные обращаются за пособием и получают его от Департамента Труда (Department of Labor) своего штата. За исключением тех штатов, где работникам платят мало, система финансируется за счёт налога, взимаемого с заработной платы, которую выплачивает работодатель.

UNEMPLOYMENT = БЕЗРАБОТИЦА – Unemployment:- unavailability of jobs for persons who are willing and able to work at the prevailing wage rate. Frictional Unemployment is not the result of disequilibrium in the supply and demand of jobs, but is due to inadequate mobility or qualifications of the work force:- unemployed either lack the qualifications to fill the jobs offered, or do not live in the areas where the jobs are available. Structural or Technological Unemployment is created by changes in economic structures, e.g., a decline in jobs in the coal mining industry. Cyclical Unemployment is the most severe form of unemployment and arises during times of economic crisis. A new form of unemployment, called Voluntary Unemployment, is emerging in countries where unemployment benefits are high and compensate for the loss of wages; workers may therefore choose unemployment, rather than look for a job. Unemployment is a situation which exists when members of the labor force wish to work at the prevailing wage or salary rates for their skills, but cannot get a job. The concept thus refers to 'involuntary' unemployment only, rather than the voluntary decision of someone to choose leisure (or productive activity outside the cash economy such as housewifery) rather than gainful employment at prevailing rates of pay. Most post-World War II governments have made it a major goal of their economic policies to keep total unemployment in their national economies at relatively low levels (subject to certain practical constraints and trade-offs imposed by their pursuit of other important goals such as economic growth, low inflation, competitiveness in international trade, and so on). Unemployment:- the condition of one who is capable of working, actively seeking work, but unable to find any work. It is important to note that to be considered unemployed a person must be an active member of the labor force and in search of remunerative work. Underemployment

is the term used to designate the situation of those who are able to find employment only for shorter than normal periods – part-time workers, seasonal workers, day or casual workers. The term may also describe the condition of workers whose education or training make them overqualified for their jobs. Statistics on unemployment are collected and analyzed by government labor offices in most countries and have come to be considered a chief indicator of economic health. Trends in unemployment and statistical differences among groups in the population are studied for what they may reveal of general economic trends and as bases for possible governmental action. Full employment has been a stated goal of many governments since World War II, and a variety of programs have been devised to attain it. It should be pointed out that full employment is not necessarily synonymous with a zero unemployment rate, for at any given time the unemployment rate will include some number of persons who are between jobs and not unemployed in any long-term sense. In the United States an unemployment rate of 2 percent is often cited as a 'base' rate. Unemployment is an inability to find work although it is actively sought. Theoretically the unemployed are those members of the active labor force who are out of work, although in most cases statistics are based on the number of people claiming jobseeker's allowance. Unemployment has been a persistent problem in industrial economies during recession over the last 200 years. Unemployment is an inability of workers who are ready, able and willing to work to find employment. Unemployment is usually expressed as a percentage of the labor force. Classical Unemployment is an Unemployment caused by wages being too high relative to productivity, so that the firms in an economy cannot profitably employ all the labor on offer at these real wages. Cyclical Unemployment exists when the level of aggregate demand in the economy is less than that required to maintain full employment. Demographic Unemployment is an Unemployment whose immediate cause is changes in the composition of the labor force. Frictional Unemployment:- a minimal level of unemployment that will occur in even the most efficient economy. Keynesian Unemployment is an Unemployment due to lack of effective demand for goods and services which people could have been employed to produce. Keynesian unemployment can be reduced by the use of monetary or fiscal policy to increase effective demand. Residual Unemployment:- the number of people in an economy that remain unemployed, even when there is full employment. Seasonal Unemployment is an unemployment due to seasonal variations in the demand for labor. Some occupations have large seasonal variations, for example agriculture and tourism. Structural Unemployment exists when jobs are available and workers are seeking jobs, but they cannot fill vacancies. Technological Unemployment exists when workers are replaced by machines faster than they can find alternative employment. Transitional Unemployment is an unemployment due to a major change in the way an economy is organized. This could apply to conversion from a wartime to a peacetime economy, industrialization of less developed countries, or a shift from central planning to a market economy. In any major change it is likely that managers and skilled workers will be needed to set up new systems and production facilities earlier than less skilled workers are needed to operate them. Unemployment is the inability to find paid work when one is willing and able to perform work. Unemployment can be measured through official registration to claim unemployment benefit, or through self-assessment in a survey. The latter generally produces a higher count. The unemployment rate is the unemployed as a percentage of the total workforce, defined as the employed plus the unemployed. The period since the late 1970s has been one of continuous high unemployment in most developed economies and this has had an important impact on the conduct of . Unemployment is an inability to obtain a job when one is willing and able to work. This can be measured in two ways:- official registration with a state agency, which carries some form of income support, and through the self-assessment of a random sample of the population. Self-assessment generally produces higher figures. See also Classical Unemployment; Cyclical Unemployment; Demographic Unemployment; Disguised Unemployment; Frictional Unemployment; Hidden Unemployment; Involuntary Unemployment; Keynesian Unemployment; Long-Term Unemployment; Natural Rate Of Unemployment; Residual Unemployment; and Seasonal Unemployment. / , например, уменьшение рабочих мест в угольной добывающей промышленности. Безработица (Unemployment):- невозможность найти работу, хотя активные её поиски предпринимаются. Теоретически безработными считаются те, кто, пребывая в трудоспособном возрасте, не имеет работы, хотя в большинстве случаев статистика учитывает только людей, получающих пособие по безработице. Во время экономического спада (recession) безработица была постоянной головной болью промышленно развитых стран на протяжении последних 200 лет. Решение проблемы безработицы путём государственного вмешательства, предложенное Британским экономистом Дьжоном Мэйнадом Кейнзом (John Maynard Keynes; 1883–1946) в 1930, казалось, имело успех в послевоенный период; однако с тех пор кейнсианство утратило свою теоретическую и практическую привлекательность во многом благодаря тому, что правительства стали рассматривать в качестве приоритетной задачи контроль над инфляцией и начали сомневаться в своих способностях контролировать безработицу в долгосрочном плане (Смотрите Кривая Филипса (Phillips Curve); в честь Новозеландского экономиста Олбэна Вильэма Хаусго 'Била' Филипса (Alban William Housego 'Bill' Phillips; 1914–1975)). В 1980-х безработица снова стала проблемой большинства Западных стран, а взгляды экономистов на возможные её решения разошлись как никогда. Смотрите также Вынужденная Безработица (Involuntary Unemployment); Показатель Нормы Безработицы, Не Ведущей К Усилению Инфляции (NAIRU); Естественный Уровень Безработицы или Естественная Ставка Безработицы (Natural Rate Of Unemployment); и Сезонная Безработица (Seasonal Unemployment). Под Безработицей понимается не зависящее от воли работника приостановление трудовой деятельности на длительный срок по причине невозможности трудоустройства, как правило, вследствие расторжения трудового соглашения между лицом наёмного труда и нанимателем. И, следовательно, безработица выступает как явление, содержание которого состоит в том, что для определённой части экономически активного населения сложилась ситуация полного отсутствия работы в определённый момент времени. Безработица выступает объективным фактором экономической жизни. Её появление стало возможным только с появлением института наёмного труда. Безработица, явление, присущее капиталистическому общественному строю, когда часть трудящихся не может найти себе работу, становясь 'излишним' населением, резервной армией труда. Как социально-экономическое явление безработица порождается действием открытого Немецким философом и экономистом Калем Максом (Karl Marx; 1818–1883) всеобщего закона капиталистического накопления и является продуктом и условием капиталистического производства. Участь 'излишних' людей первыми в истории капитализма испытали трудящиеся ныне экономически развитых стран Европы, особенно Англии (начало XIX века). Выступления пролетариата против безработицы в те времена носили стихийный характер. С переходом капитализма в империалистическую стадию массовая безработица выступает как неотъемлемая черта экономики уже большинства капиталистических стран и во времена кризисов перепроизводства охватывает почти все отрасли хозяйства. С наступлением общего кризиса капитализма массовая безработица в экономически развитых капиталистических странах становится хронической. Внешне безработица выглядит как результат несоответствия между спросом капиталистического рынка на рабочую силу и её предложением, но фактически является следствием более глубоких внутренних причин (смотрите Промышленная Резервная Армия). Стремление к наибольшей прибавочной стоимости и конкурентная борьба заставляет предпринимателей вооружать живой труд, увеличивать средства производства быстрее, чем переменный капитал. Так, в США с 1869 по 1919 число рабочих в промышленности выросло в 4 раза, продукция увеличилась в 13 раз, а стоимость капитала – в 23 раза. Особенно быстрое относительное уменьшение переменного капитала вызывается научно-технической революцией в производстве. Нередко это порождает и абсолютное сокращение спроса на труд. К тому же, чем продолжительнее рабочий день и чем сильнее напряжённость работы, тем меньше требуется лиц наемного труда, чтобы привести в движение имеющиеся средства производства. 'Чрезмерный труд занятой части рабочего класса увеличивает ряды его резервов ...' (Каль Макс, 'Капитал', Т. 1, 1955, С. 641–642). Периодические экономические кризисы капиталистического производства

усиливают действие тех факторов, которые относительно уменьшают спрос на труд. Увольнения массы рабочих – прямое ухудшение положения трудящихся – заставляют оставшихся на производстве идти на предлагаемые условия их эксплуатации, что ещё более снижает жизненный уровень всего рабочего класса. Диалектика капиталистического способа производства такова, что ‘избыточное’ трудящееся население – продукт капиталистического накопления, становится рычагом этого накопления и даже условием существования и развития капитализма. ‘... Избыточное население ... составляет необходимую принадлежность капиталистического хозяйства, без которой оно не могло бы ни существовать, ни развиваться’ (Владимир Ильич Ленин (1870–1924), Полное Собрание Сочинений, 5 Издание, Т. 2, С. 173). Часть ‘излишнего’ населения служит для капитала резервом дешёвой рабочей силы. А это при неравномерном циклическом развитии капиталистической экономики становится для буржуазии жизненно необходимым и облегчает выход из кризиса. Сам факт массовой безработица вызывает у каждого работающего пролетария боязнь оказаться в рядах безработных. Капитализм использует этот страх, и чем больше безработица, тем сильнее капитал наступает на рабочих, прибегая к повышению налогов, к инфляции, к так называемой рационализации производства, к сверхурочным работам, ‘дополнительной’ оплате в выходные и праздничные дни. Таким образом, безработица в капиталистическом обществе в силу классовых противоречий имеет двоякую сущность. Для капиталистов она – резерв дешёвой и зачастую бесправной рабочей силы, средство для усиления эксплуатации всего рабочего класса, необходимое условие существования и развития капиталистической экономики. Для трудящихся же безработица – это одни лишь материальные, физические и моральные страдания и лишения, преждевременная старость. По формам безработица подразделяется:- на текучую, скрытую и застойную. Точного учёта безработных не существует. Применяемая буржуазной политэкономией и статистикой методология определения форм безработицы, а также их способ подсчёта 245 ‘излишних’ людей преуменьшают действительные размеры безработицы. Буржуазные экономисты различают ‘полную’ и ‘неполную’ (частичную) безработицы в зависимости от срока пребывания без работы (в США, например, полностью безработными считаются те, кто не имел никакой работы в течение недели и более; те же, кто получил работу хотя бы на 1 час в неделю, уже не считаются безработными). Сведения о безработице, содержащиеся в изданиях Международной Организации Труда (МОТ), основаны на официальных публикациях национальных статистик. Эти сведения, по свидетельству экспертов МОТ, сильно расходятся по полноте и достоверности, что зависит от источников информации, от применяемых методов её сбора и обработки и от принятого в той или иной стране определения понятия ‘Безработный’. Данные по отдельным странам как правило, несопоставимы между собой. Более того, даже в пределах одной страны нередко существует несколько систем статистики безработицы. Так, в США только одних правительственных систем три:- данные Бюро Переписи (Министерство Торговли), Бюро Обеспечения Занятостью и Бюро Статистики Труда (Министерство Труда). В Италии – две статистики безработицы:- в Министерстве Труда и в Институте Статистики Труда. Несмотря на эти и другие недостатки буржуазной статистики, приходится пользоваться ею, так как иных систематических подсчётов ‘избыточного’ населения нет. Данные отдельных прогрессивных профсоюзов, хотя и вносят существенные коррективы в статистику безработицы не могут в полной мере восполнить пробел. Безработица – постоянный спутник капиталистической экономики. Во всех экономически развитых капиталистических странах масштабы ‘излишних’ трудовых ресурсов за рассматриваемый период либо оставались на одном уровне, либо в отдельные годы даже возрастали. Наибольшая тяжесть от безработицы выпала на долю рабочего класса США. Приведённые в таблице цифры не охватывают полубезработных, а число их весьма велико:- в США, например, по официальным подсчётам, – в среднем 2.5–3 миллиона человек в год. В 1967–69 в индустриально развитых странах капитализма безработица сохранялась на уровне 6–7 миллионов человек. Обнаруживаемая в 1960-х тенденция к увеличению безработицы обусловливается и некоторыми демографическими особенностями ряда Европейских стран (большие потери в людях – убитыми и искалеченными – в период 2-й Мировой Войны 1939–45, низкая рождаемость). На безработицу влияют и экономические циклы. В 1960-х капиталистическая Европа и Япония не переживали больших спадов производства. Однако в отдельные годы Англия, Италия, ФРГ и отчасти Франция и Япония испытывали кризисные явления, некоторое замедление темпов развития и определённые спады. Изменения в развитии капиталистического цикла в современный период, а также ускоренное развитие непроизводственной сферы, вобравшей в себя большие людские резервы, в свою очередь влияют на состояние безработицы. Воздействие на безработицу оказывают научно-техническая революция, ведущая в условиях капиталистического способа производства к увольнению массы рабочих и служащих, и конкретные соотношения классовых сил в отдельных странах. Учитывая сравнительно высокую организованность и сплочённость пролетариата своих стран, а также наличие социалистических государств, правящие классы в странах Западной Европы и Японии стремятся не допускать расширения масштабов безработицы до таких пределов, когда она становится для них социально опасной. На рынок рабочей силы в Западной Европе влияет государственно-монополистическая интеграция, позволяющая монополиям более эффективно использовать рынок рабочей силы охваченных этой интеграцией стран. Серьёзную проблему современной безработицы представляет наличие ‘излишнего’ населения в экономически бедствующих или депрессивных районах. Такие районы имеются в США, Англии, Италии, Франции и других странах. Как правило, ими становятся центры старых отраслей промышленности – угольной, металлургической, текстильной, ряда машиностроительных отраслей. Многие хронически безработные в этих районах, обычно не учитываемые официальной статистикой, превратились в своём большинстве в настоящих пауперов. Публикуемые МОТ сведения о безработице по отдельным развивающимся странам Азии, Африки, Центральной и Южной Америки, где безработица имеет главным образом форму аграрного перенаселения, ещё более неполны и неточны. Экономическая отсталость этих стран, феодальные пережитки и зависимость хозяйства многих из них от империализма накладывают свой отпечаток на процесс разорения и обнищания мелких производителей, на структуру относительного перенаселения. И в этих странах решение проблемы безработицы упирается в господствующие там социально-экономические условия. Лишь устранение зависимости от империализма и ликвидация феодальных пережитков и реакционных режимов могут привести к быстрому развитию экономики, в том числе и к решению проблемы безработицы. В ряде стран Азии и Африки, завоевавших государственную независимость, приняты некоторые меры, ослабляющие последствия безработицы. Например, трудовое законодательство Бирмы и Цейлона упорядочивает наём и увольнение работников, что несколько ограничивает произвол предпринимателей. Такое вмешательство государств и их содействие экономическому прогрессу также в известной мере смягчают бремя безработицы. Безработица особенно с 1930-х стала серьёзной угрозой самому существованию капиталистической системы. Социальная острота проблемы вызвана в первую очередь появлением в мире стран социализма и изменением в соотношении классовых сил как внутри капиталистических стран, так и на мировой арене. В 1960–70-е безработица, несмотря на сравнительно небольшие масштабы по отношению к общей численности наёмных работников, имеет большую социальную и политическую остроту. В то же время, с экономической точки зрения, безработица не играет для крупного капитала, как это было прежде, роли крупного резерва необходимой ему рабочей силы. В эпоху быстрого научно-технического прогресса подавляющее число безработных по уровню своей подготовки не может удовлетворить требований современного производства. Учитывая социальную опасность борьбы рабочего класса за свои жизненные интересы, буржуазные государства в последние 30 лет (по данным на 1980) пытались регулировать рынок рабочей силы, применяя, в частности, различные системы помощи безработным, в том числе и страхование на случай безработицы. В экономически развитых

странах капитала действует та или иная система помощи и с этой целью созданы специальные фонды. Они образуются прямо или косвенно самими трудящимися. В связи с многими ограничениями пользоваться ими могут меньше половины безработных. Так, в США в 1961 пользовалось пособиями лишь 45% безработных. Размер взносов предпринимателей в эти фонды сравнительно невелик. Выплачиваемые пособия и вся сумма помощи безработным возмещают лишь малую долю денежных и материальных потерь трудящихся:- в США с 1950 эти пособия не превышали в среднем 1/6–1/7 части потерянной от безработицы зарплаты. Общий же ущерб, который безработица наносит рабочему классу и всему обществу, настолько значителен, что не поддаётся исчислению. По официальным данным, США потеряли в результате безработицы с 1929 по 1966 более 9.5 миллиардов человеко-недель труда, из них около 3.5 миллиарда – после войны. Основной урон понесли от безработицы трудящиеся:- с 1929 по 1966 они потеряли примерно 500 миллиардов Долларов в зарплате (в ценах 1957–59), причём около 230 миллиардов Долларов (в тех же ценах) с 1946 по 1966. Эти подсчёты не охватывают полубезработицу. К тому же отсутствие работы – это не только денежный урон, но и деквалификация, и отставание в приобретении общих и профессиональных знаний, и непоправимый моральный ущерб как для самого трудящегося и членов его семьи, так и для общества в целом. В послевоенный период выступления пролетариата в США, Англии, Италии, Японии и других странах были непосредственно связаны с безработицей. Обычно борьба рабочих и служащих проходит в виде стачек. Одно из главных требований бастующих рабочих – воспрепятствовать капиталистическим монополиям выбрасывать на улицу ‘лишнюю’ рабочую силу. В Англии в одном только 1960 против массовых увольнений бастовали шахтёры, автостроители, рабочие химической промышленности; осенью 1962 против безработицы объявили всеобщую стачку железнодорожники, затем бастовали машиностроители и судостроители; в 1966–67 – автостроители. В забастовочную борьбу включается, также многомиллионная армия служащих капиталистических предприятий, в том числе государственных и муниципальных. Вопросы, связанные с безработицей, стоят в центре внимания профсоюзов. Некоторые профсоюзы в коллективных договорах с компаниями требуют гарантированной работы и других льгот. Однако борьба только со следствиями безработицы, а не против порождающих её причин и условий не способна ликвидировать безработицу и все тяготы, связанные с ней. Капиталистическое перенаселение, как показал исторический опыт, исчезает только вместе с падением господства капитала и созданием общества, где основные средства производства и система распределения находятся в руках народа. В капиталистических условиях профсоюзы и стачки, подчёркивал Владимир Ильич Ленин, бессильны помочь, когда товар – рабочая сила не находит спроса, ‘... бессильны изменить те условия, которые превращают рабочую силу в товар, осуждают массы трудящихся на самую тяжёлую нужду и безработицу. Чтобы изменить эти условия, необходима революционная борьба со всем современным общественным и политическим строем ...’ (Полное Собрание Сочинений, 5 Издание, Т. 5, С. 16). Безработица В Дореволюционной России:- Характер безработицы в дореволюционной России по существу ничем не отличался от безработицы других капиталистических стран. Однако отсутствие статистики безработных не давало возможности определить хотя бы приблизительно их количество в среднем за какой-либо год. Колебания числа безработных в промышленности, в отдельных городах были весьма значительны. Обострение безработицы наблюдалось в 1904–13 (Русско-Японская Война, хозяйственные кризисы, революционные события кануна 1-й Мировой Войны). Так, в Петербурге безработные составляли примерно 2% ко всему населению (1911), в Москве 1.8% (1912), Баку 2.5% (1913). В зимний сезон в период 1900–13 количество безработных достигало полумиллиона. В годы 1-й Мировой Войны 1914–18 ощущались как недостаток в рабочей силе (вследствие мобилизации около 15 миллионов мужчин), так и известный рост безработицы за счёт населения, бежавшего с театра военных действий (беженцы). Ликвидация Безработицы В Бывшем СССР:- С установлением социализма, природа которого исключает относительное перенаселение, безработица ликвидируется. В бывшем СССР в 1920-е в связи с разрухой, вызванной 1-й Мировой Войной, иностранной военной интервенцией и Гражданской Войной, безработица была ещё значительна (на 01 Января 1923 – 641 000, на 01 Августа 1926 – 1 030 000). Советское государство оказывало большую помощь безработным, принимало решительные меры к устранению безработицы. К концу 1930 в результате победы социализма в СССР безработица была полностью ликвидирована. Неуклонно развивающееся хозяйство СССР и других социалистических стран требует систематического пополнения рабочей силы. Экономическое развитие этих стран идёт более быстрыми темпами и в больших масштабах, чем увеличивается трудоспособное население. Высокие и устойчивые темпы хозяйственного и культурного строительства обеспечивают в социалистических странах полную и эффективную занятость населения.

UNEMPLOYMENT INSURANCE = СТРАХОВАНИЕ ОТ БЕЗРАБОТИЦЫ – Unemployment Insurance is a form of social insurance designed to compensate certain categories of workers for unemployment that is involuntary and short-term. Unemployment insurance programs were created primarily to provide financial assistance to laid-off workers during a period deemed long enough to enable them to find another job or be rehired at their original job. In most countries, workers who have been permanently disabled or who have been unemployed for a long period of time are not covered by unemployment insurance but are usually covered by other plans. In such countries as Canada, Germany, Israel, Norway, and the United Kingdom, all occupations are covered; the United States denies coverage to farm workers, domestic servants, workers who have been employed only briefly, government workers, and most self-employed workers; such countries as Austria, Ireland, and Japan exclude public employees. Benefits vary from one legal jurisdiction to another. In most countries the benefits are related to earnings; a few countries pay a flat rate to all beneficiaries. In addition, benefits are usually paid only for a limited period of time. Funding for unemployment insurance varies from country to country. Employers or employees may be taxed specifically for unemployment insurance, or funding may come out of general government revenues.

UNEMPLOYMENT RATE = УРОВЕНЬ БЕЗРАБОТИЦЫ (или СТАВКА БЕЗРАБОТИЦЫ) – Unemployment Rate is a measure of the extent of unemployment in the labor force at some particular time, expressed as a percentage of the total available labor force. Nearly all national governments now have some statistical agency or department charged with gathering the necessary data and estimating the unemployment rate at frequent intervals (monthly or quarterly) for the guidance of policy-makers. In broad terms the underlying concepts are pretty similar from one country to the next:- the number of people classified as unemployed is to be divided by the number of people classified as being in the available labor force, with the result expressed in percentage terms. However, differences from country to country in classification rules and practical data collection methods used for estimating both the numerator and the denominator of this fraction make precise international comparison of unemployment rates very difficult, if not impossible. The use of jobless totals derived from the agencies that distribute unemployment insurance benefits is particularly suspect but nevertheless widely practiced by some countries’ official statistical agencies. For example, some people may falsely claim they would accept a job offer at current wage rates when in fact they are making no effort (or only a token show of effort) to locate such a job, misreporting their intentions so that they may continue to draw unemployment benefits for a time. Other people may be actively, even desperately, seeking a job and yet not show up in such a count because they are technically ineligible for unemployment benefits (perhaps through lack of previous work experience or through having exhausted the time-limit) and so do not bother to report the success or failure of their job-hunting efforts to the government unemployment office. Well-designed sample surveys of the population or of employers have much better validity for measuring the true unemployment rate but still have credibility problems of their own. For example, hundreds of thousands or even millions of people who are really gainfully employed but whose work is in illegal activities – such as bootlegging,

prostitution, drug-dealing, loan-sharking, illegal gambling operations, smuggling, or simply working conventional trades 'off the books' to avoid taxes – cheerfully deny having a job when questioned by government pollsters in suits who might well inform on them to the police. Unemployment Rate is the percentage of the labor force that is unemployed and actively seeking a job. Unemployment Rate is the percentage of the people classified as unemployed as compared to the total labor force. / Ставка Безработицы или Уровень Безработицы:- доля гражданской рабочей силы, которая активно ищет, но не может найти работу. Уровень (в %) определяется Департаментом Труда США (US Department of Labor) совместно с департаментами по труду всех штатов и публично объявляется в первую Пятницу каждого месяца. На уровень безработицы влияет число людей, вливающихся в рабочую силу, а также число безработных. Важную часть отчёта Департамента Труда составляет доклад Занятость по Данным Платёжных Ведомостей (Payroll Employment), который включает данные о рабочем времени, заработной плате и занятости в несельскохозяйственных отраслях промышленности в масштабе страны с разбивкой по штатам и крупным метрополиям. Доклад о безработице является одним из отчётов правительства, который привлекает больше всего внимания, потому что даёт наиболее ясное представление об эффективности управления экономикой. Растущий уровень безработицы изучается аналитиками и Федеральным Резервом (Federal Reserve) и рассматривается как признак слабеющей экономики. Результаты этого отчёта могут заставить Федеральную Резервную Систему ослабить кредитно-денежную политику. Снижение уровня безработицы показывает, что экономика растёт, и это может породить у Федеральной Резервной Системы страх перед более высоким уровнем инфляции, и в результате могут быть установлены более высокие процентные ставки.

UNENCUMBERED = НЕОБРЕМЕНЁННОЕ – Unencumbered:- property that is not subject to any claims by creditors. For example, securities bought with cash instead of on margin and homes with mortgages paid off. / Необременённое (Unencumbered):- собственность, свободная от любых требований (претензий) кредиторов, не заложенная собственность. Например, когда домовладелец полностью выплачивает свой ипотечный заём, его дом становится свободным от долгов. Ценные бумаги, приобретённые за наличные, а не под залог (margin), свободны от претензий кредиторов.

UNENFORCEABLE CONTRACT = КОНТРАКТ, НЕ ИМЕЮЩИЙ ПРАВОВОЙ ЗАЩИТЫ (или ХХ) – Unenforceable Contract is a contract that is valid, but which the court will not enforce because of some defect such as nondisclosure, an extraordinary event or other legislation.

UNEP = UNITED NATIONS ENVIRONMENT PROGRAMME

UNEP–GRID = UNITED NATIONS ENVIRONMENT PROGRAMME–GLOBAL RESOURCES INFORMATION DATABASE

UNEQUAL = НЕРАВНОЕ (или НЕОДНОЗНАЧНОЕ, или НЕОДИНАКОВОЕ) – Unequal:- asymmetrical.

UNEQUAL TREATY = НЕРАВНЫЙ ТРАКТАТ (или НЕРАВНОПРАВНЫЙ ТРАКТАТ) – Unequal Treaty:- in Chinese history, any of a series of treaties in which China was forced to concede many of its territorial and sovereignty rights. They were negotiated during the XIX and early XX centuries between China and foreign imperialist powers, especially Great Britain, France, Germany, the United States, Russia, and Japan. Patterned largely on the terms of an accord in 1835 between China and the khanate of Kokand, the Unequal Treaties were initiated by the trading conflict between Britain and China known as the first Opium War (1839–42), which was terminated by the Treaty of Nanking (August 29, 1842). Under the terms of this agreement, China paid the British an indemnity, ceded the territory of Hong Kong, and agreed to establish a 'fair and reasonable' tariff. Moreover, British merchants, who were previously allowed to trade only at the South China port of Canton, were now to be allowed to trade at five ports (called treaty ports), including Canton and Shanghai. The agreement was supplemented the following year by the British Supplementary Treaty of the Bogue (October 08, 1843), which granted British citizens in China extraterritorial rights, by which they were to be under the control of their own consuls and were not subject to Chinese law. It also included a most-favored-nation clause, guaranteeing to Britain all privileges that China might grant to any other power. Over the next few years China concluded a series of similar treaties with other powers; the most important treaties were the Treaty of Wanghia with the United States and the Treaty of Whampoa with France (both 1844). Each additional treaty expanded upon the rights of extraterritoriality, and as a result the foreigners obtained an independent legal, judicial, police, and taxation system within the treaty ports. Following the defeat of China by Britain and France in the second Opium War (1856–60), a new series of agreements was negotiated. The resulting treaties of Tientsin (1858) supplemented the old treaties by providing for the residence of foreign diplomats in Peking, the right of foreigners to travel in the interior of China, the opening of the country's major waterway, the Yangtze River, to foreign navigation, permission for Christian missionaries to propagate their faith, legalization of opium importation and the coolie trade, and the opening of 10 new ports to foreign trade and residence. Russia, meanwhile, signed a separate agreement, the Treaty of Aigun (May 16, 1858), by which Russia would have jurisdiction over the lands north of the Amur River from its junction with the Argun River to the Tatar Strait, China would control the lands south of the Amur from the Argun to the Ussuri River, and the territory east of the Ussuri to the Sea of Japan would be held in common. According to the treaty, only Russian and Chinese vessels would have been permitted to navigate the Amur, Ussuri, and Songhuajiang rivers. In 1860, after the Chinese had failed to ratify these treaties, the British and French resumed the war, captured Peking, and forced the Chinese to sign the Peking Convention, in which they agreed to carry out the initial settlements. Other Western nations again exacted similar agreements. The Chefoo Convention, negotiated with Britain in 1876 (although not ratified by Britain until 1885) following the murder of a British explorer by Chinese nationals, resulted in more Chinese concessions and the opening of several new ports. (See also Opium Wars.) By the Treaty of Peking (November 14, 1860), Russia attained what it had sought in the unratified Treaty of Aigun; Russia was also given jurisdiction over the lands east of the Ussuri and south of Lake Khanka, which included the settlement of Vladivostok. In 1885 another Treaty of Tientsin concluded the Sino-French War and ceded Annam (now in Vietnam) to France, while the Treaty of Shimonoseki, signed in 1895 following the Sino-Japanese War, ceded Taiwan and the Pescadores to Japan, recognized the independence of Korea, and provided for the opening of still more ports as well as the right of Japanese nationals to operate factories inside China. The Boxer Protocol, signed in 1901 following China's unsuccessful attempt to expel all foreigners from the country during the Boxer Rebellion, provided for the stationing of foreign troops at key points between Peking and the sea. After the Russian Revolution, the Soviet government terminated most of the privileges gained by tsarist Russia under the Unequal Treaties. Between 1928 and 1931 the Chinese Nationalists succeeded in persuading the Western powers to return tariff autonomy to China, but extraterritorial privileges were not relinquished by Britain, France, and the United States until 1946. The British relinquished their rights in Hong Kong in 1997, and the Portuguese did the same in Macau in 1999, after both countries had concluded agreements with China. / Трактат Бог (Treaty of the Bogue). Трактат Ваньгия (Treaty of Wanghia). Трактат Вэмпоэ (Treaty of Whampoa). Трактаты Тчинцин (treaties of Tientsin). Конвенция Чэфу (Chefoo Convention). Трактат Эйган (Treaty of Aigun).

UNEQUAL VOTING = НЕРАВНОЕ ГОЛОСОВАНИЕ (или НЕОДНОЗНАЧНОЕ ГОЛОСОВАНИЕ) – Unequal Voting:- these provisions limit the voting rights of some shareholders and expand those of others. Under time-phased voting, shareholders who have held the stock for a given period of time are given more votes per share than recent purchases. Another variety is the substantial shareholder provision, which limits the voting power of shareholders who have exceeded a certain threshold of ownership.

UNESCO = UNITED NATIONS EDUCATIONAL, SCIENTIFIC AND CULTURAL ORGANIZATION

UNESPA = UNIÓN ESPAÑOLA DE ENTIDADES ASEGURADORAS Y REASEGURADORAS

UNEVEN APPEARANCE = НЕРАВНОМЕРНЫЙ ВНЕШНИЙ ВИД (или НЕРАВНОМЕРНОЕ ПРОЯВЛЕНИЕ) – Uneven Appearance:- a fabric that is unacceptable in terms of overall character. Note:- this defect may be due to numerous small blemishes, e.g., uneven yarn, small slubs, that individually would not constitute a fault. Uneven Appearance:- Fabric:- spun-rayon broadcloth; Construction:- (i) Count:- 110 x 90; (ii) Warp:- 50/1 1%-in. l-den. bright viscose rayon; (iii) Filling:- same as warp; Finish:- plain dyed beige. Defect:- rough, uneven appearance, commonly described as 'teary'. Analysis:- the filling ridges were found to be due to slack warp threads or to too heavy sizing on the warp yarns, preventing proper flexibility and uniform interlacing with the filling yarns. It is impossible to eliminate this defect in finishing and the cause is generally attributed to faulty warp tension during weaving or to improper warp sizing, which leaves the yarns fairly rigid. This type of defect is frequently encountered in plain, taffeta-weave, continuous-filament rayon fabrics, in which case the condition produces a 'frosty' appearance. / Уточина:- такая же как основа. Шероховатый Внешний Вид (uneven appearance):- порок ткани; ткань, качество которой неприемлемо с точки зрения общей характеристики. Примечание:- этот порок может произойти из-за многочисленных маленьких дефектов, например, неравномерная пряжа, маленькие узелки, заработанный пух, пилинг, которые если бы являлись одиночными, не считались бы браком.

UNEVEN CLOTH = НЕРОВНОЕ ПОЛОТНО – Uneven Cloth:- inconsistent diameters of the weft produces a shady cloth where principle of weft mixing is not used. Weaving defect. Thick and thin places are formed because of the improper take up motion. If the take-up motion takes two teeth instead of one tooth in the ratchet, then it causes the thin place. If the take-up motion fails to turn the beam wheel then it will cause the think place. The other reason is, if the cloth roller is not properly gripping the cloth forward with it as it rotates, owing to perforated covering being worn, or it is unsuitable for the fabric. This defect is also called as Uneven Cloth or Shady Pieces. / Порок или дефект ткачества. Под Неравномерной Плотностью понимается местный порок в виде видимого нежелаемого изменения плотности нитей, столбиков или рядов.

UNEVEN DYEING = НЕРАВНОМЕРНОЕ КРАШЕНИЕ – Uneven Dyeing is a fabric dyeing that shows variations in shade resulting from incorrect processing or dyeing methods or from use of faulty materials. Fabrics defect. Uneven Dyeing:- cloth which shows variations in shade due either to incorrect dyeing methods or faulty materials.

UNEVEN EDGE = НЕРОВНЫЙ КРАЙ – (1) Uneven Edge:- where stitching not straight or improperly formed in creasing machine. Sewing Room Defects. / втачивание (stitching). Порок или дефект швейного производства.

(2) Uneven Edge:- this is a minor appearance defect, except that with some tape constructions it is evidence of a possible unevenness on the opposite side to which the teeth are attached and, in this case, could cause serious physical weakness. This is especially pertinent where the cord is sewn to the tape rather than woven in at the time of manufacture. Closure defects, and namely – Metal Zippers:- Tare and Cord Defects. / Порок или дефект застёжки.

UNEVENLY APPLIED FINISH = НЕРАВНОМЕРНО ПРИМЕНЁННАЯ ЗАКЛЮЧИТЕЛЬНАЯ ОТДЕЛКА – Unevenly Applied Finish:- causes erratic sewing performance. Thread defects, and namely – Finish. / Порок или дефект ниток.

UNEVEN MILLING = НЕРАВНОМЕРНОЕ ВАЛЯНИЕ (или НЕРАВНОМЕРНАЯ ВАЛКА) – Uneven Milling:- uneven matting together of fibers results in uneven milling. Milling Defect.

UNEVENNESS = НЕРОВНОТА (или НЕРОВНОМЕРНОСТЬ) – (1) Unevenness or Irregularity:- the mass per unit length variation due to variation in fiber assembly is generally known as Irregularity or Unevenness. It is true that the diagram can represent a true relfection of the mass or weight per unit length variation in a fiber assembly. For a complete analysis of the quality, however, the diagram alone is not enough. It is also necessary to have a numerical value which represents the mass variation. The mathematical statistics offer 2 methods:- (i) the irregularity U%:- it is the percentage mass deviation of unit length of material and is caused by uneven fiber distribution along the length of the strand; and (ii) the coefficient of variation CV%. In handling large quantities of data statistically, the coefficient of variation (CV%) is commonly used to define variability and is thus well-suited to the problem of expressing yarn evenness. It is currently probably the most widely accepted way of quantifying irregulariy. It is given by coefficient variation (CV%) = (Standard Deviation / Average) x 100. The irregularity U% is proportional to the intensity of the mass variations around the mean value. the U% is independent of the evaluating time or tested material length with homogeneously distributed mass variation. The larger deviations from the mean value are much more intensively taken into consideration in the calculation of the coefficient of variation CV (squaring of the term) CV% has received more recognition in the modern statistics than the irregularity value U. The coefficient of variation CV can be determined extremely accurately by electronic means, whereas the calculation of the irregularity U is based on an approximation method. It can be considered that if the fiber assembly required to be tested is normally distributed with respect to its mass variation, a conversion possibility is available between the two types of calculation. CV% = 1.25 x U%. Index of Irregularity expresses the ratio between the measured irregularity and the so-called limiting irregularity of an ideal yarn. The manner in which irregularity is assessed can lead to different ways of expressing the index. In calculating the limit irregularity, the assumption is made that, in the ideal case, fiber distribution in a yarn is completely random and a practical yarn can never improve upon this situation.Thus, the measured irregularity will be an indication of the extent to which fiber distribution falls short of complete randomness. If all fibers are uniform in cross-sectional size, it can be shown that the limiting irregularity expressed in terms of CV is given by CV (limit) = 100 / sqrt(N). This expression also assumes a POISSON distribution in the values around 'N' (the mean number of fibers in the cross section). Let CV_{lim} = the calculated limit irregularity, CV = the actual irregularity, then, Index of Irregularity (I) = CV / CV_{lim}. By calculating the limit irregularity and then measuring the actual irregularity, we can judge the spinning performance. Deviation Rate describes by what percentage a mass deviation exceeds or falls below a certain limit. The cut length factor in m averages out the shorter, higher deviations DR (xy) = (L_1 + L_2 ... + L_n) x 100 / L tot; DR = Total relative length in (%) of all deviations of the mass signal which surpass the limit ±x% over a total test length of L meters, with the cut length of curve being y meters. Formula for DR Percentage:- the standard DR used for yarn is 1.5 m cutlength at a ±5% limit. The application of DR is similar to that of the CV_m values. One has to take in to consideration that the DR is based on threshhold values and changes more significantly than CV values when higher mass deviations over long stretches of test material arise. The deviation rate is calculated by comparing all the deviations of the positive range with the whole test length Ltot. The same is valid for all deviations in the negative range. As the zero line corresponds to the median, the Deviation Rate (DR) can reach the maximum of 50%. Deterioration in Evenness During Processing:- in processing in the spinning mill, the unevenness of the product increases from stage to stage after drawframe. There are two reasons for this:- (i) the number of fibers in the cross section steadily decreases. Uniform arrangement of the fibers becomes more difficult, the smaller their number. (ii) Each drafting operation increases the unevenness. Each machine in the spinning process adds a certain amount to the irregularity of finished yarn. The resultant irregularity at the output of any spinning process stage is equal to the square root of the sum of the squares of the irregularities of the material and the irregularity introduced in the process. Let us assume that, CV_0 – CV of output material; CV_1 – CV of input material; CV – irregularity introduced by machine; then, CV_0 = sqart(CV_1 + CV). Unevenness Over Different Cut Lengths:- a length of yarn, for example of 10 mm, contains only few fibers. Every irregular arrangement of only some of these fibers has a strong influence on the unevenness. In a length of yarn of 10 m, incorrect arrangement of the same fibers would hardly be

noticed against the background of the large number of such fibers. Accordingly, the CV value of the same yarn can be, for example, 14% based on, 8 mm, and only 2% based on 100 m. The degree of irregularity is dependent upon the regerence length. Unevenness is therefore discussed in terms of short lengths (Uster tester) : medium lengths (seldom used) : long lengths (count variation). Fabric stripiness and barre have been problematic fabric defects in the textile industry for many years. Though direct quantification has not been possible, the causes for such fabric defects have been studied. It has been shown that raw material quality and yarn mass variations (particularly medium and long term variations) contribute significantly to the guidance of such faults. Of these causes, there has been a general neglect of the control of medium term variations (variations over 1 m, 3 m, 10 m, etc). A mill needs to control the cut length variations of the yarn produced in order to ensure a fault free fabric. / Неровнота пряжи является пороком или дефектом прядения. Уштэр Тчэкнолодьжиз А.Ге. (Цельвига Уштэр) (Uster Technologies AG (Zellweger Uster)), Уштэр (или Устер), Швейцария. Под Неровнотой или Неровномерностью понимается неравномерность геометрических и физикомеханических свойств текстильных материалов – волокон, нитей, тканей и других изделий. Неровнота вызывается нестационарностью технологических процессов, изменением атмосферных условий и свойств сырья и другим. Снижает качество вырабатываемых изделий и их технико-экономические показатели.

(2) Unevenness:- with wool, this refers to a fleece that varies in type over the body.

UNEVEN OR LOOSE PILES = НЕРАВНОМЕРНЫЕ ИЛИ ПРОПУЩЕННЫЕ ВОРСИНКИ – Uneven Or Loose Piles:- in this type of defect there is variation in the pile height over the surface of the fabric. Causes:- (i) improper working of terry motion on loom; (ii) improper functioning of Jacquard; and (iii) missing pick. Mending:- non mendable. Fabric defect in terry fabrics. / Жакяр (Jacquard).

UNEVEN PANELS IN SLIPS = НЕРАВНОМЕРНЫЕ ПАНЕЛИ (или ПОЛОЧКИ, или ДЕКОРАТИВНЫЕ ПОЛОСЫ) НА КОМБИНАЦИИ – Uneven Panels In Slips:- Garments:- women's rayon slips; Fabric Construction:- (i) Count:- 150 x 94; (ii) Warp:- 75/50 dull acetate rayon; (iii) Filling:- 75, 30 35 bright viscose rayon. Complaint:- the panels of the slips varied in length after sewing. Analysis:- analysis of the fabric in the various panels of several slips submitted showed no significant differences in construction, finishing shrinkage, or finish. Inspection of the garments during the laying out of the full pieces and the cutting indicated careful operations on the part of the garment manufacturer. After the cut panels were sewed, however, a number of slips showed the uneven panel length, although measurements were carefully controlled when they were cut. It was noticed that several of the full-finished pieces were framed slightly on a bias, or of square, a condition which was not corrected when the goods were spread out for cutting. Consequently, after these pieces were cut, the panels straightened out while being sewed, producing the uneven lengths. This was considered to be a finishing defect due to carelessness in framing the goods and was readily corrected when called to the attention of the dyer. / Уточина:- 75, 30 35 .

UNEVEN PILES = НЕРАВНОМЕРНЫЕ ВОРСЫ – Uneven Piles:- in case of raised fabric, if the raising is uneven on certain spots it shows a patch. Piling and Raising Defects. / пятна.

UNEVEN PLAID = НЕРАВНОМЕРНЫЙ ПЛЕД (или НЕРАВНОМЕРНАЯ ШОТЛАНДКА) – Uneven Plaid is a synonym for unbalanced plaid. See also Unbalanced Plaid.

UNEVEN RAISING = НЕРАВНОМЕРНОЕ ВОРСОВАНИЕ (или НЕРАВНОМЕРНАЯ ОТБОЙКА ВОРСА, или НЕРАВНОМЕРНОЕ ПОДНЯТИЕ ВОРСА, или НЕРАВНОМЕРНЫЙ НАЧЁС) – Uneven Raising:- Irregularities in the appearance of a raised fabric where areas of under-raising and/or over-raising are present. Note:- this defect may be caused by variations in the fabric structure or in processing prior to raising, or to lack of control of the raising machine. / Неравномерный Ворс (uneven raising):- порок ткани в виде нарушения внешнего вида ткани с ворсом, где имеются участки с недостаточным или с избыточным ворсом. Примечание:- этот порок может быть вызван изменениями фактуры ткани или её обработкой до ворсования, или отсутствием контроля над ворсовальной машиной.

UNEVEN SHADE = НЕРАВНОМЕРНАЯ ТЕНЬ – Uneven Shade:- Fabric:- spun-rayon-and-wool suiting; Construction:- (i) Count:- 90 x 44; (ii) Warp:- 30/2 25% 1%-in. 1%-den. bright viscose rayon 50% 2-in. 3-den. dull viscose rayon 25% 58's wool cut 2 in.; (iii) Filling:- same as warp; Finish:- plain dyed gray. Defect:- pieces said to have been dyed together differed in shade when finished. Analysis:- analysis of the construction and fiber content of representative cuttings of the pieces which differed in shade showed that they were otherwise identical. Laboratory stripping and redyeing in the same bath resulted in both swatches' coming up to exactly the same shade. On checking the dyer's records, it was found that the pieces varied appreciably in length. Further investigation revealed that the shorter pieces were always lighter than the longer pieces. It was concluded that the difference in dyeing was due entirely to the variation in the lengths of the pieces. Goods dyed in a winch or dye beck should be of approximately the same length, since in the dyeing operation where the pieces are rotated over the reel in an endless rope, the longer pieces remain in the dye bath for a longer period of time, with the result that they will usually dye appreciably darker, although they are handled in the same dye lot. / Уточина:- такая же как основа.

UNEVEN SHRINKAGE = НЕРАВНОМЕРНАЯ УСАДКА (или НЕРАВНОМЕРНАЯ ДЕКАТИРОВКА) – Uneven Shrinkage:- a wavy, warpwise condition in the fabric that prevents it from lying flat on a horizontal surface.

UNEVEN SPINNING = НЕРАВНОМЕРНОЕ ПРЯДЕНИЕ (или РУЧЬИСТОСТЬ) – Uneven Spinning:- low spots that would reduce tensile. High spots that would tend to make the thread too large for a needle. Both would cause thread breakage. Thread defects, and namely – Spinning. / пятна. Ручьистость – вид неровноты. Порок или дефект ниток.

UNEVEN SPREADING = НЕРОВНОЕ РАСШИРЕНИЕ – Uneven Spreading:- front edge of lay is not even, resulting in front or back edge of marker not catching all plys. Cutting Room Defects, and namely – Spreading Defects. / Порок или дефект раскроя.

UNEVEN STITCH = НЕРАВНОМЕРНЫЙ СТЕЖОК (или НЕРОВНАЯ ПЕТЛЯ) – (1) Uneven Stitch:- caused by excessive machine speed, improper fittings, worn machine parts. Machinery defects, and namely – Sewing Machines and Attachments. / Порок или дефект от машинного оборудования.

(2) Uneven Stitch:- caused by operator speeding up machine too rapidly or by holding back or pushing fabric through machine in variance with correct machine feed. Sewing Room Defects. / Порок или дефект швейного производства.

UNEVEN SURFACE = НЕРАВНОМЕРНАЯ ПОВЕРХНОСТЬ – Uneven Surface is an irregular surface characterized by nonuniformity in the physical configuration of the yarns or fibers making up the surface of the fabric.

UNEVEN TWILL WEAVE = НЕРАВНОМЕРНОЕ САРЖЕВОЕ ПЕРЕПЛЕТЕНИЕ – Uneven Twill Weave:- the filling passes under more yarns than ones it passes over. / уточина .

UNEVEN WIDTH OF WAISTBAND = НЕРАВНОМЕРНАЯ ШИРИНА ПОЯСА – Uneven Width Of Waistband:- a variation in the overall width of the waistband and or the fold on the waistband which does not permit an even set in your sewing operation. Interlining defects. / Порок или дефект .

UNEVEN YARN = НЕРАВНОМЕРНАЯ ПРЯЖА – Uneven Yarn, i.e. count variation, thick and thin places or spinners doubles, etc is mainly caused due to not proper drafting arm pressure, loose apron, bad condition of cots at roving and ring frame, piecining of sliver is not proper at final gilling by the operator at breaking of sliver or at the time of running out of material. Uneven Yarn is a yarn that varies in diameter to an abnormal degree. / Порок или дефект прядения. Качество ткани во многом зависит от степени равномерности пряжи. Если пряжа является неравномерной, то ткань из неё будет непрочной. Ткани, полученные из неравномерной пряжи, имеют различные дефекты, например, полосатость, и ухудшенный внешний вид. Неровнота пряжи приводит к повышенной обрывности в прядении, ткачестве и трикотажном производстве, что, в свою очередь, приводит к снижению производительности. Источники неровноты пряжи встречаются на всей технологической цепочке изготовления пряжи, начиная от качества выбранного сырья и составления смески до прядильной машины. Сырьё может быть неоднородным не то чтобы от кипы к кипе, но и в пределах одной кипы. Составить идеальную смеску также очень сложно. На каждой последующей машине в цепочке прядения тоже имеются источники неравноты. В этой связи в одном и том же продукте может наблюдаться несколько различных неровнот. Применение в прядильном оборудовании современных автоматических регуляторов и сложение полупродуктов видоизменяют и уменьшают неровноту будущей пряжи.

UNEXPIRED RISKS RESERVE = РЕЗЕРВ НА НЕИСТЕКШИЕ РИСКИ – Unexpired Risks Reserve:- the amount set aside as at the end of a financial period in addition to unearned premium in respect of risks to be borne by the company after the end of that year under contracts of insurance entered into before the end of that year, in order to provide for additional costs of claims. This may be necessary because certain business is expected to be loss making, or for example. to cover claims whenever they may arise in the future under contingency insurances paid for by single premiums.

UNFAIR CALLING INSURANCE = НЕСПРАВЕДЛИВОЕ ВЫЗЫВАЮЩЕЕ СТРАХОВАНИЕ (или НЕДОБРОСОВЕСТНОЕ ВЫЗЫВАЮЩЕЕ СТРАХОВАНИЕ) – Unfair Calling Insurance:- insurance coverage to protect principals who have issued demand guarantees or bonds against an unfair or abusive call of the bond/guarantee (i.e. one which is not truly based on non-performance by the principal.

UNFAIR COMPETITION = НЕСПРАВЕДЛИВАЯ КОНКУРЕНЦИЯ (или НЕДОБРОСОВЕСТНАЯ КОНКУРЕНЦИЯ) – Unfair Competition is a broad term defining legal standards of business conduct. It provides protection against such things as simulation of trade packaging, using similar corporate and professional names, misappropriation of trade secrets, and palming off one person's goods as those of another. Protection against Unfair Competition:- the Paris Convention for the Protection of Industrial Property, Article 10bis, requires its member countries to provide protection of industrial property against unfair competition. This article is directed against acts of competition that are contrary to honest practices in industry or commerce. The Paris Convention lists the following as acts of unfair competition in relation to industrial property:- (i) all acts of such a nature as to create confusion with the establishment, the goods or the industrial or commercial activities of a competitor; (ii) false allegations in the course of trade of such a nature as to discredit the establishment, the goods or the industrial or commercial activities of a competitor; and (iii) indications or allegations, the use of which in the course of trade are liable to mislead the public as to the characteristics of certain goods. Protection against unfair competition supplements the protection of inventions, industrial designs, trademarks and geographical indications. It is particularly important for the protection of knowledge, technology or information which is not protected by a patent but which may be required in order to make the best use of a patented invention. Unfair Competition:- trading and business activities that are dishonest or fraudulent as against the activities of other traders. Unfair competition includes fraudulent advertising, counterfeiting, and similar illegal trade practices. / Широкий термин, определяющий юридические аспекты ведения бизнеса. Он предусматривает защиту от таких вещей как .

UNFAIR DISMISSAL = НЕСПРАВЕДЛИВОЕ УВОЛЬНЕНИЕ (или НЕДОБРОСОВЕСТНОЕ УВОЛЬНЕНИЕ) – Unfair Dismissal is the dismissal of an employee that an employment tribunal finds is unfair. Under the Employment Rights Act 1996 employees have the right not to be unfairly dismissed, provided they have served the required period of continuous employment. However, employees dismissed for an inadmissible reason have this right whatever their age or length of service. An employee who considers he has been unfairly dismissed can apply within three months after the effective date of termination of his employment contract to an employment tribunal for ... Unfair Dismissal is any dismissal of an employee that the employer cannot show to be fair. Under the Employment Rights Act 1996 employees have the right not to be unfairly dismissed, provided they have served the required period of continuous employment (52 weeks for full-time employment) and are not over 65 or the normal retirement age for an employee in that particular job. Dismissal for membership or non-membership of a trade union is always regarded as unfair dismissal, whatever the employee's age or length of service. Employees who consider that they have been unfairly dismissed can apply within three months after the effective date of termination of their employment contract to an employment tribunal for reinstatement, re-engagement, or compensation. The tribunal will make an award unless the employer shows that the principal reason for the dismissal was the employee's incapability, lack of qualifications, or conduct; redundancy; the fact that it would be illegal to continue employing the person; or some other substantial reason. The employer must also show that he acted reasonably in dismissing the employee. The statutory protection does not apply to members of the police and armed forces and certain other employees. Compare Wrongful Dismissal. The claimant is the person claiming unfair dismissal. / Несправедливое Увольнение (Unfair Dismissal):- увольнение работника, которое не является законным. По Закону О Защите Занятости (Консолидации) 1978, работники имею право на протест против незаконного увольнения при условии, что они непрерывно проработали на хозяина определённое время (52 недели для работающих полный рабочий день), не достигли 65 лет или иного нормального пенсионного возраста, установленного для лиц их профессии. Работник, который считает, что он был уволен незаконно, может в течение трёх месяцев со дня расторжения его трудового договора обратиться в суд по рассмотрению производственных конфликтов с требованием восстановления его на работе или выплаты компенсации. Если работодатель не сможет доказать, что главной причиной увольнения были:- неспособность работника продолжать работу, недостаток квалификации или нарушение правил работы; сокращение рабочих мест; тот факт, что дальнейший его наём является незаконным; либо указать какую-нибудь иную существенную причину, суд выносит решение в пользу работника. Работодатель должен также доказать, что, увольняя работника, он действовал разумно. Предоставляемая законодательством защита не распространяется на полицейских, военнослужащих и некоторые другие категории работников.

UNFAIR PRACTICES = НЕСПРАВЕДЛИВЫЕ ПРАКТИКИ (или НЕДОБРОСОВЕСТНЫЕ ПРАКТИКИ, или НЕЧЕСТНЫЕ ПРАКТИКИ) – Unfair Practices is:- (1) a trade practice with respect to the public or a competitor that is forbidden by statute and that is therefore subject to control by a federal trade commission; (2) unfair competition. Unfair Practice is any practice in business involving the general public or competing parties that is prohibited by statute and regulated by an appropriate government agency. / Нечестные

Методы:- дискриминационная практика в торговле товарами, когда они либо чрезмерно субсидируются, либо служат целям демпинга, или используются другие незаконные приёмы, например, подделка предметов. Смотрите также Dumping, General Agreement On Tariffs And Trade, Priority Practices, и Super 301.

UNFAIR PREJUDICE = НЕСПРАВЕДЛИВОЕ ПРЕДУБЕЖДЕНИЕ (или НЕДОБРОСОВЕСТНОЕ ПРЕДУБЕЖДЕНИЕ) – Unfair Prejudice:- conduct in the running of a company's affairs that may entitle members to a remedy under the Companies Act. In small companies, the unfairness may consist of a failure by some members to honour a common understanding reached when the company was formed, e.g., that a member be allowed to assist in the management and be paid accordingly. The usual remedy sought is for the purchase of the member's shares at a fair price. See also Minority Protection. Unfair Prejudice:- unfair conduct on the part of those entrusted to run and control a company in respect of (usually minority) company members. Any member affected may apply to the court under the Companies Act 2006 Section 994, and the court is empowered under the Act to make such order as it thinks fit (Section 996). Commonly, the unfairness consists of inequitable conduct having the effect of seriously diminishing the value of the petitioner's shareholding. / Несправедливое Предубеждение или Предубеждение При Отсутствии Повода (Unfair Prejudice):- стиль управления делами компании, который даёт возможность членам компании, в соответствии с Законом О Компаниях 1985, искать судебной защиты своих прав. В малых компаниях предубеждение – при отсутствии повода – может состоять в нежелании некоторых её членов поддерживать общее взаимопонимание, которое было достигнуто при формировании компании, например, в отказе признать то, что какой-либо член компании будет помогать в её управлении и получать за это соответствующую плату. Обычной судебной защитой в таких случаях является выкуп у предубеждённого члена компании его акций по справедливой цене. Смотрите также Защита Миноритариев (Minority Protection).

UNFAIR TRADE PRACTICE = НЕСПРАВЕДЛИВАЯ ПРАКТИКА ТОРГОВЛИ (или НЕДОБРОСОВЕСТНАЯ ТОРГОВАЯ ПРАКТИКА) – Unfair Trade Practice:- this term refers to any act, policy, or practice of a foreign government that:- (i) violates, is inconsistent with, or otherwise denies benefits to the United States under any trade agreement to which the United States is a party; (ii) is unjustifiable, unreasonable, or discriminatory and burdens or restricts United States commerce; or (iii) is otherwise inconsistent with a favorable section 301 determination by the US Trade Representative.

UNFAIR TRADER = НЕСПРАВЕДЛИВЫЙ ТОРГОВЕЦ (или НЕДОБРОСОВЕСТНЫЙ ТОРГОВЕЦ, или НЕЧЕСТНЫЙ ТОРГОВЕЦ) – Unfair Trader is a country or corporation that conducts practices providing an inequitable advantage to one party. For example, a country may keep its currency artificially weak so as to make its exports cheaper than the situation warrants. / Нечестный Торговец:- по определению Представителя США на торговых переговорах или Комиссии по Международной Торговле США – страна, организация или индивид, прибегающие к 'нечестным методам торговли'. Смотрите также Dumping, и Snap-Back.

UNFAIR TRADING = НЕСПРАВЕДЛИВАЯ ТОРГОВЛЯ (или НЕДОБРОСОВЕСТНАЯ ТОРГОВЛЯ, или НЕЧЕСТНАЯ ТОРГОВЛЯ) – Unfair Trading:- traders acting unfairly or dishonestly in their dealings with customers. The EU Directive has been out in force in the UK through The Consumer Protection from Unfair Trading Regulations 2008 (known as the CPRs). Schedule 1 of the regulations lists many practices that are always unfair. Offences against the regulations are dealt with by local authority trading standards ... . See also Consumer Protection. The Consumer Protection from Unfair Trading Regulations 2008 (known as the CPRs) control unfair practices used by traders when dealing with consumers, and create criminal offences for traders that breach them. The Regulations prohibit 31 specific practices that are always considered to be unfair, and create further offences for aggressive practices. They prohibit 'misleading actions' and 'misleading omissions' that cause, or are likely to cause, the average consumer to take a 'transactional decision' they would not have taken otherwise. They apply to commercial practices relating to products (which includes goods, services and digital content) before, during and after a contract is made. They provide consumers with rights to redress in respect of misleading and aggressive commercial practices and set out the remedies available to them. What Is Unfair? Under the Regulations, a commercial practice is 'Unfair' if it fits both of the following requirements:- (i) It falls below the good-faith standards of skill and care that a trader in that industry would be expected to exercise towards customers; and (ii) It affects, or is likely to affect, consumers' ability to make an informed decision about whether to purchase a particular product. A trader will be committing an offence under the Regulations if he knowingly or recklessly engages in an 'unfair' practice. / Недобросовестная Торговля или Нечестная Торговля (Unfair Trading):- . Смотрите также Защита Потребителей (Consumer Protection).

UNFAVORABLE BALANCE = НЕБЛАГОПРИЯТНЫЙ БАЛАНС – Unfavourable Balance:- a balance of trade or balance of payments deficit. / Неблагоприятный Баланс (Unfavourable Balance):- дефицит торгового баланса или платёжного баланса.

UNFAVORABLE BALANCE OF TRADE = НЕБЛАГОПРИЯТНЫЙ БАЛАНС ТОРГОВЛИ – Unfavorable Balance of Trade:- the value of a nation's imports in excess of the value of its exports.

UNFCCC = UNITED NATIONS FRAMEWORK CONVENTION ON CLIMATE CHANGE

UNFILLED SPIKELET = НЕЗАПОЛНЕННЫЙ (или НЕНАПОЛНЕННЫЙ) КОЛОСОК – Unfilled Spikelet:- grain that has not filled and matured due to adverse environmental conditions or other factors affecting its development.

UNFILTERED DATA = НЕОТФИЛЬТРОВАННЫЕ ДАННЫЕ – Unfiltered Data:- used to present one data feed from the exchange as being pure, unfiltered, compared to other data feeds. This is a marketing pitch. From interviews with high level developers of data feeds they will tell you that all data is unfiltered. The refresh rate, however, is different. It is how fast the data feeds refresh or display to current market price. The lower the refresh rate, the most current market prices. The quicker the refresh rate requires more processing/server power in order to handle more data flow. Refresh rates vary per data feed, not filtered vs unfiltered.

UNFINISHED OILS = ПОЛУФАБРИКАТЫ ИЗ НЕФТИ (или НЕФТЯНЫЕ ПОЛУФАБРИКАТЫ) – Unfinished Oils are all oils requiring further refinery processing except those requiring only mechanical blending. Includes naphthas and lighter oils, kerosene and light gas oils, heavy gas oils, and residuum. / Под Полуфабрикатом понимается продукт труда, прошедший одну или несколько стадий обработки и предназначенный для дальнейшей обработки и изготовления из него готовой продукции. Полуфабрикат одного предприятия может быть готовой продукцией для другого, например, ткань, выпускаемая в продажу, – готовый продукт; но та же ткань – полуфабрикат для швейных фабрик и ателье. Внутри отдельного предприятия к полуфабрикатам относят все продукты труда, которым предстоит пройти дальнейшие производственные процессы.

UNFINISHED WORSTEDS = ТКАНИ ИЗ ГРЕБЕННОЙ ШЕРСТИ С ЛЁГКИМ НАЧЁСОМ – Unfinished Worsteds:- a woven fabric made from worsted yarn that has then been brushed. This produces a firm fabric with a tight weave hidden beneath a soft nap. Unfinished Worsteds:- a worsted fabric with a relatively soft hand and a light nap. Unfinished Worsted is a suiting fabric:- in twill weave, finished with a nap longer than those of other worsteds. / камвольные костюмные ткани, сотканные из камвольной пряжи, имеющие саржевое переплетение и отделку с .

UNFORCED CAPACITY = XX (или НЕПРИНУЖДЁННАЯ УСТАНОВКА) – Unforced Capacity (UCAP) (in energy industry) is the installed capacity (ICAP) adjusted by forced outage rates. See also Installed Capacity. Unforced Capacity (UCAP) – represents the

percentage of Installed Capacity (ICAP; represents physical generating capacity adjusted for ambient weather conditions) available after a unit's forced outage rate is taken into account. Installed Capacity (ICAP):- a MegaWatt (MW) value based on the summer net dependable capability of a unit and within the capacity interconnection right limits of the bus to which it is connected. Unforced Capacity (UCAP):- the MW value of a capacity resource in the PJM Capacity Market. For a generating unit, the unforced capacity value is equal to the installed capacity of the unit multiplied by (1- unit's EFORd), i.e. UCAP offered = ICAP x (1- EFORd). Equivalent Demand Forced Outage Rate (EFORd) is a measure of the probability that generating unit will not be available due to a forced outage or forced derating when there is a demand on the unit to generate. UCAP methodology may create stronger alignment between capacity payments and resource performance. The UCAP methodology:- (i) provides greater assurance of reliability; (ii) reduces risk of paying a premium for under performing resources; (iii) allows direct comparison of the reliability value across a wide variety of resources; (iv) provides better alignment with a 'Pay-forPerformance' approach; (v) allows the clearing price to be established based on resources that have performed well in the past and increases the value of performing MWs; and (vi) bolsters auction price signals for new build when needed; (vii) provides resource owners' the relevant lost opportunity data necessary when making investment decisions to improve generator performance. Solid performance during periods of system demand would result in a higher UCAP eligibility for subsequent auctions. / Пи.Дьжей.Эм. Интёконэкшэн Эл.Эл.Си. (PJM Interconnection LLC или Пэнсэлвэйниэ Ню Дьжози Мэрилэнд Интёконэкшэн Эл.Эл.Си. (Pennsylvania New Jersey Maryland Interconnection LLC)).

UNFORESEEABLE EVENTS CLAUSE = ОГОВОРКА О НЕПРЕДВИДЕННЫХ СОБЫТИЯХ – Unforeseeable Events Clause is a clause in government contracts stating that the inability to perform due to certain new and unforeseeable events may be sufficient cause for amending or terminating the contract.

UNFRANKED INVESTMENT INCOME = НЕМАРКИРОВАННЫЙ ИНВЕСТИЦИОННЫЙ ДОХОД – Unfranked Investment Income is any investment income received by a company that did not qualify as franked investment income. / Немаркированный Инвестиционный Доход (Unfranked Investment Income):- любой доход от инвестиций, который не является доходом от маркированных инвестиций (franked investment income).

UNFSSTD = UNITED NATIONS FINANCING SYSTEM IN SCIENCE AND TECHNOLOGY DEVELOPMENT

UNFUNDED BENEFIT PLAN = НЕПРОФИНАНСИРОВАННЫЙ (или НЕФОНДИРОВАННЫЙ) ПЛАН ВЫПЛАТ (или ПЕНСИОННЫЙ ПЛАН БЕЗ ОБРАЗОВАНИЯ СПЕЦИАЛЬНОГО ФОНДА) – Unfunded Benefit Plan:- Defined benefit plans may be either Funded or Unfunded. In an unfunded defined benefit pension, no assets are set aside and the benefits are paid for by the employer or other pension sponsor as and when they are paid. Pension arrangements provided by the state in most countries in the world are unfunded, with benefits paid directly from current workers' contributions and taxes. This method of financing is known as Pay-As-You-Go. The social security systems of many European countries are unfunded, having benefits paid directly out of current taxes and social security contributions, although several countries have hybrid systems which are partially funded. Spain set up the Social Security Reserve Fund and France set up the Pensions Reserve Fund; in Canada the wage-based retirement plan (or Canada Pension Plan (CPP)) is partially funded, with assets managed by the CPP Investment Board while the US Social Security system is partially funded by investment in special US Treasury Bonds. In a Funded Plan, contributions from the employer, and sometimes also from plan members, are invested in a fund towards meeting the benefits. All plans must be funded in some way, even if they are pay-as-you-go, so this type of plan is more accurately known as Pre-Funded. The future returns on the investments, and the future benefits to be paid, are not known in advance, so there is no guarantee that a given level of contributions will be enough to meet the benefits. Typically, the contributions to be paid are regularly reviewed in a valuation of the plan's assets and liabilities, carried out by an actuary to ensure that the pension fund will meet future payment obligations. This means that in a defined benefit pension, investment risk and investment rewards are typically assumed by the sponsor/employer and not by the individual. If a plan is not well-funded, the plan sponsor may not have the financial resources to continue funding the plan. / Пенсионный План Без Образования Специального Фонда (Unfunded Benefit Plan):- пенсионный план, согласно которому компания сохраняет обязательства по выплате пенсий без учреждения отдельного фонда. Смотрите также (Funding). Пенсионный План Без Образования Специального Фонда:- пенсионный план, при котором сохраняется обязательство компании по выплатепенсий без учреждения специального фонда.

UNFUNDED DEBT = НЕФОНДИРОВАННЫЙ ДОЛГ (или ВНЕФОНДОВЫЙ ДОЛГ) – Unfunded Debt is a debt maturing within one year (short-term debt). See also Funded Debt.

UNFUNDED PENSION PLAN = НЕФОНДИРОВАННЫЙ ПЕНСИОННЫЙ ПЛАН – Unfunded Pension Plan provides for the employer to pay out amounts to retirees or beneficiaries as and when they are needed. There is no money put aside on a regular basis. Instead, it is taken out of current income. / Нефондированный Пенсионный План (Unfunded Pension Plan):- пенсионная программа, которая финансируется работодателем из текущего дохода, поскольку пенсионерам и бенефициариям требуются средства. Также известен как принцип выплаты пенсий из текущих доходов (pay-as-you-go) или пенсионная программа, финансируемая из текущих расходов. Эта программа отличается от предварительно профинансированного пенсионного плана (advance funded pension plan). В этом случае работодатель регулярно откладывает деньги на специальный фонд, который инвестируется в акции, облигации, недвижимость и другие активы.

UNFURLED LEAF = РАЗВЁРНУТЫЙ ЛИСТ – Unfurled Leaf:- the condition when a young developing leaf expands such that the unfolding edges no longer touch each other. The upper highest node on the main-stem, for practical counting purposes, is considered to be the node at which the most recent main-stem leaf has unfolded. Other states have used a leaf diameter of 1 inch. See also Main-Stem Node, Node, and Nodes Above First Square.

UNGELATINIZED KERNELS = НЕЖЕЛАТИНОЗНАЯ (или НЕЖЕЛАТИНОВАЯ) ЗЕРНОВКА (или НЕЖЕЛАТИНОЗНЫЕ (или НЕЖЕЛАТИНОВЫЕ) ЯДРА) – Ungelatinized Kernels are whole or large broken kernels of parboiled Rice with distinct white or chalky areas due to incomplete gelatinization of the starch. / К Нежелатиновым/Нежелатинозным Ядрам относятся целые или крупные битые ядра пропаренного Риса с заметными белыми или меловыми поверхностями вследствие неполной клейстеризации (желатинизации) крахмала.

UNGUI = НОГОТКОВОЕ (или КОГОТКООБРАЗНОЕ) – Ungui:- claw-like. Hence unguispinus – with claw-like spines.

UNGULATE = КОПЫТНОЕ (или ХХ) – Ungulate:- formerly, any hoofed mammal. Although the term is now used more broadly in formal classification as the Grandorder Ungulata, in common usage it was widely applied to a diverse group of placental mammals that were characterized as hoofed herbivorous quadrupeds. The feature that united them, the hoof, consists of hornlike dermal (skin) tissue, comparable to the human fingernail, which extends over the end of a broadened terminal digit. Modern hoofed mammals comprise three groups:- Artiodactyla, the even-toed Ungulates (Swine, Camels, Deer, and Bovines); Perissodactyla, the odd-toed Ungulates (Horses, Tapirs, and Rhinoceroses); and Uranotheria, which includes the Orders Proboscidea (Elephants), Hyracoidea (Hyraxes), and Sirenia (Manatees and Dugongs). The Grandorder Ungulata also includes the Orders Tubulidendata (Aardvarks) and Cetacea (Whales and Dolphins). Nine Orders of Fossil Ungulates are also recognized:- Dinocerata (Uintatheres), Procreodi, Condylarthra (Condylarths),

Arctostylopida, Litopterna (Litopterns), Notoungulata (Notoungulates, including the Toxodonts), Astrapotheria (Astrapotheres), Xenungulata (Xenungulates), and Pyrotheria (Pyrotheres).

UNHEDGED POSITION = НЕЗАХЭДЬЖИРОВАННАЯ ПОЗИЦИЯ – Any Unhedged Position in a particular currency gives rise to FX risk and such a position is said to be Open Position in that particular currency. If a bank has sold more foreign currency than he has purchased, it is said to be Net Short in that currency, alternatively if it has purchased more foreign currency than it has purchased than it is in Net Long position. Both of these positions are exposed to risk as the foreign currency may fall in value as compared to local or home currency and becomes a reason for substantial loss for the bank if it is in Net Long position or the foreign currency may rise in value and cause losses if the bank is Net Short in that currency. Also known as Naked Position.

UNI = УНИ (или ОДНО) – Uni:- one, singular, as a prefix. / , от Латинского слова Unus, означающее Один, понимается .

UNICE = UNION DES INDUSTRIES DE LA COMMUNAUTÉ EUROPÉENNE

UNICEF = UNITED NATIONS INTERNATIONAL CHILDREN'S EMERGENCY FUND

UNIDENTIFIED FLYING OBJECT = НЕОПОЗНАННЫЙ ЛЕТАЮЩИЙ ОБЪЕКТ – Unidentified Flying Object (UFO) also called Flying Saucer any aerial object or optical phenomenon not readily explainable to the observer. UFO's became a major subject of interest with the developments in aeronautics and astronautics following World War II. In 1948 the US Air Force began maintaining a file of UFO reports called Project Blue Book. A series of radar detections coincident with visual sightings near the National Airport in Washington, DC, in July 1952, led the US government to establish a panel of scientists headed by Howard Percy 'Bob' Robertson (1903–1961), a physicist of the California Institute of Technology (Pasadena), and including engineers, meteorologists, physicists, and an astronomer. The thrust of public and governmental concern was indicated by the fact that the panel was organized by the Central Intelligence Agency (CIA) and was briefed on US military activities and intelligence and that its report was originally classified Secret. Later declassified, the report revealed that 90 percent of UFO sightings could be readily identified with astronomical and meteorologic phenomena (e.g., bright planets, meteors, auroras, ion clouds) or with aircraft, birds, balloons, searchlights, hot gases, and other phenomena, sometimes complicated by unusual meteorologic conditions. The publicity given to early sightings in the press undoubtedly helped stimulate further sightings not only in the United States but also in western Europe, the Soviet Union, Australia, and elsewhere. A second panel, organized in February 1966, reached conclusions similar to those of its predecessor. This left a number of sightings admittedly unexplained, and in the mid-1960s a few scientists and engineers, notably James E. McDonald, a University of Arizona (Tucson) meteorologist, and J. Allen Hynek, a Northwestern University (Evanston, Ill.) astronomer, concluded that a small percentage of the most reliable UFO reports gave definite indications of the presence of extraterrestrial visitors. This sensational hypothesis, promoted in newspaper and magazine articles, met with prompt resistance from other scientists. The continuing controversy led in 1968 to a UFO study sponsored by the US Air Force and conducted at the University of Colorado under the direction of E.U. Condon, a noted physicist. The Condon Report, 'A Scientific Study of UFO's', was reviewed by a special committee of the National Academy of Sciences and released in early 1969. A total of 37 scientists wrote chapters or parts of chapters for the report, which covered investigations of 59 UFO sightings in detail. Condon's own 'Conclusions and Recommendations' firmly rejected ETH – the extraterrestrial hypothesis – and declared that no further investigation was needed. This left a wide variety of opinions on UFO's. A large fraction of the American public, and a few scientists and engineers, continued to support ETH. A middle group of scientists felt that the possibility of extraterrestrial visitation, however slight, justified continued investigation, and still another group favored continuing investigation on the grounds that UFO reports are useful in sociopsychological studies. In 1973 a group of American scientists organized the Center for UFO Studies in Northfield, Ill., to conduct further work. Official Records Of UFO Sightings And Events:- By 1969 Project Blue Book had recorded reports of 12 618 sightings or events, each of which was ultimately classified as 'identified' with a known astronomical, atmospheric, or artificial phenomenon, or as 'unidentified', including cases in which information was insufficient. The project, however, was terminated in December 1969 on the basis of the conclusions of the Condon Report. The only other official and fairly complete records of UFO sightings were maintained in Canada, where they were transferred in 1968 from the Canadian Department of National Defense to the Canadian National Research Council. The Canadian records totaled about 750 in the late 1960s. Less-complete records have been maintained in Great Britain, Sweden, Denmark, Australia, and Greece. Types Of UFO Reports:- UFO reports have varied widely in reliability, as judged by the number of witnesses, whether the witnesses were independent of each other, by the observing conditions (fog, haze, illumination, etc), and by the direction of sighting. Typically, the witness who reports a sighting considers the object to be of extraterrestrial origin, or possibly a military vehicle, but certainly under intelligent control; this inference is usually based on what is perceived as formation-flying by sets of objects, unnatural motions seemingly centered on a target, or sudden, apparently purposive alterations in direction, brightness, and motion. That the unaided human eye plays tricks bordering on hallucinations is well known. A bright light, such as the planet Venus, often appears to move, although a clamped telescope or a sighting bar shows it to be fixed. Visual impressions of distance are also highly unreliable, being based on assumed size. Reflections from windows and eyeglasses can provide superimposed views. Optical defects can turn point sources of light into apparently saucer-shaped objects. Such optical illusions, and the psychological desire to interpret visual images, are known to account for many visual UFO reports. Radar sightings, while more reliable in certain respects, fail to discriminate between physical objects and meteor trails, tracks of ionized gas, rain, or thermal discontinuities. Furthermore, several effects can give false radar echoes: electronic interference, reflections from ionized layers or clouds, and reflections from regions of humidity, as in a cumulus cloud. Even 'contact events' – in which activities besides sighting were reported – have been found most frequently to involve dreams or hallucinations; the reliability of such reports depended heavily on whether there were two or more independent witnesses. / Хавод Пёси 'Баб' Робэтсэн (Howard Percy 'Bob' Robertson; 1903–1961). Американский физик Дьжеймз Эдвод МэкДанэлд (James Edward McDonald; 1920–1971), и Американский астроном Дьжей. Дьжосэф Элэн Хайнэк (Josef Allen Hynek; 1910–1986). Эдвод Уля Кандэн (Edward Uhler Condon; 1902–1974).

UNIDIRECTIONAL FABRIC = ОДНОНАПРАВЛЕННАЯ ТКАНЬ – Unidirectional Fabric is a fabric having reinforcing fibers in only one direction.

UNIDO = UNITED NATIONS INDUSTRIAL DEVELOPMENT ORGANIZATION

UNIDROIT = INSTITUT INTERNATIONAL POUR L'UNIFICATION DU DROIT PRIVE = INTERNATIONAL INSTITUTE FOR THE UNIFICATION OF PRIVATE LAW

UNIFIED CLAIMS SYSTEM = СИСТЕМА ОДНОРОДНЫХ ПРЕТЕНЗИЙ – Unified Claims System is a system at Lloyd's incorporating separate marine, non-marine and aviation claims Schemes for past years of account and a common claims Scheme for business signed in the 1991 year of account and subsequent years. / Лойдз (Lloyd's).

UNIFIED CREDIT = ЕДИНЫЙ КРЕДИТ – Unified Credit:- xxxxx. / Единый Кредит (Unified Credit):- налоговый кредит (tax credit) может использоваться для компенсации налогов на дарения, налогов на наследуемое имущество и, при определённых условиях, налога на передачу имущества через поколение.

UNIFIED EXCHANGE RATE = ЕДИНАЯ ОБМЕННАЯ СТАВКА (или ЕДИНЫЙ ВАЛЮТНЫЙ КУРС) – Unified Exchange Rate:- xxxxx. / Единый Валютный Курс:- ситуация, когда страна переходит от двух или нескольких валютных курсов к единому курсу применительно ко всем операциям. Хотя единый курс не обязательно подразумевает конвертируемость, он является важным шагом на пути укрепления доверия к валюте на финансовых рынках. Смотрите также Конвертируемость (Convertibility), и Твёрдая Валюта (Hard Currency).

UNIFIED TAX CREDIT = ОДНОРОДНЫЙ НАЛОГОВЫЙ КРЕДИТ (или ЕДИНЫЙ НАЛОГОВЫЙ КРЕДИТ) – Unified Tax Credit is a federal tax credit that reduces tax liability, Dollar for Dollar, on lifetime gifts and asset transfers at death.

UNIFORM = ОДНООБРАЗНОЕ (или ОДНОРОДНОЕ) – Uniform:- even; not varying; every factor has the same treatment.

UNIFORM = ФОРМА (или ОДНООБРАЗНОЕ, или ФОРМЕННАЯ ОДЕЖДА, или ОБМУНДИРОВАНИЕ) – Uniform is a dress of a distinctive design or fashion worn by members of a particular group and serving as a means of identification; broadly, distinctive or characteristic clothing.

UNIFORM = ЮНИФОРМ – Uniform (pronunciation:- YOU-nee-form) or U is international nautical signal flag meaning:- You are running into danger. Meaning:- you are standing into danger.

UNIFORM–CHROMATICITY–SCALE DIAGRAM = ДИАГРАММА ШКАЛЫ ОДНОРОДНОЙ ХРОМАТИЧНОСТИ (или РАВНОКОНТРАСТНЫЙ ЦВЕТОВОЙ ГРАФИК, или ДИАГРАММА РАВНОМЕРНОЙ ШКАЛЫ ЦВЕТНОСТИ) – Uniform-Chromaticity-Scale Diagram is the chromaticity diagram on which all pairs of just-perceptibly different colors of equal luminance are represented by pairs of points separated by nearly equal distances.

UNIFORM CODE COUNCIL – 128 = СОВЕТ ПО УНИФИЦИРОВАННЫМ КОДАМ – 128 – UCC-128 (short for the Uniform Code Council – 128):- this barcode is a specially defined subset of Code 128 that is used mostly on shipping containers. It is numeric only, having a fixed length of 19 digits.

UNIFORM COLOR SPACE = ОДНОРОДНОЕ ЦВЕТОВОЕ ПРОСТРАНСТВО (или ОДНОКОНТРАСТНОЕ ЦВЕТОВОЕ ПРОСТРАНСТВО, или РАВНОМЕРНОЕ ЦВЕТОВОЕ ПРОСТРАНСТВО) – Uniform Color Space:- schematic arrangement of colors in space in which spatial intervals between points correspond to visual differences between colors represented by those points (goal of all color space/order systems that has yet to be achieved).

UNIFORM COMMERCIAL CODE = УНИФИЦИРОВАННЫЙ КОММЕРЧЕСКИЙ КОДЕКС – The Uniform Commercial Code (UCC), or Uniform Customs and Practice for Documentary Credits ICC Publication No. 500, was first established and published in 1933 by the International Chamber of Commerce. Revisions were made in 1951, 1962, 1974, 1983, and 1993. The code defines documentation standards to be followed by international banks when negotiating letters of credit. The code is binding, and seeks to define a worldwide standard applicable to all involved in international trade, exchanging goods, and money using the international letter of credit. Uniform Commercial Code (UCC) is collection of laws dealing with commercial business. / Единый Коммерческий Кодекс или Унифицированный Коммерческий Кодекс (Uniform Commercial Code (UCC)):- правовой кодекс, принятый большинством штатов, который кодирует различные законы, имеющие дело с коммерческими операциями, особенно связанными с продажей товаров, материальных и нематериальных, и обеспеченными сделками. Он был создан Национальной Конференцией Комиссии по Единым Законам Штатов (National Conference of Commissioners of Uniform State Laws) и распространяется на банковские депозиты, банкротства, коммерческие аккредитивы, коммерческие бумаги, варранты и другое. Статья 8 Единого Коммерческого Кодекса относится к сделкам с инвестиционными ценными бумагами.

UNIFORM CURRENCY = ЕДИНАЯ ВАЛЮТА – In the United States, Uniform Currency is the term used to describe the uniform acceptance across the country of currency notes issued by nationally chartered banks following the National Banking Act of 1863.

UNIFORM CUSTOMS AND PRACTICE FOR DOCUMENTARY CREDITS NO. 500 = УНИФИЦИРОВАННЫЕ ПРАВИЛА И ОБЫЧАИ ДЛЯ ДОКУМЕНТАРНЫХ АККРЕДИТИВОВ № 500 – Uniform Customs and Practice for Documentary Credits No. 500 published by the International Chamber of Commerce, Paris, France. This is the most frequently used standard for making payments in international trade, e.g., paying on a Letter of Credit. It is most frequently referred to by its shorthand title:- UCP No. 500. This revised publication reflects recent changes in the transportation and banking industries, such as electronic transfer of funds. The 1993 version was published as ICC Publication No. 500 and came into effect on 1994-January-01. Rules for letters of credit drawn up by the Commission on Banking Technique and Practices of the International Chamber of Commerce in consultation with the banking associations of many countries. See also Terms Of Payment. UCP first came into operation in 1933 and UCP 500, the revision currently in force, came into force with effect from 01 January 1994. In May 2003 ICC authorized the ICC Commission on Banking Technique and Practice (Banking Commission) to begin a revision of ICC. The Drafting Group considered a methodical survey of ICC Opinions and DOCDEX decisions, the legal cases and the ICC rules since UCPSOO, URR525, eUCP, ISBP for incorporation. A study of ICC Opinions under UCP500 revealed that 17 articles had either none, one or two opinions, 7 Articles in UCP accounted for over 58% of all Opinions rendered by the Banking Commission. The 7 articles that required special attention were the following:- (i) Art. 9. Liability of Issuing and Confirming Barks; (ii) Art. 13. Standard for Examination of Documents; (iii) Art. 14. Discrepant Documents and Notice; (iv) Art. 21. Unspecified Issuers or Contents of Documents; (v) Art. 23. Marine/Ocean Bill of Lading; (vi) Art. 37. Commercial Invoices; and (vii) Art. 48. Transferable Credit. The main objective of the revision was the reduction in unjustified discrepancies by banks by ensuring transparency and clarity, facilitation of remedies to reduce queries, reduction of the element of interpretation, limiting potential litigation, seeking to eradicate poor presentment by beneficiaries and to have a clearer understanding of the principles of the UCP. They also wanted to place the onus on the issuer to be precise in LC terms. This is the most comprehensive review in the history of UCP. While no draft will satisfy everyone, the drafting committee gave everyone an opportunity to express their views. All suggestions were considered, no matter how minor or small. Many UCP 500 articles have been moved or merged with older articles, while others have been deleted. Decisions on the new draft, is taken using a voting system by ICC's National Committees. Uniform Customs and Practices (Brochure 500):- International Chamber of Commerce rules (commonly referred to as UCP 500 or ICC 500), that are used for letters of credit. These letters then become legally binding when written into the text of the letter. / , например, . Унифицированные Правила и Обычаи для Документарных Аккредитивов (Uniform Rules and Customs for Documentary Credits), Публикация МТП № 500, редакция 1993 (UCP 500) – правила, разработанные Международной Торговой Палатой (МТП), применялись ко всем документарным аккредитивам (включая резервные аккредитивы, в той степени, в какой они могли быть к ним применимы) и являлись обязательными для всех заинтересованных сторон, при отсутствии прямо выраженного соглашения об ином. Они включались в каждый документарный аккредитив путём прямого указания в нём, что данный аккредитив подчинялся Унифицированным Правилам и Обычаям для Документарных Аккредитивов. Унифицированные Правила И Обычаи Для Документарных Аккредитивов:- Публикация № 500 Международной Торговой Палаты (МТП) с детализацией правил и ответственности, связанных с аккредитивами. Заменили UCP 400 в 1993.

UNIFORM CUSTOMS AND PRACTICE FOR DOCUMENTARY CREDITS NO. 600 = УНИФИЦИРОВАННЫЕ ПРАВИЛА И ОБЫЧАИ ДЛЯ ДОКУМЕНТАРНЫХ АККРЕДИТИВОВ № 600 – The Uniform Customs and Practice for Documentary Credits (UCP No. 600) is the official publication issued by the International Chamber of Commerce (ICC). The UCP provisions have determined the rules of engagement between the various parties to a (Letter of Credit (LC) and in particular between the banks involved in a transaction in some capacity. The last version of the UCP – UCP No. 500 – has been in force since 1993 and is now to be replaced with the revision titled UCP No. 600. In May 2003, the International Chamber of Commerce authorized the ICC Commission on Banking Technique and Practice (Banking Commission) to begin a revision of the Uniform Customs and Practice for Documentary Credits, ICC Publication No. 500. The UCP No. 600 has taken over 4 years to develop and deliver a more proactive business oriented set of rules for those involved in international trade. The UCP No. 600 comes into effect from 2007-July-01. All banks are expected to issue new LCs under the UCP No. 600 guidelines from that date. Existing LCs covered by earlier versions of UCP will continue until their maturity. The Uniform Customs and Practice for Documentary Credits (UCODC) No. 600 or UCP 600 is a ICC Publication that includes a set of rules which govern international documentary credit practice. UCP 600 are generally considered contractually incorporated into the documentary credit transaction by virtue of a mention in the credit application form. The UCP 600 may also have additional force as a trade custom, and in some countries UCP 600 are even recognized as having legal effect generally. In other countries, the UCP 600 is complementary to national law and jurisprudence on documentary credits. / Унифицированные Правила и Обычаи для Документарных Аккредитивов, Публикация МТП № 600, редакция 2007 (UCP 600) вступили в силу с 01 Июля 2007 и действуют наряду с правилами UCP 500, редакции 1993. Новая редакция Унифицированных Правил UCP 600 – результат трёхлетней работы рабочей группы, созданной Комиссией по Банковской Технике и Практике МТП. UCP 600 отражают современные тенденции в сфере аккредитивного бизнеса, учитывают решения, принятые на заседаниях Банковской комиссии МТП по спорным вопросам применения предыдущей редакции UCP 500, направлены на популяризацию использования аккредитивов в международной торговле.

UNIFORM DISPUTE RESOLUTION POLICY = УНИФИЦИРОВАННАЯ ПОЛИТИКА РАЗРЕШЕНИЯ СПОРОВ – Uniform Dispute Resolution Policy (UDRP):- all Internet Corporation for Assigned Names and Numbers (ICANN)-accredited registrars follow a uniform dispute resolution policy. Under that policy, disputes over entitlement to a domain-name registration are ordinarily resolved by court litigation between the parties claiming rights to the registration. Once the courts rule who is entitled to the registration, the registrar will implement that ruling. In disputes arising from registrations allegedly made abusively (such as 'cybersquatting' and 'cyberpiracy'), the uniform policy provides an expedited administrative procedure to allow the dispute to be resolved without the cost and delays often encountered in court litigation. In these cases, you can invoke the administrative procedure by filing a complaint with one of the dispute-resolution service providers. / Унифицированная Политика Разрешения Споров (УПРС) по доменным именам:- все аккредитованные Корпорацией Интернета по Распределению Имён и Номеров (КИРИН) регистраторы подчиняются требованиям единой политики разрешения споров по доменным именам. Согласно этой политике, споры, возникающие в отношении регистрации доменного имени, должны решаться в судебном порядке между сторонами, желающими зарегистрировать одно и то же доменное имя. Как только суд определит в своём решении лицо, которое имеет право на регистрацию домена, регистратор будет обязан следовать этому постановлению. На случай возникновения споров в связи с регистрацией, осуществленной со злым умыслом (такой как киберсквоттинг и киберпиратство), единая политика предусматривает оперативную административную процедуру разрешения спора без больших затрат и задержек, которые часто присущи судебным разбирательствам. В этих случаях можно ходатайствовать о проведении административной процедуры, подав жалобу одному из поставщиков услуг разрешения споров.

UNIFORM DRESS = ФОРМЕННАЯ ОДЕЖДА – Uniform Dress:- of a distinctive design or fashion worn by members of a particular group and serving as a means of identification; broadly, distinctive or characteristic clothing.

UNIFORM GIFTS TO MINORS ACT = АКТ О ЕДИНЫХ ДАРАХ НЕСОВЕРШЕННОЛЕТНИМ – Uniform Gifts to Minors Act (UGMA) is a legislation that provides a tax-effective manner of transferring property to minors without the complications of trusts or guardianship restrictions. / Единый Акт о Дарениях Несовершеннолетним (Uniform Gifts to Minors Act (UGMA)):- акт, действующий в большинстве штатов США, устанавливает простое правило передачи активов на имя ребёнка и управления ими без осложнений формального траста и ограничений попечительства по распоряжению имуществом несовершеннолетнего. Во многих штатах дарение в соответствии с UGMA может быть совершено как путём прижизненного подарка, так и по завещанию (will) дарителя. UGMA подразумевает, что прижизненные подарки стоимостью до 10 000 Долларов США освобождаются от налога на дарение. Имущество UGMA управляется попечителем (custodian), который назначается дарителем. Если даритель называет себя попечителем и если он умирает до того, как имущество будет передано несовершеннолетнему, то стоимость доверительного имущества в момент смерти дарителя-попечителя включается в облагаемое налогом имущество дарителя-попечителя, даже если имущество принадлежит несовершеннолетнему с того момента, когда сделан подарок согласно UGMA. Управляемое имущество должно быть передано несовершеннолетнему, когда он достигнет возраста, установленного в штатовском законе UGMA, согласно которому совершено дарение. В большинстве штатов это – 18 лет, но в некоторых – 21. В Штате Нью Йорк – 18 лет, если только даритель в момент дарения не упомянет возраст (21 год). Некоторые штаты приняли Единый Акт о Передаче Средств Несовершеннолетним (Uniform Transfers to Minors Act (UTMA)), который в одних случаях дополняет, а в других – заменяет UGMA.

UNIFORMITARIANISM = УНИФОРМИТАРИАНИЗМ (или ХХ) – Uniformitarianism:- in geology, the doctrine that existing processes acting in the same manner and with essentially the same intensity as at present are sufficient to account for all geologic change. Uniformitarianism posits that natural agents now at work on and within the Earth have operated with general uniformity through immensely long periods of time. When William Whewell, a University of Cambridge scholar, introduced the term in 1832, the prevailing view (called Catastrophism) was that the Earth had originated through supernatural means and had been affected by a series of catastrophic events such as the biblical Flood. In contrast to the catastrophic view of geology, the principle of uniformity postulates that phenomena displayed in the rocks may be entirely accounted for by geologic processes that continue to operate at the present day – in other words, the present is the key to the past. This principle is fundamental to geologic thinking and underlies the whole development of the science of geology. The expression uniformitarianism, however, has passed into history, for the controversy between catastrophists and uniformitarians has largely died. Geology as an applied science draws on the other sciences, but in the early XIX century geologic discovery had outrun the physics and chemistry of the day. As geologic phenomena became explicable in terms of advancing physics, chemistry, and biology, the reality of the principle of uniformity as a major philosophical tenet of geology became established and the controversy ended. The idea that the laws that govern geologic processes have not changed during the history of the Earth were articulated by the XVIII-century Scottish geologist James Hutton, who in 1785 presented his ideas – later published in two volumes as Theory of the Earth (1795) – at meetings of the Royal Society of Edinburgh. In this work Hutton showed that the Earth had a long history and that this history could be interpreted in terms of processes observed at the present, of which he gave examples. He showed, for instance, how soils were formed by the weathering of rocks and how layers of sediment accumulated. He stated that

there was no need of any preternatural cause to explain the geologic record. Hutton's proposal challenged the concept of a biblical Earth (with a history of some 6 000 years) that was created especially to be a home for man; the effect of his ideas on the learned world can be compared only with the earlier revolution in thought brought about by Nicolaus Copernicus, Johannes Kepler, and Galileo when they displaced the concept of a universe centered on the Earth with the concept of a solar system centered on the Sun. Both advances challenged existing thought and were fiercely resisted for many years. In the publication Principles of Geology, 3 Vol. (1830–33), the Scottish geologist Sir Charles Lyell deciphered the history of the Earth employing Huttonian principles and made available a host of new geologic evidence in support of the view that physical laws were permanent and that any form of supernaturalism can be rejected. Lyell's work in turn profoundly influenced Charles Darwin, who recognized Lyell as having produced a revolution in science. The publication in 1859 of the conclusions of Darwin and Alfred Wallace on the origin of species extended the principle of uniformity to the plant and animal kingdoms. Although the catastrophists continued to fight a rearguard action against the Huttonian-Lyellian-Darwinian view until the end of the century, a new criticism was raised by William Thomson (later Lord Kelvin), one of the leading researchers on thermodynamics. Thomson pointed out that the Earth is losing heat by conduction and that the nature of geologic processes may have changed as a consequence; he also concluded that this cooling placed an upper limit on the age of the Earth. With the discovery of radioactivity and the recognition that radioactive isotopes within the Earth provide a continuing internal source of heat, it became clear that Thomson's conclusion that the Earth was less than 100 million years old was incorrect, but his argument that the Earth suffers an irreversible loss of energy remains valid. This heat loss, owing in part to the decay of the heat-producing radionuclides, has an important consequence. Although the principle of uniformity is correct in that physical laws have not changed over geologic time, the behaviour of the Earth has altered as temperatures have fallen. One important consequence is that the extent of igneous activity and movement of the crust has changed during geologic time. It is possible that the plate tectonism that operates today and that has operated in past geologic intervals of time was preceded by somewhat different processes of deformation during Precambrian times. / Английский учёный Вильэм Хивэл (William Whewell; 1794–1866). Шотландский геолог Дьжеймз Хатэн (James Hutton; 1726–1797). Польский математик и астроном Николяус Цопэрницус (Nicolaus Copernicus; 1473–1543), Немецкий математик, астроном и астролог Йоханэс Кэпля (Johannes Kepler; 1571–1630), и Итальянский учёный Галилео Галилей (Galileo Galilei; 1564–1642). Шотландский геолог Сэр Чалз Лайэл (Sir Charles Lyell; 1797–1875). Английский натуралист, геолог и биолог Чалз Робэтч Давин (Charles Robert Darwin; 1809–1882). Английский натуралист и исследователь Алфрэд Расэл Волэйс (Alfred Russel Wallace; 1823–1913). Вильэм Томзэн (William Thomson; позже Лорд Келвин (Lord Kelvin); 1824–1907).

UNIFORMITY = ОДНОРОДНОСТЬ – Length Uniformity is the ratio between the mean length and the upper half mean length of the cotton fibers within a sample. It is measured on the same beards of Cotton that are used for measuring fiber length and is reported as a percentage. The higher the percentage, the greater the uniformity. If all the fibers in the sample were of the same length, the mean length and the upper half mean length would be the same, and the uniformity index would be 100. The following tabulation can be used as a guide in interpreting length uniformity results. Measurements are performed by HVI. Cotton with a low uniformity index is likely to have a high percentage of short fibers and may be difficult to process. Also known as Length Uniformity Index. Length Uniformity is the ratio between the mean length and the upper half mean length of the fibers and is expressed as a percentage. If all of the fibers in the bale were of the same length, the mean length and the upper half mean length would be the same, and the uniformity index would be 100. However, there is a natural variation in the length of cotton fibers, so length uniformity will always be less than 100. Length uniformity affects yarn evenness and strength, and the efficiency of the spinning process. It is also related to short fiber content (fiber shorter than one-half-inch). Cotton with a low uniformity index is likely to have a high percentage of short fibers. Such Cotton may be difficult to process and is likely to produce low-quality yarn. The following tabulation can be used as a guide in interpreting length uniformity measurements. / Однородность Длины – это отношение между средней длиной и наибольшей средней длиной хлопковых волокон в пробе. Она измеряется по одинаковым . Высокопроизводительный Инструмент (ВПИ; High Volume Instrument (HVI). Известна также как Индекс По Однородности Длины (Length Uniformity Index). Однородность Длины – это отношение между средней длиной и наибольшей средней длиной волокон, выраженное в процентах. Если бы все волокна в кипе были бы одной длины, то это означало бы, что средняя длина и наибольшая средняя длина были бы равными, а индекс по однородности был бы равен 100 процентам. Однако, существует природное различие в длине волокон, и в этой связи однородность длины будет всегда менее 100 процентов. Однородность длины воздействует на однородность и прочность пряжи, и на производительность процесса прядения. Она также связана с содержанием коротких волокон (волокон, длина которых менее половины дюйма). Хлопок с низким индексом однородности имеет высокое процентное содержание коротких волокон. Такой хлопок может быть труден для переработки и использован лишь для производства низкокачественной пряжи. Предлагаемая таблица может быть использована в качестве пособия в интерпретации измерений однородности длины.

Degree of Uniformity / Уровень Однородности	**Very High** / Очень Высокий	**High** / Высокий	**Intermediate** / Средний	**Low** / Низкий	**Very Low** / Очень Низкий
HVI Length Uniformity Index (Percent) / Индекс по Однородности Длины по ВПИ (в процентах)	Above 85	83 – 85	80 – 82	77 – 79	Below 77

UNIFORMITY INDEX = ИНДЕКС ПО ОДНОРОДНОСТИ – Uniformity Index is the ratio between two span lengths, the smaller value being expressed as a percentage of the higher value. / Индекс По Однородности – соотношение между двумя промежуточными длинами, когда наименьшее значение выражено как процент от наибольшего значения.

UNIFORMITY TRIAL = ИСПЫТАНИЕ НА ОДНОРОДНОСТЬ – Uniformity Trial (Blank Test) is a trial or experiment where all the operations and treatments are the same except that samples of different sizes are used to evaluate heterogeneity. / для вычисления .

UNIFORMLY DISTRIBUTED BONDED LOAD = РАВНОМЕРНО РАСПРЕДЕЛЁННАЯ СВЯЗАННАЯ НАГРУЗКА (или РАВНОМЕРНО РАСПРЕДЕЛЁННЫЙ СВЯЗАННЫЙ ГРУЗ) – Uniformly Distributed Bonded Load is a load spread evenly across the full surface of the pallet top deck, where the pattern of each single layer changes, so that the packages are interlocked. Note:- sacks are an example of a bonded load. / Равномерно Распределённый Связанный Груз:- груз, равномерно распределённый по всей поверхности верхнего настила поддона, при этом каждый ряд груза, уложенного в штабель, не смещается относительно другого ряда. Примечание:- например, заполненные мешки, уложенные в штабель, относятся к равномерно распределённому закреплённому грузу.

UNIFORMLY DISTRIBUTED UNBONDED LOAD = РАВНОМЕРНО РАСПРЕДЕЛЁННАЯ НЕСВЯЗАННАЯ НАГРУЗКА (или РАВНОМЕРНО РАСПРЕДЕЛЁННЫЙ НЕСВЯЗАННЫЙ ГРУЗ) – Uniformly Distributed Unbonded Load is a load spread evenly across the full surface of the pallet top deck where the items are not interlocked, bound or connected. / Равномерно Распределённый Несвязанный Груз:- груз, равномерно распределённый по всей поверхности верхнего настила поддона, при этом отдельные единицы груза не закреплены, не связаны (не соединены) между собой.

UNIFORM MACHINE LANGUAGE EQUIPMENT REGISTER = РЕЕСТР ОБОРУДОВАНИЯ ПО УНИФИЦИРОВАННОМУ МАШИННОМУ ЯЗЫКУ – Universal Machine Language Equipment Register (UMLER) a computer readable file of vital statistics for each railroad car in service. It applies to all railroads, types of cars, and data processing machines.

UNIFORM PRACTICE CODE = КОДЕКС УНИФИЦИРОВАННОЙ ПРАКТИКИ – Uniform Practice Code:- standards of the NASD (short for the National Association Of Securities Dealers) prescribing procedures for handling over-the-counter securities transactions, such as delivery, settlement date, and ex-dividend date. / Кодекс Унифицированной Практики (Uniform Practice Code:- правила Национальной Ассоциации Дельцов с Ценными Бумагами (National Association of Securities Dealers (NASD)) относительно стандартов и процедур касаются текущих сделок с ценными бумагами внеучётного рынка (over the counter), например, поставки, даты расчёта (settlement date), дат, после которых ценные бумаги продаются без права на дивиденды (ex-dividend date), и иных подобных сроков (например, дат, после которых ценные бумаги продаются без прав (ex-rights) или без варрантов (ex-warrants), а также являются основой для разрешения споров в арбитражном суде через Комитеты по Выработке Унифицированных Правил.

UNIFORM RULES FOR COLLECTIONS = УНИФИЦИРОВАННЫЕ ПРАВИЛА ДЛЯ ИНКАССО – Uniform Rules For Collections (URC) is a set of rules published by the International Chamber of Commerce (ICC; Paris, France) to aid bankers, buyers, and sellers in the collections process. The Rules have been prepared to resolve problems that practitioners have experienced in their everyday operations. The URC 522 (last edition) underlines the need for the principal and/or the remitting bank to attach a separate document, the collection instruction, to every collection subject to the Rules – makes it very clear that banks will not examine documents, particularly not to look for instructions – addresses problems based on bank experiences in respect of Documents Against Acceptance (D/A) and Documents Against Payment (D/P) – and clearly indicates that banks have no obligation to store and insure goods when instructed. Uniform Rules for Collections are the International Chamber of Commerce rules on the handling of documentary and clean collections.

UNIFORM RULES FOR CONTRACT GUARANTEES = УНИФИЦИРОВАННЫЕ ПРАВИЛА ДЛЯ КОТРАКТНЫХ ГАРАНТИЙ – Uniform Rules For Contract Guarantees (URCG):- The International Chamber of Commerce (ICC) has established a set of contractual rules that may be used for contract guarantees to achieve a fair balance among the legitimate interests of the three parties involved in contract guarantees, the beneficiary, the principal and the guarantor. These rules are not law, and apply only if the parties to the contract guarantee so choose. Such choice needs to be expressed by a reference in the text of the guarantee. Nevertheless, these rules have been replaced by the Uniform Rules for Demand Guarantees (URDG).

UNIFORM RULES FOR DEMAND GUARANTEES = УНИФИЦИРОВАННЫЕ ПРАВИЛА ДЛЯ ГАРАНТИЙ ПО ТРЕБОВАНИЮ – Uniform Rules For Demand Guarantees (URDG) is a set of contractual rules established by the International Chamber of Commerce (ICC; Paris, France) that may be used for demand guarantees and counter-guarantees. These rules are not law, and apply only if the parties to the demand or counter-guarantee so choose. Such choice needs to be expressed by a reference in the text of the guarantee.

UNIFORM SECURITIES AGENT STATE LAW EXAMINATION = УНИФИЦИРОВАННАЯ ЭКЗАМЕНАЦИЯ АГЕНТОВ ПО ЦЕННЫМ БУМАГАМ СОГЛАСНО ШТАТОВСКОМУ ЗАКОНОДАТЕЛЬСТВУ – Uniform Securities Agent State Law Examination:- a test required in some states for registered representatives who are employees of member firms of the NASD (short for the National Association Of Securities Dealers) or over-the-counter brokers. / Единый Государственный Экзамен по Законодательству для Агентов по Ценным Бумагам (Uniform Securities Agent State Law Examination):- тест, который должны сдать кандидаты зарегистрированным представителям (registered representatives) во многих штатах США. В дополнение к штатовским экзаменационным требованиям, все зарегистрированные представители, являющиеся работниками фирм-членов биржи или брокерами, ведущими операции на внеучётном рынке (over the counter), должны сдать Общий Экзамен для Представителей по Ценным Бумагам (General Securities Representative Examination), также известный как Экзамен секции 7, который проводится Национальной Ассоциацией Дельцов с Ценными Бумагами (НАДЦБ) (National Association of Securities Dealers (NASD)).

UNIFORM SYSTEM OF ACCOUNTS = ОДНООБРАЗНАЯ СИСТЕМА СЧЕТОВ – Uniform System of Accounts:- prescribed financial rules and regulations established by the Federal Energy Regulatory Commission for utilities subject to its jurisdiction under the authority granted by the Federal Power Act.

UNIFORM TRANSFERS TO MINORS ACT = АКТ О ЕДИНЫХ ПЕРЕДАЧАХ НЕСОВЕРШЕННОЛЕТНИМ – Uniform Transfers to Minors Act (UTMA) is a law similar to the Uniform Gifts to Minors Act that extends the definition of gifts to include real estate, paintings, royalties, and patents. / Единый Акт о Передаче Средств Несовершеннолетним (Uniform Transfers to Minors Act (UTMA)):- акт, принят всеми 50 штатами, аналогичен Единому Акту о Дарениях Несовершеннолетним (Uniform Gifts to Minors Act (UGMA)), но отличается от него тем, что расширяет понятие дарения (gifts), определяя их не только как наличные средства или ценные бумаги, но и как недвижимость, картины, гонорары и патенты. UTMA также запрещает несовершеннолетним распоряжаться активами до 21 года (в Калифорнии – до 25 лет).

UNILATERAL = ОДНОСТОРОННЕЕ – Unilateral:- an action taken by a single country on its own initiative, and not in any way dependent upon or conditional upon the actions of any other country or countries.

UNILATERAL TRANSFERS = ОДНОСТОРОННИЕ ПЕРЕДАЧИ – Unilateral Transfers:- items in the current account of the balance of payments of a country's accounting books that correspond to gifts from foreigners or pension payments to foreign residents who once worked in the particular country.

UNIMPROVED PLANT TYPE = НЕУСОВЕРШЕНСТВОВАННЫЙ ТИП РАСТЕНИЯ – Unimproved Plant Type is a traditional plant type; tall, leafy, and susceptible to lodging.

UNINCORPORATED ASSOCIATION = НЕИНКОРПОРИРОВАННАЯ АССОЦИАЦИЯ – In the United States, Unincorporated Association is a contractual relationship between the individual members of the organization, all of whom have agreed or 'contracted' to come together for a particular purpose. In some states, an unincorporated association has no legal identity of its own and in legal terms is only a collection of individuals. Arkansas, however, has adopted the Uniform Unincorporated Nonprofit Associated Act (UUNAA), which allows unincorporated nonprofit associations to receive, hold and transfer real and personal property in the name of the association. The Act also provides limited liability of members such associations from contract and tort liability of the association, while permitting the association to incur liabilities in its own name. The following states have also adopted the UUNAA:- Alabama, Colorado, Delaware, District of Columbia, Hawaii, Idaho, Texas, West Virginia, Wisconsin, Wyoming.

UNINCORPORATED JOINT VENTURE = НЕИНКОРПОРИРОВАННОЕ СОВМЕСТНОЕ ПРЕДПРИЯТИЕ – Unincorporated Joint Venture is a joint venture in which the legal means of dividing the project's equity is by shareholdings in a company.

UNINSURABLE RISK = НЕСТРАХУЕМЫЙ РИСК – Uninsurable Risk is the one not acceptable for insurance due to excessive risk. Uninsurable Risk is a condition that poses unknowable or unacceptable risk of loss or a situation in which the insurance would be against the law. Insurance companies limit their losses by not taking on certain risks that are very likely to result in a loss. Many states offer insurance for otherwise uninsurable risks through their 'high-risk pools'. However, lifetime benefits may be capped and premiums may be expensive. Uninsurable risks are those that would bring down an insurance pool, so they can't be taken on for regular coverage. The basic concept of insurance is that it spreads risk among a large group of people, so they can protect against a large loss by making a small insurance payment. For insurance to work, most of the group has to go without a loss. Otherwise, the insurance company runs out of money. Risk is insurable when the risk is calculable, so an insurable risk is one in which there is either data which feeds statistics, or a known quantity that feeds probability. If a river floods 853 times in a millennium, that flood is an insurable risk. However, you can't insure against a person's business failing or a marriage failing. With so many factors, there's no way an actuary could reasonably calculate anything meaningful. That's the essence of uninsurable risk. High-risk coverage is available from some insurance companies, and people with an uninsurable risks might be able to get some level of coverage this way, but coverage will likely be limited and premiums more expensive. Some governments offer insurance coverage when regular commercial insurance markets can't accept the risk. Government flood insurance, for instance, is available in high-risk areas because regular insurance companies won't write the policies. Why Uninsurable Risk is Difficult to Define:- Calling a risk uninsurable is not a simple conclusion to make. Some risks are clearly uninsurable because of the law, such as coverage for criminal fines and penalties. The law actually forbids such coverage. However, there isn't really a conclusive comprehensive list of all the uninsurable risks out there. Part of the job of corporate risk managers is to identify their organizational exposures as best they can and then work to manage or eliminate those risks. Sometimes, commercial insurance can be used to remove the bulk of that risk, but it's not always possible. While some coverage is available in some situations, there are five types of threats, which are mostly uninsurable:- risk to reputation, regulatory risk, trade secret risk, political risk and pandemic risk. See also Risk. / Нестрахуемый Риск или Не Подлежащий Страхованию Риск (Uninsurable Risk):- риск, не принимаемый для страхования вследствие чрезмерного риска. Смотрите также Риск (Risk). Нестрахуемый Риск – это риск, страхования которого избегает большинство страховых компаний из-за того, что вероятность связанных с ним убытков почти непредсказуема. Можно застраховаться от стихийных бедствий, таких как наводнение или землетрясение. Но страховые компании всегда неохотно рассматривают возможность сотрудничества в тех случаях, когда риск связан с акциями правительства или общей экономической ситуацией. Такие неопределённые факторы, как изменения законодательства и экономические колебания, выходят за рамки страхования. Иногда нестрахуемые риски становятся страхуемыми, когда набирается достаточно данных для точной оценки предстоящих убытков. К нестрахуемым рискам относятся:- (i) Рыночные Риски – факторы, которые могут привести к потере собственности или дохода, такие как:- сезонные или циклические изменения цен; безразличие потребителей; изменения моды; конкурент, предлагающий более высококачественный товар; (ii) Политические Риски – опасность возникновения таких событий, как:- смена правительства; война; ограничения свободной торговли; необоснованные или чрезмерные налоги; ограничения свободного обмена валюты; (iii) Производственные Риски – опасность таких факторов, как:- неэкономическая работа оборудования; нехватка сырьевых ресурсов; необходимость решать технические проблемы; забастовки, прогулы, трудовые конфликты; и (iv) Личные Риски – опасность таких факторов, как:- безработица; бедность вследствие развода, недостатка образования, отсутствия возможности получить работу или потери здоровья на военной службе.

UNINSURED MOTORIST INSURANCE = СТРАХОВАНИЕ ОТ НЕЗАСТРАХОВАННОГО МОТОРИСТА – Uninsured Motorist Insurance is the insurance that covers the policyholder and family if they are injured by a hit-and-run or uninsured motorist, assuming the other driver is at fault. / Страхование Незастрахованного Водителя (Uninsured Motorist Insurance):- форма страхования, предусматривающая выплату владельцу полиса и членам его семьи компенсации за телесное повреждение, причинённое водителем, у которого нет страхования ответственности и который тут же удирает (при условии, что этот водитель виноват). В большинстве случаев все виды ущерба, связанные с несчастным случаем, будут компенсированы. Премии за незастрахованное покрытие действий водителя, как правило, очень скромные и включены в обычный полис страхования автомобиля.

UNINTERRUPTIBLE POWER SUPPLY = БЕСПЕРЕБОЙНАЯ ПОСТАВКА ЭНЕРГИИ – Uninterruptible Power Supply (UPS):- a device that provides a constant regulated voltage output in spite of interruptions of the normal power supply. It includes filtering circuits and is usually used to feed computers or related equipment which would otherwise shutdown on brief power interruptions.

UNINTIMATED CLAIMS = НЕЗАЯВЛЕННЫЕ ПРЕТЕНЗИИ – Unintimated Claims represent claims relating to incidents occurred before year-end and only reported to the insurance company after year-end.

UNINVESTED = НЕПРОИНВЕСТИРОВАННОЕ – Uninvested:- usually refers to cash that could be invested but is being held in reserve.

UNION CLOTH = ОБЪЕДИНЁННОЕ ПОЛОТНО – Union Cloth is a traditional name for fabric made from two or more different fibers, such as a fabric woven with a wool worsted warp and a cotton filling. The term 'Union Cloth' was used primarily when this fabric was used for underwear, perhaps because a union suit was another name for shoulder-to-ankle, one-piece underwear. See also Union Suit. Union Cloth is a term describing a fabric woven from two or more types of yarn. For example, a union cloth may have a cotton warp and a wool filling. See also Combination Fabric. / основа и хлопковая уточина. Например, полульняная, полушерстяная или полушёлковая ткань, то есть ткань из разных видов волокна.

UNION DES FOIRES INTERNATIONALES = ЮНЬЁН ДЭ ФУАР ЭТЭРНАСЬЁНАЛЬ (или СОЮЗ МЕЖДУНАРОДНЫХ ЯРМАРОК) – Union des Foires Internationales (UFI; the French name) or Union of International Fairs) was founded in Milan, Italy, on 1925-April-15, by 20 leading European international trade fairs, namely:- Bordeaux, Brussels, Budapest, Cologne, Danzig, Frankfurt/Main, Leipzig, Ljubljana, Lvov, Lyon, Milan, Nizhny Novgorod, Padua, Paris, Prague, Reichenberg, Utrecht, Valencia, Vienna and Zagreb. UFI is the association of the world's leading tradeshow organisers and fairground owners, as well as the major national and international associations of the exhibition industry, and its partners. As a privileged forum for dialogue, UFI's main goal is to represent its members and the exhibition industry worldwide. By promoting the unique characteristics of trade fairs:- (i) UFI plays the role of an efficient networking platform where professionals of the exhibition industry can exchange ideas and experiences; (ii) UFI promotes trade fairs and exhibitions globally as a unique marketing and communications tool; (iii) UFI provides UFI members with valuable studies and research regarding all aspects of the exhibition industry; (iv) UFI offers educational training opportunities and a variety of high-level seminars; and (v) UFI deals with issues of common interest for its members in the frame of the regular meetings of its regional chapters and working committees. UFI represents 496 member organizations (composed of 263 Exhibition Organisers, 47 Hall Owner Managers, 120 Exhibition Organisers & Hall Owner Managers, 37 Associations and 25 Partners of the exhibition industry), present in 196 cities in 84 countries on the 6 continents. UFI has bestowed its quality label upon over 786 trade fairs and exhibitions organised by its members. As leading international tradeshow organizers, UFI members currently represent:- (i) more than 4 000 trade

fairs and exhibitions; (ii) more than 50 million square meters of exhibition space rented annually; (iii) more than 1 million exhibitors participating in these events each year; and (iv) more than 150 million visitors attending these events annually. UFI members owning exhibition centers represent a total gross rentable exhibition space of more than 12 million square meters. Headquarters are in Paris, France. Also known as The Global Association Of The Exhibition Industry. UFI Development:- from an organization representing European interests to one representing those of the global exhibition industry. 1925 to 1937:- first years of development. The primary objective of UFI was to develop cooperation among European international trade fairs in order to revitalise international commerce after World War I In 1937, UFI represented 33 member organizations. 1947 to 1956:- international challenges. After a 10-year interruption due to World War II, UFI activities resumed in 1947. UFI headquarters moved from Milan to Paris, and the 24 remaining UFI members renewed their efforts contributing toward economic recovery. In the context of international trade liberalisation, trade fairs from non-European countries began to join UFI during this period. 1957 to 1975:- extensive economic changes. With the rise of mass production and the emergence of various trade sectors, specialised exhibitions were also invited to join the growing UFI organization. However, in order to avoid a confusing membership structure, it was decided that tradeshow organising companies, not individual events; would be eligible for UFI membership status. Nevertheless; individual trade fairs and exhibitions could receive UFI recognition and approval status after meeting UFI evaluation criteria. As a strictly non-political international organization, UFI was a privileged forum of communication for tradeshow organisers from the Eastern and Western blocks working toward common goals. In 1975, UFI represented 99 member organizations in 40 countries, organising 119 specialised exhibitions and 55 general trade fairs. 1976 to 1990:- integration and maturity in a global economy. Within the framework of ever-increasing trade globalisation, UFI faced the new challenge to facilitate the integration of developing and industrialising countries into the trade fair economy. UFI's program focused on providing advisory services and training courses. Significant efforts were made to develop cooperation agreements between UFI members and trade fair representatives present in the newly developing nations succeeding the former European colonies. In 1991, UFI had 153 members, including 110 in Europe, 21 in Asia, 9 in Africa, 7 in South America, 5 in North America, and 1 in Australia. UFI had succeeded in bringing together trade fair organizations from all five continents and could truly claim to be a global organization. 1991–2000:- focus on Marketing. With the easing of East/West commercial barriers and the growth of new means of electronic communication, the trade fair industry had to face new challenges. In this context, UFI has expanded its services to its members through a wide range of educational seminars, and regular meetings of its technical committees and regional chapters. In addition, new categories of members have been allowed to join UFI:- national and international associations of the trade fair sector, fairground owners who do not organise exhibitions, and organizations controlling exhibition statistics and developing exhibition industry research. Since 2001:- New Horizons through new partnership agreements. UFI recently decided to expand its membership base to include national trade fair organisers, and partners of the exhibition industry. UFI has also formed new alliances and partnerships with key organizations of the exhibition business. / Союз Международных Ярмарок или, как это звучит на Французском языке по месту регистрации союза, Юньён дэ Фуар Этэрнасьёналь (Ю.Эф.И.; Union des Foires Internationales (UFI)). коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо).

UNION DOUANIÈRE ET ÉCONOMIQUE DE L'AFRIQUE CENTRALE = ЮНЬЁН ДУАНЬЭР Э ЭКОНОМИКЬ ДЁ Л'ЯФРИКЬ СОТРАЛЬ (или ТАМОЖЕННЫЙ И ЭКОНОМИЧЕСКИЙ СОЮЗ ЦЕНТРАЛЬНОЙ АФРИКИ) – Union Douanière Et Économique De L'Afrique Centrale (UDEAC):- established by the Brazzaville Treaty in 1966, formed a customs union with free trade area between members and a common external tariff for imports from other countries. UDEAC signed a treaty for the establishment of a Economic and Monetary Community of Central Africa (Communauté Économique et Monétaire de l'Afrique Centrale (CEMAC) established by Cameroon, Central African Republic, Chad, Republic of Congo, Equatorial Guinea and Gabon to promote economic integration among countries that share a common currency, the CFA Franc. UDEAC signed a treaty for the establishment of CEMAC to promote the entire process of sub-regional integration through the forming of monetary union with the Central Africa CFA Franc as a common currency; it was officially superseded by CEMAC in June 1999 (through agreement from 1994) to promote the entire process of sub-regional integration through the forming of monetary union with the Central Africa CFA Franc as a common currency; it was officially superseded by CEMAC in June 1999 (through agreement from 1994). See also Customs And Economic Union Of Central Africa. / Юньён Дуаньэр Э Экономикь Дё Л'Яфрикь Сотраль (Ю.Дэ.Ё.А.Сэ.; Union Douanière Et Économique De L'Afrique Centrale (UDEAC). Дё Л'Яфрикь Сотраль (Сэ.Ё.Эм.А.Сэ.; Communauté Économique et Monétaire de l'Afrique Centrale (CEMAC)). Сэ.Эф.А. Франк (CFA Franc).

UNION DYE = ОБЪЕДИНЁННЫЙ (или СОЕДИНЁННЫЙ) КРАСИТЕЛЬ – Union Dye is a dye that is a mixture of two or more different classes of dye, used typically to dye blends of fibers. 'Household' dyes, of the sort sold in grocery stores, are usually union dyes containing a direct dye which will work on cellulose fibers, and an acid dye which will work on wool or nylon. Industrially, union dyes may be other combinations, such as reactive and disperse dyes for dyeing cotton-polyester blends (often with two distinctly different sub-processes). / Найлан[T3] (Nylon[TM]).

UNION DYEING = ОБЪЕДИНЁННОЕ (или СОЕДИНЁННОЕ) КРАШЕНИЕ – Union Dyeing is a method of dyeing a fabric containing two or more fibers or yarns to the same shade so as to achieve the appearance of a solid colored fabric. See also Dyeing. Union Dyeing is a dyeing different fibers in the same cloth in one shade. Union Dyeing is the dyeing of two or more dissimilar fibers in the same fabric to the same shade in single or successive dye baths. / Крашение Смешанных Волокон.

UNION FOR PROTECTION OF NEW VARIETIES OF PLANTS = СОЮЗ ПО ЗАЩИТЕ НОВЫХ РАЗНОВИДНОСТЕЙ РАСТЕНИЙ – Union for Protection of New Varieties of Plants (UPOV) is a group of the world's countries that have jointly agreed to mutually protect the intellectual property (of owners, breeders) that is inherent in new plant varieties developed by man. These intellectual property protections are often collectively referred to as 'Breeder's Rights'.

UNION INTERNATIONALE DES CHEMINS DE FER = ЮНЬЁН ЭТЭРНАСЬЁНАЛЬ ДЭ ШМЭН ДЁ ФЭР (или МЕЖДУНАРОДНЫЙ СОЮЗ ЖЕЛЕЗНЫХ ДОРОГ) – Union International Des Chemins De Fer is the French name of the International Union Of Railways. See also the International Union Of Railways. / Смотрите также Международный Союз Железных Дорог (The International Union Of Railways).

UNION INTERNATIONALE DES TRANSPORTS ROUTIERS = ЮНЬЁН ЭТЭРНАСЬЁНАЛЬ ДЭ ТРАНСПОР РУТЭР (или МЕЖДУНАРОДНЫЙ АВТОТРАНСПОРТНЫЙ СОЮЗ) – Union Internationale Des Transports Routiers is the French name of the International Road Transport Union (IRU); an international trade organisation for the road transport industry. See also The International Road Transport Union. / Смотрите также Международный Автотранспортный Союз (The International Road Transport Union).

UNION SHOP = ПРОФСОЮЗНАЯ ЛАВКА (или ХХ) – Union Shop:- arrangement under which workers are required to join a particular union within a specified period of time after beginning employment. Such an arrangement differs from the closed shop in that the employer's choice of new employees is not restricted to union members. The justification given for the union shop is that it prevents workers from enjoying the benefits of unionism without bearing their share of the costs of such representation. Union shop agreements are uncommon in most countries, where one union seldom gains exclusive bargaining rights for all the workers of a plant. In the United

States, however, where a single union may be chosen by majority vote to represent all the workers, and in Japan, where a single union customarily represents all the employees of an enterprise, union shop agreements are both legal and common. In some states of the United States, however, so-called right-to-work laws prohibit requiring union membership as a condition of employment, thus forbidding both the union shop and the closed shop.

UNION SUIT = КОМБИНЕЗОН (или СОЕДИНЁННЫЙ КОСТЮМ) – Union Suit is a one-piece knitted undergarment extending from the neck to the knee or longer. Union Suit is an undergarment with shirt and drawers in one piece.

UNIQUE BILL OF LADING IDENTIFIER = УНИКАЛЬНЫЙ ИДЕНТИФИКАТОР КОНОСАМЕНТА (или ИДЕНТИФИКАТОР УНИКАЛЬНОСТИ КОНОСАМЕНТА) – Unique Bill Of Lading Identifier:- in the United States (US) the Customs authorities require that all shipping documents covering cargo imported into the US be marked with an identity code, identifying the issuer of tile bill of lading. Even if bills of lading are issued by charterers, the ultimate responsibility for obtaining the Code number from the Customs authorities may lie with the shipowners or their agents. The master becomes liable to penalties for failure and the master usually represents the shipowner. The Baltic and International Maritime Council (BIMCO) has recommended that all time charters, which relate to the US trade contain a 'Unique Bill of Lading Identifier' clause requiring the charterers to obtain the Unique Bill of Lading Identifier and indorse the bills of lading with that identifier. The clause should also provide that charterers indemnify the owners if this obligation is not carried out and also bear the risk of delay. US Customs' standardization:- four-alpha code unique to each carrier placed in front of nine digit Bill of Lading (B/L) number. For example, APL's unique B/L Identifier is APLU. Sea-Land uses SEAU. These prefixes are also used as the container identification. / Хозяин (или капитан) становится . В стандартизации Таможни США, код, состоящий из четырёх букв, единственный в своём роде, который каждый перевозчик размещает в начале девятизначного цифрового номера коносамента. Например, перевозчику Эй.Пи.Эл. (APL) в качестве идентификатора уникальности коносамента был присвоен код Эй.Пи.Эл.Ю. (APLU), а транснациональная корпорация Си-Лэнд (Sea-Land) использовала код Эс.И.Эй.Ю. (SEAU). Эти приставки используются также с целью идентификации контейнеров.

UNIQUE CONSIGNMENT REFERENCE = УНИКАЛЬНАЯ СПРАВКА НА ТОВАРЫ – Unique Consignment Reference (UCR) is a reference, allocated by the Customs freight simplified procedures (CFSP) authorised trader to each import or export consignment, which can be used to trace the consignment through all the trader's records.

UNIQUE DIVERSIFICATION BENEFIT = УНИКАЛЬНАЯ ДИВЕРСИФИКАЦИОННАЯ ВЫПЛАТА – Unique Diversification Benefit:- reduction in the likelihood of financial distress for a conglomerate firm that comes with its diversified investments.

UNIQUE IDENTIFIER = УНИКАЛЬНЫЙ ИДЕНТИФИКАТОР (или ИДЕНТИФИКАТОР УНИКАЛЬНОСТИ) – Unique Identifier shall mean a combination of letters, numbers or symbols specified to the payment service user by the payment service provider and to be provided by the payment service user to identify unambiguously the other payment service user and/or his payment account for a payment transaction.

UNIQUE RISK = УНИКАЛЬНЫЙ РИСК – Unique Risk:- also called Unsystematic Risk or Idiosyncratic Risk. Specific company risk that can be eliminated through diversification. See also Diversifiable Risk, and Unsystematic Risk.

UNIQUE SELLING PROPOSITION = УНИКАЛЬНОЕ ПРЕДЛОЖЕНИЕ ПО ПРОДАЖЕ – The Unique Selling Proposition (USP) is the decisive sales argument for customers to buy a product. USP needs to be communicated, and what the communication is intended to achieve in terms of consumer behaviour in the country concerned. Unique Selling Proposition (USP):- a product benefit that can be regarded as unique and therefore can be used in advertising to differentiate it from the competition. The concept is not now as popular as it was as not every product can have a USP. / Уникальное Качество (Unique Selling Proposition (USP)):- преимущество продукта, которое может рассматриваться уникальным и, следовательно, рекламироваться как отличающее данный продукт от конкурирующей продукции. Концепция рекламы уникального качества в настоящее время не так популярна, как раньше, поскольку далеко не каждый продукт обладает таким качеством.

UNISERIATE = ОДНОРЯДНОЕ – Uniseriate (Latin:- Uniserialis):- arranged in a single row, such as a single row of seeds in a pea pod. Having one line or series.

UNISEXUALITY = ОДНОПОЛОСТЬ – Unisexuality:- in biology, the condition of an organism or Species capable of producing only male or female gametes (sex cells) but never both. A unisexual organism of a bisexual Species is one in which the male and female gonads are found in separate individuals. In plants this condition is often called Dioecism. A unisexual Species is one in which all individuals are of the same sex. Some Species of whiptail lizards, for example, are only female. New individuals grow from eggs that develop without fertilization (parthenogenesis).

UNISSUED STOCK = НЕЭМИТИРОВАННАЯ АКЦИЯ (или НЕЭМИТИРОВАННЫЙ УСТАВНЫЙ КАПИТАЛ) – Unissued Stock:- shares authorized in a corporation's charter, but not issued. / Неэмитированная Акция или Невыпущенная Акция (Unissued Stock):- часть разрешённых в уставе корпорации, но не выпущенных акций. Они указываются в балансовой ведомости предприятия (balance sheet) наряду с выпущенными и находящимися на руках акционеров акциями (issued and outstanding). Невыпущенные акции могут быть выпущены по решению правления, хотя опционы на акции (stock options), права, варранты или конвертируемые ценные бумаги не могут выпускаться до тех пор, пока эти обязательства не исполнены. По невыпущенным акциям не могут выплачиваться дивиденды, и они не могут участвовать в голосовании. Их не следует путать с собственными выкупленными акциями (treasury stock), которые выпущены, но не находятся на руках акционеров.

UNIT = ЕДИНИЦА – (1) Unit:- when counting, the word 'Unit' means 'One'. For example, if a car dealer expects a shipment of 20 units, that means 20 cars. / Единица (Unit):- (1) В общем значении:- единица измерения. Любая часть количества, принимаемая в качестве стандарта измерений или обмена. Например, на рынке товарно-сырьевой продукции единицей меры Пшеницы является бушель, единицей меры Кофе – фунт, а единицей, использующейся при продаже яиц, – дюжина. Валютной единицей (unit) США является Доллар. (2) В банковских операциях:- банк, действующий только из одного офиса, не имеющий филиалов, как требуется в штатах, имеющих штатовские законы, не разрешающие создавать банковские филиалы. (3) В финансах:- (i) Сегмент (unit) или подразделение (отделение или филиал, производственная линия или завод) компании. (ii) При продаже или производстве – количество, выраженное не в Долларах. Можно сказать, например, что 'объём в единицах продукции упал, но Долларовый объём вырос после того, как были увеличены цены'. (4) В ценных бумагах:- (i) Минимальное число акций, облигаций, товарно-сырьевой продукции или иных единиц торговли, принимаемое для совершения торговых операций на бирже. Смотрите также Odd Lot; Round Lot; и Unit Of Trading. (ii) Группа специалистов на бирже, которые занимаются поддержанием честного и упорядоченного рынка на данные ценные бумаги. Смотрите также Specialist; и Specialist Unit. (iii) Более одного класса ценных бумаг, продающихся на бирже совместно; например, одна обыкновенная акция и один варрант на подписку (subscription warrant) могут продаваться совместно. (iv) При первичном и вторичном размещении ценных бумаг – одна акция или одна облигация.

(2) Unit is a shorthand word for a variety of named ‘Units’, particularly the international unit in pharmacology.

(3) Unit is more than one class of securities traded together, e.g., one common share and three subscription warrants.

(4) Unit of ownership in an investment fund. Embodies the investor’s right, enforceable against the management company, to a share in the assets and income of the investment fund.

UNITAR = UNITED NATIONS INSTITUTE FOR TRAINING AND RESEARCH

UNITARD = ЮНИТАРД (или СПОРТИВНЫЙ КОМБИНЕЗОН) – Unitard is a close-fitting one-piece garment for the torso, legs, feet, and often the arms.

UNIT BENEFIT FORMULA = ФОРМУЛА ВЫГОДЫ ЕДИНИЦЫ (или ФОРМУЛА XX) – Unit Benefit Formula is a method used to determine a participant’s benefits in a defined benefit plan. Involves multiplying years of service by the percentage of salary.

UNIT CELL = РАППОРТ (ПЕРЕПЛЕТЕНИЯ) (или ЕДИНИЧНАЯ ЯЧЕЙКА) – Unit Cell is the smallest repeating volume of a material which fully characterizes the structure. The unit cell may depend upon the property under examination, e.g., geometrical unit cells may be different than mechanical response unit cells. / Раппорт (от Французского слова Rapport, от Rapporter, означающее Приносить Обратно) – повторяющаяся часть (мотив) рисунка (узора) на ткани, трикотаже, вышивке, ковре и тому подобном. Обычно порядок переплетения нитей повторяется как по ширине, так и по длине ткани в каждом последующем раппорте. Число нитей основы, после которого начинают повторяться в прежнем порядке все предыдущие переплетения основных нитей, называется Основным Раппортом. По аналогу раппорт называется Уточным. Прямоугольник, составленный из основных и уточных нитей, число которых равно соответствующим раппортам, называется раппортом переплетения ткани. Раппорт Переплетения, от Французского слова Rapport, от Rapporter, означающее Приносить Обратно) – базовый элемент орнамента, часть узора, повторяющаяся многократно на ткани, трикотаже, вышивке, ковре, обоях и так далее. Так же наименьшее число нитей, бисера и тому подобного при изготовлении узора, после которого повторяется порядок их взаимного перекрытия. Число нитей основы, после которого начинают повторяться в прежнем порядке все предыдущие переплетения основных нитей, называется основным раппортом. Аналогично определённый раппорт для уточных нитей называется уточным раппортом. Прямоугольник, составленный из основных и уточных нитей, число которых равно соответствующим раппорт, называется раппортом переплетения ткани. Раппорт в вязании – повторяющаяся часть рисунка. Раппорт для каждого узора имеет определённое число петель по ширине и определённое число рядов по высоте. На схемах раппорт обычно выделяют, а в тексте начало и конец раппорта обозначают звёздочками (*…*). Петли для симметрии рисунка указывают до и после раппорта. Это значит, что сначала провязывают петли, указанные до раппорта, затем повторяют комбинацию петель раппорта столько раз, сколько она умещается целиком до конца ряда и, наконец, провязывают петли, указанные после раппорта. Число петель ряда должно быть кратным числу петель раппорта, а петли для симметрии узора указывают дополнительно. Две крайние петли в число петель, образующих рисунок, не входят; их следует учитывать только при наборе петель. Раппорт в шитье – повторяющаяся часть рисунка на ткани, трикотажном полотне, вышивке и тому подобном. Бывает различной величины – от 1.5–2 см до 40–45 см. Большой раппорт требует дополнительного расхода ткани (минимум на его величину). Если раппорт чётко выражен, то при раскрое необходимо так укладывать выкройки, чтобы центральный фрагмент рисунка находился посредине крупных деталей (спинки, полочки), а горизонтальный уровень рисунка был одинаков по всему изделию и совпадал с уровнем рисунка на крупных втачных деталях. Раппорт в плетении – повторяющаяся часть узлов макраме, отражённая на схеме, причём цвета нитей одного и того же раппорта в зависимости от количества раппортов может меняться.

UNIT COST = СЕБЕСТОИМОСТЬ ЕДИНИЦЫ – Unit Cost is the cost associated with a single unit of product; it is calculated as the total cost of producing a product or service divided by the number of units in the run or lot. Unit Cost:- expenditure incurred in producing one unit of a good or service, computed usually as average cost. Unit Cost is a measure of a company’s cost to build or create one unit of product. How It Works (Example):- For example, let’s assume that it costs Company XYZ USD10 000 to purchase 5 000 widgets that it willresell in its retail outlets. Company XYZ’s unit cost is:- USD10 000 / 5 000 = USD2 per unit. Often, calculating unit cost isn’t so simple, especially in manufacturing situations. Usually, unit costs involve variable costs (costs that vary with the number of units made) and fixed costs (costs that don’t vary with the number of units made). For example, at XYZ Restaurant, which sells only pepperoni pizza, the variable expenses per pizza might be:- Flour:- USD0.50, Yeast:- USD0.05, Water:- USD0.01, Cheese:- USD3.00, Pepperoni:- USD2.00, Total:- USD5.56 per pizza. Its fixed expenses per month might be:- Labor:- USD1 500, Rent:- USD3 000, Insurance:- USD200, Advertising:- USD500, Utilities:- USD450, Total:- USD5 650. If company XYZ sells 10 000 pizzas, then its unit cost would be:- Unit Cost = USD5.56 + (USD5 650 / 10 000) = USD6.125. Why It Matters:- Knowing unit cost helps business owners determine when they’ll begin to turn a profit and helps them price their products with that in mind. It provides a dynamic overview of the relationships among revenues, costs, and profits. However, typical variable and fixed costs differ widely among industries. This is why comparison of break-even points is generally most meaningful among companies within the same industry, and the definition of a ‘high’ or ‘low’ break-even point should be made within this context. Unit Cost is the cost of producing one single product, calculated by dividing the cost of producing a group of products by the number produced:- Average unit costs for small and medium-sized enterprises (SMEs) have risen for the 18th quarter in succession; higher/lower unit costs; reduce/cut unit costs. Firms can still cut their unit costs by expanding their markets. A Unit Cost is the total expenditure incurred by a company to produce, store and sell one unit of a particular product or service. Unit costs include all fixed costs, or overhead costs, and all variable costs, or direct material and labor costs. Determining the unit cost is a quick way to check if a company is producing a product efficiently. Unit cost is an important metric for evaluating a ‘unit grower’ stock, or a stock that chiefly produces items that have a low fixed cost. Typically, the larger a company grows, the lower the unit cost of production because of economies of scale. Companies that produce products or provide services often look at unit costs as a way of measuring profitability. Production at the lowest possible cost maximizes profits. The unit cost is not necessarily the retail cost of the product being produced, rather the average cost of producing one unit of a particular item. The unit cost is sometimes referred to as the breakeven point, or minimum price, at which a company must sell the product to avoid losses. A product with a unit cost of USD10 per unit may be sold to customers at twice the price, hence, gaining profit for the company. Variable and Fixed Costs:- Successful companies seek ways to improve the overall unit cost of their products by managing the fixed and variable costs. Fixed costs are production expenses that are not dependent on the volume of units produced. Examples are rent, insurance and salaries. Fixed costs, such as warehousing and the use of production equipment, can be managed through long-term rental agreements. Variable costs vary depending on the level of output produced. They are further divided into direct labor costs and direct material costs. Direct labor costs are the salaries paid to those who are directly involved in production while direct material costs are the cost of materials purchased and used in production. Variable costs can be improved by sourcing materials from the cheapest supplier or by outsourcing the production process to a more efficient manufacturer. For example, Apple outsources its iPhone production to Foxconn of China. Computing for the Unit Cost:- Unit cost is determined by combining the variable costs and fixed costs and dividing by the total number of units produced. For example, if total fixed costs are USD40 000, your variable costs are USD20 000 and you produced 120 000 units. The total production costs are the USD40 000 fixed costs added to the USD20 000 variable costs for

a total of USD60 000. Divide 30 000 units by USD60 000 to get USD2 per unit production costs. Breakeven Analysis:- The calculated the unit cost of production is the breakeven point, the minimum price a unit must be sold to make a profit. For example, if a company produces 1 000 units that cost USD4 per unit and are sold for USD5 per unit. The profit is USD5 minus USD4, or USD1 a unit. If a unit is sold at USD3 per unit, there will be a loss because USD3 minus USD4 (cost) is a loss of USD1 per unit. Unit Cost is the cost of producing a single object to sell. Unit Cost is a fundamental quantity used for businesses ranging in size from a pre-revenue bakery to a certain multi-national smartphone company. This lesson will show you what it is, how to calculate it, and why it is important to know. Definition of Unit Cost:- The simplest way to describe unit cost is the amount of money it takes to produce one unit of whatever you're talking about. Of course, that might be oversimplifying it a little. A giant corporation might build an entire factory to produce a new product with anticipated high demand. Imagine that a popular shoe company wants to design a new high-end shoe. They might spend millions of Dollars on that infrastructure, and it may take years to produce the very first new widget. Literally speaking, the unit cost for the first shoe off that production line might be measured in the millions of Dollars. Not even Michael Jordan can afford that! Let's turn now to the much more precise language of mathematics to better explain. Formula for Unit Cost:- The formula for unit cost is often written like this:- UC = c/u. In the equation, c represents the total costs of producing those items, u is the total number of units, and UC is unit cost for the time period. Typically speaking, the number of units is quite easy to calculate, while calculating the costs is more involved. We're going to talk about three types of costs that will go into our calculations:- fixed costs, direct labor costs, and direct material costs. To make things confusing, direct labor and direct material costs are also lumped together and called 'Variable Costs'. What are those you ask? Well, let's take them one at a time. Fixed Costs are all costs that go into the making of a product that do not vary with the number of units produced. Does the landlord care if your production line was down? No, he's going to expect a rent check regardless of what is happening in your factory. So, rent is a common fixed cost. The same reasoning applies to the cost of equipment used on the production line, property taxes, salaried workers not directly involved with production (such as accountants and management staff), mortgage payments, and insurance payments. Direct Labor Costs are limited to the wages paid to workers directly involved with making the product. Those people making shoes in the factory are making salaries figured in to direct labor costs. Managers and executives aren't direct labor costs, remember? They're fixed costs like we talked about earlier. Direct Material Costs are also limited to materials purchased and used in making the product. Direct labor and materials are also referred to as variable costs, because they change with the number of units produced. Sample Calculations:- Now let's look at how all of this shakes out in a real life situation. Let's calculate the unit cost of one widget, for Company A, for the month of June, given the following information for that time period:- Units Produced = 12 000, Direct Labor Costs = USD35 000, Direct Material Costs = USD25 000, Fixed Costs = USD22 000. To solve this we use our equation UC = c/u and substitute what we know:- UC = (USD35 000 + USD25 000 + USD22 000) / (12 000 units), UC = USD82 000 / 12 000 units, UC = USD6.83/unit, ... Unit Cost is the amount of money that it costs a company to produce one article. For example:- They aim to reduce unit costs through extra sales. The Unit Cost of a product is the actual cost of making one item. For example:- (i) You may also need to calculate total cost based on unit cost and number of items when you are ordering several items of the same kind. (ii) The margin for retailers and wholesalers is the difference between the product's selling price and its unit cost. (iii) The unit cost of a product is the actual cost of making one item. The Unit Cost is the cost incurred by a company to produce, store and sell one unit of a particular product. Unit costs include all fixed costs and all variable costs involved in production. Cost unit is the standard unit for buying the minimum of any product. Unit cost is the minimum cost for buying any standard unit. Unit Cost:- expenditure incurred by an organization expressed as a rate per unit of production or sales. It may be difficult to make valid comparisons of unit costs between organizations. The main problem is the arbitrary allocation of fixed overhead costs. / пица пэпэрони (pepperoni pizza). Американская компания Эпл (Apple) передала функцию производства своего айФона (iPhone) в Китай компании Факсон (Foxconn). Майкэл Дьжодэн (Michael Jordan). Себестоимость Единицы Продукции (Unit Cost):- себестоимость единицы продукции, например, себестоимость одного холодильника, изготавливаемого его производителем, или стоимость одного компонента (детали), если речь идёт о производителе деталей для автомобилей. На железной дороге это себестоимость одной пассажиро-мили. Себестоимость Единицы Продукции (Unit Cost):- все производственные затраты, отнесённые на единицу готовой продукции. Обычно рассчитывается делением суммы производственных затрат на заказ (работу, партии изделий) или за период на соответствующее количество единиц произведённой продукции. Себестоимость Продукции – сумма всех затрат предприятия (объединения) на производство и реализацию продукции. Различают:- (i) полную себестоимость, в которую включаются затраты на сырьё, основные и вспомогательные материалы, топливо, энергию, амортизацию основных фондов, заработная плата работников предприятия с начислениями и непроизводственные расходы; и (ii) фабрично-заводскую себестоимость, в которую включаются затраты на сырьё, основные и вспомогательные материалы, топливо, энергию, амортизацию основных фондов, заработная плата работников предприятия с начислениями. Себестоимость – один из важнейших качественных показателей эффективности производства, обеспечивающий контроль затрат живого и овеществлённого труда и отражающий результаты хозяйственной деятельности предприятия. Отношение чистого дохода (прибыли) к себестоимости выражает уровень рентабельности производства. В практике планирования исчисляется себестоимость всей продукции (по элементам затрат) и себестоимость единичного изделия (по статьям и калькуляции). Себестоимость – основа ценообразования, определения уровня оптовых цен.

UNIT COST ANALYSIS SCHEDULE = АНАЛИЗНЫЙ ПЕРЕЧЕНЬ СЕБЕСТОИМОСТИ ЕДИНИЦЫ (или РАСЧЁТ СЕБЕСТОИМОСТИ ЕДИНИЦЫ ПРОДУКЦИИ) – Unit Cost Analysis Schedule:- xxxxx. / Расчёт Себестоимости Единицы Продукции:- разработанная схема в попроцессном методе учёта затрат и калькулирования себестоимости, используемая для аккумулирования всех затрат на счёте Незавершённое Производство для каждого подразделения или производственного процесса и для расчёта себестоимости условной единицы продукции по материальным затратам и по затратам на обработку.

UNITED ARAB EMIRATES DIRHAM = ДИРХАМ ОБЪЕДИНЁННЫХ АРАБСКИХ ЭМИРАТОВ – United Arab Emirates Dirham:- AED is the three-letter currency ISO code representing the currency of the United Arab Emirates which is commonly known as the Dirham.

UNITED AUTOMOBILE WORKERS = ОБЪЕДИНЁННЫЕ АВТОМОБИЛЬНЫЕ РАБОЧИЕ – United Automobile Workers (UAW):- xxxxx. / Объединённые Автомобильные Рабочие:- объединенный профсоюз рабочих автомобильной и авиакосмической промышленности и сельскохозяйственного машиностроения Америки, United Automobile, Aerospace and Agricultural Implement Workers of America.

THE UNITED KINGDOM = СОЕДИНЁННОЕ КОРОЛЕВСТВО – The United Kingdom:- broadly, in the accounts, the United Kingdom comprises Great Britain plus Northern Ireland and that part of the continental shelf deemed by international convention to belong to the UK. It excludes the Channel Islands and the Isle of Man. United Kingdom (UK) is the island country located off the northwestern coast of mainland Europe. The United Kingdom comprises the whole of the island of Great Britain – which contains England, Wales, and Scotland – as well as the northern portion of the island of Ireland. The name Britain is sometimes used to refer to the United Kingdom as a whole. The capital is London, which is among the world's leading commercial, financial, and cultural centers. Other major cities include Birmingham, Liverpool, and Manchester in England, Belfast and Londonderry in Northern Ireland, Edinburgh and Glasgow in

Scotland, and Swansea and Cardiff in Wales. The origins of the United Kingdom can be traced to the time of the Anglo-Saxon King Athelstan, who in the early X century AD secured the allegiance of neighbouring Celtic kingdoms and became 'the first to rule what previously many kings shared between them', in the words of a contemporary chronicle. Through subsequent conquest over the following centuries, kingdoms lying farther afield came under English dominion. Wales, a congeries of Celtic kingdoms lying in Great Britain's southwest, was formally united with England by the Acts of Union of 1536 and 1542; Scotland, ruled by an English monarch since 1603, formally was joined with England and Wales in 1707 to form the United Kingdom of Great Britain. (The adjective 'British' came into use at this time to refer to all the kingdom's peoples.) Ireland came under English control during the 1600s and was formally united with Great Britain through the Act of Union of 1800. The republic of Ireland gained its independence in 1922, but the six counties of Ulster remained part of the United Kingdom as Northern Ireland. Relations between these constituent states and England have been marked by controversy and, at times, open rebellion and even warfare. These tensions relaxed somewhat during the late XX century, when devolved assemblies were introduced in Northern Ireland, Scotland, and Wales. Nonetheless, even with the establishment of a power-sharing assembly after referenda in both Northern Ireland and the Irish republic, relations between Northern Ireland's unionists (who favor continued British sovereignty over Northern Ireland) and nationalists (who favor unification with the republic of Ireland) remained tense into the XXI century. The United Kingdom has made significant contributions to the world economy, especially in technology and industry. Since World War II, however, the United Kingdom's most prominent exports have been cultural, including literature, theatre, film, television, and popular music that draw on all parts of the country. Perhaps Britain's greatest export has been the English language, now spoken in every corner of the world as one of the leading international mediums of cultural and economic exchange. The United Kingdom retains links with parts of its former empire through the Commonwealth. It also benefits from historical and cultural links with the United States and is a member of the North Atlantic Treaty Organization (NATO). Moreover, the United Kingdom is a member of the European Union, if a sometimes reluctant one. Many of its people hold to the sentiments of the great wartime Prime Minister Winston Churchill, who sonorously remarked, 'We see nothing but good and hope in a richer, freer, more contented European commonalty. But we have our own dream and our own task. We are with Europe, but not of it. We are linked, but not comprised. We are interested and associated, but not absorbed'. Yet a cosmopolitan, resolutely multicultural United Kingdom – incorporating African, Caribbean, and Asian as well as Anglo-Saxon and Celtic influences – is now firmly joined to the European continent, and the country's former insularity – both literal and metaphorical – and sense of exceptionalism have at least for many given way to a new vision of its place in the world, which continues to be an important one. Land:- The United Kingdom comprises four geographic and historical parts – England, Scotland, Wales, and Northern Ireland. The United Kingdom contains most of the area and population of the British Isles – the geographic term for the group of islands that includes Great Britain, Ireland, and many smaller islands. Together England, Wales, and Scotland constitute Great Britain, the larger of the two principal islands, while Northern Ireland and the republic of Ireland constitute the second largest island, Ireland. England, occupying most of Southern Great Britain, includes the Isles of Scilly off the Southwest coast and the Isle of Wight off the Southern coast. Scotland, occupying Northern Great Britain, includes the Orkney and Shetland islands off the Northern coast and the Hebrides off the Northwestern coast. Wales lies West of England and includes the island of Anglesey to the Northwest. Apart from the land border with the Irish republic, the United Kingdom is surrounded by sea. To the South of England and between the United Kingdom and France is the English Channel. The North Sea lies to the East. To the West of Wales and Northern England and to the Southeast of Northern Ireland, the Irish Sea separates Great Britain from Ireland, while Southwestern England, the Northwestern coast of Northern Ireland, and Western Scotland face the Atlantic Ocean. At its widest the United Kingdom is 300 miles (500 km) across. From the Northern tip of Scotland to the Southern coast of England, it is about 600 miles (1 000 km). No part is more than 75 miles (120 km) from the sea. The capital, London, is situated on the tidal River Thames in Southeastern England. The archipelago formed by Great Britain and the numerous smaller islands is as irregular in shape as it is diverse in geology and landscape. This diversity stems largely from the nature and disposition of the underlying rocks, which are westward extensions of European structures, with the shallow waters of the Strait of Dover and the North Sea concealing former land links. Northern Ireland contains a westward extension of the rock structures of Scotland. These common rock structures are breached by the narrow North Channel. On a global scale, this natural endowment covers a small area – approximating that of the US State of Oregon or the African country of Guinea – and its internal diversity, accompanied by rapid changes of often beautiful scenery, may convey to visitors from larger countries a striking sense of compactness and consolidation. The peoples who, over the centuries, have hewed an existence from this Atlantic extremity of Eurasia have put their own imprint on the environment, and the ancient and distinctive palimpsest of their field patterns and settlements complements the natural diversity. / Англо-Саксонский Король Асэлстэн (Anglo-Saxon King Athelstan; 894–939 AD). Премьер Министр Сэр Винстэн Лэнод Спэнсо-Чёчил (Prime Minister Sir Winston Leonard Spencer-Churchill; 1874–1965). Соединённое Королевство Великобритании и Северной Ирландии:- государство в Западной Европе, на Британских Островах (Остров Великобритания и Северо-Восточная часть Острова Ирландия, Остров Мэн и Нормандские Острова). Соединённое Королевство Великобритании и Северной Ирландии (United Kingdom of Great Britain and Northern Ireland), официальное название государства Великобритания.

THE UNITED KINGDOM – CONTINENT = СОЕДИНЁННОЕ КОРОЛЕВСТВО – КОНТИНЕНТ – The United Kingdom – Continent (UKC) is a tanker market term for the United Kingdom and Northwest European region closest to it. / Соединённое Королевство – Континент (СКК) этот термин является словосочетанием, используемым участниками рынка танкерных перевозок для обозначения региона Соединённого Королевства и части Северо-Западной Европы, наиболее близко расположенной к нему.

UNITED NATIONS = ОБЪЕДИНЁННЫЕ НАЦИИ (или ОРГАНИЗАЦИЯ ОБЪЕДИНЁННЫХ НАЦИЙ) – United Nations (UN) is an international organisation that acts as a forum for discussion and regulates international relations. Head offices are in Geneva and New York. The United Nations (UN) is the largest international organization established on 1945-October-24. The United Nations was the second multipurpose international organization established in the XX century that was worldwide in scope and membership. Its predecessor, the League of Nations, was created by the Treaty of Versailles in 1919 and disbanded in 1946. Headquartered in New York City, the UN also has offices in Geneva, Vienna, and other cities. The name United Nations was originally used to denote the countries allied against Germany, Italy, and Japan. On 1942-January-01, 26 countries signed the Declaration by United Nations, which set forth the war aims of the Allied powers. The first major step toward the formation of the United Nations was taken August 21–October 07, 1944, at the Dumbarton Oaks Conference, a meeting of the diplomatic experts of the Big Three powers plus China (a group often designated the 'Big Four') held at Dumbarton Oaks, an estate in Washington, DC. The Dumbarton Oaks proposals, with modifications from the Yalta Conference, formed the basis of negotiations at the United Nations Conference on International Organization (UNCIO), which convened in San Francisco on 1945-April-25, and produced the final Charter of the United Nations. The San Francisco conference was attended by representatives of 50 countries from all geographic areas of the world:- 9 from Europe, 21 from the Americas, 7 from the Middle East, 2 from East Asia, and 3 from Africa, as well as 1 each from the Ukrainian Soviet Socialist Republic and the Belorussian Soviet Socialist Republic (in addition to the Soviet Union itself) and 5 from British Commonwealth countries. The UN Charter was unanimously adopted and signed on June 26 and promulgated on 1945-October-24. The largest international organization in the world with 178 members and 4 observers, the UN's aim is to maintain international peace and security as well as promote cooperation involving economic, social, cultural and humanitarian problems. United Nations (UN) is the international

organization established on October 24, 1945. The United Nations was the second multipurpose international organization established in the XX century that was worldwide in scope and membership. Its predecessor, the League of Nations, was created by the Treaty of Versailles in 1919 and disbanded in 1946. Headquartered in New York City, the UN also has offices in Geneva, Vienna, and other cities. According to its Charter, the UN aims:- to save succeeding generations from the scourge of war, …to reaffirm faith in fundamental human rights, …to establish conditions under which justice and respect for the obligations arising from treaties and other sources of international law can be maintained, and to promote social progress and better standards of life in larger freedom. In addition to maintaining peace and security, other important objectives include developing friendly relations among countries based on respect for the principles of equal rights and self-determination of peoples; achieving worldwide cooperation to solve international economic, social, cultural, and humanitarian problems; respecting and promoting human rights; and serving as a center where countries can coordinate their actions and activities toward these various ends. The UN formed a continuum with the League of Nations in general purpose, structure, and functions; many of the UN's principal organs and related agencies were adopted from similar structures established earlier in the century. In some respects, however, the UN constituted a very different organization, especially with regard to its objective of maintaining international peace and security and its commitment to economic and social development. Changes in the nature of international relations resulted in modifications in the responsibilities of the UN and its decision-making apparatus. Cold War tensions between the United States and the Soviet Union deeply affected the UN's security functions during its first 45 years. Extensive post-World War II decolonization in Africa, Asia, and the Middle East increased the volume and nature of political, economic, and social issues that confronted the organization. The Cold War's end in 1991 brought renewed attention and appeals to the UN. Amid an increasingly volatile geopolitical climate, there were new challenges to established practices and functions, especially in the areas of conflict resolution and humanitarian assistance. At the beginning of the XXI century, the UN and its programs and affiliated agencies struggled to address humanitarian crises and civil wars, unprecedented refugee flows, the devastation caused by the spread of AIDS, global financial disruptions, international terrorism, and the disparities in wealth between the world's richest and poorest peoples. History And Development:- Despite the problems encountered by the League of Nations in arbitrating conflict and ensuring international peace and security prior to World War II, the major Allied powers agreed during the war to establish a new global organization to help manage international affairs. This agreement was first articulated when US President Franklin D. Roosevelt and British Prime Minister Winston Churchill signed the Atlantic Charter in August 1941. The name United Nations was originally used to denote the countries allied against Germany, Italy, and Japan. On January 01, 1942, 26 countries signed the Declaration by United Nations, which set forth the war aims of the Allied powers. The United States, the United Kingdom, and the Soviet Union took the lead in designing the new organization and determining its decision-making structure and functions. Initially, the 'Big Three' states and their respective leaders (Roosevelt, Churchill, and Soviet premier Joseph Stalin) were hindered by disagreements on issues that foreshadowed the Cold War. The Soviet Union demanded individual membership and voting rights for its constituent republics, and Britain wanted assurances that its colonies would not be placed under UN control. There also was disagreement over the voting system to be adopted in the Security Council, an issue that became famous as the 'veto problem'. The first major step toward the formation of the United Nations was taken August 21–October 07, 1944, at the Dumbarton Oaks Conference, a meeting of the diplomatic experts of the Big Three powers plus China (a group often designated the 'Big Four') held at Dumbarton Oaks, an estate in Washington, DC. Although the four countries agreed on the general purpose, structure, and function of a new world organization, the conference ended amid continuing disagreement over membership and voting. At the Yalta Conference, a meeting of the Big Three in a Crimean resort city in February 1945, Roosevelt, Churchill, and Stalin laid the basis for charter provisions delimiting the authority of the Security Council. Moreover, they reached a tentative accord on the number of Soviet republics to be granted independent memberships in the UN. Finally, the three leaders agreed that the new organization would include a trusteeship system to succeed the League of Nations mandate system. The Dumbarton Oaks proposals, with modifications from the Yalta Conference, formed the basis of negotiations at the United Nations Conference on International Organization (UNCIO), which convened in San Francisco on April 25, 1945, and produced the final Charter of the United Nations. The San Francisco conference was attended by representatives of 50 countries from all geographic areas of the world:- 9 from Europe, 21 from the Americas, 7 from the Middle East, 2 from East Asia, and 3 from Africa, as well as 1 each from the Ukrainian Soviet Socialist Republic and the Belorussian Soviet Socialist Republic (in addition to the Soviet Union itself) and 5 from British Commonwealth countries. Poland, which was not present at the conference, was permitted to become an original member of the UN. Security Council veto power (among the permanent members) was affirmed, though any member of the General Assembly was able to raise issues for discussion. Other political issues resolved by compromise were the role of the organization in the promotion of economic and social welfare; the status of colonial areas and the distribution of trusteeships; the status of regional and defense arrangements; and Great Power dominance versus the equality of states. The UN Charter was unanimously adopted and signed on June 26 and promulgated on October 24, 1945. Organization And Administration:- Principles And Membership:- The purposes, principles, and organization of the United Nations are outlined in the Charter. The essential principles underlying the purposes and functions of the organization are listed in Article 2 and include the following:- the UN is based on the sovereign equality of its members; disputes are to be settled by peaceful means; members are to refrain from the threat or use of force in contravention of the purposes of the UN; each member must assist the organization in any enforcement actions it takes under the Charter; and states that are not members of the organization are required to act in accordance with these principles insofar as it is necessary to maintain international peace and security. Article 2 also stipulates a basic long-standing norm that the organization shall not intervene in matters considered within the domestic jurisdiction of any state. Although this was a major limitation on UN action, over time the line between international and domestic jurisdiction has become blurred. New members are admitted to the UN on the recommendation of the Security Council and by a two-thirds vote of the General Assembly. Often, however, the admittance of new members has engendered controversy. Given Cold War divisions between East and West, the requirement that the Security Council's five permanent members (sometimes known collectively as the P-5) – China, France, the Soviet Union (whose seat and membership were assumed by Russia in 1991), the United Kingdom, and the United States – concur on the admission of new members at times posed serious obstacles. By 1950 only 9 of 31 applicants had been admitted to the organization. In 1955 the 10th Assembly proposed a package deal that, after modification by the Security Council, resulted in the admission of 16 new states (4 eastern European communist states and 12 noncommunist countries). The most contentious application for membership was that of the communist People's Republic of China, which was placed before the General Assembly and blocked by the United States at every session from 1950 to 1971. Finally, in 1971, in an effort to improve its relationship with mainland China, the United States refrained from blocking the Assembly's vote to admit the People's Republic and to expel the Republic of China (Taiwan); there were 76 votes in favor of expulsion, 35 votes opposed, and 17 abstentions. As a result, the Republic of China's membership and permanent Security Council seat were given to the People's Republic. Controversy also arose over the issue of 'divided' states, including the Federal Republic of Germany (West Germany) and the German Democratic Republic (East Germany), North and South Korea, and North and South Vietnam. The two German states were admitted as members in 1973; these two seats were reduced to one after the country's reunification in October 1990. Vietnam was admitted in 1977, after the defeat of South Vietnam and the reunification of the country in 1975. The two Koreas were admitted separately in 1991. Following worldwide decolonization from 1955 to 1960, 40 new members were admitted, and by the end of the 1970s there were about 150 members of the UN. Another significant increase occurred after 1989–90, when many

former Soviet republics gained their independence. By the early XXI century the UN comprised nearly 190 member states. Principal Organs:- The United Nations has six principal organs:- the General Assembly, the Security Council, the Economic and Social Council, the Trusteeship Council, the International Court of Justice, and the Secretariat. General Assembly:- The only body in which all UN members are represented, the General Assembly exercises deliberative, supervisory, financial, and elective functions relating to any matter within the scope of the UN Charter. Its primary role, however, is to discuss issues and make recommendations, though it has no power to enforce its resolutions or to compel state action. Other functions include admitting new members; selecting members of the Economic and Social Council, the nonpermanent members of the Security Council, and the Trusteeship Council; supervising the activities of the other UN organs, from which the Assembly receives reports; and participating in the election of judges to the International Court of Justice and the selection of the Secretary-General. Decisions usually are reached by a simple majority vote. On important questions, however – such as the admission of new members, budgetary matters, and peace and security issues – a two-thirds majority is required. The Assembly convenes annually and in special sessions, electing a new president each year from among five regional groups of states. At the beginning of each regular session, the Assembly also holds a general debate, in which all members may participate and raise any issue of international concern. Most work, however, is delegated to six main committees: (1) Disarmament and International Security, (2) Economic and Financial, (3) Social, Humanitarian, and Cultural, (4) Special Political and Decolonization, (5) Administrative and Budgetary, and (6) Legal. The General Assembly has debated issues that other organs of the UN have either overlooked or avoided, including decolonization, the independence of Namibia, apartheid in South Africa, terrorism, and the AIDS epidemic. The number of resolutions passed by the Assembly each year has climbed to more than 350, and many resolutions are adopted without opposition. Nevertheless, there have been sharp disagreements among members on several issues, such as those relating to the Cold War, the Arab-Israeli conflict, and human rights. The General Assembly has drawn public attention to major issues, thereby forcing member governments to develop positions on them, and it has helped to organize ad hoc bodies and conferences to deal with important global problems. The large size of the Assembly and the diversity of the issues it discusses contributed to the emergence of regionally based voting blocs in the 1960s. During the Cold War the Soviet Union and the countries of Eastern Europe formed one of the most cohesive blocs, and another bloc comprised the United States and its Western allies. The admission of new countries of the Southern Hemisphere in the 1960s and ’70s and the dissipation of Cold War tensions after 1989 contributed to the formation of blocs based on ‘North-South’ economic issues – i.e. issues of disagreement between the more prosperous, industrialized countries of the Northern Hemisphere and the poorer, less industrialized developing countries of the Southern Hemisphere. Other issues have been incorporated into the North-South divide, including Northern economic and political domination, economic development, the proliferation of nuclear weapons, and support for Israel. Security Council:- The UN Charter assigns to the Security Council primary responsibility for the maintenance of international peace and security. The Security Council originally consisted of 11 members – five permanent and six nonpermanent – elected by the General Assembly for two-year terms. From the beginning, nonpermanent members of the Security Council were elected to give representation to certain regions or groups of states. As membership increased, however, this practice ran into difficulty. An amendment to the UN Charter in 1965 increased the council's membership to 15, including the original five permanent members plus 10 nonpermanent members. Among the permanent members, the People’s Republic of China replaced the Republic of China (Taiwan) in 1971, and the Russian Federation succeeded the Soviet Union in 1991. After the unification of Germany, debate over the council’s composition again arose, and Germany, India, and Japan each applied for permanent council seats. The nonpermanent members are chosen to achieve equitable regional representation, five members coming from Africa or Asia, one from eastern Europe, two from Latin America, and two from western Europe or other areas. Five of the 10 nonpermanent members are elected each year by the General Assembly for two-year terms, and five retire each year. The presidency is held by each member in rotation for a period of one month. Each Security Council member is entitled to one vote. On all ‘procedural’ matters – the definition of which is sometimes in dispute – decisions by the council are made by an affirmative vote of any nine of its members. Substantive matters, such as the investigation of a dispute or the application of sanctions, also require nine affirmative votes, including those of the five permanent members holding veto power. In practice, however, a permanent member may abstain without impairing the validity of the decision. A vote on whether a matter is procedural or substantive is itself a substantive question. Because the Security Council is required to function continuously, each member is represented at all times at the UN’s headquarters in New York City. Any country – even if it is not a member of the UN – may bring a dispute to which it is a party to the attention of the Security Council. When there is a complaint, the council first explores the possibility of a peaceful resolution. International peacekeeping forces may be authorized to keep warring parties apart pending further negotiations. If the council finds that there is a real threat to the peace, a breach of the peace, or an act of aggression (as defined by Article 39 of the UN Charter), it may call upon UN members to apply diplomatic or economic sanctions. If these methods prove inadequate, the UN Charter allows the Security Council to take military action against the offending country. During the Cold War, continual disagreement between the United States and the Soviet Union coupled with the veto power of the Security Council’s permanent members made the Security Council an ineffective institution. Since the late 1980s, however, the council’s power and prestige have grown. Between 1987 and 2000 it authorized more peacekeeping operations than at any previous time. The use of the veto has declined dramatically, though disagreements among permanent members of the Security Council – most notably in 2003 over the use of military force against Iraq – have occasionally undermined the council’s effectiveness. To achieve consensus, comparatively informal meetings are held in private among the council’s permanent members, a practice that has been criticized by nonpermanent members of the Security Council. In addition to several standing and ad hoc committees, the work of the council is facilitated by the Military Staff Committee, sanctions committees for each of the countries under sanctions, peacekeeping forces committees, and an International Tribunals Committee. Economic And Social Council:- Designed to be the UN’s main venue for the discussion of international economic and social issues, the Economic and Social Council (ECOSOC) directs and coordinates the economic, social, humanitarian, and cultural activities of the UN and its specialized agencies. Established by the UN Charter, ECOSOC is empowered to recommend international action on economic and social issues; promote universal respect for human rights; and work for global cooperation on health, education, and cultural and related areas. ECOSOC conducts studies; formulates resolutions, recommendations, and conventions for consideration by the General Assembly; and coordinates the activities of various UN programs and specialized agencies. Most of ECOSOC’s work is performed in functional commissions on topics such as human rights, narcotics, population, social development, statistics, the status of women, and science and technology; the council also oversees regional commissions for Europe, Asia and the Pacific, Western Asia, Latin America, and Africa. The UN Charter authorizes ECOSOC to grant consultative status to nongovernmental organizations (NGOs). Three categories of consultative status are recognized:- General Category NGOs (formerly category I) include organizations with multiple goals and activities; Special Category NGOs (formerly category II) specialize in certain areas of ECOSOC activities; and Roster NGOs have only an occasional interest in the UN’s activities. Consultative status enables NGOs to attend ECOSOC meetings, issue reports, and occasionally testify at meetings. Since the mid-1990s, measures have been adopted to increase the scope of NGO participation in ECOSOC, in the ad hoc global conferences, and in other UN activities. ECOSOC has granted consultative status to more than 1 500 NGOs. Originally, ECOSOC consisted of representatives from 18 countries, but the Charter was amended in 1965 and in 1974 to increase the number of members to 54. Members are elected for three-year terms by the General Assembly. Four of the five permanent members of the Security Council – the United States, United Kingdom, Soviet Union (Russia), and France – have been

reelected continually because they provide funding for most of ECOSOC's budget, which is the largest of any UN subsidiary body. Decisions are taken by simple majority vote. Trusteeship Council:- The Trusteeship Council was designed to supervise the government of trust territories and to lead them to self-government or independence. The trusteeship system, like the mandate system under the League of Nations, was established on the premise that colonial territories taken from countries defeated in war should not be annexed by the victorious powers but should be administered by a trust country under international supervision until their future status was determined. Unlike the mandate system, the trusteeship system invited petitions from trust territories on their independence and required periodic international missions to the territories. In 1945 only 12 League of Nations mandates remained:- Nauru, New Guinea, Ruanda-Urundi, Togoland and Cameroon (French administered), Togoland and Cameroon (British administered), the Pacific Islands (Carolines, Marshalls, and Marianas), Western Samoa, South West Africa, Tanganyika, and Palestine. All these mandates became trust territories except South West Africa (now Namibia), which South Africa refused to enter into the trusteeship system. The Trusteeship Council, which met once each year, consisted of states administering trust territories, permanent members of the Security Council that did not administer trust territories, and other UN members elected by the General Assembly. Each member had one vote, and decisions were taken by a simple majority of those present. With the independence of Palau, the last remaining trust territory, in 1994, the council terminated its operations. No longer required to meet annually, the council may meet on the decision of its president or on a request by a majority of its members, by the General Assembly, or by the Security Council. Since 1994 new roles for the council have been proposed, including administering the global commons (e.g., the seabed and outer space) and serving as a forum for minority and indigenous peoples. International Court Of Justice:- The International Court of Justice, commonly known as the World Court, is the principal judicial organ of the United Nations, though the court's origins predate the League of Nations. The idea for the creation of an international court to arbitrate international disputes arose during an international conference held at The Hague in 1899. This institution was subsumed under the League of Nations in 1919 as the Permanent Court of International Justice (PCIJ) and adopted its present name with the founding of the UN in 1945. The court's decisions are binding, and its broad jurisdiction encompasses 'all cases which the parties refer to it and all matters specially provided for in the Charter of the United Nations or in treaties and conventions in force'. Most importantly, states may not be parties to a dispute without their consent, though they may accept the compulsory jurisdiction of the court in specified categories of disputes. The court may give advisory opinions at the request of the General Assembly or the Security Council or at the request of other organs and specialized agencies authorized by the General Assembly. Although the court has successfully arbitrated some cases (e.g., the border dispute between Honduras and El Salvador in 1992), governments have been reluctant to submit sensitive issues, thereby limiting the court's ability to resolve threats to international peace and security. At times countries also have refused to acknowledge the jurisdiction or the findings of the court. For example, when Nicaragua sued the United States in the court in 1984 for mining its harbours, the court found in favor of Nicaragua, but the United States refused to accept the court's decision. The 15 judges of the court are elected by the General Assembly and the Security Council voting independently. No two judges may be nationals of the same state, and the judges are to represent a cross section of the major legal systems of the world. Judges serve nine-year terms and are eligible for reelection. The seat of the World Court is The Hague. Secretariat:- The Secretary-General, the principal administrative officer of the United Nations, is elected for a five-year renewable term by a two-thirds vote of the General Assembly and by the recommendation of the Security Council and the approval of its permanent members. Secretaries-general usually have come from small, neutral countries. The secretary-general serves as the chief administrative officer at all meetings and carries out any functions that those organs entrust to the Secretariat; he also oversees the preparation of the UN's budget. The secretary-general has important political functions, being charged with bringing before the organization any matter that threatens international peace and security. Both the chief spokesperson for the UN and the UN's most visible and authoritative figure in world affairs, the secretary-general often serves as a high-level negotiator. Attesting to the importance of the post, two secretaries-general have been awarded the Nobel Prize for Peace:- Dag Hammarskjöld in 1961 and Kofi Annan, corecipient with the UN, in 2001. The Secretariat influences the work of the United Nations to a much greater degree than indicated in the UN Charter. It is responsible for preparing numerous reports, studies, and investigations, in addition to the major tasks of translating, interpreting, providing services for large numbers of meetings, and other work. Under the Charter the staff is to be recruited mainly on the basis of merit, though there has been a conscious effort to recruit individuals from different geographic regions. Some members of the Secretariat are engaged on permanent contracts, but others serve on temporary assignment from their national governments. In both cases they must take an oath of loyalty to the United Nations and are not permitted to receive instructions from member governments. The influence of the Secretariat can be attributed to the fact that the some 9 000 people on its staff are permanent experts and international civil servants rather than political appointees of member states. The Secretariat is based in New York, Geneva, Vienna, Nairobi (Kenya), and other locales. It has been criticized frequently for poor administrative practices – though it has made persistent efforts to increase the efficiency of its operations – as well as for a lack of neutrality. Subsidiary Organs:- The United Nations network also includes subsidiary organs created by the General Assembly and autonomous specialized agencies. The subsidiary organs report to the General Assembly or ECOSOC or both. Some of these organs are funded directly by the UN; others are financed by the voluntary contributions of governments or private citizens. In addition, ECOSOC has consultative relationships with NGOs operating in economic, social, cultural, educational, health, and related fields. NGOs have played an increasingly important role in the work of the UN's specialized agencies, especially in the areas of health, peacekeeping, refugee issues, and human rights. Specialized Agencies:- The specialized agencies report annually to ECOSOC and often cooperate with each other and with various UN organs. However, they also have their own principles, goals, and rules, which at times may conflict with those of other UN organs and agencies. The specialized agencies are autonomous insofar as they control their own budgets and have their own boards of directors, who appoint agency heads independently of the General Assembly or secretary-general. Major specialized agencies and related organs of the UN include the International Labour Organisation (ILO), the Food and Agriculture Organization of the United Nations (FAO), the United Nations Educational, Scientific and Cultural Organization (UNESCO), and the World Health Organization (WHO). Two of the most powerful specialized agencies, which also are the most independent with respect to UN decision making, are the World Bank and the International Monetary Fund (IMF). The United Nations, along with its specialized agencies, is often referred to collectively as the United Nations System. Global Conferences:- Global conferences have a long history in multilateral diplomacy, extending back to the period after World War I, when conferences on disarmament and economic affairs were convened by the League of Nations. With the UN's establishment after World War II, the number and frequency of global conferences increased dramatically. The trickle of narrowly focused, functional meetings from the early 1950s became a torrent in the 1990s with a series of widely publicized gatherings attended by high-level representatives and several thousands of other participants. Virtually all matters of international concern have been debated by UN global conferences, including the proliferation of nuclear weapons, small-arms trafficking, racism, overpopulation, hunger, crime, access to safe drinking water, the environment, the role of women, and human rights. The format and frequency of the conferences have varied considerably over time. The increasing number of meetings has led to complaints of 'conference fatigue' by some countries. Global conferences have served a number of significant functions. Considered 'town meetings of the world', they provide an arena for discussion and for the exchange of information. The conferences take stock of existing knowledge and help to expand it through the policy analyses that they trigger. They also serve as incubators of ideas, raise elite consciousness, and may also identify emerging issues. For example, the dramatic acceleration in the growth of the world's

population in the second half of the XX century was a challenge first identified by conferences organized by the UN in the 1950s and ’60s. Global conferences have nurtured public support for solutions to global issues. Thus, NGOs have played a key role in many of the UN global conferences. At some conferences, the NGOs have organized parallel conferences to discuss the major issues; at others, they have participated alongside government representatives, serving on national delegations and presenting position papers. Global conferences have faced a number of criticisms. Some observers claim that they are inefficient and too large and unwieldy to set international agendas. Others argue that they have been captured by different constituencies, of the North or the South, depending on the issue. Still others contend that such conferences have become too politicized, with the result that unrelated issues are sometimes linked to serve political purposes. For example, the global conferences on racism in 1978 and 2001, according to these critics, were unduly politicized by declarations asserting a link between racism and Zionism. Administration:- Finances:- The secretary-general must submit a biennial budget to the General Assembly for its approval. The Charter stipulates that the expenses of the organization shall be borne by members as apportioned by the General Assembly. The Committee on Contributions prepares a scale of assessments for all members, based on the general economic level and capacity of each state, which is also submitted to the General Assembly for approval. The United States is the largest contributor, though the proportion of its contributions has declined continually, from some two-fifths at the UN’s founding to one-fourth in 1975 and to about one-fifth in 2000. Other members make larger per capita contributions. The per capita contribution of San Marino, for example, is roughly four times that of the United States. The US contribution became a controversial issue during the 1990s, when the country refused to pay its obligations in full and objected to the level of funding it was required to provide. In 1999 the US Congress passed a UN reform bill, and after intense negotiations UN members agreed to reduce the US share of the budget and to increase contributions from other states to make up the shortfall. When the cost of the special programs, specialized agencies, and peacekeeping operations is added to the regular budget, the total annual cost of the United Nations system increases substantially. (Special programs are financed by voluntary contributions from UN members, and specialized agencies and peacekeeping operations have their own budgets.) Partly because of a rapid increase in the number of appeals to the UN for peacekeeping and other assistance after the end of the Cold War and partly because of the failure of some member states to make timely payments to the organization, the UN has suffered continual and severe financial crises. Privileges And Immunities:- A general Convention on the Privileges and Immunities of the United Nations, approved by the General Assembly in February 1946 and accepted by most of the members, asserts that the UN possesses juridical personality. The convention also provides for such matters as immunity from legal process of the property and officials of the UN. An agreement between the UN and the United States, signed in June 1947, defines the privileges and immunities of the UN headquarters in New York City. Headquarters:- The General Assembly decided during the second part of its first session in London to locate its permanent headquarters in New York. John D. Rockefeller, Jr., donated land for a building site in Manhattan. Temporary headquarters were established at Lake Success on Long Island, New York. The permanent Secretariat building was completed and occupied in 1951–52. The building providing accommodations for the General Assembly and the councils was completed and occupied in 1952. The UN flag, adopted in 1947, consists of the official emblem of the organization (a circular world map, as seen from the North Pole, surrounded by a wreath of olive branches) in white centered on a light blue background. The Assembly designated October 24 as United Nations Day. Functions:- Maintenance of international peace and security. The main function of the United Nations is to preserve international peace and security. Chapter 6 of the Charter provides for the pacific settlement of disputes, through the intervention of the Security Council, by means such as negotiation, mediation, arbitration, and judicial decisions. The Security Council may investigate any dispute or situation to determine whether it is likely to endanger international peace and security. At any stage of the dispute, the council may recommend appropriate procedures or methods of adjustment, and, if the parties fail to settle the dispute by peaceful means, the council may recommend terms of settlement. The goal of collective security, whereby aggression against one member is met with resistance by all, underlies chapter 7 of the Charter, which grants the Security Council the power to order coercive measures – ranging from diplomatic, economic, and military sanctions to the use of armed force – in cases where attempts at a peaceful settlement have failed. Such measures were seldom applied during the Cold War, however, because tensions between the United States and the Soviet Union prevented the Security Council from agreeing on the instigators of aggression. Instead, actions to maintain peace and security often took the form of preventive diplomacy and peacekeeping. In the post-Cold War period, appeals to the UN for peacekeeping and related activities increased dramatically, and new threats to international peace and security were confronted, including AIDS and international terrorism. Notwithstanding the primary role of the Security Council, the UN Charter provides for the participation of the General Assembly and nonmember states in security issues. Any state, whether it is a member of the UN or not, may bring any dispute or situation that endangers international peace and security to the attention of the Security Council or the General Assembly. The Charter authorizes the General Assembly to ‘discuss any questions relating to the maintenance of international peace and security’ and to ‘make recommendations with regard to any such questions to the state or states concerned or to the Security Council or to both’. This authorization is restricted by the provision that, ‘while the Security Council is exercising in respect of any dispute or situation the functions assigned to it in the present Charter, the General Assembly shall not make any recommendation with regard to that dispute or situation unless the Security Council so requests’. By the ‘Uniting for Peace’ resolution of November 1950, however, the General Assembly granted to itself the power to deal with threats to the peace if the Security Council fails to act after a veto by a permanent member. Although these provisions grant the General Assembly a broad secondary role, the Security Council can make decisions that bind all members, whereas the General Assembly can make only recommendations. Peacekeeping, Peacemaking, And Peace Building:- International armed forces were first used in 1948 to observe cease-fires in Kashmir and Palestine. Although not specifically mentioned in the UN Charter, the use of such forces as a buffer between warring parties pending troop withdrawals and negotiations – a practice known as Peacekeeping – was formalized in 1956 during the Suez Crisis between Egypt, Israel, France, and the United Kingdom. Peacekeeping missions have taken many forms, though they have in common the fact that they are designed to be peaceful, that they involve military troops from several countries, and that the troops serve under the authority of the UN Security Council. In 1988 the UN Peacekeeping Forces were awarded the Nobel Prize for Peace. During the Cold War, so-called first-generation, or ‘classic’, peacekeeping was used in conflicts in the Middle East and Africa and in conflicts stemming from decolonization in Asia. Between 1948 and 1988 the UN undertook 13 peacekeeping missions involving generally lightly armed troops from neutral countries other than the permanent members of the Security Council – most often Canada, Sweden, Norway, Finland, India, Ireland, and Italy. Troops in these missions, the so-called ‘Blue Helmets’, were allowed to use force only in self-defense. The missions were given and enjoyed the consent of the parties to the conflict and the support of the Security Council and the troop-contributing countries. With the end of the Cold War, the challenges of peacekeeping became more complex. In order to respond to situations in which internal order had broken down and the civilian population was suffering, ‘second-generation’ peacekeeping was developed to achieve multiple political and social objectives. Unlike first-generation peacekeeping, second-generation peacekeeping often involves civilian experts and relief specialists as well as soldiers. Another difference between second-generation and first-generation peacekeeping is that soldiers in some second-generation missions are authorized to employ force for reasons other than self-defense. Because the goals of second-generation peacekeeping can be variable and difficult to define, however, much controversy has accompanied the use of troops in such missions. In the 1990s, second-generation peacekeeping missions were undertaken in Cambodia (1991–93), the former Yugoslavia (1992–95), Somalia (1992–95), and elsewhere and included troops from the permanent

members of the Security Council as well as from the developed and developing world (e.g., Australia, Pakistan, Ghana, Nigeria, Fiji, India). In the former Yugoslav province of Bosnia and Herzegovina, the Security Council created 'safe areas' to protect the predominantly Bosniac (Bosnian Muslim) population from Serbian attacks, and UN troops were authorized to defend the areas with force. In each of these cases, the UN reacted to threats to peace and security within states, sometimes taking sides in domestic disputes and thus jeopardizing its own neutrality. Between 1988 and 2000 more than 30 peacekeeping efforts were authorized, and at their peak in 1993 more than 80 000 peacekeeping troops representing 77 countries were deployed on missions throughout the world. In the first years of the XXI century, annual UN expenditures on peacekeeping operations exceeded USD2 billion. In addition to traditional peacekeeping and preventive diplomacy, in the post-Cold War era the functions of UN forces were expanded considerably to include peacemaking and peace building. (Former UN Secretary-General Boutros Boutros-Ghali described these additional functions in his reports An Agenda for Peace (1992) and Supplement to an Agenda for Peace (1995).) For example, since 1990 UN forces have supervised elections in many parts of the world, including Nicaragua, Eritrea, and Cambodia; encouraged peace negotiations in El Salvador, Angola, and Western Sahara; and distributed food in Somalia. The presence of UN troops in Yugoslavia during the violent and protracted disintegration of that country renewed discussion about the role of UN troops in refugee resettlement. In 1992 the UN created the Department of Peacekeeping Operations (DPKO), which provides administrative and technical support for political and humanitarian missions and coordinates all mine-clearing activities conducted under UN auspices. The UN's peacekeeping, peacemaking, and peace-building activities have suffered from serious logistical and financial difficulties. As more missions are undertaken, the costs and controversies associated with them have multiplied dramatically. Although the UN reimburses countries for the use of equipment, these payments have been limited because of the failure of many member states to pay their UN dues. Sanctions And Military Action:- By subscribing to the Charter, all members undertake to place at the disposal of the Security Council armed forces and facilities for military sanctions against aggressors or disturbers of the peace. During the Cold War, however, no agreements to give this measure effect were concluded. Following the end of the Cold War, the possibility of creating permanent UN forces was revived. During the Cold War the provisions of chapter 7 of the UN Charter were invoked only twice with the support of all five permanent Security Council members – against Southern Rhodesia in 1966 and against South Africa in 1977. After fighting broke out between North and South Korea in June 1950, the United States obtained a Security Council resolution authorizing the use of force to support its ally, South Korea, and turn back North Korean forces. Because the Soviet Union was at the time boycotting the Security Council over its refusal to seat the People's Republic of China, there was no veto of the US measure. As a result, a US-led multinational force fought under the UN banner until a cease-fire was reached on July 27, 1953. The Security Council again voted to use UN armed forces to repel an aggressor following the August 1990 invasion of Kuwait by Iraq. After condemning the aggression and imposing economic sanctions on Iraq, the council authorized member states to use 'all necessary means' to restore 'peace and security' to Kuwait. The resulting Persian Gulf War lasted six weeks, until Iraq agreed to comply with UN resolutions and withdraw from Kuwait. The UN continued to monitor Iraq's compliance with its resolutions, which included the demand that Iraq eliminate its weapons of mass destruction. In accordance with this resolution, the Security Council established a UN Special Mission (UNSCOM) to inspect and verify Iraq's implementation of the cease-fire terms. The United States, however, continued to bomb Iraqi weapons installations from time to time, citing Iraqi violations of 'no-fly' zones in the northern and southern regions of the country, the targeting of US military aircraft by Iraqi radar, and the obstruction of inspection efforts undertaken by UNSCOM. The preponderant role of the United States in initiating and commanding UN actions in Korea in 1950 and the Persian Gulf in 1990–91 prompted debate over whether the requirements and spirit of collective security could ever be achieved apart from the interests of the most powerful countries and without US control. The continued US bombing of Iraq subsequent to the Gulf War created further controversy about whether the raids were justified under previous UN Security Council resolutions and, more generally, about whether the United States was entitled to undertake military actions in the name of collective security without the explicit approval and cooperation of the UN. Meanwhile some military personnel and members of the US Congress opposed the practice of allowing US troops to serve under UN command, arguing that it amounted to an infringement of national sovereignty. Still others in the United States and Western Europe urged a closer integration of United States and allied command structures in UN military operations. In order to assess the UN's expanded role in ensuring international peace and security through dispute settlement, peacekeeping, peace building, and enforcement action, a comprehensive review of UN Peace Operations was undertaken. The resulting Brahimi Report (formally the Report of the Panel on United Nations Peace Operations), issued in 2000, outlined the need for strengthening the UN's capacity to undertake a wide variety of missions. Among the many recommendations of the report was that the UN maintain brigade-size forces of 5 000 troops that would be ready to deploy in 30 to 90 days and that UN headquarters be staffed with trained military professionals able to use advanced information technologies and to plan operations with a UN team including political, development, and human rights experts. Arms Control And Disarmament:- The UN's founders hoped that the maintenance of international peace and security would lead to the control and eventual reduction of weapons. Therefore the Charter empowers the General Assembly to consider principles for arms control and disarmament and to make recommendations to member states and the Security Council. The Charter also gives the Security Council the responsibility to formulate plans for arms control and disarmament. Although the goal of arms control and disarmament has proved elusive, the UN has facilitated the negotiation of several multilateral arms control treaties. Because of the enormous destructive power realized with the development and use of the atomic bomb during World War II, the General Assembly in 1946 created the Atomic Energy Commission to assist in the urgent consideration of the control of atomic energy and in the reduction of atomic weapons. The United States promoted the Baruch Plan, which proposed the elimination of existing stockpiles of atomic bombs only after a system of international control was established and prohibited veto power in the Security Council on the commission's decisions. The Soviet Union, proposing the Gromyko Plan, wanted to ensure the destruction of stockpiles before agreeing to an international supervisory scheme and wanted to retain Security Council veto power over the commission. The conflicting positions of the two superpowers prevented agreement on the international control of atomic weapons and energy. In 1947 the Security Council organized the Commission for Conventional Armaments to deal with armaments other than weapons of mass destruction, but progress on this issue also was blocked by disagreement between the Soviet Union and the Western powers. As a result, in 1952 the General Assembly voted to replace both of these commissions with a new Disarmament Commission. Consisting of the members of the Security Council and Canada, this commission was directed to prepare proposals that would regulate, limit, and balance reduction of all armed forces and armaments; eliminate all weapons of mass destruction; and ensure international control and use of atomic energy for peaceful purposes only. After five years of vigorous effort and little progress, in 1957 the International Atomic Energy Agency (IAEA) was established to promote the peaceful uses of atomic energy. In 1961 the General Assembly adopted a resolution declaring the use of nuclear or thermonuclear weapons to be contrary to international law, to the UN Charter, and to the laws of humanity. Two years later, on August 05, 1963, the Nuclear Test-Ban Treaty was signed by the Soviet Union, the United Kingdom, and the United States. The treaty – to which more than 150 states later adhered – prohibited nuclear tests or explosions in the atmosphere, in outer space, and underwater. In 1966 the General Assembly unanimously approved a treaty prohibiting the placement of weapons of mass destruction in orbit, on the Moon, or on other celestial bodies and recognizing the use of outer space exclusively for peaceful purposes. In June 1968 the Assembly approved the Treaty on the Non-Proliferation of Nuclear Weapons, which banned the spread of nuclear weapons from nuclear to nonnuclear powers; enjoined signatory nonnuclear powers, in exchange for technical assistance in

developing nuclear power for ‘peaceful purposes’, not to develop or deploy nuclear weapons; and committed the nuclear powers to engage in measures of disarmament. The treaty represented a significant commitment on the part of more than 140 (now 185) signatory powers to control nuclear weapons proliferation; nevertheless, for many years the treaty, which went into effect in 1970, was not ratified by significant nuclear powers (including China and France) and many ‘near-nuclear’ states (including Argentina, Brazil, Egypt, Israel, Pakistan, and South Africa). Some of these states signed the treaty in the early 1990s:- South Africa signed in 1991, followed by France and China in 1992. The UN has been active in attempting to eliminate other weapons of mass destruction of a variety of types and in a variety of contexts. In 1970 the General Assembly approved a treaty banning the placement of weapons of mass destruction on the seabed. A convention prohibiting the manufacture, stockpiling, and use of biological weapons was approved by the Assembly in 1971 and took effect in 1975, though many states have never acceded to it. In 1991 the UN General Assembly passed a resolution on the registration of conventional arms that required states to submit information on major international arms transfers. During the first several years of the registry, fewer than half of the UN’s members submitted the required information; by 2000 about three-fifths of governments filed annual reports. In 1993 the Chemical Weapons Convention, which prohibited the development, production, stockpiling, and use of chemical weapons and called for the destruction of existing stockpiles within 10 years, was opened for signature. In 1996 the Comprehensive Nuclear-Test-Ban Treaty, which prohibited the testing of nuclear weapons, was signed – though it has not yet entered into force – and two years later a treaty banning the production and export of antipersonnel land mines (Convention on the Prohibition of the Use, Stockpiling, Production and Transfer of Anti-Personnel Mines and on Their Destruction) was concluded. Despite international pressure, the United States refused to sign both the test ban and the land mine agreements. Many negotiations on disarmament have been held in Geneva. Negotiations have been conducted by the Ten-Nation Committee on Disarmament (1960); the Eighteen-Nation Committee on Disarmament (1962–68); the Conference of the Committee on Disarmament (1969–78); and the Disarmament Commission (1979–), which now has more than 65 countries as members. Three special sessions of the General Assembly have been organized on disarmament, and, though the General Assembly sessions have produced little in the way of substantive agreements, they have served to focus public attention on the issue. In other forums, significant progress has been made on limiting specific types of armaments, such as bacteriologic, chemical, nuclear, and toxic weapons. Economic Welfare And Cooperation:- The General Assembly, ECOSOC, the Secretariat, and many of the subsidiary organs and specialized agencies are responsible for promoting economic welfare and cooperation in areas such as postwar reconstruction, technical assistance, and trade and development. Economic Reconstruction:- The devastation of large areas of the world and the disruption of economic relations during World War II resulted in the establishment (before the UN was founded) of the United Nations Relief and Rehabilitation Administration (UNRRA) in 1943. The UNRRA was succeeded by the International Refugee Organization (IRO), which operated from 1947 to 1951. To assist in dealing with regional problems, in 1947 ECOSOC established the Economic Commission for Europe and the Economic Commission for Asia and the Far East. Similar commissions were established for Latin America in 1948 and for Africa in 1958. The major work of economic reconstruction, however, was delegated to the International Bank for Reconstruction and Development (World Bank), one of the major financial institutions created in 1944 at the UN Monetary and Financial Conference (commonly known as the Bretton Woods Conference). Although the World Bank is formally autonomous from the UN, it reports to ECOSOC as one of the UN’s specialized agencies. The World Bank works closely with donor countries, UN programs, and other specialized agencies. Financing Economic Development:- The World Bank is also primarily responsible for financing economic development. In 1956 the International Finance Corporation was created as an arm of the World Bank specifically to stimulate private investment flows. The corporation has the authority to make direct loans to private enterprises without government guarantees and is allowed to make loans for other than fixed returns. In 1960 the International Development Association (IDA) was established to make loans to less-developed countries on terms that were more flexible than bank loans. The UN itself has played a more limited role in financing economic development. The General Assembly provides direction and supervision for economic activities, and ECOSOC coordinates different agencies and programs. UN development efforts have consisted of two primary activities. First, several regional commissions (for Europe, Asia and the Pacific, Latin America, and Africa) promote regional approaches to development and undertake studies and development initiatives for regional economic projects. Second, UN-sponsored technical assistance programs, funded from 1965 through the United Nations Development Programme (UNDP), provide systematic assistance in fields essential to technical, economic, and social development of less-developed countries. Resident representatives of the UNDP in recipient countries assess local needs and priorities and administer UN development programs. Trade And Development:- After the massive decolonization of the 1950s and early 1960s, less-developed countries became much more numerous, organized, and powerful in the General Assembly, and they began to create organs to address the problems of development and diversification in developing economies. Because the international trading system and the General Agreements on Tariffs and Trade (GATT) dealt primarily with the promotion of trade between advanced industrialized countries, in 1964 the General Assembly established the United Nations Conference on Trade and Development (UNCTAD) to address issues of concern to developing countries. Toward that end, UNCTAD and the Group of 77 less-developed countries that promoted its establishment tried to codify principles of international trade and arrange agreements to stabilize commodity prices. UNCTAD discussions resulted in agreements on a Generalized System of Preferences, providing for lower tariff rates for some exports of poorer countries, and on the creation of a Common Fund to help finance buffer stocks for commodity agreements. UNCTAD also has discussed questions related to shipping, insurance, commodities, the transfer of technology, and the means for assisting the exports of developing countries. The less-developed countries attempted a more concerted and wide-ranging effort to redistribute wealth and economic opportunities through demands for a New International Economic Order, made in 1974 by the Group of 77 (which had become a permanent group representing the interests of less-developed states in the UN and eventually came to include more than 120 states). Encouraged by the successful demonstration of economic power by the oil-producing countries during the embargo of 1973–74, developing states demanded greater opportunities for development finance, an increase in the percentage of gross national product allocated by the advanced industrialized states to foreign aid, and greater participation in the specialized agencies created to deal with monetary and development issues, including the World Bank and the IMF. These demands resulted in limited modification of aid flows and of the practices of specialized agencies and produced much greater debate and publicity surrounding development issues. Following the East Asian financial crisis of the late 1990s, UNCTAD and other UN agencies took part in discussions aimed at creating a new international financial architecture designed to control short-term capital flows. Social Welfare And Cooperation:- The United Nations is concerned with issues of human rights, including the rights of women and children, refugee resettlement, and narcotics control. Some of its greatest successes have been in the area of improving the health and welfare of the world’s population. In the 1990s, despite severe strains on the resources of UN development programs and agencies resulting from massive refugee movements and humanitarian crises, the UN increased its emphasis on social development. Refugees:- After World War II the International Refugee Organization successfully resettled, repatriated, transported, and maintained more than one million European and Asian refugees. It was abolished in 1952 and replaced by a new international refugee structure. In 1951 ECOSOC drew up, and the General Assembly approved, a Convention Relating to the Status of Refugees. The United Nations High Commissioner for Refugees (UNHCR) was then appointed and directed to act under this convention, and ECOSOC appointed an Advisory Commission to assist the high commissioner. The work of the UNHCR has become increasingly important since the late 1980s, involving major relief operations in Africa, Asia (particularly Southeast and Central Asia),

Central America, western and central Europe, and the Balkans. At the end of the 1990s approximately 20 million people had been forced to migrate or had fled oppression, violence, and starvation. The UNHCR works in more than 120 countries and cooperates with more than 450 NGOs to provide relief and to aid in resettlement. For its services on behalf of refugees, the Office of the UNHCR was awarded the Nobel Prize for Peace in 1954 and 1981. A separate organization, the United Nations Relief and Works Agency for Palestine Refugees in the Near East (UNRWA), administers aid to refugees in the Middle East. Human Rights:- Unlike the League of Nations, the United Nations incorporated the principle of respect for human rights into its Charter, affirming respect for human rights and for fundamental freedoms for all without regard to race, sex, language, or religion. According to the Charter, the General Assembly is charged with initiating studies and making recommendations, and ECOSOC is responsible for establishing commissions to fulfill this purpose. Consequently, the Commission on Human Rights, originally chaired by Eleanor Roosevelt, was created in 1946 to develop conventions on a wide range of issues, including an international bill of rights, civil liberties, the status of women (for which there is now a separate commission), freedom of information, the protection of minorities, the prevention of discrimination on the grounds of race, sex, language, or religion, and any other human rights concerns. The commission prepared the nonbinding Universal Declaration of Human Rights, which was adopted by the General Assembly in 1948. After the declaration, the commission began drafting two covenants, one on civil and political rights and another on economic and cultural rights. Differences in economic and social philosophies hampered efforts to reach agreement, but the General Assembly eventually adopted the International Covenant on Economic, Social and Cultural Rights and the International Covenant on Civil and Political Rights in 1966. The covenants, which entered into force in 1976, are known collectively, along with the Universal Declaration of Human Rights, as the international bill of rights. Although all countries have stated support for the 1948 declaration, not all observe or have ratified the two covenants. In general, Western countries have favored civil and political rights (rights to life, liberty, freedom from slavery and arbitrary arrest, freedom of opinion and peaceful assembly, and the right to vote), and developing countries have stressed economic and cultural rights such as the rights to employment, shelter, education, and an adequate standard of living. The Commission on Human Rights and its subcommission meet annually in Geneva to consider a wide range of human rights issues. Human rights violations are investigated by a Human Rights Committee set up according to the provisions of the International Covenant on Civil and Political Rights. The commission and subcommission also carry out special responsibilities delegated by the General Assembly or by ECOSOC. The commission and subcommission have strengthened human rights norms and expanded the range of recognized rights, in part by drafting additional conventions on matters such as women's rights, racial discrimination, torture, labor laws, apartheid, and the rights of indigenous peoples. In particular, the UN has acted to strengthen recognition of the rights of women and children. It established a special Convention on the Elimination of All Forms of Discrimination Against Women, which was approved in 1979 and has been ratified by some 170 countries, and the 1989 Convention on the Rights of the Child, which has been ratified by more than 190 countries. In 1995 the Fourth World Conference on Women, held in Beijing, developed a Platform for Action to recognize women's rights and improve women's livelihood worldwide, and follow-up meetings monitored progress toward meeting these goals. UNIFEM, the United Nations Development Fund for Women, has worked since 1995 to implement the Beijing Platform for Action. The UN, through special rapporteurs and working groups, monitors compliance with human rights standards. In 1993 the General Assembly established the post of United Nations High Commissioner for Human Rights (UNHCHR), which is the focal point within the UN Secretariat for human rights activity. Control Of Narcotics:- The Commission on Narcotic Drugs was authorized by the General Assembly in 1946 to assume the functions of the League of Nations Advisory Committee on Traffic in Opium and Other Dangerous Drugs. In addition to reestablishing the pre-World War II system of narcotics control, which had been disrupted by the war, the United Nations addressed new problems resulting from the development of synthetic drugs. Efforts were made to simplify the system of control by drafting one convention incorporating all the agreements in force. The UN established the Office for Drug Control and Crime Prevention (ODCCP) in 1997 to address problems relating to drugs, crime, and international terrorism. Health And Welfare Issues:- The UN, through the United Nations Children's Fund (UNICEF) and specialized agencies such as the World Health Organization (WHO), works toward improving health and welfare conditions around the world. UNICEF, originally called the UN International Children's Emergency Fund, was established by the General Assembly in December 1946 to provide for the needs of children in areas devastated by World War II. UNICEF was made a permanent UN organization in 1953. Financed largely by the contributions of member states, it has helped feed children in more than 100 countries, provided clothing and other necessities, and sought to eradicate diseases such as tuberculosis, whooping cough, and diphtheria. UNICEF promotes low-cost preventive health care measures for children, including the breast-feeding of infants and the use of oral rehydration therapy to treat diarrhea, the major cause of death in children. UNICEF has key monitoring responsibilities under the Convention on the Rights of the Child. WHO is the primary UN agency responsible for health activities. Among its major initiatives have been immunization campaigns to protect populations in the developing world, regulation of the pharmaceutical industry to control the quality of drugs and to ensure the availability of lower-cost generics, and efforts to combat the spread of HIV/AIDS. The UN has responded to the AIDS epidemic through the establishment of UNAIDS, a concerted program of cosponsoring agencies, including UNICEF, WHO, UNDP, UNESCO, and the World Bank. UNAIDS is the leading advocate of global action on AIDS, supporting programs to prevent transmission of the disease, providing care for those infected, working to reduce the vulnerability of specific populations, and alleviating the economic and social impact of the disease. In 2001 UNAIDS coordinated a General Assembly special session on the disease. The Environment:- In response to growing worldwide concern with environmental issues, the General Assembly organized the United Nations Conference on the Human Environment, which was held in Stockholm in 1972 and led to the creation of the United Nations Environment Programme (UNEP) in the same year. UNEP has attempted to find solutions to various environmental problems, including pollution in the Mediterranean Sea; the threat to aquatic resources posed by human economic activity; deforestation, desertification, and drought; the depletion of the Earth's ozone layer by human-produced chemicals; and global warming. Much disagreement has arisen regarding the scientific bases of environmental concerns and the question of how to combine the goals of environmental protection and development. Although both developed and developing countries recognize the need to preserve natural resources, developing countries often charge that the environment has been despoiled primarily by the advanced industrialized states, whose belated environmental consciousness now hampers development for other countries. In other instances, developed countries have objected to the imposition of environmental standards, fearing that such regulations will hamper economic growth and erode their standard of living. UNEP succeeded in establishing, through the General Assembly, a World Commission on Environment and Development and in 1988 outlined an environmental program to set priorities for the 1990–95 period. International conferences, such as the United Nations Conference on Environment and Development (the 'Earth Summit'), held in Rio de Janeiro in 1992, have continued to focus attention on environmental issues. The Earth Summit, which was far larger than any previous intergovernmental global conference, incorporated input from numerous NGOs. It produced a declaration of principles (the Rio Declaration on Environment and Development), a plan for the sustainable development of the Earth's resources into the XXI century (Agenda 21), and guidelines for the management, conservation, and sustainable development of forests. Subsequent UN conferences on social issues continued to incorporate sustainable development policies into their programs. Dependent Areas:- The United Nations has expressed concern for people living in non-self-governing territories. Most importantly, the UN has affirmed and facilitated the transition to independence of former colonies. The anticolonial movement in the UN reached a high point in 1960, when the General Assembly adopted a resolution sponsored by more

than 40 African and Asian states. This resolution, called the Declaration on the Granting of Independence to Colonial Countries and Peoples, condemned 'the subjection of peoples to alien subjugation, domination and exploitation' and declared that 'immediate steps shall be taken … to transfer all powers' to the peoples in the colonies 'without any conditions or reservations, in accordance with their freely expressed will and desire … in order to enable them to enjoy complete independence and freedom'. After the decolonization period of the 1950s and '60s, new states exerted increasing power and influence, especially in the General Assembly. With the admission of the new states of Africa and Asia to the United Nations in the 1960s and '70s and the end of the Cold War in 1991, politics within the General Assembly and the Security Council changed as countries formed regional voting blocs to express their preferences and principles. UN efforts to gain independence for Namibia from South Africa, carried out from the 1940s to the '80s, represent perhaps the most enduring and concerted attempt by the organization to promote freedom for a former colony. In 1966 the General Assembly took action to end the League of Nations mandate for South West Africa, providing for a United Nations Council for South West Africa in 1967 to take over administrative responsibilities in the territory and to prepare it for independence by 1968. South Africa refused to acknowledge the council, and the General Assembly, secretary-general, and Security Council continued to exert pressure through the 1970s. In 1978 the General Assembly adopted a program of action toward Namibian independence, and the Security Council developed a plan for free elections. In 1988, with Namibian independence and the departure of Cuban troops from neighbouring Angola implicitly linked, South Africa finally agreed to withdraw from Namibia. In the following year a UN force – United Nations Temporary Auxiliary Group (UNTAG) – supervised elections and assisted in repatriating refugees. Namibia gained formal independent status in 1990. Development Of International Law:- The United Nations, like the League of Nations, has played a major role in defining, codifying, and expanding the realm of international law. The International Law Commission, established by the General Assembly in 1947, is the primary institution responsible for these activities. The Legal Committee of the General Assembly receives the commission's reports and debates its recommendations; it may then either convene an international conference to draw up formal conventions based on the draft or merely recommend the draft to states. The International Court of Justice reinforces legal norms through its judgments. The commission and the committee have influenced international law in several important domains, including the laws of war, the law of the sea, human rights, and international terrorism. The work of the UN on developing and codifying laws of war was built on the previous accomplishments of the Hague Conventions (1899–1907), the League of Nations, and the Kellog-Briand Pact (1928). The organization's first concern after World War II was the punishment of suspected Nazi war criminals. The General Assembly directed the International Law Commission to formulate the principles of international law recognized at the Nürnberg trials, in which German war criminals were prosecuted, and to prepare a draft code of offenses against the peace and security of mankind. In 1950 the commission submitted its formulation of the Nürnberg principles, which covered crimes against peace, war crimes, and crimes against humanity. In the following year the commission presented to the General Assembly its draft articles, which enumerated crimes against international law, including any act or threat of aggression, annexation of territory, and genocide. Although the General Assembly did not adopt these reports, the commission's work in formulating the Nürnberg principles influenced the development of human rights law. The UN also took up the problem of defining aggression, a task attempted unsuccessfully by the League of Nations. Both the International Law Commission and the General Assembly undertook prolonged efforts that eventually resulted in agreement in 1974. The definition of aggression, which passed without dissent, included launching military attacks, sending armed mercenaries against another state, and allowing one's territory to be used for perpetrating an act of aggression against another state. In 1987 the General Assembly adopted a series of resolutions to strengthen legal norms in favor of the peaceful resolution of disputes and against the use of force. The UN has made considerable progress in developing and codifying the law of the sea as well. The International Law Commission took up the law of the sea as one of its earliest concerns, and in 1958 and 1960, respectively, the General Assembly convened the First and the Second United Nations Conferences on the Law of the Sea (UNCLOS). The initial conference approved conventions on the continental shelf, fishing, the high seas, and territorial waters and contiguous zones, all of which were ratified by the mid-1960s. During the 1970s it came to be accepted that the deep seabed is the 'common heritage of mankind' and should be administered by an international authority. In 1973 the General Assembly called UNCLOS III to discuss the conflicting positions on this issue as well as on issues relating to navigation, pollution, and the breadth of territorial waters. The resulting Law of the Sea Treaty (1982) has been ratified by some 140 countries. The original treaty was not signed by the United States, which objected to the treaty's restrictions on seabed mining. The United States signed a revised treaty after a compromise was reached in 1994, though the agreement has yet to be ratified by the US Senate. The UN has worked to advance the law of treaties and the laws regulating relations between states. In 1989 the General Assembly passed a resolution declaring 1990–99 the UN Decade of International Law, to be dedicated to promoting acceptance and respect for the principles and institutions of international law. In 1992 the General Assembly directed the International Law Commission to prepare a draft statute for an International Criminal Court. The Rome Statute of the International Criminal Court (ICC) was adopted in July 1998 and later signed by more than 120 countries. The ICC, which is to be located at The Hague upon the ratification of the statute by at least 60 signatory countries, has jurisdiction over crimes against humanity, crimes of genocide, war crimes, and crimes of aggression, pending an acceptable definition of that term. Under the terms of the convention, no person age 18 years or older is immune from prosecution, including presidents or heads of state. Since 1963 the United Nations has been active in developing a legal framework for combating international terrorism. The General Assembly and specialized agencies such as the International Civil Aviation Organization and the International Atomic Energy Agency established conventions on issues such as offenses committed on aircraft, acts jeopardizing the safety of civil aviation, the unlawful taking of hostages, and the theft or illegal transfer of nuclear weapons technology. In 2001, in the wake of devastating terrorist attacks that killed thousands in the United States, the General Assembly's Ad Hoc Committee on Terrorism continued work on a comprehensive convention for the suppression of terrorism. Assessment:- The United Nations is the only global international organization that serves multiple functions in international relations. The UN was designed to ensure international peace and security, and its founders realized that peace and security could not be achieved without attention to issues of rights – including political, legal, economic, social, environmental, and individual. Yet the UN has faced difficulties in achieving its goals, because its organizational structure still reflects the power relationships of the immediate post-1945 world, despite the fact that the world has changed dramatically – particularly with respect to the post-Cold War relationship between the United States and Russia and the dramatic increase in the number of independent states. The UN is a reflection of the realities of international politics, and the world's political and economic divisions are revealed in the voting arrangements of the Security Council, the blocs and cleavages of the General Assembly, the different viewpoints within the Secretariat, the divisions present at global conferences, and the financial and budgetary processes. Despite its intensively political nature, the UN has transformed itself and some aspects of international politics. Decolonization was successfully accomplished, and the many newly independent states joined the international community and have helped to shape a new international agenda. The UN has utilized Charter provisions to develop innovative methods to address peace and security issues. The organization has tried new approaches to economic development, encouraging the establishment of specialized organizations to meet specific needs. It has organized global conferences on urgent international issues, thereby placing new issues on the international agenda and allowing greater participation by NGOs and individuals. Notwithstanding its accomplishments, the United Nations still operates under the basic provision of respect for national sovereignty and noninterference in the domestic affairs of states. The norm of national sovereignty, however, runs into persistent conflict with the constant demand by many in the international community that the

UN take a more active role in combating aggression and alleviating international problems. For example, the United States appealed to the issue of national sovereignty to justify its opposition to the Convention on the Rights of the Child and the International Criminal Court. Thus it is likely that the UN will continue to be seen by its critics as either too timid or too omnipotent as it is asked to resolve the most pressing problems faced by the world's most vulnerable citizens. / Президент США Фрэньклын Дэлано Розэвэлт (Franklin Delano Roosevelt; 1882–1945). Лига Наций, международная организация, имевшая своей целью, согласно уставу, 'развитие сотрудничества между народами и гарантию их мира и безопасности', но на деле представлявшая собой орудие политики империалистических держав, в первую очередь Великобритании и Франции. Действовала в 1919–39. Устав Лиги Наций, выработанный специальной комиссией, созданной на Парижской Мирной Конференции 1919–20, и включённый в Версальский Мирный Договор 1919 и другие мирные договоры, завершившие 1-ю Мировую Войну с 1914–18, был первоначально подписан с 44 государствами, в том числе 31 государством, принимавшим участие в войне на стороне Антанты или присоединившимся к ней (Великобританией, Францией, США, Италией, Японией, Канадой, Австралией, Южно-Африканским Союзом, Новой Зеландией, Индией, Китаем, Бельгией, Боливией, Бразилией, Кубой, Экуадором, Грецией, Гаити) Хиджазом, Гондурасом, Либерией, Никарагуа, Панамой, Перу, Польшей, Португалией, Румынией, Югославией, Сиамом, Чехословакией, Уругваем), и 13 государствами, придерживавшимися нейтралитета в ходе войны (Аргентиной, Чили, Колумбией, Данией, Норвегией, Испанией, Парагваем, Нидерландами, Ираном, Сальвадором, Швецией, Швейцарией, Венесуэлой). США не ратифицировали устав Лиги Наций и не вошли в число её членов. Основными органами Лиги Наций являлись:- Ассамблея (в её работе участвовали все члены Лига Наций; сессии Ассамблеи проходили ежегодно в Сентябре), Совет Лиги Наций (первоначально состоял из 4 постоянных членов-представителей Великобритании, Франции, Италии и Японии и 4 непостоянных членов; впоследствии состав и число членов Совета менялись) и Постоянный Секретариат во главе с Генеральным Секретарём. Все решения Ассамблеи и Совета, за исключением решений по процедурным вопросам, должны были приниматься единогласно. При Лиге Наций на правах автономных организаций были созданы Постоянная Палата Международного Правосудия, Международная Организация Труда и другие организации. Основные органы Лиги Наций находились в Женеве, Швейцария. В первые годы своего существования Лига Наций была одним из центров организации борьбы против Советского государства. Советское правительство боролось против попыток Лиги Наций вмешаться во внутренние дела молодой Советской республики. Тем не менее оно активно участвовало в проходивших под эгидой Лиги Наций конференциях и совещаниях по разоружению, внося предложения, направленные на действительное решение этой важнейшей международной проблемы, и разоблачая политические спекуляции империалистических государств. Под прикрытием Лиги Наций в начале 1920-х был произведён в форме раздачи мандатов раздел колоний между государствами-победителями (смотрите Мандатные Территории). Лига Наций предпринимала многочисленные попытки сгладить острые противоречия между главными её участниками на основе антисоветского сговора (одна из них – Локарнские Договоры 1925), путём соглашений о репарациях (смотрите План Дауэса и План Юнга). В 1926 в Лигу Наций была допущена Германия. Однако уже в 1933 Германия, а также Япония вышли из Лиги Наций, чтобы получить полную свободу действий для подготовки новой войны (в 1931 Япония напала на Китай, не встретив реального противодействия со стороны Лига Наций, ограничившейся бесплодными 'рекомендациями'). В середине 1930-х в связи с ростом угрозы со стороны фашистской Германии, фашистской Италии и милитаристской Японии правительства некоторых государств стали искать сотрудничества с бывшим Союзом Советских Социалистических Республик (СССР) как в рамках Лиги Наций, так и вне её. 15 Сентября 1934 по инициативе Французской дипломатии, в частности Министра Иностранных Дел Франции – Жо Люи Барту (Jean Louis Barthou; 1862–1934), 30 государств-членов Лиги Наций обратились к СССР с предложением вступить в Лигу Наций. 18 Сентября 1934 СССР стал членом Лиги Наций и занял постоянное место в её Совете (против принятия СССР голосовали Нидерланды, Португалия и Швейцария). Принимая предложение о вступлении в Лигу Наций, Советское правительство рассчитывало, что в новых условиях, сложившихся после ухода из Лиги Наций, наиболее агрессивных государств, Лига Наций сможет хотя бы в некоторой степени помешать развязыванию войны. Советское правительство предупредило при этом всех участников Лиги Наций, что оно не принимает на себя ответственность за их предшествующие решения и договоры, заключённые без участия СССР. В течение 5 лет (1934–39) пребывания в Лиге Наций Советский Союз твёрдо и последовательно отстаивал дело мира и безопасности народов перед лицом фашистской агрессии. Важнейшими вопросами, обсуждавшимися в Лиге Наций в 1934–39, были:- Итальянская агрессия против Эфиопии (1935–36), нарушение Германией Версальского (1919) и Локарнского (1925) Договоров (в связи с ремилитаризацией Германией Рейнской зоны в 1936), Итало-Германская интервенция в Испании (1936–39), захват Германией Австрии (1938) и другие. В эти годы позиция Западных держав, стремившихся направить фашистскую агрессию против СССР, предопределила беспомощность Лиги Наций, не сумевшей провести ни одного эффективного мероприятия против агрессоров. Упорная борьба Советского Союза за мир и коллективную безопасность, его активная деятельность в Лиге Наций, направленная на разоблачение как фашистских агрессоров, так и политической игры правящих кругов Великобритании, Франции и США, сделали участие СССР в Лиге Наций нежелательным для правительств Западных держав. Использовав в качестве предлога Советско-Финляндскую войну 1939–40, правительства Великобритании и Франции добились принятия Советом Лиги Наций 14 Декабря 1939 решения об исключении СССР из Лиги Наций. Деятельность Лиги Наций с этого времени по существу прекратилась, формально же Лига Наций была ликвидирована в Апреле 1946 решением специально созванной Ассамблеи. Объединённые Нации (ОН) или Организации Объединённых Наций (ООН):- предшественником данной организации выступала Лига Наций (the League of Nations), учреждённая в соответствии с Версальским Трактатом (the Treaty of Versailles), подписанным 28 Июня 1919, с целью развития сотрудничества между народами и гарантии мира и безопасности. Она была формально распущена в 1946 в связи с созданием новой международной организации. Русскоязычное название Организации Объединённых Наций (ООН) в дословном переводе с Английского языка звучит просто как Объединённые Нации (ОН). Название Объединённые Нации изначально возникло для

обозначения стран, присоединившихся к борьбе против Германии, Италии и Японии во время Второй Мировой Войны (1939–1945). Тогда, 01 Января 1942, в Вашингтоне, США 26 стран (Австралия, Бельгия, Гаити, Гватемала, Гондурас, Греция, Доминиканская Республика, Индия, Канада, Китай, Коста Рика, Куба, Люксембург, Нидерланды, Никарагуа, Новая Зеландия, Норвегия, Панама, Польша, Соединённое Королевство Великобритании и Северной Ирландии, Соединённые Штаты Америки, Союз Советских Социалистических Республик, Чехословакия, Эль Сальвадор, Югославия и Южно-Африканский Союз) подписали совместную Декларацию от Объединённых Наций, предусматривавшую оказание военной помощи со стороны присоединившихся к борьбе за победу над гитлеризмом участников. Впоследствии к этой Декларации присоединились:- Боливия, Бразилия, Венесуэла, Египет, Ирак, Иран, Колумбия, Либерия, Ливан, Мексика, Парагвай, Перу, Саудовская Аравия, Сирия, Турция, Уругвай, Филиппины, Франция, Чили, Эквадор и Эфиопия. В период с 21 Августа по 07 Октября 1944 в Думбартон Окс, пригороде Вашингтона, Округ Колумбия (Dumbarton Oaks, an estate in Washington, DC), США состоялись встречи дипломатических экспертов Большой Тройки (the Big Three), представлявших власти Великобритании, СССР и США, к которым присоединились представители Китая. Объединённая группа часто упоминалась в прессе как Большая Четвёрка (the Big Four). Состоявшиеся встречи проходили под названием Думбартон Окской Конференции (the Dumbarton Oaks Conference), в ходе которой официальные уполномоченные представители стран участниц договорились о создании в будущем новой международной организации и приступили к разработке проекта её Устава (Charter). Решение об учреждении этой международной организации была принято 25 Апреля 1945 в Сан Франциско (San Francisco), США, в ходе состоявшейся там международной конференции. В этой конференции приняли участие уполномоченные представители из 50 стран мира. Устав новой организации был одобрен на анонимной основе и подписан 26 Июня 1945, а обнародован 24 Октября 1945. Фактически с этой даты Организация Объединённых Наций официально начала свою историю и деятельность. Утверждённый Устав ООН признал в качестве официальных для организации 5 языков (Английский, Испанский, Китайский, Русский и Французский). Все предшествовавшие действия стран участниц были преисполнены решимости:- (i) избавить грядущие поколения от бедствий войны, дважды в нашей жизни принесшей человечеству невыразимое горе; (ii) вновь утвердить веру в основные права человека, в достоинство и ценность человеческой личности, в равноправие мужчин и женщин и в равенство прав больших и малых наций; (iii) создать условия, при которых могут соблюдаться справедливость и уважение к обязательствам, вытекающим из договоров и других источников международного права; и (iv) содействовать социальному прогрессу и улучшению условий жизни при большей свободе. В этих целях они решили объединить все усилия с тем, чтобы:- (i) проявлять терпимость и жить вместе, в мире друг с другом, как добрые соседи; (ii) объединить все совместные силы для поддержания международного мира и безопасности; (iii) обеспечить принятием принципов и установлением методов, чтобы вооружённые силы применялись не иначе, как в общих интересах; и (iv) использовать международный аппарат для содействия экономическому и социальному прогрессу всех народов. Утверждённый Устав среди основных целей Организации Объединённых Наций наметил следующие:- (i) поддержание международного мира и безопасности, в связи с чем она должна принимать эффективные коллективные меры для предотвращения и устранения угрозы миру и подавлять акты агрессии или других нарушений мира и приводить мирными средствами, в согласии с принципами справедливости и международного права, улаживание или разрешение международных споров или ситуаций, которые могут привести к нарушению мира; (ii) развитие дружественных отношений между нациями на основе уважения принципа равноправия и самоопределения народов, а также принятие других соответствующих мер для укрепления всеобщего мира; (iii) осуществление международного сотрудничества в разрешении международных проблем экономического, социального, культурного и гуманитарного характера и в поощрении и развитии уважения к правам человека и основным свободам для всех, без различия расы, пола, языка и религии; и (iv) быть центром для согласования действий наций в достижении этих общих целей. Для достижения поставленных перед собой целей ООН и её члены действуют в соответствии со следующими Принципами:- (i) ООН основана на принципе суверенного равенства всех её членов; (ii) все члены ООН обязаны добросовестно выполнять принятые в соответствии с Уставом ООН обязательства с тем, чтобы обеспечить им всем в совокупности права и преимущества, вытекающие из принадлежности к составу членов ООН; (iii) все члены ООН обязаны разрешать свои международные споры мирными средствами таким образом, чтобы не подвергать угрозе международный мир и безопасность и справедливость; (iv) все члены ООН обязаны воздерживаться в их международных отношениях от угрозы силой или её применения как против территориальной неприкосновенности или политической независимости любого государства, так и каким-либо другим образом, несовместимым с целями ООН; (v) все члены ООН обязаны оказывать ей всемерную помощь во всех действиях, предпринимаемых ею в соответствии со своим Уставом, и воздерживаться от оказания помощи любому государству, против которого ООН предпринимает действия превентивного или принудительного характера; (vi) ООН обеспечивает, чтобы государства, которые не являются её членами, действовали в соответствии с этими Принципами, поскольку это может оказаться необходимым для поддержания международного мира и безопасности; и (vii) Устав ООН ни в коей мере не даёт ей права на вмешательство в дела, по существу входящие во внутреннюю компетенцию любого государства, и не требует от членов ООН представлять такие дела на разрешение в порядке Устава ООН; однако этот принцип не затрагивает применения принудительных мер на основании Главы VII Устава ООН, регламентирующей действия в отношении угрозы миру, нарушений мира и актов агрессии. В качестве главных органов Организации Объединённых Наций были учреждены:- Генеральная Ассамблея, Совет Безопасности, Экономический и Социальный Совет, Совет по Опеке, Международный Суд Справедливости или Международный Суд и Секретариат. Вспомогательные органы, которые могут оказаться необходимыми, могут учреждаться в соответствии с утверждённым Уставом ООН. Штабквартира Организации Объединённых Наций расположена в Нью Йорке, Штат Нью Йорк, Соединённые Штаты Америки, хотя ООН имеет также офисы в Женеве, Швейцария и Вене, Австрия. Смотрите также Генеральная Ассамблея (General Assembly), Международный Суд Справедливости или Международный Суд (International Court of Justice), Совет Безопасности (Security Council), Совет по Опеке (Trusteeship Council), и Экономический и Социальный Совет (Economic and Social Council). Организация Объединённых Наций (ООН), международная организация государств, созданная в целях поддержания и укрепления мира, безопасности и развития сотрудничества между государствами. Устав ООН, предварительно разработанный на конференции в Думбартон Оксе в 1944 представителями Великобритании, Китая, Союза Советских Социалистических Республик (СССР) и Соединённых Штатов Америки (США), подписан 26 Июня 1945 государствами участниками учредительной Сан Францисской Конференции 1945 и вступил в силу 24 Октября 1945. На 01 Января 1985 в состав ООН входило 159 государств. Главными органами ООН являются Генеральная Ассамблея ООН, Совет Безопасности, Экономический и Социальный Совет, Совет по Опеке, Международный Суд и Секретариат. Штабквартира ООН расположена в Нью Йорке, США.

UNITED NATIONS CAPITAL DEVELOPMENT FUND = ФОНД ОБЪЕДИНЁННЫХ НАЦИЙ ДЛЯ КАПИТАЛЬНОГО РАЗВИТИЯ (или ФОНД ОРГАНИЗАЦИИ ОБЪЕДИНЁННЫХ НАЦИЙ ДЛЯ КАПИТАЛЬНОГО РАЗВИТИЯ) – United Nations Capital Development Fund (UNCDF) is the United Nations (UN) organization established by the General Assembly in 1966 and fully operational in 1974. Headquartered in New York City, the UNDF, a semi-autonomous unit of the United Nations Development Programme, provides grants and loans to the least-developed members of the UN for projects in areas such as agriculture and agro-industry, drinking-water supply, health and nutrition, low-income housing, roads, and rural schools. The organization has experimented

with innovative, decentralized approaches to project planning and finance, as illustrated by its practice of microfinancing small-scale projects. UNCDF's projects are designed to forge partnerships between governments, community organizations, and the private sector.

UNITED NATIONS CENTRE FOR TRADE FACILITATION AND ELECTRONIC BUSINESS = ЦЕНТР ОБЪЕДИНЁННЫХ НАЦИЙ ПО СОДЕЙСТВИЮ ТОРГОВЛЕ И ЭЛЕКТРОННОМУ БИЗНЕСУ (или ЦЕНТР ОРГАНИЗАЦИИ ОБЪЕДИНЁННЫХ НАЦИЙ ПО СОДЕЙСТВИЮ ТОРГОВЛЕ И ЭЛЕКТРОННОМУ ДЕЛУ) – The United Nations, through its Centre for Trade Facilitation and Electronic Business (UN/CEFACT), supports activities dedicated to improving the ability of business, trade and administrative organizations, from developed, developing and transitional economies, to exchange products and relevant services effectively. Its principal focus is on facilitating national and international transactions, through the simplification and harmonisation of processes, procedures and information flows, and so contribute to the growth of global commerce. This is achieved by:- (i) analysing and understanding the key elements of international processes, procedures and transactions and working for the elimination of constraints; (ii) developing methods to facilitate processes, procedures and transactions, including the relevant use of information technologies; (iii) promoting both the use of these methods, and associated best practices, through channels such as government, industry and service associations; (iv) coordinating its work with other international organizations such as the World Trade Organization (WTO), the World Customs Organization (WCO), the Organization for Economic Co-operation and Development (OECD), the United Nations Commission on International Trade Law (UNCITRAL) and the United Nations Conference on Trade and Development (UNCTAD), notably in the context of a Memorandum of Understanding for a Global Facilitation Partnership for Transport and Trade; and (v) securing coherence in the development of Standards and Recommendations by co-operating with other interested parties, including international, intergovernmental and non-governmental organizations. In particular, for UN/CEFACT Standards, this coherence is accomplished by cooperating with the International Organization for Standardization (ISO), the International Electrotechnical Commission (IEC), the International Telecommunication Union (ITU) and selected non-governmental organizations (NGOs) in the context of the ISO/IEC/ITU/UNECE Memorandum of Understanding (MoU). These relationships were established in recognition that UN/CEFACT's work has broad application in the areas beyond global commerce and that interoperability of applications and their ability to support multi-lingual environments, are key objectives. Headquartered in Geneva, Switzerland. United Nations Centre for Trade Facilitation and Electronic Business (UN/CEFACT) is the worldwide facilitation of international transactions through the simplification and harmonization of procedures and information flows. / коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо).

UNITED NATIONS COMMISSION ON INTERNATIONAL TRADE LAW = КОМИССИЯ ОБЪЕДИНЁННЫХ НАЦИЙ ПО ПРАВУ МЕЖДУНАРОДНОЙ ТОРГОВЛИ (или КОМИССИЯ ОРГАНИЗАЦИИ ОБЪЕДИНЁННЫХ НАЦИЙ ПО ПРАВУ МЕЖДУНАРОДНОЙ ТОРГОВЛИ, или КОМИССИЯ ОБЪЕДИНЁННЫХ НАЦИЙ ПО МЕЖДУНАРОДНОМУ ТОРГОВОМУ ПРАВУ) – The United Nations Commission on International Trade Law (UNCITRAL) is the core legal body of the United Nations system in the field of international trade law. A legal body with universal membership specializing in commercial law reform worldwide for over 40 years. UNCITRAL's business is the modernization and harmonization of rules on international business. Trade means faster growth, higher living standards, and new opportunities through commerce. In order to increase these opportunities worldwide, UNCITRAL is formulating modern, fair, and harmonized rules on commercial transactions. These include:- (i) conventions, model laws and rules which are acceptable worldwide; (ii) legal and legislative guides and recommendations of great practical value; (iii) updated information on case law and enactments of uniform commercial law; (iv) technical assistance in law reform projects; and (v) regional and national seminars on uniform commercial law. UNCITRAL Secretariat headquartered in Vienna, Austria. The United Nations Commission on International Trade Law (UNCITRAL) is a United Nations agency based in Vienna, specializing in the development of model legal instruments and conventions in the area of international trade law. Most notable success is perhaps the so-called 1980 Vienna Convention whose official name is The Convention of the International Sale of Goods (CISG). Also, UNICITRAL Rules for Arbitration, which provide a procedural framework for international commercial arbitration but which, unlike the ICC rules, do not provide direct administrative supervision of arbitral process. See also Vienna Convention. Although this guide is not intended to provide legal advice or information as this is outside its scope, we shall nevertheless mention here the existence of the United Nations Commission on International Trade Law (UNCITRAL) established in 1966 by a decision of the UN General Assembly, with their office in Vienna, Austria. The aim of this Commission is to reduce divergences between trade laws of different states. Object and Functions:- The object of UNCITRAL is to promote the progressive harmonization and unification of the law of international trade:- (i) To coordinate the work of organizations active in this field and encourage cooperation; (ii) Promote wider acceptance of existing international conventions and model or uniform laws; (iii) Prepare or promote the adoption of new conventions or laws and promote the codification and acceptance of international trade terms, customs and practices; (iv) Promote means of ensuring a uniform interpretation and application of international conventions and uniform laws; and (v) Collect and disseminate information on national legislation and modern legal developments, including case-law. Activities:- (i) Formulation of Legal Texts:- These texts are not on private international law in the conflict of law sense but on substantive law in respect of international trade, related to the following priority topics:- international sales of goods, payments, commercial arbitration, shipping (maritime law) and contract practices. (ii) International Sale of Goods:- UNCITRAL's work has resulted in three legal instruments:- (a) Convention on the Limitation Period in the International Sale of Goods (New York, June 12, 1976) provides for a uniform limitation (Prescription) period during which a party may exercise a claim arising out of an international sales transaction. The United Nations Convention on Contracts for the International Sale of Goods (Vienna, April 11, 1980) covers a wide range of sales law matters, including the formation of contract and the rights and obligations of sellers and buyers and their respective remedies in case of breach of contract; and (b) Protocol amending the Convention on the Limitation Period, in order to align its scope of application with that of the new Convention. (iii) International Payments:- Major efforts relate to the unification of the law of negotiable instruments, to overcome disparities between the common law (e.g., the United Kingdom Bills of Exchange Act of 1882 and the United States Uniform Commercial Code) and the civil law systems (e.g., the series of conventions signed in Geneva in 1930 and 1931such as Bills of Exchange and Cheques, Uniform Laws). Draft conventions prepared by UNCITRAL on bill of exchange, promissory notes and cheques contain modern rules, acceptable in both systems and for optional use in international transactions. (iv) International Commercial Arbitration:- A major achievement was the preparation of UNCITRAL Arbitration Rules (1976). Based on modern practice and acceptable in the different legal systems, they are increasingly referred to in commercial contracts and used by arbitral bodies around the world (e.g., the Inter-American Commercial Arbitration Commission, the Regional Arbitration Centres in Cairo and Kuala Lumpur, the Stockholm Chamber of Commerce and its 'Operational Arbitration Clause for Use in Contracts in USA-USSR Trade, 1977', and the Iran-United Nations Claims Tribunal established under the United States-Iran Hostage and Financial Agreement of January 19, 1981). (v) International Legislation on Shipping:- UNCITRAL prepared the draft for the United Nations Convention on the Carriage of Goods by Sea, 1978 (March 31). These so-called 'Hamburg Rules' seek to remove uncertainties encountered with the 'Hague Rules' (embodied in the Brussels Convention for the Unification of Certain Rules relating to Bills of Lading of August 25, 1924). They also take into account modern transport techniques and provide for a more balanced allocation of risk between the cargo owner and the carrier, in harmony with the present laws on other modes of transport. (vi) International Contract Practices:- Work is directed either to specific clauses used in many kinds of contract or to specific types of

contracts and their typical provisions. Clauses under consideration include liquidated damages or penalty clauses, on which uniform rules have been drafted, and clauses protecting parties against the effects of currency fluctuations. As to specific types of contracts, priority is given to the preparation of a legal guide on contracts for the supply and construction of large industrial works, then to contracts on research and development, consulting, engineering, technology transfer (including licensing), service and maintenance, technical assistance, leasing, joint ventures (Joint Undertakings) and industrial cooperation in general (Industrial Property, International Protection). / Штабквартира секретариата ЮНСИТРАЛ расположена в Вене, Австрия. Смотрите также Венская Конвенция (Vienna Convention). Комиссия Организации Объединённых Наций по Праву Международной Торговли (КООНПМТ или, как это уже устоялось в Русском языке, ЮНСИТРАЛ; United Nations Commission on International Trade Law (UNCITRAL)) – основной юридический орган системы Организации Объединенных Наций (ООН) в области права международной торговли. Юридический орган с универсальным членским составом, уже в течение более 40 лет специализирующийся в проведении реформ в области коммерческого права во всем мире. Предмет заботы ЮНСИТРАЛ:- модернизация и согласование норм международной коммерческой деятельности. Торговля – это ускорение темпов роста, повышение уровня жизни и создание новых возможностей через коммерческую активность. С тем чтобы способствовать расширению этих возможностей в мировом масштабе, ЮНСИТРАЛ разрабатывает современные, справедливые и согласованные правила для коммерческих сделок. К их числу относятся следующие:- (i) всемирно признанные конвенции, типовые законы и правила; (ii) правовые и законодательные руководства и рекомендации, имеющие большое практическое значение; (iii) Обновляемая информация о прецедентном праве и законодательных актах, вводящих в действие единообразные нормы коммерческого права; (iv) Техническая помощь в осуществлении проектов правовой реформы; и (v) Региональные и национальные семинары по вопросам единообразного коммерческого права. Штабквартира Секретариата ЮНСИТРАЛ располагается в Вене, Австрия. Комиссия Объединённых Наций По Международному Торговому Праву:- создана в 1966 в качестве постоянного вспомогательного органа ООН для последовательной гармонизации и унификации международного торгового права во всемирном масштабе. Основные функции Комиссии включают координацию работы всех международных организаций в области международного коммерческого права; подготовку международных конвенций по этим вопросам для их подписания странами, содействие пониманию международного права и методам, обеспечивающим интерпретацию и применение международных конвенций.

UNITED NATIONS COMMON FUND FOR COMMODITIES = ОБЩИЙ ФОНД ОБЪЕДИНЁННЫХ НАЦИЙ ПО РОДАМ СЫРЬЯ (или ОБЩИЙ ФОНД ОРГАНИЗАЦИИ ОБЪЕДИНЁННЫХ НАЦИЙ ПО РОДАМ СЫРЬЯ) – United Nations Common Fund for Commodities (CFC):- UNCTAD IV (held in Nairobi May 1976) adopted the Integrated Programme for Commodities. Subsequently, the Agreement Establishing the Common Fund for Commodities (CFC) was adopted on 27 June 1980 at Geneva, by the United Nations Negotiating Conference on a Common Fund under the Integrated Programme for Commodities. The Agreement entered into force on 19 June 1989. The Agreement Establishing the Common Fund for Commodities stipulates that due emphasis shall be given to the LDCs (Least Developed Countries) and to small producers-exporters and to the commodities of interest to these groups. The Fund's support should continue to give priority to the LDCs and the poorer strata of the population in other developing countries. Small-holders as well as small and medium sized enterprises involved in commodity production, processing and trade in LDCs, other developing countries and countries with economies in transition will also be accorded priority consideration. LDCs shall receive particular attention with regard to the location of projects as well. Utilization by LDCs:- among the 47 countries classified as LDCs, all are members of the Common Fund, except for:- Cambodia, Eritrea, Kiribati, Liberia, Solomon Islands, South Sudan, Timor-Leste, Tuvalu and Vanuatu. See also United Nations Conference on Trade and Development. Xxxxx. The Common Fund for Commodities (CFC) is an autonomous intergovernmental financial institution established within the framework of the United Nations. The Agreement Establishing the Common Fund for Commodities was negotiated in the United Nations Conference on Trade and Development (UNCTAD) from 1976 to 1980 and became effective in 1989. The first commodity development project was approved in 1991. The Common Fund for Commodities forms a partnership of 101 Member States plus 9 Institutional Members. Membership of the Fund is open to all States Members of the United Nations or any of its specialised agencies, or of the International Atomic Energy Agency, and intergovernmental organisations of regional economic integration which exercise competence in the fields of activity of the Fund. Governing Bodies:- The governing bodies of the Fund are its Governing Council and the Executive Board. The Managing Director is the Chief Executive Officer of the Fund. The Executive Board is advised by a Consultative Committee, composed of nine independent experts, on technical and economic aspects of projects submitted to the Fund. The Governing Council meets once a year, and the Executive Board and Consultative Committee biannually. The headquarters of the Common Fund are located in Amsterdam, The Netherlands. Objectives And Main Activities:- The Common Fund's mandate is to enhance the socioeconomic development of commodity producers and contribute to the development of society as a whole. In line with its market-oriented approach, the Fund concentrates on commodity development projects financed from its resources. These resources consist of voluntary contributions, capital subscriptions by Member Countries transferred to the Second Account and interest earned. In partnership with other development institutions, the private sector and civil society, the Fund endeavours to achieve overall efficiency in and impact on commodity development. The CFC's aim is to realize the potential of commodity production, processing, manufacturing, and trade for the benefit of the poor. The CFC supports implementation of activities that:- (i) are innovative and target new opportunities in commodity markets leading to commodity based growth, employment generation, increase in household incomes, reduction in poverty, and enhancement of food security; (ii) are scalable, replicable and financially sustainable; (iii) have a potential measurable positive socio-economic and environmental impact on the stakeholders in commodity value chains as compared to the prevailing baseline situation; (iv) develop stronger connections with existing markets or create new markets along the value chain; (v) increase financial or other services to commodity producers and commodity based businesses; (vi) enhance knowledge generation and information dissemination; and (vii) build effective and cost efficient collaboration between producers, industry, governments, civil society organisations and other stakeholders for commodity based development. CFC interventions use value chain approach to identify chain participants and to pinpoint opportunities and obstacles in specific commodity value chains thereby developing viable solutions. Value chain analysis leads to identification of opportunities for value chain development. The CFC supported interventions cover all aspects of the value chain from production to consumption, i.e. from 'field to the fork'. The CFC supports commodity based activities along the entire commodity value chain which extend across local, national, regional and international markets. Specifically targeted areas are:- (i) Production, productivity and quality improvements; (ii) Processing and value addition; (iii) Product differentiation; (iv) Diversification; (v) Marketing; (vi) Technology transfer and up gradation; (vii) Introduction of measures to minimise the physical marketing and trading risks; (viii) Facilitation of trade finance; and (ix) Risk Management. Xxxxx. Our Mission:- Making commodities work for everyone. The Common Fund's mandate is to enhance the socioeconomic development of commodity producers and contribute to the development of society as a whole. In line with its market-oriented approach, the Fund concentrates on commodity development projects financed from its resources. These resources consist of voluntary contributions, capital subscriptions by Member Countries transferred to the Second Account and interest earned. In partnership with other development institutions, the private sector and civil society, the Fund endeavours to achieve overall efficiency in and impact on commodity development. Our Projects:- In the least developed countries (LDCs) people heavily depent on commodities for their livelihood. Thus, commodities form the backbone of economies and they account for the bulk of the export earnings of countries. CFC is proud to play a catalytic role in promoting and supporting poverty alleviation through commodity-focused

development. / Общий Фонд Объединённых Наций по Родам Сырья (ОФРС) (United Nations Common Fund for Commodities (CFC)):- . Смотрите также Конференция Объединённых Наций По Торговле И Развитию (United Nations Conference on Trade and Development).

UNITED NATIONS CONFERENCE ON ENVIRONMENT AND DEVELOPMENT = КОНФЕРЕНЦИЯ ОБЪЕДИНЁННЫХ НАЦИЙ ПО ОКРУЖАЮЩЕЙ СРЕДЕ И РАЗВИТИЮ (или КОНФЕРЕНЦИЯ ОРГАНИЗАЦИИ ОБЪЕДИНЁННЫХ НАЦИЙ ПО ОКРУЖАЮЩЕЙ СРЕДЕ И РАЗВИТИЮ) – United Nations Conference on Environment and Development (UNCED):- byname Earth Summit conference held at Rio de Janeiro, Brazil (June 03–14, 1992), to reconcile worldwide economic development with protection of the environment. The Earth Summit was the largest gathering of world leaders in history, with 117 heads of state and representatives of 178 nations in all attending. By means of treaties and other documents signed at the conference, most of the world's nations nominally committed themselves to the pursuit of economic development in ways that would protect the Earth's environment and nonrenewable resources. The main documents agreed upon at the Earth Summit are as follows. The Convention on Biological Diversity is a binding treaty requiring nations to take inventories of their plants and wild animals and protect their endangered species. The Framework Convention on Climate Change, or Global Warming Convention, is a binding treaty that requires nations to reduce their emission of carbon dioxide, methane, and other 'greenhouse' gases thought to be responsible for global warming; the treaty stopped short of setting binding targets for emission reductions, however. The Declaration on Environment and Development, or Rio Declaration, laid down 27 broad, nonbinding principles for environmentally sound development. Agenda 21 outlined global strategies for cleaning up the environment and encouraging environmentally sound development. The Statement of Principles on Forests, aimed at preserving the world's rapidly vanishing tropical rainforests, is a nonbinding statement recommending that nations monitor and assess the impact of development on their forest resources and take steps to limit the damage done to them. The Earth Summit was hampered by disputes between the wealthy industrialized nations of the North (i.e. Western Europe and North America) and the poorer developing countries of the South (i.e. Africa, Latin America, the Middle East, and parts of Asia). In general, the countries of the South were reluctant to hamper their economic growth with the environmental restrictions urged upon them by the North unless they received increased Northern financial aid, which they claimed would help make environmentally sound growth possible.

UNITED NATIONS CONFERENCE ON TRADE AND DEVELOPMENT = КОНФЕРЕНЦИЯ ОБЪЕДИНЁННЫХ НАЦИЙ ПО ТОРГОВЛЕ И РАЗВИТИЮ (или КОНФЕРЕНЦИЯ ОРГАНИЗАЦИИ ОБЪЕДИНЁННЫХ НАЦИЙ ПО ТОРГОВЛЕ И РАЗВИТИЮ) – Established in 1964, the United Nations Conference on Trade and Development (UNCTAD) promotes the development-friendly integration of developing countries into the world economy. UNCTAD has progressively evolved into an authoritative knowledge-based institution whose work aims to help shape current policy debates and thinking on development, with a particular focus on ensuring that domestic policies and international action are mutually supportive in bringing about sustainable development. The organization works to fulfil this mandate by carrying out three key functions:- (i) it functions as a forum for intergovernmental deliberations, supported by discussions with experts and exchanges of experience, aimed at consensus building; (ii) it undertakes research, policy analysis and data collection for the debates of government representatives and experts; and (iii) it provides technical assistance tailored to the specific requirements of developing countries, with special attention to the needs of the least developed countries and of economies in transition. When appropriate, UNCTAD cooperates with other organizations and donor countries in the delivery of technical assistance. In performing its functions, the secretariat works together with member Governments and interacts with organizations of the United Nations system and regional commissions, as well as with governmental institutions, non-governmental organizations, the private sector, including trade and industry associations, research institutes and universities worldwide. Headquartered in Geneva, Switzerland. A United Nations agency whose work in shipping includes the liner code involving the sharing of cargoes between the shipping lines of the importing and exporting countries and third countries in the ratio 40:40:20. As its name indicates, UNCTAD initially referred to a specific event, i.e. the first session of the Conference held in Geneva from 23 March to 16 June 1964. Later in the same year, the UN General Assembly authorized UNCTAD to become a permanent body and adopted its charter. There have been periodic sessions held every four years. Since the first session, an additional ten have been held:- New Delhi, India (01 February–29 March 1968); Santiago, Chile (13 April–21 May 1972); Nairobi, Kenya (05–31 May 1976); Manila, the Philippines (06–29 May 1979); Belgrade, Yugoslavia (06 June–02 July 1983); Geneva (09 July–03 August 1987); Cartagena de Indias, Colombia (08–25 February 1992); Midrand, South Africa (27 April–11 May 1996); Bangkok, Thailand (12–19 February 2000); and most recently Sao Paulo (13–18 June 2004). The Conference is UNCTAD's highest policymaking body and the forum where member States make assessments of current trade and development issues, discuss policy options and formulate global policy responses. It also formulates major policy guidelines and decides on the programmes of work for the period before the next session. Currently, the Conference membership consists of 192 member States. Many intergovernmental and non-governmental organizations have also actively participated in UNCTAD's work (the Conference and meetings of its subsidiary bodies). These periodic sessions, in the view of the UNCTAD secretariat, should be seen not as isolated events, but as important stages in the ongoing process of dialogue and negotiation on the central issues of trade and development and international economic relations (UNCTAD 1985). The United Nations Conference on Trade and Development (UNCTAD) was set up in 1964 as a permanent organ of the UN General Assembly. UNCTAD promotes international trade and seeks to increase trade between developing countries and countries with different social and economic systems. UNCTAD also examines problems of economic development within the context of principles and policies of international trade and seeks to harmonize trade, development, and regional economic policies. United Nations Conference on Trade and Development (UNCTAD) is a permanent organ of the United Nations (UN) General Assembly, established in 1964 to promote trade, investment, and development in developing countries. Headquartered in Geneva, Switzerland, UNCTAD has approximately 190 members. Negotiations at UNCTAD's meetings resulted in the Global System of Trade Preferences (1988), an agreement that reduced tariffs and removed or reduced nontariff trade barriers among participating developing countries; the Common Fund for Commodities (1989), an intergovernmental financial institution that provides assistance to developing countries that are heavily dependent on commodity exports; and various agreements for debt relief. In the 1990s UNCTAD's efforts were directed toward the challenges globalization poses to developing countries, and special attention was focused on measures to help the poorest and least developed countries become integrated into the world economy. The highest policy-making body of UNCTAD is the Conference, which meets once every four years to set policy guidelines and to formulate a program of work. The UNCTAD Secretariat, whose members form part of the UN Secretariat, performs policy analysis, monitors and implements the decisions of UNCTAD's intergovernmental bodies, and provides for technical cooperation and exchanges of information. It comprises four divisions – on globalization and development strategies; international trade; investment, technology, and enterprise development; and services infrastructure – as well as the Office of the Special Co-ordinator for Least Developed, Land-locked, and Island Developing Countries (OSC-LDC). The Trade and Development Board, UNCTAD's executive body, is responsible for the operations of the organization when the Conference is not in session. This historic Conference was held in Geneva from 26 March to 06 June 1964, and attended by the representatives of 120 countries, together with those of numerous international organizations. The substantive discussions were grouped into six agenda items:- (i) expansion of international trade and its significance for economic development; (ii) international commodity problems; (iii) trade in manufactures and semi-manufactures; (iv) improvement of the invisible trade of developing countries; (v) implications of regional

economic groupings; and (vi) institutional arrangements, methods and machinery to implement measures relating to the expansion of international trade. These agenda items were divided up among five substantive committees. Towards the end of the Conference, member States took note of the reports of these committees and took action on the draft recommendations included therein. This working procedure of the Conference has continued to the present. United Nations Conference On Trade And Development (UNCTAD) is a permanent intergovernmental body established by the United Nations General Assembly in 1964. Our headquarters are located in Geneva, Switzerland, and we have offices in New York and Addis Ababa. UNCTAD is part of the UN Secretariat. We report to the UN General Assembly and the Economic and Social Council but have our own membership, leadership, and budget. We are also part of the United Nations Development Group. UNCTAD, which is governed by its 194 member states (on 2018), is the United Nations body responsible for dealing with economic and sustainable development issues with a focus on trade, finance, investment and technology. It helps developing countries to participate equitably in the global economy. Its work can be summed up in three words: think, debate, deliver. UNCTAD carries out economic research, produces innovative analyses and makes policy recommendations to support government decision-making. UNCTAD is a forum where representatives of all countries can freely engage in dialogue, share experiences and tackle critical issues affecting the global economy. It promotes consensus at the multilateral level. UNCTAD turns research findings into practical applications and offers direct technical assistance to help countries build the capacities they need for equitable integration into the global economy and improve the well-being of their populations. Areas Of Work:- (1) Globalization And Development:- UNCTAD analyses contribute to international debate on the consequences of globalization for developing countries. (i) Examines global economic trends and the outlook for developing countries. (ii) Undertakes studies on development strategies. (iii) Analyses debt issues. (iv) Provides developing countries with technical assistance on the management of public debt. (v) Lends assistance to the Palestinian people in support of their economic development. (2) Trade And Commodities:- UNCTAD promotes development through international trade:- (i) Produces analyses and collects data to improve understanding of current and future problems in this area. (ii) Supports the participation of developing countries in international trade and international trade negotiations on an equitable basis. (iii) Seeks to strengthen international trade in services and promotes an integrated approach to trade, the environment, and sustainable development. (iv) Analyses issues related to competition policy and consumer protection. (v) Focuses on the contribution of the commodity sector to development, advocating diversification and risk management. (3) Investment And Enterprise:- UNCTAD offers member States expertise on issues related to investment and enterprise development. It also:- (i) Conducts cutting-edge research and analysis in the field of investment for sustainable development. (ii) Informs policymakers about the structure and evolution of foreign direct investment in the world and outlines the main trends in investment. (iii) Provides technical assistance to enable beneficiary countries to attract more investment for sustainable development, including through investment policy reviews. (iv) Serves as the focal point for issues related to international investment agreements. (v) Promotes entrepreneurship and enterprise creation and expansion. (vi) Participates in the setting of international accounting standards. (vii) Encourages responsible investment through initiatives such as the establishment of principles for sustainable development in agriculture. (4) Least Developed Countries:- UNCTAD helps more than 90 countries in their efforts to reach the targets they have set for economic progress. These countries belong to categories that receive special attention from the United Nations, and, in many cases, special treatment to compensate for the disadvantages they face in the global economy. (i) UNCTAD helps least developed countries – 47 states were recognized as such in 2017 – to achieve the socioeconomic progress that will allow them to graduate from this category. (ii) It supports landlocked developing countries which refuse to consider their landlocked nature as an obstacle to development. (iii) It also supports small island developing states in their continuing efforts to become less economically vulnerable, despite the many challenges they face. (5) Technology And Logistics:- In a globalized, knowledge-based economy, it is essential to stimulate innovation in developing countries to improve their competitiveness. (i) Conducts research in science, technology (including information and communication technology) and innovation for development. (ii) Helps developing countries design and implement technology and innovation policies for economic growth and sustainable development. (iii) Carries out a broad programme of work to establish efficient services in transport, trade facilitation and customs. The United Nations Conference on Trade and Development (UNCTAD):- main arm of the United Nations General Assembly dealing with trade, investment and development issues. The United Nations Conference on Trade and Development (UNCTAD) was established in 1964 as a permanent intergovernmental body. UNCTAD is the part of the United Nations Secretariat dealing with trade, investment, and development issues. The organization's goals are to:- 'maximize the trade, investment and development opportunities of developing countries and assist them in their efforts to integrate into the world economy on an equitable basis'. UNCTAD was established by the United Nations General Assembly in 1964 and it reports to the UN General Assembly and United Nations Economic and Social Council. The primary objective of UNCTAD is to formulate policies relating to all aspects of development including trade, aid, transport, finance and technology. The conference ordinarily meets once in four years; the permanent secretariat is in Geneva. One of the principal achievements of UNCTAD (1964) has been to conceive and implement the Generalised System of Preferences (GSP). It was argued in UNCTAD that to promote exports of manufactured goods from developing countries, it would be necessary to offer special tariff concessions to such exports. Accepting this argument, the developed countries formulated the GSP scheme under which manufacturers' exports and import of some agricultural goods from the developing countries enter duty-free or at reduced rates in the developed countries. Since imports of such items from other developed countries are subject to the normal rates of duties, imports of the same items from developing countries would enjoy a competitive advantage. The creation of UNCTAD in 1964 was based on concerns of developing countries over the international market, multi-national corporations, and great disparity between developed nations and developing nations. The United Nations Conference on Trade and Development was established to provide a forum where the developing countries could discuss the problems relating to their economic development. The organisation grew from the view that existing institutions like GATT (now replaced by the World Trade Organization, WTO), the International Monetary Fund (IMF), and World Bank were not properly organized to handle the particular problems of developing countries. Later, in the 1970s and 1980s, UNCTAD was closely associated with the idea of a New International Economic Order (NIEO). The first UNCTAD conference took place in Geneva in 1964, the second in New Delhi in 1968, the third in Santiago in 1972, fourth in Nairobi in 1976, the fifth in Manila in 1979, the sixth in Belgrade in 1983, the seventh in Geneva in 1987, the eighth in Cartagena in 1992, the ninth at Johannesburg (South Africa) in 1996, the tenth in Bangkok (Thailand) in 2000, the eleventh in São Paulo (Brazil) in 2004, the twelfth in Accra in 2008, the thirteenth in Doha (Qatar) in 2012 and the fourteenth in Nairobi (Kenya) in 2016. Currently, UNCTAD has 194 member states and is headquartered in Geneva, Switzerland. UNCTAD has 400 staff members and a bi-annual (2010–11) regular budget of USD138 million in core expenditures and USD72 million in extra-budgetary technical assistance funds. It is a member of the United Nations Development Group. There are non-governmental organizations participating in the activities of UNCTAD. / Конференция Объединённых Наций По Торговле И Развитию:- образована в 1964 со штаб-квартирой в Женеве, Швейцария с целью улучшения условий международной торговли для развивающихся стран и повышения уровня жизни в этих странах. Конференция Организации Объединённых Наций по Торговле и Развитию (КОНТИР, так называемая ЮНКТАД по Англоязычной аббревиатуре UNCTAD) является постоянным органом Генеральной Ассамблеи ООН, созданным в 1964. Основной функцией конференции является поощрение международной торговли, в частности между странами разных уровней развития и имеющими различные социальные и экономические системы. Конференция ООН По Торговле И Развитию (ЮНКТАД; United Nations Conference of Trade and Development), орган Генеральной Ассамблеи ООН. Учреждена в 1964.

Участниками конференции являются государства, входящие в ООН, её специализированные учреждения или в Международное Агентство По Атомной Энергии (МАГАТЭ). Основные цели ЮНКТАД:- содействие расширению торговли между странами с различными уровнями экономического развития, между развивающимися странами, а также между странами с различным социально-экономическим строем; разработка принципов и политики в сфере международной торговли и связанных с ней проблем экономического развития; координация деятельности других учреждений системы ООН в области международной торговли; организация переговоров и утверждение многосторонних правовых актов в области торговли; согласование политики государств и региональных экономических группировок в сфере торговли и развития. Создание ЮНКТАД явилось серьёзной победой прогрессивных сил, выступающих за перестройку международных экономических отношений. Оно стало возможно в результате активного сотрудничества социалистических и развивающихся стран, направленного на решение широкого круга проблем торговли и развития путём установления новых принципов в международной торговле и сотрудничестве. По уставу сессии ЮНКТАД созываются 1 раз в 3 года. Для выполнения функций конференции в перерывах между её сессиями образован постоянный выборный орган – Совет По Торговле И Развитию, созываемый ежегодно. В состав Совета входят 55 членов (31 от развивающихся, 18 от развитых капиталистических и 6 от социалистических стран). Вспомогательными органами Совета являются учреждённые им постоянные комитеты:- по сырьевым товарам; готовым изделиям; финансированию, связанному с торговлей; морским перевозкам; специальный комитет по преференциям и другие. 1-я сессия ЮНКТАД (Женева, 1964) разработала и провозгласила принципы международных торговых отношений и торговой политики, основывающиеся на суверенном равенстве государств и рассматривающие ликвидацию остатков колониализма как необходимое условие экономического развития. На формирование этих принципов большое влияние оказали прогрессивные концепции международного экономического сотрудничества, изложенные в совместных предложениях Польской Народной Республики (ПНР), Союза Советских Социалистических Республик (СССР) и Чехословацкой Социалистической Республики (ЧССР). На 2-й сессии (Дели, 1968) была разработана и одобрена программа действий по улучшению положения на рынках ряда сырьевых товаров, играющих важную роль в вывозе (или экспорте) многих развивающихся стран. Главный упор в этой программе сделан на заключение международных товарных соглашений. Были приняты резолюции по вопросам условий помощи развивающимся странам, проблемам торговли и экономического сотрудничества между государствами с различным социально-экономическим строем. Однако из-за противодействия империалистических держав многие прогрессивные принципы международного сотрудничества ещё не стали нормой взаимоотношений между всеми странами. Осложнилась обстановка на мировых товарных рынках и особенно для развивающихся стран, что проявляется в динамике цен на сырьё, в состоянии их платёжных балансов и в растущей неустойчивости в сфере валютно-финансовых отношений. Одной из важных причин этого является задержка с выполнением рекомендаций сессий ЮНКТАД большинством развитых капиталистических стран. Продолжаются также попытки принизить роль ЮНКТАД, перенести решение насущных экономических проблем в другие институты, не обладающие для этого достаточными полномочиями и компетенцией (в первую очередь ГАТТ – Генеральное Соглашение О Тарифах И Торговле). Мешает деятельности ЮНКТАД и то, что она до сих пор не стала универсальной организацией. СССР неуклонно выступал за всемерное повышение роли ЮНКТАД, претворение в жизнь прогрессивных принципов мировой торговли, активно поддерживал стремление развивающихся стран к справедливому международному разделению труда, к быстрейшей ликвидации последствии колониализма и созданию независимой национальной экономики, 3-я сессия ЮНКТАД состоялась весной 1972 в Сантьяго (Чили). Конференция ООН По Торговле И Развитию (КОНТИР (UNCTAD)), орган Генеральной Ассамблеи ООН, не являющийся международной торговой организацией. Конференция создана в 1964. Основными задачами её являются:- (i) содействие развитию международной торговли, обеспечение стабильного мира и равноправного, взаимовыгодного сотрудничества между государствами; (ii) выработка рекомендаций, принципов, организационно-правовых условий и механизмов функционирования современных международных экономических отношений; (iii) участие в координации деятельности других учреждений системы ООН в области экономического развития, налаживания хозяйственных связей и поощрения международной торговли. Конференция ООН по Торговле и Развитию – орган Генеральной Ассамблеи Организации Объединённых Наций (ООН), не являющийся международной торговой организацией. Создан в 1964 и насчитывает 168 стран-членов. Основные задачи:- содействие развитию международной торговли, равноправного взаимовыгодного сотрудничества между государствами, выработка разносторонних рекомендаций по функционированию международных экономических отношений. Резолюции, заявления ЮНКТАД имеют рекомендательный характер. Под эгидой ЮНКТАД разрабатываются многосторонние соглашения и конвенции. Высший орган ЮНКТАД – Конференция и Совет по Торговле и Развитию, в рамках которого работают шесть комитетов. Конференция Объединённых Наций по Торговле и Развитию (КОНТИР или так называемая ЮНКТАД) (United Nations Conference on Trade and Development (UNCTAD)):- постоянная организация, существующая при Организации Объединённых Наций (ООН) с 1964, которая была создана для развития мировой торговли, особенно для оказания помощи развивающимся странам в финансировании экспорта. В 1989 под её эгидой был учреждён Общий Фонд ООН по Родам Сырья (UN Common Fund for Commodities (CFC)), который призван обеспечивать финансирование международных сырьевых организаций, формировать буферные запасы (buffer stocks), поддерживать и проводить самостоятельные исследования развития рынков сырья (commodity markets).

UNITED NATIONS CONVENTION ON CONDITIONS FOR REGISTRATION OF SHIPS = КОНВЕНЦИЯ ОБЪЕДИНЁННЫХ НАЦИЙ ОБ УСЛОВИЯХ ДЛЯ РЕГИСТРАЦИИ СУДОВ (или КОНВЕНЦИЯ ОРГАНИЗАЦИИ ОБЪЕДИНЁННЫХ НАЦИЙ ПО УСЛОВИЯМ ДЛЯ РЕГИСТРАЦИИ СУДОВ) – United Nations Convention On Conditions For Registration Of Ships was adopted by the United Nations Conference on Conditions for Registration of Ships in Geneva, Switzerland on 07 February 1986. On February 07, 1986, the United Nations Convention on Conditions for Registration of Ships was finalized. This represents the culmination of efforts to define the necessary elements for the registration of vessels in a national registry. Its provisions include references to the genuine link, ownership, management, registration, accountability and the role of the flag state. This article examines each issue separately and focuses on the most important elements of ship's registration: the concept of genuine link and beneficial ownership. The main reason behind the drive for the establishment of strict regulations on registration was the proliferation of open registries, their equation with substandard and hazardous conditions and efforts from developing countries to participate equally in the management of maritime transport. The conclusion is that the convention failed to clarify the most critical issues and reinforced the status quo of open registries. The United Nations Convention on Conditions for Registration of Ships, not in force, has the stated purpose of 'ensuring or, as the case may be, strengthening the genuine link between a State and ships flying its flag, and in order to exercise effectively its jurisdiction and control over such ships with regard to identification and accountability of shipowners and operators ...' (Article 1). The Convention sets out conditions under which States may register ships. The Convention was adopted by a Conference of plenipotentiaries which met at Geneva from 20 January to 07 February 1986 under the auspices of the United Nations Conference on Trade and Development, in accordance with resolution 37/209 of the General Assembly of the United Nations dated 20 December 1982. The Conference on Conditions for Registration of Ships had held its first part from 16 July to 03 August 1984, and had resumed its work, first at its second part from 28 January to 15 February 1985 and then, at its third part from 08 to 19 July 1985, before adopting the Convention at its fourth and last part. Open for signature from 01 May 1986 to 30 April 1987 in New York, NY, the United States. Status:- Signatories:-

14. Parties:- 15. Note Yet In Force:- see article 19 which reads as follows:- ‘1. This Convention shall enter into force 12 months after the date on which not less than 40 states, the combined tonnage of which amounts to at least 25 per cent of the world tonnage, have become Contracting Parties to it in accordance with article 18. For the purpose of this article the tonnage shall be deemed to be that contained in annex III to this Convention. 2. For each State which becomes a Contracting Party to this Convention after the conditions for entry into force under paragraph 1 of this article have been met, the Convention shall enter into force for that State 12 months after that State has become a Contracting Party’. / Конвенция Объединённых Наций Об Условиях Регистрации Судов:- подписана в 1986, определяет правила ответственности и отчётности в международном судоходстве. Также устанавливает связь между судами и флагами, под которыми они плавают.

UNITED NATIONS CONVENTION ON CONTRACTS FOR THE INTERNATIONAL SALES OF GOODS = КОНВЕНЦИЯ ОБЪЕДИНЁННЫХ НАЦИЙ ПО КОНТРАКТАМ ДЛЯ МЕЖДУНАРОДНЫХ ПРОДАЖ ТОВАРОВ (или КОНВЕНЦИЯ ОРГАНИЗАЦИИ ОБЪЕДИНЁННЫХ НАЦИЙ ПО КОНТРАКТАМ ДЛЯ МЕЖДУНАРОДНЫХ ПРОДАЖ ТОВАРОВ) – United Nations Convention On Contracts For The International Sales Of Goods (CISG):- The purpose of the CISG is to provide a modern, uniform and fair regime for contracts for the international sale of goods. Thus, the CISG contributes significantly to introducing certainty in commercial exchanges and decreasing transaction costs. The contract of sale is the backbone of international trade in all countries, irrespective of their legal tradition or level of economic development. The CISG is therefore considered one of the core international trade law conventions whose universal adoption is desirable. The CISG is the result of a legislative effort that started at the beginning of the XX century. The resulting text provides a careful balance between the interests of the buyer and of the seller. It has also inspired contract law reform at the national level. The adoption of the CISG provides modern, uniform legislation for the international sale of goods that would apply whenever contracts for the sale of goods are concluded between parties with a place of business in Contracting States. In these cases, the CISG would apply directly, avoiding recourse to rules of private international law to determine the law applicable to the contract, adding significantly to the certainty and predictability of international sales contracts. Moreover, the CISG may apply to a contract for international sale of goods when the rules of private international law point at the law of a Contracting State as the applicable one, or by virtue of the choice of the contractual parties, regardless of whether their places of business are located in a Contracting State. In this latter case, the CISG provides a neutral body of rules that can be easily accepted in light of its transnational nature and of the wide availability of interpretative materials. Finally, small and medium-sized enterprises as well as traders located in developing countries typically have reduced access to legal advice when negotiating a contract. Thus, they are more vulnerable to problems caused by inadequate treatment in the contract of issues relating to applicable law. The same enterprises and traders may also be the weaker contractual parties and could have difficulties in ensuring that the contractual balance is kept. Those merchants would therefore derive particular benefit from the default application of the fair and uniform regime of the CISG to contracts falling under its scope. The CISG governs contracts for the international sales of goods between private businesses, excluding sales to consumers and sales of services, as well as sales of certain specified types of goods. It applies to contracts for sale of goods between parties whose places of business are in different Contracting States, or when the rules of private international law lead to the application of the law of a Contracting State. It may also apply by virtue of the parties’ choice. Certain matters relating to the international sales of goods, for instance the validity of the contract and the effect of the contract on the property in the goods sold, fall outside the Convention’s scope. The second part of the CISG deals with the formation of the contract, which is concluded by the exchange of offer and acceptance. The third part of the CISG deals with the obligations of the parties to the contract. Obligations of the sellers include delivering goods in conformity with the quantity and quality stipulated in the contract, as well as related documents, and transferring the property in the goods. Obligations of the buyer include payment of the price and taking delivery of the goods. In addition, this part provides common rules regarding remedies for breach of the contract. The aggrieved party may require performance, claim damages or avoid the contract in case of fundamental breach. Additional rules regulate passing of risk, anticipatory breach of contract, damages, and exemption from performance of the contract. Finally, while the CISG allows for freedom of form of the contract, States may lodge a declaration requiring the written form. The CISG applies only to international transactions and avoids the recourse to rules of private international law for those contracts falling under its scope of application. International contracts falling outside the scope of application of the CISG, as well as contracts subject to a valid choice of other law, would not be affected by the CISG. Purely domestic sale contracts are not affected by the CISG and remain regulated by domestic law. Additional Information:- Becoming a party to the CISG has no financial implications for Contracting States. Moreover, its administration at the domestic level does not require a dedicated body and does not involve any reporting obligations. The CISG is accompanied by an explanatory note. The CLOUT (Case Law on UNCITRAL Texts) system contains numerous cases relating to the application of the CISG. A Digest of those cases is also available. Related Instruments:- (i) Convention on the Limitation Period in the International Sale of Goods (New York, 1974); and (ii) United Nations Convention on the Use of Electronic Communications in International Contracts (New York, 2005). Xxxxx. The United Nations Convention on Contracts for the International Sale of Goods (CISG; the Vienna Convention) is a treaty that is a uniform international sales law. It has been ratified by 89 states that account for a significant proportion of world trade, making it one of the most successful international uniform laws. The State of Palestine is the most recent state to ratify the Convention, having acceded to it on 29 December 2017. The CISG was developed by the United Nations Commission on International Trade Law (UNCITRAL), and was signed in Vienna on 11 April 1980. The CISG is sometimes referred to as the Vienna Convention (but is not to be confused with other treaties signed in Vienna). It came into force as a multilateral treaty on 01 January 1988, after being ratified by 11 countries. As of 2018, the following 89 states have ratified, acceded to, approved, accepted, or succeeded to the Convention. The CISG allows exporters to avoid choice of law issues, as the CISG offers ‘accepted substantive rules on which contracting parties, courts, and arbitrators may rely’. Unless excluded by the express terms of a contract, the CISG is deemed to be incorporated into (and supplant) any otherwise applicable domestic law(s) with respect to a transaction in goods between parties from different Contracting States. The CISG has been regarded as a success for the UNCITRAL, as the Convention has been accepted by states from ‘every geographical region, every stage of economic development and every major legal, social and economic system’. Countries that have ratified the CISG are referred to within the treaty as ‘Contracting States’. Of the uniform law conventions, the CISG has been described as having ‘the greatest influence on the law of worldwide trans-border commerce’. It has been described as a great legislative achievement, and the ‘most successful international document so far’ in unified international sales law, in part due to its flexibility in allowing Contracting States the option of taking exception to certain specified articles. This flexibility was instrumental in convincing states with disparate legal traditions to subscribe to an otherwise uniform code. While certain State parties to the CISG have lodged declarations, the vast majority – 68 of the current 89 Contracting States – have chosen to accede to the Convention without any declaration. The CISG is the basis of the annual Willem C. Vis International Commercial Arbitration Moot held in Vienna in the week before Easter (and now also in Hong Kong). Teams from law schools around the world take part. The Moot is organized by Pace University, which keeps a definitive source of information on the CISG. / Вильэм Цэ. (Willem C. Vis International Commercial Arbitration Moot). Конвенция Объединённых Наций О Контрактах В Международной Торговле Товарами:- вступила в силу 01 Января 1988, регулирует составление контрактов, вытекающие из них обязательства, распределение риска и штрафы. Применима к контрактам на продажу товаров между сторонами, чьи предприятия расположены в разных странах.

UNITED NATIONS CONVENTION ON INTERNATIONAL MULTIMODAL TRANSPORT ON GOODS = КОНВЕНЦИЯ ОБЪЕДИНЁННЫХ НАЦИЙ ПО МЕЖДУНАРОДНОЙ МУЛЬТИМОДАЛЬНОЙ ТРАНСПОРТИРОВКЕ ТОВАРОВ (или КОНВЕНЦИЯ ОРГАНИЗАЦИИ ОБЪЕДИНЁННЫХ НАЦИЙ ПО МЕЖДУНАРОДНОЙ ПЕРЕВОЗКЕ ТОВАРОВ В СМЕШАННОМ СООБЩЕНИИ) – United Nations Convention On International Multimodal Transport On Goods was adopted by the Conference on 24 May 1980. The Convention will be open for signature at the United Nations Headquarters in New York from 01 September 1980 until 31 August 1981, after which date it will be open for accession, in accordance with its provisions. Not Yet In Force:- see article 36 which reads as follows:- '(1) This Convention shall enter into force 12 months after the Governments of 30 States have either signed it not subject to ratification, acceptance or approval or have deposited instruments of ratification, acceptance or approval or accession with the depositary. (2) For each State which ratifies, accepts, approves or accedes to this Convention after the requirements for entry into force given in paragraph 1 of this article have been met, the Convention shall enter into force 12 months after the deposit by such State of the appropriate instrument'. Status:- Signatories:- 6; Parties:- 11. Note:- The Convention was adopted by the United Nations Conference on a Convention on International Multimodal Transport, held in Geneva from 12 to 30 November 1979 and from 08 to 24 May 1980. The Conference had been convened pursuant to resolution 33/160 adopted by the General Assembly of the United Nations on 20 December 1978. The Convention was opened for signature by all States from 01 September 1980 to 31 August 1981 inclusive at the United Nations Headquarters in New York. United Nations Conference on a Convention on International Multimodal Transport was held at Geneva, Switzerland from 12 to 30 November 1979 (first part of the session) and from 08 to 24 May 1980 (resumed session). / Конвенция Объединённых Наций О Перевозке Товаров Различными Видами Транспорта:- вступила в силу в 1980; установила единую совокупность правил, регулирующих ответственность при перевозке грузов несколькими видами транспорта.

UNITED NATIONS CONVENTION ON THE CARRIAGE OF GOODS BY SEA = КОНВЕНЦИЯ ОБЪЕДИНЁННЫХ НАЦИЙ ПО ПЕРЕВОЗКЕ ТОВАРОВ МОРЕМ (или КОНВЕНЦИЯ ОРГАНИЗАЦИИ ОБЪЕДИНЁННЫХ НАЦИЙ ПО ПЕРЕВОЗКЕ ТОВАРОВ МОРЕМ) – United Nations Convention On The Carriage Of Goods By Sea:- Hamburg, 31 March 1978. Entry Into Force:- 01 November 1992, in accordance with article 30(1). Status:- Signatories:- 28; Parties:- 34. Note:- The Convention was adopted on 30 March 1978 by the United Nations Conference on the Carriage of Goods by Sea, held in Hamburg, Federal Republic of Germany, from 06 to 31 March 1978. The Conference had been convened by the Secretary-General of the United Nations in accordance with resolution 31/100 adopted by the General Assembly on 15 December 1976. The Convention was opened for signature at Hamburg on 31 March 1978 and remained open for signature by all States at the Headquarters of the United Nations, New York, until 30 April 1979. Also known as Hamburg Rules. United Nations Convention on the Carriage of Goods by Sea (Hamburg, 1978) (the 'Hamburg Rules'):- was adopted by a diplomatic conference on 31 March 1978, the Convention establishes a uniform legal regime governing the rights and obligations of shippers, carriers and consignees under a contract of carriage of goods by sea. The Convention entered into force on 01 November 1992. / Конвенция Объединённых Наций О Перевозке Товаров Морем:- принята в 1978, определила единые правила для покупателей и продавцов в отношении обязательств и ответственности при международных морских перевозках грузов.

UNITED NATIONS CONVENTION ON THE LIMITATION PERIOD ON THE INTERNATIONAL SALE OF GOODS = КОНВЕНЦИЯ ОБЪЕДИНЁННЫХ НАЦИЙ ПО ПЕРИОДУ ОГРАНИЧЕНИЯ ПО МЕЖДУНАРОДНОЙ ПРОДАЖЕ ТОВАРОВ (или КОНВЕНЦИЯ ОРГАНИЗАЦИИ ОБЪЕДИНЁННЫХ НАЦИЙ ПО ПЕРИОДУ ОГРАНИЧЕНИЯ ПО МЕЖДУНАРОДНОЙ ПРОДАЖЕ ТОВАРОВ) – United Nations Convention On The Limitation Period On The International Sale Of Goods:- New York, 14 June 1974. Entry Into Force:- 01 August 1988, in accordance with article 44 which reads as follows:- '(1) This Convention shall enter into force on the first day of the month following the expiration of six months after the date of the deposit of the tenth instrument of ratification or accession. (2) For each State ratifying or acceding to this Convention after the deposit of the tenth instrument of ratification or accession, this Convention shall enter into force on the first day of the month following the expiration of six months after the date of the deposit of its instrument of ratification or accession'. Status:- Signatories:- 12; Parties:- 30. Note:- The Convention was adopted by the United Nations Conference on Prescription (limitation) in the International Sale of Goods, which convened at the Headquarters of the United Nations, at New York, from 20 May to 14 June 1974. The Conference was convened in accordance with Resolution 3104 (XXVIII) of the General Assembly adopted on 12 December 1973. The Convention was opened for signature at the Headquarters of the United Nations, New York, on 14 June 1974, (closing date for signature:- 31 December 1975). Xxxxx. United Nations Convention On The Limitation Period On The International Sale Of Goods:- Date Of Adoption:- 14 June 1974. Date Of Adoption Of Amending Protocol:- 11 April 1980. Entry Into Force:- 01 August 1988. Purpose:- The Limitation Convention establishes uniform rules governing the period of time within which a party under a contract for the international sale of goods must commence legal proceedings against another party to assert a claim arising from the contract or relating to its breach, termination or validity. By doing so, it brings clarity and predictability on an aspect of great importance for the adjudication of the claim. Why Is It Relevant? Most legal systems limit or prescribe a claim from being asserted after the lapse of a specified period of time to prevent the institution of legal proceedings at such a late date that the evidence relating to the claim is likely to be unreliable or lost and to protect against the uncertainty that would result if a party were to remain exposed to unasserted claims for an extensive period of time. However, numerous disparities exist among legal systems with respect to the conceptual basis for doing so, resulting in significant variations in the length of the limitation period and in the rules governing the claims after that period. Those differences may create difficulties in the enforcement of claims arising from international sales transactions. In response to those difficulties, the Limitation Convention was prepared and adopted in 1974. The Limitation Convention was further amended by a Protocol adopted in 1980 in order to harmonize its text with that of the United Convention on Contracts for the International Sale of Goods (CISG), in particular, with regard to scope of application and admissible declarations. Indeed, the Limitation Convention may be functionally seen as a part of the CISG and, as such, considered as an important step towards a comprehensive standardization of international sales law. Key Provisions:- The Limitation Convention applies to contracts for the sale of goods between parties whose places of business are in different States if both of those States are Contracting States or when the rules of private international law lead to the application to the contract of sale of goods of the law of a Contracting State. It may also apply by virtue of the parties' choice. The limitation period is set at four years (Art. 8). Subject to certain conditions, that period may be extended to a maximum of ten years (Art. 23). Furthermore, the Limitation Convention also regulates certain questions pertaining to the effect of commencing proceedings in a Contracting State. The Limitation Convention further provides rules on the cessation and extension of the limitation period. The period ceases when the claimant commences judicial or arbitral proceedings or when it asserts claims in an existing process. If the proceedings end without a binding decision on the merits, it is deemed that the limitation period continued to run during the proceedings. However, if the period has expired during the proceedings or has less than one year to run, the claimant is granted an additional year to commence new proceedings (Art. 17). No claim shall be recognized or enforced in legal proceedings commenced after the expiration of the limitation period (Art. 25(1)). Such expiration is not to be taken into consideration unless invoked by parties to the proceedings (Art. 24); however, States may lodge a declaration allowing for courts to take into account the expiration of the limitation period on their own initiative (Art. 36). Otherwise, the only exception to the rule barring recognition and enforcement occurs when the party raises its claim as a defense to or set-off against a claim asserted by the other party (Art. 25(2)). Relation To Private International Law And Existing Domestic Law:- The Limitation Convention applies only to international transactions and avoids the recourse to rules of private international law for those contracts falling under its scope of application. International

contracts falling outside the scope of application of the Limitation Convention, as well as contracts subject to a valid choice of other law, would not be affected by the Limitation Convention. Purely domestic sales contracts are not affected by the Limitation Convention and are regulated by domestic law. Additional Information:- Becoming a party to the Convention has no financial implications for Contracting States. Moreover, its administration at the domestic level does not require a dedicated body, and does not involve any reporting obligations. The Limitation Convention is accompanied by an explanatory note. Case Law:- Case Law on UNCITRAL Texts (Clout). Related Instruments:- (i) United Nations Convention on Contracts for the International Sale of Goods (Vienna, 1980) (CISG); and (ii) United Nations Convention on the Use of Electronic Communications in International Contracts (New York, 2005). / Конвенция Объединённых Наций Об Исковой Давности В Международной Торговле Товарами:- принята в 1974; определила предельный срок в четыре года, в течение которого стороны по международному контракту вправе предъявлять иски в связи с неуплатой.

UNITED NATIONS DEVELOPMENT PROGRAMME = ПРОГРАММА ОБЪЕДИНЁННЫХ НАЦИЙ ПО РАЗВИТИЮ (или ПРОГРАММА ОРГАНИЗАЦИИ ОБЪЕДИНЁННЫХ НАЦИЙ ПО РАЗВИТИЮ) – United Nations Development Programme (UNDP) is the United Nations (UN) organization formed on 22 November 1965 to help countries eliminate poverty and achieve sustainable human development, an approach to economic growth that emphasizes improving the quality of life of all citizens while conserving the environment and natural resources for future generations. The largest UN development assistance program, the UNDP is headed by an administrator who oversees a 36-member Executive Board representing both developing and developed countries. It is headquartered in New York, NY, the United States. The UNDP administers aid through five-year Country Programmes, which fund projects aimed at attracting investment capital, training skilled employees, and implementing modern technologies. The UNDP also makes experts available to help developing countries increase their capacity for good governance – by building political and legal institutions that are equitable, responsive, and open to public participation – and to expand the private sector of their economies in order to provide more jobs. Recent UNDP programs have focused on reducing poverty, developing strategies to treat and combat the spread of HIV/AIDS (short for the human immunodeficiency virus infection and acquired immune deficiency syndrome), promoting environmentally sound energy and economic policies, and expanding communications and technology infrastructure. UNDP resident representatives in more than 125 developing countries help to coordinate the local activities of other UN agencies and programs, as well as those of nongovernmental organizations. See also International Bank For Reconstruction And Development.

UNITED NATIONS ECONOMIC AND SOCIAL COMMISSION FOR ASIA AND THE PACIFIC = ЭКОНОМИЧЕСКАЯ И СОЦИАЛЬНАЯ КОМИССИЯ ОБЪЕДИНЁННЫХ НАЦИЙ ДЛЯ АЗИИ И ТИХОГО ОКЕАНА (или ЭКОНОМИЧЕСКАЯ И СОЦИАЛЬНАЯ КОМИССИЯ ОРГАНИЗАЦИИ ОБЪЕДИНЁННЫХ НАЦИЙ ДЛЯ АЗИИ И ТИХОГО ОКЕАНА) – United Nations Economic and Social Commission for Asia and the Pacific (ESCAP):- xxxxx. / Экономическая и Социальная Комиссия Объединённых Наций для Азии и Тихого Океана (ЭСКАТО):- .

UNITED NATIONS ECONOMIC AND SOCIAL COMMISSION FOR WESTERN ASIA = ЭКОНОМИЧЕСКАЯ И СОЦИАЛЬНАЯ КОМИССИЯ ОБЪЕДИНЁННЫХ НАЦИЙ ДЛЯ ЗАПАДНОЙ АЗИИ (или ЭКОНОМИЧЕСКАЯ И СОЦИАЛЬНАЯ КОМИССИЯ ОРГАНИЗАЦИИ ОБЪЕДИНЁННЫХ НАЦИЙ ДЛЯ ЗАПАДНОЙ АЗИИ) – United Nations Economic and Social Commission for Western Asia (ESCWA):- xxxxx. / Экономическая и Социальная Комиссия Объединённых Наций для Западной Азии (ЭСКЗА):- .

UNITED NATIONS ECONOMIC COMMISSION FOR AFRICA = ЭКОНОМИЧЕСКАЯ КОМИССИЯ ОБЪЕДИНЁННЫХ НАЦИЙ ДЛЯ АФРИКИ (или ЭКОНОМИЧЕСКАЯ КОМИССИЯ ОРГАНИЗАЦИИ ОБЪЕДИНЁННЫХ НАЦИЙ ДЛЯ АФРИКИ) – United Nations Economic Commission for Africa (UN ECA):- xxxxx. / Экономическая Комиссия Объединённых Наций для Африки (ЭКА ООН):- .

UNITED NATIONS ECONOMIC COMMISSION FOR EUROPE = ЭКОНОМИЧЕСКАЯ КОМИССИЯ ОБЪЕДИНЁННЫХ НАЦИЙ ДЛЯ ЕВРОПЫ (или ЭКОНОМИЧЕСКАЯ КОМИССИЯ ОРГАНИЗАЦИИ ОБЪЕДИНЁННЫХ НАЦИЙ ДЛЯ ЕВРОПЫ) – United Nations Economic Commission for Europe (UNECE) is the establishment of an Economic Commission for Europe was recommended by the Temporary Sub-Commission on the Economic Reconstruction of Devastated Areas, which convened in London on 1946-July-29 and reported to the Economic and Social Council on 1946-September-13. The Council, at its fourth session, complied with the General Assembly's wishes by adopting, on 1947-March-28, resolution 36 (IV) setting up ECE and giving it its terms of reference. The Economic Commission for Europe was thus, together with the Economic Commission for Asia and the Far East (ECAFE), which was established on the same date, one of the first two regional economic commissions to be established by the Council. Subsequently the Council established the Economic Commission for Latin America (ECLA) in March 1948, the Economic Commission for Africa (ECA) in April 1958 and the Economic Commission for Western Asia (ECWA) in August 1973. UNECE strives to foster sustainable economic growth among its 56 member countries. To that end UNECE provides a forum for communication among States; brokers international legal instruments addressing trade, transport and the environment; and supplies statistics and economic and environmental analysis. The establishment of an Economic Commission for Europe was recommended by the 'Temporary Sub-Commission on the Economic Reconstruction of Devastated Areas', which convened in London on 29 July 1946 and reported to the Economic and Social Council on 13 September 1946. On 11 December 1946, the General Assembly of the United Nations, at its fifty-fifth plenary meeting, unanimously recommended 'in order to give effective aid to the countries devastated by the war, the Economic and Social Council, at its next session, give prompt and favorable consideration to the establishment of an Economic Commission for Europe'. The Council, at its fourth session, complied with the General Assembly's wishes by adopting, on 28 March 1947, resolution 36 (IV) setting up ECE and giving it its terms of reference. The Economic Commission for Europe was thus, together with the Economic Commission for Asia and the Far East (ECAFE), which was established on the same date, one of the first two regional economic commissions to be established by the Council. Subsequently the Council established the Economic Commission for Latin America (ECLA) in March 1948, the Economic Commission for Africa (ECA) in April 1958 and the Economic Commission for Western Asia (ECWA) in August 1973. Headquartered in Geneva, Switzerland. The United Nations Economic Commission for Europe (UNECE) was set up in 1947 by the UN Economic and Social Council (ECOSOC). It is one of five regional commissions of the United Nations. The others are the Economic and Social Commission for Asia and the Pacific (ESCAP), the Economic Commission for Latin America and the Caribbean (ECLAC), the Economic Commission for Africa (ECA) and the Economic and Social Commission for Western Asia (ESCWA). Its major aim is to promote pan-European economic integration. To do so, UNECE brings together 56 countries located in the European Union, non-EU Western and Eastern Europe, South-East Europe and Commonwealth of Independent States (CIS) and North America. All these countries dialogue and cooperate under the aegis of the UNECE on economic and sectoral issues. To this end, it provides analysis, policy advice and assistance to governments, it gives focus to the United Nations global mandates in the economic field, in cooperation with other global players and key stakeholders, notably the business community. The UNECE also sets out norms, standards and conventions to facilitate international cooperation within and outside the region. The area of expertise of the UNECE covers such sectors as: economic cooperation and integration, energy, environment, housing and land management, gender, population, statistics, timber, trade, and transport. UNECE has 56 member States (in 2011). However, all interested UN member States may participate in its work. Over 70 international professional organizations and other non-governmental organizations take part in UNECE activities. / коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо). Экономическая Комиссия Организации Объединённых Наций Для Европы (ЭКЕ) – региональный орган ООН. Создана в 1947. Её членами

являлись 32 (в конце 1970-х) Европейских государства, включая Союз Советских Социалистических Республик (СССР), Украинскую Советскую Социалистическую Республику (УССР), Белорусскую Советскую Социалистическую Республику (БССР), а также США и Канада. ЭКЕ функционирует под общим руководством Экономического и Социального Совета ООН. Основная задача комиссии – разработка мероприятий по укреплению и расширению экономических отношений как между Европейскими странами, так и между Европейскими странами и другими государствами. В практической работе ЭКЕ содействует торговле между Востоком и Западом, осуществляет долгосрочное экономическое планирование, научно-техническое сотрудничество; выступает за проведение общеевропейских конгрессов, межгосударственных совещаний по вопросам сотрудничества в области охраны окружающей среды, развития транспорта и другое. Высший орган – Пленарная Сессия. Местопребывание Секретариата комиссии – Женева, Швейцария.

UNITED NATIONS ECONOMIC COMMISSION FOR LATIN ANERICA AND THE CARIBBEAN = ЭКОНОМИЧЕСКАЯ КОМИССИЯ ОБЪЕДИНЁННЫХ НАЦИЙ ДЛЯ ЛАТИНСКОЙ АМЕРИКИ И КАРИБОВ (или ЭКОНОМИЧЕСКАЯ КОМИССИЯ ОРГАНИЗАЦИИ ОБЪЕДИНЁННЫХ НАЦИЙ ДЛЯ ЛАТИНСКОЙ АМЕРИКИ И КАРИБОВ) – United Nations Economic Commission for Latin America and the Caribbean (ECLAC):- xxxxx. / Экономическая Комиссия Объединённых Наций для Латинской Америки и Карибов (ЭКЛАК):- .

UNITED NATIONS EDUCATIONAL, SCIENTIFIC AND CULTURAL ORGANIZATION = ОРГАНИЗАЦИЯ ОБЪЕДИНЁННЫХ НАЦИЙ ПО ВОПРОСАМ ОБРАЗОВАНИЯ, НАУКИ И КУЛЬТУРЫ – United Nations Educational, Scientific and Cultural Organization (UNESCO) is a specialized agency of the United Nations (UN) that was created in 1946 to promote international collaboration in education, science, and culture. Its permanent headquarters are in Paris, France. UNESCO's initial emphasis was on rebuilding schools, libraries, and museums that had been destroyed in Europe during World War II. Since then its activities have been mainly facilitative, aimed at assisting, supporting, and complementing the national efforts of member states to eliminate illiteracy and to extend free education. UNESCO also seeks to encourage the free exchange of ideas and knowledge by organizing conferences and providing clearinghouse and exchange services. As many less-developed countries joined the UN beginning in the 1950s, UNESCO began to devote more resources to their problems, which included poverty, high rates of illiteracy, and underdevelopment. During the 1980s UNESCO was criticized by the United States and other countries for its alleged anti-Western approach to cultural issues and for the sustained expansion of its budget. These issues prompted the United States to withdraw from the organization in 1984, and the United Kingdom and Singapore withdrew a year later. After the election victory of the Labour Party in 1997, the United Kingdom rejoined UNESCO, and the United States followed suit in 2003. Besides its support of educational and science programs, UNESCO is also involved in efforts to protect the natural environment and humanity's common cultural heritage. For example, in the 1960s UNESCO helped sponsor efforts to save ancient Egyptian monuments from the waters of the Aswān High Dam, and in 1972 it sponsored an international agreement to establish a World Heritage List of cultural sites and natural areas that would enjoy government protection. In the 1980s a controversial study by UNESCO's International Commission for the Study of Communication Problems, headed by the Irish statesman and Nobel Peace laureate Seán MacBride, proposed a New World Information and Communication Order that would treat communication and freedom of information as basic human rights and seek to eliminate the gap in communications capabilities between developing and developed countries. Each member state has one vote in UNESCO's General Conference, which meets every two years to set the agency's budget, its program of activities, and the scale of contributions made by member states to the agency. The 58-member Executive Board, which is elected by the General Conference, generally meets twice each year to give advice and direction to the agency's work. The Secretariat is the agency's backbone and is headed by a director general appointed by the General Conference for a six-year term. National commissions, composed of local experts, have been set up by about 180 UNESCO members and serve as governmental advisory bodies in their respective states. Most work occurs in special commissions and committees convened with expert participation. Prominent examples include the Intergovernmental Oceanographic Commission (1961–), the World Commission on Culture and Development (1992–99), and the World Commission on the Ethics of Scientific Knowledge and Technology (1998–). The findings of these commissions are regularly published by UNESCO. / Высотная Асуанская Дамба (Aswān High Dam). Министр Ирландского Правительства, лауреат Нобелевской Премии Мира Щан МэкБрайд (Seán MacBride; 1904–1988). ЮНЕСКО (UNESCO – сокращение от Английского словосочетания United Nations Educational Scientific and Cultural Organization – Организация Объединённых Наций по Вопросам Образования, Науки и Культуры (ООНВОНК)), смотрите Организация Объединённых Наций по Вопросам Образования, Науки и Культуры. Организация Объединённых Наций по Вопросам Образования, Науки и Культуры, (ООНВОНК или так называемая ЮНЕСКО; (United Nations Educational Scientific and Cultural Organization (UNESCO)), межправительственная организация; специализированное учреждение ООН. Устав ЮНЕСКО разработан на Учредительной конференции организации (Ноябрь 1945), вступил в силу 04 Ноября 1946. На 01 Декабря 1974 в ЮНЕСКО входило 135 государств; Союз Советских Социалистических Республик (СССР), Украинская Советская Социалистическая Республика (УССР), и Белорусская Советская Социалистическая Республика (БССР) – члены ЮНЕСКО с 1954. Целями ЮНЕСКО, согласно Ст. 1-й её Устава, являются:- содействие миру и международной безопасности путём развития сотрудничества между государствами в области образования, науки и культуры; обеспечение всеобщего уважения основных прав и свобод человека без различия расы, пола, языка или религии. Деятельность ЮНЕСКО охватывает широкий круг вопросов:- ликвидация неграмотности и борьба с дискриминацией в области образования; воспитание молодёжи в духе мира и международного взаимопонимания; содействие в подготовке национальных кадров; изучение национальных культур; проблемы океанографии, биосферы, геологии, социальных наук, информации и другие. В 1960-е – начала 1970-х ЮНЕСКО по инициативе СССР, других социалистических стран, а также развивающихся стран приняла (вопреки сопротивлению сил, противодействующих разрядке международной напряжённости) ряд решений, направленных на активизацию её роли в борьбе за мир, против расизма и колониализма. ЮНЕСКО активно участвовала в проведении международных кампаний, связанных с юбилейными датами мирового значения. Среди них – 50-летие Великой Октябрьской Социалистической Революции (1967), 150-летие со дня рождения Карла Маркса (1968), 100-летие со дня рождения Владимира Ильича Ленина (1970), 50-летие образования СССР (1972). Высший орган ЮНЕСКО – Генеральная Конференция; исполнительные органы – Исполнительный Совет и Секретариат, возглавляемый Генеральным Директором. Генеральный Директор ЮНЕСКО – А.М. М'Боу (Сенегал, с Ноября 1974), Председатель Исполнительного Совета – Х. Уинтер (Ямайка, с Ноября 1974). Штаб-квартира расположена в Париже, Франция. ЮНЕСКО издаёт 'Курьер ЮНЕСКО' (на 15 языках, в том числе с Января 1957 на Русском языке; выходит 11 раз в год) и публикует ряд других периодических изданий.

UNITED NATIONS/ELECTRONIC DATA INTERCHANGE FOR ADMINISTRATION, COMMERCE AND TRANSPORT = ВЗАИМООБМЕН ЭЛЕКТРОННЫМИ ДАННЫМИ ОБЪЕДИНЁННЫХ НАЦИЙ ДЛЯ АДМИНИСТРАЦИИ, КОММЕРЦИИ и ТРАНСПОРТА – UN/EDIFACT (the United Nations rules for Electronic Data Interchange for Administration, Commerce and Transport) is a UN recommended standard and probably the most widely used structured business and government message standards in the world. The UN/EDIFACT standard provides a set of syntax rules to structure data which contains directories of data elements, composite data elements, segments, and messages; and there are conventions for placing messages in an 'envelope' which identifies the sender and receiver and other attributes of a transmission. As UN/CEFACT messages are a superset of many collaborations, it is

common practice to develop and publish subsets of these messages into message implementation guidelines. Organisations such as World Customs Organisation (WCO), GS1, Automotive Industry Action Group (AIAG) and Odette International Limited have contributed significantly to the continued development of UN/EDIFACT and once published, they will subset the messages into guidelines for specific sectors in their areas of interest. While its use is still growing steadily, UN/CEFACT and other Standards Organizations has seen the need to provide alternatives. Most of these new standards are based on new requirements to have semantic data models and be based on technologies such as Core Component Technical Specification (CCTS). These standards are xml based and are more familiar to implementers who are involved in Internet technologies and may therefore have the potential to be the predominant means of exchanging trade documents in the next decade. For example the UN/EDIFACT INVOICE message is widely used by large companies, particularly in retailing. UN/EDIFACT is developed by UN/CEFACT and its popularity is continuing to grow every year. EDIFACT syntax rules were first registered as an ISO standard – ISO 9735 in 1987. UN Recommendations 25 and 26, adopted in 1995, advise on the use of EDIFACT in government messaging. These recommendations were to assist governments in the adoption of messaging using EDIFACT. As XML standards were not available at this stage, no reference is made to them. United Nations/EDI for Administration, Commerce and Transport (UN/EDIFACT):- EDI Standards are developed and supported by the UN for electronic message (data) interchange on an international level. UN/EDIFACT (the United Nations rules for Electronic Data Interchange for Administration, Commerce and Transport) comprise a set of internationally agreed standards, directories, and guidelines for the electronic interchange of structured data, between independent computerized information systems. Recommended within the framework of the United Nations, the rules are approved and published by the United Nations Economic Commission for Europe (UNECE) in the UNTDID (United Nations Trade Data Interchange Directory) and are maintained under agreed procedures. UNTDID includes:- Part 1. Introduction; Part 2. Uniform rules of conduct for interchange of trade data by teletransmission (UNCID); Part 3. Terms and Definitions; Part 4. United Nations rules for electronic data interchange for administration, commerce and transport; and Part 5. United Nations directories for electronic data interchange for administration, commerce and transport. UN/EDIFACT is an international Syntax used in the exchange of electronic data. Customs bureaus use EDIFACT to interchange data with the importing trade community. / Одэт Интёнэшэнэл Лимитид (Odette International Limited).

UNITED NATIONS ENVIRONMENT PROGRAMME = ПРОГРАММА ОБЪЕДИНЁННЫХ НАЦИЙ ПО ОКРУЖАЮЩЕЙ СРЕДЕ (или ПРОГРАММА ОРГАНИЗАЦИИ ОБЪЕДИНЁННЫХ НАЦИЙ ПО ОКРУЖАЮЩЕЙ СРЕДЕ) – United Nations Environment Programme (UNEP):- organization established in 1972 to guide and coordinate environmental activities within the United Nations (UN) system. UNEP promotes international cooperation on environmental issues, provides guidance to UN organizations, and, through its scientific advisory groups, encourages the international scientific community to participate in formulating policy for many of the UN's environmental projects. Headquartered in Nairobi, Kenya, the organization also has encouraged participation by the private sector to promote the sustainable use of the world's natural resources. One of UNEP's most widely recognized activities is Earthwatch, an international monitoring system designed to facilitate the exchange of environmental information among governments. Participation in this enterprise enables members to assess significant environmental risks and to act accordingly. UNEP played a major role in initiating negotiations on reducing ozone-depleting chemicals. UNEP provides the technical assistance for a variety of international conventions, including the Montreal Protocol on Substances That Deplete the Ozone Layer (1987), the Basel Convention on the Control of Transboundary Movements of Hazardous Wastes and their Disposal (1989), and the UN Convention on Biological Diversity (1992). As the secretariat for these conventions, UNEP services the conferences, implements the decisions, monitors implementation, and provides data and information. Together with the Food and Agriculture Organization (FAO), UNEP helps to implement the Convention on the Prior Informed Consent Procedure for Certain Hazardous Chemicals and Pesticides in International Trade (1998). UNEP also coordinates the work on UN agencies with respect to desertification and the regional seas (with special attention to the Mediterranean Sea). The 58-member Governing Council, the organization's principal legislative body, is elected by the UN General Assembly for four-year terms. Seats are allocated by region to assure widespread representation, generally providing about 16 seats for African states, 13 for Asia, 6 for Eastern Europe, 10 for Latin America and the Caribbean, and 13 for Western Europe and other states.

UNITED NATIONS INDUSTRIAL DEVELOPMENT ORGANIZATION = ОРГАНИЗАЦИЯ ОБЪЕДИНЁННЫХ НАЦИЙ ПО ПРОМЫШЛЕННОМУ РАЗВИТИЮ – United Nations Industrial Development Organization (UNIDO):- international UN development agency, based in Vienna, that was established by the General Assembly on January 01, 1967. UNIDO's governing body, the General Conference, meets every two years and determines policy and approves the budget. It also elects the director-general and the Industrial Development Board, which is composed of representatives from 53 member states; the board reviews the various programs and makes recommendations on policy matters. UNIDO aims to assist in the industrialization of the developing countries by coordinating other UN organizations devoted to this end. Its activities help to formulate industrial development policies and programs by providing advisers and other assistance, mostly in terms of information, education, and research. A network of Investment and Technology Promotion offices in countries such as Bahrain, China, Italy, Japan, Greece, and Russia publicize investment opportunities and provide information to potential investors. UNIDO also maintains liaison offices in Geneva and New York City and has other field offices around the world. / Организация Объединённых Наций По Промышленному Развитию (ООНПР или так называемая ЮНИДО) в области упрощения процедур торговли ООНПР развивает прежде всего проекты по созданию лабораторий для тестирования на границе. Организация Объединённых Наций По Промышленному Развитию (ЮНИДО) (United Nations Industrial Development Organization (UNIDO)):- международная организация, которая стала специализированным агентством Организации Объединённых Наций (ООН) в 1986, возникнув в результате преобразования Центра Промышленного Развития, созданного в 1961. Штабквартира организации базируется в Вене, Австрия. В задачи ЮНИДО входит способствование процессу индустриализации в развивающихся странах, особенно развитию обрабатывающей промышленности. Оно разрабатывает политику планирования и обеспечивает техническое консультирование и техническую помощь для стран 'третьего мира'. Организация Объединённых Наций По Промышленному Развитию (ООНПР или так называемая ЮНИДО):- один из органов ООН, организация по промышленному развитию, оказывающая содействие в индустриализации развивающихся стран. Возникла в 1966 и насчитывает 137 государств. Деятельность подразделяется на оперативную, включающую оказание технической помощи развивающимся странам в осуществлении конкретных проектов, разработку региональных долгосрочных (на период до 10 лет) стратегий развития этих стран, и вспомогательную, включающую сбор, обобщение, публикацию информации, проведение исследований, организацию конференций по вопросам промышленного развития. Главными органами выступают Генеральная Конференция, Совет по Промышленному Развитию, Постоянный Комитет и Секретариат.

UNITED NATIONS INSTITUTE FOR TRAINING AND RESEARCH = ИНСТИТУТ ОБЪЕДИНЁННЫХ НАЦИЙ ДЛЯ ПОДГОТОВКИ И ИССЛЕДОВАНИЙ (или ИНСТИТУТ ОРГАНИЗАЦИИ ОБЪЕДИНЁННЫХ НАЦИЙ ДЛЯ ПОДГОТОВКИ И ИССЛЕДОВАНИЙ) – United Nations Institute for Training and Research (UNITAR):- United Nations organization established in 1965 to provide high-priority training and research projects to help facilitate the UN objectives of world peace and security and of economic and social progress. A Board of Trustees of up to 30 members is appointed by the UN secretary-general; the secretary-general himself and the presidents of the General Assembly and the Economic and Social Council (ECOSOC) are ex-officio members. Meetings usually occur once

annually. UNITAR's fundamental activities are interorganizational, with primary attention paid to analyzing UN procedures, functions, and structures. Its training program includes a variety of courses designed to benefit both new and long-standing UN delegates, as well as nondiplomatic officials.

UNITED NATIONS INTERNATIONAL CHILDREN'S EMERGENCY FUND = МЕЖДУНАРОДНЫЙ ЧРЕЗВЫЧАЙНЫЙ ДЕТСКИЙ ФОНД ОБЪЕДИНЁННЫХ НАЦИЙ (или МЕЖДУНАРОДНЫЙ ЧРЕЗВЫЧАЙНЫЙ ДЕТСКИЙ ФОНД ОРГАНИЗАЦИИ ОБЪЕДИНЁННЫХ НАЦИЙ) – United Nations International Children's Emergency Fund (UNICEF):- acronym of United Nations Children's Fund, formerly (1946–53) United Nations International Children's Emergency Fund special program of the United Nations (UN), devoted to aiding national efforts to improve the health, nutrition, education, and general welfare of children. UNICEF was created in 1946 to provide relief to children in countries devastated by World War II. After 1950 the fund directed its efforts toward general programs for the improvement of children's welfare, particularly in less-developed countries and in various emergency situations. The organization's broader mission was reflected in the name it adopted in 1953, the United Nations Children's Fund. UNICEF was awarded the Nobel Prize for Peace in 1965. It is headquartered in New York City. UNICEF has concentrated much of its effort in areas in which relatively small expenditures can have a significant impact on the lives of the most disadvantaged children, such as the prevention and treatment of disease. In keeping with this strategy, UNICEF supports immunization programs for childhood diseases and programs to prevent the spread of HIV/AIDS (short for the human immunodeficiency virus infection and acquired immune deficiency syndrome); it also provides funding for health services, educational facilities, and other welfare services. Since 1996 UNICEF programs have been guided by the Convention on the Rights of the Child (1989), which affirms the right of all children to 'the enjoyment of the highest attainable standard of health and to facilities for the treatment of illness and rehabilitation of health'. UNICEF's activities are financed by both government and private contributions.

UNITED NATIONS KOREAN RECONSTRUCTION AGENCY = АГЕНТСТВО ОБЪЕДИНЁННЫХ НАЦИЙ ПО КОРЕЙСКОЙ РЕКОНСТРУКЦИИ (или АГЕНТСТВО ОРГАНИЗАЦИИ ОБЪЕДИНЁННЫХ НАЦИЙ ПО КОРЕЙСКОЙ РЕКОНСТРУКЦИИ) – United Nations Korean Reconstruction Agency (UNKRA):- economic-rehabilitation program (1950–58) established to aid South Korea in recovering from the disruption caused by the 1945 partition creating the two Korean republics. In addition to problems of economic reconstruction, much attention was concentrated on the problem of refugees who were displaced by World War II and those who were made homeless by the ensuing Korean War. Thirty-four UN member states and five nonmember states contributed USD148 500 000 to the UNKRA program, which was terminated on July 01, 1958.

UNITED NATIONS NUMBER = НОМЕР ОБЪЕДИНЁННЫХ НАЦИЙ (или НОМЕР ОРГАНИЗАЦИИ ОБЪЕДИНЁННЫХ НАЦИЙ) – United Nations (UN) Numbers are four-digit numbers used world-wide in international commerce and transportation to identify hazardous chemicals or classes of hazardous materials. These numbers generally range between 0000 and 3500 and are ideally preceded by the letters 'UN' (for example, 'UN1005') to avoid confusion with other number codes. North American (NA) Numbers are identical to UN numbers. If a material does not have a UN number, it may be assigned an NA number; these are usually 4-digit numbers starting with 8 or 9 such as 9037 (or ideally, NA9037), the NA number for hexachloroethane. UN/NA numbers are required for the shipment of hazardous materials. You have probably seen placards (such as the one on the right) that bear a UN/NA number on railway cars, trucks, shipping containers etc. UN numbers are assigned by a committee of the United Nations, the Economic and Social Council (ECOSOC) Committee of Experts (COE) on the Transport of Dangerous Goods which issues 'Recommendations on the Transport of Dangerous Goods' (also called 'the Orange Book'). UN Recommendations are not regulations, but are recommendations addressing the international transport of dangerous goods by sea, air, road, rail and inland waterways. These recommendations are reviewed, amended and updated biennially (every second year) by the UN COE and are distributed to nations throughout the world. These recommendations serve as the basis for national, regional, and international transport regulations such as those prepared by the International Maritime Organization (IMO) and the International Civil Aviation Organization (ICAO). The UN Recommendations are also used as a basis for the development of regional (e.g., NAFTA and European Road and Rail regulations) and national transport regulations, including the US Hazardous Materials Regulations (see our entry on DOT (short for The US Department of Transportation)). We've got your DOT number at Safety Emporium with DOT placards, NFPA labels and more! The UN Recommendations on the Transport of Dangerous Goods addresses the following areas:- (i) a list of the most commonly carried dangerous goods, their identification and their classification; (ii) consignment procedures such as labelling, marking, and transport documents; (iii) standards for packaging, test procedures, and certification; and (iv) standards for multimodal tank-containers, test procedures and certification. UN numbers uniquely identify only a very small number of chemicals or families of chemicals (less than 10 000), unlike CAS Registry Numbers, which are assigned to each of the 50 000 000 unique chemical compounds that have been discovered. UN/NA numbers are very useful for shippers and emergency first-responders, but are not particularly applicable to employees occupationally exposed to the materials. UN/NA numbers are not required by OSHA on an MSDS, although many sheets have them to simplify shipping requirements. DOT's 2008 Emergency Response Guide Book is indexed by 'ID Numbers' which are actually the UN/NA number. Be careful not to confuse the ID number (UN/NA number) with the Guide number (the page that tells you about the properties and hazards). For example, the UN/NA number for ammonia is 1005, but the hazards are discussed in Guide entry 125. The Guide is a free download and is on-line searchable. Ideally, a hard copy of the Guide should be every kept on any vehicle, train, boat or aircraft that transports hazardous materials as well as every emergency rescue vehicle. A UN Number is a four-digit number assigned to hazardous material required by the US Department of Transportation (DOT) for highway transportation, by the International Maritime Dangerous Goods (IMDG) Code for water transit, and by ICAO for air transit. It is used to help designate the emergency response procedure in the event of a spill or release. UN Numbers or UN IDs are four-digit numbers that identify dangerous goods hazardous substances and articles (such as explosives, flammable liquids, toxic substances, etc) in the framework of international transport. Some hazardous substances have their own UN numbers (e.g., acrylamide has UN2074), while sometimes groups of chemicals or products with similar properties receive a common UN number (e.g., flammable liquid, not otherwise specified, have UN1993). A chemical in its solid state may receive a different UN number than the liquid phase if their hazardous properties differ significantly; substances with different levels of purity may also receive different UN numbers. UN numbers range from UN0001 to about UN3500 and are assigned by the United Nations committee of experts on the transport of dangerous goods. They are published as part of their Recommendations on the transport of dangerous goods, also known as the Orange Book. These recommendations are adopted by the regulatory organization responsible for the different modes of transport.

UNITED NATIONS OFFICE FOR THE COORDINATION OF HUMANITARIAN AFFAIRS = УПРАВЛЕНИЕ ОБЪЕДИНЁННЫХ НАЦИЙ ДЛЯ КООРДИНАЦИИ ГУМАНИТАРНЫХ ВОПРОСОВ (или УПРАВЛЕНИЕ ОРГАНИЗАЦИИ ОБЪЕДИНЁННЫХ НАЦИЙ ДЛЯ КООРДИНАЦИИ ГУМАНИТАРНЫХ ВОПРОСОВ) – United Nations Office for the Coordination of Humanitarian Affairs (OCHA):- formerly (1972–92) Office of the United Nations Disaster Relief Coordinator and (1992–98) United Nations Department of Humanitarian Affairs is an agency of the United Nations (UN) Secretariat originally established in 1972 to coordinate international relief activities to countries struck by natural or other disasters. It is headed by a disaster relief coordinator who reports directly to the UN Secretary-General and works closely with the United Nations Development Programme (UNDP). Responding to requests from stricken

states for disaster assistance, OCHA not only directs UN assistance but also mobilizes aid from nongovernmental organizations such as the International Red Cross. OCHA also functions as an information coordination centre. Since the 1980s OCHA has emphasized disaster preparedness and prevention and the execution of UNDP-assisted projects.

UNITED NATIONS PEACEKEEPING FORCES = СИЛЫ ОБЪЕДИНЁННЫХ НАЦИЙ ПО ПОДДЕРЖАНИЮ МИРА (или СИЛЫ ОРГАНИЗАЦИИ ОБЪЕДИНЁННЫХ НАЦИЙ ПО ПОДДЕРЖАНИЮ МИРА) – United Nations Peacekeeping Forces:- international armed forces first used in 1948 to observe cease-fires in Kashmir and Palestine. Although not specifically mentioned in the United Nations (UN) Charter, the use of international forces as a buffer between warring parties pending troop withdrawals and negotiations – a practice that became known as peacekeeping – was formalized in 1956 during the Suez Crisis between Egypt, Israel, France, and the United Kingdom. Although peacekeeping missions have taken many forms, they have in common the fact that they are designed to be peaceful, that they involve troops from several countries, and that the troops serve under the authority of the UN Security Council. The UN Peacekeeping Forces were awarded the 1988 Nobel Prize for Peace.

UNITED NATIONS POPULATION FUND = ФОНД ОБЪЕДИНЁННЫХ НАЦИЙ ДЛЯ НАСЕЛЕНИЯ (или ФОНД ОРГАНИЗАЦИИ ОБЪЕДИНЁННЫХ НАЦИЙ ДЛЯ НАСЕЛЕНИЯ) – United Nations Population Fund:- formerly (1969–87) known as United Nations Fund for Population Activities (UNFPA) trust fund under the jurisdiction of the United Nations Development Programme (UNDP). Established in 1969, the UNFPA is the largest international source of assistance for population programs and the leading United Nations (UN) organization for the implementation of the 1994 Programme of Action of the International Conference on Population and Development. It funds assistance, research, and advocacy programs in three major areas:- (1) reproductive health, including family planning, safe motherhood, and the prevention and treatment of sexually transmitted diseases, (2) the population problems of developed and developing countries and possible strategies for addressing them, and (3) issues related to the status of women, including the gender gap in education. UNFPA assistance programs are undertaken only in response to government requests.

UNITED NATIONS RELIEF AND REHABILITATION ADMINISTRATION = АДМИНИСТРАЦИЯ ОБЪЕДИНЁННЫХ НАЦИЙ ПО ОКАЗАНИЮ ПОМОЩИ И РЕАБИЛИТАЦИИ (или АДМИНИСТРАЦИЯ ОРГАНИЗАЦИИ ОБЪЕДИНЁННЫХ НАЦИЙ ПО ОКАЗАНИЮ ПОМОЩИ И РЕАБИЛИТАЦИИ) – United Nations Relief and Rehabilitation Administration (UNRRA):- administrative body (1943–47) for an extensive social-welfare program that assisted nations ravaged by World War II. Created on November 09, 1943, by a 44-nation agreement, its operations concentrated on distributing relief supplies, such as food, clothing, fuel, shelter, and medicines; providing relief services, with trained personnel; and aiding agricultural and economic rehabilitation. In addition, it also provided camps, personnel, and food for the care and repatriation of millions of displaced persons and refugees after the war. UNRRA discontinued its activities in 1947; unfinished projects were turned over to the International Refugee Organization, the World Health Organization, and the United Nations International Children's Emergency Fund (now the United Nations Children's Fund).

UNITED NATIONS RELIEF AND WORKS AGENCY FOR PALESTINE REFUGEES IN THE NEAR EAST = АГЕНТСТВО ОБЪЕДИНЁННЫХ НАЦИЙ ПО ОКАЗАНИЮ ПОМОЩИ И РАБОТАМ ДЛЯ ПАЛЕСТИНСКИХ БЕЖЕНЦЕВ НА БЛИЖНЕМ ВОСТОКЕ (или АГЕНТСТВО ОРГАНИЗАЦИИ ОБЪЕДИНЁННЫХ НАЦИЙ ПО ОКАЗАНИЮ ПОМОЩИ И РАБОТАМ ДЛЯ ПАЛЕСТИНСКИХ БЕЖЕНЦЕВ НА БЛИЖНЕМ ВОСТОКЕ) – United Nations Relief and Works Agency for Palestine Refugees in the Near East (UNRWA):- subsidiary agency created by the United Nations (UN) General Assembly in 1949 to provide relief, health, and education services for Palestinians who lost both their homes and means of livelihood during the Arab-Israeli wars following the establishment of the state of Israel in 1948. Beginning operations in 1950, UNRWA was originally headquartered in Beirut, Lebanon, but was moved to Vienna, Austria, in 1978. In 1996 the General Assembly moved the agency to the Gaza Strip to demonstrate the Assembly's commitment to the Arab-Israeli peace process. UNRWA's members are Belgium, Egypt, France, Japan, Jordan, Lebanon, Syria, Turkey, the United Kingdom, and the United States; the Palestine Liberation Organization (PLO) has observer status. Approximately 500 000 Palestinians originally qualified for relief, but by the late XX century there were nearly four million registered Palestinian refugees, including the children of the original refugees. As the largest UN operation in the Middle East and one of the biggest employers in the region – with service operations in Jordan, Lebanon, Syria, the West Bank, and the Gaza Strip – UNRWA provides camps, food, clothing, schools, vocational training, and health clinics, often working in cooperation with the World Health Organization (WHO), the United Nations Children's Fund (UNICEF), the United Nations Population Fund (UNFPA), and the United Nations Educational, Scientific and Cultural Organization (UNESCO). UNRWA is financed by voluntary contributions of member governments. Like its predecessor organization, the UN Relief for Palestine Refugees in the Near East, it was originally designed as a temporary agency, though its mandate has been continuously renewed by the General Assembly. Its chief officer, the commissioner-general – the only leader of a UN agency to report directly to the General Assembly – is appointed by the UN secretary-general with the approval of an Advisory Commission.

UNITED NATIONS RESEARCH INSTITUTE FOR SOCIAL DEVELOPMENT = ИССЛЕДОВАТЕЛЬСКИЙ ИНСТИТУТ ОБЪЕДИНЁННЫХ НАЦИЙ ДЛЯ СОЦИАЛЬНОГО РАЗВИТИЯ (или ИССЛЕДОВАТЕЛЬСКИЙ ИНСТИТУТ ОРГАНИЗАЦИИ ОБЪЕДИНЁННЫХ НАЦИЙ ДЛЯ СОЦИАЛЬНОГО РАЗВИТИЯ) – United Nations Research Institute for Social Development (UNRISD):- autonomous United Nations body established in 1964 to conduct research into the problems and policies of social and economic development. UNRISD is dependent on voluntary contributions from governments, from other UN organizations, and from various national and international agencies because it does not receive monies from the regular UN budget; it has been supported by 15, primarily European, governments. As a research organ, UNRISD investigates the relations between social and economic change during varying phases of economic growth. UNRISD's autonomous position frees it to conduct research using and interpreting its own data, to question internationally fashionable assumptions, and to propose alternatives. Focusing on the practical issues of developing countries, UNRISD conducts systematic field studies and comparative analyses of social and economic development. / социального и экономического развития.

UNITED NATIONS SPECIAL PROGRAMME FOR ECONOMIES OF CENTRAL ASIA = СПЕЦИАЛЬНАЯ ПРОГРАММА ОБЪЕДИНЁННЫХ НАЦИЙ ДЛЯ ЭКОНОМИК СРЕДНЕЙ АЗИИ – United Nations Special Programme for Economies of Central Asia (SPECA):- xxxxx. / Специальная Программа Объединённых Наций для Экономик Средней Азии (СПЭСА):- .

THE UNITED STATES = СОЕДИНЁННЫЕ ШТАТЫ – For Customs purposes, the United States includes all territories and possessions of the United States, except the Virgin Islands, American Samoa, Wake Island, Midway Islands, Kingman Reef, Johnston Island, and the island of Guam. United States:- unless otherwise stated, the 50 States, including offshore areas within their jurisdiction pursuant to section 3 of the Submerged Lands Act (43 USC 1311), the District of Columbia, Puerto Rico, and all territories, dependencies, and possessions of the United States, including foreign trade zones established pursuant to 19 USC 81A-81U, and also including the outer continental shelf, as defined in section 2(a) of the Outer Continental Shelf Lands Act (43 USC 1331(a)). The United States (US) means the States of the United States (USA), the District of Columbia (DC), and the territories and possessions of the United States, including the territorial sea and the overlying airspace. United States:- officially United States of America, abbreviations U.S. or U.S.A., byname America country of North America, a federal republic of 50 states. Besides the 48 contiguous states that

occupy the middle latitudes of the continent, the United States includes the state of Alaska, at the North-Western extreme of North America, and the island state of Hawaii, in the mid-Pacific Ocean. The coterminous states are bounded on the North by Canada, on the East by the Atlantic Ocean, on the South by the Gulf of Mexico and Mexico, and on the West by the Pacific Ocean. The national capital is Washington, which is coextensive with the District of Columbia, the federal capital region created in 1790. The total area of the United States is 3 679 192 square miles (9 529 063 square kilometers), making it the fourth largest country in the world in area (after Russia, Canada, and China). Outlying territories and other politically associated areas in the Pacific Ocean and the Caribbean Sea add approximately 4 000 square miles to this figure. The major characteristic of the United States is probably its great variety. Its physical environment ranges from the Arctic to the subtropical, from the moist rain forest to the arid desert, from the rugged mountain peak to the flat prairie. Although the total population of the United States is large by world standards, its overall population density is relatively low; the country embraces some of the world's largest urban concentrations as well as some of the most extensive areas that are almost devoid of habitation. The United States contains a highly diverse population; but, unlike a country such as China that largely incorporated indigenous peoples, its diversity has to a great degree come from an immense and sustained global immigration. Probably no other country has a wider range of racial, ethnic, and cultural types than does the United States. In addition to the presence of surviving native Americans (including American Indians, Aleuts, and Eskimo) and the descendants of Africans taken as slaves to America, the national character has been enriched, tested, and constantly redefined by the tens of millions of immigrants who by and large have gone to America hoping for greater social, political, and economic opportunities than they had in the places they left. The United States is the world's greatest economic power, measured in terms of gross national product (GNP). The nation's wealth is partly a reflection of its rich natural resources and its enormous agricultural output, but it owes more to the country's highly developed industry. Despite its relative economic self-sufficiency in many areas, the United States is the most important single factor in world trade by virtue of the sheer size of its economy. Its exports and imports represent major proportions of the world total. The United States also impinges on the global economy as a source of and as a destination for investment capital. The country continues to sustain an economic life that is more diversified than any other on Earth, providing the majority of its people with one of the world's highest standards of living. The United States is relatively young by world standards, being barely more than 200 years old; it achieved its current size only in the mid-XX century. America was the first of the European colonies to separate successfully from its motherland, and it was the first nation to be established on the premise that sovereignty rests with its citizens and not with the government. In its first century and a half, the country was mainly preoccupied with its own territorial expansion and economic growth and with social debates that ultimately led to civil war and a healing period that is still not complete. In the XX century the United States emerged as a world power, and since World War II it has been one of the preeminent powers. It has not accepted this mantle easily nor always carried it willingly; the principles and ideals of its founders have been tested by the pressures and exigencies of its dominant status. Although the United States still offers its residents opportunities for unparalleled personal advancement and wealth, the depletion of its resources, contamination of its environment, and continuing social and economic inequality that perpetuates areas of poverty and blight all threaten the fabric of the country. The District of Columbia is discussed in the article Washington. For discussion of other major US cities, see the articles Boston, Chicago, Los Angeles, New Orleans, New York City, Philadelphia, and San Francisco. Political units in association with the United States include Puerto Rico, discussed in the article Puerto Rico, and several Pacific islands, discussed in Guam, Northern Mariana Islands, and American Samoa. The Land:- The two great sets of elements that mold the physical environment of the United States are, first, the geologic, which determines the main patterns of landforms, drainage, and mineral resources and influences soils to a lesser degree, and, second, the atmospheric, which dictates not only climate and weather but also in large part the distribution of soils, plants, and animals. Although these elements are not entirely independent of one another, each produces on a map patterns that are so profoundly different that essentially they remain two separate geographies. (Since this article covers only the coterminous United States, see also the articles Alaska and Hawaii.) / Под Соединёнными Штатами (СШ) понимаются Соединённые Штаты Америки (США), федеральный (столичный) Округ Колумбия, и территории и владения Соединённых Штатов, включающие территориальное море (территориальные воды) и окружающее воздушное пространство.

UNITED STATES AIRLINE = АВИАЛИНИЯ СОЕДИНЁННЫХ ШТАТОВ (или ВОЗДУШНАЯ ЛИНИЯ СОЕДИНЁННЫХ ШТАТОВ) – United States Airline:- any citizen of the United States who is authorized by the US Government to engage in business as an airline. For purposes of this definition, a US citizen is:- (a) an individual who is a citizen of the United States or one of its possessions; or (b) a partnership of which each member is such an individual; or (c) a corporation or association created or organized under the laws of the United States, or of any State, Territory, or possession of the – United States, of which the president and two-thirds of the board of directors and other managing officers thereof are such individuals and in which at least 75 percent of the voting interest is owned or controlled by persons who are citizens of the United States or of one of its possessions.

UNITED STATES COAST GUARD = БЕРЕГОВАЯ ОХРАНА СОЕДИНЁННЫХ ШТАТОВ – United States Coast Guard (USCG):- military service within the US armed forces that is charged with the enforcement of maritime laws. It consists of approximately 35 000 officers and enlisted personnel, in addition to civilians. It is under the jurisdiction of the Department of Homeland Security; in time of war it functions as part of the US Navy and is under the direction of the president. The USCG was established in 1790 by Secretary of the Treasury Alexander Hamilton as the Revenue Marine Service. It later became the Revenue Cutter Service and, in 1915, was combined with the US Lifesaving Service (formed 1878) to become the Coast Guard. It was under the (peacetime) jurisdiction of the Treasury Department until 1967, when it was transferred to the Department of Transportation. In 2003 the Coast Guard was placed under the jurisdiction of the newly created Department of Homeland Security. The Coast Guard enforces all applicable federal laws on the high seas and waters within the territorial jurisdiction of the United States. It administers laws and promulgates and enforces regulations for the promotion of safety of life and property along the entire US coast (including Alaska and Hawaii). It develops and operates aids to navigation in order to maintain the safety of ports and vessels in US territorial waters. The peacetime duties of the Coast Guard involve the inspection of vessels and their equipment and the direction and operation of lighthouses, lightships, buoys, and such electronic navigational aids as loran (long-range navigation) stations and radio beacons. The Coast Guard maintains an extensive network of lifeboat and search-and-rescue stations using surface vessels and aircraft. It also operates the International Ice Patrol, which maintains surveillance of icebergs in the North Atlantic shipping lanes. The USCG also gathers data for the National Weather Service and assists distressed ships and planes. Wartime duties include escorting ships, securing ports, and manning transports. The Coast Guard also assists in the interdiction of illegal narcotics that enter the United States on or over coastal waters. The Coast Guard's organization parallels that of the US Navy, and Coast Guard ranks and ratings are identical to those of the Navy. The two services' uniforms are also similar. The USCG is headed by a Coast Guard admiral who is appointed by the president. Coast Guard Reserve was established in 1939. Women have been permitted to serve in the regular Coast Guard since 1973. The US Coast Guard Academy is located in New London, Connecticut. / Алыгзэндё Хэмилтчэн (Alexander Hamilton; 1755–1804).

UNITED STATES CUSTOMS SERVICE = ТАМОЖЕННАЯ СЛУЖБА СОЕДИНЁННЫХ ШТАТОВ – United States Customs Service is an agency of the Treasury Department charged with enforcing laws relative to imports.

THE UNITED STATES DEPARTMENT OF AGRICULTURE = ДЕПАРТАМЕНТ СЕЛЬСКОГО ХОЗЯЙСТВА СОЕДИНЁННЫХ ШТАТОВ (или МИНИСТЕРСТВО СЕЛЬСКОГО ХОЗЯЙСТВА СОЕДИНЁННЫХ ШТАТОВ) – 1862:- The United States Department of Agriculture (USDA) established:- We provide leadership on food, agriculture, natural resources, and related issues based on sound public policy, the best available science, and efficient management. We want to be recognized as a dynamic organization that is able to efficiently provide the integrated program delivery needed to lead a rapidly evolving food and agriculture system. USDA has created a strategic plan to implement its vision. The framework of this plan depends on these key activities:- expanding markets for agricultural products and support international economic development, further developing alternative markets for agricultural products and activities, providing financing needed to help expand job opportunities and improve housing, utilities and infrastructure in rural America, enhancing food safety by taking steps to reduce the prevalence of foodborne hazards from farm to table, improving nutrition and health by providing food assistance and nutrition education and promotion, and managing and protecting America's public and private lands working cooperatively with other levels of government and the private sector. Headquartered in Washington, DC, the United States. A government agency which regulates functions of specific imported merchandise, e.g., plants and plant products, domestic animals, serums and by products, etc. The United States Department of Agriculture (USDA) is the US governmental department responsible for the regulations concerning the import of foodstuffs. / В США Департамент Сельского Хозяйства или Министерство Сельского Хозяйства является федеральным агентством, которое регулирует предназначения определённой привозимой (или импортируемой) продукции, например, растений и растительной продукции, домашних животных, сывороток и побочных продуктов и так далее.

UNITED STATES DEPARTMENT OF AGRICULTURE – ANIMAL AND PLANT HEALTH INSPECTION SERVICE – PLANT PROTECTION AND QUARANTINE = ЗАЩИТА И КАРАНТИН РАСТЕНИЙ – СЛУЖБА ПО ИНСПЕКЦИИ ЗДОРОВЬЯ ЖИВОТНЫХ И РАСТЕНИЙ – ДЕПАРТАМЕНТ СЕЛЬСКОГО ХОЗЯЙСТВА СОЕДИНЁННЫХ ШТАТОВ – United States Department of Agriculture – Animal and Plant Health Inspection Service – Plant Protection and Quarantine (USDA-APHIS-PPQ):- Plant Protection and Quarantine (PPQ) is a program within the Animal and Plant Health Inspection Service (APHIS). PPQ safeguards agriculture and natural resources from the entry, establishment, and spread of animal and plant pests and noxious weeds into the United States of America; and supports trade and exports of US agricultural products. PPQ responds to many new introductions of plant pests to eradicate, suppress, or contain them through various programs in cooperation with state departments of agriculture and other government agencies. These may be emergency or longer term domestic programs that target a specific pest. This page lists a variety of insect, plant disease, mollusk, or weed programs with detailed information linked to each. The goal of PPQ's pest detection program is to protect America's agricultural and ecological resources by insuring the early detection of harmful or economically significant plant pest and weeds. View this page to learn more about this program. The Center for Plant Health Science and Technology (CPHST) provides scientific support for PPQ regulatory decisions and operations. The National Identification Services coordinates the identification of plant pests in support of USDA's regulatory programs. This page provides procedures and resources relating to the identification of plant pests of regulatory concern. PPQ serves to allow legitimate international and interstate trade while preventing the introduction of foreign plant pests. View this page to learn more about import and export requirements for live plants and plant products, such as fresh fruits and vegetables, and certification information on solid wood packing material. Links to PPQ's electronic manuals are also available at this site. Permits are required under specific USDA Animal and Plant Health Inspection Service Regulatory Authorities to import designated plants, plant products and soil into the US, transport designated plants and plant products through the US, import plant pests and biological control organisms into the US, and move plant pests and biological control organisms between States. PPQ, the Federal response agency for plant health emergencies, develops and delivers strategic science-based regulatory programs designed to protect US crops and natural resources. View this page to learn about PPQ's infrastructure, programs, and activities that strive to deliver an effective systems approach to mitigate risks posed by select agents and regulated pests. APHIS Plant Protection and Quarantine (PPQ) is the National Plant Protection Authority; the Deputy Administrator for PPQ represents the United States in the North American Plant Protection Organization and other international fora related to plant health and quarantine. The Animal and Plant Health Inspection Service (APHIS) is a multi-faceted Agency with a broad mission area that includes protecting and promoting US agricultural health, regulating genetically engineered organisms, administering the Animal Welfare Act and carrying out wildlife damage management activities. These efforts support the overall mission of USDA, which is to protect and promote food, agriculture, natural resources and related issues. To protect agricultural health, APHIS is on the job 24 hours a day, 7 days a week working to defend America's animal and plant resources from agricultural pests and diseases. For example, if the Mediterranean fruit fly and Asian longhorned beetle, two major agricultural pests, were left unchecked, they would result in several billions of dollars in production and marketing losses annually. Similarly, if foot-and-mouth disease or highly pathogenic avian influenza were to become established in the United States, foreign trading partners could invoke trade restrictions and producers would suffer devastating losses. In the event that a pest or disease of concern is detected, APHIS implements emergency protocols and partners with affected States to quickly manage or eradicate the outbreak. This aggressive approach has enabled APHIS to successfully prevent and respond to potential pest and disease threats to US agriculture. To promote the health of US agriculture in the international trade arena, APHIS develops and advances science-based standards with trading partners to ensure America's agricultural exports, worth more than USD50 billion annually, are protected from unjustified restrictions. In response to needs expressed by the American people and Congress, APHIS' mission has expanded over the years to include such issues as wildlife damage and disease management; regulation of genetically engineered crops and animal welfare; and protection of public health and safety as well as natural resources that are vulnerable to invasive pests and pathogens. While carrying out its diverse protection responsibilities, APHIS makes every effort to address the needs of all stakeholders involved in the US agricultural sector. Mission:- to protect the health and value of American agriculture and natural resources. Strategic Plan:- the APHIS Strategic Plan outlines the goals, objectives, and performance measures that set the direction of APHIS' work. By keeping this plan in mind as work is done and decisions are made, APHIS can be certain to carry out its mission. Animal and Plant Health Inspection Service (APHIS) is an agency of the United States Department of Agriculture (USDA) responsible for protecting animal health, animal welfare, and plant health. APHIS is the lead agency for collaboration with other agencies to protect US agriculture from invasive pests and diseases. APHIS is the National Plant Protection Authority for the US government, and the agency's head of veterinary services is Chief Veterinary Officer of the United States.

UNITED STATES DEPARTMENT OF TRANSPORTATION = ДЕПАРТАМЕНТ ТРАНСПОРТИРОВКИ СОЕДИНЁННЫХ ШТАТОВ – The United States Department of Transportation (US DOT), whose purpose is to provide a dynamic federal system of transportation to meet the country's needs.

UNITED STATES DOLLAR = ДОЛЛАР СОЕДИНЁННЫХ ШТАТОВ – United States Dollar:- USD is the three-letter currency ISO code representing the currency of the United States of America which is commonly known as the Dollar.

UNITED STATES GOVERNMENT SECURITIES = ЦЕННЫЕ БУМАГИ ПРАВИТЕЛЬСТВА СОЕДИНЁННЫХ ШТАТОВ – United States Government Securities are the debt issues of the United States Government, as distinguished from government-sponsored agency issues. / Ценные Бумаги Правительства Соединённых Штатов (United States Government Seciruties):- прямые

обязательства государства (government obligations), например, выпуски кредитных обязательств Правительства США, Казначейские краткосрочные и долгосрочные векселя, облигации, а также сберегательные облигации (savings bonds) серий EE и HH, в отличие от выпусков ценных бумаг спонсируемых государством агентств. Смотрите также Agency Government Securities; и Treasuries.

UNITED STATES GULF = ЗАЛИВ СОЕДИНЁННЫХ ШТАТОВ – The United States Gulf, more properly known as the Gulf of Mexico (GOM), has abbreviation USG in a tanker and oil market terminology. / Залив Соединённых Штатов, имеющий официальное географическое название Мексиканский Залив (the Gulf of Mexico), в терминологии танкерного и нефтяного рынка имеет обозначение USG. В Русскоязычной терминологии было бы правильнее использовать обозначение ЗСШ по первым буквам словосочетания Залив Соединённых Штатов, причём и США и Мексика в своих официальных названиях имеют формулировку Соединённые Штаты.

UNITES STATES MARITIME ADMINISTRATION = МОРСКАЯ АДМИНИСТРАЦИЯ СОЕДИНЁННЫХ ШТАТОВ – United States Maritime Administration:- The Maritime Administration (MARAD) promotes 'the development and maintenance of an adequate, well-balanced, United States merchant marine, sufficient to carry the Nation's domestic waterborne commerce and a substantial portion of its waterborne foreign commerce, and capable of serving as a naval and military auxiliary in time of war or national emergency'. United States Maritime Administration's Mission:- To strengthen the US maritime transportation system – including infrastructure, industry and labor – to meet the economic and security needs of the Nation. MARAD programs promote the development and maintenance of an adequate, well-balanced United States merchant marine, sufficient to carry the Nation's domestic waterborne commerce and a substantial portion of its waterborne foreign commerce, and capable of service as a naval and military auxiliary in time of war or national emergency. MARAD also seeks to ensure that the United States maintains adequate shipbuilding and repair services, efficient ports, effective intermodal water and land transportation systems, and reserve shipping capacity for use in time of national emergency.

UNITED STATES NATIONAL ARBOREUM = НАЦИОНАЛЬНЫЙ ЛЕСОПИТОМНИК (или ДЕНДРАРИЙ) СОЕДИНЁННЫХ ШТАТОВ – United States National Arboretum is an arboretum in Washington, DC, operated by the US Department of Agriculture, occupying 415 acres (168 hectares) on the west bank of the Anacostia River. Among the more than 7 000 kinds of plants are special collections of camellias, hollies, apple trees, and slow-growing conifers. The arboretum was established in 1937.

THE UNITED STATES PATENT AND TRADEMARK OFFICE = УПРАВЛЕНИЕ СОЕДИНЁННЫХ ШТАТОВ ПО ПАТЕНТАМ И ТОВАРНЫМ ЗНАКАМ – The United States Patent and Trademark Office (USPTO) is the Federal agency of the Department of Commerce for granting US patents and registering trademarks. In doing this, the USPTO fulfills the mandate of Article I, Section 8, Clause 8, of the Constitution that the Executive branch 'promote the progress of science and the useful arts by securing for limited times to inventors the exclusive right to their respective discoveries'. The USPTO registers trademarks based on the Commerce Clause of the Constitution (Article 1, Section 8, Clause 3). Under this system of protection, American industry has flourished. New products have been invented, new uses for old ones discovered, and employment opportunities created for millions of Americans. The strength and vitality of the US economy depends directly on effective mechanisms that protect new ideas and investments in innovation and creativity. The continued demand for patents and trademarks underscores the ingenuity of American inventors and entrepreneurs. The USPTO is at the cutting edge of the Nation's technological progress and achievement. The USPTO advises the President of the United States, the Secretary of Commerce, and US Government agencies on intellectual property (IP) policy, protection, and enforcement; and promotes the stronger and more effective IP protection around the world. The USPTO furthers effective IP protection for US innovators and entrepreneurs worldwide by working with other agencies to secure strong IP provisions in free trade and other international agreements. It also provides training, education, and capacity building programs designed to foster respect for IP and encourage the development of strong IP enforcement regimes by US trading partners. The USPTO headquarters occupies five interconnected buildings located at 600 Dulany St, Alexandria, State of Virginia. The office employs more than 8 900 employees – including engineers, scientists, attorneys, analysts, computer specialists – all dedicated to protecting US Intellectual Property rights. The United States Patent and Trademark Office (USPTO):- designation became effective 2000-April-03; a result of the American Inventors Protection Act of 1999. The United States Patent and Trademark Office (USPTO) is an agency of the US Department of Commerce. The mission of the USPTO is to examine and issue patents and trademarks and administer all applicable laws pertaining to patents and trademarks. The records of USPTO are crucial to protecting the legal rights of patent and trademark holders, with severe penalties to those who infringe upon their rights. USPTO must protect these rights as long as they endure, as well as preserve the records for every patent and trademark to enable the examination of 'prior art' for current applicants. Consequently, the development and implementation of sound records management policies and procedures ensuring the proper disposition of USPTO records are vital to the mission of the agency. The United States Patent and Trademark Office (USPTO) is the Washington, DC-based American Government agency that is responsible for common patent protection matters for all of America's 50 states and its territorial possessions. The USPTO allows the patenting of new and unique microbes, plants, and animals; as well as the new and unique methods to produce such biotechnology advances.

UNITED STATES TREASURY BILL = ВЕКСЕЛЬ КАЗНАЧЕЙСТВА СОЕДИНЁННЫХ ШТАТОВ (или БИЛЕТ КАЗНАЧЕЙСТВА СОЕДИНЁННЫХ ШТАТОВ) – The United States (US) Treasury Bill is the US government debt with a maturity of less than a year.

UNITED STATES TREASURY BOND = ОБЛИГАЦИЯ КАЗНАЧЕЙСТВА СОЕДИНЁННЫХ ШТАТОВ – The United States (US) Treasury Bond is the US government debt with a maturity of more than 10 years.

UNITED STATES TREASURY NOTE = БИЛЕТ КАЗНАЧЕЙСТВА СОЕДИНЁННЫХ ШТАТОВ (или НОТА КАЗНАЧЕЙСТВА СОЕДИНЁННЫХ ШТАТОВ) – The United States (US) Treasury Note is the US government debt with a maturity of one to 10 years.

UNITED STATES TREASURY SECURITIES = ЦЕННЫЕ БУМАГИ КАЗНАЧЕЙСТВА СОЕДИНЁННЫХ ШТАТОВ – The United States (US) Treasury Securities are interest-bearing obligations if the US Government issued by the US Department of the Treasury as a means of borrowing money to meet government expenditures not covered by tax revenues. There are three types of marketable Treasury securities:- bills, notes and bonds. / . Существуют три типа принимаемых рынком ценных бумаг Казначейства:- векселя, ноты (или билеты) и облигации.

UNITED STITCHES = СОЕДИНЁННЫЕ СТЕЖКИ – United Stitches:- where tying stitches on automatic machines fail to secure. Sewing Room Defects. / Порок или дефект швейного производства.

UNITEGMIC = XX (или НАРУЖНЫЙ ПОКРОВ) – Unitegmic:- with a single covering over a part, e.g., ovule.

UNIT INVESTMENT TRUST = ПАЕВОЙ ИНВЕСТИЦИОННЫЙ ТРЕСТ (или XX) – Unit Investment Trust:- money invested in a portfolio whose composition is fixed for the life of the fund. Shares in a unit trust are called Redeemable Trust Certificates, and they are sold at a premium to net asset value. / Паевой Инвестиционный Трест (Unit Investment Trust):- трест для инвестирования, зарегистрированный в Комиссии по Ценным Бумагам и Биржам (Securities and Exchange Commission) в соответствии с Актом

об Инвестиционных Компаниях от 1940 (Investment Company Act of 1940). Трест приобретает фиксированный портфель (portfolio) приносящих доход ценных бумаг, таких, как корпоративные, государственные и муниципальные облигации, ценные бумаги, обеспеченные ипотечными займами, или привилегированные акции (preferred stock). Единицы долевого участия в тресте, которые обычно стоят по меньшей мере 1 000 Долларов США, продаются брокерами инвесторам, причём взимается сбор за продажу (load) в размере примерно 4%. Владельцы долевого участия в тресте получают право неразделённого участия как в основной сумме, так и в доходе, приносимом портфелем ценных бумаг от вложенного ими капитала. Портфель ценных бумаг остаётся фиксированным до тех пор, пока не наступит срок погашения по всем ценным бумагам и владельцы долевого участия не получат назад внесённую ими часть основной суммы. Большинство брокерских фирм поддерживает вторичный рынок (secondary market) продаваемых ими прав долевого участия, так что права участия в случае необходимости могут быть перепроданы. В Великобритании открытые взаимные фонды носят название Unit Trust. Смотрите также Investment Company; Mortgage-Backed Certificate; и Unit Share Investment Trust.

UNITIZATION = ПАКЕТИЗАЦИЯ (или ПАКЕТИРОВАНИЕ, или ПАКЕТОФОРМИРОВАНИЕ) – Unitization:- the consolidation of a number of individual items into one large shipping unit for easier handling. It is also the securing or loading of one or more large items of cargo onto a single structure, such as a pallet. Unitization is a grouping together of items for transport into transport units, e.g., in containers or on pallets. Unitization is:- (i) the consolidation of a quantity of individual items into one large shipping unit for easier handling; or/and (ii) loading one or more large items of cargo onto a single piece of equipment, such as a pallet. Unitization:- to take individual items and ship them as a single larger item. Unitization is the consolidation of a quantity of cargo into one large shipping unit for easier handling, as in palletizing or containerization.

UNITIZATION = XX (или ЮНИТИЗАЦИЯ) – Unitization:- the process of changing an investment trust into a unit trust. / Юнитизация (Unitization):- процесс преобразования инвестиционного треста (investment trust) в паевой трест (unit trust).

UNIT LABOUR COSTS = РАСХОДЫ НА ТРУД В ЕДИНИЦЕ – Unit Labour Costs:- the total expenditure on labour per unit of output. A comparison between changes in productivity and labour costs in different countries enables economists to make predictions about changes in their competitiveness. For example, if labour costs and productivity both rise by the same amount in the UK, UK producers do not have to change the prices of their goods; if, however, Japanese labour costs rise by less than productivity, Japanese prices could fall, making them increasingly .... Unit Labour Costs are the costs incurred by hiring workers per unit of output. They are a measure of labour productivity. Employing organizations typically seek to reduce unit labourcosts but it is important to realize that this can be done in a variety of ways. Holding down wages to a minimum level is one approach but high-paying firms often have low unit labourcosts because they attract good workers who are productive and rely on technology and effective work design to ensure that output is high and good wages can be afforded. The classic example of this .... / Расходы На Труд В Единице или Издержки На Рабочую Силу В Единице Продукции (Unit Labour Costs):- суммарные издержки на рабочую силу в единице продукции. Сопоставление изменений в производительности труда (productivity) и издержках на рабочую силу в единице продукции в разных странах даёт экономистам возможность прогнозировать изменения в конкурентоспособности (competitiveness) этих стран. Например, если в Великобритании издержки на рабочую силу в единице продукции и производительность труда растут одинаковыми темпами, Британским производителям не требуется менять цены на товары; если, однако, в Японии издержки на рабочую силу в единице продукции растут медленнее производительности труда, цены на Японскую продукцию будут снижаться, что повысит её конкурентоспособность.

UNIT–LINKED POLICY = СВЯЗАННЫЙ С ПАЕМ ПОЛИС – Unit-Linked Policy:- a life-assurance policy in which the benefits depend on the performance of a portfolio of shares. Each premium paid by the insured person is split:- one part is used to provide life-assurance cover, while the balance (after the deduction of costs, expenses, etc) is used to buy units in a unit trust. In this way a small investor can benefit from investment in a managed fund without making a large financial commitment. As they are linked to the value of shares, unit-linked policies can go up or down in value. Policyholders can surrender the .... / Связанный С Паем Полис (Unit-Linked Policy):- полис страхования жизни, страховые выплаты по которому зависят от управления портфелем акций. Каждая страховая премия, вносимая застрахованным лицом, делится на части:- одна часть используется на формирование фонда страхового покрытия, а остаток (после вычета расходов, издержек и так далее) идёт на покупку паёв в паевом тресте (unit trust). Таким образом, мелкий инвестор имеет возможность получить прибыли от инвестиций в управляемый фонд (managed fund), не принимая на себя слишком больших финансовых обязательств. Поскольку страховые полисы подобного типа привязаны к стоимости акций, их стоимость может расти или падать. Владельцы полиса имеют право в любое время отказаться от страхового полиса; в этом случае стоимость отказа (surrender value) представляет собой цену продажи паёв, купленных на момент аннулирования полиса (минус издержки). До 1970-х прибыли по полисам страхования жизни с прибылью (with-profits life-assurance policies) определялись величиной бонуса, выдаваемого по усмотрению страховой компании; эта величина зависела от успешности инвестиций и полученных по ним прибылей в данном году. Страховые полисы, связанные с паем, включая совокупный портфель инвестиций, позволяют владельцам полисов получить больший доход, нежели бонус по полисам с прибылью. В результате произошло значительное развитие сберегательных программ, связанных с паем (unit-linked savings plans), как базирующихся на полисе страхования жизни, так и не имеющих к страхованию никакого отношения.

UNIT LOAD = ПАКЕТ – Unit Load:- otherwise known as a Unitized Load, a unit load is any arrangement of materials that are moved by material handling equipment, such as a lift truck, as a single unit (example:- palletized loads). Pallets are often referred to as a Unit Load because they permit multiple units to be shipped as one large unit. Unit Loads are parts of a shipment that can be treated as a single unit during cargo handling and transportation. The size or dimensions of the unit load can vary according to requirements and to the means of transport and packaging container available. To optimize the cargo handling, transport and storage processes, standardization of unit loads is desirable. The most common unit loads are pallets and components with bases that resemble pallets, such as pallet boxes, IBCs, etc. The most important properties of a unit load are that it can be loaded to ensure a tight fit, its modularity and its stability, the last of which ensures that it can be stowed safely and will not be damaged by load securing measures. Unit Load is the assembly of goods on a pallet for handling, moving, storing and stacking as a single entity. Unit Load:- packages loaded on a pallet, in a crate or any other way that enables them to be handled at one time as a unit. Unit Load is the packages loaded on a pallet, in a crate or any other way that enables them to be handled as a unit. / Под Пакетом, от Немецкого слова Paket, от Французского слова Paquet, понимается стопка ящиков, одинаковых деталей, строительных материалов и так далее, уложенных на специальные подкладки (поддоны) либо сформированных так, чтобы можно было захватить их грузоподъёмным устройством, и предназначенных для укладки в штабель или для погрузки в транспортные средства и перевозки. Пакетоформирующая Машина – установка для укладки грузов в пакеты. Различают пакетоформирующие машины вертикального, горизонтального и комбинированного действия с электромеханическим, пневматическим и гидромеханическим приводом, работающие в автоматическом или полуавтоматическом режиме. Пакетоформирующие машины применяют для пакетирования так называемых тарно-штучных грузов (катушек, колёс, мешков, рулонов, ящиков и так далее). Пакеторазборочная Машина – установка для разборки пакетов из тарно-штучных грузов, собранных на пакетоформирующих машинах. Применяется на

поточных автоматизированных линиях с высоким ритмом (в деревообрабатывающей, металлургической, полиграфической и других отраслях промышленности). Пакетные Перевозки – перевозка грузов, уложенных в пакеты, которые на всех стадиях транспортировочного процесса (от грузоотправителя до грузополучателя) не расформировывают, а все погрузочно-разгрузочные операции выполняют механизированным способом. Для сборки и разборки пакетов созданы специальные пакетоформирующие машины и пакеторазборочные машины. Грузовая Единица (Unit Load):- одна или более транспортных упаковок или других единиц груза, объединённых средствами пакетирования.

UNIT LOAD DEVICE = СРЕДСТВО ПАКЕТИРОВАНИЯ ГРУЗА (или ПАКЕТНОЕ ПРИСПОСОБЛЕНИЕ, или СЕКЦИОННОЕ ЗАГРУЗОЧНОЕ СРЕДСТВО) – Air companies have developed different kinds of Unit Load Devices (ULD) to meet the requirement of the customers and the limits imposed by the aircraft characteristics. The International Organization for Standardization (ISO) has a working group devoted to standardization of loading units for use in air transportation, and also the two associations of commercial airlines IATA (short for the International Air Transport Association) and ATA (short for the Air Transport Association of America) co-ordinate with each other in order to establish and maintain a uniform description of loading units, but so far different numbering system are still in use, and this lead to some confusion in the field. IATA annually publishes a handbook containing the updated technical characteristics of ULD. The ULD Technical Manual contains all the specifications agreed in the airline industry in order to assure perfect interchangeability and absolute safety of ULDs. The ULD utilised in air cargo can be classified into two groups:- (i) lower deck containers. These are all characterised by small dimensions and by special shapes that can fit the aeroplane section. This kind of ULD can be transported in the lower deck compartment of cargo and passengers aeroplanes (combi); and (ii) Main deck containers or upper deck containers. These are the most similar to the traditional intermodal loading units, and among them there is the only real intermodal ULD, the 20 ft airsurface container, which has the same characteristics of an ISO container, but it's built with lighter materials (Aluminium or composite). This kind of ULD can only be transported on the main deck of a cargo aeroplane. Unit Load Device (ULD) is a pallet or container for freight. Unit Load Device is a container that has been specifically designed to fit the cargo storage area of an airplane. Unit Load Devices (ULD) is a container or pallet for aerial transportation. / Руководство (Manual). применяемые для перевозки авиационных грузов, могут подразделяться на две группы:- .

UNIT OF ACCOUNT = ЕДИНИЦА РАСЧЁТА (или ЕДИНИЦА СЧЁТА, или СЧЁТНАЯ ЕДИНИЦА, или РАСЧЁТНАЯ ЕДИНИЦА) – (1) Unit Of Account is the economic item to which recognition and measurement rules of the International Financial Reporting Standards (IFRSs) are to be applied. / строка баланса (item).

(2) Unit Of Account:- not a real payment medium but a specially defined unit employed to process international payments. Also used for international bond issues and for the deposits of international institutions. Several units of account have been created in recent years, based on a combination (or basket) of currencies, such as the special drawing rights (SDRs) of the International Monetary Fund (IMF) and the European currency unit (ECU) created for the European Monetary System. Money also functions as a Unit Of Account, providing a common measure of the value of goods and services being exchanged. Knowing the value or price of a good, in terms of money, enables both the supplier and the purchaser of the good to make decisions about how much of the good to supply and how much of the good to purchase. A Unit Of Account is a standard monetary unit of measurement of value/cost of goods, services, or assets. It is one of three well-known functions of money. It lends meaning to profits, losses, liability, or assets. The accounting monetary unit of account suffers from the pitfall of not being a stable unit of account over time. Inflation destroys the assumption that money is stable which is the basis of classic accountancy. In such circumstances, historical values registered in accountancy books become heterogeneous amounts measured in different units. The use of such data under traditional accounting methods without previous correction often leads to invalid results. A standard unit of account allows meaningful interpretation of prices, costs, and profits, so that an entity can monitor its own performance and its shareholders can make sense of its past performance and have an idea of its future profitability. In modern economies, money in the form of currency usually serves the role of the standard unit of account. The use of money, under conditions of price stability, vastly improves the efficiency of market economies. The use of a unit of account in financial accounting, according to the American business model, allows investors to invest capital into those companies that provide the highest rate of return. The use of a unit of account in managerial accounting enables firms to choose between activities that yield the highest profit. Money is often defined in terms of the three functions or services that it provides. Money serves as a medium of exchange, as a store of value, and as a unit of account. A Unit Of Account is a standard monetary unit of measurement of value/cost of goods, services, or assets. It is one of three well-known functions of money. It lends meaning to profits, losses, liability, or assets. The accounting monetary unit of account suffers from the pitfall of not being a stable unit of account over time. Inflation destroys the assumption that money is stable which is the basis of classic accountancy. In such circumstances, historical values registered in accountancy books become heterogeneous amounts measured in different units. The use of such data under traditional accounting methods without previous correction often leads to invalid results. Unit Of Account is the unit by which value of a thing is accounted and compared. It is one of the primary functions of money. A Unit Of Account in economics is a nominal monetary unit of measure or currency used to represent the real value (or cost) of any economic item; i.e. goods, services, assets, liabilities, income, expenses. It is one of three well-known functions of money. It lends meaning to profits, losses, liability, or assets. A unit of account in financial accounting refers to the words that are used to describe the specific assets and liabilities that are reported in financial statements rather than the units used to measure them. Unit of account and unit of measure are sometimes treated as synonyms in financial accounting and economics. Historically, prices were often given in a dominant currency used as a unit of account, but transactions actually settled by using a variety of coins that were available, and often goods, all converted into their value in the unit of account. Many international transactions continue to be settled in this way, using a national value (most often expressed in the US Dollar or Euro) but with the actual settlement in something else. The unit of account in economics (unit of measure in accounting) suffers from the pitfall of not being stable in real value over time because money is generally not perfectly stable in real value during inflation and deflation. Inflation destroys the assumption that the real value of the unit of account is stable which is the basis of classic accountancy. In such circumstances, historical values registered in accountancy books become heterogeneous amounts measured in different units. The use of such data under traditional accounting methods without previous correction often leads to invalid results. All monetary units of measure, e.g., US Dollar, Euro, Yen, Yuan, Ruble, Peso, PKR, INR etc (all fiat currency units) are assumed to be perfectly stable in real value during non-hyperinflationary conditions under traditional Historical Cost Accounting in terms of which the stable measuring unit assumption is applied. The Daily Consumer Price Index (Daily CPI) – or a monetized daily indexed unit of account – is generally used to index monetary values on a daily basis when it is required to maintain the purchasing power or real value of monetary values constant during inflation and deflation. Economics:- A monetary unit of account (unit of measurement) in economics allows meaningful interpretation of prices, costs, and profits, so that an entity can monitor its own performance and its shareholders can make sense of its past performance and have an idea of its future profitability. In modern economies, money in the form of currency usually serves the role of the unit of account (unit of measurement). The use of money, as a relatively stable unit of measure, improves the efficiency of market economies. However, money is generally never perfectly stable in real value which is the fundamental problem with traditional Historical Cost Accounting which is based on the stable measuring unit assumption. Historic examples of units of measure include the livre tournois, used in France from 1302 to 1794 whether or not livre coins were minted. In the XIV century Naples used the grossi

gigliati, and Bohemia used the Prague groschen. At any one time there might be two or three units of account in one region based on the local base, silver and sometimes gold coins, and each often expressed in L.S.D. (£sd (pronounced /ɛlɛsˈdiː/ ell-ess-dee and occasionally written Lsd) is the popular name for the pre-decimal currencies once common throughout Europe, especially in the British Isles and hence in several countries of the British Empire and subsequently the Commonwealth. The abbreviation originates from the Latin currency denominations librae, solidi, and denarii (LSD). In the United Kingdom, which was one of the last to abandon the system, these were referred to as pounds, shillings, and pence (pence being the plural of penny)) units in ratio 240:12:1. The Florentine gold florin, the French Franc and the electoral rheingulden all became pounds (240 denari) of account. Units of account would often survive over 100 years despite the original coins changing composition and availability (e.g., the Castilian maravedi). A modern unit of account is the European Currency Unit, used in the European Union from 1979 to 1998; its replacement in 1999, the Euro, was also just a unit of account until the introduction of notes and coins in 2002. Unit of account is the main way of calculating a carrier or ship owner's liability in relation to carriage of goods contracts in which the Hague-Visby Rules apply. In economics, a standard unit of account is used for statistical purposes to describe economic activity. Indexes such as GDP and the CPI are so broad in their scope that compiling them would be impossible without a standard unit of account. After being compiled, these figures are often used to guide governmental policy; especially monetary and fiscal policy. In calculating the opportunity cost of a policy, a standard unit of account allows for the creation of a composite good. A composite good is a theoretical abstraction that represents an aggregation of all other opportunities that are not realized by the first good. It allows an economic decision's benefits to be weighed against the costs of all other possible goods in that society, without having to refer to any directly. Often, this is most easily accomplished with money. Modern Finance:- The use of a unit of account in financial accounting, according to the American business model, allows investors to invest capital into those companies that provide the highest rate of return. The use of a unit of account in managerial accounting enables firms to choose between activities that yield the highest profit. In Accounting:- The unit of account in financial accounting refers to the words that are used to describe the specific assets and liabilities that are reported in financial statements rather than the units used to measure them. That is, unit of account refers to the object of recognition or display whereas unit of measure refers to the tool for measuring it. Unit of measure and unit of account are sometimes treated as synonyms in financial accounting and economics. Unit of measure in financial accounting refers to the monetary unit to be used; that is, whether it should be nominal units of money as opposed to units that are adjusted for changes in purchasing power over time. Unit Of Account:- a basic function of money, providing a unit of measurement for defining, recording, and comparing value, i.e. one Dollar signifies not only a one Dollar bill, but also a Dollar's worth of money in other forms (deposits), of wealth in other forms than money, and of any good or service with a market value. The European Unit of Account (EUA) was a unit of account used in the European Communities from 1975 to 1979, when it was replaced at parity by the European Currency Unit, in turn replaced at parity in 1999 by the Euro. Initially it was used for Lomé Convention and European Investment Bank operations before being gradually introduced into other sectors of Community activity. The EUA was a basket of European currencies, originally designed to have the same value in mid-1974 as the IMF special drawing rights basket, both worth USD1.206 35; they immediately moved apart in value. Different units of account had previously been used for different purposes, including the budget, the European Coal and Steel Community, and the Common Agriculture Policy following the abandonment of the gold parity unit of account in the early 1970s in the wake of the collapse of the Bretton Woods system. European Unit of Account (EUA) is a composite (or basket) currency unit using a number of the currencies of member states of the European Union. Largely superseded by the European Currency Unit. / Счётная Единица (Unit Of Account (UA)) или Европейская Счётная Единица (European Unit Of Account (UA)):- расчётная единица Европейского Сообщества (ЕС). Она независима от национальных валют, но увязана с ними курсами пересчёта, что позволяет устанавливать единые цены для всего Европейского Сообщества. До 1971 единица имела золотое содержание, равное 0.888 670 88 грамма (г) чистого золота. Впоследствии такая конверсия не имела никакого отношения к реальной стоимости национальных валют на финансовых рынках. Европейское Сообщество приняло новую единицу – Европейскую Счётную Единицу, выраженную в виде 'корзины' валют государств-членов ЕС. Она ежедневно меняется по отношению к любой национальной валюте на основе движения соответствующих валютных курсов. Она применяется во всех операциях Европейского Сообщества, за исключением Единой Сельскохозяйственной Политики, в рамках которой платежи (теоретически) производятся на базе золотого паритета счётной единицы. Однако это компенсируется выплатами согласно системе поддержки фермерских цен и другими выплатами в соответствие с курсами финансового рынка. Смотрите также Европейская Валютная Единица (European Currency Unit), Европейская Монетарная Система (European Monetary System). Европейская Расчётная Единица (EPE):- сложная валютная единица, рассчитываемая на базе стоимости валют стран-членов Европейского Сообщества (ЕС), участвующих в Европейской валютной системе.

(3) Unit Of Account:- (1) A function of money enabling its users to calculate the value of their transactions and to keep accounts. (2) The standard unit of currency of a country (see Legal Tender). (3) An artificial currency used only for accounting ... . (3) A currency basket. See also European Currency Unit, and Special Drawing Rights. European Unit of Account is a composite (or basket) currency unit using a number of the currencies of member states of the European Union. Largely superseded by the European Currency Unit. / Счётная Единица (Unit Of Account):- (1) Функция денег, которая заключается в возможности расчитывать стоимость операций и вести счета. Сравните с Средство Сохранения Стоимости (Store Of Value). (2) Стандартная денежная единица страны. (3) Искусственно введённая валюта, используемая только для расчётов; в Европейском Сообществе (ЕС) такая счётная единица использовалась при установлении цен на сельскохозяйственную продукцию. Смотрите также Зелёные Валюты (Green Currencies).

UNIT OF CURRENCY = ЕДИНИЦА ВАЛЮТЫ (или ВАЛЮТНАЯ ЕДИНИЦА) – Unit Of Currency is the monetary unit of a country (e.g., Dollar) or of an international monetary system (e.g., Euro).

UNIT OF MEASURE = ЕДИНИЦА ИЗМЕРЕНИЯ – Unit Of Measure (UOM) is the type of measurement unit used to track inventory such as pallets or eaches (individual units) in your system.

UNIT–OF–MEASURE CONVERSIONS = КОНВЕРСИИ ЕДИНИЦ ИЗМЕРЕНИЯ – Unit-Of-Measure Conversions:- necessary when working with multiple units of measures such as pallets and eaches. Requires a conversion such as eaches per pallet in order to make the load uniform.

UNIT OF TRADING = ЕДИНИЦА ТОРГОВЛИ – Unit Of Trading is the minimum quantity of a security required for regular trading purposes. The unit of trading for most stocks is 100 shares. Also called Trading Unit, and Unit. See also Trading Unit. Unit Of Trading:- when you buy stocks, bonds, options and commodities futures, it's typical to buy in a particular volume or a particular Dollar value, called a Round Lot or a Unit Of Trading. For example, stocks are usually traded in lots of 100 shares, or multiples of 100 shares, and bonds in multiples of USD1 000. For some preferred stocks, known as Ten-Share Traders, the unit of trading is ten shares. Any variation from the standard unit of trading is known as an Odd Lot. Trading Unit is the number of shares of a particular security that is used as the acceptable quantity for trading on the exchanges. / Единица Торговли (Unit of Trading):- обычное число акций, облигаций или товарно-сырьевой продукции, составляющее минимальную торговую единицу на бирже. Для акций она обычно составляет 100 акций, хотя торговые операции с неактивными акциями проводятся поштучно или с пакетом, состоящим из 10

акций. Для корпоративных облигаций, торговые операции с которыми проводятся на Нью Йоркской Фондовой Бирже (NYSE), единицей для заключения торговых операций является номинальная стоимость в 1 000 или 5 000 Долларов США. Торговые единицы для товарно-сырьевых фьючерсов серьёзно различаются в зависимости от рода сырья (commodity). Смотрите также Futures Contract; Odd Lot; и Round Lot.

UNIT PRICING = ЦЕНООБРАЗОВАНИЕ ЕДИНИЦЫ (или УСТАНОВЛЕНИЕ ЦЕНЫ НА ЕДИНИЦУ ПРОДУКЦИИ) – Unit Pricing:- the practice of showing the price of a single unit of a product in order that shoppers can compare the price against the cost of a multipack. A single bag of crisps in a supermarket might cost 30p. A larger bag containing six single bags could be offered at £1.50, i.e. a unit price of 25p each. The shopper can therefore see at a glance that the larger purchase is the more xxxxx. Unit Pricing is the price of a single item. See also Pricing. Unit Pricing is the cost per unit of measure of goods, such as the cost per milliliter or per ounce. Unit pricing information is most commonly displayed on in-store shelf labels and/or signs. It can be in a paper or electronic format (i.e., electronic shelf labels). Unit pricing can also be displayed in internet selling sites and in advertisements. Unit pricing has been in existence since the early 1970s, growing out of the 'truth-in-labeling' era. Consumers demanded more information ('right to know') on labels to make informed purchase decisions. Many methods of unit pricing were explored, including stamping the unit price on the product, posting the unit price on large signs by category, and giving consumers a calculator and pen to allow them to compute it themselves. The current method of putting unit price information on shelf labels and other in-store price signs was chosen because it is the easiest for the consumer to use and for retailers to maintain. Unit pricing came into being about the same time the Fair Packaging and Labeling Act (FPLA) was enacted, which was in 1966. Before FPLA was passed, there was considerable discussion to require and limit the package sizes sold. Manufacturers and retailers opposed having size restrictions and instead suggested the idea of providing a unit price. As a result, the requirement to limit package sizes never became part of the FPLA. In addition, supermarket point of sale scanners started to become widely used in the early 1970s, which led to an exploration of ways to provide a better alternative to individual item (sticker) pricing. Most states allowed retailers to be exempted from item pricing requirements if they provided unit pricing. At the same time, private label brands were also gaining attention. Unit pricing was a visible way for a retailer to show the value provided by their house brand. For a variety of reasons, including a lack of voluntary requirements, several New England states developed mandatory legislation for unit pricing, with Massachusetts leading the way over 40 years ago. Over the years, other states have followed suit. In 1979, The National Conference on Weights and Measures (NCWM) first developed and adopted the Uniform Unit Pricing Regulation (UUPR), a model regulation which states can adopt as their own or as a guide in developing their own state regulations. It was further amended in 1997. / Ценообразование Единицы или Установление Цены На Единицу Продукции (Unit Pricing):- практика установления цены на единицу продукции, с тем чтобы покупатели могли сравнивать эту цену со своими расходами при покупке целой упаковки данного товара. Например, один пакетик хрустящего картофеля в супермаркете может стоить 16 пенсов. Упаковка из шести пакетиков предлагается за 90 пенсов, то есть цена единицы продукта уже равна 15 пенсам. В результате покупатель имеет возможность выяснить, что покупка упаковки более экономна.

UNIT PROFIT OR LOSS = ПРИБЫЛЬ ИЛИ УБЫТОК НА ЕДИНИЦУ ПРОДУКЦИИ – Unit Profit or Loss is the profit (or loss) attributable to one unit of production. See also Unit Cost. / Прибыль или Убыток На Единицу Продукции (Unit Profit or Loss):- прибыль или убыток, приносимая одной единицей продукции. Смотрите также Себестоимость Единицы Продукции (Unit Cost).

UNITS = ЕДИНИЦЫ – Units (U) are a measure (quantitation) of biological activity of a substance, as defined by various standardized assays (tests).

UNIT SHARE INVESTMENT TRUST = ПАЕВОЙ АКЦИОННЫЙ ИНВЕСТИЦИОННЫЙ ТРЕСТ – Unit Share Investment Trust (USIT) is a unit investment trust comprising one unit of prime and one unit of score. / Паевой Акционный Инвестиционный Трест (ПАИТ) (Unit Share Investment Trust (USIT)):- специализированная форма инвестиционного треста с двумя видами паёв – долевое участие типа Прайм (Prime), дающее право на получение дивиденда и прирост стоимости ценных бумаг до определённого уровня, и долевое участие Скор (Score), дающее право на получение доходов в результате роста котировок ценных бумаг.

UNITS–OF–ACTIVITY METHOD = МЕТОД ЕДИНИЦ АКТИВНОСТИ – Units-Of-Activity Method:- xxxxx. Units of Production Depreciation Method, also known as Units of Activity and Units of Usage Method of Depreciation, calculates depreciation on the basis of expected output or usage. For example, a machine may be depreciated on the basis of output produced during a period in proportion to its total expected production capacity. Therefore, useful life of an asset under Units of Production Method is stated in terms of production output or usage rather than years of service. Depreciation Per Annum = (Cost – Residual Value) / Useful Life. The Formula for calculation of depreciation under Units of Production Method is as follows:- Stage of Completion % = (Value of Work Certified as complete / Total Expected Production or Usage) x 100. Where:- (i) Cost includes the initial and any subsequent capital expenditure; and (ii) Residual Value is the estimated scrap value at the end of the useful life of the asset. Since residual value is expected to be recovered at the end of an asset's useful life, there is no need to charge the portion of asset's cost equaling the residual value. Example – Units Of Production Depreciation:- Oil PLC installs a crude oil processing plant costing USD12 million with an estimated capacity to process 50 million barrels of crude oil during its entire life. Production during the first year of operation is 2 million barrels. Expected residual value of the processing plant is USD2 million. Depreciation charge for the first year is calculated as follows:- Depreciation Expense = (USD12 – USD2m) x 2 / 50 = USD0.4 million. Example – Units Of Usage (Activity) Depreciation:- Plastic LTD purchases a steel mould costing USD1 million to be used in the production of plastic glasses. The mould could be used in 8 production batches after which it will have a scrap value of USD.2 million. During the first year, the company manufactures 2 batches of glasses. Depreciation charge for the year is calculated as follows:- Depreciation Expense = (USD1 – USD0.2m) x 2 / 8 = USD0.2 million. Considerations – Advantages And Disadvantages:- Units of Production Method may be appropriate where there is a high correlation between activity of an asset and its physical wear and tear. As no depreciation under this method is charged when an asset remains idle, it is not appropriate for depreciating assets that suffer a significant decrease in their earning potential with the passage of time for reasons such as technological obsolescence. / Метод Единиц Активности – метод списания пропорционально объёму продукции.

UNIT TRAIN = МАРШРУТНЫЙ СОСТАВ – Unit Train is a train comprising a specified number of railcars that remain together as a unit until reaching a designated destination. See also Intermodal Container Transfer Facility, Port of Savannah, located on-terminal at the Garden City Terminal and utilizing unit train. Train comprised of containers from one container company. Unit Train is a freight train composed of cars carrying a single type of commodity that are all bound for the same destination. By hauling only one kind of freight for one destination, a unit train does not need to switch cars at various intermediate junctions and so can make nonstop runs between two terminals. This reduces not only the shipping time but also the cost. The unit train was introduced by American railroad companies in the 1950s so that they could offer lower shipping rates and thereby make their freight service more marketable. Initially, unit trains were used primarily to haul coal from mines to power plants. By the late XX century about 50 percent of the coal shipped in the United States was carried by these trains. Other forms of bulk cargo, such as grain and cement, were also transported in this fashion. To fully exploit the advantages of the unit train and to extend this service to shippers of manufactured goods, American railroads in the second half of the XX century redesigned their equipment. They developed larger freight cars, many of which are specially constructed to carry

particular commodities. The 10 000-cubic-foot (280-cubic-meter) boxcar, for example, is three times larger than the standard car and can economically transport such items as automobile parts and television sets. Another key innovation is the tri-level rack car capable of carrying 12 to 15 finished automobiles from assembly points to distribution points. Though most widely employed in the United States, unit trains equipped with these and other types of high-volume freight cars are also used in Canada and various European countries on a limited scale. Unit Train is a train of a specified number of railcars, perhaps 100, which remain as a unit for a designated destination or until a change in routing is made. / Маршрутный Состав используется для доставки грузов по железной дороге целым составом от одного грузоотправителя к одному грузополучателю.

UNIT TRUST = ПАЕВОЙ ТРЕСТ (или ПАЕВОЙ ФОНД) – In the United Kingdom, Unit Trust is a trust into which investors may buy by acquiring units. The capital thus collected is invested in various securities in a wide range of markets. Contributors to unit trusts benefit from the diverse nature of the portfolio built up, and from the expertise of a fund manager. In Australia, a syndicated form of investment where a manager invests funds on behalf of a group of investors. Also known as Mutual Fund in the United States. In the United Kingdom, institutions within sub-sector S.123 through which investors pool their funds to invest in a diversified portfolio of securities. Individual investors purchase units in the fund representing an ownership interest in the large pool of underlying assets, i.e. they have an equity stake. The selection of assets is made by professional fund managers. Unit trusts therefore give individual investors the opportunity to invest in a diversified and professionally managed portfolio of securities without the need for detailed knowledge of the individual companies issuing the stocks and bonds. They differ from investment trusts in that the latter are companies in which investors trade shares on the Stock Exchange, whereas unit trust units are issued and bought back on demand by the managers of the trust. The prices of unit trust units thus reflect the value of the underlying pool of securities, whereas the price of shares in investment trusts are affected by the usual market forces. Unit Trust:- in the United Kingdom and other foreign markets, an open-end mutual fund. Unit Trust is an open ended investment vehicle whereby investors can buy units in an underlying pool of assets from the trust manager. If there is demand for units, the managers can create more units for sale to investors. If there are redemptions (sales by investors), the managers will buy in units offered to them. Unit trusts are trusts in the legal sense. / , то есть они . Паевые Тресты (Unit Trusts):- (1) Британское наименование паевых инвестиционных фондов; (2) ссылка на предложение Комиссии ЕС от 1976 о координации законодательства, относящегося к ‘коллективным инвестиционным начинаниям с использрванием обращающихся ценных бумаг’. В нём определены порядок их организации и деятельности, инвестиционная политика и информация, подлежащая свободному распространению. Его цель – обеспечить более единообразную защиту для всех вкладчиков. Паевой Трест (Unit Trust):- трест, созданный с целью управления портфелем обращающихся на бирже ценных бумаг, в котором мелкие вкладчики могут приобрести пай. Таким образом, мелкий вкладчик получает доступ к диверсифицированному портфелю ценных бумаг, сформированному и управляемому профессиональными управляющими фонда, которые рассчитывают либо на высокий реализованный прирост капитала, либо на высокие доходы в зависимости от характеристик соответствующей ценной бумаги. Попечители, как правило, коммерческий банк, являются законными владельцами ценных бумаг и несут ответственность за то, чтобы действия управляющих не противоречили условиям, внесённым доверенностью на управление. Цены на паи паевых трестов котируются ежедневно; разница между ценой покупки и ценой продажи обеспечивает прибыль для покрытия управленческих расходов и издержек совершения операций на Лондонской Фондовой Бирже (London Sock Exchange). С дивидендов, выплачиваемых паевыми трестами, взимается налог, расчитываемый по базовой ставке, а реализованный прирост капитала от продаж пая облагается налогом на реализованный прирост капитала, хотя сами операции по формированию портфеля ценных бумаг налогом на реализованный прирост капитала не облагаются. Британские паевые тресты получают разрешение на свою деятельность и контролируются Министерством Торговли и Промышленности и в большинстве своём входят в Ассоциацию Паевых Трестов (АПТ) (Unit Trust Association (UTA)). Многие из ныне функционирующих трестов специализируются на операциях в различных секторах рынка внутри страны и за рубежом; наряду с этим существует большая группа трестов, которые специализируются либо на достижении роста стоимости портфеля ценных бумаг, либо на получении высоких доходов. Смотрите также Страховой Полис, Связанный С Паями (Unit-Linked Policy).

UNIT TRUST ASSOCIATION = АССОЦИАЦИЯ ПАЕВЫХ ТРЕСТОВ – Unit Trust Association (UTA):- The Investment Management Association (IMA), now known as The Investment Association, is a trade association for the UK investment management industry. In 2015, the trade body was renamed ‘The Investment Association’, following the merger between the IMA and the Investment Affairs division of the Association of British Insurers. The IMA was established in 2002 after a merger of the Association of Unit Trust and Investment Funds (AUTIF) and the Fund Managers Association. AUTIF, before 1993, was itself known as the Unit Trust Association and was established in 1959. The Investment Association of today is the result of mergers between a number of organisations that were formed to protect and promote the interests of investors and investment managers. On 13 October 1959, the Association of Unit Trust Managers was formed to represent the interests of unit trusts and mutual funds. 1976:- The organisation was renamed the Unit Trust Association (UTA). The main objectives of the UTA were to:- (i) Uphold standards of unit trust practice; (ii) Protect the interests of unit holders; (iii) Maintain the good name of the industry; (iv) Represent the industry to government departments and other authorities; and (v) Work with other organisations on matters connected with investment protection. 1993:- The UTA was rebranded the Association of Unit Trusts and Investment Funds (AUTIF). Its objectives were to:- (i) Make representations to the UK government on legislative, regulatory and taxation matters; (ii) Liaise with regulators and other relevant organisations in the UK and Europe; (iii) Increase public awareness and understanding of investment funds; (iv) Seek to improve standards of training in the industry; (v) Seek to integrate personal finance education in the school curriculum; (vi) Add value to member companies by providing them with information and assistance; and (vii) Provide information to external parties interested in the industry. 2002:- AUTIF merged with the Fund Managers’ Association (FMA), which represented the institutional side of the industry. This merger created the Investment Management Association (IMA) and reflected the fact that the FMA and AUTIF had an overlap of membership and interests, as well as the marked growth of the industry. For the first time, one trade association represented the whole investment management industry – institutional and retail – creating a more powerful and persuasive voice in the UK, Europe and worldwide. 2014:- The IMA merged with the Investment Affairs Division of the Association of British Insurers to create The Investment Association. The Investment Association now covers the entire range of investment issues on behalf of investment managers and clients, whether they are domestic or international individuals, discretionary managers, life companies, pension funds, family offices or sovereign wealth funds. Headquartered in London, The United Kingdom. / Ассоциация Паевых Трестов (АПТ) (Unit Trust Association (UTA)):- ассоциация, призванная согласовывать стандарты практики управляющих паевых трестов, обеспечивающие защиту держателей паёв, а также действовать в качестве представительного органа Управляющих Авторизованных Паевых Трестов (Managers of Authorized Unit Trusts) на переговорах с правительством и другими государственными органами. Ассоциация также координирует осуществление контроля над комиссионными и взимаемой платой и ведёт реестр утверждённых агентов, являющихся посредниками в продаже паёв в паевых трестах.

UNIT TRUSTS OMBUDSMAN SCHEME = СХЕМА ОМБУДСМЭНА ПАЕВЫХ ТРЕСТОВ – Unit Trusts Ombudsman Scheme ends:- following the withdrawal of a number of large unit trust groups, the unit trust ombudsman scheme has ceased to exist as an

independent service. Its role will be undertaken by the existing insurance ombudsman. See also Financial Ombudsman. / Схема Омбудсмэна Паевых Трестов (Unit Trusts Ombudsman Scheme):- . Смотрите также Финансовый Омбудсмэн (Financial Ombudsman).

UNIVALENT = УНИВАЛЕНТ (или ОДНОВАЛЕНТНАЯ) – Univalent:- an unpaired chromosome in meiosis. / Унивалент – неспаренная хромосома при мейозе. Под Унивалентами, от Латинских слов Unus, означающее Один, и Valens, родительный падеж Valentis, означающее Сильный, понимаются единичные, неспаренные хромосомы в первом делении мейоза. В норме при созревании половых клеток в ходе мейоза (на стадии профазы) гомологичные хромосомы (несущие одинаковые наборы генов) тесно сближаются (конъюгируют) и образуют биваленты. При отсутствии конъюгации или при преждевременном расхождении бивалентов образуются униваленты. Сравните Мультиваленты.

UNIVERSAL = ВСЕОБЩЕЕ (или УНИВЕРСАЛЬНОЕ) – Universal:- in epistemology and logic, a quality or property which each individual member of a class of things must possess if the same general word is to apply to all members of that class. Universals are the qualities of individual things, or particulars. For example, the quality of redness (a universal) is possessed by all red objects (which are particulars). But does 'redness' exist apart from particular red things? In a way it does, since, like a particular, 'redness' has a name that is a noun. But in other ways universals are quite unlike particulars. For example, redness, unlike red objects, cannot be picked up, and primeness, unlike prime numbers, cannot be multiplied. Then do universals exist at all? This question has been debated since the time of Plato (428/427 BC–348/347 BC). The debate over the status of universals stems from the ancient Greek theory of forms or ideas, which Plato held to have a real existence distinct from their manifestations in individual objects; ideal beauty must exist, he thought, as a precondition of its manifesting itself, albeit imperfectly, in certain things recognized as beautiful. Aristotle was rather less positive, arguing that forms or universals exist but only 'in' the particulars in which they are discerned. Although both Plato and Aristotle (384 BC–322 BC) were realists in holding that universals are real, there was a difference between them, later summed up in the phrases Universalia Ante Rem (Plato's belief in 'Universals Before The Thing') and Universalia In Re (Aristotle's belief in 'Universals In The Thing'). Christian scholastic philosophers of the Middle Ages were influenced on the one hand by Augustine's (Saint Augustine of Hippo; 354 AD–430 AD) identification of the Platonic forms with archetypes in the mind of God and on the other by a passing reference by Boethius (477 AD–524 AD), a late Roman scholar, in his commentary on Porphyry's (233 AD–305 AD) Isagoge, to the questions 'whether genera and species are substances or are set in the mind alone; whether they are corporeal or incorporeal substances; and whether they are separate from the things perceived by the senses or set in them'. The Platonic-Augustinian position, extreme realism, is reflected in the works of the Pseudo-Dionysius the Areopagite, of John Scotus Erigena (or Johannes Scotus Erigena; 815 AD–877 AD), of Anselm (Anselmo d'Aosta; 1033–1109), of Guillaume de Champeaux (1070–1121), and of Gilbert de La Porrée (1085–1154). The Aristotelian position, moderate realism, is reflected in the writings of Albertus Magnus (1193–1280) and of Saint Thomas Aquinas (1225–1274). The medieval minority's opposition to realism granted existence to universals only as mental concepts. Conceptualist arguments were put forward by Roscelin de Compiègne (1050–1120), by Peter Abélard (1079–1142), and by William of Ockham (1285–1347); but Roscelin and Ockham were so uncompromising that their antagonists equated their conceptualism with nominalism (i.e. with the contention that universals are merely words or names arbitrarily applied to similar things for convenience). Modern scholars, however, doubt that there were any medieval nominalists, for extreme nominalism cannot explain man's perception of similarities. In the XVII century, however, the materialist philosopher Thomas Hobbes defended a moderate nominalism based on the close connection between thought and speech. Later philosophers, divided between those who upheld the validity of ontology (the theory of being) and those concerned only with logic and with linguistic analysis, shifted the perennial debate about universals into fields of epistemology barely explored by the scholastics. Thus, modified forms of all four views – Platonic, Aristotelian, conceptualist, and nominalist – are still defended. / Греческий философ Платон (Plato; 428/427–348/347 до Нашей Эры). Греческий философ Аристотель (Aristotle; 384 BC–322 до Нашей Эры). Римско-Африканский теолог и философ Святой Аугустин из Иппо (Saint Augustine of Hippo; 354–430). Римский сенатор и философ Анисиус Манлиус Сэвэринус Боэтиус (Anicius Manlius Severinus Boëthius, именовавшийся просто как Boethius; 477–524). Итальянский философ родом из Тира Порфири (Porphyry; 233–305). Псевдо-Дионисий Ареопагит (Pseudo-Dionysius the Areopagite), Ирландский теолог, философ и поэт Дьжон Скотчас Эрайюдьжина (John Scotus Eriugena или Йоханэс Скотчас Эридьжина (Johannes Scotus Erigena); 815–877), родившегося в Италии теолога и философа Святого Ансэльма (Saint Anselm; полное имя Anselmo d'Aosta; 1033–1109), Французского теолога и философа Гийом дё Шопу (Guillaume de Champeaux; 1070–1121), и Французского теолога и схоластического логика Жильбера дё ля Порэ (Gilbert de La Porrée; 1085–1154). Немецкий теолог Альбертус Магнус (Albertus Magnus; 1193–1280; был признан Святым Альбатом Великим (Saint Albert the Great)) и Итальянский Святой Томас Аквинас (Saint Thomas Aquinas; 1225–1274).Французский философ Росоля дё Компьене (Roscelin de Compiègne; 1050–1120), Французский философ и теолог Питэр Абеляр (Peter Abélard; 1079–1142), и родившийся в Англии теолог и философ Вильэм из Окэма (William of Ockham; 1285–1347).

UNIVERSAL BANK = УНИВЕРСАЛЬНЫЙ БАНК – The Universal Banks are banks which, in contrast to specialized banks, offer the full range of banking and finanical services under one umbrella. In Germany, there are three groups of universal banks:- private commercial banks, savings banks and credit cooperatives. In addition, there are specialized banks, e.g., mortgage banks, building and loan associations and capital investment companies, whose defined area of activity is not based on legal requirements but the result of historical developments. In contrast to the universal banking system, some countries have a dual banking system due to legal regulations. For example, from 1933 to 1999, it was not possible for banks in the USA to offer investment banking and commercial banking services under one umbrella. / Универсальные Банки:- крупные банки в Германии и Швейцарии, которые традиционно сочетали коммерческие и инвестиционные операции. Часто они осуществляют крупные инвестиции в промышленные фирмы.

UNIVERSAL COPYRIGHT CONVENTION = ВСЕОБЩАЯ КОНВЕНЦИЯ ОБ АВТОРСКОМ ПРАВЕ (или УНИВЕРСАЛЬНАЯ КОНВЕНЦИЯ ОБ АВТОРСКОМ ПРАВЕ) – The Universal Copyright Convention (or UCC), adopted at Geneva in 1952, is one of the two principal international conventions protecting copyright; the other is the Berne Convention. The UCC was developed by United Nations Educational, Scientific and Cultural Organization as an alternative to the Berne Convention for those states which disagreed with aspects of the Berne Convention, but still wished to participate in some form of multilateral copyright protection. These states included developing countries and the Soviet Union, which thought that the strong copyright protections granted by the Berne Convention overly benefited Western developed copyright-exporting nations, and the United States and most of Latin America. The United States and Latin America were already members of a Pan-American copyright convention, which was weaker than the Berne Convention. The Berne Convention states also became party to the UCC, so that their copyrights would exist in non-Berne convention states. The United States only provided copyright protection for a fixed, renewable term, and required that in order for a work to be copyrighted it must contain a copyright notice and be registered at the Copyright Office. The Berne Convention, on the other hand, provided for copyright protection for a single term based on the life of the author, and did not require registration or the inclusion of a copyright notice for copyright to exist. Thus the United States would have to make several major modifications to its copyright law in order to become a party to it. At the time the United States was unwilling to do so. The UCC thus permits those states which had a

system of protection similar to the United States for fixed terms at the time of signature to retain them. Eventually the United States became willing to participate in the Berne convention, and change its national copyright law as required. In 1989 it became a party to the Berne Convention as a result of the Berne Convention Implementation Act of 1988. Under the Second Protocol of the Universal Copyright Convention (Paris text), protection under US Copyright Law is expressly required for works published by the United Nations, by UN specialized agencies and by the Organization of American States. The same requirement applies to other contracting states as well. Berne Convention states were concerned that the existence of the UCC would encourage parties to the Berne Convention to leave that convention and adopt the UCC instead. So the UCC included a clause stating that parties which were also Berne Convention parties need not apply the provisions of the Convention to any former Berne Convention state which renounced the Berne Convention after 1951. Thus any state which adopts the Berne Convention is penalised if it then decides to renounce it and use the UCC protections instead, since its copyrights might no longer exist in Berne Convention states. Since almost all countries are either members or aspiring members of the World Trade Organization, and are thus conforming to the Agreement on Trade-Related Aspects of Intellectual Property Rights Agreement, the UCC has lost significance. Universal Copyright Convention (UCC) was signed on 1952-September-06 at Geneva, Switzerland. Membership:- over 80 countries worldwide. Member states must have laws that effect the following:- (i) provision of adequate and effective protection of the rights of authors and other copyright proprietors in literary, scientific and artistic works, including writings, musical, dramatic and cinematographic works, and paintings, engraving and sculpture; (ii) nationals of other contracting states receive the same protection as received by the nationals of the contracting state (published and unpublished); (iii) all formalities that can be required by a member state are satisfied if copies of the work bear the symbol accompanied by the copyright proprietor's name and the year of first publication placed in such a manner and located as to give reasonable notice of claim of copyright; and (iv) provision of a minimum copyright term of 25 years from publication, or life of the author plus 25 years. Universal Copyright Convention (UCC):- (1952), convention adopted at Geneva by an international conference convened under the auspices of UNESCO, which for several years had been consulting with copyright experts from various countries. The convention came into force in 1955. Its main features are the following:- (1) no signatory nation should accord its domestic authors more favourable copyright treatment than the authors of other signatory nations, though no minimum protection for either domestic or foreign authors is stipulated; (2) a formal copyright notice must appear in all copies of a work and consist of the symbol ©, the name of the copyright owner, and the year of first publication; a signatory nation, however, might require further formalities, provided such formalities do not favor domestic over foreign works; (3) the minimum term of copyright in member nations must be the life of the author plus 25 years (except for photographic works and works of applied art, which have a 10-year term); (4) all adhering nations are required to grant an exclusive right of translation for a seven-year period, subject to a compulsory license under certain circumstances for the balance of the term of copyright. The convention did not abrogate any other multilateral or bilateral conventions or arrangements between two or more member states. Where there are any differences, the provisions of the Universal Copyright Convention are to prevail except as regards the Berne Convention, which takes priority over the UCC, and conventions or arrangements between two or more American republics. Both the Universal Copyright Convention and the Berne Convention were revised at a Paris conference in 1971 to take into consideration the special needs of developing countries, especially with regard to translations, reproductions, public performances, and broadcasting. The liberalized regulations were to apply only to teaching, scholarship, and research. / Известна также как Всемирная Конвенция об Авторском Праве и Женевская Конвенция.

UNIVERSAL COTTON STANDARDS = УНИВЕРСАЛЬНЫЕ СТАНДАРТЫ НА ХЛОПОК – Universal Cotton Standards:- Prior to the development of official standards, Cotton was marketed primarily on the basis of its variety and where it was grown, although some physical standards for Cotton classification (sets of physical samples) were used privately. The United States Cotton Futures Act of 1914 authorised the Department of Agriculture to establish physical standards as a means of determining color grade, staple length and strength, and other qualities and properties. These standards were thereafter agreed upon and accepted by the leading European Cotton associations and exchanges. They were accordingly termed and referred to as the 'Universal Standards for American Cotton'. Indeed, when in 1923 the US Department of Agriculture (USDA) signed the Universal Cotton Standards Agreement with nine leading cotton associations in seven major European countries, the US classing system entered into increasingly global use. Under the auspices of the Agreement, the currently twenty-four signatory cotton associations representing twenty-one countries agreed to use only Universal Standards to arbitrate US grown American Upland Cotton. In addition to use by signatory countries, Universal Standards are routinely used in over twenty-five non-signatory countries as the standard for US and non-US grown Cottons. Whereas other countries started developing their own classification system, the USDA kept committed to continual development and improvement efforts in the area of Cotton classification standards. Since 1991, USDA Cotton classification has relied on instrumental measurements (in addition to or as a substitute for human vision) for fiber length, strength and length, micronaire (a measure of the Cotton's fineness), color grade, color Rd (reflectance), color +b (yellowness), and trash percent area. All instrument measurements currently utilized in USDA are performed by High Volume Instrument (HVI) patented by Uster Technologies, a leading company in textile quality controlling. Given the international acceptance of HVI testing, in 1996 the Universal Cotton Standards Agreement was amended to recognize USDA-produced HVI calibration Cotton standards for strength, length and uniformity index. The new standards were named Universal HVI Calibration Cotton Standards and continue to serve today as the most recognized standards for HVI calibration. USDA is continuing its effort toward global HVI standardisation. The quality of the Cotton fiber is determined by three factors, namely, the color of ginned Cotton, purity (the absence of foreign matter) and quality of the ginning process, and the length of fibers. Practically all Cotton grown in the United States is classed by USDA at the request of producers. While classification is not mandatory, growers generally find it essential to marketing their crop and for participation in the USDA price support program. For additional information on USDA Cotton Classification Standards, the reader is referred to the official USDA website sections on classification, the HVI system, and standardisation. Universal Cotton Standards:- other properties that are of great importance in the industrial uses of cotton, including fiber fineness and maturity, are measured in accordance with standard test methods. Classing methodology is constantly updated to include state-of-the-art methods and equipment. Term 'Universal Cotton Standards' refers to American Upland Cotton. Established in 1914 as an aid to promoting domestic and foreign trade. Recognized by 18 countries in Europe, South America and Asia. International Calibration Cotton Standards, available from the US Department of Agriculture, Agricultural Marketing Service, Cotton Division, PO Box 17723, Memphis, TN 38117, USA, may be used to calibrate the instrument employed. / Высокопроизводительный Инструмент (ВПИ; High Volume Instrument (HVI). Уштэр Тчэкнолодьжиз А.Ге. (Цельвига Уштэр) (Uster Technologies AG (Zellweger Uster)), Уштэр (или Устер), Швейцария. Термин 'Универсальные Стандарты на Хлопок' относится с средневолокнистому Американскому Нагорному Хлопку (или Хлопку с возвышенностей). Утверждены в 1914 с целью поддержки в осуществлении внутренней и внешней торговли. Признаны 18 странами Европы, Южной Америки и Азии. Международные Калибровочные Стандарты на Хлопок можно заказать в Хлопковом Управлении, Сельскохозяйственной Маркетинговой Службы, Департамента Сельского Хозяйства США по адресу:- PO Box 17723, Memphis, TN 38117, USA; они могут быть использованы для калибровки используемых для испытаний приборов.

UNIVERSAL DECIMAL CLASSIFICATION = ВСЕОБЩАЯ ДЕСЯТИЧНАЯ КЛАССИФИКАЦИЯ (или УНИВЕРСАЛЬНАЯ ДЕСЯТИЧНАЯ КЛАССИФИКАЦИЯ) – Universal Decimal Classification:- also called Brussels Classification, system of library

organization. It is distinguished from the Dewey Decimal Classification (DDC; is a proprietary library classification system first published in the United States by Melvil Dewey in 1876) by expansions using various symbols in addition to Arabic numerals, resulting in exceedingly long notations. This system grew out of the international subject index of the Institut Internationale du Bibliographie at Brussels, which in 1895 adopted the Dewey Decimal Classification as the basis for its index. First published in 1905, it was later translated into several languages. Despite differences, the Dewey and Universal Decimal Classifications are fundamentally the same. In its ability to create a hybrid notation (i.e. Arabic number plus symbol), Universal Decimal parallels the Colon Classification. Its decimal basis and attempts at hierarchical range underscore its theoretical origin in Dewey. Revision has been continuous. In particular, it is intended mainly for use with classified cards rather than books. It is, however, used in libraries, notably in Europe and in the United Nations library. Its application has been heavily weighted in the areas of science and technology. The Universal Decimal's Relative Index, for consultation by the public, is arranged alphabetically for access to the number under which a subject or book is classed. / Дюива Десятичная Классификация (ДДК; Dewey Decimal Classification (DDC); опубликованная в 1876 в Соединённых Штатах Америки (США) Мэлвилом Луисом Касэфом 'Мэлвилом' Дюи (Melville Louis Kossuth 'Melvil' Dewey; 1851–1931)).

UNIVERSAL DECLARATION OF HUMAN RIGHTS = ВСЕОБЩАЯ ДЕКЛАРАЦИЯ ГУМАННЫХ ПРАВ (или УНИВЕРСАЛЬНАЯ ДЕКЛАРАЦИЯ ПРАВ ЧЕЛОВЕКА) – Universal Declaration of Human Rights (UDHR):- foundational document of international human rights law. It has been referred to as humanity's Magna Carta (Magna Carta Libertatum is a charter of rights agreed to by King John of England at Runnymede, near Windsor, on 15 June 1215) by Eleanor Roosevelt, who chaired the United Nations (UN) Commission on Human Rights that was responsible for the drafting of the document. After minor changes it was adopted unanimously – though with abstentions from the Belorussian Soviet Socialist Republic (SSR), Czechoslovakia, Poland, Saudi Arabia, South Africa, the Soviet Union, the Ukrainian SSR, and Yugoslavia – by the UN General Assembly on December 10, 1948 (now celebrated annually as Human Rights Day), as a 'common standard of achievement for all peoples and all nations'. The French jurist René Cassin was originally recognized as the principal author of the UDHR. It is now well established, however, that, although no individual can claim ownership of this document, John Humphrey, a Canadian professor of law and the UN Secretariat's Human Rights Director, authored its first draft. Also instrumental in the drafting of the UDHR were Roosevelt; Chang Peng-chun, a Chinese playwright, philosopher, and diplomat; and Charles Habib Malik, a Lebanese philosopher and diplomat. Humphrey's main contribution lay in producing the very inclusive first draft of the declaration. Cassin was a key player in the deliberations held throughout the commission's three sessions as well as those of the commission's drafting subsidiary. At a time of increasing East-West tensions, Roosevelt used her enormous prestige and credibility with both superpowers to steer the drafting process toward its successful completion. Chang excelled in forging compromises when the committee seemed incapable on the verge of an impasse. Malik, whose philosophy was firmly rooted in natural law, was a major force in the debates surrounding key provisions and played a critical role in elucidating and refining basic conceptual issues. The massive and systematic human rights abuses committed during World War II, including the Nazi genocide of Jews, Roma (Gypsies), and other groups, spurred the development of an international human rights instrument. In particular, the inclusion of crimes against humanity in the Charter of the International Military Tribunal, which paved the way for the subsequent Nürnberg trials, signaled the need to hold the perpetrators of atrocities internationally accountable for their actions irrespective of any domestic provisions to the contrary or the silence of domestic laws. At the same time, the drafters of the UN Charter sought to highlight the interrelationship between war prevention and fundamental human rights. Two key ethical considerations underscored the main tenets of the UDHR:- a commitment to the inherent dignity of every human being and a commitment to nondiscrimination. The declaration's drafting process was marked by a series of debates on a range of issues, including the meaning of human dignity, the importance of contextual factors (especially cultural) in the determination of the content and range of rights, the relationship of the individual to the state and to society, the potential challenges to the sovereign prerogatives of member states, the connection between rights and responsibilities, and the role of spiritual values in individual and societal welfare. The onset of the Cold War between the United States and the Soviet Union and the resulting deterioration of the global political climate led to sharp ideological exchanges on comparative assessments of the human rights situations in the Soviet-bloc countries and in countries under colonial rule. The disagreements underlying these exchanges eventually resulted in the abandonment of a plan for an international bill of rights, though they did not derail efforts to develop a nonbinding human rights declaration. The UDHR comprises 30 articles that contain a comprehensive listing of key civil, political, economic, social, and cultural rights. Articles 3 through 21 outline civil and political rights, which include the right against torture, the right to an effective remedy for human rights violations, and the right to take part in government. Articles 22 through 27 detail economic, social, and cultural rights, such as the right to work, the right to form and to join trade unions, and the right to participate freely in the cultural life of the community. The latter right relates to everyone's entitlement to be directly involved in and appreciative of the arts, and it is clearly linked to the full development of one's own personality (which, in accordance with article 26, constitutes one of the goals of the right to education). Because of the ideological fissures caused by the Cold War and the concomitant failure to develop a legally binding international human rights instrument, it became common to view civil and political rights independently of economic, social, and cultural rights, though this is a misinterpretation of both the letter and the spirit of the document. For example, it is impossible for a society to fulfill its commitment to the right to education (Article 26) without taking seriously its commitment to the right to seek, receive, and impart information (Article 19). Likewise, it is difficult to envisage the realization of the right to form and to join trade unions (Article 23) without a commensurate realization of the right to peaceful assembly and association (Article 20). Yet, these obvious linkages were obscured by the selective use of human rights norms by the main adversaries in the Cold War. The selectivity served to highlight what each side considered as its respective strength vis-à-vis the other: the terrain of civil and political rights for the Western bloc and the terrain of economic, social, and cultural rights for the Eastern bloc. The indivisibility of human rights in Article 28 – which many consider the most forward-looking article of the UDHR, though it has been one of the least-studied – links all the enumerated rights and freedoms by entitling everyone to 'a social and international order in which the rights and freedoms set forth in this Declaration can be fully realized'. By pointing to a global order different from that found in the contemporary world, this article is indicative, more than any other in the declaration, that the protection of human rights in its totality could transform the world and that such a future global order would incorporate the norms found in the UDHR. Ostensibly, the UDHR's provisions highlight the interrelated and interdependent nature of different categories of human rights as well as the need for global cooperation and assistance to realize them. The document's nonbinding status was initially perceived as one of its major weaknesses. Authoritarian states, which usually sought to protect themselves against what they considered interference in their internal affairs, approved of this feature of the declaration, and even some democratic countries initially worried about the potentially intrusive nature of the obligations that a legally binding document would impose. Some observers have argued, however, that its nonbinding status is one of the UDHR's major advantages. Its inherent flexibility has offered ample room for new strategies to promote human rights and has allowed it to serve as a springboard for the development of numerous legislative initiatives in international human rights law, including the International Covenant on Civil and Political Rights and the International Covenant on Economic, Social and Cultural Rights, both of which were adopted in 1966. In addition, the UDHR has been reaffirmed in numerous resolutions passed by organs and agencies of the UN, and many countries have incorporated it into their national constitutions. These developments have led many analysts to conclude that, despite its nonbinding status, its provisions have achieved a juridical status akin to that of norms of customary international law. One factor contributing to the UDHR's moral authority is precisely that it transcends positive international law. Indeed, it enunciates general moral principles

applicable to everyone, thus universalizing the notion of a fundamental baseline of human well-being. Despite its shortcomings, including a preoccupation with the state as the main perpetrator of human rights violations – which has marginalized human rights problems stemming from socially and culturally sanctioned abusive behaviour and violence, whose perpetrators are often nonstate actors such as individuals, families, communities, and other private institutions – the UDHR was and remains the key reference point for international human rights discourse. For example, during the 1960s and '70s, several organs of the United Nations system used the declaration's provisions to condemn racial discrimination in South Africa and Southern Rhodesia (now Zimbabwe). More than any other instrument, the UDHR is responsible for making the notion of human rights nearly universally accepted. / Великая Хартия Вольности (humanity's Magna Carta или Magna Carta Libertatum) – хартия прав (charter of rights) предписанная Королём Дьжоном Английским (King John of England) в Ранимид (Runnymede), близ Винзо (Windsor), 15 Июня 1215) Эна Элэнор Розэвэлт (Anna Eleanor Roosevelt (1884–1962)). Французский юрист Роне Самюэль Кяса (René Samuel Cassin; 1887–1976). Канадский профессор права Дьжон Питёз Хамфри (John Peters Humphrey; 1905–1995). ; Пэнь Чан Чань (Peng Chun Chang; 1892–1957), Китайский playwright, философ, и дипломат; и Шарль Абиб Маликь (Charles Habib Malik; 1906–1987), Ливанский философ и дипломат. Нюрнбергские процессы (Nürnberg trials). виз-а-ви (vis-à-vis).

UNIVERSAL DENSITY BALE = КИПА УНИВЕРСАЛЬНОЙ ПЛОТНОСТИ – Universal Density Bale is a bale of cotton compressed to a density of 28 pounds per cubic foot. / Кипа Универсальной Плотности – это кипа хлопка, спрессованного с плотностью 28 фунтов на кубический фут.

UNIVERSAL LIFE = УНИВЕРСАЛЬНАЯ ЖИЗНЬ – Universal Life:- a whole life insurance product whose investment component pays a competitive interest rate rather than the below-market crediting rate. / продукт страхования целой жизни, .

UNIVERSAL LIFE CONTRACT = ДОГОВОР ПО УНИВЕРСАЛЬНОЙ ЖИЗНИ – Universal Life Contract:- xxxxx. / Универсальный Договор По Жизни:- договор универсального страхования жизни.

UNIVERSAL LIFE INSURANCE = СТРАХОВАНИЕ УНИВЕРСАЛЬНОЙ ЖИЗНИ – Universal Life Insurance:- xxxxx. / Страхование Универсальной Жизни (Universal Life Insurance):- форма страхования жизни, впервые предложенная на рынке в начале 1980-х, которая сочетает недорогую страховую защиту, предоставляемую полисами срочного страхования жизни (term life insurance) со сберегательной программой, по которой средства относятся на счёт с отсроченным налогообложением, приносящий рыночную ставку процентного дохода. Полис такого типа является гибким:- по мере изменения возраста и дохода владелец полиса может увеличивать или уменьшать страховые взносы и сумму страхового покрытия или переносить определённую часть внесённых страховых взносов на сберегательный счёт – без уплаты дополнительных сборов за продажу. Новая форма страхового полиса называется универсальным гибким страхованием жизни (universal variable life insurance), которое сочетает гибкость программы страхования универсальной жизни с потенциалом роста, присущим полисам страхования жизни с переменной (плавающей) суммой. Смотрите также Variable Life Insurance; и Whole Life Insurance.

UNIVERSAL POSTAL UNION = ВСЕОБЩИЙ ПОЧТОВЫЙ СОЮЗ (или УНИВЕРСАЛЬНЫЙ ПОЧТОВЫЙ СОЮЗ) – Universal Postal Union (UPU) is the inter-governmental organization founded in 1874 by the Treaty of Bern as the General Postal Union which, in 1878, was renamed the Universal Postal Union (UPU) and which since 1948 has been a specialized agency of the United Nations (UN). UPU negotiates international mail charges. Universal Postal Union (UPU):- specialized agency of the United Nations that aims to organize and improve postal service throughout the world and to ensure international collaboration in this area. Among the principles governing its operation as set forth in the Universal Postal Convention and the General Regulations, two of the most important were the formation of a single territory by all signatory nations for the purposes of postal communication and uniformity of postal rates and units of weight. The original agreement adopted in 1875 applied only to letter mail; other postal services, such as parcel post and international money orders, have been regulated by supplementary agreements that are binding only on signing members. A first attempt to establish some general principles governing international postal service was made at an international conference in Paris in 1863; previously, international postal exchange had been regulated by a plethora of bilateral agreements. At the first International Postal Congress 11 years later, representatives of 22 countries adopted the Bern Treaty, creating the General Postal Union. The union actually came into effect on July 01, 1875; the name was changed to Universal Postal Union at the second congress in 1878. In 1948 the UPU became a specialized agency of the United Nations. The Universal Postal Congress is the legislative body and meets every five years. The Executive Council, which consists of 40 representative countries elected by the congress, ensures the continuity of the work of the UPU and meets annually. The International Bureau is maintained at Bern and acts as a secretariat in carrying out the daily operations. / Всеобщий Почтовый Союз (ВПС):- межправительственная организация, созданная в 1874 согласно Бернскому Трактату в качестве Всеобщего Почтового Союза, который в 1878 был переименован во Всемирный Почтовый Союз (ВПС) и который с 1948 является специализированным учреждением Организации Объединённых Наций (ООН). Всемирный Почтовый Союз (ВПС), международная межправительственная организация, специализированное учреждение ООН (с 1947). ВПС был образован в 1874 на 1-м Международном Почтовом Конгрессе; до 1878 назывался Всеобщим Почтовым Союзом. Россия была одним из его учредителей. Целями ВПС, согласно его Уставу (Конституции) в редакции 1964, являлись обеспечение организации и совершенствования почтовой службы, поощрение развития международного сотрудничества в этой сфере, оказание технической помощи развивающимся странам в области организации и совершенствования почтового обслуживания. Члены ВПС образуют единую почтовую территорию для взаимного обмена различного рода корреспонденцией, обеспечивают свободу транзита корреспонденции через свою территорию и применяют единые почтовые тарифы к одинаковым видам почтовой корреспонденции. В деятельности ВПС могут участвовать не только государства, но и некоторые международные организации. На 01 Января 1971 в ВПС входило 143 государства и территории. Союз Советских Социалистических Республик (СССР) участвовал в ВПС с 1924. Главные органы ВПС:- Всемирный Почтовый Конгресс, Исполнительный Совет, Консультативный Совет по Почтовым Исследованиям и Международное Бюро. Конгресс – высший орган ВПС – состоит из представителей всех членов ВПС и созывается, как правило, 1 раз в 5 лет (в 1874–1971 состоялось 15 конгрессов ВПС). Исполнительный совет, учреждённый на 14-м Конгрессе ВПС (Вена, 1964), состоял из 31 члена, избранного конгрессом на 5 лет. Консультативный Совет, основанный в 1957, состоял из 30 членов, избранных конгрессом ВПС на 5 лет; он проводил исследования и давал консультации по техническим, эксплуатационным и экономическим вопросам почтового обслуживания. Международное Бюро – постоянный Секретариат ВПС. Официальный язык ВПС – Французский, рабочие языки – Русский, Английский и Испанский. ВПС издавал журнал Почтовый Союз, отчёты конгрессов и так далее.

UNIVERSAL PRODUCT CODE = УНИВЕРСАЛЬНЫЙ КОД ПРОДУКТА – Universal Product Code is a standard bar code used to identify grocery and other retail merchandise.

UNIVERSAL PRODUCT CODE VERSION A = ВЕРСИЯ А УНИВЕРСАЛЬНОГО КОДА ПРОДУКТА – Universal Product Code (UPC) version A (UPCA) is used to encode an 11 digit number. The first digit is the system number and the rest are data characters. Both 2 and 5 digit supplementals are also supported.

UNIVERSAL STOCK FUTURES = УНИВЕРСАЛЬНЫЕ ФЬЮЧЕРСЫ НА АКЦИИ – Universal Stock Futures are the same as Single-Stock Futures, but used to refer to those contracts that trade on the LIFFE. See also Single-Stock Futures. / То же самое, что и Фьючерсы на Акцию Без Прав, но применимое для описания тех контрактов, которые находятся в обороте Лондонской Международной Биржи Финансовых Фьючерсов и Опционов (London International Financial Futures and Options Exchange; сокращённо – ЛМБФФО или ЛАЙФ или Эл.Ай.Эф.Эф.И. (LIFFE)). Смотрите также Фьючерсы на Акцию Без Прав (Single-Stock Futures).

UNIVERSAL TIME = ВСЕОБЩЕЕ ВРЕМЯ (или УНИВЕРСАЛЬНОЕ ВРЕМЯ) – Universal Time (UT or Z) is the correct name for the time system previously called Greenwich Mean Time (GMT):- the standard time at longitude 0°. Universal Time is five hours later than Eastern Standard Time in the United States. It is always stated on the 24-hour clock; thus an event occurring at 1:26:15 pm Eastern Standard Time occurs at 18:26:15 UT (five hours after 13:26:15). Technically, the time shown on clocks is figured from Coordinated Universal Time (UTC), an international system of time measurement regulated by very precise atomic clocks. From time to time (either on June 30 or December 31), UTC is adjusted by the addition of a 'leap second'. This event, widely reported in the press but poorly understood by the public, keeps UTC within 0.9 seconds of mean solar time at longitude 0° as measured by the Earth's slightly uneven rotation. Universal Time (UT):- the mean solar time of the Greenwich meridian (0° longitude). Universal Time replaced the designation Greenwich Mean Time in 1928; it is now used to denote the solar time when an accuracy of about one second suffices. In 1955 the International Astronomical Union defined several categories of Universal Time of successively increasing accuracy. UT0 represents the initial values of Universal Time obtained by optical observations of star transits at various astronomical observatories. These values differ slightly from each other because of the effects of polar motion. UT1, which gives the precise angular coordinate of the Earth about its spin axis, is obtained by correcting UT0 for the effects of polar motion. Finally, an empirical correction to take account of annual changes in the Earth's speed of rotation is added to UT1 to convert it into UT2. Coordinated Universal Time, the international basis of civil and scientific time, is obtained from an atomic clock that is adjusted in epoch so as to remain close to UT1; in this way, the solar time that is indicated by Universal Time is kept in close coordination with atomic time.

UNIVERSE = ВСЕЛЕННАЯ (или МИР, или ХХ) – Universe is the whole cosmic system of matter and energy of which the Earth is a part. See also Cosmos.

UNIVERSE OF SECURITIES = МИР ЦЕННЫХ БУМАГ – Universe Of Securities is a group of stocks having a common feature, such as similar outstanding market capitalization or same product line. / Совокупность Ценных Бумаг (Universe of Securities):- группа акций, имеющих одинаковые характеристики. Например, один исследователь может определить совокупность как группу обращающихся на рынке акций, величина капитализации которых составляет от 100 до 500 миллионов Долларов США. Другой исследователь может построить совокупность на базе акций различных отраслей, таких, как связь, целлюлозно-бумажная промышленность, воздушный транспорт. Взаимные инвестиционные фонды часто рекомендуют себя инвесторам как фонды, специализирующиеся на определённой совокупности ценных бумаг, что позволяет инвесторам заранее знать, с какого рода ценными бумагами намерен работать конкретный фонд.

UNI–WEAVE = РАВНОМЕРНОЕ ПЕРЕПЛЕТЕНИЕ – Uni-Weave is a type of plain weave fabric wherein the warp direction consists of load bearing carbon yarns, and the fill direction contains a small amount of glass fiber. Generally the amount of glass fiber is less than 10%.

UNKRA = UNITED NATIONS KOREAN RECONSTRUCTION AGENCY

UNL = ULTIMATE NET LOSS

UNLAWFUL ASSEMBLY = НЕЗАКОННОЕ СБОРИЩЕ – Unlawful Assembly:- gathering of persons for the purpose of committing either a crime involving force or a noncriminal act in a manner likely to terrify the public. The extent to which a government penalizes disorderly assemblies often reflects the political value that it places on the right of assembly. In Anglo-American law an assembly of persons is unlawful if the participants share a common illegal purpose, regardless of whether steps are taken to effect that purpose. Thus, it is distinguishable from rout and riot, which require more than mere intent (see also Riot). In Canada an assembly is unlawful not if it has an unlawful purpose but, rather, if it causes persons in the vicinity to fear that the assembly will disturb the peace tumultuously or cause others to do so. In some US jurisdictions two persons are enough to constitute an assembly. In India five persons are required. The continental European codes usually subsume the offense of unlawful assembly under the heading of resistance to public authority. Some constitutions in code-law countries follow the US Constitution in guaranteeing freedom of assembly. But the administrative authority vested in local police forces to control the use of public parks and roads and, if there is a danger of violence, to disperse crowds can be misused to justify interference in many public gatherings that are innocent in their purpose. See also Disturbing The Peace.

UNLEADED GASOLINE = НЕЭТИЛИРОВАННЫЙ БЕНЗИН – Unleaded Gasoline is a gasoline that has not been treated with a lead compound. The NYMEX® Division Unleaded Gasoline contract is of benefit to most sectors of the petroleum industry including refiners, blenders, importers, distributors, and integrated marketers, availing them of the opportunity to protect their cash market positions from changes in market pricing. Commercial users, such as fleet operators, can also use the unleaded futures contract to hedge against price risk in meeting their fuel procurement needs, and to help stabilize procurement costs. / НАЙМЭКС® (NYMEX®).

UNLEVERAGED BETA = БЭТА БЕЗ ПЛЕЧА – Unleveraged Beta is the Beta of an unleveraged required return (i.e. no debt) on an investment when the investment is financed entirely by equity.

UNLEVERAGED PROGRAM = ПРОГРАММА БЕЗ ПЛЕЧА – Unleveraged Program:- the use of borrowed funds to finance less than 50% of a purchase of assets. In a leveraged program borrowed funds are used to finance more than 50%. / Программа Без Плеча (Unleveraged Program):- программа приобретения активов, в основном за счёт средств из собственного капитала. Товарищество с Ограниченной Ответственностью (limited partnership) использует заёмные средства для финансирования приобретения собственности, причём доля этих средств составляет менее 50% от цены покупки. И напротив, программа с массированным использованием заёмного капитала (leveraged program) предусматривает заимствование более 50%. Инвесторы, стремящиеся максимизировать получаемый доход, как правило, предпочитают программы за счёт собственных средств, в которых расходы на выплату процентов и иные вычеты их дохода минимальные. Инвесторы, стремящиеся получить 'убежище' от налогов (tax shelter), предпочитают программы с большей долей заёмного капитала, несмотря на высокий риск, связанный с приобретением большого объёма заёмных средств и последующих длительных выплат в виде процентов, хотя и несколько сокращённых благодаря исключению их из налогообложения.

UNLEVERAGED REQUIRED RETURN = ТРЕБУЕМАЯ ОТДАЧА БЕЗ ПЛЕЧА – Unleveraged Required Return is the required return on an investment when the investment is financed entirely by equity, i.e. no debt).

UNLEVERED COST OF EQUITY = XX – Unlevered Cost Of Equity is the discount rate appropriate for an investment that it is financed with 100% equity.

UNLIMITED = НЕОГРАНИЧЕННОЕ – Unlimited:- stock exchange orders without stipulated limits and executed at best.

UNLIMITED COMPANY = НЕОГРАНИЧЕННАЯ КОМПАНИЯ (или КОМПАНИЯ С НЕОГРАНИЧЕННОЙ ОТВЕТСТВЕННОСТЬЮ) – In the United Kingdom, Unlimited Company is a company either with or without a share capital whose members or shareholders do not benefit from limited liability should the company ever go into formal liquidation. It is not a requirement under company law to add or state the word or designation Unlimited or its abbreviations (Unltd., or Ultd.) at the ending of its legal company name, and most unlimited companies do not. Unlimited companies are exempted from filing accounts with the Registrar of Companies for public disclosure, subject to a few exceptions (unless the company was a qualified subsidiary or a parent of a limited company during the accounting period). See also Company. / .

UNLIMITED LIABILITY = НЕОГРАНИЧЕННАЯ ОТВЕТСТВЕННОСТЬ – Unlimited Liability is a full liability for the debt and other obligations of a legal entity. The general partners of a partnership have unlimited liability. / Неограниченная Ответственность:- присуща двум формам организации бизнеса – частному предпринимательству и товариществу, где собственники отвечают всем своим имуществом по обязательствам предприятия.

UNLIMITED MARITAL DEDUCTION = НЕОГРАНИЧЕННЫЙ СУПРУЖЕСКИЙ ВЫЧЕТ – Unlimited Marital Deduction:- the US Internal Revenue Service (IRS) provision that allows an individual to transfer an unlimited amount of assets to a spouse, during life or at death, without incurring federal estate or gift tax. See also Marital Deduction.

UNLIMITED TAX BOND = НЕОГРАНИЧЕННОЕ НАЛОГОВОЕ ОБЯЗАТЕЛЬСТВО – Unlimited Tax Bond is a municipal bond secured by the pledge to levy taxes until full repayment at an unlimited rate. / Неограниченное Налоговое Обязательство (Unlimited Tax Bond):- взимать муниципальные налоги для обеспечения обязательств до тех пор, пока обязательства не будут погашены. Муниципальные облигации (municipal bond), обеспеченные гарантией взимания неограниченных налогов, вплоть до полной оплаты облигаций.

UNLINKED PASSENGER TRIPS = НЕСВЯЗАННЫЕ ПАССАЖИРСКИЕ ПОЕЗДКИ – Unlinked Passenger Trips is the number of passengers who board public transportation vehicles. A passenger is counted each time he/she boards a vehicle even though he/she may be on the same journey from origin to destination.

UNLIQUIDATED DAMAGES = НЕЛИКВИДИРОВАННЫЕ ПОВРЕЖДЕНИЯ – Unliquidated Damages:- liabilities for damages as assessed by a court of law (cf. liquidated damages). See also Damages. / Неликвидированные Повреждения (Unliquidated Damages):- . Смотрите также Повреждения (Damages).

UNLISTED SECURITIES MARKET = РЫНОК НЕКОТИРУЕМЫХ ЦЕННЫХ БУМАГ (или РЫНОК НЕПЕРЕЧИСЛЕННЫХ ЦЕННЫХ БУМАГ) – The Unlisted Securities Market (USM), which ran from 1980 to 1996, was a stock exchange set up by the London Stock Exchange to cater for companies too small to qualify for a full listing. The USM allowed companies to be traded which did not have the full three year trading history required by the main market, or which wished to float less than 25 percent of their share capital. The USM allowed as little as 10% to be floated. The Alternative Investment Market (AIM) was set up in June 1995. The USM no longer accepted new introductions, and companies which were already quoted on the USM had twelve months to decide either to move the quotation to AIM, or to delist. / Рынок Неперечисленных Ценных Бумаг (РНЦБ) (Unlisted Securities Market (USM)):- рынок, организованный в 1980 Лондонской Фондовой Биржей (London Sock Exchange) для торговли акциями небольших компаний, не отвечающих требованиям включения в котировочный список главного рынка (main market) (хотя большинство компаний, торгующих своими ценными бумагами на рынке неперечисленных ценных бумаг, в конечном счёте нацелено на котировку на главном рынке). Вступление на рынок неперечисленных ценных бумаг обходится дешевле, а требования к получению биржевых котировок (listing requirements) менее строгие. В настоящее время (в 1990) на рынке неперечисленных ценных бумаг обращаются акции не менее 400 компаний, тогда как в котировочный список главного рынка включено более 2 000 компаний. Сравните с Внеучётный Рынок (Over-The-Counter Market), и Третий Рынок (Third Market).

UNLISTED SECURITY = НЕКОТИРУЕМАЯ ЦЕННАЯ БУМАГА (или НЕПЕРЕЧИСЛЕННАЯ ЦЕННАЯ БУМАГА) – Unlisted Security is a security traded in the over-the-counter market that is not listed on an orgainzed exchange. Unlisted Securities:- the securities which are not listed for trading on an official stock exchange. Unlisted Securities are the securities (usually equities) in companies that are not on an official stock-exchange list. They are therefore not required to satisfy the standards set for listing (see Listed Security). Unlisted securities are usually issued in relatively small companies and their shares usually carry a high degree of risk. In London, unlisted securities were traded on the Unlisted Securities Market (USM) until 1995, when it was replaced by the Alternative Investment Market. Other exchanges have similar markets. / Неперечисленные Ценные Бумаги (Unlisted Securities):- ценные бумаги (обычно акции) компаний, которые не включены в официальный котировочный список фондовой биржи. Следовательно, такие ценные бумаги не должны удовлетворять требованиям, предъявляемым к ценным бумагам, включённым в листинг (котировочный список) (смотрите Перечисленные Ценные Бумаги (Listed Securities)). Неперечисленные на основной бирже ценные бумаги обычно выпускаются относительно небольшими компаниями и характеризуются высокой степенью риска. В Лондоне некоторые из неперечисленных на основной бирже ценных бумаг обращаются на рынке неперечисленных ценных бумаг (Unlisted Securities Market (USM)) Лондонской Фондовой Биржи и на третьем рынке (third market), являясь, по крайней мере в некоторой степени, ликвидными. Для включения ценных бумаг в официальный перечень, компания должна обладать капиталом в размере не менее 500 000 Фунтов Стерлингов, а 25% её акций должны быть доступны для широкой публики. Для неперечисленных на основной бирже ценных бумаг капитал компании устанавливается на значительно более низкой отметке, достаточной также, чтобы только 10% акций компании обращались на рынке неперечисленных ценных бумаг Лондонской Фондовой Биржи. Некотируемая Ценная Бумага (Unlisted Security):- ценные бумаги, некотирующиеся на официальной бирже, например, Нью Йоркской Фондовой Бирже (New York Stock Exchange), Американской Фондовой Бирже (American Stock Exchange) или региональных фондовых биржах (regional stock exchanges). Эти бумаги реализуются на внерасчётном рынке (over the counter).

UNLISTED STOCK = НЕКОТИРУЕМАЯ АКЦИЯ (или НЕПЕРЕЧИСЛЕННАЯ АКЦИЯ) – Unlisted Stock is a security not listed for trading on an official stock exchange. Also known as Unlisted Securities. See also Over-The-Counter Market.

UNLISTED TRADING = НЕКОТИРУЕМАЯ ТОРГОВЛЯ (или НЕПЕРЕЧИСЛЕННАЯ ТОРГОВЛЯ) – Unlisted Trading is a trading in unlisted securities that occurs on an organized exchange to accommodate members. This practice is not permitted at the NYSE. / Некотируемая Торговля (Unlisted Trading):- операции с некотирующимися на официальных биржах ценными бумагами, которые проводятся на бирже в качестве специальной услуги её членам. Биржа, желающая осуществлять операции с некотирующимися ценными бумагами, должна подать заявку в Комиссию по Ценным Бумагам и Биржам (Securities and

Exchange Commission) и предоставить потенциальным инвесторам всю необходимую информацию. Нью Йоркская Фондовая Биржа (New York Stock Exchange) не предоставляет привилегий на покупку и продажу на бирже некотирующихся ценных бумаг. Американская Фондовая Биржа (American Stock Exchange) и другие крупные официальные биржи также отказались от этой практики.

UNLOADING = ИЗБАВЛЕНИЕ (или СЛИВ, или ХХ) – Unloading is a selling securities or commodities whose prices are dropping to minimize loss. / Избавление – продажа ценных бумаг или сырья, цены на которые упали, с тем чтобы минимизировать убыток. Избавление (Unloading):- выбросить на рынок по низким ценам, сбросить ценные бумаги, манипулировать. В финансах:- распродажа запасов большого количества товара по ценам ниже рыночных для быстрого получения наличных средств или для того, чтобы снизить цены на рынке данной продукции. В инвестициях:- продавать ценные бумаги или товарно-сырьевую продукцию в период спада цен, чтобы предотвратить дальнейшие убытки. Смотрите также Dump; Profit Taking; и Selling Off.

UNLOADING = ОПОРОЖНЕНИЕ (или СЛИВ, или РАЗГРУЗКА, или ВЫГРУЗКА) – Unloading is the release of contaminant that was initially captured by the filter medium. Unloading is a removal of a shipment from a vessel.

UNLTD = UNLIMITED

UNMANNED AERIAL VEHICLE = БЕЗЛЮДНОЕ ВОЗДУШНОЕ ТРАНСПОРТНОЕ СРЕДСТВО – Unmanned Aerial Vehicle (UAV) (Cat 9):- any 'aircraft' capable of initiating flight and sustaining controlled flight and navigation without any human presence on board. In addition, according to Section 744.3 of the EAR, unmanned air vehicles, which are the same as 'unmanned aerial vehicles', include, but are not limited to, cruise missile systems, target drones and reconnaissance drones.

UNMANNED MACHINERY SPACES = БЕЗЛЮДНЫЕ МАШИННЫЕ ПРОСТРАНСТВА (или БЕЗЛЮДНЫЕ МАШИННЫЕ ПОМЕЩЕНИЯ) – Unmanned Machinery Spaces is a space where alarm bells are installed on the bridge of a ship to trace or rectify any machinery faults. The computerized devices will report any fault immediately when it appears and the engineers on board can attend to the necessary ramifications.

UNMARGINED ACCOUNT = НЕМАРЖИНАЛЬНЫЙ СЧЁТ – Unmargined Account is a cash account held at a brokerage firm. / Немаржинальный Счёт (Unmargined Account):- кассовый счёт (cash account) клиента у брокера.

UNMATCHED BOOK = НЕСВЕДЁННАЯ КНИГА – Unmatched Book:- if the average maturity of a bank's liabilities is shorter than that of its assets, it is said to be running an unmatched book. The term is commonly used with the Euromarket. Also refers to entering into OTC derivatives contracts and not hedging by making trades in the opposite direction to another financial intermediary. In this case, the firm with an unmatched book usually hedges its net market risk with futures and options. Related expressions:- Open Book and Short Book.

UN–MENDED = НЕШТОПАННОЕ – Un-Mended:- during mending repair if some thing left unnoticed and not attended. Mending defect. / Порок или дефект штопки (mending defect).

UNMENTIONABLE = НЕУПОМИНАЕМОЕ (или ХХ) – Unmentionable:- (plural) pants, underwear.

UNNILENNIUM = УННИЛЕННИЙ (или УНИЛЕНИУМ, или УНИЛЕН) – Unnilennium (Une):- also called Element 109, an artificially produced element belonging to the transuranium group. It is predicted to have chemical properties resembling those of iridium. In 1982 West German physicists at the Institute for Heavy Ion Research (Gesellschaft für Schwerionenforschung (GSI)) in Darmstadt synthesized an isotope of element 109 with a mass number of 266. Using a high-energy linear accelerator, the GSI investigators, under the direction of Peter Armbruster, bombarded bismuth-209 targets with beams of iron-58 ions for roughly 10 days. The resultant fusion reaction between the bismuth and iron atoms yielded only a single nucleus of the new element; however, the sensitivity of the detection technique employed left little doubt as to the validity of the identification. Unnilennium has an estimated half-life between 2 and 20 milliseconds. / Профессор Пита Армбруста (Peter Armbruster; 1931–).

UNNILHEXIUM = УННИЛЕКСИЙ (или УНИЛЕКСИУМ, или УНИЛЕКС) – Unnilhexium (UNH):- also called Element 106, or Seaborgium an artificially produced radioactive element in Group VIb of the periodic table. In June 1974, Georgy N. Flerov of the Joint Institute for Nuclear Research at Dubna, Russia, USSR, announced that his team of investigators had synthesized and identified element 106. In September of the same year, a group of American researchers headed by Albert Ghiorso at the Lawrence Radiation Laboratory (now Lawrence Berkeley National Laboratory; the laboratory was founded in August 26, 1931 by Ernest Orlando Lawrence as the Radiation Laboratory of The University of California, Berkeley, State of California associated with the Physics Department) of the University of California at Berkeley reported their synthesis of the identical element. Disagreement arose between the two groups over the results of their experiments, both having used different procedures to achieve the synthesis. The Soviet scientists had bombarded lead-207 and lead-208 with ions of chromium-54 to produce an isotope of element 106 having a mass number of 259 and decaying with a half-life of approximately 0.007 second. The American researchers, on the other hand, had bombarded a heavy radioactive target of californium-249 with projectile beams of oxygen-18 ions, which resulted in the creation of a different isotope of element 106 – one with a mass number of 263 and a half-life of 0.9 second. Russian researchers at Dubna reported their synthesis of two isotopes of the element in 1993, and a team of researchers at Lawrence Berkeley duplicated the Ghiorso group's original experiment that same year. The International Union of Pure and Applied Chemistry recommended the element be named unnilhexium. American researchers tentatively named it seaborgium in honour of the American nuclear chemist Glenn T. Seaborg. Based on its position in the periodic table, unnilhexium is thought to have chemical properties akin to those of tungsten. / Советский физик ядерщик Георгий Николаевич Флёров (Georgiy Nikolayevich Flyorov; 1913–1990). Албёт Гиорсо (Albert Ghiorso) в Лорэнсовской Радиационной Лаборатории (Lawrence Radiation Laboratory; ныне Лорэнсовская Бёклыйская Национальная Лаборатория (Lawrence Berkeley Laboratory) в честь Онист Орлэндо Лорэнс (Ernest Orlando Lawrence; 1901–1958)). Американский физик ядерщик Глэн Сиодор Сиборг (Glenn Theodore Seaborg; 1912–1999).

UNNILOCTIUM = УННИЛОКТИЙ (или УНИЛОКТИУМ, или УНИЛОКТ) – Unniloctium (Uno):- also called Element 108, an artificially produced element belonging to the transuranium group. It was synthesized and identified in 1984 by West German researchers at the Institute for Heavy Ion Research (Gesellschaft für Schwerionenforschung (GSI)) in Darmstadt. On the basis of its position in the periodic table of the elements, it is expected to have chemical properties similar to those of osmium. The GSI research team, led by Peter Armbruster, produced an isotope of element 108 in a fusion reaction by irradiating lead-208 with ions of iron-58. The isotope, which has a mass number of 265, is exceedingly unstable and has a half-life of only 2 milliseconds. Experiments conducted by A.G. Demin and other researchers at the Joint Institute for Nuclear Research in Dubna, Russia, USSR, suggested the existence of two more isotopes of element 108 with mass numbers of 263 and 264. / Профессор Пита Армбруста (Peter Armbruster; 1931–). А.Г. Дёминым и другими исследователями в Объединённом Институте Ядерных Исследований в Дубне, Союз Советских Социалистических Республик (СССР).

UNNILPENTIUM = УННИЛПЕНТИЙ (или УНИЛПЭНТИУМ, или УНИЛПЭНТ) – Unnilpentium (UNP):- also called Element 105, Hahnium, or Nielsbohrium an artificially produced radioactive transuranium element in Group Vb of the periodic table. The discovery of unnilpentium, like that of Unnilquadium (Element 104), has been a matter of dispute between Soviet and American scientists. The Soviets may have synthesized a few atoms of Element 105 in 1967 at the Joint Institute for Nuclear Research in Dubna, Russia, USSR, by bombarding americium-243 with neon-22 ions, producing isotopes of Element 105 having mass numbers of 260 and 261 and half-lives of 0.1 second and 3 seconds, respectively. Because the Dubna group did not propose a name for the element at the time they announced their preliminary data – a practice that has been customary following the discovery of a new element – it was surmised by American scientists that the Soviets did not have strong experimental evidence to substantiate their claims. Soviet scientists contended, however, that they did not propose a name in 1967 because they preferred to accumulate more data about the chemical and physical properties of the element before doing so. After completing further experiments, they proposed the name nielsbohrium. In 1970 a group of investigators at the Lawrence Radiation Laboratory of the University of California at Berkeley announced that they had synthesized isotope 260 of Element 105, whereupon they proposed the name hahnium for the element, in honour of Otto Hahn, the discoverer of nuclear fission. The American team could not duplicate the Soviet experiment; but, when its members bombarded californium-249 with the nuclei of nitrogen-15 atoms, they produced hahnium-260, which had a half-life of about 1.6 seconds. As further evidence of their discovery, the scientists at Berkeley measured the amount of energy emitted by hahnium-260 as it decayed, as well as the elements produced in the process; these characteristics were quite different from those of previously known elements in the periodic system. The International Union of Pure and Applied Chemistry recommended that the element be named unnilpentium. Atomic Number:- 105; Mass of Most:- ; Stable Isotope:- 260; Electronic:- ; Configuration:- 2-8-18-32-32-11-2or (Rn)$5f^{14}6d^{3}7s^{2}$. / в Объединённом Институте Ядерных Исследований в Дубне, Союз Советских Социалистических Республик (СССР). в Лорэнсовской Радиационной Лаборатории (Lawrence Radiation Laboratory; ныне Лорэнсовская Бёклыйская Национальная Лаборатория (Lawrence Berkeley Laboratory) в честь Онист Орлэндо Лорэнс (Ernest Orlando Lawrence; 1901–1958)). Немецкий химик, пионер в области радиоактивности и радиохимии Ото Хан (Otto Hahn; 1879–1968).

UNNILQUADIUM = УННИЛКВАДИЙ (или УНИЛКВАДИУМ, или УНИЛКВАД) – Unnilquadium:- also called Element 104, Kurchatovium, or Rutherfordium an artificially produced radioactive transuranium element in Group IVb of the periodic table. Soviet scientists at the Joint Institute for Nuclear Research at Dubna, Russia, USSR, announced in 1964 the discovery of Element 104, which they named kurchatovium, symbol Ku (for Igor Kurchatov, a Soviet nuclear physicist). In 1969, a group of American researchers at the Lawrence Radiation Laboratory of the University of California at Berkeley announced that they had identified isotopes of the element, different from the one identified by the Soviets; the Americans then proposed the name rutherfordium, in honour of the British physicist Ernest Rutherford. Because neither group has been able to verify the results of the other, both the name and the priority of discovery are still open to question. The International Union of Pure and Applied Chemistry has recommended that the element be named unnilquadium. In their experiment, the Soviets bombarded plutonium-242 with ions of neon-22, claiming to have obtained an isotope of Element 104 that had a mass number of 260 and a half-life of 0.3 second. The Soviets then performed a series of chemical experiments with the isotope to demonstrate that it behaved in a manner that had been predicted for the element. When the workers at Dubna later used a more refined measuring technique, however, they found that the half-life of the isotope was 0.1 second, not 0.3 second as originally reported. This finding cast doubt on the chemical experiments with the element, because the results of those experiments could not have been obtained with atoms having a half-life of 0.1 second. The American investigators did not follow the same procedure as the Dubna group, because the American equipment could not accelerate neon-22 ions to the necessary energies. Instead, they bombarded a target of californium-249 with ions of carbon-12 and carbon-13. Although unable to obtain the same isotope as the Soviet scientists, the Berkeley team did report positive identification of two, possibly three, isotopes of Element 104. The bombardment of californium-249 with carbon-12 produced an isotope with a mass number of 257 and a half-life of 4–5 seconds; the carbon-13 bombardment produced an isotope with a mass number of 259 and a half-life of three to four seconds. The investigators at Berkeley subsequently, by bombarding curium-248 with oxygen-18, synthesized an isotope of Element 104 that has a mass number of 261 and a half-life of 70 seconds. Although the Soviets could make only a few atoms of their mass-260 isotope, the Berkeley group obtained thousands of the atoms having mass numbers of 257 and 259. Moreover, because the latter isotopes have longer half-lives, the Berkeley team was able to measure the energies of their emissions (alpha particles) and to detect their decay products (nobelium isotopes), thereby providing more extensive evidence of their discovery. Atomic Number:- 104; Mass of Most:- ; Stable Isotope:- 261; Electronic:- ; Configuration:- 2-8-18-32-32-10-2or (Rn)$5f^{14}6d^{2}7s^{2}$. / в Объединённом Институте Ядерных Исследований в Дубне, Союз Советских Социалистических Республик (СССР). в Лорэнсовской Радиационной Лаборатории (Lawrence Radiation Laboratory; ныне Лорэнсовская Бёклыйская Национальная Лаборатория (Lawrence Berkeley Laboratory) в честь Онист Орлэндо Лорэнс (Ernest Orlando Lawrence; 1901–1958)). Британский физик Онист Разэфэд (British physicist Ernest Rutherford; 1871–1937).

UNNILSEPTIUM = УННИЛСЕПТИЙ (или УНИЛСЭПТИУМ, или УНИЛСЭПТ) – Unnilseptium (Uns) is also called Element 107, a synthetic element in Group VIIb of the periodic table. It is thought to be chemically similar to the rare metal rhenium. In 1976 Soviet scientists at the Joint Institute for Nuclear Research in Dubna, Russia, USSR, announced that they had synthesized Element 107 by bombarding a target of bismuth-209 with ions of chromium-54. The resultant collisions were reported to have produced an isotope of the element with a mass number of 261 and a half-life of 1–2 milliseconds. The existence of the element was confirmed by West German physicists at the Institute for Heavy Ion Research (Gesellschaft für Schwerionenforschung (GSI)) in Darmstadt. / В 1976 Советские учёные в Объединённом Институте Ядерных Исследований в Дубне, Союз Советских Социалистических Республик (СССР) заявили о том, что они синтезировали 107-й элемент, бомбардируя мишень висмут-209 ионами хрома-54.

UNNONAGINTILLION = УННОНАГИНТИЛЛИОН (или ХХ) – Unnonagintillion is a unit of quantity equal to 10^{276} (1 followed by 276 zeros).

UN NUMBER = UNITED NATIONS NUMBER

UNOCTOGINTILLION = УНОКТОГИНТИЛЛИОН (или ХХ) – Unoctogintillion is a unit of quantity equal to 10^{246} (1 followed by 246 zeros).

UNOFFICIAL MARKET = НЕОФИЦИАЛЬНЫЙ РЫНОК – Unofficial Market is a specialized stock market term referring to, in general, the people that directly participate in trading through buying and selling for their own account. Banks' representatives (traders), who trade on commission, are not considered part of the unofficial market. A strong unofficial market is desirable as it spreads professional traders' buy and sell interests throughout the market, which leads to greater liquidity in the market.

UNOFFICIAL SAMPLE = НЕОФИЦИАЛЬНАЯ ПРОБА – An Unofficial Sample is a sample drawn without the supervision of an authorized employee of the Canadian Grain Commission (CGC).

UNOFFICIAL STRIKE = НЕОФИЦИАЛЬНАЯ ЗАБАСТОВКА (или НЕОФИЦИАЛЬНАЯ СТАЧКА, или НЕОФИЦИАЛЬНАЯ СХОДКА) – Unofficial Strike is one that has not been ratified by a trade union in accordance with its internal procedures. Unofficial

action, therefore, is taken by union members acting independently of the formal union, and perhaps in open defiance of trade union leaders. Under current law, unofficial action is likely to be unlawful action that has not been preceded by a properly conducted strike ballot. Unlawful unofficial action of this kind must be publicly repudiated by a trade union if it is not to lose its immunity and become liable for civil action for damages from the employer. See also Vicarious Liability. / Неофициальная Забастовка Неофициальная Стачка или Неофициальная Сходка (Unofficial Strike):- . Смотрите также Забастовка или Стачка или Сходка (Strike).

UNOPENED STAPLE = НЕРАСКРЫТЫЙ ШТАПЕЛЁК – Unopened Staple is a staple fiber in bunches or clusters in the bale in such a condition that it will not process smoothly through carding and subsequent operations in the spun-yarn plant.

UNPAID DIVIDEND = НЕВЫПЛАЧЕННЫЙ ДИВИДЕНД – Unpaid Dividend is a dividend declared by the directors of a corporation that has not yet been paid. / Невыплаченный Дивиденд (Unpaid Dividend):- дивиденды, которые были декларированы правлением корпорации, но дата оплаты (payment date) которых ещё не наступила. Как только правление принимает решение проводить дивиденды (declare), оно пересматривает структуру обязательств (liability) вплоть до выплаты дивидендов. Компания, например, объявляет размер дивидендов 01 Июля со сроком выплаты 01 Августа. На протяжении Июля эти дивиденды будут считаться объявленными, но не выплаченными. Смотрите также Ex-Dividend.

UNPRESSED PLEAT = НЕСПРЕССОВАННАЯ СКЛАДКА – Unpressed Pleat is a pleat (folds) the edges of which have not been set by pressing. The rounded edges create a look that is softer than pressed pleats. The term unpressed pleats is usually used for wide unpressed pleats, whereas cartridge pleats, also unpressed, describe narrower, decorative pleats.

UNPROCESSED SAMPLE = ПРОБА НЕОБРУШЕННОГО ЗЕРНА – Unprocessed Samples of grain are those which have not been cleaned commercially. See also Processed Sample.

UNPROFITABLE SEGMENT ELIMINATION DECISION = РЕШЕНИЕ ОБ ИСКЛЮЧЕНИИ НЕПРИБЫЛЬНОГО СЕГМЕНТА (или РЕШЕНИЕ ОБ УСТРАНЕНИИ НЕПРИБЫЛЬНОГО СЕГМЕНТА) – Unprofitable Segment Elimination Decision rule:- Retain the segment unless fixed costs eliminated exceed the contribution margin lost. Eliminating a Segment or Product (in accounting):- For this decision, the question is whether avoiding traceable and perhaps common fixed costs will offset the lost contribution margin from the eliminated segment or product. Eliminating a segment or product may also affect the profitability of some or all of the remaining segments or products. These effects must be included in the analysis of the decision:- (i) It is important to only focus on the relevant costs, or the data that chances under the alternative. (ii) A decision to discontinue a segment or product based on the net loss is inappropriate. Management sometimes must decide whether to eliminate an unprofitable business segment. For example, in recent years many airlines have quit servicing certain cities or have cut back on the number of flights. How should that portion of fixed costs that are unavoidable be handled when making a decision on whether to eliminate an unprofitable segment? They should be subtracted from the contribution margin and if that results in a net loss, the segment should be eliminated. They should not be considered as they are not relevant. They should be allocated to other segments. If that causes a loss in another segment, that segment should be eliminated as well. Fixed costs are never relevant. They should not be considered as they are not relevant. / Решение О Ликвидации Неприбыльного Сегмента:- под сегментом понимается отдельный продукт или услуга, производственная линия, подразделение компании, географическая область действий.

UNPROVED RESERVES = НЕДОКАЗАННЫЕ РЕЗЕРВЫ – Unproved Reserves are based on geologic and/or engineering data similar to that used in estimates of proved reserves; but technical, contractual, economic, or regulatory uncertainties preclude such reserves being classified as proved. Unproved reserves may be further classified as probable reserves and possible reserves. Unproved reserves may be estimated assuming future economic conditions different from those prevailing at the time of the estimate. The effect of possible future improvements in economic conditions and technological developments can be expressed by allocating appropriate quantities of reserves to the probable and possible classifications. See also Reserves.

UNQUADRAGINTILLION = УНКВАДРАГИНТИЛЛИОН (или XX) – Unquadragintillion is a unit of quantity equal to 10^{126} (1 followed by 126 zeros).

UNQUALIFIED OPINION = НЕКВАЛИФИЦИРОВАННОЕ МНЕНИЕ – Unqualified Opinion:- independent auditor's declaration that he or she has no reservation in certifying that the audited firm's financial statements (1) adequately disclose material information, (2) present fairly its financial position, and (3) show results of its operations in conformity with the provisions Generally Accepted Accounting Principles (GAAP). Unqualified Opinion is an independent auditor's opinion that a company's financial statements comply with accepted accounting procedures. Antithesis of Qualified Opinion. An Unqualified Opinion is an audit report that has been issued with no reservations regarding the state of an audit client's financial statements. In this opinion, the auditor follows a standard opinion format to state that the financial statements are a fair representation of the financial results and condition of a client, in accordance with the applicable accounting framework (such as GAAP). Creditors, lenders, and investors want to see financial statements with an unqualified opinion attached to them before they will lend money or invest funds. If there is any form of qualification to an audit opinion, this is a major red flag for financial statement users. An unqualified opinion is also known as a Clean Opinion. Unqualified Opinion is the auditor's opinion of a financial statement, given without any reservations. Such an opinion basically states that the auditor feels the company followed all accounting rules appropriately and that the financial reports are an accurate representation of the company's financial condition. Opposite of Qualified Opinion. Unqualified Opinion is an independent auditor's judgment that a company's financial records and statements are fairly and appropriately presented, and in accordance with Generally Accepted Accounting Principles (GAAP). An unqualified opinion is the most common type of auditor's report. An unqualified opinion is issued when the independent auditor believes that the company's financial statements are sound; that is, the statements are free from material misstatements. This is different from a qualified opinion which is issued when the independent auditor discovers something in the financial statements that is subject to major concern. / Неквалифицированное Мнение – безусловно положительное мнение. Неквалифицированное Мнение:- заключение независимого аудитора о том, что все материалы по финансовой отчётности фирмы были предоставлены полностью, а отчётность и бухгалтерский учёт фирмы соответствовали требованиям Общепринятых Принципов Бухгалтерского Учёта (ОПБУ; Generally Accepted Accounting Principles (GAAP)) и аудиторских стандартов (GAAS). Правомерность аудиторского заключения основывается на соответствии характера проведённых мероприятий общепринятым принципам аудиторской деятельности и на личном мнении аудитора. Смотрите также (Accountant's Opinion), (Adverse Opinion), (Qualified Opinion).

UNQUINQUAGINTILLION = УНКВИНКВАГИНТИЛЛИОН (или XX) – Unquinquagintillion is a unit of quantity equal to 10^{156} (1 followed by 156 zeros).

UNQUOTED = НЕКОТИРОВОЧНЫЕ – Unquoted:- not quoted or listed on a stock exchange, e.g., an unquoted company.

UNQUOTED SECURITIES = НЕКОТИРОВОЧНЫЕ ЦЕННЫЕ БУМАГИ – Unquoted Security is a security that previously traded on an exchange but no longer does. A security may become unquoted if the market capitalization of its issuing company falls to the point

that it no longer meets an exchange's listing requirements. An unquoted security, then, is very high risk. However, its price is likely to be low and, if it comes back, an unquoted security can provide a substantial return. Unquoted Securities:- securities which are not quoted on a recognized exchange (cf. over the counter). Sometimes assumed to imply illiquidity, although the biggest single market in securities, that for US treasuries, is an unlisted market. See also Rule 163. Unquoted Shares:- shares in some companies, often smaller ones, are not traded on any stock exchange. Companies might not be quoted (or listed) because they prefer to run their businesses in relative privacy, or they do not meet the listing requirements, such as minimum market capitalization. In other words they are too small to join a stock market. The London Stock Exchange requires companies to have a trading record of three years and sets a minimum market capitalization. / Некотировочные Ценные Бумаги (Unquoted Securities):- ценные бумаги, которые не котируются ни на одной бирже. На Лондонской Фондовой Бирже (London Sock Exchange) существуют правила, регулирующие случайные сделки с некотировочными ценными бумагами небольших компаний или новых венчурных предприятий. Некотировочные ценные бумаги обычно отражаются в балансе по их номинальной стоимости или рыночной стоимости (если её можно оценить).

UNRAVEL = РАСПУСКАНИЕ – The term Unravel means the same as ravel. It is the tendency of fabric to come unwoven or unknitted at unfinished edges. Loosely woven fabrics tend to unravel more than those made of tight weaves. Occasionally, the tendency to unravel is desirable in order to create a fringed edge. / Распускание ткани.

UNRAVELING SEAMS = РАСПУТЫВАЮЩИЕСЯ ШВЫ – Unraveling Seams generally occurs on 401 chainstitch seams where either the stitch has been broken or a skipped stitch has occurred. This will cause seam failure unless the seam is restitched. Minimizing Unraveled Stitches:- (1) use a high performance Perma Core or D-Core thread that will minimize broken stitches and skipped stitches; (2) insure proper machine maintenance and sewing machine adjustments; and (3) observe sewing operators for correct material handling techniques. Fabrics defect.

UNREALIZED CAPITAL GAIN/LOSS = НЕРЕАЛИЗОВАННЫЕ КАПИТАЛЬНЫЕ ПРИБЫЛЬ/УБЫТОК (или НЕМАТЕРИАЛИЗОВАННЫЕ КАПИТАЛЬНЫЕ ПРИБЫЛЬ/УБЫТОК) – Unrealized Capital Gain/Loss:- an increase/decrease in the value of a security that is not 'real' because the security has not been sold. Once a security is sold by the portfolio manager, the capital gains/losses are 'realized' by the fund, and any payment to the shareholder is taxable during the tax year in which the security is sold.

UNREALIZED GAIN (LOSS) ON SECURITIES HELD = НЕРЕАЛИЗОВАННАЯ ПРИБЫЛЬ (УБЫТОК) ПО УДЕРЖИВАЕМЫМ ЦЕННЫМ БУМАГАМ – Unrealized Gain (Loss) On Securities Held, this component of partnership capital results from the valuation of Loans and Investments by the General Partner(s). Unrealized appreciation is recognized for valuations above cost and unrealized depreciation is recognized for valuations below cost. Unrealized gain or loss is the sum of the unrealized appreciation or depreciation of all Loans and Investments. Estimated future tax effects associated with unrealized appreciation or depreciation are not taken into account because partnerships are not taxed at the entity level.

UNREALIZED PROFIT (OR LOSS) = НЕРЕАЛИЗОВАННАЯ ПРИБЫЛЬ (ИЛИ УБЫТОК) (или НЕМАТЕРИАЛИЗОВАННАЯ ПРИБЫЛЬ (или УБЫТОК)) – Unrealized Profit (or Loss):- xxxxx. / Нереализованная (или Нематериализованная) Прибыль (или Убыток):- прибыли или убытки, которые ещё не были получены, хотя об этом уже известно. Они становятся реализованными прибылями (или убытками) (realized profit or loss) после фактической продажи ценных бумаг или товарно-сырьевого фьючерсного контракта, в результате чего будет получена прибыль или убыток. Также называется существующими только на бумаге Бумажной Прибылью или Убытком (Paper Profit Or Loss).

UNRECORDED EXPENSES = НЕЗАПИСАННЫЕ РАСХОДЫ (или НЕЗАРЕГИСТРИРОВАННЫЕ РАСХОДЫ) – Unrecorded Expenses are the expenses occurring in one period of accounting but recorded in another. Unrecorded Expense is the expense incurred during an accounting period but recorded in a subsequent period. / Незарегистрированные Расходы:- расходы, понесённые в данном отчётном периоде, но не оплаченные в этом периоде; например, начисленная задолженность по заработной плате, процентам и тому подобному. Такие расходы начисляются в конце периода корректирующей проводкой по дебету счетов расходов и кредиту счетов обязательств. Называются также (Accrued Expenses), (Accrued Liabilities).

UNRECORDED REVENUES = НЕЗАПИСАННЫЕ ВЫРУЧКИ (или НЕЗАРЕГИСТРИРОВАННЫЕ ДОХОДЫ) – Unrecorded Revenues:- revenues earned during an accounting period but recorded in a subsequent period. What Is The Difference Between Unearned Revenue And Unrecorded Revenue? In financial accounting, unearned revenue refers to amounts received prior to being earned. For example, if ABC Service Co. receives USD24 000 on December 31, 2012 for a one-year service agreement covering January 01 through December 31, 2013, the entire USD24 000 is unearned as of December 31, 2012. On the December 31, 2012 balance sheet ABC should report a liability such as Unearned Revenues for USD24 000. During 2013 ABC should move USD2 000 per month from the liability account on its balance sheet to a revenue account on its income statement. I associate unrecorded revenue with revenues that were earned, but not yet recorded in a company's accounting records. For example, an electric utility will provide electricity to customers for up to one month before it reads the customers' meters, calculates the bills and records the billings as revenues and accounts receivable. As a result, the electric utility will have up to one month of unrecorded revenue. At each balance sheet date, the utility should accrue for the revenues it earned but had not yet recorded. This is done through an adjusting entry that debits a balance sheet receivable account and credits an income statement revenue account. Unrecorded Revenue is revenue that an entity has earned in an accounting period, but which it does not record in that period. Unrecorded Revenue is revenue that an entity has earned in an accounting period, but which it does not record in that period. The business typically records the revenue in a later accounting period, which is a violation of the matching principle, where revenues and related expenses are supposed to be recognized in the same accounting period. An example of unrecorded revenue is when an employee who is engaged in consulting services neglects to complete her timesheet at the end of the month, so that the accounting staff does not record her billable hours in that month. Instead, she records the information after the reporting period has closed, so that the revenue must instead be recognized in the next reporting period. Another example is when a company is engaged in a multi-period project for a customer, and completes work during an accounting period, but is not contractually allowed to issue an invoice until a later accounting period. The controller elects not to accrue any revenue until the actual billing period. Thus, the firm has unrecorded revenue until such time as it records an invoice. The correct accounting treatment for unrecorded revenue is to accrue revenue in the period when the revenue is earned, using a credit to an Accrued Revenue account, and a debit to an Accounts Receivable account. You would then reverse this entry in the period when you invoice the customer. Unrecorded Revenue is the amount is allocated as income but no payment has been made. In order to consider these transactions as a profit, an accountant must perform a line item adjustment to the balance sheet. / Эй.Би.Си. Сёвис Ко. (ABC Service Co.). Незарегистрированные Доходы:- доходы, заработанные, но не полученные в данном отчётном периоде; например, начисленные проценты к получению, арендные платежи к получению. Начисляются в конце периода корректирующей проводкой по дебету счетов активов и кредиту счетов доходов. Называются также (Accrued Assets), (Accrued Receivables).

UNREGISTERED STOCK = НЕЗАРЕГИСТРИРОВАННАЯ АКЦИЯ – Unregistered Stock:- xxxxx. Letter Security. / Незарегистрированная Акция:- . Смотрите также Letter Security.

UNREGISTERED VARIETY = НЕЗАРЕГИСТРИРОВАННЫЙ СЕЛЕКЦИОННЫЙ СОРТ (или НЕЗАРЕГИСТРИРОВАННАЯ РАЗНОВИДНОСТЬ) – Unregistered Variety is sometimes used for the term non-registered variety. See also Registered Variety.

UNRELATED BUSINESS TAX INCOME = НАЛОГООБЛАГАЕМЫЙ ДОХОД ОТ НЕСВЯЗАННОГО ДЕЛА – Unrelated Business Tax Income is an income earned by a tax-exempt entity that does not result from tax-exempt activities. The entity may owe taxes on this income.

UNRELATED MATERIAL = НЕРОДСТВЕННЫЕ ПРИМЕСИ (или НЕСВЯЗАННЫЕ ОСТАТКИ) – In the Rice industry, unrelated material is all matter other than Rice, related material, and seeds. See also Related Material.

UNRELAXED YARN = НЕРАЛАКСИРОВАННАЯ ПРЯЖА – Unrelaxed Yarn:- a regular filament yarns of nylon or polyester not subjected to relaxation process. See also Relaxed Yarn. / филаментная (комплексная) пряжа (filament yarn) Найлан^{T3} (Nylon^{TM}).

UNREMOVED TINT = НЕУДАЛЁННЫЙ (или НЕУСТРАНЁННЫЙ) ФОН (или ТОН, или КРАСКА) – Unremoved Tint:- Fabric:- spun-viscose-rayon-and-acetate suiting; Construction:- (i) Count:- 4S x 44; (ii) Warp:- 24/2 60% 2-in. 1^4-den. bright viscose rayon 40% 2-in. 3-den. dull acetate rayon; (iii) Filling:- same as warp; Finish:- boiled off only. Defect:- finisher reported that the red tint was not fugitive. Analysis:- laboratory scouring tests in V' of neutral soap solution at 160 °F completely eliminated the red tint present in the gray goods. On visiting the finisher's plant and attempting to repeat the scouring operation in a pail on Hi-yard cuttings, using soap supplied by the finisher, the investigators found that the tint could not be completely removed. A sample of the soap was analyzed and it was evident that it was very inferior in detergent properties when compared with a standard grade of neutral soap. Further investigation revealed that it was a poor-quality product which the finisher had purchased for several cents a pound less than the market price for commonly used commercial soap. Under the circumstances, the gray mill assumed no responsibility for this defect and the finisher was obliged to use a stripping agent (sodium hydrosulphite) to destroy the tint on goods which he had already boiled off. See also Tint. / Уточина:- такая же как основа.

UNREPAIRED DAMAGE = НЕУСТРАНИМОЕ ПОВРЕЖДЕНИЕ – Unrepaired Damage:- this term relates to damage to an insured ship that has not been repaired at the time the policy expires. It applies to both time and voyage hull policies, and provides that underwriters are not liable for unrepaired damage if the ship becomes a total loss from any cause (insured or not) before the expiry of the policy period. If the ship was not a total loss, the assured could normally claim a depreciation allowance for unrepaired damage, caused by an insured peril, on expiry of the policy. / Повреждение – одно из понятий теории надёжности; событие, заключающееся в нарушении исправности изделия. Повреждение может быть существенным и являться причиной нарушения работоспособности (отказа) и несущественным, при котором работоспособность изделия сохраняется.

UNRIPE, IMMATURE COTTON = НЕРАЗВИВШИЙСЯ (или НЕСОЗРЕВШИЙ, или НЕВЫЗРЕВШИЙ), НЕДОЗРЕЛЫЙ ХЛОПОК – Unripe, Immature Cotton:- that produced by premature opening of the bolls because of frost or drought. Technically known as Dead Cotton Fiber.

UNRISD = UNITED NATIONS RESEARCH INSTITUTE FOR SOCIAL DEVELOPMENT

UNRRA = UNITED NATIONS RELIEF AND REHABILITATION ADMINISTRATION

UNRWA = UNITED NATIONS RELIEF AND WORKS AGENCY FOR PALESTINE REFUGEES IN THE NEAR EAST

UNSATURATED FATTY ACID = НЕНАСЫЩЕННАЯ ЖИРНАЯ КИСЛОТА – Unsaturated Fatty Acid is a fatty acid containing one or more double bonds (between individual atoms of the molecule).

UNSEASONED ISSUE = НЕСЕЗОННАЯ ЭМИССИЯ (или НЕСЕЗОННЫЙ ВЫПУСК) – Unseasoned Issue is an issue of a security for which there is no existing market. See also Seasoned Issue.

UNSEAWORTHINESS = НЕПРИГОДНОСТЬ К ПЛАВАНИЮ – Unseaworthiness is the state or condition of a vessel when it is not in a proper state of maintenance, or if the loading equipment or crew, or in any other respect is not ready to encounter the ordinary perils of sea.

UNSEAWORTHY = НЕПРИГОДНОЕ К ПЛАВАНИЮ (или НЕМОРЕХОДНОЕ) – Unseaworthy is the condition of a vessel where from any cause it is unsafe to send her to sea.

UNSECURED BONDS = НЕОБЕСПЕЧЕННЫЕ ОБЛИГАЦИИ (или НЕОБЕСПЕЧЕННЫЕ ОБЯЗАТЕЛЬСТВА) – Unsecured Bonds are not secured by a specific asset, but rather by 'the full faith and credit' of the issuer. In other words, the investor has the issuer's promise to repay but has no claim on specific collateral. This doesn't necessarily have to be a bad thing:- keep in mind that US Treasuries – generally regarded as the lowest risk investment in the world when it comes to the possibility of default – are all unsecured bonds. Even owners of unsecured do have a claim on the assets of the defaulted issuer, but only after investors whose securities are higher in the 'capital structure' are paid first. If for example, Widget Corp issued unsecured bonds and secured bonds and later went into bankruptcy, the holders of the secured bonds will be paid first. Debt, such as unsecured bond debt, is said to be 'subordinated', or junior, to secured debt. Risk And Return Characteristics Of Secured Vs. Unsecured Bonds:- Generalizations regarding the risks and return characteristics of bond debt are subject to many exceptions. For example, although one might suppose that secured debt represents a lower risk to bondholders than unsecured debt, in practice the opposite is often true. Investors buy uncollateralized debt because of the issuer's reputation and economic strength. In other words, it's because the risk of default is sufficiently remote that bond investors are willing to accept the bond without collateralization. In the case of Treasury bonds, for instance, none of which are secured by anything more than the reputation of the US government, the issuer has never failed to make a scheduled interest payment or failed to return the full principal upon maturity in more than 200 years. With secured bonds – not all, but many – the reason that the bonds are secured is that the issuer is aware there's little interest from investors in buying its unsecured bonds – in other words, the issuer's reputation and perceived economic strength don't justify an investor's purchase of the bond without collateralization. In both instances, unsecured bonds by economically strong issuers and secured bonds by weaker issuers, the unsecured bond may have a lower interest rate at issuance than the secured bond. Lower-rated corporate bonds, i.e. junk bonds, always have high-interest rate schedules at issuance. But, again, these kinds of generalizations are only valid to a point. Some very strong institutions traditionally offer secured debt – among them quasi-governmental energy producers – and in such instances, the offered interest rate will be low for the same reason that unsecured debt may offer a relatively low-interest rate. In sum, the best generalizations regarding the risk and return characteristics of secured and unsecured bonds are that:- (i) Debt perceived to be risky – to represent a plausible risk of default – will always offer relatively high-interest rates and bonds whether secured or not; (ii) Debt issued by governments and corporations with a reputation for economic strength will offer relatively low interest rates. In both cases,

the truism applies:- Risks and returns are correlated. More specifically:- In bond markets, risk and yield go hand-in-hand. Unsecured Bond:- bond issue that is backed only by the creditworthiness and reputation of the issuer, and not by any pledged asset. See also Debenture. Unsecured Bonds, also called Debentures, are not backed by equipment, revenue, or mortgages on real estate. Instead, the issuer promises that they will be repaid. This promise is frequently called 'Full Faith And Credit'. Why issue unsecured bonds? Some companies do not have enough assets to collateralize. Other companies are established and are therefore trusted to repay their debts. As for governments, they can raise taxes if they need to pay off bondholders. Unsecured bonds naturally carry more risk than secured bonds; consequently, they usually pay higher interest rates than do secured bonds. If a company issuing debentures liquidates, it pays holders of secured bonds first, then debenture-holders, and then owners of subordinated debentures. Secured And Unsecured Bonds:- Bonds are issued as evidence of a loan. They may be backed with collateral or just the good faith and credit of the borrower. As an educated investor, you need to know the advantages and risks of bonds and whether they are secured or unsecured. Bonds may be secured by collateral, which is the money or physical assets that a bond issuer (borrower) must give to investors if the bond defaults. Securing bonds ensures that capital will be available to pay the principal on a bond. Corporate bonds and municipal bonds may be secured or unsecured. Federal government bonds, however, are unsecured and only backed by the good faith and credit of Uncle Sam. Identifying Secured Bonds:- Mortgage bonds are secured corporate bonds that are backed primarily by real estate, although they may include other corporate assets as well. They may cover all mortgageable property or just specific pieces. Because mortgage bond collateral provides a clear claim on a company's assets, mortgage bonds are considered high-grade and safe from default. A trustee acting on behalf of bondholders holds the collateral; if the bond defaults, this trustee may foreclose for the bondholders. Mortgage bonds may be either first mortgage bonds or junior mortgage bonds. Should an issuer have to liquidate, first mortgage bonds are paid off before juniors are. To finance projects such as bridges, hospitals, and power plants, municipalities sell revenue bonds (or limited obligation bonds). The anticipated revenue generated by those projects is used to secure them. Because they are backed with specific collateral, secured bonds are perceived as safer investments than unsecured bonds. Financial assets in the form of a securities portfolio containing stocks and bonds secure collateral trust bonds. A third-party trustee holds the securities. Equipment trust certificates are backed by company equipment such as trucks, airplanes, railroad cars, etc. They are often issued by airlines and railroads that need to finance new purchases of equipment. The equipment bought may be the same equipment that is collateralized. A trustee for the bondholders keeps the title to the equipment. After all the bondholders have been repaid, the trustee then returns the title to the company. Because they are backed with specific collateral, secured bonds are perceived as safer investments than unsecured bonds. Because they are perceived as safer, they typically pay lower interest rates. Secured bonds are favored by those who want to protect their investment capital. Below are some common types of unsecured bonds:- To meet its financial needs, the US Government issues Treasury bonds. It issues them with the full faith and credit of the federal government. Because the US Government, of all issuers, has the best ability to repay, Treasury bonds are considered the safest from default and are very popular with investors. General Obligation Bonds (GO Bonds) are municipal bonds without backing. The creditworthiness of the issuing city or state is the only security they provide. GO bonds finance municipal operations. In the event that an issuer cannot repay its debts to bondholders, it may have to lay off employees, sell some assets, or raise taxes. Income Bonds are the bonds most junior of all. Their payments are made only after the issuer earns a certain amount of income. The issuer is not bound to make interest payments on a timely or regular basis if the minimum income amount is not earned. The investor is aware of the risks involved and may be willing to invest in these bonds if there is an attractive coupon rate or high yield-to-maturity. Convertible Bonds give the investor the option to convert the bonds into shares of common stock. The conditions, the time frame, and the price must all be set down at the time the bonds are issued. Unsecured Bonds or Debentures are bonds that are not backed by some type of collateral. In other words, the bond is only secured by the bond issuer's good credit standing. There are no building, equipment, vehicles, or other assets backing up the bond. If the bond issuer defaults on the unsecured bond, the bond holders could receive nothing from their investment. They would be left up to the court system to sue the bond issuer for their investment. What Does Unsecured Bond Mean? Unsecured bonds are almost always more risky of an investment than a secured bond since secured bonds are backed with some type of guarantee or collateral. Unsecured bonds are usually only issued by companies that don't have enough assets to put up for collateral or government bodies. Example:- If a company can't raise enough capital to back a bond issuance, it is usually a sign of a risky investment. Governments, on the other hand, can always raise taxes if they need to pay off bond holders. An unsecured bond from a municipality is usually a safe investment. Even in the rare circumstance that a governmental body declares bankruptcy, the bonds are usually covered by other governmental bodies. Since unsecured bonds are more risky to investors than secured bonds, unsecured bond issuers usually have to pay a higher interest rate to the bond holders. Depending on the company or governmental organization, the interest rate could be one percent or ten percent. This rate difference largely depends on how trustworthy and financially stable the company or governmental organization is. / Необеспеченные Облигации:- облигации, выпущенные на условиях доверия к компании-эмитенту. Называются также (Debenture Bonds).

UNSECURED CREDIT = НЕОБЕСПЕЧЕННЫЙ КРЕДИТ – Unsecured Credit is a credit extended only on the basis of the debtor's promise to repay, without any collateral security. Unsecured Credit is a credit extended on the borrower's promise to repay the debt, and for which collateral is not required. Unsecured Credit:- a loan granted on the strength of the borrower's credit history or reputation. If the loan is unsecured there is no guarantee it will be repaid. The opposite of Secured Credit. / Необеспеченный Кредит – это кредит без залога и поручителей, выдаваемый банком на любые цели.

UNSECURED CREDITOR = НЕОБЕСПЕЧЕННЫЙ КРЕДИТОР – Unsecured Creditor is a creditor who has made a loan but received no security. Creditor whose claims are not guaranteed or backed by collateral. / Необеспеченный Кредитор (Unsecured Creditor):- лицо, которое ссудило организации деньги, однако не договорилось о том, что в случае непогашения ссуды какие-либо определённые активы будут служить фондом средств, из которого кредитор получит возмещение ссуды в приоритетном по сравнению с другими кредиторами порядке.

UNSECURED DEBENTURE = НЕОБЕСПЕЧЕННОЕ ДОЛГОВОЕ ОБЯЗАТЕЛЬСТВО – Unsecured Debentures are debentures that are not supported by a collateral security. No specific assets will be set aside against unsecured debentures. It is basically a loan with out any protection. They are backed only by the general credit worthiness of the issuer. Unsecured Debenture is a debenture or note not supported by a collateral security. Unsecured Debenture is a debt security, issued by a government or large company, that is not secured by an asset or lien, but rather by the all issuer's assets not otherwise secured. That is, an unsecured bond carries no collateral; in case of bankruptcy, the bondholder is considered a general creditor. Thus, the bondholder is paid out of funds that do not have a prior claim on them with a secured debt. Like most bonds, an unsecured bond can be traded. Some unsecured bonds, such Treasury securities, are considered risk-free. See also Debenture. / Необеспеченное Долговое Обязательство (Unsecured Debenture):- долговое обязательство или облигация, не обеспеченные какими-либо активами, за счёт которых в случае неспособности компании погасить долг владельцам долговых обязательств будут производиться выплаты в приоритетном по сравнению с другими кредиторами порядке.

UNSECURED DEBT = НЕОБЕСПЕЧЕННЫЙ ДОЛГ (или НЕОБЕСПЕЧЕННАЯ ЗАДОЛЖЕННОСТЬ) – Unsecured Debt:- a loan not backed by an underlying asset. Unsecured debt includes credit card debt, medical bills, utility bills and any other type of loan or credit that was extended without a collateral requirement. It presents a high risk for lenders since they may have to sue to get the money they're owed if the borrower doesn't repay the full amount owed. As a result of this high risk, unsecured debt tends to come with a high interest rate. Unsecured debt can be wiped out by bankruptcy, but taking this dramatic step makes it more difficult to obtain financing for the next seven to 10 years. Secured debt, on the other hand, is backed by an asset, also known as Collateral. Under the terms of a secured loan, the lender can seize the collateral used to guarantee the loan if the borrower defaults. Examples of secured debt include mortgages, which are secured by houses, and auto loans, which are secured by cars. Because the borrower has more to lose by defaulting on a secured loan and the lender has something to gain, this type of loan will have a lower interest rate than an unsecured loan. Unsecured Debt is a debt that does not identify specific assets that the debtholder is entitled to in case of default. Unsecured Debt is a debt instrument not backed by the issuer's pledging of assets. Unsecured bonds are called Debentures. / Необеспеченный Долг:- обязательства, не обеспеченные залогом, без какого-либо обеспечения (collateral).

UNSECURED LOAN = НЕОБЕСПЕЧЕННЫЙ ЗАЁМ – Unsecured Loan:- xxxxx. / Необеспеченный Заём:- кредит без обеспечения (Collateral).

UNSECURED LOAN STOCK = НЕОБЕСПЕЧЕННЫЙ ЗАЁМНЫЙ КАПИТАЛ – Unsecured Loan Stock (referred to as Corporate Bonds in the USA):- a fixed interest security but, unlike a debenture, it is not secured against pre-specified assets of the company. In the event the company is unable to repay the unsecured loan stock at the redemption date, the holders of the stock have to take their chance with the other creditors of the company as to whether there will be enough assets to sell in order to repay the loan stock after the company is would up.

UNSEPTUAGINTILLION = УНСЭПТУАГИНТИЛЛИОН (или XX) – Unseptuagintillion is a unit of quantity equal to 10^{216} (1 followed by 216 zeros).

UNSEXAGINTILLION = УНСЭКСАГИНТИЛЛИОН (или XX) – Unsexagintillion is a unit of quantity equal to 10^{186} (1 followed by 186 zeros).

UNSHIP = ВЫГРУЖАТЬ – Unship (maritime term):- to take apart or to remove from its place.

UNSOCIAL HOURS = НЕСОЦИАЛЬНЫЕ ЧАСЫ (или ВНЕУРОЧНЫЕ ЧАСЫ, или НЕОБЩЕСТВЕННЫЕ ЧАСЫ, или XX) – Unsocial Hours:- if someone works unsocial hours, they work late at night, early in the morning, at weekends, or on public holidays. In Britain, people are often paid extra for working unsocial hours. To Work Unsocial Hours:- to work during the night or early in the morning when most people do not have to work. Unsocial Hours are the unusual hours that cause one to work when other people are spending time together; e.g., a job with unsocial hours. Unsocial Hours is the UK term of art for working hours that are outside of 7 am to 7 pm Monday to Friday. In the United Kingdom (UK), Unsocial Hours Payments are additions to basic pay. These apply for staff whose work in standard hours, within the normal 37.5 hour working week (section 10), is undertaken at the times, and on the days, specified in the national agreement and shown in the table below. The times and the rates of payment are:- Unsocial Hours Payments:- Column 1 (Pay Band) – Column 2:- All Time On Saturday (Midnight To Midnight) And Any Week Day After 8 pm And Before 6 am – Column 3:- All Time On Sundays And Public Holidays (Midnight To Midnight):- (i) 1 – Time Plus 50% – Double Time; (ii) 2 – Time Plus 44% – Time Plus 88%, (iii) 3 – Time Plus 37% – Time Plus 74%, (iv) 4–9 – Time Plus 30% – Time Plus 60%. Unsocial hours payments are worked out using basic salary including long-term recruitment and retention premiums (RRPs), but excluding short-term RRPs, high cost area supplements, and all other supplements and payments. When more than half of a shift on a weekday, which is not a public holiday, falls within the times shown in column 2, the whole of that shift will qualify for unsocial hours payment. This system of payment may be used to pay for unsocial hours worked in the previous month (retrospectively) when shifts and payments vary from month to month or, when shifts are fixed, prospectively, so that a fixed level of payment is made each month based on a forecast of the number of unsocial hours which will be worked in future months. If the system is used prospectively there will need to be periodic checks to compare the level of payments with those produced by the system in its retrospective form. This is to ensure that the levels of payment are broadly similar overall. The national agreement on unsocial hours payments is set out in Section 2(a) (England) in the NHS Terms and Conditions of Service Handbook. A new system for unsocial hours payments was introduced in April 2008. This system, covers enhancements to basic pay for Agenda for Change staff whose standard working week includes evenings, early mornings, weekends, bank holidays and nights. Employers have been assimilating Agenda for Change staff onto the new system of unsocial hours payments with effect from 01 April 2008. / Исключённые Из Общественной Жизни Часы (Unsocial Hours):- рабочие часы сверх нормативного рабочего дня в конторе или на заводе, которые лишают работника возможности жить нормальной семейной жизнью и принимать участие в обычной общественной жизни. Труд сменных рабочих и рабочих, которые вынуждены работать в исключённые из общественной жизни часы, часто обплачивается по ставкам, превышающим совокупную заработную плату 5–9 обычных рабочих.

UNSTERILIZED INTERVENTION = НЕСТЕРИЛИЗОВАННАЯ ИНТЕРВЕНЦИЯ – Unsterilized Intervention is the foreign exchange market intervention in which the monetary authorities have not insulated their domestic money supplies from the foreign exchange transactions.

UNSTRUCTURED APPAREL = НЕСТРУКТУРИРОВАННАЯ ОДЕЖДА (или НЕСТРУКТУРИРОВАННОЕ ШВЕЙНОЕ ИЗДЕЛИЕ) – Unstructured Apparel is an apparel with little, if any, detail in tailoring. It takes its shape from the person wearing it. For example, a jacket that does not have padding, lining, or insets.

UNSTRUCTURED SUPPLEMENTARY SERVICE DATA = НЕСТРУКТУРИРОВАННЫЕ ДОПОЛНИТЕЛЬНЫЕ СЛУЖЕБНЫЕ ДАННЫЕ (или НЕРЕГЛАМЕНТИРОВАННЫЕ ДАННЫЕ ВСПОМОГАТЕЛЬНЫХ УСЛУГ) – Unstructured Supplementary Service Data:- the exchange of short messages between mobile trusted devices and possibly even computers in 'dialogue' mode.

UNSYSTEMATIC RISK = НЕСИСТЕМАТИЧЕСКИЙ РИСК – Unsystematic Risk is the risk that is unique to a company such as a strike, the outcome of unfavorable litigation, or a natural catastrophe that can be eliminated through diversification. Related Systematic Risk. Also called the Diversifiable Risk or Residual Risk.

UNTRIGINTILLION = УНТРИГИНТИЛЛИОН (или XX) – Untrigintillion is a unit of quantity equal to 10^{96} (1 followed by 96 zeros).

UNTRIMMED LOOSE THREADS = НЕОБРЕЗАННЫЕ ОСЛАБШИЕ НИТИ (или НЕОБРЕЗАННЫЕ СЛАБОНАТЯНУТЫЕ НИТИ, или НЕОБРЕЗАННЫЕ XX НИТИ) – Untrimmed Loose Threads:- any hanging threads on the face of the fabrics are termed as loose threads. Cause:- tail ends not trimmed after piecing up. Mending:- these defects can be easily rectified with the help of clipper. Untrimmed Loose Threads:- any hanging threads on the face of the fabrics are termed as loose threads. Weaving Defect. / Свободно торчащие концы нитей.

UNU = UNITED NATIONS UNIVERSITY

UNVALUED POLICY = НЕОЦЕНЁННЫЙ ПОЛИС (или ПОЛИС БЕЗ ОЦЕНКИ) – Unvalued Policy is a policy that does not express the insured value of the property insured, as distinct from the sum insured by the policy. A claim under an unvalued policy is limited to the insurable value of the subject matter insured at the time of loss, even though the sum insured may be more that the insurable value. Unvalued policies are normally used for policies covering such hull interests such as 'excess liabilities' and 'anticipated freight'. Unvalued Policy is an unvalued policy is a policy which does not specify the value of the subject-matter insured, but, subject to the limit of the sum insured, leaves the insurable value to be subsequently ascertained, in the manner hereinbefore specified. / Невалютированный Полис (Unvalued Policy):- страховой полис имущества, в котором указаны страховые суммы для каждого объекта страхования, причём страховщик не знает, какова фактическая стоимость застрахованного имущества. В результате, если застрахованный потребует выплаты страховой суммы, он обязан предъявить докоательство стоимости утраченного, повреждённого или украденного имущества.

UNVDA = UPPER NUN VALLEY DEVELOPMENT AUTHORITY

UNVIGINTILLION = УНВИГИНТИЛЛИОН (или ХХ) – Unvigintillion is a unit of quantity equal to 10^{66} (1 followed by 66 zeros).

UNWANTED CUT OUT MOTIF = ВЫШИТОЕ УКРАШЕНИЕ В ВИДЕ НЕЖЕЛАННОГО ВЫРЕЗА – Unwanted Cut Out Motif on garment. Possible Cause:- product made with recycled garment. The defect is major. The mark is permanent and cannot be removed from the fabric. It is going to adversely affect the value of the fabric. Stitching defect.

UNWANTED MARKS = НЕЖЕЛАННЫЕ ОТМЕТИНЫ (или НЕЖЕЛАТЕЛЬНЫЕ ОТМЕТИНЫ) – Unwanted Marks on fabric. Possible Cause:- oily stains with dust adhered to surface which makes the stains more prominent and difficult to remove, due to contact with oil or grease covered exposed machine parts during stitching. Careless handling could be another cause. The defect is minor. It will most probably be removed during subsequent washing. However in case it stays, due to prominence it will be termed as major. This defect has appeared after stitching as the stain is also marking the seam. Stitching defect. / развод (или потёк (stain)).

UNWANTED PIGMENT MARKING ON FABRIC = НЕЖЕЛАННАЯ (или НЕЖЕЛАТЕЛЬНАЯ) ОТМЕТИНА ПИГМЕНТА НА ТКАНИ – Unwanted Pigment Marking On Fabric:- Possible Cause:- screen has holes in it that should have been covered. This could be because of ageing of the screen and eventual damage or just improper exposure to light. This is a major defect as the design has been foiled. However, in the industry unless there is only minor damage to the screen, it is not used. Printing defect.

UNWANTED TWILL = НЕЖЕЛАТЕЛЬНАЯ (или НЕНУЖНАЯ, или НЕУГОДНАЯ, или НЕПРЕДУСМОТРЕННАЯ) САРЖА – Unwanted Twill:- twill lines introduced unintentionally into a fabric. / Нежелательное Саржевое Переплетение (unwanted twill):- порок ткани; линии саржевого переплетения, непреднамеренно проложенные в ткани.

UNWANTED WHITE PATTERNS = НЕЖЕЛАННЫЕ (или НЕЖЕЛАТЕЛЬНЫЕ) БЕЛЫЕ УЗОРЫ – Unwanted White Patterns on fabric. Possible Cause:- localized over enzyme wash. This is a minor defect as the white marks could be termed as part of the required effect. Finishing defect.

UNWASHABLE FABRIC = НЕ СТИРАЕМАЯ ТКАНЬ – Unwashable Fabric is a fabric that should not be washed by hand or by machine. Such fabrics are usually labeled 'dry clean only'.

UNWASHED WOOL = НЕМЫТАЯ ШЕРСТЬ – Unwashed Wool is a wool in its original condition as it comes from a sheep. See also Grease.

UNWATCHED = НЕПРОСМАТРИВАЕМОЕ (или НЕОБСЛУЖИВАЕМОЕ) – Unwatched (maritime term):- said of a lighthouse not tended. / говорят о необслуживаемом маяке.

UNWIND = ПОГАШЕНИЕ (или РАЗВЯЗКА, или РАЗМОТКА) – Unwind is a procedure followed in certain clearing and settlement systems in which transfers of securities and funds are settled on a net basis at the end of the processing cycle. All transfers are provisional until all participants have discharged their settlement obligations. If a participant fails to settle, some or all of the provisional transfers involving that participant are deleted from the system, and the settlement obligations from the remaining transfers are recalculated. An investor unwinds a strategy when they reverse it, e.g., buying back the two options that make up the short straddle. Unwind is the act of liquidating a position in the market. Many times this refers to a spread position, or a large position that must be covered over a period of time as opposed to a small position that can be done once at a single price. / , например, . Акт ликвидации позиции на рынке. Во многих случаях это относится к позициям по курсовой разнице, или к позиции большого размера, на исполнение ликвидации которой потребуется больший период времени, нежели для ликвидации позиции малого размера, которая может быть выполнена за раз по одной и той же цене.

UNWIND A TRADE = ПОГАСИТЬ ТОРГОВЛЮ – Unwind A Trade:- reverse a securities transaction through an offsetting transaction in the market. / Развязать Торговлю (Unwind A Trade):- компенсировать сделку с ценными бумагами путём совершения сделки противоположного характера. Смотрите также Offset.

UNWINDING PROTEIN = РАСПЛЕТАЮЩИЙ БЕЛОК – Unwinding Protein is a protein which binds (i.e. adheres to) single-stranded DNA, and thereby aids/stabilizes the unwinding of the DNA molecule's normal (helical/wound-up) structure.

UP UTTAR PRADESH

UP = ПОВЫШЕНИЕ (или ВВЕРХ) – (1) Up (market indication) – willingness to go both ways (buy or sell) at the mentioned volume and market. / Направление движения рынка, предрасположенность к действию, будь-то к покупке или продаже, в упомянутом объёме и рынке.

(2) Up (print) – up on the ticker tape, confirming that the trade has been executed.

UP ANCHOR = СНИМАТЬСЯ С ЯКОРЯ – Up Anchor:- hoist or haul in the anchor.

UPC = UNIFORM PRACTICE CODE

UPC = UNIVERSAL PRODUCT CODE

UPCE 11–DIGIT = Ю.ПИ.СИ.И. 11–ЦИФРОВОЙ – UPCE 11-Digit:- UPCE is a zero suppressed version of the UPCA (short for the Universal Product Code version A) barcode. This version allows 11 digits to be encoded. The first digit must be zero. Both 2 and 5 digit supplementals are also supported.

UPCE0 6–DIGIT = Ю.ПИ.СИ.И.0 6–ЦИФРОВОЙ – UPCE0 6-Digit:- UPCE is a zero suppressed version of the UPCA (short for the Universal Product Code version A) barcode. This version allows 6 digits to be encoded. The first digit must be zero. Both 2 and 5 digit supplementals are also supported.

UPCE1 6–DIGIT = Ю.ПИ.СИ.И.1 6–ЦИФРОВОЙ – UPCE1 6-Digit:- UPCE is a zero suppressed version of the UPCA (short for the Universal Product Code version A) barcode. This version allows 6 digits to be encoded. The first digit must be zero. Both 2 and 5 digit supplementals are also supported.

UPDRAFT AND DOWNDRAFT = ВОСХОДЯЩЕЕ И НИСХОДЯЩЕЕ – Updraft And Downdraft:- in meteorology, upward-moving and downward-moving air currents, respectively, that are due to several causes. Local daytime heating of the ground causes surface air to become much warmer than the air above, and, because warmer air is less dense, it rises and is replaced by descending cooler air. The vertical ascending current, called a Thermal, may reach an altitude of 3 km (2 miles) or more. The greater the radius of the thermal, the higher it is likely to ascend. Updrafts and downdrafts also occur as part of the turbulence that is created when air passes over topographic barriers such as mountains. Strong updrafts and downdrafts occur in thunderstorms as well. Updrafts characterize a storm's early development, during which warm air rises to the level where condensation begins and precipitation starts to develop. In a mature storm, updrafts are present alongside downdrafts caused by cooling and by falling precipitation. These downdrafts, originating at high levels, contain cold, dense air that spreads out at the ground as a cold air wedge. The sharp changes in wind direction associated with downdrafts near the ground are a threat to aircraft during landing and takeoff. Intense downdrafts are called Downbursts or Microbursts.

UPDRAFT MÉTIER = МЕТИ ВЕРХНЕЙ ТЯГИ (или МАШИНА ВЕРХНЕЙ ВЫТЯЖКИ) – Updraft Métier is a dry spinning machine in which the air flow within the drying cabinet is countercurrent to the yarn path (upward). / Мети (Métier), означающее Машина или Станок.

UPEA = UNION PROFESSIONNELLE DES ENTREPRISES D'ASSURANCE

UPF = ULTRAVIOLET PROTECTION FACTOR

UP–FRONT AUTHORITY = ИЗНАЧАЛЬНАЯ ВЛАСТЬ (или ПРЯМОЛИНЕЙНАЯ ВЛАСТЬ) – Up-Front Authority:- xxxxx. See also Proclamation Authority. / .

UP GAP = ОТРЫВ ПРИ ПОВЫШЕНИИ (или С ОТРЫВОМ ВВЕРХ) – In visual analysis, an Up Gap forms when a security opens above the previous period's High, remains above the previous High for the entire period and closes above it. Up gaps can form on daily, weekly or monthly charts and are generally considered bullish. See also Breakaway Gap, Common Gap, Continuation Gap, Down Gap, Exhaustion Gap, Gap, and Runaway Gap.

UPGMA = UNWEIGHTED PAIR GROUP METHOD, ARITHMETIC MEAN

UPGRADING = УЛУЧШЕНИЕ СОРТА (или ПОВЫШЕНИЕ СОРТА) – Upgrading is a raising the quality rating of a security because of new optimism about the prospects of a firm due to tangible or intangible factors. This can increase investor confidence and push up the price of the security. / Повышение Сорта:- повышение рэйтиньга конкретной ценной бумаги. Аналитик может повысить рэйтиньг акций или облигаций, если компания демонстрирует лучшие финансовые показатели при росте прибыльности и сокращении уровня задолженности. Рэйтиньг муниципальных облигаций может быть повышен, если расходы эмитента сократились, а налоговые поступления возросли. Сорт конкретных эмиссий акций и облигаций может повыситься и вследствие роста рыночной стоимости бумаг, когда сами инвесторы ощущают рост финансовой устойчивости эмитента бумаг. Рэйтиьг кредитоспособности эмитентов бумаг постоянно изменяется:- из-за ухудшения условий деятельности одни компании могут опуститься на несколько позиций, а другие – подняться вверх. Термин 'Повышение Сорта' также может относиться к портфелю ценных бумаг. Например, управляющий взаимного инвестиционного фонда, который хочет повысить качество облигаций, находящихся в портфеле фонда, может сказать, что 'фонд находится в процессе повышения сорта рэйтиньга своего портфеля'.

UPHOLSTERY = ОБОЙКА (или ОБИВОЧНАЯ ТКАНЬ, или МЕБЕЛЬНАЯ ТКАНЬ, или ДЕКОРАТИВНАЯ ТКАНЬ) – Upholstery:- materials used in the craft of covering, padding, and stuffing seating and bedding. The earliest upholsterers, from early Egyptian times to the beginning of the Renaissance, nailed animal skins or dressed leather across a rigid framework. They slowly developed the craft to include cushions, padding, and pillows – stuffed with such materials as goose down and horsehair. The medieval upholsterer, who was primarily concerned with fabrics, made mattresses and hangings. In the XVII century beds were draped with sumptuous fabrics and ornate trimmings; as these beddings became less fashionable, chairs and sofas were in turn elaborately upholstered with velvet, silks, and needlework. Springs, which permitted soft, bulky shapes, were first used by upholsterers in the XVIII century; helical by the mid-XIX century, they were later flattened for maximum resiliency. Upholstery techniques were revolutionized in the XX century with the introduction of molded sponge rubber, dirt and liquid retardants, plywood, naugahyde, and synthetic fibers, which created new springing, cushioning, and covering materials.

UPLAND = НАГОРЬЕ (или ВОЗВЫШЕННОСТЬ) – Upland, in general, land lying above the flood plain. Upland is a land at a higher elevation than the alluvial plain or low stream terrace; all lands outside the riparian-wetland and aquatic zones. / В общем смысле под Нагорьем или Возвышенностью понимается земля, расположенная выше плоскости затопления. Под Нагорьем понимается обширный участок земной поверхности, в пределах которого расположены горные хребты, массивы, выровненные поверхности, котловины и тому подобное, лежащие на общем высокоподнятом цоколе, например, Тибетское Нагорье. Под Возвышенностью понимаются участки земной поверхности, приподнятые относительно прилегающих территорий. Абсолютная высота 200–500 метров.

UPLAND COTTON = НАГОРНЫЙ ХЛОПЧАТНИК (или ХЛОПЧАТНИК С ВОЗВЫШЕННОСТЕЙ) – Upland Cotton:- the standard American Cotton and the one by which all other Cottons are compared for properties and characteristics. It ranges from 3/4 inch to 1-1/4 inch in staple length. Upland is raised chiefly in the Carolinas and the other Seaboard states, as well as in all other raising areas to lesser degree. Upland Cotton forms the bulk of the world's Cotton crop. See also American-Egyptian Cotton, Cotton, Extra Long Staple Cotton, Pima Cotton, and Supima®. Originally used to refer to Cotton grown on raised lands not prone to flooding. Now refers to short and medium staple Cottons. Upland Cotton means planted and stub Cotton which is produced in the United States from other than pure strain Varieties of the Barbadense Species, any hybrid thereof, or any other Variety of Cotton in which one or more of these varieties predominate. Upland Cotton is a widely cultivated American Cotton plant having short- to medium-staple fibers. Upland Cotton:- the standard American Cotton and the one with which other Cottons are compared. .... Name originally applied to Cotton grown in the upland sections of North Carolina, South Carolina and Georgia to distinguish it from coastal or Sea Island Cotton. Now grown in practically all Cotton growing regions of the United States and in many foreign countries. It ranges in staple length from 3/4 to 1-1/4 inches. Mostly about 1 inch. Upland Cotton is the predominant type of Cotton grown in the United States and in most major

Cotton producing countries of the world. The staple length of these fibers ranges from about 3/4 inch to 1-1/4 inch, averaging nearly 1-3/32 inches. / Нагорный Хлопчатник или Хлопчатник С Возвышенностей – преобладающий стандартный Американский Хлопчатник, являющийся неким эталоном, с которым все другие Хлопчатники сравниваются по свойствам и характеристикам. Его штапельная длина лежит в диапазоне от 3/4 дюйма до 1-1/4 дюйма, в среднем – 1-3/32 дюйма, что соответствует волокну с коротким и средним штапельком. В Соединённых Штатах Америки Нагорный Хлопчатник произрастает главным образом в Северной Каролине и Южной Каролине, и в других прибрежных штатах, также как и в других ареалах произрастания, но в меньшей степени. Этот Хлопчатник является также преобладающим и в большинстве стран мира, по-крупному возделывающих его. Нагорный Хлопчатник формирует львиную долю всего мирового урожая этой сельскохозяйственной культуры. Изначально этот термин применялся к Хлопчатнику, выращенному на возвышенной местности, не подвергавшейся затоплениям. В настоящее время он очень тесно ассоциируется с хлопком, имеющим короткую и среднюю штапельную длину волокна.

UPLAND FIELD = НАГОРНОЕ ПОЛЕ (или СУХОДОЛЬНОЕ ПОЛЕ) – Upland Field is a rainfed land area with no levees or dikes surrounding it to impound water; sowing is by direct seeding.

UPLAND RICE (DRYLAND RICE) = НАГОРНЫЙ РИС (БОГАРНЫЙ РИС (или РИС С ЗАСУШЛИВЫХ ЗЕМЕЛЬ)) – Upland Rice (Dryland Rice) is a Rice grown on both level and sloping fields that are not bunded, that are prepared and seeded under dry conditions, and that depend on rainfall for moisture (without surface water accumulation).

UPLB = UNIVERSITY OF THE PHILIPPINES LOS BAÑOS

UPLIFT = ВОЗДЫМАНИЕ (или СОХРАНЕНИЕ ФОРМЫ, или XX) – Uplift is a brassiere designed to hold the breasts up. A term used for the word 'Bra'. The word 'Uplift' is rarely used in modern times. / бюстгальтер или лифчик, предназначенный для удерживания грудей приподнятыми.

UPLIFT = ПОДЪЁМ – Uplift:- wind, increased in speed, moving over a structure causing negative wind pressure (suction) to be placed inside an enclosed structure, creating uplift forces (upward pull) capable of blowing off the roof. Roofs are designed to resist only certain uplift caused when high winds travel over and across the roof.

UPLIFT = ПОДЪЁМ (или ПОДНЯТИЕ, или ВЗДЫМАНИЕ, или ВОЗДЫМАНИЕ, или ГОРСТ, или СВОД, или ХРЕБЕТ) – Uplift:- in geology, vertical elevation of the Earth's surface in response to natural causes. Broad, relatively slow and gentle uplift is termed warping, or epeirogeny, in contrast to the more concentrated and severe orogeny, the uplift associated with earthquakes and mountain building. Uplift of the Earth's surface also has occurred in response to the removal of Pleistocene ice sheets through melting and wastage. Such elastic rebound is both measurable and ongoing in southern Canada and in the general Scandinavian area today.

UPM = UNIVERSITI PUTRA MALAYSIA

UP MARKET = РЫНОК ПОВЫШЕНИЯ – Up Market:- the period of time after a market bottom during which a security's price trends upwards.

UPOV = UNION FOR PROTECTION OF NEW VARIETIES OF PLANTS

UPPER CASE = XX (или ВЕРХНИЙ РЯД) – Upper Case or Upper Letter Case:- capital letters as opposed to small letters (lower case). / 'Верхний Ряд' (Upper Case):- заглавные буквы алфавита в отличие от маленьких букв (Нижний Ряд (Lower Case)).

UPPER HALF MEAN LENGTH = ВЫСШАЯ СРЕДНЯЯ ДЛИНА ПОЛОВИНЫ (или СРЕДНЯЯ ДЛИНА ВЫСШЕЙ ПОЛОВИНЫ) – Upper Half Mean Length (UHML) is the mean length by the number of fibers in the largest half by weight of fibers in a cotton sample, usually measured from the fibrogram. Upper half mean length is normally equivalent to the staple length. The HVI (High Volume Instrument) Upper Half Mean Length (UHML) is the average length of the longest 50% of fibers in a sample or bale (ASTM, 1994b). This measurement is used to place cotton into the five upland staple classes which are short (< 21.0 mm), medium (22.0–25.0 mm), medium-long (26.0–28.0 mm), long (29.0–34.0 mm), and extra long staple (ELS) (> 34.0 mm). The HVI UHML measurement also is what is traditionally used to market fiber length in the United States and the world and the data is needed in order to set drafting rollers at the proper distance for spinning. The Upper Half Mean Length (UHML) as defined by ASTM standards is the average length by number (respectively by weight) of one-half of the longest fibers when they are divided on a weight basis (respectively number basis). Desired base Upper Half Mean Length (UHML) of Upland Cotton (Gossypium Hirsutum) in the United States has been set a 27.0 mm and is shorter than the standard set by the international community. Upland Cotton genotypes from China, South Africa, West Africa, and the United States were test crossed to an Extra Long Staple Upland (ELSU) and a Short Staple Upland (SSU) and selected genotypes that included both ELSU and MSU phenotypes were crossed in a half-diallel mating scheme to estimate general combing ability (GCA) effects and specific combining ability (SCA) effects.

UPPER LOCATING PART = XX (или ВЕРХНИЙ ФИКСАТОР) – Upper Locating Part is a locating device fitted to the top of a box pallet, post pallet or cage pallet to facilitate stacking. See also Pallet. / Верхний Фиксатор (Upper Locating Part):- фиксирующее устройство в верхней части ящичных, стоечных и сетчатых поддонов, обеспечивающее устойчивость штабеля при многоярусной установке поддонов с грузом и в сложенном виде при транспортировании и хранении. Смотрите также Поддон (Pallet).

UPPER QUARTILE LENGTH = ВЫСШАЯ ДЛИНА ЧЕТВЕРТИ (или ДЛИНА ВЫСШЕЙ ЧЕТВЕРТИ) – Upper Quartile Length (UQL), according to American Society for Testing and Materials (ASTM) international standards, is defined as the fiber length which is exceeded by 25% of fibers by weight in test specimen. The Upper Quartile Length by weight UQLw (resp. by number UQLn) is defined as the length that exceeded by 25% of fibers by weight (resp. by number).

UPPERS = ВЕРХОВЬЯ (или ИЗ ВЕРХОВЬЯ, или XX) – Uppers:- a term applied to Cotton produced in the narrow upper valley of the Nile from Cairo South to Aswan (Egypt). It is generally a shorter staple than that grown in the Delta ... See also Egyptian Cotton.

UPPER TEMPERATURE LIMIT = ВЕРХНИЙ ЛИМИТ ТЕМПЕРАТУРЫ (или ВЕРХНИЙ ТЕМПЕРАТУРНЫЙ ЛИМИТ, или ВЕРХНИЙ ПРЕДЕЛ ТЕМПЕРАТУРЫ, или ВЕРХНИЙ ТЕМПЕРАТУРНЫЙ ПРЕДЕЛ) – Upper Temperature Limit:- temperatures above this limit lead to quality degradation.

UPR = UNDERWRITING PERFORMANCE REPORT

UPR = UTILITY, PLANT, AND REISSUE

UPRHS = UPPER PAMPANGA RIVER INTEGRATED IRRIGATION SYSTEM

UPRIGHT BLOCKING = ПРЯМОЕ БЛОКИРОВАНИЕ (или ВЕРТИКАЛЬНОЕ БЛОКИРОВАНИЕ) – Upright Blocking, in the context of load securing, upright blocking is understood to be wooden elements inserted vertically in order to take up and transfer loads.

UPRIGHTS = СТОЙКИ (или СТОЯКИ) – Uprights are the vertical numbers used in the storage rack for identification purposes.

UPRIGHT WHEEL = КОЛЕСО НА СТОЙКЕ (или ПРЯМОЕ КОЛЕСО, или СТОЯЧЕЕ КОЛЕСО, или ВЕРТИКАЛЬНОЕ КОЛЕСО) – Upright Wheel (also traveller or parlour):- flyer mounted above the wheel, making the wheel more portable. Will usually fit on a car passenger seat with the seat belt holding it. (также бегунок (traveller) или горница (parlour)):- .

UPROOT = КОРЧЕВАТЬ (или ВЫКОРЧЁВЫВАТЬ) – Uproot:- to pull up by the roots. / корнями.

UPS = UNINTERRUPTIBLE POWER SYSTEM

UPSET PRICE = НАЧАЛЬНАЯ ЦЕНА – Upset Price is the minimum price at which a seller of property will accept a bid at an auction. / Начальная Цена:- минимальная цена, по которой продавец согласен совершить сделку. Термин, используемый на аукционе, означает минимальную цену, начиная с которой продавец может принимать ставки.

UPSIDE = ВОСХОДЯЩИЙ – Upside:- the potential Dollar or percentage amount by which the market or a stock could rise. This is basically an educated guess on how high a stock could go in the near future. The upside can be derived through either technical analysis or fundamental analysis techniques. The estimate is used to get an idea of the attractiveness of an investment. The greater the potential dollar or percentage rise, the bigger the upside for the investment. For example, if a company has risen 100% in a short period of time based on a new product line, some people may feel that the company has limited upside in the near future as it has already had a strong run. Pertaining to higher price potential.

UPSIDE DOWN PIGMENT PRINT COPIED AT BASE OF T–SHIRT = ПИГМЕНТНАЯ ПЕЧАТЬ, СКОПИРОВАННАЯ ВВЕРХ ТОРМАШКАМИ В ОСНОВАНИИ ФУТБОЛКИ – Upside Down Pigment Print Copied At Base Of T-Shirt:- Possible Cause:- fabric was folded before the print paste dried out. This is a major defect. Though probably not visible in the picture the defect was quite apparent in the garment. Printing defect.

UPSIDE/DOWNSIDE RISK = РИСК ПОВЫШЕНИЯ/СНИЖЕНИЯ – Upside/Downside Risk:- a short forward position taken without an offsetting long physical position in the underlying commodity is said to have upside risk. This means the trader is speculating that the price of the commodity will decline. A long forward position taken without an offsetting short physical position in the underlying commodity is said to have downside risk. This means the trader is speculating that the price of the commodity will increase.

UPSIDE GAP TWO CROWS = ДВЕ ВЗЛЕТЕВШИЕ ВОРОНЫ – In technical analysis, Upside Gap Two Crowns is a three day bearish pattern that only happens in an uptrend. The first day is a long white body, followed by a gapped open with the small black body remaining gapped above the first day. The third day is also a black day whose body is larger than the second day and engulfs it. The close of the last day is still above the first long white day. / Две Взлетевшие Вороны:- в техническом анализе биржевых рынков, трёхдневная медвежья модель, возникающая только в ходе развития тенденции на повышение. Первый день отмечается длинным белым телом, за которым следует небольшое чёрное тело второго дня, открытие и закрытие которого расположены с отрывом вверх по отношению к закрытию первого дня. Завершается модель также чёрным телом, более длинным, чем предыдущее, находящееся в рамках торгового диапазона последнего (третьего дня). При этом закрытие третьего дня располагается выше закрытия длинного белого тела первого торгового дня.

UPSIDE POTENTIAL = ПОТЕНЦИАЛ ПОВЫШЕНИЯ – Upside Potential is the amount by which analysts or investors expect the price of a security may increase. / Потенциал Вверх:- движение в направлении повышения (цены, курса), которого инвестор или аналитик ожидают для данных акций, облигаций или товарно-сырьевой продукции. Это ожидание может быть основано на фундаментальном анализе или техническом анализе.

UPSIDE TASUKI GAP = ТАСУКИ ПРИ ОТРЫВЕ ВВЕРХ – In technical analysis, Upside Tasuki Gap is a continuation pattern with a long white body followed by another white body that has gapped above the first one. The third day is black and opens within the body of the second day, then closes in the gap between the first two days, but does not close the gap. / Тасуки При Отрыве Вверх:- в техническом анализе биржевых рынков, модель продолжения, в которой за первым длинным белым телом следует второе белое тело, но с отрывом вверх относительно первого. Третий день отмечается чёрным телом с открытием в пределах торгового диапазона второго дня и закрытием в пределах разрыва между первым и вторым днями, но не закрывающим самого разрыва.

UPSIZE OPTION = ОПЦИОН НА УВЕЛИЧЕНИЕ РАЗМЕРА – Upsize Option is an option in IPO (short for the Initial Public Offering) to increase the size of offering when the demand is high.

UPSTAIRS DEAL = СДЕЛКА НА ЛЕСТНИЦЕ (или СДЕЛКА МЕЖДУ ВЕРХАМИ) – Upstairs Deal is a term that describes any discretionary business decision or arrangement made within the upper echelon of management that may impact the operation of the company. Such arrangements are made in the confines of executive offices or conference rooms to eliminate the possibility of information leaks and to expedite the decision-making process. Deal arranged behind closed doors, usually in the boardroom. Many takeovers are settled by upstairs deals. Upstairs Deal:- a business agreement that is made by upper management, and is generally unknown to lower-level employees until it is publicly announced. The deal is referred to as an 'Upstairs Deal' because executives typically have their offices in the higher floors of an office building. In mergers and acquisitions, an upstairs deal between two companies is more likely to result in a friendly takeover, as opposed to a hostile takeover. Keeping word of a potential merger quiet allows executives to operate with a reduced risk of outside parties profiting from the deal by driving up share prices. Once a takeover offer is announced, share prices will react by either moving up or down to the indicated target price. For example, a deal in which a company tenders an offer of USD15 per share with shares currently trading at USD10 per share will likely result, when announced, in shares adjusting to USD15.

UPSTAIRS MARKET = ВЕРХНИЙ РЫНОК (или РЫНОК НАВЕРХУ, или РЫНОК НА ЛЕСТНИЦЕ) – Upstairs Market is a network of trading desks for the major brokerage firms and institutional investors, which communicate with each other by means of electronic display systems and telephones to facilitate block trades and program trades. / Верхний Рынок или Рынок Наверху (upstairs market):- сделка, совершённая через брокерско-дилерскую фирму, вне биржи. Деятельность Комиссии по Ценным Бумагам и Биржам, а также биржевые правила направлены на то, чтобы такие сделки не совершались по ценам менее выгодным для клиентов, чем сделки, совершаемые на бирже. Смотрите также Off Board.

UPSTAIRS ORDER = РАСПОРЯЖЕНИЕ НА ЛЕСТНИЦЕ – Upstairs Order is used for listed equity securities. See also Off-Floor Order.

UPSTAIRS TRADERS ADVISORY COMMITTEE = СОВЕЩАТЕЛЬНЫЙ КОМИТЕТ ДЛЯ ТОРГОВЦЕВ С ЛЕСТНИЦЫ (или КОНСУЛЬТАТИВНЫЙ КОМИТЕТ ДЛЯ ТОРГОВЦЕВ С ЛЕСТНИЦЫ) – Upstairs Traders Advisory Committee advises on policies and procedures designed to enhance the efficiency of New York Stock Exchange markets from the perspective of member organizations upstairs traders. It also guides the staff on ways to improve communication between the trading floor and upstairs trading desks. Its members are senior officers who daily transact large orders for individuals and institutions. / его участники являются старшими должностными лицами . коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо).

UPSTREAM = НАЧАЛЬНОЕ ЗВЕНО – In oil and gas industry, Upstream is a general term for that aspect of the industry which is engaged in the exploration for crude oil or natural gas and for drilling and production of these raw materials. Upstream:- oil and gas exploration and production, as opposed to downstream, which refers to the areas of refining and marketing. See also Downstream. The Upstream Segment involves the exploration and production of oil and natural gas, from cutting-edge geology to high-tech offshore drilling platforms. The US is the world's third-largest producer, with more than 500 000 producing wells and approximately 3 800 oil and natural gas platforms operating in US waters. Combined, they produce almost 2 billion barrels of oil a year.

UPSTREAM/DOWNSTREAM = НАЧАЛЬНОЕ/КОНЕЧНОЕ – Upstream/Downstream:- The relative location of a given activity along a supply chain. Upstream generally refers to the suppliers while downstream refers to the customers.

UPSTREAM OIL AND GAS INDUSTRY = НАЧАЛЬНОЕ ЗВЕНО НЕФТЕГАЗОВОЙ ОТРАСЛИ – A term Upstream Oil And Gas Industry refers to companies that explore for, develop and produce petroleum resources (in contrast, downstream refers to the refining and marketing components of the industry). See also Downstream, and Midstream. / Звенья нефтяной отрасли, связанные с разведкой и добычей нефти.

UP–STREAM PRICING = ЦЕНООБРАЗОВАНИЕ ХХ (или ЦЕНООБРАЗОВАНИЕ АП–СТРИМ) – Up-Stream Pricing:- xxxxx. An Upstream Price is the price of one of the main inputs of production (for processing/manufacturing, etc) or a price quoted on higher market levels (e.g., wholesale markets). Upstream prices are the prices paid by producers (as opposed to consumers), and are directly related to the cost of production / Ценообразование Ап-Стрим (с учётом последующего использования):- ценообразование, при котором рыночная стоимость товара формируется с учётом основных и побочных продуктов, которые будут получены на основе данного товара.

UPSTREAM SUBSIDIES = СУБСИДИИ НАЧАЛЬНОМУ ЗВЕНУ – Upstream Subsidies are the subsidies provided to a manufacturer's supplier of inputs for a product that will be exported.

UP–STREAM SUBSIDIZATION = ХХ (или СУБСИДИРОВАНИЕ АП–СТРИМ) – Up-Stream Subsidization:- xxxxx. / Субсидирование Ап-Стрим:- ситуация, когда правительство субсидирует производителя, последний продаёт субсидированный продукт сторонней компании, которая осуществляет дальнейшую переработку и отгружает продукт в другую страну.

UPSWING = ЗАВИСАНИЕ ВВЕРХ (или ЗАВИСАНИЕ ПОВЫШЕНИЯ) – Upswing is an upward turn in a security's price after a period of flat or falling prices (market bottom). Upswing is the period during which a security's price trends upwards. / Зависание Подъёма:- повышательное движение цен ценных бумаг и товаров после периода их снижения. Аналитики могут сказать, что 'акции оттолкнулись от самого нижнего уровня и теперь начали подъём, который может привести их на более высокий уровень'. Термин также используется для описания общеэкономической ситуации. Про экономическое оживление после продолжительного спада или рецессии говорят, что экономика находится на подъёме.

UP–THE–ROLL = ХХ – Up-The-Roll is the most prevalent horizontal orientation of fabric patterns; it includes horizontal, right-side-up or vertically running stripes.

UPTHRUST = ВЫНОС ВВЕРХ (или ОТКАТ ВВЕРХУ, или ОТСКОК ВВЕРХУ, или ВЕРХНЕЕ СПРУЖИНИВАНИЕ) – Upthrust:- a situation that occurs when prices break above resistance, but soon reverse course and break back below resistance. Price are said to 'thrust' up, but cannot maintain the upward momentum and soon decline. The upthrust can also be referred to as a Failed (Bullish) Signal and is considered bearish. Generally, the reversal should occur within 1–3 days of the resistance breakout for the failed signal to be considered valid. The opposite of Spring. Originally a Wyckoff term, is used to denote an impulsive move often associated with a test of resistance. / В техническом анализе биржевых рынков, . Ричод Ди. Выкоф (Richard D. Wyckoff).

UP TICK = ПОВЫШЕНИЕ НА ШАГ (или ШАГ ВВЕРХ) – Up Tick is a term used to designate last transaction made at a price higher than the preceding transaction. Also known as Plus Tick. See also Zero Plus Tick. / Повышение На Шаг:- локальный подъём цен, повышательный тик, последняя цена сделки выше предыдущей. Сделка, заключённая по цене выше предыдущей сделки с такими же ценными бумагами. Называется также Плюс Шаг (Plus Tick). Знак плюс указывается в течение всего дня торгов рядом с последней котировкой каждой ценной бумаги, цена на которую была выше цены предыдущей сделки на торговом месте (trading роя) биржевого брокера (specialist) в зале торгов на Нью Йоркской Фондовой Бирже. Короткие продажи могут осуществляться только на фоне локального подъёма цен или при цене ноль плюс тик (Zero Plus Tick). Смотрите также (Minus Tick), (Selling Short), и (Tick).

UPTICK RULE = ПРАВИЛО ПОВЫШЕНИЯ НА ШАГ (или ПРАВИЛО ШАГА ВВЕРХ) – Uptick Rule is a SEC (short for the United States Securities And Exchange Commission) rule that selling short is allowed only on an up tick. / Правило Повышения На Шаг:- правило Комиссии по Ценным Бумагам и Биржам о том, что продажа вкороткую может быть совершена только при повышении на шаг (uptick) котировок. В 1990 правило было расширено за счёт включения программных (по списку) торговых операций (program trading), когда покупаются или продаются все акции, входящие в определённый список ('программу').

UPTICK TRADE = ТОРГОВЛЯ С ПОВЫШЕНИЕМ НА ШАГ – Uptick Trade is a transaction that takes place at a higher price than the preceding transaction involving the same security. Related Tick Test Rules.

UP TRADE = ТОРГОВЛЯ НА ПОВЫШЕНИЕ – Up Trade:- xxxxx. See also Buy. Up Trade:- to trade (a piece of equipment, car, etc) for something similar but of greater value or quality.

UPTREND = ТЕНДЕНЦИЯ РОСТА (или ТЕНДЕНЦИЯ НА ПОВЫШЕНИЕ) – In visual analysis, a price pattern characterized by subsequent rising highs and rising lows. / В техническом анализе биржевых рынков, ценовая модель, характеризующаяся последовательным повышением максимальных и минимальных значений. Тенденция На Повышение:- движение цен на акции, облигации или товарно-сырьевую продукцию или всего рынка в целом в направлении повышения. Смотрите также Линия Тенденции (Trendline).

UP TRENDLINE = ЛИНИЯ ТЕНДЕНЦИИ НА ПОВЫШЕНИЕ (или ВОСХОДЯЩАЯ ЛИНИЯ ТЕНДЕНЦИИ) – In visual analysis, a straight line drawn upward and to the right below the reaction lows. The longer the up trendline has been in effect and the more times it

has been tested, the more significant it becomes. Violation of the trendline usually signals that the uptrend may be changing direction. / В техническом анализе биржевых рынков, .

UPTURN = ПОДЪЁМ (или ПОВЫШЕНИЕ) – Upturn is a period of growth or rising economic activity, especially real GDP (short for Gross Domestic Product), but typically employment as well.

(2) Upturn is the transition of an economy from contraction to growth, also known as a Trough of Economic Activity.

UP TWIST = КРУТКА ВВЕРХ – Up Twist:- using the same direction as the preceeding spinning. So if you spun your singles 'S' and then plyed them 'S' you would have used up twist. You would also have a yarn that could be used in collapse fabrics.

UPTWISTER = КРУТЧИК ВВЕРХ (или КРУТИЛЬНАЯ МАШИНА ДЛЯ ВЫСОКИХ КРУТОК) – Uptwister is a machine used for twisting yarns in an upward path from a rotating vertical supply package to a horizontal take-up package. Used for spun yarns and to a small extent for adding twist to some filament yarns. / филаментная (комплексная) пряжа (filament yarn).

UPTWISTING = КРУТКА ВВЕРХ (или ПЕРВАЯ КРУТКА (В ШЁЛКОКРУЧЕНИИ)) – Uptwisting is the process of twisting yarn on the uptwister. The yarn to be twisted, which has been wound on a balanced support package, is placed on a revolving spindle. The yarn form the revolving supply package is fed upward through a gathering eye or guide, over a stop motion and a tension bar or bars, through a traversing guide, and onto the revolving collecting package.

UPU = UNIVERSAL POSTAL UNION

UP VOLUME = ОБЪЁМ ПОВЫШЕНИЯ – Up Volume:- when a stock closes increases in value on a particular day, the volume in that stock is considered up volume. Related Down Volume.

UPWARD COMPATIBILITY = ХХ (или ПРОДВИНУТАЯ СОВМЕСТИМОСТЬ) – Upward Compatibility or Forward Compatibility is a design characteristic that allows a system to accept input intended for a later version of itself. The concept can be applied to entire systems, electrical interfaces, telecommunication signals, data communication protocols, file formats, and computer programming languages. A standard supports forward compatibility if a product that complies with earlier versions can 'gracefully process input designed for later versions of the standard, ignoring new parts which it does not understand. The objective for forward compatible technology is for old devices to recognise when data has been generated for new devices. Forward compatibility for the older system usually means Backward Compatibility for the new system, i.e. the ability to process data from the old system; the new system usually has Full Compatibility with the older one, by being able to both process and generate data in the format of the older system. Forward compatibility is not the same as extensibility. A forward compatible design can process at least some of the data from a future version of itself. An extensible design makes upgrading easy. An example of both design ideas can be found in web browsers. At any point in time, a current browser is forward compatible if it gracefully accepts a newer version of HTML. Whereas how easily the browser code can be upgraded to process the newer HTML determines how extensible it is. Examples:- (i) Telecommunication Standards:- The introduction of FM stereo transmission, or color television, allowed forward compatibility, since monophonic FM radio receivers and black-and-white TV sets still could receive a signal from a new transmitter. It also allowed backward compatibility since new receivers could receive monophonic or black-and-white signals generated by old transmitters. (ii) Video Gaming:- The Game Boy is able to play certain games released for the Game Boy Color. These games utilize the same cartridge design as games for the original Game Boy, though the plastic used is typically black rather than gray and feature the GBC's logo on the label and packaging; Nintendo officially refers to such titles as being 'Dual Mode'. The Leapster is able to play Leapster L-Max games. The Leapster L-Max is able to play Leapster 2 games. The original PlayStation is compatible with the DualShock 2 controller. Likewise the PlayStation 3 can be played with a DualShock 4 controller. The Neo Geo Pocket was able to play most games from Neo Geo Pocket Color. The WonderSwan is able to play some WonderSwan Color games. (iii) HTML:- HTML is designed to treat all tags in the same way (as inert, unstyled inline elements) unless their appearance or behavior is overridden; either by the browser's default settings, or by scripts or styles included in the page. This makes most new features degrade gracefully in older browsers. One case where this did not work as intended was script and style blocks, whose content is meant to be interpreted by the browser instead of being part of the page. Such cases were dealt with by enclosing the content within comment blocks. NUC (Not Upwardly Compatible):- Some products are not designed to be forward compatible, which has been referred to as NUC (not upwardly compatible). In some cases this might be intentional by the designers as a form of vendor lock-in or software regression. For example, a cubicle producer considers changing their cubicle design. One designer promotes changing the footprint from 4 foot square to 1.2 meter square. Immediately, the sales manager calls 'NUC' and the problem is understood:- if the footprint changes and existing customers are considering buying more from the producer, they will have to fit a different sized unit in an office designed for the 4 foot square cubicle. Planned obsolescence is a type of upward compatibility, but rather than adopting a policy of backwards compatibility, companies adopt a commercial policy of backwards incompatibility so that newer apps require newer devices. Upward Compatibility:- feature of new software and hardware letting it work with more powerful versions of software and hardware. A term Upward Compatible refers to software that runs not only on the computer for which it was designed, but also on newer and more powerful models. For example, a program designed to run on an Intel 386 microprocessor, which also runs on a Pentium, is upward compatible. Upward compatibility is important because it means you can move to a newer, larger, and more sophisticated computer without converting your data. In contrast to upward compatibility, Downward (Backward) Compatible means that a program runs not only on the computer for which it was designed, but also on smaller and older models. For example, a program designed to run under MS-DOS 6.0, which also works under MS-DOS 5.0, is downward compatible. Upward compatibility is sometimes called Forward Compatibility. Upward Compatibility:- feature of a new hardware or software that enables it to work with the newer or more powerful versions of the same and, often, other hardware or software. See also Downward Compatibility. / Совместимость Снизу Вверх (Upward Compatibility):- . Смотрите также Совместимость (Compatibility).

UR = UNDULATE RACHIS

UR = URUGUAY ROUND

URAA = URUGUAY ROUND AGREEMENT ON AGRICULTURE

URACIL = УРАЦИЛ – Uracil is a pyrimidine base, important as a component of ribonucleic acid (RNA). Its hydrogen-bonding counterpart in DNA is thymine. Uracil:- a colorless, crystalline organic compound of the pyrimidine family that occurs as a component of ribonucleic acid (RNA), a molecule involved in the transmission of hereditary characteristics. The RNA molecule consists of a sequence of nucleotides, each containing a five-carbon sugar (ribose), a phosphate group, and a nitrogenous base. Uracil is one of four nitrogenous bases found in the RNA molecule:- uracil and cytosine (derived from pyrimidine) and adenine and guanine (derived from purine). Deoxyribonucleic acid (DNA) also contains each of these nitrogenous bases, except that thymine is substituted for uracil. During the synthesis of an RNA strand from a DNA template (transcription), uracil pairs only with adenine, and guanine pairs only with cytosine. Uracil is also a component of several coenzymes that act in conjunction with enzymes in several processes of carbohydrate metabolism. / Урацил, 2,6-диоксипиримидин, органическое вещество из группы пиримидиновых оснований. Белый порошок или

иглоподобные кристаллы, растворимые в горячей воде; молярная масса 112. Обладает амфотерными (и кислотными, и основными) свойствами, способен к таутомерии. Впервые обнаружен в 1900 в продуктах расщепления дрожжевых нуклеиновых кислот. Присутствует во всех живых клетках, входя в состав многих нуклеотидов и рибонуклеиновых кислот (РНК).

URALS OIL = НЕФТЬ (МАРКИ) ЮРЭЛЗ – Urals Oil is a reference oil brand used as a basis for pricing of the Russian export oil mixture. It is a mix of heavy sour oil of Urals and the Volga region with light oil of Western Siberia. Other reference oils are Brent, West Texas Intermediate and Dubai. Urals brand oil is supplied through the Baku-Novorossiysk Pipeline System and the Druzhba Pipeline. Urals oil futures trade on Russian Trading System stock exchange. There was also an effort to trade it on NYMEX under the name of REBCO (Russian Export Blend Crude Oil); however, not a single trade was made. Urals blend accounts for more than 80% of Russia's exports and is a mixture of mostly Russian crude varieties. Ural is a medium heavy/sour benchmark crude, used heavily in Eastern and Central Europe, and in the Medittereanean. Summary Information:- (i) API:- 31.78; (ii) Sulphur Level:- 1.35. Distillation Yields (Product - %wt):- (i) C1 to C4 – 2.62; (ii) Naphtha – 10.13; (iii) Kerosene – 8.05; (iv) Gas Oil – 25.87; (v) Atmospheric Residue – 46.91. Other Specifications:- (i) Acidity, mg KOH/g – 0.05; (ii) Nickel, mg/Kg – 16.1; and (iii) Vanadium, mg/Kg – 55.0. Urals crude loads from a variety of Black Sea ports including Novorossiisk, Kavkaz, Theodosia, Kerch, Odessa and Yuzhny. The quality of Urals differs between load ports. Typically, Urals from Odessa and Yuzhny terminals is valued at a discount to that from Russia's Novorossiisk and Theodosia terminals because it has a higher sulfur content and a lower gravity compared to other terminals. Odessa material typically has gravity around 30.5–31 API and sulfur content of 1.4–1.6%. The gravity of Novorossiisk material is typically around 31.5 API, while the sulfur content is around 1.3%. / Нефть Марки Юрэлз (Urals) – Российская марка вывозной смешанной нефти. Получается смешением в системе трубопроводов Транснефти тяжёлой, высокосернистой нефти Урала и Поволжья (содержание серы в которых достигает 3.0 %, а тяжесть в градусах по АИН (API) не превышает 26–28) с Западно-Сибирской лёгкой нефтью Siberian Light (тяжесть 36.5 в градусах по АИН, содержание серы 0.57 %). Итоговое содержание серы в нефти сорта Юрэлз должно составлять не более 1.2–1.4%, тяжесть в градусах по АИН – 31–32 (или 860–871 кг/м^3). Для сравнения, сорта Brent и WTI имеют тяжесть 38–40° по АИН и содержание серы не более 0.2–0.4%, а ближневосточная нефть сортов Oman и Dubai имеет тяжесть 30–33° по АИН, содержание серы 1.1–2.1%. Юрэлз – сорт высокосернистой нефти (содержание серы около 1.3%), которая представляет собой смесь из нефти, добываемой в Ханты-Мансийском и Ямало-Ненецком автономных округах, Башкортостане, Татарстане и Самарской Области. Основные производители нефти Юрэлз – это компании Роснефть, Башнефть, Лукойл, Сургутнефтегаз, Газпром Нефть, ТНК-ВР и Татнефть. Стоимость Российской нефти исторически определялась как цена барреля нефти сорта Brent с дисконтом, то есть уменьшенная на 1–2 Доллара США за баррель, поскольку Российская нефть является более тяжёлой (содержит меньше бензиновой и газойлевой фракций и, как следствие, имеет более высокую плотность и тяжесть) и более высокое содержание серы. С конца 2000-х фактически является самостоятельным маркерным сортом. Сама по себе Западно-Сибирская лёгкая нефть (Siberian Light) имеет приемлемое качество (0.6% серы) и сходна по составу с Brent и WTI, которые относятся к так называемому сорту Light Sweet Oil – малосернистой (сладкой) лёгкой нефти, соответствующей большей части мирового спроса. В 2006–12 пытались вывести фьючерсы на нефть Юрэлз на Американскую биржу НАЙМЭКС (NYMEX) под маркой REBCO (Russian Export Blend Crude Oil). Поставки на вывоз (или экспорт) нефти марки Юрэлз осуществляются в основном через морские порты, в частности, Новороссийск и по системе нефтепроводов Дружба. Для уменьшения содержания серы с середины 2010-х часть добываемой высокосернистой нефти Татарстана и Башкортостана, около 20%, перерабатывается внутри России, в частности, на Нижнекамском комплексе Танеко и не поступает в вывозные (или экспортные) нефтепроводы. 2016-Ноябрь-03:- Россия представит Юрэлз в Лондоне в качестве эталонной нефти. Отечественная вывозная (или экспортная) марка нефти Юрэлз будет презентована 07 Ноября в Лондоне в качестве маркерного сорта, сообщил первый Вице-Президент Санкт-Петербургской Международной Товарно-Сырьевой Биржи (СПбМТСБ) Михаил Темниченко. В рамках презентации в Лондоне планируется обсуждение условий поставок по фьючерсным контрактам на Российскую вывозную (или экспортную) нефть. Предполагается, что поставки будут осуществляться на условиях Free on Board (FOB) через Приморск. При механизме FOB продавец поставляет товар в порт и ведёт погрузку на судно покупателя, после чего расходы и риски ложатся на плечи принимающей стороны, пишет газета Известия. 'Российская нефтяная отрасль будет представлена в контексте роли страны на мировом энергетическом рынке. Также пройдет презентация запуска поставочного фьючерсного контракта на Российскую вывозную (или экспортную) нефть Юрэлз на СПбМТСБ для участников международного рынка физической и 'бумажной' нефти', – пояснил Михаил Темниченко, заметив, что запуск планируется до конца Ноября. При этом запуск фьючерсных контрактов на другую Российскую вывозную (или экспортную) нефть – ESPO, которая идёт по трубопроводу Восточная Сибирь – Тихий океан, пока не планируется. В настоящее время биржа акцентируется только на запуске контракта на Urals FOB Приморск, вопрос запуска контракта на ESPO рассматривается в перспективе, заметил Темниченко. Как объяснил Известиям Директор по Консалтингу IHS в России Максим Нечаев, это связано с большей известностью Urals. 'Urals – все-таки более известный сорт Российской нефти, которому около 50 лет. К тому же объёмы Urals в три раза больше объёмов ESPO', – сказал Нечаев. Участие в планируемой презентации Известиям подтвердили в Минэнерго и Транснефти. По мнению Нечаева, запуск отечественного эталонного сорта нефти создаёт важный финансовый механизм, однако в долгосрочной перспективе несёт в себе и определённые риски. 'Это, конечно, актуально и интересно. Создаётся не просто сырьевой бенчмарк, а финансовый бенчмарк, который позволит производителям хэдьжировать риски. Вопрос в том, насколько в долгосрочной перспективе будет стабилен данный механизм', – отметил Нечаев. При этом он пояснил, что биржевой механизм привлечёт скорее небольших производителей нефти. 'У наших крупных компаний много долгосрочных контрактов, и поставки нефти проданы на годы вперед, под которые берутся кредиты. Скорее всего, это будет более интересно небольшим производителям, которые смогут зафиксировать цену на свои объёмы', – сообщил аналитик. Предполагается, что выход на биржу позволит устанавливать справедливую цену на Российскую нефть, а также пополнить бюджет дополнительными доходами. При этом Российские компании смогут напрямую влиять на вывозные (или экспортные) цены без привязки к другим эталонным сортам – Североморской Brent, Американской West Texas Intermediate (WTI) и Эмиратской Dubai Crude. Российские вывозные (или экспортные) сорта считаются с дисконтом к существующим эталонам:- Urals – к Brent, ESPO – к Dubai. Напомним, средняя цена нефти марки Юрэлз по итогам Января–Октября 2016 снизилась по сравнению с аналогичным периодом 2015 на 24% и составила 40.72 Доллара за баррель. По прогнозам Министерства Экономического Развития России, среднегодовая цена на нефть в 2016 сложится в размере 41–42 Доллара за баррель. В бюджетных проектировках на 2017–19 Минфин закладывает стоимость нефти на уровне 40 Долларов за баррель.

URANINITE = УРАНИНИТ – Uraninite:- a major ore mineral of uranium, uranium dioxide (UO_2). Uraninite usually forms black, gray, or brown crystals that are moderately hard and generally opaque. A variety of uraninite ore that is dense and found in granular masses with a greasy lustre is called Pitchblende. Uraninite is radioactive and is the chief source of uranium. The element uranium was discovered by German chemist Martin Heinrich Klaproth (1743–1817) in 1789 in uraninite from Joachimsthal (now Jáchymov, Czech Republic). Radium was first extracted from uraninite ore from the same locality by Pierre and Marie Curie and G. Bémont in 1898.

Uraninite has been obtained from hydrothermal vein deposits, such as those at Jáchymov and in adjacent places in the Ore Mountains (Erzgebirge) in Germany. Other vein deposits occur at Great Bear Lake in the Northwest Territories of Canada and in the Lake Athabasca district of Alberta and Saskatchewan. Uraninite is also recovered as a by-product from the conglomeratic gold ores of the Witwatersrand, South Africa, and from conglomerate rocks in the Elliot Lake area (Elliot Lake is a city in Algoma District, Ontario, Canada). Important deposits of fine-grained uraninite occur in sedimentary rocks, chiefly sandstones, in the Colorado Plateau area of the western United States. Deposits in sandstones often are extensively oxidized to carnotite and other secondary uranyl minerals, which may themselves constitute important uranium ores. Uraninite is widespread as a well-crystallized accessory mineral in pegmatites, but such occurrences are of little or no economic importance. Fine specimens have been found in pegmatites at Wilberforce, Ontario, Canada; the Spruce Pine district, State of North Carolina, the United States; and Grafton, State of New Hampshire, the United States. Through oxidation the composition of uraninite varies between UO_2 and UO_3. Thorium atoms can substitute for uranium atoms in the crystal structure, so that a complete solid-solution series extends to thorianite. Some varieties in this series contain appreciable amounts of rare earths, particularly cerium. Types rich in thorium and rare earths occur principally in pegmatites; some have been designated by varietal names. Lead accumulates in uraninite as a product of the radioactive decay of uranium and thorium; the amount present can be used to calculate the geologic age of the mineral. Uraninite often alters to yellow or orange-red hydrated oxides (e.g., gummite) and to greenish yellow silicates. It is not resistant to weathering, and the uranium may be leached and redeposited locally as autunite, torbernite, or other secondary minerals. / Матин Хайнрихь Кляпрот (Martin Heinrich Klaproth (1743–1817)). Под Уранинитом понимается минерал, безводный окисел урана (U^{4+}) с идеализированной формулой UO_2 (справедлива только для синтетических материалов). Все природные уранините наряду с UO_2 содержат и UO_3; соотношение UO_2 к UO_3 выражается величиной так называемого Кислородного Коэффициента, который колеблется от $UO_{2.17}$ до $UO_{2.92}$. Различают собственно уранинит, встречающийся в виде чётких кристаллических форм, настуран (урановая смолка, урановая смоляная руда), образующий скрытокристаллические колломорфные агрегаты, и урановые черни – рыхлые землистые агрегаты. Собственно уранинит образует изоморфные ряды с торианитом ThO_2 и иттроцерианитом $(Y, Ce)O_2$. Кроме того, все уранините содержат продукты радиогенного распада урана и тория:- K, Ac, Po, He, Pb, а также Ca и Zn. С учётом наиболее частых примесей формула уранинита (U^{4+} + U^{6+}, Th, TR, Pb, Ca) $O_{1.9–2.5}$. Уранинит кристаллизуется в кубической системе. Структура идеального уранинита аналогична структуре флюорита. В природных уранинитах в связи с вхождением в структуру уранильных групп UO^{2+}, симметрия кристаллической решётки снижается и возникает примитивная кубическая структура; наиболее часто встречающиеся формы кристаллов – кубы, октаэдры и их комбинации. Цвет чёрный со смоляным блеском. Хрупок. Твёрдость 5–6 (по минералогической шкале), плотность 8 000–10 000 килограммов на кубический метр (кг/м^3) (у настурана 6 000–9 200 кг/м^3). Собственно уранинит – высокотемпературный минерал, характерен для гранитных и сиенитовых пегматитов в ассоциации со сложными ниобо-тантало-титанатами урана (самарскит, колумбит, пирохлор и другие), цирконом, монацитом; встречается также в гидротермальных, скарновых и осадочных месторождениях. Настуран образуется в основном в низкотемпературных гидротермальных и осадочных месторождениях; спутниками настурана являются сульфиды, арсениды, самородные висмут, мышьяк и серебро, карбонаты и другие. Урановые черни особенно характерны для гидротермальных сульфидно-урановых и осадочных месторождений. Уранинит легко изменяется в зоне окисления и служит исходным материалом для образования гидроокислов, силикатов, фосфатов и других минералов U^{6+}. Все разновидности уранинита являются основой урановых руд. Крупные месторождения уранинита известны в Канаде, США, Африке, Австралии, Франции и других.

URANIUM = УРАН – Uranium (U), radioactive chemical element of the actinide series in Group IIIb of the periodic table, atomic number 92. It is an important nuclear fuel. Uranium constitutes about two parts per million of the Earth's crust. Some important uranium minerals are pitchblende, uraninite, carnotite, autunite, and torbernite. These and other recoverable uranium ores, as sources of nuclear fuels, contain many times more energy than all the known recoverable deposits of fossil fuels. One pound of uranium yields as much energy as three million pounds of coal. Uranium is a dense, hard metallic element that is silvery-white in color. It is ductile, malleable, and capable of taking a high polish. In air the metal tarnishes and when finely divided breaks into flames. It is a poor conductor of electricity. Though discovered (1789) by Martin Heinrich Klaproth, who named it after the then recently discovered planet Uranus, the metal itself was first isolated (1841) by Eugène-Melchior Péligot by the reduction of uranium tetrachloride (UCl_4) with potassium. The formulation of the periodic system by the Russian chemist Dmitry Mendeleyev in 1869 focused attention on uranium as the heaviest of the elements, a position that it held until the discovery of the first transuranium element in 1940. In 1896 the French physicist Henri Becquerel discovered in uranium the phenomenon of radioactivity, a property that was later found in many other elements. It is now known that uranium, radioactive in all its isotopes, consists naturally of a mixture of uranium-238 (99.27 percent, 4 510 000 000-year half-life), uranium-235 (0.72 percent, 713 000 000-year half-life), and uranium-234 (0.006 percent, 247 000-year half-life). These long half-lives make determinations of the age of the Earth possible by measuring the amounts of lead, uranium's ultimate decay product, in certain uranium-containing rocks. Uranium-238 is the parent and uranium-234 one of the daughters in the radioactive uranium decay series; uranium-235 is the parent of the actinium decay series. The element uranium became the subject of intense study and broad interest after Otto Hahn and Fritz Strassmann discovered in late 1938 the phenomenon of nuclear fission in uranium bombarded by slow neutrons. Enrico Fermi suggested (early 1939) that neutrons might be among the fission products and could thus continue the fission as a chain reaction. Leo Szilard, Herbert L. Anderson, Frédéric Joliot-Curie, and their coworkers confirmed (1939) this prediction; later investigation showed that an average of 2 1/2 neutrons per atom are released during fission. Those discoveries led to the first self-sustaining nuclear chain reaction (December 02, 1942), the first atomic bomb test (July 16, 1945), the first atomic bomb dropped in warfare (August 06, 1945), the first atomic-powered submarine (1955), and the first full-scale nuclear-powered electrical generator (1957). Fission occurs with slow neutrons in the relatively rare isotope uranium-235 (the only naturally occurring fissile material), which must be separated from the plentiful isotope uranium-238 for its various uses. Uranium-238, however, after absorbing neutrons and undergoing negative beta decay, becomes the synthetic element plutonium, which is fissile with slow neutrons. Natural uranium, therefore, can be used in converter and breeder reactors, in which fission is sustained by the rare uranium-235 and plutonium is manufactured at the same time by the transmutation of uranium-238. Fissile uranium-233 can be synthesized for use as a nuclear fuel from the nonfissile thorium isotope thorium-232, which is abundant in nature. Uranium is also important as the primary material from which the synthetic transuranium elements have been prepared by transmutation reactions. Uranium, which is strongly electropositive, reacts with water; it dissolves in acids but not in alkalies. The important oxidation states are +4 (as in the oxide UO_2 and the green ion U^{4+}) and +6 (as in the oxide UO_3 and the yellow uranyl ion UO_2^{2+}). It also exhibits a +3 and a +5 state, but the respective ions are unstable (the red U^{3+} and the UO^{+}_2 ion, which undergoes disproportionation to U^{4+} and UO_2^{2+}). Uranium compounds are used as colouring agents for ceramics. Uranium hexafluoride (UF_6) in the vapor state is used in the gas-diffusion method of separating uranium-235 from uranium-238. Atomic Number:- 92; Atomic Weight:- 238.03; Melting Point:- 1 132.3 °C (2 070.1 °F); Boiling Point:- 3 818 °C (6 904 °F); Specific Gravity:- 19.05; Valence:- 3, 4, 5, 6; Electronic Config.:- 2-8-18-32-21-9-2 or $(Rn)5f^3 6d^1 7s^2$. Uranium Series:- set of unstable heavy nuclei constituting one of the four radioactive series. Uranium-234 – Uranium-238 Dating:- method of age determination that makes use of the radioactive decay of uranium-238 to uranium-234; the method can be used for dating of sediments from either a marine or a playa lake environment. Because this method is useful for the period of time

from about 100 000 years to 1 200 000 years before the present, it helps in bridging the gap between the carbon-14 dating method and the potassium-argon dating method. Uranium Processing:- preparation of the ore for use in various products. Uranium (U), although very dense (19.1 grams per cubic centimeter), is a relatively weak, nonrefractory metal. Indeed, the metallic properties of uranium appear to be intermediate between those of silver and other true metals and those of the nonmetallic elements, so that it is not valued for structural applications. The principal value of uranium is in the radioactive and fissionable properties of its isotopes. In nature, almost all (99.27 percent) of the metal consists of uranium-238; the remainder consists of uranium-235 (0.72 percent) and uranium-234 (0.006 percent). Of these naturally occurring isotopes, only uranium-235 is directly fissionable by neutron irradiation. However, uranium-238, upon absorbing a neutron, forms uranium-239, and this latter isotope eventually decays into plutonium-239 – a fissile material of great importance in nuclear power and nuclear weapons. Another fissile isotope, uranium-233, can be formed by neutron irradiation of thorium-232. Even at room temperature, finely divided uranium metal reacts with oxygen and nitrogen. At higher temperatures it reacts with a wide variety of alloying metals to form intermetallic compounds. Solid-solution formation with other metals occurs only rarely, owing to the singular crystalline structures formed by uranium atoms. Between room temperature and its melting point of 1 132 °C (2 070 °F), uranium metal exists in three crystalline forms known as the Alpha (α), Beta (β), and Gamma (γ) phases. Transformation from the Alpha to the Beta phase occurs at 668 °C (1 234 °F) and from the Beta to the Gamma phase at 775 °C (1 427 °F). Gamma uranium has a body-centered cubic (bcc) crystal structure, while Beta uranium has a tetragonal structure. The Alpha phase, however, consists of corrugated sheets of atoms in a highly asymmetrical orthorhombic structure. This anisotropic, or distorted, structure makes it difficult for the atoms of alloying metals to substitute for uranium atoms or to occupy spaces between uranium atoms in the crystal lattice. Only molybdenum and niobium have been observed to form solid-solution alloys with uranium. History:- The German chemist Martin Heinrich Klaproth is credited with discovering the element uranium in 1789 in a sample of pitchblende. Klaproth named the new element after the planet Uranus, which had been discovered in 1781. It was not until 1841, however, that the French chemist Eugène-Melchior Péligot showed that the black metallic substance obtained by Klaproth was really the compound uranium dioxide. Péligot prepared actual uranium metal by reducing uranium tetrachloride with potassium metal. Prior to the discovery and elucidation of nuclear fission, the few practical uses of uranium (and these were very small) were in the coloring of ceramics and as a catalyst in certain specialized applications. Today, uranium is highly valued for nuclear applications, both military and commercial, and even low-grade ores have great economic worth. Uranium metal is routinely produced by means of the Ames process, developed by the American chemist F.H. Spedding and his colleagues in 1942 at Iowa State University, Ames. In this process, the metal is obtained from uranium tetrafluoride by thermal reduction with magnesium. Ores:- The Earth's crust contains about two parts per million uranium, reflecting a wide distribution in nature. The oceans are estimated to contain $4.5 \cdot 10^9$ tons of the element. Uranium occurs as a significant constituent in more than 150 different minerals and as a minor component of another 50 minerals. Primary uranium minerals, found in magmatic hydrothermal veins and in pegmatites, include uraninite and pitchblende (the latter a variety of uraninite). The uranium in these two ores occurs in the form of uranium dioxide, which – owing to oxidation – can vary in exact chemical composition from UO_2 to $UO_{2.67}$. Other uranium ores of economic importance are autunite, a hydrated calcium uranyl phosphate; tobernite, a hydrated copper uranyl phosphate; coffinite, a black hydrated uranium silicate; and carnotite, a yellow hydrated potassium uranyl vanadate. It is estimated that more than 90 percent of known low-cost uranium reserves occur in Canada, South Africa, the United States, Australia, Niger, Namibia, Brazil, Algeria, and France. About 50 to 60 percent of these reserves are in the conglomerate rock formations of Elliot Lake, located north of Lake Huron in Ontario, Canada, and in the Witwatersrand goldfields of South Africa. Sandstone formations in the Colorado Plateau and Wyoming Basin of the western United States also contain significant reserves of uranium. Mining And Concentrating:- Uranium ores occur in deposits that are both near-surface and very deep (e.g., 300 to 1 200 meters, or 1 000 to 4 000 feet). The deep ores sometimes occur in seams as thick as 30 meters. As is the case with ores of other metals, surface uranium ores are readily mined with large earth-moving equipment, while deep deposits are mined by traditional vertical-shaft and drift methods. Uranium ores typically contain only a small amount of uranium-bearing minerals, and these are not amenable to smelting by direct pyrometallurgical methods; instead, hydrometallurgical procedures must be used to extract and purify the uranium values. Physical concentration would greatly reduce the load on hydrometallurgical processing circuits, but none of the conventional beneficiation methods typically employed in mineral processing – e.g., gravity, flotation, electrostatics, and even hand sorting – are generally applicable to uranium ores. With few exceptions, concentration methods result in excessive loss of uranium to tailings. Extraction And Refining:- Roasting:- The hydrometallurgical processing of uranium ores is frequently preceded by a high-temperature calcination step. Roasting dehydrates the clay content of many ores, removes carbonaceous materials, oxidizes sulfur compounds to innocuous sulfates, and oxidizes any other reductants that may interfere in subsequent leaching operations. Leaching:- Roasted uranium ores are leached of their uranium values by both acidic and alkaline aqueous solutions. For the successful operation of all leaching systems, uranium must either be initially present in the more stable hexavalent state or be oxidized to that state in the leaching process. Acid leaching is commonly performed by agitating an ore-leach mixture for 4 to as long as 48 hours at ambient temperature. Except in special circumstances, sulfuric acid is the leachant used; it is supplied in amounts sufficient to obtain a final leach liquor at about pH 1.5. Sulfuric acid leaching circuits commonly employ either manganese dioxide or chlorate ion to oxidize the tetravalent uranium ion (U^{4+}) to the hexavalent uranyl ion (UO_2^{2+}). Typically, about 5 kilograms (11 pounds) of manganese dioxide or 1.5 kilograms of sodium chlorate per ton suffice to oxidize tetravalent uranium. In any case, the oxidized uranium reacts with the sulfuric acid to form a uranyl sulfate complex anion, $(UO_2(SO_4)_3)^{4-}$. Uranium ores that contain significant amounts of basic minerals such as calcite or dolomite are leached with 0.5 to 1 molar sodium carbonate solutions. Although a variety of reagents has been studied and tested, oxygen is the uranium oxidant of choice. Typically, candidate ores are leached in air at atmospheric pressure and at 75 to 80 °C (167 to 175 °F) for periods that vary with the particular ore. The alkaline leachant reacts with uranium to form a readily soluble uranyl carbonate complex ion, $(UO_2(CO_3)_3)^{4-}$. Prior to further processing, solutions resulting from either acidic or carbonate leaching must be clarified. Large-scale separation of clays and other ore slimes is accomplished through the use of effective flocculants, including polyacrylamides, guar gum, and animal glue. Treatment Of Uranium Leachates:- The complex ions $(UO_2(CO_3)_3)^{4-}$ and $(UO_2(SO_4)_3)^{4-}$ can be sorbed from their respective leach solutions by ion-exchange resins. These special resins – characterized by their sorption and elution kinetics, particle size, stability, and hydraulic properties – can be used in a variety of processing equipment – e.g., fixed-bed, moving-bed, basket resin-in-pulp, and continuous resin-in-pulp. Conventionally, sodium and ammonium chloride or nitrate solutions are then used to elute the sorbed uranium from the exchange resins. Uranium can also be removed from acidic ore leach-liquors through solvent extraction. In industrial methods, alkyl phosphoric acids – e.g., di(2-ethylhexyl) phosphoric acid – and secondary and tertiary alkyl amines are the usual solvents. As a general rule, solvent extraction is preferred over ion-exchange methods for acidic leachates containing more than one gram of uranium per litre. Solvent extraction is not useful for recovery of uranium from carbonate leach liquors, however. Precipitation Of Yellow Cake:- Prior to final purification, uranium present in acidic solutions produced by the ion-exchange or solvent-extraction processes described above, as well as uranium dissolved in carbonate ore leach solutions, is typically precipitated as a polyuranate. From acidic solutions, uranium is precipitated by addition of neutralizers such as sodium hydroxide, magnesia, or (most commonly) aqueous ammonia. Uranium is usually precipitated as ammonium diuranate, $(NH_4)_2U_2O_7$. From alkaline solutions, uranium is most often precipitated by addition of sodium hydroxide, producing an insoluble sodium diuranate, $Na_2U_2O_7$. It can also be precipitated by acidification (to remove carbon dioxide) and then neutralization (to remove the

uranium) or by reduction to less soluble tetravalent uranium. In all cases, the final uranium precipitate, commonly referred to as yellow cake, is dried. In some cases – e.g., with ammonium diuranate – the yellow cake is ignited, driving off the ammonia and oxidizing the uranium to produce uranium trioxide (UO_3) or the more complex triuranium octoxide (U_3O_8). In all cases, the final product is shipped to a central uranium-purification facility. Refining Of Yellow Cake:- Uranium meeting nuclear-grade specifications is usually obtained from yellow cake through a tributyl phosphate solvent-extraction process. First, the yellow cake is dissolved in nitric acid to prepare a feed solution. Uranium is then selectively extracted from this acid feed by tributyl phosphate diluted with kerosene or some other suitable hydrocarbon mixture. Finally, uranium is stripped from the tributyl phosphate extract into acidified water to yield a highly purified uranyl nitrate, $UO_2(NO_3)_2$. Conversion And Isotopic Enrichment:- Uranyl nitrate is produced by the ore-processing operations described above as well as by solvent extraction from irradiated nuclear reactor fuel (described below, see Conversion To Plutonium). In either case, it is an excellent starting material for conversion to uranium metal or for eventual enrichment of the uranium-235 content. Both of these routes conventionally begin with calcining the nitrate to UO_3 and then reducing the trioxide with hydrogen to uranium dioxide (UO_2). Subsequent treatment of powdered UO_2 with gaseous hydrogen fluoride (HF) at 550 °C (1 025 °F) produces uranium tetrafluoride (UF_4) and water vapor, as in the following reaction:- $UO_2 + 4HF \rightarrow UF_4 + 2H_2O$. This hydrofluorination process is usually performed in a fluidized-bed reactor. Conversion to uranium metal is accomplished through the Ames process, in which UF_4 is reduced with magnesium (Mg) at temperatures exceeding 1 300 °C (2 375 °F). (In an often-used modification of the Ames process, calcium metal is substituted for magnesium.) Because the vapour pressure of magnesium metal is very high at 1 300 °C, the reduction reaction is performed in a refractory-lined, sealed container, or ‘bomb’. Bombs charged with granular UF_4 and finely divided Mg (the latter in excess) are heated to 500 to 700 °C (930 to 1 300 °F), at which point an exothermic (heat-producing) reaction occurs. The heat of reaction is sufficient to liquefy the conversion contents of the bomb, which are essentially metallic uranium and a slag of magnesium fluoride (MgF_2):- $UF_4 + 2Mg \rightarrow U + 2MgF_2$. When the bomb is cooled to ambient temperature, the massive uranium metal obtained is, despite its hydrogen content, the best-quality uranium metal available commercially and is well suited for rolling into fuel shapes for nuclear reactors. Uranium tetrafluoride can also be fluorinated at 350 °C (660 °F) with fluorine gas to volatile uranium hexafluoride (UF_6), which is fractionally distilled to produce high-purity feedstock for isotopic enrichment. Any of several methods – gaseous diffusion, gas centrifugation, liquid thermal diffusion – can be employed to separate and concentrate the fissile uranium-235 isotope into several grades, from low-enrichment (2 to 3 percent uranium-235) to fully enriched (97 to 99 percent uranium-235). Low-enrichment uranium is typically used as fuel for light-water nuclear reactors. After enrichment, UF_6 is reacted in the gaseous state with water vapour to yield hydrated uranyl fluoride ($UO_2F_2 \cdot H_2O$). Hydrogen reduction of the uranyl fluoride produces powdered UO_2, which can be used to prepare ceramic nuclear reactor fuel (see below Chemical Compounds:- Oxide Fuels). In addition, UO_2 obtained from enriched UF_6 or from UF_6 that has been depleted of its uranium-235 content can be hydrofluorinated to yield UF_4, and the tetrafluoride can then be converted to uranium metal in the Ames process described above. Conversion To Plutonium:- The nonfissile uranium-238 can be converted to fissile plutonium-239. In this equation, uranium-238, through the absorption of a neutron (n) and the emission of a quantum of energy known as a Gamma Ray (γ), becomes the isotope uranium-239 (the higher mass number reflecting the presence of one more neutron in the nucleus). Over a certain period of time (23.5 minutes), this radioactive isotope loses a negatively charged electron, or Beta particle (β–); this loss of a negative charge raises the positive charge of the atom by one proton, so that it is effectively transformed into the element neptunium (Np; with an atomic number of 93, one more than uranium). Neptunium-239 in turn undergoes beta decay, being transformed into plutonium-239 (atomic number 94). Uranium and plutonium are recovered from irradiated nuclear fuel through the widely practiced plutonium-uranium extraction, or Purex, process. In this solvent-extraction process, the fuel cladding encasing nuclear fuel elements (typically made of aluminum, magnesium, or zirconium alloys) is removed either chemically or mechanically, and the metal or oxide fuel is dissolved in nitric acid. Plutonium and uranium are then coextracted into a tributyl phosphate solution, while practically all the fission products and nonradioactive components are left in the aqueous raffinate. The loaded organic extract is contacted with an aqueous phase containing any of several possible reductants to separate the plutonium from the uranium, and uranium is stripped from the tributyl phosphate solution into a dilute nitric acid solution. Additional extraction-strip cycles are performed as needed with the separated uranium and plutonium streams in order to complete purification from each other and from traces of coextracted fission-product zirconium and ruthenium. Purified uranium nitrate is calcined to an oxide (either UO_3 or U_3O_8) for subsequent conversion to UF_6 and enrichment of the uranium-235 content, as described above. Purified plutonium nitrate is converted to plutonium dioxide (PuO_2) either for conversion to plutonium metal (weapons-grade plutonium) or for recycling into nuclear reactor fuel. Like uranium, metallic plutonium is usually obtained by high-temperature reduction of a halide salt (plutonium tetrafluoride or plutonium trifluoride) with calcium metal. Much use is also made of the so-called Direct Oxidation-Reduction Process, whereby PuO_2 is reduced with calcium metal to plutonium metal and a calcium oxide slag:- $PuO_2 + 2Ca \rightarrow Pu + 2CaO$. The Metal And Its Alloys:- Reactor-Grade Uranium:- Uranium metal intended for use in production reactors to produce plutonium-239 is rolled into round billets typically 23 centimeters (9 inches) in diameter and 51 centimeters long. Metallic uranium fuel elements for power reactors are prepared by hot extrusion of the uranium into tubing made of Zircaloy, a corrosion-resistant alloy of zirconium and tin. Uranium fuel elements can also be clad in alloys of magnesium and aluminum. Uranium reacts with a large variety of other metals to form intermetallic compounds, solid solutions, or (in a few instances) true alloys. Many of these systems have been exploited to prepare reactor fuels that possess increased resistance to in-reactor corrosion and radiation damage as well as greater mechanical strength than pure uranium metal. Examples include low-enrichment uranium-molybdenum and uranium-aluminum alloys. Even though uranium and plutonium are completely miscible, the plutonium-uranium system is not suitable for nuclear applications. As described above, uranium exists in three crystal structures between ambient temperature and its melting point of 1 132 °C (2 070 °F). Plutonium metal undergoes five phase transformations below its melting temperature of 640 °C (1 183 °F). Transformation from one phase to the next occurs no matter what the concentration of either element, thereby preventing use of plutonium-uranium alloys over a major temperature range. However, the addition of zirconium – for example, in a fuel containing 20 percent plutonium, 10 percent zirconium, and 70 percent uranium – can yield a metallic system completely adaptable to reactor use. Depleted Uranium:- Uranium fuel elements can be sheathed in a metallic blanket containing, for example, 10 percent zirconium and 90 percent uranium depleted of its uranium-235 content. The depleted uranium, consisting almost completely of uranium-238, captures neutrons that are emitted in the fission of the fuel elements, thus producing (or ‘breeding’) plutonium-239 simultaneous with the generation of nuclear power. Certain alloys of depleted uranium are also used in armour for tanks and other military vehicles. Because of its very high density, uranium metal is well suited for this purpose as well as for armour-piercing projectiles. Chemical Compounds:- Oxide Fuels:- Pellets made of low-enrichment UO2 are universally employed as fuel in commercial light-water reactors that produce electrical energy. The pellets are made by blending appropriate quantities of enriched and natural or depleted UO_2 powders, mechanically compacting them, adding an organic binder, pressing into pellets, heating to burn off the binder, and finally sintering at high temperature to 95 percent theoretical density. Fuel pins are fabricated by loading the pellets into a Zircaloy tube. Similar procedures are employed to fabricate mixed uranium-plutonium dioxide (MOX) pellets for use in fast-neutron breeder reactors. Unirradiated MOX fuel typically contains 20 to 35 percent plutonium dioxide. Carbide Fuels:- Various uranium and plutonium carbides are known, including the monocarbides (UC, PuC), the sesquicarbides (U_2C_3, Pu_2C_3), and the dicarbides (UC_2, PuC_2). Because they are highly refractory, these compounds have been much investigated for use as fuels for nuclear reactors. For example, the fuel in the high-temperature gas-cooled reactor (HTGR) consists of highly enriched uranium,

together with thorium as a fertile material; each is in the form of carbide pellets embedded in a dense form of graphite. Nitride Fuels:- Uranium forms a mononitride (UN) and two higher nitride phases (Alpha- and Beta-sesquinitrides; α = U_2N_3 and β = U_2N_3), whereas plutonium forms only a mononitride. Both uranium and plutonium nitrides are brittle, refractory compounds that melt at temperatures generally above 2 000 °C (3 600 °F). This latter property makes the mononitrides attractive as possible high-performance nuclear reactor fuels. / (в 1789) Немецким химиком Матином Хайнрихем Кляпротом (Martin Heinrich Klaproth; 1743–1817), который назвал его . Уран (на Латинском Uranium), U, радиоактивный химический элемент III группы периодической системы Менделеева, относится к семейству актиноидов, атомный номер 92, атомная масса 238.029; металл. Природный уран состоит из смеси трёх изотопов:- ^{238}U – 99.273 9% с периодом полураспада $T_{1/2} = 4.51 \cdot 10^9$ лет, ^{235}U – 0.702 4% ($T_{1/2} = 7.13 \cdot 10^8$ лет) и ^{234}U – 0.005 7% ($T_{1/2} = 2.48 \cdot 10^5$ лет). Из 11 искусственных радиоактивных изотопов с массовыми числами от 227 до 240 долгоживущий – ^{233}U ($T_{1/2} = 1.62 \cdot 10^5$ лет); он получается при нейтронном облучении тория. 238U и 235U являются родоначальниками двух радиоактивных рядов. Историческая Справка:- Уран открыт в 1789 Немецким химиком Матином Хайнрихем Кляпротом (Martin Heinrich Klaproth; 1743–1817) и назван им в честь планеты Уран, открытой Немецко-Британским астрономом и оптиком Фрэдэриком Вильэмом (Фридрихем Вильхэльмом) Хэршэлем (Frederick William (Friedrich Wilhelm) Herschel; 1738–1822) в 1781. В металлическом состоянии уран получен в 1841 Французским химиком Ожэном-Мэлькьором Пэлиго (Eugène-Melchior Péligot; 1811–1890) при восстановлении UCl_4 металлическим калием. Первоначально урану приписывали атомную массу 120, и только в 1871 Росийский химик и изобретатель Дмитрий Иванович Менделеев (Dmitry Mendeleyev; 1834–1907) пришёл к выводу, что эту величину надо удвоить. Длительное время уран представлял интерес только для узкого круга химиков и находил ограниченное применение для производства красок и стекла. С открытием явления радиоактивности урана в 1896 и радия в 1898 началась промышленная переработка урановых руд с целью извлечения и использования радия в научных исследованиях и медицине. С 1942, после открытия в 1939 явления деления ядер (смотрите Деление Атомного Ядра), уран стал основным ядерным топливом. Распространение В Природе:- Уран – характерный элемент для гранитного слоя и осадочной оболочки земной коры. Среднее содержание урана в земной коре (кларк) $2.5 \cdot 10^{-4}$% по массе, в кислых изверженных породах $3.5 \cdot 10^{-4}$%, в глинах и сланцах $3.2 \cdot 10^{-4}$%, в основных породах $5 \cdot 10^{-5}$%, в ультраосновных породах мантии $3 \cdot 10^{-7}$%. Уран энергично мигрирует в холодных и горячих, нейтральных и щелочных водах в форме простых и комплексных ионов, особенно в форме карбонатных комплексов. Важную роль в геохимии урана играют окислительно-восстановительные реакции, поскольку соединения урана, как правило, хорошо растворимы в водах с окислительной средой и плохо растворимы в водах с восстановительной средой (например, сероводородных). Известно около 100 минералов урана; промышленное значение имеют 12 из них (смотрите Урановые Руды). В ходе геологической истории содержание урана в земной коре уменьшилось за счёт радиоактивного распада; с этим процессом связано накопление в земной коре атомов Pb, He. Радиоактивный распад урана играет важную роль в энергетике земной коры, являясь существенным источником глубинного тепла. Физические Свойства:- Уран по цвету похож на сталь, легко поддаётся обработке. Имеет три аллотропические модификации – a, b и g с температурами фазовых превращений:- a®b 668.8 ±0.4 °C, b®g 772.2 ±0.4 °C; a-форма имеет ромбическую решётку a = 2.853 8Å, b = 5.866 2Å, c = 4.955 7Å), b-форма – тетрагональую решётку (при 720 °C a = 10.759Å, b = 5.656Å), g-форма – объёмноцентрированную кубическую решётку (при 850 °C a = 3.538Å). Плотность урана в a-форме (25 °C) 19.05 ±0.2 граммво на кубический сантиметр (г/$см^3$), $t_{пл}$ 1 132 ±1 °C; $t_{кип}$ 3 818 °C; теплопроводность (100–200 °C), 28.05 Вт/(м·К) (0.067 кал/(см·сек·°C)), (200–400 °C) 29.72 Вт/(м·К) (0.071 кал/(см·сек·°C)); удельная теплоёмкость (25 °C) 27.67 кДж/(кг·К) (6.612 кал/(г·°C)); удельное электросопротивление при комнатной температуре около $3 \cdot 10^{-7}$ Ом·см, при 600 °C $5.5 \cdot 10^{-7}$ Ом·см; обладает сверхпроводимостью при 0.68 ±0.02К; слабый парамагнетик, удельная магнитная восприимчивость при комнатной температуре $1.72 \cdot 10^{-6}$. Механические Свойства Урана зависят от его чистоты, от режимов механической и термической обработки. Среднее значение модуля упругости для литого урана $20.5 \cdot 10^{-2}$ МегаНьютонов на квадратный метр (МН/$м^2$) ($20.9 \cdot 10^{-3}$ килограмм-силы на квадратный миллиметр (кгс/$мм^2$) предел прочности при растяжении при комнатной температуре 372–470 МН/$м^2$ (38–48 кгс/$мм^2$), прочность повышается после закалки из b- и g-фаз; средняя твёрдость по Бринеллю $19.6–21.6 \cdot 10^2$ МН/$м^2$ (200–220 кгс/$мм^2$). Облучение потоком нейтронов (которое имеет место в ядерном реакторе) изменяет физико-механические свойства урана:- развивается ползучесть и повышается хрупкость, наблюдается деформация изделий, что заставляет использовать уран в ядерных реакторах в виде различных урановых сплавов. Уран – радиоактивный элемент. Ядра ^{235}U и ^{233}U делятся спонтанно, а также при захвате как медленных (тепловых), так и быстрых нейтронов с эффективным сечением деления $508 \cdot 10^{-24}$ квадратного сантиметра ($см^2$) (508 барн) и $533 \cdot 10^{-24}$ $см^2$ (533 барн) соответственно. Ядра ^{238}U делятся при захвате только быстрых нейтронов с энергией не менее 1 Мэв; при захвате медленных нейтронов ^{238}U превращается в ^{239}Pu, ядерные свойства которого близки к ^{235}U. Критическая масса урана (93.5% ^{235}U) в водных растворах составляет менее 1 килограмма (кг), для открытого шара – около 50 кг, для шара с отражателем – 15–23 кг; критическая масса ^{233}U – примерно 1/3 критической массы ^{235}U. Химические Свойства:- Конфигурация внешней электронной оболочки атома урана $7s^2 6d^1 5f^3$. Уран относится к реакционноспособным металлам, в соединениях проявляет степени окисления + 3, + 4, + 5, + 6, иногда + 2; наиболее устойчивы соединения U (IV) и U (VI). На воздухе медленно окисляется с образованием на поверхности плёнки двуокиси, которая не предохраняет металл от дальнейшего окисления. В порошкообразном состоянии уран пирофорен и горит ярким пламенем. С кислородом образует двуокись UO_2, трёхокись UO_3 и большое число промежуточных окислов, важнейший из которых U_3O_8. Эти промежуточные окислы по свойствам близки к UO_2 и UO_3. При высоких температурах UO_2 имеет широкую область гомогенности от $UO_{1.60}$ до $UO_{2.27}$. С фтором при 500–600 °C образует тетрафторидирд (зелёные игольчатые кристаллы, малорастворимые в воде и кислотах) и гексафторид UF_6 (белое кристаллическое вещество, возгоняющееся без плавления при 56.4 °C); с серой – ряд соединений, из которых наибольшее значение имеет US (ядерное горючее). При взаимодействии урана с водородом при 220 °C получается гидрид UH_3; с азотом при температуре от 450 до 700 °C и атмосферном давлении – нитрид U_4N_7, при более высоком давлении азота и той же температуре можно получить UN, U_2N_3 и UN_2; с углеродом при 750–800 °C – монокарбид UC, дикарбид UC_2, а также U_2C_3; с металлами образует сплавы различных типов (смотрите Урановые Сплавы). Уран медленно реагирует с кипящей водой с образованием UO_2 и H_2, с водяным паром – в интервале температур 150–250 °C; растворяется в соляной и азотной кислотах, слабо – в концентрированной плавиковой кислоте. Для U (VI) характерно образование иона уранила UO_2^{2+}; соли уранила окрашены в жёлтый цвет и хорошо растворимы в воде и минеральных кислотах; соли U (IV) окрашены в зелёный цвет и менее

растворимы; ион уранила чрезвычайно способен к комплексообразованию в водных растворах как с неорганическими, так и с органическими веществами; наиболее важны для технологии карбонатные, сульфатные, фторидные, фосфатные и другие комплексы. Известно большое число уранатов (солей не выделенной в чистом виде урановой кислоты), состав которых меняется в зависимости от условий получения; все уранаты имеют низкую растворимость в воде. Уран и его соединения радиационно и химически токсичны. Предельно допустимая доза (ПДД) при профессиональном облучении 5 бэр в год. Получение:- Уран получают из урановых руд, содержащих 0.05–0.5% U. Руды практически не обогащаются, за исключением ограниченного способа радиометрической сортировки, основанной на излучении радия, всегда сопутствующего урану. В основном руды выщелачивают растворами серной, иногда азотной кислот или растворами соды с переводом урана в кислый раствор в виде UO_2SO_4 или комплексных анионов $(UO_2(SO_4)_3)^{4-}$, а в содовый раствор – в виде $(UO_2(CO_3)_3)^{4-}$. Для извлечения и концентрирования урана из растворов и пульп, а также для очистки от примесей применяют сорбцию на ионообменных смолах и экстракцию органическими растворителями (трибутилфосфат, алкилфосфорные кислоты, амины). Далее из растворов добавлением щёлочи осаждают уранаты аммония или натрия или гидроокись $U(OH)_4$. Для получения соединений высокой степени чистоты технические продукты растворяют в азотной кислоте и подвергают аффинажным операциям очистки, конечными продуктами которых являются UO_3 или U_3O_8; эти окислы при 650–800 °C восстанавливаются водородом или диссоциированным аммиаком до UO_2 с последующим переводом его в UF_4 обработкой газообразным фтористым водородом при 500–600 °C. UF_4 может быть получен также при осаждении кристаллогидрата $UF_4 \cdot nH_2O$ плавиковой кислотой из растворов с последующим обезвоживанием продукта при 450 °C в токе водорода. В промышленности основным способом получения урана из UF_4 является его кальциетермическое или магниетермическое восстановление с выходом урана в виде слитков массой до 1.5 тонн (т). Слитки рафинируются в вакуумных печах. Очень важным процессом в технологии урана является обогащение его изотопом ^{235}U выше естественного содержания в рудах или выделение этого изотопа в чистом виде (смотрите Разделение Изотопов), поскольку именно ^{235}U – основное ядерное горючее; осуществляется это методами газовой термодиффузии, центробежными и другими методами, основанными на различии масс ^{235}U и ^{238}U; в процессах разделения урана используется в виде летучего гексафторида UF_6. При получении урана высокой степени обогащения или изотопов учитываются их критические массы; наиболее удобный способ в этом случае – восстановление окислов урана кальцием; образующийся при этом шлак CaO легко отделяется от урана растворением в кислотах. Для получения порошкообразного урана, двуокиси, карбидов, нитридов и других тугоплавких соединений применяются методы порошковой металлургии. Применение:- Металлический уран или его соединения используются в основном в качестве ядерного горючего в ядерных реакторах. Природная или малообогащённая смесь изотопов урана применяется в стационарных реакторах атомных электростанций, продукт высокой степени обогащения – в ядерных силовых установках или в реакторах, работающих на быстрых нейтронах. ^{235}U является источником ядерной энергии в ядерном оружии. ^{238}U служит источником вторичного ядерного горючего – плутония. Уран В Организме:- В микроколичествах (10^{-5}–10^{-5}%) обнаруживается в тканях растений, животных и человека. В золе растений (при содержании урана в почве около $\cdot 10^{-4}$) его концентрация составляет $1.5 \cdot 10^{-5}$%. В наибольшей степени уран накапливается некоторыми Грибами и Водорослями (последние активно участвуют в биогенной миграции урана по цепи вода – водные растения – рыба – человек). В организм животных и человека уран поступает с пищей и водой в желудочно-кишечный тракт, с воздухом в дыхательные пути, а также через кожные покровы и слизистые оболочки. Соединения урана всасываются в желудочно-кишечном тракте – около 1% от поступающего количества растворимых соединений и не более 0.1% труднорастворимых; в лёгких всасываются соответственно 50% и 20%. Распределяется уран в организме неравномерно. Основные депо (места отложения и накопления) – селезёнка, почки, скелет, печень и, при вдыхании труднорастворимых соединений, – лёгкие и бронхо-лёгочные лимфатические узлы. В крови уран (в виде карбонатов и комплексов с белками) длительно не циркулирует. Содержание урана в органах и тканях животных и человека не превышает 10^{-7} грамма на грамм (г/г). Так, кровь крупного рогатого скота содержит $1 \cdot 10^{-8}$ грамма на миллилитр (г/мл), печень $8 \cdot 10^{-8}$ г/г, мышцы $4 \cdot 10^{-8}$ г/г, селезёнка $9 \cdot 10^{-8}$ г/г. Содержание урана в органах человека составляет:- в печени $6 \cdot 10^{-9}$ г/г, в лёгких $6 \cdot 10^{-9}$–$9 \cdot 10^{-9}$ г/г, в селезёнке $4.7 \cdot 10^{-9}$ г/г, в крови $4 \cdot 10^{-9}$ г/мл, в почках $5.3 \cdot 10^{-9}$ (корковый слой) и $1.3 \cdot 10^{-9}$ г/г (мозговой слой), в костях $1 \cdot 10^{-9}$ г/г, в костном мозге $1 \cdot 10^{-9}$ г/г, в волосах $1.3 \cdot 10^{-7}$ г/г. Уран, содержащийся в костной ткани, обусловливает её постоянное облучение (период полувыведения урана из скелета около 300 суток (сут)). Наименьшие концентрации урана – в головном мозге и сердце (10^{-10} г/г). Суточное поступление урана с пищей и жидкостями – $1.9 \cdot 10^{-6}$ г, с воздухом – $7 \cdot 10^{-9}$ г. Суточное выведение урана из организма человека составляет:- с мочой $0.5 \cdot 10^{-7}$–$5 \cdot 10^{-7}$, с калом – $1.4 \cdot 10^{-6}$–$1.8 \cdot 10^{-6}$ г, с волосами – $2 \cdot 10^{-8}$ г. По данным Международной Комиссии по Радиационной Защите, среднее содержание урана в организме человека $9 \cdot 10^{-8}$ грамма (г). Эта величина для различных районов может варьировать. Полагают, что уран необходим для нормальной жизнедеятельности животных и растений, однако его физиологические функции не выяснены. Токсическое Действие Урана обусловлено его химическими свойствами и зависит от растворимости:- более токсичны уранил и другие растворимые соединения урана. Отравления ураном и его соединениями возможны на предприятиях по добыче и переработке уранового сырья и других промышленных объектах, где он используется в технологическом процессе. При попадании в организм уран действует на все органы и ткани, являясь общеклеточным ядом. Признаки отравления обусловлены преимущественно поражением почек (появление белка и сахара в моче, последующая олигурия), поражаются также печень и желудочно-кишечный тракт. Различают острые и хронические отравления; последние характеризуются постепенным развитием и меньшей выраженностью симптомов. При хронической интоксикации возможны нарушения кроветворения, нервной системы и другое. Полагают, что молекулярный механизм действия урана связан с его способностью подавлять активность ферментов. Профилактика Отравлений:- непрерывность технологических процессов, использование герметичной аппаратуры, предупреждение загрязнения воздушной среды, очистка сточных вод перед спуском их в водоёмы, медицинский контроль за состоянием здоровья рабочих, за соблюдением гигиенических нормативов допустимого содержания урана и его соединений в окружающей среде. Урановые Руды, природные минеральные образования, содержащие уран и его соединения в концентрациях, при которых их промышленное использование технически возможно и экономически целесообразно. Известно около 100 урановых минералов, из них 12 представляют практический интерес; наибольшее промышленное значение имеют окислы урана – уранинит и его разновидности (настуран и урановая чернь), а также силикаты – коффинит, титанаты – давидит и браннерит; водные фосфаты и арсенаты уранила – урановые слюдки. По условиям образования среди урановых руд различают:- эндогенные руды, отложившиеся при повышенных температурах и давлениях из пегматитовых расплавов и водных (предположительно постмагматических) растворов, характерны для складчатых областей и активизированных платформ; экзогенные руды, сформировавшиеся в близкоповерхностных условиях и на поверхности Земли в процессе осадконакопления (сингенетические руды) или в результате циркуляции грунтовых вод (эпигенетические руды), связаны преимущественно с молодыми платформами; метаморфогенные руды, возникшие путём перераспределения первично рассеянного урана в процессе метаморфизма осадочных толщ, характерны для древних платформ. Урановые руды разделяются на природные типы и технологические сорта. По характеру урановой минерализации различают:- первичные урановые руды – не менее 75% U^{4+} от общего количества; окисленные урановые руды, содержащие главным образом U^{6+}; смешанные урановые руды, в которых U^{4+} и U^{6+} находятся примерно в равных соотношениях. Степень окисления урановых

минералов сказывается на технологии их переработки и поведении в гидрометаллургическом переделе. По ‘контрастности’, определяемой степенью неравномерности содержания U в кусковой фракции отбитой горной массы, среди урановых руд выделяются весьма контрастные, контрастные, слабо контрастные и неконтрастные руды; контрастность руд определяет возможность и целесоооразность их радиометрического обогащения. По размерам агрегатов и зёрен урановых минералов выделяются:- крупнозернистые урановые руды (свыше 25 миллиметров (мм) в поперечнике), среднезернистые (3–25 мм), мелкозернистые (0.1–3 мм), тонкозернистые (0.015–0.1 мм) и дисперсные (менее 0.015 мм); размеры агрегатов и зёрен урановых минералов определяют возможность механического обогащения руд. По содержанию полезных примесей выделяют:- собственно урановые, уран-молибденовые, уран-ванадиевые, уран-никель-кобальт-висмут-серебряные и другие руды. По химическому составу нерудной составляющей среди урановых руд различают:- силикатные урановые руды (в основном из силикатных минералов); карбонатные (более 10–15% карбонатных минералов); железоокисные, представляющие собой железо-урановые руды; сульфидные, содержащие более 8–10% сульфидных минералов; каустобиолитовые, состоящие в основном из органического вещества. Химический состав руд часто имеет решающее значение при выборе способа их переработки. Так, например, из силикатных руд уран выщелачивается кислотами, из карбонатных – содовыми растворами; железо-окисные руды подвергаются доменной плавке, при которой уран концентрируется в шлаках; каустобиолитовые урановые руды иногда обогащаются путём их сжигания и так далее. По содержанию урана выделяются 5 сортов руд:- очень богатые руды (свыше 1% урана); богатые (1–0.5%); средние (0.5–0.25%); рядовые (0.25–0.1%); бедные (менее 0.1%). В качестве побочного продукта уран извлекается из руд, содержащих 0.01–0.015% урана (например, из золотоносных конгломератов Витватерсранда, ЮАР) и даже 0.006–0.008% (фосфориты Флориды, США). В 1975 мировая добыча урана (без социалистических стран) составила 21 500 тонну (т). Главные месторождения урановых руд капиталистических стран расположены в Соединённых Штатах Америки (США) (Плато Колорадо), Канаде (Провинции Онтарио и Саскачеван), Франции (Центральный массив) и Южно-Африканской Республике (ЮАР) (Витватерсранд); крупные месторождения урана известны также в Австралии (Северная территория) и в Габоне.

URANIUM–THORIUM–LEAD DATING = УРАН–ТОРИЕВО–СВИНЦОВОЕ ДАТИРОВАНИЕ (или УРАН–ТОРИЕВО–СВИНЦОВАЯ ДАТИРОВКА) – Uranium-Thorium-Lead Dating:- also called Common-Lead Dating, method of establishing the time of origin of a rock by means of the amount of common lead it contains; common lead is any lead from a rock or mineral that contains a large amount of lead and a small amount of the radioactive progenitors of lead, i.e. the uranium isotopes uranium-235 and uranium-238 and the thorium isotope thorium-232. The important characteristic of common lead is that it contains no significant proportion of radiogenic lead accumulated since the time that the mineral or rock phase was formed. Of the four isotopes of lead, two are formed from the uranium isotopes and one is formed from the thorium isotope; only lead-204 is not known to have any long-lived radioactive progenitor. Primordial lead is thought to have been formed by stellar nuclear reactions, released to space by supernovae explosions, and incorporated within the dust cloud that constituted the primordial solar system; the troilite (iron sulfide) phase of iron meteorites contains lead that approximates the primordial composition. The lead incorporated within the Earth has been evolving continuously from primordial lead and from the radioactive decay of uranium and thorium isotopes. Thus, the lead isotopic composition of any mineral or rock depends upon its age and the environment from which it was formed; that is, it would depend upon the ratio of uranium plus thorium to lead in the parent material. The Earth can be assumed to be a very large sample containing lead evolving from primordial lead by radiogenic increments. If modern lead, for example, from marine sediments or modern basalts has the composition of lead in the Earth and if the lead in the troilite phase of iron meteorites has the composition of primordial lead, then a simple model yields about 4.6 billion years for the age of the Earth. This age is in good agreement with the age of the meteorites and the age of the Moon as determined independently.

URARTIP = UNIFIED RICE APPLIED RESEARCH, TRAINING, AND INFORMATION PROGRAM

URBAN CLIMATE = ГОРОДСКОЙ КЛИМАТ – Urban Climate:- any set of climatic conditions that prevails in a large metropolitan area and that differs from the climate of its rural surroundings. Urban climates are distinguished from those of less built-up areas by differences of air temperature, humidity, wind speed and direction, and amount of precipitation. These differences are attributable in large part to the altering of the natural terrain through the construction of artificial structures and surfaces. For example, tall buildings, paved streets, and parking lots affect wind flow, precipitation runoff, and the energy balance of a locale. Also characteristic of the atmosphere over urban centers are substantially higher concentrations of pollutants such as carbon monoxide, the oxides of sulfur and nitrogen, hydrocarbons, oxidants, and particulate matter. Foreign matter of this kind is introduced into the air by industrial processes (e.g., chemical discharges by oil refineries), fuel combustion (for the operation of motor vehicles and for the heating of offices and factories), and the burning of solid wastes. Urban pollution concentrations depend on the magnitude of local emissions sources and the prevailing meteorological ventilation of the area, i.e. the height of the atmospheric layer through which the pollutants are being mixed and the average wind speed through that layer. Heavy concentrations of air pollutants have considerable impact on temperature, visibility, and precipitation in and around cities. Moreover, there occasionally arise weather conditions that allow the accumulation of pollutants over an urban area for several days. Such conditions, termed temperature inversions (increasing air temperature with increasing altitude), strongly inhibit atmospheric mixing and can cause acute distress in the population and even, under extremely severe conditions, loss of life. Atmospheric inversion caused an air-pollution disaster in London in December 1952 in which about 3 500 persons died from respiratory diseases. The center of a city is warmer than are outlying areas. Daily minimum temperature readings at related urban and rural sites frequently show that the urban site is 6° to 11° C (10° to 20° F) warmer than the rural site. Two primary processes influence the formation of this ‘heat island’. During summer, urban masonry and asphalt absorb, store, and reradiate more solar energy per unit area than do the vegetation and soil typical of rural areas. Furthermore, less of this energy can be used for evaporation in urban areas, which characteristically exhibit greater precipitation runoff from streets and buildings. At night, radiative losses from urban building and street materials keep the city’s air warmer than that of rural areas. During winter the urban atmosphere is warmed slightly, but significantly, by energy from fuel combustion for home heating, power generation, industry, and transportation. Also contributing to the warmer urban atmosphere is the blanket of pollutants and water vapor that absorbs a portion of the thermal radiation emitted by the Earth’s surface. Part of the absorbed radiation warms the surrounding air, a process that tends to stabilize the air over a city, which in turn increases the probability of higher pollutant concentrations. The average relative humidity in cities is usually several percent lower than that of adjacent rural areas, primarily because of increased runoff of precipitation and the lack of evapotranspiration from vegetation in urban areas. Some moisture, however, is added to urban atmospheres by the many combustion sources. The flow of wind through a city is characterized by mean speeds that are 20 to 30 percent lower than those of winds blowing across the adjacent countryside. This difference occurs as a result of the increased frictional drag on air flowing over built-up urban terrain, which is rougher than rural areas. Another difference between urban and rural wind flow is the convergence of low-level wind over a city (i.e. air tends to flow into a city from all directions). This is caused primarily by the horizontal thermal gradients of the urban heat island. The amount of solar radiation received by cities is reduced by the blanket of particulates in the overlying atmosphere. The higher particulate concentrations in urban atmospheres reduce visibility by both scattering and absorbing light. In addition, some particles provide opportunities for the condensation of water vapour to form water droplets, the ingredients of fog. A city also influences

precipitation patterns in its vicinity. Such city-generated or city-modified weather factors as wind turbulence, thermal convection, and high concentrations of condensation nuclei might be expected to increase precipitation. Although appropriate continuous, quantitative measurements have not been made for a sufficient length of time, there is some data to suggest that the amount of precipitation over many large cities is about 5 to 10 percent greater than that over nearby rural areas, with the greatest increases occurring downwind of the city center.

URBAN CLUSTER = ГОРОДСКОЕ ПОСЕЛЕНИЕ (или ГОРОДСКОЕ ОБРАЗОВАНИЕ) – In the United States, an Urban Cluster (UC) consists of densely settled territory that has at least 2 500 people but fewer than 50 000 people. The US Census Bureau introduced the UC for Census 2000 to provide a more consistent and accurate measure of the population concentration in and around places. UCs are defined using the same criteria that are used to define Urban Areas (UAs). UCs replace the provision in the 1990 and previous censuses that defined as urban only those places with 2 500 or more people located outside of urbanized areas.

URBAN FORM = ГОРОДСКАЯ ФОРМА – Urban Form is the spatial imprint of an urban transport system as well as the adjacent physical infrastructures and socioeconomic activities. Jointly, they confer a level of spatial arrangement to cities.

URBANIZATION = УРБАНИЗАЦИЯ (или РОСТ ГОРОДОВ) – Urbanization:- the process by which large numbers of people become permanently concentrated in relatively small areas, forming cities. The definition of what constitutes a city changes from time to time and place to place, but it is most usual to explain the term as a matter of demographics. The United Nations has recommended that countries regard all places with more than 20 000 inhabitants living close together as urban; but, in fact, nations compile their statistics on the basis of many different standards. The United States, for instance, uses ‘urban place’ to mean any locality where more than 2 500 people live. Whatever the numerical definition, it is clear that the course of human history has been marked by a process of accelerated urbanization. It was not until the Neolithic period, roughly 10 000 years ago, that humans were able to form permanent settlements. Even 5 000 years ago the only such settlements on the globe were small, semipermanent villages of peasant farmers, towns whose size was limited by the fact that they had to move whenever the soil nearby was exhausted. It was not until the time of classical antiquity that cities of more than 100 000 existed, and even these did not become common until the sustained population explosion of the last three centuries. In 1800 less than 3 percent of the world’s population was living in cities of 20 000 or more; this had increased to about 25 percent by the mid-1960s and to about 40 percent by 1980. It is estimated that, by this measure, about half the world’s population will be urban in the year 2000. The little towns of ancient civilizations, both in the Old World and the New, were only possible because of improvements in agriculture and transportation. As farming became more productive, it produced a surplus of food. The development of means of transportation, dating from the invention of the wheel in about 3500 BC, made it possible for the surplus from the countryside to feed urban populations, a system that continues to the present day. Despite the small size of these villages, the people in early towns lived quite close together. Distances could be no greater than an easy walk, and nobody could live out of the range of the water supply. In addition, because cities were constantly subject to attack, they were quite often walled, and it was difficult to extend barricades over a large area. Archaeological excavations have suggested that the population density in the cities of 2000 BC may have been as much as 128 000 per square mile (49 400 per square km); today Calcutta and Shanghai, with densities of more than 70 000 per square mile, are regarded as extremes of overcrowding. With few exceptions, the elite – the aristocrats, government officials, clergy, and the wealthy – lived in the centre of ancient cities, which was usually located near the most important temple. Farther out were the poor, who sometimes huddled outside the city walls altogether. The greatest city of antiquity was Rome, which at its height in the III century AD covered almost 4 square miles (10 square km) and had at least 800 000 inhabitants. To provide for this enormous population, the empire constructed a system of aqueducts that channeled drinking water from hills as far away as 44 miles (70 km). Inside the city itself, the water was pumped to individual homes through a remarkable network of conduits and lead pipes, the equal of which was not seen until the XX century. As in most early cities, Roman housing was initially built from dried clay molded about wooden frameworks. As the city grew, it began to include structures made from mud, brick, concrete, and, eventually, finely carved marble. This general model of city structure continued until the advent of the Industrial Revolution, although medieval towns were rarely as large as Rome. In the course of time, commerce became an increasingly important part of city life and one of the magnets that drew people from the countryside. With the invention of the mechanical clock, the windmill and water mill, and the printing press, the interconnection of city inhabitants continued apace. Cities became places where all classes and types of humanity mingled, creating a heterogeneity that became one of the most celebrated features of urban life. In 1777 Samuel Johnson cheered this aspect of cities in his famous apothegm, ‘When a man is tired of London, he is tired of life; for there is in London all that life can afford’. (Finally, cities offered and continue to offer a greater variety of amusements, leisure activities, and intellectual stimuli. As Samuel Johnson famously put it in 1777, ‘Why, Sir, you find no man, at all intellectual, who is willing to leave London. No, Sir, when a man is tired of London, he is tired of life; for there is in London all that life can afford’.) At the time, it should be recalled, London had fewer than 100 000 citizens, and most of its streets were narrow, muddy paths. The technological explosion that was the Industrial Revolution led to a momentous increase in the process of urbanization. Larger populations in small areas meant that the new factories could draw on a big pool of workers and that the larger labor force could be ever more specialized. By the XIX century there were thousands of industrial workers in Europe, many of them living in the most miserable conditions. Attracted by the promise of paid work, immigrants from rural areas flooded into the city, only to find that they were forced to live in crowded, polluted slums awash with refuse, disease, and rodents. Designed for commerce, the streets of the newer cities were often arranged in grid patterns that took little account of human needs, such as privacy and recreation, but did allow these cities to expand indefinitely. This they did in the XX century, when most cities became surrounded by rings of suburbs. As in the past, these outer homes usually contained the poorest citizens, with the rich living in the vibrant city centre. An exception is the United States, where suburbs populated by the affluent and the middle class grew up around cities in the 1950s and ’60s. It is speculated that one result of the continuing population explosion will be the creation, in the next 100 years, of megalopolises, concentrations of urban centers that may extend for scores of miles. It is thought that the first such growth could occur in the east coast of the United States, where there may eventually be a single urban agglomeration stretching from Boston to Washington, DC. Other emerging megalopolises include the Tokyo–Ōsaka–Kyōto complex in Japan, the region between London and the Midland cities in Great Britain, and the Netherlands–central Belgium area. / В 1777 Сэмьюэл Дьжонсэн (Samuel Johnson; 1709–1784).

URBAN PLANNING = ГОРОДСКОЕ ПЛАНИРОВАНИЕ (или ГРАДОПЛАНИРОВАНИЕ) – Urban Planning:- the programs pursued in most industrialized countries in an attempt to achieve certain social and economic objectives, in particular to shape and improve the urban environment in which increasing proportions of the world’s population spend their lives. Evidence of urban planning – such as orderly street systems; division of a city into specialized, functional districts, or quarters; fortifications; and conduits for the water supply and sewage disposal – can be found in the ancient ruins of cities in China, India, Egypt, Asia Minor, the Mediterranean region, and South and Central America. During the Renaissance, European city areas were consciously planned to achieve practical circulation and also to provide fortification against invasion. The radial boulevards of Paris were designed with military as well as aesthetic objectives. The planning concepts of the European Renaissance were exported to the New World. William Penn developed the gridiron plan – the laying out of streets and plots of land adaptable to rapid change in land use – that dominated American urban planning as

the society expanded westward. By dividing land into lots, the gridiron plan accommodates itself to urban expansion, but it uses land inefficiently and creates traffic-flow problems. The modern urban planning and redevelopment movement arose in response to the disorder and squalor of the slum areas created by the Industrial Revolution in the XIX century. Reformation of these areas was the objective of the early city planners, who imposed regulatory laws establishing standards for housing, sanitation, water supply, sewage, and public health conditions. Urban planners also introduced parks and playgrounds into congested city neighbourhoods, providing places for recreation, as well as visual relief. The chief new urban-planning concept of the early XX century was zoning – the regulation of building activity to set limits of height and density and to protect established neighbourhoods. This arose in response to the sprawling, haphazard growth of industrial cities, where factories invaded residential areas, and where skyscrapers blocked out the sunlight of smaller buildings. Urban territory expanded further as a result of improved public transportation. Workers could live far from their jobs, traveling back and forth by bus, subway, or car. The sprawling and crowded metropolis, especially its downtown and commercial areas, required well-planned circulation systems. By the middle of the XX century, urban planning changed its focus. Planners realized that factors of city living must be considered as a whole, so they aimed less at attacking specific problems than at the improvement of the entire urban milieu. This movement aimed at an ideal urban environment, which would give the city dweller maximum amenity. Another aspect of urban planning has been the building of experimental new towns and cities. In Great Britain, India, Israel, and South America a few new cities were built entirely from plans. Urban planning was an important factor in Europe after World War II, when urban planners directed the reconstruction of war-shattered areas. / Вильэм Пэн (William Penn; 1644–1718).

URBAN RENEWAL = ГОРОДСКОЕ ПРЕОБРАЗОВАНИЕ (или ГОРОДСКОЕ ОБНОВЛЕНИЕ, или ХХ) – Urban Renewal:- comprehensive scheme to redress a complex of urban problems, including unsanitary, deficient, or obsolete housing; inadequate transportation, sanitation, and other services and facilities; haphazard land use; and traffic congestion. Early efforts usually focused on housing reform and sanitary and public-health measures, followed by growing emphasis on slum clearance and the relocation of population and industry from congested areas to less-crowded sites, as in the garden-city and new-towns movements in Great Britain. Each country approaches urban renewal according to its means and its political and administrative systems. The chief activities of urban renewal are redevelopment, the clearance and rebuilding of structures that are deteriorated or obsolete in themselves or are laid out in an unsatisfactory way or the reuse of the land for other purposes; rehabilitation, the improvement of structurally sound buildings that have deteriorated or lost their original functions; and conservation, a protective process designed to maintain the function and quality of an area, for instance, by requiring or assisting adequate maintenance and preventing inappropriate developments or changes in the use of land and buildings.

URC = UNIFORM RULES FOR COLLECTIONS

URCS = UNIFORM RAILROAD COST SYSTEM

URDG = UNIFORM RULES FOR DEMAND GUARANTEES

UREA = МОЧЕВИНА (или КАРБАМИД) – Urea is an organic nitrogen compound; NH_2CONH_2. Urea is used in dyeing for a number of purposes. Urea helps increase the limit of solubility of some dyes, such as MX, in water. This can be useful when strong solutions are to be made for tie-dyeing, for example. From 5% to 20% w/v can be used. Urea is used as an humectant. In tie-dyeing or similar processes it helps prevent fabric from drying out during the long periods when it is left in the open for the dye to fix. Urea increases the swelling of fibers and can break hydrogen bonds, aiding penetration and mobility of dye. Large amounts of urea, up to 30% w/v, are used in some cold pad-batch dyeing processes for wool. Most urea sold is synthesized from natural gas. Urea is sold as an 'organic nitrogen' fertilizer. Pure urea will be designated 46-0-0 when sold as such. Urea is a synthetic nitrogen compound used with all classes of dyes. It also increases the solubility of the dyes. Urea:- also called Carbamide, the diamide of carbonic acid. Its formula is H_2NCONH_2. Urea has important uses as a fertilizer and feed supplement, as well as a starting material for the manufacture of plastics and drugs. It is a colorless, crystalline substance that melts at 132.7° C (271° F) and decomposes before boiling. Urea is the chief nitrogenous end product of the metabolic breakdown of proteins in all mammals and some fishes. The material occurs not only in the urine of all mammals but also in their blood, bile, milk, and perspiration. In the course of the breakdown of proteins, amino groups (NH_2) are removed from the amino acids that partly comprise proteins. These amino groups are converted to ammonia (NH_3), which is toxic to the body and thus must be converted to urea by the liver. The urea then passes to the kidneys and is eventually excreted in the urine. Urea was first isolated from urine in 1773 by the French chemist Hilaire-Marin Rouelle. Its preparation by the German chemist Friedrich Wöhler from ammonium cyanate in 1828 was the first generally accepted laboratory synthesis of a naturally occurring organic compound from inorganic materials. Urea is now prepared commercially in vast amounts from liquid ammonia and liquid carbon dioxide. These two materials are combined under high pressures and elevated temperatures to form ammonium carbamate, which then decomposes at much lower pressures to yield urea and water. Because its nitrogen content is high and is readily converted to ammonia in the soil, urea is one of the most concentrated nitrogenous fertilizers. An inexpensive compound, it is incorporated in mixed fertilizers as well as being applied alone to the soil or sprayed on foliage. With formaldehyde it gives methylene-urea fertilizers, which release nitrogen slowly, continuously, and uniformly, a full year's supply being applied at one time. Although urea nitrogen is in nonprotein form, it can be utilized by ruminant animals (cattle, sheep), and a significant part of these animals' protein requirements can be met in this way. The use of urea to make urea–formaldehyde resin is second in importance only to its use as a fertilizer. Large amounts of urea are also used for the synthesis of barbiturates. Urea reacts with alcohols to form urethanes and with malonic esters to give barbituric acids. With certain straight-chain aliphatic hydrocarbons and their derivatives, urea forms crystalline inclusion compounds, which are useful for purifying the included substances. / Французский химик Илер-Мара Руэль (Hilaire-Marin Rouelle; 1718–1779). Немецкий химик Фридрихь Вёля (Friedrich Wöhler; 1800–1882). Под Мочевиной или Карбамидом $(NH_2)_2CO$ понимаются бесцветные кристаллы; $t_{пл}$ = 132.7 °C. Мочевина – конечный продукт белкового обмена у большинства позвоночных животных и человека. Образуется в печени. Выводится с мочой. В промышленности мочевину синтезируют из NH_3 и CO_2. Применяют для получения мочевино-формальдегидных смол, красителей, снотворных средств (барбитала, фенобарбитала), для депарафинизации нефтей; в медицине как дегидратирующее, мочегонное средство. Мочевина – концентрированное азотное удобрение для разных почв под различные сельскохозяйственные культуры (содержит 46% N). Растворима в воде. В животноводстве – заменитель протеина. Мочевина или Карбамид, H_2NCONH_2, полный амид угольной кислоты, амид карбаминовой кислоты; бесцветные кристаллы ($t_{пл}$ 132.7 °C), легко растворимые в воде, спирте, жидком аммиаке, сернистом ангидриде. Мочевина открыта Французским химиком Илером Мара Руэлем (Hilaire Marin Rouelle; 1718–1779) (в 1773) в моче, идентифицирована Английским химиком Вильэмом Праутчом (William Prout; 1785–1850) (в 1818), впервые синтезирована Немецким химиком Фридрихём Вёля (Friedrich Wöhler; 1800–1882) (в 1828) нагреванием циановокислого аммония NH_4NCO. Именно это открытие нанесло первый удар идеалистическому виталистическому учению о так называемой жизненной силе (смотрите Органическая Химия). Мочевина – весьма реакционно-способное соединение; образует комплексные соединения с многими веществами, например, с перекисью водорода $CO(NH_2)_2 \cdot H_2O_2$, с нормальными насыщенными углеводородами; последняя реакция используется в промышленности для депарафинизации нефтей (смотрите также Соединения Включения). При нагревании до 150–160 °C мочевина разлагается с образованием биурета

$H_2NCONHCONH_2$, NH_3, CO_2 и других продуктов; при нагревании водных растворов медленно гидролизуется до CO_2 и NH_3 (быстро в присутствии кислот и щёлочей), с кислотами (HNO_3, HCl и другими) даёт соли, например, CO $(NH_2)_2 \cdot HNO_3$. При алкилировании мочевины образуются алкилмочевины $RNHCONH_2$, при ацилировании – уреиды $RCONHCONH_2$, при взаимодействии со спиртами – уретаны H_2NCOOR. Мочевина легко конденсируется с формальдегидом. Атом водорода в группе NH_2 может быть замещён также на атомы галогена (F, Cl). Мочевина – конечный продукт белкового обмена у большинства позвоночных животных и человека. Обнаружена в крови, мышцах, слюне, лимфе, молоке и других жидкостях и тканях (содержание мочевины в крови человека в норме 18–38 миллиграммов на 100 миллилитров (мг/100 мл)). Биосинтез мочевины из конечных продуктов распада белков – NH_3 и CO_2 – происходит в печени в результате ряда биохимических реакций – цикла мочевины, или орнитинового цикла (мочевина и орнитин образуются при ферментативном расщеплении аминокислоты аргинина). У животных, связывающих NH_3 в мочевую кислоту, орнитиновый цикл утрачен. Мочевина участвует в регуляции водного режима животных:- поддерживает гипертоничность тканей (акуловые рыбы) и обеспечивает их гидратацию (наземные животные). Мочевина выводится почками и потовыми железами (человек выделяет около 25–30 граммов (г) мочевины в сутки). Содержание мочевины в моче зависит от количества и состава белков в пище, уровня распада белков (увеличивается при физической работе, повышении температуры тела, сахарном диабете). При нарушении функции почек и заболеваниях, связанных с усиленным распадом тканевых белков, содержание мочевины в крови возрастает (смотрите Уремия). Мочевина и орнитиновый цикл найдены у Грибов и высших Растений. В промышленности мочевину получают из аммиака и двуокиси углерода (160–200 °C, 100–400 ат):- $2NH_3 + CO_2$ ® $(H_2NCOONH_4)$ ® $H_2NCONH_2 + H_2O$. Она находит широкое применение. Мочевина – исходный материал для получения карбамидных смол (смотрите Мочевино-Формальдегидные Смолы), а также удобрений (смотрите Мочевино-Формальдегидные Удобрения), цианатов, гидразина, циануровой кислоты и её эфиров, некоторых красителей, снотворных средств (например, веронала, люминала, бромурала); в медицинской практике мочевину чистую используют как дегидратационное средство для предупреждения и уменьшения отёка мозга и тому подобного. В Сельском Хозяйстве:- Мочевина – одно из лучших концентрированных азотных удобрений. Содержит 46% N, слабо гигроскопична. Мочевину выпускают в основном гранулированной, она не слёживается, хорошо рассевается. Применяют мочевину как допосевное удобрение и для подкормок (в том числе некорневой) под многие сельскохозяйственные культуры на всех почвах. Наиболее высокие прибавки урожая получены на увлажнённых дерново-подзолистых почвах и в условиях орошения при внесении под сахарную свёклу, овощные культуры, картофель. В рубце жвачных обитают микроорганизмы, способные использовать мочевину для биосинтеза белка, поэтому её добавляют в корма как заменитель белка.

UREA–FORMALDEHYDE RESIN = МОЧЕВИНОФОРМАЛЬДЕГИДНАЯ СМОЛА – Urea-Formaldehyde Resin:- any of a class of substances belonging to the family of organic polymers, prepared by heating urea and formaldehyde in the presence of mild alkalies, such as pyridine or ammonia. The urea and formaldehyde undergo a condensation reaction in which they combine to form a water-soluble polymer. This polymer is used to formulate adhesives and coating agents or is mixed with wood fibre, pigments, and other substances to produce powders that can be molded into solid objects. Under the influence of heat and pressure, further reactions occur that can convert the polymer into a moisture- and heat-resistant resin. The molecular structure of the final product is that of a three-dimensional network resembling those of resins made by the reaction of formaldehyde with phenol or with melamine. Different types of urea-formaldehyde resins are used in making molded articles, such as buttons, tableware, and housings for apparatus, and in adhesives, lacquers, and agents that render textiles resistant to creasing or crushing.

UREAP = RATIO OF UREA–N PRICE TO ROUGH RICE PRICE

UREASE = УРЕАЗА – Urease:- an enzyme that catalyzes the hydrolysis of urea, forming ammonia and carbon dioxide. Found in large quantities in jack beans, soybeans, and other plant seeds, it also occurs in some animal tissues and intestinal microorganisms. Urease is significant in the history of enzymology as the first enzyme to be purified and crystallized (by James B. Sumner in 1926). This achievement laid the groundwork for the subsequent demonstration that urease and other enzymes are proteins. / Под Уреазой, от новоЛатинского слова Urea, означающее Мочевина, или Карбамид-Амидогидролазой понимается фермент класса гидролаз. Уреаза катализирует разложение мочевины на аммиак и двуокись углерода. Обнаружена во многих Бактериях, Грибах, Растениях (особенно большие количества уреазы содержатся в семенах Бобовых, например, Сои, Канавалии), а также у некоторых Беспозвоночных. Активную уреазу содержат уробактерии. Уреаза – первый фермент, полученный в кристаллическом виде Американским химиком Дьжеймзом Батчэлё Самнё (James Batcheller Sumner; 1887–1955) в 1926. Благодаря высокой специфичности уреазы её применяют для количественного определения мочевины.

UREC = UNAVOIDABLE RESIDUAL ENVIRONMENTAL CONTAMINATION

URENA = УРЭНЬА (или УРЕНА) – Urena (Urena Lobata):- a Plant of the Family Malvaceae and its fiber, one of the bast fiber group. The Plant, probably of Old World origin, grows wild in tropical and subtropical areas throughout the world. The name Urena apparently derives from the name given to the plant on India's Malabar Coast. Urena was used for its fiber in Brazil from ancient times, but it has been slow in achieving importance as a cultivated fiber crop and is still considered a troublesome weed in some countries. Commercial cultivation of the plant began in the Belgian Congo (now Zaire) in the 1920s and in Central Africa in the 1930s. The plant, an herbaceous perennial, is usually many-branched in the wild state and grows about 1 to 2 m (3 to 7 feet) high. Cultivated plants, densely sown, reach 3 to 4.5 m (10 to 15 feet) in height, with branches and leaves mainly concentrated near the top. The leaves vary in size and shape but are usually somewhat round, with 3 to 7 lobes and serrated edges. The flowers, growing singly from the angle between the leafstalk and plant stem (leaf axil), have five petals that are usually pink. The small seeds have hooklike appendages and are produced in the greatest quantities by uncultivated plants. Urena grows best in hot, humid climates, with direct sunlight, and in rich, well-drained soil. It is found growing wild in the tropical and temperate zones of North and South America and in Asia, Indonesia, the Philippines, and Africa. Cultivated crops, usually grown as annuals, are found mainly in the Congo Basin and Central Africa, with smaller plantings in Brazil, India, and Madagascar. Harvesting when the plants are in full flower yields a fiber of high quality. The plants' stalks are cut by hand, above the woody plant base. After the stalks are subjected to a retting operation, the fibers are removed by hand. Urena fiber is lustrous and creamy white or pale yellow in color. The fiber strands are about 1 m (3.3 feet) long. Urena fiber is fine, soft, and flexible and is readily dyed. Used much like jute, which it resembles in appearance and strength, Urena is made into cordage, burlap (hessian), sacking fabrics, and carpeting materials and is often blended with jute or other fibers. Also known as Aramina, Bun Ochra, Caesar Weed, or Congo Jute.

URETHANE = УРЕТАН (или КАРБАМАТ) – Urethane is the name of a group of organic chemical compounds or resins built from isocyanate, a very reactive material that liberates gas during reaction to produce foams of various types. Two types of compounds that react with isocyanate to form foam are polyesters and polyethers. Polyurethanes are used for foams and in other compounds in fiber form. The polyester variety should not be confused with polyester fibers. See also Spandex Fiber. / Под Уретанами или Карбаматами, NH_2COOR (R – углеводородный радикал), понимаются эфиры не известной в свободном состоянии

карбаминовой кислоты NH_2COOR; кристаллические вещества. Служат для идентификации спиртов и фенолов. Производными уретанов являются многие инсектициды, фармацевтические препараты и другие. Смотрите также Полиуретан. Уретаны или Карбаматы, NH_2COOR, эфиры неизвестной в свободном состоянии карбаминовой кислоты HaNCOOH; бесцветные кристаллические соединения. В отличие от самой кислоты, уретаны устойчивы; так, для этилуретана $H_2NCOOC_2H_5$, называемого иногда просто уретаном (отсюда и название всего класса), $t_{пл}$ 49 °C, $t_{кип}$ 184 °C. Уретаны получают взаимодействием спиртов с мочевиной $CO(NH_2)_2$, изоциановой кислотой HNCO или другими методами. N–замещённые уретаны, образующиеся в результате реакции изоцианатов RNCO со спиртами и фенолами, служат для идентификации последних. Широкое применение в промышленности получили полиуретаны, используемые в виде уретановых каучуков, полиуретановых клеев, полиуретановых лаков, полиуретановых волокон. Некоторые замещённые уретаны применяют как лекарственные средства (например, прозерин, карбахолин, пропанидид).

UREX = SIMPLIFIED VERSION OF PUREX = SIMPLIFIED VERSION OF PLUTONIUM URANIUM EXTRACTION PROCESS

URGENT CONSIGNMENTS = НЕОТЛОЖНЫЕ ПАРТИИ ТОВАРОВ (или СРОЧНЫЕ ГРУЗЫ) – Urgent Consignments (UC):- e.g., live animals and perishable goods. Certain goods, either because of their nature or because of the special circumstances surrounding their shipment, need to be conveyed rapidly from one country to another and cleared through Customs with a minimum of delay. These goods are usually referred to as Urgent Consignments, examples of which are perishable goods, live animals and newspapers. There are two categories of urgent consignments, those goods which are urgent due to their nature and goods which are urgently required because of the circumstances in which they are being sent. The basic provisions of Chapter 3 of the General Annex of the Kyoto Convention address the simplified procedures leading to the rapid clearance of urgent consignments. In particular, Standard 3.34 of the General Annex requires Customs administrations to process live animals, perishable goods and other goods which the Customs accept are urgently required, as a matter of priority. In some instances, for those goods which fall under the category of urgently required, the importer/exporter may be required to provide a request for urgent examination by Customs and indicate the reason why the goods are urgently needed. One type of consignment that clearly falls within the category of goods which are urgently required is relief consignments. This Chapter provides for rapid clearance of goods such as medicaments, vaccines, and replacement parts, etc, which are intended to aid those affected by disasters. Goods used by disaster relief personnel in order to perform their duties would also be considered relief consignments. Goods such as firefighting and rescue equipment, scientific and medical equipment, equipment for use in searches, investigations and salvage in connection with accidents, are examples of goods used by disaster relief personnel in order to perform their duties. / Срочные Грузы:- товар, который по своей природе требует быстрого прохождения через таможню, например, скоропортящиеся грузы.

URIC ACID = МОЧЕВАЯ КИСЛОТА – Uric Acid:- a compound belonging to the purine group, and the chief form in which nitrogen, resulting from the breakdown of protein during digestion, is excreted by reptiles and birds. Small quantities of uric acid (about 0.7 gram per day) are excreted by humans as a product of the breakdown of purines that are constituents of nucleoproteins. In persons suffering from gout, however, the level of uric acid in the blood may be high. Minute quantities of a sodium salt of uric acid, precipitated in cartilage and bone, are the cause of gout. Uric Acid is a chemical created when the body breaks down substances called Purines. Purines are normally produced in the body and are also found in some foods and drinks. Foods with high content of purines include liver, anchovies, mackerel, dried beans and peas, and beer. Most uric acid dissolves in blood and travels to the kidneys. From there, it passes out in urine. If your body produces too much uric acid or does not remove enough if it, you can get sick. A high level of uric acid in the blood is called Hyperuricemia. / Мочевая Кислота, 2,6,8-триоксипурин, бесцветные кристаллы, разлагаются ниже температуры плавления, плохо растворимы в воде. Мочевая кислота была открыта Шведским химиком Калем Вильхэльмом Шиэле (Carl Wilhelm Scheele; 1742–1786) в 1776 в составе мочи (отсюда название). Существует в двух формах:- (i) кетонная форма и (ii) енольная форма. У человека и приматов – конечный продукт обмена пуринов (смотрите Пуриновые Основания), образующийся в результате ферментативного окисления ксантина; у остальных Млекопитающих мочевая кислота превращается в аллантоин. Небольшие количества мочевой кислоты содержатся в тканях (мозг, печень, кровь), а также в моче и поте Млекопитающих и Человека. При некоторых нарушениях обмена веществ происходит накопление мочевой кислоты и её кислых солей (уратов) в организме (камни в почках и мочевом пузыре, подагрические отложения). У Птиц, ряда Пресмыкающихся и большинства наземных Насекомых мочевая кислота – конечный продукт не только пуринового, но и белкового обмена. Система биосинтеза мочевой кислоты (а не мочевины, как у большинства позвоночных) в качестве механизма связывания в организме более токсичного продукта азотистого обмена – аммиака – развилась у этих животных в связи с характерным для них ограниченным водным балансом (Мочевая кислота выводится из организма с минимальным количеством воды или даже в твёрдом виде). Высохшие экскременты Птиц (гуано) содержат до 25% мочевой кислоты и служат источником её получения. Обнаружена она и в ряде Растений. Мочевая кислота – исходный продукт для промышленного синтеза кофеина.

URICC = UPLAND RICE RESEARCH INTERCENTER COORDINATING COMMITTEE

URIDINE = УРИДИН – Uridine is a nucleoside form of uracil. / Уридин или Урацилрибозид, органическое вещество, нуклеозид, состоящий из остатков пиримидинового основания урацила и углевода рибозы. Белый порошок либо длинные игло- или призмоподобные кристаллы. Растворим в воде, кислотах, щёлочах, нерастворим в эфире, концентрированном этаноле; молярная масса 244.2. Присутствует во всех живых клетках в составе рибонуклеиновых кислот. Играет важную роль в углеводном обмене, входя в состав многих коферментов.

URINE = УРИНА (или МОЧА) – Urine:- liquid or semisolid solution of metabolic wastes and certain other, often toxic, substances that the excretory organs withdraw from the circulatory fluids and expel from the body. The composition of urine tends to mirror the water needs of the organism. Freshwater animals usually excrete very dilute urine. Marine animals tend to combat water loss to their salty environment by excreting concentrated urine; some develop methods actively to expel salts. Terrestrial animals, depending on their habitat, usually retain water and secrete a highly concentrated urine. In most mammals, including man, urine is formed in the nephrons of the kidneys by filtration of blood plasma into the nephron; the fluid found within the nephron is known as Capsular Urine and is essentially the same as blood plasma without the macromolecules (e.g., proteins). As the capsular urine passes along the nephron tube, water and useful plasma components such as amino acids, glucose, and other nutrients are reabsorbed into the bloodstream, leaving a concentrated solution of waste material called final, or bladder, urine. It consists of water, urea (from amino acid metabolism), inorganic salts, creatinine, ammonia, and pigmented products of blood breakdown, one of which (urochrome) gives urine its typically yellowish color. In addition, any unusual substances for which there is no mechanism of reabsorption into the blood remain in the urine. The products of nucleic acid breakdown are present as allantoin in most mammals and as uric acid in man and, through a quirk of breeding, in the Dalmatian dog. In most birds, reptiles, and terrestrial insects, the end product of amino acid metabolism is not water-soluble urea but insoluble uric acid. The urine of birds and reptiles is a whitish, aqueous suspension of uric acid crystals that is passed into the cloaca and mixed with fecal material before being expelled. The urine of terrestrial insects is solid and in some cases is stored

as pigment in the body rather than being expelled. Amphibians and fishes excrete aqueous solutions of urea; unlike those of mammals, however, their excretory organs do not reabsorb large quantities of water, so their urine remains dilute. Some marine animals retain much of the urea in the blood, thus retarding osmotic water loss. In small, primitive animals (teleost fishes, echinoderms, coelenterates, and single-celled animals), particularly those that live in aqueous environments, the end product of amino acid metabolism is the highly toxic gas ammonia, which is collected and expelled in a dilute aqueous solution. Many of the smaller animals develop no excretory system; each individual cell disposes of its waste products to the circulatory fluids, and the wastes then diffuse to the surrounding medium.

URISA = URBAN AND REGIONAL INFORMATION SYSTEMS ASSOCIATION

UROKINASE = УРОКИНАЗА – Urokinase is a thrombolytic (i.e. clot-dissolving) enzyme used as a bio-pharmaceutical.

URRC = UBON RICE RESEARCH CENTER

URTICACEAE = УРТИКАСЭАЭ (или КРАПИВНЫЕ) – Urticaceae:- the nettle Family comprising about 45 Genera of Herbs, Shrubs, small Trees, and a few vines, distributed primarily in tropical regions. The Family is typical of the Nettle Order (Urticales). Many Species, especially the Nettles (Urtica) and Australian Nettle Trees (Laportea), have stinging hairs on the stems and leaves. The leaves are varied and the sap is usually watery. The small, greenish flowers often form clusters in the leaf axils. Both male and female flowers may be borne on the same plant. The curled stamens of the male flowers straighten quickly as the flowers open, releasing the pollen. The dry, one-seeded fruit often is enclosed by the outer whorl of the flower cluster. The long fibres in the stems of some Species, such as Ramie (Boehmeria Nivea), are used in the textile industry. One Species of Australian nettle tree, Laportea Moroides, is cultivated for its raspberry-like flower clusters. Pilea, a Genus of creeping Plants that includes the Artillery Plant (Pilea Microphylla), and Pellitory (Parietaria), a Genus of wall Plants, are grown as ornamentals. Baby tears (Helxine Soleiroli), a mosslike creeping Plant with round leaves, often is grown as a ground cover. The Trumpet Tree (Cecropia Peltata), a tropical American Species, has hollow stems that are inhabited by biting ants. / Крапивные (Urticaceae), Семейство Двудольных Растений, родственное Семейству Тутовых. Однодомные или двудомные травы, полукустарники и кустарники, редко небольшие деревья с мягкой древесиной, очень редко – Лианы. Листья очередные или супротивные, простые. Цветки мелкие, невзрачные, большей частью в сложных цимозных соцветиях, обычно однополые и правильные. Около 45 Родов (свыше 700 Видов), распространённых почти повсеместно, но более всего в тропической области. Представители некоторых родов, в том числе Крапива, Лапортея и Жирардиния, снабжены жгучими волосками, вызывающими при прикосновении к ним ожоги. В бывшем Союзе Советских Социалистических Республик (СССР) 6 Родов (21 Вид) – Крапива, Постенница и 4 Рода на Дальнем Востоке. Некоторые Крапивные, например, Рами, – прядильные растения. Крапива или Кропива (Urtica), Род Многолетних или Однолетних Травянистых Растений Семейства Крапивных. Листья супротивные, зубчатые или с глубокими лопастями, обычно покрытые, как и стебли, жгучими волосками. Цветки очень мелкие, однополые, 4-членные, в пазушных колосовидных ветвящихся соцветиях. Плод орешковидный. 40–50 Видов в умеренном поясе Северного и реже Южного полушария, а также в тропиках. В бывшем Союзе Советских Социалистических Республик (СССР) 10 Видов, встречающихся почти повсеместно в тенистых сырых лесах и кустарниках и как сорные у жилья, в садах, огородах и тому подобном. Наиболее распространены многолетняя Крапива Двудомная (Urtica Dioica) и однолетняя однодомная Крапива Жгучая (Urtica Urens). Листья Крапивы Двудомной и в меньшей степени Крапивы Жгучей содержат витамины С, К, B_2, каротин (провитамин А), гликозид уртицин, дают зелёную краску, используемую в фармацевтической и пищевой промышленности. Оба эти вида используют с лечебными целями:- жидкий экстракт из листьев применяют внутрь как кровоостанавливающее средство. Молодые побеги Крапивы употребляют для супов и салатов, а также как корм для домашнего скота и птицы. Из стеблей получают волокно для изготовления верёвок и грубых тканей.

URTICALES = УРТИКАЛЭС (или КРАПИВНЫЕ, или КРАПИВОЦВЕТНЫЕ, или ТУТОВЫЕ) – Urticales:- Nettle Order of Dicotyledonous flowering Plants, the largest Order in the Subclass Hamamelidae. The Order includes a diversity of Plant Types that range from small herbaceous Species to large trees. Among the members are stinging Nettles; Mulberry, Fig, and Elm Trees; Hop Vines; and the Hemp, or Marijuana, Plant. Distribution And Abundance:- The Urticales comprise six Families (Barbeyaceae, Cannabaceae, Cecropiaceae, Moraceae, Ulmaceae, and Urticaceae) and approximately 2 200 to 2 300 Species. Alternative classifications link the Urticales with the Malvales (Subclass Dilleniidae) and Euphorbiales (Subclass Rosidae) and even Violales (Subclass Dilleniidae), a relationship first proposed in the mid-1800s. It is largely because of the traditional association of the order with other members of the Amentiferae that it continues to be retained in the Hamamelidae. The Barbeyaceae are rather unusual in the order but have been placed in the Urticales by some botanists for lack of a better alternative classification. The relationship of the other five families to each other has not been seriously questioned, although the Ulmaceae are usually considered to be somewhat distantly related to the other four. Besides containing most of the herbaceous members of the Hamamelidae, the Urticales are unusual within the subclass Hamamelidae in flowering mostly from late spring to early fall. Whether or not this is a significant means of classifying the Urticales with the Hamamelidae, it may be more than coincidental that members of the orders Malvales (Dilleniidae) and Euphorbiales (Rosidae), considered by some taxonomists to be the closest relatives of the Urticales, also display peak flowering during the warmer parts of the year and after the leaves have fully developed. The Ulmaceae contain about 150 Species, all woody, in about 15–18 Genera. The majority of the Species are in only three Genera:- Celtis, Trema, and Ulmus. The family is widely distributed in temperate and tropical areas but occurs especially in the Northern Hemisphere. The Genus Celtis (the Hackberries) is the largest in the Family, with about 70 Species distributed in the Northern Hemisphere and in Southern Africa. The elms consist of about 45 Species in north temperate areas but extend as far South as the Himalayas and Indochina in Asia and Mexico in North America. Other Genera in the tropics and subtropics include Trema, 15 Species; Gironniera, 6; Ampelocera, about 5; Parasponia, 5–6; and Chaetachme, 4. The Genus Zelkova, with about 3 Species, has a discontinuous distribution and is found from the Eastern Mediterranean region to the Caucasus and in Eastern Asia. The Genus once had a much wider distribution, dating back to the Early Tertiary (about 60 million years ago), and is known in the fossil record from several sites in North America and Eurasia. Pteroceltis, with one Species, is restricted to Eastern Asia, and Planera, also with a single Species, the planer tree, or water elm (P. Aquatica), is native to the southeastern United States. Species of Ulmus, Zelkova, and Celtis are frequently cultivated as ornamentals. The Moraceae, with about 40 Genera and 1 000 Species, are found principally in the tropics and subtropics, but a few Genera, such as Morus, the mulberry (the food plant of the silk moth, Bombyx mori, in Asia), and Broussonetia (a source of fibers for paper in Asia), are primarily distributed in temperate regions. Ficus, the largest Genus, contains between 700 and 800 Species. It is a taxonomically complex group that includes Trees, Shrubs, Lianas, and strangler Figs and contains food Plants (the common fig, Ficus Carica), ornamentals (India Rubber Tree, Ficus Elastica; the weeping Fig, Ficus Benjamina; and the sycamore Fig, Ficus Sycomorus), and the bo tree, or sacred Fig (Ficus Religiosa), of religious significance to Buddhists and Hindus and under which the Buddha is believed to have attained Enlightenment. The Banyan (Ficus Benghalensis) spreads by dropping aerial roots from the branches to the ground to become accessory trunks. The branches continue to grow horizontally so that a single individual eventually resembles a grove of trees. The famous banyan in the Indian Botanic Garden in Calcutta is more than 300 meters in circumference. Osage orange of the South-central United States is occasionally

cultivated. Breadfruit is an important dietary staple in the Old World tropics, and mulberries are a source of juicy fruits to birds, animals, and humans in temperate regions. The Urticaceae can be divided into 5 tribes containing about 45 Genera and between 800 and 1 000 Species, which are mostly herbs but are occasionally shrubs or even trees. The Genera Pilea and Elatostema each contain less than 300 Species and are almost entirely tropical and subtropical. Some of the tropical and subtropical species of Urticaceae are shrubs or trees; many of the herbaceous species form dense ground covers in moist climates or grow as epiphytes on moss-covered tree trunks and tree branches in humid regions. Although there are not many Species in temperate areas, the often Weedy Family may occupy extensive areas and may become so dense as to prevent the growth of other Species of Plants. The stinging Nettles (Urtica) can be especially common, widespread, and often abundant. Single plants of Urtica Dioica are able to form extensive colonies within a short time by growing underground stems called Rhizomes. Genera of the Family Cecropiaceae often have been placed within either the Moraceae or Urticaceae, although they do form a tightly circumscribed and concordant natural group. The Cecropiaceae (6 Genera and about 300 Species) consist of trees, shrubs, or woody vines. The sexes are found on separate plants (dioecious), in contrast to members of the Moraceae and Urticaceae, where most members retain both sexes on the same plant, but in different flowers. The largest Genus, Cecropia, with about 100 Species of large, palmately lobed leaves, comprises fast-growing pioneer trees that are prominent in disturbed areas in the New World tropics. The Cecropiaceae produce mucilaginous sap (latex). The Cannabaceae, although consisting of only two Genera and three Species, are well known and economically important for hops (Humulus Lupulus) and marijuana or hemp (Cannabis). Cannabis contains a single Species with two Subspecies, Cannabis Sativa and Cannabis Indica, the former selected for its fibers (the source of hemp) and the latter selected for its high concentration of the compound Δ9-tetrahydrocannabinol (THC), a drug that exerts effects on the central nervous system and cardiovascular system. Both Subspecies are coarse, erect, annual, dioecious herbs with opposite and alternate leaves. Species of Humulus are twining or scrambling herbs. The leaves are palmately compound in Cannabis; in Humulus, they are palmately lobed. The taxonomic position of the Family Barbeyaceae, with one Species in northeastern Africa and adjacent Arabia, is uncertain. The separate or partially fused carpels and primitive phloem are unusual in the Urticales, and some taxonomists have preferred to defer on the placement of the family until additional evidence becomes available. Economic And Ecological Importance:- Members of the Moraceae are distributed in the tropics and subtropics of both hemispheres, with some Genera extending into temperate regions. In the Ulmaceae, a Family often divided into two Subfamilies, the Genus Ulmus (Elm) is widely distributed in North temperate areas, as are its closest relatives; members of the other Subfamily, which includes the large Genus Celtis, are for the most part confined to the tropics and subtropics. The Urticaceae are widespread in most tropical regions of the world, where some are troublesome Weeds. Several Genera in the Mulberry Family are valuable sources of timber. In Africa, the wood of Antiaris, while not highly durable, is suitable for veneer and plywood, furniture components, and light construction. The light wood of the umbrella tree, Musanga Cecropioides, is used as a substitute for cork in floats and rafts, insulation, and model-making; it is a short-lived tree, suitable for plantation culture. Two species of iroko, Chlorophora Excelsa and C. Regia, cover the breadth of tropical Africa and produce durable heartwood used in joinery, boat-building and marine work, flooring, furniture, and veneer; it is often used as a substitute for oak and teak. Another Species in tropical America, C. Tinctoria (Fustic), is used in heavy construction, planking, and flooring. In Southeast Asia and Oceania, Species of Artocarpus, the same Genus cultivated for the breadfruits and jackfruits, produce woods of variable durability used in joinery, furniture and cabinetwork, and musical instruments. In the American tropics, Bagassa, Brosimum, Clarisia, Helicostylis, and Poulsenia are all sources of wood for general construction. Brosimum Guianense (Letterwood, also called Leopardwood or Snakewood), is employed in inlays, turnery, fancy handles for cutlery, and violin bows, while B. Paraense, the Brazilian redwood, is used for furniture. Species of Trophis are used locally in Venezuela. In the Cecropia Family (Cecropiaceae), C. Peltata, or Trumpetwood, resembles the North American black Cottonwood (Populus Trichocarpa; Salicaceae) in density and mechanical properties and is used in making boxes, plywood, and particle-board stock. In the Ulmaceae, most Species of Ulmus produce a superior timber with a distinctive grain and a strong resistance to decay; several Species in North America provide wood for boxes, baskets, veneer for fruit and vegetable containers, and the bent parts in furniture. The American Elm, U. Americana, once an important street tree prized for its graceful form and stature, has been nearly eliminated by Dutch elm disease. Hackberry (Celtis) wood, similar to that of elm in structure, is usually cut into lumber for furniture and containers; C. Mildbraedii of Western, Central, and Eastern Africa, while not durable, has good strength properties and can be used for flooring, commercial plywood, and veneer. In tropical America, the San Domingo boxwood, Phyllostylon Brasiliensis, has been suggested as a substitute for true boxwood (Buxus; Rosidae). It produces a fine-textured, lemon-yellow, straight-grained wood valued for the high polish it will accept; stained black, it has been used as a substitute for true ebony. The wood of Planera Aquatica is fragrant and used in cabinetmaking. The lightweight wood of Chaetachme Microcarpa, a shrub of central and southern Africa, is used for the manufacture of guitars and other instruments. The wood of Ficus is soft and of comparatively little value, but it does find use as lumber. Ficus Benghalensis has wood that is durable in water. The wide, flat, finlike buttress roots of large individuals of F. Elastic – the rubber tree grown as a houseplant – are used in tropical regions to make planks. Ficus Sycomorus, a wood of great durability, was used by the Egyptians to make mummy cases. Hemp, or Cannabis (Cannabis), has been cultivated since ancient times for the strong fiber, similar to flax, produced in its stems. Peak production was reached in the mid-XX century; costly spinning methods and competition from other fibers, both natural and synthetic, have contributed to the decline in its use. The plant is now increasingly known for the nonfiber-bearing Subspecies that is grown for the drug marijuana, derived from the upper leaves and flowers. The fiber of the Ramie Plant, Boehmeria Nivea, is currently cultivated mainly in China, the Philippines, and Brazil. Because the fibers must be separated from gums and pectins within the plant before they can be spun, the extraction process is more complicated than that for flax or jute; however, the tensile strength of ramie seems to compare well with that of Cotton, Flax, and Hemp, and it is especially suitable for blending with synthetic fibers. The fibers also are used to produce papers, cordage, and industrial bagging. Other plants with fibers like those of ramie are sometimes used as substitutes; they include Sarcochlamys Pulcherrima (duggal fiber) and Pouzolzia Occidentalis (Yaquilla). Olona (Touchardia Latifolia) was formerly an important fiber plant of Hawaii, used for cloth, cordage, and especially fishnets because of its durability in water. Several other members of the Urticaceae also yield fibers. The latex of the Figs Ficus Glabrata and Ficus Laurifolia contains the proteolytic enzyme ficin, which digests Ascaris (roundworm) without harming the human host. It is used extensively in South America and Panama. In Mexico, the caustic latex of trumpetwood is used to remove warts. The latex of several members of the mulberry Family – e.g., Artocarpus Cummingiana in the Philippines and Ficus Platyphylla in Africa – is variously treated and used as chewing gum. The fustic in tropical America, and Ficus Species in Fiji and China, are used to treat toothache. The latex of Antiaris Toxicaria, the upas tree, contains an extremely toxic cardiac glycoside, which has the effect of increasing the force of contraction of the muscles of the heart; in tropical Asia, it is a valuable source of poison for arrows and darts. Osage orange of central North America is suspected of being toxic to livestock; its milky latex can also irritate skin. The wind-borne pollen of many members of the Urticales, especially the elm and mulberry Families, is responsible for attacks of allergic rhinitis and bronchial asthma. The irritants in the stinging hairs or spines of many Genera in the Urticaceae, including Laportea (Nettle tree), Hesperocnide, Urera, and Urtica (Nettle) cause painful inflammatory skin reactions that can last from a few seconds to several days. Ficus Carica, the common fig, can provoke phytophotodermatitis, and hops (Humulus Lupulus) can cause contact dermatitis. The Moraceae contain several highly valued tropical species long cultivated for their fruits. The Fig (Ficus) is considered to be one of the first foods to be preserved by drying. Production of Ficus Carica, the only fig grown commercially as food, is highest in the Mediterranean region (Turkey, Greece, and Italy)

and the United States. The breadfruit, Artocarpus Altilis, is an extremely important food source throughout Southeast Asia and the Pacific; more recently it has been widely cultivated in the New World tropics and in Africa. The fruit, usually about the size of a grapefruit and seedless, consists of a starchy, pulpy white mass that is customarily cooked before eating. In the seeded form, the seeds are boiled or roasted and have a flavour similar to that of the chestnut. The jackfruit, or jakfruit, tree, Artocarpus Heterophyllus, bears one of the largest known edible fruits and has been cultivated for centuries throughout much of Southern Asia. While it has not gained the popularity of the breadfruit, its pulp and seeds are used in cooking. A number of lesser fruits of the order also are eaten; examples of such include the breadnut (Brosimum Alicastrum), mulberries (Morus Alba, the white mulberry; Morus Rubra, the red mulberry; and Morus Nigra, the black mulberry), and hackberries (Celtis Occidentalis, Celtis Selloviana and Celtis Iguanaea). In addition, the fruits of the following plants are edible:- Debregeasia Edulis, a Chinese and Japanese shrub that produces red or yellow fruits resembling Raspberries; Pourouma Cecropiifolia, a Brazilian tree with round, fleshy berries; Cudrania Javanensis; Myrianthus Arboreus; and Sahagunia Strepitans. Moraceae contains a number of latex-producing plants. Although Ficus Elastica was used as an early source of rubber, especially during World War II, the bulk of the world's rubber now comes from the para rubber tree, Hevea Brasiliensis, a member of the Family Euphorbiaceae (Rosidae). Several Species of Castilla, notably Castilla Elastica, are still used locally for rubber production. Latex from Ficus Species and Artocarpus Altilis is also employed in chewing gums, in glues and caulking compounds, and in birdlime, a sticky substance used to ensnare birds. Brosimum Galactodendron, the cow tree or milk tree of South America, produces an abundance of latex similar in taste to ordinary milk. Another plant of great economic importance is the hop, Humulus Lupulus, the female flowers of which are used to flavour beer and to clarify it by precipitating the protein materials that cause turbidity. The active principles of the hop also help prevent spoilage by retarding the growth of Bacteria in the beer. The leaves of the Mulberry (Morus) are the principal food of Silkworms, and the inner bark of the paper mulberry, Broussonetia Papyrifera, is used to make paper. Several members of the Urticales serve as ornamentals. The breadfruit is also a handsome ornamental with a luxuriant crown of large leathery leaves. Elms are often planted for their stately appearance. Several Species of Ficus are important in the horticulture trade; these include Ficus Elastica (the India Rubber Plant), Ficus Lyrata (fiddle-leaf Fig), Ficus Pumila (creeping or climbing Fig), and Ficus Benghalensis (Banyan). Characteristic Morphological Features:- Plants of the Urticales are evergreen or deciduous trees, shrubs, vines (both woody and herbaceous), or herbs (mostly in the family Urticaceae). They commonly have mucilage cells and canals and often have cystoliths (which probably serve as protection from insects), as in the Urticaceae, or laticifers (latex cells), as in Moraceae. The leaves are usually alternate, rarely opposite, in the Moraceae and Ulmaceae, but commonly opposite in the Urticaceae and Cannabaceae. Most leaves are simple and often oblique at the base. A few species have pinnatifid or palmately incised leaves (palmately lobed in Humulus, palmately compound in Cannabis). The flowers are wind-pollinated or insect-pollinated, with a complex and highly evolved method of pollination in Ficus. The small, inconspicuous, and usually unisexual flowers are typically arranged in cymose inflorescences (the flowers are rarely solitary or perfect). There are usually 4 or 5 tepals (sepals?), or sometimes as few as 2 or as many as 12, arranged in 1 or 2 whorls and sometimes fused with each other (connate) at the base. Tepals are rarely absent, although the flowers in the Urticales lack petals. The stamens are attached opposite the tepals and are equal to them in number; rarely are the stamens greater or less in number than the tepals. The pollen grains have at least two apertures. The ovary may be inferior or superior, usually with one or two styles. There is a single locule in each ovary and one ovule in each locule. Endosperm development is of the nuclear type; i.e. nuclei are formed by nuclear division, after which cell walls may form. The seeds may or may not contain endosperm. The fruits range from fleshy syconiums (figs), to dry achenes, to drupes (or drupelets), or frequently multiple fruits (fruits in which the ripened ovaries of many adjacent flowers are borne in clusters; these resemble the fruits of blackberries or raspberries, but in these the clusters are made up of the ripened ovaries of only a single flower). The family Ulmaceae is often divided into two Subfamilies, the Celtidoideae and Ulmoideae (as in this article's classification), or sometimes even into two separate Families, the Celtidaceae and Ulmaceae, on the basis of leaf venation, pollen characteristics, chemical composition, chromosome number, and fruit types. In the subfamily Celtidoideae the fruits are drupelike (fleshy, with one seed), and there are three strong main veins arising from the base of the leaf in addition to the pinnately arranged veins branching from the midvein. In the Ulmoideae, the fruits are dry, often winged, and the leaves are strictly pinnately veined. Members of the tribe Urereae (also known as Urticeae) are among the most conspicuous members of the Family Urticaceae (the Nettle Family) because of their stinging hairs. The stings are frequently a short-term irritant, but contact with some species can cause pain or numbness that lasts for several days. Fatalities have been reported in humans and domesticated animals from contact with the stinging hairs of Urtica Ferox and some Species of Dendrocnide and Laportea. The stinging hairs commonly have a bulbous or enlarged base and a slender tubular portion containing silica bodies. The tips of the stinging hairs break off on slight contact, leaving a sharp point that readily penetrates the skin, much like a hypodermic needle, allowing the fluid of the stinging-hair cell to enter the flesh. The compounds producing the stinging sensation in the Urticaceae have been reported to be histamine, acetylcholine, serotonin, and an unknown substance that also causes pain. Although the stinging members of the Urticaceae are among the most noticeable because of their irritating nature, they amount to only about 108 Species (10 percent of the Family). In addition to the stinging members of the Nettle Family, a few other plants in the order Urticales can cause skin irritations on contact. The fruits or leaves of the osage orange, for example, cause dermatitis in susceptible persons. Another feature characteristic of the Nettle Family and many members of the mulberry Family (Moraceae) is the presence of cystoliths, deposits of calcium carbonate inside enlarged epidermal (surface) cells. They are visible as dots or variously shaped marks, especially in pressed, dried leaves. Their function in the plant is unknown. Calcium carbonate deposits occur in another form in Chlorophora Excelsa (Moraceae), the source of iroko wood, which is very durable and practically immune to termites and wood-rotting fungi. The wood in about 3 percent of the trees carries streaks or lumps of calcium carbonate called Iroko Stones, which are hard enough to dull woodworking tools. Most members of the Order Urticales are wind-pollinated, and some Species have adaptations that enhance this process. Pilea Microphylla (Urticaceae), the artillery plant, for example, ejects its pollen in tiny explosive puffs. Many Genera, particularly in the Family Urticaceae, exhibit the same phenomenon. In the flower buds of the Nettles (especially Species of Urtica), the stamens (male, pollen-producing structures) are bent inward and held under tension (inflexed) in the bud. When the flower opens, the stamens are suddenly released and spring out with such violence that the anthers, or pollen sacs, are turned inside out, ejecting their pollen in a cloud. The pollen is then carried by the wind to the large, brushlike stigmas of other flowers. Like most wind-pollinated flowers, these flowers tend to be inconspicuous, green, and petalless. The flowers of the Genus Parietaria, unlike those of most other members of the Family Urticaceae, are bisexual in that they have the functional organs of both sexes. Self-fertilization is averted by the early maturation of the pistil, a condition known as Protogyny. In this process of fertilization, the elongated upper part of the pistil (the style and stigma) projects from the tip of the unopened flower bud ready to receive pollen from mature flowers. When the flower opens, the stamens have fully developed and release their pollen explosively, but the ovules of these flowers have already been fertilized and the style has dropped off. Most of the species in the Moraceae (the Mulberry Family) are trees, shrubs, lianas, or, rarely, herbs. All except the herbaceous genus Fatoua produce a milky latex in special cells (laticifers) found in most parts of the plant. Plants in the Moraceae sometimes produce alkaloids and usually tannins (at least proanthocyanins). Some Species of the Moraceae are pollinated by insects, particularly the figs (Ficus), where complex interdependencies between the plants and their insect pollinators have evolved. Pollination is accomplished by small wasps called fig wasps or gall wasps (Blastophaga Psenes). In the figs, separate male and female flowers are borne in a specialized inflorescence that consists of a hollow, pear-shaped stem tip with the flowers on the inside. This

structure, called a Syconium, ultimately matures into a fig. The male flowers are usually arranged near the small opening at the upper end of the syconium, and the female flowers, much more numerous, line the interior. The female flowers are of two types, long-styled fertile flowers and short-styled sterile ones. The long-styled flowers eventually produce a single, small, one-seeded, hard-shelled fruit termed the achene. The fig itself is actually a collection of many of these achenes surrounded by the fleshy tissue of the syconium. The short-styled flowers are called gall flowers; they do not develop fruits but are used as egg-laying sites by the gall wasps, which pollinate the other flowers while laying their eggs. The gall flowers then become a mass of pulpy, abnormal plant tissue, the gall, on which the wasp larvae feed and in which they develop. The three flower cluster types – male, long-styled female, and short-styled female (or gall flowers) – are produced in three distinctive syconia. The first type of syconium, produced in the spring, contains male flowers and gall flowers; each of the latter may contain one of the fig wasp eggs, deposited there in the spring by wasps that had just emerged from overwintering in another type of fig. These eggs produce wingless male and winged female wasps later in the summer. The male wasp bites through the wall of a gall containing a female wasp and mates with her. On leaving the fig to search for a suitable place to lay eggs, the female wasp becomes covered with pollen from the male flowers near the small exit hole at the tip of the fig. The second type of syconium, the true fig, bears only long-styled fertile female flowers. The female wasp, searching for egg-laying sites in summer, enters these figs and pollinates the flowers inside but does not lay eggs, because the styles are too long to suit the egg-depositing anatomy of the insect. The third type of syconium, produced in the autumn, contains only short-styled gall flowers. The eggs that are laid develop in the gall flowers and produce the following year's fig wasps. A symbiotic relationship exists between species of Cecropia (Cecropiaceae) and ants of the Genus Azteca. The ants establish colonies within the hollow trunks and stems of the Cecropia plants. The ants consume glycogen (an energy source generally produced by animals) and proteinaceous substances made by these trees. This food is continually replaced as it is eaten. There are thin areas in the stem walls through which the fertile female ants burrow to lay their eggs inside the stem. The ants provide a form of protection for the tree by viciously attacking and biting insects that would otherwise eat the plant and animals that would brush against it. The ants also chew through vines that twine around their host and clear away other vegetation that comes in contact with, and threatens to shade, the Cecropia plants. Other Cecropia plants that do not harbour Azteca ants are protected against leaf-cutting ants by a thick coating of wax on the stem, which prevents the latter from climbing up. Evolution:- The herbaceous habit and preference for moist environments, particularly in tropical and subtropical lowlands, are unusual in the Hamamelidae and are believed to have been important factors in the diversification of the Urticales. The order, which comprises approximately two-thirds of the Hamamelidae, is allied to other members of the subclass in floral features and resembles particular families (Betulaceae and Fagaceae) in its leaf venation. Pollen of the Urticales resembles fossil pollen of the Normapolles group. Thorne and Dahlgren have allied the anatomical features of the Urticales with the orders Malvales (Dilleniidae) and Euphorbiales (Rosidae). The curved embryos in the Urticales, Malvales, and Solanales are considered to be important in indicating close relationship among these groups. Thorne suggests that the Urticales show no close relationship to the Hamamelidae. The features he considers important in linking the order to the Malvales are the palmately veined, alternate, oblique, broad, stipulate leaves; the mucilage receptacles and cells and clustered crystals in the leaves and stems; extruded nucleoli in the sieve-tube elements; the alternating fibrous and nonfibrous layers in the phloem; and the often large and straight, bent, or folded embryos and other embryological features. The fossil record has not been particularly helpful in clarifying the relationships of the Urticales. Fossils considered to belong to the family Ulmaceae date back to the Turonian Age of the Late Cretaceous (roughly 90 million years ago), and extant Genera such as Ulmus (Elms), Zelkova (Keaki), Celtis (Hackberries), Aphananthe, and Gironniera are known from the early Tertiary. In contrast, the early history of the Moraceae, Cannabaceae, and Urticaceae is not well known. The earliest record of the Moraceae is in pollen assigned to the Family reported from the middle Eocene (about 45 million years ago), but both Moraceae and Cecropiaceae pollen have been reported from 2 million to 6.5 million years ago. Overall, the fossil record of the Urticales is poor:- only a single fossil flower, preserved in amber, from the Late Eocene (i.e. 40 to 37 million years ago) seems to be unquestionably of the Urticaceae. Fossils attributable with fair certainty to extant Urticales are found in deposits from the early to middle Tertiary. The oldest fossil woods of the Urticales, those of the Genus Ficoxylon in the Moraceae, are from the Paleocene to Miocene of Africa and Madagascar. More recent woods of this Genus are also known from North America, Europe, and Cambodia. Fruits are among the best fossils for certain identifications, but for the Urticales these, too, are scarce before the Eocene. From the late Eocene onward, however, the fossil record for the Order improves considerably, and many fossil fruits representative of extant Genera have been identified with certainty. / Порядок Крапивоцветные (Urticales). Тутовые (Moraceae), Семейство Двудольных Растений. Деревья и кустарники, гораздо реже – травы, содержащие (почти все) млечный сок. Листья с прилистниками, большей частью очередные. Цветки мелкие, невзрачные, правильные, однополые, в кистевидных, колосовидных, зонтиковидных или головчатых соцветиях; у многих Тутовых ось соцветия утолщена, имеет форму блюдца, чаши или шара. Околоцветник большей частью из 4 чашелистиков, иногда вовсе отсутствует. Плоды большей частью костянковидные, в соплодиях, часто сросшиеся между собой. Свыше 1 500 Видов (60–85 Родов), главным образом в тропиках и субтропиках; самый большой Род Фикус насчитывает около 1 000 Видов; в бывшем Союзе Советских Социалистических Республик (СССР) дико растёт Инжир, культивируют – Шелковицу (Тутовое Дерево), реже – Маклюру и немногие другие. Среди Тутовых много хозяйственно важных видов. Соплодия Инжира, Хлебного Дерева, Шелковицы и других, а также млечный сок Молочного Дерева съедобны; листья Шелковицы служат кормом для Тутового Шёлкопряда; Фикус Каучуконосный и Виды Рода Castilloa служат для получения каучука; Виды Родов Chiorophora, Бруссонетия, Маклюра, Шелковица и другие дают ценную древесину. Среди Тутовых есть ядовитые растения (Анчар).

URUGUAYAN PESO = УРУГВАЙСКОЕ ПЕСО – Uruguayan Peso:- UYU is the three-letter currency ISO code representing the currency of Uruguay which is commonly known as the Peso.

THE URUGUAY ROUND = УРУГВАЙСКИЙ РАУНД – The Uruguay Round was launched in September 1986. It was the most ambitious round to date, hoping to expand the competence of the GATT (short for the General Agreement on Tariffs and Trade) to important new areas such as services, capital, intellectual property, and agriculture. Agriculture was essentially exempted from previous agreements as it was given special status in the areas of import quotas and export subsidies, with only mild caveats. However, by the time of the Uruguay round, many countries considered the exception of agriculture to be sufficiently glaring that they refused to sign a new deal without some movement on agricultural products. These fourteen countries came to be known as the 'Cairns Group', and included mostly small and medium sized agricultural exporters such as Australia, Brazil, Canada, Indonesia, and New Zealand. In 1994 the GATT was updated (GATT 1994) to include new obligations upon its signatories. One of the most significant changes was the creation of the World Trade Organization (WTO). The 75 existing GATT members and the European Communities became the founding members of the WTO on 1995-January-01. The other 52 GATT members rejoined the WTO in the following two years (the last being Congo in 1997). Since the founding of the WTO, 21 new non-GATT members have joined and 28 are currently negotiating membership. Of the original GATT members, only the SFR Yugoslavia has not rejoined the WTO. Since FR Yugoslavia, renamed to Serbia and Montenegro and with membership negotiations later split in two, is not recognised as a direct SFRY successor state; therefore, its application is considered a new (non-GATT) one. The contracting parties who founded the WTO ended official agreement of the 'GATT 1947' terms on 1995-December-31. Whereas GATT was a set of rules agreed upon by nations, the WTO is an

institutional body. The WTO expanded its scope from traded goods to trade within the service sector and intellectual property rights. Although it was designed to serve multilateral agreements, during several rounds of GATT negotiations (particularly the Tokyo Round) plurilateral agreements created selective trading and caused fragmentation among members. WTO arrangements are generally a multilateral agreement settlement mechanism of GATT. 1986–93 – GATT trade ministers launch the Uruguay Round in Punta Del Este, Uruguay, embarking on the most ambitious and far-reaching trade round so far. The round extended the range of trade negotiations, leading to major reductions in agricultural subsidies, an agreement to allow full access for textiles and clothing from developing countries, and an extension of intellectual property rights. 1994 – trade ministers meet for the final time under GATT auspices at Marrakesh, Morocco to establish the World Trade Organization (WTO) and complete the Uruguay Round. 1995 – the World Trade Organization is created in Geneva. 1999 – at least 30 000 protesters disrupt WTO summit in Seattle, the United States; New Zealander Mike Moore becomes WTO director-general. The Uruguay Round:- It took seven and a half years, almost twice the original schedule. By the end, 123 countries were taking part. It covered almost all trade, from toothbrushes to pleasure boats, from banking to telecommunications, from the genes of wild rice to AIDS treatments. It was quite simply the largest trade negotiation ever, and most probably the largest negotiation of any kind in history. At times it seemed doomed to fail. But in the end, the Uruguay Round brought about the biggest reform of the world's trading system since GATT was created at the end of the Second World War. And yet, despite its troubled progress, the Uruguay Round did see some early results. Within only two years, participants had agreed on a package of cuts in import duties on tropical products – which are mainly exported by developing countries. They had also revised the rules for settling disputes, with some measures implemented on the spot. And they called for regular reports on GATT members' trade policies, a move considered important for making trade regimes transparent around the world. A round to end all rounds? The seeds of the Uruguay Round were sown in November 1982 at a ministerial meeting of GATT members in Geneva. Although the ministers intended to launch a major new negotiation, the conference stalled on agriculture and was widely regarded as a failure. In fact, the work programme that the ministers agreed formed the basis for what was to become the Uruguay Round negotiating agenda. Nevertheless, it took four more years of exploring, clarifying issues and painstaking consensus-building, before ministers agreed to launch the new round. They did so in September 1986, in Punta del Este, Uruguay. They eventually accepted a negotiating agenda that covered virtually every outstanding trade policy issue. The talks were going to extend the trading system into several new areas, notably trade in services and intellectual property, and to reform trade in the sensitive sectors of agriculture and textiles. All the original GATT articles were up for review. It was the biggest negotiating mandate on trade ever agreed, and the ministers gave themselves four years to complete it. Two years later, in December 1988, ministers met again in Montreal, Canada, for what was supposed to be an assessment of progress at the round's half-way point. The purpose was to clarify the agenda for the remaining two years, but the talks ended in a deadlock that was not resolved until officials met more quietly in Geneva the following April. Despite the difficulty, during the Montreal meeting, ministers did agree a package of early results. These included some concessions on market access for tropical products – aimed at assisting developing countries – as well as a streamlined dispute settlement system, and the Trade Policy Review Mechanism which provided for the first comprehensive, systematic and regular reviews of national trade policies and practices of GATT members. The round was supposed to end when ministers met once more in Brussels, in December 1990. But they disagreed on how to reform agricultural trade and decided to extend the talks. The Uruguay Round entered its bleakest period. Despite the poor political outlook, a considerable amount of technical work continued, leading to the first draft of a final legal agreement. This draft 'Final Act' was compiled by the then GATT director-general, Arthur Dunkel, who chaired the negotiations at officials' level. It was put on the table in Geneva in December 1991. The text fulfilled every part of the Punta del Este mandate, with one exception – it did not contain the participating countries' lists of commitments for cutting import duties and opening their services markets. The draft became the basis for the final agreement. Over the following two years, the negotiations lurched between impending failure, to predictions of imminent success. Several deadlines came and went. New points of major conflict emerged to join agriculture:- services, market access, anti-dumping rules, and the proposed creation of a new institution. Differences between the United States and European Union became central to hopes for a final, successful conclusion. In November 1992, the US and EU settled most of their differences on agriculture in a deal known informally as the 'Blair House accord'. By July 1993 the 'Quad' (US, EU, Japan and Canada) announced significant progress in negotiations on tariffs and related subjects ('market access'). It took until 15 December 1993 for every issue to be finally resolved and for negotiations on market access for goods and services to be concluded (although some final touches were completed in talks on market access a few weeks later). On 15 April 1994, the deal was signed by ministers from most of the 123 participating governments at a meeting in Marrakesh, Morocco. The delay had some merits. It allowed some negotiations to progress further than would have been possible in 1990:- for example some aspects of services and intellectual property, and the creation of the WTO itself. But the task had been immense, and negotiation-fatigue was felt in trade bureaucracies around the world. The difficulty of reaching agreement on a complete package containing almost the entire range of current trade issues led some to conclude that a negotiation on this scale would never again be possible. Yet, the Uruguay Round agreements contain timetables for new negotiations on a number of topics. And by 1996, some countries were openly calling for a new round early in the next century. The response was mixed; but the Marrakesh agreement did already include commitments to reopen negotiations on agriculture and services at the turn of the century. These began in early 2000 and were incorporated into the Doha Development Agenda in late 2001. What happened to GATT? The WTO replaced GATT as an international organization, but the General Agreement still exists as the WTO's umbrella treaty for trade in goods, updated as a result of the Uruguay Round negotiations. Trade lawyers distinguish between GATT 1994, the updated parts of GATT, and GATT 1947, the original agreement which is still the heart of GATT 1994. Confusing? For most of us, it's enough to refer simply to 'GATT'. The post-Uruguay Round built-in agenda:- Many of the Uruguay Round agreements set timetables for future work. Part of this 'built-in agenda' started almost immediately. In some areas, it included new or further negotiations. In other areas, it included assessments or reviews of the situation at specified times. Some negotiations were quickly completed, notably in basic telecommunications, financial services. (Member governments also swiftly agreed a deal for freer trade in information technology products, an issue outside the 'built-in agenda'.) The agenda originally built into the Uruguay Round agreements has seen additions and modifications. A number of items are now part of the Doha Agenda, some of them updated. There were well over 30 items in the original built-in agenda. This is a selection of highlights:- 1996:- (i) Maritime services:- market access negotiations to end (30 June 1996, suspended to 2000, now part of Doha Development Agenda); (ii) Services and environment:- deadline for working party report (ministerial conference, December 1996); and (iii) Government procurement of services:- negotiations start. 1997:- (i) Basic telecoms:- negotiations end (15 February); (ii) Financial services:- negotiations end (30 December); (iii) Intellectual property, creating a multilateral system of notification and registration of geographical indications for wines:- negotiations start, now part of Doha Development Agenda. 1998:- (i) Textiles and clothing:- new phase begins 01 January; (ii) Services (emergency safeguards):- results of negotiations on emergency safeguards to take effect (by 01 January 1998, deadline now March 2004); (iii) Rules of origin:- Work programme on harmonization of rules of origin to be completed (20 July 1998); (iv) Government procurement:- further negotiations start, for improving rules and procedures (by end of 1998); and (v) Dispute settlement:- full review of rules and procedures (to start by end of 1998). 1999:- Intellectual property:- certain exceptions to patentability and protection of plant varieties:- review starts. 2000:- (i) Agriculture: negotiations start, now part of Doha Development Agenda; (ii) Services:- new round of negotiations start, now part of Doha Development Agenda; (iii) Tariff bindings:- review of definition of 'Principle Supplier' having negotiating rights under GATT Art 28 on

modifying bindings; and (iv) Intellectual property:- first of two-yearly reviews of the implementation of the agreement. 2002:- Textiles and clothing:- new phase begins 01 January. 2005:- Textiles and clothing:- full integration into GATT and agreement expires 01 January. Uruguay Round (UR):- launched in Punta del Este, Uruguay, in September 1986, the negotiating agenda covered a complete range of trade policy issues including potential rules governing trade in services and intellectual property. Disputes on issues involving agriculture, trade in services, market access, antidumping rules, and the creation of a new, permanent institution extended the round until an agreement was signed April 15, 1994, in Marrakesh, Morocco. / Генерального Соглашения о Тарифах и Торговле (ГСТТ или ГЯТ (GATT)) . Уругвайский Раунд (УР) был запущен в Сентябре 1986 в Пунта дэль Эстэ (Punta del Este), Уругвай, в результате встречи министров 92 стран на Специальной Сессии договаривающихся сторон, начавшейся 15 Сентября 1986, и по итогам которой 20 Сентября 1986 была принята Декларация (Declaration) о решении запустить Многосторонние Торговые Переговоры (Multilateral Trade Negotiations), названные по месту их начала Уругвайским Раундом (The Uruguay Round). Уругвайский Раунд:- 08 Апреля 1989 более чем 100 стран договорились о большей либерализации торговли товарами, в том числе сельскохозяйственными, а также о распространении Генерального Соглашения по Тарифам и Торговле (ГСТТ) на такие новые области, как торговля услугами и связанные с торговлей права на интеллектуальную собственность. Это ознаменовало собой преодоление половины пути к запланированному завершению раунда – сельмого по счёту в рамках ГСТТ – в конце 1990. 07 Декабря 1990 четырёхгодичный раунд переговоров об установлении новых правил мировой торговли закончился провалом. Соединённые Штаты Америки (США) и Европейский Союз (ЕС) так и не сумели договориться по вопросу о сокращении субсидий фермерам. Попытка либерализовать правила, регулирующие мировую торговлю объёмом 4 триллиона Долларов США в год между 112 странами, потерпела неудачу применительно к 15 широким областям торговли, включая сельское хозяйство, патенты, финансовые услуги, телекоммуникации и текстиль. Хотя это и не подорвало мировую торговлю, все понимали, что торговые войны усилятся, а многообещающий выход из бедности будет закрыт для беднейших стран мира, вынужденных платить самые высокие цены за субсидируемые продукты, особенно из государств – членов ЕС. Успешное завершение Уругвайского Раунда могло бы повысить благосостояние в мире по меньшей мере на 120 миллиардов Долларов США в год, повсеместно стимулировать экономический рост (особенно в беднейших странах мира) и оживить конкуренцию. Прогнозировалось, что США ежегодно выиграют 35 миллиардов Долларов США Япония и Европа – почти по 30 миллиардов каждая, а остальной мир – около 25 миллиардов Долларов США. Выгоды для США в случае завершения Уругвайского Раунда включают:- (а) снижение тарифных и нетарифных барьеров на пути промышленных и других товаров, что могло бы обеспечить прирост продукции в мире за 10 лет на 5 триллионов Долларов США, в том числе в США – на 1 триллион, что означает дополнительные 17 000 Долларов США для средней Американской семьи из четырёх человек; (б) принятие правил защиты интеллектуальной собственности предпринимателей США, которые ежегодно теряют 60 миллиардов Долларов США из-за воровства и подделки их идей; (в) новые рынки для фирм США в сфере услуг, которые вывозят (или экспортируют) продукцию на сумму более 163 миллиардов Долларов США в год и создают 90% новых рабочих мест, а также введение новых правил, дисциплинирующих международную торговлю услугами; (г) отмену барьеров в торговле, связанных с ограничениями для инвестиций; такие инвестиции уже помогают вывозу (или экспорту) на сумму 260 миллиардов Долларов США, или 2/3 совокупного вывоза (или экспорта) товаров из США; (д) честную конкуренцию и открытые рынки в сельском хозяйстве, что открывает новые возможности для Американских фермеров, лидирующих в мировой торговле с ежегодным вывозом (или экспортом) на сумму почти в 40 миллиардов Долларов США; (е) полное участие развивающихся стран в мировой торговой системе, что может обеспечить прирост вывоза (или экспорта) США в течение ближайших 10 лет на 200 миллиардов Долларов США; (ж) ужесточение правил относительно разрешения споров, антидемпинга, субсидий и компенсаций при нарушении торговли, что сделает доступ на иностранные рынки более предсказуемым и определённым и обеспечит честную троговлю внутри страны. К началу 1994 Уругвайский Раунд оставался незавершённым. Сотрите также Проектный Финальный Акт (Draft Final Act), Генеральное Соглашение По Тарифам И Торговле (General Agreement On Tariffs And Trade), Монреальский Раунд (Montreal Round), Специальное 301 (Special 301), Торговый Представитель США (US Trade Representative).

URUGUAY ROUND AGREEMENT = СОГЛАШЕНИЕ УРУГВАЙСКОГО РАУНДА – Uruguay Round Agreement(s) or Uruguay Round Agreement on Agriculture (URAA) is a multilateral trade agreement, negotiated under the auspices of GATT, designed to open world agricultural markets. The Uruguay Round agricultural agreement covers four areas:- export subsidies, market access, internal supports, and sanitary and phytosanitary measures. It is one of the 29 individual legal texts included under an umbrella agreement establishing the World Trade Organization. Under the agreement, countries agreed to substantially reduce agricultural support and protection by establishing disciplines in the areas of market access, domestic support, and export subsidies. Under market access, countries agreed to open markets by prohibiting nontariff trade barriers (including quantitative import restrictions, variable import levies, discretionary import licensing, and voluntary export restraints), converting existing nontariff trade barriers to tariffs, and reducing tariffs. The URAA signatory countries also agreed to reduce expenditures on export subsidies and the quantity of agricultural products exported with subsidies, and prohibit the introduction of new export subsidies for agricultural products. Domestic support reductions were realized through commitments to reduce an aggregate measure of support, a numerical measure of the value of most trade-distorting domestic policies. The agreement was to be implemented over a six-year period, 1995–2000. Also Agreement on Agriculture. See also World Trade Organization (WTO). Uruguay Round Agreement on Agriculture (URAA) is an international agreement negotiated as part of the Uruguay Round of the General Agreement on Tariffs and Trade. The URAA entered into force simultaneously with the establishment of the World Trade Organization in 1995. The URAA contains commitments to improve market access, reduce distorting domestic support, and reduce export subsidies. A separate agreement covers sanitary and phyto sanitary measures known as the Agreement on the Application of Sanitary and Phytosanitary Measures (SPS Agreement). Uruguay Round Agreement on Agriculture (URAA):- the terms of the URAA are contained in the section entitled the ‘Agreement on Agriculture’ of the Final Act Embodying the Results of the Uruguay Round of Multilateral Trade Negotiations. This text contains commitments in the areas of market access, domestic support, and export subsidies, and general provisions concerning monitoring and continuation. In addition, each country’s schedule is an integral part of its contractual commitment under the URAA. There is a separate agreement entitled the Agreement on the Application of Sanitary and Phyto-sanitary Measures. This agreement seeks establishing a multilateral framework of rules and disciplines to guide the adoption, development and the enforcement of sanitary and phyto-sanitary measures in order to minimise their negative effects on trade. See also Phyto-Sanitary Regulations, and Sanitary Regulations.

USABLE IN, USABLE FOR, USABLE AS or CAPABLE OF = ИСПОЛЬЗУЕМОЕ В, ИСПОЛЬЗУЕМОЕ ДЛЯ, ИСПОЛЬЗУЕМОЕ КАК или ИСПОЛЬЗУЕМОЕ ХХ – Usable In, Usable For, Usable As or Capable Of (Missible Technology Control Regime (MTCR) context):- equipment, parts, components, materials or 'software' which are suitable for a particular purpose. There is no need for the equipment, parts, components, materials or 'software' to have been configured, modified or specified for the particular purpose. For example, any military specification memory circuit would be 'capable of' operation in a guidance system.

USAC = UNITED STATES ATLANTIC COAST

US ADVISORY COMMITTEE ON TRADE POLICY NEGOTIATIONS = СОВЕЩАТЕЛЬНЫЙ КОМИТЕТ США ПО ПЕРЕГОВОРАМ О ТОРГОВОЙ ПОЛИТИКЕ – US Advisory Committee On Trade Policy Negotiations (ACTPN) was established by the United States Trade Representative to provide overall policy advice on trade issues. The ACTPN is a statutory non-discretionary trade advisory committee established to provide overall policy advice to the United States Trade Representative on matters arising in connection with the development, implementation, and administration of the trade policy of the United States including:- (i) negotiating objectives and bargaining positions before entering into trade agreement; (ii) the impact of the implementation of trade agreements; (iii) matters concerning the operation of any trade agreement once entered into; and (iv) other matters arising in connection with the development, implementation, and administration of the trade policy of the United States. The United States Trade Representative anticipates sharing the ACTPN's advice with other relevant agencies interested in the subject matter. / Совещательный Комитет США По Переговорам О Торговой Политике:- предусмотренный Актом О Торговле от 1988 (1988 Trade Act) комитет, включающий до 45 человек; служит основным совещательным органом при представителе США на торговых переговорах.

USAF = UNITED STATES AIR FORCE

US AFFILIATE = АФФИЛЯТ США (или АФФИЛИРОВАННОЕ ЛИЦО ИЗ США) – A US Affiliate is a US business enterprise in which there is foreign direct investment – that is, in which a single foreign person owns or controls, directly or indirectly, 10 percent or more of its voting securities if the enterprise is incorporated or an equivalent interest if the enterprise is unincorporated. The affiliate is called a US affiliate to denote that the affiliate is located in the US (although it is owned by a foreign person). See also Foreign Person.

US AGRICULTURAL ADJUSTMENT ACT (1933) = АКТ США О НАЛАЖИВАНИИ СЕЛЬСКОГО ХОЗЯЙСТВА (ОТ 1933) – US Agricultural Adjustment Act (AAA) (1933):- World War I severely disrupted agriculture in Europe. That was an advantage to farmers in the United States, who increased production dramatically and were therefore able to export surplus food to European countries. But by the 1920s, European agriculture had recovered and American farmers found it more difficult to find export markets for their products. Farmers continued to produce more food than could be consumed, and prices began to fall. The decline in demand for agricultural products meant that many farmers had difficulty paying the mortgages on their farms. By the 1930s, many American farmers were in serious financial difficulty. In South Dakota, the county grain elevators listed Corn as minus three cents a bushel – if a farmer wanted to sell them a bushel of Corn, he had to bring in three cents. Fields of Cotton lay unpicked, because it couldn't be sold even for the price of picking. Orchards of olive trees hung full of rotting fruit. Oranges were being sold at less than the cost of production. Grain was being burned instead of coal because it was cheaper. When Franklin D. Roosevelt was inaugurated President in 1933, he called Congress into special session to introduce a record number of legislative proposals under what he dubbed the New Deal. One of the first to be introduced and enacted was the Agricultural Adjustment Act. The intent of the AAA was to restore the purchasing power of American farmers to pre-World War I levels. The money to pay the farmers for cutting back production by about 30 percent was raised by a tax on companies that bought farm products and processed them into food and clothing. The AAA evened the balance of supply and demand for farm commodities so that prices would support a decent purchasing power for farmers. This concept was known as 'Parity'. AAA controlled the supply of seven 'basic crops' – Corn, Wheat, Cotton, Rice, Peanuts, Tobacco, and milk – by offering payments to farmers in return for farmers not planting those crops. The AAA also became involved in assisting farmers ruined by the advent of the Dust Bowl in 1934. In 1936 the Supreme Court, ruling in United States v. Butler, declared the AAA unconstitutional. Writing for the majority, Justice Owen Roberts stated that by regulating agriculture, the federal government was invading areas of jurisdiction reserved by the constitution to the states, and thus violated the Tenth Amendment. Judge Harlan Stone responded for the minority that, 'Courts are not the only agency of government that must be assumed to have capacity to govern'. Further legislation by Congress restored some of the act's provisions, encouraging conservation, maintaining balanced prices, and establishing food reserves for periods of shortages. Congress also adopted the Soil Conservation and Domestic Allotment Act, which encouraged conservation by paying benefits for planting soil-building crops instead of staple crops. The rewritten statutes were declared constitutional by the Supreme Court in Mulford v. Smith (1939) and Wickard v. Filburn (1942). During World War II, the AAA turned its attention to increasing food production to meet war needs. The AAA did not end the Great Depression and drought, but the legislation remained the basis for all farm programs in the following 70 years. Xxxxx. Agricultural Adjustment Administration (AAA), in American history, major New Deal program to restore agricultural prosperity by curtailing farm production, reducing export surpluses, and raising prices. The Agricultural Adjustment Act (effective:- 12 May 1933) was an omnibus farm-relief bill embodying the schemes of the major national farm organizations. It established the Agricultural Adjustment Administration under Secretary of Agriculture Henry Wallace to effect a 'domestic allotment' plan that would subsidize producers of basic commodities for cutting their output. Its goal was the restoration of prices paid to farmers for their goods to a level equal in purchasing power to that of 1909–14, which was a period of comparative stability. In addition, the Commodity Credit Corporation (CCC), with a crop loan and storage program, was established to make price-supporting loans and purchases of specific commodities. Although benefit payments to farmers totaled USD1 500 000 000 by 1936, a rise in commodity prices was attributable mainly to severe drought conditions in 1933–36. In spite of its limited achievements, the early AAA program was favoured by most farmers. The Supreme Court declared the act unconstitutional in 1936, and Congress passed new agricultural legislation two years later based on the soil conservation concept. While farmers' cash income doubled between 1932 and 1936, it took the enormous demands of World War II to reduce the accumulated farm surpluses and to increase farm income significantly. / Президент США Фрэнклын Дэлано Розэвэлт (Franklin Delano Roosevelt; 1882–1945). 'Пыльный Котёл' (Dust Bowl). Батлё (Butler). Овэн Дьжосифас Рабэтс (Owen Josephus Roberts; 1875–1955). Харлэн Фиск Стоун (Harlan Fiske Stone; 1872–1946). против Смиса (Supreme Court in Mulford v. USAIP = UNITED STATES ANIMAL IDENTIFICATION PLAN

USANCE = ХХ (или ОБЫКНОВЕНИЕ) – Usance:- the interest charged on borrowed funds. / Обычная Процентная Ставка (Usance):- В прошлом – ставка процента по займу.

USANCE = ХХ (или ОБЫКНОВЕНИЕ, или ОБРАЩЕНИЕ, или СРОК ПО ОБЫЧАЮ) – Usance:- usual period allowed for payment of a bill of exchange (such as a check or draft), especially in international trade. Usance does not refer to a fixed period but varies

according to customary practice (see also Custom) in that trade or between the countries involved. See also Tenor; and Usage. Usance:- the time allowed for the payment of foreign bills of exchange, according to law or commercial practice. In international trade, Usance is the allowable period of time, permitted by custom, between the date of the bill and its payment. The usance of a bill varies between countries, often ranging from two weeks to two months. It is also the interest charged on borrowed funds. Usance is derived from the action of usury, as well as the use of goods for economic purposes. Usance applies to many items purchased on credit. For example, a company that purchases materials from a supplier will receive the goods today. The bill will be delivered today, but the company might have up to 30 days to pay it. The 30 days represents the usance for the sale. When a person lends money, he or she will charge a usance in exchange for the service. In this case, usance relates to the profits made from the lending of principal. Usance is the process of using goods to fulfill economic needs. This involves refining materials into finished goods, or the consumption of goods to satisfy needs. Usance is the allowable period of time, permitted by custom, between the date of bill and its payment. The usance of a bill varies between countries, often ranging from two weeks to two months. Usance is the time allowed for settlement of a draft. Origin of Usance:- 1350–1400; Middle English Usaunce from Old French Usance, probably from Medieval Latin Ūsantia, derivative of Latin Ūsant- (stem of Ūsāns), present participle of Ūsāre To Use. / Срок По Обычаю:- время, отведённое для расчёта по тратте. Срок Векселя (Usance):- время, в течение которого действительна срочная тратта. Обычный Срок Векселя (Usance):- Время обращения краткосрочного иностранного переводного векселя (bill of exchange) до получения платежа по нему. В различных странах обычный срок векселя неодинаков, но чаще всего он равен 60 дням.

USANCE DRAFT = ТРАТТА В СООТВЕТСТВИИ С ОБЫЧАЕМ (или ТРАТТА СО СРОКОМ ПО ОБЫЧАЮ) – Usance Draft is a written demand for payment which comes due at a specific future date. Also called Time Draft. / письменное требование по оплате, которое становится причитающимся (или обязательным) в указанную дату в будущем. Назвается также Срочной Траттой (Time Draft).

USANCE LETTER OF CREDIT = АККРЕДИТИВ В СООТВЕТСТВИИ С ОБЫЧАЕМ (или АККРЕДИТИВ СО СРОКОМ ПО ОБЫЧАЮ) – Usance Letter Of Credit is a letter of credit (L/C) payable at a predetermined time after the presentation of conforming documents. These are also called Time L/C or Deferred Payment L/C and are the opposite of L/Cs payable at sight. Usance Letter of Credit is a letter of credit payable at a determined future date after presentation of conforming documents.

USATCFE = UNITED STATES ARMY TRANSPORTATION CENTER & FORT EUSTIS

US–CANADA FREE TRADE AGREEMENT = СОГЛАШЕНИЕ США–КАНАДА О СВОБОДНОЙ ТОРГОВЛЕ – The US-Canada Free Trade Agreement of 1989 (FTA) represented a bilateral agreement between the world's largest trading partners. The United States and Canada have more trade between them than any other two countries on earth. At the time of the agreement, the United States and Canada traded roughly USD150 billion worth of goods a year. Negotiations on the FTA began in 1985, and the pact actually was agreed to on 04 October 1987. Following approval by the legislative bodies of both nations in 1988, the agreement officially took effect on 01 January 1989. The historic pact was the culmination of more than 100 years of on-again, off-again talk of free trade between the United States and its northern North American neighbor. The issue actually caused much more of a stir in Canada than in the United States. Polls taken at the time of the debate indicated that more than 40 percent of Americans were not even aware that the two nations had signed such an agreement, compared with just 3 percent of Canadians. In the United States, the FTA did not garner nearly as much press as did the North American Free Trade Agreement (NAFTA), the pact between the United States, Canada, and Mexico that came about five years later, and which incorporated most FTA provisions into its framework. In Canada, however, the FTA was the subject of long and heated debate. The Liberal party in Canada even used the FTA to force an election – with free trade virtually the only subject of the campaign. The reason for the disparity in emotion on the issue becomes readily apparent upon examination of the comparative economic situations. For the United States, while trade with Canada is significant, it is not all that large when taken as a portion of the whole economy. From the Canadian standpoint, though, United States investment and trade is a fairly hefty percentage of the economy. After all the talk and debate, the FTA was adopted and took effect on time – with the understanding that the agreement was an evolving document with mechanisms for changing and problem solving. What the FTA tried to do is put simply in the objectives agreed to by the two nations:- (i) eliminate barriers to trade in goods and services between the two countries; (ii) facilitate conditions of fair competition within the free trade area; (iii) significantly expand liberalization of conditions for cross-border investment; (iv) establish effective procedures for the joint administration of the agreement and the resolution of disputes; and (v) lay the foundation for further bilateral and multilateral cooperation to expand and enhance the benefits of the agreement. On the last point, the FTA apparently has been successful, as it helped lay the foundation for NAFTA, although certain differences do exist between the two agreements. History And Background:- When the FTA finally took effect in 1989, the issue of free trade talk between the two nations had a history that went back into the 1850s. In 1854, there actually was a reciprocal free trade agreement signed that lasted until 1866, when the United States terminated the pact. That agreement actually was negotiated between the United States and Great Britain, because the five British colonial provinces that existed back then had not yet become nations. The agreement basically covered commodities such as natural resources and agricultural products. Although manufactured products were not part of the pact, about two-thirds of trade between the then-30 United States and the Canadian provinces were covered. There were attempts to make this agreement into a common market – where both areas would set unified tariffs for all third parties – but those efforts came to an end when the United States terminated the agreement in 1866. The United States appeared to take this action as protectionism began to develop in the United States during and after the Civil War. During the next 45 years, first Canada and then the United States tried to bring back the free trade agreement, but protectionism on one or the other's part stalled progress each time. An informal agreement that was never ratified came about in 1911 after a tariff war that took place in 1907. Canada started by adopting a three-tiered tariff system that greatly affected the United States, which retaliated in 1909. An oral agreement on a free trade pact was reached in January 1911, put into a formal letter by the Canadian delegates, and then replied to formally by the United States Secretary of State, Philander Knox. But the Liberal party in Canada that negotiated the agreement was defeated in an election held because of the proposed free trade agreement, and the pact was never implemented. The two nations held no further bilateral talks until 1935, when they agreed to what was termed a modest most-favored nation agreement. The two sides held negotiations again in 1948 but the Canadian government broke off the discussions. Why the 1988 agreement succeeded where some of these earlier attempts did not is unclear, although a number of issues – including the globalization of the business world – no doubt had some impact. Some Canadians also wanted their nation protected from possible protectionist legislation they feared the United States might implement. Although most of the protectionist actions in the United States were aimed at Japan and the Far East, Canada thought it could be affected if the United States implemented emergency action under rules of the General Agreement on Tariffs and Trade (GATT). Under GATT, all nations

must be treated alike, and Canadians were afraid of the possibility of such measures from its largest trading partner. Differing Objectives:- Leading up to the signing of the agreement, both the Canadian and American sides had objectives they wished to achieve. On one side, Canada had its high tariffs that encouraged foreign manufacturers to build plants in Canada for the Canadian market, as it would be more cost efficient than to service the market with exports. During the 1950s and 1960s the Canadian economy grew extensively and the nation had few programs that influenced market conditions. But in the 1970s and 1980s, Canadians became more concerned about the extensive control and possible influence of the United States multinationals that had operations in Canada. The Canadian government began screening foreign direct investment and adopted policies aimed at making Canada less dependent on the United States and more competitive on its own. Although the ownership and control of the United States in Canada's industry did lessen, the United States share of Canada's trade remained high and Canadian competitiveness did not improve. Canadians who favored free trade began to believe that Canada's resource products would no longer sustain the nation, so the country should focus on its competitiveness in the manufacturing arena. Canada's tariffs, following seven rounds of GATF talks, were no longer high enough to shield it from foreign competition. What was keeping Canada from being competitive were nontariff barriers in foreign nations, and the threat of further such barriers, particularly in the United States. The Canadian government articulated four main objectives heading into discussions on the FTA:- access to the United States market by limiting the effects of United States trade laws; enhance access to the United States market by eliminating tariffs and achieving more liberal nontariff barriers; ensure any gains through a strong agreement with an effective dispute settlement mechanism; and maintain policy discretion in cultural industries and foreign investment in some sensitive sectors. From the United States side, officials saw the FIA as beneficial in several ways. Limitations of the GATT agreement had affected United States access to foreign markets for United States high-technology products. Various things such as trade-related investment policies, subsidies, treatment of intellectual property rights, government procurement practices, and product standards had limited the United States in trade. In addition, the United States, by reaching this agreement with Canada, would be showing the European Union, Japan, and other nations that it was open to other trade possibilities if the ongoing Uruguay Round of the GATT talks did not bring substantial results. The FTA also brought the United States a chance to eliminate the higher Canadian tariffs and to secure improvements made in the trade and investment climate. In nontariff barriers, the United States could get rid of or at least lessen discrimination of federal and provincial procurement practices along with barriers caused by technical standards and testing requirements. Basic Terms:- Over a ten-year period, the FTA was to eliminate tariffs, duty drawbacks, and most import restrictions. The phase-in was aimed at allowing certain industries to get used to the realization of competition in a free market environment. There were three options for tariff removal. As of 01 January 1989, duties were eliminated in full on about 15 percent of all dutiable goods traded between the two nations. Some of the industries and products included skis, whiskey, vending machines, needles, fur, and computers. Products that covered another 35 percent of dutiable goods were placed on a five-year elimination program, with the tariffs reduced by 20 percent each year beginning 01 January 1989. Aftermarket auto parts, chemicals, furniture, explosives, paints, some meats, paper, subway cars, and telecommunication equipment were some of the covered products. The final 50 percent of dutiable products were put on a ten-year tariff reduction path, with 10 percent of the duty taken off each year, with the process ending 01 January 1998. Those products included: most agricultural products, appliances, beef, pleasure craft, railcars, softwood plywood, steel, textiles and apparel, and tires. With regard to automotive products, tariffs were phased out on vehicles that meet a 50-percent content rule, where half the content must come from the two nations. The FTA also prohibits restrictions on exports, export taxes and subsidies, and the dual pricing of exports. There were, however, a few safeguards. During the ten-year phase-in period, duties could be restored for up to three years if domestic producers prove suffering because of the reductions. Also included were measures to standardize environmental provisions, such as pesticide and emissions regulations, usually by lowering Canadian protection standards to more lenient US levels. Both nations also will give each other's subsidiaries what is known as 'Foreign Treatment' with regard to foreign investment. Canada did reserve the right to screen direct purchases of its largest nonfinancial corporations and financial institutions. That nation's cultural industries were exempted from most provisions of the agreement. For settling disputes, the FTA set up a five-person panel with two members from the United States, two from Canada, and one decided by the other four members or chosen at random from an approved list. Issues will be referred when either side feels the other has made an unfair judgment under trade laws. The dispute-settlement process was expected to develop a set of mutually agreed rules about what constitutes dumping and subsidies, among other things. Getting It Approved:- In the United States the process was relatively quiet. President Reagan put the FTA on the fast-track process for congressional approval. That meant the Congress had only so many days to debate it and then had to either accept it or reject it in its entirety. They could not amend the agreement in any way. The United States House of Representatives approved it 09 July 1988, while the Senate followed suit on 09 September. Neither vote was close. In Canada, however, there was no equivalent to the fast-track process. Under its parliamentary form of government, the House of Commons passed the matter easily because the majority of seats were held by the Progressive Conservative party, was led by Prime Minister Brian Mulroney. But the Canadian Senate is not an elected body. Senators are appointed for life by the prime minister. Because the Liberal party had been in power for most of the 15 years prior to the FTA, that party had a majority of Senate seats and blocked passage. The Liberals used the debate to force a general election to break the impasse, and the election became an emotional debate on free trade and its impact on Canada. When the votes were counted, the conservatives still had a majority, although reduced, and the Liberal party did not oppose the voice of the people and allowed the FTA to go through. Canadians were so aware of the debate because the impact on them was far greater than on United States citizens. Exports accounted for 28 percent of the Canadians' gross national product, compared with just 7 percent in the United States. And 80 percent of Canada's exports were destined to go to the United States. Many Canadian critics felt vindicated in the years following the passage of the FTA, eyeing the contraction of employment across all industries between 1989 and 1993. The Canadian Labour Congress reported the loss of over 250 000 jobs in the first two years of the Agreement, along with a wave of takeovers of Canadian-based countries. Some commentators, however suggest that the FTA was hardly a crucial factor in these numbers, and attribute them instead to other domestic economic policies like the fight against inflation. Differences With NAFTA:- Besides bringing Mexico into the arena for free trade, the North American Free Trade Agreement (NAFTA) also broadened the parameters of the FTA between United States and Canada in many respects. Areas where NAFTA expounds upon FTA include intellectual property rights, land transportation, the environment, and several others. Below is a summary of some of the differences:- (1) Market Access:- NAFTA makes no changes in the three-stage phase-out of tariffs for items traded between the United States and Canada. (2) Rules Of Origin:- NAFTA clears up many of the questions regarding rules of origin in the FTA and also integrates the administration of the rules. It includes a provision that allows up to 7 percent of the value of North American products to originate outside the continent. It also mandates that cars and light trucks have 62.5 percent of costs derive from North America to qualify for preferential treatment. For other vehicles, NAFTA specifies 60 percent North American content after a phase-in period. NAFTA also makes the rules of origin simpler for certain electronics products and strengthens it for textiles. Fabric and yarn for garments must now come from North America, although there is a quota that allows a certain number of garments to qualify as North American in origin although they do not meet the rule. (3) Customs Issue:- NAFTA extended by two years the deadline for elimination of duty drawback to 01 January 1996. Duty drawback is the refund of duties on imported inputs incorporated into products for export. NAFTA also allows trade and professional equipment duty-free treatment when brought in on a temporary basis by professionals covered by the provisions. (4) Government Procurement:- NAFTA raises the guidelines on federal procurement of goods and services valued at over

USD50 000 (USD25 000 on goods alone) and construction contracts that are valued at over USD6.5 million. The provisions also cover certain government-owned corporations for contracts over USD250 000 on goods and services and USD10 million on construction contracts. These items are intended to allow firms from all three countries to compete on equal footing for government contracts over the threshold. For example, under the FTA, firms from the United States won 535 Canadian contracts worth in excess of USD20 million between 01 January 1989 and 30 June 1992. (5) Services:- Under NAFTA, the provisions covering services are expanded to most every service sector. The agreement also eliminates federal and local restrictions on partner country access to services markets except in some instances, as well as citizenship or permanent-residency requirements on the licensing of professional service providers. (6) Financial Services:- NAFTA sets up a series of rules on trade and investment in financial services. It also ensures that United States firms in Canada can process financial data in the United States and gives access to NAFTA dispute settlement mechanisms for financial services firms. (7) Investment:- NAFTA broadens guidelines regarding investors so that the definition includes non-NAFTA individuals who operate in a NAFTA country. NAFTA also covers real estate, stocks, bonds, and certain contracts and technologies, and provides binding arbitration in disputes between investors and any of the three governments involved in NAFTA. (8) Intellectual Property Rights:- Addressing a topic not detailed by the FTA, NAFTA extends patent protection to a minimum of 20 years; provides copyright protection for products such as computer programs, sound recordings, motion pictures, and satellite signals; and bolsters trademark protection, service markets, trade secrets, and other intellectual property rights. (9) Land Transportation:- Another area not covered by FTA, NAFFA makes certain that future Canadian laws and policies will not discriminate unfairly against land transportation service providers in the United States. (10) Environment:- In another new provision, NAFTA allows the three nations to keep their existing health, safety, and environmental standards and to impose new standards that can be scientifically justified and are not discriminatory. United States-Canada Free Trade Agreement (FTA):- this agreement was signed by President Reagan and Prime Minister Mulroney on January 02, 1988 and, after implementing legislation was enacted in the United States and Canada, the Agreement entered into force on January 01, 1989. Its main purpose is to eliminate all tariffs on trade between the US and Canada by January 01, 1998. The FTA was superseded by NAFTA (see above) on January 01, 1994. US-Canada Free Trade Agreement or Free Trade Agreement Between Canada And The United States Of America is the biggest trade agreement ever concluded between two countries. It covers more trade and more trade-related issues than any other trade agreement and breaks important new ground which will be of lasting value to the Canadian and US economies. The Agreement sets a new standard for trade agreements concluded under the General Agreement on Tariffs and Trade (GATT). It takes various GATT commitments, bilateral arrangements and ad hoc understandings and transforms them into a treaty-based relationship between Canada and the United States which should govern the trade and economic relationship for the foreseeable future. The Agreement meets the test of fairness and of mutual advantage. It is a win-win agreement. See also Canada Free Trade Agreement. October 04, 1987 marks an important date in Canada-US trade relations. In 1987, both countries agreed to the Canada-United States Free Trade Agreement (CUSFTA). Negotiations toward a free trade agreement with the US began in 1986. The two nations agreed to a historic agreement that placed Canada and the United States at the forefront of trade liberalization. Key elements of the agreement included the elimination of tariffs, the reduction of many non-tariff barriers, and it was among the first trade agreements to address trade in services. It also included a dispute settlement mechanism for the fair and expeditious resolution of trade disputes. The Canada-US Free Trade Agreement was brought into force on January 01, 1989 and is superseded by NAFTA, which includes Mexico. Canada-United States Free Trade Agreement (CUSFTA), originally known as the Free Trade Agreement (FTA; in French:- Accord de Libre-Échange (ALE)) in North America, is a trade agreement reached by negotiators for Canada and the United States on October 04, 1987, and signed by the leaders of both countries on January 02, 1988. The agreement phased out a wide range of trade restrictions in stages over a ten-year period, and resulted in a substantial increase in cross-border trade. With the addition of Mexico in 1994 FTA was superseded by the North American Free Trade Agreement (NAFTA) (in French:- Accord de Libre-Échange Nord Américain (ALENA), in Spanish:- Tratado de Libre Comercio de América del Norte (TLCAN)). As stated in the agreement, the main purposes of the Canadian-United States Free Trade Agreement were:- (i) eliminate barriers to trade in goods and services between Canada and the United States; (ii) facilitate conditions of fair competition within the free-trade area established by the Agreement; (iii) significantly liberalize conditions for investment within that free-trade area; (iv) establish effective procedures for the joint administration of the Agreement and the resolution of disputes; and (v) lay the foundation for further bilateral and multilateral cooperation to expand and enhance the benefits of the Agreement. / Президент США Ранэлд Вилсэн Рэйген (Ronald Wilson Reagan; 1911–2004) и Премьер Министр Канады Мартин Брайэн Малрони (Martin Brian Mulroney; 1939–).

US–CANADA TRADE COMMISSION = КОМИССИЯ США–КАНАДА ПО ТОРГОВЛЕ – US-Canada Trade Commission:- xxxxx. See also Trade Commission. / .

USCC = UNITED STATES CHAMBER OF COMMERCE

USCG = UNITED STATES COAST GUARD

USCGC = UNITED STATES COAST GUARD CUTTER

US CONSULAR INVOICE = КОНСУЛЬСКИЙ СЧЁТ–ФАКТУРА США – US Consular Invoice is a document required on merchandise imported into the United States. / Консульский Счёт-Фактура США:- документ, требуемый на товары, ввозимые в Соединённые Штаты Америки (США).

US CUSTOMARY UNITS = ЕДИНИЦЫ ПРИНЯТЫЕ В США – US Customary Units is the system of units of measurement used to measure things in the United States (US). The system of Imperial Units is similar and in some parts identical. Length or distance units include the inch, foot, yard and mile. Land units include square miles (2 589 998.470 32 square meter) and acres (4 046.872 6 square meter). Common volume units are the teaspoon, tablespoon (3 teaspoons), fluid ounce (two tablespoons), cup (8 ounces), pint (2 cups, or 16 fluid ounces), quart (2 pints, or 32 fluid ounces), US gallon (16 cups, 128 fluid ounces, or 3.8 liters). A barrel is the unit to measure oil. Temperature is measured in degrees Fahrenheit (°F). To convert from Celsius to Fahrenheit:- take the Celsius, multiply by nine, divide by five, and add thirty-two. Units of weight include the pound (453.6 grams), which contains 16 ounces. This should not be confused with the British pound which is a type of money. The different uses of the word Pound can cause confusion. Some people have been trying change these units in favor of the Metric System since the 1820s. Much infrastructure was built in past centuries using the old measures by both British and Americans. During the XX century some segments such as science, medicine and the military of the United States converted to the metric system but the old units are still used for daily purposes by Americans. On the other hand, world trade is conducted using the metric system and except for the US, the world uses the metric system for all purposes. / Единицы Американской Системы Мер И Весов (US Customary Units):- единицы мер и весов, принятые в Соединённых Штатах Америки (США). В основном они базируются на Британской системе мер и весов (или Имперальных Единицах (Imperial Units)), однако Американский Галлон равен 0.832 7 Британского галлона, а центнер состоит из 100 фунтов, что даёт тонну (ton), равную 2 000 фунтов (вместо Британской тонны, равной 2 240 фунтам). Переход на Метрические единицы системы мер и весов происходит медленнее, чем в Европе, однако Американцы намерены завершить этот переход.

US DOLLAR INDEX® = ИНДЕКС ПО ДОЛЛАРУ США® – The US Dollar Index® (USDX®) is an index (or measure) of the value of the United States Dollar relative to a basket of foreign currencies. It is a weighted geometric mean of the Dollar's value compared only with:- (i) Euro (EUR), 57.6% weight; (ii) Japanese Yen (JPY), 13.6% weight; (iii) Pound Sterling (GBP), 11.9% weight; (iv) Canadian Dollar (CAD), 9.1% weight; (v) Swedish Krona (SEK), 4.2% weight; and (vi) Swiss Franc (CHF) 3.6% weight. USDX® started in March 1973, soon after the dismantling of the Bretton Woods system. At its start, the value of the US Dollar Index was 100.000. It has since traded as high as the mid-160s and as low as 70.698 on 2008-March-16, the lowest since its inception in 1973. The makeup of the 'basket' has been altered only once, when several European currencies were subsumed by the Euro at the start of 1999. USDX® is updated whenever US Dollar (USD) markets are open, which is from Sunday evening New York time (early Monday morning Asia time) for 24 hours a day to late Friday afternoon New York time. USDX® can be traded as a futures contract on the IntercontinentalExchange, Inc. (ICE). It is also available in exchange traded funds (ETFs), options and mutual funds. The US Dollar Index® is computed using a trade-weighted geometric average of six foreign currencies against the Dollar. The US Dollar Index® (USDX®) is a measure of the value of the US Dollar relative to majority of its most significant trading partners. This index is similar to other trade-weighted indexes, which also use the exchange rates from the same major currencies. Currently, this index is calculated by factoring in the exchange rates of six major world currencies:- the Euro, Japanese Yen, Canadian Dollar, British Pound, Swedish Krona and Swiss Franc. This index started in 1973 with a base of 100 and is relative to this base. This means that a value of 120 would suggest that the US Dollar experienced a 20% increase in value over the time period. It is possible to incorporate futures or options strategies on the USDX®. These financial products currently trade on the New York Board Of Trade (NYBOT®). The US Dollar Index® (USDX®) measures the US Dollar's value against a basket of six overseas denominations. The US Dollar Index® measures the performance of the US Dollar against a basket of currencies:- EUR, JPY, GBP, CAD, CHF and SEK. It includes 9 chart types, 1 up to 1 000 periods and a vast range of customizable technical indicators. / Индекс по Доллару США® (Ю.Эс.Ди.Экс.®) – индекс (или мера) стоимости Доллара Соединённых Штатов Америки относительно корзины иностранных валют. Это взвешенное геометрическое значение стоимости Доллара, сравнимое только с:- (i) Евро (EUR), 57.6% веса; (ii) Японской Йеной (JPY), 13.6% веса; (iii) Фунтом Стерлингов (GBP), 11.9% веса; (iv) Канадским Долларом (CAD), 9.1% веса; (v) Шведской Кроной (SEK), 4.2% веса; и (vi) Швейцарским Франком (CHF) 3.6% веса. Ю.Эс.Ди.Экс.® был запущен в обращение в Марте 1973, вскоре вслед за демонтажом Брэтчэн Вудзской системы (Bretton Woods system). На момент начала его расчёта стоимость Индекса по Доллару США составляла 100.000. xxxxx. Эти финансовые продукты поначалу торговались в Нью Йоркской Палате Торговли (Нью Йоркском Табло Торговли, если быть более точными; соркащённо – НАЙБЭТ® (NYBOT®)). Индекс по Доллару США® (аббревиатура:- USDX®) рассчитывается с учётом приведённых к весу геометрических среднеарифметических значений курса шести валют по отношению к Доллару:- (i) Евро (EUR), 57.6% веса; (ii) Японская Йена (JPY), 13.6% веса; (iii) Фунт Стерлингов (GBP), 11.9% веса; (iv) Канадский Доллар (CAD), 9.1% веса; (v) Шведская Крона (SEK), 4.2% веса; и (vi) Швейцарский Франк (CHF) 3.6% веса. Индекс был введён в обращение в Марте 1973 вскоре после отказа от системы, сформированной решением Брэтчэн Вудзской Конференции, состоявшейся с 01 по 22 Июля 1944 в городе Брэтчэн Вудз, Штат Нью Хэмпшир (Bretton Woods, NH (State of New Hampshire)), Соединённые Штаты Америки. В этот начальный момент значение Индекса по Доллару США было определено как 100.000.
