утончился. Исчезли накладные плечи, к которым мы так привыкли, что не мыслим без них свой облик. Естественно, сузились рукава, 'поползли' вверх проймы. Застёжки тоже поднялись кверху. Жакеты часто имеют увеличенную длину. Они прилегают в груди и талии, плавно расширяясь книзу. По-прежнему популярен жакет полуприлегающего силуэта с карманами 'листочками', высокой застёжкой и отложным воротником. Юбки разнообразны, но лидируют узкие и длинные – от середины икр до щиколоток. Высокие разрезы на юбках являются не просто приёмом для показа соблазнительных ножек, но и необходимостью, дарующей свободу движений. Брюки привлекают разнообразием – от широких, развевающихся, расклешённых от бёдер или от колен, как в 1970-е, до классических прямых и узких. Не забыты и короткие узкие брючки – бриджи, молодёжи они особенно по вкусу. Брюки проникают и в вечернюю одежду. Сшитые из шёлка или шифона, отделанные плиссе, гофре, ажурной каймой, драпировками, высокими поясами, они выглядят особенно женственно. Платье – самый традиционный и женственный вид одежды – снова выходит на первый план. Обычно это платье нового силуэта – узкое в груди и талии, расширенное книзу, либо платьице в стиле 'ампир' – с приподнятой талией. Жилеты по-прежнему остаются любимцами моды. Причём не только классические (типа мужских), сшитые из шерстяных тканей, но и похожие на туники, очень длинные, зауженные в груди и талии, выполненные из шёлка, крэпдешина, ажурные вязаные, с воротником и лацканами. Ткани стали менее грубыми, более изящными, мягкими и пластичными. Они обтекают тело, обволакивают его. Акцент делается на гибкие, гладкие ткани с матово-блестящими контрастами. Это груботканые крэпы; прозрачные шёлка, шифоны, крэп-жоржеты; костюмные шерстяные в тонкую полоску, клетку, с мелкими узорами; вельветовые. Сохраняется тенденция к необычному комбинированию вещей. Речь, прежде всего, идёт о многослойности. Нередко предметы одежды комбинируются по принципу 'из-под Пятницы Суббота'. Модная цветовая гамма изменилась кардинально. Бледность возобладала над яркими красками. Многие модельеры взяли за основу деревья, цветы. Некоторые специалисты выделяют группу розовых цветов, актуальны нейтральные цвета. Единственное исключение – красный цвет, который вновь солирует. Среди синих оттеков можно отметить 'индиго', который переживает своё возрождение.

FASHIONING = ПРИДАНИЕ ФОРМЫ – Fashioning is the process of shaping a fabric during knitting by increasing or decreasing the number of needles in action. Fashioning is used in manufacturing hosiery, underwear, and sweaters.

FASHIONISTA = МОДНИК (или МОДНИЦА) – Fashionista is a very fashionable person, especially one who works in the fashion industry. Origin:- 1990–95; Fashion + Italian or Spanish -ista = -ist. Fashionista (informal) is a person who follows trends in the fashion industry obsessively and strives continually to adoptthe latest fashions.

FASHION PLATE = ХХ (или РИСУНОК КОСТЮМА, или МОДНОЕ ЛЕКАЛО) – Fashion Plate:- (1) an illustration of clothing style. (2) A person who dresses in the latest fashions. Fashion plate has nothing to do with the type of plate you eat on. Even if the Apparel Search Company eats lunch on a piece of fabric, it still would 'not' be considered a fashion plate.

FASHION TRANSPORT = ТРАНСПОРТИРОВКА МОДНЫХ ИЗДЕЛИЙ (или ПЕРЕВОЗКА МОДНЫХ ИЗДЕЛИЙ) – Fashion Transport is a transport of clothing and/or garments including shoes, belts and handbags in dedicated means of transport. Often in a Garment Container. / Перевозка одежды и/или пошитых изделий, включая обувь, пояса и ручные сумки в специально предназначенных для этой цели средствах транспорта. Часто в Контейнерах Для Перевозки Пошитых Изделий (Garment Container).

FAST = FIRST ACTION SYSTEM FOR TRADEMARKS

FAST ACID DYES = ПРОЧНЫЕ КИСЛОТНЫЕ КРАСИТЕЛИ (или СТОЙКИЕ КИСЛОТНЫЕ КРАСИТЕЛИ) – Fast Acid Dyes are the acid or premetallized dyes with high washfastness. Dyes for wool that are called Fast or Washfast may come from a variety of dye classes such as milling, reactive or premetallized.

FAST COLOR = ПРОЧНАЯ КРАСКА (или ПРОЧНЫЙ КРАСИТЕЛЬ) – Fast Color is a dye which is stable to color destroying agents, such as sunlight, perspiration, washing, abrasion, and pressing. / , мытьё, истирание и прессование.

FAST DYES = ПРОЧНЫЕ КРАСИТЕЛИ (или СТОЙКИЕ КРАСИТЕЛИ) – Fast Dyes are those dyes that are fast for the purpose for which the fabric is intended.

FASTENER = КРЕПЛЕНИЕ – Fastener is a mechanical device for joining pallet components such as nails, staples, bolts or screws.

FASTENER QUALITY ACT = АКТ О КАЧЕСТВЕ КРЕПЛЕНИЙ – Fastener Quality Act (15 USC 5401 et seq., as amended by Public Law 104-113, Public Law 105-234, and Public Law 106-34); implementing regulations:- 15 CFR Part 280 (CFR:- short for the US Code of Federal Regulations). Purpose:- protects against the sale of mismarked, misrepresented, and counterfeit fasteners.

FASTENER SHEAR INDEX = ИНДЕКС СДВИГА КРЕПЛЕНИЯ – Fastener Shear Index is the relative measure of shear resistance of the pallet fastener. / Индекс Сдвига Крепления:- относительная мера сопротивления сдвигу крепления поддона.

FAST MARKET = БЫСТРЫЙ РЫНОК – Fast Market is a condition that will be officially declared by a stock market exchange when the financial markets are experiencing unusually high levels of volatility, combined with unusually heavy trading. Fast markets occur rarely, but when one does occur, brokers are not held to the same constraints as they are during a regular market. Inexperienced investors are more likely to get burned in a fast market because of the unique problems that arise under extreme trading conditions. One problem is that quotes can become inaccurate when they can't keep up with the pace of trading. Another problem is that brokers may not be able to fill orders when investors want or expect them to, so their securities may be bought and sold at undesirable price levels that don't provide the return the investor anticipated. Rapid movement in a market caused by strong interest by buyers and/or sellers. In such circumstances price levels may be omitted and bid and offer quotations may occur too rapidly to be fully reported. Transactions in the pit or ring that take place in such volume and with such rapidity that price reporters are behind with price quotations, so they insert 'FAST' and show a range of prices. Also known as Fast Tape.

FASTNESS = УСТОЙЧИВОСТЬ (или ПРОЧНОСТЬ, или СТОЙКОСТЬ, или ТУЧНОСТЬ) – Fastness is the ability of a material or dye to maintain its color without fading or washing away. See also Colorfastness. / Смотрите также Устойчивость Окраски (Colorfastness).

FAST TAPE = БЫСТРАЯ ЛЕНТА – Fast Tape is a type of futures market that occurs when a single traded price is unavailable because of the rapid and large number of transactions occurring in the pit or ring. Rather than quoting a specific price, a fast tape will give a range of prices marked by the word 'fast' to indicate that the market is moving rapidly. Also known as Fast Market. / Быстрая Лента – тип состояния рынка фьючерсов, который возникает в тот момент, когда единственная торгуемая цена недоступна из-за очень быстрого и огромного числа транзакций, заключаемых в яме или ринге. Вместо того, чтобы котировать конкретную цену, быстрая лента предоставит диапазон цен, помеченных словом 'Быстрое' ('Fast'), чтобы указать, что рынок движется быстро. Известна также как Быстрый Рынок (Fast Market).

FAST TRACK = БЫСТРЫЙ ОТВЕТ – In the United States, Fast Track procedures for approval of trade agreements were included by Congress in trade legislation in 1974, in 1979 and again in the 1988 Trade Act. Fast track provides two guarantees essential to the successful negotiation of trade agreements:- (i) a vote on implementing legislation within a fixed period of time, and (ii) a vote, up or down, with no amendments to that legislation. Provisions in the Omnibus Trade and Competitiveness Act of 1988 include that the foreign country request negotiation of an Free Trade Agreement (FTA) and that the President give the Congress a 60-legislative-day notice of intent to negotiate an FTA. During the 60-legislative-day period, either committee can disapprove fast track authority by a majority vote. Disapproval would likely end the possibility of FTA negotiations. The 60-legislative-days can translate into five to ten months of calendar time, depending on the Congressional schedule. Formal negotiations would begin following this 60-day Congressional consideration period.

FAT = FIXED ASSET TRANSFER

FAT = ЖИР – Fat is an animal or vegetable oil which will combine with an alkali to saponify and form a soap. / Под Жирами понимается группа веществ, входящих наряду с углеводами и белками в состав всех животных и растительных организмов. Основные компоненты жира – триглицериды (полные сложные эфиры глицерина и высших жирных кислот, главным образом олеиновой, линолевой, пальмитиновой, стеариновой). Ценный высококалорийный пищевой продукт, особенно коровье, баранье, свиное сало, жир молока, а также растительные жиры (Растительные Масла или Жирные Масла). Жиры, органические соединения, полные сложные эфиры глицерина (триглицериды) и одноосновных жирных кислот; входят в класс липидов. Наряду с углеводами и белками жиры – один из главных компонентов клеток животных, растений и микроорганизмов. Все известные природные жиры содержат в своём составе три различных кислотных радикала, имеющих неразветвлённую структуру и, как правило, чётное число атомов углерода. Из насыщенных жирных кислот в молекуле жиров чаще всего встречаются стеариновая и пальмитиновая кислоты, ненасыщенные жирные кислоты представлены в основном олеиновой, линолевой и линоленовой кислотами. Физико-химические и химические свойства жиров в значительной мере определяются соотношением входящих в их состав насыщенных и ненасыщенных жирных кислот. Жиры нерастворимы в воде, хорошо растворимы в органических растворителях, но обычно плохо растворимы в спирте. При обработке перегретым паром, минеральными кислотами или щёлочью жиры подвергаются гидролизу (омылению) с образованием глицерина и жирных кислот или их солей (смотрите Мыла). При сильном взбалтывании с водой образуют эмульсии. Примером стойкой эмульсии жира в воде является молоко. Эмульгирование жиров в кишечнике (необходимое условие их всасывания) осуществляется солями жёлчных кислот. Природные жиры подразделяют на животные жиры и растительные жиры (смотрите Масла Растительные Жирные). В организме жиры – основной источник энергии. Энергетическая ценность жиров в 2 с лишним раза выше, чем углеводов. Жиры, входящие в состав большинства мембранных образований клетки и субклеточных органелл, выполняют важные структурные функции. Благодаря крайне низкой теплопроводности жир, откладываемый в подкожной жировой клетчатке, служит термоизолятором, предохраняющим организм от потери тепла, что особенно важно для морских теплокровных животных (китов, тюленей и других). Вместе с тем жировые отложения обеспечивают известную эластичность кожи. Содержание жира в организме человека и животных сильно варьирует. В некоторых случаях (при сильном ожирении, а также у зимнеспящих животных перед залеганием в спячку) содержание жира в организме достигает 50%. Особенно высоко содержание жира у сельскохозяйственных животных при их специальном откорме. В организме животных различают запасные жиры (откладываются в подкожной жировой клетчатке и в сальниках) и протоплазматические жиры (входят в состав протоплазмы в виде комплексов с белками, называемые Липопротеидами). При голодании, а также при недостаточном питании в организме исчезает запасной жир, процентное же содержание в тканях протоплазматических жиров остаётся почти без изменений даже в случаях крайнего истощения организма. Запасный жир легко извлекается из жировой ткани органическими растворителями. Протоплазматические жиры удаётся извлечь органическими растворителями только после предварительной обработки тканей, приводящей к денатурации белков и распаду их комплексов с жирами. В растениях жиры содержатся в сравнительно небольших количествах. Исключение составляют масличные растения, семена которых отличаются высоким содержанием жиров. Смотрите также Жировой Обмен.

FAT–CLEAVING ENZYMES = ЖИРОРАСЩЕПЛЯЮЩИЕ ЭНЗИМЫ – Fat-Cleaving Enzymes are lipases. / Липазы – ферменты класса гидролаз, катализирующие расщепление триглицеридов до глицерина и свободных жирных кислот. У человека и животных содержатся в тканях, а также в соке поджелудочной железы и участвуют в переваривании жиров.

FATF = FINANCIAL ACTION TASK FORCE ON MONEY LAUNDERING

FATHOM = ФАТОМ (или ФЭСОМ, или МОРСКАЯ САЖЕНЬ) – Fathom:- six feet. Comes from the Dutch word ‘fadom’ which was the distance between fingertips of outstretched hands. Each fathom is 6-feet or approximately 2 meters. Fathom is a traditional unit of distance equal to 2 yards or 6 feet (approximately 1.828 8 meters). The word comes from the Old English Fæthm, meaning ‘Outstretched Arms’, because a fathom is the distance between a man’s outstretched fingertips. This is a generic unit that has been used in many cultures since ancient times. Other versions include the Spanish Braza, the French Toise, the German Klafter, the Danish Favn (6.18 feet or 1.88 meters), the Swedish Famn (5.84 feet or 1.78 meters) and the Japanese Ken (1.81 meters). In England, the fathom was a common unit during Saxon times, and it continued to be used for many purposes through the medieval era. In fact, the length of the foot may have been defined, early in the XII century, specifically to assure that 1 foot = exactly 1/6 fathom. Today the fathom is used almost exclusively at sea, measuring water depth, the length of ships’ cables, etc. Abbreviation:- fath or fth. A nautical measure equal to six feet; used for measuring water depths, and also for indicating the lengths of lead lines, cordage and anchor chains. / Испанская Морская Сажень (Braza), Французский Туаз (Toise), Немецкая Сажень (Klafter), Датская Морская Сажень (Favn), Шведская Сажень (Famn) и Японский Кэн (Ken). Обозначение:- . Фатом или Фэсом или Морская Сажень – единица длины в Британской Империальной Системе и в США. 1 фатом = 6 футам = 2 ярдам = 1.828 8 метра. Сажень – Русская единица длины, применявшаяся до введения Метрической Системы Мер. 1 сажень = 3 аршинам = 48 вершкам = 2.133 6 метрам.

FATIGUE = УСТАЛОСТЬ – A term Fatigue refers to the resistance of a material to weakening or failure during alternate tension-compression cycles, i.e. in stretch yarns, the loss of ability to recover after having been stretched. / Усталость (материалов), изменение механических и физических свойств материала под длительным действием циклически изменяющихся во времени напряжений и деформаций. Изменение состояния материала при усталостном процессе отражается на его механических свойствах, макроструктуре, микроструктуре и субструктуре. Эти изменения протекают по стадиям и зависят от исходных свойств, вида напряжённого состояния, истории нагружения и влияния среды. На определённой стадии начинаются необратимые явления снижения сопротивления материала разрушению, характеризуемые как Усталостное Повреждение. Сначала в структурных составляющих материала и по границам их сопряжения (зёрна поликристаллического металла, волокна и матрица композитов, молекулярные цепи полимеров) образуются микротрещины, которые на дальнейших стадиях перерастают в макротрещины либо приводят к окончательному разрушению элемента конструкции или образца для

механических испытаний. Количественно усталостный процесс описывается зависимостью между накопленным повреждением и числом циклов или длительностью нагружения по параметру величины циклических напряжений или деформаций. Соответствующая зависимость между числом циклов и стадией повреждения (в том числе возникновением трещины или окончательным повреждением) называется Кривой Усталости. Эта кривая – основная характеристика усталости материалов. Накопление циклического повреждения отражает деформирование материала как макро- и микронеоднородной среды (для металлов – поликристаллический конгломерат, для полимеров – конгломерат молекулярных цепей, для композитов – регулярное строение из матрицы и волокон). Этот процесс в поле однородного напряжённого состояния (например, простого растяжения-сжатия) описывается механической моделью, звенья которой воспроизводят неоднородную напряжённость структурных составляющих материала; неоднородность характеризуется вероятностными распределениями величин микродеформаций и микронапряжений (включая остаточные). Циклическое нагружение таких неоднородных структур порождает в наиболее напряжённых структурных звеньях необратимые деформации (упругопластические, вязкоупругие), накапливающиеся с нарастанием числа циклов и длительности пребывания под циклической нагрузкой. Их увеличение до критических значений, свойственных материалу и среде, в которой он находится, приводит к зарождению макротрещины как предельного состояния на первой стадии усталостного разрушения. Кинетика изменения состояния материала на этой стадии проявляется субмикроскопически в изменении плотности дислокаций и концентрации вакансий, микроскопически – в образовании линий скольжения, экструзий и интрузий на свободной поверхности остаточных микронапряжений; механически – в изменении твёрдости, параметров петли упруго-пластического гистерезиса, циклического модуля упругости, а также макрофизических свойств (электрического, магнитного и акустического сопротивления, плотности). На второй стадии усталостного разрушения накопление повреждения оценивается скоростью прорастания макротрещины и уменьшением сопротивления материала статическому (квазихрупкому или хрупкому) разрушению, определяемому изменением статической прочности, в том числе характеристиками вязкости разрушения как критическими значениями интенсивностей напряжений у края усталостной трещины. Кривые усталости в области многоцикловой усталости (при разрушающем числе циклов более 10^5), за которые ‘ответственны’ повторные упругие деформации, наносятся в амплитудах (или максимальных напряжениях) цикла в логарифмических (lgs, lgN) или полулогарифмических (s, lgN) координатах. В зависимости от особенностей материала, гомологических температур и физико-химической активности среды кривые усталости могут иметь либо асимптотический характер, либо непрерывно снижающийся с выпуклостью, обращенной к началу координат. Величину амплитуд напряжений s_{-1}, являющихся асимптотами кривых усталости 1-го типа, называют Пределом Выносливости Материала, а величину амплитуд напряжений $(s_{-1})_{Np}$, для которых разрушение достигается при числе циклов Np по кривым 2-го типа, – ограниченным (по числу циклов) пределом выносливости. Материалам более стабильных структур и для более низких температур свойственны кривые типа 1; материалам менее стабильных структур, для более высоких температур и активных сред – кривые типа 2. Кривые усталости в области малоцикловой усталости (при разрушающем числе циклов в 10^4 и менее), за которые ‘ответственны’ повторные пластические деформации, наносятся в амплитудах этих деформаций в логарифмических координатах lg e_{ap} и lg N. Предел Усталости или Предел Выносливости материалов, наибольшая величина амплитуд напряжений симметричного цикла изменения механических нагрузок или максимального напряжения асимметричного цикла, повторное действие которых материал выдерживает, не разрушаясь, неограниченное число циклов; ограниченный предел выносливости – величина амплитуды или максимального напряжения цикла, повторение действия которых с данным числом циклов вызывает усталостное разрушение материала или возникновение в нём макротрещин. Смотрите также Усталость (Материалов).

FATIGUE = XX (или УСТАЛОСТЬ, или УТОМЛЯЕМОСТЬ) – Fatigue:- (plural) the uniform or work clothing worn on fatigue and in the field. / униформа или рабочая одежда, одеваемая при усталости и в поле.

FATIGUE CHUNKS = КОМЬЯ (или КОМКИ, или КУСКИ, или КОЛОДЫ, или ЧУРБАНЫ) УСТАЛОСТИ – Fatigue Chunks:- thick three-dimensional particles exceeding 50 microns indicating severe wear of gear teeth. / износ зуба передачи.

FATIGUED = УСТАЛОСТНОЕ – Fatigued:- a structural failure of the filter medium due to flexing caused by cyclic differential pressure.

FATIGUE LIFE = СРОК СЛУЖБЫ ПО УСТАЛОСТИ (или РЕСУРС ДО РАЗРУШЕНИЯ ОТ УСТАЛОСТИ) – Fatigue Life is the theoretical number of revolutions (or hours of operation) a bearing will last under a given constant load and speed before the first evidence of fatigue develops on one or more of the components.

FATIGUE PLATELETS = ПЛАСТИНКИ УСТАЛОСТИ – Fatigue Platelets are the normal particles between 20 and 40 microns found in gear box and rolling element bearing oil samples observed by analytical ferrography. A sudden increase in the size and quantity of these particles indicates excessive wear. / в коробке передач и . чрезмерный износ.

FAULT = ПОВРЕЖДЕНИЕ (или ОТКАЗ, или НЕИСПРАВНОСТЬ) – Fault is a short circuit. / короткое замыкание. Под Повреждением понимается одно из понятий теории надёжности; событие, заключающееся в нарушении исправности изделия. Повреждение может быть существенным и являться причиной нарушения работоспособности (отказа) и несущественным, при котором работоспособность изделия сохраняется. Под Неисправностью или Неисправным Состоянием понимается состояние изделия (устройства), при котором оно не соответствует одному или нескольким требованиям, предъявляемым как в отношении основных параметров, характеризующих его способность выполнять заданные функции, так и в отношении удобств эксплуатации, внешнего вида, комплектности и тому подобного. Неисправность – более общее понятие, чем неработоспособность (неработоспособное состояние). Неисправность возникает вследствие повреждения. Под Отказом понимается одно из основных понятий надёжности. Событие, заключающееся в нарушении работоспособности изделия (один или несколько рабочих параметров изделия выходят за допустимые пределы). Отказ изделия возникает вследствие отказов его компонентов, расстройки, разрегулирования, разрушения конструкции или изменения структуры изделия, помех и другого. Различают отказы внезапные и постепенные, полные и частичные, зависимые и независимые.

FAULTY DIMENSIONS = ПОВРЕЖДЁННЫЕ РАЗМЕРНОСТИ (или НЕГОДНЫЕ РАЗМЕРНОСТИ, или НЕПРИГОДНЫЕ РАЗМЕРНОСТИ) – Faulty Dimensions:- not readily apparent. May cause either a hard or a loose operating zipper. Either condition may result in zipper failure before garment is worn out. Closure defects, and namely – Zippers:- Slider Defects. / Порок или дефект застёжки.

FAULTY GAUGING = НЕИСПРАВНЫЙ ЗАМЕР (или ПОВРЕЖДЁННЫЙ ЗАМЕР) – Faulty Gauging:- where operator has not sewn seam to specified margin. Sewing Room Defects. / Порок или дефект швейного производства.

FAULTY MATERIAL = ПОВРЕЖДЁННЫЙ МАТЕРИАЛ (или БРАКОВАННЫЙ МАТЕРИАЛ) – (1) Faulty Material:- not apparent without testing in laboratory. Causes lack of compressive strength and poor resistance to washing and ironing. Closure defects, and namely – Plastic Buttons. / Порок или дефект застёжки.

(2) Faulty Material:- not apparent without laboratory testing. There are as many as five quality grades. Better and more uniform appearance is attained in the higher quality. Closure defects, and namely – Pearl Buttons. / Порок или дефект застёжки.

FAULTY SELVEDGE = ПОВРЕЖДЁННАЯ КРОМКА – Faulty Selvedge:- wrong drawing in denting, drawing in, selvedge end, Jacquard working or punch card is faulty. Check points are:- (i) drawing of selvedge catching ends (through shaft and reed); (ii) condition of tucking needles; (iii) drawing of Jacquard ends in ribbon selvedge; (iv) temple cover height; (v) condition of selvedge gripper; (vi) accumulation of fly, fluffs dust at selvedge gripper foot; (vii) avoid less or more tuck in; (viii) selvedge binding should be perfect; (ix) missing ends at selvedges or Jacquard ribbons; (x) condition of temple rings; (xi) working of heald shafts carrying selvedge ends; (xii) projectile brake settings; and (xiii) beam flanges. See also Defective Selvedge. Weaving defect. / Жакяр (Jacquard). Порок или дефект ткачества.

FAULTY TEXTURING = ПОВРЕЖДЁННОЕ ТЕКСТУРИРОВАНИЕ – Faulty Texturing:- portions of a bulked yarn that differ from the normal yarn in respect of degree of crimp and similar distortions of the filaments. Note:- this defect is caused by a lack of control during texturing processes. / Дефектные Текстурированые Нити (faulty texturing):- порок пряжи в тканых полотнах в виде изменения пряжи, которая отличается от обычной пряжи по структуре. Примечание:- данный порок вызван недостаточным контролем во время процессов текстурирования нитей.

FAVD = FAVORABLE RAINFED VILLAGE DUMMY

FAWN = ОЛЕНЕВОЕ (или ЖЕЛТОВАТО–КОРИЧНЕВОЕ) – Fawn:- a variable color averaging a light grayish brown. / .

FAX = FACSIMILE

FB = FLOOR BROKER

FB = FOLLOWED BY

FB = FREIGHT BILL

FBA = FLUORESCENT BRIGHTENING AGENT

FB DRYER = FLAT BED DRYER

FBIS = FOREIGN BROADCAST INFORMATION SERVICE

FBP = FOREIGN BUYER PROGRAM

FC = FORAGE CHOPPER

FC&S = FREE OF CAPTURE AND SEIZURE

FCA = FELLOW OF THE INSTITUTE OF CHARTERED ACCOUNTANTS

FCA = FIRST COST TO AGENT

FCA = FREE CARRIER

FCC = FEDERAL COMMUNICATIONS COMMISSION

FCC = FERTILITY CAPABILITY CLASSIFICATION

FCC = FLUID CATALYTIC CRACKING

FCE ACT OF 2008 = FOOD, CONSERVATION AND ENERGY ACT OF 2008

FCIA = FOREIGN CREDIT INSURANCE ASSOCIATION

FCL = FULL CONTAINER LOAD

FCM = FUTURES COMMISSION MERCHANT

FCOJ = FROZEN CONCENTRATED ORANGE JUICE

FCPA = FOREIGN CORRUPT PRACTICES ACT

FCRI = FIELD CROPS RESEARCH INSTITUTE

FCS = FREE CHOICE SCREENING TEST

FCSSP = FEDERATION OF CROP SCIENCE SOCIETIES OF THE PHILIPPINES

FCUA = FEDERAL CREDIT UNION ADMINISTRATION

FDA = FOOD AND DRUG ADMINISTRATION

FDC = FINAL DATA CAPTURE

FDC = (SPIKELET) FERTILITY DEPRESSION COEFFICIENT

FDD = FARM DITCH DENSITY

FDD = FIRST DELIVERY DATE

FDD = FREIGHT, DEMMURAGE, DEADFREIGHT

FDDI = FIBER DIGITAL DATA INTERFACE

FDI = FINANCIAL DEPOSITORY INSTITUTION

FDI = FOREIGN DIRECT INVESTMENT

FDIC = THE FEDERAL DEPOSIT INSURANCE CORPORATION

FDIUS = FOREIGN DIRECT INVESTMENT IN THE UNITED STATES

FDP = FRESH DAIRY PRODUCTS

FDP = FRUCTOSE 1.6–DIPHOSPHATASE

FDY = FULLY DRAWN YARN

FE = FIELD EMERGENCE

FEA = FEDERAL ENERGY ADMINISTRATION

FEA = FEDERAL ENTERPRISE ARCHITECTURE

FEATURES, ADVANTAGES, BENEFITS = ХАРАКТЕРИСТИКИ, ПРЕИМУЩЕСТВА, ВЫГОДЫ – Features, Advantages, Benefits (FAB):- selling points which must be personalized (you, yours) for full effectiveness. (i) Feature – facts about the product itself. (ii) Advantage – what it does. (iii) Benefits – rewards for the customer, its value. The FAB Statements are essential in explaining why someone should buy from you. FAB Statements:- FAB stands for Features, Advantages, and Benefits. A FAB Statement is explaining the feature, what it does (the advantage), and how that benefits the prospective client. (i) Features are one of the easier things to identify. These are facts or characteristics about your business, products, and services. For example, a '1 inch insulation layer' on a sleeping bag is the feature. (ii) Advantages are what the features do. These tend to be factual, and aren't connected to a prospects need … Yet. For example, 'helps retain body heat on cold nights' (sticking with our sleeping bag example). (iii) Benefits answer why someone should value the advantage. It connects the facts about your product to a solution for your client. For example, 'when you're camping, you'll have a nice warm sleep at night so that when you wake up you'll be well rested and ready for a day of fun activities'. Here's the full FAB Statement from the sleeping bag example in action:- 'Our sleeping bags have a 1 inch layer of insulation on them. This helps to retain body heat on cold nights. You'll be warm all night. Which means that you'll get a great sleep and be well rested for a day of fun activities (that you'll fully enjoy!)'. This FAB Statement will connect really well with people who are frustrated with camping because they are cold, never get a good nights rest, wake up grouchy, and can't fully enjoy the trip. Turning FAB Statements Into Marketing & Sales Messages:- once you identify your various features, advantages, and benefits, you can start compiling them into succinct marketing and sales messages. The FAB Statements exercise will help you connect better with your prospective clients. And you know that means more business for you! Follow a few easy steps to start creating your own FAB Statements:- (i) compile a list of your product features. Leave room to add your advantages and benefits later; (ii) go back over your feature list and write in one or two advantages of each; and (iii) put yourself into your prospective clients shoes, and develop a benefit statement for each advantage. Be sure to dig right down to the core human desire. From here, you can put together a whole bunch of value statements. Now, there's one final step before you have the perfect set of marketing messages:- Flip the FAB Statements. Instead of stating the feature first, state the benefit. Then explain how you accomplish the benefit (via your advantage and feature). For example, our final marketing message for our sleeping bag could actually be:- 'While you're camping, you'll get a great sleep and be well rested for a day of fun activities you'll fully enjoy. Our 1 inch layer of insulation keeps your body warm all night so you sleep comfortably'. Leave Your Competition In the Dust:- hopefully you realize how important FAB Statements are to your marketing and sales success. It's surprising how few people actually know about FAB Statements, and how fewer seem to properly go through the exercise. This alone is a good reason to take a few moments and try this in your own business. You may just end up leaving your competition in the dust.

FEBTC = FAR EAST BANK AND TRUST COMPANY

FED = FEDERAL RESERVE SYSTEM

FED = FONDS EUROPÉEN DE DÉVELOPPEMENT = EUROPEAN FUNDS OF DEVELOPMENT

FEDDAN = ФЕДДАН – Feddan is an Egyptian unit of land area, formerly used throughout the Middle East and North Africa. The feddan equals 24 kirat or about 4 200 square meters (m^2) or 0.42 hectare or 1.038 acre. / Под Федданом понимается Египетская мера площади земельного участка, когда-то использовавшаяся по всему Ближнему Востоку и Северной Африке. Феддан равен 24 киратам (kirat) или приблизительно 4 200 квадратным метрам ($м^2$) или 0.42 гектара или 1.038 акра.

FEDERAL ADVISORY COUNCIL = ФЕДЕРАЛЬНЫЙ СОВЕЩАТЕЛЬНЫЙ СОВЕТ – The Federal Advisory Council (FAC), which is composed of twelve representatives of the banking industry, consults with and advises the Board on all matters within the Board's jurisdiction. The council ordinarily meets four times a year, the minimum number of meetings required by the Federal Reserve Act. These meetings are always held in Washington, DC, customarily on the first Friday of February, May, September, and December, although occasionally the meetings are set for different times to suit the convenience of either the council or the Board. Each year, each Reserve Bank chooses one person to represent its District on the FAC, and members customarily serve three one-year terms. The members elect their own officers. In the United States, the Federal Advisory Council (FAC) is an advisory group made up of one representative (in most cases a banker) from each of the twelve Federal Reserve Districts. Established by the Federal Reserve Act, the council meets periodically with the Board of Governors to discuss business and financial conditions and make recommendations. / В Соединённых Штатах Америки Федеральный Совещательный Совет (ФСС) является консультативной группой, сформированной по одному представителю (в большинстве случаев банкира) от каждого из двенадцати Округов Федерального Резерва (Federal Reserve Districts). Создан в соответствии с Актом о Федеральном Резерве (the Federal Reserve Act). Совет периодически встречается с Советом Управляющих (the Board of Governors) для обсуждения деловых и финансовых условий и даёт рекомендации.

FEDERAL AGENCY SECURITIES = ЦЕННЫЕ БУМАГИ ФЕДЕРАЛЬНЫХ АГЕНТСТВ – Federal Agency Securities:- in the United States, interest-bearing obligations issued by federal agencies and government-sponsored entities, such as the Federal Home Loan Banks, the Federal Farm Credit Banks, the Federal National Mortgage Association (Fannie Mae), the Federal Home Loan Mortgage Corporation (Freddie Mac), and the Tennessee Valley Authority. Some federal agency securities are backed by the US government while others are not. / В Соединённых Штатах Америки (Фэни Мэй (Fannie Mae)), (Фрэди Мэк (Freddie Mac)), и . Ценные Бумаги Федеральных Агентств – долговые ценные бумаги, эмитированные агентством федерального правительства, таким, как Федеральная Национальная Ассоциация по Закладным (Federal National Mortgage Association), Федеральный Банк Фермерского Кредита (Federal Farm Credit Bank) или Управление Долины Теннесси (Tennessee Valley Authority (TVA)). Не являясь муниципальными облигациями, обеспеченными общей гарантией Казначейства США (US Treasury), подобные ценные бумаги спонсируются государством и, следовательно, имеют высший рэйтиньг безопасности.

FEDERAL AIRWAY = ФЕДЕРАЛЬНЫЙ ВОЗДУШНЫЙ ПУТЬ – Federal Airway means a part of the navigable airspace that the Administrator designates as a Federal airway.

FEDERAL BONDS = ФЕДЕРАЛЬНЫЕ ОБЛИГАЦИИ – In Germany, Federal Bonds are traded bonds of the Federal Government with a maturity of 10 to 30 years. Federal bonds have a central position on the German capital market and in capital transactions with foreign countries. Their terms and conditions have an important benchmark function for the entire market for debt instruments

denominated in EUR. Both Federal bonds and medium-term notes have fixed coupons; the issue prices vary. The purchase of Federal bonds is subject to no restrictions.

FEDERAL DEBT = ФЕДЕРАЛЬНЫЙ ДОЛГ – Federal Debt is the federal (Canada) debt which has accumulated over almost 30 years now (2004) stands at approximately CAD500 Bn. Imagine the interest charges on that. For a view of the budget – showing program spending vs interest costs in relation to total revenue check the Finance Dept's website. The Federal Government's Budget Chartbook contains a useful discussion of economic matters such as those discussed above. Statscan (http://www.statcan.ca) is another good source.

FEDERAL DEFICIT = ФЕДЕРАЛЬНЫЙ ДЕФИЦИТ – Federal Deficit is the amount by which the government's total budget outlays exceeds its total receipts for a fiscal year. Or, approximately, the federal deficit is the amount by which the federal debt increases in a single year. Or, approximately, the federal deficit is the amount by which the federal debt increases in a single year. Although the federal deficit is the amount each year by which federal outlays in the federal budget exceed federal receipts, the gross federal debt increases each year by substantially more than the amount of the deficit each year. That is because a substantial amount of federal borrowing is not counted in the budget. The two major peaks of the federal deficit in the XX century occurred during World War I and World War II. Deficits increased steadily from the 1960s through the early 1990s, and then declined rapidly for the remainder of the 1990s. The federal deficit went over 10 percent of GDP in the aftermath of the financial crisis of 2008. The United States government did not always run a deficit. In the XIX century the federal government typically only ran deficits during wartime or during financial crises. The government ran a deficit of 2 percent of GDP at the end of the war of 1812, and through the decade after the Panic of 1837 and culminating in the US – Mexican War of 1846–48. It ran a deficit of over 7 percent of GDP in the Civil War; and ran a deficit in the depressed 1890s. In the XX century the US ran a defict during World War I, the Great Depression, World War II, and in almost all years since 1960, during peace and war. See also Gross Federal Debt. Federal Deficit is the excess of government spending over its revenue. The US Federal Deficit has never fallen as fast as it's falling now without a coincident recession. To be specific, CBO expects the deficit to shrink from 8.7% of GDP in fiscal 2011 to 5.3% in fiscal 2013 if the sequester takes effect and to 5.5% if it doesn't. The US Federal Budget Deficit has topped (осень 2012) USD1 trillion for a fourth straight year. But a modest improvement in economic growth helped narrow the gap by USD207 billion compared with last year. The Treasury Department said Friday that the deficit for the 2012 budget year totaled USD1.1 trillion. Tax revenue rose 6.4 percent from last year to more than USD2.4 trillion, helping contain the deficit. The government's revenue rose as more people got jobs and received income. Corporations also contributed more tax revenue than in 2011. This pushed receipts up to USD2.449 trillion in 2012, up 6.4 percent from last year, according to the Treasury Department. 'We are seeing the stimulus spending fading and we are seeing some of the effects of the investment incentives', Lou Crandall, chief economist with Wrightson ICAP, LLC, said. Government spending fell 1.7 percent to USD3.5 trillion. The decline reflected, in part, less defense spending as US military involvement in Iraq was winding down. Worst recession since Great Depression:- Barack Obama's presidency has now coincided with four straight USD1 trillion-plus annual budget deficits – the first in history and an issue in an election campaign that ends in under four weeks. Obama's Republican challenger, Mitt Romney, contends that Obama failed to achieve a pledge to halve the deficit he inherited by the end of his first term. Social Security raise next year may be tiny:- when Obama took office in January 2009, the Congressional Budget Office forecast that the deficit for that year would total USD1.2 trillion. It ended up at a record USD1.41 trillion. The increase was due, in part, to higher government spending to fight the worst recession since the Great Depression. Tax cuts enacted under President George Walker Bush and wars in Iraq and Afghanistan contributed to the deficits. Trade deficit expands as exports decline:- the budget gaps in 2010 and 2011 were slightly lower than the 2009 deficit as a gradually strengthening economy generated more tax revenue. But the deficits still exceeded USD1 trillion. Obama is campaigning for a second term with a pledge to cut deficits by USD4 trillion over the next decade. He says he would do so by ending the Bush-era income tax cuts for higher-income Americans and by restraining the growth of spending. National debt:- USD16 trillion:- Romney has said he would cut spending growth to help narrow the budget gap. He would cap spending at 20 percent of the economy by 2016. Spending in 2012 accounted for about 23 percent of the economy. The government borrowed about 31 cents of every dollar it spent in 2012. The string of USD1 trillion-plus deficits has driven the national debt above USD16 trillion. The magnitude of that figure has intensified debate in Congress over spending and taxes but little movement toward compromise. Bernanke says low rates will help employment, Fed review a bad idea:- many fear the budget deadlock will send the economy over a 'fiscal cliff' next (2013) year, when tax increases and deep spending cuts will take effect unless a budget deal is reached. Obama wants to eliminate the income tax cuts for families that make more than USD250 000. Republicans in Congress and Romney have resisted. They argue that with the economy still weak, the government should not be raising anyone's taxes. Congress may address the budget crisis during a lame-duck session of Congress after the November elections. / Лу Крэндол (Lou Crandall), шеф экономист в Райтсэн Ай.Си.Эй.Пи., Эл.Эл.Си. (Wrightson ICAP, LLC). Бэрак Обама (Barack Obama). Митч Рамни (Mitt Romney). Дьжодьж Вокё Бош (George Walker Bush; 1946–). Бэн Щалом Бёнэньки (Ben Shalom Bernanke). Федеральный дефицит образуется в случае превышения государственных расходов над государственными доходами. Федеральный Дефицит – дефицит федеральных средств, возникающий в том случае, если государство расходует в данном финансовом году больше, чем получает дохода. Для покрытия дефицита средств правительство обычно занимает средства у населения, привлекая долгосрочные и краткосрочные займы. Дефициты федерального бюджета стали возникать с начала 1970-х и выросли до огромных размеров в начале 1980-х. Как утверждают экономисты, они являются причиной высоких процентных ставок и инфляции, поскольку конкурируют при распределении средств с частными займами коммерческих предприятий и потребителей и повышают спрос на денежные средства.

THE FEDERAL DEPOSIT INSURANCE CORPORATION = ФЕДЕРАЛЬНАЯ КОРПОРАЦИЯ ПО СТРАХОВАНИЮ ВКЛАДОВ (или ФЕДЕРАЛЬНАЯ КОРПОРАЦИЯ ПО СТРАХОВАНИЮ ДЕПОЗИТОВ) – In the United States, Federal Deposit Insurance Corporation (FDIC) is an independent deposit insurance agency created by Congress in 1933 to maintain stability and public confidence in the nation's banking system. The FDIC promotes safety and soundness of insured depository institutions and the US financial system by identifying, monitoring and addressing risks to the deposit insurance funds; minimizes disruptive effects from the failure of banks and savings associations; and ensures fairness in the sale of financial products and the provision of financial services. Headquartered in Washington, DC, the United States. Under existing law, all federally-chartered and most state-chartered depository institutions must have federal deposit insurance from the FDIC. The Federal Deposit Insurance Corporation (FDIC) preserves and promotes public confidence in the US financial system by insuring deposits in banks and thrift institutions for at least USD250 000.00; by identifying, monitoring and addressing risks to the deposit insurance funds; and by limiting the effect on the economy and the financial system when a bank or thrift institution fails. An independent agency of the federal government, the FDIC was created in 1933 in response to the thousands of bank failures that occurred in the 1920s and early 1930s. Since the start of FDIC insurance on 1934-January-01, no depositor has lost a single cent of insured funds as a result of a failure. The FDIC receives no Congressional appropriations – it is funded by premiums that banks and thrift institutions pay for deposit insurance coverage and from earnings on investments in US Treasury securities. The FDIC insures more than USD7 trillion of deposits in US banks and thrifts – deposits in virtually every bank and thrift in the country. The standard insurance amount is USD250 000.00 per depositor, per insured bank, for

each account ownership category. The FDIC's Electronic Deposit Insurance Estimator can help you determine if you have adequate deposit insurance for your accounts. The FDIC insures deposits only. It does not insure securities, mutual funds or similar types of investments that banks and thrift institutions may offer. Insured and Uninsured Investments distinguishes between what is and is not protected by FDIC insurance. The FDIC directly examines and supervises more than 4 900 banks and savings banks for operational safety and soundness, more than half of the institutions in the banking system. Banks can be chartered by the states or by the federal government. Banks chartered by states also have the choice of whether to join the Federal Reserve System. The FDIC is the primary federal regulator of banks that are chartered by the states that do not join the Federal Reserve System. In addition, the FDIC is the back-up supervisor for the remaining insured banks and thrift institutions. The FDIC also examines banks for compliance with consumer protection laws, including the Fair Credit Billing Act, the Fair Credit Reporting Act, the Truth-In-Lending Act, and the Fair Debt Collection Practices Act, to name a few. Finally, the FDIC examines banks for compliance with the Community Reinvestment Act (CRA) which requires banks to help meet the credit needs of the communities they were chartered to serve. To protect insured depositors, the FDIC responds immediately when a bank or thrift institution fails. Institutions generally are closed by their chartering authority – the state regulator, the Office of the Comptroller of the Currency, or the Office of Thrift Supervision. The FDIC has several options for resolving institution failures, but the one most used is to sell deposits and loans of the failed institution to another institution. Customers of the failed institution automatically become customers of the assuming institution. Most of the time, the transition is seamless from the customer's point of view. The FDIC employs more than 7 000 people. It is headquartered in Washington, DC, but conducts much of its business in six regional offices, three temporary satellite offices and in field offices around the country. The FDIC is managed by a five-person Board of Directors, all of whom are appointed by the President and confirmed by the Senate, with no more than three being from the same political party. The FDIC insures the deposits in all national banks. The Standard Maximum Deposit Insurance Amount is USD250 000.00 per depositor at each FDIC-insured institution, including certain requirement accounts. Individuals may qualify for more than USD250 000.00 in coverage at one insured bank or savings association if you own deposit accounts in different ownership categories. The most common account ownership categories for individual and family deposits are single accounts, joint accounts, revocable trust accounts and certain retirement accounts. The FDIC was created in 1933 in response to the thousands of bank failures that occurred in the 1920s and early 1930s. As the FDIC celebrates its 75th anniversary, we present a historical perspective on the rich history of protecting consumers. On 1933-June-16, President Franklin Roosevelt signed the Banking Act of 1933, a part of which established the FDIC. The first Board of Directors of the Federal Deposit Insurance Corporation was sworn in at the Treasury Department, Washington, DC, on 1933-September-11. / Президент США Фрэньклын Дэлано Розэвэлт (Franklin Delano Roosevelt; 1882–1945). Федеральная Корпорация по Страхованию Депозитов (ФКСД) – государственное агентство США, созданное в 1933, гарантирует (в определённых пределах) сохранность вкладов на счетах в банках и сберегательных институтах – членах корпорации и выполняет такие функции, как предоставление займов или приобретение активов у финансовых институтов – членов корпорации для облегчения их объединения и предотвращения банкротств. В 1989 Конгресс принял Акт о Спасении от Банкротства Ссудо-Сберегательных Ассоциаций, согласно которому ФКСД была реорганизована и разделена на две самостоятельные страховые организации:- Фонд Страхования Банков (Bank Insurance Fund (BIF)), который продолжает осуществлять традиционные функции ФКСД в отношении банковских организаций, и Страховой Фонд Сберегательных Ассоциаций (Savings Association Insurance Fund (SAIF)), который осуществляет страхование вкладов в сберегательных учреждениях, заменив собой Федеральную Корпорацию Страхования Ссудосберегательных Ассоциаций (Federal Savings and Loan Insurance Corporation (FSLIQ)), которая была распущена.

FEDERAL EMPLOYER IDENTIFICATION NUMBER = ФЕДЕРАЛЬНЫЙ ИДЕНТИФИКАЦИОННЫЙ НОМЕР РАБОТОДАТЕЛЯ – In the United States, Federal Employer Identification Number (FEIN or EIN):- This number is similar to a social security number in that the IRS uses the FEIN to identify a business organization's income stream for taxation purposes. In the United States, a Federal Employer Identification Number is the federal tax identification number (also known as a '95 Number' or 'EIN Number') is a number assigned to a corporation or limited liability company (LLC) by the Federal Government for purposes of taxation. The Federal Tax ID Number is to a corporation or LLC as a Social Security Number is to an individual. Most banks require that a corporation or LLC obtain a Federal Tax Identification Number as a prerequisite to opening a bank account regardless of whether the company will have employees.

FEDERAL ENERGY ADMINISTRATION = ФЕДЕРАЛЬНАЯ ЭНЕРГЕТИЧЕСКАЯ АДМИНИСТРАЦИЯ (или ФЕДЕРАЛЬНАЯ АДМИНИСТРАЦИЯ ПО ЭНЕРГЕТИКЕ) – The US Federal Energy Administration is a predecessor of the US Energy Information Administration. / Предшественник Американской Администрации по Информации в Сфере Энергетики.

FEDERAL ENERGY REGULATORY COMMISSION = ФЕДЕРАЛЬНАЯ ЭНЕРГЕТИЧЕСКАЯ РЕГУЛЯТОРНАЯ КОМИССИЯ (или ФЕДЕРАЛЬНАЯ КОМИССИЯ ПО НАДЗОРУ В СФЕРЕ ЭНЕРГЕТИКИ, или ФЕДЕРАЛЬНАЯ КОМИССИЯ ПО ЭНЕРГОНАДЗОРУ) – Federal Energy Regulatory Commission (FERC) is the US Federal agency with jurisdiction over interstate electricity sales, wholesale electric rates, hydroelectric licensing, natural gas pricing, oil pipeline rates, and gas pipeline certification. Federal Energy Regulatory Commission (FERC) is an independent regulatory agency within the US Department of Energy and is the successor to the Federal Power Commission. Federal Energy Regulatory Commission (FERC) is a quasi-independent regulatory agency within the Department of Energy having jurisdiction over interstate electricity sales, wholesale electric rates, hydroelectric licensing, natural gas pricing, oil pipeline rates, and gas pipeline certification. Mission:- Reliable, Efficient and Sustainable Energy for Customers. Assist consumers in obtaining reliable, efficient and sustainable energy services at a reasonable cost through appropriate regulatory and market means. Guiding Principles:- (i) Organizational Excellence:- the Commission strives to use its resources efficiently and effectively to achieve its strategic priorities; (ii) Due Process and Transparency:- paramount in all of its proceedings is the Commission's determination to be open and fair to all participants; (iii) Regulatory Certainty:- in each of the thousands of orders, opinions and reports issued by the Commission each year, the Commission strives to provide regulatory certainty through consistent approaches and actions; (iv) Stakeholder Involvement:- the Commission conducts regular outreach to ensure that interested parties have an appropriate opportunity to contribute to the performance of the Commission's responsibilities; and (v) Timeliness:- the Commission's goal is to reach an appropriate resolution of each proceeding in an expeditious manner. The Federal Energy Regulatory Commission, or FERC, is an independent agency that regulates the interstate transmission of electricity, natural gas, and oil. FERC also reviews proposals to build liquefied natural gas (LNG) terminals and interstate natural gas pipelines as well as licensing hydropower projects. The Energy Policy Act of 2005 gave FERC additional responsibilities as outlined in FERC's Top Initiatives and updated Strategic Plan. As part of that responsibility, FERC:- regulates the transmission and wholesale sales of electricity in interstate commerce; reviews certain mergers and acquisitions and corporate transactions by electricity companies; regulates the transmission and sale of natural gas for resale in interstate commerce; regulates the transportation of oil by pipeline in interstate commerce; approves the siting and abandonment of interstate natural gas pipelines and storage facilities; reviews the siting application for electric transmission projects under limited circumstances; ensures the safe operation and reliability of proposed and operating LNG terminals; licenses and inspects private, municipal, and state hydroelectric projects; protects the reliability of the high voltage interstate transmission system through mandatory reliability standards; monitors and investigates energy markets; enforces FERC regulatory

requirements through imposition of civil penalties and other means; oversees environmental matters related to natural gas and hydroelectricity projects and other matters; and administers accounting and financial reporting regulations and conduct of regulated companies. Many areas outside of FERC's jurisdictional responsibility are dealt with by State Public Utility Commissions. Areas considered outside of FERC's responsibility include:- regulation of retail electricity and natural gas sales to consumers; approval for the physical construction of electric generation facilities; regulation of activities of the municipal power systems, federal power marketing agencies like the Tennessee Valley Authority, and most rural electric cooperatives; regulation of nuclear power plants by the Nuclear Regulatory Commission; issuance of State Water Quality Certificates; oversight for the construction of oil pipelines; abandonment of service as related to oil facilities; mergers and acquisitions as related to natural gas and oil companies; responsibility for pipeline safety or for pipeline transportation on or across the Outer Continental Shelf; regulation of local distribution pipelines of natural gas; development and operation of natural gas vehicles; reliability problems related to failures of local distribution facilities; and tree trimmings near local distribution power lines in residential neighborhoods. Headquartered in Washington, DC, the United States of America. / Федеральное Агентство США, имеющее право регулировать продажу электричества между штатами, оптовые цены на электроэнергию, на лицензирование гидрогенерации, ценообразование на природный газ, ставки прокачки нефти по трубопроводам и сертификацию газопроводов. Федеральная Комиссия по Надзору в Сфере Энергетики (ФКНСЭ) является независимым регулирующим агентством при Министерстве Энергетики США и преемником Федеральной Энергетической Комиссии.

FEDERAL FUNDS = ФЕДЕРАЛЬНЫЕ ФОНДЫ (или ФЕДЕРАЛЬНЫЕ СРЕДСТВА) – In the United States, Federal Funds are the short-term transactions in immediately available funds between depository institutions and certain other institutions that maintain accounts with the Federal Reserve; usually not collateralized. Member bank deposits at the Federal Reserve; these funds are loaned by member banks to other member banks. In the United States, uncommitted reserves of a Federal Reserve member bank available for interbank loans at short dates, esp. to enable other banks to maintain their legally required reserves (Federal Reserve System). / Федеральные Фонды или Федеральные Средства представляют собой резервы, продаваемые среди коммерческих банков для использования до начала следующего рабочего дня в пределах одного и более миллионов Долларов США. Федеральные Фонды:- (1) Средства, депонированные коммерческими банками в банки Федеральной Резервной Системы (ФРС; Federal Reserve System (FRS или Fed)), включая средства сверх нормативного минимума банковских резервов. Банки могут предоставлять федеральные средства друг другу в течение суток по ставке, установленной для федеральных средств. Банки – члены ФРС могут также переводить средства друг друга или от имени клиентов в тот же день, дебетуя и кредитуя балансы в различных банках ФРС. (2) Денежные средства, используемые ФРС для оплаты приобретаемых ею государственных ценных бумаг. (3) Средства, используемые для расчётов по сделке при отсутствии интервала между депонированием чека в банк и платежом, то есть периодом обращения (float).

FEDERAL FUNDS RATE = СТАВКА ПО ФЕДЕРАЛЬНЫМ ФОНДАМ (или СТАВКА ПО ФЕДЕРАЛЬНЫМ СРЕДСТВАМ) – In the United States, Federal Funds Rate is a rate charged by a depository institution on an overnight loan of federal funds to another depository institution; rate may vary from day to day and from bank to bank. Interest rate at which banks in the United States lend each other Dollars for next-day repayment (overnight loans). Federal Funds Rate or funds rate is the federal funds rate is the interest rate at which a depository institution lends immediately available funds (balances at the Federal Reserve) to another depository institution overnight. The rate may vary from depository institution to depository institution and from day to day. The rate of interest charged for the use of federal funds. / В Соединённых Штатах Америки выплата (repayment) (однодневные расчётные займы). Ставка по Федеральным Фондам – процентная ставка, взимаемая банками, имеющими избыточные резервы в районном банке Федеральной Резервной Системы (Federal Reserve System (FRS или Fed)) при предоставлении кредита банкам, которым он необходим, в течение суток для удовлетворения требований нормативному резерву. Процентные ставки по федеральным фондам являются наиболее чувствительным индикатором динамики процентных ставок, поскольку они определяются рынком ежедневно, в отличие от ставки прайм рэйт (prime rate) и ставки дисконта (discount rate), которые лишь периодически изменяются банками и ФРС соответственно.

FEDERAL FUNDS TRANSACTIONS = ТРАНЗАКЦИИ С ФЕДЕРАЛЬНЫМИ ФОНДАМИ (или ОПЕРАЦИИ С ФЕДЕРАЛЬНЫМИ СРЕДСТВАМИ) – In the United States, Federal Funds Transactions are the short-term transactions in immediately available funds – between depository institutions and certain other institutions that maintain accounts with the Federal Reserve – that involve lending balances at the Federal Reserve; usually not collateralized. / В Соединённых Штатах Америки .

FEDERAL GRAIN INSPECTION SERVICE = ФЕДЕРАЛЬНАЯ СЛУЖБА ПО ИНСПЕКЦИИ ЗЕРНА – The US Federal Grain Inspection Service (FGIS) is a service program within the Grain Inspection, Packers and Stockyards Administration Agency that provides inspection of grain exports that are certified by PPQ Form 577 or 579 (short for the Plant Protection and Quarantine Form 577 or 579). Also, the Federal Grain Inspection Service is responsible for inspecting, grading, classing, standardizing, sampling, witnessing treatments, and testing specific agricultural and food commodities. Grading standards are established by the US Federal Grain Inspection Service (FGIS). The service insures buyers they will receive a clean, pest free product that conforms to the grade ordered. The consistent wide industry grading standards allow accurate communications among all parties in a trading transaction. FGIS certifies that grain produced in the United States meets the official United States Standards for Grain. As part of its responsibilities, FGIS works with international traders. Before any grain can be exported from the United States, it must first be certified by FGIS as having met a specific standard. FGIS staff explain the national inspection system, US grain standards, and commodity inspection programs; conduct briefings and tours; assess foreign inspection and weighing techniques; and respond to inquiries about quality and quantity of US grain exports. FGIS agencies in eight states are delegated authority to perform official export services at ports. The Federal Grain Inspection Service (FGIS) of the Grain Inspection, Packers and Stockyards Administration (GIPSA) of the United States Department of Agriculture (USDA). Headquartered in Washington, DC, the United States. Web-Based System:- competition in the domestic and international grain markets remains extremely tight, increasing the need for companies to improve operational efficiency and customer satisfaction. To play a relevant role in the competitive US grain market, FGIS is adjusting to better serve the emerging market needs by expanding our quality measurement capability, being more flexible to accommodate new marketing practices, and improving service delivery. FGIS has established an interdisciplinary team charged with reengineering and moving inspection-related operations to a web-based environment. FGIS envisions using a web-based system for the inspection and certification processes, data warehousing and real-time retrieval by the official system and our customers, enhancing quality control and assurance systems, providing visual inspection aids, as well as billing, licensing, equipment testing, manuals, and records. The Federal Grain Inspection Service (FGIS) facilitates the marketing of US grain and related agricultural products by establishing standards for quality assessments, regulating handling practices, and managing a network of Federal, State, and private laboratories that provide impartial, user fee funded official inspection and weighing services. / коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо).

FEDERAL HOUSING ADMINISTRATION = ФЕДЕРАЛЬНАЯ АДМИНИСТРАЦИЯ ПО ЖИЛИЩНОМУ СТРОИТЕЛЬСТВУ – The Federal Housing Administration, generally known as FHA, provides mortgage insurance on loans made by FHA-approved lenders throughout the United States and its territories. FHA insures mortgages on single family and multifamily homes including manufactured homes and hospitals. It is the largest insurer of mortgages in the world, insuring over 34 million properties since its inception in 1934. FHA mortgage insurance provides lenders with protection against losses as the result of homeowners defaulting on their mortgage loans. The lenders bear less risk because FHA will pay a claim to the lender in the event of a homeowner's default. Loans must meet certain requirements established by FHA to qualify for insurance. Unlike conventional loans that adhere to strict underwriting guidelines, FHA-insured loans require very little cash investment to close a loan. There is more flexibility in calculating household income and payment ratios. The cost of the mortgage insurance is passed along to the homeowner and typically is included in the monthly payment. In most cases, the insurance cost to the homeowner will drop off after five years or when the remaining balance on the loan is 78 percent of the value of the property – whichever is longer. FHA is the only government agency that operates entirely from its self-generated income and costs the taxpayers nothing. The proceeds from the mortgage insurance paid by the homeowners are captured in an account that is used to operate the program entirely. FHA provides a huge economic stimulation to the country in the form of home and community development, which trickles down to local communities in the form of jobs, building suppliers, tax bases, schools, and other forms of revenue. The Federal Housing Administration (FHA) is a division of the US Department of Housing and Urban Development (HUD) that insures residential mortgage loans and sets construction standards. Headquartered in Washington, DC, the United States. The US Congress created the Federal Housing Administration (FHA) in 1934. The FHA became a part of the Department of Housing and Urban Development's (HUD) Office of Housing in 1965. When the FHA was created, the housing industry was flat on its back:- (i) two million construction workers had lost their jobs; (ii) terms were difficult to meet for homebuyers seeking mortgages; (iii) mortgage loan terms were limited to 50 percent of the property's market value, with a repayment schedule spread over three to five years and ending with a balloon payment; and (iv) America was primarily a nation of renters. Only four in 10 households owned homes. During the 1940s, FHA programs helped finance military housing and homes for returning veterans and their families after the war. In the 1950s, 1960s and 1970s, the FHA helped to spark the production of millions of units of privately-owned apartments for elderly, handicapped and lower income Americans. When soaring inflation and energy costs threatened the survival of thousands of private apartment buildings in the 1970s, FHA's emergency financing kept cash-strapped properties afloat. The FHA moved in to steady falling home prices and made it possible for potential homebuyers to get the financing they needed when recession prompted private mortgage insurers to pull out of oil producing states in the 1980s. By 2001, the nation's homeownership rate had soared to an all time high of 68.1 percent as of the third quarter that year. The FHA and HUD have insured over 34 million home mortgages and 47 205 multifamily project mortgages since 1934. FHA currently has 4.8 million insured single family mortgages and 13 000 insured multifamily projects in its portfolio. In the more than 60 years since the FHA was created, much has changed and Americans are now arguably the best housed people in the world. HUD has helped greatly with that success. / Управление Министерства США по Жилищному Строительству и Городскому Развитию, которое страхует внутренние ипотечные займы и утверждает стандарты в строительной отрасли. Федеральная Администрация по Жилищному Строительству (ФАЖС) – федеральное агентство, финансируемое Правительством США, страхует займодавцев против убытков при предоставлении жилищных ипотечных займов. Она была основана в 1934 после 'Великой депрессии' для осуществления положений Акта о Национальном Жилищном Строительстве (National Housing Act). Федеральная Администрация по Жилищному Строительству была первой из группы государственных агентств, ответственных за создание растущего вторичного рынка ипотечных займов. Другими такими агентствами были Государственная Национальная Ассоциация по Закладным, так называемая Дьжини Мэй.

FEDERAL MARGIN CALL = ФЕДЕРАЛЬНОЕ МАРЖИНАЛЬНОЕ ТРЕБОВАНИЕ – In the United States, Federal Margin Call is a broker's demand upon a customer for cash, or securities needed to satisfy the required Regulation T down payment for a purchase or short sale of securities. / В Соединённых Штатах Америки .

FEDERAL MARITIME COMMISSION = ФЕДЕРАЛЬНАЯ МОРСКАЯ КОМИССИЯ – Federal Maritime Commission (FMC):- the US Commission is composed of five Commissioners appointed for 5-year terms by the President with the advice and consent of the Senate. Not more than three members of the Commission may belong to the same political party. The President designates one of the Commissioners to serve as Chairman. The Chairman is the agency's chief executive and administrative officer. As such, the Chairman has exclusive authority over agency personnel matters, organization and supervision, distribution of business, and use of funds for administrative purposes. The Chairman and the other four Commissioners are responsible for making decisions and determinations in the disposition of docketed cases, and ensuring the efficient, equitable, and expeditious resolution of all other matters arising under statutes administered by the Commission. Headquartered in Washington, DC, the United States. The US Governmental regulatory body responsible for administering maritime affairs including the tariff system, Freight Forwarder Licensing, enforcing the conditions of the Shipping Act and approving conference or other carrier agreements. Federal Maritime Commission (FMC) is the US regulatory body affecting ocean-going Carriers. US Government body that oversees all maritime rules and regulations. US Government agency responsible for overseeing regulatory aspects of the Shipping Act. Federal Maritime Commission (FMC) is the US regulatory agency responsible for rates and practices of ocean carriers shipping to and from the United States.

FEDERAL MARITIME COMMISSION NUMBER = НОМЕР ФЕДЕРАЛЬНОЙ МОРСКОЙ КОМИССИИ – Federal Maritime Commission Number is a number assigned by Government identifying tariffs, trade agreements, and authorising a freight forwarder to operate.

FEDERAL NOTES = ФЕДЕРАЛЬНЫЕ БИЛЕТЫ (или ФЕДЕРАЛЬНЫЕ НОТЫ) – In Germany, Federal Notes are regular issues of the German Government with a fixed rate of interest and a maturity of five years. Federal notes can be bought and sold daily after introduction to stock exchange trading. Federal notes are counted as 'gilt-edged' securities.

THE FEDERAL OPEN MARKET COMMITTEE = ФЕДЕРАЛЬНЫЙ КОМИТЕТ ПО ОТКРЫТОМУ РЫНКУ – The Federal Open Market Committee (FOMC):- twelve-voting-member committee made up of the seven members of the Board of Governors; the president of the Federal Reserve Bank of New York; and, on a rotating basis, the presidents of four other Reserve Banks. Nonvoting Reserve Bank presidents also participate in Committee deliberations and discussion. The FOMC generally meets eight times a year in Washington, DC, to set the nation's monetary policy. It also establishes policy relating to System operations in the foreign exchange markets. In the United States, the Federal Open Market Committee (FOMC), the committee that sets money supply targets in the US which tend to be implemented through Fed Fund interest rates etc. The Federal Open Market Committee (FOMC) is the twelve-member committee made up of the seven members of the Fed's Board of Governors; the president of the Federal Reserve Bank of New York; and, on a rotating basis, the presidents of four other Reserve Banks. The FOMC meets eight times a year to set Federal Reserve guidelines regarding the purchase and sale of government securities in the open market as a means of influencing the volume of bank credit and money in the economy. It also establishes policy relating to System operations in the foreign exchange markets. The Federal Open Market Committee is the committee of the Federal Reserve System. FOMC consists of 12 members and is responsible for open market operations. FOMC makes the key decisions affecting the cost and availability of money and credit in the economy. The

FOMC formulates the nation's monetary policy. The voting members of the FOMC consist of the seven members of the Board of Governors (BOG), the president of the Federal Reserve Bank of New York and presidents of four other Reserve Banks who serve on a one-year rotating basis. All Reserve Bank presidents participate in FOMC policy discussions whether or not they are voting members. The chairman of the Board of Governors chairs the FOMC. The FOMC typically meets eight times a year in Washington, DC. At each meeting, the committee discusses the outlook for the US economy and monetary policy options. In preparing for the meetings, FOMC members are briefed on economic conditions by members of their staffs. Also, before each meeting, they receive the 'Green Book', which contains the Federal Reserve Board staff forecasts of the US economy, the 'Blue Book', which presents the Board staffs analysis of monetary policy alternatives and the 'Beige Book', which includes a discussion of regional economic conditions prepared by each Reserve Bank. Only the Beige Book is available to the public, and it is released approximately two weeks before each FOMC meeting. What occurs at an FOMC meeting? A senior official of the Federal Reserve Bank of New York discusses developments in the financial and foreign exchange markets, along with the details of the activities of the New York Fed's Domestic and Foreign Trading Desks since the previous FOMC meeting. Senior staff from the Board of Governors (BOG) present their economic and financial forecasts. Governors and Reserve Bank presidents (including those currently not voting) present their views on the economic outlook. The BOG's director of monetary affairs discusses monetary policy options (without making a policy recommendation). The FOMC members, beginning with the chairman, discuss their policy preferences. The FOMC votes. How is the FOMC's policy formulated? Monetary policy is formulated in terms of a target for the federal funds rate, the interest rate that banks charge one another for overnight loans. The federal funds rate is sensitive to changes in the demand for and supply of reserves in the banking system and thus provides a good indication of tightness or ease in monetary conditions. At the conclusion of each FOMC meeting, the Committee issues a directive to the New York Fed's Domestic Trading Desk that guides the implementation of the Committee's policy through open market operations. In addition, the FOMC states whether economic and financial conditions pose a greater risk to price stability or to sustainable growth. The post-FOMC meeting announcements also report on discount rate changes, which are generally less frequent than changes in the target for the federal funds rate. The minutes of each FOMC meeting are published approximately six weeks later, a few days after the following meeting, and are readily available to the public. Occasionally the FOMC makes a change in monetary policy between meetings. While the Federal Reserve Bank presidents discuss their regional economies in their presentations at FOMC meetings, they base their policy votes on national, rather than local, conditions. In recent years, FOMC decisions generally have been unanimous or nearly unanimous. / Федеральный Комитет по Открытому Рынку (ФКОР) – ключевой комитет Федеральной Резервной Системы (ФРС; Federal Reserve System (FRS)), который определяет ставки процента и кредитную политику Федеральной Резервной Системы, а также центрального банка США. В Комитет по Открытому Рынку входят 12 членов. Семь входят в Совет Федерального Резерва (Federal Reserve Board) и назначаются на должность Президентом США. Остальные пять членов являются президентами 12 окружных банков Федерального Резерва (Federal Reserve banks). Четверо из пятерых регулярно переизбираются, один – президент Нью Йоркского Банка Федерального Резерва – является постоянным членом Комитета. Комитет принимает решения в отношении процентной ставки по операциям на открытом рынке, покупает и продаёт государственные ценные бумаги. Решения Комитета являются объектом пристального внимания экономистов-аналитиков, пытающихся предугадать, ужесточит ли Федеральный Резерв условия кредита и сократит инфляцию или облегчит условия кредита, стремясь оживить экономику.

FEDERAL POWER ACT = АКТ О ФЕДЕРАЛЬНОЙ ЭНЕРГЕТИКЕ (или ФЕДЕРАЛЬНЫЙ АКТ О МОЩНОСТЯХ) – In the United States, Federal Power Act:- enacted in 1920 and amended in 1935, the Act consists of three parts. The first part incorporated the Federal Water Power Act administered by the former Federal Power Commission, whose activities were confined almost entirely to licensing non-Federal hydroelectric projects. Parts II and III were added with the passage of the Public Utility Act. These parts extended the Act's jurisdiction to include regulating the interstate transmission of electrical energy and rates for its sale as wholesale in interstate commerce. The Federal Energy Regulatory Commission is now charged with the administration of this law.

FEDERAL POWER COMMISSION = ФЕДЕРАЛЬНАЯ ЭНЕРГЕТИЧЕСКАЯ КОМИССИЯ – The predecessor agency of the US Federal Energy Regulatory Commission. The Federal Power Commission was created by an Act of Congress under the Federal Water Power Act on 1920-June-10. It was charged originally with regulating the electric power and natural gas industries. It was abolished on 1977-September-30, when the Department of Energy was created. Its functions were divided between the Department of Energy and the Federal Energy Regulatory Commission, an independent regulatory agency. Federal Power Commission:- the predecessor agency of the Federal Energy Regulatory Commission. The Federal Power Commission (FPC) was created by an Act of Congress under the Federal Water Power Act on June 10, 1920. It was charged originally with regulating the electric power and natural gas industries. The FPC was abolished on September 20, 1977, when the Department of Energy was created. The functions of the FPC were divided between the Department of Energy and the Federal Energy Regulatory Commission.

FEDERAL RESERVE = ФЕДЕРАЛЬНЫЙ РЕЗЕРВ – In the United States, Federal Reserve is a Board of seven members that oversee the Federal Reserve System's financial and monetary policies. / В Соединённых Штатах Америки Федеральный Резерв это Совет из семи членов, который осуществляет надзор за финансовой и монетарной политикой Федеральной Резервной Системы.

FEDERAL RESERVE BANK = БАНК ФЕДЕРАЛЬНОГО РЕЗЕРВА (или ФЕДЕРАЛЬНЫЙ РЕЗЕРВНЫЙ БАНК) – In the United States, the Federal Reserve Bank is one of the 12 operating arms of the Federal Reserve System, located throughout the nation, that together with their 25 branches carry out various System functions, including operating a nationwide payments system or providing payment services to depository institutions, distributing the nation's currency and coin, supervising and regulating member banks and bank holding companies and serving as banker for the US Treasury or as fiscal agent for the US government. / Банк Федерального Резерва – один из 12 банков, которые вместе с филиалами составляют Федеральную Резервную Систему (ФРС; Federal Reserve System (FRS)). Эти банки расположены в Бостоне, Нью Йорке, Филадельфии, Кливленде, Ричмонде, Атланте, Чикаго, Сент Луисе, Миннеаполисе, Канзас Сити, Далласе и Сан Франциско. Роль каждого из банков ФРС заключается в контроле за деятельностью коммерческих и сберегательных банков в данном округе с целью обеспечения их следования требованиям Совета Федерального Резерва и предоставления этим банкам в случае чрезвычайной необходимости доступа к средствам через 'дисконтное окно' (discount window). Банки Федерального Резерва действуют в качестве депозитариев для банков – членов ФРС в их округах, предоставляя возможность перевода средств и иные услуги. Каждый из банков находится в собственности банков – членов ФРС в данном районе.

FEDERAL RESERVE BOARD = ПАЛАТА ФЕДЕРАЛЬНОГО РЕЗЕРВА (или СОВЕТ ФЕДЕРАЛЬНОГО РЕЗЕРВА) – Federal Reserve Board (FRB) is the US central bank that determines fiscal policy and controls policy instruments such as interest rates. Federal Reserve Board:- The Board of Governors – located in Washington, DC – is the governing body of the Federal Reserve System. It is run by seven members, or 'Governors', who are nominated by the President of the United States and confirmed in their positions by the US Senate. The Board of Governors guides the operation of the Federal Reserve System to promote the goals and fulfill the responsibilities given to the Federal Reserve by the Federal Reserve Act. All of the members of the Board serve on

the FOMC, which is the body within the Federal Reserve that sets monetary policy. Board Appointment:- Each member of the Board of Governors is appointed for a 14-year term; the terms are staggered so that one term expires on January 31 of each even-numbered year. After serving a full 14-year term, a Board member may not be reappointed. If a Board member leaves the Board before his or her term expires, however, the person nominated and confirmed to serve the remainder of the term may later be appointed to a full 14-year term. The Chair and Vice Chair of the Board are also appointed by the President and confirmed by the Senate, but serve only four-year terms. They may be reappointed to additional four-year terms. The nominees to these posts must already be members of the Board or must be simultaneously appointed to the Board. Board Responsibilities:- The Board oversees the operations of the 12 Reserve Banks and shares with them the responsibility for supervising and regulating certain financial institutions and activities. The Board also provides general guidance, direction, and oversight when the Reserve Banks lend to depository institutions and others and when the Reserve Banks provide financial services to depository institutions and the federal government. The Board also has broad oversight responsibility for the operations and activities of the Federal Reserve Banks. This authority includes oversight of the Reserve Banks' services to depository institutions, and to the US Treasury, and of the Reserve Banks' examination and supervision of various financial institutions. As part of this oversight, the Board reviews and approves the budgets of each of the Reserve Banks. The Board also helps to ensure that the voices and concerns of consumers and communities are heard at the central bank by conducting consumer-focused supervision, research, and policy analysis, and, more generally, by promoting a fair and transparent consumer financial services market. Xxxxx. The Federal Reserve Board (FRB) is the governing body of the Federal Reserve System. The Board of Governors of the Federal Reserve System, called the Federal Reserve Board or FRB for short, is a seven-member body that governs the Federal Reserve System, the US central bank in charge of making the country's monetary policy. The FRB is considered an independent agency of the federal government. The Fed has a statutory mandate to maximum employment and stable prices at moderate long-term interest rates, and the FRB chair and other officials frequently testify before Congress, but it makes monetary policy independently of the legislative or executive branches and is structured like a private corporation. Appointments, Terms And Roles:- The FRB's members are appointed by the president and confirmed by the Senate. Each is appointed to a single 14 year term, but may serve shorter or longer periods. A new board member serves the remainder of the outgoing member's term, if any. The new member may then be reappointed to one full term. If a replacement has not been confirmed when that term expires, they may continue to serve. Terms are staggered so that a new one begins every two years. The chair, vice-chair and vice-chair for supervision of the Federal Reserve Board are appointed to four-year terms by the president from among the board's existing members. They can be reappointed to these leadership roles as many times as their term limits as board members allow. The board of governors includes a number of subcommittees with their own chairs and vice-chairs. These are the committees on board affairs; consumer and community affairs; economic and financial monitoring and research; financial stability; Federal Reserve Bank affairs; supervision and regulation; payments, clearing and settlement; and the subcommittee on smaller regional and community banking. Duties:- The Federal Reserve Board members' most important role is as members of the Federal Open Market Committee (FOMC), which is in charge of the open market operations that determine the federal funds rate, one of the global economy's most important benchmark interest rates. In addition to the seven governors, the FOMC consists of the president of the Federal Reserve Bank of New York and a rotating set of four other branch presidents. The chair of the FRB also chairs the FOMC. The FRB is directly in charge of two other monetary policy tools, the discount rate (based on suggestions from the regional branches) and reserve requirements. It is also tasked with supervising the Fed's 12 regional branches.

FEDERAL RESERVE DISTRICT = ОКРУГ ФЕДЕРАЛЬНОГО РЕЗЕРВА (или ФЕДЕРАЛЬНЫЙ РЕЗЕРВНЫЙ ОКРУГ) – In the United States, the Federal Reserve District or Reserve District or District is one of the twelve geographic regions served by a Federal Reserve Bank.

FEDERAL RESERVE FLOAT = ОБРАЩАЕМАЯ МАССА ФЕДЕРАЛЬНОГО РЕЗЕРВА (или ОБРАЩЕНИЕ ФЕДЕРАЛЬНОГО РЕЗЕРВА) – In the United States, Federal Reserve Float is checkbook money that appears on the books of both the check writer (the payer) and the check receiver (the payee) while a check is being processed. Federal Reserve float is float present during the Federal Reserve's check collection process. To promote efficiency in the payments system and provide certainty about the date that deposited funds will become available to the receiving depository institutions (and the payee), the Federal Reserve credits the reserve accounts of banks that deposit checks according to a fixed schedule. However, processing certain checks and collecting funds from the banks on which these checks are written may take more time than the schedule allows. Therefore, the accounts of some banks may be credited before the Federal Reserve is able to collect payment from other banks, resulting in Federal Reserve float.

FEDERAL RESERVE NOTE = БИЛЕТ ФЕДЕРАЛЬНОГО РЕЗЕРВА (или НОТА ФЕДЕРАЛЬНОГО РЕЗЕРВА) – In the United States, Federal Reserve Note is the paper currency issued by the Federal Reserve Banks. Nearly all of the nation's circulating paper currency consists of Federal Reserve notes printed by the Bureau of Engraving and Printing (a bureau of the US Department of the Treasury) and issued to the Federal Reserve Banks which put them into circulation through commercial banks and other depository institutions. Federal Reserve notes are obligations of the US government via the Federal Reserve Banks and legal tender for all debts.

FEDERAL RESERVE REGULATORY SERVICE = РЕГУЛЯТОРНАЯ УСЛУГА ФЕДЕРАЛЬНОГО РЕЗЕРВА (или СЛУЖБА РЕГУЛИРОВАНИЯ ФЕДЕРАЛЬНОГО РЕЗЕРВА) – Federal Reserve Regulatory Service is the monthly subscription service that includes all statutes and regulations for which the Federal Reserve has responsibility, Board of Governors interpretations and rulings, official staff commentaries, significant staff opinions, and procedural rules under which the Board operates.

THE FEDERAL RESERVE SYSTEM = ФЕДЕРАЛЬНАЯ РЕЗЕРВНАЯ СИСТЕМА – Federal Reserve System is the central bank of the United States, created by Congress and made up of a seven-member Board of Governors in Washington, DC, 12 regional Federal Reserve Banks, and their 25 branches. Federal Reserve is the central bank for the United States banking system and the institution that holds the primary responsibility for the making and execution of American monetary policies. Its bank notes circulate today as the United States' everyday paper currency. (Metal coins, however, are issued by the United States Treasury Department, not by the Federal Reserve.) The Federal Reserve System represents an almost unique hybrid or blending of elements of governmental power with elements of private ownership and control. Because the authors of the 1913 legislation that set up the Federal Reserve System felt that it was vital to insulate monetary policy from 'undue' pressure and influence by partisan politicians obsessed with their own short-range re-election prospects, the Federal Reserve was set up along the lines of an independent regulatory commission – not as just one more agency of the Executive Branch that would be under the direction of the President and supervised closely by Congress. The private banking community was also given a major role in the running of the Federal Reserve System that continues to give banking interests privileged access to the process by which the US government's monetary policy is made. The Federal Reserve System's highest decision-making body is its Board of Governors, which consists of seven members. Members of the Fed's Board of Governors are nominated for their positions by the President of the United States and then must be confirmed by a majority vote of the Senate before taking office. The members of the Federal Reserve's Board of Governors serve very long terms (fourteen years), and, once appointed and confirmed, they may not be removed from office by either President or Congress (except through a cumbersome process of impeachment by Congress for serious violations of the criminal law). People selected for appointment to the Board of

Governors have nearly always been professional bankers, executives of Wall Street brokerage houses, or, occasionally, professional economists. They tend to share many of the relatively conservative political and economic views of the business and professional groups from which they are drawn. Because the President can not fire them from their positions before their fourteen-year terms expire, members of the Board of Governors normally feel relatively free to ignore or oppose the President's preferences when they make US monetary policies. Moreover, even though some members of the Board of Governors perhaps feel an ideological kinship or sense of political loyalty that might predispose them to support the policy views of the President who appointed them, the terms of the Governors are staggered, so that only one Governor's term expires every two years, making it unlikely that any President would be able to dominate the Board with a majority of his own appointees until near the end of his own second four-year term in office. (However, every four years, the President does at least get the opportunity to designate which one of the seven Governors will serve for the next four years as Chairman of the Board of Governors and exercize 'moral leadership' as first among equals in the Governors' collective deliberations on monetary policy.) Congressional influence on the Federal Reserve System's monetary policy decisions is also in practice rather limited. The Federal Reserve generates its own revenues to pay its expenses from fees paid to it by the commercial banks it regulates and from interest payments on the federal bonds, notes and bills that it holds as assets, so Congress lacks the normal leverage it has over other agencies through carrots and sticks brandished during the annual appropriations process. Of course, Congress, which created the Federal Reserve System by statute in 1913, has the constitutional power to alter or abolish the Federal Reserve system by a simple majority vote in both houses, subject to the possibility of a presidential veto, and the threat that Congress might actually do so if the Fed's policies contradict Congresssional preferences too seriously for too long undoubtedly induces a certain amount of responsiveness to Congressional jaw-boning by the Fed's policy-makers. The Federal Reserve System presided over by the Board of Governors consists organizationally of 12 separate Federal Reserve District Banks – each one located in and serving one of twelve geographical regions of the country. The district Federal Reserve banks are organized rather like private banking corporations whose shareholders consist of the private member banks in the district. But despite their semi-private character, the district Federal Reserve banks exercise Congressionally delegated legal powers to regulate the banking industry. Each district Federal Reserve Bank is managed from day to day by its own president, who is elected to a 5-year term by his district Federal Reserve Bank's own individual board of directors. Two-thirds of the members of the district boards of directors are elected to their positions by the privately owned commercial banks in the district that are member banks of the Federal Reserve system. (Member banks are divided on the basis of their assets into 'small', 'medium', and 'large' banks, with each category of banks allowed to elect two directors on a 'one bank, one vote' basis.) The other one- third of the directors in each district are appointed from Washington by the Fed's Board of Governors, rather as though the Board of Governers were a major creditor or minority stockholder with guaranteed representation on the district boards. The district Federal Reserve Banks act as non-profit 'bankers' banks' – that is, only commercial banking or depository institutions (and certain agencies of the federal government) maintain deposits at the Federal Reserve, and only member banking institutions and the US government are eligible to receive loans from it, not private citizens nor other kinds of non-bank commercial enterprises. All banks chartered as 'national banks' by Federal law must be 'member banks', that as such are obligated to maintain most of their reserves as deposits in their accounts at the Federal Reserve and to submit to detailed Federal Reserve banking regulations. Many state-chartered banks and thrift institutions nowadays also choose to be members of the Federal Reserve System and submit to its regulations in order to enjoy the valuable services which the Fed provides to them. The district Federal Reserve Banks operate clearing houses for checks and bank drafts, issue new paper currency ('Federal Reserve notes') for sale to member banks on demand, withdraw worn-out currency from circulation, sit in judgment on the applications of banks that wish permission to merge with each other, extend 'discount loans' to member banks (with the member banks putting up their own borrowers IOUs as collateral), and perform various miscellaneous regulatory functions pertaining to the banks in their districts. When the Federal Reserve System was originally created back in 1913, it was expected that the district Federal Reserve Banks would each pursue slightly different monetary policies, depending upon the economic conditions in their individual districts, so they were given the authority to collect a wide variety of information and statistical data on changes in regional business conditions to use in their decision-making. The high degree of integration of the national economy has for many years made it impractical for the district Federal Reserve Banks to maintain different levels of interest rates or pursue differing policies regarding the growth or contraction of the money stock (these policy decisions are made centrally for the entire country by the Fed's Board of Governors in consultation with the district bank presidents), but the 12 district banks are still a major source of detailed economic data used by government policy-makers at both the national, state and local levels as well as by private economic forecasters and business executives. The primary reason why the banking industry generally supported the creation of the Federal Reserve System and continues to support it today despite the inconveniences imposed by the Fed's regulations, is the valuable privilege that memberhip brings to the bankers to count on the Fed for large emergency loans of cash if they someday need it to survive a 'run' on their bank. In a bank 'run', large numbers of depositors frightened by rumors that their bank is about to fail suddenly begin crowding into the bank, demanding to withdraw all their deposits in cash. This exhausts the very limited cash reserves normally kept on hand in the bank's own vaults within a few hours. Since the large majority of the depositers' Dollars on deposit are always out on loan to the bank's credit customers, and since it takes days or weeks to call in any sizable fraction of the loans outstanding, the bank would have to 'go bankrupt' and be liquidated by the courts unless it can raise enough cash somewhere on short notice to pay off the panicky depositers demanding their money. This is where the Fed steps in as rescuing angel with armored cars full of cash pulling up to the beleagered bank within a few hours. Bank runs are much more rare nowadays than they used to be, mainly because most depositers today feel much less reason to panic when they believe that they can get their money 'for sure' – either by virtue of the Fed's stepping in with loans in the case of a short-term 'liquidity crunch' if the bank in question is relatively sound or (with more delay) by virtue of the insurance provided by the Federal Deposit Insurance Corporation if the bank really does turn out to be irretrievably in the red financially. And because runs are now both less likely to happen and less dangerous to the bank even if they do, bankers can earn higher profits by maintaining lower reserves than would otherwise be necessary and thus being able to lend out a higher percentage of their deposits at interest. Because many bankers with the 'king's X' of Federal Reserve and FDIC backing if they should get into difficulties might otherwise pursue excessively reckless lending policies to increase their profits, the Federal Reserve's Board of Governors was given the power to set minimum reserve requirements for the member banks, to make regulations limiting the riskiness of banks' loan portfolios, and to send 'bank examiners' out periodically to audit the books of member banks in order both to assure their compliance with regulations and to safeguard depositors' accounts against fraud or embezzlement by bank managers and employees. The Fed's role as maker and executer of macroeconomically significant monetary policies for the United States government centers around three major policy tools at the Fed's disposal:- (i) manipulating the legally required reserve ratios ('reserve requirements') for banks (and, less directly, for some other depository institutions, such as savings and loans and credit unions); (ii) buying or selling US government debt instruments (Treasury bonds, notes and bills) on the private financial markets in New York ('open market operations'); and (iii) setting the interest rate at which the Fed stands ready to make short-term loans to member banks and other depository institutions that would othertwise fall below the required reserve ratios (the Fed's 'discount rate'). Using its discretionary power to manipulate these policy tools, the Fed is able to exercise substantial influence (but not complete control) over changes in the size of the money stock and thus over interest rates, thereby influencing overall levels of business activity and employment in the national economy (as well as indirectly influencing the

rates at which the Dollar is exchanged for foreign currencies and thus the flow of international trade and investment across US borders). The Fed's Board of Governors sets policies regarding reserve requirements and the discount rate all by itself, but changes in these two policy levers tend to be relatively infrequent (perhaps once or twice a year on average for the discount rate, and perhaps once every five to ten years on average for the reserve requirement). The Fed's main policy tool of choice for exerting its influence on the money stock and interest rates on a week-to-week basis is its 'open market operations'. The necessary policy decisions about the Fed's on-going open market operations (buying or selling varying quantities of US bonds and other treasury securities on the New York financial markets) are made for the Fed's Board of Governors by a slightly expanded body called the Federal Open Market Committee (FOMC). The FOMC consists of all seven members of the Board of Governors plus five of the 12 banker-elected presidents of the Federal Reserve district banks. (The president of the New York district bank is a permanent member of the FOMC, while the other 11 district bank presidents serve one-year terms on a rotating basis, with only four of them having the right to vote at any given time.) The FOMC meets rather frequently in Washington, DC, but it has also been the practice in recent years for the FOMC membership to convene informally via long-distance telephone conference calls or one-on-one communications with the Fed's Chairman on almost a daily basis. Federal Reserve Act of 1913 is the federal legislation that established the Federal Reserve System. Central monetary authority of the United States, consisting of the Board of Governors, the Federal Open Market Committee, the twelve Federal Reserve Banks and their branches, the Federal Advisory Committee, and the member banks. The Federal Reserve System was created in 1913, following a severe monetary crisis in 1907 that resulted in many bank failures, to foster the regular flow of money into the banking system. The Federal Reserve issues bank notes and government securities and implements monetary policy by controlling the supply and creation of money and credit. The Federal Reserve System differs from European central banks in that its operational responsibilities are shared by the Board of Governors and the twelve regional banks. The Federal Reserve System regulates the cost and availability of bank credit through open-market operations; sets the discount rate banks pay to borrow from a Federal Reserve Bank; approves interstate banking mergers; supervises bank holding companies; and oversees international banking operations through agreements with other central banks. A central banking system in the United States, created by the Federal Reserve Act in 1913, designed to assist the nation in attaining its economic and financial goals. The structure of the Federal Reserve System includes a Board of Governors, the Federal Open Market Committee, and 12 Federal Reserve Banks (one in each Federal Reserve District):- Federal Reserve Bank of Atlanta, Federal Reserve Bank of Boston, Federal Reserve Bank of Chicago, Federal Reserve Bank of Cleveland, Federal Reserve Bank of Dallas, Federal Reserve Bank of Kansas City, Federal Reserve Bank of Minneapolis, Federal Reserve Bank of New York, Federal Reserve Bank of Philadelphia, Federal Reserve Bank of Richmond, Federal Reserve Bank of San Francisco, and Federal Reserve Bank of St. Louis. During the XIX century and the beginning of the XX century, financial panics plagued the nation, leading to bank failures and business bankruptcies that severely disrupted the economy. The failure of the nation's banking system to effectively provide funding to troubled depository institutions contributed significantly to the economy's vulnerability to financial panics. Short-term credit is an important source of liquidity when a bank experiences unexpected and widespread withdrawals during a financial panic. A particularly severe crisis in 1907 prompted Congress to establish the National Monetary Commission, which put forth proposals to create an institution that would help prevent and contain financial disruptions of this kind. After considerable debate, Congress passed the Federal Reserve Act 'to provide for the establishment of Federal reserve banks, to furnish an elastic currency, to afford means of rediscounting commercial paper, to establish a more effective supervision of banking in the United States, and for other purposes'. President Woodrow Wilson signed the act into law on 1913-December-23. Soon after the creation of the Federal Reserve, it became clear that the act had broader implications for national economic and financial policy. As time has passed, further legislation has clarified and supplemented the original purposes. Key laws affecting the Federal Reserve have been the Banking Act of 1935; the Employment Act of 1946; the Bank Holding Company Act of 1956 and the amendments of 1970; the International Banking Act of 1978; the Full Employment and Balanced Growth Act of 1978; the Depository Institutions Deregulation and Monetary Control Act of 1980; the Financial Institutions Reform, Recovery, and Enforcement Act of 1989; the Federal Deposit Insurance Corporation Improvement Act of 1991; and the Gramm-Leach-Bliley Act of 1999. Congress has also adopted legislation defining the primary objectives of national economic policy, including the Employment Act of 1946; the Federal Reserve Reform Act of 1977; and the Full Employment and Balanced Growth Act of 1978, which is sometimes called the Humphrey-Hawkins Act, after its original sponsors. These objectives include economic growth in line with the economy's potential to expand; a high level of employment; stable prices (that is, stability in the purchasing power of the Dollar); and moderate long-term interest rates. The Federal Reserve System is considered to be an independent central bank because its decisions do not have to be ratified by the President or anyone else in the executive branch of government. The System is, however, subject to oversight by the US Congress. The Federal Reserve must work within the framework of the overall objectives of economic and financial policy established by the government; therefore, the description of the System as 'independent within the government' is more accurate. Congress designed the structure of the Federal Reserve System to give it a broad perspective on the economy and on economic activity in all parts of the nation. It is a federal system, composed of a central, governmental agency – the Board of Governors – in Washington, DC, and twelve regional Federal Reserve Banks. The Board and the Reserve Banks share responsibility for supervising and regulating certain financial institutions and activities, for providing banking services to depository institutions and the federal government, and for ensuring that consumers receive adequate information and fair treatment in their business with the banking system. A major component of the System is the Federal Open Market Committee (FOMC), which is made up of the members of the Board of Governors, the president of the Federal Reserve Bank of New York, and presidents of four other Federal Reserve Banks, who serve on a rotating basis. The FOMC oversees open market operations, which is the main tool used by the Federal Reserve to inf luence overall monetary and credit conditions. The Federal Reserve implements monetary policy through its control over the federal funds rate – the rate at which depository institutions trade balances at the Federal Reserve. It exercises this control by inf luencing the demand for and supply of these balances through the following means:- (i) open market operations – the purchase or sale of securities, primarily US Treasury securities, in the open market to inf luence the level of balances that depository institutions hold at the Federal Reserve Banks; (ii) reserve requirements – requirements regarding the percentage of certain deposits that depository institutions must hold in reserve in the form of cash or in an account at a Federal Reserve Bank; (iii) contractual clearing balances – an amount that a depository institution agrees to hold at its Federal Reserve Bank in addition to any required reserve balance; and (iv) discount window lending – extensions of credit to depository institutions made through the primary, secondary, or seasonal lending programs. Two other groups play roles in the functioning of the Federal Reserve System:- depository institutions, through which monetary policy operates, and advisory committees, which make recommendations to the Board of Governors and to the Reserve Banks regarding the System's responsibilities. Also known as Fed. The Federal Reserve System is the central bank of the United States. It was founded by Congress in 1913 to provide the nation with a safer, more flexible, and more stable monetary and financial system. Over the years, its role in banking and the economy has expanded. Most developed countries have a central bank whose functions are broadly similar to those of the Federal Reserve. The oldest, Sweden's Riksbank, has existed since 1668 and the Bank of England since 1694. Napoleon I established the Banque de France in 1800, and the Bank of Canada began operations in 1935. The German Bundesbank was reestablished after World War II and is loosely modeled on the Federal Reserve. More recently, some functions of the Banque de France and the Bundesbank have been assumed by the European Central Bank, formed in 1998. Today, the Federal Reserve's duties fall into four

general areas:- (i) conducting the nation's monetary policy by inf luencing the monetary and credit conditions in the economy in pursuit of maximum employment, stable prices, and moderate long-term interest rates; (ii) supervising and regulating banking institutions to ensure the safety and soundness of the nation's banking and financial system and to protect the credit rights of consumers; (iii) maintaining the stability of the financial system and containing systemic risk that may arise in financial markets; and (iv) providing financial services to depository institutions, the US government, and foreign official institutions, including playing a major role in operating the nation's payments system. / коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо). Старейший Государственный Банк или Риксбанк (Riksbank) Швеции. Бокь дё Фрос (Banque de France) и Бундэсбанк (Bundesbank). Конгресс Соединённых Штатов После финансовых потрясений в 1893 и 1907 принял в 1913 Акт о Федеральном Резерве, в соответствии с которым в качестве государственного центрального банка, регулирующего обращение денег и кредитов для экономической стабильности и роста, была образована ФРС. ФРС была уполномочена выпускать банкноты Федерального Резерва. Известен также под сокращением Зэ Фэд или Фед (The Fed). Федеральная Резервная Система (ФРС) (Federal Reserve System), объединение 12 региональных банков США, выполняющее функции центрального банка. Учреждена в 1913. Возглавляется Советом Управляющих из 7 членов, назначаемых сроком на 14 лет Президентом США. Федеральные Резервные банки находятся в главных городах 12 Федеральных Резервных Округов, на которые разделена территория страны, Совет Управляющих – в Вашингтоне. Капитал ФРС образован за счёт продажи акций частным коммерческим банкам, вступающим в её члены. В конце 1975 из 14 600 Американских коммерческих банков 5 800 (39%) были членами ФРС; на них приходилось 73% банковских депозитов. На ФРС возложены функции:- выпуск банкнот (федеральных резервных билетов), которые составляют почти 90% всех наличных денег в стране; хранение обязательных резервов банков-членов ФРС (нормы этих резервов устанавливаются в зависимости от величины банка и колеблются от 7.5 до 16.5% суммы депозитов до востребования и от 3 до 6% суммы срочных вкладов); выдача ссуд коммерческим банкам и переучёт векселей; покупка государственных ценных бумаг; кассовое обслуживание федерального бюджета; осуществление межбанковских клиринговых расчётов; операции с иностранной валютой и хранение золотых резервов для иностранных правительств. Сумма баланса ФРС на конец 1976 (в миллиардах Долларов США) 129.3, государственные облигации 97.0, золотые сертификаты 11.6, эмиссия банкнот 83.7, резервы банков-членов 25.2, собственный капитал и резервы 2.5. ФРС служит важным инструментом государственно-монополистического контроля и регулирования конъюнктуры. Однако проводимая ею кредитная политика, направленная на смягчение кризисных падений производства, преодоление инфляции и так далее, не устраняет диспропорций и противоречий капиталистической экономики. Федеральная Резервная Система (ФРС; Federal Reserve System (FRS или просто Fed)) – система, созданная в соответствии с Актом о Федеральном Резерве от 1913 (Federal Reserve Act of 1913) с целью регулирования кредитно-финансовой и банковской системы США. ФРС включает 12 окружных банков, 24 отделения-филиала, а также все национальные банки и банки штатов, входящие в эту систему. Национальные банки являются акционерами Банка Федерального Резерва (Federal Reserve Bank) в своём округе. Основные функции ФРС состоят в регулировании денежной массы страны, установлении требований к объёму резервов банков-членов, надзоре за выпуском наличных денег, действии в качестве расчётной палаты при переводе денежных средств в рамках банковской системы и проверке деятельности банков – членов системы для обеспечения соответствия различным требованиям. Хотя члены Совета Федерального Резерва назначаются Президентом США и одобряются Сенатом, ФРС считается независимым органом, который должен принимать решения, независимо от политического влияния. Управляющие ФРС назначаются на 14 лет, что усиливает их независимость.

FEDERAL SAVINGS NOTES = ФЕДЕРАЛЬНЫЕ СБЕРЕГАТЕЛЬНЫЕ БИЛЕТЫ (или ФЕДЕРАЛЬНЫЕ СБЕРЕГАТЕЛЬНЫЕ НОТЫ) – In Germany, Federal Savings Notes:- Federal Government issue, fixed-income. Interest is paid annually (Type A, 6-year maturity) or with compound interest added to nominal amount at redemption (Type B, 7-year maturity). They are not listed in stock exchange trading.

FEDERAL SECURITIES ADMINISTRATION = АДМИНИСТРАЦИЯ ПО ФЕДЕРАЛЬНЫМ ЦЕННЫМ БУМАГАМ – The German Federal Securities Administration (FSA; or in German – Bundeswertpapierverwaltung (BWpV)) plays a significant role in Germany's debt management. Directly affiliated with the German Federal Ministry of Finance, it acts as a 'notary', certifying the loans contracted by the federal government and entering them in the federal debt register. In recent years, BWpV replaced the practice of issuing paper-based security certificates with electronic transactions. As a direct bank, BWpV procures the funds necessary for the capital market by issuing federal securities and federal savings bonds. At the same time, it ensures that creditors receive their interest. The BWpV maintains around 800 000 accounts and deposits for private and institutional investors. Using the BWpV, these clients can invest directly in the federal government without incurring service charges. In addition, the BWpV prepares reports on the debt position and structure of borrowing for the German Federal Ministry of Finance. In Germany, the Federal Securities Administration (FSA; in German, Bundeswertpapierverwaltung (BWpV)), as a financial services agency, offers investors a securities custody service free of charge for Federal Government securities and the commission-free sale of Federal savings notes, Federal notes and Federal Treasury financing papers. It acts as notary public and trustee for the Federal Government and registers the loans taken up and guarantees issued by the Federal Government and its special fund, the international participation and contribution obligations assumed by the Federal Government as well as its other financing instruments admissible under the German Budget Act. On 2002-January-01, under the Law for the Reform of the Debt Register Law of the Federal Republic of Germany and the Legal Principles for the Administration of German Government Securities ('Bundeswertpapierverwaltungsgesetz', Federal Securities Administration Act) the Federal Debt Administration ('Bundesschuldenverwaltung' ('BSV')) becomes a higher federal administrative authority within the area of responsibility of the Federal Ministry of Finance under the new name 'Bundeswertpapierverwaltung' ('BWpV', Federal Securities Administration). The law creates powers to delegate principal debt management functions within the area of responsibility of the BWpV to the German Finance Agency. On 2006-July-12, the Law for the Modernization of Federal Government Debt Management (Bundesschuldenwesenmodernisierungsgesetz) provides for all the government debt functions previously performed by the BWpV to be transferred completely to the German Finance Agency and for the BWpV to be wound up as of 2006-July-31. On 2006-August-01, the winding up of the BWpV and the integration of its functions into the German Finance Agency creates debt management 'from one source'. / Бундэсвэтпапиафэвальтунгсгэзэтц ('Bundeswertpapierverwaltungsgesetz'). Бундэсшульдэнфэвальтунг ('Bundesschuldenverwaltung' или Бе.Эс.Фау. ('BSV')). Бундэсвэтпапиафэвальтунг ('Bundeswertpapierverwaltung' или Бе.Ве.пе.Фау. ('BWpV'). Бундэсшульдэнвезэнмодэрнизиэрунгсгэзэтц (Bundesschuldenwesenmodernisierungsgesetz).

FEDERAL TAX DEPOSIT = ФЕДЕРАЛЬНЫЙ НАЛОГОВЫЙ ВКЛАД (или ФЕДЕРАЛЬНЫЙ НАЛОГОВЫЙ ДЕПОЗИТ) – In the United States, Federal Tax Deposits (FTDs) are made up of withholding taxes from employee's paycheck. This withholding includes employee's income tax and FICA (Social Security and Medicare). Employers send withheld money to an authorized financial institution or Federal Reserve Bank.

FEDERAL TREASURY NOTES = ФЕДЕРАЛЬНЫЕ КАЗНАЧЕЙСКИЕ БИЛЕТЫ (или БИЛЕТЫ ФЕДЕРАЛЬНОГО КАЗНАЧЕЙСТВА, или НОТЫ ФЕДЕРАЛЬНОГО КАЗНАЧЕЙСТВА) – In Germany, Federal Treasury Notes are one-off issues with

a maturity of 2 years placed at quarterly intervals (March, June, September, December) solely by auction. In principle, anyone can buy them. However, only banks that belong to the Bund Issues Auction Group are eligible to make direct bids for them. Other banks and non-banks can commission members of the Auction Group to place bids or can buy Federal Treasury notes on the secondary market. Federal Treasury notes are admitted to trading on the German stock exchanges.

FEDERATION = ФЕДЕРАЦИЯ – Federation is a composite or conglomerate state that consists of several regional governments with a common central government, and in which both regional and central governments each have their own spheres of policy making in which their decisions are normally presumed to be final. The powers of the regional and central governments are almost invariably spelled out in detail in a written constitution, which also normally specifies procedures to be followed for resolving conflicts between the two kinds of government (often by some process of judicial review). Generally in a federation both central and regional governments will possess taxing and enforcement powers over the citizenry and therefore both will maintain their own bureaucratic and police organizations to carry out these powers. / Под Федерацией понимается форма государственного устройства, при которой несколько государственных образований, юридически обладающих определённой политической, самостоятельностью, образуют одно союзное государство. Характерными признаками федерации, отличающими её от унитарного государства, являются следующие:- (i) территория федерации состоит из территорий её отдельных субъектов (штатов – в Австралии, Бразилии, Венесуэле, Индии, Мексике, Соединённых Штатах Америки (США); провинций – в Аргентине, Канаде; кантонов – в Швейцарии; земель – в Австрии, Федеративной Республике Германия (ФРГ); и других); (ii) субъекты федерации обычно наделяются учредительной властью, то есть правом принятия собственных конституций; (iii) компетенция между федерацией и её субъектами разграничивается союзной конституцией; (iv) каждый субъект федерации имеет свою правовую и судебную системы; (v) в большинстве федераций одновременно существуют единое союзное гражданство и гражданство союзных единиц. Федерация обычно имеет единые вооруженные силы и общефедеральный бюджет. Функции государственной власти и управления осуществляются как общефедеральными законодательными, исполнительными и судебными органами, так и соответствующими органами членов федерации. В ряде федераций в союзном парламенте имеется палата, представляющая интересы членов федерации. Под Федерацией (союзное, федеративное государство), от позднелатинского слова Foederatio, означающее Объединение или Союз, понимается:- (i) форма государственного устройства, при которой входящие в состав государства федеральные единицы – члены федерации (например, земли, края, области, республики, штаты) имеют собственные конституции, законодательные, исполнительные и судебные органы. Наряду с этим образуются единые союзные – федеральные – органы государственной власти, устанавливается единое гражданство, денежная единица и так далее. Федерацией являются Индия, США, ФРГ и другие; и (ii) международная или национальная общественная организация, например, Международная Демократическая Федерация Женщин или спортивные федерации.

FÉDÉRATION DES EXPERTS COMPTABLES EUROPÉENS = ФЕДЕРАСЬЁ ДЭ ЭКСПЭР КОНТАБЛЬ ЭРОПЕЭНН (или ФЕДЕРАЦИЯ ЕВРОПЕЙСКИХ ЭКСПЕРТОВ ПО СЧЕТАМ, или ФЕДЕРАЦИЯ ЕВРОПЕЙСКИХ БУХГАЛТЕРОВ) – Fédération des Experts Comptables Européens (FEE) is the EU-level professional body for accountants. The objectives of FEE comprise:- (i) advancing the interests of the European accountancy profession, recognising the public interest in the work of the profession; (ii) promoting co-operation among Members, and working towards an enhanced and consistent practice and regulation of accountancy, statutory audit and financial reporting in Europe in both the public and private sector; and (iii) identifying, analysing and contributing to relevant public policy developments and making representations to the EU Institutions and to international organizations. In pursuing these objectives, FEE supports the values and freedoms of the European Union. It is committed to contribute to a more efficient, transparent, and sustainable European economy. It promotes professional integrity, open and inclusive stakeholders' dialogue and good governance. In representing and servicing its Members, FEE considers the interests of the European accountancy profession in the broadest sense, including all aspects and sectors of the profession from sole practitioners to small, medium sized and large accountancy firms, as well as accountants in business and in government and public sector, taking into account the public interest. With a long term perspective in mind, it aims at providing thought-leadership across all areas of its activities as well as responding to an ever changing world. It seeks to achieve a consensus across its different constituencies with a view to contribute to the European public good. Headquartered in Brussels, Belgium. FEE is the voice of the European accountancy profession toward the EU institutions and other international organizations. FEE (Fédération des Experts-comptables Européens – Federation of European Accountants) is an international non-profit organization based in Brussels that represents 47 institutes of professional accountants and auditors from 36 European countries, including all of the 28 EU Member States. FEE has a combined membership of more than 800 000 professional accountants, working in different capacities in public practice, small and large accountancy firms, businesses of all sizes, government and education, all of whom contribute to a more efficient, transparent and sustainable European economy. FEE's objectives include analysing and contributing to professional, regulatory and public policy developments of relevance to the profession, ensuring Member Bodies' timely information and offering leadership in representing the profession. FEE also promotes cooperation between its Member Bodies. In representing the European accountancy profession, FEE recognises the public interest. FEE is also a Regional Organisation of IFAC, the International Federation of Accountants. For the past 20 years, FEE has supported progress and constant adaptation of the profession to an ever rapidly changing world, while continuously promoting the fundamental values of the profession – integrity, objectivity, independence, professionalism, competence and confidentiality. Over these years, professional accountants are proud to have contributed to bringing the European Single Market closer to a reality for consumers and business, both for listed entities and for millions of small and medium-sized enterprises that professional accountants assist daily. This day to day involvement of professional accountants in fieldwork also nurtures the feedback that FEE provides to European policymakers through a constructive dialogue, thus contributing to making policies more efficient and practicable. FEE will continue to represent professional accountants from all European countries, all sectors and all firms, and help them cooperate, reflect and innovate to fulfil market needs and serve the public interest. / Федерация Европейских Бухгалтеров или Федерасьё дэ Экспэр Контабль Эропеэнн (Эф.Э.Э. или ФЭЭ (Fédération des Experts Comptables Européens (FEE))) – профессиональная организация бухгалтеров. Штабквартира расположена в Брюсселе, Бельгия.

FÉDÉRATION INTERNATIONALE DE L'AUTOMOBILE = ФЕДЕРАСЬЁ ЭТЭРНАСЬЁНАЛЬ ДЁ Л'ЁТОМОБИЛЬ (или МЕЖДУНАРОДНАЯ АВТОМОБИЛЬНАЯ ФЕДЕРАЦИЯ) – Fédération Internationale de l'Automobile is a French name of the International Automobile Federation. See also International Automobile Federation. / Международная Автомобильная Федерация или Федерасьё Этэрнасьёналь дё л'Ётомобиль (Fédération Internationale de l'Automobile). Смотрите также Международная Автомобильная Ассоциация (International Automobile Federation).

FÉDÉRATION INTERNATIONALE DES BOURSES DE VALEURS = ФЕДЕРАСЬЁ ЭТЭРНАСЬЁНАЛЬ ДЭ БУРС ДЁ ВАЛЁР (или МЕЖДУНАРОДНАЯ ФЕДЕРАЦИЯ ФОНДОВЫХ БИРЖ) – Fédération Internationale des Bourses de Valeurs (FIBV):- The World Federation of Exchanges (WFE) was founded in London in 1961 as the International Federation of Stock Exchanges, changing to its current name in 2001 to reflect the admission of derivatives platforms and clearinghouses. The Federation traces its roots to the International Bureau of Stock Exchange, created in the 1930s in an initiative spearheaded by the International Chamber of Commerce.

The board of directors approved three priorities for 2009. It will look to help the International Organization of Securities Commissions (IOSCO) set best practices for short selling and securities lending. It will try to clarify the use of circuit breakers in volatile markets, ensuring that they are predictable and temporary, and study the effects of fragmentation and its impact on market quality. In February of 2010, the WFE announced priorities for the year. Its board of directors pledged to:- (i) support reform in the regulation of OTC derivatives markets, which were a contributing factor in the recent financial crisis; (ii) continue to press for international cooperation and coordination among regulators and exchanges on intermarket mechanisms; and (iii) examine the structure of fixed income markets in order to evaluate how post-trade transparency, risk management and investor protection could help these markets recover from the drop in liquidity that they have experienced since the credit crisis. The International Federation of Stock Exchanges encourages cooperative policies designed to simulate a free flow of capital across national boundaries. This federation has its headquarters located in Paris, France. The fifty-five member exchanges of the Paris-based International Federation of Stock Exchanges (FIBV) represent 97% of the world's stock market capitalization (in 2000), in addition to much of its options, futures, funds, and bonds. FIBV's mission-to facilitate communication, promote standards, and share resources among its members-is well-served by this useful site. A member directory lists exchange Web sites, contact information, hours, and market holidays. The site features country or exchange annual, monthly, and time-series statistics. Formatted neatly in Excel spreadsheets, this data includes topics like market capitalization, gross amount of new capital raised for debt and equities, market indicators, plus emerging market and derivatives statistics. FIBV also includes a monthly Focus Newsletter that covers major industry news. / Международная Федерация Фондовых Бирж или, как это звучит на Французском языке по месту регистрации, Федерасьё Этэрнасьёналь дэ Бурс дё Валёр (Эф.И.Бэ.Вэ.) поддерживает политики кооперации, нацеленные на воспроизведение свободного движения капитала через национальные границы. Эта федерация имеет штабквартиру, расположенную в Париже, Франция. коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо).

FÉDÉRATION INTERNATIONALE DES ASSOCIATIONS DE TRANSITAIRES ET ASSIMILIÉS = ФЕДЕРАСЬЁ ЭТЭРНАСЬЁНАЛЬ ДЭЗ АСОСЬЯСЬЁ ДЁ ТРАНЗИТЭР Э АССИМИЛЬЕ (или МЕЖДУНАРОДНАЯ ФЕДЕРАЦИЯ АССОЦИАЦИЙ ГРУЗОВЫХ ЭКСПЕДИТОРОВ) – Fédération Internationale des Associations de Transitaires et Assimiliés (FIATA) is a French name of the International Federation Of Freight Forwarders Associations. See also International Federation Of Freight Forwarders Associations. / Смотрите также Международная Федерация Ассоциаций Грузовых Экспедиторов (International Federation Of Freight Forwarders Associations).

FEDERATION OF AFRO–ASIAN INSURERS ANS REINSURERS = ФЕДЕРАЦИЯ АФРО–АЗИАТСКИХ СТРАХОВЩИКОВ И ПЕРЕСТРАХОВЩИКОВ – Federation of Afro-Asian Insurers and Reinsurers (FAIR) was established in September 1964, to promote joint cooperation among insurance and reinsurance companies in Africa and Asia. Being a professional business association, FAIR is dedicated to the cause of regional cooperation and the development of the insurance industry in Afro-Asian countries. Purpose of FAIR:- the purpose of establishing FAIR is promoting cooperation among the insurance and reinsurance companies in Africa and Asia, through the exchange of information and expertise, as well as developing reinsurance activities among members. In addition, strengthening relations with markets outside the region has also been followed since its establishment. In other words, FAIR involves two major goals:- (i) Cooperation in Asian – African region; and (ii) Development of business relations with markets outside the region. FAIR Membership:- FAIR is composed of Ordinary Members and Associate Members that are as follows:- (i) Ordinary Membership:- opened to any Afro-Asian national insurance or reinsurance companies and/or holding organizations. In all cases, an ordinary member shall have at least fifty one percent of Afro-Asian ownership and the Head-Office must be situated in Africa or Asia. Ordinary Members of FAIR are now 238 from 52 Afro-Asian countries. (ii) Associate membership:- opened to any other Afro-Asian national insurance or reinsurance company whose Head-Office is situated in Africa or Asia and any African or Asian national insurance association or institution. (iii) Other insurance and reinsurance companies or institutions:- whose collaboration is deemed conducive to promoting the aims of the FAIR, may be accepted as Correspondents. Under the umbrella of FAIR, the entities listed hereunder were established to realize its objectives. The respective activities are being undertaken as follows:- (I) Pools & Syndicate:- (1) FAIR Non-Life Reinsurance Pool, managed by Milli Re, Turkey. Ten years after the creation of the Federation, it was felt that all positive ideas on Afro-Asian cooperation widely deliberated therein had to be put to practice and thus the FAIR Non-Life Reinsurance Pool was established in 1974. The Pool has proved its professional competence and success. It provides its members with profitable reciprocal business secured through a tradition of sound, selective and conservative underwriting which has greatly contributed to weathering the ups and downs of the International Market, under the Management of Milli Re, Turkey, which has been entrusted with the task since inception. (2) FAIR Aviation Pool 'managed by Société Centrale de Réassurance (SCR), Morocco. Fifteen years after the creation of the FAIR Reinsurance Pool, the FAIR Aviation Pool incepted its activities under the Management of the SCR, Morocco, in 1989. This was the fruit of long debates which due to the high specialization of Aviation business required the creation of a separate Pool. The FAIR Aviation Pool has achieved a very distinguished record. (3) FAIR Oil & Energy Insurance Syndicate, managed by Trust International Insurance Company (TIIC), Bahrain. It is a strategic goal for FAIR Members to affirm themselves as successful partners and credible insurers and reinsurers of their national and regional Oil & Energy risks in collaboration with the international markets. Therefore, it has been quite agreeable to set up modalities for more cohesive cooperation among themselves, in order to face the challenges collectively. The Syndicate's principal objective is to underwrite Oil and Energy business from FAIR Members and/or other resources, primarily dealing with the Afro-Asian business for the account and benefit of the Members. It is very encouraging to note that the Syndicate started with twenty founding members and has presently 36 members from Asian and 8 members from African countries. The door is open for new membership and for stronger support of members to tap the vast of Oil & Energy business potentials existing in the Afro-Asian countries. (II) FAIR Forums & Societies:- (1) FAIR Reinsurance Forum (FRF):- representatives of FAIR Member Insurance and Reinsurance Companies participate in this Forum. The Forum avails a platform for all parties interested in the growth of the underwriting capacities of FAIR Member Companies, to interact through the exchange of business, experience and information. They participate and meet annually equipped by their reports, latest statistics, their reinsurance program and/or their reinsurance capacities. FRF Meetings continue to prove their importance and benefits for both insurers and reinsurers. It is assumed that Direct Insurance Companies are encouraged to take more initiative, taking into consideration the changes in the international scenario. (2) FAIR Oil and Energy Underwriters Forum (FOEUF):- the Countries constituting the FAIR area account for around fifty percent of worldwide oil production and more than three quarters of proven oil reserves. The massive investments in the various oil and gas activities represent immense insurable risks with a commensurate premium base. For various reasons, Local Insurers in many oil-producing countries have been unable to deal with, these risks which are characterized by specialized technology and high values concentrated in limited areas and with high loss potential, single handedly. With this background, FAIR Oil & Energy Underwriters are called upon to face the challenges collectively to develop capacity and promote an underwriting expertise capable of dealing with the complex and sophisticated nature of Oil & Energy Risk. They are invited to come together and work more closely, under the umbrella of FAIR Oil & Energy Underwriters Forum, which holds its meetings in conjunction with FAIR Reinsurance Forum (FRF). (3) FAIR Life Insurance Professional Group (FLIPG):- the Life Insurance penetration in the majority of the African and Asian countries is still too low. Millions of people, even those who have enough disposable income do not hold life policy. In addition, the economic reforms are going

on and the contemporary social and economic changes represent both challenge and big window of opportunities for the life insurers. The increasing consumer sophistication, naturally razes the demand on quality and the growing moves toward more investment-linked products, encourage insurers to look at the techniques of investment management beside their continued role in risk, i.e. death, medical and accident. In addition, the entry of the giant multinational insurers spurs fierce competition in the markets. Bearing all this in mind, FAIR Life Insurance Professional Group (FLIPG) was established to encourage life insurance Professionals and Managers to sit together to share and discuss the technical and administrative matters which impact their work. FLIPG is formed mainly from representatives of life Insurance companies in addition to the interested composite and life reinsurance companies. Members of the group name topics for the agenda of their meetings and FAIR Central Office act as Agenda Manager, prioritizing and circulating the topics which are most named by members allowing plenty of time to compile information and the Members' views and to prepare papers for each agenda item. FLIPG holds its meetings in the course of the Executive Committee. (4) FAIR Brokers & Consultants Society (FBCS):- recognizing the increasingly growing role of the Afro-Asian brokers aiming at developing the national insurance industry and enhancing regional cooperation and, considering the strategic goals and plans of FAIR which focus on mobilizing the national resources, to optimally profit from the existing potentials in the Afro-Asian markets and to open wider windows of opportunities for growth in a changing trading environment, FAIR Brokers & Consultants Society (FBCS) has been established, aiming at developing this profession and having a progressive and powerful arm to spur regional cooperation and to encourage business exchange among FAIR Members. (IV) Issuing FAIR Review:- the 'FAIR Review' is published quarterly by the Central Office and circulated to Members free of charge. It is devoted to disseminate the research work, articles and information which relate to the above mentioned issues and to enhance professional knowledge among insurance professionals. (V) FAIR Conferences and other Meetings:- FAIR Conferences are organized biannually in Africa or Asia rotationally, according to a decision from the General Meeting, which is the supreme authority of FAIR. FAIR General Meeting holds its sessions in the course of the FAIR Conference, to determine inter alia the general policy and work program and to elect the President of FAIR and the Executive Committee which shall meet at least once yearly and shall exercise all the powers of the General Meeting unless the latter is in session. In addition, the following Standing Sub-Committees are appointed to perform and function as delegated:- Financial, Educational, Agricultural Insurance, Life Insurance, Risk Management & Loss Prevention, and Development & Cooperation Sub-Committees. How to Join FAIR:- the Forum avails a platform for all parties interested in the growth of the underwriting capacities of FAIR Member Companies, to interact through the exchange of business, experience and information. They participate and meet annually equipped by their reports, latest statistics, their reinsurance program and/or their reinsurance capacities. New applicants for FAIR Membership have to complete the Application Form. They have also to submit the admission fees and the annual subscription as follows:- (i) USD150 Admission fees (payable only once) plus; (ii) USD1 300 Annual Subscription (for Ordinary & Associate Members); (iii) USD825 Annual Subscription (for Correspondent Members); and (iv) USD550 Annual Subscription (for Academies & Institutes). Decision for admission shall be made by FAIR Executive Committee and conveyed to the applicant. Contact FAIR:- Secretary General:- Mr Hammam Badr, 14 Gawad Hosny Street, Cairo, 11599, Egypt, Tel:- +20-2-23923630, 23951815, Fax:- +20-2-23921848, 23961007, http://www.fair.org.eg, e-mail:- central-office@fair.org.eg.

FEDORA = ФЭДОРА (или XX) – Fedora is a low soft felt hat with the crown creased lengthwise. / Мягкая Шляпа.

FEDS = FEDERAL AGENCIES

FEDWIRE = ФЭДВАЙЭ (или ПРОВОДНАЯ СЕТЬ ФЕДЕРАЛЬНОГО РЕЗЕРВА) – In the United States, Fedwire is the electronic funds transfer network operated by the Federal Reserve (also known as Fed). Fedwire is usually used to transfer large amounts of funds and US government securities from one institution's account at the Federal Reserve to another institution's account. It is also used by the US Department of the Treasury and other federal agencies to collect and disburse funds. A Federal Reserve Bank transfer system with two components, Fedwire Funds Transfer Service and Fedwire Book-Entry Securities Service. Once authorized (matched) and processed, all transfers are final. Fedwire is the electronic, large-value payment system managed by the Federal Reserve Bank of the United States. Fedwire is a real-time gross settlement (RTGS) system, meaning all transfers occur in real time, and settlement is immediate and fnal on the remitting and receiving banks' accounts with the Federal Reserve Bank. Wells Fargo is among the largest Fedwire processing banks. Daylight overdrafts are allowed in this network, but such overdrafts are closely monitored and controlled. A charge is assessed based on the amount of the overdraft per minute. Every bank in the United States that maintains an account with the central bank (The Fed) is assigned an American Banker's Association (ABA) number used to facilitate specifc business clearing needs, including high-value payments, securities, ACH (short for the Automated Clearing House), checks, etc. Having an ABA number does not necessarily indicate a bank's eligibility to participate in the high-value payment system known as Fedwire. It is common to have a series of ABA numbers dedicated to support check clearing and ACH, while a separate and distinct ABA is maintained for the purposes of high-value payment (Fedwire). Each ABA consists of nine digits. See also ACH. / Фэдвайэ (Fedwire) – федеральная сеть коммуникаций. Высокоскоростная компьютеризованная коммуникационная сеть, связывающая 12 банков ФРС, их 24 филиала, офис Совета Федерального Резерва в Вашингтоне, отделения Казначейства США в Вашингтоне и Чикаго, а также Вашингтонский офис Корпорации По Сырьевым Кредитам (Commodity Credit Corporation); также может быть написана как FedWire (ФэдВайэ). Федеральную сеть коммуникаций называют 'центральной нервной системой' перевода денег в США. Она позволяет банкам переводить резервные средства из одного банка в другой для немедленной выдачи кредита, а также переводить средства для операций по счетам коммерческих клиентов. Используя федеральную сеть коммуникаций, банки ФРС могут проводить расчёты по сделкам, выходящим за рамки их округа, необходимые для получения средств по чекам; Казначейство может быстро и без дополнительных расходов переводить средства по своим счетам в различные резервные банки; также можно осуществлять перевод краткосрочных государственных ценных бумаг на предъявителя в течение часа и без дополнительных расходов. Это производится с использованием процедуры, называемой CPD (Commissioner of Public Debt of the Treasury), разработанной в Управлении Федерального Долга при Казначействе) – это трансферт, при котором банк Федерального Резерва 'погашает' ценные бумаги продавца, в то время как другой резервный банк поставляет покупателю такое же количество тех же ценных бумаг из своих нереализованных запасов.

FEDWIRE BOOK–ENTRY SECURITIES SERVICE = СЛУЖБА ФЭДВАЙЭ ПО XX ЦЕННЫМ БУМАГАМ (или СЛУЖБА УЧЁТА ЦЕННЫХ БУМАГ ФЭДВАЙЭ) – In the United States, Fedwire Book-Entry Securities Service is a large-value transfer system that offers real-time gross settlement and that operates on a delivery vs. payment system. Used for the safekeeping and transfer of US Government securities in book-entry form. Transfers are initiated by the sender of securities. Once authorized (matched) and processed, all transfers are final. / , которая предлагает валовые расчёты в режиме реального времени .

FEDWIRE FUNDS SERVICE = СЛУЖБА ФЭДВАЙЭ ПО ОБРАБОТКЕ СРЕДСТВ (или СЛУЖБА ОБРАБОТКИ ФОНДОВ ФЭДВАЙЭ) – Electronic funds transfer network operated by the Federal Reserve Banks. It is usually used to transfer large amounts of funds from one institution's account at the Federal Reserve to another institution's account. It is also used by the US Department of the Treasury, other federal agencies, and government-sponsored enterprises to collect and disburse funds. In the United States, the Fedwire Funds Service provides a real-time gross settlement system in which more than 9 500 participants are able to initiate electronic funds transfers that are immediate, final, and irrevocable. Depository institutions that maintain an account with a Reserve

Bank are eligible to use the service to send payments directly to, or receive payments from, other participants. Depository institutions can also use a correspondent relationship with a Fedwire participant to make or receive transfers indirectly through the system. Participants generally use Fedwire to handle large-value, time-critical payments, such as payments to settle interbank purchases and sales of federal funds; to purchase, sell, or finance securities transactions; to disburse or repay large loans; and to settle real estate transactions. The Department of the Treasury, other federal agencies, and government-sponsored enterprises also use the Fedwire Funds Service to disburse and collect funds. In 2003, the Reserve Banks processed 123 million Fed-wire payments having a total value of USD436.7 trillion. Fedwire funds transfers are processed individually, rather than in batches as ACH transfers are. The Federal Reserve uses secure, sophisticated data-communications and data-processing systems to ensure that each transfer is authorized by the sender and that it is not altered while it is under the control of a Reserve Bank. Although a few depository institutions use the telephone to initiate Fedwire payments, more than 99 percent of all Fedwire funds transfers are initiated electronically. The Federal Reserve processes Fedwire funds transfers in seconds, electronically debiting the account of the sending institution and crediting the account of the receiving institution. The Federal Reserve guarantees the payment, assuming any risk that the institution sending the payment has insufficient funds in its Federal Reserve account to complete the transfer. / коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо).

FEDWIRE FUNDS TRANSFER SERVICE = СЛУЖБА ФЭДВАЙЭ ПО ПЕРЕВОДУ СРЕДСТВ (или СЛУЖБА ПЕРЕВОДА ФОНДОВ ФЭДВАЙЭ) – In the United States, Fedwire Funds Transfer Service is a large-value funds transfer system that offers real-time gross settlement. Transfers are initiated by the sender. Once authorized (matched) and processed, all transfers are final. / В Соединённых Штатах Америки Служба Перевода Фондов Фэдвайэ или Служба Фэдвайэ по Переводу Средств предполагает под собой систему перевода крупных денежных средств (фондов), которая предлагает валовые расчёты в режиме реального времени. Переводы инициируются отправителями. Раз авторизованные (достигшие встречной стороны) и обработанные, все переводы считаются свершёнными.

FEDWIRE SECURITIES SERVICE = СЛУЖБА ФЭДВАЙЭ ПО ЦЕННЫМ БУМАГАМ (или СЛУЖБА ОБРАБОТКИ ЦЕННЫХ БУМАГ ФЭДВАЙЭ) – Electronic vault that stores records of book-entry securities holdings and a transfer and settlement mechanism used by depository institutions to transfer custody of book-entry securities from one depository institution to another. The securities on the Fedwire Securities Service include the US Treasury securities, the US agency securities, mortgage-backed securities issued by government-sponsored enterprises, and securities of certain international organizations. In the United States, the Fedwire Securities Service provides safekeeping, transfer, and settlement services for securities issued by the Treasury, federal agencies, government-sponsored enterprises, and certain international organizations. The Reserve Banks perform these services as fiscal agents for these entities. Securities are safekept in the form of electronic records of securities held in custody accounts. Securities are transferred according to instructions provided by parties with access to the system. Access to the Fedwire Securities Service is limited to depository institutions that maintain accounts with a Reserve Bank, and a few other organizations, such as federal agencies, government-sponsored enterprises, and state government treasurer's offices, which are designated by the US Treasury to hold securities accounts. Other parties, specifically brokers and dealers, typically hold and transfer securities through depository institutions that are Fedwire participants and that provide specialized government securities clearing services. In 2003, the Fedwire Securities Service processed 20.4 million securities transfers with a value of USD267.6 trillion. Fedwire securities are processed individually, in much the same way that Fedwire funds transfers are processed, and participants initiate securities transfers in the same manner, using either a computer connection or the telephone. When the Federal Reserve receives a request to transfer a security, for example as a result of the sale of securities, it determines that the security is held in safekeeping for the institution requesting the transfer and withdraws the security from the institution's safekeeping account. It then electronically credits the proceeds of the sale to the account of the depository institution, deposits the book-entry security into the safekeeping account of the receiving institution, and electronically debits that institution's account for the purchase price. Most securities transfers involve the delivery of securities and the simultaneous exchange of payment, which is referred to as Delivery Versus Payment. The transfer of securities ownership and related funds is final at the time of transfer, and the Federal Reserve guarantees payment to institutions that initiate such securities transfers. / Счёт Ответственного Хранения (Safekeeping Account).

FEE = FÉDÉRATION DES EXPERTS COMPTABLES EUROPÉENS

FEE = ВОЗНАГРАЖДЕНИЕ (или ПЛАТА) – (1) Fee is an amount charged for a service performed, e.g., a broker charges a fee for buying and selling exchange instruments for clients, and auditors charge fee for carrying out company audits. / Сумма, взысканная за исполненное обслуживание, например, брокер взыскивает вознаграждение за покупку и продажу биржевых инструментов для клиентов, а аудиторы взыскивают вознаграждение за проведение аудитов компании.

(2) In the US patent law, a Fee is an amount of money charged for a particular service or product supplied by the United States Patent and Trademark Office (USPTO).

FEE = ПЛАТА – Fee is a charge imposed by a municipality to cover the cost of a public service, such as refuse collection. See also Duty, and Tax. / Плата – сбор, взимаемый муниципалитетом с целью покрытия расходов на общественное обслуживание, такое как уборка мусора. Смотрите также Налог (Tax) и Пошлина (Duty).

FEED = КОРМ – Feed is edible materials which are consumed by animals.

FEEDBACK = ОТКЛИК (или РЕАКЦИЯ, или ОБРАТНАЯ СВЯЗЬ) – Feedback:- the flow of information back into the control system so that actual performance can be compared with planned performance. / Поток информации, возращающийся в систему контроля, который позволяет сравнивать фактическое исполнение с запланированным ранее.

FEED CHEWS = ЗАЖЁВАННЫЕ ПРИ ПОДАЧЕ МЕСТА – Feed Chews:- caused by excessive machine speeds, improper selection and/or adjustment of fittings. Machinery defects, and namely – Sewing Machines and Attachments. / Порок или дефект от машинного оборудования.

FEED CUTS = ПОРЕЗЫ ПРИ ПОДАЧЕ – Feed Cuts:- caused by use of wrong type or size feed dogs for the fabric used, excessive feed pressure, improper alignment of pressure foot with feed surface, worn or damaged throat plate. Machinery defects, and namely – Sewing Machines and Attachments. / Порок или дефект от машинного оборудования.

FEEDER = ДОСТАВЩИК (или ПЛАШКОУТ, или ТРАНСПОРТЁР, или ПИТАТЕЛЬ, или ДОЗАТОР, или ЗАГРУЗОЧНОЕ УСТРОЙСТВО) – (1) Feeder:- transportation conveyance utilized to relay cargo from the mother vessel to ultimate destination or from first receipt port to mother vessel. The transportation vehicle utilized to relay cargo from mother vessel to ultimate destination, usually a small container vessel. Due to the high daily costs involved large container ships used for deep sea routes only operate between ports able to offer sufficient handling volumes. Ports generating only a low handling volume or located off major routes are usually served by feeder transport. This transport uses smaller container ships with capacities suitable for the routes they travel. Important European

routes principally served by feeder ships are the Baltic; the British Isles; the Black Sea and numerous regions along the Mediterranean coast. A study carried out by British consulting company OSC showed that traffic in and from the Baltic region is not only the largest feeder market in northern Europe in absolute terms but also the fastest growing. Container ships with tonnages of 300 to 1 000 TEUs are used on these routes. / Важными Европейскими маршрутами, обслуживаемыми, главным образом судами-доставщиками, являются Балтика; Британские Острова. Под Питателем понимается устройство для равномерной или регулируемой подачи насыпных и штучных грузов из бункеров, загрузочных лотков, магазинов и других загрузочных устройств к транспортирующим и перерабатывающим машинам. Питатели бывают гравитационными (воронки с заслонкой, мерные сосуды и клапаны) и с принудительной подачей (вибрационные, тарельчатые, шнековые и другие). Питатели делят на неуправляемые и управляемые; последние подразделяют на объёмные и весовые. Расход материала в питателе регулируется по сигналам датчиков. Наиболее распространённые весовые питатели обеспечивают автоматическое регулирование и дистанционное управление дозированием материалов. Управляемые весовые питатели бывают дискретного и непрерывного действия, по типу грузоприёмного устройства – бункерные и ленточные. Под Плашкоутом, от Голландского слова Plaatschuit, понимается несамоходное грузовое судно с упрощёнными обводами, приспособленное для перевозки грузов на верхней палубе. Плашкоут используется для перегрузочных работ на рейде. Они могут также служить опорами наплавных мостов.

(2) Feeder is a grain container or reservoir constructed around the hatchway between two decks of a ship which when filled with grain automatically feeds or fills in the vacant areas in the lower holds. / Зерновой контейнер или резервуар, сконструированный вокруг грузового люка между двумя палубами судна, который при заполнении зерном автоматически подаёт или заполняет свободные площади в расположенных ниже трюмах.

FEEDER = ФИДЕР (или ПИТАТЕЛЬ) – Feeder:- circuit conductors between the service equipment and the last downstream branch circuit overcurrent protective device. / Под Фидером понимается:- (1) в радиотехнике – проводная линия для передачи электрических колебаний радиочастоты. В качестве фидеров применяют либо симметричные открытые линии из параллельных проводов, либо симметричные или коаксиальные кабели. Чаще всего фидер соединяет антенну с передатчиком или приёмником. Термин Фидер применяют также к линиям, по которым электрические колебания звуковых частот поступают в радиотрансляционную сеть. (2) В электроэнергетике – устаревшее название распределительной кабельной или воздушной линии электропередачи (обычно на 6–10 кВ).

FEEDER BILL = ФИДЕРНЫЙ КОНОСАМЕНТ (или КОНОСАМЕНТ ПЕРЕРАСПРЕДЕЛИТЕЛЯ) – Feeder Bill is a bill of lading issued by a sub-carrier to the main carrier under a combined transport or through bill of lading, which covers only the stage and form of carriage performed by the sub-carrier, e.g., carriage by barge of parcels of cargo either from inland ports or from smaller or more remote coastal ports to a principal coastal port served by a combined transport liner service operator. Feeder bills of lading generally are of concern only to main carriers and sub-carriers and do not affect the relations between main carriers and shippers or consignees that are evidenced or created by the related combined transport or through bills of lading. Also known as Cover Bill, and Service Bill.

FEEDER CATTLE = ОТКОРМОЧНОЕ ПОГОЛОВЬЕ КРУПНОРОГАТОГО СКОТА – The Chicago Mercantile Exchange® (CME®) Feeder Cattle contracts represent 650–849 pound feeder steers to be placed in feedyards for fattening. As a derivative of the CME® Live Cattle Futures, prices are influenced by factors that affect both the feedgrain and fed cattle prices. Feeder Cattle are young animals sent to feedlots for finishing into ‘fed’ cattle, the basis of CME’s Live Cattle contracts. CME® added Feeder Cattle futures to its list of livestock products in 1971, and in 1987 the Exchange added options on this contract. These tools have enabled cattle producers who use them to manage their price risk more effectively. Over the years, the contract has continually evolved to more effectively serve both long and short hedgers.

FEEDER PORT = ПОРТ ПЕРЕРАСПРЕДЕЛЕНИЯ – Feeder Port is a central hub port from which cargo is shipped to various regional ports. Freeport, the Bahamas is an example of a true feeder port. / Центральный узловой порт, из которого груз отправляется в различные региональные порты. Фрипорт, Багамы (Freeport, the Bahamas) является примером типичного порта перераспределения.

FEEDERS = ОТКОРМОЧНИКИ (или ОТКОРМОЧНОЕ ПОГОЛОВЬЕ КРУПНОГО РОГАТОГО СКОТА) – A term Feeders refers to weaned calves grazing pasture and of sufficient weight and maturity to be placed on high-energy rations for finishing; they are generally older, weigh more, and carry more condition (finish) than stockers. See also Slaughter Cattle, Stockers, and Weaned Cattle.

FEEDER SERVICE = СЛУЖБА ПЕРЕРАСПРЕДЕЛЕНИЯ (или УСЛУГА ДОСТАВКИ) – Feeder Service:- cargo to/from regional ports are transferred to/from a central hub port for a long-haul ocean voyage. Freeport, Bahamas is an example of a true feeder port. A service which incorporates a small vessel to transport containers to the ‘mother ship’.

FEEDER VARIATION = ВАРИАЦИЯ ПИТАТЕЛЕЙ (или ПОДВОДЧИКОВ) – Feeder Variation; machine barre; slack course; tight course:- a course which differs in appearance from normal courses in a fabric knitted on a multi-feeder machine. Note:- this defect is caused by one feeder not delivering the same length of yarn as the other feeders.

FEEDER VESSEL = СУДНО ДОСТАВЩИК (или ЗАГРУЗОЧНОЕ СУДНО) – Generally Feeder Vessel is a smaller vessel which is used to relay cargo in containers from/to a line vessel from/to a beyond/advanced port of call which is not served by the line vessel directly. A short-sea vessel which transfers cargo between a central hub port and smaller ‘spoke’ ports. / Короткое морское судно, которое перевозит грузы между центральным узловым портом и портами, являющимися его мелкими составляющими. Под Плашкоутом, от Голландского слова Plaatschuit, понимается несамоходное грузовое судно с упрощёнными обводами для перевозки грузов на верхней палубе. Плашкоут используется для перегрузочных работ на рейде. Они могут также служить опорами наплавных мостов. Шаланда, от Французского слова Chaland, небольшая баржа для погрузки и разгрузки крупнотоннажных судов на рейде, перевозки земли и тому подобного.

FEEDING LESION = КОРМОВОЕ ПОРАЖЕНИЕ – Feeding Lesion is a damaged area on a plant part resulting from the feeding of an insect.

FEED MARKS = ОТМЕТИНЫ ОТ ПОДАЧИ – Feed Marks:- improper feed selection for material sewn, improper alignment of foot and feed. Machinery defects, and namely – Sewing Machines and Attachments. / Порок или дефект от машинного оборудования.

FEED RATIO = СООТНОШЕНИЕ С КОРМОМ (или СООТНОШЕНИЕ С ОТКОРМКОЙ) – Feed Ratio:- the relationship of the cost of feed, expressed as a ratio to the sale price of animals, such as the Corn-Hog Ratio. These serve as indicators of the profit margin or lack of profit in feeding animals to market weight. A ratio used to express the relationship of feeding costs to the Dollar value of livestock. See also Hog/Corn Ration and Steer/Corn Ratio. / Смотрите также Соотношение Боров/Кукуруза (Hog/Corn Ration) и Соотношение Бычок-Кастрат/Кукуруза (Steer/Corn Ratio).

FEEDSTOCK = ЗАПАСЫ ИСХОДНОГО СЫРЬЯ – Feedstock:- the supply of crude oil, natural gas liquids, or natural gas to a refinery or petrochemical plant or the supply of some refined fraction of intermediate product to some other manufacturing process.

FEEDSTOCK = XX – Feedstock (in air transport):- used passenger aircraft available and ready to convert to freighters.

FEE FOR SERVICE = ВОЗНАГРАЖДЕНИЕ ЗА УСЛУГУ – Fee For Service:- in insurance, where a broker is remunerated on the basis of a fee agreed with its client instead of brokerage. The benefit to the broker is that, subject to the terms of agreement, the fee will be payable whether or not cover is placed whereas brokerage is only payable in respect of the placement of cover.

FEEL = ОЩУЩАТЬ (или ОСЯЗАТЬ, или ОЩУПЫВАТЬ, или НА ОЩУПЬ) – Feel:- (1) to perceive through the sense of touch:- feel the velvety smoothness of a peach; or to perceive as a physical sensation:- feel a sharp pain; feel the cold; (2) to touch:- or to examine by touching. See Hand.

FEF = FORTY–FOOT EQUIVALENT

FEIN = FEDERAL EMPLOYER IDENTIFICATION NUMBER

FELL = ОПУШКА (или ПОДРУБКА, или ПОДШИВКА, или СШИВКА) – Fell is:- (1) the end of a piece of fabric that is woven last. (2) In weaving, the last filling pick laid in the fabric at any time. Fell:- to join two pieces of material with the edges folded together using double needle stitching. / (2) В ткачестве последняя уточная поперечная нить, уложенная в ткани в любое время. опушка ткани втачивание (stitching).

FELLMONGERING = ОБЕЗВОЛАШИВАНИЕ (или СГОНКА ШЕРСТИ) – Fellmongering is the process of gathering wool from the fleeces of dead sheep. The fellmonger is the only man who can expertly strip the wool from the skin of a sheep and at the same time put it into various grades. See also Pelt. Fellmongering is the trade or craft of dealing in animal skins or hides. The wool trade and, later, the cloth trade are the two industries on which the wealth of medieval England was founded, and wool production is still one of the leading industries of the British Empire. Though large quantities of wool are taken from the living sheep at the annual shearing, a good deal comes from slaughtered sheep. The handling of the sheepskin after flaying, and the separation of the wool from the pelt, are the tasks of the fellmonger, who in many cases is carrying out his work to-day by the same methods as those employed by his ancestors hundreds of years ago. Fellmongering, however, like a number of other ancient crafts, has now become the subject of scientific research. Bulletin No. 184, recently issued by the Council for Scientific and Industrial Research of Australia (Melbourne:- Gov. Printer, 1945), describes a series of important fundamental investigations on the fellmongering process carried out by F.G. Lennox, Margaret Maxwell and W.J. Ellis. / Обезволашивание или Сгонка Шерсти. Эф.Дьжи. Лэнэкс (F.G. Lennox), Магарит Максвэл (Margaret Maxwell) и ДаблЮ.Дьжей. Элыс (W.J. Ellis).

FELT = ФЕТР (или ВОЙЛОК) – Felt is a non-woven fabric made by layering thin sheets of carded wool fibers, then applying heat, moisture and pressure to shrink and compress the fibers into a thick matted cloth that will not ravel or fray. Felt is a non-woven fabric made from wool, hair, or fur, and sometimes in combination with certain manufactured fibers, where the fibers are locked together in a process utilizing heat, moisture, and pressure to form a compact material. Felt is:- (1) a nonwoven sheet of matted material of wool, hair, or fur, sometimes in combination with certain manufactured fibers, made by a combination of mechanical and chemical action, pressure, moisture, and heat. (2) A woven fabric generally made from wool, but occasionally from cotton or certain manufactured fibers, that is heavily shrunk and fulled, making it almost impossible to distinguish the weave. Felt is a very thick layer of hairs or fibers. Felt is a nonwoven fabric or interlocked fiber made from wool, fur, and hair fibers that mesh together when heat, moisture, and mechanical action are applied. Processes of spinning, weaving, or knitting are not employed. The fibers develop a tight bond and will not ravel. Some percentage of wool is necessary in the manufacture of true felt to achieve the felted effect. It is used for coats, hats, and many industrial purposes. Felt is a nonwoven cloth that is produced by matting, condensing and pressing fibers. While some types of felt are very soft, some are tough enough to form construction materials. Felt can be of any color and made into any shape or size. Felt is a cloth made of wool and fur often mixed with natural or synthetic fibers through the action of heat, moisture, chemicals, and pressure; a firm woven cloth of wool or cotton heavily napped and shrunk. An article of clothing made of felt, namely a cloth made of wool and fur made through the action of heat, moisture, chemicals, and pressure. / Под Фетром, от Французского слова Feutre, означающее Войлок, понимается материал, полученный валянием пуха (тонкого волоса) кролика, зайца, отходов меха пушных зверей ценных пород, а также овечьей шерсти. Из фетра изготовляют головные уборы, обувь и тому подобное. Фетр, от Французского слова Feutre, означающее Войлок, материал, получаемый валянием пуха (тонкого волоса) главным образом зайцев, кроликов и коз, отходов меха, тонкой и полугрубой шерсти (иногда с примесью химических волокон). В зависимости от внешней отделки различают фетр гладкий и ворсовой. Ворсовой, в свою очередь, делится на:- ‘под замшу’ (длина ворса менее 0.5 мм), коротковорсовой (длина от 0.5 до 1.5 мм), велюр (густой стоячий ворс длина 1.5–2.5 мм) и длинноворсовой (неподстриженный ворс длина от 3 до 8–12 мм). Фетр вырабатывается в виде колпаков для шляп, беретов, так называемых чулок для изготовления тонких (фетровых) валенок, а также в виде листов, из которых выкраивают детали обуви, технические изделия (фильтры, прокладки и тому подобное). Войлок (Тюркскоязычный термин) – прокладочный, уплотнительный, тепло- и звукоизоляционный материал, получаемый валянием. Войлок отличается большим разнообразием видов, свойств и назначения. Кроме шерстяного (основное количество) и полушерстяного войлока, существуют войлок минеральный из минеральной ваты на битумной связке и войлок из химических волокон. Основные виды войлока:- (а) технические (грубошёрстные, полугрубые и тонкошёрстные) плотностью от 0.09 до 0.45 г/см^3 в виде лент, пластин и готовых деталей, используемых для сальников, прокладок, амортизаторов и фитилей в автомобилях, тракторах, комбайнах, самолётах и так далее, для рабочих валов и других элементов текстильных, бумагоделательных машин, для полировки жести (войлочные полировочные круги), для музыкальных инструментов, протезов; (б) бытовые – подошвенные, обувные, шорные; и (в) строительные – для утепления концов деревянных балок в наружных каменных стенах, оконных и дверных коробок, стыков щитов в сборных домах и так далее.

FELTABILITY = СВОЙЛАЧИВАЕМОСТЬ – Feltability is the degree to which fibers will consolidate by felting.

FELTING = СВОЙЛАЧИВАНИЕ (или ВОЙЛОК, или СВОЙЛАЧИВАЕМОСТЬ, или УВАЛ, или КОШМА) – Felting is:- (1) the process of exposing wool fibers alone or in combination with other fibers to mechanical and chemical action, pressure, moisture, and heat so that they tangle, shrink, and mat to form a compact material. Felting is generally carried out in a fulling mill. See also Fulling. (2) See also Needled Fabric, and Needlepunching. Felting:- felt. Felting is the matting together of fibers during processing or use. / Смотрите также Уваливание или Валка или Валяние (Fulling).

FELTING PROPERTY = ВАЛКОСПОСОБНОСТЬ – Felting Property is the property of wool and some other fibers to interlock with each other to create felt. Felting is caused by the directional friction effect of scales on the fiber surfaces. The factors involved in felting are the fiber structure, the crimp of the fibers, the ease of deformation of the fiber and the fiber’s power of recovery from deformation.

FEMA = FEDERAL EMERGENCY MANAGEMENT AGENCY

FEMALE FLOWER = ЖЕНСКИЙ ЦВЕТОК – Female Flower is a flower with functional ovary but no stamens. / но не тычинки (stamens).

FEMALE PARENT = РОДИТЕЛЬ ЖЕНСКОГО ПОЛА (или МАТЕРИНСКАЯ ОСОБЬ, или ЖЕНСКАЯ ОСОБЬ, или МАТЕРИНСКАЯ ФОРМА) – Female Parent is the parent which contributes its egg in a cross. The plant with the ovary, style, and stigma that may produce fruits or seeds.

FEN = НИЗИННОЕ БОЛОТО (или БОЛОТИСТАЯ МЕСТНОСТЬ, или НИЗИННЫЙ ТОРФЯНИК, или ЗАЛИВНОЕ ПОЛЕ) – Fen is a peat-accumulating wetland that receives some water from surrounding mineral soils and usually supports grasslike vegetation. See also Bog, Marsh, and Swamp. A Fen is one of the four main types of wetland and one of two types of mire (the other being a bog). It is usually fed by mineral-rich surface water or groundwater. Fens are characterised by their water chemistry, which is neutral or alkaline, with relatively high dissolved mineral levels but few other plant nutrients. They are usually dominated by grasses and sedges, and typically have brown mosses in general including Scorpidium or Drepanocladus. Fens frequently have a high diversity of other plant species including carnivorous plants such as Pinguicula. They may also occur along large lakes and rivers where seasonal changes in water level maintain wet soils with few woody plants. The distribution of individual species of fen plants is often closely connected to water regimes and nutrient concentrations. Fens have a characteristic set of plant species, which sometimes provide the best indicators of environmental conditions. For example, fen indicator Species in New York include Carex Flava, Cladium Mariscoides, Potentilla Fruticosa, Pogonia Ophioglossoides and Parnassia Glauca. Fens are distinguished from bogs, which are acidic, low in minerals, and usually dominated by sedges and shrubs, along with abundant mosses in the Genus Sphagnum. Fens have been damaged in the past by land drainage, and also by peat cutting. Some are now being carefully restored with modern management methods. The principal challenges are to restore natural water flow regimes, to maintain the quality of water, and to prevent invasion by woody plants. The word ‘Fen’ is derived from Old English Fenn; from Proto-Germanic Fanja. Cognates include Gothic (Fani), Old Frisian (Fenne), Dutch (Veen, Ven) and German (Fenn(e), Venn, Vehn, Feen, Fehn). Carr is the northern European equivalent of the wooded swamp of the south-eastern United States, also known in the United Kingdom as Wet woodland. It is a fen overgrown with generally small trees of Species such as Willow (Salix Spp.) or Alder (Alnus Spp.). In general, fens may change in composition as peat accumulates. A list of species found in a fen can therefore cover a range of species from those remaining from the earlier stage in the successional development to the pioneers of the succeeding stage. Where streams of base-rich water run through bog, these are often lined by strips of fen, separating ‘islands’ of rain-fed bog. Temporary flooding by beavers can have negative effects on fens. Fen is a type of bog (q.v.), especially a low-lying area, wholly or partly covered with water and dominated by grasslike plants, grasses, sedges, and reeds. In strict usage, a fen denotes an area in which the soil is organic (peaty) and alkaline rather than acid. Fens, are peat-forming wetlands that receive nutrients from sources other than precipitation:- usually from upslope sources through drainage from surrounding mineral soils and from groundwater movement. Fens differ from bogs because they are less acidic and have higher nutrient levels. They are therefore able to support a much more diverse plant and animal community. These systems are often covered by grasses, sedges, rushes, and wildflowers. Some fens are characterized by parallel ridges of vegetation separated by less productive hollows. The ridges of these patterned fens form perpendicular to the downslope direction of water movement. Over time, peat may build up and separate the fen from its groundwater supply. When this happens, the fen receives fewer nutrients and may become a bog. Like bogs, fens are mostly a northern hemisphere phenomenon – occurring in the northeastern United States, the Great Lakes region, the Rocky Mountains, and much of Canada – and are generally associated with low temperatures and short growing seasons, where ample precipitation and high humidity cause excessive moisture to accumulate. Functions & Values:- fens, like bogs, provide important benefits in a watershed, including preventing or reducing the risk of floods, improving water quality, and providing habitat for unique plant and animal communities. Fens may be dominated by woody or herbaceous vegetation. Status:- like most peatlands, fens experienced a decline in acreage at a rate of about eight percent from 1950 to 1970, mostly from mining and draining for cropland, fuel, and fertilizer. Because of the large historical loss of this ecosystem type, remaining fens are that much more rare, and it is crucial to protect them. It is important to recognize that while mining and draining these ecosystems provide resources for people, up to 10 000 years are required to form a fen naturally.

FENC = FAR EASTERN NEW CENTURY

FENCE = ЗАФИКСИРОВАННЫЙ ДИАПАЗОН КОЛЕБАНИЙ (или ИЗГОРОДЬ) – Fence is a long (short) underlying position together with a long (short) out-of-the-money put and a short (long) out-of-the-money call. All options must expire at the same time. A Fence is a freestanding structure designed to restrict or prevent movement across a boundary. A fence entails buying a futures contract and hedging it with the purchase of an out-of-the-money put and the sale of an out-of-the-money call. The premium received from the call sale is used to subsidize the purchase of the put. Therefore, the net cost is low but the upside profit potential is limited. A fence offers a hedger unlimited downside protection by essentially creating a minimum value on physical inventory. Profits are limited if prices rally to the call’s strike price or higher. The profit/loss profile is the same as a bull call spread strategy. Also known as Window. / Известен также как Окно (Window).

FENDER = КРАНЕЦ (или ОТВОД) – Fender is an appliance made of rubber, timber and/or rope or other materials normally attached to a dock or quay used to prevent damage to the hull of a vessel during operations. Fender (maritime term):- canvas, wood or rope used over the side to protect a vessel from chafing when alongside another vessel or a dock. / Приспособление, сделанное из резины, древесины и/или канатов или иных материалов, и обычно прикреплённое к доку или причалу. Кранец используется для предотвращения повреждения корпуса судна во время осуществления каких-либо операций. Под Кранцем, от Голландского слова Krans, понимается приспособление для смягчения ударов судна о причал или борт другого судна. Судовые кранцы вывешивают за борт перед швартовкой или закрепляют на борту в местах, наиболее подверженных ударам. Причалы часто оборудуются постоянными кранцами. Изготавливают кранец из податливых материалов (дерева, резины), плетёными из растительных тросов или надувными (пневматическими). Для швартовки судов в открытом море наиболее удобны резинотканевые пневматические кранцы. На речных судах в слаборазвитых странах можно встретить кранец в виде деревянного бруса, старой автомобильной покрышки и прочего. Под Кранцем, от Голландского слова Krans, понимается приспособление для смягчения ударов бортов судна о причал или о другое судно. Кранцы вывешиваются за борт перед подачей швартовов. Изготовляют кранец из дерева, резины, плетёными из растительных тросов или надувными.

FENDERING = СИСТЕМА КРАНЦЕВ – Fendering:- wharf protection by fender (cushion placed between ships or between ship and pier). / Защита причала кранцем (смягчающая подушка между судами или между судном и причалом).

FEND OFF = ОТТАЛКИВАТЬСЯ (или НЕ ДАВАТЬ УДАРЯТЬСЯ) – Fend Off (maritime term):- to push off when making a landing.

FEQ = FORTY–FOOT EQUIVALENT

FERC = FEDERAL ENERGY REGULATORY COMMISSION

FERMENT = ФЕРМЕНТ – Ferment:- (Latin:- Fermentum – Yeast, Fermentation) certain organic substances induce decomposition, particularly fermentation, in other organic substances. The term ‘enzyme’ has generally replaced the term ‘ferment’. See also Enzyme. / Под Ферментами, от Латинского слова Fermentum, означающее Закваска, или Энзимами понимаются биологические катализаторы, присутствующие во всех живых клетках. Осуществляют превращения веществ в организме, направляя и регулируя тем самым его обмен веществ. По химической природе – белки. Ферменты обладают оптимальной активностью при определённом водородном показателе (pH), наличии необходимых коферментов и кофакторов, отсутствии ингибиторов. Каждый вид ферментов катализирует превращение определённых веществ (субстратов), иногда лишь единственного вещества в единственном направлении. Поэтому многочисленные биохимические реакции в клетках осуществляет огромное число различных ферментов. Все ферменты подразделяются на 6 классов:- гидролазы, изомеразы, лиазы, лигазы, оксидоредуктазы и трансферазы. Многие ферменты выделены из живых клеток и получены в кристаллическом виде (впервые в 1926). Ферментные препараты применяют в медицине, в пищевой и лёгкой промышленности.

FERMENTATION = ФЕРМЕНТАЦИЯ (или БРОЖЕНИЕ) – Fermentation is any of the chemical reactions induced by living or nonliving agents that split complex organic compounds into relatively simple substances, e.g., the anaerobic conversion of sugar to carbon dioxide and alcohol by yeast. Fermentation is a biochemical process in which energy is released from carbohydrates by enzymes. Fermentation is the transformation of organic substances by means of enzymes, bacteria, yeasts or fungi. When these microorganisms are optimized through biotechnological processes, fermentation can serve as an alternative to chemical processes that is both efficient and conserves resources. / и в спирт дрожжами. Под Ферментацией, от Латинского слова Fermentum, означающее Закваска, понимается . Под Брожением понимается процесс ферментативного расщепления органических веществ, преимущественно углеводов, протекающий без использования кислорода под действием микроорганизмов или выделенных из них ферментов. Служит источником энергии для жизнедеятельности организмов (микробов) и играет большую роль в круговороте веществ в природе. Некоторые виды брожения, вызываемые микроорганизмами (маслянокислое, молочнокислое, спиртовое, уксуснокислое), используются в производстве глицерина, кефира, этилового спирта и других технических и пищевых продуктов.

FERRET = ФЁРЭ (или ПОДВЕСКА, или ПЛОТНАЯ ТЕСЬМА) – Ferret:- a narrow cotton, silk, or wool tape. / укая хлопковая, шёлковая или шерстяная лента.

FERROGRAPHY = ФЕРРОГРАФИЯ (или МАГНИТОГРАФИЯ) – Ferrography is an analytical method of assessing machine health by quantifying and examining ferrous wear particles suspended in the lubricant or hydraulic fluid. / Феррография – то же, что Магнитография. Под Магнитографией или Феррографией, от Греческих слов Magnētis, означающее Магнит, от словосочетания Magnētis Lithos, означающие буквально Камень Из Магнесии (древний город в Малой Азии), и Gráphō, означающее Пишу или Рисую или Черчу, понимается способ получения на обычной бумаге изображения (букв, цифр и других знаков) с помощью магнитного порошка (как правило, оксида железа), переносимого с промежуточного носителя записи, например, магнитного барабана, на поверхность бумаги (обычно при их соприкосновении). Применяется ограниченно, например, в быстродействующих устройствах вывода информации из электронных вычислительных машин (ЭВМ) и в устройствах копирования документации. Магнитография или Феррография, способ получения на обычной бумаге буквенных, цифровых и других отпечатков при помощи магнитного порошка. Наиболее часто магнитография реализуется по так называемой схеме с промежуточным магнитным носителем. В печатающем устройстве промежуточным носителем служит магнитный барабан, по окружности которого последовательно расположены магнитные записывающие головки, узел проявления, прижимной ролик, узел очистки и стирающая головка. В процессе работы устройства магнитный барабан вращается равномерно; в его магнитном слое образуется скрытое магнитное изображение записываемого знака в виде мозаики из отдельных магнитных отпечатков, созданных соответствующими магнитными головками записи. В узле проявления к намагниченным участкам поверхности барабана притягиваются частицы ферромагнитного порошка, образуя видимое изображение записанных знаков. Соприкасаясь с бумагой, порошок ‘прилипает’ к её поверхности. Полученные таким образом отпечатки закрепляются, в простейшем случае вдавливанием частиц порошка в бумагу при прокатке между валками. Для лучшего сцепления с бумагой ферромагнетик покрывают термопластичной смолой, а валки нагревают. При прокатывании бумаги через валки смола расплавляется и прочно спаивает порошковое изображение с бумагой. Оставшийся на магнитном барабане после переноса изображения на бумагу порошок снимается в узле очистки меховыми щётками и струей воздуха, а скрытое магнитное изображение стирается магнитной головкой – барабан готов к новой записи. Если требуется получить несколько копий, скрытые магнитные изображения знаков не стирают; процесс печати может быть повторен практически неограниченное число раз. Минимальный размер отпечатка знака, получаемый при магнитографии составляет 2–3 мм; скорость печати на устройстве, выполненном по рассмотренной схеме, обычно составляет 6 000 строк/мин, но может быть значительно увеличена. Основное применение магнитографии - печатающие устройства для вывода информации из электронных вычислительных машин (ЭВМ).

FERROLYSIS = ФЕРРОЛИЗ – Ferrolysis is a soil-forming process resulting in acidification and clay destruction due to alternating reduction and oxidation in practically flooded soils. / Ферролиз (элювиально глеевый процесс) – процесс разрушения глинистых силикатов при оглеении с последующим выносом или сегрегацией продуктов разрушения и остаточным накоплением кремнезёма. Конечный результат этого процесса по своей морфологической картине сходен с результатами других элювиальных процессов, однако при этом иеттой типичной мраморизации элювиального горизонта, которая характерна для псевдооглеения, в меньшей степени проявляется и сегрегация железа. Элювиальный горизонт становится однородно окрашенным в сизоватые тона с отдельными редко разбросанными ржавыми пятнами, структура его массивная или глыбистая. В микростроении характерно преобладание отмытых от плёнок кварцевых зёрен, наличие бесформенных сгустков окислов железа или концентрических микроконкреций.

FERROUS, FERRIC = ЖЕЛЕЗИСТОЕ, ЖЕЛЕЗНОЕ – Ferrous, Ferric:- in modern use these are replaced with iron (II) and iron (III) (iron two, iron 3), respectively. See also Iron. / Железистое (Ferrous) – содержащее двухвалентное железо, Железное (Ferric) – содержащее трёхвалентное железо.

FERROUS METALS = ЧЁРНЫЕ МЕТАЛЛЫ (или ЖЕЛЕЗНЫЕ МЕТАЛЛЫ) – Ferrous Metals are metals that contain iron. Ferrous metals include steel, stainless steel, pig iron, iron ore and iron oxide. Iron and steel are used in used in everything from building, ship and bridge construction, to the manufacture of automobiles and appliances. According to the CME®, the iron ore and related ferrous market is the second largest commodity market by volume after crude oil. Iron ore (60% Fe content) swap futures are traded at the NYMEX® and ICE® OTC. Hot-Rolled Coil Steel is traded at the NYMEX®. Steel is traded at the LME. Ferrous Metals:- from 1500 to the XX century, metallurgical development was still largely concerned with improved technology in the manufacture of iron and steel. In England, the gradual exhaustion of timber led first to prohibitions on cutting of wood for charcoal and eventually to the introduction of coke, derived from coal, as a more efficient fuel. Thereafter the iron industry expanded rapidly in Great Britain, which became the

greatest iron producer in the world. The crucible process for making steel, introduced in England in 1740, by which bar iron and added materials were placed in clay crucibles heated by coke fires, resulted in the first reliable steel made by a melting process. One difficulty with the bloomery process for the production of soft bar iron was that, unless the temperature was kept low (and the output therefore small), it was difficult to keep the carbon content low enough so that the metal remained ductile. This difficulty was overcome by melting high-carbon pig iron from the blast furnace in the puddling process, invented in Great Britain in 1784. In it, melting was accomplished by drawing hot gases over a charge of pig iron and iron ore held on the furnace hearth. During its manufacture the product was stirred with iron rabbles (rakes), and, as it became pasty with loss of carbon, it was worked into balls, which were subsequently forged or rolled to a useful shape. The product, which came to be known as Wrought Iron, was low in elements that contributed to the brittleness of pig iron and contained enmeshed slag particles that became elongated fibers when the metal was forged. Later, the use of a rolling mill equipped with grooved rolls to make wrought-iron bars was introduced. The most important development of the XIX century was the large-scale production of cheap steel. Prior to about 1850, the production of wrought iron by puddling and of steel by crucible melting had been conducted in small-scale units without significant mechanization. The first change was the development of the open-hearth furnace by William and Friedrich Siemens in Britain and by Pierre and Émile Martin in France. Employing the regenerative principle, in which outgoing combusted gases are used to heat the next cycle of fuel gas and air, this enabled high temperatures to be achieved while saving on fuel. Pig iron could then be taken through to molten iron or low-carbon steel without solidification, scrap could be added and melted, and iron ore could be melted into the slag above the metal to give a relatively rapid oxidation of carbon and silicon – all on a much enlarged scale. Another major advance was Henry Bessemer's process, patented in 1855 and first operated in 1856, in which air was blown through molten pig iron from tuyeres set into the bottom of a pear-shaped vessel called a Converter. Heat released by the oxidation of dissolved silicon, manganese, and carbon was enough to raise the temperature above the melting point of the refined metal (which rose as the carbon content was lowered) and thereby maintain it in the liquid state. Very soon Bessemer had tilting converters producing 5 tons in a heat of one hour, compared with four to six hours for 50 kilograms (110 pounds) of crucible steel and two hours for 250 kilograms of puddled iron. Neither the open-hearth furnace nor the Bessemer converter could remove phosphorus from the metal, so that low-phosphorus raw materials had to be used. This restricted their use from areas where phosphoric ores, such as those of the Minette range in Lorraine, were a main European source of iron. The problem was solved by Sidney Gilchrist Thomas, who demonstrated in 1876 that a basic furnace lining consisting of calcined dolomite, instead of an acidic lining of siliceous materials, made it possible to use a high-lime slag to dissolve the phosphates formed by the oxidation of phosphorus in the pig iron. This principle was eventually applied to both open-hearth furnaces and Bessemer converters. As steel was now available at a fraction of its former cost, it saw an enormously increased use for engineering and construction. Soon after the end of the century it replaced wrought iron in virtually every field. Then, with the availability of electric power, electric-arc furnaces were introduced for making special and high-alloy steels. The next significant stage was the introduction of cheap oxygen, made possible by the invention of the Linde-Frankel cycle for the liquefaction and fractional distillation of air. The Linz-Donawitz process, invented in Austria shortly after World War II, used oxygen supplied as a gas from a tonnage oxygen plant, blowing it at supersonic velocity into the top of the molten iron in a converter vessel. As the ultimate development of the Bessemer/Thomas process, oxygen blowing became universally employed in bulk steel production. / НАЙМЭКС® (NYMEX®). Вильэм (William) и Фридрик Симэнз (Friedrich Siemens) в Британии и Пьер (Pierre) и Эмиль Марта (Émile Martin) во Франции. Хэнри Бэсэмё (Henry Bessemer). Минет (Minette). Сидни Гилкрист Томэс (Sidney Gilchrist Thomas). Линд-Фрэнькэл (Linde-Frankel). Линц-Донавиц (Linz-Donawitz). Дробная Перегонка или Фракционная Перегонка (Fractional Distillation). прокатка (rolling). волочение или протяжка или раскатка или вытяжка (drawing). в Лоррэн (Лотарингское; Lorraine). Под Чёрными Металлами понимается промышленное название железа и его сплавов; наиболее распространены железные сплавы, содержащие углерод, – сталь и чугун, а также ферросплавы. Все металлы и сплавы делят на чёрные (к ним относят железо и сплавы на его основе; на их долю приходится около 95% производимой в мире металлопродукции) и цветные, или, точнее, нежелезные (все остальные металлы и сплавы).

FERRY = ПАРОМ – Ferries are vessels of any size that carry passengers and (in many cases) their vehicles on fixed routes over short cross-water passages. The building of massive bridges and tunnels has eliminated many ferry services, but they are still justified where waters are too formidable for fixed crossings. Vessels vary greatly in size and in quality of accommodations. Some on longer runs offer overnight cabins and even come close to equaling the accommodation standards of cruise ships. All vessels typically load vehicles aboard one or more decks via low-level side doors or by stern or bow ramps much like those found on roll-on/roll-off cargo ships. A special type of ferry is the 'double-ender', built for shuttling across harbour waters. The typical vessel has propellers, rudders, control stations, and loading ramps at both ends. It is usually wide enough to handle four vehicle lanes abreast and may accommodate up to 100 four-wheeled vehicles. Special docks, fitted with adjustable ramps to cope with changes in water levels and shaped to fit the ends of the ferry, are always part of a ferry system of this type. Another special type of ferry is a high-speed vessel that in many cases is of catamaran (twin-hulled) design. This type is typically found on short runs in protected waters where the carriage of vehicles is not required. Catamaran hulls can be narrow and knifelike in shape, allowing them to operate at high speed-to-length ratios without excessive propulsive power. The engines are usually high-speed diesels, although turbine engines have been fitted in a few instances. / Под Паромом понимается судно для перевозки сухопутных транспортных средств (автомобилей, железнодорожных вагонов), грузов и пассажиров через водные преграды (проливы, реки, озёра) между определёнными береговыми пунктами. Паромы бывают самоходными и несамоходными. По назначению подразделяются на автомобильно-пассажирские, железнодорожные и универсальные. Различают паромы для местных линий небольшой протяжённости и трансокеанские. Последние имеют большое сходство с пассажирскими судами, отличаясь от них наличием гаражных помещений для транспорта в средней части. Водоизмещение некоторых паромов превышает 20 000 тонн, грузовместимость свыше 100 железнодорожных вагонов, пассажировместимость до 2 000 человек. Паромное сообщение наиболее развито в Японии и странах Западной Европы. В Ла Манше (Английском Канале) в качестве парома используются суда на воздушной подушке.

FERTILE = ФЕРТИЛЬНОЕ (или ПЛОДОРОДНОЕ, или ПЛОДОВИТОЕ, или СПОСОБНОЕ К ЗАЧАТИЮ) – Fertile is a plant with functional reproductive organs, producing pollen capable of fertilization and seeds or spores capable of germination. Fertile:- (1) Land that has enough nutrients to support abundant plant growth. (2) Plants that are reproductive and can produce fruits, seeds, spores or pollen grains. / и семян или спор, способных к зарождению. , споры или . Под Фертильным, от Латинского слова Fertilis, означающее Плодородный, понимается .

FERTILITY = ПЛОДОРОДИЕ (или ФЕРТИЛЬНОСТЬ) – Fertility (soil) is the status of a soil with respect to its ability to supply nutrients essential to plant growth. / Под Плодородием почвы понимается совокупность свойств почвы (содержание гумуса, доступных для растений питательных веществ, влаги и другого), обеспечивающая урожай сельскохозяйственных растений. Различают потенциальное (естественное) и эффективное (приобретённое под влиянием обработки, удобрений, мелиорации и тому подобного) плодородие почвы. При правильном использовании почвы её плодородие повышается.

FERTILITY = ФЕРТИЛЬНОСТЬ (или ПЛОДОВИТОСТЬ) – Fertility (genetics) is the ability to produce viable offspring. / Под Фертильностью понимается, от Латинского слова Fertilis, означающее Плодородный, понимается способность зрелого

организма производить потомство. Сравните со Стерильностью. Под Плодовитостью понимается половая продуктивность самок животных. Плодовитость у разных групп животных очень различается. У млекопитающих плодовитость колеблется от 1–2 детёнышей (часто не каждый год) до 10–15 (обычно несколько раз в год). Некоторые насекомые откладывают до нескольких сотен яиц, Луна-рыба – до 300 миллионов икринок. Повышение плодовитости сельскохозяйственных животных – одна из основных проблем животноводства.

FERTILITY CAPABILITY CLASSIFICATION = КЛАССИФИКАЦИЯ ВОЗМОЖНОСТИ ПЛОДОРОДИЯ – Fertility Capability Classification (FCC) is a classification based on quantitative topsoil and subsoil parameters directly relevant to plant growth; various soil condition 'modifiers' define specific types of soil adversity or complexes of edaphic problems.

FERTILIZATION = ОПЛОДОТВОРЕНИЕ – Fertilization (genetics) is a fusion of the nuclei of male and female gametes. The union of the pollen (male) and the egg (female) initiating reproduction. / Под Оплодотворением или Сингамией понимается слияние мужских и женских половых клеток (гамет) у растений, животных и человека, в результате чего образуется зигота, способная развиваться в новый организм. Оплодотворение лежит в основе полового размножения и обеспечивает передачу наследственных признаков от родителей потомкам.

FERTILIZATION = УДОБРЕНИЕ – Fertilization (soil) is a making soil fertile with the application of fertilizer.

FERTILIZER = УДОБРЕНИЯ (или ТУКИ) – Fertilizer is materials such as nitrogen and phosphorus that provide nutrition for plants. Commercial products may contain other chemicals or be in the form of processed sewage sludge or animal waste. Any substance or combination of substances used principally as a source of plant food or soil amendment. Fertilizer is a mix of essential nutrients supplied to plants to improve their growth or to correct a specific deficiency. For commercial fertilizers the proportions of Nitrogen : Phosphorous : Potassium are marked on the package as N:P:K ratios. Fertilizer is any substance added to the soil to supplement elements required in the nutrition of plants. / Под Удобрениями или Туками (от туки) понимаются органические и минеральные вещества, содержащие элементы питания растений. Удобрения вносят в почву, их раствором опрыскивают растения, обрабатывают семена. При правильном применении улучшают питательный, водный, воздушный и тепловой режимы почвы, её агрономические свойства, повышают урожай и его качество. План использования органических удобрений и минеральных удобрений, то есть система удобрений, состоит из основного (вносят под вспашку, обычно осенью), предпосевного (перед посевом под культивацию) и припосевного (вместе с семенами в борозды или лунки) удобрения, подкормок.

FERTILIZER BURN = ОЖОГ УДОБРЕНИЯМИ – Fertilizer Burn:- Cotton root tips may die back when fertilizer is placed beneath the planting line or too close to the soil surface. Symptoms occur at a consistent depth on the roots. Severity is increased by dry conditions between fertilizer application and planting. Root tips are 'pinched off' and sometimes blackened. All roots of affected plants are affected at the same level. If a particular row, or rows, are infected in each set across the field then a problem with the fertilizer rig is implied. Fertilizer burn occurs when either solid or liquid fertilizer is placed too close to, or directly under, the planting line. Very dry soil conditions between fertilizer application and planting may exacerbate the problem.

FERTILIZER GRADE = СОРТ УДОБРЕНИЯ – Fertilizer Grade:- the guaranteed minimum analysis of the major plant nutrient elements contained in a fertilizer material. It is expressed in percentage of N, P_2O_5, and K_2O.

FERTILIZER PELLETS = УДОБРЕНИЯ В ГРАНУЛАХ – Fertilizer Pellets are pellitized plant nutrients which are typically small, hard and either round and white, or irregular-shaped and pink or red. Fertilizer pellets are not considered a hazardous substance however there is no visible means of assuring that material resembling fertilizer pellets is not some other contaminant. Refer to the specific grain chapter for assessment procedures.

FERTILIZER RATION = РАЦИОН УДОБРЕНИЯ – Fertilizer Ration is the relative amount of N, P_2O_5, and K_2O in a fertilizer grade.

FERTILIZER REQUIREMENT = ПОТРЕБНОСТЬ В УДОБРЕНИЯХ – Fertilizer Requirement is the quantity of certain plant nutrient elements needed, in addition to the amount supplied by the soil, to increase plant growth to a designated level.

FERTILIZER RESPONSE FUNCTION = ФУНКЦИЯ ОТЗЫВЧИВОСТИ НА УДОБРЕНИЯ – Fertilizer Response Function is a function that relates yield (output per hectare) to the amount of fertilizer used (input per hectare), holding all other inputs constant.

FERTILIZER RESPONSIVENESS = РЕАКТИВНОСТЬ УДОБРЕНИЯ – Fertilizer Responsiveness is the ability of the plant to utilize the applied fertilizer.

FESTOON = ФЕСТОН (или ГИРЛЯНДА) – Festoon is a decorative cord accented by tassels. It forms a decoration for the edge of such items as table cloths.

FESTOON DRYER = ФЕСТОННАЯ СУШИЛКА (или ФЕСТОННАЯ СУШИЛЬНЯ) – Festoon Dryer is a dryer in which cloth is suspended in loops over a series of supporting horizontal poles and carried through the heated chamber in this configuration.

FET = FEDERAL EXCISE TAX

FET = FOREIGN ECONOMIC TRENDS

FEU = FORTY–FOOT EQUIVALENT UNIT

FEZ = ФЕСКА – Fez:- a brimless cone-shaped flat-crowned hat that usually has a tassel, is usually made of red felt, and is worn especially by men in eastern Mediterranean countries.

FIAT CURRENCY = ДЕКРЕТИРОВАННАЯ ВАЛЮТА (или САНКЦИОНИРОВАННАЯ ВАЛЮТА) – Fiat Currency is a term that is used to describe a currency which is created by 'fiat' or 'arbitrary order or decree' of the government. It is not created by the free market or backed by anything like gold, silver or real estate. It is essentially an 'IOU- nothing'. A lot of people do not realize that every currency in the world today is considered to be a fiat currency. (Although the Chinese may be working on creating a gold backed currency and several OPEC countries have considered it as well). The US Dollar, the Euro, the Great Britain Pound, the Japanese Yen, and the Australian Dollar are all fiat currencies, to name a few. Since everyone uses this type of currency, why is it such a big deal? Why It's Important:- When you stop and think about the idea of fiat currency, you can see that there would be a few potential issues that could lead to problems. With a fiat currency, someone in charge is essentially going to say that they want to create a certain amount of money. There's nothing backing the currency, other than the government's credit. With this type of system, someone is going to be given a lot of power to basically create money out of thin air. With the current system, the central banks have the power to do this. How does the system determine how much money is going to be created, and when will it be produced, is there any checks and balances in the system? Another issue with fiat currencies is that it is difficult to determine which currency is worth more than another one. Since all of the fiat currencies are created out of nothing, how can you figure out which currency is worth the most? Currently it is handled by currency traders through an open auction system, similar to how a stock is valued. Primarily, the value of the currency can be determined by the strength of the economy, but in the short run many other variables go into determining the value. Factors like retail sales, new home sales, non-farm payroll, and the sentiment of traders in the market can all have a short-term effect on the value of the currency. You would think countries would want their currency to be more valuable, but often countries adjust their money supply in an effort to drive the value of their currency down, so that their exports will be cheaper than other countries and thus they will have 'full employment'. Unfortunately, there is a flip side to this in that their imports will be more expensive. Other reasons they may increase the money supply is to 'stimulate' the economy or pay for debts the government afford to finance via taxes. With all of these potential issues, it is easy to see why there are lot of skeptical people when it comes to the fiat currency system that we currently have. How Did We Get Here:- So how exactly did we get wrapped up in this fiat currency system? It really all started back in 1913, when Congress passed the Federal Reserve Act. This created the Federal Reserve system in the United States, which is the central bank of the country. At that time, the United States Dollar was backed by gold. In 1944, many of the major countries of the world gathered for a meeting known as the Bretton Woods conference. They set up the International Monetary Fund and created some rules for the global financial system. This meant that other countries would peg their currencies to the US Dollar, and would buy and sell US Dollars to keep market exchange rates within plus or minus 1% of parity. Thus, the US Dollar took over the role that gold had played under the gold standard in the international financial system. But this gave the US an ability that no other country had, i.e. the ability to inflate their currency. The US inflated their Dollars and because of the peg to the Dollar basically the other countries got the inflation. Obviously, the other countries didn't appreciate this. By 1965 this became apparent as the free market value of gold was worth more than USD35 an ounce. Then in 1971, Richard Nixon officially took the US off of the gold standard by canceling a policy that allowed other countries to convert Dollars into gold. At that point, the US Dollar officially became a fiat currency.

FIAT PAPER MONEY = ДЕКРЕТИРОВАННЫЕ БУМАЖНЫЕ ДЕНЬГИ (или САНКЦИОНИРОВАННЫЕ БУМАЖНЫЕ ДЕНЬГИ) – Fiat Paper Money is the paper currency that has value because the government has decreed that it is a 'legal tender' for making tax payments and often for discharging other debts and payments as well. Fiat money does not represent a claim on some other form of money or commodity such as gold and silver. Also known as Fiat Currency. Paper money that a government decrees is legal tender. Fiat Money is a form of money that has no intrinsic value. Its value as money is based on faith in the government that issues it. This faith comes from the general understanding that the government will not create too much money nor too little. Fiat money is not backed by any commodity and therefore has no value in use other than its use as money. The name comes from the Latin word Fiat, meaning By Decree. Fiat money has value as legal tender simply because the government decrees it does. Most countries today have fiat based monetary systems. Fiat based monetary systems traditionally begin as commodity based monetary systems. Commodity money has both monetary and nonmonetary uses, e.g., gold, silver, beads, shells, tobacco, etc. Commodity money serves well as money as long as the commodity is more valuable as money than it is in its nonmonetary use. In an effort to protect or store these commodities, 'representative money' (e.g., coins and paper) is issued that can be traded and easily converted into this commodity. When demand and supply conditions of the commodity or of the representative money change so that it is no longer easily converted, the representative money is either devalued or it transitions to fiat money. In order for an object with no intrinsic value to become acceptable for use as money, certain network effects must be overcome. In other words, why do people trust it as money? An individual will only accept fiat money if he or she knows that others will accept it as money as well. This acceptance can come through government decree right away, or it can arise gradually through a system of representative money and/or fractional reserve banking. Monetary systems based on fiat money have often historically come into existence during times of war. This happens when the

expense of war exceeds the available government stock of the commodity being used as money or backing representative money. Representative money fails and governments issue fiat money to pay the expenses or debt of war. Often in these instances, governments issue too much fiat money leading to periods of high inflation. During these periods, fiat money loses its ability to serve as a store of value. Examples go back in history, such as the siege of Faenza in 1241, the cases of Germany during the Thirty Years War (beginning in 1618) and later World War I, and, even more recently, in Iraq following the 1991 Gulf War. In extreme cases, the paper it is printed on becomes more valuable as a source of fuel for generating heat than as money. Fiat money can also evolve as part of a fractional reserve banking system. Fractional reserve banking came into existence when banks (or goldsmiths) would accept deposits in gold and issue paper notes in exchange. Patrons could redeem these notes for gold at any time. Rather than conduct transactions in gold, they began conducting transactions in notes which were lighter in weight and readily accepted. Because people would occasionally exchange notes for gold, bankers would keep a fraction of the gold in the vaults to meet daily withdrawals. They would loan out the rest, thereby creating money through issuing more notes than they kept in gold to back it up. This system works as long as not everyone wants their gold at once. Modern fiat systems today work in much this same manner except that notes are no longer convertible to gold and are instead backed by trust in the government that they will always have value. To maintain this trust, governments must exercise restraint in their willingness to create and destroy money. Much of the Western world today converted to fiat monetary systems when the United States officially severed all ties of its currency to gold with the abolishment of the Bretton Woods system in 1971. Major Western countries had tied the value of their currencies to the US Dollar, which was convertible to gold. When there were many more reserves held in Dollars than the United States could possibly redeem in gold, it was eventually forced to abandon the gold exchange system, effectively creating a worldwide fiat system. Paper money backed only by the issuing government's decree. The value of fiat money stems from public confidence, rather than its convertibility into gold or other hard currency. / Бумажные деньги . бисеринки или бусинки (beads).

FIBC = FLEXIBLE INTERMEDIATE BULK CONTAINER

FIBER = ВОЛОКНО – (1) Fiber or Fibre is a morphological term for substances characterised by their flexibility, fineness and high ratio of length to cross sectional area. Fiber:- a slender strand of natural or manmade material usually having a length at least 100 times its diameter and characterized by flexibility, cohesiveness, and strength. Several strands may be combined for spinning, weaving, and knitting purposes. Cotton fibers are known as Staple Fibers since their length varies within a relatively narrow range from about 7/8 inch to 1-3/4 inches. Manmade fiber filaments are often cut to blend or mix with cotton for further processing on the cotton system. Filaments used as raw material for textile fabrics, are divided (i) animal fibers, as hair, silk, and wool; (ii) vegetable fibers, as cotton, hemp, jute, linen, ramie, etc; (iii) mineral fibers, as asbestos; and (iv) artificial fibers, as glass, metal threads, various artificial silks, etc. Fiber:- an individual strand, sometimes referred to as a Filament. It is a slender, fine-diameter, single strand. Several fibers, however, may be combined to make them ready for spinning, weaving, and knitting purposes. A fiber usually has a rather definite set length. Also known as Fibre in the United Kingdom. There are two types of fibers:- lint and linters. A cotton Fiber is classified in four ways, by its length, micronaire, strength and uniformity. The fiber typically accounts for approximately 35% of the weight of a seed cotton, though this proportion varies. See also Length, Micronaire, Strength and Uniformity. Fiber is the fundamental component used in making textile yarns and fabrics. Fibers are fine substances with a high ratio of length to thickness. They can be either natural or synthetic (man-made). Natural fibers are of animal origin (wool, mohair, etc) or vegetable origin (cotton, linen, etc) or mineral origin (asbestos). Synthetic fibers are produced from naturally occurring material, mainly wood pulp or cotton lint, and the most commonly used example of this form of fiber is rayon. Manmade fibers are produced directly by the polymerization of synthetic chemicals at present obtained as by-products of the petro-chemical industry:- typical examples are nylon and polyester. Fiber is the basic entity, either natural or manufactured, which is twisted into yarns, and then used in the production of a fabric. Fiber is a unit of matter, either natural or manufactured, that forms the basic element of fabrics and other textile structures. A fiber is characterized by having a length at least 100 times its diameter or width. The term refers to units that can be spun into a yarn or made into a fabric by various methods including weaving, knitting, braiding, felting, and twisting. The essential requirements for fibers to be spun into yarn include a length of at least 5 millimeters, flexibility, cohesiveness, and sufficient strength. Other important properties include elasticity, fineness, uniformity, durability, and luster. See also Manufactured Fiber, and Natural Fiber. Fiber is the basic unit used in the fabrication of textile yarns and fabrics. Fibers are much longer than they are wide. The term at one time was limited to materials that could be spun into yarn, but now is used to include filaments that do not require spinning, such as silk and man-made fibers. / Найлан (Nylon). подразделяются на (i) ; (ii) такие как, джут, льняное волокно, пенька (конопля), рами, хлопковое волокно и других; (iii) ; и (iv) искусственные волокна, такие как стекло (стеклянные волокна или стекловолокна), металлизированные/металлические нити, различные виды искусственного шёлка и так далее. . Хлопковое Волокно классифицируется по четырём параметрам:- по его длине, показателям майкронэйр, прочности и однородности. Как правило, волокно составляет примерно 35% в хлопке-сырце, хотя эта пропорция непостоянная. Смотрите также Длина (Length), Майкронэйр (Micronaire), Крепость (Strength) и Однородность (Uniformity). Текстильное Волокно – протяжённое тело, характеризующееся своей гибкостью, тониной и пригодное для изготовления нитей и текстильных изделий. Под текстильными Волокнами понимаются натуральные волокна, протяжённые гибкие и прочные тела с очень малыми поперечными размерами, ограниченной длиной, пригодные для изготовления пряжи и текстильных изделий. Текстильные волокна, не делящиеся в продольном направлении, называются Элементарными Волокнами, а состоящие из нескольких элементарных, скреплённых продольно, – Техническими или Комплексными Волокнами. Элементарные текстильные волокна значительной длины называются Элементарными Нитями. Почти все текстильные волокна состоят из высокомолекулярных веществ. Характерная особенность строения текстильных волокон – наличие продольных структурных элементов – фибрилл, слоёв. Некоторые текстильные волокна имеют каналы, бывают извиты или скручены. Наряду с Натуральными Текстильными Волокнами, образующимися в природе в различных частях растений, на коже животных, в минералах и так далее, широко применяют Химические Текстильные Волокна, изготовляемые заводским путём. Основная масса текстильных волокон перерабатывается в пряжу, из которой изготовляют ткани, трикотаж, кручёные, галантерейные и другие текстильные изделия. Непосредственно из текстильных волокон вырабатывают валяльно-войлочные, ватные и значительную часть нетканых изделий. Натуральные текстильные волокна используют в чистом виде, а также в смесях (например, шерсть-хлопок), чаще всего со штапельными волокнами. Смешивание улучшает качество (совмещаются различные ценные свойства компонентов), удешевляет производство, позволяет получать разнообразные внешние эффекты. Мировое производство текстильных волокон в 1968/69 составляло 25.1 миллиона тонн, из которых львиную долю занимал хлопок – 11.6 миллиона тонн (или 46.2% от общего объёма), и далее по мере убывания объёма – синтетические нити и штапельное волокно – 3.76 миллиона тонн (или 15.0%), джут – 2.74 миллиона тонн (или 10.9%), искусственное штапельное волокно – 2.16 миллиона тонн (или 8.6%), мытая шерсть – 1.61 миллиона тонн (или 6.4%), искусственные нити – 1.42 миллиона тонн (или 5.6%), пенька и другие грубые лубяные волокна – 1.10 миллиона тонн (или 4.4%), и лён – 0.67 миллиона тонн (или 2.7%). Под текстильным Волокном понимается протяжённое тело, гибкое и прочное, с малым поперечными размерами, ограниченной длины, пригодное для изготовления пряжи и текстильных изделий. Под текстильным Волокном понимается гибкое и прочное протяжённое тело ограниченной длины с малыми поперечными

размерами. Применяется для изготовления пряжи и текстильных изделий. Основное сырьё текстильного производства. Различают:- (i) натуральные (природные) волокна растительного (джут, лён, хлопок и другие), животного (шерсть, шёлк), минерального (асбест) происхождения; и (ii) химические волокна, подразделяемые соответственно на искусственные и синтетические. Искусственные волокна получают из органических природных высокомолекулярных соединений – целлюлозы, вырабатываемой из древесины или отходов хлопкового производства, из белков растительного и животного происхождения, например зеина, казеина. Синтетические волокна изготовляют из синтетических полимеров:- полиакрилонитрила, полиамидов, поливинилового спирта, поливинилхлорида, полиолефинов, полиуретанов, полиэтилентерефталата и другого. Химические волокна используются в виде элементарных и комплексных нитей, а также в резаном виде для получения пряжи. Волокнистая продукция, полученная в результате джинирования хлопка-сырца. Поперечное сечение природного волокна зависит в основном от его природы и зрелости. Так, незрелое хлопковое волокно имеет форму овала, а зрелое – боба. В силу специфики произрастания (природные) или производства (химические) волокна имеют структурную неоднородность по сечению волокна, что выражается наличием слоев структуры с разной степенью ориентации и плотности упаковки макромолекул. Так, хлопковое волокно имеет отличные друг от друга первичную и вторичную стенки волокна, шерстяное – чешуйчатый и корковый слой и так далее. Внутренняя поверхность волокна (пористость) имеет огромное влияние на его диффузионную проницаемость и сорбционную способность. Наибольшую внутреннюю поверхность имеют натуральные и искусственные волокна. Неразвитая внутренняя поверхность синтетических волокон является причиной их низкой диффузионной проницаемости. Поэтому обработка таких материалов в отделочном производстве ведется при высоких температурах, превышающих температуру стеклования волокна. В этом случае возникает свободный объем, через который и обеспечивается диффузия в волокно красителей и других отделочных препаратов.

(2) Fiber is a long narrow, tapering wood cell closed at both ends.

FIBER ARCHITECTURE = АРХИТЕКТУРА ВОЛОКОН – Fiber Architecture is the spatial arrangement of fibers in the preform. Each architecture has a definite repeating unit.

FIBER BLENDS DYEING = КРАШЕНИЕ СМЕСЕЙ ВОЛОКОН – Fiber Blends Dyeing:- natural/synthetic fiber blends are becoming more and more important in the textile industry because this allows combining the favourable technological properties of synthetic fibers with the pleasant feel of natural fibers. Of the worldwide consumption of polyester (PES) fibers, 55–60% is used in blends with cellulose fibers or wool. About 40% of polyamide is used in blends, while 50% of polyacrylic fibers is used especially in blends with wool for knitwear. Fiber blends can be produced according to three different methods:- (i) fibers of different types in the form of staple fibers are mixed at the yarn manufacturing stage, during spinning; (ii) fibers of different types are separately spun and the resulting yarns are wound together to give a mixed yarn; and (iii) fibers of different types are separately spun and combined together only at the weaving stage where one or more fiber yarns are used as warp and the other ones as weft. Dyeing of blend fibers is always longer and more difficult as an operation compared to pure fiber dyeing. Despite these disadvantages, dyeing tends to be placed as close as possible towards the end of the finishing process. In fact this enables the dyer to satisfy the requests of the market without the need to store large amounts of material already dyed in flock or yarn form in all available shades. When dyeing blend fibers, the following methods can be applied:- (i) the two fibers are dyed in the same tone (‘tone on tone’) or in two different shades using the same dyes; (ii) only one fiber is dyed (the colorant is not absorbed by the other ones); and (iii) the different fibers are dyed in different tones. For ‘tone on tone’ dyeing, it is sometimes possible to use the same dye for the different fibers. When dyes of different classes have to be employed, the dyeing process is easier to control when the selected colorants have affinity only for one fiber and not for the other one. In reality, however, this situation is exceptional and the dyeing of fiber blends remains a complex operation. Blend fibers dyeing can be done in batch, semi-continuous and continuous processes. Batch processes include:- (i) dyeing in one bath and one step (all dyes are added in the same bath in one single step); (ii) dyeing in one bath and in two steps (dyes are added to the same bath in subsequent steps); and (iii) dyeing in two baths (dyes are applied in two steps in two different baths).

FIBERBOARD = ВОЛОКНИСТАЯ ПЛИТА – Fiberboard is a broad term including materials of widely varying densities manufactured by pressing wood fibers into panels sometimes used for sheathing. / Волокнистая Плита – достаточно широкий термин, включающий в себя материалы со значительно изменяющимися плотностями, изготовленные посредством прессовки древесных волокон в панели, используемые иногда для обшивки.

FIBER CONTAMINATION = ЗАСОРЁННОСТЬ ВОЛОКНА (или КОНТАМИНАЦИЯ ВОЛОКНА) – Fiber Contamination is caused either during running of the material on m/c or at the time of material/shade change on m/c, too many shades of same count running on same m/c, no separation of dark or light shades during running on same m/c, wrong Planning of A/C in the department, i.e. Supply Duct and Return Duct are on the top of the m/c in the ceiling or contamination already present in the raw material like poly propylene because of packing materials, raw material, i.e. wool containing vegetable matters etc. In this case, nothing can be done except to remove during Mending. / Под Контаминацией, от Латинского слова Contaminatio, означающее Смешение или Соприкосновение, понимается .

FIBER DIGITAL DATA INTERFACE = ВОЛОКОННЫЙ ИНТЕРФЕЙС ЦИФРОВЫХ ДАННЫХ – Fiber Digital Data Interface:- trading floor network connecting all trading floor terminals.

FIBER DISTRIBUTION = РАСПРЕДЕЛЕНИЕ ВОЛОКОН – Fiber Distribution:- in a web, the orientation (random or parallel) of fibers and the uniformity of their arrangement.

FIBER DRUM = ВОЛОКОННЫЙ БАРАБАН (или ЦИЛИНДР, или БОЧКА, или ЦИСТЕРНА) – The Fiber Drum is the cylindrical transport container (similar to a large can or a barrel). It is made of wound kraft paper and has a sheet steel base and lid. It is generally sealed by means of closing rings and a locking lever.

FIBER DUST = ВОЛОКОННАЯ ПЫЛЬ – Fiber Dust:- xxxxx. See also Dust. Fibre Dust:- crop fertilizers and soil amendments.

FIBERFILL = ВОЛОКОННЫЙ НАПОЛНИТЕЛЬ – Fiberfill:- manufactured fibers that have been specially engineered for use as filling material for pillows, mattress pads, comforters, sleeping bags, quilted outerwear, etc. Polyester fibers are widely used. Fiberfill:- specially engineered manufactured fibers, which are used as filler material in pillows, mattresses, mattress pads, sleeping bags, comforters, quilts, and outerwear.

FIBER FINENESS = ТОНИНА ВОЛОКНА – Fiber Fineness is the mean fiber diameter which is usually expresses in microns. / Под Тониной Волокна понимается средний диаметр волокна, выражаемый обычно в микронах.

FIBER FLY = ФИБРО ПУХ – Fiber Fly is airborne fibers or parts of fibers (light enough to fly), visible as fibers to the human eye.

FIBERGLASS = ВОЛОКНИСТОЕ СТЕКЛО (или ВОЛОКОННОЕ СТЕКЛО) – Fiberglass is glass in fiber form. All forms of glass fibers begin with similar manufacturing processes. The various ingredients are mixed in a batch to make a specific formulation and then

high temperatures convert the mix into molten glass. Continuous filaments are attenuated (drawn or pulled rapidly) from the molten glass through a precision multihole spinneret. A yarn strand is produced by combining many individual continuous filaments (from 51 to 1 632) Immediately after drawing filaments are coated with an organic binder to protect them from damage during handling, processing and weaving. Glass fibers are made from different formulations:- 'E' being the most common all-purpose glass, while 'S', 'T', 'L' and others are made for special applications. Astroquartz® (a trade mark registered by JPS Industries Inc., Anderson, State of South Carolina (SC), the United States) II and III quartz fiber products are the purest form of silica. The chemical composition of the most common glass formulations is shown as follows:- Composition of Typical Glasses, (%) by weight (Ingredient – 'E' Glass – 'S', 'T' Glass – 'Astroquartz® II & III'):- (i) Silicon Dioxide – 52–60 – 64–66 – 99.99; (ii) Calcium Oxide – 16–25 – 0 – 0; (iii) Aluminum Oxide – 12–16 – 24–26 – 0; (iv) Boron Oxide – 8–13 – 0 – 0; (v) Sodium and Potassium Oxide – 0–1 – 0 – 0; and (vi) Magnesium Oxide – 0–6 – 9–11 – 0. An exact system for identifying fiberglass textile yarns is required because of the wide variety of types which are produced. The nomenclature is used for filament and yarn identification consists of two basic parts - one alphabetical, to describe the composition and construction, and the other numerical, to describe the weight and number of yarns twisted and plied together. A typical example and the of its letters and numerals follow:- Glass Composition (E = Electrical, and S = High Strength), Type Of Yarn (C = Continuous Filament), Diameter (G), Strand Count (yardage/lb (in hundreds)), Filament Yarns/Number Of Strands Plied Together, for example, ECG 150 1/2. As shown, the letters describe the basic strand by composition, type and diameter. Numbers identify strand weight and yarn construction. The above description would be for ECG 150 1/2 yarn, or more simple G-150 1/2, used in style 1581 fabric. The S-glass equivalent used in style 6781 fabric would be SCG 150 1/2, where 'S' denotes S-glass. The strand count is the first series of numbers following the letters and indicates approximate yardage per pound, in hundreds (i.e. to compute the number of yards in a pound of strand, multiply the strand count by 100). The second series of numbers designates the number of plies in continuous filament yarns. The first digit indicates the number of single strands twisted together (untwisted single strands are commonly referred to as 'singles' yarn and are designated as 1/0). The second digit, separated from the first digit by a diagonal line, designates the number of strands that are plied together. To find the total number of strands, multiply the two numbers (0 multiplied as 1). A typical nomenclature for a continuous yarn:- ECG 150-1/2; where:- E = E-glass, C = continuous filament, G = average filament diameter, 150 = 15 000 yd/lb (Nominal) of basic strand, and 1/2 = one continuous filament yarn strand consisting of two strands plied together (1X2). Approximate yards per pound of fabricated yarn can be computed by dividing the strand count, multiplied by 100, by the number of strands. Therefore:- (150 x 100) / (1 x 2) = 7 500 yds/lb for fabricated yarn. The results of this computation must always be considered approximate because yards per pound are reduced slightly in the twisting and plying operations. Description Of Continuous Filament Glass Fibers (Filament Designation – Strand Count (x 100 = yd/lb) – Nominal Filament Diameter (in) – Number Of Filaments):- (i) B – 150 – 0.000 15 – 1 224; (ii) C – 150 – 0.000 15 – 816; (iii) D:- (a) 1 800 – 0.000 23 – 51, (b) 900 – 0.000 23 – 102, (c) 450 – 0.000 23 – 204, and (d) 225 – 0.000 23 – 408; (iv) DE:- (a) 150 – 0.000 25 – 408, (b) 75 – 0.000 25 – 816, (c) 50 – 0.000 25 – 1 632, and (d) 37 – 0.000 25 – 1 632; (v) E – 225 – 0.000 29 – 204; (vi) G:- (a) 150 – 0.00036 – 204, (b) 75 – 0.000 36 – 408, and (c) 37 – 0.000 36 – 816; (vii) H – 25 – 0.000 43 – 816; and (viii) K:- (a) 75 – 0.000 51 – 204, (b) 37 – 0.000 51 – 408, (c) 25 – 0.000 51 – 608, and (d) 18 – 0.000 51 – 816. See also E-Glass Fiber, Glass Fiber, and S-Glass Fiber. / Эстроквотц® (или Астрокварц®; Astroquartz®) (товарный знак, зарегистрированный компанией Дьжей.Пи.Эс. Индэстриз Инк. (JPS Industries Inc.), Андерсон, Штат Южная Каролина (SC), Соединённые Штаты Америки).

FIBER GREASE = ВОЛОКОННАЯ ПЛАСТИЧНАЯ СМАЗКА (или КОНСИСТЕНТНАЯ СМАЗКА ВОЛОКНИСТОЙ СТРУКТУРЫ) – Fiber Grease is a grease with a distinctly fibrous structure, which is noticeable when portions of the grease are pulled apart. See also Grease.

FIBER LENGTH = ДЛИНА ВОЛОКНА – Fiber Length is the staple length of the fiber. On combing wools, this is often 3–8 inches, on the down wools 1.5–3 inches. With Cotton, it may be 1/4–1 inch long. Bast fibers, likes flax, may have a staple length of 36 inches. See also Mean Length, and Nominal Length. Fiber Length is the length of cotton fiber is an important indicator of spinnability, physically, the individual cotton fibers consist of a single long tubular cell. Its length is about 1 200–1 500 times than its breadth. Length of cotton fiber varies from 16 mm to 52 mm depending upon the type of cotton.

FIBER MIGRATION = МИГРАЦИЯ ВОЛОКНА – Fiber Migration is the variation of the distance of a fiber or filament from the yarn axis along its length. Parameters For Fiber Migration:- (i) Staple Length of Fiber:- with the increase of staple length migration will also increase; (ii) Tension:- with the increase of tension of fiber migration will also increase; and (iii) Mode of Spinning:- fiber migration in yarn depends on the methods of manufacturing processes. Mechanisms causing fiber migration:- W.E. Morton proposed that one of the mechanisms which cause fiber migration is the tension differences between fiber at different radial positions in a twisted yarn. During the twist insertion fiber are subjected to different tensions depending on their radial positions. According to the principle of the minimum energy of deformation, fiber lying near the yarn surface will try to migrate into inner zones where the energy is lower. This will lead to a cyclic interchange of fiber position. Result showed that fiber migration can be influenced mainly by three groups of factor:- (i) fiber related factor such as fiber type:- fiber length, fiber fineness, fiber initial modulus, fiber bending etc; (ii) yarn related factor, such as yarn count and yarn twist; and (iii) processing factors such as twisting tension, drafting system and number of doubling. Fiber Migration is a wandering of the fibers. See also Migration, 2. Fiber Migration can be defined as the variation in fiber position within the yarn. Migration and twist are two necessary components to generate strength and cohesion in spun yarns. Twist increases the frictional forces between fibers and prevents fibers from slipping over one another by creating radial forces directed toward the yarn interior while fiber migration ensures that some parts of the all fibers were locked in the structure. It was first recognized by Pierce that there is a need for the interchange of the fiber position inside a yarn since if a yarn consisted of a core fiber surrounded by coaxial cylindrical layers of other fibers, each forming a perfect helix of constant radius, discrete layers of the yarn could easily separate. W.E. Morton and K.C. Yen (1952; 1956) discovered that the fibers migrate among imaginary cylindrical zones in the yarn and named this phenomenon 'Fiber Migration'. Mechanisms Causing Fiber Migration:- Morton proposed that one of the mechanisms which cause fiber migration is the tension differences between fibers at different radial positions in a twisted yarn. During the twist insertion, fibers are subjected to different tensions depending on their radial positions. Fibers at the core will be under minimum tension due to shorter fiber path while fibers on the surface will be exposed to the maximum tension. According to the principle of the minimum energy of deformation, fibers lying near the yarn surface will try to migrate into inner zones where the energy is lower. This will lead to a cyclic interchange of fiber position. Later Hearle and Bose gave another mechanism which causes migration. Apart from the theoretical work cited above, several experimental investigations have been carried out during 1960's to find out the possible factors affecting fiber migration. Results showed that the fiber migration can be influenced mainly by three groups of factors:- (i) fiber related factors such as fiber type, fiber length, fiber fineness, fiber initial modulus, fiber bending modulus and torsional rigidity; (ii) yarn related factors, such as yarn count and yarn twist; and (iii) processing factors such as twisting tension, drafting system and number of doubling. / Пирс (Pierce). Дабл.Ю.И. Мортэн (W.E. Morton) и Кей.Си. Йэн (K.C. Yen). Хёрэл (Hearle) и Боуз (Bose).

FIBER NUMBER = НОМЕР ВОЛОКНА – Fiber Number is the linear density of a fiber expressed in units such as denier or tex. See also Fineness. / Номер Волокна:- линейная плотность волокна, выраженная в таких единицах как денье или текс. Смотрите также Тонина (Fineness).

FIBER PLACEMENT = РАЗМЕЩЕНИЕ ВОЛОКОН (или РАСПОЛОЖЕНИЕ ВОЛОКОН) – Fiber Placement:- in general, refers to how the piles are laid into their orientation, i.e. by hand, by a textile process, by a tape layer, or by a filament winder. Tolerances and angles are specified. Microprocessor-controlled placement that gives precise control of each axis of motion permits more intricate winding patterns than are possible with conventional winding and is used to make composites that are more complex that usual filament-wound structures.

FIBER REACTIVE DYE = РЕАКТИВНЫЙ КРАСИТЕЛЬ ДЛЯ ВОЛОКНА (или ВОЛОКОННЫЙ АКТИВНЫЙ КРАСИТЕЛЬ) – Fiber Reactive Dyes (Procion MX) are one of the most commonly used dyes for cellulose fibers (cotton, linen, viscose). They can also used on silk. These dyes are great for dip dyeing, screen printing, batik, mono printing and painting onto fabric. Unlike a pigment which just 'binds' to the surface of the fiber. Fiber reactive dyes create a permanent bond between the dye molecule and the fiber. The colors are fast under normal washing and light conditions. Auxiliary chemicals used with Fiber Reactive Dyes:- (i) Salt:- Common Salt (Sodium Chloride) helps the dye to have a greater affinity with the fiber than the water, encouraging the dye to migrate into the fiber. (ii) Soda Ash:- (Sodium Carbonate) is used as an alkali fixing agent. (iii) Urea:- urea is an agent that attracts and retains water. Urea improves dye solubility and helps improve color yield and stability. Fiber Reactive Dye Recipes and Methods:- (1) Rapid Dyeing:- this technique uses much less water and more concentrated dye solution. No salt is needed. It works out less economic than the recipe above, but is far quicker and simpler. This recipe will dye 100 gms cotton. (i) Dissolve 1 level teaspoon dye in 100 mls warm water. (ii) Dissolve 1 level teaspoon Soda Ash is 50 mls hot water. (iii) Mix these solutions together and use as quickly as possible. (The mixture will lose its ability to react with the fiber over a period of 1–2 hours.) (iv) Immerse the fabric in the dye and soda solutions and ensure dye penetrates throughout. (v) Squeeze out fabric to remove excess dye. (vi) Loosely roll fabric and place in polythene bag or cling film for 2 hours. (vii) After the 2 hours fixation time, unroll fabric and rinse thoroughly in cold water, to remove unfixed dye. Machine or hand wash in hot (60 degrees) water. (2) Dip Dyeing:- this recipe will dye 100 gms fabric a medium shade fairly evenly. It is quite laborious but will give you evenly distributed color. If a more haphazard approach suits your style better you can 'chuck' all the ingredients in at the beginning and then add your prewetted fabric- the important thing is to move the fabric every so often to distribute the dye. (i) Pour 3 liters cold water into a plastic bucket. (ii) Dissolve 2 level teaspoons dye in a little warm water. (iii) Add the dissolved dye to the cold water, stir well and then enter the pre-wetted material and stir gently for 5 minutes. (iv) Continue to stir the dye bath whilst sprinkling in 6 level tablespoons of salt over a 10 minute period. (v) Stir for a further 10 minutes which allows time for the dyed to be salted onto the fabric. (vi) Dissolve 3 level tablespoons Soda Ash in warm water and add to dye bath. For even dyeing it is recommended that the fabric is removed while the Soda Ash is stirred in. (vii) Leave fabric in dye bath for a further 35 minutes. (viii) Remove the fabric and rinse thoroughly in cold water, then machine or hand wash in hot (60 degrees) water. Printing & Painting with Procion MX dyes:- the dyes are mixed with thin or thick 'Chemical Water'. (i) Chemical Water Recipe:- 1 liter warm water; 1 level teaspoon Calgon; 10 level tablespoons Urea. Mix the above ingredients together. Don't worry about making too much as they will store indefinitely. (ii) Thin Dye Recipe (for painting, batik, etc):- 250 mls Chemical Water; 2 level teaspoons Soda Ash; 1 teaspoon Procion MX (less if paler shade required). Mix the Procion MX dye in a little warm water, add Soda Ash and Chemical water, and stir until Soda Ash has dissolved. (iii) Thickened Chemical Water Recipe (for printing):- 250 ml Chemical Water; 1 level tablespoon Manutex. Sprinkle Manutex over chemical water and whisk until smooth. Let it stand for at least 1 hour and preferably overnight. (It will become smoother) It will keep for approximately one month if stored in cool, dark place. (iv) Thick Dye Recipe:- mix 1 level teaspoon Procion MX powder in a little warm water, add Soda Ash and then mix into 250 mls thickened Chemical Water. Note:- once the dye and Soda Ash are added, the solution should be used within a day. (Or store in the fridge for further 3 days.) After painting or printing with these concentrated dyes the fabric should be kept damp by covering with polythene for a minimum of two hours to allow dye to penetrate and chemical bond to take place. After keeping damp for two hours, simply wash off excess dye with copious amounts of cold water and then subject to a hot machine wash to remove any superficial dye. Safety In Use Recommendations:- all persons handling the above products should take precautions to avoid accidental ingestion (swallowing), and inhaling of dust and skin and eye contact. The Following recommendations should be observed:- (i) wear rubber (or surgical type) gloves at all times; (ii) a full front covering apron or lab coat is recommended to protect against spillage; (iii) safety spectacles with transparent sides will provide eye protection; (iv) wherever possible avoid splashes and skin contact; and (v) if large quantities of powder dyes are to be dispersed or aerosol mists produced, it is recommended that a filter pad-type nose and mouth mask is worn to avoid inhaling any dust or mist generated. Fiber-Reactive Dyes:- a type of water-soluble anionic dye having affinity for cellulose fibers. In the presence of alkali, they react with hydroxyl groups in the cellulose and thus are liked with the fiber. Fiber-reactive dyes are relatively new dyes and are used extensively on cellulosics when bright shades are desired. Fiber Reactive Dyes are textile dyes which form a covalent bond with the fibers of the textile, resulting in a long lasting, bright dye. They can be challenging to work with and more expensive than conventional fabric dyes, but many crafters prefer them. Many craft stores sell fiber reactive dyes, as do some Internet retails, usually specifying which fibers the dye is designed to work with. In addition to the dye itself, salt and soda ash are necessary to set the dye. The earliest fiber reactive dyes were designed to interact with cellulose fibers, such as cotton, linen, and hemp. When these materials are treated with soda ash to raise their pH, the fiber reactive dye interacts with the cellulose molecules, forming a permanent bond. Other fiber reactive dyes are designed for use with proteins like silk and wool, and some companies also offer variants for polymer based fabrics like polyester. After the clothing is rinsed and dried, the dye sets, and it will not come out. Clothing colored with fiber reactive dyes will not bleed in washing or fade, unless exposed to bright light. This is why the dyes are popular for tie-dyes and batik, which often feature brightly colored patterns. Fiber reactive dyes can also be used for solid colors, or to paint on an assortment of textiles. The colorfastness and fade resistance of fiber reactive dyes makes them excellent choices for children's clothing and other textiles which need to be washed frequently. Many consumers also appreciate the eco-friendliness of fiber reactive dyes. Some companies process the dyes with natural ingredients and materials, focusing on creating a product with a minimum of harmful waste. Since the dyes are colorfast, they will not bleed into wash water, leading to a reduction in dye-laden water runoff, which can be harmful for the environment. Fiber reactive dyes made with natural pigments tend to be less brilliant and distinctive, but they can still be quite beautiful. To use a fiber reactive dye successfully, always pre-wash the textile being dyed, to remove any residual substances which may interact in a surprising way with the dye. Next, the dye should be mixed with non-iodized salt and stirred so that it is even before being strained to remove large particles. The fabric should be placed in a big tub with the dye mixture, and stirred regularly for approximately 20 minutes. Afterwards, the fabric is soaked in soda ash to set the dye, and then the mixture is rinsed before being hung to dry. See also Dyes, and Reactive Dye. / Смотрите также Красители (Dyes), и Реактивный Краситель (Reactive Dye).

FIBER SATURATION POINT = ПРЕДЕЛ НАСЫЩЕНИЯ ВОЛОКОН – Fiber Saturation Point:- the moisture content of wood, usually around 25–30 percent, at which the cell walls are saturated and the cell cavities are free of water. / Содержание влаги в древесине, обычно в пределах 25–30 процентов, при которой стенки клеток насыщены, а полости клеток не содержат воды.

FIBER THICKNESS = ТОЛЩИНА ВОЛОКНА – Fiber Thickness is the average diameter of the fiber. / Толщина волокна это среднее значение диаметра волокна.

FIBER WASH SPLAYING = РАСХОЖДЕНИЕ ВОЛОКОН ИЗ–ЗА МОЙКИ – Fiber Wash Splaying out of woven or nonwoven fibers from the general reinforcement direction. Fibers are carried along with bleeding resin during cure.

FIBONACCI = ФИБОНАЧЧИ – Leonardo Pisano Bigollo (c. 1170 – c. 1250) also known as Leonardo of Pisa, Leonardo Pisano, Leonardo Bonacci, Leonardo Fibonacci, or, most commonly, simply Fibonacci, was an Italian mathematician, considered by some 'the most talented western mathematician of the Middle Ages'. Fibonacci is best known to the modern world for the spreading of the Hindu-Arabic numeral system in Europe, primarily through the publication in the early XIII century of his Book of Calculation, the Liber Abaci; and for a number sequence named after him known as the Fibonacci Numbers, which he did not discover but used as an example in the Liber Abaci. Leonardo Fibonacci is a XII century Italian mathematician credited with developing a series of numbers that are used to evaluate market relationships. Most commonly used is the ratio between any two consecutive numbers in the series which approximates .618 (62%). This is used as the basis for retracement expectations in the market. Leonardo Fibonacci was born around 1170 to Guglielmo Fibonacci, a wealthy Italian merchant. Guglielmo directed a trading post (by some accounts he was the consultant for Pisa) in Bugia, a port east of Algiers in the Almohad dynasty's sultanate in North Africa (now Bejaia, Algeria). As a young boy, Leonardo traveled with him to help; it was there he learned about the Hindu-Arabic numeral system. Recognizing that arithmetic with Hindu-Arabic numerals is simpler and more efficient than with Roman numerals, Fibonacci traveled throughout the Mediterranean world to study under the leading Arab mathematicians of the time. Leonardo returned from his travels around 1200. In 1202, at age 32, he published what he had learned in Liber Abaci (Book of Abacus or Book of Calculation), and thereby popularized Hindu-Arabic numerals in Europe. Leonardo became an amicable guest of the Emperor Frederick II, who enjoyed mathematics and science. In 1240 the Republic of Pisa honored Leonardo, referred to as Leonardo Bigollo, by granting him a salary. In the XIX century, a statue of Fibonacci was constructed and erected in Pisa. Today it is located in the western gallery of the Camposanto, historical cemetery on the Piazza dei Miracoli (Square of Miracles). / Гульельмо Фибоначчи (Guglielmo Fibonacci). Алмэхад (Almohad). Леонардо Биголло (Leonardo Bigollo). Кампосанто (Camposanto). Пиацца дэй Мираколи (Piazza dei Miracoli). Леонардо Фибоначчи (Leonardo Fibonacci; 1180–1240), более известный под прозвищем Фибоначчи – сын Боначчи, известный также как Леонардо Пизанский (Leonardo Pisano), Итальянский математик в своём главном труде – трактате Книга Абака (или Книга по Счислению) первым систематически изложил достижения Арабской математики, чем способствовал знакомству с ними в Западной Европе. Отец мой, родом из Пизы, служил синдиком на таможне в Бужи, в Африке, куда он меня взял с собою для изучения искусства считать. Удивительное искусство считать при помощи только девяти индусских знаков мне так понравилось, что я непременно захотел познакомиться с тем, что известно об этом искусстве в Египте, Греции, Сирии, Сицилии и Провансе. Объехав все эти страны, я убедился, что Индусская система счисления есть самая совершенная... Изучив основательно эту систему и все к ней относящееся, прибавив свои собственные исследования и почерпнутое из 'Начал' Евклида, я решился написать это сочинение. Как отмечают исследователи, 'Liber Abaci' не просто выделяется, а резко возвышается над средневековой литературой по арифметике и алгебре. Прежде всего благодаря фундаментальности изложения и многообразию рассмотренных в ней методов и задач. Уровень сочинения оказался столь высок, что осилить и воспользоваться изложенными в нем сведениями смогли главным образом учёные-математики, отчасти современники Леонардо, и в ещё большой мере – представители последующих поколений. Выходит, что как учёный Леонардо Пизанский не только превзошёл, но и на многие десятилетия опередил Западно-Европейских математиков своего времени. Подобно Пифагору, привнесшему в Греческую науку знания, некогда полученные от Египетских и Вавилонских жрецов, Фибоначчи во многом способствовал передаче приобретённых им в молодости математических знаний Индусов и Арабов в Западно-Европейскую науку и заложил фундамент для её дальнейшего развития.

FIBONACCI NUMBERS = ЧИСЛА ФИБОНАЧЧИ – The Fibonacci number sequence (1, 1, 2, 3, 5, 8, 13, 21, 34, 55, 89, 144, 233, 377, 610, 987, …) is constructed by adding the first two numbers to arrive at the third. The ratio of any number to the next number is 61.8 percent, which is a popular Fibonacci retracement number. The inverse of 61.8 percent is 38.2 percent, also used as a Fibonacci retracement number. It is the ratio of the Fibonacci sequence that is important and valuable, not the actual numbers in the sequence. Fibonacci Numbers (or Fibonacci Sequence) are named after Leonardo Fibonacci, a XII century Italian mathematician, who discovered the unique properties of a particular number sequence; apparently from studying the dimensions of the Great Pyramid at Gizeh in Egypt. Fibonacci numbers:- 1, 1, 2, 3, 5, 8, 13, 21, 34, 55, 89, 144, 233, 377, 610, 987, etc. Each number in the sequence is the sum of the previous two numbers:- 1 + 1 = 2, 1 + 2 = 3, 2 + 3 = 5, and so on .... The Golden Ratio:- as we progress along the sequence, the ratio of each number to its preceding number approaches closer and closer to the golden ratio:- approximately 1.618. The golden ratio, often represented by the Greek letter Φ (Phi), is calculated as:- $(1 + \sqrt{5}) / 2$. Each number is also approximately 0.618 of its successor. This reciprocal number, known as φ (Phi), is calculated as:- $(\sqrt{5} – 1) / 2$. Where $\sqrt{5}$ is the square root of 5. Fibonacci numbers in nature occur throughout nature:- (i) the arrangement of petals in most flowers; (ii) the arrangement of leaves on most plants; (iii) sea-shell spirals; and (iv) the arrangement of seeds on sunflowers, pine cones and many other plant species. While the Fibonacci number sequence may be prevalent in nature, it is not a universal law. There are many exceptions. Four Fibonacci ratios are normally plotted:- (i) 0.618 (or 61.8 per cent), the reciprocal of the golden ratio, is the most important; (ii) 0.50 (or 50 per cent) – the second number divided by the third (1 divided by 2); (iii) 0.382 (or 38.2 per cent) – the reciprocal of the golden ratio squared (i.e. 89 / 233); and (iv) 0.236 (or 23.6 per cent) – the reciprocal of the golden ratio cubed (i.e. 55 / 233). Fibonacci ratios regularly occur in stock market cycles and in the determination of support and resistance levels. Some traders attach almost mystical significance to them, but I have yet to find any statistical support for this. The weakest of the Fibonacci ratios is 0.50. In fact some maintain that 0.50 is not really a Fibonacci ratio at all because it has no connection to the golden ratio. Nevertheless, it is probably the most prevalent:- the first line of support in a rally is the previous peak – which often equates to a 50% retracement. Fibonacci Numbers are named after Leonardo Fibonacci, a XII century Italian mathematician, who discovered the unique properties of a particular number sequence. Fibonacci and stock analysis:- Fibonacci analysis provides specific forecasts for what price might do when it hits certain levels. Although not always perfect, it can be a reliable tool in any market. We've recently examined how more advanced aspects of Fibonacci retracements combine with cycle analysis to provide a powerful big-picture view of the markets. Written with those new to Fibonacci in mind, this article will offer a more basic overview that also covers fans and arcs in both individual stocks and popular equity indexes. For those unfamiliar with the basics of Fibonacci, the term most often is used to refer to a series of numbers that were popularized by Italian mathematician Leonardo Pisano Fibonacci who lived in the XII century. The numbers are more than just a series of relationships, however. Fibonacci discovered that these numbers and the relationships between them were found throughout nature. The Fibonacci numbers themselves are a sequence in which each successive number is the sum of the two previous numbers:- 1, 1, 2, 3, 5, 8, 13, 21, 34, 55, 89, 144, 233, etc. After you advance past the first few numbers, the ratio of any number to the next approaches 0.618%, and the ratio of any number to the one prior becomes approximately 1.618%. Traders and investors use these numbers and ratios to identify points of action (new positions, liquidate positions, add to positions, etc) in the markets. There Fibonacci studies are most popular among traders:- (i) Fibonacci arcs; (ii) Fibonacci fans; (iii) Fibonacci retracements and extensions. These three studies help in predicting trend changes in

prices for stocks, commodities and currencies. Fibonacci Arcs:- Fibonacci arcs mark potential support or reversal zones to watch as prices pull back after the advance. The interpretation of Fibonacci arcs involves anticipating support and resistance as prices approach the arcs. After a decline, Fibonacci arcs are used to anticipate resistance or reversal zones for the counter-trend bounce. Fibonacci arcs are half circles that extend out from a trendline. The first and third arcs are based on the Fibonacci ratios 0.382 (38.2%) and 0.618 (61.8%), respectively. The middle arc is set at 0.50 or 50%. The first step to creating a Fibonacci arc is to draw a trendline between two extreme points, such as a swing high and swing low. Three arcs are then drawn, centered on the second extreme point so they intersect the trendline at the Fibonacci levels of 38.2%, 50.0% and 61.8%. As seen in the chart of Apple Inc., after the significant bull market, from a low of 522 on May 18, 2012, until the high of 704 on September 21, Apple stock started correcting. At that point, we can use the low and high to draw Fibonacci arcs as shown. The price correction first stopped at the 38.2% retracement, had a small pullback and again started moving lower near the next Fibonacci arc at 61.8%. The 61.8% arc retracement acted as temporary support. After price broke through, price continued to move lower with this particular arc now serving as resistance. After several attempts to break back above the 61.8% arc, price moved to the next significant Fibonacci ratio, 100%, where it found support yet again. Fibonacci Fans:- the first step to drawing Fibonacci fan lines also involves drawing a trendline between two extreme points, which are basically a swing high and swing low of a recent move. Then an 'invisible' vertical line is drawn through the second extreme point. Three trendlines are then drawn from the first extreme point so they pass through the invisible vertical line at the Fibonacci levels of 38.2%, 50.0% 61.8% and 78.6%. The Fibonacci fan lines can then be used to estimate support levels or potential reversal zones. Fibonacci fans are also useful to measure the speed of a trend's movement, higher or lower. The more steep the fan, the faster the trend. 'Fanning out' (right) shows how prices in the S&P 500 found support and resistance at the fan lines. As soon as S&P 500 prices move below a Fibonacci fan line, price falls until the next Fibonacci Fan trendline level. Because of this, traders expect Fibonacci fan lines to serve as support for uptrending markets. The chart of the S&P 500 shows an uptrend that retraced to the 38.2%, 50% and 61.8% Fibonacci fan lines. These points are marked by blue circles. In 'Euro bounce' (page 24), we can see how these lines might be used to manage a trade, even when the odds are stacked against you in the form of a strong counter trend. This Euro/Dollar currency pair daily chart shows how long trades might be initiated after prices move through the 38.2% line and continue through the 50% retracement level. Once price resumes its drop and touches the 38.2% again, a low-risk entry is taken with a stop loss of a close below the 38.2% line. We target the 50% and 61.8% line. The targets were achieved. Note that this is meant as an illustration of the technique. It is not advisable to trade against the prevailing trend. Retracements and Extensions:- Fibonacci retracements and extensions are displayed by first drawing a trendline between two extreme points, which usually are a swing high and swing low of recent move. A series of 11 horizontal lines (sometimes fewer, depending on the scale of the chart and the size of the moves being assessed) is drawn intersecting the trendline at the Fibonacci levels of 0.0%, 23.6%, 38.2%, 50%, 61.8%, 78.6%, 100%, 123.6%, 138.2%, 150% and 161.8%. After a significant price move (either up or down), prices will often retrace a significant portion (if not all) of the original move. As prices retrace, support and resistance levels often occur at or near the Fibonacci retracement levels. Fibonacci extensions work best when stocks are at new highs or new lows, where there aren't any obvious support or resistance levels on the chart. If you are long a stock and it begins to make new highs, and you want to take profits, you can calculate the extension levels to get a general idea of where it may begin to fall. In 'Line break' (left), Fibonacci retracement lines were drawn between USD1 334.00 and USD1 341.50, which were a swing high and a swing low. The rally from the lowest low (USD1 334.00) to the high (USD1 341.50) was a difference of USD7.50. The most common Fibonacci ratios are 0.382, 0.50 and 0.618, which allow us to calculate the key Fibonacci support levels. 38.2% Support:- USD1 341.5 – (0.382 x USD7.50) = USD1 338.60. 50% Support:- USD1 341.50 – (0.50 x USD7.50) = USD1 337.50. 61.8% Support:- USD1 341.50 – (0.618 x USD7.50) = USD1 336.80. As a result, those who went short once gold was unable to break the swing high for 15 minutes could have used a stop at swing high of 1 341.50, for a target of 38.2%, 50% and 61.8%, respectively. As seen above, shorts all three targets were achieved. We can see how Fibonacci extensions work in a recent example using the CNX Nifty. The Indian stock index breached its all-time high of 6415 on March 07, 2014. Traders might use Fibonacci extensions to identify the next target. As seen in 'How high'? (left), the next day the index made a new high at exactly the 123.6% extension. Fibonacci studies are used to identify potential support, resistance or reversal points. No indicator is perfect. This is why chartists must use other tools to confirm what Fibonacci analysis is telling us. Some useful tools include oscillators, moving averages and traditional chart patterns, such as triangles, head-and-shoulders formations and candlestick relationships. Any time one of these indicators corresponds at a specific price point with another, it adds to the importance of that level especially if it occurs with strong volume. The Fibonacci sequence, identified by Italian mathematician Leonardo Fibonacci in the XIII century, is used by traders in financial markets to predict points of support and resistance. Since the inception of the Internet bubble, retail interest in trading financial markets has gone up exponentially. Many traders are looking for that one method or indicator that at least will slant the odds in their favor on the road to consistency. Many believe that one method is the Fibonacci retracement. The Fibonacci method is one tool in a group of methodologies (such as Elliott Wave and Gann) that seeks to tap into and exploit an underlying universal structure of all markets. Simply put, if this structure provides the apparatus within which markets move, then measuring it and the market's place within it will give you an exceptional edge. While Fibonacci is a good method for uncovering the market's hidden order, and reliable in the right hands, it must be analyzed in the proper context. Traders also should maintain realistic expectations of what Fibonacci can, and cannot, do. Numbers game:- Fibonacci numbers are derived from the work of Leonardo de Pisa de Fibonacci, who was a XIII century mathematician. He popularized a series of numbers, later named after him, that increases by the sum of the preceding two numbers. It is, 1 (0 + 1), 2 (1 + 1), 3 (2 + 1), 5 (3 + 2), 8 (5 + 3) and so on until we get 21, 34, 55, 89, 144, 233, etc. We know that markets don't go straight up or down, making them difficult to predict. Our interest is in universal price movement, the understanding of which gives the trader a better chance to manage risk. But the Fibonacci series alone does not help manage risk in terms of price retracements. However, it does correspond to natural, universal price movement in terms of time. According to Fibonacci methodology, a move from point A to point B in any time frame can retrace either 38.2%, 50%, 61.8% or 78.6%. Other important numbers also come into play here. Briefly, the golden spiral number of 0.618 squared is 0.3819 and the square root of 0.786 is 0.886. That's why those numbers work as retracements. While 50, or one-half, does not have a tie to Fibonacci, William Delbert Gann (1878-June-06 – 1955-June-18), another analyst and finance trader who pioneered research in the order of the markets, popularized the hypothesis that a move will correct half of its progress before it rejoins its main trend. Applying Fibonacci:- of course, theory means nothing without application. There are ways we can put Fibonacci's lessons to work for us. Perhaps first and foremost is identifying Fibonacci retracements. These work best as an intermediate- to long-term forecasting tool. One of the textbook examples you will see is in the SPX covering the period from the bottom of the bear market in 2009 through the low in October 2011. The first phase of the bull peaked in April 2010 and retraced approximately 38.2% of the move, which bottomed in July 2010. The bull resumed to May 2011 where it pulled back throughout the summer and found a trading low in October 2011, very close to the 38% retracement of the larger move once again. An important point to consider is that while many traders are looking for perfection and precision, the reality is that many times the retracement will be close to the ideal but overshoot or undershoot the target by a modest amount. Also, the Fibonacci retracement analysis will be more reliable if it lines up with another universal methodology, such as Andrews' pitchfork channels. The market doesn't ring a bell at highs or lows, but does provide a hint in terms of various clues. The degree of the retracement is the market's way of playing its hand. A 38% retracement is considered a minimum correction and in an unscientific study (observation and not statistical), it has been evident dating back to the

Great Depression. In instances where the Dow pulls back 38% on a weekly time frame, odds are enhanced greatly that the market at least will touch the prior high. No other retracement level comes close in reliability. A 61% retracement portends overall weakness to the main trend, but it has value as a trading leg. In fact, many traders use the Gartley trading method, devised by Harold M. Gartley (1899–1972), which looks for an A-B-C pattern that places stops going at the 61% retracement. After a 61% retracement of the main trend, it is not a requirement that the pattern make a new high beyond the old low for the trader to be consistently profitable using that method. Finally, like its retracement counterpart, the Fibonacci time cycle window is no panacea. Markets can elect to change direction in these windows or easily bypass them. The trader who elects to front-run the bars and place an order just because he sees a window approaching (in any time frame) is likely to be disappointed. It's important to combine the Fibonacci turn window with another method, such as key support or resistance areas or an extreme in market sentiment, to have success. This also is true for the retracement. You must validate the retracement or the time window by effective use of candlestick methodology. A known formation such as a candlestick morning/evening star or engulfing pattern is needed to validate any turn. The challenge that plagues many beginning-to-intermediate-level traders is they think all they need to do is find the retracement or time window to achieve a high degree of success. The truth is that while Fibonacci is an excellent methodology, it is best used as a tool, not a trading system. The Nikkei example likely worked because sentiment was an extreme. On the flip side, markets will come to extremes and become even more extreme in sentiment as they move toward the time window. The best turns happen as a result of several factors, not any particular one. As there is no such thing as the Holy Grail, universal methods such as Fibonacci are best suited to be supporting data in a larger context of several factors. The Fibonacci sequence is calculated by adding any number in the series to the previous number – 1, 2, 3, 5, 8, 13, 21, 34, 55, 89, …. The ratio of any number in the series to the next tends towards the irrational Golden Ratio Φ (0.618…) and the ratio to the number two positions away tends to 1–Φ (0.381…). The mid-point between 0.382 and 0.618 is 0.50. These ratios (usually shown as percentages) are known as the Fibonacci Ratios and are used in technical analysis to calculate retracement levels during a correction. The inverse of Φ (0.618) is 1+Φ (1.618) and is used in calculating Elliott Wave projections. Fibonacci ratios form an integral part of Elliott Wave Theory. Sweet Sequence:- Fibonacci indicators that have become popular in technical analysis today are based upon ratios that are derived from the numbers that make up the 'Fibonacci sequence'. This sequence is the result of adding each new number to the one that precedes it, beginning with 0 and 1. For example:- 0 + 1 = 1, 1 + 1 = 2, 1 + 2 = 3, 2 + 3 = 5, 3 + 5 = 8, etc. After the first several numbers, an interesting symmetry begins to develop. For example, from 13 onward, every time you divide a number by the one to the right of it, the result is 0.618. When you divide a number by the one two places to the right, the result is 0.382. These numbers are converted by market analysts into 61.8% and 38.2% respectively. The significance of the Fibonacci numbers and resulting ratios is a topic that has been debated widely over the years. While scholars argue the veracity of many claims that Fibonacci is part of the underlying fabric of natural design, in the financial markets it is the skeptics that often take a back seat. Support and resistance levels based on Fibonacci numbers and ratios hold remarkably well when applied to chart analysis. This is true especially for forex and futures markets and in individual, high-volatility securities. There are numerous applications for Fibonacci ratios in technical analysis. Among the most popular are Fibonacci retracement levels, price and time extensions and Fibonacci fans. While these tools transcend markets, they also transcend time frames and are viable for traders and investors alike. Simple Application:- a trading minimalist can appreciate the simplicity of relying on pure price action to decide how to place and manage a trade. Many popular indicators simply create clutter and confusion, eroding confidence as opposed to bolstering it as the market landscape shifts and trends change. Fibonacci, on the other hand, is rather exceptional. It works well in both a trending market and in periods of congestion. Although learning a new system of market analysis might seem daunting, and the plethora of Fibonacci applications can make some traders shy away, many Fibonacci techniques are surprising simple to use and are relatively foolproof. Perfection is not necessary. A Fibonacci expansion is a type of extension tool that relies on three price points instead of the typical two you will find when using Fibonacci retracements. The first two anchor points in a three-point expansion are based on a primary trend move, otherwise known as an 'Impulse Wave', in a futures, currency or security. In an uptrend, the first anchor point is the low of the uptrend. This is shown as 'A' in the accompanying charts. After selecting the Fibonacci expansion tool in your charting platform, click on this first low to begin the expansion. Next, click on the high of the impulse wave. This is shown as 'B' in the accompanying charts. The third point, marked 'C', anchors the expansion move itself. Consider a trade in the E-mini Dow futures as an example. This trade uses Fibonacci expansions to demonstrate how to identify a target that developed overnight. The indicated circle in the first chart in 'Expanding opportunity' (right) shows an early buy trigger that was missed, while the circle in the second chart shows an entry zone caught later that morning after the Fibonacci expansion was re-applied. Many traders struggle with drawing Fibonacci levels properly, but even levels that are not drawn ideally will yield strong support and resistance points. Indeed, if you pick a number of random highs and lows in a security on which you base Fibonacci levels, many of the resulting horizontal lines cluster together at certain price zones. These clusters are what traders use to distinguish major from minor support and resistance. Fibonacci expansion works well for establishing price targets. When a trader can place a target level on a chart visually, holding for that target point is much easier than simply waiting for an upside move of indeterminate size. By seeing the Fibonacci-based targets hit consistently over time, it makes it even easier to hold positions into those target levels instead of jumping ship too early. Price Points:- Fibonacci combines well with other strategies, such as technical price pattern analysis. Typical price patterns in which the Fibonacci expansion tool is particularly useful are continuation strategies such as bull flags, triangles, ABCD patterns, etc. When the momentum of a price move breaking out of these periods of congestion is comparable to the impulse wave heading into them, Fibonacci expansion is most useful. These patterns can create a great deal of choppiness, however, before a breakout occurs. This can lead traders to question whether or not their anchor points are placed properly. In the E-mini Dow trade, we look at two different price points that were used for the third anchor in the Fibonacci expansion. In the first chart in 'Expanding opportunity', you will find the most commonly used third anchor:- The low of the trading channel. The 100% expansion of this move meant that the primary target would have been 15,249. Instead, the breakout move took the YM into the 138.2% expansion zone of 15,294. There are several reasons for this larger price move on this particular breakout. First, the Dow congestion held within the middle of the original impulse wave of buying. This created stronger resistance at the prior highs, which you will note corresponded to the 61.8% Fibonacci expansion level in the first chart. Second, once those highs broke, the pace of the buying was much stronger than the original impulse wave. When this is the case, it is more common for the breakout move to aim for higher expansion levels than 100%. Alternately, if the breakout move had been slower than the original impulse wave, it may have been necessary to adjust for a lower Fibonacci target, such as the 61.8% level that paused the original breakout. The second chart includes an alternate Fibonacci expansion based upon using the last low in the tightest portion of the congestion as the third anchor point. While the absolute low is the most common third anchor, often a 100% expansion target based upon this last pivot low tends to hold most often when the pace of a breakout move is similar to the pace or momentum of the impulse move. This meant that 15,270 would be the most common target going into a position such as this one. Notice, however, that a number of the Fibonacci resistance levels that result from using the last low within the congestion itself as the third anchor point are almost identical to those in the first chart. The only difference is the percentage label attached to each level. The 38.2%, 76.4% and 123.6% Fibonacci expansions in the second chart are each within a few ticks of the 61.8%, 100% and 138.2% Fibonacci expansion levels in the first chart. Either method would have yielded comparable price points as targets. While the increased momentum on the breakout allowed the Dow futures to push past the typical 100% expansion target, using the Fibonacci expansion tool demonstrated that we were working with the next

target zone, removing some guesswork from the trade. While Fibonacci expansion is an excellent tool to help traders visualize target points on continuation strategies, other popular Fibonacci tools, such as retracements and fans, offer traders a similar edge. The particular tool varies depending upon the type of strategy being traded and whether or not you are timing an entry or exit. Regardless, if you want to improve your trading and build consistency in your models, Fibonacci expansion is a solid tool to have. / виды (species). пузырь (bubble). Золотое Сечение – гармоническое деление, деление в крайнем и среднем отношении, деление отрезка AB на две части таким образом, что большая его часть AC является средней пропорциональной между всем отрезком AB и меньшей его частью CB. Алгебраическое нахождение золотого сечения отрезка AB = a сводится к решению уравнения:- a / x = x / (a – x), где x = AC, откуда x = a (√5 – 1) / 2 ≈ 0.62a. Отношение x к a может быть также выражено приближённо дробями 2/3, 3/5, 5/8, 8/13, 13/21 и так далее, где 2, 3, 5, 8, 13, 21 и так далее – Числа Фибоначчи. Геометрически построение золотого сечения отрезка AB осуществляется так:- в точке B проводят перпендикуляр к AB, откладывают на нём отрезок BE = 1/2AB, соединяют A и E, откладывают ED = EB и, наконец, AC = AD, тогда будет AB/AC = AC/CB. Золотое сечение было известно ещё в древности. В дошедшей до нас античной литературе золотое сечение впервые встречается в ‘Началах’ Евклида (III век до Нашей Эры). Термин Золотое Сечение ввёл Леонардо да Винчи (конец XV – начало XVI веков). Принципы золотого сечения или близкие ему пропорциональные отношения легли в основу композиционного построения многих произведений мирового искусства (главным образом произведений архитектуры античности и Возрождения). Под Золотой Пропорцией понимают такое деление отрезка на две части, при котором отношение меньшей части к большей равно отношению большей части к целому отрезку. Численно это равно 0.618, или 61.8%. В строении всех живых организмов прослеживается золотая пропорция. Например, линия пояса делит человеческое тело в отношении, близком к 0.618, линия шеи делит верхнюю часть тела в этом же отношении, руки и ноги делятся суставами в золотой пропорции и так далее. Такое деление человек интуитивно воспринимает как красивое. Поэтому не совсем достаточную длину ног женщины успешно компенсируют высокими каблуками, а в прошлом для этих же целей практиковался завышенный пояс. О красоте золотой пропорции знают архитекторы, художники и даже писатели и музыканты, стремящиеся создать кульминацию именно на 0.618 части от начала произведения. Как выяснилось, золотая пропорция характеризует не только строение, но и поведение живых организмов, которое оказывается предсказуемым (упорядоченным) на 61.8% и непредсказуемым (случайным) на 38.2%. Такое соотношением порядка (определённости, стабильности, предсказуемости, повторяемости) и хаоса (неопределённости, случайности, изменчивости, непредсказуемости, неожиданности) в живом организме позволяет ему существовать долго и устойчиво, адаптируясь к условиям среды в целях достижения подобия (гармонии) с природой. Стабильность строения и поведения гарантирует организму сохранение структурного ядра – основы жизни. Некоторая доля изменчивости обеспечивает выживаемость, то есть позволяет органично вписываться в окружающую среду и закрепляться в ней.

FIBONACCI RATIO = СООТНОШЕНИЕ ФИБОНАЧЧИ – Fibonacci Ratio is the ratio between any two successive numbers in the Fibonacci sequence, known as Phi (f).

FIBOR = FRANKFURT INTERBANK OFFERED RATE

FIBRANNE = ФИБРАНН (или ШТАПЕЛЬНОЕ ВОЛОКНО) – Fibranne is a fabric made of spun-rayon yarn. / .

FIBRETS = ФИБРЕТЫ – Fibrets are very short (< 1 mm), fine (diameter < 50 μ) fibrillated fibers that are highly branched and irregular resulting in very high surface area. Fibrets can be produced from a number of substances including acetate, polyester, nylon, and polyolefins. By selection of polymer type and incorporation of additives, they can be engineered to meet a range of specialized requirements. / Найлан (Nylon).

FIBRIDS = ФИБРИДЫ – Fibrids are the short, irregular fibrous products, made by mixing a dilute polymer solution with a nonsolvent with agitation. They can also be made by flash spinning and breaking up the resulting filaments. Used in felts, in papermaking, for filtration product, etc. See also Fibrets.

FIBRIL = ФИБРИЛ (или ВОЛОКОНЦЕ) – Fibril (Silk) is an extremely fine filament produced by the longitudinal splitting of a normal silk filament or brin. Fibril is a subdivision of a fiber. A fibril can be attached to the fiber (fibrillated fibers) or can be loose, independent. Fibril is a tiny threadlike element of a synthetic or natural fiber. See also Dust. / Под Фибриллами, от новолатинского слова Fibrilla, означающее Волоконце или Ниточка, от Латинского слова Fibra, означающее Волокно, понимаются нитевидные белковые структуры в клетках и тканях животных, например, коллагеновые волокна, мышечные – миофибриллы, нервные – нейрофибриллы. В основном опорные структуры, в мышцах – сократимые образования. Под Фибриллами, от новолатинского слова Fibrilla, означающее Волоконце или Ниточка, уменьшительное, от Латинского слова Fibra, означающее Волокно или Нить, понимаются нитевидные структуры в клетках и тканях животных и растительных организмов. К фибриллам относят различные по происхождению и функциям значению образования, видимые в световом микроскопе (например, коллагеновые и эластичные волокна, миофибриллы, тонофибриллы) и обнаруживаемые электронномикроскопически (например, протофибриллы мышц, цитоплазматические микрофибриллы).

FIBRILLATED–FILM YARN = ФИБРИЛЛИРОВАННАЯ ПЛЁНОЧНАЯ ПРЯЖА – Fibrillated-Film Yarn is the Yarn produced from fibrillating film that has been converted into a longitudinally fibrillated structure (cf. Polymer tape). See also Slit-Film Yarn. Fibrillated Yarns are made out of one wide tape. After mono axially stretching the film or tape, it is fibrillated by the pinned cylinders into a honeycomb structure. / Фибриллированная Плёночная Нить (Fibrillated Tape Yarn) – плёночная текстильная нить с продольными расслоениями, имеющая поперечные связи между фибриллами. Примечание:- фибриллы в данном случае являются элементами структуры, тонина которой того же порядка, что у текстильных волокон.

FIBRILLATION = ФИБРИЛЛЯЦИЯ – Fibrillation is the act or process of forming fibrils. The act of breaking up a fiber, plastic sheet, or similar material into the minute fibrous elements from which the main structure is formed. Fibrillation:- massive amounts of fly produced in a braiding process due to friction and abrasion applied to the yarns. The source of friction is other yarns and the rings and hooks over which the yarns travel. In severe cases, may cause jamming of the braiding machine if not corrected. / Фибрилляция, процесс разрушения связей между отдельными мельчайшими волоконцами (фибриллами и микрофибриллами) клеточной стенки растительных волокон под влиянием механических воздействий и проникновения воды в межфибриллярные пространства. Фибрилляция может происходить как на поверхности, так и внутри клеточной стенки волокон. В случае поверхностной фибрилляции от волокон отделяются фрагменты клеточной стенки и фибрилл, образуя на волокнах своеобразный ворс. При внутренней фибрилляции в результате ослабления и частичного разрушения связей между фибриллами повышается гибкость

и пластичность волокон. Внутренняя фибрилляция придаёт волокнам способность к образованию межволоконных связей, не снижая прочности. Фибрилляция – основной процесс при размоле целлюлозы в производстве бумаги – увеличивает наружную поверхность волокон, высвобождает гемицеллюлозы, находящиеся внутри волокон, давая им возможность участвовать в создании межволоконных связей в листе бумаги. Отщепление фибрилл создаёт условия для лучшего переплетения волокон и повышения механической прочности бумажного листа с одновременным уменьшением его впитывающей способности. Для фибрилляции используются роллы, конические и дисковые мельницы и так далее.

FIBROUS = ФИБРОЗНОЕ (или ВОЛОКНИСТОЕ, или МОЧКОВАТОЕ) – Fibrous:- thread-like.

FIBROUS/BEADS = ВОЛОКНИСТЫЙ (или ВОЛОСИСТЫЙ)/БИСЕРИНКИ (или БУСИНКИ, или ПОТЁКИ, или НАПЛЫВЫ, или МУШКИ) – Fibrous/Beads:- improper burning of fibers on fabric. Finishing defect. / Порок или дефект заключительной отделки.

FIBROUS ROOT = МОЧКОВАТЫЙ КОРЕНЬ (или РАЗВЕТВЛЁННЫЙ КОРЕНЬ, или ФИБРОЗНЫЙ КОРЕНЬ) – Fibrous Root is finely divided root system without obvious thickening or an enlarged central root. / корневая система без .

FIBROUS ROOT SYSTEM = МОЧКОВАТАЯ КОРНЕВАЯ СИСТЕМА (или ФИБРОЗНАЯ КОРНЕВАЯ СИСТЕМА) – Fibrous Root System:- adventitious roots from the base or stem of the rice plant that form the mat roots. / придаточные корни.

FIBV = FEDERATION INTERNATIONALE DES BOURSES DE VALEURS

FICA = FEDERAL INSURANCE CONTRIBUTIONS ACT

FICB = FEDERAL INTERMEDIATE CREDIT BANK

FICC = FEDERAL IDENTITY CREDENTIALING COMMITTEE

FICC = FIXED INCOME CLEARING CORPORATION

FICHU = ФИШЮ (или КОСЫНКА, или ШЕЙНЫЙ ПЛАТОК) – Fichu:- a woman's light triangular scarf that is draped over the shoulders and fastened in front or worn to fill in a low neckline. / .

FICO = FINANCING CORPORATION

FICTITIOUS INVOICES = ФИКТИВНЫЕ СЧЕТА–ФАКТУРЫ – Fictitious Invoices:- it is common practice in the offshore industry to issue false invoices as a means to transfer money to an offshore jurisdiction, while at the same time achieving a tax deduction for the paying entity. Commonly an entity associated with an offshore promoter will issue the invoice. / Под Фиктивными, от Латинского слова Fictio, означающее Выдумка или Вымысел, понимается мнимое, выдаваемое за действительность.

FICTITIOUS NAME = ФИКТИВНОЕ НАИМЕНОВАНИЕ (или ВЫМЫШЛЕННОЕ НАИМЕНОВАНИЕ) – In the United states, a Fictitious Name is a name other than the true name, under which a corporation or other business organization conducts business. Also referred to as an Assumed Name, a Trade Name or 'Doing Business As' (d/b/a). / Под Фиктивными, от Латинского слова Fictio, означающее Выдумка или Вымысел, понимается мнимое, выдаваемое за действительность.

FICTITIOUS TRADING = ФИКТИВНАЯ ТОРГОВЛЯ – Fictitious Trade is:- (1) a trade that is booked with an execution date far in the future, and is adjusted to include the correct settlement and trade date when the transaction is completed. A fictitious trade is used in the processing of a securities transaction as a form of placeholder, and is found when open dates or rates are being used. (2) A securities order used to affect the price of a security, but which does not result in shares being competitively bid for and no real change in ownership. Wash sales and matched orders are a type of fictitious trade. A fictitious trade is designed to give the impression that the market is moving in a certain direction, when in fact it is being manipulated by a broker. For example, two companies enter into a series of ongoing transactions whose values are based on an interest rate set each week. Because the interest rate can change from week to week, an open execution date is used for the transaction until the interest rate is announced. Two transactions are recorded. The first is a cash transaction with a settlement date the same as the trade date; the second transaction has the same trade date but a settlement date several weeks later. Each week, the second transaction is updated to include the correct interest rate and settlement date. Fictitious Trading:- bucketing, cross trading, wash trading, or other schemes which give the appearance of trading but actually no bona fide, competitive trade has occurred. A Fictitious Trade is a securities transaction that is falsified in some way for the benefit of the trader. This term can also refer to a type of placeholder used to record a transaction and updated later with correct information. Fictitious trades in the first sense are illegal because they are a form of market manipulation, where a broker or trader aims to benefit from a perceived change in the market that is actually created through their actions. The second type may be used for certain kinds of securities transactions by agreement. One example of a fraudulent fictitious trade is a wash trade, where brokers simultaneously buy and sell securities to create the illusion of activity. There is no net change in ownership as a result, but to other traders, it looks like something is happening on the market. This can stimulate actual activity which the broker may exploit. Other trades may be used to create the illusion of account activity on a client's statement in order to cover up embezzlement and other fraudulent activities. Regulators monitor the market for signs that investors are engaging in market manipulation, and they are alert to signs of a fictitious trade. Engaging in such activity can be grounds for expulsion from an exchange as well as legal penalties. If the trading is used to falsify account records for the purpose of defrauding clients, they may also sue for compensation and breach of contract. Money managers are charged with a fiduciary responsibility, meaning that they must care for their client's assets responsibly, and fraudulent trades are a breach of professional ethics. In effect, a fictitious trade appears to take place on the open market and looks legitimate to an outsider, but is actually fake. The securities aren't transferred to another party and any profits that may appear to have been realized are also false. These trades may be recorded on a client's account to make it look like trading activity is occurring so that at a casual glance, customers think their assets are in good hands. As a placeholder, a fictitious trade may be part of a regular transaction agreement between two companies. They set a date in the future and update it when they have information about the correct rate and settlement date to finalize the trade. This is used to record an agreement without setting the date and rate, because these may change in accordance with the terms of the contract. / заслуживающий доверия или действительный (bona fide). Под Фиктивными, от Латинского слова Fictio, означающее Выдумка или Вымысел, понимается мнимое, выдаваемое за действительность.

FID = FINANCIAL INSTITUTIONS DUTY

FID = FLOOR INFORMATION DEVICES

FID = ДРАЕК (или СВАЙКА, или ШЛАГТОВ (СТЕНЬГИ)) – Fid (maritime term):- a tapered wooden pin used to separate the strands when splicing heavy rope.

FIDA = FONDS INTERNATIONAL DE DÉVELOPPEMENT AGRICOLE = INTERNATIONAL FUND FOR AGRICULTURAL DEVELOPMENT

FIDELITY BOND = ОБЯЗАТЕЛЬСТВО ЛОЯЛЬНОСТИ – Fidelity Bond is a form of business insurance that offers an employer protection against losses – either monetary or physical – caused by its employees' fraudulent or dishonest actions. Fidelity bonds are often held by insurance companies and brokerage firms, which are specifically required to carry protection proportional to their net capital. Among the possible forms of loss a fidelity bond covers include fraudulent trading, theft and forgery. Despite its name, a fidelity bond is solely an insurance policy and is neither tradable nor can it accrue interest like a regular bond. It is also known as an Honesty Bond. In Australia a fidelity bond is called Employee Dishonesty Insurance, and in the United Kingdom it's called Fidelity Guarantee Insurance. Fidelity Bond is a bond which will reimburse an employer for loss up to the amount of the bond, sustained by an employer (the insured) by reason of any dishonest act of an employee (or employees) covered by the bond. A Fidelity Bond is a form of insurance protection that covers policyholders for losses that they incur as a result of fraudulent acts by specified individuals. It usually insures a business for losses caused by the dishonest acts of its employees. While called bonds, these obligations to protect an employer from employee-dishonesty losses are really insurance policies. These insurance policies protect from losses of company monies, securities, and other property from employees who have a manifest intent to cause the company loss. There are also many other forms of crime-insurance policies (burglary, fire, general theft, computer theft, disappearance, fraud, forgery, etc) to protect company assets. In the United Kingdom, this type of employee dishonesty insurance is called Fidelity Guarantee Insurance Coverage. In Australia, this type of employer protection is called Employee Dishonesty Insurance Coverage. Fidelity Bonds:- employee theft can deliver a striking blow to a business. Surveys show that a surprisingly large number of employees have admitted stealing from their employers during the previous year. Fidelity Bonds guarantee that the bonded employee(s) will handle their employer's money and property with fidelity. In other words, it guarantees they won't steal.

FIDELITY FUND = ФОНД ЛОЯЛЬНОСТИ – Fidelity Fund is a fund that is available in limited circumstances for clients of futures brokers who have suffered a loss because of a defalcation or fraudulent misuse of money or other property by the broker. Funds are not available to compensate for trading losses.

FIDELITY INSURANCE = СТРАХОВАНИЕ ЛОЯЛЬНОСТИ – Fidelity Insurance protects organizations from loss of money, securities, or inventory resulting from crime. Common Fidelity claims allege employee dishonesty, embezzlement, forgery, robbery, safe burglary, computer fraud, wire transfer fraud, counterfeiting, and other criminal acts. These schemes involve every possible angle, taking advantage of any potential weakness in your company's financial controls. From fictitious employees, dummy accounts payable, non-existent suppliers to outright theft of money, securities and property. Fraud and embezzlement in the workplace is on the rise, occurring in even the best work environments. Liabilities covered by crime insurance usually fall into two categories, although many polices combine both types of coverage:- (i) money and security coverage pays for money and securities taken by burglary, robbery, theft, disappearance and destruction; and (ii) employee dishonesty coverage pays for losses caused by most dishonest acts of your employees, such as embezzlement and theft. When do I Fidelity Insurance? Any business employer needs to be concerned with Employee Dishonesty or any business handing cash or securities needs protection from robbery or theft will need Fidelity. Because crime-related losses are not typically covered by most property insurance policies, crime protection insurance is a necessary component for any business. Unfortunately, the majority of businesses don't purchase enough crime protection. If yours is like the average US business, you can expect to lose 6 percent of your total annual revenues to employee fraud. According to a recent study by the Association of Certified Fraud Examiners (ACFE). It estimates the average business is losing six percent of its total annual revenue from losses involving employees – on average more than USD9 per day per employee. For an organization with 40 employees, with 250 workdays in a year, this could amount to as much as USD90 000 off its bottom line. Add to this other crimes such as robbery and burglary, where small operations are especially likely to be victims, losing at least 20 times more than large corporations. In fact, shoplifting, robbery and burglary put such a disproportionate strain on small firms that many disintegrate as a result. Why do I need Fidelity Insurance? Fraud and embezzlement in the workplace is on the rise, occurring in even the best work environments. According to a leading international accounting firm:- (i) 80% of workplace crime is carried out by employees; (ii) one in four employees has either committed or witnessed workplace fraud and abuse; (iii) one in four employees committing fraud against their employer has been with the company for more than 10 years; and (iv) only one in three of those who have witnessed a workplace crime bother to report it. The Association of Certified Fraud Examiners has found that:- (i) fraud and abuse costs US businesses more than USD400 billion annually; (ii) fraud and abuse costs employers an average of USD9 a day per employee; and (iii) the average organization loses 6% of its total annual revenue to fraud and abuse committed by its own employees. These frauds can go on for years, and when discovered the ultimate impact can be enormous. Smaller companies are especially vulnerable to Fidelity crimes. Most business insurance policies either exclude or provide only nominal amounts of coverage for loss of money and securities as well as employee dishonesty exposures. The American Management Association has estimated that employee dishonesty causes as much as 20% of the nation's business failures. White collar crime can have serious financial consequences, even threatening a private company's survival. InsureHedge offers a solution to handling crime losses committed by employees, through ForeFront Crime Liability Insurance Policy. Typical Fidelity coverage highlights include:- comprehensive coverage for:- employee theft; money and securities while on premises or in transit; forgery; funds transfer fraud; computer fraud; money order and counterfeit currency fraud; credit card fraud; optional client coverage; coverage for investigative costs for covered losses; responds to Employee Retirement Income Security Act of 1974 (ERISA) plan bonding requirement; broad definition of employee, including directors and officers; employees, including part-time, leased, temporary, and seasonal employees; and volunteers; and worldwide coverage. Actual coverage is subject to the language of the policies as issued. Fidelity Insurance is a type of insurance which is designed to protect a firm from losses caused by the dishonest acts of its employees. / Тип страхования, разработанный для защиты фирмы от убытков, вызванных недобросовестными действиями её служащих.

FIDUCIARY = ДОВЕРИТЕЛЬНЫЙ УПРАВЛЯЮЩИЙ (или ФИДУЦИАР, или ФИДУЦИАРИЙ) – Fiduciary is a person who holds assets in trust for a beneficiary. It is illegal for a fiduciary to misappropriate money for personal gain. An individual or institution responsible for acting for the benefit of another on specified matters or for holding funds in trust. A Depositary is not a Fiduciary. A person or body acting in trust. Anyone holding, say, cash in trust for another is said to be acting in a fiduciary capacity. Fiduciary is a person holding the funds or property of another in a position of trust, and who is obligated to act in a prudent and ethical manner. An example would be an attorney, bank trustee, the executor of an estate, etc. Relating to or of the nature of a legal trust, i.e. the holding of something in trust for another. A fiduciary contract; in a fiduciary capacity; fiducial power. Fiduciary is a person who is responsible for the administration of property owned by others. Corporate management is a fiduciary with respect to corporate assets which are beneficially owned by the stockholders and creditors. Similarly, a trustee is the fiduciary of a trust and partners owe fiduciary responsibility to each other and to their creditors. An individual, corporation or association responsible for managing money or property for another. A fiduciary must exercise a high standard of care in this relationship of trust. Fiduciary:- this term can be used both as an adjective and a noun. It is used in the context of a trust relationship. For example, if one is said to have a fiduciary obligation, it means that one is acting in trust for other parties. A fiduciary is one who is in a position of trust. One can also use the adjective fiducial – for example, one has fiducial dependence on someone else. Fiduciary is a person undertaking the duty to act primarily for another's benefit, e.g., executor, administrator, trustee, guardian. / , то есть . Фидуциарное, от Латинских слов Fiduciarius, от Fiducia,

означающее Доверие, . Фидуциар – лицо, компания или ассоциация, которым для управления по доверенности передаётся бенефициаром некоторая собственность. Фидуциар обязан вкладывать денежные средства разумно, в интересах бенефициара. Примерами фидуциаров являются исполнители завещаний, душеприказчики, попечители при банкротстве, доверенные лица, а также опекуны, управляющие имуществом несовершеннолетних или неполноценных бенефициаров. В большинстве штатов США действуют законы, определяющие, каким образом фидуциары могут распоряжаться активами бенефициаров; например, незаконным для фидуциаров является вложение или присвоение денег в целях личного обогащения.

FIDUCIARY CAPACITY = ЁМКОСТЬ ДОВЕРИТЕЛЬНОГО УПРАВЛЕНИЯ (или СПОСОБНОСТЬ ДОВЕРИТЕЛЬНОГО УПРАВЛЕНИЯ, или ФИДУЦИАРНАЯ СПОСОБНОСТЬ) – In the United States, Fiduciary Capacity relates to conducting business or handling property for the benefit of another person. Acting on behalf of another in a relationship that necessitates great confidence, trust and good faith. Fiduciary Capacity means an undertaking to act as executor, administrator, guardian, conservator, trustee for a family trust, authorized trust or testamentary trust or receiver or trustee in bankruptcy.

FIDUCIARY DEPOSIT = ВКЛАД ДОВЕРИТЕЛЬНОГО УПРАВЛЕНИЯ (или ФИДУЦИАРНЫЙ ВКЛАД, или ФИДУЦИАРНЫЙ ДЕПОЗИТ) – Fiduciary Deposit is an arrangement wherein a depositor charges the bank to deposit his liquid assets with another bank. The depositor chooses the degree of risk he wishes to take by predetermining the amount and period to be deposited. Although fiduciary deposits are less liquid and have higher fees, it can be beneficial to depositors desiring a high level of confidentiality. Some banks offer you the possibility to place your funds in fiduciary deposits (i.e. fixed term deposits) in all freely convertible currencies, for maturities ranging from 48 hours to 12 months. Unless instructed otherwise, the bank will renew automatically these deposits for like periods. Interest rates are interbank rates less a fiduciary commision. A Fiduciary Deposit is a fiduciary investment placed with an overseas bank and not subject to withholding tax. The investment is made in the name of Credit Suisse Group AG, but for the account and at the risk of the customer. Processing is normally carried out by Credit Suisse AG Guernsey Branch, for larger amounts investments can also be made at other banks on the euro market. (1) Fiduciary Time Deposits:- an investment at a fixed rate of interest for a certain term of between 7 days and 12 months. Minimum amounts:- 7 to 25 days term:- amounts above CHF500 000 or equivalent in foreign currency. Minimum amounts:- more than 25 days term:- amounts above CHF50 000 or equivalent in foreign currency. Commission:- dependent on investment sum. Between 0.125% pa and 0.5% pa, min. CHF200. (2) Fiduciary Call Deposits:- a short-term investment with no fixed term and with interest rates that are continually adjusted in line with market rates. Minimum amount:- CHF500 000 or the equivalent in foreign currency. Term:- no limit (subject to 48 hours' notice). Commission:- dependent on investment sum. Between 0.125% pa and 0.5% pa, min. CHF200. Risk:- credit risk (credit rating of the foreign bank); exchange rate risk (in the case of foreign currency investments); possible transfer risk. Prerequisite:- a signed fiduciary agreement. Fiduciary Deposit is a bank deposit that the bank lends to somebody else at the depositor's risk (although the depositor earns a fairly high rate of interest). It is a system used by some Swiss banks. See also Fiduciary Transactions. / Крэди Свиссэ Груп А.Ге. (Credit Suisse Group AG).

FIDUCIARY TRANSACTIONS = ФИДУЦИАРНЫЕ ТРАНЗАКЦИИ (или ОПЕРАЦИИ ДОВЕРИТЕЛЬНОГО УПРАВЛЕНИЯ) – Fiduciary Transactions are fundamentally characterized by the fact that a trustee or fiduciary acquires in his own name assets, claims (receivables), or goods at the instructions of the trustor or beneficiary and manages the assets held in trust in the interest of the principal and in accordance with his instructions. The trustee or fiduciary acts in his own name but for the account and at the risk of the trustor or beneficiary. Fiduciary transactions performed by a bank in the form of money market investments or as fiduciary loans are effected or granted in its own name, but in response to a written order, exclusively for the account and at the risk of the customer (fiduciary investments, fiduciary loans). The principal bears the currency, transfer and del credere risks. Fiduciary transactions rank among off-balance-sheet business but are shown by banks under the line. In the wider sense of the word they also include all other transactions entrusted to a fiduciary or trust company. / дэль крэдэрэ (del credere) . Фидуциарные или Доверительные Операции представляют интерес для клиентов, которые хотят поручить банку конфиденциально и надёжно инвестировать свои денежные средства от имени банка. Объектом инвестиций могут быть как реальный сектор экономики в виде выданных кредитов, так и приобретение долей капитала, ценных бумаг и финансовые рынки. При фидуциарной сделке банк выступает агентом клиента по инвестированию:- денежные средства размещаются от имени банка в указанный клиентом актив на заранее оговорённых условиях. Фидуциарные сделки дают клиентам ряд преимуществ по сравнению с прямым инвестированием:- (i) Конфиденциальность и безопасность сделки – клиент не является прямым кредитором, он застрахован от возможности влияния на свой бизнес в связи с выданным кредитом со стороны заёмщика или третьих лиц. (ii) Сервис по юридическому сопровождению сделки – специалисты банка в зависимости от конкретной ситуации подберут наиболее подходящий клиенту вид операции, корпоративную структуру, оформят соответствующую документацию. Банк по отдельному соглашению может помочь с оформлением залогов и/или другим обеспечением инвестиций клиента, а также может представлять интересы клиента на корпоративных собраниях, выполнять другие порученные операции. (iii) Клиент получает всю прибыль от инвестиций – клиент уплачивает банку лишь заранее оговорённое вознаграждение, что позволяет точно планировать свои расходы. (iv) Возможность получения прибыли третьим лицом – клиент может назначить в качестве бенефициара для получения прибыли третье лицо – в том числе детей или родственников, оговорив с банком специальные условия о порядке выплаты; и создать подобие наследственного или целевого траста. Для осуществления фидуциарной сделки необходимо иметь денежные средства на расчётном счёте в банке; документы, подтверждающие их легальное происхождение; и предоставить в банк описание операции, которую клиент планирует осуществить.

FIELD = ПОЛЕ – (1) Field is a plot of land with defined boundaries within a place of production on which a commodity is grown. Field is cultivated open land area; land used for raising crops or for conducting experiments. / Под Полем понимаются:- (i) безлесная равнинная территория; (ii) участки пашни, на которые разделена площадь севооборота, и запольные участки; (iii) площадка, оборудованная для чего-либо, например, футбольное поле; (iv) район боевых действий, например, поле битвы; (v) пространство, охватываемое глазом при наблюдении, обозрении, например, поле зрения; (vi) основной фон, на котором что-либо изображено; и (vii) свободная от письма, печати полоса вдоль края листа в тетради, книге и так далее.

(2) Field:- in a SWIFT message a data element(s) for which the identification, description and value representation has been pre-defined. Each data element constitutes an indivisible unit. Where a field consists of more than one data element, each forms a subfield. Fields may be:- fixed length or variable length, mandatory or optional, and restricted in terms of the character set which may be used. A field can appear only once in a message, unless the rules specify otherwise. Some fields consists of several sub-fields. / В сообщении Сообщества по Всемирной Межбанковской Финансовой Дальней Связи (СВМФДС; The Society for Worldwide Interbank Financial Telecommunication (SWIFT)). коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо).

FIELD BUS = ПОЛЕВАЯ МАШИНА (или ПОЛЕВОЙ АВТОБУС) – Field Bus is a part of a network solution that based on a four-tier model (actuator-sensor level, field-level, cell-level, management-level). The 'field-level' will generally comprise spatially separated machine lines and local machines linked to each other or to the superordinated level.

FIELD CAPACITY = ПОЛЕВАЯ ВЛАГОЁМКОСТЬ – Field Capacity is the percentage (expressed on the basis of weight or volume) of water remaining in a soil. The moisture level in the soil after saturation and runoff. Field Capacity is the amount of water remaining in a field soil that has been thoroughly wetted and drained until free drainage has practically ceased. The soil can no longer absorb additional moisture. / Уровень влажности почвы после поглощения или впитывания и поверхностного стока.

FIELD COLLECTING = ПОЛЕВОЕ КОЛЛЕКЦИОНИРОВАНИЕ – Field Collecting is the collection of samples from the field.

FIELD DAY = ДЕНЬ УБОРКИ – Field Day (maritime term):- a day for general ship cleaning.

FIELD RESISTANCE = ПОЛЕВАЯ УСТОЙЧИВОСТЬ – Field Resistance is a resistance observed in the field as distinguished from resistance observed in the laboratory or greenhouse. It may involve seedling resistance as well as adult plant resistance and often involves resistance to all locally occurring biotypes.

FIELD SAMPLING = ОТБОР ПРОБ В ПОЛЕ (или ОТБОР ПОЛЕВЫХ ПРОБ) – Field Sampling:- (1) fields may be chosen randomly for sampling from a map locating the coordinates and the cultivator interviewed. Samples are then taken according to the plan. (2) A field is divided into particular proportions and a grid is used for even sampling of different sections of the field. Field Sampling:- for general observations such as plant density, weed density, or estimates of yield, it is important to be sure that the sampling points where you collect your data are representative of the entire field. Generally, the data collected in an individual field are averaged to describe that field. If the field has a lot of variability, you may want to make separate sets of measurements in the different sections of the field. While the number of data collection locations per field generally depends on the type of data needed, it is often advisable to select at least 5 to 8 separate locations. A sheet for recording observations at the different sampling points is essential. Once you have made observations and collected general information about the condition of your field, you can use the following sections to correct crop problems:- (i) production problems; (ii) nutrient problems; and (iii) pests and diseases.

FIELD SCREENING = ПОЛЕВАЯ БРАКОВКА (или ПОЛЕВОЕ ОБСЛЕДОВАНИЕ, или ПОЛЕВОЙ ОТБОР, или ОТБОР В ПОЛЕ, или ПОЛЕВОЕ ТРИЕРОВАНИЕ) – Field Screening is an evaluating varieties for resistance in the field in contrast to greenhouse and screenhouse evaluations. / вычисляющие разновидности по устойчивости в поле в контрасте с вычислениями в теплицах и лабораториях.

FIELD WAREHOUSE = ПОЗИЦИОННЫЙ СКЛАД (или СЕКТОРНЫЙ СКЛАД) – Field Warehouse is a warehouse that stores goods on the goods' owner's property while the goods are under a bona fide public warehouse manager's custody. The owner uses the public warehouse receipts as collateral for a loan. / заслуживающий доверия или действительный (bona fide).

FIERY = ОГНЕННОЕ (или ПЛАМЕННОЕ, или ФИЕРИЧЕСКОЕ) – Fiery:- of the color of fire; red.

FIEWS = FOOD INFORMATION AND EARLY WARNING SYSTEM

FIFABE = FIKAMBANANA FAMPANDROSOANA NY LEMAK'I BETSIBOKA = ASSOCIATION FOR THE DEVELOPMENT OF THE PLAIN OF BETSIBOKA

FIFO = FIRST IN, FIRST OUT

FIFTH PARTY LOGISTIC MODEL = МОДЕЛЬ ПЯТОЙ СТОРОНЫ ЛОГИСТИКИ (или ПЯТИСТОРОННЯЯ МОДЕЛЬ ЛОГИСТИКИ) – Fifth Party Logistic (5PL) Model:- this applies when the switch is made from supply chains to supply networks. A fifth party logistic service provider guarantees the management of networks of supply chains. The industrial actor hires third parties for the supply of strategic, innovative logistical solutions and concepts. A fifth party logistic service provider develops and implements, preferably in close consultation with the client, the best possible supply chains or networks. Fifth party logistic is often linked to E-business.

FIFTH WHEEL = ПЯТОЕ КОЛЕСО (или СЕДЛО, или ОПОРНЫЙ КРУГ, или ПРИЦЕПНОЕ УСТРОЙСТВО) – (1) A device located on the rear of the tractor which receives the kingpin of the chassis and connects the two pieces of equipment. The Fifth Wheel coupling provides the link between a semi-trailer and the towing truck, tractor unit, leading trailer or dolly. Some recreational vehicles use a fifth wheel configuration, requiring the coupling to be installed in the bed of a pickup truck as a towing vehicle. The coupling consists of a coupling pin (or king pin) on the front of the semi-trailer, and a horseshoe-shaped coupling device called a Fifth Wheel on the rear of the towing vehicle. The configuration is sometimes called a Turn-Table in Australia and New Zealand, especially if it's a rotating ball-race-bearing type. The term 'Fifth Wheel' comes from a similar coupling used on four-wheel horse-drawn carriages and wagons. The device allowed the front axle assembly to pivot in the horizontal plane, to facilitate turning. The semi-circular steel coupling device mounted on a tractor which engages and locks with a chassis semi-trailer. Circular bearing mechanism, secured on the rear of the chassis of a truck that engages and locks the semi-trailer to the truck.

(2) In acceleration tests of cars, we often use a computerized Fifth Wheel built for us by former Chevrolet racing engineer Paul Van Valkenburgh. It consists of three basic parts:- the wheel, a data buffer and a computer/printer. A fifth wheel is just that:- an extra road wheel temporarily added to the car. The purpose is to have a corrected source of distance data that can be measured accurately. We just have to compare this distance to time, and we can calculate speed. Van Valkenburgh's fifth wheel is a high-tech sandwich of aluminium and balsa wood, fitted with a bicycle tire. It pivots from an aluminium swing arm, which is fastened to the car with either a suction cup or bumper bracket. A simple transducer counts each revolution of the wheel. The transducer feeds its information into a data buffer that stores the raw data. We collect the data with a Radio Shack TRS-80 PC-2 pocket computer, where it is automatically analyzed and transformed into useful test results via a software program Van Valkenburgh developed. We then print out the results on a Radio Shack printer. Fifth Wheel is a wheel that is temporarily attached to a vehicle to test the accuracy of the speedometer, etc. / Шеврэлэй (Chevrolet) Пол Вэн Волкэнбёг (Paul Van Valkenburgh). Рэйдиоу Шэк (Radio Shack). Под Пятым Колесом понимается прибор, применяемый при ходовых испытаниях автомобиля для определения его динамических качеств. Представляет собой колесо, обычно установленное в вилке и шарнирно соединённое с автомобилем. К поверхности дороги колесо прижимается собственным весом; при движении автомобиля линейная скорость на окружности колеса равна скорости движения автомобиля. Скорость колеса регистрируется с помощью гибкого троса самопишущим прибором, вычерчивающим диаграмму движения автомобиля (путь – время – скорость).

FIGURE = ФИГУРА (или УЗОР) – Figure is the pattern produced in a wood surface by annual growth rings, rays, knots, or irregular coloration. / Рисунок, образовавшийся на поверхности дерева за счёт годичных колец роста, сердцевинных лучей, сучков или

неравномерной раскраски. Под Фигурой, от Латинского слова Figura, означающее Внешний Вид или Образ, понимается узор, создаваемый на поверхности древесины годичными кольцами роста, лучами, сучками или неравномерной раскраской.

FIL–À–FIL = ФИЛЬ–А–ФИЛЬ (или НИТКА ЗА НИТКОЙ) – Fil-À-Fil:- allegedly invented by the French. This is a woven fabric where a white thread is interwoven with the colored thread, end upon end. Two different yarns woven together create stylish, 'fil-à-fil' fabric. Seems similar to Oxford and Chambray. A light fabric suited to all seasons; its characteristic comes from the working of the different types of cotton of which it is composed. / филь-а-филь (fil-à-fil). ткань из ниток двух цветов.

FILAMENT = НИТЬ (или ФИЛАМЕНТ) – Filament is a slender stalk of a stamen supporting anther. / Нить – тонкая ножка тычинки (stamen), поддерживающая пыльник (anther).

FILAMENT = ЭЛЕМЕНТАРНАЯ НИТЬ (или ФИЛАМЕНТ) – Filament is a fiber of very great length, considered as continuous. See also Steel Filament. Filament is a fiber of indefinite or extreme length, e.g., silk filament, which runs from 300 to 1 200 meters. Filament is a manufactured fiber of indefinite length (continuous), extruded from the spinneret during the fiber production process. Filament is a fiber of indefinite or extreme length, some of them miles long. Silk is a natural filament, while nylon and polyester are synthetic filaments. Filament fibers are generally made into yarn without the spinning operation required of shorter fibers, such as wool and cotton. Filament yarns are smoother and more lustrous than spun yarns. Filament is an individual strand of fiber indefinite in length. Man-made fibers are indefinite in length. Silk is the only natural fiber available in filament form. Silk may run several hundred yards in length. Filament:- extremely long continuous fibers that can be measured in meters or yards, or in the case of man-made fibers, in kilometers or miles. Filaments do not require spinning to form yarn. Examples are rayon, nylon, acrylic, polyester, and other man-made fibers. Silk is the only natural filament. Filament is a fiber of an indefinite or extreme length such as found naturally in silk. Manufactured fibers are extruded into filaments that are converted into filament yarn, staple, or tow. Filament is the smallest unit of a fibrous material. The basic units formed during drawing and spinning, which are gathered into strands of fiber for use in composites. Filaments usually are of extreme length and very small diameter, usually less than 25 micrometers (1 mil). Filaments are the individual fibers comprising a silk or man-made fiber yarn. / Найлан (Nylon). филаментная (комплексная) пряжа (filament yarn). Под Элементарной Нитью понимается одиночная нить, не делящаяся в продольном направлении без разрушения. Является составной частью текстильных комплексных нитей. К элементарным нитям относятся химические нити различного вида (получаемые продавливанием расплавленного раствора через отверстия фильер), а также шёлковина (одна из двух нитей, составляющих коконную нить, выделяемую шёлкопрядом). Элементарная Нить или Филамент – единичная текстильная нить практически неограниченной длины, рассматриваемая как бесконечная. Под Текстильной Нитью понимается гибкое и прочное тело с малыми поперечными размерами, значительной длины, пригодное для изготовления текстильных изделий. Вырабатываются из льняной, хлопковой, шерстяной пряжи, шёлка-сырца, химических волокон.

FILAMENTATION = ФИЛАМЕНТАЦИЯ (или XX) – (1) Filamentation:- in few qualities filament warp and weft used. While weaving due to abrasion, filaments of warp yarn gets open as it appears on fabric called Filamentation. Weaving defect. / вследствие истирания, . Порок или дефект ткачества.

(2) Filamentation:- xxxxx. / Под Филаментацией, от Латинского слова Filamentatio, от Filamentum, означающее Нить, понимается образование нитей псевдомицелия у дрожжеподобных грибов в результате удлинения клеток и расположения их в виде цепочек, что осложняет их идентификацию.

FILAMENT COUNT = ЧИСЛО ЭЛЕМЕНТАРНЫХ НИТЕЙ (или НУМЕРАЦИЯ ЭЛЕМЕНТАРНЫХ НИТЕЙ) – Filament Count is the number of individual filaments that make up a thread or yarn.

FILAMENT NUMBER = НОМЕР ЭЛЕМЕНТАРНОЙ НИТИ – Filament Number is the linear density of a filament expressed in units such as denier or tex. See also Fineness.

FILAMENT WINDING = МОТКА (или НАМОТКА, или ПЕРЕМОТКА, или РАЗМОТКА, или НАМАТЫВАНИЕ) ЭЛЕМЕНТАРНОЙ НИТИ – Filament Winding:- in the fabrication of composites, the process of placing reinforcing fibers over a rotating form, (mandrel) to make the product shape. Prepreg fibers or dry fibers that are treated in a resin bath immediately prior to winding may be used. The wound form can be cured or consolidated after the fiber winding is complete to product specifications.

FILAMENT YARN = ПРЯЖА ИЗ ЭЛЕМЕНТАРНЫХ НИТЕЙ (или ФИЛАМЕНТНАЯ ПРЯЖА, или КОМПЛЕКСНАЯ ПРЯЖА) – Filament Yarn is a yarn composed of one or more filaments. Note:- filament yarns can have the following morphologies: flat, interlaced, twisted, twistless, textured or combinations of these. Filament Yarn is the yarn composed of continuous filaments assembled with or without twist. See also Yarn. Filament Yarn:- in the spinning of manufactured filaments, fiber-forming substances in the plastic or molten state, or in solution, are forced through the fine orifices in a metallic plate called a Spinneret, or Jet, at a controlled rate. The solidified filaments are drawn-off by rotating rolls, or godets, and wound onto bobbins or pirns. There are several methods of spinning manufactured filaments:- Dry Spinning, Gel Spinning, Melt Spinning, Phase-Separation Spinning, Reaction Spinning, and Wet Spinning. / филаментная (комплексная) пряжа (filament yarn). Пряжа, состоящая из элементарных нитей непрерывной длины. Филаментные Нити в зависимости от назначения разделяются на текстильные и технические, или кордные нити (более толстые нити повышенной прочности и крутки).

FILET = ФИЛЕ – Filet is a lace with a square mesh and geometric designs. / Филе или Филейное Кружево.

FILE VIRUSES = ФАЙЛОВЫЕ ВИРУСЫ – File Viruses or Parasitic Viruses use arbitrary existing files as hosts. Usually the virus prepends the body of its code to the beginning of, or appends the body of its code to the end to the host file, in which case the original file contents remain intact, except that the OEP (original entry point) is modified, so that the virus code is executed before the original, legitimate code. This method of infection ensures that the virus code will be executed each time the infected file is launched, and also provides a means of spreading. In some instances, a file infecting virus may damage the host file when infecting it by erasing or overwriting parts of the host file. In this case, the host file may no longer run correctly, although it will still be able to spread the virus. Executable files often end in extensions like .COM, .DLL, .EXE and .SYS under Windows. Some file viruses might be scripts that were interpreted by other programs and end in extensions like .BAT (a batch file) or .VBS (a Visual Basic program). From the perspective of an AV engine, viruses need to be disinfected, in order to recover the original file, unlike trojans and worms, which are cleaned by simply deleting them (and fixing residual damage such as gimmicked registry settings). In the event file virus damaged the host file by overwriting portions of it, disinfection is not an option. While file viruses were more common in the DOS era than in the Windows era, several modern examples do exist, such as the Ramnit, Sality and Virut families, which regularly show up around the globe. See also Companion Virus, Overwriting Virus, and Virus.

FILE WRAPPER = ДЕЛО ПО ЗАЯВКЕ (или ПАПКА С МАТЕРИАЛАМИ ЗАЯВКИ) – File Wrapper:- the folder into which papers for a particular application are collected and maintained. It contains a complete record of proceedings in the United States Patent and

Trademark Office (USPTO) from the filing of the initial patent application to the issued patent. The file wrapper of a patent application that is maintained by the office (the United States Patent and Trademark Office (USPTO)) is the 'official record'.

FILE WRAPPER CONTINUING = XX – File Wrapper Continuing (FWC) application is a continuation, continuation-in-part, or divisional application filed under 37 CFR 1.62* (CFR:- short for the US Code of Federal Regulations), which uses the specification, drawings and oath or declaration from a prior nonprovisional application, which is complete as defined by 37 CFR 1.51(a)(1). * Note:- 37 CFR 1.62 was deleted effective December 01, 1997.

FILIAL GENERATIONS = ДОЧЕРНИЕ ПОКОЛЕНИЯ (или ФИЛИАЛЬНЫЕ ГЕНЕРАЦИИ) – Filial Generations:- generation after making a cross. Refer to offsprings resulting from a cross of parents, as in F_1 (first filial generation), F_2 (second filial generation), etc. / Под Филиалом, от позднелатинского слова Filialis, означающее Сыновний, понимается .

FILING BASIS = ОСНОВАНИЕ ДЛЯ ПОДАЧИ (или ОСНОВАНИЕ ДЛЯ ВНЕСЕНИЯ, или БАЗИС РЕГИСТРАЦИИ) – In the US trademark law, a Filing Basis is the legal basis for filing an application for registration of a mark. The Trademark Act sets out five filing bases, and an applicant must specify and meet the requirements of one or more bases before the mark will be approved for publication for opposition or registration on the Supplemental Register. The five bases are:- (i) use of a mark in commerce under § 1(a) of the Act; (ii) bona fide intention to use a mark in commerce under § 1(b) of the Act; (iii) a claim of priority, based on an earlier-filed foreign application under § 44(d) of the Act; (iv) registration of a mark in the applicant's country of origin under § 44(e) of the Act; and (v) extension of protection of an international registration to the United States, under § 66(a) of the Act and the Madrid Protocol. The requirements for the bases are set forth in Trademark Rule 2.34. If no basis is set forth in the original application for registration, the examining attorney will issue an Office action requiring the applicant to specify a basis and meet all requirements for the basis. In applications under §§ 1 and 44, the applicant may claim more than one basis, and/or may add or substitute a basis after filing the application. / заслуживающий доверия или действительный (bona fide).

FILING DATE = ДАТА ПОДАЧИ – Filing Date is the date of receipt in the office (the United States Patent and Trademark Office (USPTO)) of an application which includes (1) a specification containing a description and, if the application is a nonprovisional application, at least one claim, and (2) any required drawings.

FILING RECEIPT = УВЕДОМЛЕНИЕ (или РАСПИСКА) В ПРИНЯТИИ – Filing Receipt:- when an application is submitted via e-TEAS, the office (the United States Patent and Trademark Office (USPTO)) immediately issues a confirmation of filing via e-mail that includes the serial number and filing date, and a summary of all the data provided by applicant in the application. This serves as evidence of filing. Applicants who file paper applications receive printed filing receipts that list the application serial number and filing date, the mark, the applicant's name, the goods and/or services, the filing bases, if available; the international class(es), and the address to be used for correspondence.

FILING REFUSAL = ОТКАЗ В ПРИНЯТИИ – Filing Refusal:- also known as a Final Office Action (the United States Patent and Trademark Office (USPTO)), which makes 'final' any outstanding refusals or requirements. A proper response to a final office action is a) compliance with the requirements or b) appeal to the Trademark Trial and Appeal Board.

FILL = ВЫПОЛНЕНИЕ – Fill is the execution of an order. / Исполнение распоряжения.

FILL AND KILL ORDER = РАСПОРЯЖЕНИЕ НА ВЫПОЛНЕНИЕ И УНИЧТОЖЕНИЕ (или ПОРУЧЕНИЕ НА ВЫПОЛНЕНИЕ И УНИЧТОЖЕНИЕ) – Fill And Kill Order (FAK):- if there are unfilled volume after the execution of a part of an order, the unfilled volume is canceled.

FILL AND STORE ORDER = РАСПОРЯЖЕНИЕ НА ВЫПОЛНЕНИЕ И ХРАНЕНИЕ (или ПОРУЧЕНИЕ НА ВЫПОЛНЕНИЕ И ХРАНЕНИЕ) – Fill And Store Order (FAS):- if there are unfilled volume after the execution of a part of an order, the unfilled volume is stored in the order book until the expiration of its validity or the volume is filled.

FILLED GRAIN = ВЫПОЛНЕННОЕ ЗЕРНО – Filled Grain is a seed with a fully developed endosperm.

FILLER = ЗАМАЗКА (или НАПОЛНИТЕЛЬ, или УТЯЖЕЛИТЕЛЬ, или ОТЯЖЕЛЯЮЩЕЕ ВЕЩЕСТВО) – Filler is a substance used to fill the holes and irregularities in planed or sanded surfaces to decrease the porosity of the surface before applying finish coatings. As applied to adhesives, a filler is a substance added to an adhesive to improve its working strength or other properties. Filler is a nonfibrous material added to a fabric to increase its weight or to modify its appearance or hand. Also referred to as Back-Sizing. Examples of fillers are insoluble clays or gypsum, starches, and gums. Filler is:- (1) a material that does not contain any fertilizer element but is added to obtain the desired weight of a mixed fertilizer. (2) Rice variety used to fill vacant areas of an experimental plot. / пористость или рыхлость (porosity). на строганых или поверхностях. Под Наполнителями полимерных материалов понимаются вещества (главным образом высокодисперсные порошкообразные и волокнистые), которые входят в состав пластмасс, красок, резин, смесей с целью облегчения переработки, придания необходимых эксплуатационных свойств, а также удешевления. Распространённые наполнители – технический углерод, мел, тальк, каолин, диоксид кремния, стеклянные, асбестовые и химические волокна, монокристаллические волокна некоторых металлов ('усы'), ткани, бумага. Наполнители, улучшающие свойства материала, называются упрочняющими (усиливающими, активными); волокнистые и листовые наполнители часто называют также армирующими.

FILLET = ЛЕНТА – Fillet is a long, narrow strip of wire card clothing with which the doffer and cylinder of the card are spirally wrapped. Fillet:- a ribbon or narrow strip of material used especially as a headband. / игольчатая лента.

FILLING = УТОЧИНА – Filling is an individual yarn which interlaces with warp yarn at right angles in woven fabric. Usually has less twist than warp yarn, which runs lengthwise in the fabric. Also known as Filling Pick, or Pick. In a woven fabric, Filling is the yarns that run cross the fabric from selvage to selvage, and which run perpendicular to the warp or lengthwise yarns. Also known as Weft. In a woven fabric, Filling is the yarn running from selvage to selvage at right angles to the warp. Each crosswise length is called a Pick. In the weaving process, the filling yarn is carried by the shuttle or other type of yarn carrier. Filling or Weft:- the yarns that are woven across the loom, with Weft being the English term and Filling being the American term. The individual yarns are also known as Picks. / Поперечная Нить (Pick).

FILLING BAND = УТОЧНАЯ ПОЛОСА (или ПОЛОСА ОТ УТОЧИН) – Filling Bands:- solid sections of filling yarn, generally at least several inches in width with a different appearance in shade or luster or exhibiting some other characteristic which makes them distinguishable from adjacent normal sections of filling. They may be composed of one or more complete filling bobbins of yarn, or they may show changes at knots within the same filling package. Filling Band:- in woven fabrics, a visual defect across the width due to a change occurring in the yarn for a large number of picks. Compare Filling Bar. See also Filling, and Mixed End. Filling Bands:- Fabric:- cotton brassiere cloth; Construction:- (i) Count:- 144 x 84; (ii) Warp:- 100/2 combed cotton; (iii) Filling:- 90/3 combed cotton; Finish:- plain dyed peach. Defect:- light and dark filling shade bands. Analysis:- analysis showed that the shade bands were actually an optical

illusion caused by variations in pickage or set marks in the weaving. In the light-appearing sections there were 25 picks per y 4 inch, whereas in the darker adjacent % inch there were only 20 picks. Where the pick count was high, the dyestuff penetration was less and there was a very narrow light band. This band was never more than about 1 inch in width, the pick counts gradually returning to the normal. To prove that the apparent shading was an optical effect, small cuttings from the light and dark bands were removed about 2 inches from the distinct shade change and substituted for each other. The shade match was perfect, showing no difference existent beyond the narrow section where the pick count was abnormal. Such set marks, or starting-up places, are fairly common in some constructions and may be due to faulty loom take-up or let-off, or to a sagging of the warp during exceptionally long periods of its standing with the shed open. Filling Band:- Fabric:- Chambray dress goods; Construction:- (i) Count:- 96 x 92; (ii) Warp:- 50/1 cotton (blue); (iii) Filling:- 50/1 cotton (white); Finish:- plain preshrunk. Defect:- light filling band. Analysis:- examination showed that the band began at a knot and ended at a shuttle change. The filling yarn which produced the light band effect sized 32/1, instead of 50/1 as specified. This defect was evidently due to mixing of yarns at the mill since it was learned that they were also running 30/1 yarn at the time these goods were woven. Filling Bands:- Fabric:- novelty crepe dress goods; Construction:- (i) Count:- 56 x 52; (ii) Warp:- 75/30 viscose-rayon crepe ply-twisted 30 turns with 75/20 acetate rayon, woven 2 S and 2 Z; (iii) Filling:- same as warp; Finish:- plain dyed medium blue. Defect:- several bands of filling which were darker in shade than the remainder of the fabric. Analysis:- analysis showed that, in the faulty-appearing sections, the ply twist in one shuttle (Z twist) was only about 23 turns, instead of the normal 30 turns, per inch. As a result, there was more dyestuff penetration in that yarn, producing darker filling bands. Filling Bands:- Fabric:- cotton-filled rayon sateen; Construction:- (i) Count:- 145 x 76; (ii) Warp:- 150/40 bright viscose rayon; (iii) Filling:- 60/2 combed cotton; Finish:- plain dyed olive drab. Defect:- several dark-dyed filling bands, starting and stopping at shuttle changes. Analysis:- laboratory stripping and redyeing resulted in no improvement, and physical analysis of the light- and dark-dyed filling yarns showed them both to be of the same size and twist. Microscopic analysis and chemical tests, however, revealed the fact that the light-dyed cotton was not mercerized, whereas the dark (normal) yarns were mercerized. This difference in dyeing – is characteristic of mercerized and unmercerized cotton, and further study showed that the mill had been purchasing two types of yarns and had mixed them during weaving. Filling Bands:- Fabric:- sharkskin-type dress goods; Construction:- (i) Count:- 100 x 72; (ii) Warp:- 150/40 dull acetate rayon; (iii) Filling:- same as warp; Finish:- plain dyed white. Defect:- filling bands running from shuttle change to shuttle change. Analysis:- laboratory scouring and bleaching did not eliminate the bands, and boil-off of a cutting of gray goods showing a similar condition resulted in no improvement. Deniers, filament counts, and twists were the same in both light- and dark-appearing sections of the filling and there was no evidence of any abnormal breaking strength or elongation of the yarn. Microscopic examination of yarn cross sections showed the filament contour to be uniform, but the yarn in the light-appearing bands seemed to contain more pigment than that in the darker sections. This was confirmed by examination of a longitudinal section and by chemical analysis. The difference in pigment content resulted in a luster differential which could not be eliminated in dyeing or finishing. Comparison with standard dull-luster yarn of the same manufacturer indicated that the yarn with the lesser amount of pigment was normal production. It was concluded that the bobbins of more highly pigmented yarn represented some abnormal manufacturing condition. Filling Bands:- Fabric:- sharkskin-type dress goods; Construction:- (i) Count:- 120 x 52; (ii) Warp:- 150/40 dull acetate rayon; (iii) Filling:- 300/80 dull acetate rayon; Finish:- plain dyed blue. Defect:- filling shade bauds, starting and ending. Analysis:- physical tests on yarns taken from both light- and dark-dyeing portions of the filling disclosed no significant differences. By dissolving equal weights of the light- and dark-dyed yarns in identical volumes of acetone and comparing color intensity in standard Nessler tubes, it was found that there was an appreciable difference in the amount of dyestuff absorbed by the yarns coming from different filling bobbins. As deniers and filament counts identified these yarns as being from the same producer, and as there was no indication of any gray-goods operation which could cause this difference in dyeing, it was concluded that the yarn itself was at fault. Filling Bands:- Fabric:- lining twill; Construction:- (i) Count:- 112 x 68; (ii) Warp:- 150/40 bright viscose rayon; (iii) Filling:- same as warp; Finish:- plain dyed gray. Defect:- filling shade bands throughout full pieces of goods. Analysis:- deniers and filament counts of yarns taken from both the light-dyed and dark-dyed bands were normal – in this case, 150 denier, 40 filaments. Microscopic examination of the rayon cross sections showed a decided difference between the contours of the filaments in the light-dyeing sections as compared with those in the normal dark-dyed portions. Since the mill had proof of the fact that at the time these goods were woven there was only one make of 150-denier, 40-filament, bright-luster, viscose-process rayon in the mill, it was reasonable to assume that the fault was one which originated in the rayon producer's plant. This might have been caused by the mixing of two lots having different cross sections and different dyeing properties, or, more likely, through the inadvertent production of a small poundage of yarn having faulty cross-section and dyestuff affinity. Examination of representative samples from part cones of the same shipment, as well as of earlier lots from the same producer, indicated that the yarns with the flat filaments were not normal. Filling Bands:- Fabric:- pigment-taffeta dress goods; Construction:- (i) Count:- 92 x 68; (ii) Warp:- 100/60 dull viscose rayon; (iii) Filling:- 150/90 dull viscose rayon; Finish:- aqua-ground print. Defect:- filling shade bands starting and ending at shuttle changes. Analysis:- analysis of the filling yarn in representative dark- and light-dyeing bands revealed no physical differences. Laboratory stripping and redyeing to the same shade, using a level dyeing color which had light and washfastness properties equal to that of the ground shade in the original, resulted in complete elimination of the bands. Although it must be acknowledged that, while the rayon yarn was basically at fault in its tendency to dye unevenly, it appeared that the dyer had not used a dyestuff suitable for level dyeing of rayon or had been careless in his dyeing procedure. The warp also showed a slight amount of streakiness, and this, too, was eliminated in the redyed samples. Filling Bands:- Fabric:- all-spun-rayon poplin dress goods; Construction:- (i) Count:- 64 x 60; (ii) Warp:- 20/1 1%-in. 1%-den. bright viscose rayon; (iii) Filling:- 14/1 1%-in. 1%-den. dull viscose rayon; Finish:- plain dyed gold. Defect:- dark filling bands of varying intensity. Analysis:- chemical tests showed evidence of appreciable amounts of warp sizing in the dyed goods, as well as several partially unremoved colored 'Day and Night' shift-stamp marks. The bands were eliminated by laboratory stripping in sodium hydrosulphite solution and redyeing. Inspection of the gray goods showed the presence of similar sections of filling yarn which had evidently been tinted to a slightly heavier depth of shade than other portions of the filling. The defect did not appear in pieces of the same gray-goods style which were dyed in medium and dark shades, and it was concluded that unremoved tint from some portions of the filling were showing through under the gold color. Since laboratory desizing and scouring trials on a cutting of gray goods proved that the warp sizing could be completely removed in normal processing, and the shift stamp mark was made with a tint that was fugitive in a mild-soap scour at 180 °F, it was evident that the finisher had not done a thorough job in preparing these goods prior to dyeing. Filling Band:- Fabric:- spun-rayon-and-silk dress goods; Construction:- (i) Count:- 54 x 44; (ii) Warp:- 18/1 85% 1%-in. 1%-den. dull viscose rayon 15% silk noils; (iii) Filling:- same as warp; Finish:- light-blue ground with white printed stripe. Defect:- narrow filling band across the width of the piece. Analysis:- on a few threads from the filling being raveled, it was found that the 'band' did not follow the filling exactly. Careful examination showed that what appeared to be a band was actually a printing defect, some of the blue-dyed ground having been partially discharged in a narrow strip across the full width of the cloth. This condition was probably caused by some of the discharge printing paste carrying over on the doctor blade and coming into light contact with the blue ground. / Уточина:- такая же как и основа. Смотрите также Уточина (Filling), и Разная Продольная Нить или Смешанная Продольная Нить (Mixed End).

FILLING BAR = УТОЧНАЯ ПОЛОСА – Filling Bar:- in woven fabrics, a visual defect across the width which contains a limited number of picks of different appearance than normal. Compare Filling Band. Fabrics defect.

FILLING BARRÉ = ПОЛОСАТОСТЬ ПО УТОЧИНЕ – Filling Barré:- a series or cluster of streaks running in the filling direction but interspersed with sections of normal-appearing filling yarns. This condition may run from one selvage to the other, or it may be irregular in length and extend only partway across the warp. See also Barré. Filling Barré:- Fabric:- taffeta dress goods; Construction:- (i) Count:- 180 x 60; (ii) Warp:- 75/20 bright acetate rayon; (iii) Filling:- 150/40 bright acetate rayon; Finish:- plain dyed green. Defect:- several hands of filling barré, starting and stopping at shuttle changes. Analysis:- laboratory stripping and redyeing of a cutting from the portion containing the defect yielded no improvement. In fact, the condition was detected in the stripped cutting before the redyeing. Microscopic examination of the cross sections of the filling yarns in the dark- and light-appearing sections showed significant differences in the size of the filaments, although the filament count was normal (40) in both. Denier determinations were made on short lengths of the yarns, and it was found that in the dark places the denier averaged 1G5, whereas in the light-dyed sections the denier averaged only 132. The repeat of the high and low deniers was at fairly regular intervals, producing a pattern effect in the woven goods. This detect was attributed to so-called 'Periodic Denier', a variation in yarn size produced by faulty spinning during the process of yarn manufacture, probably caused by a pulsating delivery of the acetate solution to the spinnerettes. / Смотрите также Полосатость (Barré).

FILLING BOW = ДУГА ПО УТОЧИНЕ (или ПЕРЕКОС УТОЧИНЫ) – Filling Bow is a fabric condition resulting when filling yarns are displaced from a line perpendicular to the selvedge and form one or more arcs across the width of the fabric. See also Bow. / Смотрите также Дуга или Перекос (Bow).

FILLING CHANGES = СМЕНЫ УТОЧИН – Filling Changes:- generally similar in appearance to 'filling bands', except that the change is noted at a knot or a filling-bobbin transfer, but it gradually fades or disappears at some indeterminate position so that the defect is visible only at the change.

FILLING FLOATS = XX УТОЧИНЫ – (1) Defect Name:- Filling Floats. Defect Type:- warp lines, vertical lines. Fabric Type:- Denim Bottomweights – Indigo Dyed. Description:- Filling Floats:- This is the result of a knot with long ears intermittently interfering with the interlacing of the warp and filling as it makes its way through the harness to the fell of the cloth. Severity:- Major.

(2) Defect Name:- Filling Floats. Defect Type:- Isolated Defects. Fabric Type:- Shirting and Dress Goods – Oxford or Basket. Description:- Filling Floats:- Picks of filling extending unbound over or under warp ends with which they should have been interlaced. See also Shed-Splitting, Undershots, and Overshots. Severity:- Minor. / :- поперечные нити уточины .

FILLING PATTERN = УТОЧНЫЙ РИСУНОК (или УТОЧНАЯ МОДЕЛЬ) – Filling Pattern:- one repeat of the different counts or different colors of the filling yarns.

FILLING RUN–OUT = XX (или РАЗБЕЖКА, или ИЗНОС) УТОЧИНЫ – Filling Run-Out:- xxxxx. See also Broken Pick. Fabrics defect.

FILLING SKEWNESS = СКОШЕННОСТЬ УТОЧИНЫ (или КОСОСТЬ УТОЧИНЫ, или ПЕРЕКОС УТОЧИНЫ) – Filling Skewness is a fabric condition resulting when filling yarns are angularly displaced from a line perpendicular to the edge or side of the fabric. Skewness is also called Bias. See also Skewness. / Смотрите также Перекос или Кривизна или Скошенность (Skewness).

FILLING SHINERS = ПЕРЕТЯЖКИ ПО УТОЧИНЕ (или БЛЁСТКИ ПО УТОЧИНЕ) – Filling 'Shiners':- Fabric:- Oxford dress goods; Construction:- (i) Count:- 60 x 42; (ii) Warp:- 30/1 cotton; (iii) Filling:- 300/40 bright viscose rayon; Finish:- plain dyed tan. Defect:- short lengths of bright, or 'shiny', filling yarns. Analysis:- single-strand breaking-strength and elongation tests made on the short bright sections of filling yarn showed them to have only about 18.5% residual elongation, as compared with an average of 22.5% elongation in the normal portions. On the removal of the bright-appearing yarns from the fabric, it was found that they had much less crimp than the normal yarns. Physical tests made on some of the original yarn before weaving showed it to have a normal elongation of about 24% at the breaking load. This defect was due to overstretched filling yarn, the taut section with less crimp resulting in greater light reflection and a shiny appearance. With no proof of the yarn's having been delivered to the mill in a stretched condition, it was assumed that the damage was caused by the use of excessive tension in quilling.

FILLING SLUB = XX УТОЧИНЫ – Defect Name:- Filling Slub. Defect Type:- weft lines, horizontal lines. Fabric Type:- Bottomweights – Sateen Derivatives, and Twill Derivatives. Description:- Filling Slub:- Filling yarn with a short thick place in a yarn. Severity:- Minor.

FILLING SNARL = ПЕТЛЯНИЕ УТОЧИНЫ (или УТОЧНАЯ ПЕТЛЯ, или УТОЧНАЯ СУКРУТИНА) – Filling Snarl:- xxxxx. See also Snarl. / Смотрите также Петляние или Петля или Сукрутина (Snarl).

FILLING STREAKS = ЗАТАСКИ ПО УТОЧИНЕ (или ПОЛОСКИ ПО УТОЧИНЕ, или ЧЕРТЫ ПО УТОЧИНЕ) – Filling Streaks:- Fabric:- combination-yarn dress goods; Construction:- (i) Count:- 60 x 54; (ii) Warp:- 75/30 S viscose-rayon crêpe, plied IS turns S with 75/20 S dull acetate rayon; (iii) Filling:- same as warp; Finish:- plain dyed blue. Defect:- short light streaks in the filling. Analysis:- careful examination showed that the streaks were confined to the acetate component of the plied filling yarns. Microscopic analysis revealed a partial additional delustering of the acetate yarn in the streaky sections. Since it was obvious that there was no finishing operation which could have produced such a selective delustering effect, a study was made of every gray-mill manufacturing procedure where such a defect might have originated. It was finally decided that the damage could have been caused by drops of water condensing on the yarn during the steaming operation used for setting the twist in the plied vain. Water spots on the acetate rayon when it was subjected to high temperatures, particularly where the yarn was in contact with the hot metal heads of the spools, produced a partial delustering of the surface. This was confirmed by making trials and deliberately introducing water drops on the yarn during the steaming, then weaving those packages of yarn in the filling oi a piece of fabric properly identified. Laboratory dyeing of head ends disclosed the same type of defect. Filling Streaks:- Fabric:- rayon-satin foundation-garment fabric; Construction:- (i) Count:- 300 x 64; (ii) Warp:- 150/40 bright viscose rayon; (iii) Filling:- 60/1 cotton with core of cut rubber; Finish:- plain dyed tea rose. Defect:- ribbed, streaky appearance in the filling. Analysis:- analysis of the cotton filling yarn showed it to be very uniform in size. The cut rubber with which it was covered, however, showed extreme variations in cross-sectional area and weight. These variations produced a thick- and thin-appearing finished yarn, which in turn resulted in the filling streaks. This condition is less likely to occur in elastic yarns made with extruded-rubber cores, since the latter generally run comparatively uniform in diameter. Filling Streaks:- Fabric:- combination-yarn dress goods; Construction:- (i) Count:- 180 x 48; (ii) Warp:- 75/20/1 % dull acetate rayon; (iii) Filling:- two ends 100/60/50 bright viscose rayon, plied 14 turns and woven two picks S and two picks Z; Finish:- plain dyed navy. Defect:- short light streaks in filling. Analysis:- microscopic examination revealed that the so-called 'White Filling Streaks' were actually small sections of damaged warp yarns, the damage running parallel to the filling. This defect was found to be due to a bruising of the acetate warp yarns by the shuttle. The bruised sections resisted dyeing, which brought out the light streaks – particularly prominent in dark-dyed shades. These 'Shuttle Marks' are generally noticeable in acetate-warp-yarn fabrics only, because of the somewhat soft or plastic nature of acetate yarns. The acetate is evidently slightly fused by the frictional heat of the fast-moving shuttle, while at the same time the filaments are ruptured. Such damage may be due to poor warp sizing where the protection against chafing is inadequate or, more often, to excessive picking

action or a faulty shuttle. In some cases, a deeper plush covering on the shuttle race plate affords better protection of the warp ends from such damage. Filling Streaks:- Fabric:- Ninon curtain fabric; Construction:- (i) Count:- 80 x 80; (ii) Warp:- 75/20/15 bright acetate rayon; (iii) Filling:- same as warp; Finish:- plain dyed ecru. Defect:- short filling streaks, giving an open, or 'cracky', appearance. Analysis:- in the 'cracky', or open, places it was found that the twist in the filling yarn averaged about 27 turns per inch, whereas in the normal portions the twist was only 15 turns per inch, as specified. The more highly twisted yarns, being thinner in diameter, produced the streaky effect. While routine tests are commonly made by mills or throwsters, it is obvious that only a small percentage of the yarns so processed are spot-checked. It is not unusual, therefore, for some slack or high-twist yarns to escape detection until the goods are woven. In this construction, however, the defect should have been just as easy to see during the gray-goods inspection. Filling Streaks:- Fabric:- novelty dress goods; Construction:- (i) Count: 88 x 80; (ii) Warp:- eight ends 75/30/35 bright viscose rayon, 2 S and 2 Z, alternating with two ends 120/40 dull acetate rayon; (iii) Filling:- eight picks 100/40 dull viscose rayon alternating with two picks 120/40 dull acetate rayon to make checked pattern; Finish:- cross-dyed green (viscose) and white (acetate). Defect:- white filling stripes wider than normal. Analysis:- the fabric was made on a multiple-box loom in which eight picks were normally woven with the green-dyed yarn and two picks with the white-dyed yarn. In this case there were four adjacent picks of the white yarn, producing a white filling stripe that was twice the width of the normal stripe. This condition was produced by a faulty box motion on one loom, the mechanism which raised or lowered the set of shuttle boxes not functioning in the proper rotation to give the desired pattern. Filling Streaks:- Fabric:- taffeta dress goods; Construction:- (i) Count:- 220 x 52; (ii) Warp:- 100/40 bright acetate rayon; (iii) Filling:- 10/1 combed cotton; Finish:- plain dyed light blue and given moire finish. Defect:- short light streaks running about 15 inches from one edge. Analysis:- examination showed that this defect was due to a chafing of short sections of filling yarn during weaving. This was probably caused by a poorly adjusted picking motion, which caused the shuttle to rebound and rub on the yarn as it sloughed off during weaving, producing a condition commonly known as 'Box Marks'. This condition should not be confused with 'shuttle marks', although the appearance in the finished goods is somewhat similar. In the case of 'box marks', the damage is usually confined to one area running parallel to the selvage. Filling Streaks:- Fabric:- taffeta dress goods; Construction:- Count:- 174 x 64; (ii) Warp:- 75/20 bright acetate rayon; (iii) Filling:- 150/40 bright acetate rayon; Finish:- plain dyed rose. Defect:- irregular cracks in filling, producing streaky effect. Analysis:- analysis showed that the uneven appearance of the filling was due to irregular laying in of the filling yarn, which resulted in a cracky or 'raised-pick' effect. No physical or chemical differences were detected in the yarn to account for this condition, but it was finally concluded that the defect was caused by excessive static charges' being built up during weaving. This fault is commonly referred to as 'Static Cracks' and, although it may be produced by weaving at too low a relative humidity, it is generally attributed to the finish on the yarn's not being of a type adequate to reduce the static charge so as to permit good weaving. Filling Streaks:- Fabric:- pigment-taffeta shirting; Construction:- (i) Count:- 92 x 68; (ii) Warp:- 100/60 dull viscose rayon; (iii) Filling:- 150/100 dull viscose rayon; Finish:- gray goods. Defect:- examination of the gray goods at the mill showed the presence of numerous short filling streaks. Analysis:- microscopic examination revealed that the short filling streaks were due to places where the yarn had much higher twist than the normal. Twist determinations showed that, in some of these streaky sections, the twist was as high as 17 turns per inch, instead of the standard 7 turns. This defect was due to faulty rayon yarn. Filling Streaks:- Fabric;- pigment-taffeta dress goods; Construction:- (i) Count:- 92 x 68; (ii) Warp:- 100/60 dull viscose rayon; (iii) Filling:- 150/90 dull viscose rayon; Finish:- plain dyed dark blue. Defect:- short, light, fillingwise 'flashes' throughout. Analysis:- laboratory tests showed that the light-appearing 'flashes' resisted wetting out, as if they had a protective water-resistant coating in those sections. By stripping with sodium hydrosulphite solution and then redyeing, the short streaks were completely eliminated. Under the circumstances, since the finisher had already used a boil-off and scouring procedure which had been adequate to remove the warp sizing completely, it was concluded that this defect was due to the presence of sections of the original filling yarn containing finish which was abnormally difficult to remove. The fault was, therefore, classified as one for which the rayon producer was responsible. The elimination of certain imperfections by laboratory stripping and redyeing does not always indicate any fault on the part of the dyer, but is helpful in determining whether or not some condition can be so corrected to make the goods salable. Filling Streaks:- Fabric:- taffeta dress goods; Construction:- (i) Count:- 68 x 44; (ii) Warp:- 150/112 cuprammonium rayon; (iii) Filling:- same as warp; Finish:- plain dyed blue. Defect:- short filling streaks, giving a cracky appearance. Analysis:- microscopic examination showed that a large number of the filaments in the filling yarns in the streaky areas appeared to be bound together. It was impossible to pry them apart with a pick needle, and a thorough soap and soda-ash scour in the laboratory failed to open them up to a normal, full yarn. Further microscopic study of the cross sections in those portions of the filling confirmed the fact that a number of the filaments were actually bonded together. In some instances they gave the appearance of single filaments two or three times the normal diameter, with practically no line of demarcation between the several smaller filaments which had been 'fused' together. This fault was attributed to some defect in the manufacturing of the yarn which allowed adhesion to take place before the filaments were completely hardened. Filling Streaks:- Fabric:- corduroy dress goods; Construction:- (i) Count:- 76 x 140; (ii) Warp:- 22/1 carded cotton; (iii) Filling:- same as warp; Finish:- plain dyed red. Defect:- rough-appearing streaks visible on the face of the finished fabric and running in a fillingwise direction for lengths of from 2 to about 10 inches. Analysis:- the converter was advised by the dyer, who also carried out the cutting operation in the manufacture of the corduroy, that the gray goods were at fault, the raised streaky-pile effect being attributed to slubs or uneven twist in the filling yarn. When the filling-ground yarns from the portions of the fabric showing the streaks were raveled, it was found that the defect was not exactly parallel to the filling yarns. Furthermore, microscopic examination showed that the filling-ground thread in the defective places was cut through completely or partially. This was confirmed by trying to remove the filling yarn in the damaged sections and finding that it came apart with little or no tension. It was concluded that these imperfections were due to some fault in the cutting operation, the damage resulting in excess pile on the surface when the fabric was brushed. / пятна. Уточина:- такая же как основа.

FILLING STREAKS AND SLUBS = ЗАТАСКИ ПО УТОЧИНЕ (или ПОЛОСКИ ПО УТОЧИНЕ, или ЧЕРТЫ ПО УТОЧИНЕ) И НЕПРОПРЯДКА (или ШИШКА, или СЛЁТ, или ТОЛСТАЯ ПРИСУЧКА) – Filling Streaks And Slubs:- Fabric:- Chambray dress goods; Construction:- (i) Count:- 84 x 76; (ii) Warp:- 40/1 cotton (wine); (iii) Filling:- 40/1 cotton (white); Finish:- bleached and Sanforized. Defect:- filling streaks and slubs of varying lengths. Analysis:- examination showed that the streaks were due to thick and thin places and excessive slubs in the filling yarn. The unevenness of these yarns was confirmed by the weighing of short sections, as well as by examination of several yards removed and wrapped on a blackboard by a hand seriplane. By actual measurement, the yarn was found to vary from as fine as 51/1 to as heavy as 37/1 within 1 yard. This defect was attributed to a poor quality of filling yarn, particularly detrimental to the appearance in a chambray of this type because of the greater contrast between the white and the dyed yarns. / Затаск от печати, не более 2 см. Размер порока – до 0.5 см. Размер порока определяют по наибольшей протяжённости. Непропрядка – Слёт Утка – короткий утолщённый участок по утку, возникающий в том случае, если уточная нить слетает пакетиком с конца початка и в таком виде зарабатывается в ткань. Непропряды более пятикратной до восьмикратной толщины включительно. Размер порока – за каждое место. Непропряды более восьмикратной толщины.

FILLING TRAMMAGE = XX ПО УТОЧИНЕ – Filling Trammage:- Fabric:- novelty spun-rayon crêpe dress goods; Construction:- (i) Count:- 60 x 44; (ii) Warp:- 75/30 viscose rayon crêpe, plied S twist with 30/1 2-in. 3-den. bright viscose rayon; (iii) Filling:- same as warp, but woven with two picks of S twist and two picks of Z twist; Finish:- plain dyed light blue. Defect:- occasional bands of fillingwise

‘trammage’. Analysis:- in the narrow puckered areas, the filling crêpe yarn was found to have all S twist instead of alternating with two picks of Z twist, as specified. This concentration of unbalanced one-way twist resulted in a higher filling shrinkage, producing the puckered, or plissé, effect, generally called ‘Trammage’. / или плиссе или складчатое (plissé), .

FILLINGWISE CUTS = ПОРЕЗЫ ВДОЛЬ УТОЧИНЫ – Fillingwise Cuts:- Fabric:- rayon-warp cotton-filled satin; Construction:- (i) Count:- 240 x 66; (ii) Warp:- 150/40 bright viscose rayon; (iii) Filling:- 30/2 combed cotton; Finish:- plain dyed light blue. Defect:- several small broken places across width of the piece. Analysis:- examination of the sample submitted showed several spots where the warp yarns were broken, the break being exactly parallel to and along sections of the cotton filling yarns. On the cotton back of the fabric the filling yarn running parallel to the broken areas was dyed lighter than normal. Physical and chemical tests showed that the light-dyed filling yarn and the warp yarn in contact with the faulty filling were deteriorated chemically and the cotton yarns were very tender. This defect was attributed to the presence of oily filling yarn containing small amounts of iron from contact with machine bearings. When the cloth was subjected to bleach, the iron acted as a catalyst, accelerating the oxidation and producing oxycellulose in the cotton filling yarn and in the rayon warp yarn through direct contact. The rayon yarns being much weaker when wet, and excessively tender in those sections, broke when the goods were finally finished. / пятна.

FILL OR KILL ORDER = РАСПОРЯЖЕНИЕ НА ВЫПОЛНЕНИЕ ИЛИ УНИЧТОЖЕНИЕ (или ПОРУЧЕНИЕ НА НЕМЕДЛЕННОЕ И ПОЛНОЕ ВЫПОЛНЕНИЕ, В ПРОТИВНОМ СЛУЧАЕ – ОТМЕНУ) – Fill Or Kill Order (FOK) is an order which must be filled immediately, and in its entirety. Failing this, the order will be canceled. A customer order that is a price limit order that must be filled immediately or canceled. If all the volume in an order is not immediately executed, then the order is canceled. Fill Or Kill Order is an order for immediate execution or cancellation. / Распоряжение На Выполнение Или Уничтожение – распоряжение, которое должно быть исполнено немедленно и в полном объёме, в противном случае оно будет отменено. Распоряжение клиента, представляющее собой распоряжение с ограничением цены (price limit order), которое должно быть исполнено немедленно или отменено.

FILL RATE = НОРМА ИСПОЛНЕНИЯ (или ТЕМП ИСПОЛНЕНИЯ, или УРОВЕНЬ ГОТОВНОСТИ) – Fill Rate is the percentage of order items that the picking operation actually found.

FILM STRENGTH = ПРОЧНОСТЬ ПЛЁНКИ – Film Strength is a property of a lubricant that acts to prevent scuffing or scoring of metal parts.

FILM WATER = ПЛЁНОЧНАЯ ВОДА – Film Water is a layer of water surrounding soil particles and varying in thickness from 1 or 2 to perhaps 100 or more molecular layers. Usually considered as that water remaining after drainage has occurred because it is not distinguishable in saturated soil in rice production (puddled soils).

FILM YARN = ПЛЁНОЧНАЯ ПРЯЖА (или ВАТКА, или ПРОЧЁС) – Film Yarn:- xxxxx. See also Slit-Film Yarn. / Плёночная Текстильная Нить (Tape Yarn) – плоская комплексная нить, полученная расщеплением текстильной плёнки или экструдированием в виде полоски.

FILO = FIRST–IN, LAST–OUT

FILO = FREE IN LINER OUT

FILTER = ФИЛЬТР – Filter is any device or porous substance used as a strainer for cleaning fluids by removing suspended matter. Filter is a device made up of circuit elements designed to pass desirable frequencies and block all others. It typically consists of capacitors and inductors. / Под Фильтром, от Французского слова Filtre, от позднелатинского слова Filtrum, означающее буквально Войлок, понимается:- (1) устройство, прибор, сооружение, в котором с помощью фильтровальной перегородки осуществляется разделение неоднородных систем, содержащих твёрдую и жидкую (газообразную) фазы. Термин Фильтр применяется также в радио- и электротехнике, оптике и других областях. (2) Электрический (радио) фильтр, устройство для разделения электрических колебаний различной частоты. Колебания с частотой вне пределов полосы пропускания фильтра подавляются (ослабляются) им. Различают фильтры нижних и верхних частот, полосовые, заграждающие. Фильтр – устройство (сооружение) для разделения, сгущения или осветления неоднородной системы, содержащей твёрдую или жидкую фазы, пропусканием через пористую (фильтровальную) перегородку. Процесс разделения с помощью фильтра называют фильтрованием. Фильтрами называются также аппараты для очистки растворов от минеральных солей, разделения на фракции полимерных ионов и так далее с помощью ионитов и, кроме того, устройства, пропускающие или задерживающие звуковые или электромагнитные волны определённых частот. Фильтр, аппарат, в котором с помощью Фильтровальной Перегородки (ФП) осуществляется разделение, сгущение или осветление неоднородных систем, содержащих твёрдую и жидкую (газообразную) фазы. Кроме того, фильтрами называются устройства и аппараты для очистки растворов от минеральных солей, разделения на фракции полимерных ионов и так далее с помощью ионитов, а также устройства, пропускающие или задерживающие звуковые или электромагнитные волны определённых частот (смотрите Акустический Фильтр, Светофильтр, Теплофильтр, и Электрический Фильтр). В зависимости от вида неоднородной системы различают Жидкостные Фильтры (предназначены для фильтрования суспензий) и Газовые Фильтры (для разделения аэрозолей и очистки газов). Простейший фильтр – сосуд, разделённый на две части ФП. Между частями фильтра создаётся разность давлений, под действием которой жидкость (газ) проходит через перегородку, задерживающую твёрдые частицы. Жидкостные Фильтры по принципу действия подразделяются на две основные группы:- Фильтры Периодические и Фильтры Непрерывного Действия. Фильтры, принадлежащие к каждой из этих групп, различаются по способу создания в них разности давлений (работающие под вакуумом или под избыточным давлением), по геометрии фильтрующей поверхности (плоская или криволинейная), по типу применяемых ФП. В фильтрах периодического действия на всей поверхности ФП поочерёдно осуществляются поступление суспензии и образование осадка (фильтрование), обезвоживание, промывка и удаление осадка, регенерация ФП. В фильтрах непрерывного действия указанные операции проходят непрерывно, единовременно и независимо одна от другой в каждой соответствующей зоне фильтра. К фильтрам периодического действия относятся Ёмкостные Фильтры, Листовые Фильтры, Фильтр-Прессы, Патронные Фильтры. Ёмкостные Фильтры применяют для разделения небольших количеств суспензий. Он может работать под вакуумом (Путч-Фильтр) и под избыточным давлением (Друк-Фильтр). Корпус ёмкостного фильтра бывает открытым или закрытым. ФП располагается на перфорированном днище. В верхнюю часть корпуса подаётся разделяемая суспензия. Из нижней части отводится фильтрат. В фильтрах с механизированной выгрузкой осадок удаляется через откидное днище, а в фильтрах с открытым корпусом – опрокидыванием или вручную. Листовые Фильтры используют для осветления растворов и разделения суспензий, содержащих не более 5% (по объёму) твёрдой фазы. Фильтрующие элементы круглой или прямоугольной формы, обтянутые ФП (обычно тканью), соединены с коллектором для отвода фильтрата. Суспензия подаётся в корпус фильтра. Слой осадка промывается (после удаления из корпуса остатка суспензии). Фильтр-Прессы применяют в основном для разделения тонкодисперсных суспензий. К ним относятся Рамные и Камерные Фильтр-Прессы и Камерный Автоматический Фильтр-Пресс (ФПАКМ). Рамный фильтр-

пресс представляет собой блок чередующихся вертикальных плит и рам, прижатых друг к другу ручным, гидравлическим или электромеханическим зажимом. Рамы образуют в собранном аппарате свободные плоские камеры (карманы) для приёма суспензии. Плиты с рифлёными боковыми поверхностями служат дренирующим основанием для ФП. Под действием избыточного давления фильтрат проходит через ФП, затем стекает по желобкам рифлёных плит и через отводные каналы поступает в сборник. Твёрдые частицы образуют в камерах слой осадка, который удаляется при раздвигании плит. Действие камерного фильтр-пресса подобно работе рамного фильтр-пресса, но он рассчитан на более высокое избыточное давление. Камерный автоматический фильтр-пресс ФПАКМ состоит из расположенных горизонтально на некотором расстоянии одна от другой фильтрующих плит, которые в свою очередь находятся между двумя поддерживающими плитами. Сверху каждая фильтрующая плита покрыта перфорированным листом, над которым находится ФП в виде бесконечной ленты. При сжатии плит между ними образуются камеры, в которые последовательно подаётся из соответствующих коллекторов суспензия, промывная жидкость и сжатый воздух для продувки. Фильтрат проходит через ФП, а твёрдая фаза остаётся на ней в виде осадка. По окончании цикла фильтрования плиты раздвигаются, между ними открывается щель и ФП приводится в движение, вынося осадок наружу, где он снимается ножами. Работа фильтра автоматизирована. Производительность ФПАКМ в 4–10 раз выше производительности рамного фильтра. Патронный Фильтр применяют для осветления или сгущения суспензий; работает под вакуумом или под давлением и состоит из корпуса с крышкой и днищем. Внутри находится решётка, на которой закреплена ФП в виде патрона (обычно патронный фильтр имеет несколько десятков таких патронов). Удаление осадка с последней производится отдувкой сжатым воздухом, пневмогидравлическим ударом или с помощью вибрационных устройств. К Фильтрам Непрерывного Действия относятся Барабанные, Дисковые, Ленточные, Тарельчатые и Карусельные Фильтры. Барабанный Вакуум-Фильтр находит наибольшее применение в промышленности (смотрите Вакуум-Фильтр). Дисковый Вакуум-Фильтр предназначен для разделения суспензий с близкими по размерам частицами твёрдой фазы. Имеет более развитую фильтрующую поверхность, чем барабанные вакуум-фильтры. В дисковом вакуум-фильтре на горизонтально расположенном полом валу, разделённом на секции, укреплены вертикальные диски. Вал с дисками вращается в корыте, имеющем форму полуцилиндра и заполненном разделяемой суспензией. Каждый диск состоит из обтянутых ФП полых секторов, имеющих с обеих сторон перфорированную или рифлёную поверхность. Полость каждого сектора диска сообщается с отводящим каналом для удаления фильтрата. Съём осадка осуществляют сжатым воздухом (для отдувки), посредством ножей и валков (для отрыва и направления выгрузки). Ленточный Вакуум-Фильтр предназначен для разделения суспензий, образующих неоднородный по размерам частиц тяжёлый и требующий тщательной промывки осадок. Фильтр представляет собой стол, в котором имеются вакуум-камеры для отвода фильтрата и промывной жидкости. ФП (обычно ткань) покрывает прорезиненную перфорированную ленту, натянутую на крайних барабанах стола. Осадок сбрасывается в сборник при перегибе ФП. Регенерация ФП производится при обратном движении ленты с помощью механических щёток или паровых форсунок. Тарельчатые Вакуум-Фильтры применяют преимущественно для обезвоживания крупнозернистых шламов в производстве калия, в подготовке каменного угля и руд и так далее. Основная деталь фильтра – кольцо, состоящее из ряда трапецеидальных секторов, каждый из которых является фильтрующей ячейкой. Последняя открыта сверху и имеет днище, наклонённое к центру для облегчения стока жидкости. По верху ячейки уложен перфорированный лист, на котором находится ФП. Внутренняя полость каждого сектора с помощью соединительных трубок сообщается с каналами распределительного устройства, жёстко связанного с корпусом. Фильтр приводится во вращение электродвигателем. За один оборот ячейки фильтра последовательно соединяются с линиями вакуума и сжатого воздуха. Подача суспензии осуществляется в ячейки сверху. Съём осадка производится ножом или шнеком. Карусельный Вакуум-Фильтр применяется для разделения грубодисперсных суспензий; состоит из ковшей в форме трапецеидальных секторов, собранных на кольцевой раме. Ковши связаны трубками с распределительным устройством, через которое удаляются фильтрат и промывная жидкость. Ковши вращаются вокруг вертикальной оси как единое целое. Каждый ковш состоит из корпуса, образующего вместе с дренажными пластинами и ФП рабочий орган фильтра. Суспензия и промывная жидкость заливаются в ковш сверху. Для выгрузки осадка ковш автоматически поворачивается на 180° над местом выгрузки. Газовые Фильтры относятся к непрерывно действующим аппаратам. По устройству их разделяют на Фильтры С Плоской Фильтрующей Поверхностью и Батарейные Фильтры. Газовый фильтр с плоской фильтрующей поверхностью представляет собой камеру, разделённую перфорированной решёткой, на которой помещают ФП в виде слоя песка, кварца и тому подобного, либо двумя скреплёнными между собой перфорированными решётками, между которыми зажат спрессованный волокнистый материал (асбестовое волокно, стекловолокно, вата и тому подобное). Газовый поток проходит через ФП и очищается от взвешенных в нём частиц. Через определённые промежутки времени ФП очищают или заменяют новой. Батарейный газовый фильтр (рукавный) имеет ФП, выполненную из ткани в виде рукава. Газовый поток вводится в фильтр и распределяется по рукавам. Очищенный газ удаляется через газоход, а отделённые частицы оседают на внутренней поверхности рукавов. Для удаления слоя осевших частиц имеется приспособление, встряхивающее рукава. Слой частиц сбрасывается в нижнюю часть фильтра и удаляется из аппарата шнеком. В качестве батарейного фильтра для очистки газов применяется также Патронный Фильтр. Смотрите также Бактериальные Фильтры, Биофильтр, Водоочистка, Водопроводный Фильтр, Обратный Фильтр, Топливный Фильтр, Фильтрование.

FILTER AID = УСКОРИТЕЛЬ ФИЛЬТРОВАНИЯ (или ВСПОМОГАТЕЛЬНОЕ ФИЛЬТРОВАЛЬНОЕ ВЕЩЕСТВО) – Filter Aid is a powder added to a solution to be filtered that forms a porous bed to improve filtration.

FILTER CLOTH = ФИЛЬТРОВАЛЬНОЕ ПОЛОТНО – Filter Cloth is any cloth used for filtering purposed. Nylon, polyester, vinyon, PBI, and glass fibers are often used in such fabrics because they are not affected by most chemicals. / Найлан (Nylon).

FILTER EFFICIENCY = ЭФФЕКТИВНОСТЬ ФИЛЬТРА (или ПРОПУСКНАЯ СПОСОБНОСТЬ ФИЛЬТРА) – Filter Efficiency is a method of expressing a filter's ability to trap and retain contaminants of a given size.

FILTER ELEMENT = ФИЛЬТРУЮЩИЙ ЭЛЕМЕНТ (или ФИЛЬТРОВАЛЬНЫЙ ЭЛЕМЕНТ, или ФИЛЬТРОЭЛЕМЕНТ) – Filter Element is the porous device which performs the actual process of filtration. See also Filter.

FILTER FABRIC = ФИЛЬТРОВАЛЬНАЯ ТКАНЬ – Henry Filter Fabrics are a non-woven geotextile made up of polypropylene fibers. These fibers are needled to form a stable and durable network that retains their relative position. It is non-biodegradable and resistant to most soil chemicals, acids and alkali with a pH range of 3 to 12. Features:- made of 100% post consumer recycled material; non-biodegradable; resistant to most soil chemicals, acids and alkali; good tear resistance; and high permeability separation sheet. Packaging:- roll sizes (W x L):- 12.5' x 360'. Henry Company headquartered in El Segundo, State of California (CA), the United States. See also Fabric, and Technical Cloth. Geotextile Filter Fabric:- e.g., 4.5 oz. nonwoven geotextile for drainage and filtration. The 4.5 oz (weight (typical) 4.5 4.5 oz/yd^2 (142 g/m^2)) nonwoven geotextile fabric is a light weight option designed to help with draining, filtration, and subsoil separation applications. These geotextiles feature a needle-punched exterior that allows water to filter through the fabric. Due to its small pore size, these fabrics will allow water to filter through while keeping sediment in place. This helps to stabilize the area and helps limit water erosion. Nonwoven Geotextile Filter Fabric Applications:- the nonwoven geotextile fabric is a common choice for

areas looking to stabilize, separate or filter materials. All nonwoven fabrics come with a needle-punched exterior that allows thin water particles to filter through the fabric while keeping soil from filtering through. This geotextile filter fabric helps to retain fine particles when water passes from fine to coarse-grained soil layers. In addition to these applications, the nonwoven also offers permanent mechanical and hydraulic filter stability for the operating period and also facilitates drainage and gas venting. Some of the most common functions you will find a nonwoven geotextile being used in have included the following:- Soil Erosion Prevention; Erosion and Ground Control Applications; Road Repair Applications; Road Restoration Jobs; Filtration Applications; and Drainage Requirements. When used for various applications, the fabric will work to create a solid base over the eroded soil. This will provide a stable area for roads, vegetation, gravel paths, dirt and other applications to take root. Filter Fabric's Features:- (i) provides protection of one strata from damage by another; (ii) stabilizes soil whilst retaining porosity for water to flow; (iii) used for lining dams and channels for erosion protection; and (iv) perfect for road stabilization, reinforcing retaining walls, and for wrapping ag-pipe. Specifications:- (i) 0.6 meters x 50 meters, 120 g/m^2; (ii) 1.0 meters x 50 meters, 120 g/m^2; (iii) 2.0 meters x 50 meters, 120 g/m^2; and (iv) 4.0 meters x 200 meters, 270 g/m^2. Nonwoven Fabrics (Needle Punched):- these fabrics are designed to filter soil particles from drainage systems and stabilize roadways to increase performance life. Nonwoven fabrics are made by extruding continuous filaments of polypropylene which are then cut, opened, laid into a web, needle-punched, heat-set and rolled into the finished product. Nonwoven geotextiles are approved by many local, state and federal agencies including the Federal Highway Administration, US Army Corps of engineers, the environmental Protection Agency and AASHTO (short for The American Association of State Highway and Transportation Officials). Nonwovens are ideal for a variety of civil engineering applications including:- Subsurface Drainage; Roadway Separation; Railroad Stabilization; Hard Armor Underlayment; Landfill Leachate Collection; and Underground Detention/Retention Systems. Filter Fabric:- this non-woven, needle-punched fabric is ideal for use in soil stabilization and separation. The fabric works as a stabilizing force to prevent soil shifts or movements in excavated areas such as roads, sidewalks, and embankments. The fabric also helps prevent soil damage when placed around drainage pipes, retaining walls, and other buried or exposed fixtures. See also Filter Cloth, and Geotextiles. Geotextile Filter Fabric is a non woven matting. Geotextile Filter Fabric is used in almost all civil construction projects to stabilise soil whilst retaining porosity for water to flow. Geotextile Features:- (i) provides protection of one strata from damage by another; (ii) commonly refered to as bidim or geotextile/geofabric material; (iii) used for lining dams and channels for erosion protection; (iv) different grades and thicknesses suitable for any environment or application; and (v) perfect for road stabilisation, reinforcing retaining walls, and for wrapping ag-pipe. Specifications:- (i) 0.6 m x 50 m, 120 g/m^2; (ii) 1.0 m x 50 m, 120 g/m^2; (iii) 2.0 m x 50 m, 120 g/m^2; and (iv) 4.0 m x 100 m, 120 g/m^2. Geotextile Filter fabric also available in a Handi Retail Pack:- 1 m x 25 m. / пористость или рыхлость (porosity). Фильтровальные Ткани служат для улавливания твёрдых частиц из жидкостей, газов и воздуха в химической, угольной, пищевой, целлюлозобумажной, медицинской и других отраслях промышленности. Изготовляются в основном из хлопка, шерсти, льна, асбеста, синтетических волокон и так далее. Разрывная нагрузка тканей должна соответствовать давлению фильтруемой жидкости или газа и поэтому колеблется в широких пределах (от 3 до 15 кН на 50 мм). Большое распространение получили фильтровальные ткани из синтетических волокон, которые обладают исключительной стойкостью к химическим реагентам (щелочам, кислотам, солям) и имеют большую разрывную нагрузку по сравнению с натуральными волокнами.

FILTER HEAD = ГОЛОВКА ФИЛЬТРА – Filter Head:- an end closure for the filter case or bowl that contains one or more ports. See also Filter.

FILTER HOUSING = КОЖУХ ФИЛЬТРА (или КОРПУС ФИЛЬТРА) – Filter Housing:- a ported enclosure that directs the flow of fluid through the filter element. See also Filter.

FILTER LIFE = СРОК СЛУЖБЫ ФИЛЬТРА (или РЕСУРС ФИЛЬТРА) – Filter Life or Throughput is the expected amount of fluid (usually water) that a user should be able to pass through the filter prior to the filter plugging. This number is usually reported in gallons or liters and is set by the manufacturer based on test criteria. The throughput of the filter is determined by testing the actual amount of water that can pass through the filter at a specified ΔP prior to the filter falling below the minimum specified flow rate. A filter manufacturer should be able to provide test data that indicates that the filter will perform within the product specification throughout the entire rated life of the filter. This assures the user that the filter will always provide the published amount of water. See also Filter, and Pressure Drop. / забивание фильтра (filter plugging). Срок Службы, период времени от начала эксплуатации технического устройства до достижения им предельного состояния (смотрите Долговечность). Срок службы включает наработку устройства и время простоев всех видов, обусловленных как техническим обслуживанием и ремонтом, так и организационными или иными причинами. Срок службы устройств одного типа может быть различен, так как на него влияют многие случайные факторы, не поддающиеся учёту, например, проявление особенностей структуры устройства, условия его эксплуатации. Поэтому для количественной оценки срока службы используют вероятностные показатели, например, средний срок службы (математическое ожидание срока службы) и так называемый g-процентный срок службы (календарный период эксплуатации, в течение которого устройство не достигнет предельного состояния с заданной вероятностью g%). Назначенный срок службы – период эксплуатации, по истечении которого изделие снимается с эксплуатации окончательно (и подлежит списанию) или направляется на обследование его технического состояния с целью определения пригодности к дальнейшей работе. Если устройство эксплуатируется непрерывно, то его срок службы совпадает с техническим ресурсом. Во всех остальных случаях соотношение между сроком службы и ресурсом устройства определяется интенсивностью эксплуатации. Ресурс (технический), наработка технического устройства (машины, системы) до достижения им предельного состояния, при котором его дальнейшая эксплуатация невозможна или нежелательна из-за снижения эффективности либо возросшей опасности для человека. Ресурс представляет собой случайную величину, так как продолжительность работы устройства до достижения им предельного состояния зависит от большого числа не поддающихся учёту факторов, таких, например, как условия окружающей среды, структура самого устройства и тому подобное. Различают средний, гамма-процентный и назначенный ресурсы. Средний Ресурс – это математическое ожидание ресурса; гамма-процентный ресурс – наработка, в течение которой устройство не достигнет предельного состояния с заданной вероятностью (g процентов); назначенный ресурс – наработка, по выполнении которой объект снимается с эксплуатации и подлежит списанию или специальному обследованию для определения его технического состояния. Длительность назначенного ресурса определяется условиями безопасной эксплуатации устройства. Смотрите также Долговечность, и Моторесурс.

FILTER LIFE TEST = ИСПЫТАНИЕ НА СРОК СЛУЖБЫ ФИЛЬТРА (или ТЕСТ НА СРОК СЛУЖБЫ ФИЛЬТРА) – Filter Life Test is a type of filter capacity test in which a clogging contaminant is added to the influent of a filter, under specified test conditions, to produce a given rise in pressure drop across the filter or until a specified reduction of flow is reached. Filter life may be expressed as test time required to reach terminal conditions at a specified contaminant addition rate. See also Filter.

FILTER PAPER = ФИЛЬТРОВАЛЬНАЯ БУМАГА – Filter Paper is a porous paper used for filtering liquids. / Под Фильтровальной Бумагой понимается непроклеенная бумага из хлопчатобумажного волокна, зольность которой не превышает 0.8%; служит для фильтрования.

FILTRATION = ФИЛЬТРАЦИЯ (или ФИЛЬТРОВАНИЕ) – Filtration is the physical or mechanical process of separating insoluble particulate matter from a fluid, such as air or liquid, by passing the fluid through a filter medium that will not allow the particulates to pass through it. / Под Фильтрацией понимается движение жидкостей или газов через пористую среду, например, воды, нефти и газов в грунтах. При установившемся течении через фильтрующую среду среду скорость фильтрации определяется Законом Дарси (по имени Французского инженера Ари Фильбэра Гяспара Дарси (Henry Philbert Gaspard Darcy; 1803-Июнь-10–1858-Январь-03)). Под фильтрацией (или фильтрованием) понимают также отделение твёрдых частиц от жидкостей и газов с помощью пористых материалов. Фильтрация, движение жидкости (воды, нефти) или газа (воздуха, природного газа) сквозь пористую среду в естественных пластах грунта под поверхностью земли. Фильтрацией также является просачивание воды сквозь грунты и даже бетон (например, через тела земляных и бетонных плотин). Для аналогичных процессов, проводимых в промышленных и лабораторных условиях, часто также применяется термин 'Фильтрация' наряду с термином Фильтрование. Расход фильтрующейся жидкости или газа (Фильтрационный Расход) обычно определяется зависимостью:- $Q = kSh_w/L$, а скорость фильтрации – так называемым Законом Дарси:- $W = kI$, где k – эмпирический коэффициент фильтрации, S – полная площадь поперечного сечения фильтрационного потока (не только сечения пор, но и твёрдых частиц), h_w – напор, теряемый по длине L пути фильтрации, $h_w/L = I$ – напорный градиент или гидравлический уклон, показывающий величину падения напора на единицу длины пути фильтрация. Скорость фильтрации меньше действительной скорости жидкости или газа в порах, так как движение происходит только через ту часть площади сечения S, которая занята порами. Закон Дарси справедлив при ламинарном течении в порах фильтрующей среды, что большей частью и имеет место в действительности (песчаные, глинистые и тому подобные грунты, бетон). При фильтрации в крупнозернистых материалах, например, в каменной наброске, где имеет место турбулентное течение, скорость фильтрации определяется другими зависимостями, например:- $W = k"I^m$, где $k"$ и m – фильтрационные характеристики грунта, причём первая аналогична коэффициенту фильтрации, а вторая меняется от 1 до 1/2. Фильтрование, процесс разделения суспензий или аэрозолей при помощи фильтровальных перегородок (ФП), пропускающих жидкость или газ, но задерживающих твёрдые частицы. Фильтрование осуществляется в специальных аппаратах – Фильтрах. Наряду с термином Фильтрование для названия этого процесса употребляется и термин Фильтрация. Ниже рассматривается наиболее важный вид фильтрования – разделение суспензий. При фильтровании суспензий отделяемые от жидкости твёрдые частицы чаще всего образуют на ФП слой влажного осадка, который при необходимости может промываться водой и другими жидкостями или продуваться воздухом с целью его осушки. Твёрдые частицы очень вязких и малоконцентрированных тонкодисперсных суспензий могут проникать в поры ФП и задерживаться там, не образуя осадка. Возможно также фильтрование, при котором твёрдые частицы одновременно проникают в поры и образуют осадок. Для предотвращения или замедления закупорки пор применяют вспомогательные вещества (диатомит, перлит, асбест, целлюлозу и другие), которые либо наносят на ФП, либо добавляют в суспензию. Принцип действия этих материалов заключается в том, что они образуют защитные сводики над порами. Жидкость, прошедшая через ФП, называется Фильтратом. Фильтруемая жидкость при движении через слой осадка и ФП встречает гидравлическое сопротивление, для преодоления которого необходимо создание перепада давления (вакуума под ФП или избыточного давления над ней). При постоянном перепаде давления скорость фильтрования падает по мере увеличения толщины слоя осадка и, следовательно, возрастания гидравлического сопротивления. В случае подачи суспензии на ФП поршневым насосом фильтрование происходит при непрерывном росте перепада давления с постоянной скоростью. Если же суспензия подаётся центробежным насосом, изменяются непрерывно как перепад давления, так и скорость фильтрования. С повышением температуры скорость фильтрования возрастает благодаря понижению вязкости суспензии. Различают следующие виды фильтрования:- (а) собственно разделение суспензий – отделение содержащихся в них твёрдых частиц, задерживаемых на ФП, через которую удаляется подавляющее количество жидкости; (б) сгущение суспензий – повышение в них концентрации твёрдой фазы путём удаления через ФП некоторой части жидкой фазы; (в) осветление жидкостей – очистка от содержащегося в них небольшого количества тонких взвесей. Осадки, получаемые при фильтровании, бывают несжимаемые (их пористость в процессе фильтрования постоянна) и сжимаемые (пористость уменьшается). В случае несжимаемых осадков (например, частиц песка, кристаллов карбоната кальция) поток жидкости через ФП ламинарен и скорость фильтрования пропорциональна перепаду давления и высоте слоя осадка. В случае сжимаемых осадков (например, гидроокисей металлов) эта зависимость более сложна и индивидуальна для каждой суспензии. Сжатие осадка приводит к увеличению гидравлического сопротивления и уменьшению скорости фильтрования. Для предотвращения сжатия к тонкодисперсным суспензиям добавляют коагулянты и флокулянты, способствующие агрегированию мелких частиц и повышению пористости осадка. Фильтрование – эффективный метод разделения жидких неоднородных систем, широко применяемый в лабораторных и промышленных условиях (в химической, пищевой, нефтеперерабатывающей, горнорудной и других областях промышленности). Фильтрование используется также для очистки газов.

FILTRATION (BETA) RATIO = СООТНОШЕНИЕ ФИЛЬТРАЦИЯ (БЕТА) – Filtration (Beta) Ratio is the ratio of the number of particles greater than a given size in the influent fluid to the number of particles greater than the same size in the effluent fluid. See also Filtration.

FIM = FINNISH MARKKA

FIN = FINANCIAL APPLICATION

FINAL CONSUMPTION EXPENDITURE = ТРАТА ПО ЗАКЛЮЧИТЕЛЬНОМУ ПОТРЕБЛЕНИЮ (или РАСХОД ПО КОНЕЧНОМУ ПОТРЕБЛЕНИЮ) – Final Consumption Expenditure is the expenditure on goods and services that are used for the direct satisfaction of individual needs or the collective needs of members of the community as distinct from their purchase for use in the productive process. It may be contrasted with Actual final consumption, which is the value of goods consumed but not necessarily purchased by that sector. See also Intermediate Consumption.

FINAL DATA CAPTURE = ЗАКЛЮЧИТЕЛЬНЫЙ СБОР ДАННЫХ (или ОКОНЧАТЕЛЬНОЕ ВЗЯТИЕ ДАННЫХ) – Final Data Capture (FDC):- once the fee, any correspondence, and/or drawings are matched with the application and all requirements have been met for issuance as a patent, the application is then forwarded to the Final Data Capture (FDC) stage of the process. An 'Issue Notification' would be the next step in the processing of a patent and is mailed approximately 3 weeks prior to the issue date of the patent.

FINAL DEMAND = ЗАКЛЮЧИТЕЛЬНЫЙ СПРОС (или ОКОНЧАТЕЛЬНЫЙ СПРОС) – In national accounting, Final Demand is the difference between imports and the final uses of goods and services. Final demand includes consumption, gross private domestic investment, changes in inventories and the excess of merchandise exports over imports. The final demand for an economy is equal to its gross domestic product. / В национальном бюджетном процессе, .

FINAL DESTINATION = ЗАКЛЮЧИТЕЛЬНЫЙ ПУНКТ НАЗНАЧЕНИЯ (или КОНЕЧНЫЙ ПУНКТ НАЗНАЧЕНИЯ) – Final Destination is the last stopping point for a shipment. / Последний пункт остановки для грузовой отправки.

FINAL DETERMINATION = ЗАКЛЮЧИТЕЛЬНОЕ РЕШЕНИЕ (или ОКОНЧАТЕЛЬНОЕ РЕШЕНИЕ) – The US International Trade Administration makes a Final Determination after the investigation of sales at 'less than fair value' and the receipt of comments from interested parties. This determination usually is made within 75 days after the date a preliminary determination is made. However, if the preliminary determination was affirmative, the exporters who account for a significant proportion of the merchandise under consideration may request, in writing, a postponement of this determination. If the preliminary determination was negative, the petitioner make likewise request a postponement be more than 135 days after the date of the preliminary determination. If the final determination is affirmative and follows a negative preliminary determination, the matter is referred to the International Trade Commission (ITC) for a determination of the injury caused or threatened by the sales at less than fair value. Had the preliminary determination been affirmative, the ITC would have begun its investigation at that time. Not later than 45 days after the date the International Trade Administration makes an affirmative final determination, in a case where the preliminary determination also was affirmative, the ITC must render its decision on injury. Where the preliminary determination was negative, the ITC must render a decision not later than 75 days after the affirmative final determination. A negative fnal determination by the Assistant Secretary for Import Administration terminates an antidumping investigation. / , от Латинского слова Affirmo, означающее Утверждаю, .

FINAL DIVIDEND = ЗАКЛЮЧИТЕЛЬНЫЙ ДИВИДЕНД (или ОКОНЧАТЕЛЬНЫЙ ДИВИДЕНД) – Final Dividend is the last share dividend paid out by a company at the end of the year (annual dividend) after quarterly, semi-annual or other interim dividends have already been distributed in the course of the year. / Последний дивиденд по акции, выплачиваемый компанией в конце года (погодовой дивиденд) после того, как в течение этого года уже были распределены поквартальные, пополугодовой или иные промежуточные дивиденды.

FINAL INVOICE = ЗАКЛЮЧИТЕЛЬНЫЙ СЧЁТ–ФАКТУРА (или ОКОНЧАТЕЛЬНЫЙ СЧЁТ–ФАКТУРА) – Final Invoice will take the place of the preliminary invoice after goods have arrived at destination and true weight, quantity, value is determined and agreed upon. A Final Invoice is an invoice upon which payment is made by the customer. A final invoice must contain, at a minimum, the customer's name or idenfitying number and, with respect to the transaction or transactions, the date, product or product code or service of service code, quantity, price, and amount due. See also Commercial Invoice, Consular Invoice, Customs Invoice, Invoice, Preliminary Invoice, Pro-Forma Invoice, and Provisional Invoice. / Смотрите также Коммерческий Счёт-Фактура (Commercial Invoice), Консульский Счёт-Фактура (Consular Invoice), Таможенный Счёт-Фактура (Customs Invoice), Счёт-Фактура (Invoice), Предварительный Счёт-Фактура (Preliminary Invoice), Замещаемый Счёт-Фактура (Pro-Forma Invoice), и Условный Счёт-Фактура (Provisional Invoice).

FINAL MATURITY = ЗАКЛЮЧИТЕЛЬНОЕ ПОГАЩЕНИЕ (или ОКОНЧАТЕЛЬНОЕ ПОГАШЕНИЕ) – Final Maturity is the first day of the month in which a bond stops earning or bearing interest at the end of the final extended maturity period. In other words, the point at which a bond quits earning interest (Original maturity + extension(s) = final maturity). It is also known as the Final Extended Maturity Date.

FINAL OFFICE ACTION = ЗАКЛЮЧИТЕЛЬНОЕ ДЕЙСТВИЕ КОНТОРЫ (или ОКОНЧАТЕЛЬНОЕ РЕШЕНИЕ ВЕДОМСТВА) – Final Office Action (rejection) an office (the United States Patent and Trademark Office (USPTO)) action on the second or any subsequent examination or consideration by an examiner that is intended to close the prosecution of a nonprovisional patent application. Applicant's reply under 37 CFR 1.113 (CFR:- short for the US Code of Federal Regulations) to a final rejection is limited either to an appeal in the case of rejection of any claim to the Board of Patent Appeals and Interferences (37 CFR 1.191) or to an amendment complying with the requirements set forth in the office action (37 CFR 1.114 or 1.116). Reply to a final rejection must comply with 37 CFR 1.114 or include cancellation of, or appeal from the rejection of, each rejected claim. If any claim stands allowed, the reply to a final rejection must comply with any requirements or objections as to form (37 CFR 1.113(c)).

FINAL PAYMENT = ЗАКЛЮЧИТЕЛЬНЫЙ ПЛАТЁЖ (или ОКОНЧАТЕЛЬНЫЙ ПЛАТЁЖ) – The Final (usually the second) Payment is the amount outstanding for an Instalment, which must be paid to take delivery of the underlying asset. May also be referred to as the Exercise Price.

FINALS = КОНЕЧНЫЕ РЕЗУЛЬТАТЫ

FINAL SETTLEMENT PRICE = ЗАКЛЮЧИТЕЛЬНАЯ РАСЧЁТНАЯ ЦЕНА (или ОКОНЧАТЕЛЬНАЯ РАСЧЁТНАЯ ЦЕНА) – Final Settlement Price is the price at which a cash-settled futures contract is settled at maturity, pursuant to a procedure specified by the exchange.

FINAL SETTLEMENT VALUE = ЗАКЛЮЧИТЕЛЬНАЯ РАСЧЁТНАЯ СТОИМОСТЬ (или ОКОНЧАТЕЛЬНАЯ РАСЧЁТНАЯ СТОИМОСТЬ) – Final Settlement Value is a settlement value specified at the end of the last trading day of a financial contract. / Расчётная стоимость финансового контракта, указываемая в конце последнего дня торговли.

FINAL TRANSFER = ЗАКЛЮЧИТЕЛЬНЫЙ ПЕРЕВОД (или ОКОНЧАТЕЛЬНЫЙ ПЕРЕВОД) – Final Transfer is an irrevocable and unconditional transfer which discharges the obligation to deliver or pay. See also Provisional Transfer.

FINANCE = ФИНАНСЫ – (1) Finance:- study of money and its management. / Наука о деньгах и управлении ими.

(2) Finance is the Charge/Cost of credit, including interest paid by a customer for a consumer loan. Under the Truth in Lending Act, the finance charge must be disclosed to the customer in advance. Conduct or transaction of money matters, especially those affecting public spending, as in the banking or investment professions.

FINANCE BILL = ФИНАНСОВЫЙ ВЕКСЕЛЬ – Finance Bill is a bill of exchange not directly connected with an actual business transaction. Frequently takes the form of a Promissory Note. Finance Bills include Treasury Bills and Notes issued by public authorities and banker's acceptances.

FINANCE CHARGE = ФИНАНСОВЫЙ СБОР – Finance Charge is a fee charged for the use of credit or the extension of existing credit. May be a flat fee or a percentage of borrowings, with percentage-based finance charges being the most common. A finance charge is often an aggregated cost, including the cost of the carrying the debt itself along with any related transaction fees, account maintenance fees or late fees charged by the lender. Finance charges allow lenders to make a profit on the use of their money. Finance charges for commoditized credit services like car loans, mortgages and credit cards have known ranges and will depend most on the credit-worthiness of the person looking to borrow. Regulations exist in many countries that limit the maximum finance charge assessed on a given type of credit – but many of the limits still allow for predatory lending practices, where finance charges can amount to 25% or more annually. Finance Charge is the total Dollar amount paid to get credit.

FINANCE COMPANY = ФИНАНСОВАЯ КОМПАНИЯ – Finance Company is a company that makes loans to individuals. / Финансовая Компания – компания, занимающаяся предоставлением займов частным лицам или коммерческим предприятиям. В отличие от банков, финансовые компании не принимают депозиты, а получают финансирование из банков, финансовых

институтов и иных финансовых источников. В общем финансовые компании подразделяются на три категории:- (i) потребительские финансовые компании (consumer finance company), также известные как компании по предоставлению мелких займов (small loan companies), или компании по предоставлению прямых займов (direct loan companies), которые кредитуют частные лица в соответствии с законами о предоставлении мелких займов, действующими в различных штатах США; (ii) компании финансирования продаж (sale finance companies), также называемыми как акцептные компании (acceptance companies), приобретающие оптом и в розницу краткосрочные обязательства фирм, торгующих потребительскими и другими товарами, например, автомобилями; (iii) коммерческие финансовые компании (commercial finance companies), также называющиеся как коммерческие кредитные компании (commercial credit companies), предоставляют займы производителям и оптовым торговцам; эти займы обеспечиваются счетами к получению, товарными запасами и оборудованием. Финансовые компании, как правило, пользуются высоким кредитным рэйтиньгом и могут, таким образом, получать займы по низшим рыночным ставкам, что позволяет им предоставлять займы по ставкам, не намного превышающим банковские. Хотя их клиенты обычно не могут получить банковский кредит, эти компании имеют низкий процент невыплат. Финансовые компании в общем чувствительны к процентным ставкам, то есть рост и снижение рыночных процентных ставок напрямую влияют на их прибыли; по этой причине финансовые компании, представляющие собой акционерные общества открытого типа, иногда называются денежными магазинами (money stocks).

FINANCE HOUSES = ФИНАНСОВЫЕ ДОМА – Finance Houses are the financial corporations that specialize in the financing of hire purchase arrangements.

FINANCE LEASE = ФИНАНСОВАЯ АРЕНДА (или ФИНАНСОВЫЙ ЛИЗИНГ) – Finance Lease:- in the United Kingdom, an equipment-leasing arrangement that provides the lessee with a means of financing for the leased equipment; a common method for leasing motor carrier trailers. Also known as Capital Lease in the United States.

FINANCES = ФИНАНСЫ – Finances:- an entity's pecuniary resources. See also Public Finance. / Под Финансами, от Французского слова Finances, означающее Денежные Средства, понимается совокупность экономических отношений в процессе создания и использования централизованных и децентрализованных фондов денежных средств. Финансы возникли при регулярном товарно-денежном обращении с развитием государства и его потребностей в денежных ресурсах.

FINANCIAL = ФИНАНСОВЫЙ – Financial:- reference to transactions involving money. / Данный термин относится к операциям с деньгами.

FINANCIAL ACCOUNT = ФИНАНСОВЫЙ СЧЁТ – The Financial Account is the last in the sequence of accounts recording transactions. The sum of the transactions recorded in the financial account of each sector should equal the balancing item carried forward from the capital account, net lending or net borrowing, which is the outcome of its non-financial transactions. The Financial Account (in the United States) consists of transactions between US residents and nonresidents for direct investment, portfolio investment, other investment, reserves, and financial derivatives other than reserves. / строка баланса (item).

FINANCIAL ACCOUNTING STANDARDS BOARD = ФИНАНСОВАЯ ПАЛАТА ПО СТАНДАРТАМ БУХГАЛТЕРСКОГО УЧЁТА – Since 1973, the Financial Accounting Standards Board (FASB) has been the designated organization in the private sector for establishing standards of financial accounting that govern the preparation of financial reports by nongovernmental entities. Those standards are officially recognized as authoritative by the Securities and Exchange Commission (SEC) (Financial Reporting Release No. 1, Section 101, and reaffirmed in its April 2003 Policy Statement) and the American Institute of Certified Public Accountants (Rule 203, Rules of Professional Conduct, as amended May 1973 and May 1979). Such standards are important to the efficient functioning of the economy because decisions about the allocation of resources rely heavily on credible, concise, and understandable financial information. The SEC has statutory authority to establish financial accounting and reporting standards for publicly held companies under the Securities Exchange Act of 1934. Throughout its history, however, the Commission's policy has been to rely on the private sector for this function to the extent that the private sector demonstrates ability to fulfill the responsibility in the public interest. The Mission of the Financial Accounting Standards Board is to establish and improve standards of financial accounting and reporting that foster financial reporting by nongovernmental entities that provides decision-useful information to investors and other users of financial reports. That mission is accomplished through a comprehensive and independent process that encourages broad participation, objectively considers all stakeholder views, and is subject to oversight by the Financial Accounting Foundation's Board of Trustees. Our Independent Structure:- the FASB is part of a structure that is independent of all other business and professional organizations. That structure includes the Financial Accounting Foundation (Foundation), the FASB, the Financial Accounting Standards Advisory Council (FASAC), the Governmental Accounting Standards Board (GASB), and the Governmental Accounting Standards Advisory Council (GASAC). Financial Accounting Foundation (FAF):- the Foundation is the independent, private sector organization that is responsible for the oversight, administration, and finances of the FASB, the GASB, and their advisory councils FASAC and GASAC. The Foundation's primary duties include protecting the independence and integrity of the standards-setting process and appointing members of the FASB, GASB, FASAC, and GASAC. The Foundation's website includes a complete description of the Foundation, provides a list of and background information about members of the Board of Trustees, and provides other useful information. In 1973, the Foundation established the FASB to establish and improve standards of financial accounting and reporting for nongovernmental entities. Consistent with that mission, the FASB maintains the FASB Accounting Standards Codification™ (Accounting Standards Codification) which represents the source of authoritative standards of accounting and reporting, other than those issued by the SEC, recognized by the FASB to be applied by nongovernmental entities. Financial Accounting Standards Advisory Council (FASAC):- the primary function of FASAC is to advise the FASB on technical issues on the Board's agenda, possible new agenda items, project priorities, procedural matters that may require the attention of the FASB, and other matters as may be requested by the FASB or its chairman. At present, the Council has more than 30 members who represent a broad cross section of the FASB's constituency. Governmental Accounting Standards Board:- in 1984, the Foundation established the GASB to set standards of financial accounting and reporting for state and local governmental units. As with the FASB, the Foundation is responsible for selecting its members, ensuring adequate funding, and exercising general oversight. Governmental Accounting Standards Advisory Council (GASAC) has responsibility for advising the GASB on technical issues on the Board's agenda, project priorities, matters likely to require the attention of the GASB, and such other matters as may be requested by the GASB or its chairman. The seven, full-time members of the FASB are appointed by the Foundation's Board of Trustees and may serve up to two five-year terms. A 60+ person staff supports the Board. Board members and staff each have a concern for investors, other users, and the public interest in matters of financial accounting and reporting and collectively have knowledge and experience in investing, accounting, finance, business, accounting education, and research. To ensure the independence of Board members and staff, the Foundation has implemented policies about personal investments and other personal activities that are designed to prevent potential conflicts of interest. Financial Accounting Standards Board (FASB) is the US independent, non-statutory body to which SEC (short for the US Securities and Exchange Commission) delegates the task of setting accounting standards for companies in general. The Financial Accounting Standards Board (FASB) is a

private-sector organization responsible for establishing standards of accounting and financial reporting in the United States. Headquartered in Norwalk, State of Connecticut, the United States. / , от Латинского слова Affirmo, означающее Утверждаю, .

FINANCIAL ACCOUNTING STANDARDS BOARD STATEMENT 133 (FAS 133) = ОТЧЁТ № 133 СОГЛАСНО НОРМАМ ФИНАНСОВОЙ ПАЛАТЫ ПО СТАНДАРТАМ БУХГАЛТЕРСКОГО УЧЁТА – Summary of Statement No. 133:- Accounting for Derivative Instruments and Hedging Activities (Issued 6/98):- This Statement establishes accounting and reporting standards for derivative instruments, including certain derivative instruments embedded in other contracts, (collectively referred to as Derivatives) and for hedging activities. It requires that an entity recognize all derivatives as either assets or liabilities in the statement of financial position and measure those instruments at fair value. If certain conditions are met, a derivative may be specifically designated as (a) a hedge of the exposure to changes in the fair value of a recognized asset or liability or an unrecognized firm commitment, (b) a hedge of the exposure to variable cash flows of a forecasted transaction, or (c) a hedge of the foreign currency exposure of a net investment in a foreign operation, an unrecognized firm commitment, an available-for-sale security, or a foreign-currency-denominated forecasted transaction. The accounting for changes in the fair value of a derivative (that is, gains and losses) depends on the intended use of the derivative and the resulting designation:- (i) For a derivative designated as hedging the exposure to changes in the fair value of a recognized asset or liability or a firm commitment (referred to as a Fair Value Hedge), the gain or loss is recognized in earnings in the period of change together with the offsetting loss or gain on the hedged item attributable to the risk being hedged. The effect of that accounting is to reflect in earnings the extent to which the hedge is not effective in achieving offsetting changes in fair value. (ii) For a derivative designated as hedging the exposure to variable cash flows of a forecasted transaction (referred to as a Cash Flow Hedge), the effective portion of the derivative's gain or loss is initially reported as a component of other comprehensive income (outside earnings) and subsequently reclassified into earnings when the forecasted transaction affects earnings. The ineffective portion of the gain or loss is reported in earnings immediately. (iii) For a derivative designated as hedging the foreign currency exposure of a net investment in a foreign operation, the gain or loss is reported in other comprehensive income (outside earnings) as part of the cumulative translation adjustment. The accounting for a fair value hedge described above applies to a derivative designated as a hedge of the foreign currency exposure of an unrecognized firm commitment or an available-for-sale security. Similarly, the accounting for a cash flow hedge described above applies to a derivative designated as a hedge of the foreign currency exposure of a foreign-currency-denominated forecasted transaction. (iv) For a derivative not designated as a hedging instrument, the gain or loss is recognized in earnings in the period of change. Under this Statement, an entity that elects to apply hedge accounting is required to establish at the inception of the hedge the method it will use for assessing the effectiveness of the hedging derivative and the measurement approach for determining the ineffective aspect of the hedge. Those methods must be consistent with the entity's approach to managing risk. This Statement applies to all entities. A not-for-profit organization should recognize the change in fair value of all derivatives as a change in net assets in the period of change. In a fair value hedge, the changes in the fair value of the hedged item attributable to the risk being hedged also are recognized. However, because of the format of their statement of financial performance, not-for-profit organizations are not permitted special hedge accounting for derivatives used to hedge forecasted transactions. This Statement does not address how a not-for-profit organization should determine the components of an operating measure if one is presented. This Statement precludes designating a nonderivative financial instrument as a hedge of an asset, liability, unrecognized firm commitment, or forecasted transaction except that a nonderivative instrument denominated in a foreign currency may be designated as a hedge of the foreign currency exposure of an unrecognized firm commitment denominated in a foreign currency or a net investment in a foreign operation. This Statement amends FASB Statement No. 52, Foreign Currency Translation, to permit special accounting for a hedge of a foreign currency forecasted transaction with a derivative. It supersedes FASB Statements No. 80, Accounting for Futures Contracts, No. 105, Disclosure of Information about Financial Instruments with Off-Balance-Sheet Risk and Financial Instruments with Concentrations of Credit Risk, and No. 119, Disclosure about Derivative Financial Instruments and Fair Value of Financial Instruments. It amends FASB Statement No. 107, Disclosures about Fair Value of Financial Instruments, to include in Statement 107 the disclosure provisions about concentrations of credit risk from Statement 105. This Statement also nullifies or modifies the consensuses reached in a number of issues addressed by the Emerging Issues Task Force. This Statement is effective for all fiscal quarters of fiscal years beginning after 1999-June-15. Initial application of this Statement should be as of the beginning of an entity's fiscal quarter; on that date, hedging relationships must be designated anew and documented pursuant to the provisions of this Statement. Earlier application of all of the provisions of this Statement is encouraged, but it is permitted only as of the beginning of any fiscal quarter that begins after issuance of this Statement. This Statement should not be applied retroactively to financial statements of prior periods. The Financial Accounting Standards Board Statement 133 (FAS 133) obliges US companies to put all financial derivative instruments that are not used to hedge exposure on the balance sheet at market value. Companies therefore disclose unrealized gains and losses on derivatives, rather than accounting for them only at maturity.

FINANCIAL ACTION TASK FORCE ON MONEY LAUNDERING = ФИНАНСОВАЯ СЛУЖБА ПО ПРОТИВОДЕЙСТВИЮ ОТМЫВАНИЮ ДЕНЕГ – The Financial Action Task Force (FATF) is an inter-governmental body established in 1989 by the Ministers of its Member jurisdictions. The objectives of the FATF are to set standards and promote effective implementation of legal, regulatory and operational measures for combating money laundering, terrorist financing and other related threats to the integrity of the international financial system. The FATF is therefore a 'policy-making body' which works to generate the necessary political will to bring about national legislative and regulatory reforms in these areas. The FATF has developed a series of Recommendations that are recognised as the international standard for combating of money laundering and the financing of terrorism and proliferation of weapons of mass destruction. They form the basis for a co-ordinated response to these threats to the integrity of the financial system and help ensure a level playing field. First issued in 1990, the FATF Recommendations were revised in 1996, 2001, 2003 and most recently in 2012 to ensure that they remain up to date and relevant, and they are intended to be of universal application. The FATF monitors the progress of its members in implementing necessary measures, reviews money laundering and terrorist financing techniques and counter-measures, and promotes the adoption and implementation of appropriate measures globally. In collaboration with other international stakeholders, the FATF works to identify national-level vulnerabilities with the aim of protecting the international financial system from misuse. The FATF's decision making body, the FATF Plenary, meets three times per year. The Financial Action Task Force (FATF) was established in July 1989 by a Group of Seven (G-7) Summit in Paris, initially to examine and develop measures to combat money laundering. In October 2001, the FATF expanded its mandate to incorporate efforts to combat terrorist financing, in addition to money laundering. Since its inception, the FATF has operated under a fixed life-span, requiring a specific decision by its Ministers to continue. The current mandate of the FATF (2012-2020) was adopted at a Ministerial meeting in April 2012. The objectives of the FATF are to set standards and promote effective implementation of legal, regulatory and operational measures for combating money laundering, terrorist financing and other related threats to the integrity of the international financial system. Starting with its own members, the FATF monitors countries' progress in implementing the FATF Recommendations; reviews money laundering and terrorist financing techniques and counter-measures; and, promotes the adoption and implementation of the FATF Recommendations globally. The FATF currently (2013-April) comprises 34 member jurisdictions and 2 regional organisations, representing most major financial centres in all parts of the globe:- Argentina; Australia; Austria; Belgium; Brazil; Canada; China; Denmark; the European

Commission; Finland; France; Germany; Greece; Gulf Co-operation Council; Hong Kong, China; Iceland; India; Ireland; Italy; Japan; Korea, Republic of; Luxembourg; Mexico; Netherlands, Kingdom of; New Zealand; Norway; Portugal; the Russian Federation; Singapore; South Africa; Spain; Sweden; Switzerland; Turkey; the United Kingdom; and the United States. FATF Associate Members:- Asia/Pacific Group on Money Laundering (APG); Caribbean Financial Action Task Force (CFATF); Council of Europe Committee of Experts on the Evaluation of Anti-Money Laundering Measures and the Financing of Terrorism (MONEYVAL); Eurasian Group (EAG); Eastern and Southern Africa Anti-Money Laundering Group (ESAAMLG); Financial Action Task Force on Money Laundering in South America (GAFISUD); Inter Governmental Action Group against Money Laundering in West Africa (GIABA); and Middle East and North Africa Financial Action Task Force (MENAFATF). FATF Observers:- the following international organisations have observer status with the FATF. The international organisations listed are those which have, among other functions, a specific anti-money laundering mission or function:- African Development Bank; Anti-Money Laundering Liaison Committee of the Franc Zone (CLAB); Asian Development Bank; Basel Committee on Banking Supervision (BCBS); Commonwealth Secretariat; Egmont Group of Financial Intelligence Units; European Bank for Reconstruction and Development (EBRD); European Central Bank (ECB); Eurojust; Europol; Group of International Finance Centre Supervisors (GIFCS) (formerly the Offshore Group of Banking Supervisors – OGBS); Inter-American Development Bank (IDB); International Association of Insurance Supervisors (IAIS); International Monetary Fund (IMF); International Organisation of Securities Commissions (IOSCO); Interpol; Interpol/Money Laundering; Organization of American States / Inter-American Committee Against Terrorism (OAS/CICTE); Organization of American States / Inter-American Drug Abuse Control Commission (OAS/CICAD); Organisation for Economic Co-operation and Development (OECD); Organization for Security and Co-operation in Europe (OSCE); Task Force on Money Laundering in Central Africa (GABAC); United Nations – Office on Drugs and Crime (UNODC); Counter-Terrorism Committee of the Security Council (UNCTC); The Al-Qaida and Taliban Sanctions Committee (1267 Committee); World Bank; and World Customs Organization (WCO). Headquartered in Paris, France. Financial Action Task Force on Money Laundering (FATF) is the most important committee for international cooperation against money laundering and financing of terrorism. FATF was established in 1989 in Paris, France. Its main task is to discover the methods of money laundering and terrorism financing, to develop effective counter measures and to standardize the policy regarding action against money laundering and terror financing on an international level with the least requirements.

FINANCIAL ANALYSIS = ФИНАНСОВЫЙ АНАЛИЗ – Financial Analysis is an analysis of political and economic conditions, the state of the capital market (global analysis) and of the industry and the company (individual analysis) in preparation for an investment policy, an asset allocation and individual share recommendations.

FINANCIAL ANALYSIS AUDITING COMPLIANCE TRACKING SYSTEM = СИСТЕМА XX – Financial Analysis Auditing Compliance Tracking System is the US National Futures Association's computerized system of maintaining financial records of its member firms and monitoring their financial conditions.

FINANCIAL AND OPERATIONAL COMBINED UNIFORM SINGLE REPORT = ОДНООБРАЗНЫЙ ПЕРСОНАЛЬНЫЙ КОМБИНИРОВАННЫЙ ОТЧЁТ О ФИНАНСАХ И ОПЕРАЦИЯХ – Financial And Operational Combined Uniform Single Report gives the exchange a complete, detailed picture of member firms' financial and operational conditions. Firms must file monthly summaries of their financial and operational data, and must respond quarterly to several hundred questions about financial and operational conditions and activities.

FINANCIAL AND OPERATIONAL REPORTING IN A COMPUTERIZED ENVIRONMENT = ОТЧИТЫВАНИЕ О ФИНАНСАХ И ОПЕРАЦИЯХ В КОМПЬЮТЕРИЗИРОВАННОЙ СРЕДЕ – Financial And Operational Reporting In A Computerized Environment:- consolidates all available member organization financial, operational, sales practice, and other regulatory information. The system gives the New York Stock Exchange regulatory staff on-line viewing, editing, retrieval, and monitoring capabilities.

FINANCIAL APPLICATION = ФИНАНСОВОЕ ПРИЛОЖЕНИЕ (или ФИНАНСОВОЕ ПРОГРАММНОЕ ОБЕСПЕЧЕНИЕ) – Financial Application:- the SWIFT II application within which all SWIFT II user-to-user messages are input and output. Certain user-to-SWIFT and SWIFT-to-user messages may also be sent and received within the Financial Application (FIN). / Сообщество по Всемирной Межбанковской Финансовой Дальней Связи (СВМФДС; The Society for Worldwide Interbank Financial Telecommunication (SWIFT)). коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо).

FINANCIAL ASSET = ФИНАНСОВЫЙ АКТИВ – Cash or a contractual right to receive cash or another financial asset or to exchange financial assets or liabilities with another entity under potentially favorable conditions. Financial Asset is an asset that is:- (i) cash; (ii) an equity instrument of another entity; (iii) a contractual right:- (a) to receive cash or another financial asset from another entity; or (b) to exchange financial assets or financial liabilities with another entity under conditions that are potentially favorable to the entity; or (iv) a contract that will or may be settled in the entity's own equity instruments and is:- (a) a non-derivative for which the entity is or may be obliged to receive a variable number of the entity's own equity instruments; or (b) a derivative that will or may be settled other than by the exchange of a fixed amount of cash or another financial asset for a fixed number of the entity's own equity instruments. For this purpose the entity's own equity instruments do not include instruments that are themselves contracts for the future receipt or delivery of the reporting entity's own equity instruments.

FINANCIAL AUXILIARIES = ФИНАНСОВЫЕ ПОМОЩНИКИ – Financial Auxiliaries:- corporations such as securities brokers, loan brokers, floatation corporations, insurance brokers etc. They also include corporations whose principal function is to guarantee, by endorsement, bills or similar instruments intended for discounting or refinancing by financial corporations, and also corporations which arrange hedging instruments such as swaps, options, and futures or other instruments which are continually being developed as a result of wide-ranging financial innovation. Auxiliary financial activities are ones closely related to financial intermediation but which are not financial intermediation themselves, such as the repackaging of funds. Financial auxiliaries include such activities as insurance broking and fund management.

FINANCIAL CENTER = ФИНАНСОВЫЙ ЦЕНТР – Financial Center is a collective term for the interface between national and international financial systems in the broadest sense (banks, financial markets, insurance and other service companies). A financial center may be national (e.g., Switzerland), regional (e.g., Ticino in Switzerland) or a hub location with a strong banking presence and close ties to the international financial community (e.g., Zurich in Switzerland). / , например, .

FINANCIAL CONTRACT = ФИНАНСОВЫЙ КОНТРАКТ – Financial Contract:- any futures and options contracts and any other instruments designated as financial contracts which are based on any currency, for example, US Dollar Index®, the Euro Based Currency or the Japanese Based Currency, and traded at the exchange.

FINANCIAL CORPORATIONS = ФИНАНСОВЫЕ КОРПОРАЦИИ – Financial Corporations are all bodies recognised as independent legal entities whose principal activity is financial intermediation and/or the production of auxiliary financial services. However, the United Kingdom currently treats financial auxiliaries as non-financial corporations.

FINANCIAL DEPOSITORY INSTITUTION = ФИНАНСОВОЕ ДЕПОЗИТАРНОЕ УЧРЕЖДЕНИЕ (или ФИНАНСОВЫЙ ДЕПОЗИТАРНЫЙ ИНСТИТУТ) – Financial Depository Institutions (FDIs) are entities which accept money as savings or investments and in turn provide funds to borrowers. In an investment context, financial institution refers to organizations with large funds to invest, for example, pension funds and insurance companies.

FINANCIAL DERIVATIVE = ФИНАНСОВЫЙ ПРОИЗВОДНЫЙ ИНСТРУМЕНТ (или ФИНАНСОВЫЙ ДЕРИВАТИВ) – A Financial Derivative is a financial instrument that is linked to another financial instrument, index or commodity and enables specific risks (of changes in interest rates, foreign exchange rates, prices or credit standing, for example) to be traded in financial markets in their own right. For statistical purposes, a derivative is treated as a separate financial instrument from the instrument on which the contract is based.

FINANCIAL DERIVATIVES IN A NET ASSET POSITION = ФИНАНСОВЫЕ ДЕРИВАТИВЫ В ЧИСТОЙ ПОЗИЦИИ ПО АКТИВАМ – Financial Derivatives In a Net Asset Position are contracts where the market value of the opening and closing positions is positive at the reporting date. They include:- (i) options (including call and put options, exchange-traded and over-the-counter options, interest-rate options, bullion options, commodity options and equity options, warrants; (ii) interest rate swaps; (iii) cross-currency interest-rate swaps; (iv) currency swaps; (v) futures, i.e. bank bill, bond, pork bellys; (vi) forward rate agreements; and (vii) forward foreign-exchange contracts. They exclude:- (i) derivative margin accounts which hold deposits lodged with an exchange or clearing house as collateral to cover adverse movements in market prices; and (ii) Repurchase/Resale agreements despite their similarity to a Forward Rate Agreements (FRAs) and/or Swaps. / соглашения об откупе/перепродаже .

FINANCIAL DERIVATIVES IN A NET LIABILITY POSITION = ФИНАНСОВЫЕ ДЕРИВАТИВЫ В ЧИСТОЙ ПОЗИЦИИ ПО ПАССИВАМ – Financial Derivatives In a Net Liability Position are contracts where the market value of the opening and closing position is negative at the reporting date. They include:- (i) options (including call and put options, exchange-traded and over-the-counter options, interest-rate options, bullion options, commodity options and equity options, warrants; (ii) interest rate swaps; (iii) cross-currency interest-rate swaps; (iv) currency swaps; (v) futures, i.e. bank bill, bond, pork bellys; (vi) forward rate agreements; and (vii) forward foreign-exchange contracts. They exclude:- (i) derivative margin accounts which hold deposits lodged with an exchange or clearing house as collateral to cover adverse movements in market prices; and (ii) Repurchase/Resale agreements despite their similarity to a Forward Rate Agreements (FRAs) and/or Swaps. / соглашения об откупе/перепродаже .

FINANCIAL DOCUMENTS = ФИНАНСОВЫЕ ДОКУМЕНТЫ – A term Financial Documents means bills of exchange, checks, payment receipts, promissory notes, or other similar instruments used for obtaining the payment of money. See also Commercial Documents. / Финансовые документы означают переводные векселя, чеки, платёжные расписки, простые векселя, или иные подобные инструменты, используемые для получения платежа деньгами. Смотрите также Коммерческие Документы (Commercial Documents).

FINANCIAL ENGINEERING = ФИНАНСОВАЯ ИНЖЕНЕРИЯ – Financial Engineering is the use of financial instruments to facilitate transactions, i.e. financial rather than strategic or operational engineering. In its broadest sense the term is taken to mean general qualified financial advisory services, e.g., solving capital and asset management problems, selecting financing strategies and instruments, drawing up financial and cash plans, assessing and evaluating investment projects. Also known as Structured Finance. Financial Engineering may include also incorporation of offshore companies and their maintenance, legal and tax advisory services, nominee holding, mergers and acquisitions, restructuring, international corporate finance and fiduciary operations. / , то есть . , например, .

FINANCIAL FLEXIBILITY = ФИНАНСОВАЯ ГИБКОСТЬ – Financial Flexibility is the ability of an enterprise to take effective actions to alter the amounts and timing of cash flows so it can respond to unexpected needs and opportunities. An enterprise with a high degree of financial flexibility is better able to survive bad times, to recover from unexpected setbacks, and to take advantage of profitable and unexpected investment opportunities. Generally, the greater the financial flexibility, the lower the risk of enterprise failure.

FINANCIAL FUTURES = ФИНАНСОВЫЙ ФЬЮЧЕРС – Financial Futures are the contracts for the delivery of financial instruments, i.e. a currency, on a future date. Financial futures are used to hedge against the rise and fall of interest and exchange rates. Forward contracts for the purchase or sale of precious metals, securities, etc. Financial futures are traded on options exchanges. Hedge negotiated at current prices against future interest rate and currency risks. Futures contracts based on financial instruments such as US Treasury bonds, CDs and other interest-sensitive issues, currencies and stock market indicators. See also Futures and Stock Index Futures. / Финансовые Фьючерсы – контракты по поставке финансовых инструментов, то есть валюты, на дату в будущем. Финансовые фьючерсы используются для хэдьжирования против роста или падения процентных ставок и курсов обмена. Финансовый Фьючерс – фьючерсный контракт на какой-либо финансовый инструмент. Цены на подобные контракты обычно изменяются под влиянием процентных ставок. По мере роста ставок цены контрактов падают; по мере снижения процентных ставок цены контрактов растут. Примерами финансовых инструментов, на которые могут заключаться финансовые фьючерсные контракты, являются краткосрочные Казначейские векселя, долгосрочные Казначейские векселя, ценные бумаги с передачей дохода Государственной Национальной Ассоциации по Закладным, так называемой Дьжини Мэй (Government National Mortgage Association (Ginnie Mae)), иностранные валюты, а также депозитные сертификаты. Торговые операции с этими фьючерсами регулируются Федеральной Комиссией по Торговле Сырьевыми Фьючерсами (Commodities Futures Trading Commission). Инвесторы используют фьючерсы для спекуляций на динамике процентных ставок. Финансовые институты (банки, страховые компании, брокерские фирмы) используют их для хэдьжирования финансовых портфелей от неблагоприятных колебаний процентных ставок.

FINANCIAL GEARING = ФИНАНСОВАЯ ПЕРЕДАЧА (или ПРЕДОСТАВЛЕНИЕ ФИНАНСОВОГО ПЛЕЧА, или ХХ) – Financial Gearing:- the expression gearing or financial gearing is often used to refer to the impact on the profits for a company caused by fixed interest borrowing. For a financially highly geared company a small change in the total profits might have a very large proportionate impact on the profits for shareholders. A company with lots of fixed interest borrowing is ‘highly geared’.

FINANCIAL INFORMATION EXCHANGE = ОБМЕН ФИНАНСОВОЙ ИНФОРМАЦИЕЙ – Financial Information Exchange (FIX) is a messaging protocol developed for the real-time electronic exchange of securities transaction information. FIX is popular with fund managers, brokerdealers, and institutional investors.

FINANCIAL INNOVATIONS = ФИНАНСОВЫЕ ИННОВАЦИИ – Financial Innovations are the financial market instruments embodying novel conditions. / Инструменты финансового рынка, включающие в себя новые условия.

FINANCIAL INSTITUTION = ФИНАНСОВОЕ УЧРЕЖДЕНИЕ (или ФИНАНСОВЫЙ ИНСТИТУТ, или ФИНАНСОВАЯ ОРГАНИЗАЦИЯ) – (1) Financial Institution:- as applied to encryption items, means any of the following:- (i) a broker, dealer, government securities broker or dealer, self-regulatory organization, investment company or investment adviser, which is regulated or

supervised by the Securities and Exchange Commission or a self-regulatory organization that is registered with the Securities and Exchange Commission; or (ii) a broker, dealer, government securities broker or dealer, investment company, investment adviser, or entity that engages in securities activities that, if conducted in the United States, would be described by the definition of the term 'self-regulatory organization' in the Securities Exchange Act of 1934, which is organized under the laws of a foreign country and regulated or supervised by a foreign securities authority; or (iii) a US board of trade that is designated as a contract market by the Commodity Futures Trading Commission or a futures commission merchant that is regulated or supervised by the Commodity Futures Trading Commission; or (iv) a US entity engaged primarily in the business of issuing a general purpose charge, debit, or stored value card, or a branch of, or affiliate controlled by, such an entity; or (v) a branch or affiliate of any of the entities listed in paragraphs (i), (ii), or (iii) of this definition regulated or supervised by the Securities and Exchange Commission, the Commodity Futures Trading Commission, or a foreign securities authority; or (vi) an affiliate of any of the entities listed in paragraph (i), (ii), (iii), or (v), of this definition engaged solely in the business of providing data processing services to one or more bank or financial institutions, or a branch of such an affiliate; or (vii) a company organized and regulated under the laws of any of the United States and its branches and affiliates whose primary and predominant business activity is the writing of insurance or the reinsuring of risks; or a company organized and regulated under the laws of a foreign country and its branches and affiliates whose primary and predominant business activity is the writing of insurance or the reinsuring of risks. Financial Institution means:- (1) A bank in the United States which accepts demand deposits; and (2) An association organized pursuant to Federal or State law and supervised by Federal or State banking authorities.

(2) For SWIFT purposes, Financial Institution is an organization primarily established to offer and perform services specifically related to the provision of financial (monetary) services. An entity which accepts money as savings or investments and in turn provides funds to borrowers. Financial Institution is the general term for business entities whose primary activities are financial in nature – commercial banks, mutual banks, insurance companies, savings and loans associations, etc, as opposed to entities engaging in the production of goods or services. An institution authorised to accept deposits (licensed deposit taker), and to provide financial services directly to a customer. / Сообщество по Всемирной Межбанковской Финансовой Дальней Связи (СВМФДС; The Society for Worldwide Interbank Financial Telecommunication (SWIFT)). коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо).

(3) In an investment context, Financial Institution refers to organizations with large funds to invest, for example, pension funds and insurance companies. Many investors with limited time or interest choose to invest indirectly in the sharemarket by selecting an equity fund managed by a financial institution. See also Depository Institution. Financial Institution is an institution that uses its funds chief ly to purchase financial assets (such as loans or securities) as opposed to tangible assets (such as real estate). Financial institutions can be separated into two major groups according to the nature of the principal claims they issue:- (i) Depository Institutions (also called Depository Intermediaries), such as commercial banks, savings and loan associations, savings banks, and credit unions, which obtain funds largely by accepting deposits from the public; and (ii) Nondepositories (sometimes called Nondepository Intermediaries), such as life insurance and property-casualty insurance companies and pension funds, whose claims are the policies they sell or their promise to provide income after retirement. / Финансовая Организация – организация, привлекающая средства из открытых общественных источников для помещения их в финансовые активы, такие, как акции, облигации, инструменты денежного рынка, банковские депозиты или кредиты. Депозитные институты (банки, ссудо-сберегательные ассоциации, сберегательные банки, кредитные союзы) выплачивают проценты по вкладам и вкладывают средства главным образом в кредиты. Недепозитные организации (страховые компании, пенсионные планы) привлекают средства либо путём продажи страховых полисов, либо получая средства, вкладываемые работодателем, и выплачивая их по правомочным претензиям или в виде пенсионных выплат. Все чаще многие организации выполняют как депозитные, так и недепозитные функции. Например, брокерские фирмы в настоящий момент помещают деньги клиентов в депозитные сертификаты и во взаимные фонды денежного рынка, а также продают страховые полисы.

(4) Financial Institution:- in national accounting, economic units whose main role is financing, i.e. collecting, transforming and distributing available funds. Also known as Credit Institution in the United Kingdom. / В национальном бюджетном процессе, хозяйствующие субъекты, основной функцией которых является финансирование, то есть инкассирование, трансформирование и распределение доступных фондов. Известно также как Кредитное Учреждение или Кредитная Организация (Credit Institution) в Соединённом Королевстве.

FINANCIAL INSTITUTION ENTRY POINT = ФИНАНСОВОЕ УЧРЕЖДЕНИЕ, ЯВЛЯЮЩЕЕСЯ ПУНКТОМ ВХОДА – Financial Institution Entry Point (EPFI) is the first Financial Institution that receives a transaction in the receiving country.

FINANCIAL INSTRUMENT = ФИНАНСОВЫЙ ИНСТРУМЕНТ – As used by the US Commodity Futures Trading Commission (CFTC), this term generally refers to any futures or option contract that is not based on an agricultural commodity or a natural resource. It includes currencies, equity securities, fixed income securities, and indexes of various kinds. Financial Instrument is any contract that gives rise to both a financial asset of one entity and a financial liability or equity instrument of another entity. There are two basic types:- (i) a debt instrument, which is a loan with an agreement to pay back funds with interest; (ii) an equity security, which is a share or stock in a company. Bond, certificate of deposit, treasury bill or any other method of financing.

FINANCIAL INSTRUMENTS:- DISCLOSURES = ФИНАНСОВЫЕ ИНСТРУМЕНТЫ:- РАСКРЫТИЕ (или РАЗЪЯСНЕНИЕ) – IFRS 7 (short for the International Financial Reporting Standards No. 7) Financial Instruments:- Disclosures – The objective of this IFRS is to require entities to provide disclosures in their financial statements that enable users to evaluate:- (a) the significance of financial instruments for the entity's financial position and performance; and (b) the nature and extent of risks arising from financial instruments to which the entity is exposed during the period and at the reporting date, and how the entity manages those risks. The qualitative disclosures describe management's objectives, policies and processes for managing those risks. The quantitative disclosures provide information about the extent to which the entity is exposed to risk, based on information provided internally to the entity's key management personnel. Together, these disclosures provide an overview of the entity's use of financial instruments and the exposures to risks they create. The IFRS applies to all entities, including entities that have few financial instruments (e.g., a manufacturer whose only financial instruments are accounts receivable and accounts payable) and those that have many financial instruments (e.g., a financial institution most of whose assets and liabilities are financial instruments). When this IFRS requires disclosures by class of financial instrument, an entity shall group financial instruments into classes that are appropriate to the nature of the information disclosed and that take into account the characteristics of those financial instruments. An entity shall provide sufficient information to permit reconciliation to the line items presented in the balance sheet. The principles in this IFRS complement the principles for recognising, measuring and presenting financial assets and financial liabilities in IAS 32 Financial Instruments (short for the International Accounting Standard No. 32 Financial Instruments):- Presentation and IAS 39 Financial Instruments:- Recognition and Measurement. / оценивание и представление финансовых активов в МСБУ 32 (сокращение для Международного Стандарта Бухгалтерского Учёта № 32) Финансовые Инструменты:- Представление и в МСБУ 39 Финансовые Инструменты:- .

FINANCIAL INSTRUMENTS:- PRESENTATION = ФИНАНСОВЫЕ ИНСТРУМЕНТЫ:- ПРЕДСТАВЛЕНИЕ – IAS 32 (short for International Accounting Standard No. 32) Financial Instruments:- Presentation – The objective of this Standard is to establish principles for presenting financial instruments as liabilities or equity and for offsetting financial assets and financial liabilities. It applies to the classification of financial instruments, from the perspective of the issuer, into financial assets, financial liabilities and equity instruments; the classification of related interest, dividends, losses and gains; and the circumstances in which financial assets and financial liabilities should be offset. The principles in this Standard complement the principles for recognising and measuring financial assets and financial liabilities in IAS 39 Financial Instruments:- Recognition and Measurement, and for disclosing information about them in IFRS 7 Financial Instruments (IFRS is a short for the International Financial Reporting Standards):- Disclosures. The issuer of a financial instrument shall classify the instrument, or its component parts, on initial recognition as a financial liability, a financial asset or an equity instrument in accordance with the substance of the contractual arrangement and the definitions of a financial liability, a financial asset and an equity instrument. The issuer of a non-derivative financial instrument shall evaluate the terms of the financial instrument to determine whether it contains both a liability and an equity component. Such components shall be classified separately as financial liabilities, financial assets or equity instruments. A financial instrument is any contract that gives rise to a financial asset of one entity and a financial liability or equity instrument of another entity. A financial asset is any asset that is:- (a) cash; (b) an equity instrument of another entity; (c) a contractual right:- (i) to receive cash or another financial asset from another entity; or (ii) to exchange financial assets or financial liabilities with another entity under conditions that are potentially favorable to the entity; or (d) a contract that will or may be settled in the entity's own equity instruments and is:- (i) a non-derivative for which the entity is or may be obliged to receive a variable number of the entity's own equity instruments; or (ii) a derivative that will or may be settled other than by the exchange of a fixed amount of cash or another financial asset for a fixed number of the entity's own equity instruments. For this purpose the entity's own equity instruments do not include instruments that are themselves contracts for the future receipt or delivery of the entity's own equity instruments. A financial liability is any liability that is:- (a) a contractual obligation:- (i) to deliver cash or another financial asset to another entity; or (ii) to exchange financial assets or financial liabilities with another entity under conditions that are potentially unfavorable to the entity; or (b) a contract that will or may be settled in the entity's own equity instruments and is:- (i) a non-derivative for which the entity is or may be obliged to deliver a variable number of the entity's own equity instruments; or (ii) a derivative that will or may be settled other than by the exchange of a fixed amount of cash or another financial asset for a fixed number of the entity's own equity instruments. For this purpose the entity's own equity instruments do not include instruments that are themselves contracts for the future receipt or delivery of the entity's own equity instruments. An equity instrument is any contract that evidences a residual interest in the assets of an entity after deducting all of its liabilities. A financial instrument may require the entity to deliver cash or another financial asset, or otherwise to settle it in such a way that it would be a financial liability, in the event of the occurrence or non-occurrence of uncertain future events (or on the outcome of uncertain circumstances) that are beyond the control of both the issuer and the holder of the instrument, such as a change in a stock market index, consumer price index, interest rate or taxation requirements, or the issuer's future revenues, net income or debt-to-equity ratio. The issuer of such an instrument does not have the unconditional right to avoid delivering cash or another financial asset (or otherwise to settle it in such a way that it would be a financial liability). Therefore, it is a financial liability of the issuer unless:- (a) the part of the contingent settlement provision that could require settlement in cash or another financial asset (or otherwise in such a way that it would be a financial liability) is not genuine; or (b) the issuer can be required to settle the obligation in cash or another financial asset (or otherwise to settle it in such a way that it would be a financial liability) only in the event of liquidation of the issuer. When a derivative financial instrument gives one party a choice over how it is settled (eg the issuer or the holder can choose settlement net in cash or by exchanging shares for cash), it is a financial asset or a financial liability unless all of the settlement alternatives would result in it being an equity instrument. If an entity reacquires its own equity instruments, those instruments ('treasury shares') shall be deducted from equity. No gain or loss shall be recognised in profit or loss on the purchase, sale, issue or cancellation of an entity's own equity instruments. Such treasury shares may be acquired and held by the entity or by other members of the consolidated group. Consideration paid or received shall be recognised directly in equity. Interest, dividends, losses and gains relating to a financial instrument or a component that is a financial liability shall be recognised as income or expense in profit or loss. Distributions to holders of an equity instrument shall be debited by the entity directly to equity, net of any related income tax benefit. Transaction costs of an equity transaction shall be accounted for as a deduction from equity, net of any related income tax benefit. A financial asset and a financial liability shall be offset and the net amount presented in the balance sheet when, and only when, an entity:- (a) currently has a legally enforceable right to set off the recognised amounts; and (b) intends either to settle on a net basis, or to realise the asset and settle the liability simultaneously. / МСБУ 32 (сокращение для Международного Стандарта Бухгалтерского Учёта № 32) – .

FINANCIAL INSTRUMENTS:- RECOGNITION AND MEASUREMENT = ФИНАНСОВЫЕ ИНСТРУМЕНТЫ:- ПРИЗНАНИЕ И ИЗМЕРЕНИЕ – IAS 39 (short for International Accounting Standard No. 39) Financial Instruments:- Recognition and Measurement – The objective of this Standard is to establish principles for recognising and measuring financial assets, financial liabilities and some contracts to buy or sell non-financial items. Requirements for presenting information about financial instruments are in IAS 32 Financial Instruments:- Presentation. Requirements for disclosing information about financial instruments are in IFRS 7 Financial Instruments (IFRS is a short for the International Financial Reporting Standards):- Disclosures. Initial recognition:- an entity shall recognise a financial asset or a financial liability on its balance sheet when, and only when, the entity becomes a party to the contractual provisions of the instrument. Derecognition of a financial liability:- an entity shall remove a financial liability (or a part of a financial liability) from its balance sheet when, and only when, it is extinguished, i.e. when the obligation specified in the contract is discharged or cancelled or expires. Initial measurement of financial assets and financial liabilities:- When a financial asset or financial liability is recognised initially, an entity shall measure it at its fair value plus, in the case of a financial asset or financial liability not at fair value through profit or loss, transaction costs that are directly attributable to the acquisition or issue of the financial asset or financial liability. Fair value is the amount for which an asset could be exchanged, or a liability settled, between knowledgeable, willing parties in an arm's length transaction. Derecognition of a financial asset:- The following flow chart illustrates the evaluation of whether and to what extent a financial asset is derecognized. Subsequent measurement of financial assets:- For the purpose of measuring a financial asset after initial recognition, this Standard classifies financial assets into the following four categories defined in paragraph 9:- (a) financial assets at fair value through profit or loss; (b) held-to-maturity investments; (c) loans and receivables; and (d) available-for-sale financial assets. An amendment to the Standard, issued in June 2005, permits an entity to designate a financial asset or financial liability (or a group of financial assets, financial liabilities or both) on initial recognition as one(s) to be measured at fair value, with changes in fair value recognised in profit or loss. To impose discipline on this categorisation, an entity is precluded from reclassifying financial instruments into or out of this category. After initial recognition, an entity shall measure financial assets, including derivatives that are assets, at their fair values, without any deduction for transaction costs it may incur on sale or other disposal, except for the following financial assets:- (a) loans and receivables as defined in paragraph 9, which shall be measured at amortised cost using the effective interest method; (b) held-to-maturity investments as defined in paragraph 9, which shall be measured at amortised cost using the effective interest method; and (c) investments in equity instruments that do not have a quoted market price in an active market and whose fair value cannot be reliably measured and derivatives that are linked to and must be settled by delivery of such unquoted equity

instruments, which shall be measured at cost (see Appendix A paragraphs AG80 and AG81). Financial assets that are designated as hedged items are subject to measurement under the hedge accounting requirements in paragraphs 89–102. All financial assets except those measured at fair value through profit or loss are subject to review for impairment in accordance with paragraphs 58–70 and Appendix A paragraphs AG84–AG93. Subsequent measurement of financial liabilities:- After initial recognition, an entity shall measure all financial liabilities at amortised cost using the effective interest method, except for:- (a) financial liabilities at fair value through profit or loss. Such liabilities, including derivatives that are liabilities, shall be measured at fair value except for a derivative liability that is linked to and must be settled by delivery of an unquoted equity instrument whose fair value cannot be reliably measured, which shall be measured at cost. (b) financial liabilities that arise when a transfer of a financial asset does not qualify for derecognition or when the continuing involvement approach applies. Paragraphs 29 and 31 apply to the measurement of such financial liabilities. (c) financial guarantee contracts as defined in paragraph 9. After initial recognition, an issuer of such a contract shall (unless paragraph 47(a) or (b) applies) measure it at the higher of:- (i) the amount determined in accordance with IAS 37 Provisions, Contingent Liabilities and Contingent Assets; and (ii) the amount initially recognised (see paragraph 43) less, when appropriate, cumulative amortisation recognised in accordance with IAS 18 Revenue. (d) commitments to provide a loan at a below-market interest rate. After initial recognition, an issuer of such a commitment shall (unless paragraph 47(a) applies) measure it at the higher of:- (i) the amount determined in accordance with IAS 37; and (ii) the amount initially recognised (see paragraph 43) less, when appropriate, cumulative amortisation recognised in accordance with IAS 18. Gains and losses:- A gain or loss arising from a change in the fair value of a financial asset or financial liability that is not part of a hedging relationship, shall be recognised, as follows. (a) A gain or loss on a financial asset or financial liability classified as at fair value through profit or loss shall be recognised in profit or loss. (b) A gain or loss on an available-for-sale financial asset shall be recognised directly in equity, through the statement of changes in equity, except for impairment losses and foreign exchange gains and losses, until the financial asset is derecognised, at which time the cumulative gain or loss previously recognised in equity shall be recognised in profit or loss. However, interest calculated using the effective interest method is recognised in profit or loss. Dividends on an available-for-sale equity instrument are recognised in profit or loss when the entity's right to receive payment is established. For financial assets and financial liabilities carried at amortised cost a gain or loss is recognised in profit or loss when the financial asset or financial liability is derecognised or impaired, and through the amortisation process. However, for financial assets or financial liabilities that are hedged items the accounting for the gain or loss shall follow paragraphs 89–102. Impairment and uncollectibility of financial assets:- An entity shall assess at each balance sheet date whether there is any objective evidence that a financial asset or group of financial assets is impaired. Hedging:- If there is a designated hedging relationship between a hedging instrument and a hedged item as described in paragraphs 85–88 and Appendix A paragraphs AG102–AG104, accounting for the gain or loss on the hedging instrument and the hedged item shall follow paragraphs 89–102. Hedging relationships are of three types:- (a) fair value hedge:- a hedge of the exposure to changes in fair value of a recognised asset or liability or an unrecognised firm commitment, or an identified portion of such an asset, liability or firm commitment, that is attributable to a particular risk and could affect profit or loss. (b) cash flow hedge:- a hedge of the exposure to variability in cash flows that (i) is attributable to a particular risk associated with a recognised asset or liability (such as all or some future interest payments on variable rate debt) or a highly probable forecast transaction and (ii) could affect profit or loss. (c) hedge of a net investment in a foreign operation as defined in IAS 21. If a fair value hedge meets the conditions in paragraph 88 during the period, it shall be accounted for as follows:- (a) the gain or loss from remeasuring the hedging instrument at fair value (for a derivative hedging instrument) or the foreign currency component of its carrying amount measured in accordance with IAS 21 (for a non-derivative hedging instrument) shall be recognised in profit or loss; and (b) the gain or loss on the hedged item attributable to the hedged risk shall adjust the carrying amount of the hedged item and be recognised in profit or loss. This applies if the hedged item is otherwise measured at cost. Recognition of the gain or loss attributable to the hedged risk in profit or loss applies if the hedged item is an available-for-sale financial asset. If a cash flow hedge meets the conditions in paragraph 88 during the period, it shall be accounted for as follows:- (a) the portion of the gain or loss on the hedging instrument that is determined to be an effective hedge (see paragraph 88) shall be recognised directly in equity through the statement of changes in equity; and (b) the ineffective portion of the gain or loss on the hedging instrument shall be recognised in profit or loss. Hedges of a net investment in a foreign operation, including a hedge of a monetary item that is accounted for as part of the net investment (see IAS 21), shall be accounted for similarly to cash flow hedges:- (a) the portion of the gain or loss on the hedging instrument that is determined to be an effective hedge (see paragraph 88) shall be recognised directly in equity through the statement of changes in equity; and (b) the ineffective portion shall be recognised in profit or loss. / МСБУ 39 (сокращение для Международного Стандарта Бухгалтерского Учёта № 39) – .

FINANCIAL INTERMEDIARY = ФИНАНСОВЫЙ ПОСРЕДНИК – (1) In the United States (US), a Financial Intermediary is an institution like a bank that raises capital by issuing liabilities against itself, for example demand or savings deposits. The intermediary takes the funds raised and makes loans to borrowers or equity investments in nonfinancial firms. Basically, financial intermediaries bring together borrowers and savers. Financial intermediaries play less of a role in financing US corporations than they do for non-US corporations. In many countries, intermediaries play a corporate governance role, for example, helping set the operating and financial policies of the firms they have invested in by serving on corporate boards and monitoring the performance of senior managers. In the US, commercial banks are largely prohibited from exercise a corporate governance role. Financial Intermediary is a company or an institution which serves as an interface between borrowers and lenders, for example, by collecting deposits from the public and making loans to households and businesses. Institution or organization that brings together borrowers and savers, and makes funds available to borrowers at a cost. In the broad sense, the term applies to all financial institutions. Bank, building society, finance house, insurance company or other business that collects funds (from depositors, or members) to use for making loans (to borrowers). / Финансовый Посредник – коммерческий банк, ссудосберегательная ассоциация, взаимный сберегательный банк, кредитный союз или иной посредник, облегчающий процесс перемещения средств между 'точками избытка сбережений' и 'точками недостатка сбережений'. В экономике, имеющей три сектора – частный, коммерческий и правительственный, – 'точки избытка сбережений' (savings surplus units) характеризуются превышением доходов над расходами; 'точки недостатка сбережений' (savings deficit units) характеризуются превышением текущих расходов над текущими доходами и необходимостью привлечения дополнительных источников средств для компенсации разницы. В целом, частный сектор характеризуется избытком сбережений, в то время как коммерческий и правительственный сектора являются 'точками недостатка сбережений'. Финансовые посредники перераспределяют сбережения и, делая это, выполняют две важные функции:- превращают владельцев сбережений практически в 'мелких акционеров' огромных объединённых пулов капитала, который, в свою очередь, одалживается большому числу различных займополучателей, а также предоставляют отдельным владельцам сбережений возможность диверсификации риска ликвидности.

(2) Financial Intermediary is any person or organization that sells insurance (but is not an employee of an insurance company) is regarded as a financial intermediary.

FINANCIAL INTERMEDIATION = ФИНАНСОВОЕ ПОСРЕДНИЧЕСТВО – Financial Intermediation is the activity by which an institutional unit acquires financial assets and incurs liabilities on its own account by engaging in financial transactions on the market.

The assets and liabilities of financial intermediaries have different characteristics so that the funds are transformed or repackaged with respect to maturity, scale, risk, etc, in the financial intermediation process.

FINANCIAL INTERMEDIATION SERVICES INDIRECTLY MEASURED = ВЫЧИСЛЯЕМЫЕ КОСВЕННО ФИНАНСОВЫЕ ПОСРЕДНИЧЕСКИЕ УСЛУГИ – Financial Intermediation Services Indirectly Measured:- in the European Union, the output of many financial intermediation services is paid for not by charges but by an interest rate differential. The Financial Intermediation Services Indirectly Measured (FISIM) imputes charges for these services and corresponding offsets in property income. FISIM, an innovation of the 1993 System of National Accounts (SNA), has not yet been fully implemented in the UK economic accounts; the earnings are not yet allocated to the users of the services. / выработка (output). Системы Национальных Счетов (СНС). инновация .

FINANCIAL LEASE = ФИНАНСОВАЯ АРЕНДА (или ФИНАНСОВЫЙ ЛИЗИНГ) – Financial Lease is a lease which effectively transfers from the lessor to the lessee substantially all the risks and benefits incident to ownership of the leased asset without transferring legal ownership. Also known as Finance Lease, and Financial Leasing. / Финансовая Аренда – предоставление в аренду оборудования, причём услуги арендодателя ограничиваются финансированием приобретения оборудования. Все остальные обязанности, связанные с владением оборудованием, такие, как обслуживание, страхование и налоги, несёт арендополучатель. Финансовый арендный контракт обычно нельзя отменить, и он полностью оплачивается (амортизируется (amortized)) за весь период аренды.

FINANCIAL LEASING = ФИНАНСОВАЯ АРЕНДА (или ФИНАНСОВЫЙ ЛИЗИНГ) – Financial Leasing is a form of leasing in which the lessee contracts to assume the rights and responsibilities of ownership of leased goods from the lessor (the legal owner) for the whole (or virtually the whole) of the economic life of the asset. In the economic accounts this is recorded as the sale of the assets to the lessee, financed by an imputed loan. The leasing payments are split into interest payments and repayments of principal. Also known as Finance Lease, and Financial Lease. / выплата (repayment) .

FINANCIAL LEVERAGE = ФИНАНСОВОЕ ПЛЕЧО – Financial Leverage is the total value of long-term borrowed funds, overdrafts and short-term loans divided by the value of the stockholders' equity. It is a key measure of a company's long term liquidity and therefore of its ability to survive and grow. It reflects the division of the company's sources of funds between 'bankers' and stockholders. It is generally accepted that the financial leverage should not normally be above 0.5 in the United Kingdom. (Note:- this target value varies from country to country). If gearing is substantially above this figure the bankers will be concerned about the company's ability to pay its bills and therefore its ability to survive in the long term. If it is substantially below this figure the company may be able to borrow further for long term expansion. Financial leverage also measures the balance between borrowing to take advantage of opportunities and the loss of business control to the bankers.

FINANCIAL LIABILITY = ФИНАНСОВОЕ ОБЯЗАТЕЛЬСТВО (или ФИНАНСОВАЯ ОТВЕТСТВЕННОСТЬ) – Financial Liability is a contractual obligation to deliver cash or another financial asset and exchange financial assets or liabilities with another entity under potentially unfavorable conditions. Financial Liability is a liability that is:- (i) a contractual obligation:- (a) to deliver cash or another financial asset to another entity; or (b) to exchange financial assets or financial liabilities with another entity under conditions that are potentially unfavorable to the entity; or (ii) a contract that will or may be settled in the entity's own equity instruments and is:- (a) a non-derivative for which the entity is or may be obliged to deliver a variable number of the entity's own equity instruments; or (b) a derivative that will or may be settled other than by the exchange of a fixed amount of cash or another financial asset for a fixed number of the entity's own equity instruments. For this purpose the entity's own equity instruments do not include instruments that are themselves contracts for the future receipt or delivery of the entity's own equity instruments.

FINANCIAL LOAN = ФИНАНСОВАЯ ССУДА – Financial Loan is a bank loan granted to domestic or foreigner borrowers for a fixed amount and term without tying its use to a commercial transactions. See also Export Finance Credit.

FINANCIAL MARKET INSTRUMENT = ИНСТРУМЕНТ ФИНАНСОВОГО РЫНКА – Financial Market Instrument is a collective term for every form of standard, tradable financial products such as financial futures, foreign exchange instruments, options, precious metals, securities, etc.

FINANCIAL PERIOD ENDING = ОКОНЧАНИЕ ФИНАНСОВОГО ПЕРИОДА (или ОКОНЧАНИЕ ОТЧЁТНОГО ПЕРИОДА) – Financial Period Ending:- normally, the financial year ended, as released in the company's annual report but can also apply to shorter and half-yearly financial periods.

FINANCIAL REINSURANCE = ФИНАНСОВОЕ ПЕРЕСТРАХОВАНИЕ – Financial Reinsurance is a form of reinsurance which considers the time value of money and has loss containment provisions. One of its objectives is the enhancement of the cedant's financial statements or operating ratios, e.g., the combined ratio; loss portfolio transfers; and financial quota shares are examples. Form of reinsurance that provides risk financing which may be combined with elements of traditional risk transfer.

FINANCIAL REPORTING = ФИНАНСОВАЯ ОТЧЁТНОСТЬ – Financial Reporting is the preparation and reporting of a reporting entity's financial position, financial performance, and cash flows, regarding, but not limited to, the preparation of the financial statements under International Financial Reporting Standards (IFRSs).

FINANCIAL RESPONSIBILITY = ФИНАНСОВАЯ ОТВЕТСТВЕННОСТЬ – Financial Responsibility:- motor carriers must have bodily injury and property damage (not cargo) insurance of not less than USD500 000.00 per incident per vehicle; higher financial responsibility limits apply for motor carriers transporting oil or hazardous materials.

FINANCIAL RISK = ФИНАНСОВЫЙ РИСК – Financial Risk is the risk of a possible future change in one or more of a specified interest rate, financial instrument price, commodity price, foreign exchange rate, index of prices or rates, credit rating or credit index or other variable, provided in the case of a non-financial variable that the variable is not specific to the party to the contract. Term used to describe the increasing uncertainty that the buyer of goods will have the capacity to pay when payment is due the longer the time period he is given to make payment.

FINANCIALS = SECURITIES OF THE FINANCIAL INSTITUTES

FINANCIAL SECRECY = ФИНАНСОВАЯ СЕКРЕТНОСТЬ (или ФИНАНСОВАЯ ТАЙНА) – Financial Secrecy:- this term refers to the confidentiality afforded to financial transactions either by enactment of law or by other means. There are many forms of financial secrecy. Financial secrecy can be a part of an agreement between the institution and the client. Law can impose it with either criminal or civil sanctions. Financial secrecy can be operationally given by the financial institution whereby the institutional practices call for only top management to know who owns the account or no bank official knows who owns the account, such as a numbered account. It can also be obtained by the imposition of an attorney, nominee, or entity between the bank and its client.

THE FINANCIAL SERVICES AND MARKETS ACT 2000 = АКТ О ФИНАНСОВЫХ СЛУЖБАХ И РЫНКАХ ОТ 2000 – The Financial Services and Markets Act 2000 (FSMA) – the legislation that set up the Financial Services Authority and defines its powers. It came into force in late 2001. The Financial Services & Markets Act 2000 (FSMA) is concerned with the regulation of financial services and markets in the United Kingdom (UK). Under Section 19 of FSMA, any person who carries on a regulated activity in the UK must be authorized by the Financial Services Authority (FSA) or exempt (an appointed representative or some other exemption). Breach of section 19 may be a criminal offence and punishable on indictment by a maximum term of two years imprisonment and/or a fine. A copy of FSMA, as well as secondary and related legislation, can be found on the Treasury's website. Bear in mind that this version of FSMA does not include amendments made to it by subsequent legislation. Does my firm need to be authorized? You need to establish whether your firm's proposed business requires you to apply for authorization to carry on regulated activities. For most smaller firms, this would typically include intermediaries selling investments and/or home finance activities and/or general insurance. For each regulated activity you must also identify with which investment type your activities will be concerned. The activities and specified investments are detailed in The Financial Services and Markets Act 2000 (Regulated Activities) Order 2001 (RAO), which is secondary legislation under FSMA. What are the regulated activities? Specified activities are defined in Part II of the RAO and comprise:- accepting deposits; issuing e-money; effecting or carrying out contracts of insurance as principal; dealing in investments (as principal or agent); arranging deals in investments; arranging home finance activities; operating a multilateral trading facility; managing investments; assisting in the administration and performance of a contract of insurance; safeguarding and administering investments; sending dematerialized instructions; establishing etc collective investment schemes; establishing etc stakeholder pension schemes; providing basic advice on stakeholder products; advising on investments; advising on home finance activities; Lloyd's market activities; entering funeral plan contracts; entering into a home finance activity; administering a home finance activity; agreeing to do most of the above activities. Specified investments are defined in Part III of the RAO and comprise:- deposits; electronic money; rights under a contract of insurance; shares etc; instruments creating or acknowledging indebtedness; sukuk (shariah compliant debt instruments); government and public securities; instruments giving entitlement to investments; certificates representing certain securities; units in a collective investment scheme; rights under a stakeholder pension scheme; rights under personal pension scheme; options; futures; contracts for differences; Lloyd's syndicate capacity and syndicate membership; rights under funeral plan contracts; rights under regulated mortgage contracts; rights under a home reversion plan; rights under a home purchase plan; rights to or interests in anything that is a specified investment listed, excluding 'Rights under regulated mortgage contracts', 'Rights under regulated home reversion plans' and 'Rights under regulated home purchase plans'. For smaller firms, we have developed several standard permission profiles containing regulated activities and investment types. You can find these in the application packs. If none of these profiles match the business that you want to do, you will need to construct your own. The activities and specified investment types we regulate are described in greater detail in chapter 2 of the Perimeter Guidance Manual (PERG). Business test:- Under section 22 of the FSMA, for an activity to be a regulated activity, it must be carried on 'By way of business'. FSA guidance on the business element can be found in PERG 2.3. Exclusions:- exclusions are provisions that turn activities that would otherwise be regulated activities into unregulated activities. So if you can rely on an exclusion for an activity, you would not require FSA authorization to carry it out. Examples of exclusions include:- (i) introducer exclusion; and (ii) overseas Persons exclusion. Who is exempt from authorization? A person who is an appointed representative is exempt from authorization. Further information can be found in the factsheet 'Becoming an appointed representative'. Other exemptions include:- a professional firm (i.e. a firm of solicitors, accountants or actuaries) carrying on certain regulated activities that are incidental to its main business; or a local authority or certain kind of housing body carrying on insurance mediation or mortgage activities. Financial promotions:- a financial promotion is an invitation or inducement to engage in investment activity. Investment activity is defined under section 21(8) FSMA as:- (a) entering or offering to enter into an agreement the making or performance of which by either party constitutes a controlled activity; or (b) exercising any rights conferred by a controlled investment to acquire, dispose of, underwrite or convert a controlled investment. Under section 21 of FSMA, an unauthorized person may not communicate a financial promotion in the UK, in the course of business, unless either:- (1) its contents are approved for the purposes of section 21 by an authorized person or (2) it is subject to an exemption under the Financial Services & Markets Act 2000 (Financial Promotion) Order 2005 (FPO). Controlled activities and controlled investments are prescribed under Schedule 1 of the FPO and include such things as buying shares or bonds, selling insurance and managing investments. You can find further guidance on financial promotions in PERG 8. How do I get authorized? Any person wishing to carry on one or more regulated activities, by way of business, must apply to us for authorization (unless they can abide by the terms of exclusion or are exempt). Money Laundering Regulations 2007 (MLR):- the FSA is also responsible for the registration of firms that conduct activities under Annex 1 of the Banking Coordination Directive (BCD), in addition to firms authorized by the FSA under FSMA. The activities are also listed in The FSA's new role under the Money Laundering Regulations 2007:- Our Approach. Further information can be located at:- Money Laundering Regulations 2007 (MLR). Payment Services Regulations 2009 (PSRs):- the Payment Services Directive (PSD) aims to provide a common regulatory approach to the provision of electronic payment services. It came into force in the UK on 1st November 2009 through the PSRs. For further information please see:- Guidance on the scope of the Payment Services Regulations (PERG 15). Payment Services Regulations. Electronic Money Regulations 2011 (EMRs):- The EMRs, which implements the second Electronic Money Directive (2EMD) in the UK, came into force on 30 April 2011. 2EMD aims to encourage the growth of the electronic money market. For further information please see:- Guidance on the scope of the Electronic Money Regulations 2011 (PERG 3A). Electronic Money Regulations. Contact details:- for guidance on whether a firm needs to be authorized, please refer to PERG. If you remain unsure whether an activity that you intend to carry out would require FSA authorization, please contact the Customer Contact Centre. Please be aware that we can only refer you to the relevant sections of the FSA Handbook that you need to consider. For a definitive answer on whether you need to be authorized you should seek independent legal or compliance advice. Telephone number:- +44-845-6069966 (opening times 09:00–17:00 Monday to Friday; e-mail address:- fcc@fsa.gov.uk.

THE FINANCIAL SERVICES AUTHORITY = УПРАВЛЕНИЕ ПО ФИНАНСОВЫМ УСЛУГАМ – The Financial Services Authority (FSA®) is an independent non-governmental body, given statutory powers by the Financial Services and Markets Act 2000. We are a company limited by guarantee and financed by the financial services industry. The Board sets our overall policy, but day-to-day decisions and management of the staff are the responsibility of the Executive Committee. We are accountable to Treasury Ministers and, through them, Parliament. We are operationally independent of government and are funded entirely by the firms we regulate. We are an open and transparent organisation and provide full information for firms, consumers and others about our objectives, plans, policies and rules, including through this website. Main Statutory objectives:- (i) market confidence; (ii) financial stability; (iii) consumer protection; and (iv) reduction of financial crime. We are the independent body that regulates the financial services industry in the UK. We have been given a wide range of rule-making, investigatory and enforcement powers in order to meet our four statutory objectives. In meeting these, we are also obliged to have regard to the Principles of Good Regulation. Financial Services Authority (FSA®) is the single financial services regulator in the United Kingdom (UK). Headquartered in London, the United Kingdom. Website:- http://www.fsa.gov.uk. History:- The Chancellor of the Exchequer announced the reform of financial services regulation in the UK and the creation of a new regulator on 20 May 1997. The Chancellor announced his decision to merge banking supervision and investment services regulation into the Securities and Investments Board (SIB). The SIB formally changed its name to the Financial Services

Authority in October 1997. The first stage of the reform of financial services regulation was completed in June 1998, when responsibility for banking supervision was transferred to the FSA® from the Bank of England. In May 2000 the FSA® took over the role of UK Listing Authority from the London Stock Exchange. The Financial Services and Markets Act, which received Royal Assent in June 2000 and was implemented on 01 December 2001, transferred to the FSA® the responsibilities of several other organisations:- (i) Building Societies Commission; (ii) Friendly Societies Commission; (iii) Investment Management Regulatory Organisation; (iv) Personal Investment Authority; (v) Register of Friendly Societies; and (vi) Securities and Futures Authority. In addition, the legislation gives us some new responsibilities – in particular taking action to prevent market abuse. In October 2004, following a decision by the Treasury, we took on responsibility for mortgage regulation. In January 2005, to implement the Insurance Mediation Directive and in accordance with a Government announcement in 2004 we took on regulation of general insurance business. In June 2010, the Chancellor announced the government's intention to replace the FSA® as a single financial services regulator with two new successor bodies, and restructure the UK's financial regulatory framework. In the United Kingdom, the Financial Services Authority (FSA®) is the agency appointed by the Government under the Financial Services and Markets Act to oversee the regulation of the investment industry.

FINANCIAL SETTLEMENT = ФИНАНСОВЫЙ РАСЧЁТ – (1) Financial Settlement is a cash settlement, especially for energy derivatives. / Денежный расчёт, особенно для производных на энергоносители.

(2) Financial Settlement is a required step in Abilene Christian University's enrollment process each semester for new and current students. It simply means you've met your financial obligations for the semester. Financial Settlement may be met by paying the amount due in full, enrolling in a Wildcat Pay Plan or having an approved loan in place to cover the account balance. Students who have not reached Financial Settlement by the deadline each semester will have their classes dropped and student ID card deactivated. In addition, a hold will be placed on the student account, preventing class registration and the release of official transcripts. To re-register and regain access to student services, Financial Settlement must be met. Students are subject to any late registration fees and the original class schedule may no longer be available.

FINANCIAL SOUNDNESS VALUATION = ОЦЕНИВАНИЕ ФИНАНСОВОЙ УСТОЙЧИВОСТИ (или ОЦЕНИВАНИЕ ПЛАТЁЖЕСПОСОБНОСТИ) – Financial Soundness Valuation is a methodology intended to provide a prudently realistic picture of the overall financial position of the long-term insurer, allowing explicitly for actual premiums that will be received and future experience that may be expected in respect of interest rates, expenses, mortality, morbidity and other relevant factors.

FINANCIAL STATEMENTS = ФИНАНСОВЫЕ ОТЧЁТЫ – Financial Statements are general purpose financial statements prepared and presented in accordance with International Financial Reporting Standards (IFRSs). A structured representation of the financial position and financial performance of an entity. The objective of general purpose financial statements is to provide information about the financial position, financial performance and cash flows of an entity that is useful to a wide range of users in making economic decisions. Financial statements also show the results of management's stewardship of the resources entrusted to it. To meet this objective, financial statements provide information about an entity's:- (i) assets; (ii) liabilities; (iii) equity; (iv) income and expenses, including gains and losses; (v) other changes in equity; and (vi) cash flows. This information, along with other information in the notes, assists users of financial statements in predicting the entity's future cash flows and, in particular, their timing and certainty. Document summarizing a company's activities, assets and liabilities, including the balance sheet and profit and loss account. Also known as Accounts in the United Kingdom. Financial Statements is a presentation of financial data including balance sheets, income statements and statements of cash flow, or any supporting statement that is intended to communicate an entity's financial position at a point in time and its results of operations for a period then ended. The balance sheet and profit and loss account (income statement) of a company prepared at the end of the financial year. / Баланс и отчёт о прибылях и убытках (отчёт о доходах) компании, подготовленные в конце финансового года. Финансовый Отчёт – письменный отчёт о финансовом положении частного лица, ассоциации или коммерческой организации. Финансовый Отчёт включает бухгалтерский баланс (balance sheet) и отчёт о доходах (income statement) или отчёт о прибыли и убытке (profit and loss statement), а также может включать отчёт о потоке наличности (statement of cashflows), отчёт об изменениях суммы нераспределённых заработов (statement of changes in retained earnings) и иные аналитические документы.

FINANCIAL SURPLUS OR DEFICIT = ФИНАНСОВЫЙ ПРОФИЦИТ ИЛИ ДЕФИЦИТ – Financial Surplus Or Deficit is the former term for Net Lending(+)/Net Borrowing (–), the balance of all current and capital account transactions for an institutional sector or the economy as a whole.

FINANCIAL TIMES AND THE LONDON STOCK EXCHANGE 100 = ФАЙНЭНШЭЛ ТАЙМЗ ЭНД ЗЭ ЛАНДЭН СТОК ЭКСЧЭЙНДЬЖ 100 (или 100 ОТ ФИНАНСОВЫХ ВРЕМЁН И ЛОНДОНСКОЙ ФОНДОВОЙ БИРЖИ) – The FTSE® 100 is a market-capitalization weighted index representing the performance of the 100 largest UK-domiciled blue chip companies, which pass screening for size and liquidity. The index represents approximately 85.18% of the UK's market capitalization and is suitable as the basis for investment products, such as funds, derivatives and exchange-traded funds. The FTSE® 100 Index also accounts for 7.84% of the world's equity market capitalization (based on the FTSE® All-World Index as at 2010-May-28). FTSE® 100 constituents are all traded on the London Stock Exchange's SETS trading system. The index is designed for the creation of derivatives, index tracking funds, ETFs and performance benchmarks. Stocks are free-float weighted to ensure that only the investable opportunity set is included within the index. Stocks are liquidity screened to ensure that the index is tradable. Capital and total return versions are available for this index. The index is calculated in accordance with the Industry Classification Benchmark (ICB), a global standard developed in partnership with Dow Jones Indexes. The indices are managed according to a transparent and public set of index rules, and overseen by an independent committee of leading market professionals. The committee ensures that the rules are correctly applied and adhered to. Regular index reviews are conducted to ensure that a continuous and accurate representation of the market is maintained. Index Universe:- FTSE® All-Share Index. Index Launch:- 1984-January-03. Base Date:- 1983-December-30. Base Value:- 1 000.00. Investability Screen:- Free Float adjusted and liquidity screened. Index Calculation:- Real-time and end-of-day index available. Realtime index calculated every 15 seconds. End-of-Day Distribution:- Index available at 20:00 GMT or BST via FTP and email. Currency:- GBP & EUR. Review Dates:- March, June, September and December. FTSE Group (FTSE®) is a world-leader in the creation and management of over 120 000 equity, bond and alternative asset class indices. With offices in London, Frankfurt, Hong Kong, Beijing, Shanghai, Madrid, Milan, Mumbai, Paris, New York, San Francisco, Sydney and Tokyo. FTSE Group works with partners and clients in 77 countries worldwide. FTSE International Limited is an independent company jointly owned by The Financial Times and the London Stock Exchange. FTSE® does not give financial advice to clients, which allows for the provision of truly objective market information. FTSE® indices are used extensively by a range of investors such as consultants, asset owners, fund managers, investment banks, stock exchanges and brokers. The indices are used for purposes of:- (i) investment analysis; (ii) performance measurement; (iii) asset allocation; (iv) portfolio hedging; and (v) creation of index tracking funds. Independent committees of senior fund managers, derivatives experts, actuaries and other experienced practitioners review and approve all changes to the indexes to ensure that they are made objectively and without bias. FTSE International Limited headquartered in London, the United Kingdom. The

FTSE® 100 Index is a capitalization-weighted index of the 100 most highly capitalized companies traded on the London Stock Exchange. The equities use an investibility weighting in the index calculation. The index was developed with a base level of 1 000.00 as of 1984-January-03. The FTSE® 100 Index, also called FTSE® 100, FT-SE®, or FTSE®, or, informally, the 'Footsie™' – is a share index of the 100 most highly capitalized UK companies listed on the London Stock Exchange. Although FTSE® is jointly owned by the Financial Times and the London Stock Exchange, the initials are not an acronym nor an initialism and do not stand for 'Financial Times Stock Exchange'. They are borrowed from FTSE's two parent companies. The index began on 1984-January-03 with a base level of 1 000.00; the highest value reached to date is 6 950.6, on 1999-December-30. After falling dramatically during the financial crisis of 2007–10 to a low of below 3 500.00, the index has recovered by a significant margin to 6 091.33 on 2011-February-08, its highest level since mid-2008. It is the most widely used of the FTSE Group's indices, and is frequently reported (e.g., on UK news bulletins) as a measure of business prosperity. The index is maintained by the FTSE Group, an independent company which originated as a joint venture between the Financial Times and the London Stock Exchange. It is calculated in real time and published every 15 seconds. FTSE® 100 companies represent about 81% of the market capitalization of the whole London Stock Exchange. Even though the FTSE® All-Share Index is more comprehensive, the FTSE 100 is by far the most widely used UK stock market indicator. Other related indices are the FTSE 250 Index (which lists the next largest 250 companies after the FTSE® 100), the FTSE® 350 Index (which is the aggregation of the FTSE® 100 and 250), FTSE® SmallCap Index and FTSE® Fledgling Index. The FTSE® All-Share aggregates the FTSE® 100, FTSE® 250 and FTSE® SmallCap. The constituents of the index are determined quarterly; the largest companies in the FTSE® 250 Index are promoted if their market capitalization would place them in the top ninety firms of the FTSE 100 Index. As of December 2008, the threshold for inclusion is about £1.7 billion. As of December 2008, the five largest constituents of the index were BP, HSBC Holdings PLC, the Vodafone Group, GlaxoSmithKline, and Royal Dutch Shell which were each valued at more than £60 billion. Component companies must meet a number of requirements set out by the FTSE Group, including having a full listing on the London Stock Exchange with a Sterling or Euro denominated price on SETS, and meeting certain tests on nationality, free float, and liquidity. With only historical exceptions, the companies listed on this index must by law include the abbreviation 'PLC' at the end of their name, indicating their status of public limited company. Continuous trading starts at 08:00 and ends at 16:30 (when the closing auction starts), and closing values are taken at 16:35 (Coordinated Universal Time (UTC)). They involve the total market capitalization of the companies weighted by their effect on the index, so the larger companies make more of a difference to the index than smaller. This is also called the Free Float Method. The basic formula for any index is (be it capitalization weighted or any other stock index):- Index level = Σ(Price of stock x Number of shares) x Free float factor / Index Divisor. The Free float Adjustment factor represents the proportion of shares that are readily available for trading as a percentage of all issued shares. The factor is then rounded up to the nearest multiple of 5% for calculation purposes. To find the free-float capitalization of a company, first find its market cap (number of shares x share price) then multiply by its free-float factor. Free-float capitalization, therefore, does not include restricted stocks, such as those held by company insiders. FTSE® 100 Index comprises the 100 most highly capitalized blue chip companies, representing approximately 81% of the UK market. It is used extensively as a basis for investment products, such as derivatives and exchange-traded funds. / Дау Дьжонз (Dow Jones). Индекс по Сотке от Финансовых Времён и Лондонской Фондовой Биржи или, как это звучит на Английском языке, Файнэншэл Таймз энд зэ Ландэн Сток Эксчэйндьж Ван Хандрэд Индэкс или сокращённо – Эф.Ти.Эс.И.® 100 Индэкс (Financial Times and the London Stock Exchange 100 Index (FTSE® 100 Index), именуемый также как Эф.Ти.Эс.И.® 100 (FTSE® 100), или Эф.Ти.-Эс.И. (FT-SE®), или Эф.Ти.Эс.И. (FTSE®), или, неформально, Футси™ (the Footsie™). Би.Пи. (BP), Эйч.Эс.Би.Си. Холдиньгз Пи.Эл.Си. (HSBC Holdings PLC), Водэфон Груп (Vodafone Group), ГлаксоСмисКлайн (GlaxoSmithKline), и Ройэл Датч Щел (Royal Dutch Shell). Футси™ 100 – фондовый индекс, рассчитываемый агентством Файнэншэл Таймз (Financial Times) и Лондонской Фондовой Биржей (the London Stock Exchange). Считается одним из наиболее влиятельных биржевых индикаторов в Европе. Дата запуска индекса в обращение – 03 Января 1984, а расчётное базовое значение в 1 000.00 пунктов было определено 30 Декабря 1983. Достиг своего рекордного значения в 6 950.60 пунктов 30 Декабря 1999. Индекс основывается на стоимости акций 100 компаний Соединённого Королевства с наибольшей капитализацией, включённых в котировочный список Лондонской Фондовой Биржи (ЛФБ). Суммарная капитализация этих компаний составляет 80% капитализации биржи. Компании, чьи акции учитываются в расчёте индекса FTSE® 100, должны удовлетворять условиям, предъявляемым FTSE® Group:- (i) входить в список Лондонской Фондовой Биржи; (ii) стоимость акций индекса FTSE® 100 должна выражаться в Фунтах или Евро; (iii) пройти тест на принадлежность к определённому государству; и (iv) акции FTSE® 100 должны находиться в свободном обращении и быть легко ликвидными. Торги на бирже идут с 08.00 до 16.29 по Гринвичскому Среднему Времени (ГСВ) (GMT зимой, летом GMT+1) (когда начинаются действия по закрытию), цена закрытия высчитывается в 16.35 по ГСВ, известному сейчас как Универсальное Координированное Время (УКВ; Coordinated Universal Time (UTC)).

FINANCIAL TRANSACTIONS AWAITING SETTLEMENT = ФИНАНСОВЫЕ ТРАНЗАКЦИИ, ОЖИДАЮЩИЕ РАСЧЁТА (или ФИНАНСОВЫЕ ОПЕРАЦИИ, ОЖИДАЮЩИЕ РАСЧЁТА) – In Accounts Receivable of a balance sheet, Financial Transactions Awaiting Settlement relates to short-term receivables (typically due in three days or less) where transactions have been effected but cash has not yet been transferred. This includes assets that have been sold and liabilities that have been issued.

FINANCIAL TRANSMISSION RIGHT = ПРАВО XX – Financial Transmission Right (FTR) is a financial instrument entitling the holder to receive revenues based on transmission congestion measured as hourly energy LMP (short for the locational marginal price) differences in the PJM Day-Ahead Energy Market across a specific path. PJM Interconnection LLC (Pennsylvania New Jersey Maryland Interconnection LLC. / Пи.Дьжей.Эм. Интёконэкшэн Эл.Эл.Си. (PJM Interconnection LLC или Пэнсэлвэйниэ Ню Дьжози Мэрилэнд Интёконэкшэн Эл.Эл.Си. (Pennsylvania New Jersey Maryland Interconnection LLC)).

FINANCIAL YEAR = ФИНАНСОВЫЙ ГОД – Financial Year:- every company has a duty to keep accounting records and must prepare annual accounts that report on the performance and activities of the company during the year. The period reported on in the accounts is called the Financial Year. This starts on the day after the previous financial year ended or, in the case of a new company, on the day of incorporation. A more precise term for a financial year is an Accounting Reference Period.

FINANCING = ФИНАНСИРОВАНИЕ – Financing is an obtaining or supplying money or credit for an investment. Methods and means of payment used to finance a project. There are two major sources of financing for business entities:- internal financing from cash flow generated by the business through profits, provisions, retained earnings, and external financing, which includes all long-term and short-term contributions of funds to the business from individuals or other entities, through increases in capital or borrowing. See also Capital Stock, Credit, Debt, and Loan.

FINANCING ACTIVITIES = ВИДЫ ФИНАНСОВОЙ ДЕЯТЕЛЬНОСТИ (или ФИНАНСОВАЯ ДЕЯТЕЛЬНОСТЬ ПО ВИДАМ) – Financing Activities are activities that result in changes in the size and composition of the contributed equity and borrowings of the entity. The separate disclosure of cash flows arising from financing activities is important because it is useful in predicting claims on future cash flows by providers of capital to the entity. An entity shall report separately major classes of gross cash receipts and gross cash payments arising from investing and financing activities. Investing and financing transactions that do not require the use of cash

or cash equivalents shall be excluded from a cash flow statement. Such transactions shall be disclosed elsewhere in the financial statements in a way that provides all the relevant information about these investing and financing activities. Those activities which relate to changing the size and/or composition of the financial structure of the entity, including equity, and borrowings not defined as cash. The statement of cash flows shows the total cash flow from financing activities. This includes proceeds from issuing equity instruments, and the outlays to buy back such instruments; proceeds from borrowings; repayment of borrowings; and dividend payments. / Отчёт о движении денежных средств . выплата (repayment) .

FINANCING DEFICIT = ДЕФИЦИТ ФИНАНСИРОВАНИЯ – In national accounting, Financing Deficit is a balance of the capital account of an agent when it appears on the liabilities side of the account. / В национальном бюджетном процессе, .

FINANCING FEE = ВОЗНАГРАЖДЕНИЕ ЗА ФИНАНСИРОВАНИЕ – Financing Fee is the fee a lender charges to originate a loan. The fee is based on a percentage of the loan amount; one point is equivalent to one percent.

FINANCING OF MONTH–END CLOSING = ФИНАНСИРОВАНИЕ ПОД ОКОНЧАНИЕ (или НА КОНЕЦ) МЕСЯЦА – Financing Of Month-End Closing:- a borrowing in order to bridge temporary liquidity shortages at month-end. This kind of financing furnished by the central bank to the commercial banks helps to avoid extreme interest rate fluctuations. / избежать флуктуаций (колебаний) процентной ставки.

FINANCING SURPLUS = ИЗБЫТОК ФИНАНСИРОВАНИЯ (или ПРЕВЫШЕНИЕ ФИНАНСИРОВАНИЯ) – In national accounting, Financing Surplus is a name given to the capital account of an agent when it appears on the asset side of the account. / В национальном бюджетном процессе, .

FIND FREE = ПРИЗНАВАТЬ СВОБОДНОЙ (или НАХОДИТЬ СВОБОДНОЙ) – Find Free:- to inspect a consignment, field or place of production and consider it to be free from a specific pest.

FINDINGS = ПРИКЛАДЫ – Findings are:- (1) miscellaneous items attached to garments and shoes during manufacture. Included are buttons, hooks, snaps, and ornaments; and (2) miscellaneous fabrics in garments such a zipper tapes, linings, pockets, waistbands, and facings. Findings:- any extra items attached to a garment during the manufacturing process. This can include trims, buttons, hooks, snaps, or embellishments. / Швейные Приклады портного; фурнитура сапожника.

FINE = ШТРАФ (ил ВЗЫСКАНИЕ) – (1) Fine is the money paid as penalty, usually for an illegal act. Fine – money extracted as a penalty. Also known as Penalty. A Fine is money paid as a financial punishment for the commission of minor crimes or as the settlement of a claim. A synonym, typically used in civil law actions, is Mulct. Common examples of fines are monies paid for violations of traffic laws. Currently in English law relatively small fines are used either in place of or alongside community service orders for low-level criminal offences. Larger fines are also given independently or alongside shorter prison sentences where the judge or magistrate considers a considerable amount of retribution is necessary but there is unlikely to be significant danger to the public. For instance, fraud is often punished by very large fines since fraudsters are typically debarred from the position or profession they abused to commit their crimes. / Смотрите также Неустойка (Penalty). Под Пеней, от Латинского слова Poena, означающее Наказание, понимается вид неустойки, исчисляемый в процентах от суммы неисполненного или ненадлежащее исполненного обязательства и уплачивается за каждый день просрочки. Под Административным Взысканием понимается мера наказания, применяемая уполномоченными государственными органами или должностными лицами за административный проступок (правонарушение). В бывшем Союзе Советских Социалистических Республик (СССР) меры административного взыскания:- предупреждение, штраф, административный арест, возмездное изъятие или конфискация предмета, явившегося орудием совершения или объектом правонарушения, исправительные работы, лишение специальных прав.

(2) Fines can also be used as a form of tax. Money for bail may be applied toward a fine.

FINE CLEANER = МАШИНА ТОНКОЙ ОЧИСТКИ – Fine Cleaning is done with different types of machines. Some fine cleaners are with single opening rollers and some are with multiple opening rollers. If single roller cleaning machines are used, depending upon the amount and type of trash in the cotton, the number of fine cleaning points can be either one or two. If the production rate is lower than 250 kg and the micronaire is less than 4.0, it is advisable to use single roller cleaning machines instead of multiple roller cleaning machine. Saw tooth beaters can be used, if trash particles are more and the machine is not using suction and deflector blades, i.e. beater and regualar grid bar arrangements. Normal beater speeds with sawtooth beater depends upon the production rate, fiber micronaire and trash content. Fine Cleaner is a cleaner is used for opening a cleaning of fiber material before carding. Machine connected with dust exhausting system. The cleaning points in CVT1, CVT3, CVT4 (Rieter's machines), etc consists of opening roller, deflector blades, moteknives and suction hood. Trash particles released due to centrifugal forces are separated at the moteknives and continuously taken away by the suction. This gives better cleaning. The Crosrol Fine Cleaner (CFC) is usually regarded as the final cleaning point in an opening line and is used to process both natural and synthetic fibers. The 1 500 mm working width (standard with all Crosrol blowroom machines) ensures a gentle action with the additional ability to give very high production rates (up to 750 kg's per hour). The single beater roll concept significantly reduces the negative side effects familiar with multi-roll intensive cleaners, i.e. higher nep counts and loss of good fibers. This together with a wide range of pinned and wired beaters ensures that the Crosrol fine cleaner range of machines gives optimum cleaning and increased fiber yield during this vital stage of the opening line. A new single cleaning cylinder minimizes the negative side effects familiar from multi-cylinder cleaners, i.e. higher nep counts and loss of good fibers. The tufts are fed evenly into the lamellar chute by the integrated feeding fan and the divider element. The material is guided downwards through the chute and a perforated drum. Unidirectional feeding is performed by a feed roller and a feed trough. The nipping/combing point distance is adjusted according to the staple length. The modular grid with the carding element and the cleaning cylinder work together to open the tufts further and separate the remaining trash from the fibers. A spiked or saw-tooth roller is used, depending on the raw material. The speed of the cleaning cylinder and the position of the grid rods depend on the settings entered at the operator's panel. The cleaning result can easily be checked at any time in the waste chamber. This enables opening to be optimized while the machine is in operation. The machine can be adapted to meet all raw material and end product requirements. The staple length of the fibers. This is converted for the basic setting of the feed trough nip. The relative amount of waste as a number between 1 and 10; this primarily affects the angle of the separating blades. The cleaning intensity as a number between 0.0 and 1.0, which affects the rotation speed of the cleaning cylinder and the feed trough nip. These settings can be entered directly at the operator's panel or remotely via the control system. This enables technological values to be adjusted with hitherto unequalled accuracy. / Новая машина с одним чистящим валиком минимизирует негативные эффекты, действуя более щадяще, нежели машины с несколькими валиками, после которых обнаруживается большее содержание узелков и потеря прядомых волокон. Пучки волокнон равномерно подаются в пластинчатую камеру с помощью встроенного подающего вентилятора и разделяющего элемента. Равномерная подача осуществляется питающим валиком и питающим лотком. Зазор между точками зажима и чесания регулируется в соответствии со штапельной длиной. Смодулированная с чёсальными элементами колосниковая решётка и чистящий валик работают совместно, обеспечивая дальнейшее разрыхление пучков и выделение из волокон остающихся примесей. В

зависимости от типа сырья, используется либо вал, оснащённый иглами, либо вал, оснащённый пилками. Скорость чистящего валика и положение колосников решётки зависит от параметров, вводимых на операторской панели. Результаты очистки можно легко и в любое время проверить, заглянув в камеру для угаров. Это позволяет оптимизировать процесс рыхления во время работы самой машины. Эта машина может быть адаптирована под нужды использования всех видов сырья и удовлетворения требований к конечному продукту. Штапельная длина волокон. Она пересчитывается для базовой настройки питающего лотка. Удельное содержание отходов в виде числового параметра от 1 до 10; это, главным образом, воздействует на изменение угла атаки отделительных ножей по отношению к колосниковой решётке. Интенсивность очистки в виде числового параметра от 0.0 до 1.0, определяет скорость вращения чистящего валика и расстояние до питающего лотка. Эти настройки могут быть непосредственно введены на операторской панели, а также через систему контроля с помощью дистанционного управления. Это позволяет вводить настройки технологических параметров с непревзойдённой точностью. В прядильном производстве. Машина для тонкой (тщательной) очистки волокна. , то есть .

FINE END = ТОНКАЯ ПРОДОЛЬНАЯ НИТЬ (или УТОНЧЁННАЯ ПРОДОЛЬНАЯ НИТЬ) – Fine End is:- (1) a warp yarn of smaller diameter than that normally used in the fabric. (2) A term for a defect in silk warp yarn consisting of thin places that occur when all the filaments required to make up the full ply are not present. This condition is generally caused by poor reeling. Fine End is a smaller than normal diameter warp end. Synonym:- Light End, and Thin End. Compare Coarse End. Fine End is a defect in silk warp yarn consisting of thin places that occur when some of the filaments that should be in the warp yarn are absent, generally caused by improper reeling. Warp end of abnormally small diameter, i.e. long thin places of class I1 and I2 also is referred as fine end.

FINE FILLING = ТОНКАЯ УТОЧИНА (или УТОНЧЁННАЯ УТОЧИНА) – Fine Filling:- the weft yarn whose thickness is unacceptably less than that of the adjacent yarns. See also Thin Filling. Fabrics defect.

FINE FINISH = УТОНЧЁННАЯ ОТДЕЛКА (или ТОНКАЯ ОТДЕЛКА) – Fine Finish:- coatings of paint, varnish, lacquer, wax or other material applied to high quality wood surfaces to protect and enhance their durability and appearance. / Покрытия краски, олифы, .

FINE GOLD CONTENT = СОДЕРЖАНИЕ ЧИСТОГО ЗОЛОТА – Fine Gold Content is the actual quantity of pure gold in a bar and is expressed to three places of decimals. The fine gold content is thus calculated by multiplying the recorded gross weight by the fineness (to one place of decimals). Rounding of the third decimal in the resulting figure is allowed if the fourth decimal (prior to any rounding) is a 9. For example, a Good Delivery bar with a gross weight of 404.075 ounces and a fineness of 995.8 would contain a net weight of gold or fine gold content of 402.377 fine ounces (404.075 x 0.995 8 = 402.377 885; no rounding up). On the other hand, if the same bar had a fineness of 999.5, the fine gold content would be 403.873 fine ounces (404.075 x 0.999 5 = 403.872 962 5; rounding up the third decimal, as the fourth is a 9).

FINENESS = ПРОБА (или ЧИСТОТА) – Fineness is the proportion of precious metal in an alloy expressed as parts in 1 000; thus 995 or two nines five is 995/1000 or 99.5% pure. Fineness is the proportion of precious metal in an alloy expressed as parts in 1 000. Gold purity, usually expressed in parts per thousand; thus 995 or two nines five is 995/1 000 or 99.5% pure. 995 was the highest purity to which gold could be manufactured when good delivery was determined, but for very high technology applications now it is possible to produce metal of up to 99.999 9% purity. The purity of precious metal measured in parts per thousand. Fineness is a measure of the proportion of gold or silver in a bullion bar or platinum or palladium in a plate or ingot and is expressed in terms of the fine metal content in parts per 1 000. It therefore defines the purity of a gold or silver bar or platinum or palladium plate or ingot. Fineness is a ratio of weight of pure precious metal to gross weight of alloyed metal. Expressed in parts per thousand. / Чистота благородных металлов, выражаемая числом частей металла в 1 000 частях (по массе) лигатурного сплава. должным образом осуществлённая поставка . Под Пробой благородных металлов понимается количественное содержание золота, палладия, платины и серебра в лигатурном сплаве, из которого изготавливаются ювелирные изделия и производится чеканка монет. По Метрической Системе проба благородных металлов, принятая в большинстве стран, выражается числом частей металла в 1 000 частях (по массе) лигатурного сплава, чистому металлу соответствует 1 000-я проба благородного металла. В бывшем Союзе Советских Социалистических Республик (СССР) для ювелирных изделий были установлены следующие пробы:- (i) для золота – 375, 500, 583, 750 и 958; (ii) для палладия – 500 и 850; (iii) для платины – 950; и (iv) для серебра – 750, 800, 875, 916, 925 и 960. До 1927 в России была золотниковая система, при которой 1 000-я проба благородного металла соответствовала 96 условным единицам. По Метрической Системе обозначение Пробы, принятое в большинстве стран, выражается числом граммов благородного металла в 1 000 граммах сплава, причём чистому металлу соответствует 1 000-я проба. В бывшем Союзе Советских Социалистических Республик (СССР) проба изделий гарантировалась постановкой на них государственного клейма. Под Пробой благородных металлов, от Немецкого слова Probe, от Латинского слова Probo, означающее Испытываю или Оцениваю, понимается количественное содержание золота, серебра, платины или палладия в лигатурном сплаве (смотрите Лигатура), из которого изготовляются ювелирные изделия, зубопротезные диски, монеты, медали и другое. В большинстве стран принята Метрическая Система обозначения проб; в бывшем СССР она была введена 15 Ноября 1927. По этой системе проба обозначается числом частей благородного металла в 1 000 частях (по массе) лигатурного сплава. По Каратной Системе, принятой в США, Великобритании и Швейцарии, 1 000-я проба металла соответствует 24 условным единицам, называемым Каратами. До 1927 в России существовала золотниковая система обозначения проб (на основе Русского фунта, содержащего 96 золотников), по которой проба выражалась весовым количеством металла в 96 единицах сплава. Проба сплавов благородных металлов, из которых разрешается изготовлять ювелирные и другие изделия, устанавливаются законодательным путём. Проба гарантируется государством, для чего изделия обязательно проходят Пробирный Контроль (Опробование и Анализ) и на них накладываются оттиски Пробирных Клейм (смотрите Пробирный Анализ). Слитки благородных металлов клеймятся пробой, определённой в сплаве. Не подлежат клеймению ордена, наградные медали и монеты, хотя проба их сплавов строго регламентирована и контролируется. Контроль за пробами сплавов и изделий и клеймение в бывшем СССР выполняется инспекциями Пробирного Надзора. В странах, где установлен государственный пробирный надзор, торговля изделиями из благородных металлов без оттисков пробирных клейм запрещена, а подделка пробирного клейма преследуется законом. Для клеймения изделий применяются пробирные клейма разнообразных форм и рисунков. Рисунок клейма (обычно эмблема страны, города и тому подобное) сочетается с цифрами пробы (например, Великобритания) или с условными цифрами 1, 2 и так далее, где каждая цифра соответствует определённой пробе (например, Австрия, Аргентина, Болгария, Венгрия, Камерун, Италия, Нидерланды, Польша, Румыния, Чехословакия, Югославия, Португалия, Мексика); иероглифами (Египет, Тунис, Турция). Иногда проба обозначает клеймо только в виде цифр метрической пробы (Монголия). В СССР пробирное клеймо состояло из 3 элементов:- эмблемы (серп и молот на фоне пятиконечной звезды); трёхзначных цифр метрической пробы; шифра (в виде буквы), закреплённого за определённой инспекцией пробирного надзора. Клеймение ювелирно-бытовых изделий известно со средних веков (например, в Англии и Италии с XV века, во Франции с XVI века). В ряде стран клеймение введено в XX веке (например, в Канаде с 1913, Австралии с 1923). В некоторых странах ювелирно-бытовые изделия из благородных металлов хотя и клеймятся (чаще самими фирмами-производителями изделий), но контроль за пробами со стороны государства не обязателен или слабый

(например, Австралия, Бельгия, Дания, Италия, Канада, Мальта, США, ФРГ, Швейцария, Швеция). В России государственное клеймение изделий узаконено:- серебряных – в 1613, золотых – в 1700; в СССР:- платиновых – в 1927, палладиевых – в 1956. Пробирный Надзор – государственный контроль за соответствием ювелирно-бытовых изделий из драгоценных металлов (золота, серебра, платины и палладия) узаконенным пробам, с тем чтобы не допустить продажи изделий из неблагородных или низкопробных металлов под видом благородных и полнопробных, а также избежать фальсификации пробирных клейм на изделиях. В большинстве стран установлены обязательный пробирный надзор, осуществляемый государством, и обязательное клеймение изделий из благородных металлов пробирными учреждениями. В бывшем СССР функции пробирного надзора осуществлялись Министерством Финансов СССР через Инспекции Пробирного Надзора. Пробирный Анализ – определение содержания золота, палладия, платины и серебра в рудах, полупродуктах, слитках и готовых изделиях. Пробирный Анализ или Пробирное Искусство – методы количественного определения содержания металлов, главным образом благородных, в рудах, различных продуктах металлургического производства, отходах, сплавах, изделиях и другом. Методы пробирного анализа были известны за 2000 лет до Нашей Эры в Египте, а позже в Вавилонии, Греции, Риме и использовались в связи с добычей и торговым обращением золота. Развитию пробирного анализа в России содействовали реформы Петра I (расширение торговли, увеличение объёма чеканки золотых и серебряных монет, развитие добычи золота и серебра). Вклад в совершенствование пробирного анализа внесли работы Русских учёных Михаила Васильевича Ломоносова (1711-Ноябрь-19–1765-Апрель-15) и Дмитрия Ивановича Менделеева (1834-Февраль-08–1907-Февраль-02), а также Советских учёных Николая Константиновича Пшеницына (1891-Июль-13–1961-Январь-15), О.Е. Звягинцева, Владимира Яковлевича Мостовича (1880-Апрель-08(20)–1935-Август-05), В.Г. Агеенкова, Игоря Николаевича Плаксина (1900-Октябрь-08–1967-Март-15) и других. Методы пробирного анализа точны и позволяют определять, например, содержание золота в рудах до 0.1–0.05 грамма на тонну (г/т); это даёт возможность использовать его в качестве контрольного и арбитражного методов. По данным пробирного анализа рассчитывают содержание благородных металлов в залежах полезных ископаемых, осуществляют контроль за технологией извлечения, аффинажа, гальванического покрытия и тому подобного, ведут учёт расходования благородных металлов, выпускают ювелирно-бытовые изделия определённых проб и другое. Пробирный анализ выполняют пирометаллургическим (смотрите Пирометаллургия) и химическим методами. К пирометаллургическим методам относят тигельную и шерберную плавки, а также купелирование. Тигельная Плавка применяется для анализа руд и продуктов их переработки с содержанием благородных металлов от десятых долей г до десятков и более г в 1 т исходного продукта; требуют взятия для анализа навески 25–100 г. Шерберная Плавка применяется как дополнительная операция при анализе руд и продуктов их переработки и как самостоятельный метод анализа рудных продуктов с богатым содержанием благородных металлов (сотни г золота или платины и кг серебра в 1 т продукта); требуют взятия для анализа навески менее 5 г. Купеляция В Муфеле – о перация при тигельной и шерберной плавках и самостоятельный метод анализа сплавов, слитков, полуфабрикатов, изделий. Химические методы пробирного анализа применяются для всех материалов, содержащих благородные металлы, за исключением продуктов, указанных для тигельной плавки. Иногда химические методы пробирного анализа используются в сочетании с пирометаллургическими. Из химических методов пробирного анализа получил распространение экспресс-способ определения пробы ювелирно-бытовых изделий без нарушения их целостности – опробование на Пробирном Камне. На поверхность пробирного камня наносят испытуемым изделием однородно-плотную полоску (черту) 10–12 миллиметров (мм) длиной и 2–3 мм шириной. Рядом с промежутком 0.5–1 мм наносят такую же полоску Пробирной Иглой с заведомо известной пробой, подходящей к пробе испытуемого изделия, а для золота – и одинаковой по цвету. Нанесённые полоски смачивают соответствующим Пробирным Реактивом и наблюдают за его действием в течение нескольких секунд (сек). По окончании реакции реактив осторожно снимают с камня фильтровальной бумагой и сравнивают действие реактива на полосках. По степени интенсивности окраски пятна на полоске от изделия и окраски пятна на полоске от иглы судят о пробе изделия из благородного металла. Пробирный Камень – слабометаморфизированный, тонкозернистый, углистый, кремнистый сланец в виде чёрного бруска, на котором по цвету черты испытуемого благородного металла определяют его пробу. Основные требования к пробирному камню:- твёрдость по минералогической шкале 4.7–6.5; содержание C 8–23%; примеси не более 2% (Al, Fe, Ca, Mn, S, Na, Cl и другие). Пробирный камень должен быть без трещин и не реагировать с неорганическими кислотами и их смесями. В бывшем СССР горные породы, отвечавшие требованиям пробирного камня, под названием Шунгит встречаются на Урале, в устье Реки Чёрная Арагви (близ Тбилиси, Грузия), в карьере Усовая Гора (Карельская АССР). Богатые месторождения кремнистых сланцев за рубежом расположены на территории древнего государства Лидия (на Западе Малой Азии), в связи с чем порода приобрела название Лидийский Камень. Разработана технология изготовления искусственных пробирных камней (спеканием или плавкой заранее подготовленной шихты определённого состава). Однако эти камни по своим качествам уступают высокосортным природным пробирным камням. Пробирные Иглы – эталонные пластинки из определённых сплавов благородных металлов, предназначенные для определения пробы на пробирном камне. Пробирная игла изготавливается из того благородного металла, для опробования которого она предназначается. Выпускавшиеся в бывшем СССР пробирные иглы содержали благородного металла (в %):- золотые – 37.5, 50.0, 58.3, 75.0, 95.8; серебряные – 75.0, 80.0, 87.5, 91.6, 92.5, 96.0; платиновые – 95, палладиевые – 50 и 85. В состав лигатуры игл также входят:- золотых – в основном Ag и Cu, реже –Ni, Zn, Pd и другие; серебряных и платиновых – только Cu; палладиевых – Ag и Ni. Например, золотые пробирные иглы 583-й пробы изготовляются 15 номеров различных по составу лигатуры и цвету, где № 1 содержит 41.7% Ag и не содержит Cu, а № 15 содержит 41.7% Cu, но не содержит Ag (промежуточные иглы с № 2 по № 14 содержат Ag в убывающих, а Cu – в возрастающих пропорциональных количествах). Пробирные иглы для определения пробы зубопротезных дисков содержат 90.0% Au, 4.0% Ag и 6.0% Cu. Пробирные Реактивы – реактивы для определения пробы ювелирно-бытовых изделий и сплавов из благородных металлов на пробирном камне. Для опробования золотых изделий применяют растворы хлорида золота и кислотные реактивы; серебряных изделий – растворы нитрата серебра. Опробование платины производится кислотным реактивом или растворами иодида калия, соляной и азотной кислоты. Для определения пробы палладия используют реактив иодида калия. Под Пробирной Пошлиной, от Немецкого слова Probieren, означающее Испытывать или Пробовать, понимается вид денежного сбора, взимаемого государственными органами пробирного надзора за опробование, анализы и клеймение ювелирно-бытовых изделий из драгоценных металлов. В бывшем СССР за пробирные работы взималась плата по таксе, установленной Министерством Финансов СССР, размер её зависит от массы изделия.

FINENESS = ТОНИНА – (1) Fineness is a relative measure of fiber size expressed in denier or tex for manufactured fibers. For cotton, fineness is expressed as the mean fiber weight in micrograms per inch. For wool, fineness is the mean fiber width or mean fiber diameter expressed in microns (to the nearest 0.001-millimeter).

(2) For yarn fineness, see also Yarn Number. / По тонине пряжи смотрите также Номер Пряжи (Yarn Number).

(3) For fineness of knit fabrics, see also Gauge. / По тонине трикотажных тканей смотрите также Петля (Gauge).

FINE PICK = ТОНКАЯ ПОПЕРЕЧНАЯ НИТЬ (или УТОНЧЁННАЯ ПОПЕРЕЧНАЯ НИТЬ) – Fine Pick:- the weft yarn whose thickness is unacceptably less than that of the adjacent yarns. See also Thin Filling. Fabrics defect.

FINES = МЕЛЬЧАЙШИЕ ЧАСТИЧКИ – Fines are the particles or dust of polymer formed during the process of cutting to produce chip.

FINES, PENALTIES AND FORFEITURES SYSTEM = СИСТЕМА ШТРАФОВ, ВЗЫСКАНИЙ, И ОТЧУЖДЕНИЙ (или КОНФИСКАЦИЙ) – The Fines, Penalties and Forfeitures System (FPFS):- a part of Customs' Automated Commercial System, is used to assess, control and process penalties resulting from violations of law or Customs regulations. FPFS provides retrieval of case information for monitoring case status.

FINE STRIPE = ТОНКАЯ ПОЛОСА – Fine Stripe (FS):- seedlings show fine greenish white longitudinal stripes at tip and margin of leaf blade. Stripes often disappear in the tillering stage.

FINE STRUCTURE = ТОНКАЯ СТРУКТУРА – Fine Structure:- orientation, crystallinity, and molecular morphology of polymers, including fiber-forming polymers.

FINE TEXTURE = ТОНКИЙ СОСТАВ (или ТОНКАЯ ТЕКСТУРА) – Fine Texture:- consisting of or containing large quantities of fine fractions, particularly of silt and clay.

FINE–TUNING OPERATION = ТОНКО ПОДОГНАННАЯ ОПЕРАЦИЯ – Fine-Tuning Operation is a non-regular open market operation executed by the Eurosystem mainly in order to deal with unexpected liquidity fluctuations in the market.

FINE WEIGHT = ЧИСТЫЙ ВЕС – Fine Weight is the weight of precious metal contained in a coin or bullion as determined by multiplying the gross weight by the fineness. Fine Weight is the weight of gold contained in a bar, coin or bullion as determined by multiplying the gross weight by the fineness. / Чистый Вес – вес благородного металла, содержащегося в монете или слитке, который определяется посредством умножения брутто веса на чистоту.

FINE WOODWORK = (ОКОНЧАТЕЛЬНАЯ) УТОНЧЁННАЯ ДЕРЕВООБРАБОТКА – Fine Woodwork:- products such as trim, panelling used for architectural woodwork to provide a high quality decorative appearance to rooms. / .

FINE WOOL = ТОНКАЯ ШЕРСТЬ – Fine Wool is the finest grade of wool – 64's or finer, according to the numerical count grade OR wool with an 18 to 24 micron count. Also, the wool from any of the Merino breeds of sheep. Fine wools may have as many as 30 crimps per inch.

FINE YARN = ТОНКАЯ ПРЯЖА (или УТОНЧЁННАЯ ПРЯЖА) – Fine Yarn or Thin End or Thin Pick:- the yarn whose thickness is unacceptably less than that of the adjacent yarns. Note:- this defect is caused by variation in the linear density of the yarn. See also Thin End, and Thin Pick. / Тонкая Пряжа; Тонкая Продольная Нить; Тонкая Поперечная Нить (fine yarn; thin end; thin pick):- порок пряжи в тканых полотнах, нить толщиной значительно меньшей, чем смежные нити. Примечание:- данный порок вызван использованием в ткани продольной нити несоответствующей линейной плотности.

FINE YARN or LOOSE COURSE = ТОНКАЯ ПРЯЖА или XX (или УТОНЧЁННАЯ ПРЯЖА или XX) – Defect Name:- Fine Yarn or Loose Course. Defect Type:- weft lines, horizontal lines. Fabric Type:- Single Knit Fabrics. Description:- Fine Yarn or Loose Course:- This defect is the result of a fine yarn; however, the appearance is very similar to that of a loose course. Both defects appear as fine width-wise cracks. This view is the back of the fabric. Severity:- Major.

FINGERING–WEIGHT YARNS = XX ПРЯЖИ – Fingering-Weight Yarns:- these yarns knit to a gauge of 7 or more stitches per inch on size 0, 1, 2, or 3 US needles. These yarns have approximately 1 700–2 300 yards per pound, or more, depending upon fineness. This category would include yarns with names like lace weight, baby weight, fine, fingering. Yarns of this weight are used for lightweight fabrics.

FINGERJOINT = СОЕДИНЕНИЕ В ЗАМОК (или ЗУБЧАТОЕ СОЕДИНЕНИЕ, или СОЕДИНЕНИЕ ШТИФТАМИ, или ШИПОВОЕ СОЕДИНЕНИЕ, или СОЕДИНЕНИЕ НА ШКАНТАХ, или СОЕДИНЕНИЕ КЛИНОВИДНЫМИ ШИПАМИ) – Fingerjoint is an end joint made up of several meshing wedges or fingers of wood bonded together with an adhesive. Fingers are sloped and may be cut parallel to either the wide or narrow face of the piece. / соединение встык (end joint), клиньев или . Шкант (устаревшее название), шип (обычно круглого сечения), с помощью которого соединяются столярные детали. Шкант вставляется в подготовленное отверстие (закрепляется клеем). Штифт, от Немецкого слова Stift, цилиндрический или конический стержень для неподвижного соединения деталей или для фиксации деталей при сборке.

FINGER MARK = ОТМЕТИНА ОТ ПАЛЬЦЕВ – Finger Mark is a defect of woven fabrics that is seen as an irregular spot showing variation in picks per inch for a limited width. Causes are spreading of warp ends while the loom is in motion and pressure on the fabric between the reed and take-up drum. Finger Mark is an irregular spot showing variation in picks per inch for a limited width. / пятно. Отметина От Пальцев – порок ткани в виде следа, оставленного грязными пальцами. Вмятина От Вальяна (finger mark):- порок ткани; нехарактерное для полотна пятно, возникающее вследствие изменения фактуры поверхности ткани на определённом участке. Примечание:- этот порок часто вызывается механическими помехами в небольшом масштабе.

FINIDA = FINNISH INTERNATIONAL DEVELOPMENT ASSISTANCE

FINISH = АППРЕТУРА (или АППРЕТ, или АППРЕТИРОВАНИЕ, или ЗАКЛЮЧИТЕЛЬНАЯ ОТДЕЛКА) – Finish is:- (1) a substance or mixture of substances added to textile materials to impart desired properties. (2) A process, physical or chemical, performed on textile materials to produce a desired effect. (3) A property, such as smoothness, drape, luster, water repellency, flame retardancy, or crease resistance that is produced by 1 and/or 2 above. (4) The state of a textile material as it leaves a process. See also Finishing. Finish is a chemical composition applied to yarns in order to facilitate processing.

FINISH COMPOSITION (YARD) = КОМПОЗИЦИЯ АППРЕТА (ЯРД) – Finish Composition (Yard):- physical and chemical analysis of the lubricant applied to yarns to reduce friction and improve processibility.

FINISHED COMPONENTS NOT MEASURING TO TOLERANCES = ЗАКЛЮЧИТЕЛЬНЫЕ КОМПОНЕНТЫ, НЕ УКЛАДЫВАЮЩИЕСЯ В ДОПУСКИ – Finished Components Not Measuring To Tolerances:- could be caused by faulty pattern, cutting, previous operations in stitching or by indifferent operator attention to the specified tolerance. Sewing Room Defects. / при втачивании (stitching). раскрой (cutting). Порок или дефект швейного производства.

FINISHED FABRIC = ОТДЕЛАННАЯ ТКАНЬ (или ГОТОВАЯ ТКАНЬ) – Finished Fabric is a fabric that has gone through all the necessary finishing processes, and is ready to be used in the manufacturing of garments. These processes include bleaching, dyeing, printing, heat setting, etc. Finished Fabric is a fabric that is ready for the market, having passed through the required finishing process.

Woven or machine-knitted fabrics that will not undergo further processing and are ready for sale to the final demand user, either an individual consumer or business firm. Also known as Finished Cloth. Finished Fabric is a fabric that is ready for the market, having passed through the necessary finishing processes. / Ткани после процесса заключительной отделки.

FINISHED GOOD INVENTORY = ИНВЕНТАРЬ ИЗ ГОТОВОГО ТОВАРА – In the official statistics of US Census Bureau, Finished Good Inventory:- the value of all completed products ready for shipment and all inventories and goods bought for resale requiring no further processing or assembly. No accumulation of finished goods inventories should occur with long-term contracts unless the total sales receipts are not recorded until the time of delivery.

FINISHED GOODS = ГОТОВЫЕ ТОВАРЫ – Finished Goods is the total value of the finished inventories on hand at the end of the period. Also shown as Finished Inventories. Finished Goods are goods that have been completed by the manufacturing process, or purchased in a completed form, but which have not yet been sold to customers. Goods that have been purchased in completed form are known as Merchandise.

FINISHED GOODS INVENTORY = МАТЕРИАЛЬНЫЕ ЦЕННОСТИ ИЗ ГОТОВЫХ ТОВАРОВ (или ИНВЕНТАРИЗАЦИЯ ГОТОВЫХ ТОВАРОВ) – Finished Goods Inventory:- products that are ready to ship.

FINISHED INVENTORIES = ГОТОВЫЕ МАТЕРИАЛЬНЫЕ ЦЕННОСТИ – Finished Inventories:- xxxxx. See also Finished Goods.

FINISHED MOTOR GASOLINE = ГОТОВЫЙ АВТОМОБИЛЬНЫЙ БЕНЗИН (или ТОВАРНЫЙ АВТОМОБИЛЬНЫЙ БЕНЗИН) – Finished Motor Gasoline is a complex mixture of relatively volatile hydrocarbons with or without small quantities of additives, blended to form a fuel suitable for use in spark-ignition. Motor gasoline, as defined in the American Society for Testing and Materials (ASTM) Specification D-4814 or Federal Specification VV-G-1690C, is characterized as having a boiling range of 122–158 degrees Fahrenheit at the 10-percent recovery point to 365–374 degrees Fahrenheit at the 90-percent recovery point. Motor Gasoline includes conventional gasoline, all types of oxygenated gasoline including gasohol, and reformulated gasoline, but excludes aviation gasoline. Volumetric data on blending components, as well as oxygenates, are not counted in data on finished motor gasoline until the blending components are blended into the gasoline. / Американское Общество по Испытаниям и Материалам (АОИМ). без присадок (добавок) в малых количествах, . насыщенные кислородом.

FINISHED PRODUCT INVENTORY = МАТЕРИАЛЬНЫЕ ЦЕННОСТИ ИЗ ГОТОВЫХ ПРОДУКТОВ (или ИНВЕНТАРИЗАЦИЯ ГОТОВЫХ ПРОДУКТОВ) – Finished Product Inventory:- available products to ship to customers.

FINISHING = ОТДЕЛКА (или ЗАКЛЮЧИТЕЛЬНАЯ ОТДЕЛКА, или ОТДЕЛОЧНАЯ ОБРАБОТКА, или ФИНИШНАЯ ОБРАБОТКА) – (1) Finishing:- in the fabric production, those processes through which a fabric passes after being taken from the loom, such as bleaching, dyeing, lacquering, sizing, waterproofing, and defect removing. All the processes through which fabric is passed after bleaching, dyeing, or printing in preparation for the market, or use. Finishing is all the processes through which fabric is passed after bleaching, dyeing, or printing in preparation for the market or use. Finishing includes such operations as heat-setting, napping, embossing, pressing, calendering, and the application of chemicals that change the character of the fabric. The term finishing is also sometimes used to refer collectively to all processing operations above, including bleaching, dyeing, printing, etc. Finishing:- coupling agents are applied to the fabric during finishing. The coupling, or finishing, agents act to provide optimum adhesion between the reinforcement fabric and the polymer matrix. Ballistic fabrics may undergo scouring and water repellent treatment in the finishing stage. Finishing is an overall term that usually refers to all processes, with the exception of coloring, to make fabric more acceptable (some experts also include coloring). Much of the look, feel, and behavior of a fab ric is determined by the finishing steps taken. Finishing can be mechanical (as in calendering) or chemical, or both. Special treatments are applied to fabrics during finishing to make them perform better, shrink less, resist flarnes, and repel water. Calendering refers to a process in which the fabric is passed through heated cylinders. This gives the fabric a lustrous surface and can also emboss it. Another important step in finishing, and usually the final process, is tentering. / Порок или дефект. В широком смысле этого слова под Отделкой тканей понимаются процессы крашения, отбеливания, печатания рисунка и заключительные операции:- аппретирование, высушивание с одновременным ширением (восстановлением ширины ткани) и ликвидацией перекосов по основе и утку, декатировка, мягчение и другие. В узком значении этого слова под отделкой понимают лишь заключительные операции. Под Отделкой текстильных материалов понимается комплекс химических, физикохимических и механических процессов и операций для придания материалам ценных потребительских свойств. Основные процессы отделки текстильных материалов:- беление (отбелка), крашение, печатание и аппретирование (заключительная отделка). Заключительная Отделка – комплекс физико-механических и химических процессов, применяемых для улучшения внешнего вида ткани и придания ей необходимых потребительских свойств:- малосминаемая комфортная отделка (МКО), малосмываемый аппрет на основе термореактивных смол (МАРС), малосмываемый аппрет на основе термореактивных смол улучшенного качества (МАРС-У), лёгкое глажение (ЛГ), лёгкое глажение улучшенного качества (ЛГ-У), лёгкая в уходе, улучшенная противоусадочная химическая (УПХ), ‘стирай-носи’ (малосминаемая в сухом и мокром состоянии (СН)), серебристо-шёлковистая (СШ), серебристо-шёлковистая улучшенная (СШУ), тиснение (Т), улучшенное тиснение (УТ), лощение (Л), улучшенное лощение (УЛ), несмываемая глянцевая, формоустойчивая. Отделка тканей – в широком значении – процессы отбеливания, крашения, печатания и заключительные операции облагораживания тканей (так называемая заключительная отделка тканей). В более узком значении под отделкой тканей понимают лишь заключительную отделку:- аппретирование тканей, высушивание с одновременным ширением и ликвидацией перекосов по основе и утку, стрижку, разглаживание, декатировку, мягчение, безусадочную отделку – процессы, улучшающие вид и качество тканей, повышающие сопротивляемость их различным воздействиям при эксплуатации (стирка, истирание и другое). Цикл операций заключительной отделки тканей определяется структурой и назначением тканей, причём в некоторых случаях отдельные операции могут быть исключены, например, каландрирование, декатировка, мягчение.

(2) Finishing refers to additional steps used after the yarn is removed from the bobbin. See also Brushing, and Fulling. / Смотрите также Очистка (Brushing), и Уваливание (Fulling).

FINISHING BAR = ПОЛОСА ОТ ОТДЕЛКИ – Finishing Bar is a noticeable streak across the entire width of a fabric, usually caused by machine stoppage during processing. Finishing Bar is an uneven appearance across the entire fabric width.

FINISHING SPOT = ПЯТНО ОТ ОТДЕЛКИ – Finishing Spot is a discolored area on a fabric caused by foreign material such as dirt, grease, or rust.

FINISH TURNS = ОКОНЧАТЕЛЬНОЕ ЧИСЛО КРУЧЕНИЙ – Finish Turns is the actual degree of twist in the final yarn product.

FIO = FIXED INTEREST OFFERING

FIO = FREE IN AND OUT

FIOS FREIGHT RATES = FREE IN/OUT STOWED FREIGHT RATES

FIOT = FREE IN/OUT AND TRIMMED

FIPA = FÉDÉRATION INTERNATIONALE DES PRODUCTEURS AGRICOLES = INTERNATIONAL FEDERATION OF AGRICULTURAL PRODUCERS

FIPS = FEDERAL INFORMATION PROCESSING STANDARD

FIPS = FOREIGN INTEREST PAYMENT SECURITIES

FIRE = ОГОНЬ – Fire:- both direct and consequential damage whether from smoke or steam or efforts to extinguish a fire. Spontaneous combustion occurring in the insured shipment is excluded unless specifically assumed by the underwriters.

FIRE ASSAY = ОГНЕВОЕ ПРОБИРОВАНИЕ (или ОПРОБИРОВАНИЕ ОГНЁМ) – Fire Assay is considered the most reliable method for accurately determining the content of gold, silver, and platinum-group metals (except osmium and ruthenium) in ores or concentrates. This process involves melting a gold-bearing sample in a clay crucible with a mixture of fluxes (such as silica and borax), lead oxide (called Litharge), and a reducing agent (frequently flour). The fluxes lower the melting point of the oxidic materials, allowing them to fuse, and the molten litharge is reduced by the flour to extremely fine drops of lead dispersed throughout the charge. The drops of lead dissolve the gold, silver, and platinum-group metals, then coalesce and gradually descend through the sample to form a metallic layer at the bottom of the crucible. After cooling, the lead 'button' is separated from the slag layer and heated under oxidizing conditions to oxidize and eliminate the lead. The shiny metallic bead that is left contains the precious metals. The bead is boiled in nitric acid to dissolve the silver (a process called Parting), and the gold residue is weighed. If platinum metals are present, they will alter the appearance of the bead, and their concentration can sometimes be determined by use of an arc spectrograph. Fire Assay is a method of determining the content of a metal (most commonly gold) in an alloy involving the removal of other metals by what is in effect a combination of fire-refining (for the removal of base metals) and chemical refining (for the removal of silver) and then determining the gold content by comparing the initial and final weights of the sample. Fire assay can determine the gold content of Good Delivery-type alloys to an accuracy of better than 1 part in 10 000. Fire assay is also known as Cupellation or Gravimetric Analysis. / Купелирование (Cupellation). Муфельный Метод – наиболее точный метод для опробирования драгоценных металлов. Упрощённо этот метод называют Горячим Анализом и применяют его только в химических лабораториях. Существует несколько способов взятия проб от испытуемого металла. Наиболее часто применяется проба от слитков и тигельная. Пробу от слитков берут либо сверлением, либо вырубанием. Если пробу берут сверлением, то от каждого отдельного слитка сверху, снизу и с диагонально-противоположных концов, несколько отступив от краёв слитка, высверливают 1–2 г стружки. Поверхностную стружку из пробы следует удалять, так как состав поверхностного слоя может отличаться от состава слитка. Если пробу берут вырубкой, то от краёв каждого слитка с верхней и нижней части зубилом при помощи молотка вырубают по кусочку металла, которые затем вручную раскладывают на наковальне и прокатывают до желаемой толщины. Тигельную, или Горошковую, пробу берут непосредственно из тигля от расплавленного и хорошо перемешанного металла. Взятую таким образом пробу жидкого сплава отливают в изложницу или дробят отливкой в воду. Для выполнения анализа на содержание драгоценных металлов пользуются муфельными и тигельными печами, тиглями, щеберами (плоскими блюдечками из огнеупорных материалов), капелями (чашечками из костяной муки и цемента) и другим. Пробирный анализ на содержание золота, серебра и платиновых металлов состоит в сплавлении испытуемого вещества (пробы) с флюсами, содержащими металлический свинец или глет (двуокись свинца) с восстановителем. Расплавленный свинец смачивает частицы благородных металлов и образует с ними сплав, называемый веркблеем, который плотно объединяет все металлические зёрна. Остальные компоненты с флюсами образуют легкоплавкий шлак, Веркблей отделяется от шлака и обрабатывается купелированием. Сущность купелирования состоит в отделении окислов металлов от драгоценных металлов, основанном на избирательном смачивании капели окислами вещества. Окислы всасываются пористой массой капели, а металлы остаются на её поверхности. Полученный при купелировании 'королёк' в относительно редких случаях состоит только из одного драгоценного металла (чисто золотой, серебряный и платиновый). Чаще он представляет собой сплав этих металлов, обычно золота с серебром. Для разделения на составляющие компоненты 'королёк' расковывают, прокатывают в тонкую ленту и растворяют (разваривают) в кислотах. Разделение золота и серебра азотной кислотой основано на том, что последняя количественно растворяет серебро, не действуя на золото, если содержание его в сплаве превышает содержание золота примерно в три раза. Однако при разваривании в кислоте следует избегать распадания золота с образованием мелких частиц. Также следует обеспечить полное растворение серебра. То и другое достигается получением сплава золота и серебра в требуемых соотношениях путём квартования, то есть сплавления золота с серебром в отношении, отвечающем условиям полного разделения полученного сплава кислотой. Навеску для анализа золотого сплава муфельным путём берут массой около 250 мг, добавляют необходимое количество чистого серебра с тем, чтобы отношение серебра к золоту в 'корольке' было равно 2.5:1. Золотую 'корточку', полученную после разварки 'королька' в кислоте, взвешивают на пробирных весах, и полученную массу, выраженную в миллиграммах, умножают на 4. Результат является пробой анализируемого сплава. Серебро, применяемое для квартования, проверяют на содержание золота, свинец, употребляемый при купелировании, – на содержание в нём золота и серебра. Если золото обнаружено в квартовочном серебре, такое серебро не может применяться для анализов, а если золото и серебро обнаружено в свинце, то при подсчёте результатов анализа необходимо сделать соответствующую поправку. При определении серебра в изделиях и сплавах муфельным путём также берут навеску массой около 250 мг и купелируют. Полученный при этом 'королёк' взвешивают на пробирных весах, и массу, выраженную в миллиграммах, умножают на 4. Полученный результат является пробой анализируемого сплава.

FIRE–BLOCKING LAYER = СЛОЙ, БЛОКИРУЮЩИЙ ОГОНЬ – Fire-Blocking Layer is a fabric layer composed of fibers with flame-retardant properties used in aircraft seat cushions and other upholstery constructions to decrease the overall flammability of the total construction by preventing access of flame to the body of the construction.

FIREBURNT KERNELS = ОБГОРЕЛАЯ ЗЕРНОВКА (или ОБГОРЕЛЫЕ ЯДРА) – Fireburnt Kernels are kernels burned or scorched by fire. A cross-section of a fireburnt kernel resembles charcoal, with numerous air holes. These air holes result in a low-weight kernel which crumbles easily under pressure Fireburnt kernels are kernels burned or scorched by fire. A cross-section of a fireburnt kernel resembles charcoal, with numerous air holes. These air holes result in a low-weight kernel which crumbles easily under pressure. The Off-Grades of Grades of Grain and Grades of Screenings Order excludes from any Class I or Class II grade any grain having a fireburnt odor or containing fireburnt kernels in excess of established tolerances, because it is not possible to separate all kernels affected by smoke or heat from samples containing grain damaged by fire. / Сорта Высевок (Grades of Screenings).

FIRE COMPARTMENT = ПРОТИВОПОЖАРНЫЙ ОТСЕК – Fire Compartment is an enclosed space in a building that is separated from all other parts of the building by enclosing construction that provides a fire separation and which has a required fire-resistance rating. / .

FIRE–ENGINE RED = КРАСНОЕ КАК У ОГНЕННОГО ДВИГАТЕЛЯ – Fire-Engine Red:- a bright red.

FIRE/EXPLOSION = ПОЖАР/ВЗРЫВ – Fire/Explosion is one type of the casualty. A shipboard fire is a terrifying situation. The fire may be too serious to be dealt with using the vessel's own firefighting resources and, therefore, salvage assistance will be required. Salvage tugs are equipped with powerful firefighting systems. In recent years, the International Salvage Union (ISU) salvors have dealt with a number of very serious fires involving laden tankers and container vessels. / Под Пожаром понимается неконтролируемый процесс горения, сопровождающийся уничтожением материальных ценностей и создающий опасность для жизни людей. Под Взрывом понимается освобождение большого количества энергии в ограниченном объёме за короткий промежуток времени. Взрыв приводит к образованию сильно нагретого газа (плазмы) с очень высоким давлением, который при расширении оказывает механическое воздействие (давление, разрушение) на окружающие тела. В твёрдой среде сопровождается её разрушением и дроблением. Взрыв происходит за счёт освобождения химической энергии (главным образом взрывчатого вещества (ВВ)), внутриядерной энергии (ядерный взрыв), электромагнитной энергии (искровой разряд, лазерная искра и другие), механической энергии (при падении метеоритов на поверхность Земли, извержении вулканов и другом). Проектируемые взрывы осуществляются в основном промышленными ВВ и лежат в основе многих технологических процессов.

FIRE INSURANCE = СТРАХОВАНИЕ ОТ ОГНЯ – Fire Insurance is an insurance that is used to cover damage to a property caused by fire. Fire insurance is a specialized form of insurance beyond property insurance, and is designed to cover the cost of replacement, reconstruction or repair beyond what is covered by the property insurance policy. Policies cover damage to the building itself, and may also cover damage to nearby structures, personal property and expenses associated with not being able to live in or use the property if it is damaged. Homeowners and property owners may consider fire insurance in addition to a property insurance policy if the property contains valuable items. A best practice would be to document the property and its related contents, which makes identifying the value of items damaged or lost much easier after a fire has taken place. A fire insurance policy may contain exclusions based on the cause of the fire, such as not covering fires caused by wars. Fire Insurance is an insurance against fire, lightning or explosion. It can also include insurance against windstorm, earthquake, flood and other natural hazards or political risks. / Страхование от огня, молнии или взрыва. Оно может также включать в себя и страхование от бури, землетрясения, наводнения и иных природных опасностей или политических рисков.

FIREMAN = КОЧЕГАР – Fireman is an unlicensed member of the engine, room staff whose duties consist of standing watch in the boiler room and insuring the oil burning equipment is working properly.

FIRE POINT = ТОЧКА ВОСПЛАМЕНЕНИЯ (или ТЕМПЕРАТУРА ВОСПЛАМЕНЕНИЯ) – Fire Point (Clevelend Open Cup) is the temperature to which a combustible liquid must be heated so that the released vapor will burn continuously when ignited under specified conditions. / Точка Воспламенения (по методу Открытого Тигля Кливлэнда) . Точка Воспламенения или Температура Воспламенения – наименьшая температура испытуемого образца, скорректированная на барометрическое давление 101.3 кПа, при которой при поднесении источника зажигания происходит воспламенение паров образца и устойчивое горение в течение не менее 5 секунд (с) при установленных условиях испытания. Температура Воспламенения – это температура, при которой газы, испаряющиеся из нагретой в открытом тигле жидкости, горят после поднесения открытого огня не менее пяти секунд. Температура воспламенения обычно выше температуры вспышки на 10–50 °C. Воспламенение, процесс возникновения горения. Может происходить путём зажигания или самовоспламенения.

FIREPROOF = ОГНЕУПОРНОЕ (или НЕСГОРАЕМОЕ) – Fireproof means that a fabric literally will not burn. To be labeled fireproof, the Federal Trade Commission requires that a fabric must be 100% fireproof. If the fiber or fabric has been treated to prevent flames from spreading, it must be labeled as fire resistant. See also Fire Resistant, and Flame Retardant Fabric.

FIRE–RESISTANCE RATING = РЭЙТИНЬГ ОГНЕСТОЙКОСТИ (или ПРЕДЕЛ ОГНЕСТОЙКОСТИ) – Fire-Resistance Rating:- the time in hours or minutes that a material or assembly of materials will withstand the passage of flame and the transmission of heat when exposed to fire under specified conditions of test and performance. It can also be determined by extension or interpretation of information derived from fire test results, as prescribed in the building code. / по спецификационным условиям . Под Огнестойкостью понимается способность изделия, конструкции или элемента сооружения сохранять при пожаре несущую и огнепреграждающую способность, то есть сопротивляться обрушению (разрушению), прогреву до температур возгорания, образования сквозных отверстий и трещин, а также препятствовать распространению горения по поверхности или внутри изделия (конструкции, сооружения). Время, в течение которого изделие сохраняет огнестойкость при специальных огневых испытаниях, называют пределом огнестойкости. Высокую огнестойкость (свыше 1 часа) имеют конструкции из камня, кирпича, бетона; низкую огнестойкость (около 0.25 часа) – из стали. Для повышения огнестойкости стальные конструкции облицовывают теплоизоляционными материалами или покрывают специальными вспучивающимися покрытиями.

FIRE RESISTANT = ОГНЕСТОЙКОЕ – A term Fire Resistant refers to a fabric or fiber that has been treated to discourage the spreading of flames. See also Flame Retardant Fabric.

FIRE RESISTANT FLUID = ОГНЕСТОЙКАЯ ЖИДКОСТЬ – Fire Resistant Fluid is a fluid difficult to ignite which shows little tendency to propagate flame. Fire-Resistant Fluid is a lubricant used especially in high-temperature or hazardous hydraulic applications. Three common types of fire-resistant fluids are:- (1) water-petroleum oil emulsions, in which the water prevents burning of the petroleum constituent; (2) water-glycol fluids; and (3) non-aqueous fluids of low volatility, such as phosphate esters, silicones, and halogenated hydrocarbon-type fluids.

FIRE–RETARDANT CHEMICAL = ПРОТИВОВОСПЛАМЕНЯЮЩЕЕ ХИМИЧЕСКОЕ ВЕЩЕСТВО (или ПРОТИВОВОСПЛАМЕНИТЕЛЬНОЕ ХИМИЧЕСКОЕ ВЕЩЕСТВО) – Fire-Retardant Chemical is a chemical or preparation of chemicals used to reduce flammability or to retard the spread of a fire over the surface of a material. / .

FIRE–RETARDANT COATING = ПРОТИВОВОСПЛАМЕНЯЮЩЕЕ ПОКРЫТИЕ (или ПРОТИВОВОСПЛАМЕНИТЕЛЬНОЕ ПОКРЫТИЕ) – Fire-Retardant Coating:- a fluid applied to a material, such as wood, using a brush, roller, or sprayer which reduces the burning characteristics of the surface. / опрыскиватель (sprayer).

FIRE–RETARDANT TREATED WOOD = ДРЕВЕСИНА, ОБРАБОТАННАЯ ПРОТИВОВОСПЛАМЕНИТЕЛЬНЫМИ ВЕЩЕСТВАМИ – Fire-Retardant Treated Wood is a wood or a wood product that has had its surface-burning characteristics, such as flame- spread, rate of fuel contribution and density of smoke developed, reduced by pressure treating with fire retardant chemicals. / .

FIRE SEPARATION = ПРОТИВОПОЖАРНАЯ ПРЕГРАДА – Fire Separation:- a construction assembly that acts as a barrier against the spread of fire. A fire separation may or may not have a fire-resistance rating. / Противопожарные Преграды – устройства, предназначенные для ограничения распространения пожара внутри зданий, между ними (общие противопожарные преграды) или по поверхности элементов зданий (местные противопожарные преграды). К общим противопожарным преградам относят противопожарные стены, зоны, несгораемые перекрытия, экраны, разрывы между зданиями; к местным противопожарным

преградам – устройства для ограничения разлива жидкостей (бортики, обваловки и другие), противопожарные пояса в плоскости стен, огнезадерживающие устройства в материалопроводах и воздуховодах, противопожарные фартуки и перегородки в чердаках и другое.

FIREWALL = ПРОТИВОПОЖАРНАЯ СТЕНА (или БРАНДМАУЭР) – Firewall is a type of fire separation of noncombustible construction, which subdivides a building or separates adjoining buildings to resist the spread of fire and which has a fire-resistance rating as prescribed in the codes and has structural stability to remain intact under fire conditions for the required fire rated time. / Противопожарная Стена или, как её раньше называли, Брандмауэр (от Немецкого слова Brandmauer от Brand, означающее Пожар, и Mauer, означающее Стена) предназначена для разобщения смежных помещений одного здания либо двух смежных зданий с целью воспрепятствовать распространению пожара. Она выполняется из несгораемых материалов (бетона, железобетона, камня). Она должна иметь самостоятельный фундамент или опираться на другую несгораемую конструкцию.

FIRKIN = ФИРКИН (или БОЧОНОК В ФОРМЕ ЧЕТЫРЁХГРАННОЙ ПРИЗМЫ, или КАНИСТРА, или ЧЕТВЕРТЬ, или ЧЕТВЕРИК) – (1) Firkin is a capacity measurement equal to one-fourth of a barrel. Firkin is a traditional unit of volume equal to 1/4 barrel or 1/2 kilderkin. Since barrels are of various sizes, the capacity of a firkin varies. Based on the standard US barrel of 31.5 gallons, a firkin would equal 7.875 gallons, 1.05 cubic feet, or about 29.81 liters. Traditional British barrels and firkins are larger; in the Imperial system a firkin holds 1.445 cubic feet or 40.91 liters. The unit is of Dutch origin, and its name is based on the Dutch word vier for four. Abbreviation:- fir. / его наименование в Английском языке основано на Датском слове Vier, означающее Четыре. Обозначение:- . В России под Четвертью понималась единица объёма (вместимости) сыпучих тел и жидкостей, применявшаяся до введения Метрической Системы мер. Для сыпучих тел 1 четверть = 8 четверикам = 209.91 кубическим дециметрам (дм^3). Для жидких тел 1 четверть = 1/4 ведра = 3.074 8 дм^3. В России в XVII веке существовала мера объёма (вместимости) сыпучих тел ‘Четверик’, которая равнялась 8 гарнцам или 26.238 7 кубическим дециметрам (дм^3) или литрам. С введением Метрической Системы мер была упразднена. Ведро – сосуд, обычно цилиндрической формы, с ручкой в виде дужки для жидкостей, сыпучего. А также старая Русская мера жидкостей, равная 1/40 бочки или 12 литров. Бочонок – маленькая бочка.

(2) Firkin is a traditional unit of weight for butter and soap, equal to 4 stone or 56 pounds (about 25.40 kilograms). Abbreviation:- fir. / Под Фиркином понимается традиционная единица веса масла и мыла, равная 4 stone или 56 фунтам (около 25.4 килограмм). Обозначение:- .

FIRM = ТВЁРДОЕ (или УСТОЙЧИВОЕ) – Firm is a term used to indicate higher than average, or higher than expected prices, usually in the context of crude or spot/rack prices. Also used to portray upward pressure, or an upward trend, in prices. The opposite of Soft. Expression indicating that stock market prices or foreign exchange rates are tending upward or remaining high. / Выражение, указывающее, что цены на фондовом рынке или курсы иностранных валют имеют тенденцию на повышение или остаются высокими. Устойчивое или Твёрдое:- твёрдость, надёжность соглашения. Например, твёрдый заказ производителю или твёрдая ставка на акции по некоторой цене означают, что заказ или ставка гарантированы.

FIRM = УПЛОТНЯТЬ (или УТРАМБОВЫВАТЬ) – Firm is a term describing the consistency of a moist soil that offers distinctly noticeable resistance to crushing but can be crushed with moderate pressure between the thumb and forefinger.

FIRM = ФИРМА – Firm is a corporation, partnership, limited partnership, association, company, trust, or any other kind of organization or body corporate, situated, residing, or doing business in the United States or any foreign country, including any government or agency thereof. Firm:- this term means a corporation, partnership, limited liability company, sole proprietorship or other entity. / Этот термин подразумевает под собой корпорацию, товарищество, компанию с ограниченной ответственностью, частного предпринимателя или иное юридическое лицо. Под Фирмой, от Итальянского слова Firma, означающее Подпись, понимается:- (i) тип производственного объединения предприятий; или (ii) наименование (фирменное наименование) торгового или промышленного предприятия; объект промышленной собственности. Фирма – торговое или промышленное предприятие, пользующееся правами юридического лица. Во времена существования бывшего Союза Советских Социалистических Республик (СССР) фирмами обычно назывались объединения производственных предприятий во главе с ведущим, так называемым головным, предприятием, крупные торговые предприятия, а также некоторые предприятия бытового обслуживания. Фирма – общий термин для обозначения коммерческого предприятия, корпорации, товарищества или частного предприятия. С юридической точки зрения фирма не считается корпорацией, поскольку может не являться акционерным обществом, а владельцы фирмы не воспринимаются отдельно от фирмы как таковой. Например, это может быть верно по отношению к юридической или бухгалтерской фирме.

FIRM ENERGY = БЕСПЕРЕБОЙНО ПОСТАВЛЯЕМАЯ ЭЛЕКТРОЭНЕРГИЯ (или УСЛОВНАЯ БРОНЬ, или НЕСНИЖАЕМЫЙ УРОВЕНЬ, или ПОТРЕБНАЯ ЭНЕРГИЯ) – Firm Energy:- the highest quality sales of electric transmission service offered to customers under a filed rate schedule that anticipates no planned interruption. In other words, energy sales which, although not subject to interruption for economic purposes, may be interrupted under force majeure conditions. / Продажи высококачественных услуг по поставке электроэнергии потребителям осуществляются по фиксированным расценкам и не предполагают запланированных перерывов. Иными словами, продажи энергии, поставки по которым не подлежат отмене по экономическим причинам, однако, могут быть прерваны в силу форс мажора.

FIRM GAS = ТВЁРДЫЙ ГАЗ (или ОБЕСПЕЧЕННЫЙ ГАЗ, или ПОТРЕБНЫЙ ГАЗ) – Firm Gas is a gas sold on a continuous and generally long-term contract.

FIRM POINT–TO–POINT TRANSMISSION = БЕСПЕРЕБОЙНАЯ ПЕРЕДАЧА ОТ ПУНКТА К ПУНКТУ (или ХХ) – Firm Point-To-Point Transmission is a firm transmission service that is reserved and/or scheduled between specified points of receipt and delivery.

FIRM POWER = ТВЁРДАЯ МОЩНОСТЬ (или УСТОЙЧИВАЯ МОЩНОСТЬ, или ПОТРЕБНАЯ МОЩНОСТЬ) – Firm Power is a power or power producing capacity intended to be available at all times during the period covered by a guaranteed commitment to deliver, even under adverse conditions. / Под электрической Мощностью понимается работа электрического тока в единицу времени. В цепи постоянного тока мощность равна произведению напряжения и тока. Произведение мгновенных значений переменного напряжения и тока – Мгновенная Мощность, её среднее за период значение – Активная Мощность, произведение действующих значений тока и напряжения – Полная Мощность, для синусоидального тока произведение полной мощности на синус угла сдвига фаз между током и напряжением – Реактивная Мощность. Под электрической Мощностью понимается величина, характеризующая скорость изменения (передачи, преобразования, рассеяния и тому подобного) электрической энергии. В цепях постоянного тока электрическая мощность равна произведению напряжения и силы тока. В цепях переменного тока различают:- активную, мгновенную, полную и реактивную электрическую мощность.

FIRM SERVICE = ТВЁРДАЯ УСЛУГА (или ТВЁРДАЯ ПОСТАВКА, или БЕСПЕРЕБОЙНОЕ ОБСЛУЖИВАНИЕ) – Firm Service is the utility service which assumes no interruption except if residential customers' supply is threatened. The opposite of Interruptible Service. / Поставка электроэнергии энергопредприятием, которая может быть прервана лишь при угрозе срыва поставок электроэнергии населению. В противоположность Прерываемому Обслуживанию или Обслуживанию с Перебоями (Interruptible Service).

FIRM TRANSMISSION = БЕСПЕРЕБОЙНАЯ ПЕРЕДАЧА (или ХХ) – Firm Transmission is a transmission service that is intended to be available at all times to the maximum extent practicable. Service availability is, however, subject to an emergency, an unanticipated failure of a facility or other event.

FIRM TRANSMISSION SERVICE = УСЛУГА ОБЕСПЕЧЕННОЙ ПЕРЕДАЧИ (или УСЛУГА ТВЁРДОЙ ПЕРЕДАЧИ) – Firm Transmission Service:- point-to-point transmission service that is reserved and/or scheduled for a term of one year or more and that is of the same priority as that of the Transmission Provider's firm use of the transmission system. Firm Transmission service that is reserved and/or scheduled for a term of less than one year shall be considered Short-Term Firm Transmission Service for the purposes of service liability.

FIRM UNDERWRITING = РАСПИСЫВАНИЕ ВНУТРИ ФИРМЫ (или ЗАКРЫТАЯ ПОДПИСКА) – Firm Undertaking is an undertaking by a bank or syndicate to assume the risk of buying a new issue of securities and to offer them for public subscription at its own risk. Also known as Direct Underwriting.

FIRREA = FINANCIAL INSTITUTIONS REFORM, RECOVERY AND ENFORCEMENT ACT OF 1989

FIRST ASSISTANT ENGINEER = ПЕРВЫЙ ПОМОЩНИК МЕХАНИКА (или ПЕРВЫЙ ПОМОЩНИК ИНЖЕНЕРА) – First Assistant Engineer (engineer department (licensed)):- in charge of four to eight watch. Usually works from eight to four handling engine maintenance. Assigns duties to unlicensed personnel and monitors and records overtime. Consults with Chief regarding work priorities.

FIRST COST TO AGENT = ПЕРВАЯ СТОИМОСТЬ ДЛЯ АГЕНТА – First Cost To Agent (FCA):- a form of payment terms.

FIRST DELIVERY DATE = ДАТА ПЕРВОЙ ПОСТАВКИ – A term First Delivery Date means the first business day of the expiring month for commodity futures contracts. / Термин Дата Первой Поставки означает первый рабочий день истекающего месяца поставки по фьючерсным контрактам на сырьё.

FIRST FLOWER = ПЕРВЫЙ ЦВЕТОК – First Flower (in a field):- The time when about one-half of plants in a population have developed at least one white flower, rather than when the first flower appears in the field. First flower thus refers to an average flowering date, and is often referred to as '50% flower'. The first flower on an individual plant will normally occur on the first fruiting position from the main-stem axis on the lowest sympodium and can generally be expected to occur about 55 to 65 days after planting.

FIRST FRUITING NODE = ПЕРВЫЙ ПЛОДОНОСЯЩИЙ УЗЕЛ – First Fruiting Node is the lowest main-stem node above the cotyledonary node from which a sympodial branch develops. Usually occurs at main-stem nodes 5 to 7, although this is influenced by temperature and cultural practice; typically, the first square on the plant will appear on this sympodial branch at the fruiting position nearest the main stem. See also First Square.

FIRST HALF A YEAR = ПЕРВОЕ ПОЛУГОДИЕ

FIRST IN, FIRST OUT = ПЕРВЫМ ОПРИХОДОВАНО, ПЕРВЫМ СПИСАНО – First In, First Out (FIFO) is a method of storing and relieving Cost of Goods Sold based upon applying the first (oldest) cost in the record to sales as they are posted, the remaining inventory reflecting the most recent costs. First In, First Out (FIFO) is a method whereby the goods which have been longest in stock (first in) are used, delivered (sold) and/or consumed first (first out). Accountancy principle whereby stock-in-trade is assumed to be issued to customers in the order that it is received. Thus stock currently held may be valued at current prices. See also Last In, First Out (LIFO). First In, First Out (FIFO):- inventory allocation method whereby the first product stored is the first product that is utilized or allocated for the fulfillment of orders. / (ПОПС или, как это звучит на Английском языке, ФАЙФО (FIFO)). Первым Оприходовано, Первым Списано (ПОПС) – метод оценки и учёта товарных запасов или портфеля ценных бумаг ПОПС, при котором в буквальном смысле считается, что товары продаются в прямой хронологической зависимости от момента их приобретения. Например, при подсчёте стоимости проданных товаров используется следующая формула:- в соответствии с методом ПОПС стоимость товарного запаса переносится с наиболее давних закупок вперёд, когда товарный запас в начале отчётного периода является начальной точкой, а товарный запас на конец отчётного периода представляет последние закупки. Метод ПОПС противоположен методу Последним Оприходовано, Первым Списано (ПОПС; Last In, First Out (LIFO)). Разница между ними становится очевидна, когда инфляция или дефляция влияют на цену товара. В период инфляции метод ПОПС даёт более высокую оценку товаров на конец отчётного периода, более низкий показатель стоимости проданных товаров и более высокую совокупную прибыль. Метод LIFO, напротив, даёт более низкую оценку товаров на конец отчётного периода, более высокий показатель стоимости проданных товаров и более низкую совокупную прибыль. При ведении бухгалтерской отчётности о покупке и продаже ценных бумаг в целях налогообложения Служба Внутренних Доходов – налоговое управление США (IRS) использует метод ПОПС, если ему не рекомендуется использовать альтернативный метод.

FIRST–IN, LAST–OUT = ПЕРВЫМ ОПРИХОДОВАНО, ПОСЛЕДНИМ СПИСАНО – First-In, Last-Out (FILO) is a system of inventory.

FIRST MATE (CHIEF MATE) = ПЕРВЫЙ ПОМОЩНИК (СТАРШИЙ ПОМОЩНИК) – First Mate or Chief Mate:- In charge of four to eight watch. Directly responsible for all deck operations (cargo storage and handling, deck maintenance deck supplies). Assigns and checks deck department overtime. Ship's medical officer.

FIRST MORTGAGE = ПЕРВАЯ ЗАКЛАДНАЯ – First Mortgage is a real estate loan with the right to payment in full before payments to other lenders are made. First mortgages are generally considered low-risk investments, although the quality of real estate pledged as collateral is of crucial importance in determining the riskiness of the mortgage. Mortgage that has precedence over all other mortgages as a lien against a specific property. Usually granted for up to around two thirds of the property's market value. See also Junior Mortgage; and Second Mortgage. First Mortgage is a mortgage that has a first-priority claim against the property in the event the borrower defaults on the loan. For example, a borrower defaults on a loan secured by a property worth USD100 000.00 net of sale costs. The property has a first mortgage with a balance of USD90 000.00 and a second mortgage with a balance of USD15 000.00. The first mortgage lender can collect USD90 000.00 plus any unpaid interest and foreclosure costs. The second mortgage lender can collect only what is left of the USD100 000.00. First Mortgage is the mortgage that has first claim in the event of a default. First Mortgage is a mortgage on a property in which the lender has the right to full payment before any other lenders or liens on the same property are paid. That is, if the borrower defaults on the mortgage, the lender of the first mortgage has first right to the property and other lenders using the same property as collateral may only use it after the first lender has been fully satisfied. Generally speaking,

first mortgages carry lower risk for lenders than other mortgages. / Первая Закладная – заём под залог недвижимости, ссуда, которая предоставляет кредитору преимущественное право на собственность, впервые предложенную в качестве обеспечения. В случае возврата займов первая закладная имеет преимущественное право на собственность по сравнению со всеми остальными закладными. Смотрите также Младшая Закладная (Junior Mortgage); и Вторая Закладная (Second Mortgage).

FIRST NAMED INSURED = ПЕРВЫЙ ПОИМЕНОВАННЫЙ СТРАХОВАТЕЛЬ – The First Named Insured appearing on a commercial policy. The latest forms permit the insurer to satisfy contractual duties by giving notice to the 'first' named insured rather than requiring notice to all named insureds.

FIRST NOTICE DAY = ПЕРВЫЙ ДЕНЬ УВЕДОМЛЕНИЯ (или ДЕНЬ ПЕРВОГО УВЕДОМЛЕНИЯ) – First Notice Day is the first day on which notices of intent to deliver actual commodities against futures market positions can be received. First notice day may vary with each commodity and exchange. The first day on which notice of intent to deliver a commodity in fulfillment of an expiring futures contract can be given to the clearing house by a seller and assigned by the clearing house to a buyer. First Notice Day is the first day on which the clearing house notifies clearing members of delivery allocations. The clearing house also informs the seller who they have been matched up with. Varies from contract to contract, i.e. the New York Mercantile Exchange's energy contracts have only one notice day, and metals contracts have notice days just prior to the beginning and end of the delivery period. First Notice Day is the first day on which notice intentions can be made or received to deliver actual commodities against futures contracts. It usually precedes the beginning of the delivery period. / Первый день, в который уведомление о намерении поставить товар для исполнения фьючерсного контракта с истекающим сроком поставки может быть направлено в клиринговую палату продавцом и передано клиринговой палатой покупателю. Такие даты отличаются от контракта к контракту, то есть .

FIRST–ORDER TRANSITION TEMPERATURE = ТЕМПЕРАТУРА (ФАЗОВОГО) ПЕРЕХОДА ПЕРВОГО РОДА (или ТЕМПЕРАТУРА (ФАЗОВОГО) ПРЕВРАЩЕНИЯ ПЕРВОГО РОДА) – First-Order Transition Temperature is the temperature at which a polymer freezes or melts.

FIRST PARTY LOGISTIC MODEL = МОДЕЛЬ ПЕРВОЙ СТОРОНЫ ЛОГИСТИКИ (или ОДНОСТОРОННЯЯ МОДЕЛЬ ЛОГИСТИКИ) – First Party Logistic (1PL) Model:- the manufacturer or the industrial actor does not outsource transport and logistic activities to third parties. These functions are carried out by the company's own departments.

FIRST PAYMENT = ПЕРВЫЙ ПЛАТЁЖ – The First Payment is the initial payment (capital plus interest and fees) to purchase the shares via an Instalment Warrant.

FIRST PICK = ПЕРВЫЙ СБОР – First Pick is either the process, or the product obtained, when a Cotton crop is harvested by a mechanical spindle picker for the first time. Under this harvesting method a second pick is made at a later date to harvest late opening bolls. First pick cotton normally has fiber quality superior to second pick. The second pick is often referred to as 'Scrapping'.

FIRST POSITION BOLLS = КОРОБОЧКИ ПЕРВОЙ ПОЗИЦИИ – First Position Bolls are the Cotton bolls on sympodial branches at nodal positions nearest the main stem.

FIRST QUALITY = ПЕРВОЕ КАЧЕСТВО – The term First Quality is equal to 1st grade quality yarn. See also Yarn Quality. / Первое Качество – первый сорт или отличное качество.

FIRST QUARTER = ПЕРВЫЙ КВАРТАЛ – First Quarter (Q1) of the year. / Первый квартал этого года. По аналогу второй (Q2), третий (Q3) и четвёртый (Q4) кварталы этого года.

FIRST REFUSAL = ПЕРВЫЙ ОТКАЗ (или ПЕРВОЕ ОТКЛОНЕНИЕ) – First Refusal is the chance of buying a house, merchandise, etc, before the offer is made to other potential buyers. First Refusal:- first attempt at best offer that can be matched.

FIRST SQUARE = ПЕРВЫЙ БУТОН (или ПЕРВЫЙ ПОДЦВЕТНИК) – First Square:- The first fruiting bud to appear on a Cotton Plant. The first square will appear on the first (lowest) sympodial branch at the fruiting position closest to the main-stem. Recorded as the first appearance of the square, although the young developing square was present much earlier. See also First Fruiting Node.

FIRST TRADING DATE = ПЕРВАЯ ТОРГОВАЯ ДАТА (или ДАТА ПЕРВОЙ ТОРГОВЛИ) – First Trading Date is the first day on which a futures or option contract may be traded on the exchange. It shall always be a business day. / Первый день, в который фьючерсный или опционный контракт на фьючерс может быть куплен или продан на данной бирже. Он всегда должен быть рабочим днём.

FISCAINVEST = ФИСКАИНВЕСТ – Fiscainvest is the retirement saving service package offered by UBS in Switzerland. Under the Swiss Federal Law on Occupational Retirement, Survivors' and Disability Pension Plans, Fiscainvest is tax-privileged. Capital in the Fiscainvest Pension Fund Foundation is maintained in accounts, and money managed by the Fiscainvest Investment Foundation may be invested in securities.

FISCAL AGENCY SERVICES = УСЛУГИ ФИСКАЛЬНОГО АГЕНТСТВА – In the United States, Fiscal Agency Services are the services performed by the Federal Reserve Banks for the US Government and other organizations, including maintaining accounts for the US Department of the Treasury, paying checks and making electronic payments on behalf of the Treasury, and selling and redeeming marketable Treasury securities and savings bonds.

FISCAL POLICY = ФИСКАЛЬНАЯ ПОЛИТИКА (или ХОЗЯЙСТВЕННАЯ ПОЛИТИКА) – In the United States, Federal government policy regarding taxation and spending, set by the US Congress and the President. Fiscal Policy is that part of government policy which is concerned with raising revenue through taxation and with deciding on the amounts and purposes of government spending. Keynesian economic theorists believe that government can, and should, regulate the overall pace of activity in the national economy through fiscal policy, principally by deliberately having government borrow to spend more than it takes in (running a budget deficit) to increase total demand for goods and services in times of high unemployment and economic slowdown (the deficit being created either by cutting taxes or by increasing spending or both). Similarly, Keynesian theorists would advocate having government spend less than it takes in (running a budget surplus) to cool down the national economy when too great an expansion of total demand has pushed production to its physical limits and threatens to bring on excessive inflation. The federal government's decisions about the amount of money it spends and collects in taxes to achieve a full employment and noninflationary economy. Taxation and spending policies of the federal government, implemented by adjusting budget deficits or surpluses to achieve economic goals. Fiscal policy is administered independently of the Federal Reserve System's monetary policy.

FISCAL YEAR = ФИСКАЛЬНЫЙ ГОД (или ХОЗЯЙСТВЕННЫЙ ГОД) – In the United States, Fiscal Year is the official Federal Government operating year which begins October 01. The fiscal year is used by program agencies in reporting much of their data on the cotton program. In the United States, Fiscal Year is a period of twelve months for the purposes of tax calculation. Fiscal Year is an

accounting period for which a business unit, firm or government prepares budgets and financial statements. With few exceptions, the period covers 12 months, but it does not necessarily correspond to the calendar year. In a seasonal business, companies often prefer to report their earnings for the full production cycle. Corporations prepare year-end financial statements for their fiscal year, and submit them to their shareholders for approval at the annual meeting. The earnings for the year are then distributed in the form of dividends or held as retained earnings to be reinvested in the company. Not all governments follow the same fiscal year:- in the United States, the fiscal year begins on October 01; in the United Kingdom, it runs from April 06 to the following April 05; France's fiscal year is the calendar year. In the United States, Fiscal Year (FY) for the National Futures Association begins on 2010-July-01 and ends on 2011-June-30. A unit of one year used for budgeting or accounting. A fiscal year has the same length as an ordinary year, but its starting date may be different. In the United States, for example, the federal government's fiscal year starts on October 01. Generally, fiscal year n ends in ordinary year n, so the US federal fiscal year 2007 begins 2006-October-01 and ends 2007-September-30. Also known as Financial Year in the United Kingdom. Fiscal Year is a period of 12 consecutive months chosen by an entity as its accounting period which may or may not be a calendar year. Fiscal Year is a corporation's accounting year. Due to the nature of that particular business, some companies do not use the calendar year for their bookkeeping. A typical example is the department store that finds December 31 too early a date to close its books after the Christmas rush. For that reason many stores wind up their accounting year January 31. Their fiscal year, therefore, runs from February 01 of one year through January 31 of the next. The fiscal year of other companies may run from July 01 through the following June 30. Most companies, though, operate on a calendar year basis. In the United States, a Fiscal Year (FY) is the federal fiscal Year extends from October 01 through September 30. Fiscal Year (FY):- in Canada this refers to a company's financial year which may be different from the calendar year. Companies are free to choose their fiscal year-end as they wish (this may have seasonal, tax, or other practical advantages). Companies report their financial results based on their fiscal years (any 12-month period). The term Fiscal came from 'Fiscus' – the purse in which wealthy landlords held their gold. Companies generally report their results on a fiscal quarter basis. So when a company reports on its Q2 performance, it is referring to its fiscal calendar – not the annual calendar. It is a common practice (although not mandated) to use a specific month-end date, e.g., September 30th. / В бывшем Союзе Советских Социалистических Республик (СССР) Хозяйственный Год совпадал с календарным годом и начинался с 01 Января, а заканчивался 31 Декабря. Однако в период с 1921 по 1930 он исчислялся с 01 Октября текущего года и заканчивался 30 Сентября последующего года. Во многих странах мира хозяйственный год в промышленности совпадает с календарным годом, а в сельском хозяйстве определяется периодом сельскохозяйственного года.

FISH = FLUORESCENT IN SITU HYBRIDIZATION

FISHER PRICE INDEX = ФИЩЁВСКИЙ ИНДЕКС ПО ЦЕНАМ – The Fisher Price Index is an index formula used in price statistics for measuring the price development of goods and services, on the basis of the baskets from both the base and the current period. It is defined as the geometric average of the Laspeyres price index (which only uses the base period basket) and the Paasche price index (which only uses the current period basket). For this reason, the Fisher price index (named after American economist Irving Fisher) is also known as the 'Ideal' Price Index. The choice of a price index formula (Laspeyres, Paasche or Fisher) in a particular case is partly determined by the data available. The Fisher price index requires more data than both others and as a result may often be impracticable. The Fisher Price Index (FPI) is a consumer price index used to measure the increase in prices of goods and services over a period of time and is calculated as the geometric mean of the Laspeyres Index and the Paasche Price Index. Fisher Index Formula:- Fisher Price Index = (LPI * PPI) ^0.5; where:- LPI = Laspeyres Price Index = Σ(Pn,t) * (Qn,0) * 100 / (Pn,0) * (Qn,0), and PPI = Paasche Price Index = Σ(Pn,t) * (Qn,t) * 100 / (Pn,0) * (Qn,0); where:- Pn,t is the price of the item at the n^{th} period, Pn,0 is the price of the item at the base period, Qn,t is the quantity of the item at the n^{th} period, and Qi,0 is the quantity of the item at the base period. Advantages of the FPI:- (i) FPI is often called the real index as it corrects for the upward bias of the Laspeyres Price Index and the downward bias of the Paasche Price Index by taking the geometric average of the two weighted indices. It uses both current year and base year quantities as weight. (ii) Although it is not very frequently used index owing to its structural complexity and the number of variables required, it has very widespread use in academic circles and research. Disadvantages of the FPI:- (i) The only limitation of the FPI is it is a little more complex constructs than the other two; and (ii) The quantities of the future years have to be forecasted while in the case of Laspeyres Price Index only the future prices have to be found out. Conclusion:- Although the Fisher Index is the better of the three indices Laspeyres Price Index is more commonly used for inflation calculations. But if we can make an accurate forecast of future quantities of an item Fisher-price index gives a more accurate measure. See also Laspeyres Price Index, and Paasche Price Index. / названный в честь Американского экономиста Овиня Фищё (Irving Fisher; 1867–1947). Немецкие экономисты Эрнэст Люи Этен Ляспэр (Ernst Louis Étienne Laspeyres; 1834–1913) и Хэрман Пашэ (Hermann Paasche; 1851–1925), а также Американский экономист Овинь Фищё (Irving Fisher; 1867–1947). Смотрите также Ляспэровский Индекс по Ценам (Laspeyres Price Index), и Пашэвский Индекс по Ценам (Paasche Price Index).

FISH EYE = РЫБИЙ ГЛАЗОК – (1) Fish Eye or pinhole:- small apertures occasionally in a wale. See also Pinhole. / Pinhole = Порок вязания в виде петли больше обычных размеров по поверхности чулочного или трикотажного изделия.

(2) Fish Eye:- when you look at a photograph taken with a wide angle lens, you'll notice that lines of walls or stairs or anything straight appears to be curved. This is due to the shape and circular nature of lenses. This phenomenon is called Barrel Distortion. A Fisheye Lens is the extreme of barrel distortion, but Pinhole Cameras do not produce any barrel distortion. All of the straight lines remain straight. This makes architecture a great subject for pinhole photographers. Architecture photographers use very expensive software to correct this problem, but with your pinhole camera, you'll be armed to compete with them.

FISHING = ВЫУЖИВАНИЕ – Fishing is slang for an attempt to gather information while pretending to be doing something else. A term Fishing is used to refer to Internet trolling attempts, as well as purposefully misleading post titles. A person who recognizes the troll after having responded (or, in case of a post title nak-si, having read the actual post) would often refer to himself as a caught fish. / Выуживание:- это форма атаки с использованием социотехники или мошенничества в Интернете, в рамках которой злоумышленник выдаёт себя за надёжный источник, чтобы выудить у жертвы конфиденциальную информацию. В некоторых случаях атаки с целью выуживания весьма убедительно замаскированы. Человек не может быть бдительным постоянно, а вот хорошее решение по Ай.Ти. (IT) безопасности может выявлять такие атаки, которые невозможно определить невооружённым взглядом.

FISHNET = СЕТКА (или АЖУРНОЕ ВЯЗАНИЕ, или РЫБОЛОВНАЯ СЕТЬ) – Fishnet:- a coarse open-mesh fabric. / Колготки в сетку (fishnet tights).

FISIM = FINANCIAL INTERMEDIATION SERVICES INDIRECTLY MEASURED

FISMA = FEDERAL INFORMATION SECURITY MANAGEMENT ACT

FISSURE = НАДЛОМ (или ИЗЛОМ, или РАСЩЕЛИНА, или ТРЕЩИНА) – Fissure is a very minute crack or opening in a material that frequently leads to the breaking or rupture of the material.

FIT = FEDERAL INCOME TAX

FIT = FOREIGN INDEPENDENT TOUR

FITC = FOUNDATION FOR INTERNATIONAL TECHNOLOGICAL COOPERATION

FITCH = ФИТЧ – Dual-headquartered in New York and London with 50 offices worldwide, Fitch Ratings Ltd is a global rating agency dedicated to providing value beyond the rating through independent and prospective credit opinions, research and data. Offering a world of knowledge and experience behind every opinion, we transform information to deliver meaning and utility to investors, issuers and other market participants. Fitch Ratings' global expertise draws on local market knowledge and spans across the fixed-income universe. The additional context, perspective and insights we provide help investors make important credit judgments with confidence. Since 2008, Fitch Solutions has offered a range of comprehensive data, analytical tools and risk services to fixed-income investors and other market participants. The firm also distributes Fitch Ratings' credit ratings, research and data through a variety of platforms. Product offerings cover research services, risk and performance analytics, structured finance solutions, pricing and valuation services, quantitative analytics and training. Fitch Ratings and Fitch Solutions, as well as Algorithmics, a leader in enterprise risk management solutions, are part of the Fitch Group. The Fitch Group is a majority-owned subsidiary of Fimalac, SA, headquartered in Paris, France. Fitch Ratings was founded as the Fitch Publishing Company on 1913-December-24 by John Knowles Fitch. Located in the heart of the Financial District in New York City, the Fitch Publishing Company began as a publisher of financial statistics whose consumers included the New York Stock Exchange. Soon Fitch Publishing Company became the recognized leader in providing critical financial statistics to the investment community through such publications as the 'Fitch Bond Book' and the 'Fitch Stock and Bond Manual'. In 1924, the Fitch Publishing Company introduced the now familiar 'AAA' to 'D' ratings scale to meet the growing demand for independent analysis of financial securities. The company's ratings scale, coupled with in-depth analysis by a staff of investment experts, quickly became recognized as the benchmark by which the financial community based fixed-income investment decisions. Fitch Ratings was one of the three ratings agencies first recognized as a nationally recognized statistical rating organization (NRSRO) by the Securities and Exchanges Commission in 1975. In 1989, Fitch Ratings was recapitalized under a new management team and has since experienced dramatic growth. Throughout the 1990s, Fitch Ratings grew in all areas including the new area of structured finance, by providing investors with original research, clear explanations of complex credits, and more rigorous surveillance than the other ratings agencies. In 1997, Fitch Ratings merged with IBCA Limited, headquartered in London, significantly increasing Fitch Ratings' worldwide presence and coverage in banking, financial institutions, and sovereigns. Through the merger with IBCA, Fitch Ratings became owned by Fimalac SA, a holding company which acquired IBCA in 1992. The merger represented the first step in Fitch Ratings' plan to meet investors' need for an alternative global, full service rating agency. The next step towards building Fitch Ratings into a global competitor was the acquisition of Duff & Phelps Credit Rating Co., headquartered in Chicago, in April, 2000. This was followed by the acquisition later that year of the rating business of Thomson BankWatch. These acquisitions strengthened Fitch Ratings' coverage in the corporate, financial institution, insurance and structured finance sectors, as well as adding a significant number of international offices and affiliates. Today, Fitch Ratings is a global rating agency dedicated to providing the world's credit markets with independent and prospective credit opinions, research and data. As a result of Fitch Ratings' growth and acquisitions, it today has over 2 100 professionals at its 49 worldwide offices. Fitch Ratings is headquartered in New York and London. Fitch Group Subsidiaries:- In December 2004, the Fitch Group announced an agreement to acquire Algorithmics, a leader in enterprise risk management. Over the several years prior, Fitch Ratings had been building a world-class risk practice as an extension of its core business in credit ratings. The purchase of Algorithmics, which was finalized in January of 2005, was the latest in a series of business and technology initiatives expanding the capabilities of the Fitch Group's risk business. The acquisition expanded the customer base and product offerings of Fitch Risk Management, and Algorithmics benefited from a parent company that was able to invest in product development and expand Algorithmics' geographic reach. Founded in 1989 and based in Toronto, Canada, Algorithmics is a recognized leader in enterprise risk management. Algorithmics employs over 660 people in 18 offices worldwide. In January 2008, Fitch Group announced the development of Fitch Solutions, a provider of data, analytics and related services. This group was developed to further the independence of Fitch Ratings' credit ratings and analytics and to create an entity with a singular focus on the development of fixed income products and services. The division ensures an even greater division between analytical activities and ratings. It also creates a more comprehensive and focused content and distribution platform for Fitch Ratings' offerings. Fitch Training, a part of Fitch Solutions, is a specialist training firm focused on the provision of credit and corporate finance training programs for professionals working in fixed income, credit risk management and origination/relationship management. Fitch Training provides services to a variety of financial institutions in investment and commercial banks, fund management firms, and regulators, among others. Fitch Training has a global presence with trainers based in the United Kingdom, Continental Europe, the United States and Asia. Headquartered:- Fitch, Inc in New York, State of New York (NY), the United States; and Fitch Ratings Ltd in London, the United Kingdom. Fitch Ratings, as well as Fitch Solutions and Algorithmics, are part of the Fitch Group. The Fitch Group is a majority-owned subsidiary of Fimalac, SA, headquartered in Paris, France. Dual-headquartered in New York and London with 50 offices worldwide, Fitch Ratings is a global rating agency dedicated to providing value beyond the rating through independent and prospective credit opinions, research and data. Fitch Ratings was one of the three Nationally Recognized Statistical Rating Organizations (NRSRO) designated by the US Securities and Exchange Commission in 1975, together with Moody's and Standard & Poor's. It is one of the 'Big Three credit rating agencies' (Standard & Poor's, Moody's Investor Service Ltd and Fitch Ratings Ltd). The firm was founded by John Knowles Fitch on 1913-December-24 in New York City as the Fitch Publishing Company. It merged with London-based IBCA Limited in December 1997. In 2000 Fitch acquired both Chicago-based Duff & Phelps Credit Rating Co. (April) and Thomson Financial BankWatch (December). Fitch Ratings is the smallest of the 'big three' NRSROs, covering a more limited share of the market than S&P and Moody's, though it has grown with acquisitions and frequently positions itself as a 'tie-breaker' when the other two agencies have ratings similar, but not equal, in scale. Types of ratings:- (1) Long-term credit ratings:- Fitch Ratings' long-term credit ratings are assigned on an alphabetic scale from 'AAA' to 'D', first introduced in 1924 and later adopted and licensed by S&P. (Moody's also uses a similar scale, but names the categories differently.) Like S&P, Fitch also uses intermediate +/- modifiers for each category between AA and CCC (e.g., AA+, AA, AA-, A+, A, A-, BBB+, BBB, BBB-, etc). (i) Investment grade:- (a) AAA:- the best quality companies, reliable and stable; (b) AA:- quality companies, a bit higher risk than AAA; (c) A:- economic situation can affect finance; and (d) BBB:- medium class companies, which are satisfactory at the moment. (ii) Non-investment grade:- (a) BB:- more prone to changes in the economy; (b) B:- financial situation varies noticeably; (c) CCC:- currently vulnerable and dependent on favorable economic conditions to meet its commitments; (d) CC:- highly vulnerable, very speculative bonds; (e) C:- highly vulnerable, perhaps in bankruptcy or in arrears but still continuing to pay out on obligations; (f) D:- has defaulted on obligations and Fitch believes that it will generally default on most or all obligations; and (g) NR:- not publicly rated. (2) Short-term credit ratings:- Fitch's short-term ratings indicate the potential level of default within a 12-month period:- (a) F1+:- best quality grade, indicating exceptionally strong capacity of obligor to meet its financial commitment; (b) F1:- best quality grade, indicating strong capacity of obligor to meet its financial commitment; (c) F2:- good quality grade with satisfactory capacity of obligor to meet its financial commitment; (d) F3:- fair quality grade with adequate capacity of obligor to meet its financial commitment but near term adverse conditions could impact the obligor's commitments; (e) B:- of speculative nature and obligor has

minimal capacity to meet its commitment and vulnerability to short term adverse changes in financial and economic conditions; (f) C:- possibility of default is high and the financial commitment of the obligor are dependent upon sustained, favorable business and economic conditions; and (g) D:- the obligor is in default as it has failed on its financial commitments. Credit rating agencies such as Fitch Ratings have been subject to criticism in the wake of large losses in the collateralized debt obligation (CDO) market that occurred despite being assigned top ratings by the CRAs. For instance, losses on USD340.7 million worth of collateralized debt obligations (CDO) issued by Credit Suisse Group AG added up to about USD125 million, despite being rated AAA by Fitch. However, differently from the other agencies, Fitch has been warning the market on the constant proportion debt obligations (CPDO) with an early and pre-crisis report highlighting the dangers of CPDO's. Since 2008, Fitch Solutions has offered a range of comprehensive data, analytical tools and risk services to fixed-income investors and other market participants. The firm also distributes Fitch Ratings' credit ratings, research and data through a variety of platforms. Product offerings cover research services, risk and performance analytics, structured finance solutions, pricing and valuation services, quantitative analytics and training. Fitch Ratings is a global rating agency dedicated to providing value beyond the rating through objective and balanced credit opinions, research and data. Offering a world of knowledge and experience behind every rating, we transform information to deliver meaning and utility to investors, issuers and other market participants. The additional context, perspective and insights we provide help financial professionals make important business decisions with confidence. Fitch Solutions offers a range of comprehensive data, analytical tools and risk services, and is the distribution channel for Fitch Ratings content. Fitch Ratings Ltd was founded as the Fitch Publishing Company on December 24, 1913 by John Knowles Fitch. Located in the heart of the Financial District in New York City, the Fitch Publishing Company began as a publisher of financial statistics whose consumers included the New York Stock Exchange. Today, Fitch Ratings is a global rating agency dedicated to providing the world's credit markets with independent and prospective credit opinions, research, and data. As a result of Fitch Ratings' growth and acquisitions, it today has over 2 000 professionals at its 51 worldwide offices. Fitch Ratings is dual-headquartered in New York, the United States and London, the United Kingdom. / Мудиз Инвэстоз Сёвис Лимитид (Moody's Investors Service Ltd). Крэди Свиссэ Груп А.Ге. (Credit Suisse Group AG). Томсэн (Thomson). Фитч Рэйтиньгз Лимитид (Fitch Ratings Ltd) – международное рэйтиньговое агентство, нацеленное на предоставление мировым кредитным рынкам независимых и ориентированных на перспективу оценок кредитоспособности, аналитических исследований и данных. Сотрудники Fitch Ratings, работающие в 50 офисах по всему миру, обладают глобальным аналитическим опытом и знанием специфики местных рынков и проводят анализ по рынкам капитала более 150 государств. Инвесторы, эмитенты и банкиры в различных странах отмечают надёжность, прозрачность и своевременность аналитических продуктов Фитч Рэйтиньгз. Фитч Рэйтиньгз имеет штабквартиры в Нью Йорке и Лондоне и входит в состав группы Фитч. Помимо Фитч Рэйтиньгз в группу входит Фитч Солушэнз (Fitch Solutions), подразделение по распространению продуктов и услуг Фитч Рэйтиньгз, предоставляющее информационные и аналитические материалы и сопутствующие услуги. Также в группу Фитч входит Элгоритмикс (Algorithmics), мировой лидер в области решений для управления рисками компаний. Мажоритарный пакет акций группы Фитч принадлежит компании Фималак Эс.А. (Fimalac SA), штабквартира которой расположена в Париже, Франция. Фитч Рэйтиньгз было основано Дьжоном Ноулзом Фитчем (John Knowles Fitch) 24 Декабря 1913 как издательство Фитч Паблишинь Кампэни (Fitch Publishing Company). Компания располагалась в самом сердце финансового района Нью Йорка и начинала свою деятельность с публикации финансовых статистических данных. В число её клиентов входила Нью Йоркская Фондовая Биржа. Вскоре Фитч Паблишинь Кампэни стала признанным лидером по представлению важных статистических данных инвестиционному сообществу через свои издания, такие как 'Книга Фитч об Облигациях' ('Fitch Bond Book') и 'Руководство Фитч по Акциям и Облигациям' ('Fitch Stock and Bond Manual'). В 1924 для удовлетворения растущего спроса на независимые исследования по финансовым инструментам Фитч Паблишинь Кампэни ввела широко известную сейчас рэйтиньговую шкалу от 'AAA' до 'D'. Рэйтиньговая шкала в сочетании с глубоким анализом, проводимым инвестиционными экспертами компании, быстро завоевала признание и стала ориентиром для финансового сообщества при принятии инвестиционных решений по инструментам с фиксированным доходом. Фитч Рэйтиньгз стало одним из трёх агентств, первыми получивших официальный статус статистических рэйтиньговых организаций от Комиссии по Ценным Бумагам и Биржам США в 1975. В 1989 в Фитч Рэйтиньгз пришла новая команда управляющих, был увеличен капитал, и агентство начало демонстрировать впечатляющий рост. В 1990-е Фитч Рэйтиньгз демонстрировало рост по всем направлениям деятельности, включая такие новые области, как структурированное финансирование, предоставляя инвесторам собственные аналитические материалы, чёткие разъяснения по сложным инструментам/эмитентам и наиболее глубокие исследования среди рэйтиньговых агентств. В 1997 было проведено слияние Фитч Рэйтиньгз и компании Ай.Би.Си.Эй. Лимитид (IBCA Limited), имеющей штабквартиру в Лондоне, что существенно усилило присутствие Фитч Рэйтиньгз в мире и расширило аналитический охват банков, финансовых организаций и суверенных эмитентов. После слияния с Ай.Би.Си.Эй. Лимитид владельцем агентства стала холдиньговая компания Фималак Эс.А., которая приобрела Ай.Би.Си.Эй. Лимитид в 1992. Это слияние стало первым шагом в стремлении агентства удовлетворить потребность инвесторов в альтернативном глобальном рэйтиньговом агентстве, предоставляющем полный спектр услуг. Следующим шагом в создании международного конкурентоспособного агентства стало приобретение в Апреле 2000 компании Даф энд Фэлпс Крэдит Рэйтинь Ко. (Duff & Phelps Credit Rating Co.) со штабквартирой в Чикаго. Позже в том же году была приобретена рэйтиньговая компания Томсэн БэнькВоч (Thomson BankWatch). Эти приобретения позволили агентству обеспечивать более полный аналитический охват корпоративных эмитентов, финансовых институтов, страховых компаний и сектора структурированного финансирования. Кроме того, агентство смогло значительно увеличить количество своих представительств и аффилированных компаний по всему миру. Сегодня Фитч Рэйтиньгз является международным рэйтиньговым агентством, нацеленным на предоставление

мировым кредитным рынкам независимых и направленных на перспективу оценок кредитоспособности, аналитических исследований и данных. После достигнутого роста и проведённых поглощений в настоящее время количество сотрудников Фитч Рэйтиньгз насчитывает более 2 100 человек в 50 филиалах и дочерних компаниях по всему миру. Фитч Рэйтиньгз имеет два главных офиса – в Лондоне и Нью Йорке. Дочерние структуры группы Фитч:- В Декабре 2004 группа Фитч объявила о заключении соглашения о приобретении Элгоритмикс, лидера в области управления рисками компаний. До этого в течение нескольких лет Фитч Рэйтиньгз накапливало практику управления рисками на уровне мировых стандартов в качестве дополнения к своей основной деятельности по присвоению кредитных рэйтиньгов. Покупка Элгоритмикс, которая была завершена в Январе 2005, является самым недавним приобретением в серии деловых и технологических инициатив, нацеленных на расширение возможностей группы Фитч в сегменте управления рисками. Данное приобретение позволило увеличить клиентскую базу и набор предлагаемых продуктов Фитч по управлению рисками, а компания Элгоритмикс получила преимущество в виде материнской структуры, имеющей возможности инвестировать в развитие продукции и расширение географического охвата Элгоритмикс. Компания Элгоритмикс была основана в 1989 и базируется в Торонто, Канада. Элгоритмикс является признанным лидером в области управления рисками предприятий. Число сотрудников компании насчитывает более 660 человек, которые работают в 18 офисах по всему миру. В Январе 2008 группа Фитч объявила о развитии подразделения Фитч Солушэнз, специализирующегося на предоставлении данных, аналитических инструментов и сопутствующих услуг. Цель развития этого подразделения – укрепить независимость кредитных рэйтиньгов и аналитических исследований Фитч Рэйтиньгз и создать структуру, деятельность которой будет полностью сфокусирована на разработке продуктов и услуг в сфере инструментов с фиксированным доходом. Благодаря данному подразделению обеспечивается ещё более глубокое разделение между аналитической и рэйтиньговой деятельностью. Кроме того, с его помощью создана комплексная и детализированная платформа для распространения материалов Фитч Рэйтиньгз. Фитч Тчрэйнинь (Fitch Training) входит в состав Фитч Солушэнз и специализируется на тренингах по вопросам кредитоспособности и корпоративных финансов для профессионалов в сфере инструментов с фиксированным доходом, кредитного риск-менеджмента и управления взаимоотношениями с клиентами/функциями оригинатора. Фитч Тчрэйнинь предоставляет услуги различным финансовым организациям, включая инвестиционные и коммерческие банки и управляющие компании, а также регулирующим органам. Фитч Тчрэйнинь имеет глобальное присутствие, так как специалисты компании по проведению тренингов работают в Великобритании, континентальной Европе, США и Азии.

FIT–FOR–PURPOSE PACKAGING = УПАКОВКА, УДОВЛЕТВОРЯЮЩАЯ (или ПРИГОДНАЯ ДЛЯ) ОПРЕДЕЛЁННОЙ ЦЕЛИ – The Fit-for-Purpose Packaging is a packaging that is able to withstand any stresses that can be expected during the voyage and that will afford appropriate protection to the products. The stresses could vary significantly depending on the method of transport (road, rail, air, sea, combined methods of transport, repeated transshipment, etc).

FITW = FEDERAL INCOME TAX WITHHOLDING

FIVE AGAINST BOND SPREAD = ПЯТЬ ПРОТИВ КУРСОВОЙ РАЗНИЦЫ ПО ОБЛИГАЦИЯМ – Five Against Bond Spread is a futures spread trade involving the buying (selling) of a five-year Treasury Note futures contract and the selling (buying) of a long-term (15–30 year) Treasury Bond futures contract. / Торговля на курсовой разнице фьючерсов, заключающаяся в одновременной покупке (продаже) фьючерсных контрактов на пятилетние Казначейские Билеты (five-year Treasury Note futures contract) и продаже (покупке) фьючерсных контрактов на долгосрочные (15–30-летние) Казначейские Облигации (long-term (15–30 year) Treasury Bond futures contract).

FIVE AGAINST NOTE SPREAD = ПЯТЬ ПРОТИВ КУРСОВОЙ РАЗНИЦЫ ПО БИЛЕТАМ – Five Against Note Spread is a futures spread trade involving the buying (selling) of a five-year Treasury Note futures contract and the selling (buying) of a ten-year Treasury Note futures contract. / Торговля на курсовой разнице фьючерсов, заключающаяся в одновременной покупке (продаже) фьючерсных контрактов на пятилетние Казначейские Билеты (five-year Treasury Note futures contract) и продаже (покупке) фьючерсных контрактов на десятилетние Казначейские Билеты (ten-year Treasury Note futures contract).

FIVE–K COUNTRIES = СТРАНЫ ПЯТЬ–КЕЙ. – Five-K Countries are those countries as defined under Section 5(k) of the US Export Administration Amendments Act of 1985. Such countries are eligible for the same treatment as CoCom (abbreviation for the Coordinating Committee for Multilateral Export Controls) countries in relation to export control requirements if those countries maintain comparable export control programs. Also known as 5(k) Countries. CoCom was dissolved in March 1994. / КоКам (CoCom).

FIX = FINANCIAL INFORMATION EXCHANGE

FIX = ФИКСИРОВАТЬ – Fix:- the London gold fixing takes place twice daily (10:30 am and 03:00 pm) over the telephone and sets a price at which all known orders to buy and sell gold on a spot basis at the time of the fix can be settled. The fix is widely used as the benchmark for spot transactions throughout the market. See also Gold Fixing.

FIXATION = ФИКСАЦИЯ (или ФИКСИРОВАНИЕ, или ЗАКРЕПЛЕНИЕ) – (1) Fixation is a formation of the 'final' bond between the dye and fiber. The bond type formed between the fiber and the dye varies with the type of dye and the fiber. As examples, reactive dyes fix by covalent bonding while acid dyes fix by a variety of mechanisms such as ionic bonding and hydrophobic forces. Disperse and vat dyes are fixed in the fiber largely by physical entrapment of insoluble dye within the fiber. The bond that causes final fixation is not necessarily the same type of bond is first made as the dye exhausts onto the fiber. In textile industry, fixation is the process of setting a dye after dyeing of printing, usually by steaming or other heat treatment. / такие как ионное скрепление и .

(2) Fixation is the process by which certain nutrient elements in a soil are converted from available form to unavailable form essential for plant growth, being converted from a soluble or exchangeable form to a much less soluble or to a nonexchangeable form. Examples are potassium, ammonium, and phosphorus fixation.

(3) Fixation is a setting of a present or future price of a commodity, such as the twice-daily London gold fixing . In other commodities, prices are fixed further into the future for the benefit of both buyers and sellers of that commodity. Fixation is the process of setting a price of a commodity, whether in the present or the future. See also Gold Fixing. / В отношении цен Фиксация представляет собой установление текущей или будущей цены на товарно-сырьевую продукцию, например фиксирование цены на золото (gold fixing), проводимое в Лондоне дважды в день. Для иной товарно-сырьевой продукции цены фиксируются на более длительный срок в интересах как покупателей, так и продавцов.

FIXATIVE = ФИКСАТОР – (1) In dyeing Fixative is a chemical that helps improve washfastness of dyed fabric. Some types of dye do not bond strongly to fibers, and will wash out over time. Direct dyes are notorious for this. Fixatives applied after dyeing can help, although some will degrade lightfastness or cause shade changes. Some fixative contain a small amount of formaldehyde, which is now regarded as carcinogenic. Much care is warranted in use of these fixatives, and garments should be thoroughly washed before being worn. Many of the newer fixatives do not contain formaldehyde. The mechanisms by which fixatives work vary, but typically form

large, relatively insoluble complexes with dye molecules inside the fiber. Soda ash is sometimes called a Fixative For Reactive Dyes, but it actually creates the high-pH conditions that allow the reactive dye to bond directly to cellulose fibers, and is not a fixative in the accepted sense.

(2) Fixative is a preservative or chemical used to keep plants for subsequent study.

FIXED ADVANCE = ФИКСИРОВАННЫЙ АВАНС – Fixed Advance:- fixed-rate commercial loan of a specific amount repayable at an agreed due date or when called. / в согласованную надлежащую (причитающуюся) дату .

FIXED AMMONIUM = ФИКСИРОВАННЫЙ АММОНИЙ (или ЗАКРЕПЛЁННЫЙ АММОНИЙ) – Fixed Ammonium is the ammonium in soil that cannot be replaced by a neutral potassium salt solution.

FIXED ASSET INVESTMENTS = ИНВЕСТИЦИИ В НЕДВИЖИМЫЕ АКТИВЫ (или ВЛОЖЕНИЯ В ОСНОВНЫЕ ФОНДЫ) – Fixed Asset Investments (FAIs) are investments in fixed assets. In the United Kingdom, the Treasury's Financial Reporting Manual (FReM) rules on Fixed Asset Investments in the balance sheet are that:- (i) loans, public dividend capital and other interests in entities outside the departmental resource accounting boundary … should be reported at historical cost, less any impairment; and (ii) other investments should be reported at market value. If a market value cannot be readily ascertained, the investment should be valued on a basis determined by the entity, in agreement with the Treasury to be appropriate in the circumstances. Under UK GAAP, Fixed Asset Investments are held in the balance sheet at the lower of cost or net realisable value. Under US GAAP, fixed asset investments which are available for sale are stated at fair value with unrealised gains or losses included in shareholders' equity. Fixed asset is land, buildings, equipment, machinery, vehicles, leasehold improvements, and other such items. Fixed assets are not consumed or sold during the normal course of a business but their owner uses them to carry on its operations. In accounting, 'fixed' does not necessarily mean 'immovable'; any asset expected to last, or be in use for, more than one year is considered a fixed asset. On a balance sheet, these assets are shown at their book value (purchase price less depreciation). Also known as Non-Current Investments in the United States. Long-lived property owned by a firm that is used by a firm in the production of its income. Tangible fixed assets include real estate, plant, and equipment. Intangible fixed assets include patents, trademarks, and customer recognition. / Руководство (Manual). строка баланса (item).

FIXED ASSETS = НЕДВИЖИМЫЕ АКТИВЫ (или ОСНОВНЫЕ ФОНДЫ) – In the United Kingdom, produced assets that are themselves used repeatedly or continuously in the production process for more than one year. They comprise buildings and other structures, vehicles and other plant and machinery and also plants and livestock which are used repeatedly or continuously in production, e.g., fruit trees or dairy cattle. They also include intangible assets such as computer software and artistic originals. Assets which are not easily converted into cash (such as your house, superannuation etc) and which would not in the normal operations of the company be consumed within twelve months after the end of the last financial year. Fixed Assets are the assets acquired by a company that are not intended for immediate consumption, e.g., equipment, furniture, land, machinery, tools, etc. Also includes certain immaterial values (licenses, patents, processes) and permanent participations. Also known as Capital Assets. The opposite of Current Assets. Fixed Assets are products or items purchased for use by the business instead of for resale to customers. Non-current, tangible assets with a life in excess of one year. Called 'Property, Plant and Equipment' in the balance sheet. Contrast with current assets, which are used up during the production cycle. Fixed assets, with the exception of land, are used up through wear and tear or obsolescence, in a process called Depreciation. Fixed asset is any tangible asset with a life of more than one year used in an entity's operations. Fixed Assets:- that are used repeatedly, or continuously, in production processes for more than one year and that may be tangible (dwellings, other buildings and structures, machinery and equipment, and cultivated assets, such as livestock for breeding and plantations) or intangible (mineral exploration, computer software, and entertainment, literary, or artistic originals):- (i) Residential Building / Dwellings on free hold land:- dwellings on freehold land are buildings on freehold land that are used entirely or primarily as residences, including any associated structures, such as garages, and all permanent fixtures customarily installed in residences; movable structures, such as caravans, used as principal residences of households are included. (ii) Other Buildings and structures on freehold land (Capital work in progress – civil works):- the other buildings and structures on freehold land category of non-financial, produced, tangible fixed assets consists of non-residential buildings and other structures, such as civil engineering works on freehold land. (iii) Residential Building / Dwellings on lease hold land:- dwellings on leasehold land are buildings on leasehold land that are used entirely or primarily as residences, including any associated structures, such as garages, and all permanent fixtures customarily installed in residences; movable structures, such as caravans, used as principal residences of households are included. (iv) Other building and structures on leasehold land (Capital work in progress – civil works):- the other buildings and structures on leasehold land category consist of nonresidential buildings and other structures, such as civil engineering works on freehold land. (v) Furniture and fixture:- all type of furniture and fixtures including those acquired under financial leases for the purpose of business. (vi) Electrical, office and computer equipments:- all office equipments other than those acquired through financial leases use for the business including counting and computing equipments, printers, scanners, photocopiers, fax machines etc. (vii) Other machinery and equipment:- the other machinery and equipment category of non-financial, produced, tangible fixed assets including those acquired through financial lease and equipment assets not classified as 'Transport Equipment' and 'Office Equipment'. (viii) Vehicles:- vehicles (as assets) including those acquired through financial leases consist of equipment for moving people and objects, other than any such equipment acquired by households for final consumption. Transport equipments such as motor vehicles, trailers, ships, aircrafts, motorcycles, bicycles etc. (ix) Other tangible fixed assets (produced):- consists other tangible produced assets not specified elsewhere. Produced assets are non-financial assets that have come into existence as outputs from production processes. (x) Computer software:- computer software is an asset consisting of computer programs, program descriptions and supporting materials for both systems and applications software; included are purchased software and software developed on own account, if the expenditure is large. (xi) Entertainment, literary or artistic originals (intangible fixed assets):- entertainment, literary or artistic originals are the original films, sound recordings, manuscripts, tapes, models, etc, on which drama performances, radio and television programming, musical performances, sporting events, literary and artistic output, etc, are recorded or embodied. (xii) Other intangible fixed assets (produced):- other intangible fixed assets are new information, specialized knowledge, etc, not elsewhere classified, whose use in production is restricted to the units that have established ownership rights over them or to other units licensed by the latter. / нематериальные активы (immaterial values). / , например, . строка баланса (item). Под Основными Фондами понимается совокупность материально-вещественных ценностей, действующих в течение длительного времени. К ним относятся:- здания, машины, оборудование, рабочий и продуктивный скот, сооружения, транспортные средства и тому подобное. Основные фонды, функционирующие в сфере материального производства, называются производственными основными фондами, в непроизводственной сфере – непроизводственными основными фондами. Основные фонды являются важной частью национального богатства. Основные фонды, выраженные в денежном эквиваленте, называются основными средствами. Недвижимые Активы или Основные Фонды:- материальная собственность, используемая для ведения коммерческой деятельности, но не подлежащая потреблению или обратимости в наличность в случае нормального хода событий. Производственные помещения, механизмы и оборудование, мебель и установки, а в большинстве компаний и затраты на

усовершенствование арендуемой собственности включаются в недвижимые активы. Они, как правило, представлены в бухгалтерском балансе по их чистой стоимости.

FIXED BASIS POOL = ПАРТИЯ С ЗАФИКИСИРОВАННЫМ БАЗИСОМ – Fixed Basis Pool:- the grower nominates a set number of bales in 100 bale lots. When the grower is confident of producing the quantity committed to this pool, they will agree on a fixed basis with their merchant. The advantage of this is that the grower knows the exact price of the basis to calculate their return per bale. The disadvantage, particularly for dryland growers, is that 'force majeure' does not apply and therefore the grower has an obligation to deliver the physical bales.

FIXED BOX PALLET = ЗАФИКСИРОВАННЫЙ ЯЩИЧНЫЙ ПОДДОН – Fixed Box Pallet is a box pallet with sides permanently and rigidly fixed to the deck.

FIXED CAGE PALLET = ЗАФИКСИРОВАННЫЙ КЛЕТЬЕВОЙ ПОДДОН (или РАЗБОРНЫЙ СЕТЧАТЫЙ ПОДДОН) – Fixed Cage Pallet is a cage pallet with sides permanently and rigidly fixed to the deck. / Разборный Сетчатый Поддон – ящичный поддон сетчатый, стенки которого крепятся к основанию поддона.

FIXED CHARGES = ФИКСИРОВАННЫЕ СБОРЫ (или ФИКСИРОВАННЫЕ ПЛАТЫ, или ФИКСИРОВАННЫЕ (или ПОСТОЯННЫЕ) ИЗДЕРЖКИ, или СБОРЫ ПОСТОЯННОГО ХАРАКТЕРА, или ПОСТОЯННЫЕ (или ФИКСИРОВАННЫЕ) (НАКЛАДНЫЕ) РАСХОДЫ) – Fixed Charge is any type of fixed expense that recurs on a regular basis. Fixed charges can include insurance, salaries, utilities, vehicle payments, loan payments and mortgage payments. These charges allow both individuals and businesses to create more predictable budgets and estimate their cash flows more accurately. Both businesses and individuals can have fixed charges. Businesses may have liability or malpractice insurance, while individuals pay car and home insurance. Businesses can often deduct many or all of their fixed charges as business expenses. Fixed Charge:- the assignment of specified assets of a company or an individual as security for a debt. Fixed Charges:- a company's fixed expenses, such as bond interest, which it has agreed to pay whether or not earned, and which are deducted from income before earnings in equity capital are computed.

FIXED COSTS = ФИКСИРОВАННЫЕ ЗАТРАТЫ (или ПОСТОЯННЫЕ РАСХОДЫ, или ПОСТОЯННЫЕ ИЗДЕРЖКИ) – Fixed Costs are the costs that are incurred regardless of the level of output. This includes costs such as depreciation of facilities, administration and other overhead costs. Fixed Costs are the costs that do not vary with short-term changes in the level of output, such as heating costs or rates. Total Fixed Costs are constant over a defined time period. Examples might include certain salaries and wages, depreciation, insurance premiums, heating, rental charges, property taxes, and fixed interest charges. They are 'fixed' only in the sense that they do not vary in total with the short term planned activity levels of the organization. In the long term, all costs are variable since they can be adjusted to new levels of activity following expansion or contraction. Many costs are partially fixed. A telephone bill may contain a fixed equipment rental element and a variable call charge. Although fixed costs do not vary with activity, they can be changed by management action. Staff can be recruited or dismissed, depreciation policies can be changed, reward systems may change, insurance can be switched to more competitive suppliers, etc. A policy decision is required by management to alter the cost structure of the business. For example, managers may change payment of the sales force from salary to a salary plus commission basis. The total amount paid to the sales force may increase or decrease or even stay the same, but payment will now be part fixed and part variable. Variable costs vary in direct relationship with changes in an identified causal factor (driver). So, twice as much glass is used to produce two cars as one. Fixed costs remain unaltered despite changes in their identified causal factors. Thus, the cost of employing a pension administrator will be the same whether there are 150 or 200 on the payroll. The level of variable costs is largely a technical matter the cost of glass will be a function of the number of cars produced. But the level of fixed costs will largely be a matter of discretion for management. There may come a point at which there are not enough people on the payroll to justify a pension administrator and managers may decide to outsource this work. In general terms, when scale or activity in the causal factors change, total fixed costs will remain unchanged but unit fixed costs will change (total fixed costs divided by total units of causal factor). The reverse is true of variable costs. Within the range of planned activity (the relevant range) for a given configuration of land, labor, and capital, fixed costs will not vary. If the scale or arrangement of this configuration is changed, then the cost structure of the business changes and will need to be redefined for business control purposes. The operational gearing or leverage of the firm describes its cost structure as a ratio between revenue minus variable cost and its profit. The higher the proportion of fixed costs in its cost structure, the higher will be the firm's operational gearing ratio. The higher the ratio, the more exposed is the firm to large swings in profitability as market conditions change. The behavior of fixed costs in relation to increasing levels of output is a source of scale economies. It is also a principal feature of a number of important management accounting decision support techniques. Cost volume profit analysis focuses on the break even level of output which a firm must achieve to cover its total fixed costs. Only after this level does the firm achieve profits. Contribution analysis is used to optimize the use of productive resources when in short supply. Contribution is defined as price minus unit variable cost. The residual represents a contribution to the fixed costs of the business. The purpose is to maximize the contribution these scarce resources (or limiting factors) make to the firm's fixed costs. This form of analysis is also used for make orbuy decisions, or decisions whether to accept special orders on terms that do not fully recover total accounted costs. This situation might arise when the firm has idle capacity. In such situations the important point is to consider only the relevant costs. In deciding to accept a contract at a discounted price, the fixed costs are irrelevant to the decision since they will not change whatever decision transpires. Provided the discounted price covers the variable cost involved in production and distribution of the contract volume, the business will be better off accepting it and making some contribution to its fixed costs. The differentiation between fixed and variable costs provides the basis for flexible budgeting. Budgets are set with an assumed level of output. In reality this level changes and the budget will be flexed with the variable element changing in relation to the actual level of activity, the fixed level remaining unaltered. Costs that do not vary with the level of activity. Some fixed costs continue even if no cargo is carried. Terminal leases, rent and property taxes are fixed costs. Business operating expenses that do not vary with the volume of output, as opposed to variable costs. The identification of fixed and variable costs is of fundamental importance in cost analysis techniques and in the accurate computation of the cost of sales. Fixed costs include expenses needed for a business to operate, such as depreciation on plant and equipment, insurance, interest on bonds, maintenance, rent, salaries of management and administrative staff, taxes, etc. Also known as Constant Costs. See also Costs. / выработка (output). Фиксированные Расходы (издержки):- затраты, которые остаются постоянными, независимо от динамики объёма продаж. Фиксированные расходы включают заработную плату руководящих работников, расходы на уплату процентов, аренду, амортизацию и страхование. Они отличаются от переменных издержек (variable costs) – прямых расходов на оплату труда, сырьё и материалы, – которые отличны от частично переменных издержек (semivariable costs). Величина подобных издержек также может изменяться, но не обязательно в прямой связи с объёмом продаж. Они могут оставаться фиксированными вплоть до определённого уровня объёма продаж, затем вырасти, если продажи увеличатся. Например, издержки на доставку товаров грузовиком являются фиксированными до тех пор, пока уровень продаж не вырастает настолько, что потребуется второй грузовик. Очевидно, никакие издержки не являются чисто фиксированными; предположение об их неизменности, однако, служит целям учёта издержек в течение ограниченного периода планирования. При учёте общих издержек следует принимать во внимание распределение фиксированных издержек между расходами на

приобретение товарного запаса, также называется непрямыми расходами, накладными расходами, производственными накладными расходами и дополнительными накладными расходами.

FIXED CRANE = СТАЦИОНАРНЫЙ КРАН – Fixed Crane is a crane of which the principal structure is mounted on permanent or semi permanent foundations. / Кран, у которого основная структура крепится на неподвижных или полуподвижных основаниях.

FIXED–DATE BILL = ВЕКСЕЛЬ С ЗАФИКСИРОВАННОЙ ДАТОЙ (или ВЕКСЕЛЬ ПЛАТЕЖОМ НА ОПРЕДЕЛЁННУЮ ДАТУ В БУДУЩЕМ) – Fixed-Date Bill is a bill of exchange which becomes due and payable at a stipulated date after the issue date. Common in overseas transactions. Also known as After-Sight Bill.

FIXED–DEMAND BID = XX – Fixed-Demand Bid is a bid to purchase a defined MW (MegaWatt) level of energy, regardless of locational marginal price (LMP).

FIXED DISPLACEMENT PUMP = НАСОС С ПОСТОЯННОЙ ПРОИЗВОДИТЕЛЬНОСТЬЮ – Fixed Displacement Pump is a pump in which the displacement per cycle cannot be varied. See also Pump.

FIXED EXCHANGE RATE = ЗАФИКСИРОВАННЫЙ ОБМЕННЫЙ КУРС – A Fixed Exchange Rate is a monetary regime adopted by a nation's government or its central bank in the context of its international trade and finance to maintain a fixed price of its currency in terms of the currency (or a basket of currencies) of its major trading partner(s). The fixed exchange rate is achieved through a nation's intervention (buying and selling) of the designated currencies on the foreign exchange market, a private entity. This activity by the monetary authority of a nation compensates for the disequilibria of the demand and supply between the local and foreign currencies resulting from market fluctuations and subsequently keeps the exchange rate on the desired target. The fixed exchange regime is also referred to as a Pegged Exchange System, in which case a nation's currency is pegged to a major world currency such as the US Dollar (USD) or Euro at a particular rate. A country with a fixed exchange rate regime maintains a sufficient amount of the foreign currency that it pegs to (e.g., USD) in its foreign exchange reserves in order to keep its foreign exchange regime solvent. Suppose that China fixes its currency Yuan with USD. After agreeing to purchase a number of Boeing airplanes from the United States, a large quantity of USD is demanded (or bought) by supplying (or selling) the Yuan in order for the Chinese buyer to pay Boeing. Consequently, the amount of USD decreases while the quantity of Chinese Yuan increases at the foreignexchange market. Accordingly and to counterbalance for its fixed exchange rate, the monetary authority in China will need to demand (buy or revalue) Yuan from and supply (sell or devalue) USD to the foreignexchange market. The reserved currency or value in this case could either be in the form of cash or US Treasury bonds. Countries with a fixed exchange rate regime also need to intervene when the interest rates of the two countries are at disparity. Using the same two country example above, when the United States lowered its interest rate during the credit crisis to save the economy in 2008, Americans demanded more Yuan for higher expected asset returns in China. The central bank in China will need to infuse more Yuan and buy back USD at the foreign exchange market. The foreign exchange reserve increases when the country runs a balance of payments (BoP) surplus and decreases when BoP is in deficit under a fixed exchange rate regime. In more recent years, a modified version was developed within the fixed exchange rate regime adopting a narrow band around the target rate for small adjustments. Under the European Exchange Rate Mechanism, member nations have a fixed exchange rate to the European Currency Unit (ECU). The central bank of a nation may intervene to stabilize its currency if it moves out of the 2.5 percent range, plus or minus, with the ECU. A fixed exchange rate regime provides a higher level of certainty and control for traders in goods, services, and currencies. Because it is shielded from day to day fluctuations in the foreign exchange market, international trade and investment becomes less volatile and incurs limited speculation. Under a wellmanaged fixed exchange rate regime, where there are absences of expectations in devaluation of the local currency, inflation is contained and investments in domestic assets are protected. Nonetheless, the fixed exchange rate regime may cause a BoP crisis when there is excessive demand in the foreign exchange reserve that ultimately brings foreign currency down to zero and when the system becomes depleted. The cause of the crisis could be due to a serious deficit in the BoP with the reserve currency country because the fixed exchange rate regime does not follow market mechanisms and the lack of transparency of the system, which may also be mismanaged by the monetary authority, could cause high expectations of devaluation of the local currency. This anticipation from investors could lead to capital flight (swapping of domestic assets for foreign assets) and cause the fixed exchange rate regime to collapse. Under a fixed exchange rate regime, government has less control of its monetary policy for either expansion or contraction to maneuver its economy because the local currency needs to be maintained at a certain level relative to the foreign currency to keep the fixed exchange rate valid. However, the system may be suitable for less developed nations where the benefit of running a fixed exchange regime exceeds its cost in an economy that seeks an optimal level of development and control. Officially Fixed Exchange Rate of a currency. The rate is kept within the permitted margin of fluctuations in trading on the foreign exchange markets, if necessary by central bank intervention. The opposite of Floating. Fixed Exchange Rate is the exchange rate that the government attempts to control and fix in the short term by instructing the central bank to buy or sell foreign exchange reserves, or by introducing tariffs. Fixed Exchange Rate is the relative values of currencies are established and maintained by government intervention. / флуктуации (колебания) в торговле на рынках иностранных валют, .

FIXED EXCHANGE RATE SYSTEM = СИСТЕМА ЗАФИКСИРОВАННЫХ ОБМЕННЫХ КУРСОВ – Fixed Exchange Rate System:- exchange rates between currencies that are set at predetermined levels and don't move in response to changes in supply and demand.

FIXED EXPENSES = ФИКСИРОВАННЫЕ РАСХОДЫ (или ПОСТОЯННЫЕ РАСХОДЫ) – Fixed Expenses:- expenses that are independent of production capacity or of amount actually produced in given period. Examples of fixed expenses are insurance premiums, interest on debt, and rent. Fixed Expenses are expenses which does not change as sales increase or decrease. See Variable Expenses.

FIXED FUND = ЗАФИКСИРОВАННЫЙ ФОНД – Fixed Fund is an investment fund (mutual fund) where the type and amounts of the individual investments are exactly specified at the time the fund is established. The expression is no longer common today. The opposite of Flexible Fund.

FIXED HEIGHT LOAD CARRYING TRUCK = ПЕРЕВОЗЯЩИЙ ГРУЗОВИК С ФИКСИРОВАННОЙ ВЫСОТОЙ ЗАГРУЗКИ – Fixed Height Load Carrying Truck is a truck carrying its load on a non-elevating platform. Synonym:- Fixed Platform Truck.

FIXED–INCOME FUND = ФОНД ФИКСИРОВАННЫХ ДОХОДОВ – Fixed Income Fund is a fund that invests solely in fixed income investments, such as bonds or certificates of deposit. These funds are dependable and limit the amount of risk an investor takes on, although it could mean a lesser return that would be possible in a more risky fund. Investment fund which invests in bonds. / Инвестиционный фонд, который инвестирует в облигации.

FIXED–INCOME SECURITY = ЦЕННАЯ БУМАГА С ФИКСИРОВАННЫМ ДОХОДОМ – The term Fixed-Income Security can refer to bonds, mortgage bonds, debentures, annuity bonds. Fixed-income paper embodies a right to repayment of a nominal value plus interest. Issuers use bonds to borrow on the capital market. The rights securitized by a bond are regulated by law, but as a rule are supplemented by additional bond conditions. Depending on the type of interest rate arrangements agreed, a distinction is drawn

between bonds at constant interest over the entire life, bonds at variable interest during the life and bonds with no nominal interest (zero bond). Depending on the issuer, a distinction is also drawn between public-sector bonds (e.g., Treasury bonds, bonds of the Federal states, municipal bonds), industrial bonds and bonds issued by banks, mortgage banks or public-sector institutions (mortgage bonds and communal bonds). A security whose nominal (or current Dollar) yield is fixed or determined with certainty at the time of purchase, typically a debt security. In the broadest sense a term for any security whose interest rate remains constant throughout its life and which is redeemed at its face value. This includes corporate bonds, public-sector bonds and mortgage bonds (Pfandbriefe). In current usage the term is used to describe all securities that constitute a creditor's claim, including zero bonds and floating rate notes. The opposite are equity instruments (such as shares), which represent an ownership interest in a company and which entitle the shareholder to dividend payments reflecting the company's business success. / Ценная бумага номинальная (или текущая Долларовая) доходность зафиксирована или установлена с увязкой к дате приобретения. Как правило, к таким бумагам относятся долговые ценные бумаги (debt security).

FIXED INTEREST = ФИКСИРОВАННЫЙ ПРОЦЕНТ – Fixed Interest:- a security where the return when held to maturity is fixed. Fixed interest securities normally receive periodic interest payments and repayment of principal at maturity. The term also embraces discount securities which may not attract interest payments. / выплата (repayment) .

FIXED INTEREST SECURITIES = ЦЕННЫЕ БУМАГИ С ФИКСИРОВАННЫМ ПРОЦЕНТОМ – Fixed-Interest Securities are the securities on which the borrower must pay interest at a set rate for their entire maturity, such as bonds, debentures, medium-term notes, notes, etc. The opposite of Floating Rate Bond. Fixed Interest Securities:- those where the interest payments (also called Coupons) are fixed and known at the date of purchase. Contrast with Variable Interest Securities like Ordinary Shares where you are not sure what the size of the dividends will be in future years.

FIXED LINE = ФИКСИРОВАННАЯ ЛИНИЯ (или ЗАКРЕПЛЁННАЯ ЛИНИЯ) – Fixed Line is a breeding line that continues to breed true to type and does not segregate. / В генетике под Линией, от Латинского слова Linea, понимаются размножающиеся половым путём родственные организмы, которые происходят, как правило, от одного предка или одной пары общих предков и воспроизводят в ряду поколений одни и те же наследственно устойчивые признаки. Линия – основа для получения высокопродуктивных гибридов в растениеводстве и животноводстве.

FIXED PHOSPHORUS = ФИКСИРОВАННЫЙ ФОСФОР (или ЗАКРЕПЛЁННЫЙ ФОСФОР) – Fixed Phosphorus is that phosphorus which has been changed to an unavailable form as a result of reaction with the soil.

FIXED PLATFORM = СТАЦИОНАРНАЯ ПЛАТФОРМА – Fixed Platforms consist of a jacket (a tall vertical section made of tubular steel members supported by piles driven into the seabed) with a deck placed on top. The deck provides space for crew quarters, a drilling rig and production facilities to separate the oil, gas and produced waters from the wells drilled from the platform. A fixed platform is economically feasible in water depths up to 1 500 feet. See also Offshore Production Platform, Spar Platform, and Tension Leg Platform. / В Соединённых Штатах Америки. Смотрите также Морская Эксплуатационная Платформа (Offshore Production Platform), Спаренная Платформа (Spar Platform), и Платформа С Растянутыми Опорами (Tension Leg Platform).

FIXED POST PALLET = ПОДДОН С ЗАКРЕПЛЁННЫМИ СТОЙКАМИ – Fixed Post Pallet is a post pallet with posts permanently and rigidly fixed to the deck. / Поддон С Закреплёнными Стойками – стоечный поддон с жёстко закреплёнными стойками.

FIXED PRICE FORWARD CONTRACT = ФОРВАРДНЫЙ КОНТРАКТ С ЗАФИКСИРОВАННОЙ ЦЕНОЙ (или СРОЧНЫЙ КОНТРАКТ С ЗАФИКСИРОВАННОЙ ЦЕНОЙ) – A Fixed Price Forward Contract is a contract in which the contractor agrees to a fixed contract price, or a fixed rate per unit of output, which in some cases is subject to cost escalation clauses. Forward contract in which a certain price (as distinct from a formula for a variable price) is established at the time the contract is signed. / выработка (output). Форвардный контракт или срочный контракт, в котором конкретная цена (определённая по изменяемой цене с помощью формулы) утверждается на дату подписания контракта.

FIXED PRICE OFFERING SYSTEM = СИСТЕМА ПРЕДЛОЖЕНИЯ ПО ФИКСИРОВАННОЙ ЦЕНЕ – Fixed-Price Offering System is a traditional procedure for placing securities, in which the issuing price is fixed by the lead manager and the issuer prior to publication of the sales prospectus. The price is established on the basis of the company's fundamentals, also considering the stock market valuation of similar companies and the overall market situation. Opposite:- Book-Building.

FIXED PRICE REOFFER METHOD = МЕТОД ПОВТОРНОГО ПРЕДЛОЖЕНИЯ ПО ФИКСИРОВАННОЙ ЦЕНЕ – Fixed Price Reoffer (FPRO) Method is a standard procedure on international bond markets. Initially, terms and conditions for a bond issue are established as a spread to a benchmark. Investors subcriptions are then taken up and the issue is placed at a fixed yield, known as the Reoffer Price. The sale to investors is settled quickly, within a few hours. The FPRO procedure is very similar to the book-building process for newly issued shares.

FIXED RATE = ФИКСИРОВАННАЯ СТАВКА – Fixed Rate:- a traditional approach to determining the finance charge payable on an extension of credit. A predetermined and certain rate of interest is applied to the principal.

FIXED RATE AGREEMENT = СОГЛАШЕНИЕ О ФИКСИРОВАННОЙ СТАВКЕ – A Fixed Rate Agreement (FRA) is a contract between two parties to lock in a forward interest rate, for a period, starting at a specific date in the future. For example, a 6 v 9 FRA is a contract that begins 6 months from now and ends after 9 months, i.e. lasts for 3 months. The two counterparties, one buyer and one seller, settle by cash payment at the start of the contract period (in this example 6 months from now). Settlement is based on the difference between the actual interest rate prevailing on the fixing date and the rate specified in the contract, for a specific notional principal stated in the contract. Fixed rate agreements are also known as Forward or Future Rate Agreements.

FIXED–RATE MORTGAGE = ЗАКЛАДНАЯ С ФИКСИРОВАННОЙ СТАВКОЙ – Fixed-Rate Mortgage is a mortgage with a fixed, unchangeable interest rate running for a period agreed on between the bank and the borrower, usually between two and ten years.

FIXED TERM DEPOSIT = ВКЛАД С ФИКСИРОВАННЫМ СРОКОМ (или ДЕПОЗИТ НА ФИКСИРОВАННЫЙ СРОК) – Fixed-Term Deposit is a deposit of funds with a bank under an agreement stating that the funds must be kept on deposit for a specified period of time, at least 30 days. The actual term is established on contract conclusion. Time deposit accounts earn higher interest rates than current accounts, with interest depending on the amount invested, the agreed term and general market interest rates. On maturity, fixed-term deposits can either be prolonged (usually at the current interest rate) or placed on sight deposit accounts. Also known as Time Deposit.

FIXED TERM LOANS = ЗАЙМЫ НА ФИКСИРОВАННЫЙ СРОК – Fixed-Term Loans are investments made with central banks, international institutions and commercial banks. These include advances to central banks and international institutions as part of committed and uncommitted standby facilities. The balance sheet total 'Time deposits and advances to banks' also includes call and notice accounts.

FIXING = ФИКСАЦИЯ (или ФИКСИРОВАНИЕ) – (1) Fixing is the setting of firm reference prices, e.g., for gold, platinum and silver. Prices are reset at the same time each day. Reflecting the prevailing market conditions at the time it is set, the fixed price remains valid for all trader transactions until next determined. Computation of price at which a spot commodity will be billed. Fixing is used in the London Gold Market, which is done twice a day, for example. See also Gold Fixing. / , например, . Под Фиксацией или Фиксированием, от Латинского слова Fixus, означающее Закреплённый или Прочный, понимается закрепление чего-либо в определённом положении.

(2) Fixing is a chartering a Vessel or Setting a Time.

FIXTURE = СОСТЯЗАНИЕ (или ИМУЩЕСТВО, или ФРАХТОВАЯ СДЕЛКА, или ДОГОВОР ФРАХТОВАНИЯ) – (1) Fixture is any chattel attached or annexed to land, in which case it becomes part of the property. See also Chattel.

(2) Fixture is a conclusion of shipbrokers negotiations to charter a ship – an agreement. / – соглашение.

FJ = FIJI

FJD = FIJIAN DOLLAR

FK = FALKLAND ISLANDS (MALVINAS)

FKP = FALKLAND ISLANDS POUND

FL = FLOWERING

FLA = FULL LOAD AMPERES

FLACCID = ПОНИКШЕЕ (или ОТВИСЛОЕ, или ВЯЛОЕ, или СЛАБОЕ, или УВЯДШЕЕ) – Flaccid:- limp, flabby or drooping. / вялое, дряблое/слабое или .

FLAG = ФЛАГ – (1) Flag is an indication of the country in which a vessel is registered. / Признак страны, в которой зарегистрировано судно. Под Флагом, от Голландского слова Vlag, понимается прикреплённое к древку или шнуру полотнище установленных размеров и цветов, иногда с изображением на нём герба, эмблемы. Может нести в себе функцию принадлежности к какому-то государству. Флаг морского судна.

(2) Nautical Flags and Their Meanings:- signal flags are used to communicate messages, at times because radio silence is required. Here are their names and meanings, both International and/or specific to the Navy, as well as meanings when used in a Sailing Regatta. There is also a signaling system called Semaphore which uses the position of the flags relative to a person to denote the letter. International signals used by ships at sea, used to spell out short messages, or used individually or in combination each with a special meaning. Also used to dress a ship for ceremonial and festive occasions (protocol). There are also numeric pennants, answering pennants. Signal Flags:- US Navy/NATO/International:- The following table shows the flags and pennants typically used in US Navy ships for visual signaling and gives basic explanations of their meanings. A comprehensive explanation of the meanings of these flags is far beyond the scope of this FAQ – the publications used to encode, decode, and interpret flag signals (the NATO Allied Tactical Publications – ATP-1A and B) comprise two binders, each about three inches thick! In a formation one ship is designated the Guide, and all ships will take their stations relative to this vessel. The Guide flies the Golf flag. The Guide may or may not be the ship from which tactical (maneuvering) signals are sent. The Guide may change throughout an evolution or series of signals. All ships in company generally carry the Golf flag closed up (hoisted all the way to the yardarm) at the main, on centerline, but with the flag rolled up and tied with twine so that it cannot be seen. That way, if your ship is designated the Guide, all you do is give a sharp tug to the halyard, the twine breaks, the flag unfurls, and you're now the Guide. And you've looked sharp and seamanlike to boot. A complete signal may comprise one or many flags. A limited number of flags can be accommodated on a single halyard, so a complete signal may take more than one halyard, but it is also possible to have more than one signal in a single hoist. One halyard of flags, whether a single flag or many, is called a Hoist. When a signal must be broken into multiple hoists, it must be divided at such a point that the meaning is not changed. A complete signal or group of signals – whether on one hoist or on two or more adjacent hoists flying at the same time – is called a Display. When displays of more than one hoist are raised, the separate hoists are run up, one by one, in the order they are to be read. A hoist of flags is always read from the top down; when multiple hoists are displayed, the signal is read top down, outboard to inboard, and from forward to aft. As a rule, a signal too long to be shown completely on three halyards is made into two or more displays. When two or more displays are used, the heading(the initial part of the signal) must be hoisted on a separate halyard and kept flying while successive displays are made. When several hoists are displayed simultaneously from different points, they are read in the following order:- (1) masthead; (2) triatic stay (a line run between masts or from masthead to stack, etc); (3) starboard yardarm; and (4) port yardarm. Signals hoisted at yardarms of different heights are read beginning with the tallest. A typical flag signal is raised at the dip (not fully raised up the halyards) by the ship which has the OTC (Officer in Tactical Command) embarked. All ships in the formation read the signal. Each ship's signals gang bends on exactly the same signal, and hoists it at the dip. This signifies that the ship has correctly read the signal (much embarrassment results if a ship hoists an incorrect version of the signal). As each receiving ship breaks (decodes) and understands the signal, it fully raises, orcloses up, the hoist to show that it understands and is ready to carry out the orders and maneuvers implied by the signal. Once all receiving ships have closed up the signal, the OTC closes up the signal to indicate prepare to execute. Execution of the signal occurs when the OTC briskly hauls down the signal hoist. Some flags have pretty obvious meanings, e.g., the Speed flag. Other flags, such as Corpen, can have many meanings depending on how it is used, where in the signal hoist it is found, what type of formation is currently in effect, etc. Some non-intuitive examples are given below:- (i) In its simplest usage, Corpen means course. The signal Mike Corpen Two Three Zero breaks as My course is two three zero degrees True. But Corpen Zero Niner Zero signals that a column of ships will turn in succession (as each reaches the point where the lead ship turned) to true course 090 (think of a columnmovement when marching, if that helps). Yet if you're in a different formation (not in a column), the meaning of the exact same signal is different. A carrier will signal Fox Corpen XXX, in which XXX degrees True is the planned course for flight operations (but don't you believe it – the carrier always lies, and will roar off in search of the flight deck wind it needs without necessarily telling you in advance, and woe betide if you find yourself in front of the birdfarm!). (ii) Similarly, Turn Starboard Niner breaks as a simultaneous turn by all ships, ninety degrees to starboard, yet Turn Starboard Zero Niner Zero breaks as a simultaneous turn to course zero nine zero degrees true, pretty much regardless what formation you are in. (iii) Designation (spoken Desig) is typically used to ascribe a name to something; for example, Echo X-ray Three Tack Three Desig Miller Time breaks as, Upon execution, commence exercise named Miller Time. (iv) Preparatory (called Prep) is used inport when getting ready for morning or evening colors. At the dip:- 15 minutes prior. Closed up:- 5 minutes prior. Hauled down:- execute colors. (v) Tack is not a flag at all, but a six-foot length of line with a snap hook on one end and a loop on the other (signal flags have the same snap and loop arrangement to permit quick attachment and detachment of a flag from a halyard). Tack is used to take up a signal flag-sized space in a hoist of flags. It separates two signals in one hoist, or it can represent a dash. Signals from a ship to small craft can be made using the USN/NATO numeral eight flag, with modifiers as needed:- (i) Eight (flown alone) – Steer straight away from the ship; (ii) Eight flown with Port – Alter

course to port. When the hoist is hauled down, cease turn and steady on course; (iii) Eight flown with Starboard – Alter course to starboard. When the hoist is hauled down, cease turning and steady on course; and (iv) Eight flown with Screen – Steer straight toward the ship. All this wonderful complexity exists for most of the non-numerical flags, thereby leading to the need for three-inch thick binders. A ship when underway will usually display its international radio callsign in signal flags at all times. There are international meanings for many of the alphabetic flags; these meanings may differ from standard USN usage.

(3) Flag and Pennant:- these two short-term chart patterns are continuation patterns that are formed when there is a sharp price movement followed by a generally sideways price movement. This pattern is then completed upon another sharp price movement in the same direction as the move that started the trend. The patterns are generally thought to last from one to three weeks. As you can see in Figure 5, there is little difference between a pennant and a flag. The main difference between these price movements can be seen in the middle section of the chart pattern. In a pennant, the middle section is characterized by converging trendlines, much like what is seen in a symmetrical triangle. The middle section on the flag pattern, on the other hand, shows a channel pattern, with no convergence between the trendlines. In both cases, the trend is expected to continue when the price moves above the upper trendline. Flag is a continuation chart pattern that generally lasts less than three weeks and resembles a parallelogram that slopes against the prevailing trend. The flag represents a minor pause in a dynamic price trend. Flag is a continuation pattern within an established trend where a sharp vertical run in prices (the flag pole) is followed by a drift pattern that appears as a minor counter-trend channel (flag). Traders measure the length of the pole and project it forward as a price objective. A price chart pattern that looks like a flag-pole with a rectangular ‘flag’ hanging off it. It is often seen as a sign that the trend is likely to continue after a brief consolidation. In technical analysis, Flag is one of the basic chart patterns. In a bull market a flag occurs when prices consolidate for a period then continue to rise. In a bear market the converse occurs, i.e. prices resume falling after a period of consolidation. Bull Flag or Bear Flag:- A small, few bars pattern that moves counter to the larger term trend, a small correction or consolidation pattern. We look for a breakout of this flag to signal the resumption of the larger trend. A Flag is an aptly named continuation pattern composed of price action that looks like a flag pole and a flag. The flag pole forms when the market rallies or sells off sharply. Then the flag, a consolidation area, can be identified by drawing parallel lines. The flag portion should be sloped against the trend or horizontally. The underlying concept is when a market rallies or sells off sharply, it can’t continue forever. It needs to take a break before resuming its course in the direction of the flag pole. It is confirmed when price breaks out of the flag. If you find one in an uptrending market, it’s known as a Bull Flag. If you find one in a downtrending market, it’s called a Bear Flag. Flag patterns help filter the information. Pennants are similar to flag patterns. They are formed and interpreted exactly the same as a flag except the consolidation area is marked by converging lines rather than parallel lines. See also Pennant, and Technical Analysis. / Медвежий Флаг (Bear Flag) перевёрнут вниз, то есть древок флага идёт сверху вниз, а сам флаг как бы делается временным ценовым коридором вверх. Обычно вместе с флагами рассматриваются и Вымпелы (Pennants), являющиеся Фигурами Продолжения (Continuation Patterns). Вычерчиванием параллельных линий. Фигура на графике цен, напоминающая флагшток со свисающим с него прямоугольным ‘флагом’. Часто рассматривается как признак того, что тенденция продолжит свое развитие после краткой консолидации. В техническом анализе биржевых рынков под Флагом понимается модель технического графика, напоминающая по форме флаг, имеющая вид параллелограмма с ‘древками’ с обеих сторон и отражающая консолидацию тенденции. Она является результатом колебания цен в рамках узкого спектра, до и после которого наблюдаются резкие подъёмы или спады. Если флаг – период консолидации – следует за подъёмом, то за ним обычно также следует подъём; за спадом же следует новый спад.

FLAG CARRIER = ПЕРЕВОЗЧИК ПОД ФЛАГОМ – Flag Carrier is an airline or vessel of one national registry whose government gives it partial or total monopoly over international routes. A Flag Carrier is a transportation company, such as an airline or shipping company, that, being locally registered in a given state, enjoys preferential rights or privileges, accorded by the government, for international operations. It may be a state-run, state-owned or private but state-designated company or organization. Flag carriers may be known as such due to maritime law requiring all aircraft or ships to display the state flag of the country of their registry. A flag carrier (if it is a certificated airline rather than a holding company, conglomerate, or multinational private equity firm) may also be known as a national airline or a national carrier, although this can have different legal meanings in some countries. The first definition is rooted in the fact that pursuant to Article 17 of the Convention on International Civil Aviation aircraft have the nationality of the state in which they are registered. The US law (14 CFR § 121.153 (a) (1)) requires American air carriers to operate aircraft registered in the United States and most countries have similar laws. Thus when an airline operates an international route, between two countries, having been designated pursuant to a Bilateral Air Transport Agreement any crime that would be committed on board would be prosecuted under the laws of the airline’s state. Article 3 (1) of Tokyo Convention declares that ‘The State of registration (of the aircraft) is competent to exercise jurisdiction over ‘offenses and acts committed on board’. Therefore the aircraft is truly carrying the flag of its country. The American definition of ‘US-flag air carrier service’ contained in 48 CFR 47.403-1. is based on this first definition. The US requirements under the Fly America Act, are consistent with requiring that Title 18 of the United States Code (US Criminal Law) would protect US government employees on flights to foreign countries. The second and more broadly used definition of ‘flag carrier’ is a legacy of the time when countries established state-owned airline companies. Governments then took the lead due to the high capital costs of establishing and running airlines. However, not all such airlines were government-owned; Pan Am, TWA, Cathay Pacific, Union de Transports Aériens, Canadian Pacific Air Lines and Olympic Airlines were all privately owned. Most of these were considered to be flag carriers as they were the ‘main national airline’ and often a sign of their country’s presence abroad. The heavily regulated aviation industry also meant aviation rights are often negotiated between governments, denying airlines the right to an open market. These Bilateral Air Transport Agreements similar to the Bermuda I and Bermuda II agreements specify rights awardable only to locally registered airlines, forcing some governments to jump-start airlines to avoid being disadvantaged in the face of foreign competition. Some countries also establish flag carriers such as Israel’s EL AL or Lebanon’s Middle East Airlines for nationalist reasons, or to aid the country’s economy, particularly in the area of tourism. In many cases, governments would directly assist in the growth of their flag carriers typically through subsidies and other fiscal incentives. The establishment of competitors in the form of other locally registered airlines may be prohibited, or heavily regulated to avoid direct competition. Even where privately run airlines may be allowed to be established, the flag carriers may still be accorded priority, especially in the apportionment of aviation rights to local or international markets. In the last two decades, however, many of these airlines have since been corporatized as a public company or a state-owned enterprise, or completely privatized. The aviation industry has also been gradually deregulated and liberalized, permitting greater Freedoms of the air particularly in the United States and in the European Union with the signing of the Open Skies agreement. One of the features of such agreements is the right of a country to designate multiple airlines to serve international routes with the result that there is no single ‘flag carrier’. The term is also used loosely to refer to any dominant or major airline sized carrier in a country, or in reference to a mainline carrier with a history of a state sponsored legacy of airline service, even long after their privatization. / Пэн Эм (Pan Am), Ти.Дабл.Ю.Эй (TWA), Касэй Пэсифик (Cathay Pacific), Юньё дё Троспор Аэръё (Union de Transports Aériens), Кэнэйдиэн Пэсифик Эа Лайнз (Canadian Pacific Air Lines) и Олымпик Эалайнз (Olympic Airlines). Эль Аль (EL AL).

FLAGELLUM = ФЛАГЭЛЛУМ (или УС, или ЖГУТИК, или РЕСНИЧКА, или ПЛЕТЬ, или СТЕЛЮЩИЙСЯ ПОБЕГ) – Flagellum (Pl. Flagella) is a whip-like hair, usually motile in lower plants and plankton. Hence:- Adj. Flagelliform = Whip-like, Flagellate = a single cell form of plankton with a flagellum. Flagellum is a thread-, hair-, or whiplike structure that serves to propel a motile cell.

FLAG LEAF = ФЛАГОВЫЙ ЛИСТ – Flag Leaf is the uppermost leaf originating just below the panicle base. / Флаговый Лист – лист, имеющий удлинённую форму.

FLAG OF CONVENIENCE = УДОБНЫЙ ФЛАГ (или ПОДСТАВНОЙ ФЛАГ) – A ship flies a Flag Of Convenience (FOC) if it is registered in a country other than its country of ownership. A more formal definition is as follows:- The flag of a country with easy or lax maritime regulations and low fees and taxes, flown by ships that register their vessels in such countries, even though their ownership and main cruising areas are elsewhere. Maritime tradition follows the rule of the flag in other words, the specific flag flown by a ship determines the country's law to be applied, regardless of which court has personal jurisdiction over the parties involved, be they owners, operators, or crew. At the present time it appears that approximately half the world's tonnage of merchant ships is registered under flags of convenience, and while (as suggested by the above provided definition) reduced cost is a prime motivator, be this either operating costs because of low wages or the avoidance of taxes, the circumvention of 'inconvenient' environmental regulations is now emerging as a significant consideration, with fishing boats, for example, ignoring conservation agreements entered into by their home countries. This situation has caused Franz Fishler, former European Union commissioner for fisheries, to describe flags of convenience as the scourge of today's maritime world. The possibility of abuse of the system to benefit arms smugglers or human traffickers is another rampant concern. Ships registered in the United States have to be manned by American crews. Elsewhere, problems are perceived to stem from such aspects as language differences that make communication between seafarers difficult. Poor crew conditions, inadequate training, questionable safety records, and the abandoning of crew members in distant ports all such activities have called into question the operating of a scheme that many commentators have found reprehensible. One safeguard is the international Ship and Port Facility Security Code, which requires minimum standards for vessels entering the waters of its signatory nations. Thus the United States Coast Guard can inspect vessels entering American territorial waters and refuse entry to any exhibiting significant defects. Panama was the first nation to become a flag of convenience country and remains, to this day, the most significant flag of convenience country as measured either by gross tonnage or number of vessels (and by a very considerable margin; the CIA World Factbook is a useful source of comparative data). But Panama does at least have a reputation for having adopted a 'responsible' attitude toward an activity that is elsewhere considered reprehensible, since it is claimed to have given rise to the adoption of lax labor laws and low safety standards, thereby leading to a reduction in revenue for countries that apply stricter standards. Thus in the Panamanian case its own consulates deal with the necessary paperwork and collect the registration fees. Compare this with the situation of 'Liberian' registration (run by a company based in Virginia), or 'Cambodian' registration (operated from Singapore). In other words, registration does not even have to occur in the country where the vessel is supposedly based. Interestingly, to offer a flag of convenience facility it is not even necessary to possess a seaboard. Thus, ships may even be registered in La Paz (Bolivia is landlocked) or Mongolia (the largest landlocked country in the world). The sinking of the oil tanker Prestige off the Spanish coast in 2002 heightened concern over who should pay for the damage in such a circumstance, and there is much opposition to the flag of convenience system and the abuses to which it is seen to give rise (in fact, of the absolute tonnage lost to maritime accidents in 2001, 63 percent of the total was accounted for by just 13 flag of convenience registers). Various international bodies have come down heavily on the practice, including the World Wildlife Fund, which is attempting to develop a review of the system and ensure that flag states (the country in which a vessel is registered) meet their responsibilities in applying and enforcing international shipping standards, and that the guilty party is held responsible for the consequences of poor shipping standards and practices. Additionally, the International Transport Workers' Federation, in association with the International Maritime Employers' Committee, now collectively negotiates pay scales for seafarers on flag of convenience ships. There are, inevitably, supporters of, as well as detractors from, the flag of convenience system. The principal argument mounted here is likely to be that of arguing that the owners of a vessel engaged in international trade should be unencumbered in their choice of jurisdiction (the concept of laissez faire taken to its logical conclusion, perhaps). Other advantages may exist in terms of a sophisticated maritime court structure and/or vessel financing possibilities. But the overriding consideration has to be that of keeping operating costs lower than would be imposed through registration with a (largely) non–flag of convenience nation such as the United States or United Kingdom. Flag Of Convenience (FOC):- the registration of ships in a country whose tax on the profits of trading ships is low or whose requirements concerning manning or maintenance are not stringent. Sometimes referred to as Flags Of Necessity; denotes registration of vessels in foreign nations that offer favorable tax structures and regulations; also the flag representing the nation under whose jurisdiction a ship is registered. Ships are always registered under the laws of one nation but are not always required to establish their home location in that country. / домогательство (abuse). коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо). сохранение (conservation). Лессе Фэр (Laissez Faire) = Представьте Делу Идти Своим Порядком; Позиция Невмешательства или Недоговорённости (на Французском). Судно под удобным флагом.

FLAG WAIVER = С ОТКАЗОМ ФЛАГА – Flag Waiver:- a permission from government to carry cargo otherwise reserved for a particular flag Carrier.

FLAKES = ХЛОПЬЯ – Flake is a term that refers to the granular form in which cellulose acetate and triacetate polymers exist prior to dissolving or feeding into the extrusion or molding unit. Flakes:- an ingredient rolled or cut into flat pieces with or without prior steam conditioning. / ацетат целлюлозы или ацетилцеллюлоза (cellulose acetate). Экструзия или Выдавливание (Extrusion).

FLAKE YARN = ЗАСТИЛИСТАЯ ПРЯЖА (или ПРЯЖА С ХЛОПЬЯМИ) – Flake Yarn is the yarn in which roving or short, soft staple fibers are inserted at intervals between long filament binder yarns. / Пряжа С Хлопьями – пряжа фасонной крутки с петельками и хлопьями.

FLAKING = ШЕЛУШЕНИЕ (или ОТСЛАИВАНИЕ ПОВЕРХНОСТИ, или РАССЛОЕНИЕ) – Flaking is a common fault during the production of enamel goods. In a general sense, it refers to the separation of areas of the surface due to strain and mechanical stress. Lifting of the paint from the underlying surface in the form of flakes or scales. / в форме клочков или чешуек. эмаль (enamel).

FLAK JACKET = ЖАКЕТ ОТ ОСКОЛКОВ – Flak Jacket is a jacket containing metal plates for protection against flak; broadly, a bulletproof vest. Also called Flak Vest.

FLAKY WEB = ХЛОПЬЕВИДНАЯ (или ЧЕШУЙЧАТАЯ, или ЗАСТИЛИСТАЯ) ВАТКА (или ПРОЧЁС) – Flaky Web is a web at the card that shows thick and thin places, approximately 1 to 6 square inches in size. This indicates that, instead of a free flow of fibers through the card, either an uneven amount has been fed into the card, or groups of fibers have hesitated in the card and then dropped back into production.

FLAME = ПЛАМЕННОЕ (или ОГНЕННОЕ, или ХХ) – Flame:- a strong reddish orange.

FLAME OUT = СРЫВ ПЛАМЕНИ (или ЗАГЛУШЕНИЕ) – Flame Out:- this is the time that a company has before it runs out of cash and flames out. It can be estimated by taking cash on hand and dividing it by the burn rate.

FLAME RESISTANCE = СТОЙКОСТЬ К ВОСПЛАМЕНЕНИЮ (или ОГНЕСТОЙКОСТЬ, или ОГНЕУПОРНОСТЬ) – Flame Resistance is the property of a material whereby flaming combustion is slowed, terminated or prevented. Note:- flame resistance can be an inherent property of the basic material or it may be imparted by specific treatment. The degree of flame resistance exhibited by a material during testing may vary with the test conditions. Flame Resistance is the characteristic of a fabric that causes it to self-extinguish when the source of ignition is removed. The most commonly used test method is ASTM D6413 Standard Test Method for Flame Resistance of Textiles (Vertical Test). The vertical flame test is a test method with no pass/fail requirements. Industry established standards range from 4" to 6" (100 mm to 150 mm) maximum char lengths. It is very important for flame resistant fabrics to self-extinguish. Fabrics that self-extinguish after the source of ignition is removed can dramatically reduce body burn percentage and increase the chance for survival. However, char length measurements by themselves have no correlation to the protection afforded by a flame resistant fabric. True protection to thermal events is better measured by testing the thermal resistance of fabrics against exposures to simulated hazards, such as the flash fire manikin test or the arc thermal performance test – both which we perform on a regular basis. American Society for Testing and Materials (ASTM). / Американское Общество по Испытаниям и Материалам (АОИМ).

FLAME RESISTANCE TESTS = ТЕСТЫ НА СТОЙКОСТЬ К ВОСПЛАМЕНЕНИЮ (или ИСПЫТАНИЯ НА ОГНЕСТОЙКОСТЬ или ОГНЕУПОРНОСТЬ) – Flame Resistance Tests:- xxxxx. See also Flammability Tests. This performance specification covers the design characteristics and associated test methods that relate specifically to the flame resistance of textile materials used in the fabrication of basic protection level occupational apparel worn by electrical workers who are exposed to momentary electric arc and related thermal hazards such as exposure to open flame and radiant heat. When evaluated in accordance with the test procedures enlisted herein, knit fabrics and woven fabrics of different fabric weights shall conform to individually specified values of the following properties:- colorfastness such as laundering shade change, dry-cleaning shade change, and dimensional change; initial flammability characteristics and flammability characteristics after 25 washes/dry-cleaning such as char length and afterflame time; and arc test rating. Knit fabrics shall additionally be tested and adhere accordingly to bursting strength characteristics. Conversely, woven fabrics shall also be tested and adhere accordingly to breaking load, tear resistance, and seam slippage characteristics.

FLAME RESISTANT = ОГНЕСТОЙКОЕ (или ОГНЕУПОРНОЕ) – Flame Resistant is a term used to describe a material that burns slowly or is selfextinguishing after removal of an external source of ignition. A fabric or yarn can be flame resistance because of the innate properties of the fiber, the twist level of the yarn, the fabric construction, or the presence of flame retardants, or because of a combination of these factors. See also Flame-Retardant, and Inherent Flame Resistance. Flame Resistant:- fabrics treated with special chemical agents or finishes to make them resistant to burning. Today many fabrics achieve this property by using fibers that have this property built directly into the polymer. A fabric is considered flame resistant if it passes federal specifications for specific end-uses.

FLAME RETARDANT = РЕТАРДАНТ ВОСПЛАМЕНЕНИЯ (или ПРОТИВОВОСПЛАМЕНЯЕМОЕ, или ЗАДЕРЖИВАНИЕ РАСПРОСТРАНЕНИЯ ПЛАМЕНИ (ОГНЕСТОЙКИМИ ТКАНЯМИ)) – Flame Retardant is a chemical compound that can be incorporated into a textile fiber during manufacture or applied to a fiber, fabric, or other textile item during processing or use to reduce its flammability. See also Flame Resistant. Flame Retardant:- any process which can improve the resistance of a fabric to burning. Flame Retardant is a chemical applied to a fabric, or incorporated into the fiber at the time of production, which significantly reduces a fabric's flammability.

FLAME RETARDANT FABRIC = ТКАНЬ, ЗАДЕРЖИВАЮЩАЯ РАСПРОСТРАНЕНИЯ ПЛАМЕНИ (или ПРОТИВОВОСПЛАМЕНЯЕМАЯ ТКАНЬ) – Flame Retardant Fabric is a fabric that resists or retards the spreading of flames. A flame retardant fabric can be made by using fibers that are themselves flame retardant, or by using special finishes on fabrics. Below is a list of some flame retardant fabrics. Many companies produce similar items but have not given them names referring specifically to their flame retardant nature.

FLAME RETARDANT FIBER = ВОЛОКНО, ЗАДЕРЖИВАЮЩЕЕ РАСПРОСТРАНЕНИЯ ПЛАМЕНИ (или ОГНЕСТОЙКОЕ ВОЛОКНО) – Flame Retardant Fiber is produced by combining the phosphorous aent in the fiber, has a self-extingusihing property when the fire is removed from the fiber. The advantages of fire retardant fiber is that it is semi-durable compared with finish oil treatment fiber and will not emit toxic halogen gas. It has passed flame resistant textiles and films flammability test. Flame retardant fiber grade 1 500–5 000 ppm (short for the parts per million). Advantages:- (i) excellent fire retardant function; (ii) excellent processing; and (iii) no toxic halogen gas, More Safety. Usage:- padding, curtain, wall covering, filter media, carpet, seat cover; and (ii) in industries:- filling materials, insulation materials, Automobile. Specification:- (i) Denier:- 1.5/ 3/ 4/ 6/ 7/ 12/15d; and (ii) Length:- 38/ 51/ 64 mm. EATERLON Flame Retardant Fiber combining the phosphorous agent in the fiber. It has a self-extinguishing property when the fire is removed from the fiber. The advantages of EATERLON flame retardant fiber is that it is semi-durable compared with finish oil treatment fiber and will not emit toxic halogen gas. EATERLON flame retardant fiber could pass flame resistant textiles and films flammability test (small scale) NFPA-701 and CPAI-84. There are 3 different grades of EATERLON flame retardant fiber. V1 grade:- Phosphorous content 5 000 ppm, V2 grade:- Phosphorous content 2 500 ppm; and V3 grade:- Phosphorous content 1 500 ppm.

FLAME RETARDANT PRODUCTS = ПРОДУКТЫ РЕТАРДАНТЫ ВОСПЛАМЕНЕНИЯ (или ПРОДУКТЫ, ЗАДЕРЖИВАЮЩИЕ ВОСПЛАМЕНЕНИЕ) – Flame Retardant Products in context of Oeko-Tex Standard 100 are those active chemical products that are used with the intention to reduce the flammability and/or combustibility. When using flame retardant products it is distinguished between fiber materials which receive the flame retardant properties in the spinning mass already (copolymers, additives) and a finish with flame retardant products in a later processing step. Fiber materials with flame retardant properties are accepted for a certification according to Oeko-Tex Standard 100, product classes I to III, when an assessment by Oeko-Tex reveals, that these fibers may be used from a human-ecological point of view without any restrictions. Finishes with flame retardant products are accepted within a certification according to Oeko-Tex Standard 100, product classes I to III, when a thorough assessment by Oeko-Tex from a human-ecological point of view has shown that the finish carried out according to the recommendations of the manufacturer of the product are harmless to the human health. See also Active Chemical Products, Biological Active Products, and Oeko-Tex Standard 100.

FLAME–SPREAD RATING = РЭЙТИНЬГ РАСПРОСТРАНЕНИЯ ПЛАМЕНИ (или РЭЙТИНЬГ РАЗРАСТАНИЯ ВОСПЛАМЕНЕНИЯ) – Flame-Spread Rating is an index or classification indicating the extent of spread of flame on the surface of a material, or an assembly of materials, as determined in a standard fire test as prescribed in the building codes. / .

FLAMMABILITY = ВОСПЛАМЕНЯЕМОСТЬ – Flammability is the ability of a textile to burn under specified test conditions.

FLAMMABILITY TESTS = ИСПЫТАНИЯ НА ВОСПЛАМЕНЯЕМОСТЬ (или ТЕСТЫ НА ВОСПЛАМЕНЯЕМОСТЬ) – Flammability Tests:- many procedures have been developed for assessing the flame resistance of textiles. The most common currently in use are detailed below:- (i) Diagonal (45°) Flame Test:- in this test for flame resistance, a specimen is mounted at a 45° angle and exposed to

an open flame for a specific time; the test measures the ease of ignition and the rate of burning; (ii) Horizontal Flame Test:- a test for flame resistance in which a specimen is mounted in a horizontal holder and exposed to an open flame for a specific time to measure the burning rate and char-hole diameter; (iii) Methenamine Pill Test; (iv) Mushroom Apparel Flammability Test; (v) Radiant Panel Test; (vi) Smoke Chamber Test; (vii) Tablet Test; (viii) Thermo-Man; (ix) Tunnel Test; and (x) Vertical Flame Test:- a test for flame resistance in which a specimen is mounted in a vertical holder and exposed to an open flame for a specific time; the open flame is then extinguished and continued flaming time and char-length of the sample are measured.

FLAMMABLE = ВОСПЛАМЕНЯЕМОЕ (или ОГНЕОПАСНОЕ, или ВОСПЛАМЕНЯЮЩЕЕСЯ) – Flammable:- capable to be set on fire under given circumstances. / Способное к воспламенению в данных обстоятельствах.

FLANGE = ФЛАНЕЦ – Flange is a ring welded onto the end of a pipe. It is used with its counterpart to join pipes. The rings are provided with drilled holes through which the pipes can be bolted together. / Плоское кольцо, приваренное на конце трубы. Он используется с аналогичной соединительной частью другой трубы с целью обеспечения герметичности и прочности их соединения. Фланцы имеют отверстия под болты или шпильки, с помощью которых две трубы прочно притягиваются одна к другой. Под Фланцем, от Немецкого слова Flansch, понимается соединительная часть труб, арматуры, резервуаров, валов и так далее, выполняемая, как правило, заодно с основной деталью; обычно плоское кольцо или диск с равномерно расположенными отверстиями под болты или шпильки. Обеспечивает герметичность или (и) прочность соединения. В трубах и резервуарах фланцы с уплотнением обеспечивают герметичность внутренних полостей; фланцы валов и аналогичных вращающихся деталей обеспечивают надлежащую прочность для передачи усилий.

FLANGE CRIMPING = ФЛАНЦЕВАЯ ИЗВИТОСТЬ – Flange Crimping is a simultaneous crimping of two ends of yarn by using heated snubber pins, then combining both ends on a draw roll after they contact a rubber flange on the draw roll.

FLANNEL = ФЛАНЕЛЬ – Flannel is a cotton cloth, originating in Wales, that is napped on one or both sides to imitate wool flannel. It is heavier than flannelette and is often called Canton Flannel. Simple twill weaves are used to make the cloth, which is featured by a soft-spun filling to give a good nap, sized warp, and a light, well-twisted warp yarn. The dull finish tends to canceal the weave. The cloth comes in blue, white, and fancy effects, chiefly in stripe form. There is considerable variance in the weight and texture of flannel. The fabric is finished from 30 to 39 inches, made of 14's to 22's yarn, with textures ranging from 48 to 62 by 48 to 58. Flannel is used for dresses, imitation serge, nightwear, outing material, shirting, skirting, and slacks. There is also baby flannel. Flannel is the mediumweight plain- or twill-weave, slightly napped fabric, usually of wool or cotton, but may be made of other fibers. Flannel is a medium-weight, plain or twill weave fabric that is typically made from cotton, a cotton blend, or wool. The fabric has a very soft hand, brushed on both sides to lift the fiber ends out of the base fabric and create a soft, fuzzy surface. End-uses include shirts and pajamas. Traditionally, flannel is an all-wool fabric of plain or twill weave with a soft handle. Flannel:- soft twilled wool or worsted fabric with a loose texture and a slightly napped surface; a plain or twill woven cotton fabric napped and of soft yarns simulating the texture of wool flannel; a stout cotton fabric usually napped on one side. (Plural) flannel underwear; outer garments, especially men's trousers, of flannel, namely soft twilled wool, cotton, or worsted fabric with a loose texture and a slightly napped surface. The cotton flannel must be made from cotton with a fiber long enough to hold in the yarn, otherwise the fibers will shed from the flannel or pill into little balls on the surface. Flannel is a soft, woven fabric of varying fineness. It usually doesn't have a nap, and instead, gains its softness through the loosely spun yarn it is woven from. It is commonly used to make clothing, bedsheets and sleepwear. / Под Фланелью, от Французского слова Flanelle, понимается мягкая хлопковая или шерстяная ткань с двусторонним начёсом. Из фланели шьют бельё, женское или детское платье, мужские рубашки и тому подобное. Фланель – мягкая лёгкая хлопчатобумажная или шерстяная ткань с начёсанным ворсом; вырабатывается полотняным или саржевым переплетением нитей. Шерстяная фланель используется для пошива костюмов и пальто, хлопчатобумажная – для тёплого женского и детского платья, халатов, белья. Существует много сортов фланели, имеющих специальные названия, например, Турецкий сорт – галгас.

FLANNELETTE = БАЙКА (или ФЛАНЕЛЕТ) – Flannelette is a medium-weight, plain weave fabric with a soft hand, usually made from cotton. The fabric is usually brushed only on one side, and is lighter weight than flannel. End-uses include shirts and pajamas. Flannelette is a cotton flannel, soft material with a napped finish, usually only on one side. It may be bleached, dyed, printed, or woven in colored stripes. Plain and twill weave. / Под Байкой, от Польского слова Байка (Bajka), от Голландского слова Бай (Baai), понимается мягкая, плотная хлопчатобумажная или шерстяная ткань с густым начёсанным ворсом. Из хлопчатобумажной байки шьют тёплое бельё, женскую или детскую одежду; из шерстяной – демисезонное пальто. Дорогие сорта шерстяной байки были очень популярны в период расцвета Английской моды в России 1840-х, особенно для пошива мужских пальто и спортивной одежды.

FLAP = ОТКИДНОЙ БОРТ (или ОТВОРОТ) – Flap is a collapsible rail/ramp for moving loads into the belly of the ship.

FLAP LIP = ОТКИДНАЯ КРОМКА – Flap Lip is a flexible projection of the top deck of a paper pallet, intended for load retention purposes. See also Pallet. / Откидная Кромка:- съёмный выступ верхнего настила, предназначенный для крепления ограждающих приспособлений, поддерживающих груз. Смотрите также Поддон (Pallet).

FLAPPER = ФАЛДА (или КЛАПАН, или ПОЛА) – Flapper is the movable side of a fiber-crimping chamber that periodically opens or flaps to permit crimped fiber to be expelled from the chamber.

FLARE = РАСПУШИВАНИЕ (или БОРТ (чулка или костюма), или РАЗДВИЖКА) – Flare:- the spreading of the filament ends or the strand ends at the cut end of a cord.

FLARED NATURAL GAS = СЖИГАЕМЫЙ В ФАКЕЛЕ ПРИРОДНЫЙ ГАЗ – Flared Natural Gas is a gas disposed of by burning in flares usually at the production sites or at gas processing plants. Natural gas burned in flares on the base site or at gas processing plants.

FLARING = СЖИГАНИЕ В ФАКЕЛЕ (или ФАКЕЛЬНЫЙ ВЫБРОС) – Flaring is the burning off of gas produced in association with oil due to technical or economic reasons, prohibiting re-injection or shipment. Flaring is the controlled burning of natural gas that cannot be processed for sale because of technical or economic reasons. The biggest portion is solution gas flaring, which involves the burning of natural gas produced along with crude oil and bitumen. Flaring contributes primarily to emissions of sulphur dioxide and greenhouse gases. Depending on the combustion efficiency of the flare, there may be other compounds produced in very small quantities, some of which are considered to be toxic. / Факельный Выброс – устройство для отведения вредных примесей, имеющихся в технологических и вентиляционных газах, на большую высоту с тем, чтобы эти примеси при приближении к приземному пространству (на высоте 1.5–2 метров от поверхности земли) рассеивались бы атмосферным воздухом до предельно допустимых концентраций. В факельном выбросе вентилятор нагнетает в атмосферу газы, содержащие вредные вещества, через суживающийся к выпускному отверстию конический патрубок (конфузор) со скоростью до 20–30 метров в секунду (м/с).

FLASH ADHERING TO BUTTON = ХХ К ПУГОВИЦЕ – Flash Adhering To Button:- vitally important not to have sharp edges if automatic feed is used. Closure defects, and namely – Plastic Buttons. / Порок или дефект застёжки.

FLASH AGEING = ПОКАЗНОЕ СТАРЕНИЕ – Flash Ageing is a process for rapid reduction and fixation of vat dyes obtained when the printed fabric is padded with caustic soda and sodium hydrosulfite and immediately steamed in air-free steam.

FLASH EXTRUSION = ЭКСТРУЗИЯ ВСПЫШКОЙ (или ВЫДАВЛИВАНИЕ ВСПЫШКОЙ, или ВЫТАЛКИВАНИЕ ВСПЫШКОЙ) – Flash Extrusion is the process in which a fiber-forming substance in a volatile solvent is extruded from a high-temperature, high-pressure environment into lower temperature and pressure conditions, causing the solvent to rapidly evaporate, leaving a lacy, net-like fabric. / Экструзия или Выдавливание (Extrusion).

FLASH FLOOD = ЛИВНЕВЫЙ ПАВОДОК – Flash Flood is a rapid surge of flooding that subsides after several days and lasts no longer than 10–12 days. / Под Паводком понимается сравнительно кратковременное и непериодическое поднятие уровня воды, возникающее в результате быстрого таяния ледников, снега, обильных дождей. Следующие один за другим могут образовать половодье. Значительный паводок может вызвать наводнение.

FLASH POINT = ТОЧКА ВСПЫШКИ (или ТЕМПЕРАТУРА ВСПЫШКИ) – Flash Point (Cleveland Open Cup) is the temperature to which a combustible liquid must be heated to give off sufficient vapor to form momentarily a flammable mixture with air when a small flame is applied under specified conditions. (ASTM Designation D 92). American Society for Testing and Materials (ASTM). Flash Point of oil can be defined as the lowest temperature at which the oil will give off sufficient inflammable vapour to produce a flash when a small flame is brought to the surface of the oil. Flash Point is a minimum temperature at which a fluid will support instantaneous combustion, but before it will burn continuously. The flash point is an important indicator when determining the fire and explosion hazard of a petroleum product. Flash Point is the lowest temperature at which a commodity produces enough vapor to form a flammable mixture with air. / Точка Вспышки (по методу Открытого Тигля Кливлэнда) Американское Общество по Испытаниям и Материалам (АОИМ). Точка Вспышки или Температура Вспышки – наименьшая температура испытуемого образца, скорректированная на барометрическое давление 101.3 кПа, при которой при поднесении источника зажигания происходит воспламенение паров образца и распространение пламени на поверхности жидкости при установленных условиях испытания. Наименьшая температура, при которой сырьё выделяет достаточное количество испарения чтобы в воздухе сформировалась самовозгораемая смесь. При повышении температуры из масла выделяются пары, которые при поднесении открытого огня вспыхивают. Это значение температуры называется Температурой Вспышки. Температура Вспышки отражает степень огнеопасности жидкости. Температура вспышки – это температура, при которой происходит испарение такого количества горючих газов, которое может вызвать вспыхивание при поднесении открытого огня, но жидкость при этом не горит. Вспышка, воспламенение смеси воздуха с парами жидкости (или твёрдого вещества) без загорания самой жидкости. Вспышка происходит при соприкосновении паровоздушной смеси с пламенем или раскалённым телом, а также при проскакивании электрической искры. Вспышка может произойти только в том случае, если состав паровоздушной смеси находится между нижним и верхним пределами воспламенения (смотрите Взрыв). Температура Вспышки, то есть наиболее низкая температура жидкости, при которой возможно воспламенение находящейся над ней смеси её паров с воздухом, является важной характеристикой, применяемой для определения огнеопасности жидкостей, в том числе различных топлив и смазочных масел. Температуры Вспышки некоторых веществ:- этилового эфира –41 °C, бензола –12 °C, толуола 6.5 °C, керосина 28 °C, вазелинового масла 135 °C, машинного масла 170 °C, цилиндрового масла 210 °C.

FLASH SPINNING = ПРЯДЕНИЕ ВСПЫШКОЙ – Flash spinning is a specialised technique for producing very fine fibers without the need to make very fine spinneret holes. It is used in making only two fabric types. Flash spinning depends on the fact that the intramolecular bonds in polyethylene and polypropylene are much weaker than similar bonds in polyester and polyamide. When a thin sheet of polyolefin is very highly drawn (10 or 12 to 1) the molecules align in the direction of drawing giving high strength in that direction, but across the drawing direction the strength is based only on the intramolecular bonds and so is very low, so low that any mechanical action such as bending, twisting or abrasion causes the sheet to split. Depending on the original thickness of the sheet and the amount of splitting, the result may be fiber-like but with a rectangular cross-section. The process is known as Fibrillation. In flash spinninh the polymer is dissolved in a solvent and is extruded as a sheet at a suitable temperature so that when the pressure falls on leaving the extruder the solvent boils suddenly. This blows the polymer sheet into a mass of bubbles with a large surface area and consequently with very low wall thickness. Subsequent drawing of this sheet, followed by mechanical fibrillation, results in a fiber network of very fine fibers joined together at intervals according to the method of production. This material is then laid to obtain the desired mass per unit area and directional strength. Flash-spun material is only bonded in two ways, so that it seems sensible to discuss both the bonding and the products at this juncture. One method involves melting the fibers under high pressure so that virtually all fibers adhere along the whole of their length and the fabric is almost solid with very little air space. This method of construction makes a very stiff material with high tensile and tear strengths. It is mainly used in competition with paper for making tough waterproof envelopes for mailing important documents and for making banknotes. The fact that the original fibers were very fine means that the material is very smooth and can be used for handwriting or printing. The alternative method of bonding is the same, that is, heat and pressure but is only applied to small areas, say 1 mm square, leaving larger areas, say 4 mm square, completely unbounded. The bonded areas normally form a square or diagonal pattern. This material, known as Tyvek, has a lower tensile strength than the fully bonded fabric, but has good strength and is flexible enough to be used for clothing. Because the fine fibers leave very small pores in the fabric, it is not only waterproof but is also resistant to many other liquids with surface tensions lower than water. The presence of the pores means that the fabric is permeable to water vapour and so is comfortable to wear. Tyvek is used principally for protective clothing in the chemical, nuclear and oil industries, probably as protection for the armed forces and certainly in many industries not requiring such good protection but where it is found to be convenient. The garments can be produced so cheaply that they are usually regarded as disposable. Flash Spinning is a process for producing plexifilamentary products by spinning from a solution of a primary solvent selected from the group consisting of methylene chloride and 1,2-dichloroethylene and a co-solvent, and a spin solution of a polyolefin dissolved in a primary solvent selected from the group consisting of methylene chloride, and 1,2-dichloroethylene, and a co-solvent. See also Spinning. / пузырь (bubble).

FLAT = БЛЁКЛОЕ (или ТУСКЛОЕ, или ПРИТУПЛЁННОЕ, или ПЛОСКОЕ, или РОВНОЕ, или ГЛАДКОЕ) – Flat:- (1) of a coating material, a material that is capable of imparting a finish free of gloss. (2) Of a surface finish, free of gloss.

FLAT = ПЛОСКОЕ (или ГОРИЗОНТАЛЬНОЕ, или ФЛЭТ, или РОВНОЕ, или ПОЛОГОЕ, или БЕЗ ИЗМЕНЕНИЙ, или БЕЗ ОТКЛОНЕНИЙ, или НЕОЖИВЛЁННОЕ, или ВЯЛОЕ, или ЗАТИШЬЕ) – (1) A term Flat is:- (1) describing a stock or other security that is neither rising nor falling in price; (2) in foreign exchange, having no position. That is, an investor is flat if he/she has neither bought nor short sold a given currency; and (3) describing a bond that trades without interest that has accumulated since the last coupon payment. It is fairly unusual for bonds to trade flat, as the buyer is normally expected to compensate the seller for the next coupon that the seller will no longer receive from the issuer. However, bonds in default trade flat. Flat, or Flatness, describes an object

or condition that is very smooth or level. In Great Britain and Ireland, a Flat means exactly the same as an apartment. Flat:- (i) in convertibles:- earning interest on the date of payment only; (ii) in general:- having neither a short nor a long position in a stock; Clean; (iii) in market:- characterized by horizontal price movement, usually the result of low activity; and (iv) in equities:- to execute without commission or markup. Flat:- having a relatively smooth or even surface. Flat is:- (1) a price that is neither rising nor declining. If a stock over the last month has been trading around USD30, it can be thought of as trading flat. (2) In forex, the condition of being neither long nor short in a particular currency. Also referred to as 'Being Square'. If you had no positions in the US Dollar or your long and short positions canceled each other out, you would be flat or have a flat book. (3) A bond that is trading without accrued interest. A bond is trading flat if the buyer of the bond is not responsible for paying the interest that has accrued since the last payment (accrued interest is usually part of the bond purchase price). Bonds that are in default trade flat. Flat:- (1) of, relating to, or being a market maker's inventory position that is neither long nor short; that is, the inventory is zero; and (2) of, relating to, or being a bond that trades without accrued interest. For example, bonds of a company in bankruptcy proceedings trade flat. A bond trading flat is indicated in bond transaction tables by the symbol f. / Биржевой термин, обозначающий без калькуляции процентов, то есть проценты уже включены в курс акций.

(2) Flat:- commercially inactive; sluggish, i.e. not progressing or increasing; or progressing slowly. For example:- 'flat sales for the month'; 'prices remained flat'; 'a flat market'. / В торговых сделках означает качество 'как есть' (as is), без дополнительных уточнений.

(3) Flat:- commercially inactive; also characterized by no significant rise or decline from one period to another, e.g., sales were flat. / Применительно к рынку:- боковик, консолидированный (невыгодный), нулевой, без дохода, в затишьи. Период времени, при котором цена не повышается и не падает, обычно его относят к коррекции или тенденции к 'боковику'.

(4) Flat:- in bond trading, without accrued interest.

(5) Flat:- to be flat is to be neither long or short, or to have no positions, or if all the positions held cancel each other out. Also known as Square. Inventory of market maker with net zero position (neither long nor short).

(6) Flat:- underwriter's position if all securities are sold from inventory.

(7) Flat:- position in foreign exchange market where buying commitments are equal to selling commitments (squared position).

FLAT = ШЛЁПАНЕЦ – Flat:- a shoe or slipper having a flat heel or no heel. / heel = каблук или пятка.

FLAT = ШЛЯПКА – In carding, Flat is one of the parts forming an endless chain that partially surrounds the upper portion of the cylinder and gives the name to a revolving flat card. Flats are made of cast iron, Tshaped in section, about 1 inch wide, and as long as the width of the cylinder. One side of the flat is nearly covered with fine card clothing, and the flats are set close to the teeth of the cylinder so as to work point against point. A chain of flats contains approximately 110 flats and operates at a surface speed of about 3 inches per minute.

FLAT = FLAT RACK

FLAT ABRASION TESTER = ТЕСТЁР ПО ИСТИРАНИЮ ПЛОСКОСТЬЮ – Flat Abrasion Tester:- this tester can be used as a supplementary equipment for professional physical performance examination in industries of pigment, coating and printing ink. The structure of the whole instrument is compact with simple appearance. It is convenient to adjust rotation speed and load. It is also simple and convenient to dismantle the glass plate. Meanwhile it adopts single chip microcomputer to autocontrol with distinct digital display. Parameter settings are convenient and reliable. See also Stoll-Quartermaster Universal Wear Tester. Factors Affecting Abrasion Test Results:- during testing, the resistance to abrasion is also greatly affected by the conditions of the tests, such as the nature of the abradant, variable motion of the abradant over the area of specimen, the tension of the specimen, the pressure between the specimen and the abradant, and the condition of the specimen (wet or dry). The type of abrasion like flat, flex or edge abrasion or a combination of more than one affect the test results as expected. In many fabrics the abrasion resistance in the warp direction differs from that of the weft direction. Ideally the rubbing motion used by an abrasion machine should be such as to eliminate directional effects. In Jacquard and textured fabrics, the test sample should include both the textured and different parts, sensitive to abrasion. Abradants can consist of anything that will cause wear. A number of different abradants have been used in abrasion tests including standard fabrics, abrasive paper (glass paper, sand paper, etc) or stones (aluminum oxide or silicon carbide), steel plates and metal 'knives'. The nature of abradants and the type of action control the severity of the test. For the test to correspond with actual wear in use it is desirable that the abrasive should be similar to that encountered in service. The abradant itself wear during the test so they should be replaced after a certain usage time. Abrasion tests are all subject to variation due to changes in the abradant during specific tests. The abradant must accordingly be discarded at frequent intervals or checked periodically against a standard. With disposable abradants, the abradant is used only once or discarded after limited use. With permanent abradants that use hardened metal or equivalent surfaces, it is assumed that the abradant will not change appreciably in a specific series of tests. Similar abradants used in different laboratories will not change at the same rate, due to differences in usage. Permanent abradants may also change due to pick up of finishing or other material from test fabrics and must accordingly be cleaned at frequent intervals. The measurement of the relative amount of abrasion may also be affected by the method of evaluation and may be influenced by the judgment of the operator (ASTM D 3884). The pressure between the abradant and the sample and the test speed affects the severity and rate at which abrasion occurs. It has been shown that using different pressures can seriously alter the ranking of a set of fabrics when using a particular abradant. Excessive pressure and testing speed can result in shorter testing time but however, the results can not simulate the normal usage conditions. The tension of the mounted specimen is also important, and it should be same for all samples. Tension during the test is provided by backing foam or inflated diaphragm. See also Abrasion. American Society for Testing and Materials (ASTM). / Американское Общество по Испытаниям и Материалам (АОИМ). Жакяр (Jacquard).

FLAT BED = МОДУЛЬ (или БЕЗБОРТОВАЯ ПЛАТФОРМА) – Flat Bed is a wheeled trailer or a semi-trailer with a flat cargo carrying surface or deck and without any superstructure. Truck designed to haul heavy or oversized non-containerisable cargo. A Flat Bed is a semi-trailer with no sides and with floor of unit at a standard height from the ground.

FLAT BED TRAILER = БЕЗБОРТОВЫЙ ПРИЦЕП–ПЛАТФОРМА – Flat Bed Chassis is a semi-trailer with a level bed and no sides or tops. A wheeled trailer or a semi-trailer with a flat cargo carrying surface. Flat Bed Trailer is a wheeled trailer or a semi-trailer with a flat cargo carrying surface or deck and without any superstructure.

FLAT CANCELLATION = БЕЗУСЛОВНАЯ ОТМЕНА – Flat Cancellation is a cancellation of an insurance policy as of the date of its start with no premium charge. / Отмена страхового полиса начиная с даты его начала, в случае неполучения причитающейся страховой премии.

FLAT CAR = (БЕЗБОРТОВЫЙ) ВАГОН–ПЛАТФОРМА – Flat Car is a rail car without a roof and walls. Railroad car on which container or container/chassis is placed. / Платформа – грузовой вагон открытого типа с небольшими бортами; с расширением специализации вагонов применяются платформы для большегрузных контейнеров, двухъярусные платформы для перевозки легковых автомобилей и другие.

FLAT CARD = КАРДОЧЁСАЛЬНАЯ МАШИНА СО ШЛЯПКАМИ – Flat Card is the type of card used for cotton fibers and for cotton-system processing. It is named for the flat wire brushes called Flats that are assembled on an endless chain that partially surrounds the main cylinder. The staple is worked between the flats and cylinder, transferred to a doffer roll, and peeled off as a web that is condensed into a sliver. See also Flat.

FLAT CRÊPE = ГЛАДЬЕВОЙ КРЭП – Flat Crêpe is a firm, medium-weight silk crêpe with a soft, almost imperceptible crinkle. It has crêped fillings alternating with two S and two Z twists. The surface is fairly flat. Flat crêpe may also be made of man-made fibers. It is used for dresses, negligees, and blouses. See also Crêpe De Chine. Flat Crêpe:- also called French Crêpe or Lingerie Crêpe but not exactly the same. It is the flattest of all the crêpes with only a very slight pebbled or crêpe effect hard twist alternating 25 x 22 in filling; warp has ordinary twist. It is very soft and pliable, which makes it good for draping. It is very light weight – 2 times as many ends as picks. It may be white, colored, or printed. Most of it launders well. / уточина. Смотрите также Крэп Дё Шин (Crêpe De Chine).

FLAT DUCK = ГЛАДКОЕ ГРУБОЕ ПОЛОТНО (или ГЛАДКАЯ ПАРУСИНА, или ПОЛУДВУНИТКА) – Flat Duck is a compact, firm, heavy, plain-weave fabric. Flat duck has a warp of two singles yarns woven as one and a filling either singles or plied yarn. See also Duck. / (Duck). и уточина либо . Ткань Полудвунитка. Duck = Грубое Полотно; Парусина; Техническая Тяжёлая Ткань из однониточной хлопчатобумажной пряжи; Ткань Цвета Суровья.

FLAT GAS = НЕИЗМЕННЫЙ ГАЗ – Flat Gas is a gas purchased with zero swing and 100% take-or-pay. See also Swing, and Take-Or-Pay. / Неизменный Газ это газ, приобретённый на условиях нулевого колебания спроса предложения и забирай-или-плати по всем 100%. Смотрите также Зависание или Колебание (Swing), Забирай-Или-Плати (Take-Or-Pay).

FLAT INCOME BOND = ОБЛИГАЦИЯ БЕЗ ДОХОДОВ (или ОБЛИГАЦИЯ С НЕИЗМЕННЫМ ДОХОДОМ) – A term Flat Income Bond means that the price at which a bond is traded includes consideration for all unpaid accruals of interest. Bonds that are in default of interest or principal are traded flat. Income bonds that pay interest only to the extent earned are usually dealt in 'and interest', which means that the buyer pays to the seller the market price plus interest accrued since the last payment date.

FLAT–KNIT FABRIC = ПЛОСКОВЯЗАНАЯ ТКАНЬ – Flat-Knit Fabric is:- (1) a fabric made on a flat-knitting machine, as distinguished from tubular fabrics made on a circular-knitting machine. While tricot and milanese warp-knit fabrics (non-run) are knit in flat form, the trade uses the term flat-knit fabric to refer to weft-knits fabrics made on a flat machine, rather than warp-knit fabrics. (2) A term used in the underwear trade for plain stitch fabrics made on a circular-knitting machine. These fabrics have a flat surface and are often called Flat-Knit Fabrics to differentiate them from ribbed-knit or Swiss rib fabrics. In this case, the term refers to the texture, not the type of machine on which the fabric was knit. Flat Knit or Jersey Knit fabrics have visible flat vertical lines on the front and dominant horizontal ribs on the back of the fabric. The flat or Jersey knit stitch is used frequently because it is fast, inexpensive, and can be varied to produce fancy patterned fabrics. A major disadvantage of regular flat knits is their tendency to 'run' if a yarn is broken. However, a variation of the stitch will create run-resistant flat knits. The flat or Jersey stitch can be varied by using different yarns or double-looped stitches of different length to make terry, velour, and plus fabrics. This stitch is also used in making nylon hosiery, men's underwear, and T-shirts. / Найлан (Nylon).

FLAT KNITTING = ГЛАДКИЙ ТРИКОТАЖ (или ПЛОСКОВЯЗАЛЬНЫЙ) – Flat Knitting:- the fabric is produced on the knitting machine in flat form, the threads alternating back and forth across the fabric. The fabric can be given shape in the knitting process by increasing or decreasing loops. Full-fashioned garments are made on a flatknitting machine. See also Flat-Knit Fabric, and Knitting.

FLAT–KNITTING MACHINE = ПЛОСКОВЯЗАЛЬНАЯ МАШИНА – Flat-Knitting Machine is a weft-knitting machine with needles arranged in a straight line in a flat plate called the Bed. The yarn travels alternately back and forth, and the fabric may be shaped or varied in width, as desired, during the knitting process. Lengthwise edges are selvages. Flat-knitting machines may be divided into two types:- latch-needle machines for sweaters, scarves, and similar articles and fine spring-needle machines for full-fashioned hosiery.

FLAT LAND = РОВНАЯ (или РАВНИННАЯ, или ПЛОСКАЯ) ЗЕМЛЯ – Flat Land is the low-lying flat areas or a plain where Rice grows.

FLAT MARKET = ПЛОСКИЙ РЫНОК (или ВЯЛЫЙ РЫНОК, или РЫНОК В ЗАТИШЬИ, или НЕИЗМЕННЫЙ (или СКУЧНЫЙ, или МОНОТОННЫЙ, или НЕИНТЕРЕСНЫЙ, или ПОДАВЛЕННЫЙ, или УГНЕТЁННЫЙ, или ВЫДОХШИЙСЯ) РЫНОК) – Flat Market is a market in neither an uptrend nor a downtrend. That is, the securities in a flat market are relatively constant in price, at least for a certain period of time. A market may be flat while investors wait to hear some relevant information, such as an earnings report. A flat market is sometimes associated with low trading volume. It is also called a Sideways Market or a Deer Market. Flat Market is a securities market in which there has been no tendency either to rise or to fall significantly. Also called Sideways Market. / Вялый Рынок – рынок, на котором фиксируется небольшое число сделок при некоторой понижательной тенденции цен. Вялый Рынок – рынок, характеризующийся горизонтальным движением цен (horizontal price movement). Обычно это является результатом низкой активности. Однако такие ситуации, как стабилизация (stabilization), консолидация, распределение (distribution), также характеризуются горизонтальным движением цен и активным ведением торговых операций.

FLAT(S) = FLAT STRIPS

FLAT or HARNESS MISDRAW = XX или XX – Defect Name:- Flat or Harness Misdraw. Defect Type:- warp lines, vertical lines. Fabric Type:- Shirting and Dress Goods – Chambray, and Plain Weave. Description:- Flat or Harness Misdraw:- This harness misdraw results in two ends weaving as one and opposing two other ends weaving as one. This is commonly referred to as a 'Flat'. Severity:- Major.

FLAT or RUNNING YIELD = ТЕКУЩАЯ или НАБЕГАЮЩАЯ ДОХОДНОСТЬ – Flat or Running Yield:- defined as the interest (coupons) payable in a year on the fixed interest stock/security divided by the current price of the stock/security, e.g., if £6 is the fixed interest (coupons) payable in a year on £100 nominal of the stock/security and the current price is £95 per £100 nominal then the flat or running yield is 6/95 = 0.063 16 or 100 x 6 / 95 = 6.316% in percentage terms. Contrast with the Redemption Yield.

FLAT PACKING = ПЛОСКАЯ УПАКОВКА (или РОВНАЯ УПАКОВКА, или ПОДОГНАННАЯ УПАКОВКА) – Flat Packing:- cargo to presented stacked and secured as an integral unit.

FLAT PALLET = ПЛОСКИЙ ПОДДОН – Flat Pallet is a pallet with a top deck without a raised superstructure. / Плоский Поддон:- поддон с настилом без надстроек.

FLAT PLANTING = ПОСАДКА ПО РОВНОЙ ПОВЕРХНОСТИ – Flat Planting is a method of planting in which the seed is planted on harrowed, dragged, or plowed flat land with a planter that causes minimum disturbance to the smooth surface. / сеялка точного высева (planter).

FLAT PROPERTY = КВАРТИРНАЯ СОБСТВЕННОСТЬ – Flat Property:- in the United Kingdom, ownership of an entire floor of a building or of a particular apartment (flat) within a multifamily dwelling. Mortgages may be obtained for the acquisition of condominiums similarly to mortgages for entire properties. Also known as Condominium Ownership Of An Apartment in the United States.

FLAT RACK = ПЛОСКАЯ ПОДСТАВКА (или КОНТЕЙНЕР НА БАЗЕ ПЛАТФОРМЫ) – Flat Rack is a 20, 35 or 40 foot container with no sides or frames at the front and rear of container used for loading machinery and heavy equipment by side loading. Available in a variety of sizes and models. Flat racks are used for lumber, mill products, large/heavy/bulky items, machinery and vehicles. Some are equipped with removable sides. A container with no sides and frame members at the front and rear. Container can be loaded from the sides and top. A steel tray used to carry unitized cargo. A flat bed 20' op 40' container with fixed or collapsible ends suitable for the carriage of cargo of excessive width and plated for carriage of heavy loads. Flatrack (flat) is a container without side walls and roof, with fixed or collapsible end walls. / Плоская Подставка – контейнер без бортовых стен и крыши, с закреплёнными или сборными концевыми стенками.

FLAT RACK CONTAINER = КОНТЕЙНЕР В ФОРМЕ ПЛОСКОЙ ПОДСТАВКИ (или КОНТЕЙНЕР НА БАЗЕ ПЛАТФОРМЫ) – Flatracks are especially suited to heavy loads or cargo that needs loading from the top or sides, such as pipes and machinery. There are collapsible and non-collapsible containers with or without walls. Manufactured from steel. Flat Rack Container is a container with no sides and frame members at the front and rear. Such container can be loaded from the sides and top. Flat Rack Containers are especially suitable for heavy loads and cargo that needs loading from the top or sides, such as pipes and machinery. You will find collapsible containers and non-collapsible containers with or without walls. Flat rack containers are manufactured from steel and come in 20' and 40' sizes. Specific dimensions and capacity of flat rack containers may vary depending on the container manufacturer, the age of the container and the container owner. / Контейнер без бортовых стен и элементов рамы спереди и сзади. Такой контейнер может быть загружен как сбоку, так и сверху.

FLAT RATE = ПЛОСКАЯ СТАВКА (или ПРОСТАЯ СТАВКА) – In reinsurance, a Flat Rate is a percentage rate applied to a ceding company's premium writings for the classes of business reinsured to determine the reinsurance premiums to be paid the reinsurer. A Flat Fee, also referred to as a Flat Rate or a Linear Rate, refers to a pricing structure that charges a single fixed fee for a service, regardless of usage. Rarely, it may refer to a rate that does not vary with usage or time of use. Another term used is 'Flate', a hybrid of 'Flat' and 'Rate'.

FLAT–RATE FORWARDS = ФОРВАРДЫ НА ПЛОСКУЮ СТАВКУ – Flat Rate Forward:- in this contract the producer sells its production forward in stages over an agreed time period. For example, the producer may agree a contract with a 12-month final maturity with the gold being delivered every 3 months. Under normal forward pricing theory this would involve a different price for each settlement. However, as the product name suggests, the contract is structured in such a way each of the four deliveries takes place at a single forward price. The single price is based on the weighted average of the forward prices at each settlement date. The calculation is the sum of the forward rates at each of the delivery dates weighted by a discount factor of the same maturity, all divided by the sum of the discount factors. Flat-Rate Forwards are forward contracts offering a constant contango throughout the life of the contract. A forward contract in which the contango is partly payable in advance. This transaction is also known as a Flat Rate Forward or Stabilized Contango.

FLAT RATE TAX = НАЛОГ ПО ПЛОСКОЙ СТАВКЕ – Flat Rate Tax:- private investment income taxation procedure at source. The levy is independent from the personal tax rate of the taxpayer. By deduction of the flat rate tax the investment income tax obligation of the taxpayer is met. This method was introduced in Germany on 01 January 2009. Until then the withholding tax on interest income was applied.

FLATSPOTTING = ОБРАЗОВАНИЕ ПЛОСКИХ УЧАСТКОВ – Flatspotting is a characteristic of certain tire cords. It occurs with all materials but is more noticeable with nylon cord and is associated with nylon cord by users. Nylon exerts a shrinkage force as it becomes heated in tire operation. When the tire is stopped under load, the cord in the road-contact portion of the tire is under less tension than that in other portions of the tire, and it shrinks to conform to the flat surface of the road. When cooled in this position, the cord maintains the flat spot until it again reaches its glass transition temperature in use. / Найлан (Nylon). Образование Плоских Участков на протекторе шины в результате проскальзывания или длительной стоянки.

FLAT STRIPS = ШЛЯПОЧНЫЕ ОЧЁСЫ (или ШЛЯПОЧНЫЕ СДИРЫ, или ШЛЯПОЧНЫЕ ОЧЁСКИ) – Flat Strips:- short, immature, and waste fibers stripped from the revolving flats on a cotton card. This waste is wound into a lap form and is used for manufacturing rope and spindle banding. A flat-top card produces Flat Strips that are removed from the flats as they leave the proximity of the cylinder. These strips are accumulations of short, damaged, and usually unwanted fibers mixed with some good ones. Flat Strips:- cotton flat is a by product derived from the yarn spinning industry-produced in the first carding machine. When compared to comber noil; this cotton waste contains a high level of trash. Flat upper carded waste has its best use as a blend with superior quality cotton in open-end spinning process. This is usually longer and has 3 categories when it comes to subject of specification:- (1) Flat A:- length – 20–26 mm, strength – 22+, trash – 4–6%, micronaire – 3.0–4.0; (2) Flat B:- length – 20–26 mm, strength – 22+, trash – 8–11%, micronaire – 3.0–4.0; and (3) Flat:- length – 20–26 mm, strength – 22+, trash – 15%, micronaire – 3.0–4.0. Flat-Strip Waste:- Cotton flat is a by-product of the yarn spinning industry produced in the first carding machine. The fiber has higher trash compared to comber Noil. It is mostly used in OE (open-end) spinning for blending with good quality cotton. / в виде холста и. В процессе работы гарнитура шляпок засоряется, образуется шляпочный очёс. Для его снятия на ходу машины устанавливается механизм очёсывания шляпок с пневматической системой удаления очёса. Количество шляпочного очёса на машине увеличивается с увеличением скорости главного барабана и шляпок. Под Веретеном или Шпинделем, от Немецкого слова Spindel, означающее Веретено, понимается .

FLATTENED NAP = СПЛЮЩЕННЫЙ ВОРС (или СПЛЮЩЕННЫЙ НАЧЁС) – Flattened Nap:- pressing on incorrect equipment. Machinery defects, and namely – Pressing Equipment. / Порок или дефект от машинного оборудования.

FLAT–TOP CARD = КАРДОЧЁСАЛЬНАЯ МАШИНА СО ШЛЯПКАМИ СВЕРХУ – A Flat-Top Card produces flat strips that are removed from the flats as they leave the proximity of the cylinder. These strips are accumulations of short, damaged, and usually unwanted fibers mixed with some good ones. Settings of the clearances between the cylinder and the co-operating surfaces are important. As the settings are reduced below the normal levels, the short fiber content of the fiber carried away by the flats increases. These wastes are often treated as non-reworkable. Fixed top cards produce no flat strips but do produce waste. Mote knives, gids, and/or screens under the cylinder allow waste to drop through, and there is also waste discharged from the licker-in. This non-

reworkable waste probably contains cotton dust harmful to the worker; therefore it is now the practice to remove the material pneumatically by automatic means. See also Flat Card.

FLAVESCENS = ФЛАВЕССЭНС (или ЖЕЛТЕЮЩЕЕ, или ЖЕЛТОВАТОЕ, или ЗОЛОТИСТО–ЖЁЛТОЕ) – Flavescens:- becoming yellow.

FLAVISPINA = ФЛАВИСПИНА (или ЗЛАТОШИПЧАТОЕ, или ЖЁЛТОШИПОВОЕ) – Flavispina:- with yellow spines.

FLAVOR = ПРИВКУС (или АРОМАТ, или ВКУС) – Flavor is the taste and smell of particular Rice varieties. / Под эстетическим Вкусом понимается способность человека к различению, пониманию и оценке эстетических явлений во всех сферах жизни и искусства. Формирование и развитие вкуса – задача эстетического воспитания.

FLAX = ЛЁН – Flax is an important type of bast fiber, the plant is called the Flax Plant and the product is called Linen. Flax is obtained from the plant stalk, which grows in many world areas. It is the oldest textile fiber known in the vegetable group and it may attain a length of about 40 inches. The name of the Plant is Linum Usitatissimum. The Plant is raised for two purposes, the fiber and the seed. The latter is known commercially as linseed, and it is used as linseed meal for animal feed, for birdseed, and in cake form in the chemical industry. The fibers are manipulated into yarn and cloth, and the fabric is used for tablecloths, napkins, doilies, runners, crash, toweling, suiting material, twine, canvas, aprons, shoe thread, fishing tackle and nets, cigarette paper, currency and bank-note paper, and similar products. The chief Flax-producing countries are Russia, which supplies 75 per cent of the world output; Belgium, which raises the best flax in the world; Ireland, where the best workmanship is found; the United States, Holland, South Africa, France, India, Japan, China, and Asia Minor. In the United States, Oregon is the leader for fiber and seed, while Kentucky, Michigan, Minnesota, Washington and Wisconsin are interested mainly in the seed. Fiber flax is sown about 85 to 100 pounds to the acre. The straws grow straight to a height of 30 to 40 inches. The seed branches are seen at the top only. The Oregon fiber is high in quality and compares favorably with the well-known Belgian thread fiber called Courtrai Stock. See also Linen. Flax is a Plant from which the cellulosic fiber linen is obtained. Flax (1924) is a slender annual Plant, the bast fiber of which is called Linen. The plants are pulled before ripe, retted (submerged in water until the woody parts of the stalk are decomposed), after which the straw is crushed, broken between rollers, scutched (causing the removal of the woody parts with revolving blades), and hackled (or drawn through iron combs). The fiber ranges from creamy to greenish or bluish color before bleached. The most important grades of the flax are:- (1) in Russia, the Motchenetz and Slanetz, the first containing the following Varieties:- Pochocon, Uglitz, Rieff, Jaropol, Stepurin. The Varieties of the Slanetz are called Bejetsky (usually best), Krasnoholm, Troer, Kashin, Gosposky, Nerechta, Wologda, Jaroslaw, Gresowetz, Kostroma. The Flax marketed through Riga, Dunabourg and Kowno is graded K, HK, PK, HPK, SPK, HSPK, ZK, GZK, HZK, RG. The Archangelsk (Russia) grades for dew retted bales are first, second, third, and fourth crown, and first and second zabrack. The marks for Dorpat and Pernau (Russia) flax are:- LOD, OD, D, HD, R, G. The marks for water retted Flax from Hoffs (Russia) are:- HD, PHD, FPHD, SFPHD, XHDX, XRX. The marks for Pskoff are:- OD, PWW, OW, O, OO, OOO, PI, PII, PIII. The marks for the Flax from Reval and Dorpat, exported in bobbins, are:- GR, HD, D, OD, OOD. The Petrograd marks are classed, comprising:- Fabrichny, Otbornoi, first crown, second crown; superior Siretz, comprising Polochno, Fabrichny, Otbornoi, first crown, second crown; medium Siretz; common Siretz, comprising Otbornoi, first crown, second crown. (2) The Koenigsberg, Germany, (now Kaliningrad City, Russia) marks are:- FWPCM, FGPCM,WPCM, LPCM, FPCM, PCM, P1, P2. (3) In Belgium, the Courtrai Flax is graded I/III, II/III, I/IV, II/IV, I/V, II/V, VI; the Flemish or blue Flax grades are II/IV, I/V, II/V, VI, VII, VIII, IX. The flax from Furnes and Bergues is marked A, B, C, D; from Zealand, IX, VIII, VII, VI; from Friesland, D, E, Ex, F, Fx, Fxx, G, Gx, Gxx, Gxxx; the Walloon flax is marked II, III and IV. The Flax from Ireland and France is known by the names of the counties and districts it comes from. (4) Dutch Flax is graded II/IV, I/V, II/V, VI, VII, VIII, IX. In chemical properties the pure bleached linen is similar to cotton, the following tests serving to distinguish unbleached linen from cotton; treated with olive oil, linen becomes translucent and cotton opaque and white; when burned the ends of the cotton fibers are tufted, those of the linen round; treated with concentrated solution of caustic soda both cotton and linen shrink and curl, the former becoming grayish, the latter yellow in color; treated with concentrated sulphuric acid and then with diluted ammonia water, linen remains unchanged, while cotton becomes soluble in water. In fabrics the tests are:- if it is a white fabric a piece is boiled in 50 per cent solution of caustic soda, which renders the cotton pale clear yellow and the linen dark yellow. A sample of the fabric is washed in a solution of cyanin in alcohol, then rinsed and after treated with thin solution of sulphuric acid, after which the linen will become blue, while the cotton stays white. Under the microscope the linen fiber discloses regular cylindrical or polygonal cells, with many transverse joints and a lumen in the center. Flax is a slender, erect, annual Plant (Genus Linum) having narrow, lance-shaped leaves and blue flowers, cultivated for its fiber and seeds. The fiber of this Plant, manufactured into linen yarn for thread in woven fabrics. Flax is often considered the oldest fiber used in the Western world. Remnants of flax fabric (linen) have been found in excavations at the historic lake regions of Switzerland, which date back to about 10 000 BC. Although the archaeologists dispute the origins of Flax, some believe that it came from the region of Tepe Sabz, Iran (Mesopotamia), ca. 5 500–5 000 BC. By 4 000 BC the Egyptians were cultivating and processing Flax and ancient wall carvings show laborers harvesting Flax. Examples have been found that were spun so fine that more than 360 threads joined together to form one warp thread. The rather incredible characteristics and properties of Flax are once again being recognized. Although linen has been primarily considered as a fashion fabric in modern times, the industry and the markets are beginning to understand its potential as a performance fiber, delivering high strength and durability, abrasion resistance and high moisture regain, as well as a luxurious hand and appearance. Flax:- fibers of the Flax Plant that are spun into linen yarns and woven into linen cloth. The word ‘Linen’ is derived from ‘Linum’, part of the scientific name for the Flax Plant. See also Linen. Flax:- The Plant:- Flax fibers obtained from the stems of the Plant Linum Usitatissimum are used mainly to make linen. The Plant has been used for fiber production since prehistoric times. It grows best at Northern temperate latitudes, where moderately moist summers yield fine, strong but silky Flax. In Poland, a hectare of Flax Plants yields 1.5 to 3.5 tons of fiber. The Fiber:- Like Cotton, Flax fiber is a cellulose polymer, but its structure is more crystalline, making it stronger, crisper and stiffer to handle, and more easily wrinkled. Flax fibers range in length up to 90 cm, and average 12 to 16 microns in diameter. They absorb and release water quickly, making linen comfortable to wear in hot weather. Flax:- One of nature’s strongest vegetable fibers, flax was also one of the first to be extracted, spun and woven into textiles. Uses Of Flax:- Fine and regular long Flax fibers are spun into yarns for linen textiles. More than 70% of linen goes to clothing manufacture, where it is valued for its exceptional coolness in hot weather – the legendary linen suit is a symbol of breezy summer elegance. Linen fabric maintains a strong traditional niche among high quality household textiles – bed linen, furnishing fabrics, and interior decoration accessories. Shorter Flax fibers produce heavier yarns suitable for kitchen towels, sails, tents and canvas. Lower fiber grades are used as reinforcement and filler in thermoplastic composites and thermoset resins used in automotive interior substrates, furniture and other consumer products. Producers:- The leading producers of Flax fiber are France, Belgium and the Netherlands. Other significant producers are China, Belarus and the Russian Federation. The total area dedicated to Flax cultivation for fiber is estimated at around 120 000 ha in Europe, and some 320 000 ha worldwide. Production And Trade:- In 2007, the European Union produced 122 000 tons of Flax fiber, making it the world’s biggest producer, followed by China with about 25 000 tons. China is also a major buyer of raw Flax for processing, with imports of 60 000 tons a year, including most of Europe’s Flax fibers. Bulk linen production has shifted to Eastern Europe and China, but niche producers in Ireland, Italy and Belgium continue to supply the market for

high quality fabrics in Europe, Japan and the USA. Flax is the Plant from which cellulosic linen fiber is obtained. Linen is used in apparel, accessories, draperies, upholstery, tablecloths, and towels. / выработка (output). каустическая сода или едкий натр (caustic soda). Лён – Однолетнее Травянистое Растение, возделываемое в основном для получения волокна, используемого в текстильной промышленности. Волокна Льна получают из стеблей и используют для выработки пряжи, из которой изготавливают ткани, кручёные изделия (верёвки, канаты, нитки, шнуры) и тому подобное. Из семян Льна получают масло, а из неволокнистой, древесинной части стебля – строительный материал (в виде прессованных плит и других изделий). Лён относится к Роду Одно- и Многолетних Трав и Кустарников Семейства Льновых. В мире насчитывается свыше 200 Видов, из которых в России – около 50. Возделывают в основном Лён-Долгунец, в стеблях которого 20–28% волокна, и Лён Масличный или Лён-Кудряш, в семенах которого 35–52% льняного масла. Некоторые Виды Льна являются декоративными. В 1978 мировая посевная площадь (i) Льна-Долгунца (Египет, Россия, Турция, страны Европы и другие) составляла 1.47 миллионов гектаров (га); средняя урожайность волокна составляла 4 центнера (ц) с одного гектара; а (ii) масличного льна соответственно 5.5 миллионов га (Аргентина, Индия, Соединённые Штаты Америки (США) и другие) и 5 ц/га. Льняное Масло относится к растительному жирному маслу, получаемому из семян льна. Оно применяется для приготовления масляных лаков, олифы, медицинских мазей, а также в пищу. Из всех лубяных волокон (bast fibers) Льняное Волокно обладает наиболее высокой прядильной способностью. Из него вырабатывают более тонкую пряжу (от 16.6 до 300 текс) сухого и мокрого способов прядения. Льняное волокно по способам механической обработки тресты подразделяется на длинное трёпаное волокно, получаемое в результате мытья и трепания длинной тресты, и короткое волокно, получаемое при обработке короткостебельной тресты и при обработке отходов трепания. Трёпаный лён в зависимости от его качества делится на 19 сортов:- 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 18, 20, 22, 24, 26, 28, 30 и 32. Короткое льняное волокно подразделяется на 7 сортов, обозначаемых номерами:- 2, 3, 4, 6, 8, 10, 12. Трёпаный лён, поступающий на льнопрядильные фабрики с заводов первичной обработки, представляет собой довольно неоднородное волокно. Поэтому на льнопрядильных фабриках лён вначале сортируют по линейной плотности и длине волокон и их цвету. Сортировка волокон по линейной плотности необходима для правильного и рационального использования его в пряже. Волокна по длине сортируют для правильной установки технологических параметров заправки льночёсальной и последующих машин. Льняное волокно по длине подразделяют на 5 групп:- 1-я – короче 450 мм; 2-я – от 450 до 550 мм; 3-я – от 550 до 650 мм; 4-я – от 650 до 750 мм; и 5-я – длиннее 750 мм. Сортировку волокон по цвету необходимо осуществлять для того, чтобы получить однородную по цвету пряжу и избежать излишней потери прочности отдельных компонентов смеси при химической обработке, которой подвергается льняная пряжа мокрого прядения. По цвету лён сортируют на 4 группы:- (i) светло-серый и светло-табачный; (ii) чёрный и табачный; (iii) жёлтый; (iv) бурый и зелёный. Вырабатываемая из льняного волокна пряжа характеризуется высокой разрывной нагрузкой и небольшим разрывным удлинением (2–3%). Трёпаный лён и короткое льняное волокно перерабатывают по трём системам прядения:- гребенной без кардочесания (льняной), кардной (очёсной) и гребенной с кардочесанием. В зависимости от системы прядения и способа прядения вырабатывают различную по линейной плотности пряжу. При выработке пряжи из чёсаного льна применяют два способа прядения:- мокрое и сухое. Способ прядения определяет характер вытягивания в вытяжных приборах прядильных машин и их конструкцию. При при мокром способе прядения пряжа формируется из элементарных волокон или из небольших их комплексов, а при сухом способе – из технических волокон. Лён (Linum), Род Одно- и Многолетних Травянистых Растений Семейства Льновых, лубоволокнистая прядильная и масличная культура. Около 230 Видов, преимущественно в субтропических и умеренных поясах; в бывшем СССР насчитывалось около 50 Видов. Для получения волокна и семян возделывают в основном Лён Культурный (Linum Usitatissimum), подразделяемый на 5 Подвидов, из которых наиболее распространён Евразийский Подвид, включающий 4 группы Разновидностей – Долгунец, или Прядильный, Масличный, или Кудряш, Межеумок, или Промежуточный, и Стелющийся. Происходит от Льна Узколистного (Linum Angustifolium), культивируемого в прошлом в горных районах Индии, Китая, Средиземноморья и Закавказья. В бывшем СССР выращивали на волокно Лён-Долгунец (введён в культуру на территории Грузии в Колхиде, в Древнем Египте и других странах за несколько тысяч лет до Нашей Эры, в X–XIII веках повсеместно распространился на Руси), для получения масла из семян – Кудряш и Межеумок, объединяемые под названием Лён Масличный (возделывают с глубокой древности). Посевы Льна культурного засоряет Лён-Прыгунец (Linum Crepitans). Некоторые Виды Льна (Linum Grandiflorum, Linum Flavum, Linum Austriacum и другие) выращивают как декоративные Растения. Лён-Долгунец – однолетнее Растение. Хорошо развивается в условиях умеренного климата, всходы переносят заморозки до –4 °C. Очень влаголюбив, особенно в период бутонизации и цветения. Требователен к содержанию в почве питательных веществ в легкоусвояемой форме (вследствие слабого развития корневой системы), очень чувствителен к недостатку бора. Вегетационный период 75–90 суток. Лён – самоопылитель, возможно перекрёстное опыление. Лучшие почвы – средние и лёгкие слабооподзоленные суглинки с pH 5–6. Из льняного волокна (в стеблях его 20–28%) изготовляют ткани, из костры делают термоизоляционные материалы и строительные плиты. В семенах содержится до 37% жирного масла. Основные льносеющие районы в бывшем СССР:- Нечернозёмная зона, Прибалтийские республики. Сорта – Светоч, Л-1120, Томский 9, ВНИИЛ 11, Призыв 81, Мрия, Украинский 2, Сальдо, Союз и другие. Новые сорта – Славный (раннеспелый), 108-С (среднеспелый) с высоким содержанием волокна в стеблях (28–30%), устойчивы к полеганию и наиболее опасным болезням, с повышенной урожайностью соломы и семян. Урожайность волокна 6–8 ц/га. Лён-Долгунец выращивают в полевых севооборотах, лучшие предшественники – многолетние травы, озимые, картофель, викоовсяная смесь. Норма минерального удобрения (кг/га):- 20–45 N, 40–90 P_2O_5 и 60–120 K_2O. Навоз вносят под пропашные предшественники. Сеют в хорошо обработанную почву в ранние сроки, узкорядным способом (междурядья 7–8 см), норма посева семян 100–150 кг/га, глубина посева 1.5–3 см. Убирают в период ранней жёлтой спелости раздельным и прямым способами. Внедряется рулонная технология уборки:- из уложенных в ленты соломы после теребления или тресты пресс-подборщиком формируют рулоны, которые и отправляют на льнозаводы. Такая технология по сравнению со сноповой в 4–8 раз повышает производительность труда. Стебли для выделения волокна – подвергают первичной обработке (мочка или запаривание, мятьё и трепание). Лён-долгунец – одна из наиболее трудоёмких культур. Комплекс машин, выпускавшихся промышленностью бывшего СССР, и интенсивная технология выращивания позволяли значительно снижать затраты труда. Сеют льняной сеялкой, при уборке применяют льнокомбайн, льнотеребилку, льноподборщик-молотилку, льнорасстилочную машину. Интенсивная технология возделывания Льна-долгунца включает:- размещение посевов по лучшим предшественникам, на чистых от сорняков полях; использование высокоурожайных, устойчивых к болезням и вредителям сортов и первоклассных семян; оптимальную обработку почвы и внесение гербицидов; полное обеспечение растений элементами питания с учётом содержания их в почве; десикацию посевов хлоратом магния; использование рулонной технологии на уборке (рулоны из льняной соломы массой 250–300 кг позволяют в 1.5–2 раза снизить потребность в транспортных средствах); строгое соблюдение технологической дисциплины (сроков и параметров агротехнических приёмов). Интенсивная технология обеспечивает повышение урожайности льноволокна на 40–46% (до 15.5 ц/га). Лён Масличный – однолетнее, более теплолюбивое и менее требовательное к влаге, чем Лён-Долгунец, растение. Вегетационный период до 150 суток. Опыляется ветром. Лучшие почвы – чернозёмы и каштановые. Семена Льна масличного содержат до 52% жирного масла, которое, как и масло Льна-Долгунца, используют для

приготовления олифы, лаков, красок, употребляют в пищу. Жмых скармливают скоту. Семена Льна и льняное масло применяют в медицине. Волокно (10–15% в стеблях) пригодно для выработки мешковины, брезента, шпагата. Основные районы выращивания в бывшем СССР:- Казахстан, Западная Сибирь, Поволжье, степная зона Украины. Распространённые сорта – Воронежский 1308, Сибиряк, ВНИИМК 5237, Рекорд и другие. Новые сорта – Бахмальский 2, Циан. Урожайность семян 6–10 ц/га. Предшественники – Яровая Пшеница, идущая по пару, Кукуруза, многолетние травы, вико-овсяная смесь. Норма минеральных удобрений (кг/га):- 30 N, 45–60 P_2O_5 и 30–40 K_2O. Сеют узкорядным и обычным рядовым (междурядья 7–8 и 15 см) способами, норма посева семян 50–60 кг/га, глубина посева 3–7 см. Убирают Лён масличный в фазе жёлтой спелости. Вредители Льна – Льняные Блошки, Льняные Долгоносик-Скрытохоботник, Трипс и Плодожорка-Листовёртка, Вредная Долгоножка, Совка-Гамма, и Луговой Мотылёк; болезни – фузариоз, ржавчина, полиспороз, антракноз, аскохитоз, пасмо льна. Льновые (Linaceae), Семейства Двудольных Цветковых Растений. Травянистые Растения Полукустарники и Кустарники. Листья очередные, реже супротивные, цельные, с мелкими прилистниками. Цветки обоеполые с 5- или 4-членным околоцветником (тычинок 5–10, плодолистиков 3–5, иногда 2), собраны в циммозные соцветия (монохазий) или кисти. Плод коробочковидный. Семя без эндосперма. В Семействе 6 Родов (около 250 Видов). Распространены в умеренных и субтропических областях, немногие в тропиках Старого Света. В Семейство Льновые часто включают Семейства Hugoniaceae, Ixonanthaccae и Humiriaccae. В таком объёме в Льновых более 25 Родов (около 500 Видов), в том числе деревья и лианы, распространённые от тропиков до умеренных областей обоих полушарий. В бывшем СССР 2 Рода:- Лён – прядильная и масличная культура и Радиола (Radiola; 1 Вид). Льняное Волокно, лубяное волокно, содержащееся в стеблях Льна; сырьё для текстильной промышленности. Состоит из удлинённых, веретеновидных клеток – элементарных волокон длиной 20–30 мм (до 120 мм, иногда более). Оболочка их содержит целлюлозу, гемицеллюлозу, пектины и лигнин. Чем больше целлюлозы в волокне, тем оно лучше. В среднем в льняном волокне 80–90% целлюлозы, 6–8% пектиновых веществ и 3–7% лигнина. Элементарные волокна (по 10–50) соединены между собой пектиновыми веществами в пучки. Пучок или группа пучков образует техническое волокно в виде длинных тонких лент, которые расположены по периферии стебля за эпидермисом в паренхимной ткани. Льняное волокно получают из стеблей льна при переработке тресты на мяльных и трепальных машинах. В зависимости от способа получения льняное волокно бывает стланцевое (из стланцевой льняной тресты), моченцовое (из замоченной в воде льняной соломы) и паренцовое (из соломы, запаренной под давлением). При оценке качества длинного льняного волокна учитывают его крепость, тонину (то есть способность при чесании делиться на тонкие комплексы), гибкость, длину, тяжеловесность, цвет, запах и другое, а также его пороки:- засорённость, пестроту, пухлявость, обсечённость, шишковатость и другое. Качество льняного волокна обозначается номерами (длинное волокно подразделяют на 19 номеров:- 6–16, 18, 20, 22, 24, 26, 28, 30 и 32), чем выше номер, тем меньше пряжи идёт на 1 м ткани. При чесании длинного волокна получают чёсаный лён (длинное параллелизованное техническое волокно в виде прядей – горстей) и очёс льняной. Короткое льняное волокно в зависимости от крепости и содержания костры подразделяют на 7 номеров:- 2, 3, 4, 6, 8, 10 и 12. Влажность длинного и короткого льняного волокна должна быть не более 12%. Льняное волокно используют для изготовления технических (брезент, парусина, приводные ремни и другое), бытовых (бельевое полотно, костюмные, и платьевые ткани) и тарных тканей.

FLAXEN = XX (или ЛЬНЯНОЕ) – Flaxen:- resembling flax especially as in a pale soft strawy color.

F LAYER = СЛОЙ ЭФ. – F Layer is a soil layer of partially decomposed litter with portions of plant structures still recognizable. Occurs below the L layer (O11 horizon) on the forest floor in forest soils. / (горизонт) .

FLB = FEDERAL LAND BANK

FLEECE = РУНО – Fleece is the wool from one sheep, either as it comes from the animal or after it is rolled into a bundle and tied. Fleece is the wool shorn from any sheep, or from any animal in the wool category. Fleece:- from animals, usually a sheep. Fleece is also used to describe certain coating fabrics that have a deep, thick pile that imitats this wool. / Под Руном понимается шёрстный покров Овцы, состриженный сплошным пластом. Руно, шерсть, снятая с Овцы в виде цельного пласта. Состоит из штапелей (пучков) или косиц, прочно удерживающихся друг около друга в однородной шерсти переходящими шерстинками (перебежчиками), в неоднородной – сваливанием пуха у основания косиц. Руно снимается с тонкорунных и полутонкорунных Овец, а также с полугрубошёрстных и грубошёрстных при весенней стрижке; осенняя и поярковая (с молодняка) шерсть руно не образует, распадается на отдельные куски. Руном называется также шёрстный покров на Овце до стрижки.

FLEECE FABRIC = ТКАНЬ ФЛИС – Fleece Fabric is a lightweight fabric with a thick, heavy fleece-like surface. It may be a pile or napped fabric, or either woven or knit construction. End uses include coats, jackets, blankets, etc. Fleece fabrics are available in a variety of constuctions:- (i) Polarfleece® is the original fleece fabric, developed in 1979, by Malden Mills. It is typically used for non-technical garments, and it is only available at Malden Mills; and (ii) Polartec®, also developed by Malden Mills, was created for today's high-performance technical garments, which provides enhanced durability warmth, wind resistance, breathability and weather protection. Fleece is a soft, bulky fabric with deep pile. It is lightweight, dries quickly and is able to insulate even when wet. Polar fleece is usually made from 100% polyester and is machine-washable. Fleece:- a soft bulky deep-piled knitted or woven fabric used chiefly for clothing. Has a deep, soft nap or pile, obtained by heavily napping with wire brushes or with a pile weave. This provides air space giving good insulating properties without too much weight. The interlacings are covered by the nap. The nap wears out in time, but good quality cloth gives good wear. Range from cheap to expensive clothes. Material is often cumbersome and bulky, therefore it may be difficult to manipulate. Also, the name for the entire coat of wool taken from a sheep at shearing time. Fleece Fabric is a fabric with a thick, heavy surface resembling sheep's wool. It may be a pile or napped fabric of either woven or knit construction. / Полафлис® (Polarfleece®) Молдэн Милз (Malden Mills). Полатчэк® (Polartec®). Полярный Флис – мохнатый утеплённый материал для демисезонных курток, кашне и тому подобного.

FLEECE WOOL = РУННАЯ ШЕРСТЬ – Fleece Wools are the wools produced on farms in areas east of the Rockies, inclusive of those produced east of the Mississippi River.

FLEET = ФЛОТ (или ФЛОТИЛИЯ) – Fleet is any group of means of transport acting together or under one control. / Любая группа транспортных средств, действующая совместно или под одним общим контролем. Под Флотом, от Французского слова Флёт (Flotte), от Голландского слова Флоот (Vloot), понимается совокупность судов определённого назначения (транспортный флот, промысловый флот, военно-морской флот), типа (галёрный флот, парусный флот, дизельный флот) или района дислокации (например, Тихоокеанский флот). Под Флотилией, от Французского слова Флётийе (Flottille), от Итальянского слова Флоттыльа (Flottiglia), понимается группа совместно действующих промысловых, экспедиционных, спортивных и других судов.

FLEMISH DOWN = УКЛАДЫВАТЬ – Flemish Down (maritime term):- to coil flat down on deck, each fake outside the other, beginning in the middle and all close together. / Укладывать трос в плоскую спиральную бухту.

FLESHY = УПИТАННОЕ (или МЯСИСТОЕ) – Fleshy:- thick and soft.

FLEX ABRASION TESTER = ТЕСТЁР ПО ИСТИРАНИЮ СГИБОМ – Flex Abrasion Tester:- multipurpose and precision Universal Flex-Abrasion Tester for measuring the resistance to surface, flex and edge abrasion of paper, plastic, rubber, textiles, leather, paper, and a vast array of other materials. All tests may be run wet or dry with an automatic end point. A continuously changing abrading head is also available. See also Stoll-Quartermaster Universal Wear Tester. The CSI Flex Abrasion Tester is the most suitable instrument for rating textile materials for resistance to abrasion when the material is flexed for a period of time. The Flexing and Abrasion Tester is intended for use in determining the abrasion resistance of fabrics when a specimen is subjected to unidirectional reciprocal folding and rubbing action under known conditions of pressure and tension. To evaluate a material, a standard test sample is placed over the flex bar and held by the balanced head on top and the reciprocating block at the bottom. The abrasion test is initiated via an Operator Console, until the specimen breaks. The CSI-39 automatically detects the break to end the test. The apparatus includes:- (i) balanced head assembly; (ii) flexing bar that produces the abrasion; (iii) tensioning device with a weight holding pan; (iv) flex block to cause the rubbing of the sample; and (v) automatic test-stop device to end the test. Custom Scientific Instruments, Inc. (CSI) headquartered in Forks Township (Easton), State of Pennsylvania (PA), the United States. See also Abrasion. / протирание или притирка (rubbing).

FLEXIBILITY = ГИБКОСТЬ – Flexibility is:- (1) the ability to be flexed or bowed repeatedly without rupturing; and (2) a term relating to the hand of fabric, referring to ease of bending and ranging from pliable (high) to stiff (low).

FLEXIBLE EXCHANGE RATE = ГИБКИЙ ОБМЕННЫЙ КУРС – In contrast to the fixed exchange rate regime, the Flexible Exchange Rate system encompasses various forms of exchange rate regimes that allow the exchange rate of two nations to be determined by the demand and supply of the currencies in the foreignexchange market. The term floating exchange rate is also used to describe the general form of the flexible exchange rate in the system. In principle, the flexible exchange rate system is driven by a free market force while allowing some variations of central bank intervention. Major forms of exchange rate regimes under the flexible exchange rate system include freely floating (or clean floating) and managed floating (or dirty floating). In some cases, adjustable peg and crawling peg are also considered part of the flexible exchange rate system. In the early 1970s, countries with major currencies, such as the United States, began to adopt a flexible rate system after the collapse of the Bretton Woods system, under which a fixed or pegged exchange rate regime prevailed. Though the majority of the developing nations still remained on the fixed exchange rate at the time, many had shifted to more flexible exchange rate systems such as the adjustable peg, crawling peg, and managed floating exchange rate systems. What caused the movement from a fixed to a more flexible exchange rate system in this 20 year period for the emerging markets, though via a gradual process, were (i) sharp changes in value in major currencies that these nations tied their currencies to, (ii) slower growth of more developed nations that launched opportunity seeking in the developing nations, (iii) steep rise in the interest rate worldwide that encouraged a more flexible exchange rate system, (iv) debt crisis as a result of overexpansion or huge capital inflow that put pressure on local currencies, and (v) inflation problems that called for changes in monetary policy that are more suited for a flexible exchange rate regime. In short, during these volatile times, a more flexible exchange rate regime was demanded for countries under fixed exchange rate regimes to adapt quickly and to be able to survive in the international trade and investment market. In other words, as the financial market globalized and the developing economies were more closely integrated with those of the more developed, the international exchange rate system had moved toward forms that allow nations to work more cooperatively and efficiently. Though quite a few developing countries shifted to a more flexible exchange rate system after the mid 1990s, many still adopted the system with various degrees of control through central bank intervention or managed floating. This trend was due to the nations' smaller economies and relatively thin financial markets that were intolerant of extreme volatilities. In addition, many of these nations depend heavily on their exports or imports, and any big swings in their foreign exchange rates could cause serious imbalances in their balance of payments (e.g., a sudden depreciation in a nation's currency accompanied by a large import would cause a huge increase in its deficit in balance of payments). However, in terms of the effect of the flexible exchange rate system on the domestic economy, and compared with that of the fixed exchange rate regime, the flexible exchange rate is more suitable when there are large inflows of capital transmitted to a developing economy. In China's case and in order to achieve stability in its economy, given the size and speed of its growth in the past 20 years, a crawling peg or managed floating exchange rate regime is more appropriate when its market is inundated with large inflows of capital. In other words, a crawling peg or managed floating exchange rate regime is more apt to alleviate the upward pressure for its currency to appreciate in a progressive manner. And in many cases, a specific form of the flexible exchange rate, e.g., managed floating, that is adopted by the central bank and is believed to be the most appropriate at the time usually work in synchronization with a nation's economy at a particular development stage. While the freely floating exchange rate may contribute to inflation at times, proper use of the monetary policy, such as interest rate increasing, will not only address the inflation problem but also encourage imports, one of the autocorrection responses from the market that further reduces inflation pressure. Nonetheless, the flexible exchange rate system, with various degrees of government intervention, still requires a nation to be equipped with an adept regulatory establishment, a solid banking structure and supervision, and a free market that permits free information transmission to pave the way for the system to work efficiently and well. Flexible Exchange Rate is the value of a country's currency varies and is determined by the supply and demand for the currencies. Arrangements in which the rate of exchange between countries' currencies (the foreign exchange rate) is allowed to fluctuate in response to market forces of supply and demand.

FLEXIBLE–FUEL VEHICLES = ТРАНСПОРТНЫЕ СРЕДСТВА С ГИБКИМ ВЫБОРОМ ТОПЛИВА – Flexible-Fuel Vehicles (FFVs) are the vehicles that can run on either gasohol or on hydrous ethanol.

FLEXIBLE FUND = ГИБКИЙ ФОНД – Flexible Fund is an investment fund (mutual fund) where the management company is free to decide on the investment of assets within the framework of the legal and statutory regulations. The opposite of Fixed Fund.

FLEXIBLE INTERMEDIATE BULK CONTAINER = МЯГКИЙ ПАКЕТООБРАЗНЫЙ (или ВСПОМОГАТЕЛЬНЫЙ) КОНТЕЙНЕР ДЛЯ СЫПУЧИХ ГРУЗОВ – The company's Flexible Intermediate Bulk Containers (FIBC) or Big Bags are the ideal solution for packaging, storage and transport of bulk goods in powder, granular and semi liquid form. The entire Big Bags range is very diverse with special versions available besides various basic types. Big Bags are the simplest and most effective low cost packing technique that helps to save time and money in handling, storing and transportation of bulk commodities. The basic fabric consists of polypropylene which is manufactured out of UV stabilized triplex tapes of denier ranging from 1 300 to 3 000. Fabrics are also given an additional coating or supplied with an extra polyethylene insert. This gives special protection against dampness. In addition to that, Big Bags is made for safety factor of 5 to 1 which means that for a one ton Big Bag, the load bearing capacity is up to a limit of 5 tons. Heavy duty loops of nylon/PP multi filament yarn are given special attention. The polypropylene fabrics is characterized by high degree of UV resistance, tensile strength and flexibility. On request the company also supplies anti-static bags. Big Bags designs are thoroughly tested by an independent Testing Body to obtain full certification to meet international performance and quality standards. Designs through joint consultations with the customer to meet specific requirements, is one of the major strengths of company – Big Bags. Big Bags otherwise known as Jumbo Bags, are manufactured to fit all standard pallet size and can be handled from above all types of fork-lifts or cranes for easier filling. These FIBCs can be quickly and efficiently filled through a simple rig or by using structure to ensure precise weight control. Big Bags can be sized and made for box trailers and containers,for transportation of cement, fertilizers, chemicals and products requiring a plastic liner. Big Bags are available with inside liner thickness of up to 120 microns. For fast and

convenient ship loading, Big Bags can be lifted in by spreaders in multiples of 2.36 or 8 at a time. Strong, reinforced straps/loops on top are made for easier handling. The power of quality, technical refinement and design have spearheaded Big Bags into the most competitive markets world-wide. Big Bags uncompromising commitment to quality keeps the company ahead of the rest. See also Big Bag. Flexible bulk material containers are more in demand than ever as transport and storage containers, because containers like big bags have numerous practical advantages over packaging such as sacks, drums and metal containers, not only in terms of environment friendliness, functionality and price. But emptying big bags does not always prove easy. Transporting, emptying and disposing of the containers is not always straightforward, and not always as successful as hoped with improvised solutions. / Найлан (Nylon). филаментная (комплексная) пряжа (filament yarn). Найлан^{T3} (Nylon^{TM})/ПП . ультрафиолетовое (УФ (UV)) излучение.

FLEXIBLE OPTIONS = ГИБКИЕ ОПЦИОНЫ – Flexible Options:- in additional to regular option listings for the corresponding underlying futures month some ICE Futures US® (former NYBOT®) markets also list Flexible Options. Flexible options help commercial firms to customize specific option strategies by allowing the user to select certain contract terms and conditions including the option expiration date, strike price and method of exercise (American or European). American style options allow for exercise on any day up until expiration while European style can only be exercised on the final day. See also Serial Options. A Flexible Option (also known as a Flexible Exchange or Flex Option) is a customizable exchange-traded option which allows the buyer to customize contract terms such as expiry date and contract size in addition to the strike price. Flexible options with single stock, index, or even currency underlyings are traded on several major exchanges. / Гибкие Опционы:- в дополнение в перечням обычных опционов для соответствующего месяца поставки лежащего в основе фьючерса некоторые рынки Ай.Си.И. Фьючез Ю.Эс.® (ICE Futures US® (бывшая НАЙБЭТ® (NYBOT®)) внесли в перечень Гибкие Опционы. Гибкие опционы помогают коммерческим фирмам приспосабливать специфические опционные стратегии посредством допуска пользователя к выбору определённых контрактных порядков и условий, включая дату прекращения признания, сходную цену и метод исполнения (Американский или Европейский). Опционы в Американском стиле допускают для исполнения любой день до прекращения признания, в то время как опционы в Европейском стиле могут быть исполнены только в последний день действия такого опциона. Смотрите также Периодические Опционы (Serial Options).

FLEXIBLE PATH EQUIPMENT = ОБОРУДОВАНИЕ С ГИБКИМ ХОДОМ – Flexible Path Equipment:- materials handling devices that include hand trucks and forklifts.

FLEXITANK = МЯГКИЙ БАК (или ЭЛАСТИЧНЫЙ БАК) – Flexitank is a polythene bag which can be fitted inside a 20’ container for the transportation of non-hazardous liquids. Flexitank:- a large polythene liner which can be fitted inside a 20’ GP (General Purpose) container for the transportation of non-hazardous liquids. / Полиэтиленовый. Бак – большой сосуд для жидкостей.

FLEXURAL FATIGUE = ИЗГИБНАЯ УСТАЛОСТЬ (или УСТАЛОСТЬ НА ИЗГИБ) – Flexural Fatigue is a physical property expressed by the number of times a material can be bent on itself through a prescribed angle before it ruptures or loses its ability to recover.

FLEXURAL RIGIDITY = ЖЁСТКОСТЬ К ИЗГИБУ – Flexural Rigidity (or Stiffness) is one of the important physical properties of geosynthetic reinforcement materials. This property is indicative of the geosynthetic’s inherent capability of providing a suitable working surface for installation, especially under extremely soft soil conditions. Stiffness is defined as the resistance to bending. The stiffness is a measure of the interaction between the geosynthetic weight and its bending stiffness, as shown by the manner in which the geosynthetic gravitationally bends under its own weight. See also Bending Rigidity. Flexural Rigidity:- this measure of a material’s resistance to bending is calculated by multiplying the material’s weight per unit area by the cube of its bending length. / Жёсткость На Изгиб или Устойчивость К Изгибу (Flexural Rigidity).

FLEXURAL STRENGTH = ПРОЧНОСТЬ ПРИ ИЗГИБЕ (или КРЕПОСТЬ НА ИЗГИБ) – Flexural Strength is the ability of a material or a construction to withstand bending. / выдерживать сгибание. В сопротивлении материалов под Изгибом понимается вид деформации, характеризующийся искривлением оси или срединной поверхности деформируемого объекта (балки, оболочки, плиты и другого) под действием внешних сил или температуры. Применительно к прямому брусу различают:- (i) Косой Изгиб, являющийся частным случаем сложного изгиба; (ii) Простой или Плоский Изгиб, при котором внешние силы лежат в одной из главных плоскостей бруса (то есть плоскостей, проходящих через его ось и главные оси инерции поперечного сечения); и (iii) Сложный Изгиб, вызываемый силами, расположенными в разных плоскостях. В зависимости от действующих в поперечном сечении изгибаемого элемента силовых факторов изгиб называют:- (a) Поперечным – при наличии изгибающих моментов и поперечных сил; (b) Продольным – под действием центрально приложенных продольных сжимающих сил; (c) Продольно-Поперечным – под действием продольных и поперечных сил; и (d) Чистым – при наличии только изгибающих моментов. Под Прочностью понимается свойство .

FLICKER = ТРЕПАНИЕ – Flicker is a hand tool that looks like a small hand card on a long handle. To use it, hold one end of a lock of wool in your left hand rested on your thigh and ‘flick’ the tool up and down with your other hand catching the end of the fiber. This will open out the lock and make it easier to spin. It is recommended to wear a sturdy pair of jeans or place a leather pad on your left thigh. / Трепание, очистка волокон хлопка, льна, шерсти и других от примесей и пороков и их разрыхление. Один из основных технологических процессов прядильного производства, а также первичной обработки лубяных волокон. Как правило, трепание производят после предварительного разрыхления материала, когда ударное воздействие наиболее успешно может очистить материал при минимальном повреждении волокон. Трепание состоит в ударном воздействии рабочих органов машины на слой волокон, зажатых питающими органами. При этом разрушаются связи между волокнами и примесями. В процессе трепания волокнистый материал очищается лишь от наиболее крупных и наименее цепких примесей. Разделение на отдельные волокна и очистка от цепких примесей происходят при последующем чесании волокнистых материалов. Трепание осуществляется на трепальных машинах. Основные рабочие (треплющие) органы – ножевые, колковые или бильные барабаны и трепала. В зависимости от конструкции бил различают планочные (гладкие призматические била), игольчатые (била, усаженные крупными колками), пильчатые (била, несущие пильные зубья) и комбинированные трепала. В трепальной машине для хлопка:- Разрыхлённые клочки хлопка из последней машины разрыхлительного агрегата поступают в питающий бункер. Регулирующее устройство поддерживает постоянную высоту хлопка в бункере, что обеспечивает равномерность потока волокна, выходящего из машины. Хлопок из бункера с помощью валиков и питающих цилиндров подаётся к ножевому барабану. Ножи барабана, вращающегося с частотой 500 – 600 оборотов в минуту (об/мин), наносят удары по слою хлопка, отрывают от него клочки и бросают их на окружающую барабан колосниковую решётку. При этом клочки дополнительно встряхиваются, и освободившиеся сорные примеси выпадают через промежутки между колосниками в угарные камеры. Вентилятор отсасывает воздух из сетчатых барабанов, благодаря чему создаётся поток воздуха, который снимает клочки хлопка с ножей барабана и колосниковой решётки и транспортирует их к сетчатым барабанам. При вращении эти барабаны формируют из отдельных клочков слой, который снимается с их поверхности съёмными цилиндрами. Далее слой поступает в зажим питающих цилиндров, подающих его к трепалу. Делая 900 – 1 000 об/мин, трепало наносит удары планками по слою

хлопка, разрыхляя его и выделяя сорные примеси, которые проваливаются через колосниковую решётку в угарную камеру. Воздушный поток снимает клочки хлопка с планок трепала и транспортирует их в следующую машину. Трепальные машины для лубяных волокон оснащаются бильными барабанами. Основными рабочими органами трепальных машин для шерсти являются колковые барабаны. Интенсивность трепания определяется степенью трепания, то есть числом ударов треплющего органа, приходящихся на единицу длины или массы слоя волокон.

FLIGHT CAPITAL = БЕГЛЫЙ КАПИТАЛ (или ЛЕТУЧИЙ КАПИТАЛ) – Flight Capital:- capital that is removed from a country that seems to be politically or economically unstable, and taken to a more stable environment. The capital transferred by the owner to another country in violation of capital export or exchange control laws. / Капитал, переведённый владельцем в другую страну в нарушение законодательства по вывозу капитала или законодательства по валютному контролю.

FLIGHT SUIT = ЛЁТНЫЙ КОСТЮМ – Flight Suit is a usually one-piece garment especially of fire-resistant fabric worn especially by military aircrews.

FLIP = РАЗВОРОТ – Flip:- to reverse positions in the market by closing out a long/short, and quickly entering an opposite position on the short/long side. Commonly used to explain the Commitments of Traders Report data where trader groups reverse positions from one report to the next.

FLIP–FLOP = ФЛИП–ФЛЁП (или ТРИГГЕР) – Flip-Flop:- a rubber sandal loosely fastened to the foot by a thong. / .

FLIPPER = ЛАСТ (или ХХ) – Flipper:- a flat rubber shoe with the front expanded into a paddle used in skin diving.

FLO = FAIRTRADE LABELLING ORGANIZATIONS

FLOAT = ВЫПУСКАТЬ В ОБРАЩЕНИЕ – Float:- the initial raising of capital by public subscription to securities, such as shares offered on the sharemarket for the first time. / Первоначальное повышение капитала посредством открытой (публичной) подписки на ценные бумаги, такие как акции, предлагаемые на рынке акций в первый раз.

FLOAT = ОБРАЩЕНИЕ (или В ОБРАЩЕНИИ) – (1) A Float is collected as payment for the loading operation. It is used to pay liability due to acquiring banks and purse holders and allows a guarantee to be given to acceptors. A float is never considered as the purse holder's deposit. There is no net creation of money. Float is a sum of money that represents checks that are outstanding.

(2) Float:- freely tradable shares of a company held by many shareholders. The number of shares that are not held by major shareholders and can therefore be acquired and traded by the general public. The larger the float, the larger the trading volume of a share. The shares in the share index of Deutsche Börse are weighted on the basis of the float according to trading volume and market capitalization. Float is the number of shares in a company which can trade freely in the market, i.e. total shares issued minus any control blocks or escrowed shares. / Немецкая Биржа АО или Дойчэ Бёрзэ А.Ге. (Deutsche Börse AG).

FLOAT = ПЕРЕКРЫТИЕ (или ПОДПЛЕТИНА, или ПОПЛАВОК, или ПОДНЫРКА НИТИ, или НЕПОДРАБОТКА НИТИ) – Floats:- caused by an end or ends failing to weave into fabric in the manner in which they should. The loom not functioning in the proper way will also cause floats. The weaver, because of laxity in fixing ends that need attention, is another cause. Incorrect drawing-in or reeding-in can cause one or more ends to form float areas in cloth. Floats can be remedied in the dry-finishing department in the mill as a last resort. Float is:- (1) flaw in the cloth, caused by loose threads floating instead of being bound in the weave. (2) A certain length of the warp or filling in the fabric, left free between two points of binding for the purpose of forming certain designs. Float is:- (1) the portion of a warp or filling yarn that extends over two or more adjacent filling picks or warp ends in weaving for the purpose of forming certain designs. (2) In a knit fabric, a portion of yarn that extends for some length without being knitted in. (3) Float is a fabric defect consisting of an end lying or floating on the cloth surface instead of being woven in properly. Floats are usually caused by slubs, knot-tails, knots, or fly waste, or sometimes by ends being drawn in heddle eyes incorrectly or being twisted around heddle wires. Float:- slack warp, faulty pattern card. Float is formed when there is no proper interlacement of the warp and weft yarns over a certain area. The remedial measures are the use of overall high warp tension and keeping the lease rods close to the heald shafts. Woven fabric defect. Float is formed when there is no proper interlacement of the the warp and weft yarns over a certain area, and is caused by an entanglement of adjoining ends in the region between the healds and the fell of the cloth. So here the warp and weft is not interlaced and not giving the actual design or structure of the fabric and forming this defect. Float is a defect in which warp or filling yarn extends unbound over the ends with which it should be interlaced. Synonym:- Harness Skip, Overshot, and Skip. Float:- a length of yarn extendrng unbound over a number of wales with which it should be intermeshed. Note:- this defect is caused by a needle failing to take the yarn, or by yarn casting off from the knitting elements prematurely. Float:- that part of a warp or filling yarn in a fabric thai ua unbound by the yarns in the opposite direction as specified by the weave. In some weaves, of course. Boats may be an integral part of the pattern. Float:- this is caused by a miss stitch which is the result of failure of one or more needles to have been raised to catch the yarn. Knitted fabric defect, and namely:- stitch defect. Float is a weaving defect consisting of an end lying, or floating on the fabric surface instead of being properly woven in. Float (woven fabric defect) is the improper interlacement of warp and weft threads over a certain area. Causes:- (i) improper sizing (ends sticking); and (ii) broken end entangling with the other ends. Mending:- only minor floats can be rectified. The floating threads are cut with a clipper. Combing in both direction rectifies the resultant patch. Float:- slack warp and Faulty Pattern Card are the main reasons for a float in a woven fabric. Float:- it is formed due to improper interlacement of the warp and weft yarn over certain area and is caused by an entanglement of adjoining ends. This kind of fault is most objectionable as the cloth has to be cut near this defect. This defect is caused due to warp breakages on loom arising out of incorrect shedding or bad sizing. Minor Defect Classification:- < 0.5 sq.cm. Major Defect Classification:- > 0.6 sq.cm. Float is the improper interlacement of warp and weft threads in the fabric over a certain area. Weaving Defect. / уточные поперечные нити. Порок или дефект ткачества. Часть пряжи в трикотажной ткани, которая . Под Подплетинами понимается дефект суровой ткани в виде нарушения переплетения на небольшом участке из-за групповой неподработки нитей (когда концы нескольких оборвавшихся нитей основы заплетают соседние нити), причина этого порока – разладка основонаблюдателя. Подплетина представляет собой обрыв группы нитей основы с их последующим перепутыванием с нитями утка и общим нарушением переплетения. Подплетина является очень грубым, недопустимым дефектом, ухудшающим внешний вид и свойства ткани. Под Подплетиной понимается местный порок в виде неправильно переплетённых рядом лежащих нитей. Под Подплетинами понимается дефект суровой ткани в виде нарушения переплетения на небольшом участке из-за групповой неподработки нитей (когда концы нескольких оборвавшихся нитей основы заплетают соседние нити), причина этого порока – разладка основонаблюдателя. Неподработка Нитей Основы – дефект, состоящий в том, что некоторые нити основы не переплетаются с уточными. Образуется этот дефект вследствие ослабления натяжения части основных нитей, их провисания, в результате чего не образуется 'чистого' зева и нити основы не зарабатываются в ткань. Неподработка основы – грубый дефект, резко ухудшающий внешний вид и свойства тканей. Отрывы (Float) – обрыв большого количества нитей основы с последующей неудовлетворительной их приработкой. На ткани видна поперечная полоса по месту отрыва и приработки. Обрывы основы могут возникать при зажиме челнока в зеве. Под Сбитым Рисунком понимается местный порок в виде нарушения структуры

рисунка или цвета нитей. Подныркы, не более 5 сантиметров (см). Размер порока – до 1 см. Под Сбитым Рисунком или Разом (Раз) понимается дефект суровой ткани, когда по всей ширине ткани нарушен рисунок переплетения, появляется при разладках каретки или при пуске станка без предварительного отыскания раза. Под Подныркаами понимается дефект суровой ткани, когда уточные нити на коротких участках не переплетаются с основными, а выступают в виде скобочек или петель сверху или снизу полотна; причины – нечистый зев, несвоевременный ввод уточной нити в зев, провисание нитей основы, излишне высокое или низкое расположение шпаруток и другое. Неподработка Нитей образуется, когда нити основы на некотором протяжении не переплетаются с утком по принятому рисунку, а выступают на поверхности ткани. Подныркы – тот же порок, образуемый уточными нитями. Подныркы – местный порок в виде одной или нескольких нитей одной системы, неправильно перекрывающих нити другой системы, нарушая переплетение. Подныркы не более 5 см. Размер порока – до 1 см. Под Подныркаами понимается дефект суровой ткани, когда уточные нити на коротких участках не переплетаются с основными, а выступают в виде скобочек или петель сверху или снизу полотна; причины – нечистый зев, несвоевременный ввод уточной нити в зев, провисание нитей основы, излишне высокое или низкое расположение шпаруток и другое. Подплетина (float):- порок ткани в виде неправильно переплетённых между собой нитей. Примечание:- этот порок может быть вызван слабой основой или неправильной узорообразующей картой.

FLOAT CHARGE = ПЛАВАЮЩИЙ ЗАРЯД – Float Charge:- charging current supplied to a battery which overcomes the battery self-discharge rate. This current, under otherwise normal conditions, will maintain the battery in a fully charged state.

FLOATER POLICY = ПЛАВАЮЩИЙ ПОЛИС (или 'ПОПЛАВОК') – Floater Policy is a policy under the terms of which protection follows moveable property, covering it wherever it may be. / Полис, в соответствии с условиями которого, движимое имущество будет находится под защитой страхового покрытия где бы оно ни было.

FLOAT/FLOTATION = ОБРАЩЕНИЕ/НАХОЖДЕНИЕ В ОБРАЩЕНИИ (или ФЛОТАЦИЯ) – Float/Flotation:- the first public offering of a company's shares or securities on a regulated exchange.

FLOATING = ВЫПУСК В ОБРАЩЕНИЕ – Floating:- perfoming an Initial Public Offering (IPO). Also known as Flotation.

FLOATING = ПЛАВАЮЩИЙ – Floating:- free (flexible) fluctuation of the exchange rate in response to supply and demand on the foreign exchange market. In the absence of any (or at most minimal) central bank intervention (currency support buying or selling) floating is said to be clean. In actual practice, most countries with floating exchange rates essentially allow the rates to develop freely but their central banks do sometimes Intervene (Dirty Floating). / Свободное (гибкое) колебание (флуктуация) обменного курса в ответ на спрос и предложение на рынке иностранной валюты.

FLOATING CAPITAL = ОБОРОТНЫЙ КАПИТАЛ – Floating Capital:- the part of a business entity's capital that is invested in current assets, net of current liabilities, as opposed to fixed or other capital assets. Also known as Net Working Capital. / Под Оборотным Капиталом понимается часть производительного капитала (затраты на сырьё, материалы, рабочую силу), которая переносит свою стоимость на вновь созданный продукт полностью и возвращается к предприятию в денежной форме в конце каждого кругооборота капитала.

FLOATING CHARGE = СБОР ЗА ОБРАЩЕНИЕ (или ПЛАТА ЗА ОБРАЩЕНИЕ) – Floating Charge:- the assignment of all the assets of a company or an individual as security for a debt.

FLOATING CRANE = ПЛАВУЧИЙ КРАН – Floating Cranes are used mainly in bridge building and port construction, but they are also used for occasional loading and unloading of especially heavy or awkward loads on and off ships. Some floating cranes are mounted on a pontoon, others are specialized crane barges with a lifting capacity exceeding 10 000 tons and have been used to transport entire bridge sections. Floating cranes have also been used to salvage sunken ships. Heavy duty cranes that are able to handle exceptionally heavy cargo if unable to use conventional gantry cranes. Floating Cranes are heavy-duty cranes brought in to handle cargo when unable to use gantry crane. A crane mounted on a barge or pontoon, which can be towed or is self-propelled. / Плавучий Кран – грузоподъёмный кран, установленный на самоходном или буксируемом понтоне. По конструкции верхние строения плавучего крана подразделяются на неповоротные (мачтовые, козловые и краны с качающимися стрелами), полноповоротные, или универсальные, у которых стрела может поворачиваться в вертикальной плоскости и вращаться вокруг вертикальной оси, и комбинированные с двухъярусным верхним строением (на нижней основной ферме установлен поворотный или передвижной кран). Плавучие краны для тяжеловесных грузов изготовляются с качающейся стрелой. Краны имеют чаще всего дизель-электрический, реже дизельный или паровой привод. Плавучие краны грузоподъёмностью до 25 тонн используют для массовых погрузочно-разгрузочных работ, а краны грузоподъёмностью до 1 600 тонн – для строительных (в том числе судостроительных), монтажных и аварийно-спасательных работ.

FLOATING DOCK = ПЛАВУЧИЙ ДОК – Floating Dock is a floating structure which can be partially submerged to enable vessels to enter and leave the structure for use as a dry dock. A floating structure that can be partially submerged to enable vessels to enter and to leave and which can be raised for use as a dry dock. / Под Доком, от Голландского слова Dok, понимается сооружение (камера) для извлечения судов из воды, осмотра и ремонта их подводной части (докование) либо для постройки судов. Различают наливные, плавучие и сухие доки. Камера наливного дока имеет канал для ввода судов и площадки с опорами для их установки, расположенные выше обычного уровня воды. В наливном доке судно садится на опоры при откачке из дока воды. Плавучий док состоит из плоского прямоугольного понтона, на палубе которого размещены опоры для судов, и одной-двух продольных башен. Плавучий док при установке судна притопляется. Сухой док представляет собой водонепроницаемую камеру, закрываемую в головной части (со стороны акватории) шлюзом с затвором. При постановке в сухой док судно вводят в камеру, закрывают затвор, осушают камеру, и судно садится на опоры. Все доки оборудуют механизмами и устройствами для ввода и установки судов на опоры, насосами для перекачки воды, передвижными кранами, устройствами для подачи электрической энергии, пара, воды, сжатого воздуха и тому подобным при ремонтных или строительных работах.

FLOATING END = ПЛАВАЮЩАЯ ПРОДОЛЬНАЯ НИТЬ – Floating End:- single end continuously floating on the fabric. Weaving defect. Floating Ends:- Fabric:- all-cotton napped cord suiting; Construction:- (i) Count:- 140 x 76; (ii) Warp:- 38/1 cotton; (iii) Filling:- 40/1 cotton; Finish:- suede finish, plain dyed tan. Defect:- floating ends throughout several pieces. Analysis:- analysis showed that, whenever the defect appeared, there were several wrong draws in the goods. In some places as many as three ends were found weaving as one. In the sueding napping) operation, the picks were sufficiently weakened in these places to break through and allow the warp ends to float loosely on the surface. See also Floats. / Порок или дефект ткачества. Уточина:- .

FLOATING EXCHANGE RATE = ПЛАВАЮЩИЙ ОБМЕННЫЙ КУРС – Floating Exchange Rate is the price of a nation's currency in terms of the price of the currency of another nation that is determined by the foreign exchange market based on the demand and supply of the currencies. For example, if the equilibrium level of USD1 is at ¥107 on a particular day, the exchange rate between US Dollars and Japanese Yen is said to be ¥107/USD. When demand for yen increases, the value of Yen appreciates and the floating

exchange rate reaches ¥105/USD. In order for the floating exchange rate to work, currency systems in both the United States and Japan need to be in the floating exchange rate zone. After the establishment of the Smithsonian Agreement in December 1971 when the US Dollar was devalued to USD38 for an ounce of gold (from USD35), a wider band with 4.5 percent fluctuation was adopted in the fixed exchange rate system. When the US Dollar was devalued again in 1973 to USD42.22 for an ounce of gold, the United States and other nations began the floating exchange rate system. There are, however, two forms of floating exchange rate in the system, the managed floating and the freely floating; the former was adopted initially in 1973. A mirror image of the adjustable fixed exchange rate system, where government intervenes to keep the exchange around a pegged rate, the managed floating exchange rate regime follows the principle of a floating exchange rate yet with government intervention, though with reluctance, to prevent extreme movement of its currency that could interfere with its trade and investments in the international market. In the freely floating case, a country allows its currency to fluctuate based solely on the market mechanism of currency trading. Strictly speaking, a nation's exchange rate under the floating system depends on the demand and supply of the nation's currency relative to other currencies in the foreign exchange market. The rationale behind the floating exchange rate system is its 'auto correction' mechanism. For example, when the interest rate was reduced by the Federal Reserve Bank in the United States in 2008 during the credit crisis, the US Dollar depreciated initially relative to currencies of its major trading partners, a phenomenon that makes US goods and services less expensive to foreign buyers. However, the US Dollar also appreciated from time to time during the year due to high demand for the Dollar as its exports accelerated and spending increased from international tourists. The demand and supply of a country's currency is largely influenced and counterbalanced by the movement of its balance of payments, the effect of its monetary policy, and the dynamics and expectations that global trades bring to its economy on the foreign exchange market. And when the fluctuation of the currency becomes too volatile, e.g., there is too much demand for US goods that could cause higher inflation, the central bank may step in to buy Dollars back, a form of managed floating exchange rate, in order to maintain the currency within a desirable boundary. While the floating exchange rate system provides the balance power to a country's currency through the automatic correction of demand and supply in the foreign exchange market, the system also tends to be better protected from any unexpected economic or monetary movement of its trading partners. For example, under normal circumstances, when inflation in China reaches its 12 year high, its currency should depreciate to the level that US importers would not pay a higher price than that before the inflation for China's exporting goods. Unlike the fixed exchange rate regime, countries under the floating exchange rate system do not need to maintain their currency at a fixed level. Subsequently, central banks are free to exert monetary policies needed for domestic economic development without interfering with its exchange rate system. However, there are side effects under the floating exchange rate regime. In the freely floating case, because not all information that involves currency movement, such as future or forward contracts, is immediately available for investors and traders and the automatic adjustment process may take time to adjust depending on the market and economic conditions of involved nations, risk of loss due to high currency volatility can be high. In addition, a freely floating exchange rate system provides the opportunity for speculation, which could cause currency to deviate from its true equilibrium zone and therefore create greater uncertainties and losses in the international trading markets. Floating Exchange Rate is a fixed exchange rate is when the value of a currency is fixed by governmental action at some officially determined level in terms of another currency. / Смитсониэнское Соглашение (Smithsonian Agreement). Плавающий Обменный Курс – изменение обменных курсов иностранной валюты вследствие изменения соотношения спроса и предложения; также известен как Гибкий Обменный Курс (Flexible Exchange Rate). Усиление или ослабление валют зависит от изменений национальных резервов твёрдой валюты и золота, международного торгового баланса страны, уровня инфляции, процентных ставок и общего состояния её экономики. Страны, как правило, не стремятся к тому, чтобы их валюта была слишком сильной, поскольку это делает товары, произведённые в стране, слишком дорогими для зарубежных покупателей. Слабая валюта может означать экономическую нестабильность, если слабость обусловлена высокой инфляцией или экономическим спадом. Противоположностью плавающему обменному курсу является Фиксированный Обменный Курс (Fixed Exchange Rate).

FLOATING INTEREST RATE = ПЛАВАЮЩАЯ ПРОЦЕНТНАЯ СТАВКА – Floating Interest Rate is an interest rate that is allowed to move up and down with the rest of the market or along with an index. This contrasts with a fixed interest rate, in which the interest rate of a debt obligation stays constant for the duration of the agreement. A floating interest rate can also be referred to as a Variable Interest Rate because it can vary over the duration of the debt obligation. For example, residential mortgages can be obtained with a fixed interest rate, which is static and can't change for the duration of the mortgage agreement, or with a floating interest rate, which changes periodically with the market. In the case of floating interest rates in mortgages, and most other floating rate agreements, the prime lending rate is used as a basis for the floating rate, with the agreement stating that the interest rate charged to the borrower is the prime interest rate plus a certain spread. Floating Interest Rate is an interest rate that fluctuates as market rates move.

FLOATING OIL STORAGE = ХРАНЕНИЕ НЕФТИ НА ПЛАВУ – Floating Oil Storage:- oil stored on floating vessels. It has been the practice for oil to be stored in large laid-up oil tankers in order to offset the loss involved while the tankers are inactive.

FLOATING PRODUCTION STORAGE AND OFF–LOADING VESSEL = СУДНО ДЛЯ РАЗГРУЗКИ И ХРАНЕНИЯ ПРОДУКЦИИ НА ПЛАВУ (или МОРСКИЕ ПЕРЕГРУЖАТЕЛИ) – Floating Production Storage And Off-Loading Vessel is the vessel, often a convert oil tanker, is used offshore as a floating platform for the drilling, production, storage and loading of crude oil. See also Offshore-Loaded.

FLOATING RATE BOND = ОБЛИГАЦИЯ С ПЛАВАЮЩЕЙ СТАВКОЙ (или ОБЛИГАЦИЯ С ПЕРЕМЕННОЙ СТАВКОЙ) – Floating Rate Bonds are the bonds with a variable interest rate (floaters), which changes every three or six months in line with short-term Euro market interest rates (LIBOR or Euribor). The coupon may also be linked to the inflation rate. Since floaters are not subject to significant price fluctuations they afford investors a certain amount of protection against the risk of interest rate changes on the market. Floaters are an alternative to time deposits. Reverse floaters enable investors to profit from falling interest rates, since the coupon is paid as a combination of a fixed basic interest rate minus a certain reference rate. Bond whose interest can change under certain circumstances. / (более известная в Англоязычном звучании как ЛАЙБО или ЛИБО (LIBOR)) или ЮРИБО (или ЮРАЙБО; EURIBOR). Облигация, процент по которой может изменяться при определённых обстоятельствах.

FLOATING RATE NOTE = БИЛЕТ С ПЛАВАЮЩЕЙ СТАВКОЙ (или НОТА С ПЕРЕМЕННОЙ СТАВКОЙ) – A Floating Rate Note, often called an FRN or Floater, is a debt instrument that pays a floating interest rate. The interest rate is usually based on an accepted market benchmark rate such as LIBOR. Maturities at issue are usually in the three to five year range. The value of FRNs is not as sensitive to interest rates as that of debt securities that pay fixed interest. This makes them less risky for an investor who may which to sell them. From the point of view of an investor who wishes to secure a stable income and is willing to hold to maturity, FRNs are more risky. As interest rates change in line with the risk free rate the present value of an FRN is fairly stable providing that its risk does not change (provided the issuer remains equally financially stable). Note whose interest can change under certain circumstances. On the Euromarket FRNs (Floating Rate Notes) are generally issued with a minimum coupon and a current interest margin over LIBOR. The potential band for interest rate fluctuations is limited in most cases by a floor or cap. Floating-Rate Note (FRN) is a note with a variable interest rate. The adjustments to the interest rate are usually made every six months and are tied to a certain money-market index. Also known as a Floater. These protect investors against a rise in interest rates (which have an inverse relationship with bond prices),

but also carry lower yields than fixed notes of the same maturity. It's essentially the same concept as an adjustable-rate mortgage, except FRNs are investments (not debt). Floating Rate Note (FRN) is a Eurobond with a variable rate of interest. FRNs are usually medium term with interest paid quarterly based on a spread over 3-month Libor. / (более известная в Англоязычном звучании как ЛАЙБО (LIBOR)). В большинстве случаев потенциальный коридор для флуктуаций (колебаний) процентной ставки ограничен нижним или верхним пределами. Облигация с Плавающей Ставкой – долговой инструмент с плавающей процентной ставкой, корректировка которой производится периодически, каждые 6 месяцев, кроме того, она привязывается к индексу по денежному рынку, как, например, процентная ставка по Казначейским векселям. Облигации с плавающей ставкой обычно имеют срок погашения примерно 5 лет. Они предоставляют владельцам защиту от роста процентных ставок, но по ним выплачивается более низкий доход, чем по облигациям с фиксированной процентной ставкой, имеющим тот же срок погашения. Также используется название Floater (долговой инструмент с плавающей процентной ставкой).

FLOATING RICE = ПОПЛАВКОВЫЙ РИС – Floating Rice is a Rice that can maintain their canopies above the water in slowly rising flood as deep as several meters. It can take gradually increasing water level up to several meters at a maximum rate of 15 cm per day, provided there is adequate growth at the seedling stage approximately six weeks before the onset of flooding. Examples are floating Rice varieties grown where maximum water depth ranges between 1 and 6 m for more than half of the growth duration. In densely populated areas, floating Rice is grown as a subsistence crop because no other crop will grow.

FLOATING SELVEDGE = ПЛАВАЮЩАЯ КРОМКА – Floating Selvedge:- monogram viscose end in name selvedge floats instead of binding called floating selvedge. Weaving defect. / Порок или дефект ткачества.

FLOATING STORAGE = ХРАНЕНИЕ НА ПЛАВУ – Floating Storage:- changes in floating storage represent estimates of the change in global crude oil stocks held in moored tankers used for temporary storage between producing and consuming countries.

FLOAT LOOP = ПЕТЛЯ ПЕРЕКРЫТИЯ (или НЕПОДРАБОТАННАЯ ПЕТЛЯ) – Float Loop is a knitted stitch when a needle holds its old loop and does not receive a new yarn. It connects two loops on the same course but not in adjacent wales. Also called a Miss-Loop.

FLOATS = ПЕРЕКРЫТИЯ (или ПОДНЫРКИ, или НЕПОДРАБОТКИ НИТЕЙ) – Floats are two types:- Warp & Weft Float. Length of the warp or weft, which is not woven as per the fabric design, floats on the fabric 2 to 3 pick long at face or back. Weaving defect. Floats and Floating Ends:- (i) wax liquor pick up and its concentration at warping; (ii) shed openings; (iii) shed height and staggering; (iv) warp tension; (v) avoid bead formation in warp; (vi) height of cloth supporting bracket; (vii) position of wip roller; (viii) condition of projectile guide; (ix) condition of temple ring; (x) end obstruction due to yarn knot, fluffs, yarn quality, warp break, shedding timings etc; and (xi) heald wire broken or bent. Floats:- it is a kind of defect where a warp or weft yarn floats over the fabric surface for a few centimeter lengths due to missing of interlacement of two series of yarns. / Основное или Уточное Перекрытие. Подныркa или Неподработка Нити – порок или дефект ткачества. Неподработка Нитей образуется, когда нити основы на некотором протяжении не переплетаются с утком по принятому рисунку, а выступают на поверхности ткани. Подныркa – тот же порок, образуемый уточными нитями. Подныркa – местный порок в виде одной или нескольких нитей одной системы, неправильно перекрывающих нити другой системы, нарушая переплетение. Подныркa не более 5 см. Размер порока – до 1 см. Под Подныркaми понимается дефект суровой ткани, когда уточные нити на коротких участках не переплетаются с основными, а выступают в виде скобочек или петель сверху или снизу полотна; причины – нечистый зев, несвоевременный ввод уточной нити в зев, провисание нитей основы, излишне высокое или низкое расположение шпаруток и другое.

FLOATS STITCHES = СТЕЖКИ ПЕРЕКРЫТИЙ – Floats Stitches:- a place in the fabric where warp and weft yarns escape the required interlacement due to entanglement of warp threads. Weaving defect. / Порок или дефект ткачества.

FLOAT STITCH = ПЕТЛЯ ПЕРЕКРЫТИЯ – Float Stitch or Welt Stitch is composed of a held loop, one or more float loops and knitted loops. It is produced when a needle (M) holding its old loop fails to receive the new yarn that passes, as a float loop, to the back of the needle and to the reverse side of the resultant stitch, joining together the two nearest needle loops knitted from it. The float stitch shows the missed yarn floating freely on the reverse side of the held loop. (This is the technical back of single-Jersey structures but is the inside of rib and interlock structures.) The float extends from the base of one knitted or tucked loop to the next, and is notated either as an empty square or as a bypassed point. It is assumed that the held loop extends into the courses above until a knitted loop is indicated in that wale. A single float stitch has the appearance of a U-shape on the reverse of the stitch. Structures incorporating float stitches tend to exhibit faint horizontal lines. Float stitch fabrics are narrower than equivalent all-knit fabrics because the wales are drawn closer together by the floats, thus reducing width-wise elasticity and improving fabric stability. See also Miss-Stitch. A Float Stitch is produced by missing interlooping over a series of needles so that the thread floats over a few loops in each course. / Смотрите также Пропущенная Петля (Miss-Stitch).

FLOCCOSE = ХЛОПЬЕВИДНООПУШЁННОЕ – Floccose (of plants):- having tufts of short soft woolly hairs. / С пучками мягких волосков; С хохолками; Шерстистое.

FLOCCULATING = ФЛОККУЛЯЦИЯ (или ХЛОПЬЕОБРАЗОВАНИЕ) – Flocculating is a coagulating or coalescing a material into a small, loosely aggregated mass. / Флоккуляция это коагулирование (свёртывание; coagulating) или коалесцирование или коалесценция (сращение; coalescing) .

FLOCK = ФЛОК (или ОХЛОПЬЯ, или ОЩИПКИ) – Flock is the material obtained by reducing textile fibers to fragments by cutting or grinding. There are two main types:- precision cut flock, where all fiber lengths are approximately equal, and random cut flock, where the fibers are ground or chopped to produce a broad range of lengths. Flock is very short fibers, intentionally produced for other purposes than spinning. / Флок является нетканым текстилём. Первое упоминание о тканях, созданных без применения ткацкого станка, относится к I веку до Нашей Эры. Искусство наклеивать мелко нарезанный ворс (он и называется флоком) на плотную текстильную основу с помощью тонкого слоя смолы родилось в Китае и только в позднем средневековье распространилось в Европе. При создании флока используют мелкий нейлоновый ворс. Заранее сотканная основа движется по станку, при этом на неё тонким слоем наносится клеевой состав. Из расположенного над станком бункера поступает флок. Частички ворса просто равномерно высыпают на основу. При этом над самой основой создают постоянное электростатическое поле. Наэлектризованные частички ворса падают в этом поле на клеевую основу строго вертикально, чем и достигается ровность ворсового покрытия, и что потом создаёт ощущение мягкости при прикосновении к флоку. Различаются печатные и тиснёные флоки. На первые цветной рисунок наносится с помощью бумажной печати (в упрощённом виде это можно представить как печать текста через 'копирку'). Вторые же представляют собой однотонные ткани, а тиснение выполняется валом, на который и нанесён рисунок.

FLOCKING = ФЛОКИРОВАНИЕ (или ХЛОПЬЕОБРАЗОВАНИЕ, или ПРИКЛЕИВАНИЕ, или ПРИЛИПАНИЕ, или ОЧЁСЫВАНИЕ, или ОПУШЕНИЕ, или ОЩИПЫВАНИЕ, или ЩИПАНИЕ) – Flocking:- a type of raised decoration applied to the

surface of a fabric in which an adhesive is printed on the fabric in a specific pattern, and then finely chopped fibers are applied by means of dusting, air-brushing, or electrostatic charges. The fibers adhere only to the areas where the adhesive has been applied, and the excess fibers are removed by mechanical means. Flocking is a method of cloth ornamentation in which adhesive is printed or coated on a fabric, and finely chopped fibers are applied all over by means of dusting, air-blasting, or electrostatic attraction. In flock printing, the fibers adhere only to the printed areas and are removed from the unprinted areas by mechanical action. Flocking is the application of fine particles to adhesive coated surfaces. The majority of flocking done worldwide uses finely cut natural or synthetic fibers. A flocked finish imparts a decorative and/or functional characteristic to the surface. The variety of materials that are applied to numerous surfaces through different flocking methods create a wide range of end products. The flocking process is used on items ranging from retail consumer goods to products with high technology military applications. Historians claim that flocking can be traced back to circa 1000 BC, when the Chinese used resin glue to bond natural fibers to fabrics. Fiber dust was strewn onto adhesive coated surfaces to produce flocked wall coverings in Germany during the middle ages. In France, flocked wall coverings became popular during the reign of Louis XIV. / Флокирование (Flocking). нарезанные или рубленые волокна. Люи XIV (Louis XIV).

FLOC POINT = ТОЧКА ПОМУТНЕНИЯ (или ТЕМПЕРАТУРА ПОМУТНЕНИЯ) – Floc Point is the temperature at which wax or solids separate in an oil.

FLOODING = ЗАТОПЛЕНИЕ (или ПОЛОВОДЬЕ) – A Flooding is:- (1) the normal process that floods the plains where deepwater Rice is grown. (2) To apply water to the field for the benefit of saturating the soil for land preparation. (3) Establishing and maintaining an irrigated Rice crop. / Под Половодьем понимается ежегодно повторяющееся в один и тот же сезон относительно длительное увеличение водности реки, вызывающее подъём вод из меженного русла и затоплением поймы.

FLOOD PLAIN = ПОЙМА (или ПОЙМЕННАЯ ПЛОЩАДЬ, или ДОЛИНА ЗАТОПЛЕНИЯ) – Flood Plain is the land bordering a stream or river, built up of sediments from the overflow of the stream or river and subject to inundation at the peak of the flood period. / Под Поймой понимается часть дна речной долины, затопляемая только в половодье.

FLOOR = НИЖНИЙ ПРЕДЕЛ (или ОПЦИОН НА НИЖНИЙ ПРЕДЕЛ, или ОПЦИОН НА ПРЕНИЖЕНИЕ ПРЕДЕЛА) – (1) For over-the-counter markets, Caps and Floors are options which provide the right, but not the obligation, to enter into a long or short position at a specified price. Caps and floors are similar to swaps since they provide price protection at a predetermined level. However, caps and floors are different from swaps in that allow producers and end users to benefit from favorable price changes. The buyer of the cap or floor pays an up-front cash premium for this price protection. With caps and floor purchases, all risks are predefined; the premium paid for the option will always be the maximum ‘loss’ or ‘cost’ incurred by the buyer. Floors are referred as Put Options. For this premium, the buyer minimises exposure to adverse price movements while retaining the ability to capitalize fully on advantageous of an upswing of the underlying asset. See also Collar. A supply contract between a buyer and seller of a commodity, whereby the seller is assured that he will receive at least some minimum price. This type of contract is analogous to a put option. Individually structured interest option stipulating a minimum interest rate as a long-term hedge for buyers.

(2) A Floor is a lower limit. An interest rate floor guarantees a minimum interest rate level or interest amount. It is an agreement between a floor seller and a floor buyer such that, when the market rate falls below a specified limit (floor rate), the floor seller pays the floor buyer the difference between the rates for an agreed priod of time (floor term). A floor is the opposite of a Cap. Lower limit applying to a quantity, price or interest rate, for example, minimum interest rate on Floating Rate Bonds. The opposite of Cap. Floor is a contract whereby the seller agrees to pay to the purchaser, in return for upfront premium, the difference between a reference rate and an agreed strike rate should the strike rate exceed the reference rate. Interest rate floors, such as caps, are effectively a string of interest rate guarantees.

(3) Floor is a supply contract between a buyer and seller of a commodity, whereby the seller is assured that he will receive at least some minimum price. This type of contract is analogous to a put option, which gives the holder the right to sell the underlying at a predetermined price. The Floor is a standard height from the ground. Floor is a recognized low point in market prices. This may be a point the market does not expect the price to fall below, the lowest price achieved before the market rises or a level set by a customer as a minimum selling price.

FLOOR = ПОЛ – Floor is the main huge trading area, about the size of a football field, where stocks are bought and sold on the New York Stock Exchange. A specially constructed arena on the trading floor of exchange where futures and options trading is conducted. See also Pit, and Ring. / Специально сконструированная арена в операционном зале биржи, где происходит торговля акциями, индексами, ценными бумагами, фьючерсами и опционами. Смотрите также Яма (Pit), и Ринг (Ring). Пол торгового зала биржи – часть фондовой биржи, где непосредственно происходит заключение торговых сделок или исполняются распоряжения брокерам на фиксацию убытка (stop loss orders).

FLOOR BROKER = БРОКЕР НА ПОЛУ – Floor Broker is a person with exchange trading privileges who, in any pit, ring, post, or other place provided by an exchange for the meeting of persons similarly engaged, executes for another person any orders for the purchase or sale of any commodity for future delivery. An exchange member who executes orders to buy or sell futures and options in the trading ring on the floor of a commodities exchange. The largest single membership group of the New York Stock Exchange (NYSE®). There are two main types:- Commission Brokers, employed by brokerage houses, buy and sell securities on the NYSE® floor for the general public; Independent Floor Brokers work for themselves, they execute orders for brokerages without full-time commission brokers or for overly busy brokers. Floor Broker is any person who, in or surrounding any trading pit, floor, ring, post or other place provided by a contract market for the meeting of persons similarly engaged, executes for any other person any orders for the purchase or sale of any commodity for future delivery and receives a prescribed fee or commission. The US Floor Brokers must be registered with the National Futures Association. / Лицо, которое в окружённой будь-то торговой яме, на полу, ринге, у дисплея или иного места, используемого рынком контрактов для встречи лиц, вовлечённых в аналогичное мероприятия, исполняет для любого другого лица любые распоряжения по покупке или продаже любого товара для будущей поставки и получает за это установленную плату или комиссию. Американские Брокеры на Полу должны быть зарегистрированы в Национальной Ассоциации по Фьючерсам. НЙФБ® или Эн.Уай.Эс.И.® (NYSE®). Брокер на Полу торгового зала биржи – член биржи, являющийся работником фирмы – члена биржи и выполняющий приказы клиентов в качестве агента в торговом зале. Брокер на полу получает приказ по телетайпной сети из торгового отдела фирмы, затем идёт к соответствующему торговому посту в зале биржи, присоединяется к другим брокерам и специалистам и осуществляет сделку по наиболее выгодной имеющейся цене. По завершении сделки клиента уведомляют через зарегистрированного представителя фирмы, и сделка заносится на ленту тикера, дающего информацию по всем сделкам с ценными бумагами, котируемыми на НЙФБ® или Эн.Уай.Эс.И.® (NYSE®) и АМЭКС® (AMEX®); эта информация через электронную сеть распространяется по всей стране. Брокера на полу не следует путать с торговцем на полу (floor trader), который ведёт операции преимущественно за свой счёт, а не действует в качестве брокера.

FLOOR INFORMATION DEVICES = ИНФОРМАЦИОННЫЕ УСТРОЙСТВА НА ПОЛУ – Floor Information Devices:- displays consolidated close, New York Stock Exchange last sale, quotes, net change, regional ITS Quotes, ex-dividend and Dow Jones news indicators. / Дау Дьжонз (Dow Jones).

FLOOR LOAD = НАГРУЗКА НА ПЕРЕКРЫТИЕ (или НАГРУЗКА НА ПОЛ) – A term Floor Load refers to product stacked directly onto the floor of a trailer without pallets or slip sheets; product must be unloaded manually without the use of a forklift.

FLOOR TRADER = ТОРГОВЕЦ НА ПОЛУ – Floor Trader is the exchange trader who executes trades strictly for his own account. Also known as Local. A person with exchange trading privileges who executes his own trades by being personally present in the pit for futures trading. Floor Trader is an individual who is a member of an exchange and usually executes his own trades strictly for his own account by being personally present in the pit or place for futures trading. Floor traders must be registered with the National Futures Association. Floor Trader is an exchange member who usually executes his own trades by being personally present in the pit or place for futures trading. Sometimes called a Local. Floor Trader is an exchange member who personally executes trades on the floor (trading pits) of the trading exchange. / Биржевой торговец, который исполняет все свои торговые операции строго за свой собственный счёт. Известен также как Местный (Local). Торговец на Полу торгового зала биржи – член фондовой или товарно-сырьевой биржи, ведущий операции в зале биржи за свой счёт. Он должен подчиняться правилам ведения торговых операций, аналогичным правилам для специалистов, ведущих операции от имени иных лиц. Этот термин не следует путать с термином брокер на полу (floor broker).

FLOOR TRANSACTION = ТРАНЗАКЦИЯ НА НИЖНИЙ ПРЕДЕЛ (или ОПЕРАЦИЯ С ОПЦИОНОМ НА НИЖНИЙ ПРЕДЕЛ) – Floor Transaction is a transaction in which one party pays a single or periodic amount and the other party pays periodic amounts of the same currency based on the excess, if any, of a specified per annum rate (in the case of an interest rate floor) or a specified price (in the case of a commodity floor) over a specified floating rate (in the case of an interest rate floor) or commodity price (in the case of a commodity floor). See also Floor. / Операция, при которой одна сторона выплачивает разовые или периодические суммы, а другая сторона выплачивает периодические суммы в той же валюте, основанные на излишке, если не оговорено иначе, спецификационном с привязкой к годовой ставке (в случае операции с опционом на нижний предел процентной ставки) или спецификационной цены (в случае операции с опционом на нижний предел цены сырья) против спецификационной плавающей ставки (в случае операции с опционом на нижний предел процентной ставки) или цены сырья (в случае операции с опционом на нижний предел цены сырья).

FLOP = ПРОВАЛ (или ШЛЁПАНЬЕ, или XX) – Flop is a difference in color and appearance of a material viewed over two widely different aspecular angles.

FLOP ANGLE = УГОЛ XX – Flop Angle is the aspecular angle when a material is viewed from a direction far from the specular, typically 70° or more, normally associated with a change in color and appearance at two viewing angles.

FLORA = ФЛОРА – Flora is all the plant species in an area. A book or treatise on plant species from a particular region. / виды (species). Под Флорой, от Латинского слова Flora, означавшего в Римской мифологии имя богини Флора, от Латинского слова Flos, родительный падеж Floris, означающее Цветок, понимается исторически сложившаяся совокупность видов растений, населяющих какую-либо территорию или населявших ей в прошедшие геологические эпохи. Различают флору Земли, отдельных материков и их частей, островов, горных систем и тому подобное, а также флору стран, административных областей и другого.

FLORAL = ОТНОСЯЩЕЕСЯ К ФЛОРЕ (или ОТНОСЯЩЕЕСЯ К ЦВЕТКУ, или ЦВЕТКОВОЕ, или ЦВЕТОЧНОЕ) – Floral:- relating to, or resembling, or made from, or containing flowers.

FLORET = ЦВЕТОЧЕК – Floret is a small flower, generally one of a dense cluster but an individual flower in members of families Poacea and Asteracea. Floret is a small flower, especially as one component of a dense multiple flower cluster. Floret is a unit of the spikelet, including the lemma, palea, and the enclosed flower. / Цветочек – маленький цветок, особенно когда речь идёт об одном компоненте густого многочисленного рацемозного (или ботрического) соцветия (flower cluster). Цветочек – отдельный компонент сложного цветка или компактного соцветия.

FLORID = XX (или БАГРОВОЕ) – Florid:- tinged with red; ruddy.

FLOSS SILK = УГАРНЫЙ ШЁЛК (или ВЫШИВАЛЬНЫЙ ШЁЛК) – Floss Silk is a tangled silk waste. Floss is also a twisted silk yarn used in art needlework. / от Французского слова Флёс (Floss) = Отходы кокономотания и шёлкокручения, которые служат сырьём для шёлкопрядильного производства.

FLOTATION = НАХОЖДЕНИЕ В ОБРАЩЕНИИ (или ФЛОТАЦИЯ) – Flotation:- in the United Kingdom, when a company's shares are admitted to trading on an exchange. / В Соединённом Королевстве это относится к моменту допуска акций компании для торговли на бирже. Под Флотацией, от Французского слова Flottation от Флёттэ (Flotter), означающее Плавать На Поверхности Воды, понимается .

FLOTSAM = ПЛАВАЮЩИЕ ОБЛОМКИ – Flotsam:- cargo cast or lost overboard and recoverable by reason of its remaining afloat. Floating wreckage of a ship or its cargo, or floating debris. / Плавающие обломки судна или его груз, или плавающие осколки.

FLOW = ПОТОК – Flow:- movement of objects or values determined by a set of operations and decisions working in the same direction. The term is used in economics by analogy with the concepts of physics or biology (flow of liquids, ebb and flow of tides, etc). In business accounting, a flow shows the change in the amount of an item over time, in an income statement for example, as opposed to a snapshot of an item at a given point in time, as in a balance sheet. Economic flows reflect the creation, transformation, exchange, transfer or extinction of economic value. They involve changes in the volume, composition or value of an institutional unit's assets and liabilities. They are recorded in the production, distribution and use of income and accumulation accounts. / строка баланса (item).

FLOWABILITY = ТЕКУЧЕСТЬ – Flowability is an ability of crystalline, pulverulent or granular goods to flow freely. / Под Текучестью понимается свойство сред пластически или вязко деформироваться под действием механических напряжений. Количественно текучесть – величина, обратная вязкости. У газов и жидкостей текучесть проявляется при любых напряжениях, у пластичных твёрдых тел – лишь при высоких напряжениях, превышающих предел текучести. Под Текучестью жидкости понимается величина, обратная динамической вязкости жидкости. Единица текучести в СИ – $Па^{-1}·с^{-1}$.

FLOWABLE = ТЕКУЧЕЕ – Flowable:- a two-phase formulation containing solid herbicide suspended in liquid, and that forms a suspension when added to water. Flowable (F):- a formulation which consists of a pesticide plus dust diluent that is blended in a small quantity of water.

FLOW CHART = ГРАФИК СОБЫТИЙ (или БЛОК–СХЕМА) – Flow Chart is a diagram, using symbols and depicting the sequence of events that should take place in a complex set of tasks. / Диаграмма, использующая символы и изображающая последовательность событий, которые должны иметь место в комплексном наборе задач.

FLOW CONTROL VALVE = КЛАПАН РЕГУЛИРОВАНИЯ РАСХОДА (или ХХ) – Flow Control Valve is a valve whose primary function is to control flow rate. See also Valve.

FLOWER = ЦВЕТОК – Flower is the complex reproductive organ of an angiosperm plant which may include sepals, petals, stamens and pistil. Flowers may include either male or female parts or both. The colorful parts of a flower and its perfume attract pollinators and guide them to the nectary, usually at the base of the flower tube. Pollination usually occurs incidentally to foraging for nectar or pollen as food. Xerophytic plants may have flowers that are produced and open in response to rain and produce seed within a few weeks of pollination, thus completing their life cycle. Species with tubular red flowers have often evolved to attract humming birds and other avian pollinators. Some night-flowering species have specialised to attract bats with foetid fleshy blooms or moths with large strongly-perfumed flowers. See also Catkin, Corymb, Cyathium, Cyme, Fascicle, Panicle, Raceme, Spadix, Spike, Thyrse Umbel. Flower is the reproductive part of the angiosperms. In rice, it consists of two lodicules, six stamens, and the pistil. Flower (Rice):- the two lodicules, six stamens, and the pistil. / , который может состоять из чашелистиков (sepals), лепестков венчика (petals), тычинок (stamens) и пестика (pistil). Виды (species) с . Смотрите также Серёжка (Catkin), Щиток (Corymb), Букетик (Cyathium), Полузонтик или Ложный Зонтик (Cyme), Пучок или Гроздь (Fascicle), Метёлка (Panicle), Кисть (Raceme), Початок (Spadix), Колос (Spike), Тирсоидный Зонтик (Thyrse Umbel). Репродуктивный орган ангиоспермов (цветковых или покрытосеменных растений). У Риса он состоит из двух лодикул, шести тычинок (stamens), и пестика. Под Цветком понимается орган полового размножения цветковых растений; специализированный укороченный побег. В цветке различают цветоложе, околоцветник (чашечку и венчик), андроцей – совокупность тычинок, гинецей – совокупность плодолистиков, которые образуют один или несколько пестиков. В нижней части пестика (завязи (ovary)) развиваются семязачатки, из которых формируются семена; завязь превращается в плод. Цветки могут быть женскими (имеют только пестик (pistil) или пестики), мужскими (содержат только тычинки) или обоеполыми. Цветки часто имеют яркую окраску, запах, что привлекает животных-опылителей (птиц, насекомых), питающихся нектаром и пыльцой. Растения с цветками разнообразной окраски и красивой формы используют для декоративного оформления помещений, садов, парков и так далее. Цветок, укороченный и ограниченный в росте репродуктивный побег, выполняющий функции микро- и мегаспорогенеза, опыления (осуществляемого при содействии агентов переноса пыльцы), оплодотворения, развития зародыша и образования плода. Цветок заканчивает собой стебель (главный или боковой). Часть стебля под цветком, обычно лишённая листьев, называется Цветоножкой (Pedicle или Peduncle). Нередко она очень укорочена и едва выражена, и тогда цветок называется сидячим. Цветоножка переходит в укороченную ось цветка – Цветоложе (Receptacle), которое обычно шире цветоножки и характеризуется слабо выраженными междоузлиями. Цветоложе может быть различной формы. На его узлах расположены все части цветка, как стерильные (чашелистики и лепестки), так и фертильные (тычинки и плодолистики). Чашелистики (Sepals), образующие в совокупности Чашечку (Calyx), обычно служат органами защиты цветка, особенно до его распускания (в бутоне), а часто также дополнительными органами фотосинтеза. Нередко они становятся лепестковидными и принимают на себя функцию лепестков, например у Ломоноса. В процессе эволюции цветка чашелистики часто срастаются в сростнолистную чашечку. Лепестки (Petals) служат для привлечения опылителей. Совокупность лепестков цветка называется Венчиком (Corona или Corolla или Coronet). Чашечка и венчик составляют вместе Околоцветник (Perianth), или покров цветка. Когда в цветке имеются как чашечка, так и венчик, то околоцветник называется двойным. В тех случаях, когда лепестки отсутствуют или когда нет ясно выраженных различий между чашечкой и венчиком, околоцветник называется простым. В центре цветка расположены Тычинки (Stamens или Stamina) и Плодолистики. Как по своей функции, так и по происхождению тычинки представляют собой микроспорофиллы. Наиболее примитивные из них (у ряда представителей семейства Магнолиевых и Винтеровых) представляют собой широкую лентовидную пластинку, снабжённую четырьмя попарно сближенными линейными микроспорангиями, более или менее погружёнными в ткань пластинки. В процессе эволюции тычинки постепенно дифференцировались на Тычиночную Нить (Filament) и Пыльник (Anther), состоящий из двух половинок, соединённых связником (продолжение тычиночной нити). Совокупность тычинок в цветке называется Андроцеем. Тычиночные нити часто срастаются как между собой, так и с членами околоцветника и с плодолистиками. Иногда тычинки срастаются между собой также пыльниками (нередко только пыльниками). Плодолистики, или Карпеллы, представляют собой сильно видоизменённые и специализированные мегаспорофиллы. Нередко плодолистик называется Пестиком (Pistil) (Простым Пестиком), однако этот термин применяется в разных смыслах и вносит путаницу. Наиболее примитивный тип плодолистика сохранился у родов Дегенерия (семейство Дегенериевые) и рода Тасмания из семейства Винтеровых. Он состоит из короткой ножки (гиноподия) и относительно тонкой адаксиально сложенной (кондупликатной) пластинки и внешне очень напоминает сложенные в почки кондупликатные листья. Вдоль плодолистика проходят 3 проводящих пучка (жилки), из которых средняя, или спинная (дорсальная), сильно ветвится. Между средней и боковыми жилками расположены многочисленные Семязачатки, или Семяпочки. На ранних стадиях развития края плодолистиков дегенерии почти не соприкасаются между собой, а защита семязачатков во время цветения обеспечивается благодаря тесному сближению широких боковых участков плодолистика, расположенных между его краями и плацентами. Срастание этих сближенных внутренних поверхностей происходит лишь после цветения, то есть в процессе развития плода. У других представителей Винтеровых наблюдаются самые различные стадии срастания. У всех цветковых растений на плодолистике имеется особая, служащая для улавливания пыльцы железистая ткань, называемая Рыльцем (Stigma или Stigmata). У Дегенерии и Тасмании рыльце примитивное и протягивается по всей длине плодолистика. Верхняя часть плодолистика, в которой оно локализуется, обычно вытягивается в тонкий стерильный столбиковидный вырост, приподнимающий рыльце над фертильной частью (завязью (ovary)) плодолистика и служащий для прохождения пыльцевой трубки. Эта специализированная тонкая часть плодолистика называется Столбиком (Style) (нередко её называют Стилодием, оставляя термин столбик только для сросшихся стилодиев). На ранних стадиях эволюции столбика (стилодия) он характеризуется низбегающим рыльцем, но в процессе дальнейшей эволюции рыльце постепенно локализуется на Верхушке (головчатое рыльце). Совокупность плодолистиков в цветке называется Гинецеем. Наиболее примитивные типы гинецея со свободными плодолистиками (например, у Магнолии, Лютика, Пиона) называются Апокарпными. В процессе эволюции плодолистики постепенно срастаются между собой, и из апокарпного гинецея возникает ценокарпный (смотрите Ценокарпия), в котором стилодии могут оставаться свободными или же срастаться, образуя столбик. Эволюция ценокарпного гинецея, как и эволюция апокарпного, обычно сопровождается уменьшением числа плодолистиков и в большинстве случаев также числа семязачатков. Крайняя форма редукции числа семязачатков в ценокарпном гинецее – так называемый псевдомономерный гинецей, у которого фертилен и полностью развит один плодолистик (у Ильма, Шелковицы, Крапивы, Конопли и других). В цветке большинства цветковых растений имеются специальные экскреторные органы для производства нектара – Нектарники (Nectary). Они возникли в самых разных ветвях эволюции цветковых растений и на самой разной морфологической основе, то есть на самых разных частях цветка. Примитивные типы цветков характеризуются относительно

длинным Цветоложем (Receptacle), но в некоторых случаях, как, например, у Мышехвостика или у некоторых Магнолиевых, имеется сильно удлинённое цветоложе вторичного происхождения. В процессе эволюции происходит постепенное укорочение цветоложа, в связи с чем части цветка всё более сближаются и первоначально спиральное их расположение изменяется на циклическое (круговое). Части циклического цветка обычно расположены мутовчато, реже – супротивно. Они встречаются гораздо чаще спиральных. Промежуточное положение занимают спироциклические цветки, например, цветок Лютика. Примитивные цветки – актиноморфные ('правильные'), то есть такие, которые могут быть разделены вертикальной плоскостью, проходящей через ось симметрии, на равные половины не менее чем в двух направлениях. В процессе эволюции (связанной с биологией опыления) из актиноморфных возникли зигоморфные ('неправильные') цветки. Они могут быть разделены на две половины только в одном направлении (например, цветок Гороха или Львиного Зева). В отличие от симметричных, то есть актиноморфных и зигоморфных цветков, встречаются также асимметричные цветки, которые невозможно разделить плоскостью симметрии на две равные половины, например, у Канны. Цветки могут быть обоеполыми или однополыми (раздельнополыми). Однополые цветки произошли из обоеполых в результате редукции в одних случаях – тычинок, в других – плодолистиков. В однополых цветках часто сохраняются рудименты тычинок и плодолистиков. Предполагают, что цветок произошёл из репродуктивных побегов гипотетических предков цветковых растений – Семенных Папоротников. В результате укорочения оси побега она превратилась в цветоложе, а в результате упрощения их расчленённых микро- и мегаспорофиллов возникли простые, неразветвлённые тычинки и плодолистики цветковых растений. (Предположение, что цветок произошёл из стробила (шишки) Саговников (Цикадовых), Гнетовых или Беннеттитовых, маловероятно.) При этом эволюция цветка, как и эволюция стробилов разных групп голосеменных, пошла разными путями. Таким образом, современные представления основаны на предположении, что основные части цветка – тычинки и плодолистики – произошли из спороносных органов предков цветковых растений. Трудно сказать с определённостью, были ли эти спороношения трёхмерными или плоскими, лишёнными хлорофилла или зелёными. Вероятнее всего, они представляли собой плоские и более или менее упрощённые (возможно, лопастные) спорофиллы, которые (особенно мегаспорофиллы), вероятно, частично несли функцию фотосинтеза.

FLOWER HEAD = ЦВЕТОЧНАЯ ГОЛОВКА (или ГОЛОВКА ЦВЕТКА) – Flower Head is a dense arrangement of flowers arising from a common point as in, e.g., Umbelliferae or Compositae. / плотное расположение цветков, произрастающих из общей точки как, например, у Зонтичных (Umbelliferae) или . Под Головкой понимается соцветие с укороченной, иногда утолщённой (но не плоской) осью, на верхушке которой на коротких цветоножках сидят цветки (у Ворсянки, Клевера и других).

FLOWERING = ЦВЕТЕНИЕ – Flowering is the stage when the anthers of the terminal spikelets protrude and shed pollen. / Стадия, во время которой пыльники .

FLOWERING DATE = ДАТА ЦВЕТЕНИЯ – Flowering Date is the date recorded when the panicles emerge from the boot.

FLOWERING GREENHOUSE PLANTS = ЦВЕТКОВЫЕ ПАРНИКОВЫЕ РАСТЕНИЯ – Flowering Greenhouse Plants, as relates to the US/Canada Greenhouse Certification Program, are those plants grown for their attractive flowers. They are grown indoors and are often incapable of surviving outdoor growing conditions in colder climates. Flowering greenhouse plants include Poinsettias, Easter Lilies, Hydrangeas, Cyclamens, Gloxinias, and Hibiscus. / Парник (Greenhouse). Цветковые Парниковые Растения включают:- Пуанзеции (Poinsettias), Пасхальные Лилии (Easter Lilies), Гортензии (Hydrangeas), Цикламены или Дряквы (Cyclamens), Глоксинии (Gloxinias) и Гибискусы (Hibiscus).

FLOWERING INTERVAL = ИНТЕРВАЛ ЦВЕТЕНИЯ (или ХХ) – Flowering Interval:- The time in days between the appearance of white flowers either at adjacent fruiting positions along the same sympodial branch (horizontal flowering interval (HFI)) or at the same fruiting position on the next higher sympodial branch (vertical fruiting interval (VFI)).

FLOWERING PLANT = ЦВЕТКОВОЕ РАСТЕНИЕ (или ЦВЕТУЩЕЕ РАСТЕНИЕ) – Flowering Plant is an angiosperm. / Цветковое или Цветущее Растение – ангиосперм (Покрытосеменное Растение). Под Цветковыми или Покрытосеменными Растениями понимается Отдел Высших Растений. Семязачатки погружены в ткани завязи, из которой после оплодотворения развивается плод с заключёнными в нём семенами (отсюда второе название). Характерно также наличие настоящего цветка и двойное оплодотворение. Около 250 000 Видов, по всему земному шару. Два Класса – Однодольные и Двудольные. Играют большую роль в жизни человека, снабжая продуктами питания, строительными материалами, сырьём для промышленности (текстильной, мебельной, фармацевтической и других).

FLOW FATIGUE RATING = РЭЙТИНЬГ ЗАТУХАНИЯ ПОТОКА – Flow Fatigue Rating:- the ability of a filter element to resist a structural failure of the filter medium due to flexing caused by cyclic differential pressure.

FLOWMETER = РАСХОДОМЕР (или ПОТОКОМЕР) – Flowmeter is a device which indicates either flow rate, total flow, or a combination of both. / Расходомер в технике, прибор для измерения расхода – объёма или массы среды, протекающей через прибор в единицу времени. Используется для контроля и учёта жидкости, пара или газа при их производстве, отпуске, потреблении и хранении, а также служит для регулирования технологических и теплоэнергетических процессов в автоматических системах контроля и регулирования. Расходомеры, работающие в течение произвольного промежутка времени, называются Счётчиками Жидкости и Газа; они могут использоваться как самостоятельные приборы или входить в измерительный узел топливо-маслораздаточной колонки и тому подобных установок. Иногда расходомеры снабжают интеграторами – устройствами для суммирования измеряемых масс или объёма. Наибольшее распространение получили расходомеры переменного и постоянного перепада давления. К Расходомерам Переменного Перепада Давления относятся Дифманометры, при использовании которых перепад давления в трубопроводе создаётся сужающими устройствами (диафрагмами, соплами, Трубой Вентури и тому подобными). В Расходомерах Постоянного Перепада Давления изменяется площадь проходного сечения, а перепад до и после него остаётся неизменным. Такого типа расходомеры выполняются с погружным поплавком или поршнем. В некоторых случаях, когда невозможно применять расходомеры, скорость потока измеряют с помощью напорных трубок, гидравлических вертушек и анемометров в нескольких точках трубопровода и вычисляют скорость потока в каком-либо его сечении. Объёмный расход определяют, умножая скорость на площадь сечения. Этот метод применим при различных испытаниях, когда временная установка расходомера нецелесообразна. В некоторых расходомерах (главным образом специального назначения) используют индукционные, ультразвуковые, радиоактивные и другие методы измерений.

FLOW MOISTURE POINT = ТОЧКА ТЕКУЧЕЙ ВЛАГИ (или ВЛАЖНОСТИ) – Flow Moisture Point (FMP) is a point at which the goods change from solid to liquid state.

FLOW RACK = ПОТОКОВЫЙ СТЕЛЛАЖ – Flow Rack:- racking equipment that allows for the product to be stocked in through one side and removed for order fulfillment purposes from the other side. Product stored in Flow Rack is naturally allocated via FIFO (short for the First In, First Out) based on the racking equipment design. Flow Rack is a storage method where product is presented to picking

operations at one end of a rack and replenished from the opposite end. / Метод хранения, при котором продукция, предполагаемая для отбора, берётся с одного конца стеллажа/платформы, а восполняется с противоположного конца. Под Стеллажом, от Немецкого слова Stellage, от Голландского слова Stellage от Stellen, означающее Помещать или Ставить, понимается многоярусное устройство, состоящее из ряда вертикальных стоек или стенок с полками, ящиками, кронштейнами, укреплённых в несколько ярусов на стойках каркасов. Стеллажи используются для хранения различных предметов и штучных материалов, а также для раскладки материалов, нуждающихся в сушке (например, кирпича, торфа). Стеллажи могут быть переставными (например, стеллажи-вертушки для медикаментов, инструментов) и передвижными (с ручным и электрическим приводом) для грузов, приём и выдача которых производятся в определённых местах.

FLOW RATE = ТЕМП ПОТОКА (или СКОРОСТЬ ПОТОКА, или СКОРОСТЬ ТЕЧЕНИЯ, или МОЩНОСТЬ ПОТОКА) – Flow Rate is the volume, mass, or weight of a fluid passing through any conductor per unit of time. A term Flow Rate refers to the flow of material (usually water) through a filter at a defined pressure difference between the upstream side of the filter and the downstream side. Flow rate is always reported in units of volume over time at a specified pressure drop (example, liters/min @ 3 pounds per square inch (psi)). As the filter begins to plug, the flow rate will decrease due to the openings in the filter being filled with captured contaminants. The filter is considered exhausted when the flow rate through the filter decreases to a point that it is too difficult to use.

FLOW RATE OF A WELL = ПРОИЗВОДИТЕЛЬНОСТЬ СКВАЖИНЫ (или ДЕБИТ СКВАЖИНЫ) – Flow Rate Of A Well is a quantity of hydrocarbons obtained from a well in a given period of time (usually one day). / Производительность Скважины или Дебит Скважины это количество углеводородов, добываемых из скважины в данный период времени (как правило за одни сутки). Под Производительностью Оборудования понимается объём продукции (работы), производимой в единицу времени данным оборудованием в соответствии с его конструктивными особенностями, технической характеристикой и определёнными организационно-производственными условиями. Производительность оборудования измеряется в тоннах, штуках, метрах и так далее в единицу времени. Под Дебитом, от Французского слова Debit, означающее Расход или Сбыт, понимается объём жидкости (воды, нефти и других) или газа, поступающих в единицу времени из естественного или искусственного источника (колодца, буровой скважины и другого). Дебит жидкости выражается в литрах в секунду (л/с) или кубических метрах в секунду ($м^3$/с), кубических метрах в час ($м^3$/ч), кубических метрах в сутки ($м^3$/сут), а дебит газа выражается в кубических метрах в сутки ($м^3$/сут). Дебит характеризует устойчивое поступление жидкости или газа в течение длительного времени. Объём воды, протекающей в единицу времени через поперечное сечение реки или водоносного горизонта, называется Расходом Воды. Этот же терин часто применяют для объёма воды, получаемого при искусственной откачке воды из колодцев и скважин, в процессе которой подаваемое количество жидкости зависит от способа и интенсивности откачки и понижения её уровня. Для характеристики производительности водозаборных скважин служит Удельный Дебит – дебит, отнесённый к понижению уровня воды при откачке на 1 метр. Дебит Скважины или Колодца зависит от водопроницаемости и мощности водоносного слоя, условий его питания, распространения и взаимосвязи с другими водоносными горизонтами, наличия напора и прочим, а также от условий эксплуатации водоносного горизонта, степени его вскрытия, понижения уровня воды при откачке, типа фильтра и других факторов. Необходимо различать Установившийся и Неустановившийся Дебит, так как в первое время можно получить завышенное значение дебита, особенно если вскрыта вода или нефть, заключающие большое количество газов. Дебит Воды определяется мерными сосудами, водосливами, водомерами различных конструкций, самопишущими дебитографами; иногда расчёт дебита производят по формулам динамики подземных вод. Для измерения Дебита Жидкостей применяются водомеры типа Вентури, основанные на создании перепада давления при измерении сечения трубопровода. Наблюдая разность давления ($p_1 – p_2$) по шкале или передавая её на самописец, можно определить количество протекающей воды по формуле:- $q = k\sqrt{(p_1 – p_2)}$, где k – постоянный коэффициент. В тех случаях, когда от места истечения воды образуется постоянный водоток (с дебитом не менее 1 л/с), дебит можно измерять с помощью водосливов. В зависимости от формы сечения водослива расчёт дебита ведётся по различным формулам, в которые входят значения высоты напора воды (h) и ширины водослива (b). На основе наблюдений за Дебитом Нефтяных Скважин строят кривые, показывающие изменения дебита в процессе эксплуатации. Анализируя эти кривые, определяют промышленные категории запасов нефти. Этот метод кривых основан на статистическом учёте добычи нефти за определённые периоды времени. По кривой зависимости дебита от времени с помощью математических расчётов устанавливают коэффициент падения дебита, который служит основой подсчёта запасов нефти по группам скважин и по пласту в целом. При гидрогеологических исследованиях (определении производительности водозаборов, оценке запасов подземных вод, исследования притоков воды к дренам и прочего). Дебит скважин и колодцев является одним из важнейших показателей. Расчёты дебита воды колодцев и скважин, если не производятся опытные работы, ведут с помощью данных о коэффициенте фильтрации пласта, его мощности, напорном градиенте, а также путём сравнения с дебитом скважин и колодцев, находящихся в сходных гидрогеологических условиях. Для наиболее точного определения дебита эксплуатационного сооружения проводятся опытные откачки. Дебит Газа обычно измеряется в $м^3$/сут. При измерении дебита газа применяются анемометры, шайбенные измерители и другие приборы. Например, при измерении дебита газа, выделяющегося на дне водоёма, отбор пробы газа выполняется следующим образом:- газ должен быть полностью захвачен воронкой. Дебит определяется по времени заполнения газом сосуда определённой ёмкости. В случае газирующей воды устраиваются Газоотделители и определяется Газовый Фактор.

FLS = FRONT LINE STATES

FLUCTUATION = КОЛЕБАНИЕ (или ФЛУКТУАЦИЯ) – Fluctuation is a wavering, unsteady, irresolute, or undetermined movement or pattern; irregular rising and falling. / Под Флуктуацией, от Латинского слова Fluctuatio, означающее Колебание, понимается случайное отклонение от средних значений физических величин, характеризующих систему из большого числа частиц; вызывается тепловым движением частиц системы. Флуктуации определяют теоретически возможный предел чувствительности приборов. Флуктуации давления проявляются, например, в броуновском движении малых частиц под влиянием точно не скомпенсированных ударов молекул окружающей среды. Флуктуации характерны для любых случайных процессов.

FLUE GAS DESULFURIZATION UNIT (SCRUBBER) = УСТАНОВКА ПО ОБЕССЕРИВАНИЮ ТОПОЧНОГО ГАЗА (СКРУББЕР) (или УСТАНОВКА ПО ДЕСУЛЬФУРАЦИИ ТОПОЧНОГО ГАЗА (СКРУББЕР)) – Flue Gas Desulfurization Unit (Scrubber) is an equipment used to remove sulfur oxides from the combustion gases of a boiler plant before discharge to the atmosphere. Chemicals, such as lime, are used as the scrubbing media. / из выхлопных газов котельных станций перед выбросом в атмосферу. Химикалии, такие как известь, используются в качестве . Под Десульфурацией, от Латинских слов De, означающее Отделение или Отмена или Удаление или Уничтожение, и Sulphur, означающее Сера, или Обессериванием понимается физико-химические процессы, обеспечивающие удаление серы из расплавленного металла, например, стали, чугуна. Сера может переходить в шлак (в виде сульфидов – CaS и других) или в газ (например, в виде SO_2). Для внедоменной десульфурации чугуна (в ковшах) эффективными десульфураторами являются магний, сода. Под Скруббером понимается:- (1) устройство для

очистки газов и извлечения одного или нескольких компонентов с помощью жидкостей. (2) Барабанная машина для промывки полезных ископаемых.

FLUE GAS PARTICULATE COLLECTORS = КОЛЛЕКТОРЫ ТВЁРДЫХ ЧАСТИЦ ТОПОЧНОГО ГАЗА – Flue Gas Particulate Collectors are the equipment used to remove fly ash from the combustion gases of a boiler plant before discharge to the atmosphere. Particulate collectors include electrostatic precipitators, mechanical collectors (cyclones), fabric filters (baghouses), and wet scrubbers.

FLUFFING = ОПУШЕНИЕ (или ЗАПУШЕНИЕ) – Fluffing is a term describing the appearance of a carpet after loose fiber fragments left during manufacture have worked their way to the surface. Fluffing is not a defect; it is simply a characteristic of new carpets that disappears with vacuuming.

FLUID = ЖИДКОСТЬ – Fluid:- a general classification including liquids and gases. / Под Жидкостями понимаются вещества в конденсированном агрегатном состоянии, промежуточном между твёрдым и газообразным. Вещество находится в состоянии жидкости при давлениях, больших давления в Тройной Точке, и при температурах, заключающихся в интервале от Температуры Кристаллизации до Температуры Кипения. Различие между жидким и газообразным состоянием вещества исчезает в Критическом Состоянии. Жидкости, подобно твёрдым телам, обладают малой сжимаемостью и большой плотностью и в то же время, подобно газам, не обладают упругостью формы и легко текут. В жидкости среднее расстояние между молекулами – порядка размеров самих молекул (~0.1 нм), и силы молекулярного взаимодействия весьма значительны. Этим, например, объясняются особые свойства поверхностного слоя жидкости (смотрите Поверхностное Натяжение). В отличие от ‘дальнего порядка’ в расположении частиц твёрдого тела по узлам кристаллической решётки, в жидкости наблюдается ‘ближний порядок’:- в среднем для каждой молекулы жидкости число ближайших соседей и их взаимное расположение одинаковы. Подобно частицам твёрдого тела, молекулы жидкости совершают тепловые колебания около некоторых положений равновесия. Однако если в твёрдых телах эти положения равновесия неизменны, то в жидкостях они время от времени изменяются:- по истечении некоторого времени t молекула жидкости перескакивает в новое положение равновесия, перемещаясь на расстояние порядка среднего расстояния между молекулами жидкости. Эти перескоки молекул жидкости обусловливают её текучесть. Среднее значение t, называющееся средним временем ‘оседлой жизни’ молекул, зависит от природы жидкости и очень быстро уменьшается с увеличением температуры:- $\langle t \rangle = t_0 \exp (E / kT)$, где $t_0 \sim 10^{-12}$ с, k – Постоянная Больцмана, T – термодинамическая температура, E – энергия активации перехода молекулы из одного положения равновесия в соседнее. Для маловязких жидкостей $\langle t \rangle \sim 10^{-11}$ с. Динамическая вязкость разных жидкостей весьма различна (например, при температуре T = 273 K для воды она равна 1.79 мПа·с, а для глицерина – 12.1 Па·с). С понижением температуры вязкость жидкости увеличивается. У некоторых жидкостей это увеличение вязкости столь значительно, что они, будучи переохлаждёнными, не успевают кристаллизоваться и образуют аморфные тела (например, глины, смолы, стёкла). Под Жидкостью понимается агрегатное состояние вещества, сочетающее в себе черты твёрдого состояния (сохранение объёма, определённая прочность на разрыв) и газообразного (изменчивость формы). Для жидкости характерны ближний порядок в расположении частиц (молекул, атомов) и малое различие в кинетической энергии теплового движения молекул и их потенциальные энергии взаимодействия. Тепловое движение молекул жидкости состоит из колебаний около положений равновесия и сравнительно редких перескоков из одного равновесного положения в другое, с этим связана текучесть жидкости. Жидкость, агрегатное состояние вещества, промежуточное между твёрдым и газообразным состояниями. Жидкость, сохраняя отдельные черты как твёрдого тела, так и газа, обладает, однако, рядом только ей присущих особенностей, из которых наиболее характерная – текучесть. Подобно твёрдому телу, жидкость сохраняет свой объём, имеет свободную поверхность, обладает определённой прочностью на разрыв при всестороннем растяжении и так далее. С другой стороны, взятая в достаточном количестве жидкость принимает форму сосуда, в котором находится. Принципиальная возможность непрерывного перехода жидкости в газ также свидетельствует о близости жидкого и газообразного состояний. По химическому составу различают однокомпонентные, или чистые жидкости, и двух- или многокомпонентные жидкие смеси (растворы). По физической природе жидкости делятся на нормальные (обычные), жидкие кристаллы с сильно выраженной анизотропией (зависимостью свойств от направления) и квантовые жидкости – жидкие ^{4}He, ^{3}He и их смеси – со специфическими квантовыми свойствами при очень низких температурах. Нормальные чистые жидкости имеют только одну жидкую фазу (то есть существует один единственный вид каждой нормальной жидкости). Гелий ^{4}He может находиться в двух жидких фазах – нормальной и сверхтекучей, а жидкокристаллические вещества – в нормальной и одной или даже двух анизотропных фазах. Общим для всех нормальных жидкостей, в том числе и для смесей, является их макроскопическая однородность и изотропность при отсутствии внешних воздействий. Эти свойства сближают жидкости с газами, но резко отличают их от анизотропных кристаллических твёрдых тел. Аморфные твёрдые тела (например, стекла), с современной точки зрения, являются переохлаждёнными жидкостями (смотрите Аморфное Состояние) и отличаются от обычных жидкостей только численными значениями кинетических характеристик (существенно большей вязкостью и дргими). Область существования нормальной жидкой фазы ограничена со стороны низких температур фазовым переходом в твёрдое состояние – кристаллизацией или (в зависимости от величины приложенного давления) фазовым переходом в сверхтекучее состояние для ^{4}He и в жидко-анизотропное состояние для жидких кристаллов. При давлениях ниже критического давления $p_к$ нормальная жидкая фаза ограничена со стороны высоких температур фазовым переходом в газообразное состояние – испарением. При давлениях $p > p_к$ фазовый переход отсутствует и по своим физическим свойствам жидкость в этой области неотличима от плотного газа. Наивысшая температура $T_к$, при которой ещё возможен фазовый переход жидкость-газ, называется Критической Температурой. Значения $p_к$ и $T_к$ определяют критическую точку чистой жидкости, в которой свойства жидкости и газа становятся тождественными. Наличие критической точки для фазового перехода жидкость-газ позволяет осуществить непрерывный переход из жидкого состояния в газообразное, минуя область, где газ и жидкость сосуществуют (смотрите Критическое Состояние). Таким образом, при нагревании или уменьшении плотности свойства жидкостей (теплопроводность, вязкость, самодиффузия и другие), как правило, меняются в сторону сближения со свойствами газов. Вблизи же температуры кристаллизации большинство свойств нормальных жидкостей (плотность, сжимаемость, теплоёмкость, электропроводность и так далее) близки к таким же свойствам соответствующих твёрдых тел. В таблице приведены значения теплоёмкости при постоянном давлении (C_p) ряда веществ в твёрдом и жидком состояниях при температуре кристаллизации. Малое различие этих теплоёмкостей показывает, что тепловое движение в жидкостях и твёрдых телах вблизи температуры кристаллизации имеет примерно одинаковый характер. Теплоёмкость некоторых веществ (в Дж/(кг·К)), при температуре кристаллизации:-

	Na	Hg	Pb	Zn	Cl	NaCl
C_p, тв.	1 382	138	146	461	620	1 405
C_p, ж.	1 386	138	155	542	1 800	1 692

Молекулярная Теория Жидкостей:- по своей природе силы межмолекулярного взаимодействия в жидкостях и кристаллах одинаковы и имеют примерно одинаковые величины. Наличие в жидкостях сильного межмолекулярного взаимодействия

обусловливает, в частности, существование поверхностного натяжения на границе жидкости с любой другой средой. Благодаря поверхностному натяжению жидкость стремится принять такую форму, при которой её поверхность (при данном объёме) минимальна. Небольшие объёмы жидкости имеют обычно характерную форму капли. В отсутствии внешних сил, когда действуют только межмолекулярные силы (например, в условиях невесомости), жидкость приобретает форму шара. Влияние поверхностного натяжения на равновесие и движение свободной поверхности жидкости, границ жидкостей с твёрдыми телами или границ между несмешивающимися жидкостями относится к области капиллярных явлений. Фазовое состояние вещества зависит от физических условий, в которых оно находится, главным образом от температуры T и давления p. Характерной определяющей величиной является зависящее от температуры и давления отношение e (T, p) средней потенциальной энергии взаимодействия молекул к их средней кинетической энергии. Для твёрдых тел e (T, p) >> 1; это значит, что силы межмолекулярного взаимодействия велики и удерживают молекулы (атомы, ионы) вблизи равновесных положений – узлов кристаллической решётки, несмотря на тепловое движение частиц. В твёрдых телах тепловое движение имеет характер коллективных колебаний атомов (ионов) около узлов кристаллической решётки. В газах осуществляется обратный предельный случай e (T, p) << 1; силы притяжения между молекулами недостаточны, чтобы удержать их вблизи друг от друга, вследствие чего положения и скорости молекул распределены почти хаотически. Для жидкостей e (T, p) ~ 1:- интенсивности упорядочивающих межмолекулярных взаимодействий и разупорядочивающего теплового движения молекул имеют сравнимые значения, чем и определяется вся специфичность жидкого состояния вещества. Тепловое движение молекул в неметаллических жидкостях состоит из сочетания коллективных колебательных движений того же типа, что и в кристаллических телах, и происходящих время от времени скачков молекул из одних временных положений равновесия (центров колебаний) в другие. Каждый скачок происходит при сообщении молекуле энергии активации, достаточной для разрыва её связей с окружающими молекулами и перехода в окружение других молекул. В результате большого числа таких скачков молекулы жидкостей более или менее быстро перемешиваются (происходит самодиффузия, которую можно наблюдать, например, методом меченых атомов). Характерные частоты скачков составляют ~ 10^{11}–10^{12} $сек^{-1}$ для низкомолекулярных жидкостей, много меньше для высокомолекулярных, а в отдельных случаях, например, для сильно вязких жидкостей и стекол, могут оказаться чрезвычайно низкими. При наличии внешней силы, сохраняющей своё направление более длительное время, чем интервалы между скачками, молекулы перемещаются в среднем в направлении этой силы. Таким образом, статические или низкочастотные механические воздействия приводят к проявлению текучести жидкости как суммарному эффекту от большого числа молекулярных переходов между временными положениями равновесия. При частоте воздействий, превышающей характерные частоты молекулярных скачков, у жидкости наблюдаются упругие эффекты (например, сдвиговая упругость), типичные для твёрдых тел. Однородность и изотропность нормальных жидкостей молекулярная теория жидкостей объясняет отсутствием у них дальнего порядка во взаимных положениях и ориентациях молекул (смотрите Ближний Порядок, и Дальний Порядок). Положения и ориентации двух или более молекул, расположенных далеко друг от друга, оказываются статистически независимыми. В идеальном кристаллическом теле, как правило, существует ‘жёсткий’ дальний порядок в расположении и ориентации молекул (атомов, ионов). В жидком кристалле дальний порядок наблюдается лишь в ориентации молекул, но он отсутствует в их расположении. Жидкости иногда разделяют на неассоциированные и ассоциированные, в соответствии с простотой или сложностью их термодинамических свойств. Предполагается, что в ассоциированных жидкостях есть сравнительно устойчивые группы молекул – комплексы, проявляющие себя как одно целое. Существование подобных комплексов в некоторых растворах доказывается прямыми физическими методами. Наличие устойчивых ассоциаций молекул в однокомпонентных жидкостей недостоверно. Основой современных молекулярных теорий жидкого состояния послужило экспериментальное обнаружение в жидкостях ближнего порядка – согласования (корреляции) во взаимных положениях и ориентациях близко расположенных групп, состоящих из 2, 3 и большего числа молекул. Эти статистической корреляции, определяющие молекулярную структуру жидкости, простираются на область протяжённостью порядка несколько межатомных расстояний и быстро исчезают для далеко расположенных друг от друга частиц (отсутствие дальнего порядка). Структурные исследования реальных жидкостей, позволившие установить эту особенность жидкого состояния, производятся методами рентгеновского структурного анализа и нейтронографии. По структуре и способам их описания жидкости делят на простые и сложные. К первому сравнительно малочисленному классу относят однокомпонентные атомарные жидкости. Для описания свойств таких жидкостей достаточно указать лишь взаимное расположение атомов. К этому классу жидкостей относятся жидкие чистые металлы, сжиженные инертные газы и (с некоторыми оговорками) жидкости с малоатомными симметричными молекулами, например, CCl_4. Для простых жидкостей результаты рентгено-структурного или нейтронографического анализа могут быть выражены с помощью так называемой Радиальной Функции Распределения g (r). Эта функция характеризует распределение частиц вблизи произвольно выбранной частицы, так как значения g (r) пропорциональны вероятности нахождения двух атомов (молекул) на заданном расстоянии r друг от друга. Ход кривой g (r) наглядно показывает существование определённой упорядоченности в простой жидкости – в ближайшее окружение каждой частицы входит в среднем определённое число частиц. Для каждой жидкости детали функции g (r) незначительно меняются с изменением температуры и давления. Расстояние до первого пика определяет среднее межатомное расстояние, а по площади под первым пиком можно восстановить среднее число соседей (Среднее Координационное Число) атома в жидкости. В большинстве случаев эти характеристики вблизи линии плавления оказываются близкими к кратчайшему межатомному расстоянию и координационному числу в соответствующем кристалле. Однако, в отличие от кристалла, истинное число соседей у частицы и истинное межатомное расстояние в жидкости являются не постоянными числами, а случайными величинами, и по графику g (r) устанавливаются лишь их средние значения. При сильном нагревании жидкости и приближении к газовому состоянию ход функции g (r) постепенно сглаживается соответственно уменьшению степени ближнего порядка. В разреженном газе g (r) >> 1. Для сложных жидкостей п для жидких смесей расшифровка рентгенограмм более сложна и во многих случаях полностью не может быть осуществлена. Исключение составляет вода и некоторые другие низкомолекулярные жидкости, для которых имеются довольно полные исследования и описания их статистической структуры. Теория кинетических и динамических свойств жидкостей (диффузии, вязкости и так далее) разработана менее полно, чем равновесных свойств (теплоёмкости и других). Динамическая теория жидкого состояния весьма сложна и пока не получила достаточного развития. В теории жидкостей большое развитие получили численные методы, позволяющие рассчитывать свойства простых жидкостей с помощью быстродействующих вычислительных машин. Наибольший интерес представляет метод молекулярной динамики, непосредственно моделирующий на вычислительной машине совместное тепловое движение большого числа молекул при заданном законе их взаимодействия и по прослеженным траекториям многих отдельных частиц восстанавливающий все необходимые статистические сведения о системе. Таким путём получены точные теоретические результаты относительно структуры и термодинамических свойств простых неметаллических жидкостей. Отдельную и ещё не решённую проблему составляет вопрос о структуре и свойствах простых жидкостей в непосредственной окрестности критической точки. Некоторые успехи были здесь достигнуты в последнее время методами теории подобия. В целом проблема критических явлений для чистых жидкостей и смесей остаётся ещё недостаточно выясненной. Отдельную проблему составляет вопрос о структуре и свойствах жидких металлов, на которые

значительное влияние оказывают имеющиеся в них коллективизированные электроны. Несмотря на некоторые успехи, полной электронной теории жидких металлов ещё не существует. Значительные (пока ещё не преодолённые) трудности встретились при объяснении свойств жидких полупроводников. Основные Направления Исследований Жидкого Состояния:- многочисленные макроскопические свойства жидкостей изучаются и описываются методами различных разделов механики, физики и физической химии. Равновесные механические и тепловые свойства жидкостей (сжимаемость, теплоёмкость и другие) изучаются термодинамическими методами. Важнейшей задачей является нахождение уравнения состояния для давления и энергии как функции от плотности и температуры, а в случае растворов – и от концентраций компонентов. Знание уравнения состояния позволяет методами термодинамики установить многочисленные связи между различными механическими и тепловыми характеристиками жидкостей. Имеется большое количество эмпирических, полуэмпирических и приближённых теоретических уравнений состояния для различных индивидуальных жидкостей и их групп. Неравновесные тепловые и механические процессы в жидкостях (например, диффузия, теплопроводность, электропроводность и другие), особенно в смесях и при наличии химических реакций, изучаются методами термодинамики необратимых процессов. Механические движения жидкостей, рассматриваемых как сплошные среды, изучаются в Гидродинамике. Важнейшее значение имеет Уравнение Навье-Стокса, описывающее движение вязкой жидкости. У так называемых Ньютоновских Жидкостей (вода, низкомолекулярные органические жидкости, расплавы солей и другие) вязкость не зависит от режима течения (в условиях ламинарного течения, когда Число Рейнольдса $R < R_{критич.}$), в этом случае вязкость является физико-химической постоянной, определяемой молекулярной природой жидкости и её состоянием (температурой и давлением). У Неньютоновских (структурно-вязких) Жидкостей вязкость зависит от режима течения даже при малых числах Рейнольдса (жидкие полимеры, стекла в интервале размягчения, эмульсии и другие). Свойства Неньютоновских Жидкостей изучает Реология. Специфические особенности течения жидких металлов, связанные с их электропроводностью и лёгкой подверженностью влиянию магнитных полей, изучаются в Магнитной Гидродинамике. Приложения методов гидродинамики к задачам молекулярной физики жидкостей изучаются в Физико-Химической Гидродинамике.

FLUID COMPATIBILITY = СОВМЕСТИМОСТЬ ЖИДКОСТИ – Fluid Compatibility is the suitability of filtration medium and seal materials for service with the fluid involved.

FLUID FRICTION = ЖИДКОСТНОЕ ТРЕНИЕ (или ГИДРОДИНАМИЧЕСКОЕ ТРЕНИЕ) – Fluid Friction is a friction due to the viscosity of fluids. / Трение текучей среды (жидкости или газа).

FLUID MARKET = НЕОПРЕДЕЛЁННЫЙ (или ПОДВИЖНЫЙ) РЫНОК – Fluid Market is a market where supply and demand readily adjust to each other. In reality, only relative fluidity can be found in economies, for economic or structural reasons:- government efforts to fight inflation often involve price-setting measures; the economic systems of industrial nations generate imperfect competition, where fluidity, by definition, is limited.

FLUID OPACITY = НЕПРОЗРАЧНОСТЬ ЖИДКОСТИ – Fluid Opacity related to the ability of a fluid to pass light.

FLUID POWER = ЭНЕРГИЯ ЖИДКОСТИ (или ГИДРАВЛИЧЕСКАЯ МОЩНОСТЬ) – Fluid Power is an energy transmitted and controlled through use of a pressurized fluid.

FLUID VELOCITY = СКОРОСТЬ ЖИДКОСТИ – Fluid Velocity is the measured speed at which a fluid moves through the inside of a tube.

FLUORESCENCE = ФЛУОРЕСЦЕНЦИЯ (или КРАТКОВРЕМЕННОЕ СВЕЧЕНИЕ) – Fluorescence is the property of emitting electromagnetic radiation usually as visible light resulting from external stimulation with another light (or energy) source and occurring only during the absorption of radiation from some other source. Fluorescence is an emission of electromagnetic radiation, usually as visible light, that is caused by the flow of energy into the emitting body. The emission ceases abruptly when the excitation ceases. Fluorescence is a process by which radiant flux of certain wavelengths is absorbed and reradiated nonthermally at other, usually longer, wavelengths. (this phenomenon creates colors that show an abnormal color response and are used for packaging and other dramatic effects). See also Luminescence, and Phosphorescence. / возбуждение (excitation). Смотрите также Люминесценция (Luminescence), и Фосфоресценция (Phosphorescence). Под Флуоресценцией понимается люминесценция, затухающая, в отличие от фосфоресценции, в течение короткого времени после прекращения возбуждения. Как правило, возникает при спонтанных квантовых переходах молекул или атомов, поэтому длительность флуоресценции определяется временем жизни их возбуждённого состояния.

FLUORESCENT BRIGHTENER = ФЛУОРЕСЦЕНТНЫЙ БЛЕСКООБРАЗОВАТЕЛЬ – Fluorescent Brightener or Fluorescent Brightening Agent (FBA):- Optical Brighteners are synthetic chemicals that make fabrics appear to glow in the presence of ultraviolet light. They don't have anything to do with getting things clean – they're only added to detergents to make us think our laundry is brighter and whiter than it really is. Designed to intentionally remain behind on our clothes and linens, optical brighteners rub off on our skin where they can cause a reaction that looks like sunburn. They're no fun for the environment either. Optical brighteners washed down our drains frequently survive wastewater treatment and escape into our lakes, rivers, and streams. Once there, they don't completely biodegrade and instead accumulate in fish. Optical brighteners are chemicals that make fabrics seem brighter or whiter than they are. They remain behind on clean laundry as a coating of microscopic fluorescent particles. When invisible ultraviolet light hits these particles, they convert it into visible light to create an optical illusion that tricks the eye into thinking our clothes are super clean. Many optical brighteners are derived from benzene, a very toxic compound. In addition, these chemicals generally don't break down in the environment and remain in the waters they're washed into, where they poison fish and other aquatic life. Optical brighteners can also cause allergic reactions in people via a process called Phototoxicity. When they rub off on our skin from laundered clothes and come into contact with sunlight, they can create a rash or irritation that's mistaken for sunburn. See also Optical Brightener. Optical brighteners (i.e. fluorescent dyes that absorb UV radiation and re-emit visible light in the blue region of the spectrum) have been used in all layers of the photographic paper – paper base, baryta layer, undercoating, emulsion, or protective layer. The optical brightener, a compound that absorbs the UV radiation and re-emits it in the blue end of the visible spectrum, helps adjust for any dullness or yellow color that may be retained by the paper after processing. The inclusion of optical brighteners in the black and white photographic papers creates concerns for those responsible for the care and exhibition of these artifacts. The UV wavelengths of light are required to give the photographic papers the brightened white appearance. However, these same UV wavelengths can be potentially damaging to the long term stability of the optical brightener by causing photobleaching of the dye and fading of the chromophore. Therefore, this study has focused on the appearance changes from the optical brightener as well as the long term stability of the optical brightener exposed to UV light. / хромофор (chromophore). Оптический Блескообразователь или Оптический Отбеливатель (Optical Brightener).

FLUORESCENT BRIGHTENING AGENT = ФЛУОРЕСЦЕНТНЫЙ БЛЕСКООБРАЗУЮЩИЙ АГЕНТ – Fluorescent Brightening Agents (FBAs) are are colorless fluorescent dyes. They are also called Optical Brighteners. In accordance with their definition as

‘Colorless’ Fluorescent dyes, Their Coloristic performance is that of fluorescent dyes, without absorbing light in the visible range of the spectrum. They absorb ultraviolet rays present in incident sunlight. This absorbed Ultraviolet light is Re-Emitted by the Fluorescent Brightening Agent, which is of longer wavelength than the incident Ultraviolet light and is known as the Fluorescence Light. This generally falls in the blue region of the visible spectra. The Fluorescence light is then superimposed on the reflected light thereby restoring the balance of different colors and hence producing brilliant white effect. See also Optical Brightener. / Оптический Блескообразователь или Оптический Отбеливатель (Optical Brightener).

FLUORESCENT FABRIC = ФЛУОРЕСЦЕНТНАЯ ТКАНЬ – Fluorescent Fabric is a fabric that glows with a more vivid color than usual under daylight, headlights, and ultra-violet light. Fluorescent fabrics are important, especially in colors such as orange, where high visibility is essential for safety in hunting clothes, clothes for crossing guards, and outfits for school children. Occasionally, fluorescent fabrics become fashionable for other items of clothing.

FLUORESCENT ILLUMINANT = ФЛУОРЕСЦЕНТНОЕ ОСВЕТИТЕЛЬНОЕ СРЕДСТВО (или ФЛУОРЕСЦЕНТНЫЙ ИЛЛЮМИНАНТ) – Fluorescent Illuminant is an illuminant representing the spectral distribution of the radiation from a specified type of fluorescent lamp (as expressed as a set of data in color computer programs).

FLUOROFIBER = ФТОРВОЛОКНО – Fluorofiber is a synthetic fiber composed of linear macromolecules made from aliphatic fluorocarbon monomers. Alphabetic code – PTFE; and relevant commercial allowance – 0.00 (refers to European Union Directives on Textile Labelling). Fluorofiber (generic name) is a term used to describe fibers composed of linear macromolecules made from fluorocarbon aliphatic monomers. / Под Фторволокном понимается синтетическое волокно, формуемое из фторсодержащих полимеров, главным образом политетрафторэтилена. Под Фторволокнами понимаются синтетические волокна, получаемые формованием фторосодержащих полимеров, например, политетрафторэтилена (polytetrafluorethylene). Устойчивы в агрессивных средах, обладают высокими электроизоляционными и антифрикционными свойствами. Используются для изготовления фильтров, космических скафандров и другой защитной одежды, прокладок для подшипников, электроизоляционных материалов, протезов (например, кровеносных сосудов, клапанов сердца).

FLURRIES = МЕТАНИЯ – Flurries are the short periods of active trading, as on a stock exchange. Flurry is a drastic volume increase in a specific security. Sudden increase in trading activity in a particular security. For example, there will be a flurry of trading in the stock of a company that was just the target of a surprise takeover bid. There are often trading flurries right after a company releases its quarterly earnings. / В биржевом деле краткосрочные периоды активной торговли как, например, на фондовых или сырьевых биржах.

FLUSH = ПРОМЫВКА – Flush is a short, quick watering period; a sudden growth burst.

FLUSH = XX (или РУМЯНЕЦ) – Flush:- of a ruddy health color.

FLUSHING = ПРОМЫВКА – Flushing:- light irrigation – particularly used soon after planting pre-irrigated cotton if the surface soil dries too rapidly for emerging cotton seedlings.

FLUSHING = ПРОМЫВКА (или СМЫВАНИЕ) – Flushing is a fluid circulation process designed to remove contamination from the wetted surfaces of a fluid system. / Промывка – процесс циркуляции жидкости, разработанный для удаления засорения с увлажнённых поверхностей жидкостной системы. Промывка Осадков в химической технологии, извлечение (или уменьшение концентрации) вещества, растворённого в жидкости, находящейся в порах осадка. Под осадком понимают совокупность твёрдых частиц с жидкостью в промежутках (порах) между ними, образующуюся при разделении суспензий в отстойниках и сгустителях, в фильтрах и центрифугах, в гидроциклонах или других разделительных аппаратах. В качестве промывной жидкости используют воду, органические растворители и другие. При промывке осадков методом разбавления чередуются смешение и разделение осадка и промывной жидкости; диффузионная промывка осадков осуществляется благодаря переходу отмываемого вещества из поровой жидкости в промывную под влиянием разности концентраций при контактировании осадка с промывной жидкостью; фильтрационную промывку осадков (методом вытеснения) осуществляют путём просачивания промывной жидкости через слой осадка, находящийся на фильтрующей перегородке; при этом поровая жидкость частично вытесняется и замещается промывной. Наиболее эффективны многоступенчатые процессы комбинированной фильтрационной и репульпационной промывки осадков. Благодаря промывке осадков либо удаляют вредные примеси, либо извлекают ценные компоненты, содержащиеся в поровой жидкости.

FLUSHING ON POLYESTER FABRIC = ЗАЛИВКА КРАСКОЙ НА ПОЛИЭФИРНОЙ ТКАНИ – Flushing On Polyester Fabric:- Possible Cause:- low viscosity of print paste. Major as it happens throughout the fabric unless the viscosity is corrected. Printing defect.

FLUSH PALLET = ЩИТОВОЙ ПОДДОН – Flush Pallet is a pallet with deckboards flush with the stringers, stringer-boards or blocks along the sides of the pallet.

FLUTED NAIL = XX (или РИФЛЁНЫЙ ГВОЗДЬ) – Fluted Nail is a round wire nail with thread-crests parallel to the nail shank. See also Pallet. / Рифлёный Гвоздь (Fluted Nail):- круглый гвоздь с гребнями, параллельными стержню гвоздя. Смотрите также Поддон (Pallet).

FLUX = ПОТОК – Flux is a rate of transfer of a quantity (water, heat, etc) across a surface.

FLUXIAL = ПОТОКОВЫЙ – Fluxial:- pertaining to flooding by surface water conveyed from elsewhere.

FLUX DENSITY = ПЛОТНОСТЬ ПОТОКА – Flux Density:- flux across a unit cross-sectional area.

FLUXIC = ПОТОКОВОЕ (или ПОТОЧНОЕ) – Fluxic:- derived from the flux or passing through. Descriptive of a wet land type where free water remains in the field when the soil has been puddled, but the depletion rate of free water, including evapotranspiration losses, is more than 10 mm/day.

FLY = ПУХ – (1) Fly:- fibers which come off the machines during carding, drawing or similar textile operations. Fly is the short, waste fibers that are released into the air in textile processing operations such as picking, carding, spinning, and weaving. Fly:- short fibers which generally float in the air in a spinning or weaving mill and which may come to rest and be deposited on yarns or fabric during the process of manufacture. Fly is a very short cotton waste; used for heavy backing yarns. See also Dust. Another concern arises about the level of fibers in the air (fly) because it can and does cause defects in the yarn produced. An accumulation of fly landing on the yarn being made in a ring frame obviously creates a blemish. Not so obvious is the result of fly on other products. For example, fly landing on roving during manufacture is often thrown off again during spinning, only to land on the yarn. A good spinner keeps an eye open for the sources of fly production and tries to eliminate them. Fiber and dust can carry electrical charges, and so can the surfaces of machinery. Friction between moving surfaces, and separation of those surfaces, also produce electrical charges. Much of the dust and fiber is highly flammable and if the electrical charges build up sufficiently to cause a spark, then a dangerous conflagration can occur.

The remedies are to keep relative humidity (rh) at a proper level and to ground all machinery by connecting it to earth with a conductive cable. In that way, electrical charge build-up is minimized and any that does form is leaked to earth before it can cause damage. There are also other reasons for controlling the electrical charge. If the rh is too low, electrified fibers coagulate and interfere with processing. The optimum level varies from fiber to fiber and from process to process. A common symptom of incorrect humidification in spinning is when roll laps occur. See also Fly Cotton, and Pneumafil.

(2) Fly:- usually caused by the spinning process, small fibers spun into the yarn of another stock. Often caused by lack of precaution to prevent contamination. Woven fabric defect. / Порок или дефект ткачества.

FLY ASH = ЛЕТУЧАЯ ЗОЛА – Fly Ash is a particle matter from coal ash in which the particle diameter is less than $1 \cdot 10^{-4}$ meter. This is removed from the flue gas using flue gas particulate collectors such as fabric filters and electrostatic precipitators. / Под Летучей Золой понимается зола, уносимая из топки продуктами сгорания твёрдого топлива. Загрязняет и изнашивает поверхности нагрева котла, засоряет атмосферу.

FLY COTTON = ХЛОПКОВЫЙ ПУХ – Fly Cotton:- short, immature, neppy cotton fibers obtained in the carding operation. See also Fly. A very short cotton waste; used for heavy backing yarns. / Пух Хлопковый:- к хлопковому пуху относят засорённый и пропыленный пух, улавливаемый циклонами:- после батарейных конденсоров хлопкового линтта и семеочистителей перед вторым и третьим линтерованием. Хлопковый пух пропускают для очистки от пыли, сора и посторонних примесей через очиститель волокнистых материалов. Хлопковый пух имеет вид закатанных в комочки коротких волокон. Хлопковый пух в зависимости от сорта хлопка-сырца делят на две группы:- 1 – получаемую при переработке хлопка-сырца I и II сортов; и 2 – получаемую при перерабоке хлопка-сырца III и IV сортов. Нормированная влажность хлопкового пуха составляет:- для 1-й Группы – 9%, и 2-й Группы – 12%. Группу хлопкового пуха определяют по внешнему виду путём сравнения с образцами, утверждёнными в установленном порядке. Основные образцы хлопкового пуха изготавливали и хранили в бывшем СССР в Центральном Научно-Исследовательском Институте Хлопкоочистительной Промышленности (ЦНИИХпром). Срок действия образцов – 5 лет. Для хлопкозаводов и предприятий-потребителей ЦНИИХпром изготавливали дубликаты образцов.

FLYER = РОГУЛЬКА – Flyer is an inverted 'U-shaped' device which sets on the spindle top and revolves with it. It has a solid arm and a slubbing or roving enters the top of the hollow arm, travels downward and emerges at the bottom and is then wound around the presser finger of the device. The stock, after leaving the eyelet in the presser finger, is wound onto the bobbin set around the spindle. The flyer inserts twist into the fibers and winds the stock onto the bobbin in uniform manner. The device is used on all cotton slubbers and fly frames, on flyer-spinning and flyer-twisting machines, and on many of the drawing frames used in worsted-yarn manufacture. Flyer is a rotating device that adds twist to the slubbing or roving and winds the stock onto a spindle or bobbin in a uniform manner. Flyer is:- (1) a device used to insert twist into slubbing, roving, or yarn, and to serve as a guide for winding it onto a bobbin. The flyer is shaped like an inverted U that fits on the top of the spindle and revolves with it. One arm of the U is solid and the other is hollow. The yarn enters through the top of the hollow arm, travels downward, and emerges at the bottom where it is wound around a presser finger onto the take-up package. Flyer is an inverted U-shaped device which sets on the spindle top and revolves with it. It has a solid arm and a hollow arm. (2) Flyer:- xxxxx. Weaving defect. See also Loom Fly. In weave rooms where different types of rayon staple or rayon and cottons are run, a frequent source of trouble is 'Fly', or contamination by 'foreign fibers' being trapped in the goods during weaving. This condition is especially serious since detecting it is practically impossible until after the goods are dyed. Because viscose and cellulose acetate rayon, cotton, and. / (2) Пух.

FLYER BEARINGS = ПОДШИПНИКИ РОГУЛЬКИ – Flyer Bearings:- holds the flyer, same material as used in wheel bearings. Replacement Flyer Bearings for Ashford spinning wheels. Choose from 1/4" ID (rear-split), 1/2" ID (front), 3/4" ID (jumbo). ID stands for Inner Diameter.

FLYER LEAD = ОПЕРЕЖЕНИЕ РОГУЛЬКИ – In spinning, Flyer Lead:- a single band drives the flyer. The bobbin has an adjustable friction band to slow it.

FLYER SPINNING = РОГУЛЕЧНОЕ ПРЯДЕНИЕ (или ПРЯДЕНИЕ НА РОГУЛЕЧНОЙ ПРЯДИЛЬНОЙ МАШИНЕ) – Flyer Spinning is a method of spinning by means of a driven flyer. It is used primarily for spinning worsted and coarser yarns. See also Flyer, 1. / Прядение пряжи очень низкого номера.

FLYER SPINNING FRAME = РОГУЛЕЧНАЯ ПРЯДИЛЬНАЯ МАШИНА – Flyer Spinning Frame with slip drafting system are widely used for producing coarser count Jute yarn and ring spinning frames for fine count Jute yarn. See also Spinning Frame.

FLYER WASTE = РОГУЛЕЧНЫЕ ОТХОДЫ – Flyer Waste:- during the roving operation, flyer waste refers to fibers that free themselves by centrifugal force from the regular bulk of roving and accumulate on the flyers and adjacent machinery.

FLY FRAME = XX РАМА (или РОВНИЧНАЯ МАШИНА) – Fly Frame:- any of various slubbing, roving, intermediate, and other frames on which flyers are used. See also Roving Frame. / или иные рамы, на которых используются рогульки. Смотрите также Ровничная Рама (Roving Frame).

FLYING SHUTTLE = ЛЕТУЧИЙ ЧЕЛНОК – The textile industry drove groundbreaking scientific innovations. The Flying Shuttle was patented in 1733 by John Kay. It became widely used around Lancashire after 1760 when John's son, Robert, designed what became known as the Drop Box. Lewis Paul patented the Roller Spinning Frame and the flyer-and-bobbin system for drawing wool to an even thickness. The technology was developed with the help of John Wyatt of Birmingham. Paul's invention was advanced and improved by Richard Arkwright in his Water Frame and Samuel Crompton in his Spinning Mule. Flying Shuttle is one of the key developments in the industrialization of weaving during the early Industrial Revolution. It allowed a single weaver to weave much wider fabrics and could be mechanized, allowing for automatic machine looms. It was patented by John Kay in 1733.

FLY LINT = ПОДПУШЕК (или ЗАСОРЁННЫЙ ХЛОПКОВЫЙ ПУХ, или ПРОПЫЛЕННЫЙ КОРОТКОШТАПЕЛЬНЫЙ ПУХ) – Fly Lint:- fiber fly is airborne fibers or parts of fibers (light enough to fly), visible as fibers to the human eye. Short (less than 50 μm) cotton fibers, usually emitted from condensers and mote fan. Also known as Fiber Fly or Lint Fly. / Короткие (меньше чем 50 микрометров) хлопковые волокна, обычно выбрасываемые из конденсоров и циклонов (mote вентиляторов).

FLY WASTE = ПУХОСОДЕРЖАЩИЕ ОТХОДЫ – Fly Waste:- chaff and other light wastes found in textile mills; fly often floats in the air prior to landing. Short fibers and some minute foreign matter that fall through the cylinder screen on a card. Modern mills use vacuum strippers which take the card strips and other matter and deliver them to dust chambers. There is a waste of about 1 per cent or so of strippings, about 1/2 per cent of fly waste, 4 per cent of flat-strip waste, and 1 per cent of unforeseen loss during the carding operations. Short cotton waste picked up around the machines in cotton manufacturing; often used with longer-staple fibers to make yarn. / Пухосодержащие Отходы представляют собой отходы от очистителя волокнистых материалов, полученные при

переработке пухоотходов:- циклонов конденсоров линта и системы аспирации; семеочистителей, установленных после линтеров.

FM = FEDERATED STATES OF MICRONESIA

FMC = FEDERAL MARITIME COMMISSION

FMC–2 COLOR DIFFERENCE = ЦВЕТОВОЕ РАЗЛИЧИЕ ПО ЭФ.ЭМ.СИ.–2 – FMC-2 Color Difference is the color difference calculated by use of the Friele-MacAdam-Chickering, Version 2, equations based on the MacAdam chromaticity-difference-perceptibility ellipses and the Munsell value function. L.F.C. Friele (1910–1996), the Dutch psychologist. In 1961 Friele began devising a formula with which MacAdam's ellipsus could be described with accuracy. The formula was slighly modified and symplified by MacAdam and later by K.D. Chickering and became known as the 'Friele-MacAdam-Chikering' or 'FMC-1' Formula. Dr. David Lewis MacAdam (1910–1998) was an American physicist and color scientist who made important contributions to color science and technology in the fields of colorimetry, color discrimination, color photography and television, and color order. FMC-2 Color Difference:- the adjustable parameters in a MacAdam-modified version of Friele's 1965 proposal for calculating color differences have been optimized, according to a criterion of MacAdam, to fit PGN experimental data. The mean-square error of fitting is 0.030. The distribution of the resulting color-metric coefficients more closely approximates those of the PGN data than do previous versions of Friele's proposals. The optimized primaries have chromaticity coordinates of x = 0.740 54, y = 0.259 46 for the red; x = –1.116 96, y = 2.116 96 for the green; and x = 0.139 39, y = –0.034 54 for the blue primary. On May 01, 1967 K.D. Chickering published:- Optimization of the MacAdam-Modified 1965 Friele Color-Difference Formula. / Фриле-МэкАдэм-Чикэринь (Friele-MacAdam-Chickering), Мюнсэл (Munsell). Эл.Си.Эф. Фриле (L.F.C. Friele; 1910–1996). Доктор Дэйвид Луис МэкАдэм (Dr. David Lewis MacAdam; 1910–1998)). Кей.Ди. Чикэринь (K.D. Chickering).

FMC NO. = FEDERAL MARITIME COMMISSION NUMBER

FMD = FOOT AND MOUTH DISEASE

FMDN = FARM MACHINERY DEVELOPMENT NETWORK

FMFIA = FEDERAL MANAGERS' FINANCIAL INTEGRITY ACT

FMS = FATHOMS

FMS = FOREIGN MILITARY SALES

FMV = FOREIGN MARKET VALUE

F_N = ЭФ.$_{ЭН.}$ (или ЭННОЕ ПОКОЛЕНИЕ) – Fn – n^{th} filial generation.

FND = FIRST NOTICE DATE

FNMA = FEDERAL NATIONAL MORTGAGE ASSOCIATION = FANNIE MAE

FNRI = FOOD AND NUTRITION RESEARCH INSTITUTE

FO = FAROE ISLANDS

FO = FREE OUT

FOAM = ПЕНА – Foam is an agglomeration of gas bubbles separated from each other by a thin liquid film which is observed as a persistent phenomenon on the surface of a liquid. Foam is a dispersion of gas in a liquid or solid. The gas bubbles may be any size. The term covers a wide range of useful products such as insulating foam, cushions, etc. It also describes the undesirable froth in polymer melts, dyebaths, etc. / пузырь (bubble). Пены, ячеистые дисперсные системы, представляющие собой совокупность пузырьков газа (пара), разделённых тонкими прослойками жидкости. Пены по размеру пузырьков относятся к грубодисперсным системам; размер пузырьков, составляющих дисперсную фазу, лежит в пределах от долей миллиметра (мм) до нескольких сантиметров (см). Общий объём заключённого в них газа может в сотни раз превосходить объём дисперсионной среды – жидкости, находящейся в прослойках. Отношение объёма пены к объёму жидкой фазы называется Кратностью Пены. При формировании высокократных пен пузырьки превращаются в многогранные (полиэдрические) ячейки, а жидкие прослойки – в плёнки толщиной несколько сотен, иногда несколько десятков нанометров (нм). Такие плёнки образуют пространственный каркас, обладающий некоторой упругостью и прочностью. Поэтому пены имеют свойства структурированных систем (смотрите Гели, Дисперсная Структура). Одна из основных характеристик пен – устойчивость, определяемая по времени уменьшения на 50% объёма или высоты слоя пены, изменению её дисперсности и другими методами. Образование пены, или Вспенивание, происходит при диспергировании газа в жидкой среде и во время выделения новой газовой фазы в объёме жидкости. Возникновение устойчивых высокодисперсных пен обусловлено присутствием в жидкости стабилизаторов пены, или Пенообразователей. Эти вещества облегчают вспенивание и затрудняют отток жидкости (дренаж) из пенных плёнок, препятствуя коалесценции (слиянию) пузырьков. Действуют они так же, как стабилизаторы эмульсий и лиофобных коллоидных систем:- снижают поверхностное натяжение и создают адсорбционно-сольватный слой с положительным расклинивающим давлением. В водных средах особенно эффективны мыла, мылоподобные поверхностно-активные вещества и некоторые растворимые полимеры, образующие на границе жидкости с газом слои с явно выраженными структурно-механическими свойствами (смотрите также Мономолекулярный Слой). Увеличение вязкости дисперсионной среды повышает устойчивость пены. Чистые жидкости с низкой вязкостью не образуют пену. Устойчивые и обильные пены с двуокисью углерода в качестве газовой фазы широко используют как средство тушения пожаров. Пену для этой цели получают с помощью пенных огнетушителей и разного типа пеногенераторов. Пенную флотацию применяют при обогащении полезных ископаемых. Вспенивание жидких и полужидких продуктов с последующим отверждением полученных пен имеет важное значение в производстве многих пищевых продуктов:- хлеба, бисквитов, разнообразных кондитерских изделий, кремов и других. Твёрдые строительные и конструкционные ячеистые материалы (пеностекло, пеношлаки, пенопласты, пористые резины и так далее) также получают вспениванием первоначально жидких суспензий, расплавов, растворов или полимерных композиций. Ряд технологических процессов, особенно в химической, текстильной и пищевой промышленности, сопровождается нежелательным пенообразованием. Для разрушения пены (пеногашения) или предупреждения их образования используют противопенные вещества, или пеногасители. Эффективные пеногасители – поверхностно-активные вещества, вытесняющие с поверхности жидкости пенообразователи, но сами не способные обеспечить стабилизацию пены. К их числу относятся различные спирты, эфиры, алкиламины. Иногда пену разрушают воздействием высоких температур, механическим путём или просто 'отстаиванием'.

FOAM BONDING = СКРЕПЛЕНИЕ ПЕНОЙ (или ПЕННОЕ СВЯЗЫВАНИЕ) – Foam Bonding is a means to apply binder at low water and high binder-solids concentration levels. The basic concept employed involves using air as well as water as the binder diluent and carrier medium. Foam-bonded nonwovens require less energy in drying, since less water is used. The foam is generated by introducing air into the formulated latex while mechanically agitating the binder solution. Air/latex dilutions or blow ratios in the order of 5:25 are practiced for various products. With the addition of a stabilizing agent to the binder solution, the foam can resist collapsing during application and curing, and the bonded fabric will exhibit enhanced loft, hand, and resilience. Non-stabilized foams are referred to as Froths; froth-bonded fabrics are similar in properties to some saturation-bonded nonwovens. The advantages include less energy required to dry the web, less binder migration and controllable softness by choices and amount of binders. The disadvantages are difficulties in controlling process and adequate foaming.

FOAMING = ВСПЕНИВАНИЕ (или ПЕНООБРАЗОВАНИЕ) – Foaming:- a frothy mixture of air and a petroleum product (e.g., lubricant, fuel oil) that can reduce the effectiveness of the product, and cause sluggish hydraulic operation, air binding of oil pumps, and overflow of tanks or sumps. Foaming can result from excessive agitation, improper fluid levels, air leaks, cavitation, or contamination with water or other foreign materials. Foaming can be inhibited with an antifoam agent. The foaming characteristics of a lubricating oil can be determined by blowing air through a sample at a specified temperature and measuring the volume of foam, as described in test method ASTM D 892. American Society for Testing and Materials (ASTM). / Американское Общество по Испытаниям и Материалам (АОИМ).

FOAM INHIBITOR = ИНГИБИТОР ПЕНЫ – Foam Inhibitor is a substance introduced in a very small proportion to a lubricant or a coolant to prevent the formation of foam due to aeration of the liquid, and to accelerate the dissipation of any foam that may form. See also Inhibitor.

FOB = FREE ON BOARD

FOB = FRONT ON BREAST

FOB AIRPORT = ФОБ АЭРОПОРТ (или ФРАНКО БОРТ АЭРОПОРТ) – FOB Airport is based on the same principle as the ordinary FOB term. The seller's obligations include delivering the goods to the air carrier at the airport of departure. The risk of loss of or damage to the goods is transferred from the seller to the buyer when the goods have been so delivered. / В сделках купли-продажи (поставки) товара под Франко, от Итальянского слова Franco, означающее Свободный, понимается термин, обозначающий распределение транспортных расходов между продавцом и покупателем до места, указанного в договоре, например, Франко Борт, Франко Вагон, Франко Склад Покупателя и тому подобное. Франко-Аэропорт (FOB Airport):- базисные условия поставки, при которых продавец несёт ответственность за товар до доставки его в аэропорт. Договор воздушной перевозки заключается за счёт покупателя.

FOB FREIGHT ALLOWED = ФОБ (или ФРАНКО БОРТ) ФРАХТ ПРИЗНАВАЕМ – FOB Freight Allowed is the same as FOB Named Inland Carrier, except the buyer pays the transportation charge and the seller reduces his invoice by a like amount. / В сделках купли-продажи (поставки) товара под Франко, от Итальянского слова Franco, означающее Свободный, понимается термин, обозначающий распределение транспортных расходов между продавцом и покупателем до места, указанного в договоре, например, Франко Борт, Франко Вагон, Франко Склад Покупателя и тому подобное.

FOB FREIGHT PREPAID = ФОБ (или ФРАНКО БОРТ) ФРАХТ ОПЛАЧЕН ПРЕДВАРИТЕЛЬНО – FOB Freight Prepaid is the same as FOB Named Inland Carrier, except the seller pays the freight charges of the inland carrier. / В сделках купли-продажи (поставки) товара под Франко, от Итальянского слова Franco, означающее Свободный, понимается термин, обозначающий распределение транспортных расходов между продавцом и покупателем до места, указанного в договоре, например, Франко Борт, Франко Вагон, Франко Склад Покупателя и тому подобное.

FOC = FREE OF CHARGE

FOCAL POINT = ФОКУСНАЯ ТОЧКА – Focal Point:- a group of Eurostat staff sharing an interest in a subject which cuts across Eurostat's organisational structures. / группа персонала Евростат, .

FO'C'SLE = БАК – Fo'c'sle (maritime term):- a modern version of the old term 'Forecastle', or bow section of the ship, where the crew lived.

FOCUS = FINANCIAL AND OPERATIONAL COMBINED UNIFORM SINGLE REPORT

FOETID = ЗЛОВОННОЕ – Foetid:- with an offensive stinking odor.

FOFIFA = FOIBE FIKAROHANA AMPIHARINA AMIN'NY FAMPANDROSOANA NY ENY AMBANIVOHITRA = CENTRE NATIONAL DE LA RECHERCHE APPLIQUE AU DEVELOPPEMENT RURAL = NATIONAL CENTER FOR APPLIED RESEARCH RURAL DEVELOPMENT

FOG–BOUND = ЗАДЕРЖАННОЕ ТУМАНОМ – Fog-Bound (maritime term):- said of a vessel when forced to heave to or lie at anchor due to fog.

FOG HORN = ТУМАННЫЙ ГОРН – Fog Horn (maritime term):- a sound signal device (not necessarily mechanically operated).

FOGMARKING = ЗАТУМАНИВАНИЕ (или ЗАМАРЫВАНИЕ ДЫМОМ ИЛИ ПЫЛЬЮ, СТОЯЩИМИ В ВОЗДУХЕ) – Fogmarking:- localized soiling of the fabric usually confined to edges and folds, though sometimes apparent as bars. Note:- this defect is often caused by deposition of atmospheric dirt during waiting periods in processing or when the fabric is stored in plated form, and is often aggravated by static-charge attraction. / Матовость (fogmarking):- порок ткани; загрязнение на определённом участке ткани различной формы, иногда выглядит как полосатость. Примечание:- этот порок часто вызывается перемещением атмосферной пыли во время периодов ожидания обработки или, когда ткань хранится в плакированной форме и часто подвергается притяжению электростатического заряда.

FOGS = FUNCTIONING OF THE GATT SYSTEM

FOIA = FREEDOM OF INFORMATION ACT

FOIL ADHESIVE = КЛЕЙ ДЛЯ ФОЛЬГИ – Foil Adhesive:- a clear plastisol based ink for applying brilliant high-gloss metallic foils by transfer application.

FOK = FILL OR KILL ORDER

FOLDED SELVAGE = СЛОЖЕННАЯ (или ЗАГНУТАЯ) КРОМКА – Folded Selvage is a curled selvage.

FOLDED YARN = КРУЧЁНАЯ ПРЯЖА (или СЛОЖЕННАЯ ПРЯЖА, или КРУЧЁНКА) – Folded Yarn is another term for plied yarns. Folded Yarn (synonym:- Plied Yarn) is the yarn in which two or more single yarns are combined by a single twisting operation. Folded Yarn or Plied Yarn:- two or more components (single yarns); one twisting operation; similar or dissimilar components. Folded Yarn:- In the traditional count systems a folded yarn is denoted by the count of the singles yarn preceded by a number giving the number of single yarns that make up the folded yarn. For example, 2/24s cotton count system implies a yarn made from two 24s count cotton yarns twisted together; 1/12s cotton count means a single 12s count cotton yarn. In the tex system there are two possible ways of referring to folded yarns:- one is based on the linear density of the constituent yarns and the other is based on the resultant linear density of the whole yarn. In the first way the tex value of the single yarns is followed be a multiplication sign and then the number of single yarns which go to make up the folded yarn, e.g., 80 tex X 2. This indicates a yarn made from twisting together two 80 tex yarns. In the second way of numbering folded yarns is R 74 tex / 2. It means R = resultant, 74 tex is the final yarn count and 2 is denoting no. of plies twisted together. Folded Yarn is English term for a Ply Yarn composed of several single-ply yarns. See also Plied Yarn. Folded Yarn:- The calculations for ascertaining the resultant counts of folded yarns when the counts of the component threads are given in the direct or universal system like tex is very simple. This is because of the fact that the count number in these systems expresses the weight of one length unit of the yarn or thread. The weight of one unit length of folded yarn is equal to the sum of the weights of it's component threads in one length unit. Therefore the count of the folded yarn will be also the sum of the count numbers of it's component threads. Thus the resultant count of a two folded yarn, composed of two threads one of 50 denier and the other of 60 denier, will be the sum of the count number of these two component threads, i.e. (50 + 60) = 110 denier. As already stated, there will be some contraction in length when the component threads are twisted together. The resultant count number in the above two examples will be higher than the sum of the count numbers of the component threads. The reverse also holds good. Thus if a two fold yarn of 42 tex is composed of two single threads of identical counts, then the count number of each components will be slightly less or finer than 42/2 or 21 tex. This is of course not very significant for ordinary cases. However, in the case of hard twisted yarns, special or fancy yarns, e.g., crepe yarns, cork-screw yarns, loop yarns, etc this factor is very significant and must be taken into account. The count of the folded yarn in such cases will be much higher than the sum of the count numbers of the component threads. The following formulas will be used during calculating count of folded yarn in tex system:- (1) To calculate the resultant count of the folded yarn when the counts of the component threads are known. As explained in the above, the count of the folded yarn will be the sum of the count numbers of the component threads. Resultant count of the folded yarn, = weight of one length unit of folded yarn in appropriate unit. = Total weight in appropriate unit of one length unit of component threads A, B, C (where A, B, C are the component threads). Or, resultant count of the folded yarn, = Count of A + count of B + count of C. Example 01:- Calculate the count of three fold nylon yarns, if the count of it's three component threads are 28 denier, 29 denier and 30 denier. Solution:- Resultant count of the three folded yarns, = Count of A + count of B + count of C; = 28 + 29 + 30 (where A = 28, B = 29 and C = 30) = 58 denier. So, the count of three fold nylon yarn is 58 denier. (2) To calculate the count of one of the unknown component thread when the counts of other components and the resultant folded yarn are known. Count of the unknown component thread, = (Weight in appropriate unit of one length unit of the folded yarn) – (sum of the weights in appropriate unit of one length unit of each of A, B). Where A, B ... are the known component threads. Or, Count of the unknown component thread, = Count of the folded yarn – (count of A + count of B + count of C ... etc). Example 02:- If the counts of a 3 fold yarn and it's component threads A, B, & C are 36 tex, 11 tex & 13 tex respectively, calculate the count of the unknown component thread. Solution:- Count of the unknown component thread, = Count of the folded yarn – (count of A + count of B + count of C); = 36 – (11 + 13); = 36 – 24; = 12 tex. So, Count of the unknown component thread is 12 tex. / ; одна операция кручения; . Крученая Пряжа (Folded Spun Yarn) – крученая нить, состоящая из двух или более пряж. Крученая Нить (Folded Yarn) – текстильная нить, скрученная из одной или более текстильных нитей.

FOLDER = СКЛАДЫВАТЕЛЬ – Folder or Folding Machine:- there are several types of this machine in the trade used to fold piece goods in some particular manner.

FOLDING IN LAYERS = СЛОЖЕНИЕ В СЛОИ – Folding In Layers is the process of placing a sliver, top or tow into successive layers in which each layer is made of regular parallel folds.

FOLIAGE = ФОЛИАЖ (или ЛИСТВА, или ЛИСТЬЯ) – Foliage is the leaves of plants. / , от Латинского слова Folium, означающее Лист, понимается . Фолиаж это категория растений, которые используются для украшения букетов и создания икебаны.

FOLIAGE PLANTS = ДЕКОРАТИВНО–ЛИСТВЕННЫЕ РАСТЕНИЯ – Foliage Plants, as relates to the US/Canada Greenhouse Certification Program, Foliage Plants are distinguished by the beautiful foliage they produce rather than by the flowers. Foliage Plants includes all tropical Plants such as Dieffenbachias, Ferns, Scheffleras, and Philodendrons as well as Coleus, Crontons, Fittonias, Pileas, and Peperomia. / Парник (Greenhouse). все тропические растения, такие как Диффэнбахии (Dieffenbachias), Папоротники (Ferns), Шэффлеры (Scheffleras), и Филодэндроны (Philodendrons), а также Колеусы (Coleus), Кротоны (Crotons), Фиттонии (Fittonias), Пилеи (Pileas), и Пэпэромии (Peperomia). Под Декоративными Растениями понимаются культурные и дикорастущие Растения (Деревья, Кустарники, Многолетние и Однолетние Травы), применяемые в озеленении, для украшения жилых помещений и общественных зданий. Отличаются красивой формой, разнообразной окраской листьев, цветков и плодов.

FOLIAR = ЛИСТВЕННОЕ (или ЛИСТОВОЕ) – Foliar:- referring to leaves of a plant; application of chemicals to the leaves.

FOLIAR ACTIVITY = ЛИСТВЕННАЯ АКТИВНОСТЬ – Foliar Activity is the term used to describe post-emergent herbicide effects on the leaves of plants. / Термин, используемый для описания воздействий послевсходовых гербицидов на листья растений.

FOLIAR DIAGNOSIS = ЛИСТОВОЙ ДИАГНОЗ (или ЛИСТОВАЯ ДИАГНОСТИКА) – Foliar Diagnosis is an estimation of mineral nutrient deficiencies (excesses) of plants based on examination of the chemical composition of leaves and the color and growth characteristics of the foliage of the plants. / Листовой Диагноз служит для оценки питания растения.

FOLIAR FEEDING = ЛИСТОВАЯ ПОДКОРМКА (или ЛИСТВЕННАЯ ПОДКОРМКА) – Foliar Feeding:- on cotton:- (1) leaf consumption, usually by caterpillars; (2) the feeding of nutrients, such as nitrogen-containing fertilizer, to the cotton plant via a liquid applied to the foliage. / Под Подкормкой Растений понимается внесение органических и минеральных удобрений под сельскохозяйственные культуры в период их роста и развития.

FOLLICLE = ФОЛЛИКУЛ (или ЛИСТОВКА, или ПУЗЫРЁК, или МЕШОЧЕК, или СУМКА, или СТРУЧОК) – Follicle is a dry dehiscent, many-seeded fruit derived from one carpel and splitting along one suture. Follicle is the skin structure from which hair or wool fiber grows. / Листовка – тип плода. Под Фолликулом, от Латинского слова Folliculus, означающее Мешочек, понимается пузырьковидное образование в органах животных и человека, выполняющее различные функции. Например, зрелый фолликул яичника содержит яйцеклетку, фолликул щитовидной железы – место окончательного синтеза гармонов.

FOLLOWING THE FORTUNES = СЛЕДОВАНИЕ УДАЧАМ – In reinsurance, Following The Fortunes is the clause stipulating that once a risk has been ceded by the reinsured, the reinsurer is bound by the same fate thereon as experienced by the ceding company.

FOLLOWING UNDERWRITER = ПОСЛЕДУЮЩИЙ РАСПИСЧИК (или ПОСЛЕДУЮЩИЙ АНДЕРРАЙТЕР) – Following Underwriter is an underwriter of a syndicate or an insurance company that agrees to accept a proportion of a given risk on terms set by another underwriter called the Leading Underwriter.

FOMC = THE FEDERAL OPEN MARKET COMMITTEE

FOOD AND AGRICULTURAL SERVICE = ПРОДОВОЛЬСТВЕННАЯ И СЕЛЬСКОХОЗЯЙСТВЕННАЯ СЛУЖБА – 1943:- forty-four governments, meeting in Hot Springs, Virginia, the United States, commit themselves to founding a permanent organization for food and agriculture. 1945:- first session of FAO Conference, Quebec City, Canada, establishes FAO as a specialized United Nations agency. 1951:- FAO headquarters moved to Rome, Italy, from Washington, DC, the United States. The Food and Agricultural Service (FAO) was established in 1945, as a specialized agency of the United Nations to combat hunger and malnutrition. The FAO serves as a coordinating body between government representatives, scientific groups and non-governmental organizations to carry out development programs relating to food and agriculture.

FOOD AND AGRICULTURE ORGANIZATION = ПРОДОВОЛЬСТВЕННАЯ И СЕЛЬСКОХОЗЯЙСТВЕННАЯ ОРГАНИЗАЦИЯ (или ОРГАНИЗАЦИЯ ПО ПРОДОВОЛЬСТВИЮ И СЕЛЬСКОМУ ХОЗЯЙСТВУ) – The Food and Agriculture Organization (FAO):- 1943 – forty-four governments, meeting in Hot Springs, Virginia, the United States, commit themselves to founding a permanent organization for food and agriculture. 1945 – First session of FAO Conference, Quebec City, Canada, establishes FAO as a specialized United Nations agency. 1951 – FAO headquarters moved to Rome, Italy, from Washington, DC, the United States. Achieving food security for all is at the heart of FAO's efforts – to make sure people have regular access to enough high-quality food to lead active, healthy lives. FAO's mandate is to raise levels of nutrition, improve agricultural productivity, better the lives of rural populations and contribute to the growth of the world economy. FAO provides the kind of behind-the-scenes assistance that helps people and nations help themselves. If a community wants to increase crop yields but lacks the technical skills, we introduce simple, sustainable tools and techniques. When a country shifts from state to private land ownership, we provide the legal advice to smooth the way. When a drought pushes already vulnerable groups to the point of famine, we mobilize action. And in a complex world of competing needs, we provide a neutral meeting place and the background knowledge needed to reach consensus. An intergovernmental organization, FAO has 191 member nations, one associate member and one member organization, the European Union. Every two years, representatives of all members meet at the FAO Conference to review work carried out and to approve a new budget. The Conference elects a smaller group of 49 member countries, known as the Council, to serve three-year rotating terms to govern the Organization's activities. The Conference also elects a Director-General to a six-year term. FAO is composed of seven departments:- (i) Agriculture and Consumer Protection; (ii) Economic and Social Development; (iii) Fisheries and Aquaculture; (iv) Forestry; (v) Corporate Services, Human Resources and Finance; (vi) Natural Resources Management and Environment; and (vii) Technical Cooperation. Besides its headquarters in Rome, FAO is present in over 130 countries. The decentralized network includes five regional offices, 11 subregional offices, two multidisciplinary teams, 74 fully fledged country offices (excluding those hosted in regional and subregional offices), eight offices with technical officers/FAO Representatives, and 36 countries covered through multiple accreditation. In addition, the Organization maintains five liaison offices and four information offices in developed countries. FAO's overall programme of work is funded by assessed and voluntary contributions. The assessed contributions are member countries' contributions, set at the biennial FAO Conference. The FAO regular budget for the 2010–11 biennium is USD1 billion. The voluntary contributions provided by members and other partners support technical and emergency (including rehabilitation) assistance to governments, as well as direct support to FAO's core work. The voluntary contributions are expected to reach approximately USD1.2 billion in 2010–11. A comprehensive programme of organizational reform and culture change began in 2008. Headquarters restructuring and delegation of decision making has created a flatter more responsive structure and reduced costs. Modernizing and streamlining of administrative and operational processes are under way. Improved internal teamwork and closer external partnerships coupled with upgrading of IT infrastructure and greater autonomy of FAO's decentralized offices allows the Organization to respond quickly where needs are greatest. As FAO is primarily a knowledge based organization, investing in human resources is a top priority. Capacity building including a leadership programme, employee rotation and a new junior professional programme has been established. Individual performance management, an ethics officer and an independent office of evaluation are designed to improve performance through learning and strengthened oversight. The Food and Agricultural Service (FAO) was established in 1945, as a specialized agency of the United Nations to combat hunger and malnutrition. The FAO serves as a coordinating body between government representatives, scientific groups and non-governmental organizations to carry out development programs relating to food and agriculture. The Food and Agriculture Organization (FAO), oldest permanent specialized agency of the United Nations, established in October 1945 with the objective of eliminating hunger and improving nutrition and standards of living by increasing agricultural productivity. The FAO coordinates the efforts of governments and technical agencies in programs for developing agriculture, forestry, fisheries, and land and water resources. It also carries out research; provides technical assistance on projects in individual countries; operates educational programs through seminars and training centres; maintains information and support services, including keeping statistics on world production, trade, and consumption of agricultural commodities; and publishes a number of periodicals, yearbooks, and research bulletins. Headquartered in Rome, Italy, the FAO maintains offices throughout the world. The organization, which has more than 180 members, is governed by the biennial FAO conference, in which each member country, as well as the European Union, is represented. The conference elects a 49-member Council, which serves as its executive organ. In the late XX century the FAO gradually became more decentralized, with about half its personnel working in field offices. During the 1960s the FAO concentrated on programs for the development of high-yield strains of grain, the elimination of protein deficiencies, the provision of rural employment, and the promotion of agricultural exports. In 1969 the organization published An Indicative World Plan for Agricultural Development, which analyzed the main problems in world agriculture and suggested strategies for solving them. The 1974 World Food Conference, held in Rome during a period of food shortages in the southern Sahara, prompted the FAO to promote programs relating to world food security, including helping small farmers implement low-cost projects to enhance productivity. In the 1980s and '90s, FAO programs for sustainable agriculture and rural development emphasized strategies that were economically feasible, environmentally sound, and technologically appropriate to the skill level of the host country. The Food and Agriculture Organization (FAO) of the United Nations leads international efforts to defeat hunger. Serving both developed and developing countries, FAO acts as a neutral forum where all nations meet as equals to negotiate agreements and debate policy. FAO is also a source of knowledge and information. We help developing countries and countries in transition modernize and improve agriculture, forestry and fisheries practices and ensure good nutrition for all. Since our founding in 1945, we have focused special attention on developing rural areas, home to 70 percent of the world's poor and hungry people. FAO's activities comprise four main areas:- (i) putting information within reach; (ii) sharing policy expertise; (iii) providing a meeting place for nations; and (iv) bringing knowledge to the field. Food and Agriculture Organization (FAO) of the United Nations (UN) is an organization that leads international efforts to defeat hunger. Serving both developed and developing countries, the Food and Agriculture Organization of the United Nations acts as a neutral forum where all nations meet as equals to negotiate agreements and debate policy, and is also a source of knowledge and information.

FOOD, CONSERVATION AND ENERGY ACT OF 2008 = АКТ О ПРОДОВОЛЬСТВИИ, КОНСЕРВАЦИИ И ЭНЕРГИИ ОТ 2008 – The Food, Conservation and Energy Act of 2008 (FCE Act of 2008) is the US farm legislation replaces the Farm Security and Rural Investment Act of 2002 (FSRI Act of 2002) and covers the period 2008–13. The Food, Conservation, and Energy Act of 2008 (Pub.L. 110–234, H.R. 2419, 122 Stat. 923, enacted May 22, 2008, also known as the 2008 US Farm Bill) was a USD288 billion, five-year agricultural policy bill that was passed into law by the United States Congress on June 18, 2008. The bill was a continuation of the 2002 Farm Bill. It continues the United States' long history of agricultural subsidies as well as pursuing areas such as energy, conservation, nutrition, and rural development. Some specific initiatives in the bill include increases in Food Stamp benefits, increased support for the production of cellulosic ethanol, and money for the research of pests, diseases and other agricultural problems. On January 01, 2013, Congress passed the American Taxpayer Relief Act of 2012 to avert the fiscal cliff and the next day President Barack Obama signed the Act into law. (Public Law No:- 112-240) The 'fiscal cliff' deal was primarily enacted to avoid automatic tax hikes and spending cuts, but also included provisions extending portions of the 2008 Farm Bill for nine months through September 30, 2013. Senate Majority Leader Harry Reid demonstrated a commitment to working on a new five-year Farm Bill by reintroducing last session's Senate Farm Bill in the 113th Congress.

FOOD FOR PROGRESS = ПРОДОВОЛЬСТВИЕ ВО ИМЯ ПРОГРЕССА – In the United States, the Food For Progress (FFP) program is carried out by the Department of Agriculture, using the authority of either Public Law 480 or Section 416 of the Agricultural Act of 1949. The program provides commodities to needy countries to encourage agricultural reform. In fiscal year 1991, no agreements were signed under the FFP program. Public Law 480 is a food aid and market development program which focuses on the needs of developing countries and is aimed at establishing a US presence in such markets and supporting their economic growth. Section 416 of the Agricultural Act of 1949 provides for the donation of food and feed commodities owned by Agriculture's Commodity Credit Corporation and is focused on people in developing countries.

FOOD GRADE = ПИЩЕВОЙ СОРТ – Food Grade is a term applied to chemicals that are of quality suitable for use in food (in the USA, the letters 'FCC' (short for Food Chemicals Codex), may appear on the label. Food grade chemicals are often similar in purity to technical grade products, but might be somewhat better, and will have been processed to avoid impurities and contamination that would be detrimental in food. The cost is often just a bit more than technical grade. Packaging, for dry products, is often in bags in the range of 25 kg or 50 pounds. Food grade products are suitable for use in dyeing, and may be more readily available from industrial suppliers than technical grade, depending on what local industries use. See also Grades Of Chemicals.

FOOD GRADE LUBRICANTS = СМАЗКИ ПИЩЕВОГО СОРТА – Food Grade Lubricants are the lubricants acceptable for use in meat, poultry and other food processing equipment, applications and plants. The lubricant types in food-grade applications are broken into categories based on the likelihood they will contact food. The United States Department of Agriculture (USDA) created the original food-grade designations H1, H2 and H3, which is the current terminology used. The approval and registration of a new lubricant into one of these categories depends on the ingredients used in the formulation. See also Lubricants.

FOOD SECURITY ACT OF 1985 = АКТ О ПРОДОВОЛЬСТВЕННОЙ БЕЗОПАСНОСТИ ОТ 1985 – In the United States, the Food Security Act (FSA) Of 1985 is the farm act covering the years 1986–90. The Food Security Act Of 1985 (Public Law 99-198 (PL 99-198)), a 5-year omnibus farm bill, allowed lower commodity price and income supports and established a dairy herd buyout program. This 1985 farm bill made changes in a variety of other USDA programs. Several enduring conservation program were created, including sodbuster, swampbuster, and the Conservation Reserve Program. Shortly after enactment, the Technical Corrections to Food Security Act of 1985 Amendments (PL 99-253 gave USDA discretion to require cross-compliance for Wheat and feed grains instead of mandating them, changed acreage base calculations, and specified election procedures for local Agricultural Stabilization and Conservation committees. Technical changes and other modifications were enacted by the Food Security Improvements Act of 1986 (PL 99-260), including limiting the non-program crops that could be planted under the 50/92 provision, permitting haying and grazing on diverted Wheat and feed grain acreage for a limited period in regions of distress, and increasing deductions taken from the price of milk received by producers to fund the dairy termination program (also called the Whole Herd Buy-Out) program. Again in 1986, the Omnibus Budget Reconciliation Act of 1986 (PL 99-509) made changes in the 1985 Act requiring advance deficiency payments to be made to producers of 1987 Wheat, feed grains, upland Cotton, and Rice crops at a minimum of 40% for Wheat and feed grains and 30% for Rice and upland Cotton. The 1985 Act also amended the Farm Credit Act of 1971. Further commodity program changes were made in the FY1987 agricultural appropriations bill (PL 99-591). In addition to its funding provisions, PL 99-591 set the annual payment limitation at USD50 000.00 per person for deficiency and paid land diversion payments, and included honey, resource adjustment (excluding land diversion), disaster, and Findley payments under a USD250 000.00 aggregate payment limitation. Once again, the Omnibus Budget Reconciliation Act of 1987 (PL 100-203) not only set the 1988 fiscal year budget for agriculture and all federal agencies, but also set target prices for 1988 and 1989 program crops, established loan rates for program and non-program crops, and required a voluntary paid land diversion for feed grains. PL 100-203 further defined who could receive farm program payments by defining a 'person' in terms of payment limitations. and its successor, the 1990 Food, Agriculture, Conservation, and Trade Act (FACTA). The signing of the Food Security Act of 1985 (FSA 85), by President Reagan in December 1985 culminated a lengthy deliberation process involving food producing and consuming groups throughout the United States. During the debate, an analysis of a wide range of policy options for the 1985 Farm Bill was helpful to various interest groups in assessing their support for particular features of FSA 85. The various state agricultural interest groups who participated in the political process at the federal level have a continuing interest in information on the implications of the new Farm Bill. The first comprehensive analysis on the effects of the FSA 85 was recently completed by the Food and Agricultural Policy Research Institute (FAPRI) and provided information on commodity markets, government budgets, and farm income at the national level. / сохранение (conservation). Президент США Ранэлд Вилсэн Рэйген (Ronald Wilson Reagan; 1911–2004). В Соединённых Штатах Америки, Акт о Продовольственной Безопасности от 1985 служил законодательным актом, регулировавшим фермерскую деятельность и действовавшим в течение 1986–90.

FOODTRAYS = ПРОДОВОЛЬСТВЕННЫЕ ЛОТКИ (или КОРМУШКИ) – Foodtrays are preformatted small packages which are also used for sales presentations.

FOOL'S GOLD = ЗОЛОТО ДУРАКОВ (или ПОДДЕЛЬНОЕ ЗОЛОТО) – Fool's Gold:- pyrites of iron sulphide, which is gold-like in appearance and can delude amateur prospectors. / Пириты сульфида железа, которые выглядят как золото и могут ввести в заблуждение старателей дилетантов. В России этот термин можно было бы ассоциировать с так называемым Цыганским Золотом, также являющимся поддельным.

FOOT = ОПОРА (или XX) – Foot is a locating device fitted to the base of a box pallet, post pallet or cage pallet to facilitate stacking and handling. See also Pallet. / Опора (Foot):- элемент основания ящичных, стоечных или сетчатых поддонов, обеспечивающий штабелирование. Смотрите также Поддон (Pallet).

FOOT = ФУТ – Foot plural feet in measurement, any of numerous ancient, medieval, and modern linear measures (commonly 25 to 34 cm) based on the length of the human foot and used exclusively in English-speaking countries, where it generally consists of 12 inches

or one-third yard. In most countries and in all scientific applications, the foot, with its multiples and subdivisions, has been superseded by the metre (meter), the basic linear unit in the metric system. In the United States the definition of the foot as exactly 30.48 cm took effect in 1959. / Под Футом, от Английского слова Foot, означающее Ступня, понимается единица длины в Британской Имперальной Системе. Обозначение:- фт (ft). 1 фут = 12 дюймам = 1/3 ярда = 0.304 8 метра. Под Футом, от Английского слова Foot, буквально означающее Ступня, понимаются:- (1) единица длины Русской Системы Мер, отменённой в 1918. 1 Фут = 1/7 сажени = 12 дюймам = 0.304 8 метра (м). (2) Единица длины в системе Английских мер. 1 Фут = 1/3 ярда = 12 дюймам = 0.304 8 м.

FOOT CANDLE = ФУТ–СВЕЧА – Foot Candle is the unit of illuminance equal to one lumen per square foot. / Фут-Свеча – единица освещённости, равная одному люмену на квадратный фут.

FOOT LENGTH = ДЛИНА СТУПНИ – Foot Length:- the length of a foot is commonly defined as the distance between two parallel lines that are perpendicular to the foot and in contact with the most prominent toe and the most prominent part of the heel. Foot length of the foot is measured with the subject standing barefoot and the weight of the body equally distributed on both feet. The sizes of the left and right feet are often slightly different. In this case, both feet are measured, and purchasers of mass-produced shoes are advised to purchase a shoe size based upon the larger foot because, contrary to the reality of foot sizes, most manufacturers do not sell pairs of shoes in non-matching sizes. Each size of shoe is considered suitable for a small interval of foot lengths. The inner cavity of a shoe must typically be 15–20 mm longer than the foot, but this relation varies between different types of shoes. A shoe-size system can refer to three characteristic lengths:- (i) The Median Length Of Feet For Which A Shoe Is Suitable:- for customers, this measure has the advantage of being directly related to their body measures. It applies equally to any type, form, or material of shoe. However, this measure is less popular with manufacturers, because it requires them to test carefully for each new shoe model, for which range of foot sizes it is recommendable. It puts on the manufacturer the burden of ensuring that the shoe will fit a foot of a given length. (ii) The Length Of The Inner Cavity Of The Shoe:- this measure has the advantage that it can be measured easily on the finished product. However, it will vary with manufacturing tolerances and provides the customer only very crude information about the range of foot sizes for which the shoe is suitable. (iii) The Length Of The 'Last':- the foot-shaped template over which the shoe is manufactured. This measure is the easiest one for the manufacturer to use, because it identifies only the tool used to produce the shoe. It makes no promise about manufacturing tolerances or for what size of foot the shoe is actually suitable. It leaves all responsibility and risk of choosing the correct size with the customer. Further, the last can be measured in several different ways resulting in different measurements. All these measures differ substantially from one another for the same shoe. Total Foot Length:- to measure the total length of your foot, place a ruler or tape measure on the floor. Position the back of your heel at the beginning of the tape and the measure to your longest toe. / Длина Ступни:- горизонтальное расстояние в сантиметрах между перпендикулярами, опущенными от конца наиболее выступающего пальца и наиболее выступающей части пятки. При измерении человек стоит босиком, масса тела равномерно распределена на обе ноги. Примечание:- допускается для определения размера необходимой обуви проводить измерения длины и ширины ступней в миллиметрах (мм), при этом на ногу надевают чулок (носок) в соответствии с типом обуви.

FOOTMAN = ЛАКЕЙ – Footman is the vertical connection between the treadle and the crank.

FOOTWEAR = ОБУВЬ – Footwear is a type of clothing worn on the feet (generally over socks ...). Sneakers, boots, sandals and several other types of shoe fall into the footwear category.

FOPPS = FARM OPERATIONS, PLANT PROTECTION, AND (PEST) SURVEILLANCE

FOR = FREE ON RAIL

FORAGE = ФУРАЖ – Forage is plant material (mainly plant leaves and stems) eaten by grazing livestock. Historically, the term Forage has meant only plants eaten by the animals directly as pasture, crop residue, or immature cereal crops, but it is also used more loosely to include similar plants cut for fodder and carried to the animals, especially as hay or silage. While the term Forage has a broad definition, the term Forage Crop is used to define crops, annual or biennal, which are grown to be utilized by grazing or harvesting as a whole crop. / Под Фуражем, от Французского слова Fourrage, понимается концентрированные (зерно Злаков и Бобовых культур) и грубые (сено, солома) корма для сельскохозяйственных животных. Фураж, корма, заготавливаемые для сельскохозяйственных Животных:- зерно Злаковых и Бобовых культур (смотрите Зернофуражные Культуры), а также сено, солома, мякина и другие грубые корма.

FORASTERO COCOA BEAN = БОБ КАКАО ФОРАСТЭРО – Forastero Cocoa Bean:- originating from the Upper Amazon region, Forastero grows in several South American countries, including Peru, Ecuador, Colombia, Brazil, Guyana, French Guyana and in southern Venezuela near the Orinoco. They are also found in West Africa, in the Ivory Coast, Ghana, Cameroon and São Tomé, as well as in South-East Asia. Forastero, means foreigner or stranger. Hence, the Spanish called Cocoa Trees from the Amazon Forastero. The Forastero Cocoa bean is the most widely grown Variety, accounting for about 70–80% of total Cocoa world production, but its quality is not as highly regarded as the Criollo Variety. Its characteristics include:- (i) very, sometimes extremely, bitter; (ii) very tannic and astringent and can be overwhelming with its forceful aromatic power, but lacks finesse and diversity; (iii) offers a limited range of flavors; and (iv) is comparable to Robusta Coffee.

FORCE = FINANCIAL AND OPERATIONAL REPORTING IN A COMPUTERIZED ENVIRONMENT

FORCE = СИЛА – Force:- the unit of force is the Newton (N). One newton is the force which when applied to a body having a mass of one kilogram (kg) imparts thereto an acceleration of one meter per second, per second. The Newton, its multiples and sub-multiples are used in the field of textiles for the expression of force, such as tension, breaking force and force at specified elongation. In the International System of units (SI), symbol:- F; unit:- Newton (N); SI base unit:- $kg \cdot m \cdot s^{-2}$. See also Force At Break, Force At Rupture, and Force At Specified Elongation. / В механике под Силой понимается мера механического действия на данное материальное тело со стороны других тел. Это действие вызывает изменение скоростей точек тела или его деформацию и может иметь место как при непосредственном контакте (давлении прижатых друг к другу тел), так и через посредство создаваемых телами полей (поле тяготения, электромагнитное поле). Сила – величина векторная и в каждый момент времени характеризуется численным значением, направлением в пространстве и точкой приложения.

FORCE AT BREAK = СИЛА ПРИ РАЗРЫВЕ – Force At Break:- xxxxx. Breaking Force:- the maximum force which a test specimen can support during a test of loading to break under defined conditions. The recommended units for breaking force are the centiNewton for fibers and yarns, and decaNewton for cabled yarns. Uster Tensorapid 3:- the automatic tensile testing installation determines the breaking force and the corresponding elongation of staple fiber yarns, ply yarns and filament yarns, slivers, skeins and woven fabric samples. Force measurements up to 1 000 N are possible without exchanging the force transducer. (1) Force at break before accelerated aging: Ultimate tensile strength (MPA) not less than 21.0. Ultimate elongation (%) not less than 700. (2). Force at break

after accelerated aging: Ultimate tensile strength (MPA) not less than 16.0. Ultimate elongation (%) not less than 500. See also Breaking Force. The Breaking Force is the force needed to be applied on a yarn to make it break. It is expressed in Newton (N). The elongation at break is the increase of the length produced by stretching a yarn to its breaking point. It is expressed as a percentage of its initial length. The test is carried out on a dynamometer with a constant stretching speed, under the following conditions:- (i) length of yarn between clamps:- 500 mm (or 250 mm); (ii) pretension of yarn between clamps:- 0.5 cN/Tex; (iii) test speed:- (a) 50 mm/min (25 mm/min) if elongation at break ≤ 8%, (b) 500 mm/min (250 mm/min) if elongation at break is between 8 and 50%, and (c) 1000 mm/min (500 mm/min) if elongation at break ≥ 50%. / Уштэр Тэнзорапид Трай (Uster Tensorapid 3). Уштэр Тчэкнолодьжиз А.Ге. (Цельвига Уштэр) (Uster Technologies AG (Zellweger Uster)), Уштэр (или Устер), Швейцария.

FORCE AT RUPTURE = СИЛА ПРИ ПРОРЫВЕ – Force At Rupture is the final force just before complete rupture of a test specimen.

FORCE AT SPECIFIED ELONGATION = СИЛА ПРИ СПЕЦИФИКАЦИОННОМ УДЛИНЕНИИ – Force At Specified Elongation is the force associated with a specified elongation on the force-elongation curve. Force At Specified Elongation (FASE) is the force necessary to stretch the industrial multifilament yarn to a define extension (usually 2% and 5%). / филаментная (комплексная) пряжа (filament yarn).

FORCED LIQUIDATION = ПРИНУДИТЕЛЬНАЯ ЛИКВИДАЦИЯ – Forced Liquidation:- the situation in which a customer's account is liquidated (open positions are offset) by the brokerage firm holding the account, usually after notification that the account is under-margined through margin calls. / Ситуация, при которой брокерская компания, поддерживающая счёт заказчика, ликвидирует данный счёт, а более точно, производит зачёт маржинальными средствами открытых ранее позиций этого заказчика. Такое производится, как правило, после нотификации о том, что данный счёт не пополнен свободными денежными средствами, необходимыми для поддержания маржи на соответствующем уровне, после неуодвлетворённых требований об этом.

FORCED SALE OF COLLATERAL = ВЫНУЖДЕННАЯ ПРОДАЖА ОБЕСПЕЧЕНИЯ (или ПРОДАЖА ОБЕСПЕЧЕНИЯ В ПРИНУДИТЕЛЬНОМ ПОРЯДКЕ) – Forced Sale Of Collateral is the forced sale of the assets pledged as security to the bank for a loan if the credit utilization exceeds the lending value of the pledged collaterals or if the customer is in default regarding repayment of principal or payment of interest. / Вынужденная продажа активов, заложенных в банке под заём в качестве обеспечения, если использование кредита превышает выплата (repayment) основной суммы долга или оплаты процента.

FORCED SAVING = ПРИНУДИТЕЛЬНОЕ СБЕРЕЖЕНИЕ – Forced Saving:- compulsory saving on a large scale by a state-imposed limitation of consumer spending, engineered in such a way that the money 'saved' is directed into investments, pension fund financing, etc.

FORCE FEED LUBRICATION = ПРИНУДИТЕЛЬНОЕ СМАЗЫВАНИЕ (или СМАЗЫВАНИЕ ПРИНУДИТЕЛЬНОЙ ПОДАЧЕЙ, или СМАЗЫВАНИЕ ПОД ДАВЛЕНИЕМ) – Force Feed Lubrication is a system of lubrication in which the lubricant is supplied to the bearing surface under pressure. See also Lubrication. / Принудительное Смазывание или Смазывание Под Давлением – смазывание, при котором смазочный материал подводится к поверхности трения под давлением.

FORCE MAJEURE = ФОРС МАЖОР (или НЕПРЕОДОЛИМАЯ СИЛА) – Force Majeure is the title of a common clause in contracts, exempting the parties for non-fulfillment of their obligations as a result of conditions beyond their control, such as earthquakes, floods or war. A state of emergency or condition that permits a company to depart from the strict terms of contract because of an event or effect that cannot be reasonably anticipated or controlled, i.e. beyond human control (French superior or irresistible force). Force Majeure:- the title of a standard clause in marine contract exempting the parties for nonfulfillment of their obligations as a result of conditions beyond their control, such as earthquakes, floods or war. Literally, 'greater force'; a clause designed to protect against failures to perform contractual obligations caused by unavoidable events beyond the party's control, such as natural disasters or wars. The title of a common clause in contracts, exempting the parties for non-fulfillment of their obligations as a result of conditions beyond their control, such as earthquakes, floods or war. Circumstances beyond the control of one of the parties to a contract which may, depending on the terms and conditions of the contract, relieve that party of liability for failing to execute such contract. Force Majeure:- a clause in a supply contract that permits either party not to fulfill the contractual commitments due to events beyond their control. These events may range from strikes to export delays in producing countries. Also known as Act Of God. A standard clause which indemnifies either or both parties to a transaction whenever events which the exchange declares to be reasonably beyond the contract. Force Majeure:- should any circumstances arise which hinder prevents complete or partial fulfillment by any of the parties of their respective obligations under the contract, namely, export or import ban, refusal to issue Export License, act of God, plague or other epidemics, quarantine, fire, explosion, war, blockade, embargo, insurrection, mobilization, warlike conditions, riots, civil commotions, governmental directions, restraints of prices, currency restrictions, restraints by rulers or by international organizations, or intervention of civil, naval, military authorities or other agencies of Government, deviation from route due to military actions, traffic accidents, prolonged failure or shortage of electric current, strikes, lockouts, slowdowns, sabotage, affecting the activities of the parties, manufacturer or any other person, firm or corporation directly or indirectly connected with the manufacture, sale, shipment or delivery, or any other causes beyond the control of source of Force Majeure, the parties shall not be liable for any delay in shipment or delivery, non-delivery, destruction or deterioration of all or any part of the goods, or for any other default in performance of the contract caused by such circumstances. Force Majeure is an occurrence outside human control (e.g., earthquake), a superior power. / , порядки и условия . При наступлении обстоятельств, делающих невозможным полное или частичное исполнение любой из сторон их соответствующих обязательств по контракту, а именно:- запрещение вывоза (или экспорта) или привоза (или импорта), отказ в выдаче Вывозной (или Экспортной) Лицензии, стихийное бедствие, эпидемии чумы или других заразных болезней, карантин, пожар, взрыв, война, блокада, эмбарго, восстание, мобилизация, военное положение, нарушение общественного порядка, гражданские волнения, правительственные директивы, ограничения цен, валютные ограничения, ограничения со стороны властей или международных организаций, или вмешательство гражданских, таможенных, военных властей или иных ведомств Правительства, отклонение от маршрута в связи с военными действиями, дорожные происшествия, затяжного отсутствия или нехватки электроэнергии, забастовки, локауты, снижения темпов работы, саботаж, воздействие на деловую активность сторон, производителя или любых других лиц, фирм или корпораций, прямо или косвенно связанных с производством, продажей, отгрузкой или поставкой, или в любых других случаях, вызванных Форс Мажором и неподвластных контролю, стороны освобождаются от ответственности за любую задержку отгрузки или поставки, непоставку, уничтожение или порчу всего или любой части товаров, или за любое другое неисполнение Контракта, вызванные такими обстоятельствами. Смотрите также Действие Бога (Act Of God), и Вис Майор (Vis Major). Форс Мажор (от Французского слова Force Majeure). Смотрите Непреодолимая Сила. Непреодолимая Сила (на Латинском языке Vis Major, на Французском языке Force Majeure), в гражданском праве – обстоятельство, освобождающее от ответственности. Под непреодолимой силой понимается чрезвычайное событие, вредные последствия которого не могло предотвратить лицо, обязанное это сделать. К таким событиям относятся стихийные бедствия (например, землетрясения, наводнения), общественные явления (например, война). Будучи непредотвратимой, непреодолимая сила обладает тем не менее относительным характером:- событие,

непреодолимое в одних условиях, может стать преодолимым в других. Как правило, непреодолимая сила освобождает от имущественной ответственности, если именно непреодолимая сила – причина правонарушения и отсутствует вина обязанного лица. В некоторых случаях правонарушитель несёт имущественную ответственность даже при наличии непреодолимой силы (например, согласно Статьи 101 Воздушного Кодекса СССР). Непреодолимая сила является также основанием приостановления срока течения исковой давности. В праве под Непреодолимой Силой (Форс Мажором), от Французских слов Форс Мажор (Force Majeur), понимается чрезвычайное и непредотвратимое при данных условиях событие, например, наводнение, шторм и другие стихийные бедствия, освобождающее, как правило, от имущественной ответственности за неисполнение договора или причинение вреда, а также приостанавливающее течение срока исковой давности. Под Стихийными Бедствиями понимаются катастрофические природные явления и процессы (засухи, землетрясения, извержения вулканов, наводнения, сели, ураганы, цунами и прочие), которые могут вызывать человеческие жертвы и наносить материальный ущерб. Характеризуются непредсказуемостью или неопределённостью во времени наступления и неоднозначностью последствий. Форс-Мажор (Force Majeure или Act of God):- чрезвычайные обстоятельства, непреодолимая сила (пожары, войны, стихийные бедствия и тому подобное), которые не могут быть ни предусмотрены условием соглашения договора или предотвращены действиями одной или нескольких сторон договора. Обстоятельства, связанные с Форс-Мажором по условию договора, служат основанием разрешающим переносить срок его исполнения или вообще освобождающее стороны (полностью или частично) от выполнения договорных обязательств.

FOR DEPOSIT ONLY = ТОЛЬКО ДЛЯ ДЕПОНИРОВАНИЯ – For Deposit Only:- endorsement on the face of a check indicating that the amount must be credited to an account and cannot be paid out in cash. / Индоссамент на лицевой стороне чека, указывающий на то, что данная сумма должна быть зачисленной кредитом на счёт и не может быть использована для выплаты наличными. При помощи бланкового индоссамента чек становится предъявительским документом и любой законный владелец может получить по нему деньги в банке. Такой индоссамент состоит из одной подписи держателя чека на обороте. Именной индоссамент позволяет указать имя лица, которому передается право получения денег по чеку. Это имя ставится рядом с подписью держателя чека. Целевой индоссамент выражает ограничения возможностей получения денег по чеку. На обороте указывается цель передачи чека другому лицу, например, в виде ‘только для депонирования’.

FORE = ФОК (или ФОКА, или ФОР) – Fore:- at or near the bow or forward portion of the vessel. / То, что находится на или вблизи носовой или передней части судна. В Русскоязычной морской терминологии в большинстве случаев используется в качестве приставки.

FORE AND AFT = ВДОЛЬ ЧЕГО–ЛИБО (или ОТ ФОРШТЕВНЯ ДО АКТЕРШТЕВНЯ, или ПРОДОЛЬНО, или ВДОЛЬ КИЛЯ СУДНА, или НОС И КОРМА) – Fore And Aft is the direction on a vessel parallel to the center line. From the bow to the stern; lengthwise or set lengthwise, as sails.

FORE AND AFT STOWAGE = ПРОДОЛЬНАЯ ШТИВКА (или ШТИВКА С НОСА К КОРМЕ) – Fore And Aft Stowage is a stowage from the bow to the stern (lengthwise), as opposed to stowage athwartships. Load stowed along the length of the container or the ship. Contrast athwartships stowage. In the context of load securing, it is of utmost importance whether a container is stowed fore and aft or athwartships on a ship. In the case of athwartships stowage, the greatest acceleration forces act on the actual container longitudinally rather than transversely. Load securing measures must then be taken with this in mind. / Штивка с носа к корме.

FOREBODY = НОС (или НОСОВАЯ ЧАСТЬ) – Forebody:- that part of a ship which is forward of midships. / Та часть судна, которая простирается вперёд от миделя (средней части судна).

FORECAST = ПРОГНОЗ – Forecast is prospective financial statements that are an entity’s expected financial position, results of operations, and cash flows. Prediction of future business and economic conditions made on the basis of statistics describing past and current conditions, primarily by using economic indicators. / В экономике под Прогнозом понимается система научных исследований о возможностях направления будущего развития экономики и отдельных её сфер. Прогнозы бывают краткосрочными, среднесрочными, долгосрочными и сверхдолгосрочными. Прогнозирование – определение вероятных тенденций и перспектив развития различных процессов, объектов, систем, трудовых ресурсов на основе имеющихся данных. Прогнозирование предшествует планированию, при котором разрабатывают методы и способы достижения целей, определённых при прогнозировании. В зависимости от срока, на который составляется прогноз, он может быть краткосрочным, среднесрочным и долгосрочным. Достоверность прогноза зависит от полноты статистической информации, степени выявления закономерностей прогнозируемых процессов, глубины анализа основных тенденций развития в прошлом, настоящем и будущем. Прогнозы с большой дальностью часто носят гипотетический характер.

FORECASTLE = БАК – Forecastle is the raised part at the bow of the ship. Forecastle (maritime term):- a compartment where the crew lives. See also Fo’c’sle. Forward part of a vessel where stores, ropes and anchor chains are located. Forecastle is the raised part of the forward end of a ship’s hull. The inside space may be used for crew accommodation or quarters, though on new ships this space is being used for the storage of paints, tackle, deck and engine stores, tarpaulins, etc. / Возвышающаяся часть на носу корабля. Передняя часть судна, на которой размещаются судовые запасы, тросы и якорные цепи. Бак это носовая надстройка судна для защиты верхней палубы от заливания встречной волной, для повышения непотопляемости (закрытый бак), размещения служебных помещений. На баке находятся якорное и швартовное устройства.

FORECLOSURE = ОБРАЩЕНИЕ ВЗЫСКАНИЯ – Foreclosure is a seizure of collateral by a creditor when default under a loan agreement occurs. Foreclosure is the legal process used to force the payment of debt secured by collateral whereby the property is sold to satisfy the debt. / Обращение Взыскания это конфискация кредитором обеспечения в случае возникновения несостоятельности (дифолта) заёмщика и его соответствующего неисполнения соглашения о займе. Обращение Взыскания это юридический процесс, используемый для принуждения оплаты долга, гарантированного обеспечением, в соответствии с которым заложенное имущество распродаётся для удовлетворения долга перед кредитором. Обращение Взыскания на залог является юридическим процессом, используемым с целью принудительной оплаты долга, гарантированного обеспечением. Данный процедура исполняется посредством распродажи имущества, выступавшего в качестве обеспечения, для удовлетворения возникшей задолженности. Обращение Взыскания на залог – процесс, в ходе которого домовладелец, не внёсший своевременных платежей в счёт основной суммы и процентов по ипотечному займу, теряет право владения домом. Владелец ипотеки – банк, ссудосберегательная ассоциация или частное лицо – должен обратиться в суд, чтобы получить права на собственность, которая может быть продана для удовлетворения претензий по ипотечному займу.

FOREFOOT = ХВОСТОВИК ФОРШТЕВНЯ (или НОСОВОЙ ДЕЙДВУД, или БАКС, или БАКСОВАЯ ШТУКА) – Forefoot:- the lower part in the stem of a ship that curves to meet the keel. Forefoot (maritime term):- the heel of the stem where it connects to the keel. / Нижняя часть в форштевне судна, которая изгибается до места сопряжения с килем.

FOREIGN AFFILIATE OF A FOREIGN PARENT = ИНОСТРАННЫЙ АФФИЛИАТ ИНОСТРАННОЙ МАТЕРИНСКОЙ КОМПАНИИ (или ЗАРУБЕЖНЫЙ АФФИЛИАТ ИНОСТРАННОЙ МАТЕРИНСКОЙ ГРУППЫ) – A Foreign Affiliate Of A Foreign Parent is, with reference to a given US affiliate, any member of the affiliated foreign group owning the US affiliate that is not a foreign parent of the US affiliate.

FOREIGN AGRICULTURAL SERVICE = ИНОСТРАННАЯ СЕЛЬСКОХОЗЯЙСТВЕННАЯ СЛУЖБА (или ЗАГРАНИЧНАЯ СЕЛЬСКОХОЗЯЙСТВЕННАЯ СЛУЖБА, или ЗАРУБЕЖНАЯ СЕЛЬСКОХОЗЯЙСТВЕННАЯ СЛУЖБА) – The Foreign Agricultural Service (FAS) of the US Department of Agriculture (USDA) works to improve foreign market access for US products, build new markets, improve the competitive position of US agriculture in the global marketplace, and provide food aid and technical assistance to foreign countries. FAS has the primary responsibility for USDA's international activities – market development, trade agreements and negotiations, and the collection and analysis of statistics and market information. It also administers USDA's export credit guarantee and food aid programs, and helps increase income and food availability in developing nations by mobilizing expertise for agriculturally led economic growth. FAS also enhances US agriculture's competitiveness by providing linkages to global resources and international organizations.FAS produces hundreds of documents each year that chart and analyze production, consumption, trade flows, and market opportunities for about 100 agricultural products. FAS informational products, which are available online at http://www.fas.usda.gov, include:- (i) periodical reports that present information on US and world production, supply and demand, and trade for many commodities, as well as the latest trade policy developments and export marketing information; (ii) FAS Worldwide, a quarterly online magazine (formerly AgExporter) featuring news about worldwide agricultural markets, trade policy, international linkages and food aid; (iii) market- and commodity-specific reports; (iv) trade leads, foreign buyers list, US suppliers list, and other practical information; and (v) news releases and program announcements about FAS programs and policies. In the United States, the Foreign Agricultural Service (FAS) is an agency of the Department of Agriculture. FAS maintains a global network of agricultural officers as well as a Washington-based staff to analyze and disseminate information on world agriculture and trade, develop and expand export markets and represent the agricultural trade policy interests of US producers in multilateral forums. FAS also administers USDA's export credit and concessional sales programs. The US Department of Agriculture, Foreign Agricultural Service (FAS) mission is to link US agriculture to the world to enhance export opportunities and global food security. In the Central Europe-Baltic Region, FAS has a regional office in Warsaw that also supervises an office in Prague. The office covers six nations, all members of the European Union, Poland, Czech Republic, Slovak Republic, Estonia, Latvia, and Lithuania. As a regional office operating inside the European Union, FAS Warsaw-Prague works closely with the US Mission to the European Union in Brussel. We also work closely with various US agricultural cooperator organizations to identify and expand market opportunities for US agricultural products and facilitate contact between local importers and US exporters. / вывозной (или экспортный) кредит (export credit).

FOREIGN AIR CARRIER = ИНОСТРАННЫЙ ВОЗДУШНЫЙ ПЕРЕВОЗЧИК (или ЗАРУБЕЖНЫЙ ВОЗДУШНЫЙ ПЕРЕВОЗЧИК, или ЗАГРАНИЧНЫЙ ВОЗДУШНЫЙ ПЕРЕВОЗЧИК) – Foreign Air Carrier means a person, not a citizen of the United States, undertaking by any means, directly or indirectly, to provide foreign air transportation.

FOREIGN AIR COMMERCE = ИНОСТРАННАЯ ВОЗДУШНАЯ КОММЕРЦИЯ (или ЗАРУБЕЖНАЯ ВОЗДУШНАЯ КОММЕРЦИЯ, или ЗАГРАНИЧНАЯ ВОЗДУШНАЯ КОММЕРЦИЯ) – Foreign Air Commerce means the transportation of passengers or property by aircraft for compensation, the transportation of mail by aircraft, or the operation of aircraft in furthering a business or vocation, between a place in the United States and a place outside the United States when any part of the transportation or operation is by aircraft.

FOREIGN AIR TRANSPORTATION = ИНОСТРАННАЯ ВОЗДУШНАЯ ТРАНСПОРТИРОВКА (или ЗАРУБЕЖНАЯ ВОЗДУШНАЯ ТРАНСПОРТИРОВКА, или ЗАГРАНИЧНАЯ ВОЗДУШНАЯ ТРАНСПОРТИРОВКА) – Foreign Air Transportation means the transportation of passengers or property by aircraft as a common carrier for compensation, or the transportation of mail by aircraft, between a place in the United States and a place outside the United States when any part of the transportation is by aircraft.

FOREIGN ASSETS = ИНОСТРАННЫЕ АКТИВЫ (или ЗАГРАНИЧНЫЕ АКТИВЫ, или ЗАРУБЕЖНЫЕ АКТИВЫ) – Foreign Assets means any investments (including foreign currencies) for which the primary market is outside the United States, and any cash and cash equivalents that are reasonably necessary to effect the Fund's transactions in those investments Credit balances or claims, for example in the form of loans, granted to customers abroad. The opposite of Domestic Assets, and Foreign Liabilities.

FOREIGN ASSETS CONTROL = КОНТРОЛЬ ЗА ИНОСТРАННЫМИ АКТИВАМИ (или КОНТРОЛЬ ЗА ЗАГРАНИЧНЫМИ АКТИВАМИ, или КОНТРОЛЬ ЗА ЗАРУБЕЖНЫМИ АКТИВАМИ) – In the United States, the Treasury Department's Office of Foreign Assets Control (OFAC) administers sanctions programs involving specific countries and restricts the involvement of US persons in third country strategic exports.

FOREIGN ASSISTANCE ACT OF 1991 = АКТ ОБ ИНОСТРАННОЙ ПОДДЕРЖКЕ ОТ 1991 (или АКТ О ЗАРУБЕЖНОЙ ПОДДЕРЖКЕ ОТ 1991, или АКТ О ЗАГРАНИЧНОЙ ПОДДЕРЖКЕ ОТ 1991) – In the United States, this Act replaced the Support for East European Democracy (SEED) Act. The Foreign Assistance Act allows support to 26 countries, including all East European nations and most of the Soviet republics, but not to the Soviet Union itself.

FOREIGN AVAILABILITY = ПРИГОДНОСТЬ ИНОСТРАННОЙ ПРОДУКЦИИ – In the United States, the Bureau of Export Administration (BXA) conducts reviews to determine the Foreign Availability of selected commodities or technology subject to export control. The reviews use four criteria to determine foreign availability:- comparable quality, availability-in-fact, foreign source and adequacy of available quantities that would render continuation of the US control ineffective in meeting its intended purpose. A positive determination of foreign availability means that a non-US origin item of comparable quality may be obtained by one or more proscribed countries in quantities sufficient to satisfy their needs so that US exports of such item would not make a significant contribution to the military potential of such countries. A positive determination may result in the decontrol of a US product that has been under export control, or the approval of an export license. However, the control may be maintained if the President invokes the national security override provision of the Act. Beginning with the 1977 amendments to the Export Administration Act, the Congress directed that products with foreign availability be identified and decontrolled unless essential to national security. In 1983, a program to assess the foreign availability of specific products was established within the Office of Export Administration, now the Bureau of Export Administration. Further, 1985 amendments to the Act directed that an Office of Foreign Availability be created.

FOREIGN BODY = ИНОРОДНОЕ ТЕЛО – Foreign Body:- an inclusion of non-textile matter. Note:- this defect is often caused by insufficient attention to the cleanliness of looms and of the weaving shed. / Инородное Тело (Foreign Body):- порок ткани; включение нетекстильного вещества. Примечание:- этот порок часто вызывается недостаточным вниманием к чистоте ткацких станков и ткацкого цеха.

FOREIGN BOND = ИНОСТРАННАЯ ОБЛИГАЦИЯ (или ЗАГРАНИЧНАЯ ОБЛИГАЦИЯ) – Foreign Bond is a bond issued in one country's domestic bond market by an overseas borrower.

FOREIGN BOND ISSUE = ЭМИССИЯ ИНОСТРАННОЙ ОБЛИГАЦИИ (или ВЫПУСК ЗАГРАНИЧНОЙ ОБЛИГАЦИИ) – Foreign Bond Issue:- issued on a country's capital market by a company not resident in that country; foreign bond issues are denominated in the currency of the country of issue and, for the most part, are placed, traded and listed on a stock exchange in that country. Bond issue placed by a public or private entity outside its country of domicile. The issues are usually denominated in the currency of the country where the issue is offered for subscription. The opposite of Domestic Bond Issue.

FOREIGN BUYER PROGRAM = ПРОГРАММА ДЛЯ ИНОСТРАННЫХ ПОКУПАТЕЛЕЙ – In the United States, the Foreign Buyer Program (FBP) is a joint industry-International Trade Administration (ITA) program to assist exporters in meeting qualified foreign purchasers for their product or service at trade shows held in the United States. ITA selects leading US trade shows in industries with high export potential. Each show selected for the FBP receives promotion through overseas mailings, US embassy and regional commercial newsletter and other promotional techniques. ITA trade specialists counsel participating US exhibition.

FOREIGN COMPANY = ИНОСТРАННАЯ КОМПАНИЯ (или ЗАГРАНИЧНАЯ КОМПАНИЯ) – Foreign Company is a body corporate incorporated in an external Territory, or outside Australia and that Territory, which is not a corporation sole or a exempt public authority. The Corporations Law extends the term to certain unincorporated bodies.

FOREIGN CORRUPT PRACTICES ACT = АКТ ОБ ИНОСТРАННЫХ КОРРУПЦИОННЫХ ПРАКТИКАХ (или АКТ О КОРРУПЦИОННЫХ МАХИНАЦИЯХ ЗА РУБЕЖОМ) – In the United States, the Foreign Corrupt Practices Act (FCPA) of 1977 prohibits US individuals, companies and direct foreign subsidiaries of US companies from offering, promising, or paying anything of value to any foreign government official in order to obtain or retain business. The Foreign Corrupt Practices Act (FCPA), enacted in 1977, generally prohibits the payment of bribes to foreign officials to assist in obtaining or retaining business. The FCPA can apply to prohibited conduct anywhere in the world and extends to publicly traded companies and their officers, directors, employees, stockholders, and agents. Agents can include third party agents, consultants, distributors, joint-venture partners, and others. The FCPA also requires issuers to maintain accurate books and records and have a system of internal controls sufficient to, among other things, provide reasonable assurances that transactions are executed and assets are accessed and accounted for in accordance with management's authorization. The sanctions for FCPA violations can be significant. The SEC may bring civil enforcement actions against issuers and their officers, directors, employees, stockholders, and agents for violations of the anti-bribery or accounting provisions of the FCPA. Companies and individuals that have committed violations of the FCPA may have to disgorge their ill-gotten gains plus pay prejudgment interest and substantial civil penalties. Companies may also be subject to oversight by an independent consultant. The SEC and the Department of Justice are jointly responsible for enforcing the FCPA. The SEC's Enforcement Division has created a specialized unit to further enhance its enforcement of the FCPA.

FOREIGN COTTON = ИНОСТРАННЫЙ ХЛОПОК – Foreign Cotton is a term applied to all Cotton grown outside the United States.

FOREIGN CREDIT INSURANCE ASSOCIATION = АССОЦИАЦИЯ ПО СТРАХОВАНИЮ ИНОСТРАННЫХ КРЕДИТОВ – Foreign Credit Insurance Association (FCIA) is a group of insurance companies that, along with the Export-Import Bank, serve as export credit agencies (ECAs), which extend credit to American exporters. They also provide guarantees and insurance for exports. In general, the FCIA provides insurance for lower risk clients, with the ExIm Bank taking those the FCIA cannot insure. Like call ECAs, the FCIA is controversial. Critics allege that they negatively impact international development, as developing countries cannot compete with such insured exports. Proponents of ECAs argue that they enable developing countries to import products they otherwise would not be able to afford. In the United States, the Foreign Credit Insurance Association (FCIA) is an agency of the Export-Import Bank which offers insurance covering political and commercial risks on export receivables. FCIA was founded in 1961 as a partnership of Eximbank and a group of private insurance companies. Eximbank is responsible for the political risk and may underwrite or reinsure the commercial risk. FCIA acts as an agent responsible for the marketing and daily administration of the program. Foreign Credit Insurance Association (FCIA) is a federal agency that provides insurance for US exporters. The Foreign Credit Insurance Association is a voluntary association formed in 1961 by some 50 US insurance companies and sponsored by the Export-Import bank. The insurance provided protects the purchaser from both commercial risk (when the debtor is unable to pay due to their business situation) and political risk (when the debtor is unable to pay due to changes in the politics of a particular country). The Export-Import bank deals primarily with political risk, while the FCIA covers commercial risk. / вывозной (или экспортный) кредит (export credit).

FOREIGN CURRENCY ACCOUNT = СЧЁТ В ИНОСТРАННОЙ ВАЛЮТЕ – Foreign Currency Account is an account not denominated in local currency but in the currency of another country. Also known as Nostro Account. / Счёт, по которому осуществляются операции не в местной валюте, а в валюте другой страны. Известен также как Счёт Ностро (Nostro Account).

FOREIGN CURRENCY CLAUSE = ОГОВОРКА ОБ ИНОСТРАННОЙ ВАЛЮТЕ – Foreign Currency Clause is a clause aimed at removing the risk (with regard to a particular claim) of a devaluation of one's own currency, by designating a fixed ratio or exchange rate between this currency and the foreign currency.

FOREIGN CURRENCY OPERATIONS = ОПЕРАЦИИ С ИНОСТРАННОЙ ВАЛЮТОЙ – (1) Foreign Currency Operations is purchase or sale of the currencies of other nations by a central bank for the purpose of influencing foreign exchange rates or maintaining orderly foreign exchange markets. Also known as Foreign-Exchange Market Intervention. In the United States, The Federal Reserve conducts Foreign Currency Operations – the buying and selling of Dollars in exchange for foreign currency – under the direction of the FOMC, acting in close and continuous consultation and cooperation with the US Treasury, which has overall responsibility for US international financial policy. The manager of the System Open Market Account at the Federal Reserve Bank of New York acts as the agent for both the FOMC and the Treasury in carrying out foreign currency operations. Since the late 1970s, the US Treasury and the Federal Reserve have conducted almost all foreign currency operations jointly and equally. The purpose of Federal Reserve foreign currency operations has evolved in response to changes in the international monetary system. The most important of these changes was the transition in the 1970s from a system of fixed exchange rates – established in 1944 at an international monetary conference held in Bretton Woods, New Hampshire – to a system of flexible (or floating) exchange rates for the Dollar in terms of other countries' currencies. Under the Bretton Woods Agreements, which created the IMF and the International Bank for Reconstruction and Development (known informally as the World Bank), foreign authorities were responsible for intervening in exchange markets to maintain their countries' exchange rates within 1 percent of their currencies' parities with the US Dollar; direct exchange market intervention by US authorities was extremely limited. Instead, US authorities were obliged to buy and sell Dollars against gold to maintain the Dollar price of gold near USD35.00 per ounce. After the United States suspended the gold convertibility of the Dollar in 1971, a regime of flexible exchange rates emerged; in 1973, under that regime, the United States began to intervene in exchange markets on a more significant scale. In 1978, the regime of flexible exchange rates was codified in an amendment to the IMF's Articles of Agreement. Under flexible exchange rates, the main aim of Federal Reserve foreign currency operations has been to counter disorderly conditions in exchange markets through the purchase or sale of foreign currencies (called Foreign Exchange Intervention Operations), primarily in the New York market. During some episodes of downward pressure on the foreign exchange value of the Dollar, the Federal Reserve has purchased Dollars (sold foreign currency) and has thereby absorbed some of the selling pressure on

the Dollar. Similarly, the Federal Reserve may sell Dollars (purchase foreign currency) to counter upward pressure on the Dollar's foreign exchange value. The Federal Reserve Bank of New York also executes transactions in the US foreign exchange market for foreign monetary authorities, using their funds. In the early 1980s, the United States curtailed its official exchange market operations, although it remained ready to enter the market when necessary to counter disorderly conditions. In 1985, particularly after September, when representatives of the five major industrial countries reached the so-called Plaza Agreement On Exchange Rates, the United States began to use exchange market intervention as a policy instrument more frequently. Between 1985 and 1995, the Federal Reserve – sometimes in coordination with other central banks – intervened to counter Dollar movements that were perceived as excessive. Based on an assessment of past experience with official intervention and a reluctance to let exchange rate issues be seen as a major focus of monetary policy, US authorities have intervened only rarely since 1995. Intervention operations involving Dollars affect the supply of Federal Reserve balances to US depository institutions, unless the Federal Reserve offsets the effect. A purchase of foreign currency by the Federal Reserve increases the supply of balances when the Federal Reserve credits the account of the seller's depository institution at the Federal Reserve. Conversely, a sale of foreign currency by the Federal Reserve decreases the supply of balances. The Federal Reserve offsets, or 'sterilizes', the effects of intervention on Federal Reserve balances through open market operations; otherwise, the intervention could cause the federal funds rate to move away from the target set by the FOMC. For example, assume that the Federal Reserve, perhaps in conjunction with Japanese authorities, wants to counter downward pressure on the Dollar's foreign exchange value in relation to the Japanese Yen. The Federal Reserve would sell some of its yen-denominated securities for Yen on the open market and then trade the Yen for Dollars in the foreign exchange market, thus reducing the supply of Dollar balances at the Federal Reserve. In order to sterilize the effect of intervention on the supply of Federal Reserve balances, the Open Market Desk would then purchase an equal amount of US Treasury securities in the open market (or arrange a repurchase agreement), thereby raising the supply of balances back to its former level. The net effect of such an intervention is a reduction in Dollar-denominated securities in the hands of the public and an increase in Yen-denominated securities. The operations have no net effect on the level of Yen balances at the Bank of Japan or on the level of Dollar balances at the Federal Reserve. A Dollar intervention initiated by a foreign central bank also leaves the supply of balances at the Federal Reserve unaffected, unless the central bank changes the amount it has on deposit at the Federal Reserve. If, for example, the foreign central bank purchases Dollars in the foreign exchange market and places them in its account at the Federal Reserve Bank of New York, then the supply of Federal Reserve balances available to US depository institutions decreases because the Dollars are transferred from the bank of the seller of Dollars to the foreign central bank's account with the Federal Reserve. However, the Open Market Desk would offset this drain by buying a Treasury security or arranging a repurchase agreement to increase the supply of Federal Reserve balances to US depository institutions. Most Dollar purchases by foreign central banks are used to purchase Dollar securities directly, and thus they do not need to be countered by US open market operations to leave the supply of Dollar balances at the Federal Reserve unchanged. / Брэтэн Вудз (Bretton Woods). (соглашение об откупе) .

(2) Foreign Currency Operations:- transactions in the foreign exchange markets involving the purchase of the currency of one nation with that of another. Also known as Foreign Exchange Transactions.

FOREIGN DIRECT INVESTMENT = ПРЯМОЕ ИНОСТРАННОЕ КАПИТАЛОВЛОЖЕНИЕ (или ПРЯМЫЕ ИНОСТРАННЫЕ ИНВЕСТИЦИИ) – Foreign Direct Investment (FDI) reflects the objective of obtaining a lasting interest by a resident entity in one economy ('direct investor') in an entity resident in an economy other than that of the investor ('direct investment enterprise'). The lasting interest implies the existence of a long-term relationship between the direct investor and the enterprise and a significant degree of influence on the management of the enterprise. Direct investment involves both the initial transaction between the two entities and all subsequent capital transactions between them and among affiliated enterprises, both incorporated and unincorporated. Foreign Direct Investment (FDI) is an Investment in a country's manufacturing or service sector by an entity domiciled in another country. Normally a holding of 10 percent or more in an enterprise.

FOREIGN DIRECT INVESTMENT IN THE UNITED STATES = ПРЯМОЕ ИНОСТРАННОЕ КАПИТАЛОВЛОЖЕНИЕ В СОЕДИНЁННЫХ ШТАТАХ (или ПРЯМЫЕ ИНОСТРАННЫЕ ИНВЕСТИЦИИ В СОЕДИНЁННЫХ ШТАТАХ) – Foreign Direct Investment In The United States is the ownership or control, directly or indirectly, by a single foreign person (an individual, or related group of individuals, company or government) of 10 percent or more of the voting securities of an incorporated US business enterprise or an equivalent interest in an unincorporated US business enterprise, including real property. Such a business is referred to as a US affiliate of a foreign direct investor.

FOREIGN DIRECT INVESTOR = ПРЯМОЙ ИНОСТРАННЫЙ ВКЛАДЧИК КАПИТАЛА (или ПРЯМОЙ ИНОСТРАННЫЙ ИНВЕСТОР) – A Foreign Direct Investor is an individual, an incorporated or unincorporated public or private enterprise, a government, a group of related individuals, or a group of related incorporated and/or unincorporated enterprises which has a direct investment enterprise – that is, a subsidiary, associate or branch – operating in a country other than the country or countries of residence of the foreign direct investor or investors.

FOREIGN ECONOMIC TRENDS = ЗАГРАНИЧНЫЕ ЭКОНОМИЧЕСКИЕ ТЕНДЕНЦИИ – In the United States, Foreign Economic Trends (FETs) are report prepared by US embassies abroad to describe foreign country economic and commercial trends and trade and investment climates. The reports describe current economic conditions; provide updates on the principal factors influencing developments and the possible impacts on American exports; review newly announced foreign government policies as well as consumption, investment and foreign debt trends.

FOREIGN EXCHANGE = ДЕВИЗЫ (или ИНОСТРАННЫЕ ВАЛЮТНЫЕ ЦЕННОСТИ) – (1) Foreign Exchange:- foreign money or other instrument in a foreign currency used in settlement of international trade between countries. Means of payment – bank notes, travelers' checks, bank deposits and other forms of money – denominated in the currency of another country. Mechanism whereby international transactions are settled. Instruments used to make payments between countries, esp. in the form of foreign currency, checks, bills of exchange, debits and credits, etc. Often referred to as Forex or Interbank Market. Foreign Exchange are claims denominated in foreign currency which are payable abroad:- credit balances held with foreign banks in foreign currency. Drafts and cheques denominated in foreign currency payable abroad. Strictly speaking, foreign notes and coins do not constitute foreign exchange in the classic sense of the term. / Инструменты, используемые для проведения платежей между разными странами, особенно в виде иностранной валюты, чеков, переводных векселей, долгов и кредитов и тому подобном. Часто соотносится с Форэкс (Forex) или Межбанковским Рынком (Interbank Market). Под Девизами, от Французского слова Devises, понимаются платёжные средства в иностранной валюте, используемые в международных расчётах. В период домонополистического капитализма преобладали девизы в виде коммерческих переводных векселей (тратт), выписанных экспортёром на импортёра. С расширением мировой торговли и корреспондентских связей банков девизы приняли форму банковских платёжных средств:- аккредитивов, векселей, платёжных поручений (преимущественно в форме телеграфных переводов), чеков, а также взаимных межгосударственных краткосрочных кредитов – свопов. В международном платёжном обороте девизы выступают также в виде

банкнот и иностранных ценных бумаг. При золотодевизном стандарте девизы служили обеспечением банкнотной эмиссии и разменным фондом. Как международные платёжные средства девизы качественно неоднородны и зависят от степени их размена на золото и другие девизы, особенно девизы, выраженные в валютах стран, играющих основную роль в международной торговле и платёжном обороте. В качестве последних выступают резервные или относительно устойчивые, обратимые валюты, которые входят в состав ликвидных ресурсов центральных банков, казначейств и правительственных органов. Доля этих валют в официальных золотовалютных ресурсах капиталистического мира возрастает:- в 1938 составляла 8%, в 1948 – 28% и в 1969 была равна 44.9%. Цена девиз в национальной валюте изменяется с изменением валютного курса. Девизная Политика – один из методов воздействия государства на движение курса национальной валюты путём купли-продажи иностранной валюты. С целью повышения курса своей валюты центральный банк продаёт иностранную валюту на национальную, искусственно увеличивая спрос на неё на валютных рынках. Покупка Девиз увеличивает предложение национальной валюты и снижает её курс. Девизная политика начала применяться в XIX веке и получила широкое распространение в период общего кризиса капитализма. В 30-х годах девизная политика использовалась рядом стран (США, Великобританией и другими) для понижения курса своей валюты в целях поощрения вывоза (или экспорта) товаров и борьбы за внешние рынки. В современных условиях девизная политика направлена на поддержание валютных курсов, регулируемых Международным Валютным Фондом (МВФ) на уровне официальных паритетов с отклонениями в пределах ±1%. С 1972 МВФ решил расширить пределы отклонений до ± 2.25%. Однако в условиях инфляции и кризиса международной валютной системы капитализма фактическое отклонение их от паритетов больше. Условие проведения девизной политики – наличие у страны крупных валютных резервов. Воздействуя на спрос и предложение валюты, буржуазное государство временно сглаживает колебания валютного курса, но не может устранить стихийную основу его и задержать обесценение валюты при расстройстве платёжного баланса и усилении инфляции. Разновидностью девизной политики является валютная интервенция, которая отличается более крупными масштабами и кратким периодом применения. Девизная политика кратковременно применялась в бывшем Союзе Советских Социалистических Республик (СССР) в период НЭПа (Новой Экономической Политики) для поддержания курса Червонца.

(2) Foreign Exchange:- trading in foreign currency. The trading, buying or selling of foreign currencies in relation to the national currencies.

FOREIGN EXCHANGE CONTRACT = КОНТРАКТ НА ИНОСТРАННУЮ ВАЛЮТУ (или ДЕВИЗНЫЙ КОНТРАКТ) – On the OTC market, a category of the Foreign Exchange Contracts includes all deals involving exposure to more than one currency, whether in interest rates or exchange rates (with the exception of those already reported in the commodity or equity categories).

FOREIGN EXCHANGE CONTROL = КОНТРОЛЬ ЗА ИНОСТРАННОЙ ВАЛЮТОЙ (или ДЕВИЗНЫЙ КОНТРОЛЬ, или ВАЛЮТНЫЙ КОНТРОЛЬ) – Foreign Exchange Control:- state measures to regulate the extent to which a country's currency can be exchanged for that of another country and to allocate existing and future foreign exchange balances. Usually regulations are imposed to restrict the outflow of foreign (and frequently also domestic) currency. Countries with foreign currency shortages generally introduce very sweeping exchange controls. System in which any transaction involving foreign currency conversion is subject to government authorization. Government regulations pertaining to the purchase and sale of foreign currency.

FOREIGN EXCHANGE DEALER = ДЕЛЕЦ ПО ИНОСТРАННОЙ ВАЛЮТЕ (или ДЕВИЗНЫЙ ДИЛЕР) – Foreign Exchange Dealer is a bank employee who deals in foreign exchange on the foreign exchange market on behalf of the bank's customers, who pay a commission for such services. Person employed by a bank who specializes in buying and selling foreign currencies. / Лицо, нанятое банком, которое специализируется на покупке и продаже иностранной валюты.

FOREIGN EXCHANGE DESK = УПРАВЛЕНИЕ ОБМЕНА ВАЛЮТЫ – The Foreign Exchange trading Desk at the New York Federal Reserve Bank. The desk undertakes operations in the exchange markets for the account of the Federal Open Market Committee, and as agent for the US Treasury and for foreign central banks.

FOREIGN EXCHANGE INTERVENTION = ИНТЕРВЕНЦИЯ ИНОСТРАННОЙ ВАЛЮТОЙ (или ДЕВИЗНАЯ ИНТЕРВЕНЦИЯ) – Foreign Exchange Intervention:- a foreign currency operation designed to influence the value of the US Dollar against foreign currencies, typically with the aim of stabilizing disorderly markets. / Валютная Интервенция предусматривает вмешательство государства в операции на валютном рынке путём продажи или скупки крупной суммы иностранной валюты или золота с целью повышения или понижения курса национальной или иностранной валюты.

FOREIGN EXCHANGE MARKET = РЫНОК ИНОСТРАННОЙ ВАЛЮТЫ (или ДЕВИЗНЫЙ РЫНОК) – Foreign Exchange Market is a market where foreign currencies are traded by foreign exchange brokers (intermediaries) and foreign exchange dealers (bank employees). Futures and options on forward exchange rates are also traded. The buying and selling of foreign currency. Most Forex is quoted against US Dollar. If other currencies are traded (e.g., XXX/CHF) then it is known as a Cross Rate. Also known as Forex or Forex Market. Foreign Exchange Market is floor trading or electronic trading system for foreign exchange dealing. / , например, . Под Валютным Рынком понимается совокупность национальных и международных банков и бирж, через которые производятся продажа, покупка или обмен иностранной валюты, чеков, векселей и денежных переводов. Валютный рынок опосредует международные расчёты.

FOREIGN EXCHANGE OPERATIONS = ОПЕРАЦИИ С ИНОСТРАННОЙ ВАЛЮТОЙ (или ДЕВИЗНЫЕ ОПЕРАЦИИ) – Foreign Exchange Operations are the buying or selling of foreign exchange. In the context of the Eurosystem, this means buying or selling other currencies against the Euro.

FOREIGN EXCHANGE POSITION = ПОЗИЦИЯ ПО ИНОСТРАННОЙ ВАЛЮТЕ (или ДЕВИЗНАЯ ПОЗИЦИЯ) – Foreign Exchange Position:- positive or negative difference between the claims and debts of a business entity or bank denominated in each of the foreign currencies in which transactions are carried out. Foreign Exchange Position:- for purposes of financial disclosure, 'foreign currency' is the official currency of a country other than the United States. It is possible to hold a foreign currency through a foreign exchange transaction. A Foreign Exchange Transaction results in the purchase of one currency for investment purposes and the simultaneous sale of another. This constitutes an open position that is later offset to terminate the position. Both the short and the long position must be offset to close out the holding. One may take a position in a foreign currency for speculation or for hedging purposes. The increase or decrease in the exchange rate between the two currencies may result in a profit or loss. A foreign exchange transaction always involves a currency pair of which the first listed is the 'base currency' and second is the 'quoted currency'. For example, in the US Dollar-Japanese Yen pair, the US Dollar is the base currency and the Yen is the quoted currency. The nature of a foreign exchange transaction requires that you are always long one currency of the pair and short the other. This process happens through a foreign exchange broker, who bankrolls the entire transaction by supplying all the currencies in the exchange. So, for example, if you anticipated that the Dollar was going to appreciate versus the Yen, you could buy the Dollar and short the Yen. You borrow the Yen

from your broker and then sell short the Yen and simultaneously buy the Dollar. In this example, the broker would charge you interest on the Yen that the broker lent you, and the broker would pay you interest on the Dollar, which you own but which is held by the broker.

FOREIGN EXCHANGE RATE = ОБМЕННЫЙ КУРС ИНОСТРАННОЙ ВАЛЮТЫ (или ДЕВИЗНАЯ СТАВКА) – Foreign Exchange Rate is a price of the currency of one nation in terms of the currency of another nation.

FOREIGN EXCHANGE RESERVES = РЕЗЕРВЫ В ИНОСТРАННОЙ ВАЛЮТЕ (или ЗОЛОТОВАЛЮТНЫЕ РЕЗЕРВЫ, или ДЕВИЗНЫЕ РЕЗЕРВЫ) – Foreign Exchange Reserves:- resources available to a nation's monetary authorities to pay for balance of payments deficits. There are three classes of foreign exchange reserves:- foreign currencies, gold, and Special Drawing Rights. / Ресурсы, доступные монетарным властями страны для оплаты дефицита платёжного баланса. Существуют три класса золотовалютных резервов:- золото, иностранные валюты и Специальные Права Заимствования. Под Золотовалютными Резервами понимаются принадлежащие государству (казначейству или центральному банку) золото в слитках и монетах, иностранная валюта, а также средства в иностранной валюте на счетах иностранных банков. Золотовалютные Резервы – принадлежащие казначействам и центральным банкам запасы золота в слитках и монетах, средства в иностранных валютах на счетах банков за границей и иностранные банкноты и монеты. Страны-члены Международного Валютного Фонда (МВФ) включают в сумму своих золотовалютных резервов также свободный остаток лимита, в пределах которого они пользуются безусловным правом истребовать у Фонда иностранную валюту. Общая сумма этого лимита определяется размером взноса страны золотом в капитал Фонда в счёт своей квоты, а с начала 1970 – сверх того ещё установленной для страны суммой её участия в специальных правах на получение валюты в Фонде. Золотовалютные резервы выполняют в основном функции запасного фонда международных платёжных средств и используются в необходимых случаях для покрытия дефицита платёжного баланса, а также для интервенции на валютном рынке в целях поддержания курса национальной валюты страны. Золотовалютные резервы страны не представляют собой постоянной величины. Оптимальным является поддержание их на уровне, обеспечивающем внешнюю ликвидность, то есть способность страны своевременно, без перебоев погашать причитающиеся другим странам платежи. Истощение золотовалютных резервов свидетельствует о неблагоприятном валютном положении страны. Относительное же сокращение общей суммы золотовалютных резервов стран капиталистического мира по отношению к совокупной стоимости их привоза (или импорта), являющегося основной статьей использования резервов, характеризует в известной мере состояние международной ликвидности, которая, по данным МВФ, за послевоенные годы непрерывно ухудшалась. Резкое снижение уровня международной ликвидности было вызвано в основном недостаточным притоком золота. Это связано с нерентабельностью его добычи в ряде стран при низкой официальной цене 38 Долларов США (до Марта 1972 – 35 Долларов США) за Тройскую унцию и скупкой вновь добытого золота и даже части золота из централизованных резервов промышленниками, тезавраторами и спекулянтами. В результате золотые резервы капиталистических стран в целом, возросшие к концу 1965 до 42.0 миллиардов Долларов США, снизились до 36.2 миллиардов Долларов США на конец Сентября 1971. Недостаточный рост золотовалютных резервов и опасность дальнейшего снижения международной ликвидности вынудили участников МВФ под нажимом США пойти на создание искусственных международных резервных средств в форме Специальных Прав Заимствования валюты в Фонде, которые не имеют самостоятельной стоимости или реального обеспечения и предназначены для урегулирования сальдо платёжных балансов и расчётов с МВФ. Общая сумма золотовалютных резервов распределена между капиталистическими странами крайне неравномерно. В Сентябре 1971 приходилось (в %) на долю ФРГ 14, Японии 11, США 10, Италии, Франции и Швейцарии по 6, Великобритании и Канады по 4, а на все остальные страны всего 39. Доля золота в резервах стран также резко колеблется в зависимости от того, насколько их правительства поддавались нажиму США не предъявлять Доллары США к обмену на золото. В Сентябре 1971 в золотовалютных резервах Франции доля золота составляла 48%, Швейцарии 44%, Италии 43%, ФРГ 24%, Великобритании 16%, Канады 16%, Японии 5%. В бывшем СССР и других социалистических странах золотовалютные резервы являлись частью народно-хозяйственных резервов, накапливаемых и используемых в плановом порядке в соответствии с интересами строительства социализма и коммунизма и повышения материального благосостояния народов этих стран.

FOREIGN EXCHANGE SWAP = СВОП НА ИНОСТРАННУЮ ВАЛЮТУ (или ДЕВИЗНЫЙ СВОП) – Foreign Exchange Swap is the simultaneous spot and forward transactions exchanging one currency against another. The Eurosystem can execute open market operations in the form of foreign exchange swaps, where the national central banks (or the European Central Bank) buy or sell Euro spot against a foreign currency and, at the same time, sell or buy them back in a forward transaction. A Foreign Exchange Swap (in contrast to a currency swap) is the simultaneous purchase and sale of a certain amount of foreign currency for two different value dates without periodic exchange of interest payments. See also Currency Swap. In 1995, of the overall forward market, 85% of all transactions are foreign exchange swaps, i.e. transactions involving the exchange of two currency amounts on a specific date and a reverse exchange of the same amounts at a later date. The purpose of foreign exchange swaps is to manage liquidity and currency risk by executing foreign exchange transactions at the most appropriate moment. Effectively, the underlying amount is simultaneously borrowed and lent in two currencies, for example by selling Dollars for Deutsche Mark for spot value and agreeing to reverse the deal at a fixed future date. Since currency risk is replaced by credit risk, the transaction is conceptually different from spot transactions. It is, however, closely linked, since foreign exchange swaps are often initiated to move the delivery date of foreign currency originating from spot or outright forward transactions to a more optimal point in time. By keeping maturities to less than a week and renewing swaps continuously, market participants maximise their flexibility in reacting to market events. Foreign exchange swaps have on average shorter maturities than outright forwards. Swaps with a maturity of up to one week account on average for 71% of the deals, compared with 53% for outright forwards. As with outright forwards, swaps with maturities over one year are rare. The growing role of foreign exchange swaps is indicative of increasingly sophisticated liquidity and currency risk management by investors. Because liquidity, i.e. the ability to complete large deals without moving prices significantly, is very important to swaps, market activity tends to migrate to the centers which offer the greatest liquidity, creating exceptionally high growth in some of the larger centers such as London (99%), Singapore (75%), Hong Kong (97%), Germany (70%) and France (113%). Transaction, which involves the actual exchange of two currencies (principal amount only) on a specific date at a rate agreed at the time of the conclusion of the contract (the short leg), and a reverse exchange of the same two currencies at a date further in the future at a rate (generally different from the rate applied to the short leg) agreed at the time of the contract (the long leg). Both spot/forward and forward/forward swaps should be included. Short-term swaps carried out as 'tomorrow/next day' transactions should also be included in this category. Foreign Exchange Swap is a transaction which involves the actual exchange of two currencies (principal amount only) on a specific date at a rate agreed at the time of the conclusion of the contract (the short leg), and a reverse exchange of the same two currencies at a date further in the future at a rate (generally different from the rate applied to the short leg) agreed at the time of the contract (the long leg). Both spot/forward and forward/forward swaps are included. / Смотрите также Валютный Своп или Своп На Валюту (Currency Swap). из безотлагательных или неотложных форвардных операций .

FOREIGN EXCHANGE TRADING = ТОРГОВЛЯ ИНОСТРАННОЙ ВАЛЮТОЙ (или ДЕВИЗНАЯ ТОРГОВЛЯ) – Foreign Exchange Trading is the foreign exchange dealing is conducted in unoffical trading by telephone or via electronic trading systems. It constitutes the world's biggest financial market and has the highest average daily turnover figures. Purchase and sale of foreign exchange against domestic or foreign currency. Foreign exchange trades are settled spot or forward. Also known as Forex Trading. A transaction providing for the purchase and sale of one currency with another currency providing for settlement either on a spot or two-day basis or a specified future date.

FOREIGN EXPORT = ИНОСТРАННЫЙ ВЫВОЗ (или ЭКСПОРТ ИНОСТРАННОЙ ПРОДУКЦИИ) – Foreign Export:- in the United States, exports of foreign merchandise (re-exports), consist of commodities of foreign origin which have entered the United States for consumption or into Customs bonded warehouses or US Foreign Trade Zones, and which, at the time of exportation, are in substantially the same condition as when imported. / вывоз (exportation).

FOREIGN FIBER = ИНОРОДНОЕ ВОЛОКНО (или ПОСТОРОННЕЕ ВОЛОКНО) – Defect Name:- Foreign Fiber. Defect Type:- warp lines, vertical lines. Fabric Type:- Bottomweights – Sateen Derivatives. Description:- Foreign Fiber:- This is the result of a piece of polyester waste being spun into a cotton warp yarn. Severity:- Major. Foreign Fibers are the fibers of a different type and/or color from the other fibers in the fabric. Note:- this defect is caused by the contamination of the fabric by extraneous fiber which is either included in the yarn or woven into the fabric. / Инородное Волокно:- является результатом того, что кусочек полиэфирного отхода, был заработан в хлопковую пряжу основы. Постороннее Волокно (foreign fiber):- порок ткани; волокна различного типа и/или цвета, отличающиеся от других волокон в ткани. Примечание:- этот порок происходит вследствие заработка в ткань постороннего волокна, которое или содержится в пряже или заткано в ткань.

FOREIGN FLAG = ИНОСТРАННЫЙ ФЛАГ – Foreign Flag:- a reference to a carrier not registered in the United States that flies the American flag. The term applies to air and sea transportation. / флаг морского или воздушного судна.

FOREIGN FLY = ИНОРОДНЫЙ ПУХ – Foreign Fly between loops of constructed fabric. Possible Cause:- unclean environment or improper maintenance of machine can cause fly to end up in the knitting zone where it becomes part of the fabric. Depending on the nature of the material that gets caught up fly can be removed with ease or difficulty. It is usually a minor defect unless very frequent. Knitting defect.

FOREIGN GRAIN = ИНОСТРАННАЯ ЗЕРНОВАЯ КУЛЬТУРА – Foreign Grain:- in Canada, if the inspector suspects that a sample or shipment of grain is not of Canadian origin, the shipper must provide a letter indicating the country of origin, before official grading occurs. Inspection services may be provided for samples of foreign grains. Certificates or letters must clearly indicate that the grade provided is the grade the sample would qualify for if the grain had been of Canadian origin. Inspection records and certificates specify the class of grain and, in place of the grade, the country of origin. For example, Corn, USA origin.

FOREIGN INDEPENDENT TOUR = ИНОСТРАННЫЙ НЕЗАВИСИМЫЙ ТУР (или САМОСТОЯТЕЛЬНЫЙ ТУР ЗА РУБЕЖ, или САМОСТОЯТЕЛЬНАЯ ПОЕЗДКА ЗА РУБЕЖ) – A Foreign Independent Tour (FIT) is a prepaid travel arrangement, tailored to meet a traveler's specific wishes.

FOREIGN INTEREST PAYMENT SECURITIES = ИНОСТРАННЫЕ ЦЕННЫЕ БУМАГИ С ОПЛАТОЙ ПРОЦЕНТОВ – is Foreign Interest Payment Security (FIPS) is an instrument in the Swiss capital market. Its features are similar to a reverse dual-currency bond that offers interest payments in a foreign currency but keeps the principal in Swiss francs. Foreign Interest Payment Securities (FIPSs):- dual currency bond.

FOREIGN JURISDICTION CLAUSE = ОГОВОРКА ОБ ИНОСТРАННОЙ ЮРИСДИКЦИИ (или ОГОВОРКА О ЮРИСДИКЦИИ ДРУГОЙ СТРАНЫ) – Foreign Jurisdiction Clause is a clause agreed by underwriters and attached to the policy, that provides for the policy to be subject to legal jurisdiction of the country named in the clause. This will, normally, take precedence over the English jurisdiction clause in the MAR policy form; but it is customary for the latter to be deleted in such cases to avoid confusion. It does not take precedence over the English law and practice clause in the Institute clauses.

FOREIGN LIABILITIES = ИНОСТРАННЫЕ ПАССИВЫ (или ЗАГРАНИЧНЫЕ ОБЯЗАТЕЛЬСТВА, или ЗАРУБЕЖНЫЕ ОБЯЗАТЕЛЬСТВА) – Foreign Liabilities:- financial obligations towards foreign creditors, for example in the form of debts vis-à-vis banks located abroad. The opposite of Domestic Liabilities, and Foreign Assets.

FOREIGN MARKET VALUE = ИНОСТРАННАЯ РЫНОЧНАЯ СТОИМОСТЬ (или СТОИМОСТЬ НА РЫНКЕ ЗА РУБЕЖОМ) – Foreign Market Value:- in the United States, the price at which merchandise is sold, or offered for sale, in the principal markets of the country from which it is exported. If information on foreign home market sales is not useful, the foreign market value is based on prices of exports to third countries or constructed value. Adjustments for quantities sold, circumstances of sales and differences in the merchandise can be made to those prices to ensure a proper comparison with the prices of goods exported to the United States.

FOREIGN MATERIAL = ИНОРОДНЫЙ МАТЕРИАЛ (или ИНОРОДНАЯ ПРИМЕСЬ) – (1) In the Wheat industry, all matter other than Wheat that remains in the sample after the removal of dockage and shrunken and broken kernels. Foreign Material is material other than grain of the same class that remains in the sample after the removal of dockage. Some examples of foreign materials found in grain samples are:- (i) cereal grains, sometimes called Other Cereal Grains; (ii) earth pellets, soft; (iii) ergot; (iv) fertilizer pellets, hard; (v) large seeds; (vi) matter other than cereal grains; (vii) roughage; (viii) sclerotinia; (ix) small oilseeds; (x) small seeds; and (xi) stones. Many of the materials, such as stones, ergot, and sclerotinia have separate tolerances. Foreign material reduces the value – there is less desired grain for the weight or volume purchased. In addition, the presence of foreign material in grain compromises our reputation for clean grain. Even the presence of other cereal grains can compromise the quality of the predominant grain. For example, the presence of Barley in Wheat reduces milling yield. Oats in red spring Wheat reduces milling yield and gives the flour a duller color. / и щуплой и битой зерновки. (i) Злаковые Зерновые (cereal grain).

(2) In the Rice industry, foreign material is all matter other than Rice and seeds. Hulls, germs, and bran which have separated from the kernels of Rice shall be considered foreign material. Foreign matter means other matter than Rice. This includes Rice husk and bran detached from Rice kernels. / Инородные примеси означают любые другие примеси, за исключением самого Риса. Они включают в себя рисовую шелуху и плёнчатый околоплодник, удалённые с рисовой зерновки (рисового ядра). Колосковая чешуя, зародыши, и плёнчатый околоплодник.

(3) Foreign Matter:- any of the matter, foreign or otherwise, that affects cotton as to quality or grade. Anything that is not part of the cotton plant. The Foreign Matter in stripped cotton consists of burs, sticks, and the trash, which generally consists of fine leaf trash and soil particles. During the ginning process, sticks and fine trash are more difficult to remove than burs. Also sticks may include bark, which can contaminate the lint and result in grade reductions and losses of USD20–25/bale. Bark contamination occurs somewhere between the removal of bolls from the plant and the separation of lint and seed at the gin stand. Environmental conditions, production

practices, preparation of plants for harvest, and stripper operating parameters affect the incidence of bark contamination. Foreign Matter:- extraneous material found in cotton, i.e. bits of leaf, boll, twig, seed, dirt, etc. / Всё, что угодно, не являющееся при этом частью Хлопчатника. состоят из створок коробочек (burs или burrs), черешков листьев (sticks).

(4) Foreign Matter:- Fabric:- underwear fabric; Construction:- (i) Count:- 150 x 98; (ii) Warp:- 75/50/3 bright acetate rayon; (iii) Filling:- 75/30/35 Z bright viscose rayon; Finish:- plain dyed tea rose. Defect:- small particles of 'Foreign Matter' woven into the fabric. Analysis:- microscopic examination of particles of the contaminating material showed that it consisted of woodlike splinters. Chemical tests, however, disclosed the fact that the 'splinters' were soluble in acetone and reacted like cellulose acetate. It was concluded that this defect was due to bits of fused acetate-rayon filaments that accumulated on the bottom of the shuttle and were occasionally deposited and woven into the cloth. The acetate 'splinters' probably came from warp yarn that was struck and chafed by the shuttle. The resultant bruise marks on the warp would not be seen in fabric dyed in pastel shades. Foreign Matter:- Fabric:- spun-rayon dress goods; Construction:- (i) Count:- 64 x 38; (ii) Warp:- 30/1 1%-in. 1%-den. bright viscose rayon; (iii) Filling: 15/1 1%-in. 1%-den. bright viscose rayon; Finish:- plain dyed rose. Defect:- dark specks, described by the examiner as 'foreign matter', in warp and filling. Analysis:- microscopic examination showed the 'foreign matter' to be composed of hard bunches of rayon staple dyed darker than the normal fiber. This defect, frequently described as 'splinters', is produced in the manufacture of the fiber and is caused by the adhesion of several filaments during the spinning operation, forming larger, coarser filament bunches, which characteristically dye darker. / Уточина:- .

FOREIGN–OWNED AFFILIATE IN THE UNITED STATES = ПРИНАДЛЕЖАЩИЙ ИНОСТРАННОМУ ЛИЦУ АФФИЛИАТ В СОЕДИНЁННЫХ ШТАТАХ – Foreign-Owned Affiliate In The United States is a business in the United States in which there is sufficient foreign investment to be classified as direct foreign investment. To determine fully the foreign owners of a US affiliate, three entities must be identified:- the foreign parent, the ultimate beneficial owner and the foreign parent group. All these entities are 'persons' in the broad sense:- thus, they may be individuals; business enterprises; governments; religious, charitable and other nonprofit organizations; estates and trusts; and associated groups. A US affiliate may have an ultimate beneficial owner (UBO) that is not the immediate foreign parent; moreover, the affiliate may have several ownership chains above it, if it is owned at least 10 percent by more than one foreign person. In such cases, the affiliate may have more than one foreign parent, UBO and/or foreign parent group.

FOREIGN PARENT = ИНОСТРАННАЯ МАТЕРИНСКАЯ КОМПАНИЯ – Foreign Parent:- in the United States, the first foreign person or entity outside the United States in an affiliate's ownership chain that has direct investment in the affiliate. The Foreign Parent consists only of the first person or entity outside the United States in the affiliate's ownership chain; all other affiliated foreign persons are excluded.

FOREIGN PARENT GROUP = ИНОСТРАННАЯ МАТЕРИНСКАЯ ГРУППА – In the United States, a Foreign Parent Group (FPG) consists of:- (i) the foreign parent; (ii) any foreign person or entity, proceeding up the foreign parent's ownership chain, that owns more than 50 percent of the party below it, up to and including the ultimate beneficial owner (UBO); and (iii) any foreign person or entity, proceeding down the ownership chain(s) of each of these members, that is owned more than 50 percent by the party above it. A particular US affiliate may have several ownership chains above it, if it is owned at least 10 percent by more than one foreign party. In such cases, the affiliate may have more than one foreign parent, UBO and/or foreign parent group.

FOREIGN PERSON = ИНОСТРАННАЯ ПЕРСОНА (или ИНОСТРАННОЕ ЛИЦО) – In the United States, a Foreign Person is any person resident outside the United States or subject to the jurisdiction of a country other than the United States. 'Person' is any individual, branch, partnership, association, associated group, estate, trust, corporation, or other organization (whether or not organized under the laws of any State) and any government, including a foreign government, the US Government, a State or local governments and any agency, corporation, financial institution, or other entity or instrumentality thereof, including a government sponsored agency.

FOREIGN POLICY CONTROLS = КОНТРОЛИ ИНОСТРАННОЙ (или ВНЕШНЕЙ) ПОЛИТИКИ – Foreign Policy Controls are distinct from national security controls (CoCom or other international agreements) and are imposed to further US foreign policy. The controls are typically imposed in response to developments in a country or countries, such as considerations regarding terrorism and human rights, or to developments involving a type or types of commodities and their related technical data. Foreign policy controls expire annually, unless extended. CoCom was dissolved in March 1994. / КоКам (CoCom).

FOREIGN PRODUCTS = ИНОСТРАННЫЕ ПРОДУКТЫ – Foreign Products are those plants and unprocessed or unmanufactured plant products that have officially entered US commerce but were grown or produced in countries other than the US, its possessions, and the Commonwealth of Puerto Rico.

FOREIGN QUALIFICATION = ИНОСТРАННАЯ КВАЛИФИКАЦИЯ (или ЗАРУБЕЖНАЯ КВАЛИФИКАЦИЯ) – Foreign Qualification is the process to obtain permission to do business in a different state than the state where a company was originally registered.

FOREIGN SALES AGENT = ИНОСТРАННЫЙ АГЕНТ ПО ПРОДАЖАМ (или АГЕНТ ПО ИНОСТРАННЫМ ПРОДАЖАМ) – Foreign Sales Agent:- in the United States, an individual or firm that serves as the foreign representative of a domestic supplier and seeks sales abroad for the supplier.

FOREIGN SALES CORPORATION = КОРПОРАЦИЯ ИНОСТРАННЫХ ПРОДАЖ (или КОРПОРАЦИЯ МЕЖДУНАРОДНОЙ ТОРГОВЛИ) – In the United States, a Foreign Sales Corporation (FSC) is a corporation created to secure US tax exemption on a portion of earnings derived from the sale of US products in foreign markets. To qualify for special tax treatment, a FSC must be a foreign corporation, maintain an office outside the US territory, maintain a summary of its permanent books of account at the foreign office and have at least one director resident outside of the United States.

FOREIGN SECURITIES DEPOSITORY = ДЕПОЗИТАРИЙ ИНОСТРАННЫХ ЦЕННЫХ БУМАГ – Foreign Securities Depository is a special form of securities depository where the buyer or depositor only has a contractual claim on the return of equal, but not identical, securities. Foreign securities depositories are used, for example, for the safekeeping of securities abroad. The securities account holder receives a credit from his domestic bank for his securities acquired and deposited there.

FOREIGN SERVICE = ИНОСТРАННАЯ СЛУЖБА (или ЗАГРАНИЧНАЯ СЛУЖБА, или ЗАРУБЕЖНАЯ СЛУЖБА) – The United States Foreign Service is a component of the United States federal government under the aegis of the United States Department of State. It consists of approximately 15 000 professionals carrying out the foreign policy of the United States and aiding US citizens abroad. Created in 1924 by the Rogers Act, the Foreign Service combined all consular and diplomatic services of the US government into one administrative unit. In addition to the unit's function, the Rogers Act defined a personnel system under which the United States Secretary of State is authorized to assign diplomats abroad. Members of the Foreign Service are selected through a series of written and oral examinations. They serve at any of the 265 United States diplomatic missions around the world, including embassies, consulates, and other facilities. Members of the Foreign Service also staff the headquarters of the four foreign affairs agencies:- the Department of State, headquartered at Harry S. Truman Building in the Foggy Bottom neighborhood of Washington, DC; the

Department of Agriculture; the Department of Commerce; and the United States Agency for International Development. On September 15, 1789, the 1st United States Congress passed an Act creating the Department of State and appointing duties to it, including the keeping of the Great Seal of the United States. Initially there were two services devoted to diplomatic and consular activity. The Diplomatic Service provided ambassadors and ministers to staff embassies overseas, while the Consular Service provided consuls to assist United States sailors and promote international trade and commerce. Throughout the XIX century, ambassadors, or ministers, as they were known prior to the 1890s, and consuls were appointed by the president, and until 1856, earned no salary. Many had commercial ties to the countries in which they would serve, and were expected to earn a living through private business or by collecting fees. In 1856, Congress provided a salary for consuls serving at certain posts; those who received a salary could not engage in private business, but could continue to collect fees for services performed. The Rogers Act of 1924 merged the diplomatic and consular services of the government into the Foreign Service. An extremely difficult Foreign Service examination was also implemented to recruit the most outstanding Americans, along with a merit-based system of promotions. Since the Rogers Act, about two-thirds of US ambassadors appointed by the President of the United States have come from within the ranks of the Foreign Service. The Rogers Act also created the Board of the Foreign Service and the Board of Examiners of the Foreign Service, the former to advise the Secretary of State on managing the Foreign Service, and the latter to manage the examination process. In 1927 Congress passed legislation according diplomatic status to representatives abroad of the Department of Commerce (until then known as 'Trade Commissioners'), creating the Foreign Commerce Service. In 1930 Congress passed similar legislation for the Department of Agriculture, creating the Foreign Agricultural Service. Though formally accorded diplomatic status, however, commercial and agricultural attachés were civil servants (not officers of the Foreign Service). In addition, the agricultural legislation stipulated that agricultural attachés would not be construed as public ministers. On July 01, 1939, however, both the commercial and agricultural attachés were transferred to the Department of State under Reorganization Plan No. II. The agricultural attachés remained in the Department of State until 1954, when they were returned by Act of Congress to the Department of Agriculture. Commercial attachés remained with State until 1980, when Reorganization Plan Number 3 of 1979 was implemented under terms of the Foreign Service Act of 1980. In the meantime, in 1946 Congress at the request of the Department of State passed a new Foreign Service Act creating six classes of employees:- chiefs of mission, Foreign Service Officers, Foreign Service Reservists, Foreign Service Staff, 'alien personnel' (subsequently renamed Foreign Service Nationals and later Locally Engaged staff), and consular agents. Officers were expected to spend the bulk of their careers abroad and were commissioned officers of the United States, available for worldwide service. Reserve officers often spent the bulk of their careers in Washington but were available for overseas service. Foreign Service Staff personnel included clerical and support positions. The intent of this system was to remove the distinction between Foreign Service and civil service staff, which had been a source of friction. The Foreign Service Act of 1946 also repealed as redundant the 1927 and 1930 laws granting USDA and Commerce representatives abroad diplomatic status, since at that point agricultural and commercial attachés were appointed by the Department of State. The 1946 Act replaced the Board of Foreign Service Personnel, a body concerned solely with administering the system of promotions, with the Board of the Foreign Service, which was responsible more broadly for the personnel system as a whole, and created the position of Director-General of the Foreign Service. It also introduced the 'up-or-out' system under which failure to gain promotion to higher rank within a specified time in class would lead to mandatory retirement, essentially borrowing the concept from the US Navy. The 1946 Act also created the rank of Career Minister, accorded to the most senior officers of the service, and established mandatory retirement ages. The new personnel management approach was not wholly successful, which led to an effort in the late 1970s to overhaul the 1946 Act. During drafting of this Act, Congress chose to move the commercial attachés back to Commerce while preserving their status as Foreign Service Officers, and to include agricultural attachés of the Department of Agriculture in addition to the existing FSOs of the Department of State, US Information Agency, and US Agency for International Development. The Foreign Service Act of 1980 is the most recent major legislative reform to the Foreign Service. It abolished the Foreign Service Reserve category of officers, and reformed the personnel system for non-diplomatic locally employed staff of overseas missions (Foreign Service Nationals). It created a Senior Foreign Service with a rank structure equivalent to general and flag officers of the armed forces and to the Senior Executive Service. It enacted danger pay for those diplomats who serve in dangerous and hostile surroundings along with other administrative changes. The 1980 Act also reauthorized the Board of the Foreign Service, which 'shall include one or more representatives of the Department of State, the United States Information Agency, the United States Agency for International Development, the Department of Agriculture, the Department of Commerce, the Department of Labor, the Office of Personnel Management, the Office of Management and Budget, the Equal Employment Opportunity Commission, and such other agencies as the President may designate'. This board is charged with advising 'the Secretary of State on matters relating to the Service, including furtherance of the objectives of maximum compatibility among agencies authorized by law to utilize the Foreign Service personnel system and compatibility between the Foreign Service personnel system and the other personnel systems of the Government'. In the United States, the Foreign Service supports the President and the Secretary of State in pursuing America's foreign policy objectives. Foreign service functions include:- representing US interests; operating US overseas missions; assisting Americans abroad; public diplomacy and reporting; communicating and negotiating political, economic, consular, administrative, cultural and commercial affairs. The Foreign Service comprises officers from the Departments of State, Commerce and Agriculture and the United States Information Service. / Акт Родьжеза (Rogers Act). Хзри Эс. Тчрумэн (Harry S. Truman).

FOREIGN SERVICE INSTITUTE = ИНСТИТУТ ИНОСТРАННОЙ СЛУЖБЫ (или ИНСТИТУТ ЗАГРАНИЧНОЙ СЛУЖБЫ, или ИНСТИТУТ ЗАРУБЕЖНОЙ СЛУЖБЫ) – The Foreign Service Institute (FSI) is the Federal Government's primary training institution for officers and support personnel of the US foreign affairs community, preparing American diplomats and other professionals to advance US foreign affairs interests overseas and in Washington. At the George P. Shultz National Foreign Affairs Training Center, the FSI provides more than 600 courses – including some 70 foreign languages – to more than 100 000 enrollees a year from the State Department and more than 40 other government agencies and the military service branches. The Institute's programs include training for the professional development of Foreign Service administrative, consular, economic/commercial, political, and public diplomacy officers; for specialists in the fields of information management, office management, security, and medical practitioners and nurses; for Foreign Service Nationals who work at US posts around the world; and for Civil Service employees of the State Department and other agencies. Ranging in length from one day to two years, courses are designed to promote successful performance in each professional assignment, to ease the adjustment to other countries and cultures, and to enhance the leadership and management capabilities of the US foreign affairs community. Other courses and services help family members prepare for the demands of a mobile lifestyle and living abroad, and provide employees and their families with important information about such critical and timely topics as emergency preparedness and cyber security awareness, among others. The Foreign Service Institute is organized like a university and consists of five schools:- (i) The School of Language Studies; (ii) The School of Applied Information Technology; (iii) The School of Leadership and Management; (iv) The School of Professional and Area Studies; and (v) The Transition Center. In the United States, the Foreign Service Institute was founded in 1946 to train US foreign and civil service officials. Training courses cover administrative, consular, economic, commercial and political work, foreign languages and diplomatic life overseas. The Foreign Service Institute (FSI) is the United States Federal Government's primary training institution for employees of the US foreign affairs community, preparing American diplomats and other professionals to advance US foreign affairs interests overseas and in Washington. FSI provides more than 600

courses – including some 70 foreign languages – to more than 100 000 enrollees a year from the Department of State and more than 40 other government agencies and the military service branches. The FSI is based at the National Foreign Affairs Training Center in Arlington, Virginia. The Institute's programs include training for the development of United States Foreign Service and Civil Service professionals, and for Foreign Service Nationals who work at US posts around the world. Ranging in length from one day to two years, courses are designed to promote successful performance in each professional assignment, to ease the adjustment to other countries and cultures, and to enhance the leadership and management capabilities of the US foreign affairs community. Other courses and services help family members prepare for the demands of a mobile lifestyle and living abroad, and provide employees and their families with important information about such critical and timely topics as emergency preparedness and cyber-security awareness, among others. The Director of the Foreign Service Institute is equivalent in rank to an Assistant Secretary of State, and is appointed by the Secretary of State. The current Director of the Foreign Service Institute is Ambassador Nancy McEldowney. The Foreign Service Institute was initially authorized in Title VII of the Foreign Service Act. The issuance of Departmental orders fulfilling this section of the Act were delayed by the need to first resolve certain administrative issues. The orders were ultimately issued and, on March 13, 1947, Secretary of State George Marshall announced the establishment of the Foreign Service Institute. A number of different training schools and programs preceded the Foreign Service Institute, including the Consular School of Application (1907), the Wilson Diplomatic School (1909), the Foreign Service School (1924), the Foreign Service Officers' Training School (1931) and the Division of Training Services (1945). / Дьжодьж Пи. Шолц (George P. Shultz). Нэнси МэкЭлдауни (Nancy McEldowney). Дьжодьж Маршэл (George Marshall). Вилсэн (Wilson).

FOREIGN TRADERS INDEX = УКАЗАТЕЛЬ ПО ИНОСТРАННЫМ ТОРГОВЦАМ (или ИНДЕКС ПО ЗАРУБЕЖНЫМ ТОРГОВЦАМ, или КАРТОТЕКА ПО ЗАРУБЕЖНЫМ ТОРГОВЦАМ) – The Foreign Traders Index (FTI) is the US and Foreign Commercial Service headquarters compilation of overseas contact files, intended for use by domestic business. The FTI includes background information on foreign companies, address, contact person, sales figures, size of company and products by SIC (Standard Industrial Classification) code. The Foreign Trader Index (FTI) is a customized trade and mailing list service now proposed through the Contact Information Management System (CIMS) and replaces the former EMLS. It professes to be more customized and current. It is a list of prospects from the DOC's file of foreign firms known as the Foreign Traders Index (FTI). Retrievals are targeted by commodity classification and identify manufacturers, agents, retailers, and service firms, listing their address, product/service interest, year established, and other data. FTI information is available in computer printout form, and custom orders will range from USD30, depending on the amount of data requested and the job's complexity. Unfortunately, FTI has been one of the weakest of the US and Foreign Commercial Service (US&FCS) services. Because it is so difficult to keep the lists current, many firms included in recent lists were not qualified and a 2 percent return was considered a good return froma mailing relying on these names. The DOC is hoping the advent of the CIMS Foreign Trader Index in computerized form will allow easier maintenance and faster access to improve the value of these lists.

FOREIGN TRADE ZONE = ИНОСТРАННАЯ ТОРГОВАЯ ЗОНА (или ЗАГРАНИЧНАЯ ТОРГОВАЯ ЗОНА) – Foreign Trade Zones (FTZs) or bonded warehouses, or free ports, or free zones are special commercial and industrial areas in or near ports of entry where foreign and domestic merchandise, including raw materials, components and finished goods, may be brought in without being subject to payment of customs duties. Merchandise brought into these zones may be stored, sold, exhibited, repacked, assembled, sorted, graded, cleaned or otherwise manipulated prior to reexport or entry into the national customs territory. FTZs are restricted-access sites in or near ports of entry, which are licensed in the United States by the Foreign Trade Zones Board and operated under the supervision of the Customs Service. Zones are operated under public utility principles to create and maintain employment by encouraging operations in the US which might otherwise have been carried on abroad. Quota restrictions do not normally apply to foreign goods stores in zones, but the Board can limit or deny zone use in specific cases on public interest grounds. Domestic goods moved into a zone for export may be considered exported upon entering the zone for purposes of excise tax rebates and drawback. 'Subzones' are a special-purpose type of ancillary zone authorized by the Board, through grantees of public zone when it can be demonstrated that the activity will result in significant public benefit and is in the public interest. Goods in a zone for a bona fide Customs reason are exempt from state and local ad valorem tax. A free port in a country divorced from Customs authority but under government control. Merchandise, except that which is prohibited, may be stored in the zone without being subject to import duty regulations. A facility which – under license issued by the Foreign Trade Zone (FTZ) board – has acquired extra-territorial status. Merchandise entered into a FTZ are considered as having been exported and can be subjected to manipulation or manufacturing processes without Customs supervision, but will be subject to other applicable federal or state laws and terms of the storage contract. / заслуживающий доверия или действительный (bona fide). обратный вывоз (или реэкспорт; reexport).

FOREIGN TRADE ZONE ENTRY = ВВОЗ В ИНОСТРАННУЮ ТОРГОВУЮ ЗОНУ (или ВВОЗ В ЗАГРАНИЧНУЮ ТОРГОВУЮ ЗОНУ) – Foreign Trade Zone Entry is a form declaring goods which are brought duty-free into a Foreign Trade Zone for further processing or storage and subsequent exportation. / вывоз (exportation).

FOREIGN WASTE = ИНОРОДНЫЕ ОТХОДЫ – Foreign Waste is the thread waste or lint that is twisted in the yarn or woven in the fabric. If such foreign matter is of a different fiber, it may dye differently and thus show plainly.

FORE PEAK = ФОРПИК – Fore Peak (maritime term):- the part of the vessel below decks at the stem.

FOREST = ЛЕС – A Forest is an area with a high density of trees. As with cities, depending on various cultural definitions, what is considered a forest may vary significantly in size and have different classifications according to how and of what the forest is composed. A forest is usually an area filled with trees but any tall densely packed area of vegetation may be considered a forest, even underwater vegetation such as kelp forests, or non-vegetation such as fungi, and bacteria. Tree forests cover approximately 9.4 percent of the Earth's surface (or 30 percent of total land area), though they once covered much more (about 50 percent of total land area). They function as habitats for organisms, hydrologic flow modulators, and soil conservers, constituting one of the most important aspects of the biosphere. A typical tree forest is composed of the overstory (canopy or upper tree layer) and the understory. The understory is further subdivided into the shrub layer, herb layer, and also the moss layer and soil microbes. In some complex forests, there is also a well-defined lower tree layer. Forests are central to all human life because they provide a diverse range of resources:- they store carbon, aid in regulating the planetary climate, purify water and mitigate natural hazards such as floods. Forests also contain roughly 90 percent of the world's terrestrial biodiversity. Forest is a plant community dominated by trees or other large plants, e.g., large Aloes, Yuccas. / Лес – растительное сообщество, доминированное деревьями или иными крупными растениями, например, крупными Алоэ (Aloes), Юкками (Yuccas). Под Лесом понимается один из типов растительности, господствующий ярус которого образован деревьями одного или нескольких видов, с сомкнутыми кронами; из других жизненных форм для леса характерны кустарнички, лишайники, мхи, травы. Различают хвойные, лиственные (как чистые, так и смешанные), листопадные и вечнозелёные леса. Жизненная среда для многих птиц и зверей, источник древесины, ягод, грибов и технического сырья. Биомасса, накапливаемая лесом, составляет 90% всей земной биомассы (её величина составляет от 1

$650 \cdot 10^9$ до $1\ 911 \cdot 10^9$ тонн сухого вещества, около 14–15% её образуют хвойные леса, 55–60% – тропические). Имея важное климаторегулирующее, почво- и водозащитное значение, лесной покров Земли является одним из факторов устойчивости биосферы и требует постоянной заботы о его сохранении и возобновлении.

FORESTAY = ФОКА–ШТАГ – Forestay is a wire support to the foreside (foresail) of a mast. / Проволочная подвеска к фок-мачте или фоку (парусу) мачты.

FOREST GREEN = ЛЕСНОЙ ЗЕЛЁНЫЙ – Forest Green:- a dark yellowish or moderate olive green.

FOREX = FOREIGN EXCHANGE

FOREX = ФОРЭКС – Forex is the interbank foreign exchange market is an over-the-counter market, a network of commercial banks, central banks, brokers, and customers who communicate with each other by telex and telephone throughout the world's major financial centers. Foreign exchange traders also make markets or speculate in different currencies, usually anticipating future appreciation of stronger currencies against weaker ones, through the foreign exchange Forward Market and the Currency Futures market. An over-the-counter market where buyers and sellers conduct foreign exchange transactions. also called Foreign Exchange Market. The Foreign-Exchange Market (Forex or FX) is the place where currencies are traded. The forex market is the largest, most liquid market in the world with an average traded value that exceeds USD1.9 trillion per day. There is no central marketplace for currency exchange, rather, trade is conducted over-the-counter. The forex is open 24 hours a day, five days a week, with currencies being traded worldwide among the major financial centers of London, New York, Tokyo, Zurich, Frankfurt, Hong Kong, Singapore, Paris and Sydney – spanning most time zones. FOREX market is an abbreviation of Foreign Exchange market. FOREX ([for-eks] –noun) is a commonly used abbreviation for 'foreign exchange'. It is typically used to describe trading in the foreign exchange market, especially by investors and speculators. People trade currencies all the time, but how can currency be an investment? Here's a simple example. Imagine that you took a trip from the United States to Europe in 2002. For the trip, you changed your US Dollars into Euros. At the end of a trip, you typically would change any extra Euros back into US Dollars. But what if you didn't? In 2002, one Euro was worth about 90 US cents (USD0.90). Say that you decided to hold on to 500 Euros, and left them sitting in your desk drawer for 5 years. In 2007, you took your Euros to the bank and sold them for a 2007 price of USD1.40. Since you bought the Euros for USD0.90 and sold them for USD1.40, you made a USD0.50 profit per Euro. You would have made USD250 just because you held on to those Euros and had bought and sold at the right time. That's a 55% return in 5 years. The USD4 trillion forex market mostly runs on the same idea. Many of the world's giant banks, hedge funds, and insurance companies actively trade currencies as a way to make money. Since they do so in very large amounts, they record profits and losses in the millions every day for the smallest fraction-of-a-cent movements in exchange rates. Many have not heard of the forex market because the market has historically been largely exclusive to industry professionals. The average person could buy a stock but couldn't trade currencies. So it remained solely in the hands of the big boys. Like the online stock trading revolution of the 1990s, the Internet has brought forex trading within reach of the average person sitting at home. Thousands of individual traders around the world can now trade currencies from their living rooms, with nothing but a computer, an Internet connection, and a small trading account. You can now make trading and investment decisions to buy and sell British Pounds or Japanese Yen at any time, day or night (Sunday through Friday). This brief guide will show you how. But first, it's important to know why you should trade forex. Online forex trading has become very popular in the past decade because it offers traders several advantages:- (i) Forex never sleeps:- trading goes on all around the world during different countries' business hours. You can, therefore, trade major currencies any time, 24 hours per day. Since there are no set exchange hours, it means that there is also something happening at almost any time of the day or night. (ii) Go long or short:- unlike many other financial markets, where it can be difficult to sell short, there are no limitations on shorting currencies. If you think a currency will go up, buy it. If you think it will fall, sell it. This means there is no such thing as a 'bear market' in forex – you can make (or lose) money any time. (iii) Low trading costs:- most forex accounts trade without a commission and there are no expensive exchange fees or data licenses. The cost of trading is the spread between the buy price and the sell price, which is always displayed on your trading screen. (iv) Unmatched liquidity:- because forex is a USD4 trillion a day market, with most trading concentrated in only a few currencies, there are always a lot of people trading. This makes it typically very easy to get in to and out of trades at any time, even in large sizes. (v) Available leverage:- because of the deep liquidity available in the forex market, you can trade forex with considerable leverage (up to 50:1). This can allow you to take advantage of even the smallest moves in the market. Leverage is a double-edged sword, of course, as it can significantly increase your losses as well as your gains. (vi) International exposure:- as the world becomes more and more global, investors hunt for opportunities anywhere they can. If you want to take a broad opinion and invest in another country (or sell it short!), forex is an easy way to gain exposure while avoiding vagaries such as foreign securities laws and financial statements in other languages. Currencies trade on an open market, just like stocks, bonds, computers, cars, and many other goods and services. A currency's value will fluctuate depending on its supply and demand, just like anything else. If something increases supply or lowers demand for a currency, that currency will fall. For example, when Greece threatened to default on its debt, it threatened the existence of the Euro, and investors around the world rushed to sell Euros. With a sudden dramatic rise in the number of Euros for sale and a definite lack of demand for them, the Euro dropped precipitously against the US Dollar and other currencies. The best thing about forex is that you can buy or sell at any time and in any order. So, if you think the Eurozone is going to break apart, you can sell the Euro and buy the Dollar. If you think the Federal Reserve is printing too much money, you can sell the Dollar and buy the Euro. When looking at the future, many traders will have an opinion on where a currency is going. If a trader is optimistic and thinks a currency will rise, he is said to be 'bullish'. If the trader is negative and expects a currency to fall, he is said to be 'bearish'. Every day, the bulls and the bears do battle and the price moves as one or the other gets the upper hand. Our job as forex traders is to look at the currencies available to us and to buy the strongest while selling the weakest. So, if after reading the news you became bearish of Euros and bullish of US Dollars, you could trade that opinion by selling Euros and buying US Dollars. Because you are always comparing one currency to another, forex is quoted in pairs. This may seem confusing at first, but it is actually pretty straightforward. To the right is an example of a EUR/USD quote. It shows you how much one Euro (EUR) is worth in US Dollars (USD). If you, instead, wanted to look at the Euro in terms of the Japanese Yen (JPY), you would look at the EUR/JPY rate. If you wanted to see the value of a US Dollar in Canadian Dollars (CAD), you would look at the USD/CAD. The first currency in a currency pair is the 'base currency'; the second currency is the 'counter currency'. When you buy or sell a currency pair, you are performing that action on the base currency. So, if you are bearish of Euros, you could sell EUR/USD. Now, when selling EUR/USD, you are not only selling Euros, but are buying US Dollars. If you are more bullish on the Japanese Yen than you are on the US Dollar, you could sell the EUR/JPY instead. It's all up to you. Let's say that you sell EUR/USD at 1.4022. If the EUR/USD falls, that means the Euro is getting weaker and the US Dollar is getting stronger. Say the EUR/USD falls to 1.3522. In that case, you would have a profit. If it rose to 1.4522, you would have a loss. So just remember:- if you sell a pair, down is good; if you buy the pair, up is good. You can buy or sell anything you see active on your trading station, even if you don't have any of that currency. When trading forex, you are speculating on the change in rates. You do this by borrowing the Euros. This is standard for most forex traders. This also allows you access to leverage, which can increase your profits and your losses. So, let's look at the example again. When you sell EUR/USD, you borrow 1 000 Euros and sell them to someone else in the market, earning the equivalent in US Dollars.

Say you did this while the EUR/USD is at 1.4022. In that case, you borrowed 1 000 Euros, sold them for USD1 402.20, and held on to those US Dollars. Two weeks later, you sold those US Dollars when the rate was 1.3522. Since the EUR/USD price has fallen, you get more Euros back at the end than you borrowed. So, you return the 1 000 Euros you borrowed, and the remaining €36.98 is your profit to keep. If the price had risen to 1.4522 instead, that €36.98 would instead be a loss. Your trading station will do the math for you and apply the profit or loss directly to your account. So remember:- Buy currencies that are going up. Sell currencies that are going down. Find the best pair to do that with. Over the years, professional forex traders have come up with some shorthand to make forex trading simple so you can quickly make decisions about your trading without needing to take out a calculator every time. A Pip is the unit you count profit or loss in. Most currency pairs, except Japanese yen pairs, are quoted to four decimal places. This fourth spot after the decimal point (at one 100^{th} of a cent) is typically what one watches to count 'pips'. Every point that place in the quote moves is 1 pip of movement. For example, if the EUR/USD rises from 1.4022 to 1.4027, the EUR/USD has risen 5 pips. Stock indices have 'Points', futures have 'Ticks', forex has 'Pips'. The monetary value of a pip can vary according to the size of your trade and the currency you are trading. FXCM (http://www.fxcm.com) demo accounts typically trade in increments or 'lots' of 10 000. A pip in a standard demo account in EUR/USD is worth USD1.00 per lot. If you were trading 3 lots, you would have 3 pips of profit or loss per pip the EUR/USD moves, and, therefore, USD3.00 of profit or loss. Some currency pairs will have different pip values. For example:- The EUR/JPY pips are valued in Japanese Yen. USD/CAD pips are in Canadian Dollars, and so on. Once again, your trading station makes it all simple by doing the math for you. As mentioned before, all trades are executed using borrowed money. This allows you to take advantage of leverage. Leverage of 50:1 allows you to trade with USD10 000 in the market by setting aside only USD200 as a security deposit. This means that you can take advantage of even the smallest movements in currencies by controlling more money in the market than you have in your account. While leverage can be advantageous in increasing your profits, it can also significantly increase your losses when trading, so it should be used with caution. Start trading in small sizes so that you don't take on too much risk. FXCM's margin watcher feature ensures that you can never lose more money trading than is in your account. But it is still best to be careful. Leverage is a double-edged sword. Like with profit and loss, the trading station keeps track of margin for you. Used Margin (Usd Mr) is how much money you have set aside to secure your open trades. Usable Margin (Usbl Mr) is money left in your account to open new trades or to absorb losses. Always make sure that you have plenty of usable margin, otherwise you may get a margin call. If your usable margin gets low, you should close some trades or deposit money into your account. So, you now know what forex traders do all day (and all night!). Seems pretty simple, right? Buy rising currencies and sell falling ones. Nothing complicated there. You've already taken the first step by learning what forex is. Now it's time to try it. Start with a demo account. It's a free simulation of a real trading account. It has all the functions of a real account (streaming forex prices, pip, P/L, charts, etc), but the money isn't real. Think of it as test driving a car. But how do you know which currencies will rise and which will fall? Over the years, forex traders have developed several methods for figuring out how far currencies will go. Fundamental Analysis:- since currencies trade in a market, you can look at supply and demand. This is called Fundamental Analysis. Interest rates, economic growth, employment, inflation, and political risk are all factors that can affect supply and demand for currencies. Technical Analysis:- price charts tell many stories and most forex traders depend on them in making their trading decisions. Charts can point out trends and important price points where traders can enter or exit the market, if you know how to read them. Money Management:- an essential part of trading. All traders need to know how to measure their potential risks and rewards and use this to judge entries, exits, and trade size. There are several important skills needed in order to become a forex trader. And like all skills, learning them takes a bit of time and practice. We have grouped all these needed skills together into an interactive trading course. You can learn how to analyze and trade the market from experienced instructors and traders. They teach using video-ondemand lessons and live office hours are available so you can get personal feedback, study on any schedule, and learn at your own pace. And the best part is it's free. All you need to do is show that you're serious about getting into the world's largest market. Open a live trading account with FXCM and you will become a real trader with real money. You'll have unlimited free access to the course, as well as tool such as charts, research, and trading signals. A term Forex refers to the over-the-counter market for foreign exchange transactions. Also known as Foreign Exchange Market. / В отношении фондовых индексов для обозначения термина Шаг используется термин Пункт (Points), для фьючерсов – Тик (Ticks), а для Форэкса – Пип (Pip). Термин сформировался путём словосочетания сокращений от двух Английских слов – Форэн (Foreign) и Эксчэйндьж (Exchange). Современный международный межбанковский валютный рынок сформировался в 1970-е, когда международная торговля перешла от системы фиксированных курсов к системе плавающих обменных курсов валют. Курсы валют определяются соотношением между спросом и предложением на рынке. Межбанковский рынок иностранных валют, известный под обозначениями Форэкс (Forex) или Эф.Экс. (FX) – производное от Англоязычного словосочетания Форэн Эксчэйндьж (Foreign Exchange).

FOREX FORWARD = ФОРЭКСНЫЙ ФОРВАРД (или ФОРВАРДНЫЙ КОНТРАКТ НА ФОРЭКС) – Forex (FX) Forward:- product description:- purchase of a currency for an equivalent in another currency with the settlement date over three business days. The foreign exchange rate for a forward transaction is linked to the current spot rate, increased/decreased by forward points depending on the mutual relationship between the interest rates of the traded currencies. Terms of Service:- (i) accounts in the relevant currencies; (ii) minimum volume of a transaction has been set out as, e.g., CZK1 000 000 or an equivalent in EUR, USD, GBP, CHF and PLN, for other currencies have been the minimum volume certify; (iii) maturity – up to 1 year; (iv) traded currencies are limited by the scope of the foreign exchange list of the investing bank; (v) Master Agreement on Treasury Trades; and (vi) Agreement on Financial Collateral Account. / (v) Головное Соглашение.

FOREX MARKET = РЫНОК ФОРЭКС – Forex Market is the market in which participants are able to buy, sell, exchange and speculate on currencies. The forex markets is made up of banks, commercial companies, central banks, investment management firms, hedge funds, and retail forex brokers and investors. The currency market is considered to be the largest financial market in the world, processing trillions of dollars worth of transactions each day. The foreign exchange markets isn't dominated by a single market exchange, but involves a global network of computers and brokers from around the world. Central banks use their massive buying and selling capabilities to alter exchange rates through their open market activities and in many cases will do so not with profit in mind, but rather for any number of policy reasons. Forex brokers act as market makers as well, and may post bid and ask prices for a currency pair that differs from the most competitive bid in the market. Forex Market is an over-the-counter market where buyers and sellers conduct foreign exchange business by telephone and other means of communication. Also known as Foreign Exchange Market. / коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо). Под Рынком Форэкс понимается внеучётный рынок, на котором покупатели и продавцы осуществляют бизнес по купле-продаже иностранной валюты посредством использования телефона и иных средств связи. Известен также как Рынок Иностранной Валюты (Foreign Exchange Market).

FOREX SPOT = ФОРЭКСНЫЙ ХХ – FX Spot or Spot Foreign Exchange:- product description:- some investing bank offer individual foreign exchange rates for the purchase of one currency for an equivalent in another currency with settlement on the day of deal execution or up to two business days (inclusive) thereafter. These banks carry out conversions based on your binding orders for the required exchange rate level and pre-specified notional amounts. Terms of Service:- (i) accounts in the relevant currencies; (ii) sufficient account balance (converted amount equivalent); (iii) minimum volume of a transaction has been set forth as, e.g., CZK300

000 or an equivalent in a foreign currency; (iv) traded currencies are limited by the scope of the foreign exchange list of the investing bank.

FOREX SWAP = ФОРЭКСНЫЙ СВОП (или СВОП НА ФОРЭКС) – Forex (FX) Swap:- product description:- exchange of funds in one currency for an equivalent in another currency for a fixed period of time. If such a term starts in the future, this option is called a Forward FX Swap. Technically, a FX Swap is constituted by two simultaneously concluded FX conversions. Settlement is performed in the form of two separate conversions, i.e. the initial sale of funds by the client to the investing bank for the current market FX rate and their future buy-back by the client from the bank for the forward rate. Terms of Service:- (i) accounts in the relevant currencies; (ii) sufficient account balance (converted amount equivalent); (iii) minimum volume of a transaction has been set out as, e.g., CZK1 000 000 or an equivalent in EUR, USD, GBP, CHF and PLN, for other currencies have been the minimum volume certify; (iv) maturity – up to 1 year; (v) traded currencies are limited by the scope of the foreign exchange list of the investing bank; (v) Master Agreement on Treasury Trades; and (vi) Agreement on Financial Collateral Account. / (v) Головное Соглашение.

FORFAIT = ФОРФЭ (или ФОРФЭТ, или ОТЧУЖДЕНИЕ) – Forfait:- purchase of negotiable instruments, most often avalized drafts, without recourse. The forfaiter assumes the credit risk of being able to collect payment when due. Also known as Forfaiting, and Forfeiting. / , от Французского слова Форфэ (Forfait), означающее Злодеяние или Преступление, понимается:- (1) соглашение о выполнении обязательства по общей заранее устанавливаемой твёрдой цене (за выполнение будущих работ, за будущие услуги); заранее обусловленная общая оплата (à forfeit) – по общей установленной, заранее обусловленной цене (независимо от реальных расходов); (2) определение суммы налога на основании общей предполагаемой суммы доходов; (3) (в приложении) за общую обусловленную твёрдую цену; (4) неустойка за неучастие лошади в скачках.

FORFAITING = ФОФЭТИНЬ (или ОТЧУЖДЕНИЕ, или ФОРФЭЙТИНГ) – Forfaiting is a form of financing (generally in export business) where receivables due at a later date are sold to a bank or financial services provider without recourse. In this connection 'à forfait' means that the forfaiter (buyer) assumes all economic and political risks involved, without recourse to the exporter. The seller is only liable for the claim being valid and effective. Forfaiting is a means of mobilizing funds immediately when payment terms have been given. That leads to improved liquidity and helps streamline the balance sheet by reducing capital backing requirements. The claims are usually in the form of bills of exchange and are generally secured by bank guarantees or commercial letters of credit from first-class banks in the importer's country. Specialist banking service by which the bank buys foreign debts at a discounts without recourse, thus removing the risk to the seller of non-payment. Forfaiting is the selling, at a discount, of longer term accounts receivable or promissory notes of the foreign buyer. These instruments may also carry the guarantee of the foreign government. Forfaiting emerged after the Second World War to expedite finance transactions between Eastern and Western European countries. More recently, it has become popular in Asian and Third world countries. Both US and European forfeiting houses, which purchase the instruments at a discount from the exporters, are active in the US market. Also known as Forfait, and Forfeiting. Forfeiting is a form of export finance developed in Vienna, Austria and Zurich, Switzerland to finance trade with Eastern European countries. Forfeiting is derived from the French 'Forfait', meaning 'to surrender something'. Although it has been used for over 30 years in certain parts of Europe, it has only recently been introduced on a wide scale, primarily because of the pressures caused by the world debt crisis. Today, the main market for the 'Forfeit' is located in London, United Kingdom. When there is a need for long-term financing, the forfeiting bank purchases the exporters' receivables (in the form of bills of exchange and promissory notes), and discounts them (with an appropriate fixed discount rate), assuming that the exporter has fulfilled his obligations. The discounted amount of money is received by the exporter and the buyer receives credit for the agreed period of time. Also known as Forfait, and Forfaiting. / Форфэ (Forfait), и Форфэтинь или Форфэйтинг (Forfaiting). (1) Фофэтинь – операция по приобретению финансовым агентом (форфэтором) коммерческого обязательства заёмщика (покупателя, импортёра) перед кредитором (продавцом, экспортёром). (2) Фофэтинь – специфическая форма кредитования торговых операций. Основное условие форфэтиня состоит в том, что все риски по долговому обязательству переходят к форфитору без права оборота на продавца обязательства. Форфитин – способ кратко- и среднесрочного финансирования внешней (как правило) торговли, при котором форфитор финансирует покупателя (импортёра) без права регресса к поставщику (экспортёру) путём учёта/приобретения/принятия свободно обращаемого долгового обязательства (freely negotiable instrument of debt). Активы, возникающие в результате форфитиновых сделок, могут впоследствии обращаться на вторичном рынке форфейтинговых активов. Классика (кредит поставщика):- (i) простые векселя; и (ii) переводные векселя, в том числе выпущенные в рамках документарных аккредитивов. Современность:- (i) кредит поставщика:- (a) простые векселя (+ авалированные); (b) переводные векселя, в том числе выпущенные в рамках документарных аккредитивов; (c) будущие платежи по аккредитивам с отсрочкой платежа; и (d) дебиторская задолженность, обеспеченная банковскими/суверенными гарантиями (поручительствами) или резервными аккредитивами. (ii) Кредит покупателю:- (a) простые векселя (+авалированные); (b) кредитные соглашения, в том числе обеспеченные гарантиями, поручительствами, резервными аккредитивами; и (c) постфинансирование документарных аккредитивов. Эволюция форфитина:- (i) начало 1960-х – становление современного форфитина:- финансирование поставок машин и оборудования из Западной в Восточную Европу и бывший СССР; (ii) 1970–80-е – начало финансирования поставок товаров капитального назначения в страны Латинской Америки, Азии, Индии, а впоследствии в страны Ближнего Востока; (iii) начало 1990-х – первый 'кризис' форфитинового рынка:- коллапс Варшавского Блока и СССР и приостановление выплат СССР по коммерческим долгам; (iv) середина 1990-х – становление форфитинового финансирования в странах Восточной Европы и бывшего СССР; (v) конец 1990-х – второй 'кризис' форфитинового рынка в связи с чередой финансовых кризисов в Азии, Латинской Америке и России; (vi) 1998–2001 – работа по реструктуризации 'зависших долгов', точечные сделки по рынкам бывшего СССР; (vii) 2002–… – ренессанс форфитина (рост рынка за 2006 год – 233% (по данным Sumitomo Mitsui Banking Corporation)). Текущие объекты финансирования:- (i) внешнеторговые сделки – вывоз (или экспорт) или привоз (или импорт); (ii) товары и услуги капитального назначения; и (iii) предвывозное (или предэкспортное) финансирование. Сроки финансирования (в зависимости от финансово-экономической репутации страны) – 1–7 лет. Основные пользователи форфитина:- (i) банки:- (a) фондирование кредитов на закупки товаров капитального назначения зарубежом, (b) фондирование предвывозных (или предэкспортных) кредитов, (c) постфинансирование аккредитивов по привозу (или импортных аккредитивов), и (d) кредитование клиентов – участников внешнеэкономической деятельности (ВЭД) под резервные аккредитивы банков; и (ii) Экспортёры:- финансирование коммерческих кредитов (рассрочек платежа) покупателям товаров капитального назначения. Форфитин для банков:- в качестве инструментов финансирования (как до года, так и свыше года) служат простые векселя (+ Side Letter), кредитное соглашение, кредитное соглашение с резервным аккредитивом и постфинансирование документарного аккредитива. Преимущества:- (i) привлечение фондирования, скоординированного по срокам с активом; (ii) фиксирование маржи/процентной ставки на срок финансирования; (iii) оперативность привлечения фондирования; и (iv) расширение круга зарубежных инвесторов, принимающих риск банка-заёмщика. Перспективы:- (i) смещение фокуса на более длинные сроки финансирования; (ii) расширение перечня используемых инструментов; (iii) использование форфитина как одного из способов фондирования проектного финансирования для предприятий; и (iv) участие во вторичном обращении форфитиновых активов. Форфитин для экспортёров:- в качестве инструментов финансирования

выступают:- (i) до года:- (a) дисконтирование документарных аккредитивов с рассрочкой платежей, и (b) дебиторская задолженность, обеспеченная гарантией/резервным аккредитивом; (ii) свыше года:- (a) дисконтирование документарных аккредитивов с рассрочкой платежей, и (b) переуступка будущих платежей по документарным аккредитивам с рассрочкой платежей. Преимущества:- (i) финансирование отсрочек платежа на длительный период до 7 и более лет; (ii) экспортёр полностью уходит от платёжных, процентных, валютных и политических рисков; (iii) возможность финансирования как подписанных, так и готовящихся к подписанию контрактов; (iv) фиксирование процентных ставок по коммерческому кредиту для покупателя; и (v) позволяет работать с новыми клиентами, на новых незнакомых рынках, предоставляя условия оплаты выгодные для импортёра без риска неоплаты техники. Недостатки:- (i) обязательность наличия банка-гаранта (эмитента аккредитива) или суверенной гарантии в стране покупателя; (ii) приобретение задолженности происходит после отгрузки и предоставления экспортёром всех документов по сделке, полностью удовлетворяющих форфитора. Перспективы:- (i) выход на новые зарубежные рынки сбыта; (ii) усиление конкуренции с Западными поставщиками; (iii) увеличение потребностей в финансовой поддержке вывозных (или экспортных) продаж; и (iv) организация кредитов иностранным покупателям как альтернатива отсрочкам платежа. Форфейтинг возник после второй мировой войны. Несколько банков в Цюриха, Швейцария, имевших богатый опыт финансирования международной торговли, стали использовать этот приём для финансирования закупок зерна странами Западной Европы в США. В те годы поставки продукции и конкуренция между поставщиками настолько возросли, что покупатели потребовали увеличения сроков предоставляемого кредита до 180 дней против привычных 90. Кроме того, произошло изменение структуры мировой торговли в пользу дорогостоящих товаров с относительно большим сроком производства. Таким образом, повысилась роль кредита в развитии международного экономического обмена, и поставщики были вынуждены искать новые методы финансирования своих сделок. По мере того как падали барьеры в международной торговле и многие Африканские, Азиатские, а также Латиноамериканские страны стали более активны на мировых рынках, Западноевропейские предприниматели всё труднее предоставляли кредиты за счёт собственных источников, почему поставщики и были вынуждены использовать новые методы финансирования своих сделок. В настоящее время одним из основных центров форфейтинга является Лондон, Соединённое Королевство, поскольку вывоз (или экспорт) многих Европейских стран давно финансируется из Сити, никогда не медлившего с освоением новых банковских технологий. Значительная часть форфейтингового бизнеса сконцентрирована также в Германии. Наибольшее развитие форфейтинг получил в странах, где относительно слабо развито государственное кредитование вывоза (или экспорта). Первоначально форфейтирование осуществлялось коммерческими банками, но по мере увеличения объёма операций ‘а-форфе’ стали создаваться также специализированные институты. Форфейтинг развивается в различных финансовых центрах, причём отмечается ежегодный рост подобных сделок. Тем не менее, было бы ошибкой связывать увеличение количества сделок ‘а-форфе’ с ростом числа таких центров. Это объясняется возрастанием рисков, которые несут экспортёры, а также недостатком адекватных источников финансирования в связи с ростом рисков. Форфейтинг обладает существенными достоинствами, что делает его привлекательной формой среднесрочного финансирования. Основным достоинством этой формы является то, что форфейтер берёт на себя все риски, связанные с операцией. Кроме того, её привлекательность возрастает в связи с отказом в некоторых странах от фиксированных процентных ставок, хроническим недостатком во многих развивающихся странах валюты для оплаты привозимых (или импортируемых) товаров, ростом политических рисков и некоторыми иными обстоятельствами. Работа форфейтинговых компаний заключается в разграничении от любых торговых сделок всех рисков и позволяет экспортёру сосредотачиваться на своем бизнесе. Импортёры в развивающихся странах готовы платить за товар с отсрочкой платежа серьёзные деньги. Поскольку доступ к среднесрочному и долгосрочному финансированию в таких странах ограничен, импортёр приводит выплаты по контрактам в соответствии с получением доходов от проекта, заранее фиксируя процент за время пользования кредитом. Фофэтинь (от Английского слова Forfeiting) – форма кредитования внешнеэкономических операций в виде покупки у экспортёра векселей, акцептованных импортёром. При форфэтине продавец переуступает свои требования к покупателю конкретному кредитному учреждению. Продавец покупает сразу всю сумму за вычетом процентов. При этом покупатель товаров ликвидирует свои долговые обязательства регулярным (обычно полугодовым) взносом. От обычного учёта векселей банками форфэтинь отличается тем, что предполагает переход всех рисков по долговому обязательству к его покупателю – форфэтору. Форфэтинь позволяет сократить дебиторскую задолженность продавца, улучшить структуру баланса, ускорить оборот капитала. Хотя форфэтинь дороже банковского кредита, он стабилизирует ставки кредитования, упрощает оформление переуступки векселей и других долговых требований. Другие определения Форфэтиня:- форфэтинь – это операция при продаже в кредит. Банк (форфэтор) выкупает векселя (тратты) импортёра сразу после поставки товара, обеспечивая экспортёру немедленный платёж стоимости товара за вычетом разницы между стоимостями экспортного и форфейтингового кредитов. Комиссия форфэтора составляет обычно около 1–1.5%. Форфэтор требует от импортёра предоставления банковской гарантии или сам принимает на себя риск за дополнительную плату. Форфэтинь защищает экспортёра практически от всех валютных рисков. Форфейтинговые сделки:- существует два возможных инициатора форфейтинговой сделки – экспортёр и импортёр. Чаще всего в этой роли выступает экспортёр либо его банк. И это естественно, поскольку для дисконтирования представляются или переводные векселя, выписанные экспортёром, или простые векселя, оплачиваемые ему. Именно этим определяется необходимость проведения переговоров инициатора с форфейтером на ранних стадиях подготовки контракта. Ещё до того, как экспортёр и импортёр подпишут контракт, форфейтер может определить свои требования к гарантии или авалю, хотя бы приблизительно указать размер дисконта. Без этой информации экспортёр не в состоянии точно определить цену контракта. На практике далеко не каждый экспортёр вступает в переговоры с форфейтером на столь ранней стадии, а в результате он может обнаружить, что маржа за финансирование, включённая им в цену контракта, необоснованна. Первое, что должен определить для себя форфейтер, – это характер сделки, то есть выяснить, с какими ценными бумагами ему придётся иметь дело – финансовыми или товарными. Финансовые векселя – это ценные бумаги, выпущенные с целью аккумуляции средств, которые заёмщик в дальнейшем может использовать по своему усмотрению. Товарные же векселя оформляются в случае сделок купли-продажи продукции. Однако граница между финансовыми и товарными сделками в определённой мере размыта (скажем, выписывается вексель без совершения торговой сделки, но затем полученные средства используются для покупки каких-либо товаров). Тем не менее, определённость в вопросе о том, являются ли векселя финансовыми или товарными, для форфейтера имеет важное значение по следующим причинам:- Во-первых, некоторые участники вторичного форфейтингового рынка не желают приобретать финансовые векселя. Существуют различные объяснения этого нежелания. Некоторые вторичные форфейтеры рассматривают подобный способ привлечения ресурсов как свидетельство финансового неблагополучия заёмщика (хотя это не всегда так). Иные отдают предпочтение товарным векселям по той причине, что деньги обесцениваются, что пугает инвесторов, и реальный товар кажется им более надёжным вложением средств. Во-вторых, даже тот, кто согласен купить финансовые бумаги, хочет знать, с каким видом бумаг он будет иметь дело, поскольку это влияет на оценку общего риска, которому он подвергается. Большая часть векселей, продаваемых на вторичном форфейтинговом рынке, является товарными. Поэтому в случае предложения финансовых бумаг обязательным считается предварительное письменное предупреждение об этом. Если это условие нарушено, покупатель финансовых бумаг имеет право потребовать

аннулирования сделки. Форфейтер всегда должен иметь на руках краткое описание сделки, лежащей в основе операций с векселями. Оно может быть получено по телексу или факсу при предварительном обсуждении условий операции. После того как форфейтер выяснит характер сделки, он должен определить следующее:- (i) объём финансирования, валюта, срок. (ii) Кто является экспортёром и в какой стране он находится? Этот вопрос важен, потому что хотя финансирование обеспечивается без права регресса, существуют обстоятельства, при которых форфейтер может предъявить претензии экспортёру. Кредитоспособность экспортёра также имеет значение. Кроме того, форфейтер должен проверить подлинность подписей на векселях. (iii) Кто является импортёром и из какой он страны? Для проверки достоверности подписей и соответствия оформления векселей законодательству форфейтер должен точно определить импортёра и его местонахождение. (iv) Кто является гарантом и из какой он страны? (v) Чем оформляется долг, подлежащий форфетированию:- простым векселем, переводным и так далее? (vi) Каким образом долг застрахован? (vii) периоды погашения векселей, суммы погашения; (viii) вид вывозимых (или экспортируемых) товаров. Этот вопрос интересует форфейтера, во-первых, с точки зрения целесообразности всей сделки, во-вторых, с позиции легальности вывоза (или экспорта). (ix) Когда будет производиться поставка товара? Дата должна быть близка к дате предоставления финансирования. Важно также и то, что гарант вряд ли сможет авалировать вексель до тех пор, пока поставка не будет осуществлена. (x) Когда поступят документы, подлежащие дисконтированию? Пока документы не будут получены, форфейтер не сможет проверить и дисконтировать их. (xi) Какие лицензии и иные документы по условиям контракта должны быть представлены для поставки товаров? Форфейтер несёт ответственность за то, что не возникнет никаких задержек в исполнении финансируемого им контракта. (xii) В какую страну будет совершён платёж форфейтеру? Это важно знать, поскольку платёж в заграничный банк может задержать получение средств, и такая задержка должна быть учтена при дисконтировании бумаг, существует также возможность замораживания средств на счетах властями страны, и эта возможность тоже должна быть учтена при расчёте дисконта. Форфейтер может даже отказаться от сделки, если его не устраивает банк, в который поступят средства. Кредитный анализ:- после того как форфейтер получит ответы на вышеперечисленные вопросы, он должен провести кредитный анализ. Большинство форфейтинговых операций осуществляется банками, и кредитный анализ является обязательным этапом подготовки сделки. Существует как минимум четыре вида риска, которые должны быть проанализированы форфейтером:- риск гаранта, риск покупателя, риск импортёра, и риск страны. Кроме того, форфейтер должен собрать следующую информацию:- (i) какова кредитоспособность гаранта? (ii) можно ли будет в дальнейшем продать бумаги по приемлемой цене? (iii) есть ли какие-либо сомнения в кредитоспособности, компетентности экспортёра или импортёра и на чём они основываются? и (iv) имеется ли возможность покупки данного долга с учётом уже имеющихся в портфеле форфейтера ценных бумаг, и какая при этом ожидается степень риска? После этого форфейтер может называть свою твёрдую цену. Однако с момента передачи заявки на совершение форфейтинговой сделки до реальной поставки товаров, когда форфейтер сможет купить векселя, проходит определённое время, в течение которого процентные ставки могут измениться в неблагоприятном для форфейтера направлении. Этот рисковый период может быть разделён на две части. (i) Первая часть – время между передачей на рассмотрение заявки и принятием её импортёром. Естественно, пока заявка не согласована с последним, нет уверенности в том, что сделка вообще состоится. На это время форфейтер может предложить экспортёру опцион – вид контракта, по которому покупатель имеет право в течение определённого срока либо купить по фиксированной цене оговорённую сумму иностранной валюты, либо продать её. Владелец опциона принимает решение о том, воспользоваться или нет предоставленным ему правом, в зависимости от динамики валютных курсов. Во всех случаях риск, которому подвергается владелец опциона, заранее ограничен ценой опциона, а выигрыш теоретически не ограничен. Если период предоставленного опциона не превышает 48 часов, то форфейтер может принять на себя риск и без начисления комиссии, если превышает – начисляется определённая сумма комиссии. Обычно форфейтеры не соглашаются на опционы сроком свыше 1 месяца, хотя бывают исключения (до 3 месяцев). (ii) Вторая часть – время между утверждением заявки и поставкой товаров. В течение этого времени (обычно от нескольких дней до 12 месяцев) форфейтер и экспортёр несут обязательства, от которых они могут отказаться лишь при условии компенсации всех расходов другой стороне. В случае отказа экспортёр должен компенсировать расходы форфейтера по другим обязательствам, которые он мог принять на себя с целью финансирования данной сделки; форфейтер – компенсировать экспортёру все расходы по организации другого, возможно, более дорогого источника финансирования. Кроме того, форфейтер обычно взимает с экспортёра так называемые ‘комиссионные за обязательство’, то есть за то, что, принимая на себя определённые обязательства в отношении данного экспортёра, он лишает себя потенциальной возможности заключить иные, возможно, более выгодные сделки. Документальное оформление сделки:- после того как достигнута предварительная договоренность о сделке, форфейтер посылает документы с предложением (телексом или письмом) экспортёру, который должен письменно подтвердить своё согласие. Форфейтер также перечисляет документы, с которыми ему необходимо ознакомиться до того, как он приступит к дисконтированию векселей (лицензия на вывоз (или экспорт) товаров, иные уведомительные документы). Знакомство с указанной документацией должно дать ему возможность убедиться в том, что сделка совершится. Когда предложение будет принято экспортёром, он должен подготовить серию переводных векселей или подписать соглашение о принятии простых векселей от покупателя. На данной стадии экспортёр должен также получить гарантию или аваль на свои векселя. Кроме того, он делает надпись на векселях:- ‘без права регресса’. Таким образом, будут готовы все документы, на основе которых форфейтер может произвести дисконтирование, даже если отгрузка товаров фактически ещё не произведена. Средства обеспечения возврата кредита форфейтеру:- в международной торговле экспортёр получает от иностранного покупателя переводные или простые векселя, оплата которых должна быть произведена в предусмотренные сроки. Банк в стране импортёра либо авалирует такие оборотные документы, либо гарантирует их исполнение. Поскольку форфейтер покупает долговые обязательства без права регресса, он несёт все риски возможного неплатежа. Поэтому если должник не является первоклассным заёмщиком, форфейтер будет стремиться получить определённое обеспечение – в форме аваля или безусловной гарантии банка. Гарантийное обязательство:- выдаётся гарантом кредитору в обеспечение своевременной уплаты причитающейся с должника суммы. Гарантия предоставляется в форме соответствующего письма, которое должно содержать следующие реквизиты:- кем выдано письмо, юридический адрес гаранта, № гарантийного письма, объект гарантии (сделка, дата поставки продукции, процентная ставка и так далее). Существует несколько видов гарантий, различающихся по субъекту гарантийного обязательства, порядку оформления гарантии, источнику средств, используемому для гарантийного платежа. В качестве субъекта гарантийного обязательства при сделках ‘а-форфе’ могут выступать финансово устойчивые предприятия или специальные учреждения, располагающие средствами. Чаще всего такими учреждениями являются банки. Кроме снижения рисков форфейтера гарантии обеспечивают более высокую ликвидность дисконтированных бумаг на вторичном рынке. Если предоставляется банковская гарантия, то обычно её выставляют международные банки, имеющие представительства в стране импортёра. Аваль:- вексельное поручительство, в силу которого авалист принимает ответственность за выполнение обязательств какого-либо обязанного по векселю лица. Кроме подписи аваль должен содержать надпись на векселе:- ‘per aval’, а если это переводный вексель, на нём должны быть указаны также имя, отчество, фамилия авалиста. По сравнению с гарантией аваль обладает преимуществом, заключающимся в том, что он неотделим от векселя. Кроме того, оформление аваля значительно

проще, чем оформление гарантийного письма. Гарантийные оборотные документы учитываются экспортёром в своём банке без права регресса требований. Банк экспортёра, таким образом, действует как форфейтер. Это вытекает из самого соглашения о форфейтинге, которое обычно заключается лишь после того, как достигнута договорённость между продавцом и его банком о том, что банк выступит в качестве форфейтера, и между покупателем и его банком о том, что банк авалирует векселя или предоставит гарантию их оплаты. Форфейтер особенно заинтересован в эффективном обеспечении приобретаемого им оборотного документа. Если таким обеспечением является аваль, то, например, по Английским законам такое обязательство считается действительным и авалист как гарант несёт такую же ответственность, как и индоссант документа. Если обеспечение имеет форму банковской гарантии, в ней указывается, что она является основной гарантией и гарант занимает положение главного должника, что она является безотзывной и безусловной, что она делима и передаваема. Юрисдикция:- договор между экспортёром и форфейтером обычно содержит оговорку о применимом праве и юрисдикции. Если обеспечением является гарантия, аналогичная оговорка включается в гарантию, которую банк даёт форфейтеру в стране импортёра. Роль первичного форфейтера:- продадавец форфейтинговых бумаг, независимо от того, происходит ли продажа на первичном или вторичном рынке, обязан оперировать действительными долговыми обязательствами, связанными с реальными сделками. Если покупатель обнаружит, что приобрёл требование, не имеющее силы, он вправе выставить иск на продавца (этого не может предотвратить даже надпись на ценной бумаге:- ‘без права регресса’). Однако между первичным покупателем (форфейтером) и покупателем на вторичном рынке существует принципиальное различие:- форфейтер обязан проверить документацию, подтверждающую реальность и законность сделки, в то время как вторичный покупатель обычно этого не делает. Существуют три очевидные причины, из-за которых такая проверка является функцией первичного покупателя. Во-первых, именно он составляет соглашение с экспортёром при покупке векселей и имеет возможность проверить все документы, а также правильность оформления векселей. На вторичном рынке может оказаться немало потенциальных покупателей форфейтинговых бумаг, и если они все захотят проверить документы, относящиеся к сделке, то это займёт много времени, поскольку документы могут находиться в различных банках, а их ксерокопирование и пересылка замедлят операцию. Во-вторых, банк, предлагающий векселя на вторичный рынок, чаще всего предпочитает не афишировать имя экспортёра, пока не будет достигнута договорённость о продаже. Помимо других причин это объясняется тем, что, узнав, кто является экспортёром, вторичный покупатель может ‘выйти’ на него, минуя первичного форфейтера. В-третьих, важны также обычные соображения конфиденциальности. Исходя из этого, банк не желает предоставлять документы, относящиеся к сделке, всем потенциальным покупателям. Другим направлением, где первичный форфейтер несёт определённые обязанности, не разделяемые вторичными покупателями, является проверка аваля и гарантии. Безусловно, покупатель на вторичном рынке при желании может послать запрос гаранту. Однако это приведёт к ненужному и, возможно, многократному дублированию работы, связанной с подобной проверкой. Издержки участников сделки:- (1) Издержки Импортёра:- издержками импортёра, участвующего в форфейтинговой операции, являются комиссионные в пользу гаранта. Обычно комиссионные (комиссия) – это определённый процент от номинальной стоимости гарантированных или авалированных векселей, являющийся объектом переговоров между импортёром и гарантом. В тех случаях, когда форфейтер не настаивает на гарантии, он может потребовать от импортёра уплаты определённой суммы в качестве компенсации за дополнительный риск. Комиссия за гарантию обычно выплачивается раз в год (в начале года). Иногда она может выплачиваться в момент подписания гарантийного письма или авалирования векселя. Бывает также, что комиссия рассчитывается как процент от номинальной стоимости каждого векселя отдельно и выплачивается по истечении его срока. (2) Издержки Экспортёра:- издержки экспортёра по организации форфейтингового финансирования складываются из:- ставки дисконта, комиссии за опцион и комиссии за обязательство. Ставка дисконта базируется на процентной ставке за кредит, предоставляемый на срок, равный среднему сроку дисконтируемых векселей. Например, если форфейтер дисконтирует векселя, срок которых истекает в интервалы, равные 6 месяцам в течение 5 лет, то средний срок всех векселей будет равен 2 3/4 года. В этом случае форфейтер будет основывать свои расчёты на превалирующей процентной ставке, начисляемой на кредиты, выданные сроком в 2 3/4 года. Учитывается, естественно, и тенденция изменения процентной ставки. Затем форфейтеру нужно определить размер премии, взимаемой им сверх суммы дисконта. Уровень премии отражает степень рисков, которым подвергается форфейтер. Чаще всего они связаны с политическими трудностями или проблемами трансферта, значительно реже – с несостоятельностью гаранта, поскольку гарантию обычно берут у первоклассного института. Если гарантом выступает крупный международный банк или государственный банк, премия будет несколько ниже. Для большинства стран её размер может колебаться от 0.5 до 5%. Следующий компонент премии связан с тем, что форфейтинговое финансирование предоставляется по фиксированной процентной ставке. И хотя форфейтер может согласовать сроки полученных и предоставленных ссуд, процентный риск остаётся (всегда существует реальная возможность того, что финансирование по выгодной ставке может оказаться недоступным). Если векселя выражены в валюте, мало распространённой на рынке, то премия может включать в себя ещё один компонент, а именно комиссионные, связанные с проведением форфейтером операции валютного свопа. Наконец, ещё одной составляющей премии являются средства, обеспечивающие форфейтеру покрытие его управленческих расходов на организацию сделки (обычно, 0.5% от ставки дисконта). Размер премии будет несколько выше, если форфейтер и экспортёр договорятся о покупке векселей через определённый промежуток времени (например, через 1 месяц или более). Кроме вышеперечисленных издержек, включаемых в премию, существуют и другие затраты. Это могут быть, например, комиссия (премия) за опцион, предоставленный форфейтеру экспортёром, и так называемая комиссия за обязательство (за неполученную часть кредита). Обычно размер этой последней комиссии определяется ежемесячно или ежегодно в виде процента от номинальной стоимости векселей и взимается до момента их дисконтирования. Размер комиссии может колебаться от 0.25 до 1.5% в год. Как правило, оплата совершается в начале каждого месяца. Многие форфейтеры ежемесячно публикуют котировки своих ставок в различных специальных изданиях.

FORFEITING = ФОФЭТИНЬ (или ОТЧУЖДЕНИЕ, или ФОРФЭЙТИНГ) – Forfeiting is a form of export finance developed in Vienna, Austria and Zurich, Switzerland to finance trade with Eastern European countries. Forfeiting is derived from the French ‘Forfait’, meaning ‘to surrender something’. Although it has been used for over 30 years in certain parts of Europe, it has only recently been introduced on a wide scale, primarily because of the pressures caused by the world debt crisis. Today, the main market for the ‘Forfeit’ is located in London, United Kingdom. When there is a need for long-term financing, the forfeiting bank purchases the exporters’ receivables (in the form of bills of exchange and promissory notes), and discounts them (with an appropriate fixed discount rate), assuming that the exporter has fulfilled his obligations. The discounted amount of money is received by the exporter and the buyer receives credit for the agreed period of time. Also known as Forfait, and Forfaiting. / Известно также как Форфэ (Forfait), и Фофэтинь или Форфэйтинг (Forfaiting). В Гражданском Праве под Отчуждением понимается передача имущества в собственность другого лица. Оно является одним из способов осуществления собственником правомочия распоряжения своим имуществом. Различаются возмездное отчуждение (купля-продажа) и безвозмездное отчуждение (дарение). Форфейтинг, от Французского слова a forfai, означающее Общей Суммой или Целиком, интересен преимущественно машиностроительным предприятиям, вывозяжим (или экспортирующим) свою продукцию и предоставляющим покупателям торговые кредиты (отсрочку платежа). При форфейтинге компания-экспортёр продаёт долговые обязательства покупателя

форфейтеру (банку или форфейтинговой компании). Компания-экспортёр получает деньги за свою продукцию сразу и может их направить на развитие бизнеса. Импортёр рассчитывается самостоятельно с форфейтером. Обязательство покупателя перед продавцом оформляется в виде долгового инструмента – векселя или аккредитива. В сделке участвуют экспортёр, импортёр, форфейтер и два банка – банк продавца и банк покупателя. Банк покупателя открывает аккредитив на импортёра, банк продавца авизует это обязательство (уведомляет поставщика). После отгрузки товара экспортёр сообщает банку импортёра, что уступает право требования по аккредитиву, а форфейтер выплачивает деньги экспортёру. Многие иностранные покупатели готовы платить за товар дороже при условии предоставления отсрочки. Поэтому форфейтинг способен повысить конкурентоспособность национальных предприятий на международном рынке. В России пока ни один Российский банк форфейтингом не занимается, поэтому экспортёры могут рассчитывать лишь на услуги зарубежных форфейтеров. Форфейтинг интересен прежде всего экспортёрам товаров и услуг промышленного (капитального) назначения:- техники, машин, транспортных средств, оборудования, услуг по строительству инженерных объектов за рубежом. Форфейтинговые бумаги:- основным видом форфейтинговых ценных бумаг являются векселя – переводные и простые. Операции с ними обычно осуществляются быстро и просто, без неожиданных осложнений. Кроме векселей объектом форфейтинга могут быть обязательства в форме аккредитива. Аккредитив, как известно, – это расчётный или денежный документ, представляющий собой поручение одного банка (кредитного учреждения) другому произвести за счёт специально забронированных средств оплату товарно-транспортных документов за отгруженный товар или выплатить предъявителю аккредитива определённую сумму денег. Документарный аккредитив может быть отзывным и безотзывным. Безотзывный аккредитив является твёрдым обязательством банка-эмитента произвести платежи по предоставлении ему коммерческих документов, предусмотренных аккредитивом, и соблюдении всех его условий. В России аккредитивы применяются в расчётах между иногородними поставщиками и покупателями, а также в международных расчётах. В мировой торговле документарные аккредитивы используются в расчётах главным образом по внешнеторговым операциям. В качестве объекта форфетирования аккредитивы применяются редко. Это объясняется сложностью операции, заключающейся прежде всего в том, что в случае с аккредитивом необходимо предварительно и подробно согласовать условия сделки, что приводит к увеличению сроков всей процедуры. Между тем, форфейтинговый рынок предполагает высокую скорость заключения и совершения сделки, а также простоту документооборота. С точки зрения форфейтера принципиальное неудобство операций с аккредитивом заключается в следующем:- дело в том, что этот участник операции предполагает, что возмещение будет осуществляться периодически и приблизительно равными долями. Это удобно и ему, и остальным участникам – должнику и гаранту. Однако если частичные погашения по векселям могут быть оформлены отдельными документами, каждый из которых легко обращается при желании форфейтера продать их, то по аккредитивам все объединяется в единый документ в пользу бенефициара, и этот документ зачастую не может быть продан без специального разрешения должника, что значительно усложняет всю операцию. Форфейтинг и факторинг:- суть факторинга в связи с вывозом (или экспортом) сводится к тому, что финансовый институт (фактор) соглашается освободить экспортёра от финансового бремени вывозной (или экспортной) сделки, в особенности от взимания выручки с зарубежных покупателей, с тем, чтобы он мог сосредоточиться на своей основной деятельности. По сравнению с факторингом форфейтинг обладает определёнными преимуществами. Первый обычно используется для среднесрочного финансирования (90–180 дней), к тому же предоставляется в относительно небольшом количестве валют, и при этом всегда остаётся определённый риск для экспортёра (финансовые институты обычно принимают только до 80% долга и требуют сохранения права регресса на экспортёра в случае неплатёжеспособности импортёра). Недостатком факторинга является и то, что процент по нему обычно выше, чем при форфейтинговой форме финансирования. Наконец, в отличие от факторинговых операций при форфейтинге банк приобретает векселя на всю сумму и на полный срок, беря на себя все коммерческие риски и без права регресса, что также более выгодно для экспортёра. Форфейтинг, как и факторинг, является операцией по продаже дебиторской задолженности. Однако существуют и заметные различия между этими операциями. Суть операции форфейтинга заключается в следующем:- (i) Продавец, предоставляя отсрочку по платежам, может потребовать от покупателя выписать долговую расписку (вексель). По векселю продавец получает бесспорное право получения платежа по векселю при наступлении срока исполнения обязательства. Вексель с отсроченным платежом, называется векселем с оборотом. Для уменьшения риска продавец может требовать гарантий третьего лица исполнения обязательств по векселю. Гарантия третьего лица на векселе называется авалем, а вексель – авалированным. (ii) Вексель – вид ценной бумаги. По своим свойствам вексель можно квалифицировать, как частный случай бескупонной облигации. Вексель можно в любой момент продать третьему лицу (форфейтеру) надписав его. Передаточная надпись на векселе называется индоссаментом. Продавая вексель, его владелец переуступает форфейтеру право требования долга. Таким образом, продав вексель, поставщик может получить деньги до наступления срока платежа. При продаже векселя его владелец не платит комиссии. Интерес форфейтера заключается в скидке, предоставляемой владельцем векселя, от номинала. Эта скидка называется дисконт, её размер оговаривается сторонами при заключении сделки и зависит от текущих процентных ставок и рисков. Сравнительная характеристика факторинга и форфейтинга:- (1) объект операции:- при факторинге – преимущественно счёт-фактура; при форфейтинге – преимущественно вексель (простой или переводный); (2) кредитование:- при факторинге – краткосрочное (до 180 дней); при форфейтинге – среднесрочное (от 180 дней до 10 лет); (3) сумма кредита:- при факторинге – ограничена возможностями фактора; при форфейтинге – может быть достаточно высокой вследствие возможности синдицирования; (4) действия:- при факторинге – фактор авансирует оборотный капитал кредитора 70–90% суммы долга, остальные 10–30% поступают на счёт кредитора только после погашения долга покупателем продукции за вычетом комиссии и процентов; при форфейтинге – форфейтер выплачивает сумму долга полностью за вычетом дисконта; (5) риски:- при факторинге – фактор или оставляет за собой право регресса к кредитору или отказывается от этого права, но и в этом случае при вывозе (или экспорте) товаров политические и валютные риски несёт экспортёр; при форфейтинге – форфейтер несёт все риски неоплаты долга включая политические и валютные риски при экспорте товаров; (6) дополнительное обслуживание:- при факторинге – операция может быть дополнена элементами бухгалтерского, информационного, рекламного, сбытового, юридического, страхового и другого обслуживания кредитора (клиента); при форфейтинге – не предполагает какого-либо дополнительного обслуживания; (7) перепродажа актива:- при факторинге – возможность перепродажи факторингового актива фактором не предусмотрена; при форфейтинге – предусматривается возможность перепродажи форфейтером форфейтингового актива на вторичном рынке; (8) поручительство или гарантия:- при факторинге – не требуется поручительства от третьего лица; при форфейтинге – требуется гарантия третьего лица или аваль; и (9) прочее:- при факторинге – предполагает кредитование под уже существующее денежное требование, или под требование, которое возникнет в будущем, но чётко обозначенное в договоре финансирования под уступку денежного требования; при форфейтинге – возможно кредитование под уступку финансового векселя, выпущенного с целью аккумуляции средств, для реализации иных целей не ограниченных торговыми. Оба метода кредитования по-своему уникальны и востребованы экономиками разных стран. Целесообразность использования того или другого метода определяется целью, которую преследует кредитор (продавец, экспортёр):- (i) Факторинговое обслуживание наиболее эффективно для малых и средних предприятий, которые традиционно испытывают финансовые затруднения из-за несвоевременного погашения долгов

дебиторами и ограниченности доступных для них источников кредитования. Этот метод ещё более интересен для этих предприятий, так как дополняется элементами бухгалтерского, информационного, рекламного, сбытового, юридического, страхового и другого обслуживания кредитора (клиента), что даёт возможность клиентам сосредоточиться на производстве и экономить на издержках по оплате труда. (ii) Форфейтинг наиболее эффективен для крупных предприятий, которые преследуют цель аккумуляции денежных средств для реализации долгосрочных и дорогостоящих проектов.

FORFEITURE OF SHARES = ОТЧУЖДЕНИЕ АКЦИЙ (или ЛИШЕНИЕ ПРАВА НА АКЦИИ) – Forfeiture Of Shares:- share rights may be forfeited if a shareholder fails to pay the subscription price of new shares or fails to pay a call duly made on him. The shares concerned may be cancelled or newly issued.

FORGERY = ПОДДЕЛКА (или ПОДЛОГ) – Forgery:- the making or alteration of any document to the prejudice of another person. Checks on which the signature is not valid or on which the amount has been altered are invalid. Other instruments frequently forged are bank notes, coins, securities and stamps. False documents, especially counterfeit banknotes or securities, are referred to as Forgeries. See also Contrafaction, and Falsification. / Подделка это преступление, заключающееся в изготовлении фальшивых бланков, денег, ценных бумаг, знаков почтовой оплаты, печатей, проездных билетов, штампов, документов, представляющих какие-либо права или освобождающих от обязанностей. Подделкой является также изменение формы и содержания подлинных документов. Подлог документов является преступлением, заключающемся в подделке подлинных и составлении фальшивых документов, например, должностной подлог, подлог с целью уклониться от призыва на военную службу, подлог избирательных документов и другие. Под Суррогатом, от Латинского слова Surrogatus, означающее Поставленный Взамен, понимается:- (i) продукт или предмет, заменяющий какой-либо другой продукт или предмет, с которым он имеет некоторые общие свойства, но не обладает его качествами, например, суррогат зёрен кофе – жёлуди, ячмень; или (ii) подделка; подделанный, фальсифицированный продукт.

FOR–HIRE CARRIER = НАНИМАЕМЫЙ ПЕРЕВОЗЧИК – For-Hire Carrier:- persons or firms engaged in the transportation of goods or passengers for compensation. Classified into two general categories, specialized and general freight motor carriers. A carrier that provides transportation service to the public on a fee basis. / Перевозчик, который обеспечивает население услугами по транспортировке за вознаграждение.

FORI = FOREST RESEARCH INSTITUTE

FORK ENTRY = ПРОЁМ ДЛЯ ВИЛ – Fork Entry is an opening between decks, beneath the top deck or beneath the stringer notch to admit forks.

FORK HOIST = ГРУЗОПОДЪЁМНИК С ВИЛОЧНЫМ ЗАХВАТОМ (или ВИЛОЧНЫЙ ПОДЪЁМНИК, или ШТАБЕЛЛЁР) – Fork Hoist is a heavy forklift machine used for lifting and stacking containers and cargo. See also Hoist. Fork Hoist is a small industrial vehicle with a power-operated fork-like pronged platform that can be raised and lowered for insertion under a load, often on pallets, to be lifted and moved. / Грузоподъёмная Машина, устройство для подъёма груза и людей в вертикальной или близкой к ней наклонной плоскости (лифты – грузовые и пассажирские, подъёмники – шахтные, скиповые, строительные и прочие). Термин Грузоподъёмная Машина объединяет различные по конструкции и кинематическим схемам машины. К грузоподъёмным машинам относятся и такие простейшие устройства, как домкраты, тали, вороты, полиспасты, и такие сложные, как самоходный стреловой полноповоротный кран, или автопогрузчик. Грузоподъёмная машина в зависимости от назначения может быть стационарной, самоходной или передвижной, прерывного или непрерывного действия, с электроприводом, с приводом от двигателя внутреннего сгорания или с каким-либо другим. Грузоподъёмность машин колеблется от нескольких килограммов (кг) до нескольких сотен тонн (т). Многие грузоподъёмные машины обеспечивают не только подъём, опускание груза и удержание его на заданной высоте, но и перемещение в горизонтальной плоскости (различного рода краны). При одновременном включении механизмов подъёма и горизонтального перемещения груз можно передвигать в пространстве по любой траектории. Основные части грузоподъёмной машины:- остов, механизм подъёма, грузонесущий (грузозахватный) орган. Самоходные грузоподъёмные машины снабжаются также механизмом передвижения, а поворотные – механизмом поворота. Грузозахватные приспособления грузоподъёмной машины, как и конструкция самой машины, зависят от размеров, веса и свойств перемещаемого груза, а также от технологии производственного процесса. Для подъёма и опускания людей используют клети и кабины, для штучных грузов – различные крючья и специальные захваты, а для сыпучих грузов – бадьи, ковши, грейдеры и прочее.

FORKLIFT = ГРУЗОПОДЪЁМНИК С ВИЛОЧНЫМ ЗАХВАТОМ (или ВИЛОЧНЫЙ ПОГРУЗЧИК) – Forklift:- a warehouse vehicle, also called a Lift Truck, which is used for lifting and transporting pallets of product. A forklift may have a special attachment on the front for specialized handling of product.

FORKLIFT TRUCK = ГРУЗОПОДЪЁМНИК С ВИЛОЧНЫМ ЗАХВАТОМ (или ВИЛОЧНЫЙ АВТОПОГРУЗЧИК, или ТЕЛЕЖКА С ВИЛОЧНЫМ ПОГРУЗЧИКОМ) – Forklift Truck:- used primarily for lifting, stacking, and moving heavy objects; it consists typically of projecting blades that can be slid under the load and then raised or lowered. A machine used to pick up and move goods loaded on pallets or skids. Forklift Truck is a mechanical truck with forks at the front designed for lifting, carrying and stowing cargo. / Самоходная подъёмно-транспортная машина с вилочным захватом для погрузки, разгрузки, укладки и перемещения грузов. Погрузчик – машина периодического или непрерывного действия для погрузки, выгрузки, транспортирования грузов на небольшие расстояния. Применяется на складах, в цехах, портах и так далее. Погрузчик может оснащаться сменными рабочими органами (навесным оборудованием):- вилочным захватом, ковшом, бадьёй, специальными захватами для пакетов и так далее. По роду привода различают автопогрузчики и электропогрузчики. В различных отраслях экономики используют специальные погрузчики:- в горной промышленности на базе врубовой машины – погрузчики для транспортирования горных пород, в сельском хозяйстве – картофелепогрузчики, свеклопогрузчики, машины для погрузки сена, минеральных удобрений, торфа и так далее. Электропогрузчик, колёсный погрузчик периодического действия с приводом от аккумуляторной батареи. Электропогрузчик общего назначения применяется для работы в помещениях, железнодорожных вагонах и на открытых площадках с твёрдым и ровным покрытием. Основное рабочее оборудование электропогрузчика – грузоподъёмник с вилочным захватом. Грузоподъёмник состоит из вертикальной рамы, внутри которой на цепи перемещается с помощью гидроцилиндра каретка с установленными на ней вилами. Рама укреплена на шасси электропогрузчика шарнирно и может наклоняться с помощью другого гидроцилиндра вперёд на 3–5° при подхвате и выдаче грузов и назад на 8–15° при их транспортировании. Помимо вилочного захвата применяются штыревой захват для работы с грузами тороидальной формы (автопокрышки, трос в бухтах, проволока в мотках), различные зажимы с грузозахватными челюстями плоской или полукруглой формы для работы с бочками, рулонами, ящиками и прочим. Для обслуживания высокорасположенных объектов и для ремонтных работ электропогрузчики оснащаются рабочей подъёмной платформой, а для удобства штабелирования грузов – сталкивателем. Шасси электропогрузчика выполняют по трёх- и четырёхопорной схемам на пневматических или монолитных массивных шинах. Всё электрооборудование, включая электродвигатели механизма передвижения и привода

насосов, работает на постоянном токе напряжением 24–50 Вольт (В). Основные параметры вилочных электропогрузчиков:- грузоподъёмность 0.5–5 тонн (т), высота подъёма вил до 4.5 м, наибольшая скорость подъёма груза 12 метров в минуту (м/мин), наибольшая транспортная скорость с грузом 12 километров в час (км/ч). Грузоподъёмность специальных электропогрузчиков достигает 40 т и более. Среди специальных электропогрузчиков широкое применение получили электроштабелёр (смотрите Штабелёр) и электропогрузчик с боковым выдвижным грузоподъёмником, транспортирующий длинномерные грузы.

FORK POCKETS = ПРОЁМЫ ДЛЯ ВИЛ – Fork Pockets are the openings or recesses in a side of a container for the entry of the forks of a fork lift truck.

FORKS = ВИЛЫ – Forks:- lift-truck attachment used to move stock on pallets.

FORM = ФОРМА – (1) Forms are provided as either official or unofficial (optional) formats to facilitate providing all information required to initiate desired procedures or respond to official procedural correspondence. Control numbers are assigned to identify each form and customers are usually instructed to locate forms by short form numbers rather than lengthy form titles. / Под Формой, от Латинского слова Forma, понимается:- (1) внешнее очертание, наружный вид, контуры предмета; (2) внешнее выражение какого-либо содержания; (3) установленный образец чего-либо, например, написать отчёт по форме; (4) приспособление для придания чему-либо определённых очертаний, например, литейная форма; (5) одинаковая по цвету и покрою одежда, например, форма военнослужащих; и (6) совокупность приёмов и изобразительных средств художественного произведения, например, стихотворная форма.

(2) Form or Forma is the smallest degree of consistent differentiation between plants which may be formally named, e.g., spine length or flower color.

(3) Form:- in art is an essential for representation of ideas or expression of emotions, forms can be achieved or created only when the perception or understanding is adhered with certain shapes, so form is a cognitive element. ‘Form’ is also sometimes referred to as a Mannequin.

FORMAE SPECIALES = ОСОБЫЕ ФОРМЫ – Formae Speciales (F. Sp.) is a sub-grouping (special Form) of a Fungal Species based on specificity for a particular host Plant. See also FOV. / Виды (Species).

FORMAL = ФОРМАЛЬНЫЙ (или ОФИЦИАЛЬНЫЙ, или ЦЕРЕМОННЫЙ, или XX) – Formal (Formalwear):- Black Tie, Dinner Suit or Tuxedo.

FORMALDEHYDE = ФОРМАЛЬДЕГИД (или МУРАВЬИНЫЙ АЛЬДЕГИД) – Formaldehyde is an important chemical used widely by industry to manufacture building materials and numerous household products. It is also a by-product of combustion and certain other natural processes. Thus, it may be present in substantial concentrations both indoors and outdoors. Sources of formaldehyde in the home include building materials, smoking, household products, and the use of un-vented, fuel-burning appliances, like gas stoves or kerosene space heaters. Formaldehyde, by itself or in combination with other chemicals, serves a number of purposes in manufactured products. For example, it is used to add permanent-press qualities to clothing and draperies, as a component of glues and adhesives, and as a preservative in some paints and coating products. In homes, the most significant sources of formaldehyde are likely to be pressed wood products made using adhesives that contain urea-formaldehyde (UF) resins. Pressed wood products made for indoor use include: particleboard (used as sub-flooring and shelving and in cabinetry and furniture); hardwood plywood paneling (used for decorative wall covering and used in cabinets and furniture); and medium density fiberboard (used for drawer fronts, cabinets, and furniture tops). Medium density fiberboard contains a higher resin-to-wood ratio than any other UF pressed wood product and is generally recognized as being the highest formaldehyde-emitting pressed wood product. Other pressed wood products, such as softwood plywood and flake or oriented strand board, are produced for exterior construction use and contain the dark, or red/black-colored phenol-formaldehyde (PF) resin. Although formaldehyde is present in both types of resins, pressed woods that contain PF resin generally emit formaldehyde at considerably lower rates than those containing UF resin. Health Effects:- formaldehyde, a colorless, pungent-smelling gas, can cause watery eyes, burning sensations in the eyes and throat, nausea, and difficulty in breathing in some humans exposed at elevated levels (above 0.1 parts per million). High concentrations may trigger attacks in people with asthma. There is evidence that some people can develop a sensitivity to formaldehyde. It has also been shown to cause cancer in animals and may cause cancer in humans. Health effects include eye, nose, and throat irritation; wheezing and coughing; fatigue; skin rash; severe allergic reactions. May cause cancer. May also cause other effects listed under ‘organic gases’. Formaldehyde is a one-carbon aldehyde, (CH_2O), it is a colorless, pungent gas at room temperature. This compound is used primarily for disinfectant and preservative and in synthesizing other compounds and resins. / Формальдегид, или метаналь – газообразный канцероген с острым запахом, ранее называвшийся Муравьиным Альдегидом. Большая часть всего товарного формальдегида, производимого в мире, представляет собой раствор – формалин. Человеком формальдегид используется в качестве реагента в химической промышленности, однако также он может образовываться и в природных условиях. Наибольшая концентрация формальдегида в воздухе отмечена в тёплые месяцы из-за фотохимических реакций, происходящих в атмосфере. Так как, помимо всего прочего, формальдегид является продуктом горения углеводородного топлива, то в городах с большим количеством автотранспорта его доля в атмосфере серьёзно возрастает. Ещё одним источником этого канцерогена являются различные предприятия химической промышленности и некоторые другие заводы и фабрики, в частности – кожевенные и деревообрабатывающие. Так чем же опасен формальдегид? Этот бесцветный газ достаточно токсичен, чтобы нанести серьёзный вред почти всем системам человеческого организма, включая дыхательную, зрительную и нервную. Опасность формальдегида для человека:- формальдегид – сильный раздражитель и аллерген с мутагенными свойствами. Под воздействием этого токсина у человека может развиться рак дыхательных путей, а по некоторым данным – даже лейкемия. При длительном воздействии формальдегида на организм человека у подвергшегося отравлению возникает подавленное психическое состояние, мигрень, становится тяжело дышать. В больших концентрациях это вещество способно вызвать смерть от остановки дыхания. В случае отравления через вдыхание газа проявляются симптомы конъюнктивита и воспаления лёгких, вплоть до их отёка. Если формальдегид попадает в организм человека через рот, то может вызвать серьёзные химические ожоги всего пищеварительного тракта, отёки и также остановку дыхания. Формалин, хотя и не является чистым формальдегидом, тоже несёт в себе существенную угрозу здоровью человека. Так, у людей, вынужденных работать с этим веществом на протяжении длительного времени, начинается поражение нервной системы, различные физические расстройства, астма. При длительном контакте чувствительность к формалину только возрастает, что крайне пагубно сказывается на здоровье человека. Формальдегид в повседневной жизни:- итак, формальдегид в мебели и других предметах представляет опасность. Однако, несмотря на вред, наносимый здоровью, без формальдегида тяжело представить многие виды современной промышленности, в особенности химической и лесной. Формалин активно используется для изготовления кинофотоплёнки, а также в медицинской консервации. Формальдегид играет важную роль в производстве различных сортов пластика, однако большая его часть применяется при изготовлении древесностружечных материалов. Так, формальдегид

содержится в мебели, которая окружает человека в повседневной жизни. Это обусловлено тем, что токсичная смола на основе формальдегида, составляющая до 18% массы ДСП, существенно удешевляет производство. Формальдегид в мебели имеет свойство свободно выделяться в воздух, тем самым увеличивая концентрацию токсина в нём до опасного значения. Основными источниками формальдегида в домах в настоящий момент являются отделочные панели из МДФ и лакокрасочные материалы, используемые при обработке мебели. Процесс выделения формальдегида, содержащегося в мебели, имеет различные масштабы и варьируется в зависимости от температуры воздуха и влажности, однако никогда не останавливается полностью. Формальдегид в мебели из ДСП и подобных материалов, выделяясь даже в малом количестве, способен сильно загрязнить воздух. Степень загрязнения зависит не только от мощности и числа объектов, выделяющих формальдегид, но и от общей температурной среды и влажности. Считается, что увеличение температуры воздуха на каждые 5 °C, начиная с 18 °C, провоцирует рост концентрации токсина в полтора раза. Гораздо меньшее влияние на этот фактор имеет относительная влажность. Установлено, что формальдегид в значительно меньшей степени выделяется в воздух в зимний период на Северных широтах, что связано с большей разницей температур внутри и снаружи зданий, что, в свою очередь, увеличивает уровень вентиляции помещений. Можно ли снизить воздействие формальдегида? Из-за высокой токсичности формальдегида нивелировать его воздействие на организм тяжело. Это обусловлено тем, что, попав в организм, газ изменяет свою структуру и превращается либо в муравьиную кислоту, либо в метанол. Поэтому лучше всего стараться избегать мест с высоким содержанием формальдегида:- автомобильных пробок, промышленных зон, слабопроветриваемых помещений. Учитывая то, что формальдегид в мебели, изготовленной из ДСП или ДВП, будет присутствовать всегда, чтобы снизить концентрацию токсичных веществ дома, можно использовать безопасные материалы при проектировании жилища. Тогда проблема формальдегида в мебели исчезнет сама. Также некоторые комнатные растения обладают специфическими свойствами и поглощают накопленный в воздухе формальдегид. К таким растениям можно отнести кустовую Хризантему, Плющ, Фикус и некоторые другие. Так, хотя подобные меры и не в состоянии полностью огородить человека от негативного воздействия формальдегида, они хотя бы дадут организму время оправиться от влияния токсинов, позволив ему пусть даже небольшую часть дня провести в безопасной среде.

FORM A LOAN = ССУДА ПО ФОРМЕ ЭЙ. – Form A Loan means a nonrecourse loan entered into between a producer and Commodity Credit Corporation of the US Department of Agriculture (CCC). A term Producer means any individual, group of individuals, partnership, corporation, estate, trust association, cooperative, or other business enterprise or other legal entity who is, or whose members are, a citizen of, or legal resident alien in the United States, and who directly or indirectly, shares in the risk of producing milk, makes contributions including land, labor, management, equipment, or capital to the dairy operation at least commensurate to the producers' share of the operation, to the dairy operation of the individual or entity, as determined by the Deputy Administrator.

FORMAT = ФОРМАТ – Format:- the rules governing the layout of a SWIFT message, e.g., for a SWIFT message type or field within a message type. / Под Форматом, от Латинского слова Formo, означающее Придаю Форму, понимаются правила, предписывающие планировку или расположение сообщения Сообщества по Всемирной Межбанковской Финансовой Дальней Связи (СВМФДС; The Society for Worldwide Interbank Financial Telecommunication (SWIFT)), например, для типа сообщения СВМФДС или поля в типе сообщения. коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо).

FORMAT CHECKING = СВЕРКА ФОРМАТА – Format Checking:- that part of the SWIFT processing which checks that a message format conforms to the message type rules. The checks include, among others:- presence of mandatory fields, absence of forbidden fields, field length restrictions and character restrictions. / Сообщество по Всемирной Межбанковской Финансовой Дальней Связи (СВМФДС; The Society for Worldwide Interbank Financial Telecommunication (SWIFT)). коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо).

FORMED FABRIC = ФОРМОВАННАЯ (или ОБРАЗОВАННАЯ) ТКАНЬ – Formed Fabric:- xxxxx. See also Nonwoven Fabric. Wholly Formed Fabrics (for Customs purposes) means that all of the production processes, starting with polymers, fibers, filaments, textile strips, yarns, twine, cordage, rope, or strips of fabric and ending with a fabric by a weaving, knitting, needling, tufting, felting, entangling or other process, took place in the United States or in one or more beneficiary countries.

FORM G LOAN = ССУДА ПО ФОРМЕ ДЬЖИ. – Form G Loan means a Commodity Credit Corporation of the US Department of Agriculture (CCC) nonrecourse loan entered into between a Cooperative Marketing aAssociation (CMA) and CCC.

FORMIC ACID = МУРАВЬИНАЯ КИСЛОТА – Formic Acid, HCOOH, is an organic weak acid. Formic acid is commercially often used with acid dyes for wool. It produces a pH lower than that of acetic acid, but higher than that of sulfuric acid. It is a pungent, flammable liquid. Formic acid is not easy for art dyers to procure. / Муравьиная Кислота .

FORMOSUL = ФОРМОСУЛ – Formosul is a sodium formaldehyde sulfoxylate. It is the preferred discharge for silk and wool which requires steaming. Formosul is a trade name for sodium formaldehyde sulfoxylate. / формальдегид сульфоксилат натрия (sodium formaldehyde sulfoxylate).

FORMULA INVESTING = ФОРМУЛЬНОЕ КАПИТАЛОВЛОЖЕНИЕ (или ИНВЕСТИРОВАНИЕ ПО ФОРМУЛЕ) – Formula Investing is an investment technique. One formula calls for the shifting of funds from common shares to preferred shares or bonds as a selected market indicator rises above a certain predetermined point – and the return of funds to common share investments as the market average declines. See also Dollar Cost Averaging. / Инвестирование по Формуле – метод инвестирования, основанный на предварительно установленной временной модели или модели распределения активов, которая устраняет необходимость эмоционального принятия решений. Один из видов таких инвестиций, называемый усреднением долларовой стоимости, основан на вложении одной и той же суммы в акции или взаимный фонд через определённые промежутки времени таким образом, что больше акций приобретается в случае понижения цены и меньше – в случае повышения цены. Ещё один метод инвестиций по формуле требует перемещения средств из акций в облигации и, наоборот, по мере того, как цены на фондовом рынке достигают определённых уровней. Если котировки акций поднимаются до определённого уровня, то некоторое количество акций из портфеля вложений продаётся, и средства помещаются в облигации. Если же котировки акций падают до определённой низкой цены, то деньги переводятся из облигаций в акции.

FORMULATION = СОСТАВ (или СОСТАВЛЕНИЕ) – (1) Formulation is a mixture of a pesticide with diluents, solvents, wetting agents, or other inert ingredients which can be used in pest control. Formulation:- (i) herbicide preparation supplied by a manufacturer for practical use; and (ii) the process, carried out by manufacturers.

(2) Formulation describes the combination of one or more active substances with excipients like emulsifiers, stabilizers and other non-active components in order to improve the applicability and effectiveness of various products, such as cosmetics, pharmaceuticals, agricultural chemicals, paints and coatings.

FORM W–2, WAGE AND TAX STATEMENT = ФОРМА ДАБЛ.Ю.–2, ВЫПИСКА О ЗАРПЛАТЕ И НАЛОГАХ – In the United States, Form W-2, Wage and Tax Statement:- every employer engaged in a trade or business who pays remuneration, including noncash payments of USD600 or more for the year (all amounts if any income, social security, or Medicare tax was withheld) for services performed by an employee must file a Form W-2 for each employee (even if the employee is related to the employer) from whom:- (i) income, social security, or Medicare tax was withheld; and (ii) income tax would have been withheld if the employee had claimed no more than one withholding allowance or had not claimed exemption from withholding on Form W-4, Employee's Withholding Allowance Certificate. / Форма W-2:- налоговая форма, подготовленная работодателем для работника в дополнение к Форме 1040 (1040 Form). В ней суммируются заработная плата, полученная за год, отсроченные федеральные и штатовские налоги и приводится специальная налоговая информация для системы социального страхования (social security).

FORM W–4, EMPLOYEE'S WITHHOLDING ALLOWANCE CERTIFICATE = ФОРМА ДАБЛ.Ю.–4, СВИДЕТЕЛЬСТВО ОБ УДЕРЖАНИИ ОТЧИСЛЕНИЙ У РАБОТНИКА – In the United States, Form W-4, Employee's Withholding Allowance Certificate:- complete Form W-4 so that your employer can withhold the correct federal income tax from your pay. Consider completing a new Form W-4 each year and when your personal or financial situation changes. How To Fill Out Form W-4:- use Form W-4 to figure the right amount of federal income tax to have withheld from your paycheck. You may want to review your withholding every year, especially after finishing your tax return. You can have more, or less, income tax withheld from your paycheck. What's a Withholding Allowance? It represents your total tax deductions divided by the personal exemption rate. The withholding allowance is related to, but not the same as, the number of dependents you can claim on your tax return. Difficulty:- Easy. Time Required:- 10 minutes. Here's How:- (i) Download Form W-4 from the IRS (short for the US Internal Revenue Service) website. This form is in a PDF format, and you can type your information on your computer before printing it out. (ii) Provide your name, address, and Social Security Number. (iii) Check the box for married or single, depending on your marital status. (iv) Calculate how many withholding allowances to claim. For most people, this is the same as the number of personal exemptions they claim on their tax return (see Line 6d on your 1040A or 1040). (v) If you have more than one job, if your spouse works, or if you itemize your deductions, use the worksheet on Form W-4 page 2. Use this worksheet to calculate the number of allowances to claim instead of relying on your personal exemptions. (vi) You can also use the IRS Withholding Calculator to calculate your withholding allowances more exactly. (vii) If you have more than one job, make sure you claim zero allowances at your second job. Claiming 'exempt' is not the same as claiming zero. By claiming zero, the highest amount of tax will be withheld. (viii) If you claim more than 9 allowances, your employer may be required to send your W-4 to the IRS for review. Don't be alarmed. People with substantial itemized deductions may need to claim over nine allowances. (ix) You are exempt from income tax withholding only if your income for the year will be less than USD800. If you are exempt, skip lines 5 and 6, and write 'EXEMPT' on line 7. (x) Print, sign, and date the form. (xi) Give the W-4 to your employer. They will fill out lines 8, 9, and 10. / Форма W-4 (Form W-4) – налоговая форма, заполняемая работником для работодателя, в которой перечисляются льготы и указывается номер его карточки социального страхования. Предназначена для того, чтобы работодатель мог определить сумму налогов, удерживаемых из заработной платы работника.

FORTY–FOOT EQUIVALENT UNIT = ТРАНСПОРТНОЕ СРЕДСТВО, ЭКВИВАЛЕНТНОЕ СОРОКАФУТОВОМУ КОНТЕЙНЕРУ (или ЕДИНИЦА, ЭКВИВАЛЕНТНАЯ СОРОКАФУТОВИКУ) – Forty-Foot Equivalent Unit is the unit of measurement equivalent to one forty foot shipping container. Forty-foot Equivalent Unit (FEU) is the international standard measure of containers. Used when differentiating between container lengths and numbers. The abbreviation FEU is occasionally used for Forty foot Equivalent Unit. The Forty foot Equivalent Unit refers to a 40ft container. A 40ft container comprises 2 TEUs (Twenty foot Equivalent Unit, 20ft container). Therefore:- 1 FEU = 2 TEU. / Сорокафутовый Эквивалент (СФЭ).

FORWARD = ВПЕРЁД (или ПЕРЕДНИЙ) – Forward:- at or in the direction of the bow. Also the fore part of the ship. Toward the bow of a ship. / По направлению к носу судна.

FORWARD = ФОРВАРД – (1) Forward is a term designating the standardized contracts covering the sale of commodities for future delivery on a non-exchange market. See also Forward Contract. / Термин, разработанный для стандартизированных контрактов, обеспечивающих продажу различных родов сырья с поставкой в будущем на внебиржевом реальном рынке сырья.

(2) Forward is a deal that will commence at an agreed date in the future, i.e. a 3 month GBP/USD will commence 3 months from the deal date. / , то есть 3-месячная GBP/USD .

FORWARDATION = ПО ВОЗРАСТАНИЮ – Forwardation is a pricing situation in which the futures price is higher than the spot price. Forwardation mainly occurs when supplies are sufficient or in excess. It reflects the carrying costs involved, e.g., handling, financing, insuring. Also known as Contango. / По Возрастанию:- ситуация в ценообразовании, когда цены будущих периодов поставки выше цены для безотлагательной поставки. Такое происходит главным образом вследствие того, что в данный момент предложение достаточное или в избытке, то есть спрос удовлетворён либо вовсе, либо с лихвой. Она также отражает наличие сопровождающих расходов, например, на перевалку, финансирование и страхование. Известна также как Возрастающая Последовательность или Контэнго (Contango).

FORWARD CASH CONTRACT = ФОРВАРДНЫЙ НАЛИЧНЫЙ КОНТРАКТ – Forward Cash Contract is an agreement between a buyer and seller covering a quantity and quality of bushels to be delivered at a specified location and time in exchange for a specific price. Example:- 5 000 bushel of #2 Yellow Corn delivered to Local Co-op the last half of February. The cash price at delivery will be – USD0.30 under the March Corn futures contract that closed at USD4.00/bu. A Forward Cash Contract is a binding transaction between the seller and buyer for a later delivery date. Conditions are set including the quantity of bushels, the quality, delivery time and cash price. Forward Cash Contracts often used and (i) sets the cash price and delivery terms; (ii) are available both before and after harvest; (iii) don't require margin deposits or premiums; and (iv) you're working with your grain merchandiser. Advantages:- (i) no margin deposit required; (ii) lock in price and delivery terms; and (iii) cash price can't go lower. Disadvantages:- (i) penalties if you cannot deliver the contracted bushels; (ii) cash price can't go higher; and (iii) might not receive the best basis. Hedge-to-Arrive (HTA) Contracts are similar to Forward Cash Contracts. The binding transaction sets the:- (i) Delivery Date and Location; (ii) Amount of Bushels to Deliver; (iii) Quality of those Bushels; and (iv) Basis is typically not set when the transaction is initiated, however the Futures Price is established. Similar to a Forward Cash Contract, but an HTA typically doesn't have the Basis set when the contract is initiated. The Seller usually sets the Basis prior to Delivery of the grain. Key Points:- Forward Cash Contracts:- (i) Forward Cash and Hedge-to-Arrive (HTA) Contracts are between the seller and buyer for a later delivery date of grain; and (ii) The primary difference is that the basis is typically not set on an HTA when the contract is initiated. The Seller usually sets the Basis prior to Delivery of the grain.

FORWARD COLLECTION = ПРЕДСТАВЛЕНИЕ НА ИНКАССО (или ОТПРАВЛЕНИЕ НА ИНКАССО) – The term Forward Collection means the transfer by a bank of a check to a collecting bank for settlement or the paying bank for payment.

FORWARD CONTRACT = ФОРВАРДНЫЙ КОНТРАКТ – A Forward Contract is an agreement in which one party commits to buy a currency, obtain a loan or purchase a commodity in future at a price determined today. Exchange rate forward contract, interest rate

forward contract (also called forward rate agreement) and commodity forward contracts are the three main types of forward contracts. Forward contracts are derivative instruments mainly used by companies to hedge their risks. However, they can also be used to speculate on currencies, commodities, stock exchange, bonds, interest rates, etc. The party that agrees to buy the commodity, obtain a loan or purchase a currency, etc. is said to have a long position while the other party is said to have a short position. A forward contract differs from the future contract in that the future contracts are standardized forward contracts traded on established futures exchanges while the forward contracts are over-the-counter instruments tailor-made to the exact requirements of the counterparties, i.e. the parties which engage in the forward contract. Forwards are similar to the futures contracts types of agreements that lock in a future price in the present, but forwards are traded over-the-counter (OTC) and have customizable terms that are arrived at between the counterparties. A Forward Contract or Forward is a non-standardized contract between two parties that establishes the price of a commodity to be delivered at a specific date in the future. It differs from a spot contract which is an agreement to buy or sell an asset today. It differs from a futures contract in that is not standardized. See also Forward. Forward Contracts are negotiated contracts that are entered into by two parties. As a result, the exact terms can be customized to individual needs. In particular, the two parties must spell out the quantity and quality of the delivered item, as well as the date and location of delivery. The consequences of failing to meet the obligations should also be laid out. Since each party may default, the credit worthiness of the counterparty is an important issue. The fact that the contract is customized to fit the needs of the two parties has its advantages. Unfortunately, it also has its downside. In particular, since the contract is unique, it may be difficult to establish its fair market value. As a result, if one party wants to terminate the contract prior to the delivery date, establishing the appropriate compensation to the counterparty may be difficult. Also, depending on the terms of the contract, permission may be required to trade the forward contract to another party. Forward Contract is a contract in which one party agrees to buy, and the other to sell, a specified product at a specified price on a specified date or dates in the future. Forward Contracts represent agreements for delayed delivery of financial instruments or commodities in which the buyer agrees to purchase and the seller agrees to deliver, at a specified future date, a specified instrument or commodity at a specified price or yield. Forward contracts are generally not traded on organised exchanges and their contractual terms are not standardised. The reporting exercise also includes transactions where only the difference between the contracted forward outright rate and the prevailing spot rate is settled at maturity, such as non-deliverable forwards (i.e. forwards which do not require physical delivery of a non-convertible currency) and other contracts for differences. Sale of a commodity from a future crop for future delivery. The sale could involve all of the crop from a given contract acreage or, more commonly, a given quantity of specified quality. Forward Contracts represent agreements for delayed delivery of financial instruments or commodities in which the buyer agrees to purchase and the seller agrees to deliver, at a specified future date, a specified instrument or commodity at a specified price or yield. Forward contracts are generally not traded on organized exchanges and their contractual terms are not standardized. The reporting exercise should also include transactions where only the difference between the contracted forward outright rate and the prevailing spot rate is settled at maturity, such as non-deliverable forwards (i.e. forwards which do not require physical delivery of a non-convertible currency) and other contracts for differences. A Forward is a customized, privately negotiated agreement between two parties to exchange an asset or cash flows at a specified future date at a price agreed on the trade date. Entering a forward contract typically does not require the payment of a fee. A cash transaction common in many industries, including commodity merchandising, in which a commercial buyer and seller agree upon delivery of a specified quality and quantity of goods at a specified future date. Terms may be more 'personalized' than is the case with standardized futures contracts (i.e. delivery time and amount are as determined between seller and customer). A price may be agreed upon in advance, or there may be agreement that the price will be determined at the time of delivery. Forward Contract is a contract which requires a seller to agree to deliver a specified cash commodity to a buyer sometime in the future. All terms of the contract are privately customized, in contrast to futures contracts whose terms are standardized. Forward contracts are not traded on exchanges. Also know as Cash Contract. Purchase or sale of a specific quantity of a commodity, currency, or security at the current, or spot price, with delivery and settlement to be made at a specific future date. Unlike spot transactions, forward contracts cover a wide variety of negotiable instruments traded in special markets, including commodities, securities and currencies. They are primarily used in stock market and foreign currency transactions. A binding contract specifying the price (or price formula such as basis), quantity and quality of a product to be delivered at some specified date. The quantity may be expressed in units of output or as the production from a specified area. Forward Contract is a supply contract between a buyer and seller, whereby the buyer is obligated to take delivery and the seller is obligated to provide delivery of a specified quality and quantity of a commodity at a predetermined price on a specified future date. Payment in full is due at the time of, or following, delivery. A price may be fixed in the contract; parties may agree to fix the price at any date in the future or upon delivery. This differs from a futures contract where settlement is made daily, resulting in partial payment over the life of the contract. Forward contracts are not usually traded on an organized exchange and most often result in the physical delivery of a given commodity. A Forward Contract is an agreement between two parties to buy or sell an agreed amount of a commodity or financial instrument at an agreed price, for delivery on an agreed future date. In contrast to a futures contract, a forward contract is not transferable or exchange tradable, its terms are not standardized and no margin is exchanged. The buyer of the forward contract is said to be long the contract and the seller is said to be short the contract. Forward Contract:- in India, Forward Contract means a contract for the delivery of goods and which is not a ready delivery contract. Ready Delivery Contract means a contract which provides for the delivery of goods and the payment of a price therefor, either immediately or within such period not exceeding eleven days after the date of the contract and subject to such conditions as the Central Government may, by notification in the official Gazette, specify in respect of any goods, the period under such contract not being capable of extension by the mutual consent of the parties thereto or otherwise. Option In Goods means an agreement, by whatever name called, for the purchase or sale of a right to buy or sell, or a right to buy and sell, goods in future and includes a Teji, a Mandi, a Tejimandi, a Galli, a Put, a Call in goods. Forward contracts in notified goods illegal or void in certain circumstances:- the Central Government may, by notification in the official Gazette, declare this section to apply to such goods or class of goods and in such areas as may be specified in the notification, ... and thereupon, subject to the or with any such member shall be illegal. Prohibition of options in goods:- notwithstanding anything contained in this Act or in any other law for the time being in force, all options in goods entered into after the date on which this section comes into force shall be illegal. Transferable Specific Delivery (TSD) Contract means specific delivery contract which is not a non-transferable specific delivery contract and which is subject to such conditions relating to its transferability as the Central Government may by notification in the official Gazette, specify in this behalf. TSD contracts, in the City of Calcutta, entered into for the import of Jute into India, are exempted. NB:- (1) (i) in raw jute, hessian and sacking trading is permitted in TSD contracts; (ii) East India Jute & Hesian Exchange Ltd., Kolkatta is recognised for trading in Raw Jute only for TSD contracts. (2) In case of pepper, international futures' trading is permitted. In this case, one or both the parties to the forward contract can be a foreign participant. NB:- (a) besides the exemptions from the provisions of the FC(R) Act, 1952, mentioned above, the following general exemptions also have been granted:- ... Exporters:- every forward contract, entered into between an exporter from India and an importer in foreign country, for the export out of India of any goods, is exempted from the operation of so much of provisions of Sections 15 to 18 of the Act, as are applicable. Certain offences to be cognizable:- (i) notwithstanding anything contained in the Code of Criminal Procedure, the following offences shall be deemed to be cognizable within the meaning of that Code, namely:- (a) an offence falling under sub-clause (ii) of clause (a) of Section 20 in so far as it relates to the failure to comply with any requisition made under sub-section (3) of Section 8; (b) an offence falling under clause (d) of

Section 20; (c) an offence falling under clause (e) of Section 20 other than a contravention of the provisions of sub-section (3-A) or sub-section (4) of Section 15; and (d) an offence falling under Section 21. Forward Contract is a contract for the cash sale of grain at a specified price for future delivery. Forward Contract is an agreement requiring the producer to deliver a specific quantity and quality of grain to the elevator at a specified time and location for a previously agreed on price. See also Basis Contract; Delayed Payment Contract; Elevator Cash Contract; Hedge-To-Arrive Contract; Minimum Price Contract; Offer Contract; and Price-Later (Delayed Price) Contract. Forward Contract is an obligation in the form of a contract to buy (or sell) a specified asset on a specified date, at a specified price. No money changes hands until the specified date. A Forward Contract is a legal agreement that specifies either the price or basis for a quantity (either bales or acreage) and quality of cotton delivered by a future date. Forward contracts are used by cotton merchants to guarantee minimum supplies at an established price in order to make sale commitments to end users. Forward contracts are more widely used in other parts of the Cotton Belt than in Texas. The reason for this is that the contracting merchants face less production risk in the more stable production areas (which is also why they tend to offer bale contracts in those regions). Due to extreme variations in weather and production in Texas, most forward contracts are based on contracted acres, and are offered more during times of relative shortage. Acreage contracts imply that the merchant will share in more of the production risk, although he may make up for this in the price/basis terms offered, and also in the late timing that contracts are offered during the season.The terms of cotton marketing contracts are fairly uniform across the country being based on model contracts approved by the Texas Cotton Association and the American Cotton Shippers Association (ACSA). Considerations:- The wisdom of the ages applies to forward contracts:- Read the fine print. Contracts may or may not include disaster clauses, penalties for late delivery, yield limitations, etc., so it behooves the grower to study them in detail. Another important question of any forward contract is how it affects the grower's legal ownership status ('beneficial interest' in USDA parlance) during the period when growers will also be participating in USDA loan programs. In general, growers want contract language which allows them to retain beneficial interest until after the grower makes application for loan deficiency payments (discussed below). Advantages/Disadvantages:- One major advantage of forward contracts is being able to reduce price (or basis) risk by locking in a favorable price (or basis) when the opportunity exists in the market. Growers should recognize that this reduction in price risk is not free. The price/basis terms offered by the buyer are likely what is required to either bear the price risk or else hedge his position in the futures market. Another advantage of early contracting is that it may enable growers to more easily secure operating loans. The disadvantages of forward contracting to the grower include:- (1) no attractive contracts being offered when the market opportunity is there; (2) having no transparent way to evaluate the terms of different contracts on a consistent basis (other than just hearsay or experience); and (3) having quality specifications be subject to the USDA's Commodity Credit Corporation (CCC) loan schedule of premiums and discounts. Research has shown that the CCC loan schedule overly penalizes Texas cotton in accurately reflecting the true market value of quality differences. / Форвардный Контракт – соглашение, по которому одна сторона берётся купить валюту, получить заём или приобрести сырьё в будущем по цене предопределённой сегодня. Форвардный контракт на обменный курс, форвардный контракт на процентную ставку (называемый также соглашением о форвардной ставке) и форвардные контракты на сырьё являются тремя основными типами форвардных контрактов. Форвардные контракты являются производными инструментами, используемыми компаниями главным образом с целью хэдьжирования своих рисков. Однако, они могут быть использованы также и для спекуляции валютами, различными родами сырья, обмена акциями, облигациями, процентными ставками и тому подобным. О стороне форвардного контракта, которая соглашается купить сырьё, получить заём или приобрести валюту и тому подобное, говорят, что она имеет длинную позицию (или позицию покупки), в то время как о другой стороне говорят, что она имеет короткую позицию (или позицию продажи). Форвардный контракт отличается от фьючерсного контракта тем, что все фьючерсные контракты являются стандартизированными форвардными контрактами, торгуемыми на созданных биржах фьючерсов, в то время как сами форвардные контракты являются внеучётными инструментами, адаптированными к точным требованиям встречных сторон, то есть сторон, которые участвуют в данном форвардном контракте. Фьючерсы могут быть использованы для двух целей:- хэдьжирования или спекулирования торговлей ими. Форвардные контракты или просто форварды являются аналогичными фьючерсным контрактам типами соглашений, которые замыкают будущую цену на момент их заключения; и они имеют обращение на внеучётном рынке и настраиваемые условия, которые достигаются между контрагентами. Xxxxx , то есть . выработка (output). разница между законтрактованной форвардной неотложной ставкой и превалирующей безотлагательной ставкой . Форвардный Контракт:- приобретение или продажа определённого количества товара, государственных ценных бумаг, иностранной валюты или иных финансовых документов по текущей цене или цене при оплате наличными (spot price) с доставкой и завершением сделки на определённую дату в будущем. Поскольку это – окончательный исполняемый контракт (в противоположность опционному контракту), когда владелец имеет право исполнять или не исполнять контракт, то он может быть покрытием (cover) для продажи фьючерсного контракта (futures contract).

FORWARD COVER = ФОРВАРДНОЕ ПОКРЫТИЕ (или ПОКРЫТИЕ ФОРВАРДОМ) – Forward Cover is a purchase of currency or financial futures to offset unexpected fluctuations in the exchange rate for a foreign exchange contract. / Приобретение валюты или финансовых фьючерсов с целью погашения последствий неожиданных колебаний обменного курса по контрактам на иностранную валюту.

FORWARD DISCOUNT = ФОРВАРДНЫЙ ДИСКОНТ – Forward Discount is the term (similar to mark-down) used when a currency's forward rate is lower than its spot price. The currency is then traded with a forward discount. The opposite is known as a Contango (Mark-Up).

FORWARDER = ЭКСПЕДИТОР – Forwarder is an independent business that dispatches shipments for exporters for a fee. The firm may ship by land, air, or sea, or it may specialize. Usually it handles all the services connected with an export shipment, including preparation of documents, booking cargo space, warehousing, pier delivery, and export clearance. The firm may also handle banking and insurance services on behalf of a client. The US forwarder is licensed by the Federal Maritime Commission for ocean shipments. The party arranging the carriage of goods including connected services and/or associated formalities on behalf of a shipper or consignee. Also known as Freight Forwarder. / Экспедитор:- (1) физическое или юридическое лицо, действующее на основании договора поручения или комиссии, организующее транспортно-экспедиторское обслуживание, но не принимающее непосредственного участия в процессе транспортирования; (2) работник предприятия или организации, в обязанности которого входит приём грузов, их сопровождение, оформление перевозочных документов и так далее; сотрудник экспедиции. Экспедитор:- (1) сторона договора экспедиции. В бывшем Союзе Советских Социалистических Республик (СССР) – социалистической организации:- транспортно-экспедиционного агентства и конторы автомобильного, железнодорожного, внутреннего водного транспорта, морские порты, экспедиционные организации исполкомов местных Советов, системы потребительской кооперации и некоторые другие организации, в уставах (положениях) которых предусмотрено совершение транспортно-экспедиционных операций. (2) Работник предприятия, организации, осуществляющий в соответствии с трудовым договором получение грузов, их сопровождение при перевозке, сдачу, оформление товаро-распорядительных документов. Под Экспедицией, от Латинского слова Expeditio, означающее Приведение В Порядок, в гражданском праве понимается договор, по которому одна сторона (экспедитор) обязуется за счёт другой и от её имени (клиента) или от своего имени

отправлять или принимать принадлежащие клиенту грузы, выполнять иные связанные с этим действия, а клиент – сдавать для отправки, принимать грузы и оплачивать услуги экспедитора. В основе экспедиции – перевозка грузов автотранспортом. Она дополняется совершением экспедитором действий фактического (упаковка, погрузка, разгрузка, маркировка, хранение грузов, такелажные работы и другие) и юридического характера (оформление транспортных и приёмо-сдаточных документов, производство расчётов за перевозку с другими транспортными предприятиями, информация клиентов о прибытии или отправке их грузов, таможенные операции и другие). Экспедиционные услуги оказываются также органами связи (доставка почтовых отправлений). В бывшем Союзе Советских Социалистических Республик (СССР) договор экспедиции регулировался общими нормами Основ Гражданского Законодательства и Гражданскими Кодексами Союзных республик об обязательствах, специальными главами ГК Казахской Советской Социалистической Республики (ССР), Узбекской ССР, Молдавской ССР, Азербайджанской ССР, а также транспортными кодексами, уставами (в том числе Уставом Связи СССР), правилами и другими правовыми актами. Услуги экспедитора оплачиваются по установленным тарифам, а при их отсутствии – по соглашению сторон. В зарубежных социалистических странах договор экспедиции регулировлася аналогично (Польская Народная Республика (ПНР)) или как разновидность договора комиссии (Народная Республика Болгария (НРБ), Чехословацкая Социалистическая Республика (ЧССР)). По законодательству капиталистических государств отношения по экспедиции регулировались как разновидность договоров комиссии (Франция), поручения (Италия), перевозки (Испания, большинство стран Латинской Америки), как самостоятельный договор экспедиции (Федеративная Республика Германия (ФРГ)), агентский договор (страны Англо-Саксонской правовой системы).

FORWARDER'S CARGO RECEIPT = РАСПИСКА ЭКСПЕДИТОРА О ПОЛУЧЕНИИ ГРУЗА (или ЭКСПЕДИТОРСКАЯ РАСПИСКА О ПОЛУЧЕНИИ ГРУЗА) – (1) Forwarder's Cargo Receipt is a document issued by a freight forwarder or freight consolidator indicating goods have been received from the seller and are being held at the disposal of the buyer. Goods are generally received in the seller's country and the forwarder/consolidator will arrange shipment, and possibly consolidation with other goods, to the buyer according to the buyer's instructions.

(2) Forwarder's Cargo Receipt is a non-negotiable document issued by a forwarder which will satisfy legal requirements for a letter-of-credit. Since a forwarder is not an Non-Vessel Operating Common Carrier (NVOCC) it cannot issue actual Bills of Lading. The Forwarder's Cargo Receipt (FCR) is legally binding upon the forwarder and is an industry standard.

FORWARDER'S RECEIPT = РАСПИСКА ЭКСПЕДИТОРА (или ЭКСПЕДИТОРСКАЯ РАСПИСКА) – Forwarder's Receipt:- forwarding agent's written declaration confirming receipt of goods for shipment. Not a security, but often necessary for the execution of a documentary credit.

FORWARD EXCHANGE = ФОРВАРДНЫЙ ОБМЕН ВАЛЮТЫ – Forward Exchange is a type of foreign exchange transaction whereby a contract is made to exchange one currency for another at a fixed date in the future at a specified exchange rate. By buying or selling forward exchange, businesses protect themselves against a decrease in the value of a currency they plan to sell at a future date.

FORWARDING INSTRUCTION = ИНСТРУКЦИЯ ПО ЭКСПЕДИЦИИ – Forwarding Instruction is a document issued to a freight forwarder, giving instructions to the forwarder for the forwarding of goods described therein. / Инструкция по Экспедиции – документ, вручаемый грузовому экспедитору и инструктирующий его по всем нюансам доставки товаров, описанных в этом документе.

FORWARD INTEREST RATE = ФОРВАРДНАЯ ПРОЦЕНТНАЯ СТАВКА – A Forward Interest Rate is the interest rate that is applicable to a transaction that will occur at a specified time in the future. For example, an investor agrees today to invest USD1 in six months time at an annual rate of 3% for the following six months. In this example, 3% is the forward rate. Forward interest rates can be specified to cover any period of time and begin at any time in the future. Forward interest rates are presented in a term structure where different forward rates are matched with different maturities. In this capacity, forward rates can be used to compare investments between different periods. They are used extensively in forward and futures contracts and in foreign currency exchange. Forward rates are derived from spot rates which are in turn derived from the US Treasury yield curve. A spot rate is equivalent to the market rate and is defined as the rate for a zero coupon security. (The derivation of forward rates is beyond the scope of this definition.) Therefore the value of an investment should be virtually the same whether one uses the forward rate or the spot rate. For example, if USD1 is invested in a 1-year security at a spot rate of 10% compounded semi-annually, the future value would be USD1.210. Similarly, the same USD1 can be invested in an 8% security for the first 6 months and then reinvested in a 12% security for the second 6 months, resulting in a similar year end value of USD1.209. Forward Interest Rate f(t,T,S):- at time t (measured from the origin at t = 0), the average force of interest (i.e. the interest rate compounding continuously), operating over the future period from time T (measured from the origin) to time S (measured from the origin), i.e.:- $f(t,T,S) = -(1 / (S - T)) \ln((P(t,S) / P(t,T))$. Forward Interest Rate is the interest rate that can be locked today for some future period. It is the rate at which a party commits to borrow or lend a sum of money at some future date. Forward rates can be computed from spot interest rates (i.e. yields on zero-coupon bonds) through a process called Bootstrapping. Forward interest rates can be guaranteed through derivative contracts, i.e. interest rate forward contracts (also called Forward Rate Agreements), etc. A spot interest rate for period with n years represents the cumulative effect of interest expectations of all n periods. It can be reconstructed as equal to the combined effect of the forward interest rate for first, second, third and nth period. This concept can be expressed mathematically as follows:- $(1 + s_n)^n = (1 + f_1) \times (1 + f_2) \times (1 + f_3) \times ... \times (1 + f_n)$. Formula:- From the equation above, it follows that the combined effect of n–1 forward rates for consecutive periods must equal the spot rate for n–1 periods. Hence, it follows that the forward interest rate for period n in future can be determined using the following formula:- $fn = (((1 + s_n)^n) / ((1 + s_{n-1})^{n-1})) - 1$. Where fn is the future interest rate for period n in future, s_n and s_{n-1} are the spot interest rates with n and n–1 years to maturity respectively. sn and s_{n-1} equal the yield to maturity on zero-coupon bonds with n and n–1 years till maturity respectively. Example:- Let's say you have USD910 which you want to invest for next 2 years. You can invest them in a 2-year zero-coupon bond that yields 4.5% or you can investment it in a 1-year zero-coupon bond that yields 4.7% and simultaneously agree with a dealer to invest the proceeds received at the maturity of the 1-year zero-coupon bond with him at the end of first year at a forward rate f_2. You can determine the forward rate f_2 that you should pay using the no-arbitrage principle which dictates that your total return must be equal in both scenarios. If you invest USD910 for 2 years at 4.5% your future value will be as follows:- $FV_1 = USD910 \times (1 + 4.5\%)^2$. If you invest USD910 at 4.7% for first year, the value of your investment will be USD952.77 (= USD910 x (1 + 4.7%)) which you have committed to invest at f_2 for second year. Your investment value at the end of second year under this second scenario can be calculated as follows:- $FV_2 = USD910 \times (1 + 4.7\%)^1 \times (1 + f_2)$. Based on no-arbitrage principle, FV_1 must equal FV_2:- $USD910 \times (1 + 4.5\%)^2 = USD910 \times (+4.7\%)^1 \times (1 + f_2)$. Rearranging we get:- $f_2) = (((USD910 \times (1 + 4.5\%)^2) / ((USD910 \times (1 + 4.7\%)^1)) - 1$. Solving the above equation, f2 equals 4.3%. The above equation is the same as the formula given above.

FORWARD MARKET = ФОРВАРДНЫЙ РЫНОК – A term Forward Market refers to informal (non-exchange) trading of commodities to be delivered at a future date. Contracts for forward delivery are 'personalized', i.e. delivery time and amount are as determined between seller and customer. Non-exchange trading of commodities or other assets to be delivered at a future date. Contracts for

forward delivery are tailored, i.e. delivery time, location and amount are determined between each seller and buyer and generally involve marketing, merchandising and delivery. See also Over-The-Counter Market. / Термин Форвардный Рынок является разновидностью срочного рынка и относится к повседневной торговле различными видами сырья, которые должны быть поставлены на какую-то оговариваемую дату в будущем. Контракты для срочной поставки являются весьма ‘персонализированными’, то есть порядок и сроки поставки, а также объёмы и качество в них прописывается так, как договорятся между собой продавец и потребитель. Внебиржевая торговля сырьём или иными активами, в соответствии с которой поставка должна осуществляться по истечении определённого срока. Контракты для поставки в будущем персонализированы, то есть срок поставки, размещение и сумма определены между каждым продавцом и покупателем и, как правило, предусматривают в себе маркетинг, обработку и поставку. Смотрите также Внеучётный Рынок (Over-The-Counter Market).

FORWARD MONTHS = ФОРВАРДНЫЕ МЕСЯЦЫ – Forward Months:- futures contracts, currently trading, calling for later or distant delivery. See also Back Months and Deferred Futures.

FORWARD PREMIUM = ФОРВАРДНАЯ ПРЕМИЯ – Forward Premium:- the difference between spot and forward quotations which will be determined by money and precious metal interest rates and storage charges.

FORWARD PRICE = ФОРВАРДНАЯ ЦЕНА – The Forward Price is the agreed upon price of an asset in a forward contract. The difference between the forward and the spot price is the forward premium (if percentage is positive, meaning the forward price is higher than the spot price) or forward discount (if percentage is negative, meaning the forward price is lower then the spot price), generally considered a form of a profit (or loss) by the purchasing party. There is a difference between forward and futures prices when interest rates are stochastic. This difference disappears when interest rates are deterministic.

FORWARD RATE = ФОРВАРДНАЯ СТАВКА – The price paid for a future transaction or on the futures markets. The opposite of Spot Rate. Forward Rates are quoted in terms of forward points, which represents the difference between the forward and spot rates. In order to obtain the forward rate from the actual exchange rate the forward points are either added or subtracted from the exchange rate. The decision to subtract or add points is determined by the differential between the deposit rates for both currencies concerned in the transaction. The base currency with the higher interest rate is said to be at a discount to the lower interest rate quoted currency in the forward market. Therefore the forward points are subtracted from the spot rate. Similarly, the lower interest rate base currency is said to be at a premium, and the forward points are added to the spot rate to obtain the forward rate. / или срочная ставка.

FORWARD RATE AGREEMENT = СОГЛАШЕНИЕ О ФОРВАРДНОЙ СТАВКЕ (или СОГЛАШЕНИЕ О СРОЧНОЙ СТАВКЕ) – Forward Rate Agreements (FRAs) are the most common types of forward. They are cash settled bilateral contracts relating to short term loans where both parties agree to exchange the difference between two interest rates on a notional loan at a future date. One party will agree to pay a fixed rate (the contract rate); the other pays a floating rate, for example, LIBOR (London Interbank Offered Rate), determined at the maturity of the FRA (the underlying rate). The payments made are the difference between the contract rate and the underlying rate. In this way an FRA is similar to an interest rate swap which can be characterised as a series of forward contracts on interest rates. Forward Rate Agreement (FRA) is an interest rate forward contract in which the rate to be paid or received on a specific obligation for a set period of time, beginning at some time in the future, is determined at contract initiation. Futures contract on interest rates, i.e. contract by which two parties agree on the interest rate to be paid at a future settlement date. One party seeks to protect itself from a future increase in interest rates, while the other wants protection from a future decline in interest rates. The parties agree to an interest rate for a specified period, starting at a certain date in the future. At maturity, they settle by paying or receiving only the difference between the interest rate agreed earlier and the then-prevailing interest rate. Also known as Future Rate Agreement. See also Futures Market. Interest rate forward contract in which the rate to be paid or received on a specific obligation for a set period of time, beginning at some time in the future, is determined at contract initiation. A Forward Rate Agreement (FRA) is a forward contract on a short-term interest rate, usually LIBOR, in which cash flow obligations at maturity are calculated on a notional amount and based on the difference between a predetermined forward rate and the market rate prevailing on that date. The settlement date of an FRA is the date on which cash flow obligations are determined. Forward Rate Agreements are individually negotiated interest rate forward contracts that result in cash settlement at a future date for the difference between a contracted rate of interest and the prevailing market rate. Forward Rate Agreement (FRA) is an over-the-counter interest futures contract. Two parties agree to pay a certain amount at some future date. This amount is the difference between two interest rates – the currently agreed contractual interest rate (FRA rate) and the future market interest rate (reference rate) – relating to a certain nominal amount and a fixed future period (hedging period). The nominal amount itself does not change hands. Forward Rate Agreement is a forward contract on interest rates in which the rate to be paid or received on a specific obligation for a set period of time, beginning at some time in the future, is determined at contract initiation. A Forward Rate Agreement (FRA) allows purchasers/sellers to fix the interest rate for a specified period in advance. One party pays fixed, the other an agreed variable rate. Maturities are generally out to two years and are priced off the underlying yield curve. The transaction is done on a nominal amount and only the difference between contracted and actual rates is paid. If rates have risen by the time of the agreement’s maturity, the purchaser receives the difference in rates from the seller and vice versa. A swap is therefore a strip of FRAs. FRAs are off-balance sheet – there are no up-front or margin payments and the credit risk is limited to the mark-to-market value of the transactions. Unlike interest rate swaps, FRAs settle at the beginning of the interest period, two business days after the calculation date. A Forward Rate Agreement (FRA) is a contract between two parties to lock in a forward interest rate, for a period, starting at a specific date in the future. For example, a 6 v 9 FRA is a contract that begins 6 months from now and ends after 9 months, i.e. lasts for 3 months. The two counterparties, one buyer and one seller, settle by cash payment at the start of the contract period (in this example 6 months from now). Settlement is based on the difference between the actual interest rate prevailing on the fixing date and the rate specified in the contract, for a specific notional principal stated in the contract. Forward rate agreements are also known as Fixed or Future Rate Agreements. / , то есть . (более известная в Англоязычном звучании как ЛАЙБО (LIBOR)).

FORWARD RATE TRANSACTION = ТРАНЗАКЦИЯ ПО ФОРВАРДНОЙ СТАВКЕ (или ОПЕРАЦИЯ ПО СРОЧНОЙ СТАВКЕ) – Forward Rate Transaction is a transaction in which one party agrees to pay a fixed rate for a defined period and the other party agrees to pay a rate to be set on a specified date in the future. The payment calculation is based on a notional rate and is settled based, among other things, on the difference between the agreed forward rate and the prevailing market rate at the time of settlement.

FORWARD TRANSACTION = ФОРВАРДНАЯ ТРАНЗАКЦИЯ (или ФОРВАРДНАЯ ОПЕРАЦИЯ) – With Forward Transactions, the terms alone are specified upon conclusion of the contract, whereas payment and delivery take place in the future. This type of trading is possible with all kinds of goods, e.g., with securities, interest rates, currencies, precious metals and agricultural goods. A distinction is made between commodity futures and financial futures. Forward transactions can be carried out on an organized futures market (futures exchange) or over the counter. The buyer enters into a long position, the seller into a short position. Forward Transaction is a purchase or sale for delivery and payment at an agreed date in the future.

FOSSIL FUEL = ИСКОПАЕМОЕ ТОПЛИВО – Fossil Fuel is any naturally occurring organic fuel, such as petroleum, coal, and natural gas. An energy source formed in the Earth's crust from decayed organic material, such as coal, natural gas, and petroleum. Fossil Fuels are hydrocarbons, primarily coal, fuel oil or natural gas, formed from the remains of dead plants and animals. In common dialogue, the term fossil fuel also includes hydrocarbon-containing natural resources that are not derived from animal or plant sources. These are sometimes known instead as mineral fuels. The utilization of fossil fuels has enabled large-scale industrial development and largely supplanted water-driven mills, as well as the combustion of wood or peat for heat. Fossil fuel is a general term for buried combustible geologic deposits of organic materials, formed from decayed plants and animals that have been converted to crude oil, coal, natural gas, or heavy oils by exposure to heat and pressure in the earth's crust over hundreds of millions of years. The burning of fossil fuels by humans is the largest source of emissions of carbon dioxide, which is one of the greenhouse gases that allows radiative forcing and contributes to global warming. A small portion of hydrocarbon-based fuels are biofuels derived from atmospheric carbon dioxide, and thus do not increase the net amount of carbon dioxide in the atmosphere. Fuels sourced from plant and animal matter that have undergone transformation through heat and pressure. / из сгнившего органического материала, такого как нефть, природный газ и уголь. Под Топливом понимаются горючие вещества, основной составной частью которых является углерод, применяемые с целью получения при их сжигании тепловой энергии. По происхождению топливо делится на:- (i) искусственное топливо, к которому относятся генераторные газы, кокс, моторные топлива и другие; и (ii) природное топливо, к которому относятся горючие сланцы, древесина, нефть, природный газ, торф и уголь. По агрегатному состоянию топливо подразделяется на газообразное, жидкое и твёрдое. Основной характеристикой топлива является теплота сгорания. Для сопоставления различных видов топлива и суммарного учёта его запасов принята единица учёта – условное топливо, для которого низшая теплота сгорания принята 29.3 МДж/кг (7 000 ккал/кг). В связи с развитием техники термин 'топливо' стал применяться в более широком смысле и распространился на все материалы, служащие источником энергии, например, ядерное топливо, используемое для осуществления цепной реакции деления ядер в ядерном реакторе.

FOSSIL–FUEL PLANT = ЭЛЕКТРОСТАНЦИЯ НА ИСКОПАЕМОМ ТОПЛИВЕ – Fossil-Fuel Plant is a plant using coal, petroleum, or gas as its source of energy. A Fossil Fuel Power Plant is a system of devices for the conversion of fossil fuel energy to mechanical work or electric energy. The main systems are the steam cycle and the gas turbine cycle. The steam cycle relies on the Rankine cycle in which high pressure and high temperature steam raised in a boiler is expanded through a steam turbine that drives an electric generator. The steam gives up its heat of condensation in a condenser to a heat sink such as water from a river or a lake, and the condensate can then be pumped back into the boiler to repeat the cycle. The heat taken up by the cooling water in the condenser is dissipated mostly through cooling towers into the atmosphere. The gas turbine cycle relies on the Brayton cycle in which air compressed to high pressure, and heated to high temperature by the combustion of natural gas or light fuel oil, is the working fluid that expands in the turbine to provide the torque for driving both a compressor and the electric generator. The gas turbine demands clean fuels such as natural gas or light fuel oil. Combustion is the prevailing fuel utilization technology in both the above cycles. Coal is the preferred fuel for the steam cycle because of its low cost and broad and secure availability worldwide. Combustion-generated pollutants, such as oxides of nitrogen (NO_x), of sulfur (SO_x), and particulates, if uncontrolled and emitted into the atmosphere represent environmental and health hazards, such as acid rain. Environmental regulations supported by intensive research and developments have reduced pollutant emissions significantly. Improvements in efficiency and emissions come by increasing steam pressure and temperature in the steam cycle, and by increased turbine inlet temperature in the gas turbine cycle. Coal gasification produces a fuel gas that is capable of being used in the gas turbine. By integrating coal gasification with gas turbine and steam cycles, advantage can be taken of high efficiency and low pollutant emission while using coal, an inexpensive, secure and indigenous fuel in many countries throughout the world. A potential additional advantage of the Integrated Gasification Combined Cycle (IGCC) is the capability of capturing carbon dioxide (CO_2) from the fuel gas and making it ready for high-pressure pipeline transportation to a carbon sequestration site. This will be key to the commercial and clean co-production of electricity and hydrogen from coal. / на цикле Брэйтчэна (Brayton cycle).

FOT = FREE ON TRAIN

FOT = FREE ON TRUCK

FOUL = НЕЧИСТОЕ (или ГРЯЗНОЕ, или ЗАГРЯЗНЁННОЕ) – Foul (maritime term):- jammed, not clear.

FOULARD = ФУЛЯР – Foulard is a material that is used in many of the products that men and women use every day. Here is some background on foulard, how it is created, and what the material is most often used for in the way of garments and other fabric creations. As the proper name for a silk handkerchief in French, the name of foulard is very appropriate for the name of this particular type of material. Essentially, foulard is a lightweight fabric that is created by using a spinning and weaving process to produce plain woven sheeting or twill fabric. Historically, using silk, cotton, or a silk and cotton blend as the base fibers for the finished product produces foulard. Foulard carries a higher thread count, which means that the weave on the fabric is very tight, more so than with many types of fabric sheeting. The result is that the texture of foulard is smooth, silky, and because of the cotton content is still easy to care for and allows the wearer to breathe. Foulard is often used in dressmaking, notably in dresses that are meant for wear in warmer climates. The cotton in the foulard allows air to pass between the threads in the weave, and allows the wearer of the garment to take better advantage of any breeze. In many cultures, men's shirts and slacks are also made of foulard. One of the more popular items of men's wear that are made of foulard is a lightweight twill style suit. Popular in warm climates, the twill suit allows the male to still carry a professional appearance even if the weather is less than comfortable. Sportswear and jogging shorts and shirts that are meant for use during the summer months are examples of modern uses for foulard. Again, the weave of the woven silk and cotton material allows for efficient circulation of air, resulting in a greater level of comfort for the wearer. In addition, the process for making foulard is so inexpensive these days that the garments can be sold at competitive prices. The combination of reasonable pricing and the ability to breathe in the clothing makes the use of foulard a natural with such sports as running, tennis, jogging, and biking. Foulard is also a perfect material to be used in the production of hand painted screens. This should come as no surprise, since foulard is believed by many to have originated in the Far East. As a canvass used for hand painting scenes that can then be attached to screens and fitted together to make room dividers, foulard works very well. Of course, foulard is the ideal material for scarves and handkerchiefs that help to compliment a number of male and female wardrobes all over the world. In fact, any garment that should be soft and silky to the touch can usually be created using foulard. As a staple material in a number of different types of clothing, as well as artistic uses, foulard is sure to be part of the landscape for many years to come. Foulard is a lightweight twill-weave fabric, made from filament yarns like silk, acetate, polyester, with a small all-over print pattern on a solid background. The fabric is often used in men's ties. Foulard is a lightweight, soft, plain- or twill-weave fabric made of silk, mercerized cotton, rayon, acetate, or thin worsted wool. Foulard has a high luster on the face and dull on the reverse side. It is often printed, and the patterns range from simple polka dots to small, allover elaborate designs on light or dark grounds. It is also made in plain and solid colors. Foulard has a characteristic hand that can be described as light, firm, and supple. It is used for spring and summer dresses, scarves, robes, and neckties, and frequently sold as surah. Foulard is a lightweight, lustrous 2/2 twill that is usually printed with small figures on a solid background, foulard is frequently

used in men's ties. Foulards are made of silk, filament polyester, acetate, etc. Foulard is an article of clothing made of foulard, namely a lightweight plain-woven or twilled silk with a printed pattern. Very soft, light fabric. Noted for its soft finish and feel. It is usually printed with small figures on a dark or light background. Similar to Surah and Tie Silk, but finer. Was originally imported from India. Twill, 2 up 2 down. Foulard:- a lightweight plain-woven or twilled silk usually decorated with a printed pattern. / филаментная (комплексная) пряжа (filament yarn). Под Фуляром, от Французского слова Foulard, означающее Фуляр или Платок или Галстук, понимается лёгкая мягкая шёлковая ткань, гладкокрашеная или с набивным рисунком. Получила распространение с XVIII века. Из фуляра делали носовые и шейные платки, а в начале XX века шили также женские платья, изготовляли абажуры, занавески. Если речь идёт о процессе, то это слово означает Плюсовка. Фуляр – ткань из шёлковых некручёных нитей различного переплетения, в дешёвых сортах – с добавлением хлопчатобумажной пряжи. Характер обработки сырья позволял получать особенно тонкие, мягкие и лёгкие сорта. Фуляр выпускали как одноцветным, так и орнаментированным. Орнамент чаще всего использовался геометрический, очень популярной под влиянием В. Скотта была клетка. Использовался фуляр для изготовления шейных платков, шалей, пошива платья.

FOUL BILL OF LADING = ГРЯЗНЫЙ КОНОСАМЕНТ (или КОНОСАМЕНТ С ОТМЕТКАМИ) – Foul Bill Of Lading is a bill of lading that has been claused to show that the goods were not received in a sound condition. A receipt for goods issued by a carrier with an indication that the goods were damaged when received. Compare Clean Bill of Lading.

FOULED HAWSE = НЕЧИСТЫЕ ЯКОРНЫЕ ЦЕПИ – Fouled Hawse (maritime term):- said of the anchor chain when moored and the chain does not lead clear of another chain.

FOUNDATION SEED = СЕМЕННОЙ ФОНД (или СУПЕРЭЛИТНОЕ СЕМЯ) – Foundation Seed is the seed stock produced from breeder seed by or under the direct control of an agricultural experiment station. Foundation seed is the source of certified seed, either directly or through registered seed organizations. Foundation Seed:- seed stocks increased from breeder seed, and so handled as to closely maintain the genetic identity and purity of a variety. Foundation seed is the source of certified seed, either directly or through registered seed. / Под Семенным Фондом понимается запас семян для посева. Создаётся в сельскохозяйственных структурах с учётом планов сева и норм посева. Под Суперэлитой понимаются семена лучших растений, полученные в семеноводческих питомниках научно-исследовательских учреждений, наиболее полно передающие все признаки и свойства сорта. Используют для получения семян элиты.

FOUNDER = ТОНУТЬ (или ИДТИ КО ДНУ, или ПОГРУЖАТЬСЯ) – Founder (maritime term):- to sink (out of control).

FOUNDER'S SHARE = АКЦИЯ ОСНОВАТЕЛЯ (или АКЦИЯ УЧРЕДИТЕЛЯ) – Founder's Share:- shares issued to founders of a company as compensation for previously unpaid services. They grant certain preferential rights, e.g., to a part of the next profit or the liquidation proceeds. Also known as Deferred Ordinary Shares in the United Kingdom. No-par value stock which gives the right to participate in business profits and sometimes liquidation dividends, usually issued by a company in exchange for an asset contribution with no specific valuation. / , например, .

FOUR BALL TESTER = ЧЕТЫРЁХШАРИКОВЫЙ ПРИБОР – Four Ball Tester:- this name is frequently used to describe either of two similar laboratory machines, the Four-Ball Wear Tester and the Four-Ball Extreme Pressure (EP) Tester. These machines are used to evaluate a lubricant's anti-wear qualities, frictional characteristics or load carrying capabilities. It derives its name from the four 1/2 inch steel balls used as test specimens. Three of the balls are held together in a cup filled with lubricant while the fourth ball is rotated against them. / противоизносные качества, . Чётырёхшариковый Прибор служит для оценки свойств смазок. Сверхвысокое Давление .

FOUR–BOX MODEL = МОДЕЛЬ ЧЕТЫРЁХ ЯЩИКОВ – The Four-Box Model could be described as the banking version of open standards where the payer and the payee can interact although they have agreements with two different (and competing) banks. The reason for this is that the banks themselves have an agreement to participate in an enabling network (such as Visa, MasterCard, SWIFT, giro systems). / Виза (Visa), МэстчёКард (MasterCard), Сообщество по Всемирной Межбанковской Финансовой Дальней Связи (СВМФДС; The Society for Worldwide Interbank Financial Telecommunication (SWIFT)). коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо).

FOUR DRAGONS = ЧЕТЫРЕ ДРАКОНА – Four Dragons are the four small Asian less developed countries (LDCs) that have experienced unusually rapid economic growth. This group consists of Hong Kong, Singapore, South Korea, and Taiwan. Also known as Four Tigers.

FOUR–HARNESS SATIN WEAVE = ЧЕТЫРЁХРЕМИЗНОЕ АТЛАСНОЕ ПЕРЕПЛЕТЕНИЕ – The Four-Harness Satin (Crowfoot) Weave is more pliable than the plain weave and is easier to conform to curved surfaces typical in reinforced plastics. In this weave pattern there is a three by one interlacing, where a fill yarn floats over three warp yarns and under one. / Четырёхремизное Атласное Переплетение или Четырёхнитное Атласное Переплетение или Турецкое Атласное Переплетение – переплетение с неправильными перерывами или сдвигами.

FOURIER TRANSFORM INFRARED SPECTROSCOPY = ИНФРАКРАСНАЯ СПЕКТРОСКОПИЯ С ПРЕОБРАЗОВАНИЕМ ФУРЬЕ – Fourier Transform Infrared Spectroscopy (FTIR):- a test where infrared light absorption is used for assessing levels of soot, sulfates, oxidation, nitro-oxidation, glycol, fuel, and water contaminants. See also Infrared Spectroscopy. / Инфракрасная Спектроскопия С Преобразованием Фурье, по имени Французского математика и физика Жо-Батистэ Жозэф Фурье (Jean-Baptiste Joseph Fourier; 1768-Март-21–1830-Май-16), испытание, в котором абсорбция инфракрасного света используется для определяющих уровней сажи, сульфатов, окисления, нитроокисления, гликоля, топлива и водных загрязнителей.

FOUR–IN–HAND = ЧЕТЫРЕ–В–РУКИ (или ХХ) – Four-In-Hand:- a necktie tied in a slipknot with long ends overlapping vertically in front.

FOURRAGÈRE = ФУРАЖЭР (или АКСЕЛЬБАНТ) – Fourragère:- a braided cord worn usually around the left shoulder, especially when awarded as a military decoration. / украшение на военной форме одежды. Аксельбант.

FOURTH PARTY LOGISTIC MODEL = МОДЕЛЬ ЧЕТВЁРТОЙ СТОРОНЫ ЛОГИСТИКИ (или ЧЕТЫРЁХСТОРОННЯЯ МОДЕЛЬ ЛОГИСТИКИ) – Fourth Party Logistic (4PL) Model:- the manufacturer does not only outsource the organisation of its logistic tasks to third parties, but also the management thereof. Fourth party logistic service providers often check the entire supply chain. The organisational and executive activities are again often outsourced to other parties. Fourth party logistic service providers often have no means of transport and warehouses (non-asset based logistics). The fourth party logistic role demands intense involvement from the service supplier in the clients business activities. After all, not only does the latter outsource the execution but also the monitoring of the logistic processes. The short-term thinking with collaboration agreements purely on the basis of cost-related reasons is replaced with long-term partnerships where quality of the service will play a primary role, and which involves shared risks and benefits.

FOURTH PARTY LOGISTICS PROVIDER = ОБЕСПЕЧИВАЮЩИЙ ЧЕТВЁРТУЮ СТОРОНУ ЛОГИСТИКИ (или ОБЕСПЕЧИВАЮЩИЙ ЧЕТЫРЁХСТОРОННЮЮ ЛОГИСТИКУ) – Fourth Party Logistics Provider (4PL):- the term '4PL' was introduced into the supply chain to convey that deep informational technology skills and deeper analytical skills were required to achieve supply chain leadership. But the true evolution of the 4PL term is better defined in context of the global marketplace where outsourced logistics creates more of a partnership critical to success than a supplier/customer relationship. Companies in the global marketplace are finding that supply chain engineered logistics is not a commodity, and understand it is a vital means to boost their cost savings, enhancing their cash flow and improving servicing levels for getting their products to market.

FOURTH TRUE–LEAF = ЧЕРВЁРТЫЙ НАСТОЯЩИЙ ЛИСТ – A Fourth True-Leaf is the first four leaves after the cotyledons, prior to the unfurling of the fifth leaf – last possible Cotton growth stage for the safe over-the-top application of glyphosate in Roundup Ready Cotton. / Первые четыре листа после семядоли .

FOUR TIGERS = ЧЕТЫРЕ ТИГРА – Four Tigers or Four Asian Tigers:- the high-growth economies of Hong Kong, Singapore, South Korea and Taiwan. The four Asian tigers consistently maintained high levels of economic growth since the 1960s, fueled by exports and rapid industrialization, which enabled these economies to join the ranks of the world's richest nations. Hong Kong and Singapore are among the biggest financial centers worldwide, while South Korea and Taiwan are important hubs of global manufacturing in automobile/electronic components and information technology, respectively. Also going by the nickname of Asian dragons, common characteristics of the four Asian tigers includes a focus on exports, an educated populace and high savings rates. The economies of the four tigers have proved to be resilient enough to withstand local crises, such as the Asian financial crisis of 1997, as well as global shocks like the credit crunch of 2008. The International Monetary Fund (IMF) includes the four Asian tigers in its category of 35 advanced economies. See also Four Dragons. / Смотрите также Четыре Дракона (Four Dragons).

FOUR–WAY BLOCK PALLET = ЧЕТЫРЁХЗАХОДНЫЙ ХХ ПОДДОН – Four-Way Block Pallet is a pallet with openings at both pallet ends and along pallet sides sufficient to admit hand-pallet jacks; full four-way entry pallet.

FOUR–WAY PALLET = ЧЕТЫРЁХЗАХОДНЫЙ ПОДДОН – Four-Way Pallet is a pallet designed so that the forks of a fork lift truck can be inserted from all four sides. Four-Way Pallet allows equipment entry from all four sides, but has limited staking ability due to lack of strength and load transfer capability. Four-Way Pallet or Four-Way Entry Pallet is a flat pallet permitting the entry of the fork arms of forklift trucks and pallet trucks from all four directions. / Четырёхзаходный Поддон:- плоский поддон, конструкция которого обеспечивает возможность ввода вилочного захвата с четырёх сторон.

FOUR–WAY STRETCH = ЧЕТЫРЁХЗАХОДНЫЙ ХХ – Four-Way Stretch is a fabric that stretches both on the crosswise and lengthwise grains of the fabric. It is the same as two-way stretch.

FOV = FUSARIUM OXYSPORUM VASINFECTUM

FOXTROT = ФОКСТРОТ – Foxtrot (pronunciation:- FOKS-trot) or F is international nautical signal flag meaning:- I am disabled; communicate with me. On aircraft carriers:- Flight Operations underway. Meaning:- I am disabled, communicate with me. NATO:- on aircraft carrier, conducting Flight Operations.

FOXY = ЛИСИЙ (или РЫЖИЙ) – Foxy:- of a warm reddish brown color.

FP = FIXED PLATFORM

FP = FLOATING POLICY

FP = FLOOD–PRONE RICE PROGRAM

FP = FULLY PAID

FPA = FREE OF PARTICULAR AVERAGE

FPAAC = FREE OF PARTICULAR AVERAGE, AMERICAN CONDITIONS

FPAEC = FREE OF PARTICULAR AVERAGE, ENGLISH CONDITIONS

FPC = FEDERAL POWER COMMISSION

FPI = FOOD PRICE INDEX

FPLI = FUNCTIONAL PLANT LOSS INDEX

FPM = FIXED–PAYMENT MORTGAGE

FPPL = FORECAST PERIOD PEAK LOAD

FPR = FORECAST POOL REQUIREMENT

FPRDI = FOREST PRODUCTS RESEARCH AND DEVELOPMENT INSTITUTE

FPRL = FOREST PRODUCTS RESEARCH LABORATORY

FPSO VESSEL = FLOATING PRODUCTION STORAGE AND OFF–LOADING VESSEL

FPU = FABRIC PRODUCTION UNIT

FQA = FASTENER QUALITY ACT

FR = FARM RESERVOIR

FR = FAULT REPORT

FR = FEDERAL REGISTER

FR = FIRST REFUSAL

FR = FRANCE

FRA = FEDERAL RESERVE ACT

FRA = FORWARD RATE AGREEMENT

FRACTION = ЧАСТЬ (или РАЗБИВКА, или ДРОБЬ, или ФРАКЦИЯ) – Fraction:- in share trading, a number of share units which is smaller than the number of units usually traded, as distinguished from the round lot, which is a multiple of the trading unit. This term also used in commodities trading. Also known as Odd Lot.

FRACTIONAL DISTILLATION = ДРОБНАЯ ПЕРЕГОНКА (или ФРАКЦИОННАЯ ПЕРЕГОНКА, или ФРАКЦИОНАЛЬНАЯ ДИСТИЛЛЯЦИЯ) – Fractional Distillation:- this process is applied for the separation of cadmium from zinc. In the metallurgy of zinc, the metal is invariably associated with cadmium. The impure zinc is mixed with powdered coke and heated when the first portion of the condensate contain cadmium while zinc is obtained in the subsequent portions.

FRACTIONAL RIGHTS = ЧАСТИЧНЫЕ ПРАВА (или ДРОБНЫЕ ПРАВА) – Fractional Rights:- in securities business, a subscription rights which are not sufficient to subscribe to a whole new share. The shareholder can either purchase additional rights on the market to buy whole new shares or can sell his fractional rights at the prevailing market price.

FRACTIONAL SHARE = ЧАСТИЧНАЯ ДОЛЯ (или ДРОБНАЯ АКЦИЯ) – Fractional Share:- less than a full share of stock. Fractional shares generally result from either purchases from dividend reinvestment accounts or from calculations from transactions such as exchanges and tenders. Fractional shares can be maintained in book entry accounts, but if the holder wants their shares certificated, the issuer will generally issue a cash-in-lieu check for the value of the fractional share. Fractional Share is an ownership in a corporation in an amount less than a full share. Portion of a single share of stock. Often arising from company dividend reinvestment plans, where the cash dividend is automatically reinvested in shares of stock purchased on the open market, thereby creating fractional shares.

FRACTIONATION = ФРАКЦИОНИРОВАНИЕ (или ДРОБНАЯ ПЕРЕГОНКА) – Fractionation is the process whereby saturated hydrocarbons from natural gas are separated into distinct parts or fractions such as propane, butane, ethane, etc. / Под Дробной Перегонкой или Фракционированием понимается разделение жидкостей сложного состава на фракции, кипящие в определённом интервале температур. Дробная перегонка применяется в нефтяной промышленности для получения бензина, керосина и так далее; в химической промышленности.

FRACTURE = ИЗЛОМ (или ПЕРЕЛОМ) – Fracture is a random breakage that results in fragments of unpredictable shape. / В медицине под Переломом понимается нарушение целостности кости.

FRACTURING = РАЗРЫВ (или РАСТРЕСКИВАНИЕ) – In oil industry, Fracturing is the practice of pumping special fluids down the well under high pressure. Fracturing causes the formation to crack open, creating passages for the reservoir fluids to flow more easily into the wellbore. Also known as Frac'ing. / Практика использования при добыче нефти нагнетания специальных жидкостей под высоким давлением на дно скважины. Разрыв/растрескивание вынуждает трещину в формации (пласте) разойтись, создавая тем самым проходы для более свободного перетока жидкости в данном резервуаре непосредственно к буровой скважине. Известно также как Фрэйсинь (Frac'ing).

FRACTURING = РАСТРЕСКИВАНИЕ (или РАЗЛОМ, или РАЗЛАМЫВАНИЕ) – Fracturing is a way of increasing production from low permeability structures by breaking up the rock and expanding fissures, for example by applying very high fluid pressures. / Способ увеличения продукции из слабо проницаемых структур посредством разбивания горной породы и расширения трещин, например, за счёт воздействия применяющейся под высоким давлением или напором жидкости.

FRAGILE = ХРУПКОЕ – Fragile:- easily breakable. Term denoting that goods should be handled with care. / Под Хрупкостью понимается способность твёрдых тел разрушаться при механических воздействиях без заметной пластичной деформации (свойство, противоположное Пластичности). Хрупкость зависит от структурного состояния тела и условий испытания; увеличивается при увеличении скорости нагружения и при понижении температуры, при повышении степени концентрации напряжений и запаса упругой энергии. Хрупкость материала, наблюдающаяся только при ударных нагрузках, называется Ударной Хрупкостью этого материала. Хрупкость, проявляющуюся только при низких температурах, называют Хладноломкостью.

FRAGILIS = ХРУПКОЕ (или ЛОМКОЕ, или НЕПРОЧНОЕ) – Fragilis:- fragile, easily broken. / хрупкое, легко разбиваемое.

FRAME = СТАНОК (или РАМА) – Frame is:- (1) a general term for many machines used in yarn manufacturing such as the drawing frame, roving frame, and spinning frame. (2) See also Tenter Frame.

FRAME SPINNING = МАШИННОЕ ПРЯДЕНИЕ (или СТАНОЧНОЕ ПРЯДЕНИЕ) – Frame Spinning (a commercial term):- the manufacture of yarn by attenuating a sliver by means of rollers and then inserting twist by means of a flyer, a ring and traveller, or a cap.

FRAME WHEEL = СТАНОЧНОЕ КОЛЕСО – Frame Wheel:- the flyer is usually mounted above the wheel, which means less floor space is used. Also called a Castle Wheel. A well-known example of this is Alden Amos' castle wheel. / Олдэн Эймос (Alden Amos).

FRAMEWORK AGREEMENT = РАМОЧНОЕ СОГЛАШЕНИЕ – A Framework Agreement is an 'Umbrella Agreement' that sets out the terms (particularly relating to price, quality and quantity) under which individual contracts (call-offs) can be made throughout the period of the agreement (normally a maximum of 4 years). Framework agreements are typically used where the authority knows they are likely to have a need for particular products or services, but are unsure of the extent or schedule. So framework agreements are commonly set up to cover things like office supplies, IT equipment, consultancy services, repair and maintenance services etc. See also The Tokyo Round. / Смотрите также Токийский Раунд (The Tokyo Round).

FRAMEWORK KNITTING = ОСТОВ (или СТАНИНА) ВЯЗАНИЕ – Framework Knitting:- stockings, socks, shirts, gloves, handkerchiefs, underwear, and other fabrics were knitted by men, women, and children in their own home, or in a small workshop, in the towns and villages of Nottinghamshire, Leicestershire, and South Derbyshire from the second half of the XVII century to the beginning of the XX century. The basic frame had been invented in 1589 by William Lee of Calverton (Nottinghamshire), but the craft was practised at first in London, and did not become established in the midlands until after the Restoration of Charles II. Apprenticeship indentures among the inland revenue records at The National Archives show that by the second decade of the XVIII century the craft had gained a foothold in nearly all the places where it was subsequently to prosper. At first, the frame was so heavy it was used only by men, though later it may have been used by women; children worked at associated jobs. In the XVII and early XVIII centuries framework knitters were often part-timers who also farmed a smallholding, but in the late XVIII and XIX centuries, as the population rose to unprecedented heights, the rural craft became a poor cottage industry. Parish registers (which often used the abbreviation FWK) show that in many midland villages for much of the XIX century the majority of the inhabitants were working at this trade. Frames and raw materials were supplied by middlemen known as 'Bag-Hosiers', who worked for a firm in one of the nearby towns, from Mansfield in the North to Hinckley in the south. See also Knitting, and Weft Knitting. A stocking frame was a mechanical knitting machine used in the textiles industry. It was invented by William Lee of Calverton near Nottingham in 1589. Its use, known traditionally

as Framework Knitting, was the first major stage in the mechanisation of the textile industry, and played an important part in the early history of the Industrial Revolution. / Вильэм Ли (William Lee). Чалз II (Charles II).

FRANCHISE = ФРАНШИЗА (или КОНЦЕССИЯ) – (1) Franchise is a license bought by a retailer or supplier of services that entitles him or her to sell the goods of a particular manufacturer under a particular trading name. This system enables the manufacturer to have direct control over who sells the goods, and often gives the seller exclusive rights to sell those goods in his or her area. Right granted by a manufacturer or service firm to an independent distributor to sell goods or services under its trademark in exchange for payment of a royalty. Franchise is a type of license that a party (franchisee) acquires to allow them to have access to a business's (the franchisor) proprietary knowledge, processes and trademarks in order to allow the party to sell a product or provide a service under the business's name. In exchange for gaining the franchise, the franchisee usually pays the franchisor initial start-up and annual licensing fees. Franchises are a very popular method for people to start a business, especially for those who wish to operate in a highly competitive industry like the fast-food industry. One of the biggest advantages of purchasing a franchise is that you have access to an established company's brand name; meaning that you do not need to spend further resources to get your name and product out to customers. Franchise is legal arrangement whereby the owner of a trade name, the franchiser, contracts with a party that wants to use the name on a non-exclusive basis to sell goods or services, the franchisee. Frequently, the franchise agreement grants strict supervisory powers to the franchiser over the franchisee which, nevertheless, is an independent business. / Фрэнчайзо (Franchisor) – компания, которая позволяет индивидуалу (известному как Фрэнчайзи (Franchisee)). Франшиза или Концессия:- (1) В общем значении:- (i) право, предоставляемое дилеру производителем или организацией по обслуживанию франшизеров, в отношении распространения изделий или услуг предоставившей франшизу стороны в данном регионе, на эксклюзивной или на неэксклюзивной основе. Подобные договорённости иногда формализуются в соглашении о франчайзинге (franchise agreement), которое представляет собой контракт между стороной, предоставившей франшизу, и стороной, получившей франчайзинг, в котором первая сторона может предлагать консультации, помощь в рекламе, финансирование и иные привилегии в обмен на определённый процент прибыли или объёма продаж. (ii) Коммерческое предприятие, принадлежащее стороне, получившей франшизу, которая обычно должна внести первоначальную сумму инвестиций наличными. (2) Правительство:- юридическое право, предоставленное компании или частному лицу государством на выполнение определённых экономических функций. Например, коммунальная компания по предоставлению электричества может иметь право, в соответствии с условиями франчайзинга, использовать городскую собственность для предоставления услуг по обеспечению электроэнергией населения города.

(2) Franchise is a minimum percentage or amount of loss which must be attained before insurers are liable to meet a claim. Once it is attained the insurers must pay the full amount of the loss. In insurance, an amount which in case of damage is borne by the insured. A provision in some policies stating that the insurance company shall not be responsible for any loss which is less than a certain amount. If the loss equals or exceeds that amount, however, it will be paid in full. Deductible. Excess. A provision in freight insurance conditions which exempts the insurer from particular average losses, in any one accident, under 3%. The provision is waived if the loss is caused by fire, or by the ship stranding, sinking or being in collision. In an English policy the term 'Franchise' has been used to define a percentage expressed in the policy (e.g., the 'memorandum' in the SG policy form) which was applied to particular average losses. If the loss fell below this percentage of the amount insured, no claim attached to the policy. If the loss attained the franchise percentage, the claim was paid in full. The franchise system is not generally used in the London market today and is used only in policies which cover freight at risk of the carrier. / Имущество, как правило, страхуется не на всю стоимость. Застрахованная часть стоимости имущества представляет собой страховую сумму. Кроме того, устанавливается доля, возмещение которой осуществляет сам страхователь, а не страховщик. Эта доля называется Франшизой (Franchise) и выражается в виде либо фиксированной суммы, либо фиксированного процента от страховой оценки. Франшиза может быть условной и безусловной. При установлении условной франшизы ущерб, превышающий её размер, возмещается полностью, а при установлении безусловной – только в объёме, превышающем франшизу. Например, если в страховом полисе установлена франшиза, равная 3%, а фактический ущерб составил 4%, то при условной франшизе страховщик возместит 4%, а при безусловной – только 1%.

FRANCHISEE = КОНЦЕССИОНЕР (или ФРЭНЧАЙЗИ) – Franchisee is the party in a franchising agreement that is purchasing the right to use a business's trademarks, associated brands and other proprietary knowledge in order to open a branch. In addition to paying an annual franchising fee to the underlying company, the franchisee must also pay a portion of its profits to the franchisor. One of the benefits of being a franchisee is that the franchisor provides all the information that is needed for running the business (such as, training and suppliers). Furthermore, a franchisee is also usually given an exclusive area, where no other franchises belong to the same underlying business can set up shop in order to prevent internal competition. Franchisee is a managing agent. / Управляющий агент. Фрэнчайзо (Franchisor) – компания, которая позволяет лицу (известному как Фрэнчайзи (Franchisee)).

FRANCHISE TAX = НАЛОГ НА КОНЦЕССИЮ (или НАЛОГ НА ФРАНШИЗУ) – In the United States, Franchise Tax is a tax levied on for profit corporations and other legal entities for the privilege of either incorporating or qualifying to do business in a certain state. A franchise tax may be based upon income, assets, outstanding shares, a combination of the above, or the tax may be a flat fee. Franchise Tax is a tax or fee usually levied annually upon a corporation, limited liability company or similar business entity for the right to exist or do business in a particular state. Failure to pay the franchise tax or similar fees may result in the administration dissolution of the company and forfeiture of the charter. / Налог на Концессию или Налог на Франшизу – налог штата, обычно регрессивный (то есть ставка налогообложения уменьшается по мере роста основной суммы налогообложения), налагаемый на зарегистрированные в штате корпорации за право ведения коммерческой деятельности под их корпорационными именем. Налоги на Франшизу обычно рассчитываются на основе большого числа показателей, таких, как акционерный капитал, акционерный капитал плюс избыток капитала, капитал, прибыль или собственность в штате.

FRANCHISING = КОММЕРЧЕСКАЯ КОНЦЕССИЯ (или ФРЭНЧАЙЗИНЬ) – Franchising is a system under which a licence is granted to manufacture or market a product or service for which the equipment or supplies are manufactured and furnished by the franchisor. The franchisee makes an initial payment and/or pays a royalty on the product or service to the franchisor. Franchises are often granted for a particular territory and for a particular period. The franchisor usually performs certain managerial functions and assumes specific investment and operating costs, while the franchisee operates for his own account. / Правообладатель и Концессионер (Пользователь). Фрэнчайзо (Franchisor) – компания, которая позволяет лицу (известному как Фрэнчайзи (Franchisee)).

FRANCHISOR = ФРЭНЧАЙЗО (или XX) – Franchisor is the company that allows an individual (known as the Franchisee) to run a location of their business. The franchisor owns the overarching company, trademarks, and products, but gives the right to the franchisee to run the franchise location, in return for an agreed-upon fee. Fast-food companies are often franchised. Franchise Board and their respective committees and executives. Franchisor or Franchiser is a party in a franchising enterprise that ultimately owns the

rights, trademarks and proprietary knowledge of the specific business entity. This owner (franchiser) grants the right to operate a branch of the business under the names, brands and all associated aspects of the business to another party (the franchisee) in exchange for an annual fee and a portion of the branch's profits. Becoming a franchiser is a good method for a business with an established brand to potentially expand across different markets and passively earn a good amount of revenues. However, franchisers must be very diligent in assessing potential franchisees and monitoring the quality and performance of existing franchises. Discrepancies of service quality or bad press will not only affect the financial performance of the franchise in question, but will also negatively affect the public's outlook about the entire brand in general. The Franchisor owns the overall rights and trademarks of the company and allows its franchisees to use these rights and trademarks to do business. The franchisor usually charges the franchisee an upfront franchise fee for the rights to do business under the franchise name. In addition, the franchisor usually collects an ongoing franchise royalty fee from the franchisee. / Фрэнчайзо (Franchisor) – компания, которая позволяет лицу (известному как Фрэнчайзи (Franchisee)).

FRANC POINCARÉ = ФРАНК ПУАНКАРЕ – In French, a value unit in which the limitation of the carrier's liability may be expressed. One Franc Poincaré consists of 65.5 milligram of gold with a fineness of 900/1000. The Franc Poincaré is a unit of account that was used in the international regulation of liability. It is defined as 65 miligrams of gold of millesimal fineness 900. Formerly it was identical to the French Franc, although it has not been so since the 1920s.

FRANC ZONE = ЗОНА ФРАНКА – Consisting of 15 member states, the Franc Zone is the monetary union among countries whose currencies are linked to the French Franc. / Состоящая из 15 стран Западной и Центральной Африки, Зона Франка является монетарным союзом, объединяющим страны, валюты которых были увязаны к Французскому Франку (French Franc).

FRANKED DIVIDEND = ФРАНКИРОВАННЫЙ ДИВИДЕНД – Franked Dividend is a dividend paid by a company out of profits on which the company has already paid tax. The investor is entitled to an imputation credit, or reduction in the amount of income tax that must be paid, up to the amount of tax already paid by the company.

FRANKFURT INTERBANK OFFERED RATE = ФРАНКФУРТСКАЯ МЕЖБАНКОВСКАЯ СТАВКА ПРЕДЛОЖЕНИЯ – Frankfurt Interbank Offered Rate (FIBOR) was formerly a daily interest rate for interbank time deposits denominated in D-Marks at the Frankfurt financial centre. It was a reference rate for variable-interest bonds. Since the introduction of the Euro, this function has now been assumed by EURIBOR. / ЮРИБО или ЮРАЙБО (EURIBOR).

FRANKING RATE = СТАВКА ФРАНКИРОВАНИЯ – Franking Rate is the company tax rate at which the dividend is franked.

FRASS = БУРОВАЯ МУКА (или ЭКСКРЕМЕНТЫ НАСЕКОМЫХ) – Frass is a term applied to Insect feces, the shape of which is sometimes used in Family- or Species-level identification; also called Fecal Pellets or Droppings. / Известная также как Фекальные Гранулы (Fecal Pellets) или Помёт или Экскременты (Droppings).

FRAUD = МОШЕННИЧЕСТВО – Fraud is intentional misrepresentation, concealment, or omission of the truth for the purpose of deception or manipulation to the detriment of a person or an organization. Fraud is a legal concept and the application of the term in a specific instance should be determined by a legal expert. Fraud is the use of one's occupation for personal enrichment through the deliberate misuse or misapplication of employing an organization's resources or assets. This can include the fraudulent conversion and obtaining of money or property by false pretenses.

FRAUDULENT TRADING = МОШЕННИЧЕСКАЯ ТОРГОВЛЯ – Fraudulent Trading is defined under Section 213 of the Insolvency Act 1986 (UK) and is considered more serious than Wrongful Trading, but harder for an Insolvency Practitioner to prove. The definition of Fraudulent Trading is, if in the course of the winding up of a company it appears that any business of the company has been carried on with intent to defraud creditors of the company or creditors of any other person, or for any fraudulent purpose. The Court could then, on the application of the Liquidator or Administrator, declare that any persons who were knowingly parties to the carrying on of the business in the manner abovementioned are to be liable to make personal contributions to the company's assets as the Court thinks proper. How you can help protect yourself against the risk of Wrongful or Fraudulent Trading? The most important protection against possible actions is to demonstrate that you acted reasonably as a director at all times. You should be aware of your duties to the company as a director and ensure that at all times you act in the best interests of the company and its creditors. The key four steps you should take as a matter of course as directors are to:- (1) Hold regular formal board meetings to discuss the performance and stability of the company. (2) Ensure that you review the company accounts on a regular basis and familiarize yourself with the contents, ask your accountant if you are not sure of something as they will be happy to help. (3) Document all decisions made and file them in the company records. By doing this you can make sure that you are able to defend all actions taken. (4) Take professional advice at an early stage, involve your accountant and allow them to assist you. Too many times we are brought in at a stage where it is too late to save the company, meaning you have lost your company and your accountant has lost a client. If they can't help you, they will refer you to us for our guidance.

FRAY = РАСПОЛЗАНИЕ (или РЕДИНА, или РЕДОЧЬ, или ПРОТИРАНИЕ) – Fray:- the slipping or shifting of one set of yarns over the other in woven goods or at cut or unfinished edges. Fray is a a raveled place or worn spot (as on fabric). / пятно.

FRAYED SEAMS = РАСПОЛЗАННЫЕ (или ОБТРЕПАВШИЕСЯ, или ОБТРЁПАННЫЕ, или ИЗНОШЕННЫЕ, или ПРОТЁРТЫЕ) ШВЫ – Frayed Seams:- Garments:- men's gabardine sport shirts; Fabric Construction:- (i) Count:- 96 x 50; (ii) Warp:- 20/1 85% 1%-in. 1%-den. dull viscose rayon 15% 2-in. 3-den. dull acetate rayon; (iii) Filling:- same as warp. Complaint:- seams had a frayed or 'fuzzy' appearance. Analysis:- inspection revealed that what appeared to be frayed or fuzzy seams, particularly noticeable where there were several thicknesses of fabric stitched together, such as at the collars and on the pockets, were actually a series of cut filling threads extending beyond the seams. Tensile-strength tests in those sections showed the seams to be abnormally weak and when the sewing thread was removed, it was found that the yarns had been badly cut during sewing. Tests were made on many other sections of several shirts which had been returned and it was found impossible to sew through several fabric layers without obtaining an abnormal amount of needle cutting. With the application of a small amount of softener (as a lubricant) it was found that the needle cutting was completely eliminated. In this case the fault was traced to one small lot of finished goods which had been improperly processed at the finishing plant. / Уточина:- такая же как и основа.

FRAYING = РАЗДВИЖКА (или РАЗДЁРГИВАНИЕ, или ОСЫПАНИЕ) – Fraying is the slipping or raveling of yarns from unfinished edges of cloth. / Раздёрганное место в ткани; Раздёргивание; Перетирание; Путание. Раздвижка – порок ткани.

FRB = FEDERAL RESERVE BANK

FRB = FEDERAL RESERVE BOARD

FRD = FEDERAL RESERVE DISTRICT

FREDDIE MAC = ФРЭДИ МЭК – In the United States, Freddie Mac is a corporation (government-sponsored enterprise) created by Congress to support the secondary mortgage market; it purchases and sells residential mortgages insured by the Federal Home Administration (FHA) or guaranteed by the Veterans Administration (VA). Formerly the Federal Home Loan Mortgage Corporation. See also Fannie Mae. Freddie Mac is the government-sponsored enterprise (GSE) that buys and sells home mortgages, either as whole mortgages or mortgagebacked securities. Freddie Mac was organized as a privately-owned corporation in 1970, primarily as a means to provide competition to the newly private Fannie Mae. In September 2008, Treasury placed Freddie Mac and Fannie Mae into conservatorship that continues through the date of publication. / В Соединённых Штатах Америки бывшая Федеральная Корпорация По Жилищным Займам Под Закладную (Federal Home Loan Mortgage Corporation) изначально организованная в 1970 как корпорация, владеемая частным образом. Смотрите также Фэни Мэй (Fannie Mae). Фрэди Мэк:- (1) Неформальное название Федеральной Корпорации по Жилищным Займам под Закладную (Federal Home Loan Mortgage Corporation (FHLMC)). (2) Обеспеченные пулом закладных ценные бумаги, имеющие номинал минимум в 25 000 Долларов, которые переоформляются, гарантируются и продаются FHLMC. Обеспеченные закладной ценные бумаги являются выпусками, в которые переоформляются жилищные займы под закладную, перепродаваемые затем инвесторам.

FREE AIR = СВОБОДНЫЙ ВОЗДУХ (или АТМОСФЕРНЫЙ ВОЗДУХ) – Free Air is an air at ambient temperature, pressure, relative humidity, and density. / Воздух, естественная смесь газов, главным образом азота и кислорода, составляющая земную атмосферу. Под действием воздуха и воды совершаются важнейшие геологические процессы на поверхности Земли, формируется погода и климат. Воздух является источником кислорода, необходимого для нормального существования подавляющего числа живых организмов (смотрите Аэробы, Дыхание). Сжиганием топлива на воздухе человечество издавна получает необходимое для жизни и производственной деятельности тепло (смотрите Горение). Воздух – один из важнейших источников химического сырья. Сухой Воздух состоит из следующих газов (% по объёму):- азота N_2 78.09; кислорода O_2 20.95; аргона Ar 0.93; углекислого газа CO_2 0.03. Воздух содержит очень небольшие количества остальных инертных газов, а также водорода H_2, озона O_3, окислов азота, окиси углерода CO, аммиака NH_3, метана CH_4, сернистого газа SO_2 и других (подробнее о составе сухого воздуха смотрите таблицу в статье Атмосфера). Учитывая молекулярную массу каждого компонента и его долю в составе воздуха, можно рассчитать среднюю молекулярную массу воздуха, равную 28.966 (приблизительно 29). Содержание в воздухе азота, кислорода и инертных газов практически постоянно, причём постоянная концентрация O_2 (и отчасти N_2) поддерживается растительным миром Земли (смотрите Азотфиксация, Фотосинтез). Содержание в воздухе углекислого газа, окислов азота, сернистых соединений существенно колеблется (в частности, возрастает вблизи больших городов и промышленных предприятий; смотрите также Воздушный Бассейн). Содержание воды в воздухе непостоянно и может составлять от 0.000 02 до 3% по объёму (смотрите Влажность Воздуха). В воздухе всегда находится большое число мелких твёрдых частичек – пылинок (от нескольких миллионов в 1 кубическом метре ($м^3$) чистого комнатного воздуха до 100–300 миллионов в 1 $м^3$ воздуха больших городов, смотрите Аэрозоли). Такие частички зачастую служат центрами конденсации атмосферной влаги и являются причиной образования туманов. Воздух проникает в почву, составляя от 10 до 23–28% её объёма. Почвенный воздух, благодаря биологическим процессам в почве, существенно отличается от обычного по составу; он содержит (по объёму):- 78–80% O_2, 0.1–20.0% N_2 и 0.1–15.0% CO_2. Историческая Справка:- учёные древности считали воздух одним из элементов, из которых состоит всё существующее. Древнегреческий философ Анаксимен (Anaximenes; 585–528 до Нашей Эры) из Милета (VI веке до Нашей Эры) называл воздух ‘Первоматерией’, а древнегреческий философ, врач, государственный деятель и жрец Эмпедокл (Empedocles; 495–430 до Нашей Эры) (V век до Нашей Эры) и древнегреческий философ и учёный Аристотель (Aristoteles; 384–322 до Нашей Эры) (IV век до Нашей Эры) – одним из четырёх элементов – стихий (наряду с огнём, водой и землёй), в которых заключены все присущие материи свойства. Представление о воздухе как о самостоятельном индивидуальном веществе господствовало в науке до конца XVIII века. В 1775–77 Французский химик Отуан Лёро Лявуази (Antoine Laurent Lavoisier; 1743–1794) показал, что в состав воздуха входят открытые незадолго до того химические элементы азот и кислород. В 1894 Английские учёные Дьжон Вильэм Стчрат, 3-й Барон Рэйли (John William Strutt, 3rd Baron Rayleigh; 1842–1919) и Сэр Вильэм Рамзи (Sir William Ramsay; 1852–1894) обнаружили в воздухе ещё один элемент – аргон, затем в воздухе были открыты и другие инертные газы. Большую роль в истории науки сыграло изучение физических свойств воздуха. Итальянский учёный Галилео Галилей (Galileo Galilei; 1564–1642) в 1632 нашёл, что воздух в 400 раз легче воды. Итальянские учёные Винчэнцо Вивиани (Vincenzo Viviani; 1622–1703) и Эвандьжелиста Торричелли (Evangelista Torricelli; 1608–1647) (1643) открыли существование атмосферного давления и изобрели для его измерения барометр. Французский учёный Блез Паскаль (Blaise Pascal; 1623–1662) обнаружил уменьшение атмосферного давления с высотой. Изучая соотношение между давлением и объёмом воздуха, химик, физик и изобретатель Робэт Вильэм Бойл (Robert William Boyle; 1627–1691) и математик Ричад Таунли (Richard Townley; 1629–1707) в 1662 в Англии и Эдм Марьёт (Edme Mariotte; 1620–1684) в 1676 во Франции открыли закон, названный их именами (смотрите Закон Бойла-Марьёта или Закон Бойля-Мариотта); в дальнейшем, с развитием науки были установлены и другие газовые законы (смотрите Газы). Долгое время воздух и его главные компоненты не удавалось превратить в жидкость, и потому их считали ‘постоянными’ газами. Неудача попыток сжижения воздуха была объяснена лишь после того, как Русский учёный Дмитрий Иванович Менделеев (1834–1907) в 1860 установил понятие критической температуры и давления. В 1877, используя охлаждение воздуха до температуры ниже критической (около –140 °C) под высоким давлением, Французский физик и изобретатель Люи-Поль Кайотэ (Louis-Paul Cailletet; 1832–1913) и Швейцарский физик Рауль-Пьер Пиктэ (Raoul-Pierre Pictet; 1846–1929) удалось превратить воздух в жидкость. В 1895 Немецкий инженер Карл Пауль Готфрид фон Линдэ (Carl Paul Gottfried von Linde; 1842–1934) сконструировал и построил первую промышленную установку для сжижения воздуха (смотрите Сжижение Газов). Физические Свойства:- давление воздуха при 0 °C на уровне моря 101 325 Ньютонов на квадратный метр ($Н/м^2$) (1.013 25 б, 1 ат, 760 мм рт.ст.); в этих условиях масса 1 литра (л) воздуха равна 1.292 8 грамма (г). Для большинства практических целей воздух можно рассматривать как идеальный газ; в частности, парциальное давление каждого газа, входящего в состав воздуха, не зависит от присутствия других компонентов воздуха (смотрите Законы Дальтона). Критическая температура –140.7 °C, критическое давление 3.7 $МН/м^2$ (37.2 ат). Перечисленные ниже свойства воздуха даны при давлении 101 325 $Н/м^2$ или 1.013 25 б (так называемое Нормальное Давление). Удельная теплоёмкость при постоянном давлении C_p $10.045 \cdot 10^3$ Дж/(кг·К), то есть 0.24 кал/(г·°C) в интервале 0–100 °C, а при постоянном объёме C_v $8.3710 \cdot 10^3$ Дж/(кг·К), то есть 0.200 2 кал/(г·°C) в интервале 0–1 500 °C. Коэффициент теплопроводности 0.024 276 Вт/(м·К), то есть 0.000 058 кал/(см·сек·°C) при 0 °C и 0.030 136 Вт/(м·К), то есть 0.000 072 кал/(см·сек·°C) при температуре 100 °C; коэффициент теплового расширения 0.003 670 (0–100 °C). Вязкость 0.000 171 (0 °C) и 0.000 181 (20 °C) $мН \cdot сек/м^2$ (сПз). Степень сжимаемости $z = pV/p_0V_0$ 1.000 60 (0 °C), 1.092 18 (25 °C), 1.183 76 (50 °C); показатель преломления 1.000 29; диэлектрическая проницаемость 1.000 059 (0 °C). Растворимость в воде (в кубическом сантиметре ($см^3$) на 1 литр (л) воды) 29.18 (0 °C) и 18.68 (20 °C). Поскольку растворимость кислорода в воде несколько выше, чем азота, соотношение этих газов при растворении в воде изменяется и составляет соответственно 35% и 65%. Скорость звука в воздухе при 0 °C около 330 метров в секунду (м/сек). Жидкий Воздух – голубоватая жидкость с плотностью 0.96 $г/см^3$ (при –192 °C и нормальном давлении). Свободно испаряющийся при нормальном давлении жидкий воздух имеет температуру около –190 °C. Состав его непостоянен, так как азот (и аргон) улетучивается быстрее кислорода.

Фракционное испарение жидкого воздуха используют для получения чистого азота и кислорода, аргона и других инертных газов. Жидкий воздух хранят и транспортируют в Сосудах Дьюара (по имени Английского физика и химика Дьжеймза Дюа (James Dewar); 1842–1923) или в резервуарах специальной конструкции – танках. Сжатый воздух хранят в стальных баллонах при 15 МН/м^2 (150 ат); окраска баллонов чёрная с белой надписью ‘Сжатый Воздух’. Воздух:- Физиолого-Гигиеническое Значение Воздуха:- Колебания содержания азота и кислорода в атмосфере воздуха незначительны и не оказывают существенного влияния на организм человека. Для нормальной жизнедеятельности человека важен процентный состав воздуха, в частности парциальное давление кислорода. Парциальное давление кислорода воздуха над уровнем моря составляет 21 331.5 Ньютонов на квадратный метр (Н/м^2) (или 160 миллиметров ртутного столба (мм рт.ст.)), при уменьшении его до 18 665.1 Н/м^2 (140 мм рт.ст.) появляются первые признаки кислородной недостаточности, которые легко компенсируются у здоровых людей учащением и углублением дыхания, ускорением кроветока, увеличением количества эритроцитов и так далее. При уменьшении парциального давления до 14 665.4 Н/м^2 (110 мм рт.ст.) компенсация становится недостаточной и появляются признаки гипоксии, а уменьшение его до 6 666.1–7 999.3 Н/м^2 (50–60 мм рт.ст.) опасно для жизни. Повышение парциального давления кислорода вплоть до дыхания чистым кислородом (парциальное давление 101 325 кН/м^2 – 760 мм рт.ст.) переносится здоровыми людьми без отрицательных последствий. При обычном парциальном давлении азот инертен. Увеличение его парциального давления до 0.8–1.2 МН/м^2 (8–12 ат) приводит к проявлению наркотического действия (смотрите Наркоз). Значительное увеличение процентного содержания азота в воздухе (до 93% и более) вследствие уменьшения парциального давления кислорода может привести к аноксемии и даже смерти. Содержание углекислого газа – физиологического возбудителя дыхательного центра в атмосфере воздуха, составляет обычно 0.03–0.04% по объёму. Некоторое повышение его концентрации в воздухе промышленных центров несущественно для организма. При высоких концентрациях углекислого газа и снижении парциального давления кислорода может наступить асфиксия. При содержании в воздухе 14–15% CO_2 может наступить смерть от паралича дыхательного центра. Увеличение концентрации CO_2 в воздухе помещений происходит в основном за счёт дыхания и жизнедеятельности людей (взрослый человек в покое при 18–20 °С выделяет около 20 л CO_2 в час). Поэтому содержание в воздухе углекислого газа, с одной стороны, и органических соединений, микроорганизмов, пыли и тому подобного, с другой, увеличиваются одновременно; концентрация CO_2 в воздухе помещений является санитарным показателем чистоты воздуха. Содержание CO_2 в воздухе жилых помещений не должно превышать 0.1%. Находящиеся в незначительном количестве в атмосфере воздуха инертные газы – аргон, гелий, неон, криптон, ксенон при нормальном давлении индифферентны для организма. Обнаруживаемые в атмосфере воздуха в ничтожных концентрациях радиоактивные газы радон и его изотопы – актинон и торон, имеющие малый период полураспада, не оказывают неблагоприятного воздействия на человека. В атмосфере воздуха обычно обнаруживаются различные микроорганизмы (бактерии, грибки и другие). Однако патогенные микроорганизмы встречаются в воздухе крайне редко, в связи с чем передача инфекционных заболеваний через атмосферу воздуха может происходить в исключительных случаях, например, при применении бактериологического оружия, в закрытых помещениях при наличии больных, выделяющих в воздух патогенные микроорганизмы вместе с мельчайшими капельками слюны при кашле, чихании, разговоре. В зависимости от устойчивости микроорганизмов они могут передаваться через воздух как воздушно-капельным, так и воздушно-пылевым путём (наиболее устойчивые, например, возбудители туберкулёза, дифтерии). Для жизнедеятельности человека большое значение имеют температура, влажность, движение воздуха. Для обычно одетого человека, выполняющего лёгкую работу, оптимальная температура воздуха 18–20 °С. Чем тяжелее работа, тем ниже должна быть температура воздуха. Благодаря совершенным механизмам терморегуляции человек легко переносит изменения температуры и может приспособиться к различным климатическим условиям. Оптимальная для человека относительная влажность воздуха 40–60%. Сухой воздух при всех условиях переносится хорошо. Повышенная влажность воздуха действует неблагоприятно:- при высокой температуре она способствует перегреванию, а при низкой температуре переохлаждению организма. Движение воздуха вызывает увеличение теплоотдачи организма. Поэтому при высокой температуре (до 37 °С) ветер способствует предохранению человека от перегревания, а при низкой – переохлаждению организма. Особенно неблагоприятна для человека комбинация ветра с низкой температурой и высокой влажностью. Известное значение придаётся ионизации воздуха. Лёгкие ионы с отрицательным зарядом оказывают положительное воздействие на организм. Для ионизации воздуха предложен ряд приборов. Воздух:- Загрязнение Воздуха:- рост масштабов хозяйственной деятельности увеличивает загрязнение воздуха. Развитие промышленности, энергетики, транспорта приводит к повышению содержания в воздухе углекислого газа (на 0.2% от имеющегося в воздухе количества ежегодно) и ряда других вредных газов. Металлургические и химические предприятия и ТЭЦ загрязняют воздух сернистым газом, окислами азота, сероводородом, галогенами и их соединениями. Другим серьёзным источником загрязнения воздуха служит автотранспорт. По некоторым подсчётам, 1 000 автомобилей в день выбрасывает с выхлопными газами в воздух 3.2 тонны (т) окиси углерода, от 200 до 400 килограммов (кг) других продуктов неполного сгорания топлива, 50–150 кг соединений азота. Очень велико загрязнение воздуха твёрдыми частицами. В Питсбурге (США) на 1 квадратной миле (кв. миле) (или 259 гектарах (га)) ежегодно осаждается 610 т пыли. Промышленные предприятия, ТЭЦ, автотранспорт, лесные пожары, пыльные бури, возникающие в результате эрозии почв при неправильном землепользовании, повышают концентрацию твёрдых частиц (пыли и дыма) в воздухе настолько, что это существенно (на 20–40%) понижает солнечную радиацию, дошедшую до поверхности земли в районе больших городов. О масштабах таких процессов можно судить хотя бы по тому, что пыльные бури 1930–34 в США унесли до 25 сантиметров (см) почвенного слоя и перенесли около 200 миллионов т пыли на расстояния до 1 000 километров (км). Загрязнение воздуха приводит к ухудшению условий жизни человека, животных и растений. Вредное действие на живые организмы при этом вызывается не только первичными компонентами промышленных выбросов, но и образующимися из них новыми токсическими веществами, так называемыми Фотооксидантами. Загрязнение воздуха иногда может достигать таких масштабов, что приводит к увеличению заболеваемости и смертности населения. Особую опасность представляют радиоактивные загрязнения воздуха; вследствие постоянных движений воздушных масс они носят глобальный характер (смотрите Радиоактивное Загрязнение). Некоторые загрязнения воздуха вызывают профессиональные заболевания. Влияние загрязнений воздуха на условия жизни весьма велико. В бывшем СССР были приняты законы об охране природы, предусматривавшие необходимость санитарного контроля за состоянием воздуха и ответственность руководителей промышленных предприятий за тщательную очистку и обезвреживание промышленных газов до их выброса в атмосферу (смотрите Очистка Газов). В качестве обязательных мероприятий при планировке и застройке городов и посёлков и размещении промышленных объектов предусматривается создание санитарно-защитных зон (разрывов), вынос вредных в санитарном отношении промышленных предприятий за пределы жилых районов и так далее (смотрите Благоустройство Населённых Мест, Реконструкция Города). Смотрите также Воздушный Бассейн. Анализ Воздуха:- предельно допустимые концентрации (обычно в мг на 1 л или на 1 м^3 воздуха) вредных и взрывоопасных веществ в производственной воздушной среде регламентируются законодательно. Методы анализа воздуха зависят от агрегатного состояния определяемого вещества. Например, пыль и аэрозоли обычно улавливают ватными или бумажными фильтрами; иногда для улавливания аэрозолей применяют стеклянные фильтры; туманы и газы поглощают главным образом жидкостями. Наиболее распространённые методы определения содержания вредных веществ в воздухе – фотометрический анализ,

нефелометрия и турбидиметрия. Для быстрого определения малых концентраций токсичных и взрывоопасных веществ в воздухе наиболее часто используют автоматические газоанализаторы. Особое место в анализе воздуха занимает определение радиоактивных загрязнений (смотрите Дозиметрия). Воздух В Технике:- благодаря содержащемуся в воздухе кислороду, он используется как химический агент в различных процессах. Сюда относятся:- горение топлива, выплавка металлов из руд (доменный и мартеновский процессы), промышленное получение многих химических соединений (серной и азотной кислот, фталевого ангидрида, окиси этилена, уксусной кислоты, ацетона, фенола и других); ценность воздуха как химического агента существенно повышают, увеличивая содержание в нём кислорода. Воздух является важнейшим промышленным сырьём для получения кислорода, азота, инертных газов. Физические свойства воздуха используют в тепло- и звукоизоляционных материалах, в электроизоляционных устройствах; упругие свойства воздуха – в пневматических шинах; сжатый воздух служит рабочим телом для совершения механической работы (пневматические машины, струйные и распылительные аппараты, перфораторы и так далее). Искусственный Воздух (точнее – искусственная атмосфера, смеси газов, пригодные для дыхания) впервые был использован в медицине при заболеваниях, сопровождающихся кислородной недостаточностью (40–60% кислорода в смеси с обычным воздухом или 95% кислорода и 5% CO_2). Подобные искусственные газовые смеси применяются в высотной авиации, горноспасательном деле. Особое значение имеет искусственный воздух в водолазном деле. Обычный воздух непригоден для работы при давлениях, существенно превышающих нормальное:- в этих условиях воздух оказывает наркотическое действие, а повышение растворимости азота в крови и тканях тела делает опасным быстрый подъём водолаза на поверхность. Выделение пузырьков азота из крови может вызвать кессонную болезнь и смерть. Поэтому в последние 10–15 лет испытываются для работ на больших глубинах (в условиях высоких давлений) безазотные газовые смеси, содержащие главным образом гелий (до 96.4%) и кислород (4–2%) под давлением 0.7–2 МН/м^2 (7–20 ат). Такие смеси устраняют опасность кессонной болезни, однако создают определённый дискомфорт из-за высокой теплопроводности гелия; отмечено также существенное изменение тембра голоса в такой атмосфере. Проблема искусственного воздуха решается также при создании обитаемых космических кораблей (смотрите Атмосфера Кабины). Советские космические корабли ‘Восток’ и ‘Восход’ были оборудованы специальной системой, поддерживающей состав воздуха, близкий к обычному:- парциальное давление кислорода 20–40 кН/м^2, объёмная концентрация CO_2 0.5–1%. Американские космические корабли ‘Дьжеминай’ (или ‘Дьжемини’; Gemini) имели чисто кислородную атмосферу при давлении около 0.3 ат.

FREE ALONGSIDE SHIP = СВОБОДНО ВДОЛЬ БОРТА СУДНА (или ФРАНКО ВДОЛЬ БОРТА СУДНА) – Free Alongside Ship (FAS), a term of INCOTERMS® 2000, means that the seller delivers when the goods are placed alongside the vessel at the named port of shipment. This means that the buyer has to bear all costs and risks of loss of or damage to the goods from that moment. The FAS term requires the seller to clear the goods for export. This is a reversal from previous INCOTERMS® versions which required the buyer to arrange for export clearance. However, if the parties wish the buyer to clear the goods for export, this should be made clear by adding explicit wording to this effect in the contract of sale. This term can be used only for sea or inland waterway transport. Free Alongside Ship (FAS) at a named port of export:- under FAS, the seller quotes a price for the goods that includes charges for delivery of the goods alongside a vessel at the port of departure. The seller handles the cost of unloading and wharfage; loading, ocean transportation, and insurance are left to the buyer. FAS is also a method of export and import valuation. FAS (insert named port of shipment) Incoterms® 2010:- this rule is to be used only for sea or inland waterway transport. ‘Free Alongside Ship’ means that the seller delivers when the goods are placed alongside the vessel (e.g., on a quay or a barge) nominated by the buyer at the named port of shipment. The risk of loss of or damage to the goods passes when the goods are alongside the ship, and the buyer bears all costs from that moment onwards. The parties are well advised to specify as clearly as possible the loading point at the named port of shipment, as the costs and risks to that point are for the account of the seller and these costs and associated handling charges may vary according to the practice of the port. The seller is required either to deliver the goods alongside the ship or to procure goods already so delivered for shipment. The reference to ‘procure’ here caters for multiple sales down a chain (‘string sales’), particularly common in the commodity trades. Where the goods are in containers, it is typical for the seller to hand the goods over to the carrier at a terminal and not alongside the vessel. In such situations, the FAS rule would be inappropriate, and the FCA rule should be used. FAS requires the seller to clear the goods for export, where applicable. However, the seller has no obligation to clear the goods for import, pay any import duty or carry out any import customs formalities. Free Alongside Ship (FAS):- and the price includes delivery of goods along side the vessel but not the cost of loading. / Свободно Вдоль Борта Судна, условие поставки во внешнеторговом договоре купли-продажи (поставки) товара, связанное с его доставкой водным путём, когда в цену товара включается стоимость доставки его к борту судна. ИНКОТЁРМЗ® 2000 (INCOTERMS® 2000).

FREE AND OPEN MARKET = СВОБОДНЫЙ И ОТКРЫТЫЙ РЫНОК – Free And Open Market is a market in which supply and demand are freely expressed in terms of price. Contrasts with a controlled market in which supply, demand and price may all be regulated. / Под Свободным И Открытым Рынком понимается рынок, в котором спрос и предложение свободно отражено в порядках цены. Контрастирует с контролируемым рынком, в котором спрос, предложение и цена все могут быть регулируемыми.

FREE ASTRAY = БЕСПЛАТНАЯ ДОСТАВКА РАНЕЕ УТЕРЯННОГО – Free Astray is an astray shipment (a lost shipment that is found) sent to its proper destination without additional charge.

FREE BOARD = НАДВОДНЫЙ БОРТ (или ВЫСОТА НАДВОДНОГО БОРТА) – Free Board is the height between the deck line and the Plimsoll (or Load) line. The minimum vertical distance from the surface of the water to the gunwale. Freeboard (maritime term):- the distance from the surface of the water to the main deck or gunwale. / Минимальное вертикальное расстояние от поверхности воды до линии пересечения верхней палубы с бортом или верхней кромки борта.

FREE CARRIER = ФРАНКО ПЕРЕВОЗЧИК – Free Carrier (FCA), a term of INCOTERMS® 2000, means that the seller delivers the goods, cleared for export, to the carrier nominated by the buyer at the named place. It should be noted that the chosen place of delivery has an impact on the obligations of loading and unloading the goods at that place. If delivery occurs at the seller’s premises, the seller is responsible for loading. If delivery occurs at any other place, the seller is not responsible for unloading. This term may be used irrespective of the mode of transport, including multimodal transport. ‘Carrier’ means any person who, in a contract of carriage, undertakes to perform or to procure the performance of transport by air, rail, road, sea, inland waterway or by a combination of such modes. If the buyer nominates a person other than a carrier to receive the goods, the seller is deemed to have fulfilled his obligation to deliver the goods when they are delivered to that person. Free Carrier (FCA) to a named place. This term replaces the former ‘FOB Named Inland Port’ to designate the seller’s responsibility for the cost of loading goods at the named shipping point. It may be used for multimodal transport, container stations, and any mode of transport, including air. FCA (insert named place of delivery) Incoterms® 2010:- this rule may be used irrespective of the mode of transport selected and may also be used where more than one mode of transport is employed. ‘Free Carrier’ means that the seller delivers the goods to the carrier or another person nominated by the buyer at the seller’s premises or another named place. The parties are well advised to specify as clearly as possible the point within the named

place of delivery, as the risk passes to the buyer at that point. If the parties intend to deliver the goods at the seller's premises, they should identify the address of those premises as the named place of delivery. If, on the other hand, the parties intend the goods to be delivered at another place, they must identify a different specific place of delivery. FCA requires the seller to clear the goods for export, where applicable. However, the seller has no obligation to clear the goods for import, pay any import duty or carry out any import customs formalities. / Франко Перевозчик (ФРП (FCA)). В сделках купли-продажи (поставки) товара под Франко, от Итальянского слова Franco, означающее Свободный, понимается термин, обозначающий распределение транспортных расходов между продавцом и покупателем до места, указанного в договоре, например, Франко Борт Судна, Франко Вагон (ФРВ (FOR)), Франко Грузовик (ФГР (FOT)), Франко Завод (ФРЗ (FXW)), Франко Корабль (ФРК (EXS)), Франко Причал (ФПР (EXQ)), Франко Самолёт (ФРС (FOA)), Франко Склад Покупателя, Франко Экспедитор (ФЭК (FRC)) и тому подобное. ИНКОТЁРМЗ 2000 (INCOTERMS® 2000).

FREE CASH FLOW = СВОБОДНОЕ ДВИЖЕНИЕ ДЕНЕЖНЫХ СРЕДСТВ (или СВОБОДНЫЙ (или ДОСТУПНЫЙ) ДЕНЕЖНЫЙ ПОТОК, или СВОБОДНАЯ ОБОРАЧИВАЕМОСТЬ НАЛИЧНОСТИ) – Free Cash Flow is represented by net cash from operating activities less cash used for certain investing activities. Free cash flow is commonly used by investors, analysts and credit rating agencies to assess and evaluate our performance over time and within the wireless telecommunications industry. Because free cash flow is not based in US GAAP (short for the Generally Accepted Accounting Principles) and excludes certain sources and uses of cash, the calculation should not be looked upon as an alternative to our Consolidated statement of cash flows or other information prepared in accordance with US GAAP. Free Cash Flow is cash provided by operating activities less payments related to property, plant and equipment and intangible assets. / коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо).

FREE CIRCULATION = СВОБОДНОЕ ОБРАЩЕНИЕ (или СВОБОДНОЕ ХОЖДЕНИЕ, или СВОБОДНАЯ ЦИРКУЛЯЦИЯ) – Free Circulation is the movement of goods within the European Community without the need to pay any duty. / Перемещение товаров в пределах Европейского Сообщества без необходимости оплаты каких-либо пошлин.

FREE CROWD SYSTEM = СИСТЕМА ВСЕОБЩЕГО ДОСТУПА – Free Crowd System is a system of trading, common to most US commodity exchanges, where all floor members may bid and offer simultaneously either for their own accounts or for the accounts of customers, and transactions may take place simultaneously at different places in the trading ring. See also Board Broker System, and Specialist System.

FREE DELIVERY = БЕСПЛАТНАЯ ПОСТАВКА – Free Delivery:- securities delivered without a corresponding receipt of funds. / Ценные бумаги, поставленные без соответствующего получения денежных средств.

FREE DESPATCH = БЕЗ ДИСПАЧА – Free Despatch:- if loading/discharging achieved sooner than agreed, there will be no freight money returned. / В случае, когда погрузка/выгрузка состоялись ранее оговорённого времени, и при наличии такого выражения в условиях контракта на перевозку груза, никакие суммы из денежных средств, направленных на оплату фрахта, возвращаться не будут.

FREEDOM OF ESTABLISHMENT = СВОБОДА ПРЕДПРИЯТИЯ – Freedom Of Establishment:- in the context of insurance the right of an insurer located in one member state of the European Union (EU) to sell insurance in another member state of the EU through a local branch, agency or subsidiary. In the case of Lloyd's this includes business that is underwritten by a coverholder in a EU member state where Lloyd's has a representative office and where the coverholder may enter into contracts of insurance without first consulting the managing agent that granted the binding authority. / Лойдз (Lloyd's).

FREEDOM OF SERVICES = СВОБОДА ОКАЗАНИЯ УСЛУГ – Freedom Of Services:- the right to provide services on a cross-border basis within the European Union (EU). The essential feature so far as the provision of insurance is concerned is that the contract is made in an EU member state which is different from the member state where the risk is located. See also European Union/European Economic Area Risk. It therefore covers open market business (with or without the involvement of a local intermediary) and business that is written under any binding authority where the local coverholder does not have authority to enter into contracts of insurance without first consulting the managing agent that granted the binding authority.

FREE ENTRY = СВОБОДНЫЙ ПРОЁМ – Free Entry is an entry through which the fork-arm wheels of a pallet truck can pass without leaving the ground. See also Pallet. / Свободный Проём (Free Entry):- отверстие, через которое вводят вилы вилочной тележки без отрыва поддона от земли. Смотрите также Поддон (Pallet).

FREE–ENTRY PALLET = ПОДДОН СО СВОБОДНЫМ ПРОЁМОМ – Free-Entry Pallet is a flat pallet having entries through which the fork-arm wheels of a pallet truck can pass without leaving the ground. / Поддон Со Свободным Проёмом:- плоский поддон, имеющий свободные проёмы, обеспечивающие возможность ввода вилочного захвата без отрыва поддона от земли.

FREE EXINS = FREE OF ANY EXTRA INSURANCE

FREE FATTY ACIDS = СВОБОДНЫЕ ЖИРНЫЕ КИСЛОТЫ – Free Fatty Acids:- oilseed quality is determined in part by the free fatty acid test. Free Fatty Acids are components that reduce the smoke point in frying fats and oxidize rapidly, giving rancid flavours. The test gives a direct measure of the processing qualities of the oil and the amount of lye required to refine oils. Top canola seed usually has less than 0.7% free fatty acids. International specifications for top grade oil are usually set at 2.0% free fatty acids.

FREE FLOAT = СВОБОДНОЕ ОБРАЩЕНИЕ (или В СВОБОДНОМ ОБРАЩЕНИИ) – Free Float:- shares in a company that are owned by many different shareholders and can be freely traded in the capital market. The float refers to shares that are not held by majority shareholders, and can therefore be acquired and traded by the general public. As a rule, the larger the float, the easier it is for investors to buy and sell stock. The proportion of a company's issued shares that are in public hands. Also known as Public Float. Free Float is the portion of the capital that is available to the public. The free float will be calculated to the exclusion of all interests with more than 5% of capital in the issuing entity, except where such an interest is held by an undertaking for collective investment or a pension fund. Free float calculated in this way will be rounded up to the next multiple of 5%.

FREE FLOAT MARKET CAPITALIZATION = РЫНОЧНАЯ КАПИТАЛИЗАЦИЯ В СВОБОДНОМ ОБРАЩЕНИИ – The Free Float Market Capitalization is the product of the number of shares times the price and times the free float factor. Free-float market capitalization is obtained by multiplying the number of issued shares by the share price, and then multiplying the result by the free float.

FREE FROM = СВОБОДНО ОТ – Free From (of a consignment, field or place of production):- without pests (or a specific pest) in numbers or quantities that can be detected by the application of phytosanitary procedures. / Свободно от (о грузе, поле или месте производства):- без вредителей (или конкретного вредителя) в числах или количествах, которые могут быть выявлены посредством применения фитосанитарных процедур.

FREE GOODS = ДАРОВЫЕ БЛАГА – The Free Good is a term used in economics to describe a good that is not scarce. A free good is available in as great a quantity as desired with zero opportunity cost to society.

FREEHOLD = ФРИГОЛЬД (или ПОЛНОПРАВНОЕ ВЛАДЕНИЕ, или ПОЛНОПРАВНОЕ ОБЛАДАНИЕ) – Freehold:- the permanent ownership of land or buildings which can be legally passed on to heirs and the most usual form of ownership for houses. Also known as property that is held in 'fee simple'. Ownership with absolute rights in perpetuity. Freehold:- the freeholder of land is in practice the absolute owner of it in perpetuity. / Вечное пользование. Владение с абсолютными правами в бессрочном периоде. В средневековой Англии под Фригольдом понималось феодальное держание, наследственное или пожизненное. Фригольд могло быть городским, крестьянским, рыцарским и церковным. Крестьяне-фригольдеры обладали личной свободой, имели фиксированную ренту, право завещания, отчуждения, держания, защиты в Королевских судах.

FREEHOLD LAND = ЗЕМЛЯ В ПОЛНОПРАВНОМ ВЛАДЕНИИ – Freehold Land is land over which the Crown has granted an interest. The freehold interest is the least restricted interest in land and is usually known as 'Ownership' of land. Unlike leasehold, the land is no longer called Crown land after the freehold interest has been granted. The Crown cannot put conditions on the use of the land like it can with Leasehold. There may be some restrictions on how the land can be used because of other laws (such as local government laws). The terms 'freehold' and 'fee simple' mean the same thing and are usually both called 'ownership' of land. Freehold gives the owner of that interest the exclusive right to the land for an indefinite period of time. The owner of the freehold can sell the land to anyone else. The owner may also lease (or rent) the land to someone else on whatever conditions they like (just like the Crown can lease land). When the Crown grants the freehold interest, it keeps a right to compulsorily buy the land back (in other words, even if you do not agree with the Crown buying the land back, it can) for public works such as roads, railways, bridges, schools, hospitals or other purposes to benefit the State. When freehold land is needed for that sort of use, the Crown first tries to buy the land by agreement with the owner. If that fails, then the Crown will compulsorily buy the land and pay compensation to the owners. Real property held under fee simple absolute in possession. In the United Kingdom, Freehold Land was and is held 'in fee simple'. Freehold land was owned absolutely by the owner, who was free to sell it, pass it by will, or settle it, so that it passed to anyone he or she choosed. If no other arrangements were made, the land would pass to the heir of the owner after his or her death. Also known as Land Owned in the United States. / Вечное пользование.

FREE IN = БЕСПЛАТНАЯ ПОГРУЗКА – Free In (FI):- in the international ocean freight terminology the word 'Free' means 'Not Included', i.e. if FI, then the shipper is responsible for the coast of loading goods onto a vessel for the international shipping overseas. Free In (FI) is the contract term which specifies that loading costs shall be paid by the buyer of the cargo and not by the charterer. A pricing term indicating that the charterer of a vessel is responsible for the cost of loading goods onto the vessel.

FREE IN AND OUT = БЕСПЛАТНАЯ ПОГРУЗКА И РАЗГРУЗКА – Free In and Out (FIO) is the contract term which specifies that loading and unloading costs shall be paid by the buyer of the cargo and not by the charterer. Cost of loading and unloading a vessel is borne by the charterer/shipper. Transport term signifying that the freight rate excludes the costs of loading/discharging, stowage, and lashing. A pricing term indicating that the charterer of a vessel is responsible for the cost of loading and unloading goods from the vessel. Free In and Out (FIO) is the international shipping term used in the ocean freight industry means that the carrier is not responsible for the cost of loading and unloading gods onto/from the vessel. Cargo to be loaded and discharged free to the vessel. / Груз, который должен быть бесплатно погружен на судно и разгружен из него.

FREEING PORT = ПОРТ УДАЛЕНИЯ (или ПОРТ ОСВОБОЖДЕНИЯ, или СВОБОДНАЯ ГАВАНЬ, или ОСУШИТЕЛЬНЫЙ ПОРТ, или ШТОРМОВОЙ ПОРТ) – Freeing Port (maritime term):- a port in the bulwark for the purpose of freeing the deck of water.

FREE IN LINER OUT = БЕСПЛАТНАЯ ПОГРУЗКА, РАЗГРУЗКА ЗА СЧЁТ ПЕРЕВОЗЧИКА (или ЛИНЕЙНЫЕ УСЛОВИЯ ПРИ РАЗГРУЗКЕ) – Free In Liner Out:- seafreight with which the shipper pays load costs and the carrier pays for discharge costs. Transport condition denoting that the freight rate is inclusive of the sea carriage and the cost of discharging, the latter as per the custom of the port. It excludes the cost of loading and, if appropriate, stowage and lashing. Transport term signifying that the freight rate is inclusive of the ocean carriage and the cost of discharging, the latter usually as per the custom of the port. It excludes the cost of loading, stowage, and lashing. / Морской фрахт, при котором грузоотправитель оплачивает расходы по погрузке, а перевозчик оплачивает расходы по разгрузке.

FREE IN/OUT AND TRIMMED = БЕСПЛАТНАЯ ПОГРУЗКА/РАЗГРУЗКА И ТОРЦОВКА (или ТОРЦЕВАНИЕ) – Free In/Out And Trimmed:- as per Free In/Out Stowed Freight Rates (FIOS) but includes trimming, e.g., the levelling of bulk cargoes. FIOS includes seafreight, but excludes loading/discharging and stowage costs. Charterer pays for cost of loading/discharging cargo, including stowage and trimming. / , например, . , включая штивку и торцовку (торцевание) – обработку торцов.

FREE IN/OUT STOWED FREIGHT RATES = СТАВКИ ФРАХТА С БЕСПЛАТНОЙ ПОГРУЗКОЙ/РАЗГРУЗКОЙ ИЗ ШТАБЕЛЯ – Free In/Out Stowed Freight Rates quoted FIOS exclude all aspects related to cargo handling. The ship is responsible only for expenses related to the ship calling the port.

FREE INTO STORE = СВОБОДНО В МАГАЗИН – Free Into Store (FIS) is an unofficial trade term indicating that the seller's price includes all costs up to delivery to the buyer.

FREELY NEGOTIABLE LETTER OF CREDIT = СВОБОДНО НЕГОЦИИРУЕМЫЙ (или ОБРАЩАЕМЫЙ) АККРЕДИТИВ – Freely Negotiable Letter Of Credit is a letter of credit that indicates it is available with any bank by negotiation. By including this wording, the issuing bank authorizes the beneficiary to present documents to the bank of his choice for examination and collection of payment. / Свободная Негоциация – негоциация в любом банке по выбору бенефициара.

FREE MOVEMENT OF GOODS = СВОБОДНОЕ ПЕРЕМЕЩЕНИЕ ТОВАРОВ – The Free Movement Of Goods is one of the freedoms of the single market of the European Union. Since January 1993, controls on the movement of goods within the internal market have been abolished and the European Union is now a single territory without internal frontiers. The abolition of customs tariffs promotes intra-Community trade, which accounts for a large part of the total imports and exports of the Member States. Articles 28 and 29 of the Treaty establishing the European Community prohibit import and export restrictions between all Member States. However, if there is a threat to public health or the environment, Member States may restrict the free movement of goods. Free Movement Of Goods:- system in which goods admitted into the European Community are allowed to circulate freely among member nations.

FREE OF CAPTURE AND SEIZURE = БЕЗ ЗАХВАТА И КОНФИСКАЦИИ – Free Of Capture And Seizure:- commonly abbreviated to FC&S, this term was used until 1982 in all marine insurance contracts to refer to the war exclusion clause. Its use was discontinued in the UK cargo insurance market in 1982 and in the hull insurance market in 1983.

FREE OF PARTICULAR AVERAGE = СВОБОДНО ОТ ЧАСТНОЙ АВАРИИ – The FPA, or 'Free of Particular Average', clause excludes from coverage partial losses to the cargo or to the hull except those resulting from stranding, sinking, burning, or collision.

Under its provisions, losses below a given percentage of value, say 10 percent, are excluded. In this way the insurer does not pay for relatively small losses to cargo. The percentage deductible varies according to the type of cargo and its susceptibility to loss. Free Of Particular Average (FPA) is a marine insurance term meaning that the assurer will not allow payment for partial loss or damage to cargo shipments except in certain circumstances, such as stranding, sinking, collision or fire.

FREE OF PARTICULAR AVERAGE, AMERICAN CONDITIONS = СВОБОДНО ОТ ЧАСТНОЙ АВАРИИ, АМЕРИКАНСКИЕ УСЛОВИЯ – Free Of Particular Average, American Conditions:- average clause that limits recovery of partial losses under the perils clause to those losses directly resulting from fire, stranding, sinking, or collision of the vessel.

FREE OF PARTICULAR AVERAGE, ENGLISH CONDITIONS = СВОБОДНО ОТ ЧАСТНОЙ АВАРИИ, АНГЛИЙСКИЕ УСЛОВИЯ – Free Of Particular Average, English Conditions:- same as Free of Particular Average, American Conditions (FPAAC) except that partial losses under the perils clause are fully recover-able if the vessel has been stranded, sunk, burned, been on fire, or in collision, without requiring that the damage actually be caused by one of these perils.

FREE ON BOARD = СВОБОДНО НА БОРТУ (СУДНА) (или ФРАНКО БОРТ (СУДНА)) – Free On Board (FOB):- in international trade, FOB is a facility for distributing the costs and risks of loss or damage between the importer and exporter, as governed by the Incoterms. Under an FOB arrangement, tthe seller delivers when the goods pass the ship's rail at the named port of shipment. Responsibility for all costs and risks pass to the buyer at that point. In international commerce, FOB and CIF (cost, insurance, freight) are the most common means of distributing responsibility in the context of documentary letters of credit. Goods delivered on board the vessel free of extra charge to the purchaser. The goods become the responsibility of the buyer once they are on board the ship. Free On Board (FOB):- the price quoted applies only at inland shipping point, and the seller arranges for loading of the goods on, or in, railway cars, trucks, lighters, barges, aircraft or other conveyance furnished for transportation. Free On Board (FOB) at a named port of export. The seller quotes the buyer a price that covers all costs up to and including delivery of goods aboard a vessel at a port. FOB is also a method of export valuation. Free On Board (FOB), a term of INCOTERMS® 2000, means that the seller delivers when the goods pass the ship's rail at the named port of shipment. This means that the buyer has to bear all costs and risks of loss of or damage to the goods from that point. The FOB term requires the seller to clear the goods for export. This term can be used only for sea or inland waterway transport. If the parties do not intend to deliver the goods across the ship's rail, the FCA term should be used. Free on Board (FOB):- export term in which the price quoted by the exporter does not include the costs of ocean transportation, but does include loading on board the vessel. FOB (insert named port of shipment) Incoterms® 2010:- this rule is to be used only for sea or inland waterway transport. 'Free on Board' means that the seller delivers the goods on board the vessel nominated by the buyer at the named port of shipment or procures the goods already so delivered. The risk of loss of or damage to the goods passes when the goods are on board the vessel, and the buyer bears all costs from that moment onwards. The seller is required either to deliver the goods on board the vessel or to procure goods already so delivered for shipment. The reference to 'procure' here caters for multiple sales down a chain ('string sales'), particularly common in the commodity trades. FOB may not be appropriate where goods are handed over to the carrier before they are on board the vessel, for example goods in containers, which are typically delivered at a terminal. In such situations, the FCA rule should be used. FOB requires the seller to clear the goods for export, where applicable. However, the seller has no obligation to clear the goods for import, pay any import duty or carry out any import customs formalities. Free On Board (FOB), the valuation of imports and exports of goods used in the economic accounts, including all costs invoiced by the exporter up to the point of loading on to the ship but excluding the cost of insurance and freight from the country of consignment. Free On Board (FOB) refers to a transaction where the seller pays for transportation of the goods to the port of shipment, plus loading costs. The buyer pays cost of marine freight transport, insurance, unloading, and transportation from the arrival port to the final destination. Risk is transferred from the seller to the buyer when the goods pass the ship's rail at the port of shipment. Free On Board (FOB) price usually includes cost of transport, insurance and loading onto a vessel at the port of departure. Free On Board (FOB):- as it relates to closeout merchandise:- 'This refers to the location of the merchandise being represented and shipped from. This can be some indication that the merchandise is being 'Brokered', obviously if the company you are dealing with is located in Texas and lists merchandise FOB Florida you can almost assume your broker has never seen the merchandise offered. Be careful as this is not the case in all situations. A company may have multiple warehouse locations. This is a gray area and very hard to determine. You will notice many companies stating, 'We have many FOB or warehouse points all over the US'. This should not be construed as company owned facilities'. Free on Board (FOB):- usually, the point used or quotation is the port of export, and the price includes local delivery and loading. / Выражение Свободно На Борту (Судна) или Франко Борт является термином внешнеторгового договора купли-продажи (поставки) товара, связанного с его доставкой водным путём, когда в цену товара включаются транспортные и другие расходы по его доставке на борт судна. когда товары пересекли планширь фальшборта судна в указанном порту отгрузки. Фальшборт, от Немецкого слова Falschbord, лёгкий стальной пояс, выполненный как продолжение бортовой обшивки судна и расположенный выше верхней палубы. Фальшборт служит ограждением открытых частей палубы и уменьшает накат волн на неё. ИНКОТЁРМЗ® 2000 (INCOTERMS® 2000). Франко Борт Судна (ФОБ (FOB)). Франко Борт – международный торговый термин, одно из условий поставки товаров в международной торговле (Группа F по Инкотёрмз). 'Свободно на Борту' означает, что продавец считается выполнившим свое обязательство по поставке с момента перехода товара через поручни судна в порту отгрузки. С этого момента покупатель должен нести все расходы и риски гибели или повреждения товара. По условиям ФОБ на покупателя возлагаются обязанности по очистке товара от пошлин для его вывоза (или экспорта). Данный термин может применяться лишь при перевозке товара морским или внутренним водным транспортом. В случаях, когда момент перехода товара через поручни судна не имеет практического значения, например при перевозках в контейнерах, более целесообразно применение термина ФАС. Свободно На Борту (Судна) или Франко Борт – термин, использующийся в области транспортных перевозок, означающий, что прейскурантные цены включают доставку за счёт продавца в определённый пункт, но не дальше. Например, 'FOB наш склад в Ньюарке' означает, что покупатель должен оплачивать все расходы на доставку и иные сборы, связанные с перевозкой товара от склада продавца в Ньюарке к пункту получения товара покупателем. Право владения товаром обычно переходит от продавца к покупателю в пункте ФОБ путём передачи накладной. ФОБ (FOB или Free On Board):- базисные условия поставки, согласно которым продавец оплачивает расходы по транспортировке, страхованию, а также таможенные расходы до момента доставки товара на борт судна зафрахтованного покупателем, в согласованном порту погрузки в установленный срок. Покупатель обязан зафрахтовать судно и своевременно известить продавца о сроке и месте погрузки, названии, времени прибытия судна, условиях погрузки. Риск переходит с продавца на покупателя в момент погрузки товара на борт судна.

FREE OUT = БЕСПЛАТНАЯ РАЗГРУЗКА – Free Out is a pricing term indicating that the quoted prices includes the cost of unloading the goods from the vessel. Cost of unloading a vessel is borne by the charterer. Free Out (FO) is the international shipping term in ocean freight that indicates that the consignee (recipient) is responsible for the cost of unloading cargo from the vessel at the destination. Free Out (FO) is the contract term wich specifies that unlading costs shall be paid by the buyer of the cargo and not the charterer.

FREE PORT = СВОБОДНЫЙ ПОРТ (или ОТКРЫТЫЙ ПОРТ) – Free Port is an area considered apart from the rest of the country for Customs purposes. Goods for local use or re-export can enter free ports duty free. The union between Hamburg and the German empire in 1881 was accompanied by a customs union in which Imperial Chancellor Bismarck sought to appease Hamburg, traditionally used its trade privileges, with the establishment of a freeport. This freeport consists of an enclosed area 16 square kilometers in size and free of all customs limitations. Imported goods from abroad can be stored, repacked or processed in any way without incurring customs duty. Customs duty is only payable when the goods cross the customs boundary and enter German territory. The crossing points have toll bars and are guarded around the clock by officials in green uniforms. As a sign of gratitude for this concession, which made trade much easier for the Hamburg Port, the citizens of Hamburg erected a massive monument to Bismarck in St Pauli. An area, such as a port city, into which merchandise may legally be moved without payment of duties. Free Port is a restricted area at a seaport for the handling of duty-exempted import goods. Also called a Foreign Trade Zone. An international port or an area within an international port at which, crew, passengers, baggage, cargo, mail and stores may be disembarked or unloaded, may remain and may be transhipped, without being subjected to any customs charges or duties. Examination is possible for instance to meet security or narcotics control requirements. / Бисмак (Bismarck).

FREE PRATIQUE = РАЗРЕШЕНИЕ НА СВОБОДНОЕ СНОШЕНИЕ С БЕРЕГОМ – Clearance by the Health Authorities. Free Pratique is a permission granted by local medical authorities, meaning that the vessel has a clean Bill of Health allowing people to embark and disembark.

FREE RIDER = XX (или СВОБОДНЫЙ НАЕЗДНИК) – Free Rider is a person who chooses to receive the benefits of a 'public good' or a 'positive externality' without contributing to paying the costs of producing those benefits.

FREE RIDING = БЕЗРАССУДНОЕ ДЕЙСТВО – In the United States, Free Riding is a term for the practice of buying and selling securities, usually on the same day, in amounts greatly exceeding the amount allowed under margin collateral requirements. The practice is also referred to as 'Day Trading'. The free rider attempts to profit from short-term changes in market prices without placing significant personal funds at risk. This practice may result in a violation of 12 CFR (short for the US Code of Federal Regulations:- Title 12) 221 (Regulation U), and is addressed by OCC (US Office of the Comptroller of the Currency) Banking Circular 275, 'Free Riding in Custody Accounts', 1993-September-03.

FREE SALE CERTIFICATE = СВИДЕТЕЛЬСТВО О СВОБОДНОЙ ПРОДАЖЕ (или СЕРТИФИКАТ О СВОБОДНОЙ ПРОДАЖЕ) – Free Sale Certificate:- the US Government does not issue certificates of free sale. However, the Food and Drug Administration, Silver Spring, Maryland, will issue, upon request, a letter of comment to the US manufacturers whose products are subject to the Federal Food, Drug and Cosmetic Act or other acts administered by the agency. The letter can take the place of the certificate.

FREE SPAN = СВОБОДНЫЙ ПРОЁМ (или СВОБОДНЫЙ ЗАЗОР) – In pallets, Free Span is the distance between supports in a warehouse rack.

FREE SUPPLY = СВОБОДНОЕ ПРЕДЛОЖЕНИЕ – Free Supply is the amount of grain available to the market. It excludes government held grain.

FREE TIME = СВОБОДНОЕ ВРЕМЯ (или БЕСПЛАТНОЕ ВРЕМЯ) – (1) Free Time is the amount of time provided by tariff for the consignee/agent to accept delivery of cargo at the expiration of which demurrage charges accrue. Time allowed for shippers or consignees/receivers to load or unload cargo before demurrage, detention and other charges accrue. Free Time is a period of time allowed for loading/unloading of cargo before demurrage or detention charges begin accruing. Storage allowed at carrier facility without penalties assessed. That amount of time that a carrier's equipment may be used without incurring additional charges. Free Time is the period allowed to the owner to accept delivery before storage charges begin to accrue. / Под Свободным Временем понимается часть внерабочего времени (в границах суток, недели, года) остающаяся у лица за вычетом непреложных, необходимых затрат.

(2) Free Time:- the amount of time provided by TIR contract to carriers for the loading or unloading of container at the expiration of which detention charges will accrue.

FREE TRADE = СВОБОДНАЯ ТОРГОВЛЯ – Free Trade is a legal arrangement or national policy under which the exchange of goods and services across international borders is neither restricted nor subsidized by techniques of government intervention such as import tariffs, import quotas, export subsidies, discriminatory regulations disadvantaging foreign buyers or foreign sellers, trade embargoes, political manipulation of foreign currency exchange rates, and the like. From their first origins in the writings of Adam Smith up to the present, the classical and neoclassical schools of economic theory have emphasized the advantages of free trade policies and the disadvantages of protectionism for the improvement of popular living standards and the promotion of overall rates of economic growth. Although the theoretical arguments can and do become extremely detailed and complex, the basic conclusion of classical and contemporary neoclassical economic theory is that the advantages of free international trade represent basically only a special case of the advantages of the free market system in general. Although moving toward free trade may represent very real financial losses for the small minority of companies with the political influence to get themselves protected from foreign competition, these losses are normally much more than counterbalanced by the gains to the great majority of the population. Free trade leaves the country's consumers free to seek out the best bargains they can find by not arbitrarily restricting their ability to choose foreign suppliers when they offer a better deal than their domestic competitors in terms of price and/or quality. This enhances competition and breaks down local monopolies. Free trade also enhances the profitability of many other local industries by enabling them to shop around for better deals in purchasing their supplies of raw materials and other capital goods and thus helping them to reduce their costs of production. In the most general terms, free trade makes possible a progressive extension of the area within which specialization and the division of labor takes place according to the principle of comparative advantage, producing gains from trade in overall productivity and economic efficiency that result in higher average living standards both at home and abroad. Removal of all trade barriers in international commerce. See also Free Trade Area. / Снятие всех торговых барьеров в международной коммерции. Смотрите также Зона Свободной Торговли (Free Trade Area).

FREE TRADE AGREEMENT = СОГЛАШЕНИЕ О СВОБОДНОЙ ТОРГОВЛЕ – A Free Trade Agreement (FTA) is an arrangement which establishes unimpeded exchange and flow of goods and services between trading partners regardless of national borders. An FTA does not (as opposed to a common market) address labor mobility across borders or other common policies such as taxes. Member countries of a free trade area apply their individual tariff rates to countries outside the free trade area.

FREE TRADE AREA = АРЕАЛ СВОБОДНОЙ ТОРГОВЛИ – Free Trade Area:- agreement between a group of countries to abolish mutual customs tariffs and other trade barriers and to allow goods produced in their territories to circulate freely among them. Differs from a customs union in that each member nation is free to apply its own tariffs against other countries rather than adopting a common tariff applied by all members to countries outside the area. The European Free Trade Association (EFTA) is a free trade area, while the

European Community (EC) is a customs union. A cooperative arrangement by a group of nations whereby trade barriers are removed among the members, but each may maintain its own trade regime with nonmember nations. A free trade area allows member countries to maintain individually separate tariff schedules for external countries; members of a customs union employ a common external tariff.

FREE TRADE ZONE = ЗОНА СВОБОДНОЙ ТОРГОВЛИ – A port designated by the government of a country for duty-free entry of any non-prohibited goods. Merchandise may be stored, displayed, used for manufacturing, etc, within the zone and re-exported without duties. Free Trade Zones (FTZs) offer outstanding advantages to exporters. Goods brought into the zones enter free of taxes and duties. Their entry does not imply that their final destination is for consumption. The customs authority regulating the goods treats them as stored in a third country; therefore, incoming products are subject to inspection with the sole purpose of classifying quantity and type.

FREE WATER = СВОБОДНАЯ ВОДА (или НЕСВЯЗАННАЯ ВОДА, или СЛОЙНАЯ ВОДА) – Free Water is a water droplets or globules in the system fluid that tend to accumulate at the bottom or top of the system fluid depending on the fluid's specific gravity. / Слойная Вода в нефтепродукте.

FREE–WHEELING = ХОЛОСТОЕ КРУЖЕНИЕ (или СВОБОДНОЕ КРУЖЕНИЕ) – Free-Wheeling:- in reference to rolls, spinning without the application of either driving or braking force.

FREE WOOLS = СВОБОДНАЯ ШЕРСТЬ – Free Wools usually means wool that is free from defects, such as vegetable matter. / Порок или дефект.

FREEZER BURN = ОЖОГ ЗАМОРАЖИВАТЕЛЕМ – Freezer Burn is a drying out of frozen goods.

FREEZER CONTAINER = РЕФРИЖЕРАТОРНЫЙ КОНТЕЙНЕР С МАШИННЫМ ОХЛАЖДЕНИЕМ (или КОНТЕЙНЕР ЗАМОРАЖИВАТЕЛЬ) – Freezer Container is a special type of refrigerated container which can maintain the temperature of the cargo at approximately –65°C. At approximately –62°C, the eutectic point is reached, i.e. as of this temperature, all the water in a product is completely frozen. No microbial activity can occur when there is no free water, and therefore the product does not suffer any further loss of quality. At these temperatures, the product has an infinite storage life. / , то есть .

FREEZING CHAIN = ЦЕПОЧКА ЗАМОРОЗКИ – Freezing Chain is unbroken chain from manufacture through to the consumer in which the prescribed freezing temperature is constantly maintained.

FREE ZONE = СВОБОДНАЯ ЗОНА – Free Zone:- a part of the territory of a State where any goods introduced are generally regarded, insofar as import duties and taxes are concerned, as being outside the Customs territory and are not subject to the usual Customs control. A distribution may be between commercial and industrial free zones. In commercial free zones, goods are admitted pending subsequent disposal and processing or manufacture is normally prohibited. Goods admitted to industrial free zones may be subjected to authorized processing operation. Free zones are dealt with in Annex F.1. to the Kyoto Convention. In some countries free zones are also known under various other names, such as 'Free Ports', 'Free Warehouses' or 'Foreign Trade Zones'. / В разных странах свободные зоны могут быть известны под разными названиями, например, Свободные Порты (Free Ports), Свободные Склады (Free Warehouses) или Иностранные Торговые Зоны (Foreign Trade Zones).

FREIGHT = ГРУЗОВАЯ ПЕРЕВОЗКА – Freight is a method or service for transporting goods, especially bulky goods, by water, land, or air. A Freight is the movement of goods by lorries, trains, ships, or aeroplanes. Freight Transport is the physical process of transporting commodities and merchandise goods and cargo. The term Shipping originally referred to transport by sea but in American English, it has been extended to refer to transport by land or air (International English:- Carriage) as well. Logistics is a term borrowed from the military environment, is also used in the same sense. See also Carriage; and Logistics. In British English, Freight is the commercial transport that is slower and cheaper than express. / Грузовые Перевозки, перемещение грузов различными средствами транспорта – универсальными и специальными. (Перемещение земляных масс при производстве строительных работ с помощью бульдозеров и других строительных машин к грузовым перевозкам не относится.) Различают:- (а) Внутрипроизводственные Грузовые Перевозки, технологически связанные с производством той или иной продукции в пределах отдельного предприятия; (б) Народнохозяйственные Грузовые Перевозки – перевозки продукции в сфере обращения от производителей к потребителям либо непосредственно (транзитные поставки), либо через склады долгосрочного хранения и торовая сеть (повторные перевозки). Объём грузовых перевозок (измеряемый в тоннах) обусловлен объёмом производства продукции и импорта и коэффициентом повторности перевозок, то есть тем, сколько раз одна и та же тонна продукции перевозится от предприятия-производителя до пунктов потребления (производственного или личного). Коэффициент повторности зависит от действующей системы снабжения и сбыта продукции, величины транзитных норм поставки, ёмкости и размещения складов, степени развитости так называемых смешанных перевозок, осуществляемых двумя или несколькими видами транспорта (при таких перевозках одна и та же продукция учитывается отдельно каждым видом транспорта, то есть имеет место повторный учёт), и от других факторов. Как правило, в социалистических странах коэффициент повторности перевозок меньше, чем в капиталистических, вследствие преимуществ плановой системы снабжения предприятий и сбыта их продукции. В 1967 все виды транспорта всех стран мира перевезли около 85 миллиардов тонн (т) на среднее расстояние 258 километров (км). При общей массе всей мировой продукции промышленности и сельского хозяйства, равной около 26 миллиардам тонн, каждая тонна продукции перевозилась в среднем 3.3 раза. В бывшем Союзе Советских Социалистических Республик (СССР) в 1970 транспорт перевёз почти 18 миллиардов т. Объём грузовых перевозок во всём мире возрос за последние 50 лет почти в 15 раз, а в бывшем СССР за период 1913–70 более чем в 80 раз. В 1970 наибольшая масса (по тоннажу) грузовых перевозок производилась автомобильным транспортом – 4/5 (на короткие расстояния) и 1/5 другими видами транспорта вместе взятыми (на дальние расстояния). Грузовые Потоки, показатели, характеризующие объём перевозок грузов по участкам и направлениям транспортной сети, а также между корреспондирующими предприятиями, пунктами или районами. Грузовые потоки изображаются либо графически или схематически, либо в виде так называемых косых таблиц, в которых указываются и корреспондирующие пункты и объём перевозок между ними. Грузовые потоки, как правило, неравномерны по отдельным участкам сети и по направлениям 'туда' и 'обратно'. В бывшем Союзе Советских Социалистических Республик (СССР) наиболее мощные грузовые потоки складывались на линиях, связывающих основные районы горнодобывающей, металлургической и лесозаготовительной промышленности с крупными центрами обрабатывающей промышленности (например, Донбасс с Центром, Кузбасс с Уралом и так далее). Направление преобладающего грузопотока (например, из Донбасса в Центр) называется грузовым, а обратное – порожним. В бывшем СССР по сети железных дорог в обратных направлениях перевозилось примерно 3/5 массы грузов, перевозившихся в грузовых направлениях. Неравенство грузовых потоков по направлениям 'туда' и 'обратно' вызывало порожние пробеги подвижного состава и непроизводительные пробеги локомотивов, судов, автомобилей, увеличение себестоимости перевозок и капиталовложений. Для смягчения неравномерности грузовых потоков осуществлялись меры стимулирования загрузки порожних направлений, включая применение пониженных тарифов. Мощность грузовых потоков измеряется показателем

густоты перевозок (или грузонапряженности). Она зависит от объёма производства продукции, связанного с ним грузооборота и протяжённости сети. На железных дорогах бывшего СССР средняя густота перевозок в 1967 составляла 18.5 миллионов тонно·километров на километр (т·км/км); она была втрое выше средней густоты всей мировой сети железных дорог и в 5 раз больше, чем в Соединённых Штатах Америки (США). Высокой грузонапряжённости обычно сопутствуют более высокая степень использования производственных фондов транспорта, низкая себестоимость перевозок. Вместе с тем усложняется задача обеспечения бесперебойной работы транспорта и его содержание. Поэтому при чрезмерно высокой грузонапряжённости отдельных направлений сети строят параллельные разгружающие линии.

FREIGHT = ПРОВОЗНАЯ ПЛАТА (или ФРАХТ) – By the Marine Insurance Act, 1906, s.90, 'Freight' includes the profit derivable by a shipowner from the employment of his ship to carry his own goods or moveables, as well as freight payable to a third party, but does not include passage money. The amount of money due for transporting the goods, payable either in advance or upon delivery. According to the Lisbon Rules, Freight means the remuneration payable for the carriage by the vessel of property or passengers or for the use of the vessel. / Под Фрахтом, от Голландского слова Vracht и Немецкого слова Fracht, понимается плата владельцу транспортного средства за предоставленные им услуги по перевозке грузов или пассажиров различными видами транспорта. Обычно плательщиком фрахта выступает фрахтователь, то есть лицо, заключившее договор о перевозке с владельцем транспортных средств (фрахтовщиком), который принимает на себя обязательство перевезти груз из одного пункта в другой. Понятие Фрахт применяется к перевозкам различными видами транспорта (авиационным, автомобильным, железнодорожным, морским, речным), однако наиболее распространён в морских перевозках. В Фрахт включаются не только плата за перевозку грузов или пассажиров, но и в некоторых случаях (в зависимости от условий договора) плата за погрузку и выгрузку. На фрахтовом рынке трампового тоннажа ценой транспортных услуг выступает фрахтовая ставка, устанавливаемая каждый раз при заключении договора на морские перевозки в условиях складывающейся конъюнктуры. В линейных перевозках цена услуг имеет форму транспортных тарифов, действующих на протяжении определённого времени, и устанавливается главным образом в одностороннем порядке судовладельческими компаниями. Срок оплаты фрахта определяется в договорах. Обычно фрахт оплачивается по завершении перевозки. Исчисляется путём умножения цены перевозки (ставки фрахта или тарифа), установленной договором морской перевозки, на количество груза, доставленного в пункт назначения, или на количество груза, принятого к погрузке в пункте отправления. В случаях, когда заранее трудно определить количество груза, подлежащего перевозке, вместо ставки фрахта в договоре указывается сумма фрахта за один рейс. При фрахтовании судна на время (тайм-чартер) фрахт исчисляется в соответствии с арендной ставкой, которая устанавливается либо за тонну полной грузоподъёмности судна в месяц, либо за использование судна в сутки. Фрахт:- плата за перевозку груза.

FREIGHT = ФРАХТ (или ГРУЗ) – Freight is the merchandise carried and or hauled by a transportation line. Refers to either the cargo carried or the charges assessed for carriage of the cargo. For insurance purposes, the term 'Freight' relates to the remuneration received or receivable by a carrier for the carriage of goods, and can include the profit he derives from the carriage of his own goods. Where freight is paid in advance by the shipper, on a non returnable basis, the insurable interest is vested in the shipper and is normally embraced within the insured value of the goods. Where freight is paid on 'outturn' of the goods at the destination port, the insurable interest is vested in the carrier (shipowner or charterer). In shipping practice, the term freight may be used to define the goods carried in transit. Thus, personnel involved in arrangements for such transit may be termed 'Freight Forwarders'. It is commonplace to hear goods referred to as 'Freight' in regard to rail carriage, air carriage, etc. / Фрахт:- перевозимый на зафрахтованном транспортном средстве (первоначально на судне) груз, а также сама такая перевозка.

FREIGHT ALL KINDS = ФРАХТ В ЛЮБЫХ ФОРМАХ (или ФРАХТ ЛЮБОГО ВИДА) – Freight All Kinds (FAK), usually referring to full container loads of mixed shipments. Single freight which is charged irrespective of the commodity. Freight All Kinds (FAK) is a shipping classification. Usually refers to consolidated cargo. Goods classified FAK are usually charged higher rates than those marked with a specific classification and are frequently in a container which includes various classes of cargo.

FREIGHT BILL = СЧЁТ ЗА ФРАХТ (или ФРАХТОВОЕ СВИДЕТЕЛЬСТВО) – Freight Bill is an invoice for transportation charges generated when a load is delivered. Destination (Collect) Freight Bill:- prepaid freight bill. (i) Bill rendered by a transportation line to consignee containing description of freight shipper name, point of origin and weight charges (if not prepaid). (ii) Bill rendered by a transportation line to shipper containing description of freight, consignee, destination and weight charges. Freight Bill is a document issued by the carrier based on the bill of lading and other information; used to account for a shipment operationally, statistically, and financially. An Invoice. (a) Destination Freight Bill:- A bill rendered by a transportation line to consignee, giving a description of the amount of charges (if not pre-paid). (b) Pre-paid Freight Bill:- A bill rendered by a transportation line to shipper, giving a description of the freight, the names of consignee and destination, weight and amount of charges.

FREIGHT BROKERAGE = ФРАХТОВОЧНАЯ БРОКЕРСКАЯ КОМИССИЯ – Freight Brokerage is a commission paid to a licensed Freight Forwarder or Custom House Broker by the steamship line concerning export transactions. Commission is paid either as a percentage or the freight charges or as a lump sum amount per container, depending on the carrier and/or trade lane.

FREIGHT CASHIER = ТОВАРНЫЙ КАССИР (или ФРАХТОВЫЙ КАССИР) – Freight Cashier:- responsible for collections of freight/charges/release of cargo/release of bills of lading.

FREIGHT CHARGE = ФРАХТОВЫЙ СБОР – Freight Charge is a compensation paid to Logistics Depot by the client for transportation services performed.

FREIGHT CLAIM = ПРЕТЕНЗИЯ ПО ФРАХТУ – Freight Claim is a formal letter with supporting documents, i.e. bill of lading (B/L), delivery receipt (D/R), temperature chart, etc, making claim against carrier for lost or damaged cargo. / формальное письмо с подкрепляющими документами, то есть Коносаментом, .

FREIGHT COLLECT = ПРОВОЗНАЯ ПЛАТА ПО ПРИБЫТИИ (или ФРАХТ ВОЗЛАГАЕТСЯ НА …, или ФРАХТ ВЗЫСКИВАЕТСЯ С …) – Freight Collect and Freight Prepaid are common terms used in international freight. It is very important to understand the difference, it is a statement of who will be paying for all the international freight charges. If you export your goods on 'Freight Collect' terms (EXW, FCA, FAS and FOB are all Freight Collect terms of Incoterms® 2020) that means that the importer (your buyer) will 'collect' and pay all of the freight charges on their side, you will not have to pay any freight at all. If you are the exporter and sell the goods on CFR, CIF, CPT, CIP, DAP, DPU and DDP terms of Incoterms® 2020, this means that you will pay for the freight charges ('Freight Prepaid' – you will pre-pay the freight charges). These are linked to the selling terms of your invoice, if you are selling your goods on FOB (Free on Board) terms then you are only covering the costs to get the goods loaded on board the vessel. All charges thereafter will be charged to the receiver of the goods (consignee) – so it will be Freight Collect. These freight terms are stated on the bill of lading (BL), the document issued by the shipping line or freight forwarder. Freight Collect is a term used on shipping documents and in price quotations denoting that the buyer or consignee must pay all shipping charges. See also Freight Prepaid.

Freight Collect and Freight Prepaid:- What's the Difference? Negotiating shipping contracts can feel a bit like a game of chess. You make one wrong move and the whole game is lost. One of those 'wrong moves' is agreeing to shipping terms you don't actually understand. Unfortunately, this is a rather common occurrence and one of the biggest mistakes we see on a daily basis. Freight Prepaid and Freight Collect are two such terms that are often confused and misunderstood. Keep reading to get a better understanding of freight collect and freight prepaid, then contact the team at carrier to simplify your shipping process. Freight prepaid and freight collect are two terms used to define who pays for a specific freight shipment, but they are often paired with another term, which defines who owns a shipment until delivery. (1) A term Freight Prepaid indicates that the shipper or consignor is responsible for the shipping charges, as well as any ancillary charges that might come up along the way. This is also sometimes referred to as 'Prepaid & Add'. (i) FOB Origin, Freight Prepaid:- In this scenario, the buyer takes ownership of the shipment when it is picked up by the carrier. However, the seller maintains the responsibility for the cost and safety of the shipment. (ii) FOB Destination, Freight Prepaid:- In this scenario, the seller maintains ownership of the shipment throughout the shipping process and is responsible for the cost and safety of the shipment until delivery. (2) A term Freight Collect indicates that the consignee or shipment receiver is responsible for the shipping charges, as well as any ancillary charges. This is sometimes referred to as 'Collect Upon Arrival'. (i) FOB Origin, Freight Collect:- In this scenario, the buyer or receiver of the shipment takes ownership as soon as it is picked up by the carrier at the origin pick-up location. The buyer is also responsible for the cost and safety of the shipment until arrival. (ii) FOB Destination, Freight Collect:- In this scenario, the seller maintains ownership of the shipment throughout the shipment process, and would be responsible if something were to happen to the shipment. However, the buyer is responsible for the cost of the shipment. Common Shipping Acronyms & Their Meanings:- In addition to Freight Prepaid and Freight Collect, there are a couple of other key terms you'll want to be familiar with when negotiating shipping contracts including the following:- (i) FOB, Free on Board:- This is the point in the supply chain in which the buyer accepts ownership of a shipment and the seller relinquishes their ownership. (ii) COD, Cash on Delivery:- This is a situation in which the carrier would collect payment when the shipment is delivered. (iii) BOL, Bill of Lading:- This is the terms and conditions for the shipment that outlines the freight and payment terms. Freight and charges be paid at destination (by the consignee). If for any reason the freight is not paid for by the consignee the shipper remains responsible for all expenses. When selling on 'Freight Collect' the consignor is responsible for paying the freight charges. A common mistake of the shippers is that once the shipment has been dispatched he has no further responsibility in the matter. This is not true. According to the British International Freight Association (BIFA) trading conditions paragraph 12B:- 'Despite the acceptance by the Company of instructions from the Customer to collect freight, duties, charges, dues, or other expenses from the Consignee, or any other Person, on receipt of evidence of proper demand by the Company, and, in the absence of evidence of payment (for whatever reason) by such Consignee, or other Person, the Customer shall remain responsible for such freight, duties, charges, dues, or other expenses'. So if you ship on 'Freight Collect' terms and the consignee refuses to pay the freight, port handling charges, demurrage and any other duties, you, as a shipper, will be obliged to cover these expenses to the shipping line. This condition is especially important when the goods are sold on open credit or partial pre-payment basis. The shipping line will hold your cargo until all expenses are covered, unless you have special agreements with the transport company. You have to keep in mind that every day on demurrage can cost you a lot of money and in most cases it will be cheaper to pay the due amount first and try to collect the money from the consignor afterwards. We recommend using 'Freight Collect' only when the goods are sold on pre-payment terms, the seller has received an irrevocable letter of credit or when you have your contract insured. 'Freight pre-paid' is the safest way to ship the cargo and avoid possible conflicts with the shipping line. Freight charges to be paid by consignee at destination. Freight Collect is a term used in the freight moving business that means that the freight will be paid by the person receiving the freight. The alternative would be 'Freight Prepaid'. If you order something, and you pay the shipper for shipping, then they will pay the charges the trucking company charges to move the item. This amount could be more or less than what you give the shipper. If you tell the shipper that you will pay the cost when it arrives, then they will ship it 'freight collect', meaning the trucking company will need a check payable to them when they deliver your item. If you have an account with a certain trucking company, then you can request that the shipper use that company so that you maybe billed. It will still be 'Freight Collect', but will be automaticaly billed to you by the company that you use. Freight Collect is a term denoting that transportation charges have been paid or are to be paid at final point of destination. / Сборы по Провозной Плате (Фрахту) должны быть оплачены консигнатором (грузополучателем) по месту назначения.

FREIGHT CONTINGENCY = НЕПРЕДСКАЗУЕМОСТЬ ФРАХТА – Freight Contingency:- the insurable interest of a consignee who has paid freight on goods when delivered over the ship's side, but where the goods are still subject to peril until they arrive at the final destination.

FREIGHT COSTS = ЗАТРАТЫ ПО ФРАХТУ – Freight Costs are the costs incurred by the merchant in moving goods, by whatever means, from one place to another under the terms of the contract of carriage. In addition to transport costs this may include such elements as packing, documentation, loading, unloading and transport insurance. Freight Costs is the cost of an item at the time of receiving is generally considered a Landed Cost, which is the raw cost plus inbound freight costs. Freight Cost is the compensation paid to the contracted carrier by logistics depot for the transportation services performed.

FREIGHTED BILL OF LADING = ФРАХТОВОЧНЫЙ КОНОСАМЕНТ (или ФРАХТОВЫЙ КОНОСАМЕНТ) – Freighted Bill Of Lading is a Bill of Lading that lists all charges pertaining to cargo movement from origin to destination.

FREIGHTER = ГРУЗОВОЕ СУДНО – Freighter (maritime term):- a ship designed to carry all types of general cargo, or 'dry cargo'. Freighter is a vessel used for the carriage of cargo. Breakbulk vessels both refrigerated and unrefrigerated, containerships, partial containerships, roll-on/roll-off vessels, and barge carriers. / Под Грузовым Судном понимается судно, предназначенное для перевозки различных грузов. Различают комбинированные, наливные и сухогрузные грузовые суда. Способы перевозки (отдельными счётными единицами – бочками, контейнерами, мешками, слитками, ящиками и другими либо общей массой – наливом или насыпью) и характер грузов определяют конструктивные особенности грузовых судов:- число палуб, поперечных и продольных переборок, размеры и расположение погрузочно-разгрузочных отверстий, цистерн для балласта, положение машинного отделения и другое. Смотрите также Судно.

FREIGHT FORWARDER = ГРУЗОВОЙ ЭКСПЕДИТОР – Freight Forwarder is a person engaged in the business of assembling, collecting, consolidating, shipping, and distributing less than trailerload freight. Also a person acting as agent in the transshipping of freight to or from countries and the clearing of freight through US Federal Customs. Also known as Forwarder. Freight Forwarder is an independent business which handles export shipments for compensation. Freight Forwarder arranges shipments for customers usually break bulk. Does not actually carry the cargo or conduct business for the ship. A person whose business is to act as an agent on behalf of the shipper. A freight forwarder frequently makes the booking reservation. Freight Forwarder is an independent business that dispatches shipments for exporters for a fee. The firm may ship by land, air, or sea, or it may specialize. Usually it handles all the services connected with an export shipment, including preparation of documents, booking cargo space, warehousing, pier delivery, and export clearance. The firm may also handle banking and insurance services on behalf of a client. The US forwarder is licensed by the Federal Maritime Commission (FMC) for ocean shipments. Federally licensed (by FMC) company that handles documentation details

for shipper of export cargo (US). A Freight Forwarder is defined in the Interstate Commerce Act as follows:- 'Freight Forwarder' means a person holding itself out to the general public (other than as pipeline, rail, or water carrier) to provide transportation of property for compensation and in the ordinary course of its business:- (i) assembles and consolidates, or provides for assembling and consolidating shipments and performs or provides for break-bulk and distribution operations of the shipments; (ii) assumes responsibility for the transportation from the place of receipt to the place of destination; and (iii) uses for any part of the transportation a carrier subject to the jurisdiction under this subtitle. 49 USC §13101(8) (2005; 49 USC is short for the United States Code:- Title 49). Only surface freight forwarders are subject to Carmack liability requirements. A surface 'Freight Forwarder' can be either a receiving or a delivering carrier. 49 USC §14706(a)(2). A 'Freight Forwarder' is considered a 'Receiving Carrier' when the freight forwarder uses a motor carrier to receive property from a consignor and consents to the execution of the bill of lading or receipt by the motor carrier. A 'Freight Forwarder' is a 'Delivering Carrier' when it consents to the motor carrier's delivery of its property to a consignee. The party arranging the carriage of goods including connected services and/or associated formalities on behalf of a shipper or consignee. Freight Forwarder is a person or corporation who arranges transport of goods on behalf of either the seller or buyer. In many cases the freight forwarder will also consolidate several small shipments into one larger one to take advantage of better freight rates. In most cases the freight forwarder will assume the legal liabilities of acting as a carrier. A Freight Forwarder is one who assembles small shipments into one large shipment which is then tendered to a regulated carrier. Freight Forwarder is an entity that organizes the shipment of goods from originating company to end market, consumer, or distribution location. / Экспедитор:- (1) физическое или юридическое лицо, действующее на основании договора поручения или комиссии, организующее транспортно-экспедиторское обслуживание, но не принимающее непосредственного участия в процессе транспортирования; (2) работник предприятия или организации, в обязанности которого входит приём грузов, их сопровождение, оформление перевозочных документов и так далее; сотрудник экспедиции. Экспедитор:- (1) сторона договора экспедиции. В бывшем Союзе Советских Социалистических Республик (СССР) – социалистической организации:- транспортно-экспедиционного агентства и конторы автомобильного, железнодорожного, внутреннего водного транспорта, морские порты, экспедиционные организации исполкомов местных Советов, системы потребительской кооперации и некоторые другие организации, в уставах (положениях) которых предусмотрено совершение транспортно-экспедиционных операций. (2) Работник предприятия, организации, осуществляющий в соответствии с трудовым договором получение грузов, их сопровождение при перевозке, сдачу, оформление товаро-распорядительных документов.

FREIGHT FORWARDER'S BILL OF LADING = КОНОСАМЕНТ ГРУЗОВОГО ЭКСПЕДИТОРА – A contract of carriage between a shipper and forwarder (who is usually a NVOCC); a non-negotiable document. Freight Forwarder's Bill of Lading, generally, it is a document with the effect of a cargo delivery order issued to a shipper of cargo by a freight forwarder, which thereafter arranges, usually as agent for the shipper, for shipment of the cargo under a combined transport or ocean bill of lading. However, regard must be had to the substance and not merely to the title or form of a document and a freight forwarder's bill of lading might on its true construction be a fully transferable bill of lading and not merely a cargo delivery order. Also known as Freight Bill, and House Bill.

FREIGHT INVOICE = ТОВАРНЫЙ СЧЁТ–ФАКТУРА (или СЧЁТ–ФАКТУРА НА ГРУЗ) – Freight Invoice is an itemized list of goods shipped and services rendered stating fees and charges. An itemised list of cargo shipped and services rendered listing charges involved.

FREIGHT INSURANCE = СТРАХОВАНИЕ ФРАХТА – Freight Insurance is more for the couriers, hauliers and freight forwarders that transport a third party's goods. If you are looking for freight liability cover. See also Cargo Insurance. / курьеры, подвозчики (доставщики), и экпедиторы груза.

FREIGHT MANIFEST = ГРУЗОВОЙ МАНИФЕСТ (или ФРАХТОВЫЙ МАНИФЕСТ) – Freight Manifest is a (cargo) manifest including all freight particulars. A summary of cargoes stating all freight particulars.

FREIGHT MARKET = ФРАХТОВЫЙ РЫНОК – The Freight Market is the market in the shipping industry which covers the transport of cargo. The first official freight market was the Baltic shipping exchange (The Baltic Exchange; headquartered in London, the United Kingdom) in the XIX century. However before that time there were already several places which could be seen as centers of freight market for instance the Baltic coffee house. Transport of goods over sea can be regulated in different types of chartering. The freight derivatives market is a relatively new part of the freight market. The idea of the freight derivatives market is to minimize the future risks of trading goods. This is necessary because a trader may buy a commodity which he wants to ship in the future and sell on another place. However if the freight rate would rise to a higher point by the time he wants to ship he will have to calculate for this unexpected expense and he may very well lose a lot of money when selling the commodity again. The freight derivatives market handles this problem by giving an estimate of what the future of the freight market will be. So the ship-owner and the trader can agree a price that will most likely be close to the freight rate at that future time this limiting both their risks. The freight future market started with trading through the Baltic International Freight Futures Exchange in 1985 which was later replaced by forward freight agreements. See also The Baltic Exchange, and Worldscale. In 1744 the owners of a coffee house in Threadneedle Street in London changed its name from the Virginia and Maryland to Virginia and Baltick to reflect the trade of the regulars who met there to make arrangements and draw up agreements for the transportation of goods by sailing ship. Just as the opening of Edward Lloyd's coffee house in Tower Street was the birth of Lloyd's of London, so the opening of the Virginia and Baltick Coffee House can be said to be the birth of the Baltic Exchange. The coffee house of 1744 was an open house with no members, but the common interest was in the trade of tallows, oils, flax, hemp and seeds from the Baltic states. As Europe's population grew rapidly throughout the XVIII and XIX centuries and London became the commercial heart of the expanding British Empire, so began the growth of the shipping industry centered around the Virginia and Baltick. The informal arrangements of the original coffee house were not robust enough to deal with the wild speculations in commodities so prevalent at the time and in 1823 a committee was formed with the power to formulate rules and regulations for the admission of members. 23 merchants, tallow chandlers, soap makers and brokers closed ranks. The committee decided that one room – the Subscription Room – would be open only to those willing to pay for the privilege and the number of subscribers limited to three hundred. The framework had been laid for what would one day become the Baltic Exchange, the most important market for shipping in the world. The Subscription Room opened on 01 May 1823 and within the first few weeks subscribers had introduced visitors from Paris, Stockholm, St Petersburg, Marseilles, Amsterdam, the Canaries, Sydney, Antwerp, Gibraltar, Madrid, Hamburg, Madeira and Jamaica. The Baltic was off to a good international start. Rules and regulations of the Baltic house agreed to at a General Meeting of the Subscribers held on Tuesday 22 April 1823, AH Thompson, Esqr., in the Chair. First:- that the name of the establishment to be the Baltic Coffee House. Second:- that the number of subscribers do not exceed three hundred (reckoning firms as single subscribers) without the consent of a general meeting and further that the number of subscriptions from the Stock Exchange do not exceed six. Third:- that new subscribers are to be admitted only on the recommendation of six subscribers, which recommendation is to be approved by the Committee. Fourth:- that the subscription be as follows, viz:- Four guineas per annum for an individual, six guineas for firms consisting of two persons, eight guineas for firms consisting of more than two persons (partners not resident in London or the neighbourhood not to be counted as belonging to firms), and that the allowance for the waiter shall be one guinea per annum for individuals and in the same proportion for firms, viz, one guinea and a half per annum for firms of two persons, two guineas per annum

for firms of more than two persons, and that no additional renumeration be given to the waiters in the room, and that there be at least four waiters provided. Fifth:- that the room be opened on the first day of May, 1823, and that the subscriptions be paid for one year in advance – within one month of that time. Sixth:- that a dining and a sale room be provided for the accommodation of the subscribers and the public, and that wine, tea, coffee, chocolate and sandwiches be furnished in the coffee room. Seventh:- that gentlemen out of business, and resident more than 20 miles from London, or in business and resident more than 50 miles from London, be admitted on introduction by a member of the Committee who shall write the name of the visitor and his place of abode in a book to be kept for that purpose and who must re-insert the name every week. Eighth:- that there be only one door for admission. Ninth:- that the Committee shall call a general meeting of the subscribers on a requisistion being presented to them stating the object for which the meeting is to be called, and signed by at least 50 subscribers, but the Committee to have at all times the power of calling general meetings. Tenth:- that a meeting of the Committee be held on the first and third Tuesday in every month at two o'clock precisely, and that five members of the Committee form a quorum. Eleventh:- that a book is to be kept by the Secretary in which is to be entered the rules and regulations of the establishment – together with the names of the Committee and subscribers. A committee meeting was held on 23 February 1854 which saw the first appearance of a noteworthy member – Panita Ralli – a member of a Greek family of corn merchants and bankers, beginning a long and mutually beneficial relationship between the Baltic and Greek members. In 1873 the first list of Baltic members was produced containing 1 164 names including five Iondeses, six Mavrogordatoses, eleven Rallis, four Rodoacachis, six Schilizzis and five Ziffos – a contingent of Greeks whose contribution to world shipping had long been centred on Britain as it still is today. 1846–73:- the repealing of the Corn Laws in 1846 resulted in the wholesale importation of foreign wheat. The numbers of shipowners and brokers rose to meet this need and the Baltic suddenly required more space. A company – The Baltic Company Ltd – was formed to purchase a new and larger premises and in 1857 South Sea House on Threadneedle Street was acquired. A full time secretary, William Oxley, was appointed to the company and by 1859 membership of the Baltic grew to 737. 1859 was also the year in which a telegraph office was established at South Sea House enabling faster and more frequent communication around the world. Ten years later the Suez Canal was opened, heralding a new era for commerce and shipping. However, the increasing size of trade and the required growth in ship tonnage led to a very contemporary problem - the raising of capital to finance new shipbuilding. At that time shipbrokers owned and managed steamers raising the cash for them from friends and clients. However, this meant unlimited liability. The advent of the concept of limited liability meant that large numbers of people began to invest in shipping on speculative basis. The first Baltic posting:- it was during this period that the first incident of blackballing was recorded, a process which still exists today under the Baltic's 'postings' service which ensures that the high ethics encapsulated in the Baltic motto 'Our Word Our Bond' are maintained. WR Arbuthnot & Co. complained that Baltic member William Kern had left a parcel of linseed oil in their hands for acceptance by 11:20 am at the commercial sales room. The clerk was there on time, waited for 5 minutes, and then went over to Kern's office to see if he could locate him before returning to the Baltic. He met Kern coming in by the back entrance, but Kern informed him that he could no longer have the linseed oil as he was too late. Arbuthnot argued that as the fault was not theirs, they should not be penalised and suggested arbitration as a means of settling the dispute. Kern at first refused, but relented after Arbuthnot threatened to refer the case to the Baltic. After the arbitration went against him he refused to abide by it. Arbuthnot complained by highlighting a fundamental aspect of business:- 'It is important that a broker's word should be considered binding and trustworthy ... he should not be allowed to escape with impunity for such gross breach of faith'. And he was not. Kern accepted the judgement. An important article of faith had been established. 1873–1914:- the late XIX century was a period of unparalleled prosperity for Great Britain. It controlled nearly a third of all global industrial output, with its nearest rival the USA lagging far behind. Britain's trade was worth double that of France and the amount of shipping organised by members of the Baltic was proportionately enormous. It was around this period that the telephone made its first appearance and the Edison Telephone Company which first installed telephones at the Baltic. By 1881 calls to and from South Sea House numbered 200 a day. As membership of the Baltic grew arguments broke out between the shareholders and the members as to the quality and quantity of services provided and a rival organization – the London Shipping Exchange – opened at 19 Billiter Street in March 1892. Two leading Baltic members joined its board of directors and by 1896 boasted around 1 600 members. However, the Baltic at South Sea House still maintained its pre-eminence which the London Shipping Exchange was desperate to emulate. Two competing exchanges with a shared membership was clearly not in the best interests of the market and by 1898 moves began to merge the two institutions. The lease on South Sea House was due to run out in 1900 and the City of London Exchange Company was formed to purchase a new site and create a new exchange in Jeffrey Square (now St Mary Axe) and in 1900 a new company – the Baltic Mercantile and Shipping Exchange Limited – was incorporated. By 1902 the London Shipping Exchange, the Baltic Company Ltd and the City of London Exchange Syndicate Ltd merged and moved to the grand new building built in St Mary Axe following a short spell at the Great Eastern Hotel at Liverpool Street. St Mary Axe building:- the 1903 Baltic Exchange was one of the City's grandest trading halls. The building was designed by T.H. Smith and W. Wimble and saw trading on a daily basis. Shipbrokers, owners and charterers representatives would gather to share information and to physically transact the deals. Up until 1920s the Baltic was primarily a grain exchange with up to 250 000 tons of grain bought and sold on its trading floor every day. By attending the Baltic the brokers not only learnt what the shippers were offering – the types of grain and the periods of shipment, but also obtained concessions on price and terms which neither buyer nor seller could manage if they met face to face. In the course of a series of conversations on the trading floor, a chartering clerk obtained a firm offer of a vessel and a firm bid for the carriage of the cargo much more easily and swiftly than was possible by telephone, telegram or letter. The heads of all the firms, big and small, walked the trading floor every day and stayed for lunch. Amid the hustle and bustle, brokers would queue for the telephones and strain to make themselves heard above the din of business chatter. 1914–45:- the First World War created huge difficulties for an international institution like the Baltic Exchange with its German and Austro-Hungarian members and their clerks banned. 62 Baltic members lost their lives in the war and their sacrifice was commemorated on marble panels unveiled in 1920, to which were added five stained-glass windows as a war memorial in 1922. These windows can now be found at the National Maritime Museum in Greenwich. The return to peacetime conditions saw the role of the Baltic shifting. The decline of the British Empire and Britain's position on the global stage was reflected by a crisis of confidence at the Baltic Exchange. Members began to ask whether a broker was necessary and a series of conferences with grain merchants, millers and seed crushers and oilseed brokers was called. By the end of the 1920s not only ships, but also aeroplanes were being chartered to carry goods. In February 1929 S Instone & Company issued Britain's first charter-party. 1929 also saw the introduction of the London Corn Trade Association's futures market at St. Mary Axe. Trade at the Baltic was however declining as the Wall Street Crash of 1929 led to a global economic crisis. Trade patterns altered as governments implemented protectionist policies in the face of the Depression sweeping the industrial world. The earnings of those engaged in shipping slumped as international trade declined and the number of Baltic members dropped. By 1935 the days of the Baltic as a commodity market were over as the Baltic became a freight market. The brokers had ceased to depend solely on the British merchant navy for their business and fixed cargoes of all nationalities, and from ports in one part of the world to another without touching the British Isles. 1939 saw the outbreak of the Second World War and the government introduced the Ministry of Shipping to organise the chartering of ships and cutting out the Baltic brokers. After a few weeks of war, Britain began to run short of wheat imports and the government abandoned the system and introduced the direct acquisition of ships. The ministry would instruct the owners to carry certain cargoes and follow certain routes and all chartering was on a time charter basis. The Baltic was forced to suspend its

operations and was not back in business until September 1945. The Ministry of Shipping still retained full control of the direction of voyages, but shipowners and their brokers could arrange chartering and conclude fixtures. 1949–Today:- in 1949 the Baltic became world's first air freight exchange and the Baltic Airbrokers Association was formed. It was however not until 1952 that the government relaxed its control of the commodity and shipping markets. Membership of the Baltic rose again and the exchange expanded, building an annexe to house the secretariat and offices for tenants. Sir Winston Churchill laid the foundation stone in 1955 and in 1956 Queen Elizabeth II formally opened the extension. In May 1971 there was a radical redrafting of the rules for membership. It was stipulated that a company seeking membership must satisfy the board that it had a reasonably large capital. Most of the members by this stage were limited companies who nominated individuals to represent them on the Baltic's trading floor. Through the 1970s and 1980s the communications revolution gathered pace. First the telex machine, then faxes, cheap international calls, mobile phones, e-mail and the internet made face to face meetings on the trading floor increasingly redundant. The number of sessions held declined as shipbrokers increasingly stayed in their offices. Freight Futures:- in 1985 the world's first freight futures market was launched allowing owners and charterers the ability to protect themselves from fluctuating freight rates. The Baltic International Freight Futures Exchange (BIFFEX) opened for business on the trading floor. However, the most important part of the operation was the production of the Baltic Freight Index. Produced by a panel of shipbrokers around the world giving their assessment of the market value of a basketful of dry cargo routes. Today the Baltic produces more than 40 daily route assessments, a sale and purchase index, forward prices, fixture lists and market reports. The Baltic was no stranger to futures markets having housed a coarse grain futures market of one description or another since 1929. Main crop potatoes, pig meat, live cattle, soya meal and early potatoes markets were sited on its trading floor in the 1970s and 1980s. The Financial Services Act in 1988 brought this all to an end forcing all of the 'Baltic' futures markets to unite under the banner of the Baltic Futures Association and re-sited at the London Commodity Exchange. Friday, 10 April 1992:- at 21:20 hrs an Irish Republican Army (IRA) bomb consisting of 100 pounds of Semtex wrapped in a ton of fertilizer exploded in a van parked outside the Baltic Exchange. Three people died, including Baltic attendant Tom Casey and many more were injured as the bomb ripped through the Baltic destroying offices of major companies in the building and rendering the trading floor unoccupiable. By Monday morning the Baltic was installed in Lloyd's of London and by Wednesday a trading floor opened. The Baltic Exchange was unable to redevelop 30 St Mary Axe incorporating the historical elements as required by English Heritage and the site was sold to Trafalgar House in 1995. Most of the remaining structures on the site were then carefully dismantled whilst the interior of Exchange Hall and the facade were preserved and sealed from the elements. Later assessment by English Heritage determined that the damage was far more severe than had previously been thought, and they dropped their insistence on restoration; a decision that led to much controversy. London's latest landmark, the Swiss Re tower, also widely known as the Gherkin, now stands on the site of the old Baltic Exchange. The Baltic today:- the Baltic Exchange today is housed at 38 St Mary Axe, next to the 1903 exchange site. There is no longer a trading floor, but the Baltic continues to provide meeting and catering facilities for its members and tenants. The Baltic today focuses on providing freight market information, dispute resolution and a light regulatory framework for the shipping market. The Freight Market is the trading of freight and the means to transport this freight. The better known origin of this market lies in the Baltic Exchange. This has now become a website. And most of this trade now goes by the Internet. As shipping companies sell the use of ships, the way these ship are deployed must be agreed upon, including whether the charter has full control or a certain degree of it. This is done by the charter. In this contract the obligations of both parties are described. This can be done on basis of time, voyage, freight, etc. Even the party responsible for maintenance and crewing is hereby settled. The history of The Baltic Exchange (today the organization is the world's main international shipping exchange) spans more than 250 years and traces its origins back to a humble Coffee house – the traditional meeting place of merchants and sea captains – in the City of London. Timeline:- 1744:- The Virginia and Maryland Coffee House in Threadneedle Street changes its name to Virginia and Baltic. This reflects the business of the merchants and shipowners who regularly gather there. 1810:- the coffee house had become too crowded and the Virginia and Baltic Coffee House moved to the nearby Antwerp Tavern (also known as the Baltic Coffee House). 1823:- to combat 'wild gambling' in the market and establish some regulation, a committee of senior coffee house regulars is formed. Rules are devised and an admission procedure developed. A private meeting room is established, to which admission is strictly controlled. This is the start of the modern Baltic market. (In 1823, as London's global trading connections expanded, the Baltic Club was founded, and it was known as the Baltic Coffee House. It was a formal association and it standardized trading regulations.) 1857:- The Baltic Company Limited is formed to buy the lease of South Sea House (wound up in 1899), Threadneedle Street. New rules and a committee of 30 is introduced. 1899:- the exchange formed a committee called the City of London Exchange Syndicate to purchase a site in Jeffrey's Square (wound up in 1990). 1900:- The Baltic Club merged with the London Shipping company and formed the Baltic and Mercantile Shipping Exchange Ltd (i.e. the London Shipping Exchange becomes part of the Baltic Exchange). 1903:- The Baltic moves to a new purpose built exchange in St Mary Axe (new premises in the City of London). 1929:- the growth of the air industry sees the growth of the first air charter party. 1985:- The Baltic Freight Index is launched – the first in a series of freight market indices produced by the Baltic. 1992:- a terrorist bomb destroys the Baltic Exchange. Despite this trading continues, first at Lloyd's of London and then back to a part of the old Exchange building. 1994:- The Baltic celebrates its 250th anniversary. 1995:- new permanent premises are found at 38 St Mary Axe – home of the Baltic today. The Jerusalem Coffee House was frequented by managing owners of East India Company ships and East India merchants and brokers. In 1892 the Jerusalem became the Jerusalem Shipping Exchange of 22 Billiter Street, setting itself up as a rival to the newly established London Shipping Exchange. The London Shipping Exchange was more successful and bought out the Jerusalem Shipping Exchange later that year. In 1903 the London Shipping Exchange amalgamated with the Baltic Committee to become the Baltic Mercantile and Shipping Exchange Ltd. / Эдэсэн (Edison). привоз (importation). Кофейня Эдвода Лойда (Edward Lloyd's coffee house). Сэт Мэри Экс (St Mary Axe) Грэйтч Истён Хотчэл (Great Eastern Hotel) на Ливерпулской Улице (Liverpool Street). Кофейня Вёдьжиниа энд Марилэнд (Virginia and Maryland Coffee House). Болтик Кампэни Лимитид (Baltic Company Limited). Срэднидэл (Threadneedle). Дьжэфри (Jeffrey). Под Фрахтовым Рынком понимается сфера международной торговли услугами морского транспорта по перемещению грузов и пассажиров. Эти услуги выступают в различных формах организации перевозок:- (i) Линейные Перевозки – перевозки грузов мелкими партиями при работе судов по расписанию; (ii) Трамповые Перевозки – перевозки грузов судовыми партиями без заранее фиксированных расписаний работы судов; и (iii) Пассажирские Перевозки. Каждому виду перевозок соответствует свой фрахтовый рынок. В зависимости от вида судов, предоставляющих услуги по перемещению грузов, фрахтовый рынок трампового тоннажа разделяется на фрахтовый рынок сухогрузного, нефтеналивного, рефрижераторного тоннажа, газовозов и другого. Кроме того, фрахтовый рынок трампового тоннажа подразделяется на отдельные географические секции – районы отгрузки основных массовых грузов:- Североатлантическую, Тихоокеанскую, Южноамериканскую и другие. Отдельные части и секции фрахтового рынка отличаются специфическими условиями торговли, однако они тесно взаимосвязаны, образуя в целом единый мировой фрахтовый рынок. На мировом фрахтовом рынке большая часть сделок совершается на фрахтовых биржах. Долгое время для океанского тоннажа центральным фрахтовым рынком был Лондон, Соединённое Королевство, в частности Лондонская Судоходная Биржа (The London Shipping Exchange; основана в конце 1891) и Балтийская Биржа (The Baltic Exchange; как таковая основана в 1857). Это соответствовало доминировавшей тогда роли Английского торгового флота в мировом судоходстве. Котировки Лондонской биржи были решающими для остальных местных фрахтовых рынков. С конца 1920-х – начала 1930-х рост коммерческих

флотов Соединённых Штатов Америки (США), Норвегии, Греции, Японии, Германии, Италии и других стран привёл к усилению роли национальных фрахтовых рынков этих стран и к освобождению их от монополии Лондона. В середине 1970-х усилилась роль национальных фрахтовых рынков, особенно в Осло, Норвегия, где заключалось много сделок на наливные суда, в Пирее, Греция и Генуе, Италия – для фрахтового рынка Средиземного Моря, В Нью Йорке, США – для фрахтования судов по перевозке угля и зерна и тому подобных. Однако значение Лондонской фрахтовой биржи по-прежнему оставалось велико. Бывший Союз Советских Социалистических Республик (СССР) активно участвовал в международной торговле транспортными услугами на мировом фрахтовом рынке. Например, за 1961–70 объём фрахтовых операций возрос примерно в 7 раз. До начала 1960-х СССР в основном фрахтовал суда капиталистических судовладельцев для перевозки грузов Советской внешней торговли. Быстрый рост морского торгового флота позволил Советскому Союзу уже в середине 1960-х выступить на мировом фрахтовом рынке в качестве экспортёра транспортных услуг, а в конце 1960-х – войти в число крупнейших судовладельческих держав мира, осуществлявших перевозки грузов на всех основных мировых торговых путях. Большой удельный вес в вывозе (или экспорте) услуг морского транспорта СССР занимали перевозки внешнеторговых грузов других социалистических стран. С развитием фрахтовых операций по взаимному предоставлению тоннажа и грузов между странами-членами бывшего Совета Экономической Взаимопомощи (СЭВ) к началу 1970-х сформировался мировой социалистический фрахтовый рынок, на котором, в отличие от мирового капиталистического фрахтового рынка, где господствовали законы анархии производства и обмена с резкими колебаниями конъюнктуры, конкуренцией, всё большее развитие получала система планомерного развития перевозок и фрахтования, способствовавшая утверждению стабильных и долгосрочных отношений.

FREIGHT PREPAID = ПРОВОЗНАЯ ПЛАТА ВЗЫСКАНА ПРИ ОТПРАВЛЕНИИ (или ФРАХТ ОПЛАЧЕН ПРЕДВАРИТЕЛЬНО) – Freight Collect and Freight Prepaid are common terms used in international freight. It is very important to understand the difference, it is a statement of who will be paying for all the international freight charges. If you export your goods on 'Freight Collect' terms (EXW, FCA, FAS and FOB are all Freight Collect terms of Incoterms® 2020) that means that the importer (your buyer) will 'collect' and pay all of the freight charges on their side, you will not have to pay any freight at all. If you are the exporter and sell the goods on CFR, CIF, CPT, CIP, DAP, DPU and DDP terms of Incoterms® 2020, this means that you will pay for the freight charges ('Freight Prepaid' – you will pre-pay the freight charges). These are linked to the selling terms of your invoice, if you are selling your goods on FOB (Free on Board) terms then you are only covering the costs to get the goods loaded on board the vessel. All charges thereafter will be charged to the receiver of the goods (consignee) – so it will be Freight Collect. These freight terms are stated on the bill of lading (BL), the document issued by the shipping line or freight forwarder. Freight Collect is a term used on shipping documents and in price quotations denoting that the buyer or consignee must pay all shipping charges. See also Freight Collect. Freight Collect and Freight Prepaid:- What's the Difference? Negotiating shipping contracts can feel a bit like a game of chess. You make one wrong move and the whole game is lost. One of those 'wrong moves' is agreeing to shipping terms you don't actually understand. Unfortunately, this is a rather common occurrence and one of the biggest mistakes we see on a daily basis. Freight Prepaid and Freight Collect are two such terms that are often confused and misunderstood. Keep reading to get a better understanding of freight collect and freight prepaid, then contact the team at carrier to simplify your shipping process. Freight prepaid and freight collect are two terms used to define who pays for a specific freight shipment, but they are often paired with another term, which defines who owns a shipment until delivery. (1) A term Freight Prepaid indicates that the shipper or consignor is responsible for the shipping charges, as well as any ancillary charges that might come up along the way. This is also sometimes referred to as 'Prepaid & Add'. (i) FOB Origin, Freight Prepaid:- In this scenario, the buyer takes ownership of the shipment when it is picked up by the carrier. However, the seller maintains the responsibility for the cost and safety of the shipment. (ii) FOB Destination, Freight Prepaid:- In this scenario, the seller maintains ownership of the shipment throughout the shipping process and is responsible for the cost and safety of the shipment until delivery. (2) A term Freight Collect indicates that the consignee or shipment receiver is responsible for the shipping charges, as well as any ancillary charges. This is sometimes referred to as 'Collect Upon Arrival'. (i) FOB Origin, Freight Collect:- In this scenario, the buyer or receiver of the shipment takes ownership as soon as it is picked up by the carrier at the origin pick-up location. The buyer is also responsible for the cost and safety of the shipment until arrival. (ii) FOB Destination, Freight Collect:- In this scenario, the seller maintains ownership of the shipment throughout the shipment process, and would be responsible if something were to happen to the shipment. However, the buyer is responsible for the cost of the shipment. Common Shipping Acronyms & Their Meanings:- In addition to Freight Prepaid and Freight Collect, there are a couple of other key terms you'll want to be familiar with when negotiating shipping contracts including the following:- (i) FOB, Free on Board:- This is the point in the supply chain in which the buyer accepts ownership of a shipment and the seller relinquishes their ownership. (ii) COD, Cash on Delivery:- This is a situation in which the carrier would collect payment when the shipment is delivered. (iii) BOL, Bill of Lading:- This is the terms and conditions for the shipment that outlines the freight and payment terms. Freight Prepaid:- freight charges to be paid by Shipper/Exporter prior to shipment. Term used in price quotations showing that the seller has paid the costs of freight beyond a named point to a second named point. Title to the shipment passes to the buyer at the first named point. Also known as Free (Of Charge), and Postage Paid. Freight Prepaid is a term denoting that transportation charges have been paid or are to be paid at the point of shipment. Freight Prepaid is the shipper pays the freight cost and freight collect is the consignee whom burdens for the cost related. Freight and charges to be paid by the Shipper.

FREIGHT QUOTATION = РАСЦЕНКА ПРОВОЗНОЙ ПЛАТЫ (или КОТИРОВКА ФРАХТА) – Freight Quotation is a quotation from a carrier or forwarder covering the cost of transport between two specified locations.

FREIGHT RATE = СТАВКА ПРОВОЗНОЙ ПЛАТЫ (или СТАВКА ФРАХТА) – Freight Rate:- the charge made for the transportation of freight. / Сбор, взимаемый за транспортировку фрахта. Ставка Фрахта:- цена перевозки одной фрахтовой единицы груза. Обычно размер ставки фрахта зависит от вида и транспортировки характеристик груза, условий рейса и связанных с ним расходов, а также от конъюнктуры фрахтового рынка. Если размер фрахта не предусмотрен тарифом, то ставка фрахта устанавливается по соглашению сторон.

FREIGHT RELEASE = РАЗРЕШЕНИЕ НА ОТПУСК ГРУЗА – Freight Release:- evidence that the freight charges for the cargo have been paid. If in writing, it may be presented at the pier to obtain release of the cargo. Normally, once the freight is paid, releases are usually arranged without additional documentation. Also referred to as Freight Bill Receipt, proof that freight charges have been paid for the shipment.

FREIGHT TON = ФРАХТОВАЯ ТОННА (или ФРАХТОВОЧНАЯ ТОННА) – Freight Ton is the a unit of volume for freight that weighs one ton, varying with the type of freight measured, as 40 cubic feet of Oak timber or 20 bushels of Wheat. Freight Ton is the unit for freighting cargo according to weight and/or cubic measurement.

FREIGHT TONNE–KILOMETER = ФРАХТОВЫЙ ТОННО–КИЛОМЕТР – Freight Tonne-Kilometer:- one tonne of cargo carried one kilometer.

FREIGHT WAIVER CLAUSE = ОГОВОРКА ОБ ОТКАЗЕ ВО ФРАХТЕ – Freight Waiver Clause:- the underwriter insuring hull and machinery of a ship is entitled, on payment of a constructive total loss, to take over the ship, arrange to deliver the cargo and retain any

freight earned thereby. The 'Freight Waiver Clause' in the hull policy conditions waives the right to earned freight. Prior to publication of the 1983 hull clauses this clause was commonly termed the 'Freight Abandonment' Clause.

FREIT = FINITE LIFE REIT = FINITE LIFE REAL ESTATE INVESTMENT TRUST

FRENCHBACK = ФРАНЦУЗСКАЯ ИЗНАНКА – Frenchback is a fabric with a corded twill backing of different weave than the face. The backing, which is frequently of inferior yarn, gives added weight, warmth, and stability to the cloth. / Двойная костюмная ткань с саржевой лицевой стороной и с атласной изнанкой.

FRENCH COMBING WOOL = ШЕРСТЬ ФРАНЦУЗСКОГО ГРЕБНЕЧЕСАНИЯ – French Combing Wool:- wools that are intermediate in length between strictly combing and clothing. French combs can handle fine wools from 1.25–2.5 inch in length. Yarns that have been produced with the French combing method are combed dry; without oil added. (See Bradford Spinning.) The yarn is softer and loftier than the Bradford (worsted) yarn. / Брэдфэд (Bradford).

FRENCH CUFF = ФРАНЦУЗСКИЙ ХХ (или ФРАНЦУЗСКИЙ МАНЖЕТ, или ФРАНЦУЗСКИЙ ОБШЛАГ) – French Cuff:- a soft double cuff that is made by turning back half of a wide cuff band and fastening with cuff links.

FREQUENCY = ЧАСТОТА – (1) Frequency:- in uniform circular motion or in any periodic motion, the number of revolutions or cycles completed in unit time.

(2) Frequency is the number of complete alternations or cycles per second of an alternating current. It is measured in Hertz (Hz). The standard frequency in the United States is 60 Hz. However, in some other countries the standard is 50 Hz. Also known as Cycles Per Second. / Под Частотой колебаний понимается количественная характеристика периодических колебаний, равная отношению числа циклов колебаний ко времени их совершения. Частота – величина ν (в технике её часто обозначают f), обратная периоду колебаний T:- ν = 1 / T. Единица частоты (в СИ) – Герц (Гц).

FREQUENCY DISTRIBUTION = РАСПРЕДЕЛЕНИЕ В ЧАСТНОСТИ – In statistics, Frequency Distribution is a proportion of individuals in a certain population showing a given trait of the characteristic being analyzed. For example, the frequency distribution of salaries of 3 000 employees in ABC Company Ltd might show that 150 earn from USD15 000.00 to USD16 000.00 per year; the frequency of salaries in that range would be:- 150 / 3 000 = 5%. The frequency distribution of different statistical variables is shown in a bar chart when they are discrete variables (the height of each bar is in proportion to the frequency of occurrence), or in a histogram in the case of constant variables. / Эй.Би.Си. Кампэни Эл.ти.ди. (ABC Company Ltd).

FRESH = СВЕЖЕЕ – Fresh:- living; not dried, deep-frozen or otherwise conserved.

FRESH DAIRY PRODUCT = СВЕЖИЙ МОЛОЧНЫЙ ПРОДУКТ – Fresh Dairy Products contain all dairy products and milk which are not included in the processed products (butter, cheese skim milk powder, whole milk powder and for some cases casein and whey). The quantities are in cow milk equivalent.

FRETTING = ФРЕТТИНГ (или ФРЭТИНЬ, или РАЗЪЕДАНИЕ, или ИСТИРАНИЕ) – Fretting:- wear phenomena taking place between two surfaces having oscillatory relative motion of small amplitude. / износ .

FRETTING CORROSION = ФРЕТТИНГ КОРРОЗИЯ – Fretting Corrosion can take place when two metals are held in contact and subjected to repeated small sliding, relative motions. Other names for this type of corrosion include wear oxidation, friction oxidation, chafing, and brinelling. / износ . Под Фреттинг-Коррозией, от Английского слова Fretting, от Fret, означающее Подтачивать или Разъедать, понимается коррозия, наблюдаемая в местах контакта плотно сжатых или катящихся одна по другой деталей, если в результате вибраций между их поверхностями возникают микроскопические смещения сдвига. Смотрите также Коррозия Металлов. Фреттинг-Коррозия наблюдается в местах контакта плотно сжатых или катящихся одна по другой деталей, если в результате вибраций между их поверхностями возникают микроскопические смещения сдвига.

FRF = FRENCH FRANC

FRIBBY WOOL = ПУСТЯЧНАЯ ШЕРСТЬ – Fribby Wool is a wool containing an excessive amount of second cuts and/or sweat locks.

FRICTION = ТРЕНИЕ – Friction:- the resisting force encountered at the common boundary between two bodies when, under the action of an external force, one body, moves or tends to move relative to the surface of the other. Friction:- the resistance that occurs when one object is moved on another object. The friction depends on the smoothness of the sliding surfaces and on the force used to press them on one another. / Трение – это комплекс явлений, наблюдающихся в зоне соприкосновения двух перемещающихся относительно друг друга тел. В результате этих явлений возникает сопротивление движению. Кинетическое Трение – это трение, возникающее при относительном перемещении двух тел. По виду движения кинетическое трение делится на:- Трение Скольжения и Трение Качения. Трение, возникающее в зоне контакта перемещающихся относительно друг друга элементов машин, называется Внешним Трением. Трение, возникающее при относительном перемещении составных элементов одного и того же тела (например, отдельных молекул смазочного масла), называется Внутренним Трением. По другим критериям различают Сухое Трение, Граничное Трение и Жидкостное Трение. Внешнее трение, возникающее между поверхностями трения, называется Сухим Трением. Физически сухое (ювенильное) трение возникает при контакте чистых поверхностей твёрдых тел. Технически сухое трение возникает при контакте поверхностей твёрдых тел, покрытых плёнками окисей металлов, образующимися в результате взаимодействия металлов с воздухом. Внутреннее трение смазочного масла называется Жидкостным Трением. Трение, возникающее при взаимном движении двух поверхностей, покрытых очень тонким слоем (граничным слоем, граничной плёнкой) смазочного масла, носит название Граничного Трения. При эксплуатации оборудования периодически возникает смешанное трение, когда одновременно имеет место жидкостное и граничное трение. Появлению смешанного трения способствуют высокие нагрузки, низкая относительная скорость и нестационарный режим работы узла трения. Сопротивление трения выражается силой трения T:- T= μ x N, где μ – коэффициент трения; N – нагрузка. Под Внешним Трением понимается механическое взаимодействие между твёрдыми телами, которое возникает в местах их соприкосновения и препятствует относительному перемещению тел в направлении, лежащем в плоскости их соприкосновения. Трение между взаимно неподвижными телами называется Трением Покоя, а между движущимися телами – Кинематическим Трением. В зависимости от вида движения одного тела по поверхности другого различают кинематическое Трение Скольжения и Трение Качения. Трение покоя объясняет так называемое Явление Застоя, заключающееся в отсутствии относительного перемещения двух соприкасающихся тел при действии на них касательных сил $F \le F_0 = f_0 P$, где F_0 – предельная (наибольшая) сила трения покоя, P – сила нормального давления тел друг на друга, f_0 – коэффициент трения покоя. Трение между телами, поверхности которых не смазаны, называется Сухим Трением, а при обильной смазке – Жидкостным Трением. Сила сухого трения скольжения по Закону Амонтона равна:- $F_{CK} = fP$, где f – коэффициент трения скольжения (обычно $f < f_0$). Более точен Двучленный Закон Трения Дерягина:- $F_{CK} = \mu (P + p_0 S)$, где μ – истинный коэффициент

трения, p_0 – добавочное давление, вызванное силами молекулярного притяжения, S – общая площадь всех областей непосредственного контакта между телами. Сила сухого трения качения шара или круглого цилиндра радиуса r по плоской поверхности по Закону Кулона равна:- $F_{КАЧ} = f_K P/r$, где f_K – коэффициент трения качения. Обычно силы трения качения значительно меньше сил трения скольжения. В технике внешнее трение играет двоякую роль. С одной стороны, вследствие явления застоя оно создаёт возможность движения всех колёсных и других устройств, а также передачи усилий от одних деталей машин к другим (фрикционные, ремённые и другие передачи). С другой стороны, кинематическое трение вызывает износ и нагревание трущихся частей механизмов. Смотрите также Внутреннее Трение, и Вязкость. Внешнее Трение, механическое сопротивление, возникающее в плоскости касания двух соприкасающихся тел при их относительном перемещении. Сила сопротивления F, направленная противоположно относительно перемещению данного тела, называется Силой Трения, действующей на это тело. Внешнее трение – диссипативный процесс, сопровождающийся выделением тепла, электризацией тел, их разрушением и так далее. Различают внешнее трение скольжения и качения. Характеристика первого – коэффициент трения скольжения f_c – безразмерная величина, равная отношению силы трения к нормальной нагрузке; характеристика второго – коэффициент трения качения f_k представляет собой отношение момента трения качения к нормальной нагрузке. Внешние условия (нагрузка, скорость, шероховатость, температура, смазка) влияют на величину внешнего трения не меньше, чем природа трущихся тел, меняя его в несколько раз. Трение Скольжения:- если составляющая приложенной к телу силы, лежащая в плоскости соприкосновения двух тел, недостаточна для того, чтобы вызвать скольжение данного тела относительно другого, то возникающая сила трения называется Неполной Силой Трения; она вызвана малыми (~ 1 мкм) частично обратимыми перемещениями в зоне контакта, величина которых пропорциональна приложенной силе и изменяется с увеличением последней от 0 до некоторого максимального значения, называемого Силой Трения Покоя; эти перемещения называются Предварительными Смещениями. После того как приложенная сила превысит критическое значение, предварительное смещение переходит в скольжение, причём сила внешнего трения несколько уменьшается и перестаёт зависеть от перемещения (Сила Трения Движения). Вследствие волнистости и шероховатости каждой из поверхностей, касание двух твёрдых тел происходит лишь в отдельных ‘пятнах’, сосредоточенных на гребнях выступов. Размеры пятен зависят от природы тел и условий внешнего трения. Более жёсткие выступы внедряются в деформируемое контртело, образуя единичные пятна реального контакта, на которых возникают силы прилипания (адгезия, химические связи, взаимная диффузия и другие). В результате приработки пятна касания бывают ‘вытянуты’ в направлении движения. Диаметр эквивалентного по площади пятна касания составляет от 1 до 50 мкм в зависимости от природы поверхности, вида обработки и режима внешнего трения. При скольжении эти пятна наклоняются под некоторым углом к направлению движения, материал раздвигается в стороны и подминается скользящей неровностью, а пятна прилипания, образующиеся из поверхностных плёнок, покрывающих твёрдое тело, называются Мостиками, непрерывно разрушаются (срезаются) и формируются вновь. В этих пятнах реализуются напряжения лишь в несколько раз меньшие теоретической прочности материала. Сопротивление оттеснению материала при сдвиге зависит от безразмерной характеристики h/R – отношения глубины h внедрения единичной неровности, моделированной сферическим сегментом, к его радиусу R. Это отношение определяет механическую составляющую силы внешнего трения. Большей частью описанное формоизменение упруго и рассеяние энергии обусловлено потерями на гистерезис. В пятнах касания возникают силы межмолекулярного взаимодействия, потери на преодоление которого оцениваются безразмерной характеристикой t/s_s, где t – сдвиговое сопротивление молекулярной связи, s_s – предел текучести основы. Молекулярное сдвиговое сопротивление $t = t_0 + bP_r$, где t_0 – прочность мостика при отсутствии сжимающей нагрузки, P_r – фактическое давление на пятне касания, b – коэффициент упрочнения мостика. Каждое пятно касания (так называемая Фрикционная Связь) существует лишь ограниченное время, так как выступ выходит из взаимодействия. Продолжительность жизни фрикционной связи – важная характеристика, так как определяет температуру, развивающуюся при внешнем трении, износостойкость и другое. Таким образом, процесс внешнего трения представляет собой двойственный процесс – с одной стороны он связан с диссипацией энергии, обусловленной преодолением молекулярных связей, с другой – с формоизменением поверхностного слоя материала внедрившимися неровностями. Общий коэффициент внешнего трения определяется суммой механической и молекулярной составляющих:- $f = f_{мол} + f_{мех} = \tau_0/Pr + ß + K\alpha_r\sqrt{(h/R)}$, где К – коэффициент, связанный с расположением выступов по высоте, α_r – коэффициент гистерезисных потерь. Из уравнения следует, что коэффициент внешнего трения в зависимости от давления при постоянной шероховатости или от шероховатости при постоянном давлении переходит через минимум. При приработке пар трения устанавливается шероховатость, соответствующая минимуму коэффициента внешнего трения. Для эффективной работы пары трения существенно, чтобы поверхностный слой твёрдого тела имел меньшее сдвиговое сопротивление, чем глубжележащие слои. Это достигается применением различных жидких смазок. В этом случае трущиеся тела разделены слоем жидкости или газа, в котором проявляются объёмные свойства этих сред и вступают в силу законы жидкостного трения, характеризующиеся отсутствием трения покоя. Иногда необходимо иметь ослабленным поверхностный слой самого тела; это достигается применением поверхностно-активных веществ (присадки к смазкам), покрытий из мягких металлов, полимеров или созданием защитных плёнок с пониженным сопротивлением сдвигу. В зависимости от характера деформирования поверхностного слоя различают внешнее трение при упругом и пластическом контактированиях и при микрорезании. В определённых условиях, зависящих от нагрузки и механических свойств каждой пары трения, внешнее трение переходит во Внутреннее Трение, для которого характерно отсутствие скачка скорости при переходе от одного тела к другому. Нагрузка, при которой внешнее трение нарушается для данной пары трения, называется Порогом Внешнего Трения. Трение Качения:- значения силы трения качения очень малы по сравнению с силами трения скольжения. Трение качения обусловлено:- (а) потерями на упругий гистерезис, связанный со сжатием материала под нагрузкой перед катящимся телом; (б) затратами работы на передеформирование материала при формировании валика перед катящимся телом; (в) преодолением мостиков сцепления. При достаточно протяжённых размерах пятна касания в зоне контакта возникает Проскальзывание, приводящее к уже рассмотренному выше трению скольжения. При больших скоростях качения, сопоставимых со скоростью распространения деформации в теле, сопротивление перекатыванию резко увеличивается, и тогда выгоднее переходить к трению скольжения. Управление трением путём подбора пар трения, конструкций узлов и правильной их эксплуатации – тема новой технической науки, называемой Триботехникой. Внутреннее Трение, совокупность различных процессов внутри твёрдого тела (а также в жидкостях и газах), приводящих к необратимому рассеянию механической энергии при деформации, связанному с преобразованием механической энергии в тепловую (смотрите Внутреннее Трение в твёрдых телах). О внутреннем трении в жидкостях и газах смотрите в статье Вязкость.

FRICTION–ENHANCING MAT = MAT, УСИЛИВАЮЩИЙ ТРЕНИЕ – Friction-Enhancing Mat is a mat made of material which hinders slipping.

FRICTION FALSE–TWIST TEXTURING = ФРИКЦИОННОЕ ТЕКСТУРИРОВАНИЕ ЛОЖНОЙ КРУТКИ – Friction False-Twist Texturing:- a finish for synthetic filament yarn which decreases broken filaments and ends down in friction false-twist texturing includes 40 to 98 wt % of a polyether compound, and essentially comprises components (A) and (B); wherein the component (A) is at least one

member selected from the group consisting of (A1) a C_1–C_{10} fatty acid, (A2) a C_1–C_{10} hydroxyfatty acid, (A3) a sarcosine derivative, and salts thereof, and the amount of the component (A) in the finish ranges from 0.05 to 5 wt %; and wherein the component (B) is an alkylphosphate salt and the amount of the component (B) in the finish ranges from 0.01 to 3 wt %. See also Texturing, False-Twist Method. The finish for Friction False-Twist Texturing of the present invention may contain at least one of known emulsifiers, penetrants, and stabilizers including polyoxyethylene (hereinafter referred to as POE) alkyl ether, polyethylene glycol (hereinafter referred to as PEG) ester, and POE alkylphenyl ether. The examples of the stabilizers include water, ethylene glycol, and propylene glycol. The amount of the stabilizers is not specifically restricted, and preferably ranges from 0.5 to 30 wt %, more preferably from 1 to 20 wt %. The finish for friction false-twist texturing of the present invention may also contain a lubricant, such as a fatty acid ester, so far as the effect of the present invention is not deteriorated. The examples of the fatty acid ester include esters of a monohydric alcohol and a monocarboxylic acid (such as methyl oleate, butyl stearate, isooctyl palmitate, isooctyl stearate, isooctyl oleate, lauryl oleate, isotridecyl stearate, hexadecyl stearate, isostearyl oleate, oleyl laurate, and oleyl oleate); esters of a polyhydric alcohol and a monocarboxylic acid (such as diethylene glycol dioleate, hexamethylene glycol dioleate, neopentyl glycol dilaurate, trimethylolpropane tricaprylate, glycerin trioleate, pentaerythritol tetraoleate, bisphenol A dilaurate, and thiodipropanol dilaurate; esters of a polycarboxylic acid and a monohydric alcohol (such as dioleyl maleate, diisotridecyl adipate, dioleyl adipate, dioctyl sebacate, dioctyl azelate, dioctyl phthalate, and triacryl trimellitate); esters of an alcohol/alkylene oxide adduct and a carboxylic acid (such as the ester of POE (2) NEODOL 23 (a synthetic alcohol manufactured by Shell) and lauric acid, the ester of POP (2) isotridecyl alcohol and lauric acid, and the diester of POE (2) NEODOL 23 and adipic acid); alkylene oxide copolymers and their derivatives (such as block or random copolymers of ethylene oxide and propylene oxide, and copolymers produced by capping one or both ends of the block or random copolymers with an alcohol or carboxylic acid); and thio-ethers of a thiobisphenol derivatives or long chain hydrocarbons. Two or more of those lubricants may optionally be employed. The amount of the lubricants in a finish is not specifically restricted, and preferably ranges from 1 to 50 wt %, more preferably from 2 to 30 wt %. The finish of the present invention may also contain a surfactant or antioxidant for the purpose of emulsifying the finish in water, optionally removing the finish from yarn with water after texturing, or facilitating finish adhesion on yarn surface, so far as the effect of the present invention is not deteriorated. The surfactant may also be employed for imparting antistaticity or cohesiveness to yarn. A surfactant having lubricating performance may also be employed. The examples of such surfactant include nonionic surfactants (such as polyoxyethylene lauryl ether, polyoxyethylene oleyl ether, polyoxyethylene nonylphenyl ether, polyoxyethylene lauryl aminoether, polyethylene glycol monolaurate, polyethylene glycol dilaurate, polyethylene glycol monooleate, polyethylene glycol dioleate, glycerin monooleate, sorbitan monooleate, polyoxyethylene glycerin monolaurate, polyoxyethylene sorbitan trioleate, polyoxyethylene castor oil ether, and polyoxyethylene hydrogenated castor oil ether); and known anionic surfactants such as alkyl sulfonate salt. The examples of the antioxidant include phenolic antioxidants, sulfur-containing antioxidants, and phosphite antioxidants which are known to those skilled in the art. One of or a plurality of those surfactants and antioxidants may be used. The amount of the surfactants and antioxidants in a finish is not specifically restricted, and the sum of the surfactants and antioxidants should preferably range from 0.1 to 50 wt %, more preferably from 0.1 to 30 wt %. The method of producing the finish for friction false-twist texturing of the present invention is not specifically restricted, and a known method may be employed. The finish for friction false-twist texturing may be produced by blending the above-mentioned components in any order. The finish for friction false-twist texturing of the present invention should preferably be applied to filament yarn with kiss-roll or metering-guide finish application devices from an oil-in-water emulsion prepared by dispersing the finish in water. An oil-in-water finish emulsion for finish application should contain a finish in an amount preferably from 4 to 30 wt %, more preferably from 6 to 20 wt %. The method for preparing a finish application emulsion is not specifically restricted, and may be prepared in a known method. The finish for friction false-twist texturing of the present invention is especially suitable for synthetic filament yarns, such as polyester filament, polyamide filament, and polypropylene filament, which are processed in false-twist texturing. Polyesters comprising filament yarn include polyester (PET) comprising ethylene terephthalate as a major constituent unit, polyester (PTT) comprising tri-methylene-ethylene terephthalate as a major constituent unit, polyester (PBT) comprising butylene-ethylene terephthalate as a major constituent unit, and polyester (PLA) comprising lactic acid as a major constituent unit. Polyamides comprising filament yarn include nylon 6 and nylon 66, and polypropylenes comprising filament yarn include polypropylene. The process for applying the finish for friction false-twist texturing of the present invention to synthetic filament yarn and the process for false-twist texturing the finish-applied synthetic filament yarn are explained in the following description. The finish for friction false-twist texturing of the present invention should be applied to as-spun synthetic filament yarn in spinning process with kiss-roll or metering-guide finish application devices from an oil-in-water emulsion prepared by dispersing the finish in water. The finish may be applied to filament yarn in neat state or from dilution with a low-viscosity mineral oil. The amount of the finish for friction false-twist texturing applied to synthetic filament yarn preferably ranges from 0.1 to 5 wt % of yarn weight, more preferably from 0.2 to 2 wt %, further more preferably from 0.25 to 1.5 wt %. An amount lower than 0.1 wt % may incompletely coat filament to cause broken filaments and ends down. On the other hand, an amount higher than 5 wt % may increase the amount of finish thrown off from yarn onto heater surface to seriously increase stain on heater surface. The synthetic filament yarn applied with the finish for friction false-twist texturing of the present invention is heated, drawn, and false-twisted throughout the course between a first feed roller positioned just before a first heater (including a contact type heater to directly heat synthetic filament yarn being contacted to the heater, and a non-contact type heater to heat synthetic filament yarn with radiation heat from a high temperature heater) and a second feed roller positioned just after a false-twisting device (including devices for pin-spindle false-twisting method and friction false-twisting method with discs or belts), cooled down on a cooling plate, applied with 0.3 to 5.0 wt % of an after oil (or corning oil), and taken up into a package of false-twist textured yarn. The false-twisting device is positioned just after the cooling plate and functions to false-twist the yarn. The false-twisted yarn may sometimes be heat-set on a second heater. Broken filaments and ends down are caused by monofilament breakage which is resulted from high speed drawing and false-twisting of filament yarn passing through a first heating unit (especially above a non-contact-type heater) or drawing and false-twisting of filament yarn of low monofilament tenacity. In a texturing process with a contact-type heater, broken filaments and ends down are caused from thermally damaged yarn due to a finish of poor heat resistance or from damaged yarn due to a finish thrown off from yarn onto heater surface to be decomposed (turning into tar). A finish decomposed (turning into tar) on a first heater inhibits constant yarn running to result in yarn swinging. The inconstant yarn running or yarn swinging may also be the causes of broken filaments and ends down. The finish for friction false-twist texturing of the present invention exhibits excellent lubricity under extreme pressure, and prevents monofilament breakage caused by high-speed drawing and false-twisting. The finish has excellent heat resistance to avoid its decomposition (turning into tar) so as to prevent broken filaments and ends down in false-twist texturing with special yarns or in high-speed false-twist texturing, which are increasing recently. The finish also prevents stain on heater surface so as to extend heater-cleaning intervals. / развод (или потёк (stain)). Найлан (Nylon). Щел (Shell). филаментная (комплексная) пряжа (filament yarn). мононить (monofilament). Фенольное (Phenolic).

FRICTION SPINNING = ФРИКЦИОННОЕ ПРЯДЕНИЕ – Friction Spinning is a spinning system in which the yarn receives its twist by being rolled along the longitudinal axis in the nip between two revolving surfaces. The surfaces may rotate at the same or different speeds in the same or opposite directions depending on the particular machine design. Potential advantages include high production capacity, low stress on the fiber in processing, and the capacity to produce very fine counts. / Фрикционное Прядение, то есть когда

вращающаяся поверхность образована парой близкорасположенных фрикционных барабанов, например по меньшей мере одним всасывающим барабаном.

FRIES = ФРИЗ (или БАЙКА, или БОБРИК) – Fries or Frise:- rayon most popular, also mohair and silk and synthetics. The ground or backing yarns are usually made of cotton. Sometimes jute or hemp are combined with the cotton. Pile (looped). Made usually with uncut loops in all-over pattern. It is sometimes patterned by shearing the loops at different lengths. Some made with both cut and uncut loops in the form of a pattern. Frise is also spelled Frieze but frieze really refers to a rough, fuzzy, rizzy, boardy woolen overcoating fabric which originated in Friesland Holland. Often used for overcoating material for soldiers. Much adulteration is given the cloth. Irish frieze is quite popular and more reliable and is called 'Cotha More'.

FRIEZÉ = ФРИЗЭ (или БАЙКА, или БОБРИК, или МОНТАНЬЯК, или РАТИН) – Friezé is:- (1) a term applied when the pile of a velvet, plush, velour, or other pile fabric is uncut. A friezé fabric is sometimes patterned by shearing the loops at different lengths. Friezé fabrics are widely used for upholstery. (2) A cut-pile carpet made of highly twisted yarns normally plied and heat-set. A kinked or curled yarn effect is achieved. Excellent durability results from the hard-twist pile yarns. Friezé:- refers to a rough, heavy, fuzzy, rizzy, boardy woolen overcoating fabric with a rough surface which originated in Friesland Holland. Often used for overcoating material for soldiers. Much adulteration is given the cloth. Irish friezé is quite popular and more reliable and is called 'Cotha More'. Friezé is a heavy pile fabric used primarily for upholstery, slipcovers, and draperies. Frieze is looped, and the loops are often sheared to varying heights to form the pattern. Originally made of cotton (and still often referred to as Cotton Friezé), the fabric is now usually made of mohair, wool, cotton, and blends of cotton and man-made fibers. Also called Frise. / Под Фризэ, от Французского слова Frisé, означающее Ворсованое или Вьющееся или Извитое или Завитое. Ткани Фризэ (Friezé Fabrics) = Ратинированная Ткань или Ратин. Friezed Cloth = Байка или Бобрик или Кастор или Монтаньяк. Бобрик – жёсткая плотная шерстяная ткань с коротким стоячим ворсом. Используется для пошива верхней одежды. Бобрик был в моде и выпускался в большом количестве в 1950-е.

FRIGHT WIG = СТРАШНЫЙ ПАРИК – Fright Wig is a wig with hair that stands out from the head.

FRINGE = БАХРОМА – Fringe is a trimming made of hanging yarns, cords, or tassels. It may be made in loop form or with the loops cut. Fringes are tied or untied tasseled parts of ground warps and pile warps which are left unwoven at the beginning and the end edges of the terry towel. / Бахрома по Кромке – порок ткани размером более 1.5 см с одной стороны и более 2 см с другой стороны.

FRISE = ФРИЗ – Frise is a lace made by using a pil. See also Friezé. Frise = Friezé. / Фриз – кружево, изготовленное с использованием . Фризэ (Friezé).

FRITTED TRACE ELEMENTS = ЭЛЕМЕНТЫ ФРИТТОВОГО СЛЕДА – Fritted Trace Elements are sintered silicates having total guaranteed analyses of micronutrients with controlled (relatively slow) release characteristics.

FRN = FLOATING RATE NOTE

FROCK = ХХ (или РЯСА, или ПОДРЯСНИК) – Frock is an outer garment worn by monks and friars; an outer garment worn chiefly by men; a long loose mantle; a workman's outer shirt; a woolen jersey worn especially by sailors; a woman's dress.

FROCK COAT = ХХ (или СЮРТУК) – Frock Coat is a man's knee-length usually double-breasted coat.

FROG = БУФЕР (ЗАМОЧНОГО МЕХАНИЗМА ТКАЦКОГО СТАНКА) – Frog is a decorative fastening for clothing consisting of twisted cord wound into a design that looks like three petals joined to a similar design on the opposite edge of an opening with a loop of the cord. / Переставной Упор; или Буфер Замочного Механизма Ткацкого Станка; или Упор Механизма Откидного Бёрда; или Замок Станка; или Подвижная Упорная Щёчка.

FRONT = ПЕРЕД (или ПЕРЕДНИЙ) – Front (stitched down):- a front the has a double-turned hem that is stitched down full length of the front. The term may also refer to the shell (outside) front of self-goods.

FRONTING = ФРОНТИРОВАНИЕ (или ВЫДВИЖЕНИЕ) – Fronting is often used to describe a form of car insurance fraud, when someone claims to be the main driver on a car insurance policy when they are not. Fronting often happens when a higher risk driver, such as a younger driver, is added as a named driver to a car insurance policy, when they are in fact the main driver or owner of the vehicle. If a driver is found to be fronting they may have all or part of their insurance claim refused by their insurer, their policy may be cancelled and they could face prosecution for fraud, which can lead to a criminal record. Additionally, they may find it difficult to get insurance again in the future. In insurance, Fronting is a procedure whereby a company legally guarantees a risk by transferring it, in full or in part, to another company which is not named in the contract, and which is usually unknown to the insured party. Insurance Fronting is the term used to describe the process of taking out insurance for yourself but trying to save money by putting the policy in someone else's name. Nice idea, but you won't be legally insured. Generally this illegal activity is most acute amongst younger drivers. Let's take an example …. You're 17 or 18 years old and you've just passed your test. Fantastic! With a bit of financial help you've found a car or motorbike to buy and you can't wait for the freedom this will give you. Then you start checking out insurance quotes. Suddenly the world doesn't look so rosy. For the vehicle you've got your heart set on, the comparison websites are indicating a premium of more than £2 000 – if indeed they will give you a quote at all. Ouch! So what do you do? You quickly realise that the problem is your age and lack of driving or riding experience. With a zero no claims bonus you're being quoted the full whack – and that doesn't come cheap. You're also being penalised because of the high level of claims from younger drivers and motorbike riders. So what about getting a parent or older brother or sister to take out the insurance in their name, with you as just a 'named driver or rider'? Wow, see those insurance quotes fall! It sounds like the perfect solution, except for two things:- (i) You won't be legally insured because you're not the main driver; and (ii) You won't start building up a no claims discount. Here's what the BBC website has to say about 'fronting':- 'If an insurance company believes 'fronting' has taken place, it can refuse to pay any claim. The young driver can then be treated as driving without insurance and face a fine with six points penalty points on their licence'. On top of that nightmare your licence gets revoked back to a provisional again and you may even have to cough up the money to pay the claim! It can also land you in court on a fraud charge. So what's our advice? Bite the bullet. Accept the fact that your car insurance is going to be expensive at first and will then fall dramatically for each year of claims-free motoring or riding. For example an 18 year old male can go from £2 500 in the first year to less than half that with a years no claim bonus and a full licence over 12 months. Stay inside the law and you will be fully covered in the event of you having an accident. You will also be on the happy road to reduced premiums each year, as a result of building up your own no claims bonus – something that wouldn't happen if you were insured on your parents' policy.

FRONTLET = ВЕНЧИК (или ХХ) – Frontlet is a band or phylactery worn on the forehead. / лента или филактерия, одеваемая на лоб.

FRONT–LINE STATES = ГОСУДАРСТВА НА ПЕРЕДНЕЙ ЛИНИИ – Frontline States (FLS) was an organization established to achieve democratic majority rule in South Africa. It no longer exists. Former members included Angola, Botswana, Lesotho,

Mozambique, Tanzania, Zambia, Zimbabwe. United States relations with Front Line States reached their peak during the human rights push of the Carter administration. During the Reagan administration's Assistant Secretary of State for Africa Chester A. Crocker, the Front Line States were engaged diplomatically to achieve landmark peace accords between South Africa, Mozambique, Angola (Lusaka Protocol), and Namibia (New York Accords). Front-Line States (FLS) consists of 7 South African states with the goal of achieving black majority rule in South Africa. Frontline States were those bordering on or in close proximity to South Africa, including Angola, Botswana, Lesotho, Malawi, Mozambique, Swaziland, Tanzania, Zambia and Zimbabwe. After 1960 the anti-apartheid forces had to adjust to the new environment of exile politics. It became crucial to cultivate and maintain overseas sanctuary, support and funding. But it was equally crucial to have the cooperation of independent African states closer to home. These could provide sites for military training; they could also become launching pads from which to infiltrate South Africa and impose other pressures on the apartheid government. In particular, the three former protectorates, Lesotho, Botswana and Swaziland were South Africa's Achilles heel. They became invaluable to the exiled African National Congress (ANC), serving for almost 30 years as havens of asylum for political activists and freedom fighters. For reasons of logistics, activists from the eastern Cape tended to use Lesotho, while those from Natal went to Swaziland. Botswana was also used for sanctuary until entry there from South Africa became more regulated. By the mid-1960s the ANC external mission also had important African bases in Tanzania and Zambia. However a major drawback to gaining the cooperation of many of the frontline states was their economic reliance on South Africa and the fact that numbers of their people worked as migrant laborers on South African mines. South Africa has been conducting an undeclared terrorist war on the Front-line States, and in particular on Angola, Lesotho, Mozambique, Tanzania and Zimbabwe, for more than three years. / Дьжеймз Орл Картё Младший (James Earl Carter Jr.; 1924–). Президент США Ранэлд Вилсэн Рэйген (Ronald Wilson Reagan; 1911–2004). Чэстё Асэ Кракё (Chester Arthur Crocker; 1941–).

FRONT LOAD = ФРОНТАЛЬНАЯ НАГРУЗКА – Front Load:- as a rule, when mutual fund units are purchased, a premium known as the 'Front Load' is charged as consideration to cover the selling costs. This front load is expressed as a percentage of the repurchase price. The repurchase price plus the front load gives the issue price.

FRONT MONTH = ФРОНТОВОЙ МЕСЯЦ (или ПЕРЕДОВОЙ МЕСЯЦ) – The Front Month is the nearest unexpired futures contract of a given commodity. When commodity prices are quoted, the price being quoted is the price of the front month of the commodity. The front month is also known as the Spot Month. The nearest traded contract month. Also known as Nearby Delivery Month or Spot Month. See also Back Month. / Фронтовой Месяц или Передовой Месяц – ближайший торгуемый месяц контракта. Известен также как Ближайший Месяц Поставки (Nearby Delivery Month) или Спотовый Месяц (Spot Month). Смотрите также Тыловой Месяц (Back Month).

FRONT OFFICE = ПЕРЕДОВОЙ ОТДЕЛ (или ИСПОЛНИТЕЛЬНЫЙ ОТДЕЛ) – A Front Office is a designation that describes an area of a business where clients and company personnel interact. Front offices are typically called so because they are at the front or entrance of a business, giving customers easy access to office workers. This vital section of the business can serve many purposes, depending on the company, and are often the best place to obtain any customer-related information. Front offices may have an entry desk staffed with a secretary or administrative worker. This main desk can offer assistance to incoming clients or customers, and can direct queries to correct personnel. Alternatively, all personnel in the department may be trained in customer assistance; since front office workers may have many duties, training all of them in customer service means that someone will almost always be available to help a client. In addition to being a contact point for clients, this area may also serve as the main hub of communication for the entire company. Office workers often serve secretarial functions, and may be in charge of taking messages, handling orders, and relaying information to different departments. Many front offices work in concert with sales and marketing departments in order to create and distribute information to clients. Depending on the size and function of the business, the front office can serve as a jack of all trades. Workers in this area may handle daily mail sorting and distribution, provide copy and fax services to other departments, work directly with clients, and perform data entry duties. A typical worker in this position will have a blend of customer service skills and office skills. Organizational skills, computer literacy and typing are often vital to surviving the hectic atmosphere of this area. The front office may also serve as the home for office machinery. Common devices found in the front office include copiers, fax machines, multi-line phones, postage and scale machines for mail, and office computers. Many front office experts suggest that it is wise to ask front office workers for assistance before attempting to use any of these machines; a broken or jammed machine can cause hours of headaches and slow production for an entire company. The person in charge of this energetic area may have a variety of different titles, such as head secretary, office manager, office supervisor, or administrator. This person is generally responsible for training and managing assistants and serving as a department head. Front office managers typically have excellent managerial skills as well as a clear understanding of the company and its function. Front Office is a firm's trading unit and other areas that are responsible for developing and managing relationships with counterparties. See also Back Office. The terms Front Office and Back Office are generally used to describe the parts of the company (or of its information system) that are dedicated, respectively, to the direct relationship with the client and proper management of the company. The Front-Office (sometimes also called Front Line) refers to the front part of the company, visible for the clients and in direct contact with them, such as the marketing, user support, or after-sales service teams. In turn, Back Office refers to all parts of the information system to which the final user does not have access. The term therefore covers all internal processes within the enterprise (production, logistics, warehousing, sales, accounting, human resources management, etc). In reality, Back Office and Front office are not entirely separate since the teams in charge of the customer relationship must know a minimum of information regarding the process of producing the product or providing the service of the company. In turn, the sectors that are dedicated to product design must be kept informed of problems that are encountered by the users or, in turn, their needs, in order to reenter a circle of continuous improvement. The Front Office usually means the trading room. Front Office:- the sales personnel and corporate finance employees in a financial services company. It's in the front office where revenues are generated. A financial services company is logically broken up into three parts:- the front office includes sales personnel and corporate finance, the middle office manages risk and IT resources, and the back office provides administrative and support services. Front Office:- this term means any department, division, group, or personnel of submitter or any of its affiliates, whether or not identified as such, that performs, or personnel exercising direct supervisory authority over the performance of, any pricing (excluding price verification for risk management purposes), trading, sales, marketing, advertising, solicitation, structuring, or brokerage activities on behalf of a third party or for proprietary purposes. / коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо). Исполнительный Отдел обычно означает кабинет, сотрудники которого заключают сделки в биржевой торговле. Исполнительный Отдел – банка или брокерской фирмы, занятый непосредственно сделками. Служащие брокерских фирм, страховых компаний и других финансовых компаний, непосредственно зарабатывающие доход фирме, в отличие от служащих, выполняющих административные и вспомогательные функции (back office).

FRONT ON BREAST = XX (или ПОЛОЧКА НА ГРУДИ) – Front On Breast (FOB):- as in men's FOB watches that used to be worn on a chain tucked into the breast pocket of a waistcoat (US-vest). Tailoring term used to describe positioning of pockets etc.

FRONT RUNNING = УПРЕЖДЕНИЕ – Frontrunning is a special kind of insider trading. Frontrunning refers to investment advisors, analysts or stock market traders buying securities before recommending them to their clients for purchase. It is also known as Frontrunning if bank employees do not execute customer orders until they have purchased or sold securities for their own account. Frontrunning is prohibited pursuant to the German Securities Trading Act. With respect to commodity futures and options, a process whereby a futures or options position is taken based on non-public information about an impending transaction by another person in the same or related futures or options contract. Also known as Trading Ahead. Front Running is the unethical practice of a broker trading an equity based on information from the analyst department before his or her clients have been given the information. For example, analysts and brokers who buy up shares in a company just before the brokerage is about to recommended the stock as a strong buy are practicing front running. Another example is a broker who buys himself 200 shares in a stock just before his or her brokerage plans to buy a large block of 400 000 shares. Frontrunning is a illegal activity in which a trader takes a position in an equity in advance of an action which he/she knows his/her brokerage will take that will move the equity's price in a predictable fashion. Also called Forward Trading. / Известна также как Упреждающая Торговля (Trading Ahead). Упреждение или Опережающий Бег – практика, при которой дилер по ценным бумагам или товарно-сырьевой продукции занимает позицию (position) для того, чтобы получить прибыль благодаря заранее полученной информации о крупной ожидающейся сделке, которая должна повлиять на рыночные цены. На фондовом рынке это может быть сделано путём покупки опциона (option) на акции, которые, как ожидается, подорожают в результате сделки с крупным пакетом (блоком) (block) акций. В операциях с товарно-сырьевой продукцией общим признаком являются двойные торговые операции (dual trading), которые предоставляют возможность получить прибыль с помощью заранее полученной информации.

FRONT SPREAD = ФРОНТАЛЬНАЯ КУРСОВАЯ РАЗНИЦА (или ФРОНТАЛЬНЫЙ СПРЭД) – Front Spread is a Delta-neutral ratio spread in which more options are sold than bought. A front spread will increase in value if volatility decreases. Also known as Ratio Vertical Spread. / соотносительная (или пропорциональная) курсовая разница (ratio spread).

FROST DAMAGE = ПОВРЕЖДЕНИЕ ЗАМОРОЗКАМИ – The severity of Frost Damage depends on the stage of maturity of the grain, the temperature to which the grain is exposed, and the duration of exposure. In Wheat, as the degree of frost damage increases:- (i) Wheat milling becomes more difficult; (ii) flour yield decreases; (iii) flour ash content increases; (iv) flour color becomes darker, which may not be commercially acceptable; and (v) bread volume, appearance, crumb structure and crumb color deteriorate. / Повреждение – одно из понятий теории надёжности; событие, заключающееся в нарушении исправности изделия. Повреждение может быть существенным и являться причиной нарушения работоспособности (отказа) и несущественным, при котором работоспособность изделия сохраняется.

FROST/HEAT STRESS = СТРЕСС ОТ ЗАМОРОЗКОВ/ТЕПЛОВОЙ СТРЕСС – A term Frost/Heat Stress refers to Wheat kernels with blistered brans as a result of exposure to freezing temperatures or prolonged hot weather conditions. The degree of blistering ranges from fine to coarse and is dependent upon the maturity of the grain, the temperature to which the grain is exposed and the duration of the exposure. Samples containing kernels affected by frost/heat stress are graded according to the degree of soundness definition as reflected in the standard or guide samples for each grade. / на зерновку пшеницы . в стандартных или справочных пробах по каждому сорту.

FROSTING = ГЛАЗУРЬ (или ЗАМОРАЖИВАНИЕ) – Frosting is a change in color in a limited area of a fabric caused by abrasive wear. Discussion:- frosting may be the result of differential wear, as in multicomponent blends in which the fibers do not match in shade, or of the abrasion of single-fiber constructions in which there is some variation in penetration, or incomplete penetration, of dye-stuff. The use of the terms 'Differential Wear' and 'Fibrillation' as substitutes for the concept of frosting is undesirable. Frosting is color change due to flat abrasion. See also Color Abrasion. Frosting is a change of color in a fabric caused by localized abrasive wear. It may be the result of differential wear, as in multicomponent blends in which the fibers do not match in shade, or of the abrasion of single-fiber constructions in which there is a variation in or incomplete penetration of dyestuff. Frosting is sometimes referred to as Differential Wear or Fibrillation. There are two test methods for evaluating frosting:- (i) the emery method and (ii) screen wire method. The emery method produces in an accelerated manner a localized color change similar to that produced in some garments over relatively long periods of actual wear in which the garment is exposed to relatively severe abrasion. The test specimen is mounted over a diaphragm inflated under controlled air pressure and rubbed multidirectionally against an emery abradant surface mounted on weighted head for a specified number of rubs or for a specified time. Any change in color of the specimen is evaluated by comparison with the gray scale for color change. The screen wire method produces in an accelerated manner a localized color change similar to that produced in some garmets over extremely short periods of actual wear in which the garment is exposed to relatively mild abrasive action. The test specimen is mounted over a foam rubber cushion and rubbed multidirectionally against a wire screen mounted on a weighted head for a specified number of rubs or for a specified time. Any change in color of the specimen is evaluated by comparison with gray scale for color change. / абразивная поверхность наждака (emery abradant surface).

FROST MARKS = ОТМЕТИНЫ ОТ ЗАМОРОЗКИ (или МАТОВЫЕ ОТМЕТИНЫ) – Frost Marks is a defect of woven fabric consisting of surface highlights that give a frosted appearance. Frost marks are caused by improper sizing or insufficient warp tension as a result of uneven bending of some warp ends over the picks.

FROWZY WOOL = ЗАТХЛАЯ (или СПЁРТАЯ, или ВОНЮЧАЯ, или ДУШНАЯ, или ГРЯЗНАЯ) ШЕРСТЬ – Frowzy Wool:- a wasty, lifeless-appearing, dry, harsh wool, lacking in character. See also Lofty.

FROZEN CONCENTRATED ORANGE JUICE = ЗАМОРОЖЕННЫЙ КОНЦЕНТРИРОВАННЫЙ АПЕЛЬСИНОВЫЙ СОК – Frozen Concentrated Orange Juice (FCOJ) is a commodity product traded on the major commodity exchanges, including the New York Board of Trade and the Brazilian Mercantile and Futures Exchange. When water is added to freshly-unfrozen concentrated orange juice, it is reconstituted. Most of orange juice sold today throughout the world is reconstituted juice. There is a huge difference in the volume of frozen concentrated orange juice and unprocessed juice and this makes a difference in the price the consumer is charged. There is some disagreement about the quality of fresh-squeezed juice versus juice that has been processed into frozen concentrated orange juice and reconstituted, as freshly squeezed orange juice often tastes better. However, while it might seem that concentrating and freezing would reduce the freshness of the juice, the time required for the juice to be bottled/packaged and delivered to the consumer might reduce the flavor just as much as the concentration/freezing process. The largest exporter of orange juice is Brazil, followed by the United States (predominantly from Florida, where orange juice is the official state beverage). Orange juice is commonly exported in dried form and infused in the destination country. Juice which is shipped in liquid form is traded as direct juice between producers. It is sold to consumers (in the United States and Canada), described as Not From Concentrate. Oranges are then selected from labeled bins to enable blending juice of optimal quality and transported via conveyor to juicing machines (extractors). After juice extraction, the stream of pulpy juice goes through a finisher (screen) where the pulp and seeds are removed, and along with the peel, diverted to be used for by-products. At this stage, the juice is made into one of two product forms:- (i) bulk frozen concentrated orange juice (FCOJ) or (ii) not-from-concentrate (NFC). Juice made into bulk FCOJ is sent to an evaporator where vacuum and heat are used to remove

excess water in order to obtain a base concentrate of 65° brix, which is a seven-to-one strength ratio to normal single-strength juice. The bulk FCOJ is then stored at 20 °F or lower in a tank farm or in 55-gallon drums until it is sold or packaged for sale. Bulk FCOJ is packaged by orange juice marketers into either frozen concentrated orange juice or chilled reconstituted (recon) ready-to-serve (RTS) orange juice. Packaged FCOJ is made by adding single-strength juice or water and flavor oils and essences to bulk FCOJ to reduce it from 65° brix to 42° brix, which is a four-to-one strength ratio to normal single-strength juice. Then the product is packaged into 6-, 12-, or 24-oz. cans and sold in frozen form. To convert this FCOJ into ready-to-drink orange juice, consumers thaw it and then mix it with three parts water. Recon RTS is made by adding water and flavor oils and essences to bulk FCOJ to reduce it from 65° brix to 11.8° brix, pasteurizing it, packaging it in cardboard cartons or glass containers and selling it as chilled RTS orange juice. Juice made into NFC is de-oiled to .02–.04% oil levels with a centrifuge, then either pasteurized, chilled and packaged or stored for future sale and/or packaging. NFC is stored a number of ways:- frozen as blocks in warehouses; frozen in 55-gallon drums; pasteurized and chilled in large stainless steel aseptic tanks; or, pasteurized and chilled in 4' x 4' wooden boxes containing a plastic bag which holds about 300 gallons of juice. Frozen Concentrated Orange Juice (FCOJ) is produced from oranges in approximately 35 Florida citrus processing plants. The mechanical extractors used to obtain juice from the fruit are amazingly efficient and remove the juice from 400 to 700 oranges per minute. The processing plants have very large capacities with some plants processing more than 100 000 boxes of oranges per day. This is 517 000 gallons of orange juice per day – a year's supply of FCOJ for 17 000 people. The Frozen Concentrate Orange Juice futures at the NYCE® have the second slimmest volumes of the softs. The 15 000 pounds of orange solids specified by the contracts can come in drums or tanks, at the sellers option. The United States and Brazil outpace all others in orange juice production. The orange crop is another commodity more susceptible to weather than most. Systems such as hurricanes, freezes and tropical storms can shock the market into the stratosphere if they hit at the right time. It's obvious why. More than 98% of the US crop comes from Florida, a geographic concentration soybean crushers would dread. Another measure of the orange juice supply is the number and quality of Citrus Trees, a number published bi-annually by the Florida Agricultural Statistics Service. The report also breaks down trees by type – 1996 orange trees up 3% to 84.2 million, of which 78.5 million produced fruit, for example. A tree can take as long as 15 years to reach maturity. / включая Нью Йоркскую Палату Торговли (Нью Йоркское Табло Торговли, если быть более точными) и .

FRP = FAIR AND REMUNERATIVE PRICE

FRS = FEDERAL RESERVE SYSTEM

FRT = FLOATING ROTOTILLER

FRUIT = ПЛОД (или ФРУКТ) – Fruit is the mature ripened reproductive body (ovary) of a seed plant which encloses the seed in fertile species of plant. True fruits develop from the ovary wall. See also Pericarp. Many fungi, myxobacteria (slime moulds) and lichens produce a fruiting body, a macroscopic reproductive structure enclosing the spores. Fungal fruiting bodies often have distinctive sizes, shapes, and colors characteristic of each species. See also Achene, Apothecium, Berry, Capsule, Caryopsis, Cynarrhodium, Drupe, Follicle, Pepo, Pitahaya, Pome, Samara. Fruit refers to Cotton squares (or flower buds), blooms, and bolls; reproductive parts of the plant. Cotton fruit is susceptible to a wide range of insect pests. Fruit is the ripened (mature) ovary containing one or more seeds. / и лишайники производят . Виды (Species). Смотрите также , Крылатка (Samara). В ботанике под Плодом понимается орган покрытосеменных растений, образующийся из цветка и служащий для формирования, защиты и распространения заключённых в нём семян. Развивается обычно после оплодотворения (исключение составляют так называемые партенокарпичные плоды). Наружная часть плода представлена околоплодником. Сухие плоды – боб, зерновка, коробочка, листовка, орех, семянка, стручок и другие. Сочные плоды – костянка, тыквина, яблоко, ягода и другие. Многие плоды – ценные продукты питания, сырьё для получения лекарств, красящих веществ и тому подобного.

FRUIT FIBER = ПЛОДОВОЕ ВОЛОКНО – Fruit Fibers:- Coir is the primary fruit fiber. It is produced from the fibrous pulp surrounding the hard shell of the seed of the Coconut Palm (Cocos Nucifera). Coconut Palms flower monthly but since the fruit requires a year to ripen, any given Coconut Palm will always contain fruit at all 12 stages of maturity. Harvesting usually takes place on a 45–60 day cycle, with each tree yielding 50–100 Coconuts per year. Before the Coconut fruit is shipped to market, it is stripped of its leathery external skin, as well as its 5–8 cm thick intermediate layer of fibrous pulp. The fibers recovered from that pulp are called Coir. Coir is the third most important natural fiber produced in the world, after Cotton and Jute. The main producing countries are India and Sri Lanka, with some minor production in the Pacific countries. About 75% of Coir fiber comes from India and Vietnam. Total production rose to 1.2 million tons in 2013. The fibers are extracted by various methods involving retting and soaking. The husk is kept in an environment that encourages the action of naturally occurring microbes. This action partially decomposes the husk pulp, allowing it to be separated into coir fibers and a residue called Coir Pith. After the husks are naturally softened by the above methods, the fibers are extracted manually by beating or mechanically through various mechanisms. The fibers thus removed are sieved for cleaning purposes before processing to obtain the final product. The main uses are rope, fishing nets, brushes, doormats, rugs, etc. Fibers are 100% biodegradable. Coir fibers measure around 35 centimeters and contain one of the highest concentrations of lignin, making it stronger than cotton but less flexible and unsuitable for dyeing. The two categorizations of coir fibers are color (brown or white) and fiber length. Coir fibers longer than 20 cm are called Bristle Fiber and those shorter than 20 cm are called Mattress Fiber.

FRUITING BRANCH = ПЛОДОНОСЯЩАЯ ВЕТВЬ – Fruiting Branch is a lateral branch of a Cotton Plant, typically arising from the fourth through eighth node and higher on the plant; has fruiting position at each node; Sympodium or Reproductive Branch. See also Sympodial Branch. / Симподий (Sympodium) или Симподиальная Ветвь (Sympodial Branch) или Репродуктивная Ветвь (Reproductive Branch).

FRUITING NODE = ПЛОДОНОСЯЩИЙ УЗЕЛ – Fruiting Node:- Main-stem nodes producing sympodial or fruiting branches. Not to be confused with nodal positions on a sympodial branch. See also Fruiting Site, and Nodes.

FRUITING POSITION = ПЛОДОНОСЯЩЕЕ РАСПОЛОЖЕНИЕ (или ПОЗИЦИЯ ПЛОДОНОШЕНИЯ) – Fruiting Position is any main stem, vegetative branch, or fruiting branch location on which fruit is either present or aborted.

FRUITING SITE = ПЛОДОНОСЯЩИЙ УЧАСТОК – Fruiting Site or Fruiting Position:- Nodal position on a sympodium where a boll may be produced. A scar is produced if fruit is aborted. Note that the majority of the yield comes from the first (about 60%) and second (30%) fruiting positions along a sympodial branch. Boll size and lint quality decreases with each fruiting position away from the main stem. Fruiting Site is a position at a node on a fruiting branch where reproductive structures, squares and bolls, are produced. See also Fruiting Node, and Nodes.

FRUIT RESPIRATION = ДЫХАНИЕ ФРУКТОВ (или ДЫХАНИЕ ПЛОДОВ) – Fruit Respiration is an exchange of gases between fruits and the ambient air. Apples, for instance, constantly take in oxygen when they respire and release approximately the same quantity of carbon dioxide. If you change the concentration of the gases which are involved in respiratory metabolism, you can

permanently affect the intensity of the fruit respiration. This will delay the maturity and degradation processes and thus increase the duration of storage.

FRUITS AND VEGETABLES = ФРУКТЫ И ОВОЩИ – Fruits And Vegetables is a commodity class for fresh parts of plants intended for consumption or processing and not for planting.

FRUSTRATION = ФРУСТРАЦИЯ – Frustration:- charterers when canceling agreement sometimes quote 'doctrine of frustration', i.e. vessel is lost, extensive delays. / Фрахтователи при расторжении соглашения иногда ссылаются на 'доктрину фрустрации', к которой можно отнести, например, пропажу судна или экстенсивные задержки. Под Фрустрацией, от Латинского слова Frustratio, означающее Неудача или Обман или Разрушение (планов, замыслов) или Расстройство или Тщетное Ожидание, от Frustror, означающее Делаю Тщетным или Обманываю или Расстраиваю, понимается психологическое состояние гнетущего напряжения, тревожности, чувства безысходности и отчаяния; возникает в ситуации, которая воспринимается личностью как неотвратимая угроза достижению значимой для неё цели, реализации той или иной её потребности. Сила фрустрации зависит как от степени значимости блокируемого действия, так и от близости его к намеченной цели. Реакцией на состояние фрустрации могут быть следующие основные типы 'замещающих' действий:- 'уход' от реальной ситуации в область фантазий, грёз, мечтаний, то есть переход к действию в своеобразном 'магическом' мире; возникновение внутренней тенденции к агрессивности, которая либо задерживается, проступая в виде раздражительности, либо открыто прорывается в виде гнева; общий 'регресс' поведения, то есть переход к более лёгким и примитивным способам действия, частая смена занятий и другие. В качестве последствия фрустрации нередко наблюдается остаточная неуверенность в себе, а также фиксация применявшихся в ситуации фрустрации способов действия. Часто фрустрация бывает одним из источников неврозов. Особое значение (прежде всего, с точки зрения прикладных задач) приобретает в современной психологии проблема 'выносливости' (стойкости) человека в отношении фрустрации.

FRUSTRATION OF ADVENTURE = ФРУСТРАЦИЯ АВАНТЮРЫ – Frustration Of Adventure:- a circumstance whereby a ship or goods cannot reach the contemplated destination but remain undamaged and are not lost to the owner. Claims based on frustration of the voyage or adventure are normally excluded from policies covering war risks and strike risks. / Обстоятельство, в связи с проявлением которого, судно или товары не могут достичь запланированного пункта назначения, однако остаются неповреждёнными и не потерянными для владельца. Претензии, базирующиеся на фрустрации рейса или авантюры обычно исключаются из полисов, покрывающих военные риски и риски, связанные с забастовками.

FRUTESCENS = КУСТАРНИКОВОЕ (или КУСТИСТОЕ) – Frutescens:- shrubby. / – кустистое.

FS = FALSE SMUT

FS = FINAL SETTLEMENT

FS = FINANCIAL STATEMENT

FS = FINE STRIPE

FSA = FARM SERVICE AGENCY

FSA® = THE FINANCIAL SERVICES AUTHORITY

FSC = FOREIGN SALES CORPORATION

FSD = FINANCIAL SURPLUS OR DEFICIT

FSLIC = FEDERAL SAVINGS AND LOAN INSURANCE CORPORATION

FSMA = THE FINANCIAL SERVICES AND MARKETS ACT 2000

F. Sp. = FORMAE SPECIALES

FSR = FARMING SYSTEM RESEARCH

FSRI = FARMING SYSTEMS RESEARCH INSTITUTE

FSSRI = FARMING SYSTEMS AND SOIL RESOURCES INSTITUTE

FT = FAIRTRADE

FT = FLOOR TRADER

FTA = FINANCIELE TERMIJNMARKT AMSTERDAM

FTA = FREE TRADE AGREEMENT

FTAA = FREE TRADE AGREEMENT OF THE AMERICAS

FTC = FEDERAL TRADE COMMISSION

FTD = FEDERAL TAX DEPOSIT

FTD = FIRST TRADING DATE

F TEST = ТЕСТ ЭФ. (или ИСПЫТАНИЕ ЭФ.) – F Test is a test of statistical significance consisting of the ratio of two independent variances of normally distributed variables.

FTI = FEDERAL TAX INCLUDED

FTIR = FOURIER TRANSFORM INFRARED SPECTROSCOPY

FTK = FREIGHT TONNE–KILOMETER

FTM = FIELD TO MARKET

FTR = FINANCIAL TRANSMISSION RIGHT

FTSE® 100 = FINANCIAL TIMES AND THE LONDON STOCK EXCHANGE 100

FTZ = FOREIGN TRADE ZONE

FUCHSIA = ФЬЮША (или ФУКЗИА, или МАЛИНОВОЕ, или ФУКСИН, или РЫЖИЙ) – Fuchsia is a bluish-red color named after a flower named after Herr Fuchs. See also Magenta. Fuchsia:- vivid reddish purple. / Немецкий персонаж Хэр Фукс или Господин Лис (Herr Fuchs). Фуксин, $C_{20}H_{19}N_3$, красный основный трифенилметановый краситель.

FUEL = ТОПЛИВО (или ГОРЮЧЕЕ) – Fuel is any substance that can be burned to produce heat; also, materials that can be fissioned in a chain reaction to produce heat. / Под Топливом понимаются горючие вещества, основной составной частью которых является углерод, применяемые с целью получения при их сжигании тепловой энергии. По происхождению топливо делится на природное (горючие сланцы, древесина, нефть, природный газ, торф, ископаемые угли (антрацит, каменный и бурый уголь), растительные отходы) и искусственное (коксовый и генераторный газы, кокс доменных печей, моторные топлива и другие), по агрегатному состоянию – на газообразное, жидкое и твёрдое. Наиболее широко используются природные топлива. Основная характеристика топлива – теплота сгорания. Для сопоставления различных видов топлива и суммарного учёта его запасов используется понятие – Условное Топливо, для которого низшая теплота сгорания принята 29.3 МегаДжоулей на килограмм (МДж/кг) (7 000 килокалорий на килограмм (ккал/кг)). В связи с развитием новых отраслей техники термин Топливо стал применяться в более широком смысле и распространился на все материалы, служащие источником энергии, например, ракетное топливо, ядерное топливо.

FUEL DILUTION = РАЗЖИЖЕНИЕ ТОПЛИВА (или РАЗБАВЛЕНИЕ ТОПЛИВА) – Fuel Dilution:- the amount of raw, unburned fuel that ends up in the crankcase of an engine. It lowers an oil's viscosity and flash point, creating friction-related wear almost immediately by reducing film strength. / износ, связанный с трением .

FUEL ECONOMY = ЭКОНОМИЯ ТОПЛИВА (или ТОПЛИВНАЯ ЭКОНОМИЧНОСТЬ) – Fuel Economy:- the amount of fuel required to move a machine over a given distance.

FUEL EXPENSES = ТОПЛИВНЫЕ РАСХОДЫ (или РАСХОДЫ НА ТОПЛИВО) – Fuel Expenses:- these costs include the fuel used in the production of steam or driving another prime mover for the generation of electricity. Other associated expenses include unloading the shipped fuel and all handling of the fuel up to the point where it enters the first bunker, hopper, bucket, tank, or holder in the boiler house structure. / :- эти затраты включают топливо, использованное в производстве пара или .

FUEL OIL = СОЛЯР (или СОЛЯРОВОЕ ТОПЛИВО, или ГОРЮЧЕЕ, или МАЗУТ, или ДИЗЕЛЬНОЕ ТОПЛИВО) – Refined petroleum products used as a fuel for home heating and industrial and utility boilers. Fuel oil is divided into two broad categories, distillate fuel oil, also known as New York Mercantile Exchange's No. 2 fuel, gasoil, or diesel fuel; and residual fuel oil, also known as NYMEX's No. 6 fuel, or outside the United States, just as fuel oil. No. 2 fuel is a light oil used for home heating, in compression ignition engines, and in light industrial applications. No. 6 oil is a heavy fuel used in large commercial, industrial, and electric utility boilers. Fuel Oil includes fuel oil, ship fuel oil, oil residues and raw material for technical carbons. Fuel Oil is a fraction obtained from petroleum distillation, either as a distillate or a residue. Broadly speaking fuel oil is any liquid petroleum product that is burned in a furnace or boiler for the generation of heat or used in an engine for the generation of power, except oils having a flash point of approximately 40 °C (104 °F) and oils burned in cotton or wool-wick burners. In this sense, diesel is a type of fuel oil. Fuel oil is made of long hydrocarbon chains, particularly alkanes, cycloalkanes and aromatics. The term fuel oil is also used in a stricter sense to refer only to the heaviest commercial fuel that can be obtained from crude oil, i.e. heavier than gasoline and naphtha. In Australia the term 'distillate' refers specifically to Diesel fuel. The ASTM (short for the American Society for Testing and Materials) classification system was originally based on early refining and combustion engineering practices and nomenclature. Some specifications have changed over the years to reflect new refining practices and refinery by-products. Other organizations have published modified versions of the original six fuel specifications to assist operators of older equipment find appropriate fuels from current refinery products. Although the following trends generally hold true, different organizations may have different numerical specifications for the six fuel grades. The boiling point and carbon chain length of the fuel increases with fuel oil number. Viscosity also increases with number, and the heaviest oil has to be heated to get it to flow. Price usually decreases as the fuel number increases. (1) Number 1 Fuel Oil is a volatile distillate oil intended for vaporizing pot-type burners. It is the kerosene refinery cut that boils off right after the heavy naphtha cut used for gasoline. Older names include coal oil, stove oil and range oil. (2) Number 2 fuel oil is a distillate home heating oil. Trucks and some cars use similar diesel fuel with a cetane number limit describing the ignition quality of the fuel. Both are typically obtained from the light gas oil cut. Gas oil refers to the original use of this fraction in the late XIX and early XX centuries – the gas oil cut was used as an enriching agent for carburetted water gas manufacture. (3) Number 3 fuel oil was a distillate oil for burners requiring low-viscosity fuel. ASTM merged this grade into the number 2 specification, and the term has been rarely used since the mid-XX century. (4) Number 4 fuel oil is a commercial heating oil for burner installations not equipped with preheaters. It may be obtained from the heavy gas oil cut. (5) Number 5 fuel oil is a residual-type industrial heating oil requiring preheating to 170–220 °F (77–104 °C) for proper atomization at the burners. This fuel is sometimes known as Bunker B. It may be obtained from the heavy gas oil cut, or it may be a blend of residual oil with enough number 2 oil to adjust viscosity until it can be pumped without preheating. (6) Number 6 fuel oil is a high-viscosity residual oil requiring preheating to 220–260 °F (104–127 °C). Residual means the material remaining after the more valuable cuts of crude oil have boiled off. The residue may contain various undesirable impurities including 2 percent water and one-half percent mineral soil. This fuel may be known as Residual Fuel Oil (RFO), by the Navy specification of Bunker C, or by the Pacific Specification of PS-400. Mazut is a residual fuel oil often derived from Russian petroleum sources and is either blended with lighter petroleum fractions or burned directly in specialized boilers and furnaces. It is also used as a petrochemical feedstock. / Американское Общество по Испытаниям и Материалам (АОИМ). Продукты нефтепереработки, используемые в качестве топлива для отопления домов, а также в промышленных котлах и котлах электро- и теплостанций. Дизельное топливо подразделяется на две общие категории:- дистиллятые маловязкие фракции топлива, известные также как топливо № 2, газойль, или дизельное топливо на Нью Йоркской Товарной Бирже; и высоковязкие остаточные топлива, известные также как НАЙМЭКС-ное (NYMEX) топливо № 6, а за пределами Соединённых Штатов, просто как топочный мазут. Топливо № 6 это тяжёлое топливо, используемое в больших коммерческих, промышленных котлах, а также в котлах элетростанций. К Соляре или Соляровому Топливу или Дизельному Топливу относятся:- топочный мазут, флотский мазут, остатки нефтяные и сырьё для техуглерода. Слово Мазут было заимствовано из Тюркского языка. Оно означает густую жидкость тёмно-коричневого цвета, остаток после отгона от нефти бензина, керосина и фракций дизельного топлива. Плотность мазута составляет 0.89–1.00 граммов на кубический сантиметр (г/см^3), теплота сгорания 39.4–40.7 МегаДжоулей на килограмм (МДж/кг). Мазут применяют как жидкое котельное топливо, а также для производства битумов, кокса и моторных топлив. Под Мазутом (происхождение слова из Тюркского языка) понимается остаток после перегонки нефти при атмосферном давлении (отгонки бензина, керосина и дизельного топлива). Мазут – густая тёмная жидкость; плотность 890–1 000 килограммов на кубический метр (кг/м^3), низшая теплота сгорания около 40 МДж/кг. Применяется как сырьё для крекинга, в качестве котельного топлива, для получения смазочных масел. Остаток после отбора масляных фракций называется гудроном. Марки мазута различаются по вязкости, температуре вспышки, зольности, температуре застывания и прочему. Под Котельными Топливами понимаются тяжёлые продукты переработки

нефтей, каменных углей, горючих сланцев. Применяются для корабельных, судовых и стационарных котельных установок и в промышленных печах различного назначения.

FUGITIVE COLORS = НЕПРОЧНЫЕ КРАСКИ (или НЕСТОЙКИЕ КРАСИТЕЛИ, или НЕСТОЙКИЕ ЦВЕТА, или ЦВЕТА ПОДЦВЕТКИ) – Fugitive Colors:- dyes that fade, especially those that lose color relatively quickly when exposed to natural light.

FUJI = ФУДЗИ – Fuji is a spun silk clothing fabric in plain weave originally made in Japan.

FULFILLMENT = ВОСПОЛНЕНИЕ (или ПОПОЛНЕНИЕ) – Fulfillment:- the picking and processing of orders for shipping from a distribution or warehouse. / съём и обработка заказов на отгрузку из центра распределения или со склада.

FULFILLMENT/CONSOLIDATION WAREHOUSES = ПОПОЛНЯЮЩИЕ/КОНСОЛИДАЦИОННЫЕ СКЛАДЫ – Fulfillment/Consolidation Warehouses are the warehouses where products are generally received in large quantities and shipped out in a large number of smaller mixed shipments. Such pick and pack operations require special inventory management and picking procedures. Location tracking is essential. Billing methods are generally similar to distribution warehouses.

FULGIDA = БЛЕСТЯЩЕЕ (или БЛИСТАЮЩЕЕ, или СВЕРКАЮЩЕЕ, или СИЯЮЩЕЕ) – Fulgida:- glittering, shining.

FULIGINOUS = ДРЕВОТОЧИСТОЕ (или ЗАКОПЧЁНИСТОЕ, или ХХ) – Fuliginous:- having a dark or dusky color. / имеющее тёмный и смуглый цвет.

FULL CARRY = ИТОГО РАСХОДОВ – Full Carry:- a futures market in which the price difference between contracts with two different delivery months equals the full cost of carrying the commodity from the delivery month of the first contract to the next. Carrying costs include interest, insurance and storage. Also known as Full Carry Market or Full Carrying Charge Market. For example, let's say commodity X has a May 05 futures price of USD10/unit. If the cost of carry for commodity X is USD0.50/month and the June 05 contract is trading at USD10.50/unit the price indicates a full carry, or in other words the contract represents the full cost associated with the holding the commodity for an additional month. See also Carrying Charges. / Смотрите также Накладные Расходы (Carrying Charges).

FULL CARRYING CHARGE = ПОЛНЫЙ СБОР ЗА ПЕРЕНОС (или ИТОГО НАКЛАДНЫХ РАСХОДОВ) – Full Carrying Charge:- a situation where the carrying charge of a commodity represents the actual value of carrying the commodity for another month. If the next month's carrying charge for a commodity contains the price as well as carrying costs such as interest or storage, the value is considered a full carrying charge. Also called Full Carry, and Full Carry Market. See also Carrying Charges. Full Carrying Charge:- an unusual situation in the futures market in which the price difference between delivery months refl ects the full fixed and variable costs of storing grain for the specified period at delivery-point elevators. Delivery-point elevators are higher cost than country elevators. / Смотрите также Накладные Расходы (Carrying Charges).

FULL CARRYING CHARGE MARKET = РЫНОК С ПОЛНЫМИ НАКЛАДНЫМИ РАСХОДАМИ – Full Carrying Charge Market is a futures market where the price difference between delivery months reflects the total costs of interest, insurance, and storage. / Фьючерсный рынок, на котором разница в ценах между месяцами поставки отражает сумму всех затрат по процентам, страхованию и хранению.

FULL–CELL PROCESS PRESSURE–TREATING = СПОСОБ ПОЛНОЙ ПРОПИТКИ (или СПОСОБ СКВОЗНОЙ ПРОПИТКИ, или СПОСОБ ПРОПИТКИ СО СТУПЕНЧАТЫМ ПОВЫШЕНИЕМ ДАВЛЕНИЯ) – Full-Cell Process Pressure-Treating is a pressure treating process in which a vacuum is drawn to remove air from the wood before admitting the preservation, resulting in a heavy absorption and retention of preservative due to the cells being almost filled. See also Empty-Cell Process Pressure-Treating, and Pressure-Treating. / .

FULL CONTAINER LOAD = ПОЛНАЯ ЗАГРУЗКА КОНТЕЙНЕРА – (1) Full Container Load (FCL):- containers are charged a specific rate for ocean transit regardless of their (lack of) contents. A full container will thus offer a better price per unit shipped than will a Less Than Container Load (LCL). Container packed by the shipper for door-to-door delivery without any transshipment operations. A general reference for identifying container loads of cargo loaded and/or discharged at merchants' premises. Full Container Load or FCL Container packed by the shipper for door-to-door delivery without any transshipment operations. / груза, погруженного в и/или разгружаемого в помещениях коммерсантов. Объём загрузки контейнера, соответствующий предельно допустимым нормам объёма или полезной нагрузки самого контейнера.

(2) Full Container Load (FCL):- a container stuffed or stripped under risk and for account of the shipper and/or the consignee.

FULL CONTAINERSHIP = ПОЛНОЦЕННЫЙ КОНТЕЙНЕРОВОЗ (или ВСЕЦЕЛО КОНТЕЙНЕРОВОЗ) – Full Containership:- ships equipped with permanent container cells, with little or no space for other types of cargo. See also Cellular Containership.

FULL–CUT = ЦЕЛЬНОКРОЁННОЕ – Full-Cut:- not tapered.

FULL–FASHIONED = ПОЛНОПРИДАННОЙ ФОРМЫ (или КАТОННОЕ, или КОТОННОЕ) – Full-Fashioned is a term applied to fabrics produced on a flat-knitting machine, such as hosiery, sweater, and underwear, that have been shaped by adding or reducing stitches. / к тканям, связанным на котонных машинах, такие как чулочно-носочные изделия, .

FULL FLOW FILTER = ПОЛНОПОТОЧНЫЙ ФИЛЬТР – Full Flow Filter is a filter that, under specified conditions, filters all influent flow. See also Filter. / Полнопоточный Фильтр – фильтр, через который проходит весь поток циркулирующей жидкости.

FULL–FLOW FILTRATION = ПОЛНОПОТОЧНАЯ ФИЛЬТРАЦИЯ – Full-Flow Filtration is a system of filtration in which the total flow of a circulating fluid system passes through a filter. See also Filtration.

FULL FLUID FILM LUBRICATION = СМАЗЫВАНИЕ ПОЛНОЙ ЖИДКОЙ ПЛЁНКОЙ – Full Fluid Film Lubrication:- presence of a continuous lubricating film sufficient to completely separate two surfaces, as distinct from boundary lubrication. Full-fluid-film lubrication is normally hydrodynamic lubrication, whereby the oil adheres to the moving part and is drawn into the area between the sliding surfaces, where it forms a pressure.

FULL–FORCED OUTAGE = ПОЛНОСТЬЮ (или ПОЛНОМАСШТАБНЫЙ) ВЫНУЖДЕННЫЙ ПРОСТОЙ – Full-Forced Outage:- the net capability of main generating units that are unavailable for load for emergency reasons.

FULLING = ВАЛЯНИЕ (или ВАЛКА, или УВАЛИВАНИЕ) – Fulling is a finishing process used in the manufacture of woolen and worsted fabrics. The cloth is subjected to moisture, heat friction, chemicals, and pressure which cause it to mat and shrink appreciably in both the warp and filling directions, resulting in a denser, more compact fabric. Fulling is the operation of shrinking and felting a woolen fabric to make it thicker and denser. Also known as Milling. You can also full woolen yarn to give you a lovely knitting yarn. If you were going to weave with the same yarn, you wait until you had woven the fabric. Fulling (Milling):- a wool-fabric finishing operation

which causes the felting of the wool fibers and shrinkage in length and width, producing a full, compact texture. / направлениях основы и уточины. Валяние или Валка, процесс изготовления шерстяных изделий (войлока, валяной обуви, фетра, сукна) путём сцепления и переплетения между собой волокон шерсти. Шерсть – единственное волокно, обладающее валкоспособностью. Валкоспособность обусловливается сочетанием чешуйчатости шерсти, создающей неодинаковый коэффициент трения (больший в направлении корня, чем кончика волоса) и способствующей направленному перемещению волокон при валянии, и эластичности, позволяющей волокнам взаимно переплетаться, а затем сокращаться при механических воздействиях в условиях влажности, температуры и кислой или щелочной среды, которая даёт возможность регулировать процесс валки. При валянии изделие усаживается по площади:- сукно на 30–35%, войлок и валенки до 80%. При этом возрастают плотность и прочность изделия. Максимальная плотность, создаваемая при валянии, 0.55 г/см^3 (плотность подошвы валенок 0.42 г/см^3). Дальнейшее повышение плотности вызывает распадение изделия на части вследствие разрыва перенапряжённых волокон. При производстве валяных изделий шерсть разрыхляют на трепальных и щипальных машинах, замасливают и смешивают в смесовых машинах. Из ‘смески’ на чёсальных машинах получают вату, из которой наслоением приготовляют ‘основу’ по форме готового изделия, но большего размера. Основу уплотняют на свойлачивающих машинах с нагретыми вибрирующими плитами, пропитывают раствором серной кислоты и в валяльных машинах уваливают до нужных размеров и плотности. Валяние ведётся в несколько периодов. После каждого периода изделие выравнивают на растягивающих машинах. Валенки и шляпы насаживают на формы, а войлок в свободном виде сушат в паровых сушилках. Процесс заканчивается отделочными операциями:- шлифовкой и чисткой ворса, прессованием, обрезкой, аппретированием и другим. В суконном производстве валяние является лишь отделочным процессом. Валка Сукна – процесс отделки суконных тканей, в результате которого увеличиваются плотность, мягкость ткани, образуется застил поверхности, улучшаются теплоизоляционные свойства и внешний вид. Валка сукна производится на цилиндрической сукновальной машине под воздействием давления на сукно. При валке сукна волокна взаимно перемещаются в смоченной мыльным или кислым раствором ткани. Длительность валки сукна 2–5 часов при 40 °C, усадка 10–30% по длине, 20–45% по ширине в зависимости от типа ткани. Гребенные ткани только слегка подваливают (‘фулеруют’) 20–40 минут.

FULLING AGENT = ВАЛЯЛЬНЫЙ АГЕНТ – Fulling Agent is a chemical, usually a surfactant, that acts as a lubricant during the process of fulling.

FULL LEGAL TENDER COINS = ПОЛНОСТЬЮ ЗАКОННЫЕ К ОПЛАТЕ МОНЕТЫ (или МОНЕТЫ, ПОЛНОСТЬЮ ЯВЛЯЮЩИЕСЯ ЗАКОННЫМ СРЕДСТВОМ ПЛАТЕЖА) – Full Legal Tender Coins are the coins which by law must be accepted as legal tender without restrictions. Gold coins, for example, were legal tender in countries on the gold standard. / Монеты, которые по закону должны быть приняты без ограничений в качестве законного средства платежа. Например, золотые монеты являлись средством законного платежа в странах в соответствии с золотым стандартом.

FULL LINER TERMS = ПОЛНЫЕ ЛАЙНЕРНЫЕ ПОРЯДКИ – Full Liner Terms:- freight amount includes both shore-based and on-board stevedoring, lashing, unlashing, dunnage materials, securing, unsecuring and all costs for receiving the cargo.

FULL LOAD AMPERES = АМПЕР ПОЛНОЙ НАГРУЗКИ – Full Load Amperes, also sometimes abbreviated FLA for full load Amperes. This is the current in Amperes that a motor requires to produce rated nameplate horsepower output when rated nameplate voltage and frequency is provided to it’s terminals.

FULL–SERVICE BANK = УНИВЕРСАЛЬНЫЙ БАНК (или БАНК С ПОЛНЫМ НАБОРОМ УСЛУГ) – Full-Service Bank is a bank operating in all banking sectors and for all types of clients. This type of bank can only be found in countries where there is no legislation (such as the Glass-Steagall Act in the United States) requiring that commercial banking be kept separate from investment banking. See also Dual Banking System. / (такого как Акт Глэса-Стигэла (Glass-Steagall Act) в Соединённых Штатах Америки), .

FULL SERVICE LEASING = ПОЛНОМАСШТАБНЫЙ ЛИЗИНГ (или ЛИЗИНГ С ПОЛНЫМ НАБОРОМ УСЛУГ) – Full Service Leasing:- an equipment-leasing arrangement that includes a variety of services to support the leased equipment; a common method for leasing motor carrier tractors.

FULL SET = ПОЛНЫЙ КОМПЛЕКТ – Full Set is a term used in documentary credit transactions for a bill of lading which has been drawn up in three original copies. / Термин, используемый в сделках с документарным аккредитивом для коносамента, который был выписан в трёх оригинальных экземплярах.

FULL SET = ПОЛНЫЙ КОМПЛЕКТ (или ПОЛНЫЙ НАБОР) – Full Set is a term that indicates that all guide eyes in a guide bar each have a yarn from the warp.

FULL SIBS = ПОЛНОСТЬЮ СИБСЫ (или ПОЛНОЦЕННЫЕ РОДСТВЕННЫЕ) – Full Sibs are the individuals derived from the same parents. / Под Сибсами понимаются потомки одних родителей, родные братья и сёстры. Термин используется в генетике человека и животных.

FULL TRAILER = ПОЛНЫЙ ПРИЦЕП – Full Trailer:- a truck trailer constructed in such way that its own weight and that of the cargo rest upon its own wheels, instead of being supported by, e.g., a tractor. / Прицеп грузовика, сконструированный таким образом, чтобы его собственный вес и вес груза приходился бы на его собственные колёса, а не на поддержание, например, тягачём.

FULL TRUCKLOAD = ПОЛНАЯ ЗАГРУЗКА ГРУЗОВИКА – Full Truckload:- this term refers to a shipment comprising a full or almost full load on a truck. A full or almost full load is considered to be 39 000–44 000 pounds. Shipments rated on the use of a truck’s entire capacity based on weight or volume. Full Truckload carriers normally deliver a semi trailer to a shipper who will fill the shipment with freight for one destination. After the trailer is loaded the driver returns to the shipper to collect the required paperwork (i.e. Bill of Lading, Invoice, Customs paperwork) and depart with trailer containing freight. In most cases the driver then proceeds directly to the consignee and delivers the freight him or herself. Occasionally, a driver will transfer the trailer to another driver who will drive the freight the rest of the way. Full Truckload transit times are normally constrained by the drivers availability according to Hours of Service regulations and distance. It is normally accepted that Full Truckload drivers will transport freight at an average rate of 47 US miles per hour, including traffic jams or queues at intersections. / , то есть .

FULL VISIBLE CAPACITY = ПОЛНОСТЬЮ ЗАГРУЖЕННЫЙ (или ЗАГРУЖЕННЫЙ ПОД ЗАВЯЗКУ) – Full Visible Capacity:- the trailer is loaded as full as the nature of the freight and other conditions permit, so that no more of the same type of freight can be loaded, consistent with safety and damage precautions. / прицеп, загруженный так полно, как это разрешает фрахт или иные условия, .

FULLY CELLULAR CONTAINERSHIP = ПРОСТО СОТОВЫЙ КОНТЕЙНЕРОВОЗ (или ВСЕЦЕЛО ЯЧЕИСТЫЙ КОНТЕЙНЕРОВОЗ) – Fully Cellular Containership is a vessel specially designed to carry containers, with cell-guides below deck and necessary fittings and equipment on deck. / Специально сконструированное судно для перевозки контейнеров, со специальными

ячейками с направляющими из профильной стали (в которых в вертикальном положении устанавливают и закрепляют контейнеры, что исключает их горизонтальные перемещения при крене судна) под палубой и необходимыми фитингами и оборудованием на палубе. Чтобы максимально использовать грузовместимость судов, часть контейнеров транспортируется как палубный груз. Поэтому должна быть гарантирована определённая прочность контейнеров в условиях волнения на море. Контейнеры, транспортируемые на палубе, в зависимости от размеров укладываются в один, два, три и даже четыре ряда. От перемещений их удерживают особые фиксаторы, цепи и талрепы. Суда, построенные исключительно для перевозки контейнеров, называются контейнеровозами. Они делятся на две группы:- фидерные и морские. Дедвейт фидерных судов 1 000–2 000 тонн; они доставляют контейнерные грузы из малых портов в большие порты, где контейнеры перегружаются на морские суда. Другая область применения таких судов – каботажное судоходство. Наибольшее распространение получили морские контейнерные суда. Они ходят на океанских линиях, таких как Европа – Северная Америка, Северная Америка – Дальний Восток, Европа – Дальний Восток. Особые успокоительные цистерны, которыми оборудуются современные контейнеровозы, автоматически заполняются или осушаются, уменьшая тем самым крен судна во время перегрузки. Это ещё более облегчает погрузочно-разгрузочные работы в порту и сокращает их длительность.

FULLY COVERED WARRANT = ПОЛНОСТЬЮ ОБЕСПЕЧЕННЫЙ ВАРРАНТ – Fully Covered Warrant is a warrant series is said to be fully covered if the warrant issuer ensures that the underlying securities held in the cover arrangement can only be dealt with in accordance with the terms of this arrangement, and all the criteria under the Austarlian Securities Exchange (ASX) Business Market Rules are satisfied.

FULLY DILUTED (EARNINGS) = ПОЛНОСТЬЮ ОБОБЩЁННЫЕ (или ПРИВЕДЁННЫЕ, или РАСПРЕДЕЛЁННЫЕ) (ЗАРАБОТКИ) – Fully Diluted (Earnings):- earnings per share of a company calculated by dividing the net profit by the number of outstanding shares and those shares which could potentially come into existence through the exercise of rights attached to convertible bonds or other securities conferring entitlement to purchase the company's shares. Fully Diluted Earnings are the earnings of a company, usually expressed on a per share basis, where the total number of shares takes into account not only the issued shares but also shares which might be issued in the future if all existing options on shares where to be exercised. Since companies often have, on average, granted share purchase options equal in number to 10% or more of the issued number of shares, fully diluted earnings can be more than 10% less than earnings based only on issued shares. This figure is a more useful or conservative indication of a company's performance.

FULLY DISCLOSED = ПОЛНОСТЬЮ РАСКРЫТЫЙ – Fully Disclosed:- an account carried by a Futures Commission Merchant in the name of an individual customer. The opposite of Omnibus Account.

FULLY DRAWN YARN = ПОЛНОСТЬЮ ТЯНУТАЯ ПРЯЖА – Fully Drawn Yarn (FDY) is produced by a process similiar to the Partially Oriented Yarn (POY) manufacturing except that the yarn is produced at higher spinning speeds coupled with intermediate drawing integrated in the process itself. This allows stabilisation through orientation and crystallization. FDY is mainly used as weft or weaves in making fabrics. FDY can be knitted or woven with any other filament yarn to get fabric of various different varieties. It is mainly used in Home Furnishing Fabrics, Fashion Fabrics, Denim, Terry Towel and others. FDY yarn is mainly available in 3 lustre:- Semi-Dull (SD), Bright (BR or BRT) having circular section, and Trilobal Bright (TBR) having triangular cross-sections. Filament yarn having trilobal bright lustre is widely used in making curtains, bed-sheets and carpets. FDY is available in Raw-white (RW) as well dope dyed. Dope Dyed FDY yarn can be used to make the colored fabric directly instead of making the fabric with FDY Raw-White first and then dyeing it. Catonic FDY is another variation of Filament yarn. Catonic FDY yarn is made from Catonic PET Chips. For example:- 30D (Denier) 14F (No. of Filament) SD or 300D 96F BR. Polyester FDY is the abbreviation for Polyester Fully Drawn Yarn. It is also know as Polyester Filament Yarn (PFY) or Spin Draw Yarn (SDY). Polyester FDY yarn can also be twisted to make Polyester Embroidery Thread that is widely used in sewing. India and China are the leading manufacturers of Polyester FDY yarn. Currently we are exporting FDY yarns from China, India, Malaysia, Thailand and Indonesia to various countries in the world.

FULLY–MILLED WHITE RICE = ПОЛНОСТЬЮ ОБРУШЕНЫЙ БЕЛЫЙ РИС – Fully-Milled White Rice, it is also known as Polished Rice because most of the outer layers, such as the husk and the bran layer, are removed from the kernel, through the milling process. / Полностью Обрушенный Белый Рис, известный также как Полированный Рис или Шлифованный Рис (Polished Rice), из-за того, что большая часть наружных слоёв, таких как экзокарпий или шелуха (husk) и слой околоплодника (bran layer), была удалена с зерновки (ядер) риса в процессе рушения.

FULVOUS = КРАСНОВАТО–ЖЁЛТОЕ (или РЫЖЕВАТОЕ, или БУРОЕ, или С ЖЕЛТИЗНОЙ, или РЫЖЕЕ) – Fulvous:- yellow or tawny or yellow flecked with a mixture of gray or brown. Fulvous:- of a dull brownish yellow; tawny.

FUME FADING = ВЫЦВЕТАНИЕ ОТ ДЫМА – Fume Fading is a result of a chemical change in the dye stuff. Acid gases that form in the atmosphere as a product of combustion react with some dyes to cause a gradual color change. This type of change can occur even when a garment is stored in your closet. It is usually not uniform, but is more noticeable on exposed areas such as shoulders and sleeves. Sometimes this type of color change may not be noticed until after washing or drycleaning, but these immersion processes cannot cause this localized type of change. Fume fading is most common on acetates. Fume Fading is is a form of color loss along the edges of walls, around the edges of drapes, and down the edges of stair. The photo below is of a rose colored carpet that is turning green from fume fading. See also Gas Fading. Most people are familiar with color loss in clothing that is caused by exposure to the sun. But did you know that air pollution contributes in a major way to color loss? We call a color loss from air pollution Fume Fading, and you need to be familiar with it. Air pollution from car exhausts especially in urban areas – exists indoors as well as outdoors. In fact, it is more damaging to clothing in confined spaces, such as dresser drawers and closets where there is little circulation. Unfortunately, fume fading often shows up only after cleaning, because soils may mask the condition and because the heat of the cleaning process heightens the problem. You can identify fading caused by pollution by its streaked appearance. Fading from sunlight is usually even. There's not much we can do to help a garment that's already damaged. But you can fight this condition through regular cleaning care and by storing your clothes in clean closets with good air flow.

FUMIGANT = ФУМИГАНТ – Fumigant is any volatile, poisonous substance used to kill insects, nematodes, and other animals or plants that damage stored foods or seeds, human dwellings, clothing, and nursery stock. Soil fumigants are sprayed or spread over an area to be cultivated and are worked into the soil to control disease-causing Fungi, Nematodes, and Weeds. Fumigants with a high vapor pressure, such as methyl bromide, ethylene oxide, hydrogen cyanide, and hydrogen phosphide, penetrate quickly and are used to treat sealed storage areas or materials enclosed in gasproof sheets. Low-pressure compounds such as ethylene dibromide and ethylene dichloride diffuse more slowly; they are used to treat more open storage areas and as soil fumigants. Common fumigants used to treat stored products or nursery stock include hydrogen cyanide, naphthalene, nicotine, and methyl bromide. Soil fumigants commonly used as nematocides are methyl bromide, dichloropropane, propylene oxide, dibromochloropropane, organophosphate insecticides, and chloropicrin. Because these substances may kill other soil organisms that ordinarily control nematodes by predation or infection, serious nematode infestations may follow fumigation. Other compounds used as fumigants include acrylonitrile, carbon

disulfide, ethylene, paradichlorobenzene, sulfur dioxide, and sulfuryl fluoride. Fumigants are poisonous to warm-blooded animals, including humans; they should be applied only by trained persons using proper equipment. Fumigant is a gas that acts as a respiratory poison against pests. Fumigant is a highly volatile chemical that kills Mice, Insect, Weeds, and other living organisms. / Газ, действующий на насекомых в качестве яда при вдыхании ими воздуха. Под Фумигантом, от Латинского слова Fumigo, означающее Дымлю или Окуриваю, понимается жидкий, твёрдый или газообразный, а также выделяющий газообразное вещество в условиях применения химический препарат из группы пестицидов для уничтожения вредителей и возбудителей болезней сельскохозяйственных растений путём отравления ядовитыми парами, газами и аэрозолями – фумигации. Фумиганты используются для дезинсекции, уничтожения грызунов, фунгицидной обработки продовольственных запасов, закрытых помещений, транспортных средств, а также для обработки почвы с целью уничтожения грибков, насекомых, семян сорняков.

FUMIGATION = ФУМИГАЦИЯ (или ГАЗАЦИЯ, или ОКУРИВАНИЕ) – Fumigation is a treatment with a chemical agent that reaches the commodity wholly or primarily in a gaseous state. Treating of cargoes with gases to exterminate unwanted life forms. Treating of cargoes with gases to exterminate vermin. The application of smoke, vapor, or gas for the purpose of disinfecting or destroying pests or microorganisms. Fumigation is the process used to destroy bacteria, insects, or pests by smoke or exposure to poisonous gas. Fumigants:- Methyl Bromide, Phosphine, and others. / Фумигация или Газация или Окуривание – обработка химическим агентом, который полностью охватывает сырьё или в основном в газообразном состоянии. Способ обеззараживания продукции газо- или парообразными химическими препаратами (фумигантами):- Бромистым Метилом (Methyl Bromide), Фосфином (Phosphine) и другими. Окуривание. Применяют на складах, в теплицах, парниках, для обработки зерна, овощей, фруктов, хлопкового волокна и тому подобного. Фумигацию проводят специальными машинами – фумигаторами. Под Фумигатором, от Латинского слова Fumigo, означающее Дымлю или Окуриваю, понимается машина для борьбы с вредителями и болезнями сельскохозяйственных культур. Различают фумигаторы наземно-палаточные (окуривают растения парами, газами) и почвенные (вносят растворы жидких фумигантов в почву). В бывшем СССР выпускалась машина ФВ-2 (ФУН) для внесения в почву жидких фумигантов производительностью 1.6 га/ч. Глубина внесения рабочей жидкости до 55 см.

FUMIGATION CLAUSE = ОГОВОРКА О ФУМИГАЦИИ – Fumigation Clause:- in the event of loss or damage to the interest insured caused by fumigation, Underwriters agree to indemnify the Insured for such loss or damage, and the Insured hereby agrees to subrogate these Underwriters any recourse they may have for recovery of such loss or damage from others but this clause does not extend to cover loss or damage caused by customary fumigation applied prior to or at the inception of risk. Fumigation Clause provides coverage for damage to cargo caused by fumigation of the vessel. / Оговорка О Фумигации предусматривает покрытие повреждения груза вследствие фумигации судна.

FUNCTIONAL FINISH = ФУНКЦИОНАЛЬНАЯ ОТДЕЛКА – Functional Finish is a special finish added to a fabric as une of the final steps in its manufacture that alters the performance and contributes a specific attribute to the fabric in some way. A water repellent finish, for example, is a functional finish because it prevents water from penetrating the fabric, thereby changing the function of the fabric. Other examples of special finishes are soil release and crease resistant. / Функциональная Отделка – специальная отделка, отделка особого назначения, например, водоотталкивающая, водоупорная, противосминаемая, огнестойкая, молестойкая и другие.

FUNCTIONAL PLANT LOSS INDEX = ИНДЕКС ПО ФУНКЦИОНАЛЬНОЙ ПОТЕРЕ РАСТЕНИЙ – Functional Plant Loss Index (FPLI) is a formula based on the plant weight loss and damaged ratings due to insect feeding which is used in determining levels of tolerance when identifying components of resistance.

FUNCTIONS OF MONEY = ФУНКЦИИ ДЕНЕГ – Functions Of Money:- (i) Medium of exchange:- acts as a go-between to make it easier to buy and sell goods or services or pay debts. Allows buyers and sellers to avoid the difficulties associated with barter exchanges of goods and services. (ii) Store of value:- allows people to transfer the purchasing power of their present money income or wealth into the future, ideally without a loss of value. Stores purchasing power between the time money is earned and the time is spent. (iii) Unit of account:- serves as a way to measure and compare the value of goods and services in relation to one another. When comparing prices, individuals can determine if one good is a better buy than another. It also allows people to keep accurate financial records.

FUND = ФОНД – (1) Fund means a management investment company registered under the Act (15 USC 80a; 15 USC is short for the United States Code:- Title 15) and incorporated or organized under the laws of the United States or of a state. A Fund or Investment Fund, a term generally interchangeable with Mutual Fund, is a company that brings together money from many people and invests it in stocks, bonds or other assets. The combined holdings of stocks, bonds or other assets the fund owns are known as its portfolio. Each investor in the fund owns shares, which represent a part of these holdings. Also known as Mutual Fund. / Под Фондом, от Французского слова Fond от Латинского слова Fundus, означающее Основание, понимается организация или учреждение для оказания . Инвестиционный фонд.

(2) Fund is the assets of an investment company that are invested in securities, real estate, securities or other money market istruments. Mutual funds pool the assets of many investors and invest them in stocks, bonds and other assets. The advantage for small investors lies in being able to diversify their investments by purchasing units in various funds, while reducing their overall investment risk at the same time. Mututal funds are the investment of choice for investors who do not wish to constantly monito their investments, and who prefer to leave the task of tracking and analyzing the market, and making investment decisions, up to professional portfolio managers.

FUNDAMENTAL ANALYSIS = ФУНДАМЕНТАЛЬНЫЙ АНАЛИЗ – Fundamental Analysis is a method of analysis using ratios and percentages calculated from financial data of a company to assess the company's quantitative and qualitative aspects. Ratios of particular industry groups and /or major competitors may also be included in the analysis to determine it's suitability for investment. Fundamental Analysis is the study of basic underlying factors which will affect the supply and demand of a traded commodity. Factors other than psychological or technical (chart or related price fluctuations) that influence the price development on the physical or futures market, e.g., physical supply and demand, stock levels, currency exchange rates, interest rates, weather (forecasts), etc. An analysis concerned with economic factors, comparing the relationship between the supply and demand for a given commodity or asset. A market analysis that relies on economic supply and demand information as opposed to focusing on charts and market indicators for a technical analysis. A cause-and-effiect study of market behavior based on factors of news, events, economy and politics. The study of pertinent supply and demand factors which influence the specific price behavior of commodities. Study of basic, underlying factors that will affect the supply and demand of the commodity being traded in futures contracts. See also Technical Analysis, and Technicals. Fundamental Analysis is the evaluation of non-visual information to evaluate trading activity and make trading decisions. Whereas technical analysts utilize charts and mathematical indicators to quantify price activity, fundamental analysts utilize market news and market forecasts to qualify price activity. There are numerous market events that move financial markets every week. Some affect

every market instrument while others affect specific instruments. If the outcome of a market event has been fully discounted by the market, traders will not notice any discernible impact on their charts. If the outcome of a market event has not been fully discounted by the market, the result is either price appreciation or price depreciation and traders will see this activity on their charts. Every week, there are fundamentally-important market events that are scheduled in every country at specific times. Similarly, there are fundamentally-important market events that may not be scheduled for specific times. Some countries (Germany, for instance) often do not schedule market events for specific times. The outcome of market events is sometimes leaked in advance in certain countries (Germany, for instance) for different reasons. Market events include the release of economic data, speeches and testimony by government officials, interest rate decisions, and others. A method of anticipation asset price movement using supply and demand information. The value of a company or stock is related to its earnings, its growth prospects and its management. Fundamental Analysis is the cornerstone of investing. In fact, some would say that you aren't really investing if you aren't performing fundamental analysis. Because the subject is so broad, however, it's tough to know where to start. There are an endless number of investment strategies that are very different from each other, yet almost all use the fundamentals. The goal of this tutorial is to provide a foundation for understanding fundamental analysis. It's geared primarily at new investors who don't know a balance sheet from an income statement. While you may not be a 'stock-picker extraordinaire' by the end of this tutorial, you will have a much more solid grasp of the language and concepts behind security analysis and be able to use this to further your knowledge in other areas without feeling totally lost. The biggest part of fundamental analysis involves delving into the financial statements. Also known as Quantitative Analysis, this involves looking at revenue, expenses, assets, liabilities and all the other financial aspects of a company. Fundamental analysts look at this information to gain insight on a company's future performance. A good part of this tutorial will be spent learning about the balance sheet, income statement, cash flow statement and how they all fit together. But there is more than just number crunching when it comes to analyzing a company. This is where qualitative analysis comes in – the breakdown of all the intangible, difficult-to-measure aspects of a company. Finally, we'll wrap up the tutorial with an intro on valuation and point you in the direction of additional tutorials you might be interested in. Fundamental Analysis is the analysis concerned with economic factors rather than price data, as are studied in Technical Analysis. See also Technical Analysis. Fundamental Analysis is a method of evaluating a security that entails attempting to measure its intrinsic value by examining related economic, financial and other qualitative and quantitative factors. Fundamental analysts attempt to study everything that can affect the security's value, including macroeconomic factors (like the overall economy and industry conditions) and company-specific factors (like financial condition and management). The end goal of performing fundamental analysis is to produce a value that an investor can compare with the security's current price, with the aim of figuring out what sort of position to take with that security (underpriced = buy, overpriced = sell or short). This method of security analysis is considered to be the opposite of technical analysis. Fundamental analysis is about using real data to evaluate a security's value. Although most analysts use fundamental analysis to value stocks, this method of valuation can be used for just about any type of security. For example, an investor can perform fundamental analysis on a bond's value by looking at economic factors, such as interest rates and the overall state of the economy, and information about the bond issuer, such as potential changes in credit ratings. For assessing stocks, this method uses revenues, earnings, future growth, return on equity, profit margins and other data to determine a company's underlying value and potential for future growth. In terms of stocks, fundamental analysis focuses on the financial statements of the company being evaluated. One of the most famous and successful fundamental analysts is the Oracle of Omaha, Warren Buffett, who is well known for successfully employing fundamental analysis to pick securities. His abilities have turned him into a billionaire. Fundamental Analysis is the analysis of a company's share value and potential for future profit and dividends, based on accounting and economic information. A term Fundamental Analysis refers to the analysis of market supply and demand conditions for a commodity. / Анализ, связанный больше с экономическими факторами, нежели с ценовыми данными, обрабатываемыми в техническом анализе биржевых рынков. , например, . флуктуации (колебания) цены. Орэкэл (Oracle) Ворэн Эдвод Бафит (Warren Edward Buffett). Больших приверженцев фундаментального анализа на биржевом жаргоне именуют Фундаментальщиками. Фундаментальный Анализ:- в экономике – исследование таких ведущих факторов, как процентные ставки, валовой национальный продукт, инфляция, безработица и товарные запасы, в целях прогнозирования динамики развития экономики. В инвестиционной деятельности – анализ бухгалтерского баланса и отчёта о доходах компаний в целях прогнозирования динамики курсов их акций. Аналитики, занимающиеся анализом фундаментальных факторов, рассматривают прошлые записи об активах, доходах, продажах, изделиях, мэнэдьжменте и рынках для того, чтобы спрогнозировать будущие тенденции этих показателей успеха или неудачи компании. Оценивая перспективы фирмы, они стремятся определить, не занижены ли цены на акции данной компании (недооценённые – undervalued) или, напротив, завышены (переоценённые – overvalued) при текущем рыночном курсе. Вторым основным способом анализа рынка акций является технический анализ (technical analysis), который опирается на курсы и размеры изменений котировок акций и не связан с финансовой статистикой. Фундаментальный Анализ – метод прогнозирования изменения цены, основанный на анализе текущей экономической ситуации. Фундаментальный анализ предусматривает изучение балансов, годовых отчётов, биржевой конъюнктуры и перспектив развития отраслей экономики. Фундаментальный анализ – в узком смысле – анализ финансовой деятельности компании с целью выявления неправильно оцененных ценных бумаг. При таком анализе основное внимание уделяется доходам, прогнозам по дивидендам и будущим процентным ставкам, а также оценке риска компании.

FUNDAMENTAL RESEARCH = ФУНДАМЕНТАЛЬНОЕ ИССЛЕДОВАНИЕ – Fundamental Research:- analysis of industries and companies based on such factors as sales, assets, earnings, products or services, markets and management. As applied to the economy, fundamental research includes consideration of gross national product, interest rates, unemployment, inventories, savings, etc. Also known as Fundamental Analysis. See also Technical Research.

FUNDAMENTALS = ФУНДАМЕНТАЛЬНЫЕ ФАКТОРЫ – Fundamentals are any factors that could be considered important to the understanding of a particular business. Fundamentals are usually considered outside the context of the market as a whole. Some examples of fundamentals include a company's growth, revenues, earnings, management, and capital structure. The use of fundamentals as an investment strategy is called Fundamental Analysis. Factors other than psychological or technical (chart or related price fluctuations) that influence the price development on the physical or futures market, e.g., physical supply and demand, stock levels, currency exchange rates, interest rates, weather (forecasts) etc. Fundamentals are the one of two major sets of factors of analyzing prices. Fundamentals are supply and demand factors that influence prices of commodities. Technical analysis (chart patterns) is the other major set of factors affecting prices. / Фундаментальными Факторами являются любые факторы, которые могут рассматриваться в качестве важных для понимания конкретного дела. флуктуации (колебания) цены.

FUND ASSETS = АКТИВЫ ФОНДА – Fund Assets is the total value of a portfolio's securities, cash, and other holdings, minus any outstanding debts.

FUNDED COVER = ФОНДИРУЕМОЕ ПОКРЫТИЕ (или ПЕРЕСТРАХОВАНИЕ НА ОСНОВЕ УПРАВЛЯЕМОГО ФОНДА) – Funded Cover is a reinsurance contract under which the ceding company pays high premiums to build a fund from which to pay

expected losses. The premium less the reinsurance charge is paid out to the ceding company in the future as loss payments, returned premiums, or contingent commissions.

FUNDED SYSTEM = ФОНДИРУЕМАЯ СИСТЕМА – Funded System:- method of financing employed by insurance companies and pension funds. The contributions of the insured parties are accumulated to form the capital required for the payment of insurance benefits. The opposite of Pay-As-You-Go System.

FUND FAMILY = СЕМЕЙСТВО ФОНДОВ (или ФОНДОВОЕ СЕМЕЙСТВО) – Fund Family is a set of funds with different investment objectives offered by one management company. In many cases, investors may move their assets from one fund to another within the family at little or no cost.

FUNDING AGREEMENT = СОГЛАШЕНИЕ О ФОНДИРОВАНИИ – The term Funding Agreement means any contract, grant, or cooperative agreement entered into between any US Federal agency, other than the Tennessee Valley Authority, and any contractor for the performance of experimental, developmental, or research work funded in whole or in part by the US Federal Government. Such term includes any assignment, substitution of parties, or subcontract of any type entered into for the performance of experimental, developmental, or research work under a funding agreement as herein defined.

FUND MANAGEMENT COMPANY = КОМПАНИЯ УПРАВЛЕНИЯ ФОНДАМИ (или УПРАВЛЯЮЩАЯ ФОНДАМИ КОМПАНИЯ) – The Fund Management Company is an independent company which manages investment funds for the account of investors and in its own name. The fund management company decides which investments to acquire and sell, in the same way as it decides on distributions and the issuing of units.

FUND MANAGER = УПРАВЛЯЮЩИЙ ФОНДОМ – The duties of a Fund Manager typically include:- (i) the role of administrator (i.e. liaison with shareholders, calculation of Net Asset Values (NAVs) etc); (ii) overall control of the Fund's operations; and (iii) the role of investment manager/advisor (day-to-day investment management/advice). Exceptionally, the appointment of an external Fund Manager is not mandatory for a Professional Investor Fund (PIF). Accordingly, a PIF may act as its own Fund Manager in which case the directors and officers of the PIF will be held responsible for the functions and duties of a Fund Manager. In this case, the PIF will not require a separate investment services license (in addition to the CIS license) to act as Fund Manager to itself. A PIF may not, however, act as Fund Manager to another PIF, but a licensed Fund Manager may act for a number of PIFs. The external Fund Manager, if appointed, requires a license and, in its regard, the usual licensable requirements apply. The individual or organization in charge of investing funds on behalf of a financial institution. Fund Manager is the person whose responsibility it is to oversee the allocation of the pool of money invested in a particular mutual fund. The fund manager is charged with investing the money to attain returns consistent with the level of risk outlined in the mutual fund prospectus. / Физическое лицо или организация, заведующая инвестиционными средствами от имени финансового института.

FUND OF FUNDS = ФОНД ФОНДОВ – Fund Of Funds is a mutual fund or hedge fund or investment fund which invests exclusively in the units of other funds. Not to be confused with Umbrella Fund. Fund Of Funds is a mutual fund that invests in other mutual funds. This method is sometimes known as Multi-Management. A fund of funds allows investors to achieve a broad diversification and an appropriate asset allocation with investments in a variety of fund categories that are all wrapped up into one fund. However, if the fund of funds carries an operating expense, investors are essentially paying double for an expense that is already included in the expense figures of the underlying funds. Historically, a fund of funds showed an expense figure that didn't always include the fees of the underlying funds. As of January 2007, the SEC began requiring that these fees be disclosed in a line called 'Acquired Fund Fees and Expenses' (AFFE). Fund Of Funds:- mutual funds which invest their fund assets in other funds. Designed to achieve greater diversification and risk spread. A Fund Of Funds (FOF) is an investment strategy of holding a portfolio of other investment funds rather than investing directly in stocks, bonds or other securities. This type of investing is often referred to as Multi-Manager Investment. A fund of funds may be 'fettered', meaning that it invests only in funds managed by the same investment company, or 'unfettered', meaning that it can invest in external funds. There are different types of 'fund of funds', each investing in a different type of collective investment scheme (typically one type per FoF), for example 'mutual fund' FoF, hedge fund FoF, private equity FoF or investment trust FoF but the original Fund of Funds was created at First London Securities PLC. Investing in a collective investment scheme may increase diversity compared to a small investor holding a smaller range of securities directly. Investing in a fund of funds may achieve greater diversification. According to modern portfolio theory, the benefit of diversification can be the reduction of volatility while maintaining average returns. However, this is countered by the increased fees paid on both the FoF level, and of the underlying investment fund. An investment manager may actively manage with a view to select the best securities. A FoF manager will try to select the best performing funds to invest in based upon the managers past performance and other factors. If the FoF manager is skillful, this additional level of selection can provide greater stability and take out some of the risk relating to the decisions of a single manager. As in all other areas of investing, there are no guarantees for regular returns. As a fund of funds invests in the scheme of other funds, it provides a greater degree of diversification. Instead of investing in different stocks of mutual funds and keeping records of all of them, it is much easier to invest and track only one fund which in turn invests in other mutual funds. Management fees for Funds Of Funds are typically higher than those on traditional investment funds because they include the management fees charged by the underlying funds. As in the case of schemes of mutual funds, FOF schemes also work under the due diligence of a fund manager. This gives the scheme an additional expertise. It also helps to provide access to information which may be difficult to obtain information by an investor on a case by case basis. Every fund manager has a particular style of diversification. This diversification has a perfect correlation with the number of managers involved. Once a FOF reached a certain level of managers, adding more flattens return curve and diversifies away alpha (Harry Prasun Kat2). Since a fund of funds buys many different funds which themselves invest in many different securities, it is possible for the fund of funds to own the same stock through several different funds and it can be difficult to keep track of the overall holdings. Funds of funds are often used when investing in hedge funds and private equity funds, as they typically have a high minimum investment level compared to traditional investment funds which precludes many from investing directly. In addition hedge fund and private equity investing is more complicated and higher risk than traditional collective investments. The lack of accessibility favors a FoF with a professional manager and built-in spread of risk. Pension funds and other institutions often invest in funds of hedge funds for part or all of their 'alternative asset' programs, i.e. investments other than traditional stock and bond holdings. After allocation of the two levels of fees payable and taxation, returns on FoF investments will generally be lower than single-manager funds. The due diligence and safety of investing in FoFs has come under question as a result of the Bernie Madoff scandal, where many FoFs put substantial investments into the scheme. It became clear that a motivation for this was the lack of fees by Madoff which gave the illusion that the FoF was performing well. The due diligence of the FoFs apparently did not include asking why Madoff was not making this charge for his services. 2008 and 2009 saw fund of funds take a battering from investors and the media on all fronts from the hollow promises made by over-eager marketers to the strength (or lack) of their due diligence processes to those carefully explained and eminently justifiable extra layers of fees, all reaching their zenith with the Bernie Madoff fiasco. The fund-of-funds structure may be useful for asset-allocation funds, that is, an 'ETF of ETFs' or 'mutual fund of mutual funds'. For example, iShares has

asset-allocation ETFs, which own other iShares ETFs. Similarly, Vanguard has asset-allocation mutual funds, which own other Vanguard mutual funds. The 'parent' funds may own the same 'child' funds, with different proportions to allow for 'aggressive' to 'conservative' allocation. This structure simplifies management by separating allocation from security selection. A commodity pool that invests in other commodity pools rather than directly in futures and options contracts. A common type of hedge fund is a 'Fund Of Funds'. A 'fund of funds' does not pursue alternative investment strategies itself, but instead invests in a number of different underlying hedge funds to spread risk across these funds. The overall performance of the 'fund of funds' depends on the individual performance of each underlying fund. Investors rely on the expertise of the fund of funds manager to pick a combination of hedge funds, as well as the skills of the underlying hedge fund managers. The fee structure of a fund of funds means that there are fees paid to both the fund of funds manager and the underlying fund managers. This means that a fund of funds must outperform a single fund manager in order to generate the same return to investors. / Фёст Ландэн Сикьюритиз Пи.Эл.Си. (First London Securities PLC). Хари Прасун Кэт2 (Harry Prasun Kat2). Бёни Мэдоф (Bernie Madoff). айШерэз (iShares). Вэнгад (Vanguard). Фонд Фондов – взаимный фонд, который инвестирует в другие взаимные фонды. Идея таких фондов состоит в том, что они могут перемещать деньги между лучшими фондами в отрасли и тем самым увеличивать доход акционеров, предоставляя больше возможностей для капиталовложений, чем может предложить один фонд. Тем не менее, фонд фондов критикуется в связи с увеличением для акционеров издержек управления, поскольку комиссионные выплачиваются как управляющей инвестиционной компании фонда, так и всем нижестоящим инвестиционным компаниям. В США Комиссия по Ценным Бумагам и Биржам (SEC) ограничивает размер общей суммы выплат, которую акционеры должны перечислять в такой фонд. В семью фондов обычно организуются фонды, которые специализируются на различных направлениях. Фонды фондов были очень популярны в 1960-е, но в 1970-е их популярность упала из-за скандала, к которому оказался причастен фонд фондов Equity Funding. Однако в последние годы снова наблюдается некоторый рост их популярности.

FUNDRAISING = ДОБЫВАНИЕ ФОНДОВ – Fundraising is a process of soliciting financial support (usually as grants) for a non-commercial cause. Fundraising or Fund Raising (also known as 'Development') is the process of gathering voluntary contributions of money or other resources, by requesting donations from individuals, businesses, charitable foundations, or governmental agencies (see also Crowd Funding). Although fundraising typically refers to efforts to gather money for non-profit organizations, it is sometimes used to refer to the identification and solicitation of investors or other sources of capital for for-profit enterprises. Traditionally, fundraising consisted mostly of asking for donations on the street or at people's doors, and this is experiencing very strong growth in the form of face-to-face fundraising, but new forms of fundraising, such as online fundraising, have emerged in recent years, though these are often based on older methods such as grassroots fundraising. Organizations:- fundraising is a significant way that non-profit organizations may obtain the money for their operations. These operations can involve a very broad array of concerns such as religious or philanthropic groups such as research organizations, public broadcasters, political campaigns and environmental issues. Some examples of charitable organizations include student scholarship merit awards for athletic or academic achievement, humanitarian and ecological concerns, disaster relief, human rights, research, and other social issues. Some of the most substantial fundraising efforts in the United States are conducted by colleges and universities. Commonly the fundraising, or 'development'/'advancement', program, makes a distinction between annual fund appeals and major campaigns. Most institutions use professional development officers to conduct superior fundraising appeals for both the entire institution or individual colleges and departments. Examples of this include athletics and libraries. Equally important are fundraising efforts by virtually all recognized religious groups throughout the world. These efforts are organized on a local, national, and global level. Sometimes, such funds will go exclusively toward assisting the basic needs of others, while money may at other times be used only for evangelism or proselytism. Usually, religious organizations mix the two, which can sometimes cause tension. Fundraising also plays a major role in political campaigns. This fact, despite numerous campaign finance reform laws, continues to be a highly controversial topic in American politics. Political action committees (PACs) are the best-known organizations that back candidates and political parties, though others such as 527 groups also have an impact. Some advocacy organizations conduct fundraising for-or-against policy issues in an attempt to influence legislation. While public broadcasters are completely government-funded in much of the world, there are many countries where some funds must come from donations from the public. In the United States less than 15% of local public broadcasting stations' funding comes from the federal government. Pledge drives, a type of annual giving, commonly occur about three times each year, usually lasting one to two weeks each time. Viewership and listenership often decline significantly during funding periods, so special programming may be aired in order to keep regular viewers and listeners interested. Sources:- fundraising can come from a variety of sources using a variety methods. These include grants from government agencies, non-profit foundations or corporations; donations from individuals; and sales and services. Income from endowment is not strictly fundraising but rather the fruits of the investment of previous fundraising. Purposes:- organizations raise funds to support capital projects, endowments, or operating expenses of current programs. Capital fundraising is when fundraising is conducted to raise major sums for a building or endowment, and generally keep such funds separate from operating funds. This is often done over a period of time (in a capital campaign) to encourage donors to give more than they would normally give and tap donors, especially corporations and foundations who would not otherwise give. A capital campaign normally begins with a private phase before launching a public appeal. Many non-profit organizations solicit funds for a financial endowment, which is a sum of money that is invested to generate an annual return. Although endowments may be created when a sizable gift is received from an individual or family, often as directed in a will upon the death of a family member, they more typically are the result of many gifts over time from a variety of sources. Taxation (in the United States):- organizations in the United States established for charitable purposes are allowed to raise funds from many sources. They are given a specific designation by the Internal Revenue Service (IRS), commonly noted as 501(c)(3) organizations. Other nonprofits such as fraternal associations have different IRS designations, and may or may not be eligible to raise funds. Financial information on many nonprofits, including all nonprofits that file annual IRS 990 forms is available from GuideStar. Fund-Raising is the act or process of raising funds, as for nonprofit organizations or for a political cause. Fund-Raising is the organized activity of raising funds (as for an institution or political cause) – often used before another noun:- a fund-raising drive or campaign; or fundraising events. / ГайдСтар (GuideStar).

FUNDS = ФОНДЫ – (1) Funds:- (i) means assets of every kind, whether tangible or intangible, movable or immovable, however acquired; and (ii) includes legal documents or instruments in any form, including electronic or digital, evidencing title to, or interest in, such assets, including but not limited to, bank credits, travellers' cheques, bank cheques, money orders, shares, securities, bonds, drafts and letters of credit. A sum of money or resources set aside for a specific purpose. Funds shall mean banknotes and coins, money on account and electronic money. / Под Фондом, от Французского слова Fond от Латинского слова Fundus, означающее Основание, понимаются денежные и материальные средства, запасы, ресурсы, используемые предприятием.

(2) Funds:- usually a large sum of trading capital that is actively managed by a trading advisor for speculative gains. Taken as an industry group in general, the funds are thought to be mostly trend-following computer traders that hold significant positions in many markets at the same time.

FUNDS AT LLOYD'S = ФОНДЫ У ЛОЙДА – Funds At Lloyd's are the funds of an approved form that are lodged and held in trust at Lloyd's as security for a member's underwriting activities. They comprise the members deposit, personal reserve fund and special reserve fund and may be drawn down in the event that the member's syndicate level premium trust funds are insufficient to cover his liabilities. The amount of the deposit is related to the member's premium income limit and also the nature of the underwriting account.

FUND SWITCHING = СМЕНА ФОНДА – Fund Switching is a moving money within a mutual fund family from one mutual fund to another.

FUNGAL FILM = ГРИБНАЯ ПЛЁНКА (или ГРИБКОВАЯ ПЛЁНКА) – Fungal Film is a film of fungal growth, e.g., on microscope lenses.

FUNGAL HYPHAE = ГРИБНЫЕ ГИФЫ – Fungal Hyphae are fungal filaments. / грибные нити. Под Гифами, от Греческого слова Hyphē, означающее Паутина или Ткань, понимаются микроскопические тонкие, простые или ветвящиеся нити, из которых формируются вегетативное тело (грибница, или мицелий) и плодовые тела Грибов.

FUNGIBILITY = ВЗАИМОЗАМЕНЯЕМОСТЬ – Fungibility is the characteristic of interchangeability. Futures contracts for the same commodity and delivery month traded on the same exchange are fungible due to their standardized specifications for quality, quantity, delivery date, and delivery locations. / С технической точки зрения Взаимозаменяемость означает свойство одних и тех же изделий (одинаковых деталей, сборочных единиц, таких как узлов или агрегатов машин, механизмов, аппаратов и других конструкций), позволяющее устанавливать их в процессе сборки или заменять без предварительной подгонки при сохранении всех требований, предъявляемых к работе изделия в целом. Основа взаимозаменяемости – рациональная система допусков размеров или других параметров изделий (деталей, сборочных единиц). Взаимозаменяемость может быть полной (для всех изделий) и неполной или частичной (при разделении изделий на партии по сопрягаемым размерам и другим параметрам; в пределах партии изделия используются уже без подбора). Взаимозаменяемость позволяет осуществлять специализацию и широкое кооперирование производства.

FUNGIBLE = ВЗАИМОЗАМЕНЯЕМЫЕ (или ОДНОРОДНЫЕ) – (1) A term Fungible means freely exchangeable or replaceable. Fungible items are objects which can be measured in terms of size, quantity or weight and are therefore easily interchangeable. Stock exchanges are markets for fungible securities. Securities representing the same class of equity or debt that may be traded across multiple markets. Freely exchangeable for or replaceable by similar securities or goods in the satisfaction of an obligation.

(2) Fungible:- interchangeable. Products which can be substituted for purposes of shipment or storage.

FUNGIBLE GOODS = ВЗАИМОЗАМЕНЯЕМЫЕ ТОВАРЫ – Fungible Goods:- goods which are standardized and can be substituted for one another. These goods can be mixed with or exchanged for similar goods owned by another person without affecting legal rights. Examples are raw materials; certain agricultural commodities, such as Wheat and wool; and mass-produced goods, ranging from automobiles to canned goods. Marketable securities are also fungible goods, as they provide the same rights to dividends or payment of interest. Money is the most fungible good, because it is a universally accepted means of payment within a community, and its only reason for being is that it can be exchanged for other goods. Fungibility is a prerequisite for the existence of a true market.

FUNGIBLE ITEMS = ВЗАИМОЗАМЕНЯЕМЫЕ ИЗДЕЛИЯ – Fungible Items:- in general, any good, product or instrument in which every unit is so similar to or identical with every other unit that they can be exchanged for one another without legal consequences, e.g., bearer shares, commodities, etc. / В общем смысле, любой товар, продукт или инструмент, в котором всякая единица похожа или идентична со всякой другой единицей в том плане, чтобы они могли быть заменены одна другой без каких-либо юридических последствий, например, акции на предъявителя, сырьё и тому подобное.

FUNGICIDE = ФУНГИЦИД – Fungicide:- synthetic or biosynthetic compounds used to control fungal diseases in Animals and Plants. A fungistat prevents the spread of a Fungus, whereas a fungicide kills the Fungus. Seeds and seedlings are protected against Fungi in the soil by treating the seeds and the soil with fungicides. Seed-treating materials must be safe for seeds and must resist degradation by soil and soil microorganisms. Some soil fungicides are safe to use on living plants. Others are injurious to seeds and living plants. These compounds are useful because they are volatile. Used before planting, they have a chance to kill soil fungi and then escape from the soil. Formic acid, acetic acid, and propionic acid up through pelargonic acid and capric acid (the C_1–C_{10} volatile fatty acids) possess significant fungicidal activity. Many of them are present in natural foodstuffs that are resistant to fungal attack. Use of the volatile fatty acids and their salts in bread to prevent ropy mold is widespread. Artturi Ilmari Virtanen (1895–1973), a Finnish chemist was awarded the Nobel prize in 1945 for his discovery and development of these lower volatile fatty acids to prevent fungal growth and so preserve the nutritious quality of cattle fodders. Since these volatile fatty acids stop fungal growth, they prevent mycotoxin generation and lessen the risk of cancer from exposure to mycotoxins. Two types of fungicides are used to control plant diseases:- (1) Surface protectants remain on the plant surface and exert their toxic action on fungi before they have penetrated into plant tissue. (2) Systemic fungicides move into plant tissue and exert their toxic action on Fungi which have already penetrated internally. These fungicides can also provide surface protection by acting on fungi before they have penetrated the plant. Most agricultural fungicides are systemic compounds that act at a single target site in fungal cells, such as cell membranes, microtubules, or ribosomes. There have been very few instances of fungal resistance to surface protectant fungicides which is attributed to their action at multiple sites within fungal cells. However, most systemic fungicides that act at a single site have generated serious problems with fungal resistance. A single gene mutation in a Fungus can lead to loss of effectiveness of all fungicides in a particular mode-of-action group. Experience has shown that frequent, uninterrupted use of a fungicide increases the risk for development of a resistant strain of the target organism. That risk can be reduced by alternating use of fungicides with different modes of action or by using them in mixtures. Fungicide is a material used to control or kill Fungi. Fungicide is a chemical agent that kills or inhibits fungal spores or mycelium. A pesticide used to treat or prevent diseases caused by pathogenic Fungi. Fungicide kills Fungi. Fungicide is any toxic substance used to kill or inhibit the growth of Fungi that either cause economic damage to crop or ornamental plants or endanger the health of domestic animals or humans. Most fungicides are applied as sprays or dusts. Seed fungicides are applied as a protective covering before germination. Systemic fungicides, or chemotherapeutants, are applied to plants, where they become distributed throughout the tissue and act to eradicate existing disease or to protect against possible disease. Bordeaux mixture, a liquid composed of hydrated lime, copper sulfate, and water, was one of the earliest fungicides. Bordeaux mixture and Burgundy mixture, a similar composition, are still widely used to treat orchard trees. Copper compounds and sulfur have been used on plants separately and as combinations. Synthetic organic compounds are now more commonly used because they give protection and control over many types of fungi and are specialized in application. Cadmium chloride and cadmium succinate are used to control turfgrass diseases. Mercury (II) chloride, or corrosive sublimate, is used as a dip to treat bulbs and tubers. Other substances occasionally used to kill Fungi include chloropicrin, methyl bromide, and formaldehyde. Many antifungal substances occur naturally in plant tissues. Creosote, obtained from wood tar or coal tar, is used to prevent dry rot in wood. Also known as Antimycotic. Fungicide:- (Latin:- Fungus – Fungus, Cide – Inhibiting) is a means used to combat mold. / муравьиная кислота (formic acid). грибные споры или . Артуры Ильмары Виртанэн (Artturi Ilmari Virtanen; 1895–

1973), Финский химик. Бордо (Bordeaux) и Бюрганди (Burgundy). Фунгициды или Фунгисиды (Fungicides), от Латинских слов Fungus, означающее Гриб, и Caedo, означающее Убиваю, химические препараты из группы пестицидов, широко используемые в сельском хозяйстве для уничтожения или предупреждения развития патогенных Грибов и Бактерий – возбудителей болезней сельскохозяйственных растений. То есть, они служат для борьбы с бактериальными, грибными, вирусными заболеваниями растений, а также с грибными повреждениями растительных продуктов. В качестве фунгицидов применяют, например, неорганические соединения меди, мышьяка, серы, ртутьорганические соединения, производные карбаминовых кислот, формалин. Фунгициды вносят в почву, ими протравливают семена, проводят опыливание и опрыскивание растений.

FUNGISTAT® = ФУНГИСТАТ® (или ФАНДЬЖИСТАТ®) – FungiStat® is a substance that inhibits the growth of Fungi. Fungistat drug forms, composition and dosages:- (i) Cream; Topical; Terconazole 0.8%; and (ii) Ovules; Vaginal; Terconazole 80 mg. Manufacturer:- Janssen Pharmaceuticals, Inc. (headquartered in Titusville, Mercer County, NJ, and in Raritan, Somerset County, NJ, the United States). / ФунгиСтат® или ФандьжиСтат® (FungiStat®). Йенсэн Фамэсутиколз, Инк. (Janssen Pharmaceuticals, Inc.).

FUNGUS = ФУНГУС (или ГРИБ, или ГРИБОК) – Fungus (Pl. Fungi) is simple spore-producing Eukaryotic Plants that obtain energy and nutrients by breaking down other organic material and abrorbing it through their cell walls. The Kingdom Fungi includes Yeasts, Moulds, Mildews, Mushrooms, Rusts, Slime Moulds, Smuts, and Toadstools. Fungus is:- (1) an organism with no chlorophyll, reproducing by sexual or asexual spores, usually having mycelia with well-marked nuclei. (2) Heterotrophic microorganisms chiefly saprophytic or parasitic, that constitute the Kingdom Fungi. / споры, обычно имеющие . Под Грибом, от Латинского слова Fungus, означающее Гриб, понимается одно из Царств живых организмов (ранее относили к Низшим Растениям). Сочетают признаки как Растений (неподвижность, верхушечный рост, наличие клеточных стенок и другие), так и Животных (гетеротрофный тип обмена, наличие хитина, образование мочевины и другие). Свыше 100 000 Видов, наибольшее число в Европе и Северной Америке. Вегетативное тело в виде грибницы, или мицелия (за исключением внутриклеточных паразитов). Размножаются вегетативным, бесполым (спорами) и половым путём. 3 Отдела:- (i) Настоящие Грибы, (ii) Оомицеты и (iii) Слизевики. Пять Классов Настоящих Грибов:- (i) Хитридиомицеты, (ii) Зигомицеты, (iii) Аскомицеты, (iv) Базидиомицеты, и (v) Несовершенные. Грибы минерализуют растительные остатки в почве, патогенные Грибы вызывают болезни Растений, Животных и Человека. Многие Виды Плесневых Грибов используют в микробиологической промышленности для получения витаминов, антибиотиков, ферментов, стероидных гормонов. Многие Грибы съедобны, дрожжи применяют в хлебопечении и пивоварении. Ряд Видов культивируют (Вешенки, Трюфели, Шампиньоны). Наука о Грибах – Микология.

FUNICLE = ФУНИКУЛУС (или СЕМЯНОЖКА) – Funicle is the stalk of an ovule or seed. The thread like tissue connecting the developing seed, via the hilum, to the fruit. (Latin:- Funiculus = Little Rope). / Фуникулус или Семяножка – это ножка семяпочки (или семязачатка) или семени. Ткань, похожая на нить, соединяющая развивающееся семя через . Под Фуникулусом или Фуникулюсом, от Латинского слова Funiculus, означающее Канат, понимается ножка семяпочки, отходящая от плаценты внутри завязи. Под Семяножкой или Фуникулусом понимается часть семяпочки, соединяющая её с плацентой. Под Семяносцем или Плацентой понимается место возникновения семяпочки или семяпочек в завязи покрытосеменных растений.

FUR = MEX – Fur is a body hair of any nonhuman mammal, also known as the Pelage. It may consist of short ground hair, long guard hair and, in some cases, medium awn hair. Some commercially sold fur, however, is artificial and produced from synthetic materials. See also Pelt. Fur is an article of clothing made of or with fur. / известный также как Шкура (Pelage).

FURLONG = ФУРЛОНГ (или ФАРЛОНГ) – Furlong is an English unit of length equal to 660 feet, 220 yards, 40 poles, 10 chains or one-eighth of an English mile (Metric:- 201.168 meters). Literally a 'Furrow Long' from Old English Furlang, the length of a single furrow that a horse could plough without stopping and hence the length of a medieval field. Still used in horse racing. / Под Фурлонгом или Фарлонгом понимается Британская мера длины. 1 фурлонг = 220 ярдам = 201.168 метру).

FURROW = БОРОЗДА (или БОРОЗДКА) – Furrow is a trench or long narrow cut in the soil after a plow passes through it, a trench or ditch dug by hand. / Под Бороздой понимается канавка, образованная почвообрабатывающим или другим орудием, для отвода воды с полей при избыточном увлажнении, поливе в орошаемом земледелии и для посева сельскохозяйственных культур. Борозда, канавка, образованная почвообрабатывающим или другим орудием. В зонах избыточного увлажнения служит для отвода воды с полей, в орошаемом земледелии – для полива. Бороздной посев защищает семена и всходы от выдувания.

FURROWED = ЗАБОРОНОВАННОЕ (или БОРОЗДЧАТОЕ, или С НАРЕЗАННЫМИ БОРОЗДАМИ) – Furrowed:- with parallel longitudinal grooves or channels. / жёлоб или паз (groove) или каналами.

FURROW IRRIGATION = БОРОЗДКОВОЕ ОРОШЕНИЕ (или БОРОЗДКОВЫЙ ПОЛИВ, или БОРОЗДНОЙ ПОЛИВ) – Furrow Irrigation is the irrigation of farmland by water run in furrows between the crop rows. Furrow irrigation is suitable for a wide range of soil types, crops and land slopes. Furrow irrigation is suitable for many crops, especially row crops. Crops that would be damaged if water covered their stem or crown should be irrigated by furrows. Furrow irrigation is also suited to the growing of tree crops. In the early stages of tree planting, one furrow alongside the tree row may be sufficient but as the trees develop then two or more furrows can be constructed to provide sufficient water. Sometimes a special zig-zag system is used to improve the spread of water. Corrugation irrigation, frequently mentioned in literature, is a special type of furrow irrigation, used for broadcast crops. Corrugations are small hills pressed into the soil surface. The application of this method is limited and is not included in this manual. In summary, the following crops can be Irrigated by furrow irrigation:- (i) row crops such as Maize, Sunflower, Sugarcane, Soybean; (ii) crops that would be damaged by inundation, such as Tomatoes, vegetables, Potatoes, beans; (iii) fruit trees such as citrus, grape; and (iv) broadcast crops (corrugation method) such as Wheat. Furrow Irrigation is an ancient form of surface irrigation, using parallel channels or trenches along the field length. Water is introduced at the high end of each furrow and gravity forces it to flow down the channel. / Бороздковый Полив или Бороздной Полив является одним из наилучших и широко применяемых методов поверхностного орошения по всему миру. Бороздковый полив можно использовать почти для всех культур, включая фруктовые деревья. Он лучше всего подходит для фермеров с малыми площадями и требует много рабочей силы, но почти никаких особых инвестиций. Посредством приспособления планировки борозд, его можно использовать для различных типов почв и уклонов. Бороздковый полив широко применяется не только в Кыргызстане, но и во всей Средней Азии. Технология практиковалась ещё в Советское время, и вся система ирригации была сформирована в Советскую пору. Хотя воду можно сэкономить при бороздковом поливе, чем при поливе с затоплением, эффективность бороздкового полива составляет только 60%, что означает, что 40% используемой воды не потребляется культурой и теряется из-за сбросов и инфильтрации. Во многих местах можно увидеть негативные стороны орошения – сокращение урожая, нарушения структуры и снижения плодородия почвы. Использование улучшенных технологий бороздкого полива становится необходимым. После распада Советского Союза в 1991 и последующих земельных реформ, земельные ресурсы, принадлежавшие колхозам, были распределены фермерам. Впоследствии появилось много малых фермеров с независимыми хозяйствами. У многих фермеров не было достаточного знания по управлению сельским хозяйством и орошением, что в свою очередь привело к неэффективному использованию

водных и земельных ресурсов и снижению урожая. Некомпетентность в вопросах эффективного управления водой также повлияла на распределение водных ресурсов. Конфликты, вытекающие из-за распределения водных ресурсов между фермерами, мурабами и АВП, как результат нехватки воды в вегетационный сезон, стали являться часто наблюдаемым явлением. В настоящее время фермеры в Кыргызстане в значительной степени используют длинные борозды для орошения своих полей. Несмотря на то, что орошение по длинным бороздам не является наилучшей практикой в силу неравномерного распределения воды, и требует значительного времени для орошения. Фермеру необходимо эффективно оросить свой участок за то время, которое даётся ему по расписанию. На сегодня улучшенные методы орошения, позволяющие повысить эффективность орошения и сэкономить воду, доступны для фермера. Борозды являются параллельными траншеями с малым поперечным сечением, сделанными на поле трактором, вручную или с помощью скота. Оросительная вода распределяется и течёт по бороздам в результате силы гравитации. Факторы бороздкого полива – форма, длина и расстояние между бороздами, в основном определяются естественными обстоятельствами, такими как, уклон и тип почвы. Размер потока воды в борозду зависит от планировки поля и водопроницаемости почвы. Бороздковый полив подходит почти для всех типов почв, кроме сильно песчаных, в которых высокий риск потерь из-за просачивания. Хотя борозды могут быть длиннее, когда уклон земли круче, максимально рекомендуемый уклон борозды – 2% для избежания эрозии почвы. Если уклон земли круче, необходимо сделать контурные борозды. Размер потока воды, то есть объём воды, протекающей за единицу времени, является ключевым фактором орошения. Поэтому размер потока воды должен быть приспособлен с учётом уклона, почвы и длины борозды. Максимальный размер потока воды, который не приведёт к эрозии почвы, зависит от уклона борозды. В любом случае, рекомендуется не использовать размер потока больше чем 3 л/с. Бороздковый Полив применяют при орошении Хлопчатника, Кукурузы, томатов, сахарной Свёклы. Ширина междурядий на посевах этих культур составляет 0.6–0.9 м, – а ширина водного потока в поливной борозде – до 0.2 м. Потери почвы за один полив могут достигать 100 т/га. В пересчёте на единицу времени это гораздо больше, чем при дождевой эрозии или при эрозии во время снеготаяния. Объясняется это тем, что при поливе по бороздам количество воды, взаимодействующей с почвой в единицу времени, гораздо больше, чем при дождях или при снеготаянии.

FURROW SLICE = ПОЧВЕННЫЙ ПЛАСТ (или СРЕЗ БОРОЗДЫ) – Furrow Slice is the ribbon of soil cut, lifted, pulverized, thrown, or turned to one side by the plow bottom.

FUSARIUM HEAD BLIGHT = КРАСНАЯ ФУЗАРИОЗНАЯ ГНИЛЬ – Fusarium Head Blight is a fungal disease of Wheat and other cereal crops. In Wheat it is characterized by the presence of kernels that appear lifeless, thin and shrunken. The kernels show a whitish or pinkish fibrous mould usually occurring in the crease area but sometimes found in the germ of the kernel as well. The presence of the mould on individual kernels is confirmed using a 10-power magnifier. Fusarium may produce mycotoxins such as vomitoxin. Affected grain may be unpalatable or toxic to animals, and is considered acceptable for human consumption only when virtually free of mycotoxins. / В отношении Пшеницы она характеризуется наличием зерновки (ядер), .

FUSARIUM OXYSPORUM VASINFECTUM = ФУСАРИУМ ОКСИСПОРУМ ВАСИНФЭКТУМ – Fusarium Oxysporum Vasinfectum is the full name of the Fungus that causes Fusarium Wilt of Cotton. / Полное название Гриба, вызывающего Фузариозный Вилт (Fusarium Wilt) у Хлопчатника. Фусариум (или Фузариум), Род Несовершенных Грибов. Насчитывается 26 Видов. Сапрофиты и паразиты вызывают фузариозы – болезни Растений, при которых загнивают всходы, увядают вегетативные органы. Фузариозы поражают Бобовые, Картофель, Лён, Тыквенные, Хлопчатник и другие культуры. Употребление в пищу зерна, содержащего токсины фузариума, приводят к развитию у Человека алейкии алиментарно-токсической, у Животных – фузариотоксикоза. Один из Видов Фузариумов образует гормоны Растений – гиббереллины.

FUSARIUM WILT = ФУЗАРИОЗНЫЙ ВИЛТ – Fusarium Wilt, caused by the soil-borne fungal pathogen Fusarium Oxysporum f. sp. Vasinfectum (FOV), is almost impossible to eradicate following introduction and can result in fields becoming unsuitable for Cotton production. A number of strains are present in Australia; however, if new exotic strains (races) were introduced, new management strategies and resistant varieties would be required. In addition, some exotic races are more damaging, particularly in association with nematode pests. Symptoms:- external symptoms include stunted growth and dull and wilted leaves followed by yellowing or browning of the leaves and eventual death from the top of the plant. Some affected plants may reshoot from the base of the stem. External symptoms can appear in the crop at any stage. Most commonly symptoms become apparent in the seedling phase when plants are beginning to develop true leaves, or after flowering during boll fill. Symptoms can appear as individual plants or as a small patch, often but not always, near the tail drain or low-lying areas of the field. Internal symptoms can be checked by cutting the stem. An affected plant will reveal continuous brown discoloration of the stem tissues running from the main root up into the stem. The discoloration is similar to that of Verticillium wilt but usually appears as continuous browning rather than flecking. Economic Impact:- once introduced to a field or farm, the pathogen is almost impossible to eradicate. FOV can persist in the absence of cotton plants by surviving as a saprophyte on decaying residues in the soil and may be quickly dispersed to other fields via the irrigation system and movement of infested soil. Failure to control the build-up of the disease results in fields becoming unsuitable for cotton production. Favoured By:- (i) use of susceptible varieties; (ii) stresses in the crop, e.g., waterlogging, root damage through cultivation, cool and wet growing conditions; and (iii) poor farm hygiene on and between farms and between districts. Survival:- there is no commercially viable way to eradicate this pathogen from infested soil. Spores are effectively spread over long distances in infected soil attached to boots, vehicles and farm equipment, and in water (irrigation and overland flows). It can also be transferred in infected plant material, including seed. Host Range:- the pathogen is specific to cotton but can also live in the residues of most non-host crops. Bladder ketmia, sesbania pea, dwarf amaranth, bellvine and wild melon are alternative weed hosts that show no external symptoms. These weeds may act as an on farm reservoir for the pathogen and need to be managed in-crop and during fallow periods. Control Strategy:- (i) Planning:- (a) if your farm is free from this disease, try to keep it this way! Ensure all farm staff and contractors practice good farm hygiene and Come Clean Go Clean; (b) select varieties with a high F rank; (c) use BION® Plant Activator, a seed treatment that helps protect seeds and emerging plants from Fusarium wilt and Black root rot. (ii) Planting:- if possible, delay planting until soil temperatures are 16 °C and rising. (iii) In Crop:- (a) manage the crop to avoid stresses such as waterlogging, over-fertilisation and root damage; (b) avoid mechanical inter-row cultivations if possible, as this causes root damage and provides an entry point for the pathogen; (c) conduct regular field inspections for early detection and containment of isolated outbreaks; (d) isolate affected areas from irrigation flows and traffic to avoid spreading the pathogen; and (e) minimise tail water from affected fields. (iv) After Harvest:- (a) after harvest, root pull and retain crop residues on the surface for at least month prior to incorporation. Raking and burning the whole field is not an option as raking is likely to spread the pathogen (if present); and (b) the pathogen can survive on non-host crop residues, so residues should be buried or baled as soon as possible after harvest. Avoid green manure crops. (v) Rotations:- rotate with non-hosts for up to 3 years; hosts such as legumes can potentially increase disease incidence; a summer Sorghum/Maize-fallow Cotton rotation can increase Cotton plant survival, reduce disease incidence and increase yield in the third year compared to continuous Cotton. Assessment:- Establish a transect across the field and assess for the presence or absence of disease symptoms in ten plants in every tenth row. The presence of the disease is best determined by checking for the characteristic brown internal discoloration within the lower stem.

Fusarium Wilt has emerged as a major threat to irrigated Cotton production in Australia. Evidence suggests that the disease has been dispersed with soil and crop residues attached to vehicles and machinery and in flood waters. The disease has been observed in a small number of dryland crops, especially where those fields have been inundated previously with contaminated flood water. Varieties with some resistance to this disease are available. Wilt disease can be one of the most devastating problems in Cotton. Fusarium Wilt, which is caused by the Fungus Fusarium Oxysporum F.Sp. (Formae Speciales) Vasinfectum, is most commonly found in the southern counties of the southern High Plains (Dawson, Terry, and Gaines counties). Symptoms:- Fusarium wilt, under high inoculum pressure, will start to show symptoms during the late seedling phase. By about 30 to 40 days after planting, plants will die. Even the survivors may have severe hypocotyl lesions that can be mistaken for damage by the seedling disease pathogen, Rhizoctonia. Wind damage can also be confused with early season Fusarium wilt. There is a need to look carefully to distinguish the cause of seedling death. Later in the season, leaves show a distinct loss of turgor and yellowing occurs starting at the leaf margin between the main veins. The yellowing progresses inward and is followed by necrosis. Defoliation occurs starting at the bottom of the plant, and working towards the top. In severe cases, plant death can occur. Generally, the vascular discoloration with Fusarium wilt is a solid dark brown ring around the outer portion of the stem, when seen in cross section. Fusarium Wilt usually becomes obvious early in the season, especially with cool wet weather. Seedlings are stunted, wilt and die. This results in a gappy stand, often with bare strips along rows in the direction of irrigation. Stunting, yellowing, wilting and plant death occur at any time during the season. Plants die back from the top and may re-grow from the base later in the season. The Fungus is introduced to fields in infested soil or cotton residues carried on vehicles and machinery and in irrigation or flood water. Movement in irrigation water results in ‘comet’ – shaped patches and Fusarium wilt is often first observed as dead plants at the tail drain. The disease will be present for a number of seasons before large dead patches become obvious. A feature of Fusarium wilt is solid brown discoloration throughout the woody part of the stem and the tap root of seedlings and mature plants. The browning may progress to fill the whole stem. Some leaves develop a yellow mottle that may be confused with symptoms of Verticillium wilt. See also Bronze Wilt, Sudden Wilt, and Verticillium Wilt. / изменение цвета . жёлтая крапчатость (yellow mottle). жилка (vein). Вилт известен также как Трахеомикоз (Трахеомикозная Болезнь). Смотрите также Бронзовый Вилт (Bronze Wilt), Вертициллиозный Вилт (Verticillium Wilt), и Молниеносный Вилт или Скоротечный Вилт (Sudden Wilt). Фузариозный Вилт (или Фузариозное Увядание) (Fusarium Wilt):- грибная болезнь, поражающая кроме Хлопчатника ещё многие Виды культурных Растений. К примеру, от неё страдают Бобовые, Зерновые, Картофель, Лён, Люцерна, Овоще-Бахчевые, Шелковица и многие другие сельскохозяйственные культуры. Возбудитель болезни – Несовершенный Гриб Рода Фусариум (или Фузариум (Fusarium)), обладающий макроконидиями (органами размножения) и хламидоспорами (зимующими спорами). Этот Гриб как сапрофит обитает в слое почвы на глубине от 0 до 60 сантиметров от поверхности, превращаясь в заболевшем растении в паразита. При попадании в растение Гриб выделяет токсичные вещества (фузариевая кислота, ликомаразмин и другие), а своим мицелием Гриб пронизывает сосуды растения, приводя сначала к их закупориванию, а затем к резкому нарушению всех жизненных функций растения вследствие такой закупорки. Болезнь разносится по полю изначально заражёнными семенами, поливной водой, сбрасываемой с заражённых участков на здоровые, и орудиями обработки. Изначально болезнь поражала длинноволокнистый Хлопчатник, но с 1970-х и средневолокнистый Хлопчатник. Причём для тонковолокнистого Хлопчатника возбудителем этой болезни является Гриб Фусариум Оксиспорум Формаэ Спэсиалес (F. Sp.) Васинфэктум (Fusarium Oxysporum Formae Speciales Vasinfectum). Внутренним признаком заболевания растения фузариозным вилтом является побурение водопроводящих сосудов древесины, хорошо заметное на поперечных срезах стебля. На разных фазах вегетационного периода Хлопчатника болезнь оказывает и разную степень воздействия, например, из-за прохладной и влажной погоды на стадии всходов заражение приводит к гибели молодых растений и, соответственно, уменьшению густоты стояния растений; оставшаяся часть растений существенно отстаёт в своём росте и развитии. Начиная с семядольных листьев, болезнь первоначально проявляется в виде желтоватой сетчатости на них. С развитием болезни эта сетчатость увеличивается, занимая всю поверхность листьев. Иногда на настоящих листьях болезнь проявляется в виде желтоватой каймы. Поражённая часть листа может засохнуть, приняв при этом светло-коричневый окрас. Листья теряют свой тургор, скручиваются вдоль главной жилки и опадают. Ближе к концу вегетационного периода фузариозный вилт может проявляться в молниеносной или скоротечной форме, листья при этом увядают, оставаясь зелёными, верхушка стебля поникает, и очень скоро всё растение засыхает. Болезнь наносит значительный ущерб урожаю Хлопчатника. К примеру, при поражении болезнью 15% участка потери урожая на нём составляют 5.8%, а при поражении болезнью 48% участка – более 28%. Фузариозный вилт распространён во всех климатических зонах. В качестве основной меры борьбы с фузариозным вилтом служат внесение под основную вспашку триходермина с навозно-земляным компостом, возделывание более устойчивых к данной болезни сортов Хлопчатника, заготовка семенного хлопка-сырца только со здоровых полей, уборка растительных остатков с поля, севооборот. Важное значение имеет также профилактика фузариозного вилта; с этой целью необходимо использовать такую практику обработки растений, при которой с запасным поливом за 20–30 суток до сева применяется карбатион из расчёта 0.5 тонны на один гектар (т/га), а под зяблевую вспашку – тиазин из расчёта 200 килограммов на один гектар (кг/га), и которая исключает сбрасывания воды с заражённых участков на здоровые, поскольку споры несовершенных грибов Рода Фусариум легко распространяются с током воды.

FUSCOUS = ЧЕРНОВАТОЕ – Fuscous:- dusky, blackish or a grayish-brown color. Fuscous:- of any of several colors averaging a brownish gray.

FUSECUT = XX – Fusecut (label) finishing is the most common cutting method for printed labels. This procedure utilizes a hot knife to heat seal the ends as the label is cut from the roll. It is the most economical form of finishing by virtue of its speed and the fact that it saves fabric. However, it is not recommended for shuttle weave products.

FUSED = СЛИВШЕЕСЯ (или СОЕДИНИВШЕЕСЯ, или РАСПЛАВЛЕННОЕ) – Fused:- joined and growing together.

FUSED ACETATE = ПЛАВЛЕНЫЙ АЦЕТАТ – Fused Acetate is:- (1) a hard particle of acetate material of almost any shape or size other than recognizable fiber. Sometimes fused acetate particles resemble rock-like, hardened drops of acetate dope; in other cases fused acetate consists of particles covered with fiber clusters and completely hardened in the center. (2) Acetate yarns in which the individual filaments are coalesced.

FUSED FILAMENTS = ПЛАВЛЕНЫЕ ЭЛЕМЕНТАРНЫЕ НИТИ – Fused Filaments are a group of filaments bonded together in a tow by drips or frictional effects and thereby resistant to filament separation and crimp deregistering.

FUSED RIBBON = ПЛАВЛЕНАЯ ЛЕНТА – Fused Ribbon:- acetate fabrics in wide widths may be cut into narrow ones by the application of heat. A hot knife blade caused the edges to sear and bead, thereby doing away with selvages on the edges of the goods.

FUSED SELVEDGES = ПЛАВЛЕНЫЕ (или КЛЕЕВЫЕ) КРОМКИ – Fused Selvedges are obtained by pressing a hot mechanical element on the fabric edge; this method can be applied on fabrics in man-made fibers. Sometimes used to split wider fabrics in to narrow width fabrics. See also Leno Selvedges, Melt Selvedges, Selvedge, and Tucked-In Selvedges.

FUSIBLE INTERLININGS = ПЛАВКИЕ ПОДКЛАДКИ – Fusible Interlinings are of considerable help in the clothing industry because for shaping, edge stitching, securing, strengthening and under picking, which eliminates tacking or stitching procedures. Interlinings are particularly applied in the tailoring of jackets and blazers, overcoats, uniforms, dresses, blouses, shirts, overalls and in the sportswear sector.

FUSING = ПЛАВЛЕНИЕ – Fusing is:- (1) a melting; or (2) uniting, as by melting together.

FUSING MACHINES = ПЛАВЯЩИЕ МАШИНЫ (или СКЛЕИВАЮЩИЕ МАШИНЫ) – Fusing Machines:- bond precut textiles with interlinings.

FUSION = СЛИЯНИЕ – Fusion is the union of two broken fragments.

FUSTIAN = ФАСТИЭН (или БУМАЗЕЯ, или ФЛАНЕЛЬ, или МАНЧЕСТЕР, или УТОЧНЫЙ БАРХАТ) – Fustian is a fabric originally made by weaving two sets of cotton wefts, or fillings, on a linen warp, popular during the European Middle Ages. The word has come to denote a class of heavy cotton fabrics, some of which have pile surfaces, including moleskin, velveteen, and corduroy. Fustian probably originated in Al-Fustāt, now part of Cairo, about ad 200, and eventually spread to Spain and Italy, where there were guilds of fustian weavers in the XIII century. As the material became popular its production spread Northward; Southern Germany and Switzerland had a rising fustian industry in the XIV century, and French weavers were making fringed and roughened fustians in the XVI. These early fustians appear to have been smooth fabrics with a soft raised nap; eventually, a ribbed pile surface was developed. By the XIX century cotton was being used for the warp as well as the filling. In all fustians one of the sets of filling yarns is made up of floats (yarns that skip over two or more adjacent warp yarns). When a pile fabric is desired, the weft floats must be cut, a process originally performed by hand with a fustian knife but now done mechanically. The pile is brushed, sheared, and singed, and finally the fabric is bleached and dyed. Fustian is a strong cotton and linen fabric. Fustian, a thick woven drill or twill, made from a linen or wool and cotton blend. / хлопковые утки или уточины, на льняной основе, . Фастиэн (Fustian). Аль-Фустат (или Ал-Фастэт; Al-Fustāt).

FUTA = FEDERAL UNEMPLOYMENT TAX ACT

FUTURE RATE AGREEMENT = СОГЛАШЕНИЕ О БУДУЩЕЙ СТАВКЕ – Future Rate Agreement (FRA) is a contract between two parties to lock in a forward interest rate, for a period, starting at a specific date in the future. For example, a 6 v 9 FRA is a contract that begins 6 months from now and ends after 9 months, i.e. lasts for 3 months. The two counterparties, one buyer and one seller, settle by cash payment at the start of the contract period (in this example 6 months from now). Settlement is based on the difference between the actual interest rate prevailing on the fixing date and the rate specified in the contract, for a specific notional principal stated in the contract. Future rate agreements are also known as Fixed or Forward Rate Agreements. Also known as Forward Rate Agreement. / Известно также как Соглашение О Форвардной Ставке (Forward Rate Agreement).

FUTURES = ФЬЮЧЕРС – Future is a financial instrument by which the buyer is obliged to buy or sell an underlying (for example a share), at a certain time and at a price determined in advance. A Future is a contract to buy or sell a standard quantity of a given instrument, at an agreed price, on a given date. A future is similar to a forward contract and differs from an option in that both parties are obliged to abide by the transaction. Futures are traded on a range of underlying instruments including commodities, bonds, currencies, stock indices and even pollution. The most important difference between futures and forwards is that futures are almost always traded on an exchange and cleared by a clearing house, whereas forwards are over-the-counter instruments. Furthermore, futures, unlike forwards, have standard delivery dates and trading units. Most futures contracts expire on a quarterly basis. Contracts specify either physical delivery of the underlying instrument or cash settlement at expiry. Cash settlement involves the company paying or being paid the difference between the price struck at the outset and the expiry price of the contract. The clearing house is crucial, acting as the counterparty to all transactions; that is, it acts as the buyer to the seller of the future, and as the seller to the buyer. Since for every long futures position there must be a short position, the clearing house has a net position of zero at the end of each day. It also operates a system known as Margining. On entering a transaction, a company will be required to lodge a specified sum of money (initial margin) with the clearing house. The amount depends on how much the clearing house considers prudent to set aside to protect against a dramatic move in the underlying market. Each day, the company also gives or receives variation margin, which is the difference between the original contractual price and the daily closing price. In pricing futures, an important distinction is between futures on assets held for investment and those held almost exclusively for consumption (such as pork bellies or soya beans). The price of futures on investment assets is determined by the relative interest rates or dividend yields of the asset and cash, such as to eliminate riskless arbitrage through buying the future and selling the asset or vice versa. By contrast, futures on commodities not held for investment cannot readily be priced by an arbitrage approach – perceived supply and demand considerations are much more significant. Futures provide a formalized method of transferring risk from those wanting to reduce their market exposure to those wanting to increase it. For example, futures markets allow commodity producers to hedge against falling prices, or fund managers to weight their stock, bond or currency portfolios according to their required risk profiles. For fund managers, futures also provide a way of entering and exiting markets with typically much lower transaction costs (friction) than would be the case with cash alternatives. This is especially true in equity markets. Because of their standardized nature, however, futures contracts may not match precise hedging needs. Instead the hedger may incur basis risk, the risk that the return on the futures position may differ from that on the spot. Futures are the contracts that require delivery of a commodity of specified quality and quantity, at a specified price, on a specified future date. Commodity futures are traded on a commodity exchange and are used for both speculation and hedging. Unlike the cash market, where transactions are settled immediately after conclusion, participants on the derivatives markets trade contracts on transactions to be settled in the future. Options and futures allow investors to protect their investments against price fluctuations. Speculation in futures and options tempts with prospects of high returns for low investments, but caution is recommended:- you can just as easily lose all your money! Instruments which give the holder the right to purchase a commodity or a financial asset at a future date. Futures trading is not suitable for all investors, and involves the risk of loss. Futures are a leverages investment, and because only a percentage of a contract's value is required to trade, it is possible to lose more than the amount of money deposited for a futures position. Therefore, traders should only use funds that they can afford to lose without affecting their lifestyles. And only a portion of those funds should be devoted to any one trade because they cannot expect to profit on every trade. All orders are entirely at your risk, and it will be your responsibility to monitor these orders. There are limitations to the protection given by stop loss orders therefore we give no assurance that limit or stop loss orders will be executed, even if the limit price is met, in full or at all. Futures is a way of trading financial instruments, currencies or commodities for forward value dates or delivery. Futures is a contract specifying a future date of delivery or receipt of a certain amount of a specific tangible or intangible product. The commodities traded in futures markets include stock index futures; agricultural products like Wheat, Soybeans and pork bellies; metals; and financial instruments. Futures are used by business as a hedge against unfavorable price changes and by speculators who hope to profit from such changes. Also known as Futures Contracts. A term designating the standardized contracts covering the sale of physical commodities or financial instruments for future delivery on a futures exchange. Futures are derivatives contract in which the seller agrees to deliver, and the buyer agrees to purchase, a certain quantity of an underlying commodity or instrument at a predetermined price on a specified settlement date. Futures

are highly liquid standardized financial instruments whose value depends on the value of the respective underlier. There are two types of futures:- financial futures and commodity futures. The underlying instruments of financial futures are stock indices, currencies, or interest rates, whereas commodity futures are tied to the movements of real goods such as raw materials or agricultural products. There are two sides to a futures transaction. A 'long position' represents the buyer's obligation to purchase the underlying instrument or commodity at a predetermined price on settlement date; a 'short position' represents the seller's obligation to deliver the underlying instrument or commodity, in exchange for which he receives the agreed purchase price. Today, most futures contracts do not require actual delivery of the underlier, but are settled by means of a cash exchange. Futures contracts are forward exchange-traded contracts, meaning they represent a pledge to make a certain transaction at a future date. These contracts require the delivery of a bond, commodity, currency, or stock index, at a specified price, on a specified future date. / Термин Фьючер (Future) или Фьючерс (Futures):- разработанный для унифицированных контрактов фьючерсных бирж, предусматривающих продажу реального сырья или финансовых инструментов для поставки по истечении определённого срока. Известен также как Фьючерсный Контракт (Futures Contract). В современном Русскоязычном биржевом жаргоне для определения термина 'Фьючерс' часто используется сокращение 'Фьюч' или 'Фьючи' для множественного числа.

FUTURES COMMISSION MERCHANT = КОМИССИОНЕР ПО ФЬЮЧЕРСАМ (или ТОРГОВЕЦ ФЬЮЧЕРСАМИ ЗА КОМИССИЮ) – An Futures Commission Merchant (FCM) is the only industry participant who receives, handles, and manages customer funds, margin payments, and commission charges. He is also responsible for confirmation of trade slips, customer statements, and guarantees. Individuals, associations, partnerships, corporations and trusts that solicit or accept orders for the purchase or sale of futures and options on futures and that accept payment from or extend credit to those whose orders are accepted. Futures Commission Merchants (FCMs) must be registered with the National Futures Association. Give-up – (i) a trade that is directed to a floor broker by an exchange member FCM (executing firm) and, after the trade is executed, it is given to another firm to clear (clearing firm); (ii) a trade in which a customer contacts a floor broker directly, and after execution of the customer's order the floor broker gives up the name of the clearing member who will clear the trade. Futures Commission Merchant (FCM) is the legal term for a US commodity brokerage house handling futures exchange business. A firm or person engaged in soliciting or accepting and handling orders for the purchase or sale of commodities for future delivery on, or subject to, the rules of a futures exchange and who, in connection with such solicitation or acceptance of orders, accepts any money or securities to margin any resulting trades or contracts. Must be licensed under the Commodity Exchange Act. Also known as Commission House or Wire House.

FUTURES CONTRACT = ФЬЮЧЕРСНЫЙ КОНТРАКТ – Futures Contracts are firm commitments to make or accept delivery of a specified quantity and quality of a commodity during a specific month in the future at a price agreed upon at the time the commitment is made. Less than 3% of all metals futures contracts traded each year result in delivery of the underlying commodities. Instead, traders generally offset their futures positions before their contracts mature. The difference between the initial purchase or sale price and the price of the offsetting transaction represents the realized profit or loss. A legally binding agreement to buy or sell a security, commodity or financial instrument at a fixed price on a specified date in the future. Based on a contract specification fixed by the exchange and traded in a single commodity. In the case of cotton there is significant international cotton exchange, based at New York. The basic unit of trading is 22 700 kilos or 50 000 lb (approximately 100 US statistical bales) of Grade 41 (Strict Low Middling) staple 34 (1-1/16") micronaire 3.5–4.9. Less than 2 percent of contracts are actually delivered. They are used more as a price discovery tool or a hedging mechanism. A regulated, legally binding agreement made on the trading floor of a futures exchange to buy or sell a fixed quantity of a commodity for delivery at a specified time and location in the future:- (i) at a price that is determined at initiation of the contract; (ii) that obligates each party to the contract to fulfill the contract at the specified price; (iii) that is used to assume or shift price risk; and (iv) that may be satisfied by delivery or offset. A legally binding agreement, made on the trading floor of a futures exchange, to buy or sell a commodity or financial instrument sometime in the future. Based on a contract specification fixed by the exchange and traded in a single commodity. Futures contracts are standardized according to the quality, quantity, and delivery time and location for each commodity or asset. They are used more as a price discovery tool or a hedging mechanism. It is, in effect, a forward contract in which the main elements have been standardized for all traders. Only the price for a transfer of the 'contract' itself is negotiated. The current price of a futures contract determines the current futures price of the commodity. A contract to deliver can be 'closed out' by buying a futures contract to take delivery; and vice versa. A supply contract between a buyer and seller, whereby the buyer is obligated to take delivery and the seller is obligated to provide delivery of a fixed amount of a commodity at a predetermined price at a specified location. Futures contracts are traded exclusively on regulated exchanges and are settled daily based on their current value in the marketplace. A Futures Contract is a standardized contract for selling or buying an asset, such as a physical commodity or a financial instrument, at a specified future date and at a price agreed today (the futures price). The contracts are traded on a futures exchange. A futures contract is a forward contract standardized in term of size, deliverable grade, delivery date, and delivery location. Each individual contract for a particular commodity is identical to the next, but they differ among different commodities. Futures Contracts are traded on an organized exchange. Futures contracts have standard delivery dates, trading units, terms and conditions established by the exchange. A futures contract also represents a valid agreement of purchase or sale of a physical commodity. Futures contracts are sold and purchased through members of futures exchanges. Qualified members may execute transactions for commission brokers, be retained by independent clients, or speculate for profit. Futures Contract is an agreement made on an organized exchange to buy or sell a specific commodity or financial instrument on a set date in the future at a set price. In practice, most futures positions are 'squared off' before maturity with delivery, if it takes place, in the form of a warehouse receipt. Futures Contract is an agreement to buy or sell a specific commodity or financial instrument on a set date in the future at a set price. Futures Contracts:- a financial contract entitling, in principle, its holder to buy or sell a given commodity at a given price for a certain period of time. Such contracts are entered into between buyers and sellers in a market and are a zero sum game. They are simply a 'paper' game used primarily for hedging (avoiding risk) purposes. For example, Canadian currency futures contracts could be used to lock in a foreign (USD) profit pending collection of that receivable. Futures contracts must always be closed out (i.e. unwound). There is always an equal number of long (bought) contracts and short (sold) contracts. Futures Contract:- like a forward contract, this is a contract to buy (or sell) an asset on an agreed basis in the future. However, futures contracts are standardised contracts traded on a recognized exchange like LIFFE. The profit or loss from the futures contract is calculated every day and the change in this value is paid by one party to the other this is called Marking To Market. Futures Contract is a contract traded on a futures exchange for the delivery of a specified commodity at a future point in time. Most futures contracts do not result in physical delivery. An offsetting transaction usually occurs prior to delivery and any price differences are settled in cash. Futures Contract is the firm commitment to deliver or to receive a specified quantity of a commodity or cash payment during a designated month with commodity price or cash payment being determined by public auction among exchange members. Futures Contract is a contract traded on a futures exchange that calls for delivery of a standardized amount and quality of a commodity during a specific month. The contract price (per unit of commodity) is established through competitive trading at the organized exchange. / Лондонская Международная Биржа Финансовых Фьючерсов и Опционов (London International Financial Futures and Options Exchange; сокращённо – ЛМБФФО или ЛИФ или ЛАЙФ или Эл.Ай.Эф.Эф.И. (LIFFE)). порядки и условия . Фьючерсный Контракт – соглашение о покупке или продаже товарно-сырьевой продукции или финансовых

инструментов в определённом количестве по оговорённой цене на указанную дату в будущем. О цене покупатель и продавец договариваются в торговом зале биржи, используя систему открытого выкрика (open outcry). Фьючерсный контракт обязывает покупателя приобрести соответствующую товарно-сырьевую продукцию, а продавца – продать её, если контракт не продан иному лицу до наступления даты закрытия контракта, что может случиться, когда продавец ждёт возможности получить прибыль или сократить убытки. Эта практика противоположна операциям с опционами, когда покупатель опциона может решить, реализовать или не реализовать опцион по наступлении даты его истечения.

FUTURES CONTRACT MONTHS = МЕСЯЦЫ ФЬЮЧЕРСНОГО КОНТРАКТА – Futures Contract Months are the delivery months in which futures contracts are traded.

FUTURES–EQUIVALENT = ЭКВИВАЛЕНТ ФЬЮЧЕРСА – Futures-Equivalent is a term frequently used with reference to speculative position limits for options on futures contracts. The futures-equivalent of an option position is the number of options multiplied by the previous day's risk factor or delta for the option series. For example, ten deep out-of-money options with a delta of 0.20 would be considered two futures-equivalent contracts. The delta or risk factor used for this purpose is the same as that used in delta-based margining and risk analysis systems. See also Series. / Часто встречающийся термин, используемый в отношении лимитов по спекулятивным позициям для опционов на фьючерсные контракты. Эквивалент фьючерса для позиции по опциону соответствует количеству опционов, умноженному на фактор риска предыдущего дня (previous day's risk factor) или Дельту (Delta) для серий опционов. Например, десять весьма убыточных опционов со значением Дельты, равным 0.20, могли бы рассматриваться как два эквивалента фьючерсного контракта. Смотрите также Серии (Series).

FUTURES EQUIVALENT CONTRACT = ЭКВИВАЛЕНТНЫЙ ФЬЮЧЕРСУ КОНТРАКТ – Futures Equivalent Contract:- this term means an option that has been converted to a futures contract equivalent in accordance with the rules of the exchange. / Этот термин означает опцион, который был превращён в эквивалент фьючерсного контракта в соответствии с правилами данной биржи.

FUTURES EXCHANGE = БИРЖА ФЬЮЧЕРСОВ – Futures Exchange is a central marketplace with established rules and regulations where buyers and sellers meet to trade futures and options on futures contracts. Futures Exchange (market) is a centralized, regulated market where an actual commodity is not physically traded; instead, futures contracts are bought and sold. / Биржа Фьючерсов – центральная рыночная площадка с утверждённым регламентом и предписаниями, где встречаются друг с другом покупатели и продавцы для торговли фьючерсами и опционами на фьючерсные контракты.

FUTURES HEDGE = ХЭДЬЖ ФЬЮЧЕРСАМИ – Futures Hedge:- it is a zero sum arrangement, when what is gained on one side of the market is forfeited on the other (futures or cash). / Фактически это сделка с нулевым результатом, когда прибылью на одном рынке гасят убыток на другом. В данном случае принимаются во внимание фьючерсный и реальный рынок того или иного инструмента, например, какого-то сырья.

FUTURES INDUSTRY ASSOCIATION = АССОЦИАЦИЯ ИНДУСТРИИ ФЬЮЧЕРСОВ (или АССОЦИАЦИЯ ФЬЮЧЕРСНОЙ ОТРАСЛИ) – The Futures Industry Association (FIA) was founded on 1955-July-14 in New York as the Association of Commodity Exchange Firms. It was originally established to provide a forum to discuss issues, work with exchanges, represent the public customer, study ways to reduce costs, eliminate the abuse of credit, cooperate on educational efforts and protect firms from fraudulent warehouse receipts. In 1973, the New York association expanded to include Chicago FCMs. It was renamed the Futures Industry Association in 1978 and moved to Washington 'in recognition of the truly national scope of the futures industry'. The FIA broadened its reach again in the mid-eighties when international organizations were invited to become members. In 1988, FIA established a non-profit educational foundation, Futures Industry Institute, to further develop and implement the FIA's educational goals.Today (in 2011), the FIA's more than 250 members represent a diverse group of market participants with a common desire to see the industry grow and prosper. A membership organization for the Futures Commission Merchants (FCMs) which, among other activities, offers education courses on the futures markets, disburses information, and lobbies on behalf of its members. The Futures Industry Association's (FIA) core constituency is the intermediary, and the primary focus of the Association is exchange-traded derivatives. FIA's regular members represent 90% of the customer business conducted on US futures markets and, with their affiliates, a significant portion of the US customer business executed on non-US markets. Approximately 50% of FIA's revenues come from regular member dues. The principal objectives of the FIA are to:- (i) represent industry views before Congress; (ii) seek regulatory relief for exchanges and intermediaries in the US and abroad; (iii) promote global futures business regardless of location; (iv) assure that the financial integrity of the markets, clearinghouses, and clearing members is always considered; and (v) educate and inform market participants, the press, regulators, and legislative bodies. FIA provides a forum for futures and options professionals from around the world to share information and concerns about the global futures industry. FIA works to facilitate cross-border trading, monitor and provide input to international regulators, advise new markets, and work toward standardization of practices and policies to create greater efficiency in cross-border trading. The FIA takes on international projects such as the development of recommendations to enhance the protection of assets of market participants wherever they are trading, and collecting information on rules, technology, and system design of international exchanges. The FIA serves as an effective liaison between the industry and Congress, the Commodity Futures Trading Commission (CFTC) and other regulators whose activities affect the derivatives markets. Over the years, FIA has fought against user fees, worked to lift regulatory burdens and protect the interests of FCMs and their customers. FIA represents the interests of both institutional and retail customers. FIA staff monitors legislative and regulatory developments, attends CFTC meetings and Congressional hearings, testifies before Congress and regulators and writes comment letters on proposed rules and other issues that impact the industry. We bring our members together to present a strong, unified voice on topics of concern in Washington. FIA is frequently called on by regulators and Congressional representatives to provide the industry perspective on issues under consideration. Regular members of the FIA are brokerage firms. Many of FIA's members are global players representing global clients in global markets. FIA works to facilitate cross-border trading, monitor and provide input to international regulators, advise new markets, and work toward standardization of practices and policies to create greater efficiency in cross-border trading. The FIA takes on international projects such as the development of recommendations to enhance the protection of assets of market participants wherever they are trading, and collecting information on rules, technology, and system design of international exchanges. Associate members include international exchanges and clearinghouses, banks, legal and accounting firms, introducing brokers, commodity trading advisors, commodity pool operators and other market users, and information and service providers headquartered in the United States and abroad. FIA divisions are a vital component of the FIA. They give members the opportunity to discuss common issues, exchange ideas, give input to the FIA board, exchanges and other regulatory and self-regulatory bodies, and network with peers. Division initiatives bring industry professionals together to find solutions for common problems. Divisions also support FIA efforts at the international level. FIA divisions meet in New York, Chicago, London, the United Kingdom, and Tokyo, Japan. Any employee of a member firm is eligible to join a division for a small annual membership fee. Headquartered in Washington, DC, the United States. The US national not-for-profit futures industry trade association that represents the brokerage community on industry (such as Futures Commission Merchants), regulatory, political, and educational issues. / домогательство (abuse).

FUTURES MARKET = РЫНОК ФЬЮЧЕРСОВ (или ФЬЮЧЕРСНЫЙ РЫНОК) – Futures Markets bring a number of benefits to the global oil market. First, crude oil futures markets provide information about future expectations regarding supply and demand conditions. Second, these expectations are made transparent, i.e. known to the market, in the form of a series of futures prices for crude to be delivered at different dates in the future. Finally, crude oil producers, marketers, refiners, and others are able to use the financial contracts on the exchanges to manage risk, facilitated, in part, by the increasing participation of the number of investors without a commercial interest in the petroleum industry, i.e. no capacity to produce, refine, store, or sell physical volumes of crude or petroleum products. As described above, futures markets bring together valuable information about the market's expectations about future supply and demand conditions in the physical market – conditions that will ultimately determine the price for oil. If, for example, the price today of an oil futures contract for the delivery of oil three months from now is USD65 per barrel, that 'futures' price represents thousands of buyers' and sellers' best estimate of what the price of oil will be for physical delivery three months hence. And, if in this hypothetical situation, the current (spot) price were USD60 per barrel, the futures market would then be revealing the fact that it is the market's current expectation that prices are expected to increase over the near future. That is, based on the information of thousands of commercial participants and sophisticated financial institutions, futures prices are telling producers and consumers alike that the crude oil market is likely to remain tight for the foreseeable future. Of course, actual prices for crude in the future may be different than those implied by today's future prices. Because it is the market's best estimation today that oil will be USD65 per barrel in three months does not necessarily imply that oil will, in three months, be USD65 per barrel. As expectations about future supply and demand conditions change, e.g., due to colder than expected weather or unforeseen political events that could cause temporary supply disruptions, so too will current and future expected prices. This trading process, i.e. the competition between various market players in the futures markets, is beneficial because it provides transparent price information to those who can respond to this information by, for example, putting additional oil in storage or taking steps to reduce their consumption in the future. To illustrate, when prices of futures contracts with early delivery dates exceed those with later delivery dates, the market consensus is for prices to fall in the future. The futures market is commonly said to be 'backwardated' under these conditions. This provides an economic incentive to draw down inventory today – thereby softening prices today. On the other hand, when prices of futures contracts with early delivery dates are lower than those with later delivery dates, the market consensus is for prices to rise in the future. The futures market, under these conditions, is commonly termed 'in contango'. This provides the economic incentive to build inventories if the higher futures prices will cover the cost of storage. This saves supply for the future when prices say it is most needed. In short, futures market prices provide information about expected future supply and demand conditions that producers and consumers can act on today. The effect of these actions is to shift the supply of crude oil from periods of relatively lower prices to periods where crude oil prices are expected to be higher. These actions, in turn, tend to ameliorate price swings. Finally, futures markets permit industry participants to manage the significant risks they bear in the production, refining, and transacting in crude oil and petroleum products. (These risks include market risk, i.e. risk due to the change in oil prices; credit default risk, i.e. the counter-party may fail to meet the financial terms of the contract; liquidity risk; i.e. risk arising from the inability to sell an asset; basis risk, i.e. prices for the types of crudes or products owned by the participant do not perfectly track changes in the benchmark product; operational risk; and political risk, e.g., expropriation.) They do so by making it possible, for example, for an oil producer to lock in prices for its future production on the futures market or to use other instruments to limit the price fluctuations it will realize. The fact that these financial markets are highly liquid, with thousands of traders, allows users to shed risk at the least possible cost and at prices that reflect all of the information brought to the market by those trading. Consumers benefit because holding down producers' risks encourages investment in future supplies. Commodity exchange on which futures contracts are traded. The opposite of Spot Market. Market where contracts for future delivery of commodities are bought and sold. Futures contracts for financial instruments are called Financial Futures Contracts, while those for foreign exchange are called Forward Exchange Contracts. The contracts themselves are called Futures, which are defined as agreements to take or make delivery of a specific commodity or instrument on a particular date. Futures Market is a centralized market where traders buy and sell futures contracts. Futures Markets provide a number of advantages. They represent an efficient way of buying and selling commodities for future delivery, particularly seasonal farm crops. A futures contract also represents a valid agreement of purchase or sale of a physical commodity. Futures Market is a trade center for quoting prices on contracts for delivering a specified quantity of a commodity at a specified time and place in the future. Market participants primarily use the crude oil futures market to manage financial risk associated with price uncertainty. / флуктуации (колебания) цены. Рынок Фьючерсов:- биржи, на которых ведутся торговые операции с фьючерсными контрактами (futures contract). Различные биржи специализируются на различных типах контрактов. Основными биржами являются следующие:- Американская Фондовая Биржа (Атех), Товарная Биржа (Сотех), Нью Йоркская Биржа Кофе, Сахара и Какао, Нью Йоркская Биржа Хлопка, Нью Йоркская Товарная Биржа и Нью Йоркская Срочная Финансовая Биржа (все находятся в Нью Йорке); Чикагская Палата Торговли (СИБАТ®; Chicago Board of Trade (CBOT®)), Международный Валютный Рынок (International Monetary Market), Чикагская Товарная Биржа (Chicago Merkantile Exchange® (CME®)), Чикагская Биржа Риса и Хлопка (Chicago Rice and Cotton Exchange), СреднеАмериканская Сырьевая Биржа (MidAmerica Commodity Exchange) (все расположены в Чикаго); Палата Торговли Города Канзаса (Kansas City Board of Trade); Миннеаполисская Биржа Зерна (Minneapolis Grain Exchange).

FUTURES OPTION = ОПЦИОН НА ФЬЮЧЕРС – Futures Option is an option on a futures contract. / Опцион На Фьючерс – опцион на фьючерсный контракт.

FUTURES PREMIUM = ПРЕМИЯ ЗА ФЬЮЧЕРС (или ПРЕВЫШЕНИЕ ФЬЮЧЕРСА) – Futures Premium is the amount that the price for one futures contract month exceed that of another futures contract month.

FUTURES PRICE = ФЬЮЧЕРСНАЯ ЦЕНА (или ЦЕНА ФЬЮЧЕРСА) – Futures Price is the price agreed by open competition, at any given time, for a commodity which will be delivered on a specified month. There is a fixed set of months for this purpose (March, May, July, and December in the case of Cotton), and a fixed set of delivery points. For Cotton, futures prices are established mainly at the New York Board of Trade. A Futures Price is the price in a futures contract that specifies the amount of money to be paid for a commodity to be delivered at a later date. In the Cotton industry of the United States, the current price of Cotton established at a futures exchange to be delivered at some future date. Futures contracts are primarily traded by merchants to hedge their price risks of adverse price movements but are also used by growers, mills, and others to reduce risks of adverse price movements. The so-called No. 2 contract, covering Strict Low Middling (SLM) White 1-1/16-inch Cotton, is traded daily on the New York Cotton Exchange. The Chicago Rice and Cotton Exchange's short staple Cotton futures contract covers SLM Light Spotted 31/32-inch Cotton. Futures Price is the value of a commodity at a point in time. It is determined through open negotiation and competition among buyers and sellers on a trading floor of the exchange. / главным образом в Нью Йоркской Палате Торговли (Нью Йоркском Табло Торговли, если быть более точными).

FUTURES SPREADS = КУРСОВЫЕ РАЗНИЦЫ НА ФЬЮЧЕРСЫ (или СПРЭДЫ НА ФЬЮЧЕРСЫ) – Futures Spreads combine both short and long positions (called Legs) at the same time in related futures contracts. Spread volatility is lower than short or long positions held individually since prices of related contracts tend to move in the same direction and changes in the commodities

fundamentals will affect both legs in equal manner. Futures spreads, depending on which contracts are bought or sold, are either bull or bear.

FUTURES TRADING = ТОРГОВЛЯ ФЬЮЧЕРСАМИ – Futures Trading is a market activity to buy, sell, or both.

FUTURES TRANSACTION = ТРАНЗАКЦИЯ С ФЬЮЧЕРСАМИ (или ОПЕРАЦИЯ С ФЬЮЧЕРСАМИ) – (1) Futures Transaction is a purchase or sale of a futures contract. / Транзакция С Фьючерсами или Операция С Фьючерсами – приобретение или продажа фьючерсного контракта.

(2) Futures Transaction:- exchange of a futures position for the physical or cash commodity. / Обмен фьючерсной позиции на фактическое или наличное сырьё.

FUTURE TRANSACTIONS = ФЬЮЧЕРСНЫЕ ТРАНЗАКЦИИ (или ФЬЮЧЕРСНЫЕ ОПЕРАЦИИ) – Future Transactions:- the buying and selling of commodities, foreign exchange, or securities under contracts providing for the delivery of specific amounts, at a particular price and at some specified future date. Also known as Forward Transactions. The opposite of Spot Transactions.

FUTURE VALUE = БУДУЩАЯ СТОИМОСТЬ – Future Value (FV):- this is the future value of a present amount when taking into account the growth due to interest. The future value of an investment is calculated by the formula $FV = PV \times (1 + i)^n$, where PV – is the present value, i – is the rate of interest per period (as a decimal), and n – is the number of periods. When the interest rate is annual, then n is the number of years; when the interest rate is monthly, then n is the number of months; and so on.

FUZZ BALL = КАТЫШЕК (или ПУШИСТЫЙ ШАРИК, или РАСТРЁПАННЫЙ КЛУБОЧЕК) – Fuzz Ball:- loose and frayed fibers that have formed into a ball and have then been woven or knitted into the fabric. Synonym:- Lint Ball, and Snow Ball. Compare Pills. Defect Name:- Fuzz Balls. Defect Type:- Isolated Defects. Fabric Type:- Bottomweights – Twill Derivatives. Description:- Fuzz Balls:- This is the result of insufficient size on the warp yarns (often referred to as a Soft Warp) lowering their resistance to the abrasion of the harness and reed. The fibers are broken loose and pushed back on the yarn forming balls of fuzz encircling the yarn. This contributes to very poor weaving conditions and often necessitates the removal of the warp from the loom. Severity:- Major. Fuzz Ball:- bed sheets were ok for awhile, but after a couple of washes, those little fuzz balls started to appear and won't go away. See also Balling Up. Fuzz Balls:- Fabric:- pigment-taffeta dress goods; Construction:- (i) Count:- 104 x 72; (ii) Warp:- 100/60 dull viscose; (iii) Filling:- 150/90 dull viscose; Finish:- plain dyed maize. Defect:- small bunches or balls of fiber gave the cloth a 'neppy' appearance. Analysis:- examination showed that this defect was due to the presence of what is commonly known as 'Fuzz Balls'. These are nothing more than a few broken filaments in the warp yarns which have 'balled up' in the reed or drop-wires on the loom and, in this case, had managed to get by into the cloth. Usually this chafing and balling up of some filaments will result in a break in that warp end, especially if the chafing is very severe. Microscopic examination revealed the fact that the rayon filaments comprising these fuzz balls were much finer in size than those of the normal yarns. Under the circumstances, it was reported as a yarn fault, since the filaments in any one yarn are usually fairly uniform in diameter. Where these particular ends contained a few extra-fine filaments, they were naturally more subject to damage in processing and weaving, and the weaver did not feel responsible for this abnormal condition. Attention is called to the fact that similar fuzz balls are not due to faulty yarn but may be traced to abnormal chafing during weaving. / Уточина:- .

FUZZINESS = МУШКОВАТОСТЬ (или ШИШКОВАТОСТЬ, или МШИСТОСТЬ, или ОПУШЁННОСТЬ) – (1) Fuzziness:- hairy effect on some fabrics caused by broken fibers or filaments. Also known as Fuzzy. Fuzziness is a term describing a woven fabric defect characterized by a hairy appearance due to broken fibers or filaments. Principle causes are underslashed warp; rough drop wires, heddles, or reed; fabric slippage on take-up drum; rough shuttles; cut glass, dents, or reeds in warper; and damage in slashing. / Мшистость – порок или дефект ткани. Мушковатость – распространённый порок в виде наличия на поверхности полотна небольших комочков перепутанных волокон, прочно удерживающихся на её поверхности. Под Шишковатостью понимается распространённый порок в виде наличия на поверхности полотна коротких утолщений пряжи в результате скопления волокон или элементарных нитей. Под Мушковатостью понимается распространённый порок в виде наличия на поверхности полотна небольших комочков перепутанных волокон, прочно удерживающихся на её поверхности.

(2) Fuzziness is a term describing a fabric intentionally made with a hairy surface; such fabrics are usually produced from spun yarns.

FUZZINESS OF COTTON SEED = ОПУШЁННОСТЬ СЕМЯН ХЛОПЧАТНИКА – The Fuzziness of Cotton Seed:- when the lint was removed from the seed, the remaining fuzz and short fiber caused the seeds to adhere to each other. Fuzziness arises because of uncertain crop yield response to various factors (such as farm practices and climatic variables) other than to the applied water. A presence of short fibers adhered to the cottonseed hull, called as Cottonseed Fuzziness. / Отношение (в процентах) волокнистой массы, оставшейся на семенах после джинирования или линтерования, или делинтерования к исходной массе семян.

FUZZY = МШИСТАЯ (или ОПУШЁННАЯ, или ЗАПУШЁННАЯ) – Fuzzy:- fibrous appearance of the cloth due to the presence of abraded yarns. Weaving defect. Fuzzy (adj):- characterized by a hairy appearance due to protruding broken fibers or filaments. Synonym:- Hairy. / Порок или дефект ткачества. Мшистость – порок ткани.

FUZZY HULL = ОПУШЁННАЯ ШЕЛУХА (или ЗАПУШЁННАЯ ШЕЛУХА) – Fuzzy Hull (Hg or Lh):- long, smooth, dense hairs on the hull resulting in a fuzzy appearance; probably synonymous with shaggy hull. / покрытая пушком.

GABARDINE = ГАБАРДИН – Gabardine is a tightly woven, twilled, worsted fabric with a slight diagonal line on the right side. Wool gabardine is known as a Year-Round Fabric for business suiting. Polyester, cotton, rayon, and various blends are also used in making gabardine. Gabardine is a firm, durable, warp-faced cloth, showing a decided twill line, usually a 45° or 63° right-hand twill. Gabardine has long been a fabric choice that comes to mind when the order of the day is durability and style. Here is some historical background on the creation of gabardine, how it is manufactured, and some of the common uses for the fabric. Thomas Burberry created gabardine during the latter part of the XIX century. As the founder of the Burberry house of fashion in Basingstoke, the idea was to create a versatile fabric blend that would hold up well to a lot of wear and tear. Burberry drew his inspiration and the name for his new fabric from the gaberdina of the Middle ages. Gabardina were loose and long garments that were worn over the breeches and blouses. Typically, beggars used them for extra protection from the elements. Often, the gabardina were tied around the waist. In order to create his new material, Burberry came up with a tightly woven fabric that relied heavily on worsted wool. The weave of the worsted wool was relatively smooth on one side, and had a ribbed appearance on the other side. From the perspective of the weaving, this made gabardine a twill fabric. Burberry used the new fabric to produce several garments that caught the eye of the public quickly. Twill suits and trousers became favorites with men, as well as the wives and house staff that were responsible for making sure the suits remained in top condition at all times. Gabardine has a tendency to hold its shape and not wrinkle too easily, which was a huge plus for anyone that had to keep up the wardrobe. Over time, gabardine blends became popular, adding cotton and synthetic fibers into the mix of the fabric. The addition of fibers other than wool helped to create a high sheen fabric that still worked well as twill. The sheen made gabardine ideal for creating fashions for women as well as men. Along with suits and trousers for the men, gabardine became a popular choice for women's skirts and matching jackets, slacks, and pantsuits. Overcoats for both genders are another enduring use of gabardine today. Depending on the fibers contained in the gabardine, some of the garments produced today can be cleaned by using a gentle cycle on the washer, and a low heat setting on the dryer. These same garments do well with hand washing. However, gabardine

blends that rely heavily on worsted wool require dry cleaning to avoid shrinkage and a general breakdown of the material's ability to hold its shape. In either case, a warm iron set on a low setting is usually fine for quick press, but care should be taken to not use too much heat, as it will scar the fabric permanently. Silk Gabardine is a dressy smooth twill weave fabric, characterized by the distinct diagonal line on the fabric. Faintly lustrous, it has a beautiful drape, resists wrinkles, but creases well. Durable and crisp, gabardine is most often used for skirts, slacks and suits. Easy to sew, doesn't show pin marks. Does unravel, so seams should be finished. Gabardine is a tough, tightly woven fabric used to make suits, overcoats, trousers and other garments. The fiber used to make the fabric is traditionally worsted wool, but may also be cotton, synthetic or mixed. The fabric is smooth on one side and has a diagonally ribbed surface on the other. It is a form of twill weave. Gabardine is a strong, hard-finished, clear-surfaced, mediumto heavy-weight, tightly woven steep-twilled fabric with rounded wales and a flat back. The diagonal wales are fine, close, and steep, and are more pronounced than in serge. The wales cannot be seen on the wrong side of the fabric. Gabardine goes in and out of fashion. / Бобёри (Burberry). Под Габардином, от Французского слова Gabardine, понимается лёгкая шерстяная, полушерстяная, шёлковая или хлопковая ткань; имеет мелкие наклонные рубчики. Из габардина шьют пальто и костюмы. Габардин, от Французского слова Gabardine, шерстяная ткань, вырабатываемая из мериносовой пряжи, очень тонкой, кручёной в два конца для основы, и менее тонкой, одинарной – для утка. Благодаря применению особого вида переплетения – сложной саржи на лицевой поверхности габардина образуется резко выраженный мелкий рубчик, идущий наклонно под углом 60–70°. Из габардина шьют весенне-летние мужские и женские пальто, а также костюмы и некоторые виды офицерского обмундирования.

GABARDINE = ДЛИННОПОЛЫЙ КАФТАН – Gabardine is a garment of gabardine, namely a durable wool or rayon fabric twilled with diagonal ribs on the right side. A firm hard-finish durable fabric (as of wool or rayon) twilled with diagonal ribs on the right side; also Gaberdine. Steep twill (approximately 63 degrees). Gabardine is a coarse long loose outer garment worn in medieval times and especially by Jews since the XVI century; an English laborer's smock. / Длиннополый Кафтан из грубого сукна.

GAC = GOVERNMENTAL ADVISORY COMMITTEE

GAGE = ИЗМЕРИТЕЛЬ (или ...МЕР, или КАЛИБР) – Gage is an instrument or device for measuring, indicating or comparing a physical characteristic. See also Gauge, 13. Gage is a variant spelling of the word Gauge. / инструмент или устройство для измерения, указывающее или сравнивающее физические характеристики. Англоязычное слово Гейдьж (Gage) является вариантом произношения опять же Английского слова Гейдьж (Gauge). например, расходомер. Под Измерителем понимается краткая форма термина Измерительный Прибор, применяемая в тех случаях, когда в название прибора включается название измеряемой физической величины, например, измеритель напряжённости магнитного поля. В метрологии под Калибром понимается бесшкальный измерительный инструмент, предназначенный для контроля размеров, формы и расположения поверхностей деталей. Калибры бывают предельные и нормальные. Предельные Калибры имеют 2 стороны – проходную и непроходную и служат для контроля нахождения проверяемого размера в пределах допуска. Предельными калибрами проверяют размеры гладких цилиндрических, конусных, резьбовых и шлицевых поверхностей. Нормальные Калибры называются Шаблонами, применяют для контроля сложных профилей. Под Калибром, от Французского слова Calibre, понимается измерительный, бесшкальный измерительный инструмент, предназначенный для контроля размеров, формы и взаимного расположения частей изделий. Контроль состоит в сравнении размера изделия с калибром по вхождению или степени прилегания их поверхностей. Такое сравнение позволяет рассортировывать изделия на годные (размер находится в пределах допуска) и бракованные с возможным исправлением или неисправимые. Наиболее распространены предельные калибры:- проходные, выполненные по наименьшему предельному размеру отверстия или наибольшему размеру вала и входящие в годные изделия, и непроходные, выполненные по наибольшему размеру отверстия или наименьшему размеру вала и не входящие в годные изделия. По назначению различают калибры:- рабочие – для проверки изделий на предприятии-изготовителе, приёмные – для перепроверки изделий заказчиком и контрольные – для проверки или регулировки рабочих и приёмных калибров. Достоинства калибров – простота конструкции, возможность комплексного контроля изделий сложной формы. Недостатки – малая универсальность, невозможность определить действительные отклонения размеров. Применение калибров в машиностроении сокращается за счёт внедрения универсальных средств измерения, механизированных и автоматических приборов. Калибр (в прокатном производстве) – просвет, образованный вырезами (ручьями) двух сопряжённых прокатных валков, через который пропускают обжимаемый металл для придания ему требуемой формы. Различают калибры:- обжимные (вытяжные), черновые (подготовительные), отделочные (чистовые). Обжимные калибры служат для уменьшения поперечного сечения исходных заготовок без существенного изменения их формы; черновые – для получения проката, по форме сечения приближающегося к чистовому; отделочные – для придания металлу окончательной формы и размеров. Калибр (у оружия), диаметр канала ствола огнестрельного оружия, а также диаметр снаряда (пули); одна из основных величин, определяющих мощь огнестрельного оружия. Калибр определяется у гладкоствольного оружия по внутреннему диаметру ствола, у нарезного – по расстоянию между противоположными полями нарезов, у снарядов (пуль) – наибольшим поперечным сечением. Орудия с коническим стволом характеризуются входным и выходным калибрами. В 1540 в Нюрнберге впервые была разработана шкала (линейка) с диаметрами каменных и чугунных ядер. В России Петр I установил свою единицу измерения – артиллерийский фунт – чугунное ядро диаметром в 2 дюйма и массой в 115 золотников (около 480 граммов (г)). На основе этого артиллерийского фунта была создана шкала для гладкоствольной артиллерии, по которой 3-фунтовому ядру соответствовал калибр 2.8 дюйма (70 миллиметров (мм)), 12-фунтовому – 4.7 дюйма (120 мм) и так далее. С 1877 в России калибр обозначался в линейных мерах (дюймы, линии):- 3-, 6-дюймовая пушка, 3-линейная винтовка и другие. Калибр всех видов современного оружия обозначают обычно в мм. Длину ствола орудия в артиллерии чаще выражают в калибрах – сколько раз диаметр канала ствола уложится в длине ствола, стольким калибрам равна длина ствола оружия. Калибр охотничьих гладкоствольных ружей выражается количеством круглых пуль, равных по массе и диаметру, отлитых из 400 г чистого свинца и входящих в канал ствола ружья без зазора. Например, если отлито 12, 16, 20 и больше пуль, то калибр этих ружей соответственно будет выражен цифрами 12, 16, 20 и так далее.

GAI = GUARANTEED ANNUAL INCOME

GAIM = GLOBAL ANALYSIS, INTERPRETATION, AND MODELLING

GAIN = ПРИРОСТ (или ПРИБАВЛЕНИЕ, или ПРИРАЩЕНИЕ, или ПРИБЫЛЬ) – Gain:- increase in the price or rate of securities, foreign exchange, bank notes, etc. / Прирост в цене или в курсе ценных бумаг, иностранной валюты, банкнот, и прочего.

GAITER = ГЕТРЫ (или ГАМАША) – Gaiter is a cloth or leather leg covering reaching from the instep to above the ankle or to mid-calf or knee; an ankle-high shoe with elastic gores in the sides; and overshoe with fabric upper.

GAITING = ЗАПРАВКА (или УБОРКА, или РАССТАВЛЕНИЕ) – Gaiting:- the spacing of the needles in the dial and cylinder in relation to each other on rib (double-knit) and interlock knitting machines. In rib gaiting, the dial needles are midway between the cylinder needles. For interlock gaiting the dial and cylinder needles are in direct alignment. In rib knitting, the needles of the cylinder are

between the needles of the dial. In interlock gaiting, the needles of the cylinder are directly opposed to the needles in the dial (opposed to each other). / Уборка Жаккардова станка.

GALATEA = ГАЛАТЕЯ (или ГАЛАТСКАЯ) – Galatea is a sturdy, serviceable, warp-effect, five-shaft, left-hand twill-weave fabric, frequently cotton or a cotton blend, used for children's play clothes. / Галатея – рубашечная хлопчатобумажная ткань в полоску.

GALL = ГАЛЛ – Gall is an abnormal plant growth, swelling or tumor induced by another organism such as an insect. / Под Галлами, от Латинского слова Galla, означающее Чернильный Орешек, или Цецидиями понимаются патологические разрастания на органах растений, вызываемые Бактериями, Вирусами, Грибами, Клещами, Насекомыми, Нематодами. Ослабляют растение и могут привести к его гибели. Галлы на Дубе, Сумахе и Фисташке богаты дубильными веществами.

GALLIGASKINS = ГАЛИГАСКИНЗ (или КОЖАНЫЕ ГАМАШИ) – Galligaskins:- loose hose or breeches worn in the XVI and XVII centuries; very loose trousers; (chiefly British) leggings.

GALLING = ВЫРАБОТКА (или ИСТИРАНИЕ, или НАВОЛАКИВАНИЕ, или ЗАДИР) – Galling is a form of wear in which seizing or tearing of the gear or bearing surface occurs. See also Wear. / Выработка поверхности трения. форма износа, в которой возникает задирание или раздирание поверхности (зубчатой) передачи или подшипника.

GALL MIDGE = ГАЛЛИЦА (или ГАЛЛООБРАЗУЮЩЕЕ МЕЛКОЕ ДВУКРЫЛОЕ НАСЕКОМОЕ) – Gall Midge is an insect pest (Orseolia oryzae) that causes the youngest leaf or the shoot in a tiller to appear as light-colored tubular gall resembling an onion leaf. Tillers with gall midge do not produce panicles. / Под Галлицами понимается Семейство Насекомых Отряда Двукрылых. Длиной 1–5 миллиметров. Около 4 000 Видов, в бывшем Союзе Советских Социалистических Республик (СССР) насчитывалось около 500. Личинки ряда Видов, развиваются в тканях растений, вызывая образование галлов (отсюда название). Некоторые, например, Гессенская Муха вредят культурным растениям и лесу.

GALLON = ГАЛЛОН – (1) US Gallon is a unit of volume in the US Customary System, used in liquid measure, equal to 4 quarts, or 3.785 41 liters or cubic decimeters. Abbreviation:- gal. In the USA, a gallon is approximately 3.79 liters. A US gallon of water weighs approximately 8.3 pounds. / (1) Единица объёма (ёмкости, вместимости) в Обычной Системе Мер США, используемая для измерения жидких субстанций – жидкостный галлон, равный 4 квартам, или 3.785 41 литрам или кубическим дециметрам; и для измерения сухих субстанций – сухой галлон, равный 4.404 88 литрам. Обозначение:- гал.

(2) Imperial Gallon is a unit of volume in the British Imperial System, used in liquid and dry measure, equal to 4 quarts, or 4.546 09 liters or cubic decimeters. Abbreviation:- gal. In Britain and Canada, a gallon is approximately 4.55 liters. An Imperial gallon of water weighs approximately 10 pounds. / Под Галлоном понимается единица объёма (ёмкости, вместимости) в Британской Имперальной Системе, используемая для измерения жидких и сухих субстанций и равная 4 квартам, или 4.546 09 литрам или кубическим дециметрам. Обозначение:- гал.

GALLOON = ГАЛУН – Galloon is a closely woven, flat braid used for accenting draperies and furniture. Also called Braid. The term galloon is also used for any narrow fabric with decorative edges, such as scallops finished the same on each side. Lace made in this way is called Galloon Lace.

GALLUS = ГАЛЛЮС (или ПЕТУШИНОЕ, или ПЕТУХ, или ФРАНЦУЗИК) – Gallus:- (chiefly dialectical) suspender. Usually used in plural. / .

GALOSH = ГАЛОША – Galosh is a high overshoe worn especially in snow and slush.

GALVANOTROPISM = ГАЛЬВАНОТРОПИЗМ – Galvanotropism:- bending, growth or movement of a part under the influence of an electric current. See also Tropism. / Смотрите также Тропизм (Tropism). Под Тропизмом, от Греческого слова Trópos, означающее Направление или Поворот, понимается ростовое движение органов растений (корня, стебля, листьев), обусловленное направленным действием какого-либо раздражителя – света (фоторопизм), силы земного тяготения (геотропизм), температуры (термотропизм), прикосновения (гаптотропизм), воды (гидротропизм), кислорода (аэротропизм) и других химических веществ (хемотропизм). В основе тропизма лежит неравномерный рост, вызываемый перераспределением в растении фитогормонов.

GAMBANDO = ГЭМБЭНДО (или КОЖАНЫЕ КРАГИ) – Gambando:- a horseman's legging. / gambado = кожаные краги для наездников.

GAMBOGES = ЖЁЛТЫЕ ПИГМЕНТЫ (или ГУММИГУТЫ) – Gamboges:- a strong yellow. / .

GAMETE = ГАМЕТА (или ПОЛОВАЯ КЛЕТКА) – Gamete is a mature reproductive male or female germ cell (sperm or egg) specialized for fertilization. Gamete is the male and female sexual cells that combine at fertilization to form the zygote. / Под Гаметами, от Греческого слова Gametē, означающее Жена, или Gamétēs, означающее Муж, понимаются половые, или репродуктивные, клетки; женские (яйца, или яйцеклетки) и мужские (сперматозоиды, спермии) половые клетки животных и растений, обеспечивающие при слиянии развитие новой особи и передачу наследственных признаков от родителей потомкам.

GAMETIC = ГАМЕТИЧЕСКОЕ – Gametic (tissue or generation):- having n number of chromosomes (haploid) in contrast to zygotic tissue with 2n (diploid).

GAMETOCIDE = ГАМЕТОЦИД – Gametocide is the organic or inorganic chemicals used for killing the functional sexual parts (pollen, ovule) of the plant. These may be selective for male or female parts. / для мужских и женских органов.

GAMETOPHYTE = ГАМЕТОФИТ – Gametophyte or Gametophore is the part of the plant which bears the gametes or sexual cells. The haploid state of life of a sexually reproducing plant. / Гаметофит или Гаметофор (Gametophore) это орган растения, который производит гаметы или половые клетки. Гаплоидное состояние жизни растения, размножающегося половым путём. Под Гаметофитом, от Греческих слов Gametē, означающее Жена, или Gamétēs, означающее Муж, и Phytón, означающее Растение, понимается половое поколение, этап жизненного цикла растений; чередуется со спорофитом. Образуется из споры, содержит гаплоидный набор хромосом; продуцирует гаметы в гаметангиях. У покрытосеменных гаметофит редуцирован до пылинки (мужской гаметофит) и зародышевого мешка (женский гаметофит).

GAMETOPHYTIC = ГАМЕТОФИТНОЕ – Gametophytic:- in this system, the sterility/fertility reaction is imparted to the pollen by the genetic constitution of the pollen itself and is controlled by a single gene which may have large numbers of allelic forms.

GAMMA = ГАММА – In option price theory, Gamma is a measurement of how fast Delta changes, given a unit change in the underlying spot price. In mathematical terms this corresponds to the second derivation of the Black-Scholes formula based on the price of the underlier. See also Delta. Gamma measures the rate of change of Delta. Gamma is smallest for deep out of the money and deep

in the money options. Gamma is highest when the option gets near the money. The sensitivity of an option's Delta to changes in the price of the underlying futures contract. A measurement of how fast Delta changes, given a unit change in the underlying futures price. Statistical measure of the absolute change in the Delta of an option when the price of the underlying moves. Gamma is the sensitivity of an option's Delta to changes in the price of the underlying instrument. Gamma is the rate of change in the Delta of an option for a small change in the underlying. The rate of change is greatest when an option is at-the-money and decreases as the price of the underlying moves further away from the strike price in either direction – Gamma is therefore – shaped. A long Gamma position is one in which a trader is long options. For a position that is short Gamma, the opposite holds. Gamma can be hedged by mirroring the options position. Alternatively, a trader may choose to adjust the position in the underlying continually in order to maintain Delta neutrality. / В анализе ситуации в биржевой торговле опционами название буквы Гамма (прописная – Г, строчная – γ) Греческого алфавита было использовано для обозначения ставки изменения Дельты. Самое минимальное значение Гаммы у чересчур убыточных опционов и у чересчур прибыльных опционов, а самое максимальное значение – у бесприбыльных опционов. Чувствительность Дельты опциона к изменениям в цене соответствующего фьючерсного контракта. Мера того, насколько быстро изменяется значение Дельты, данная для единицы изменения цены соответствующего фьючерса. Статистическая мера абсолютного изменения Дельты опциона в зависимости от изменения цены соответствующего биржевого инструмента или актива. Гамма – показатель изменения Дельты (Delta) опциона на каждый пункт изменения цены финансового инструмента, лежащего в его основе. Например, предположим, что акции XYZ торгуются на уровне 60, цена исполнения опциона на покупку по этим акциям составляет 55, Гамма равна 0.05, а Дельта – 75. Если акции повышаются до 61, то новое значение Дельта составит 80.

GAMMA CELLULOSE = ГАММА ЦЕЛЛЮЛОЗА – Gamma Cellulose is one of the three forms of cellulose. With beta cellulose it is called Hemicellulose. See also Alpha Cellulose, and Beta Cellulose. / Смотрите также Альфа Целлюлоза (Alpha Cellulose), и Бета Целлюлоза (Beta Cellulose). Гамма Целлюлоза – условное обозначение части геми-целлюлозы, которая остаётся в щелочном растворе, не выпадая в осадок при его подкислении уксусной кислотой.

GAMMA SCALPING = СКАЛЬПИРОВАНИЕ ПО ГАММЕ – Gamma Scalping:- attempting to scalp gamma with a very small account is a big waste of time, and not every trader has learned enough (yet) to successfully understand the nuances involved with gamma scalping. Some argue that any trading idea that makes money should be widely adopted, regardless of trading experience. I (Mark D. Wolfinger) was a gamma scalper for two decades when I was a market maker with giant positions and lots of money in my trading account. Now that I am a retail trader with a modest account, I've learned to stay away from positive gamma positions – unless I have a need to bet on a big move for a specific stock. In truth, that need never arises. The goal of a scalping trading style is to take profits on small price changes. The holding period varies, but the objective is to own the trade for a short time. Normal scalping requires traders buy or sell, thereby opening a risk position. Scalpers tend to have a fairly rigid exit strategy, because they know it is crucial to avoid taking a large loss that easily wipes out many small gains. Gamma scalping involves far less risk, because traders buy when they are long or sell when short to lessen risk and move a position back to delta neutral. When scalpers both buy and sell, the scalp is completed, and a profit is locked in. These scalping profits offset some of the cost (time decay) of owning the position. It is one way to diversify a portfolio that is composed primarily of negative gamma from income-producing strategies (covered call writing, iron condors, butterflies, etc). Understand one simple fact:- Gamma scalping is not an end unto itself. Traders do not build positions so they can scalp gamma. That raises the obvious question:- Why do traders own positions with positive gamma and then attempt to scalp that gamma? The answer to this simple question explains why gamma scalping is not viable for most option traders:- Why would a trader build a gamma-scalping position? (i) Trader believes that the options of one specific underlying asset are cheap. Translation:- the marketplace is underestimating just how volatile this underlying stock is going to be between now and when the options expire. (ii) Trader finds that one specific option is relatively inexpensive when compared with others in its 'class'. (iii) The trader builds a positive gamma, delta-neutral position by buying more of one option and selling fewer of another (back spread). Or the trader buys calls and puts (strangle). Or the trader buys calls and shorts stock. Or the trader buys puts and buys stock. (iv) The trader expects to earn a profit when the market corrects its mistake and the undervalued option(s) move back to fair value. Obviously this does not happen every time, nor does it happen immediately. However, that is how the trader anticipates earning a profit. We know that positive gamma positions come with negative theta, or negative time decay. Waiting for the options to reach the trader's idea of fair value is expensive – due to that time decay. The plan is to make money from the re-evaluation of the option prices and not from a gigantic move in the price of the underlying. Therefore, the trader tries to remain near delta neutral while waiting for that re-evaluation. Playing for that big move is a different strategy and has nothing to do with gamma scalping. Moving back to delta neutral is accomplished by buying and selling delta – usually shares of the underlying asset – as necessary. (Determining the frequency of these delta-reducing trades is a skill that requires development.) By selling deltas as the underlying rallies (because positive gamma makes the trader's position delta long) and buying deltas as the underlying declines, the trader gets back to delta neutral. That eliminates much of the market risk. By buying low and selling high, the trader completes some scalps and locks in gains. When the stock is more volatile than predicted by the implied volatility of the options, then the trader was proven to be correct. If enough scalps were completed, the trader should have a profit that more than offsets theta-based losses. However, it must be mentioned that sometimes profits are not realized. How is that possible? Here's one example:- If the stock rallies and the trader attempts to sell shares at 54.37 (for example), it is possible that the stock does not quite reach that point before declining. Thus a scalping opportunity has been lost. To avoid that, the trader can sell fewer shares more frequently, and that works well when the stock moves higher, then lower, then higher. It is not so easy to know how far to allow the stock to move before getting delta neutral. This alone makes gamma scalping more difficult that it seems to be. When a trader owns a large position with significant gamma, delta builds quickly, and it becomes easy to buy and sell shares of the underlying stock. (Yes, adjustments can be made using options.) However, think about the trader with a USD5 000.00 account who does not want to devote the whole account to this single technique. That trader may have a position with one or two gamma. It's impossible to earn a profit by selling one or two shares every time the stock moves one point. Trying to earn profits by scalping gamma is difficult for the small trader. That is why I adamantly believe it should play no serious role in the education of the new option trader. For traders with a larger account, the play becomes viable, but that does not make it any easier to know when to make the delta-adjusting trades. The profits may be far less than needed to offset theta if traders sell or buy too soon. Try to delay the buy or sell trades, and the opportunity may be lost. Trade fewer shares frequently, and commissions may become a burden. There is much to learn. Gamma scalping is a risk management technique, not a strategy. It is something done while waiting for a position to revalue. Repeat: Gamma scalping is not the source of profits. Its primary use is to offset theta while a trader is waiting for something good to happen to the position. / Марк Ди. Волфингё (Mark D. Wolfinger).

GAMOPETALOUS = СРОСТНОЛЕПЕСТНЫЙ – Gamopetalous or Sympetalous:- of a flower with the petals of the corolla more or less fused, to form a tube or funnel. / Сростнолепестный или Спайнолепестный (Sympetalous):- о цветке с лепестками венчика (corolla), более или менее слившимися, сформировав тем самым трубочку или воронку.

GANG = ШАЙКА (или БРИГАДА, или КОМАНДА) – Gang is a group of stevedores, usually four to five members, with a supervisor assigned to a hold or portion of the vessel being loaded or unloaded. Gang is a number of workmen acting together especially for performing manual tasks in connection with loading and/or discharging of a vessel by means of the necessary gear. / Группа грузчиков, обычно от четырёх до пяти человек, с проверящим, назначенные для погрузки или выгрузки из трюма или какой-то части судна. Число рабочих, действующих сообща специально для выполнения ручных работ, связанных с погрузкой и/или разгрузкой судна с помощью необходимых устройств.

GANGWAY = СХОДНЯ (или (СХОДНОЙ) ТРАП, или ПАНДУС, или АППАРЕЛЬ, или СЛУЖЕБНЫЙ ПРОХОД) – Gangway:- this term is used for the crossing from a ship to land. A stairway, mostly made from aluminium, which is let down at right angles to a ship's hull to connect the deck of a ship to the quay. Gangway is a narrow portable platform used as a passage, by persons entering or leaving a vessel moored alongside a pier or quay. Bridge/staircase laid from an opening in the railing or side of a vessel to the shore or to a platform giving access to the vessel. / Под Трапом, от Голландского слова Trap, понимается верёвочная, деревянная или металлическая судовая лестница. Различают:- внутренний и забортный трап, постоянный и съёмный трап, наклонный и вертикальный трап. Забортные трапы (парадные трапы, шторм-трапы) служат для сообщения с береговыми причалами или с плавучими средствами. Верёвочный трап, используемый для сообщения между судами на стоянке и на неспокойном море, называется шторм-трапом. Трапом называются также лестницы различной конструкции, используемые при посадке/высадке в вертолёты, самолёты и тому подобное. Под Пандусом, от Французского словосочетания Pente Douce, означающее Пологий Склон, понимается наклонная площадка, служащая для подъёма автомобилей в гаражах; для въезда к расположенному над цоколем здания парадному входу; в отдельных случаях заменяет лестницы. Под Аппарелем, от Французского слова Appareil, означающее Въезд, понимается:- (i) железобетонная или мощёная платформа на уровне пола вагона для погрузки грузов в железнодорожные вагоны. Аппарель имеет спуск (пандус) до уровня подъёма к аппарелю. (ii) Устройство в виде наклонной плиты, рамы или направляющих реек для проезда (прохода) в здание, сооружение. (iii) Устройство в носовой части корабля в виде опускаемой в наклонное положение части палубы для схода личного состава и техники на берег. Под Аппарелем понимается:- (i) наклонная платформа для погрузки в вагоны или иные транспортные средства автомобилей и других машин; или (ii) плита с небольшим уклоном для проезда или прохода в здание или сооружение.

GANN THEORY = ТЕОРИЯ ГЯНА – Gann Theory:- various analytical techniques based on price, time, and pattern to project changes in the direction of the markets. William Delbert Gann (1878-June-06–1955-June-18) or WD Gann, was a finance trader who developed the technical analysis tools known as Gann Angles, Square of 9, Hexagon, Circle of 360 (these are Master charts). Gann market forecasting methods are based on geometry, astronomy and astrology, and ancient mathematics. Opinions are sharply divided on the value and relevance of his work. Gann wrote a number of books on trading. Biography:- Gann was born June 06, 1878 in Lufkin, Texas. His father was a cotton farmer. He started trading in 1902 when he was 24. He was believed to be a religious man by nature who believed in religious as well as scientific value of Bible as the greatest book ever written. This can be repeatedly observed in his books. He was also a 33rd degree Freemason of the Scottish Rite Order, to which some have attributed his knowledge of ancient mathematics, though he was also known to have studied the ancient Greek and Egyptian cultures. Stock Market Trading:- Gann described the use of angles in the stock market in The Basis of My Forecasting Method (1935). Calculating a Gann angle is equivalent to finding the derivative of a particular line on a chart in a simple way. Each geometrical angle (which is really a line extended into space) divides time and price into proportionate parts. The most important angle Gann called the 1x1 or the 45° angle, which he said represented one unit of price for one unit of time. If you draw a perfect square and then draw a diagonal line from one corner of the square to the other, you have illustrated the concept of the 1x1 angle, which moves up one point per day. There has been a general disagreement whether he made profits by speculation himself. However, his famous Ticker Interview shows that his claim to profits was as real as his documented forecasts. Xxxxx. Gann Theory can be described as the study of pattern, price and time relationships and how these relationships affect the market. Gann Theory looks at pattern, price and time as the key elements in forecasting the future movement of the market. While each element has its own unique characteristics, each also has a unique, overlapping quality. The study and focus of Gann Theory is to find the interlocking relationship between these three primary indicators of changes in trend and market direction. In other words, in certain instances a pattern is having a large influence on the market while at other times price and time are exerting their dominance on the market. It is the balance of these three elements, especially price and time, which create the best trading opportunities which can lead to more success in the market. Gann Theory helps the trader to determine the best combinations of pattern, price and time to initiate successful trades. While trades can be triggered by each element individually, a trader who weights his signal too much toward one of these elements may experience a large number of losses while a trader who is patient enough to wait for a proper balancing of pattern, price and time may experience more success. Pattern, Price and Time:- Pattern study consists of the proper construction of Minor, Intermediate and Main Trend Indicator Swing Charts and Closing Price Reversal patterns. Price study consists of Gann Angle analysis and percentage retracements. Time study looks at swing timing, cycle timing and historical dates. The combination of these three factors help the trader decide when and where to buy or sell. In this article, I will describe techniques which help the trader determine how to discover these elements through proper chart construction and how each are related in trading activity. Gann Theory and Its Application to Trading:- Gann theory is based on the principle that price and time must balance. Markets are constantly in a position of change and subject to movement sometimes with great volatility. Gann Theory states that there is order to this movement. By using the proper tools to analyze this movement, an accurate forecast for future direction can be made. Finding the balancing points is necessary to predict future prices and movement. Gann developed a number of methods to help determine these balance points. The first method uses patterns created by swing charts to find the balance points. The second method uses angles and the squaring of price and time to find the balance points. Finally, the third method uses time. While the perfect market remains balanced all the time, it also proves to be uninteresting because major moves occur when price is ahead of time or time is ahead of price. The proper use of the various Gann analysis tools will help you to determine when these major moves are most likely to occur. Now that the theory has been explained, how can it be applied to trading? The first step is to create the charts which properly demonstrate the concepts of pattern, price and time analysis. The second step is to create swing charts or trend indicator charts which provide the trader with a way to analyze the size and duration of the rallies and breaks. The third step is to use the information derived from the swing chart to forecast future price and time targets. In addition to forecasting, this chart is also used to determine the trend of the market. After the pattern has been analyzed in the form of the swing chart, the trader moves to step four which is the creation of Gann angle charts. Using the tops and bottoms discovered with the swing chart, the trader draws properly scaled geometric angles up from bottoms and down from tops. Since these angles move at uniform rates of speed, the trader uses the angles as support or resistance and attempts to forecast the future direction and price potential of the market. Percentage retracement levels are also created using the information derived from the swing charts. Each paired top and bottom on the swing chart forms a range. Inside of each range are the percentage retracement levels. The strongest being the 50 percent price level. Step five is to draw the percentage retracement level inside of each range. At this point, the trader can judge the strength or weakness of the market by relating the current market price with the percentage levels. For example, a strong market will be trading above the 50 percent price and a weak market will be trading below the 50 percent price. Finally, time studies are applied to the market in step six. Traders should

use historical charts to search for anniversary dates and cycles which could indicate the dates of future tops and bottoms. The swing chart is used to forecast the future dates of tops and bottoms based on the duration of previous rallies and breaks. Gann angle charts are used to predict when the market will be squaring price and time. Finally, the percentage retracement chart creates the major time divisions of the current range with 50 percent in time being the most important. Step seven is to combine the information obtained from the pattern, price and time charts into a trading strategy. This is the most important step because it demonstrates where the three charts are linked. For example, the swing chart tells the trader when the trend changes. If the trend changes to up, the trader uses the previous rallies to forecast how far and how long the rally can be expected to last. The Gann angles drawn from the swing chart bottom show the trader uptrending support which is moving at a uniform rate of speed. In addition, the Gann angle chart shows the trader the time which will be required to reach the swing chart objective based on the speed of the Gann angle. The 50 percent price level acts as support when the market is above it and as resistance when it is below it. The strongest point on the chart will occur at the intersection of the uptrending Gann angle and the 50 percent price. Finally, time indicators are used to prove to the trader the upside target is possible because anniversary dates and cycles can verify the existence of similar market movement in the past. Combining pattern, price and time, the trader creates a trading strategy. This trading strategy is based on the principle of price and time balancing at certain points on the chart. The three methods of analysis draw this information out of the chart. Without the proper application of the three analysis tools, valuable information would be lost to the trader. This is the essence of Gann theory which states there is order to the market if the proper tools are used to read the charts. Xxxxx. Gann studies have been used by active traders for decades and, even though the futures and stock markets have changed considerably, they remain a popular method of analyzing an asset's direction. New trading areas, such as the foreign exchange market and the invention of exchange-traded funds (ETFs) have also made it necessary to revisit some of the construction rules and application concepts. Although the basic construction of Gann Angles remains the same, this article will explain why the changes in price levels and volatility have deemed it necessary to adjust a few key components. Basic Elements of Gann Theory:- Gann angles are a popular analysis and trading tool that are used to measure key elements, such as pattern, price and time. The often-debated topic of discussion among technical analysts is that the past, the present and the future all exist at the same time on a Gann angle. When analyzing or trading the course of a particular market, the analyst or trader tries to get an idea of where the market has been, where it is in relation to that former bottom or top, and how to use the information to forecast future price action. Gann Angles Versus Trendlines:- of all of W.D. Gann's trading techniques available, drawing angles to trade and forecast is probably the most popular analysis tool used by traders. Many traders still draw them on charts manually and even more use computerized technical analysis packages to place them on screens. Because of the relative ease traders today have at placing Gann angles on charts, many traders do not feel the need to actually explore when, how and why to use them. These angles are often compared to trendlines, but many people are unaware that they are not the same thing. A Gann angle is a diagonal line that moves at a uniform rate of speed. A trendline is created by connecting bottoms to bottoms in the case of an uptrend and tops to tops in the case of a downtrend. The benefit of drawing a Gann angle compared to a trendline is that it moves at a uniform rate of speed. This allows the analyst to forecast where the price is going to be on a particular date in the future. This is not to say that a Gann angle always predicts where the market will be, but the analyst will know where the Gann angle will be, which will help gauge the strength and direction of the trend. A trendline, on the other hand, does have some predictive value, but because of the constant adjustments that usually take place, it's unreliable for making long-term forecasts. Past, Present and Future:- As mentioned earlier, the key concept to grasp when working with Gann angles is that the past, the present and the future all exist at the same time on the angles. This being said, the Gann angle can be used to forecast support and resistance, strength of direction and the timing of tops and bottoms. Gann Angles Provide Support and Resistance:- Using a Gann angle to forecast support and resistance is probably the most popular way they are used. Once the analyst determines the time period he or she is going to trade (monthly, weekly, daily) and properly scales the chart, the trader simply draws the three main Gann angles:- the 1X2, 1X1 and 2X1 from main tops and bottoms. This technique frames the market, allowing the analyst to read the movement of the market inside this framework. Uptrending angles provide the support and downtrending angles provide the resistance. Because the analyst knows where the angle is on the chart, he or she is able to determine whether to buy on support or sell at the resistance. Traders should also note how the market rotates from angle to angle. This is known as the 'Rule Of All Angles'. This rule states that when the market breaks one angle, it will move toward the next one. Another way to determine the support and resistance is to combine angles and horizontal lines. For example, often a downtrending Gann angle will cross a 50% retracement level. This combination will then set up a key resistance point. The same can be said for uptrending angles crossing a 50% level. This area becomes a key support point. If you have a long-term chart, you will sometimes see many angles clustering at or near the same price. These are called Price Clusters. The more angles clustering in a zone, the more important the support or resistance. Gann Angles Determine Strength and Weakness:- the primary Gann angles are the 1X2, the 1X1 and the 2X1. The 1X2 means the angle is moving one unit of price for every two units of time. The 1X1 is moving one unit of price with one unit of time. Finally, the 2X1 moves two units of price with one unit of time. Using the same formula, angles can also be 1X8, 1X4, 4X1 and 8X1. A proper chart scale is important to this type of analysis. Gann wanted the markets to have a square relationship so proper chart paper as well as a proper chart scale was important to his forecasting technique. Since his charts were 'square', the 1X1 angle is often referred to as the 45-degree angle. But using degrees to draw the angle will only work if the chart is properly scaled. Not only do the angles show support and resistance, but they also give the analyst a clue as to the strength of the market. Trading on or slightly above an uptrending 1X1 angle means that the market is balanced. When the market is trading on or slightly above an uptrending 2X1 angle, the market is in a strong uptrend. Trading at or near the 1X2 means the trend is not as strong. The strength of the market is reversed when looking at the market from the top down. Anything under the 1X1 is in a weak position. Gann Angles Can be Used for Timing:- Finally, Gann angles are also used to forecast important tops, bottoms and changes in trend. This is a mathematical technique known as Squaring, which is used to determine time zones and when the market is likely to change direction. The basic concept is to expect a change in direction when the market has reached an equal unit of time and price up or down. This timing indicator works better on longer term charts, such as monthly or weekly charts; this is because the daily charts often have too many tops, bottoms and ranges to analyze. Like price action, these timing tools tend to work better when 'clustered' with other time indicators. Conclusion:- Gann angles can be a valuable tool to the analyst or trader if used properly. Having an open mind and grasping the key concept that the past, present and future all exist at the same time on a Gann angle can help you analyze and trade a market with more accuracy. Learning the characteristics of the different markets in regard to volatility, price scale and how markets move within the Gann angle framework will help improve your analytical skills. / Вилъйэм Дэлбёт Гян (William Delbert Gann; 1878-Июнь-06–1955-Июнь-18).

GANTLINE = ГОРДЕНЬ (или ЛЕЕР) – Gantline (maritime term):- a line rove through a single block secured aloft.

GANTRY CRANE = КОЗЛОВЫЙ КРАН (или (БЕРЕГОВОЙ) КОНСОЛЬНЫЙ ПЕРЕГРУЖАТЕЛЬ) – Long popular in Europe, Gantry Cranes have become a widely accepted alternative to overhead bridge cranes. This type of crane is similar to the bridge crane except that it runs on a runway at the floor level. The bridge is supported by a pair of rigid steel legs which are carried by a pair of end trucks along the floor level runway. Benefits of a gantry crane:- (i) less expensive – often costs less than a bridge crane; (ii) built to heavy duty Class D specifications, which meet the demands of high duty cycles and multiple shift operation, as well as providing decades of reliable service for all applications; (iii) available in spans to 150 feet and capacities to 150 tons; (iv) can be used either

indoors or outside; (v) space saving – can operate in a work-zone of limited area occupying less work space; and (vi) adaptive – can be custom-engineered to power through and navigate inclines. Because gantry cranes ride on the ground rather than on overhead runways, they don't require a runway structure. Nor do they usually require concrete foundations. Their installation is fast and simple. Depending on the environment and application, gantry cranes can sometimes provide the same material handling capabilities as a comparable bridge crane system, but with a significant cost savings. Gantry Crane is a crane hoisting machine mounted on a frame or structure spanning an intervening space. Used primarily in modern container handling ports. A Gantry Crane has a hoist in a fixed machinery house or on a trolley that runs horizontally along rails, usually fitted on a single beam (mono-girder) or two beams (twin-girder). The crane frame is supported on a gantry system with equalized beams and wheels that run on the gantry rail, usually perpendicular to the trolley travel direction. These cranes come in all sizes, and some can move very heavy loads, particularly the extremely large examples used in shipyards or industrial installations. A special version is the container crane (or 'Portainer' crane, named by the first manufacturer), designed for loading and unloading ship-borne containers at a port. Gantry is a mount for a traveling crane consisting of a large archlike or bridgelike frame designed to move along a set of tracks. Gantry Crane is a crane or hoisting machine mounted on a frame or structure spanning an intervening space, which often travels on rails. Gantry is a a bridge-like overhead structure supporting equipment such as a crane or railway signals. A Gantry Crane has a hoist in a trolley which runs horizontally along gantry rails, usually fitted underneath a beam spanning between uprights which themselves have wheels so that the whole crane can move at right angles to the direction of the gantry rails. These cranes come in all sizes, and some which are extremely large for use in shipyards or industrial installations can move very heavy loads. A special version is the Portainer™ crane for loading and unloading ship-borne containers of freight. A crane or hoisting machine mounted on a structure spanning an intervening space, which often travels on rails. There are two common types of container handling Gantry Crane:- (i) high profiles (luffing boom) where the boom is hinged at the waterside of the crane structure and lifted up in the air to clear the ships for navigation; and (ii) low profiles shuttle boom crane where the boom is shuttled/pulled towards and over the ship to allow the trolley to load and discharge containers. See also Portainer™. Gantry Crane is the port crane used to load and discharge containers from vessels, can be positioned by moving along rail tracks. / Потэйнё[T3] (Portainer™). (Береговой Консольный) Перегружатель для контейнеров, Мостовой Перегружатель для сыпучих грузов. для порузки и разгрузки контейнеров. Козловый Кран (Gantry Crane) – грузоподъёмный кран в виде моста на жёстких опорах (козлах), передвигающийся по наземному рельсовому пути или бетонному основанию. Пролётное строение (мост) козлового крана перекрывает при движении прямоугольную пощадь, на которой производят погрузочно-разгрузочные работы (на открытых складских и монтажных площадках, а также на заводских территориях). На мосту устанавливается и передвигается грузовая тележка или таль с грузозахватным приспособлением. Применяют для обслуживания открытых складов и в строительстве. Грузоподъёмность 3–50 тонн, иногда до 800 тонн, пролёты кранов общего назначения 4–40 метров, иногда до 170 метров. Под Консольным Краном (Cantilever Crane) понимается передвижной или стационарный грузоподъёмный кран с поворотной либо неподвижной консолью, по которой передвигается грузовая тележка или таль. Передвижные консольные краны перемещаются по рельсам, расположенным один за другим. Консольный Кран (Cantilever Crane) – передвижной или стационарный грузоподъёмный кран с поворотной либо неповоротной консольной фермой, по которой передвигается грузовая тележка или таль, перемещая грузы в вертикальном и горизонтальном направлениях. У консольных кранов с неповоротной фермой грузовая тележка передвигается по консоли, подкрановый путь не занимает площади больше цеха, поэтому такие краны нашли применение на различных промышленных предприятиях. Консольные краны с поворотной фермой имеют много конструктивных вариантов. К ним относятся велосипедный кран, кран на колонне, кран-укосина, мачтовый кран и другие. Передвижные консольные краны перемещаются по рельсам, расположенным один под другим. Консольные краны широко используются на машиностроительных заводах, стройках и в портах. Грузоподъёмность консольного крана 4–10 тонн.

GAP = GOLD ACCUMULATION PLAN

GAP = GOOD AGRICULTURAL PRACTICE

GAP = ОТРЫВ (или РАСХОЖДЕНИЕ, или РАЗРЫВ, или ПРОМЕЖУТОК, или ЗАЗОР) – Gaps form when opening price movements create a blank spot on the chart. This occurs when the High of the day is below the Low of the previous day, or when the Low of the day is above the High of the previous day. Gaps are especially significant when accompanied by an increase in volume. In visual analysis, sharp price leap between two exchange trading sessions. Gaps happen every day in the stock market. Often, they mean nothing, but there are instances when they provide critical signals regarding price direction bias. A gap happens when a financial instrument's price makes a sharp move either to the upside or downside, skipping over certain prices in the process. Visually speaking, a gap creates a hole, or a void, on a price chart. Gaps often are created during earnings announcements, surprise corporate news for a particular company, when analysts upgrade or downgrade a particular stock, when a company launches some new product or amid far-reaching economic or political events. Whatever the reason, the news typically breaks when the market is closed. The result is buying or selling pressure before and at the start of the next session's trading that causes the instrument to open at a price outside the range of the previous day. Gaps can occur in either direction:- (i) Gap Up:- occurs when the current day's low is greater than the previous day's high. On an interim basis, a provisional gap up forms when the current day opens above the previous day's high. (ii) Gap Down:- occurs when the current day's high is less than the previous day's low. On an interim basis, a provisional gap down forms when the current day opens below the previous day's low. Gaps can set the tone for market conditions that play out in predictable ways. Gap Classification:- gaps can be placed into four different groups:- (i) Breakaway Gaps or Breakout Gaps; (ii) Continuation Gaps; (iii) Exhaustion Gaps; and (iv) Common Gaps. Filling The Gap:- a common saying in investing is 'gaps were made to be filled'. While this is not always true, in time many gaps indeed are filled. This simply means that price returns to the area of the gap on subsequent bars to trade within the price range of the gap. One example from recent price action occurred in the Euro 60-minute chart (see 'Mind the gap', right). The market gapped down to 1.29 on 2013-March-18 because of the Cyprus crisis. By March 25, however, the Euro had rallied following the approval of the bailout. The Euro traded within the price range of the large gap down before it subsequently broke lower again. An astute trader might have kept this gap in mind while keeping an eye on political developments, identifying the upper end of the gap's range as a likely target for an upward swing. When provisional gaps are filled within the same trading day on which they occur, this is referred to as Fading, which can be used by intraday traders as a trade signal. The logic behind fading is that once the financial instrument starts the gap-filling process, it rarely will stop because there is often no immediate support or resistance within the gap's range. This happened on a 15-minute chart for the Nifty 50 – an index of the top 50 stocks on India's National Stock Exchange – on March 25. The Nifty opened with a gap higher at 5708 due to positive global cues. It made a high of 5717 in early trading and then fell into a consolidation pattern. Astute traders would anticipate the gap open to be filled and use the 15-minute high of 5717 as a stop loss, shorting the market with the target of 5650 (the previous day's close). The target was eventually achieved as the Nifty filled the gap to complete the fading process. Gap trading strategies rely on context-specific criteria to enter and exit. It is an uncomplicated approach if properly employed and offers opportunities for quick profits. While you will not capture either the top or bottom of a stock's

price range on a particular move, you will be able to profit in a structured manner and minimize losses. Stops are recommended, as well as confirmation from complementary technical tools, such as pivot analysis and oscillators. Gap is a price area on the chart where no trading was accomplished. Usually due to a sudden change in market equilibrium between the previous settlement price and the follow opening price. A Gap is defined as an unfilled space or interval. On a technical analysis chart, a gap represents an area where no trading takes place. On the Japanese candlestick chart, a window is interpreted as a gap. In an upward trend, a gap is produced when the highest price of one day is lower than the lowest price of the following day. Thus, in a downward trend, a gap occurs when the lowest price of any one day is higher than the highest price of the next day. For example, the price of a share reaches a high of USD30.00 on Wednesday, and opens at USD31.20 on Thursday, falls down to USD31.00 in the early hour, moves straight up again to USD31.45, and no trading occurs in between USD30.00 and USD31.00 area. This no-trading zone appears on the chart as a gap. Gaps can play an important role when spotted before the beginning of a move. There are four different types of gaps, excluding the gap that occurs as a result of a stock going ex-dividend. Since each type of gap has its own distinctive implication, it is very important to be able distinguish between such gaps:- (i) Breakway Gap; (ii) Common Gap; (iii) Exhaustion Gap; and (iv) Measuring Gap. Caution:- it is quite possible that confusion between measuring gap and exhaustion gap can cause an investor to position himself incorrectly and to miss significant gains during the last half of a major uptrend. Keeping an eye on the volume can help to find the clue between measuring gap and exhaustion gap. Normally, noticeable heavy volume accompanies the arrival of exhaustion gap. Trading gaps for profit:- some market speculators 'Fade' the gap on the opening of a market. This means for example that if the S&P 500 closed the day before at 1550 (16:15 EST) and opens today at 1560 (09:30 EST), they will short the market expecting this 'Upgap' to close. A 'Downgap' would mean today opens at for example 1540, and the speculator buys the market at the open expecting the 'downgap to close'. The probability of this happening on any given day is around 70%, depending on which market you look at. Once the probability of 'Gap Fill' on any given day or technical position is established, then the best setups for this trade can be identified. Some days have such a low probability of the gap filling that speculators will trade in the direction of the gap. Gap is a movement in the price of a share that occurs as a result of changes in stock valuation. Gap is a break between prices on a chart that occurs when the price of a stock makes a sharp move up or down with no trading occurring in between. Gaps can be created by factors such as regular buying or selling pressure, earnings announcements, a change in an analyst's outlook or any other type of news release. An example of two different gaps can be seen in the chart above. Notice how the stock closes the trading session before the first gap at USD50 and opens the next trading day near USD46 with no trading occurring between the two prices. Gaps are a regular occurrence in all financial markets. However, they are rarely seen in the forex market since it is highly liquid and trades 24 hours a day. See also Breakaway Gap, Common Gap, Continuation Gap, Down Gap, Exhaustion Gap, Runaway Gap, and Up Gap. A Gap in a chart is an empty space between a trading period and the following trading period. This occurs when there is a large difference in prices between two sequential trading periods. For example, if the trading range in one period is between USD25 and USD30 and the next trading period opens at USD40, there will be a large gap on the chart between these two periods. Gap price movements can be found on bar charts and candlestick charts but will not be found on point and figure or basic line charts. Gaps generally show that something of significance has happened in the security, such as a better-than-expected earnings announcement. There are three main types of gaps:- Breakaway, Runaway (measuring) and Exhaustion. A breakaway gap forms at the start of a trend, a runaway gap forms during the middle of a trend and an exhaustion gap forms near the end of a trend. Gap is a day in which daily range is completely above or below the previous day's daily range. / Нифти (Nifty). Эс.ЭндПи. 500 (S&P 500). Смотрите также Отрыв С Пробоем Уровня (Breakaway Gap), Обычный Отрыв (Common Gap), Отрыв Продолжения (Continuation Gap), С Отрывом Вниз (Down Gap), Отрыв Истощения (Exhaustion Gap), Отрыв Ускорения (Runaway Gap), и С Отрывом Вверх (Up Gap). Под Зазором понимается расстояние между двумя сопряжёнными . Отрыв или Расхождение или Разрыв или Промежуток или Зазор:- (1) Финансы:- потребность в финансировании, средства на которое необходимо изыскать. Например, компании ABC может требоваться 1.5 миллиона Долларов для приобретения и оборудования нового производственного помещения. Она получает ипотечный кредит в 700 000 Долларов, средства на покупку оборудования в размере 400 000 Долларов и привлекает дополнительный акционерный капитал на сумму 150 000 Долларов. Это оставляет разрыв в 250 000 Долларов, для которого компания ищет средства. Недостающая сумма может быть получена от правительства штата или местного правительственного органа, заинтересованного в экономическом развитии. (2) Ценные бумаги:- термин, использующийся в области операций с ценными бумагами для описания движения курсов акций или цен на товарно-сырьевую продукцию, когда разброс цен одного дня не перекрывает этого показателя другого дня, создавая разрыв, или интервал, в котором торговые операции не велись. Такая ситуация обычно возникает вследствие некоторых экстраординарных позитивных или негативных новостей о компании или товарно-сырьевой продукции.

GAP ANALYSIS = АНАЛИЗ РАЗРЫВОВ (или АНАЛИЗ ОТРЫВОВ, или АНАЛИЗ РАСХОЖДЕНИЙ) – Gap Analysis is:- (1) the process through which a company compares its actual performance to its expected performance to determine whether it is meeting expectations and using its resources effectively. Gap analysis seeks to answer the questions 'where are we?' (current state) and 'where do we want to be?' (target state). Conducting a gap analysis can help a company re-examine its goals to determine whether it is on the right path to be able to accomplish them. A company will list the factors that define its current state, outline the factors that are required to reach the target state, and then determine how to fill the 'gaps' between the two states. (2) A method of asset-liability management that can be used to assess interest rate risk (IRR) or liquidity risk excluding credit risk. Gap analysis is a simple IRR measurement method that conveys the difference between rate sensitive assets and rate sensitive liabilities over a given period of time. This type of analysis works well if assets and liabilities are compromised of fixed cash flows. Because of this a significant shortcoming of gap analysis is that it cannot handle options, as options have uncertain cash flows. Gap analysis was widely used in the 1980's typically in tandem with duration analysis. It was found to be harder to use and less widely implemented than duration analysis but it can still be used to assess exposure to a variety of term structure movements.

GAP–FILLING ADHESIVE = ЗАПОЛНЯЮЩЕЕ ЗАЗОРЫ СВЯЗУЮЩЕЕ (или СВЯЗУЮЩЕЕ ЗАПОЛНИТЕЛЬ) – Gap-Filling Adhesive is an adhesive suitable for use where the surfaces to be joined may not be in close or continuous contact owing either to the impossibility of applying adequate pressure or to slight inaccuracies in matching mating surfaces. / .

GAPOLOGY = ИЗУЧЕНИЕ ОТРЫВОВ (или ИЗУЧЕНИЕ РАЗРЫВОВ) – Gapology is the study or discussion of marked differences between groups, viewpoints, or situations. Also, gapologist, a person who studies such differences. Etymological Note:- gap = 'a conspicuous disparity or difference (between two things)' + –ology = 'study of'. In visual analysis, Gapology is a study of chart gaps. Typically an insatiable desire to classify all gaps and determine their inner hidden meaning. See also Gap Analysis. / В визуальном анализе, изучение отрывов или разрывов в графиках. Участникам рынка вполне типично ненасытное стремление классифицировать все отрывы и определять их внутренний скрытый смысл.

GAP THROUGH = СКВОЗЬ ПРОРЫВ (или ПРОЛОМ, или ПРОХОД, или ПРОМЕЖУТОК, или БРЕШЬ, или РАЗРЫВ, или ЗАЗОР, или ЛЮФТ) – Gap Through:- when a market opens or trades through the specified level of a market order without actually trading at the price of the market order.

GARB = НАРЯД (или ОБЛАЧЕНИЕ, или УТИЛЬ, или ХХ) – Garb is a style of apparel.

GARBOARD STRAKE = ШПУНТОВЫЙ ПОЯС – Garboard Strake is the shell plating of a ship that is next to the keelplate. Garboard Strake (maritime term):- the strake next to the keel (running fore and aft). / Обшивка корпуса судна, следующая за нижним горизонтальным листом киля.

GARDNER COLOR SCALE = ЦВЕТОВАЯ ШКАЛА ГАДНЁ (или ШКАЛА ЦВЕТОВ ПО ГАРДНЕРУ) – Visual color scales, including the Gardner Color Scale, have two inherent flaws – one is the variation in the color of standards, batch to batch. The second and most obvious is the variability of the human observer. The Gardner Scale is a visual scale originally developed in the 1920s to describe the color of drying oils, varnishes, fatty acids, polymerized fatty acids and resin solutions. These liquids are generally a moderately-saturated greenish or reddish-yellow color in the raw form, and get progressively clear at higher levels of processing. As the science of color measurement has developed, the Gardner Scale has been correlated with colorimetric scales. The original Gardner visual scale describes a degradation of near white or clear products due to age. The Gardner scale contains a set of 18 visual transparent standards made of potassium dichromate, ferric chloride, cobaltous chloride, and potassium chloroplatinate to set levels of yellowness. These solutions although sealed in glass, were unstable, faded with time and difficult to reproduce. These chemical solutions were eventually replaced with glass filters on a wheel. As the standards range from 1 to 18, the color goes from light to dark, increasing in dominant yellow saturation, and shifting from a greenish tint to a red tint. With the advent of instrumentation, the visual scales were correlated with colorimetric scales. The first of these colorimetric scales provides a relationship between Gardner Index and CIE Yxy (ASTM D1544). The second published method of comparison triangulates the relationship to chromaticity values (ASTM D6166). The Gardner Scale was developed separately from other Yellowness indices such as ASTM E313, ASTM D1925 and APHA. In June 1997, the ASTM D01.34 (Naval Stores) subcommittee approved another instrumental correlation to the visual Gardner Color Scale. This new instrumental Gardner scale is based on a 10 mm path length transmission measurement and is described in ASTM D6166, Standard Test Method for Color of Naval Stores and Related Products (Instrumental Determination of Gardner Color). This color scale triangulates the chromaticity coordinates and expands the values to include a decimal. This scale is thought to be more robust for off-hue samples. Gardner Color Scale is a color scale for clear, light-yellow fluids, defined by the chromaticities of glass standards numbered from 1 for the lightest to 18 for the darkest. The Gardner Color Scale as specified in ASTM D1544 is a single number, one dimensional, color scale for grading the color of similarly colored liquids such as resins, varnishes, lacquers, drying oils, fatty acids, lecithin's, sunflower oil and linseed oil. The scale ranges from a pale yellow to a red in shade and is described in terms of the values 1–18. The glass standards used with the comparator can achieve a resolution of 1 unit, automatic PFX and PFXi instruments 0.1. To comply with specifications a 10 mm path length must be used. The light yellow Gardner color numbers (1 to 8) are based on potassium chloroplatinate solutions, numbers 9 to 18 on solutions of ferric chloride, cobaltous chloride and hydrochloric acid. In 1958 The Tintometer Ltd were instrumental in the development of the master glass standards that were utilised when the current Gardner scale was specified in 1963; the earlier 1933 and 1953 versions are available upon request in the form of Comparator 2000 discs. The Gardner Color Scale as specified in ASTM D1544 is a single number color scale for grading light transmitting samples with color characteristics ranging from light yellow to brownish red. It is widely used for oils, paint and chemicals, such as resins, varnishes, lacquers, drying oils, fatty acids, lecithin, sunflower oil, linseed oil. The scale is defined by the chromaticities of glass standards numbered from 1 for the lightest to 18 for the darkest. The Gardner Scale was developed in the 1920s to classify the color of drying oils, varnishes, fatty acids, polymerized fatty acids, and resin solutions. The scale originally consisted of 18 liquid standards composed of potassium dichromate, ferric chloride, cobaltous chloride, and potassium chloroplatinate and represented in sealed glass tubes for visual comparison, ranging from light yellow (1) to dark brown (18). These liquids were vulnerable to instability, color variation, and reproduction difficulties, and were eventually replaced by glass filters in 1958 in an attempt to enhance precision. However, the Gardner Scale remained a visual evaluation method relying on the subjective human gaze, leading to inaccuracies and difficulties maintaining color consistency. Dr. Henry Alfred Gardner, Sr.. American Society for Testing and Materials (ASTM). / Американское Общество по Испытаниям и Материалам (АОИМ). Доктор Хэнри Алфрэд Гаднё Старший (Gardner). Тинтомэтё Эл.ти.ди. (Tintometer Ltd) Цветовая Шкала Гаднё (или Гарднера), как указано в АОИМ Ди.1544 (ASTM D1544), является целочисленной цветовой шкалой для анализа пропускающих свет образцов, окрашенных в цвета от светло-жёлтого до красно-коричневого. Шкала широко используется для анализа цветности масел, включая подсолнечное и льняное, лаков, красок, жирных кислот, лецитинов. Шкала Гарднера задаётся цветами стандартов, представляющих собой окрашенные стеклянные пластины с номерами от 1 для самой светлой до 18 для наиболее тёмной.

GARIBALDI = ГАРИБАЛЬДИ (или ГАРИБАЛЬДИЙКА) – Garibaldi is a woman's blouse copied from the red shirt worn by the Italian patriot, general and politician Giuseppe Garibaldi (1807–82), who played a large role in the history of Italy. / знаменитая красная рубаха Джузеппе Гарибальди.

GARLAND = ГИРЛЯНДА (или ВЕНОК, или ХХ) – Garland:- wreath, chaplet.

GARLICKY CANOLA = КЭНОЛЭ С ПРИМЕСЬЮ ДИКОГО ЧЕСНОКА (или ЧЕСНОЧНАЯ КЭНОЛЭ) – Garlicky Canola is a Canola that contains more than two green Garlic bulblets or an equivalent quantity of dry or partly dry bulblets in approximately a 500 gram portion. / К Кэнолэ с примесью Дикого Чеснока относится Кэнолэ, которая содержит более двух зелёных луковичек Дикого Чеснока или аналогичное количество высохших или частично высохших луковичек в 500 граммовой навеске.

GARLICKY WHEAT = ПШЕНИЦА С ПРИМЕСЬЮ ДИКОГО ЧЕСНОКА (или ЧЕСНОЧНАЯ ПШЕНИЦА) – Garlicky Wheat is Wheat that contains in a 1 000 gram portion more than two green Garlic bulblets or an equivalent quantity of dry or partly dry bulblets. / К Пшенице С Примесью Дикого Чеснока относится Пшеница, которая в 1 000 граммовой навеске содержит более двух зелёных луковичек Дикого Чеснока или аналогичное количество высохших или частично высохших луковичек.

GARMENT = ШВЕЙНОЕ ИЗДЕЛИЕ (или ПРЕДМЕТ ОДЕЖДЫ) – Garment is:- (i) any article of clothing, e.g., dresses, suits, coats, gown, and other garments; (ii) an outer covering or outward appearance; and (iii) to provide with clothes or put clothes on (to cover or clothe); Middle English, from Old French Garnement, from Garnir = to equip, of Germanic origin. A Garment is a piece or an article of clothing, e.g., a shirt. See also Apparel. / Швейные Изделия:- Перспективное Направление Моды:- Конечно, нельзя сказать, что в моде начала XXI века вообще нет никаких правил и перемен. Нет тотальных, кардинальных изменений. Но существуют чёткие тенденции развития моды, и с ними надо считаться, чтобы не 'выпасть из времени'. Это, однако, не мешает придерживаться своего собственного стиля, соответствующего личной философии и образу жизни. Силуэт всегда был главной характеристикой модной одежды. Сегодня он изменился до неузнаваемости, – вытянулся, утончился. Исчезли накладные плечи, к которым мы так привыкли, что не мыслим без них свой облик. Естественно, сузились рукава, 'поползли' вверх проймы. Застёжки тоже поднялись кверху. Жакеты часто имеют увеличенную длину. Они прилегают в груди и талии, плавно расширяясь книзу. По-прежнему популярен жакет полуприлегающего силуэта с карманами 'листочками', высокой застёжкой и отложным воротником. Юбки разнообразны, но лидируют узкие и длинные – от середины икр до щиколоток. Высокие разрезы на юбках являются не просто приёмом для показа соблазнительных ножек, но и необходимостью, дарующей свободу

движений. Брюки привлекают разнообразием – от широких, развевающихся, расклешённых от бёдер или от колен, как в 1970-е, до классических прямых и узких. Не забыты и короткие узкие брючки – бриджи, молодёжи они особенно по вкусу. Брюки проникают и в вечернюю одежду. Сшитые из шёлка или шифона, отделанные плиссе, гофре, ажурной каймой, драпировками, высокими поясами, они выглядят особенно женственно. Платье – самый традиционный и женственный вид одежды – снова выходит на первый план. Обычно это платье нового силуэта – узкое в груди и талии, расширенное книзу, либо платьице в стиле 'ампир' – с приподнятой талией. Жилеты по-прежнему остаются любимцами моды. Причём не только классические (типа мужских), сшитые из шерстяных тканей, но и похожие на туники, очень длинные, зауженные в груди и талии, выполненные из шёлка, крепдешина, ажурные вязаные, с воротником и лацканами. Ткани стали менее грубыми, более изящными, мягкими и пластичными. Они обтекают тело, обволакивают его. Акцент делается на гибкие, гладкие ткани с матово-блестящими контрастами. Это груботканые крепы; прозрачные шелка, шифоны, креп-жоржеты; костюмные шерстяные в тонкую полоску, клетку, с мелкими узорами; вельветовые. Сохраняется тенденция к необычному комбинированию вещей. Речь прежде всего идёт о многослойности. Нередко предметы одежды комбинируются по принципу 'из-под Пятницы Суббота'. Модная цветовая гамма изменилась кардинально. Бледность возобладала над яркими красками. Многие модельеры взяли за основу деревья, цветы. Некоторые специалисты выделяют группу розовых цветов, актуальны нейтральные цвета. Единственное исключение – красный цвет, который вновь солирует. Среди синих оттеков можно отметить 'индиго', который переживает своё возрождение. Швейные Изделия:- требования, предъявляемые к ассортименту одежды и тканям:- (i) гигиенические – защита человека от воздействий неблагоприятных факторов внешней среды; обеспечение нормальной жизнедеятельности организма (кожное дыхание, газообмен); вентиляция пододёжного слоя воздуха; поддержание теплового баланса благодаря выбору материала из ассортимента шерстяных тканей для пошива данного изделия. (ii) Эксплуатационные – обеспечение удобства в носке благодаря достаточной свободе движений и правильному выбору застёжек (на жилете – однобортная до низа жилета, на брюках – в боковом шве левой половинки); прочность и надёжность в эксплуатации, характеризующиеся хорошим сопротивлением материалов и швов разрывным нагрузкам, формоустойчивостью деталей и износостойкостью материалов. (iii) Эстетические – художественное оформление одежды, выражающееся в выборе полуприлегающего силуэта жилета и гармоничных пропорций частей одежды. (iv) Функциональные – соответствие своему основному назначению, соответствие свойств ткани назначению модели и выбор ткани в соответствии с сезоном. (v) Экономические – проектируемое изделие характеризуется минимальной площадью деталей и, соответственно, минимальными отходами материалов при раскрое. (vi) Технологические – уменьшение трудоёмкости обработки за счёт ликвидации отдельных операций, упрощения способов обработки, создания условий для максимальной механизации технологических процессов и повышения производительности труда. Швейная Промышленность является одной из крупнейших отраслей лёгкой промышленности. Главная задача швейной промышленности – удовлетворение потребности людей в одежде высокого качества и разнообразного ассортимента. При этом швейные изделия для нужд промышленности в последнее время всё более актуальны, так как это уже не просто рабочая одежда, а униформа, оформление которой в фирменной стилистике компании призвано ещё более сплотить корпоративный дух сотрудников и рассказать о брэнде широкому кругу людей. Швейная Промышленность является одной из крупнейших отраслей лёгкой промышленности. Главная задача швейной промышленности – удовлетворение потребности людей в одежде высокого качества и разнообразного ассортимента. Решение этой задачи осуществляется на основе повышенной эффективности производства, ускорения научно-технического прогресса, роста производительности труда, всемерного улучшения качества работы, совершенствования труда и производства. При массовом производстве швейных изделий решающая роль принадлежит технологическому процессу, который представляет собой экономически целесообразную совокупность технологических операций по обработке и сборке деталей и узлов швейных изделий. Современная швейная отрасль, выпускающая одежду массового производства, должна характеризоваться достаточно высоким уровнем техники, технологии и организации производства, наличием крупных специализированных предприятий и производственных объединений. Совершенствование швейного производства предусматривает внедрение высокопроизводительного оборудования, поточных линий, расширение ассортимента и улучшение качества одежды, выпуск изделий, пользующихся повышенным спросом. Ассортимент швейных изделий должен обновляться в результате расширения ассортимента и улучшения качества сырьевой базы швейной промышленности. Технология современного швейного производства всё более становится механической, её эффективность в первую очередь зависит от применяемого оборудования. Решение задач, стоящих перед швейной промышленностью требует больших и глубоких знаний от технологов. Без этих знаний невозможно внедрять новые технологические процессы швейного производства, необходимые для изготовления одежды высокого качества.

GARMENT DYEING = КРАШЕНИЕ ШВЕЙНОГО ИЗДЕЛИЯ – Garment Dyeing:- dye is applied to finished products such as apparels and garments. Garment Dyeing:- when the finished textile product such as hosiery or sweaters are dyed, it is called Garment Dyeing. A number of garments are packed loosely in a nylon net and put into a dyestuff filled tub with a motor driven paddle. The dye is thrown upon the garments by the moving paddles' effect. / Найлан (Nylon).

GARMENT NOT FOLDED TO SPECIFICATIONS = ШВЕЙНОЕ ИЗДЕЛИЕ, НЕ УЛОЖЕННОЕ СОГЛАСНО СПЕЦИФИКАЦИЙ – Garment Not Folded To Specifications:- self-explanatory. Finishing department defects, and namely – Folding Defects. / Порок или дефект заключительной обработки.

GARMENT NOT FOLDED WITH PROPER MATERIALS = ШВЕЙНОЕ ИЗДЕЛИЕ, НЕ УЛОЖЕННОЕ С СООТВЕТСТВУЮЩИМИ МАТЕРИАЛАМИ – Garment Not Folded With Proper Materials:- cardboard, tissue or other specified packaging materials omitted. Finishing department defects, and namely – Folding Defects. / Порок или дефект заключительной обработки.

GARMENT–ON–HANGER = ШВЕЙНЫЕ ИЗДЕЛИЯ НА ВЕШАЛКАХ – Garment-On-Hanger (GOH) is a method of storing apparel in containers for garments that should not be folded. / Швейные Изделия На Вешалах (ШИНВ) является методом наполнения одеждой контейнеров для транспортировки швейных изделий, которые не должны подвергаться складыванию друг на друга.

GARMENTS NOT BUTTONED, FLYS NOT CLOSED, INCORRECT NUMBER OF PINS = ШВЕЙНЫЕ ИЗДЕЛИЯ, XX – Garments Not Buttoned, Flys Not Closed, Incorrect Number Of Pins:- self-explanatory. Finishing department defects, and namely – Folding Defects. / Порок или дефект заключительной обработки.

GARMENTS NOT THOROUGHLY DRIED = НЕ ТЩАТЕЛЬНО ПРОСУШЕННЫЕ ШВЕЙНЫЕ ИЗДЕЛИЯ – Garments Not Thoroughly Dried:- resulting in excessive wrinkling of garment. Finishing department defects, and namely – Pressing Defects. / Порок или дефект заключительной обработки.

GARMENTS ON HANGER CONTAINER = КОНТЕЙНЕР ДЛЯ ШВЕЙНЫХ ИЗДЕЛИЙ НА ВЕШАЛКАХ – Garments On Hanger Containers (GOH Containers) are available in 20' and 40'. In some countries, Garments On Hanger Containers (GOH Containers) also known as Hangtainers. The GOH Containers are available as dry cargo container, reefer container etc as per the requirements of apparel shipper. In GOH Containers, (Garments On Hanger Containers), arrangements to use string or bar or combination of string and

bar are available. So, Garments On Hanger containers are flexible, greater loading capacity and minimizing transportation and handling costs. GOH Containers (hangtainers) are useful mainly for apparel exporters who can save a good amount of time, labor and money. Garment On Hanger containers are connected with racks and poles by screws and nuts so as to enable the garments to be loaded safely. The clothing cover made of plastic covers inner sides and dryer hanged on every pole which is dustproof. The systematic arrangements of horizontal poles on the roof of GOH Containers help to load maximum volume of garments. The garments can be directly hanged by using hooks as GOH Container poles hangs buckles, nylon straps or ropes. Garment On Hanger (GOH) Container give customers the option of using a string or bar system, or a combination of both. The GOH containers offer increased flexibility, greater internal load capacity and savings on transportation and handling costs. GOH containers are available in 20' and 40' sizes. Specific dimensions and capacity of garments on hangers containers may vary depending on the container manufacturer, the age of the container and the container owner. Garment On Hanger (GOH) (also known in certain circles as Hangtainer) containers are standard/dry containers that are converted/outfitted to be able to safely and conveniently carry garments on hangers – the same way you see them hanging in all the major retail stores. A lot of the shipping lines have their own GOH containers for which they charge a premium for the conversion and outfitting. The retail companies benefit a lot in terms of time, labour and money by using GOH for their garment imports as they can move the garments from the container to the shop floor directly and in a good condition. / Найлан (Nylon).

GARMENT TECHNOLOGIST = ТЕХНОЛОГ ШВЕЙНЫХ ИЗДЕЛИЙ – Garment Technologist:- this includes pattern construction, a broad knowledge of textiles and quality issues. The use of the computer aided manufacturing (CAM) and relative packages is required as a garment technologist.

GARNET = ГРАНАТОВОЕ – Garnet:- a variable color averaging a dark red.

GARNETTED YARN = РАСПУШЕННАЯ ПРЯЖА (или ПРЯЖА ПУТАНКА) – Garnetted Yarn is the yarn that has little bits ('garnets') of other fibers carded in. Usually the garnets are of a different color – but they can also be from a different fiber.

GARNETTING = РАСПУШЕНИЕ – Garnetting is a process for reducing various textile waste materials to fiber by passing them through a machine called a Garnett, that is similar to a card. Garnetting is a shredding wool fabrics into a fibrous state, prior to remanufacture into woolen yarn. Garnetting is a mechanical process whereby short cotton fibers and/or other fibers are combed into a specific orientation and formed into a thin web, which are then layered to create a batting that is generally used as an upholstery material. / Распушение – процесс превращения пряжи-путанки (бракованной) и лоскута в волокно.

GARNISHMENT = ОБРАЩЕНИЕ ВЗЫСКАНИЯ НА ПРЕДМЕТ ЗАЛОГА (или ПРЕДСТАВЛЕНИЕ О НАЛОЖЕНИИ ВЗЫСКАНИЯ) – Garnishment is a legal procedure by which a creditor can collect what a debtor owes by reaching the debtor's property when it is in the hands of someone other than the debtor. Garnishment is a drastic measure for collecting a debt. A court order of garnishment allows a creditor to take the property of a debtor when the debtor does not possess the property. A garnishment action is taken against the debtor as defendant and the property holder as garnishee. Garnishment is regulated by statutes, and is usually reserved for the creditor who has obtained a judgment, or court order, against the debtor. A debtor's property may be garnished before it ever reaches the debtor. For example, if a debtor's work earnings are garnished, a portion of the wages owed by the employer go directly to the Judgment Creditor and is never seen by the debtor. Some property is exempt from garnishment. Exemptions are created by statutes to avoid leaving a debtor with no means of support. For example, only a certain amount of work income may be garnished. Under 15 USCA § 1673, a garnishment sought in federal court may not exceed 25 percent of the debtor's disposable earnings each week, or the amount by which the debtor's disposable earnings for the week exceed thirty times the federal minimum hourly wage in effect at the time the earnings are payable. In Alaska, exemptions include a burial plot; health aids necessary for work or health; benefits paid or payable for medical, surgical, or hospital care; awards to victims of violent crime; and assets received from a retirement plan (Alaska Stat. § 09.38.015, .017). Because garnishment involves the taking of property, the procedure is subject to due process requirements. In Sniadatch v. Family Finance Corp. of Bay View, 395 US 337, 89 S. Ct. 1820, 23 L. Ed. 2d 349 (1969), the US Supreme Court struck down a Wisconsin statute that allowed pretrial garnishment of wages without an opportunity to be heard or to submit a defense. According to the Court, garnishment without prior notice and a prior hearing violated fundamental principles of due process. Garnishment may be used as a provisional remedy. This means that property may be garnished before a judgment against the debtor is entered. This serves to protect the creditor's interest in the debtor's property. Prejudgment garnishment is usually ordered by a court only when the creditor can show that the debtor is likely to lose or dispose of the property before the case is resolved. Property that is garnished before any judgment is rendered is held by the third party, and is not given to the creditor until the creditor prevails in the suit against the debtor. Garnishment is similar to lien and to attachment. Liens and attachments are court orders that give a creditor an interest in the property of the debtor. Garnishment is a continuing lien against nonexempt property of the debtor. Garnishment is not, however, an attachment. Attachment is the process of seizing property of the debtor that is in the debtor's possession, whereas garnishment is the process of seizing property of the debtor that is in the possession of a third party. Garnishment is a notice to an employer or other asset holder requiring that monies, wages, or property due a debtor be withheld and given a creditor to be applied to a specific debt in arrears. Garnishment is:- (1) in law:- (a) a legal proceeding whereby money or property due a debtor but in the possession of another is applied to the payment of the debt owed to the plaintiff; and (b) a court order directing a third party who holds money or property belonging to a defendant to withhold it and appear in court to answer inquiries. (2) Ornamentation; embellishment. / Сниадэтч (Sniadatch) против Фэмили Файнэнс Корп. (Family Finance Corp.).

GARRISON CAP = ГАРНИЗОННАЯ ШЛЯПКА – Garrison Cap is a visor-less folding cap worn as part of a military uniform. Compare Service Cap.

GARTER = ПОДВЯЗКА (или ПОДВЯЗОЧНАЯ ЛЕНТА) – Garter is a band worn to hold up a stocking or sock; a band worn to hold up a shirt sleeve.

GAS = ГАЗ – Gas is a fuel burned under boilers and by internal combustion engines for electric generation. These include natural, manufactured, and waste gas. / Под Газом, от Французского слова Gaz, от Греческого слова Cháos, означающее Хаос, понимается агрегатное состояние вещества, в котором кинетическая энергия теплового движения его частиц (молекул, атомов, ионов) значительно превосходит потенциальную энергию взаимодействий между ними, в связи с чем частицы движутся свободно, равномерно заполняя в отсутствие внешних полей весь предоставленный им объём. Под Газом понимается одно из агрегатных состояний вещества, в котором его частицы не связаны или весьма слабо связаны между собой молекулярными силами притяжения и хаотически движутся, заполняя весь возможный объём. При обычных давлениях и температурах среднее расстояние между молекулами в газе примерно в 10 раз больше, чем в жидкостях и твёрдых телах, поэтому плотность газа значительно меньше их плотности. При обычных температурах газы – хорошие диэлектрики, так как их атомы и молекулы электрически нейтральны. При достаточно малой плотности реальный газ можно практически считать идеальным газом, например, воздух при нормальном давлении и температуре. Связь между давлением, объёмом и температурой идеального газа выражается уравнением Клапейрона. Более точно состояние реального газа, с учётом

собственного объёма молекул и влияния сил межмолекулярного притяжения, выражается уравнением Ван-дер-Ваальса. Газ обладает лишь объёмной упругостью. Поэтому в нём могут распространяться только продольные упругие волны.

GASCARRIER = ГАЗОВОЗ – A Gas Carrier, or Gas Tanker, is a ship designed to transport LPG, LNG or liquified chemical gasses in bulk. Types:- (i) Fully Pressurized Gas Carrier:- the seaborne transport of liquefied gases began in 1934 when a major international company put two combined oil/LPG tankers into operation. The ships, basically oil tankers, had been converted by fitting small, riveted, pressure vessels for the carriage of LPG into cargo tank spaces. This enabled transport over long distances of substantial volumes of an oil refinery by-product that had distinct advantages as a domestic and commercial fuel. LPG is not only odorless and non-toxic, it also has a high calorific value and a low sulphur content, making it very clean and efficient when being burnt. Today, most fully pressurised LPG carriers are fitted with two or three horizontal, cylindrical or spherical cargo tanks and have capacities up to 6 000 m^3. However, in recent years a number of larger-capacity fully pressurised ships have been built with spherical tanks, most notably a pair of 10 000 m^3 ships, each incorporating five spheres, built by a Japanese shipyard in 1987. Fully pressurised ships are still being built in numbers and represent a cost-effective, simple way of moving LPG to and from smaller gas terminals. (ii) Semi-Pressurised Ships:- these ships carried gases in a semi-pressurized/semi-refrigerated state however due to further development semi-pressurised/fully refrigerated gas carriers had become the shipowners' choice by providing high flexibility in cargo handling. These carriers, incorporating tanks either cylindrical, spherical or bi-lobe in shape, are able to load or discharge gas cargoes at both refrigerated and pressurised storage facilities. (iii) Ethylene and Gas/Chemical Carriers:- ethylene carriers are the most sophisticated of the Gas tankers and have the ability to carry not only most other liquefied gas cargoes but also ethylene at its atmospheric boiling point of –104 °C. These ships feature cylindrical, insulated, stainless steel cargo tanks able to accommodate cargoes up to a maximum specific gravity of 1.8 at temperatures ranging from a minimum of –104 °C to a maximum of +80 °C and at a maximum tank pressure of 4 bar. (iv) Fully Refrigerated Ships:- they are built to carry liquefied gases at low temperature and atmospheric pressure between terminals equipped with fully refrigerated storage tanks. However, discharge through a booster pump and cargo heater makes it possible to discharge to pressurized tanks too. The first purpose-built, fully refrigerated LPG carrier was constructed by a Japanese shipyard, to a United States design, in 1962. Prismatic tanks enabled the ship's cargo carrying capacity to be maximised, thus making fully refrigerated ships highly suitable for carrying large volumes of cargo such as LPG, ammonia and vinyl chloride over long distances. Today, fully refrigerated ships range in capacity from 20 000 to 100 000 m^3. The main types of cargo containment system utilised on board modern fully refrigerated ships are independent tanks having rigid foam insulation. The insulation used is quite commonly polyurethane foam. Older ships can have independent tanks with loosely filled perlite insulation. In the past, there have been a few fully refrigerated ships built with semi-membrane or integral tanks and internal insulation tanks, but these systems have only maintained minimal interest. (v) Liquefied Natural Gas (LNG) Carrier:- the majority of LNG carriers are between 125 000 and 135 000 m^3 in capacity. In the modern fleet of LNG carriers, there is an interesting exception concerning ship size. This is the introduction of several smaller ships of between 18 000 and 19 000 m^3 having been built in 1994 and later to service the needs of importers of smaller volumes. Gascarrier:- LPG and LNG (short for the Liquefied Natural Gas) carriers are sophisticated vessels that demand competent crew and high-quality operations. (1) Fully Refrigerated Vessel:- a gas carrier designed to carry cargoes fully refrigerated at atmospheric pressure. (2) Semi-Refrigerated Vessel:- a gas carrier designed to carry cargoes both fully refrigerated and under higher pressure than atmospheric pressure. Also known as Liquefied Natural Gas Carrier. / Под Газовозом понимается судно для транспортировки сжиженных газов (бутана, пропана и других). Газы перевозятся в теплоизолированных танках либо под давлением, либо охлаждёнными до температуры кипения при атмосферном давлении, либо при небольшом совместном сжатии и охлаждении. Грузовместимость первых газовозов ограничивалась 130 000 кубических метров. Газовоз, судно, перевозящее сжиженные газы (аммиак, бутан, метан, пропан и другие). Газы транспортируются в цистернах под давлением 1–1.8 Мн/$м^2$ (10–18 кгс/$см^2$, 1–1.8 МПа), охлаждёнными до $t_{кип}$ при атмосферном давлении (около –161 °С для метана, –42 °С для пропана) либо при небольшом совместном охлаждении и сжатии (например, 5 °С и 0.65 МПа). Грузоподъёмность современных газовозов от нескольких десятков до 25 000–35 000 тонн, грузовместимость достигает 70 000 $м^3$ и более. Цистерны газовозов прямоугольные, сферические или цилиндрические с тепловой изоляцией наружной или внутренней поверхности. Газовозы оборудуют разгрузочными насосно-компрессорными установками, системами отвода из цистерны испаряющегося газа, подачи в цистерны инертного газа и другим. Газовозы обеспечивают дистанционным контролем состояния груза (давления, температуры, уровня) и противопожарными средствами.

GAS FADING = ГАЗОВОЕ ВЫЦВЕТАНИЕ (или ОБЕСЦВЕЧИВАНИЕ (ОКРАСОК) ДЫМОВЫМИ ГАЗАМИ) – Gas Fading:- the change of shade in fabrics containing cellulose acetate fibers and dyed with certain colors, when the fabrics are exposed to some atmospheric gases. Generally the change is from blue or shades containing a blue component to reddish hues. Gas Fading is a change of shade of dyed fabric caused by chemical reaction between certain disperse dyes and acid gases from fuel combustion, particularly oxides of nitrogen. Gas Fading is the loss of color some fabrics suffer because of nitrogen in the atmosphere rather than exposure to sunlight. Certain dyes (blues and greens, for example) are often more susceptible to gas fading than others, as are certain fibers (acetate). Special dyes can be used on these fabrics and colors to reduce or eliminate this problem. Also called Atmosphere and Pollution Fading.

GAS FRACTIONATION = ГАЗОФРАКЦИОНИРОВАНИЕ – Gas Fractionation is an obtaining separate light hydrocarbons or hydrocarbon fractions with higher degrees of purity from associated petroleum gas. / Газофракционирование это получение индивидуальных лёгких углеводородов или углеводородных фракций высокой чистоты из попутного нефтяного газа. Оно осуществляется на газофракционирующей установке, комплексе устройств для стабилизации газового бензина и извлечения из него бутана, пропана и этана. Установка состоит из нескольких газофракционирующих колонн. В них поддерживаются давление и температурный режим, при которых в верхней части колонн конденсируется один из индивидуальных углеводородов (бутан, пропан, этан), а стабильный бензин сливается из нижней части колонны. Газофракционирующая установка входит в состав газобензиновых, газоперерабатывающих, нефтехимических и химических заводов.

GASGA = GROUP FOR ASSISTANCE ON SYSTEMS RELATING TO GRAIN AFTER HARVEST

GASGA = GROUP FOR ASSISTANCE ON THE STORAGE OF THE GRAINS IN AFRICA

GASIFICATION = ГАЗИФИКАЦИЯ – Gasification is the process of turning liquefied natural gas into a vaporous or gaseous state by increasing the temperature and decreasing the pressure. / Процесс преобразования сжиженного природного газа в парообразное или газообразное состояние посредством повышения температуры и снижения давления. Под Газификацией, от Греческого слова Cháos, означающее Хаос, и Латинского слова Facio, означающее Делаю, понимаются:- (1) превращение твёрдого или жидкого топлива в горючие газы окислением его воздухом, кислородом, водяным паром и другим. Газификация производится в наземных аппаратах (газогенераторах) и в подземных условиях (подземная газификация угля, нефтяного пласта). (2) Процесс применения в различных отраслях техники и быта горючих газов, преимущественно метана и его гомологов (этан и другие).

GASKIN = ЧУЛКИ – Gaskin:- (plural and obsolete) hose, breeches.

GASOHOL = БЕНЗОСПИРТ (или ГАЗОГОЛЬ, или СМЕСЬ БЕНЗИНА И СПИРТА) – Gasohol is a mixture of gasoline and ethanol derived from fermented agricultural products containing at least 9 percent ethanol. Gasohol emissions contain less carbon monoxide than those from gasoline. Gasohol is a blend of 10% anhydrous ethanol (ethyl alcohol) and 90% gasoline, by volume. Used as a motor fuel. Gasohol is a blend of finished motor gasoline containing alcohol (generally ethanol but sometimes methanol) at a concentration between 5.7–10 percents by volume. See also Oxygenated Motor Gasoline. Gasohol:- fuel that is a mixture of gasoline and anhydrous ethanol. / Термин Газохол широко распространён в США и определяется как смесь разных марок топлив с концентрацией этанола от 5.59% до 10%, обозначаемая буквой E и числом, обозначающим содержание спирта в процентах. Наиболее используемым является топливо E10.

GASOIL = ГАЗОЙЛЬ – Gas-Diesel Oil (distillate fuel oil):- heavy oils distilling between 200 °C and 380 °C, but distilling less than 65% in volume at 250 °C, including losses, and 85% or more at 350 °C. Its flash point is always above 50 °C and its specific gravity is higher than 0.82. Heavy oils obtained by blending are grouped together with gas oils on the condition that their kinematic viscosity does not exceed 27.5 cSt at 38 °C. Also included are middle distillates intended for the petrochemical industry. Gas-diesel oils are used as fuel for internal combustion in diesel engines, as burner fuel in heating installations, such as furnaces, and for enriching water gas to increase its luminosity. Other names for this product are diesel fuel, diesel oil and gas oil. All organizations include diesel used for transport as well as heating oil and other gas oil. Gas/Diesel Oil refers to heavy oils obtained from atmospheric distillation or vacuum redistillation. The viscosity does not exceed 115" Redwood 1 at 38 °C. Liquid fuels obtained from atmospheric distillation of petroleum between 200 °C and 380 °C. It is heavier than kerosene and used in diesel and other compression-ignition engines. Diesel Oil, under this term, you can find the following products:- (i) industrial diesel oil; (ii) marine diesel for ships; (iii) diesel oil for road motor vehicles; and (iv) gas oil which is a topping or catalytic cracking cut that some countries import or export to achieve a better balance for their refineries. In some countries industrial or marine diesel is called Gas Oil. This term can also be applied to a fuel that is slightly lighter than diesel oil, suitable for use in tractors and agricultural machinery. Gas/Diesel Oil is primarily a medium distillate distilling between 180 °C and 380 °C. Several grades are available depending on use:- (i) Transport Diesel:- On road diesel oil for diesel compression ignition (cars, trucks, etc), usually of low sulphur content; and (ii) Heating and other Gas oil:- (a) light heating oil for industrial and commercial uses; (b) marine diesel and diesel used in rail traffic; and (c) other gas oil including heavy gas oils which distil between 380 °C and 540 °C and which are used as petrochemical feed stocks. Gas/Diesel Oil is a lighter fuel oil distilled off during the refining process and used primarily for heating, automotive purposes in diesel engines and for power generation. Two main types are distinguished by their uses:- (i) Transport diesel is a fuel used for internal combustion in on-road diesel engines, cars and trucks etc, usually of low sulphur content. (ii) Heating Oil and Other Gasoil is a distillate fuel oil used mainly in stationary or marine diesel engines. It includes light heating oil which is used for residential or commercial space heating, or in industrial plants. It also includes marine diesel which is used for barge and boat engines and other heavier gas oils which may be used as petrochemical feed stocks. Include also all gas/diesel oil which is used as international marine bunker fuel. Gas/Diesel Oil is primarily a medium distillate distilling between 180 °C and 380 °C. Several grades are available depending on uses:- (i) Diesel Oil for diesel compression ignition (cars, trucks, marine, etc), (ii) Light Heating Oil for industrial and commercial uses, and (iii) Other Gasoil including heavy gasoils which distil between 380 °C and 540 °C and which may be used as petrochemical feedstocks. The ICE (IntercontinentalExchange, Inc.) Gas Oil futures contract is a highly flexible and liquid contract and has developed into a benchmark for spot middle distillate across north-west Europe and beyond. It was ICE Futures' first futures contract to be launched in 1981 and is often referred to as Heating Oil in Europe or the United States. The ICE Futures Gas Oil futures contract is designed to provide users with an effective hedging instrument and trading opportunities. Its underlying physical market is heating oil barges delivered in ARA (Antwerp, Rotterdam, Amsterdam). It is used as the pricing reference for all distillate trading in Europe and beyond. ICE® Gas Oil futures have become very closely associated with the physical market and are based on physical delivery in the Amsterdam, Rotterdam and Antwerp area. Final settlement of the contract is made by delivery or tender of the physical commodity. Most contract users however use it as a financial mechanism and less than 1% of traded volume goes to delivery. European designation for No. 2 heating oil and diesel fuel. Gasoil is a petroleum distillate (obtained by fractional distillation of petroleum) intermediate in boiling range and viscosity between kerosene and lubricating oil. It is used as diesel fuel and heating oil. In general, gasoils are derived from oils with a higher boiling range than gasoline. This product yields 12% more power than gas, but it is not quite as explosive. European Gasoil futures are traded at the NYMEX® and the ICE Futures Europe®. / НАЙМЭКС® (NYMEX®) и Ай.Си.И. Фьючез Юрэп® (ICE Futures Europe®). Дробная Перегонка или Фракционная Перегонка (Fractional Distillation). Европейское определение для печного бытового топлива № 2 и дизельного топлива. Лёгкое печное бытовое топливо (light heating oil). Газойль это смесь углеводородов, к которым относятся фракции нефти, получаемые при её атмосферной ($t_{кип}$ 180–360 °C) или вакуумной (350–500 °C) перегонке. Газойль является дизельным топливом, сырьём для каталитического крекинга и гидрокрекинга. Газойль, фракции нефти, выкипающие в интервале температур 200–400 °C и занимающие при перегонке нефти промежуточное положение между керосином и фракциями смазочных масел (лёгкими индустриальными маслами). Газойль используется главным образом как компонент дизельного топлива, а также как сырьё для каталитического крекинга и другого. Как товарный продукт с точно нормированными константами не вырабатывается.

GASOLINE = ГАЗОВЫЙ БЕНЗИН (или ГАЗОЛИН) – Gasoline comprises motor gasoline, natural gasoline and aviation gasoline. Motor gasoline is a light hydrocarbon oil for use in internal combustion engines such as motor vehicles, excluding aircraft. It distills between 35 °C and 200 °C, and is treated to reach a sufficiently high octane number of generally between 80 and 100 RON (Research Octane Number). Treatment may be by reforming, blending with an aromatic fraction, or the addition of benzole or other additives (such as tetraethyl lead). Natural gasoline is a light spirit extracted from wet natural gas, often in association with crude petroleum. It is used as a petroleum refinery and petrochemical plant input and is also used directly for blending with motor spirit without further processing. Aviation gasoline is a motor spirit prepared especially for aviation piston engines, with an octane number varying from 80 to 145 RON and a freezing point of –60 °C. A complex mixture of relative volatile hydrocarbons, with or without small quantities of additives that have been blended to form a fuel suitable for use in internal combustion engines; includes gasoline used in aviation. Gasoline is a mixture of light liquid hydrocarbons obtained from petroleum distillation and/or natural gas treatment, within boiling point range of 30 °C to 200 °C. It also includes alcohol obtained in distilleries and used as a fuel. This group includes:- (i) Aviation gasoline:- this is a mixture of reformed high-octane naphthas, which is very volatile and stable, with a low freezing point, used in propeller aircraft with piston engines. (ii) Motor gasoline:- this is a complex mixture of relatively volatile hydrocarbons, which with or without additives (such as lead tetraethyl), is used as fuel by internal combustion engines. (iii) Natural gasoline:- this is a product from natural gas processing. It is used as a raw material for industrial processes (petrochemicals), in refineries, or it is directly mixed with naphthas. (iv) Alcohol:- this includes both ethanol (ethyl alcohol) and methanol (methyl alcohol) used as fuels. (v) Ethanol is a colorless liquid that may be produced by the fermentation of plant materials with high sugar content, such as sugar-cane syrup or molasses; plant materials with high starch content, such as cassava, corn, etc; and materials with high cellulose content, such as firewood and plant wastes. It may be used in its anhydrous or hydrated state, alone or mixed with gasoline in internal combustion engines. (vi) Methanol is also a colorless liquid that may be produced on the basis of a variety of raw materials, e.g., wood, plant wastes, methane, natural gas, coal. It is used in internal

combustion engines. Motor Gasoline consists of a mixture of light hydrocarbons distilling between 35 °C and 215 °C. It is used as a fuel for land-based spark ignition engines. Motor gasoline may include additives, oxygenates and octane enhancers, including lead compounds such as TEL (tetraethyl lead) and TML (tetra methyl lead). Aviation Gasoline is motor spirit prepared especially for aviation piston engines, with an octane number suited to the engine, a freezing point of –60 °C and a distillation range usually within the limits of 30 °C and 180 °C. Gasoline, also known as Petrol, is a liquid mixture obtained by the process of fractional distillation directly from crude oil. It is used as fuel in internal combustion engines and also as solvent. It contains the additives toluene and benzene for higher octanage levels. Since gasoline is a crude oil refined product, gasoline prices tend to follow crude oil prices. RBOB gasoline and Gulf Coast gasoline are traded at the NYMEX® (New York, NY, USA). Gasoline is also traded at the TOCOM (Tokyo, Japan). / НАЙМЭКС® (NYMEX®). ТЧОКОМ (TOCOM). безводное (anhydrous). Дробная Перегонка или Фракционная Перегонка (Fractional Distillation). Под Бензином, от Французского слова Benzine, понимается смесь лёгких углеводородов различного строения с $t_{кип}$ 30–205 °C; прозрачная бесцветная жидкость, плотность 700–780 кг/м^3. Бензин получают главным образом перегонкой или крекингом нефти, а также переработкой сланцев и каменных углей, природных и попутных газов. Бензин является основным видом топлива для поршневых авиа- и автодвигателей. Экстрагент и растворитель для жиров, каучуков, смол и тому подобного. Предельно допустимая концентрация в воздухе паров автомобильного и авиационного бензинов 100 мг/м^3, бензина-растворителя (нефрас-С 50/170) – 300 мг/м^3. Марки отечественного автомобильного бензина – А-72 (ранняя), А-76 (ранняя), АИ-80, АИ-92, АИ-93 (ранняя), АИ-95, АИ-98; цифры соответствуют октановому числу бензина. Марки Российского авиационного бензина – Б-100/130, Б-95/130, Б-91/115; числитель – октановое число, знаменатель – показатель сортности бензина. Под Газолином понимается смесь лёгких жидких углеводородов, получаемая при перегонке нефти или при разделении промышленных газов. Газолин – легко воспламеняющаяся и взрывоопасная жидкость, применяется как топливо для карбюраторных двигателей внутреннего сгорания (газовый бензин с пределами выкипания 30–200 °C), растворитель при экстракции масличных и смолистых веществ (фракция 70–100 °C), для лабораторно-аналитических работ (петролейный эфир с пределами выкипания 30–80 °C) и других целей. Газолин как единый товарный продукт с точно нормированными свойствами промышленностью бывшего Союза Советских Социалистических Республик (СССР) не вырабатывался. В настоящее время термин Газолин стал устаревшим, вместо него используют термин Газовый Бензин.

GAS PROCESSING PLANT = ГАЗОПЕРЕРАБАТЫВАЮЩИЙ ЗАВОД (или ЗАВОД ПО ПЕРЕРАБОТКЕ ГАЗА) – Gas Processing Plant is any facility which performs one or more of the following:- (i) removing liquefiable hydrocarbons from wet gas or casinghead gas, (ii) removing undesirable gaseous and particulate elements from natural gas, and (iii) removing water or moisture from the gas stream. / Любая установка, выполняющая одно или более из приводимых действий:- (i) выделение сжижаемых углеводородов из жирного газа (wet gas) или газа из буровой скважины (casinghead gas), (ii) выделение нежелательных газообразных и каких-либо конкретных элементов из природного газа, и (iii) выделение воды или влаги из газового потока.

GASSED YARN = ГАЗООПАЛЁННАЯ ПРЯЖА – Gassed Yarns are spun cellulose yarns passed over a heat source (or through a flame) to remove unwanted fibers on the surface. This gives a smoother surface but is not recommended at home. Cellulose fibers are quite flammible.

GASSING = ГАЗООПАЛИВАНИЕ (или ГАЗООПАЛКА, или ГАЗОВОЕ ОПАЛИВАНИЕ) – Gassing is an industrial defibrillation process for yarn, where yarn traveling at high speed passes through a gas flame in order to burn off fibers which poke out. The term gassing is usually reserved for treatment of yarn. Singeing is the term usually used for fabric. See also Singeing. / Смотрите также Опаливание или Опалка (Singeing).

GASSING = ГАЗООТДЕЛЕНИЕ (или ВЫДЕЛЕНИЕ ГАЗА) – Gassing:- gas by-products produced by the chemical reactions that occur when charging a battery. Since one of these gasses is often hydrogen, safety precautions must be taken to ensure proper ventilation to avoid the danger of explosion.

GAS TO LIQUIDS = ИЗ ГАЗА В ЖИДКОСТИ – Gas To Liquids (GTL) means the technology used for chemical conversion of natural gas into transportable liquids (diesel and naphtha) and specialty products (base oils). Gas-To-Liquids (GTL):- a process that converts natural gas into highquality liquid transportation fuels and other products.

GAS TURBINE = ГАЗОВАЯ ТУРБИНА – Gas Turbine is an engine that uses the energy of expanding gases passing through a multi-stage turbine to create rotating power. / Газовая Турбина – двигатель, который использует энергию . Под Газовой Турбиной понимается турбина, в лопаточном аппарате которой энергия газа, находящегося под давлением и имеющего высокую температуру, преобразуется в механическую работу на валу. Газовая турбина состоит из последовательно расположенных неподвижных лопаточных венцов соплового аппарата и вращающихся венцов рабочего колеса, образующих её проточную часть. Сопловой аппарат в сочетании с рабочим колесом составляет ступень турбины. Газовые турбины входят в состав газотурбинных двигателей. Нагревание сжатого газа может осуществляться в камере сгорания, ядерном реакторе и так далее. Различают Активные Турбины и Реактивные Турбины. Практически все газовые турбины – многоступенчатые турбины. В бывшем Союзе Советских Социалистических Республик (СССР) строили газовые турбины мощностью до 100 МВт; разрабатывались газовые турбины на 150 МВт. Газовая Турбина, тепловой двигатель непрерывного действия, в лопаточном аппарате которого энергия сжатого я нагретого газа преобразуется в механическую работу на валу. Нагревание сжатого газа может осуществляться в камере сгорания, ядерном реакторе и другом. Первые газовые турбины появились в конце XIX века как часть газотурбинного двигателя и по конструктивному выполнению были близки к паровой турбине. Газовая турбина представляет собой ряд последовательно расположенных неподвижных лопаточных венцов соплового аппарата и вращающихся венцов рабочего колеса, образующих её проточную часть. Сопловой аппарат в сочетании с рабочим колесом составляет Ступень Турбины. Ступень состоит из статора, в который входят неподвижные детали (корпус, сопловые лопатки, бандажные кольца), и ротора, представляющего собой совокупность вращающихся частей (рабочие лопатки, диски, вал). Газовая турбина классифицируют по направлению газового потока, количеству ступеней, способу использования теплоперепада и способу подвода газа к рабочему колесу. По направлению газового потока различают:- осевые газовые турбины (наиболее распространены) и радиальные, а также диагональные и тангенциальные газовые турбины. В осевых газовых турбинах поток в меридиональном сечении движется в основном вдоль оси турбины, в радиальных турбинах – перпендикулярно оси. Радиальные турбины могут быть центростремительными и центробежными. В диагональной турбине газ течёт под некоторым углом к оси вращения турбины. Рабочее колесо тангенциальной турбины не имеет лопаток, такие турбины применяются при очень малом расходе газа, например, в приборах. Газовые турбины бывают одноступенчатые и многоступенчатые. Число ступеней определяется назначением турбины, её конструктивной схемой, мощностью, развиваемой одной ступенью, а также срабатываемым перепадом давления. По способу использования располагаемого теплоперепада различают турбины со ступенями скорости, в рабочем колесе которых происходит только поворот потока, без изменения давления (активные турбины), и турбины со ступенями давления, в которых давление уменьшается как в сопловых аппаратах, так и на рабочих лопатках (реактивные турбины). Газ может подводиться к рабочему колесу по части окружности соплового

аппарата (парциальные газовые турбины) или по полной его окружности. Процесс преобразования энергии в многоступенчатой турбине состоит из ряда последовательных процессов в отдельных ступенях. Сжатый и подогретый газ с начальной скоростью поступает в межлопаточные каналы соплового аппарата, где в процессе расширения происходит преобразование части располагаемого теплоперепада в кинетическую энергию вытекающей струи. Дальнейшее расширение газа и преобразование теплоперепада в полезную работу происходит в межлопаточных каналах рабочего колеса. Поток газа, действуя на рабочие лопатки, создаёт крутящий момент на валу турбины. При этом абсолютная скорость газа уменьшается. Чем меньше эта скорость, тем большая часть располагаемой энергии газа преобразуется в механическую работу на валу турбины. Рабочие лопатки воспринимают усилия, возникающие как вследствие изменения направления скорости газа, обтекающего их (активное действие потока), так и в результате ускорения потока газа при его относительном движении в межлопаточных каналах (реактивное действие потока). Совершенство газовой турбины характеризуется эффективным коэффициентом полезного действия (кпд), представляющим собой отношение работы, снимаемой с вала, к располагаемой энергии газа перед турбиной. Эффективный кпд современных многоступенчатых турбин достигает 0.92–0.94. Большой вклад в развитие газовых турбин внесли Советские учёные Борис Сергеевич Стечкин (1891–1969), Николай Романович Брилинг (1876–1961), Владимир Васильевич Уваров (1899–1977), Георгий Сергеевич Жирицкий (1893–1966), К.В. Холщевиков, Иван Иванович Кириллов (1902–1993) и другие. Значительных успехов в создании газовых турбин для стационарных и передвижных газотурбинных установок достигли зарубежные фирмы (Швейцарские Браун, Бувери Унд Цие. (Brown, Boveri & Cie.), в которой работал известный Словацкий учёный Аурэль Штодоля (Aurel Stodola; 1859–1942), и Сульца (Sulzer), Американская Дьжэнерэл Илэктрик (General Electric) и другие). Дальнейшее развитие газовых турбин зависит от возможности повышения температуры газа перед турбиной, что связано с созданием жаропрочных материалов и надёжных систем охлаждения лопаток, совершенствования проточной части и другого.

GAS TURBINE PLANT = ГАЗОТУРБИННАЯ СТАНЦИЯ – Gas Turbine Plant is a plant in which the prime mover is a gas turbine. A gas turbine consists typically of an axial-flow air compressor, one or more combustion chambers, where liquid or gaseous fuel is burned and the hot gases are passed to the turbine and where the hot gases expand to drive the generator and are then used to run the compressor. / Под Газотурбинной Электростанцией понимается Тепловая Электростанция (ТЭС), в которой в качестве привода электрического генератора используется газовая турбина. Получили распространение газотурбинные электростанции с газотурбинными двигателями. Во многих странах тепловые блоки мощностью 500 МВт дополняются газотурбинными установками мощностью 25–100 МВт для покрытия пиковых нагрузок. Существуют газотурбинные электростанции с двумя-четырьмя турбоагрегатами на базе авиационных турбин, каждый мощностью 10–20 МВт. Газотурбинные электростанции используются в качестве основного источника электрической энергии на местах новых разработок месторождений полезных ископаемых, особенно нефтяных месторождений, где газотурбинные электростанции могут выработать на природном газе, а также в качестве резервных источников электроэнергии. Газотурбинные электростанции, как правило, автоматизированы и имеют дистанционное управление. Передвижные газотурбинные электростанции применяются сравнительно редко, так как их эксплуатационные характеристики значительно хуже, чем, например, дизельных электростанций. Перспективны комбинированные парогазотурбинные установки, в которых теплота отработавших газов может быть использована для подогрева воды или выработки пара низкого давления в паровом котле.

GAS UTILITY = ГАЗОСНАБЖАЮЩЕЕ ПРЕДПРИЯТИЕ (или ГАЗОРЕАЛИЗУЮЩЕЕ ПРЕДПРИЯТИЕ) – Gas Utilities are local distribution companies (LDCs) that own and operate the means for natural gas to be delivered to your home or business. The gas utility owns the infrastructure that delivers natural gas to factories, shops and homes in a given area. See also Utility. / Смотрите также Снабжающее Предприятие (Utility).

GAS WELL = ГАЗОВАЯ СКВАЖИНА – Gas Well is a well completed for production of natural gas from one or more gas zones or reservoirs. Such wells contain no completions for the production of crude oil. Wells producing both crude oil and natural gas are classified as Oil Wells. / Скважина, оборудованная для добычи природного газа из одной или более газоносных зон или резервуаров. Такие скважины не имеют оборудования для добычи нефти. Скважины, добывающие как нефть, так и природный газ классифицируются как Нефтяные Скважины (Oil Wells). Скважина – искусственная цилиндрическая горная выработка глубиной от нескольких метров до 10 километров и более и диаметром обычно 75–800 миллиметров. Скважины разделяются на взрывные, вспомогательные (вентиляционные, водоотливные и так далее), разведочные, специальные (дренажные, замораживающие и тому подобные), эксплуатационные (для добычи воды, газа, нефти и так далее). Проходка скважины осуществляется буровыми установками. Элементы скважины:- забой – дно; ствол или стенки – боковая поверхность; устье – выход на поверхность скважины. Буровая Скважина – цилиндрическая горная выработка, имеющая относительно малое поперечное сечение (обычно 75–350 миллиметров). Различают горнотехнические, исследовательские, строительные и эксплуатационные скважины.

GATE = ВХОДНЫЕ ВОРОТА (или ЗАТВОР, или ПРОХОД, или НАРУЖНЫЙ ЗАТВОР ДОК–БАССЕЙНА, или ВХОД С МОРЯ, или ВХОДНОЙ КАНАЛ, или ПОДХОД) – Gate is an access to the wharf is provided through a gate. Also known as Gatehouse. / Входной Рейд – часть внутренней акватории, примыкающая к входным воротам, предназначенная для маневрирования судов при следовании в заданный район порта или при выходе из него.

GATE = XX (или ДВЕРИ) – Gate is a side, or part of a side, of a box pallet or cage pallet, which may be hinged or removable for easier access to the contents. See also Pallet. / Двери (Gate):- стенка или часть стенки ящичного или сетчатого поддона, которая может быть шарнирной или съёмной, для обеспечения доступа к грузу. Смотрите также Поддон (Pallet).

GATE BOLT = ДВЕРНОЙ БОЛТ – Gate Bolt is a additional security device used either to prevent movement of a gate or for the assembly of a demountable box pallet. See also Pallet. / Дверной Болт (Gate Bolt):- Дополнительное устройство безопасности, применяемое для предотвращения перемещения двери или для сборки деталей разборного ящичного поддона. Смотрите также Поддон (Pallet).

GATE BRACKET = ДВЕРНАЯ ПЕТЛЯ – Gate Bracket is a shaped bracket into which a gate hook fits. See also Pallet. / Петля (Gate Bracket):- деталь, имеющая форму скобы, в которую вставляют дверной крючок. Смотрите также Поддон (Pallet).

GATE HOOK = ДВЕРНОЙ КРЮЧОК – Gate Hook is a hook, either L-shaped or straight, for fastening rails or gates to a post pallet or a box pallet. See also Pallet. / Дверной Крючок (Gate Hook):- деталь L-образной или прямоугольной формы, применяемая для закрывания поперечин или дверей в ящичных и стоечных поддонах. Смотрите также Поддон (Pallet).

GATEHOUSE = ВХОДНЫЕ ВОРОТА (или ПРОХОД, или НАРУЖНЫЙ ЗАТВОР ДОК–БАССЕЙНА, или ЗАТВОР, или НАРУЖНЫЙ ЗАТВОР ДОК–БАССЕЙНА, или ВХОД С МОРЯ, или ВХОДНОЙ КАНАЛ, или ПОДХОД) – (1) Gatehouse is an entry to wharf or terminal areas. Also known as Gate. / Входной Рейд – часть внутренней акватории, примыкающая к входным воротам, предназначенная для маневрирования судов при следовании в заданный район порта или при выходе из него.

(2) A Gatehouse, Gate House, or Valve House for a dam is a structure housing sluice gates, valves, or pumps (in which case it is more accurately called a Pumping Station). Many gatehouses are strictly utilitarian, but especially in the XIX century, some were very elaborate.

GATEWAY = ВХОД (или ПРОХОД) – (1) Gateway (in shipping) is a point at which freight moving from one territory to another is interchanged between transportation lines. For example, the Port of Savannah is considered by many to be the gateway to the Southeastern United States for containerized cargo, while the Port of Brunswick is growing in reputation as the South-Eastern gateway for auto movement.

(2) Electronic Gateway, e.g., at the Swiss Exchange, linking trader systems with the exchange system. Guarantees equal treatment of exchange members. / , например, .

(3) Gateway (in computers):- computers, like bridges and routers, are a method of connecting two local area networks. Gateways translate between two LAN protocols. Gateways are protocol-specific and can only translate between two types of networks, not directly to PCs.

(4) In the context of travel activities, Gateway refers to a major airport or seaport. Internationally, gateway can also mean the port where customs clearance takes place.

GATHER WAY = НАБИРАТЬ ХОД – Gather Way (maritime term):- to attain headway (to get going or pick up speed).

GATS = GENERAL AGREEMENT ON TRADE IN SERVICES

GATT = GENERAL AGREEMENT ON TARIFFS AND TRADE

GAU = GROUP ART UNIT

GAUGE = ПЕТЛЯ (или СТЕЖОК, или ПЕТЕЛЬНЫЙ ШАГ, или КАЛИБР, или СОРТАМЕНТ (проволоки), или МЕРКА, или ПРИБОР) – (1) Gauge is a generic term for various measurement instruments such as pressure or thickness gauges. / является обобщённым термином для разнообразных измерительных приборов, таких как .

(2) Gauge is a measurement most commonly associated with knitting equipment. It can mean the number of needles per inch in a knitting machine. However, in full fashioned hosiery and sweater machines, the number of needles per 1-1/2 inches represents the gauge. Gauge is the number of needles per given distance in a knitting machine. The number of needles per unit length (usually 1 inch) along a needle bed or needle bar or flat knitting machine. For circular knitting machines, the unit length is the circumference of the needle cylinder. Gauge is the number of needles per linear inch of the needle bar. For most warp knits that refers to a one linear inch, but can be for two. / число игл на единицу длины. Шаг – число игл на погонный дюйм фонтуры (или игольницы). Для большинства основовязаных трикотажных полотен это относится к одному погонному дюйму, но может также относиться и к двум погонным дюймам. Шаг – расстояние между иглами. Класс Трикотажа – показатель количества игол в одном дюйме вязальной машины (1 дюйм равен 25.4 мм). Пример:- в изделии 8 класса, на один дюйм приходится восемь игл, то есть расстояние между иглами примерно 3 мм, а в 3 классе расстояние между иглами примерно 8 мм. Другими словами, чем выше класс, тем тоньше изделие и наоборот. Трикотажная Игла, петлеобразующий орган вязальных машин. Наиболее распространены крючковые, язычковые и составные иглы. Изготовляются из высокоуглеродистой стальной проволоки или ленты.

(3) Gauge (ga) is a unit expressing the fineness of a knitted fabric, equal to the number of loops per 1.5 inches (38.1 millimeters). The same unit is also used to express the size of the knitting needles used to create a fabric of that fineness. Gauge is the number of wales per inch in a knit fabric. / единица, отражающая тонину трикотажной ткани, равная числу петель на 1.5 дюйма (38.1 миллиметров).

(4) Gauge is the thickness of the knitting needle in the shank and the hook.

(5) Gauge is the number of wales per inch in a knit fabric.

(6) On spinning or twisting frames, Gauge is the distance from the center of one spindle to the center of the next spindle in the same row. / В контексте с прядильными или крутящими станками, расстояние от центра одного веретена до центра следующего веретена в одном и том же ряду. Под Веретеном или Шпинделем, от Немецкого слова Spindel, означающее Веретено, понимается .

(7) Gauge is a means of designating wool or mohair, primarily according to the fineness or length of fiber. There are three major ways to determine and refer to them:- blood grade, Bradford count, and micron measure.

(8) Gauge (ga) is a traditional unit measuring the interior diameter of a shotgun barrel. The gauge of a shotgun was the number of lead balls, each of a size just fitting inside the barrel, that were required to make up a pound. In other words, if a lead ball weighing 1/12 pound just fit in the barrel of a shotgun, then it was a 12-gauge shotgun. Notes:- (i) In some cases it is customary to state the diameter directly in inches:- a '.410 gauge' shotgun, more properly called .410 bore, has a bore diameter of 0.41 inch. This measurement is really the caliber rather than a gauge. (ii) The gauge number is intended to be the number of lead balls per pound, the balls being of a size that will just fit into the barrel. Today, the internal diameters for each gauge number are read from a table. / Под Калибром, от Французского слова Calibre, понимается диаметр канала ствола огнестрельного оружия. В бывшем Союзе Советских Социалистических Республик (СССР) и ряде стран – расстояние между противоположными полями – выступами нарезов. В Соединённых Штатах Америки (США), Великобритании и ряде других стран – расстояние между углублениями – нарезами. Одна из основных величин, определяющих мощь оружия. У современных артиллерийских орудий калибр выражают в миллиметрах (мм), дюймах (25.4 мм), линиях (2.54 мм). Калибр охотничьих ружей – число круглых пуль, отлитых для ружья данного калибра из 453.6 грамм свинца.

Gauge	6	10	12	14	16	20	24	28	32
Bore diameter (millimeters)	23.3	19.7	18.5	17.6	16.8	15.6	14.7	14.0	13.4
Bore diameter (inches)	0.92	0.77	0.73	0.69	0.66	0.615	0.58	0.55	0.526

(9) Gauge (ga) is a traditional unit measuring the diameter (or the cross-sectional area) of a wire. Various wire gauge scales have been used in the United States and Britain. In traditional scales, larger gauge numbers represent thinner wires. For very thick wires, repeated zeros are used instead of negative numbers, so gauges 00, 000, and 0000 represent -1, -2, and -3, respectively. In the American Wire Gauge (AWG) scale, 0000 gauge represents a wire having a diameter of 0.46 inch and 36 gauge represents a diameter of 0.005 inch (5 mils). Diameters for the other gauges are obtained by geometric interpolation, meaning that the ratio between successive diameters is a constant, except for necessary roundoff. Thus n gauge wire has a diameter of $.005 \cdot 92^{((36-n)/39)}$ inch. The metric wire gauge number is equal to 10 times the diameter of the wire, in millimeters; thus a metric 8 gauge wire has diameter 0.8 millimeters. A table of wire gauge equivalents is provided. Note that 4/0 (pronounced 'four aught') is an abbreviation for 0000, 2/0 for 00, and so on. Origin of wire sizing:- the way wire is made leads to a 'natural' series of sizes. A rod (made in a rolling mill) is heated and pulled through a hole whose diameter is slightly smaller than the rod's. This process is repeated through ever-smaller holes until the wire is as fine as desired. To reduce the number of steps for economy's sake, the manufacturer would like the change in size at each drawing to be as large as possible; on the other hand if the change in size is too great the wire will break while being drawn. Older wire gauges like the Birmingham, Washburn & Moen, and Lancashire came from calling the wire from the first drawing number 1, from the second drawing #2, and so on. Note that the higher the number, the finer the wire. Washburn & Moen Wire Gauge:- also called the Steel Wire Gage, Roebling, and the American Steel and Wire Co. Established about 1830 and named after the Washburn and Moen Manufacturing Company, which was later merged into the American Steel and Wire Co. Imperial Wire Gauge, or British Standard Gauge:- legalized Standard Wire Gauge, Imperial Standard Wire Gauge, or in other countries, simply British Standard. Abbreviated SGW or ISGW. Fixed by order of council 1883-August-23. It was constructed by improving the Birmingham wire gage. Made legal standard 1884-March-01. Birmingham Wire Gauge:- the steps are irregular. Departmental sanction by the United States government ended in 1914. Stub's Steel Wire Gauge:- used for drill rod and tool steel wire. It is the basis of, though not identical to, the numbered sizes of American Standard twist drills. Note that there is also a Stub's Iron Wire Gauge. Brown & Sharpe, or American Wire Gauge (AWG):- used in the United States since at least the 1880s for wires in all metals except iron and steel. Number 0000 wire is 0.4600 inch in diameter. The diameter of each succeeding size is 0.890 525 times the diameter of the previous size. / Стил Вайэ Гэйдьж (Steel Wire Gage), Ройблин (Roebling). Амэрикэн Стил энд Вайэ Ко. (American Steel and Wire Co.) Вошбён энд Моэн Мэньюфакшэринь Кампэни (Washburn and Moen Manufacturing Company). Браун Энд Щап (Brown & Sharpe). (10) Gauge (ga) is a traditional unit measuring the thickness of sheet metal. Larger gauge numbers represent thinner metal:- 10 gauge represents a thickness of 0.134 5 inch (3.416 millimeters) and each increase of 1 in the gauge number corresponds to a reduction of about 10% in the thickness. A table is provided.

Gauge (ga)	Standard Steel Thickness (inches)	Galvanized Steel Thickness (inches)	Aluminum Thickness (inches)

(11) Gauge (ga) is a traditional unit measuring the thickness of plastic film. For this purpose 1 gauge equals 0.01 mil or 10^{-5} inch (0.254 micrometer). / 0.01 мил или .

(12) Gauge (ga) is a traditional unit measuring the thickness of tennis racquet strings. There are two systems in use. In the US system larger gauge numbers indicate thinner strings; in the European system larger gauge numbers indicate thicker strings. This table compares the US and European gauge numbers measuring the thickness of tennis racket strings.

US Gauge	14	15	15L	16	16L	17	18	19	20
European Gauge	11	9.5	9	8.5	8	7.5	7	4	3.5
Millimeters	1.50 – 1.65	1.41 – 1.49	1.33 – 1.41	1.26 – 1.34	1.22 – 1.30	1.16 – 1.24	1.06 – 1.16	0.90 – 1.06	0.80 – 0.90

(13) Gauge, also spelled Gage, in manufacturing and engineering, a device used to determine, either directly or indirectly, whether a dimension is larger or smaller than another dimension that is used as a reference standard. Some devices termed gauges may actually measure the size of the object to be gauged, but most gauges merely indicate whether the dimensions of the test object are sufficiently close to those of the standard; i.e. whether they are in the range between set limits, known as the Tolerance, for a particular object. Gauges may operate mechanically or electrically. Gauges are usually regarded as either fixed-type or deviation-type instruments. Fixed-type gauges are used to indicate whether a given dimension is larger or smaller than the standard. They may be of hard steel,

soft steel, or glass. Sometimes chrome plating or tungsten-carbide coatings are used to prevent wear. Plug, ring, snap, and limit gauges are fixed gauges usually made to satisfy special requirements. To check the accuracy of a hole, a cylindrical bar (plug gauge) with highly finished ends of different diameters is used. If the hole size is correct within tolerable limits, the small end (marked 'go') will enter the hole, while the large end ('not go') will not. Ring gauges for checking the dimensions of cylindrical parts also utilize the tolerance principle, with 'go' and 'not go' sections. A snap gauge is formed like the letter C, with outer 'go' and inner 'not go' jaws, and is used to check diameters, lengths, and thicknesses. Flush-pin gauges have one moving part and are used to gauge the depth of shoulders or holes. Form gauges are used to check the profile of objects; two of the most common types are radius gauges, which are packs of blades with both concave and convex circular profiles that are used to check the radii of grooves and corners, and screw-thread pitch gauges, which are blades with triangular serrations spaced to correspond with various pitches, or numbers of threads per inch or per centimeter. Gauge blocks, also known as Johannsson Blocks, after their inventor, came into significant industrial use during World War I. They are small steel blocks, usually rectangular, with two exceptionally flat surfaces parallel to each other and a specified distance apart. They are sold as sets of blocks that can be wrung together in increments of ten-thousandths of an inch to gauge almost any linear dimension. Angle-gauge blocks can be put together to measure angles. Deviation-type gauges indicate the amount by which the object being gauged deviates from the standard. This deviation is usually shown in units of measurement, but some gauges show only whether the deviation is within a certain range. They include dial indicators, in which movement of a gauging spindle deflects a pointer on a graduated dial; wiggler indicators, which are used by machinists to centre or align work in machine tools; comparators, or visual gauges; and air gauges, which are used to gauge holes of various types. Very precise measurements may also be obtained by the use of light-wave interference, but the instruments that do so are referred to as Interferometers. / жёлоб или паз (groove).

GAUGE LENGTH = ОТКАЛИБРОВАННАЯ ДЛИНА (или МЕРНАЯ ДЛИНА, или РАСЧЁТНАЯ ДЛИНА, или ДЛИНА ОБРАЗЦА, или ДЛИНА ЗАЗОРА, или ДЛИНА ПРОМЕЖУТКА) – Gauge Length is a length of a specimen under specified pre-tension measured from nip-to-nip of the jaws of holding clamps in their starting position at the beginning of the test. Gauge Length is the distance between two effective clamping points of a testing device. / Длина образца удерживающих зажимов в их начальной позиции в момент начала теста.

GAUGE WIRE = ОТКАЛИБРОВАННАЯ ПРОВОЛОКА (или МЕРНАЯ ПРОВОЛОКА) – Gauge Wire is used with an extra filling yarn during weaving, this type of standing wire controls the height of fabric pile. / используется с экстра уточной пряжей втечение ткачества, .

GAUNTLET = РУКАВИЦА (или КРАГА, или ОБШЛАГ, или XX) – Gauntlet is a glove worn with medieval armor to protect the hand; any of various protective gloves used especially in industry; a dress glove extending above the wrist. / Обшлаг или Крага перчатки.

GAUZE = МАРЛЯ (или БАРЕЖ) – Gauze is a thin, sheer, open, loosely woven, plain-weave cotton fabric with widely spaced yarns, used for diapers and surgical dressings. It can also be made of wool, silk, rayon, or other man-made fibers. Some weights are stiffened for curtains, trimmings of dresses, and other decorative or apparel purposes. Gauze is a thin, translucent fabric with a loose, open weave that is usually made of cotton or silk. It is used to make apparel such as blouses and dresses, home décor items such as curtains, or even medical bandages. Gauze:- made of several types of construction, 30's yarn is often used for the typical cloth. Textures vary considerably depending upon the ultimate use. The warp in gauze is carefully sized, then desized so that total absorbency is obtained without entailing loss of weaving production. This plain weave, lightweight cloth finds use in bandages, sanitary goods, surgical dressings, etc. Fine gauze is made of 60's yarn and has about the same uses as ordinary gauze. One of the chief uses is for tea bags. See also Surgical Gauze. Gauze is a thin, sheer plain-weave fabric made from cotton, wool, silk, rayon, or other manufactured fibers. End-uses include curtains, apparel, trimmings, and surgical dressings. Gauze is a thin, sheer-woven fabric in which each filling yarn in encircled by two warp yarns twisted around each other, gauze is similar to cheesecloth. It may by made of silk, cotton, wool, or manufactured fibers. Cotton gauze is primarily for surgical dressings. Gauze is a thin often transparent fabric used chiefly for clothing or draperies. Gauze is a light, see-through, openwork fabric that takes its name from the city of Gaza, obtained by crossing straight threads and twisted threads to stop the threads slipping; by extension, any openwork taffeta fabric. / каждая уточная пряжа . Бареж – ткань перевивочного переплетения. Под Марлей, от Французского слова Marli, означающее Кисея, понимается лёгкая, прозрачная, гигроскопичная хлопковая ткань, обычно белого цвета. Употребляется как перевязочный материал, а также в швейном производстве, в полиграфии и так далее. Марля – лёгкая, прозрачная, рыхлая, гигроскопичная хлопчатобумажная ткань полотняного переплетения. Марля выпускается отбеленная реже суровая. Употребляется как перевязочный материал, а также для швейного приклада, наклейки карт и тому подобного. Бареж – сорт шёлковой ткани, изготовленной в так называемой газовой технике, когда при переплетении нити основы и утка не прибиваются плотно друг к другу, а только слегка соприкасаются. Шёлковый бареж в XIX веке был одной из самых дорогих тканей, пока для его изготовления не стали использовать отходы прядения, соединяя шёлковую некручёную основу с хлопчатобумажным или шерстяным утком. Вышел из моды в конце XIX века. Название происходит от города Бареж (Barège) во Франции, места первоначального изготовления ткани.

GAWI = GERMAN CORPORATION FOR TECHNICAL ASSISTANCE TO DEVELOPING COUNTRIES

GAYLORD = ГЭЙЛОД (или ПЕДИК, или КОРОБ СО СЪЁМНЫМ ДНОМ И КРЫШКОЙ) – Gaylord is a large corrugated carton that has the same length and width as a pallet. Gaylords are usually used to protect loose parts in bulk and are frequently used in manufacturing. Each gaylord is usually used to store a single, distinct part or product. Many objects can be used to cushion products stored in gaylords, one of which is packing peanuts.

GAZAR = ГЭЗАР (или ГАЗАР) – Gazar is a silk organza, a sheer, lightweight fabric with a plain weave, of silk or, sometimes, a synthetic fiber, having a glazelike sheen and moderate stiffness. An example of Gazar is the crisp silk used in a wedding dress. Gazar is a loosely woven silk with a crisp finish. Origin of Gazar:- probably ultimately from Arabic Qazz (Raw Silk). Gazar (also Gazaar) is a silk or wool plain weave fabric made with high-twist double yarns woven as one. Gazar has a crisp hand and a smooth texture. Silk gazar is much used in bridal and evening fashion due to its ability to hold its shape. Gazar was developed by the Swiss textile firm Alexander in collaboration with Basque couturier Cristóbal Balenciaga, who featured silk gazar in his collections of 1960–68. Balenciaga's mastery of this gleaming, lightweight fabric with its 'claylike' ability to hold its shape was exemplified by the trapezoid wedding gowns in his collections of 1967 and 1968. / была разработана Швейцарской текстильной фирмой Александа (Alexander) Кристобаль Баленсиага (Cristóbal Balenciaga).

GEAR = ПЕРЕДАЧА (или ЗУБЧАТАЯ ПЕРЕДАЧА, или ПРИВОД, или ЗУБЧАТОЕ КОЛЕСО, или ШЕСТЕРНЯ, или ТРАНСМИССИЯ) – Gear is a machine part which transmits motion and force by means of successively engaging projections, called Teeth. The smaller gear of a pair is called The Pinion; The Larger, The Gear. When the pinion is on the driving shaft, the gear set acts as a speed reducer; when the gear drives, the set acts as a speed multiplier. The basic gear type is the spur gear, or straight-tooth gear, with teethe cut parallel to the gear axis. Spur gears transmit power in applications utilizing parallel shafts. In this type of gear, the teeth mesh along their full length, creating a sudden shift in load from one tooth to the next, with consequent noise and vibration. This problem is overcome by the helical gear, which has teeth cut at an angle to the center of rotation, so that the load is transferred progressively along the length of the tooth from one edge of the gear to the other. When the shafts are not parallel, the most common gear type used is the bevel gear, with teeth cut on a sloping gear face, rather than parallel to the shaft. The spiral bevel gear has teeth cut at an angle to the plane of rotation, which, like the helical gear, reduces vibration and noise. A hypoid gear resembles a spiral bevel gear, except that the pinion is offset so that its axis does not intersect the gear axis; it is widely used in automobiles between the engine driveshaft and the rear axle. Offset of the axes of hypoid gears introduces additional sliding between the teeth, which, when combined with high loads, requires a high-quality extreme pressure (EP) oil. A worm gear consists of a spirally grooved screw moving against a tooth wheel; in this type of gear, where the load is transmitted across sliding, rather than rolling surfaces, compounded oils or EP oils are usually necessary to maintain effective lubrication. See also Bevel Gear, Helical Gear, Hypoid Gear, Open Gear, Pinion, Spur Gear, and Worm Gear. Xxxxx. What's the Difference Between Spur, Helical, Bevel, and Worm Gears? Gears are a crucial part of many motors and machines. Gears help increase torque output by providing gear reduction and they adjust the direction of rotation like the shaft to the rear wheels of automotive vehicles. Here are some basic types of gears and how they are different from each other. Spur Gears are the helical gears have a smoother operation due to the angle twist creating instant contact with the gear teeth. Spur gears are mounted in series on parallel shafts to achieve large gear reductions. The most common gears are spur gears and are used in series for large gear reductions. The teeth on spur gears are straight and are mounted in parallel on different shafts. Spur gears are used in washing machines, screwdrivers, windup alarm clocks, and other devices. These are particularly loud, due to the gear tooth engaging and colliding. Each impact makes loud noises and causes vibration, which is why spur gears are not used in machinery like cars. A normal gear ratio range is 1:1 to 6:1. Helical Gears:- helical gears operate more smoothly and quietly compared to spur gears due to the way the teeth interact. The teeth on a helical gear cut at an angle to the face of the gear. When two of the teeth start to engage, the contact is gradual – starting at one end of the tooth and maintaining contact as the gear rotates into full engagement. The typical range of the helix angle is about 15 to 30 deg. The thrust load varies directly with the magnitude of tangent of helix angle. Helical is the most commonly used gear in transmissions. They also generate large amounts of thrust and use bearings to help support the thrust load. Helical gears can be used to adjust the rotation angle by 90 deg. when mounted on perpendicular shafts. Its normal gear ratio range is 3:2 to 10:1. Bevel Gears:- bevel gears are used to change the direction of a shaft's rotation. Bevel gears have teeth that are available in straight, spiral, or hypoid shape. Straight teeth have similar characteristics to spur gears and also have a large impact when engaged. Like spur gears, the normal gear ratio range for straight bevel gears is 3:2 to 5:1. Spiral teeth operate the same as helical gears. They produce less vibration and noise when compared to straight teeth. The right hand of the spiral bevel is the outer half of the tooth, inclined to travel in the clockwise direction from the axial plane. The left hand of the spiral bevel travels in the

counterclockwise direction. The normal gear ratio range is 3:2 to 4:1. In the hypoid gear above, the larger gear is called the Crown while the small gear is called the Pinion. Hypoid gears are a type of spiral gear in which the shape is a revolved hyperboloid instead of conical shape. The hypoid gear places the pinion off-axis to the ring gear or crown wheel. This allows the pinion to be larger in diameter and provide more contact area. The pinion and gear are often always opposite hand and the spiral angle of the pinion is usually larger then the angle of the gear. Hypoid gears are used in power transmissions due to their large gear ratios. The normal gear ratio range is 10:1 to 200:1. Worm Gears are used in large gear reductions. Gear ratio ranges of 5:1 to 300:1 are typical. The setup is designed so that the worm can turn the gear, but the gear cannot turn the worm. The angle of the worm is shallow and as a result the gear is held in place due to the friction between the two. The gear is found in applications such as conveyor systems in which the locking feature can act as a brake or an emergency stop. / высококачественное масло для сверхвысокого давления. Под Трансмиссией, от Латинского слова Transmissio, означающее Передача или Переход, понимается устаревшее название Силовой Передачи. Трансмиссия – устройство для передачи механической энергии от двигателя к исполнительным органам машины либо к другим рабочим машинам (станкам, мельницам и тому подобным). Передача вращения от трансмиссии (трансмиссионного вала) к рабочим машинам обычно производится приводными ремнями (контрпривод). В современной технике под трансмиссией понимается вся совокупность передаточных устройств от вала двигателя до рабочих органов машины, на которой он установлен. Так, в автомобиле или тракторе в состав механической трансмиссии входят силовая передача, сцепление, карданная передача, дифференциальный механизм и другие устройства. На тепловозах, судах, грузовых автомобилях, тракторах используются также гидромеханические (гидротрансформатор и механическая коробка передач), гидрообъёмные (гидронасос с гидромоторами) и электромеханические (генератор и электродвигатели) трансмиссии. Под Силовой Передачей понимается механизм, предназначенный для передачи энергии от двигателя к её потребителям с увеличением сил (вращающих моментов) за счёт уменьшения скорости (частоты вращения), а иногда – для изменения характера движения. Под Передачей понимается механизм, служащий для передачи движения, как правило, вращательного, с преобразованием скорости и соответственным изменением вращающего момента. При помощи передачи решаются следующие задачи:- (i) понижение (реже повышение) скорости; (ii) ступенчатое или бесступенчатое регулирование скорости в широком диапазоне при постоянной мощности; (iii) изменение направления движения; (iv) преобразование вращательного движения в поступательное, винтовое и другое; и (v) приведение в движение одним двигателем нескольких механизмов. Основные характеристики передачи:- передаваемый вращающий момент, частота вращения на входе (или на выходе), передаточное отношение, и коэффициент полезного действия (КПД). Различают:- (i) Гидравлические Передачи; (ii) Механические Передачи; (iii) Пневматические Передачи; и (iv) Электрические Передачи. Механические Передачи, основанные на использовании зацепления (Зубчатая Передача, Цепная Передача, Червячная Передача и другие) и трения (Ремённая Передача, Фрикционная Передача и другие), оплучили распространение в приводах с постоянным передаточным отношением, а также в приводах малой и средней мощности с изменяемым передаточным отношением, коробках скоростей и вариаторах станков, автомобилей, тракторов. Гидравлические и Электрические Передачи, позволяющие передавать большие мощности и имеющие простую и удобную систему автоматического регулирования, применяются в различных областях техники, особенно в приводах тяжёлых транспортных машин. Пневматические Передачи используются при больших частотах вращения выходного звена (например, до 30 000 оборотов в минуту (об/мин) во внутришлифовальных станках). Передача в машинах, механизм, служащий для передачи непрерывного вращательного движения. При помощи передачи в различных приводах осуществляют понижение (или повышение) скорости; ступенчатое или бесступенчатое регулирование скорости; изменение направления движения; приведение в движение нескольких механизмов одним двигателем. Основные характеристики передачи:- передаваемый момент, угловая скорость, передаточное число, коэффициент полезного действия (КПД). Различают следующие типы передач:- механический (в том числе с твёрдыми звеньями, гидравлический, пневматический) и электрический. Механические передачи, основанные на использовании зацепления, например, зубчатая передача, цепная передача, червячная передача, и передача трения, например, ремённая передача и фрикционная передача, получили распространение в приводах с постоянным передаточным отношением, а также в приводах малой и средней мощности с изменяемым передаточным отношением:- в коробках скоростей и вариаторах станков, автомобилей, тракторов. Гидравлические и электрические передачи, позволяющие передавать большие мощности и имеющие простую и удобную систему автоматического регулирования, применяются в различных областях машиностроения, особенно в приводах тяжёлых транспортных машин. Под Зубчатой Передачей понимается механизм для передачи вращательного движения между валами и изменения частоты вращения, состоящий из зубчатых колёс (либо зубчатого колеса и рейки) или из червяка и червячного колеса. Простейшая одноступенчатая зубчатая передача состоит из стойки, ведущего и ведомого колёс. Многоступенчатая зубчатая передача образуется последовательным соединением нескольких одноступенчатых. По виду зубьев различают:- прямозубые, косозубые (винтовые) и шевронные (комбинированные) зубчатые передачи. По расположению осей вращения различают:- цилиндрические (параллельные оси), конические (пересекающиеся оси) и гиперболоидные (скрещивающиеся оси) зубчатые передачи. Зубчатые передачи могут быть встроены в механизм или выполнены в виде самостоятельного агрегата – редуктора. К зубчатым передачам относятся коробки скоростей, планетарные передачи, дифференциальные механизмы и другие. Зубчатые передачи с гибким зубчатым колесом называются Волновой Передачей. Зубчатая Передача, механизм, состоящий из колёс с зубьями, которые сцепляются между собой и передают вращательное движение, обычно преобразуя угловые скорости и крутящие моменты. Зубчатые передачи разделяют по взаимному расположению осей на передачи:- с параллельными осями – цилиндрические; с пересекающимися осями – конические, а также редко применяемые цилиндро-конические и плоско-цилиндрические; с перекрещивающимися осями – зубчато-винтовые (червячные, гипоидные и винтовые). Частным случаем зубчатой передачи является зубчато-реечная передача, преобразующая вращательное движение в поступательное или наоборот. В большинстве машин и механизмов применяют зубчатые передачи с внешним зацеплением, то есть с зубчатыми колёсами, имеющими зубья на внешней поверхности, реже – с внутренним зацеплением, при котором на одном колесе зубья нарезаны на внутренней поверхности. Зубчатые колёса выполняют:- с прямыми зубьями для работ при невысоких и средних скоростях в открытых передачах и в коробках скоростей; с косыми зубьями для использования в ответственных передачах при средних и высоких скоростях (свыше 30% всех цилиндрических зубчатых колёс); с шевронными зубьями для передачи больших моментов и мощностей в тяжёлых машинах; с круговыми зубьями – во всех ответственных конических зубчатых передачах. Как правило, в машинах и механизмах применяют зубчатые передачи с постоянным Передаточным Числом:- $i = w_1 / w_2 = z_2 / z_1$, где w_1, z_1 и w_2, z_2 – угловая скорость и число зубьев соответственно быстроходного и тихоходного зубчатых колёс. Зубчатые передачи с переменным передаточным числом осуществляют некруглыми цилиндрическими колёсами, которые ведомому элементу сообщают заданную плавно изменяющуюся скорость при постоянной скорости ведущего. Такие зубчатые передачи применяют редко. Передаточное число одной пары колёс в редукторах обычно до 7, в коробках скоростей – до 4, в приводах столов станков – до 20 и более. Окружные скорости для высокоточных прямозубых зубчатых передачах – до 15 метров в секунду (м/сек), для косозубых – до 30 м/сек, в быстроходных передачах скорости достигают 100 м/сек и более. Зубчатые передачи являются наиболее рациональным и распространённым видом механических передач. Их применяют для передачи мощностей – от ничтожно малых до десятков тысяч килоВатт (кВт),

для передачи окружных усилий от долей грамма до 10 МегаНьютонов (МН) (1 000 тонн силы (тс)). Основные достоинства зубчатой передачи:- значительно меньшие габариты, чем у других передач; высокий коэффициент полезного действия (кпд) (потери в точных, хорошо смазываемых передачах 1–2%, в особо благоприятных условиях 0.5%); большая долговечность и надёжность; отсутствие проскальзывания; малые нагрузки на валы. К недостаткам зубчатой передачи можно отнести шум при работе и необходимость точного изготовления. Зубчатые колёса находятся в так называемом Зубчатом Зацеплении, основной кинематической характеристикой которого является постоянство мгновенного передаточного отношения при непрерывном контакте зубьев. При этом общая нормаль (линия зацепления) к профилям зубчатых колёс в любой точке их касания должна проходить через полюс зацепления. В цилиндрических передачах полюсом зацепления является точка касания начальных окружностей зубчатых колёс, то есть окружностей, которые катятся друг по другу без скольжения. Диаметры начальных окружностей d_1 и d_2 можно определить из соотношений:- $d_1 = 2A / (1 + i)$; $d_2 = 2Ai / (1 + i) = d_1 i$, где A – межосевое расстояние (расстояние между осями колёс). Указанному условию удовлетворяют многие кривые, в частности эвольвенты, которые наиболее выгодны для профилирования зубьев с точки зрения сочетания эксплуатационных и технологических свойств, поэтому эвольвентное зацепление получило преимущественное применение в машиностроении. Колёса с эвольвентным профилем могут быть нарезаны одним инструментом, независимо от числа зубьев и так, чтобы каждое эвольвентное колесо могло входить в зацепление с колёсами, имеющими любое число зубьев. Профиль зубьев инструмента может быть прямолинейным, удобным для изготовления и контроля. Эвольвентное зацепление мало чувствительно к отклонениям межосевого расстояния. Контакт профилей зубьев происходит в точках линии зацепления, проходящей через полюс зацепления касательно к основным окружностям с диаметрами $d_{01} = d_1 \cos \alpha$ и $d_{02} = d_1 \cos \alpha$, где α – угол зацепления. Основной размерный параметр эвольвентных и других зубчатых зацеплений – модуль m, равный отношению диаметра делительной окружности зубчатого колеса $d_д$ к числу зубьев z. Для некорригированных эвольвентных зацеплений (смотрите Корригирование Зубчатых Колёс) начальные и делительные окружности совпадают:- $d_1 = d_{д1} = mz_1$ и $d_2 = d_{д2} = mz_2$. Профиль так называемой Производящей Рейки при образовании зубчатого колеса очерчивается по исходному контуру основной рейки, которая получается при увеличении числа зубьев нормального эвольвентного зубчатого колеса до бесконечности. Зубья производящей рейки имеют увеличенную высоту $h = (h' + h'')$ для образования радиального зазора в зацеплении ($c_o m$), толщину по делительной окружности s, радиус закругления r_i, шаг зацепления t, угол зацепления $\alpha_д$. В косозубых колёсах исходный контур принимают в сечении, нормальном к линии зуба. В конической зубчатой передаче начальные цилиндры заменяются начальными конусами. Профили зубьев приближённо рассматриваются как линии пересечения боковых поверхностей зубьев с дополнительными конусами, соосными начальным, но с образующими, перпендикулярными образующим начальных конусов. Модуль, начальные и делительные окружности измеряют на внешнем дополнительном конусе. Для удобства профилирования зубьев дополнительные конусы развертывают на плоскость. Эвольвентное зацепление может быть улучшено корригированием. Кроме эвольвентного зацепления, в часовых механизмах и некоторых других приборах применяют циклоидальное зацепление, работающее с меньшими потерями на трение и позволяющее применять зубчатые колёса с малым числом зубьев, но не обладающее указанными достоинствами эвольвентного зацепления. В тяжёлых машинах наряду с эвольвентными передачами применяют круговинтовые передачи, предложенные в 1950-х Советским учёным Михаилом Леонтьевичем Новиковым (1925–1956). Профили зубьев колёс в зацеплении Новикова очерчиваются дугами окружностей. Выпуклые зубья одного зубчатого колеса (обычно малого) контактируют с вогнутыми зубьями другого. Начальное касание (без нагрузки) происходит в точке. В передаче Новикова зубчатые колёса косозубые. Точки контакта зубьев перемещаются не по высоте зубьев, а только в осевом направлении, таким образом, линия зацепления параллельна осям колёс. К достоинствам таких зубчатых передач относятся:- пониженные контактные напряжения, благоприятные условия для образования масляного клина, возможность применения колёс с малым числом зубьев и, следовательно, большие передаточные числа. Несущая способность передач Новикова по критерию контактной прочности существенно выше, чем эвольвентных. Для удовлетворительной работы зубчатой передачи необходима достаточная их точность. Для зубчатых передач предусмотрено 12 степеней точности, выбираемых в зависимости от назначения и условий работы передачи. Основные причины выхода из строя зубчатых передач – поломки зубьев, усталостное выкрашивание поверхностных слоёв зубьев, абразивный износ, заедание зубьев (наблюдаемое при разрушении масляной плёнки от больших давлений или высоких температур). Основными материалами для зубчатых колёс являются легированные стали, подвергаемые термической или химико-термической обработке:- поверхностной закалке, преимущественно токами высокой частоты, объёмной закалке, цементации, нитроцементации, азотированию, цианированию. Зубчатые передачи из сталей, улучшаемых термообработкой до нарезания зубьев, изготовляют при отсутствии жёстких требований к их габаритам, чаще всего в условиях мелкосерийного и индивидуального производства. При особых требованиях к бесшумности и малых нагрузках одно из зубчатых колёс делают из пластмассы (текстолита, капролона, древеснослоистых пластиков, полиформальдегида), а сопряжённое – из стали. Зубчатые передачи рассчитывают на прочность по напряжениям изгиба в опасном сечении у основания зубьев и по контактным напряжениям в полюсе зацепления. Зубчатые передачи применяют в виде простых одноступенчатых передач и в виде различных сочетаний нескольких передач, встроенных в машины или выполненных в виде отдельных агрегатов. Широко используют зубчатые передачи для понижения угловых скоростей и повышения крутящих моментов в редукторах. Редукторы выполняют обычно в самостоятельных корпусах одно-, двух- и трёхступенчатыми с передаточными числами соответственно 1.6–6.3; 8–40; 45–200. Наиболее распространены двухступенчатые редукторы (около 95%). Для получения различных частот вращения выходного вала при постоянной скорости приводного двигателя применяют коробки скоростей. Возможности зубчатых механизмов расширяются с применением планетарных передач, которые используются в качестве редукторов и дифференциальных механизмов. Небольшие габариты и масса планетарных зубчатых передач обусловливаются распределением нагрузки между несколькими совершающими планетарное движение зубчатыми колёсами (сателлитами) и применением внутреннего зацепления, обладающего повышенной несущей способностью. При переходе от простых передач к планетарным достигается уменьшение массы в 1.5–5 раз. Наименьшие относительные габариты имеют волновые передачи, обеспечивающие передачу больших нагрузок при высокой кинематической точности и жёсткости. Зубчатое Колесо, основная деталь зубчатой передачи в виде диска с зубьями на цилиндрической или конической поверхности, входящими в зацепление с зубьями другого зубчатого колеса. Цилиндрические зубчатые колёсо могут иметь наружные или внутренние зубья. Зубья выполняются прямыми, винтовыми, шевронными (угловыми) или криволинейными. Наиболее распространённый профиль зубьев зубчатого колеса – эвольвентный, реже – циклоидальный и другие (смотрите Зубчатая Передача). Зубчатые колёса называют также Шестернями. Например, в редукторостроении принято малое ведущее зубчатое колесо независимо от числа зубьев называть Шестерней, а большое ведомое – Колесом. Часто все зубчатые колёса называют Шестернями. Конструкция зубчатого колеса зависит от его назначения, размеров и способа получения заготовки. Под Приводом понимается устройство для приведения в действие машин и механизмов. Привод состоит из источника энергии, механизма для передачи энергии (движения) и аппаратуры управления. Источником энергии служит двигатель (гидравлический, пневматический, тепловой, электрический и другие) или устройство, отдающее заранее накопленную механическую энергию (гиревой, инерционный, пружинный механизм и другие). В

некоторых случаях привод осуществляется за счёт мускульной силы (например, в ручных лебёдках, в некоторых бытовых и других механизмах и машинах – швейных машинах, велосипедах). По характеру распределения энергии различают групповой, индивидуальный и многодвигательный привод. В групповом приводе движение от одного двигателя передаётся группе рабочих машин или механизмов через одну или несколько передач. Вследствие технического несовершенства групповой привод почти полностью вытеснен индивидуальным приводом, в котором каждая рабочая машина имеет собственный двигатель с передачей. Такой привод позволяет работать при наиболее выгодной частоте вращения, производить быстрый пуск машины и торможение, осуществлять реверсирование движения. В многодвигательном приводе отдельные рабочие органы машины приводятся в движение самостоятельным двигателем через свою систему передач. Такой привод позволяет получать компактную конструкцию машины, применять автоматическое управление. По назначению приводы машин разделяют на:- Передвижной Привод, используемый на движущихся рабочих машинах; Стационарный Привод, то есть установленный неподвижно на раме или фундаменте; Транспортный Привод, применяемый для различных транспортных средств. В качестве стационарного привода наиболее распространён электрический привод, в котором источником механической энергии является электродвигатель; на передвижных рабочих и транспортных машинах используются главным образом тепловые двигатели с непосредственной механической или электрической передачей. В производстве применяются также гидропривод машин и пневмопривод, в которых энергия сжатых жидкостей или воздуха преобразуется в механическую энергию гидро- и пневмодвигателями. Привод, энергосиловое устройство, приводящее в движение машину или механизм. Привод состоит обычно из источника энергии, передаточного механизма и аппаратуры управления. Источником энергии служит двигатель (тепловой, электрический, пневматический, гидравлический и другой) или устройство, отдающее заранее накопленную механическую энергию (пружинный, инерционный, гиревой механизм и другое). В некоторых случаях привод осуществляется за счёт мускульной силы (например, в ручных лебёдках, в некоторых счётных, бытовых и других механизмах и машинах – арифмометрах, швейных машинах, велосипедах). По характеру распределения энергии различают групповой, индивидуальный и многодвигательный привод. В групповом приводе движение от одного двигателя передаётся группе рабочих машин или механизмов через одну или несколько трансмиссий. Вследствие технического несовершенства групповой привод почти полностью вытеснен индивидуальным приводом, в котором каждая рабочая машина имеет собственный двигатель с передачей. Такой привод позволяет работать при наиболее выгодной частоте вращения, производить быстрый пуск машины и торможение, осуществлять реверсирование. В многодвигательном приводе отдельные рабочие органы машины приводятся в движение самостоятельным двигателем через свою систему передач. Такой привод позволяет получать компактную конструкцию машины, применять автоматическое управление; он используется в сложных металлорежущих станках, прокатных станах, подъёмно-транспортных машинах и другом. По назначению привод машин разделяют на стационарный, то есть установленный неподвижно на раме или фундаменте; передвижной, используемый на движущихся рабочих машинах; транспортный, применяемый для различных транспортных средств. В качестве стационарного привода наиболее распространён электропривод, в котором источником механической энергии является электродвигатель; на передвижных рабочих и транспортных машинах используются главным образом тепловые двигатели с непосредственной механической или электрической передачей. В производстве применяются также гидропривод машин и пневматический привод, в котором энергия вырабатываемого компрессором сжатого воздуха преобразуется в механическую энергию пневмодвигателями. Развитие различных систем привода связано с созданием и совершенствованием двигателей. Уже первые паровые машины (Английского механика Дьжеймза Вота (или Уатта (James Watt); 1736–1819), Русского изобретателя Ивана Ивановича Ползунова (1728–1766) и других) потребовали применения передач и механизмов управления, которые в комплексе с паровым двигателем позволили получить экономичный, постоянно действующий источник механической энергии, не зависящий от природных условий. В процессе дальнейшего развития привода были созданы паровые и гидравлические турбины и двигатели внутреннего сгорания. С конца XIX–начала XX веков эти двигатели, объединённые с системами механических передач, стали основным типом привода транспортных и рабочих машин – автомобилей, самолётов, тракторов, экскаваторов и других. В начале XX века в приводе машин производственного назначения широкое применение получили электрические двигатели (сначала постоянного тока, а затем трёхфазные асинхронные двигатели, имеющие высокий коэффициент полезного действия (кпд), надёжные в эксплуатации, экономичные). Переход к обслуживанию машин (особенно станков, кузнечно-прессового и другого оборудования) индивидуальным и многодвигательным приводом дал возможность располагать рабочие машины в необходимой последовательности и подготовить условия для развития в промышленности массового производства. Объединение электропривода с машиной-орудием позволило создать станки-автоматы, а затем автоматические системы машин (смотрите Автоматическая Линия) и перейти к управлению производством с помощью средств вычислительной техники. Электропривод получил также широкое применение в коммунальном и бытовом обслуживании (швейные, стиральные, кухонные машины, электробритвы и так далее). В приводе транспортных машин ведущая роль сохраняется за двигателями внутреннего сгорания (в автомобилях, тепловозах, теплоходах), газовыми турбинами (в самолётах, газотурбовозах), ядерными силовыми установками (на подводных лодках, ледоколах, военных кораблях). В начале 1970-х около 80% суммарной мощности всех существующих двигателей приходилось на долю транспортных. Для обеспечения сложных по режиму условий работы используются комбинированные приводы, например, паровые турбины устанавливаются совместно с тепловыми двигателями или газовыми турбинами, гидропривод комбинируется с электроприводом и так далее (гидроэлектропривод, газотурбогидропривод и другие). Мощность привода определяется возможностями применённого в нём двигателя. Диапазон мощностей привода современных машин очень широк:- от десятков МегаВатт (МВт) (привод гребных винтов, мощных насосов, вентиляторов аэрогидродинамических труб) до долей Ватт (Вт) (микропривод электрических часов). Использование передаточных механизмов в приводе машин обусловлено рядом конструктивно-эксплуатационных факторов:- по условиям компоновки, габаритов, техники безопасности двигатель не всегда можно непосредственно соединить с исполнительным механизмом; требуемые скорости машины обычно не совпадают с оптимальной частотой вращения двигателя; в большинстве технологических и транспортных машин необходимо обеспечить регулирование скоростей и возможность работы с большими моментами при малых скоростях (регулирование же скорости двигателя не всегда возможно и экономично); двигатели предназначены главным образом для равномерного вращательного движения, а рабочие органы машин осуществляют часто поступательное, винтовое и другие виды движений, а также движение с заданным законом изменения скоростей и так далее. В приводе машин передачи выполняют с постоянным или регулируемым передаточным отношением. Наиболее часто в приводе используются:- механизмы, сохраняющие постоянное передаточное отношение, – редукторы и мультипликаторы (соответственно понижающие и повышающие частоту вращения); коробки передач (скоростей), позволяющие ступенчато изменять частоту вращения; вариаторы, обеспечивающие бесступенчатое регулирование числа оборотов и оптимальный скоростной режим; различные открытые передачи (ремённые, цепные, зубчатые и другие). Привод механизмов дистанционного управления и контроля (в автомобилях, тракторах, мотоциклах) осуществляется с помощью гибких валов. Кроме механических передач, в приводе машин используются электрические, гидравлические и другие передачи. Применяется также так называемый встроенный привод, целиком смонтированный в рабочем органе машины (электробарабаны ленточных конвейеров и грузоподъёмных машин, приводные ролики роликовых конвейеров, мотор-колёса

мощных автомобилей). Аппаратура управления привода служит для пуска, остановки, изменения направления вращения, регулирования скорости, торможения, защиты двигателей и механизмов машин от перегрузок и повреждений, блокировки отдельных механизмов и так далее. Системы управления привода могут быть ручными, полуавтоматическими и автоматическими. При ручной системе все операции управления осуществляются аппаратами, непосредственно воздействующими на силовую цепь двигателя (рубильники, контроллеры, реостаты и другие) или на систему его питания, зажигания и так дале. При полуавтоматическом управлении непосредственное воздействие оказывается на специальные командоаппараты (кнопки, педали, командо-контроллеры, путевые и конечные выключатели и другие). Контакты командоаппаратов включены в маломощные вспомогательные цепи реле и контакторов, которые, в свою очередь, переключают силовые цепи двигателей без непосредственного участия человека. При автоматическом управлении начальный импульс для включения привода посылается механическим или электрическим реле или иными аппаратами (датчиками). В дальнейшем автоматическая работа системы поддерживается и контролируется электрическими, механическими, гидравлическими или другими аппаратами (регуляторами, распределителями, фото- и термоэлементами, логическими, программными, телевизионными устройствами и так далее). Автоматизация управления привода позволяет осуществлять регулирование скорости при заданной программе в функции пути, времени или нагрузки, регулирование ускорения и замедления, перераспределение нагрузки между приводами, точную остановку или реверс всех или отдельных приводов, защиту от перегрузки, разноса, неправильного начального положения и тому подобного. Применение автоматизации (даже частичной) увеличивает надёжность и точность работы привода, повышает производительность машин в целом, позволяет управлять приводом на расстоянии. В ряде случаев автоматизация привода диктуется условиями безопасности труда (нежелательностью пребывания людей в токсичной или пыльной среде, при работе с радиоактивными материалами и тому подобными). Автоматизация управления приводом даёт возможность перейти от индивидуального управления рабочими машинами к автоматическому управлению производственными агрегатами участками, цехами (смотрите Автоматизация Производства).

GEAR = СНАСТИ (или ПРИСПОСОБЛЕНИЯ) – Gear (maritime term):- the general name for ropes, blocks and tackles, tools, etc (things). Gear:- a general terms for ropes, tackle, etc. / Общее обозначение для канатов, такелажа и прочего.

GEAR AND TACKLE = СНАСТИ И ТАКЕЛАЖ – Gear And Tackle is ship's equipment used to level, secure and brace cargo for loading/unloading from vessel. / Судовое борудование, используемое для выравнивания, закрепления и связывания груза при погрузке или выгрузке из судна. Под Такелажем, от Голландского слова Takelage, понимаются:- (i) совокупность судовых снастей (прутки, тросы, цепи) для крепления рангоута, управления парусами, грузоподъёмных работ; различают стоячий (неподвижный – ванты, штаги и прочее) и бегучий (подвижный – топенанты, фалы, шкоты и прочее) такелаж; или (ii) стропы, тросы, цепи, применяемые совместно с грузоподъёмными устройствами для подъёма тяжёлых грузов.

GEARBOX = КОРОБКА ПЕРЕДАЧ (или КОРОБКА СКОРОСТЕЙ) – Gearbox (gear housing):- a casing for gear sets that transmit power from one rotating shaft to another. A gear box has a number of functions:- it is precisely bored to control gear and shaft alignment, it contains the gear oil, and it protects the gears and lubricant from water, dust, and other environmental contaminants. Gear boxes are used in a wide range of industrial, automotive, and home machinery. Not all gears are enclosed in gear boxes; some are open to the environment and are commonly lubricated by highly adhesive greases. / Под Коробкой Скоростей понимается многозвенный механизм, предназначенный для изменения частоты вращения ведомого вала при постоянной частоте вращения ведущего вала путём изменения Передаточного Отношения. Состоит из переключаемых зубчатых передач, размещённых в отдельном корпусе (коробке) или в одном корпусе с другими механизмами. Наряду с термином Коробка Скоростей применяют термин Коробка Передач, например, для механизма, входдящего в привод ведущих колёс автомобиля. Коробка Скоростей, механизм, предназначенный для ступенчатого изменения частоты (скорости) вращения ведомого вала при постоянной частоте вращения ведущего путём изменения передаточного числа. Коробка скоростей состоит из переключаемых зубчатых передач, размещённых в отдельном корпусе (коробке) или в общем корпусе с другими механизмами. Наряду с термином Коробка Скоростей применяют термин Коробка Передач, например, для механизма, входящего в привод ведущих колёс автомобиля и других транспортных средств. Под Коробкой Передач понимается многозвенный механизм, в котором ступенчатое изменение Передаточного Отношения осуществляется при переключении зубчатых передач, размещённых в отдельном корпусе (коробке) или в общем корпусе с другими механизмами. Коробка передач предназначена для изменения частоты вращения ведомого вала при постоянной частоте вращения ведущего вала, называется также Коробкой Скоростей, например, в приводе главного движения резания металлорежущих станков. Коробка передач, предназначенная для изменения подачи в металлорежущих станках, называется Коробкой Подач. Коробки передач широко применяются в приводах ведущих колёс автомобилей и других транспортных средств, работающих от двигателей внутреннего сгорания. Конструкция коробки передач зависит от её назначения, способа переключения передач и технической характеристики машины или станка:- передаваемой мощности, быстроходности, числа передач (до 48), диапазона регулирования. Для ускорительных передач передаточное отношение обычно принимают не менее 1/2, для замедляющих – не более 4; число передач между двумя валами не более 6–8. По способу переключения передач различают:- (i) коробки передач со скользящими зубчатыми блоками (с кулачковыми и зубчатыми муфтами); (ii) коробки передач, имеющие зубчатые муфты с синхронизаторами; (iii) коробки передач с фрикционными муфтами и тормозами; и (iv) коробки передач с муфтами свободного хода. Коробка Передач, механизм для ступенчатого изменения передаточного числа, то есть скорости вращения или величины подачи. Коробка передач состоит из переключаемых зубчатых передач, размещённых в отдельном корпусе (коробке) или в общем корпусе с другими механизмами. Коробка передач, применяемая для изменения скорости главного движения резания металлорежущих станков, называется также Коробкой Скоростей. Коробка передач, предназначенная для изменения подачи в металлорежущих станках и имеющая некоторые кинематические особенности, называется Коробкой Подач. Коробки передач широко применяются в приводах ведущих колёс автомобилей и других транспортных средств, работающих от двигателя внутреннего сгорания, который при небольшой частоте вращения не может развивать большого вращающего момента и большой мощности, а также не допускает изменения направления вращения вала (реверсирования). Использование коробки передач позволяет получить достаточный момент на колёсах, рациональные режимы работы двигателя при различных скоростях движения, а также обеспечивает задний ход. Передаточные числа u коробки передач обычно соответствуют геометрическому ряду (u_1; $u_2 = \varphi u_1$; $u^3 = \varphi^2 u_1$, ...), что обеспечивает одинаковое относительное увеличение u при переключении с любой скорости на следующую. Значения u в бывшем Союзе Советских Социалистических Республик (СССР) были стандартизованы:- 1.06; 1.12; 1.26; 1.41; 1.58; 2.00. Иногда применяют ступенчатый геометрический ряд с разным φ на определённых участках регулирования или арифметический ряд (например, в коробке подач). Конструкция коробки передач зависит от её назначения, способа переключения передачи и технической характеристики машины или станка – передаваемой мощности, быстроходности, числа скоростей (до 48), диапазона регулирования. Для ускорительных передач коробки передач обычно принимают u не менее 1/2, для замедляющих – не более 4, число передач между двумя валами не более 6–8. По способу переключения передач различают:- коробки передач со скользящими зубчатыми блоками (с

кулачковыми и зубчатыми муфтами); коробки передач, имеющие зубчатые муфты с синхронизаторами; коробки передач с фрикционными муфтами и тормозами; коробки передач с муфтами свободного хода. Коробки передач со скользящими блоками допускают переключение только при остановках или на малой скорости холостого хода; имеют простую и компактную конструкцию, широко применяются в металлорежущих станках с большим числом скоростей. При малом φ конструкцию коробки передач можно упростить и сократить по длине, применив корригирование зубчатых колёс, позволяющее одно и то же зубчатое колесо сцеплять с разными колёсами на других валах. Коробки передач, имеющие зубчатые муфты с синхронизаторами, позволяют сначала вводить в соприкосновение небольшие фрикционные поверхности, выравнивающие угловые скорости вала и включаемого зубчатого колеса, а затем вводить в зацепление зубчатую муфту. Эти коробки передач обеспечивают безударное переключение на холостом ходу; применяются преимущественно в автомобилях. Коробки передач с фрикционными муфтами и тормозами допускают переключение на ходу под нагрузкой, а при использовании муфт и тормозов с электромагнитным, гидравлическим или пневматическим управлением обеспечивают дистанционное переключение и возможность автоматизации. Ввиду сложности конструкции и больших габаритов такие коробки передач применяют при малом числе скоростей; переключение тормозами используют в планетарных коробках передач. Коробки передач с муфтами свободного хода осуществляют переключение передач при изменении направления вращения ведущего вала при неизменном направлении вращения ведомого; применяются редко. Переключение скоростей в коробке передач осуществляется:- механизмами индивидуального управления, в которых каждый зубчатый блок или муфта переключается отдельной рукояткой; механизмами централизованного управления (последовательного и выборочного включения и с предварительным выбором, или преселективные), в которых все зубчатые блоки и муфты переключаются одной общей рукояткой; электрическими и другими устройствами дистанционного управления; устройствами автоматического управления, переключающим скорости в зависимости от изменяющихся условий работы. Недостатки коробки передач по сравнению с механическими Вариаторами:- ступенчатое изменение передаточного числа и менее удобное управление; преимущества – жёсткая кинематическая связь, то есть строгое постоянство передаточных чисел между ведущим и ведомым валами, высокая надёжность и долговечность, компактность и простота конструкции, что обеспечило их широкое применение в современных машинах.

GEAR CRIMPED YARN = ИЗВИТАЯ (или ЗАВИТАЯ, или ГОФРИРОВАННАЯ) ШЕСТЕРНЯМИ ПРЯЖА – Gear Crimped Yarn is a textured filament yarn obtained by passing the yarn between a pair of intermeshed toothed wheels. / филаментная (комплексная) пряжа (filament yarn).

GEAR CRIMPING METHOD = МЕТОД ШЕСТЕРЁННОГО ИЗВИВАНИЯ (или МЕТОД СКЛАДЫВАНИЯ ЗАЦЕПЛЕНИЯ, или МЕТОД ЗАВИВАНИЯ ЗАЦЕПЛЕНИЕМ (или СЦЕПЛЕНИЕМ)) – Gear Crimping Method:- in this texturing method, yarn is fed through the meshing teeth of two gears. The yarn takes on the shape of the gear teeth. See also Crinkle Yarn, Textured Yarn, and Texturing. / Пряжа принимает форму шестерёнчатых зубьев. Смотрите также .

GEARED = ОСНАЩЁННОЕ СНАСТЯМИ – Geared:- vessel/conveyance carries its own means of loading/unloading cargo.

GEARING = ПРЕДОСТАВЛЕНИЕ ПЛЕЧА (или ПРЕДОСТАВЛЕНИЕ РЫЧАГА, или ПРЕУМНОЖЕНИЕ, или ПЕРЕДАЧА, или ПРИВОД, или РЕДУКТОР, или КОЭФФИЦИЕНТ УСИЛЕНИЯ, или ЗУБЧАТАЯ ПЕРЕДАЧА, или ЗУБЧАТОЕ ЗАЦЕПЛЕНИЕ, или ПРИВОДНОЙ МЕХАНИЗМ) – A term Gearing refers to the process of increasing funds available for investment through borrowing. the ratio of debt finance to equity finance or as:- The use of long-term debt in financing an entity. Gearing may be measured as:- EBIT / (EBIT – Interest). Used to be known as Leverage. The proportion of long-term debt to equity finance on the balance sheet of a company. Most specifically, it is the ratio of borrowed capital against total capital employed, expressed as a percentage. Also known as Leverage. Gearing is a measure for the incremental percentage change of a warrant price with respect to an incremental percentage change of its underlying asset. A warrant's gearing is calculated by multiplying the warrant's leverage by its delta. Also known as Elasticity, or referred to using the Greek letter Eta. Gearing:- the potential to magnify profits or losses by incurring exposure to large positions from an initially small investment outlay. Also known as Leverage. / В технике под Рычагом понимается устройство для уравновешивания большей силы меньшей, дающее выигрыш в силе, при этом столько же проигрывающее в перемещении и не дающее выигрыша в работе.

GEAR LUBRICANT = ПЕРЕДАТОЧНАЯ СМАЗКА (или СМАЗКА ДЛЯ (ЗУБЧАТЫХ) ПЕРЕДАЧ, или ТРАНСМИССИОННАЯ СМАЗКА) – Gear Lubricant (GL):- the American Petroleum Institute (API) has a system of specifications for classifying gear and differential oils with a GL (Gear Lubricant) rating. GL-1:- denotes lubricants intended for manual transmissions operating under such mild conditions that straight petroleum or refined petroleum oil may be used satisfactorily. Oxidation and rust inhibitors, defoamers, and pour depressants may be added to improve the characteristics of these lubricants. Friction modifiers and extreme pressure additives shall not be used. API GL-1 lubricants are generally not satisfactory for many passenger car manual transmissions. However, these lubricants have been used in some truck and tractor manual transmissions. Lubricants meeting service designation API MT-1 are an upgrade in performance over lubricants meeting API GL-1 and are preferred by major commercial vehicle manual transmission manufacturers. In all cases the transmission manufacturer's lubricant quality recommendations should be followed. GL-2:- denotes lubricants intended for automotive worm-gear axles operating under such conditions of load, temperature, and sliding velocities that lubricants satisfactory for API GL-1 service will not suffice. Products suited for this type of service contain anti-wear or film-strength improvers specifically designed to protect worm gears. GL-3:- denotes lubricants intended for manual transmissions operating under moderate to severe conditions and spiral-bevel axles operating under mild to moderate conditions of speed and load. These service conditions require a lubricant having load-carrying capacities exceeding those satisfying API GL-1 service but below the requirements of lubricants satisfying API GL-4 service. Gear lubricants designated for API GL-3 service are not intended for axles with hypoid gears. Some transmission and axle manufacturers specify API Category 'CC' or 'CD' motor oils for this service. The manufacturer's specific lubricant quality recommendations should be followed. GL-4:- denotes lubricants intended for axles with spiral bevel gears operating under moderate to severe conditions of speed and load or axles with hypoid (see note) gears operating under moderate speeds and loads. These oils may be used in selected manual transmission and transaxle applications where MT-1 lubricants are unsuitable. The manufacturer's specific lubricant quality recommendations should be followed. Although this service designation is still used commercially to describe lubricants, some test equipment used for performance verification is no longer available. Procedures to define this performance are currently being reviewed for adoption by ASTM. Note:- frictional requirements for axles equipped with limited-slip differentials are normally defined by the axle manufacturer. GL-5:- denotes lubricants intended for gears, particularly hypoid (see note) gears, in axles operating under various combinations of high-speed/shock load and lowspeed/high-torque conditions. Lubricants qualified under US Military Specification MILL-2105D (formerly MIL-L-2105C) satisfy the requirements of the API GL-5 service designation, although the API designation does not require military approval. Performance test details are in ASTM Publication STP-512A. Note:- frictional requirements for axles equipped with limited-slip differentials are normally defined by the axle manufacturer. API MT-1:- denotes lubricants intended for nonsynchronized manual transmissions used in buses and heavyduty trucks. Lubricants meeting the requirements of API MT-1 service provide protection against the combination of thermal degradation, component wear,

and oil-seal deterioration, which is not provided by lubricants in current use meeting only the requirements of API GL-1, 4, or 5. API MT-1 does not address the performance requirements of synchronized transmissions and transaxles in passenger cars and heavy-duty applications. API MT-1 lubricants should not be mixed with engine oils in the same transmission unit. Transmission manufacturers' specific lubricant quality recommendations should be followed. Important:- of the original five GL (Gear Lubricant) categories, only GL-5 is still valid and verifiable. Even GL-4 is no longer valid and new oils cannot be tested to this specification because the test equipment is also no longer available. GL classifications are primarily for the American market and are no measure of synchromesh compatibility. However, it has been shown that API GL-4 oil types are more likely to be synchromesh ringcompatible because they contain fewer additives than GL-5 oils which are seldom synchromesh ringcompatible because of the high proportion of sulphur in their formulations. API GL-4:- mainly manual gearboxes, moderate loads API GL-5:- mainly highly-stressed differentials and sometimes manual gearboxes (transaxles). See also Gear, and Lubricant. Gear Lubricants are a high-performance line of industrial and automotive gear oils. These products are designed for use in any industrial gear or bearing application that requires a thermally stable, extreme pressure lubricant. They also meet the requirements for use in many hypoid gear applications employed in heavy-duty mobile equipment. In addition, these products are fortified with a shear stable tackifier to provide adhesion to the metal during use. They contain dual acting wear-reducing and extreme pressure additive. API GL:- API stands for American Petroleum Industry and GL stands for Gear Lubricant. API GL-1:- straight mineral oil; API GL-2:- mild EP for worm gears; API GL-3:- mild EP for spur and spiral bevel gears in axles and transmissions; API GL-4:- medium EP, MIL-L-2105 quality, moderate severity hypoid gears, manual transmissions; API GL-5:- high EP, MIL-L-2105D quality, all hypoid axles, some manual transmissions; and API GL-6:- extra high EP, now obsolete. Is it important to select the right API GL rating? Yes. Selecting the correct gear oil performance level will provide the best protection to the components of the transmission. American Society for Testing and Materials (ASTM). / Американское Общество по Испытаниям и Материалам (АОИМ).

GEAR OIL = ПЕРЕДАТОЧНОЕ МАСЛО (или МАСЛО ДЛЯ (ЗУБЧАТЫХ) ПЕРЕДАЧ, или ТРАНСМИССИОННОЕ МАСЛО) – Gear Oil is a high-quality oil with good oxidation stability, load-carrying capacity, rust protection, and resistance to foaming, for service in gear housings and enclosed chain drives. Specially formulated industrial extreme pressure (EP) gear oils are used where highly loaded gear sets or excessive sliding action (as in worm gears) is encountered. See also Gear. / сверхвысокое давление . Под Трансмиссионными Маслами понимаются нефтяные и синтетические смазочные масла для коробок передач, ведущих мостов и других агрегатов силовой передачи автомобилей и тракторов. В гидродинамических и гидрообъёмных передачах трансмиссионные масла служат также средой, передающей мощность и заполняющей регулирующие системы. Кинематическую вязкость трансмиссионных масел составляет $(6.5–42)\cdot10^{-6}$ квадратных метров в секунду ($м^2/с$) (при 100 °C). Содержат противоизносные, противозадирные, антиокислительные и другие присадки. Трансмиссионные масла с особенно эффективными противозадирными присадками называют Гипоидными Маслами. Трансмиссионные Масла, нефтяные масла (иногда синтетические) с противозадирными присадками (сераорганическими соединениями, хлорсодержащими органическими соединениями и другими). Используются в зубчатых зацеплениях коробки передач, зацеплениях картера заднего моста и рулевого управления транспортных машин для предотвращения задира, уменьшения износа трущихся поверхностей и отведения от них тепла.

GEF = GLOBAL ENVIRONMENT FACILITY

GEL = ГЕЛЬ – Gel is:- (1) a colloid in which the dispersed particles have combined with the continuous phase to produce a viscous, jelly-like product. (2) Degraded polymer occurring in process lines. Usually seen as specks in polymer or yarn. / Под Гелями, от Латинского слова Gelo, означающее Застываю, понимаются дисперсные системы с жидкой или газообразной дисперсионной средой, обладающие некоторыми свойствами твёрдых тел:- способностью сохранять форму, прочностью, упругостью, пластичностью. Эти свойства гелей обусловлены существованием у них структурной сетки (каркаса), образованной частицами дисперсной фазы, которые связаны между собой молекулярными силами различной природы (подробнее смотрите Дисперсная Структура). Типичные гели в виде студенистых осадков (Коагелей) образуются из золей при их коагуляции или в процессах выделения новой фазы из пересыщенных растворов как низко-, так и высокомолекулярных веществ. Гели с водной дисперсионной средой называют Гидрогелями, с жидкой углеводородной средой – Органогелями. Отверждение золей во всём объёме без выделения осадка и нарушения их однородности даёт так называемые Лиогели. Вся дисперсионная среда в таких гелях лишена подвижности (иммобилизована) вследствие механического захватывания в ячейках структурной сетки. Чем больше асимметрия частиц, тем при более низком содержании дисперсной фазы образуется гель. В случае гидрозоля пятиокиси ванадия, например, для отверждения системы достаточно 0.05%, в других случаях – нескольких объёмных процентов дисперсной фазы. Лиогели обладают малой прочностью, пластичностью, некоторой эластичностью и тиксотропией, то есть способностью обратимо восстанавливать структуру, разрушенную механическим воздействием. Таковы, например, гели мыл и мылоподобных поверхностно-активных веществ, гели гидроокисей многих поливалентных металлов. Высушиванием лиогелей можно получить Аэрогели, или Ксерогели, – микропористые системы, лишённые пластичности, имеющие хрупкую, необратимо разрушаемую структуру. Так получают распространённые сорбенты:- алюмогель из геля гидроокиси алюминия и силикагель из студней кремнёвой кислоты. Гели часто отождествляют со студнями. Однако последние, в отличие от гелей являются однофазными (гомогенными) системами – истинными растворами полимеров (органических или неорганических) в низкомолекулярных жидкостях. В химии и технологии синтетических смол гелями по традиции называют неплавкие и нерастворимые твёрдые (хрупкие) или твёрдообразные (упруго-вязкопластичные) продукты поликонденсации или полимеризации. Пространственную структуру в таких системах образует непрерывная сетка химически связанных макромолекул.

GELATINIZATION TEMPERATURE = ТЕМПЕРАТУРА КЛЕЙСТЕРИЗАЦИИ (или ТЕМПЕРАТУРА ЖЕЛАТИНИЗАЦИИ) – Gelatinization Temperature is a temperature at which about 90% of the starch granules have swelled irreversibly in hot water. Final gelatinization temperature may be classified as low (< 70 °C), intermediate (70 to 74 °C), and high (> 74 °C). Instead of hot water, 1.7% potassium hydroxide solution may be used to gelatinize the starch. The digestibility of the milled Rice starch, as indicated by the degree of spreading and clearing, is inversely related to gelatinization temperature. Gelatinization Temperature (GT):- the time required for cooking milled Rice is determined by gelatinization temperature or GT. Environmental conditions, such as temperature during ripening, influence GT. A high ambient temperature during development results in starch with a higher GT. GT of milled Rice is evaluate by determinining the Alkali spreading value. In many Rice-growing countries, there is a distinct preference for Rice with intermediate gelatinization temperature.

GELATINOUS = ЖЕЛАТИНОВОЕ (или ЖЕЛАТИНОЗНОЕ, или СТУДЕНИСТОЕ) – Gelatinous is a slimy and sticky jelly-like substance with a water base. / Желатиновое – слизистая и клейкая субстанция типа желе с водной основой. Под Желатином, от Французского слова Gélatine, от Латинского Gelatus, означающее Замёрзший или Застывший, понимается студнеобразующее вещество, продукт денатурации коллагена – белка соединительной ткани. Получают вываривaнием костей, хрящей,

сухожилий (наиболее чистый – из рыбных хрящей). Применяют в пищевой промышленности, для изготовления фотоэмульсий, в микробиологии как среду для культивирования микроорганизмов, в качестве столярного клея.

GELCON = GEL CONSISTENCY

GEL CONSISTENCY = КОНСИСТЕНЦИЯ ГЕЛЯ – Gel Consistency is a degree of Rice gel firmness measured as the length of cold milled Rice gelatinized in 2 ml of dilute potassium hydroxide in a 13- x 100-mm test tube, placed horizontally for 30 minutes or 1 hour. Gel consistency may be classified as hard (27 to 40 mm), medium (41 to 60 mm), or soft (61 to 100 mm). It is correlated with hardness of cooked Rice. Gel Consistency measures the tendency of the cooked Rice to harden after cooling. Within the same amylose group, varieties with a softer gel consistency are preferred, and the cooked Rice has a higher degree of tenderness. Harder gel consistency is associated with harder cooked Rice and this feature is particularly evident in high-amylose Rice. Hard cooked Rice also tends to be less sticky. Gel consistency is determined by heating a small quantity of Rice in a dilute alkali. / твёрдость (hardness). Под Консистенцией, от позднелатинского слова Consistentia, означающее Состояние, понимается понятие, характеризующее подвижность (густоту) вязких жидкостей и полутвёрдых тел (битумов, мазей, паст, теста и прочего). Под Гелями, от Латинского слова Gelo, означающее Застываю, понимаются дисперсные системы с жидкой дисперсионной средой, в которых частицы дисперсной фазы образуют пространственную структуру (сетку). Обладают некоторыми признаками твёрдых тел:- способностью сохранять форму, прочностью, пластичностью. Типичные гели образуются, например, при слипании частиц золей и имеют вид студенистых осадков. Высушиванием геля получают хрупкие микропористые тела, называемые аэрогелями (алюмагель, силикагель).

GEL DYEING = КРАШЕНИЕ ГЕЛЯ – Gel Dyeing is a continuous tow-dyeing method in which soluble dyes are applied to wet-spun fibers (e.g., acrylic or modacrylic fibers) in the gel state, i.e. after extrusion and coagulation, but before drawing and drying. Gel Dyeing:- passing a wet-spun fiber that is in the gel state (not yet at full crystallinity or orientation) through a dyebath containing dye with affinity for the fiber. This process provides good accessibility of the dye sites. See also Dyeing. / Экструзия или Выдавливание (Extrusion).

GEL ELECTROPHORESIS = ЭЛЕКТРОФОРЕЗ ГЕЛЯ (или ГЕЛЬ–ЭЛЕКТРОФОРЕЗ) – Gel Electrophoresis is a technique where nucleic acids or proteins are separated according to size and charge by subjecting them to an electric current in a suitable gel and buffer system. / Под Электрофорезом, от Греческих слов Ēlektron, означающее Янтарь, и Phórēsis, означающее Несение или Перенесение, или Катафорезом понимается:- (1) движение частиц, находящихся во взвешенном состоянии в жидкой или газообразной среде, под действием внешнего электрического поля. Одно из электрокинетических явлений, на котором основано, например, улавливание частиц дыма и пыли. Явление, обратное электрофорезу, – возникновение так называемого потенциала осаждения, то есть разности электрических потенциалов при оседании содержащихся в среде заряженных дисперсионных частиц. (2) Лекарственный электрофорез (гальваноионотерапия), лечащий метод воздействия на организм постоянным током и лекарственными веществами, вводимыми при его помощи через кожу или слизистые оболочки. Сочетание электрофореза с индуктотермией называется Индуктоэлектрофорезом.

GEL SPINNING = ПРЯДЕНИЕ ИЗ ГЕЛЯ (или ФОРМОВАНИЕ ИЗ ГЕЛЯ) – Gel Spinning is an old technique that has come into use commercially only since the 1980s. As originally applied, solutions of very high solid contents (20–80 percent) were used; such solutions were similar to semisolids. In the modern adaptation of this process, polymer of an extremely high molecular weight is dissolved in a solvent of low concentration (i.e. 1 to 2 percent), making a very viscous solution. This solution is either dry- or wet-spun to fiber, which, still retaining most of the solvent, is actually a gel of polymer and solvent. While in the gel state, the fiber can be stretched in order to pull the molecules of the polymer into an elongated state, instead of the usual solid state of chain-folded molecules. Ultrahigh-strength, high-stiffness polyethylene fibers, marketed under such trademarks as Spectra, are commercially produced using gel-spinning techniques. Gel Spinning is a spinning process in which the primary mechanism of solidification is the gelling of the polymer solution by cooling to form a gel filament consisting of precipitated polymer and solvent. Solvent removal is accomplished following solidification by washing in a liquid bath. The resultant fibers can be drawn to give a product with high tensile strength and modulus. See also Spinning, 2. There are four types of spinning for polymers – wet spinning, dry spinning, melt spinning, and gel spinning. Gel spinning:- it is also known as Dry-Wet Spinning because the filaments first pass through air and then are cooled further in a liquid bath. Gel spinning is used to make very strong and other fibers having special characteristics. The polymer here is partially liquid or in a 'gel' state, which keeps the polymer chains somewhat bound together at various points in liquid crystal form. / осадок (precipitate).

GELTEMP = GEL TEMPERATURE

GEM = GLOBAL EXPORT MANAGER

GEMINATE = СДВОЕННОЕ (или ДВОЙНОЕ, или ПАРНОЕ) – Geminate:- arranged in pairs.

GEMMS = GILT–EDGED MARKET MAKERS

GEMS = GLOBAL ENVIRONMENTAL MONITORING SYSTEM

GENCON = GENERAL CHARTER CONDITIONS

GENDER ANALYSIS = ПОЛОВОЙ АНАЛИЗ (или ГЕНДЕРНЫЙ АНАЛИЗ) – Gender Analysis refers to the variety of methods used to understand the relationships between men and women, their access to resources, their activities, and the constraints they face relative to each other. Gender analysis provides information that recognizes that gender, and its relationship with race, ethnicity, culture, class, age, disability, and/or other status, is important in understanding the different patterns of involvement, behaviour and activities that women and men have in economic, social and legal structures. Gender analysis is an essential element of socio-economic analysis. A comprehensive socio-economic analysis would take into account gender relations, as gender is a factor in all social and economic relations. An analysis of gender relations provides information on the different conditions that women and men face, and the different effects that policies and programs may have on them because of their situations. Such information can inform and improve policies and programs, and is essential in ensuring that the different needs of both women and men are met. At the local level, gender analysis makes visible the varied roles women, men, girls and boys play in the family, in the community, and in economic, legal and political structures. A gender perspective focuses on the reasons for the current division of responsibilities and benefits and their effect on the distribution of rewards and incentives. An understanding of socio-economic relations, and with it gender relations, is an integral part of policy analysis, and is essential in creating and implementing effective development co-operation initiatives. Analysis of the different situations of men and women can provide an understanding of the different impacts that legislation, cultural practices, policies, and programs can have on women and men. Gender analysis offers information to understand women's and men's access to and control over resources that can be used to address disparities, challenge systemic inequalities (most often faced by women), and build efficient and equitable solutions. The information gathered during the research stage of the analysis should make the differences

between women and men explicit (using sex-disaggregated data) so that policies, programs and projects can build effective actions that promote equality. Since gender relations will change in each context and over time, a gender analysis should be done within each development initiative. Gender analysis can also provide insights on how gender equality can be promoted within efforts for sustainable development to ensure maximum efficiency in pursuing development goals. To be most effective, it must be part of each step of a development initiative:- from conception and design to implementation and evaluation. By being part of this process, gender analysis has already led to changes in strategies for development cooperation that previously did not meet the needs of women. An analysis of gender relations can tell us who has access, who has control, who is likely to benefit from a new initiative, and who is likely to lose. Gender analysis asks questions that can lead us in a search for information to understand why a situation has developed the way it has. It can also lead us to explore assumptions about issues such as the distribution of resources and the impact of culture and traditions. It can provide information on the potential direct or indirect benefit of a development initiative on women and men, on some appropriate entry points for measures that promote equality within a particular context, and on how a particular development initiative may challenge or maintain the existing gender division of labor. With this information measures of equity can be created to address the disparities and promote equality. In the case of primary education, gender analysis can tell us that a gender gap exists in most countries; that is, there is a gap between girls' and boys' enrolment and retention in school. In the majority of countries where there is a gender gap, the gap works against girls, but in others, it works against boys. In India, an average six year-old girl can expect to spend six years in school, three years less than a boy of the same age. Girls in rural areas are at even greater disadvantage: their risk of dropping out of school is three times that of a boy. In Jamaica, however, it is boys who are at higher risk of missing out on education. Boys are often pulled out of school and sent to work to boost family income, and thus, their drop-out rate is higher than that of girls'. In their efforts to balance the need to meet the needs of both girls and boys, governments are increasingly using gender analysis to investigate the source of the gap and what measures can be adopted to reduce the distortions in the educational system. Where is gender analysis used? Development cooperation always involves people. Within Canadian International Development Agency (CIDA), a gender analysis that addresses the connections of gender with factors such as race, ethnicity, culture, class, age, disability, and/or other status, among others, is required for all policies, programs and projects. While it is easy to see the people involved in more practical and tangible initiatives, such as capacity building for local authorities, any policy or project will ultimately have an effect on people, and must work to promote the equal status of women and men. For example, the development of a country's environmental policy, should involve a holistic socio-economic analysis that addresses gender relations to fully understand the situation and ensure that the policy and its directives promote equality. This might involve understanding the perceptions of women and men of the environment, a sex-disaggregated account of activities performed and their affect on the environment, and the uses men and women make of natural resources, such as land and water. Many of women's contributions to the economy continue to go unrecognized because their work is not easily counted within the conventional structures. Women do a majority of the work within the informal sector and the home and as a result, much of their work is not counted or is underrepresented in official statistics. The lack of a gender analysis in economic policies can result in women's perspectives and priorities being left out of strategies for development. When in the process is gender analysis applied? Gender analysis takes place throughout the entire development process, throughout research, to problem definition, planning, implementation, monitoring and evaluation. By examining basic assumptions each step of the way, the interrelationships between social context and economic factors can be understood and initiatives that respond to those needs can be designed. CIDA-led initiatives must undertake gender analysis at the planning stage and integrate the findings and recommendations at each step of the way, from planning through to evaluation. For example, the Serviço Nacional de Aprendizagem Industrial (SENAI; Portuguese language for National Service for Industrial Training) or National Industrial Apprenticeship Program in Brazil, a technical training program, built in gender analysis from the beginning and responded to the under-representation of female students. Consequently, a portion of the program focused on a sensitization campaign geared towards students and industry. In it, promotional materials showcased female role-models in non-traditional jobs, such as posters with women involved in construction. As a result of undertaking and following through on the gender analysis, the number of women in technical courses jumped from 13.5% to 31.3% in seven years. Who undertakes gender analysis? It is the task of analysts, policy-makers and program managers located in both donor and partner countries, in both government and civil society, to work in partnership with women and men involved to advance gender equality. This participatory process provides the context for the creation, implementation and evaluation of development initiatives to promote gender equality. Additionally, a gender analysis should identify local and national initiatives undertaken by both governments and civil society in order to strengthen and complement these efforts. Individuals, groups and communities affected by development initiatives must be involved from the beginning of the process in order to determine the gender dimensions of the issue at hand. Without local knowledge and expertise, some of the intricacies of the gender roles and social relationships may not be easily understood. In the case of the organizations delivering food aid to vulnerable members of the Dinka people of South Sudan there was a puzzling issue. When Dinka mothers began voluntarily to remove malnourished children from therapeutic feeding programs, the organizations involved were surprised. They questioned their own assumptions of the vulnerability of people and the way that food aid was being distributed. They then set-up discussions between members of aid organisations and women and men involved in decision-making about food in the local communities. During the discussions it became clear that each group had different definitions of need and different ideas of how aid should be distributed. For example, both Dinka people and organisations identified widows and people with disabilities as vulnerable. Dinka people, however, also identified male and female farmers and fishers with no livestock or fish, and men and women without daughters. The donor strategy often called for the provision of food aid to one child within a family, but the Dinka explained that gifts are to be distributed within the clan and the family. This exchange has led to devising methods to better account for local definitions of social assets, and to establishing a more appropriate manner of distributing aid that takes into account local practices. Elements of Gender Analysis:- for a good gender analysis, resources and commitment to implement the results of the analysis are necessary. Consider three important points:- (i) it requires skilled professionals with adequate resources; (ii) it benefits from the use of local expertise; and (iii) the findings must be used to actually shape the design of policies, programs and projects. Undertaking gender analysis begins with examining the issue so that the broad reality of gender roles and relationships is taken into account. Gathering information to enrich the understanding of the gender roles and relations in a specific context means asking difficult questions. When doing research, consider if you are challenging the existing gender division of labor, tasks, responsibilities and opportunities. Who are the intended recipients of the benefits of the proposed policy, program or project, and who could potentially lose? Both women and men must be consulted on the issue at hand, and have the opportunity to contribute to the definition of the solution. At the same time, it is important to keep in mind the long term impact of a policy, program or project in terms of women's equality with men. How will these enable women to have increased control over their lives? Take, for example, the case of maternal mortality. Every year at least 585 000 women die of pregnancy or childbirth related causes around the world (the World Health Organization (WHO), 2000). A medical approach to maternal mortality can only partly address this tragic and complex problem. Broadening the focus and giving attention to equality issues such as child marriage, limited access to reproductive health services and family planning, female genital mutilation, and women and girls eating last and least can reduce and transform the recurring nature of maternal mortality. Reconsidering an issue using gender analysis expands the understanding of the challenges women face and the range of solutions available. Tools for Gender Analysis:- there are a variety of tools that have been developed to assist people in

asking these questions. Each tool is different, with some advantages and disadvantages, some account for other social characteristics and factors better, while others are more participatory. Following are some examples. The Harvard Analytical Framework is a tool to collect data at the community and household level. It has three main components:- an activity profile ('who does what?'), an access and control profile ('who has access and who controls what?'), and an analysis of influencing factors ('how does gender influence the profiles?'). Module 1 of the ILO/SEAPAT's Online Gender Learning & Information, entitled Some Gender Planning Approaches and Strategies offers descriptions of the Harvard Analytical Framework, Moser's Gender Planning Framework, the Women's Empowerment Framework and the Social Relations Framework. Regardless of the tool or method used, information should account for differences between men and women, boys and girls, and should ask questions for the reasons behind these differences. Without this, development initiatives will come short in their efforts to support sustainable development. Gender Analysis is the systematic effort to document and understand the roles of women and men within a given context. / Сэрвису Насьонал дэ Апрэндизажэнь Индустриал (СЭНАЙ; Serviço Nacional de Aprendizagem Industrial (SENAI)). Половой (или Гендерный) Анализ – это процесс оценки различного воздействия, оказываемого на женщин и мужчин, существующими или предлагаемыми программами, законодательством, государственным политическим курсом – во всех сферах жизни общества и государства. Половой анализ также – сбор качественной информации и понимание половых тенденций в экономике и обществе, использование этих знаний для выявления потенциальных проблем и поиска решений в ежедневной работе. Одновременно это инструмент для понимания социальных процессов. Он позволяет увидеть и сравнить:- каким образом и почему политические, экономические, социальные и иные факторы влияют на женщин и мужчин? Половой анализ зиждется на убеждении в том, что политика не может быть отделена от социального контекста, что социальные вопросы – неотъемлемая составная часть экономических. Анализ социального воздействия (социальная экспертиза), включающий половой анализ, не является просто 'прибавкой', которая должна быть рассмотрена после оценки затрат и прибылей (выгоды/пользы), а представляет собой интегральный компонент любого добротного анализа политического курса во всех сферах жизни. Он пронизывает от начала и до конца полный цикл политического процесса по выработке и реализации государственной деятельности. Суть полового анализа – в полном раскрытии любых последствий для обоих полов, а не в том, чтобы способствовать продвижению или ослаблению позиций одной из сторон. В целом, анализ, основанный на половом подходе – важная часть универсального социально-экономического анализа государственной политики. Социально-экономические данные, обработанные в свете учёта половых различий, свидетельствуют, например, о том, что в среднем мужчины располагают более высокими доходами по сравнению с женщинами, и что женщины оказываются в невыгодном положении в результате осуществления своих социальных ролей и неадекватной оценки этих ролей в обществе. Однако в случаях, когда мужчины оказываются в невыгодном социально-экономическом положении (например, более ранняя мужская смертность) – половой анализ высветит также и подобные факты. Реальное положение мужчин и женщин может быть различно как вследствие пола (биологических различий), так и вследствие половых особенностей (социальных различий). Система мер или программа, законодательство, разработанные без учёта этих различий, могут не соответствовать интересам и чаяниям ни женщин, ни мужчин. Такой политический курс не способен оказать нужного воздействия, а значит, не может быть социально достаточным и достоверным. Половой анализ подвергает сомнению утверждение о том, что любой человек, независимо от пола, испытывает одинаковое воздействие политических курсов, программ и законодательства. Такое представление соответствует поло-нейтральной политике. По существу, такая политика игнорирует различные физические, социальные, экономические характеристики и жизненный опыт женщин и мужчин, также как и особых групп женщин и мужчин, например, инвалидов. Ведь равенство означает обеспечение всем людям, независимо от их пола, расы или способностей, одинаковых возможностей доступа к позитивным результатам проводимого политического курса. Существуют различные способы применения полового анализа на практике. На международном уровне Организация Объединённых Наций, Всемирный Банк, Международная Организация Труда подготовили Руководства по Половому Анализу или опубликовали Заявления по Половому Анализу. Правительства многих стран, например, Новой Зеландии, Норвегии, Канады и других также выпустили инструкции по половому анализу. В политических культурах, в которых не развиты поло-ориентированные измерения, поло-чувствительная политика обречена на конфликт с доминирующими ценностями, определяющими правила организации и жизнедеятельности общества.

GENDER BLINDNESS = ПОЛОВАЯ СЛЕПОТА (или ГЕНДЕРНАЯ СЛЕПОТА) – Gender Blindness is the inability to perceive that different gender roles and responsibilities are held by men and women, leading to different effects on men and women of development policies, programs, and projects. / Под Слепотой или Амаврозом понимается потеря зрения на оба глаза вследствие глаукомы, трахомы, травмы, диабета и других причин.

GENDER NEUTRAL = НЕЙТРАЛЬНОЕ В ПОЛОВОМ ОТНОШЕНИИ – Gender Neutral:- having equal impact on both men and women, giving them equal access to resources and benefits of a development initiative.

GENDER ROLES = ГЕНДЕРНЫЕ РОЛИ – Gender Roles:- learned behaviors that condition activities, tasks, and responsibilities viewed within a given society as 'masculine' or 'feminine'.

GENE = ГЕН (или НАСЛЕДСТВЕННЫЙ ФАКТОР) – Gene is:- (1) a functional hereditary unit that occupies a fixed location in a chromosome, has a specific influence on the phenotype (usually) through encoding a single polypeptide chain or molecule), and is capable of mutation to various allelic forms. (2) DNA segment that performs a specific function and is a unit of inheritance. Gene is an inheritable factor, carried on the chromosomes, determining a character or trait in an organism. / Под Геном, от Греческого слова Génos, означающее Происхождение или Род, понимается единица наследственного материала, ответственная за формирование какого-либо элементарного признака. У высших организмов (эукариот) входит в состав хромосом. Совокупность всех генов организма составляет его генетическую конституцию – генотип. Дискретные наследственные задатки были открыты в 1865 Австрийским естествоиспытателем Грегором Иоганном Менделем (Mendel; 1822–1884), основоположником учения о закономерностях наследственности (менделизм). В 1909 один из основоположников современной генетики – Датский биолог Вильгельм Людвиг Иогансен (Johannsen; 1857–1927) назвал их генами; он же ввёл термины Генотип и Фенотип. Развитие молекулярной генетики привело к раскрытию химической природы генетического материала и представлению о гене как об участке молекулы ДНК (у некоторых вирусов РНК) со специфическим набором нуклеотидов, в линейной последовательности которых закодирована генетическая информация. Каждый ген ответствен за синтез определённого белка (фермента или другого). Контролируя их образование, гены управляют всеми химическими реакциями организма и определяют таким образом его признаки. Уникальное свойство генов – сочетание их высокой устойчивости (неизменяемости в ряду поколений) со способностью к наследуемым изменениям – мутациям, которые являются источником генетической изменчивости организмов и основой для действия естественного отбора.

GENE ACTION = ДЕЙСТВИЕ ГЕНА – Gene Action is the expression of genes by their control on the specificity and rate of biosynthetic processes or on the regulated action of other genes.

GENEALOGY = ГЕНЕАЛОГИЯ – Genealogy is the noted history of the genetic ancestry of a variety. / Под Генеалогией, от Греческого слова Genealogia, означающее Родословная, понимается вспомогательная историческая дисциплина, изучающая происхождение и родственные связи исторических лиц, родов, фамилий, до XVIII века практическая отрасль знаний, составление родословий.

GENE BANK = БАНК ГЕНОВ – Gene Bank is an institution that serves as a center of exchange and preservation for a large number of varieties.

GENE CONVERSION = КОНВЕРСИЯ ГЕНА – Gene Conversion is the asymmetrical segregation of genes during replication that leads to an apparent conversion of one gene into another. / Сегрегация или Выделение или Зейгерование или Разделение По Крупности (Segregation).

GENE DEPLOYMENT = РАЗВЁРТЫВАНИЕ ГЕНА – Gene Deployment is a system of assigning specific resistance genes to a specific geographic area to control pests.

GENE DOSAGE = ДОЗИРОВКА ГЕНА – Gene Dosage is the number of times that a particular gene occurs in the nucleus of a cell.

GENE EXPRESSION = ПРОЯВЛЕНИЕ ГЕНА – Gene Expression is the process by which the polypeptide encoded by a gene is synthesized at the appropriate time, place, and rate. When a gene is 'decoded' by the cell and a new protein is produced, the gene is said to be 'expressed' by the plant.

GENE–FOR–GENE RESISTANCE = УСТОЙЧИВОСТЬ (или СОПРОТИВЛЕНИЕ) ГЕН ДЛЯ ГЕНА – Gene-For-Gene Resistance:- Arabidopsis NDR1 (non-race specific disease resistance 1) plays an essential role in resistance mediated by the CC-NBS-LRR class of resistance proteins, including RPS2, RPM1 and RPS5. Upon infection with Pseudomonas syringae pv. Tomato DC3000 expressing bacterial effector proteins AvrRpt2, AvrB/AvrRpm1 and AvrPphB, resistance is activated by the aforementioned resistance proteins. NDR1 is a plasma membrane-localized glycosylphosphatidyl-inositol (GPI)-anchored protein. While the expression of NDR1, as well as the genetic requirement for NDR1 in plant disease resistance has been detailed, the specific biochemical mechanism of NDR1 function is largely unknown. One of the main research areas of the Day lab is the structure-function analysis of NDR1 to characterize its role in the R-gene mediated defense pathway. It has been demonstrated the NDR1 and RIN4 interact in planta (Figure 1; Day et al., 2006) and that this interaction is required for the activation of disease resistance signaling following infection with P. syringae DC3000 expressing AvrRpt2. NDR1 associates with itself in planta (Figure 2 and 3) following activation by a ligand such as RIN4 and forms a homodimer in one of two possible configurations. Using homology modeling and structure threading to predict the tertiary structure of NDR1, the structure of Arabidopsis LEA14 was identified as having a significant structural probability match to NDR1 (Figure 4). This has led to the use of site-directed mutagenesis targeting the ω-site of NDR1, as well as conserved motifs known to be required for LEA14-like proteins (Figure 5), to elucidate a role for NDR1 in resistance signaling. Gene-For-Gene Resistance:- active plant defense, also known as Gene-For-Gene Resistance, is triggered when a plant resistance (R) gene recognizes the intrusion of a specific insect pest or pathogen. Activation of plant defense includes an array of physiological and transcriptional reprogramming. During the past decade, a large number of plant R genes that confer resistance to diverse group of pathogens have been cloned from a number of plant species. Based on predicted protein structures, these genes are classified into a small number of groups, indicating that structurally related R genes recognize phylogenetically distinct pathogens. An extreme example is the tomato Mi-1 gene, which confers resistance to potato aphid (Macrosiphum euphorbiae), whitefly (Bemisia tabaci), and root-knot nematodes (Meloidogyne spp.). While Mi-1 remains the only cloned insect R gene, there is evidence that gene-for-gene type of plant defense against piercing-sucking insects exists in a number of plant species. See Vertical Resistance. In Gene-For-Gene systems, resistance of a plant to a pathogen is due to the 'recognition' by plant surveillance system (i.e. plant resistance gene product) of a pathogen avirulence determinant encoded by an avirulence gene to eventually result in triggering of plant immunity. Avirulence proteins (or products) actually are effectors involved in pathogenicity. In viruses, virtually all the proteins can behave as avirulence determinants. In all other cases, avirulence genes are extremely diverse, being often species or isolate/strain-specific and rarely have matches in sequence databases. They often are specifically expressed or strongly over-expressed during plant–pathogen interaction and the encoded proteins show the presence of secretion signals and translocation signals (e.g., the Type III secretion signal for bacteria). Avirulence genes seem to be submitted to high-speed diversifying selection allowing the pathogen to diversify its effector repertoire and rapidly escape recognition by the plant resistance gene. Key concepts:- (i) effectors of plant pathogens are pathogen molecules that manipulate host cell structure and function thereby facilitating infection; (ii) effectors often contribute quantitatively to pathogen aggressiveness and are dispensable for the pathogen life cycle; (iii) in the course of plant–pathogen co-evolution, plants have evolved receptors that detect pathogen effectors (or the effect of the effectors on a plant target) and activate defence responses; (iv) the effectors specifically recognized by 'matching' resistance proteins (termed R proteins) are termed avirulence (AVR) proteins; (v) this forms the basis of the gene-for-gene concept, genetically demonstrated by Flor between 1942 and 1955 and stating that plants producing a specific R gene product are resistant towards a pathogen that produces the corresponding Avr gene product whereas whenever one of the genes or both are lacking the plant is susceptible and disease ensues; (vi) in wild plant and pathogen populations, avirulence and resistance are discontinuous traits, only present in part of the population. Thus resistance will be applied against only part of the pathogen population (harbouring the corresponding Avr allele) and pathogen will only be avirulent towards part of the plant population (harbouring the matching resistance gene). (vii) all plant pathogens from viruses to nematodes, but also some pests like aphids produce avirulence proteins; (viii) when submitted to resistant populations of plants, pathogens can alter or delete their avirulence proteins to avoid defence elicitation, at risk of a fitness cost associated with loss-of-function of those effectors. / Псевдомонада или Псевдомонас (Pseudomonas syringae pv. Tomato).

GENE FREQUENCY = ЧАСТОТА ГЕНА – Gene Frequency is the proportion in which alternative alleles of a gene occur in a population.

GENE INTERACTION = ВЗАИМОДЕЙСТВИЕ ГЕНОВ – Gene Interaction is a modification of a gene action by a nonallelic gene or genes.

GENE LIBRARY = БИБЛИОТЕКА ГЕНОВ – Gene Library is a clone library which contains a large number of representative nucleotide sequences from all sections of the DNA of a given genome; a random collection of DNA fragments from a single organism, linked to vectors, and cloned in a suitable host.

GENE LOCUS = ЛОКУС ГЕНА – Gene Locus is a place or a position occupied by a gene on a chromosome. / Под Локусом, от Латинского слова Locus, понимается место локализации определённого гена на генетической карте хромосомы.

GENE MAPPING (GENOME MAPPING) = КАРТИРОВАНИЕ ГЕНОВ (КАРТИРОВАНИЕ ГЕНОМОВ) – Gene Mapping (Genome Mapping) is the assigning/locating of a specific gene to particular region of a chromosome; the determination of the sequence of specific genes and their relative distances from each other on a given chromosome.

GENE PAIR = ГЕННАЯ ПАРА – Gene Pair is the identical or nonidentical alleles of a specific gene at a given locus on homologous chromosomes in a diploid cell.

GENE POOL = ГЕННЫЙ ПУЛ – Gene Pool is the sum total of genetic variability present in a crop Species.

GENE–POOLS = ГЕННЫЕ ПУЛЫ – Gene-Pools are desired genes or gene-complexes in genetically diverse populations.

GENERAL AGGREGATE LIMIT = ОБЩИЙ СОВОКУПНЫЙ ЛИМИТ – General Aggregate Limit is a Commercial General Liability limit that applies to all damages paid for bodily injury, property damage, personal injury, advertising injury, and medical expenses, except damages included in the products-completed operations hazard. / Лимит Коммерческого Полиса по Страхованию Общей Ответственности, который применяется ко всем оплачиваемым видам ущерба за телесные повреждения, повреждения имущества, причинение вреда личности, вред при рекламировании, и медицинские расходы, за исключением видов ущерба, включённых в рисковую опасность, связанную с причинением вреда вследствие недостатков приобретённых законченных товаров или услуг (или страховой ответственности производителя продукции после завершения работ). Под Генеральным, от Латинского слова Generalis, понимается Ведущий или Главный или Основной, например, генеральная линия развития; Всеобщий или Коренной или Общий.

GENERAL AGREEMENT ON TARIFFS AND TRADE = ГЕНЕРАЛЬНОЕ СОГЛАШЕНИЕ О ТАРИФАХ И ТОРГОВЛЕ – The Uruguay Round was a trade negotiation lasting from September 1986 to April 1994 which transformed the General Agreement on Tariffs and Trade (GATT) into the World Trade Organization (WTO). It was launched in Punta del Este in Uruguay (hence the name), followed by negotiations in Montreal, Geneva, Brussels, Washington (DC), and Tokyo, with the 20 agreements finally being signed in Marrakesh – the Marrakesh Agreement. The main aims of the Uruguay round of negotiations was to reduce agricultural subsidies, put restrictions on foreign investment, and begin the process on opening trade in services like banking and insurance. They also wanted to draft a code to deal with copyright violation and other forms of intellectual property rights. The WTO replaced GATT as an international organization, but the General Agreement still exists as the WTO's umbrella treaty for trade in goods, updated as a result of the Uruguay Round negotiations. Trade lawyers distinguish between GATT 1994, the updated parts of GATT, and GATT 1947, the original agreement which is still the heart of GATT 1994. The General Agreement on Tariffs and Trade (typically abbreviated GATT) was originally created by the Bretton Woods Conference as part of a larger plan for economic recovery after World War II. The GATT's main purpose was to reduce barriers to international trade. This was achieved through the reduction of tariff barriers, quantitative restrictions and subsidies on trade through a series of different agreements. The GATT was an agreement, not an organization. Originally, the GATT was supposed to become a full international organization like the World Bank or IMF called the International Trade Organization. However, the agreement was not ratified, so the GATT remained simply an agreement. The functions of the GATT have been replaced by the World Trade Organization which was established through the final round of negotiations in the early 1990s. The history of the GATT can be divided into three phases: the first, from 1947 until the Torquay round, largely concerned which commodities would be covered by the agreement and freezing existing tariff levels. A second phase, encompassing three rounds, from 1959 to 1979, focused on reducing tariffs. The third phase, consisting only of the Uruguay Round from 1986 to 1994, extended the agreement fully to new areas such as intellectual property, services, capital, and agriculture. Out of this round the WTO was born. The first version of GATT, developed in 1947 during the United Nations Conference on Trade and Employment in Havana, Cuba, is referred to as GATT 1947. On 1948-January-01 the agreement was signed by 23 countries:- Australia, Belgium, Brazil, Burma, Canada, Ceylon, Chile, the Republic of China, Cuba, the Czechoslovak Republic, France, India, Lebanon, Luxembourg, Netherlands, New Zealand, Norway, Pakistan, Southern Rhodesia, Syria, South Africa, the United Kingdom, and the United States. 45 000 tariff concessions were made influencing over USD10 billion in trade which comprised 20% of the total global market at the time. The General Agreement on Tariffs and Trade (GATT) (61 Stat. (pt. 5) A58; 8 UST (pt. 2) 1786) is a multilateral agreement setting forth basic principles governing international trade among its signatories. The GATT's main obligations relate to most-favored-nation treatment, the maintenance of scheduled concession rates of duty, and national (nondiscriminatory) treatment for imported products; the GATT also provides the legal framework for customs valuation standards, 'escape clause' (emergency) actions, antidumping and countervailing duties, and other measures. Results of GATT-sponsored multilateral tariff negotiations are set forth by way of separate schedules of concessions for each participating contracting party with the US schedule designated as Schedule XX. Multilateral agreement concluded by 23 countries in Geneva in 1947, designed to increase international trade by reducing or eliminating customs tariffs and quotas. The General Agreement On Tariffs And Trade has been affiliated with the United Nations as a specialized agency since 1958. It is headquartered in Geneva, Switzerland. The WTO officially replaced the GATT on 1995-January-01, although the GATT continued to exist through 1995 to allow member countries to accede to the WTO and to allow resolution of dispute settlements. See also WTO. From 1948 to 1994, the General Agreement on Tariffs and Trade (GATT) provided the rules for much of world trade and presided over periods that saw some of the highest growth rates in international commerce. It seemed well-established, but throughout those 47 years, it was a provisional agreement and organization. The original intention was to create a third institution to handle the trade side of international economic cooperation, joining the two 'Bretton Woods' institutions, the World Bank and the International Monetary Fund. Over 50 countries participated in negotiations to create an International Trade Organization (ITO) as a specialized agency of the United Nations. The draft ITO Charter was ambitious. It extended beyond world trade disciplines, to include rules on employment, commodity agreements, restrictive business practices, international investment, and services. The aim was to create the ITO at a UN Conference on Trade and Employment in Havana, Cuba in 1947. Meanwhile, 15 countries had begun talks in December 1945 to reduce and bind customs tariffs. With the Second World War only recently ended, they wanted to give an early boost to trade liberalization, and to begin to correct the legacy of protectionist measures which remained in place from the early 1930s. This first round of negotiations resulted in a package of trade rules and 45 000 tariff concessions affecting USD10 billion of trade, about one fifth of the world's total. The group had expanded to 23 by the time the deal was signed on 30 October 1947. The tariff concessions came into effect by 30 June 1948 through a 'Protocol of Provisional Application'. And so the new General Agreement on Tariffs and Trade was born, with 23 founding members (officially 'contracting parties'). The 23 were also part of the larger group negotiating the ITO Charter. One of the provisions of GATT says that they should accept some of the trade rules of the draft. This, they believed, should be done swiftly and 'provisionally' in order to protect the value of the tariff concessions they had negotiated. They spelt out how they envisaged the relationship between GATT and the ITO Charter, but they also allowed for the possibility that the ITO might not be created. They were right. The Havana conference began on 21 November 1947, less than a month after GATT was signed. The ITO Charter was finally agreed in Havana in March 1948, but ratification in some national legislatures proved impossible. The most serious opposition was in the US Congress, even though the US government had been one of the driving forces. In 1950, the United States government announced that it would not seek Congressional ratification of the Havana Charter, and the ITO was effectively dead. So, the GATT became the only multilateral instrument governing international trade from 1948 until the WTO was established in 1995. For almost half a century, the GATT's basic legal principles remained much as they were in 1948. There were additions in the form of a section on development added in the 1960s and 'plurilateral' agreements (i.e. with voluntary membership) in the 1970s, and efforts to reduce tariffs further continued. Much of this was achieved through a series of multilateral negotiations known as 'Trade Rounds' – the biggest leaps forward

in international trade liberalization have come through these rounds which were held under GATT's auspices. In the early years, the GATT trade rounds concentrated on further reducing tariffs. Then, the Kennedy Round in the mid-sixties brought about a GATT Anti-Dumping Agreement and a section on development. The Tokyo Round during the seventies was the first major attempt to tackle trade barriers that do not take the form of tariffs, and to improve the system. The eighth, the Uruguay Round of 1986-94, was the last and most extensive of all. It led to the WTO and a new set of agreements. GATT was provisional with a limited field of action, but its success over 47 years in promoting and securing the liberalization of much of world trade is incontestable. Continual reductions in tariffs alone helped spur very high rates of world trade growth during the 1950s and 1960s – around 8% a year on average. And the momentum of trade liberalization helped ensure that trade growth consistently out-paced production growth throughout the GATT era, a measure of countries' increasing ability to trade with each other and to reap the benefits of trade. The rush of new members during the Uruguay Round demonstrated that the multilateral trading system was recognized as an anchor for development and an instrument of economic and trade reform. But all was not well. As time passed new problems arose. The Tokyo Round in the 1970s was an attempt to tackle some of these but its achievements were limited. This was a sign of difficult times to come. GATT's success in reducing tariffs to such a low level, combined with a series of economic recessions in the 1970s and early 1980s, drove governments to devise other forms of protection for sectors facing increased foreign competition. High rates of unemployment and constant factory closures led governments in Western Europe and North America to seek bilateral market-sharing arrangements with competitors and to embark on a subsidies race to maintain their holds on agricultural trade. Both these changes undermined GATT's credibility and effectiveness. The problem was not just a deteriorating trade policy environment. By the early 1980s the General Agreement was clearly no longer as relevant to the realities of world trade as it had been in the 1940s. For a start, world trade had become far more complex and important than 40 years before:- the globalization of the world economy was underway, trade in services – not covered by GATT rules – was of major interest to more and more countries, and international investment had expanded. The expansion of services trade was also closely tied to further increases in world merchandise trade. In other respects, GATT had been found wanting. For instance, in agriculture, loopholes in the multilateral system were heavily exploited, and efforts at liberalizing agricultural trade met with little success. In the textiles and clothing sector, an exception to GATT's normal disciplines was negotiated in the 1960s and early 1970s, leading to the Multifibre Arrangement. Even GATT's institutional structure and its dispute settlement system were causing concern. These and other factors convinced GATT members that a new effort to reinforce and extend the multilateral system should be attempted. That effort resulted in the Uruguay Round, the Marrakesh Declaration, and the creation of the WTO. A multilateral treaty to help reduce trade barriers between the signatory countries and to promote trade through tariff concessions. The World Trade Organization (WTO) superseded GATT in 1994. The GATT is a binding contract among 103 governments. GATT was established in 1947 as an interim measure pending the establishment of the International Trade Organization, under the Havana Charter. The International Trade Organization (ITO) was never ratified by the US Congress. Operating in the absence of an explicit international organization, GATT has provided the legal framework for international trade with its primary mission being the reduction of trade barriers. See also Rounds. General Agreement on Tariffs and Trade (GATT) is an agreement originally negotiated in Geneva, Switzerland, in 1947 among 23 countries, including the United States, to increase international trade by reducing tariffs and other trade barriers. This multilateral trade agreement provides a code of conduct for international commerce. GATT also provides a framework for periodic multilateral negotiations on trade liberalization and expansion. The General Agreement on Tariffs and Trade (GATT) was an international trade agreement signed by 23 nations, including Canada, in 1947. GATT came into effect on 01 January 1948 and was refined over eight rounds of negotiations, leading to the creation of the World Trade Organization (WTO), which replaced GATT in 1995. GATT was focused on trade in goods and aimed to liberalize trade by reducing tariffs and removing quotas among member countries. Each member of GATT was expected to open its markets equally to other member nations, removing trade discrimination. The agreements negotiated through GATT reduced average tariffs on industrial goods from 40 per cent (1947) to less than 5 per cent (1993). It was an early step towards economic globalization. Why Was GATT Created? GATT was established in 1948 to regulate world trade. It was created as a means to boost economic recovery after the Second World War by reducing or eliminating trade tariffs, quotas and subsidies. During the Great Depression, a breakdown of international relations and an increase in trade regulation made poor economic conditions worse and contributed to the outbreak of the Second World War. After the war, the Allies believed that a multilateral framework for world trade would loosen the protectionist policies that defined the 1930s and create an economic interdependency that would encourage partnership and reduce the risk of conflict. The idea was to establish a code of conduct that would progressively liberalize (remove or loosen restrictions on) international trade. Within this code of conduct, consultation on trade issues among member nations could take place and be resolved, and data on world trade characteristics and trends could be collected and shared. Established over a year before the North Atlantic Treaty Organization (NATO), a Western military alliance, GATT played an important role in the Cold War, which began shortly after the Second World War. It helped the US-led capitalist West spread its influence by liberalizing trade through multilateral agreements. The West, with which Canada was aligned, gained more economic allies through these agreements, which strengthened its global influence in the face of the communist Eastern bloc led by the Soviet Union. After the Cold War, with the collapse of the Soviet Union in 1991, GATT transitioned into a truly global organization – the WTO – and admitted former communist bloc countries, such as Czech Republic, Poland and Romania. GATT Negotiations:- GATT was first discussed at the United Nations Conference on Trade and Employment in Havana, Cuba (1947), where the idea of creating the International Trade Organization (ITO) was proposed (see United Nations). It was hoped that ITO would complement the World Bank and International Monetary Fund (IMF) in fostering international economic cooperation. While more than 50 nations were negotiating ITO and organizing its founding charter, preparatory sessions were held regarding GATT. After several sessions, Canada and 22 other nations signed GATT on 30 October 1947 in Geneva, Switzerland. The agreement came into effect on 01 January 1948. It was initially seen as a provisional agreement that would be superseded by ITO. After the United States backed away from ITO in 1950, the focus shifted to GATT (see also Globalization). While regular trade negotiations were conducted and refined among member states on a regular basis, eight multilateral trade conferences (called rounds) were held between 1947 and 1994 (see International Trade). GATT was established at the first round in 1947, with subsequent rounds hosted in Annecy, France (1949), and Torquay, England (1951). All other rounds were held in Geneva in 1956, 1960–62 (Dillon Round), 1964–67 (Kennedy Round), 1973–79 (Tokyo Round) and 1986–94 (Uruguay Round). Bilateral Negotiations:- To prepare for GATT, the 23 signing nations carried out negotiations among themselves to reduce some tariffs and other trade barriers. Canada negotiated bilaterally with seven of the countries. Its discussions with the United States were the most extensive of any that took place at that time. Canada had negotiated trade agreements with the US in 1935 and 1938, but once both nations signed GATT, it became the basic agreement governing trade relations between them, superseding the 1938 agreement (see Canada-US Economic Relations). GATT rules required that any member country give all members the same privileges regarding tariffs and other commercial policy measures that it gives to the most favoured nation (MFN) with which it negotiates. This is known as the MFN principle, and it was established to remove trade discrimination. Multilateral Trade Groups:- Canada was part of several multilateral trading groups that operated in concert with GATT, including the Organisation for Economic Co-operation and Development (OECD), the Quadrilateral Group and the Cairns Group of Fair Trading Nations. Membership in these groups allowed Canada to influence the direction of trade negotiations. The most influential group was the informal Quadrilateral Group, or the 'Quad' as it was called, which surfaced early on in GATT's history. The group included Canada, Japan, the US and the

European Union – the world's largest trade entities at the time. The Quad introduced most of GATT's reciprocal tariff cuts, which lowered rates among all GATT countries in accordance with the MFN principle. The Quad became a more formal alliance at the 1981 G7 summit in Montebello, Québec. It was most influential during the Uruguay Round, when it prioritized agricultural negotiations and pushed for the creation of the WTO. Did Canada Receive Special Benefits? Some exceptions to the MFN principle were permitted, and Canada was a beneficiary of several of them. The US received a waiver from the MFN rules to enter the Canada-US Automotive Products Agreement (Auto Pact) in 1965. Canada didn't need to get a waiver because it allowed firms from every country to participate, provided that they adhered to the rules. Like other developed countries, Canada also received waivers to grant tariff preferences to developing countries on a range of products under the Generalized System of Preferences. Canada was also a party to the Multifibre Arrangement (MFA), which allowed developed countries to impose quantitative import restrictions on textile imports from developing countries (the agreement was replaced by the WTO Agreement on Textiles and Clothing in 1995). Finally, free trade arrangements among countries were allowed under GATT, opening the door to the Canada-US Free Trade Agreement in 1989 and the North American Free Trade Agreement (NAFTA) in 1994, among others. Imports and Export Subsidies:- Quantitative limits on imports and export subsidies were generally prohibited by GATT, but exceptions were permitted under certain circumstances. The two most important exceptions for Canada were the MFA and arrangements for agricultural products. The latter products were excluded from the trade liberalization framework of GATT, primarily due to US insistence. Canada and other major agricultural exporters vigorously objected (see Agriculture and Food). Canada also objected to the special waiver that the US received in 1955 to enable it to restrict imports of dairy products, even though it had no domestic production controls. Subsequently, after much controversy, Germany and Switzerland got other waivers to restrict agricultural imports. Canada, too, developed its own share of restrictions on imports of grains and dairy and poultry products, as well as export subsidies of some dairy products and eggs to dispose of surpluses. As a result, early exclusions and waivers from GATT produced a maze of restrictions on agricultural imports and export subsidies that have plagued world production and trade in these product lines ever since (see Protectionism). GATT also condemned the practice of dumping (selling products abroad for less than they are sold domestically). Anti-dumping duties could be applied to countries that engaged in these practices if material injury to domestic industry occurred or was threatened or if a domestic industry could not be established because of them. Uruguay Round:- The most important round of GATT negotiations was the Uruguay Round, which commenced in September 1986. It was concluded on 15 April 1994 after nearly eight years of negotiations and came into effect on 01 January 1995. The resulting comprehensive document included both major revisions to GATT as it existed after the previous seven rounds of negotiations and introduced a wide range of other agreements on two types of items:- (1) matters not previously covered by regular GATT rules, such as trade-related investment measures, trade in services, intellectual property rights and agriculture, textiles and clothing; and (2) issues addressed in an incomplete fashion in earlier negotiations, such as rules of origin, dumping, subsidies, safeguards and dispute settlement procedures. By the end of the Uruguay Round, 128 nations were part of GATT. Founding of the World Trade Organization:- The agreement struck at the end of the Uruguay Round also established the World Trade Organization (WTO) as an administrative institution replacing or subsuming GATT and encompassing all of the agreements and arrangements concluded in the Uruguay Round. While GATT was formally concluded at the end of the Uruguay Round on 15 April 1994, with the WTO taking effect on 01 January 1995, GATT remained the WTO's umbrella treaty on trade in goods. Those nations wishing to be members of the WTO must first complete negotiations to become contracting members to GATT. As of July 2016, 164 countries were members of the WTO and 21 were observer governments (in the process of joining). General Agreement on Tariffs and Trade (GATT), which has been superseded as an international organization by the WTO. An updated General Agreement is now the WTO agreement governing trade in goods. GATT 1947:- The official legal term for the old (pre-1994) version of the GATT. GATT 1994:- The official legal term for new version of the General Agreement, incorporated into the WTO, and including GATT 1947. / 'Брэтчэн Вудз' ('Bretton Woods'). Генеральное Соглашение о Тарифах и Торговле (ГСТТ или ГЯТ (GATT)) являлось многосторонним межправительственным соглашением, направленным на снижение таможенных пошлин и других барьеров в международной торговле. Изначально, оно было разработано в 1947 и подписано 01 Января 1948 в Женеве, Швейцария уполномоченными представителями 23 стран. Генеральное Соглашение О Тарифах И Торговле (ГСТТ; General Agreement on Tariffs and Trade (GATT)) – многостороннее межправительственное соглашение о режиме торговли и торговой политике, подписанное в Женеве, Швейцария в Октябре 1947 23 странами. К началу 1971 в ГСТТ на различных условиях участвовало более 90 стран (в том числе социалистические государства Куба, Польша, Чехословакия и Югославия). Секретариат ГСТТ находится в Женеве. ГСТТ включает в себя соглашение о принципах торговой политики, которых должны придерживаться во внешней торговле страны-участницы, и согласованный список взаимных уступок (на основе этого списка в рамках ГСТТ его участниками заключаются двусторонние договоры). Заключение соглашения имело целью отказ его участников от количественных ограничений привоза (или импорта) как средства внешнеторговой политики. Однако принципы торговой политики, зафиксированные в ГСТТ, в значительной мере использовались в своих интересах империалистическими странами. Социалистические страны, используя механизм ГСТТ, пытаются улучшить свои торгово-политические позиции в отношениях с капиталистическими странами-членами соглашения. За время действия ГСТТ было осуществлено снижение таможенных тарифов в торговле между его членами. Вместе с тем договор не обеспечил провозглашённых целей в области либерализации внешней торговли вследствие противоречий между основными капиталистическими странами, особенно обострившихся с созданием обособленных интегрированных экономических блоков (Европейское Экономическое Сообщество, Европейская Ассоциация Свободной Торговли и другие). Кроме того, выдвигая требования либерализации торговли, ГСТТ не делает необходимых различий между развитыми капиталистическими и развивающимися странами. Требуя от последних отказа от количественных ограничений привоза (или импорта) промышленных товаров, ГСТТ фактически препятствует становлению в них национальной промышленности. В то же время сохранение ограничений привоза (или импорта) сельскохозяйственных товаров и сырья, допускаемое ГСТТ, сдерживает рост вывоза (или экспорта) развивающихся стран и отрицательно сказывается на их экономическом положении. В 1965 при Секретариате ГСТТ был учреждён особый комитет, который формально должен заниматься проблемами развивающихся стран, фактически его организацией Западные державы стремились принизить значение Конференции ООН По Торговле И Развитию, созданной в 1964. В рамках ГСТТ с 1964 велись переговоры о взаимных тарифных уступках (Раунд Кеннеди), которые вследствие противоречий между участниками закончились лишь в 1967 рядом взаимных торговых уступок. При этом остались неудовлетворёнными главные требования развивающихся стран (отмена нетарифных барьеров на пути их вывоза (или экспорта) и другие). Генеральное Соглашение о Тарифах и Торговле (ГСТТ) – международная организация в рамках ООН, штабквартира которой находится в Женеве, Швейцария. Призвана содействовать снятию торговых барьеров в торговле между странами. В 1994 Конгресс США принял Пакт о сокращении тарифов, международной защите прав на интеллектуальную собственность и общей либерализации торговли.

GENERAL AGREEMENT ON TARIFFS AND TRADE PANEL = КОЛЛЕГИЯ В РАМКАХ ГЕНЕРАЛЬНОГО СОГЛАШЕНИЯ О ТАРИФАХ И ТОРГОВЛЕ – General Agreement On Tariffs And Trade Panel is a panel of neutral representatives that may be established by the GATT (short for the General Agreement on Tariffs and Trade) Secretariat under the dispute settlement provisions of the GATT to review the facts of a dispute and render findings of GATT law and recommend action. / Жюри нейтральных

представителей, которое могло быть образовано Секретариатом Генерального Соглашения о Тарифах и Торговле (ГСТТ или ГЯТ (GATT)) в соответствии с положениями ГСТТ в отношении урегулирования споров для рассмотрения фактов спора и представления решений по законодательству ГСТТ и рекомендуемых действий.

GENERAL ASSEMBLY = ГЕНЕРАЛЬНАЯ АССАМБЛЕЯ – The only body in which all UN members are represented, the General Assembly exercises deliberative, supervisory, financial, and elective functions relating to any matter within the scope of the UN Charter. Its primary role, however, is to discuss issues and make recommendations, though it has no power to enforce its resolutions or to compel state action. Other functions include admitting new members; selecting members of the Economic and Social Council, the nonpermanent members of the Security Council, and the Trusteeship Council; supervising the activities of the other UN organs, from which the Assembly receives reports; and participating in the election of judges to the International Court of Justice and the selection of the secretary-general. Decisions usually are reached by a simple majority vote. On important questions, however – such as the admission of new members, budgetary matters, and peace and security issues – a two-thirds majority is required. The Assembly convenes annually and in special sessions, electing a new president each year from among five regional groups of states. At the beginning of each regular session, the Assembly also holds a general debate, in which all members may participate and raise any issue of international concern. Most work, however, is delegated to six main committees:- (i) Disarmament and International Security, (ii) Economic and Financial, (iii) Social, Humanitarian, and Cultural, (iv) Special Political and Decolonization, (v) Administrative and Budgetary, and (vi) Legal. The General Assembly has debated issues that other organs of the UN have either overlooked or avoided, including decolonization, the independence of Namibia, apartheid in South Africa, terrorism, and the AIDS epidemic. The number of resolutions passed by the Assembly each year has climbed to more than 350, and many resolutions are adopted without opposition. Nevertheless, there have been sharp disagreements among members on several issues, such as those relating to the Cold War, the Arab-Israeli conflict, and human rights. The General Assembly has drawn public attention to major issues, thereby forcing member governments to develop positions on them, and it has helped to organize ad hoc bodies and conferences to deal with important global problems. / для данного случая (ad hoc). Генеральная Ассамблея – один из главных органов Организации Объединённых Наций (ООН). В соответствии с Уставом ООН (Статья 9, Пункт 1) состоит из всех государств-членов ООН. Полномочна обсуждать любые вопросы или дела в пределах Устава ООН или относящиеся к полномочиям и функциям любого из органов, предусмотренных Уставом, и делать рекомендации членам ООН или Совету Безопасности ООН по любым, за некоторыми исключениями, таким вопросам или делам. Уполномочена, в частности, рассматривать общие принципы сотрудничества в деле поддержания международного мира и безопасности (в том числе принципы, определяющие разоружение, регулирование вооружений), обсуждать любые вопросы, относящиеся к поддержанию международного мира и безопасности. Полномочия Генеральной Ассамблеи ограничены с учётом особых функций и полномочий Совета Безопасности, на который члены ООН возложили главную ответственность за поддержание международного мира и безопасности:- любой вопрос, относящийся к поддержанию международного мира и безопасности, по которому необходимо предпринять действия, передаётся Генеральной Ассамблеей Совету Безопасности ООН до или после его обсуждения (Устав ООН, Статья 11). Решения Генеральной Ассамблеи по общему правилу имеют характер рекомендаций, то есть не являются юридически обязательными для государств-членов, однако по ряду вопросов, касающихся внутренней жизни ООН, эти решения носят обязательный характер:- приём в члены и исключение из членов ООН, выборы непостоянных членов Совета Безопасности, Международные суда, назначение Генерального Секретаря ООН и другие (часть решений по указанным вопросам принимается с участием Совета Безопасности). Решения Генеральной Ассамблеи принимаются большинством голосов присутствующих на заседании и принимающих участие в голосовании членов ООН (воздержавшиеся при голосовании члены ООН не считаются участвующими в голосовании). Решения по важным вопросам принимаются квалифицированным большинством в 2/3 присутствующих и участвующих в голосовании членов. Генеральная Ассамблея собирается ежегодно на очередные сессии; в случае необходимости проводятся чрезвычайные и специальные сессии. Каждое государство-член ООН может быть представлено на сессии 5 делегатами (и 5 их заместителями) и имеет при голосовании один голос. Очередные сессии открываются, как правило, в третий Вторник Сентября. На 01 Января 1971 состоялось 25 очередных, 5 специальных и 5 чрезвычайных специальных сессий Генеральной Ассамблеи ООН. Для осуществления своих функций при Генеральной Ассамблее имеется 7 главных комитетов, которые рассматривают по существу большинство пунктов повестки дня сессии Генеральной Ассамблеи:- 1-й Комитет (политические вопросы и вопросы безопасности, включая разоружение), Специальный Политический Комитет (те же вопросы), 2-й Комитет (экономические и финансовые вопросы), 3-й Комитет (социальные и гуманитарные вопросы и вопросы культуры), 4-й Комитет (вопросы опеки и несамоуправляющихся территорий), 5-й Комитет (административные и бюджетные вопросы), 6-й Комитет (правовые вопросы). Для координации работы комитетов на каждой сессии образуется Генеральный Комитет в составе Председателя Ассамблеи, 17 его Заместителей и Председателей 7 главных комитетов. На каждой сессии образуется Комитет по Проверке Полномочий в составе 9 членов. Имеются также 2 постоянных комитета:- Консультативный Комитет по Административным и Бюджетным Вопросам и Комитет по Взносам; члены этих комитетов избираются Генеральной Ассамблеей на 3 года. Кроме того, широко практикуется учреждение специальных комитетов и комиссий:- например, Специальный Комитет по Вопросу о Ходе Осуществления Декларации о Предоставлении Независимости Колониальным Странам и Народам, Комитет по Использованию Космического Пространства в Мирных Целях, Комиссия Международного Права и другие. С 1964 существуют особые органы Генеральной Ассамблеи на правах автономных международных организаций:- Конференция ООН по Торговле и Развитию (ЮНКТАД; с 1964), Организация Объединённых Наций по Промышленному Развитию (ЮНИДО; с 1965), Фонд Капитального Развития (1966). Генеральная Ассамблея является одним из главных органов Организации Объединённых Наций (ООН). Она состоит из всех членов организации, каждый из которых имеет в ней один голос, при этом несмотря на то, что может иметь в ней не более пяти представителей. Генеральная Ассамблея уполномочивается обсуждать любые вопросы или дела в пределах Устава ООН или относящиеся к полномочиям и функциям любого из органов, предусмотренных Уставом ООН, и, за исключением, предусмотренными статьёй 12 Устава, делать рекомендации членам ООН или Совету Безопасности или/и членам ООН и Совету Безопасности по любым таким вопросам или делам. Она организует исследования и делает рекомендации в целях:- (i) содействия международному сотрудничеству в политической области и поощрения прогрессивного развития международного права и его кодификации; и (ii) содействия международному сотрудничеству в области экономической, социальной, культуры, образования, здравоохранения и содействия осуществлению прав человека и основных свобод для всех, без различия расы, пола, языка и религии. Она также получает и рассматривает ежегодные и специальные доклады Совета Безопасности и других органов ООН. Генеральная Ассамблея рассматривает и утверждает бюджет ООН. Члены ООН несут её расходы по распределению, устанавливаемому Генеральной Ассамблеей. Генеральная Ассамблея собирается на очередные ежегодные и на такие специальные сессии, которых могут потребовать обстоятельства. Специальные сессии созываются Генеральным Секретарём по требованию Совета Безопасности или большинства членов ООН. Она устанавливает свои собственные Правила процедуры и избирает своего Председателя на каждую сессию. Генеральная Ассамблея уполномочивается учреждать такие вспомогательные органы, которые она сочтёт необходимыми для осуществления своих функций. Среди главных комитетов Генеральной Ассамблеи комитет по политическим вопросам и вопросам безопасности, по вопросам разоружения и

международной безопасности, по экономическим и финансовым вопросам, и другие, среди которых два постоянных комитета:- консультативный комитет по административным и бюджетным вопросам и комитет по взносам. Кроме того, у ассамблеи имеются особые органы на правах автономных международных организаций, например, Конференция ООН по Торговле и Развитию (так называемая ЮНКТАД).

GENERAL AVERAGE = ОБЩАЯ АВАРИЯ – (1) General Average (GA):- an internationally accepted rule of the sea. When a ship is in danger at sea, whereby the maritime adventure is likely to become a total loss, the master is at liberty to sacrifice property in the adventure or to incur reasonable expenditure to save the adventure. Measures taken for the sole benefit of any particular interest are not general average. On successful completion of the adventure. or if it is abandoned in a place of safety, on successful attainment of such place the ship is declared as entering 'under average'. Security in the shape of deposits or guarantees is taken from each cargo interests and an average adjuster is appointed. The adjuster calculates the value of the saved interests and each interest is required to contribute a rateable proportion to make good the general average loss. The Marine Insurance Act (MIA) 1906 (a UK Act of Parliament regulating marine insurance), provides that underwriters are liable for general average contribution only where the circumstances causing the GA act constitute the operation of an insured peril but it is customary for cargo insurers to qualify this by applying the exception only to exclusions expressed in the cargo clauses. Marine policies on standard conditions, comply with the MIA provision that underwriters' liability is reduced by any underinsurance indicated by a comparison between the insured value, less any PA (Particular Average) claim and the contributory value in the GA (General Average) adjustment. A loss that arises from the reasonable sacrifice at a time of peril of any part of a ship or its cargo for the purpose of preserving the ship and the remainder of its cargo together with any expenditure made for the same purpose. An example of a general average loss would include jettisoning cargo to keep a ship afloat and an example of general average expenditure would include towing a stricken vessel into port. An average adjuster calculates the value of each saved interest to each interested party which is then obliged to contribute towards the general average loss or expenditure proportionately. Subject to the terms of the policy, insurance will generally only apply if the loss was incurred to avoid or in connection with the avoidance of an insured peril. General Average:- partial loss of the whole adventure deliberately made to prevent loss of the adventure. It may be sacrifice of property or expenditure incurred to save the adventure. Parties who benefit from a general average loss are required to make good that loss by contributing in the proportion that the saved value of the party's property bears to the saved value of all interests involved in the adventure. General Average (GA) is a rule of the sea and is implied in all contracts of carriage by sea. Parties to the contract are liable to contribute in GA wether or not their property is insured. Loss resulting from a voluntary sacrifice of any part of the vessel or cargo, or an expenditure to safeguard the vessel and the rest of the cargo. When such a loss occurs, it is paid on a pro rata basis by the ship owner and all cargo owners. See also Particular Average. Loss resulting from a voluntary sacrifice of any part of the vessel or cargo, or an expenditure to safeguard the vessel and the rest of the cargo. When such a loss occurs, it is paid on a pro rata basis by the ship owner and all cargo owners. Intentional act or sacrifice that is carried out to safeguard vessel and cargo. When a vessel is in danger, the master has the right to sacrifice property and/or to incur reasonable expenditure. Measures taken for the sole benefit of any particular interest are not considered general average. Intentional act or sacrifice which is carried out to safeguard vessel and cargo. If the maritime venture is in peril and the captain decides to sacrifice the ship or cargo for the common good, then all parties who gain by the safe completion of the voyage make a contribution to reimburse those who have suffered from the sacrifice. Measures taken for the sole benefit of any particular interest are not considered general average. General Average is defined in the York-Antwerp Rules as:- there is a General Average act when, and only when, any extraordinary sacrifice expenditure is intentionally and reasonably made or incurred for the common safety for the purpose of preserving from peril the property involved in a common maritime adventure. When a cargo ship encounte a serious accident at sea, e.g., a grounding, the vessel owners may ha to incur additional costs to salvage the ship and its cargo, and may resort to declaring General Average. General Average requires that all parties with an interest in saving ship, the cargo, etc share proportionately the cost of saving the common adventure. This means that cargo owners would be responsible a proportion of the costs equal to the proportion of the value of the cargo to the common adventure. General Average is applied according to an internationally acknowledged set of rules, the York-Antwerp Rules. The principle in maritime law that when a sacrifice is made or an expense voluntarily incurred to preserve the rest of a venture the loss or expense should be shared among all the interests involved in proportion to their value. General Average is a principle of maritime law where in the event of emergency, if cargo is jettisoned or expenses incurred, the loss is shared proportionately by all parties with a financial interest in the voyage. In the expression 'General Average' the word 'Average' should be read as 'Loss' as the principle relates to the common proportionate liability of all to contribute to the loss of one or a few, incurred to save the vessel otherwise in distress (such as throwing cargo overboard to keep a boat afloat until rescued). The principle is of ancient original and is the only legal maxim which survives of the great body of law of the Island of Rhodes, circa 800 BC (known as the Lex Rhodia). Today, the maxim is often referred to by the name of the international set of rules which purport to establish points of detail as to its application:- the York-Antwerp Rules. The United States Supreme Court, in 1869, described general average as follows:- 'General average contribution is defined to be a contribution by all the parties in a sea adventure to make good the loss sustained by one of their number on account of sacrifices voluntarily made of part of the ship or cargo to save the residue and the lives of those on board from an impending peril, or for extraordinary expenses necessarily incurred by one or more of the parties for the general benefit of all the interests embarked in the enterprise. Losses which give a claim to general average are usually divided into two great classes:- (1) Those which arise from sacrifices of part. If the ship or part of the cargo, purposely made in order to save the whole adventure from perishing. (2) Those which arise out of extraordinary expenses incurred for the joint benefit of ship and cargo. Common justice dictates that where two or more parties are engaged in the same sea risk, and one of them, in a moment of imminent peril, makes a sacrifice to avoid the impending danger or incurs extraordinary expenses to promote the general safety, the loss or expenses so incurred shall be assessed upon all in proportion to the share of each in the adventure. Where expenses are incurred or sacrifices made on account of the ship, freight, and cargo, by the owner of either, the owners of the other interests are bound to make contribution in the proportion of the value of their several interests, but in order to constitute a basis for such a claim it must appear that the expenses or sacrifices were occasioned by an apparently imminent peril; that they were of an extraordinary character; that they were voluntarily made with a view to the general safety; and that they accomplished or aided at least in the accomplishment of that purpose'. In Birkley v Presgrave (1801), the British House of Lords used these words as credited to Lords Kenyon and Lawrence:- '... all extra perils of the sea and ordinary losses and damages sustained by the ship happening immediately from the storm ... must be borne by the ship owners. But all those articles which were made use of by the master and crew upon the particular emergency, and out of the usual course, for the benefit of the whole concern, and the other expenses incurred, must be paid proportionably .... All loss which arises in consequence of extraordinary sacrifices made or expenses incurred for the preservation of the ship and cargo come within general average and must be borne proportionably by all who are interested. Natural justice requires this'. The law of general average occupies rows in the law libraries of maritime law schools. The fundamental terminology is as follows:- (i) an act which purports to create compensation based on general average is called a General Average Act; (ii) an emergency expenditure which qualifies under the principle of general average, and which gives rise to proportionate contribution from others, is called a General Average Expenditure; and (iii) a contribution from a person towards the loss of another by operation of the general average law, is called a General Average Contribution. An international convention on working the law of general average in practice exists and is known as the York-Antwerp Rules, and is

managed by the Comité Maritime International, based in Antwerp, Belgium. Understanding general average and applying it are two different things as each case involves jurisdiction issues, interest, contributions and other such detail and subject to the workings of insurance adjusters and appraisals. In the result, most cases settle or, as was stated by Justice Collier in the Canadian case, Northland Navigation:- 'most claims do not go to litigation'. / хозяин (или капитан). Бёкли (Birkley) против Прэсгрэйва (Presgrave) (1801), Лорды Кэньон и Лорэнс (Lords Kenyon and Lawrence):- . экстраординарные . Международный Морской Комитет или, как это звучит на Французском по месту регистрации, Комите Маритим Этэрнасьёналь (Comité Maritime International), расположенный в Антверпене, Бельгия. Общая Авария – это убытки, понесённые вследствие произведённых намеренно и разумно чрезвычайных расходов о пожертвований в целях спасения судна, фрахта и перевозимого груза от общей для них опасности. Смотрите также Частная Авария (Particular Average). В морском праве под Общей Аварией подразумеваются убытки, причинённые намеренно в целях спасения судна и груза от угрожающей им общей опасности. Такие убытки распределяются пропорционально стоимости судна, фрахта и груза. При Общей Аварии убытки, понесённые вследствие произведённых намеренно и разумно чрезвычайных расходов или пожертвований в целях спасения судна, фрахта и перевозимого на судне груза от общей для них опасности. Общая авария определяется тремя признаками:- (i) намеренностью и разумностью действий, причинивших убытки; (ii) их чрезвычайным характером, выражающимся в том, что эти действия выходят за пределы круга обычных действий, совершаемых в нормальных условиях плавания; и (iii) совершением действий в целях спасения судна, фрахта и груза от общей для них опасности. Общая Авария:- ущерб, убытки, нанесённые в результате произведённых намеренно действий и чрезвычайных расходов или пожертвований в целях спасания судна, перевозимого на нём груза и фрахта, в том числе ущерб, нанесённый выбрасыванием за борт груза, тушением пожара, намеренной посадкой судна на мель, повреждением судового двигателя и котлов при их форсировании; повреждения или убытки, возникшие в результате преднамеренных действий хозяина судна или капитана (например, выброса за борт всего или части груза для спасения судна), делятся между всеми участвующими сторонами, например, между хозяином судна и всеми владельцами груза. В отличие от аварии, представляющей собой какое-либо происшествие на море (столкновение, кораблекрушение), Общая авария – это лишь убытки, которые распределяются между сторонами. Судовладельцы имеют право до сдачи груза потребовать от грузополучателей взнос по общей аварии, то есть определённую сумму денег в обеспечение покрытия их пропорциональной доли расходов, причинённых по общей аварии. Взнос по аварии вносится в депозит на банковский счёт как обеспечение для покрытия расходов по спасанию. В некоторых случаях вместо депозита выдаётся гарантийное письмо. Расходы покрываются на основании договора морского страхования.

(2) General Average:- an Ocean Marine coverage meaning a partial loss which has resulted from the voluntary and deliberate sacrifice of some cargo for the benefit of all concerned, and which must be shared by all parties (owners of ship, cargo and freight) in proportion to their interest. For example, if 100 containers were jettisoned from a 1 000 container load in order to protect the ship, the owners of the remaining 900 containers, the owners of the ship, and the owners of the freight would all contribute to offset the losses of those whose cargo was jettisoned for the benefit of the whole.

GENERAL AVERAGE ACT = АКТ ОБ ОБЩЕЙ АВАРИИ – There is a General Average Act when, and only when any extraordinary sacrifice or expenditure is intentionally and reasonably made or incurred for the common safety for the purpose of preserving from peril the property involved in a common maritime adventure. Also known as York-Antwerp Rules. An act which purports to create compensation based on general average is called a General Average Act. / экстраординарное .

GENERAL AVERAGE BOND = ОБЯЗАТЕЛЬСТВО ПО ОБЩЕЙ АВАРИИ – General Average Bond is an agreement signed by all parties involved in a general average act.

GENERAL AVERAGE CLAUSE = ОГОВОРКА ОБ ОБЩЕЙ АВАРИИ – The General Average Clause in ocean marine insurance obligates the insurers of various interests to share the cost of losses incurred voluntarily to save the voyage from complete destruction. Such sacrifices must be made voluntarily, must be necessary, and must be successful. For example, if a shipper's cargo is voluntarily jettisoned in a storm in order to save the vessel from total loss, the general average clause requires the insurers of the hull and of all other cargo interests to make a contribution to the loss of the shipper whose goods were sacrificed. Other types of losses may also be covered. It has been held, for example, that losses suffered from efforts to put out a fire on shipboard, which result in damage to specific goods, can be included in a general average claim. Similarly, losses from salvage efforts to free a stranded vessel may qualify under a general average claim to which all interests must contribute.

GENERAL AVERAGE CONTRIBUTION = КОНТРИБУЦИЯ ПО ОБЩЕЙ АВАРИИ – General Average Contribution is the payment due from a party in a marine venture to pay for a general average loss. It is in proportion to the value of his interest as compared with the total values of all interests in the venture. The proportion payable by one of the parties involved in a general average act to make good the loss suffered in that act. The proportionate shares of the vessel owner and each of the cargo owners in order to make up the expenditure or sacrifice incurred for the common good. A contribution from a person towards the loss of another by operation of the general average law, is called a General Average Contribution. / Аварийный Взнос (General Average Contribution):- (1) денежная сумма, истребуемая судовладельцем либо диспашером от его имени у грузовладельца в качестве обеспечения уплаты его доли расходов по общей аварии; и (2) часть убытка, падающая на конкретного участника расходов по общей аварии и соразмерная стоимости принадлежащего ему имущества:- судна, груза или фрахта. В международной практике грузовых перевозок аварийный взнос называют Аварийным Депозитом.

GENERAL AVERAGE DEPOSIT = ДЕПОЗИТ ПО ОБЩЕЙ АВАРИИ – General Average Deposit is a deposit which a shipowner requires of a cargo owner as a condition of releasing his lien on cargo that is subject to a general average contribution. A deposit paid by a consignee in return for delivery of the goods where such goods are subject to general average contribution. Paid by a consignee to obtain release of the cargo from the carrier following a general average act. This may be replaced by an Underwriter's guarantee. / Депозит по Общей Аварии – в страховании – денежная сумма, вносимая грузовладельцем на специальный счёт в банке в обеспечение уплаты им взноса по общей аварии. Счёт открывается совместно на имя судовладельца и грузовладельца с условием, что платежи с депозита могут производиться только по указанию диспашера или по совместному указанию представителей сторон. Размер депозита по общей аварии должен соответствовать падающей на груз доле по общей аварии. Если груз застрахован и по условиям страхования покрывается общая авария, то по требованию страхователя депозит подлежит внесению страховщиком.

GENERAL AVERAGE DISBURSEMENTS = РАСХОДЫ ПО ОБСЛУЖИВАНИЮ ПРИ ОБЩЕЙ АВАРИИ – General Average Disbursements:- expenses paid by the shipowner as part of a general average act. Such expenses are recovered by the shipowner from the general average fund. Unlike general average (GA) sacrifice, there is no direct liability on hull underwriters to reimburse the assured for GA disbursements. The disbursements will be included in the final GA adjustment and incorporated in the GA contribution, underwriters paying this insofar as it is recoverable under the policy.

GENERAL AVERAGE FUND = ФОНД ПО ОБЩЕЙ АВАРИИ – General Average Fund:- the total arrived at by adding together general average expenditure and the value of property sacrificed in a general act, plus costs of its adjustment.

GENERAL AVERAGE GUARANTEE = ГАРАНТИЯ ПО ОБЩЕЙ АВАРИИ – General Average Guarantee is an insurer's guarantee that may be accepted by a shipowner in lieu of a general average deposit. An undertaking by a financial house or an underwriter to pay the contribution due towards a general average fund. Paid by a consignee to obtain release of the cargo from the carrier following a general average act. This may be replaced by an Underwriter's guarantee.

GENERAL AVERAGE IN FULL = ПОЛНОСТЬЮ ПО ОБЩЕЙ АВАРИИ – General Average In Full:- an agreement in a cargo insurance whereby underwriters do not reduce a claim for general average contribution in event of underinsurance.

GENERAL AVERAGE IN FULL CLAUSE = ОГОВОРКА ОБ ОБЩЕЙ АВАРИИ В ПОЛНОМ ОБЪЁМЕ – General Average In Full Clause is a clause in a cargo policy whereby the underwriter agrees to pay general average contributions in full even though the contributory value may be greater than the insured value.

GENERAL AVERAGE INSURANCE = СТРАХОВАНИЕ ОТ ОБЩЕЙ АВАРИИ – General Average Insurance:- in water transportation, the deliberate sacrifice of cargo to make the vessel safe for the remaining cargo. Those sharing in the spared cargo proportionately cover the loss.

GENERAL AVERAGE SACRIFICE = В ЖЕРТВОВАНИЕ ПО ОБЩЕЙ АВАРИИ – General Average Sacrifice:- the voluntary destruction of part of the vessel or the cargo, or the deliberate expenditure of funds in time of grave peril, which is successful in avoiding total disaster.

GENERAL AVERAGE SECURITY = ЦЕННАЯ БУМАГА ПО ОБЩЕЙ АВАРИИ (или ОБОРОТНЫЙ ДОКУМЕНТ ПО ОБЩЕЙ АВАРИИ) – General Average Security:- documents the cargo owner presents to the General Average Adjuster to replace the vessel owner's maritime lien on cargo for its share of General Average and to obtain release of the goods by the Steamship Company. GA Security consists of a GA Bond and either a cash deposit or an Underwriter's Guarantee.

GENERAL AVERAGE STATEMENT = АВАРИЙНЫЙ СЕРТИФИКАТ (или ЗАКЛЮЧЕНИЕ ПО ОБЩЕЙ АВАРИИ, или ВЫПИСКА ПО ОБЩЕЙ АВАРИИ, или ДИСПАША) – General Average Statement:- this shows in detail all general average costs and expenses and the contribution of each interest in the general average in proportion to its value. Statement showing details of all general average costs and expenses and the contribution of each interest in the general average in proportion to its value. / Диспашер составляет диспашу с расчётом убытков по авариям.

GENERAL BILL OF LADING = ОБЩИЙ КОНОСАМЕНТ – General Bill Of Lading is a document issued by an overseas carrier which is a receipt for cargo received on board and is evidence of the contract between shipper and shipowner. It is also evidence of title to the holder of the bill to the goods described on it.

GENERAL BUSINESS CONDITIONS = ВСЕОБЩИЕ УСЛОВИЯ ДЛЯ БИЗНЕСА – General Business Conditions (GBCs) are standard contractual conditions regulating the principal aspects of the business relations between the bank and its customers. When business relations are established, the customer is expressly informed that they are governed by the General Business Conditions. The GBC lead to a simplification of business between bank and customer because similar transactions are executed according to standard principles with respect to all customers. The principles and guidelines that govern business relations. They are an integral part of contracts concluded between a company (e.g., a bank) and any of numerous business partners. / , например, .

GENERAL CARGO = ГЕНЕРАЛЬНЫЙ ГРУЗ – General Cargo is a cargo, consisting of goods, unpacked or packed, for example in cartons, crates, bags or bales, often palletized. General Cargo is a non-bulk oil cargo composed of miscellaneous goods. Cargo, consisting of merchandise, unpacked or packed in cartons, crates, bags or bales, often palletised. General cargo can be shipped either in Breakbulk or stuffed in containers. / Различные штучные грузы:- металлопродукция, подвижная техника (самоходная и несамоходная на колёсном или гусеничном ходу), железобетонные изделия и конструкции, контейнеры, тарно-штучные грузы, грузы в транспортных пакетах, крупногабаритные и тяжеловесные грузы, лесные грузы.

GENERAL CARGO BERTH = ПРИЧАЛ ДЛЯ ГЕНЕРАЛЬНЫХ ГРУЗОВ – General Cargo Berth is an area where ships of all types have their cargoes loaded and unloaded. / Зона, в которой суда всех типов имеют возможность загрузки и выгрузки грузов. Под Пристанью понимается небольшой порт на внутренних водных путях, имеющий обычно 1–2 причала. Причал, комплекс сооружений и устройств, предназначенных для подхода, швартовки, стоянки, обработки и обслуживания судов, посадки и высадки пассажиров, грузовых операций и тому подобного. Различают грузовые, пассажирские, судоремонтные и другие причалы.

GENERAL CARGO CARRIER = ПЕРЕВОЗЧИК ГЕНЕРАЛЬНЫХ ГРУЗОВ – General Cargo Carrier:- breakbulk freighters, car carriers, cattle carriers, pallet carriers and timber carriers.

GENERAL CARGO RATE = СТАВКА ДЛЯ ГЕНЕРАЛЬНОГО ГРУЗА – General Cargo Rate is the rate for the carriage of cargo other than a class rate or specific commodity rate. / Ставка за перевозку груза иная, нежели ставка по классу (по категории) или ставка за конкретное сырьё.

GENERAL CARGO SHIP = СУДНО ДЛЯ ГЕНЕРАЛЬНОГО ГРУЗА – Modern General Cargo Ships are built to perform different transport functions; to distinguish them from other multipurpose freighters, they are sometimes known as Break-Bulk Freighters. In addition to the equipment which makes them suitable for carrying break-bulk cargoes, they generally also have facilities to allow them to accommodate containers. Such ships are of open construction, i.e. the hatch area is very large relative to the deck area. This ensures that lifting gear can gain direct access to containers. The same applies to general cargo or access is at least facilitated to such an extent that below deck stowage can (very largely) be avoided. Specific construction features may increase handling efficiency in port and reduce the loss ratio.

GENERAL CHARTER CONDITIONS = ГЕНЕРАЛЬНЫЕ УСЛОВИЯ ЧАРТЕРА – General Charter Conditions (agreement) or GENCON, or Gencon Charter Party, is the most commonly form of voyage charter party used worldwide, and particularly known also as Gencon 1994. Gencon, first issued in 1922 and revised in 1976 and 1994. Gencon 1994 includes two parts:- Part 1:- is the 'box form' which all the necessary information to be completed by the parties; and Part 2:- contains all the standard terms and conditions which are usually non-negotiable.

GENERAL CLEARING MEMBER = ГЕНЕРАЛЬНЫЙ КЛИРИНГОВЫЙ ЧЛЕН – General Clearing Member is a member of an exchange entitled to clear its own transactions, those of its customers and those of the floor brokers without a clearing license.

GENERAL COMBINING ABILITY = ГЕНЕРАЛЬНАЯ ВОЗМОЖНОСТЬ СОЧЕТАНИЯ (или ГЕНЕРАЛЬНАЯ КОМБИНАЦИОННАЯ ВОЗМОЖНОСТЬ) – General Combining Ability is the average performance of a parent in a series of crosses.

GENERAL COMMODITY RATE = ГЕНЕРАЛЬНАЯ СТАВКА ДЛЯ СЫРЬЯ – General Commodity Rate is a rate applied to commodities in transit. Unless otherwise specified, all commodities have the same rate applied, usually priced by bulk unit. Also known as General Cargo Rate.

GENERAL COUNCIL = ГЕНЕРАЛЬНЫЙ СОВЕТ – The General Council comprises:- the President of the European Central Bank (ECB); the Vice-President of the ECB; and the governors of the national central banks (NCBs) of the 27 EU Member States. In other words, the General Council includes representatives of the 17 Euro area countries and the 10 non-Euro area countries. The other members of the ECB's Executive Board, the President of the EU Council and one member of the European Commission may attend the meetings of the General Council but do not have the right to vote. Responsibilities:- the General Council can be regarded as a transitional body. It carries out the tasks taken over from the European Monetary Institute which the ECB is required to perform in Stage Three of Economic and Monetary Union on account of the fact that not all EU Member States have adopted the Euro yet. The General Council also contributes to:- (i) the ECB's advisory functions; (ii) the collection of statistical information; (iii) the preparation of the ECB's annual report; (iv) the establishment of the necessary rules for standardising the accounting and reporting of operations undertaken by the NCBs; (v) the taking of measures relating to the establishment of the key for the ECB's capital subscription other than those laid down in the Treaty; (vi) the laying-down of the conditions of employment of the members of staff of the ECB; and (vii) the necessary preparations for irrevocably fixing the exchange rates of the currencies of the 'EU Member States with a derogation' against the Euro. In accordance with the Statute of the European System of Central Banks and of the European Central Bank, the General Council will be dissolved once all EU Member States have introduced the single currency. See also Governing Council. General Council: one of the decision-making bodies of the ECB. It comprises the President and Vice-President of the ECB and the governors of all EU NCBs. General Council is the supreme decision-making body of the European Central Bank (ECB). It comprises all members of the Executive Board (including the President and the Vice-President) of the ECB and the governors of the national central banks (NCBs) of the countries that have adopted the Euro. / Смотрите также Руководящий Совет (Governing Council).

GENERAL DEPARTMENT STORE MERCHANDISE = ГЕНЕРАЛЬНАЯ ПРОДУКЦИЯ ДЛЯ УНИВЕРСАМОВ – General Department Store Merchandise (GDSM) is a classification of commodities that includes goods generally shipped by mass-merchandise companies. This commodity structure occurs only in service contracts.

GENERAL EXCEPTION = ОБЩЕЕ ИСКЛЮЧЕНИЕ – General Exception:- CoCom controls exports at three levels, depending on the item and the proposed destination. At the highest or 'general exception' level, unanimous approval by CoCom members is necessary. CoCom was dissolved in March 1994. / КоКам (CoCom).

GENERAL EXCLUSIONS CLAUSE = ОГОВОРКА ОБ ОБЩИХ ИСКЛЮЧЕНИЯХ – General Exclusion Clause:- in no case shall this insurance cover:- (1) loss damage or expense attributable to wilful misconduct of the Assured; (2) ordinary leakage, ordinary loss in weight or volume, or ordinary wear and tear of the subject-matter insured; (3) loss damage or expense caused by insufficiency or unsuitability of packing or preparation of the subject-matter insured (for the purpose of this Clause 3 'packing' shall be deemed to include stowage in a container or liftvan but only when such stowage is carried out prior to attachment of this insurance or by the Assured or their servants); (4) loss damage or expense caused by inherent vice or nature of the subject-matter insured; (5) loss damage or expense proximately caused by delay, even though the delay be caused by a risk insured against (except expenses payable under Clause 2 above); (6) loss damage or expense arising from insolvency or financial default of the owners managers charterers or operators of the vessel; (7) deliberate damage to or deliberate destruction of the subject-matter insured or any part thereof by the wrongful act of any person or persons; and (8) loss damage or expense arising from the use of any weapon of war employing atomic or nuclear fission and/or fusion or other like reaction or radioactive force or matter. General Exclusions Clause is a clause in the Institute Cargo Clauses 1982, which specifies risks that are excluded, irrespective of the risks covered elsewhere in the wording.

GENERAL EXPORT LICENSE = ГЕНЕРАЛЬНАЯ ЛИЦЕНЗИЯ НА ВЫВОЗ (или ГЕНЕРАЛЬНАЯ ЭКСПОРТНАЯ ЛИЦЕНЗИЯ) – General Export License:- any of various export licenses covering export commodities for which validated export licenses are not required. In the United States, any of various US export licenses covering export commodities for which Validated Export Licenses are not required. No formal application or written authorization is needed to ship exports under a General Export License.

GENERAL IMPORTS = ВСЕОБЩИЕ ПРИВОЗЫ (или ВСЕОБЩИЙ ИМПОРТ) – 'General Imports' measure the total physical arrivals of merchandise from foreign countries, whether such merchandise enters consumption channels immediately or is enteres into bonded warehouses of Foreign Trade Zones under Customs custody.

GENERALIZED SYSTEM OF PREFERENCES = ОБОБЩЁННАЯ СИСТЕМА ПРЕФЕРЕНЦИЙ – The US Generalized System of Preferences (GSP) is a program designed to promote economic growth in the developing world by providing preferential duty-free entry for up to 5 000 products when imported from one of 127 designated beneficiary countries and territories. The GSP program also supports US jobs. US businesses imported USD19.9 billion worth of products under the GSP program in 2012, including many inputs used in US manufacturing. According to a 2005 US Chamber of Commerce study, over 80 000 American jobs are associated with moving GSP imports from the docks to farmers, manufacturers, and retail shelves. GSP was instituted on January 01, 1976, by the Trade Act of 1974. Products that are eligible for duty-free treatment under GSP include:- most manufactured items; many types of chemicals, minerals and building stone; jewelry; many types of carpets; and certain agricultural and fishery products. Among the products that are not eligible for GSP duty-free treatment are:- most textiles and apparel; watches; and most footwear, handbags, and luggage products. On October 21, 2011, President Obama signed legislation to reauthorize the GSP program through July 31, 2013. The Generalized System of Preferences (GSP) is a framework under which developed countries give preferential tariff treatment to manufactured goods imported from certain developing countries. GSP is one element of a coordinated effort by the industrial trading nations to bring developing countries more fully into the international trading system. The US GSP scheme is a system of nonreciprocal tariff preferences for the benefit of these countries. The US conducts annual GSP reviews to consider petitions requesting modification of product coverage and/or country eligibility. United States GSP law requires that a beneficiary country's laws and practices relating to market access, intellectual property rights protection, investment, export practices, and workers rights be considered in all GSP decisions. Since 1971, the EU has had rules ensuring that exporters from developing countries pay lower duties on some or all of what they sell to the EU. This gives them vital access to EU markets contributing to the growth of their economies. This scheme is known as the 'Generalised Scheme of Preferences' (GSP). The EU adopted a new GSP on 31 October 2012. Regulation (EU) 978/2012 of the European Parliament and of the Council. In order to allow ample time for economic operators to adapt to the new scheme, the new preferences will apply as of 01 January 2014. Until 31 December 2013, the preferences under the previous scheme will continue to apply. Those preferences were defined by Council Regulation (EC) No. 732/2008 and extended until 31 December 2013 by a GSP 'Roll-over' Regulation. The objectives of the EU's new GSP are to focus help on those truly in need; to strengthen GSP+ as an

incentive to good governance and sustainable development; and to make the scheme more transparent, stable and predictable. The three main variants of the scheme (the overall GSP scheme, the 'GSP+' incentive scheme for the respect of labor, human, environmental and good governance rights and rules, and the 'Everything but Arms' scheme for least developed countries) are reinforced, by re-adjusting the preferences and ensuring they have a higher impact. On 17 December 2012, the Commission adopted the list of the sectors that are graduated for the period 2014–16, according to the provisions of the new Regulation. On 21 February 2013, the Commission published its regulation on the rules of procedure for GSP+. Main features of the new GSP:- (i) concentrating GSP preferences on fewer countries. A number of countries would no longer benefit from the scheme, including:- (a) countries that have preferential access to the EU which is at least as good as under GSP – for example, under a Free Trade Agreement or a special autonomous trade regime; (b) countries which have achieved a high or upper middle income per capita, according to World Bank classification such as Brazil, Malaysia, Russia and Saudi Arabia; and (c) a number of overseas countries and territories (OCTs), which have an alternative market access arrangement for developed markets; (ii) reinforcing the incentives for the respect of core human and labor rights, environmental and good governance standards through the GSP+ scheme; (iii) strengthen the effectiveness of the trade concessions for Least Developed Countries (LDCs) through the 'Everything but Arms' scheme. Reducing GSP to fewer beneficiaries will reduce competitive pressure and make the preferences for LDCs more meaningful. The EU's Everything But Arms scheme (EBA scheme) is already unmatched by any other developed country. (iv) Increasing predictability, transparency and stability. With the exception of EBA, which has no expiry date, the new scheme will last 10 years, while it is currently subject to review every three years. This will make it easier and more attractive for EU importers to purchase from GSP beneficiary countries. In addition, procedures will become even more transparent, with clear, better defined legal principles and objective criteria. The EU Generalised System of Preferences (GSP) is a system of tariff preferences operated by developed countries. The EU's scheme, introduced in 1971, was designed to foster the development of developing countries by granting them easier access to the EU market. Beneficiary countries granted GSP treatment were not required to contribute anything in return. The Generalized System of Preferences (GSP) affords nomeciprocal tariff preferences to developing countries to aid their economic development and to diversify and expand their production and expons. The US GSP, enacted in title V of the Trade Act of 1974 and renewed in the Trade and Tariff Act of 1984, applies to merchandise imported on or after January 01, 1976 and before September 30, 1994. Indicated by the symbol 'A' or 'A*' in the special subcolumn of column 1, the GSP provides duty-free entry to eligible articles the product of and imported directly from designated beneficiary developing countries, as set forth in general note 4 to the HTS. The Generalized System of Preferences (GSP) aims at contributing to the economic development of developing countries. GSP provides benefits to developing countries by enabling qualified products to enter the markets of preference-giving countries at changing rates from duty free to reductions in the Most Favored Nation (MFN rate).

GENERAL LEDGER = ГЛАВНАЯ КНИГА (или XX) – General Ledger is a record of entries summarizing all of a company's financial transactions, through offsetting debit and credit accounts.

GENERAL LICENSE = ГЕНЕРАЛЬНАЯ ЛИЦЕНЗИЯ – General License:- in the United States, these are licenses, authorized by the Bureau of Export Administration, that permit the export of non-strategic goods to specified countries without the need for a validated license. No prior written authorization is required and no individual license is issued. There are over twenty different types of general licenses, each represented by a symbol. The reason so many general licenses exist is to accommodate the various exporting situations that the Bureau of Export Administration has determined should not require an Individual Validated License (IVL). These licenses include:- General License BAGGAGE, General License CREW, General License GATS, General License GCG, General License G-COCOM, General License GCT, General License G-DEST, General License GFW, General License GIFT, General License GIT, General License GLR, General License GLV, General License G-NNR, General License GTDA, General License GTDR, General License G-TEMP, General License GTF-US, General License GUS, General License PLANE STORES, General License RCS, General License SAFEGUARDS, General License SHIP STORES. / КоКам (CoCom).

GENERAL LICENSE BAGGAGE = ГЕНЕРАЛЬНАЯ ЛИЦЕНЗИЯ НА ОБРАБОТКУ (или ОБСЛУЖИВАНИЕ) БАГАЖА – In the United States, General License BAGGAGE authorizes individuals leaving the United States for any destination to take with item as personal baggage the following items:- personal effects, household effects (including personal computers), vehicles, and tools of the trade (including highly technical ones), provided that certain conditions concerning these items pertain.

GENERAL LICENSE CREW = ГЕНЕРАЛЬНАЯ ЛИЦЕНЗИЯ НА ПРЕДОСТАВЛЕНИЕ УСЛУГ ЭКИПАЖАМ – In the United States, with limitations, General License CREW authorizes a member of the crew on an exporting carrier to export personal and household items among his/her effects. / вывозить персональные вещи и домашнюю утварь .

GENERAL LICENSE FREE WORLD = ГЕНЕРАЛЬНАЯ ЛИЦЕНЗИЯ НН – In the United States, General License Free World (GFW) authorizes exports of certain low level commodities subject to national security controls. In most cases, these commodities have performance characteristics that permit the United States to approve exports to controlled countries with only notification to other CoCom governments. CoCom was dissolved in March 1994. / КоКам (CoCom).

GENERAL LICENSE GATS = ГЕНЕРАЛЬНАЯ ЛИЦЕНЗИЯ НН – In the United States, General License Aircraft on Temporary Sojourn (GAT) authorizes the departure form the United States of foreign registry civil aircraft on temporary sojourn in the United States and of US civil aircraft for temporary sojourn abroad.

GENERAL LICENSE GCG = ГЕНЕРАЛЬНАЯ ЛИЦЕНЗИЯ НН – In the United States, with limitations, General License Shipments to Agencies of Cooperating Governments (GCG) authorizes the export of commodities for official use of any agency of a cooperating government within the territory of the cooperating government.

GENERAL LICENSE G–COCOM = ГЕНЕРАЛЬНАЯ ЛИЦЕНЗИЯ ДЬЖИ.–КОКАМ – In the United States, General License G-COCOM authorizes exports to CoCom participating countries, Austria, Finland, Ireland and Switzerland, for use or consumption therein, of commodities that the United States may approve for export to controlled countries with only notification to the CoCom governments, as well as commodities within the China 'Green Zone'. CoCom was dissolved in March 1994. / КоКам (CoCom).

GENERAL LICENSE GCT = ГЕНЕРАЛЬНАЯ ЛИЦЕНЗИЯ НН – In the United States, General License GCT authorizes exports to eligible countries of all 'A' level commodities except those specifically excluded by the 'Commodities Not Eligible for GCT' paragraphs in certain Export Control Commodity Numbers (ECCNs) on the Commodity Control List. Exports may be made under GCT only when intended for use or consumption within the importing country, reexport among and consumption within eligible countries, or reexport in accordance with other provisions of the Export Administration Regulations. / обратный вывоз (или реэкспорт; reexport).

GENERAL LICENSE G–DEST = ГЕНЕРАЛЬНАЯ ЛИЦЕНЗИЯ НН – In the United States, General License Shipments of Commodities to Destinations (G-DEST) not requiring a validated license. The majority of all items exported fall under the provisions of General License G-DEST.

GENERAL LICENSE GIFT = ГЕНЕРАЛЬНАЯ ЛИЦЕНЗИЯ НА ОБРАБОТКУ ПОСЫЛОК С ПОДАРКАМИ – In the United States, subject to various provisions and limitations, General License Shipment of Gift Parcels (GIFT) authorizes the export of gift parcels by an individual in the United States.

GENERAL LICENSE GIT = ГЕНЕРАЛЬНАЯ ЛИЦЕНЗИЯ НН – In the United States, with limitations, General License Intransit Shipments (GIT) authorizes the export from the United States of commodities that originate in one foreign country and are destined to another foreign country.

GENERAL LICENSE GLR = ГЕНЕРАЛЬНАЯ ЛИЦЕНЗИЯ НН – In the United States, subject to various provisions, General License Return or Replacement of Certain Commodities (GLR) authorizes the return or repair of commodities and the replacement of parts.

GENERAL LICENSE GLV = ГЕНЕРАЛЬНАЯ ЛИЦЕНЗИЯ НН – In the United States, General License Shipments of Limited Value (GLV) authorizes a 'single shipment' of a commodity when the shipment does not exceed the value limit specified in the GLV paragraph of the ECCN (Export Control Classification Number, formerly Export Commodity Classification Number).

GENERAL LICENSE GTDA = ГЕНЕРАЛЬНАЯ ЛИЦЕНЗИЯ НН – In the United States, General License Technical Data (GTDA) available to all destinations. Authorizes exports to all destinations of technical data that are in the public domain and generally available.

GENERAL LICENSE GTDR = ГЕНЕРАЛЬНАЯ ЛИЦЕНЗИЯ НН – In the United States, when exporting technical data to free world destinations and the information does not qualify under GTDA and an Individual Validated License (IVL) is not required, an exporter may use GTDR. GTDR shipments must be accompanied by a written assurance from the foreign consignee stating that neither the technical data nor the direct product thereof will be shipped to Country Groups Q, S, W, Y or Z, the People's Republic of China or Afghanistan.

GENERAL LICENSE G–TEMP = ГЕНЕРАЛЬНАЯ ЛИЦЕНЗИЯ НН – In the United States, subject to conditions and exceptions, General License G-TEMP authorizes the temporary export of commodities and software for temporary use abroad for a period generally not to exceed 12 months.

GENERAL LICENSE GTF–US = ГЕНЕРАЛЬНАЯ ЛИЦЕНЗИЯ НН – In the United States, General License Goods Imported for Display at US Exhibitions or Trade Fairs (GTF-US) authorizes the export of commodities that were:- (i) imported into the United States for display at an exhibition or trade fair; and (ii) either entered under bond or permitted temporary free importation under bond providing for their export and are being exported in accordance with the terms of such bond. / привоз (importation).

GENERAL LICENSE GUS = ГЕНЕРАЛЬНАЯ ЛИЦЕНЗИЯ НА ОБЕСПЕЧЕНИЕ АМЕРИКАНСКИХ ПРАВИТЕЛЬСТВЕННЫХ СЛУЖБ ЗА РУБЕЖОМ – In the United States, with limitations, General License shipments to personnel and agencies of the US Government (GUS) authorizes the export of commodities and software for personal or official use to any destination.

GENERAL LICENSE PLANE STORES = ГЕНЕРАЛЬНАЯ ЛИЦЕНЗИЯ НА ОБЕСПЕЧЕНИЕ ЗАПАСОВ АВИАСУДОВ – In the United States, with limitations, General License Plane Stores authorizes the export on aircraft of US or foreign registry departing from the United States of usual and reasonable kinds and quantities of commodities necessary to support the operation of an aircraft, provided the commodities are not intended for unloading in a foreign country and are not exported under a bill of lading as cargo.

GENERAL LICENSE SAFEGUARDS = ГЕНЕРАЛЬНАЯ ЛИЦЕНЗИЯ НН – In the United States, with limitations, General License Safeguards authorizes exports to the International Atomic Energy Agency (IAEA) and the European Atomic Energy Community (EURATOM).

GENERAL LICENSE SHIP STORES = ГЕНЕРАЛЬНАЯ ЛИЦЕНЗИЯ НА ОБЕСПЕЧЕНИЕ СУДОВЫХ ЗАПАСОВ – In the United States, with limitations, General License Ship Stores authorizes the export of usual and reasonable kinds and quantities of the commodities to support the operations of a vessel, provided the commodities are not intended for unloading in a foreign country and are not exported under a bill of lading as cargo.

GENERALLY ACCEPTED ACCOUNTING PRINCIPLES = ОБЩЕПРИНЯТЫЕ ПРИНЦИПЫ ВЕДЕНИЯ БУХГАЛТЕРСКОГО УЧЁТА – Generally Accepted Accounting Principles (GAAP) is the common set of accounting principles, standards and procedures that companies use to compile their financial statements. GAAP are a combination of authoritative standards (set by policy boards) and simply the commonly accepted ways of recording and reporting accounting information. GAAP are imposed on companies so that investors have a minimum level of consistency in the financial statements they use when analyzing companies for investment purposes. GAAP cover such things as revenue recognition, balance sheet item classification and outstanding share measurements. Companies are expected to follow GAAP rules when reporting their financial data via financial statements. If a financial statement is not prepared using GAAP principles, be very wary! That said, keep in mind that GAAP is only a set of standards. There is plenty of room within GAAP for unscrupulous accountants to distort figures. So, even when a company uses GAAP, you still need to scrutinize its financial statements. Generally Accepted Accounting Principles (GAAP) is a recognized common set of accounting principles, standards, and procedures. This is a combination of accepted methods of doing accounting and authoritative standards set by policy boards. The US accountants use Generally Accepted Accounting Principles (GAAP) to guide them in recording and reporting financial information. GAAP comprises a broad set of principles that have been developed by the accounting profession and the Securities and Exchange Commission (SEC). Two laws, the Securities Act of 1933 and the Securities Exchange Act of 1934, give the SEC authority to establish reporting and disclosure requirements. However, the SEC usually operates in an oversight capacity, allowing the FASB and the Governmental Accounting Standards Board (GASB) to establish these requirements. The GASB develops accounting standards for state and local governments:- the current set of principles that accountants use rests upon some underlying assumptions. The basic assumptions and principles presented on the next several pages are considered GAAP and apply to most financial statements. In addition to these concepts, there are other, more technical standards accountants must follow when preparing financial statements. Some of these are discussed later in this book, but other are left for more advanced study. (1) Economic Entity Assumption:- financial records must be separately maintained for each economic entity. Economic entities include businesses, governments, school districts, churches, and other social organizations. Although accounting information from many different entities may be combined for financial reporting purposes, every economic event must be associated with and recorded by a specific entity. In addition, business records must not include the personal assets or liabilities of the owners. (2) Monetary Unit Assumption:- an economic entity's accounting records include only quantifiable transactions. Certain economic events that affect a company, such as hiring a new chief executive officer or introducing a new product, cannot be easily quantified in monetary units and, therefore, do not appear in the company's accounting records. Furthermore, accounting records must be recorded using a stable currency. Businesses in the United States usually use US Dollars for this purpose. (3) Full Disclosure Principle:- financial statements normally provide information about a company's past performance. However, pending lawsuits, incomplete transactions, or other conditions may have imminent and significant effects on the company's financial status. The full disclosure principle requires that financial statements

include disclosure of such information. Footnotes supplement financial statements to convey this information and to describe the policies the company uses to record and report business transactions. (4) Time Period Assumption:- most businesses exist for long periods of time, so artificial time periods must be used to report the results of business activity. Depending on the type of report, the time period may be a day, a month, a year, or another arbitrary period. Using artificial time periods leads to questions about when certain transactions should be recorded. For example, how should an accountant report the cost of equipment expected to last five years? Reporting the entire expense during the year of purchase might make the company seem unprofitable that year and unreasonably profitable in subsequent years. Once the time period has been established, accountants use GAAP to record and report that accounting period's transactions. (5) Accrual Basis Accounting:- in most cases, GAAP requires the use of accrual basis accounting rather than cash basis accounting. Accrual basis accounting, which adheres to the revenue recognition, matching, and cost principles discussed below, captures the financial aspects of each economic event in the accounting period in which it occurs, regardless of when the cash changes hands. Under cash basis accounting, revenues are recognized only when the company receives cash or its equivalent, and expenses are recognized only when the company pays with cash or its equivalent. (6) Revenue Recognition Principle:- revenue is earned and recognized upon product delivery or service completion, without regard to the timing of cash flow. Suppose a store orders five hundred compact discs from a wholesaler in March, receives them in April, and pays for them in May. The wholesaler recognizes the sales revenue in April when delivery occurs, not in March when the deal is struck or in May when the cash is received. Similarly, if an attorney receives a USD100 retainer from a client, the attorney doesn't recognize the money as revenue until he or she actually performs USD100 in services for the client. (7) Matching Principle:- the costs of doing business are recorded in the same period as the revenue they help to generate. Examples of such costs include the cost of goods sold, salaries and commissions earned, insurance premiums, supplies used, and estimates for potential warranty work on the merchandise sold. Consider the wholesaler who delivered five hundred CDs to a store in April. These CDs change from an asset (inventory) to an expense (cost of goods sold) when the revenue is recognized so that the profit from the sale can be determined. (8) Cost Principle:- assets are recorded at cost, which equals the value exchanged at the time of their acquisition. In the United States, even if assets such as land or buildings appreciate in value over time, they are not revalued for financial reporting purposes. (9) Going Concern Principle:- unless otherwise noted, financial statements are prepared under the assumption that the company will remain in business indefinitely. Therefore, assets do not need to be sold at fire-sale values, and debt does not need to be paid off before maturity. This principle results in the classification of assets and liabilities as short-term (current) and long-term. Long-term assets are expected to be held for more than one year. Long-term liabilities are not due for more than one year. (10) Relevance, Reliability, and Consistency:- to be useful, financial information must be relevant, reliable, and prepared in a consistent manner. Relevant information helps a decision maker understand a company's past performance, present condition, and future outlook so that informed decisions can be made in a timely manner. Of course, the information needs of individual users may differ, requiring that the information be presented in different formats. Internal users often need more detailed information than external users, who may need to know only the company's value or its ability to repay loans. Reliable information is verifiable and objective. Consistent information is prepared using the same methods each accounting period, which allows meaningful comparisons to be made between different accounting periods and between the financial statements of different companies that use the same methods. (11) Principle of Conservatism:- accountants must use their judgment to record transactions that require estimation. The number of years that equipment will remain productive and the portion of accounts receivable that will never be paid are examples of items that require estimation. In reporting financial data, accountants follow the principle of conservatism, which requires that the less optimistic estimate be chosen when two estimates are judged to be equally likely. For example, suppose a manufacturing company's Warranty Repair Department has documented a three-percent return rate for product X during the past two years, but the company's Engineering Department insists this return rate is just a statistical anomaly and less than one percent of product X will require service during the coming year. Unless the Engineering Department provides compelling evidence to support its estimate, the company's accountant must follow the principle of conservatism and plan for a three-percent return rate. Losses and costs – such as warranty repairs – are recorded when they are probable and reasonably estimated. Gains are recorded when realized. (12) Materiality Principle:- accountants follow the materiality principle, which states that the requirements of any accounting principle may be ignored when there is no effect on the users of financial information. Certainly, tracking individual paper clips or pieces of paper is immaterial and excessively burdensome to any company's accounting department. Although there is no definitive measure of materiality, the accountant's judgment on such matters must be sound. Several thousand Dollars may not be material to an entity such as General Motors, but that same figure is quite material to a small, family-owned business. Generally Accepted Accounting Principles (GAAP):- these exist for USA and most EU countries (e.g., US GAAP and UK GAAP) but vary in terms of their regulatory or statutory authority. Many run to many hundreds of pages of text. Generally Accepted Accounting Principles (GAAP):- the accounting professions in the United States (US) and in Canada have established GAAP as guidelines that are used in financial reporting. The US and Canadian GAAP are not identical. Companies usually state whether they follow US GAAP or Canadian GAAP. / наём (hiring). Дьженерэл Мотоз (General Motors).

GENERAL MEETING = ОБЩЕЕ СОБРАНИЕ – The General Meeting (GM) is an official body of a stock corporation, alongside the Management Board and Supervisory Board. It is a forum where shareholders assemble to exercise their rights. It deals with matters such as the resolution of the dividend distribution as proposed by the Management Board, or the appointment of members of the Supervisory Board.

GENERAL MORTGAGE BOND = ГЕНЕРАЛЬНАЯ ЗАЛОГОВАЯ ОБЛИГАЦИЯ (или ОБЛИГАЦИЯ ПОД ОБЩУЮ ЗАКЛАДНУЮ) – General Mortgage Bond is a bond that is secured by a blanket mortgage on the company's property but may be outranked by one or more other mortgages.

GENERAL OBLIGATION BOND = ОБЛИГАЦИЯ С ОБЩИМ ОБЯЗАТЕЛЬСТВОМ – General Obligation Bond is a type of municipal bond backed by the full faith and credit of the governmental unit that issues it.

GENERAL ORDER = ГЕНЕРАЛЬНОЕ РАСПОРЯЖЕНИЕ (или ПРАВИЛА СУДОПРОИЗВОДСТВА) – General Order:- when US Customs orders shipments without entries to be kept in their custody in a bonded warehouse. Cargo seized by Customs due to failure on the part of Consignee to make Customs entry within allotted free time (US).

GENERAL ORDER WAREHOUSE = СКЛАД ПО ГЕНЕРАЛЬНЫМ РАСПОРЯЖЕНИЯМ – General Order Warehouse is a US Customs warehouse utilised when cargo goes into General Order due to lack of permit/entry filed. In the United States, a warehouse for the storage of freight which has not cleared Customs. All must be entered within a period of 14 days from date of vessel sailing or must be taken from dock and put into this warehouse. The Customs depart may pickup from the carrier who has a lien on cargo in order to be paid ocean charges before entry can be made from the warehouse.

GENERAL PARTNER = ГЕНЕРАЛЬНЫЙ ПАРТНЁР (или ПОЛНЫЙ ПАРТНЁР, или ПРОСТОЙ ПАРТНЁР) – The General Partner (GP) in a limited partnership is responsible for managing the business and has unlimited liability. See also Limited Partnership. The GPs are, in all major respects, in the same legal position as partners in a conventional firm, i.e. they have management control, share

the right to use partnership property, share the profits of the firm in predefined proportions, and have joint and several liability for the debts of the partnership. As in a general partnership, the GPs have actual authority as agents of the firm to bind all the other partners in contracts with third parties that are in the ordinary course of the partnership's business. As with a general partnership, 'An act of a general partner which is not apparently for carrying on in the ordinary course the limited partnership's activities or activities of the kind carried on by the limited partnership binds the limited partnership only if the act was actually authorized by all the other partners'. See also Limited Partner.

GENERAL PARTNERSHIP = ПРОСТОЕ ТОВАРИЩЕСТВО (или ПРОСТОЕ ПАРТНЁРСТВО) – In the United States of America, General Partnership is a partnership in which all the partners are jointly liable for the debts of the partnership. It is typically created by agreement rather than being created by a public filing.

GENERAL RATE INCREASE = ПОВЫШЕНИЕ ОБЩЕЙ СТАВКИ – General Rate Increase:- used to describe an across-the-board tariff rate increase implemented by conference members and applied to base rates.

GENERAL RATE INCREASING = ПОВЫШЕНИЕ ОБЩЕЙ СТАВКИ – General Rate Increasing (GRI) is across-the-board tariff rate increase implemented by conference members and applied to base rates.

GENERAL RISK RESERVE = ОБЩИЙ РЕЗЕРВ НА ПОКРЫТИЕ РИСКОВ (или РЕЗЕРВ НА ПОКРЫТИЕ ОБЩИХ РИСКОВ) – General Risk Reserve:- the prescribed minimum provisions by central bank of a country on performing advances and allocations to this reserve is made from after tax distributable reserves.

GENERAL SERVICES ADMINISTRATION = АДМИНИСТРАЦИЯ ПО ОБЩИМ УСЛУГАМ – General Services Administration (GSA) is an agency of the US government.

GENERAL STANDARD = ГЕНЕРАЛЬНЫЙ СТАНДАРТ – General Standard:- Deutsche Börse stock listing segment for companies fulfilling the transparency requirements prescribed by German law. Admission to General Standard does not require any action on the issuers' part; it occurs automatically in connection with listing on either the Official or Regulated Market. General Standard is basically the initial listing segment for smaller companies. For admission to Prime Standard, the market segment for joint-stock companies with international operations, and inclusion in one of the selection indices of Deutsche Börse, such as the DAX®, companies must fulfil more stringent transparency criteria. / Немецкая Биржа АО или Дойчэ Бёрзэ А.Ге. (Deutsche Börse AG), ДАКС® (DAX®).

GENERAL SYSTEM OF PREFERENCES = ГЕНЕРАЛЬНАЯ СИСТЕМА ПРЕФЕРЕНЦИЙ – In GATT, General System of Preferences (GSP):- in order to qualify for preferential treatment, goods must satisfy the direct consignment rule and comply with the origin criteria specified in the respective national schemes. In general, goods are considered to have originated in a preference-receiving country if they have been wholly produced or have undergone substantial transformation in that country. Western European preference-giving countries (including the EEC) and Japan base their requirement for substantial transformation on the process criterion, i.e. the transformation must be such as to result in a change of tariff heading. Negative and positive exceptions to this rule are enumerated in Lists A and B, which may differ from country to country. A number of preference-giving countries define substantial transformation as taking place if the value of imported marteriaLs does not exceed a specified percentage of the value of the finished product, or if the value of originating material and certain domestic costs of processing are equal or exceed a specified percentage. The method of calculation and the minimum percentage requirement for the domestic content or non-originating content vary from scheme to scheme. Since the introduction of the GSP, various forms of cumulative origin have been adopted under the rules of preference-giving countries. Some of them grant full and global cumulation in that all processes and value added in any of the preference-receifing countries may be added up or cumulated in order to determine whether the percentage requirement has been satisfied. Other countries permit only partial cumulation related to certain economic groupings. Certain countries apply a system of partial regional cumulation. Under the GSP certain documentary evidence is required, generally in the form of a certificate of origin to be issued by defined governmental certifying authorities.

GENERAL TARIFF = ОБЩИЙ ТАРИФ (или ГЕНЕРАЛЬНЫЙ ТАРИФ) – General Tariff is a tariff that applies to countries that do not enjoy either preferential or most-favored-nation tariff treatment. Where the general tariff rate differs from the most-favored-nation rate, the general tariff rate is usually the higher rate.

GENERATED CONTAMINANT = ОБРАЗОВАВШИЙСЯ ЗАГРЯЗНИТЕЛЬ (или ОБРАЗОВАВШЕЕСЯ ЗАГРЯЗНЯЮЩЕЕ ВЕЩЕСТВО) – Generated Contaminant:- caused by a deterioration of critical wetted surfaces and materials or by a breakdown of the fluid itself.

GENERATING UNIT = ГЕНЕРИРУЮЩАЯ УСТАНОВКА – Generating Unit is any combination of physically connected generator(s), reactor(s), boiler(s), combustion turbine(s), or other prime mover(s) operated together to produce electric power.

GENERATION = ГЕНЕРАЦИЯ (или ПОКОЛЕНИЕ) – Generation is an offspring having a common parent or parents and constituting a single stage of descent. / это потомство (приплод или помёт), имеющее общего родителя или родителей и . Под Генерацией или Поколением, от Латинского слова Generatio, означающее Рождение или Размножение, понимается:- (1) различающиеся по строению, образу жизни, способу размножения и тому подобному формы одного организма, сменяющиеся в процессе его жизненного цикла. (2) Группа особей одинаково отдалённых в родственном отношении от общих предков. Например, у человека:- родители, дети, внуки – 3 последовательных поколения; промежуток времени между рождением отца и сына, матери и дочери называется Длиной Поколения (около 30 лет). (3) В демографии:- люди, родившиеся на протяжении, как правило, года; сосуществование и взаимодействие поколений образуют возрастную структуру населения. (4) В историко-культурных исследованиях понятие Поколение чаще всего имеет символический смысл, характеризуя участников или современников важных исторических событий (поколения Октябрьского переворота, Великой Отечественной Войны), людей с общими ориентациями или настроениями ('потерянное поколение').

GENERATION = ГЕНЕРАЦИЯ (или ПРОИЗВОДСТВО, или ВЫРАБОТКА) – Generation is the process of producing electric energy by transforming other forms of energy. The amount of energy produced is expressed in Watt hours (Wh). Generation (electricity) is the process of producing electric energy by transforming other forms of energy; also, the amount of electric energy produced, expressed in Watt-hours (Wh). See also Gross Generation, and Net Generation. / Процесс производства электроэнергии посредством преобразования иных форм энергии. Количество производимой энергии выражается в Ваттчасах (Втч).

GENERATION OF ELECTRONIC PAYMENT INITIATOR = ГЕНЕРАЦИЯ ИНИЦИАТОРА ЭЛЕКТРОННОГО ПЛАТЕЖА – Generation Of Electronic Payment Initiator is the process of creating an electronic Payment Initiator (ePI). An ePI is created by, or on behalf of, the beneficiary.

GENERATION OF EPI = GENERATION OF ELECTRONIC PAYMENT INITIATOR

GENERATION OFFERS = ОФЕРТЫ ПО ГЕНЕРАЦИИ (или ПРЕДЛОЖЕНИЯ ПО ГЕНЕРАЦИИ) – Generation Offers:- schedules of MW (MegaWatt) offered and the corresponding offer price.

GENERATION OF IBAN = GENERATION OF INTERNATIONAL BANK ACCOUNT NUMBER

GENERATION OF INTERNATIONAL BANK ACCOUNT NUMBER = ГЕНЕРАЦИЯ МЕЖДУНАРОДНОГО НОМЕРА БАНКОВСКОГО СЧЁТА – Generation Of International Bank Account Number (IBAN) is the one time process of creating an IBAN for an account. This process is under the sole responsibility of the bank servicing the customer's account.

GENERATION PLANT = СТАНЦИЯ ГЕНЕРАЦИИ (или ГЕНЕРАТОРНАЯ СТАНЦИЯ) – In reference to electricity, Generation Plant is a facility, consisting of one or more generating units, where electric energy is produced from some form of energy by means of a suitable apparatus. / По отношению к электричеству, установка, состоящая из одной или более генерирующих устройств, в которой происходит генерация электричества из других форм энергии посредством применения соответствующих аппаратов.

GENERATOR = ГЕНЕРАТОР – Generator is a rotating machine which converts mechanical energy into electrical energy. In the automotive industry traditional terminology uses generator to refer to only those machines designed to produce dc current through brushes and a commutator (as opposed to alternator). Generator is a machine that converts mechanical energy into electrical energy. / Под Генератором, от Латинского слова Generator, означающее Производитель, понимается устройство, аппарат, машина, производящие какие-либо продукты (например, ацетиленовый генератор, газогенератор, льдогенератор, парогенератор), вырабатывающие электрическую энергию (например, электромашинный, магнитогидродинамический, термоэмиссионный генераторы) либо создающие электрические, электромагнитные, световые или звуковые сигналы – колебания, импульсы (например, квантовый, ламповый, магнетронный, ультразвуковой генераторы, и генератор радиосигналов).

GENERATOR NAMEPLATE CAPACITY = ЁМКОСТЬ ГЕНЕРАТОРА ПО ШИЛЬДУ – Generator Nameplate Capacity:- the full-load continuous rating of a generator, prime mover, or other electric power production equipment under specific conditions as designated by the manufacturer. Installed generator nameplate rating is usually indicated on a nameplate physically attached to the generator.

GENERATOR OWNER = ВЛАДЕЛЕЦ ГЕНЕРАТОРА – Generator Owner is a PJM member that owns or leases, with rights equivalent to ownership, facilities for generation of electric energy that are located within PJM (PJM Interconnection LLC (Pennsylvania New Jersey Maryland Interconnection LLC). / Пи.Дьжей.Эм. Интёконэкшэн Эл.Эл.Си. (PJM Interconnection LLC или Пэнсэлвэйниэ Ню Дьжози Мэрилэнд Интёконэкшэн Эл.Эл.Си. (Pennsylvania New Jersey Maryland Interconnection LLC)).

GENERIC = ГЕНЕРИЧЕСКОЕ (или РОДОВОЕ) – Generic:- pertaining to a Genus. / :- подходящее к Роду (Genus). Характерное для определённого Рода.

GENERIC NAMES SUPPORTING ORGANIZATION = ОРГАНИЗАЦИЯ ПО ПОДДЕРЖКЕ РОДОВЫХ ИМЁН – The Generic Names Supporting Organization (GNSO) is the successor to the responsibilities of the Domain Name Supporting Organization (DNSO) that relate to the generic top-level domains. The GNSO is the body of six constituencies, as follows:- the Commercial and Business constituency, the gTLD Registry constituency, the ISP constituency, the non-commercial constituency, the registrar's constituency, and the IP constituency. / Организация по Поддержке Родовых Имён (ОПРИ) взяла на себя обязанности существовавшей ранее Организации по Поддержке Доменных Имён (ОПДИ), относящиеся к родовыми доменам верхнего уровня. ОПНИ – это орган, в состав которого входит шесть следующих постоянных групп:- постоянная группа коммерческих и деловых пользователей, постоянная группа реестров рДВУ, постоянная группа поставщиков услуг Интернета (ISP), постоянная группа некоммерческих пользователей, постоянная группа регистраторов и постоянная группа защитников интеллектуальной собственности.

GENERIC TERMS = ТОЖДЕСТВЕННЫЕ ИЛИ СХОДНЫЕ ДО СТЕПЕНИ СМЕШЕНИЯ ПОРЯДКИ (или РОДОВЫЕ ПОНЯТИЯ, или РОДОВЫЕ ТЕРМИНЫ, или ОБЩИЕ ОБОЗНАЧЕНИЯ, или ПОРЯДКИ ОБЩЕГО ТИПА, или НА ОБЩИХ ПОРЯДКАХ) – In the US trademark law, Generic Terms are the terms that the relevant purchasing public understands primarily as the common or class name for the goods or services. These terms are incapable of functioning as trademarks denoting source, and are not registrable on the Principal Register under §2(f) or on the Supplemental Register. Examples include:- CLASSES ONLINE for classes provided via the Internet, PIZZA.COM for pizza ordering and delivery services, and LIVE PLANTS for plant nurseries.

GENERIC TOP LEVEL DOMAIN = РОДОВОЙ ДОМЕН ВЕРХНЕГО УРОВНЯ – Generic Top Level Domain (gTLD):- most TLDs with three or more characters are referred to as 'Generic' TLDs, or 'gTLDs'. They can be subdivided into two types, 'sponsored' TLDs (sTLDs) and 'unsponsored' TLDs (uTLDs), as described in more detail below. In the 1980s, seven gTLDs (.com, .edu, .gov, .int, .mil, .net, and .org) were created. Domain names may be registered in three of these (.com, .net, and .org) without restriction; the other four have limited purposes. Over the next twelve years, various discussions occurred concerning additional gTLDs, leading to the selection in November 2000 of seven new TLDs for introduction. These were introduced in 2001 and 2002. Four of the new TLDs (.biz, .info, .name, and .pro) are unsponsored. The other three new TLDs (.aero, .coop, and .museum) are sponsored. Generally speaking, an unsponsored TLD operates under policies established by the global Internet community directly through the Internet Corporation for Assigned Names and Numbers (ICANN) process, while a sponsored TLD is a specialized TLD that has a sponsor representing the narrower community that is most affected by the TLD. The sponsor thus carries out delegated policy-formulation responsibilities over many matters concerning the TLD. A Sponsor is an organization to which is delegated some defined ongoing policy-formulation authority regarding the manner in which a particular sponsored TLD is operated. The sponsored TLD has a Charter, which defines the purpose for which the sponsored TLD has been created and will be operated. The Sponsor is responsible for developing policies on the delegated topics so that the TLD is operated for the benefit of a defined group of stakeholders, known as the Sponsored TLD Community, that are most directly interested in the operation of the TLD. The Sponsor also is responsible for selecting the registry operator and to varying degrees for establishing the roles played by registrars and their relationship with the registry operator. The Sponsor must exercise its delegated authority according to fairness standards and in a manner that is representative of the Sponsored TLD Community. / Родовой Домен Верхнего Уровня (рДВУ):- большинство доменов с тремя или более символами относится к 'родовым' доменам верхнего уровня (рДВУ). Их можно поделить на два типа:- 'спонсируемые' ДВУ (sTLD) и 'неспонсируемые' ДВУ (uTLD). Подробное описание представлено ниже. В 1980-х было создано семь рДВУ (.com, .edu, .gov, .int, .mil, .net и .org). В трёх из них (.com, .net и .org) доменное имя можно зарегистрировать без ограничений, остальные четыре домена имеют ограниченное назначение. В течение следующих двенадцати лет обсуждалось введение дополнительных рДВУ, что привело в Ноябре 2000 к созданию семи дополнительных ДВУ. Они были введены в 2001 и 2002. Четыре новых ДВУ (.biz, .info, .name и .pro) – неспонсируемые. Остальные три (.aero, .coop и .museum) – спонсируемые. Вообще говоря, неспонсируемые ДВУ функционируют согласно политикам, установленным мировым Интернет-сообществом непосредственно под руководством Корпорации Интернета по Распределению Имён и Номеров (КИРИН), в то время как спонсируемые ДВУ являются специализированными ДВУ, имеющими спонсоров, и представляют собой более узкое сообщество, которое наиболее сильно подвержено влиянию спонсируемого домена верхнего уровня. Таким образом, спонсор несёт делегированную ему ответственность за разработку политики по многочисленным вопросам, относящимся к ДВУ. Спонсор –

это организация, которой предоставлены определённые полномочия по разработке стратегии в отношении функционирования конкретного спонсируемого ДВУ. Спонсируемый ДВУ имеет свой устав, определяющий цель создания и правила функционирования ДВУ. Спонсор отвечает за разработку таких политик в отношении делегированных ему тематических областей, которые обеспечат полезность ДВУ для сообщества спонсируемого ДВУ – определённой группы лиц, непосредственно заинтересованных в функционировании этого ДВУ. Спонсор также несёт ответственность за выбор оператора реестра, и в различной степени за назначение функций, выполняемых регистраторами, и за их взаимодействие с оператором реестра. Спонсор должен использовать делегированные ему полномочия в соответствии с нормами честности и интересами сообщества спонсируемого ДВУ.

GENE SYMBOLS = ГЕННЫЕ СИМВОЛЫ – Gene Symbols are a system of nomenclature for designating genes or a species.

GENETIC = ГЕНЕТИЧЕСКОЕ (или НАСЛЕДСТВЕННОЕ) – Genetic:- resulting from, or produced by, soil-forming processes; for example, a genetic soil profile or a genetic horizon. / горизонт.

GENETIC ADVANCE = ГЕНЕТИЧЕСКОЕ УЛУЧШЕНИЕ (или ГЕНЕТИЧЕСКАЯ ПРОДВИНУТОСТЬ) – Genetic Advance is a progress in shifting the genotypic mean and gene frequencies of a trait in the population toward the desired direction as a result of selection.

GENETICALLY MODIFIED COTTON = ГЕНЕТИЧЕСКИ МОДИФИЦИРОВАННЫЙ ХЛОПЧАТНИК – In 2007, approximately 20 different Genetically Modified Cotton (GM Cotton) Varieties were cultivated on 43% (15 million ha) of the global Cotton cultivation area. More than 90% of the United States and Argentine Cotton, 68% of the Chinese Cotton and 66% of the Indian Cotton is genetically modified. The primary objectives of this modifications are:- (i) resistance against pests, e.g., bollworm (Bt Cotton); (ii) tolerance against herbicides, e.g., glyphosate (RoundUp Ready) or glufosinate (Liberty Link); (iii) adaptation to abiotic factors like cold, heat, dryness, and salt; and (iv) improved fiber qualities, e.g., optimization of length and strength. / РаундАп Рэди (RoundUp Ready) или Лыбёти Лыньк (Liberty Link).

GENETICALLY MODIFIED ORGANISM = ГЕНЕТИЧЕСКИ МОДИФИЦИРОВАННЫЙ ОРГАНИЗМ – A Genetically Modified Organism (GMO) is an organism whose genetic material has been altered using techniques in genetics generally known as Recombinant Deoxyribonucleic Acid (DNA) Technology. Recombinant DNA technology is the ability to combine DNA molecules from different sources into one molecule in a test tube. Thus, the expression of certain traits, the phenotype of the organism, or the proteins it produces, can be altered through the modification of its genes. The term generally does not cover flower organisms whose genetic makeup has been altered by conventional cross breeding or by 'mutagenesis' breeding, as these methods predate the discovery of the recombinant DNA techniques. Technically speaking, however, such techniques are by definition genetic modification. Examples of GMOs are diverse, and include transgenic experimental animals such as mice, several fish species, transgenic plants, or various microscopic organisms altered for the purposes of genetic research or for the production of pharmaceuticals. The term Genetically Modified Organism does not necessarily imply, but does include, transgenic substitution of genes from another species, and research is actively being conducted in this field. / Дезоксирибонуклеиновая Кислота (ДНК). виды (species).

GENETICALLY MODIFIED PLANTS = ГЕНЕТИЧЕСКИ МОДИФИЦИРОВАННЫЕ РАСТЕНИЯ – Genetically Modified Plants (GM Plants) contain foreign genes that provide the Plants with new properties like herbicide tolerance or insect resistance. The function of genes depends on certain regulatory DNA (Deoxyribonucleic Acid) sequences, so-called Promoters and Terminators. All gm plants approved in the European Union and most of the plants cultivated worldwide contain such regulatory sequences. The most common ones are the 35S promoter from the cauliflower mosaic virus (CaMV) and the nos terminator, i.e. the 3'untranslated region of the nopaline synthase gene from agrobacterium tumefaciens. Since many different gm plants contain the identical regulatory sequences a positive screening result strongly indicates the presence of some genetic modification but does not allow the unambiguous identification of a specific gm plants. One gene or several genes together with the necessary regulatory sequences is called a Gene Construct. Often identical constructs have been inserted into different plant species. So the detection of a particular construct may prove an exact genetic modification without giving any clues about the specific gm plant. An event-specific analysis searches for the presence of a DNA sequence unique to a certain gm plant, usually the junction between the gene construct and the plant's original DNA. This approach is ideal to precisely identify a specific gm plant. / виды (species). Генетически Модифицированные Растения (Растения ГМ) содержат инородные гены, которые обеспечивают данные растения новыми характеристиками, как-то толерантность (устойчивость) к гербицидам или невосприимчивость (резистентность) по отношению к насекомым. Функция генов зависит от упорядоченной в определённой последовательности ДНК (Дезоксирибонуклеиновой Кислоты), так называемых стимуляторов (промоторов) и терминаторов. Все растения гм, одобренные в Европейском Союзе, и большинство растений, культивируемых по всему миру, содержат такие упорядоченные последовательности. Наиболее являются стимулятор 35S из вируса мозаичной болезни цветной капусты (Cauliflower Mosaic Virus (CaMV)) и синтезированного гена нопалина (nopaline synthase gene) из опухолей (набуханий) агробактерий. положительный результат обследования чётко указывает на наличие некоторой генетической модификации, но . Один или несколько генов вместе в необходимой упорядоченной последовательности называются конструкцией гена или генной конструкцией. Очень часто идентичные конструкции вживляются в различные семейства растений. Так, обнаружение конкретной конструкции может утверждать о точной генетической модификации, не предоставляя при этом любых других сведений о конкретном растении гм.

GENETICALLY MODIFIED PEST–PROTECTED PLANTS = ГЕНЕТИЧЕСКИ МОДИФИЦИРОВАННЫЕ РАСТЕНИЯ, УСТОЙЧИВЫЕ К ВОЗДЕЙСТВИЮ ВРЕДИТЕЛЕЙ – Genetically Modified Pest-Protected Plants are the Plants whose genes have been modified through genetic engineering techniques, such as recombinant Deoxyribonucleic Acid (DNA) technology, to express traits that make them resistant to certain pests and disease. These transgenic plants may include genes from distantly related species or even from different biological kingdoms. Refers to any Plant that has been genetically modified to express a pesticidal trait (both structural and chemical traits that deter or resist pests both structural and chemical traits that deter or resist pests), regardless of the technique used (does not include herbicide-tolerant plants). / Генетически Модифицированные Растения с Защитой от Вредителей. Дезоксирибонуклеиновая Кислота (ДНК). виды (species).

GENETIC BASE = ГЕНЕТИЧЕСКАЯ БАЗА – Genetic Base is the genotypic background of a breeding line or population. Cultivars with a broad genetic base can adopt more readily to changing environments or selection efforts than can a narrowly based one.

GENETIC CODE = ГЕНЕТИЧЕСКИЙ КОД – Genetic Code is the conversion table which allows the interpretation of triplet codons to their matching amino acids and carries the information for protein synthesis. / кодон триплет (единица генетического кода), состоящий из трёх последовательных нуклеотидов в молекуле ДНК или РНК. Под Генетическим Кодом понимается свойственная живым организмам единая система 'записи' наследственной информации в молекулах нуклеиновых кислот в виде последовательности нуклеотидов. Единица генетического кода – кодон. Реализация генетического кода в клетке происходит в два этапа. Первый (транскрипция) протекает в ядре и заключается в синтезе молекул информационной

рибонуклеиновой кислоты (иРНК; messenger Ribonucleic Acid (mRNA)) на соответствующих участках ДНК. При этом последовательность нуклеотидов ДНК 'переписывается' в нуклеотидную последовательность иРНК, комплементарную ДНК (кДНК; Complementary DNA (cDNA)). Второй этап (трансляция) протекает в цитоплазме на рибосомах; при этом последовательность нуклеотидов иРНК переводится в последовательность аминокислот в синтезирующемся белке. 61 кодон из 64 кодирует определённые аминокислоты, а 3 так называемых стоп-кодона определяют окончание синтеза полипептидной цепи. Код называется вырожденным, так как несколько кодонов могут кодировать одну и ту же аминокислоту, но он не является двусмысленным, поскольку один и тот же кодон не способен кодировать две различные аминокислоты. Расшифровка генетического кода, то есть нахождение соответствия между кодонами и аминокислотами, осуществлена Американскими биохимиками Маршаллом Уорреном Ниренбергом (Nirenberg; 1927–), Северо Очоа (Ochoa; 1905–) и другими.

GENETIC COMPOSITION = ГЕНЕТИЧЕСКАЯ КОМПОЗИЦИЯ – Genetic Composition is the genetic makeup of a plant.

GENETIC CONSERVATION = ГЕНЕТИЧЕСКАЯ КОНСЕРВАЦИЯ (или ГЕНЕТИЧЕСКОЕ СОХРАНЕНИЕ) – Genetic Conservation:- collection, maintenance, and preservation of all segments of germplasm in a crop species and its wild relatives.

GENETIC DIVERSITY = ГЕНЕТИЧЕСКОЕ РАЗНООБРАЗИЕ – Genetic Diversity is the genetic variability present in a population or in a species.

GENETIC DRIFT = ГЕНЕТИЧЕСКИЙ ДРЕЙФ – Genetic Drift:- changes in the gene frequencies of a population when the size of sample chosen for rejuvenation is small. Genetic drift leads to a loss of certain genotypes in the population.

GENETIC ENGINEERING = ГЕНЕТИЧЕСКАЯ ИНЖЕНЕРИЯ – Genetic Engineering is the alteration of the genes of the organisms. The genetic integrity of the organism producing the enzyme is changed for ever. Usually such enzymes are used in a confined environment and are sometimes engineered in a such way that they can not survive in the natural environment. Such alterations can be effected by breeding and by mutation – the natural processes that for billions of years have formed the basis for the evolution of new organisms. The process whereby genes mutate to achieve small (but sometimes beneficial) alterations is called Mutagenesis. Genetic Engineering:- technologies used to isolate genes from an organism, manipulate them in the laboratory, and insert them stably into another organism. It refers to all of the techniques used to manipulate DNA, including gene isolation and cloning, gene splicing, plasmid construction, and transformation. / Под Генетической Инженерией или Генной Инженерией понимается раздел молекулярной биологии, связанный с целенаправленным конструированием новых, не существующих в природе сочетаний генов с помощью генетических и биохимических методов. Основана на извлечении из клеток какого-либо организма гена или группы генов, соединении их с определёнными молекулами нуклеиновых кислот и внедрении полученных гибридных молекул в клетки другого организма. Открывает новые пути для решения некоторых проблем биотехнологии, генетики, медицины и сельского хозяйства. Под Генетической Инженерией или Генной Инженерией понимается раздел молекулярной генетики, предметом которого являются новые комбинации генетического материала, создаваемые искусственным путём. Генетическая инженерия ведёт начало с 1972, когда под руководством Американского биохимика, Профессора Пола Наима Бёга (или Берга; Paul Naim Berg; 1926–) была впервые получена рекомбинантная ДНК, включающая фрагменты фага-лямбда, E. coli и вируса обезьян SV40.

GENETIC EQUILIBRIUM = ГЕНЕТИЧЕСКОЕ РАВНОВЕСИЕ – Genetic Equilibrium is the condition in which successive generations of a population contain the same genotypes in the same proportions with respect to particular genes or combinations of genes.

GENETIC EVALUATION AND UTILIZATION = ГЕНЕТИЧЕСКОЕ ВЫЧИСЛЕНИЕ И ИСПОЛЬЗОВАНИЕ – Genetic Evaluation And Utilization (GEU) is an interdisciplinary and problem-oriented approach to improve rice varieties by testing, research, and breeding.

GENETIC LINKAGE = ГЕНЕТИЧЕСКАЯ СВЯЗЬ – Genetic Linkage is any association of genes in inheritance that exceeds what is expected from the independent assortment due to their being located on the same chromosome. Linkage is assessed by the tendency of genes to remain together during recombination.

GENETIC MAP = ГЕНЕТИЧЕСКАЯ КАРТА – Genetic Map is the linear arrangement of genes on a chromosome. / Под Генетической Картой хромосом понимается схема относительного расположения генов в хромосомах, позволяющая предсказывать характер наследования изучаемых признаков организмов.

GENETIC MARKER = ГЕНЕТИЧЕСКИЙ МАРКЁР – Genetic Marker is any gene whose presence can be readily detected by its phenotypic expression and which is used to locate other genes. Also detectable restriction fragment length polymorphism (RFLP) used to identify a specific linked gene or an individual carrying a gene of interest. / Под Маркёром, от Французского слова Marquer, означающее Отмечать, понимается.

GENETIC MATERIAL = ГЕНЕТИЧЕСКИЙ МАТЕРИАЛ – Genetic Material:- the chromosome nucleic acid, predominantly DNA but at times RNA, that carries the information for the synthesis of proteins and other nucleic acids.

GENETIC POTENTIAL = ГЕНЕТИЧЕСКИЙ ПОТЕНЦИАЛ – Genetic Potential:- the likelihood that the genetic material is capable of producing many new genotypic combinations.

GENETIC PURITY = ГЕНЕТИЧЕСКАЯ ЧИСТОТА – Genetic Purity:- trueness to type; seeds or plants genetic potential. The likelihood that the genetic material (improved or primitive) is capable of producing many new genotypic combinations from stored variousness by hybridization and subsequent segregation, recombination, and selection under varying pressures conforming to the characteristics of the variety, line, or hybrids. / Сегрегация или Выделение или Зейгерование или Разделение По Крупности (Segregation).

GENETIC RECOMBINATION = ГЕНЕТИЧЕСКАЯ РЕКОМБИНАЦИЯ – Genetic Recombination is the production of progeny that derives some of its genes from one parent and some from another genetically different parent; as a result, the combination of genes in the progeny is different from that of either of the parents. In higher organisms, recombination occurs by way of independent assortment or crossing over; in lower organisms, it occurs by way of transformation, conjugation, or transduction.

GENETIC RESOURCES = ГЕНЕТИЧЕСКИЕ РЕСУРСЫ – Genetic Resources:- germplasm that includes the entire array of cultivars in the crop species, related wild species in the genus, and hybrids between the wild and cultivated species.

GENETIC RESOURCES CENTER = ЦЕНТР ГЕНЕТИЧЕСКИХ РЕСУРСОВ – Genetic Resources Center is an institution concerned with the collection, conservation, and utilization of germplasm. / сохранение (conservation).

GENETICS = ГЕНЕТИКА – Genetics is the study of inheritance of characteristics. Genetics is the science of heredity and variation. / Под Генетикой, от Греческого слова Génesis, означающее Происхождение, понимается наука о законах наследственности и изменчивости организмов и методов управления ими. Основы современной генетики заложены Австрийским естествоиспытателем Грэгором Йоханом Мендэлем (Gregor Johann Mendel; 1822–1884), основоположником учения о

закономерностях наследственности (менделизм), открывшим законы дискретной наследственности (1865), и школой Американского биолога Томэса Ханта Моргэна (Thomas Hunt Morgan; 1866–1945), обосновавшей хромосомную теорию наследственности (1910-е). В 1920–30-х большую роль в развитии генетики сыграли работы Российских учёных биологов Николая Ивановича Вавилова (1887–1943), Николая Константиновича Кольцова (1872–1940), Александра Сергеевича Серебровского (1892–1948), генетика Сергея Сергеевича Четверикова (1880–1959) и других Российских учёных. Генетика включает ряд отраслей, в том числе по объектам исследования:- генетика микроорганизмов, растений, животных и человека. Показав, что наследственность и изменчивость основаны на преемственности и видоизменении сложных внутриклеточных структур, генетика внесла важный вклад в познание картины мира и доказательство взаимосвязи физио-химических и биологических форм организации материи. Тесно связана с эволюционным учением, цитологией, молекулярной биологией, селекцией. Данные генетики имеют важное значение для медицины.

GENETIC SHIFT = ГЕНЕТИЧЕСКИЙ СДВИГ – Genetic Shift is a change in the genetic makeup of the line, variety, or hybrid if grown over a long period particularly in areas outside their adaptation.

GENETIC STOCK = ГЕНЕТИЧЕСКИЙ ЗАПАС – Genetic Stock:- a cultivar/line possessing specific genetic trait(s).

GENETIC TESTER = ГЕНЕТИЧЕСКИЙ ТЕСТЁР – Genetic Tester:- (1) a cultivar/line used for testing the presence/absence of a gene in a given line/cultivar. (2) A pure line or hybrid known to carry one or more genes that distinctly express themselves in morphological or physiological features. The mode of inheritance of such traits is known by prior genetic experiments.

GENETIC VARIABILITY = ГЕНЕТИЧЕСКАЯ ИЗМЕНЧИВОСТЬ – Genetic Variability is the state of being genetically variable, i.e. having more than one genetic state or allele at each gene locus. Such genetically variable populations are referred to as Polymorphic.

GENETIC VULNERABILITY = ГЕНЕТИЧЕСКАЯ УЯЗВИМОСТЬ – Genetic Vulnerability is the status of crops that have a narrow genetic base, which could lead to increased threat of attack from pests and pathogens. Genetically vulnerable crops have a limited number of varieties and a narrow range of genetic resistance to pests and diseases. Modern breeding has narrowed the genetic base of crops, compared with what farmers grow in traditional systems. These systems are often characterized by many different varieties, often expressing different levels of susceptibility to a given pest or disease. This heterogeneity, as opposed to homogeneity in modern varieties, reduces risk of attack by pests and pathogens.

GENEVA BANDS = ЖЕНЕВСКИЕ ЛЕНТЫ – Geneva Bands:- two strips of white cloth suspended from the front of a clerical collar and sometimes used by Protestant clergymen. Also called Geneva Tabs.

GENEVA GOWN = ЖЕНЕВСКАЯ МАНТИЯ – Geneva Gown is a loose large-sleeved black academic gown widely used as a vestment by members of the Protestant clergy.

GENIC MALE STERILITY = ГЕННАЯ МУЖСКАЯ СТЕРИЛЬНОСТЬ (или ГЕННАЯ СТЕРИЛЬНОСТЬ ПО МУЖСКОЙ ЛИНИИ) – Genic Male Sterility is a type of male sterility conditioned by nuclear genes.

GENOME = ГЕНОМ – Genome is a complete single set of the genetic material of a cell or organism; the complete set of genes in a gamete, the single DNA/RNA molecule of bacteria, phages, and most animal and plant viruses. In plants, composed of the nuclear genome, the mitochondrial genome, and the chloroplast genome. / Под Геномом понимается совокупность генов, содержащихся в гаплоидном (одинарном) наборе хромосом данного организма.

GENOME ANALYSIS = ГЕНОМНЫЙ АНАЛИЗ – Genome Analysis is a procedure which helps to identify the chromosomes corresponding to the haploid set of species which contributed to the evolution of an allopolyploid species.

GENOTOXICITY = ГЕНОТОКСИЧНОСТЬ – Genotoxicity:- the chemical and structural complexity of the chromosomal DNA and associated proteins of mammalian cells, and the multiplicity of ways in which changes to the genetic material can be effected make it difficult to give precise, discrete definitions. Genotoxicity is a broader term and refers to potentially harmful effects on genetic material, which may be mediated directly or indirectly, and which are not necessarily associated with mutagenicity. Thus, tests for genotoxicity include tests which provide an indication of induced damage to DNA (but not direct evidence of mutation) via effects such as unscheduled DNA synthesis (UDS), sister chromatid exchange (SCE) or mitotic recombination, as well as tests for mutagenicity. See also Mutagenicity. / Химическое и структурное разнообразие хромосомной ДНК и взаимосвязанных протеинов клеток млекопитающих, и многочисленность способов, в которых изменения в отношении генетического материала могут привести к сложности в формировании точных, разборчивых определений. Генотоксичность является достаточно широким термином, относящимся к потенциально вредному воздействию на генетический материал, которое может быть опосредованным прямо или косвенно, и которое не должно быть обязательно связанным с мутагенностью. Таким образом, тесты на генотоксичность включают тесты, которые обеспечивают признак вызванного повреждения ДНК (но не прямое свидетельство мутации) посредством эффектов, таких как репаративный синтез ДНК (РСД), сестринский хроматидный обмен (СХО) или митотическая рекомбинация, а также тесты на мутагенность. Смотрите также Мутагенность (Mutagenicity).

GENOTYPE = ГЕНОТИП – Genotype is the genetic characteristics of an organism. Genotype is the genetic constitution of an organism. / Под Генотипом, от Греческих слов Génos, означающее Происхождение или Род, и Тýpos, означающее Образец или Отпечаток или Форма, понимается генетическая (наследственная) конституция организма, совокупность всех его генов. В современной генетике рассматривается не как механический набор независимо функционирующих генов, а как единая система, в которой любой ген может находиться в сложном взаимодействии с остальными генами. Генотип, совокупность всех генов, локализованных в хромосомах данного организма. В более широком смысле генотип – совокупность всех наследственных факторов организма – как ядерных (геном), так и неядерных, внехромосомных (то есть цитоплазматических и пластидных наследственных факторов). Термин предложен Датским биологом Вильхэльмом Йоансэном (Wilhelm Johannsen; 1857–1927) в 1909. Генотип – носитель наследственной информации, передаваемой от поколения к поколению. Он представляет собой систему, контролирующую развитие, строение и жизнедеятельность организма, то есть совокупность всех признаков организма – его фенотип. Генотип – единая система взаимодействующих генов, так что проявление каждого гена зависит от генотипической среды, в которой он находится. Например, красная окраска цветков у некоторых сортов Душистого Горошка возникает только при одновременном присутствии в генотипе доминантных аллелей двух различных генов, тогда как порознь каждая из этих аллелей обусловливает белую окраску цветков (смотрите Комплементация). Взаимодействие генотипа с комплексом факторов внутренней и внешней среды организма обусловливает фенотипическое проявление признаков. Примером влияния среды на фенотипическое проявление генотипа может служить окраска меха у кроликов так называемой Гималайской линии:- при одном и том же генотипе эти кролики при выращивании на холоде имеют чёрный мех, при умеренной температуре – ‘Гималайскую’ окраску (белая с чёрными мордой, ушами, лапами и хвостом), при повышенной температуре – белый мех. Потомки этих трёх групп животных наследуют не какую-то одну неизменную окраску меха, а способность давать определённую окраску, различную в разных условиях среды. Поэтому в общем виде правильнее говорить, что генотип

определяет наследование не конкретных признаков, а норму реакции организма на все возможные условия среды. На разных этапах развития особи в активном состоянии находятся то одни, то другие гены; поэтому генотип в онтогенезе функционирует как изменчивая подвижная система. Термин ‘Генотип’ иногда употребляют в более узком смысле для обозначения лишь группы генов или даже отдельных генов, наследование которых составляет предмет наблюдения. Например, в расщепляющемся потомстве от моногибридного скрещивания АА (аа принято говорить о генотипах АА, Аа и аа, отвлекаясь от возможных различий между соответствующими особями (или группами особей) по другим генам.

GENSCAPE = ДЬЖЕНСКЭЙП – A nimble, innovation-minded company, Genscape™ thrives on increasing transparency across global commodity and energy markets. The world’s largest private and patented network of land, sea, and satellite monitors delivers exceptionally accurate market insight and intelligence. The market data provider Genscape™, which flies helicopters equipped with infrared cameras and other technology over Cushing twice a week to measure storage levels, estimates Cushing is two-thirds full. Hillary Stevenson, who manages storage, pipeline and refinery monitoring for Genscape™, says Cushing could be full by mid-April 2015. Supplies are increasing at ‘the highest rate we have ever seen at Cushing’, she says. Genscape™ Group:- Genscape, Inc. (headquarters in Louisville, KY, USA), and Genscape International, Inc. (headquarters in Amsterdam, The Netherlands). A Brief History:- We Invented This Market:- Genscape™ was founded in 1999 by two power traders who grew frustrated with the lack of transparency into the market – and set about inventing new technologies to expand high quality data access to more market participants than ever before. Over the next decade, Genscape™ invested heavily in research and development and continues to be awarded numerous patents. Now operating the world’s largest private network of in-the-field monitors, Genscape™ recently added satellite reconnaissance, artificial intelligence, and maritime freight tracking to its data acquisition capabilities. Today, Genscape™ delivers its unique brand of unsurpassed market intelligence across the commodity and energy spectrum:- Power, Oil, Natural Gas, Petrochemical and NGL, Agriculture, Biofuels, and Maritime Freight. In 2011, Matthew Burkley joined Genscape™ as CEO, strengthening the leadership team, acquiring numerous companies, and building upon Genscape’s core brand value:- to provide the highest quality fundamental data faster than any other organization, bar none. Proprietary Data and Delivery:- Genscape™ measures market fundamentals using thousands of patented monitors strategically deployed worldwide, delivering exceptional insight and competitive advantage to clients. Genscape™ data and intelligence are delivered to customers through a web-based interface, as PDF reports, and/or via direct data feeds into customer or third-party trading and publishing systems. Clients:- Genscape™ provides its information through a subscription service. Customers include the majority of the top global commodity and energy trading hedge funds, banks, producers, marketers, as well as numerous government entities, including US Department of Energy and the Federal Energy Regulatory Commission (FERC). Since 2013, small-to-midsize market participants are purchasing more from Genscape™, as the price-to-value relationship is increasingly attractive to otherwise large, upfront investments in monitoring, information technology, and in-house processing teams. By leveraging Genscape’s unsurpassed data quality, new market participants can better leverage their resources into more sophisticated trading or risk management activities. Parent Company:- Genscape™ is part of DMG Information (DMGI; headquartered in Stamford, Connecticut, DMGI has an international focus with significant operations through our businesses in the United States, UK, Australia and Continental Europe), which comprises a portfolio of high growth, innovative, must-have information media businesses in the property, education, energy and commodity and structured finance sectors. DMGI is a division of Daily Mail and General Trust PLC (DMGT), a publicly listed company quoted on the London Stock Exchange (LSE:- DMGT). / Дьжэнскэйп[ТЗ] (Genscape™). Дьженскэйп Интёнэшэнэл, Инк. (Genscape International, Inc.). Ди.Эм.Дьжи. Инфомэйшэн (Ди.Эм.Дьжи.Ай.; DMG Information (DMGI)). Дэйли Мэйл энд Дьженерэл Тчраст Пи.Эл.Си. (Daily Mail and General Trust PLC (DMGT)).

GENSET = ГЕНЕРАТОРНАЯ УСТАНОВКА – Generator Sets (Gensets):- which supply power to refrigerated containers when no external source is available. It is used to regulate the temperature in a reefer container. It can use its own power or plugs provided on the pier/vessel. A portable generator, which can be attached to a refrigerated container to power the refrigeration unit during transit. Gen-Set (short for the Generator Set) is a generator which can be attached to a container or a truck chassis and which generates power for supplying electricity to a refrigerated container. Generator used to provide power to regulate temperature in a reefer container; can be run on its own fuel or plugs provided on pier/vessel.

GENTLEMEN’S AGREEMENT = ДЖЕНТЛЬМЕНСКОЕ СОГЛАШЕНИЕ – Gentlemen’s Agreement is a verbal agreement between two parties who trust each other and have a strong sense of honor. A voluntary agreement between parties secured only by the honor of the participants. In Switzerland, this expression is often applied to the agreements between the commercial banks and the Swiss National Bank. / В международной дипломатической практике под Джентльменским Соглашением понимают договор, заключаемый без соблюдения официальных формальностей, в устной форме. Кроме того, им может считаться и одна из форм сговора монополий о ценах, квотах и тому подобном.

GENUS = РОД – Genus is a class, kind, or group marked by common characteristics or by one common characteristic; a category or biological classification ranking between the family and the species, comprising of structurally or phylogenetically related species or an isolated species exhibiting unusual differentiation, and being designated by a Latin or latinized capitalized singular noun. Genus (pl. Genera) is a group of related species with sufficiently distinct unique characteristics in common to be treated as a separate unit. The name of the genus forms the first part of the binomial name of each species, and is always capitalized. See also Class, Division, Family, Kingdom, Order, Phylum, Specie, Tribe, and Type. / Смотрите также Вид (Specie), Класс (Class), Отдел (Division), Отряд (Phylum), Порядок (Order), Семейство (Family), Тип (Type), Триба или Колено (Tribe), и Царство (Kingdom). Род, имеющий несколько Видов. Под Родом понимается основная надвидовая таксономическая категория (ранг) в биологической систематике. Объединяет близкие по происхождению Виды, например, разные Виды Кошек (Бенгальская, Дикая, Камышовая и другие) составляют Род Кошек; Виды Сосен (Обыкновенная, Сибирская и другие) – Род Сосен. Близкие Роды объединяют в Семейство. Род (Genus) – основная надвидовая таксономическая категория, объединяющая филогенетически наиболее близкие друг другу (близкородственные) Виды. Например, разные Виды Кошек (Лесная, Камышовая, Бенгальская и другие) объединяют в Род Кошки (Felis); разные Виды Сосен (Обыкновенная, Сибирская и другие) – в Род Сосна (Pinus). Научное название Род обозначают одним Латинским словом Genus. Одни Роды (‘большие’) состоят из десятков, а в ряде случаев даже из сотен и тысяч Видов (некоторые Роды Насекомых, Растений), другие – лишь из 2–4 Видов и даже 1 Вида. Роды, включающие всего 1 Вид, например, Род Выхухоль (Desmana) или Род Вельвичия (Welwitschia), называют Монотипными Родами. Род с несколькими или многими Видами часто делят на Подроды, объединяющие особенно близкие между собой Виды. Каждый Род обязательно входит в состав какого-либо Семейства, но между этими двумя таксономическими категориями нередко выделяют ещё промежуточные – Трибы, группируемые в Подсемейства, а последние уже в Семейства. В палеоботанике, помимо обычных Родов, выделяют ещё Орган-Роды и Формальные Роды. Род:- группа Видов с достаточно общими признаками, по которым их объединяют.

GEO–ELECTRICS = ГЕОЭЛЕКТРИЧЕСКОЕ ИЗЫСКАНИЕ (или ГЕОЭЛЕКТРОРАЗВЕДКА, или ГЕОЭЛЕКТРИЧЕСКИЕ ПОИСКИ) – Geo-Electrics is a technique of finding mineral deposits by studying the Earth’s electromagnetic fields. Also known as

Electromagnetic Exploration. / , от Греческого слова Gē, означающее Земля, и . Геоэлектрическое изыскание или Геоэлектроразведка это техника поиска полезных ископаемых на основе изучения электромагнитных полей Земли. Известно также как Электромагнитная Разведка (Electromagnetic Exploration).

GEOGRAPHICAL INDICATION = ГЕОГРАФИЧЕСКОЕ УКАЗАНИЕ – A Geographical Indication is a sign used on goods that have a specific geographical origin and possess qualities, reputation or characteristics that are essentially attributable to that place of origin. Most commonly, a geographical indication includes the name of the place of origin of the goods. Agricultural products typically have qualities that derive from their place of production and are influenced by specific local factors, such as climate and soil. Whether a sign is recognized as a geographical indication is a matter of national law. Geographical indications may be used for a wide variety of products, whether natural, agricultural or manufactured. An appellation of origin is a special kind of geographical indication. It generally consists of a geographical name or a traditional designation used on products which have a specific quality or characteristics that are essentially due to the geographical environment in which they are produced. The concept of a geographical indication encompasses appellations of origin. Can geographical indications only be used for agricultural products? The use of geographical indications is not limited to agricultural products. They may also highlight qualities of a product which are due to human factors associated with the place of origin of the products, such as specific manufacturing skills and traditions. That place of origin may be a village or town, a region or a country. For example, 'Bohemia' is recognized as a geographical indication in many countries for specific products made in the Czech Republic, in particular crystal ware. What does a geographical indication do? A geographical indication points to a specific place, or region of production, that determines the characteristic qualities of the product which originates from that place. It is important that the product derives its qualities and reputation from that place. Since those qualities depend on the place of production, a specific 'link' exists between the products and their original place of production. Why do geographical indications need protection? Geographical indications are understood by consumers to denote the origin and the quality of products. Many of them have acquired valuable reputations which, if not adequately protected, may be misrepresented by dishonest commercial operators. False use of geographical indications by unauthorized parties is detrimental to consumers and legitimate producers. Consumers are deceived into believing that they are buying a genuine product with specific qualities and characteristics, when they are in fact getting an imitation. Legitimate producers are deprived of valuable business and the established reputation of their products is damaged. What is the difference between a geographical indication and a trademark? A trademark is a sign used by an enterprise to distinguish its goods and services from those of other enterprises. It gives its owner the right to exclude others from using the trademark. A trademark will often consist of a fanciful or arbitrary name or device. A geographical indication tells consumers that a product is produced in a certain place and has certain characteristics that are due to that place of production. It may be used by all producers who make their products in the place designated by a geographical indication and whose products share specified qualities. Unlike a trademark, the name used as a geographical indication will usually be predetermined by the name of the place of production. How are geographical indications protected? Geographical indications are protected in accordance with international treaties and national laws under a wide range of concepts, including:- (i) special laws for the protection of geographical indications or appellations of origin; (ii) trademark laws in the form of collective marks or certification marks; (iii) laws against unfair competition; (iv) consumer protection laws, or (v) specific laws or decrees that recognize individual geographical indications. In essence, unauthorized parties may not use a geographical indication in respect of products that do not originate in the place designated by that indication. Applicable sanctions range from court injunctions preventing the unauthorized use to the payment of damages and fines or, in serious cases, imprisonment. How are geographical indications protected on the international level? A number of treaties administered by WIPO provide for the protection of geographical indications, most notably the Paris Convention for the Protection of Industrial Property of 1883, and the Lisbon Agreement for the Protection of Appellations of Origin and Their International Registration. In addition, Articles 22 to 24 of the Agreement on Trade-Related Aspects of Intellectual Property Rights (TRIPS) deal with the international protection of geographical indications within the framework of the World Trade Organization (WTO). What is a 'generic' geographical indication? If a geographical term is used as the common designation of a kind of product, rather than an indication of the place of origin of that product, then the term no longer functions as a geographical indication. Where this has occurred in a certain country, then that country may refuse to recognize or protect that term as a geographical indication. For example, the term 'cologne' now denotes a certain kind of perfumed toilet water, regardless of whether or not it was produced in the region of Cologne. What is WIPO's role in the protection of geographical indications? WIPO is in charge of the administration of a number of international agreements which deal partly or entirely with the protection of geographical indications (see, in particular, the Paris Convention for the Protection of Industrial Property, and the Lisbon Agreement for the Protection of Appellations of Origin and Their International Registration). Furthermore, through the work of the Standing Committee on the Law of Trademarks, Industrial Designs and Geographical Indications (SCT), made up of representatives of Member States and interested organizations, WIPO explores new ways of enhancing the international protection of geographical indications. A Geographical Indication is a sign used on goods that have a specific geographical origin and possess qualities or a reputation that are due to that place of origin. Agricultural products typically have qualities that derive from their place of production and are influenced by specific local factors, such as climate and soil. Whether a sign functions as an indication is a matter of national law and consumer perception. Geographical indications may be used for a wide variety of agricultural products, such as 'Tuscany' for olive oil produced in a specific area of Italy, or 'Roquefort' for cheese produced in a certain region of France. The use of geographical indications is not limited to agricultural products. They may also highlight particular qualities of a product, which are due to human factors found in the place of origin of the products, such as specific manufacturing skills and traditions. That place of origin may be a village or town, a region or a country. An example for the latter is Switzerland or Swiss, which is widely perceived as a geographical indication for products that are made in Switzerland, in particular for watches. An appellation of origin is a special kind of geographical indication, used on products that have a specific quality that is exclusively or essentially due to the geographical environment in which the products are produced. The concept of geographical indication encompasses appellations of origin. Examples of appellations of origin which are protected in states party to the Lisbon Agreement for the Protection of Appellations of Origin and their International Registration include 'Habana' for tobacco grown in the Havana region of Cuba, or 'Tequila' for spirits produced in particular areas of Mexico. Geographical indications are protected in accordance with national laws under a wide range of concepts, such as laws against unfair competition, consumer protection laws, laws for the protection of certification marks or special laws for the protection of geographical indications or appellations of origin. In essence, unauthorized parties may not use geographical indications if such use is likely to mislead the public as to the true origin of the product. Applicable sanctions range from court injunctions preventing the unauthorized use, to the payment of damages and fines or, in serious cases, imprisonment. / , включая Абана (Habana) для Табака, выращенного в регионе Аваны (Гаваны; Havana) в Кубе, или Тэкила (Tequila) для спиртных напитков, произведённых в конкретных ареалах Мексики. Под Географическим Указанием, от Греческого слова Gē, означающее Земля, и Gráphō, означающее Пишу, понимается обозначение, используемое на товарах, которые имеют особое географическое происхождение и обладают свойствами или репутацией, присущими этому месту происхождения. В более общем плане географическое указание состоит из названия места происхождения товаров. Типичным примером могут являться сельскохозяйственные продукты, свойства которых обусловлены местом, где они произведены, и обусловлены такими особыми местными географическими факторами, как климат и почва. Функционирование обозначения в качестве

географического указания определяется национальным законодательством и восприятием потребителей. Географические указания могут использоваться в связи с широким разнообразием сельскохозяйственной продукции, как например, Тоскэни или Тускани (‘Tuscany’) применительно к оливковому маслу, произведённому в особом районе Италии (охраняется в Италии Законом № 169 от 05 Февраля 1992) или Рокфор (‘Roquefort’) в отношении сыра, произведённого во Франции (охраняется в Европейском Союзе в соответствии с Правилом (ЕС) № 2081/92 и в Соединённых Штатах в соответствии с сертификационным регистрационным знаком № 571/798). Могут ли географические указания использоваться только в отношении сельскохозяйственных продуктов? Использование географических указаний не ограничено сельскохозяйственными продуктами. Они могут также подчеркивать особые свойства продукта, которые являются результатом человеческих факторов, присущих месту происхождения этих продуктов, в частности таких, как особые навыки и традиции изготовления. Таким местом происхождения может быть поселок или город, регион или страна. Примером последней может служить указание ‘Швейцария’ (‘Switzerland’) или ‘Швейцарский’ (‘Swiss’), которое во многих странах воспринимается как географическое указание товаров, изготовленных в Швейцарии, и в частности, в отношении часов. Что такое наименование места происхождения? Наименование места происхождения товаров – это особый вид географического указания, используемого для обозначения товара, особые свойства которого исключительно или главным образом определяются характерными для данного географического объекта природными условиями, в которых производятся такие товары. Концепция географического указания включает в себя наименования мест происхождения. Каково назначение географического указания? Географическое указание указывает на особое место или регион производства, которые определяют особые свойства товара, происходящего из этого места или региона. Очень важно, чтобы особые свойства и репутация данного товара определялись этим местом. Поскольку особые свойства зависят от географического места, где производится товар, существует особая ‘связь’ между товарами и местом, где они были первоначально произведены. Почему географические указания нуждаются в охране? Географические указания рассматриваются потребителями как показатель происхождения и качества товаров. Многие из них приобрели ценную репутацию, которая при отсутствии надлежащей охраны может быть искажена нечестными коммерческими дельцами. Ложное использование географических указаний лицами, не имеющими разрешения на такое использование, наносит ущерб потребителю и законным производителям. Потребители являются обманутыми и введёнными в заблуждение в том смысле, что они покупают якобы настоящий продукт, обладающий особыми качествами и свойствами, в то время как фактически они приобретают не представляющую никакой ценности имитацию. Законным производителям наносится ущерб, поскольку у них отнимают ценный бизнес и вредят установившейся репутации их продукции. Какова разница между географическим указанием и товарным знаком? Товарный знак – это обозначение, используемое предприятиями для того, чтобы отличить их товары и услуги от товаров и услуг других предприятий. Товарный знак предоставляет владельцу право запрещать его использование другими лицами. Географическое указание информирует потребителей, что товар произведён в определённом месте и имеет особые свойства, которые определяются местом его изготовления. Оно может использоваться всеми производителями, которые в обозначенном географическим указанием месте производят товары, обладающие характерными свойствами. Как охраняется географическое указание? Географические указания охраняются в соответствии с национальным законодательством и согласно широкому спектру концепций, в частности, таких как законодательство по борьбе с недобросовестной конкуренцией, законодательство по охране интересов потребителей, законодательство по охране сертификационных знаков или специальные законы по охране географических указаний или наименований места происхождения. По существу, лица, не имеющие надлежащего разрешения, не могут использовать географические указания, если такое использование может ввести публику в заблуждение в отношении действительного происхождения товаров. Применимые санкции варьируются от судебных запретов, предотвращающих несанкционированное использование, до возмещения убытков и штрафов или, в случае серьёзных нарушений, тюремного заключения. Как географические указания охраняются на международном уровне? Ряд договоров, административные функции которых выполняет Всемирная Организация Интеллектуальной Собственности (ВОИС), предусматривают охрану географических указаний, главным образом это Парижская Конвенция по охране промышленной собственности от 1883 и Лиссабонское Соглашение об Охране Наименований Мест Происхождения и Их Международной Регистрации. Кроме того, Статьи 22–24 Соглашения о Торговых Аспектах Прав Интеллектуальной Собственности (ТРИПС) регулируют международную охрану географических указаний в рамках Всемирной Организации Торговли (ВОТ). Что такое ‘родовое’ географическое указание? Если название местности используется в качестве обозначения определённого вида товара вместо наименования места происхождения этого товара, то такой термин больше не применяется в качестве географического указания. Например, ‘Дижонская Горчица’ (‘Dijon Mustard’) – вид горчицы, происходящей из Французского города Дижон, с течением времени стала обозначать определённый вид горчицы, независимо от места его производства, в то время как раньше ‘Дижонская Горчица’ изготовлялась только в Дижоне. Какова роль ВОИС в охране географических указаний? ВОИС осуществляет администрацию ряда международных соглашений, которые частично или полностью регулируют охрану географических указаний (в особенности Парижская Конвенция по охране промышленной собственности и Лиссабонское Соглашение об Охране Наименований Мест Происхождения и Их Международной Регистрации). Кроме того, в рамках Постоянного Комитета по Законодательству о Товарных Знаках, Промышленных Образцах и Географических Указаниях, в работе которого участвуют государства-члены ВОИС и другие заинтересованные организации, ВОИС исследует новые пути совершенствования международной охраны географических указаний.

GEOGRID = ХХ (или ГЕОРЕШЁТКА) – Geogrid is a manufactured polymer constructions characterized by large openings made by one of the following methods:- (1) coating woven or knit products to form a grid; and (2) welding oriented strands to form a grid; (3) punching holes in flat sheets then drawing them to align the polymer molecules. Used for soil stabilization, drainage, and erosion control applications. See also Geotextiles.

GEOMEMBRANE PROTECTION FABRICS = ТКАНИ С ГЕОМЕМБРАННОЙ ЗАЩИТОЙ – Geomembrane Protection Fabrics:- fabric systems used in the construction of landfills to protect the membrane liner from puncture and installation damage. The fabric may be installed on one or both sides of the liner. It can also be used in the leachate collection system since it is permeable to fluids and gases. See also Geotextiles.

GEOMETRIC INDEX = ГЕОМЕТРИЧЕСКИЙ ИНДЕКС – Geometric Index is based on the geometric mean of the ratio of the share prices.

GEOMORPHOLOGY = ГЕОМОРФОЛОГИЯ – Geomorphology is a study of the origin of landforms; largely replaces the term ‘physiography’. / Под Геоморфологией, от Греческих слов Gē, означающее Земля, Morphē, означающее Форма, и Lógos, означающее Слово или Учение, понимается наука о рельефе суши, дна океанов и морей. Изучает внешний облик, происхождение, возраст рельефа, историю развития, современную динамику и закономерности распространения. Данные геоморфологии используются при поисках месторождений полезных ископаемых, проектировании дорог и сооружений. Появление геоморфологии как самостоятельной области знания относится к концу XIX – началу XX веков, когда оформились

две самостоятельные школы:- Американская во главе с геологом и географом Вилъйэмом Морисом Дэйвисом (или Девисом; (William Morris Davis; 1850-Февраль-12–1934-Февраль-05) и Европейская (главным образом Немецкая), представителями которой были Немецкие учёные геоморфолог и географ Альбрэхт Фридрихь Каль Пэньк (Albrecht Friedrich Karl Penck; 1858-Сентябрь-25–1945-Март-07), разработавший геоморфологическую классификацию климатов, и его сын геоморфолог и геолог Вальта Пэньк (Walther Penck; 1888-Август-30–1923-Сентябрь-29), установивший зависимость между характером рельефа, экзогенными процессами и тектоническими движениями. Основы геоморфологии в России и бывшем Союзе Советских Социалистических Республик (СССР) заложили Пётр Алексеевич Кропоткин (1842–1921), Иван Васильевич Мушкетов (1850–1902), Иван Семёнович Щукин (1885–1985), Яков Самойлович Эдельштейн (1869–1952), Константин Константинович Марков (1905–80) и другие.

GEORGETTE = ЖОРЖЭТ – Georgette fabric is a textile traditionally made from silk, although synthetic fibers such as polyester are sometimes used as well. The thing that makes georgette fabric distinctive is the crinkly crêpe-light texture, which feels slightly rough and dull, but gives the fabric a bouncy, flowing look. Many fabric stores carry georgette fabric in a range of colors and prints for various projects. Department stores also carry clothing and drapery made from georgette. The threads used in georgette fabric are highly twisted, which causes them to crinkle as they relax. The weave of georgette tends to be rather tight, but the overall appearance is slightly sheer, since the threads are very thin. Unlike some fine silks, georgette fabric is also unusually strong, and it holds up well to varied wear. Since silk is highly absorbent, georgette fabric can easily be dyed in a myriad of colors, or printed with a pattern. The crêpe-like texture of georgette fabric makes it very springy, so that the fabric almost appears to move on its own. It also drapes very well, making it a popular choice for women's fashions in which clingy, flowing fabrics are favored. Since georgette fabric is thin, it is also lightweight, and can be used as a layer in a larger garment without being heavy or bulky. Layers of georgette fabric may be used for a fanciful effect, especially in gowns. Bridal gowns, evening dresses, and other formal wear are sometimes made with georgette fabric. It may also be used to make jackets and shirts, usually for women. The fabric can be left plain, or decorations such as embroidery and beading may be added. Decorations are usually kept simple so that they do not drag the fabric down and pull the garment out of shape. High load seams may be doubled to ensure that the fabric does not unravel. Because georgette fabric is textured and slightly slippery, it can be difficult to sew. Interweaving tissue paper or something similar can help to keep pieces of the fabric together while they are worked on, and pins should be used with caution since georgette fabric can show pin holes. As a general rule, georgette fabric can be hand washed in cold water with mild detergent and hung to dry, although it should be kept out of the sun to avoid fading. In some cases, dry cleaning may be necessary; always check product tags to make sure that you care for the garment as the manufacturer recommends. Georgette is a sheer lightweight fabric, often made of silk or from such manufactured fibers as polyester, with a crêpe surface. End-uses include dresses and blouses. Georgette Silk is a fine, lightweight, plain weave, crêpe fabric, usually having two highly twisted S and two highly twisted Z yarns alternately in both warp and weft. Made of crêpe yarn, silk georgette has a grainy texture, a sheer feel, and a thin, very dry hand. It is heavier than chiffon, and is similar to silk crêpe, but is not as soft or lustrous as crêpe. Georgette is durable, but snags easily. Drapes very fluidly, and falls into soft ripples. With its crêped surface, this sheer and strong silk fabric is great for blouses, bias-cut flared skirts, evening wear, dresses, and scarves. Doesn't show pin marks, and doesn't hold a crease. Relatively difficult to sew. Standard construction of the gray high count fabric in Japan:- 100% polyester filament, 50d x 50d, 44". Georgette is a sheer, strong silk or polyester clothing fabric with a dull, crinkled, crêpe-like surface. It is typically used to make apparel such as blouses or flowing dresses. Georgette is a soft, sheer dull-textured silk fabric, similar to chiffon, made with a crêpe yarn to give the fabric a crêpe appearance. The crepy surface is obtained by alternating right-hand and left hand twist yarns in warp and filling. It is used for summer and evening dresses. See also Chiffon, and Crêpe. Georgette:- a thin strong clothing crêpe of fibers woven from hard-twisted yarns to produce a dull pebbly surface. Lightweight, heavy, sheer fabric. Has quite a bit of stiffness and body. Gives excellent wear. Has a dull, crinkled surface. Achieved by alternating S and Z yarns in a high twist in both warp and filling directions. Georgette has a harser, duller, more crinkled feel and appearance than crêpe de chine. / Смотрите также Крэп (Crêpe). высокая крутка . в основе и уточине. Под Жоржэтой, от Французского слова Georgette, означающее женское имя, понимается .

GEOTEXTILES = ГЕОТЕКСТИЛЬ – Geotextiles are the manufactured fiber products made into fabrics of various constructions for use in a wide variety of civil engineering applications including several described below:- asphalt overlay fabrics, drainage fabrics, erosion control fabrics, geomembrane protection fabrics, reinforcement fabrics, and subsurface stabilization fabrics. Geotextiles are manufactured fiber materials made into a variety of fabric constructions, and used in a variety civil engineering applications. Geotextiles is a popular term. It means manufactured fiber products made into fabrics of various constructions for use in a wide variety of civil engineering applications. / , от Греческого слова Gē, означающее Земля, и . Геотекстиль является популярным термином. Он означает продукцию в виде тканей различной конструкции (строения) из искусственного волокна, используемую в широком спектре применения в гражданском строительстве.

GEOTHERMAL PLANT = ГЕОТЕРМАЛЬНАЯ СТАНЦИЯ – Geothermal Plant is a plant in which the prime mover is a steam turbine. The turbine is driven either by steam produced from hot water or by natural steam that derives its energy from heat found in rocks or fluids at various depths beneath the surface of the earth. The energy is extracted by drilling and/or pumping. / Под Геотермальной Электростанцией понимается Гидроэлектростанция (ГЭС), преобразующая внутреннее тепло Земли (энергию горячих пароводяных источников) в электрическую энергию. В бывшем Союзе Советских Социалистических Республик (СССР) первая геотермальная электростанция (Паужетская) мощностью 5 МегаВатт (МВт) была пущена в 1966 на Камчатке, Россия. К 1980 её мощность была доведена до 11 МВт. Под Геотермальной Электростанцией понимается тепловая электростанция, использующая тепловую энергию горячих источников Земли для выработки электроэнергии и теплоснабжения. Температура геотермальных вод может достигать 200 °C и более. В геотермальные электростанции входят:- буровые скважины, выводящие на поверхность пароводяную смесь или перегретый пар; устройства газовой и химической очистки; электроэнергетическое оборудование; система технического водоснабжения и так далее. Геотермальные электростанции дёшевы, относительно просты; но получаемый пар имеет низкие параметры, что снижает их экономичность. Сооружение геотермальных электростанций оправдано там, где термальные воды наиболее близко подходят к поверхности Земли. В бывшем СССР первая геотермальная электростанция (Паужетская, на Юге Камчатки) мощностью 5 МВт пущена в 1966; к началу 1980-х её мощность доведена до 11 МВт. Геотермическая Электростанция, тепловая электростанция, преобразующая внутреннее тепло Земли в электрическую энергию. Источники глубинного тепла – радиоактивные превращения, химические реакции и другие процессы, происходящие в земной коре (смотрите Геотермика). Температура пород с глубиной растёт и на уровне 2 000–3 000 метров (м) от поверхности Земли превышает 100 °C. Циркулирующие на больших глубинах воды нагреваются до значительных температур и могут быть выведены на поверхность по буровым скважинам. В вулканических районах глубинные воды, нагреваясь, поднимаются по трещинам в земной коре. В этих районах термальные воды имеют наиболее высокую температуру и расположены близко к поверхности, иногда они выделяются в виде перегретого пара. Глубинное бурение в будущем позволит освоить высокую температуру магматических очагов. Термальные воды с температурой до 100 °C выходили на поверхность во многих районах бывшего Союза Советских Социалистических Республик

(СССР). В Советском Союзе первая геотермическая электростанция мощностью 5 МВт была пущена в 1966 на Юге Камчатки, в долине Реки Паужетки, в районе вулканов Кошелева и Камбального. Пароводяная смесь с теплосодержанием до 840 килоДжоулей на килограмм (кДж/кг) (200 килокалорий на килограмм (ккал/кг)) выводится буровыми скважинами на поверхность и направляется в сепарационные устройства, где при давлении 0.23 МН/м^2 (2.3 ат) пар отделяется от воды. Отсепарированный пар поступает в турбины, а горячая вода при температуре 120 °С используется для теплоснабжения населённых пунктов и для других целей. На электростанции установлены две турбины мощностью по 2.5 МВт. На геотермической электростанции нет котельного цеха, топливоподачи, золоулавливателей и многих других устройств, необходимых для обычной тепловой электростанции; практически станция состоит из машинного зала и помещения для электротехнических устройств. Себестоимость электроэнергии на этой геотермической электростанции в несколько раз ниже, чем на местных дизельных электростанциях. Получение электроэнергии на геотермической электростанции осуществляется по одной из схем:- прямой, непрямой и смешанной. При прямой схеме природный пар из скважин направляется по трубам прямо в турбины, соединённые с электрическими генераторами. Пар и сконденсировавшаяся вода далее идут для теплофикации и иногда в химическое производство. При непрямой схеме производится предварительная очистка пара от агрессивных (сильно коррелирующих) газов. При смешанной схеме природный неочищенный пар поступает в турбины, и затем из сконденсировавшейся воды удаляются не растворившиеся в ней газы. Энергия термальных вод с температурой около 100 °С в невулканических районах страны может быть использована путём применения вакуумной турбины с несколькими расширителями или на основе цикла с низкокипящими рабочими веществами – фреонами и другими. За рубежом геотермические электростанции построены и сооружаются в Италии (Тоскана, район Лардерелло), Новой Зеландии (зона Таупо), США (Калифорния, Долина Больших Гейзеров) и Японии. В районе Рейкьявика (Исландия) геотермальные воды используются для теплофикации.

GEOTROPISM = ГЕОТРОПИЗМ – Geotropism is a growth response to gravitational forces causing bending, growth or movement of a part under the influence of a gravitational field. See also Tropism. / Смотрите также Тропизм (Tropism). Под Геотропизмом, от Греческих слов Gē, означающее Земля, и Trópos, означающее Направление или Поворот, понимается ростовое движение органов растений под влиянием силы земного тяготения. Геотропизм обусловливает вертикальное направление осевых органов растений – главного стебля вверх (отрицательный геотропизм), главного корня вниз (положительный геотропизм). Под Тропизмом понимается ростовое движение органов растений (корня, стебля, листьев), обусловленное направленным действием какого-либо раздражителя – света (фоторопизм), силы земного тяготения (геотропизм), температуры (термотропизм), прикосновения (гаптотропизм), воды (гидротропизм), кислорода (аэротропизм) и других химических веществ (хемотропизм). В основе тропизма лежит неравномерный рост, вызываемый перераспределением в растении фитогормонов. Геотропизм, способность органов растений принимать определённое положение под влиянием земного притяжения. Геотропизм обусловливает вертикальное направление осевых органов растения:- главный корень направляется прямо вниз (положительный геотропизм), главный стебель – прямо вверх (отрицательный геотропизм). Если под каким-либо внешним воздействием, например, будучи согнут или повален ветром, главный стебель растения выведен из свойственного ему вертикального положения, то в молодой, ещё растущей части происходит изгиб и верхняя его часть поднимается и снова оказывается правильно ориентированной. Кончик главного корня, выведенного из вертикального положения, изгибается вниз. Геотропические изгибы тесно связаны с ростом и осуществляются благодаря тому, что в стеблях, выведенных из вертикального состояния, нижняя сторона начинает расти быстрее, а верхняя замедляет свой рост. Неодинаковая скорость роста верхней и нижней сторон горизонтально расположенных стеблей связана с перемещением под влиянием силы тяжести ауксинов на нижнюю сторону стебля или корня. Закончившие рост части растений не способны к геотропическим изгибам; поэтому у растений, которые полегли под действием ветра или дождя, приподнимается только молодая, растущая верхушка стебля. Кажущееся исключение составляют злаки, у которых узлы очень долго сохраняют способность возобновлять рост; под влиянием полегания нижняя сторона нижних узлов сильно разрастается и поднимает расположенную выше часть соломины. Кроме стеблей, растущих под влиянием геотропизма вертикально, – ортотропных, встречаются и горизонтально растущие стебли – плагиотропные; это большей частью корневища и столоны (усы). Изменение геотропической реакции может происходить и под влиянием внешних воздействий, например, пониженной температуры, вызывающих прижимание побегов к земле у Альпийских или Полярный растений, а также под влиянием некоторых газов, например, этилена. Смотрите также Тропизмы.

GERANIUM = ГЕРАНЕВЫЙ (или ГЕРАНЬ) – Geranium:- a vivid or strong red.

GERD = GROSS EXPENDITURES ON RESEARCH AND DEVELOPMENT

GERDAT = GROUPEMENT D'ÉTUDES ET DE RECHERCHES POUR LE DÉVELOPPEMENT DE L'AGRONOMIE TROPICALE

GERM = ЗАРОДЫШ – The Germ is the embryo which, if fertilized by pollen, will sprout into a new plant. It contains many B vitamins, some protein, minerals, and healthy fats. See also Embryo. Germ is the embryo of a seed; pathogenic or harmful microorganism. / Смотрите также Эмбрион (Embryo). Под Зародышем понимается:- (i) у животных и человека Зародыш, или Эмбрион, – организм на ранних стадиях развития. Заключён в яйцевые и зародышевые оболочки. Развивается обычно из оплодотворённого яйца, питается за счёт имеющихся в нём запасов питательных веществ или за счёт материнского организма. (ii) Зачаток папоротникообразных и семенных растений; развивается обычно из оплодотворённой яйцеклетки. Зародыш:- (1) у животных и человека Зародыш, или Эмбрион, – организм в раннем периоде развития – от оплодотворённого яйца (зиготы) до появления способности к самостоятельному питанию и активному передвижению. Развитие зародыша происходит, как правило, в яйцевых оболочках или специальных органах материнского организма. Смотрите Зародышевое Развитие, Зародышевые Оболочки. (2) У растений Зародыш, или Эмбрио, – зачаток новой особи, развивающийся из зиготы, которая возникает в результате оплодотворения яйцеклетки зародышевого мешка или из клеток нуцеллуса или интегумента (в случае апомиксиса). Наиболее простой тип эмбрионального развития у зелёных Водорослей, например, у Спирогиры, зигота которой не образует спорофитной нити, а сразу приступает к мейозу. У бурых Водорослей, например, у Фукуса, зигота прикрепляется к субстрату, делится, после чего образует эмбриональное тело с точкой роста таллома. У мохообразных зародыш прорастает на материнском организме – гаметофите, за счёт которого он питается, затем образует спорогенную ткань, где формируются споры. Такой тип зародыша не встречается среди других групп высших растений. У древнейших высших растений – Псилотовых – развитие зародыша протекает в ткани гаметофита, где происходит ряд последовательных делений зиготы. Из клеток нижней части формируется ножка, внедряющаяся в ткань гаметофита, в верхней – закладывается точка роста побега с двумя меристематическими бугорками (смотрите Меристема). Зародыш здесь – поляризованная структура, один конец которой образует наземный побег, другой – корневище. У плауновидных зародыш имеет два симметричных бугорка будущих зародышевых листочков, между которыми находится точка роста в виде верхушечной клетки. Развитие зародыша у хвощей характеризуется правильным планом сегментации в виде 4 зон, дающих начало побегу, корню, первому листу и ножке. У папоротниковидных в первых 4 клетках, возникших в результате двух первых делении зиготы,

определено место закладки верхушки побега, первого листа, корня и ножки. У голосеменных начальный цикл развития зародыша характеризуется свободноядерной, или ценоцитной, стадией (у саговников, например, свободных ядер 1 024), которая сменяется образованием клеток; затем в формирующемся зародыше происходит закладка точек роста побега, корня и семядольных бугорков (у некоторых видов сосны – до 18). У большинства покрытосеменных зигота делится на две клетки:- апикальную, дающую начало собственно зародышу, п базальную – подвеску, или суспензору. В эмбриогенезе различают 2 фазы развития:- предзародышевую (от зиготы до образования эмбриодермы) и зародышевую (закладка основных структур:- точки роста побега, семядоли, гипокотиля и центрального зародышевого корешка). На основе первых этапов деления предзародыша были созданы классификации эмбриональных типов, используемые систематиками при решении вопросов эволюции и филогении растений. Предзародышевая стадия развития двудольных и однодольных одинакова. На более поздних стадиях у однодольных апикальная зона проэмбрио даёт начало только 1 семядольному бугорку; у двудольных таких бугорков может возникнуть 2, а у некоторых видов 3 и даже больше, что приводит к образованию многосемядольности. У покрытосеменных растений развитие зародыша, в отличие от голосеменных, сопровождается образованием клеточных перегородок. Лишь у пионов обнаружен новый тип эмбриогенеза, при котором в зиготе вначале возникают свободные ядра, а затем такая многоядерная структура становится клеточной и на её периферии возникают проэмбриональные бугорки; из них в собственно зародыше развивается только один. По наличию или отсутствию у зародыша покрытосеменных зелёного пигмента – хлорофилла – они делятся на 2 группы:- хлороэмбриофиты (Бобовые, Крестоцветные и другие) и лейкоэмбриофиты (лютиковые, злаковые и другие). В процессе эволюции среди некоторых групп покрытосеменных, например, у растений паразитов (заразиховые) и сапрофитов (орхидные), наблюдается редукция зародыша. Источником питания зародыша служит эндосперм, который у одних Видов (Бобовые) поглощается целиком растущим зародышем, у других (злаки) – сохраняется. Иногда зародыш в семени окружён не только эндоспермом, но и другой запасной тканью – перисперм, развивающимся из клеток нуцеллуса (Свёкла, Чёрный Перец и другие).

GERMINATION = ПРОРАСТАНИЕ – Germination is the resumption of active growth of the embryo in the seed and the process by which a seed sprouts to development into a seedling when a favorable environment exists, culminating in the development of a plant from the seed. The initiation of growth in seeds. / Начало роста семян. Прорастание семян, процесс перехода семян от состояния покоя к интенсивной жизнедеятельности, в результате чего трогается в рост зародыш и образуется проросток, из которого развивается молодое растение; начальный этап онтогенеза растений. Прорастание семян происходит только при достаточном обеспечении их влагой, кислородом, при определённом температурном, а иногда и световом режиме. Прорастание семян характеризуется повышением обмена веществ в зародыше и эндосперме. При поступлении воды в семена они набухают, в них активируются ферменты, усиливаются процессы превращения запасных веществ (крахмала, жиров, белков) с преимуществ, их распадом на сахара, жирные кислоты, аминокислоты. Это обеспечивает семена энергией и пластическими веществами, необходимыми для синтеза веществ, идущих на построение новых тканей проростка. По окончании набухания зародыш семени трогается в рост. Первым, как правило, растёт корешок, который прорывает оболочку семени (семя наклёвывается). Затем в рост трогается у одних растений гипокотиль (в результате чего семядоли и верхушечная почка выходят на поверхность почвы), у других – эпикотиль (при этом семядоли остаются в почве, а на поверхность выносится только верхушечная почка). Потребность в воде для прорастания семян зависит от химического состава и физиологического состояния семени. При недостатке кислорода, например, при длительном погружении семян в воду или при образовании почвенной корки в них накапливаются этиловый спирт, молочная комитета, аммиак и другие вредные для зародыша вещества. Влияние температуры на прорастание семян связано не только с поступлением влаги в семена и активированием обмена веществ, но и с изменением в них соотношения различных регуляторов роста. Например, при нагревании только что собранных семян Хлопчатника или Арахиса в них снижается содержание ингибиторов роста и прорастание семян ускоряется. Для ускорения прорастания семян многих других растений, наоборот, необходимо воздействие низкой положительной температуры (смотрите Стратификация Семян), при которой увеличивается содержание гиббереллинов и других стимуляторов роста. Для прорастания семян некоторых растений, кроме влаги, кислорода и соответствующей температуры, необходим свет определённого спектра. Так, красный свет стимулирует прорастание семян Латука, Сосны, Щавеля, а инфракрасный тормозит. Даже для прорастания семян с одного и того же растения, с одного колоса необходимы различные условия среды. Семена некоторых растений, находясь в благоприятных условиях, всё же не прорастают. Такая задержка прорастания семян обусловливается или тем, что они не вышли из состояния покоя (смотрите Покой У Растений), или их твёрдыми покровами, не пропускающими кислород и воду к зародышу (в этом случае применяют скарификацию семян – механическое повреждение покровов, например у Миндаля, Ореха, Винограда). Прорастание семян заканчивается переходом проростка к автотрофному питанию, что совпадает с появлением всходов растений. Поэтому создание условий, оптимальных для прорастания семян, а следовательно, и повышения всхожести семян – одна из предпосылок получения высоких урожаев.

GERMINATION = ПРОРАСТАНИЕ (или НАЧАЛО РОСТА, или ЗАРОЖДЕНИЕ, или ВСХОЖЕСТЬ) – Germination is the sprouting of a seed. Development of a spore. / Развитие споры. Прорастание или Всхожесть семян. Образование почки. Всхожесть – способность семян образовывать нормально развитые проростки за определённый срок проращивания, предусмотренный ГОСТом для каждой культуры. Лабораторную всхожесть определяют в процентах как отношение нормально проросших семян (за определённый срок при определённых условиях) к общему их количеству, взятому при проращивании в лаборатории. Полевую всхожесть семян выражают в процентах взошедших на поле растений от числа всех высеянных семян. Полевая всхожесть всегда ниже лабораторной (иногда на 20–30%). Это объясняется тем, что часть прорастающих в почве семян погибает от вредителей и болезней, часть их не всходит в результате образования после дождей корки, глубокой или мелкой заделки. Всхожесть семян – способность семян образовывать нормально развитые проростки. Для определения всхожести семян Хлопчатника используют две пробы по 100 семян. Энергия Прорастания Семян Хлопчатника – способность семян быстро и дружно прорастать. Нормально проросшие семена – семена, имеющие корешок размером не менее длины семени. Ненормально проросшие семена – семена, проросшие через разрыв в семенных оболочках, а также с уродливыми корешками – нитевидными, утолщёнными. Непроросшие здоровые семена – семена, которые не проросли к установленному дню подсчёта всхожести, но имеют здоровое по состоянию и окраске ядро, что определяется после вскрытия оболочки. Загнившие семена – семена с мягкими разложившимися тканями.

GERMINATION PERCENTAGE = ПРОЦЕНТ ПРОРАСТАНИЯ – Germination Percentage (GP):- germination in polythelene glycol solution.

GERMINATION TO EMERGENCE = ОТ ПРОРАСТАНИЯ ДО ВСХОЖЕСТИ (или ОТ ПРОРАСТАНИЯ ДО НАЧАЛА РОСТА) – Germination To Emergence is the period which is signified by the emergence (coming out) of the radicle or coleoptile from the germinating embryo in the seed.

GERMINATOR = ПРОРАЩИВАТЕЛЬ – Germinator is a piece of equipment used for germinating seed which provides the necessary conditions needed for germination.

GERMPLASM = ГЕРМОПЛАЗМА (или ГЕРМОПЛАЗМ) – Germplasm is:- (1) the sum total of genetic material in a species. (2) The material basis of heredity. (3) The potential hereditary materials within a species, taken collectively. Germplasm:- plants intended for use in breeding or conservation programs. Germplasm:- total of the genotypes that constitute a species. / сохранение (conservation). Немецкий зоолог и эволюционист Август Фридрихь Леопольд Вайсман (August Friedrich Leopold Weismann; 1834–1914), основатель неодарвинизма, отверг идею наследуемости приобретённых свойств. В подтверждение своей концепции он отрезал хвосты у новорождённых мышей нескольких поколений. Затем рождались новые мышата с обычными хвостами, вопреки теории наследования приобретённых черт. Эти и другие опыты подтвердили гипотезу, что не среда на самом деле, а внутренние органические факторы ответственны за наследственную информацию. В 'Очерке о Наследственности и Связанных с Ней Биологических Вопросах' (1892) Вайсман отделил понятие Гермоплазмы, ответственной за наследование, от понятия телесной плазмы. Гермоплазма – наиболее ответственная часть организма, она определяет формы и характеристики телесной плазмы. Тело находится на службе гермоплазмы, делая её способной к репродукции. В этом причина того, почему некоторые соматические мутации не наследуются.

GERMPLASM BANK = БАНК ГЕРМОПЛАЗМЫ – Germplasm Bank is a facility to store plant genetic resources for custody, conservation, exchange, and use by present and future generations. / сохранение (conservation).

GERMPLASM COLLECTION = КОЛЛЕКЦИЯ ГЕРМОПЛАЗМЫ – Germplasm Collection is a collection of genotypes of a particular species, from different sources and geographic sites, used as source materials in plant breeding.

GESELLSCHAFT MIT BESCHRÄNKTER HAFTUNG = ГЕЗЭЛЬШАФТ МИТ БЭШРЭНКТА ХАФТУНГ (или ОБЩЕСТВО С ОГРАНИЧЕННОЙ ОТВЕТСТВЕННОСТЬЮ) – Gesellschaft mit beschränkter Haftung (GmbH) is the German equivalent of the UK Private Limited Company (abbreviation:- Ltd), or the US abbreviation LLC (short for Limited Liability Company). In Austria:- minimum capital EUR35 000.00, in Germany:- minimum capital EUR25 000.00 (If under the trade name 'Unternehmergesellschaft (haftungsbeschränkt)', its minimum capital is EUR1.00 (times the number of shares)), in Switzerland:- CHF20 000.00. / Общество с Ограниченной Ответственностью или, как это звучит на Немецком языке по месту применения, Гезэльшафт мит бэшрэнкта Хафтунг (Ге.эм.бе.Ха.) (Gesellschaft mit beschränkter Haftung (GmbH)), является эквивалентом частной Компании с Ограниченной Ответственностью (Limited Company) в Соединённом Королевстве.

GETA = ГЭТА – Geta is a Japanese wooden clog for outdoor wear.

GEU = GENETIC EVALUATION AND UTILIZATION

GF = FRENCH GUIANA

GF = GRAIN FILLING

GFCF = GROSS FIXED CAPITAL FORMATION

GFD = GRAIN FILLING DURATION

GFR = GRAIN FILLING RATE

GFW = GENERAL LICENSE FREE WORLD

GGVSEE = ГЕ.ГЕ.ФАУ.ЗЭЭ – GGVSee is a short for the Gefahrgutverordnung-See. Regulation in the Federal Republic of Germany concerning the transportation of dangerous goods by sea-going vessels.

GH = GHANA

GH = GREENHOUSE

GHC = GREEN HAIRY CATERPILLAR

GHG = GREENHOUSE GAS

GHILLIE SUIT = МАСКХАЛАТ (или КОСТЮМ ПОМОЩНИКА ОХОТНИКА, или МАСКИРОВОЧНЫЙ КОСТЮМ) – Ghillie Suit, or Yowie Suit, or Camo Tent is a type of camouflage clothing designed to resemble heavy foliage. Typically, it is a net or cloth garment covered in loose strips of cloth or twine, sometimes made to look like leaves and twigs, and optionally augmented with scraps of foliage from the area. Snipers and hunters may wear a ghillie suit to blend into their surroundings and conceal themselves from enemies or targets. The suit gives the wearer's outline a three-dimensional breakup, rather than a linear one. When manufactured correctly, the suit will move in the wind in the same way as surrounding foliage.

GHS = GLOBALLY HARMONIZED SYSTEM OF CLASSIFICATION AND LABELLING OF CHEMICALS

GHZ = GIGAHERTZ

GI = GEOGRAPHICAL INDICATIONS

GI = GIBRALTAR

GI = GOVERNMENT ISSUE

GIANT CARTON = ГИГАНТСКИЙ КОРОБ – Giant Carton is a container comprising a large number of packages arranged in several layers.

GIBBERELLIN = ГИББЕРЕЛЛИНЫ – Gibberellin:- a group of plant hormones based on gibberellic acid produced by seeds, mosses, ferns, algae and fungi. Gibberellins stimulate synthesis of nucleic acids and proteins and promote cell elongation, meristematic growth at the root and shoot tips, mobilization of food reserves in seeds and other processes. Their absence results in the dwarfism of some plant varieties. These relatively expensive chemicals have been used commercially in the production of seedless grapes and navel oranges and in plant micropropagation from tissue culture and have been found to reverse the effects of some herbicides. Compare with auxins which inhibit root growth in high concentrations. Gibberellins are plant growth regulators responsible for cell elongation. / разведение или распространение (propagation). Под Гиббереллинами понимается группа гормонов Растений (фитогармонов). Стимулируют рост и развитие растений, способствуют прорастанию семян. По химической природе – дитерпеновые полициклические кислоты; известно свыше 60 гиббереллин, основная – гибберелловая кислота. Образуются также одним из видов микроскопических грибов, который используют для промышленного получения гиббереллин. Гиббереллины, ростовые вещества Растений. Известно 27 гиббереллин; все они принадлежат к тетрациклическим дитерпеноидам и являются карбоновыми кислотами. Основной структурной единицей гиббереллинов считается гиббереллин $ГК_9$ (I); остальные гиббереллины рассматриваются как его производные. Гиббереллины неустойчивы и быстро разрушаются в кислой или

щелочной среде. Наибольшей биологической активностью чаще обладает гиббереллловая кислота ($ГК_3$), отличающаяся от $ГК_9$ наличием гидроксилов у углеродов (отмечены стрелками) и двойной связью (II):- молярная масса 346.39, $t_{пл}$ 233–235 °C. Гиббереллины открыты Японским учёным Эйчи Куросава (Eiichi Kurosawa) в 1926 при исследовании болезни Риса (чрезмерном его росте), вызываемой Грибом Gibberella Fujikuroi Sow. В 1935 Японский учёный Тэйдьжиро Ябута (Teijiro Yabuta) выделил гиббереллины из этого Гриба в кристаллическом виде и дал им существующее название. У высших растений наиболее богаты гиббереллинами быстрорастущие ткани; они содержатся в незрелых семенах и плодах, проростках, развёртывающихся семядолях и листьях. Гиббереллины – компоненты системы, регулирующей рост растений. Гиббереллины ускоряют деление клеток в зоне, непосредственно примыкающей к верхушке стебля, и рост в фазе растяжения. Гиббереллины стимулируют рост (главным образом стеблей и черешков) сильнее ауксинов; при некоторых условиях они могут ускорять рост листьев, цветков и плодов. Гиббереллины стимулируют развитие растений, зависящее от температуры и фотопериода (смотрите Фотопериодизм), а в определённых условиях – цветение и завязывание плодов. Свет способствует образованию гиббереллин в растении. Отсутствие или избыток гиббереллин определяют некоторые патологические симптомы – карликовость или чрезмерный рост. Гиббереллины применяют в практике растениеводства для повышения выхода волокна Конопли и Льна, для увеличения размеров ягод у бессемейных сортов Винограда, ускорения плодоношения Томатов, для повышения урожайности трав, стимуляции прорастания семян (обработка гиббереллинами нарушает состояние покоя тканей и оказывает стратифицирующее действие на семена – смотрите Стратификация Семян; при естественном выходе семян из состояния покоя содержание эндогенных гиббереллин повышается) и другое. Так как гиббереллины вызывают резкое ускорение роста зелёной массы растений, применение их должно сопровождаться усилением питания растений. Гиббереллины получают главным образом микробиологическим способом из продуктов жизнедеятельности Грибов Рода Fusarium.

GIBBOUS = ВЫПУКЛОЕ (или ВЗДУТОЕ, или ВЫСТУПАЮЩЕЕ, или ГОРБАТОЕ, или ВЫДАЮЩЕЕСЯ) – Gibbous:- swollen on one side, usually near the base, to form a pouch or sack.

GIC = GUARANTEED INVESTMENT CONTRACT

GICP = GENERAL INFORMATION CONCERNING PATENTS

GICS = GLOBAL INDUSTRY CLASSIFICATION STANDARD

GIDA = GRUPO INTERNACIONAL PARA EL DESARROLLO AGRICOLA EN AMERICA LATINA = INTERNATIONAL GROUP FOR AGRICULTURAL DEVELOPMENT IN LATIN AMERICA

GIFFEN EFFECT = ЭФФЕКТ ГИФЭНА – Giffen Effect is an unusual situation in which an increase in the price of a good leads to an increase in the demand for that good. The Giffen effect is subject to a number of conditions:- (i) the good must be a basic staple; (ii) the buyers' income level must be very low, to the extent that a change in the price for the good will have a disproportionate effect on their purchasing power; and (iii) the poorer classes must live in a monetary economy and have no alternative sources for the staple, such as gardens for growing their own food. Sir Robert Giffen (1837–1910), an Scottish statistician and economist. / Сэр Робёт Гифэн (1837–1910), Шотландский статистик и экономист.

GIFT = ПОДАРОК (или ДАР) – In the United States in most cases, a Gift is a voluntary transfer of property without valuable consideration to the donor. However, under proposed legislation, for gifts made after 2002-December-20 a transfer of property for which the donor received an advantage will still be considered a gift for purposes of the Income Tax Act as long as we are satisfied that the transfer of property was made with the intention to make a gift. The existence of an advantage will not necessarily disqualify the transfer from being a gift if the amount of the advantage does not exceed 80% of the fair market value of the transferred property. For gifts made after 2002-December-20, it is the eligible amount of the gift that is used to calculate the donor's donation tax credit or deduction.

GIFT BOND = ПОДАРОЧНАЯ ОБЛИГАЦИЯ (или ДАРИМАЯ ОБЛИГАЦИЯ) – A Gift Bond is a savings bond or note that does not bear the name of the purchaser as owner or as either co-owner.

GIFT–IN–KIND = ПОДАРОК В ФОРМЕ МАТЕРИАЛЬНОЙ ЦЕННОСТИ – In the United States, Gifts-In-Kind also known as Non-Cash Gifts, are gifts of property. They cover items such as artwork, equipment, securities, and cultural and ecological property. A contribution of service, that is, of time, skills or efforts, is not property and, therefore, does not qualify as a gift or gift in kind for purposes of issuing official donation receipts. / или подарок в натуре (gift in kind).

GIGA– = ГИГА– – Giga- (G-) is a metric prefix denoting 10^9 or one billion (in the American meaning of the word billion). This prefix was coined from the Greek word gigas, meaning giant. The Greeks pronounced the word with a two hard g sounds, as in 'gig'. The prefix is sometimes pronounced with an initial soft g sound, as in 'jig'. Some dictionaries favor this choice, but the hard g pronunciation seems more common. / Под Гига, от Греческого слова Gigas, означающее Гигантский, понимается приставка для образования наименований десятичных кратных единиц, соответствующая множителю 10^9. Обозначение:- Г (G).

GIGAHERTZ = ГИГАГЕРЦ – GigaHertz (GHz) is a unit of frequency equal to 10^9 per second, or 1 per nanosecond. Cellular phones and microwave ovens operate with radio waves having frequencies in the GigaHertz range. See also Hertz.

GIGAJOULE = ГИГАДЖОУЛЬ – GigaJoule (GJ) is a metric unit of energy commonly used in the energy industry. One GigaJoule equals 947 817 Btu, 277.777 8 kiloWatt hours, or about 9.48 therms. See also Joule. One billion Joules, approximately equal to 948 211 British thermal units (Btus). One million Btus equals 1.054 617 5 GJ. / Один миллиард Джоулей, приблизительно равен 948 211 Британским единицам теплоты (Бет). Один миллион Британских единиц теплоты равен 1.054 617 5 ГигаДжоулю (ГДж). Под Гига, от Греческого слова Gigas, означающее Гигантский, понимается приставка для образования наименований десятичных кратных единиц, соответствующая множителю 10^9. Обозначение:- Г (G).

GIGAWATT = ГИГАВАТТ – GigaWatt (GW) is a metric unit of power equal to one billion (10^9) Watts or about 1.341 million horsepower. See also Watt. Gigawatt (GW) is one billion Watts. / Один миллиард Ватт. Под Гига, от Греческого слова Gigas, означающее Гигантский, понимается приставка для образования наименований десятичных кратных единиц, соответствующая множителю 10^9. Обозначение:- Г (G).

GIGAWATT HOUR = ГИГАВАТТ–ЧАС – GigaWatt hour (GW·h) is a metric unit of energy equal to one billion Watt hours, 3.6 teraJoules, or about 3.412 billion Btu. GigaWatthour (GWh) is one billion Watt-hours. / ГигаВатт-Час (ГВт·ч) – один миллиард Ватт-час. Под Гига, от Греческого слова Gigas, означающее Гигантский, понимается приставка для образования наименований десятичных кратных единиц, соответствующая множителю 10^9. Обозначение:- Г (G). КилоВатт-час является допускаемой к применению наравне в единицами СИ внесистемной единицей энергии или работы, применяемой преимущественно в

электротехнике. Обозначение:- кВт·ч. 1 кВт·ч = $3.6 \cdot 10^6$ Дж = 3.6 МДж. Ватт-Час является внесистемной единицей работы и энергии. Обозначение:- Вт·ч. 1 Вт·ч = 3 600 Дж.

GIGGING = ВОРСОВКА – Gigging:- to raise the nap of fabric. See also Napping. Gig, also called Gig Mill, is a roller containing teasels, used for raising nap on a fabric. / Ворсовка ворсовальными шишками. Смотрите также Ворсование (Napping).

GILGUY = ГИЛГАЙ (или ПРИБАМБАС) – Gilguy (or Gadget) (maritime term):- a term used to designate an object for which the correct name has been forgotten.

GILLIE = ГИЛЫ (или СЛУГА, или ПОМОЩНИК ОХОТНИКА) – Gillie:- a shoe with a low top and decorative lacing. / Ghillie = полуботинок с настроченными петлями в области подъёма для продёргивания шнурков.

GILLING = ОПЕРАЦИЯ ОБРАБОТКИ ГРЕБЕННОЙ ШЕРСТИ НА ЛЕНТОЧНЫХ ГРЕБЕННЫХ МАШИНАХ – Gilling is a commercial process called 'Pin Drafting' used to produce top fibers. See also Pin Drafting. / игольное вытягивание .

GILT = ГИЛТ (или ПОЗОЛОТА, или ОБЛИГАЦИЯ) – Gilts are the bonds issued or guaranteed by the UK Government. Also known as British Government Securities or Giltedged Securities. Bonds issued or guaranteed by the UK Government. Also known as British Government Securities and Gilt-Edged Securities. All UK Gilts are tax free to non-residents on application. Closing mid-prices are shown in Pounds per 100 Pounds nominal of stock. Gilt is a common term for fixed interest securities such as gilt edged securities or index linked securities issued by the United Kingdom Government. The Bank Of England run a Central Gilts Office (CGO) – book entry transfer system for gilts. Also known as Government Bond in the United Kingdom. Gilt is the short for Gilt-Edged Security, a debt security issued by the British Government that pays regular coupons. / Известны также как Правительственные Облигации в Соединённом Королевстве. Гилты – золотообрезные облигации Правительства Великобритании. Считается, что, как и облигации Казначейства США, золотообрезные облигации не несут риска невыполнения обязательств. Следовательно, доход от инвестирования в золотообрезные облигации гарантирован. Доходность этих облигаций является базой для определения доходности всех других облигаций, выпускаемых в Великобритании. Фьючерсы на золотообрезные облигации продаются на Лондонской Международной Бирже Финансовых Фьючерсов (London International Financial Futures Exchange). Название 'золотообрезные' облигации получили от сертификатов Британского Правительства, имевших золотой рант.

GILT EDGE = ОКАЙМЛЁННЫЕ ПОЗОЛОТОЙ (или ОБРАМЛЁННЫЕ ПОЗОЛОТОЙ, или ПОЗОЛОЧЕННЫЕ ПО КРАЯМ) – Gilt Edge:- bonds which are rated Aaa are judged to be of the best quality. They carry the smallest degree of investment risk and are generally referred to as Gilt Edge. Interest payments are protected by a large or by an exceptionally stable margin and principal is secure. While the various protective elements are likely to change, such changes as can be visualized are most unlikely to impair the fundamentally strong position of such issues.

GILT–EDGED BONDS = ОКАЙМЛЁННЫЕ ПОЗОЛОТОЙ (или ОБРАМЛЁННЫЕ ПОЗОЛОТОЙ, или ПОЗОЛОЧЕННЫЕ ПО КРАЯМ) ОБЛИГАЦИИ – Gilt-Edged Bond is a high-grade bond issued by a company that has demonstrated its ability to earn a comfortable profit over a period of years and pay its bondholders their interest without interruption. Highly rated bonds whose issuers have long-standing reputations for paying interest on time. In the United States, bonds issued by companies with a good reputation for dividend payment and with a good profit record. See also Consols. / Высококлассная облигация, выпущенная компанией, которая в течение некоторого количества лет демонстрировала свою способность зарабатывать приличные доходы и выплачивать владельцам своих облигаций их проценты без нарушений. Высоко оцениваемые облигации, эмитенты которых в течение длительного периода времени сохраняют репутацию своевременных плательщиков процентов. В Соединённых Штатах Америки облигации, выпущенные компаниями с хорошей репутацией для оплаты дивидендов и с прописанной хорошей прибылью. Смотрите также Консоли (Consols).

GILT–EDGED SECURITY = ОКАЙМЛЁННАЯ ПОЗОЛОТОЙ (или ОБРАМЛЁННАЯ ПОЗОЛОТОЙ, или ПОЗОЛОЧЕННАЯ ПО КРАЯМ) ЦЕННАЯ БУМАГА – In the United Kingdom, Gilt-Edged Security is a security that carries little or no risk, in particular, government-issued stocks, known as Gilt for short.

GIM = GOVERNMENT INSTRUMENT MARKET

GIMP = ПОЗУМЕНТ (или КАНИТЕЛЬ, или ГИПЮР) – Gimp is an edging often with small scallops of fine cord along its edges. Gimp was originally designed to hide upholstery tacks on chairs and sofas, but now is used for other decorative purposes. / Гипюр – кружева из хлопчатобумажной пряжи и шёлка с рельефным рисунком на прозрачном фоне.

GIN = ВОЛОКНООТДЕЛИТЕЛЬ (или ДЖИН) – (1) Gin is a machine used to separate the Cotton seed from the lint. The colonists had the ability to produce much Cotton but were restricted by the mechanical know-how. It was Samuel Slater, an English mill worker, who changed this by migrating to America in 1790 and building the first American Cotton mill from memory. With the development of the Cotton mill, Eli Whitney saw the need for a faster means of removing the lint (Cotton fibers) from the seed. In 1793, he invented a machine known as the Cotton Gin. This invention revolutionized the way lint was separated from the seed. Up to that time, for centuries, the separation process had all been done by hand. With Whitney's gin, short for the word engine, lint volume was increased for each worker from 1 lb to 50 lb per day. Gin is a machine that separates Cotton lint from seed and removes most of the trash and foreign matter from the lint. The lint is cleaned, dried, and compressed into bales weighing approximately 500 pounds, including wrapping and ties. There are about 2 000 gins located throughout the Cotton Belt in the United States. The term also is loosely used to include the entire facility involved in drying, cleaning, ginning, and baling of the lint. Two basic types of gins are used in modern Cotton processing, the roller gin and saw gin. Extra-long staple Cotton is ginned with roller gins while most upland Cotton is ginned with saw gins. Following pre-cleaning comes the ginning and lint cleaning processes. At the 'gin feeder', the seed Cotton is separated so that single locks of seed Cotton are fed into and through the 'gin stand'. The gin stand takes seed Cotton and separates it into lint (Cotton fiber, a raw agricultural feedstock) and cottonseed (a raw agricultural commodity with several uses). The lint cleaner provides the first opportunity for combing and precision cleaning of the Cotton fiber and separates the foreign material into a separate process stream of by-products called Motes. After ginning and lint cleaning, the combed lint is pneumatically conveyed to a 'condenser', which forms the cotton lint into a 'batt' and then meters and feeds the stream of batted lint down a 'lint slide' into the bale press. The function of the bale press is to produce uniform, compact, densely-packed bales of cotton lint that go to warehouses for storage or directly to textile mills for processing into apparel, home furnishings and other textiles. The bale of lint is the first form of cotton lint that has any market value to a cotton producer and subsequently to other handlers of the crop. Prior to the ginning and subsequent baling of the lint cotton, there is no marketable commodity that exists. Following ginning, lint cleaning and baling there exists marketable commodities of cotton lint, cottonseed, mote and cotton by-products (foreign material). The word Gin is apparently a corruption of the word Engine. Full name is Cotton Engine. See also Roller Gin, and Saw Gin. Machinery that separates raw cotton from trash, separates the fiber from seed, and presses the lint into bales. There are two ginning technologies:- saw ginning and roller ginning. Gin is the machine used to separate cotton fibers from the seed. / Сэмьюэл Слэйтё (Samuel Slater). Илай Витни (Eli Whitney). Оборудование, отделяющее различные

виды сора из хлопка-сырца и волокно от семени, а затем прессующее это волокно в кипы. Существуют две технологии джинирования:- пильное джинирование и валичное джинирование. Волокноотделитель или Джин, машина для отделения волокон хлопка от семян. Принцип волокноотделения основан на том, что прочность прикрепления волокон хлопка к семени в 2–4 раза меньше прочности самих волокон. Различают валичные и пильные волокноотделители. Валичные волокноотделители работают по методу зажима пучка волокон и отрыва его от семени валиками. Валичными волокноотделителями пользуются при обработке слабо опушённых семян с длинными и нежными, сравнительно легко отделяемыми волокнами (современные длинноволокнистые или длинноштапельковые или тонковолокнистые Хлопчатники). В пильных волокноотделителях прядка волокон в её средней части захватывается зубьями дисковой пилы и отрывается от семени протаскиванием сквозь щель. Они применяются для сильно опушённых семян с прочно прикреплёнными волокнами (современные средневолокнистые хлопки). Хлопок с валичных волокноотделителей – напоминает руно, состоящее из плотных прядок; хлопок с пильных волокноотделителей – рыхлый и пушистый. Волокноотделитель (или Джин):- машина для отделения хлопкового волокна от семян (смотрите Хлопок). Имеются волокноотделители пильные и валичные. В пильных волокноотделителях прядка волокон в её средней части захватывается зубом пилы и отрывается от семени протаскиванием сквозь щель; они применяются для сильно опушённых семян с прочно прикреплёнными волокнами (Советские средневолокнистые хлопки). Валичные волокноотделители работают по методу зажима пучка волокон и отрыва его от семени; валичными волокноотделителями пользуются при обработке слабоопушённых семян с длинными и нежными, сравнительно легко отделяемыми волокнами (Советские тонковолокнистые Хлопки). Хлопок с пильных волокноотделителей – рыхлый и пушистый, с валичных – напоминает руно, состоящее из плотных прядок. Волокноотделитель Churka, происхождение которого не установлено, состоял из двух валов, которые вращались вместе с одинаковой поверхностной скоростью, отщипывая волокно от семян и производя примерно 1 килограмм (кг) хлопкового волокна в сутки. Приблизительно 80 миллионов кип хлопка производится ежегодно во всем мире, 20 миллионов из которых производится примерно 1 300 волокноотделителями в Соединённых Штатах. Основной функцией волокноотделителя является отделение хлопкового волокна от семени, но также волокноотделитель должен быть снабжён оборудованием для удаления из хлопка большого процентного содержания инородного вещества, которое значительно снижает ценность джинированного хлопкового пуха. Оператор волокноотделителя должен преследовать две цели:- (1) произвести хлопковое волокно, качественно удовлетворяющее требованиям фермерского рынка, и (2) джинировать хлопок-сырец с минимальными потерями в прядильных качествах волокна для того, чтобы хлопок соответствовал требованиям его конечных пользователей, оператора прядильной машины и потребителя. Соответственным образом сохранение хорошего качества хлопка во время джинирования предполагает надлежащий отбор и функционирование каждой из машин, которые входят в систему джинирования хлопка-сырца. Механическая обработка и сушка могут изменить природные качественные характеристики хлопка. В лучшем случае оператор волокноотделителя может лишь защитить качественные характеристики, присущие хлопку, при его подаче в волокноотделитель. Широко используются два типа волокноотделителей – пильный и валичный. В 1794 Илай Витни (Eli Whitney) изобрёл волокноотделитель, который отделял волокно от семени посредством шипов или пил на цилиндре. В 1796 Хэнри Огдэн Холмз (Henry Ogden Holmes) изобрёл волокноотделитель, снабжённый пилами и рёбрами, который заменил волокноотделитель Витни и превратил процесс джинирования из группового технологического процесса в непрерывно-поточный. Хлопок (обычно Gossypium hirsutum) поступает на стойку пильного волокноотделителя через переднюю шелушильную панель. Пилы схватывают хлопок и протягивают через широко расставленные рёбра, известные в качестве шелушильных рёбер. Пучки хлопка протягиваются от шелушильных рёбер в основание валичной камеры. Настоящая операция джинирования осуществляется именно в валичной камере стойки для джинирования. Джинирование производится набором пил, вращающихся между ребрами волокноотделителя. Зубья пилы проходят между рёбрами в точке джинирования. Здесь передняя кромка зуба пилы приблизительно параллельна ребру, и зубья вытягивают волокна из семян, которые слишком велики, чтобы пройти между рёбрами. Интенсивность джинирования, превышающая рекомендованную производителем оборудования, может нанести ущерб качеству волокна, повредить семена и привести к забивке машины. Современные Советские хлопкоуборочные машины имеют вертикально расположенный вращающийся вал, который захватывает волокна вместе с семенами и вытаскивает их из коробочек. Волокно щётками счищается с вала, отделяется от семян и всасывается в сборник. В давние времена хлопок очищали и волокна отделяли вручную (производительность 500 граммов (г) в день на человека), но в конце XVIII века появились волокноотделители, с помощью которых сейчас очищается большая часть хлопка-сырца. Хлопок движется по колосниковой решётке с расположенными на ней пилами. Они захватывают волокна и протягивают через решётку, в процессе чего зерна отрываются. Очищенный хлопок прессуется в кипы, которые затем должны быть помещены в оболочку, чтобы предотвратить их загрязнение при транспортировке и хранении. Производятся кипы трёх типов:- модифицированные плоские, сжатые с универсальной плотностью и джинированные с универсальной плотностью. Эти кипы пакуются при плотностях величиной в 224 и 449 кг/м^3 для модифицированных плоских и универсальной плотности кип соответственно. В большинстве волокноотделителей хлопок пакуется в так называемом прессе двойного уплотнения, где сначала механический либо гидравлический трамбовщик сжимает хлопок в спрессованный короб; затем посредством вращения данный короб подвергается дальнейшему уплотнению при плотности приблизительно 320 или 641 кг/м^3 для модифицированных плоских или джинированных универсальной плотности спрессованных масс соответственно. В конце 1950-х усилиями US Department of Agriculture (USDA) Agricultural Research Service с Southwestern Cotton Ginning Research Laboratory, Северо-Американских производителей волокноотделителей и частных хлопкоочистительных заводов был разработан валичный волокноотделитель с вращающимся ножом. Этот валичный волокноотделитель в настоящее время является единственным представителем своего типа, используемым в Соединённых Штатах Америки. Изначально производство тканей было ручным промыслом, которым занимались надомные прядильщики и ткачи, а также небольшие группы квалифицированных ремесленников. В процессе технологического развития возникли большие и экономически важные предприятия, в первую очередь в Великобритании и Западно-Европейских странах. Ранние поселенцы в Северной Америке принесли с собой фабрики по производству тканей в Новую Англию (Сэмьюэл Слэйтё (Samuel Slater), ранее бывший супервайзером на фабрике в Англии, по памяти собрал прядильную машину в Провиденс, Род Айлэнд, в 1790); а изобретение Илаем Витни (Eli Whitney) волокноотделителя, который мог очищать собранный хлопок с большой скоростью, привело к росту спроса на хлопчатобумажные ткани. В хлопке-сырце содержится 28–33% волокна различной длины и 67–72% семян. Отделение волокна от семян производится на хлопкоочистительных заводах при помощи так называемых волокноотделителей. При этой обработке с семян снимают длинное (20–35 мм) волокно, которое используется для переработки в текстильной промышленности. Оставшиеся более короткие (8–22 мм) волокна хлопка отделяются от семян на машинах, называемых пухоотделителями.

(2) Gin is a plant or facility where cotton lint is compressed into bales. Also known as Ginnery. / Волокноотделитель (или Джин):- завод или установка, где хлопковое волокно прессуется в кипы. Известен также как Хлопкоочистительное Предприятие или Предприятие По Волокноотделению (Ginnery).

GIN BALE = КИПА ДЖИНА – Gin Bale is the low density bale of cotton made at a gin. Its average density is about twelve pounds per cubic foot, weight about 500 pounds, and dimensions about 27 x 54 x 45 inches. Also called flat bale, box bale, square bale. See also Bale. Смотрите также Кипа (Bale).

GIN CUT = СЪЁМ ВОЛОКНООТДЕЛИТЕЛЯ (или ДЖИНОВЫЙ СЪЁМ) – Gin Cut:- Cotton in which some of the fibers have been cut by the saws of the gin. This reduces the value of the cotton considerably as it increases the per cent of short fibers present and the waste in processing. Often caused by ginning cotton that is not dry. See also Gin. / Смотрите также Волокноотделитель или Джин (Gin).

GIN FALL = ОТХОДЫ ДЖИНИРОВАНИЯ (или ОТХОДЫ ВОЛОКНООТДЕЛЕНИЯ) – Gin Fall:- trash and other sort of waste remaining in cotton lint after it has been ginned. See also Gin. / Сор и иные разновидности отходов, остающиеся в хлопковом волокне после его джинирования. Смотрите также Волокноотделитель или Джин (Gin).

GIN = ВОЛОКНООТДЕЛИТЕЛЬ (или ДЖИН)

GINGER = ИМБИРНОЕ (или ИМБИРЬ, или XX) – Ginger:- a strong brown.

GINGHAM = ГИНГАМ (или ПЁСТРОТКАНОЕ РУБАШЕЧНОЕ ПОЛОТНО) – Gingham is a printed or dyed fabric that is known for its checked patterns of white and a bold color. The size of the checks can vary, and although it typically is found with the checks appearing in horizontal rows and vertical columns, the checks also can appear to be arranged diagonally. Originally, this fabric was intended to be woven into stripes. Its name comes from the word Genggang, which means ‘striped’ in the Malay language spoken in places such as Malaysia and Indonesia, where it is believed to have originated. History:- This fabric dates to at least the XVII century, when it was imported to Europe and later to the American colonies. Its production was a major economic boon in many places, including Manchester, England, and the colonies in what is now the southeastern United States. Originally, two differently colored fibers were used to produce a striping effect. As time passed, gingham fabrics began to appear with a checked pattern, as well as plaids. Blue and white was the color combination of choice for many years, although it can now be found in virtually any bold color paired with white. Manufacturing:- Gingham is produced in cotton, synthetic fiber blends and even man-made olefin fibers. The appearance of gingham, especially when made as an all-cotton fabric, is that of a flat luster. Many manufactures will treat the fabric to make it resistant to wrinkles because it normally tends to wrinkle very easily. It is, however, a midweave fabric that wears well and is easy to clean. Uses:- this fabric is used in many applications. Gingham curtains are found in many kitchens, and gingham handkerchiefs are found in many back pockets. It is a favorite for lightweight shirts and blouses, as well as summer dresses for women. Many barbecue aprons are made with gingham checks, and even pajamas and bedspreads can be created with this fabric. Gingham typically is considered to provide a youthful, whimsical or relaxed feel. This might be because it frequently is used in children’s clothing and décor, or that feel might be why it is used for those purposes. It can be found virtually anywhere, but it most often is found in informal settings. As a lightweight and easy-to-clean fabric option, it is considered to be a great choice for many household linens as well as comfortable clothing. Gingham is a medium weight, plain weave fabric with a plaid or check pattern. End-uses include dresses, shirts, and curtains. Gingham:- cotton, man-made, and synthetics. Word derived from Italy ‘Ging-gang’ meaning ‘Striped’. Medium or fine yarns of varying quality are used to obtain the checks, plaids, stripes, and plain effects. The cloth is yarn dyed or printed. The warp and the filling are usually balanced and if checks of two colors, usually same sequence in both the warp and the filling. It is strong, substantial, and serviceable. It launders well but low textured, cheap fabric may shrink considerably unless preshrunk. Has a soft, dull luster surface. Wrinkles unless wrinkle-resistant. Tissue or zephyr ginghams are sheer being woven with finer yarns and a higher thread count. Gingham is a woven fabric characterized by a block or check effect produced by weaving in dyed yarns at fixed intervals in both the warp and the filling. Gingham (common) is a single cloth composed entirely of cotton and always woven with a plain weave; it is the most universally known fabric on the market and is made in various grades, having from 50 to 76 ends per inch in the reed and at 1/26’s to 1/40’s cotton yarns in both-warp and filling. The name is Indonesian in origin, assimilated into Dutch (Vichy in French). When originally imported (in the XVII century), it was a striped fabric, but from the mid XVIII century, when it was being produced in the mills of Manchester, England, it had become woven into checked or plaid patterns (often blue and white). It is a wash fabric, made in both check and plaid patterns, into which an almost unlimited variety of color combinations are introduced. It is most commonly used In the manufacture of ladies’ and children’s apron and summer outing dresses. It can be woven in any power loom having a box motion attached; roller loom, using four harness or heddle shafts, and having as a selvage eight double ends on each side. Gingham warps are made in two lengths, 720 yards and 1 080 yards, and these lengths being subdivided into shorter lengths or cuts, usually 14 and 21, respectively. When a gingham warp is woven out the set of harnesses or noddies, it is taken out of the loom, and is placed in a twisting frame and twisted, an operation which means the fastening together, by means of the fingers, of those ends remaining in the set of harness, and those of the new warp. Gingham is a fabric made from dyed cotton yarn that forms a checkered pattern with white yarns. Standard construction of the gray fabric in Taiwan:- 40’s x 40’s, 110 x 70 threads per inch, 58/60”, yarn dyed. / Геньгэнь (Genggang). Основа и уточина . Обычно полосатая или клетчатая хлопчатобумажная или льняная ткань.

GINGHAM CHECK = КЛЕТКА ГИНГАМ – Gingham Check is a regular check in which the design is woven so that, in a red and white checked gingham, for example, there are squares of solid red, squares of solid white, and squares of white warp and red filling, as well as squares with red warp and white filling. Gingham checks are also printed on woven and knitted fabrics, and are knitted into some fabrics by means of a Jacquard attachment. / из белой основыи и красной уточины, а также как . Жакяр (Jacquard).

GIN MOTES = КОМОЧКИ ОТ ВОЛОКНООТДЕЛЕНИЯ (или ОРЕШЕК ОТ ДЖИНИРОВАНИЯ, или (ВОЛОКНИСТЫЙ) УЛЮК ОТ ДЖИНИРОВАНИЯ) – Gin Motes are small, broken, or immature seeds with attached fibers. The gin removes the motes at a different stage from the mature, whole seeds. As is well known, Gin Motes are produced as the waste product of cotton gins and contain cotton fiber, trash, undeveloped cotton seeds, broken bolls, leaf, dust, dirt. Prior to the widespread use of machines for picking cotton, when it was common practice to pick cotton by hand, the cotton arriving at the gin was relatively free from trash. However, machine-picked cotton contains a comparatively larger amount of trash, stems, leaves, broken bolls, etc. Thus, the cotton gins in use today for processing machine-picked cotton are designed to remove considerably more trash than in the past. However, this also results in the removal of a larger proportion of valuable fibers along with the trash. The percentage of cotton fiber in today’s gin motes may normally range from approximately 55% to about 70%. However, the cotton fibers contained in the gin motes vary significantly in length and range from extremely short non-spinnable linter fibers to conventional cotton staple lengths. While gin motes have been employed to some extent in the production of nonwoven battings and in the production of very coarse yarns such as mop yarns (which generally fall within the range of about 0.5 to about 2 cotton count), because of the high variation in fiber length (Coefficient of Variation) and the presence of a substantial proportion of short non-spinnable fibers, as well as the large amount of trash, gin motes have little commercial value. Thus, gin motes are normally regarded as waste and disposed of by the cotton gins. Because of increasingly stringent government pollution standards, the cotton gins are being forced to stop burning gin motes as has been the conventional practice. Thus, uncleaned or raw gin motes are available in increasingly large quantities from the cotton gins at a very low cost. The cotton fibers contained in the gin motes range in length from the normal cotton staple length of the cotton processed at the gin (e.g.,

about 7/8” to 31/32” (or 31/32” to 1” or 1 inch to 1 1/4 inches)) to short non-spinnable dust-like fibers or linters. The gin motes, after cleaning and carding, contain a large number of long fibers of spinnable length, but also contain a substantial proportion of short non-spinnable fibers. The coefficient of variation (CV) in fiber length of cleaned and carded gin motes may normally range from about 45% to about 60%. By way of comparison, the coefficient of variation (CV) for normal cotton is usually about 30% to 32%. Cotton fiber of a high CV containing a considerable amount of short fiber spins into uneven yarn. This type of stock is uncontrollable both in ring spinning and in preparatory processing such as drawing for ring or open-end spinning. Gin Motes are the short fragments of unmanufactured cotton fiber removed from lint cleaners after ginning cotton. This is the waste obtained from ginning mills during ginning process of raw cotton. This includes all types of gin motes such as uncleaned motes, incline cleaner processed motes, and motes processed through one or more lint cleaners. The quality of gin motes varies according to the type of cleaning and weather conditions during cotton picking. See also Motes.

GINNERY = ХЛОПКООЧИСТИТЕЛЬНОЕ ПРЕДПРИЯТИЕ (или ПРЕДПРИЯТИЕ ПО ВОЛОКНООТДЕЛЕНИЮ) – Ginnery is the term used to include the entire facility involved in drying, cleaning, ginning, and baling of the lint. Ginnery is a mill for ginning cotton. Cotton gins are used to separate cotton fiber from the seed and waste. / Хлопкоочистительное Предприятие – компания, занимающаяся очисткой хлопка-сырца на своих джинах. Последовательность операций на хлопкоочистительном предприятии бывшего Союза Советских Социалистических Республик (СССР):- первоначально собранный на полях хлопок-сырец завозился на хлопкозаготовительный пункт (cotton procurement center), оснащённый лабораторией для оперативной оценки качества принимаемого от фермеров и хранящегося хлопка-сырца, весами для взвешивания хлопка-сырца, бунтовыми площадками, навесами и крытыми хранилищами. Из заготовительного пункта непосредственно на перерабатывающее предприятие завозился хлопок-сырец. Традиционно в странах бывшего СССР хранение хлопка-сырца на хлопкозаводе производилось путём его складирования в бунты (stacks), представляющие собой утрамбованную массу хлопка-сырца на специальных открытых площадках. Для защиты от климатических воздействий (дождь, град, снег) полностью сформированные бунты укрывали брезентом. Из разбираемых бунтов хлопок-сырец с помощью пневмотранспорта, в состав которого входили также вакуум клапан и уловитель посторонних тяжёлых примесей, направлялся в сепаратор, расположенный на площадке над питателем сушильной установки. Теплоснабжение сушильной установки обеспечивалось теплогенератором, работавшем как на жидком, так и на газообразном топливе. Высушенный хлопок-сырец влажностью 7–8% подавался на очистители крупного и мелкого сора. Очистительный эффект каждого очистителя в зависимости от засорённости сырья составлял порядка 70%. После очистки хлопок-сырец пневмотранспортом подавался на распределительный шнек батареи, например, из двух 118-пильных джинов. Снятое джинами волокно вместе с воздухом транспортировалось через соединительный патрубок в аэродинамический волокноочиститель, а затем – в пильный волокноочиститель, на которых производлась его очистка от сорных примесей и пороков. Производительность современных джинов составляет порядка 1 000 килограммов (кг) волокна в час при очистительном эффекте после волокноочистки 30–40%. После очистки волокно по сборному волокноотводу направлялось в конденсор, откуда в виде уплотнённого холста поступало по лотку в ящик пресса. Для пакетирования хлопкового волокна использовался пресс с гидравлической трамбовкой, обеспечивавший выпуск кип весом в среднем 220–230 кг. Для улучшения товарного вида кип и недопущения появления дефектов при транспортировке, их упаковка производилась с применением ПЭТ-ленты и ПЭ-мягких контейнеров из прочных современных полимерных материалов. Семена из джинов попадали в сборный шнек и через систему внутрицехового механического транспорта поступали на линтерование в батарею, например, из 6 линтерных агрегатов. Выработанный линт, направлялся в конденсор, а затем с помощью пресса пакетировался в кипы. С учётом предъявляемых высоких требований к качеству хлопковой продукции со стороны прядильщиков, на многих хлопкозаводах в настоящее время внедряется система управления качеством в соответствии с требованиями международного стандарта ISO 9001.

GINNIE MAE® = GOVERNMENT NATIONAL MORTGAGE ASSOCIATION

GINNIE MAE® = ДЬЖИНИ МЭЙ® – Pass-through mortgage-backed certificates guaranteed by the Government National Mortgage Association (GNMA or Ginnie Mae®). The certificates are backed by pools of the Federal Home Administration (FHA) insured and/or Veteran’s Administration (VA) guaranteed residential mortgages, with the mortgage and not held in safekeeping by a custodial financial institution. Also known as GNMA Certificates, or GNMAs. Ginnie Mae® is a registered service mark of the US Government National Mortgage Association. See also Government National Mortgage Association. In 1934, during the depths of the Depression, Congress passed the National Housing Act to strengthen a deeply troubled housing market. An important element of this legislation was to make mortgage funds available to more Americans by protecting lenders from the risk of default. In 1938, Congress amended the act to create the Federal National Mortgage Association – an entity designed to help mortgage lenders gain access to capital for mortgage loans. The provisions of the act changed gradually over the years until, in 1968, Congress established the Government National Mortgage Association, commonly known as Ginnie Mae®, as a government-owned corporation within the Department of Housing and Urban Development (HUD). Today, Ginnie Mae® securities are the only mortgage-backed securities that offer the full faith and credit guaranty of the United States government. In its earliest days, housing finance was a fragmented, inefficient and illiquid market, with mortgage rates varying considerably from region to region, and some locations having practically no funds available at all. This was a direct consequence of the near impossibility of selling individual mortgages on the secondary market. Lending institutions would issue a mortgage, collect payments, and file the mortgage away until the principal was paid off. The problem:- a lack of available, consistently priced capital put a ceiling on the number of new mortgages that could be issued. Ginnie Mae® solved this problem and revolutionized the American housing industry in 1970 by pioneering the issuance of mortgage-backed securities. Today, lenders pool packages of qualifying Federal Housing Administration (FHA), the Veterans Administration (VA), Department of Agriculture’s Rural Housing Service (RHS) or the Department of Housing and Urban Development’s Office of Public and Indian Housing (PIH) mortgages and convert them into securities. Ginnie Mae guarantees investors the timely payment of principal and interest on these securities. In a single step, the issuance of Ginnie Mae® mortgage-backed securities converts individual mortgages into safe, liquid securities for investors around the world. Ginnie Mae® thus helps channel global capital into American housing markets, helping make more mortgages available. Ginnie Mae’s programs continue to develop and evolve. Over the years, we have guaranteed more than USD2.8 trillion (overall, USD2.7 trillion for Single Family alone (2011)) in mortgage-backed securities, helping more than 35 million households in America gain access to affordable housing. The Government National Mortgage Association (GNMA) is a government agency within the Department of Housing and Urban Development that, among other things, guarantees payment on mortgage-backed certificates. Government-owned corporation, nicknamed Ginnie Mae®, which is an agency of the US Department of Housing and Urban Development. GNMA guarantees, with the full faith and credit of the US Government, full and timely payment of all monthly principal and interest payments on the mortgage-backed Pass-Through Securities of registered holders. The securities, which are issued by private firms, such as Mortgage Bankers and savings institutions, and typically marketed through security broker-dealers, represent pools of residential mortgages insured or guaranteed by the Federal Housing Administration (FHA), the Farmer’s Home Administration (FmHA), or the Veterans Administration (VA). / (Дьжи.Эн.Эм.Эй. (GNMA) или Дьжини Мэй® (Ginnie Mae®)).

GINNIE MAE® PLATINUM SECURITIES = ПЛАТИНОВЫЕ ЦЕННЫЕ БУМАГИ ДЬЖИНИ МЭЙ® – Ginnie Mae® Platinum Securities provide investors with greater operating efficiency, allowing holders of multiple Mortgage-Backed Securities to combine them into a single platinum certificate. The Ginnie Mae® Platinum Securities can be used in structured finance transactions, repurchase transactions as well as general trading. See also Government National Mortgage Association, Mortgage-Backed Securities, and Real Estate Investment Conduit. / , операции по откупу, впрочем как и обычная торговля.

GINNING = ВОЛОКНООТДЕЛЕНИЕ (или ДЖИНИРОВАНИЕ) – Ginning, in its strictest sense, is the process of separating cotton fibers from the seeds which is what Eli Whitney's invention of the cotton gin accomplished in 1794. But today's modem cotton gin is required to do much more. To convert mechanically harvested cotton into a marketable product, gins have to dry and clean (remove plant parts and field trash) from the seed Cotton, separate the fiber from the seed, further clean the fibers and place the fiber into an acceptable package, while preserving the quality of the fiber. American Upland cotton is saw ginned, which is a process different from roller ginning used for American Pima Cotton. Saw gin stands can operate at capacities as high as 12 (480 lb) bales per hour. The saw gin removes the fiber from the Cotton seeds using a cylinder that has saw teeth around its circumference. There are approximately 1 600 gins located throughout the Cotton Belt. In the United States, roller ginning is limited to the areas of West Texas, New Mexico, Arizona and California that produce Pima Cotton. The process of separating cotton lint from the seed. The term also implies the other processes entained in producing a gin bale. See also Roller Ginning. The Cotton Ginning process is analogous to other types of seasonal harvesting processes that produce raw agricultural products. Typical cotton gins operate in mostly rural areas for one to two months per year. On rare occasions when cotton production exceeds expectations, the ginning season may last for four or more months. This is followed by a repair period when maintenance is performed in preparation for the next ginning season. The products of the ginning process are:- (i) cotton bales and mote bales; (ii) cottonseed that is conveyed to a separate holding facility from the gin plant; and (iii) gin by-products (cotton burrs, sticks, stems, sand and dirt, and similar trash) that also are conveyed away from the gin plant (burrs, sticks and other gin by-products are conveyed away from gin buildings and stored either in hopper bottomed storage houses or in large piles until they can be removed. Burrs and other gin by-products may be composted, fed as roughage to cattle or hauled and dumped back on farms or pasture land. Gin motes are considered a by-product that is typically separated and sold for various uses such as batting/felt or in waste spinning to make low grade fabrics or mops). There are two ginning technologies:- saw ginning and roller ginning. Cotton Ginning is seasonal. It begins with the maturing of the cotton crop, which varies by region, and ends when the crop is finished. Each year the cotton ginning season starts in the lower Southwest region in midsummer, continues through the south central and other geographical regions in late summer and early autumn, and ends in the upper Southwest region in late autumn and early winter. Overall, US cotton is ginned between October 01 and December 31, with the bulk of the crop from each geographical region being ginned in 6 to 8 weeks. During the remainder of the year, the gin is idle. All US cotton in commercial production is now harvested by machines of two types, picking and stripping. Machine-picked cotton accounts normally for 70 to 80 percent of the total cotton harvested, while the rest is machine stripped. Machine picking differs from machine stripping mainly in the method by which the cotton lint and seed are removed from the plant. Machine picking is done by a spindle picker machine that selectively separates the exposed seed cotton from the open capsules, or bolls. In contrast, the mechanical stripper removes the entire capsule, with lint plus bract, leaf, and stem components in the harvested material. Strippers collect up to six times more leaves, burs, sticks, and trash than the spindle picker machines. This higher ratio of trash to lint requires additional equipment for cleaning and trash extraction. Stripper-harvested cotton may produce 1 000 pounds of trash per 500-pound bale of lint, compared to 150 pounds of trash per 500-pound bale from spindle picking. The modular system of seed cotton storage and handling has been rapidly adopted. This system stores seed cotton in the field after harvesting until the gin is ready to process it. Modules can also be transported longer distances, allowing gins to increase productivity. In 1994, 78 percent of the US crop was handled in modules. Ginning is the mechanical process that removes the cotton fibers from the seed. Ginning:- specif., the process of separating the lint cotton from the seed, but usually extended to cover other processes involved in turning out a gin bale. / Илай Витни (Eli Whitney). и (iii) побочные продукты джинирования (gin by-products), такие как створки коробочки Хлопчатника (cotton burs или burrs), черешки листьев (sticks), стебли (stems), песок и грязь, и аналогичный сор. плюс компоненты прицветничка, листьев и стеблей в собранном материале. Процесс отделения волокон от семян с помощью волокноотделительной установки (джина). Одну треть веса хлопка-сырца составляет хлопковое волокно, а остальные две трети – составляют семена и другие инородные примеси.

GINNING OUTTURN = ВЫХОД ПО ВОЛОКНООТДЕЛЕНИИ (или ВЫХОД ПО ДЖИНИРОВАНИИ) – Ginning Outturn is a percentage of lint received following ginning of a cotton lot. Expressed in terms of the weight of the seed cotton, the average for American bales is around 35 per cent. The span may run from 20 per cent to 50 per cent. The ratio of lint to seed cotton produced by the ginning process. Ginning Outturn is the amount of lint received after ginning a lot of cotton, expressed as per cent of the weight of seed cotton. It ranges from 20% to 50%, but averages about 35% for American Cotton. / Соотношение волокна, производимого в процессе волокноотделения (или джинирования), с хлопком-сырцом.

GIN STAND = ВОЛОКНООТДЕЛИТЕЛЬНАЯ УСТАНОВКА – Gin Stand is the heart of the ginning plant where gin saws (usually several in parallel) separate the cotton lint from the seeds.

GIN TRASH = СОР ОТ ВОЛОКНООТДЕЛЕНИЯ (или СОР ОТ ДЖИНИРОВАНИЯ) – Gin Trash:- all material produced during the cleaning and ginning of seed cotton, except lint, linters, cotton seed, and gin waste. The ginning of cotton (the separation of lint from the seed) results in 'cotton gin by-product' (CGB), a mixture of extraneous plant parts which includes leaves, petioles, carpels, small seed (motes), and lint. CGB provides useful roughage and nutritional value for ruminant livestock. Previously referred to as Gin Trash, this by-product is a bulky, low-nutrient product that accumulates at harvest time and must be removed from the gin yard. All of the material produced during the cleaning and ginning of seed cotton, bollies or snapped cotton except the lint, cottonseed, and gin waste. Cotton gin by-product (CGB) consists of extraneous plant parts which accumulate as cotton fiber is separated from the seed at the gin. CGB consists of residual plant parts from mechanical harvesting and remnant seed (motes) and lint from ginning; in times past referred to as Gin Trash. CGB is considered as a raw agricultural commodity (RAC) which includes many other crops grown for livestock feed and parts or by-products of other crops with useful nutritional or feeding value. CGB contains 4 to 8% protein and has some nutritional value as a roughage for ruminant livestock. (In 2001) More than 2.3 million tons of cotton gin by-product are produced in 17 states, but nearly 60% occurs within 150 miles of Lubbock, Texas, in close proximity to major beef feed lots of the United States. Over 50% of the product is applied to farmland as a soil amendment. Less than 45% is fed to ruminant livestock, including cows and stocker cattle on pasture. Less than one-fourth of the US beef feedlots use CGB. Most estimates of CGB use were about 5% of the diet since hay and other roughages are more available and desirable. Cotton gin by-product (CGB) is one of many raw agricultural commodities (RAC) with economic and nutritional value to commercial livestock industries in the United States.

GIN WASTE = ОТХОДЫ ВОЛОКНООТДЕЛЕНИЯ (или ОТХОДЫ ДЖИНИРОВАНИЯ) – Gin Waste:- all forms of unmanufactured waste cotton fiber resulting from the ginning of seed cotton, including gin motes.

GINZY TRADING = НЕДОБРОСОВЕСТНАЯ (или НЕЭТИЧНАЯ) ТОРГОВЛЯ (или СДЕЛКИ С ВОЗМОЖНОЙ ЛОВУШКОЙ, или СДЕЛКИ С ЗАИНТЕРЕСОВАННОСТЬЮ, или ДЬЖИНЗИ ТРЭЙДИНЬ) – Ginzy Trading is an illegal trading practice used by floor brokers. It is considered to be non-competitive, as it involves the execution of large trades at different prices. Floor brokers attempt to ginzy trade in order to create split ticks or fractional increments in prices that are unacceptable under exchange rules. A non-competitive trade practice in which a floor broker, in executing an order – particularly a large order – will fill a portion of the order at one price and the remainder of the order at another price to avoid an exchange's rule against trading at fractional increments or split ticks. Ginzy Trading is the illegal practice occasionally engaged in by floor brokers. It is a trading practice where large trades are split up into smaller orders and are executed at a variety of different prices. Brokers do this in order to try to avoid rules which prohibit trading a single order at various increments. However, this resulting practice is still illegal because it breaks rules which prohibit the broker from quoting different prices on the same order.

GIPSA = GRAIN INSPECTION, PACKERS AND STOCKYARDS ADMINISTRATION

GIPSEY = ТУРАЧКА (или ШВАРТОВНЫЙ БАРАБАН) – Gipsey (or Gypsey) (maritime term):- a drum of a windlass for heaving in line.
