Remember that knitting machines from loops of yarn with many pointed needles or shafts. The needles draw new loops through the previous loops. The vertical rows of loops are called Ribs or Wales, and the horizontal rows of loops are called Courses. Knits made with more wales per inch will be more stable and rigid in the horizontal direction and will tend to shrink less in that direction. If there are more courses per inch, the knit fabric will be more stable and will shrink less in the lengthwise direction. A loose knit construction with fewer wale and course yarns per inch will tend to stretch, sag, and bag easily. Use of more wale and course yarns per inch creates a knit that has good recovery from stretch. The two basic methods of constructing knits are:- (i) Weft (or Filling) Knits, and (ii) Warp Knits. Each method produces a variety of types of knit fabrics. Weft or Filling Knits are constructed from one yarn that is fed into knitting machine needles in a horizontal direction. Either a circular or a flat-bed knitting machine can be used to make weft knits. The circular knitting machine creates a spiral characteristic, it is often difficult to have the wales and courses of the knit fabric form a perfect 90 degree angle match. This difficulty may produce an 'off-grain' effect in some fabrics, particularly where stripes or other geometric fabric designs are involved. Four basic stitches are used in manufacturing weft or filling knits. They are:- (i) the Flat or Jersey Stitch (also sometimes called a Plain Knit); (ii) the Purl Stitch; (iii) the Rib Stitch; and (iv) the Interlock Stitch, which is also used in Double Knits. Knit Fabric:- fabrics made from only one set of yarns, all running in the same direction. Some knits have their yarns running along the length of the fabric, while others have their yarns running across the width of the fabric. Knit fabrics are held together by looping the yarns around each other. Knitting creates ridges in the resulting fabric. Wales are the ridges that run lengthwise in the fabric; courses run crosswise. (i) Double Knit Fabric is a firmer knit fabric that can be found in a medium to heavier weight. This type of knit has a minimum amount of stretch and can be sewn in much the same manner as woven fabrics. Examples of double knit fabric can be seen in sweatshirts and sportswear attire. (ii) Ribbing is a knit fabric with 100 percent elasticity across the fabric grain. It is distinguishable from other knits due to the ribbing on both sides of the fabric. This fabric is generally used for making cuffs, neckbands and garment waistbands. (iii) Single Knit Fabric:- also known as Moderate Stretch or Jersey Knit Fabric, single knit fabric is a light to medium fabric that has roughly 20 percent to 25 percent elasticity across the grain of the fabric. This knit fabric contours to the body loosely. Single knit fabrics are often used in t-shirts, shorts and sleepwear. (iv) A Two-Way Stretch Knit is a stronger knit fabric then other types of knits due to its ability to stretch lengthwise and crosswise. This fabric has 50 percent to 75 percent elasticity in both directions. This type of knit conforms to the body closely and is used in swimwear, active wear and leggings. / Уток (или Уточина). Под Трикотажем, от Французского слова Tricotage, от Tricoter, означающее Вязать, понимается вязаное полотно или готовое изделие, полученное из одной или многих нитей образованием петель и их взаимным переплетением на трикотажной машине. В отличие от других текстильных изделий, трикотаж обладает растяжимостью по всем направлениям из-за возможности петель изменять форму и размеры. Рыхлая петельная структура придаёт трикотажу мягкость и несминаемость. Трикотаж используется для изготовления предметов одежды, а также в производстве искусственного меха, кружев, рыболовных сетей, технических и медицинских изделий и тому подобного. Классификация Трикотажа:- трикотаж подразделяют по волокнистому составу, структуре, отделке и назначению. Для его изготовления в основном используют хлопчатобумажные и шерстяные нити, волокна химические (искусственные и синтетические, в том числе текстурированные нити). Пористость и лёгкая проницаемость трикотажа для воздуха, влаги способствуют более широкому, чем в тканях, использованию в нём синтетического сырья. Изготавливается однородным (из волокон одного вида), смешанным (из нитей, полученных из смеси различных волокон) и неоднородным (из нитей различных видов). Трикотаж из пряжи, полученной из смеси хлопка и небольшого количества шерстяных отходов, называется вигоневым. По структуре различают поперечновязаный трикотаж (кулирный) и основовязаный, одинарный – однофонтурный и двойной – двухфонтурный (смотрите Трикотажное Переплетение). По сравнению с одинарным двойной трикотаж более плотный и тяжёлый, не закручивается с краёв и применяется преимущественно для изготовления верхних (иногда бельевых) изделий. По способу отделки различают суровый (неотделанный), отбелённый, гладкокрашеный (окрашенный в один цвет) и пёстровязаный трикотаж. Для отделки используется красильно-отделочное оборудование, приспособленное к обработке трикотажа. Помимо гладкой поверхности, трикотаж может иметь пушистый слой (ворс), который образуется расчёсыванием нитей на поверхности трикотажа с помощью игольчатых лент и шишек, закреплённых на валах ворсовальных машин. По назначению различают бельевой, верхний, чулочно-носочный, перчаточный, платочно-шарфовый и другой трикотаж. Бельевые и верхние изделия в основном шьют из трикотажного полотна, остальные изделия, как правило, получают готовыми на машине. Бельевой обладает гигроскопичностью, мягкостью, эластичностью, имеет высокую воздухо- и паропроницаемость и тому подобное. Для его изготовления в основном используются полотна из хлопко-полиэфирной (хлопко-лавсановой) пряжи, а также так называемые платированные полотна, у которых лицевая сторона выработана из шёлковых нитей, а изнаночная – из хлопка. Трикотажные полотна для верхних изделий имеют, как правило, большую, чем бельевые, толщину, характеризуются формоустойчивостью, хорошими теплозащитными свойствами. Основные характеристики и свойства трикотажа:- строение трикотажа обусловливается переплетением петель и их геометрическими параметрами (длина нити в петле, модуль петли – отношение длины нити в петле к её толщине, высота петельного ряда и другие); линейной плотностью нити (масса 1 километра (км) нити в граммах (г)), толщиной и числом сложений нити, структурой поверхности (гладкая, ворсовая) и тому подобным. Качество трикотажа определяется поверхностной плотностью, числом петель на единицу длины в направлении по петельному столбику (плотность по вертикали) и по петельному ряду (плотность по горизонтали), а также механическими и физическими свойствами. Поверхностная плотность характеризует материалоёмкость и косвенно толщину трикотажа; для верхних изделий составляет 300–600 г/м^2, для бельевых 115–240 г/м^2. Для оценки механических свойств трикотажа определяют растяжимость, упругость, эластичность, прочность на разрыв, истирание, распускаемость, закручиваемость с краёв и тому подобное. Растяжимость трикотажа зависит от вида переплетения и строения петель; наибольшее увеличение размеров имеет поперечновязаный трикотаж (например, для чулочных изделий до 400%), наименьшее – основовязаный. Во всех случаях удлинение трикотажа в поперечном направлении больше, чем в продольном. Малорастяжимый трикотаж не требует специальной обработки при изготовлении одежды; пошив изделий выполняют на швейных машинах цепного стежка. Уменьшение растяжимости трикотажа, предназначенного для изготовления верхних изделий, достигается применением комбинированных переплетений, в которых иногда используют уточные нити. Нити могут прокладываться вдоль петельных рядов (поперечный уток) и вдоль столбиков (продольный уток). Растяжимость трикотажа при этом снижается до 5–10%. Упругость (способность мгновенно восстанавливать первоначальную форму после снятия нагрузки) и эластичность трикотажа (способность восстанавливать форму через некоторое время после снятия нагрузки) в основном зависят от вида сырья и переплетения. Наибольшей упругостью обладает трикотаж из текстурированных нитей, а также трикотаж из шерстяной пряжи, выработанный переплетением 'ластик'. Упругость и эластичность способствуют сохранению формы изделия в процессе носки, значительно повышают стойкость одежды к истиранию и многократным растяжениям. Прочность трикотажа на разрыв составляет обычно 50–70% от суммарной прочности нитей, входящих в поперечное сечение полотна. Устойчивость трикотажа к истиранию зависит от поверхности волокна, крутки нитей, вида переплетения, отделки. Наибольшей устойчивостью к истиранию обладает трикотаж из синтетических нитей, наименьшей – шерстяной трикотаж и трикотаж с ворсовой поверхностью. Разрушение нити в петлях в результате истирания или повреждения вызывает распускание (или сбегание) петли. Интенсивность сбегания зависит от вида переплетения и гладкости нити. Основовязаный трикотаж, в котором в состав

каждой петли входят две нити, практически нераспускаем; трикотаж кулирных переплетений, как правило, легко распускается. Исключение составляют ажурные, прессовые и перевитые переплетения. Закручиваемость трикотажа с краёв характерна для всех переплетений, выработанных на машинах с одной игольницей (однофонтурных). Вызывается стремлением нити, изогнутой в петлю, распрямиться. Величина закручивания зависит от упругости и линейной плотности нити, внешних условий, вида отделки. Это свойство трикотажа затрудняет швейную обработку изделий:- временно может быть устранено влажно-тепловым воздействием на каландрах или прессах. Преждевременный износ трикотажных изделий иногда возникает в результате недостаточной стабильности размеров и формы изделия в носке и стирке, свойственной петельным структурам с высоким модулем петли. Признаком формоустойчивости трикотажа служит его способность к растяжению. Переплетения, имеющие малоподвижные петли или высокую плотность, а также химически стабилизированные в вытянутом состоянии, характеризуются большой стабильностью размеров. При оценке гигиеничности трикотажа обычно определяют его физические свойства:- способность поглощать влагу из окружающей среды (гигроскопичность), воздухо-, водо- и паропроницаемость, электризуемость и другие. Гигроскопичность зависит от вида волокон; наилучшими свойствами обладает хлопчатобумажный трикотаж, почти не поглощают влаги изделия из синтетических волокон. Трикотаж благодаря рыхлой петельной структуре имеет воздухо-, водо- и паропроницаемость значительно выше, чем ткани. Изменяя плотность вязания или применяя нити, отличающиеся по структуре (пушистости), получают различную проницаемость трикотажа. Электризуемость трикотажа (способность накапливать электростатические заряды до размеров, ощутимых человеком) зависит от волокнистого состава трикотажа. Гидрофобные волокна (большинство синтетических волокон) создают в трикотаже высокую электризуемость; для уменьшения её применяется обработка трикотажа химическими препаратами – антистатиками. Смешанный трикотаж, в котором значительна доля гидрофильных волокон, не обладает высокой электризуемостью. Трикотаж делят на основовязальный и кулирный:- (i) в основовязальном каждая нить образует в петельном ряду по одной петле и переходит в следующий ряд; для образования петельного ряда основовязального трикотажа требуется, как правило, столько нитей, сколько петель в петельном ряду; (ii) в кулирном трикотаже каждая нить последовательно образует петли одного петельного ряда; для образования одного петельного ряда кулирного трикотажа достаточно одной нити. Кулирный и основовязальный трикотаж может быть как одинарным, так и двойным. Одинарный трикотаж вырабатывается на машинах с одной игольницей, а двойной трикотаж – на машинах с двумя игольницами. Согласно классификации все трикотажные переплетения разделяются на главные (переплетения, имеющие простейшую структуру) и производные (сочетание нескольких одинаковых главных переплетений, взаимно ввязанных так, что между петельными столбиками одного переплетения размещаются петельные столбики другого такого же переплетения). На базе каждого из классов этих групп можно образовать рисунчатые и комбинированные переплетения (переплетения, которые состоят из переплетений нескольких классов). Сырьё является одним из основных факторов, формирующих качество трикотажных изделий. В настоящее время трикотажные предприятия перерабатывают практически все виды и разновидности волокон и получаемых из них нитей. Нити состоят из коротких или длинных элементарных волокон различной природы. Они делятся в поперечном направлении на составляющие их части – волокна путём раскручивания. По виду применяемого сырья трикотажные полотна и изделия подразделяют на три группы:- (i) из пряжи – это нити, состоящие из коротких волокон, образованных в результате кручения; (ii) из нитей, состоящих, как правило, из длинных моноволокон и имеющие различную крутку; и (iii) из различных сочетаний пряжи и нитей. В настоящее время в трикотажном производстве перерабатывают все виды сырья, включая пряжу из очёсов натурального шёлка и из льняных волокон в смеси с синтетическими; применяют нити различной толщины и степени крутки. В основном используют пряжу и нити смешанного волокнистого состава, что обеспечивает хорошие гигиенические свойства полотен, меньшие усадку и сминаемость, хорошую износостойкость. Бельевые полотна вырабатывают преимущественно из хлопчатобумажной, хлопколавсановой, хлопкополинозной, хлопковискозной пряжи, а также из вискозных, ацетатных и полиамидных комплексных нитей. Некоторое количество полотен вырабатывают из полушерстяной и чистошерстяной пряжи. Полотна для верхнего трикотажа изготовляют из всех видов сырья; чулочно-носочные изделия – в основном из полиамидных нитей, хлопчатобумажной и полушерстяной пряжи. В зависимости от назначения полотен подбирают нити разной структуры:- пряжу различных способов прядения и степени крутки, комплексные нити из химического сырья однониточные и кручёные, нити фасонных круток, текстурированные нити, причём в разных сочетаниях – пряжа, скручённая с комплексными нитями, текстурированные нити – с пряжей и так далее. Тонкие и гладкие нити из химического сырья применяют для полотен с повышенной гладкостью поверхности (лицевой и изнаночной), которые должны легко скользить по поверхности кожи и верхней одежды. Это бельевые, блузочные и сорочечные полотна. Блестящая поверхность нитей подчеркивает эффект блестящих и матовых полос, оттенков. Из нитей повышенной объемности – текстурированных – получают полотна с рельефной поверхностью, повышенной толщины при небольшой массе 1 м^2. Толстую, рыхлую пряжу используют для начёса в полотнах для тёплого белья или спортивной одежды. Пряжа и нити повышенной крутки придают полотну жёсткость; петельная структура такого трикотажа неровная вследствие повышенной напряжённости нити при изгибе в петли, увеличивается закручиваемость краёв полотна, однако его поверхность менее рыхлая, более износостойкая. Кручённые пряжу и нити подвергают предварительной обработке (запариванию, стабилизации, замасливанию) с целью уравновешивания их структуры и снятия напряжений. Самая хорошая по свойствам пряжа не может быть признана удовлетворительной, если она не соответствует требованиям вырабатываемого изделия или не подготовлена для переработки на оборудовании в современных условиях производства. Неполная подготовленность сырья к переработке отрицательно сказывается не только на качестве и сортности продукции, но и на показателях работы предприятия и использование техники. Широкий диапазон требований к сырью для трикотажных изделий объясняется очень большим разнообразием самих изделий. Например, требования к структуре нити предъявляют, начиная от капроновых мононитей для тонких чулок и кончая рыхлой шерстяной и синтетической пряжей для пуловеров и жакетов. Свойства нити для трикотажного производства определяют, изучая структуру петель, деформацию этой структуры, то есть рассматривая, прежде всего, механические функции нити в петле трикотажа. Если представить себе схематически нить круглой в поперечном сечении, то с увеличением диаметра нити значительно повысится её сопротивление изгибу. Для нас представляет интерес увеличение диаметра нити без увеличения количества волокон в поперечном сечении. Это вполне возможно, если нити предать рыхлую структуру. Рыхлая структура пряжи имеет много достоинств, главными из которых являются:- (1) повышение упругого сопротивления изгибу и способность лучше восстанавливать форму петли при деформациях; (2) высокая застилистость, позволяющая применять нити меньшей линейной плотности (на 10–15%) без увеличения плотности вязания (уменьшения длины нити в петле) и поэтому без снижения производительности вязальных машин; (3) облегчение массы изделия и придание ему приятной мягкости на ощупь; (4) повышение теплоизоляционного свойства изделий; и (5) улучшение способности пряжи к переработке на вязальных машинах. Нить (пряжа) рыхлой структуры особенно необходима для изготовления верхних трикотажных изделий. Для бельевых изделий, которые должны хорошо облегать тело, нужна не жёсткая нить, а очень гибкая, состоящая из тонких волокон, но неплотной структуры, способной сохранять форму петли. Для зимних чулочных изделий нужна нить рыхлой структуры, а для большинства других чулочных изделий желательна нить более плотная, кручёная. Для женских чулок предпочтительнее нить самая плотная, такая как мононить, с минимальной застилистостью, чтобы чулок выглядел более тонким. Рыхлая структура

пряжи достигается благодаря пониженной крутке, что связанно с понижением прочности пряжи. Если для ткани прочность является основным свойством нити, то для трикотажа это свойство имеет второстепенное значение. Для трикотажных изделий ровнота нити по толщине и крутке имеет более важное значение, чем для изделий из ткани. Структура петель трикотажа такова, что короткий отрезок нити изгибается несколько раз, переплетаясь сам с собой и образуя петли, распложенные рядом друг с другом. Нить в каждой петле как бы складывается вдвое, отчего неровнота её становится ярко выраженной. Из утолщённого или утонённого участка нити образуется группа петель, легко отличимая от соседних. При периодической неровноте нити получается дефект, известный под названием Зебристость. Таким образом, требования к сырью по ровноте нити основаны на особенностях строения петель трикотажа. Трикотаж (от Французского слова Tricotage, от Tricoter (Трикотэ), означающее Вязать) получают из одной или многих нитей на трикотажной машине образованием петель и их взаимным переплетением. В отличие от других текстильных изделий, трикотаж обладает растяжимостью по всем направлениям из-за возможности материала изменять форму и размеры. Рыхлая петельная структура придаёт трикотажу мягкость и несминаемость. Трикотаж используется для изготовления предметов одежды, а также в производстве искусственных кружев, мехов, технических и медицинских изделий и тому подобного. Трикотаж подразделяют по волокнистому составу, структуре, отделке и назначению. Для его изготовления в основном используют хлопковые и шерстяные нити, волокна химические (искусственные и синтетические, в том числе текстурированные нити). Трикотажные изделия обладают лёгкой проницаемостью для воздуха, влаги; способствуют более широкому, чем в тканях, использованию в нём синтетического сырья. Изготавливаются однородным (из волокон одного вида), смешанным (из нитей, полученных из смеси различных волокон) и неоднородным (из нитей различных видов). Трикотаж из пряжи, полученной из смеси хлопка и небольшого количества шерстяных отходов, называется вигоневым. По структуре различают трикотаж:- поперечновязаный (кулирный) и основовязаный, одинарный – однофонтурный и двойной – двухфонтурный. По сравнению с одинарным двойной трикотаж более плотный и тяжёлый, не закручивается с краев и применяется преимущественно для изготовления верхних (иногда бельевых) изделий. По способу отделки различают суровый (неотделанный), отбелённый, гладкокрашеный (окрашенный в один цвет) и пёстровязаный трикотаж. Для отделки используется красильно-отделочное оборудование, приспособленное к обработке трикотажа. Помимо гладкой поверхности, трикотаж может иметь пушистый слой (ворс), который образуется расчёсыванием нитей на поверхности трикотажа с помощью игольчатых лент и шишек, закреплённых на валах ворсовальных машин. По назначению различают бельевой, верхний, чулочно-носочный, перчаточный, платочно-шарфовый и другие. Трикотажные Бельевые и верхние изделия в основном шьют из трикотажного полотна, остальные изделия, как правило, получают готовыми на машине. Бельевой трикотаж обладает гигроскопичностью, мягкостью, эластичностью, имеет высокую воздухо- и паропроницаемость и тому подобное. Для его изготовления в основном используются полотна из хлопко-полиэфирной (хлопко-лавсановой) пряжи, а также так называемые платированные полотна, у которых лицевая сторона выработана из шёлковых нитей, а изнаночная – из хлопка. Трикотажные полотна для верхних изделий имеют, как правило, большую, чем бельевые, толщину, характеризуются формоустойчивостью, хорошими теплозащитными свойствами. Основные характеристики и свойства трикотажа:- Строение трикотажа обусловливается переплетением петель и их геометрическими параметрами (длина нити в петле, модуль петли – отношение длины нити в петле к её толщине, высота петельного ряда и другие); линейной плотностью нити (масса 1 км нити в г), толщиной и числом сложений нити, структурой поверхности (гладкая, ворсовая) и тому подобным. Качество трикотажа определяется поверхностной плотностью, числом петель на единицу длины в направлении по петельному столбику (плотность по вертикали) и по петельному ряду (плотность по горизонтали), а также механическими и физическими свойствами. Поверхностная плотность характеризует материалоёмкость и косвенно толщину трикотажа; для верхних изделий составляет 300–600 г/м^2, для бельевых 115–240 г/м^2. Для оценки механических свойств трикотажа определяют растяжимость, упругость, эластичность, прочность на разрыв, истирание, распускаемость, закручиваемость с краёв и тому подобное. Растяжимость трикотажа зависит от вида переплетения и строения петель; наибольшее увеличение размеров имеет поперечновязаный трикотаж (например, для чулочных изделий до 400%), наименьшее – основовязаный. Во всех случаях удлинение трикотажа в поперечном направлении больше, чем в продольном. Малорастяжимый трикотаж не требует специальной обработки при изготовлении одежды; пошив изделий выполняют на швейных машинах цепного стежка. Для изготовления верхних изделий предусматривается уменьшение растяжимости трикотажа, достигается применением комбинированных переплетений, в которых иногда используют уточные нити. Нити могут прокладываться вдоль петельных рядов (поперечный уток) и вдоль столбиков (продольный уток). Растяжимость трикотажа при этом снижается до 5–10%. Упругость (способность мгновенно восстанавливать первоначальную форму после снятия нагрузки) и эластичность трикотажа (способность восстанавливать форму через некоторое время после снятия нагрузки) в основном зависят от вида сырья и переплетения. Наибольшей упругостью обладает трикотаж из текстурированных нитей, а также трикотаж из шерстяной пряжи, выработанный переплетением ‘ластик’. Упругость и эластичность способствуют сохранению формы изделия в процессе носки, значительно повышают стойкость одежды к истиранию и многократным растяжениям. Прочность трикотажа на разрыв составляет обычно 50–70% от суммарной прочности нитей, входящих в поперечное сечение полотна. Устойчивость трикотажа к истиранию зависит от поверхности волокна, крутки нитей, вида переплетения, отделки. Наибольшей устойчивостью к истиранию обладает трикотаж из синтетических нитей, наименьшей – шерстяной трикотаж и трикотаж с ворсовой поверхностью. Разрушение нити в петлях в результате истирания или повреждения вызывает распускание (или сбегание) петли. Интенсивность сбегания зависит от вида переплетения и гладкости нити. Основовязаный трикотаж, в котором в состав каждой петли входят две нити, практически нераспускаем; трикотаж кулирных переплетений, как правило, легко распускается. Исключение составляют ажурные, прессовые и перевитые переплетения. Закручиваемость трикотажа с краёв характерна для всех переплетений, выработанных на машинах с одной игольницей (однофонтурных). Вызывается стремлением нити, изогнутой в петлю, распрямиться. Величина закручивания зависит от упругости и линейной плотности нити, внешних условий, вида отделки. Это свойство трикотажа затрудняет швейную обработку изделий:- временно может быть устранено влажно-тепловым воздействием на каландрах или прессах. Преждевременный износ трикотажных изделий иногда возникает в результате недостаточной стабильности размеров и формы изделия в носке и стирке, свойственной петельным структурам с высоким модулем петли. Признаком формоустойчивости трикотажа служит его способность к растяжению. Переплетения, имеющие малоподвижные петли или высокую плотность, а также химически стабилизированные в вытянутом состоянии, характеризуются большой стабильностью размеров. Гигиеничность трикотажа обычно определяют по его физическим свойствам:- способность поглощать влагу из окружающей среды (гигроскопичность), воздухо-, водо- и паропроницаемость, электризуемость и другие. Гигроскопичность зависит от вида волокон; наилучшими свойствами обладает хлопчатобумажный трикотаж, почти не поглощают влаги изделия из синтетических волокон. Трикотаж благодаря рыхлой петельной структуре имеет воздухо-, водо- и паропроницаемость значительно выше, чем ткани. Изменяя плотность вязания или применяя нити, отличающиеся по структуре (пушистости), получают различную проницаемость трикотажа. Электризуемость трикотажа (способность накапливать электростатические заряды до размеров, ощутимых человеком) зависит от волокнистого состава трикотажа. Гидрофобные волокна (большинство синтетических волокон) создают в трикотаже высокую электризуемость; для уменьшения её применяется обработка трикотажа

химическими препаратами – антистатиками. Смешанный трикотаж, в котором значительна доля гидрофильных волокон, не обладает высокой электризуемостью. Под Трикотажем, от Французского слова Tricotage от Tricoter (Трикотэ), означающее Вязать, понимаются текстильные изделия или полотна, полученные из одной или многих нитей путём образования петель и их взаимного переплетения. По структуре трикотаж подразделяется на:- (i) поперечновязаный (кулирный) трикотаж и (ii) продольновязаный (основовязаный) трикотаж; (iii) одинарный трикотаж и (iv) двойной (более плотный и тяжёлый) трикотаж; (v) гладкий трикотаж и (vi) рисунчатый трикотаж. Из трикотажа изготовляют одежду, береты, перчатки, платки, чулки и тому подобное, а также гардины, ковры, технические изделия (прокладки, сети, трубки, фильтры), изделия медицинского назначения (бинты, кровеносные сосуды, протезы внутренних органов) и так далее. Трикотажное Полотно изготовляют на однофонтурных и двухфонтурных плосковязальных и кругловязальных машинах переплетениями:- кулирное одинарное и двойное – гладкое, рисунчатое, комбинированное полное и неполное; основовязаное одинарное и двойное – гладкое, рисунчатое, комбинированное, одногребёночное и многогребёночное с полной и неполной проборкой гребёнок. Полотно выпускают отваренным, отбеленным, окрашенным, набивным, однотонным, пёстровязаным, с различными видами отделок (ворсование, тиснение, стрижка и другие) и подвергают сушке, стабилизации или влажно-тепловой обработке в соответствии с типовыми технологическими режимами. Техническая характеристика полотна (вид и класс вязального оборудования, вид и линейная плотность сырья, наименование переплетения, число петельных столбиков и петельных рядов и допускаемые отклонения, поверхностная плотность и допускаемое отклонение, растяжимость при нагрузке 6 Н, группа устойчивости к истиранию, разрывная нагрузка по петельным столбикам, вид отделки) должна быть предусмотрена в техническом описании на модель или в техническом описании на полотно (товарное). Нормированная влажность полотна однородного сырьевого состава должна соответствовать нормативно-технической документации на пряжу и нити. Фактическая влажность полотна комбинированного сырьевого состава должна соответствовать значению, полученному расчётным путём по ГОСТ 6611.4. Допускаемые отклонения по поверхностной плотности:- (i) для полотна основоязаного вертелочного – минус 5%; (ii) для остальных видов полотен – минус 6%. Плюсовой допуск по поверхностной плотности не ограничивается. Отклонения по числу петельных столбиков и петельных рядов должны обеспечивать допускаемые отклонения по поверхностной плотности полотна. Полотно в зависимости от растяжимости по ширине при нагрузке 6 Н подразделяют на три группы:- (i) I – с растяжимостью от 0 до 40%; (ii) II – от 41 до 100%; и (iii) III – свыше 100%. Устойчивость окраски полотна должна соответствовать требованиям ГОСТ 2351. Изменение линейных размеров полотна после мокрой обработки должно соответствовать требованиям ГОСТ 26289 – для полотен, используемых для изготовления бельевых изделий, ГОСТ 26667 – для полотен, используемых для изготовления верхних и перчаточных изделий. Устойчивость к истиранию полотна, предназначенного для изготовления верхних и перчаточных изделий, должна соответствовать требованиям ГОСТ 16486. Разрывная нагрузка по петельным столбикам должна быть, Н, не менее:- (i) 68 – для полотна основовязаного (вертелочного) из искусственных нитей; (ii) 59 – для полотна основовязаного (вертелочного) из искусственных нитей в сочетании с другими видами сырья; и (iii) 80 – для остальных видов полотен. Сортность полотна, в том числе перекос, определяют по НТД, а полотна в купонах и деталях изделий – по ГОСТ 1115. Трикотажные полотна обладают рядом ценных свойств:- они мягки, эластичны, не стесняют движений человека, даже при плотном прилегании. Они устойчивы к истиранию и почти не сминаются, хорошо драпируются, обладают высокими гигиеническими свойствами – большой воздухопроницаемостью (8–9 раз большей, чем тканые ткани) и гигроскопичностью, хорошими теплозащитными свойствами. Трикотажное полотно представляет собой гибкий, прочный материал, состоящий из петель, соединённых в поперечном и долевом направлении. Петли, расположенные по горизонтали, образуют Петельные Ряды, а петли расположенные по вертикали Петельные Столбики. По способу получения трикотаж подразделяют на поперечновязаный и основовязаный. В поперечновязаном трикотаже все петли одного петельного ряда образованы из одной нити. В основовязаном трикотаже каждая петля петельного ряда образована из отдельной нити. Структура трикотажных полотен и её характеристики:- одна из основных структурных характеристик трикотажных полотен – вид переплетения. Вид трикотажного переплетения определяется формой, размерами, порядком расположения и взаимосвязи петель. От вида переплетения во многом зависит внешний вид и физико-механические свойства трикотажного полотна.

KNIT LOOP = ВЯЗАНАЯ ПЕТЛЯ – Knit Loop is a stitch in a fabric where the yarn is formed into a loop shape by the knitting elements. Knitting meshes or interlocks these loops to form a fabric.

KNIT–MISS = XX – Knit-Miss is a form of tricot knitting in which yarns on each bar of a two-bar machine are knit at alternate courses only. This type of knitting permits the use of heavy-denier yarns without creating undesirable bulkiness in the fabric.

KNIT STITCH = ТРИКОТАЖНОЕ ПЕРЕПЛЕТЕНИЕ – Knit Stitch is the most common stitch in knitting; stitches are formed on the left-hand needle by placing the point of the right-hand needle through the loop from left to right, winding the wool from the right-hand needle under the point of the right-hand needle and back across the front, pulling the loop through, and slipping the stitch off the left-hand needle. Knit Stitch is a basic knitting stitch usually made with the yarn at the back of the work by inserting the right needle into the front part of a loop on the left needle from the left side, catching the yarn with the point of the right needle, and bringing it through the first loop to form a new loop – compare Purl Stitch. / Трикотажное Переплетение (Knitted Stitch) – строение петельной структуры трикотажа; определяет внешний вид трикотажа и его свойства (упругость, крепость, воздухопроницаемость и другое). Трикотажные переплетения отличаются друг от друга составом элементов петельной структуры (петля, набросок, протяжка) и их взаимным расположением. В зависимости от числа нитей, участвующих в процессе образования петельного ряда, различают поперечновязаные (кулирные) и основовязаные трикотажные переплетения. При поперечновязаном трикотажном переплетении горизонтальный петельный ряд образуется последовательным изгибанием одной нити. В основовязаном трикотажном переплетении горизонтальный петельный ряд составляется системой нитей (основой), отдельные нити образуют последовательно по 1 (редко по 2) петле в каждом ряду. Трикотажные переплетения бывают одинарные и двойные. У одинарного трикотажа одна сторона состоит из лицевых петель, у двойного, который вырабатывается на трикотажных машинах с 2 игольницами, обе стороны лицевые. Из многочисленных видов трикотажных переплетений обычно выделяют простейшие (главные), производные, комбинированные и сложные переплетения. В главных трикотажных переплетениях каждый ряд состоит из самого простого сочетания только одного основного элемента – петель. В группу главных поперечновязаных трикотажных переплетений входят:- гладь кулирная (одинарное однолицевое трикотажное переплетение) и ластик (двойное, двухлицевое трикотажное переплетение). Группа главных основовязаных трикотажных переплетений включает также цепочку, трико и атлас, которые могут быть и одинарными, и двойными. Трикотажное переплетение цепочка не представляет собой трикотаж в обычном понимании этого слова. Цепочка состоит из петель одной нити, нанизанных друг на друга. Цепочки не имеют поперечной связи между собой; используются для получения более сложных основовязаных трикотажных переплетений, например трико и атласа. Производные трикотажные переплетения (производная гладь, производный ластик и другие) представляют собой сочетание петельных столбиков из разных видов простейших трикотажных переплетений. В группу комбинированных трикотажных переплетений (например, прессовых, жаккардовых и других) входят переплетения, у которых в горизонтальных петельных рядах сочетаются различные элементы петельной структуры и

чередование рядов более сложное по сравнению с простейшими трикотажными переплетениями. Сложные трикотажные переплетения (ажурные, зигзагообразные и другие) получают путём дополнительных операций при петлеобразовании, например, перенесением петель, переплетением с фиксированным расположением 2 нитей в петле.

KNIT TERRY CLOTH = ВЯЗАНОЕ МАХРОВОЕ ПОЛОТНО – Knit Terry Cloth:- a terry cloth is a soft, absorbent fabric with loops on one or both sides. When this fabric is knit rather than woven, it is called Knit Terry. Knit terry is especially popular for bathrobes and beach wear because of its absorbency. Stretch knit terry (usually made stretchable by the addition of a synthetic elastic fiber) is popular for baby clothes because of its absorbency and comfort.

KNITTING = ВЯЗАНИЕ (или ВЯЗАНЬЕ) – (1) Knitting is the process of constructing an elastic, porous fabric by interlocking a series of loops of one or more yarns with needles. It may be done by hand or by machine. These yarns form a series of connecting loops that support one another like a chain. Almost any textile item can be and has been knitted, including rugs. A warp knit is made on a machine in which parallel yarns run lengthwise and are locked into the series of loops. Warp knits have a good deal of crosswise stretch. Wett knits are made on a machine that forms loops in a circular direction and have one continuous thread running across the fabric. The following entries are common knit terms. Knitting is a method of constructing fabric by interlocking series of loops of one or more yarns. The two major classes of knitting are warp knitting and weft knitting, as follows:- (i) Warp Knitting:- (a) Milanese Knitting, (b) Raschel Knitting, and (c) Tricot Knitting; and (ii) Weft Knitting:- (a) Circular Knitting, and (b) Flat Knitting. Knitting:- the art and science of constructing fabric by interlooping of yarn loops, through the use of needles and a ‘loop within a loop’. The most essential unit in a knit fabric is the loop or stitch. A vertical row of stitches is called a Wale; the horizontal or crosswise row of stitches is known as a Course. The number of wales per inch, measured across the fabric depends on the count or size of the yarn used, and the number of needles per inch in the machine. The two major classes of knitting are warp and weft. Knitting Types:- (i) Warp Knitting:- a type of knitting in which the yarns generally run lengthwise in the fabric. The yarns are prepared as warps on beams with one or more yarns for each needle. Examples include:- Rachel (a plain or lacy knit) and Tricot (run resistant) Knitting. Knitting (Warp):- a type of knitting in which the yarns generally run lengthwise in the fabric. The yarns are prepared as warps on beams. Examples of this type of knitting include tricot, Milanese, and Raschel knitting. (ii) Weft Knitting:- a common type of knitting, in which one continuous thread runs crosswise in the fabric making all of the loops in one course. An example is Circular Knitting, where the fabric produced on the knitting machine is in the form of a tube, the threads running continuously around the fabric. Knitting (Weft):- a type of knitting, in which one continuous thread runs crosswise in the fabric making all of the loops in one course. Weft knitting types are circular and flat knitting. Knitting (Circular):- a weft knitting process where the fabric is a tube, with the threads running continuously around the fabric. Double-knit fabrics are produced on a circular knitting machine equipped with two sets of latch needles situated at right angles to each other. Knitting is a method of constructing fabric by interlocking series of loops of one or more yarns. The two major classes of knitting are warp knitting and weft knitting, as follows:- (1) Warp Knitting is a type of knitting in which the yarns generally run lengthwise in the fabric. The yarns are prepared as warps on beams with one or more yarns for each needle. Examples of this type of knitting are tricot, milanese, and raschel knitting. (1.1.) Milanese Knitting is a type of run resistant warp knitting with a diagonal rib effect using several sets of yarns. (1.2.) Raschel Knitting is a versatile type of warp knitting made in plain and Jacquard patterns; the latter can be made with intricate eyelet and lacy patterns and is often used for underwear fabrics. Raschel fabrics are coarser than other warp-knit fabrics, but a wide range of fabrics can be made. Raschel knitting machines have one or two sets of latch needles and up to thirty sets of guides. (1.3.) Tricot Knitting is a run-resistant type of warp knitting in which either single or double sets of yarn are used. (2) Weft Knitting is a common type of knitting, in which one continuous thread runs crosswise in the fabric making all of the loops in one course. Weft knitting types are circular and flat knitting. (2.1.) Circular Knitting is the fabric is produced on the knitting machine in the form of a tube, the threads running continuously around the fabric. (2.2.) Flat Knitting is the fabric is produced on the knitting machine in flat form, the threads alternating back and forth across the fabric. The fabric can be given shape in the knitting process by increasing or decreasing loops. Knitting (Flat or Single):- a weft knitting process where the fabric is in flat form. The threads run back and forth across the fabric. Shape can be added in the knitting process by increasing or decreasing the loops or stitches. Full-fashioned garments are made on a flat-knitting machine. Also called Plain Knit, a fabric constructed with one needle bed and one set of needles. (2) Circular Knitting is a weft knitting process where the fabric is a tube, with the threads running continuously around the fabric. Double-knit fabrics are produced on a circular knitting machine equipped with two sets of latch needles situated at right angles to each other. (3) Flat or Single Knitting is a weft knitting process where the fabric is in flat form. The threads run back and forth across the fabric. Shape can be added in the knitting process by increasing or decreasing the loops or stitches. Full-fashioned garments are made on a flat-knitting machine. (4) Raschel Knitting is a versatile warp knitting made in plain and Jacquard patterns; the fabrics are coarser than other warp knits. Raschel knitting machines have one or two sets of latch needles and up to thirty sets of guides that enable them to create a wide range of fabrics. (5) Warp Knitting is a type of knitting in which the yarns generally run lengthwise in the fabric. The yarns are prepared as warps on beams. Examples of this type of knitting include tricot, Milanese, and Raschel knitting. (6) Weft Knitting is a type of knitting, in which one continuous thread runs crosswise in the fabric making all of the loops in one course. Weft knitting types are circular and flat knitting. / Жакяр (Jacquard). (2) Кругловязальный Трикотаж (Circular Knitting). на кругловязальной машине, оборудованной двумя наборами . (3) Плосковязальный или Одинарный Трикотаж (Flat or Single Knitting). (4) Рашельные Трикотажные Машины или Вертелки (Raschel Knitting Machines) имеют один или два набора . (5) Основовязальный или Продольновязаный Трикотаж (Warp Knitting). (6) Уточновязальный или Поперечновязаный Трикотаж (Weft Knitting). Трикотаж это полотно из текстиля или изделие, которое получено путём вязания. Следовательно, каждый трикотажный материал – это нити, преобразованные во взаимно переплетённые в продольном и поперечном направлении петли. Петля – это начальный элемент трикотажной структуры. От формы петли, представляющей собой пространственную кривую, зависят свойства трикотажного полотна. По форме петли могут быть самые разные – широкие, зауженные, удлинённые, округлые. Кроме этого, петли различаются по высоте. Они могут быть нормальной величины, а также, увеличенные и уменьшенные. Полотно будет казаться тем светлее, чем выше петля и чем прямее нить. Такой эффект проявляется из-за направленного отражения света. Те петли, которые соединяются между собой по вертикали, образуют петельные столбики (wales), по горизонтали – петельные ряды (courses). Существует также понятие петельного шага, так называют расстояние между одноимёнными точками или центрами двух петель, расположенных рядом. Трикотаж подразделяют на основовязальный, в котором каждая нить в петельном ряду образует по одной петле, переходя затем в следующий ряд, и на кулирный, в котором нить образует петли одного петельного ряда. Одной нити достаточно, для того чтобы получился один петельный ряд кулирного трикотажа, а для основовязального трикотажа для образования петельного ряда, как правило, нужно такое же количество нитей сколько петель в ряду. Трикотаж, как основовязальный, так и кулирный, может быть одинарным и двойным. Для производства одинарного трикотажа нужна машина с одной игольницей, для двойного – с двумя. Существует классификация, по которой трикотажные переплетения подразделяются на главные и производные. Главные переплетения имеют простейшую структуру, в производных сочетаются несколько одинаковых главных переплетений, соединённых таким образом, что между петельными столбиками одного переплетения располагаются петельные столбики другого. На основе каждого из классов этих групп образовываются переплетения рисунчатые и

комбинированные, состоящие из различных переплетений нескольких классов. Рибана С Ажуром (Ластик С Ажуром) – эластичное мягкое трикотажное полотно в дырочку (ажур). За счёт рисунка, создаваемого дырочками, материал выглядит очень эффектно и нарядно. Этот материал хорошо сохраняет форму. Рибана прекрасно тянется по ширине и облегает фигуру, она очень мягкая, и является одной и самых популярных тканей для детской одежды. Так как это натуральный материал, он пропускает воздух и позволяет коже дышать.

KNITTING = ТРИКОТАЖНОЕ ПРОИЗВОДСТВО (или ВЫРАБОТКА ТРИКОТАЖА) – Knitting is another method of turning yarn into fabric. Knit fabric is constructed of yarns made into loops (stitches) which are linked together by the use of needles. There are two basic types of knitted fabric:- (i) the weft knit fabrics are made with yarns forming loops the width of the fabric on a circular machine, producing Jersey knit used in T-shirts and underwear; and (ii) the warp knit fabrics are produced by feeding yarns to form loops in a lengthwise direction and are used for tricot fabrics and cotton lace. Knitted fabrics are softer and more flexible than woven fabrics. Making them ideal for sweaters, active sportswear and hosiery. Knitting is a method of constructing fabric by interlocking a series of loops of one or more yarns. The two major classes of knitting are Warp Knitting and Weft Knitting. In warp knitting, yarns run lengthwise in the fabric; in weft knitting, the thread runs back and forth crosswise in a fabric. Warp knit fabrics are flatter, closer, and less elastic than the weft knit. Tricot and Milanese are typical warp knit fabrics, while Jersey is a typical weft knit. / делая их идеальной для свитеров, активной спортивной одежды и чулочно-носочных изделий. Технология производства трикотажа:- Полотно получают на ткацких станках путём ткачества, но это совсем другая технология, к трикотажу не имеющая отношения. Таким образом, для трикотажного изделия, сначала вяжется заготовка, а потом она кроится и сшивается. Швейные же изделия изготавливаются путём раскроя рулонов ткани. Трикотажное изделие характеризует большая растяжимость и пластичность, что придаёт ощущение лёгкости и комфорта. Трикотажные изделия могут быть изготовлены следующими способами:- (i) цельнокроёные (практически, по швейной технологии); (ii) частично кроёные (полурегулярные); и (iii) цельно вывязанные (регулярные). Цельнокроёные трикотажные изделия – полностью кроёные изделия, сделанные из трикотажного рулонного полотна (типа джерси). Такие изделия не имеют заработанных краёв. Все края (рукава, полочки, спинки) подвернуты и прошиты. Обычно, такая технология применяется для недорогих изделий, в массовых производствах и бельевом трикотаже. Частично кроёные трикотажные изделия – сделаны из трикотажных ‘купонов’ заданной ширины и длины. Такие изделия имеют заработанный (не подвёрнутый) край на рукаве, полочке, спинке и сшиваются в местах спряжений спинки с полочкой и рукавом. У частично кроёных изделий большое преимущество в достижении наилучшего прилегания и посадки изделия. Цельновывязанные трикотажные изделия – изделия вывязываются целиком без швов или отдельные детали вяжутся по контуру, а потом сшиваются цепным стежком. Это метод достаточно новый и наиболее дорогой. Две последние технологии наиболее применимы в эксклюзивном мелкосерийном производстве, так как дают возможность достичь высокого качества изделия, максимальный ассортимент изделий и быструю сменяемость моделей. Производство трикотажного изделия можно разделить на следующие этапы:- предварительная обработка пряжи; вязание купонов; стирка купонов; сушка купонов; отпарка купонов; крой купонов; швейная сборка изделий; межоперационная утюжка; ручные работы; окончательная утюжка; приёмка каждого изделия по качеству; упаковка, маркировка изделий; и складирование, хранение и отправка изделий. Сумма всех этапов даёт технологический цикл производства и от того на сколько качественно проделан каждый этап, и скажется на качестве трикотажных изделий. Некоторые производители не выполняют один или несколько из вышеперечисленных этапов, чтобы сократить время и затраты на выпуск, что, безусловно, отрицательно сказывается на качестве изделий. Очень важно понимать, что качество изделия трудно определить сразу (например, при выборе в магазине), обычно – это проявляется позже, в процессе эксплуатации или после первой стирки. Трикотажный гардероб делится на четыре основные группы по классам оборудования:- (i) 1 группа 2.5–3 класс (фасонные изделия, ручная вязка); (ii) 2 группа 5–8 класс (жакеты, жилеты, пальто); (iii) 3 группа 10–14 класс (юбки, брюки, джемпера); и (iv) 4 группа 16–24 класс (бельевой трикотаж). Класс трикотажа – показатель количества игол в одном дюйме вязального станка (один английский дюйм равен 25.4 мм). Пример:- в изделии 8 класса, на один дюйм приходится восемь игл, то есть расстояние между иглами примерно 3 мм, а в 3 классе расстояние между иглами примерно 8 мм. Другими словами, чем выше класс, тем тоньше изделие и наоборот. Трикотажное Производство подразумевает под собой совокупность главным образом механических технологических процессов, обеспечивающих формирование трикотажного полотна или трикотажных изделий из пряжи и химических нитей. Трикотажная машина (то же, что вязальная машина) применяется для механического вязания трикотажного полотна или штучных изделий. Первые трикотажные машины были созданы в Англии (ручная – в 1589, механическая – в 1769). В зависимости от способа прокладывания и провязывания нитей (пряжи) различают трикотажные машины поперечного и продольного вязания. Трикотажные машины могут быть плоскими и круглыми, одинарными и двойными. Трикотажная Промышленность – подотрасль текстильной промышленности. Трикотажные предприятия вырабатывают трикотажное полотно, включая техническое, чулочно-носочные изделия, бельевой и верхний трикотаж, перчаточные изделия, головные уборы, шарфы, а также изделия промышленного и медицинского назначения. В производстве трикотажных изделий используется широкий ассортимент нитей из хлопка, шерсти и химических волокон. Производство трикотажной одежды начало развиваться во Франции, Великобритании и Германии в конце XVIII – начале XIX веков. В России первые кустарные трикотажные предприятия появились в конце XIX века. В 1913 насчитывалось 22 таких предприятия, на которых было выпущено 15 миллионов пар чулочно-носочных изделий, 1.5 миллиона штук бельевых изделий, 250 тысяч штук верхнего трикотажа и 3 миллиона платков. В бывшем Союзе Советских Социалистических Республик (СССР) в 1928 в системе лёгкой промышленности (без трикотажных предприятий местной промышленности) чулочно-носочные и трикотажные изделия производились на 70 трикотажных предприятиях, было выработано 67.7 миллионов пар чулочно-носочных изделий, 6.9 миллионов штук бельевого трикотажа, 1.4 миллиона штук верхнего трикотажа. За годы довоенных пятилеток (1929–40) трикотажная промышленность получила большое развитие. Построены крупные трикотажные фабрики:- Ивантеевская Фабрика имени Дзержинского (Московская Область), Тушинская Чулочная Фабрика (Москва), Витебская Фабрика КИМ (Витебск, Беларусь), Киевская Фабрика имени Розы Люксембург (Киев, Украина), Азтрикотаж (Баку, Азербайджан), трикотажные предприятия в Новосибирске (Россия), Тбилиси (Грузия), Коканде (Узбекистан) и другие. В развитии трикотажной промышленности большую роль сыграли организация производства трикотажного оборудования (в Москве, Ленинграде, Полтаве и других городах) и расширение сырьевой базы. На выпуске пряжи для трикотажной промышленности был специализирован ряд прядильных фабрик. Благодаря выпуску искусственных волокон расширился ассортимент трикотажных изделий. В годы Великой Отечественной Войны 1941–45 трикотажной промышленности был нанесён большой ущерб. Были выведены из строя предприятия Украинской Советской Социалистической Республики (УССР; нынешней Украины), Белорусской Советской Социалистической Республики (БССР; нынешней Беларуси), Прибалтийских республик (нынешних Латвии, Литвы и Эстонии) и Западных областей РСФСР (нынешней России), на которых вырабатывалась значительная часть продукции трикотажной промышленности. В 4-й пятилетке (1946–50) разрушенные трикотажные предприятия были восстановлены, реконструированы и оснащены новым оборудованием; производство продукции трикотажной промышленности превысило довоенный уровень. Удельный вес одежды из трикотажа неуклонно повышался, что объяснялось её высокими функциональными характеристиками и экономичностью. Развитию трикотажной промышленности

способствовало непрерывно растущее производство химических волокон, особенно синтетических нитей (в частности, текстурированных), и быстрый прогресс техники для трикотажного производства. В 1950–75 были построены новые предприятия, оборудованные современными машинами и автоматами, с совершенной технологией. Среди них были прядильно-трикотажные комбинаты в Астрахани, Курске, Огре, Пинске, фабрики по производству трикотажного полотна в Великих Луках, Горловке, бельевого трикотажа в Андижане, Белове, Биробиджане, Джезказгане, Мукачеве, Орске, Рыбнице, Смоленске, чулочно-носочных изделий в Бресте, Караганде, Лысьве, Черемхове и других городах. Промышленное производство трикотажных изделий было организовано во всех бывших Союзных республиках. В 1974 трикотажная промышленность включала около 500 предприятий. Основной принцип размещения трикотажной промышленности – приближение её к месту потребления. Основные направления развития техники и технологии трикотажного производства:- создание автоматизированных поточных линий для производства полотна и чулочно-носочных изделий; интенсификация процессов путём замены оборудования более производительным; отделка полотен непрерывным способом с применением органических растворителей; дальнейшая специализация предприятий по производственному циклу и ассортименту изделий. Трикотажная промышленность была высоко развита и в бывших зарубежных социалистических странах (Болгарии, Венгрии, Германской Демократической Республики (ГДР), Польше, Румынии и Чехословакии). Из капиталистических стран того времени наиболее развитую трикотажную промышленность имели Великобритания, Соединённые Штаты Америки (США), Федеративная Республика Германия (ФРГ) и Япония.

KNITTING MACHINE = ТРИКОТАЖНАЯ МАШИНА (или ВЯЗАЛЬНАЯ МАШИНА) – Knitting Machine Types:- fully fashioned and flat knitting are the two most common manufacturing sectors within the industry. The knitting industry as a whole can be divided into four manufacturing sectors, these are:- fully fashioned, flat knitting, circular knitting and warp knitting. Within the wool industry both fully fashioned and flat knitting is widely used. Circular knitting is limited to certain markets and warp knitting is seldom used. (1) Circular Knitting Machines:- there are many types of circular knitting machines which produce long lengths of tubular fabric and quite often they are manufactured with very specific end uses in mind. (2) Double Jersey Machines are single Jersey machines with a dial which houses an extra set of needles positioned horizontally adjacent to the vertical cylinder needles. This extra set of needles allows the production of fabrics that are twice as thick as single Jersey fabrics. Typical examples include interlock based structures for underwear/base layer garments and 1 x 1 rib fabrics for leggings and outerwear products. Much finer yarns used as singles yarns do not present a problem for double Jersey knitted fabrics, as the double layer construction works to cancel out the residual torque between the face and reverse sides, the net effect being no spirality. (3) Flat Knitting Machines:- sometimes referred to as ‘Flatbeds’ or ‘V-beds’ due to the nature and arrangements of the knitting beds where two opposing needle beds are positioned so that the upper ends form an inverted ‘V’. Needles slide up and down the beds in slots known as ‘Tricks’ and in this case the gauge refers to the number of needles per 1 inch. The carriage or ‘cam box’ traverses across the needle beds and selects needles to be knitted as it reciprocates side to side. The carriage effectively raises and lowers the needles on both beds simultaneously as it passes over them, depending on the desired pattern. Needle bed lengths can vary from 1.0 m to 2.2 m width and each is designed for a specific task or purpose. What makes these machines so versatile, apart from the virtually unlimited patterning capacity, is that the stitches can be passed from one bed to the other and the beds can be moved linearly in relation to each other. This not only allows panels to be shaped, but it also opens up extensive patterning possibilities using stitch transfer, like those used in Aran-style sweaters. Furthermore, parts of the garment that are normally added during make-up such as pockets, collars, trims and V-necks can now all be knitted as an integral part of the panel. Advanced technology has now made it possible for complete garments to be knitted on the machine, without the need for any making-up. The technique of complete garment knitting is done in one of two ways – either using an adapted version of a V-bed or by using a special machine that has four needle beds. (4) Fully Fashioned Machines:- traditionally these machines produce plain classical-styled wool knitwear by producing panels that are shaped to style ‘Fashioned’ during knitting. After knitting the front, back and sleeve panels are linked to form the garment. Fully Fashioned machines are sometimes referred to as Straight-Bar, Flat Bar, ‘Cottons Patent’ or ‘Cotton machines’ due to patents that were given to William Cotton back in the mid-1800s. Bearded needles are used which are set into a straight-bar in a long row and the entire bar is reciprocated by rotary cams which causes the knitting action. The knitting yarn is laid across the width of the needles which is simultaneously followed by the sinkers/dividers, which push the yarn firmly against the stem of the needles ready for loop formation. Generally Fully Fashioned machines only have one set of needles and therefore can only produce plain knit fabric, making it necessary to produce the welts/cuffs on special ribbing knitting machines. The ribs are held on ‘running-on’ bars and are either transferred on to the Fully Fashioned machine by hand or automatically depending on the age of the machine. The patterning capability of Fully Fashioned machines is limited to plain knit fully fashioned panels. Machines with stitch transfer and intarsia capabilities can create the well-known ‘Argyle’ styles. The gentle knitting action of these machines allows the use of delicate fine count woollen spun yarns and also enables the machines to run faster where possible giving good knitting efficiency. The gauges of Fully Fashioned machines range from a relatively course 9gg (needles per 1.5 inch) through to a super-fine 33gg. (5) Single Jersey Machines are equipped with a single cylinder, about 30 inch diameter, of needles that produce plain fabrics (single thickness). Wool production on single Jersey machines tends to be limited to 20 gauge or coarser, as these gauges can use two-fold wool yarns which will give spirality-free fabrics. An additional inherent feature of wool single Jersey fabrics is that the fabric edges tend to curl inwards. This is not a problem whilst the fabric is in tubular form but once cut open can become so if the fabric is not finished correctly. Other single Jersey-based machines include:- terry loop machines:- the basis for fleece fabrics which are produced by knitting two yarns into the same stitch, one ground yarn and one loop yarn. These protruding loops are then brushed or raised during finishing creating a fleece fabric. Sliver knitting machines:- single Jersey machines that have been adapted to trap a sliver of staple wool fiber in to the knit structure. / Машины Дьжёзи (Jersey Machines). Вильэм (William). Трикотажные Машины подразделяются на две большие группы:- Основовязальные Машины и Кулирные (или Поперечновязальные) Машины; и те и другие, в свою очередь, делятся на две подгруппы:- Круглые Вязальные Машины (Circular Knitting Machines) и Плоские Вязальные Машины (Flat Knitting Machines). (1) К круглым основовязальным трикотажным машинам относятся Чулочные Машины с язычковыми иглами. (2) К плоским основовязальным трикотажным машинам относятся:- (i) Вертелки с пазовыми иглами; (ii) Вертелки и Рашельные Вертелки (или Рашель-Вертелки) с крючковыми иглами; и (iii) Рашельные Машины (или Машины Рашель) с язычковыми иглами. (3) К круглым поперечновязальным трикотажным машинам относятся:- (i) Мальезные Машины и Машины МТ с крючковыми иглами; и (ii) Многосистемные Машины, Чулочные Автоматы и Тонколастичные Машины с язычковыми иглами. (4) К плоским поперечновязальным трикотажным машинам относятся:- (i) Котонные Машины с крючковыми иглами; и (ii) Фанговые Машины, Оборотные Машины и Перчаточные Машины с язычковыми иглами. Кругловязальные Машины (КВМ), которые бывают однофонтурные (имеющие одну игольницу) и двухфонтурные (имеющие две игольницы); Основовязальные Машины (ОВМ), в том числе и Рашельные Машины (или Вертелки); Плетельные Машины; Плосковязальные Машины (ПВМ; привод замковой каретки); Чулочно-Носочные Автоматы (ЧНА). Трикотажная Машина (Knitting Machine) – вязальная машина, применяется для механического вязания трикотажного полотна или штучных изделий. На трикотажной машине осуществляется образование из нитей петель и соединение их между собой в разнообразные переплетения. Трикотажные машины различают по назначению, конструкции, виду трикотажных игл и так далее (смотрите в статье Вязание). Основные типы трикотажных машин:- Плоские Основовязальные и Круглые Поперечновязальные. Все

трикотажные машины подразделяются на классы, которые определяются числом трикотажных игл, приходящихся на единицу длины игольницы. Наиболее распространена Английская система, в которой за единицу измерения длины игольницы принят Английский дюйм (1 дюйм = 25.4 миллиметров (мм)). В бывшем Союзе Советских Социалистических Республик (СССР) выпускались машины от 3-го до 36-го классов. Чем выше класс машины, тем более тонкое полотно она вырабатывает. Например, для вязания тонких чулок применяли трикотажные машины 34-го класса, что соответствовало размещению игл в игольнице с шагом (расстояние между иглами) 0.75 мм. Основные рабочие органы трикотажной машины:- петлеобразующий (вязальный) механизм, механизм питания (подачи нитей) и оттяжной механизм (товароотвод). Петлеобразующий Механизм имеет игольницы с иглами, платины, пресс (для крючковых игл), нитеводители и другие элементы. Платины (пластинки, имеющие сложную форму) изгибают нити в петли и передвигают их вдоль стержня иглы (если иглы неподвижны) или удерживают (если иглы подвижны); размещаются на машинах обычно по одной в промежутках между иглами. Пресс представляет собой призму, пластинку или диск, которые, нажимая на крючок, препятствуют попаданию петли под него. Механизм Питания во время прокладывания нити на иглы обеспечивает определённое и постоянное натяжение её с помощью нитенаправителей, тормозов, нитеоттягивателей и других приспособлений. Имеются механизмы питания, в которых дозируется (отмеривается) длина нити для каждого петельного ряда. Питание пряжей может осуществляться подачей отдельных нитей (машины поперечного вязания) и групп нитей (основовязальные машины). Оттяжной Механизм служит для отвода от игольниц готового трикотажа с постоянным натяжением. Может быть грузовым (натяжение создаётся под действием веса товароотводящей системы или груза) или оттяжным (оттягивание осуществляется с помощью валиков). Процессы вязания на трикотажной машине автоматизируются с помощью механизмов, контролирующих непрерывность питания, постоянство натяжения нитей, исправность игл, наличие дефектов (спущенных петель) и тому подобное. При вязании штучных изделий используют механизмы, выполняющие перенос петель при изменении ширины полотна, образующие разделительные петельные ряды, вводящие усилительную нить, изменяющие плотность вязания, вывязывающие сложные объёмные формы в изделиях (чулки, перчатки) и другое. Разработаны электронные устройства управления работой трикотажной машины, механизмы отбора (введения в работу) игл при вязании рисунчатых и ажурных переплетений. Для вязания искусственного меха используют круглые трикотажные машины, имеющие в каждой петлеобразующей системе миниатюрные чесальные аппараты. С помощью этих аппаратов в петли ввязываются пучки длинных волокон, образующих ворс. Производительность трикотажных машин (миллион петель в 1 минуту):- основовязальных – до 3.74; круглотрикотажных – до 5.94; круглочулочных автоматов – до 1.44. Широкое распространение получили трикотажные машины, изготавливаемые в Германии, США, Великобритании, Чехии. Дальнейшее развитие трикотажных машин направлено на повышение класса машин, увеличение числа петлеобразующих систем и автоматизацию процесса вязания. Помимо промышленных трикотажных машин, выпускаются также бытовые ручные вязальные машины и аппараты. Основные узлы ручных машин:- петлеобразующие элементы (язычковые иглы и платины), каретка, счётчик рядов. Каретка управляет работой игл и платин в момент вязания; перемещается вручную по направляющим рельсам. Вязальные аппараты имеют оттягивающие крючки, гребёнку со штырями, на которую вручную навешивают петли, и линейки, при помощи которых перемещаются крючки и регулируется плотность вязания. Кеттельная Машина (от Немецкого слова Ketteln, означающее Соединять Петли) – машина для соединения (кеттлёвки) открытых крайних петель частей трикотажных изделий (носков, чулок и других) кеттельным швом, по структуре и свойствам близким к трикотажу. Кругловязальная Машина (КВМ; Circular Knitting Machine) – машина для вязания трикотажа в виде трубки. Имеет цилиндрическую игольницу, оснащённую язычковыми или крючковыми иглами. Оборотная Машина – машина для вязания полотен и деталей верхних изделий двойными или одинарными переплетениями. Оборотные машины имеют 2 игольницы, расположенные одна против другой; в пазах игольниц перемещаются двухголовочные язычковые иглы с помощью игловодителей. Если иглы переводить из одной игольницы в другую, то можно получать изнаночные переплетения. Основовязальная Машина (ОВМ) – трикотажная машина (плоская или круглая) для выработки трикотажа различных видов. Основовязальная машина – машина продольного вязания. Нити прокладываются одновременно на все иглы гребёнками, каждая на свою иглу. Основовязальные машины отличаются классом (числом игл на 1 единицу длины игольницы), числом гребёнок (от 2 до 8), шириной рабочей части игольницы (от 2 до 6 метров). Основовязальные машины бывают одинарные и двойные. Последние имеют 2 игольницы. Основовязальные машины применяют для выработки трикотажа различного назначения:- белья, платьев, костюмов, спортивных изделий, гардин, ковров, искусственного меха, полотен технического назначения и тому подобного. Плоская Кулирная Машина или Котонная Машина – трикотажная машина поперечного вязания; служит для выработки одинарного трикотажа всех видов. Имеет одну или две плоские игольницы, в пазах которых неподвижно установлены крючковые иглы. Плосковязальная Машина (ПВМ) – трикотажная машина поперечного вязания. Вырабатывает гладкий и рисунчатый, одинарный и двойной трикотаж для верхней одежды, а также трикотаж в виде трубки или деталей заданной формы. Петлеобразующими органами являются 2 игольницы с зубьями, расположенными под углом друг к другу, и язычковые иглы, которые перемещаются замковой кареткой с нитеводами. Плосковязальные машины подразделяют на ручные, механизированные (полуавтоматы) и автоматы.

KNITTING NEEDLE = ТРИКОТАЖНАЯ ИГЛА – Knitting Needle is the principal part of the loop-forming mechanism of knitting machines. The knitting needle, made of wire or flat steel, is 25–100 mm long and 0.3–1 mm thick. The size of the loop depends on the thickness of the needle:- the thinner the needle, the smaller the loop it can make and the more loops that can be formed per unit of fabric width. The most common types of knitting machine needles are classified as latch, spring, and compound needles. The hook of a Latch Needle is opened and closed by a latch, which is activated by a loop as the loop slides along the needle. The needle is provided with a butt or butts so that it may be inserted into the groove of the needle cylinder; the number of butts depends on the design of the knitting machine. In addition to single-hook needles there are also double-hook needles with two latches. Latch needles are used in virtually all types of machines that have Raschel knitting action. The hook of a spring needle has an elongated shape. During loop formation, a special device called a Presser forces the hook down into a groove on the needle, preventing the loop from catching on the hook. Spring Needles are usually rigidly fixed in the needle cylinder by means of a butt. They are used in warp machines of the Vertelka type (Raschel machines), as well as loop-wheel machines, multisection spring-wheel frames, and other machines that have warp knitting action. Compound Needles consist of a hollow rod with a hook and a sliding member (latch) that moves inside a groove in the rod to close the hook. The needles are rigidly secured in the needle cylinder and are used in warp machines of the Vertelka type, which have Raschel knitting action. See also Bearded Spring Needle, Latch Needle, Needle (2), and Spring Needle. The fundamental elements in construction of knitted fabrics are the Knitting Needles as they are the main elements for intermeshing of loops. The quality of the knitted fabric is largely dependent on the effectiveness and accuracy of the loop, which in turn largely depends on the needle. Small variations in the needle manufacture can lead to irregular fabric. The surface of needles should be highly polished allowing the yarn and the loop to slide free. The needle must have high strength and toughness to give durability. A typical needle must perform several million knitting actions without fault. Types of knitting needles:- these are:- Bearded Needle; Compound Needle; and Latch Needle. The Latch Needle is primarily used in weft knitting, and the other two are used for warp knitting. A coarse (large and thick) needle usually knits with a coarse yarn (large hook), whereas a fine (small and thin) needle usually knits with fine yarn (small hook). / Под Трикотажной Иглой понимается основная деталь петлеобразующего механизма трикотажных машин, служащая для

образования петель. Изготоляется из стальной проволоки или ленты; имеет длину 25–100 миллиметров (мм), толщину 0.3–1 мм. От толщины иглы зависит размер петли:- чем тоньше игла, тем меньше петля, которую можно на ней получить, и тем больше петель помещается на единицу ширины трикотажного полотна. Наиболее распространены Язычковые (Latch Needle), Крючковые (Bearded Needle) и Пазовые (Compound Needle) трикотажные иглы. Крючок (hook) Язычковой Иглы закрывается и открывается язычком, который поворачивается петлёй, скользящей по игле при петлеобразовании. Для перемещения иглы в пазу игольницы служат пяточки (butts), число которых зависит от конструкции машины. Помимо одноголовочных, иглы бывают также двухголовочные, с двумя язычками и другие. Применяются почти во всех типах машин, выполняющих петлеобразование по вязальному способу. У Крючковой Иглы крючок имеет удлинённую форму. При петлеобразовании специальное устройство (пресс) нажимает на крючок, который погружается в чашу (groove или eye; углубление на стержне иглы), препятствуя попаданию петли под крючок. Иглы с помощью пяточек закрепляются в игольнице обычно неподвижно. Применяются в основовязальных машинах типа ‘Вертелка’, а также мальезных, котонных и других, выполняющих петлеобразование по трикотажному способу. Пазовые Иглы состоят из стержня (stem) с крючком и движка (замыкателя), перемещающегося для закрывания крючка в пазу вдоль стержня иглы. Закрепляются в игольнице неподвижно. Используются в основовязальных машинах типа Вертелка, выполняющих петлеобразование по вязальному способу.

KNITTING PROCESS = ПРОЦЕСС ВЯЗАНИЯ (или ПРОЦЕСС ПРОИЗВОДСТВА ТРИКОТАЖА) – Industrial Knitting Process:- it is a known fact that the main material for fabric construction is yarn. Knitting is the second most frequently used method, after weaving, that turns yarns or threads into fabrics. It is a versatile technique that can make fabrics having various properties such as wrinkle-resistance, stretchability, better fit, particularly demanded due to the rising popularity of sports wear and casual wears. As of present day, knitted fabrics are used widely for making hosiery, underwears, sweaters, slacks, suits and coats apart from rugs and other home furnishings. Knitting Industry:- knitting industry is a very complex one. It has two primary areas having their own sub divisions of specialization. One of the key segment of knitting industry manufactures knitted goods for garment manufacturers, sewing centers, and consumers among others. The other one produces finished apparels such as hosiery, sweaters, underwear etc. Basic Principle of Knitting:- a knitted fabric may be made with a single yarn which is formed into interlocking loops with the help of hooked needles. According to the purpose of the fabric, the loops may be loosely or closely constructed. Crocheted fabric is the simplest example of knitting where a chain of loops is constructed from a single thread with the help of a hook. As the loops are interlocked in a knitted fabric, it can stretch in any direction even when a low-grade yarn having little elasticity is used. Basic Construction Process of Knitted Fabric:- the construction of knitted fabric is assessed by the number of stitches or loops per square inch. When the interlocking loops run lengthwise, each row is called a Wale that corresponds to the direction of warp in woven fabrics. When the loops run across the fabric, each row is called a Course that corresponds to the filling or weft in woven fabrics. A knitted fabric having 50 loops or stitches in one inch of width and 60 loops in one inch of length will be said to have 50 wales and 60 courses. Importance of Needles in Knitting Process:- the needle quality also affect the knitted fabric’s quality. If the thickness of the hook differs from one needle to another then the stitches will also vary in width. Same is the case with loops which will vary in length with the needle lengths. Various types of needles are used for making different knitted fabrics including latch needle, spring-beard needle, and compound needle. Latch needle has a latch or swinging finger that closes onto the hook of the needle as it pulls the yarn through a loop in order to form a new loop. It is used for Jersey and rib knitting. A spring-beard needle has a fine, springy hook looking like a beard. This hook has to be used with a sinker to hold the fabric down and a presser to close the hook as it forms the loop. It is used for making more fine fabrics with smaller loops. A compound needle made up of a hook and a sliding closing element is used for faster knitting with lesser fabric distortion. Types of Knitted Fabrics:- there are various types of knitted fabrics and each type has different appearance and characteristics. The construction of a knitted fabric depends upon the type being constructed. A knitted fabric that has more wales will be rigid and stable in width while a fabric that has more courses will be rigid and stable in length. A fabric having many wales and courses per square inch will have better recovery from stretching than a fabric having lesser wales and courses. Such fabric that will have fewer wales and courses will be less rigid, stretch more easily, fit to body shape in a better way but will have poorer recovery ability. All the knitted fabrics are classified into two general categories:- (i) Weft Knit Fabric, where one continuous yarn forms courses across the fabric; and (ii) Warp Knit Fabric, where a series of yarns form wales in the lengthwise direction of the fabric. Weft Knitting:- there are three basic stitches in weft knitting:- (a) Plain-Knit Stitch; (b) Purl Stitch; and (c) Rib Stitch. Any other stitch is a variation of these three stitches. Hand knitting is basically weft knitting. When done on weft knitting machines, individual yarn is fed to a single or multiple needles at a time. (a) Plain-Knit Stitch:- plain knit, the basic form of knitting can be produced in flat knit or in tubular (or circular) form. It is also called Jersey Stitch or Balbriggan Stitch. A row of latch or beard needles is arranged in a linear position on a needle plate or in a circular position on a cylinder. The side by side evenly spaced needles are moved by cams, which act on the needle butts. The spacing of the needles is called Guage, Gage or Cut which refers to the number of needles in one and a half inches, for example, a 60 guage machine will have 40 needles per inch. The needles intermesh loops drawn to one side of the fabric, forming vertical herringbone like ribs or wales on the right side or technical face of the fabric. On the reverse side or the technical back, courses are visible as interlocking rows of opposed half circles. These fabrics have the tendency of curling up at the edges which is controlled to a level through certain finishes. Plain knit allows the use of single or plied yarns produces comparatively lightweight fabrics than produced by other stiches. The production rate is higher, about 5 times more than weaving. It is inexpensive and a variety of designs may be produced including stripes, multicolored patterns, textured surfaces produced by raised designs and pile effects. Plain-knit fabrics stretch more in the width than in the length and as such, they are widely used for making underwear, gloves, hosiery and sweaters. (b) Purl Stitch:- purl stitch, also called Link-and-Link Stitch, is made on flat bed knitting machines and circular machines by needles using hooks on both ends to alternately draw loops to the front of the fabric in one course and to the back in the next course. The fabrics look similar on both the sides resembling back of the plain knit. Heavy, jumbo stitch is also possible which gives a bulky effect to the fabrics. However, It is comparatively slower and a costly technique. The fabric doesn’t curl at the edges. Purl stitch is widely used in infant wear and kids clothing due to its crosswise stretch and excellent lengthwise stretch. (c) Rib Stitch:- rib stitch produces alternate lengthwise rows of plain and purl stitches and as such the face and back of the fabrics are a lookalike. Rib stitch can be produced on a flat rib machine as well as circular rib machine. In the flat rib machine, one set of needles is placed opposite the other set of needles in an inverted V position. In the circular rib machine, one set of needles is placed vertically in a cylinder and the other set of needles is placed horizontally on a dial. In both the machines, one set of needles pulls the loops to the front and the other set of needles pulls the loops to the back of the fabric. Each set of needles alternately draws loops in its own direction, depending on the width of the rib desired. For instance, rib stitches can be 1 x 1, 2 x 2, 2 x 1, 3 x 1, and the like. Accordion rib is the combination of 1 x 1 and 2 x 2. As a greater amount of yarn is required for rib stitch and the rate of production is also slower, it is an expensive method of fabric construction. The fabric doesn’t curl at the edges and as the fabric possess an excellent widthwise elasticity, it is widely used for making such clothing that needs an excellent fit such as wristbands of sleeves and waistbands of garments, underwear and socks for men and children. (1) Warp Knitting:- warp knitting is different from weft knitting in the sense that in it each needle loops its own thread. The needles of warp knitting machines produce parallel rows of loops that are interlocked in a zigzag pattern. The stitches on the front side of the fabrics appear vertically having a slight angle. The stitches on the backside appear horizontally as floats at a slight angle. These floats are called Laps or Underlaps and are a distinguished features of warp knit fabrics. Warp knitting machine Warp knitting

may be flat or tubular that can produce a variety of patterns. It is a very fast technique that can produce fabric with a dimensional stability almost equal to that of a woven fabric. It can also use yarns of man made fibers very efficiently. There are basically seven types of warp knitting:- (i) Tricot Knit; (ii) Milanese Knit; (iii) Simplex Knit; (iv) Raschel Knit; (v) Ketten Raschel Knit; (vi) Crochet; and (vii) Weft-Insertion Warp. Warp knit fabrics are very popular due to their many properties such as smoothness, sheerness, wrinkle resistance, shrink resistance, strength and abrasion resistance. Comparison of Weft Knitting and Warp Knitting:- warp knit fabrics have certain advantages over weft knits:- (i) warp knit fabrics do not ravel easily; (ii) they are less prone to sagging; (iii) quality is generally better than weft knits; (iv) Stitch definition, texture and fabric cover are also usually better than weft knits; and (v) warp knits have superior dimensional ability. / (a) (Plain-Knit Stitch); (b) Бисерный Стежок (Purl Stitch) при обмётке петли; and (c) (Rib Stitch). соответствует уточине или утку в тканых тканях. Трикотажное Переплетение, строение петельной структуры трикотажа; определяет внешний вид трикотажа и его свойства (упругость, крепость, воздухопроницаемость и другие). Трикотажное переплетение отличаются друг от друга составом элементов петельной структуры (петля, набросок, протяжка) и их взаимным расположением. В зависимости от числа нитей, участвующих в процессе образования петельного ряда, различают поперечновязаные (кулирные) и основовязаные трикотажные переплетения. При поперечновязаном трикотажном переплетении горизонтальный петельный ряд образуется последовательным изгибанием одной нити. В основовязаном трикотажном переплетении горизонтальный петельный ряд составляется системой нитей (основой), отдельные нити образуют последовательно по 1 (редко по 2) петле в каждом ряду. Трикотажные переплетения бывают одинарные и двойные. У одинарного трикотажа одна сторона состоит из лицевых петель, у двойного, который вырабатывается на трикотажных машинах с 2 игольницами, обе стороны лицевые. Из многочисленных видов трикотажных переплетений обычно выделяют простейшие (главные), производные, комбинированные и сложные переплетения. В главных трикотажных переплетениях каждый ряд состоит из самого простого сочетания только одного основного элемента – петель. В группу главных поперечновязаных трикотажных переплетений входят:- гладь кулирная (одинарное однолицевое трикотажное переплетение) и ластик (двойное, двухлицевое трикотажное переплетение). Группа главных основовязаных трикотажных переплетений включает цепочку, трико и атлас, которые могут быть и одинарными, и двойными. Трикотажное переплетение цепочка не представляет собой трикотаж в обычном понимании этого слова. Цепочка состоит из петель одной нити, нанизанных друг на друга. Цепочки не имеют поперечной связи между собой; используются для получения более сложных основовязаных трикотажных переплетений, например, трико и атласа. Производные трикотажные переплетения (производная гладь, производный ластик и другие) представляют собой сочетание петельных столбиков из разных видов простейших трикотажных переплетений. В группу комбинированных трикотажных переплетений (например, прессовых, жаккардовых и других) входят переплетения, у которых в горизонтальных петельных рядах сочетаются различные элементы петельной структуры и чередование рядов более сложное по сравнению с простейшими трикотажными переплетениями. Сложные трикотажные переплетения (ажурные, зигзагообразные и другие) получают путём дополнительных операций при петлеобразовании, например, перенесением петель, переплетением с фиксированным расположением 2 нитей в петле.

KNITWEAR = ТРИКОТАЖ (или ВЯЗАНАЯ ОДЕЖДА) – Knitwear is the knitted apparel, including hosiery, underwear, outerwear, and sportswear. Knitwear is a knitted clothing. / Под Трикотажем, от Французского слова Tricotage от Tricoter (Трикотэ), означающее Вязать, понимаются текстильные изделия или полотна, полученные из одной или многих нитей путём образования петель и их взаимного переплетения. По структуре трикотаж подразделяется на поперечновязаный (кулирный) и продольновязаный (основовязаный), одинарный и двойной (более плотный и тяжёлый), гладкий и рисунчатый. Из трикотажа изготовляют одежду, береты, перчатки, платки, чулки и тому подобное, а также гардины, ковры, технические изделия (прокладки, сети, трубки, фильтры), изделия медицинского назначения (бинты, кровеносные сосуды, протезы внутренних органов) и так далее.

KNOCKED DOWN = ПОЛУЧИВШЕЕ ПОСТОЯННЫЙ КРЕН – Knocked Down (maritime term):- the situation of a vessel when listed over by the wind to such an extent that she does not recover.

KNOCKED DOWN = РАЗОБРАННОЕ – Knocked Down:- articles which are taken apart to reduce the cubic footage displaced or to make a better shipping unit and are to be re-assembled. / Изделия, которые разобраны с целью уменьшения занимаемого кубического футажа или для формирования более приемлемой грузовой единицы, и которые должны быть собраны заново.

KNOCKED DOWN CONDITION = В РАЗОБРАННОМ СОСТОЯНИИ – Knocked Down Condition:- goods, e.g., vehicles, dismantled for transit. / Товары, например, транспортные средства, демонтированные для транзита.

KNOCK–IN OPTION = ОПЦИОН НА ПРИБЫТИЕ – In options, Knock-In Option is an exotic option in which the option becomes valid only when a predetermined price level (usually different to the strike price) is touched during the lifetime of the option.

KNOCK OFF = ШАБАШ (или ПРЕКРАЩАТЬ, или ЗАКАНЧИВАТЬ) – Knock Off (maritime term):- to stop, especially to stop work.

KNOCK–OUT BARRIER = БАРЬЕР ДЛЯ ВЫБЫВАНИЯ – Knock-Out Barrier is a type of barrier. Such barriers can be integrated into, for example, warrants or certificates. If the underlying goes above or below the barrier, the knock-out product expires and becomes worthless. Some knock-out products have an additional integrated stop-loss limit at which the warrant or certificate expires, but the investor receives a rebate for the residual value that depends on the distance to the knock-out barrier.

KNOCKOUT OPTION = ОПЦИОН НА ВЫБЫВАНИЕ – Knockout Options (a type of OTC barrier option) differ from standard options in that they are canceled if the exchange rate reaches certain knockout levels, and therefore leave the investor unhedged against large exchange rate movements. Nonetheless, they are widely used since they are less expensive than standard options. In 1995 and 1998, knockout options, particularly down-and-out put options on the Dollar, amplified exchange rate dynamics through two separate channels:- (i) Japanese exporters who bought knockout options to protect against a moderate depreciation of the Dollar sold Dollars into a declining market when the knockout options were canceled to prevent further losses on their Dollar receivables; and (ii) dynamic hedging strategies employed by sellers of knockout options required the sudden sale of Dollars after the knockout levels had been reached. Ironically, OTC knockout options that protect only against moderate exchange rate fluctuations can sometimes increase the likelihood of large exchange rate movements – the very event they do not protect against. Although knockout options represented a relatively small share of total outstanding currency options (between 2 and 12 percent), they had a profound effect on the market for standard exchange-traded options. It is easy to see why:- knockout options are sometimes hedged by a portfolio of standard options. Dealers who employed this hedging technique needed to buy a huge amount of standard options at the same time as other market participants were trying to contain losses from canceled down-and-out puts. As a consequence, prices of exchange-traded put options (implied volatilities) doubled in March 1995 and almost doubled in October 1998. An option that is worthless at expiration if the underlying asset or currency price reaches a specific price level. Knock-Out Option is an exotic option which is automatically terminated or ‘knocked out’ if the price of the underlying asset reaches a predetermined level (usually different to the strike price) during the lifetime of the option. / Опцион, который ничего не стоит в плане прибыли на дату прекращения признания, если цена соответствующего актива или валюты достигла своего определённого уровня. Опцион на Выбывание – вид производного

финансового инструмента, дающего покупателю право, но не обязывающего его купить товар, валюту или занять другую позицию по текущей цене. Однако в отличие от обычных опционов такие опционы теряют ценность, или 'получают нокаутирующий удар', если цена товара или валюты, на которые составлен контракт, достигают определённого уровня. Например, опцион на выбывание на базе курса Доллара США к Немецкой Марке получает 'нокаутирующий удар', если курс Доллара по отношению к Марке упадёт ниже определённого уровня. Обычные опционы не устанавливают нижних и верхних пределов. Опционы на выбывание гораздо дешевле обычных опционов и позволяют покупателю занимать более активные позиции, вкладывая меньше денег. Опционы на выбывание часто используются хэдьж фондами и другими спекулянтами.

KNOP = ШИШКА (или ПОЧКА, или ВЫПУКЛОСТЬ, или УЗЕЛ, или КУЧКА) – Knop is a 'bunch' of fibers appearing along the length of yarn, giving a spot effect. / эффект пятна. Шишки – короткие местные утолщения пряжи, образованные прикрученным к пряже пухом.

KNOT = СУЧОК – Knot is that portion of a branch or limb that has been surrounded by subsequent growth of the stem. The shape of the knot as it appears on a lumber surface depends on the angle of the cut relative to the long axis of the knot. See also Loose Knot, Pin Knot, and Sound Knot. / Та часть сучка или ветви, которая окружалась/опоясывалась последующим ростом стебля. Форма сучка, находящегося на поверхности пиломатериалов, зависит от угла пропила относительно продольной оси сучка. Смотрите также Выпадающий Сучок (Loose Knot), Булавочный или Карандашный Сучок (Pin Knot), и Здоровый Сучок (Sound Knot). Под Сучком понимается часть ветви, заключённая в древесине ствола. В пилопродукции и деталях измерение сучков в зависимости от их разновидности измеряют следующими способами:- (i) не выходящие на ребро круглые, овальные, продолговатые и разветвлённые сучки измеряют:- (a) по расстоянию между касательными к контуру сучка, проведёнными параллельно продольной оси сортимента, и (b) по наименьшему диаметру разреза сучка; (ii) сшивные сучки, а также выходящие на ребро продолговатые и разветвлённые сучки измеряют:- (a) по расстоянию между ребром и касательной к контуру сучка, проведённой параллельно ребру, с измерением на той стороне сортимента, куда выходит поперечный разрез сучка, и (b) по наименьшему диаметру продольного сечения сучка; выходящие на ребро продолговатые и разветвлённые сучки, если это обусловлено спецификой сортимента, допускается измерять и по расстоянию между ребром и касательной к контуру сучка, проведённой параллельно ребру, с измерением на той стороне сортимента, куда выходит продольное сечение сучка; для разветвлённых сучков допускается измерять, если это обусловлено спецификой сортимента, и по сумме размеров составляющих сучков с измерением каждого из них по способу, соответствующему его разновидности по форме; (iii) выходящие на ребро круглые и овальные сучки измеряют:- (a) по расстоянию между ребром и касательной к контуру сучка, проведённой параллельно ребру, и (b) по протяжённости сучка на ребре; (iv) групповые сучки измеряют суммой размеров всех сучков, выходящих на одну сторону сортимента, с измерением каждого сучка по способу, соответствующему его разновидности по форме; и (v) сучки, окружённые корой, измеряют вместе с корой по способу, соответствующему разновидности каждого сучка. Сучковатость – порок древесины, вызываемый наличием в ней оснований ветвей (сучков), живых или отмерших в период роста. Сучковатость нарушает однородность строения древесины, ухудшает её механические свойства и затрудняет обработку. Прорость – порок древесины в виде зарастающей или заросшей раны, содержащей кору и омертвелую древесину. Различают прорость открытую и закрытую.

KNOT = УЗЕЛ – (1) Knots is how the speed of aircraft and boats is measured. Both miles per hour and knots is a speed which is the number of units of distance that is covered for a certain amount of time. 1 knot = 1 nautical mile per hour = 6 076 feet per hour. 1 mph = 1 mile per hour = 5 280 feet per hour. For example, if a train is moving at 50 mph on a track, how would you represent this speed in knots (even though trains are not usually represented in knots)? To do this problem easily, one must convert the speed in miles per hour that the train is moving to the speed in feet per hour. This is accomplished by multiplying by the number of feet in a mile. That is, (50 mph) x (5 280 feet/mile) = 264 000 feet/hr. Now, convert the feet per hour to knots by multiplying by the knots conversion factor (1 knot / 6 076 (feet/hr)). (264 000 (feet/hr)) x (1 knot / 6 076 (feet/hour)) = 43.4 knots. In aerodynamics, speed is also measured by the Mach number, which is the ratio of the speed of the object to the speed of sound. Mach 1 means that you are traveling at the speed of sound or 661.7 knots, or Mach 1 = 661.7 knots. Knot:- speed of 1 nautical mile per hour (1.7 land miles per hour). 1 knot (kn or kt) = 1 nautical miles/hour (nmi/h or naut mi/h) = 1.150 8 statute miles/hour (st mi/h) = 1.852 kilometers/hour (km/h). The Knot is defined as one nautical mile per hour; 1 kn = (1 852 / 3 600) m/s. There is no internationally agreed symbol, but the symbol kn is commonly used. Knot is the unit of velocity equal to one nautical mile per hour. Knots are customarily used to express speeds at sea, including the speed of the ship as well as the speeds of the wind and of the current. The word comes from the former method of measuring a ship's speed, which involved use of a knotted cord called the Log Line. One knot equals about 1.150 8 miles per hour, exactly 1.852 kilometers per hour, or 0.514 3 meters per second. Since kt is the established symbol for the kilotonne, kn is the best choice as a symbol for the knot. Abbreviation:- kn or kt. Knot is the unit of speed in navigation which is the rate of nautical mile (6 080 feet or 1 852 meters) per hour. Knot:- one nautical mile (6 076 feet or 1 852 meters) per hour. In the days of sail, speed was measured by tossing overboard a log which was secured by a line. Knots were tied into the line at intervals of approximately six feet. The number of knots measured was then compared against time required to travel the distance of 1 000 knots in the line. / Узел является внесистемной единицей скорости, применяемой в морской навигации для определения скорости судов. 1 узел соответствует 1 морской миле в час или 1.852 километра в час (км/ч) или 0.514 4 метра в секунду (м/с). Обозначение:- уз (kn или kt). Узел в навигации, внесистемная единица скорости, применяемая для определения скорости судов. 1 узел = 1 миля/ч = 1.852 км/ч = 0.514 4 м/сек. Термин Узел возник во времена парусного флота, когда скорость судов определяли по быстроте сматывания троса (лаглиня) с вьюшки ручного лага. Лаглинь был разбит на отрезки по 50 футов 8 дюймов (мили), обозначавшиеся Узлами. Скорость сматывания лаглиня определялась за время мин (ч). Количество узлов (отрезков), сошедших с вьюшки за мин, соответствовало скорости судна в милях в час.

(2) Knot:- a twisting, turning, tying, knitting, or entangling of ropes or parts of a rope so as to join two ropes together or make a finished end on a rope, for certain purpose.

(3) Knot:- joint of broken thread. Spinning defect. Knots:- occurs when broken threads are pieced together by improper knotting. Yarn Defect. / Порок или дефект прядения.

(4) Knot is defined as a knob or lump formed by interlacing portions of one or more flexible strands or a quantity of yarn, or thread, which varies with the fiber; it consists of a set of coils. Control in pirn winding, the winding to binding coils ratio can solve this problem. Woven fabric defect. (1) Defect Name:- Knot. Defect Type:- Isolated Defects. Fabric Type:- Denim Bottomweights – Piece Dyed. Description:- Knot:- This is a spooler knot. Severity:- Minor. (2) Defect Name:- Knot. Defect Type:- Isolated Defects. Fabric Type:- Shirting and Dress Goods – Oxford or Basket. Description:- Knot:- A place where two ends of yarn have been tied together, and the tails of the knot are protruding from the surface. Severity:- Minor. Knot is a fastening made by tying together the ends of yarn. Causes:- thread breaks during process of winding, warping, sizing or weaving. Mending:- non mendable. / Порок или дефект сотканной ткани. Под Узлом понимается местный порок в виде связанных концов нитей, заметных на лицевой стороне полотна.

KNOTS = УЗЛЫ – Defect Name:- Knots. Defect Type:- Isolated Defects. Fabric Type:- Shirting and Dress Goods – Plain Weave. Description:- Threshold Scale for Knots:- These graduations of slubs are designed to facilitate determination of thresholds-for-penalty in point grading. Value of 1; Value of 2; Value of 3; Value of 4; and Value of 5. Scale of 1 to 5 with 1 being the lowest penalty and 5 being the highest penalty. Severity:- Minor. Knots:- caused by tying spools of yarn together.

KNOTS WITH HALOS = УЗЛЫ С ГАЛО (или УЗЛЫ С ОРЕОЛОМ) – Defect Name:- Knots With Halos. Defect Type:- Isolated Defects. Fabric Type:- Bottomweights – Sateen Derivatives. Description:- Knots With Halos:- These are spooler knots. During the dyeing process the knots, being the last to dry, tend to wick the dye from the surrounding area, leaving halos. Severity:- Minor.

KNOTTED FRINGE = УЗЕЛКОВАЯ БАХРОМА – Knotted Fringe is a fringe in which the hanging sections are knotted to form a pattern, and the ends are allowed to hang like regular fringe. See also Fringe. / Смотрите также Бахрома (Fringe).

KNOW–HOW = НОУ–ХАУ (или ЗНАЮ КАК) – Know-How:- expert skill, information, or body of knowledge that (1) imparts an ability to cause a desired result, (2) is not readily available, and is (3) outside the public domain. Know how may include tangible material (such as blueprints, formulas, instructions, patterns, specifications, and trade-secrets) or intangibles (such as manufacturing practices, marketing concepts, quality control, and testing techniques) which are not common knowledge. In technology transfer agreements, know how is the most valuable factor and may have an indefinite enforceable life. In legal terms, it may be defined as 'any industrial information and technique likely to assist in the manufacture or processing of goods or materials'. In the recent years, know how has come to be recognized as a factor of production in its own right, distinct from labor. Know-How is the knowledge and skill needed to complete a task. Mechanics have a lot of know-how when it comes to cars. This folksy word pretty much defines itself: when you have know-how, you know how to do something. People pick up know-how in many ways. In school, you can gain know-how, especially in classes that are very practical. The best way to get know-how is through experience. For example, teachers may learn about teaching in school, but they won't have a lot of know-how till they've spent a few years in front of a class of students. / Ноу-Хау:- конфиденциальные сведения коммерческого характера, которые способствуют владельцу в реализации его продукции на рынке, а также сведения управленческого и организационного характера; технические решения, не охраняемые патентами, или новшества, которые могли бы быть защищены патентами, но владелец по тем или иным причинам не пожелал их патентовать; знания и опыт владельца.

KNOWLEDGE, SKILLS AND ABILITIES = ЗНАНИЯ, НАВЫКИ И СПОСОБНОСТИ – Knowledge, Skills and Abilities (KSA):- job qualifications.

KNOWN LOSS = ИЗВЕСТНАЯ УТРАТА (или ИЗВЕСТНЫЙ УБЫТОК) – (1) Known Loss is a loss discovered before or at the time of delivery of a shipment. / Убыток, вскрывшийся до или в момент поставки партии груза.

(2) Known Loss is a loss known to one or both parties when a broker and underwriter are negotiating a placing. / Убыток, известная одной или обеим сторонам, когда брокер и расписчик ведёт переговоры о размещении.

KOALA = КОАЛА – Australian Koalas are one of the earliest platinum bullion coins to be issued by any nation. As with its other Koala bullion coins, the design on the obverse (front) of the platinum Koala features an Ian Rank Broadley portrait of Queen Elizabeth II. She is encircled by her name, the name of the country, and the denomination. In keeping with the design rotations for all its bullion coins, the reverse (back) design of the Koala changes annually, save for the larger sizes in certain years. Each year features a different representation of the cuddly, tree-climbing marsupial. The Perth Mint stamps the traditional 'P' Mint Mark on its Koalas. These platinum coins enjoy legal tender status as outlined in the Australian Currency Act 1965. Coin size and face value:- (i) 1 kg – USD3 000.00*; (ii) 10 oz – USD1 000.00*; (iii) 2 oz – AUD200.00*; (iv) 1 oz – AUD100.00; (v) 1/2 oz – AUD50.00; (vi) 1/4 oz – USD25.00; (vii) 1/10 oz – AUD15.00; and (viii) 1/20 oz – AUD5.00. Note:- * in 1991 the 2 oz, 10 oz, and 1 kg had face values of AUD500.00, AUD2 500.00, and AUD10 000.00, respectively. Dates:- 1988–2000 (1/4 oz,1/2 oz,1 oz); 1989–2000 (1/10 oz, 1/20 oz); 1992–99 (2 oz, 10 oz, and 1 kg). Koala is the Australian platinum coin with a fineness of 999.5. Australia was the first major nation in modern times to announce its intention to produce an ounce-denominated platinum coin issue and since its first year of issue, the Australian Koala platinum coins have remained a leader in world investment coin markets. Each Koala is beautifully designed and extensively frosted, for a luminous brilliance not found on other platinum bullion coins. Platinum buyers who buy small quantities will probably receive their Platinum Koalas in vinyl sleeves. Koalas are .9995 fine, are legal tender, and sell at prices that reflect the value of their platinum content, not their face values. Market value:- platinum pricing is based on the current market 'spot platinum ask price'. / Коала или Сумчатый Медведь, млекопитающее семейства Лазающих Сумчатых. Обитает в эвкалиптовых лесах Восточной Австралии.

KOLLER BLINDS = КОЛЬЛЕРСКИЕ ЗАНАВЕСИ (или КОЛЬЛЕРСКИЕ ЖАЛЮЗИ) – Koller Blinds are shades wound around a roller or dowel when the window is exposed. Originally made only in neutral colors, today these shades often are made in colors or matched and coordinated with the draperies in a room. Koller E. SA, Mezzovico, Switzerland. / Кольлер И. Эссы.А. (E. Koller SA).

KOMMANDITGESELLSCHAFT = КОММАНДИТНОЕ ТОВАРИЩЕСТВО (или КОММАНДИТГЭЭЛЬШАФТ) – In Germany, Kommanditgesellschaft (KG) is equal to limited partnership (LP) in the United Kingdom. / В Германии Коммандитное Товарищество или Коммандитгээльшафт (Ка.Ге.; (Kommanditgesellschaft (KG)) равноценно ограниченному партнёрству (ОП) или товариществу с ограниченной ответственностью (ТОО; limited partnership (LP)) в Соединённом Королевстве. Акционерная Коммандита, в буржуазных государствах вид компании (товарищества), соединяющий элементы Акционерного Общества и Коммандитного Товарищества. Особенность Акционерной Коммандиты состоит в том, что часть участников – вкладчики – отвечает по обязательствам Акционерной Коммандиты всем своим имуществом, а часть – акционеры – лишь в пределах своего вклада, воплощённого в акциях. Ведение дел Акционерной Коммандиты и выступление в обороте от его имени осуществляют полностью ответственные вкладчики.

KONDRATIEV WAVE = ВОЛНА КОНДРАТЬЕВА – Kondratiev Waves also called Supercycles, Surges, Long Waves or K-Waves are described as regular, sinusoidal-like cycles in the modern (capitalist) world economy. Averaging fifty and ranging from approximately forty to sixty years in length, the cycles consist of alternating periods between high sectoral growth and periods of relatively slow growth. Nikolai Kondratieff (Kondratiev), a Russian economist was the first to suggest that industrial economies followed a cycle of change in prices and production. Actually, this cycle is a cycle of liquidity and not price. But rising and declining trends for money, labor and products are an effect of the cycle. Kondratieff Cycle averaged 54 years in duration, however cyclic periods can expand and contract and are therefore inherently unreliable for precise timing. But the sequence of events in the Kondratieff Wave may be an immutable social process regardless of how many decades it takes it to play out. The presence of a credit inflating mechanism causes extreme booms and busts during the cycle. As liquidity expands in the initial phase of the cycle, commodity prices rise reflecting the increasing business activity and inflation. As business activity and inflation accelerate, speculators bid up commodity prices due to their fear that inflation will continue to accelerate. After the rate of inflation peaks and starts to fall, the acceleration premium is removed from prices. Thus, commodity prices start to fall despite continued but slowing inflation, a trend called Disinflation. At the same time, a change in psychology away from fear and toward feelings of relief and hope induces people to channel the excess purchasing media

created during disinflation into bidding up the prices of investment assets such as stocks. Because inflation continues, the wholesale prices that manufacturers charge for finished products, the retail prices that stores charge for goods and the levels of wages that employers pay for labor all continue to rise but at a continously lesser rate, following the rising but slowing trend of business activity and inflation. Near the end of the cycle, the rates of change in business activity and inflation flip to zero. When they fall below zero, deflation is in force. As liquidity contracts, commodity prices fall more rapidly, and prices for stocks, wages and wholesale and retail goods join in the decline. When deflation ends and prices reach bottom, the cycle begins again. Other Explanations of Kondratieff Cycle:- Early on, four schools of thought emerged as to why capitalist economies have these long waves. These schools of thought centered on innovations, capital investment, war and capitalist crisis. According to the innovation theory, these waves arise from the bunching of basic innovations that launch technological revolutions that in turn create leading industrial or commercial sectors. Kondratiev's ideas were taken up by Joseph Schumpeter in the 1930s. The theory hypothesized the existence of very long-run macroeconomic and price cycles, originally estimated to last 50 to 54 years. A rough schematic drawing showing the 'World Economy' over time according to the Kondratiev theory. Since the inception of the theories, various studies have expanded the range of possible cycles, finding longer or shorter cycles in the data. The Marxist scholar Ernest Mandel revived interest in long wave theory with his 1964 essay predicting the end of the long boom after five years and in his Alfred Marshall lectures in 1979. However, in Mandel's theory, there are no long 'cycles', only distinct epochs of faster and slower growth spanning 20 to 25 years. More recently, investment theorist Ian Gordon has advocated a 4 season Kondratiev model in which spring is moderate growth from a stock market and inflationary bottom, summer is characterized by accelerating growth and high inflation, autumn is characterized by declining inflation and asset bubbles, and winter involves the collapse of the asset bubbles. Long wave theory is not accepted by most academic economists, but it is one of the bases of innovation-based, development, and evolutionary economics, i.e. the main heterodox stream in economics. Among economists who accept it, there has been no universal agreement about the start and the end years of particular waves. This points to another criticism of the theory:- that it amounts to seeing patterns in a mass of statistics that aren't really there. Moreover, there is a lack of agreement over the cause of this phenomenon. How much this matters is disputed: some scientific patterns have in the past been identified before an explanation could be advanced. (The best known example is that of the precursors to the periodic table, which were in fact rejected by many scientists precisely on the grounds of lack of explanation.) There is controversy over the validity of Kondratiev's theory among many scholars. Some believe that not enough is attributed to actual human errors that have created some of the economic situations of history, and too much to the inevitability of the characteristics of the phases of the waves. They claim that many of the situations were entirely avoidable, not the consequences of an unstoppable wave pattern. Others doubt the legitimacy of Kondratiev's waves because they believe that every wave is a structural cycle that has unique characteristics and cannot be repeated. There is also controversy over Kondratiev's research. Many believe that the conclusions and results of his research are biased because he highlighted and used only certain events to reach his conclusions and left out other important data and events that could have affected his outcomes. Most cycle theorists agree, however, with the 'Schumpeter-Freeman-Pérez' paradigm of five waves so far since the industrial revolution, and the sixth one to come. These five cycles are:- (1) The Industrial Revolution 1771; (2) The Age of Steam and Railways 1829; (3) The Age of Steel, Electricity and Heavy Engineering 1875; (4) The Age of Oil, the Automobile and Mass Production 1908; and (5) The Age of Information and Telecommunications 1971. According to this theory, we are currently at the turning-point of the 5th Kondratiev. Some scholars, particularly Immanuel Wallerstein, argue that cycles of global war are tied to Capitalist Long Waves. Major, highly-destructive wars tend to begin just prior to an output upswing. A specific modification of the theory of Kondratiev cycles was developed by Daniel Šmihula. For the era of the modern society and capitalistic economy he defined 6 long economic waves (cycles) and each of them was initiated by a specific technological revolution:- (1) 1600–1780:- the wave of the Financial-Agricultural Revolution; (2) 1780–1880:- the wave of the Industrial Revolution; (3) 1880–1940:- the wave of the Technical Revolution; (4) 1940–1985:- the wave of the Scientific-Technical Revolution; (5) 1985–2015:- the wave of the Information and Telecommunications Revolution; (6) 2015–2035(?):- the hypothetical wave of the Post-Informational Technological Revolution. Unlike original Kondratiev's and Schumpeter's views in Šmihula's conception each new wave (due to acceleration of scientific and technological progress) is shorter then a previous one. The main stress is put on technological progress and new technologies as decisive factors of any long-time economic development. Each of these waves has its innovation phase (there occur innovations in a form applicable in practical life and also their first real application) which is described as a technological revolution and an application phase in which the number of revolutionary innovations falls and attention focuses on exploiting and extending existing innovations. (As soon as an innovation or a chain of innovations becomes available, it becomes more efficient to invest in its adoption, extension and use than in creating new innovations.) Each wave (each cycle) of technological innovations can be characterized by the area in which the most revolutionary changes took place (leading sectors). Every wave of innovations lasts approximately until the profits from the new innovation or sector falls to the level of other, older, more traditional sectors. It is a situation when the new technology, which originally increased a capacity to utilize new sources from nature, reached its limits and it is not possible to overcome this limit without an application of another new technology. For the end of an application phase of any wave there are typical an economic crisis and stagnation. The crisis in 2007–10 is a result of the coming end of the wave of the Information and telecommunications technological revolution. According to the bible of deflation, Conquer the Crash, multiple degrees of Elliott Waves have topped around the year 2000 and we are going into a crash that happens once in 400 years. This crash is the Kondratieff Winter. Kondratiev Wave:- named after Soviet economist Nikolay Dmitriyevich Kondratiev, the theory that Western capitalist economies are susceptible to high performance volatility. Sometimes called Kondratiev cycles, it refers to stock market cycles which last 50–60 years. A Kondratieff Wave is a long-term economic cycle believed to result from technological innovation and produce a long period of prosperity. This theory was founded by Nikolai D. Kondratieff (also spelled Kondratiev), a Communist Russia era economist who noticed agricultural commodity and copper prices experienced long-term cycles. Kondratieff believed that these cycles involved periods of evolution and self-correction. Economists have identified five Kondratieff Waves since the XVIII century. The first resulted from the invention of the steam engine and ran from 1780 to 1830. The second cycle arose because of the steel industry and the spread of railroads. It ran from 1830 to 1880. The third cycle resulted from electrification and innovation in the chemical industry, and ran from 1880 to 1930. The fourth cycle was fueled by autos and petrochemicals and lasted from 1930 to 1970. The fifth cycle was based on information technology and began in 1970 and ran through the present. Some economists believe we are at the start of a sixth wave and that this one will be driven by biotechnology and healthcare. What Happened to Nikolai D. Kondratieff? K-Waves are not widely accepted by economists, and the theory was also not welcomed in Kondratieff's Russia. His views were disliked by Communist officials because they suggested that capitalist nations were not on an inevitable path to destruction but that they experienced ups and downs. As a result, he ended up in a concentration camp in Siberia, where he faced the death penalty in 1938. / Российский и Советский экономист Николай Дмитриевич Кондратьев (1892-Март-04(16)–1938-Сентябрь-17) – основоположник теории экономических циклов. Австрийский политический экономист Йозэф Алёис Шумпита (Joseph Aloïs Schumpeter; 1883–1950) в 1930-е. Марксистский экономист, Троцкистский активист и теоретик Эрнэст Эзра Мандэл (the Marxist scholar Ernest Ezra Mandel; 1923–1995; родившийся в Германии Бельгиец), Британский экономист Алфрид Машэл (Alfred Marshall; 1842–1924) в 1979. инвестиционный теоретик и фондовый брокер Иэн Годэн (Ian Gordon; Канадец Британского происхождения; основатель и президент Лонвэйв Груп (Longwave Group)). Парадигм Шумпита-Фримэн-Перэс ('Schumpeter-Freeman-Perez' paradigm; Британский экономист Кристэфэ

Фримэн (Christopher Freeman; 1921–2010); Британо-Венесуэльский учёный Карлёта Перэс (Carlota Pérez; 1939–)). Американский социолог, исторический социальный учёный и аналитик мировых систем Иманьюэл Морис Волестин (Immanuel Maurice Wallerstein; 1930–). Словацкий теоретик Даниэл Шмиула (Daniel Šmihula). взглядов Шумпита (Schumpeter's views) в концепции Шмиула (Šmihula's conception). Волны Элыэта (Elliott Waves).

KP = DEMOCRATIC PEOPLE'S REPUBLIC OF KOREA

KPW = NORTH KOREAN WON

KR = REPUBLIC OF KOREA

KRAFTCORD = КРАФТКОРД – Kraftcord:- this yarn produced by tightly twisting plant fiber is sometimes used in carpet backings.

KRAFTLINER = ЛИНОВАННАЯ КРАФТ БУМАГА (или ПЛОСКИЙ ЛИСТ УПАКОВОЧНОЙ БУМАГИ) – Kraftliner is a kraft paper made of bleached/unbleached kraft pulp and used to make the outer layers of corrugated board and millboard.

KRAFT PAPER = КРАФТ БУМАГА (или УПАКОВОЧНАЯ БУМАГА) – Kraft Paper is made of at least 90% fresh, usually unbleached, sulfate pulp (kraft pulp). It is characterized by high strength and resistance. / Крафт Бумага, от Немецкого слова Kraft, означающее Сила, понимается бумага, производимая из слабо проваренной длинноволокнистой сульфатной целлюлозы. Она применяется для упаковки товарной продукции.

KRAFT PULP = КРАФТ ПУЛЬПА (или КРАФТ ЦЕЛЛЮЛОЗА) – Kraft Pulps are the pulps prepared in the alkaline liquor consisting of sodium hydroxide, sodium carbonate, and sodium sulfide. Also called Sulfate Pulp. / Сульфатная Пульпа или Сульфатная Целлюлоза (Sulfate Pulp).

KRAFT YARN = КРАФТ ПРЯЖА – Kraft Yarn is the yarn made by twisting a strip of paper manufactured from kraft pulp.

KRESEK = КРЭСЭК – Kresek is the Indonesian term for the systemic phase of the disease called Bacterial Blight at the seedling stage.

KRIMPSIEKTE = КРЫМПСИКТЭ (или БОЛЕЗНЬ СМОРЩИВАНИЕ) – Krimpsiekte or Cotyledonosis or 'Shrinking Disease' is a disease of livestock in Southern Africa, caused by consumption of plants from the genera Tylecodon, Cotyledon and related plants that contain bufadienolide cardiac glycosides such as cotyledoside. These cumulative toxins cause symptoms of exercise intolerance, paresis, paralysis, torticollis, paralysis of the lower jaw and tongue, dysphagia, drooling of saliva, abdominal pain and convulsions followed by death within a few hours. Secondary poisoning occurs in humans and animals that eat contaminated meat from diseased animals. There are no significant lesions at autopsy. Krimpsiekte (in Afrikaans) is 'Shrinking Disease'; caused by poisoning by Cotyledon and Tylecodon spp. plants. Some Tylecodons are grubbed out by South African farmers to protect livestock and are therefore endangered in their habitat. / котиледон (семядоля).

KRONOS = КРОНАС – KRONOS is a Danish RTGS system that settles on a continuous basis during the day with intraday finality. Receiving banks can immediately use the incoming funds for the fulfillment of their own obligations. KRONOS is designed as a RTGS for interbank large value payments and time-critical payments in Danish Kroner and Euro. The normal RTGS facilities, such as queuing mechanisms and intraday liquidity facilities, are in place. For the settlement of Euros KRONOS is linked to TARGET, the large value system of the ESCB. Payments in Danish Kroner can be sent in and settled from 07:00 am to 03:30 pm. Euros can be settled between 07:00 am and 06:00 pm. Payment orders can be submitted via the KRONOS terminal, a dedicated client server network or via SWIFT. Use of the SWIFT network is mandatory for the settlement of Euro transactions. The system can also settle payments in Swedish Kroner and Icelandic Kroner in relation to securities transactions in these currencies but is hardly used for that purpose. There are two main clearing systems in Denmark – KRONOS and Sumclearingen. KRONOS processes high-value and urgent DKK and EUR payments, and is the TARGET-linked system, which processes EUR-denominated payments. KRONOS is operated by the Nationalbank. Two payment systems are declared systemically important by the Danish authorities:- (i) KRONOS, the real-time gross-settlement (RTGS) system for large-value payments; and (ii) Sumclearing, a multilateral netting system for the clearing and settlement of retail payments. Sumclearing is defined as systemically important primarily because it is the only retail payment system in Denmark and it also handles relatively large payments. KRONOS is a multicurrency system that settles transactions in Danish Kroner and Euro. For the settlement of Euros, KRONOS is linked to TARGET, the large-value system of the European System of Central Banks (ESCB). In addition, the system settles transactions in Swedish Kroner and Icelandic Kroner, however only in connection with the settlement in VP of securities denominated in these currencies. The developments in the payment infrastructure and payment instruments are mainly market driven. A major payment system reform has not taken place since the introduction of KRONOS in November 2001, and no major changes are planned for the near future. Although KRONOS is a RTGS system, the recognition of netting and the finality of payments in a netting scheme are important for the functioning of this system, since it settles the multilateral netting results of several ancillary systems like:- (i) the Continuous Linked Settlement or CLS (which is owned by large international banks, is an international multilateral clearing and settlement system for foreign-exchange transactions in 15 currencies at present, including Danish Kroner), the international clearing and settlement system for foreign exchange transaction; (ii) VP Securities AS, the Danish central securities depository (CSD), and Clearing and Settlement System for Securities; (iii) FUTOP (is owned by the Copenhagen Stock Exchange and is a multilateral net settlement system for settlement of transactions in futures and options that are listed on the Copenhagen Stock Exchange), the clearing system for derivatives; and (iv) Sumclearing. After the clearing results of the different ancillary systems are settled in KRONOS, participants can use the amounts received in these systems immediately for other payment obligations in KRONOS or lend the money out in the interbank money market. Participants in KRONOS that have signed a deed of pledge with Danmarks Nationalbank can pledge securities that are classified as eligible by Danmarks Nationalbank, such as government bonds and mortgage bonds. They have to transfer the collateral to a safekeeping account in VP registered in their own name. This account is, in accordance with Section 66 of the STA, pledged to Danmarks Nationalbank. Under the aforementioned deeds of pledge for credit facilities, Danmarks Nationalbank is entitled to seek immediate fulfillment in the securities that have been deposited in the safekeeping account, without the obligation to give advance notice to the debtor. On the basis of these deeds of pledge, Danmarks Nationalbank is also entitled to take over ownership of the securities in the pledge account in case of a default. The interest payments and redemptions related to the pledged securities will be paid to a specific yield account in KRONOS that is automatically pledged to Danmarks Nationalbank and are fully available for the redemption of outstanding debts to it. Under Danmarks Nationalbank's terms and conditions for provision of collateral, a margin, and in specific cases additional haircuts, are applicable to ensure that the value of all outstanding loans will not exceed the value of the pledged securities, should the market price of these securities drop. In case the drop in market value exceeds the margin, the pledgor is, unprompted, obliged to re-establish the margin by providing further collateral. Pursuant to Section 57b of the STA, such provision of collateral cannot be revoked pursuant to the Insolvency Act Section 70 (1) that requires that collateral should be provided when the debt is incurred, or to Section 72C of the same Act that opens the possibility for retroactive action with respect to certain dispositions that take place after the filing of a request for bankruptcy. / взаиморасчёт или сведение

(netting) . Сообщество по Всемирной Межбанковской Финансовой Дальней Связи (СВМФДС; The Society for Worldwide Interbank Financial Telecommunication (SWIFT)). порядки и условия . KROY® SHRINKPROOFING PROCESS = ПРОЦЕСС БЕЗУСАДОЧНОСТИ ПО–КРОЙСКИ® – Kroy® Shrinkproofing Process is the continuous process for shrinkproofing wool tops in which there is a direct chlorination step with no intervening chemical reaction followed by anti-chlorination and neutralization. Provides better hand and strength than does conventional shrinkproofing. / Крой® (Kroy®).

KRUGERRAND = КРЮГАРАНД (или КРЮГАВСКИЙ РАНД, или КРЮГАСКИЙ РАНД) – One Ounce of Gold:- the South African Chamber of Mines had an inspired idea to help market South African gold. It was to issue a one ounce bullion coin, to be sold at a very low premium over the intrinsic gold value. Back in 1967:- Krugerrands were first minted and issued in 1967, and have been produced every year since. They have legal tender status in South Africa, which allowed them to be imported into many, but not all, countries without import taxes, duty or VAT. The Krugerrand Family:- originally only one size was issued, which contained one full troy ounce (31.103 5 grams) of fine gold. This was originally known as a Krugerrand, or Kruger, for short. From 1980, three other sizes were introduced, namely a half, quarter, and tenth ounce size. Because of these, the original Krugerrand is sometimes referred to as a 'full' or 'one ounce' Kruger or Krugerrand, although within the trade, the word Kruger or Krugerrand is understood to be the full sized original one ounce version. British Investors Missed Out:- at the time of the Kruger's introduction, it was not legally possible for British residents to acquire bullion gold coins, so that the Krugerrand was almost unknown in Britain until 1971. Low Premium Over Gold Content:- according to the publicity at the time, the Kruger was to be made available to world bullion dealers at a 3% premium over the current gold fix, so that after distribution costs, the coins would be available to investors in quantity at about 4% to 5% over intrinsic gold values, and possibly 10% premium for single pieces. Higher Premium on Smaller Sizes:- the fractional sizes were issued at higher premiums to bullion dealers of 5%, 7%, and 9% respectively. The fractional coins have never been as popular as the full one ounce coins, usually only being purchased as singles, so that in practice, it would usually cost 10% to 15% premium for the half and quarter ounce, and from 20% to 50% premium for the tenth ounce, most of which seem to have been used in jewellery. Most bullion houses do not want the bother of handling small quantities of low value coins. As an example of this, in the 1970's we, as a small provincial dealer, would frequently handle 500 Krugerrands in a single day, but a purchase of 100 tenth Krugerrands was a major event, yet it was only 1/50th the size of deal! Not a Pretty Sight:- Krugers were never intended to be an aesthetically pleasing coin, just a lump of gold with a known weight and value. They certainly cannot be called pretty. Collectors seeking aesthetically attractive coins would be better looking at British gold sovereigns, or some of the newer bullion coins. VAT Introduced in 1973:- in Britain VAT was imposed on all coins, except antiques. In January 1995, this was relaxed on almost all second-hand goods, including gold coins. This means that existing privately owned coins can be traded by dealers under a 'special scheme' whereby the only VAT chargeable is on the dealer's margin, which is negligible. Because VAT was still payable on any 'new' coins, it remained more difficult and expensive to buy and sell large quantities of bullion coins. Continuous Service from Chard:- throughout the whole of this time, Chard have maintained a dealing service for both collectors and investors in bullion and numismatic coins. During the period from 1965 to 1971, we were one of only a small number of dealers who were granted a dealers licence. South African gold coin first issued in 1967 with a fineness of 916.6. / Золотой Крюгаранд впервые был выпущен в 1967. С этого момента принят стандарт выпуска инвестиционных монет – 1 oz весом 1 Тройская унция. Это самая распространённая монета в мире, с очень высокой ликвидностью. Крюгаранд легко купить и продать во всём мире. Крюгаранд это монета, которая продаётся по биржевой цене с очень маленькой наценкой, покрывающей производство и распространение. Очень большое количество данных монет на рынке сделало их самыми дешёвыми среди инвестиционных монет. Было найдено решение для инвесторов, желающих приобрести высоколиквидное инвестиционное золото. Отпала необходимость покупать слитки больших размеров или монеты разных размеров и номиналов, которые требуют использование калькулятора для подсчёта содержания в них реального золота и их соответственной ценности. Крюгаранд чеканился на в качестве циркулируемого в обращении наравне с обычными монетами. Эта монета содержит 0.916 7 долей золота (сплав в 22 карата). В качестве добавки использована медь, для придания монете прочности, что также влияет на цвет монеты. Южноафриканский Крюгаранд является официальным платёжным средством и отвечает всем требованиям и характеристикам инвестиционных монет. Аверс:- изображение Штэфануса Йоханнэса Паулюса Крюга (Stephanus Johannes Paulus Kruger; born on 10 October 1825 in Bulhoek farm, near Cradock, Eastern Cape (then Cape Colony), South Africa, died 14 July 1904 in Clarens, Vaud, Switzerland), бывшего 5-го Президента Южно-Африканской Республики (5th President of the South African Republic; 09 May 1883 – 10 September 1900). По ободу надпись SUID-AFRIKA (на Африкаанс), равноценна Англоязычной SOUTH AFRICA (Южная Африка). Реверс:- изображение спрингбока – антилопы, символа Южно-Африканской Республики. Год изготовления и надпись FIN GOUD (на Африкаанс), равноценна Англоязычной FINE GOLD (Чистое Золото), и вес монеты 1 oz (Тройская унция).

KUBELKA–MUNK THEORY = ТЕОРИЯ КУБЭЛЬКИ–МУНКА – Kubelka-Munk Theory is a phenomenological turbid-medium theory relating the reflectance and transmittance of scattering and absorbing materials to optical constants (Kubelka-Munk absorption coefficient (K), Kubelka-Munk scattering coefficient (S)) and the concentrations of their colorants. The basis of computer color-matching calculations. The Kubelka-Munk Theory of Reflectance was originally developed for paint films but works quite well in many circumstances for paper. Originally it was published in 1931. It is not, however, terribly good for dyed papers (or very dark, unbleached papers) when light absorption reaches a high level. A limiting assumption is that the particles making up the layer must be much smaller than the total thickness. Both absorbing and scattering media must be uniformly distributed through the sheet. Ideally, illumination should be with diffuse monochromatic light and observation should be of the diffuse reflectance of the paper. The theory works best for optically thick materials where > 50% of light is reflected and < 20% is transmitted. / Чешские химики Пауль Кубэлька (Paul Kubelka; 1900–56) и Франц Мунк (Franz Munk; 1900–64). Коэффициент поглощения и коэффициент рассеяния.

KÜSTERS DYEING RANGE = ДИАПАЗОН КРАШЕНИЯ ПО КЮСТАЗ – Küsters Dyeing Range is the continuous dye range for carpets. The unit wets the carpet, applies dyes and auxiliary chemicals by means of a doctor blade, fixes the dyes in a festoon

steamer, and washes and dries the carpet in one pass through the range. An optional auxiliary unit may be installed to randomly drip selected dyes onto the background shade for special styling effects. This process is called TAK Dyeing. TAK dyeing, which is a relatively recent development in the carpet industry, is a continuous dyeing process in which dye is deposited, in drops, on the tufted side of the carpet. A wide variety of dye colors may be employed and different random color patterns obtained. Tak dyeing is used to provide coloration for the nylon tufts. Since Küsters established the first continuous dyeing range for carpets in 1966, we have delivered more than 180 ranges to our customers world-wide. Continuous dyeing was the basis for an increasing growth of the carpet industry due to higher productivity and cost reduction of up to 75%. The innovation started with application systems along with improved dyes and chemicals. The first ranges were for solid shade only, followed by multicolor and print dye ranges which utilized new types of applicators. We have delivered ranges for solid shade, multicolor, printed, combination print and solid, and carpet tiles for nylon, polyester and wool fibers. Our latest innovation enables our customers to reduce inventory by millions of dollars, minimize waste and shorten the cycle time from order to delivery. Conventional dye, which is made up in tanks, is a slow and time consuming process. Our Instacolor system, in combination with our quick change applicators, now allows our customers to 'dye to order'. Our customers are now dyeing over 200 individual orders in 24 hours. / непрерывное крашение (continuous dyeing). Найлан^{T3} (Nylon^{TM}).

K–WAVES = ВОЛНЫ К – K-Waves:- long-term cycle analysis can set the stage for short-term trades, but only if you can keep the strategy in the proper perspective. Nicolai Kondratieff was a Russian agriculture economist who, while working on a five-year plan for the development of Soviet agriculture, published his paper, 'Long Economic Cycles', in 1925. He outlined what later became known as 'Kondratieff Waves'. Kondratieff Waves were observations of a series of super cycles, long surges, 'K-Waves' or long economic cycles of alternating booms and depressions or of periods of strong growth offset by periods of slow growth in capitalist societies. These waves or cycles were, at the time, calculated to last from 50 to 60 years, or roughly a human lifetime in those days. Kondratieff applied his theories to capitalist societies, most notably to the United States from the time of the American Revolution. His undoing came in 1928 when he published his 'Study of Business Activity in the Soviet Union' that came to much the same cycle conclusions for the Soviet economy that he had noted for capitalist societies. Josef Stalin saw Kondratieff's latest work as criticism. Kondratieff was arrested and, following a series of trials, he was banished to the Gulag, where he died in 1938. Since 1925, there has been further research on the subject. His thesis attracted many adherents who formulated their own explanations for the rhythms:- Rostow, Volland, Borchert, Shumpeter, Mensch, Mandel and Trotsky among them. Here, we will compare long-term charts with the principles presented by Kondratieff in his original paper and interpret current conditions to establish where we stand in the currently active K-Wave cycle. Government Intervention:- when Kondratieff formulated his findings, mainstream economic thought was that the economy existed in a state of general equilibrium, meaning that the economy naturally consumes whatever it produces because the needs of consumers are always greater than the capacity of the economy to satisfy those needs. Government intervention was not present during Kondratieff's time. After his death, governments began to control economic cycles through active fiscal policies and through regulation of interest rates, mainly derived from Keynesian economics. The reflexive effect generated by government intervention of economic cycles is best described by Julian Snyder:- Historical studies show that money printing can postpone recessions and depressions, but it has never turned a major economic cycle. Therefore, to identify where we may be in the cycle today, we have to look at the descriptive data, rather than the period in years, which can be misleading. Now cycles constantly face intervention by governments resulting in a disruption of the long-term wave's natural rhythm. Even with the enlargement of the wave, the core forces of capitalism are working in the background. The diagnostic will be evident by studying the convergence of factors, such as the behavior of interest rates, gold prices, stock prices and the psychological mood of the public. Kondratieff studies going back to Napoleonic wars show a strong relationship between economic conditions and secular trends on interest rates. This may be a vital component of the K-Wave and, therefore, a good starting point for reading the cycle. The US government bond yield for the 10-year notes is used to read the yield required by investors to loan funds to the government, and it reflects inflation expectations. The chart going back 100 years shows the last low in yields back in 1941. Then, the 40-year upswing from 1941–81 set in, followed by a 31-year downswing from 1981 to today, the new low. From the chart, we can infer that fiscal policies and interest rates regulation have enlarged the cycle to 71 years. The last time the government implemented strategies to increase interest rates was during the last peak of the debt-to-Gross Domestic Product (GDP) ratio back in 1940s. This period coincides with the beginning of the last upswing of the K-Wave. The long cycle seems to be reflected in the debt-to-GDP ratio, as a curve that is inversely correlated to the interest rates historical chart. Let's not forget that at the current time, the Federal Reserve is shifting its policies on interest rates again, after a period of quantitative easing. This also is in line with the K-Wave principle. Gold & Stocks:- long cycles, according to Kondratieff, may be regarded as a disturbance and restoration of the economic equilibrium of a long period. The equilibrium balance equation also can be read through the long wave in gold prices. The theory states that gold attains its highest purchasing power at the end of the downward wave of the long cycle. For the last 30 years, since the peak of interest rates, gold prices were stable up until 10 years ago, when the price increased by about 400%, reaching an all-time high of USD1 898.30 per ounce in September 2011. Now we are witnessing lower swing prices in the long-term gold chart, indicating that its highest purchasing power is behind us and, therefore, we are at the end of the downswing of the K-Wave. The stock market is not the subject of the study of Kondratieff directly in his paper, but it is the best economic barometer available. He mentions in his work that the long downswing will carry successive crises with certain regularity. Since the last peak in interest rates, during the last 30 years we have seen successive crises in the economy that are consistent with the Kondratieff model. Between 1941 and 1981, before the peak in interest rates, we did not see any strong disruption of the stock market. After the fall of interest rates, we have witnessed the 1987, 2001 and 2007 stock market crashes. Kondratieff explains that crashes naturally happen to shake the economy to its foundations, based on his observations of the 1820s and 1860s. Since the last crisis, the United States' stock market as represented by the Dow Jones Industrial Average has rallied to mark new all-time highs. The upswing in the benchmark seems to anticipate the beginning of an upswing on the long-wave cycle. Behavioral Economics:- behavioral models typically integrate insights from psychology with economic cycles. Kondratieff was not extensive in his research about the behavioral economics in history, because of the non-existent data on the subject, but he was able to establish that in the downward phase, decreasing wages, decreasing profits and the lack of surplus profit opportunity directly correlate to people's disenchantment with capitalism. We have witnessed social movements such as Occupy Wall Street and The End of Capitalism, which highlight social and economic inequality, impoverishment and global warming. Looking at the bigger picture presented by Kondratieff 90 years ago, this phenomenon is viewed as a typical behavior on the long-wave cycle. Before and during the beginning of the rising wave of a long cycle, the society's economic life undergoes considerable changes. These changes are usually in production, exchange techniques, inventions and involvement of new

territories in worldwide economic relations. The landscape has changed during the last 20 years in those areas. It is an interesting period in history. The raw facts of the long-term charts seem to point to better economic times. If this holds true, and we follow Kondratieff findings, we are entering a 30-year inflationary period where wages will increase and commodity prices will allow for the expansion of agriculture around the world. In addition, we are likely to see radical changes to society and greater social upheavals given the high tension in the expansion of economic forces. / Дьжулиэн Снайдё (Julian Snyder). Дау Дьжонз (Dow Jones).

KYOTO CONVENTION = КИОТСКАЯ КОНВЕНЦИЯ – The full name is 'International Convention on the Simplification and Harmonization of Customs Procedures (Kyoto Convention)'. It is an international instrument on the harmonization of Customs techniques which covers all aspects of Customs legislation. It was done at Kyoto, Japan, on 18 May 1973 and entered into force in 1974. Since then the growth in international cargo, developments in information technology and a highly competitive international business environment have created conflict with traditional Customs methods and procedures. World Customs Organization (WCO) has therefore revised and updated the Kyoto Convention to ensure that it meets the current demands of international trade. The WCO Council adopted the revised Kyoto Convention in June 1999 as the blueprint for modern and efficient Customs procedures in the XXI century. Kyoto Convention 1974:- apart from the body of the Convention, it comprises 31 annexes, not all of which have entered into force. The following two annexes have direct relevance to the delivery of humanitarian assistance:- (i) Annex B.2. concerning relief from import duties and taxes in respect of goods declared for home use:- All Customs regulations mention cases of relief from duties and taxes applicable in specified circumstances and where certain conditions have been met. In some countries such relief is provided for in the Customs tariff, whereas in others it may be set out in separate legislation or regulations. The Annex does not merely list examples of relief from duties and taxes; in addition, in order to encourage countries to advance along the path of harmonization, it also formulates a number of conditions to which the granting of the relief facility may be subject. In particular, it recommends that 'relief from import duties and taxes and from economic prohibitions and restrictions should be granted in respect of basic necessities (such as foodstuffs, medicaments, clothing and blankets) sent as gifts to an approved organization for distribution free of charge to needy persons by the organization or under its control'. The goods sent as disaster relief items fulfil the above stipulated conditions and may be considered as being covered by this clause. However, as this is a matter of interpreting the text of Kyoto Convention, the final decision belongs to the Customs of the recipient country. (ii) Annex F.5. concerning urgent consignments:- The purpose of this Annex is to facilitate the Customs clearance of goods which, because of their nature or because of the circumstances surrounding their shipment, have to be conveyed rapidly from one country to another and cleared through Customs with a minimum of delay. Such goods are of course subject to the same Customs controls and formalities as ordinary consignments of goods but this Annex provides for shipments which are recognised by the Customs authorities as being urgently needed to be cleared as a matter of priority subject to the necessary revenue safeguards and any prohibitions and restrictions. In particular the Annex contains a number of special facilitation provisions recommended for the clearance of consignments of humanitarian nature and relief consignments (i.e. 'goods, such as vehicles and other means of transport, foodstuffs, medicaments, clothing, blankets, tents, prefabricated houses or other goods of prime necessity, forwarded as aid to those affected by natural disaster and similar catastrophes'). Thus the goods sent as disaster relief items may be considered as covered by this Annex. Personal effects of disaster relief teams and their equipment should also be treated under the provisions of this Annex due to the humanitarian nature and the urgent need for them. However, as this is a matter of interpreting the text of Kyoto Convention, the final decision belongs to the Customs of the recipient country. Revised Kyoto Convention 2000:- The Kyoto Convention (Revised) has incorporated important modern concepts, such as the application of new technology, the implementation of new philosophies on Customs control, and the willingness of private sector partners to engage with Customs in mutually beneficial alliances. It contains new and obligatory rules for its application which all Contracting Parties must accept without reservation. Apart from the body of the convention, the revised Convention comprises one General Annex and ten Specific Annexes with Chapters. Chapter 5 'Relief Consignments' of Specific Annex J 'Special procedures' has direct relevance to the delivery of humanitarian assistance. It has taken into account the relevant facilitation measures recommended in the earlier WCO international instruments, and, in particular, in the Model Agreement between the United Nations and a State/Government concerning measures to expedite the import, export and transit of relief consignments and possessions of relief personnel in the event of disasters and emergencies (approved by the Permanent Technical Committee of WCO at its 157–158th sessions in April 1996). For the purposes of this Chapter the term 'Relief Consignments' is defined as:- (i) goods, including vehicles and other means of transport, foodstuffs, medicaments, clothing, blankets, tents, prefabricated houses, water purifying and water storage items, or other goods of prime necessity, forwarded as aid to those affected by disaster; and (ii) all equipment, vehicles and other means of transport, specially trained animals, provisions, supplies, personal effects and other goods for disaster relief personnel in order to perform their duties and to support them in living and working in the territory of the disaster throughout the duration of their mission. The Chapter contains three standards and three recommended practices. The standards are:- (i) clearance of relief consignments shall be governed by the provisions of this Chapter and, insofar as applicable, by the provisions of the General Annex; (ii) clearance of relief consignments for export, transit, temporary admission and import shall be carried out as a matter of priority; and (iii) in the case of relief consignments the Customs shall provide for:- (a) lodging of a simplified Goods declaration or of a provisional or incomplete Goods declaration subject to completion of the declaration within a specified period; (b) lodging and registering or checking of the Goods declaration and supporting documents prior to the arrival of the goods, and their release upon arrival; (c) clearance outside the designated hours of business or away from Customs offices and the waiver of any charges in this respect; and (d) examination and/or sampling of goods only in exceptional circumstances. Three recommended practices are:- (i) clearance of relief consignments should be granted without regard to the country of origin, the country from which arrived or country of destination; (ii) in the case of relief consignments any economic export prohibitions or restrictions and any export duties or taxes otherwise payable should be waived; and (iii) relief consignments received as gifts by approved organizations for use by or under the control of such organizations, or for distribution free of charge by them or under their control, should be admitted free of import duties and taxes and free of economic import prohibitions or restrictions. The expression commonly used to refer to the international Convention on the simplification and harmonization of Customs procedures adopted by the Customs Co-operation Council in Kyoto in 1973. / Киотская Конвенция – международная конвенция об упрощении и гармонизации таможенных процедур была заключена в Киото в 1973, последняя редакция вступила в силу 3 Февраля 2006. Киотская Конвенция является универсальным кодифицированным международно-правовым актом в области таможенного дела, регулирующим практически все таможенные вопросы. Конвенция, с одной стороны, направлена на стимулирование внешнеторговой деятельности путём упрощения и ускорения процедур таможенного оформления и

таможенного контроля, а с другой стороны – на то, чтобы такое ускорение и упрощение не привели к нанесению ущерба интересам государства и общества (в части пополнения доходной части государственного бюджета и защиты внутреннего рынка).

KYOTO PROTOCOL = КИОТСКИЙ ПРОТОКОЛ – The Kyoto Protocol is an international agreement linked to the United Nations Framework Convention on Climate Change. The major feature of the Kyoto Protocol is that it sets binding targets for 37 industrialized countries and the European community for reducing greenhouse gas (GHG) emissions .These amount to an average of five per cent against 1990 levels over the five-year period 2008–12. The major distinction between the Protocol and the Convention is that while the Convention encouraged industrialised countries to stabilize GHG emissions, the Protocol commits them to do so. Recognizing that developed countries are principally responsible for the current high levels of GHG emissions in the atmosphere as a result of more than 150 years of industrial activity, the Protocol places a heavier burden on developed nations under the principle of 'common but differentiated responsibilities'. The Kyoto Protocol was adopted in Kyoto, Japan, on 1997-December-11 and entered into force on 2005-February-16. The detailed rules for the implementation of the Protocol were adopted at COP 7 in Marrakesh in 2001, and are called the 'Marrakesh Accords'. The Kyoto mechanisms:- under the Treaty, countries must meet their targets primarily through national measures. However, the Kyoto Protocol offers them an additional means of meeting their targets by way of three market-based mechanisms. The Kyoto mechanisms are:- (i) emissions trading – known as 'The Carbon Market'; (ii) clean development mechanism (CDM); and (iii) joint implementation (JI). The mechanisms help stimulate green investment and help parties meet their emission targets in a cost-effective way. Monitoring emission targets:- under the Protocol, countries' actual emissions have to be monitored and precise records have to be kept of the trades carried out. Registry systems track and record transactions by parties under the mechanisms. The United Nations (UN) Climate Change Secretariat, based in Bonn, Germany, keeps an international transaction log to verify that transactions are consistent with the rules of the Protocol. Reporting is done by parties by way of submitting annual emission inventories and national reports under the Protocol at regular intervals. A compliance system ensures that parties are meeting their commitments and helps them to meet their commitments if they have problems doing so. Adaptation:- the Kyoto Protocol, like the Convention, is also designed to assist countries in adapting to the adverse effects of climate change. It facilitates the development and deployment of techniques that can help increase resilience to the impacts of climate change. The Adaptation Fund was established to finance adaptation projects and programmes in developing countries that are parties to the Kyoto Protocol. The Fund is financed mainly with a share of proceeds from CDM project activities. The road ahead:- the Kyoto Protocol is generally seen as an important first step towards a truly global emission reduction regime that will stabilize GHG emissions, and provides the essential architecture for any future international agreement on climate change. By the end of the first commitment period of the Kyoto Protocol in 2012, a new international framework needs to have been negotiated and ratified that can deliver the stringent emission reductions the Intergovernmental Panel on Climate Change (IPCC) has clearly indicated are needed. Japan, New Zealand, and Russia have participated in Kyoto's first-round but have not taken on new targets in the second commitment period. Other developed countries without second-round targets are Canada (which withdrew from the Kyoto Protocol in 2012) and the United States (which has not ratified the Protocol). Some examples:- (1) the People's Republic of China; signature:- 1998-May-29; approval:- 2002-August-30 (Note:- in a communication received on 30 August 2002, the Government of the People's Republic of China informed the Secretary-General of the following:- In accordance with article 153 of the Basic Law of the Hong Kong Special Administrative Region of the People's Republic of China of 1990 and article 138 of the Basic Law of the Macao Special Administrative Region of the People's Republic of China of 1993, the Government of the People's Republic of China decides that the Kyoto Protocol to the United Nations Framework Convention on Climate Change shall provisionally not apply to the Hong Kong Special Administrative Region and the Macao Special Administrative Region of the People's Republic of China. Further, in a communication received on 8 April 2003, the Government of the People's Republic of China notified the Secretary-General of the following:- 'In accordance with the provisions of Article 153 of the Basic Law of the Hong Kong Special Administrative Region of the People's Republic of China of 1990, the Government of the People's Republic of China decides that the United Nations Framework Convention on Climate Change and the Kyoto Protocol to the United Nations Framework Convention on Climate Change shall apply to the Hong Kong Special Administrative Region of the People's Republic of China. The United Nations Framework Convention on Climate Change continues to be implemented in the Macao Special Administrative Region of the People's Republic of China. The Kyoto Protocol to the United Nations Framework Convention on Climate Change shall not apply to the Macao Special Administrative Region of the People's Republic of China until the Government of China notifies otherwise'. In a communication received on 14 January 2008, the Government of the People's Republic of China notified the Secretary-General of the following: In accordance with Article 138 of the Basic Law of the Macao Special Administrative Region of the People's Republic of China, the Government of the People's Republic of China decides that the Kyoto Protocol to the United Nations Framework Convention on Climate Change shall apply to the Macao Special Administrative Region of the People's Republic of China); entry into force:- 2005-February-16; and % of emissions:- ??%. (2) The Russian Federation:- signature:- 1999-March-11; ratification:- 2004-November-18; entry into force:- 2005-February-16; and % of emissions:- 17.4%. (3) The United States of America:- signature:- 1998-November-12. Russia confirmed on 2012-September-13 it would not make cuts in greenhouse gas emissions from 2013 under the UN's Kyoto Protocol, joining Canada and Japan in rejecting an extension of the plan for fighting climate change. The Protocol to the United Nations Framework Convention on Climate Change (UNFCCC) was adopted at the third session of the Conference of the Parties (COP 3) in Kyoto, Japan, on 1997-December-11. In accordance with Article 24, it was open for signature from 16 March 1998 to 15 March 1999 at United Nations Headquarters, New York, the United States. By that date the Protocol had received 84 signatures. Pursuant to Article 22, the Protocol is subject to ratification, acceptance, approval or accession by Parties to the UNFCCC. Parties to the UNFCCC that have not signed the Protocol may accede to it at any time. The Protocol entered into force on 2005-February-16 in accordance with Article 23, that is the ninetieth day after the date on which not less than 55 Parties to the UNFCCC, incorporating Parties included in Annex I which accounted in total for at least 55% of the total carbon dioxide emissions for 1990 of the Parties included in Annex I, have deposited their instruments of ratification, acceptance, approval or accession. Currently (in 2012), there are 192 Parties (191 States and 1 regional economic integration organization) to the Kyoto Protocol to the UNFCCC. The total percentage of Annex I Parties emissions is 63.7%. Moscow won't join the second phase of the Kyoto Protocol, which starts on 2013-January-01. Russia decided to discontinue its participation in the protocol because the world's major producers of greenhouse gases – the United States, China and India – are still refusing to commit themselves to reduce greenhouse gas emissions. Because of that, Russian leaders say, the Kyoto Protocol, which came into force seven years ago, had no impact on the rate of global warming. Delegates to UN climate talks in Doha agreed Saturday (December 08, 2012) to extend the Kyoto Protocol, a pact that aims to curb greenhouse gas emissions from industrialized nations but will cover only about 15 percent of the world's carbon output. The outcome of the two-week negotiations, which nearly collapsed in their final hours in a dispute over how to compensate poor countries for the losses they will suffer as the result of climate change, underscored the challenge policymakers face in confronting global warming. The hard decisions were put off, including how much major developing countries such as China and India will commit to cutting their greenhouse gas emissions and to what extent the richest nations will assist vulnerable ones over the next decade. While the European Union agreed to conduct another set of emissions cuts between 2013 and 2020 under the Kyoto Protocol, several nations, including Canada, Japan, Russia and New Zealand, declined

to join them. Both academics and environmentalists described the extension of Kyoto as insufficient in terms of reducing the world's growing carbon emissions, which could raise global temperatures by as much as 7.2 degrees by 2100, according to several studies. / коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо).

LABEL = (МАРКИРОВОЧНЫЙ) ЯРЛЫК – Labels are, in accordance with the dangerous goods stipulations of the IMDG code, adhesive labels that indicate to all parties concerned what type of dangerous goods are being transported. They differ from placards in terms of size, although placards have the same purpose. Labels with dimensions of 10 x 10 cm are designed for use on each of the items to be transported. Placards of at least 25 x 25 cm must be attached to the outside of the container or vehicle. / , например, . знак опасности или трафарет размером 25 x 25 см.

LABEL = ЭТИКЕТКА – Label is a slip of, e.g., paper or metal attached to an object to indicate the nature, ownership destination, contents and/or other particulars of the object. Label:- the directions for using a herbicide approved as a result of the registration process. Label is a legally binding document affixed to every pesticide container outlining the product's constituents, amount of active ingredients, primary uses, precautions, and Worker Protection Standard (WPS) information. Label is an attachment used for identification purposes in field trials. Can also refer to incorporated radioactive marker. Some clients require inventory or shipment Labels to be attached to packaging, i.e. box, case, pallet, etc. Many labels contain bar-coded information, to allow scanning devices to quickly and automatically transfer the information into inventory systems. In some cases, labels are preprinted and pre-affixed by the manufacturer. In other cases, labels must be created and applied by the Distribution Center prior to shipment of the product in accordance with retailer or customer requirements. / , например, . Этикетка – ярлык на товаре, экспонате, продукте производства и другом. Этикетка с указанием названия, производителя, даты производства (или срока годности) и других сведений о нём. Этикетка – листок специальной (этикеточной) бумаги небольшого формата, содержащий сведения о товаре или продукции и сопровождающий её; предполагает клеевой способ крепления. Этикетка – ярлык, сопровождающий товар, с указанием названия и цены товара, других его параметров. Этикетка – это любая красочная или описательная характеристика продукта и его изготовителя, напечатанная в виде трафарета, штампа, рельефа на единице упаковки, а также на листе-вкладыше или ярлыке, прикреплённом или прилагаемом к каждой единице товара. Большинство упакованных в производственных условиях продовольственных товаров имеют на упаковке этикетку, на которой текст, рисунки и другая информация нанесены типографским способом. Этикетирование консервных банок осуществляется путём приклеивания бумажной этикетки или нанесения её литографическим способом. Иногда этикетка наносится непосредственно на товар (например, маркировка на донышке посуды, на электробытовых товарах и другом). В этикетке указывают:- наименование изделия, обозначение изделия или его индекс, технические данные, номер стандарта или ТУ, требованиям которых соответствует изделие, сведения о приёмке изделия отделом технического контроля (ОТК), сведения о качестве, цену, дату выпуска. Этикетка (иначе имеет название ярлык) – это текстовый или графический знак, выполненный в виде наклейки, талона или бирки на любой продукт производства или выставочный экспонат. В общем случае на ней указывается название товара или изделия, торговая марки изготовителя, дата производства, срок годности продукта и другая важная для потребителя информация. Кроме информационного назначения для потребителя этикетка несёт с собой ещё ряд важных функций:- (i) этикетка может являться средством упаковки товара или средством укупорки продукта; (ii) этикетка является средством идентификации продукции; (iii) этикетка является средством продвижения товара на рынке (этикетка может сделать непопулярный без её наличия товар конкурентным и наоборот); и (iv) этикета может явиться средством фальсификации продукции. В связи с последним свойством этикеток в настоящее время существует множество их различных видов, кроме обычной наклейки из бумаги или картона, этикетки могут быть следующими:- (i) сложными или многослойными этикетками (этикетки-книжки); (ii) самоклеющимися, как на бумажной основе, так и полимерные этикетки – в настоящее время самые востребованные; (iii) стикерами (это самоклеющиеся этикетки, применяемые в рекламе для метро, выставочных павильонов и прочих объектов); (iv) термоэтикетками; (v) термоусадочными и прочими. Требования К Этикетке:- в РФ является действующим ряд законов и нормативов, которые устанавливают требованиям к этикеткам в целом, требования к информации на этикетке, требования к оформлению этикетки, а также требования к этикеткам на товары, относящиеся к тому или иному классу продукций. В качестве обязательных для исполнения приняты следующие законодательные и нормативные документы:- ФЗ РФ № 2300-1 'О Защите Прав Потребителей' от 07 Февраля 1992; Постановление Правительства РФ № 1575 от 27 Декабря1996 'О Наличии Обязательной Информации На Русском Языке На Этикетках Товаров, Импортируемых Из-за Рубежа В РФ'; ФЗ 'О Качестве И Безопасности Пищевых Продуктов' от 02 Января 2000; ГОСТ Р 51074-2003, содержащий нормативные требования к этикеткам пищевых продуктов; ФЗ № 184 'О Техническом Регулировании' от 27 Декабря 2002 устанавливает требования маркировки знаком обращения на рынке или знаком соответствия в зависимости от системы сертификации, где происходило подтверждение соответствия товаров исполнению Российских нормативов на продукцию; Приказ Минздрава РФ № 206 от 16 Мая 2003 'Об Указании На Этикетке Лекарственных Средств, Изготовленных В Аптеке, Способа Использования'; ГОСТ Р ИСО/МЭК 15426-1-2002 применяется для продукции, имеющей штриховое кодирование на этикетке и другие документы. Общие требования к этикетке и требования к этикетке на товаре сформулированы в законе 'О Защите Прав Потребителей'. Этикетка должна исполнять требования к оформлению этикетки и требования к информации на этикетке и включать, в том

числе, следующие сведения:- (i) об основных потребительских свойствах продукции; (ii) гарантийный срок или срок допустимого использования, если они установлены; (iii) дату выпуска изделия; (iv) правила и условия безопасного и эффективного применения товаров; (v) фирменное наименование производителя, продавца и исполнителя, их место нахождения; (vi) лицо (и его место нахождения место нахождения), уполномоченное производителем на принятие претензий от потребителей товаров или других участников рынка. Требования к этикетке на товаре, относящемся к пищевым продуктам:- такие требования в РФ наиболее суровые, что соответствует необходимости защиты потребителя от злоупотреблений производителей продуктов. С целью унификации множественных регламентирующих и законодательных документов касательно пищевых продуктов и требования к информации на этикетке был разработан ГОСТ Р 51074-2003. Он позволяет в значительной степени защищать потребительский рынок России от проникновения некачественных товаров. При этом содержит следующие требования к этикеткам на товаре:- (i) информация о продуктах питания (Российских и привозных (или импортных)) должна быть, в том числе, на Русском языке; (ii) должно быть указано наименование продукта; (iii) состав продукта; (iv) его пищевая ценность; (v) изготовитель продукта; (vi) страна изготовления продута (или страна происхождения); (vii) товарный знак производителя; (viii) масса нетто, объём или количество продукта; (ix) условия хранения; (x) срок годности продукта; (xi) обозначение государственного стандарта или стандарта предприятия (Технических условий для Российских изготовителей) либо другого нормативного документа, в соответствии с которым произведён продукт; (xii) информация об обязательной и добровольной сертификации (в форме графического изображения, установленного законодательством, либо в форме текста). Требования к этикетке на товаре пищевого назначения предусматривают обязательность указания информации об использовании при их приготовлении или о содержании следующих веществ:- (i) биологически активных добавок к пище; (ii) ароматизаторов; (iii) пищевых красителях; (iv) улучшителях вкуса; (v) пищевых продуктов нетрадиционного состава; (vi) продуктов с включением несвойственных им компонентов белковой природы; (vii) о наличии генетически модифицированных веществ или компонент. Технические регламенты РФ также содержат требования, относящиеся к этикеткам конкретных групп товаров и об идентификации продукции в зависимости от её состава. Так, например, Технический Регламент позволил разделить молочную продукцию на Российском продовольственном рынке на именно молочные изделия и молоко содержащие изделия. Также данный регламентирующий документ обязал указывать на этикетке о наличии сухого молока в продукте. Этикетка При Сертификации:- этикетка в любой обязательной или добровольной системе оценки соответствия наряду с самой продукцией подлежит подтверждению исполнения требований того нормативного документа, которым регулируется выпуск продукции. При этом должны исполняться все требования к этикетке на товаре, требования к оформлению этикетки, требования к информации на этикетке. Специалисты анализируют, в том числе, содержание информации на этикетке. Она не должна противоречить другим документам, предоставленным в орган сертификации в качестве доказательной базы. Информация на этикетке должна быть достаточной и не вводить в заблуждение потребителя. Более того, этикетка должна соответствовать фактическим показателям продукта, если данная информация указывается на этикетке. Подтверждение соответствия этикетки при сертификации точно такое же равноправное действие, как и идентификация самого продукта оценки соответствия. Если этикета не проходит процедуру подтверждения соответствия, то такая продукция не может получить положительное заключение и соответствующий разрешительный документ подтверждения. Этикетка после сертификации может (и обязана в случае подтверждения соответствия товара в обязательной системе оценки соответствия) подвергнуться изменениям. Так как наличие Сертификата Соответствия или Декларации о Соответствии даёт право (и обязывает) производителя маркировать продукцию путём проставления соответствующего знака (знака обращения на рынке или знака соответствия) на этикетке, эксплуатационной и сопроводительной документации.

LABEL CARGO = МАРКИРУЕМЫЙ (ЗНАКАМИ ОПАСНОСТИ) ГРУЗ – Label Cargo is the cargo, including all commodities, requiring a label according to the provisions of the International Maritime Dangerous Goods Code.

LABEL NOT SHOWING = НЕ ПРОСМАТРИВАЮЩАЯСЯ ЭТИКЕТКА – Label Not Showing:- garment not positioned in package to show label on top surface. Finishing department defects, and namely – Folding Defects. / Порок или дефект заключительной обработки.

LABILE = НЕУСТОЙЧИВОЕ (или ЛАБИЛЬНОЕ) – Labile:- a substance that readily undergoes transformation or is readily available to plants.

LABILE GENES = НЕУСТОЙЧИВЫЕ ГЕНЫ (или ЛАБИЛЬНЫЕ ГЕНЫ) – Labile Genes are the genes that are always mutating.

LABIUM = ЛАБИУМ (или ГУБА) – In Latin:- labium is a lip. / Латинское слово Labium означает Губа.

LABOR = ТРУД – Labor is the collective or generic name given to all the various productive services provided by human beings, including physical effort, skills, intellectual abilities and applied knowledge. Although a market society with a complex division of labor involves hundreds or even many thousands of discrete types of labor differentiated according to the kinds of skills and abilities required (each with their own separate but interconnected labor markets), economists often find it useful for theorizing to simplify the real situation by speaking as though there was only one homogeneous kind of labor to be considered, with this single factor of production being freely and easily substitutable across all different alternative production processes for all different sorts of goods and services. When economists moving beyond such very simple models of the economy want to recognize the reality that acquiring specialized labor skills involves a process of specialized learning that is often very costly and time-consuming, they are apt to refer (somewhat contradictorily and confusingly) to ‘investment in human capital’ and treat the individual’s process of decision-making in deciding what sorts of training to pursue according to a marginal costs of production and marginal revenues logic analogous to firms’ decision-making processes in choosing to invest in physical capital. / Под Трудом понимается целесообразная деятельность человека, направленная на видоизменение и приспособление предметов природы для удовлетворения своих потребностей. Труд сыграл решающую роль в формировании и развитии человека. Процесс труда включает три момента:- собственно труд, предметы труда и средства труда. При первобытнообщинном строе труд выступал как коллективный, не было эксплуатации чужого труда. В антагонистических формациях труд непосредственного производителя – раба, крепостного крестьянина, наёмного рабочего – подвергается эксплуатации со стороны господствующих классов.

LABOR = ХХ (или ПОТУГИ) – Labor (maritime term):- a vessel is said to labor when she works heavily in a seaway (pounding, panting, hogging and sagging). / Преодолевать волнение в условиях сильной качки.

LABORATORY = ЛАБОРАТОРИЯ – Laboratory is a public or private facility that calibrates, tests, identifies or conducts diagnoses. / Под Лабораторией, от позднелатинского слова Laboratorium, от Латинского слова Laboro, означающее Работаю, понимается учреждение или отдел, подразделение в составе научных учреждений, министерств, предприятий, учебных заведений, проводящее научные, производственно-контрольные эксперименты или учебные занятия. 4 типа лабораторий:- отраслевые, проблемные, производственно-контрольные и учебные.

LABORATORY SAMPLE = ЛАБОРАТОРНЫЙ ОБРАЗЕЦ – Laboratory Sample is a portion of the contents of the containers in the consignment sample to be taken to the laboratory for testing. The laboratory samples must be taken in such a way that collectively they represent the whole consignment.

LABOR MARKET = РЫНОК ТРУДА – Labor Market is the nominal market in which workers find paying work, employers find willing workers, and wage rates are determined. Labor markets may be local or national (even international) in their scope and are made up of smaller, interacting labor markets for different qualifications, skills, and geographical locations. They depend on exchange of information between employers and job seekers about wage rates, conditions of employment, level of competition, and job location. Labor Market is the availability of people for work, e.g., in the ricefields.

LAC = LATIN AMERICA AND THE CARIBBEAN

LAC = LEGAL ADVISORY COMMITTEE

LACE = КРУЖЕВО – Lace is a decorated openwork fabric created by looping, interlacing, braiding, or twisting threads. It is made (either on a background fabric of net or without a background fabric) with a design formed by a net work of threads made by hand or on special lace machines, with bobbins, needles, or hooks. The pattern in lace is usually open and most often floral in design. Machine-made lace is most commonly seen today and many patterns formerly only made by hand, are imitated by machine. hace is the traditional bridal fabric, but it is also used for other nonformal clothing such as sports clothes. The following entries are some of the major types of lace. Lace is the ornamental openwork fabric, made in a variety of designs by intricate manipulation of the fiber by machine or by hand. Lace is an openwork fabric, patterned with open holes in the work, made by machine or by hand. The holes can be formed via removal of threads or cloth from a previously woven fabric, but more often, open spaces are created as part of the lace fabric. Lace is an openwork usually figured fabric made of thread or yarn and used for trimmings, household coverings, and entire garments. / Кружево – текстильное изделие без тканой основы в котором ажурный орнамент и изображения образуются в результате переплетения нитей (шёлковых, хлопчатобумажных, шерстяных, металлических и других). Кружево применяется для отделки одежды, белья в виде окаймления (мерные кружева; полосы-прошивки, зубчатые бордюры) или вставок (штучные кружева треугольники квадраты овалы), а также для изготовления дорожек, салфеток, покрывал (штучные кружева). Главные особенности кружева как вида декоративно-прикладного искусства – воздушность, тонкость, эластичность, узорность. Для кружева характерно слияние ажурных узоров и грунта (сетка фона) или контрасты плотного узора (порой рельефного) и ажурного грунта, разнообразие ритмического построения узора, выявление цвета, блеска, фактуры нитей. Часто выразительность кружева подчёркивается цветом и фактурой ткани, с которой кружево сочетается. По технике исполнения кружево бывает ручное и машинное. Ручное Кружево плетётся на коклюшках (точёные или резные деревянные палочки), шьётся иглой. Существует также Вязаное Кружево, выполненное крючком или на спицах и имитирующее плетёное и шитое Кружево. Плетёное Кружево подразделяется на численное и сколочное. Численное Кружево выполняется по числу переплетений без предварительного рисунка. Для него характерны геометрические узоры. Сколочное Кружево (‘парное’ и ‘сцепное’ делается по ‘сколку’ – рисунку, наколотому на картон или плотную бумагу, которые закреплены на валике. По точкам узора вкалываются булавки, которые оплетаются нитями образующими кружево. В ‘парном’ кружеве узор и фон плетутся одновременно. В ‘сцепном’ кружеве основные элементы узора выполняются в виде тесёмки (так называемой Вилюшки) и соединяются между собой (с помощью крючка) нитями ‘сцепками’ или ‘решётками’). В ‘парном’ кружеве преобладают геометрические узоры а в ‘сцепном’ – растительные. Кружево появилось на рубеже XV–XVI веков, по видимому, в Италии. Ранние шитые кружева представляли собой полоску с зубцами, заполненную геометрическим или растительным орнаментом, а также изображениями людей и животных. В конце XVI века получил распространение (в Венеции, Милане, Генуе) гипюр, то есть кружево, в котором элементы шитого или плетёного узора соединены тонкими связками. В середине XVII века узор шитых Венецианских гипюров состоял из характерных для барокко динамичных завитков и крупных цветов с рельефным контуром. В XVIII веке Италия теряет своё значение как ведущая страна по изготовлению кружев, на первое место выступают Фландрия и Франция. Во Фландрии производство кружева развивалось с конца XVI века:- сначала шитых, с геометрическим узором, затем – плетёных. Особенно славились тонкие плетёные кружева типов Бенш, Валансьенн, Малин (названия по городам, в которых они производились), с орнаментом, образованным плотным переплетением нитей, на фоне из узорных сеток. В начале XVIII века стали изготовлять лёгкое и воздушное тюлевое кружево (смотрите Тюль), в орнаменте которого использовались мотивы рококо:- гирлянды, завитки и так далее. Крупнейшим центром кружевоплетения стал Брюссель, Бельгия. С середины XVIII века здесь делали аппликацию по тюлю. Способ изготовления такого кружева ускорил, удешевил производство и создал условия для появления крупных изделий – шалей, пелерин и так далее. Во Франции производство кружев развивалось с середины XVII века. Шитый гипюр с изящным узором (мелкие растительные побеги, фигурки людей, амуров и другие) изготовлялся в Алансоне, Аржантапе, Седане. В XVIII веке в тех же центрах производили шитое по тюлю кружево с узором в виде букетов, гирлянд и завитков. В конце XVIII – начале XIX веков орнамент тюлевого кружева располагался по краю, а на остальной части фона помещались мелкие цветочки, или так называемые Мушки. В городах Кан, Шантийи, Байё, Ле-Пюи производились и плетёные тюлевые кружева типов Блонды (из золотистого и чёрного несучёного шёлка) и шантийи (из белого и чёрного кручёного шёлка). В России первые сведения о производстве в Царских мастерских плетёных кружев в виде прошивок из золотых и серебряных нитей с характерным крупным плоскостным узором относятся к 1-й четверти XVII века. Введение в XVIII веке общеевропейского костюма способствовало дальнейшему распространению производства кружев в монастырях и помещичьих усадьбах. Художественный эффект Русского кружева XVIII века с геометрическими и растительными узорами (нередко близкими орнаменту крестьянской вышивки и тканья) заключался в живописности, достигаемой применением различных материалов:- белого льна, цветного шёлка, золотой и серебряной нити. Однако, помимо общих черт, в Русском кружеве XVIII века наблюдаются и особенности, характерные для отдельных художественных центров:- Галича (ныне Костромской Области), Ростова, Вологды, Балахны, Калязина, Торжка, Рязани и других. В 1-й четверти XIX века производство кружева начинает принимать форму промысла. В Советское время (1920-е) была организована промысловая кооперация, объединившая кружевниц в основных центрах кружевоплетения, созданы курсы и художественно-профессиональные школы. В Советском кружеве, развивающем богатые художественные традиции Русского кружева, используются Русские типы узоров, а также новые орнаментальные мотивы. Смотрите также Вологодское Кружево и Елецкое Кружево. Кружево:- с XIX века получает распространение дешёвое машинное кружево, подражающее образцам ручных кружев. Первые попытки механизировать производство грунта сделаны в 1768, когда на трикотажной (чулочной) машине изготовили сетку, похожую на фон кружева. В 1809 Английский конструктор Дьжон Хискот (John Heathcoat; 1783–1861) из Дафилд, Дабиша (Duffield, Derbyshire) изобрёл тюлевую челночную машину. Постепенно машинное производство получило распространение, так как вышивание рисунка на готовой сетке занимало сравнительно немного времени и не было таким трудоёмким процессом, как изготовление грунта. С 1863, после изобретения в Швейцарии вышивальной машины, начали применять машинный способ нанесения рисунка на тюлевую сетку. Одновременно стали нашивать на тюлевое полотно аппликации из тонкого батиста. В 1834 удалось установить жаккардовый аппарат (смотритет Машина Жаккарда) на тюлевую

машину. С этого времени грунт и рисунок (то есть кружево в целом) вырабатывается машинным способом. В 1837 тюлевые машины были впервые завезены в Россию (в Петербург), где было организовано гардинное производство. Машинное кружево вырабатывается на плетельных машинах с жаккардовым аппаратом, челночных кружевных машинах, на вышивальных машинах и основовязальных машинах. На челночных машинах кружево образуются за счёт перевива двух систем нитей:- основной и уточной (челночной). При взаимодействии челнока и бёрда во взаимно перпендикулярных плоскостях происходит кручение (обвивка) нитей с последующим связыванием между собою узлами. На этих машинах вырабатываются только хлопчатобумажные кружева. Однако тяжёлые условия труда (смазка рабочих органов машины графитом) при выработке челночных кружев, а также невозможность вырабатывать их из химических волокон заставили искать новые способы производства кружева. В дальнейшем кружево стали изготовлять способом вязания. Он в несколько раз производительнее челночного и не требует графитной смазки. Фон (сетка-грунт) кружев, полученных на челночных машинах, имеет ромбовидную структуру, а на основовязальных прямоугольную. Кружево с ромбовидной структурой сетки без какого либо рисунка носит название Гладкий Тюль. Кружево с рисунком, имитирующим рисунок кружева с челночных машин, вырабатывают на Рашель-машинах с узорообразующими гребёнками. Рабочая ширина основовязальных машин до 4 000 миллиметров (мм). Одновременно вырабатывают несколько десятков полос кружева, которые снимаются в виде сплошного полотна, а затем разрезаются или распускаются на отдельные полосы.

LACE STITCH = КРУЖЕВНОЙ СТЕЖОК – Lace Stitch:- in this knitting stitch structure, loops are transferred from the needles on which they are made to adjacent needles to create a fabric with an open or a raised effect.

LACHA = ЛАЧА (или ХХ) – Lacha is a long skirt and tunic combination along with a chunni makes up a complete set. Traditional garment from India.

LACING = ШНУР (или СВЯЗЫВАНИЕ (ШНУРКОМ), или ШНУРОВАНИЕ) – Lacing is the string, cord, or ribbon strung through eyelets or over hooks in order to bring together and fasten parts of an item such as a blouse, belt, or shoe.

LACK OF FINISH = ОТСУТСТВИЕ АППРЕТА – Lack Of Finish:- results in poor sewability. Thread defects, and namely – Finish. / Порок или дефект ниток.

LACK OF PUCKER = НЕДОСТАТОК (или НЕХВАТКА, или ОТСУТСТВИЕ) СКЛАДКИ (или СБОРКИ, или МОРЩИНЫ) – Lack Of Pucker:- Fabric:- rayon-and-cotton seersucker dress goods; Construction:- Count:- 88 x 72; (ii) Warp:- 150 40 dull acetate-rayon ground, 36/2 combed-cotton puckered stripe; (iii) Filling:- 150 40 dull acetate rayon; Finish:- cross-dyed green (cotton) and white (acetate). Defect:- pieces with much less warp pucker than normal. Analysis:- in a woven seersucker construction, the pucker is obtained by taking the warp yarn from two beams. One is held under ordinary tension for the ground weave, while the other is allowed to run slack, to permit the weaving in of those warp yarns at a faster rate, producing the crinkled effect. It was first suspected that the flat-appearing pieces had been excessively stretched in finishing, so that some of the crinkle was pulled out; but analysis of the pick count proved that the warpwise shrinkage in finishing was exactly the same in both the normal and the flat pieces. The lack of pucker was attributed to too much tension on the slack beam during weaving, which resulted in insufficient contraction in the colored stripe. Take-up of this yarn in one of the normal pieces was found to be 29.5%, whereas in one of the flat pieces it was only 17.5%. / Уточина:- .

LACNIC = LATIN AMERICAN AND CARIBBEAN INTERNET ADDRESSES REGISTRY

LACQUER = ЛАКОВЫЙ НАГАР (или ЛАКОВОЕ ОТЛОЖЕНИЕ) – Lacquer is a deposit resulting from the oxidation and polymerization of fuels and lubricants when exposed to high temperatures. Similar to, but harder, than varnish. / Аналогичен, но твёрже, чем олифа. Лаковый Нагар в двигателях внутреннего сгорания.

LACTATING DAIRY COWS = ЛАКТИРУЮЩИЕ КОРОВЫ МОЛОЧНОЙ ПОРОДЫ (или ПОДСОСНЫЕ КОРОВЫ МОЛОЧНОЙ ПОРОДЫ) – Lactating Dairy Cows:- female dairy breed Cattle that are producing milk for human food.

LACTEUS = ЛАКТОЗНОЕ (или МОЛОЧНОЕ, или МЛЕЧНОЕ, или ХИЛЁЗНОЕ) – Lacteus:- milky. / – молочное.

LADDER = СПУЩЕННАЯ ПЕТЛЯ – Ladder:- wales collapse in straight line. Knitted fabric defect. Ladder:- a wale or several consecutive wales in a weft-knitted fabric in which the loop formation has collapsed into straight lengths of yarn. Note:- this defect is caused by the breakdown of a stitch that, when the fabric is subsequently subjected to tension, permits the de-knitting of the stitches in the same wale or wales within previous courses. See also Run. / Порок или дефект.

LADDER = ТРАП – Ladder (maritime term):- a metal, wooden or rope stairway. / металлическая, деревянная или канатная лестница. Под Трапом, от Голландского слова Trap, понимается судовая лестница. Трапы бывают постоянными и съёмными, наклонными либо вертикальными. Подъёмный забортный трап для связи на стоянке между судном и причалом или другим, меньшим, судном называется парадным. Верёвочный трап для сообщения между судами разных размеров при стоянке их на неспокойном море называется шторм-трапом (на крупных судах заменяются механическими подъёмниками). Внутренние трапы в жилых и пассажирских помещениях располагаются внутри огнестойких ограждений.

LADDERING = РОСПУСК ПЕТЛИ – Laddering:- Possible Cause:- continued knitting with a broken needle. This is a major defect. However if the ladder is located towards the edge of the fabric it may be classified as minor. Knitting defect.

LADEN = ПОГРУЖЁННОЕ (или НАГРУЖЕННОЕ) – Laden:- loaded aboard a vessel.

LADEN ON BOARD = ПОГРУЖЕНО НА БОРТ – Laden On Board is a statement on a Bill of Lading which indicates that a shipment has been loaded on board a vessel.

LADING = ГРУЗ – A term Lading refers to the freight shipped; the contents of a shipment.

LAGAN = ЛЯГАН (или ВЫБРОШЕННЫЙ ЗА БОРТ И ЗАТОНУВШИЙ ГРУЗ, ОТМЕЧЕННЫЙ БУЕМ, или ПЛАВАЮЩИЙ ОБЛОМОК КОРАБЛЯ) – Lagan is a cargo thrown overboard, but buoyed so that it may be recovered. In legal contexts Lagan:- goods or wreckage lying on the bed of the sea. Lagan is a cargo or equipment thrown into the sea but attached to a float or buoy so that it can be recovered. Also known as Ligan. Lagan is goods or wreckage on the sea bed, sometimes attached to a buoy to permit recovery. Compare Flotsam, and Jetsam. Lagan:- goods thrown or sunk in the sea but attached to a buoy so that they may be recovered. / Под Французским словом Ляган (Lagan) понимается груз, выброшенный за борт, но отмеченный буем с тем, чтобы он мог бы быть найден и поднят спустя какое-то время.

LAGGARD = ОТСТАЮЩЕЕ (или НЕПРЕУСПЕВАЮЩЕЕ) – (1) Laggard is an industry or company that is underperforming the market.

(2) Laggard:- share that does not keep up with the average price of comparable shares.

LAGGING INDICATORS = ЗАПАЗДЫВАЮЩИЕ ИНДИКАТОРЫ – Lagging Indicators are the market indicators showing the general direction of the economy and confirming or denying the trend implied by the leading indicators. Also known as Concurrent Indicators. See also Leading Indicators. / Индикаторы рынка, показывающие генеральное направление в движении экономики и подтверждающие или отрицающие тенденцию, обозначаемую опережающими индикаторами. Известны также как Совпадающие Индикаторы (Concurrent Indicators). Смотрите также Опережающие Индикаторы (Leading Indicators). Запаздывающие Индикаторы – экономические индикаторы, характеризующие экономическую активность с запаздыванием. Департамент Торговли (Commerce Department) США ежемесячно публикует индекс по запаздывающим индикаторам (lagging indicators), индекс по опережающим индикаторам (leading Indicators) и индекс по совпадающим индикаторам (coincident indicators). Запаздывающие индикаторы имеют шесть составляющих – уровень безработицы, затраты на товары производственного назначения, удельные трудовые затраты, банковские непогашенные кредиты, банковские процентные ставки, балансовая стоимость промышленных и торговых запасов.

LAG PHASE = ФАЗА ЗАДЕРЖКИ (или ЛАГ–ФАЗА) – (1) Lag Phase is the first stage of the sigmoidal growth curve where growth declines within a brief span of time. / Первая стадия сигмоидального роста, . Под Фазой, от Греческого слова Phásis, означающее Появление, понимается определённый момент в ходе развития какого-либо процесса.

(2) Lag Phase (vegetative) is that portion of the vegetative phase affected by the photoperiod to which the plant is exposed. The period from end of basic vegetative phase to panicle initiation; also called Photoperiod-Sensitive Phase.

LAI = LEAF AREA INDEX

LAID–IN FABRIC = ХХ ТКАНЬ – Laid-In Fabric is a knit fabric in which an effect yarn is tucked in, not knitted into, the fabric structure. The laid-in yarns are held in position by the knitted yarns.

LAID–IN YARN = ЗАВИТАЯ (или ПРОДЕТАЯ) ПРЯЖА – Laid-In Yarn is formed from a spun singles yarn having a yarn number of 16/1 (Cotton count). The laid-in-yarn can be removed leaving a plain knit plated fabric. See also Axial Yarn.

LAID UP TONNAGE = ТОННАЖ ПОСТАВЛЕННЫХ НА ПРИКОЛ – Laid Up Tonnage:- ships not in active service; a ship which is out of commission for fitting out, awaiting better markets, needing work for classification, etc.

LAK = LAO NEW KIP

LAKE = ЛЭЙК (или ЛАК, или АНИЛИНОВОЕ) – Lake:- carmine, or a vivid red. / Красочный лак.

LAKER = ОЗЁРНОЕ СУДНО – Laker is a vessel specially constructed for navigation in the waterways of the Great Lakes and canal systems of North America. Type of ship which trades only in the Great Lakes of North America. They usually carry grain and ore cargoes. A Laker is a long, shallow draft ship designed to transport cargoes within the inland water system of the St Lawrence Seaway. / Озёрное Судно, это длинное судно с малой осадкой, построенное для перевозки грузов в системе внутренних вод Морского Пути Святого Лорэнса.

LAKH = ЛАК – Lakh is a traditional unit of quantity in India, equal to 10^5 or 100 000. In India the lakh is used commonly instead of the million and commas are used to isolate the number of lakh. For example, the number 9 800 000 is called 98 lakh and written 98,00,000. Also known as Lac. See also Crore. Lakh or Lac is the Indian term for 100 000. Frequently used to describe silver or gold orders. Lakh or Lac is a traditional unit of quantity in India, equal to 105 or 100 000. In India the lakh is used commonly instead of the million and commas are used to isolate the number of lakh; for example, the number 5 300 000 is called 53 lakh and written '53,00,000'. See also Crore. / В Индии Лак является традиционной мерой количества, равной 10^5 или 100 000. В этой стране лак используется, как правило, вместо миллиона, а запятые в числе используются для выделения количества лаков. Например, число 9 800 000 (девять миллионов восемьсот тысяч) будет указываться как 98 лаков, а записываться как 98,00,000. Известен также как Лэк (Lac). Смотрите также Крор (Crore).

LAMB MARKING = МАРКИРОВКА ЯГНЯТ – Lamb Marking is a set of procedures commonly done at the same time. May include earmarking, ear tagging, vaccination, drenching, tail docking and castration of lambs.

LAMBREQUIN = ЛЁМБРЁКЯ (или ЛАМБРЕКЕН) – Lambrequin is a structure at the top and sides of a window that frames it and is usually part of the window decoration. Lambrequins are often covered with fabric and trimmed. They are usually made of wood and may be simply painted. Lambrequin is a scarf used to cover a knight's helmet. / Под Лёмбрёкян или Ламбрекеном, от Французского слова Lambrequin, понимается декоративная драпировка верхней части проёма окна, двери или алькова в виде короткой горизонтальной занавески во всю ширину карниза. Часто выполняется из плотной плиссированной ткани, может иметь дополнительные декоративные элементы в виде кистей, воланов, ритмически расположенных вырезов, например, в виде зубцов. Как правило, ламбрекены размещают поверх штор и крепят к ней же (либо к карнизу). Длина классического ламбрекена составляет 1/5 или 1/6 длины самой шторы. Нередко ламбрекены размещают над кроватью или картиной. Термин также используется в геральдике. В строительстве и архитектуре слово Ламбрекен используется в качестве синонима термина Наличник, обозначая резные или кованые украшения окон или крыш.

LAMBSKIN = КОЖА ЯГНЁНКА (или БАРАШЕК, или МЕРЛУШКА, или ОВЧИНА) – Lambskin is a common name in leather for the hide of an animal with the fur removed.

LAMB'S WOOL = ШЕРСТЬ ЯГНЁНКА (или ПОЯРКОВАЯ ШЕРСТЬ, или ПОЯРОК) – Lamb's Wool is a wool shorn from lambs, usually when they are less than 7–8 months old. It is soft and has spinning qualities superior to fleeces of similar quality produced on older sheep. Lamb's Wool is the first clip of wool sheered from lambs up to eight months old. The wool is soft, slippery and resilient. It is used in fine grade woolen fabrics. Lamb's Wool is a soft, resilient wool clipped from sheep less than eight months old. It is used in fine-grade woolen fabrics. / Поярковая Шерсть – шерсть, получаемая при стрижке молодняка овец в возрасте 5–7 месяцев. От шерсти взрослых овец поярковая шерсть грубошёрстных и полугрубошёрстных пород отличается лучшими технологическими свойствами (большим блеском, лучшей уравнённостью, эластичностью, извитостью) и более высоким выходом чистого волокна. Поярок – шерсть, остриженная в первый раз с ягнёнка.

LAMÉ = ЛЯМЕ – Lamé:- just about everyone has heard of some sort of Lamé for eveningwear or costuming for theater and variety show productions. However, there are other applications for this fabric that incorporates metallic fibers that may not be as well known. Here is some information about the production of lamé, as well as some of the various uses for the material. Lamé is a shimmering material that is created by combining metallic fibers and natural or synthetic fibers into a woven or knit fabric. The high gloss finish of lamé makes it a very striking material that catches the smallest lights and seems to give a sense of movement to any garment created with the material. Most often, gold lamé and silver lamé are the most common types of the fabric in use, although in recent years, copper fibers have been used in the metallic cloth to good effect. As the basis for striking clothing, lamé finds its most common uses for

theatrical costumes. Often used for such applications as stage variety shows, movies, television and musical concerts, this metallic fabric is associated in the minds of many as being a sign of glamour. It is certainly true that gold and silver lamé adds a touch of fun to just about any occasion. From evening dresses to wraps for the ladies to cummerbunds and tuxedo scarves for the men, lamé can make even a dressy outfit seem a little dressier. These days, several other applications for lamé have gained ground. One of the more creative uses today has to do with wrapping gifts. Lamé gift bags are a great way to wrap a present such as a bottle of wine or gifts of food and other types of drink. Applications of lamé material to the exterior of gift boxes create the ideal container for everything from shirts and socks to books to jewelry. In fact, giving a gift that is wrapped in lamé is like giving two gifts. If the actual present does not impress the receiver, the container will often be much appreciated. Lamé has gained a lot of ground as a material for use around the home as well. For instance, lamé can add some visual interest to a bedroom. Along with simple window panels that catch every bit of light, lamé can also be employed as material for bed curtains. Pearl lamé in particular can be used in the bedroom to soften the hard lines of the furnishings and make the room seem more inviting. Elsewhere in the home, lamé can be a great choice for holiday linens such as pillow covers, table cloths, and as draping material for piano tops and fireplace mantels. In fact, lamé can go a lot of places and do a lot of things. From an evening out to appearing on the stage and moving on to enhancing the look of the home, lamé is a versatile material. Available in most fabric stores, lamé comes in several metallic finishes, so there is something for just about any application. Lamé is a woven fabric using flat silver or gold metal threads to create either the design or the background in the fabric. Lamé:- French for ‘trimmed with leaves of gold or silver’. Silk or any textile fiber in which metallic threads are used in the warp or the filling. Lamé is also a trade mark for metallic yarns. Often has pattern all over the surface. The shine and glitter of this fabric makes it suitable for dressy wear. The term comes from the French for ‘worked with gold and silver wire’. Lamé is a fabric woven with flat metal threads, usually silver or gold, that form either the background or the pattern. Lamé:- brocade, damask, or brocatelle fabrics in which flat metallic yarns (or with a combination of metallic and other fiber yarns) are woven or knitted in warp and filling for a luxurious effect. Today, most lamé is made from one of the nontarnishable metallic fibers, a great improvement over lamé of the past that tended to darken with age. Lamé is also a trademark term for a nontarnishable metallic yarn. Glitter is sometimes used to describe this type of fabric and is used for evening dresses, blouses, and trimmings. Lamé is a brocaded clothing fabric made from any of various fibers combined with tinsel filling threads often of gold or silver. Lamé is a type of fabric, woven or knit, with thin ribbons of metallic yarns. It is usually gold or silver in color. It is subject to seam or yarn slippage, making it not ideal for garments with frequent usage. It is often used in evening and dress wear, and also in theatrical dance costumes. / брокатель (brocatelle). В основе и уточине для . Под Ляме, от Французского слова Lamé, понимается . Парча, покрытая металлическими полосами. Ляме – ткань атласного переплетения из натурального или искусственного шёлка, с одной стороны типа крепмарокена, с другой – блестящая. Была популярна в 1930-е. Современное ляме – блестящая, переливчатая ткань с металлическими и другими блестящими эффектными нитями.

LAME DUCK = ХРОМАЯ УТКА (или НЕУДАЧНИК) – Lame Duck (maritime term):- a term for disabled vessel that had to fall out of a convoy and thus became easy prey for submarines.

LAMELLA = ЛАМЕЛЛА (или ПЛАСТИНКА, или ЧЕШУЙКА, или ТОНКИЙ СЛОЙ) – Lamella is a thin plate or layer. / Ламелла в хлоропласте.

LAMFALUSSY STANDARDS = СТАНДАРТЫ ЛЁМФАЛЮСИ – Lamfalussy Standards are thte minimum standards of the Lamfalussy report (Lamfalussy standards):- the six minimum standards for the design and operation of cross-border and multi-currency netting schemes or systems. (i) Netting systems should have a well-founded legal basis under all relevant jurisdictions. (ii) Netting scheme participants should have a clear understanding of the impact of the particular scheme on each of the financial risks affected by the netting process. (iii) Multilateral netting systems should have clearly defined procedures for the management of credit risks and liquidity risks which specify the respective responsibilities of the netting provider and the participants. These procedures should also ensure that all parties have both the incentives and the capabilities to manage and contain each of the risks they bear and that limits are placed on the maximum level of credit exposure which can be produced by each participant. (iv) Multilateral netting systems should, as a minimum, be capable of ensuring the timely completion of daily settlements in the event of an inability to settle by. For more details, see the ‘Report of the Committee on Interbank Netting Schemes of the Central Banks of the Group of Ten Countries’ (the ‘Lamfalussy report’), BIS, November 1990. A report on netting schemes, issued in 1998, which advanced minimum standards for netting systems. In common references, the recommended standards took the name of the chairman of the committee issuing the report. / Александрэ Лёмфалюси (Alexandre Lamfalussy). взаиморасчёт или сведение (netting) . Настоящий доклад в значительной мере основан на работе, проведённой ранее Комитетом по Платёжным и Расчётным Системам (КПРС) центральных банков стран ‘Группы из Десяти’ и соответствующими группами, главным образом на Докладе Комитета по схемам межбанковского неттинга, представленном Управляющим стран ‘Группы из Десяти’ (‘Доклад Лёмфалюси’). В этом докладе, опубликованном в 1990, содержится анализ аспектов, влияющих на трансграничные и мультивалютные схемы неттинга, и даны минимальные стандарты и более общие цели в отношении структуры и функционирования таких схем, равно как и принципы сотрудничества центральных банков в области надзора. ‘Стандарты Лёмфалюси’ принимаются и применяются все более широко, причём не только в отношении конкретной области, для которой они были разработаны, но и применительно к платёжным, клиринговым и расчётным системам многих других видов. Содержащиеся в настоящем докладе ключевые принципы развивают ‘Стандарты Лёмфалюси’, добавляя ряд новых принципов, и являются более широко применимыми к системно значимым платёжным системам всех видов. Перечисленные в настоящем докладе задачи центральных банков по применению ключевых принципов аналогичным образом расширяют принципы сотрудничества центральных банков в области надзора, содержащиеся в Докладе Лёмфалюси, и распространяют их на национальные системы. Стандарты Лёмфалюси помогли обратить внимание разработчиков и операторов неттинговых систем и органов надзора за ними на необходимость учёта рисков и обеспечение соблюдения минимальных стандартов. Оптимальная практика в то же время предъявляет более жёсткие требования, нежели минимум, и все большее число систем признают преимущества, например, способности противостоять краху более чем одного крупнейшего нетто-дебитора в системе. Нарушения в процессе расчётов могут оказывать непосредственное воздействие на центральные банки, выступающие в роли основных поставщиков межбанковских расчётных услуг и кредиторов последней инстанции для банковской системы, а также на проведение ими монетарной политики. Руководствуясь этими соображениями, центральные банки стран, входящих в Группу из Десяти, установили в 1990 ряд минимальных стандартов в области организации и функционирования систем взаимозачётов, обслуживающих международные платежи в различных валютах, особенно денежные переводы на крупные суммы. Эти стандарты в равной мере распространяются и на внутренние системы межбанковских чистых расчётов. Стандарты Лёмфалюси, названные так по имени председателя комитета, занимавшегося их разработкой, призваны обеспечить контроль над риском в системах взаимозачётов. Общепризнанной стала точка зрения, согласно которой все системы крупных денежных переводов должны быть приведены в соответствие с этими стандартами. Барон Александрэ Лёмфалюси (Alexandre Lamfalussy; 1929–2015; родившийся в Венгрии Бельгийский экономист) – бывший Генеральный Управляющий Банка Международных Расчётов (БМР; the Bank for International Settlements (BIS)), Базель, Швейцария, а также Председатель Рабочей Группы по Платёжным Системам ЕС.

LAMINA = ЛАМИНА (или ПЛАСТИНКА) – Lamina is the blade or expanded part of a leaf. / Ламина или Листовая Пластинка – пластинка или расширенная часть листа. Под Ламиной, от Латинского слова Lamina, означающее Пластинка или Полоска, понимается листовая пластинка.

LAMINAR FLOW = ЛАМИНАРНОЕ ТЕЧЕНИЕ (или ЛАМИНАРНЫЙ ПОТОК, или СЛОИСТОЕ ТЕЧЕНИЕ) – Laminar Flow is a flow situation in which fluid moves in parallel lamina or layers. Laminar Flow is a streamline flow in a viscous fluid, such as molten polymer, near a solid boundary. See also Turbulent Flow. / Ламинарное Течение, от Латинского слова Lamina, означающее Пластинка или Полоска, упорядоченное течение жидкости или газа, при котором жидкость (газ) перемещается как бы слоями, параллельными направлению течения. Ламинарное течение наблюдаются или у очень вязких жидкостей, или при течениях, происходящих с достаточно малыми скоростями, а также при медленном обтекании жидкостью тел малых размеров. В частности, ламинарные течения имеют место в узких (капиллярных) трубках, в слое смазки в подшипниках, в тонком пограничном слое, который образуется вблизи поверхности тел при обтекании их жидкостью или газом, и другом. С увеличением скорости движения данной жидкости ламинарное течение может в некоторый момент перейти в неупорядоченное турбулентное течение. При этом резко изменяется сила сопротивления движению. Режим течения жидкости характеризуется так называемым Числом Рейнольдса Re. Когда значение Re меньше некоторого критического числа $Re_{кр}$, имеет место ламинарное течение жидкости; если $Re > Re_{кр}$, режим течения может стать турбулентным. Значение $Re_{кр}$ зависит от вида рассматриваемого течения. Так, для течения в круглых трубах $Re_{кр} >> 2\ 200$ (если характерной скоростью считать среднюю по сечению скорость, а характерным размером – диаметр трубы). Следовательно, при $Re_{кр} < 2\ 200$ течение жидкости в трубе будет ламинарным течением. Расход жидкости при ламинарном течении в трубе определяется Законом Пуазёйля.

LAMINAR PARTICLES = ЛАМИНАРНЫЕ ЧАСТИЦЫ – Laminar Particles are the particles generated in rolling element bearings which have been flattened out by a rolling contact.

LAMINATED FABRIC = ДУБЛИРОВАННАЯ ТКАНЬ (или ЛАМИНИРОВАННАЯ ТКАНЬ) – Laminated Fabric is:- (1) a fabric composed of a high-strength reinforcing scrim or base fabric between two plies of flexible thermoplastic film. Usually open scrims are used to permit the polymer to flow through the interstices and bond during calendering. (2) See also Bonded Fabric, 1. Laminated Fabric is a term used to describe fabrics which have been joined together through the use of a high-strength reinforcing scrim or base fabrics between two plies of flexible thermoplastic film. It can a bonded utilizing either foam itself, or some other material, such as adhesives, heat, or chemical bonding agents. See also Bonding. / , тепло, или химические скрепляющие агенты.

LAMINATED STRAND LUMBER = ЛАМИНИРОВАННЫЙ ПИЛОМАТЕРИАЛ ИЗ XX (или ЛАМИНИРОВАННЫЙ XX ПИЛОМАТЕРИАЛ) – Laminated Strand Lumber (LSL) uses timber from logs that are not large, strong, or straight enough to be of structural value in conventional wood products and is most often made from Aspen or Yellow Poplar. 75% of the tree is used. This engineered timber product marketed under the trade name TimberStrand®, this Laminated Strand Lumber (LSL) product, can be up to 60 feet long, 8 feet wide and over 6 inches thick. Beams, headers, decking are the most popular structural applications. As a substitute for traditional framing materials, costs may be higher than dimension lumber. We have, in our opinion only, some question as to its durability and its performance when exposed to moisture. Another possible disadvantage is that it is heavier than an equivalent amount of pine. For instance, in our testing, a 2 x 6, 16 feet in length, weighed approximately 29 pounds. An LSL functional equivalent weighed approximately 43 Pounds. / под торговым названием ТимбёСтрэнд® (TimberStrand®).

LAMINATED VENEER LUMBER = ЛАМИНИРОВАННЫЙ ПИЛОМАТЕРИАЛ ИЗ ШПОНА (или ЛАМИНИРОВАННЫЙ ШПОНОМ ПИЛОМАТЕРИАЛ) – Laminated Veneer Lumber (LVL) is an engineered wood product that uses multiple layers of thin wood assembled with adhesives. It offers several advantages over typical milled lumber:- it is stronger, straighter, and more uniform. It is much less likely than conventional lumber to warp, twist, bow, or shrink due to its composite nature. Made in a factory under controlled specifications, LVL products allow users to reduce the onsite labor. They are typically used for headers, beams, rimboard, and edge-forming material. It is similar in appearance to plywood without crossbands, and is typically rated by the manufacturer for elastic modulus and allowable bending stress. Common elastic moduli are 1 800 000 psi (12 400 MPa); 1 900 000 psi (13 100 MPa); and 2 000 000 psi (14 000 MPa); and common allowable bending stress values are 2 800 psi (19 MPa); and 3 000 psi (21 MPa). A comparable material is parallel strand lumber (PSL), which is used in the same applications. Rather than being manufactured from full, parallel veneers, Parallel Strand uses veneers with more defects in a more random-looking pattern. Laminated strand lumber (LSL) is another similar type that uses smaller veneers, and so is similar to oriented strand board (OSB) in appearance. Laminated Veneer, Parallel Strand, and Laminated Strand all belong to the general category of Structural Composite Lumber. Laminated Veneer Lumber (LVL) is a structural lumber product manufactured from veneers laminated so that the grain of all veneers run parallel to the axis of a member. Laminated Veneer Lumber (LVL) is an engineered wood product created by layering selected dried and graded wood veneers with waterproof adhesive into blocks of material known as Billets. This product is manufactured to disperse wood's natural defects, such as knots, thus minimizing their effect on performance and stability. Before bonding, the grain of the component wood pieces making up each layer is placed at right angles to the grain of each other successive layer, adding strength and helping to prevent warpage in the finished product. These blocks are then sawn into popular lumber sizes. Marketed under the trade name Microllam®, LVL can be made with wood from smaller, faster-growing trees. Microllam® products are typically available in various thicknesses and widths that can be wider in dimension that native grown lumber. LVL is also known as Structural Composite Lumber (SCL). / под торговым названием Майкролэм® (Microllam®). Под Шпоном, от Немецкого слова Span, означающее Щепка, понимаются тонкие листы древесины определённой толщины (обычно в диапазоне 0.35–4 миллиметров (мм)), используемые для производства слоистой клеёной древесины (древеснослоистых пластиков, клеёных заготовок, фанеры) и для облицовывания изделий или сборочных единиц из древесины и древесных материалов с целью улучшения их механических свойств и внешнего вида. Различают:- (i) лущёный шпон, полученный лущением на лущильном станке; и (ii) строганный шпон, полученный строганием на шпонострогальном станке. Лущёный шпон изготовляют из древесины Берёзы, Бука, Дуба, Ели, Кедра, Клёна, Липы, Лиственницы, Ольхи, Осины, Пихты, Сосны, Тополя и Ясеня; строганный шпон – из бархатного дерева, Берёзы, Бука, Вяза, Граба, Груши, Дуба, Ивы, Ильма, Карагача, Каштана, Клёна, Красного Дерева, Липы, Лиственницы, Ольхи, Ореха, Осины, Сосны, Тополя, Ясеня. Строганный шпон отличается красивой текстурой, используется как ценный облицовочный материал. Ламинированная Древесностружечная Плита (ДСП или ЛДСтП) – древесностружечная плита, у которой одна или обе пласти облицованы бумагосмоляными плёнками на основе меламиноформальдегидных смол.

LAMINATING = ЛАМИНИРОВАНИЕ (или ДУБЛИРОВАНИЕ, или РАСКАТЫВАНИЕ, или НАСЛОЕНИЕ, или РАСПЛЮЩИВАНИЕ) – Laminating is the joining of one fabric to another by an adhesive such as natural rubber has long been practiced in rainwear manufacture. Composite materials were later joined by bonding a layer of polyurethane or other foam to a conventional textile fabric. The two components were stuck together by flame bonding or by an adhesive in the form of a continuous coating, in spots, or as a powder. This laminating process has been extended to the joining of two layers of fabric. Each fabric layer can be quite thin, and the amount and type of adhesive are chosen to add only minimum stiffening. Such materials offer a variety of

applications. A coating fabric, for example, may be joined to a lining; dimensionally stable composites can be made from cloth layers that are in themselves dimensionally unstable. Acetate knitted fabrics are frequently used as backing material in laminates. Laminating is the sticking of a fabric to a plastic foam or sheet of plastic. A method of joining one fabric to another by rneans of an adhesive. Polyurethane is often laminated to the back of an outerwear coating fabric for warmth. The term Laminating is occasionally used as a synonym for bonding, but this is incorrect. See also Bonding.

LAN = LOCAL AREA NETWORK

LANATE = ВОЛОСИСТОЕ (или ВОРСИСТОЕ, или ШЕРСТИСТОЕ, или ПУШИСТОЕ) – Lanate:- with long, soft wooly hairs.

LANCEOLATE = ЛАНЦЕТОВИДНОЕ (или ЛАНЦЕТООБРАЗНОЕ, или КОПЬЕВИДНОЕ) – Lanceolate:- (1) lance-shaped, several times longer than wide; widest towards the base and tapering at both ends. (2) Lance shaped, much longer than broad, widening above the base, and tapering to the apex. Lanceolate:- shaped like a long narrow lance with a gradual taper from the base to the tip. / .

LANCEOLATE LEAF = ЛАНЦЕТНЫЙ ЛИСТ (или ЛАНЦЕТОВИДНЫЙ ЛИСТ, или КОПЬЕВИДНЫЙ ЛИСТ) – Lanceolate Leaf:- length greater than width, broadest at the base, narrowing to the apex, lance-shaped, e.g., Fraxinus pennsylvanica. Lanceolate Leaf:- spear-shaped; gradually extending at the base and lessening to the apex. / Ланцетный Лист у:- Ивы ломкой, Ивы остролистной, Миндаля низкого.

LAND = ЗЕМЛЯ – Land is a generalized economists' term or label to cover all those factors of production that are still in their raw state (or nearly so) – that is, that have not yet been worked on or transformed by human labor. Thus, 'land' in the economists' sense means not only the dry portion of the earth's surface, but also all those natural resources such as mineral deposits, wild plants and animals, soil fertility, surface water, solar energy and the bounty of the seas that can be used in production. See also Human Capital. / Под Землёй как средством производства понимается необходимая материальная предпосылка процесса труда, один из важнейших вещественных факторов. Земля относится к невоспроизводимым средствам производства. В сельском и лесном хозяйствах земля – главное средство производства, данное самой природой. Земля имеет цену и выступает объектом купли-продажи. Основное производительное свойство земли – её плодородие. Различия в плодородии и местоположении земельных участков создают основу для образования дифференцированной ренты. Экономическая оценка земли даётся в Земельном Кадастре страны.

LAND & BUILDINGS = ЗЕМЛЯ И ЗДАНИЯ – Land & Buildings shows the value of land and buildings. It shows the value at the last valuation and therefore may be substantially different from the current value.

LAND BRIDGE = НАЗЕМНОЕ ЗВЕНО (или НАЗЕМНЫЙ УЧАСТОК ПУТИ) – (1) Land Bridge is a joint ocean/rail/ocean movement between two foreign countries. See also Mini Land Bridge (MLB). Containers moving from a foreign country by vessel, and then sent to an inland point in the United States or elsewhere by land transportation (rail or truck). The movement of goods from one port to another partially by land and partially by water. Cross-country rail service connecting two ocean ports. Movement of cargo by water from one country through the port of another country, thence, using rail or truck, to an inland point in that country or to a third country. As example, a through movement of Asian cargo to Europe across North America. / и частично по воде.

(2) Landbridge is a system of through rates and service offered by a carrier for cargo shipments from a foreign port to a US port, across US land to another US port and finally by sea to a foreign port destination.

LAND, BUILDINGS AND EQUIPMENT = ЗЕМЛЯ, ЗДАНИЯ И ОБОРУДОВАНИЕ – In the balance sheet, the cost of the bank's Buildings and Equipment is capitalized and depreciated on a straight line basis over the estimated useful lives of the assets concerned, as follows:- (i) buildings – 50 years; (ii) building installations and machinery – 15 years; (iii) information technology equipment – up to 4 years; and (iv) other equipment – 4 to 10 years. The bank's land is not depreciated. The bank undertakes an annual review of impairment of land, buildings and equipment. Where the carrying amount of an asset is greater than its estimated recoverable amount, it is written down to that amount. Legal issues about Land, Buildings And Equipment may include:- hiring a venue or equipment; leasing a building or land for your community organization; letting or sub-letting a building or land that is owned by your community organization; buying or selling property; being gifted property; vehicles; and related insurance and tax issues. Net Land, Buildings and Equipment:- land; buildings and building equipment; leasehold improvements; plant machinery; office furniture and equipment; construction in progress; and other. / наём (hiring). В экономике земля, производственные здания и сооружения, машины и оборудование, инструменты и приспособления, средства перемещения грузов и средства связи относятся к средствам труда, с помощью которых люди воздействуют на предметы труда (сырьё). В средствах труда выделяются орудия производства (машины, оборудование и так далее), которым принадлежит определяющая роль в средствах производства.

LAND CHARGE = ЗЕМЕЛЬНЫЙ СБОР (или СБОР ЗА ЗЕМЛЮ) – Land Charge is a property charge which stipulates that a certain sum of money is owed to the holder of the land charge (see also § 1191 of the German Civil Code). Land charges are abstract and, unlike mortgages, do not relate to a certain claim. An annuity charge is a type of land charge.

LANDED COST = СТОИМОСТЬ ПО ВЫГРУЗКЕ (или СЕБЕСТОИМОСТЬ ПРИ ВЫГРУЗКЕ) – Landed Cost is the purchase cost of a product including inbound freight costs, or the amount it costs to 'land' the product in the store. See also Raw Cost. The total cost of a good to a buyer, including the cost of transportation. The Dollar-per-barrel price of crude oil at the port of discharge. Included are the charges associated with the purchase, transporting, and insuring of a cargo from the purchase point to the port of discharge. Not included are charges incurred at the discharge port, e.g., import tariffs or fees, wharfage charges, and demurrage charges. The total cost of oil off-loaded at a port, including duties, fees and taxes. / Цена нефти в Долларах США за баррель в порту разгрузки. Полная себестоимость нефти, выгруженной в порту, включая пошлины, сборы и налоги. например, .

LANDED PRICE = ЦЕНА ПО ВЫГРУЗКЕ – Landed Price is the actual delivered cost of oil to a refiner, taking into account all costs from production or purchase to the refinery. / В нефтяной промышленности фактическая стоимость поставленной нефтепереработчику нефти, с учётом принятия в расчёт всех расходов, начиная от производства или приобретения и заканчивая расходами на передачу этой нефти нефтепереработчику.

LANDED VALUE = СТОИМОСТЬ ПО ВЫГРУЗКЕ – Landed Value is a wholesale market value at destination on final day of discharge. / Оптовая рыночная цена товара в день окончательной разгрузки в месте назначения.

LAND EQUIVALENT RATIO = СООТНОШЕНИЕ С ЭКВИВАЛЕНТОМ ЗЕМЛИ – Land Equivalent Ratio (LER) is the area needed under sole cropping to produce the same amount as 1 ha of intercropping or mixed cropping.

LANDFILL GAS = СВАЛОЧНЫЙ ГАЗ (или ГАЗ, ВЫДЕЛЯЕМЫЙ ИЗ СВАЛКИ ОТХОДОВ) – Landfill Gas is the mixture of gases produced from the anaerobic breakdown of organic material in landfill. Typically consists of 50–60% methane (CH_4), 30–40% carbon

dioxide (CO_2), 10% nitrogen (N_2), small amounts of other volatile organic compounds (VOCs). Methane is a very potent greenhouse gas, 21 times more so than carbon dioxide.

LANDFORM = ФОРМА РЕЛЬЕФА (или ФОРМА ЗЕМЛИ) – Landform is the morphology and specific character of the land surface resulting from the interaction of physical processes and the earth's crustal movements with the geology of the surface layers. / свойство (character) .

LANDHOLDINGS = ЗЕМЛЕВЛАДЕНИЯ – Landholdings:- land owned or occupied or used by farmers or tenant farmers. Landholding is an ownership of land; the state or fact of owning land. / Под Землевладением понимается обладание землёй на определённых правовых основаниях (собственности, пользования и другого), обусловливающих соответственные права и обязанности владельцев. В бывшем Союзе Советских Социалистических Республик (СССР) исключительным собственником земли являлось государство; гражданам и организациям земля могла предоставляться компетентными государственными органами только в пользование.

LANDING AREA = ЗОНА ПРИЗЕМЛЕНИЯ – Landing Area means a place on land or water, including an airport or intermediate landing field, used, or intended to be used, for the takeoff and landing of aircraft, even when facilities are not provided for sheltering, servicing, or repairing aircraft, or for receiving or discharging passengers or cargo.

LANDING CERTIFICATE = СВИДЕТЕЛЬСТВО О ВЫГРУЗКЕ (или СЕРТИФИКАТ ВЫГРУЗКИ) – The Landing Certificate is issued by consular officials of some importing countries at the point or place of export when the subject goods are exported under bond.

LANDING GEAR = ПРИЗЕМЛЯЮЩАЯ ЗУБЧАТАЯ ПЕРЕДАЧА (или МЕХАНИЗМ ОПУСКАНИЯ И ПОДЪЁМА ОПОРНЫХ КОЛЁС (ПОЛУПРИЦЕПА)) – Resting support for trailer when not attached to tractor. Landing Gear is a support fixed on the front part of a chassis (which is retractable); used to support the front end of a chassis when the tractor has been removed.

LAND LEASE = АРЕНДА ЗЕМЛИ (или ЗЕМЕЛЬНЫЙ ЛИЗИНГ) – Land Lease is a contract under which the owner of a parcel of land (The Lessor) grants the use of that land to another (The Lessee) in exchange for the lessee's obligation to pay a fixed annual amount to the lessor. The amount of the lease payment is determined in advance and is not dependent upon income derived from the land. See also Capital Lease, and Lease.

LANDLUBBER = СУХОПУТНАЯ КРЫСА – Landlubber (maritime term):- the seaman's term for one who does not go to sea.

LAND MILE = СУХОПУТНАЯ МИЛЯ – Land Mile:- the ordinary statute mile, equal to 5 280 feet or 1 609.344 meters, is sometimes called a 'Land Mile' to distinguish it from the nautical mile. Similarly, a land league is equal to 3 statute miles (5 280 yards or 4 828.03 meters) as distinguished from 3 nautical miles. / Обыкновенная законная миля (ordinary statute mile), равная 5 280 футам или 1 609.344 метрам, иногда называемая 'сухопутной милей' для отличия её от морской мили (nautical mile). По аналогу, в США сухопутная лига (land league) равна 3 законным милям (5 280 ярдам или 4 828.03 метрам) в отличие от 3 морских миль или 5 556 метров.

LAND OWNED = ВЛАДЕЕМАЯ ЗЕМЛЯ (или ЗЕМЛЯ ВО ВЛАДЕНИИ) – In the United States, Land Owned for productive use is referred to as a Fixed Asset Account (not subject to depreciation due to its un-wasting nature) and is listed under the equipment, land, and plant subheading in a balance sheet. It is recorded at its purchase price plus legal and development costs (such as for surveying, draining, excavation, filling, and grading). Land held for investment is listed under investments; a real estate firm, however, may list it under inventory. Also known as Freehold Land in the United Kingdom.

LAND PREPARATION = ПОДГОТОВКА ЗЕМЛИ – Land Preparation is the process of preparing the soil for planting, to provide a soil environment favorable for plant germination and/or growth.

LAND RACE = МЕСТНАЯ РАСА (или ЗЕМЕЛЬНАЯ РАСА) – Land Race is a traditional Variety of Rice endemic to a given location.

LAND REGISTER = ЗЕМЕЛЬНЫЙ КАДАСТР (или ЗЕМЕЛЬНЫЙ РЕЕСТР) – Land Register is the public register of land records, maintained by the Land Registry of the Local Court responsible for a particular district. It enjoys public trust and may be inspected by anyone who can prove a legitimate interest. The Land Register is subdivided into three sections:- details of ownership are set out in the first section, the second section covers the charges and restrictions, and the third section contains the liens on property, such as mortgages, land charges and annuity charges. Public register in which all rights to real estate properties are entered. Under Swiss law, the Land Register consists of the main ledger (one page for each property), supporting documents and a chronological register for entries, building lot plans and property descriptions. The Land Register is kept by the Land Register Office under the supervision of the cantons. / . главной книги (ledger) .

LAND REGISTER EXTRACT = ВЫПИСКА ИЗ ЗЕМЕЛЬНОГО КАДАСТРА – Land Register Extract:- description of all entries (rights, charges, notations, provisional reservations, encumbrances, etc) in the Land Register referring to a particular property.

LANDSCAPE = ЛАНДШАФТ – Landscape is the overall surface form of an area including both natural and man-made features; it includes various landforms among its properties. / Под географическим Ландшафтом, от Немецкого слова Landschaft, понимается основная категория территориального деления географической оболочки (в широком смысле – синоним природного территориального комплекса любого ранга), одно из главных понятий физической географии и ландшафтоведения. Географические ландшафты однородны по условиям развития, состоят из морфологических частей (местностей, урочищ, фаций) и компонентов (горных пород, почв, растительности и другого). Процессы обмена веществом и энергией между ними определяют структуру каждого географического ландшафта. Подвержены ритмическим и необратимым изменениям.

LAND UTILIZATION INDEX = ИНДЕКС ПО ЗЕМЛЕПОЛЬЗОВАНИЮ (или ИНДЕКС ПО ЗЕМЛЕУСТРОЙСТВУ, или ИНДЕКС ПО ОСВОЕНИЮ ЗЕМЕЛЬНОЙ ПЛОЩАДИ) – Land Utilization Index (LUI) is the number of days during which crops occupy the land during a year, divided by 365.

LAND WATER REQUIREMENT = ПОТРЕБНОСТЬ ЗЕМЛИ В ВОДЕ – Land Water Requirement is the net seepage and percolation requirement of the soil. / чистое пропитывание (впитывание) и потребность почвы в просачивании (проникновении).

LANE METER = ПОЛОСНЫЙ ИЗМЕРИТЕЛЬ (или ПОЛОСНЫЙ СЧЁТЧИК) – Lane Meter is a unit of deck area for 'roll on/roll off' ships:- cargo vessels designed so that containers or other cargo can be rolled on and off the decks of the ship. A lane is a strip of deck 2 meters wide. A lane meter is an area of deck one lane wide and one meter long, that is, 2 square meters (21.528 square feet). A method of measuring the space capacity of Ro/Ro ships whereby each unit of space (Linear Meter) is represented by an area of deck 1.0 meter in length x 2.0 meters in width.

LANG'S LAY = ХХ СВИВКА – Lang's Lay:- cord in which the direction of lay in the stranding is the same as the direction of lay in cabling the cord. See also Lay.

LA NIÑA = ЛЯ НИНЬА – La Niña:- climatic condition associated with the temperature of major sea currents. / Ля Ниньа:- .

LANOLIN = ЛАНОЛИН (или ШЕРСТЯНОЙ ВОСК) – Lanolin is a wax produced by woolly animals as a form of waterproofing. The wax naturally coats their wool to prevent them from getting wet. Lanolin is similar in composition to oils produced by the skin of other animals for the purpose of waterproofing, hydration, and lubrication. It is sometimes known as Wool Fat or Wool Oil, although chemically it is classified as a wax. In its pure state, lanolin is yellow in color, with a strong odor. People who handle sheep and raw wool often find that their fingers are softened and supple as a result of all of the wax their skin absorbs, but also that their hands tend to smell strong and a bit gamey because of the lanolin. In processing, some of this odor can be removed, making the smell more neutral. During wool processing, much of the lanolin is stripped from the wool, although some may be left in to confer natural waterproofing. The wax can be purified for commercial use once it has been removed from the wool. This wax is especially useful in emulsions of water and oil. It appears in many cosmetic products, especially those which are meant to lubricate or soothe skin. Cracked, dry skin can benefit from regular applications of this product, and it also shows up in products used to treat chafing, rashes, and similar conditions. Lanolin creams are even applied to the udders of milk animals to soreness and chafing, which in some cases means that sheep are treated with their own lanolin! Lanolin is also used in lubricants, as a base for cosmetics, in rust prevention products, and in products designed to provide waterproofing. What works for sheep also works for things like boots and coats, and a layer of this wax can be a very effective waterproofing which will also allow the material to breathe, and keep the material supple and flexible. Flexibility can be key with waterproofing products, as it reduces the risk that the material will crack after being treated to waterproof it. Pure lanolin can be obtained through a variety of sources, while products which contain the wax are readily available at stores which sell skincare supplies, lubricants, waterproofing materials, and so forth. People with sheep and other woolly animals can also process their own during the shearing and wool processing procedure which takes place annually. With large flocks, enough lanolin can be produced for it to be commercially valuable, while smaller home flocks can produce enough to keep a household amply stocked. Lanolin is a purified wool grease, chiefly a mixture of cholesterol esters. It is used in salves, cosmetic, grease paints, and ointments. / Под Ланолином, от Латинских слов Lana, означающее Шерсть, и Oleum, означающее Масло, понимается животный воск; вязкая белая или светло-жёлтая масса ($t_{пл}$ 35–37 °C). Получают промывкой шерсти овец с дальнейшей очисткой. Основа мазей и косметических кремов. Под Ланолином, от Латинских слова Lana, означающее Шерсть, и Oleum, означающее Масло, или Шерстяным Воском, понимается животный воск, получаемый при промывании шерсти овец; вязкая буровато-жёлтая масса. Отличается от других восков высоким содержанием стеринов (в частности, холестерина). Ланолин хорошо всасывается в кожу и обладает смягчающим действием; широко применяется в составе различных косметических средств – кремов и тому подобного, в медицине используется как основа для различных мазей, а также для смягчения кожи (в смеси с равным количеством вазелина).

LANSDOWNE = ЛЯНСДАУН – Lansdowne is a lightweight twill fabric made from natural or man-made fibers and usually used for dresses.

LANYARD = ШТЕРТ (или ШТЕРТИК, или (ТРОСОВЫЙ) ТАЛРЕП, или ФАЛИНЬ) – Lanyard (maritime term):- a rope made fast to an article for securing it (knife lanyard, bucket lanyard, etc), or for setting up rigging.

LAO PDR = LAO PEOPLE'S DEMOCRATIC REPUBLIC

LAP = ХОЛСТ – Lap is a continuous, considerably compressed sheet of fibers that is rolled under pressure into a cylindrical package, usually weighing between 40 and 50 pounds. The lap is used to supply the card. Lap is a wide layer of carded or combed fibers, wound on a roller, ready to be spun. Cotton wound in a lap form ready for further processing. Card lap is from 40 to 45 inches wide; sliver lap is ten inches wide; ribbon lap, 12 inches wide. Card lap will weigh around 40 pounds when ready for carding. Worsted top is often spoken of as lap in the mill. Fibers in lap form are easy to unwind and manipulate. / В прядильном производстве под Холстом понимается тонкий слой волокон; полуфабрикат в прядении и при производстве нетканых материалов.

LAPEL = ОТВОРОТ (или ЛАЦКАН) – (1) Lapel is the part of a garment that is turned back in the front. The front fold on a shirt that is a continuation of the collar. Lapel is the front part of a garment that is folded back on the chest and forms a continuation of the collar. A notched lapel joins the collar at a seam and its outer point slants downward.

(2) Lapels (padding):- attaching the lapel to canvas with several rows of blindstitching.

LAPELS = ЛАЦКАНЫ (или ОТВОРОТЫ) – Lapels are are the folded flaps of cloth on the front of a jacket or coat, and are most commonly found on formal clothing and suit jackets. Usually they are formed by folding over the front edges of the jacket or coat and sewing them to the collar, an extra piece of fabric around the back of the neck. There are three basic forms of lapels:- notched, peaked and shawl. Notched lapels, the most common, are usually seen on business suits. Peaked lapels are more formal, and nearly always used on double breasted jackets or coats. Shawl lapels are usually carried by tuxedos. (i) The Notched Lapel (American English), Step Lapel or Step Collar (British English) is sewn to the collar at an angle, creating a step effect. This is the standard on single-breasted suits, and is used on nearly all suit jackets, blazers, and sports jackets. The notched lapel double-breasted jacket is a rare setting. The size of the notch can vary, and a small notch is called Fishmouth. This was the first type of lapel to appear. M notch lapel is a historical variant of notched lapel, is the M shapel lapel, popular in the first decades of XIX century. The peaked lapel (American English), double breasted style lapel or pointed lapel (British English), is the most formal, featuring on double-breasted jackets, all formal coats such as a tailcoat or morning coat, and also commonly with a tuxedo (both single and double breasted). In the late 1920s and 1930s, the single breasted peaked lapel jacket was considered a very stylish design. The feature was carried into day clothing by the increasing popularity of the peaked dinner jacket. The ability to properly cut peak lapels on a single-breasted suit is one of the most challenging tailoring tasks, even for very experienced tailors. The shawl lapel, roll collar, or shawl collar is a continuous curve. Originally seen on the Victorian smoking jacket, it is now most common on the tuxedo. This similarly began as informal eveningwear, and was then made in both more and less formal versions, depending on the situation in which it was to be used. Lapel features:- lapels have a buttonhole on the left, which is intended to hold a boutonnière, a decorative flower. These are now only commonly seen at more formal events. To hold the flower properly, a loop is fixed to the back of the lapel. For symmetry, double breasted suits often have a button hole on each lapel. A lapel pin is also sometimes worn. The width of the lapel is a widely varying aspect of suits, and has changed widely over the years. Some designers maintain however that most stylish lapel width does not change, and that the lapel 'should extend to just a fraction less than the halfway mark between the collar and shoulder line'. Origin:- the most common style of lapel, the notched lapel, originated in older types of jacket or coat that buttoned to the neck, by unbuttoning and turning back the upper part of the closure at an angle indoors or in hot weather, and then removing the upper buttons. The upper points are derived from the end corners of the collar. This can be duplicated by similarly turning back the closure in a modern button-to-the-neck garment such as an outdoor coat or a boilersuit Sometimes when caught outside in bad weather in a lapelled jacket and nothing over it, its wearer may unfold the lapels and hold them that way to temporarily reproduce the ancestral to-the-neck closure. As tailcoats evolved rapidly among the wealthy during the Regency period, various styles of closure saw popularity, from fastenings at the top, the middle, or even hanging open. The turn-down collar popular on earlier garments like the frock was succeeded by long lapels folded down to below the waist (fashionably tightly

nipped in). Invariably, there were long rows of buttons down the front, most of which did not fasten; in fact even into the late Victorian era, all frock coats had a long row of button holes on the lapel, long since obsolete. As buttoning styles changed, the loosely folded front of the coat correspondingly shifted shape, and the V then formed by the meeting of the fold and the collar continues now in the traditional shape of notched and peaked lapels, both of which originate from that period. Once double breasted frock coats were established, lapels were sharply creased and their form was more static, varying only in details such as height, since they were buttoned nearly to the neck by the Edwardians, then lengthened to the classic three-button shape, the two-button jacket being a further American innovation. The other significant change over that period was the use of the revers in the construction of the lapel, as the Victorians used elaborate three-part patterns to cut a fold of cloth from the lining into the front of the lapel, a universal consideration of frock coats and dress coats of the period, but abandoned in favor of the current single-piece lapels at the same time as the switch to morning coats and lounge suits. Modern lapels are largely identical in form to their 1930s counterparts. Some historians of dress such as Bernard Rudofsky have ridiculed the evolution of jacket lapels into 'vastly unnecessary flaps' and 'decorative rudiments', while others have celebrated the transformation of lapels into 'fetishes' as part and parcel of fashion as expression. Lapelless jackets:- though less common among men's suits in the west, other jacket styles feature no lapels. Jackets with mandarin collars, also called stand collars, band collars or choker collars, include Nehru jackets and various military dress uniforms, such as the British Army and US Marine Corps. Turndown collars, also called Prussian Collars and Ghillie Collars, were once common on military uniforms and on the Mao suit. / бутоньэр (boutonnière). Бернард Рудофски (Bernard Rudofsky). Лацканы пиджака:- к плечам пиджака пришивается воротник и лацканы, которые в длину доходят как раз до того места, где находятся пуговицы. Лацканы могут быть разных видов и в нескольких вариациях. Самой важной из таких вариаций является, пожалуй, ширина лацканов. Достаточно вспомнить былые 'крики' моды:- необычайно узкие лацканы в 1950-х и невероятно широкие – в 1970-х. Как водится, вне времени и неподвластна моде традиционная, средняя ширина лацканов. Помимо различия в ширине, лацканы могут различаться по стилю. Так, существуют три основных вида лацканов:- (i) зазубренные (или зубчатые), которые имеют широкий V-образный вырез в том месте, где лацкан соединяется с воротником; (ii) заострённые (или приподнятые), заканчивающиеся острым углом и имеющие очень узкий V-образный вырез; и (iii) так называемые 'обтекающие' (или 'шалька'), при которых лацкан и воротник неотличимы друг от друга. Зазубренные и заострённые – классические варианты и практически равнозначны, хотя второй можно чаще встретить на двубортных пиджаках. Последний тип лацканов ограничен в использование только в официальном костюме (для торжественных случаев), хотя их иногда можно увидеть и в повседневной жизни. Если же необходимо создать 'классический' образ, такого типа лацканов следует всё же избегать.

LAP FORMATION FRAME = МАШИНА ДЛЯ ФОРМИРОВАНИЯ ХОЛСТА (или ХОЛСТООБРАЗУЮЩАЯ МАШИНА) – In spinning process, Lap Formation Frame for making a lap by doubling of slivers as a input for combing frame. Suitable for fiber length from 27 up to 50.8 mm. Frame is equipped by dust exhausting system. / сдваиванием лент . Машина комплектуется системой отвода пыли. Холст, тонкий слой волокон; полуфабрикат в прядении и при производстве нетканых материалов.

LAPPET = ЛЭПИТ (или ЛАППЕТИНОВЫЙ УЗОР) – Lappet is an ornamental embroidery effect woven into a cloth by a series of needles. The design, often in zigzag effect, is not clipped. / Lappet = Фалда или Складка или Клапан или Лацкан.

LAPPING = НАМАТЫВАНИЕ (или СКЛАДЫВАНИЕ) – Lapping is a term describing the movement of yarn guides between needles, at right angles to the needle bar, or laterally in relation to the needle bar, or laterally in relation to the needle bar during warp knitting.

LAPSE = ПРЕКРАЩЕНИЕ – In reference to insurance, a Lapse is the non-renewal of a policy for any reason.

LAP SPLITTING = ДРОБЛЕНИЕ ХОЛСТА – Lap Splitting is a condition caused by a lap that will not unwind in carding in the same thickness as it was wound in picking. This splitting of the sheet of fiber can result in either a thicker or thinner sheet being fed into the card.

LAR = LEAF AREA RATIO

LARGE CAPS = АКЦИИ КОМПАНИЙ С БОЛЬШОЙ КАПИТАЛИЗАЦИЕЙ – Large Caps:- widely popular shares of highly capitalized companies. Enjoy lively trading. Frequently referred to as Blue Chips.

LARGE HUB AIRPORT = АЭРОПОРТ С БОЛЬШИМ УЗЛОМ – Large Hub Airport means a commercial service airport (as defined in section 47102) that has at least 1.0 percent of the passenger boardings.

LARGE/LONG RANGE TANKER = КРУПНОТОННАЖНЫЙ/ДАЛЬНОХОДНЫЙ ТАНКЕР – Large/Long Range Tanker, 45 000–159 999 dwt. Divided into LR1 (45 000–79 999 dwt), and LR2 (80 000–159 999 dwt). See also Tankers. / Крупнотоннажный/Дальноходный Танкер, 45 000–159 999 т грп. Подразделяются на LR1 (45 000–79 999 т грп) и LR2 (80 000–159 999 т грп). Смотрите также Танкеры (Tankers).

LARGE ORDER EXECUTION PROCEDURES = РЕГЛАМЕНТ ИСПОЛНЕНИЯ КРУПНЫХ РАСПОРЯЖЕНИЙ – Large Order Execution Procedures:- rules in place at the Chicago Mercantile Exchange that authorize a member firm that receives a large order from an initiating party to solicit counterparty interest off the exchange floor prior to open execution of the order in the pit and that provide for special surveillance procedures. The parties determine a maximum quantity and an 'intended execution price'. Subsequently, the initiating party's order quantity is exposed to the pit; any bids (or offers) up to and including those at the intended execution price are hit (acceptable). The unexecuted balance is then crossed with the contraside trader found using the Large Order Execution (LOX) procedures.

LARGE RISKS = КРУПНЫЕ РИСКИ – Large Risks is an official term used in the European Ecomonic Area (EEA) insurance regulation. The formal definition of 'Large Risks' is found in the EU's 2nd Non-Life Insurance Directive (88/357). It can be summarized as meaning:- (i) Risks classified as:- Railway rolling stock, Aircraft (including aircraft liability), Ships (sea, lake and river and canal vessels) (including liability), Goods in transit (including merchandise, baggage, and all other goods). (ii) Risks classified as Credit or Surety where the policyholder is engaged professionally in an industrial or commercial activity or in one of the liberal professions, and the risks relate to such activity. (iii) Risks classified as:- Fire and natural forces, Other damage to property, General liability. Miscellaneous financial loss in so far as the policyholder exceeds the limits of at least two of the following three criteria:- (i) balance-sheet total:- 6.2 million Euros, (ii) net turnover:- 12.8 million Euros, and (iii) average number of employees during the financial year:- 250. If the policyholder belongs to a group of undertakings for which consolidated accounts are drawn up, the criteria mentioned above is applied to the consolidated accounts.

LARGE SEEDS = КРУПНЫЕ СЕМЕНА – Large Seeds are considered foreign material in some classes of grain. Large seeds include domestic and wild seeds that remain on top of the No. 4.5 round-hole sieve.

LARGE SPECULATOR = КРУПНЫЙ СПЕКУЛЯНТ – Large Speculator is a trader that enters the market for speculative gain and holds a reportable position size. This trader group is tracked by the Commitments Of Trader Report data and thought to have 'deep pockets', meaning they are well capitalized and not easily forced out of the market due to margin requirements.

LARGE TRADER = КРУПНЫЙ ТОРГОВЕЦ – A Large Trader is one who holds or controls a position in any one future or in any one option expiration series of a commodity on any one exchange equaling or exceeding the exchange or the US Commodity Futures Trading Commission-specified reporting level.

LARGE–VALUE PAYMENTS = КРУПНЫЕ ПЛАТЕЖИ (или ПЛАТЕЖИ КРУПНЫХ СУММ) – Large-Valued Payments are the payments, usually but not always interbank ones, for large amounts.

LARIAT = АРКАН – Lariat is a woven belt that looks like a cowboy's rope.

LARRIGAN = ЛЭРИГЭН (или ВЫСОКИЙ МОКАСИНОВЫЙ САПОГ (для лесорубов), или КАНАДСКИЕ БАХИЛЫ) – Larrigan:- an oil-tanned moccasin with a leg often reaching the knee. Larrigan is a moccasin with knee-high leggings made of oiled leather. Larrigan is a knee-high boot of oiled leather with a moccasin foot, worn by lumbermen and trappers. / .

LARVA = ЛИЧИНКА (или ЛАРВА) – A Larva (Latin; plural Larvae) is a juvenile form of animal with indirect development, undergoing metamorphosis (for example, Insects or Amphibians). The larva can look completely different from the adult form, for example, a caterpillar differs from a butterfly. Larvae often have special (larval) organs which do not occur in the adult form. The larvae of some Species can become pubescent and not further develop into the adult form (for example, in some newts). This is called Neoteny. Larva is the immature stage of an Insect with four distinct metamorphic stages, e.g., Cabbage Looper:- egg, larva (caterpillar), pupa, and adult. Larva is the immature, wingless, and often vermiform (wormlike) feeding form that hatches from the egg of many insects, alters chiefly in size while passing through several molts, and is finally transformed into a pupa or chrysalis from which the adult emerges. Larva is the immature form of an insect such as a caterpillar, grub or maggot, that hatches from an egg, feeds and growth through a number of instars then pupates. See also Nymph, and Pupa. / Недоразвитая форма Насекомого, такая как гусеница, червь или сама личинка, которое выводится из яйца, питается и растёт, проходя через ряд стадий, а затем окукливается. Смотрите также Нимфа (Nymph) и Куколка (Pupa). Под Ларвой, от Латинского слова Larva, означающее Личинка или Маска, понимается . Личинка является стадией индивидуального развития многочисленных Насекомых, отличная по строению и образу жизни от взрослых форм. Насекомое на стадии личинки ведёт самостоятельный образ жизни. Личинка Насекомых, постэмбриональная стадия развития, от вылупления из яйца до превращения во взрослую особь. При неполном превращении личинки похожи на взрослое Насекомое (прямокрылые и другие), при полном – отличаются от него (гусеницеобразные, камподеовидные и червеобразные личинки). В стадии личинки Насекомые обычно ведут самостоятельный образ жизни. Личинка, стадия индивидуального развития многих беспозвоночных и некоторых позвоночных Животных (Рыб и Земноводных), у которых запасы питательных веществ в яйце недостаточны для завершения зародышевого развития. Организм на стадии личинки ведёт самостоятельную жизнь, обычно имеет специальные органы, не свойственные взрослой форме, и лишён многих органов, присущих последней. У многих Животных стадия личинки обусловлена различным образом их жизни на ранних этапах развития и во взрослом состоянии:- так, характерная для Многощетинковых Червей и многих Моллюсков личинка – трохофора ведёт свободноплавающий образ жизни, тогда как взрослые формы обитают на дне. Иногда наличие личинки связано со сменой среды обитания во время развития. Например, у многих Земноводных личинка приспособлена к жизни в воде (смотрите Головастик), а взрослое Животное – к условиям суши. У морских сидячих или малоподвижных Животных плавающая личинка обеспечивает их расселение. Таковы личинки Губок и Кишечнополостных – Паренхимула, Амфибластула и Планула, а также личинка Иглокожих и Кишечнодышащих – Диплеурула. Превращение личинки во взрослое Животное (смотрите Метаморфоз) заключается в перестройке организации, тем более глубокой, чем сильнее личинка отличается от закончившего своё развитие организма. Особенно резкие изменения происходят при метаморфозе личинок некоторых Беспозвоночных (Немертин, Иглокожих, Насекомых). Например, у Высших Насекомых на стадии куколки, следующей за стадией личинка, почти все личиночные органы разрушаются, а органы взрослого Животного формируются заново из особых зачатков – имагинальных дисков. Личинки некоторых Животных сохраняют черты строения предковых форм, что указывает на происхождение этих Животных. Подобное филогенстическое значение придают, например, личинки Губок и Кишечнополостных (Паренхимуле и Плануле), а также хвостатой личинки Асцидий, которая напоминает по строению свободноплавающего предка.

LARVICIDE = ЛАРВИЦИД – Larvicide is a compound that kills the larval stage of Insects. / Под Ларвицидом, от Латинских слов Larva, означающее Личинка или Маска, и Caedo, означающее Убиваю, понимается .

LAS = LEAGUE OF ARAB STATES

LASE = LOAD AT SPECIFIED ELONGATION

LASER = ЛАЗЕР – Laser is a device for producing an intense beam of coherent light. It is used for cutting, spectroscopy, photography, biomedical investigations, etc.

LASER LEVELING = ЛАЗЕРНОЕ ВЫРАВНИВАНИЕ (или НИВЕЛИРОВАНИЕ С ПОМОЩЬЮ ЛАЗЕРА, или ЛАЗЕРНАЯ ПЛАНИРОВКА) – Laser Leveling is the land leveling technique wherein the leveling device, normally tractor-drawn, is controlled by a laser beam set at a certain bench mark or level. Laser Land Levelling, a simple operation to prepare the land before sowing, can reap massive returns such as increasing yields, saving water and reducing greenhouse gas emissions. Laser-levelling in Rice fields reduced irrigation time by 47–69 hours per hectare per season and improved yield by approximately 7 percent compared with traditionally levelled fields. In Wheat, irrigation time was reduced by 10–12 hours per hectare every season and yield increased by 7–9 percent in laser levelled fields. It increases yields by an average 8 percent for both crops. It saves electricity about 755 kWh per hectare per year for Rice-Wheat systems. It's cost effective. As demand increases, service providers rent out equipment and farmers collectively share the costs. A study showed that it reduces greenhouse gas emissions from saving on energy, reducing cultivation time and increasing input efficiency. Higher yeilds means higher incomes for farmers.

LASH = LIGHTER ABOARD SHIP

LASH = РАСТЯЖКИ (или ОБВЯЗКИ, или НАЙТОВ) – Lash:- materials used to secure cargo in a container or trailer, or to secure containers or other heavy lifts in or on the vessel. Such materials usually consist of wire rope, turnbuckles, chains, and binders, etc. The act of securing cargo in containers or trailers or securing other heavy lifts and/or containers in or on a vessel. To hold cargo in position by the use of wires, ropes, chains, rods and straps. Containers stacked on the deck of a ship are secured (lashed) at all four corners by wires or rods. / К Растяжкам (Обвязкам) относятся проволока, полосы, цепи, стальные тросы, металлические стержни и другие, используемые для крепления грузов. Найтов, от Голландских слов Naaien, означающее Шить, и Touw, означающее Канат или Трос, – трос или цепь, с помощью которых на судне крепятся различные предметы.

LASH BARGE = СЧАЛЕННАЯ БАРЖА (или БАРЖА ТИПА ЛЭШ, или ЛИХТЕР, ПЕРЕВОЗИМЫЙ ЛИХТЕРОВОЗОМ) – Lash Barge is a type of barge carried by LASH vessels (lighter aboard ship vessels). / Тип барж, перевозимых судами типа ЛЭШ (судами лихтеровозами типа ЛЭШ).

LASHED–IN FILLING = ПРИБИТАЯ УТОЧИНА – Lashed-In Filling:- xxxxx. See also Pulled-In Filling.

LASH–IN = ПРОЛЁТ (или ПРОМЁТКА, или ПРИБИВАТЬ) – Lash-In:- xxxxx. See also Jerk-In. Fabrics defect. / Пролёт или Промётка – порок ткани.

LASHING = КРЕПЛЕНИЕ РАСТЯЖКАМИ (или КРЕПЛЕНИЕ ОБВЯЗКАМИ, или КРЕПЛЕНИЕ НАЙТОВАМИ, или КРЫЖЕВАНИЕ, или СХЛЁСТЫВАНИЕ) – Lashing:- materials used to secure cargo in a container or trailer, or to secure containers or other heavy lifts in or on the vessel. Such materials usually consist of wire rope, turnbuckles, chains, and binders, etc. The act of securing cargo in containers or trailers or securing other heavy lifts and/or containers in or on a vessel. Securing cargo or product. Attaching or fixing/securing a load to a means of transport/or securing a load inside a container in order to prevent it from sliding or falling. Lashing is a widely used international term. The term can be modified to indicate the type of lashing that is meant (direct lashing, diagonal lashing, tie-down lashing). The lashing equipment may be prefabricated lashing belts, chains, wire rope, as well as ropes made of artificial or natural fibers, or a combination of such. / крепление/раскрепление грузов .

LASHING = НАЙТОВ (или СЧАЛКА, или КРЕПЛЕНИЕ НАЙТОВАМИ, или КРЫЖЕВАНИЕ) – Lashing (maritime term):- a passing and repassing of a rope so as to confine or fasten together two or more objects; usually in the form of a bunch.

LASHING CAPACITY = ДОПУСТИМАЯ НАГРУЗКА ДЛЯ КРЕПЛЕНИЯ РАСТЯЖКАМИ (или ДОПУСТИМАЯ НАГРУЗКА ДЛЯ КРЕПЛЕНИЯ ОБВЯЗКАМИ, или ДОПУСТИМАЯ НАГРУЗКА ДЛЯ КРЕПЛЕНИЯ НАЙТОВАМИ, или ДОПУСТИМАЯ НАГРУЗКА ДЛЯ КРЫЖЕВАНИЯ) – The permissible Lashing Capacity (LC) is the maximum force that may be applied to a lashing. This lashing capacity can be found on a label that is attached to the lashing equipment.

LASHING CROSSPIECE = СТЯГИВАЮЩАЯ КРЕСТОВИНА (или ХХ) – Lashing Crosspiece is a construction similar in appearance to a girder, manufactured primarily from steel and offering attachment points for lashing equipment.

LASHING EQUIPMENT = ОБОРУДОВАНИЕ ДЛЯ КРЕПЛЕНИЯ РАСТЯЖКАМИ (или ОБОРУДОВАНИЕ ДЛЯ КРЕПЛЕНИЯ ОБВЯЗКАМИ, или ОБОРУДОВАНИЕ ДЛЯ КРЕПЛЕНИЯ НАЙТОВАМИ, или ОБОРУДОВАНИЕ ДЛЯ КРЫЖЕВАНИЯ) – Various types of equipment used to secure containers/cargo on board vessel. Lashing Equipment:- devices or aids for securing loads against slippage, tipping and falling. It may comprise chains, wires, ropes, straps or rods and is generally used in conjunction with a tensioning device, e.g., turnbuckle, twistlock or ratchet tensioner. Depending on the way in which the load is secured, it may be referred to as Cylinder Lashing, Cross Lashing, Wire-Rope Lashing or Round-Turn Lashing. Verb:- to lash. / , например, .

LASHING–IN = ПРОЛЁТ (или ПРОМЁТКА) – Lashing-In is the term used to describe bits of extra weft yarn found tucked into the selvedge of the fabric. Remedial measures are:- (i) proper maintenance of accessories and loom parts; (ii) adjusting the pattern of changes of the boxes; and (iii) the use on drop-box looms of a suitable brush fixed at the end of the temple rod. Lashing In:- cutting setting variation intension in weft tuck needle not works properly exclusive tail out goes in selvedge, feeder and projectile setting also affects the same. Lashing In:- an extra piece of yarn woven into the fabric in the vicinity of the selvedge. Causes:- (i) defective setting of the shuttle box; (ii) early or late picking; and (iii) in case of auto loom, weft cutters worn out or not set properly. Mending:- this defect can be corrected by pulling out the extra pick from the selvedge end, which can be clipped with the help of clipper. A bare patch is formed and can be filled by combing in both directions with the help of metallic comb. Weaving defect. Lashing In:- it is the length of the yarn, i.e. pulled inadvertently into the shed during weaving and this yarn is found touched in selvedge (widthwise edges) of the fabric. This defect is common in auto-looms. When the weft yarn is caught due to damaged picker or any rough surface in the box, this extra length of the weft gets loosely caught in the selvedge. Alternately improper functioning of shutter eye cutter on auto looms can cause this kind of defect. Minor Defect Classification:- Occurring less frequently. Major Defect Classification:- Occurring more frequently. Lashing-In:- an extra piece of yarn woven into the fabric in the vicinity of the selvedge. Lashing In:- also known as Weft Trail or Jark In Weft it is caused by an extra yarn dragged into the cloth along with the regular pick. / Порок или дефект ткачества. Пролёты в одну уточную прокидку. Размер порока – за каждое место.

LASHING POINT = ТОЧКА ДЛЯ КРЕПЛЕНИЯ РАСТЯЖКАМИ (или ТОЧКА ДЛЯ КРЕПЛЕНИЯ ОБВЯЗКАМИ, или ТОЧКА ДЛЯ КРЕПЛЕНИЯ НАЙТОВАМИ, или ТОЧКА ДЛЯ КРЫЖЕВАНИЯ) – Lashing Point is a point on a means of transport to which wires, chains, ropes or straps, which are used to hold goods in position, are attached. / Точки на транспортных средствах к которым приворачиваются проволока, цепи, канаты или стропы (ремни), используемые для крепления товаров в определённом положении.

LASHING ROD = КРЕПЯЩИЙ СТЕРЖЕНЬ – Lashing Rod is a metal rod for securing (lashing) containers on deck.

LASIACANTHA = ЛАЗИАКАНТА – Lasiacantha:- with shaggy or hairy spines.

LASPEYRES PRICE INDEX = ЛЯСПЭРОВСКИЙ ИНДЕКС ПО ЦЕНАМ – The Laspeyres Price Index (LPI) is an index formula used in price statistics for measuring the price development of the basket of goods and services consumed in the base period. The question it answers is how much a basket that consumers bought in the base period would cost in the current period. It is defined as a fixed-weight, or fixed-basket, index that uses the basket of goods and services and their weights from the base period. It is also known as a 'base-weighted index'. In price statistics other price index formulas may be used (Paasche Price Index, Fisher Price Index). The choice of the index formula, however, often depends on the availability of data. In contrast to the other formulas, the Laspeyres index does not require information on the basket of the current period. Therefore in practice the Laspeyres formula is usually preferred for the calculation of consumer price indices, which are typically compiled and released rapidly – before consumption or production information for the current period could have been collected. Laspeyres Price Index is a methodology to calculate the consumer price index by measuring the change in the price of the basket of goods to the base year. It was invented by Étienne Laspeyres, an economist from Germany to analyze the changes in the prices as compared to the base year period. The index generally uses a base year of 100 to analyze the index. An index greater than 100 implies the rise in prices and an index less than 100 implies a fall in prices. Year 0 will be termed as the base year while calculating year will be termed as an observation year period. It is more used by economists to analyze the economic growth of the country taking into consideration the inflation in the goods and services. Laspeyres Price Index Formula:- Laspeyres Price Index = Σ(Observation Price * Base Qty) / Σ(Base Price * Base Qty); where:- Observation Price refers to the price at the current levels for which the index needs to be calculated; Observation Qty refers to the qty at the current levels for which the index needs to be calculated; and Base Price refers to the price at year 0 which is known as the base year for calculating the index. Advantages of Laspeyres Index:- Is one of the most important tools to observe the inflation in the basket of goods and services by comparing the current price levels with the base year quantities. Below mentioned are some of the major advantages of Laspeyres index ratio:- (i) It is very easy to calculate in an excel sheet; (ii) It focuses on base year quantities and current level prices only hence

there is no need to calculate the quantities for the future years; (iii) It gives a fair picture and value of the commodities since base year quantities are been used thus ignoring the current level quantities; and (iv) It is a good parameter to frame future policies that will control inflation. Disadvantages of Laspeyres Index:- (i) It does not take into account the current level of quantities; (ii) Ignores the growing economy; (iii) Since there can be a change in the production level in the future years, ignoring this fact will not be correct in the model; (iv) It completely ignores the new entrants in the market; (v) It does not take into account the change in quality and substitute goods that can have a major impact on the prices; and (vi) In the case of Substitute goods, with the old ones becoming obsolete may push the price up to and also the levels of production. hence by ignoring the future quantities will not show a correct figure of the index and will have an in a direct impact on the government policies ahead. Limitations of Laspeyres Index:- (i) More mathematical less practical; (ii) It is not used commonly among economists since the Pastiche index gives a better picture; (iii) Prices tend to rise on a yearly basis keeping in mind the consumption patterns and rising standard of living among the people; and (iv) Deciding the base year is a major challenge. Points to Note:- A significant change in the Laspeyres Price Index will give a trigger point to the government to control the growing inflation by implementing new policies that will clear the market thereby reducing the price rise pressure on the common public. Conclusion:- It is one of the key ratios in order to determine the speed of inflation for goods and services. Since this index is different from the Paasche Price Index which uses current level quantities in its formula, while the Laspeyres Price Index uses base year quantities, both cannot be compared with each other and will give an altogether different picture reflecting the rise or fall in the prices. This index is been widely used by the economist in taking the financial and economic decision for the country and to drive the consumer market without passing on the pressure of price rise to the common public. See also Fisher Price Index, and Paasche Price Index. / Немецкие экономисты Эрнэст Люи Этен Ляспэр (Ernst Louis Étienne Laspeyres; 1834–1913) и Хэрман Пашэ (Hermann Paasche; 1851–1925), а также Американский экономист Овинь Фищё (Irving Fisher; 1867–1947). Смотрите также Фищёвский Индекс по Ценам (Fisher Price Index), и Пашэвский Индекс по Ценам (Paasche Price Index).

LAST = ПОСЛЕДНЯЯ – Last:- the last price the stock sold for, or closing price.

LAST CARRIER = КРАЙНИЙ ПЕРЕВОЗЧИК (или КОНЕЧНЫЙ ПЕРЕВОЗЧИК) – Last Carrier is the participating airline over which air routes the last section of carriage under the waybill is undertaken or performed (aircargo). / В перевозках авиационных грузов .

LAST DELIVERY DATE = ПОСЛЕДНЯЯ ДАТА ПОСТАВКИ (или КРАЙНЯЯ ДАТА ПОСТАВКИ) – For Cotton No. 2 futures contracts, the term Last Delivery Date means the seventh last business day of the expiring month. / Для фьючерсных контрактов № 2 на Хлопок Нью Йоркской биржи Ай.Си.И. Фьючез Ю.Эс., Инк. (ICE Futures US, Inc.) термин Последняя Дата Поставки или Крайняя Дата Поставки означает семнадцатый рабочий день истекающего месяца поставки.

LAST EFFECTIVE FLOWER/BOLL POPULATION = ПОСЛЕДНЯЯ ЭФФЕКТИВНАЯ ПОПУЛЯЦИЯ ЦВЕТКОВ/КОРОБОЧЕК – Last Effective Flower/Boll Population:- The latest developing population of flowers which have a high probability of being retained and developing into bolls having adequate size and fiber properties. This population can be determined physiologically (e.g., nodes above white flower (NAWF) = 5) or by weather restraints. See also Latest Possible Cutout Date, and Nodes Above White Flower.

LAST IN, FIRST OUT = ПОСЛЕДНИМ ОПРИХОДОВАНО, ПЕРВЫМ СПИСАНО – (1) Last In First Out (LIFO) is a method of storing and relieving Cost of Goods Sold based upon applying the latest cost in the record to sales as they are posted, the resulting inventory reflecting the older costs. LIFO can have tax advantages and is more often calculated at year end than computed real-time. Last In, First Out (LIFO) is a method of which the assumption is that the most recently received (last in) is the first to be used or sold (first out). In accounting, a system of stock-keeping, whereby the latest items manufactured or bought are used or sold before old stock is cleared. In a period of deflation this has the effect of maximizing profit, because new goods or materials have cost less to manufacture or buy. Last In, First Out (LIFO) is the inventory allocation method that selects newest inventory first. / Последним Оприходовано, Первым Списано (ПОПС или как это звучит на Английском языке, Эл.Ай.Эф.Оу. или ЛАЙФО (LIFO)). строка баланса (item).

(2) Last In First Out (LIFO) is a method by which some companies make employees redundant, on the basis of length of service. Thus, the last people to be employed are the first to be laid off.

LASTING = ЛАСТИН (или ЗАТЯХКА (ОБУВИ), или ЛАСТИК) – Lasting is a sturdy cotton or worsted cloth used especially in shoes and luggage. / торговое название обувной ткани саржевого переплетения из сильно кручёной пряжи.

LAST NOTICE DAY = ПОСЛЕДНИЙ ДЕНЬ УВЕДОМЛЕНИЯ (или КРАЙНИЙ ДЕНЬ УВЕДОМЛЕНИЯ) – Last Notice Day is the final day on which notices of intent to deliver on futures contracts may be issued. For Cotton No. 2 futures contracts, the term Last Notice Day means five business days prior to the Last Delivery Day. / Последним Днём Уведомления или Крайним Днём Уведомления считается заключительный день, в который ещё могут быть выданы уведомления о намерении поставки по фьючерсным контрактам. Для фьючерсных контрактов № 2 на Хлопок Нью Йоркской биржи Ай.Си.И. Фьючез Ю.Эс., Инк. (ICE Futures US, Inc.) термин Последний День Уведомления означает дату, определяемую следующим образом:- от даты Последнего Дня Поставки (Last Delivery Day) вычитаются пять рабочих дней, получается дата Последнего Дня Уведомления.

LAST POSSIBLE FLOWER/BOLL = ПОСЛЕДНИЙ ВОЗМОЖНЫЙ ЦВЕТОК/КОРОБОЧКА – Last Possible Flower/Boll:- The latest developing individual flower which will develop into a harvestable boll (last effective boll). These flower/bolls are normally associated with nodes above white flower (NAWF) < 5 or anthesis after the latest possible cutout date, and typically exhibit low boll retention and small boll size. Management inputs to protect such flowers or salvage such bolls are usually wasted with little or no return on the investment. See also Latest Possible Cutout Date, and Nodes Above White Flower.

LASTRILE FIBER = ЛЭСТРЛОВОЕ ВОЛОКНО (или ВОЛОКНО ЛЭСТРЛ, или ВОЛОКНО ЛЭСТРАЙЛ) – Lastrile Fiber is a manufactured fiber in which the fiber-forming substance is a copolymer of acrylonitrile and a diene composed of at least 10% by weight, but not more than 50% by weight, of acrylonitrile [–CH_2–CH(CN)–] units. Lastrile is the generic name for a made-made elastic fiber. There is not now, and has never been, any commercial production of this fiber in the United States.

LAST TRADING DAY = ПОСЛЕДНИЙ ДЕНЬ ТОРГОВЛИ – Last Trading Day:- this term means, with respect to any futures or option month, the last day on which trading is permitted for such futures or option month in accordance with the rules of an exchange. Last Trading Day is a day on which trading ceases for the maturing (current) delivery month. The final day under an exchange's rules during which trading may take place in a particular futures delivery month. Futures contracts outstanding at the end of the last trading day must be settled by delivery of the underlying asset or, in the case of cash settlement, by an exchange of cash value differences. For Cotton No. 2 futures contracts – tenth business day prior to the Last Delivery Day or last Friday which precedes First Notice Day for underlying future by at least 5 business days. Last Trading Day is the last day of trading in a particular futures or options contract month. Unsettled contracts at the end of the last trading day must be fulfilled by delivery of the physical product or closed through cash settlement procedures if the contract does not permit delivery. / Для Фьючерсных Контрактов на Хлопок № 2^{3O} Нью Йоркской биржи Ай.Си.И. Фьючез Ю.Эс., Инк. (ICE Futures US, Inc.) термин Последний День Торговли по старой спецификации на данный контракт означал дату, предшествующую десяти рабочим дням Последнего Дня Поставки или последнюю Пятницу,

которая по крайней мере на 5 рабочих дней предшествует Первому Дню Уведомления для соответствующего фьючерса; а по новой – семнадцатый рабочий день с конца самого месяца поставки. Последний День Торговли – последний день, в течение которого может быть оплачен фьючерсный контракт с поставкой в текущем месяце. Если контракт не учтён (offset), то должно быть заключено новое соглашение между покупающей и продающей сторонами, в ином случае товарно-сырьевая продукция должна быть доставлена от продавца покупателю.

LATCHET = ШНУРОК (или ТЕСЁМКА, или ЛАЧЭТ, или ЗАЩЁЛКА) – Latchet is a narrow leather strap, thong, or lace that fastens a shoe or sandal on the foot. Origin:- Middle English Lachet, from Anglo-French Lachet, Lacetenoose, from Lace, Laz Snare, Lace – more at lace. First Known Use:- XV century. / Лэситэнос (Lacetenoose), от Лэйс (Lace).

LATCH NEEDLE = ЯЗЫЧКОВАЯ (ТРИКОТАЖНАЯ) ИГЛА – Latch Needle is one of the two types of knitting machine needles. The latch needle has a small terminal hook with a latch that pivots automatically in knitting to close the hook. The fabric loop is cast off. The latch then opens, allowing a new loop to be formed by the hook, and loop-forming and casting-off proceed simultaneously. See also Needle (2), and Spring Needle. / Смотрите также Игла (2; Needle (2)), и Пружинная Игла (Spring Needle).

LATE CROP = ПОЗДНЯЯ КУЛЬТУРА (или ПОЗДНИЙ УРОЖАЙ, или ПОЗДНЕСПЕЛАЯ КУЛЬТУРА) – Late Crop is a subjective term which refers to bolls produced on the upper and outer periphery of the plant canopy, usually developed late in the season. These bolls may experience increased inclement weather and insect risks and are often small and have low fiber and seed quality. Bolls developed after nodes above white flower (NAWF) = 5 or after the latest possible cutout date in the Mississippi River Delta are considered a late crop. See also Latest Possible Cutout Date, and Nodes Above White Flower.

LATE CROP REMOVAL = ПОЗДНИЙ СБОР УРОЖАЯ (или ПОЗДНЕЕ УДАЛЕНИЕ КУЛЬТУРЫ) – Late Crop Removal (LCR):- one of the Cotton Choices™ is Cotton Choices™ 2:- Late Crop Removal (LCR) with Extended Terms. It entitles you to receive a full refund on your technology fee if your crop is removed due to hail, drought or for any other reason. Visit the website for full terms and conditions.

LATENT = ЛАТЕНТНОЕ (или СКРЫТОЕ) – Latent:- something, e.g., a gene or disease that is present in a plant but is unexpressed. / Под Латентным, от Латинского слова Latens, означающее Скрытый, понимается .

LATENT CRIMP = ЛАТЕНТНАЯ (или СКРЫТАЯ) ИЗВИТОСТЬ (или ГОФРЕННОСТЬ, или ЗАВИТОСТЬ) – Latent Crimp is a crimp in fibers that can be developed by a specific treatment. Fibers are prepared specially to crimp when subjected to specific conditions, e.g., tumbling in a heated chamber or wet processing. Latent Crimp is a crimp that can be developed by a thermal treatment or by tensioning and subsequent relaxation. See also Crimp.

LATENT DEFECT = СКРЫТЫЙ ДЕФЕКТ (или ЛАТЕНТНЫЙ ДЕФЕКТ) – Latent Defect is a defect in the construction of a ship or machinery that is not readily discernible to a competent person carrying out a normal inspection. Discovery of a latent defect does not give a rise to a claim on the ordinary hull policy, but damage caused thereby is usually covered. A defect not immediately apparent. / Под Латентным, от Латинского слова Latens, означающее Скрытый, .

LATENT (GRADUALLY DEVELOPING) DISEASE = ЛАТЕНТНОЕ (ПОСТЕПЕННО РАЗВИВАЮЩЕЕСЯ) ЗАБОЛЕВАНИЕ (или СКРЫТАЯ (ПОСТЕПЕННО РАЗВИВАЮЩАЯСЯ) БОЛЕЗНЬ) – Latent (Gradually Developing) Disease is an illness that lies dormant for some years before manifesting itself. / Латентное (Постепенно Развивающееся) Заболевание является болезнью, которая бездействует в течение нескольких лет, прежде чем начинает проявлять себя.

LATENT HEAT = СКРЫТАЯ ТЕПЛОТА – Latent Heat is the quantity of heat absorbed or released by a substance undergoing a change of state, such as ice changing to water or water to steam, at constant temperature and pressure. When a solid material is heated and reaches its melting point, it goes from solid to liquid. During this process the material absorbs a certain amount of heat, Despite the heat input, the temperature of the material stays at a relatively constant level, even though phase change is taking place. We thus speak of latent (concealed) heat having been taken up by the material.

LATENT INFECTION = ЛАТЕНТНАЯ ИНФЕКЦИЯ (или СКРЫТАЯ ИНФЕКЦИЯ) – Latent Infection is the state in which a host is infected with a pathogen but does not show any symptoms. / Под Инфекцией, от позднелатинского слова Infectio, означающее Заражение, понимается внедрение и размножение в организме человека или животного болезнетворных микроорганизмов, сопровождающееся комплексом реактивных процессов; завершается инфекционным заболеванием, бактерионосительством или гибелью микробов. Источник возбудителя инфекции заражает здоровых при соприкосновении, через рот (с водой и пищей), воздух (с капельками слюны и слизи), членистоногих переносчиков.

LATENT PERIOD = ЛАТЕНТНЫЙ ПЕРИОД (или СКРЫТЫЙ ПЕРИОД) – Latent Period:- (1) in epidemiology, latent period refers to the time elapsed from arrival of a dispersal unit at a susceptible plant surface until the formation of the next generation of dispersal units. (2) Incubation period of a virus in an insect. The time between acquisition of the virus and the time when it becomes infective. / Под Латентным Периодом или Скрытым Периодом понимается:- (1) в физиологии – время момента воздействия какого-либо раздражителя на организм до появления ответной реакции. Определение латентного периода имеет значение в психологии, в том числе инженерной. (2) Латентный период беременности – временная задержка развития оплодотворённого яйца у ряда млекопитающих (Барсук, Косуля, Соболь и другие). (3) В медицине – период скрытого протекания заболевания.

LATERAL = ЛАТЕРАЛЬНОЕ (или БОКОВОЕ) – Lateral (root system) are the secondary roots attached to the tap root generally in a horizontal plane. Lateral:- growing or positioned at the sides. Lateral:- on the side. / Под Латеральным, от Латинского слова Lateralis, означающее Боковой, от Latus, означающее Бок, понимается расположенный сбоку, удалённый от срединной продольной плоскости тела. Сравните с Медиальным.

LATERAL AND FRONT STACKING TRUCK = ГРУЗОВИК ДЛЯ БОКОВОГО (или ПОПЕРЕЧНОГО) И ФРОНТАЛЬНОГО ШТАБЕЛИРОВАНИЯ – Lateral And Front Stacking Truck is a high-lift stacking truck capable of stacking and retrieving loads ahead and on either both sides of the driving direction.

LATERAL BRACE = ГОРИЗОНТАЛЬНАЯ СВЯЗЬ (или ГОРИЗОНТАЛЬНЫЙ ПОДКОС) – Lateral Brace is a continuous member connected to a truss chord to maintain the vertical position of the truss during construction. / пояс фермы (truss chord). В строительных конструкциях под Связями понимаются соединительные элементы каркаса здания (сооружения), обеспечивающие устойчивость основных (несущих) конструкций каркаса и пространственную жёсткость сооружения в целом. Связи обеспечивают также перераспределение нагрузок, приложенных к отдельным конструкциям, на соседние конструкции или на всё сооружение. Система связей обычно состоит из стержневых конструкций (порталов, ферм) и отдельных стержней (раскосов и других).

LATERAL DUNNAGE = БОКОВОЙ ДЕННАЖ (или ЛАТЕРАЛЬНЫЙ ДЕННАЖ) – Lateral Dunnage:- covering the sides of the container with dunnage provides protection against dripping sweat.

LATERAL MOVEMENT = ЛАТЕРАЛЬНОЕ ПЕРЕМЕЩЕНИЕ – Lateral Movement is a movement of a herbicide through soil, generally in a horizontal plane, from the original site of application.

LATERAL TIER = БОКОВОЙ ЯРУС (или ЛАТЕРАЛЬНЫЙ ЯРУС) – Lateral Tier is a lateral layer of cargo. Generally used to stabilize the stow or to close off the face of the load.

LATEST POSSIBLE CUTOUT DATE = САМАЯ ПОСЛЕДНЯЯ ВОЗМОЖНАЯ ДАТА XX – Latest Possible Cutout Date is the latest date from which accumulation of heat units required for boll maturation is probable, based upon the historical weather patterns within a specific geographical region. This date becomes later as the user assumes a higher acceptable weather risk, or in growing regions progressively closer to the equator.

LATEX = ЛАТЭКС (или ЛАТЕКС) – Latex is a milky aqeous emulsion containing a variety of organic substances, often including rubber and various proteins. Commercially, latex produced from within bark of the rubber tree is coagulated by heat to produce natural rubber. A synthetic resin used in the manufacture of water soluble paint coatings. PVA and acrylic are two types of latex resins used to make latex coatings. Latex is the name for the liquid form of natural or man-made rubber. It can be formed into thread for use as an elastic yarn. Latex is also used extensively as part of the backing in the manufacture of rugs and at one time, was used extensively in corsets and brassieres. Now, however, although some latex foundation garments are still made, it has been largely replaced by spandex. Solid latex is sometimes referred to as Rubber. See also Spandex. Latex is a milky fluid found in certain cells of some families of seed plants. Latex is the raw material from which rubber is made. / Под Латэксом, от Латинского слова Latex, означающее Влага или Жидкость или Сок, понимаются водные дисперсии полимеров. Различают следующие виды латэксов:- (i) натуральный латэкс – млечный сок каучуконосных растений, в котором диспергированы высокомолекулярные углеводороды и растворены белки, соли, углеводы и эфирные масла. К растениям с богатым содержанием латэкса относятся растения семейства молочайных, сложноцветных, тутовых и других. Наибольшее промышленное значение имеет латэкс Бразильской гевеи, из которого выделяют натуральный каучук. Кроме натурального латэкса имеется и (ii) синтетический латэкс в виде водных дисперсий каучуков или некоторых синтетических полимеров – пластиков. Синтетические латэксы образуются при эмульсионной полимеризации соответствующих мономеров в водной среде. Синтетические латэксы применяются для изготовления красок, метеорологических оболочек, пенорезины, для аппретирования и пропитки текстильных материалов, защиты почвы от эрозии, отделки бумаги и многого другого. (iii) Искусственные латэксы – дисперсии, получаемые эмульгированием растворов полимеров в воде; чаще всего для этого используют каучуки, которые синтезируют полимеризацией в растворе, – бутилкаучук, изопреновые каучуки. Латэксы, особенно синтетические, занимают среди полимерных материалов одно из первых мест по возможностям применения. Их используют для пропитки шинного корда, изготовления разнообразных резиновых изделий (в том числе губчатых, тонкостенных), производства полимерцементов, эмульсионных красок, для отделки кожи, в качестве клеёв и так далее. Натуральные латэксы применяют преимущественно для получения натурального каучука.

LATICIFER = СОДЕРЖАЩЕЕ ЛАТЭКС – Laticifer is cells containing a characteristic milky fluid called Latex.

LATIN AMERICA ADVISORY COMMITTEE = СОВЕЩАТЕЛЬНЫЙ КОМИТЕТ ПО ЛАТИНСКОЙ АМЕРИКЕ (или КОНСУЛЬТАТИВНЫЙ КОМИТЕТ ПО ЛАТИНСКОЙ АМЕРИКЕ) – Latin America Advisory Committee provides the representative views and attitudes of the Latin American corporate community on the role of the New York Stock Exchange in international matters, including such areas as:- strengthening exchange policies and programs dealing with the internationalization of the capital markets; facilitating multinational offerings of corporate securities; monitoring legislative and regulatory proposals that impose duties or responsibilities on corporate boards of directors of publicly owned issuers; and strengthening communications between the exchange and the Latin American corporate community. / коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо).

LATIN AMERICAN AND CARIBBEAN INTERNET ADDRESSES REGISTRY = РЕЕСТР ЛАТИНО–АМЕРИКАНСКИХ И КАРИБСКИХ АДРЕСОВ ИНТЕРНЕТА – The Latin American and Caribbean Internet Addresses Registry (LACNIC) is a Regional Internet Registry (RIR) for Latin America and the Caribbean. / Реестр Латино-Американских и Карибских Адресов Интернета (РЛАКАИ) – региональный Интернет-реестр (РИР) для стран Латинской Америки и Карибского Бассейна.

THE LATIN–AMERICAN ENERGY ORGANIZATION = ЛАТИНО–АМЕРИКАНСКАЯ ОРГАНИЗАЦИЯ ПО ЭНЕРГЕТИКЕ – The Latin-American Energy Organization is English name of the Organización Latinoamericana De Energía (OLADE) in Spanish. See also Organización Latinoamericana De Energía. / Смотрите также Органисасьон Латиноамэрикана Дэ Энэрхиа (Organización Latinoamericana De Energía).

LATIN SQUARE DESIGN = ДИЗАЙН ЛАТИНСКОГО КВАДРАТА – Latin Square Design is the experimental design used when there are two sources of variation among experimental units, as in the presence of a bidirectional fertility gradient in field experiments. / Латинский Квадрат – способ размещения вариантов в полевом опыте.

LATITUDE = ШИРОТА – Latitude is the angular distance of a position on its meridian north or south from the equator, measured in degrees (a vessel at 25 degrees north latitude). / Под Широтой понимается одна из координат в ряде систем сферических координат, определяющая положение точек на поверхности Земли, Солнца, планет и на небесной сфере относительно экватора (эклиптики). Под геомагнитной широтой понимается угловое расстояние от геомагнитного экватора до рассматриваемой точки земной поверхности. Она отсчитывается вдоль большого круга, проходящего через данную точку и геомагнитные полюсы. Широта – угловая величина, определяющая положение точек на сфере, в том числе на земной поверхности. Под широтой понимается двугранный угол, составленный отвесной линией, проходящей через данную точку, с плоскостью экватора.

LATTICE = РЕШЁТКА – Lattice is a grid-like structure, mainly wooden, used to secure the load.

LATTICE DESIGNS = РЕШЁТЧАТЫЕ ДИЗАЙНЫ – Lattice Designs are the incomplete block designs used in single-factor experiments having a large number of treatments.

LATTICE ENERGY = ЭНЕРГИЯ РЕШЁТКИ – Lattice Energy is the energy required to separate the ions of a crystal to an infinite distance from each other.

LAUNCH = СПУСК – Launch (maritime term):- to place in the water. / Спуск судна на воду.

LAUNDER–OMETER = ИЗМЕРИТЕЛЬ СТИРАНИЯ – Launder-Ometer is a standard laboratory devise for testing a fabric's fastness to washing. / Прибор для определения прочности тканей к стирке.

LAUREL = ЛОРЭЛ (или ЛАВР) – Laurel:- a crown of laurel. / .

LAVALAVA = ЛАВАЛАВА – Lavalava or Lava-Lava is a rectangular cloth of cotton print worn like a kilt or skirt in Polynesia and especially in Samoa. / в Полинезии и особенно в Самоа.

LAVENDER = ЛАВЭНДЁ (или БЛЕДНОЛИЛОВОЕ, или ЛАВАНДА, или ЛАВАНДОВОЕ) – Lavender:- a variable color averaging a pale purple.

LAWN = БАТИСТ (или ЛИНО–БАТИСТ, или ЛОН) – Lawn is a light, fine cloth made using carded or combed, linen or cotton yarns. The fabric has a crease-resistant, crisp finish. Linen lawn is synonymous with handkerchief linen. Cotton lawn is a similar type of fabric, which can be white, solid colored, or printed. Lawn:- cotton plain weave. Word derived from Laon, a city in France, where linen lawn was manufactured extensively. Light weight, sheer, soft, washable. It is crispier than voile but not as crisp as organdy. Made with fine high count yarns, silky feel. Made with either carded or combed yarns. Comes in white or may be dyed or printed. When made with combed yarns with a soft feel and slight lustre it is called Nainsook. Used in underwear, dresses, blouses, night wear, curtains, lingerie, collars, cuffs, infant wear, shirtings, handkerchiefs. Standard construction of the gray fabric in Japan:- 100% cotton, 60's x 60's, 90 x 88 threads per inch, 50". Lawn is a light-weight, single cloth wash fabric, weighing from 1% ounces to 2% ounces per yard and in widths from 36 inches to 40 inches finished. It is composed of all cotton yarns (bleached) from 1/40's to about 1/100's, and is always woven with a plain weave. The term 'Lawn' is derived from 'Laon', a city in France which was a large manufacturer of linen lawn. Plain Lawn is made of solid white or bleached yarn in tooth the warp and filling. The fancier grades, or those having a color effect, are produced by printing vines, floral stripes, small flowers etc; in bright colors, in scattered effects upon the face of the goods, the warp and the filling in all cases being bleached yarns. The patterns are always printed, newer woven. Lawn is used principally in the manufacture of ladies' and children's summer dresses, sash curtains, dresses, blouses, nightwear, underwear, lingerie etc. Being a rather sheer fabric, lawn is best adapted to those light running looms in which the action of shedding is easiest upon tine fine yarns used in this style of goods. The warp for this fabric is dressed or beamed upon a regular dressing frame. It is then drawn in on 4 harnesses to permit of freedom in shedding. The plain weave requires but two harnesses, 'but where there are a great number of ends in the warp, the yarn would be very much crowded if the warp was drawn in on two harnesses. Therefore, four or more harnesses' are used. Lawn, when finished, should have a very soft, smooth feel. Therefore the finishing process includes 'brushing, very light starching or sizing, then calendering or pressing. 16 square inches equals 6.9 grains. 40 x 36 equals 1 440 x 6.9 equals 9 936 divided by 16 equals 621 divided by 437.5 equals 1.419 ounces per yard, 40 inches wide finished. Making Lawn in early XX century:- Carding and Spinning Particulars:- the counts of yarns from which lawn is made vary according to the quality of lawn being made. This varies from 40's to 100's. The yarns are made in the third division of mills, as given in a previous lesson or those mills which make high count yarns. In this article we will consider the warp yarn to be 60's and the filling yarn to be 100's. For these two counts raw stock of two different lengths of staple and grade of yarn would be used. For 100's a Sea Island Cotton of about 1%-inch staple may be used and for 'the warp yarn an Allen Cotton of about 1% inches staple. The two cottons would be treated differently at every process' and so we will describe the two Cottons at each process. The Allen cotton would be put through the bale breaker, in the manner ascribed in the article of last week, and carried to its proper bin. Lawn is a light, thin cloth made of carded or combed yarns, this fabric is given a creaseresistant, crisp finish. Lawn is crisper than voile but not as crisp as organdy. Lawn is a light, well-hackled linen fabric first made in Laon, France. Now, it is a lightweight, fairly sheer, fine, plain-weave cotton or linen muslin fabric generally more sheer and with a higher count than nainsook. It can be given a soft or crisp finish and is sized and calendered to produce a soft, lustrous appearance. Linen lawn is synonymous with handkerchief linen. Cotton lawn is a similar type of fabric. Lawn is slightly stiffer than batiste, but can be used for similar purposes. It is white, solid colored, or printed and is used tot dresses, blouses, curtains, lingerie, and as a base for embroidered items. See batiste, nainsook, and handkerchief linen. / город Ляон или Лан (Laon) во Франции. основа и уточина . Под Батистом, от Французского слова Batiste, понимается тонкая, полупрозрачная льняная или хлопчатобумажная ткань полотняного переплетения. Из батиста шьют женское бельё, лёгкое платье. Батист, тонкая, полупрозрачная льняная или хлопчатобумажная ткань полотняного переплетения, вырабатываемая из кручёной пряжи высоких номеров (наиболее тонкой). Батист выпускается отбелённым, мерсеризованным (смотрите Мерсеризация), гладкокрашеным и набивным. Употребляется для женского белья, летних платьев, блузок, а также как полуфабрикат для изготовления кальки.

LAW OF DEMAND = ЗАКОН СПРОСА – Law Of Demand:- other things being held constant, the lower the price of a good (or service), the greater the quantity of it that will be demanded by purchasers at any given time. / Под Законом понимается внутренняя существенная и устойчивая связь явлений, обусловливающая их упорядоченное изменение.

LAW OF DIMINISHING RETURNS = ЗАКОН О СОКРАЩАЮЩИХСЯ ОТДАЧАХ – A Law Of Diminishing Returns, sometimes also referred to as the Law of Variable Proportions, this 'law' is really a generalization economists make about the nature of technology when it is possible to combine the same factors of production in a number of different proportions to make the same product. The law states:- When increasing amounts of one factor of production are employed in production along with a fixed amount of some other production factor, after some point, the resulting increases in output of product become smaller and smaller. That is, first the marginal returns to successive small increases in the variable factor of production turn down, and then eventually the overall average returns per unit of the variable input start decreasing. Since the law assumes that the available quantity of at least one factor of production is fixed at a given level and that technological knowledge does not change during the relevant period, the law of diminishing returns normally translates into a statement about the short-run choice of production possibilities facing a firm (since in the longer run it is virtually always possible for the firm to acquire more of the temporarily 'fixed' factor – building an additional factory building, buying additional land, installing additional machines of the same kind, installing newer and more advanced machinery, and so on). A simple example of the workings of the law of diminishing returns comes from gardening. A particular twenty by twenty garden plot will produce a certain number of pounds of tomatoes if the gardener just puts in the recommended number of rows and plants per row, waters them appropriately and keeps the weeds pulled. If the gardener varies this approach by adding a pound of fertilizer to the topsoil, but otherwise does everything the same, he can increase the number of pounds of tomatoes the garden plot yields by quite a bit (notice the amount of land is being held fixed or constant). If he adds two pounds of fertilizer (rather than just one), probably he can get still more tomatoes per season, but the increase in tomatoes harvested by going from one pound to two pounds of fertilizer is probably smaller than the increase he gets by going from zero pounds to one (diminishing marginal returns). Applying three pounds of fertilizer may still increase the harvest, but perhaps by only a very little bit over the yields available using just two pounds. Applying four pounds of fertilizer turns out to be overdoing it – the garden yields fewer tomatoes than applying only three pounds because the plants begin to suffer damage from root-burn. And five pounds of fertilizer turns out to kill nearly all the plants before they even flower. Another similar example of diminishing returns in an industrial setting might be a widget factory that features a certain number of square feet of work space and a certain number of machines inside it. Neither the space available nor the number of machines can be added to without a

long delay for construction or installation, but it is possible to adjust the amount of labor on short notice by working more shifts and/or taking on some extra workers per shift. Adding extra man-hours of labor will increase the number of widgets produced, but only within limits. After a certain point, such things as worker fatigue, increasing difficulties in supervising the large work force, more frequent breakdowns by over-utilized machinery, or just plain inefficiency due to overcrowding of the work space begin to take their toll. The marginal returns to each successive increment of labor input get smaller and smaller and ultimately turn negative. The law of diminishing returns is significant because it is part of the basis for economists' expectations that a firm's short-run marginal cost curves will slope upward as the number of units of output increases. And this in turn is an important part of the basis for the law of supply's prediction that the number of units of product that a profit-maximizing firm will wish to sell increases as the price obtainable for that product increases.

LAW OF SUPPLY = ЗАКОН ПРЕДЛОЖЕНИЯ – Law Of Supply:- other things being held constant, the higher the price of a good (or service), the larger the quantity of that good (or service) that will be offered for sale in a particular time period.

LAWYER = АДВОКАТ (или ЮРИСТ, или ПРАВОВЕД, или ЮРИСКОНСУЛЬТ) – Lawyer is the somebody licensed to practice law. In Canada, a lawyer is usually referred to as a Barrister or a Solicitor only in formal and professional usage. In the United Kingdom, the term may be applied to a solicitor, but is most usually (and loosely) used as a synonym for attorney or barrister. In the United States, attorney, counsel, or lawyer predominates in everyday contexts. See also Barrister and Solicitor. / Известен также как Барристер (Barrister) и Солиситор (Solicitor). Лицо, профессия которого – оказание юридической помощи гражданам и организациям, в том числе защита их интересов в суде. Юрисконсульт, от Латинского слова Juris-consultus, означающее Правовед, должностное лицо юридической службы министерства, ведомства, предприятия или иных организаций. Он следит за обеспечением законности в деятельности данной организации, защищает её права и интересы в судебных и административных органах.

LAX PANICLE = РЫХЛАЯ МЕТЁЛКА – Lax Panicle is a panicle that is loose or open with a few lateral branches and sparsely distributed spikelets. / В ботанике под Метёлкой понимается ложное соцветие, многократно ветвящееся и несущее на концах ветвей простые соцветия – кисти (Сирень), колоски (у Злаков), корзинки (у Сложноцветных).

LAY = БАТАН (или ВИТОК (ровницы на катушке), или ВИТЬ, или СВИВАТЬ) – Lay is:- (1) a name given to the collective parts of a loom which actually makes weaving possible. The lay comes forward when the loom is in action, and makes it possible for the movable parts to perform their functions. Parts of the lay of the loom include reed, reed-cap, raceplate, shuttles, shuttle boxes, picker sticks, lug straps, cams. (2) To make the disposition of paper patterns upon cloth before cutting, so arranged as to effect economy of fabric and to obtain exact matching of patterns. (3) A strand of rope (nautical). Lay:- a term in common use in cordage and steel cord industry, similar to twist in the textile industry. / бёрдо (reed), xx бёрда (reed-cap), raceplate, shuttles, shuttle boxes, picker sticks, lug straps, cams. Лопасть Батана. нарезка ткани определённой длины по требованию заказчика (cutting) . Батан, от Французского слова Battant, означающее буквально Бьющий, один из основных механизмов ткацкого станка; служит для продвижения (прибоя) уточной нити к опушке ткани и направления челнока (или прокладчика), вводящего уток в ткань. Батан, один из основных механизмов ткацкого станка, служащий для направления челнока, вводящего уток в основу ткани, и для прибоя уточины к опушке.

LAY ALOFT = УКЛАДЫВАТЬ НА ВЕРХУ (или УКЛАДЫВАТЬ НА МАРСЕ, или ПОДНИМАТЬСЯ НА МАЧТЫ) – Lay Aloft (maritime term):- the order to go aloft (go up above).

LAY–AWAY = ОТЛОЖЕННАЯ (или ПРИДЕРЖИВАТЬ ТОВАРЫ ДЛЯ БУДУЩЕЙ ТОРГОВЛИ) – Lay-Away:- form of retail selling in which merchandise is held by the seller while the buyer makes periodic payments, taking delivery only after the goods have been paid for in full.

LAY–BY = ОТЛАВЛИВАТЬ – Lay-By is a final, typically post-directed herbicide application designed to eliminate or suppress weeds through harvest time. Lay-By is the last application and incorporation of herbicides prior to canopy closure.

LAYCAN (DATE) = LAYDAYS/CANCELING (DATE)

LAY DAYS = СТАЛИЙНЫЕ ДНИ (или СТАЛИЙНЫЕ СУТКИ) – A term Laydays refers to a period of specified days (e.g., 'Jan 7/16') during which owners must present the vessel for loading. Laydays should not be confused with laytime, which is the period allowed to the charterers for loading and/or discharging without payment additional to the freight. Lay Days:- the number of days allowed in a charter party for the loading and discharging of cargo. Lay days may be indicated in different ways, e.g., consecutive days, working days, weather working days. / Под Сталийными Сутками или Сталийными Днями понимается число суток (или дней), предоставленных чартер партией для погрузки и выгрузки груза. Сталийные дни или сутки могут указываться разными способами, например, последовательными днями, рабочими днями, рабочими погожими днями.

LAYDAYS/CANCELLING (DATE) = СТАЛИЙНЫЕ ДНИ/(ДАТА) ОТМЕНЫ – A term Laydays refers to a period of specified days (e.g., 'Jan 7/16') during which owners must present the vessel for loading. Laydays should not be confused with laytime, which is the period allowed to the charterers for loading and/or discharging without payment additional to the freight. The Cancelling Date is the final layday and the date beyond which, if the chartered vessel has not been presented for loading, the charterers may reject her and cancel the charter. Will usually be found in a Cancelling Clause, which provides that the charterers will not be entitled to cancel the charter before the stated cancelling date, even when it is obvious that the vessel cannot arrive at the loading port by this date. Together, Laydays/Cancelling or, as it is often called, the 'Laycan' is the period within which the vessel must be presented at the agreed port or place. If the vessel arrives before the first day of the period, the charterers do not have to accept her until commencement of the agreed laydays. If she arrives after the final layday, the charterers are entitled to reject the vessel and cancel the charter. The charterers cannot be made to declare whether they intend to cancel or not before the vessel arrives at the loading port. Even after the cancelling date has passed, owners can still not compel the charterers to declare whether or not they will load the vessel (and in practice the charterers will often stay silent, hoping to make a new contract with owners). To avoid delay to the vessel in awaiting the charterer's decision on cancellation, some charter parties have an extension to the Cancelling Clause compelling the charterers to declare within a specified time whether or not they elect to cancel after being informed of the vessel's late arrival. In charter parties and related documents the laycan will usually be written as (for example) '10/20 May', meaning 10 May is the first layday while 20 May is the cancelling date. Layday/Cancelling (Date):- range of dates within the hire contract must start. A term Laycan is an abbreviation for the 'Laydays and Cancelling' clause in a charterparty. This clause establishes the earliest date, when the ship is required by the charterer, (e.g., 'Laytime for loading shall not commence before ...') and the latest date for the commencement of the charter (e.g., '... and should the vessel's Notice of Readiness not be given before ...') when the charterers have the option of cancelling the charter. This is the latest date mutually agreed upon between shipowners and charterers, on which the vessel must be ready to load at the first port or be delivered to the time charterer. The arrival of the vessel on time may be essential to the charterer for various reasons. Should the vessel be late, charterers are entitled to cancel the charterparty. If it appears that a vessel cannot possibly arrive at the port of loading in time and the delay has not been occasioned by events beyond the owners' control, and. which would automatically terminate the

charter, the shipowners are bound' to send their vessel to the port of loading, irrespective of the delay in arrival beyond the original cancelling date. The charterer can cancel even if there is no fault of the shipowner, for example, if the vessel is delayed by bad weather on its approach voyage to the place of delivery or the first loading port. Only after notice of readiness has been given to the charterers will they have to decide whether they will accept the vessel or whether they will cancel the charter. Commercially, their decision will be governed mainly by the trend of the freight market. Should the open market rates have risen since the fixture of the vessel in question, it is clear that the original charter will be maintained. Conversely, the charter will be cancelled or a new charter will be closed at a lower rate, if the open market rates have declined in the meantime and suitable cheaper tonnage can be chartered for prompt loading. The charterparty clause containing the cancelling date also contains another date, the earliest when the charterer expects the ship to commence performing under the charter. This is the 'laydays' date and the combined dates are called the 'Laycan' or 'Lay/can' Dates. The 'laydays' date refers to the earliest commencement time for loading, for example, in a voyage charter. Different charterparties contain the cancelling (or laycan) clause in ways, which sometimes give the charterers what seems to be an unfair option to cancel, even if there is no real breach of the charter by the owner. For example, in the NYPE (short for the New York Produce Exchange) time charterparty; cl. 14 states:- '14. That if required by Charterers, time not to commence before ... and should vessel not have given written notice of readiness on or before ... but not later than 04:00 pm. Charterers or their Agents to have the option of cancelling this Charter at any time not Later than the day of vessel's readiness'. The BALTIME charterparty provides that:- 'Should the vessel not be delivered by the ... day of ... 19.., the charterers to have the option of cancelling'. The effect of the cancelling clause/date is to allow the charterers the option to cancel even if there has been no breach of the charter terms by the owner. This is different from any right the charterers may have to treat the contract as ended because the owner has breached some term. The 'option' also means that the shipowner is deprived of an automatic cancellation of the charter and the freedom to fix the vessel under another charter. In a charter the commencement of laytime or time on hire depends on the notice of readiness being given before the cancelling time. The cancelling time is the equivalent of the expiry of the period in which notice of readiness can be given. The notice must be given when the ship is in every way ready and fit, by the cancelling date, for the contracted service. Minor deficiencies may not cause the ship to be 'unready'. In the case of voyage charters the ship's readiness is viewed more strictly, for example, the condition of the ship's cargo compartments. Readiness for laytime purposes and for cancelling purposes may be similar but for cancelling purposes courts would be reluctant to apply the two in the same way. A lack of readiness for laytime purposes would have an effect on the counting of laytime, in a voyage charter, but for cancelling purposes, the result is forfeiture or cancelling of the whole contract. This can work hardship on shipowners or lead to unjust results but shipowners and charterers can use appropriate clauses in the charter to reduce the difficulties. Therefore, a clause can be used which will allow the shipowner to arrange for an extension if it appears probable that the ship will miss the cancelling date. Sometimes the clause provides more precisely for such a contingency by specifying that charterers must decide in such a case within a stipulated period whether they intend to cancel or not. For example in MULTIFORM it is stated in the 'Laydays and Cancelling Clause':- 'Laytime for loading shall not commence before 08:04 hours on ... and should the vessel's notice of readiness not be given before 17:00 hours on ... in accordance with Clause 7, the Charterers shall at any time thereafter, but not later than the time when such notice has been delivered, have the option of cancelling this Charterparty. If, prior to tendering notice tinder this Charterparty, the vessel's cancelling date has already passed or, whichever first occurs, the vessel has begun her approach voyage and in the ordinary course of events would be unable to tender notice before the cancelling date, the Owners, having given a revised expected readiness to load date, may require the Charterers to declare whether they elect to cancel the Charterparty and Charterers shall be given up to 48 running hours to make this declaration. Should the Charterers not elect to cancel, the cancelling date shall be extended by three running days, Sundays (or their equivalents) excluded, from the vessel's revised expected readiness to load date ...'. In order to eliminate difficulties on this score, it is important to agree upon a fair margin between the beginning of laydays and cancelling date. It is obvious that in case a ship is fixed for a number of consecutive voyages, the risk that she will miss the cancelling date for the last voyage will increase, as the original estimate of the number of days required for the previous voyages may be upset by unforeseen circumstances, such as bad weather, slow discharge, strikes, etc. However, in the case of charters for consecutive voyages, it frequently occurs that a cancelling date is only provided for the first voyage, the other voyages following automatically, subject only to the time the vessel will take to discharge her cargo and return to her loading port for the next voyage. It is rare for charterers to establish a claim for damages by reason of a vessel having missed her cancelling date, unless, of course, there had been some deliberate misrepresentation on the part of the shipowners with regard to the expected time of readiness. As a rule, the delay will be due to exceptional circumstances, e.g., damage to engines, beyond the shipowners' control, in which case charterers are not entitled to any indemnification. With regard to damages, the usual form of cancelling clause does not allow the charterer to recover damages if the vessel is late. It only allows him to cancel the charter. If the charterer wishes to recover damages, he must prove an independent breach of the charter and that the shipowner was aware of the consequences of the breach. The range of dates during which a ship will load. / БОЛТАЙМ (BALTIME). Диапазон дат, в течение которого будет произведена погрузка на судно.

LAYER = СЛОЙ (или МНОГОУРОВНЕВОЕ (или МНОГОСЛОЙНОЕ) ОБЕСПЕЧЕНИЕ) – A Layer is a horizontal segment of the liability insured, e.g., the second USD100 000.00 of a USD500 000.00 liability is the first layer if the cedant retains USD100 000.00 but a higher layer if it retains a lesser amount. Section of cover in a non-proportional reinsurance programme in which total coverage is divided into a number of consecutive layers starting at the retention or attachment point of the ceding company up to the maximum limit of indemnity. Individual layers may be placed with different (re)insurers.

LAYER PAD = XX (или МЯГКАЯ ПРОКЛАДКА, или ПОДКЛАДНОЙ ЛИСТ) – Layer Pad is xxxxx. See also Stack. Layer Pads are used inside cases to divide layers of stacked products such as cans, bottles and other rigid packaging. The layer pad stabilises the products and disperses weight evenly to ensure they remain free from damage during transit. The top layer pad also offers additional product protection when cases are being cut open. Layer pads are available in a range of corrugated cardboard or solid board grades and are designed to provide the required amount of strength to meet the physical requirements of your supply chain. 100% recyclable and made from a renewable resource, layer pads are an environmentally friendly alternative to plastic products. Features:- available in a range of corrugated cardboard or solid board grades; bespoke to your exact size and performance requirements; die cut to meet any corner or groove requirements; water resistant and other barrier coatings available; and can be high quality printed. Benefits:- reduction in transit damage as products remain stable and secure inside the case; eliminates any blade damage during opening of case; environmentally friendly – made from a renewable resource and 100% recyclable; and opportunity to communicate product and brand messages on printed layer pads. Markets:- beverages; bakery; confectionery; dairy; fruit and vegetables; meat, poultry and fish; other foods; health and beauty; household cleaning; electronics; tobacco; and other consumer goods. / Мягкая Прокладка или Подкладной Лист (Layer Pad):- лист обычно из бумаги или картона, помещаемый между одним или более слоями единиц груза для обеспечения устойчивости штабеля. Смотрите также Штабель (Stack).

LAYOUT = КОМПОНОВКА (или ПЛАНОВОЕ РАСПОЛОЖЕНИЕ, или СХЕМА РАЗМЕЩЕНИЯ) – Layout is a plan showing the allocation of treatments among experimental units. A detailed plan showing the arrangement of replications and treatments in an experiment. Layout is a design and set-up of warehouse storage.

LAYTIME = СТАЛИЯ (или СТАЛИЙНОЕ ВРЕМЯ) – Laytime is a time allowed by the shipowner to the voyage charterer or bill of lading holder in which to load and/or discharge the cargo. It is expressed as a number of days or hours or as a number of tons per day. Time at charterers disposal for purpose of loading/unloading. / в которое они должны погрузить и/или разгрузить груз. Это время выражается как число суток или часов или как число тонн в сутки. Под Сталией или Сталийным Временем понимается время, в течение которого должна быть произведена погрузка или разгрузка морского судна.

LAY UP = СТАВИТЬ НА ПРИКОЛ (или СТАВИТЬ НА КОНСЕРВАЦИЮ) – Lay Up:- temporary cessation of trading of a ship by a shipowner during a period when there is a surplus of ships in relation to the level of available cargoes. This surplus, known as Overtonnaging, has the effect of depressing freight rates to the extent that some shipowners no long find it economical to trade their ship, preferring to lay them up until there is a reversal in the trend.

LAY–UP RETURN = ВОЗВРАТ ЧАСТИ ПРЕМИИ ЗА СТОЯНКУ НА ПРИКОЛЕ – Lay-Up Return:- part of the annual premium on a ship time policy paid back to the assured by the underwriters because the ship has been laid up and not exposed to full navigational risks for a minimum period, usually not less than 30 consecutive days. Such return is not paid until the natural expiry date of the policy and is forfeit if the vessel becomes a total loss before such date.

LAZARETTO = КЛАДОВАЯ – Lazaretto (maritime term):- a low headroom space below decks used for provisions or spare parts, or miscellaneous storage. / Кладовая в кормовом отсеке.

LAZY = ЛЕНИВЕЦ – Lazy (la):- plants grow prostrate rather than upright because of an ageotropic growth habit. In Rice literature, some extreme spreading forms have been mis-termed lazy. / Ленивец – волокуша для нарезания валиков.

LAZY KATE = ЛЕНИВАЯ КЕЙТ – Lazy Kate is the device used to support full bobbins while plying. A fairly traditional design, involves two vertical posts that support the bobbins. Rather like a free-standing ladder. And example of this can be found on the LeClerc site. Another form, favored by Schacht, has the bobbins supported horizontally with the addition of a breaking cord to control the backspin. Now, Alden Amos favors a vertical support with the addition of leather washers to help slow down the backspin. At this time, there is no image available. Lazy Kate or Lizzy Kate is a device used to hold bobbins or spindles while plying. / Ленивая Кейт – устройство, используемое для удерживания полных бобин во время .

LB = LEBANON

L/B = LENGTH/BREADTH RATIO OF GRAIN

LB = POUND

LBMA = THE LONDON BULLION MARKET ASSOCIATION

LBMA GOOD DELIVERY LIST = СПИСОК ЛАРС ПО ДОЛЖНОЙ ПОСТАВКЕ (или СПИСОК ЛАРС ПО ПОДОБАЮЩЕЙ ПОСТАВКЕ) – LBMA Good Delivery List is a list of acceptable refiners of gold and silver whose bars meet the required standard (of fineness, weight, marks and appearance) of the London Bullion Market Association. LPPM Good Delivery Lists is a list of acceptable refiners of platinum and palladium whose plates and ingots meet the required standard (of fineness, weight, marks and appearance) of the London Platinum and Palladium Market.

LBMP = LOCATIONAL–BASED MARGINAL PRICING

LBO = LEVERAGED BUYOUT

LBP = LEBANESE POUND

LC = LETHAL CONCENTRATION

LC = L/C = LETTER OF CREDIT

LC = LIBRARY OF CONGRESS

LC = SAINT LUCIA

LC50 = ЛК50 – LC50:- LC stands for Lethal Concentration. LC values usually refer to the concentration of a chemical in air but in environmental studies it can also mean the concentration of a chemical in water. According to the (Organisation for Economic Cooperation and Development) (OECD) Guidelines for the Testing of Chemicals, a traditional experiment involves groups of animals exposed to a concentration (or series of concentrations) for a set period of time (usually 4 hours). The animals are clinically observed for up to 14 days. The concentrations of the chemical in air that kills 50% of the test animals during the observation period is the LC50 value. Other durations of exposure (versus the traditional 4 hours) may apply depending on specific laws. See also LD50. LC50 is the lethal concentration that causes 50% mortality. The LC50 is the lethal concentration of toxicant causing 50% mortality of the test animals. The probit analysis (PB) method, the linear regression of probit mortality on log dosage, was employed to obtain a regression equation to estimate the 24 h, 48 h, 72 h, and 96 h LC50. The maximum allowable toxicant concentration (MATC) is the concentration of toxicant that may be present without causing harm. It can be calculated by multiplying the 96 h LC50 by application factor (AF). An AF of 0.05 is suggested by Boyd for general use.

LCA = LIFE CYCLE ASSESSMENT

LCA = LOAD CONTROL AREA

LCAC = LISTED COMPANY ADVISORY COMMITTEE

LCH = THE LONDON CLEARING HOUSE LIMITED

LCL = LESS THAN CONTAINER LOAD

LCM = LEAST COMMON MULTIPLE

LCP = LIGHT COMPENSATION POINT

LCP = LIQUID CRYSTAL POLYMER

LCR = LATE CROP REMOVAL

LCR = LIGASE CHAIN REACTION

LCV = LEAF CURL VIRUS

LD = LETHAL DOSE

LD = LOW DENSITY

LD50 = ЛД50 – LD50:- duration, in days, to 50% mortality. LD50:- LD stands for Lethal Dose. LD50 is the amount of a material, given all at once, which causes the death of 50% (one half) of a group of test animals. The LD50 is one way to measure the short-term poisoning potential (acute toxicity) of a material. Toxicologists can use many kinds of animals but most often testing is done with rats and mice. It is usually expressed as the amount of chemical administered (e.g., milligrams) per 100 grams (for smaller animals) or per kilogram (for bigger test subjects) of the body weight of the test animal. The LD50 can be found for any route of entry or administration but dermal (applied to the skin) and oral (given by mouth) administration methods are the most common. Why study LD50's? Chemicals can have a wide range of effects on our health. Depending on how the chemical will be used, many kinds of toxicity tests may be required. Since different chemicals cause different toxic effects, comparing the toxicity of one with another is hard. We could measure the amount of a chemical that causes kidney damage, for example, but not all chemicals will damage the kidney. We could say that nerve damage is observed when 10 grams of chemical A is administered, and kidney damage is observed when 10 grams of chemical B is administered. However, this information does not tell us if A or B is more toxic because we do not know which damage is more critical or harmful. Therefore, to compare the toxic potency or intensity of different chemicals, researchers must measure the same effect. One way is to carry out lethality testing (the LD50 tests) by measuring how much of a chemical is required to cause death. This type of test is also referred to as a 'quantal' test because it is measures an effect that 'occurs' or 'does not occur'. Who invented the idea of an LD50? In 1927, John William Trevan attempted to find a way to estimate the relative poisoning potency of drugs and medicines used at that time. He developed the LD50test because the use of death as a 'target' allows for comparisons between chemicals that poison the body in very different ways. Since Trevan's early work, other scientists have developed different approaches for more direct, faster methods of determining the LD50. What are some other toxity dose terms that are used? LD01 – lethal dose for 1% of the animal test population. LD100 – lethal dose for 100% of the animal test population. LDLO – the lowest dose causing lethality. TDLO – the lowest dose causing a toxic effect. Why are LD50 and LC50 values a measure of acute toxicity? Acute toxicity is the ability of a chemical to cause ill effects relatively soon after one oral administration or a 4-hour exposure to a chemical in air. 'Relatively soon' is usually defined as a period of minutes, hours (up to 24) or days (up to about 2 weeks) but rarely longer. See also LC50. / Британский фармаколог Дьжон Вилъйэм Тчрэван (John William Trevan; 1887–1956).

L–DAX® = П–ДАКС® – L-DAX® is the late index, indicator for the development of prices on the trading floor of the FWB (Frankfurt Stock Exchange) between 05:30 pm and 08:00 pm. This index was introduced so that the German benchmark index can be calculated even after the close of Xetra® trading (05:30 pm). In its composition, the L-DAX® corresponds exactly to the 'original' index DAX®. However, it is based only on the trading floor prices at the Frankfurt Stock Exchange. The late indices (L-DAX®, L-MDAX®, L-SDAX®, L-TecDAX®) serve merely as indicators and not as underlyings for any derivative products such as certificates, warrants, funds, etc. / П-ДАКС® – это поздний индекс ДАКС®, отражающий ситуацию, творящуюся на торговом полу Франкфуртской Фондовой Биржи (ФФБ) в промежуток времени между 17:30 и 20:00 по местному времени (UTC+1). Ксэтра® (Xetra®).

LDB® = LIQUIDITY DATA BANK®

LDC = LEAST DEVELOPED COUNTRY

LDC = LESS DEVELOPED COUNTRY

LDC = LOCAL DISTRIBUTION COMPANY

LDC GROUP = LEAST DEVELOPED COUNTRIES GROUP

LDD = LAST DELIVERY DATE

LDG = LODGING

LDP = LOAN DEFICIENCY PAYMENT

LEA = ПАСЬМА – Lea is:- (1) one-seventh of an 840-yard cotton hank, i.e. 120 yards. (2) A standard skein with 80 revolutions of 1.5 yards each (total length of 120 yards). It is used for strength tests. (3) The unit of measure, 300 yards, used to determine the yarn number of linen yarn. The number of leas in one pound is the yarn number. Lea is a form of measuring linen yarns in 300-yard increments and weighing one pound. A 4-lea skein would also weigh one pound but would be 1 200 yards long. / Пасьма – единица длины пряжи. Пасьма льняной пряжи (300 ярдов или 274.2 метра); пасьма хлопчатобумажной пряжи для определения номера и крепости (80 оборотов по 1.5 ярда каждый или 109.7 метров); пасьма пряжи по Метрической системе, равная 100 метрам.

LEACHING = ВЫЩЕЛАЧИВАНИЕ – In mining industry, Leaching is a process used to separate the copper or gold contained in the ore by means of slowly percolating solutions. Leaching is the extraction of a soluble metallic compound from ore by dissolving the metals in a solvent. / В горной (горнодобывающей) промышленности, Выщелачиванием считается процесс, используемый для выделения меди или золота, содержащихся в руде посредством медленных перколяционных растворений. Перколяция означает способ выщелачивания металлов из неподвижного слоя измельчённой руды, предполагающий просачивание в чанах (перколяторах). Под Выщелачиванием понимается извлечение отдельных компонентов твёрдого материала с помощью водного или органического растворителя, например, бактериальное выщелачивание урана из руд, гидрометаллургическое извлечение металлов из руд, щелочное извлечение лигнина из древесины. Выщелачивание основано на способности извлекаемого вещества растворяться лучше, чем остальные составляющие материала, подвергаемого выщелачиванию. Выщелачивание применяют в гидрометаллургии, горном деле (например, для добычи соли), сахарном производстве, химической промышленности, а также для извлечения дубильных и других полезных веществ из растительного сырья. Известно также как Экстрагирование.

LEACHING = ВЫЩЕЛАЧИВАНИЕ (или ВЫСОЛАЖИВАНИЕ, или ВЫНОС, или ПРОМЫВКА) – Leaching is the removal or loss of nutrient elements in soil solution due to the downward movement of water. Leaching is the movement of a substance downward or out of the soil as the result of water movement. Leaching is the removal of any substance or dye from textiles by the percolating action of a suitable liquid.

LEA COUNT CONSTANT = ПОСТОЯННОЕ ЧИСЛА ПАСМ (или ХХ) – Lea Count Constant:- xxxxx. See also Break Factor. A Lea Strength Tester measures the strength of one lea yarn. One lea means 120 yards. Strength is a measure of the steady force necessary to break a material and is measured in pound.

LEAD = СВИНЕЦ – Lead is a chemical element in the periodic table that has the symbol Pb (in Latin, Plumbum) and atomic number 82. A soft, heavy, toxic and malleable poor metal, lead is bluish white when freshly cut but tarnishes to dull gray when exposed to air. Lead is used in building construction, lead-acid batteries, bullets and shot, and is part of solder, pewter, and fusible alloys. Lead has

the highest atomic number of all stable elements – although the next element, bismuth, has a half life so long it can be considered stable. Like mercury, another heavy metal, lead is a potent neurotoxin which accumulates in soft tissues and bone over time. / Свинец, на Латинском языке Плумбум (Plumbum), символ Pb, химический элемент IV группы периодической системы Менделеева. Атомный номер 82, атомная масса 207.2. Свинец – синевато-серый металл, тяжёлый, мягкий, ковкий. На воздухе покрывается оксидной плёнкой, стойкой к химическим воздействиям. Плотность 11 340 кг/м^3, $t_{пл}$ 327.4 °C. Главнейший минерал – свинцовый блеск, или галенит. В промышленности сульфидную руду, содержащую свинец, сначала концентрируют флотацией, а затем нагревают в печи с коксом и известняком; полученный свинец очищают электролизом, значительные количества свинца получают из вторичных ресурсов. Основная масса выплавляемого свинца идёт на изготовление пластин для аккумуляторов (около 30% выплавляемого свинца), полупроводниковых материалов. Благодаря коррозионной стойкости свинец применяется для изготовления химической аппаратуры (главным образом в серно-кислотном производстве), для оболочек электрических кабелей и так далее. Свинец – основной материал для защиты от радиоактивного гамма-излучения (стенки из свинцовых кирпичей). Свинец – компонент компонент типографских и антифрикционных сплавов. Разнообразно применение соединений свинца:- антидетонатор тетраэтилсвинец (требования охраны окружающей среды приводят к сокращению применения тетраэтилсвинца), различные краски – красный сурик Pb_3O_4, жёлтый глёт PbO, свинцовые белила $2PbCO_3 \cdot Pb(OH)_2$; сульфид PbS – полупроводник (в первые годы развития использовался в детекторных радиоприёмниках). Свинцевание, нанесение защитного слоя свинца (иногда с добавками олова или сурьмы) на поверхность металлических изделий в качестве покрытия для предохранения их от коррозии, а также от действия рентгеновских лучей. Осуществляется погружением изделий в расплавленный свинец, натиранием, металлизацией, плакированием, гальваническим и другими способом. Свинцовые Руды, главные минералы:- англезит, галенит, церуссит; составная часть полиметаллических руд, реже образуют самостоятельные залежи. Главные добывающие страны:- Австралия, Канада, Мексика, Перу, США.

LEADAGE = ПОДАЧА – Leadage is the cost of transporting coal from colliery to place of shipment. / Стоимость транспортировки угля от шахты до места отгрузки.

LEAD BOARD = КРАЙНЯЯ ДОСКА – Lead Boards or End Boards is a deckboard located at the end of the pallet. See also Pallet. / Крайние Доски (Lead Boards или End Boards):- крайние доски настила. Смотрите также Поддон (Pallet).

LEAD BROKER = ВЕДУЩИЙ БРОКЕР – Lead Broker:- banks and financial serivces providers can be admitted as lead brokers in floor trading by the management of the stock exchange. They enter price estimates for the securities allocated to them – these are non-binding likely execution prices provided to market as a guide – and calculate the actual execution prices. The basis for this is the order book in which all current buy and sell orders are pooled. There is only one designated lead broker for each security.

LEADEN = ЛЭДЭН (или СВИНЦОВОЕ) – Leaden:- dull gray.

LEADER = ГЛАВНОЕ ДВИГАТЕЛЬНОЕ КОЛЕСО В МАШИНЕ – Leader is the length of yarn attached to the center core of a bobbin or shank of a spindle to aid in starting your yarn. Leader is the starting yarn that comes up off the spindle. A leader may be made from your fiber or from an already made bit of yarn.

LEADER = ЛИДЕР – Leader is an industry or company that is outperforming the market.

LEADER MARK = ОТМЕТИНА ОТ ТОВАРОВВОДНОЙ ТКАНИ – Leader Mark:- xxxxx. Fabrics defect. See also Decating Mark.

LEADING INDICATORS = ОПЕРЕЖАЮЩИЕ ИНДИКАТОРЫ – Leading Indicators are the market indicators that signal the state of the economy for the coming months. Some of the leading indicators include:- average manufacturing workweek, initial claims for unemployment insurance, orders for consumer goods and material, percentage of companies reporting slower deliveries, change in manufacturers' unfilled orders for durable goods, plant and equipment orders, new building permits, index of consumer expectations, change in material prices, prices of stocks, change in money supply. See also Lagging Indicators. / Смотрите также Запаздывающие Индикаторы (Lagging Indicators). Опережающие Индикаторы – компоненты составного индекса по опережающим индикаторам, публикуемого ежемесячно Бюро Экономического Анализа при Департаменте Торговли США (US Commerce Department's Bureau of Economic Analysis). Этот индекс включает среднюю продолжительность рабочей недели промышленных рабочих; средний еженедельный объём заявок на штатную компенсацию по безработице; объём новых заказов на потребительские товары и материалы; объём торговли посредников (компаний, получающих долгосрочные поставки от оптовиков); нетто число новых предприятий; объём контрактов на заводы и оборудование; число разрешений на постройку зданий; изменения объёма невыполненных заказов на товары длительного пользования; цены на имеющие важное значение материалы; котировки акций; рост денежной массы (money supply, M-2), а также объём потребительских кредитов. Перечень опережающих индикаторов, которые корректируются с учётом инфляции, позволяет точно прогнозировать подъёмы и спады делового цикла.

LEADING UNDERWRITER = ВЕДУЩИЙ РАСПИСЧИК (или ВЕДУЩИЙ АНДЕРРАЙТЕР) – At the Corporation of Lloyd's, Leading Underwriter is the underwriter of a syndicate or insurance company who is responsible for setting the terms of an insurance or reinsurance contract that is subscribed by more than one syndicate or insurance company and who generally has primary responsibility for handling any claims arising under such a contract. Where an insurance or reinsurance contract that is underwritten by more than one syndicate Xchanging Claims Services normally acts as the representative of the following underwriters as regards the agreement of claims under the contract. In certain situations a managing agent of a following syndicate will be appointed together with Xchanging Claims Services to represent the following underwriters. However some matters require to be referred to all the following underwriters on risk and an insured may always insist that its claim is shown to each following underwriter. / Корпорэйшэн оф Лойдз (Corporation of Lloyd's). Ксчэньджин Клэймз Сёвисиз (Xchanging Claims Services).

LEAD MANAGER = ВЕДУЩИЙ УПРАВЛЯЮЩИЙ – Also called:- Bookrunner, Global Coordinator, Syndicate Leader. The Lead Manager manages the syndicate in close cooperation with the issuers of the security and takes care of all of the taks that are central to the issue. He is repsonsible for formulating the equity story, marketing the shares to investors, specifying the placement volume and handling the documentation, including the preparations of the sales prospectus and documents for the public offering and exchange listing as well as for the time schedule and the coordination of the involved parties. In practice, the success of the transaction depends to a significant degree on the know-how of the lead manager, which is why this bank handles the largest ratio of the securities to be issued. Bank or company acting as the leader of an underwriting syndicate. It manages the transaction and is normally responsible for contact with the borrower, for the structure, organization and text of the loan agreement and prospectus, as well as for the composition of the underwriting syndicate and the selling group and, ultimately, for the placement itself. For this service, the lead manager usually receives a higher commission than the other members of the syndicate. See also Syndicated Credit.

LEAD NAPHTHENATE = НАФТЕНАТ СВИНЦА – Lead Naphthenate is a lead soap of naphthenic acids, the latter occurring naturally in petroleum.

LEAD REINSURER = ВЕДУЩИЙ ПЕРЕСТРАХОВЩИК – A Lead Reinsurer is the reinsurer who negotiates the terms, conditions, and premium rates and first signs on to the slip; reinsurers who subsequently sign on to the slip under those terms and conditions are considered following reinsurers.

LEADS AND LAGS = ОПЕРЕЖЕНИЯ И ЗАДЕРЖКИ – Leads And Lags:- language in a contract or credit agreement that allows a business entity to either accelerate (lead) or delay (lag) payments of foreign trade obligations to its trading partners or foreign subsidiaries. Decision to accelerate or delay payment is based on the importer's perception of the strength of the currency in which the invoice is denominated. If importers expect their national currency to be devalued, they try to accelerate payments.

LEAD TIME = СРОК ИСПОЛНЕНИЯ (или ПЕРИОД РАЗРАБОТКИ) – Lead Time is the total time that elapses between an order's placement and its receipt. It includes the time required for order transmittal, order processing, order preparation, and transit. Lead Time is an amount of time needed to inspect or examine a shipment before its shipping date. Some countries interpret shipping date as the date a commodity physically leaves the exporting country.

LEAF = ЛИСТ – Leaf is an outgrowth from a node on a plant's stem. Leaves come in many shapes and sizes, but are often flattened to maximize their surface area for capture of energy from sunlight (photosynthesis) using chlorophyll contained in chloroplasts, thin to allow light to penetrate the tissues and oriented to optimize exposure to sunlight. In most plants, leaves also allow gas exchange, guttation, respiration and transpiration to take place. Leaves can store food and water and may be modified for other purposes. See also:- (i) Leaf Blade:- simple, compound, palmate, peltate, pinnate, scabrous, trifoliate; (ii) Leaf Arrangement On The Stem:- alternate, decussate, distichous, opposite, rosulate, spiral, whorled; (iii) Leaf Margins:- ciliate, crenate, crenolate, dentate, entire, guttered, serrate, sinuate, teeth; and (iv) Leap Tip:- acuminate, drip tip, emarginate, hooked, lanceolate, mucro, mucronate, spatulate. Leaf is an outgrowth from the stem of a vascular plant, usually green. It consists of a leaf-base, petiole and flattened lamina, which is usually conspicuously veined. Leaf:- in botany, any usually flattened green outgrowth from the stem of a vascular plant. Leaves manufacture food for plants, which in turn ultimately nourish and sustain all land animals. Botanically, leaves are an integral part of the stem system, and they are initiated in the apical bud along with the tissues of the stem itself. Certain organs that are superficially very different from the usual green leaf are formed in the same manner and are actually modified leaves; among these are the sharp spines of the Japanese barberry, pine needles, and the scales of an asparagus stalk or a lily bulb. Typically, a leaf consists of a broad, expanded blade (the lamina), attached to the plant stem by a stalklike petiole. Leaves are, however, quite diverse in size, shape, and various other characteristics, including the nature of the blade margin and the type of venation (arrangement of veins). Veins, which support the lamina and transport materials to and from the leaf tissues, radiate through the lamina from the petiole. The types of venation are characteristic of different kinds of plants:- for example, dicotyledons have netlike venation and usually free vein endings; monocotyledons have parallel venation and rarely free vein endings. The leaf may be simple – with a single blade – or compound – with separate leaflets; it may also be reduced to a spine or scale. The main function of a leaf is to produce food for the plant by photosynthesis. Chlorophyll, the substance that gives plants their characteristic green color, absorbs light energy. The internal structure of the leaf is protected by the leaf epidermis, which is continuous with the stem epidermis. The central leaf, or mesophyll, consists of soft-walled, unspecialized cells of the type known as Parenchyma. As much as one-fifth of the mesophyll is composed of chlorophyll-containing chloroplasts, which absorb sunlight and, in conjunction with certain enzymes, use the radiant energy in decomposing water into its elements, hydrogen and oxygen. The oxygen liberated from green leaves replaces the oxygen removed from the atmosphere by plant and animal respiration and by combustion. The hydrogen obtained from water is combined with carbon dioxide in the enzymatic processes of photosynthesis to form the sugars that are the basis of both plant and animal life. Oxygen is passed into the atmosphere through stomates – pores in the leaf surface. Chlorophylls, green pigments, are usually present in much greater quantities than others. In autumn chlorophyll production slows as the days get shorter and cooler. As the remaining chlorophyll breaks down and fades, the colors of other pigments are revealed. These include carotene (yellow), xanthophyll (pale yellow), anthocyanin (red if the sap is slightly acidic, bluish if it is slightly alkaline, with intermediate shades between), and betacyanin (red). Tannins give oak leaves their dull brown color. Leaves are essentially short-lived structures. Even when they persist for two or three years, as in coniferous and broad-leaved evergreens, they make little contribution to the plant after the first year. The fall of leaves, whether in the first autumn in deciduous trees or after several years in evergreens, results from the formation of a weak zone, the abscission layer, at the base of the petiole. Abscission layers may form when leaves are seriously damaged by insects, disease, or drought. Their normal formation in autumn appears to be, in part at least, due to the shortening of the day. Perhaps the shorter days accentuate the senile changes normal in older leaves. As a result, a zone of cells across the petiole becomes softened until the leaf falls. A healing layer then forms on the stem and closes the wound, leaving the leaf scar, a prominent feature in many winter twigs and an aid in identification. A typical Leaf of a dicotyledonous plant consists of two main parts:- (i) the blade; and (ii) the petiole. The leaf blade varies greatly in shape and there are numerous terms to describe its general shape. The leaf blade has two types of configuration. It may be in one unit, in which case the leaf is called a Simple Leaf, or it may be divided into numerous small parts that look like individual leaves and which form a Compound Leaf. It may be difficult to tell whether one is looking at a simple leaf or the leaflet (pinna) of a compound leaf. The distinction can be made by the fact that a leaf (simple or compound) has an axial bud between the petiole and the stem. See also Blade, and Petiole. / Щелочное (Alkaline). имеющий жилки. Смотрите также:- (i) Листовая Пластинка (Leaf Blade):- простая (simple), сложная (compound), пальчатая (palmate), щитовидная (peltate), перистая (pinnate), шероховатая (scabrous), трёхлистная или тройчатая (trifoliate); (ii) Листорасположение на Стебле (Leaf Arrangement On The Stem):- очередное (alternate), перекрёстно-парное (decussate), двухрядное (distichous), супротивное (opposite), розетчатое или розеточное (rosulate), спиральное (spiral), мутовчатое (whorled); (iii) Края Листа (Leaf Margins):- бахромчатые (ciliate), городчатые или округлозубчатые (crenate), xxxxx (crenolate), заострённые (dentate), цельнокрайные (entire), xxxxx (guttered), резные или пиловидные (serrate), выемчатые (sinuate), зубчатые (teeth); и (iv) Верхушка Листа (Leaf Tip):- заострённая или остроконечная (acuminate), капельное остриё (drip tip), надрезанная (emarginated), крючковатая (hooked), копьевидная или ланцетная или ланцетовидная (lanceolate), острым концом или выемкой (mucro), остроконечная или выемчатая (mucronate), лопатчатая (spatulate). Под Листом понимается орган высших растений, выполняющий функции фотосинтеза, транспирации и газообмена. Состоит из листовой пластинки и основания, представленного листовой подушечкой или расширенным влагалищем. Между пластинкой и основанием часто имеется черешок. Мякоть листа (мезофилл), в толще которой проходят жилки, покрыта эпидермой с кутикулой. Зелёная окраска обусловлена хлорофиллом. Форма листа – видовой признак. Нередко листья превращаются в усики, колючки, чешуи. Размер листа от нескольких миллиметров до 20 метров. Продолжительность жизни менее 1 года, реже до 2–5 лет, очень редко – 25 и более лет (у Ели Шренка). Под Листорасположением понимается порядок размещения листьев на стебле. Систематический признак. Типы листорасположения:- спиральное или очередное (1 лист на узле стебля, например у Дуба); супротивное (2 листа на узле стебля, например, у Клёна); мутовчатое (3 и более листьев, например, у Олеандра). Лист представляет собой боковую структурную часть (или орган) побега, как правило, характеризующуюся ограниченным ростом и плоской формой. Он выполняет три главнейшие функции:- фотосинтез, транспирацию (испарение влаги) и газообмен. Первые листовые органы семенных растений – семядоли зародыша. Следующие листья формируются первоначально в виде меристематических бугорков, возникающих на апексе побега. Позднее бугорки развиваются в клиновидные выступы –

листовые примордии, а эти последние – в листья. Эволюционно лист большинства высших растений образовался в результате уплощения и последующего объединения в единое целое групп соседствующих конечных веточек – теломов архаичных растений типа риниофитов. При этом была утеряна способность к длительному верхушечному нарастанию и ветвлению. Лишь у Папоротников листья, носящие специальное название вай, сохраняют определённую способность к более длительному, чем у прочих растений, росту в длину. Это, очевидно, связано с тем, что листья Папоротников возникли в результате уплощения целой системы теломов. В некоторых случаях листья представляют собой выросты – энации стебля и получили название энационных. Такие энационные листья характерны для современных и ископаемых плауновидных. Проводящие пучки в них идут из стебля, не образуя листовых прорывов – лакун. Лист (folium), боковой орган побега высших растений, выполняющий функции фотосинтеза и транспирации, а также обеспечивающий газообмен с воздушной средой и участвующий в других важнейших процессах жизнедеятельности растений. Первые листовые органы семенных растений – семядоли – дифференцируются из меристемы предзародыша ещё до возникновения конуса нарастания (апекса) и верхушечной почки главного побега. Последующие листья возникают в виде меристематических бугорков или валиков на апексе побегов. Обычно зачаток листа, заключённый в почке, растёт сначала верхушкой, затем интеркалярным (вставочным) и краевым ростом. По выходе из почки зачаток листа развёртывается и сильно разрастается, сохраняя первоначальную форму. Вскоре, достигнув определённых размеров, лист прекращает рост, так как это орган с ограниченным ростом. Типичный лист состоит из пластинки, в которой происходят все основные физиологические процессы, основания, соединяющего его со стеблем, и часто черешка (черешковые листья). Благодаря неравномерному росту черешка пластинка листа способна занимать определённое положение по отношению к свету, изменяя его в зависимости от направления солнечных лучей. Листья без черешка называют сидячими. Основание листа часто имеет форму влагалища, которое разрастается в виде трубки, охватывая узел. Листья с хорошо выраженным влагалищем характерны, например, для зонтичных, злаков и других. У многих растений на основании листа развиваются парные прилистники в виде листочков, щетинок, чешуек и тому подобное. Различают лист простой, с одной пластинкой, и сложный, с главным черешком (рахисом) и черешочками последующих порядков, несущими свои пластинки – листочки; форма пластинки листа бывает самой разнообразной. Длина листа от нескольких миллиметров до 29 метров (у пальмы Рафии смолистой). Продолжительность жизни листьев, особенно у растений умеренных широт, обычно невелика – около 6 месяцев; с окончанием вегетационного сезона у листопадных растений листья отмирают. У вечнозелёных растений листья живут более года (например, у Брусники 2–3 года, у Лавра до 5 лет, у хвойных от 2–3 до 15–29 лет). В течение жизни растения они многократно сменяются. Пластинка листа с обеих сторон покрыта однослойной тканью – кожицей, или эпидермой. Клетки её, тесно примыкающие друг к другу, лишены хлорофилла, за исключением расположенных в эпидерме устьичных клеток. Снаружи эпидерма обычно покрыта кутикулой, а иногда и восковым налётом (защитная функция). Через многочисленные устьица осуществляются газообмен и транспирация. Листья благодаря фотосинтетической деятельности определяют космическую роль растений, поглощая солнечную энергию и используя её на биосинтез, то есть создавая органическое вещество на Земле. Через процессы фотосинтеза и дыхания листья поддерживают баланс O_2 и CO_2 в воздухе, через транспирацию участвуют в круговороте воды на Земле. Листья многих растений используются в пищу, на корм скоту, как сырьё для фармацевтической, пищевой, парфюмерной промышленности и другого. Лист:- игловидный; линейный (видны узел, влагалище, язычок и пластинка); продолговатый; ланцетовидный; овальный; эллиптический, дуговидножилковатый, цельнокрайний; округлый; яйцевидный, перистожилковатый, зубчатый; обратнояйцевидный; ромбовидный; лопатчатый; сердцевидно-яйцевидный, городчатый; почковидный; стрелковидный; копьевидный; перистолопастный; пальчатолопастный, пальчатожилковатый; пальчатораздельный с пильчатыми долями; пальчаторассечённый; лировидный; тройчатосложный; пальчатосложный; парноперистосложный с прилистниками и усиками; непарноперистосложный с прилистниками; дваждыперистосложный; многократноперистосложный; прерывчатоперистый; и чешуйчатый.

LEAF ANGLE = УГОЛ ЛИСТА (или ЛИСТОВОЙ УГОЛ) – Leaf Angle is the angle of the leaf blade from the stem. The descriptive terms often used are erect (angle of 0–30°), intermediate (31–60°), horizontal (61–90°), and descending (more than 90°). The angle of the flag leaf on the Rice plant is important in photosynthesis. / Угол между стеблем и листом.

LEAF AREA INDEX = ИНДЕКС ПО ПЛОЩАДИ ЛИСТЬЕВ (или ИНДЕКС ПО ЛИСТОВОЙ ПЛОЩАДИ, или ИНДЕКС ПО ЛИСТОВОЙ ПОВЕРХНОСТИ) – Leaf Area Index (LAI) is the sum of leaf area of all leaves divided by the ground area covered by the leaves. Leaf Area Index is the sum of the leaf area of all green leaves divided by the ground area above which the leaves were growing.

LEAF BLADE = ЛИСТОВАЯ ПЛАСТИНКА (или ПЛАСТИНКА ЛИСТА) – Leaf Blade is the thin, elongated, flat portion of the leaf.

LEAF BLAST = ОЖОГ ЛИСТЬЕВ (или ЛИСТОВОЙ ПИРИКУЛЯРИОЗ, или ВЫГОРАНИЕ ЛИСТЬЕВ) – Leaf Blast is a Rice disease caused by the fungus Pyricularia Oryzae. Symptoms consist of elliptical spots with pointed ends, with gray or whitish center, and with brown or reddish brown margin.

LEAF CURLING = КУРЧАВОСТЬ ЛИСТЬЕВ – Leaf Curling or Leaf Rolling is the rolling of the leaves to control water loss affected by lack of atmospheric or soil moisture. Also the bending or twisting of the leaves due to viral disease (as in Rice ragged stunt) or to other harmful agents.

LEAF CURL VIRUS = ВИРУС КУРЧАВОСТИ ЛИСТЬЕВ – Leaf Curl is a plant disease caused by a Virus (especially Genus Begomovirus of the Family Geminiviridae) or Fungus (Genus Taphrina) and characterized by curling of leaves. One of the most notable types is peach leaf curl, caused by the Fungus Taphrina Deformans. Infected plant has stunted young leaves and shoots. It grows very slowly, becomes bushy, and dwarfed. The leaf margin rolls either inward or upward and is rather stiff with yellowish margin. Its leaves are thicker than normal, with leathery texture. The young leaves have yellowish color, cupped, thick, and rubbery. On Cotton, the flowers fail to open and drop so with the bolls. / Вирус, вызывающий курчавость листьев Хлопчатника. и характеризуется скручиванием листьев (curling of leaves). и становятся карликовыми.

LEAFFOLDER = ОГНЁВКА – Leaffolder is the insect Cnaphalocrocis medinalis which causes damage by making a leafy tube and feeds within the tube consuming the leaf tissues except the epidermis. / Под Огнёвками понимается Надсемейство Дневных Бабочек. Крылья в размахе обычно 1–3 сантиметра (см), иногда до 5 см и более. Около 10 000 Видов. В бывшем Союзе Советских Социалистических Республик (СССР) насчитывалось свыше 1 300 Видов, главным образом в пустынях и степях. Некоторые Виды – вредители сельскохозяйственных культур:- Луговой Мотылёк, Мучная, Подсолнечниковая, Южная Огнёвка и другие.

LEAF GRADE = ЛИСТОВОЙ СОРТ (или СОРТ ПО ЗАСОРЁННОСТИ ЛИСТЬЯМИ) – Leaf Grade describes the leaf or trash content in the Cotton. Purity as regards the presence of foreign matter (waste such as leaves or earth) is of the utmost importanceLeaf grade describes the leaf or trash content in the Cotton. Purity as regards the presence of foreign matter (waste such as leaves or earth) is of the utmost importance. Other foreign matter (such as seed coat fragments), as well as the degree of smoothness or roughness

with which Cotton is ginned, may all affect the purity of the Cotton lint. Additional explanatory terms considered necessary to describe adequately the condition of the Cotton may thus be entered on classification memorandums or certificates. In the United States, an HVI trash measurement is also available, although the traditional method of classer determination for leaf grade and extraneous matter continues to be included as part of USDA's official Cotton classification. Trash in raw Cotton is measured by a video scanner, commonly referred to as a Trash Meter. It is a measure of both leaf and other elements such as grass and bark. The surface of the Cotton sample is scanned by the camera and the percentage of the surface area occupied by trash particles is calculated. In the US Cotton industry, Leaf Grade:- effective August 01, 1993, Cotton is now classed for both color and 'leaf grade'. Leaf grade 1–5 are deliverable for white Cotton and leaf grade 1–3 are deliverable for light-spotted cotton. The classer's Leaf Grade is a visual estimate of the amount of Cotton plant leaf particles in the Cotton. There are seven leaf grades, designated as leaf grade 1 through 7, and all are represented by physical standards. In addition, there is a below grade designation which is descriptive. Leaf content is affected by plant variety, harvesting methods, and harvesting conditions. The amount of leaf remaining in the lint after ginning depends on the amount present in the Cotton prior to ginning, and on the type and amount of cleaning and drying equipment used. Even with the most careful harvesting and ginning methods, a small amount of leaf remains in the Cotton lint. From the manufacturing standpoint, leaf content is all waste, and there is a cost factor associated with its removal. Also, small particles cannot always be successfully removed and these particles may detract from the quality of the finished fabrics. / Высокопроизводительный Инструмент (ВПИ; High Volume Instrument (HVI).

LEAFHOPPER = ЦИКАДКА (или КОБЫЛОЧКА) – Leafhopper is an insect of the Order Homoptera, Family Cicadellidae, which feeds by sucking sap from leaf veins of the Rice plant. They have more slender bodies and move more quickly than planthoppers. / из жилок листьев растения Риса. Под Цикадовыми понимается Подотряд Насекомых Отряда Равнокрылых. Длиной 3–65 миллиметров, крылья в размахе до 18.5 сантиметров. Около 17 000 Видов. Распространены широко. В бывшем Союзе Советских Социалистических Республик (СССР) насчитывалось около 2 000 Видов. Многие Цикадовые – Вредители сельскохозяйственных Растений. Некоторые передают вирусные заболевания Растений (закукливание Злаков, мозаика озимой Пшеницы). Под Кобылками понимается общее название различных Видов Одиночных (Нестадных) Саранчовых Насекомых. Распространены широко. В бывшем СССР насчитывалось около 70 Видов. Многие – Вредители сельскохозяйственных Растений, например, Атбасарская Крестовая, Сибирская, Туркменская Кобылка.

LEAFLET = ЛИСТОЧЕК – Leaflet is a part of a compound leaf. Leaflet is a segment of a compound leaf. / Листочек – часть сложного листа. Листочек – сегмент сложного листа.

LEAF MESOPHYLL CELLS = МЕЗОФИЛЬНЫЕ КЛЕТКИ ЛИСТА (или ЛИСТОВЫЕ МЕЗОФИЛЬНЫЕ КЛЕТКИ) – Leaf Mesophyll Cells are the cells within a leaf that produce carbohydrates in photosynthesis. / Под Мезофильными Клетками Листа, от Греческих слов Mésos, означающее Промежуточный или Средний, и Phýllon, означающее Лист, понимаются фотосинтезирующие тонкостенные клетки листовой пластинки растений, содержащие хлорофилл.

LEAF ROLLING = СКРУЧИВАНИЕ ЛИСТЬЕВ – Leaf Rolling or Leaf Curling is the rolling of the leaves to control water loss affected by lack of atmospheric or soil moisture. Also the bending or twisting of the leaves due to viral disease (as in Rice ragged stunt) or to other harmful agents.

LEAF SCALD = ОЖОГ ЛИСТЬЕВ (или ОМЕРТВЕНИЕ ЛИСТЬЕВ, или ПЯТНИСТОСТЬ ЛИСТЬЕВ, или ВЫГОРАНИЕ ЛИСТЬЕВ) – Leaf Scald is a Rice disease caused by the Fungus Gerlachia Oryzae with symptoms consisting of zonate lesions starting from leaf tips or edges; the symptoms are usually observed in mature leaves.

LEAF SCRAPING = ВЫСКАБЛИВАНИЕ ЛИСТА (или СОСКАБЛИВАНИЕ ЛИСТА) – Leaf Scraping is the removal of the epidermal portion of a leaf by the feeding of an insect.

LEAF SENESCENCE = СТАРЕНИЕ ЛИСТА (или ОДРЯХЛЕНИЕ ЛИСТА) – Leaf Senescence is a change in color from green to yellow or brown due to a reduction of metabolic activities in the plant preceding the death of the plant. Natural drying of the leaves due to crop maturity.

LEAF SHEATH = ВЛАГАЛИЩЕ ЛИСТА (или ЛИСТОВОЕ ВЛАГАЛИЩЕ) – Leaf Sheath is the lower part of the leaf enclosing the stem, originating from a node and wrapping around the culm above the node. Leaf Sheath (syn. Sheath, and Vagina) is the lower part of the leaf, originating from a node and enclosing the internode above it and sometimes the leaf sheaths and blades of the succeeding internodes. / Под Влагалищем понимается обкладка, окружение некоторых органов у Животных и Растений, например, влагалище сухожилия, листа.

LEAF SPOTS = ПЯТНИСТОСТЬ ЛИСТЬЕВ (или ПЯТНА НА ЛИСТЬЯХ) – Leaf Spots generally occur after periods of wet weather and are usually most severe on the lower leaves of the plant. Alternaria leaf spot is characterized by brown or gray, dry spots which are most common on either very young seedlings or on plants approaching maturity. Bacterial blight features dark green, angular, water-soaked spots that are particularly obvious on the lower surface of the leaf and may occur throughout the season. Both of these leaf spot pathogens can also infect young developing bolls. The fungi that cause Alternaria leaf spot (Alternaria Macrospora and Alternaria Alternata) survive from season to season on crop residues and on some weed hosts. Crops that are subject to stress late in the season tend to be more susceptible. Some Cultivars are more resistant than others. Most commercial cultivars grown in Australia are completely resistant to bacterial blight. The Pima cultivars are very susceptible. The bacterium which causes the disease (Xanthomonas Campestris pv. Malvacearum) survives within seed and on infested Cotton crop residue. Xxxxx. Leaf Spots:- pest type:- disease; crops affected:- Cotton; scientific name:- Alternaria Macrospora, Alternaria Alternata, Cercospora Gossypina, or Rhizoctonia Spp. Symptoms:- several leaf spot diseases may occur at the same time. Symptoms are varied, but sometimes these organisms cause circular concentric lesions similar to a target spot. Cotton leaves often get small, brown, circular lesions that enlarge to approximately 0.4–0.7 inch. Old lesions sometimes develop gray centers, which may fall out. Disease Cycle:- these foliar diseases tend to be more prevalent at or near crop maturity and during periods of high humidity. Most leaf spot fungi overwinter in infected plant debris. Control Measures:- preventative control measures are generally most effective, including seed treatment fungicides, good management practices (e.g., proper fertility levels, adequate drainage, and minimizing rank growth), and destruction of plant residue after harvest. Cotton Varieties differ in susceptibility to leaf spot Fungi. Though fairly common, leaf spot diseases are generally considered of minor importance, and specific controls are often not recommended. / Ксантомонас или Ксантомонада (Xanthomonas Campestris pv. Malvacearum).

LEAF VEINS = ЖИЛКИ ЛИСТЬЕВ – Leaf Veins are the vascular bundles of the leaf. In monocotyledonous plants such as Rice, leaf veins are seen as longitudinal ridges. / Под Жилками понимается система проводящих пучков в листьях и других органах высших растений, исключая мхи.

LEAFY COTTON = ОБЛИСТВЕННЫЙ ХЛОПОК – Leafy Cotton is the ginned Cotton with considerable amounts of leaf matter. The minute objectionable matter is referred to as Pepper Leaf or Pin Leaf. / Джинированный хлопок со значительным содержанием сорных примесей в виде кусочков листьев. О таком хлопке может быть заявлено, что он имеет Мелкий Сор или Перечный Лист (Pepper Leaf), или Пыль или Буловачный Лист (Pin Leaf).

LEAGUE OF ARAB STATES = ЛИГА АРАБСКИХ ГОСУДАРСТВ – The League Of Arab States, commonly called the Arab League, is a regional organization of Arab states in North Africa, Northeast Africa (Horn of Africa) and Southwest Asia (Middle East). It was formed in Cairo on 22 March 1945 with six members:- Egypt, Iraq, Transjordan (renamed Jordan in 1949), Lebanon, Saudi Arabia and Syria. Yemen joined as a member on 05 May 1945. Currently, the League has 22 members, although Syria's participation has been suspended since November 2011 as a consequence of repression during the ongoing uprising. The League's main goal is to 'draw closer the relations between member States and co-ordinate collaboration between them, to safeguard their independence and sovereignty, and to consider in a general way the affairs and interests of the Arab countries'. Through institutions such as the Arab League Educational, Cultural and Scientific Organization (ALECSO) and the Economic and Social Council of the Arab League's Council of Arab Economic Unity (CAEU), the Arab League facilitates political, economic, cultural, scientific and social programs designed to promote the interests of the Arab world. It has served as a forum for the member states to coordinate their policy positions, to deliberate on matters of common concern, to settle some Arab disputes, and to limit conflicts such as the 1958 Lebanon crisis. The League has served as a platform for the drafting and conclusion of many landmark documents promoting economic integration. One example is the Joint Arab Economic Action Charter which sets out the principles for economic activities in the region. Each member state has only one vote in the League Council, while decisions are binding only for those states that have voted for them. The aims of the league in 1945 were to strengthen and coordinate the political, cultural, economic, and social programs of its members, and to mediate disputes among them or between them and third parties. Furthermore, the signing of an agreement on Joint Defense and Economic Cooperation on 13 April 1950 committed the signatories to coordination of military defense measures. In early 1970s, the Economic Council of the League of Arab States put forward a proposal to create Joint Arab Chambers of Commerce across the European states. This led, under the decree of the League of Arab States no. K1175/D52/G, to the decision by the Arab governments to set up the Arab British Chamber of Commerce which was mandated to:- 'promote, encourage and facilitate bilateral trade' between the Arab world and its major trading partner, the United Kingdom. The Arab League has also played a role in shaping school curricula, advancing the role of women in the Arab societies, promoting child welfare, encouraging youth and sports programs, preserving Arab cultural heritage, and fostering cultural exchanges between the member states. Literacy campaigns have been launched, intellectual works reproduced, and modern technical terminology is translated for the use within member states. The league encourages measures against crime and drug abuse, and deals with labor issues – particularly among the emigrant Arab workforce. The League of Arab States, established in March 1945, aims to improve economic, social, political and military relations among Arab nations. Headquarters are located in Cairo, Egypt. 22 Members (in 2013) include:- Algeria, Bahrain, Comoros, Djibouti, Egypt, Iraq, Jordan, Kuwait, Lebanon, Libya, Mauritania, Morocco, Oman, Palestine, Qatar, Saudi Arabia, Somalia, Sudan, Syria, Tunisia, United Arab Emirates and Yemen. The League Of Arab States (LAS) or Arab League is regional organization of Arab states in the Middle East, formed in Cairo, Egypt on 1945-March-22. The founding member states were Egypt, Syria, Lebanon, Iraq, Transjordan (now Jordan), Saudi Arabia, and Yemen. Other members are Libya (1953); The Sudan (1956); Tunisia and Morocco (1958); Kuwait (1961); Algeria (1962); Bahrain, Oman, Qatar, and the United Arab Emirates (1971); Mauritania (1973); Somalia (1974); the Palestine Liberation Organization (PLO; 1976); Djibouti (1977); and the Comoros (1993). When Yemen was a divided country, from 1967 to 1990, the two regimes were separately represented. Each member has one vote on the League Council, decisions being binding only on those states that have voted for them. The aims of the league in 1945 were to strengthen and coordinate the political, cultural, economic, and social programs of its members and to mediate disputes among them or between them and third parties. The signing on 1950-April-13, of an agreement on joint defense and economic cooperation also committed the signatories to coordination of military defense measures. In its early years, the Arab League concentrated mainly on economic, cultural, and social programs. In 1959 it held the first Arab petroleum congress and in 1964 established the Arab League Educational, Cultural and Scientific Organization (ALECSO). Also in 1964, despite objections by Jordan, the league admitted the PLO as the representative of all Palestinians. Under the leadership of Mahmoud Riad, the third secretary-general (1972–79), political activity increased. The league, however, was weakened by internal dissension on political issues, especially those concerning Israel and the Palestinians. After Egypt signed a peace treaty with Israel on 1979-March-26, the other members of the Arab League voted to suspend Egypt's membership and to transfer the league's headquarters from Cairo to Tunis. Egypt was reinstated as a member of the Arab League in 1989, and the league's headquarters returned to Cairo in 1990. The Iraqi invasion of Kuwait in 1990 and the later involvement, at the request of Saudi Arabia, of Western countries – mainly the United States – in ridding Kuwait of Iraqi presence caused a deep rift in the league. Saudi Arabia, Egypt, Syria, Morocco, Qatar, Bahrain, Kuwait, the United Arab Emirates, Lebanon, Djibouti, and Somalia endorsed the presence of foreign troops in Saudi Arabia, and all but the last three had some degree (however slight) of military involvement in the war. Also known as Arab League. / Известна также как Арабская Лига (Arab League). / Лига Арабских Государств или Лига Арабских Стран (Джамиат Ад-Дуал Аль-Арабия), региональная организация независимых Арабских государств; основана 22 Марта 1945 на состоявшейся в Каире конференции представителей Египта, Ирака, Сирии, Ливана, Трансиордании (с 1946 – Иордания), Саудовской Аравии и Йемена (с 1962 – Йеменская Арабская Республика). Позднее в неё вступили Ливия (1953), Судан (1956), Тунис и Марокко (1958), Кувейт (1961), Алжир (1962), Народная Демократическая Республика Йемен (1967), Катар, Бахрейн, Оман и Объединённые Арабские Эмираты (1971). С 1964 в работе Лиги участвует Организация Освобождения Палестины. Устав Лиги предусматривает 'укрепление отношений между государствами-членами и координацию их политической деятельности, имея в виду осуществление тесного сотрудничества между ними, защиту их независимости и суверенитета и общее рассмотрение дел и интересов арабских стран'; сотрудничество Арабских государств в области экономики, культуры и в других вопросах. В условиях развёртывания национально-освободительного движения в Арабских странах, особенно после Июльского переворота в Египте 1952, Лига стала играть важную роль в координации действий её членов в поддержку борьбы отдельных Арабских стран за свободу и национальную независимость. Лига выступала и выступает за всемерное объединение действий Арабских стран против империалистических планов, направленных на установление неоколониалистских порядков на Ближнем Востоке и вовлечение Арабских стран в сферу влияния империализма. Лига постоянно поддерживала требования своих членов о ликвидации иностранных баз на их территории. Лига решительно осудила продолжающуюся с Июня 1967 Израильскую агрессию против Арабских стран и поддержку, оказываемую Израилю международным империализмом и сионизмом. Лига выдвигала ряд предложений с целью выработки единой политической и экономической стратегии Арабских стран для ликвидации последствий Израильской агрессии. На конференции глав Арабских государств в Хартуме (Август 1967) были приняты решения о путях борьбы за освобождение оккупированных Израилем земель, об оказании помощи, в том числе финансовой, странам, подвергшимся агрессии. Важное значение в объединении военно-политических и экономических усилий Арабских стран в борьбе против Израильской агрессии имели заседания Совета совместно обороны при Лиге в Ноябре 1971, Ноябре 1972, Январе 1973. В период возобновления военных действий на Ближнем Востоке в Октябре 1973 Лига способствовала выработке совместно действий Арабских стран с целью оказания давления на Израиль и поддерживающие

его государства (ограничение производства и поставок Арабской нефти на международный рынок и другие). Руководящий орган Лиги – Совет Лиги, в который входят главы или премьер-министры Арабских стран или уполномоченные ими лица. При Совете имеются:- Совет Совместной Обороны, Политический Комитет, Экономический Совет, Комитет Начальников Штабов Вооружённых Сил Арабских Стран и другие. Между сессиями Совета (2 раза в год) деятельностью Лиги руководит избираемый на 5-летний срок Генеральный Секретарь. Решения Совета Лиги и организаций при Лиге (Арабский Общий Рынок, 1964, Арабский Финансовый Институт Экономического Развития, 1959, и другие) обязательны только для тех государств-членов Лиги, которые за них голосовали. Штаб-квартира Лиги находится в Каире, Египет.

LEAGUE OF RED CROSS AND RED CRESCENT SOCIETIES = ЛИГА ОБЩЕСТВ КРАСНОГО КРЕСТА И КРАСНОГО ПОЛУМЕСЯЦА – The League Of Red Cross And Red Crescent Societies (LORCS), established in 1919, is made up of 147 members and 2 associate members with the goal of providing humanitarian aid in peacetime. LORCS is the former name of the International Federation of Red Cross and Red Crescent Societies (IFRC). IFRC is the world's largest humanitarian organization, with 187 (in 2013) member National Societies. As part of the International Red Cross and Red Crescent Movement, our work is guided by seven fundamental principles; humanity, impartiality, neutrality, independence, voluntary service, unity and universality. Headquartered in Geneva, Switzerland. The International Federation of Red Cross and Red Crescent Societies (IFRC) was founded in 1919 in Paris in the aftermath of World War I. The war had shown a need for close cooperation between Red Cross Societies, which, through their humanitarian activities on behalf of prisoners of war and combatants, had attracted millions of volunteers and built a large body of expertise. A devastated Europe could not afford to lose such a resource. It was Henry Davison, President of the American Red Cross War Committee, who proposed forming a federation of these National Societies. An international medical conference initiated by Davison resulted in the birth of the League of Red Cross Societies, which was renamed in October 1983 to the League of Red Cross and Red Crescent Societies, and then in November 1991 to become the International Federation of Red Cross and Red Crescent Societies. The first objective of the IFRC was to improve the health of people in countries that had suffered greatly during the four years of war. Its goals were 'to strengthen and unite, for health activities, already-existing Red Cross Societies and to promote the creation of new Societies'. There were five founding member Societies:- Britain, France, Italy, Japan and the United States. This number has grown over the years and there are now 187 recognized National Societies – one in almost every country in the world. / Хэнри Дэйвисэн (Henry Davison). Лига Обществ Красного Креста и Красного Полумесяца (ЛОККП) была основана в 1919 с целью обеспечения гуманитарной помощи в мирное время. В настоящее время в её составе находятся 147 членов и 2 ассоциативных члена.

LEAN HOGS = ТОЩИЕ СВИНЬИ (или ТОЩАК) – With settlement of the December 1996 Live Hog contract, the Chicago Mercantile Exchange® (CME®) switches completely to the Lean Hog contract (trading unit:- 40 000 pounds carcass weight). There were several reasons for the change, not least being that 70% of hogs are sold now on a grade and yield (carcass merit) basis. The Chicago Mercantile Exchange® (CME®) Lean Hog futures offers both near term and longer term trading and spreading strategies based on the supply and demand of current cash hog, product prices and the longer term cyclical pricing patterns. Live Hog prices are quoted in cents per pound and are the traditional terms used when talking about the actual hog markets. Lean hog prices are also quoted in cents per pound, but refer to the lean hog contract that trades at the Chicago Mercantile Exchange. The change began with the February of 1997 contract and is based on 40 000 pounds of pork which is equivalent to the meat from 220 hogs. To convert a live hog price to a lean hog price, divide the live hog price by .74. So when the USDA says that the average price for cash hogs should be 45 cents (for example), you will know that this is equivalent to 61 cents on the lean hog futures contract. The Chicago Merchantile Exchange® (CME®) Live Hogs futures and options contracts have undergone considerable improvements. Effective with the February 1997 contract, new and improved specifications, including a new name – Lean Hogs – make this contract even a more viable hedging tool for producers and packers throughout the United States. The new cash settlement feature also makes this a viable hedging tool for international producers and pork importers/exporters. The CME Group Lean Hog futures contract, symbol HE, calls for 40 000 lbs of hogs on a lean (carcass) basis. Today, a 270 lb live hog produces a 203 lb carcass. Pricing is quoted on a Dollar-perhundred-weight (cwt) basis. Therefore, a quote on the screen of 85 000 is called USD85 per cwt. The minimum tick size is 2.5 cents per cwt. A minimum tick move from 85 000 to 85 025 would represent a change in value of USD10 per contract. (Take note that some quote systems do not quote the last digit.) The contract is cash-settled against a two-day weighted average of the cash market called the Lean Hog Index, symbol IHX. Contract expiration is generally around the 12th of each contract month. Supply projections are pretty straightforward for lean hogs. It takes just six months from birth (farrowing) to slaughter. When you add in a 114-day pregnancy period, you have a relatively modest 10-month delay from a decision to expand or contract to when those numbers hit the packing plant and affect prices. The main long-term supply picture comes from the USDA's quarterly survey of producers called the Hogs & Pigs Report. The general trader can get a quick idea of supply for the next six months out by looking at the weight breakdowns in the 'kept for marketing' numbers. With slightly more effort, the farrowing intention numbers can help provide a map of supply for the next full year out. For 2013, with sharply lower grain prices, the question in the industry is not if producers will expand, but when and by how much. / Тощие Свиньи или Тощак.

LEA PRODUCT = ПАСЬМОВЫЙ ПРОДУКТ (или ПРОДУКТ В ПАСМАХ) – Lea Product:- xxxxx. See also Break Factor.

LEAPS® = LONG–TERM EQUITY ANTICIPATION SECURITIES

LEASE = АРЕНДА (или ЛИЗИНГ) – (1) Lease is a contract by which the owner of an asset (the lessor) permits another (the lessee) to use the asset for a stated time in return for payment at an agreed rate. The asset remains at all times the property of the lessor although sometimes the lessee is given an option to purchase the asset either during the currency of the lease or at its termination. A contract by which one party gives to another party the use of property or equipment, e.g., containers, for a specified time against fixed payments. Contract whereby the owner of a property (the lessor) grants the possession and use of the property to a lessee for a stated period and at a stated price. See also Capital Lease, and Land Lease. / , например, . Арендатор = Наниматель (The Lessee). Аренда или Лизинг – контракт, предоставляющий право на пользование недвижимостью, оборудованием или иными средствами производства в течение определённого периода времени в обмен на оплату, обычно в форме арендной платы. Владелец арендованной собственности называется арендодателем, а пользователь – арендатором.

(2) Lease is a financial instrument based upon the contango in the gold or silver market to finance precious metals inventory.

LEASE AND PLANT FUEL = ПОПУТНОЕ И ЗАВОДСКОЕ ТОПЛИВО – Lease And Plant Fuel is the natural gas used in well, field, and lease operations (such as gas used in drilling operations, heaters, dehydrators, and field compressors) and used as fuel in natural gas processing plants. / природный газ, используемый для операций со скважиной, месторождением, и арендой (такой как газ, используемый в операциях бурения, , водоотделитель (dehydrator) и используемый в качестве топлива .

LEASE CONDENSATE = КОНДЕНСАТ ИЗ ПОПУТНОГО ГАЗА – Lease Condensate is a mixture consisting primarily of pentanes and heavier hydrocarbons, which is recovered as a liquid from natural gas in lease or field separation facilities. This category excludes natural gas liquids, such as butane and propane, which are recovered at natural gas processing plants or facilities.

LEASE FINANCING = АРЕНДНОЕ ФИНАНСИРОВАНИЕ – Lease Financing is a specialized area of finance dealing with renting property owned by a lender, financing the leases of a company engaged in rentals, financing the purchase of an item to be leased out by a borrower.

LEASEHOLD = ПРЕДМЕТ АРЕНДЫ (или ЛИЗГОЛЬД, или ПОЛЬЗОВАНИЕ НА ПРАВАХ АРЕНДЫ) – Leasehold is a term used to describe property held by lease or other than in absolute ownership. On leasehold land, the lessee pays ground rent to the person who holds the freehold. Leasehold:- a lease is an agreement which allows one of the parties (the leaseholder) the use of a specified portion of a building for a specified period in return for some payment. / Под Лизгольдом, от Английского слова Leasehold, от Английских слов Lease, означающее Аренда, и Hold, означающее Владение или Держание, понимается форма земельной аренды в средневековой Англии. Крупный лизгольд развился в фермерскую капиталистическую аренду, мелкий (крестьянский) – стал одним из первых объектов огораживаний – насильственных сгонов крестьян феодалами с земли, которую феодалы затем огораживали изгородями, канавами и прочим. Лизгольд, вид земельной аренды в Англии. Начал развиваться в позднее средневековье, когда с ликвидацией барской запашки лорды манора стали практиковать сдачу в аренду своего домена целиком одному лицу (крупный лизгольд, со временем превратившийся в фермерскую капиталистическую аренду) либо нескольким арендаторам (мелкий крестьянский лизгольд). Среди последних были наиболее распространены арендаторы ‘по воле лорда’ со сроком аренды 1–3 года, которые в конце XV–XVI веков в первую очередь были согнаны с земли в ходе огораживаний. Предмет Аренды или Лизгольд – арендованная собственность или право использования собственности в соответствии с контрактом аренды (lease).

LEASEHOLD INSURANCE = СТРАХОВАНИЕ ПРЕДМЕТА АРЕНДЫ (или СТРАХОВАНИЕ АРЕНДОВАННОГО ИМУЩЕСТВА) – Leasehold Insurance is an insurance for the tenant of a property leased against the loss of value of the lease or of profit from a sub-lease through termination of the lease by fire or other peril insured against.

LEASE RATE = СТАВКА АРЕНДЫ – Lease Rate:- pricing of gold forward rate:- back in pricing of futures, we discussed about the theoretical pricing of futures. But the futures price (or more technically correct, the forward price) of gold is calculated differently. This is because there is a lease rate for gold. As we mentioned before in get paid to borrow gold and silver? But for a certain class of gold owners, they do earn interests on gold. Right now, instead of receiving interest for lending out gold, they are paying people to borrow gold. The best way to explain gold forward pricing is to use an example. To understand this, we assume that you have already read and understood Pricing of futures beforehand. Let’s suppose the spot price of gold is USD1 000 per ounce. The lease rate for 180 days is 2 percent per annum while the carry cost (which includes storage and interests) is 5% per annum. So, we borrow USD1 000.00 for 180 days. At the carry cost of 5%, we have to repay USD1 000.00 * (1 + 0.05(180/365)) = USD1 024.66 in 180 days time. With the borrowed USD1 000.00, we buy 1 ounce of gold and lease it out. At the end of the 180 days lease period, we expect to get back 1 * (1 + 0.02(180/365) = 1 (1.01) = 1.01 ounce of gold. Therefore, 1 ounce of gold has grown to 1.01 ounce in 180 days time at a value of USD1 024.66. Therefore, the forward price of gold will have to be USD1 024.66 / 1.01 = USD1 014.51. If the 180-day forward price of gold is not at USD1 014.51, then an arbitrage opportunity exists. To sum it all up with an equation, if the spot price is S, the forward price is F(T) for a time-horizon of T days, the carry cost is r, and the gold lease rate is r*, we have:- F(T) = S [1 + r (T/365)] / [1 + r* (T/365)].

LEASE RODS = РАЗДЕЛЯЮЩИЕ ПРУТКИ (или ХОДОВЫЕ ПОПЕРЕЧИНЫ, или ХОДОВЫЕ КОЛОДКИ, или ЦЕНОВЫЕ ПАЛОЧКИ) – Lease Rods are two wooden or glass rods set between the whip roll and the harness frames. These rods help to keep the lease in the warp threads. For example, all even-numbered warp ends may pass over the back lease rod and under the front lease rod; all odd-numbered warp ends may pass under the back lease rod and over the front lease rod. By this arrangement of warp threads, the lease rods aid considerably in finding broken warp ends, keeping the ends under control, and preventing possible gnarling, tangling and rolling of the warp ends. In addition the rods cause the ends to enter the heddle eyes on the harness frames in an even, uniform manner.

LEASES = ВИДЫ АРЕНДЫ (или АРЕНДА ПО ВИДАМ) – (1) In the balance sheet, property, plant and equipment acquired through capital lease arrangements are recorded at the present value of the minimum lease payments or fair value, if it is lower. These assets are depreciated over the shorter of the useful life of the assets or the lease term. IAS 17 (short for International Accounting Standard No. 17) – Leases – prescribes, for lessees and lessors, the appropriate accounting policies and disclosure to apply in relation to leases. The classification of leases adopted in this standard is based on the extent to which risks and rewards incidental to ownership of a leased asset lie with the lessor or the lessee. A lease is classified as a finance lease if it transfers substantially all the risks and rewards incidental to ownership. A lease is classified as an operating lease if it does not transfer substantially all the risks and rewards incidental to ownership. Leases in the financial statements of lessees:- (i) Operating Leases:- lease payments under an operating lease shall be recognised as an expense on a straight-line basis over the lease term unless another systematic basis is more representative of the time pattern of the user’s benefit. (ii) Finance Leases:- at the commencement of the lease term, lessees shall recognise finance leases as assets and liabilities in their balance sheets at amounts equal to the fair value of the leased property or, if lower, the present value of the minimum lease payments, each determined at the inception of the lease. The discount rate to be used in calculating the present value of the minimum lease payments is the interest rate implicit in the lease, if this is practicable to determine; if not, the lessee’s incremental borrowing rate shall be used. Any initial direct costs of the lessee are added to the amount recognised as an asset. Minimum lease payments shall be apportioned between the finance charge and the reduction of the outstanding liability. The finance charge shall be allocated to each period during the lease term so as to produce a constant periodic rate of interest on the remaining balance of the liability. Contingent rents shall be charged as expenses in the periods in which they are incurred. A finance lease gives rise to depreciation expense for depreciable assets as well as finance expense for each accounting period. The depreciation policy for depreciable leased assets shall be consistent with that for depreciable assets that are owned, and the depreciation recognised shall be calculated in accordance with IAS 16 Property, Plant and Equipment and IAS 38 Intangible Assets. If there is no reasonable certainty that the lessee will obtain ownership by the end of the lease term, the asset shall be fully depreciated over the shorter of the lease term and its useful life. Leases in the financial statements of lessors:- (i) Operating Leases:- lessors shall present assets subject to operating leases in their balance sheets according to the nature of the asset. The depreciation policy for depreciable leased assets shall be consistent with the lessor’s normal depreciation policy for similar assets, and depreciation shall be calculated in accordance with IAS 16 and IAS 38. Lease income from operating leases shall be recognised in income on a straight-line basis over the lease term, unless another systematic basis is more representative of the time pattern in which use benefit derived from the leased asset is diminished. Finance Leases:- lessors shall recognise assets held under a finance lease in their balance sheets and present them as a receivable at an amount equal to the net investment in the lease. The recognition of finance income shall be based on a pattern reflecting a constant periodic rate of return on the lessor’s net investment in the finance lease. Manufacturer or dealer lessors shall recognise selling profit or loss in the period, in accordance with the policy followed by the entity for outright sales. If artificially low rates of interest are quoted, selling profit shall be restricted to that which would apply if a market rate of interest were charged. Costs incurred by manufacturer or dealer lessors in connection with negotiating and arranging a lease shall be recognised as

an expense when the selling profit is recognised. Sale and leaseback transactions:- A sale and leaseback transaction involves the sale of an asset and the leasing back of the same asset. The lease payment and the sale price are usually interdependent because they are negotiated as a package. The accounting treatment of a sale and leaseback transaction depends upon the type of lease involved. / МСБУ 17 (сокращение для Международного Стандарта Бухгалтерского Учёта № 17) – . для незамедлительных продаж.

(2) Leases consist of an obligation to make a series of payments (in consideration for using the leased object) followed by the return of the leased object; some leases also allow a purchase option for the obligor. Leased objects are commonly vehicles, however, some pools may be comprised of equipment. In economic substance, leasing products are similar to balloon loans where the obligor has a return option. Lease products differ from loans in terms of legal and tax treatment.

LEASING = ЛИЗИНГ (или АРЕНДА) – Leasing:- movable or immovalbe goods are leased, or rented so to speak, by a financial institution, called the Leasing Company, or by the manufacturer of the goods. Leasing is a special form of financing. Instead of a purchase with equity or debt capital financing or a mixture of the two, the rent or lease payment is provided. Possible categorization aspects of leasing can be: period and ability to terminate the leasing contract (financial and operating leasing), the role of the lessor (direct and indirect leasing), type of object being leased (real estate, furniture and staff leasing), etc. The renting out, for a specific period, of industrial equipment, facilities and capital goods (machines, technical installations, vehicles, etc). The manufacturer or – in the case of leasing in the narrower sense of the word (financial leasing) – special leasing companies act as principals. Leasing helps to preserve liquidity. 100% borrowing on a pay-as-you-earn basis. Fixed monthly costs cover interest, amortization, the upfront fee and (e.g., with car leasing) the insurance premium. / , например, .

LEASING COMPANY = ЛИЗИНГОВАЯ КОМПАНИЯ – Leasing Copany is the company from which property or equipment is taken on lease. / Лизинговая Компания – компания, у которой имущество или оборудование было взято в лизинг.

LEASING CONTRACT = ЛИЗИНГОВЫЙ КОНТРАКТ (или ДОГОВОР АРЕНДЫ) – Leasing Contract is a contract for the leasing of property or equipment. / Лизинговый Контракт – контракт по лизингу имущества или оборудования.

LEAST DEVELOPED COUNTRIES GROUP = ГРУППА НАИМЕНЕЕ РАЗВИТЫХ СТРАН – The LDC Group:- the Least Developed Countries as classified by the United Nations are composed of 49 countries of which 32 are members of the WTO and 12 are in the process of acceding to the WTO. The LDCs:- (i) constitute 12% of the world's population but account for less than 1% of world trade; (ii) account for less than half percent point of the world's trade in commercial services (i.e. 0.44% in 2008); (iii) have populations which, in the main, live below the poverty datum line and have limited, or no, access to basic services; and (iv) recognise that, disparate as their nations may be, working together brings greater strength and benefits than could be achieved as individuals. For this reason, the Group has pursued common positions in the negotiations under the Doha Development Agenda. The Group has also pursued parallel discussions to ensure that appropriate mechanisms are put in place to complement market access initiatives. Among other achievements this has led to:- (i) the inclusion in the negotiating modalities specific flexibilities targeted at LDCs; (ii) recognition for the enhancement of market access by granting duty free and quota free treatment to products originating from all LDCs as well as the simplification and transparency of preferential rules of origin; (iii) the adoption of modalities for the special treatment of LDCs with regard to Trade in Services; (iv) the adoption of accession modalities for LDCs; (v) recognition among WTO members to accord special priority to issues of interest/concern to LDCs; and (vi) the enhancement of the Integrated Framework to better respond to the needs of LDCs in the area of trade mainstreaming, building supply capacities and integration into the multilateral trading system. The Enhanced Integrated Framework became effective in July 2009 and has so far benefited a number of LDCs in enhancing/establishment of National Implementation Units (NIU). However, participation of the LDCs in multilateral trade negotiations has not gone without challenge:- although commitments have been made to grant duty free and quota free market access to LDCs; to simplify and make transparent preferential rules of orign; to deal with Cotton expeditiously, ambitiously and specifically as well as according special priority to services sectors and service suppliers from LDCs, these commitments have not been fully made operational. The delay in concluding the negotiations under the Doha Development Agenda has further exacerbated the situation of LDCs in the multilateral trading system. For this reason, the Group will continue to press for early harvest. The LDC remain optimistic and committed to ensure that negotiations under the DDA are concluded soon. The Group will continue to pursue outcomes that will contribute to enhancing development and economic growth of LDCs. Coordination:- The LDC Group coordinates its engagement in negotiations under the multilateral trading system through an inclusive consultative process. The Group has undertaken to advance common positions while respecting the sovereign right of individual countries to pursue national interests. Through a rotational system, a coordinator is selected among LDCs to lead the Group's engagement at all levels (Ministerial, Senior Officials/Ambassadorial, experts). In order to ensure ownership, inclusiveness, transparency and consistency in positions adopted, the Group also maintains a pool of focal points for each subject areas (drawn from among the group members) supported by alternates and a core group. The Group has also undertaken to hold, as appropriate, a Ministerial session to renew the mandate for engagement in the negotiations. These sessions normally result in the adoption of a declaration outlining the Group's positions on each subject under negogtiation. Regular meetings are held of senior technical officials; Ambassadors (representing their countries in Geneva to the WTO). Efforts are also made to ensure that officials based in Geneva, working directly with other LDC nations and with the WTO, are equally in touch with their capital based colleagues. The restricted section of this site is for the information of LDC country officials who may apply for registration where indicated.

LEAST DEVELOPED COUNTRY = НАИМЕНЕЕ РАЗВИТАЯ СТРАНА – The OECD/DAC (Organization of Economic Cooperation and Development/Development Assistance Committee) classification, LLDC (short for the Least Developed of the Less Developed Countries), is substantially the same as the United Nations LDCs. The Least Developed Country list is reviewed at three-year intervals. At each review, countries may remain, be added, or be graduated out. There are three criteria for UN categorization as an LDC:- (i) low-income – as of the most recent review, the low income threshold was a Gross National Income (GNI) of USD750 per capita; (ii) weak human assets – measured by a composite index based on indicators of nutrition, health, school enrolment, and literacy; and (iii) economic vulnerability – measured by a composite index based on indicators of instability in agricultural production, instability in exports of goods and services, economic importance of non-tradition activities, economic concentration, and economic smallness. UNCTAD (the United Nations Conference on Trade and Development) is the United Nations lead agency for the least developed countries (LDCs). In that capacity, it manages the Action Plan for the Least Developed Countries and also issues biennial reports on the position, prognosis and possibilities of those countries. Least Developed Countries (LDCs):- the world's poorest countries. The WTO uses the UN list http://www.un.org/special-rep/ohrlls/ldc/list.htm. WTO members (31):- Angola, Bangladesh, Benin, Burkina Faso, Burundi, Cambodia, Central African Republic, Chad, Democratic Republic of the Congo, Djibouti, Gambia, Guinea, Guinea-Bissau, Haiti, Lesotho, Madagascar, Malawi, Mali, Mauritania, Mozambique, Myanmar, Nepal, Niger, Rwanda, Senegal, Sierra Leone, Solomon Islands, Tanzania, Togo, Uganda, and Zambia. WTO observers (12):- Afghanistan, Bhutan, Comoros, Equatorial Guinea, Ethiopia, Lao People's Democratic Republic, Liberia, Samoa, Sao Tomé and Principe, Sudan, Vanuatu, and Yemen. Not WTO members or observers (5):- Eritrea, Kiribati, Somalia, Timor-Leste, and Tuvalu. Least Developed Countries are nations identified as such by the United Nations Economic and Social Council through its Committee for Development Policy and includes countries with 'a low per

capita income', 'a low level of human resource development' and 'a high degree of economic vulnerability'. The figures for this criteria are reviewed every three years. Specific parameters as defined during the triennial review by the Committee in 2009 are as presented below:- Criteria for Least Developed Countries:- (i) Gross National Income Per Capita:- the threshold for inclusion is a three-year (2005–07) average Gross National Income (GNI) per capita of USD905.12 and the graduation threshold is USD1 086.00. (ii) Human Assets Index:- The Human Assets Index (HAI) reflects the following dimensions of the state of human development:- (a) health and nutrition, measured by:- (i) percentage of the population; undernourished; and (ii) under-five child mortality rate; and (b) education, measured by: (i) gross secondary school enrolment ratio; and (ii) adult literacy rate. The HAI threshold for inclusion a value of 60 and the threshold for graduation is 66. (iii) Economic Vulnerability Index:- The Economic Vulnerability Index (EVI) reflects a risk posed to a country's development by exogenous shocks. The EVI threshold is 42 and the threshold for graduation is 38. The next triennial Review is scheduled for 2012. Adapted from United Nations Committee for Development Policy, Report on the Eleventh Session (9-13 March 2009); Economic and Social Council Official Records, 2009, Supplement No. 13. Least Developed Countries currently total 49, including Afghanistan, Angola, Bangladesh, Benin, Bhutan, Burkina Faso, Burundi, Cambodia, Central African Republic, Chad, Comoros, Democratic Republic of the Congo, Equatorial Guinea, Eritrea, Djibouti, Ethiopia, Gambia, Guinea, Guinea Bissau, Haiti, Lao People's Democratic Republic, Kiribati, Lesotho, Liberia, Madagascar, Malawi, Maldives, Mali, Mauritania, Mozambique, Myanmar, Nepal, Niger, Rwanda, Samoa, Sao Tomé and Principe, Senegal, Sierra Leone, Solomon Islands, Somalia, Sudan, Tanzania, Togo, Timor-Leste, Tuvalu, Uganda, Vanuatu, Yemen and Zambia. Countries whose recommendations for graduation were recently approved by the UN General Council include Equatorial Guinea, Maldives and Samoa. Distinct definition of the Least Developing Countries first emerged from the Seventh Session of the United Nations Committee for Development Planning held in 1971 in its quest to examine challenges peculiar to the least developed among developing countries. The Committee was tasked to propose criteria for identifying these countries in response to the recognition by the United Nations General Assembly that the capacity of the least developed among developing countries to respond to deliberate development initiatives including those contained in the International Development Strategy for the Second United Nations Decade was far less due to their peculiar handicaps. Identification criteria and procedure was found to be particularly essential for grating a concrete expression of political will towards the implementation of special measures in favor of the vulnerable group. / сводный индекс.

LEAST DEVELOPED OF THE LESS DEVELOPED COUNTRIES = НАИМЕНЕЕ РАЗВИТЫЕ ИЗ СЛАБОРАЗВИТЫХ СТРАН – The classification Least Developed Of The Less Developed Countries (LLDC) was developed by the United Nations (UN) to give some guidance to donor agencies and coutries about an equitable allocation of foreign assistance. The criteria for designating a country an LLDC, originally adopted by the UN Committee for Development Planning in 1971, have been modified several times. Criteria have included low:- per-capita-income, literacy, and manufacturing share of the country's total gross domestic product. There is continuing concern that the criteria should be more robust and less subject to the possibility of easy fluctuation of a country between less developed and least developed status. See also Less Developed Country. This designation was created by the United Nations to determine which countries in the world were in the greatest need of aid. Burma was given this status on 1987-December-11. The criteria used to determine the countries in greatest need were per capita GDP (Gross Domestic Productthe goods and services a country produces), share of manufacturing in total GDP, the adult literacy rate, the quality of life index, the economic diversification index and population size. Forty-nine countries are currently designated by the United Nations as least developed of the less developed countries (LLDCs). The list is reviewed every three years by the Economic and Social Council (ECOSOC). The criteria underlying the current list of LLDCs are:- low income, weak human resources, and a low level of economic diversification. They are sometimes referred to as the Fourth World. The OECD/DAC (Organization of Economic Cooperation and Development/Development Assistance Committee) classification, LLDC (least developed of the less developed countries), is substantially the same as the UN LDCs. / лёгкого колебания .

LEAS TIES = ЦЕНОВЫЕ ПОДВЯЗКИ – Leas Ties, also known as Lees Ties. This is such an interesting term that pops in and out of textiles. I asked a longtime weaver which was correct. She said it wasn't so much correct but where you learned to weave. The fact that a term used in measuring linen yarns is 'lea' makes me think leas ties came from that direction. So what are they? They are the short threads tied around hanks of yarn to help keep them from tangling while being washed, dyed, and stored. They are also the short threads tied around a warp to allow you carry it from the warping board/mill to the loom. They serve the same process of keeping the threads in order. They are tied by running a thread at right angles to the warp/hank and interweaving through and coming back at opposite angles. Kind of a series of sideways figure 8's.

LEAST SQUARES GROWTH RATE = СРЕДНЕКВАДРАТИЧНАЯ СТАВКА РОСТА – The Least Squares Growth Rate, r, is estimated by fitting a linear regression trend line to the logarithmic annual values of the variable in the relevant period, as follows:- Ln(xt) = a + r * t and is calculated as [exp (r) – 1].

LEATHER = КОЖА – Leather is the hide of an animal with the fur removed. It has been used throughout history for clothing and other purposes. Today, manmade fabrics that imitate leather are widely available. Common leather names include alligator, buckskin, calfskin, chamois, cordovan, cowhide, crocodile, doeskin, grain leather, kid, lambskin, morocco, nappa, patent, peccary, pigskin, pin seal, reptile, reversed leather, Russian, shearling, skiver, snakeskin, and suede. Making of Leather Fabric:- leather is a versatile fabric used in a variety of apparel and non-apparel products. One cannot think of riding a bike without a leather jacket or leather pants combined with leather gloves on a cold wintry night. Ladies love to carry leather handbags and leather lingerie is fast becoming their hot favorites. Leather footwear, accessories like leather belts, wallets, leather upholstery for sofas, automobile seats, leather shields and weapon sheathes, engine gaskets and harnesses – the list can go on but the uses of leather can never said to have exaggerated. This now so common fabric called Leather has a very complicated manufacturing process. Making of leather fabric is very different from that of other fabrics and its interesting to know this very ancient art of leather making which is being refined with time. Sources of Leather:- leather is obtained from the skin or hide of animals. The skin of larger animals are termed as 'Hide' such as cowhide or horsehide and the term 'Skin' is used to represent that of smaller animals like calfskin or kidskin. Nowadays, skins of animals such as ostrich, lizard, eel, and Kangaroo are also used to make leather but the commonly used leathers come from Cattle, Sheep, Lamb, Goat, kid, Horse, Mule, Zebra, Buffalo, Pig, Hog, Seal, Walrus, Whale, and Alligator. Process of making Leather Fabric:- there are many varieties of leather. All kinds of leathers have to pass through three main stages viz. preparatory processes, tanning and finishing processes. Sometimes surface coating is also applied to certain kinds of leathers. Preparatory Processes:- when the hide or skin is prepared for tanning, it has to go through the processes such as pickling, soaking, liming, fleshing, splitting, deliming, bating, degreasing, bleaching, and depickling. Pickling:- the raw hide is cleaned and soaked in acids or salts to prevent decomposition. Soaking:- after reaching the tannery, it is soaked in water to restore moisture lost during salting. Liming:- it is then soaked in lime solution for removing hair, inter-fibrillary protein and epidermis. Fleshing:- mechanical instruments like rollers and blades are used to remove fat, muscle and flesh from the skin. Splitting:- the hides are usually composed of three layers- epidermis or the outer layer, corium or dermis, the middle layer, and the innermost fatty layer. These layers are separated or split to obtain the corium from which the leather is made. Deliming:- the hide is washed in a mixture of water and ammonium chloride or ammonium sulphate to neutralize it.

Bating:- the hide is treated with digestive enzymes to remove non-fibrous proteins. Degreasing:- lipases are used to dissociate fat particles set in the skin. Bleaching:- the hide is made colorless by applying chemicals. Depickling:- the hide is put in sulphuric acid to lower the pH or the acidity gained during pickling. Tanning:- tanning converts the protein of the raw hide into a stable material which does not decompose and can be used for making end-products. For tanning different methods and materials are used. The hides are soaked in a tanning liquor which slowly penetrates through the hide. When the penetration is done to a satisfactory level, the pH of the float is slowly raised in a process called Basification. Basification fixes the tanning material to the leather. Mineral Tanning:- chrome is the most common material used for tanning. Chromium salts used in this method gives pale blue color to the leather and thus it is also known as 'Wet Blue' Leather. It makes leather water proof and stretchable. Vegetable Tanning:- in this method, which is also called Bark Tanning, the hide is soaked in a solution of bark of oak or chestnut. The leather becomes flexible but when dry, it doesn't stretch much. Oil Tanning:- in this method, fish and animal oil is used which makes the leather very soft and flexible. Finishing Processes:- after tanning, the leather undergoes different finishing processes that may include drying, softening, lubricating, dyeing and coloring. For a smooth finish, the leather may be treated with waxes, shellac or emulsified synthetic resins, dyes, and pigments. Sometimes, glazing is done to get polished surface. Drying:- the leather is dried in the air or in a drying tunnel. Sometimes, other methods like paste and vacuum drying are also used. Lubricating:- oils and greases are incorporated into the leather to lubricate it for enhancing its softness, strength, and water resistance. Dyeing:- methods like drum dyeing, spraying, brush dyeing, and staining are used for giving color to leather. Some leathers are surface coated for additional resistance to abrasion, cracking, peeling, water, heat, and cold. See also Fur, Skin, and Pelt. / оленья кожа или лосиная кожа (buckskin), , шамуа или замша или серна (chamois), кордовская (cordovan). тонкая кожа (skiver). шеллак (shellac). Кожа – это обработанная дерма шкуры животного, волокнистая структура которой в основном сохранена, но физические, физико-механические и химические свойства её структурных элементов изменены в зависимости от назначения кожи. Кожу изготавливают из шкур крупного рогатого скота, козлины, овчины, оленьих и свиных. Производство кожи состоит из трёх основных этапов:- (1) превращение шкуры в недубленый полуфабрикат (гольё) определённой структуры и химического состава; (2) закрепление структуры голья и изменение её качества (формирование новой структуры, в результате чего обеспечивается стойкость голья к влаге, температурным и бактериальным выделениям) и введение наполняющих веществ; этот этап завершается получением дубленого полуфабриката; и (3) обработка дубленого полуфабриката для придания ему необходимого комплекса свойств (физико-механических, гигиенических, технологических, органолептических и других) и товарного внешнего вида. В соответствии с указанными этапами производство кожи разделяется на три группы процессов и операций:- подготовительные, дубильные и отделочные. Технологию производства кожи разрабатывают, исходя из характеристик шкуры (вид сырья, толщина, площадь, химический состав и свойства) и требований к выделанной коже, зависящих от её назначения. В результате выполнения подготовительных операций со шкуры удаляют волос, эпидермис и подкожно-жировой слой. К основным подготовительным операциям относятся отмока, мездрение, золение, обезволашивание, распиливание по толщине, раскраивание, обеззоливание, мягчение, пикелевание, обезжиривание. Выполнение операций и их последовательность зависят от вида и назначения сырья. Так, мягкое сырьё и тонкие шкуры крупного рогатого скота (КРС) по толщине не распиливают. Отмока:- для приведения шкуры в состояние, близкое к парному, её обрабатывают водой с добавлением ускорителей процесса (главным образом, сульфида натрия и поверхностных веществ). При отмоке из шкуры удаляют кровь, консервирующие вещества, водорастворимые белки. Мездрение:- в процессе мездрения от дермы отделяют подкожную клетчатку – мездру. Обезволашивание и Золение:- на шкурах после отмоки имеются волос, эпидермис, остатки подкожной клетчатки, которые необходимо удалить. Обезволашивание заключается в химическом или ферментативном ослаблении связи волоса с дермой и последующем механическом удалении шерсти. Золение обеспечивает изменение структуры дермы и удаление белков, присутствующих в шкуре наряду с коллагеном, набухание (нажор) и обезжиривание. Сгонка Шерсти и Чистка:- ослабление связи волоса с дермой, достигнутое после обезволашивания и золения, позволяет мягко удалить волос. Полуфабрикат, полученный после удаления шерсти и подкожно-жирового слоя (мездры), называют Гольём. Распиливание По Толщине:- распиливание заключается в снятии лицевого голья. Верхний слой, имеющий натуральную лицевую поверхность, называют Лицевым Спилком, нижний слой – Бахтармяным Спилком. Раскраивание:- для удобства обработки на кожевенном заводе крупный полуфабрикат раскраивают, разделяя на разнородные по свойствам участки (Чепрак, Полы, Вороток). Обеззоливание:- гольё обеззоливают для удаления щёлочи, так как наличие её препятствуют нормальному проведению последующих процессов, повышает жёсткость кожи и способствует появлению известковых пятен. Мягчение:- осуществляется при обработке голья ферментными препаратами. Пикелевание:- это обработка голья перед дублением раствором, содержащим кислоту и соль. Обезжиривание:- гольё обезжиривают для удаления избыточного количества природного жира. Дубление:- это основной этап кожевенного производства, при котором существенно изменяются свойства кожевенного сырья. Процесс превращения голья в кожу в результате химического и адсорбционного взаимодействия дубящих веществ с коллагеном дермы называется Дублением. Выдубленный полуфабрикат существенно отличается по свойствам от голья. В зависимости от применяемых дубителей различают следующие методы дубления:- (i) Хромовое Дубление – дубление голья водными растворами основных солей трёхвалентного хрома; (ii) Алюминиевое Дубление – дубление голья водными растворами основных солей алюминия; (iii) Альдегидное Дубление – дубление голья водными растворами альдегидов; (iv) Кремнекислое Дубление – дубление голья водными растворами кремниевой кислоты; (v) Титановое Дубление – дубление голья водными растворами дубящих соединений титана; (vi) Циркониевое Дубление – дубление голья водными растворами дубящих соединений циркония; (vii) Железное Дубление – дубление голья водными растворами основных солей трёхвалентного железа; (viii) Жировое Дубление – дубление голья жирами; (ix) Лайковое Дубление – дубление голья смесью алюминиевых квасцов, поваренной соли, яичного желтка и муки; (x) Танидное Дубление – дубление голья растворами растительных дубильных веществ; и (xi) Комбинированное Дубление – дубление голья несколькими дубящими веществами одновременно или в определённой последовательности. После дубления шкура приобретает основные ценные качества, свойственные готовой коже. Цель отделочных операций – придать коже, прошедшей дубление, некоторые физико-механические свойства и товарный внешний вид. Целью последубильных операций является подготовка выдубленного полуфабриката к отделке. В процессе отделки он приобретает красивый внешний вид и необходимые физико-механические свойства, требуемые для кож данного назначения. К последубильным операциям относятся:- промывка, пролёжка, отжим, распиливание (распиливают кожи хромового метода дубления), строгание (для выравнивания толщины), промывка и нейтрализация. К операциям отделки относятся:- крашение, жирование, додубливание и наполнение кож хромового дубления, разводка (разглаживание складок на коже, придание лицевой поверхности гладкости), сушка, увлажнение (для повышения пластичности полуфабриката), тяжка (для выравнивания, повышения гладкости и мягкости кожи), покровное крашение (аппретирование) (обеспечивает внешний вид кожи:- цвет, матовость или блеск). В зависимости от назначения кож применяют различные виды покрытий:- эмульсионное, казеиновое, эмульсионно-казеиновое, нитроцеллюлозное, нитроэмульсионное, полиуретановое. В зависимости от вида, числа, характера расположения пороков на лицевой поверхности и назначения кожи применяют анилиновую, полуанилиновую или пигментную отделку. Качество кожевенного сырья и его строение зависят от породы скота. Крупный рогатый скот молочных пород имеет тонкую и эластичную шкуру, рабочий скот – толстую шкуру высокой плотности, скот мясных пород –

шкуру с сильно развитой подкожной жировой клетчаткой, рыхлым и толстым слоем дермы. Свойства кожевенного сырья существенно зависят от кормления и условий содержания скота. Натуральная кожа, используемая для одежды, должна быть мягкая на ощупь, хорошо выделанная, без жировых пятен и налётов, без складок и морщин, с покрытием, устойчивым к утюжке при температуре 80 °C, без общей садки, ломкости и осыпания покрытия; велюр должен иметь густой низкий ворс. По художественно-эстетическим показателям кожи оцениваются в соответствии со следующими требованиями (наименование показателя – предел оценки в баллах):- (i) Эластичность высшей категории качества – 8, первой категории качества – 8–7; (ii) Отделка высшей категории качества – 20–18, первой категории качества – 20–16; (iii) Структура Лицевой Поверхности высшей категории качества – 12–10, первой категории качества – 12–9. Физико-механические свойства одёжных кож оцениваются по следующим показателям:- содержание влаги; содержание веществ, экстрагируемых органическими растворителями; содержание окиси хрома; нагрузка при разрыве; жёсткость; толщина; площадь кожи. По химическим и физико-механическим показателям кожи должны соответствовать следующим нормам (наименование показателя – норма):- Массовая Доля Влаги – 10–16%; Массовая Доля Окиси Хрома – не менее 3.6%; Массовая Доля Веществ, Экстрагируемых Органическими Растворителями (Без Полимерного Соединения):- (a) для кож из шкур овец и свиней – 6.0–14.0%, (b) для кож из козлины – 10.0–18.0%; Предел Прочности При Растяжении По Коже:- (a) для кож из шкур овец и коз – не менее 1.2 (10 МПа), (b) для кож из шкур свиней – не менее 1.0 (10 МПа); Удлинение При Напряжении 10 МПа По Коже:- (a) из шкур овец и коз – не менее 30.0–50.0%, (b) из шкур свиней – не менее 25.0–46.0%. Натуральная кожа для одежды должна иметь следующие показатели:- масса одного квадратного метра – 400–600 г; нагрузка, характеризующая жёсткость – 3–5 сН; разрывная нагрузка – не менее 35 даН (разрушающее напряжение не менее 10 МПа); сопротивление раздиранию – не менее 2 даН; усадка после намокания и высушивания – не более 2%; число циклов истирания до изменения внешнего вида (залащивания) – не менее 200; устойчивость окраски к сухому и мокрому трению – не менее 4 баллов, к свету – не менее 7 баллов. Так как кожа является пористым материалом, то необходимо различать вес единицы объёма плотного вещества кожи. Объёмный вес и пористость кожи (кожа – объёмный вес, пористость):- (i) 1 и 2 Классы Танидного Дубления – 0.99–1.24 г/см^3, 29–47%; (ii) 3 Класс Танидного Дубления – 0.6–1.00 г/см^3, 22–68%; (iii) 3 Класс Хромового Дубления – 0.42–0.72 г/см^3, 47–58%; и (iv) То Же, Замша – 0.23–0.42 г/см^3, 67–77%. Кожи так же характеризуются паропроницаемостью, гигроскопичностью, намокаемостью и влагоёмкостью, термостойкостью. Воздухопроницаемость определяется в лёгких кожах. Она обусловлена наличием сквозных пор в коже. С увеличением пористости и уменьшением толщины кожи растёт её воздухопроницаемость. Воздухопроницаемость мягких кож без лицевого покрытия колеблется в пределах 100–180 см^3/(см^2·ч). В большинстве случаев воздухопроницаемость кожи с лицевым покрытием находится в пределах 10–100 см^3/(см^2·ч). Паропроницаемость у хромовых кож без покрытий достигает 7–1.6 мг/(см^2·ч) и снижается до 5.5–0.5 мг/(см^2·ч) в кожах с покрытием. Кожа обладает большой гигроскопичностью. Это свойство, объяснимое её пористостью и гидрофильностью, обеспечивает поглощение кожей пара. Кожа может накапливать в себе влагу в значительном количестве. Кожа при 100% относительной влажности воздуха может иметь равновесную влажность в 35–65%, что свидетельствует о её большей гигроскопичности. Максимальное количество влаги поглощают кожи хромового дубления. Для характеристики способности кожи поглощать воду за определённый промежуток времени пользуются показателями:- намокаемость, намокаемость с поправкой на вымывание, и влагоёмкость. Водопроницаемость кожи выражается количеством воды в миллилитрах (мл), проходящей через 1 квадратный сантиметр (см^2) площади кожи в течение 1 часа (ч) и при давлении столба жидкости высотой 1 метр (м). На её величину влияет вид дубления, способность волокон к набуханию, плотность укладки структурных элементов кожи, степень наполнения. Раскройные свойства кож характеризуются особенностями структуры её отдельных топографических участков, толщиной, площадью, конфигурацией, конструкцией изделия, сортностью (наличием пороков, определяющих при современных методах раскроя требования к материалу, из которого изготовлены детали изделий), возможностью использования кожи по целевому назначению. Участки шкуры и кожи, соответствующие определённым частям тела животного и различающиеся по толщине, плотности, характеру переплетения волокон, химическому составу и физико-механическим свойствам, называют топографическими. Кожу условно делят на Чепрачную и Периферийную части. Чепрачная Часть (средняя часть кожи), площадь которой доходит до 55% от общей площади кожи, обладает примерно одинаковыми свойствами в продольном и поперечном направлениях. Изменение толщины кожи в пределах чепрака незначительно. Из чепрачной части кожи следует выкраивать наиболее ответственные детали одежды. К Периферийной Части кожи относят участки кожи, непосредственно примыкающие к чепраку спереди (вороток) и с боков (полы). Из этих участков следует выкраивать менее ответственные детали или размещать участки деталей, которые не несут больших механических нагрузок, а в готовом изделии мало заметны. Направление удлинения (тягучести) кожи имеет существенное значение при изготовлении изделия, направление наибольшего удлинения на отдельных участках необходимо учитывать при раскрое. На чепрачном участке кожа имеет наименьшее удлинение в долевом и поперечном направлениях. На участке воротка наибольшее удлинение направлено веерообразно. Полы и Лапы имеют наименьшее удлинение в продольном направлении. Хребтовая Линия Шкуры (Кожи) – условная прямая линия, проходящая по линии позвоночника от головы до корня хвоста. Белая Линия Шкуры – анатомическая граница сращения брюшных мышц у животных, по которой проводят разрез шкуры при её снятии пластом. Полукожа – половина целой кожи, полученная разрезом по хребтовой линии. Чепрак – средняя часть шкуры (кожи), ограниченная прямыми линиями, соединяющими впадины передних и задних лап и линией, соединяющей передние пашины. Получепрак – половина чепрака, разрезанная вдоль хребтовой линии кожи. Огузок – участок шкуры (кожи), расположенной ниже линии, соединяющей впадины задних лап (линия БС на рисунке). Крупон – чепрак, выкроенный в виде прямоугольника со сторонами БМНС (приводятся на рисунке) с отрезанным огузком. Полы – крайние боковые участки шкуры (кожи), ограниченные от остальных частей линиями, соединяющими впадины передних и задних лап (линия АБ и СД, ЖМБ и ЗНС на рисунке). Припольный Участок – участок чепрака, расположенный близко к полам. Рыбка – часть шкуры (кожи) после отделения пол, а иногда и головной части. Головная Часть – участок шкуры, снятый с головы животного без ушей и губ. Лобаш – участок шкуры, снятый со лба животного. Щёки – боковые участки головной части шкуры. Вороток – участок шкуры, расположенный между головной частью и чепраком (линия ЖМНЗ и АМНД на рисунке). Сходы – откроенные от шкуры (кожи) две полы и вороток. Лапы – участки шкуры, снятые с ног животного. Пашины – участки шкуры, прилегающие к лапам со стороны белой линии. Хвост – участок шкуры, снятый с хвоста животного. Конскую шкуру условно можно разрубить на две основные части:- переднюю и заднюю. Передина – передняя часть конской шкуры, от которой отделён хаз (линия аб на рисунке). Полупередина – половина передины, разрезанной по хребтовой линии шкуры (кожи). Хаз – задняя часть конской шкуры вместе с лапами (линия аб на рисунке) от которой отделена передина. Шпигель – два овальных участка по обе стороны хаза, симметрично расположенные к хребтовой линии. Грива – жёсткий участок шеи конской шкуры, образованный длинными, густо и глубоко сидящими остевыми волосами. Характеристика Сортности Кож:- важным фактором, влияющим на рациональное использование кож, является сорт. В зависимости от наличия пороков, количества и топографического расположения на коже, а также отклонений от требований, предъявляемых к качеству и внешнему виду, кожи делят на пять сортов. Пороком кожи считают любое повреждение, обнаруженное при органолептической оценке и внешнем осмотре, приводящее к снижению использования площади этой кожи. Кожи высшей категории качества должны быть не ниже 3-го сорта. Полезной площадью

считают площадь, свободную от пороков или с наличием таких пороков, которые для данного вида кож допускаются. При определении сорта кож для одежды и головных уборов допустимыми пороками считают:- отмин; единичные хорошо заросшие свищи и оспины; единичные хорошо заросшие и закрашенные царапины, не задевающие дерму; и неровную окраску и изменяемость цвета при растягивании кож с анилиновой и полуанилиновой отделками. В кожах не допускаются:- (i) неродуб (светлые непрокрашенные участки в среднем слое толстых кож); (ii) подсед (короткие волоски на поверхности кожи); (iii) садка общая (трещины); (iv) жёсткость общая (гремучесть при прощупывании); (v) ломкость общая (трещины на лицевой поверхности при изгибе); (vi) отдушистость свыше 60% площади чепрака; (vii) пятна и налёты жирового или минерального происхождения, не поддающиеся удалению, занимающие свыше 50% площади кожи; (viii) бронзистость; (ix) нестойкость к утюжке при температуре 80 °C и ниже; (x) осыпание покрытия; (xi) неровная окраска, за исключением кож с анилиновой, полуанилиновой отделками и велюра; и (xii) неровное строгание. На кожах высшей категории качества и вырабатываемых для Госзаказа, кроме перечисленных пороков, не допускаются:- тощесть, отдушистость и пятна жирового или минерального происхождения. Учитываемые пороки делятся на измеряемые и неизмеряемые по длине и площади. Неизмеряемые пороки оцениваются в соответствии со следующим (наименование порока – оценка порока, %):- (i) Садка или Ломка Местная – 25%; (ii) Тощестость – 20%; и (iii) Серость Окраски Для Чёрных Кож – 10%. К порокам, измеряемым по площади, относятся те, которые дают общее поражение участка кожи, а также пороки, расположенные группой и на расстоянии не более 7 см друг от друга. Для определения площади пороков их вписывают в наименьший прямоугольник, в который должны помещаться все пороки. Площадь пороков, вписываемых в прямоугольник, измеряют в квадратных сантиметрах ($см^2$). Если меньшая сторона прямоугольника равна или менее 2 см, порок считают линейным и измеряют в сантиметрах. Пороки длиной до 2 см или площадью до 4 $см^2$ считают единичными. Если стороны прямоугольника выходят за контуры кожи, порок вписывают в несколько прямоугольников, не выходящих за пределы кожи. При наличии на одном участке кожи двух или более пороков различного характера площадь учитывают по пороку с наибольшей площадью поражения. Сорт кожи определяется в зависимости от полезной площади. Полезной площадью считают площадь, свободную от пороков или с наличием таких пороков, которые для данного вида кож допускается. Классификация кож по сортам и их полезная площадь следующие (сорт кожи – полезная площадь в %):- 1 – от 100 до 95%; 2 – от 94.99 до 85%; 3 – от 84.99 до 70%; 4 – от 69.99 до 50; и 5 – от 49.99 до 30. Кожи площадью от 20 до 40 квадратных дециметров ($дм^2$) относятся к 5 сорту, если они имеют полезную площадь не менее 50%. Площадь кожи измеряют кожемерной машиной в соответствии с нормативной документацией и другими машинами, удовлетворяющими аналогичным требованиям. Для определения сорта кожи необходимо установить:- (i) величину всех пороков, измеряемых по площади ($\Sigma Q_{пл}$) в $дм^2$; и (ii) величину всех линейных пороков ($\Sigma Q_{л}$) в $дм^2$, вычисляемую по формуле:- $\Sigma Q = 0.03\Sigma L$, где L – длина линейных пороков в сантиметрах (см), и 0.03 – коэффициент эквивалентности линейных и площадных пороков. Общую площадь всех пороков (ΣQ) в процентах вычисляют по формуле:- $\Sigma Q = ((\Sigma Q_{пп} + \Sigma Q_{л}) / S) \cdot 100 + Q_{н}$, где S – площадь кожи в $дм^2$, и $Q_{н}$ – оценка неизмеряемых пороков в %. Полезную площадь кожи ($Q_{пол}$) в процентах вычисляют по формуле:- $Q_{пол} = 100 - \Sigma Q$. В соответствии с полезной площадью кожи определяют сорт кожи. Свойства кож оказывают существенное влияние на качество готовых изделий. В соответствии с ТУ 17-995-75 ‘Одежда Верхняя Из Натуральной Кожи. Общие Технические Требования’ качество изделий в зависимости от размеров и количества дефектов внешнего вида основного материала определяются в соответствии с характеристикой дефектов внешнего вида основного материала, допускаемых в изделии, исходя из следующей информации (Дефект Внешнего Вида Основного Материала – Размеры И Количество Дефектов Внешнего Вида Основного Материала В Одном Изделии Или Части Комплекта (для 1 Сорта и 2 Сорта)):- (i) Разнооттеночность – 1 Сорта – Малозаметная и 2 Сорта – Заметная; (ii) Неровный Ворс, Нечёткая Или Неравномерно Нанесённая Нарезка, Заметно Выраженная – 1 Сорта – Не Допускается и 2 Сорта – Допускается; (iii) Одиночные Заломы, Не Предусмотренные Образцом, До 150 мм, Мест – 1 Сорта – Не Допускается и 2 Сорта – 3; (iv) Царапины (Сдиры) Не Более 1/5 Толщины Материала, Длиной Не Более 50 мм, Мест – 1 Сорта – Не Допускается и 2 Сорта – 1; (v) Пятна, Брызги, Заметно Выраженные, До 200 $мм^2$, Мест – 1 Сорта – Не Допускается и 2 Сорта – 2; (vi) Затёки Малозаметные До 500 $мм^2$, Мест – 1 Сорта – Не Допускается и 2 Сорта – 3; (vii) Тощая Кожа, Неотделанная Или Загрязнённая Бахтарма, Неровная Стрижка, Отдушистость До 50% Площади, Жёсткость Местная – 1 Сорта – Не Допускается и 2 Сорта – Не Допускается; и (viii) Дыры, Прорези, Прелины, Глубокие Подрезы (Более 1/4 Толщины Кож) Молеедины, Солевые Пятна, Выхваты, Безличины, Шерстодавины, Парша, Кожеедины, Оспины, Незаросшие Болячки, Садка Общая, Неустойчивость Аппретуры, Отдушистость Свыше 50% Площади, Бронзистость Покрытия, Непродуб, Жёсткость Общая, Подсед – 1 Сорта – Не Допускается и 2 Сорта – Не Допускается. Особенности Раскроя Натуральных Кожевенных Материалов:- процесс раскроя натуральных кож существенно отличается от раскроя текстильных материалов. Натуральные кожевенные материалы характеризуются неоднородностью свойств топографических участков, ограниченностью размеров, наличием пороков и различными требованиями, предъявляемыми к деталям одежды. Кроме того, различные участки кож имеют неодинаковую толщину, тягучесть, пороки в зависимости от сортности кож могут быть расположены на разных топографических участках кож. Чепрачная часть (средняя часть кожи), площадь которой доходит до 55% от общей площади кожи, обладает примерно одинаковыми свойствами в продольном и поперечном направлениях. Изменение толщины кожи в пределах чепрака незначительно. Из чепрачной части кожи следует выкраивать наиболее ответственные детали одежды, такие как верхний воротник, верхняя часть рукава, составные части переда, спинки. К переферийной части относят участки кожи, непосредственно примыкающие к чепраку спереди (вороток) и с боков (полы). Из этих участков следует выкраивать менее ответственные детали или размещать участки деталей, которые не несут больших механических нагрузок, а в готовом изделии малозаметны. К таким деталям относятся нижняя часть половины рукава, верхняя часть отрезного бочка в пиджаках и женских жакетах, нижний воротник, нижняя часть подборта и так далее. Направление удлинения (тягучести) кожи имеет существенное значение при изготовлении изделия, направление наибольшего удлинения на отдельных участках необходимо учитывать при раскрое. На таких участках следует располагать детали или участки деталей, не несущие больших механических нагрузок в процессе эксплуатации изделий. Технологические операции выполнения раскладки лекал на кожах и вырезания деталей составляют 50% трудоёмкости всех работ, выполняемых закройщиком. Кроме того, от качества выполнения раскладки лекал в значительной степени зависит рациональное использование площади кож. Рациональное использование натуральных кожевенных материалов является важным фактором, так как от него в решающей степени зависит себестоимость и качество изготовляемой одежды. Основным процессом, от которого зависит рациональное использование кож, является раскрой. Непосредственно перед раскроем проверяется количество кож и их площадь; внимательно осматривается каждая кожа, отмечаются пороки, отдельно выделяются пороки недопустимые в изделии и допустимые в менее ответственных деталях на невидимых частях изделия. Пороки отмечаются с лицевой стороны кожи, чтобы при раскрое не допускать их попадания на видимые части деталей изделия. Структура кожи не допускает увеличивать детали или перемещать конструктивные линии в процессе примерки, поскольку при соединении деталей ручным или машинным способами на поверхности кожи остаются следы от прокола иглы. Ограничена и площадь каждой кожи. Перечисленные особенности требуют точного конструктивного решения каждого изделия. При раскрое кож учитываются следующие требования:- (i) симметричные детали изделия, расположенные на разных кожах, должны быть однородными по

оттенку, толщине, удлинению и выкроены из одинаковых топографических участков кожи; (ii) раскладка деталей изделия производится на каждой коже отдельно; (iii) более ответственные детали, такие как перед, спинка, верхняя часть рукава, верхний воротник выкраиваются из чепрачной части кожи; (iv) допускаемые отклонения от хребтовой линии не должны превышать 10%; (v) детали изделия на кожах с ворсовой поверхностью должны располагаться в одном направлении; и (vi) раскладку деталей изделия начинают с крупных деталей. Особенности раскроя, размещения деталей на кожах обусловлены следующим:- (i) площадь комплекта лекал деталей одежды превышает площадь одной кожи, что вызывает необходимость использования для одного изделия нескольких единиц кож; при этом площадь лекал крупных деталей одежды может быть соизмерима, а в некоторых случаях и больше площади одной кожи; (ii) сложность размещения крупных деталей на ограниченной площади кож; (iii) неоднородность свойств различных топографических участков кожи; и (iv) сортность кожи и случайное расположение пороков. По назначению кожи делят на четыре основные класса:- обувные, шорно-седельные, технические и одёжно-галантерейные. В классе одёжно-галантерейных кож выделяют кожи для одежды, галантерейных и дорожно-сумочных изделий. Для изготовления одежды используют кожи разные по внешнему виду и свойствам. Для изготовления одежды (пиджака, куртки, плаща и тому подобного) в основном используются кожи, выработанные методом хромового дубления из шкур овец (одёжный шеврет), свиней и других животных. Также используется замша, выработанная из шкур овец, коз, свиней. По способу и характеру отделки кожи подразделяются на следующие виды:- (i) с естественной нешлифованной лицевой поверхностью – гладкие и тиснёные; и (ii) со шлифованной лицевой поверхностью – гладкие и нарезные, велюр. К Гладким Кожам Естественной Нешлифованной Лицевой Поверхности относят кожи:- (i) прессованные гладкой плитой; и (ii) с промежуточным прессованием мелкомерейной плитой с пылевидным рисунком с последующим прессованием отделанных кож гладкой плитой. К Гладким Кожам С Естественной Подшлифованной Лицевой Поверхностью относят кожи, с лицевой поверхности которых частично удалена мерея:- (i) прессованные гладкой плитой; и (ii) с промежуточным теснением мелкомерейной плитой с пылевидным рисунком с последующим прессованием отделанных код гладкой плитой. К Гладким Кожам Со Шлифованной Лицевой Поверхностью относят кожи, у которых естественная лицевая поверхность удалена полностью и нанесена искусственная лицевая поверхность:- (i) прессованные гладкой плитой; и (ii) с промежуточным прессованием мелкомерейной плитой с пылевидным рисунком с последующим прессованием отделанных код гладкой плитой. К Нарезным Кожам относят кожи, прессованные любыми плитами, кроме плит с пылевидным рисунком и плит, применяемых для отделки тиснёных кож. К Тиснёным Кожам С Естественной Нешлифованной И Подшлифованной Лицевой Поверхностью относят кожи с характерной мереей, полученной прессованием специальными плитами. По методу крашения кожи подразделяют на:- (i) барабанного крашения; и (ii) покровного крашения. По виду отделки кожи покрывного крашения подразделяют:- (i) с анилиновой отделкой; и (ii) с эмульсионным покрытием (в том числе с полуанилиновой отделкой). По цвету кожи подразделяют на:- (i) цветные; (ii) чёрные; и (iii) белые. Различают следующие виды кож, используемых для одежды:- (i) Шеврет (артикул 972146) – кожа из овчины хромового дубления с естественной лицевой поверхностью, характеризующаяся красивым рельефным рисунком в виде неглубоких воронкообразных впадин, рыхлая на ощупь и сильно растяжимая. (ii) Одёжный Велюр (артикул 932159) – кожа из свиной шкуры хромового дубления с ворсовой поверхностью. Велюр может быть получен и из шкур овец. Ворсовую поверхность получают путём шлифования бахтармяной (нижней, не лицевой) стороны шкуры. Лицевая поверхность велюра имеет бархатистый вид, ворс густой, ровный, хорошо прокрашенный. (iii) Нубук – получают из опойка, выростка и полукожника шлифованием лицевой поверхности, имеющей пороки, обычно натурального цвета или светлых тонов. (iv) Замша – кожа из овчины жирового дубления. Характеризуется особой мягкостью, низким, густым и блестящим ворсом, повышенной растяжимостью, хорошей воздухопроницаемостью, устойчивостью к воде. Замша очень пориста, удельный вес замши составляет 0.3–0.4 г/см^3. При намокании и высушивании замша не теряет мягкости, её можно стирать в тёплой воде и мыльном растворе, так как она не содержит веществ, экстрагируемых (вымываемых) водой. Температура сваривания замши около 65 °C. (v) Шевро и Козлина Хромового Дубления – кожи из козлины хромового метода дубления площадью до 60 дм^2 называют Шевро, а более крупные – Козлиной. Характеризуются особой мягкостью и красивым внешним видом. (vi) Спилок делят по виду кожи, из которого его вырабатывают, на хромового дубления и велюр. Спилок изготавливают гладким или нарезным, а также с ворсом (велюр). Для изготовления верхней одежды также используется опоек или тонкий выросток – кожи, выработанные из шкур телят методом хромового дубления. (vii) Опоек – кожа из шкур телят, выкормленных в основном молоком. Опоек имеет гладкую лицевую поверхность с приятной мягкой мереей. (viii) Выросток – кожа, выделанная из шкур более старших телят, полностью перешедших на растительное питание. Физические свойства кожи характеризуются её геометрическими параметрами, плотностью, пористостью, проницаемостью, поглощением и отдачей влаги, теплофизическими и другими показателями. Из всех геометрических характеристик кож (толщина, длина, ширина, площадь) наиболее важными являются площадь и толщина. Площадь кожи зависит от размеров шкуры, в некоторой степени от метода дубления и условий выполнения операций (сушка, тяжка, разводка и другие). В зависимости от площади кожи для одежды подразделяют на три группы:- (i) от 60 до 80 дм^2 включительно; (ii) свыше 80 до 100 дм^2 включительно; и (iii) свыше 100 дм^2. На предприятиях, изготавливающих одежду по индивидуальным заказам, по согласованию с заказчиком допускается использовать кожи для одежды площадью от 40 до 60 дм^2. Толщина кожи является важной характеристикой для производств, перерабатывающих натуральные кожевенные материалы, так как свойства готовых изделий во многом предопределяются этим показателем. Толщина различных участков кожи зависит от вида, пола и возраста животных, условий содержания этих животных, химического состава кожи и режимов выполнения операций кожевенного производства. Для наиболее распространённых видов кож минимальная толщина отдельных участков достигает 0.3 мм, максимальная – 8 мм. В связи со значительной разницей толщины различных топографических участков натуральных кож, этот показатель измеряют в точке Н. Расположение точки измерения толщины определено стандартом. Стандартную точку определяют на правой половине кожи на пересечении линии ЛМ, расположенной на расстоянии 75 мм от хребтовой линии ХУ, с линией ИК, расположенной на расстоянии 150 мм от линии ВГ, касательной к впадине заднего ряда. В зависимости от толщины в стандартной точке Н кожи подразделяют на тонкие (от 0.6 до 0.9 мм включительно) и средние (свыше 0.9 до 1.2 мм включительно). По согласованию изготовителя с потребителем допускается вырабатывать кожи толщиной 0.4–0.6 мм. Толщина в любой точке воротка должна составлять не менее 90%, а в любой точке полы – не менее 80% от толщины кожи в стандартной точке Н.

LEATHER CONVERTER = ПРЕОБРАЗОВАТЕЛЬ КОЖИ – Leather Converter is a business that buys hides and skins, has them processed in contract tanneries, and then sells the finished product.

LEATHERETTE = КОЖИМИТ – Leatherette is a term used for imitation leathers. More correctly, these should be described by their actual construction, such as vinyl-coated fabric. / Кожимит, устаревшее название имитации кожи, применявшееся ранее для обозначения всех видов заменителей кожи.

LEAVE–OFF = ЗАБЫТОЕ (или ОСТАВЛЕННОЕ, или БРОШЕННОЕ) – Leave-Off:- a load booked and intended to be scheduled for loading on a given vessel, but left off in error.

LEAVERS LACE = ЛИВЁЗОВСКОЕ КРУЖЕВО – Leavers Lace is a machine-made lace named for the inventor of the machine on which it is made. Many hand-made lace patterns can be copied on this machine. The term is sometimes used in preference to machine-made lace to imply quality. The name 'Leavers' comes from the name of the loom on which the lace is produced. These are antique looms that were first used in England in the early XIX century and later arrived in France, at Calais, where the greatest concentration of fine lace production can still be found today. Calais currently holds the world record for producing Leavers lace and has about 1 000 of the existing 1 200 looms currently in use. Characterised by very elaborate processes to weave the weft and warp, the ability of the leavers loom to work with a very high number of threads means that the lace created stands out thanks to the high definition of the pattern and a particularly fine gauge. / во Францию, в город Кале (Calais), где .

LECTIN = ЛЕКТИН (или ФИТОГЕМАГГЛЮТИНИН) – Lectin is a diverse group of plant proteins capable of aglutinating cells (such as red blood cells). Lectins contain sites that recognize and bind to sugar residues, such as those included in the structure of glycoproteins. Ricin is a notorious toxic lectin from the seeds of the castor oil plant. First Lectin was opened by Dr. Peter Hermann Stilmark (1860–1923) in Derptskom University (Estonia). They were famous ricin, a protein toxin derived from the seed extract Castor (Ricinus communis), which made its name. The laboratory director Eduard Rudolph Köbert (1852–1922) at this time, studies on the effects of different toxins organisms animals, their blood and the blood. G. Stilmark found ability to produce toxins agglutinative, i.e. together, bonding erythrocyte. So ricin was the first open lectin belonging to a group of plant or lectin fitogemagglyutinin. Lectins found not only in plants. Lectins some micro-streptococcal living in the mouth, leading to the formation of dental calculus, which is a lot of trouble for us. A lectins microorganisms living in a thin intestines of humans or animals, however, it is we need. Without these proteins, we are opening access harmful pathogenic microorganisms. The list of known lectins very high. But the term lectin off fitogemagglyutinin appeared recently. Impose it in the lexicon William C. Boyd (at Boston University) in the 1960s, using the Latin word 'Legere' (To Pick Our or Choose). This, he stressed how lectin's ability to selectively communicate with any carbohydrate cell receptors. This allows some lectins vegetable differently agglutinate human blood cells, according to their blood group. The D'Adamo, lectins contained in the food, attached to the mucosal lining the gastrointestinal tract or enter the blood. Each lectin agglutinative can cause blood cells of a particular type. Depending on where lectins fixed, likely to develop certain diseases, such as liver cirrhosis, nefroskleroz or Colitis. The author of the theory did not take into account that in the process of digestion of food proteins with enzymes split into separate free amino acids and short chain of amino acid naturally fully spoilage. Some amino acids in the blood carried on the whole body, which are 'building blocks' we need protein molecules. / Доктор Пита Хеман Штильмарк (Dr. Peter Hermann Stilmark; 1860–1923). Эдуад Рудольф Кюбэрт (Eduard Rudolph Köbert; 1852–1922). Д'Адамо (D'Adamo). Лектин или Фитогемагглютинин (ФГА; Phytohaemagglutinin (PHA)). Рицин (Ricin). Вилъйэм Си. Бойд (William C. Boyd).

LECTOTYPE = ЛЕКТОТИП – Lectotype is a specimen selected from the original type material to serve as the nomenclatural type when a holotype was not originally designated, or is missing. / Лектотип или Прототип, взятый в качестве образца, например, при селекции. , от Греческих слов , означающее , и Ту́pos, означающее Образец или Отпечаток или Форма, понимается .

LED = LIGHT EMITTING DIODE

LEDERHOSEN = ЛЕДАХОЗЭН (или КОЖАНЫЕ ШОРТЫ) – Lederhosen:- leather shorts often with suspenders worn especially in Bavaria. Lederhosen are short leather trousers for men that are a traditional part of Bavarian, Swiss, and Austrian costume often referred to as Trachten. Lederhosen are perhaps the most well-known part of the costume, apart from the dirndl. They are very close fitting and made from a robust and durable leather. Today, we associate Trachten Lederhosen with cultural events such as the Oktoberfest but they were once viewed as a practical garment for labouring men who lived and worked in a mountainous environment. The leather was warm and easy to keep clean; the fact that the legs ended above the knee permitted freedom of movement – and the fact that less material was required meant that they were an economical option. The exact age of Trachten leather shorts is unknown but we know that they were commonly worn by the end of the sixteenth century. Interest in Trachten surged in the 1880s when many clubs were founded in Munich and other cities devoted to preserving traditional styles. Today, the traditional Alpine costume is enjoying another resurgence in popularity – and the knee length breeches are seen as of particular cultural importance. They have been an essential part of the Oktoberfest outfit for many years, but are now increasingly being worn as everyday wear. Choosing the right pair can be tricky because there are so many variants and designs for traditional shirts. However, many men now opt to wear a pair of knee shirts with a modern hoodie or t-shirt – combining elements of Trachten with casual men's wear looks stylish. / Ледахозэн:- кожаные шорты часто с подтяжками, одеваемые особенно в Баварии, Германия. Трахтэн (Trachten). Октобафэст (Oktoberfest). Дирндэль (Dirndl).

LEE = ПОДВЕТРЕННАЯ (или ПОЛОСА ЗАШТИЛЕНИЯ) – Lee:- side away from wind or protected from wind.

LEE SHORE = ПОДВЕТРЕННЫЙ БЕРЕГ – Lee Shore (maritime term):- the land to the leeward of the vessel (wind blows from the ship to the land).

LEEWARD = ПОДВЕТРЕННАЯ СТОРОНА (или В ПОДВЕТРЕННУЮ СТОРОНУ, или ПО ВЕТРУ) – Leeward (maritime term):- side or direction away from the wind.

LEEWAY = ВЕТРОВОЙ ДРЕЙФ (или СНОС) – Leeway:- sideways movement of ship caused by wind or current.

LEFT–HAND TWILL = САРЖЕВОЕ ЛЕВОЙ КРУТКИ – Left-Hand Twill is any twill weave which runs from the left. The twill or diagonal line on the face of the fabric will run from the upper left-hand corner to the lower right-hand corner of the fabric.

LEFT–WING = ИЗ ЛЕВОГО КРЫЛА – Left-Wing or Leftist are general descriptive terms for any of several otherwise quite varied political ideologies (socialism, communism, social democracy, welfare statism, contemporary American liberalism, some versions of anarchism, etc) that join in denouncing the extent of economic and social inequality in the present order of society and advocate the adoption of vigorous public policies to reduce or eliminate these inequalities, usually through some combination of the following:- (i) reduction or elimination of legal protections for private property rights; (ii) greater regulation (or complete expropriation) of private economic activity; (iii) stringent limitations on the right to inherit wealth; and (iv) higher tax burdens on the rich and the middle-class, and/or the provision of more tax-supported government services and money payments to the poor. In America, the term has a somewhat more derogatory flavor than in European usage.

LEG = ОТРЕЗОК МАРШРУТА (или ГАЛС) – A Leg has an origin, destination, and carrier and is composed of all consecutive segments of a route booked through the same carrier. Also know as Bookable Leg. / Под Галсом, от Голландского слова Hals, понимаются:- (1) Отрезок пути судна (от поворота до поворота), идущего зигзагообразно при лавировании под парусами, промерах, тралении и другом. (2) Положение судна относительно ветра. Различают:- (a) левый галс, когда ветер дует с левой стороны; и (b) правый галс, когда ветер дует справа. (3) Снасть, прикрепляющая к мачте передний нижний угол косого паруса.

LEGAL ADVISORY COMMITTEE = СОВЕЩАТЕЛЬНЫЙ КОМИТЕТ ПО ПРАВОВЫМ ВОПРОСАМ – Legal Advisory Committee:- these distinguished members of the legal profession primarily advise on matters relating to corporate governance. They also advise on

other subjects involving broad legal issues or principles directly or indirectly affecting the New York Stock Exchange (NYSE®), the securities industry or capital markets. The committee also advises the exchange staff on policies relating to the NYSE® Listed Company Manual, the American Law Institute's Corporate Governance Project, financial services industry regulation, and the legal aspects of industry rules and regulations. / (НЙФБ® или Эн.Уай.Эс.И.® (NYSE®)) Руководство (Manual).

LEGAL CAPITAL = УСТАВНЫЙ КАПИТАЛ – Legal Capital:- an amount of capital that a corporation is authorized to issue according to its charter. Also known as Authorized Capital, and Registered Capital. / Под Уставным Капиталом понимается первоначальная сумма капитала предприятия (фирмы), необходимая для начала его деятельности и определённая его уставом или договором об основании предприятия, акционерного общества, компании, корпорации или иного объединения предпринимателей. Уставный капитал формируется в основном за счёт выручки от продажи акций, а также вложений частных капиталов или государственных средств. Для обозначения уставного капитала употребляются также термины Акционерный Капитал, Основной Капитал, Разрешённый Капитал. Законодательством ряда стран (Германия, Франция) устанавливается обязательный размер уставного капитала, при наличии которого предприятия и объединения регистрируются как действующие. В Великобритании и Соединённых Штатах Америки размер уставного капитала законодательством не лимитируется. Уставный капитал значительно меньше привлечённого в форме кредитов, инвестиций и облигаций и тому подобного капитала. Вместе с резервным капиталом он составляет собственные средства предприятия. Так как соответствие уставного капитала общему объёму хозяйственной деятельности считается признаком финансовой устойчивости, при высоких темпах инфляции предприятия и банки регулярно увеличивают размер уставного капитала путём размещения вновь выпускаемых акций.

LEGAL INSTRUMENTS EXAMINER = ЭКЗАМЕНАТОР (или ЭКСПЕРТ) С ЗАКОННЫМИ ИНСТРУМЕНТАМИ – Legal Instruments Examiner (LIE) is a position classification for the United States Patent and Trademark Office (USPTO) employees charged with docketing cases and other administrative processing that support the workflow and examination of applications.

LEGALIZATION = ЛЕГАЛИЗАЦИЯ – Legalization:- to give legal validity to documents or signatures by having them verified by authorized officials. Also known as Authentication. / Придание документам или подписям юридической силы посредством их заверения уполномоченными сотрудниками. Известна также как Аутентификация (Authentication). Под Легализацией, от Латинского слова Legalis, означающее Законный, понимается:- (i) разрешение деятельности какого-либо лица, его узаконение, придание юридической силы какому-либо акту, действию; и (ii) подтверждение подлинности имеющихся на документах подписей. Легализации, как правило, подлежат документы, составленные за границей или предназначенные для действия в зарубежном государстве. Легализация производится в форме удостоверительной надписи консула.

LEGAL LIST = ЗАКОННЫЙ СПИСОК (или ПРАВОВОЙ СПИСОК, или ОФИЦИАЛЬНО РАЗРЕШЁННЫЙ СПИСОК) – Legal List is a list of investments selected by various states in which certain institutions and fiduciaries, such as insurance companies and banks, may invest. Legal lists are often restricted to high quality securities meeting certain specifications. See also Prudent Man Rule. / Законный Список – ценные бумаги, определяемые агентством штата, обычно департаментом по делам банков, в качестве разрешённых вложений для взаимных сберегательных банков, пенсионных фондов, страховых компаний и иных попечительских (fiduciary) организаций. Для защиты средств, которые частные лица помещают в эти организации, в перечень включаются только высококачественные кредитные обязательства и ценные бумаги на капитал. Альтернативой законному списку в некоторых штатах является 'правило разумного человека' (prudent man rule).

LEGAL OBLIGATION = ПРАВОВОЕ ОБЯЗАТЕЛЬСТВО (или ЮРИДИЧЕСКИ ЗАКРЕПЛЁННОЕ ОБЯЗАТЕЛЬСТВО) – Legal Obligation is an obligation that derives from:- (i) a contract, through its explicit or implicit terms; (ii) legislation; or (iii) other operation of law.

LEGAL OWNERSHIP = ЗАКОННОЕ ВЛАДЕНИЕ (или ВЛАДЕНИЕ НА ЗАКОННЫХ ОСНОВАНИЯХ) – Legal Ownership:- recognition in law as the owner of a security or financial instrument. / Признание по закону в качестве владельца ценной бумаги или финансового инструмента.

LEGAL REPRESENTATIVE = ЗАКОННЫЙ ПРЕДСТАВИТЕЛЬ – Legal Representative is a person appointed by a court to act on behalf of the estate of another. This is a generic term encompassing all types of representatives, including executors, administrators, personal representatives, and guardians. / Законные Представители, лица, которые в силу закона (без особого полномочия) выступают во всех учреждениях, в том числе в суде, в защиту личных и имущественных прав и законных интересов недееспособных, ограниченно дееспособных, а также дееспособных, находящихся под попечительством. В бывшем СССР законные представители – родители (в отношении детей до 18 лет), опекуны и попечители.

LEGAL RESERVES = ОБЯЗАТЕЛЬНЫЕ РЕЗЕРВЫ – Legal Reserves:- the minimum sum or reserves which must be formed in compliance with legal requirements. For example, Swiss banking law stipulates that 5% of the annual profit is to be allocated to a reserve fund (until 20% of the paid-in capital has been reached) plus a tenth of the amount distributed from the annual profit after the regular allocation to the reserve fund and after payment of 5% to shareholders and others entitled to a share in profits.

LEGAL RISK = ПРАВОВОЙ РИСК – Legal Risk is the risk of loss because a law or regulation is applied in an unexpected way or because a contract cannot be enforced. / Правовой Риск – риск возникновения у кредитной организации убытков вследствие:- (i) несоблюдения кредитной организацией требований нормативных правовых актов и заключённых договоров; (ii) допускаемых правовых ошибок при осуществлении деятельности (неправильные юридические консультации или неверное составление документов, в том числе при рассмотрении спорных вопросов в судебных органах); (iii) несовершенства правовой системы (противоречивость законодательства, отсутствие правовых норм по регулированию отдельных вопросов, возникающих в процессе деятельности кредитной организации); и (iv) нарушения контрагентами нормативных правовых актов, а также условий заключённых договоров.

LEGAL TENDER = ЛЕГАЛЬНОЕ ПЛАТЁЖНОЕ СРЕДСТВО (или ЗАКОННОЕ ПЛАТЁЖНОЕ СРЕДСТВО, или ЗАКОННОЕ СРЕДСТВО ПЛАТЕЖА) – Legal Tender:- the coin or currency which the national monetary authority declares to be universally acceptable as a medium of exchange; acceptable for instance in the discharge of debts. Coins that have been authorized by the US Congress. This includes circulating coins and all commemorative coins legislated by the US Congress. Currency; coins or notes that may be offered as a medium of exchange.

LEGAL TENDER LAWS = ЗАКОНЫ О ЛЕГАЛЬНОМ ПЛАТЁЖНОМ СРЕДСТВЕ (или ЗАКОНЫ О ЗАКОННОМ ПЛАТЁЖНОМ СРЕДСТВЕ, или ЗАКОНЫ О ЗАКОННОМ СРЕДСТВЕ ПЛАТЕЖА) – Legal Tender Laws are the Government laws that decree that creditors are required to accept an asset (such as paper money or coins) in settlement of debts and that the government will accept the asset in payment of taxes. When paper money and coins are a legal tender and people use them to settle a debt, the obligation is considered to be paid in full.

LEGAL UNIT = ЛЕГАЛЬНОЕ СРЕДСТВО (или ЗАКОННОЕ СРЕДСТВО) – Legal Unit:- a contract as determined according to the legal definition in the jurisdiction of the contract, in contrast with the term Contract as used in the International Actuarial Standard of Practice (IASP).

LEGAL WEIGHT = ЛЕГАЛЬНЫЙ ВЕС – Legal Weight is a maximum weight limitation for a total highway authorities which, when exceeded, may subject carriers to fines or impounding vehicles. / Ограничение по максимальному весу для ведомств, отвечающих за дороги и шоссе. В случае превышения данного лимита в отношении перевозчиков могут быть наложены штрафы или насильственное размещение транспортных средств в специальных отстойниках (конфискация транспортных средств). Сцепной Вес – часть веса, приходящегося на ведущие (движущие) оси автомобиля, колёсного трактора, локомотива и так далее, передающаяся на путь. Сцепной вес определяет максимально возможное тяговое усилие (тягу) между колёсами и дорогой (рельсами).

LEGAL WEIGHT = ЛЕГАЛЬНЫЙ ВЕС (или ВЕС В ПЕРВИЧНОЙ УПАКОВКЕ) – Legal Weight is the weight of the goods and interior packing, but not the container (a term used in foreign trade). The weight of the goods plus any immediate wrappings which are sold along with the goods, e.g., the weight of a tin can as well as its contents. Legal Weight is weight of article plus paper, box, bottle, etc, containing the article as usually carried in stock. Legal Weight is a net weight of goods plus the inside packing. / Вес товаров и внутренней упаковки, но не контейнера (термин, используемый во внешней торговле). Вес товаров плюс вес любой непосредственной обёртки или упаковки, которая продаётся вместе с этими товарами, например, вес консервной банки наряду с весом содержимого в ней. Легальный Вес это вес изделия плюс вес бумаги, каробки, бутыли и тому подобного, внутри которых это изделие обычно перевозится в массовом порядке.

LEGGINGS = ЛЕГИНСЫ – Legging is a covering, as of leather or cloth, for the leg, usually used in plural; also, tights. / Легинсы – это облегающие брюки без карманов и застёжек, очень похожие на колготки, но в отличие от которых не закрывают ступни ног. История:- легинсы пришли к нам из восьмидесятых годов прошлого столетия. Тогда были откровенно синтетическими и даже, если можно так сказать, специально синтетическими – кислотно-яркими, облегающими, аж искрящимися от своей вызывающей искусственности. Это был как бы вызов времени – вызов буржуазности, размеренности и стабильности жизни; вызов архаичным материалам. В 1990-х легинсы носят не как брюки, а скорее как колготки, вместо синтетики 1980-х используется хлопок, из цветов популярен чёрный, коричневый, серый или тёмно-синий. Сегодня же легинсы выглядят почти благородно. Они имеют либо чёрный цвет, либо очень спокойные умеренные оттенки – серый, коричневый, тёмный синий, бордо, винный, бежевый. К тому же, сохранив в своем составе искусственные волокна, они все же ближе к натуральным материалам – хлопку, шерсти. А за прошедшие годы те же искусственные волокна благодаря техническому прогрессу приобрели такие свойства, что часто выглядят выигрышнее натуральных. В итоге они остались такими же тонкими и облегающими, но в то же время стали достаточно мягкими, тёплыми и комфортными. С Чем Носить? Сегодня легинсы (в первую очередь чёрные или серые) носят с чем угодно – прямыми цельнокроеными платьями, длинными юбками из тонких драпирующихся тканей, короткими юбками-тюльпанами, даже шортами. Самый простой вариант, который сегодня является остромодным и который, в общем-то, заимствован из восьмидесятых – это сочетание легинсов и длинного платья-свитера. Выбрав такой вариант, вы не ошибётесь – при спокойной цветовой гамме это практичная одежда для работы, учёбы, отдыха и поездок за город. В общем, очень универсальный и удобный вариант для прохладной и холодной погоды. Для дневного варианта прекрасно подходят сочетания с плащом-тренч и балетками или широкой накидкой и полуботинками на каблуках. Вечером легинсы смотрятся очень эффектно с трикотажным платьем мини или короткой кожаной курткой в сочетании со строгой юбкой до колен. На вечеринку легинсы можно надеть с коротким платьем-бюстье, мини-юбкой или мини-шортами. Легинсы будут уместны не только на молодёжной вечеринке, но и на ответственном мероприятии. Имея пару-другую симпатичных легинсов, можно придумать множество вариантов, сочетая их с жакетами, блузками, классическими рубашками. Очень популярно сочетание легинсов с длинным джемпером и высокими каблуками. Советы Стилистов:- (i) если длина легинсов совпадает с длиной платья (юбки), это выглядит нелепо; легинсы должны быть хоть немного длиннее; (ii) желательно избегать длины до колен – такие легинсы только подчеркнут все несовершенства ног; и (iii) предпочтительнее выбирать легинсы из однотонной ткани, лучше тёмной. Выбор Звёзд:- то, что легинсы подходят далеко не каждой представительнице прекрасного пола – небольшое заблуждение. Ведь сегодня их можно сочетать не только с мини-юбками и джемперами, но и с платьями и юбками до колена и с одеждой свободного кроя. Хотя, безусловно, лучше иметь стройные ножки, чтобы со спокойной душой позволить себе носить этот предмет одежды. Голливудские звёзды обычно хорошо следят за своими фигурками, а потому носят легинсы без капли стеснения. Кто-то от них откровенно фанатеет, как Линдси Лохан, а кто-то просто имеет пару-тройку в своём гардеробе на все случаи жизни. Звёзды одевают легинсы на красные дорожки так же часто, как и в повседневной жизни. Ведь легинсы могут быть как шикарным, дорогим, так и простым, обиходным предметом одежды. В общем, трудно придумать что-нибудь более комфортное и одновременно элегантное, чем легинсы. Тем более, что они сегодня выступают вполне самостоятельным предметом гардероба и носятся просто как облегающие брючки, которые надеваются с жакетами или блузками, а могут на манер 1980-х соседствовать с объёмными платьями-свитерами или просто платьями, как плотные колготки. Легинсы успешно продолжают оставаться неотъемлемым атрибутом гардероба каждой модницы уже многие годы.

LEGGY = ГОЛЕНАСТОЕ – Leggy:- of plants exhibiting excessive, rank growth, often caused by excessive watering, application of fertilizer or insufficient light. / Голенастое о растении.

LEGHEMOGLOBIN = ЛЕГГЕМОГЛОБИН – Leghemoglobin is an iron-containing, red pigment produced in root nodules during the symbiotic association between Rhizobium and leguminous plants. / в корневых клубеньках в течение . Под Гемоглобином, от Греческого слова Háima, родительный падеж Háimatos, означающее Кровь, и Латинского слова Globus, означающее Шар, понимается красный дыхательный пигмент крови человека, позвоночных и некоторых беспозвоночных животных. Состоит из белка (глобина) и железопорфирина – гема. Переносит кислород от органов дыхания к тканям и углекислый газ от тканей к дыхательным органам. У различных видов организмов гемоглобин имеет разное строение. Многие заболевания крови (анемии) связаны с нарушениями строения гемоглобина, в том числе наследственными.

LEGHORN = ЛЕГОРН (или ЛЭГХОН, или ЛЕГОН) – Leghorn is a hat made of leghorn straw, namely a fine plaited straw made from an Italian Wheat. / .

LEGHORN STRAW = СОЛОМКА ЛЕГОРН – Leghorn Straw is a braided straw popular for hats and is made from Wheat grown in Italy. See also Straw.

LEGISLATION = ЗАКОНОДАТЕЛЬСТВО – Legislation is any act, law, regulation, guideline or other administrative order promulgated by a government.

LEGITIMACY = ЛЕГИТИМНОСТЬ (или ЗАКОННОСТЬ) – Legitimacy is the principle that indicates the acceptance of the decisions of government leaders and officials by (most of) the public on the grounds that these leaders' acquisition and exercise of power has been in accordance with the society's generally accepted procedures and political or moral values. Legitimacy may be conferred upon power holders in a variety of ways in different societies, usually involving solemn formal rituals of a religious or quasi-religious nature – royal birth and coronation in monarchies, popular election and 'swearing in' in democracies and so on. 'Legitimate' rulers typically require less use of physical coercion to enforce their decisions than rulers lacking in legitimacy, because most of the people are apt to feel a moral obligation to obey the former but not the latter. Consequently, people who gain or hold power by illegitimate means tend to work very hard to discover or create ways of endowing themselves with legitimacy after the fact, often by inventing a new ideology or religion and attempting to indoctrinate the people with its legitimating formulas through various forms of propaganda, thus creating moral incentives for the citizenry to obey their government. / Под Легитимностью, от Латинского слова Legitimus, означающее Законный, понимается .

LEGUME = БОБ – Legume is a fruit with a single compartment that splits along two sutures or seams, e.g., pea pod. Legume, also called Pod, fruit of Plants in the Pea Family (Fabaceae). Most legumes are dehiscent fruits that release their seeds by splitting open along two seams, though some, such as Peanuts (Arachis Hypogaea) and Carobs (Ceratonia Siliqua), do not naturally open. The fruits come in a variety of sizes and shapes; many, however, are long and narrow and bear their seeds in a single line. The largest legumes are borne by the Monkey Ladder (Entada Gigas) and can reach up to 2 meters (6.6 feet) in length. At maturity, legume fruits are usually dry and papery or hard and woody; the legumes of certain food crops, such as Snow Peas (Variety of Pisum Sativum), Edamame (Glycine Max), and Green Beans (Phaseolus Vulgaris), are harvested while still green and fleshy. See also Pod, and Silique. / Под Стручком понимается плод Растений, раскрывающийся двумя опадающими створками, после чего остаётся перегородка с семенами. Характерен для Крестоцветных (Горчица, Капуста). Стручок (Siliqua), сухой ложнодвугнёздный паракарпный плод большинства Растений Семейства Крестоцветных, образующийся из двух плодолистиков и обычно вскрывающийся от основания к вершине двумя опадающими створками. На растении остаётся рамка с плацентами и более или менее прозрачной ложной перегородкой. Реже встречаются невскрывающийся стручок (Редька Посевная) и членистый стручок (Редька Дикая). Под Бобом понимается одногнёздный плод Растений Семейства Бобовых, обычно вскрывающийся от вершины к основанию двумя створками. В быту бобом неправильно называют семена Бобовых. Боб, плод Растений Порядка Бобовых; образуется из верхней завязи одним плодолистиком. Чаще всего это сухой плод, раскрывающийся от вершины к основанию двумя створками (Горох, Фасоль, Вика и другие). У некоторых Видов боб – нераскрывающийся (Донник, Клевер). Бобы Арахиса созревают в почве и не растрескиваются. У 'Цареградских Рожков' (Ceratonia Siliqua) боб сочный и сладкий. Боб содержит чаще несколько семян, прикреплённых короткими семяножками к брюшному шву. Размер, форма и строение бобов разнообразны:- у большей части видов они прямые, более или менее плоские (Горох, Фасоль и другие), у других – округлые, согнутые или свёрнутые спиралью (Люцерна Посевная). У некоторых Видов бобы распадаются на односемянные части. У диких Видов Бобовых Растений створки мгновенно скручиваются и разбрасывают семена. В быту бобами называют семена бобовых, а сами бобы называют стручками. Это неправильно, так как стручок имеет другие признаки и характерен для Семейства Крестоцветных. Типы бобов:- (i) раскрывающийся двумя створками (Гороха); (ii) членистый раскрывающийся (Мимозы); (iii) завитой боб (Люцерны); (iv) боб-орешек (Астрагала); (v) двусемянный боб (Арахиса).

LEGUME = БОБОВОЕ – Legume is a Plant in the Family Leguminosae (Peas, Beans) that can fix nitrogen from the soil due to the presence of symbiotic Bacteria (e.g., Rhizobium Species) in root nodules. Legume is a plant belonging to the Family Leguminosae. Most legumes form a symbiosis with nitrogen-fixing rhizobia bacteria in specialized nodule structures that fix nitrogen. / Бобовое – Растение в Семействе Бобовых (Горохи, Фасоли), которое может фиксировать азот из почвы благодаря наличию Симбиотической Бактерии (например, Видов Клубеньковых (Rhizobium Species)) в корневых клубеньках. Под Бобовыми понимается Семейство Двудольных Растений, имеющих плод – боб. Около 17 000 Видов (около 700 Родов), по всему земному шару; в бывшем Союзе Советских Социалистических Республик (СССР) насчитывалось около 1 800 Видов (около 65 Родов). На корнях Бобовых живут Клубеньковые Бактерии. Среди Бобовых есть продовольственные культуры (Горох, Соя, Фасоль и другие), кормовые (Вика, Клевер, Люцерна и другие), технические, декоративные Растения и так далее. Продукты из Бобовых богаты белками. Включает 3 Подсемейства (собственно Бобовые, или Мотыльковые, Мимозные и Цезальпиниевые), которые часто выделяют в самостоятельные Семейства. Бобовые (Fabaceae, Leguminosae), Семейство Двудольных Растений, широко распространённое во всех областях земного шара. Некоторые под названием 'Бобовые' объединяют 3 близкородственных Семейства:- Мотыльковые (Papilionaceae, или Fabaceae), Цезальпиниевые (Caesalpiniaceae) и Мимозовые (Mimosaceae). Листья у Бобовых большей частью очередные, как правило, с прилистниками и сложные. Цветки преимущественно в кистевидных, колосовидных или головчатых соцветиях, обычно зигоморфные (так называемые Мотыльковые), очень редко актиноморфные. Чашечка сростнолистная. Лепестков 5; верхний, или задний, – самый крупный (так называмый Флаг, или Парус); 2 боковых лепестка меньшего размера образуют так называемые Вёсла, или Крылья; 2 ещё более мелких составляют так называемую Лодочку, или Киль. Изредка венчик редуцирован. Тычинки (10, очень редко 9–5) сросшиеся все или только 9, одна остаётся свободной. Пестик из одного плодолистика; завязь верхняя; плод – боб. К Бобовым относится около 500 родов и 12 000 Видов Однолетних и Многолетних Трав, Полукустарников, Кустарников, Лиан и реже Деревьев (главным образом в тропиках). В бывшем СССР более 60 Родов и 1 800 Видов. На корнях Бобовых образуются своеобразные клубеньки, содержащие клубеньковые бактерии, способные фиксировать атмосферный азот. Вместе со злаками Бобовые являются наиболее питательными луговыми травами. Особенно высока кормовая ценность Клевера, Люцерны, Вики, Люпина, Эспарцета, Чины, Сераделлы и других, имеющих также важное значение в травопольных севооборотах. Богатые белками семена Бобовых, например Гороха, Бобов, Сои, многих Видов Фасоли, Чечевицы, Нута, Арахиса (земляного Ореха), голубиного Гороха (Каянуса) и других, – широко распространённые пищевые продукты. Масло из семян Арахиса, Сои и других видов также идёт в пищу и используется в технических целях. Среди Бобовых немало Видов, дающих продукты, применяемые в технике, например выделяющие камедь трагакантовые Астрагалы и ценные Бальзамные Деревья (виды рода Myroxylon). Из некоторых Бобовых получают дорогую древесину – так называемое Розовое Дерево (Виды Рода Dalbergia) и Африканское Чёрное Дерево (Dalbergia Melanoxylon). Красное Сандаловое Дерево (Pterocarpus Santalinus) и древесина других Видов Рода Pterocarpus используются для изготовления дорогой мебели, а также для получения смолы кино. Среди Бобовых есть и красильные – Индиго, Дрок и другие. Важным техническим и вместе с тем лекарственным Растением является Солодка. Из других лекарственных Растений наиболее известны Термопсис, Стальник, Донник, Сферофиза, а также сильно ядовитое тропическое растение – так называемые Калабарские Бобы (Physostigma venenosum). Некоторые Бобовые (Деррис, Лонхокарпус и другие) ядовиты и используются как инсектициды. На полях Бобовые могут играть роль Сорных Растений, в том числе ядовитые Виды (Термопсис и Софора). Многие Бобовые широко используют в качестве декоративных Растений (Душистый Горошек, Люпины, Глицинии, Робиния, Карагана и другие). Бобовые Овощные Культуры, Однолетние Растения Семейства Бобовых, выращиваемые для получения овощей:- Бобы, Горох, Фасоль, Вигна (Лобия). Богаты белками, углеводами, витаминами, минеральными солями калия, фосфора, кальция и магния. Выращиваются ради получения молодых

бобов, называемых лопатками, а также недозрелых семян. Бобовые овощи идут в пищу в свежем и консервированном виде (их сушат и замораживают).

LEG WARMERS = СОГРЕВАТЕЛИ НОГ (или ОБОГРЕВАТЕЛИ НОГ) – Leg Warmers are the bulky knit, footless socks that extend from ankle to midthigh. They can be worn over stockings, boots, and pants, and also with skirts. Leg Warmer is a usually knitted covering for the leg.

LEHMAN INVESTMENT OPPORTUNITY NOTE = ЛИМЭНСКИЙ БИЛЕТ ВОЗМОЖНОСТИ КАПИТАЛОВЛОЖЕНИЯ – Lehman Investment Opportunity Note (LION) is a type of zero-coupon Treasury bond issued by the US government through Lehman Brothers. Lehman Investment Opportunity Notes (LIONs), were created as a new breed of security that separated principal and interest and were issued at a discount. LIONs made no regular interest payments to bondholders; the return on investment came from realizing the difference between the discounted issue price and the par value received at maturity. LIONs are one of three types of 'feline' securities (along with Treasury Income Growth Receipts (TIGRs) and Certificates of Accrual on Treasury Securities (CATS)) issued between 1982 and 1986. The US government introduced its own direct version of this bond in 1986 with zero-coupon STRIPS. This effectively rendered the previous private issues obsolete, although they still trade on the secondary market. See also CATS, STRIPS, and TIGRs. Lehman Brothers Holdings Inc. (former NYSE® ticker symbol LEH) was a global financial services firm. Before declaring bankruptcy in 2008, Lehman was the fourth-largest investment bank in the US (behind Goldman Sachs, Morgan Stanley, and Merrill Lynch), doing business in investment banking, equity and fixed-income sales and trading (especially US Treasury securities), research, investment management, private equity, and private banking. Headquartered in New York, State of New York (NY), the United States. TIGRs, CATS, and LIONs – actually referred to as 'Felines' by some – are acronyms for securities issued by private companies but derived from US Treasury bonds. The catlike appellations are brand names belonging to the brokerage firms that first created them. For instance, Salomon Brothers invented CATS – Certificates of Accrual on Treasury Securities. Merrill Lynch introduced TIGRs (Treasury Income Growth Receipts), and Lehman Brothers created LIONs (Lehman Investment Opportunity Notes). Introduced between 1982 and 1986, the felines are zero coupon instruments based on Treasury bonds the brokerages held in escrow. They were created through a process known as Coupon Stripping:- the brokerage would separate – strip – the bond's interest (or coupon) from its principal, and issue bonds based on the interest separately. Unlike regular bonds, CATS don't make regular payments of interest to their holders. Instead, investors buy them at a deep discount from their face value, which is the amount the investor receives when the bond matures. The difference between the face value and the actual price of the zero-coupon bond represents the interest earnings of the investment. In 1986, the Treasury instituted its own STRIPS system for backing zero coupons with Treasury securities, one that made it easier for private firms to issue them and that was safer for investors. As a result, our menagerie of feline bonds is no longer being issued. However, they are still available on the secondary bond market. / НЙФБ® или Эн.Уай.Эс.И.® (NYSE®). Лимэн Бразёз Холдиньгз Инк. (Lehman Brothers Holdings Inc.). Голдмэн Сэкс (Goldman Sachs), Моргэн Стэнли (Morgan Stanley), и Мёрл Лынч (Merrill Lynch).

LEI = ГИРЛЯНДА (или ХХ) – Lei is a wreath or necklace usually of flowers or leaves.

LEISA = LOW EXTERNAL INPUT AND SUSTAINABLE AGRICULTURE

LEISURE SUIT = КОСТЮМ ДЛЯ СВОБОДНОГО ВРЕМЕНИ – Leisure Suit is a suit consisting of a shirt jacket and matching trousers for informal wear.

LEMMA = ЦВЕТКОВАЯ ЧЕШУЯ (или ЛЕММА) – Lemma (syn. Outer Glume):- one of the two bracts enclosing the flower or spikelet of rice. It becomes the covering of two-thirds of the rice seed surface and has five vertical ridges, formed along the surface, from the vascular bundles. Lemma (syn. Fertile Lemma, Flowering Glume, Glume, Outer Glume, Lower Palea, Palea Inferior, and Valve):- the indurate (hardened), 5-nerved bract of the floret partly enclosing the palea.

LEMON = ЛИМОННОЕ – Lemon:- of the color lemon yellow.

LEMON YELLOW = ЖЁЛТО–ЛИМОННОЕ (или ЛИМОННОЕ ЖЁЛТОЕ) – Lemon Yellow:- a brilliant greenish yellow color.

LENDER OF LAST RESORT = ССУДОДАТЕЛЬ ПОСЛЕДНЕЙ ИНСТАНЦИИ (или ЗАЙМОДАВЕЦ ПОСЛЕДНЕЙ ИНСТАНЦИИ) – Lender Of Last Resort:- as the nation's central bank, the US Federal Reserve has the authority and financial resources to act as 'Lender Of Last Resort' by extending credit to depository institutions or to other entities in unusual circumstances involving a national or regional emergency, where failure to obtain credit would have a severe adverse impact on the economy. / Займодавец Последней Инстанции:- (1) Функции центрального банка по поддержанию банка, который может столкнуться со значительным оттоком средств. В США займодавцем последней инстанции является Банк Федерального Резерва (БФР; Federal Reserve Bank (FRB)). Банки члены Федеральной Резервной Системы (ФРС) могут получать займы в дисконтном окне (discount window) для удовлетворения требований о поддержании резерва или для выплат при снятии значительных сумм. ФРС, таким образом, поддерживает стабильность банковской системы, которая была бы нарушена в случае банкротств банков. (2) Государственные программы по финансированию малого бизнеса и муниципальные организации по экономическому развитию, основным предварительным условием для предоставления займов которыми является неспособность получить финансирование из иных источников.

LENDING BUSINESS = ССУДНЫЙ БИЗНЕС (или РОСТОВЩИЧЕСКОЕ ДЕЛО) – Generally, Lending Business covers the banking business on the assets side of the balance sheet. In a narrower sense, the advances, loans, mortgages and other types of credit granted to customers or banks. The opposite of Deposit Business.

LENDING LIMIT = ЛИМИТ ОДАЛЖИВАНИЯ (или РОСТОВЩИЧЕСКИЙ ЛИМИТ) – Lending Limit is the maximum value of a particular object which may serve as collateral for a loan or mortgage (sometimes expressed as a percentage).

LENDINGS = ЗАЁМЫ (или ЗАЙМЫ, или ОДАЛЖИВАНИЯ) – (1) In the United States, disposing of money or property with the expectation that the same thing (or an equivalent) will be returned – loaning. Also known as Loans, and Advances in the United Kingdom. / Заём, в гражданском праве договор, в силу которого одна сторона (заимодавец) передаёт другой стороне (заёмщику) в собственность или оперативное управление деньги или вещи, определённые родовыми признаками – числом, весом, мерой (например, зерно), а заёмщик обязуется возвратить такую же сумму денег или равное количество вещей того же рода и качества. Договор заёма относится к числу так называемых реальных (права и обязанности сторон по нему возникают лишь с момента передачи заёма) и односторонних договоров (заимодавец имеет право требовать возврата переданного взаймы имущества и не несёт обязанностей, а заёмщик обязан возвратить это имущество и не наделён какими-либо правами). По бывшему Советскому законодательству договор заёма предполагался безвозмездным – взимание процентов по нему допускалось только в случаях, установленных законодательством Союза Советских Социалистических Республик (СССР), а также по заёмным операциям касс общественной взаимопомощи и городских ломбардов. Договор на сумму свыше 50 Рублей должен был совершён в письменной форме. Смотрите также Кредит. Займы государственные, разновидность

кредитных отношений, в которых государство (или его местные органы) выступает заёмщиком или кредитором. Обычно государственные займы выпускаются в денежной форме, хотя иногда (при обесценении денег) они выпускались в натуральной форме и погашались продуктами. Государственные займы бывают краткосрочные (текущие) со сроком погашения до года, среднесрочные (от года до 5 лет) и долгосрочные (свыше 5 лет). По видам доходности различают государственные займы процентные (их держатели получают твёрдый доход по фиксированной ставке) и выигрышные (по которым доход выплачивается при выходе облигации в тираж погашения. Размещаются государственные займы по подписке среди населения, через банки или сберегательные кассы, путём продажи на бирже и с аукциона. По месту размещения государственные займы делятся на внутренние (в национальной валюте) и внешние, реализуемые на иностранных денежных рынках (в валюте страны-кредитора, государства-заёмщика или какой-либо третьей страны). Облигации внутренних займов могут покупать в выпустившей их стране иностранные граждане (общества), и наоборот, облигации внешних займов часто скупаются за границей выпустившим их государством или его гражданами и возвращаются в страну-должник (репатриация займов). Размер внешнего долга определяется стоимостью облигаций всех займов данной страны, размещённых среди иностранных держателей. Социальное содержание государственных займов как способа привлечения денежных средств на покрытие государственных расходов определяется природой и функциями данного государства. В докапиталистических формациях государственные займы впервые появились в рабовладельческом обществе и применялись главным образом при чрезвычайных обстоятельствах. При капитализме государственные займы – основная форма функционирования государственного кредита. Буржуазное государство за сравнительно короткий срок мобилизует с помощью займов крупные денежные средства. Обычно государственные займы носят добровольный характер, то есть буржуазное государство предлагает капиталистам выгодное помещение капитала. В принудительном порядке займы капиталистических государств размещаются в случае сильного расстройства финансовой системы. Принудительные займы возникли в период зарождения капитализма в Италии, часто применялись в XV–XVIII веках. Они ведут к подрыву государственного кредита, поэтому своё значение постепенно утрачивают. После 1-й Мировой Войны 1914–18 принудительные займы выпускались в ряде Западно-Европейских стран в связи с расстройством государственных финансов; во время 2-й Мировой Войны 1939–45 – фашистской Германией и Японией. Такие займы означают неприкрытую эксплуатацию трудящихся масс со стороны буржуазного государства. Одним из новейших видов принудительных займов служит инфляционный выпуск бумажных денег. ‘Все признают, – писал Владимир Ильич Ленин в Сентябре 1917, что выпуск бумажных денег является худшим видом принудительного займа, что он ухудшает положение всего сильнее именно рабочих, беднейшей части населения, что он является главным злом финансовой неурядицы’ (Полное Собрание Сочинений, 5 Издание, Том 34, Страница 187). При империализме, особенно в период общего кризиса капитализма, государственные займы используются для финансирования расходов хронически дефицитных государственных бюджетов, что связано с милитаризацией экономики, подготовкой и ведением войн, содержанием разбухшего государственного военно-полицейского аппарата. За годы 1-й Мировой Войны Соединённые Штаты Америки (США) за счёт государственных займов покрыли 61%, Великобритания 68%, Франция 81%, Германия 84% всех государственных расходов, а за годы 2-й Мировой Войны – США 54%, Великобритания 50%, Германия 61%, Япония 58%. Прибегая к государственным займам, буржуазное государство неизбежно увеличивает государственный долг. Внешние займы, способствуя вывозу и приложению за границей относительного избытка капитала, являются для стран-кредиторов орудием захвата рынков сбыта и источников сырья в государствах-заёмщиках. Вывоз капитала за границу монополиями объясняется прежде всего более высокой нормой прибыли в экономически отсталых странах по сравнению с нормой прибыли в развитых странах, а также политическими и военно-политическими целями. С развитием государственно-монополистического капитализма в роли кредитора всё чаще выступает буржуазное государство. Рост внешней задолженности приводит к усилению экономической и политической зависимости страны-заёмщика от страны-кредитора, прежде всего от мирового кредитора – США, что особенно характерно для периода после 2-й Мировой Войны. Внешние займы Американского империализма превратились в прямое средство экспансии, агрессии и международной реакции. Тяжесть государственных займов в капиталистических странах падает на трудящихся, так как источником их погашения и уплаты процентов по ним являются средства, изымаемые у массового налогоплательщика. В то же время капиталисты в виде процентов получают подавляющую часть гарантированных доходов. Поэтому через займы, как и через налоги, происходит перераспределение национального дохода в интересах эксплуататорских классов. Владимир Ильич Ленин указывал, что, обогащаясь за счёт возрастающей прибыли от государственных займов, финансовый капитал облагает всё общество данью (смотрите там же, Том 27, Страницы 349–350). Государственные займы в социалистических странах, в отличие от займов в капиталистических странах, имеют своим назначением мобилизацию временно свободных денежных ресурсов для хозяйственного и культурною строительства за счёт трудовых сбережений широких слоев населения. В государственные займы в Союзе Советских Социалистических Республик (СССР) помещались до 1963 также стабильные остатки вкладов в сберегательных кассах. Производительное назначение, массовый характер, использование средств в интересах всего народа – характерные черты государственных займов социалистических государств. В первые годы Советской власти государственные займы существовали в двух формах – денежной и натуральной (последняя была обусловлена недостаточно развитыми денежными отношениями и интересами охраны владельцев облигаций от обесценения денежных знаков). Первый Советский государственный заём был выпущен 20 Мая 1922 на 10 миллионов пудов Ржи и на срок 8 месяцев. В 1923 были выпущены ещё два натуральных государственных займа – хлебный и сахарный (беспроцентные). Первый Советский денежный заём выпущен 31 Октября 1922 на 100 миллионов Рублей. В золотом исчислении сроком на 10 лет. За 1924–28 было выпущено четыре гарантийных займа на общую сумму 900 миллионов Рублей золотом размещавшихся на предприятиях и в организациях. Государственные и кооперативные организации по мере роста рентабельности производства приобретали значительную часть облигаций этих займов, средства от реализации которых направлялись на развитие отраслей народного хозяйства. В эти же годы выпускались и крестьянские выигрышные займы. Была применена новая форма размещения займа – проведение подписки на заём среди трудящихся с предоставлением им рассрочки платежей. Возрастанию роли Советского государственного заёма способствовал рост доходов трудящихся. В широком масштабе проводилась подписка на заём индустриализации (1–3-й выпуски), заём ‘Пятилетка в 4 года’, займы 3-й пятилетки (1–4-й выпуски) и другие, которые послужили одним из источников средств для социалистической индустриализации и развития народного хозяйства в предвоенные годы. Заём укрепления обороны (1937), займы военных лет (1–4-й выпуски) сыграли важную роль в финансировании военных расходов государства в период Великой Отечественной Войны 1941–45. В послевоенные годы средства от размещения Советских государственных займов (5 выпусков займов восстановления и развития народного хозяйства СССР 1946–50 и займы развития народного хозяйства СССР 1951–57) способствовали восстановлению и развитию Советской экономики. Поступления в государственный бюджет СССР от государственных займов в годы довоенных пятилеток составили около 50 миллиардов Рублей, в годы Великой Отечественной Войны – 76 миллиардов Рублей и в период 1946–58 – 260 миллиардов Рублей (в денежном масштабе до 1961). Число подписчиков на займы возросло с 6 миллионов в 1927 до 60 миллионов к началу 1941 и 70 миллионов к 1946. С 1958 выпуск государственных займов, размещаемых по подписке среди населения, был прекращён. В целом удельный вес средств от займов в доходах государственного бюджета до Великой

Отечественной Войны составлял примерно 5%, в годы войны не более 10%, а в 1965, в связи с прекращением выпуска займов, размещаемых по подписке среди населения, снизился до 0.2%. 24-й Съезд Коммунистической Партии Советского Союза (КПСС) принял решение о досрочном погашении этих займов начиная с 1974 с тем, чтобы сократить срок погашения государственного долга на 6 лет и закончить погашение облигаций в 1990. В соответствии с этим решением в государственном пятилетнем плане развития народного хозяйства СССР на 1971–75 на эти цели было выделено по 1 миллиарду Рублей в 1974 и 1975. С 1938 в СССР выпускались свободно обращающиеся займы, облигации которых свободно продавались и покупались сберкассами. Таким займом, выпущенным на 20 лет, являлся Государственный 3%-ный внутренний выигрышный заём (1966). Облигации этого займа приносили их держателям доход, выплачиваемый в форме выигрышей. В других социалистических странах первые государственные займы были выпущены вскоре после 2-й Мировой Войны 1939–45. Поступления от государственных займов направлялись вначале на восстановление народного хозяйства (в Болгарии – 'Заём Свободы' (1945), в Польше – 'Заём Восстановления' (1946), в Венгрии – 'Первый Государственный Заём' (1946)). Размещались эти займы среди рабочих и служащих, кооперативных и других организаций, а также среди части буржуазии; в дальнейшем для привлечения средств на индустриализацию – по подписке среди населения (кроме Чехословакии, Румынии и Германской Демократической Республики (ГДР)). Поступления от внутренних государственных займов в доходах бюджетов социалистических стран не превышали 2–4%. К 1956 Европейские страны в связи с быстрым ростом социалистического накопления от использования государственных займов отказались. Внешние государственные займы социалистических стран, выражая новый тип экономических отношений – сотрудничества и взаимопомощи, носили льготный характер, характеризовались низкими процентными ставками (2–2.5% годовых), долгосрочностью кредита (10–12 лет), а также выгодными условиями его погашения (товарами или обратимой валютой по выбору страны-дебитора).

(2) Lending is one form of carry. In this case the simultaneous selling of metal for a near dated prompt and the buying of that metal for a later dated prompt. In effect the party is lending the metal for the period.

LENGHA = ЛЭНЬГА – Lengha is a long full skirt. Traditional garment from India.

LENGHA/CHOLI = ЛЭНЬГА/ЧОЛИ – Lengha/Choli is a long skirt and and blouse combination along with a chunni makes up a complete set. Traditional garment from India.

LENGTH = ДЛИНА – (1) Cotton fiber length varies genetically and has a fiber length array or length distribution. The HVI reports fiber length as the upper half mean length in hundredths of an inch. The lengths of linters and comber noils are less than 0.5 inches. US Upland raw cotton is normally between 0.9 and 1.2 inches. Pima Cotton can be as long as 1.6 inches. Fiber Length is defined as the average length of the longer one-half of the fibers (upper half mean length). Fiber length is basically an inherited/genetically character of the seed variety. However, weather, nutrient deficiencies, as well as excessive cleaning and/or drying at the gin may also affect the fiber length. By affecting yarn strength and evenness, and the efficiency of the spinning process, the length of the fiber has a great influence on quality and price. According to USDA's classing methodology, length measurement of American upland cotton is performed by HVI in accordance with standard test methods. The length of staple, measured in inches and fractions of an inch, is classed according to the specific codes. Fiber Length is the average length of the longer one-half of the fibers (upper half mean length) after the ginning process. It is reported in both 100^{th} and 32^{nds} of an inch. It is measured by passing a beard of parallel fibers through a sensing point. The beard is formed when fibers from a sample of cotton are grasped by a clamp, then combed and brushed to straighten and parallel the fibers. Fiber length is largely determined by variety, but the cotton plant's exposure to extreme temperatures, water stress, or nutrient deficiencies may shorten the length. Excessive cleaning and/or drying at the gin may also result in shorter fiber length. Fiber length affects yarn strength, yarn evenness, and the efficiency of the spinning process. The fineness of the yarn which can be successfully produced from given fibers is also influenced by the length of the fiber. See conversion chart below. / Высокопроизводительный Инструмент (ВПИ; High Volume Instrument (HVI). зажимом (clamp), . Длина волокна – это средняя длина самой длинной половины группы волокон (наибольшая средняя длина) после процесса его джинирования. Она указывается как, в сотых, так и в 32-х дюйма.

(2) Length:- refers to the stringer or stringerboard (in block pallets) length; also refers to the first dimension given to describe a pallet, i.e. 48" x 40", where 48" is the pallet stringer/stringerboard length. See also Pallet. Length (l) is a top deck dimension in the direction of stringers or stringerboards or, if these members are not present, the longer dimension. Notes:- in the case of square pallets without stringers or stringer boards, the length and width can be designated by the manufacturer; and in the case of a square post or block pallet without a stringer board and having a structural panel deck, the length of the pallet shall correspond to the direction of the wood grain in the surface of the panel. / Длина l (Length):- габаритный размер настила по направлению продольных брусьев или досок. Примечания:- в квадратных поддонах при отсутствии продольных брусьев или досок длину и ширину поддона определяет изготовитель; и в квадратных поддонах при отсутствии продольных брусьев или со сплошным настилом длину поддона определяют размером настила. Смотрите также Поддон (Pallet).

(3) Length:- improper zipper length for given opening. Closure defects, and namely – Zippers:- Chain or Teeth Defects. / Порок или дефект застёжки.

LENGTH OF LAY = ДЛИНА СВИВКИ – Length Of Lay is the axial distance required to make a 360 degree revolution of any element in strand or cord. See also Lay.

LENGTH OVERALL = ГАБАРИТНАЯ ДЛИНА – Length Overall is the maximum length of a vessel. / Максимальная длина судна.

LENO = АЖУРНАЯ (или БАРЕЖЕВАЯ, или ТКАНЬ ПЕРЕВИВОЧНОГО ПЕРЕПЛЕТЕНИЯ, или ТКАНЬ ГАЗОВОГО ПЕРЕПЛЕТЕНИЯ) – Leno is an open, lacy woven fabric made with a special loom attachment. In a leno weave a pair of filling yarns twist around the warp yarns in various patterns to achieve the lacy effect. A leno weave is also made by twisting adjacent warps around each other like a figure eight. The filling passes through the twisted warps. Leno fabrics are popular for curtains and summer dresses. Leno is a fabric made with leno weave, namely an open weave in which pairs of warp yarns cross one another and thereby lock the filling yarn in position. / переплетении пара уточных пряж .

LENO SELVEDGES = ПЕРЕВИВОЧНЫЕ КРОМКИ – Leno Selvedges are obtained by binding the wefts with strong additional threads working in gauze weave and by eliminating through cutting the protruding weft ends. The leno gauze system is optimally suited for heavy fabrics, blankets, wall coverings. Figure 116 illustrates the operation scheme of the device proposed by a manufacturer, in which device two complete leno gauze mechanisms work in combination. A leno device produces the fabric selvedge, while the other device forms the auxiliary selvedge. See also Fused Selvedges, Melt Selvedges, Selvedge, and Tucked-In Selvedges.

LENO WEAVE = ПЕРЕВИВОЧНОЕ ПЕРЕПЛЕТЕНИЕ (или АЖУРНОЕ ПЕРЕПЛЕТЕНИЕ, или БАРЕЖЕВОЕ ПЕРЕПЛЕТЕНИЕ, или ГАЗОВОЕ ПЕРЕПЛЕТЕНИЕ) – Leno Weave has two or more warp threads crossing over each other and interlacing with one or more than one filling threads. A leno weave fabric is very sheer and durable with no yarn slippage. It is stronger and firmer permitting the passage of both light and air through it. Leno weave fabric is also called as Gauze or Doup Weave. The fabric was primarily used to prevent shifting of fibers in the open weave fabrics. It maintains uniformity of threads and minimises the distortion of threads. Characteristics of Leno Weave:- (i) it has open-weave effect; (ii) it has low yarn count; (iii) it is a good dimensional stability; (iv) it has lesser yarn slippage; and (v) the paired warp yarns resemble figure 8 down the length of the fabric. See also Weave. Leno Weave is a construction of woven fabrics in which the resulting fabric is very sheer, yet durable. In this weave, two or more warp yarns are twisted around each other as they are interlaced with the filling yarns; thus securing a firm hold on the filling yarn and preventing them from slipping out of position. Also called the Gauze Weave. Leno weave fabrics are frequently used for window treatments, because their structure gives good durability with almost no yarn slippage, and permits the passage of light and air. Leno Weave is a weave in which the warp yarns are arranged in pairs with one twisted around the other between picks of filling yarn as in marquisette. This type of weave gives firmness and strength to an openweave fabric and prevents slippage and displacement of warp and filling yarns. The Leno Weave is used where relatively low numbers of yarns are involved. The leno weave locks the yarns in place by crossing two or more warp threads over each other and interlacing with one or more fill threads. Light weight membrane applications such as EIFS use the leno weave. / уточные нити. Перевивочное Переплетение известно в Англоязычном мире текстильщиков как Gauze Weave или Doup Weave.

LENTICEL = ЧЕЧЕВИЧКА – Lenticel is a pore in tree bark through which gas exchange occurs. / Чечевичка – это пора у растения в стебле или корне. Чечевички (в ботанике), линзообразные рыхлые скопления клеток в перидерме, выступающие на поверхности стволов многолетних ветвей, а иногда и корней древесных растений в виде бугорков. Чечевички возникают вследствие деятельности феллогена и закладываются обычно под устьицами. Выполняют функции газообмена.

LENTICULAR = ЧЕЧЕВИЦЕОБРАЗНОЕ (или ЧЕЧЕВИЦЕВИДНОЕ, или ДВОЯКОВЫПУКЛОЕ) – Lenticular:- shaped like a biconvex lens.

LÉOTARD = ЛЕОТАР (или ТРИКО) – Léotard is a close-fitting one-piece garment worn especially by dancers, acrobats, and aerialists; also tights. Often used in plural. / танщцевальное трико, закрывающее от мысков до пояса.

LEPA = LOW ENERGY PRECISION APPLICATION

LEPIDOPTERA = ЛЭПИДОПТЭРА (или БАБОЧКА, или ЧЕШУЕКРЫЛОЕ) – Lepidoptera is an Order of Insects with two pairs of scaly wings and spirally coiled haustellate (formed for sucking) mouth structure, which undergoes complete metamorphosis. The larva has a chewing type of mouth parts and is always pestiferous. Lepidoptera is the name of the order to which the silkworm belongs. / Чешуекрылые, Отряд Насекомых; то же, что Бабочки. Под Бабочками или Чешуекрылыми понимается Отряд Насекомых. Крылья (2 пары) покрыты различно окрашенными чешуйками. У крупных особей крылья в размахе до 30 сантиметров, у мелких – около 3 миллиметров. Взрослые (имаго) живут от нескольких часов до нескольких недель (зимующие – несколько месяцев). Около 140 000 Видов; в бывшем Союзе Советских Социалистических Республик (СССР) насчитывалось около 15 000 Видов. Многие Бабочки способствуют опылению растений; из коконов Тутового и других Шёлкопрядов получают шёлк. Личинки многих Бабочек (гусеницы) повреждают сельскохозяйственные и лесные культуры, продовольственные запасы, изделия из шерсти и меха. 104 Вида находились в Красной Книге бывшего СССР. Бабочки или Чешуекрылые (Lepidoptera, от Греческих слов Lepis, означающее Чешуя, и Pteron, означающее Крыло), обширный (более 140 000 Видов) Отряд Насекомых с полным превращением. Крыльев две пары, покрыты чешуйками. Ротовой аппарат сосущий, в виде хоботка (в покое свёрнут спиралью). Тело густо покрыто волосками и чешуйками. Переднегрудь слабо развита, с подвижно сочленёнными выростами – патагиями; среднегрудь с подвижными пластинчатыми выростами – тегулами. Брюшко 10-члениковое; у самок в большинстве случаев раздельные копулятивное и яйцевыводное отверстия. Личинки – гусеницы с грызущим ротовым аппаратом. Куколки обычно покрытого типа, с конечностями и крыльями, плотно спаянными с покровами тела. Размеры Бабочек разнообразны. Наиболее крупной является Южно-Американская Совка (Erebius (Thysania) Agrippina) – крылья в размахе до 30 сантиметров (см), среди Европейских Бабочек – Павлиноглазка (Saturnia Pyri) (12–15 см). Существуют и крохотные формы, у которых крылья в размахе около 3 миллиметров (мм), например Моли-Малютки (Stigmellidae). Название отряд получил от покрывающих их крылья чешуек (‘пыльцы’) – видоизменённых и уплощённых волосков. Всё исключительное разнообразие окраски и рисунка крыльев Бабочек создаётся строением и пигментацией чешуек. Окраска чешуек Бабочек определяется различного рода пигментами, но наиболее яркие, блестящие цвета (металлический блеск, переливы и тому подобное) обусловлены тончайшим строением поверхности чешуек, вызывающим сложные явления лучепреломления, дифракции. Расположение различно окрашенных чешуек на крыле закономерно и образует сложные рисунки, характерные для каждого Вида, а часто и систематической Группы. Окраска и рисунок крыльев имеют двоякое биологическое значение. Для Бабочек, активных в дневное время, это – средство узнавания особей своего Вида. При этом играют роль и ‘скрытые’ (для человека) рисунки, обусловленные неодинаковым отражением разными участками крыла ультрафиолетовых лучей, воспринимаемых глазом Насекомых. Окраска и рисунок играют и защитную роль; Бабочки дают множество замечательных примеров мимикрии и миметизма. Большинство Бабочек ведёт сумеречный или ночной образ жизни, лишь Булавоусые и немногие представители других групп активны днём. Питаются Бабочки нектаром цветов, соками гниющих плодов и различными сахаристыми выделениями растений, но некоторые (например, Мешочницы, Коконопряды, Хохлатки) во взрослом состоянии не принимают пищи и живут за счёт резервных веществ, накопленных в жировой ткани ещё в стадии личинки (гусеницы). Хоботок Бабочек состоит из пары сильно вытянутых желобовидных наружных лопастей нижних челюстей, скреплённых в виде трубки, по которой всасывается пища. Из остальных частей типичного аппарата насекомых у Бабочек сохраняется лишь пара нижнегубных щупиков, поддерживающих с боков свёрнутый хоботок; нередко имеются и челюстные щупики. У непитающихся Видов Бабочек хоботок иногда полностью исчезает. Исключением среди Бабочек являются представители Семейства Зубатых Молей, которые питаются пыльцой цветов и сохранили грызущий ротовой аппарат с развитыми жвалами. Эта Группа служит связующим звеном между современными высшими формами Бабочек и вымершими их предками, близкими к Ручейникам. Органы зрения у Бабочек хорошо развиты. По бокам головы расположены большие полушаровидные сложные глаза, состоящие из громадного числа (до 27 000) омматидиев, дающих общее мозаичное изображение. Над сложными глазами часто имеется два так называемых простых глазка. Важную роль в жизни Бабочек, особенно ночных, играет чувство

обоняния. Обонятельные органы (так называемые сенсиллы) в большом числе располагаются на поверхности усиков. Последние очень разнообразны:- от щетинковидных до сложных перистых. У самцов, отыскивающих малоподвижных самок по запаху (Павлиноглазки, Волнянки, Мешочницы), усики сильно разветвлены и имеют гораздо большую поверхность, чем у самок. Органы вкуса (контактные хеморецепторы) расположены не только на ротовых частях, но зачастую и на лапках:- прикосновение лапками к сахаристой жидкости вызывает рефлекторное развёртывание хоботка. Наличие органов слуха установлено пока лишь у высших форм Отряда с ночной активностью. Слуховой аппарат расположен либо в области заднегруди (Совки, Хохлатки), либо в основании брюшка (Пяденицы, Огнёвки). Воспринимаемые звуковые волны лежат в области высоких частот (15–80 килоГерц (кГц)). Бабочки способны воспринимать ультразвуковые эхолокационные сигналы летучих мышей (смотрите Эхолокация), что позволяет Бабочкам своевременно от них скрыться. Эволюция Бабочек в значительной степени шла в направлении совершенствования полёта, что отразилось на строении крыла и грудной области. У примитивных Бабочек (Подотряд Равнокрылые) сохраняются сходная форма и значительная функциональная самостоятельность передней и задней пар крыльев. В Подотряде Разнокрылых Бабочек всё большее значение в полёте приобретает передняя пара крыльев, тогда как задняя пара уменьшается в размерах и теряет часть жилок. Соответственно прогрессивно усиливается среднегрудной сегмент и его мускулатура, тогда как заднегрудной ослабляется. Подчинению задних крыльев передним способствует аппарат сцепления в виде щетинок, расположенных в основании заднего крыла, и зацепки на нижней поверхности переднего крыла. Высокого совершенства полёт достигает у Бражников, у которых большая скорость (до 54 километров в час (км/ч)) сочетается с высокой маневренностью, позволяющей им добывать нектар из цветов налету. У многих Бабочек отмечались дальние, на сотни км, перелёты, а у Американских Бабочек Danaus Plexippus известны регулярные сезонные миграции. Бабочки раздельнополы, лишь изредка наблюдается естественный партеногенез. Половой диморфизм у Бабочек иногда резко выражен:- кроме отличий в строении усиков, самцы, как правило, мельче самок и часто иначе окрашены, например, у Непарного Шёлкопряда, Крушинницы, Зорьки. Наиболее сильное проявление диморфизма – частичная или полная утрата самками крыльев (Волнянки-Кистехвосты, некоторые Пяденицы и особенно Мешочницы). У Мешочниц самки часто червеобразны и лишены не только крыльев, но также ног и усиков. Бескрылость самок во многих случаях связана с климатическими условиями и особенно типична для Видов Бабочек, летающих ранней весной или поздней осенью, а также для высокогорных и арктических. Развитие Бабочек идёт с полным превращением. Яйца богаты желтком и одеты плотной наружной оболочкой (хорионом), поверхность которой имеет специфический для видов или групп микроскульптуру. В оболочке имеется сложно устроенное микропилярное отверстие, через которое при оплодотворении проникает сперматозоид. Форма яиц у примитивных групп чаще уплощённо-овальная, у высших – полушаровидная или бутылковидная. Яйца откладываются одиночно или группами, как правило, на растение, служащее кормом для гусеницы. Количество откладываемых яиц у большинства Видов исчисляется сотнями, достигая у некоторых Совок 2 000–3 000. Стадия гусеницы морфологически довольно однотипна. Резко выделяются лишь гусеницы Зубатых Молей, по большинству признаков стоящие ближе к личинкам Отряда Скорпионовых Мух. У остальных наибольшим изменениям подвержено число брюшных ног и степень развития волосков на теле. На теле всегда, даже если Бабочка кажется голой, имеются волоски (хеты), выполняющие функцию осязательных рецепторов. У многих открыто живущих видов развивается густой вторичный покров из волосков (Медведицы, Коконопряды, Волнянки и другие). Рост сопровождается линьками. Чаще всего линек четыре и соответственно пять межлиночных периодов – возрастов. Подавляющая часть гусениц растительноядна. Для гусениц более примитивных Групп Отряда характерны скрытый образ жизни и питание в свёрнутых листьях, в тканях листа, плодах, стеблях, корнях. В эволюционно более молодых Семействах у гусениц преобладают открытый образ жизни и питание листьями или хвоей. Наряду с часто наблюдаемой многоядностью (полифагия) (например, у Озимой Совки, Непарного Шёлкопряда, Лугового Мотылька) очень распространено явление олигофагии, то есть приспособленности к питанию ограниченной группой растений, обычно систематически родственных и близких по биохимическому составу. Например, гусеницы Капустницы и многих других Белянок питаются только растениями из Семейства Крестоцветных, содержащими горчичные гликозиды. Примером крайней пищевой специализации служит Тутовый Шёлкопряд, который нормально развивается только при питании листьями Белой Шелковицы (Morus Alba). Низшие Растения используются немногими видами (Лишайницы, Грибные Моли). Ещё реже наблюдается питание веществами животного происхождения:- воском (Вощинные Огнёвки), шерстью (Платяная и Шубная Моли). Хищники – только гусеницы некоторых Совок и Молей, поедающие Червецов и Щитовок. Для всех гусениц характерна способность к выделению шёлка. Выводной проток шёлкоотделительных желёз открывается на особом выросте нижней губы – прядильном сосочке. Шёлк используется гусеницами для скрепления листьев, постройки гнёзд и убежищ, но особенно для плетения кокона – защитной оболочки, внутри которой гусеница окукливается. Куколки Бабочек в подавляющем большинстве относятся к Типу Покрытых, у которых подвижными остаются лишь некоторые сегменты брюшка. Только в Семействах Зубатых Молей и первичных Молей куколки свободного типа – все части тела и конечности у них обладают известной подвижностью. У Бабочек, выходящих из куколочной оболочки, крылья ещё коротки ей мягкие. Под давлением гемолимфы, нагнетаемой в жилки крыла, они расправляются, увеличиваясь в несколько раз, и вскоре затвердевают, после чего Бабочка становится способной к полёту. Достоверные ископаемые остатки Бабочек известны лишь с Палеогена, преимущественно из Балтийского янтаря. Все найденные здесь виды относятся уже к современным Семействам, а часто даже к существующим или очень близким к ним Родам. Возникновение Отряда предположительно относят к Мезозою (Юрский период). Бабочки несомненно один из самых молодых Отрядов Насекомых, развитие которого шло в значительной мере параллельно с эволюцией Цветковых Растений. Современная фауна Бабочек богаче всего в тропиках. Здесь встречаются наиболее крупные формы, часто поражающие яркостью и красотой окраски (например, Южно-Американский Род Morpho, Индо-Малайские Ornitnoptera). По направлению к полюсам фауна постепенно беднеет, но даже за Полярным кругом ещё довольно обильна. Некоторые Виды – Перламутровка (Argynnis Polaris), Волнянка (Dasychira Rossii) – заходят за 82° Северной широты. Общее число Видов Бабочек, обитающих на территории бывшего Союза Советских Социалистических Республик (СССР), превышает 15 000. Из них около 2/3 относятся лишь к 5 Семействам:- Листовёртки, Выемчатокрылые Моли, Огнёвки, Пяденицы и Совки. Систематика:- Отряд Чешуекрылых делится на два Подотряда:- (1) Подотряд Равнокрылые (Jugata):- Передние и задние крылья почти равных размеров и формы. Радиальная жилка всегда с 4–5 ветвями. Крылья скрепляются с помощью особого выступа (югальной лопасти) на переднем крыле. Сюда относятся наиболее архаичные Семейства – Зубатые Моли (Micropterygidae), Первичные Моли (Eriocraniidae) и Тонкопряды (Hepialidae). (2) Подотряд Разнокрылые (Frenata):- Передние и задние крылья неодинаковой формы. На задних крыльях радиальная жилка лишена ветвей, крылья скрепляются с помощью зацепки – frenulum. Подотряд включает подавляющую часть всех Бабочек. Более 70 Семейств, образующих две большие Группы:- Microfrenata и Macrofrenata. К Microfrenata относятся более примитивные и преимущественно мелкие Бабочки. Основные Семейства:- Моли-Малютки (Stigmellidae), Настоящие Моли (Tineidae), Мешочницы (Psychidae), Пестрянки (Anthroceridae), Стеклянницы (Aegeriidae), Древоточцы (Cossidae), Листовёртки (Tortricidae), Моли-Минёры (Lithocolletidae), Горностаевые Моли (Hyponomeutidae), Выемчатокрылые Моли (Gefechiidae), Огнёвки (Pyralidae), Пальцекрылки (Pterophoridae). Группа Macrofrenata включает высокоорганизованных, сравнительно крупных Бабочек. Серия Семейства Булавоусых (Rhopalocera) объединяет общеизвестных Дневных Бабочек:- Толстоголовки

(Hesperiidae), Парусники (Papilionidae), Белянки (Pieridae), Голубянки (Lycaenidae), Нимфалиды (Nymphalidae). К Ночным, или Разноусым (Heterocera), относятся следующие основные Семейства:- Коконопряды (Lasiocampidae), Настоящие Шёлкопряды (Bombycidae), Павлиноглазки (Attacidae), Бражники (Sphingidae), Пяденицы (Geometridae), Хохлатки (Notodontidae), Волнянки (Lymantriidae), Медведицы (Arctiidae), Ложнопестрянки (Syntomididae), Совки (Noctuidae). Хозяйственное Значение Бабочек:- Растительноядность и огромное число Видов определяют большую роль Бабочек в природе и хозяйственной деятельности человека. На территории бывшего СССР культурными растениями питается около 1 000 Видов Бабочек, среди которых такие важные вредители, как Озимая, Хлопковая, Капустная и другие Совки, Луговой и Кукурузный Мотыльки, Яблонная, Восточная и Сливовая Плодожорки. Столь же многочисленны вредители древесных пород, причиняющие громадные убытки лесному хозяйству. Так, вспышки размножения Сибирского Шёлкопряда (Dendrolimus Sibiricus) могут приводить к усыханию хвойного леса на площадях в сотни тысяч гектаров (га). Ряд Видов Бабочек, преимущественно из Огнёвок и Настоящих Молей, приспособившихся к обитанию в домах и на складах, повреждает пищевые запасы, меха, шерстяные и шёлковые изделия. Полезная деятельность Бабочек в природе связана с участием их в опылении Цветковых Растений, особенно Ночных. Некоторые виды Бабочек разводят для получения шёлка. Основным производителем натурального шёлка является одомашненный Тутовый Шёлкопряд, происходящий из Юго-Восточной Азии. Более грубый шёлк, типа чесучи, дают некоторые полудикие Азиатские Павлиноглазки, например, Китайский Дубовый Шёлкопряд и Айлантовый Шёлкопряд.

LEPIDOPTEROUS = ЧЕШУЕКРЫЛОЕ (или БАБОЧКА) – Lepidopterous:- pertaining to the insects in the Order Lepidoptera. / Чешуекрылые, Отряд Насекомых; то же, что Бабочки.

LEPO = LOW EXERCISE PRICE OPTION

LEPTOCAULIS = ЛЭПТОКАУЛИС (или ЛЕПТОСТЕБЕЛЬ, или ЛЕПТОСТЕРЖЕНЬ, или ЛЕПТОКОЧЕРЫЖКА) – Leptocaulis:- with slender stems.

LEPTON® TEST KIT = НАБОР ДЛЯ ИСПЫТАНИЙ ЛЭПТАН® – LepTon® Test Kit is a simple test kit that uses monoclonal antibodies to differentiate between the two species of Heliothis moth (Heliothis Armigera – resistant to a number of synthetic chemicals and Heliothis Punctigera – no resistance). One of newest tools in the arsenal to help combat the cotton bollworm and tobacco budworm, which caused the heaviest crop losses in the United States, is the LepTon® Test Kit. The kit, a joint project between Cotton Incorporated and Abbott Laboratories, Chicago, effectively and quickly distinguishes between the eggs and small larval stages of bollworms and budworms. The test involves the use of an antibody which recognizes a specific protein unique to each worm. While it is relatively easy to identify adult bollworms and budworms, it is nearly impossible tell them apart at the early stages of the lifecycle. The information obtained from the kit will enable growers to make better decisions on which insecticides to use. Because of the budworm's increasing resistance to pyrethroids, a wrong choice of insecticides has often led to greater worm damage, lower yields, higher production costs and even greater resistance to insecticides. Effective use of the LepTon® kit will help producers better manage their control of bollworms and budworms, which last year infested 82 percent of the US cotton acreage and required an average of nearly 2.5 applications of per acre. / виды (species).

LER = LAND EQUIVALENT RATIO

LESION = ПОРАЖЕНИЕ (или РАНА) – Lesion is an area of dead or dying host tissue. A well defined area of diseased tissue, e.g., seedling disease effects on roots or leaf spots. Lesion is a localized spot of diseased tissue on a plant. / Участок мёртвой ткани растения или ткани, окрашенной самим растением. Отчётливо определяемые участки ткани, поражённой болезнью, например, болезнь всходов воздействует на корни или приводит к появлению пятен на листьях.

LESS DEVELOPED COUNTRY = СЛАБОРАЗВИТАЯ СТРАНА – Less Developed Country is a country with low per capita gross national product. Terms such as third world, poor, developing nations and underdeveloped have also been used to describe less developed countries. See also Least Developed of the Less Developed Countries. A developing country is a country with a low income average, a relatively backwards infrastructure and a poor human development index when compared to the global norm. The term has tended to edge out earlier ones, including the Cold War-defined Third World. The less developed countries include all of Africa, all of Asia except Japan, the Transcaucasian and Central Asian republics of the NIS (New Independent States; fifteen nations formed from the former Soviet Union. The Commonwealth of Independent States (CIS) refers to these countries excluding the three Baltic nations of Latvia, Estonia, and Lithuania), all of Latin America and the Caribbean, and all of Oceania except Australia and New Zealand. This category matches the less developed country classification employed by the United Nations. Less developed countries are also referred to in the report as Developing Countries. / Слаборазвитые Страны – страны с недостаточно развитым промышленным производством и страны, не имеющие развитых финансовых и правовых систем. Эти страны, также называются странами третьего мира, обычно имеют низкий уровень дохода на душу населения, высокую инфляцию и задолженность, а также большой торговый дефицит. Всемирный Банк (World Bank) может оказывать таким странам кредитную поддержку. Кредиты, предоставляемые таким странам, обычно называют суверенным долгом слаборазвитых стран (LDC debt от less developed countries (LDC)).

LESSEE = АРЕНДАТОР (или ЛИЗИНГОПОЛУЧАТЕЛЬ) – Lessee is a person or firm to whom a lessor grants a lease. Lessee:- this term means an individual who leases an equity membership or a trading permit from the owner thereof pursuant to the rules of the exchange.

LESSER GRAIN BORER = ЗЕРНОВОЙ ТОЧИЛЬЩИК – Lesser Grain Borer (Rhyzopertha Dominica (Fabricus)):- the eggs are laid in the grain mass and the larvae may enter the kernels and develop within or they may feed externally in the flour-like dust that accumulates from the feeding of the adults and other larvae. The optimum temperature for reproduction is 34 °C and the optimal relative humidity is 60–70% Females lay 300–500 eggs and the life cycle lasts 20–84 days. / Зерновой Точильщик (Rhizopertha Dominica и Rhizopertha Releyi):- систематическое положение:- Отряд Жуки, или Жесткокрылые, Семейство Лжекороеды (Bostrychidae). Встречается в партиях зерна в Северо-Кавказском и Поволжском регионах. Повреждает зерно Пшеницы, Ржи, Риса, Кукурузы, Овса, Гречихи и другие продукты растительного происхождения. Жук длиной 2.5–3 мм, красновато-коричневый, блестящий; переднеспинка спереди с зубчиками; голова втянута в переднегрудь; летает. Личинка белая, с маленькой головкой, передние сегменты тела значительно шире остальных. Теплолюбивый вид, развивается при температуре воздуха не ниже 16.4 °C. Оптимальные условия развития:- температуры 32–35 °C, относительная влажность воздуха около 50%. Понижение температуры воздуха до 0 °C выдерживает не более 17 суток, до –5 °C – 10 суток. Самка откладывает до 580 яиц, размещая их на поверхности зерна или других субстрат. Эмбриональное развитие при температуре воздуха 32 °C продолжается около 5 дней, а полный цикл развития завершается за 30 дней. Личинки внедряются в зерновки, питаются эндоспермом и здесь же окукливаются. Отродившиеся молодые жуки в течение нескольких дней дополнительно питаются, а затем выходят наружу. От зерновки остаётся лишь оболочка. Жук способен повреждать зерно влажностью 8%.

При массивном размножении вредитель превращает партии хранящегося зерна в мучную пыль. При благоприятных условиях точильщик может дать четыре-пять поколений.

LESSOR = АРЕНДОДАТЕЛЬ (или ЛИЗИНГОДАТЕЛЬ) – Lessor is a person or firm that grants a lease. Lessor:- this term means an individual who leases an equity membership or a trading permit of which he is the owner to another individual who thereby becomes the lessee of such equity membership or trading permit.

LESS THAN CONTAINER LOAD = МЕНЬШЕ ПОЛНОЙ ЗАГРУЗКИ КОНТЕЙНЕРА – Less Than Container Load (LCL), a consignment of cargo, which is inefficient to fill a shipping container. It is grouped with other consignments for the same destination in a container at a container freight station. Part full container. A general reference for cargo in any quantity intended for container carriage, where stuffing/unstuffing is carried out by the line, but where an LCL container usually consists of multiple consignments. For operational purposes container is considered a container in which multiple consignments or parts thereof are shipped. Less Than Container Load (LCL) is a common term for an amount of goods to be shipped and which do not fill an entire container. Ocean rates for Less Than Container Load (LCL) are commonly higher on a per-unit basis than for a full container load. Thus, consolidation of several LCL loads from different places or shippers into a full container can save on costs. The quantity of freight which is less than that required for the application of a container load rate. Loose Freight. See also Less Than Truckload. Less Than Container Load (LCL):- shipments weighing less than required for the application of a full container rate. When the shipment is less than a full container load, the freight may be calculated as an LCL shipment. / Частично заполненный контейнер.

LESS THAN TRUCKLOAD = МЕНЬШЕ ПОЛНОЙ ЗАГРУЗКИ ГРУЗОВИКА – Less Than Truckload (LTL) shipping is the transportation of relatively small freight. The alternatives to LTL carriers are parcel carriers or full truckload carriers. Parcel carriers usually handle small packages and freight that can be broken down in to units less than 150 US pounds. Full truckload carriers move freight that is loaded into a semi trailer. Semi trailers are typically between 26 and 52 US feet and thereby require a substantial amount of freight to make such transportation economical. See also Less Than Container Load (LCL). A term used if the quantity or volume of one or more consignment(s) does not fill a standard truck. Less Than Truckload (LTL):- shipments weighing less than required for the application of a truckload rate. A typical full truckload shipment is 39 000–44 000 pounds. Weight breaks may vary across LTL classifications and in some instances it is less expensive to apply a full truckload rate even thought the shipment size may be less than 39 000–44 000 pounds. Less-Than-Truckload (LTL) is a transportation term that describes shipments that are less than a trailer load. LTL also is used to describe the carriers that handle these loads. LTL carriers generally use strategically placed hubs to sort and consolidate LTL shipments into full-truck-load shipments.

LE SYSTÈME INTERNATIONAL D'UNITÉS = ЛЁ СИСТЭМ ЭТЭРНАСЬЁНАЛЬ Д'ЮНИТЕ (или МЕЖДУНАРОДНАЯ СИСТЕМА ЕДИНИЦ) – Le Système International d'Unités (SI) is International System of Units in French. See also International System Of Units. / Под Лё Систэм Этэрнасьёналь д'Юните сокращённо – Эс.И. или, как её уже устоялось называть в России, СИ (Le Système International d'Unités (SI)) во Французском языке понимается Международная Система Единиц. Смотрите также Международная Система Единиц (International System Of Units).

LETHAL = ЛЕТАЛЬНЫЙ (или СМЕРТЕЛЬНЫЙ) – Lethal:- (Latin:- letalis – fatal) Fatal. / Фатальный или Пагубный или Губительный.

LETHAL DOSAGE = СМЕРТЕЛЬНАЯ ДОЗИРОВКА (или ЛЕТАЛЬНАЯ ДОЗА) – LD50 (short for the Lethal Dosage) is the dose that is lethal to 50% of the test animals or micro organisms in a given time period. It is usually expressed in milligrams of insecticides per kilogram of body weight in mammals, and micrograms of insecticides per gram of body weight in insects. The lower the LD value, the higher the toxicity. / Под Летальной, от Латинского слова Letalis, означающее Смертельный, понимается .

LETHAL GENE = ЛЕТАЛЬНЫЙ ГЕН (или СМЕРТЕЛЬНЫЙ ГЕН) – Lethal Gene is a gene whose effect is sufficiently drastic to kill the bearer of certain genotypes.

LET OFF BAR = ПОЛОСКА ОТ СПУСКА – Let Off Bar:- irregular pick density in fabric but not at equal interval. Weaving defect. Let Off Bar:- let off working faulty, due to clutch is not properly in action due to clutch plate worn out, and play in mechanism. Cloth roller pressure not proper, beam bracket jammed, higher play in glass, vibration in whip rolls, exclusive play in regulation arms, motor problems. / Порок или дефект ткачества.

LET–OFF MARK = ОТМЕТИНА ОТ СПУСКА – Let-Off Mark:- in woven fabrics, a corrugated defect pattern distributed across the fabric width. Compare Shier. Discussion:- Let-off marks are caused by badly adjusted let-off motions of a loom. Fabrics defect.

LET–OFF MOTION = РЕГУЛЯТОР ДЛЯ ОСНОВЫ (или УСТРОЙСТВО ДЛЯ СПУСКА ОСНОВЫ) – Let-Off Motion:- the slow unwinding of the yarn from the warp beam to supply an even flow of warp yarn to replace this yarn as it is fed into the loom and woven into fabric. The motion is usually governed by the action of the warp beam and the whip roll, working in conjunction with one another. Let-Off Motion is a device for controlling the delivery and tension of the warp during weaving. / Регулятор Для Основы – механизм подачи и натяжения основы.

LETTER 'A' HAS A CUT OFF CORNER AND THE FOLLOWING 'Z' ALSO HAS A CUT ON THE EDGE = БУКВА 'ЭЙ.' ИМЕЕТ ОТРЕЗАННЫЙ УГОЛ И ПОСЛЕДУЮЩАЯ 'ЗЭД.' ТАКЖЕ ИМЕЕТ НАДРЕЗ НА КРАЮ – The Letter 'A' Has A Cut Off Corner And The Following 'Z' Also Has A Cut On The Edge (in the printed word 'Aijaz?.'. Possible Cause:- the presence of a stray yarn on the fabric during transfer printing caused the design to be printed on the yarn which when later removed caused the defect. A quality check for stray yarns before printing can reduce occurrence. Defects of this type are usually minor. However in some case if the print design is affected such that the variation in design is very easily detectable and reveals a definite non-conformity in the garment the defect may be labeled major. Printing fabric defect.

LETTER OF ADVICE = УВЕДОМИТЕЛЬНОЕ ПИСЬМО (или ПИСЬМО ОБ ИЗВЕЩЕНИИ) – Letter Of Advice:- in this document (sent by one business to another to whom they have sent a shipment, on consignment or otherwise) appears a description of the goods sent, the carrier or other means of transportation used, the date of departure and all other relevant data. Bankers use the term 'Letter of Advice' when notifying interested parties of such actions as the opening of credits, the drawing of drafts, the payment or non-payment of drafts.

LETTER OF CREDIT = АККРЕДИТИВ (или ПИСЬМО О КРЕДИТЕ) – Letter Of Credit is a financial guaranty issued by a bank that permits the party to which it is issued to draw funds from the bank in the event of a valid unpaid claim against another party. Letter Of Credit (LC or L/C):- also referred to as Documentary Credit. This constututes a contractual obligation on the part of a bank to pay a specific amount of money or to provide some other financial service by order of, for account of and according to the instructions of a customer against the presentation of certain documents and subject to the fulfilment of certain conditions. The legal basis for the letter of credit is the ICC publication 'Uniform Customs and Practice for Documentary Credits'. The letter of credit is used mainly in

international lending business and in goods trade. This form of settlement gives the buyer the certainty that he does not have to pay until the seller has delivered and has proven this by submitting clean documents. The seller has the certainty that he will receive payment after delivering the goods and presenting clean documents. Letter Of Credit (LC or L/C) is a conditional bank commitment issued on behalf of a customer to pay a third party in accordance with certain terms and conditions. The two primary types are commercial letters of credit and standby letters of credit. Letter Of Credit (LC) is:- (i) Letter of agreement issued by a bank stating a foreign purchaser has established a line of credit in a seller's favor, and confirming that payment for goods will be made upon presentation of certain documents which are in agreement with terms on the letter of credit. (ii) A letter addressed by a banker to a correspondent certifying that a person named therein is entitled to draw on him or his credit up to a certain sum. (iii) A letter addressed by a banker to a person, to whom credit is given, authorizing him to draw on the issuing bank or on a bank in his country up to a certain sum and guaranteeing to accept the drafts if duly made, also called Commercial Letter Of Credit, Confirmed Credit or Confirmed Letter Of Credit. Letters of credit may take various forms, represent various undertakings for various purposes and be subject to different conditions. A form letter issued by a bank indicating that a purchaser in a foreign country has established credit in a specified amount in the seller's favor and that payment will be made upon presentation of draft together with certain specified documents. A financial document issued by a bank at the request of the consignee guaranteeing payment to the shipper for cargo if certain terms and conditions are fulfilled. Normally it contains a brief description of the goods, documents required, a shipping date, and an expiration date after which payment will not longer be made. See also Confirmed Letter Of Credit, Documentary Letter Of Credit, Irrevocable Letter Of Credit, and Revocable Letter Of Credit. A written undertaking by a bank (issuing bank) given to the seller (beneficiary) at the request, and on the instructions of the buyer (applicant) to pay at sight or at a given future date up to a stated sum of money, within a prescribed time limit and against a stipulated set of documents (including the original Bill of Lading). Document issued by one bank authorizing a correspondent or agent bank to extend credit to the party named in the letter of credit, up to a certain amount and for a specified period. A letter of credit is not a credit instrument, but a means of transferring funds, or a method of payment. In presupposes that there are sufficient funds in the customer's account at the bank issuing the letter of credit. Through the letter of credit, the bank informs the correspondent or agent bank that the named party is authorized to withdraw a certain amount for a certain period. Letter Of Credit is a financial guaranty issued by a bank that permits the party to which it is issued to draw funds from the bank in the event of a valid unpaid claim against the other party; in reinsurance, typically used to permit reserve credit to be taken with respect to non-admitted reinsurance; and alternative to funds withheld and modified coinsurance. Letter of Credit is a conditional order in writing, issued by a buyer's bank, guaranteeing to pay the seller upon presentation of stipulated documents, strictly in accordance with the credit. It is strongly recommended that every exporter and importer has a copy of the 'Uniform Customs and Practice for Documentary Credits', International Chamber of Commerce publication 500. These are available from most major Chambers of Commerce, or from us at AUD20.00 including postage, handling and GST, to Australian addresses only. Letter of Credit – Confirmed:- a letter of credit which has been further guaranteed by a local bank generally in the exporter's country. Letter of Credit – Irrevocable:- a credit which cannot be revoked, cancelled or amended unless the beneficiary agrees. Virtually all L/Cs issued under UCP500. Letter of Credit – Discrepancy:- where a document does not comply strictly with the terms and conditions of an L/C. Letter of Credit – Under Reserve:- where documents with discrepancy/ies are nevertheless negotiated against an L/C, and the negotiating bank reserves the right to take back the funds from the exporter if the discrepancy is not acceptable to either the buyer or the L/C issuing bank. Letter Of Credit is a document issued by a bank authorizing an exporter to draw a stated amount of money from the issuing bank. Letters of credit are strictly fiduciary document. For the purposes of phytosanitary certification, letters of credit cannot be considered official notifications of changes or exceptions to plant quarantine regulations, which must come from the plant protection services of the foreign countries. Therefore, letters of credit are not phytosanitary documents and cannot be referenced on an export certificate. / Покрытый и Непокрытый Аккредитив. порядки и условия. Аккредитив относится к именной ценной бумаге удостоверяющей право лица, на имя которого она была выписана, получить в банке или любом другом кредитном учреждении указанную в ней сумму. Под Аккредитивом, от Латинского слова Accredo, означающее Доверяю, понимается поручение владельца счёта банку произвести платёж со счёта в другом банке на указанных условиях. К таким условиям может относиться, например, акцепт представляемых поставщиком счётов-фактур уполномоченным потребителя и тому подобное. Аккредитив – вид банковского счёта, по которому осуществляются безналичные расчёты. Аккредитивы по способу обеспечения платежа подразделяются на покрытые и непокрытые. Покрытыми являются аккредитивы, при открытии которых банк эмитент предварительно предоставляет в распоряжение исполняющего, подтверждающего или рамбурсирующего банка средства (валютное покрытие) в сумме аккредитива на срок действия обязательств банка эмитента с условием возможности их использования для выплат по аккредитиву. Все остальные аккредитивы являются непокрытыми. Валютное покрытие может предоставляться путём:- (i) кредитования суммой аккредитива корреспондентского счёта исполняющего, подтверждающего либо рамбурсирующего банка в банке эмитенте или другом банке; (ii) размещения банком эмитентом в исполняющем, подтверждающем либо рамбурсирующем банке депозитов покрытия или страховых депозитов; и (iii) предоставления исполняющему, подтверждающему либо рамбурсирующему банку права списать сумму аккредитива с ведущегося у него счёта банка эмитента в момент оплаты по аккредитиву. Такое списание может производиться как за счёт имеющихся на счёте банка эмитента средств, так и за счёт кредитных линий, открытых банку эмитенту. Аккредитив может быть авизован бенефициару через другой банк (авизующий банк) без обязательства со стороны авизующего банка, однако этот банк должен проверить по внешним признакам подлинность аккредитива, который он авизует. Если банк пользуется услугами другого банка или банков (авизующего банка(ов)) для авизования аккредитива бенефициару, то он должен и пользоваться услугами того же банка(ов) для авизования каких-либо изменений. Если банк решил не авизовать аккредитив, он должен немедленно информировать об этом банк эмитент. Если авизующий банк не может по внешним признакам установить подлинность аккредитива, он должен незамедлительно уведомить об этом банк, от которого, судя по полученному аккредитиву, поступили инструкции; если он всё же решил авизовать аккредитив, он должен сообщить бенефициару, что не смог установить подлинность аккредитива. Если банк эмитент уполномочивает или просит другой банк подтвердить его безотзывный аккредитив, и последний добавляет своё подтверждение, то такое подтверждение, если предусмотренные документы представлены и соблюдены все другие условия аккредитива, составляет твёрдое обязательство такого банка (подтверждающего банка) в дополнение к обязательству банка эмитента:- (i) если аккредитив предусматривает платёж по предъявлении, – платить по предъявлении документов, указанных в аккредитиве; (ii) если аккредитив предусматривает платёж с рассрочкой, – платить в сроки, определяемые в соответствии с условиями аккредитива; (iii) если аккредитив предусматривает акцепт, – акцептовать переводные векселя (тратты), выставленные бенефициаром на подтверждающий банк и оплатить их по наступлении срока платежа или акцептовать и оплатить по наступлении срока платежа переводные векселя (тратты), выставленные бенефициаром на подтверждающий банк в случае, если банк трассат, указанный в аккредитиве, не акцептует выставленные на него переводные векселя (тратты) или оплатить переводные векселя (тратты), акцептованные, но не оплаченные таким банком трассатом по наступлении срока платежа; и (iv) если аккредитив предусматривает негоциацию, – негоциировать без оборота на трассантов и/или добросовестных держателей переводные векселя (тратты), выставленные бенефициаром, и/или документы, представленные в соответствии с аккредитивом. Если банк, который уполномочен банком эмитентом или к которому банк эмитент обратился с

просьбой добавить свое подтверждение по аккредитиву, не готов это сделать, то он должен без задержки сообщить об этом банку эмитенту. Если только банк эмитент не укажет иного в своём полномочии или просьбе о подтверждении, авизующий банк может авизовать аккредитив бенефициару без добавления своего подтверждения. Если какой-либо банк по просьбе бенефициара подтверждает аккредитив, не имея на то полномочий банка эмитента, (закрытое подтверждение, silent confirmation), такой подтвердивший аккредитив банк не является подтверждающим в соответствии с Унифицированными Правилами, и банк эмитент не несёт перед таким банком ответственности, как перед подтверждающим банком, по возмещению произведённых им выплат по аккредитиву. Закрытое подтверждение относится только к отношениям между подтвердившим банком и бенефициаром, которые оформляются соглашением, предусматривающим, как правило, право регресса подтвердившего банка к бенефициару. В каждом аккредитиве должно быть указано, каким способом он исполняется:- путём платежа по предъявлении, платежа с рассрочкой, путём акцепта переводных векселей (тратт) бенефициара или негоциации переводных векселей (тратт) и/или других документов. В аккредитиве также должен быть указан исполняющий банк. Исполняющим банком может выступать сам банк эмитент (в таком случае аккредитив является прямым (простым)) или подтверждающий банк, или авизующий банк, или другой банк, уполномоченный банком эмитентом. В аккредитиве со свободной негоциацией любой банк является исполняющим банком. Стороны, заключающие внешнеэкономический контракт, могут предусмотреть, в зависимости от конкретных условий контракта, один из следующих способов исполнения аккредитива:- (i) платёж исполняющим банком (авизующим банком, банком эмитентом или другим банком, получившим на то полномочия) по предъявлении бенефициаром исполняющему банку обусловленных документов; (ii) платёж с рассрочкой исполняющим банком (авизующим банком, банком эмитентом или другим банком, получившим на то полномочия) в сроки, обусловленные в аккредитиве; (iii) негоциацию исполняющим банком (авизующим банком, другим указанным банком или любым банком, но не банком эмитентом) переводных векселей (тратт), выставленных бенефициаром сроком по предъявлении или в иной срок на банк эмитент или иной банк, указанный банком эмитентом, и/или документов, представленных по аккредитиву; и (iv) акцепт срочных тратт, выставленных бенефициаром на исполняющий банк (банк эмитент или иной банк, уполномоченный банком эмитентом). Указав в соответствии с инструкциями приказодателя (заявителя) аккредитива какой-либо банк в качестве исполняющего банка, банк эмитент тем самым уполномочивает такой банк произвести, в соответствии с условиями аккредитива, платёж, акцепт или негоциацию и обязуется предоставить такому банку соответствующее возмещение. Банк эмитент несёт перед исполняющим банком ответственность также за любую потерю процентов, если возмещение не произведено по первому требованию, как это оговорено в аккредитиве или взаимно согласовано. Приказодатель аккредитива обязан принять от банка эмитента правильно оплаченные документы и возместить ему понесённые им расходы. При негоциации (покупке) документов по аккредитиву банком, не являющимся исполняющим, банк эмитент не несёт никакой ответственности перед таким банком по предоставлению ему возмещения. Порядок возмещения исполняющему банку выплачиваемых им по аккредитиву средств указывается в аккредитиве. Возмещение может производиться непосредственно банком эмитентом (такое возмещение называется прямой (простой) рамбурс) или другим банком в соответствии с полученными от банка эмитента инструкциями и/или полномочиями. Под межбанковским рамбурсом понимается процесс возмещения, когда банк эмитент уполномочивает банк, не участвующий в аккредитиве (рамбурсирующий банк), произвести рамбурсирование (предоставить возмещение) по требованию исполняющего банка или выступающего от его имени другого банка (рекламирующего банка). Рамбурсирующий банк в соответствии с полученными от банка эмитента инструкциями и/или полномочиями (рамбурсными инструкциями) может принять на себя (выставить) самостоятельное рамбурсное обязательство – обязательство по отношению к рекламирующему банку оплатить его рамбурсное требование, если указанные в обязательстве условия выполнены. Если рамбурсное обязательство выставлено, рамбурс является подтверждённым. При проведении операций, связанных с межбанковскими рамбурсами, могут применяться Унифицированные Правила для Межбанковских Рамбурсов по Документарным Аккредитивам Международной Торговой Палаты, редакция 1996, Публикация № 525, для чего в тексте рамбурсных инструкций и аккредитивов должна быть сделана соответствующая оговорка. При авизовании аккредитивов и рамбурсных инструкций по системе SWIFT в соответствующих форматах 7 категории, указанные правила применяются без специальных оговорок об этом, если только в тексте сообщения не сказано об ином. По операциям с аккредитивами все заинтересованные стороны имеют дело только с документами, а не с товарами, услугами и/или другими видами исполнения обязательств. Во всех инструкциях об открытии аккредитивов, в самих аккредитивах, а также во всех инструкциях об изменениях аккредитивов и в самих изменениях должны быть точно указаны документы, против которых следует производить платёж, акцепт или негоциацию. Для характеристики организаций и лиц, выдающих какие-либо документы, не должны употребляться такие термины, как ‘первоклассный’, ‘хорошо известный’, ‘квалифицированный’, ‘независимый’, ‘официальный’, ‘компетентный’, ‘местный’ и тому подобные. В случае, когда такие термины включены в условия аккредитива, банки принимают соответствующие документы в том виде, в каком они предъявлены, при условии, что по внешним признакам они соответствуют другим условиям аккредитива и не были выставлены бенефициаром. Перечень документов, подлежащих представлению бенефициаром по аккредитиву для получения платежа, определяет приказодатель аккредитива – импортёр. Банки при рассмотрении вопроса о том, принять или отказать в приёме того или иного документа, руководствуются только соответствующими положениями Унифицированных Правил, если аккредитив прямо не предусматривает, какого характера и с какими оговорками документ должен быть представлен. Внешнеэкономический контракт, предусматривающий расчёты в форме аккредитива, как правило, должен содержать полный перечень и точную характеристику документов, подлежащих представлению по аккредитиву, а также предусматривать возможные оговорки в документах (например, касающиеся оплаты транспортных расходов, возможности отклонения от указанных в аккредитиве суммы, веса или количества товара и другое). В условия аккредитива должны включаться только такие положения контракта, которые могут быть подтверждены представленными банку документами. Эти условия также не должны содержать лишние подробности и детали, касающиеся товара, условий поставки и другие, затрудняющие исполнение аккредитива. Банки должны тщательно проверять документы, чтобы удостовериться, что по внешним признакам они соответствуют условиям аккредитива и не противоречат друг другу. Соответствие документов условиям аккредитива по внешним признакам устанавливается исходя из общепринятой международной банковской практики, отражённой в Унифицированных Правилах. Банки проверяют также выполнение бенефициаром и других условий аккредитива (сроков и так далее). В случае представления бенефициаром документов, не соответствующих требованиям аккредитива, либо нарушения каких-либо иных условий аккредитива подтверждающий банк или банк эмитент, или исполняющий банк, действующий от их имени, вправе отказать в приёме документов для оплаты, акцепта или негоциации по аккредитиву. Бенефициары – клиенты уполномоченного банка должны обеспечивать своевременное представление уполномоченному банку документов, находящихся в строгом соответствии с условиями аккредитива, и соблюдение других указаний, содержащихся в аккредитиве. Банки, прибегающие к услугам другого банка или других банков для выполнения инструкций приказодателя, делают это за счёт и риск данного приказодателя. Банки не несут обязательств или ответственности в случае невыполнения передаваемых ими инструкций, даже если они сами взяли на себя инициативу в выборе того или иного банка. Приказодатель связан всеми обязательствами и ответственностью, которые вытекают из законодательства и обычаев

государств участвующих в аккредитиве сторон, и обязан возместить банкам расходы, связанные с их исполнением. На бенефициара не распространяются договорные отношения между банками, а также между приказодателем и банком эмитентом. Банки не несут ответственности за форму, полноту, точность, подлинность, подделку или юридическую силу любых документов, равно как и за общие и/или частные условия, содержащиеся в документах или включённые в них дополнительно. Банки также не несут ответственности за описание, количество, вес, качество, состояние, упаковку, доставку, стоимость или фактическое наличие товара, указанного в документах, а также за добросовестность, действия и/или бездействие, платёжеспособность, выполнение обязательств и репутацию грузоотправителей, перевозчиков, экспедиторов, грузополучателей, страховщиков товаров или любых других лиц. Банки не несут ответственности за последствия, вызванные задержкой и/или утерей в пути любых сообщений, писем или документов, за задержку, а также искажение или другие ошибки, возникающие при передаче телекоммуникационных сообщений. Банки не несут никакой ответственности за ошибки в переводе и/или толковании технической терминологии и оставляют за собой право передавать термины аккредитивов без их перевода. Банки не несут ответственности за невыполнение своих обязательств в связи с приостановлением их деятельности по причине стихийных бедствий, бунтов, гражданских волнений, восстаний, войн или каких-либо других не зависящих от них обстоятельств, а также из-за забастовок или локаутов. По возобновлении своей деятельности банки не будут без специального на то разрешения производить оплату, принимать обязательство платежа с рассрочкой, акцептовать переводные векселя (тратты) и/или производить негоциацию по аккредитивам, срок действия которых истёк во время такого приостановления деятельности банков. Аккредитив открывается банком эмитентом и доводится до сведения бенефициара, как правило, при посредничестве авизующего банка, которому направляется телетрансмиссионное сообщение (сообщение, переданное по SWIFT, телексу и тому подобному) либо письменный документ (по почте). Аналогичным образом оформляются также и любые изменения и дополнения к аккредитиву. При работе с аккредитивами с использованием телетрансмиссионных средств банки, как правило, используют сообщения 7-й категории в соответствии со стандартами SWIFT. Международной Торговой Палатой разработаны и рекомендованы к применению стандартные формы аккредитива. Стандартная форма аккредитива, оформляемого в виде письменного документа (при открытии аккредитива по почте), представляет собой комплект бланков, который состоит из авизо для бенефициара, авизо для авизующего банка, информационной копии для приказодателя, контрольной копии и, при необходимости, одной или нескольких дополнительных копий для банка эмитента. Банки вправе применять другие формы аккредитива. Телетрансмиссионное сообщение является рабочим аккредитивом или рабочим изменением к аккредитиву и не требует почтового подтверждения за исключением случаев, когда в это сообщение включены слова:- ‘подробности следуют’ (или слова аналогичного значения) или в нём указано, что рабочим аккредитивом или рабочим изменением будет почтовое подтверждение. Инструкции по открытию аккредитивов, сами аккредитивы, инструкции по внесению в них любых изменений и сами изменения должны быть полными и точными. Если полученные инструкции об авизовании, подтверждении или изменении аккредитива неполны или неясны, банк, которому адресованы эти инструкции, может послать бенефициару предварительное уведомление только в порядке информации и без ответственности со своей стороны. Аккредитив авизуется, подтверждается или в него вносятся изменения только после получения банком необходимой дополнительной информации и при согласии банка действовать в соответствии с инструкциями. Расхождения в представленных документах:- В том случае, если:- (i) в результате проверки сотрудником уполномоченного банка представленных бенефициаром документов по аккредитиву обнаружены расхождения документов с условиями аккредитива или между собой (неправильно оформлены транспортные документы или переводные векселя (тратты), на транспортном документе нет указания об оплате транспортных расходов (фрахта) или о погрузке на борт, если это требуется по условиям аккредитива, недостаточна сумма страхования или страхование согласно страховому документу вступает в силу позднее даты отгрузки, описание товара в счёте-фактуре не соответствует его описанию в аккредитиве, в счёте-фактуре указаны расходы, не предусмотренные в аккредитиве и другое); (ii) не представлены предусмотренные аккредитивом оригиналы каких-либо документов или необходимое количество их копий; и/или (iii) документы по аккредитиву представлены по истечении сроков, установленных аккредитивом, – уполномоченный банк незамедлительно сообщает бенефициару о всех обнаруженных расхождениях и просит бенефициара переоформить документы, если это возможно, либо предоставить инструкции по поводу документов с расхождениями. Данное сообщение должно быть направлено уполномоченным банком бенефициару не позднее седьмого рабочего дня после дня представления документов, и в нём должно быть также указано, держит ли уполномоченный банк документы у себя в распоряжении бенефициара либо возвращает их ему. Возвращаемые документы направляются бенефициару с сопроводительным письмом, подписанным наделённым соответствующими полномочиями работником уполномоченного банка. Если переоформление документов, содержащих расхождения с условиями аккредитива, которые были обнаружены бенефициаром или уполномоченным банком, по каким-либо причинам невозможно, а также в случае истечения сроков для представления документов исполняющему банку бенефициар может:- (i) незамедлительно связаться с приказодателем с просьбой дать инструкции банку эмитенту об изменении условий аккредитива (пролонгировать сроки или изменить другие условия) или принять документы с указанными расхождениями; (ii) просить уполномоченный банк незамедлительно посредством телетрансмиссии (за счёт бенефициара) обратиться к банку эмитенту с просьбой изменить условия аккредитива или дать согласие (поручение) на совершение платежа, акцепта или негоциации; (iii) поручить уполномоченному банку отправить документы на инкассо; и (iv) просить уполномоченный банк совершить условный (с оговоркой) платёж, акцепт или негоциацию или выдать гарантию исполняющему аккредитив банку нерезиденту для совершения им условного платежа, акцепта или негоциации. При совершении условного платежа, акцепта или негоциации уполномоченный банк, направляя документы банку эмитенту или подтверждающему банку, указывает перечень имеющихся расхождений. Условный платёж или негоциация против принятых документов с расхождениями даёт уполномоченному банку право регрессного требования против бенефициара в случае, если банк эмитент или подтверждающий банк в срок, не превышающий семи рабочих дней после получения им документов, примет решение об отказе в приёме документов с расхождениями и потребует возврата выплаченных по аккредитиву сумм, а условный акцепт даёт право уполномоченному банку аннулировать свой акцепт. При условном акцепте переводные векселя (тратты) хранятся в уполномоченном банке до получения им сообщения от банка эмитента (подтверждающего банка) о принятии документов с расхождениями или истечения установленного Унифицированными Правилами срока в семь рабочих дней для проверки документов банком эмитентом (подтверждающим банком), после чего могут быть выданы бенефициару. Если банк эмитент или подтверждающий банк до окончания срока в семь рабочих дней после получения им документов не направил уполномоченному банку телетрансмиссионное сообщение об отказе в приёме документов с расхождениями, уполномоченный банк не обязан выполнять основанное на расхождении в документах требование банка эмитента или подтверждающего банка о возврате уплаченной бенефициару суммы. Если банк эмитент или подтверждающий банк своевременно отказывает в приёме документов ввиду наличия расхождений, уполномоченный банк незамедлительно информирует об этом бенефициара и запрашивает его указаний относительно документов:- поручить банку эмитенту представить документы приказодателю на базе инкассо или вернуть их бенефициару. При этом, если уполномоченный банк ранее произвёл условный платёж или негоциацию, выплаченная сумма, а также суммы комиссии, расходов и процентов за пользование средствами списываются со

счёта бенефициара в бесспорном порядке, если это предусмотрено в договоре между бенефициаром и уполномоченным банком. Списание оформляется мемориальным ордером, первый экземпляр которого помещается в документы для уполномоченного банка, второй – в аккредитивное дело, третий экземпляр направляется бенефициару. В случае условного акцепта переводные векселя (тратты) аннулируются путём их уничтожения либо производится аннулирование акцепта путём его зачеркивания. Бенефициару направляется письменное извещение об аннулировании акцептованных переводных векселей (тратт) или возвращаются переводные векселя (тратты) с аннулированным акцептом. Взаимные права и обязанности уполномоченного банка и бенефициара при совершении условного платежа, акцепта или негоциации оговариваются в договоре, заключаемом между ними. Уполномоченный банк не несёт ответственности в случае отказа банка эмитента или подтверждающего банка в соответствии с положениями Унифицированных Правил принять документы, содержащие расхождения с условиями аккредитива, если на эти расхождения уполномоченным банком было указано бенефициару. Аккредитив – обязательство банка выплатить продавцу товаров или услуг определенную сумму в случае представления им документов, подтверждающих отправку товара или выполнение услуги, соответствующих условиям такого обязательства. Аккредитив или Письмо о Кредите (ПК) – финансовое обязательство или документ, выписывается банком и гарантирует оплату векселей клиента вплоть до определённой суммы в течение указанного периода времени. Он является заменой банковского кредита для покупателя и устраняет риск для продавца. Аккредитивы широко используются в международной торговле. Коммерческие (торговые) аккредитивы (commercial letter of credit), как правило, выписываются на третью сторону, называемую бенефициаром. Подтверждённый аккредитив (confirmed letter of credit) предоставляется банком корреспондентом и гарантируется выпустившим его банком. Револьверный или Возобновляемый Аккредитив (revolving letter of credit) выпускается на определённую сумму и автоматически возобновляется на ту же сумму в течение определённого периода времени, что даёт возможность выписывать любое число векселей, пока они не превышают совокупный лимит. Аккредитив Путешественника (traveler's letter of credit) выпускается для удобства путешествующих клиентов, и в нём, как правило, перечисляются банки корреспонденты, в которых векселя могут быть оплачены. Аккредитив под исполнение (performance letter of credit) выпускается для гарантирования исполнения контрактных обязательств. Расчёты при помощи товарных аккредитивов осуществляются в таком же порядке, как и внутри страны. Особенность состоит в том, что в отличие от внутренних расчётов, оплата аккредитива осуществляется не в банке поставщика (экспортёра), а в банке покупателя (импортёра). В банковской практике по обслуживанию вывозо-ввозных (или экспортно-импортных) операций встречаются некоторые особенные формы аккредитива:- револьверный (постоянно пополняется до установленного уровня, используется для оплаты регулярных поставок товаров); компенсационный (предусматривает многоразовое использование аккредитива для параллельных расчётов со многими поставщиками). От операций по обслуживанию вывозо-ввозных (или экспортно-импортных) операций коммерческие банки имеют прибыль, состоящую из комиссионного вознаграждения и процента за кредит (в случае его предоставления). Под Аккредитивом, от Латинского слова Accredo, означающее Доверяю, понимается:- (1) Денежный Аккредитив – документ, именная ценная бумага, дающая право конкретному физическому или юридическому лицу, на чьё имя она выдана, получить указанную в аккредитиве сумму полностью или частично в кредитном учреждении (банке) в течение определённого срока; или (2) Товарный Аккредитив – форма расчётов между компаниями и организациями, смысл которой состоит в том, что плательщик даёт поручение своему банку, чтобы банк, обслуживающий получателя платежа, оплатил требуемую сумму в оговорённый срок на основе условий, записанных в аккредитивном заявлении плательщика. Товарный аккредитив применяется для расчётов главным образом при сделках купли-продажи. Имеется пять видов товарного ккредитива:- (а) Отзывной – покупатель имеет право в любое время его отозвать или изменить условия; (б) Безотзывной – в течение конкретного времени аккредитив не может быть отозван без согласия продавца; (в) Подтверждённый – банк-корреспондент даёт продавцу гарантию платежа; (г) Револьверный – автоматически возобновляемый после очередного платежа и на прежних условиях, вплоть до предельной суммы; (д) Переводной – продавец имеет право переадресовать платежи третьему лицу. Все отношения между сторонами по аккредитивным платежам и правила проверки документов описаны в Унифицированных Правилах и Обычаях для Документальных Аккредитивов, издаваемых Международной Торговой Палатой. За проведение операций по аккредитивам банки получают комиссию. Аккредитив:- (1) денежный документ, содержащий поручение о выплате определённой суммы денег физическому или юридическому лицу в соответствии с условиями, указанными в документе. Денежные аккредитивы являются именными. Они позволяют получить указанную в аккредитиве сумму полностью или частями в течение определённого периода времени. (2) Способ безналичных расчётов между предприятиями и организациями, суть которого состоит в том, что банк плательщика даёт поручение банку, обслуживающему получателя платежа, оплатить требуемую сумму в оговорённый срок на основе условий, предусмотренных в аккредитивном заявлении плательщика.

LETTER OF CREDIT OPENING = ОТКРЫТИЕ АККРЕДИТИВА (или ПИСЬМО ОБ ОТКРЫТИИ АККРЕДИТИВА) – Letter Of Credit Opening is a letter by the bank of the principal notifying the beneficiary that a letter of credit has been opened. / Письмо банка принципала, извещающее бенефициара об открытии аккредитива.

LETTER OF GOOD STANDING = ПИСЬМО О БЛАГОСОСТОЯНИИ – In the United States, a Letter Of Good Standing is a document that is provided by a parent body or a head body, which confirms the name of an internal division and its status as a branch, section, parish, or congregation. The document must give the date the internal division was established, the name of the governing document under which it was established, and the name of the governing document it currently follows. The document must be dated and signed by a director or trustee of the parent body or the head body, and must show their position.

LETTER OF HYPOTHECATION = ПИСЬМО ОБ ИПОТЕКЕ (или ЗАЛОГОВОЕ ПИСЬМО) – Letter Of Hypothecation:- when a bank discounts a draft, it obtains only the documents and not the goods as collateral. However, if the bank requires the drawer to sign a 'letter of hypothecation' the bank obtains possession of the goods themselves and can dispose of them if the drawee does not honor the draft. When this happens, the bank sends the 'Letter of Hypothecation' to its agents or branch abroad, who can then sell the goods if the draft is not honored.

LETTER OF INDEMNITY = ПИСЬМО О ВОЗМЕЩЕНИИ (УБЫТКОВ) (или ГАРАНТИЙНОЕ ПИСЬМО) – Letter Of Indemnity (LOI) for issuing clean bills of lading (B/Ls). Shippers may offer to give the carrier an LOI in return for issuing clean B/Ls (often because they would otherwise not be paid by their buyer) even though the goods are in some way defective. Whilst the issuance of LOIsby the shipper to the carrier is not per seillegal, the LOI will be unenforceable if the carrier had been deceitful in that he knew the goods were not in good order and condition but nonetheless issued a clean B/L. Courts have held that this is tantamount to fraud on the receiver and the court will therefore not assist the carrier in enforcingthe LOI against the shipper. Letters Of Indemnity can be used for numerous situations where a voyage is not completed in accordance with the terms of the Bill of Lading, e.g., a change of discharge port. However, the most common Letter of Indemnity is the Letter of Indemnity used to procure the delivery of cargo in the absence of production of the Bill of Lading. In this regard, where a receiver/ultimate buyer is unable to present a Bill of Lading to the carrier in order to obtain his cargo, then he may seek a Letter of Indemnity instead. This happens in every trade, but in view of fast voyage times and

multiple sales/purchase contracts, it is almost invariable in the oil/tanker trade. It has been noted as to how a Bill of Lading works to draw transactions together. In a perfect world, the Bill of Lading will arrive at the discharge port at the same time as the vessel. However, invariably, this does not happen. Thus, delivery is taken as against an LOI. This is the wording required by the P&I Clubs (short for Protection and Indemnity Clubs). This LOI:- (i) indemnifies the carrier for delivery; (ii) undertakes to surrender the Bill on receipt of the Bill; and (iii) will also include a choice of law jurisdiction clause. It is to be noted that under English law, a Master is not obliged to give delivery under an LOI (unless ordered by the Court). He is entitled to insist on the original Bill of Lading being presented. However, in relation to Charterparties, there are often Charterparty terms requiring the Master to give delivery against an LOI. In many cases, where the Receiver is not a well-established company, the receiver will require the LOI to be signed by a bank. P&I Clubs do not regard delivery of cargo without a Bill of Lading as a mutual risk. The carrier is, therefore, 'off cover' in respect of misdelivery if he gives such an LOI. Thus, the LOI effectively takes the place of his P&I cover. A Receiver presenting an LOI (an Indemnifier) is liable to indemnify the carrier not only for the claim of a Bill of Lading holder but also costs incurred by the ship, i.e. provision of security, release from arrest or loss of hire. If damages are an insufficient remedy, the Court can order specific performance. If a Bank countersigns an LOI without qualification, it is probably signing as Indemnifiers (rather than as a verifier of their customer's signature). Carriers should ensure that any LOI is issued with the authority of the Indemnifier. Letter Of Indemnity (LOI) is a letter indemnifying a company the carrier from the consequences associated in the release of goods without an original bill of lading. This practise should be exercised with extreme caution, and cannot be recommended. When a bank does not wish to accept a so-called 'Foul Bill Of Lading' the shipper (so that there shall be nothing to prevent the draft in question from being discounted, or for any other reason) may obtain a clean bill of lading. To do so, the shipper signs a so-called 'Letter Of Indemnity', on the basis of which the shipper may obtain the clean bill of lading although the dock or mate's receipt, given on delivery of the goods to dock or ship, showed that the shipment was damaged or in bad condition. In order to obtain the clean bill of lading, the shipper signs a letter of indemnity to the carrier on the basis of which may be obtained the clean bill of lading, although the dock or mate's receipt showed that the shipment was damaged or in bad condition. / , например, изменение порта разгрузки. хозяин (или капитан).

LETTER OF INDEMNITY FOR MISSING BILL OF LADING = ПИСЬМО О ВОЗМЕЩЕНИИ (УБЫТКОВ) ПО НЕДОСТАЮЩЕМУ КОНОСАМЕНТУ – Letter Of Indemnity For Missing Bill Of Lading is used specifically for importers when the bill of lading is missing. It has a purpose to secure any claims by the shipping line/shipping company on:- (i) the buyer resulting from the goods arriving from overseas being released without the original bill of lading being presented (e.g., due to postal delays or even loss); and (ii) the supplier due to issuance of a replacement bill of lading (original misplaced or lost). Guarantee amount:- 1 to 2 years; in practice, however, often unlimited or until the original bill of lading or release document from the beneficiary is presented. Term:- 1 to 2 years; in practice, however, often unlimited or until the original bill of lading or release document from the beneficiary is presented. In practice, the wording of the guarantee is frequently stipulated by the shipowner and must be sent directly by the debtor, with a counter-guarantee from the bank, to the shipping line.

LETTER OF WISHES = ПИСЬМО О ВОЛЕИЗЪЯВЛЕНИЯХ – Letter Of Wishes is a letter of wishes is a document that purportedly has no legal status. In fact the document is used to transmit the wishes of the creator or the alleged owner of the trust to the trustee. A letter of wishes is a separate document and not a part of the trust instrument. Letters of wishes are generally used by the beneficial owner of the trust assets to retain some control over the trust assets. Trustees normally welcome this tool. It enables them to exercise their discretion having in mind the wishes of the grantor. The trustee may consider the letter but is not bound or otherwise accountable by its terms. In reality the letter of wishes will be honored as if it were a binding legal document. Although a letter of wishes is frequently associated with abusive trusts, both domestic and offshore, it is also used as a part of normal estate planning and in other contexts for legitimate purposes.

LETTING OFF = ПОДАЧА И НАТЯЖЕНИЕ (ОСНОВЫ) – Letting Off is the releasing warp yarns from the warp beam as the weaving operation proceeds.

LEUCO = ЛЕЙКО – A term Leuco refers to vat dyes in the reduced form; in general a prefix meaning white. Vat dyes are converted from the insoluble pigment form to the soluble leuco dye form by means of a reducing agent and an alkali, often sodium hydrosulfite and sodium hydroxide. Sulfur dyes are also converted to leuco form for application. Once on the fiber, the leuco form is converted back to the insoluble pigment by oxidation. In spite of the formal definition of leuco as a prefix, dyes are often still colored in the leuco form (for example, leuco indigo is yellow-green). / Щёлочь (Alkali). Лейко – приставка, означающая бесцветные или малоокрашенные производные красителей.

LEVEE = ДАМБА ОБВАЛОВАНИЯ (или БЕРЕГОВОЙ ВАЛ) – Levee (also called Bund or Dike):- an embankment of soil for retaining water inside the ricefield. A dike made of soil to retain water in Rice fields. / Под Обвалованием понимается система заградительных земляных валов (защитных дамб) вдоль берегов рек, водохранилищ, морских побережий и тому подобного. Служит для защиты прилегающей территории от временного затопления в паводок, во время приливов, ветрового нагона воды.

LEVEL = УРОВЕНЬ (или НИВЕЛИР) – Level is a flat surface of a ricefield, a horizontal line, or an index of altitude. / Под Нивелиром, от Французского слова Niveler, означающее Выравнивать, понимается оптико-механический инструмент для геометрического нивелирования, снабжённый зрительной трубой, вращающейся в горизонтальной плоскости, и чувствительным уровнем.

LEVEL = УРОВЕНЬ (или РОВНОТА) – Level is uniform in shade over the surface of a piece of dyed fabric or along the length of dyed yarn. Level dyeing is usually the objective in commercial processes. Some dyes, such as leveling acid dyes, are easy to accomplish level results with. They do not bind tightly to the fabric in the dye bath, and dye can leave the fiber and re-enter the dye bath. Other dyes, such as reactive dyes, don't level as easily, and greater care is required to achieve level results. In general, level dyeing is promoted by good agitation, careful control of the rate of rise of the temperature of the dye bath, control of pH, and sometimes by use of special leveling agents or retarders. It is often the case that the dyes that level most easily are the least washfast. Level is a dye term referring to even color.

LEVELER = ПЛАНИРОВЩИК (или УРАВНИТЕЛЬ) – (1) Leveler is a dock plate that adjusts to the height of a trailer. / табличка.

(2) A Laser Land Leveller – a machine equipped with a laser guided drag bucket – is much more effective and quicker in ensuring a flat table-top like surface. An even land means irrigation water reaches every part of the field with minimal waste from run-off or water-logging. See also Laser Levelling.

LEVELING = ВЫРАВНИВАНИЕ (или НИВЕЛИРОВАНИЕ, или ВЫВЕРКА) – (1) Leveling is a migration leading to uniform distribution of dye in a dyed material. Leveling may be a property of the dye or it may require chemical assistance.

(2) Leveling is a land preparation involving moving soil from high to low spots in the field to achieve a flat horizontal surface so that irrigation water will be evenly distributed throughout the field. / Нивелирование; выравнивание пашни. Под Нивелированием понимается определение высот точек земной поверхности относительно некоторой избранной точки или над уровнем моря. Различают геометрическое, тригонометрическое и другие виды нивелирования.

LEVELING ACID DYE = ВЫРАВНИВАЮЩИЙ КИСЛОТНЫЙ КРАСИТЕЛЬ – Leveling Acid Dye is a class of acid dyes. Leveling acid dyes typically offer bright colors and level easily. Unfortunately, the same property that makes it easy to get level results causes washfastness that is not as good as that of many other acid dye classes. Leveling acid dyes are often used for wool.

LEVELING AGENT = ВЫРАВНИВАЮЩИЙ АГЕНТ (или ВЫРАВНИВАТЕЛЬ) – Leveling Agent is a dyebath additive to promote level dyeing. See also Retarder.

LEVEL LOOP = РОВНАЯ ПЕТЛЯ – Level Loop is a term describing a tufted or woven carpet with uncut, equal length loops composing the pile surface.

LEVEL RETURN = НИВЕЛИРОВАНИЕ (или СОФИТ/НИЖНЯЯ ПОВЕРХНОСТЬ РАЗВОДКА/ОТРАЖЕНИЕ) – Level Return is a lumber filler placed horizontally from the end of an overhang tail returning back to the outside wall, to form a soffit that is level with the ground. Level Return:- lumber filler placed horizontally from the end of an overhang to the outside wall to form a soffit. Also known as Soffit Return. / .

LEVERAGE = ПЛЕЧО (или РЫЧАГ, или ПРЕУМНОЖЕНИЕ, или УСИЛЕНИЯ) – (1) A term Leverage means of enhancing profitability using borrowed money. A leverage effect can also be achieved with derivatives, enabling market operators to invest in sizeable holdings of an underlying for a relatively modest capital outlay. The upshot of leveraging is that any percentage change in the gains and losses on options and futures contracts will be larger than the corresponding change in the underlying. Leverage is the ability to use a small amount of money to attract other funds, including loans, grants and equity investments. The effect on a company when the company has bonds, preferred stock, or both outstanding. Example:- if the earnings of a company with 1 000 000 common shares increases from USD1 000 000.00 to USD1 500 000.00 – earnings per share would go from USD1.00 to USD1.50, or an increase of 50 percent. But if earnings of a company that had to pay USD500 000.00 in bond interest increased that much – earnings per common share would jump from 50 cents to USD1.00 a share, or 100 percent. The ability to control large amounts of currency/commodity with a comparatively small amount of capital. Leverage is the ratio between the amount of the pledge and the borrowed funds allocated for it:- 1:100, 1:200, 1:500. The leverage 1:100 means that for a deal execution you should have the trading account with the broker in the amount of 100 times less than the transaction sum. The crediting coefficient is called the Leverage. Its value may vary widely from 1:1 to 1:500, which means the possibility of buying/selling the currencies by the client in the amount exceeding the pledge sum of 500 times! For example, if the trader chooses the leverage 1:100 for the trading account and makes the deposit of USD100, then he/she has the opportunity to purchase the currency amounting to 100 x 100 = USD10 000. After the currencies purchasing, in case of favorable movements, the trader executes the sale, thereby makes profit on rates variance. Id est, he/she completes the transaction. At the moment of sealing the bargain the credit automatically closes, the pledge sum remains on the trader's account as well as the earned profit in full. It is this scheme that allows to gain significant profit, sometimes exceeding the amount of the pledge involved in a certain transaction, at slight changes in foreign exchange rates. The trader's risk is restricted only by the amount of the pledge, as the financial dealer (dealing center) does not provide the real amount of currencies for the whole sum of the opened transaction, but only guarantees the deposit of the loss or profit sum in full at the deal's closing. The closure of a transaction is the opposite operation: for buying some currencies amount it is selling the same volume of it and vice versa. The definition of the leverage is inseparably linked to the margin. Yet, at a closer look, there are differences between these two concepts. But there is one benefit for the stock jobber:- the more the leverage is, the more the ratio of his/her own funds and possible speculative transactions is in favor of the latter. But how does it affect on the trading itself? Let us start with the history of the margin. Initially, the margin trade principle was associated with transactions on commodity markets. In the XIX century the commodity exchanges were markets on which trade deals were carried out in cash. The brokers, who provided services for transactions' executions, transfers of money and accounts management were the dealers at these markets. The brokers maintained accounts using a special method of recording, so-called 'Circle' Recording. This method was the most efficient to settle accounts between clients at frequents resales of goods. The circle method of calculations had been applied on futures' markets up to the 1920's, as long as it met the needs of these markets. Within the framework of this method the exchange members, making deals, were to fulfill their obligations set by these contracts as the parties to a treaty. They were the only ones to be responsible for the execution of deal obligations. Thanks to such payment system clients did not need to deposit their own funds to financially guarantee the fulfillment of any exchange-traded contract and could enjoy trading at lower prices. The previous method of settlements was more advantageous for that stage of exchange trade, when most transactions were purely commercial, i.e. purchase and sale of contracts implied a real demand for goods or the good itself. The members of exchange had to have substantial financial assets to guarantee the execution of obligations under any condition. But at the beginning of the last century, as the speculative transactions were growing in numbers, more innovative risk management technologies appeared on the part of brokers, margin trading was a great option for those who wanted to make their fortune from a paltry sum of money (traders) and those who made good profit from this desire (brokers). So, if talking about Forex is topical, then it is time to move to the concept of leverage. Leverage is the use of borrowed assets by a business to enhance the return on the owner's equity. The expectation by the company is that the interest rate charged will be lower than the earnings made from the loan. Leverage is the ability to gear your account into a position greater than your total account margin. For instance, if a trader has USD1 000 of margin in his account and he opens a USD100 000 position, he leverages his account by 100 times, or 100:1. If he opens a USD200 000 position with USD1 000 of margin in his account, his leverage is 200 times, or 200:1. Increasing your leverage magnifies both gains and losses. To calculate the leverage used, divide the total value of your open positions by the total margin balance in your account. For example, if you have USD10 000 of margin in your account and you open one standard lot of USD/JPY (100 000 units of the base currency) for USD100 000, your leverage ratio is 10:1 (USD100 000 / USD10 000). If you open one standard lot of EUR/USD for USD150 000 (100 000 x EURUSD 1.5000) your leverage ratio is 15:1 (USD150 000 / USD10 000). A Leverage is the potential to magnify profits or losses by incurring exposure to large positions from a small investment outlay. See also Gearing. The ability to control large amounts of an underlying variable for a small initial investment. Futures and options are regarded as leveraged products because the initial premium paid by the purchaser is generally much smaller than the nominal amount of the underlying. Leverage is usually measured as a quantity called Lambda. Many structured notes are said to be leveraged because their coupon is governed by a multiple of a reference interest rate (such as Libor). It is also possible to deleverage a note by linking its coupon to a fraction of the reference rate. Leverage gives a trader the ability to increase the potential return on an investment. Leverage works both ways however; it increases potential returns, but it also increases potential risk. Therefore leveraging magnifies both gains and losses. / (более известная в Англоязычном звучании как ЛАЙБО или ЛИБО (LIBOR)). Преумножение. В технике под Рычагом понимается устройство для уравновешивания большей силы меньшей, дающее выигрыш в силе, при этом столько же проигрывающее в перемещении и не дающее выигрыша в работе. Рычаг:- (1) Операционный Рычаг:- – доля фиксированных операционных издержек компании (оплата

аренды помещения, страхования, заработная плата административных работников) в противоположность переменным издержкам (материалы, прямые расходы на оплату труда). В полностью автоматизированной компании, почти все издержки которой являются фиксированными, увеличение объёма продаж на 1 Доллар означает увеличение на 1 Доллар операционных доходов после достижения точки безубыточности (момента, когда стоимость продаж равна издержкам) (breakeven point), поскольку издержки остаются постоянными при любом уровне производства. В противоположность этому компании, издержки которых значительно изменяются, демонстрируют относительно небольшое увеличение операционных доходов при увеличении производства и объёма продаж, поскольку объём издержек растёт вместе с объёмом производства. Рычаг возникает потому, что небольшое изменение объёма продаж приводит к большим изменениям операционных доходов и издержек. Уровень операционного рычага (degree of operating leverage) – отношение процентного изменения операционного дохода к процентному изменению объёма продаж или числа проданных единиц товара – является мерой чувствительности прибылей компании к изменениям объёма продаж. Компания, где уровень операционного рычага высокий, имеет точку безубыточности при относительно высоком уровне продаж. (2) Финансовый Рычаг или соотношение заёмных и собственных средств (debt-to-equity ratio), или отношение суммарных обязательств и долгосрочных заимствований к акционерному капиталу, или отношение суммы долга (long-term debt) (обычно в виде облигаций) и привилегированных акций (preferred stock) к акционерному капиталу (shareholders' equity). Чем больше доля долгосрочных обязательств, тем выше финансовый рычаг. Акционеры получают пользу от финансового рычага в той степени, в какой доход, приносимый заёмными средствами, выше затрат на оплату процентов, а также в той степени, в какой растёт рыночная стоимость их акций. По этой причине финансовый рычаг часто называется торговлей капиталом (trading on the equity). Поскольку финансовый рычаг также означает уплату процентов и выплату основной суммы долга, то, следовательно, риск невыплаты долга и желаемый уровень соотношения заёмных и собственных средств в значительной степени определяют стабильность доходов. В качестве универсального правила можно предложить следующее:- промышленная компания с долей долга в акционерном капитале более чем 30% имеет высокий уровень финансового рычага (исключением являются фирмы с надёжным доходом и потоком наличности, например, энергетические компании). Поскольку проценты по долгосрочным займам являются для компании фиксированными расходами, финансовый рычаг, как правило, используется тогда, когда операционные издержки становятся стабильными, что ещё больше увеличивает влияние на доходы в расчёте на акцию изменений в уровне продаж. В общем высокий уровень операционного рычага должен сопровождать низкий уровень финансового рычага, и наоборот. (3) Инвестиционный Рычаг:- способы увеличения прибыли или стоимости без увеличения инвестиций. Покупка ценных бумаг под маржу является примером инвестиционного рычага; усиление рычага возможно, если приобретённые с его использованием ценные бумаги могут быть конвертированы в обыкновенные акции. Права (rights), гарантии (warrants) и опционы обеспечивают рычаг без участия заёмных средств, но с перспективой получения высокой прибыли при небольших инвестициях или без вложения новых средств вообще.

(2) Leverage:- the ratio of a company's debts to total capital or shareholders' funds. In a buoyant market, a high proportion of debt has a beneficial effect on share earnings, because it is usually possible for the company to earn more on its loan capital than it is paying in interest. In such circumstances, high gearing is beneficial to shareholders. Conversely, a fall in demand or a rise in interest rates affects a highly-geared company adversely. A company's leverage or gearing often has a significant effect on its share price in an open market. Also known as Gearing in the United Kingdom. Ratio Leverage = Net Debt / Total Capital.

(3) In connection with options and warrants, Leverage is a key figure used to establish in a purely arithmetic manner the number of units that the value of a warrant would rise or fall if the underlier rises or falls by one unit. Formula:- Price Of Underlier / (Subscription Ratio x Option or Warrant Price).

LEVERAGE CONTRACT = КОНТРАКТ С ПРОПОРЦИОНАЛЬНЫМ ЗАЛОГОМ – Leverage Contract is a contract, standardized as to terms and conditions, for the long-term (ten years or longer) purchase (long leverage contract) or sale (short leverage contract) by a leverage customer of leverage commodity which provides for:- (i) participation by the leverage transaction merchant as a principal in each leverage transaction; (ii) initial and maintenance margin payments by the leverage customer; (iii) periodic payment by the leverage customer or accrual by the leverage transaction merchant to the leverage customer of a variable carrying charge or fee on the initial value of the contract plus any margin deposits made by the leverage customer in connection with a short leverage contract; (iv) delivery of a commodity in an amount and form which can be readily purchased and sold in normal commercial or retail channels; (v) delivery of the leverage commodity after satisfaction of the balance due on the contract; and (vi) determination of the contract purchase and repurchase, or sale and resale, prices by the leverage transaction merchant. / и откуп. порядки и условия .

LEVERAGED BUYOUT = ВЫКУП С ПРИВЛЕЧЕНИЕМ ЗАЁМНЫХ СРЕДСТВ (или ВЫКУП ПОД ЗАЛОГ) – Buyout of a large company by a smaller one, the capital for which has been borrowed from a friendly source, secured on the assets of the company being bought. In a Leveraged Buy-Out (LBO) a company is taken over by outside or company-internal investors. In particular, a takeover by a third-party management team is called a 'Management Buy-In', and by the company's own management a 'Management Buy-Out'. This kind of company acquisition typically involves the use of only a small amount of equity capital. The major portion of the capital needed to purchase the company is obtained through bank loans and/or the issuing of bonds. Interest and amortization payments are financed through the acquired company's future earnings, but in many cases also through the sale of company units, i.e. from the net asset value. Takeover of a company using the acquired firm's assets as security for the bulk of the loans taken out. Leveraged Buyouts basically operate like management buyouts. The main difference is that the initiative for the buyout is taken by debt and equity investors rather than by the management of the company. The formal purchaser will usually be a newly formed acquisition company that will be merged into the target after the share acquisition in order to ensure an efficient structure for tax purposes which allows for setting off interest payments with earnings and leads to an acceptable debt-equity ratio (see, however, above for the limits of such structure). The investors normally take an active part in the management of the company after the acquisition so as to make it ready to be floated in 2 to 5 years. / Выкуп с Привлечением Заёмных Средств – поглощение (takeover) или выкуп компании с использованием заёмных средств (финансового рычага). Наиболее часто активы компании служат в качестве обеспечения займов, взятых компанией покупателем, которая погашает их из потока наличных средств приобретённой компании. Управляющие могут использовать этот подход для того, чтобы сохранить контроль над компанией, превратить её из открытой акционерной в частную. Для того чтобы приобрести компанию, группа инвесторов может также получить заём в банке, используя в качестве обеспечения собственные активы. Практически во всех случаях выкупа с привлечением заёмных средств акционеры открытой акционерной компании получают премию сверх текущей рыночной стоимости их акций.

LEVERAGE DEALER = ДЕЛЕЦ, РАБОТАЮЩИЙ С ПЛЕЧОМ – Leverage Dealer:- xxxxx. Also known as Leverage Transaction Merchant.

LEVERAGED FINANCE = УСИЛЕННЫЕ ФИНАНСЫ – Leveraged Finance:- financing of a company acquisition carried out by external financial investors, usually with the involvement of the company's management. Leveraged finance typically comprises a very

high amount of external debt (leverage) in the purchase price financing, which is serviced exclusively from the acquired company's future cash flow and secured by the company's assets.

LEVERAGED MANAGEMENT BUY–OUT = ВЫКУП ПРАВЛЕНИЕМ С ИСПОЛЬЗОВАНИЕМ ЗАЙМА (или ВЫКУП МЭНЭДЬЖМЕНТОМ С ИСПОЛЬЗОВАНИЕМ ЗАЙМА) – Leveraged Management Buy-Out is a purchase of a corporation by all or part of its employees using borrowed funds. / Приобретение корпорации всеми или частью служащих самой корпорации с использованием заёмных средств.

LEVERAGE EFFECT = ЭФФЕКТ ПЛЕЧА (или ЭФФЕКТ РЫЧАГА, или ЭФФЕКТ УСИЛЕНИЯ) – (1) In corporate finance, the Leverage Effect describes the potential advantageousness of substituting 'expensive' equity capital (e.g., share capital of stock corporations) by 'inexpensive' debt capital (e.g., loans) in the financing of investment projects. The resulting possible reduction of overall capital costs can increase the net return on the investment after deducting the costs of capital. It is important to note that taking on an excessive amout of debt capital increases the company's credit risk and raises the interest rate demanded by lenders for their loans. This diminishes the leverage effect. Increase in return on equity caused by an increase in debt, which occurs when the profitability of an operations is greater than the cost of financing the debt incurred to pay for it. See also Leverage. Also known as Gearing Effect in the United Kingdom.

(2) In options trading, Leverage Effect is a key figure widely used to determine the value of warrants and options. A leverage of 3 on a warrant means that a third of what the underlying asset (a share, for instance) costs has to be invested in the warrant in order to arithmetically participate in the same absolute price change. The higher the leverage factor, the greater the leverage effect it creates. In case of a leverage factor of 3 on a warrant combined with a low premium on it, it can generally be assumed that the price of the warrant will rise or fall by roughly the same factor in relation to a change in the underlier. Formula:- current leverage = share price / (warrant price x subscription ratio).

LEVERAGE RATIO = СООТНОШЕНИЕ С УСИЛЕНИЕМ (или КОЭФФИЦИЕНТ ФИНАНСОВОЙ НЕЗАВИСИМОСТИ) – Leverage Ratio is a measure that indicates the financial ability to meet debt service requirements and increase the value of the investment to the stockholders, i.e. the ratio of total debt to total assets. Ratio of debt/liabilities to equity/assets. Includes debt and debt-equity ratios.

LEVERAGE TRANSACTION MERCHANT = КОММЕРСАНТ, ОСУЩЕСТВЛЯЮЩИЙ ТРАНЗАКЦИИ С ЗАЛОГОМ (или КОММЕРСАНТ, ОСУЩЕСТВЛЯЮЩИЙ ОПЕРАЦИИ С ЗАЛОГОМ) – Leverage Transaction Merchant is any individual, association, partnership, corporation, or trust that is engaged in the business of offering to enter into, entering into, or confirming the execution of leverage contracts, or soliciting or accepting orders for leverage contracts, and who accepts leverage customer funds or extends credit in lieu of those funds.

LEW = LEAF EPICUTICULAR WAX

LF = LEAFFOLDER

LGJS CONTAINER CAR = ВАГОН С ХХ ДЛЯ КОНТЕЙНЕРОВ – Lgjs Container Car:- series of rail cars for container transportation. The letter j in the name indicates that the car is fitted with buffers.

LGLR = LONDON GOLD LEASE RATE

L/I = LETTER OF INTENT

LI = LIECHTENSTEIN

LIABILITIES = ПАССИВЫ (или ОБЯЗАТЕЛЬСТВА) – (1) Liabilities are the claims against the firm. Current liabilities are usually repayable within twelve months of the balance sheet date. Also known as Payables. See also Assets, Balance Sheet, and Current Liabilities. Liabilities are future sacrifices of economic benefits stemming from present legal, equitable, or constructive obligations of an entity to transfer assets or provide services to other entities in the future as a result of past transactions or events affecting the entity. Liabilities are all the claims against a corporation. Liabilities include accounts, wages and salaries payable; dividends declared payable; accrued taxes payable; fixed or long-term liabilities, such as mortgage bonds, debentures and bank loans. These include accounts payable, short-term debt and other current liabilities. The obligation of a business to its creditors, suppliers, customers, etc, as distinguished from those to its proprietors, partners or shareholders. Liabilities can be short-term, medium-term or long-term. The opposite of Assets. Also known as Debt Overhang, and Outstanding Credit. Total amount of credit of all kinds owed by a given person or entity. / Обязательства по уплате декларированных (заявленных) дивидендов и (начисленных) налогов, фиксированные или долгосрочные обязательства, такие как ипотечные облигации, и банковские заёмы. Обязательства предприятия перед своими кредиторами, поставщиками, заказчиками и им подобным, которые не являются владельцами, партнёрами или акционерами. Обязательства могут быть краткосрочными, среднесрочными и долгосрочными. В противовес к Активам (Assets). Под Пассивом, от Латинского слова Passivus, означающее Недеятельный, понимается одна из сторон бухгалтерского баланса. Он показывает источники средств предприятия по их составу, целевому назначению и принадлежности. Под Пассивными Счетами понимаются основные счета бухгалтерского учёта, отражающие источники формирования хозяйственных средств и их целевое назначение. Обязательства – существующая обязанность компании, возникшая в результате событий прошлых периодов, погашение которых, как ожидается, приведёт к оттоку из компании ресурсов, содержащих экономическую выгоду. Пассив или Обязательство – требование к активам компании или частного лица, за исключением собственного капитала (equity). Основные черты:- (i) представляет собой обязательства о передаче активов или услуг на указанную или определяемую позже дату; (ii) компания или частное лицо имеет лишь ограниченную возможность отказаться от передачи активов или вообще не имеет такой возможности; и (iii) событие, явившееся причиной возникновения обязательств, уже произошло.

(2) In general, Liabilities are the obligations and commitments an entity is obliged under law to honour or perform. Also known as Debt. Obligation under a bill or other instrument. See also Without Our Liability.

LIABILITIES AND SHAREHOLDERS' EQUITY = ПАССИВЫ И СРЕДСТВА АКЦИОНЕРОВ – In balance sheet, the Liabilities And Shareholders' Equity side of the balance sheet lists, under equity and debt capital, the sources of the funds that serve in the financing of the company's (assets) transactions. Right side of the balance sheet, showing the claims of creditors on an entity's assets and shareholders' equity. / Правая сторона балансового отчёта, показывающая претензии кредиторов по активам юридического лица и средствам акционеров.

LIABILITY = ОБЯЗАТЕЛЬСТВО – Liability is money owed or potentially owed by the company, such as Customer Deposits, by the company. See also Asset. Liability is the money an individual or organization owes; same as debt. A claim on an institutional unit by another body which gives rise to a payment or other transaction transferring assets to the other body. Conditional liabilities, i.e. where

the transfer of assets only takes place under certain defined circumstances, are known as Contingent Liabilities. Legal responsibility for an act or failure to act. Broadly, any legally enforceable obligation; a responsibility of one person to another, enforceable in law. Legal responsibility for the consequences of certain acts or omissions. Commitment, obligation or responsibility from which a third-party claim may arise. Liabilities consist of total obligations under contract and are shown on the right, or liabilities, side of a business entity's balance sheet. In banking, liabilities are also components of loan and credit assets, which immobilize resources. In public accounting, a liability is the preliminary stage in the spending process, culminating in a payment. Liability is an amount payable in Dollars or by future services to be rendered. Liability is debts or obligations owed by one entity (debtor) to another entity (creditor) payable in money, goods, or services. / или упущений (omissions). Под юридическим Обязательством понимается гражданское правоотношение, в силу которого одна сторона (должник) обязана совершить в пользу другой стороны (кредитора) определённое действие (передать имущество, выполнить работу и тому подобное) либо воздержаться от него, а кредитор имеет право требовать от должника исполнения его обязанности. Обязательство, гражданское правоотношение, в силу которого одна сторона (должник) обязана совершить в пользу другой стороны (кредитора) определённое действие (передать имущество, выполнить работу, уплатить деньги) либо воздержаться от него. Кредитор, в свою очередь, имеет право требовать от должника исполнения его обязанности. По Советскому праву сторонами обязательства являются социалистические организации и граждане; возникают обязательства, как правило, из договора, актов планирования и иных административных актов, вследствие причинения имущественного вреда, подлежащего возмещению, неосновательного приобретения или сбережения имущества и так далее. В зависимости от содержания прав и обязанностей сторон различают обязательства, направленные на:- возмездное или безвозмездное отчуждение (приобретение) имущества в собственность или оперативное управление; возмездное или безвозмездное предоставление имущества в пользование; выполнение работ и оказание услуг; охрану социалистической и личной собственности, иных имущественных прав. При наличии в обязательстве нескольких кредиторов и нескольких должников порядок его исполнения участниками определяется в зависимости от предмета обязательства и условий соглашения сторон. Если каждый из участников обязательства обязан его исполнить в определённой (равной или неравной) доле, такое обязательство называется Долевым Обязательством. Если кредитор вправе требовать от любого из должников выполнения обязательства полностью (что означает освобождение от ответственности других участников обязательства), такое обязательство называется Солидарным Обязательством. Исполнение обязательства может обеспечиваться дополнительным обязательством (смотрите Обеспечение Исполнения Обязательств). Если обязательство не исполняется добровольно, к обязанному лицу могут быть применены меры государственного принуждения (путём обращения кредитора в суд или арбитраж). Обязательство прекращается после его исполнения путём зачёта встречных однородных требований; по соглашению сторон; в связи с невозможностью исполнения обязательства, за которую должник не отвечает; ликвидацией юридического лица (должника или кредитора), если исполнение обязательства в этом случае законодательство не возлагает на другое юридическое лицо, и другому.

LIABILITY = ОТВЕТСТВЕННОСТЬ – Liability is legal responsibility for injury to other persons or damage to their property. / Ответственность – юридическая ответственность за ущерб другим лицам или за повреждение их имущества.

LIABILITY ADEQUACY TEST = ТЕСТ НА ДОСТАТОЧНОСТЬ ОБЯЗАТЕЛЬСТВ – Liability Adequacy Test:- an assessment of whether the carrying amount of an insurance liability needs to be increased (or the carrying amount of related deferred acquisition costs or related intangible assets decreased), based on a review of future cash flows.

LIABILITY INSURANCE = СТРАХОВАНИЕ ОТВЕТСТВЕННОСТИ – Liability Insurance is an insurance to reimburse the assured for any amount paid by him by way of damages in respect of a wrong done to another party. The liability may be due to damage to another's property or person, or to infringement of another's rights. Such insurance covers only the legal liability of the assured and although the Marine Insurance Act (MIA) 1906 states the measure the indemnity to be the amount of the liability, it is usual for the insurer to fix a limit as the maximum amount recoverable under the policy. The most common form of liability insurance in the marine market is that for collision liability under a hull policy. Most other shipowner's liabilities are covered in Protection and Indemnity Clubs. An insurance which covers the insured against third party claims or, in the case of employer's liability insurance, claims by employees, subject to specified terms and conditions. That insurance that pays and renders service on behalf of an insured for loss arising out of his responsibility, due to negligence, to others imposed by law or assumed by contract. Insurance for damages that a policyholder is obliged to pay because of bodily injury or property damage caused to another person or entity based on negligence, strict liability or contractual liability. / порядки и условия . Страхование Ответственности можно разделить на следующие три вида:- (1) Страхование Гражданской Ответственности – страхование ответственности перед третьими лицами водителей автотранспортных средств, предпринимателей перед работающими по найму, авиаперевозчиков, судовладельцев. (2) Страхование Профессиональной Ответственности – данный вид страхования действует, как правило, в отношении следующих профессий – врач, бухгалтер, адвокат, архитектор, инженер. Целью данного вида страхования является покрытие ответственности за нанесение имущественного ущерба в результате ошибочных действий представителей вышеназванных профессий. (3) Страхование Ответственности За Качество Продукции – страхование ответственности производителей продукции перед её потребителями в случае, если в результате потребления продукции из-за её плохого качества потребителю был нанесён имущественный ущерб. Договор страхования ответственности предоставляет два вида покрытия:- возмещение ущерба и предоставление страховой защиты, в результате чего страхователь получает уверенность в том, что страховая компания будет защищать его интересы в случае предъявления ему судебного иска. Некоторые полисы в дополнение к основному покрытию предусматривают и возмещение медицинских расходов. В соответствии с общепринятой мировой практикой виновная сторона обязана полностью компенсировать ущерб, причинённый третьей стороне, даже в том случае, если ущерб носил незначительный, случайный характер. В этой ситуации договор страхования ответственности, заключённый страхователем со страховой организацией, с одной стороны защищает страхователя от финансовых потерь, которые он может понести в результате предъявления к нему по решению суда исков о погашении ущерба, причинённого третьей стороне. С другой стороны, система страхования ответственности защищает имущественные интересы и третьих лиц, поскольку у виновной в нанесении ущерба стороны может попросту не оказаться достаточно средств, чтобы оплатить убытки. Именно поэтому во многих странах ряд видов деятельности, таящих в себе постоянную угрозу для общества, подлежат обязательному страхованию. При этом страхователь полностью свободен в выборе страховой организации. Главное, что должно быть в наличии, – это страховой полис. В противном случае наступает уголовная ответственность. К числу обязательных видов страхования ответственности относятся:- (i) страхование водителей автотранспортных средств перед третьими лицами, поскольку именно дорожно-транспортные происшествия (ДТП) могут иметь серьёзные последствия с точки зрения причинения материального ущерба. За базу расчёта ответственности берётся принцип финансовой компенсации понесённого пострадавшей стороной ущерба (ремонт разбитого автотранспорта, расходы на медицинское обслуживание жертв ДТП, компенсация потерь в заработной плате – временная или постоянная, вплоть до пенсии в случае нанесения увечья, расходы по обслуживанию калеки и так далее). (ii) Страхование ответственности предпринимателей перед работающими по найму. Работодатель отвечает за предоставление рабочим и служащим безопасных условий труда.

Страхование в данном случае выступает в качестве одного из важнейших элементов социальной защиты человека. Наиболее ярким примером действия данного вида страхования может служить выплата страхового возмещения страховыми организациями в результате взрыва в 1988 на платформе Пайпер Альфа в Северном Море, унёсшего жизнь 167 человек. Страховые компании незамедлительно выплатили семьям погибших по 1 миллиону Долларов США на семью по искам, которые были предъявлены компаниям – собственникам платформы. Общая же сумма ущерба, оплаченного страховыми компаниями, составила 2 миллиарда Долларов США. (iii) В ряде стран обязательному страхованию ответственности подлежат некоторые экологические риски, например, введена ответственность судовладельцев за загрязнение моря нефтью. (iv) Обязательному страхованию ответственности подлежит целый ряд видов деятельности, для осуществления которых требуются специальные государстенные лицензии, которые, в свою очередь, не выдаются без предъявления страхового полиса. К таким видам деятельности в первую очередь относятся авиаперевозки, поскольку авиакомпании несут перед пассажирами ответственность, которая также должна быть застрахована. Страхование Ответственности – страхование денег, которые держатель полиса должен заплатить за телесное повреждение или ущерб, причинённые собственности другого лица, предусмотренные в полисе. Ответственность может возникнуть в случае нанесения ущерба собственности, телесного повреждения, клеветы и любого другого вреда, причинённого страхователем. Страховая компания (страховщик) согласится оплатить такие убытки, если они будут признаны судом, в пределах сумм, оговорённых в договоре страхования. Страховщик может также оплатить судебные расходы, возникшие в процессе судебного разбирательства.

LIABILITY LIMITS = ЛИМИТЫ ОТВЕТСТВЕННОСТИ – Liability Limits:- the sum or sums beyond which a liability insurance company does not protect the insured on a liability policy. / Сумма или суммы, сверх которых ответственность страховой компании не распространяется на защиту застрахованного лица по полису ответственности.

LIABILITY ON BILLS OF EXCHANGE = ОБЯЗАТЕЛЬСТВО ПО ВЕКСЕЛЮ (или ОТВЕТСТВЕННОСТЬ ПО ВЕКСЕЛЮ) – Liability On Bills Of Exchange is a liability arising from the signature on the bill of exchange. / Обязательство, которое вступает в силу после подписания векселя.

LIANA = ЛИАНА – Liana or liane is a woody, climbing vine. / Под Лианами понимаются древесные и травянистые лазящие или вьющиеся растения, использующие в качестве опоры другие растения, скалы, здания и прочее. Свыше 2 000 видов. Преимущественно во влажнотропических лесах. На территории бывшего СССР встречаются в Закавказье (ежевика, ломонос, плющ, сассапариль и другие), в Уссурийском Крае (актинидия, лимонник и другие), повсеместно – травянистые лианы (вьюнок и другие). Важнейшие культурные лианы – виноград, хмель. Некоторые виды декоративны.

LIBERALISM = ЛИБЕРАЛИЗМ – Liberalism:- a XIX century political viewpoint or ideology associated with strong support for a broad interpretation of civil liberties for freedom of expression and religious toleration, for widespread popular participation in the political process, and for the repeal of protectionist legal restrictions inhibiting the operation of a capitalist free market economy. In the XX century US, the term has come to describe an ideology with similar views on civil liberties and personal freedom issues but now supporting a much stronger role for government in regulating and manipulating the private economy and providing public support for the economically and socially disadvantaged, though still stopping well short of full socialism. In Europe, the term liberalism is still used more in its XIX century sense, and European liberals are rather more respectful of the values of the free market than their American namesakes, whose views sometimes more closely resemble those of Europeans styling themselves as social democrats. Economic doctrine stating that the best economic system is based on laissez-faire and on the individual initiative of consumers and producers. There are numerous liberal schools, but all share a common thread:- the belief that there is a natural order in economics, which is determined by the independent action of the individual, or homo economicus, whose behavior is based on obtaining the maximum possible satisfaction for the minimum possible effort. / Laissez-Faire = Представьте Делу Идти Своим Порядком; Позиция Невмешательства или Недоговорённости (на Французском). Экономическая доктрина, утверждающая, что лучшая экономическая система основывается на принципе ‘Лессэ-Фэр’ (от Французского словосочетания Laissez-Faire, означающее Позволить Осуществлять или Разрешить Осуществлять или Оставить В Покое) и на индивидуальной инициативе потребителей и производителей. Существуют многочисленные либеральные школы, но . Под Либерализмом, от Латинского слова Liberalis, означающее Касающийся Свободы или Свободный, понимается идеологическое и общественно-политическое течение, объединяющее сторонников парламентского строя, буржуазных свобод и свободы капиталистического предпринимательства.

LIBERALIZATION = ЛИБЕРАЛИЗАЦИЯ – Liberalization:- measure(s) designed to promote international trade by reducing customs tariffs and eliminating some or all quotas. / Мера(ы), предназначенная(ые) для продвижения международной торговли посредством снижения таможенных тарифов и устранения некоторых или всех квот.

LIBERTY = УВОЛЬНЕНИЕ НА БЕРЕГ – Liberty (maritime term):- permission to be absent from the ship for a short period (authorized absence).

LIBERTY CAP = ШЛЯПКА СВОБОДА – Liberty Cap is a close-fitting conical cap used as a symbol of liberty by French revolutionists and in the United States before 1800.

LIBERTYLINK® COTTON = ХЛОПЧАТНИК ЛЫБЁТИЛЫНК® – LibertyLink® Cotton has been developed by Bayer CropScience. Its active ingredient is Glusfosinate Ammonium (Glufosinate or its ammonium salt is an active ingredient in several nonselective systemic herbicides – Basta, Challenge, Finale and Liberty and Rely), commonly known as Ignite. This variety survives when sprayed over the top of the crop while controlling grass Weeds and troublesome broadleaf Weeds such as Morning Glory, Pigweed and Johnson Grass. Plans are to produce stacked gene Varieties with Bollgard® and Bollgard II® genes. Liberty Link® Cotton is a Cotton variety that has been genetically altered to tolerate the herbicide Liberty (glufosinate). / Глюфосинат Аммония.

LIBID = THE LONDON INTERBANK BID RATE

LIBOR = THE LONDON INTERBANK OFFERED RATE

LIBRARY = БИБЛИОТЕКА – Library (biotechnology) is a collection of cloned DNA fragments. / Под Библиотекой, от Греческих слов Biblion, означающее Книга, и Thēkē, означающее Вместилище или Хранилище или Ящик, понимается учреждение, организующее сбор, хранение, общественное пользование произведениями печати.

LICENSE = ЛИЦЕНЗИЯ (или СПЕЦИАЛЬНОЕ РАЗРЕШЕНИЕ) – (1) License is a permission to do something which, without such permission, would be illegal. For example, a license to use digital information gives the Licensee permission to access and use the information under the terms and conditions described in the agreement between the Licensor and the Licensee. / порядки и условия. Под Лицензией, от Латинского слова Licentia, означающее Право или Свобода, понимается разрешение на:- (i) ведение какого-либо вида деятельности, например, торговли, на отстрел животных и другое; (ii) выдаваемая владельцем патента на использование изобретения или иного научно-технического достижения (Обычно лицензия выдаётся на изобретение, по

которому подана заявка на патент или получен этот документ. Лицензия оформляется лицензионным соглашением, согласно которому владелец патента (лицензиар) предоставляет за определённое вознаграждение покупателю лицензии (лицензиату) полное или частичное право на использование изобретения); и (iii) выдаваемая компетентным государственным органом на осуществление внешне-торговых операций по ввозу или вывозу какой-либо продукции, например, привозная (или импортная) или вывозная (или экспортная) лицензии. Лицензия – разрешение на использование изобретения или иного технического достижения, предоставляемое на основании Лицензионного Договора либо судебного или административного решения компетентного государственного органа. Обычно лицензия выдаётся на изобретение, по которому подана заявка на Патент или получен этот документ. Так называемые Беспатентные Лицензии выдаются на достижения (в том числе секреты производства), которые по законам данной страны не могут охраняться патентом, либо на изобретения, на которые по каким-либо причинам заявка на получение охранного документа не подана. Стоимость Патентной Лицензии обычно выше беспатентной. Основные виды лицензий:- Простая Лицензия, Исключительная Лицензия и Полная Лицензия. При Простой Лицензии Лицензиар (владелец патента) предоставляет Лицензиату право использовать изобретение в установленных договором пределах, но сохраняет за собой право применять его на той же территории, а также предоставлять лицензии на таких же условиях неограниченному кругу лиц (лицензиат не имеет права выдавать сублицензии). По договору Исключительной Лицензии предоставляется исключительное право на использование изобретения в установленных договором пределах, владелец патента отказывается от самостоятельного его применения на этой территории и предоставления лицензии другим лицам. При Полной Лицензии предоставляется право использовать все основанные на патенте права в течение срока действия патента (эта форма лицензии используется сравнительно редко). По основаниям и в порядке, предусмотренном в законе, суд или орган государственного управления может по ходатайству заинтересованного лица установить Принудительную Лицензию – дать разрешение на использование запатентованного изобретения на определяемых им условиях. Обычно такая лицензия выдаётся в случае неиспользования или недостаточного (с точки зрения интересов государства) использования изобретения. Кроме того, принудительная лицензия может быть предоставлена в интересах обороны страны, а также в тех случаях, когда изобретение имеет особо важное значение для государства, но с патентообладателем не была достигнута договорённость о выдаче лицензии. Например, в бывшем Союзе Советских Социалистических Республик (СССР) в соответствии со статьёй 112 Основ Гражданского Законодательства такая лицензия могла быть предоставлена по решению Совета Министров СССР.

(2) License:- some governments require certain commodities to be licensed prior to exportation or importation. Clauses attesting to compliance are often required on the bill of lading (B/L). Various types issued for export (general, validated) and import as mandated by government(s). / привоз (importation). вывоз (exportation). Лицензия Вывозная (или Экспортная) или Привозная (или Импортная) – разрешение, выдаваемое компетентным государственным органом на осуществление внешнеторговых операций. Вывозная (или Экспортная) Лицензия или Привозная (или Импортная) Лицензия – разрешение, выдаваемое компетентным государственным органом на осуществление внешнеторговых операций. Выдача лицензий – одна из форм государственного контроля за вывозом (или экспортом) и привозом (или импортом) товаров и, одновременно, расходованием валютных средств. В капиталистических странах выдача лицензий преследует цель ограничения, вплоть до полного сокращения, торговли с какой-либо страной или группой стран, защиты национальной промышленности от иностранной конкуренции, контроля за расходованием валюты, а также пополнения доходов бюджета путём взимания лицензионных сборов за выдачу разрешения на вывоз (или экспорт) – привоз (или импорт). В развивающихся странах выдача лицензий используется в первую очередь для защиты национальной экономики против иностранных монополий. В социалистических странах выдача лицензий – одна из форм реализации монополий внешней торговли. Лицензии выдают министерства, ведающие внешней торговлей (в бывшем Союзе Советских Социалистических Республик (СССР), например, Министерство Внешней Торговли).

(3) License:- Authorization granted by a government to engage in certain activities or to conduct certain transactions. / Лицензия – официальный документ, выданный регулирующим органом, дающий разрешение частному лицу, которое обычно проходит курс обучения для получения определённой квалификации, на проведение определённого вида деятельности. Например, брокеру, торгующему акциями, облигациями и долями взаимных фондов, требуется лицензия на проведение операций с ценными бумагами. Лицензия требуется страховщику, продающему страховые полисы. Прежде чем водитель получит права (license), он должен сдать экзамен, подтверждающий его знание правил дорожного движения. Если человек, имеющий лицензию, не подчиняется регулирующим нормам, то он может быть лишён лицензии.

LICENSE AGREEMENT = ЛИЦЕНЗИОННОЕ СОГЛАШЕНИЕ (или ЛИЦЕНЗИОННЫЙ ДОГОВОР) – License Agreement is a written contract setting forth the terms under which a licensor grants a license to a licensee. / Письменный контракт, устанавливающий порядки, на которых лицензиар (лицензедатель) предоставляет лицензию лицензиату (лицензеполучателю). Лицензионный Договор – договор, по которому одна сторона (Лицензедатель, или Лицензиар) предоставляет право на использование изобретения или иного технического достижения (Лицензию), а другая сторона (Лицензеполучатель, или Лицензиат) выплачивает за это соответствующее вознаграждение. Объектом лицензионного договора являются технические решения, признаваемые изобретениями по закону страны, гражданином которой является приобретатель лицензии; им могут быть также иные технические достижения, в том числе секреты производства (‘Ноу-Хау’). Существенными признаками лицензионного договора являются предоставление права пользования объектом договора и нематериальный характер этого объекта, определяемого специфическими признаками (научно-технические достижение). Объём предоставляемых по лицензионному договору прав зависит от вида лицензии. Условия лицензионного договора могут устанавливать территорию применения лицензии (часть государства, одно или несколько государств), форму использования объекта лицензии (производство изделий и (или) их продажа, применение технологии и так далее), его объём в количественном отношении, срок применения (обычно от 5 до 10 лет) и так далее. В лицензионный договор включаются также условия о передаче приобретателю лицензии технической документации, оказании ему технической помощи путём посылки и приёма специалистов, о поставке образцов машин и оборудования, взаимной информации сторон о внесённых в объект технических усовершенствованиях, об участии сторон в защите прав владельца лицензии против нарушения этих прав третьими лицами, о порядке разрешения споров по лицензионному договору и другое. В лицензионном договоре определяются также размер Лицензионного Вознаграждения, порядок его определения и выплаты. В бывшем СССР лицензионные договоры применялись в торговых отношениях с иностранными организациями и рассматривались как один из видов внешнеторговых сделок. Такие договоры могли заключаться только внешнеторговыми организациями – специализированным всесоюзным объединением Лицензинторг и другими внешнеторговыми объединениями. В зарубежных государствах, в том числе в некоторых социалистических странах, лицензионные договоры применялись и в отношениях между организациями данной страны.

LICENSE ROUND = ЛИЦЕНЗИОННЫЙ РАУНД – License Round:- the placing by a state of a number of specified areas on offer to oil companies for exploration.

LICENSED STORE = ЛИЦЕНЗИРОВАННОЕ ХРАНИЛИЩЕ – Licensed Store:- this term means that portion of a licensed warehouse which has been approved by the appropriate warehouse and license committee as suitable for the storage of an exchange commodity. / Лицензированное Хранилище:- этот термин означает ту часть лицензированного склада, которая была одобрена соответствующим складом и лицензионным комитетом в качестве приемлемой для хранения биржевого сырья.

LICENSED WAREHOUSE = ЛИЦЕНЗИРОВАННЫЙ СКЛАД – Licensed Warehouse is a warehouse approved by an exchange from which a commodity may be delivered on a futures contract. Warehouse which have been approved for the storage of a commodity deliverable against the exchange's commodity futures contract. Licensed Warehouse is an exchange designated delivery warehouse (elevator) where a commodity must be delivered on a futures contract. See also Regular Warehouse.

LICENSED WEIGHMASTER = ЛИЦЕНЗИРОВАННЫЙ ВЕСОВЩИК – Licensed Weighmaster is an organization approved by the exchange to witness and verify the weighing of a commodity delivered against the exchange's commodity futures contract. / Лицензированный Весовщик:- организация, утверждённая биржей, для проведения засвидетельствования и подтверждения взвешивания сырья, поставляемого по биржевому фьючерсному контракту на сырьё.

LICENSEE = ЛИЦЕНЗИАТ (или ЛИЦЕНЗЕПОЛУЧАТЕЛЬ) – (1) Licensee is the person or entity that is given permission through a license to access or otherwise use digital information. The licensee, often a library, educational or research organization, generally pays the Licensor a fee for permission to use digital information. In law, one to whom a license has been granted; in property, one whose presence on the premises is not invited but tolerated. Thus, a licensee is 'a person who is neither a customer, nor a servant, nor a trespasser, and does not stand in any contractual relation with the owner of the premises, and who is permitted expressly or impliedly to go thereon merely for his own interest, convenience, or gratification'. 118 SE 697, 698. In tort law, one's status as a licensee may affect the duty of care owed to him. Typically, 'the law places those who come upon the premises of another in three classes: invitees are those who are expressly or impliedly invited, as a customer to a store; licensees are persons whose presence is not invited, but tolerated; trespassers are persons who are neither suffered nor invited to enter. The duty of the owner toward an invitee is to exercise reasonable care to keep the premises in a safe condition, but licensees take the premises as they find them, the only duty of the occupier being to give notice of traps or concealed dangers (of which the occupier himself has knowledge). Toward trespassers the occupier need only refrain from willful or wanton injury as modified by the 'attractive nuisance' line of cases'. 282 NW 389, 392. Some jurisdictions have abandoned the tort law distinction between invitees and licensees. This term Licensee means a person licensed by the exchange as a chemist, grader, master sampler, tank facility, warehouse or weighmaster.

(2) In insurance, Licensee is an individual permitted to enter property with the permission of the owner or the person who controls the property. There is no mutual profit motive; the licensee comes onto the property for his or her sole benefit. For example, the owner of land gives an individual permission to hunt on the property but does not charge a fee. The owner must warn the licensee of any hidden dangers on the property of which he or she is aware.

LICENSE PLATE NUMBER = ЛИЦЕНЗИОННЫЙ НОМЕР В ТАБЛИЧКЕ – License Plate Number:- otherwise known as an 'LPN', this is a number used to identify products and containers. / табличка.

LICENSING = ЛИЦЕНЗИРОВАНИЕ – Licensing is a business arrangement in which the manufacturer of a product (or a firm with proprietary rights over certain technology, trademarks, etc) grants permission to some other group or individual to manufacture that product (or make use of that proprietary material) in return for specified royalties or other payment.

LICENSOR = ЛИЦЕНЗИАР (или ЛИЦЕНЗЕДАТЕЛЬ) – Licensor is the person or entity that gives or grants a License. The Licensor owns or has permission to distribute digital materials to a Licensee. A person (individual or organization) who gives another a license, particularly a private party doing so, such as a business giving someone a license to sell its product. A term Licensor refers to a person or legal entity granting a license to another person or legal entity. By granting a license the licensor permits or authorizes another person or class of persons to exercise, infringe or otherwise not observe their rights. The licensor does not waive their rights except under the circumstances of the license.

LICHEN = ЛИШАЙНИК – Lichen is a complex differentiated organism formed by a symbiotic relationship between an Algae and a Fungus. / между Альгами (Водорослями) и Грибами. Под Лишайниками понимают Группу Низших Растений, образованных симбиозом Гриба (Аскомицета или Базидиомицета) и Водоросли (зелёной, редко желтозелёной и бурой). Их взаимоотношения основаны на паразитизме и отчасти сапротрофности, главным образом со стороны Гриба. Различают накипные, листоватые и кустистые Лишайники. Размножение бесполое. Около 26 000 Видов (свыше 400 Родов). Наиболее разнообразны в тропиках и субтропиках, обильны в тундре и на высокогорьях. Растут на почве, деревьях, гнилой древесине, горных породах; играют существенную роль в почвообразовании. Лишайники используют для получения антибиотиков, ароматических веществ, лакмуса; многие Виды – индикаторы загрязнения окружающей среды; некоторые – пища Оленей.

LICKERIN = ПРИЁМНЫЙ БАРАБАН – Lickerin is a part of the feed mechanism of the card. It consists of a hollow, metal roll with a spirally grooved surface containing a special saw-toothed wire. The lickerin opens up the tufts of the picker lap as it is fed to the card and transfers the fibers to the main cylinder. / Приёмный Барабан чёсальной машины.

LICKER–IN DROPPINGS = ОТБРОСЫ ПРИЁМНОГО БАРАБАНА (или ОРЕШЕК, или XX) – Licker-in Droppings otherwise known as Carding waste no:- 1 or clean Lickerin is a byproduct gained during manufacturing of yarn in mills. This carding waste cotton fiber is rich in fiber and is low in cost when compared to other cotton waste. Licker-in specification as below, making it a match for low count yarn in open end spinning in high definition mills. Length – 19–20 mm, trash – 16%, micronaire – 3.0–3.5. / . Это хлопковое волокно, являющееся отходом кардочесания, содержит много волокнам и при этом имеет низкую стоимость в отличии от других отходов хлопка. . Длина волокна – 19–20 мм, засорённость – 16%, майкроэйр – 3.0–3.5.

LICKERIN LOADING = ЗАГРУЗКА ПРИЁМНОГО БАРАБАНА – Lickerin Loading is a condition whereby fibers are imbedded in the lickerin wire clothing so as to resist transfer to the cylinder clothing.

LID = КАСКА (или КРЫШКА, или ПОКРЫШКА) – Lid is a slang for hat.

LID = XX (или КРЫШКА) – Lid is a top fitting to cover a box pallet, cage pallet or pallet collar. See also Pallet. / Крышка (Lid):- деталь для закрывания ящичного и стоечного поддонов или бортика поддона. Смотрите также Поддон (Pallet).

LIE = LEGAL INSTRUMENTS EXAMINER

LIE = XX – Lie:- sheep are able to rest on their sternums without restriction or contact with other sheep or structure.

LIEN = УДЕРЖАНИЕ (или ПРАВО НА ОБРАЩЕНИЕ ВЗЫСКАНИЯ НА ПРЕДМЕТ ЗАЛОГА, или ОБРЕМЕНЕНИЕ) – Lien:- when an asset is pledged as security against a loan, the lender is said to take 'Lien', i.e. a legal security interest, in the asset. Liens are usually registered against assets and recorded in a public office (or on-line). It behooves a buyer of an asset to conduct a search to

ensure that there are no liens against an asset. It is conceivable that an asset can be sold to an unsuspecting buyer in which case the lien holder has a priority interest in the asset. Lien is a creditor's claim against a property, which may entitle the creditor to seize the property if a debt is not repaid. Lien is a claim against property which then serves as security for the payment of that claim. Retention of property until outstanding dept is paid. The right to possession of property until such time that an outstanding liability has been repaid. A banker's lien gives a bank the right to retain or sell the property of a debtor in lieu of payment. A legal claim upon goods for the satisfaction of some debt or duty. See also Carriers' Lien. Lien is the right to retain the lawful possession of the property of another until the owner fulfills a legal duty to the person holding the property, such as the payment of lawful charges for work done on the property. A mortgage is a common lien. In its widest meaning this term includes every case in which real or personal property is charged with the payment of any debt or duty; every such charge being denominated a lien on the property. In a more limited sense it is defined to be a right of detaining the property of another until some claim be satisfied. The right of lien generally arises by operation of law, but in some cases it is created by express contract. There are two kinds of lien; particular and general. When a person claims a right to retain property, in respect of money or labor expended on such particular property, this is a particular lien. (1) Liens may arise in three ways:- (i) by express contract; (ii) from implied contract, as from general or particular usage of trade; and (iii) By legal relation between the parties, which may be created in three ways:- (a) when the law casts an obligation on a party to do a particular act and in return for which, to secure him payment, it gives him such lien; common carriers and inn keepers are among this number; (b) when goods are delivered to a tradesman or any other, to expend his labor upon, he is entitled to detain those goods until he is remunerated for the labor which he so expends; and (c) when goods have been saved from the perils of the sea, the salvor may detain them until his claim for salvage is satisfied; but in no other case has the finder of goods a lien. (2) General liens arise in three ways:- (i) by the agreement of the parties; (ii) by the general usage of trade; and (iii) by particular usage of trade. Liens are also divided into legal and equitable. The former are those which may be enforced in a court of law; the latter are valid only in a court of equity. The lien which the vendor of real estate has on the estate sold for the purchase money remaining unpaid, is a familiar example of an equitable lien. A Lien is a legal claim upon goods for the satisfaction of debt or duty. / Удержание – в гражданском праве один из способов обеспечения исполнения обязательств. Согласно Гражданского Кодекса Российской Федерации кредитор, у которого находится вещь, подлежащая передаче должнику либо лицу, указанному должником, вправе – в случае неисполнения последним в срок обязательства по оплате этой вещи или возмещению кредитору связанных с нею издержек и других убытков – удерживать её до тех пор, пока соответствующее обязательство не будет исполнено. Удержание вещи могут обеспечивать и требования, если они возникли из обязательства, сторонами которого являются предприниматели. Кредитор может удерживать вещь даже после того, как права на неё приобретены третьим лицом. Требования кредитора, удерживающего вещь, удовлетворяются из её стоимости в объёме и порядке, предусмотренных для залоговых обязательств. Общеизвестно, что собственник вправе совершать любые законные действия в отношении принадлежащего ему имущества – отчуждать его во владение другим лицам, отдавать в залог, обременять другими способами. Под Обременением понимают наличие установленных законом или уполномоченными органами условий, запрещений, стесняющих правообладателя при осуществлении права собственности либо иных вещных прав на конкретный объект недвижимого имущества. Наиболее распространённые виды ограничения – аренда, ипотека, сервитут, доверительное управление. Обременение правами третьих лиц – это один из способов распоряжения имуществом. Его нередко применяют в целях исключения 'недружественного' захвата имущества (в данном случае совершение всех сделок необходимо осуществлять исключительно с 'дружественными' компаниями). Обременение – действие, процесс или событие, направленные на уменьшение свободы действий субъекта или на уменьшение возможностей изменения состояния объекта. Обременённый объект или субъект всегда является в определённом смысле ущербным по отношению к необременённому, поскольку лишён каких-либо качеств, свойств или возможностей к изменению своего состояния или статуса. Обременение – статус объекта или субъекта, выражающийся в ограниченной свободе действий субъекта или на уменьшении возможностей изменения состояния объекта. Обременение – статус объекта, ограничивающий возможность действий по распоряжению объектом, а также по изменению его качеств, характеристик и состояния. Наиболее распространёнными видами обременения являются залог и арест. Удержание или Обременение – право ареста имущества для удовлетворения претензий кредитора. Требование кредитора против имущества, например ипотечный заём означает право удержания дома, то есть если заём не выплачивается в срок, дом может быть конфискован для удовлетворения претензий кредитора. Аналогичным образом облигация означает право удержания активов компании, то есть если проценты или основная сумма не выплачиваются в срок, активы могут быть конфискованы для выплаты средств владельцам акций. Как только долг выплачен, право удержания снимается. Право удержания может быть предоставлено судом для исполнения принятых им решений.

LIEN IN REM = УДЕРЖАНИЕ У СЕБЯ – Lien In Rem:- a restricted right to hold and retain property until a claim is satisfied. If the claim is not met, the creditor is entitled to realize the property securing the lien and to satisfy his claim out of the resulting proceeds. Also known as Right Of Lien. See also In Rem. / Ограниченное право удерживать и сохранять имущество до той поры, пока не будет удовлетворена претензия, связанная с ним. В случае, если претензия не удовлетворена, кредитору предоставляется право реализовать данное имущество, находящееся в удержании, и удовлетворить свою претензию за счёт поступлений от данной реализации. Известно также как Право На Удержание (Right Of Lien). Смотрите также Ин Рэм или Вещь В Себе (In Rem).

LIEN ON REAL PROPERTY = УДЕРЖАНИЕ РЕАЛЬНОГО ИМУЩЕСТВА – Lien On Real Property:- liens on real property serve as collateral for loan claims and are entered in Section III of the Land Register (in Germany). The creditor is entitled to settlement of his claims against the lien object. If required, therefore, the owner is obliged to accept foreclosure of his property. The principal types of lien include mortgages and land charges.

LIFE ASSURANCE POLICY = ПОЛИС СТРАХОВАНИЯ ЖИЗНИ – In the United Kingdom, Life Assurance Policy is a document confirming that a contract for life insurance coverage has been concluded. Serves only as evidence and therefore lacks the characteristics of a security. Also known as Life Insurance Policy in the United States. A policy that pays a specified sum to beneficiaries upon the death of the life assured, or upon the assured surviving a given number of years, depending on the terms of the policy. Life insurance policies may be for fixed or indefinite term. See term life as regards fixed term policies. / Полис Страхования Жизни – контракт, заключаемый между страховой компанией и страхователем, в котором указаны условия страхового покрытия в случае смерти страхователя. Наряду с другими эти условия включают премии, условия кредитования (loan procedure), номинальную стоимость, назначение бенефициаров. Полисы могут быть срочными и с неизменной денежной стоимостью покрытия.

LIFE ASSURED = СТРАХОВАТЕЛЬ ЖИЗНИ (или ЛИЦО, ЗАСТРАХОВАВШЕЕ ЖИЗНЬ) – Life Assured is the person whose life is insured under a life insurance. / Персона, чья жизнь застрахована страхованием жизни.

LIFEBOAT = СПАСАТЕЛЬНАЯ ШЛЮПКА – Lifeboat is a specially constructed double ended boat which can withstand heavy, rough seas.

LIFEBOAT DRILL = УЧЕНИЕ С ИСПОЛЬЗОВАНИЕМ СПАСАТЕЛЬНОЙ ШЛЮПКИ – Lifeboat Drill:- the master of every vessel is bound by international law to make the officers, crew and passengers adequately acquainted with the procedures of lowering and the use of lifeboats in case of emergency. / хозяин (или капитан) каждого судна .

LIFE CYCLE = ЖИЗНЕННЫЙ ЦИКЛ (или ЦИКЛ РАЗВИТИЯ, или ЦИКЛ ДОЛГОВЕЧНОСТИ) – (1) Life Cycle is the lifetime of a product or business, from its creation to its demise or transformation. / Жизненный Цикл:- срок существования продукта или бизнеса, с момента его создания и до его кончины или трансформации. Жизненный Цикл – чаще всего термин употребляется в отношении продолжительности жизни человека и изменений в направлениях инвестирования. Термин также применяют, когда говорят о сроке существования продукта или продолжительности бизнеса, которые включают такие этапы, как возникновение, развитие, рост, расширение, зрелость и спад (или изменение). С недавнего времени термин стал употребляться в отношении семейного бизнеса, когда говорят о поколениях глав семейного бизнеса. Послевоенный бум рождаемости дал поколение предпринимателей, которые открывали свой бизнес, и теперь второе поколение либо встаёт во главе, либо продаёт семейный бизнес. Жизненный Цикл – период времени, в течение которого товар обладает жизнеспособностью, обращается на рынке, пользуется спросом, приносит доход производителям и продавцам. Принято считать, что жизненный цикл товара состоит из следующих этапов:- (1) поступление товара в широкую продажу; (2) рост объёма продаж товара вследствие наличия и увеличения спроса; (3) период зрелости, когда достигается максимальный объём продаж; (4) насыщение рынка данным товаром, снижение спроса, уменьшение сбыта; (5) резкий спад объёма продаж, снижение прибыли.

(2) Life Cycle:- the stages in the growth and development of an organism that occur between the appearance of the individual and its reproduction or death. / Жизненный Цикл:- стадии роста и развития организма, которые происходят между появлением особи и её репродукцией или смертью. Жизненный Цикл или Цикл Развития, совокупность фаз развития, пройдя которые организм достигает зрелости и становится способным дать начало следующему поколению, замыкая тем самым жизненный цикл. Длительность жизненного цикла определяется числом поколений (генераций), развивающихся в течение года, или числом лет, на протяжении которых жизненный цикл осуществляется; она зависит также от продолжительности периода покоя и диапаузы. У животных различают простой жизненный цикл – при прямом развитии особей, и сложный жизненный цикл – с метаморфозом или сменой поколений. При развитии с метаморфозом жизненный цикл прослеживается на развитии одной особи (например, у Свиного Солитера:- яйцо – онкосфера – финка – взрослый Цепень; у Майского Жука:- яйцо – личинка – куколка – имаго). При развитии со сменой поколений или сменой способов размножения жизненный цикл прослеживается на двух и более особях, принадлежащих разным поколениям, до появления исходной формы. Например, у Сцифоидных:- яйцо – планула – сцифистома – эфира – медуза; у Печёночного Сосальщика:- яйцо – мирацидий – редии – церкарии – адолескарии – взрослые черви; у Тлей:- яйцо – самка-основательница – мигранты – полоноски – обоеполые Насекомые. Таким образом, единицей при изучении жизненного цикла может быть как один онтогенез, так и ряд сменяющих друг друга онтогенезов. У высших Растений различают однолетний, двулетний и многолетний жизненный цикл. Для жизненного цикла многих низших Растений и Папоротников типична смена гаметофита и спорофита. У Паразитических Грибов жизненный цикл по сложности сходны с таковыми Паразитических Червей. У Ржавчинных Грибов жизненный цикл сложный – имеются формы, дающие эцидиоспоры, уредоспоры, телейтоспоры, а также базидиальная стадия. Из простейших наиболее сложны жизненные циклы у Споровиков, например, у Грегарин и Гемоспоридий. О жизненном цикле микроорганизмов смотрите Бактерии, о жизненном цикле человека смотрите Онтогенез.

(3) Lifecycle is the timing of various stages in the life of a plant, e.g., emergence, flowering, seed set.

LIFE–CYCLE PROCESSING = ПЕРЕРАБОТКА С УЧЁТОМ ЖИЗНЕННОГО ЦИКЛА – Life-Cycle Processing is an accounting approach in which a company sets product prices based on recovering costs over the life cycle of the product. US authorities dispute the validity of this approach because projections of future yield improvements cannot be verified at the time of dumping calculations.

LIFE INSURANCE = СТРАХОВАНИЕ ЖИЗНИ – Life Insurance, sometimes referred to as Life Assurance, provides for a payment of a sum of money upon the death of the insured. In addition, life insurance can be used as a means of investment or saving. / Страхование Жизни – страховой полис, по которому выплачивается страховое возмещение бенефициарам после смерти страхователя. За страхование своей жизни страхователь уплачивает страховую премию, как правило, ежегодно. Оплата срочного страхования (term insurance) производится до момента смерти страхователя, без увеличения денежной стоимости полиса. Размер премий по срочному страхованию ниже, чем по полисам с объявленной денежной стоимостью (cash value policies), таким, как полис пожизненного страхования, полисы страхования жизни с инвестированием части премии в финансовые активы, универсальный полис страхования жизни, по которым выплачивается страховка в случае смерти, а также предусмотрено увеличение денежной стоимости. Выплаты налогов на полисы могут быть отсрочены, а средства инвестированы в акции, облигации, недвижимость и так далее. Держатели полисов могут взять кредит под свой полис, который вычитается из страхового возмещения, если кредит не погашается. Некоторые виды страхования жизни приносят выгоду держателям полиса ещё при их жизни, например доход.

LIFE JACKET = XX (или СПАСАТЕЛЬНЫЙ ЖАКЕТ) – Life Jacket is a life preserver in the form of a buoyant vest.

LIFE–LINE = СПАСАТЕЛЬНЫЙ ЛЕЕР (или ШТОРМОВОЙ ЛЕЕР) – Life-Line (maritime term):- a line secured along the deck to lay hold of in heavy weather; a line thrown on board a wreck by life-saving crew; a knotted line secured to the span between life-boat davits for the use of the crew when hoisting and lowering.

LIFE OF CONTRACT = СРОК ДЕЙСТВИЯ КОНТРАКТА (или ЖИЗНЬ КОНТРАКТА) – Life Of Contract is a period between the beginning of trading in a particular futures contract and the expiration of trading. In some cases, this phrase denotes the period already passed in which trading has already occurred. For example, 'The Life-Of-Contract high so far is USD2.50'. Also known as Life Of Delivery, or Life Of The Future. Life Of Contract is the time period during which a specific contract month has been trading. Life of Contract is the period of time during which a particular futures contract is traded, from the first trading day to the last trading day. (Usually about 11 months for Grains). / Период от начала до окончания торговли конкретным фьючерсным контрактом. В некоторых случаях, эта фраза относится к уже пройденному периоду, в течение которого осуществлялась данная торговля. Например, 'Срок Действия Контракта длится до той поры, пока он стоит USD2.50'. Известен также как Срок Действия Поставки (Life Of Delivery) или Срок Действия Фьючерса (Life Of The Future).

LIFE TO FIRST REPAIR = СРОК СЛУЖБЫ ДО ПЕРВОГО РЕМОНТА – Life To First Repair:- output from the Pallet Design System© (PDS©) program which is equivalent to the number of trips the pallet will last before needing repair.

LIFE VEST = СПАСАТЕЛЬНЫЙ ЖИЛЕТ (или XX) – Life Vest is a life jacket.

LIFFE = LONDON INTERNATIONAL FINANCIAL FUTURES AND OPTIONS EXCHANGE

LIFO = LAST IN, FIRST OUT

LIFO = LINER IN FREE OUT

LIFTING = НАЛИВ – A term Lifting refers to tankers and barges loading cargoes of petroleum at a terminal or transshipment point. The act of loading petroleum or petroleum products at a terminal or transfer point. / Относится к танкерам и баржам, загружающим в качестве груза нефтепродукты на терминале или пункте перевалки или перегрузки. Процесс погрузки нефти или нефтепродуктов с терминала или на перевалочном пункте.

LIFT ON / LIFT OFF = ПОДЪЁМ / СПУСК (или ВЕРТИКАЛЬНЫЙ МЕТОД ГРУЗООБРАБОТКИ) – Lift On/Lift Off is a method by which cargo is loaded onto and unloaded from an ocean vessel, which in this case is with a crane. Also known as LO/LO. / Метод, посредством которого груз загружается и выгружается из океанского судна, и в данном случае с помощью крана. Известен также как Эл.Оу./Эл.Оу. (LO/LO).

LIFT–ON–LIFT–OFF OPERATION = ОПЕРАЦИЯ ПОДЪЁМА–СПУСКА – Lift-On-Lift-Off Operation:- (Lo-Lo) Loading and unloading of Intermodal Transport Units (ITUs) using lifting gear.

LIFT TRUCK = ГРУЗОВИК С ПОДЪЁМНИКОМ – Lift Truck is a vehicle that is utilized to move and transfer product/freight in a distribution center, warehouse, terminal, manufacturing site, or dock. Often referred to as a Forklift.

LIGATION = ЛИГАТУРА (или СРАЩИВАНИЕ, или ПЕРЕВЯЗЫВАНИЕ, или ЛИГИРОВАНИЕ, или СШИВАНИЕ) – Ligation is a joining of DNA fragments to produce a single DNA molecule. Ligases are enzymes which perform this reaction. Fragments of plant DNA are ligated into bacterial plasmids during the cloning of probes for use for restriction fragment length polymorphism (RFLP) analysis. / Под Лигатурой, от позднелатинского слова Ligatura, означающее Связь, понимается .

LIGHT = СВЕТ (или СВЕТЛОЕ) – (1) Light is the electromagnetic radiation of which a human observer is aware through the visual sensations that arise from the stimulation of the retina of the eye. This portion of the spectrum includes wavelengths from about 380 nm to 780 nm. Thus, it is incorrect to speak of ultraviolet or infrared 'light' because the human observer cannot see radiant energy in the ultraviolet and infrared regions. (2) Light:- referring to the color of a non-self-luminous body, having a high luminous reflectance factor, as 'light green' or 'light gray'.

LIGHT ACTION = ЛЁГКОЕ ДЕЙСТВИЕ – Light Action:- snap fastener does not stay closed because of lack of proper tensions. Same comment applies as for tight closure. Closure defects, and namely – Snap Fasteners. / Порок или дефект застёжки.

LIGHT BILL = МЕЛКИЙ СЧЁТ – Light Bill is a receipt for the payment of light dues.

LIGHT BOX = ЛЁГКИЙ СУНДУК – Light Box is a container containing less than the full load of cargo by volume or weight and in which other small shipments can reasonably be loaded. / Контейнер, по объёму или весу содержащий меньше груза, чем при полной загрузке, и в который мелкие партии иного груза могли бы быть догружены.

LIGHT CRUDE = ЛЁГКАЯ НЕФТЬ – Light Crude oil is liquid petroleum that has low density and that flows freely at room temperature. It has low viscosity, low specific gravity and high API gravity due to the presence of a high proportion of light hydrocarbon fractions. It generally has a low wax content as well. On the other hand, heavy crude oil or extra heavy crude oil is any type of crude oil which does not flow easily. It is referred to as 'Heavy' because its density or specific gravity is higher than that of light crude oil. Heavy crude oil has been defined as any liquid petroleum with an API gravity less than 20°. Extra heavy oil is defined with API gravity below 10.0 °API (API gravity, is a measure of how heavy or light a petroleum liquid is compared to water. If its API gravity is greater than 10, it is lighter and floats on water; if less than 10, it is heavier and sinks.) Light crude oil receives a higher price than heavy crude oil on commodity markets because it produces a higher percentage of gasoline and diesel fuel when converted into products by an oil refinery. Heavy crude oil has more negative impact on the environment than its light counterpart since its refinement requires the use of more advanced techniques an the use of contaminants. The sweet light crude oil Western Texas Intermediate (WTI) is used as a benchmark in oil pricing. Crude oil with a low specific gravity and high American Petroleum Institute gravity due to the presence of a high proportion of light hydrocarbon fractions. Has an API gravity higher than 33 degrees. The higher the API gravity, the lighter the crude oil. / Имеет тяжесть по АИН выше 33 градусов. Чем выше тяжесть по АИН, тем легче нефть.

LIGHT DISPLACEMENT TONNAGE = ТОННАЖ ВОДОИЗМЕЩЕНИЯ ПОРОЖНЕМ (или МАССОВОЕ ВОДОИЗМЕЩЕНИЕ ПОРОЖНЕМ) – Light Displacement Tonnage:- the weight of a ship's hull, machinery, equipment and spares. This is often the basis on which ships are paid for when purchased for scrapping. The difference between the loaded displacement and light displacement is the ship's deadweight.

LIGHT DUES = МАЯЧНЫЕ СБОРЫ – Light Dues:- moneys collected by the UK Customs on behalf of Trinity House for the maintenance of lighthouses and buoys. Dues are levied on vessels according to their net registered tonnage. / Деньги, собираемые Таможней Соединённого Королевства от имени Дома Троицы (Trinity House, Британская маячно-лоцманская компания) для поддержания маяков и буёв. Эти сборы, налагаются на владельцев судов исходя из расчёта их чистой регистровой вместимости или чистого регистрового тоннажа (net registered tonnage).

LIGHT EMITTING DIODE = ДИОД, ЭМИТИРУЮЩИЙ СВЕТ (или ДИОД, ИСПУСКАЮЩИЙ СВЕТ, или СВЕТОИЗЛУЧАЮЩИЙ ДИОД) – Light Emitting Diode (LED):- solid state light emitters that are extremely stable and durable, the latest technology in color instrument light sources.

LIGHT END = ЛЁГКАЯ ПРОДОЛЬНАЯ НИТЬ (или РЕДКАЯ ПРОДОЛЬНАЯ НИТЬ) – Light End:- xxxxx. See also Fine End. Fabrics defect.

LIGHT ENDS = ЛЁГКИЕ ПОГОНЫ (или ЛЁГКИЕ КОНЦЕВЫЕ ФРАКЦИИ, или ЛЁГКИЕ ХВОСТОВЫЕ ФРАКЦИИ, или ГОЛОВНЫЕ ПОГОНЫ) – Light Ends are the low-boiling volatile materials in a petroleum fraction. They are often unwanted and undesirable, but in gasoline the proportion of light ends deliberately included are used to assist low-temperature starting. Light End is:- (1) the low boiling fraction in distillation; (2) See also Fine End, 1. Light Ends are the more volatile products of petroleum refining, such as butane, ethane, and propane. Group of petroleum products with the lowest boiling temperatures, including gasolines and distillate fuels. / Наиболее нестабильные продукты очистки нефти, такие как бутан, пропан и этан. Группа нефтепродуктов с наинизшей температурой кипения, в том числе бензины и дистиллятные топлива. Под Нефтяными Погонами или Нефтяными Дистиллятами понимаются фракции, отбираемые при перегонке нефти, например, бензиновая или керосиновая. С повышением температуры кипения фракции повышается плотность, изменяются свойства и углеводородный состав нефтяных дистиллятов. Аналогичные по температурам кипения фракции разных нефтей могут различаться между собой.

LIGHTENING = ОБЛЕГЧЕНИЕ – Lightening:- a vessel discharges part of its cargo at anchor into a lighter to reduce the vessel's draft so it can then get alongside a pier. / Судно разгружает часть своего груза в лихтер, стоя на якоре с тем, чтобы уменьшить осадку судна до такого уровня, который позволил бы ему пришвартоваться бортом к пирсу.

LIGHTER = ЛИХТЕР – Lighter is a general name for a broad, flat-bottomed boat used in transporting cargo between a vessel and the shore. The distinction between a lighter and a barge is more in the manner of use than in equipment. The term 'lighter' refers to a short haul, generally in connection with loading and unloading operations of vessels in harbor while the term 'barge' is more often used when the cargo is being carried to its destination over a long distance. A Lighter is an inland water vessel or barge usually without an engine that was originally used for reducing the draft of a ocean-going vessel by lightening the load thus allowing it to enter the port. An open or covered barge towed by a tugboat and used mainly in harbors and inland waterways to carry cargo to/from alongside a vessel. See also Barge. / Под Лихтером, от Голландского слова Lichter, понимается несамоходное сухогрузное морское судно для перевозок с помощью буксирных судов, для беспричальных грузовых операций при погрузке или разгрузке на рейде глубокосидящих морских судов, которые не могут войти в порт, а также для частичной разгрузки глубокосидящих морских судов перед постановкой к мелководному причалу. Для перевозок на баржевозах используются стандартные лихтеры грузоподъёмностью 370 тонн. Лихтеры иногда имеют собственное грузовое устройство – один из видов судовых устройств для погрузки, выгрузки и перемещения грузов.

LIGHTER ABOARD SHIP = ЛИХТЕРОВОЗ (или БАРЖЕВОЗ) – Lighter Aboard Ship (LASH) is an ocean ship which carries barges. These barges are loaded with cargo, often at a variety of locations, towed to the ocean ship, sometimes referred to as the Mother Ship, and lifted or, in some cases, floated on board. After the ocean crossing, the barges are off-loaded and towed to their various destinations. The ocean ship then receives a further set of barges which have been assembled in readiness. This concept was designed to eliminate the need for specialized port equipment and to avoid transshipment with its consequent extra cost. A vessel which carries barges. Lighter Aboard Ship (LASH) is a barge carrier designed to act as a shuttle between ports, taking on and discharging barges. A specially constructed vessel equipped with an overhead crane for lifting specially designed barges and stowing them into cellular slots in an athwartship position. Lighter Aboard Ship (LASH) is a specialized container ship carrying very large floating containers, or lighters. The ship carries its own massive crane, which loads and discharges the containers over the stern. The lighters each have a capacity of 400 tons and are stowed in the holds and on deck. While the ship is at sea with one set of lighters, further sets can be made ready. Loading and discharge are rapid at about 15 minutes per lighter, no port or dock facilities are needed, and the lighters can be grouped for pushing by towboats along inland waterways. / Судно, несущее свой собственный массивный кран, который погружает и разгружает контейнеры . Под Лихтеровозом или Баржевозом понимается судно, предназначенное для транспортировки грузов в баржах – плавучих контейнерах. Первый баржевоз был построен в 1969. Существует много проектов таких судов, но эксплуатируются в основном баржевозы двух типов:- с крановой и горизонтальной грузообработкой. На баржевозы с крановой грузообработкой баржи поднимаются с воды, перемещаются вдоль палубы и устанавливаются в трюмы козловым краном. Такие баржевозы вмещают до 83 барж, каждая из которых имеет массу с грузом до 450 тонн. На баржевозы с горизонтальной грузообработкой баржи поднимаются до уровня грузовой палубы с помощью специального кормового подъёмника и через открытые кормовые ворота перемещаются на тележках к месту установки. Вместимость баржевозов этого типа до 38 барж, имеющих водоизмещение до 1 000 тонн.

LIGHTERAGE = ЛИХТЕРОВКА (или ЛИХТЕРНЫЕ ПЕРЕВОЗКИ) – Lighterage:- conveying cargo with another vessel known as a lighter from ship to shore, or vice versa. Also known as Lightering. The carriage of goods within a port area by a barge. Refers to carriage of goods by lighter and the charge assessed therefrom. / Лихтеровка – процесс разгрузки или погрузки судов на рейде с помощью лихтера (несамоходное морское судно, которое используется для перевозки грузов, а также для беспричальных грузовых операций при погрузке или разгрузке на рейде глубокосидящих судов, которые не могут войти в порт). Обычно в чартерах предусматривается, что все расходы, связанные с наймом лихтеров, оплачиваются грузоотправителем или грузополучателем.

LIGHTERAGE = ЛИХТЕРОВКА (или ЛИХТЕРНЫЙ СБОР) – Lighterage is a charge for conveying cargo by lighters or barges. The price paid for loading or unloading ships by lighters or barges. / Цена, оплачиваемая за погрузку или выгрузку судов с использованием лихтеров или барж.

LIGHTFASTNESS = УСТОЙЧИВОСТЬ К СВЕТУ (или СВЕТОСТОЙКОСТЬ, или СВЕТОПРОЧНОСТЬ) – Lightfastness is a measure of how resistant a coloring material, such as dye, is to fading due to exposure to light. There are a number of textile industry standard methods for evaluating how lightfast dyed fabric is. Differences in the lightfastness of individual dyes mixed to make a specific color can result in a color shift over time as the dyes of lesser fastness fade while others fade much less. Lightfastness mostly depends on the molecular structure of the dye itself, but can be influenced by the fiber or contaminants. Lightfastness is the ability of a material to withstand color change on exposure to light. Lightfastness is the degree of resistance of dyed textile materials to the color-destroying influence of sunlight. Two methods of testing are in use:- (i) exposure to sunlight, either directly or under glass, and (ii) accelerated testing in a laboratory apparatus equipped with any of several types of artificial light sources. / Устойчивость (Окраски) К Свету.

LIGHT FILLING = ЛЁГКАЯ УТОЧИНА (или РЕДКАЯ УТОЧИНА) – Light Filling:- xxxxx. See also Thin Filling. Fabrics defect.

LIGHT FRAMING = ФОРМИРОВАНИЕ ОБЛЕГЧЁННОГО КАРКАСА (или ОБЛЕГЧЁННОЕ ОБРАМЛЕНИЕ) – Light Framing is the use of dimension lumber, trusses, and other small cross- section members to provide support and enclosure for a building. / .

LIGHTNING = УДАР МОЛНИИ – Lightning can cause circular or irregular patches of dead or damaged plants. A key characteristic is that all plants in a patch are affected at the same height. In mature crops the damage, including browning inside the stem, may occur at the top of the plant, while the roots and lower stem are unaffected. A circular, or sometimes irregular, patch of dead plants that may be from two to over fifty meters across. All plants are killed or affected simultaneously and there should be no effect on plant stand. Most plants are completely killed, wilt immediately and dry quickly with leaves 'frozen' on the plant. Sometimes only the top of the plant is killed and the roots and lower stem appear unaffected. These plants may shoot again from the live portion of the stem. / в то время как корни и прикорневая часть растения (lower stem) остаются нетронутыми. вилт.

LIGHT METALS = ЛЁГКИЕ МЕТАЛЛЫ – Light Metals:- another important development of the late XIX century was the separation from their ores, on a substantial scale, of aluminum and magnesium. In the earlier part of the century, several scientists had made small quantities of these light metals, but the most successful was Henri-Étienne Sainte-Claire Deville, who by 1855 had developed a method by which cryolite, a double fluoride of aluminum and sodium, was reduced by sodium metal to aluminum and sodium fluoride. The process was very expensive, but cost was greatly reduced when the American chemist Hamilton Young Castner developed an electrolytic cell for producing cheaper sodium in 1886. At the same time, however, Charles M. Hall in the United States and Paul-Louis-Toussaint Héroult in France announced their essentially identical processes for aluminum extraction, which were also based on electrolysis. Use of the Hall-Héroult process on an industrial scale depended on the replacement of storage batteries by rotary power

generators; it remains essentially unchanged to this day. / Ори-Этен Сэнт-Клер Дёвиль (Henri-Étienne Sainte-Claire Deville). Американский химик Хэмилтчэн Ян Кэстнё (Hamilton Young Castner). Чарлз Эм. Хол (Charles M. Hall) в Соединённых Штатах Америки и Поль-Люи-Туса Эруль (Paul-Louis-Toussaint Héroult). Использование процесса Хола-Эруля в промышленном масштабе зависит от .

LIGHTNESS = СВЕТЛОТА (или СВЕТЛЫНЬ, или ЛЁГКОСТЬ, или ОСВЕЩЁННОСТЬ) – Lightness is:- (1) the attribute of color perception by which a non-self-luminous body is judged to reflect more or less light. (2) The attribute by which a perceived color is judged to be equivalent to one of a series of grays ranging from black to white.

LIGHT OBSCURATION = ЛЁГКОЕ ПОТЕМНЕНИЕ (или ЛЁГКАЯ ОБСКУРАЦИЯ, или ЛЁГКОЕ ЗАТЕМНЕНИЕ) – Light Obscuration is the degree of light blockage as reflected in the transmitted light impinging on the photodiode. / степень лёгкого засорения .

LIGHT OIL = ЛЁГКИЕ НЕФТЯНЫЕ ФРАКЦИИ – Light Oil:- lighter fuel oils distilled off during the refining process. Virtually all petroleum used in internal combustion and gas-turbine engines is light oil. / Под Нефтяными Погонами или Нефтяными Дистиллятами понимаются фракции, отбираемые при перегонке нефти, например, бензиновая или керосиновая. С повышением температуры кипения фракции повышается плотность, изменяются свойства и углеводородный состав нефтяных дистиллятов. Аналогичные по температурам кипения фракции разных нефтей могут различаться между собой.

LIGHT PICK = ЛЁГКАЯ ПОПЕРЕЧНАЯ НИТЬ (или РЕДКАЯ ПОПЕРЕЧНАЯ НИТЬ) – Light Pick:- xxxxx. See also Thin Filling. Fabrics defect.

LIGHT PRODUCTS YIELD = ВЫХОД ЛЁГКИХ ПРОДУКТОВ – Light Products Yield is a ratio of the total volume of gasoline, diesel fuel and their fractions (useable as motor oil components), jet fuel, illuminants and technical kerosene, low-viscosity ship fuel and heating oil (fractions, which vaporize between 28 and 360 degrees Celsius) to the total volume of oil processed at a refinery in a given period. / Выход Лёгких Продуктов – это отношение общего количества произведённых бензина, дизельного топлива и их фракций в виде товарной продукции (которые могут использоваться в качестве компонентов моторных топлив), реактивного топлива, осветительного и технического керосина, судового маловязкого и печного бытового топлива (фракции, выкипающие в пределах 28–360 градусов Цельсия (°C)) ко всему объёму переработанной нефти на нефтеперегонном заводе (НПЗ) за данный период.

LIGHT SMUTTY WHEAT = СЛЕГКА ПОРАЖЁННАЯ ГОЛОВНЁЙ ПШЕНИЦА – Light Smutty Wheat is a Wheat that has an unmistakable odor of smut, or which contains, in a 250-gram portion, smut balls, portions of smut balls, or spores of smut in excess of a quantity equal to 5 smut balls, but not in excess of a quantity equal to 30 smut balls of average size. / головнёвых шариков, или споры головни.

LIGHT SOIL = ЛЁГКАЯ ПОЧВА – Light Soil is a coarse-textured soil such as sandy soil. / Почва лёгкого механического (гранулометрического) состава.

LIGHT SOURCE = ИСТОЧНИК СВЕТА – Light Source is an object that emits light or radiant energy to which the human eye is sensitive. The emission of a light source can be described by the relative amount of energy emitted at each wavelength in the visible spectrum, thus defining the source as an illuminant, or the emission may be described in terms of its correlated color temperature.

LIGHT SOURCE TUNGSTEN = ВОЛЬФРАМОВЫЙ ИСТОЧНИК СВЕТА – Light Source Tungsten is:- (1) constant burning tungsten, traditional light source in color instruments. (2) Flashing tungsten, latest low cost light source, typically used in portable color instruments.

LIGHT SOURCE XENON = КСЕНОНОВЫЙ ИСТОЧНИК СВЕТА – Light Source Xenon:- high energy, pulsed light used in color instruments.

LIGHT SPECKS = СВЕТЛЫЕ КРАПИНКИ (или СВЕТЛЫЕ МУШКИ) – Light Specks:- Fabric:- twill suiting; Construction:- (i) Count:- 90 x 48; (ii) Warp:- 30/2 1%-in. IV^-den. dull viscose rayon; (iii) Filling:- 30/2 combed cotton; Finish:- plain dyed light blue. Defect:- light specks in the filling. Analysis:- microscopic analysis showed that the light specks (undyed) were neps of immature or so-called 'Dead' Cotton Fiber. While a certain amount of such fibers are present in all cotton, poorer qualities will contain an excessive proportion of such fiber. In some cases these neps are removed in carding and combing. Also, in the case of all cotton goods which receive very severe boil-off and mercerization, there is further opportunity to minimize the appearance of such cotton-fiber imperfections. / Уточина:- .

LIGHT SWEET CRUDE OIL = ЛЁГКАЯ МАЛОСЕРНИСТАЯ НЕФТЬ – Nothing Fuels the Energy Marketplace Like NYMEX® WTI (short for the West Texas Intermediate, also known as Texas Light Sweet, is a grade of crude oil used as a benchmark in oil pricing). The World's Most Liquid Crude Oil Benchmark:- Light Sweet Crude Oil (WTI) futures and options are the world's most actively traded energy product. Customers around the world have sought out WTI futures for price discovery and risk management for more than 25 years. Here is why:- Key Facts about NYMEX® Light Sweet Crude Oil (CL):- (i) Most Liquid:- WTI is the deepest and most liquid global energy benchmark, trading nearly 850 000 futures and options contracts daily; (ii) Open Interest:- total open interest in WTI has exceeded 3 million lots, equivalent to more than 3 billion barrels; (iii) Increased Access and Production:- this (2013) year's 7 percent annual growth, the largest single-year gain since 1951, is driven by improved infrastructure and technology as well as procurement of oil from ample shale basins. Production of supply from the Mid-Continent, Bakken, and Canadian oil fields is expected to continue to rise. (iv) Most Transparency:- WTI's superior transparency and convergence to the physical market enables investors to make sound judgments on the basis of accurate weekly supply and demand information; and (v) Efficient Margining:- CME Group offers margin erosion and has the most WTI and Brent offsets. Product Information:- (i) outright contract between a buyer and seller; (ii) accessible to international spot markets via pipelines; (iii) several grades of domestic and internationally traded foreign crudes; (iv) swaps and six types of options:- American style, calendar spread, crack spreads, average price, European style and daily; (v) Light Sweet Crude Oil (WTI) Futures and Options; and (vi) Global Energy Marketplace. The World's Most Liquid Crude Oil Benchmark:- Light Sweet Crude Oil (WTI) is a significant physical market price reference – it serves as a benchmark for approximately 10 million barrels of daily North American production and has become the most efficient hedging tool for hundreds of commercial oil companies. Light Sweet Crude Oil (WTI) futures and options are the world's most actively traded energy contracts. Customers around the world have sought out WTI futures for price discovery and risk management for more than 25 years. What Is WTI? WTI crude oil is a blend of several US domestic streams of light sweet crude oil. For WTI crude oil, the delivery point in Cushing, Oklahoma, is a vital transshipment point, where storage facilities and intersecting pipelines provide easy access to refiners and suppliers. Crude oil flows inbound to Cushing from around the country and outbound through dozens of pipelines. Light Sweet Crude Oil (WTI) Futures and Options:- the world's most liquid crude oil benchmark. WTI crude oil is a blend of several US domestic streams of light sweet crude oil. For WTI crude oil, the delivery point in Cushing, Oklahoma, is a vital transshipment point, where storage facilities and intersecting pipelines provide easy

access to refiners and suppliers. Crude oil flows inbound to Cushing from around the country and outbound through dozens of pipelines. Naturally, Light Sweet Crude Oil (WTI) is a significant physical market price reference – it serves as a benchmark for approximately 10 million barrels of daily North American production and has become the most efficient hedging tool for hundreds of commercial oil companies. Light Sweet Crude Oil (WTI) futures and options are the world's most actively traded energy contracts. Customers around the world have sought out WTI futures for price discovery and risk management for more than 25 years. Here is why:- (1) More Choices. More Volume. More Benefits for Energy Traders:- (i) the world's most liquid benchmark oil futures contract; (ii) security through centralized clearing, guaranteed counterparty credit and segregation of customer funds through CME Clearing; (iii) the ability to trade anywhere, 23 hours a day on CME Globex; (iv) anonymity and price transparency for all market participants; and (v) physically delivered and financially settled (full-sized and E-mini) futures contracts. (2) Light Sweet Crude Oil Futures Provide:- (i) the most reliable risk management tool in uncertain times; (ii) physical delivery and a vital connection to the physical market; (iii) the deepest liquidity of any crude oil futures product; (iv) the most transparent and reliable pricing available in the energy marketplace; and (v) a tested mechanism for reflecting crude oil supply and demand fundamentals. (3) Key Facts:- (i) outright contract between a buyer and seller; (ii) accessible to international spot markets via pipelines; (iii) several grades of domestic and internationally traded foreign crudes; (iv) swaps and six types of options:- American Style, Calendar Spread, Crack Spread, Average Price, European Style and Daily. (4) Venues:- (i) CME Globex – for select products; (ii) CME ClearPort; (iii) CME Direct; and (iv) Open Outcry. Specification:- (1) Product Symbol:- CL. (2) Venue & Hours (NY Time/ET):- (i) CME Globex and CME ClearPort:- Sunday – Friday 06:00 pm – 05:15 pm (05:00 pm – 04:15 pm Central Time/CT) with a 45-minute break each day beginning at 05:15 pm (04:15 pm CT); (ii) Open Outcry:- Monday – Friday 09:00 am to 02:30 pm (08:00 am to 01:30 pm CT). (3) Contract Size:- 1 000 Barrels. (4) Price Quotation:- US Dollars and Cents per barrel. (5) Min. Fluctuation:- USD0.01 per barrel. (6) Termination:- trading in the current delivery month shall cease on the third business day prior to the twenty-fifth calendar day of the month preceding the delivery month. If the twenty-fifth calendar day of the month is a non-business day, trading shall cease on the third business day prior to the last business day preceding the twenty-fifth calendar day. In the event that the official Exchange holiday schedule changes subsequent to the listing of a Crude Oil futures contract, the originally listed expiration date shall remain in effect. In the event that the originally listed expiration day is declared a holiday, expiration will move to the business day immediately prior. (7) Listed Contracts:- crude oil futures are listed nine years forward using the following listing schedule: consecutive months are listed for the current year and the next five years; in addition, the June and December contract months are listed beyond the sixth year. Additional months will be added on an annual basis after the December contract expires, so that an additional June and December contract would be added nine years forward, and the consecutive months in the sixth calendar year will be filled in. Additionally, trading can be executed at an average differential to the previous day's settlement prices for periods of two to 30 consecutive months in a single transaction. These calendar strips are executed during open outcry trading hours. (8) Settlement Type:- physical. / НАЙМЭКС® (NYMEX®).

LIGHT TRANSMISSION RATIO = СООТНОШЕНИЕ С ПРОПУСКАНИЕМ СВЕТА – Light Transmission Ratio is a light intensity at the ground level of a population divided by the light intensity at the top of the population.

LIGHT TRAP = СВЕТОВАЯ ЛОВУШКА (или СВЕТОЛОВУШКА) – Light Trap is a device consisting of at least an ultraviolet light (which is attractive to a number of night-flying insects) and a collection container. Used to monitor the timing and relative abundance of selected insect species, e.g., Bollworm and European Corn Borer. Light Trap is a device for collecting insects, consisting of a light source which attracts insects at night and a mechanism that traps the insects.

LIGHT VESSEL = СУДНО НА ЛЕГКЕ (или ПОРОЖНЕЕ СУДНО) – Light Vessel is a vessel which has space available for the acceptance of additional loaded containers. / Судно, которое имеет пространство, доступное для размещения в нём дополнительных загружаемых контейнеров.

LIGHTWEIGHT = ВОДОИЗМЕЩЕНИЕ ПОРОЖНЕМ – Lightweight is a weight of an empty vessel including equipment and outfit, spare parts required by regulatory bodies, machinery in working condition and liquids in the systems, but excluding liquids in the storage tanks, stores and crew.

LIGHT WEIGHT = ЛЁГКИЙ ВЕС – Light Weight:- having an airy weave. Used as a light weight base layer in apparel for aerobic activities and cool weather.

LIGNE = ЛИНЬЯ (или ЛИНИЯ, или ШОВ) – Ligne:- a button's ligne, refers to a button's size. The word Ligne, is a French word that became the standard reference used by German button manufacturers in the early XVIII century. Ligne is the internationally recognized standard. Consensus at the time was that a 'ligne' measured the inside diameter of a 'round wick folded flat'. One inch is equal to 40 English ligne, 11 French ligne, and 25.5 mm. / Линия – мера длины, равная 2.25 миллиметра (мм). Канадская линия равна 3.175 миллиметра.

LIGNIN = ЛИГНИН – Lignin is a diverse group of non-toxic organic polymers often associated with cellulose in the walls of many plant cells, especially in woody plants. In this form, lignin acts as a cement to exploit the strength of cellulose fibers, while allowing flexibility. The mechanical properties of this natural composite material (wood) compare favorably with many man-made composite materials such as fiber-glass. After cellulose, lignin may be the second most abundant biopolymer in the world with an estimated annual production of 108 tons, but see also Chitin. Lignin is formed by the irreversible removal of water from sugar monomers to create phenolic aromatic structures. Polymerisation and extensive cross-linking occur to create very large three-dimensional lignin molecules. Sometimes lignin is isolated as a brown powder, but more often as a gummy mixture of lignins with a wide range of molecular weights. Lignin resists attack by most microorganisms, and anaerobic processes tend not to attack the aromatic rings at all. Aerobic breakdown of lignin is slow and may take many days. Hence, the presence of lignin strongly affects the bio-degradeability of woody materials. The presence of lignin is demonstrated by a characteristic red color on contact with sodium hypochlorite (bleach). The second most abundant constituent of wood after cellulose. It is the thin cementing layer between the wood cells. Lignin is a mixture of natural aromatic organic compounds found in woody and grassy plant material. Lignin occurs in bast fibers such as linen. Lignins are normally removed from fabric to be dyed, since they may dye easily but with poor fastness. Lignins extracted from wood pulp used to make paper are used to make some types of surfactants. Lignin is the major noncarbohydrate portion of wood. It is an amorphous polymeric substance that cements the fibrous portions together. / Фенольное (Phenolic). Под Лигнином, от Латинского слова Lignum, означающее Дерево или Древесина, понимается высокомолекулярное соединение клеток сосудистых растений, состоящее из производных ароматических спиртов. Отложение Лигнина в клеточных оболочках (так называемая лигнификация) вызывает одревеснение клеток и увеличивает их прочность. Состав природного Лигнина зависит от породы деревьев. Содержание Лигнина в древесине хвойных доходит до 50%, лиственных пород – 20–30%, соломе злаков – 12–20%. Лигнин плохо усваивается животными. Содержание его в травянистых растениях может служить критерием для оценки усвояемости растительных кормов. Лигнин – источник ароматической части почв, гуминовых кислот. Лигнин – органическое полимерное соединение, содержащееся в клеточных оболочках сосудистых растений. Лигнин вызывает их одревеснение. Лигнин является ценным химическим сырьём, используемым во многих производствах. Лигнин – аморфное, жёлто-коричневое

высокомолекулярное вещество, содержащееся в древесине (20–35%). Образуется как побочный продукт в производстве целлюлозы и при гидролизе растительных материалов. Применяют как крепитель и связующее в литейном производстве, для понижения вязкости бурильных растворов, в качестве сырья в производстве активного угля, синтетических дубящих веществ, ванилина и другого. Лигнин, сложное полимерное соединение, содержащееся в клетках сосудистых растений. Относится к инкрустирующим веществам оболочки растительной клетки. Отложение лигнина в клеточных оболочках вызывает одревеснение клеток и увеличивает их прочность. Древесина лиственных пород содержит 20–30% лигнина, хвойных – до 50%; у низших растений (Водоросли, Грибы) и Мхов лигнин не обнаружен. Одревеснevшие клеточные оболочки обладают ультраструктурой, которую можно сравнить со структурой железобетона:- микрофибриллы целлюлозы по своим свойствам соответствуют арматуре, а лигнин, обладающий высокой прочностью на сжатие, – бетону. Химическое строение лигнина не установлено окончательно. Молекула лигнина состоит из продуктов полимеризации ароматических спиртов; основной мономер – конифериловый спирт. Лигнин – аморфное вещество жёлто-коричневого цвета; нерастворим в воде и органических растворителях; окрашивается основными красителями и даёт цветные реакции, характерные для фенолов. Биосинтез лигнина полностью не исследован. Его предшественником, как и ряда других ароматических соединений в растениях, является шикимовая кислота. Образование лигнина осуществляется через следующие основные стадии:- шикимовая кислота x фенилаланин x коричная кислота x феруловая кислота x конифериловый спирт x лигнин. Лигнин в промышленности получают как отход при производстве целлюлозы (сульфатный лигнин, лигносульфоновые кислоты) и гидролизе растительных материалов (гидролизный лигнин). Лигнин является ценным химическим сырьём, используемым пока далеко не полностью. Сульфатный лигнин может применяться как усилитель синтетического каучука, в качестве пластификатора в керамическом производстве и тому подобном. Лигносульфоновые кислоты используются как дешёвые крепители и связующие в литейном производстве, добавки к шихте при производстве цемента и для других целей. Гидролизный лигнин применяют для получения лигнинового угля, активного угля (коллактивита), при производстве пористого кирпича, для выработки нитролигнина – понизителя вязкости глинистых растворов, применяемых при бурении скважин.

LIGNITE = ЛИГНИТ – Lignite is the lowest rank of coal. It is a peat that has been transformed into a rock and that rock is a brown-black coal. Lignite sometimes contains recognizable plant structures. By definition it has a heating value of less than 8 300 British Thermal Units per pound on a mineral matter free basis. It has a carbon content of between 60 and 70% on a dry ash-free basis. In Europe, Australia and the UK some low-level lignites are called Brown Coal. Brownish black coal having qualities in between those of bituminous coal and peat. The texture of the original wood often is visible in lignite. Lignite is a brownish-black coal of low rank with high inherent moisture and volatile matter (used almost exclusively for electric power generation). It is also referred to as Brown Coal. Comprises two groups classified according to the following ASTM Specification D388-84 for calorific values on a moist material-matter-free basis. American Society for Testing and Materials (ASTM). / Американское Общество по Испытаниям и Материалам (АОИМ). Слабообугленная древесина в пластах бурого угля, сохранившая строение тканей. Под Лигнитом, от Латинского слова Lignum, означающее Дерево или Древесина, понимается горючее полезное ископаемое, представляющее собой слабообугленную древесину в пластах бурого угля и сохранившую строение тканей. В Соединённых Штатах Америки и некоторых странах Европы лигнит относится к слабоуглефицированному бурому углю. Лигнит – ископаемая слабоуглефицированная древесина (преимущественно хвойных пород), сохранившая строение тканей и по внешним признакам сходная с неизменной древесиной. Залегает в пластах бурого угля. Лигнитом называют также бурый уголь, состоящий целиком или в основном из такой древесины.

LIGULE = ЛИГУЛА (или ЯЗЫЧОК, или УШКО) – Ligule is a thin, upright, membranous appendage at the top of the leaf sheath. It is attached to the base on the inside of the leaf collar of the Rice plant and some grasses. Ligule is a projection at the junction of the leaf blade and leaf sheath in grasses. Ligule is a thin, upright, membranous structure seated on the inside of the collar at ita base where the blade joins the leaf sheath. It is often bilobed, ciliate or glabrous. / Ушки листьев у Злаков. В ботанике под Язычком понимается вырост над влагалищем листа (у основания листовой пластинки) у Злаков и некоторых других Однодольных.

LIGULELESS = БЕЗЛИГУЛЬНЫЕ (или БЕЗЪЯЗЫЧКОВЫЕ) – Liguleless (lg):- said of leaves that lack collar, ligule, and auricles; synonymous with juncturaless. The blade stands upright at base. / Безлигульные (Безъязычковые) формы злаков (Ржи, Пшеницы) – растения, у которых влагалища листьев, охватывающие стебель, переходят в листовую пластинку постепенно в отличие от обычных, имеющих плёнчатый язычок в месте отхождения пластинки от верха влагалищной трубки.

LIKELIHOOD OF CONFUSION = ВЕРОЯТНОСТЬ СМЕШЕНИЯ – Likelihood Of Confusion:- a statutory basis (Trademark Act Section 2(d), 15 USC Section 1052(d), TMEP § 1207 et seq.) for refusing registration of a trademark or service mark because it is likely to conflict with a mark or marks already registered or pending before the United States Patent and Trademark Office (USPTO). After an application is filed, the assigned examining attorney will search the USPTO records to determine if such a conflict exists between the mark in the application and another mark that is registered or pending before the USPTO. The USPTO will not conduct any preliminary searches for conflicting marks before an applicant files an application and cannot provide legal advice on whether a particular mark can be registered. The principal factors considered by the examining attorney in determining whether there is a likelihood of confusion are:- (1) the similarity of the marks; and (2) the commercial relationship between the goods and/or services listed in the application. To find a conflict, the marks do not have to be identical, and the goods and/or services do not have to be the same. It may be enough that the marks are similar and the goods and/or services related. If a conflict exists between your mark and a registered mark, the examining attorney will refuse registration on the ground of likelihood of confusion. If a conflict exists between your mark and a mark in a pending application that was filed before your application, the examining attorney will notify you of the potential conflict and possibly suspend action on your application. If the earlier-filed application registers, the Examining Attorney will refuse registration of your mark on the ground of likelihood of confusion. / Вероятность Смешения – субъективный критерий правомочности знака при наличии сходных товарных знаков на родственные товары.

LILAC = СИРЕНЕВОЕ (или СИРЕНЬ, или ЛАЙЛЭК) – Lilac:- a variable color averaging a moderate purple.

LIMA = ЛИМА – Lima (pronunciation:- LEE-mah) or L is international nautical signal flag meaning:- You should stop your vessel immediately. Come Within Hail or Follow Me (Sailing Regatta). Meaning:- you should stop, I have something important to communicate. Inport:- This ship is under quarantine. Underway:- You should stop your vessel immediately. With 4 numerals, latitude; first 2 numerals signify degrees, second two numerals indicate minutes.

LIMBER HOLE = ШПИГАТ (или ШТОРМОВОЙ ПОРТИК, или СТОЧНОЕ ОТВЕРСТИЕ, или ЛИМБЕРБОРДОВОЕ ОТВЕРСТИЕ) – Limber Hole is a drainage hole in a ship. / Под Шпигатом, от Голландского слова Spiegat или Spuigat, понимается отверстие в палубе судна для удаления воды за борт. Под Штормовыми Портиками понимаются отверстия в фальшборте судна, устроенные для стока воды. Фальшборт, от Немецкого слова Falschbord, лёгкий стальной пояс, выполненный как продолжение бортовой обшивки судна и расположенный выше верхней палубы. Фальшборт служит ограждением открытых частей палубы и уменьшает накат волн на неё.

LIME = ИЗВЕСТЬ – Lime is a compound containing carbonates, oxides and/or hydroxides or calcium and/or magnesium used to neutralize soil acidity. / Под Известью понимается обобщённое название продуктов обжига (и последующей переработки) известняка, мела и других карбонатных пород. Различают известь негашёную (CaO), гашёную ($Ca(OH)_2$), натронную (смесь гашёной извести с NaOH) и другие. Известь используют в строительстве (для приготовления кладочных и штукатурных растворов, силикатных бетонов), сельском хозяйстве (для известкования почв) и так далее.

LIMEAN = THE LONDON INTERBANK MEAN RATE

LIMIT = ЛИМИТ – (1) For exchange orders, a Limit places a restriction on the highest or lowest price. If the exchange price exceeds the limit (for a buy order) or if the exchange price is lower than the limit (for a sell order), the respective order is not executed. Highest price given for the purchase or sale of securities (price limit). The maximum daily allowable amount of a futures price may advance or decline in any one day's trading session. Limits are also placed on the number of positions a participant may hold in the market. See also Position Limit, Price Limit, Variable Limit. / Под Лимитом, от Французского слова Limite от Латинского слова Limes, означающее Граница или Предел, понимается предельная норма.

(2) Upper Limit for the utilization of a credit (credit line). / Верхний лимит по использованию кредита (кредитной линии).

LIMIT DOWN = ЛИМИТ НА ПОНИЖЕНИЕ – Limit Down:- the maximum price decline from the previous day's settlement price permitted during one trading session, as fixed by the rules of an exchange. In some futures contracts, the limit may be expanded or removed during a trading session a specified period of time after the contract is locked limit. See also Daily Price Limit.

LIMITED CHECK = ЛИМИТИРОВАННЫЙ ЧЕК – A Limited Check is one bearing a statement that indicates the check is void if written over a certain amount. Such checks are used for payroll or may be received as payment of insurance claims. A limited check also specifies a time limit during which it is negotiable, for example, 'Void twelve months from issue date'. If the time limit has passed, the check is referred to as a Stale Check.

LIMITED COMPANY = КОМПАНИЯ С ОГРАНИЧЕННОЙ ОТВЕТСТВЕННОСТЬЮ (или ОГРАНИЧЕННАЯ КОМПАНИЯ) – Limited Company is a company formed from a group of people, whose liability is limited to the extent of the investment they have made, usually to purchase shares of the company, although occasionally liability is limited by guarantee to a certain amount as specified in the memorandum. Also known as Limited Liability Company. / Компания с Ограниченной Ответственностью – вид коммерческого предприятия, наиболее распространённый в Великобритании, где регистрация в соответствии с Актом о Компаниях является аналогичной регистрации компании в соответствии с законами штата в США. Обозначается сокращением Ltd или PLC.

LIMITED GENERATION SYSTEM = СИСТЕМА ЛИМИТИРОВАННОГО ПОКОЛЕНИЯ (или СИСТЕМА ЛИМИТИРОВАННОЙ ГЕНЕРАЦИИ) – Limited Generation System is a certification scheme wherein the planting stock for each seed class is limited as to eligibility by compliance with established disease tolerances and the number of increases made in the field. The classes or generations of the limited generation system included are:- Prenuclear, Nuclear, Generation 1, Generation 2, Generation 3, Generation 4 and Generation 5; where Prenuclear is laboratory production, Nuclear is greenhouse production and Generations 1-5 are the first and subsequent field increases. / парник (greenhouse).

LIMITED LIABILITY = ОГРАНИЧЕННАЯ ОТВЕТСТВЕННОСТЬ – Limited Liability is a restriction of the owners' loss in a liquidated company to the amount of capital each has invested. The loss of the individual shareholder in such an eventuality is limited to the value of his or her holding. In the event of liquidation the company itself remains liable for its outstanding debts; creditors are generally paid by selling off or dividing up the bankrupt company's assets. When the partnership is being constituted or the composition of the firm is changing, limited partners (LPs) are generally required to file documents with the relevant state registration office. LPs must also explicitly disclose their LP status when dealing with other parties, so that such parties are on notice that the individual negotiating with them carries limited liability. It is customary that the notepaper, other documentation, and electronic materials issued to the public by the firm will carry a clear statement identifying the legal nature of the firm and listing the partners separately as general and limited. Hence, unlike the general partners (GPs), the LPs do not have inherent agency authority to bind the firm unless they are subsequently held out as agents and so create an agency by estoppel or acts of ratification by the firm create ostensible authority. In some jurisdictions, the limited liability of the LPs is contingent on their not participating in management. Limited companies have limited liability. The liability of the shareholder in this type of company is limited to the extent of the value of their shares or guarantee. In the United States, Limited Liability – the maximum amount a person participating in a business organization may lose or be held liable for in claims against an organization with notable exceptions. For example, stockholders in a corporation can only lose their investment. But directors involved in defrauding the public are nonetheless personally liable for their tortious conduct beyond their investment share. See also Tort. / Ограниченная Ответственность – основной принцип организации корпорации (corporation) и товарищества с ограниченной ответственностью (limited partnership) в США и компании с ограниченной ответственностью акционеров (limited company) в Великобритании, когда ответственность ограничивается размером первоначальных инвестиций. В отличие от акционеров с ограниченной ответственностью полный (основной) партнер или владелец собственности (proprietorship) несёт неограниченную ответственность.

LIMITED LIABILITY COMPANY = КОМПАНИЯ С ОГРАНИЧЕННОЙ ОТВЕТСТВЕННОСТЬЮ – Limited Liability Company (LLC) is a form of doing business combining limited liability for all owners (called Members) with taxation as a partnership. An LLC is formed by filing articles of organization with an appropriate state official. Rules governing LLCs vary significantly from state to state. A company the liability of whose members are limited by shares or guarantee. In the case of the former, liability is limited to the amounts unpaid on the shares, in the case of the latter by the amount undertaken to be contributed in the event of a winding up of the company. In the United States, a Limited Liability Company (LLC) is an artificial entity created under and governed by the laws of the jurisdiction in which it was formed. Limited liability companies are generally able to provide the limited personal liability of corporations and the pass-through taxation of partnerships or S corporations. In the United States, Limited Liability Company (LLC) is a relatively new and flexible business organization that offers the advantages of liability protection for all its members while also offering the simplicity of a partnership management structure. Caveat:- Arkansas has not recognized LLCs for nonprofit organizations. In the United States of America, abbreviations LLC, LC, Ltd. Co. – limited liability company is a form of business whose owners enjoy limited liability, but which is not a corporation. Allowable abbreviations vary by state. Note that Ltd. by itself is not a valid abbreviation for an LLC, because in some states (e.g., Texas), it may denote a corporation instead.

LIMITED LIABILITY CORPORATION = КОРПОРАЦИЯ С ОГРАНИЧЕННОЙ ОТВЕТСТВЕННОСТЬЮ – Limited Liability Corporation is one of the types of corporations in Switzerland, the Limited Liability Corporation (Gesellschaft mit beschränkter Haftung (GmbH)) and the Co-operative (Genossenschaft) are of lesser practical importance. They numbered approximately 31 900 and 2 300 respectively at the end of 2001. Since 1992, when the minimum share capital for corporations was raised to CHF100 000.00 and when companies limited by shares were required to appoint qualified auditors, the number of newly formed limited liability corporations has increased, given that the minimum capital of such entities is only CHF20 000.00 and under certain circumstances there is no need to

appoint auditors. However, the law relating to limited liability corporations is currently under revision to align it with the law governing corporations. The bill on the required amendments to the CO (short for the Companies Ordinance – the Federal Code of Obligations of 30 March 1911 Указ о Компаниях) was made public in June 2004 and is now subject to debate in parliament. See also Corporation, Limited Partnership, and Partnership. In Switzerland, abbreviation GmbH is equal to Ltd in the United Kingdom, or LLC in the United States of America. Minimum capital:- CHF20 000.00. Registered shares only, of a par value of min. CHF100.00 each. Name, address and share of each owner (and any changes) publicly recorded in the Federal Commercial Registry Office (Eidgenössischen Amt für das Handelsregister (EHRA)) Bern, Switzerland. Also referred to as Corporation. Limited liability corporation is a type of legal entity provided for in the laws of most modern economically developed countries that two or more investors may agree to create for the purpose of combining some of their resources and going into business together. Corporations have the status of 'artificial legal persons' and thus may own property, make contracts, be held responsible for committing crimes or torts, initiate court actions such as lawsuits, and so on. In the United States, businesses organized as limited liability corporations must indicate their status as such by including the word 'Incorporated' ('Inc.') in the name of the firm. In other countries, the same purpose is served by using the equivalent abbreviations 'Ltd.' (Limited) or 'S.A.' (Anonymous Society) at the end of the company's name. It is today by far the most widespread and successful form of ownership of business property in all advanced capitalist countries. The key feature of the modern business corporation that sets it apart from simple partnerships and sole proprietorships is that it provides the owners of the business with the important legal protection of 'limited liability', whereas these other forms of business organization generally do not. If a failing business enterprise that is owned as a sole proprietorship or partnership is unable to generate enough money to pay its bills, the personal liability of the owners is unlimited – that is, the unpaid creditors of the business can take legal action to seize not only any assets directly connected with the business itself but also the personal property of any individual owner as well, up to the full amount of the debt. But if a limited liability corporation goes belly up, the legal claims of the company's creditors normally can extend only to the assets actually owned by the corporation in its own name, and not to the individually-owned property of the company's shareholders. The individual owner's shares in the corporation might become worthless if the business fails, but he or she does not have to worry about the Sheriff showing up to seize the house or the car or the family bank accounts to pay off the rest of what the company's creditors are owed. Protection from personal liability makes it much safer and therefore more attractive for more individuals to use some of their savings to become part-owners of very large business organizations. Without limited liability, even the tiniest investment would put a shareholder's entire remaining fortune at risk. During the Middle Ages and the early years of the Industrial Revolution, the corporate form of ownership for business organizations was generally available only as a very special privilege occasionally awarded by the government to a handfull of royal favorites. But changes in the legal codes of Great Britain, the United States, France and other economically progressive countries during the XIX century removed most of the practical barriers to widespread adoption of the corporate form of ownership. This made it much easier to raise capital for new business enterprises. By allowing for pooling the savings of hundreds, thousands, or even millions of individual investors at manageable levels of risk, the widespread adoption of the corporate form of business ownership made extremely large scale private investment projects practical for the first time in history, thereby contributing greatly to the modern era's historic surge in economic growth that continues up to the present day. / Один из типов корпораций в Швейцарии, Корпорация с Ограниченной Ответственностью или, как это звучит на Немецком языке по месту регистрации, Гэзэльшафт мит бэшрэнкта Хафтунг (Гэ.эм.бэ.Ха.; Gesellschaft mit beschränkter Haftung (GmbH)) и Кооператив или, как это звучит на Немецком языке по месту регистрации, Гэноссэншафт (Genossenschaft) являются менее значимыми с практической точки зрения. в Федеральном Управлении Коммерческого Регистра или, как это звучит на Немецком языке по месту регистрации, Айдгэноссишэн Амт фюр дас Хандэльрэгиста (Э.Ха.Эр.А.; Eidgenössischen Amt für das Handelsregister (EHRA)), Берн, Швейцария.

LIMITED LIABILITY PARTNERSHIP = ТОВАРИЩЕСТВО С ОГРАНИЧЕННОЙ ОТВЕТСТВЕННОСТЬЮ – In the United States of America, Limited Liability Partnership (LLP) is a partnership where a partner's liability for the debts of the partnership is limited except in the case of liability for acts of professional negligence or malpractice. This is often the only form of limited partnership allowed for law firms (as opposed to general partnerships). Limited Liability Partnership (LLP) is a general partnership which, via registration with an appropriate state authority, is able to enshroud all its partners in limited liability. Rules governing LLPs vary significantly from state to state. In the United States, Limited Liability Partnership (LLP) is a business organization registered through the state that confers limited liability on the general partners. The advantage is obvious:- the general partner retains the management control and shares in the profits of the firm, as in a limited partnership, but in addition enjoys the same immunity as the limited partners for joint and several liability for any torts or debts of the partnership. See also Limited Liability, and Limited Partnership.

LIMITED ORDER = ОГРАНИЧЕННОЕ РАСПОРЯЖЕНИЕ (или ОГРАНИЧЕННОЕ ПОРУЧЕНИЕ) – Limited Order is an order to which there is some restriction attached as to the time or price for execution of the order. See also Limit Order.

LIMITED PARTNER = ОГРАНИЧЕННЫЙ ПАРТНЁР – Like shareholders in a corporation, Limited Partners (LPs) have limited liability, meaning they are only liable on debts incurred by the firm to the extent of their registered investment and have no management authority. The general partners (GPs) pay the LPs a return on their investment (similar to a dividend), the nature and extent of which is usually defined in the partnership agreement. General Partners thus carry more liability, and in cases of financial misfortune, the GP becomes 'the generous partner'. See also General Partner.

LIMITED PARTNERSHIP = ОГРАНИЧЕННОЕ ПАРТНЁРСТВО (или ТОВАРИЩЕСТВО С ОГРАНИЧЕННОЙ ОТВЕТСТВЕННОСТЬЮ) – Limited Partnerships (LP) are distinct from limited liability partnerships, in which all partners have limited liability. A Limited Partnership is a form of partnership similar to a general partnership, except that in addition to one or more general partners (GPs), there are one or more limited partners (LPs). It is a partnership in which only one partner is required to be a general partner. See also General Partner. In the United States, Limited Partnership (LP) is a partnership where at least one partner has unlimited liability and one or more partners have limited liability. In the United States, a Limited Partnership is a statutory form of partnership consisting of one or more general partners who manage the business and are liable for its debts, and one or more limited partners who invest in the business and have limited personal liability. Partnership in which one or more partners have only limited liability for the firm's debts. In each limited partnership there must be one general partner with unlimited liability. A limited partnership is therefore unpopular and a public limited company is preferred, because all shareholders in such a company have only limited liability. In the United States, Limited Partnership (LP) is a business organization consisting of two classes of partners:- general partners and limited (or silent) partners. The general partners have management control, share the profits of the firm but have joint and several liability for any torts or debts of the partnership. Each general partner has the authority as an agent of the firm to bind all the other partners in agreements with third parties. The general partners pay the limited partners the equivalent of a dividend on their investment as defined in the partnership agreement. The limited partners are akin to shareholders in a corporation in that they are only liable for torts or debts incurred by the firm to the extent of their investment amount. In addition, as with stockholders, limited partners have no management authority. Partnership in which certain partners, called Limited Partners, invest in a business, but are not involved in its management, in exchange for a share of profits. The maximum liability of the limited partners is the amount of their investment. The general partner in a limited partnership is responsible for managing the business and has unlimited liability. One of the types of

corporations in Switzerland, comparatively few business entities in Switzerland are organized as partnerships. At the end of 2001, approximately 10 000 general Partnerships (Kollektivgesellschaften) and 1 600 Limited Partnerships (Kommanditgesellschaften) were recorded in the commercial register. See also Corporation, Limited Liability Corporation, and Partnership. / В конце 2001 в коммерческом реестре были вписаны приблизительно 10 000 общих Товариществ или, как это звучит на Немецком языке по месту регистрации, Колетивгезэльшафтэн (Kollektivgesellschaften) и 1 600 Коммандитных Товариществ или, как это звучит на Немецком языке по месту регистрации, Командитгезэльшафтэн (Kommanditgesellschaften). Ограниченное Партнёрство или Товарищество с Ограниченной Ответственностью – организация, включающая полного (основного) партнёра (general partner), осуществляющего управление проектом, и партнеров с ограниченной ответственностью, которые вкладывают в товарищество свои средства, но несут лишь ограниченную ответственность, не участвуют в постоянном управлении и, как правило, не могут потерять больше, чем они вложили в капитал партнёрства (товарищества). Обычно партнёры, несущие ограниченную ответственность, получают доход, прибыль на капитал и налоговые льготы; полный (основной) партнёр взимает плату и получает определённый процент прибыли на капитал и дохода. Типичные товарищества с ограниченной ответственностью создаются в области недвижимости, добычи нефти и газа или аренды оборудования, но они также могут заниматься финансированием киносъёмок, научными исследованиями и разработками и другими проектами. Как правило, доли участия в открытых товариществах с ограниченной ответственностью реализуются через брокерские фирмы при минимальной сумме вложений 5 000 Долларов, в то время как закрытые товарищества с ограниченной ответственностью создаются с участием менее 35 партнёров, каждый из которых вкладывает более 20 000 Долларов.

LIMITED PERSONAL LIABILITY = ОГРАНИЧЕННАЯ ПЕРСОНАЛЬНАЯ ОТВЕТСТВЕННОСТЬ – In the United States, a Limited Personal Liability is the protection generally afforded a corporate shareholder, limited partner or a member of a limited liability company from the debts of and claims against the company.

LIMITED TERMS = ОГРАНИЧЕННЫЕ ПОРЯДКИ – Limited Terms is an insurance expression meaning that the policy gives less cover than a policy on full conditions, e.g., total loss only. / Выражение в страховании, означающее, что данный полис предоставляет меньшее покрытие, нежели полис на полных условиях (полноценный полис). Это может означать, например, что данный полис обеспечивает возмещение только лишь при полном истреблении или полной гибели (total loss only).

LIMITING OXYGEN INDEX = УКАЗАТЕЛЬ ПО ОГРАНИЧЕНИЮ КИСЛОРОДА – Limiting Oxygen Index is a relative measure of flammability that is determined as follows. A sample is ignited in an oxygen/nitrogen atmosphere. The oxygen content is adjusted until the minimum required to sustain steady burning is found. The higher the value, the lower the flammability.

LIMIT MOVE = ЛИМИТНОЕ ДВИЖЕНИЕ (или ПРЕДЕЛ ИЗМЕНЕНИЯ ЦЕНЫ) – Limit Move:- a price that has advanced or declined the permissible amount during one trading session, as fixed by the rules of an exchange. See also Locked Limit. Limit Move is the maximum change in price from the previous day's settlement, as established by the exchange. The amount of a limit move may change from time to time as market conditions dictate.

LIMIT OF INDEMNITY = ЛИМИТ ВОЗМЕЩЕНИЯ (или ПРЕДЕЛ КОМПЕНСАЦИИ, или ЛИМИТ ОТВЕТСТВЕННОСТИ) – Limit Of Indemnity is another term for policy limit. It refers to the maximum amount payable under a policy of insurance or reinsurance, either overall or with reference to a particular section of a policy. Limit Of Indemnity is a maximum sum an insurer can be expected to pay under a policy or section of a policy. May be expressed as 'per accident', 'per event', 'per occurrence', 'per annum', etc.

LIMIT ONLY = ТОЛЬКО В ПРЕДЕЛАХ ЛИМИТА – Limit Only:- the definite price stated by a customer to a broker restricting the execution of an order to buy for not more than, or to sell for not less than, the stated price. / Определённая цена, указываемая заказчиком брокеру, ограничивающая исполнение распоряжения на покупку не выше чем или распоряжения на продажу не ниже чем по указанной цене.

LIMIT ORDER = РАСПОРЯЖЕНИЕ С ОГРАНИЧЕНИЕМ (или ЛИМИТНОЕ ПОРУЧЕНИЕ) – Limit Orders have a restriction on their executable prices. The buy or sell order is carried out at the requested price or better. Xetra® provides for the entry of stop orders. The system places these orders automatically in the order book as soon as the price of the specified limit is reached and executes the order at the next exchange price. This makes it possible for owners of securities to secure a profit or limit a loss without having to continually monitor the market. See also Limited Order, and Market Order. An order placed by a client for a transaction to be executed at a specified price. The order is triggered if the market touches that price (or betters it). Limit Order is an order in which the customer specifies a price limit or other condition, such as time of an order, as contrasted with a market order which implies that the order should be filled as soon as possible. An order to buy below or sell above the current price at an amount fixed by the customer. When setting a limit, the customer should inform the broker how long it is to remain in force. The opposite of At Best Order, or At Market Order. Limit Order is an order to buy or sell an asset at a specific price. As opposed to a market order, limit orders might not be filled immediately if the market moves away from the specified price. An order in which the customer specifies a minimum sale price or maximum purchase price, as contrasted with a market order, which implies that the order should be filled as soon as possible at the market price. A contingent order for an options or futures trade specifying a certain maximum (or minimum) price, beyond which the order (buy or sell) is not to be executed. An order to buy or sell when and if an asset reaches a specific price. Limit Order (LO) is an order to buy or sell with a specified price that will be executed at the specified price or better. A buy LO is executed at the price that was specified or lower and a sell LO is executed at the price that was specified or higher. An order given to a broker with restrictions upon its execution, such as price and time. Limit Order is an order that has restrictions placed on it. The customer specifies a price and the order can only be executed if the market moves to or betters that price. Limit Order:- the customer sets a limit on either the price and/or the time of execution. / Ксэтра® (Xetra®). Распоряжение, переданное брокеру, с рядом ограничений по его исполнению, такими как цена и срок.

LIMIT PRICE MOVE = ОГРАНИЧЕННОЕ ДВИЖЕНИЕ ЦЕНЫ – Limit Price Move is the maximum permitted price increase or decrease from the previous day's closing price.

LIMITS = ЛИМИТЫ (или ПРЕДЕЛЫ) – Limits are the points, edges, or lines beyond which something cannot or may not proceed. See also Position Limit, Price Limit, and Variable Limit. Limit is the greatest amount of something that is possible or allowed.

LIMIT STATE = ПРЕДЕЛЬНОЕ СОСТОЯНИЕ – In civil engineering, a Limit State is the condition beyond which a structure or a structural member is deemed unsafe due to one or more loads or load effects. Limit state is a condition of a structure at which the structure ceases to fulfil the design function as applied in Limit States Design. Limit State is a condition beyond which a structure is unfit to perform its intended function. / Состояние сооружения, при котором данное сооружение перестаёт выполнять расчётную функцию, заложенную в нём в Расчёте по Предельному Состоянию (Limit States Design). В строительной механике под Предельным Состоянием понимается состояние конструкции (сооружения), при котором она перестаёт удовлетворять эксплуатационным требованиям. Нормативные Нагрузки – наибольшие нагрузки, отвечающие нормальным условиям эксплуатации зданий и сооружений. Они используются при расчёте конструкций по предельным состояниям. Предельное

Состояние в строительной технике, состояние строительной конструкции или основания здания (сооружения), при котором они перестают удовлетворять эксплуатационным требованиям. Понятием ‘Предельное Состояние’ пользуются при расчёте конструкций по методу того же названия, разработанному в бывшем Союзе Советских Социалистических Республик (СССР) и введённому Строительными Нормами и Правилами (СНиП) в 1955. По сравнению с ранее применявшимися методами (по допускаемым напряжениям и по разрушающим нагрузкам) метод расчёта по предельному состоянию является более совершенным; он отличается полнотой оценки несущей способности и надёжности конструкций благодаря учёту вероятностных свойств действующих на конструкции нагрузок и сопротивлений этим нагрузкам, особенностей работы отдельных видов конструкций, а также пластических свойств материалов. В методе расчёта по предельному состоянию вместо ранее применявшегося единого коэффициента запаса прочности используют несколько независимых коэффициентов, каждый из которых имеет определённое значение в обеспечении надёжности конструкции и гарантии от возникновения предельного состояния. Основные из них:- (i) коэффициент безопасности по материалу (и грунту), учитывающий статистическую изменчивость прочностных свойств материалов (грунтов), а также некоторые другие факторы, исключающие или сильно затрудняющие возможность статистической оценки, например, отличие сопротивлений материалов в конструкциях от определяемых испытаниями контрольных образцов; (ii) коэффициент перегрузки, учитывающий возможное отклонение величин нагрузок от исходных (нормативных) значений из-за изменчивости нагрузок и отступления от условий нормальной эксплуатации; (iii) коэффициент условий работы, учитывающий особенности действительные работы элементов конструкций, оснований, а также зданий и сооружений в целом, не отражаемые непосредственно в расчётах; и (iv) коэффициент надёжности, учитывающий степень капитальности зданий и сооружений, а также значимость последствий наступления тех или иных предельных состояний. Различают предельные состояния, при которых конструкция становится непригодной к нормальной эксплуатации, и предельные состояния, при которых она полностью утрачивает несущую способность. Пригодность к нормальной эксплуатации обычно определяется требованиями жёсткости, ограничениями осадок, трещиностойкостью и так далее. Потеря несущей способности может проявляться в виде хрупкого, вязкого, усталостного разрушения материала, изменения конфигурации конструкции, а также потери устойчивости её формы, положения и так далее Основная цель расчёта по предельному состоянию – предотвратить их возникновение в течение всего срока службы здания (сооружения). Метод расчёта по предельному состоянию получил широкое распространение в бывшем СССР, странах – членах бывшего СЭВ (Совета Экономической Взаимопомощи) и странах, входящих в Международную Организацию по Стандартизации и Европейский Комитет по Бетону. В СССР этот метод применялся также при расчёте некоторых машиностроительных конструкций, например металлических конструкций мостовых, подвесных и башенных грузоподъёмных кранов.

LIMIT UP = ЛИМИТ НА ПОВЫШЕНИЕ – Limit Up:- the maximum price advance from the previous day’s settlement price permitted during one trading session, as fixed by the rules of an exchange. In some futures contracts, the limit may be expanded or removed during a trading session a specified period of time after the contract is locked limit. See also Daily Price Limit. / Под Лимитом На Повышение понимается максимальное повышение цены с уровня расчётной цены предыдущего дня торговли, разрещённое в течение одной торговой сессии, и что закреплено регламентом биржи. Для некоторых фьючерсных контрактов лимит может быть .

LIMP FABRIC = МЯГКАЯ ТКАНЬ – Limp Fabric is a fabric that is too soft because of inadequate amounts or improper application of finishing materials. / Мягкая Ткань – ткань, которая слишком мягкая из-за неадекватных количеств или ненадлежащего применения отделывающих материалов.

LINE = ДЛИННОВОЛОКНИСТЫЙ ЛЁН – Line:- longest flax fibers used for fine, even linen yarns. Shortest flax fibers are called Tow. See also Tow. / Самые длинные волокна Льна, используемые для тонких, равномерных льняных пряж. Самые короткие волокна Льна называются Tow. Смотрите также Tow (Tow).

LINE = ЛЕЕР – Line (maritime term):- a general term for light rope.

LINE = ЛИНИЯ – Line:- in plant breeding, plants originating from common parents or a common cross that is undergoing selection or improvement and which may become identified as a variety.

LINE = ЛИНИЯ (или ПОЛОСА) – Line:- a narrow variation, often only one thread wide, in the warp direction. / Линия (line):- порок в виде полосы по длине ткани, отличающейся от остальной поверхности интенсивностью окраски, линейной плотностью нитей, натяжением.

LINE = ЛИНИЯ (или ПРЕДЕЛ УДЕРЖАНИЯ, или ДОЛЯ УДЕРЖАНИЯ) – Line is the proportion of an insurance or reinsurance risk that is accepted by an underwriter or which an underwriter is willing to accept. When it refers to a line that is entered on a slip it is commonly expressed as a percentage of the limit of indemnity. / Под Линией, от Латинского слова Linea, означающее Льняная Нить, понимается общая часть двух смежных областей поверхности.

LINEAR = ЛИНЕЙНОЕ – Linear:- long and narrow with parallel or nearly parallel sides. Linear:- long and narrow with nearly parallel edges.

LINEAR (ARITHMETIC) SCALING = ЛИНЕЙНОЕ (АРИФМЕТИЧЕСКОЕ) МАСШТАБИРОВАНИЕ – On a Linear (Arithmetic) Scale chart, the spacing between each point on the vertical scale is identical. Thus the vertical distance between 10 and 20 is the same as the vertical distance between 90 and 100. While this kind of scaling is intuitive and easy to recreate by hand, linear scaling should not be used on charts with large vertical ranges. A move from 10 to 20 is much better than a move from 90 to 100, but on a linear scale they both appear the same.

LINEAR DENSITY = ЛИНЕЙНАЯ ПЛОТНОСТЬ – The SI (short for the International System of units) unit of Linear Density is the kilogram per meter (kg/m). In the man-made fiber industry linear density is expressed in dtex (symbol:- dtex). A fiber which has a mass of n grams per 10 000 meters of length is said to have a linear density of n dtex. 1 tex = 1 g/km = 1 mg/m. See also Tex. Linear Density is the mass per unit length of an essentially linear structure, for example of a staple fiber, filament yarn, tow or cord. The Linear Density in decitex corresponds to the weight in grams of 10 000 m industrial multifilament yarn. A sample of 25 or 100 meters is wound up on a standard reel under a pretension of 0.5 cN/Tex and weighed on an analytical scale. The grams per 10 000 m yarn length are then calculated. Linear Density:- mass per unit length expressed as grams per centimeter, pounds per foot, or equivalent units. It is the quotient obtained by dividing the mass of a fiber or yarn by its length. / филаментная (комплексная) пряжа (filament yarn).

LINEAR LEAF = ЛИНЕЙНЫЙ ЛИСТ – Linear Leaf:- strip-shaped; several times longer than wide; not pointed at the apex like in the acicular type. Linear Leaf:- parallel sides, long and very narrow, e.g., Hemerocallis.

LINEARLY WEIGHTED MOVING AVERAGE = ЛИНЕЙНО ВЗВЕШЕННОЕ СКОЛЬЗЯЩЕЕ СРЕДНЕЕ ЗНАЧЕНИЕ (или ЛИНЕЙНО ВЗВЕШЕННОЕ СКОЛЬЗЯЩЕЕ СРЕДНЕАРИФМЕТИЧЕСКОЕ) – Linearly Weighted Moving Average:- the more recent prices are given more weight in computing the average. See also Moving Average.

LINEAR POLYMER = ЛИНЕЙНЫЙ ПОЛИМЕР – Linear Polymer is a polymer formed by end-to-end linking of molecular units. The resulting polymer is very long and narrow. It is typical of fibrous forms. / Линейные Полимеры являются уникальными соединениями, макромолекулы в которых представлены в виде длинной цепи. В свою очередь молекулы этой цепи являются химически инертными в отношении друг друга. Они связываются между собой исключительно силами Ван-дер-Ваальса. Стоит отметить, что линейные полимеры – это именно те полимеры, которые наделены специфическими макромолекулами. Другими словами в таких макромолекулах атомные группы расположены в виде открытой цепи. Обратим внимание на основные преимущества рассматриваемых полимеров:- (i) эти полимеры с лёгкостью образовывают высокопрочные плёнки и волокна; (ii) они обладают определённой упругостью; (iii) такие полимеры в состоянии образовывать растворы достаточно высокой вязкости; и (iv) они весьма гибкие. Последнее их качество способствует тому, что появляется возможность плотного формирования упакованных упорядоченных структур, которые называются кристаллическими областями. В качестве примера кристаллического полимера можно привести полиэтилен, полиамид, полипропилен, а также некоторые термопластические полиэфиры. Стоит отметить, что для кристаллических полимеров характерна достаточно большая усадка непосредственно при литье.

LINEAR REGRESSION = (ПРЯМО)ЛИНЕЙНАЯ РЕГРЕССИЯ – Linear Regression is a type of statistical analysis where a straight line or linear relationship characterizes the amount of change in a dependent variable which is associated with a unit change in the independent variable. / В теории вероятностей и математической статистике под Регрессией понимается зависимость среднего значения какой-либо величины от некоторой другой величины или от нескольких величин.

LINEAR TARIFF CUT = ЛИНЕЙНОЕ УРЕЗАНИЕ ТАРИФА – Linear Tariff Cut is a reduction in all tariff rates by the same percentage. / Снижение всех тарифных ставок на один и тот же процент.

LINE BREEDING = ЛИНЕЙНОЕ РАЗВЕДЕНИЕ – Line Breeding is a system of breeding in which a number of genotypes which have been progeny-tested with respect to some character or group of characters are composited to form a variety. / свойство (character) . Под Разведением сельскохозяйственных животных понимается наука о размножении сельскохозяйственных животных и улучшении их наследственных качеств, совершенствовании существующих и выведении новых пород; раздел зоотехнии; производственная деятельность по осуществлению этих задач. Разрабатывает теорию и практические приёмы племенной работы применительно ко всем видам сельскохозяйственных животных. Важнейшие методы разведения сельскохозяйственных животных – чистопородное разведение, скрещивание и гибридизация при тщательном отборе и подборе животных. Тесно связано с генетикой.

LINE CHARTS = ЛИНЕЙНЫЕ ГРАФИКИ – Line Charts:- the simplest type of chart in which the data is presented as a line. This type of chart is used for mutual fund charts as there is only one price for each day of trading. Price charts that connect the closing prices of a given market over a span of time that form a curving line on the chart. This type of chart is most useful with overlay or comparison charts that are commonly employed in intermarket analysis. It is also used for visual trend analysis of open end mutual funds. Line Charts are created by connecting a specified price for each time interval displayed. A typical line chart would display a line that connects the closing price for each time interval. / Линейные Графики относятся к самому простейшему типу графика, на котором данные представляется в качестве линии. В техническом анализе биржевых рынков Линейные Графики строятся посредством проведения линии через определённые значения цен для каждого отражаемого временного интервала. Типичный линейный график может отражать линию, соединяющую значения цен закрытия для каждого временного интервала.

LINE ENCRYPTION = ЛИНЕЙНАЯ ШИФРОВКА – Line Encryption is a method used to ensure the confidentiality of data at the communication level; the encryption algorithms are implemented outside the application, e.g., in an encryption box. / коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо).

LINE FLAX = (ЧЁСАНЫЙ) ДЛИННОВОЛОКНИСТЫЙ ЛЁН – Line Flax is the long flax fiber that has been drawn off of the hackles. The finest preparation is often used for wet-spun linen, but line can also be dry spun.

LINE FLEECE = ЛИНЕЙНОЕ (или ПРЕДЕЛЬНОЕ, или ПРИГРАНИЧНОЕ) РУНО – Line Fleece is a fleece of wool midway between two grades in quality and length, which can be thrown into either grade.

LINE FUNCTIONS = ЛИНЕЙНЫЕ ФУНКЦИИ – Line Functions:- the decision-making areas companies associate with daily operations. Logistics line functions include traffic management, inventory control, order processing, warehousing, and packaging. / Линейная Функция (в математике), функция вида y = kx + b. Основное свойство линейной функции:- приращение функции пропорционально приращению аргумента. Графически линейная функция изображается прямой линией. При равных масштабах на осях коэффициент k; (угловой коэффициент) равен тангенсу угла, образованного прямой с осью 0x (k = tg j), a b – отрезку, отсекаемому прямой на оси 0y. При b = 0 линейная функция называется однородной; её график изображает пропорциональную зависимость:- y = kx. Линейная функция широко применяется в физике и технике для представления (нередко – приближённо) зависимостей между различными величинами. Рассматривают также линейные функции многих переменных; однородные линейные функции многих переменных называют Линейными Формами. Если и аргумент и функция суть векторы, то однородными линейными функциями являются линейные преобразования.

LINE HANDLING = ОБСЛУЖИВАНИЕ ЛИНИИ – Line Handling:- task of securing lines to the wharf when a vessel berths.

LINE–HAUL = МАГИСТРАЛЬНЫЙ РЕЙС – Line-Haul is the transportation from one city to another as differentiated from local switching service. Line-Haul is the marine portion of a vessel's route covering the greatest distance, usually across an ocean, e.g., Singapore–Los Angeles.

LINE–HAUL–OCEAN = МАГИСТРАЛЬНЫЙ РЕЙС ЧЕРЕЗ ОКЕАН – Line-Haul-Ocean is the movement of freight between major market areas, i.e. Japan to US versus feeder vessel operations.

LINE–HAUL–ROAD = МАГИСТРАЛЬНЫЙ РЕЙС ПО АВТОДОРОГАМ – Line-Haul-Road is the movement of freight over the road from one town or city (usually at a long distance) to another town or city.

LINE HAUL SHIPMENT = ГРУЗОВАЯ ОТПРАВКА МАГИСТРАЛЬНЫМ РЕЙСОМ – Line Haul Shipment is a shipment that moves between cities and over distances more than 100 to 150 miles in length. / Грузовая отправка или отгрузка, которая предполагает автомобильную перевозку между городами и на большие расстояния, нежели 100–150 миль.

LINE ITEM = ОТЛИЧИТЕЛЬНОЕ СООБЩЕНИЕ (или ЛИНЕЙНОЕ ИЗДЕЛИЕ, или ЛИНЕЙНЫЙ АРТИКУЛ, или ЛИНЕЙНЫЙ НОМЕР) – Line Item is a specific and unique identifier assigned to a product by the responsible enterprise. / Специфический и уникальный идентификатор, придаваемый продукту ответственным предприятием.

LINE–ITEM VETO = ПОСТАТЕЙНОЕ ВЕТО – Line-Item Veto is a special form of veto in which the chief executive has the right to prevent particular provisions of a bill enacted by a legislative assembly from becoming law without having to kill all the other parts of the bill at the same time. Many state governors in the United States have line-item veto power with respect to at least some kinds of legislative enactment. The US Presidents Richard Nixon, Gerald Ford, Ronald Reagan, George Bush, and Bill Clinton have all endorsed the idea of granting the President line-item veto powers over appropriations bills as a means of controlling the budget deficit problem, but the President of the United States has only recently acquired a very limited line-item veto power through certain changes in the rules of the House of Representatives and Senate. In 1998, the US Supreme Court ruled that even this limited form of line-item veto enacted by a simple Congressional majority was unconstitutional. Most Congressmen and Senators seem reluctant to approve a constitutional amendment to provide for a permanent line-item veto for the President because this power would enable him more easily to veto pork barrel projects or other special interest legislation that they have traditionally added into more urgent omnibus appropriations bills through skillful logrolling – thus giving the President additional power to punish severely those members of Congress who have in some way opposed or displeased the President and potentially upsetting the current balance of power between the Executive and Legislative branches of the Federal government. / Президенты США Ричод Никсэн (Richard Nixon), Дьжэрэлд Фод (Gerald Ford), Президент США Ранэлд Вилсэн Рэйген (Ronald Wilson Reagan; 1911–2004), Дьжодьж Бош (George Bush), и Бил Клынтчэн (Bill Clinton).

LINE LOAD = ЛИНЕЙНАЯ НАГРУЗКА (или ПОГОННАЯ НАГРУЗКА, или РАСПРЕДЕЛЁННАЯ НАГРУЗКА) – (1) Line Load is a weight force which can be withstood by a container floor per running meter. / В строительной механике под Нагрузками понимаются силовые воздействия, вызывающие изменения напряжённо-деформированного состояния конструкций зданий и сооружений. По характеру изменений во времени различают:- (i) динамические нагрузки; и (ii) статические нагрузки. Статические нагрузки подразделяются на:- (a) временные нагрузки, в свою очередь делящиеся на неподвижные нагрузки (например, вес стеллажей и бункеров в складских помещениях) и подвижные нагрузки; и (b) постоянные нагрузки. По характеру приложения к телу, на которое они воздействуют, различают:- (i) распределённые нагрузки, прилагаемые ко всей поверхности (линии) или части её; и (ii) сосредоточенные нагрузки, прилагаемые к весьма малой площадке (точке). Распределённую нагрузку постоянной интенсивности называют равномерно-распределённой нагрузкой, а нагрузку, точки приложения которой непрерывно заполняют всю данную площадь (или отрезок), – сплошной нагрузкой. При расчёте строительных конструкций нагрузки подразделяют на:- (i) нормативные, отвечающие нормальным условиям эксплуатации; и (ii) расчётные – максимальные, определяемые умножением нормативных нагрузок на коэффициент надёжности по нагрузкам. При действии нескольких нагрузок в расчёте учитывают наименее выгодные их сочетания. Нормативные Нагрузки – наибольшие нагрузки, отвечающие нормальным условиям эксплуатации зданий и сооружений. Они используются при расчёте конструкций по предельным состояниям.

(2) Line Load is the weight of a unit load concentrated along a narrow area across the full length or width of the pallet.

LINEN = ЛЬНЯНАЯ – Linen fabric is a fabric made from linen fibers obtained from inside the woody stem of the Flax Plant. Linen fibers are much stronger and more lustrous than cotton. Linen fabrics are very cool and absorbent, but wrinkle very easily, unless blended with manufactured fibers. Linen is one of the oldest textile fibers. Fabrics made of the fibers of the Flax. The Plant is called the Flax Plant and the product is called Linen. See also Flax. (1924). Flax, the raw material used to make linen fabric, is a fine, soft bast fiber obtained from the stalks of the plant by the process of retting. The fibers are silver gray, bluish gray, brown, or creamy white in color and from 12 to 40 inches long. Flax has a soft, silky luster and is a good conductor of heat. Flax line and tow refer to the lengths of the fibers used in industry. Line fibers are those ten inches or more in length; tow fibers are shorter; naturally the line fibers are the more desirable. There are several properties and characteristics of flax and linen that are important. Like cotton, linen is of vegetable origin and is classed as a dead fiber. The smoothness and lintlessness, however, of the fiber prevent the finished product from soiling as easily as many other fabrics. Flax is a coarse-pored fiber that takes up moisture rapidly, thereby making it very absorbent in linen materials. The property of absorbency and its ability to give off moisture rapidly by evaporation makes linen a cool fiber or fabric. Linen is the term used for fabric made from Flax. Linen is generally favored for its fine, strong, cool-wearing properties. It is commonly cursed for it's wrinkling. In knitwear, linen is combined with other natural or synthetic fibers for improved strength and resiliency. Linen:- cellulosic fibers derived from the stem of the Flax Plant or a fabric made from these fibers. Linen fibers are much stronger and more lustrous that cotton; they yield cool, absorbent fabrics that wrinkle easily. Fabrics with linen-like texture and coolness but with good wrinkle resistance can be produced from manufactured fibers and blends. Linen:- a textile made from the fibers of the Flax Plant. It is labor-intensive to make, but its garments are valued for exceptional coolness and freshness in hot weather. It is also very absorbent, but wrinkles easily unless blended with manufactured fibers. Linen:- a vegetable fiber obtained from the inside of the woody stalk of the Flax Plant. It is one of the oldest fabrics known. It is strong, and today's man-made fibers are often blended with it to improve its wrinkle resistance and give the fabric other desirable qualities. Linen is woven in various weights for different purposes and is occasionally used in knit blends. The following entries are common linen names. Linen is a cloth made from Flax and noted for its strength, coolness, and luster. / Льняная Ткань – ткань вырабатываемая из льняной пряжи (смотрите Льнопрядение), в основном полотняным переплетением. При включении в основу или уток хлопчатобумажной пряжи ткань называется полульняной. Наиболее ценные свойства льняной ткани – высокая прочность и способность впитывать влагу при сравнительно большой воздухо- и теплопроницаемости, а также стойкость к гниению. Льняные ткани отличаются также добротностью, повышенной жёсткостью, которые усиливаются аппретированием. Льняные ткани весьма носки и дают сравнительно небольшую усадку при увлажнении, масса 1 $м^2$ льняных тканей колеблется от 100 г (батист) до 1 000 с лишним г (брезент). Льняные ткани применяют для изготовления бельевых, технических, тарных и других изделий. По назначению и структуре различают следующие виды льняных тканей:- столовые камчатные (скатерти, салфетки); полотенечные камчатные и махровые; холсты и полотенца гладкие; костюмно-плательные ткани (рогожки, трико и другие); полотна простынные, тонкие (бельевые), террасные и тики; грубые (технические), бортовки, парусины брезентовые, паковочные и мешочные ткани, а также пожарные рукава и другие. Льняные ткани выпускаются суровыми, полубелыми, белыми и крашеными. Высокими качествами (несминаемость, износостойкость и другими) отличаются ткани из льна с лавсаном. Лён:- из стеблей растения добывают волокна, из которых прядут льняную пряжу для льняного полотна. Льняное полотно имеет очень гладкую поверхность с матовым блеском, мало загрязняется и не осыпается. Благодаря гигроскопичности одежда из льна способствует естественной терморегуляции тела и особенно подходит для ношения летом и в тропических условиях.

LINEN LEA = ЛЬНЯНАЯ ПАСЬМА (или ПАСЬМА ЛЬНА) – Linen Lea is the number of 300-yard hanks contained in one pound. / Пасьма льняной пряжи – 300 ярдов (274.2 метра).

LINENS AND DOMESTICS = БЕЛЬЁ И ДОМАШНЯЯ УТВАРЬ – Linens And Domestics is the term used in stores to describe various household items which, at one time, were made of linen. Today, most linens and domestics are made of cotton and man-made fibers. The following entries are some of the items found in the linens and domestics sections of stores. See also Bedding, Blankets, and Towels.

LINEN STRAW = ЛЬНЯНАЯ СОЛОМКА – Linen Straw is a type of straw made to resemble woven linen. See also Straw.

LINEN TESTER = ХОЛСТОВЫЙ ТЕСТЕР (или ТКАЦКАЯ ЛУПА) – Linen Tester is a magnifying glass for counting cloth, also called Pick Glass or Pick Counter.

LINE OF CREDIT = КРЕДИТНАЯ ЛИНИЯ – Line Of Credit is an arrangement in which a bank agrees to make available to a customer a certain sum of money, to be borrowed by the customer as the need arises. See also Revolving Line Of Credit. / Договорённость, по которой банк согласен сделать доступной заказчику определённую сумму денежных средств, которая должна быть заимствована данным заказчиком по мере возникновения нужды в ней. Смотрите также Возобновляемая Кредитная Линия (Revolving Line Of Credit).

LINE–PACK = МАГИСТРАЛЬНОЕ НАГНЕТАНИЕ (или МАГИСТРАЛЬНАЯ НАКАЧКА, или МАГИСТРАЛЬНОЕ УПЛОТНЕНИЕ) – Line-Pack is increasing the amount of gas in the system or pipeline segment by temporarily raising the pressure to meet high demand for a short period of time. Often exercised overnight as a temporary storage medium to meet anticipated next-day peaking demands. / Магистральное Нагнетание это возрастание объёма газа в системе или сегменте трубопровода посредством временного увеличения давления с целью удовлетворения высокого спроса за короткий промежуток времени. Часто это производят в ночной период времени с тем, чтобы удовлетворить предполагаемый пиковый спрос на следующий день.

LINER = ЛАЙНЕР (или ЛИНЕЙНОЕ СУДНО) – Liner is a ship on a regular schedule calling at specified ports. Vessel engaged in regular liner trade. Liner is a cargo-carrying ship which is operated between scheduled, advertised ports of loading and discharge on a regular basis. A vessel sailing between specified ports on a regular basis. / порты погрузки и разгрузки на регулярной основе. Под Лайнером или Линейным Судном понимается крупное быстроходное транспортное судно дальнего плавания, совершающее регулярные рейсы по расписанию и обслуживающее определённые направления (линии) с целью перевозки грузов или пассажиров. Воздушными лайнерами называют скоростные многоместные самолёты.

LINERBAG = ЛИНЕЙНЫЙ МЕШОК – Liner Bag:- plastic fabric fixed inside a standard container with bulk cargo. Bag, usually made of plastic, used to line the inside of containers for subsequent stowage of dry bulk commodities, e.g., nuts, Cocoa beans, etc. / , например, орехов, Какао бобов и так далее.

LINER BILL = ЛИНЕЙНЫЙ КОНОСАМЕНТ – Liner Bill is a bill of lading issued by a particular shipping line that offers a regular, scheduled service between specified load and discharge ports. / Линейный Коносамент – коносамент, выдаваемый конкретной грузовой линией, которая предлагает регулярное обслуживание в соответствии с утверждённым графиком между спецификационными портами погрузки и разгрузки.

LINER CONFERENCE = ЛИНЕЙНАЯ КОНФЕРЕНЦИЯ – Liner Conference is a group of two or more vessel-operating carriers, which provides international liner services for the carriage of cargo on a particular trade route and which has an agreement or arrangement to operate under uniform or common freight rates and any other agreed conditions, e.g., Far Eastern Freight Conference (FEFC). / , например, .

LINE RELEASE SYSTEM = ЛИНЕЙНАЯ СИСТЕМА ВЫПУСКА – In the United States, the Line Release System, a part of Customs' Automated Commecial System, is designed for the release and tracking of shipments through the use of personal computers and bar code technology. To qualify for line release, a commodity must have a history of invoice accuracy, and be selected by local Customs districts on the basis of high volume. To release the merchandise, Customs reads the bar code into a personal computer, verifies that the bar code matches the invoice data, and enters the quantity. The cargo release is transmitted to the Automated Commercial System, which establishes an entry and the requirement for an entry summary, and provides the Automated Broker Interface system participants with release information.

LINER IN FREE OUT = ПОГРУЗКА ЗА СЧЁТ ПЕРЕВОЗЧИКА, ВЫГРУЗКА БЕСПЛАТНАЯ (или ЛИНЕЙНЫЕ УСЛОВИЯ ПРИ ПОГРУЗКЕ) – Liner In Free Out is the transport condition denoting that the freight rate is inclusive of the sea carriage and the cost of loading, the latter as per the custom of the port. It excludes the cost of discharging. / Условие перевозки, обозначающее, что в ставку фрахта включены перевозка морем и стоимость погрузки, причём второе – как по обычаю порта. Оно исключает стоимость выгрузки.

LINER SERVICE = ЛИНЕЙНОЕ ОБСЛУЖИВАНИЕ (или ЛАЙНЕРНОЕ ОБСЛУЖИВАНИЕ, или ОБСЛУЖИВАНИЕ ЛАЙНЕРАМИ) – Liner Service:- vessels operating on fixed itineraries or regular schedules and established rates available to all shippers. The freight rates which are charged are based on the shipping company's tariff or if the company is a member of a liner conference, the tariff of that conference. Liner Service is a service provided by a common carrier operating on a definite, advertised schedule, giving relatively frequent sailingsat regular intervals between specific ports and areas. / членом линейной конференции . Линейные Перевозки грузов мелкими партиями при работе судов по расписанию.

LINER SHIPPING COMPANY = ЛИНЕЙНАЯ СУДОХОДНАЯ КОМПАНИЯ – Liner Shipping Company is a company transporting goods over sea in a regular service. / Компания, транспортирующая товары по морям на регулярной основе. Под Морскими Линиями (Линейным Судоходством) понимается понимаются перевозки грузов и пассажиров по определённым направлениям (линиям); суда их обслуживающие называются линейными (лайнерами).

LINER TERMS = ЛАЙНЕРНЫЕ ПОРЯДКИ (или ЛИНЕЙНЫЕ ПОРЯДКИ) – Liner Terms:- a condition of carriage according to which thet costs for loading and unloading are borne by the carrier. Liner Terms (LI/LO):- qualification to a freight rate which signifies that it consists of the ocean carriage and the cost of cargo handling at the loading and discharging ports according to the custom of those ports. This varies widely from country to country and, within countries, from port to port:- in some ports, the freight excludes all cargo handling costs while in others the cost of handling between the hold and the ship's rail or quay is included. General statement of undefined terms of contract that tend to vary from port to port around the world.

LINER TERMS HOOK TO HOOK = ЛИНЕЙНЫЕ ПОРЯДКИ ГАК К ГАКУ (или КРЮК К КРЮКУ, или ПРИХВАТ К ПРИХВАТУ) – (1) Liner Terms Hook To Hook (LTHH):- given that this is a notional point in chartering terms, this is best described as the Shipper/Receiver arranging for delivery/receival of cargo to/from directly under ships hook and the ship paying for the labor to stow the cargo in the vessels cargo holds, as well as on-board lashing and securing and provision of dunnage materials, and to discharge again over the ship's side. Shore based stevedoring aspects remain the responsibility of the shipper/receiver, however, there are some owners that may incorporate these costs into their Liner Terms Hook To Hook (LTHH) rate. Once again, ask owners to clearly define

this aspect. Wharfage charges/dues/taxes can be a contentious issue but are usually considered to be for the Shippers/Receivers account and there may also be many other statutory levies on cargo or freight that may apply. Many Shippers/Receivers are unaware of these additional costs and do not include them into their costing and consequently may be left with an unexpected considerable expense at the completion of a project. Hook to Hook:- describe the period from the time the cargo comes within reach of a vessel's tackle until the cargo leaves it at the discharging port. Hook is the high-capacity J-shaped equipment used to hang various other equipment, particularly the swivel and kelly, the elevator bails or topdrive units. The hook is attached to the bottom of the traveling block and provides a way to pick up heavy loads with the traveling block. The hook is either locked (the normal condition) or free to rotate, so that it may be mated or decoupled with items positioned around the rig floor, not limited to a single direction. / , и разгружать .

(2) Liner Terms Hook To Hook (LTHH):- Shipper/Receiver arranges for delivery of cargo to/from directly under ships hook and the ship paying for the labor to stow the cargo in the vessels cargo holds, as well as on-board lashing and securing and provision of dunnage materials, and to discharge again over the ship's side. Shore based stevedoring aspects remain the responsibility of the shipper/receiver. / , и разгружать .

LINE SLIP = СЛИП С ПРЕДЕЛОМ УДЕРЖАНИЯ (или ЛИНЕЙНАЯ КВИТАНЦИЯ) – Line Slip is a signing slip issued off a long term cover.

LINE SOWING = ЛИНЕЙНЫЙ ПОСЕВ – Line Sowing:- to sow the seed in lines with a drill or by hand. / Под Посевом понимается заделка семян в верхние слои почвы для их прорастания. Способы:- квадратно-гнездовой, перекрёстный, разбросной, рядовой (ленточный, узкорядный, широкорядный) и другие. Проводится сеялками, иногда с самолёта.

LINET = ЛЫНЭТЧ – Linet is a French-make lining fabric of unbleached linen. / Линэт (Linette), в переводе с Французского языка, Льняное Семя.

LINE YARN = ДЛИННОВОЛОКНИСТАЯ ЛЬНЯНАЯ ПРЯЖА (или ЛИНЕЙНАЯ ПРЯЖА, или ПРЯЖА ИЗ ДЛИННОВОЛОКНИСТОГО ЛЬНА) – Line Yarn is the well-hackled, even linen yarn made of long fibers. / Пряжа из лубяного длинного волокна.

LINGERIE = ЖЕНСКОЕ БЕЛЬЁ – Lingerie is another term for women's underwear and nightwear, including panties, slips, petticoats, camisoles, pajamas, and nightgowns. Lingerie implies delicate fabric, often lace-trimmed. The term lingerie fabrics is occasionally used for very delicate fabrics. Formerly, the finest lingerie was made of muslin, lawn, or silk. Lingerie is a women's intimate apparel. / В группу Женского Белья, как правило, входят:- бюстгальтеры, широкие трусы (panties; так называемые шорты) и так называемые боди; хотя в некоторых классификациях к ней также относятся обычные узкие трусы (slips), подъюбочники (petticoats), маечки (camisoles), пижамы (pajamas) и ночные платья (nightgowns). Термин Ткани Для Женского Белья (Lingerie Fabrics) иногда используется в отношении очень деликатных тканей. Когда-то тончайшее женское бельё шилось из муслина, батиста или шёлка.

LINGERIE CRÊPE = ЛЭНЖЭРИ КРЭП (или БЕЛЬЕВОЙ КРЭП, или ТОНКИЙ КРЭП, или КРЭП ДЛЯ ТОНКОГО ЖЕНСКОГО БЕЛЬЯ) – Lingerie Crêpe:- formerly called French Crêpe because it was originally made in France. The crêped surface was made by embossing (pressing cloth over a fleece blanket). Because it is no longer pressed, it is not a crêpe and it is used for lingerie and spring and summer dresses.

LINING = ПОДКЛАДКА – Lining is a fabric made in the same shape as the outer fabric, a lining supports and protects the outer fabric and hides seams as well. Linings are found not only in apparel, but also in draperies and oc casionally curtains and bedspreads. Items that are lined tend to wear better and last longer than unlined items and the appearance of a lined item is usually better than that of an unlined one. Special lining fabrics include those sold under the trademarks Si Bonne and Earl-Glo. Linings should be of the same construction as the outer fabric. / под торговыми марками Си Бонн (Si Bonne) и Эл-Глоу (Earl-Glo).

LINING FABRIC = ПОДКЛАДОЧНАЯ ТКАНЬ – Lining Fabric is a fabric that is used to cover inner surfaces, especially when the inner surface is of a different material than the outer. May refer to garment lining, lining for boxes, coffins, etc. Generally of smooth, lustrous appearing fabrics, but also of felt and velvet. Both manufactured fibers and natural fibers are used. Lining Fabric is a fabric that is used to cover the inside of a garment to provide a finished look. Generally, the lining is made of a smooth lustrous fabric.

LINKAGE = СЦЕПЛЕНИЕ – Linkage is the association between two or more genes located on the same chromosome that tend to be inherited together. / Генная связь или сцепление с полом. Под Сцеплением Генов понимается связь между генами, обусловленная их расположением в одной хромосоме. Гены, лежащие в одной хромосоме, составляют одну группу сцепления и наследуются большей частью совместно.

LINKAGE = УВЯЗКА (или ВЗАИМОСВЯЗЬ) – Linkage is the ability to buy (sell) contracts on one exchange (such as the Chicago Mercantile Exchange) and later sell (buy) them on another exchange (such as the Singapore International Monetary Exchange). / Способность покупать (продавать) контракты на одной бирже (такой как Чикагская Товарная Биржа) с тем, чтобы позже продать (купить) их на другой бирже (такой как Сингапурская Международная Валютная Биржа).

LINKAGE GROUP = ГРУППА СЦЕПЛЕНИЯ – Linkage Group is a set of genes that assort together and that assort independently of other genes.

LINKAGE MAP = КАРТА СЦЕПЛЕНИЯ – Linkage Map is a scale representation of a chromosome that shows the relative positions of all its known genes or DNA sequences.

LINK–AND–LINK = XX – Link-And-Link:- xxxxx. See also Purl. / Link = Звено; Связь; Соединение; Шарнир; Кулиса; Тяга; Шатун.

LINK BETWEEN SECURITIES SETTLEMENT SYSTEMS = СВЯЗЬ МЕЖДУ СИСТЕМАМИ РАСЧЁТА ПО ЦЕННЫМ БУМАГАМ – Link Between Securities Settlement Systems:- procedures and arrangements between securities settlement systems (SSSs) for the transfer of securities through a book-entry process. As an alternative to the correspondent central banking model (CCBM), the Eurosystem uses eligible links for the cross-border mobilisation of collateral.

LINKED LOAD = ВЗАИМОСВЯЗАННАЯ ЗАГРУЗКА – Linked Load is a load against the European Electronic Purse's (EEP's) associated account.

LINKED PROCESSES = СОПРЯЖЁННЫЕ ПРОЦЕССЫ – A term Linked Processes refers to the connection of the various steps of fiber-to-yarn processing via pneumatic fiber-transport systems, on-line monitoring, and process control. Process linking results in less labor-intensive processing. A typical linked system might include all stages from bale opening through carding.

LINKED PURSE = ВЗАИМОСВЯЗАННЫЙ КОШЕЛЁК – Linked Purse is an European Electronic Purse (EEP) application with a reference to a funding account. This reference shall reside either in the EEP application or on the Purse Provider host.

LINKERS = INFLATION LINKED SECURITIES

LINKING = СШИВКА (или СТАЧКА) – Linking:- xxxxx.

LINKSPAN = ПАНДУС (или ТРАП, или АППАРЕЛЬ) – A Linkspan or Link-Span is a device used mainly in the operation of moving vehicles on and off a RO-RO vessel or ferry. Linkspans are usually found at ferry terminals where a vessel uses a combination of ramps either at the stern, bow or side (or a combination of any) to load or unload cars, vans, trucks and buses onto the shore, or alternately at the stern and/or the bow to load or unload railroad cars. Bridge between ship and shore. / автомобили, фургоны, грузовики и автобусы . Лестница между судном и берегом. Под Пандусом, от Французского словосочетания Pente Douce, означающее Пологий Склон, понимается наклонная площадка, служащая для подъёма автомобилей в гаражах; для въезда к расположенному над цоколем здания парадному входу; в отдельных случаях заменяет лестницы. Под Трапом, от Голландского слова Trap, понимается верёвочная, деревянная или металлическая судовая лестница. Различают:- внутренний и забортный трап, постоянный и съёмный трап, наклонный и вертикальный трап. Забортные трапы (парадные трапы, шторм-трапы) служат для сообщения с береговыми причалами или с плавучими средствами. Верёвочный трап, используемый для сообщения между судами на стоянке и на неспокойном море, называется шторм-трапом. Трапом называются также лестницы различной конструкции, используемые при посадке/высадке в вертолёты, самолёты и тому подобное. Под Аппарелем, от Французского слова Appareil, означающее Въезд, понимается:- (i) железобетонная или мощёная платформа на уровне пола вагона для погрузки грузов в железнодорожные вагоны. Аппарель имеет спуск (пандус) до уровня подъёма к аппарелю. (ii) Устройство в виде наклонной плиты, рамы или направляющих реек для проезда (прохода) в здание, сооружение. (iii) Устройство в носовой части корабля в виде опускаемой в наклонное положение части палубы для схода личного состава и техники на берег. Под Аппарелем, от Французского слова Appareil, означающее Въезд, понимается:- (i) наклонная платформа для погрузки в вагоны или иные транспортные средства автомобилей и других машин; или (ii) плита с небольшим уклоном для проезда или прохода в здание или сооружение.

LINNAEAN SYSTEM = ЛИННЭЕВСКАЯ СИСТЕМА (или СИСТЕМА ЛИННЭЯ) – Carolus Linnaeus (1707–78) is a Swedish scientist who devised the binomial nomenclature used to identify every living Species. The Linnaean System of classification is based on a simple hierarchical structure in which all known organisms are listed according to Kingdom, Phylum, Class, Order, Family, Genus and Species. / Царство (Kingdom), Отряд (Phylum), Класс (Class), Порядок (Order), Семейство (Family), Род (Genus) и Виды (Species). Карл Линнэ (Carl Linné) или, по-Латински, Каролус Линнэус (Carolus Linnaeus), известный в России как Карл Линней, был Шведским естествоиспытателем, создателем системы растительного и животного мира, первым Президентом Шведской Академии Наук (1739), Иностранным Почётным Членом Петербургской Академии Наук (1754). Впервые последовательно применил бинарную номенклатуру и построил наиболее удачную искусственную классификацию Растений и Животных, описал около 1 500 Видов Растений. Выступал в защиту постоянства Видов и креационизма. Автор Системы Природы (1735), Философии Ботаники (1751) и другого.

LINON A JOUR = ЛИНО А ЖУР (или ДНЕВНОЙ ЛИНОН) – Linon A Jour is a gauze-like linen fabric used as dress goods. / Лино (или Батист, или Тонкий); Ажурное (или изделие или ткань).

LINSAY = ХХ (или ТРЯПЬЁ) – Linsay is a pattern of crossed stripes of green and bright pink. / узор из скрещенных полосок зелёного и ярко розового цвета.

LINSEY–WOOLSEY = ЛИНЗИ–ВУЛЗИ – Linsey-Woolsey:- when linen and wool were woven together in the XVIII century, the resulting coarse, loosely woven, and rather scratchy fabric, was called Linsey-Woolsey. Although linen and wool blends are occasionally made today, the use of finer finishing techniques makes them extremely comfortable and the name linsey-woolsey is limited to historical references. Linsey-Woolsey is a coarse sturdy fabric of wool linen or cotton. / Линзи-Вулзи – домотканое грубое сукно из льна и шерсти; тарабарщина.

LINT = ВОЛОКНО – The raw fiber, now called Lint, makes its way through another series of pipes to a press where it is compressed into bales (lint packaged for market), banded with eight steel straps, sampled for classing, wrapped for protection then loaded onto trucks for shipment to storage yards, textile mills and foreign countries. See also Linters; and Noil. All forms of raw ginned cotton, either baled or unbaled, except linters and waste. Lint:- raw cotton that has been separated from the cottonseed by ginning. Lint is the primary product of the cotton plant, while cottonseed and linters are byproducts. Lint, or raw cotton, is used for spinning. Lint:- the good, workable fiber used to make yarn. In this sense, it is the staple cotton fiber which will withstand machine treatment. Lint should not be confused with linters, the short brown fibers taken from the seeds in ginning, usually from second-time ginning. The cotton fiber obtained by the ginning process once the cotton seed, leaves and casing have been removed. Good workable fiber used to make yarn. Lint:- particles and short fibers that fall from a textile product during the stresses of use. / В настоящее время сырьевое волокно стало именоваться на Английском языке как слово Lint, означающее ныне Волокно. Хлопковое волокно вырабатывается в процессе джинирования (или волокноотделения), когда из собранного и доставленного на хлопкозавод хлопка-сырца отделяются семена Хлопчатника, листья, остатки коробочки и инородные примеси.

COMPARISON OF ATTRIBUTES OF LINT, NOIL AND LINTERS
СРАВНЕНИЕ СВОЙСТВ ВОЛОКНА, ОЧЁСА И ЛИНТА

Parameters Параметры	**Lint** Волокно	**Noil** Очёс	**Linters** Линт
Length, mm	20 – 38	15 – 19	Less than 6 (in India)
Micronaire/Maturity	3.0 – 6.5 (Depending on length)	Less than Lint	Less than Noil
Strength, g/tex	16 – 34	Weaker than Lint	Weaker than Noil
Short Fiber Content, %	4 – 5 (Increases with decrease In Length)	Increases to 10%	Shortest fibers
Amenability To Cleaning	Depends on maturity and length, generally poor	Better than Lint	Better than Lint and Noil
Degree Of Polymerization (DP), ChainLength	1 800 – 3 200	1 200 – 1 500	600 – 800
Cellulose Content, %	80 – 85	85 – 95	Above 98
Specific Surface Area	Lowest	Higher than Lint	Very high surface area
Affinity To Chemical Reagents	Poor	Increases commensurate to lowering DP	Very high affinity
Adhesion Of Microorganisms	Poor	Increases with surface area	High adhesion

Value Addition	Heavily dependent on length, fineness strength and structure	Quality of cellulose primarily, fiber parameters secondary role	Mainly on the quality and quantity, purity of cellulose

LINT ACCUMULATION = АККУМУЛЯЦИЯ ВОЛОКНА – Lint Accumulation:- extraneous matter caught in spinning. Thread defects, and namely – Spinning. / Порок или дефект ниток.

LINT BALL = ВОЛОКНОВЫЙ КАТЫШЕК – Lint Ball:- fuzz and lint balls can make clothes look worn and older than they are. There are a couple of ways you can learn how to successfully get lint balls off of polyester garments. Lint balls are a nuisance no matter what kind of fabric you have. You are lucky though; polyester is one of the easiest materials to remove lint balls. (1) You can remove lint balls off polyester with sticky tape. You need a really sticky tape, like box tape, to remove lint balls. Wrap the tape around your hand or a few of your fingers, stinky side out. Using your hand, press and roll the tape over the area of the polyester garment that has lint balls. The tape will lift the lint off the fabric as you roll over the polyester. (2) Get a lint roller. You can purchase a lint roller just about anywhere. A lint roller is inexpensive and works the same way as sticky tape. Roll over the polyester and the lint balls will come off. (3) Use a razor. For those lint balls that are really stuck to polyester, use a razor to get them off. You can purchase a razor at the store, or you can use a single-blade disposable razor you may already have at home. You have to lay the polyester garment flat and graze the material with the razor to remove the lint balls. Do this carefully so you do not ruin the polyester. (4) A pumice stone works, too. Another way to remove lint balls off polyester is by using a pumice stone. Lay the polyester garment flat and swipe the pumice stone over the lint balls. Use the pumice stone delicately. You do not need to apply much pressure when using the stone. Too much muscle may snag the polyester. See also Balling Up, and Fuzz Ball.

LINT CLEANER = ЧИСТИТЕЛЬ ВОЛОКНА (или ВОЛОКНООЧИСТИТЕЛЬ) – Before about 1947, the cleaning at gins was done mainly on seed cotton. However, some early pioneers introduced the use of lint cleaning equipment. Theodorick James in 1842 tried fiber cleaning in the gin stand immediately behind the ribs. He used a series of brush sticks to remove pin and pepper trash before doffing from the saws took place. About 1858, A.Q. Withers, of Tunica, Mississippi, removed lint materials from cotton in his multi-cylinder gin stand. His machine transferred the ginned lint from gin saws over screens to a doffer and then to high-speed second saws to a final doffer (Bennett, 1962). A US patent was issued in 1894 to Henry Rembert of Texas, on a cotton cleaner for lint. Features of this cleaner included a special receiving cylinder of coarse mesh. The cylinder consisted of a rotary screen drum with interior stationary shield, which permitted the conveying air to also remove fine trash. Rembert's invention was made in two styles, single and double cylinder. US patents were issued in 1926 to John Garner and in 1929 to George Spencer on flotation lint cleaners. Spencer used a special lint flue with herringbone grids. The grids were located along the lower half of the lint flue. His flotation trunk had a trash pocket below the grids to trap dirt dislodged during air conveyance. Some other early patents that included ideas on lint cleaning were issued in 1844 to Carver for using special motes bars and splitters; in 1899 to Archer for spiked comb and keen angle grids; and in 1914 to Reardon for a screen trunk with corrugations. Later, US patents were issued to Garner (1926) for a flotation lint cleaner for spinning mills, Sanders (1940) using airblast gin with hollow ribs and high pressure doffing, Farr (1940) brush cleaner cylinders, and Graham (1941) a return lint flue with perforated corrugations. A patent was issued in 1943 to Hopper for utilizing lint cleaning blow tubes at top of ribs. About 1938, the USDA Cotton Ginning Research Laboratory, Stoneville, MS, began a series of studies to utilize principles of existing cotton mill fiber cleaning equipment at cotton gins. The staff studied the feasibility of using single lint-cleaning devices behind each gin stand, the use of a larger capacity master unit in the main lint flue system, and the possibility of combining the two. Work on lint cleaning by the USDA became an incentive to the entire industry, and a number of private patents were issued a few years after the Government research began. US patents on a saw-type lint cleaner for gins were issued in 1947 to Brooks for close saws, beaters, with pinch-roll feeding; in 1951 to Stedronsky and Shaw for a flow-through lint cleaner; and in 1958 to Moss for improvements in lint cleaning. Lint cleaners were developed specifically for removing leaf particles, motes, cottonseed, grass, and bark that remain in cotton after seed cotton cleaning, extracting and ginning. They were developed and improved in conjunction with the transition from manual to mechanized harvesting of cotton during the 1950's. The lint cleaners now being marketed are mainly of two general types; flow-through air type and controlled-batt saw type. The flow-through air lint cleaner has no saws, brushes, or moving parts. They are less effective in improving the grade of cotton than saw lint cleaners, but they also remove less weight from the bale. They are particularly designed to remove large trash particles and immature cottonseed. Fiber length, strength, and neps are generally unaffected by the air lint cleaner. The controlled-batt saw cleaner is now the most common in the ginning industry for processing Upland varieties. In this cleaner, loose lint from the gin stand or another lint cleaner is formed into a batt, passed between a closely fitted feed roller and feed bar, and fed onto a saw-cylinder. A combing action takes place as the saw teeth seize the fibers. The fibers are cleaned by a combination of centrifugal force; scrubbing action between saw cylinder and 5 to 9 grid bars, and gravity assisted by an air current. A standard saw cleaner generally uses a 16-in. diameter saw with five or six grid bars. Saw-type lint cleaners improve the grade classification of the lint. They also blend light-spotted cottons so that some of these pass into the 'white' grades and reduce the grass and bark content. However, they reduce bale weights and may decrease staple length, and these opposing factors affect bale value. In many cases, the offsetting losses cause bale value to be reduced by lint cleaning. When price spreads between grades are small, the grower can obtain maximum bale value most often by using one standard saw lint cleaner on early season clean cottons and two stages of lint cleaning on late season, trashier, or light spotted cotton. This holds true for both spindleharvested and machine-stripped cottons. Increasing the number of saw lint cleaners at the gin increases the shorter fiber and neps in the lint. During spinning at the textile mill, this often has the adverse effect of increasing neps in the card web and lowering the yarn strength and appearance. Consequently, from a spinning standpoint, the use of more than two saw lint cleaners in series is discouraged. In saw lint cleaners, the uniformity and thickness of the batt, ginning rate, combing ratio, saw speed, and settings between cleaner components are important factors in the effective operation of the saw-type lint cleaner. Increasing the combing ratio and saw speed usually increases the cleaning efficiency on the cleaner, but may adversely affect the spinning qualities of the cotton. The best overall performance on a lint cleaner is usually obtained by using the settings recommended by the manufacturer. Other saw-type lint cleaners, where a batt is not created or controlled, have been used at a few gins in recent years. Optimized use of lint cleaners was enhanced by a computerized gin process control system that has operated successfully at numerous (over 70) commercial gins in 2002. The system utilizes the cotton market price and the performance characteristics of gin machinery to determine the optimum machine sequence. Based on cotton measurements made with electronic devices, special routing valves are used to bypass or select any combination of seed cotton cleaners, dryers, and saw lint cleaners. Selections are directed by computer process control software. There is no best lint cleaning system for all gins because not all cotton is the same. The best lint cleaner system is the one that will meet the demands of the farmer and the textile industry. The cleaning needs at a roller gin handling extra long staple Pima cotton is different from that required at a saw gin processing Upland varieties. Cleaning needs for a saw ginning plant are influenced by whether the gin processes spindle- or stripper-harvested cottons and whether both smooth- and hairy-leaf Upland varieties are grown extensively in the area. A more demanding cleaning system might be needed if the gin does both custom ginning and ginning for growers who own the gin. Demands of any contract ginning for textile mills per their specifications must also be considered. Ginning for the market and maximum bale value in recent years means producing cotton graded with a color designation of 41 and a leaf designation of 4 in all areas of the United States except the West where color 31 and

leaf 3 are required. Generally, one or two saw-type lint cleaners can produce this grade level. Cleaning above the required designations will reduce the cotton's market value because of weight losses more than offsetting the minimal increase in lint value per pound. Replacing an old lint cleaning system with a new installation is no guarantee of better grades and higher bale value. Many older saw-type lint cleaner units still fulfill the gin cleaning requirements. However, it is necessary to regularly check and adjust settings and spacing. The saw teeth and grid bars should also be checked for sharpness. Well-kept lint cleaners will give many years of good service. In the cotton gin, a machine for removing foreign material from lint cotton. In cotton ginning, a machine that is used for cleaning of cotton lint after ginning by removing seed coats, leafy matter after ginning, short fiber clusters from ginned lint, micro-dust, etc. It improves lint grade and appearance, and reduces trash content and other contamination. / Сиодорык Дьжеймз (Theodorick James) в 1842. контаминация. Около 1858, Эй.Кью. Визёз (A.Q. Withers), из городка Туника, Штат Миссисипи (Tunica, State of Mississippi), удалил волокнистые материалы из хлопка . Бэнэт (Bennett, 1962). В 1894 в США был выдан патент Хэнри Рэмбёту (Henry Rembert) из Техаса, на чиститель хлопка для волокна (cotton cleaner for lint). В США на xxx (on flotation lint cleaners) были выданы патенты в 1926 Дьжону Ганёру (John Garner) и в 1929 Дьжодьжу Спэнсёру (George Spencer). в 1844 Кавэру (Carver) за использование специальных xxx (special motes bars and splitters); в 1899 Ачёру (Archer) за xxx (spiked comb and keen angle grids); и в 1914 Риадэну (Reardon) за xxx (screen trunk with corrugations). Позже в США были выданы патенты Ганёру (Garner; 1926) за xxx (flotation lint cleaner for spinning mills), Сэндёзу (Sanders; 1940), Фару (Farr; 1940), и Грэйэму (Graham; 1941). В 1943 был выдан патент Хапёру (Hopper) за . в 1947 Бруксу (Brooks) за ; в 1951 Стэдронски и Шо (Stedronsky and Shaw) за ; и в 1958 Macy (Moss) за .

LINT COTTON = ВОЛОКНО ХЛОПКОВОЕ (или ВОЛОКНИСТЫЙ ХЛОПОК) – Lint Cotton is the term used to denote cotton fibers from which the ginning process has removed the trash and seeds. Cotton fibers from which the trash and seeds have been removed by the gin. Lint Cotton means cotton that has passed through the ginning process. / Волокно Хлопковое – термин, используемый для обозначения хлопковых волокон, из которых в процессе джинирования (волокноотделения) были удалены сор и семена. Хлопковые волокна, из которых сор и семена были удалены джином (волокноотделителем).

LINTERS = ЛИНТ (или ПУХ И ПОДПУШЕК) – Linters:- the short, fuzzy cotton fibers which cover the seeds of certain types of cotton after the lint cotton or fiber has been removed at the cotton gin. Linters are very short, usually less than 1/8 inch, and they may be gray, greenish, or brown in color. One ton of cottonseed will yield over 200 pounds (90.7 kg) of linters. The production of linters is governed by the staple length of the fiber, the efficiency of the cotton gins and types of other equipment used in the processing. About 30 per cent of the total production taken from the seed is first-cut or first-time linters, while second-cut linters provide the remaining 70 per cent. First-cut linters under normal conditions, sell for around 15 to 18 cents per pound; second-cut linters are about 4 cent per pound less in price. Linters are used in the manufacture of guncotton, the stuffing in upholstery, absorbent cotton, mattresses, and the manufacture of pure cellulose sheets in the making of rayon and acetate. Linters are not used to make cotton yarn. See also Lint; and Noil. Fine cotton fiber next to the boll shell, contains occasional small particles of the hull. Ground cotton is processed through a Wiley mill equipped w/ a screen having 5 mm diameter apertures. When cotton is ginned, the long staple cotton is removed from the seed and used in the textile industry to make cloth. Then the seed is further processed in a machine called a 'Linter', which removes the rest of the seed hairs (the closer to the seed, the shorter the fiber). The first pass of the seed through the linter machine results in 1st cut cotton linters; the next pass produces 2nd cut cotton linters. Cotton linters pulp has been cooked, bleached, beaten, and then made into compressed sheets. Cotton linters have a shorter fiber length than abaca, and paper made from them will show watermarking and laid and chain lines extremely well. We've made sheets of paper from cotton linters from various pulp mills and have found our current supplier to have the best quality pulp. The short fiber of 2nd cut linters makes it very useful to pick up details in casting or other types of paper sculpture. Contrary to the practice in the United States where linters are removed from cotton seed at the oil mils, in the former USSR a single (or first) cut of linters was taken at the ginning plant immediately after the ginning operation (removal of lint from seed). The short fibers adhering to cotton seed after the operation of ginning (seed removal and cleaning). These fibers are cut from the seed in a series of passes through cutting blades, and are therefore referred to as, 'First-Cut Linters', 'Second-Cut Linters', 'Mill Run', etc. Linters are used in the manufacture of cotton fiber content paper and cellulose derivatives. Residual unmanufactured cotton fiber separated from cottonseed after the lint has been removed. Linters are very short fibers that cover the cotton seeds after the l long fibers have been removed by ginning. These short, fuzzy fibers, after removal from the cotton seeds, are a source of cellulose for rayon and acetate. Short-staple cotton removed from the seed and husk by a second ginning, or by a linter machine. Seldom used for textiles; commonly used in plastics and mattress padding. Linters are the short cotton fibers that are not removed from the seed during the first ginning. The linters are cut from the seed and used as a source for cellulose derivatives such as nitrocellulose or viscose rayon. Linters are fibers that are too short for spinning. They are being used for other purposes, e.g., in cellulose chemical fibers. Cotton Linters are the fine, silky fibers which remain adhered to the seeds of the cotton plant after ginning, including parts of the longer textile fibers, or 'Lint', as well as coarse, short fuzz fibers in most upland species of the plant. When purified, linters are used in the manufacture of paper. They can be used to replace from 5 to 35% of the rag content of fine papers with little or no loss of strength. Linters improve uniformity and the color properties of paper, and also provide a cleaner, bulkier sheet. Although linters do find use in papermaking, their principal use is as a raw material in the manufacture of cellulose derivatives. All forms of cotton fiber separated from cottonseed after the lint has been removed, excluding so-called Hull Fiber. Cottonseed Linters, the short fibers removed from seed as the first step in processing, are sometimes referred to as 'The Fabulous Fuzz'. Through mechanical or chemical conversion, they enter a wider variety of end use products than any of the other products of cottonseed. Markets for linters fall into two broad classes – chemical and non-chemical. At the present time, chemical applications account for approximately three-fourths of total volume. Generally, first-cut linters – fibers removed the first time seed are run through the delinting machinery – are longer and find non-chemical uses. Second-cut linters, those removed in subsequent delinting passes usually enter chemical products. Mill-run linters, the one-pass 'Run Of The Mill Fiber', move into both markets. Limited quantities of the highest grades of first-cut linters are used in manufacturing absorbent cotton, medical pads, gauze, twine, wicks, and carpet yarns. A much greater quantity is put through a process known as Garnetting to produce felts or batting for use in mattresses, other bedding products, and in cushioning for furniture and automobiles. As batting leaves the garnetting machine it is sprayed with a compound which greatly improves its resilience, cohesion, and stability; it also reduces flammability and dusting. This product, called Cotton Flote, is a highly desirable cushioning material due to its absorbency and breathability properties and resulting comfort. Linters are composed principally of pure cellulose and are, therefore, an important raw material to the chemical industry. Linters are purified in a chemical treatment consisting of digesting, bleaching, washing, and drying. The resulting linter pulp may be bulk baled or formed into large continuous sheets. Sheets can be wound into rolls or cut and packaged flat in bales for shipment. Today's health and calorie-conscious consumer is seeking a wide variety of low calorie, high fiber food products and a recently developed linter product is meeting that need. Increasing dietary fiber is now recommended by many health professionals. Edible grades of cottonseed linter fiber contain more than 99% total fiber. The product is a pure white, flavorless, odorless flour that is chemically stable so it will not react with other ingredients to form objectionable flavors, colors or odors in foods. It is used in many food products including baked goods, dressings, snacks and processed meats. Linter fiber is also used to improve the viscosity of dressings and is commonly used to bind solids in pharmaceutical preparations such as tablets. It helps retain

moisture and extends the shelf life of baked goods. Since linter fiber is white and is one of the purest forms of fiber, it has obvious advantages over other sources of edible fiber such as wood pulp. Linter pulp has many other applications. One of the earliest uses was in making smokeless gun powder. Still today, selected small arms ammunition, air-to-air and air-to-ground rocket propellants, and large solid-fuel rockets utilize nitrocellulose derived from cotton linter pulp. A large quantity of linter pulp is also used in photographic film and in the production of molding plastics and lacquers. Plastics are used in many molded products such as instrument panels, steering wheels, radio cases, signs, toys, flexible pipe, and handles for toothbrushes and tools. A substantial volume of linter pulp is also used in the manufacture of high grade bond paper. Cotton rags and clippings were traditionally used for this purpose, but many of the rags and clippings generated today contain synthetic, thermo-plastic fibers not suitable for paper making. Therefore, manufacturers are turning increasingly to linter pulps to obtain the strength and fold resistance they desire in fine high cotton content papers. Linter pulp is also used in the production of such diverse items as sausage casings, cellulose lacquers for use on furniture, metal, and in fingernail polishes, decorative laminates, industrial and automotive filters, battery separators, and printed electrical circuit boards for use in the computer and electronics industry. Linter pulp is higher in price than competing products, but in each of the markets it serves, it is preferred on the basis of superior quality and performance. Cotton Linters are the remaining short fibers after removing cotton lint from cotton seeds. Linters:- Cotton Linters are usually obtained by delinting ginned seeds. Cotton Linters are obtained in 2 stages and 1st Cut Cotton linter have longer fiber length than 2nd Cut Cotton linters. Cotton Linters are very useful for paper board industry and thus wood pulp and other natural resources are saved. This cotton is the fuzz on cotton seeds which have been combed out the long fiber cotton used for cloth. This fuzz or linters is cut off the seeds before the seeds are made into cottonseed oil. The First Cut Cotton Linters or First Shear cotton linters are cut off the seeds before the seeds go to the mill. This First Shear cotton linters is very resilient and springy. It is used in higher grades of cotton batting. Although very resilient, First Shear cotton Linters, by itself, is not very stable in a futon. It is best used in combination with staple cotton. Second Shear linter cotton is a lower quality cotton that is cut from cotton seeds at a cottonseed oil mill. Cotton fiber has a very high Alpha cellulose content, which makes this pulp ideal for producing long life archival papers. First cut Cotton linters find uses in Artists Drawing papers, which must have a resistance to fading, neutrality and stability. These are heavier weight papers were the finish varies from a coarse surface for paint to a smooth surface for graphic work. First cut linters also find uses in some boards (e.g., greetings cards) and Mill Run and First cut linters are used as extenders to the much longer Staple Cotton fibers, in currency papers. Second cut linters are valued for their bulk and purity. In addition to uses in the above grades, Second cut linters are used in Fine and Security to add bulk and prestige value. For Fine papers requiring a good formation, care should be taken when selecting the linter grade to ensure that it is clear of 'Fiber Knots'. The latter, if present in large numbers in the pulp, can give rise to a poor formation or a 'Fish Eye' problem. The cleaned seed is then sent to gin stands, similar to those in cotton saw gins, where the linters are removed from the seed (delinted). This linter removal process is usually done twice and the fibers are collected and pressed into 600 pound bales. The linters of the highest grade, referred to as First-Cut Linters (longer more resilient fibers) are used in manufacturing non-chemical products, such as medical supplies, twine, and candle wicks. The second-cut linters (short fibers or fuzz), removed in further delinting steps, are incorporated in chemical products, found in various foods, toiletries, film, and paper. Characteristics of Cotton Linters:- (1) Chemical Characteristics:- (i) Moisture – 7–8%, (ii) Ash – 1.5%, (iii) Alpha cellulose – 85% min; (iv) Pentosan – 2% max; (v) Extracting with water – 2% max; and (vi) Extracting with Alsohol/ Benzene(1/2) L – 1% max. (2) Specification for 1st Cut Cotton Linter:- (i) Aappearance – cream white; (ii) Cotton length – 5 mm to 10 mm; (iii) Cotton diameter – 0.0205 mm max; (iv) Insoluble matter (trash) – 10–15%; (v) Extra with water – 20%; (vi) Ash – 1.5% max; (vii) Moisture – 8.0 %; (viii) Pentozen – 2.0%; (ix) Maturity – 75% min. (3) Specification for 2nd Cut Cotton Linter:- (i) Appearance – blackish white; (ii) Moisture – 3%; (iii) Maturity – 75% min; (iv) Sulphate acid-infusibility matter – 3.5% (±1); (v) Ash less than – 1.3% (±0.2); (vi) Iron less than – 250 ppm (MG/KG); (vii) Whiteness and appearance – correspond to the authorized samples; (viii) Length of staple – 2–6 mm; (ix) No foreign fiber and no contamination; (x) Foreign matter – no more than 2.00–3.5%. The cargo of cotton linters should be devoid from the below vermin, pest, and agricultural parameters:- Pectinophora Gossypiella, Pectinophora Scutigera, Helicoverpa Zea, Earias Fabia, Anthonomus Grandis, Glomerella Gossypii, Xanthomonas Campestris Pv. Malvacearum. Linters are the fuzz or short fibers which remain attached to the seed after ginning. Linters are usually less than 1/8 inch in length and are removed from the seed by a delinting process. Linter is traditionally used in the manufacture of paper and as a raw material in the manufacture of cellulose. Linter is almost pure cellulose and provides for making plastics, explosives, archival papers and other products. This includes fade-resistant high-quality paper products that also need neutrality and stability. These are heavier weight papers where the finish varies from a coarse surface for paint to a smooth surface for graphic work. First cut linters are linters of the highest grade with more resilience and length, and are used in manufacturing non-chemical products, such as medical supplies, twine, and candle wicks. Second-cut linters (short fibers or fuzz), removed in further delinting steps, are incorporated in chemical products, found in various foods, toiletries, film, and paper. These are valued for their bulk and purity and used for archival papers and other securities. They are processed into batting for padding mattresses, furniture and automobile cushions. As a refined product, cotton linter also has medical, cosmetic and other uses. Linters Staple Length (in India):- (i) First Cut Linters – longest fiber – 5–10 mm; (ii) Second Cut Linters – shorter fiber – 2–5 mm; and (iii) Third Cut Linters – more shorter fiber – 1.6–2.0 mm. Linters:- fibers of very short staple length. Fibers of very short staple length, adhering to the cottonseed after the spinnable lint has been removed by ginning and which is subsequently recovered from the seed by a process called Delinting. This short fibrous material is unsuitable for spinning. Linter: - The fine silky fibers left behind on the cotton seed after ginning are called Linters that is use in the making of paper and cellulose. Linters:- Seed cotton harvested in the field undergoes the primary processing of separation of lint and seed in ginning factories. This process is the most important and significant operation that decides both the yield of lint and its quality. The cotton seed that gets separated in the process is an important genetic material having the potential to yield a fresh crop as well as several valuable by products, if processed in a scientific manner, sequentially. The current availability of Cotton seed is estimated to be more than 50 million tons world-wide. The Global cotton seed sector is a vibrant industry projected to grow with a Compound Annual Growth Rate (CAGR) of 5.2% since 2019. It is envisaged that this thriving sector attracting newer investments and players is expected to touch USD1.0 Billion in the near future. With the introduction of genetically modified Cotton in many countries, this industry has witnessed increased investments from the private sector in developing and releasing newer strains of cotton with active participation of the farming community. The cotton seed that leaves a ginning factory is surrounded on its surface by a thick fuzz that could not be separated during ginning. The amount of fuzz residue on the seed is, however, decided by the type of ginning/mechanism employed for ginning viz. saw ginning or roller ginning. The fuzz, known as Linters, is a mass of short fibres that adhere to the seed tenaciously even after ginning, and has a thicker secondary wall at the seed surface accounting for the resistance to removal during separation. If the cotton seed is processed in a scientific manner then the fibers could be separated and put to effective use. Scientific processing of cotton seed is a system of operations that enables separation and recovery of invaluable constituents viz. linters, seed hulls (outer cover of the kernel) and kernel, and also provides avenue for preparation of seed meal or de-oiled cake. Each of these by products or constituents has tremendous scope for value addition and contributes effectively to the composite economy of cotton. As already noted, the process of separating the fuzz from ginned seeds is known as de-linting. This process of removal of short fibers adhering to the seed can be effected in more than one way depending on the end use of the seed. Two processes, in vogue, commercially have gained importance (1) Acid delinting and (2) Mechanical delinting. Though, many other mechanisms such as flame treatment have evoked research interest in purifying seed to

enhance its germination potential in the field,they have not gained popularity. While acid delinting is a process of treating ginned seeds with acids with the primary purpose of sowing the seed for the next crop, the fuzz is completely lost in the process. In mechanical delinting the fibers are not degraded unlike in acid delinting and is recovered for further use. This is usually accomplished by high speed rotating sharp screws or abrasive surfaces to cut or rub the fibers off the surface of the seed hull. This process heavily relies on the physical friction to remove the fuzz forcibly. (a) Advantages of Mechanical Delinting:- Several beneficial traits have been identified during mechanical delinting of ginned seeds. The recovery and recyclability of the fuzz (linter) is the primary advantage apart from prevention of environmental pollution. However, the cost of delinting is found to be higher compared to acid delinting. In view of the emerging uses of linters enhancing its scope for value addition, several researchers have attempted to improve the functioning of mechanical delinter particularly its ease of operation. A typical yield of cotton linters is around 9% by weight of the seed. A study of yield of linters from different species of Cotton revealed that, the linter content from Gossypium Hirsutum Cotton is about 10.5%, whereas the native Cottons from India belonging to Gossypium Arboreum and Gossypium Herbaceum yield linters varying from 4.3–5.9%. Gossypium Barbadense species produce naked seeds. Hybrid Cotton seeds (intra-Hirsutum and Hirsutum x Barbadense) have shown higher fuzz with linter content exceeding 10%. The linters collected after the first phase using delinting machines are called 'First Cut Linters' and after second phase are called 'Second Cut Linters'. 'Third Cut Linters' are often referred to as Hull Fibers. However a mixed version of linters, denoted as 'Mill Runs' is used for production of pulp. (b) Physical & Chemical Characteristics Of Linters:- The physical parameters of the linters recovered depended on the phase of collection from the delinting machine. The comparison here is among three types of celluloses:- (1) Lint (primary processed – fiber extracted from seed cotton); (2) Noil (compressed bale opened, reprocessed, individualized); and (3) Linter (ginned seed, reprocessed by saws to remove fuzz). While the primary processed material has a form dependency, the reprocessed material relies on internal organization and quantity of the constituent cellulose. (c) Primary Processing of Linters – Bleaching:- The foreign matter present in linters is removed by bleaching, currently by using peroxide. The bleached linter is one of the purest forms of alpha cellulose (more than 99%). Due to their purity and whiteness and lower degree of polymerization (DP) (around 600–800), this cellulose forms the basis for a large number of special and niche products. Availability And Market Prospects Of Cotton Linters:- Globally, the availability of cotton linters depends on the production of Cotton in general, barring the Gossypium Barbadense Species. A rough estimate of linters is projected to be approximately 18% of the cotton production in that year. The current level of production potential for linters globally is around (prospectively could be) 5–5.2 million tonnes. However, it is reported that the global availability would not be more than 1.0 million tons. In India, the extraction of cotton linters is about 90 000–100 000 tons, contributing only to less than 10% of the world production. The price of cotton linters depends on the foreign matter content, whether it is first cut or mill run, and its cellulose content. The price varies with that of cotton internationally. The price in India, fluctuates with the availability in the market, governmental regulations, and export. The price in recent years varies between USD1 000 to USD1 500 per ton again depending on the quality of bleaching. The marketable commodity in export arena is in the form of a bale. In India, cotton linters are always in short supply and as a result it becomes unaffordable to small processors. This situation is essentially due to absence of scientific processing of cotton seed in large quantities. However it is reported that out of the available quantity, internationally, a very small fraction of the linters (say about 10%) is used for value addition, offering scope for its enhanced utilization, posing no threat to the availability of the raw material. Market research analysis and prospective growth rate predictions in global cotton linter sector are routinely carried out by market analysis experts, although all such information is not available in public domain. However, Asia Pacific region is expected to hold the largest share in global bleached linter cellulose market. The factors supporting Asia pacific is the availability of cotton. India and China are prominent cotton lint manufacturers with cost effectiveness. Owing to improved socio economic aspects in the region, use of cotton linters in pharmaceutical, food, and personal care products are expanding, there by contributing to the growth of the bleached linter cellulose market. The linter market is segmented into high grade and technical grade. The technical grade market constituted the major chunk of the overall industry in 2018. Technical grade linter is used in pulp and paper, personal care, paints, packaging etc. The market size in 2018 was around USD1.0 billion and in 2025, it is expected to be about USD1.3 billion with a Compound Annual Growth Rate (CAGR) of around 4%. Bleached linter market, due to presence of several small and medium scale manufacturers, remains fragmented. However, this is the product that is used as raw material for viscose, acetate, carboxymethyl cellulose etc, for their manufacture. This industry is always on the look-out for cheaper raw material from plant biomass of natural fibres in general, that could prove to be cheaper substitute for linter. This can limit the prospective potential of bleached linter market in the near immediate future. Diversified Value Added Products From Cotton Linters:- As already noted, being the purest form of cellulose, linter contains only cellulose up to 98–99%, in which alpha cellulose constitutes more than 80%, with negligible lignin, and other non-cellulosic components. Linters are employed traditionally and in modern times with improved technology, for manufacture of several products with diverse application in wide-ranging fields. A panoramic view of the products that could be manufactured from bleached linters is summarized in Figure-2. In the sections below, it is intended to summarize the research carried out in some of the above areas, delineating salient findings and applications. (a) Absorbent Cotton:- Absorbent cotton is one of the value added products, manufactured with minimal processing once the bleached cotton linters are available. Also referred to as 'Surgical Cotton', this product becomes highly absorbing and is soft on skin. The ease with which surgical cotton is made both by using comber noil as well as linters (depending on the availability in a region) has made it very popular among small scale manufacturers. Linters from the first cut consisting of longer fibers, if in a compressed bale form, are opened, scoured, and bleached. In the wet state, the bleached fibers are opened, got rid of water and dried. The dried fibers are again opened, carded and made into a roll. The absorbent cotton is then converted into wipes, pads or wound dressing cloth/gauze depending on the need. (b) Pulp And Paper:- Bleached cotton linter is made into pulp and the pulp then is used to prepare various kinds of high grade paper products such as, technical paper, security paper, insulating paper, filter paper, art paper, and also high quality printing paper. The originally brown colored linter cellulose, is bleached with 12% sodium hypochlorite. The bleached linter pulp has a whiteness index of 67.5%, bright ness of 64%, and yellowness reduced to a single digit, 6%. Several pulping methods have been used to produce pulp with better qualities and with least load on the environment. Organo-solv pulping, has been attempted to prepare quality pulp on Egyptian Cotton linters, that possessed good length but simultaneously higher impurities. Conventionally, cotton linters are used in small quantities or in a mix with wood pulp. This is due to poor inter fiber bonding and low tensile and burst strength. The above deficiencies are ably overcome by introducing addition or substitution reactions to modify and make the material amenable to pulping. Chemically modified celluloses showed good inter fiber bonding and thus removed inherent shortfall in linters. Hydroxy-ethyl cellulose and carboxy methyl cellulose (CMC) improved inter fibre bonding by 85% and also exhibited significant tenacity improvements when they were mixed in proportion with a cationic cellulose. Several attempts have been made, to improve paper quality by introducing additional treatments to the bleached pulp. Addition of 0.25 to 2.0% of potassium permanganate solution improved the paper characteristics. When comber noil and linters are mixed in a blend as 80/20 and pulp prepared; the quality of pulp and that of paper products did not show any reduction thus paving the way for some cost saving. An innovation that has been brought about in paper making is by additives in the pulp mixture to effect special properties to paper. Electrical Insulated paper has been prepared by the addition of hydrophobic fibres such as polyester to pulp to prepare paper of low density, high porosity, and high dieletric resistance. The dielectric constant has been shown to improve further if lead sulphate is added to the pulp. A very recent study, has clearly demonstrated that addition of micro-fibrillated cellulose extracted from cotton linters up to 10% to unbleached Kraft pulp/paper

improved the tensile strength by 11–18%, burst factor by 11–13%, and enhanced the Z directional tensile strength. (c) Regenerated Cellulose:- Another well developed route to add value to linters is to convert them into regenerated cellulose in various forms such as staple fiber, continuous filament yarn, films etc. Over the years, regenerated cellulose manufacturing process has undergone several changes. Cotton linter as an effective raw material has significantly contributed to these developments in no small measure. Traditionally, cellulosic fibers (comber noil or linters) after purification and bleaching are treated with carbon-disulfide (CS_2) solution to dissolve cellulose and by using an appropriate extrusion mechanism, regenerated cellulose fibers/filaments are prepared. An alternate route has been to prepare Cuprammonium Rayon by dissolving cotton linters in a solution of cuprammonium hydroxide and ammoniacal copper sulphate and the dissolved cellulose is treated with sulfuric acid and extruded as regenerated cellulose. These conventional celluloses referred to as 'Rayon' had problems with toxic releases and other environmental issues. An improved process of preparing regenerated cellulose known as 'LYOCELL' process is to dissolve cellulose in N-Methylmorpholine N-oxide (NMMO; organic compound) solution prior to regeneration. The over-all process involves dissolution- spinningdeformation-cooling- relaxation-coagulation- washing and finishing. There were several positive characters in LYOCELL such as environment friendliness, efficiency, high crystallinity, long crystallites, high strength and modulus in comparison to conventional Rayon. One of the demerits of this process has been fibrillation of cellulose. In order to counter the fibrillation problems in LYOCELL cellulose, an attempt was made to prepare a dope of cotton linters and wood pulp prior to dissolution. This dope could, not only significantly reduce the cost of raw material but also could to a large extent reduce fibrillation. Another way to reduce fibrillation has been noted, in spun regenerated fibers prepared from high molecular weight cotton linters (derived from high molecular weight cotton) treated with NMMO via LYOCELL process. A large number of research reports concentrated on enhancing the solubility of cellulose prior to regeneration to improve the properties of cellulose extruded/produced. This included dissolving linter cellulose in NaOH/Urea solutions, organic electrolyte solution and ionic liquids. It was noted that the procedure of dissolving cellulose in NaOH (6% wt)/Urea (4% wt) was a non-polluting process. The strength of the regenerated cellulose film so produced was much better than commercially available cellophane film. Treatment with organic electrolyte solution reduced cellulose degradation significantly and improved the mechanical properties and thermal stability of the film cast. A novel way of dissolving cellulose is by using ionic liquids. The regenerated fibers displayed smooth, highly uniform and dense morphology. The fibers could effectively replace polypropylene and polyethylene in preparing a transparent, biodegradable packaging material. (d) Micro Crystalline Cellulose:- Microcrystalline cellulose is a form of cellulose having industrial applications and wide variety of uses, Microcrystalline cellulose popularly known as MCC, has received serious attention of researchers and manufacturers alike. MCC is a type of cellulose possessing a balanced degree of polymerization (due to hydrolysis) and mechanical separation of particles. It has a porous structure and density similar to crystalline density of cellulose (1.539–1.545 g/cm^3). MCC is dispersive but insoluble in water and acids, organic solvents, oil etc. It swells in dilute alkaline solutions and partly dissolves in it. A white transparent paste or gel is formed if MCC is dispersed in water and this dispersion remains stable but for very dilute solutions. Table-3 below summarizes properties of MCC prepared from linters. MCC is produced from bleached linters by treating with dilute acids (hydrolysis) at desired temperatures. Slow hydrolysis (low concentration acid, low temperature, long duration) enhanced the yield and growth of crystals. The duration of hydrolysis affected the yield, quality, and polymeric form of the processed Alpha cellulose. MCC is widely used in pharmaceutical, food, chemical industry, and synthetic leather industry. Alternate raw materials other than linters have been used for the production of MCC, sometimes with better yield and properties. In India, Yield And Properties Of MCC (properties varied considerably with quality of raw material, hydrolysis conditions, and measurement techniques):- (i) Yield – 75.3–85%; (ii) Moisture Content – 7.2%; (iii) Ash Content – 0.12%; (iv) Density – 1.38–1.55 gm/cm^3; (v) Crystallinity – 65–80%; (vi) Crystallite Width – 8.8 nm; and (vii) Crystallite Length – 35–45 nm. (e) Nano Cellulose:- Bleached cotton linter is one of the most preferred raw material for preparation of nano cellulose be it in a powder form or fibrillar form. Being a pure cellulose form with appropriate degree of polymerization (DP) and optimum access to reagents, nano-cellulose is one of the most sought after starting material. Several studies have dealt with different pathways for production of nano material from linter/cotton cellulose. J. P. S. Morais et. al., have developed a method to produce nano cellulose structures (composites) from raw cotton linters without the necessity to make pulp. Gossypium Hirsutum linters, once converted to nano cellulose showed increased hydrophilicity despite higher crystallinity owing to improved surface area for adsorption. The nano crystals so developed possessed good size, measuring up to 177 nm in length and 12 nm wide. In the hydrolysis-homogenization procedure for nano cellulose powder preparation, pretreatment with zinc chloride solution (70%) for a fixed duration, enhanced the yield of nano cellulose. A pretreatment with cellulase enzyme also improved the yield of nano cellulose. Cellulase pretreatment prior to acid treatment improved the yield of nano crystalline cellulose (NCC) by 12%. This pretreatment reduced sulfur content by 0.8% and average particle size rose to 35 nm, and also the concentration of acid could be reduced thereby saving on chemicals. Another variation in the hydrolysis-homogenization routine is the use of ionic liquids to dissolve the cellulose. Nano fibrillated cellulose (NFC) is yet another form of nano cellulose, widely used in various applications such as paper, electronics, pharmaceuticals, fuel cells, and even in fertilizers. A combined process of enzymatic pretreatment and fibrillation (refining) resulted in optimum production of NFC with reduced energy requirement (by 27%) and is one of the areas where NFC production needs serious improvement. The fibrillated cellulose had a diameter ranging from 50 to 200 nm with very good separation into individual fibrils. A cocktail of cellulase and another oxidative enzyme could improve the mechanical fibrillation significantly to increase the yield of NFC. This treatment brings in enhancement in transparency and barrier properties essential for packaging. Significant advances have been made in the recent past to use nano cellulose efficiently and effectively in various areas. Nano cellulose from cotton linters in fibrillated form has been used as a reinforcing agent for guar gum in film preparation for packaging purposes. Antimicrobial nano materials were prepared using regenerated cellulose from cotton linters by incorporating silver, copper oxide, or zinc oxide nano particles in the dope. Strong antibacterial activity, against Escherichia Coli, and Listeria Monocytogens was noted and this material could be used as filler in antibacterial packaging films containing nano whiskers. As reinforcing material in thermos plastic starch, nano composite films prepared thereby could be effectively used in food and pharmaceutical packaging. (f) Chemically Modified Cellulose:- Raw cotton fibers, owing to the presence of a primary wall composed of pectin and waxes and a longer chain length, remain inert to most of the chemical reagents. Cotton linter, on the other hand, with appropriate degree of polymerization (DP) and pure cellulose as constituent becomes a perfect raw material for preparation of chemically modified cellulose products, cellulose acetate, cellulose nitrate, and carboxy methyl cellulose, all industrially relevant products. (i) Cellulose Acetate:- Homogeneous acetylation of cellulose to manufacture cellulose acetate (cellophane film) has been attempted employing different chemicals, di methyl sulfoxide (DMSO), and paraformaldehyde and a combination of DMSO and tetrabutyl ammonium fluoride tri hydrate. The cellulose acetate so prepared had degree of substitution (DS), varying from 0.5 to 2.8. Using different temperatures for varying durations, employing acetic anhydride as the reagent, iodine as catalyst, cotton linter was acetylated to DS 2–2.5 when the starting pulp was 98% pure. Cellulose acetate films are ecofriendly materials and exhibit high level of biodegradability. The rate of decomposition of this material is 1.5 times faster than conventional products. (ii) Carboxy Methyl Cellulose:- Carboxy methyl cellulose, more popularly called carboxy methyl cellulose (CMC) has wide spread applications in textile, paper, detergents, pharamaceuticals, paints, lubricants, food, ceramics, cosmetics, etc. It is specially used as a thickening agent in food, if the viscosity is quite high. Cotton linter in mono chloro acetic acid and NaOH reacts slowly, and when neutralized with acetic acid and methanol, yields CMC. Homogeneous carboxymethylation process is also attempted on cotton linters using NaOH/Urea system, to achieve a DS of 0.2 to 0.62. The CMC so produced was soluble in water. (iii) Cellulose

Nitrate:- Popularly known as Gun Powder, cellulose nitrate is an important industrial product. In the DS range of 1.8 to 2.8, it is a white transparent, odorless, nontoxic and hydrophobic material. Linters are treated in nitric acid at optimum concentration to prepare cellulose nitrate. Cotton linters are preferred for preparation of military grade nitro cellulose. More often, the nitration bath contains sulfuric acid as a condensing agent and a typical bath producing cellulose nitrate has a nitrogen content of 11%, (nitric acid 25%, sulfuric acid 55% and water 20%). Since cellulose nitrate is extensively used for defence purposes, more often than not, cotton linter use within the country and export are regulated by governments. Recent Innovations In Value Addition:- What has been described so far, pertains to value addition areas and products where cellulose holds an upper hand. In this section a few of the most innovative pathways of value creation would be described where cellulose is either entering the synthetic market or where cellulose is effectively and more competitively replacing products traditionally manufactured by using synthetic fibers. (a) Non Wovens And Composites:- A composite is a select combination of two or more dissimilar materials formed with a specific internal structure with non-woven as one of the component. They are designed to produce materials with unique mechanical properties and superior performance characteristics, not possible with any one of the components, alone. The non-woven material characteristic depends on forming the fiber web and bonding the web suitably (needle punching, thermal bonding, wet-laid etc). For preparation of cotton, non wovens, cotton linter/comber noil is extensively used for non-woven in a composite application. Sometimes cotton linters are pretreated with solvents like dimethyl peroxide/acetic anhydride/acrylamide and then incorporated in composite preparation to improve thermal properties. Global non-woven market is a growing sector having a size of USD40 billion. A process of non-woven manufacture known as wet laid, a technology taken from the paper industry, enables achievement of cloth-like characteristics without weaving and also without the use of continuous filaments. This process is endowed with high speed and flexibility. The fibers are suspended in an aqueous solution and then formed into a sheet in a moving screen, where the water gets removed. Cotton linters of 12 to 15 mm preferred in wet laid more often in combination with other fibers (synthetic) . A schematic lay out of wet laid non-woven is shown in the figure-3. When the web, now devoid of water is moved further, it gets impregnated with a suitable binder (specially required if a blend of hydrophilic and hydrophobic fibers are employed in combination). Here refined cellulosic pulp fibers get better bonded with synthetic fibers to form a good wet laid. Thin wet laid non-woven finds extensive applications in hygiene, filtration, wipes, coverings, upholstery etc. Another application of thin non-woven is as cover material for agricultural crops. (b) Bio Degradable Composites And Plastics:- With concern for the environment and its conservation rising over the globe, degradability of a material in quick time with least load on the atmosphere has gained importance. Cellulose composites and plastics made from them are proven biodegradables and environment friendly as per their life cycle assessment. Recent interest in research and manufacture of bio-plastics centered around cellulose/cotton linters. Using cotton linters, cellulose acetate bio-fiber is produced with a yield of 54%. This bio polymer was found to be biodegradable and less affected by acid compared to poly-propylene, and poly-styrene and can find application in food industry and medicine. A bio-plastic made by hot pressing cellulose solution in alkali hydroxide/urea system resulted in a transparent and uniformly oriented sheet. Compared to common plastics, this biodegradable polymer sheet possessed higher tensile strength, flexural strength, thermal stability, and lower thermal coefficient. The advantage of this method is that the cellulose is not converted to pulp prior to treatment and hot pressing. (c) Hydrogels And Aerogels:- Hydrogels and aerogels are gel structures prepared from cellulose that have high adsorptive/absorbtive power of oils, water etc, combined with bio compatibility and bio degradability. They are special porous materials, with low density, high porosity, large specific surface area, adequate surface chemical activity. They are prepared by various techniques such as acetylation, and cyano-ethylation of linters. Subjecting cellulose lint, Micro Crystalline Cellulose (MCC), or cellulosic powder with high impact mechanical pulses of various amplitudes and frequencies, graft polymerization of acrylic acid in cotton linters, and ultrasonic treatment or dispersion of nano-cellulose or modified cellulose and solvent exchange and drying process are the various methods of preparation. Hydrogels/aerogels prepared from cellulose possess high compressive strength than synthetic aerogels and are used in oil/water separation, oil absorption or as super absorbents. (d) Carbon Fibers:- Carbon fibers are fibers about 5–10 micrometer in diameter that are highly stiff, composed of carbon atoms. These fibers possess high tensile strength, low weight, high chemical resistance, high temperature tolerance, and low thermal expansion. Carbon fibers are generally produced from poly-acrylonitrile (PAN). They are used to reinforce composite materials, such composites known as Graphite-Reinforced Polymers. The strength to weight ratio is much higher than steel or plastic. Attempts have been made to prepare carbon fibers from cotton linters through a process of Carbonization and wet spinning technology. The carbon fibers prepared had a smooth surface, and round compact morphology in cross section. The tensile strength was about 0.72 Gpa with carbon yield up to 36%, parameters compatible and highly favourable from bio mass material. Is linter Cellulose An Effective Replacement for Synthetics? From the discussions on value addition enumerated here, it is possible to decipher areas where linter cellulose competes well or sometimes even excels synthetic fibers. The diagram below illustrates the point. Entrepreneurship Development In Cotton Linters:- Although there are several value addition technologies and products where successful business ventures could be set up, manufacture of Micro Crystalline Cellulose (MCC), is one of the fairly simple techniques where both big as well as medium and small entrepreneurs could invest and reap the benefits. This product has an ever growing clientele and market. Even in new and unexplored regions, the MCC is finding its foot hold. As already noted a Compound Annual Growth Rate (CAGR) of 4.71% is expected between 2018–2028, to this already burgeoning market. A project report/feasibility report and plant lay out prepared by NIIR project consulting services is available for consultation. A snap shot of the report indicates the following details:- The figures below would entail revision in values depending on the place, availability of raw materials, labor and other incidentals. These figures are provided to give a rough idea of estimated investment. Estimated Investment And Returns (2020; India):- (i) Plant Capacity = 8 Metric tons/day; (ii) Plant and Machinery = USD0.2 million (approx.); (iii) Working Capital = USD1.1 to 1.2 million (approx.); (iv) Return on Investment = 45%; and (v) Break Even = 36%. Future Out Look On Cotton Linters:- The discussions and observations made in this report clearly bring out the versatility of cotton linter as a raw material for use in many varied applications. The crucial point at this juncture would be the availability of raw material. Although global potential for cotton linter production is around 5 million metric tonnes (based on available ginned seeds), one report estimates the availability at 1 million metric tonnes, whereas as another survey states that the current availability of linter worldwide could be as much as 2.5 million Metric tons. Be that as it may, this clearly points out to the lack of prevalence of scientific processing of cotton seeds in many regions of the world. Going by the Indian experience, there is hardly 10% of ginned seeds that undergo the rigorous processing to extract invaluable constituents (linter, hulls etc), and the rest 90% seeds are directly crushed for oil extraction. The impediment in large scale adoption of linter extraction is cited to be high recurring cost. It is known that more than 50% of the incidental expenses go in power to run huge saw machines for extraction. An urgent need to devise a highly energy efficient or an alternate novel mechanism to extract linters is felt seriously. Just like ginning, if delinting is also made a way of life, by introducing an appropriate sized delinter capable of serving a ginning industry year-long for extraction of linters from its seed, the situation could improve for the better. However the fact remains undisputed that there exists a huge untapped potential for creating, value adding and establishing successful business ventures world over by using this veritable cellulosic raw material. In India, Characteristics Of The Linters (Parameter – Value; the constituents do not necessarily add up to 100% as they are measured on different samples):- (i) Fiber Length (the ensemble contains a large proportion of short fibers (fibers less than the average length)):- (a) 1st Cut – 2.5–6.0 mm, (b) 2nd Cut – 2.0–3.0 mm, and (c) 3rd Cut – Less than 2.0 mm; (ii) Color (depending on cut):- Clear, clear to brown, brown; (ii) Cellulose (the cellulose linter has low viscosity and therefore low degree of polymerization (DP)) – Higher than 80% up to 85%:- (a) Holo Cellulose – 80%, and (b) Alpha Cellulose – 78%; (iii) Water/Moisture Content – 6.0–8.0%; (iv)

Extractables – 5.0–6.0%, Fat And Waxes – 2.0%, and Pectin – 1.0%; (v) Proteins – 2.0%; (vi) Ash – 2.0%; (vii) Insoluble Lignin – 0.7%; (viii) Foreign Matter – 1.0%; and (ix) Seed Hulls – 11.0. / Линт или хлопковый Пух имеет длину волокон менее 20 миллиметров (мм), получается после отделения длинных волокон. Волокнистый покров семян, оставшийся после джинирования, а также волокнистая продукция, полученная в результате линтерования семян Хлопчатника. , например, . первого съёма (первого линтерования), второго съёма (или второго линтерования). Под хлопковым Линтом или Пухом понимаются короткие и грубые волокна, снимаемые с семян Хлопчатника после отделения хлопка-волокна. Различают хлопковый пух 1-го и 2-го съёма (first-cut linters и second-cut linters, соответственно). Хлопковый линт или пух используют для изготовления ваты, прокладочных, изоляционных материалов, фильтров и других целей. Пух Хлопковый или Линт – короткие волокна, остающиеся на семенах Хлопчатника после отделения нормального волокна. Содержание пуха – 4–8% от массы семян. Снимается с семян после волокноотделения в 2–3 приёма (для увеличения съёма и разделения по качеству). Используется как сырьё для получения ваты, искусственного волокна, плёнок, лаков, взрывчатых веществ и так далее.

LINTERS CLEANER = ЧИСТИТЕЛЬ ЛИНТА (или ЛИНТООЧИСТИТЕЛЬ) – Cotton Linters Cleaner is mainly applicable for removing impurities from and cleaning cotton linter and barren cottonseeds and for recovering useful fibers at cotton processing factories. It is also applicable for removing impurities from and loosely cleaning fibers such as chemical fibers and rabbit hair. / В хлопковой отрасли, машина для очистки линта от сорных примесей. виды (species).

LINTON TWEED = ЛИНТОНОВСКИЙ ТВИД – Linton Tweed is the trademark of Linton, Ltd., Carlisle, England. These tweeds are noted for their softness and subtle or vivid calorings. / Линтон Эл.ти.ди. (Linton, Ltd.).

LIPASES = ЛИПАЗЫ – Lipases:- (Greek:- lipos – fat, oil) Fat-cleaving enzymes.

LIPI = LEMBAGA ILMU PENGETAHUAN INDONESIA = INDONESIAN INSTITUTE OF SCIENCES

LIP SEAL = КРОМОЧНОЕ САМОПОДЖИМНОЕ УПЛОТНЕНИЕ (или ПОРОГОВОЕ УПЛОТНЕНИЕ) – Lip Seal is an elastomeric or metallic seal that prevents leakage in dynamic and static applications by a scraping or wiping action at a controlled interference between itself and the mating surface. See also Seal.

LIPS–GROSS SYSTEM = LUXEMBOURG INTERBANK PAYMENT SYSTEM – GROSS SETTLEMENT SYSTEM

LIQUATION = ЛИКВАЦИЯ (или СЖИЖЕНИЕ, или ПЛАВЛЕНИЕ, или ЗЕЙГЕРОВАНИЕ) – Liquation:- this process is used for refining easily fusible metals like lead and tin. The impure metal is heated on the slopy hearth of a electric furnace. The metal melts and flows down leaving the impurities.

LIQUEFIED NATURAL GAS = СЖИЖЕННЫЙ ПРИРОДНЫЙ ГАЗ – Liquefied Natural Gas (LNG) means lean gas, primarily methane, converted to liquid form through refrigeration to minus 163 degrees Celsius under atmospheric pressures. Natural gas cooled to liquid for transport by tanker or trucks to destinations not connected by pipeline. Liquefied Natural Gas (LNG) is the supercooled natural gas that is maintained as a liquid at or below –160 °C; LNG occupies 1/640th of its original volume and is therefore easier to transport if pipelines cannot be used. Natural gas (primarily methane) that has been liquefied by reducing its temperature to –260 degrees Fahrenheit at atmospheric pressure. Liquefied Natural Gas (LNG) is a natural gas which has been made liquid by reducing its temperature to minus 258 degrees Fahrenheit at atmospheric pressure. Its volume is 1/600 of gas in vapor form. Liquefied Natural Gas (LNG) is a natural gas that is liquefied under extremely cold temperatures to facilitate storage or transportation in specially designed vessels.

LIQUEFIED NATURAL GAS CARRIER = ПЕРЕВОЗЧИК СЖИЖЕННОГО ПРИРОДНОГО ГАЗА (или ГАЗОВОЗ) – A tanker specially designed to carry liquefied natural gas (LNG), fitted with insulated pressure tanks made of stainless steel or aluminium. The load is refrigerated to –162 °C. Liquefied Natural Gas (LNG) Carrier, perhaps the most sophisticated of all commercial ships. The cargo tanks are made of a special aluminum alloy and are heavily insulated to carry natural gas in its liquid state at a temperature of –285 °F. The LNG ship costs about twice as much as an oil tanker of the same size. Also known as Gascarrier.

LIQUEFIED PETROLEUM GAS = СЖИЖЕННЫЙ НЕФТЯНОЙ ГАЗ (или СЖИЖЕННЫЙ УГЛЕВОДОРОДНЫЙ ГАЗ) – Liquefied Petroleum Gas (LPG):- hydrocarbons which are gaseous under conditions of normal temperature and pressure but are liquefied by compression or cooling to facilitate storage, handling and transportation. They are:- (i) extracted by stripping of natural gas at crude petroleum and natural gas sources; (ii) extracted by stripping of imported natural gas in installations of the importing country; and (iii) produced both in refineries and outside of refineries in the course of processing crude petroleum or its derivatives. It is generally made up of propane (C_3H_8) or butane (C_4H_{10}), or a combination of the two. Also included is ethane (C_2H_6) from petroleum refineries or natural gas producers' separation and stabilization plants. Only the United Nations Statistics Division (UNSD) includes ethane under LPG. For all other organizations, LPG comprises merely propane and butane. Volumes of LPG reported in all flows of the Joint Oil Data Initiative (JODI) questionnaire include LPG from gas plants except for the flow of refinery output. LPG is a light hydrocarbons fraction of the paraffin series produced in refineries and gas plants, comprising propane (C_3H_8) and butane (C_4H_{10}) or a mixture of these two hydrocarbons. LPG consists of a mixture of light hydrocarbons which are obtained from petroleum distillation and/or natural gas treatment. The following three types are identified:- (i) a mixture of hydrocarbons of the C_3 group (propane, propene, propylene); (ii) a mixture of hydrocarbons of the C_4 group (butane, butene, butylene); and (iii) a mixture of C_3 and C_4 in any proportions. LPG is light saturated paraffinic hydrocarbons derived from the refinery processes, crude oil stabilization and natural gas processing plants. It consists mainly of propane (C_3H_8) and butane (C_4H_{10}) or a combination of the two. It is normally liquefied under pressure for transportation and storage. Liquefied Petroleum Gas (LPG) is the generic name for commercial propane and commercial butane. It can be produced from natural gas processing plants or from refineries. LPG occurs naturally as gas at atmospheric pressure. It has the special property of becoming liquid at atmospheric temperature if moderately compressed and can easily be converted from liquid into gas by being released to atmospheric pressure. In order to facilitate transport and storage, LPG is usually bottled in liquid state (about 250 times more dense than in its gaseous form), propane however can also be supplied in bulk for storage tanks at consumers' premises. LPG is used domestically, mainly for heating and cooking purposes and industrially, for example as feedstock by the Petrochemical industry. It is also increasingly used in the transport sector as vehicle fuel, because of its cleaner burning properties and often lower end-use price. When crude oil and natural gas are produced from the well (either from associated or non-associated wells), they are a mixture of oil, water, sediment and dissolved gases (methane, ethane, propane, butane and pentanes). In the first instance, all gases are separated from the oil/gas mixture in natural gas processing plants and separation plants. The gases are extracted because of their higher value and their readily marketable state, such as propane and butane which are Liquefied Petroleum Gases (LPG). In a later stage, the sediment and other unwanted substances are removed in treatment plants. The gases are separated in a wellhead separation plant from onshore and offshore wells respectively. This happens through a separator on the platform. The methane will form the constituent of natural gas, while the others form the Natural Gas Liquids (NGL). Natural gas liquids however, can also be produced in conjunction with natural gas. Large amounts of LPG are also produced in petroleum refineries where they are separated from crude oil in the distillation process. Liquefied Petroleum Gas (LPG) consists primarily of propane and butane, which

turn liquid under a pressure of six to seven atmospheres. LPG is shipped in special vessels. Liquefied Petroleum Gas (also called Liquified Petroleum Gas or Liquid Petroleum Gas, or LPG, or LP Gas, or Autogas) is a mixture of hydrocarbon gases used as a fuel in heating appliances and vehicles, and increasingly replacing chlorofluorocarbons as an aerosol propellant and a refrigerant to reduce damage to the ozone layer. Varieties of LPG bought and sold include mixes that are primarily propane, mixes that are primarily butane, and the more common, mixes including both propane (60%) and butane (40%), depending on the season – in winter more propane, in summer more butane. Propylene and butylenes are usually also present in small concentration. A powerful odorant, ethanethiol, is added so that leaks can be detected easily. LPG is manufactured during the refining of crude oil, or extracted from oil or gas streams as they emerge from the ground. Propane, butane, or propane-butane mixtures derived from crude oil refining or natural gas fractionation. For convenience of transportation, these gases are liquefied through pressurization. Butylene, ethane, ethylene, isobutene, isobutylene, normal butane, propane, and propylene produced at refineries or natural gas processing plants, including plants that fractionate raw natural gas plant liquids. Also known as LPG. Liquefied Petroleum Gas (LPG) is a propane-butane used as vehicle fuel, technical propane, technical butane, technical propane-butane, and isobutane. Liquefied Petroleum Gas (LPG):- light gases, such as butane and propane, that can be maintained as liquids while under pressure. / выработка (output). Бутилен, этан, этилен, изобутен, изобутилен, фракция нормального бутана, пропан и пропилен. Сжиженный Нефтяной Газ (СНГ) или Сжиженный Углеводородный Газ (СУГ) это пропан-бутан, используемый в качестве автомобильного топлива, технический пропан, технический бутан, технический пропан-бутан, и изобутан. Под Нефтяными Газами понимаются углеводородные газы, растворённые в нефти (так называемые попутные), свободные газы газовой шапки, располагающейся в купольных структурах над залежами нефти, а также газы, образующиеся при её переработке. В 1 м^3 нефтяного газа содержится до 100–150 г бензиновых фракций, которые отбираются на газобензиновых заводах. Теплота сгорания нефтяного газа 29–38 МДж/м^3. Характерная особенность нефтяных газов – наличие в них, кроме метана, до 80% (обычно 20–40%) этана, пропана, бутана и паров более тяжёлых углеводородов. Во многих нефтяных газах присутствуют сероводород и негорючие компоненты (азот, углекислый газ, аргон и гелий). Сжижение Газов – перевод вещества из газообразного состояния в жидкое. Сжижение газов возможно только при температурах, меньших критической температуры. В промышленности сжижение газов критической температурой выше температуры окружающей среды (практически выше –50 °C) осуществляется сжатием газа в компрессоре и последующей конденсацией его в теплообменнике, охлаждаемом водой или холодным рассолом. Сжижение газов, критическая температура которых значительно ниже температуры окружающей среды, производится методами глубокого охлаждения. Современные промышленные методы глубокого охлаждения для сжижения газов основаны на Джоуля-Томсэна эффекте либо на адиабатном процессе расширения газа в детандере.

LIQUID = ЖИДКОСТЬ – Liquid is any substance that flows readily or changes in response to the smallest influence. More generally, any substance in which the force required to produce a deformation depends on the rate of deformation rather than on the magnitude of the deformation. / Жидкость, агрегатное состояние вещества, промежуточное между твёрдым и газообразным состояниями. Жидкость, сохраняя отдельные черты как твёрдого тела, так и газа, обладает, однако, рядом только ей присущих особенностей, из которых наиболее характерная – текучесть. Подобно твёрдому телу, жидкость сохраняет свой объём, имеет свободную поверхность, обладает определённой прочностью на разрыв при всестороннем растяжении и так далее. С другой стороны, взятая в достаточном количестве жидкость принимает форму сосуда, в котором находится. Принципиальная возможность непрерывного перехода жидкости в газ также свидетельствует о близости жидкого и газообразного состояний. По химическому составу различают Однокомпонентные, или Чистые Жидкости, и Двух- или Многокомпонентные Жидкие Смеси (Растворы). По физической природе жидкости делятся на нормальные (обычные), жидкие кристаллы с сильно выраженной анизотропией (зависимостью свойств от направления) и квантовые жидкости – жидкие ^{4}He, ^{3}He и их смеси – со специфическими квантовыми свойствами при очень низких температурах. Нормальные чистые жидкости имеют только одну жидкую фазу (то есть существует один единственный вид каждой нормальной жидкости). Гелий ^{4}He может находиться в двух жидких фазах – нормальной и сверхтекучей, а жидкокристаллические вещества – в нормальной и одной или даже двух анизотропных фазах. Общим для всех нормальных жидкостей, в том числе и для смесей, является их макроскопическая однородность и изотропность при отсутствии внешних воздействий. Эти свойства сближают жидкости с газами, но резко отличают их от анизотропных кристаллических твёрдых тел. Аморфные твёрдые тела (например, стекла), с современной точки зрения, являются переохлаждёнными жидкостями (смотрите Аморфное Состояние) и отличаются от обычных жидкостей только численными значениями кинетических характеристик (существенно большей вязкостью и других). Область существования нормальной жидкой фазы ограничена со стороны низких температур фазовым переходом в твёрдое состояние – кристаллизацией или (в зависимости от величины приложенного давления) фазовым переходом в сверхтекучее состояние для ^{4}He и в жидко-анизотропное состояние для жидких кристаллов. При давлениях ниже критического давления $p_к$ нормальная жидкая фаза ограничена со стороны высоких температур фазовым переходом в газообразное состояние – Испарением. При давлениях $p > p_к$ фазовый переход отсутствует и по своим физическим свойствам жидкость в этой области неотличима от плотного газа. Наивысшая температура $T_к$, при которой ещё возможен фазовый переход жидкость-газ, называется Критической Температурой. Значения $p_к$ и $T_к$ определяют критическую точку чистой жидкости, в которой свойства жидкости и газа становятся тождественными. Наличие критической точки для фазового перехода жидкость-газ позволяет осуществить непрерывный переход из жидкого состояния в газообразное, минуя область, где газ и жидкость сосуществуют (смотрите Критическое Состояние). Таким образом, при нагревании или уменьшении плотности свойства жидкости (теплопроводность, вязкость, самодиффузия и другие), как правило, меняются в сторону сближения со свойствами газов. Вблизи же температуры кристаллизации большинство свойств нормальных жидкостей (плотность, сжимаемость, теплоёмкость, электропроводность и так далее) близки к таким же свойствам соответствующих твёрдых тел. Ниже приведены значения теплоёмкости при постоянном давлении (C_p) ряда веществ в твёрдом и жидком состояниях при температуре кристаллизации. Малое различие этих теплоёмкостей показывает, что тепловое движение в жидкостях и твёрдых телах вблизи температуры кристаллизации имеет примерно одинаковый характер. Теплоёмкость некоторых веществ (в Дж/(кг·К)), при температуре кристаллизации выглядит следующим образом:- (i) Cl:- Ср, тв. – 620, Ср, ж. – 1 800; (ii) Hg:- Ср, тв. – 138, Ср, ж. – 138; (iii) Na:- Ср, тв. – 1 382, Ср, ж. – 1 386; (iv) NaCl:- Ср, тв. – 1 405, Ср, ж. – 1 692; (v) Pb:- Ср, тв. – 146, Ср, ж. – 155; и (vi) Zn:- Ср, тв. – 461, Ср, ж. – 542. Молекулярная Теория Жидкостей:- по своей природе силы межмолекулярного взаимодействия в жидкостях и кристаллах одинаковы и имеют примерно одинаковые величины. Наличие в жидкостях сильного межмолекулярного взаимодействия обусловливает, в частности, существование Поверхностного Натяжения на границе жидкости с любой другой средой. Благодаря поверхностному натяжению жидкость стремится принять такую форму, при которой её поверхность (при данном объёме) минимальна. Небольшие объёмы жидкости имеют обычно характерную форму капли. В отсутствии внешних сил, когда действуют только межмолекулярные силы (например, в условиях невесомости), жидкость приобретает форму шара. Влияние поверхностного натяжения на равновесие и движение свободной поверхности жидкости, границ жидкости с твёрдыми телами или границ между несмешивающимися жидкостями относится к области капиллярных явлений. Фазовое состояние вещества зависит от физических условий, в которых оно находится, главным образом от температуры T и давления p. Характерной определяющей величиной является зависящее от температуры и давления отношение e (T, p) средней

потенциальной энергии взаимодействия молекул к их средней кинетической энергии. Для твёрдых тел e (T, p) >> 1; это значит, что силы межмолекулярного взаимодействия велики и удерживают молекулы (атомы, ионы) вблизи равновесных положений – узлов кристаллической решётки, несмотря на тепловое движение частиц. В твёрдых телах тепловое движение имеет характер коллективных колебаний атомов (ионов) около узлов кристаллической решётки. В газах осуществляется обратный предельный случай e (T, p) << 1; силы притяжения между молекулами недостаточны, чтобы удержать их вблизи друг от друга, вследствие чего положения и скорости молекул распределены почти хаотически. Для жидкостей e (T, p) ~1:- интенсивности упорядочивающих межмолекулярных взаимодействий и разупорядочивающего теплового движения молекул имеют сравнимые значения, чем и определяется вся специфичность жидкого состояния вещества. Тепловое движение молекул в неметаллических жидкостях состоит из сочетания коллективных колебательных движений того же типа, что и в кристаллических телах, и происходящих время от времени скачков молекул из одних временных положений равновесия (центров колебаний) в другие. Каждый скачок происходит при сообщении молекуле энергии активации, достаточной для разрыва её связей с окружающими молекулами и перехода в окружение других молекул. В результате большого числа таких скачков молекулы жидкости более или менее быстро перемешиваются (происходит самодиффузия, которую можно наблюдать, например, методом меченых атомов). Характерные частоты скачков составляют ~10^{11}–10^{12} $сек^{-1}$ для низкомолекулярных жидкостей, много меньше для высокомолекулярных, а в отдельных случаях, например, для сильно вязких жидкостей и стёкол, могут оказаться чрезвычайно низкими. При наличии внешней силы, сохраняющей своё направление более длительное время, чем интервалы между скачками, молекулы перемещаются в среднем в направлении этой силы. Таким образом, статические или низкочастотные механические воздействия приводят к проявлению текучести жидкости как суммарному эффекту от большого числа молекулярных переходов между временными положениями равновесия. При частоте воздействий, превышающей характерные частоты молекулярных скачков, у жидкости наблюдаются упругие эффекты (например, Сдвиговая Упругость), типичные для твёрдых тел. Однородность и изотропность нормальных жидкостей молекулярная теория жидкостей объясняет отсутствием у них дальнего порядка во взаимных положениях и ориентациях молекул (смотрите Дальний Порядок И Ближний Порядок). Положения и ориентации двух или более молекул, расположенных далеко друг от друга, оказываются статистически независимыми. В идеальном кристаллическом теле, как правило, существует ‘жёсткий’ дальний порядок в расположении и ориентации молекул (атомов, ионов). В жидком кристалле дальний порядок наблюдается лишь в ориентации молекул, но он отсутствует в их расположении. Жидкости иногда разделяют на Неассоциированные Жидкости и Ассоциированные Жидкости, в соответствии с простотой или сложностью их термодинамических свойств. Предполагается, что в ассоциированных жидкостях есть сравнительно устойчивые группы молекул – комплексы, проявляющие себя как одно целое. Существование подобных комплексов в некоторых растворах доказывается прямыми физическими методами. Наличие устойчивых ассоциаций молекул в однокомпонентных жидкостях недостоверно. Основой современных молекулярных теорий жидкого состояния послужило экспериментальное обнаружение в жидкости ближнего порядка – согласования (корреляции) во взаимных положениях и ориентациях близко расположенных групп, состоящих из 2, 3 и большего числа молекул. Эти статистические корреляции, определяющие молекулярную структуру жидкости, простираются на область протяжённостью порядка нескольких межатомных расстояний и быстро исчезают для далеко расположенных друг от друга частиц (отсутствие дальнего порядка). Структурные исследования реальных жидкостей, позволившие установить эту особенность жидкого состояния, производятся методами Рентгеновского структурного анализа и нейтронографии. По структуре и способам их описания жидкости делят на Простые Жидкости и Сложные Жидкости. К первому сравнительно малочисленному классу относят однокомпонентные атомарные жидкости. Для описания свойств таких жидкостей достаточно указать лишь взаимное расположение атомов. К этому классу жидкостей относятся жидкие чистые металлы, сжиженные инертные газы и (с некоторыми оговорками) жидкости с малоатомными симметричными молекулами, например, CCl_4. Для простых жидкостей результаты рентгено-структурного или нейтронографического анализа могут быть выражены с помощью так называемой радиальной функции распределения g (r). Эта функция характеризует распределение частиц вблизи произвольно выбранной частицы, так как значения g (r) пропорциональны вероятности нахождения двух атомов (молекул) на заданном расстоянии r друг от друга. Ход кривой g (r) наглядно показывает существование определённой упорядоченности в простой жидкости – в ближайшее окружение каждой частицы входит в среднем определённое число частиц. Для каждой жидкости детали функции g (r) незначительно меняются с изменением температуры и давления. Расстояние до первого пика определяет среднее межатомное расстояние, а по площади под первым пиком можно восстановить среднее число соседей (Среднее Координационное Число) атома в жидкости. В большинстве случаев эти характеристики вблизи линии плавления оказываются близкими к кратчайшему межатомному расстоянию и координационному числу в соответствующем кристалле. Однако, в отличие от кристалла, истинное число соседей у частицы и истинное межатомное расстояние в жидкости являются не постоянными числами, а случайными величинами, и по графику g (r) устанавливаются лишь их средние значения. При сильном нагревании жидкости и приближении к газовому состоянию ход функции g (r) постепенно сглаживается соответственно уменьшению степени ближнего порядка. В разреженном газе g (r) >> 1. Для сложных жидкостей п для жидких смесей расшифровка рентгенограмм более сложна и во многих случаях полностью не может быть осуществлена. Исключение составляет вода и некоторые другие низкомолекулярные жидкости, для которых имеются довольно полные исследования и описания их статистической структуры. Теория кинетических и динамических свойств жидкости (диффузии, вязкости и так далее) разработана менее полно, чем равновесных свойств (теплоёмкости и других). Динамическая теория жидкого состояния весьма сложна и пока не получила достаточного развития. В теории жидкостей большое развитие получили численные методы, позволяющие рассчитывать свойства простых жидкостей с помощью быстродействующих вычислительных машин. Наибольший интерес представляет метод молекулярной динамики, непосредственно моделирующий на вычислительной машине совместное тепловое движение большого числа молекул при заданном законе их взаимодействия и по прослеженным траекториям многих отдельных частиц восстанавливающий все необходимые статистические сведения о системе. Таким путём получены точные теоретические результаты относительно структуры и термодинамических свойств простых неметаллических жидкостей. Отдельную и ещё не решённую проблему составляет вопрос о структуре и свойствах простых жидкостей в непосредственной окрестности критической точки. Некоторые успехи были здесь достигнуты в последнее время методами теории подобия. В целом проблема критических явлений для чистых жидкостей и смесей остаётся ещё недостаточно выясненной. Отдельную проблему составляет вопрос о структуре и свойствах Жидких Металлов, на которые значительное влияние оказывают имеющиеся в них коллективизированные электроны. Несмотря на некоторые успехи, полной электронной теории жидких металлов ещё не существует. Значительные (пока ещё не преодолённые) трудности встретились при объяснении свойств Жидких Полупроводников. Основные Направления Исследований Жидкого Состояния:- многочисленные макроскопические свойства жидкостей изучаются и описываются методами различных разделов механики, физики и физической химии. Равновесные механические и тепловые свойства жидкостей (сжимаемость, теплоёмкость и другие) изучаются термодинамическими методами. Важнейшей задачей является нахождение Уравнения Состояния для давления и энергии как функции от плотности и температуры, а в случае растворов – и от концентраций компонентов. Знание уравнения состояния позволяет методами термодинамики установить

многочисленные связи между различными механическими и тепловыми характеристиками жидкости. Имеется большое количество эмпирических, полуэмпирических и приближённых теоретических уравнений состояния для различных индивидуальных жидкостей и их групп. Неравновесные тепловые и механические процессы в жидкостях (например, диффузия, теплопроводность, электропроводность и другие), особенно в смесях и при наличии химических реакций, изучаются методами термодинамики необратимых процессов. Механические движения жидкостей, рассматриваемых как сплошные среды, изучаются в Гидродинамике. Важнейшее значение имеет Уравнение Навье-Стокса, описывающее движение вязкой жидкости. В так называемых Ньютоновских Жидкостях (вода, низкомолекулярные органические жидкости, расплавы солей и другие) вязкость не зависит от режима течения (в условиях ламинарного течения, когда Число Рейнольдса $R < R_{критич.}$), в этом случае вязкость является физико-химической постоянной, определяемой молекулярной природой жидкости и её состоянием (температурой и давлением). У неНьютоновских (структурно-вязких) жидкостей вязкость зависит от режима течения даже при малых числах Рейнольдса (жидкие полимеры, стекла в интервале размягчения, эмульсии и другие). Свойства неНьютоновских жидкостей изучает Реология. Специфические особенности течения жидких металлов, связанные с их электропроводностью и лёгкой подверженностью влиянию магнитных полей, изучаются в Магнитной Гидродинамике. Приложения методов гидродинамики к задачам молекулярной физики жидкостей изучаются в Физико-Химической Гидродинамике.

LIQUID = ЛИКВИДНОЕ – Liquid:- a characteristic of a security or commodity market with enough units outstanding to allow large transactions without a substantial change in price. Institutional investors are inclined to seek out liquid investments so that their trading activity will not influence the market price. The opposite of Illiquid. / Характеристика ценной бумаги или рынка сырья, по которым имеется достаточный объём как со стороны спроса, так и со стороны предложения, что позволяет обеспечить заключение любых крупных сделок без существенного изменения цены при этом. Институциональные инвесторы склонны к поиску ликвидных инвестиций при том расчёте, чтобы их торговая активность не повлияла бы на рыночную стоимость. В противовес к Неликвидной или Неликвидному (Illiquid).

LIQUID ASSETS = ЛИКВИДНЫЕ АКТИВЫ – (1) Liquid Assets:- assets that are readily convertible into cash, or that already consist of cash, such as bank deposits, marketable securities, and short-term notes receivable. Assets which you can easily convert into cash, such as shares or fixed interest investments. / Активы, такие как акции или инвестиции с фиксированным процентом, которые Вы можете легко преобразовать в наличные деньги.

(2) Total company assets that can be converted into cash immediately or almost immediately.

LIQUIDATE = ЛИКВИДИРОВАТЬ – (1) Liquidate:- to take a second futures or options position opposite to the initial or opening position. To sell (or purchase) futures contracts of the same delivery month purchased (or sold) during an earlier transaction or make (or take) delivery of the cash commodity represented by the futures contract. Also known as Offset.

(2) When a company fails, the process of converting all of its assets back into cash and distributing it to those with a claim on it.

LIQUIDATE A POSITION = ЛИКВИДИРОВАТЬ ПОЗИЦИЮ – Liquidate A Position:- the action of offsetting an open exchange position with the related hedge position, for example, covering securities sold forward for a certain date by a forward purchase as of the same date. Also known as Close A Position, or Square A Position.

LIQUIDATED = ЛИКВИДИРОВАННОЕ (или ЛИКВИДИРУЕМОЕ) – Liquidated:- a company may be liquidated or dissolved by selling all of its assets and then using the cash to meet any obligations to creditors. Any remaining cash will then go to the shareholders of the company.

LIQUIDATED DAMAGES = ЛИКВИДИРУЕМЫЕ НАРУШЕНИЯ – Liquidated Damages are damages that the parties to a contract specify will have to be paid in the event of a breach. For example, if Ann and John make a contract to do business, one provision of that contract may stipulate that if either of the two breaches the contract and doesn't fulfill the promise, that person will have to pay the other USD1 000.00. The clause setting this USD1 000.00 payment penalty is a liquidated damage clause, with the USD1 000.00 being the 'liquidated' damages that will have to be paid. Liquidated damages provisions are not used in every contract, but they may make sense in certain instances. When most breach of contracts cases occur, the damages that are awarded are based on the actual financial loss incurred by the party who suffered the breach. Sometimes, this is easy to figure out. For example, if Joe is renting an apartment from Ann for USD500.00 a month and then Joe breaks the lease and Ann can't find a new tenant for a month, then Ann has suffered USD500.00 in damages and that would be what Joe has to pay. Sometimes, however, it can be difficult or impossible to calculate how much a breached contract would cost. As such, the parties to the contract can decide on an amount that will need to be paid if either breaches and they can include details about that amount right in the contract. The court will generally enforce the liquidated damages provision and make the breaching party pay whatever is specified, if it finds that a breach did, in fact, occur. However, courts will usually only enforce a liquidated damages clause if the damages really are difficult to determine and if the clause is reasonable, i.e. not punitive – you can't put a clause in a contract specifying USD1 000 000.00 in liquidated damages if you really only lose about USD100.00. If you are writing a contract with a liquidated damages provision, or considering signing one, getting a lawyer involved is a good idea to help make sure your legal rights are protected. The penalty a seller must pay if the construction project does not meet contractual standards or deadlines. Liquidated Damages are a fixed amount set forth in a contract by an agency to compensate the agency for unexcused delay in the performance of the contract. The purpose of the liquidated damages clause is to establish, in advance, a reasonable estimate of the damages that would be incurred by the agency if there is an unexcused delay, or a breach of contract, which causes the work to be extended beyond the contractual completion date. This establishment of damages is designed to avoid arguments about the reasonableness of the actual damages an owner may have due to unexcused delays by the contractor. If the amount of liquidated damages is later found to be greater than the amount of actual damages that should have been anticipated, the liquidated damages may be deemed a penalty, and, hence, unenforceable. The liquidated damages set forth in the contract provision must be a reasonable forecast of the actual anticipated damages. If the liquidated damages do not meet this test, then they could be deemed an unenforceable penalty by a court or administrative contract appeals board. Since liquidated damages are only imposed for delays in project completion, it is manifest that only those delays should be considered which actually affect project completion. By their nature the delayed activities involved must necessarily lie on the critical path of the project as it was actually completed. In terms of the concurrent delay rule then, the concurrent delay must pertain to activities whose completion was critical to completion of the project itself. A contractor cannot successfully urge that because critical contractor-caused delays ... were concurrent with noncritical Government delays ... the imposition of liquidated damages may be avoided. Relief from the imposition of liquidated damages must depend upon showing concurrent delay in respect to activities on the critical path. Liquidated damages are generally used where it is difficult, if not impossible, to accurately estimate the harm to the agency if late, unexcused performance of the contract occurs. Liquidated damages are established by the government prior to the issuance of the solicitation. These damages, expressed as a daily amount to be assesed against the contractor for each day of delay beyond the contract completion date, must be a reasonable forecast of the damages the government will incur for each day of delay. The daily amount must not be in the nature of a

penalty, however. Even though the parties may agree to a contract with a liquidated damages clause, such contract provisions are strictly construed by the courts and boards of contract appeals because of the potential that the liquidated damages may be in the nature of a penalty, which is onerous and unenforceable. To be enforceable, the liquidated damages must be a reasonable forecast of the likely or actual damages if a delay occurs and not disproportionate to the presumed loss or injury to the non-breaching party. If the forecast of damages prior to contract performance was unreasonable and excessive, then the courts and boards will consider these damages to be a penalty and, hence, unenforceable. Damages of an amount already specified in a contract. / Эн (Ann) и Дьжон (John).

LIQUIDATION = ЛИКВИДАЦИЯ – (1) Liquidation:- settlement of forward or future transactions on the exchanges, with specific dates stipulated ahead of time for the individual operations, e.g., option declaration, payment, delivery of securities, etc. The liquidation calendar is determined by the stock exchange board. Liquidation is a transaction that offsets or closes out a long or short position. Also known as Offset. Liquidation is the process of exiting positions (long or short). A market is thought to be in liquidation when the total open interest starts trending down over a period of days or weeks. The closing of an existing position through the execution of an offsetting transaction. The closing out of a long position. The term is sometimes used to denote closing out a short position, but this is more often referred to as Covering. See also Cover, and Offset. Liquidation:- conversion of assets, such as securities or inventory, into cash. Liquidation is the cancellation of a future sale (purchase) obligation by the off-setting purchase (sale) of the same futures contract. Liquidation is an offsetting an existing position by selling (buying) a futures or option contract that was previously purchased (sold). Also called Offset or Covering. / Конверсия активов, таких как ценные бумаги или материальные ценности, в наличные деньги. , например, .

(2) Liquidation:- dissolution of a bankrupt business or other economic unit by selling its assets and paying off its creditors. See also Bankruptcy, Insolvency, and Reorganization. Selling the assets of an insolvent business or person and using the proceeds to pay creditors, pursuant to Chapter 7 of the US Bankruptcy Act. Dissolution of assets or of a company by realizing the assets and settling the debts. Liquidation is a winding up an activity by distributing its assets to the appropriate parties and settling its debts. / или иного хозяйствующего субъекта посредством продажи его активов и расплаты с его кредиторами. Раздел или роспуск активов или компании.

LIQUIDATION DIVIDEND = ЛИКВИДАЦИОННЫЙ ДИВИДЕНД – Liquidation Dividend is a payment to creditors on a winding up or bankruptcy when the creditors cannot be repaid in full or are repaid in instalments. Amount paid to shareholders upon liquidation or dissolution of a business, representing the difference between total cash remaining after the sale of assets minus all liabilities and shareholders' equity. This amount is distributed to the owners or shareholders in proportion to their ownership. / роспуске или разделе бизнеса.

LIQUIDATION PREFERENCE = ПРЕФЕРЕНЦИЯ ПРИ ЛИКВИДАЦИИ – Liquidation Preference:- sometimes, usually by virtue of an agreement, certain shareholders will receive preferential treatment if a company is liquidated. Investors may insist on this so that if a company fails, they are paid out first before any other shareholders receive any payouts.

LIQUIDATION SYSTEM = СИСТЕМА ЛИКВИДАЦИИ – In the United States, the Liquidation System, a part of Customs' Automated Commercial System, closes the file on each entry and establishes a batch filing number which is essential for recovering an entry for review or enforcement purposes. An entry liquidation is a final review of the entry. Customs Procedural Reform and Simplification Act of 1978 requires that all liquidations be performed within one year from the date of consumption entry or final withdrawal on a warehouse entry. Three one-year extensions are permitted.

LIQUIDATOR = ЛИКВИДАТОР – In business, Liquidator is a person or entity in charge of liquidating the assets of a business. See also Bankruptcy Trustee. In Australia, the person appointed to wind up a company. See also Winding Up.

LIQUID BULK = НАЛИВОМ – Liquid Bulk:- liquid cargo. / жидкий груз.

LIQUID CRYSTAL = ЖИДКИЙ КРИСТАЛЛ – Liquid Crystal is a liquid in which the molecules are oriented parallel to each other resulting in birefringence and interference patterns visible in polarizing light.

LIQUID CRYSTAL POLYMER = ЖИДКОКРИСТАЛЛИЧЕСКИЙ ПОЛИМЕР – Many of the high performance fibers are made from Liquid Crystal Polymers (LCP's). The term liquid crystal has a different meaning for fibers polymers as compared to, e.g., liquid crystal displays. In the latter case the crystals change orientation under the influence of an electric field. In the discussion that follows, liquid crystal describes polymers which self-organize into crystalline domains when put into a liquid state (either through dissolution or by melting). Formation and alignment of crystalline domains leads to higher strength, modulus, thermal resistance, and other improvements over amorphous polymer based fibers. Examples include aramid (e.g., Kevlar™), which is acid spun from a lyotropic LCP, and ar-ester (e.g., Vectran™), which is melt spun from a thermotropic LCP. Vectran™ can be crimped, and spun in a similar manner as other high performance fibers. Vectran™ yarns can also be produced using stretch breaking. Hybrid yarns and blends with Nylon or polyester can be produced for better dyeability and cost. Liquid Crystal Polymers (LCP's) are the polymers such as aramids or the thermotropic polyesters that form liquid crystals when in the appropriate state, (concentrated solution or melt). Most liquid crystal polymers have in their structure a succession of para-ring structures. The liquid crystal formation is thought to relate to the fact that there is a limiting concentration of rod-like chains that can exist in a random arrangement in a solution or melt. Once this concentration is reached, ordering or alignment of the chains in necessary to accommodate them. Fibers from liquid crystal polymers generally have high modulus and tenacity, good chemical resistance, and hightemperature resistance. They are used in a wide range of applications including protective apparel, tire cord, composites, ropes and cables, etc. / Кэвла® или Кевлар® (Kevlar®), Вэктрэн™ (Vectran™). Найлан™ (Nylon™).

LIQUID FUNDS = ЛИКВИДНЫЕ ФОНДЫ – Liquid Funds:- assets which can be used immediately to make payments (cash liquidity). According to the banking law of some countries, liquid assets consist of cash and equivalent, giro (clearing) balances with the central bank of the country and postal checking account balances. / Активы, которые могут быть использованы немедленно для осуществления платежей (наличная ликвидность). В соответствии с банковским законодательством ряда стран ликвидные активы включают в себя наличные и их эквивалент, безналичные (расчётные) остатки в центральном банке данной страны и остатки на удерживаемых почтовых счетах.

LIQUIDITY = ЛИКВИДНОСТЬ – Liquidity:- if a security, such as a stock, does not trade actively, as measured by its trading volume, it means that investors have an illiquid market, i.e. it is difficult to buy or sell stock without a major impact on price. For small cap, and especially micro-cap stocks, liquidity is a very important requirement. It helps ensure an orderly, efficient, and fair market. Liquidity is the ease of converting an asset to cash as measured by the Current Ratio or Acid/Quick Ratio. The term Liquidity can appear in three different contexts:- (1) it refers to the ability of a bank to discharge all of its payment obligations on time. Pursuant to the German Banking Act (Kreditwesengesetz (KWG)), credit institutions must invest their resources in such a way as to guarantee adequate

payment reserves at all times. The Federal Minstry of Finance, in consultation with the Deutsche Bundesbank, establishes the principles to assess in general whether a credit institution has sufficient liquidity. A Deposit Protection Fund is there to assist a bank in the event that it experiences liquidity problems. (2) Liquidity also refers to a market situation in which a security can be bought and sold at any time. A security's liquidity depends on the number of units in circulation and the number of market participants who are willing to buy or sell these units. For liquid securities, there is sufficient supply and demand so that a transaction contract, i.e. the reciprocal buying and selling of a security, is always possible. For less liquid securities, the market maker or designated sponsor ensures additional liquidity by providing quotes of prices at which they are prepared to buy or sell the security. (3) Furthermore, liquidity refers to the characteristic of being able to quickly convert a means of payment into cash. Liquidity is the quality that makes an asset easily convertible into cash with relatively little loss of value in the conversion process. Sometimes used more broadly to encompass credit in hand and promises of credit to meet needs for cash. The ease with which a financial instrument can be exchanged for goods and services. Cash is very liquid whereas a life assurance policy is less so. Being able to convert assets into cash easily, quickly and with little or no loss of capital. A liquid market is a market with enough participants to make buying and selling easy. The quality possessed by a financial instrument of being readily convertible into cash without significant loss of value. A market is said to be liquid when it has a high level of trading activity, allowing buying and selling with minimum price disturbance. The ability of an enterprise to meet its payment obligations on time. In a wider sense it means the availability of cash and cash-like funds within a company, on the money and capital markets and within the national or world economy. The ease with which an asset may be bought or sold in volume on the marketplace without causing dramatic price fluctuations. A highly liquid stock is characterized by a large volume of trading and a large pool of interested buyers and sellers. Relative ease with which an economic unit can meet financial obligations without selling fixed assets. By extension, assets that are immediately available to pay a debt. Liquidity is of paramount importance in banking. A bank must have sufficient cash on hand at all times to cover its customers' withdrawals. In the money market, liquidity is the availability of short-term funds for banks and other financial institutions, and is determined by reserve requirements. A market characterized by the ability to buy and sell with relative ease. How easily one's assets can be converted back into cash. For example, money in an account that can't be withdrawn for ten years is not very liquid. The ability of the market in a particular asset to absorb a reasonable amount of buying or selling at reasonable price changes. Liquidity is one of the most important characteristics of a good market. A characteristic of an asset market with enough units outstanding to allow large transactions without a substantial change in price. A market is liquid when it has a high level of trading activity, allowing buying and selling with minimum price disturbance. Liquidity is a group of measures of the financial strength of a company and so answer the questions 'Have we enough cash? Should we borrow more? Can we borrow more?' Measures of liquidity look at whether the company can fulfill its financial obligations to bankers, suppliers etc. Key measures of liquidity are as follows:- Current Ratio; Quick Ratio; Trade Creditors to Stock; Cash Less Overdraft; Financial Leverage; Income Gearing; and Stockholders' Equity/Fixed Assets. Liquidity is the market tradability of an asset. A highly liquid market has a large number of buyers and sellers, or lenders, making it easy to enter or exit. Liquidity is the ability of market participants to enter and exit trades quickly and with low transaction costs. Although liquidity can be measured several ways, in general, futures contracts with higher volume and open interest tend to be more liquid than those with lower volume and open interest. Liquidity is the amount of trading in a particular contract on a given day. / Крэдитвезэнгезэц (Ка.Ве.Ге.; Kreditwesengesetz (KWG)). Рынок считается ликвидным, когда имеет высокий уровень торговой активности, обеспечивающий покупку и продажу с минимальным колебанием цен. Относительная лёгкость, с которой хозяйствующий субъект может . Под Ликвидностью, от Латинского слова Liquidus, означающее Жидкий или Текучий, понимается мобильность активов предприятий, банков, обеспечивающая своевременную оплату их обязательств. флуктуации (колебания) цены. Под Ликвидностью, от Латинского слова Liquidus, означающее Жидкий или Текучий, понимается подвижность, мобильность активов предприятий, фирм или банков в капиталистических странах, обеспечивающая фактическую возможность (способность) бесперебойно оплачивать в срок все их обязательства и предъявляемые к ним законные денежные требования. Степень ликвидности определяется соотношением между денежными средствами и быстро реализуемыми активами предприятия, фирмы или банка и суммой их краткосрочных обязательств. К быстро реализуемым (ликвидным) активам относятся государственные ценные бумаги, акции и облигации крупных акционерных компаний, пользующиеся постоянным спросом на фондовой бирже, срочные векселя солидных фирм, беспрепятственно принимаемые к учёту и переучёту банками, золото и другие драгоценные металлы, а также бесспорная дебиторская задолженность, подлежащая погашению по первому требованию или через краткие сроки. У промышленных и торговых предприятий к ликвидным активам относятся также легко реализуемые товаро-материальные ценности. Чем выше доля активов, способных быстро превратиться в денежную наличность, тем выше ликвидность предприятия, фирмы, банка. Особое значение в капиталистической экономике имеет ликвидность коммерческих банков, бесперебойная оплата ими требований вкладчиков. Для её обеспечения законодательством о банках обычно устанавливаются размеры денежных резервов, которые коммерческие банки обязаны хранить в центральном банке – в процентном отношении к сумме их текущих счетов и срочных вкладов (так называемые Минимальные Резервы Банков). Конъюнктурные колебания и в особенности экономические кризисы ухудшают ликвидность отдельных предприятий, фирм и банков, что приводит их к банкротству. В условиях общего кризиса капитализма ликвидность менее мощных банков ухудшается, они поглощаются более крупными банками, которые сливаются в банки-гиганты (смотрите Концентрация Банков). Особый вид ликвидности – международная ликвидность, определяемая соотношением между золотовалютными резервами правительств и центральных банков капиталистических стран и суммой их внешних платежей, которые должны обеспечиваться этими резервами. После Второй Мировой Войны (1939–45) это соотношение ухудшилось и проблема международной ликвидности резко обострилась. Значительно расширились обороты по внешней торговле (как по физическому объёму, так и в особенности в ценностном выражении) в связи с повсеместной инфляцией и ростом цен при относительной стабильности суммы золотых резервов ввиду искусственно поддерживавшейся США заниженной цены золота (до Декабря 1971 – 35 Долларов США, до Февраля 1973 – 38 Долларов, с Февраля 1973 – 42.2 Доллара за 1 Тройскую унцию) и с неравномерным распределением золотовалютных резервов между странами (смотрите также Валютные Резервы).

LIQUIDITY DATA BANK® = БАНК ДАННЫХ ПО ЛИКВИДНОСТИ – Liquidity Data Bank®:- a computerized profile of Chicago Board of Trade (CBOT®) market activity, used by technical traders to analyze price trends and develop trading strategies. There is a specialized display of daily volume data and time distribution of prices for every commodity traded on the Chicago Board of Trade. / Чикагской Палаты по Торговли (Чикагского Табло Торговли, если быть более точными; СИБАТ® (CBOT®)) .

LIQUIDITY EVENT = СОБЫТИЕ ЛИКВИДНОСТИ – A term Liquidity Event refers to the way in which investors in a usually private company can get back their investment, i.e. liquidate their investment – either by having the company go public and getting tradable shares or by having the company merge with another firm thereby getting cash or stock which can be liquidated. Liquidity Event is an event that allows initial investors in a company to cash out some or all of their ownership shares and is considered an exit strategy for an illiquid investment. Liquidity events are typically used in conjunction with venture capital/angel investors or private equity firms, which will aim to reach one within a reasonable amount of time after initially making an investment. The most common liquidity events are initial public offerings (IPOs) and direct acquisitions by other corporations or private equity firms.

LIQUIDITY PREFERENCE = ПРЕДПОЧТЕНИЕ ЛИКВИДНОСТИ (или ХХ) – Liquidity Preference:- the liquidity preference theory is based on the generally accepted belief that investors prefer liquid assets to illiquid ones. Investors require a greater return to encourage them to commit funds for a longer period. Long dated stocks are less liquid than short dated stocks, so yields should be higher for long dated stocks.

LIQUIDITY RATIO = СООТНОШЕНИЕ С ЛИКВИДНОСТЬЮ (или КОЭФФИЦИЕНТ ЛИКВИДНОСТИ) – Liquidity Ratio:- ratios that measure a business entity's ability to pay debts as they come due. Liquidity ratios include ratios calculated by comparing the relationship between current assets and current liabilities as measured in various ways, including the current or working capital ratio, the acid-test or quick ratio. See also Current Ratio, and Ratio. Total Dollar value of cash and marketable securities divided by current liabilities. The liquidity ratio measures the extent to which a corporation or other entity can quickly liquidate assets and cover short-term liabilities, and therefore is of interest to short-term creditors.

LIQUIDITY RISK = РИСК ЛИКВИДНОСТИ – Liquidity Risk: in the case of securities issued by small companies (second-tier stocks), occasional illiquidity of the market is to be expected. This can mean that securities cannot be traded at the desired time and/or in the desired quantity and/or at the desired price. Liquidity Risk is the risk of being unable to meet its obligations to pay as they fall due without incurring unacceptable losses. In banking, Liquidity Risk is the risk that a depository institution will not have sufficient cash or liquid assets to meet the claims of depositors and other creditors. The Liquidity Risk is understood to mean the risk that not enough money is available to fulfill payment commitments or that it is only available on less favorable terms. Liquidity Risk is the risk that a given security or asset cannot be traded quickly enough in the market to prevent a loss. Changes in the bond markets since the financial crisis have led to less liquidity. The closing of proprietary trading desks, less arbitrage investors, and more governmental regulation imparted on commercial and investment banks has reduced the markets overall liquidity. The tradeoff between highly liquid products such as government bonds and illiquid products such as one- time issuance or real estate deals will be directly reflected in the level of yield received. Measuring the appropriate mix of holdings is dependent upon an investors risk profile and the impact of rising rate may have a great effect on the liquidity of the product. Liquidity Risk is the risk that a counterparty will experience demands for funds (or collateral) that are too large to meet when due. / Риск Ликвидности – риск убытков вследствие неспособности кредитной организации обеспечить исполнение своих обязательств в полном объёме. Риск ликвидности возникает в результате несбалансированности финансовых активов и финансовых обязательств кредитной организации (в том числе вследствие несвоевременного исполнения финансовых обязательств одним или несколькими контрагентами кредитной организации) и (или) возникновения непредвиденной необходимости немедленного и единовременного исполнения кредитной организацией своих финансовых обязательств.

LIQUIDITY SQUEEZE = ПРОЛЁТ С ЛИКВИДНОСТЬЮ (или ВРЕМЕННАЯ ПОТЕРЯ ЛИКВИДНОСТИ, или ДЕФИЦИТ ЛИКВИДНОСТИ) – In business, Liquidity Squeeze is a temporary shortage of cash caused by an economic downturn.

LIQUIDITY STATEMENT = ВЫПИСКА (или ЗАКЛЮЧЕНИЕ, или ОТЧЁТ) О ЛИКВИДНОСТИ – Liquidity Statement is a statement showing the relationship between the disposable means and the easily marketable assets on the one hand and the short-term liabilities on the other.

LIQUID MARKET = ЛИКВИДНЫЙ РЫНОК – A Liquid Market is a situation when a 'close' spread is obtained between the bid and the offer price. It can also mean that the number of institutions trading in the market is high. A market is said to be 'liquid' when it has a high level of trading activity and open interest. A Liquid Market is a market in which selling and buying can be accomplished with minimal effect on price.

LIQUID YIELD OPTION NOTE = БИЛЕТ С ОПЦИОНОМ ЛИКВИДНОЙ ДОХОДНОСТИ – Liquid Yield Option Note is the zero coupon note with an option to convert into common stock at maturity. / Билет С Опционом Ликвидной Доходности – бескупонный билет с опционом на конвертацию в обыкновенную акцию при погашении.

LIQUOR = ЩЁЛОК – Liquor is a solution of dye and/or other chemicals.

LIQUOR RATIO = СООТНОШЕНИЕ СО ЩЁЛОКОМ (или МОДУЛЬ ВАННЫ) – Liquor Ratio or Liquor To Goods Ratio is the ratio of the weight of the dyebath or other processing bath to the weight of the goods being dyed or processed. For immersion dyeing in art dyeing processes, a common liquor to goods ratio is 20:1. That is, for each kilogram of fiber to be dyed, 20 kilograms of dyebath are used. In the metric system, this is easy to calculate, since one liter of water weighs one kilogram. High liquor ratios are generally avoided, since they often cause poor exhaustion of the dye, though this is not true for all dye types. Modern commercial dyeing equipment often works with low liquor ratios. Very low ratios may be used for methods where essentially all of the dye solution is to be absorbed by the fiber, such as padding. In wet processing, Liquor Ratio is the ratio of the weight of liquid used to the weight of goods treated.

LIRIPIPE = ЛЫРИПАЙП (или ДЛИННЫЙ ШАРФ) – Liripipe:- tippet, scarf.

LIRRTP = LAO–IRRI RICE RESEARCH AND TRAINING PROJECT

LISLE = ФИЛЬДЕКОСОВОЕ – Lisle:- a hard, usually long-staple cotton or wool yarn of defined length in two or more ply and with a minimum twist far a given count specified by the Federal Trade Commission (FTC) rules for hosiery. Lisle:- a smooth tightly twisted thread usually made of long-staple cotton.

LISLE YARN = ФИЛЬДЕКОСОВАЯ ПРЯЖА – Lisle Yarn is a high-quality cotton yarn made by plying yarns spun from long combed staple. Lisle is singed to hive it a smooth finish.

LIST = КАЙМА (или КРОМКА, или КРАЙ, или ТЕСЬМА) – List:- xxxxx.

LIST = КРЕН (или УГОЛ КРЕНА) – List is the amount in degrees that a vessel tilts from the vertical. / Значение угла наклона судна от вертикали, выраженное в градусах. Под Креном, от Голландского слова Krengen, означающее Класть Судно На Бок, понимается поворот судна или летательного аппарата относительно продольной оси. Под Тангажем, от Французского слова Tangage, понимается угловое движение судна или летательного аппарата, например, самолёта, относительно главной поперечной (горизонтальной) оси инерции. Угол тангажа – угол между продольной осью летательного аппарата и горизонтальной плоскостью.

LISTED = ПРЕДПИСАННОЕ (или ИЗ СПИСКА, или ПЕРЕЧИСЛЕННОЕ) – Listed:- an electrical device or material that has been tested by a recognized organization and shown to meet appropriate standards. Many local governmental authorities require that installed electrical products be listed. A well-known listing organization is Underwriters Laboratories (UL).

LISTED COMPANY ADVISORY COMMITTEE = СОВЕЩАТЕЛЬНЫЙ КОМИТЕТ ДЛЯ КОТИРУЕМЫХ КОМПАНИЙ (или КОНСУЛЬТАТИВНЫЙ КОМИТЕТ ДЛЯ КОТИРУЕМЫХ КОМПАНИЙ, или КОНСУЛЬТАТИВНЫЙ КОМИТЕТ ДЛЯ КОМПАНИЙ,

ВКЛЮЧЁННЫХ В КОТИРОВАЛЬНЫЙ СПИСОК) – Listed Company Advisory Committee provides a forum for the securities-related concerns of listed companies, and advises the board on contemplated policies and programs affecting listed companies. It also acts as an New York Stock Exchange staff sounding board on contemplated policies and programs affecting listed companies' interests and recommends, on its own initiative, policies or actions aimed at promoting those interests.

LISTED PRICE = КОТИРУЕМАЯ ЦЕНА – Listed Price is a price being paid for securities or currencies on the exchange. When expressed as percent quotations, the listed price is calculated by multiplying the nominal amount with the price and then dividing by 100.

LISTED SECURITY = КОТИРУЕМАЯ ЦЕННАЯ БУМАГА (или ЦЕННАЯ БУМАГА, ВКЛЮЧЁННАЯ В КОТИРОВАЛЬНЫЙ СПИСОК) – Listed Security:- US securities listed on a US stock exchange. The issuer has filed a listing application with the exchange and registered the securities with the SEC under the Securities Exchange Act of 1934. Also known as Listed Stock, and Official Quotation.

LISTED STOCK = КОТИРУЕМАЯ АКЦИЯ (или АКЦИЯ, ВКЛЮЧЁННАЯ В КОТИРОВАЛЬНЫЙ СПИСОК) – Securities which are approved for admission to the Official List and so, for trading on the Stock Exchange. Listed Stock is the stock of a company that is traded on a securities exchange. The various stock exchanges have different standards for listing. Some of the guides used by the New York Stock Exchange for an original listing are national interest in the company and a minimum of 1 100 000 shares publicly held among no less than 2 000 round-lot stockholders. The publicly held common shares should have a minimum aggregate market value of USD40 000 000.00. The company should have net income in the latest year of over USD2 500 000.00 before federal income tax and USD2 000 000.00 in each of the preceding two years. / Некоторые справочники, используемые Нью Йоркской Фондовой Биржей .

LISTER PLANTING = ЛИСТЕРНАЯ ПОСАДКА (или БОРОЗДНАЯ ПОСАДКА, или БОРОЗДОВАЯ ПОСАДКА) – Lister Planting is a method of planting in which the seed is planted in the bottom of lister furrows, usually simultaneously with the opening of these furrows. A lister is a type of plow. / Под Посадкой понимается размещение рассады (Капусты, Табака, Томата), саженцев плодовых, декоративных и лесных культур, клубней Картофеля, луковиц Лука, Тюльпана и других по площади поля с заделкой в почву. Проводят рассадо-посадочными машинами, картофелесажалками и вручную.

LISTING = ВКЛЮЧЕНИЕ В КОТИРОВАЛЬНЫЙ СПИСОК (или ЛИСТИНГ) – Listing is an admission of a security (shares, bonds, etc) for official trading on a stock exchange or exchanges. Also known as Admission. See also Official Quotation. / Смотрите также Официальная Котировка (Official Quotation).

LISTING = ЗАКРАЙКА (или ОПИЛЕННЫЙ КРАЙ, или ОПИЛКА КРАЕВ, или КРОМКА) – Listing or Selvage or Selvedge:- taken from the words 'List' (or border), and 'Self-Edge'. The series of ends found on the edges of woven cloth. These ends are part of the warp and run in the vertical direction in the goods. The primary function of the selvage is to hold out the warp so that the shuttle with the filling does not pull in the warp in width, thereby causing poor loom action. Another function is to allow the dyer of the cloth a hold on the edges for clips and pins, so that they do not tear the body of the goods. The selvage keeps the edges of the cloth parallel and straight. It is distinguished from body of the cloth in the following ways:- (i) by the use of a weave that is different from the body of the warp; (ii) by the use of colored ends different from those of the warp; (iii) by increased twist in the selvage ends; and (iv) by the doubling up of the ends that constitute the selvage (This is done by placing two ends through each heddle eye instead of the customary single end. This will give the selvage sufficient strength to withstand and offset the friction that the filling might give as it comes off the nose of the bobbin. The doubled ends give a firmer feel and substance to the edges of the cloth). Listing may or not be cut from the cloth in the cutting-up house. Cottons often have the listing cut off prior to manipulation of the cloth into garment. Woolens, worsteds and rayons retain the selvage, which is placed underneath and covered up in the cut, fit and trim of the garment. It is found along the seams on the under side of the finished garment. Listing:- a difference in color between the selvedges and the center of a fabric. Note:- this defect is often caused by uneven batching-up of the fabric or by differences in temperature from the selvedges to the center of the fabric during dyeing and finishing. / уточина. раскрой (cutting); нарезка ткани определённой длины по требованию заказчика (cutting) . Разнооттеночность (listing):- порок заключительной отделки ткани в виде различия оттенка или интенсивности цвета между краями и центром полотна. Примечание:- этот порок возникает в результате неровной укладки полотна, разницы температур на краях и в центре полотна во время процессов крашения и отделки или неравномерности давления во время грунтования.

LISTING (or MIDDLEBREAKING) = ОБРАБОТКА ПОЧВЫ ЛИСТЕРОМ (или БОРОЗДОВАНИЕ, или НАРЕЗКА БОРОЗД МЕЖДУ РЯДКАМИ) – Listing (or Middlebreaking) is a tillage and land-forming operation using a tool which turns two furrows laterally in opposite directions, thereby producing beds or ridges. / Бороздование – нарезка борозд. Бороздодел или Бороздоделатель, сельскохозяйственное орудие с двухотвальным плужным рабочим органом. Применяется для устройства выводных борозд (Бороздодел-Канавокопатель), а также борозд-щелей (Бороздодел-Щелерез) для полива сельскохозяйственных растений. Поливные борозды нарезают съёмными бороздоделами, устанавливаемыми на культиваторах (вместо лап) и сеялках.

LISTING CRITERIA = КРИТЕРИЙ ДЛЯ ВКЛЮЧЕНИЯ В КОТИРОВАЛЬНЫЙ СПИСОК (или КРИТЕРИЙ ДЛЯ ЛИСТИНГА) – Listing Criteria:- each stock exchange sets its listing standards (or criteria), indicating to investors that companies have to met certain standards in order to have the privilege of a listing. The criteria for listing on the Toronto Stock Exchange (TSE) are higher than those for listing on the Vancouver Stock Exchange (VSE). That makes sense because the VSE caters to junior companies. Investors know that, in general, a VSE company is likely to be smaller and riskier than a TSE company. Companies may choose to be interlisted in order to gain broader market access, e.g., the USA via NASDAQ®. An OTC (Over-the-Counter) company does not trade on an exchange, although it does trade on a market maintained by brokers. There are no listing standards for OTC companies and hence they are considered more risky and more volatile (there are fewer rules and regulations). Lots of scams occur on the OTC markets! In the USA, the most common OTC market is the OTC-BB (i.e. OTC Bulletin Board) market (see http://www.otcbb.com) and in Canada it is the CDN (Canadian Dealing Network) market – see the Globe and Mail for prices. / НЭЗДЭК® (NASDAQ®) .

LISTING MARKS = ОТМЕТИНЫ ЗАКРАЙКИ – Listing Marks:- shade is the darker near selvedge than the surface of the fabric is known as Listing Mark. Dyeing defect. / Порок или дефект крашения.

LIST OF DRAWINGS = СПИСОК (или ПЕРЕЧЕНЬ) ЗАИМСТВОВАНИЙ (или ПОГАШАЕМЫХ) – List Of Drawings is a published list showing the numbers of the securities drawn for premature redemption (such as the bonds of a particular issue). / публикуемый список, отражающий номера ценных бумаг, изымаемых для преждевременного выкупа (таких как облигаций конкретного выпуска).

LITER = ЛИТР – Liter or Litre is the common metric unit of volume. The liter was originally defined to be the volume occupied by a kilogram of water, and the gram as the mass of a cubic centimeter of water. This would make the liter equal to exactly one cubic decimeter, that is, to the volume of a cube 0.1 meter (or 10 centimeters) on a side. Unfortunately, the physical objects constructed to

represent the meter and kilogram disagreed slightly. As measured by the standard meter and standard kilogram, the standard liter turned out to be about 1.000 028 cubic decimeters. This discrepancy plagued the metric system for a long time. In 1901 an international congress accepted the discrepancy and formally defined the liter to be exactly 1.000 028 dm^3. No one was particularly happy with such an awkward definition, and in 1964 the Conférence Générale des Poids et Mesures (CGPM) repealed the definition. In the International System of Units (Système International d'Unités (SI)), volumes are to be measured in cubic meters or power-of-ten multiples thereof, not in liters. However, the SI states that the liter 'may be employed as a special name for the cubic decimeter'. Throughout this dictionary, the liter is used as a name for exactly 1 cubic decimeter, 1 000 cubic centimeters, or 0.001 cubic meter. In its renewed guise as the cubic decimeter, the liter is approximately 61.023 744 cubic inches. Compared to the customary volume units, the liter is a little more than a US liquid quart (1.056 688 qt or 33.814 fluid ounces) but a little less than a US dry quart (0.908 08 qt) or a British Imperial quart (0.879 89 qt or 35.195 fluid ounces). Its name comes from a French volume unit, the litron, which was in turn derived from the Latin litra. Both the lower case letter l and the upper case L are accepted as symbols for the liter, but the US Department of Commerce specifies that L be used, at least by businesses, to avoid confusion with the numeral 1. The unit is spelled Liter in the United States and Litre in Britain; there are many other spellings in various languages. Liter is a unit of volume in the metric system equal to 1 000 ml or 1 000 cc. Litre (typically spelled 'Liter' in the USA) is a metric volume equal to 1 cubic decimeter (1 000 cubic centimeters). One litre is approximately 1.06 US liquid quarts, or 0.88 Imperial quarts. One litre of water weighs, for practical purposes, 1 kilogram. / Конференс Женераль дэ Пуа э Мёзюр (Сэ.Жэ.Пэ.Эм.; Conférence Générale des Poids et Mesures (CGPM)). Лё Систэм Этэрнасьёналь д'Юните (Эс.И. или, как её уже устоялось называть в России, СИ). Под Литром, от Французского слова Litre, от позднелатинского слова Litra, означающее Мера Ёмкости, понимается допускаемая к применению наравне с единицами СИ внесистемная единица объёма (вместимости) и единица ёмкости в метрической системе мер. Обозначение:- л (l). 1 л = 1 $дм^3$ = 0.001 $м^3$. До 1964 1 л = 1.000 028 $дм^3$. Литр – единица объёма и ёмкости (вместимости) в метрической системе мер. Обозначается л (l). Решением 3-й Генеральной Конференции по Мерам и Весам (1901) Литр был определён как объём 1 кг чистой воды при нормальном атмосферном давлении (10 $кН/м^2$ или 760 мм ртутного столба) и температуре наибольшей плотности воды (4 °C); 1 л = 1.000 028 $дм^3$ 12-я Генеральная Конференция по Мерам и Весам (1964) отменила это определение и приняла, что 1 л = 1 $дм^3$ (точно); теперь наименование Литр в случаях, не относящихся к выражению результатов измерений высшей точности, может употребляться как особое наименование $дм^3$.

LITERATURE = ЛИТЕРАТУРА – Literature is the body (accumulation) of written work produced by scholars or researchers in a given field. / Под Литературой, от Латинского слова Lit(t)eratura, означающее буквально Написанное, понимаются произведения письменности, имеющие общественное значение, например, научная литература, художественная литература, эпистолярная литература. Чаще под литературой понимают художественную литературную продукцию (художественная литература; соответствие в XIX веке – 'изящная словесность'). В этом значении литература – явление искусства ('искусство слова'), эстетически выражающее общественное сознание и в свою очередь формирующее его. Художественная литература как вид искусства возникает на почве устно-поэтического народного творчества путём осознания роли личности в историческом процессе. Художественная литература хранит, накапливает и передаёт от поколения к поколению эстетические, нравственные, философские, социальные ценности. Будучи средством постижения действительности, литература выражает мировоззрение и эстетические идеалы определённых классов, социальных групп, наций, эпох. Литература представляет собой формирующуюся на протяжении тысячелетий сложнейшую динамическую систему литературных родов (эпос, лирика, драма), жанров, мотивов, сюжетов, образов, стиховых и прозаических форм, изобразительных средств языка, приёмов композиции. Существуют виды письменных произведений, смыкающиеся с художественной литературой, – мемуарная, эпистолярная, документальная литература. Древнейшие произведения писались в стихах, проза – относительно более поздняя область художественной литературы. Только в XVIII–XIX веках эти две области сравнялись по значению. Для XX века характерны связи художественной литературы с другими, преимущественно новыми видами искусства – кино, радио, телевидением. Творчество выдающихся деятелей художественной литературы знаменуют важнейшие фазы развития мировой и национальной культуры. Литература изучается Литературоведением.

LITHAO = ЛИТАО (или ЛАЙТАО) – Lithao is a Philippine farm implement used for making small parallel furrows.

LITHIUM GREASE = ЛИТИЕВАЯ ПЛАСТИЧНАЯ СМАЗКА (или ЛИТИЕВАЯ КОНСИСТЕНТНАЯ СМАЗКА) – Lithium Grease is the most common type of grease today, based on lithium soaps. See also Grease.

LITHOPHYTE = ЛИТОФИТ – Lithophyte:- growing on rocks. / Под Литофитами, от Греческих слов Lithos, означающее Камень, и Phytón, означающее Растение, понимаются Растения, развивающиеся на камнях и скалах. Вначале поселяются Бактерии и Водоросли, затем Лишайники и Мхи (накапливающие слой гумуса) и, наконец, Высшие Растения (Папоротники, Виды Овсяницы и другие).

LITTERALIS = ПРИБРЕЖНОЕ (или ПИСЬМЕННОЕ, или ПЕРЕПИСКА) – Litteralis:- belonging to the sea shore.

LITTLE DUST SEPARATOR = УСТАНОВКА ДЛЯ ОТДЕЛЕНИЯ МЕЛКОЙ ПЫЛИ – In spinning process, Little Dust Separator is mainly used in the frontier of the blowroom and card system. It can separate little dust and make air current balance. This product is usually used before Roller Cleaner. / В прядильном производстве.

LITTORAL = ЛИТОРАЛЬ (или ЛИТОРАЛЬНОЕ) – Littoral:- growing on the beach. / Литоральное – обитающее в приливно-отливной зоне. Под Литоралью, от Латинского слова Litoralis, означающее Береговой или Прибрежный, понимается зона морского дна, затопляемая во время прилива и осушаемая при отливе. Литораль располагается между уровнем воды в самый низкий отлив и уровнем воды в самый высокий прилив. Литораль – экологическая зона морского дна, затопляемая во время прилива и осушаемая при отливе. Располагается между уровнем воды в самый низкий отлив и уровнем воды в самый высокий прилив; покрывается водой и освобождается от неё дважды в сутки. Ограничена сверху Супралиторалью, снизу – Сублиторалью. Некоторые зарубежные исследователи называют литоралью всё дно морских водоёмов до глубины 200 метров (м) (континентальная ступень, зона распространения растений), другие – до глубины 40–50 м (нижняя граница действия волн). В зависимости от уклона дна и амплитуды приливо-отливных колебаний ширина литораля может быть от нескольких м до многих км. По характеру грунта различают:- Илистую Литораль, Песчаную Литораль, Каменистую Литораль и Скалистую Литораль. Смотрите также Литоральная Фауна, Литоральная Флора, и Литоральные Отложения. Литоральные Отложения – отложения литорали.Очень разнообразны по составу:- валуны, гальки различной степени окатанности, гравий, песок, илистые осадки; нередко отмечается высокое содержание органических остатков. Современные литоральные отложения встречаются лишь в пределах узкой зоны. Древние литоральные отложения формировались при перемещениях береговых линий. Во время трансгрессии моря литоральные отложения погребались под другими типами морских отложений. Хорошо сохраняются в разрезах, залегая на резко размытой поверхности более древних пород или на континентальных отложениях. Литоральная Фауна – совокупность животных, населяющих литораль. Для литоральной фауны характерна приспособленность к строго периодическому пребыванию на воздухе, к резким суточным и сезонным колебаниям

температуры и солёности, к действию прямой солнечной радиации и прибоя. Многие обитатели литорали во время отлива прячутся под камнями, среди водорослей, под навесами скал или совершают регулярные перемещения по вертикали, следуя за приливными изменениями уровня моря. В состав литоральной фауны входят многие беспозвоночные (Губки, Кишечнополостные, Черви, Ракообразные, Моллюски, Мшанки, Иглокожие и другие), рыбы. Наиболее богата и разнообразна литоральная фауна тропиков; по направлению от экватора к полюсам она становится всё беднее видами; в Арктике и Антарктике, где большую часть года литораль покрыта льдом, и на открытых прибойных пляжах тропического пояса, где очень сильна инсоляция, литоральная фауна крайне бедна или отсутствует. В умеренной зоне средняя величина биомассы литоральной фауны составляет 2–3 килограмма на квадратный метр (кг/м^2), достигая в отдельных местах 30–40 кг/м^2. В тропиках при средних величинах биомассы несколько менее 1 кг/м^2 она может тоже достигать 40–43 кг/м^2. У литоральных животных выработались разнообразные приспособления, препятствующие высыханию во время отлива, например, способность плотно замыкать раковину (у многих моллюсков и усоногих ракообразных – Морских Жёлудей), плотно присасываться к камням (у Хитонов и Морских Блюдечек), сильно сжиматься и покрываться слизью (у Голожаберных Моллюсков и Актиний) и так далее. Разные виды способны оставаться на воздухе более или менее продолжительное время, что обусловливает вертикальную зональность в распределении литоральной фауны. Хорошо защищённые от высыхания животные селятся в верхних горизонтах, менее защищённые – в средних и нижних. Обитающие в сублиторали животные (некоторые рыбы, креветки и другие) только во время прилива появляются на литорали, используя обильную здесь пищу. В морях умеренной зоны одни литоральные животные на зиму мигрируют в сублитораль, другие впадают в анабиоз и могут даже переносить длительное промерзание. На скалах обитают Морские Жёлуди (Баланусы) и Устрицы, Мидии и другие Митилиды, Актинии, Хитоны, Литорины, Морские Блюдечки; на водорослях и среди них – Гидроиды, Мшанки, Асцидии; в мягких грунтах – многие Черви, роющиеся двустворчатые Моллюски. Литораль служит переходной зоной между морем и сушей. Здесь чаще всего осуществляется переход от морского к наземному образу жизни (Крабы, Черви и другие) и вторичный переход наземных форм в море (например, Лёгочные Моллюски). В морях, лишённых приливо-отливных колебаний, литоральной фауне соответствует население узкой прибрежной полосы, омываемой волнами, – так называемая псевдолиторальная фауна; фауна супралиторали – зоны заплеска и прибоя – называется супралиторальной. Многие литоральные животные используются в пищу и служат объектом промысла – Устрицы, Мидии, Крабы, Морские Ежи, некоторые Черви. Литоральная Флора – растительный мир литорали. В морях литоральная флора состоит в основном из зелёных, бурых, красных и сине-зелёных водорослей, прикреплённых к грунту. Видовой состав литоральной флоры существенно изменяется от верхнего горизонта литорали к нижнему; большое значение в распределении литоральной флоры имеют свойства грунта; на каменистых грунтах литоральная флора богаче, чем на мягких. Наиболее пышного развития литоральная флора достигает в умеренном поясе; здесь в верхнем горизонте литорали растут главным образом зелёные водоросли, в среднем и нижнем – бурые и красные. В северных широтах литоральная флора развита слабо; в тропиках, на участках побережья, подверженных действию прямых солнечных лучей, литоральная флора представлена мангровыми деревьями и реже травами и водорослями. Литоральная флора играет большую роль в прибрежной полосе как основной источник накопления органического вещества, а также как убежище и часто корм для животных, населяющих литораль. Литоральная флора внутренних водоёмов занимает обширную зону до границы глубинного распространения растительности и состоит в основном из цветковых растений.

LIVE CATTLE = ЖИВОЙ КРУПНЫЙ РОГАТЫЙ СКОТ (или ЖИВОЙ КРУПНОРОГАТЫЙ СКОТ) – CME® broke the mold of traditional futures markets, in the mid-1960's by introducing a futures contract on a non-storable commodity – Live Cattle. The Live Cattle contract has undergone significant changes. Each of these changes has enhanced the usefulness of the contract in risk management programs. These tools have enabled cattle producers who use them to manage their risk more effectively. The Chicago Mercantile Exchange® (CME®) continues to work with the cattle industry to meet producers' changing needs by improving these contracts. Cattle, commonly referred to as Cows. The CME Group Live Cattle futures contract, symbol LE, also is traded in a 40 000 lb allotment. Though packers buy on a carcass- and live-animal basis, this contract is based off the live animal pricing. It also is different from hogs in that it can be physically delivered. Keep that in mind as first notice day approaches. Pricing is quoted as dollars per cwt. A price of 127 000 on your screen is therefore USD127 per cwt. Supply projections are a little different for cattle because there is a two-stage production process. The base producer in the industry carries a herd of mothers (cows) and sells the offspring in the form of 400–500 lb calves or later as 600–900 lb feeder cattle. Those offspring are fed out in feedlots from three to eight months, depending on various factors, until they are 1 100 to 1 400 lbs. Profitability in the feedlot phase is dependent on the purchase price of feeder cattle, feed costs and selling price of live cattle. Important for us for the long term is that the base producer has a separate concern as well:- Quality pastures. With drought a lingering concern in the Plains, the breeding herd has been in liquidation for eight years. As there is a three-year lag between a decision to expand and when that expansion hits the packing plant, the long-term supply picture is clear here. The report that the industry gauges to determine monthly supply is the USDA's Cattle on Feed Report. A supply picture for the coming months can be made by following the number of new calves and feeders starting their feeding period, called 'Placements'. We can gauge whether feedlots are actively selling market-ready animals on time by monitoring the marketing numbers. The CME® Live Cattle contract reflects current supply and demand for fed cattle, competing meats and feedgrains, along with long term cyclical patterns for meat supply and consumer preferences. / Под Крупным Рогатым Скотом (КРС) понимаются домашние парнокопытные жвачные животные семейства полорогих рода настоящих быков. Произошли от дикого быка тура. КРС разводят в основном из-за молока и мяса. Средний годовой удой коров молочных пород составляет 4–5 тонн кг, рекордный – около 20 тонн кг. В среднем жирность молока находится в диапазоне 3.6–4%, хотя может доходить и до 6%. Средний вес коров составляет 200–600 килограммов (иногда доходит до 1 000 килограмм), а быков – 300–900 килограмм (иногда доходит до 1 600 килограмм). Молодняк мясных пород к 1.5–2 годам весит 400–500 килограмм. К КРС относят также зебу. Крупный Рогатый Скот (КРС), домашние парнокопытные жвачные животные Семейства Полорогих. К ним относятся Буйволы, Яки и все домашние породы крупного рогатого скота, принадлежащие к Роду Настоящих Быков (Bos). Домашний Крупный Рогатый Скот (Bos Taurus) произошёл от дикого Быка Тура (Bos Primigenius), который за несколько тысячелетий до Нашей Эры был распространён на всей территории Европы, Азии и Африки. Последние его представители исчезли в начале XVII века. Одомашнивание Туров началось около 8 000 лет назад, сначала в Индии, затем в Передней Азии, Средиземноморье, Средней Европе. По краниологическим признакам домашний Крупный Рогатый Скот делят на четыре основные Подвида:- Европейский скот степных и равнинных зон – Длиннорогий (Bos Taurus Primigenius), Европейский скот горных и лесных зон – Короткорогий (Bos Taurus Brachyceros), Центрально-Азиатский скот (Bos Taurus Turanomongolicus) и Южно-Азиатский и Северо-Африканский горбатый скот – Зебу (Bos Taurus Indicus). Продолжительность жизни коров около 20 лет, редко до 35 лет; быков 15–20 лет. Срок использования молочных коров 12–13 лет (к этому времени стираются зубы и продуктивность снижается). На мясо КРС целесообразно забивать после откорма или нагула, в возрасте 1-1/2–2 лет. Племенных животных используют для воспроизводства стада 5–10 лет. Рост животных продолжается до 5 лет, у некоторых позднеспелых пород до 6–7 лет. Половая зрелость наступает у тёлок в 7–9 месяцев (мес), у быков в 6–8 мес. В случку тёлок пускают в 18–22 мес, бычков в 14–18 мес. Продолжительность сервис-периода (от отёла до первой охоты) около 3 недель. Стельность продолжается в среднем

285 суток (сут). Коровы, как правило, одноплодны, двойни бывают редко (около 2%); встречаются случаи рождения одновременно 6–7 телят. Двойни чаще разнояйцевые (однополые и разнополые). Большинство тёлок из разнополых двоен не способны к воспроизводству (фримартинизм). Масса телят при рождении в зависимости от пород 18–45 килограммов (кг), иногда до 60 кг, масса бычков на 1–3 кг больше. Масса взрослых коров 200–600 кг, наивысшая более 1 000 кг; быков 300–900 кг, наивысшая 1 600 кг. Продуктивность скота определяется породными особенностями животных и условиями их кормления и содержания. Средние удои коров молочных пород, записанных в племенные книги, 3 500–4 000 кг, жирность молока 3.6–4%. В лучших хозяйствах удои около 6 000 кг. Рекордные удои за лактацию около 20 000 кг молока (Голландская порода). Максимальный суточный удой 82.2 кг (Корова Ярославской породы). Наивысший пожизненный удой 120 247 кг молока (Корова Костромской породы за 13 лактаций). Удои коров мясных пород за лактацию около 1 000 кг молока. Лактация у коров продолжается 280–320 суток (сут), сухостой (время от запуска до отёла) 1.5–2 месяца (мес). Максимальные удои у скороспелых пород – в четвёртую лактацию, у позднеспелых – в пятую–шестую, иногда в седьмую. Молоко КРС – ценный продукт питания людей и сырьё для пищевой промышленности. Цельное молоко и отходы его переработки используются также в кормлении молодняка сельскохозяйственных животных. Мясная продуктивность КРС выше у скота специализированных мясных пород. По сравнению с молочным мясной скот быстрее откармливается, даёт больший убойный выход и лучшее по качеству мясо. При откорме жир откладывается не только на внутренних органах и поверх туши, но и внутри мышечной ткани в виде тонких прослоек (‘мраморное’ мясо). Особенно ценно мясо откормленного молодняка. К 1-1/2–2-летнему возрасту молодняк достигает массы 400–450 кг. Говядина и телятина имеют высокие пищевые качества, калорийны, легко перевариваются, обладают диетическими свойствами. При забое КРС, кроме мяса, получают шкуры, из которых выделывают различные сорта кож, а при переработке боенских отходов – мясокостную, костную и кровяную муку, эндокринные препараты, стеарин, клей, мыло и так далее. Быков и волов некоторых пород используют также в качестве тягловой силы. Крупный рогатый скот отличается неприхотливостью и хорошей приспосабливаемостью к условиям содержания. Обладая объёмистым сложным желудком, крупный рогатый скот способен переваривать большое количество грубого растительного корма. Основные корма – зелёная пастбищная трава, сено, силос, корнеклубнеплоды, концентраты, отходы технических производств (жмыхи, шроты, жом, барда и другое), а также протеиновые, минеральные и витаминные подкормки. Нормируют кормление в зависимости от массы животных, их продуктивности и физиологического состояния, по уровню питания, переваримому протеину, минеральным веществам и витаминам. В стойловый период основу рациона КРС составляют грубые и сочные корма, в пастбищный – зелёные. Системы содержания КРС – привязная и беспривязная на глубокой подстилке или в боксах. В летний период в районах, обеспеченных пастбищами, применяют пастбищное содержание, при недостатке пастбищ – стойловое. В районах с обширными отдалёнными пастбищами применяют отгонную систему содержания. Разводят КРС во всех странах. Мировое поголовье его на конец 1970–71 составило 1 141 миллион. Создано большое количество пород, приспособленных к различным климатическим зонам. Смотрите также Животноводство, Скотоводство и статьи по породам – Голландская Черно-Пёстрая Порода, Джерсейская Порода и другие.

LIVE LOAD = ДИНАМИЧЕСКАЯ НАГРУЗКА (или ПОДВИЖНАЯ НАГРУЗКА, или ВРЕМЕННАЯ НАГРУЗКА, или ЖИВАЯ НАГРУЗКА, или ПОЛЕЗНАЯ НАГРУЗКА) – Live Load:- any loading that is of a temporary nature such as snow, wind, earthquake, and construction loads. / Под Динамической Нагрузкой понимается нагрузка, для которой характерно быстрое изменение во времени её значения и направления, например, под действием ветра. Динамическая Нагрузка – нагрузка, характеризующаяся быстрым изменением во времени её значения, направления или точки приложения. Динамическая нагрузка может вызывать в элементах конструкции значительные напряжения. В строительной механике под Нагрузками понимаются силовые воздействия, вызывающие изменения напряжённо-деформированного состояния конструкций зданий и сооружений. По характеру изменений во времени различают:- (i) динамические нагрузки; и (ii) статические нагрузки. Статические нагрузки подразделяются на:- (a) временные нагрузки, в свою очередь делящиеся на неподвижные нагрузки (например, вес стеллажей и бункеров в складских помещениях) и подвижные нагрузки; и (b) постоянные нагрузки. По характеру приложения к телу, на которое они воздействуют, различают:- (i) распределённые нагрузки, прилагаемые ко всей поверхности (линии) или части её; и (ii) сосредоточенные нагрузки, прилагаемые к весьма малой площадке (точке). Распределённую нагрузку постоянной интенсивности называют равномерно-распределённой нагрузкой, а нагрузку, точки приложения которой непрерывно заполняют всю данную площадь (или отрезок), – сплошной нагрузкой. При расчёте строительных конструкций нагрузки подразделяют на:- (i) нормативные, отвечающие нормальным условиям эксплуатации; и (ii) расчётные – максимальные, определяемые умножением нормативных нагрузок на коэффициент надёжности по нагрузкам. При действии нескольких нагрузок в расчёте учитывают наименее выгодные их сочетания. Нормативные Нагрузки – наибольшие нагрузки, отвечающие нормальным условиям эксплуатации зданий и сооружений. Они используются при расчёте конструкций по предельным состояниям. В строительной механике Подвижная Нагрузка – нагрузка, место приложения и направление действия которой могут изменяться в процессе эксплуатации сооружения, например, вес поезда, движущегося по пролётному строению моста.

LIVER = ПЕЧЁНОЧНОЕ (или КРАСНОВАТО–КОРИЧНЕВОЕ) – Liver:- a grayish reddish brown (also called Liver Brown and Liver Maroon).

LIVE RACK = ХХ (или ПРОХОДНОЙ СТЕЛЛАЖ) – Live Rack is a slanted rack that allows for easier picking. Items are put into the high end of the rack and then picked from the low end. Desirable for the first in, first out (FIFO) picking procedures. See also FIFO.

LIVE REEFER = ИЗОТЕРМИЧЕСКИЙ КОНТЕЙНЕР ПОД НАПРЯЖЕНИЕМ – Live Reefer is a reefer container used for transport of temperature-controlled cargo. The opposite of Dry Reefer.

LIVERISH = ЖЕЛЧЕВАТОЕ (или ЖЕЛЧНОЕ) – Liverish:- resembling liver especially in color.

LIVERY = ЛИВРЕЯ (или ЛЫВЁРИ, или УНИФОРМА) – Livery:- the distinctive clothing or badge formerly worn by the retainers of a person of rank; servant’s uniform; distinctive dress, garb. Middle English, from Anglo-French Liveree, Livree, literally, delivery, from Liverer to deliver, from Latin Liberare to free – more at Liberate. First Known Use:- XIV century. / .

LIVESTOCK = ЖИВОЙ СКОТ – Livestock is a cargo consisting of live animals, such as horses, cows, sheep and chickens. / Груз, состоящий из живых животных, таких как, лошади, коровы, овцы и цыплята.

LIVESTOCK COMMODITIES INDEX = СЫРЬЕВОЙ ИНДЕКС ПО ЖИВОМУ СКОТУ – The Livestock Commodities Index ($GVX) charted by StockCharts.com is published by Goldman Sachs. The feeder cattle, lean hogs, live cattle are the livestock included. / Голдмэн Сэкс (Goldman Sachs).

LIVE WEIGHT = ЖИВОЙ ВЕС – Live Weight is the weight of meat, finfish and shellfish at the time of their capture or harvest. Calculated on the basis of conversion factors from landed to nominal weight and on rates prevailing among national industries for each type of processing.

LIVID = МЕРТВЕННО–БЛЕДНОЕ (или СИНЕВАТОЕ, или СЕРОВАТО–СИНЕЕ, или СИНЕВАТО–БАГРОВОЕ, или XX) – Livid:- reddish.

LIVING MODIFIED ORGANISM = ЖИВУЩИЙ МОДИФИЦИРОВАННЫЙ ОРГАНИЗМ – Living Modified Organism is any living organism that possesses a novel combination of genetic material obtained through the use of modern biotechnology.

LIVING RING = XX – Living Ring:- xxxxx. See also Revolving Spinning Ring.

LK = SRI LANKA

LKH = LOWEST KNOWN HYDROCARBONS

LKR = SRI LANKAN RUPEE

LLAMA = ЛАМА – Llamas are a member of the Camelid Family fiber originally from South America. / Под Ламой понимается понимается Род Парнокопытных животных Семейства Верблюдовых. Длина 1.2–1.75 м. 2 Вида – Гуанако и Викунья, обитают в высокогорьях Анд; оба одомашнены – собственно Лама (одомашненный Гуанако) и Альпака (Гуанако, скрещённый с Викуньей). Лам используют как вьючных животных; очень ценится шерсть. Лама (Lama), Род Парнокопытных животных Семейства Верблюдовых. В отличие от Верблюдов, не имеют горба. Размеры сравнительно небольшие:- длина тела 120–175 сантиметров (см), высота в холке 90–100 см, весят 48 – 96 килограммов (кг). Ноги длинные, тонкие. Шея и уши длинные, хвост короткий. Шерсть длинная. В диком состоянии встречаются 2 Вида – Гуанако и Вигонь, или Викунья. Некоторые зоологи выделяют Вигонь в особый Род Vicugna. Кроме того, существуют одомашненные Ламы. Дикие и домашние Виды Лам в неволе при совместном содержании могут скрещиваться, часто давая плодовитое потомство. Собственно Лама – одомашненный Гуанако – несколько крупнее дикого (весит до 110 кг). Окраска от чисто белой до чёрной, часто пятнистая. Ламы разводят в Перу и Боливии как вьючное животное; по горным дорогам могут нести вьюк до 60 кг. Шерсть стригут и используют для изготовления грубой ткани. Альпака (весит до 80 кг) – одомашненный Гуанако, скрещённый с Вигонью; разводят ради ценной шерсти в высокогорье Анд (на высоте более 3 800 метров (м)).

LLC = LIMITED LIABILITY COMPANY

LLCOTTON25 = ЭЛ.ЭЛ.ХЛОПЧАТНИК25 – LLCotton25, gm Cotton, contains the bar gene which confers tolerance to the herbicide glufosinate ammonium (also called Phosphinothricin), the active constituent of the herbicides Basta®, Finale®, Buster® and Liberty®. LLCotton25 plants can be sprayed with glufosinate ammonium to kill problem weeds without damaging the crop itself. LLCotton25 contains a single copy of the bar gene derived from the common soil Bacterium Streptomyces Hygroscopicus. The bar gene encodes the phosphinothricin acetyltransferase (PAT) enzyme, which converts glufosinate ammonium, the active constituent in herbicides such as Basta® and Liberty®, into an inactive form and thus renders the plant tolerant to the herbicide. The bar gene confers tolerance to the herbicide glufosinate ammonium in both laboratory cultures during the initial stage of selection of gm plants and when applied to whole plants in the field. No other selectable marker was used. The gm plants show tolerance to the herbicide at all developmental stages.

LLCOTTON25/BOLLGARD II® = ЭЛ.ЭЛ.ХЛОПЧАТНИК25/БОЛГАД II® – LLCotton25/Bollgard II®, gm Cotton, was produced by conventional breeding of LLCotton25 with GM Bollgard II® Cotton. This introduced two genes that produce insecticidal proteins which provide resistance to the major caterpillar Pests of Cotton. LLCotton25/Bollgard II® Cotton Plants contain all of the genes introduced into each of the parental gm Cottons.

LLDC = LEAST DEVELOPED OF THE LESS DEVELOPED COUNTRIES

LLOYD'S = ЛОЙДЗ – Lloyd's:- depending on the context this term may refer to:- (i) the society of individual and corporate underwriting members that insure and reinsure risks as members of one or more syndicates. Lloyd's is not an insurance company; (ii) the underwriting room in the Lloyd's Building in which managing agents underwrite insurance and reinsurance on behalf of their syndicate members. In this sense Lloyd's should be understood as a market place; or (iii) the Corporation of Lloyd's which regulates and provides support services to the Lloyd's market. Over 300 years ago Lloyd's began in Edward Lloyd's coffee house as a place where ship-owners could meet people with capital to insure them. Since then, Lloyd's has grown from its marine insurance base to become the world's leading market for specialist property and casualty insurance, covering some of the world's largest, most complicated and unique risks. Today, Lloyd's remains a face-to-face market, with all the dynamism and innovation that a market generates. Like any market, it enables those with something to sell – underwriters providing insurance coverage – to make contact with those who want to buy – brokers, working on behalf of their clients who are seeking insurance. The Underwriting Room is central to the smooth running of the Lloyd's subscription market, where large and complex risks can be shared between market participants. Lloyd's is not an insurance company, it is a partially mutualised market where members of Lloyd's join together as syndicates to insure risks. Much of Lloyd's business is written on a subscription basis, with more than one syndicate taking a share of the same risk. Lloyd's is licensed to underwrite business in 79 territories and can accept risks proposed from over 200 countries and territories in accordance with local laws and regulation. Lloyd's licences offer broad access to major direct and reinsurance markets worldwide. A full list of countries covered by Lloyd's licences is available at:- http://www.lloyds.com/worldwide. Lloyd's total business by class (in 2007):- (i) Reinsurance – 33%, (ii) Property – 23%, (iii) Casualty – 21%, (iv) Marine – 8%, (v) Energy – 6%, (vi) Motor – 6%, and (vii) Aviation – 3%. As at 31 December 2007, there were 72 syndicates at Lloyd's. Syndicates operate on an ongoing basis, although they are technically a series of annual ventures. Members have the right, but not the obligation, to participate in syndicates for the following year. In practice, most syndicates are supported by the same capital providers for several years. The stability of the core capital base enables syndicates to function like permanent insurance operations under the Lloyd's umbrella. A large proportion of Lloyd's business is conducted in the Underwriting Room at Lloyd's, where most of the syndicates have a presence. Here, detailed negotiations take place regarding the risks brokers wish to place at Lloyd's. Most of these placements involve face-to-face negotiations with much work underway to improve the supporting business processes and to develop an electronic infrastructure. Some syndicates specialise in underwriting a certain type of insurance, whereas others write a range of classes. Having direct access to this concentration of underwriting skill gives Lloyd's its excellent reputation for expertise, innovation and quick decision-making. As at 31 December 2007, there were 46 managing agents at Lloyd's. A managing agent is a company set up to manage one or more syndicates on behalf of the members who are the providers of capital. The managing agent employs the underwriters and handles the day to day running of the syndicate's infrastructure and operations. Many syndicates are now managed and funded by a single corporate group, integrating the management and capital provision. In a 'dedicated' model, the syndicate is supported by a single capital provider, ownership of which is not connected to ownership of the managing agent. For other syndicates, the capital is provided by a 'spread' of different members, who may include both private individuals and corporate groups, and the managing agent may be separately owned and managed. It is the members of Lloyd's who provide the capital to support the syndicates' underwriting. Today, members are drawn from some of the world's major insurance groups and companies listed on the UK stock exchanges as well as individuals and limited partnerships. Corporate members provide a significant majority of the total capital of the Lloyd's market. Private members typically support a number of syndicates, while

a corporate member usually underwrites through a single syndicate. Members' agents provide advisory and administrative services to members. A member is liable only for its share of the risks underwritten and is not responsible for meeting any other member's underwriting liabilities. Lloyd's unique capital structure, often referred to as the 'Chain Of Security', provides excellent financial security to policyholders and capital efficiency to members. The Corporation is responsible for setting both member and central capital to achieve a level of capitalization that is robust and allows members the potential to earn superior returns. There are three 'links' in the chain:- the funds in the first and second links are held in trust, primarily for the benefit of policyholders whose contracts are underwritten by that member. Members underwrite for their own account and are not liable for other members' losses. The third link contains mutual assets held by the Corporation which are, subject to the approval of the Council, available to meet the insurance liabilities of any member. All premiums received by a syndicate are held in its premiums trust funds, and are the first resource for paying policyholder claims of that syndicate. Funds are generally held in liquid assets to ensure that liabilities can be met as they fall due. Profits are not released until full provision has been made for future liabilities. The reserves of each syndicate are subject to annual independent audit and actuarial review. Each member, either corporate or individual, must provide capital to support its underwriting at Lloyd's. In accordance with the FSA regime, each syndicate produces an 'Individual Capital Assessment' (ICA) stating how much capital it requires to cover its underlying business risks. The Corporation reviews each syndicate's ICA, to assess the adequacy of the capital level proposed. When agreed, each ICA is then 'uplifted' (by 35% for 2007) to ensure extra capital is in place to support Lloyd's ratings and financial strength. This uplifted ICA (known as the Economic Capital Assessment or ECA) for the syndicate is used to determine the capital that the syndicate's members must provide to support their underwriting. This capital is held in trust as readily realisable assets and can be used to meet any Lloyd's insurance liabilities of that member but not the liabilities of other members. The Corporation's central assets are the third level of security. The Central Fund is funded by members' annual contributions and subordinated debt, issued by the Corporation in 2004 and 2007. In addition to the Central Fund and assets of the Corporation, central assets may be supplemented by a 'callable layer' of up to 3% of members' overall premium limits. Through detailed analysis, the Corporation determines the optimum level of central assets, seeking to balance the need for robust financial security against the members' desire for cost-effective mutuality of capital. In particular, the Corporation's sophisticated modelling stress tests each member's underwriting portfolio against a number of scenarios and a range of forecasts of market conditions. The Corporation's current target for unencumbered central assets is a minimum of GBP1.7 bn. Members' contributions to the Central Fund are set at 0.5% of gross written premiums for 2008. The Council of Lloyd's regularly reviews the central assets target and the level of contributions in light of the current financial position and forecasted needs, and will adjust the contribution levels as required. The Corporation also prepares an ICA for Lloyd's overall, using the FSA's six risk categories to examine the risks that are not captured in each syndicate's ICA. The Corporation, for example, must consider the risks posed by a global pandemic or damage to the Lloyd's building. In addition, the Corporation calculates and reports on the statutory solvency position of the Society of Lloyd's to the FSA. As at 2007-December-31, the Society had an estimated solvency surplus of GBP2 289 m. As with all insurers, the largest risk facing Lloyd's is insurance risk: the inherent uncertainty of the size and timing of insurance liabilities. At Lloyd's, each syndicate sets its own risk appetite, develops a business plan, plans its reinsurance protection and manages its exposures and claims. Through the Franchise Performance Directorate, the Corporation regularly reviews the performance of the syndicates in each of these activities to ensure that it is satisfied with the level of risk posed to the overall market and its mutual assets. The Corporation uses various tools to control and monitor insurance risk, including:- (i) setting guidelines for catastrophe exposure and reinsurance usage; (ii) setting realistic disaster scenarios to assist in the measurement and management of catastrophe exposures at a syndicate and market level; (iii) reviewing business plans and determining appropriate capital requirements; and (iv) establishing and monitoring underwriting standards, including claims and exposure management principles. Each area of potential risk is considered by expert teams within the Corporation. If a syndicate's operations pose an unacceptable risk, the Corporation will work with that syndicate to make appropriate changes. If the syndicate does not respond to this facilitative approach, the Corporation can also withhold or withdraw approval of a business plan and in extreme cases can terminate the right of a managing agent and its syndicate to trade in the market. The process of setting required capital for syndicates and members also begins with the syndicate's assessment of its own risks. / инновация . Корпорэйшэн оф Лойдз (Corporation of Lloyd's), Английское страховое объединение, одна из важнейших Английских монополий, тесно связанная с крупными промышленными монополиями и банками Великобритании и других капиталистических стран. Лойд возник в конце XVII века и получил название от Эдвода Лойда (Edward Lloyd), владельца кофейного дома в Лондоне, где заключались сделки морского страхования. Устав Лойда был утверждён в 1871 Актом о Лойде (Lloyd's Act). В дальнейшем он претерпел изменения, вызванные расширением операций. От проведения операций по морскому страхованию Лойд с начала XX века перешёл к проведению практически всех видов имущественного, а также личного страхования. В 1970 получил страховых платежей на сумму 786 миллионов Фунтов Стерлингов. Лойд в значительной степени определяет условия и конъюнктуру по морскому и авиационному страхованию на международном рынке. Юридически Лойд – ассоциация отдельных членов-страховщиков, которые объединены в страховые синдикаты. В 1973 насчитывалось свыше 7 тысяч членов Лойда, входивших в 261 синдикат. Во главе Лойда стоит комитет, ведающий только организационными вопросами. Как объединение Лойд не несёт ответственности перед страхователями по обязательствам отдельных членов. Страхования заключаются от имени членов Лойд, каждый из которых несёт ответственность перед страхователем в пределах той суммы, которую принял на свой риск. В отличие от акционеров акционерных страховых компаний, ответственность которых ограничена их долей в акционерном капитале, члены Лойд отвечают всем своим имуществом. Страхования могут заключаться только через посредников-брокеров Лойда. 75% всех операций Лойд проводит за границей. Поступления от страховых операций в других странах в 1972 составили 206 миллионов Фунтов Стерлингов, или почти половину всех поступлений Английского страхового рынка от зарубежных операций. Контакты с другими монополиями внутри страны и с международными организациями осуществляются через ассоциации Лойда. Старейшими являются:- Ассоциация Морских Страховщиков Лойда, Ассоциация Страховщиков Лойда, проводящих страхование от огня, и другие неморские страхования, Ассоциация Страховых Брокеров Лойда и другие. В начале XVIII века Лойд стал издавать список судов. Впоследствии на этой основе была создана самостоятельная организация с представительством в ней комитета Лойда – Регистр Судоходства Лойда (Lloyd's Register of Shipping), который наблюдает за постройкой морских судов, присваивает им класс и ежегодно издаёт список судов морского торгового флота всех стран с указанием порта приписки. В 1856 Лойд совместно с Английскими страховыми компаниями создал Спасательную Ассоциацию (Salvage Association), с 1867 – Ассоциация для защиты коммерческих интересов в отношении подвергнувшегося крушению и повреждённого имущества.

LLOYD'S ACT 1982 = АКТ О ЛОЙДЗ ОТ 1982 – Under Lloyd's Act 1982, the governing body of the market is the Council of Lloyd's. Under the Act, the Council has the management and superintendence of the affairs of the Society and the power to regulate and direct the business of insurance at Lloyd's. In addition, the Council also has the power to make byelaws for the proper and better execution of the Lloyd's Acts and the furtherance of the objects of the Society, and for various specific purposes set out in the Act. The Council comprises six working and six external members, together with six nominated members. Nominated members are usually appointed for three-year terms which can be renewed. Working and external members are generally elected for terms of three years by the working and external members of the Society respectively. In accordance with Lloyd's Act 1982, the Chairman and Deputy Chairmen of Lloyd's

are elected annually by the Council from among the working members of the Council. The Chairman of Lloyd's commits as much time as is necessary to successfully undertake the role. The Council acknowledges that the Chairman has other commitments outside Lloyd's and is satisfied that these can be accommodated with the Chairmanship of Lloyd's. The nominated members of the Council may be regarded, for the purposes of the Combined Code, as independent members of the Council with the exception of the CEO who is included within their number. Although the concept of a senior independent director does not strictly apply to the Council, Bill Knight (a nominated member) was elected a Deputy Chairman of the Council by the Council. In the elections for working members of the Council, voting operates on a one member, one vote basis. In the elections for external members of the Council, the voting entitlement of an external member of the Society is based on the member's allocated underwriting capacity as determined under the Council and Committee Byelaw. The Council reports to the members at the Annual General Meeting. Voting entitlement at general meetings is generally capacity-based for both external and working members, except at general meetings called on the requisition of members under section 6(4) of the Lloyd's Act 1982 for the purpose of revoking or annulling byelaws, at which each member has one vote. The Council met 6 times in 2007. The most recent of seven private Acts of Parliament that define the powers of the Society of Lloyd's. The Council of Lloyd's was made the governing body of Lloyd's under this Act. By Lloyd's Act 1871, the then existing association of underwriters was incorporated as the Society and Corporation of Lloyd's (the 'Society'). Its activities are governed by statute and, since 1982, have been managed by the Council of Lloyd's pursuant to Lloyd's Act 1982. The Society is not an insurance company, although the group does include insurance company subsidiary undertakings. Its principal activities are:- (i) to facilitate the carrying on of insurance business by members of Lloyd's, who join together as syndicates to insure and reinsure risks, and the protection of their interests in this context; and (ii) to maintain the Lloyd's Central Fund where assets are held and administered at the discretion of the Council of Lloyd's, primarily as funds available for the protection of policyholders. / Корпорэйшэн оф Лойдз (Corporation of Lloyd's).

LLOYD'S AGENT = АГЕНТ ЛОЙДЗ – Persons appointed by the Corporation of Lloyd's and stationed in most world ports. One of their many functions is to safeguard Lloyd's interests and report movements and losses of ships. Lloyd's Agent is a firm that is appointed to conduct or arrange surveys of ships and cargoes for Lloyd's underwriters, other insurers and commercial interests throughout the world. Many Lloyd's agents also undertake non-marine surveys, act as loss adjusters and provide information about shipping movements and losses. There are over 300 Lloyd's agents, 160 of whom have authority to settle claims on behalf of Lloyd's underwriters and insurance companies. / Корпорэйшэн оф Лойдз (Corporation of Lloyd's).

LLOYD'S AMERICAN TRUST FUND = АМЕРИКАНСКИЙ ТРАСТОВЫЙ ФОНД ЛОЙДЗ – Lloyd's American Trust Fund is a trust fund that is maintained in the United States for the protection of holders of US Dollar denominated policies which incepted between August 1939 (when the fund was established) and 1995-July-31. It is a premiums trust fund.

LLOYD'S BROKER = БРОКЕР ЛОЙДЗ – Lloyd's Broker is an intermediary who negotiates insurance contracts with Lloyd's underwriters on behalf of his clients, the assured. For a broker to be admitted as a Lloyd's broker he must satisfy the Committee of Lloyd's that he is a suitable person to become a Lloyd's broker. Only Lloyd's brokers and their nominated substitutes (holding a valid Lloyd's security pass) are permitted to enter the underwriting room at Lloyd's to transact business with underwriters. A firm that is listed in the register of Lloyd's brokers maintained under the Intermediaries Byelaw which is permitted to broke insurance business at Lloyd's. A syndicate can generally only accept insurance business that has been broked or placed from or through a Lloyd's broker.

LLOYD'S CANADIAN TRUST FUND = КАНАДСКИЙ ТРАСТОВЫЙ ФОНД ЛОЙДЗ – Lloyd's Canadian Trust Fund is a trust fund that is maintained in Canada for the protection of holders of insurance policies covering Canadian risks. It is a premiums trust fund.

LLOYD'S DOLLAR TRUST FUNDS = ДОЛЛАРОВЫЕ ТРАСТОВЫЕ ФОНДЫ ЛОЙДЗ – Lloyd's Dollar Trust Funds:- these funds are maintained in the United States for the protection of holders of US Dollar denominated policies which incepted on or after 1995-August-01 (when the fund was established). They are premiums trust funds.

LLOYD'S FRANCHISE BOARD = ПРАВЛЕНИЕ ЛОЙДЗ ПО ФРАНШИЗАМ – Franchise Board is the board established by the Council, which is responsible for managing the Franchise. The Council established the Franchise Board as from 2003-January-01 and set it a goal:- 'To create and maintain a commercial environment at Lloyd's in which the long-term return to all capital providers is maximised'. The Franchise Board must operate within the boundaries of the limitations established by the Council which include operating in accordance with the Franchise Principles. The latter cover three main areas:- (i) the overriding principles (relating to legal, regulatory and corporate governance); (ii) the capital principles (which emphasise equity between capital providers and prudence in capital setting); and (iii) the operating principles (including setting the market supervision framework in accordance with FSA requirements). In 2007, the Franchise Board comprised the Chairman of Lloyd's, who was also its Chairman, the CEO, the Franchise Performance Director and the Director, Finance, Risk Management and Operations, with the balance of the Board made up of three non-executives connected with the Lloyd's market and three independent non-executives. The Franchise Board held 11 meetings in 2007. It also held one half day off-site meeting. The main committees of the Franchise Board and their purpose are outlined below:- (i) Market Supervision and review committee (MSARC):- MSARC acts as a review body capable, where appropriate, of amending, modifying or withdrawing certain decisions taken by the executive affecting managing agents. It also acts as the body that determines whether certain decisions can be referred to the Lloyd's Appeal Tribunal and can also make certain business decisions itself. MSARC also takes decisions regarding the exercise of Lloyd's enforcement powers. The MSARC met on 4 occasions in 2007. (ii) Capacity Transfer Panel:- the Capacity Transfer Panel has been established principally to exercise the Council's powers in relation to minority buyouts and mergers. The Panel met on 6 occasions in 2007. (iii) Investment Committee:- the Investment Committee sets the investment objectives and parameters of centrally managed assets and is responsible for monitoring the performance of these funds. In addition, it monitors the investment operations of the Lloyd's Treasury department in respect of all funds under its management and approves all investment counterparties. It may also make more general recommendations concerning investment activity at Lloyd's. The Investment Committee met on 4 occasions in 2007. The board established by the Council of Lloyd's which is responsible for developing and directing the implementation of the franchise policy to create an maintain a commercial environment at Lloyd's in which the long term return to all capital providers is maximized. The Council delegates certain of its powers to the Board which may operate within limitations set by Council. The Council of Lloyd's is the governing body of the Society of Lloyd's, with ultimate responsibility for the management of Lloyd's. For many of its functions, the Council now acts through the Franchise Board, whose members are appointed by the Council and are drawn from inside and outside the Lloyd's market. The day-to-day powers and functions of the Council and Franchise Board are exercised by the executive of the Corporation. The members of the Executive Team are the CEO and the Directors of the Corporation.

LLOYD'S MARKET = РЫНОК ЛОЙДЗ – Lloyd's Market:- this term may refer to the place where business is transacted between managing agents and Lloyd's brokers, or to the syndicates that provide cover at Lloyd's. The Lloyd's Market remains in a strong competitive position. Interest from new sectors, record financial strength, rating agency affirmations and a number of new syndicate applicants confirm that Lloyd's is an attractive place to do business. / , от Латинского слова Affirmo, означающее Утверждаю, .

LLOYD'S MARKET BOARD = ПРАВЛЕНИЕ РЫНКА ЛОЙДЗ – Lloyd's Market Board is the committee of the Council of Lloyd's that was formerly responsible for the development and growth of Lloyd's worldwide business. It was abolished in 2002 in anticipation of the transfer of its responsibilities to Lloyd's Franchise Board.

LLOYD'S OF LONDON = У ЛОЙДЗ ИЗ ЛОНДОНА (или ЛОНДОНСКИЙ ЛОЙДЗ) – Lloyd's Of London is a society, incorporated under Act of Parliament of 1871 and known as the Corporation of Lloyd's, which provides the premises for a wide variety of services, administrative staff and other facilities to enable the Lloyds market to carry on insurance business efficiently. The international insurance and reinsurance market in London. Lloyd's of London is a British insurance market. It serves as a meeting place where multiple financial backers or members, whether individuals (traditionally known as Names) or corporations, come together to pool and spread risk. Unlike most of its competitors in the reinsurance market, it is neither a company nor a corporation. / Корпорэйшэн оф Лойдз (Corporation of Lloyd's). Лондонский Лойдз – Лондонская асссоциация андеррайтеров (Lloyd's Underwriters) и страховых брокеров (Lloyd's Brokers), которая получила известность благодаря страхованию от большого числа различных рисков. Lloyd's сама не является андеррайтером. Она представляет более 350 синдикатов андеррайтеров (Lloyd's Underwriters), насчитывающих порядка 30 000 андеррайтеров, которые стали членами ассоциации, сделав значительный взнос и взяв на себя неограниченную ответственность. Операции по страхованию осуществляют порядка 260 основных брокеров – членов Lloyd's (Lloyd's Brokers).

LLOYD'S OPEN FORM = ОТКРЫТАЯ ФОРМА ЛОЙДЗ – The bottom left hand corner of every Lloyd's Open Form (LOF) lists dates on which previous editions of the form have been published. The earliest date is 1908-January-15, but several forms of salvage agreement acceptable to Lloyd's had been in existence for many years previously. By 1908, a significant number of salvage claims had been resolved by arbitration, either by the Committee of Lloyd's or by an arbitrator appointed by the Committee. The story of LOF began in April 1890 when, in response to concern regarding the activities of certain salvors in the Dardenelles and Black Sea regions, Colonel Sir Henry Hozier, the Secretary to Lloyd's, visited Vincent Grech, the most prominent salvor in the area. There had been complaints from Masters of unreasonable behaviour by salvors. Invariably, the Master was compelled to sign a contract for payment of a lump sum frequently regarded as grossly excessive. Nevertheless, in January 1891 further support for arbitration by or on behalf of the Committee of Lloyd's was received from the General Shipowners' Society, which called on Lloyd's to prepare a standard form of salvage agreement in terms which might receive universal support Nevertheless, in January 1891 further support for arbitration by or on behalf of the Committee of Lloyd's was received from the General Shipowners' Society, which called on Lloyd's to prepare a standard form of salvage agreement in terms which might receive universal support. Lloyd's adopted this suggestion and a draft contract was prepared by Waltons. Whilst modelled on the agreement negotiated with Grech, it differed in one important respect. Instead of providing that the fixed price should be paid to the salvor on completion of the services, it stated that the amount should be paid to Lloyd's in cash, where it would be held on deposit pending the outcome of arbitration. The draft was approved by Lloyd's Agency Committee on 1891-July-28. Negotiations then took place, in the hope that the draft would prove acceptable to all concerned. A measure of success was achieved but the International Salvage Union (ISU) of Copenhagen refused to accept the arbitration provisions. In their view, in the event of a dispute, Lloyd's and the salvor should each appoint their own arbitrator, who would have power to appoint an umpire if they were unable to reach agreement on remuneration. The ISU, however, was prepared to accommodate Lloyd's on one point. It was willing to agree not only that the fixed price need not be paid at termination of the services but that, in the event of an objection to the price, it would be sufficient for the underwriters concerned to provide security to Lloyd's for the payment of the amount awarded by arbitration. In pragmatic fashion, Lloyd's concluded a separate agreement with the ISU on this basis in December 1891. Shortly afterwards, a similar arrangement was agreed with another prominent salvor, Berging Maatschappij of Maasluis. Progress had been made, but the fact that it had not been possible to achieve a form of contract acceptable to all was recognised as unsatisfactory. Accordingly, during 1892, various amendments were made to the July 1891 draft, in the hope that this would improve the form's acceptability. Unfortunately, this produced complaints from Grech and others, who felt that the form had become too lengthy. Waltons responded with a shortened form and both long and short versions were published in 'Lloyd's Seaman's Almanac'. Yet Lloyd's remained keen to pursue the goal of one standard form and Waltons prepared the first so-called 'Lloyd's Salvage Agreement' in November 1892. Its material provisions are set out in the report of the Court of Appeal's decision in 'The City of Calcutta' (1898) 8 Asp. 442 – the first case to come before the courts involving a 'Lloyd's Salvage Agreement'. A form for continuous or open coverage based on standards and forms set by Lloyd's of London. The first modern text of the Lloyd's Form of Salvage Agreement (universally known as Lloyd's Open Form, or LOF) was adopted in 1892. By 1908 the text had been standardised. Since then LOF has undergone 10 revisions; the current edition is LOF 2000, introduced in September 2000. The LOF contract continues to evolve, to meet changing circumstances and new concerns – most recently the priority now given to protection of the marine environment. LOF is the most widely used 'no cure-no pay' salvage contract. In return for salvage services, the salvor receives a proportion of the 'salved value' (the value of the ship, its bunkers and cargo). Traditionally, reward depends upon success and the recovery of property. In the past, if there was no recovery, there was no payment, whatever the expense of the operation. This has changed in recent years, to reflect the public interest in prevention of damage to the environment. The salvor can now contract in such a way that he is shielded from loss when responding to high risk or low value casualties. There are various alternative 'national' forms of salvage contract, such as the Japanese Form, Beijing Form, Moscow Form and Turkish Form. LOF, however, remains the internationally preferred contract. A total of 4 987 salvage operations were performed by ISU members in the period 1978–2004. Of this total, 2 644 operations were carried out under LOF, no cure-no pay. The 'salved value' of ships, bunkers and cargoes involved in these operations totalled some USD30.2 billion. LOF is administered in London by the Salvage and Guarantees Department of Lloyd's. The contract is designed to encourage instant action to save ships and cargoes, by avoiding delays that might otherwise arise from commercial haggling. The resolution of disputes, together with the assessment of the salvage award, is deferred until the salvage task is completed. The parties can get on with the job, safe in the knowledge that – at the end of the day – there will be a fair and just conclusion. / хозяин (или капитан). Полковник Сэр Хэнри Хозиэ, Секретарь Лойдз (Colonel Sir Henry Hozier, the Secretary to Lloyd's) Винсэнт Грэк (Vincent Grech). Волтэнз (Waltons). Берхинь Мацхапэй (Berging Maatschappij) из Маслёса или Масслёйса (Maasluis), Нидерланды.

LLOYD'S POLICY SIGNING OFFICE LTD = ЛОЙДЗ ПАЛИСИ САЙНИНЬ АФИС ЛИМИТИД (или ПОДПИСЫВАЮЩИЙ ПОЛИСЫ ОФИС ЛОЙДЗ ЭЛ.ТИ.ДИ.) – Lloyd's Policy Signing Office Ltd used to be part of the Corporation of Lloyd's. Following its incorporation it is now part of the Xchanging group of companies. / Корпорэйшэн оф Лойдз (Corporation of Lloyd's).

LLOYD'S REGISTER = РЕГИСТР ЛОЙДЗ – Lloyd's Register has been published annually since at least 1775; since 1834, it has been published in the middle of the year, covering the following period 01 July through 30 June. A catalogue of ships describing each ship – dimensions, age, place of construction, registry, ownership, etc. A necessary tool for the ocean marine underwriter. Similar information is published by the American Bureau of Shipping. Lloyd's Register of (British and Foreign) Shipping is a British publication that describes, classifies and registers vessels according to certain criteria of physical structure and equipment, to enable underwriters, shipbrokers, and shipowners more easily to assess commercial risk and to negotiate marine insurance rates. The name Lloyd derives from Edward Lloyd, the coffee man, as he called himself, who operated a coffee house in London, originally in Tower Street, then, from

just after Christmas 1691, in Lombard Street, near the General Post Office. Lloyd's coffee house served as a meeting place for merchants wishing to exchange news, as well as for merchants and underwriters wishing to negotiate insurance on vessels and cargo. / Американское Бюро Судоходства, Регистр Судоходства Лойда. Эдвод Лойд (Edward Lloyd). Под Регистром, от позднелатинского слова Registrum, означающее Перечень или Список, понимается:- (i) опись, перечень, список или учётный документ, имеющий правовое значение; или (ii) название специального органа, осуществляющего функции надзора в специальной области управления.

LLOYD'S REGISTER OF SHIPPING = РЕГИСТР СУДОХОДСТВА ЛОЙДЗ – Lloyd's Register Of Shipping:- an independent non-profit-making society. It undertakes surveys and classification of vessels; also produces various annual publications. Lloyd's Register of Shipping is the British classification society. / Регистр Судоходства Лойдз – Британское классификационное общество.

LLOYD'S REGISTRY = РЕГИСТРАТУРА ЛОЙДЗ – Lloyd's Registry is an organization maintained for the surveying and classing of ships so that insurance underwriters and others may know the quality and condition of the vessels offered for insurance or employment. / Под Регистром, от позднелатинского слова Registrum, означающее Перечень или Список, понимается:- (i) опись, перечень, список или учётный документ, имеющий правовое значение; или (ii) название специального органа, осуществляющего функции надзора в специальной области управления. Под Реестром, от Польского слова Rejestr от позднелатинского слова Regestrum или Registrum, означающее Перечень или Список, понимается:- (i) опись, перечень или список; или (ii) книга для регистрации дел, документов, имущества и тому подобного.

LLOYD'S SOLVENCY TEST = ТЕСТ ЛОЙДЗ НА ПЛАТЁЖЕСПОСОБНОСТЬ – Lloyd's Solvency Test is a test that is undertaken annually to ensure that members of the Society have sufficient eligible assets to meet their underwriting liabilities. The test is undertaken at member level and also on an aggregate basis for all members taking in account the centrally held assets of the Society such as the New Central Fund. Any member that fails the solvency test at member level will be required to provide additional funds or cease underwriting. The centrally held assets of the Society must be sufficient to cover any shortfall of assets at member level.

LLOYD'S SYNDICATE = СИНДИКАТ ЛОЙДЗ (или СИНДИКАТ ЛОЙДА) – Lloyd's Syndicate is a group of underwriting members at Lloyd's whose acceptances and liabilities are handled jointly by an underwriting agency acting on their behalf, while each member remains legally liable solely for his/her own share of the syndicate's liability. A group of underwriters at London Lloyd's who entrust the underwriting of their business to one underwriter. Lloyd's is not an insurance company. It is an insurance market of members. As the oldest continuously active insurance marketplace in the world, Lloyd's has retained some unusual structures and practices that differ from all other insurance providers today. Originally created as an unincorporated association of subscribing members in 1774 it was incorporated by the Lloyd's Act 1871, and is currently governed under the Lloyd's Acts of 1871 through to 1982. Lloyd's itself does not underwrite insurance business, leaving that to its members. Instead the Society operates effectively as a market regulator, setting rules under which members operate and offering centralised administrative services to those members. Structurally Lloyd's is governed by the Council of Lloyd's, an 18 member body roughly equivalent to the board of directors of a company. The Council administers the Corporation of Lloyd's which runs the various services and administrative operations of Lloyd's. The Council delegates most of its day to day oversight roles, particularly relating to ensuring the market operates successfully, to the Franchise Board. There are two classes of people and firms active at Lloyd's. The first are members or providers of capital, the second are agents, brokers, and other professionals who support the members, underwrite the risks, and represent outside customers (for example, individuals and companies seeking insurance, or insurance companies seeking reinsurance). For most of Lloyd's history, rich individuals (Names) backed policies written at Lloyd's with all of their personal wealth (unlimited liability). Since 1994, Lloyd's has allowed corporate members into the market, with limited liability. The losses in the early 1990s devastated the finances of many Names (upwards of 1 500 out of 34 000 Names were declared bankrupt) and scared away others. Today, individual Names provide only 10% of capacity at Lloyd's, with corporations accounting for the rest. No new Names with unlimited liability are admitted, and the importance of individual Names will continue to decline as they slowly withdraw, convert (generally, now, into Limited Liability Partnerships) or die. Managing agents sponsor and manage syndicates. They canvas members for commitments of capacity, create the syndicate, hire underwriters, and oversee all of the syndicate's activities. Managing agents may run more than one syndicate. Members' agents coordinate the members' underwriting and act as a buffer between Lloyd's, the managing agents and the members. They were introduced in the mid 1970s and grew in number until many went bust; there are now only three left (Argenta, Hampden and LMAS (which has no active names). It is mandatory that unlimited Names write through a members' agent. Outsiders, whether individuals or other insurance companies, cannot do business directly with Lloyd's syndicates. They must hire Lloyd's brokers, who are the only customer-facing companies at Lloyd's. They are therefore often referred to as Intermediaries. Lloyd's brokers shop customers' policies among the syndicates, trying to obtain the best prices and terms. When corporations became admitted as Lloyd's members, they did not like the traditional structure. Insurance companies did not want to rely on the underwriting skills of syndicates they did not control, so they started their own. An integrated Lloyd's vehicle (ILV) is a group of companies that combines a corporate member, a managing agent, and a syndicate under one ownership. Some ILVs allow minority contributions from other members, but most now try to operate on an exclusive basis. / Адьжентэ (Argenta), Хэмпдэн (Hampden). Лойдз является обобщённым именем Английской страховой монополии, занимающейся морским страхованием и всеми видами имущественного и личного страхования. В начале 1980-х 75% своих операций она проводила за границей. Была основана в конце XVII века. С середины XIX века при Лойдз как самостоятельная организация существуют классификационное общество Регистр Судоходства Лойдз (Lloyd's Register of Shipping), которое наблюдает за постройкой морских торговых судов, присваивает им класс, ежегодно издаёт списки судов морского торгового флота всех стран с указанием порта приписки.

LLOYD'S UNDERWRITERS = РАСПИСЧИКИ ЛОЙДЗ (или АНДЕРРАЙТЕРЫ ЛОЙДЗ) – Lloyd's Underwriters:- this term may variously refer to:- (i) the professional underwriters who are employed by managing agents to underwrite insurance and reinsurance business on behalf of the members of the syndicates that those agents manage; (ii) the members of one or more syndicates that underwrite a particular policy; or (iii) all members (of the Society) collectively. / Этот термин в зависимости от ситуации может относиться к:- (i) профессиональным расписчикам, которые наняты управляющими агентами для расписывания в страховом или перестраховом деле от имени членов синдикатов, которыми те агенты управляют; (ii) членам одного или более синдикатов, которые расписывают конкретный полис; или (iii) ко всем членам (Сообщества) в целом.

LLOYD'S WAITER = ПОДАЮЩИЙ ЛОЙДЗ (или ПОДАВАЛЬЩИК ЛОЙДЗ) – Lloyd's Waiter is a liveried member of Lloyd's staff. / Одетый в фирменную одежду член персонала Лойдз.

LLP = LIMITED LIABILITY PARTNERSHIP

LM = LUMP SUM

LME = LONDON METAL EXCHANGE (LIMITED)

LMO = LIVING MODIFIED ORGANISM

LMP = LOCATIONAL MARGINAL PRICING

LMP = LONDON MARKET PRINCIPLES

LMPCR = LIGASE MEDIATED POLYMERASE REACTION

LMP SLIP = СЛЭП ЭЛ.ЭМ.ПИ. (или КАРТОЧКА ЭЛ.ЭМ.ПИ.) – LMP Slip is a standard form slip that managing agents must use to underwrite insurance at Lloyd's except (i) if the insured requires some other slip to be used; or (ii) the slip relates to motor business, personal lines including motor business or term life business and the slip will not be processed by LPSO Ltd. Research from the London Market Principles (LMP) Programme Office, shows that brokers expect to place 95 percent of their open market business on LMP slips. Lloyd's revealed last year that it was mandating the compulsory use of the LMP slip for ordinary business this year. The latest analysis predicts that only 5 percent will fall under the exemption rules laid down by Lloyd's (2003). The use of standard LMP Slips has helped greatly in our efforts to acheive and promote Contract Certainty (contract certainty is achieved by the complete and final agreement of all terms, including signed down lines, between the insured and insurers before inception). The LMP style slip is designed to establish a market standard for slip construction and to provide greater contractual clarity. Benfield (company), in line with all other Lloyd's brokers, has been the subject of a quarterly slip audit by the LMP Programme Office. Their audit regime has now been embedded in the market and the audit team currently check 25% of all slips placed, analysing compliance and publishing (anonymous) league tables and providing feedback to particpants. The standard LMP Slip has been developed to offer an alternative and improved placement document, which contains all the terms and conditions of the contract. This is also known as the LMP Policy. LMP Slip is a document that provides a complete, accurate and definitive record of the provisions of the contract or contracts of insurance which the insurers enter into, including:- the terms and conditions of each contract (either in full or by reference to Registered Clauses) and will include the risk details including the insured, the premium, the sum insured etc and the other terms and conditions applying to the contract. The identity of the insurer or insurers that have underwritten each contract and what proportion of each contract they have underwritten. The LMP Slip was introduced in October 2001 and was mandated by the Lloyd's Franchise Board for business incepting from the 2nd January 2004. This version (April 2005) of the LMP slip replaces the LMP BRAT slip (November 2003). The document has been updated to reflect changes in the exemptions to the mandate, recent regulatory changes and includes further feedback from the market. This document sets out details of the LMP slip for open market business and defines the business that falls within the scope of the Lloyd's Franchise Board mandate. This document has been agreed and is supported by Lloyd's, the Lloyd's Market Association (LMA), the International Underwriting Association of London (IUA) and the the London Market Insurance Brokers' Committee (LMBC). The LMP Slip, recently replaced by the Market Reform Slip (The Market Reform Slip (MRS June 2006) replaced the LMP April 2005 slip), was first introduced in October 2001 and was mandated by Lloyd's Franchise Board for open market business incepting from 2004-January-02. At this time, Binding Authority Agreements (BAA) were exempt from the mandate as a consistent format did not exist upon which to apply the principles arising from LMP. Subsequently the principles arising from LMP were mandated for Binding Authorities and now Market Reform principles have been established for use with BAAs. This Market Reform Binding Authority Slip guidance sets out the structure and content of the Market Reform Slip for Binding Authorities. The changes made in this version of the slip are designed to align it with the Contract Certainty Code of Practice guidance issued by the Market Reform Group (MRG). We also saw the introduction of the London Market Principles (LMP) Slip. The aim of this was to ensure a common format and content to the way that insurance business was conducted. The LMP slip was followed by the Market Reform slip in an attempt to further increase the efficiency of the placement process. In June 2007 this was replaced by the Market Reform Contract (MRC), the use of which was mandatory for the London market from 2007-November-01. It was intended that the MRC would be the precedent standard for the contract of insurance between the insured and the insurer. / Бэнфилд (Benfield). порядки и условия .

LMRA = LABOR–MANAGEMENT RELATIONS ACT

LNG = LIQUEFIED NATURAL GAS

LNG CARRIER = LIQUEFIED NATURAL GAS CARRIER

LND = LAST NOTICE DATE

LOA = LENGTH OVERALL

LOAD = ЛОУД (или ГРУЗОВАЯ ПАРТИЯ) – A Load of sawn or hewn timber contains 50 cubic feet (1.416 cubic meters), and a load of unhewn timber 40 cubic feet (1.133 cubic meters). / Лоуд – мера измерения объёма круглого леса и пиломатериалов. Лоуд распиленного и тёсаного лесоматериала содержит 50 кубических футов (1.416 кубических метров), а лоуд нетёсаного лесоматериала – 40 кубических футов (1.133 кубических метров).

LOAD = НАГРУЗКА – (1) Load is the amount of electricity delivered or required at any specific point or points on a system. The load of an electricity system is effected by many factors and changes on a daily, seasonal, and annual basis, typically following a pattern. System load is usually measured in MegaWatts (MW). Load is also referred to as Demand. Load is a device which consumes electrical power and is connected to a source of electricity. Load (electric) is the amount of electric power delivered or required at any specific point or points on a system. The requirement originates at the energy consuming equipment of the consumers. Load:- demand for electricity at a given time. / Количество электроэнергии, поставляемое в определённую точку или точки в системе, и необходимое в такой точке или точках. На нагрузку энергетической системы влияет множество постоянных и переменных факторов суточного, сезонного и ежегодного характера, как правило, определённым образом упорядоченных. Нагрузка системы обычно измеряется в МегаВаттах (МВт). Иногда на нагрузку ссылаются как на Потребление или Потребляемую Мощность (Demand).

(2) Load is the product that is picked and loaded onto a truck and transported to a consignee. / Под Партией понимаются товары, направляемые в адрес одного получателя по одному транспортному документу (накладной, коносаменту и так далее) в соответствии с транспортными правилами, а также пересылаемого по одной почтовой накладной или перемещаемые в ручной клади и багаже одного лица, следующего через границу.

LOAD = НАЦЕНКА – (1) Load is the portion of the offering price of shares of open-end investment companies in excess of the value of the underlying assets. Covers sales commissions and all other costs of distribution. The load is usually incurred only on purchase, there being, in most cases, no charge when the shares are sold (redeemed). See also Investment Company. / часть цены предложения акций .

(2) Load is the fee a brokerage firm charges an investor for handling transactions.

LOAD AGGREGATOR = XX – Load Aggregator is an entity licensed to sell energy to retail customers located within the service territory of a local distribution company.

LOAD AT SPECIFIED ELONGATION = НАГРУЗКА ПРИ СПЕЦИФИКАЦИОННОМ УДЛИНЕНИИ – Load At Specified Elongation (LASE) is the load required to produce a given elongation of a yarn or cord.

LOAD BEARING SURFACE = НЕСУЩАЯ НАГРУЗКУ ПОВЕРХНОСТЬ – Load Bearing Surface is an actual area of material in contact with and supporting a unit load.

LOAD BUILDING = НАГРУЗОЧНОЕ СТРОЕНИЕ (или СТРОЕНИЕ НАГРУЗКИ) – A term Load Building refers to programs that are aimed at increasing the usage of existing electric equipment or the addition of electric equipment. Examples include industrial technologies such as induction heating and melting, direct arc furnaces and infrared drying; cooking for commercial establishments; and heat pumps for residences. Load Building should include programs that promote electric fuel substitution. Load Building effects should be reported as a negative number, shown with a minus sign.

LOAD–CARRYING CAPACITY = НЕСУЩАЯ СПОСОБНОСТЬ (или СПОСОБНОСТЬ ВЫДЕРЖИВАТЬ НАГРУЗКУ) – Load-Carrying Capacity is a property of a lubricant to form a film on the lubricated surface, which resists rupture under given load conditions. Expressed as maximum load the lubricated system can support without failure or excessive wear. / или чрезмерный износ.

LOAD COMBINATION FACTOR = ФАКТОР СОЧЕТАНИЯ НАГРУЗОК (или ФАКТОР КОМБИНАЦИИ НАГРУЗОК, или КОЭФФИЦИЕНТ КОМБИНАЦИИ НАГРУЗОК) – Load Combinating Factor is a factor applied to the factored loads in Limit States Design, other than dead load, to take into account the reduced probability of a number of loads from different sources acting simultaneously as applied to Limit States Design. / для Расчёта Предельного Состояния.

LOAD CURVE = КРИВАЯ НАГРУЗКИ – Load Curve is a curve of power versus time showing the level of a load for each time period covered. The horizontal axis is time and the vertical access is load (MW). / Изменение потребляемой мощности во времени, отражающее уровни нагрузки за каждый представленный период времени. Ось абсцисс – время, ось ординат – нагрузка (МВт).

LOAD–DEFORMATION CURVE = КРИВАЯ НАГРУЗКА–ДЕФОРМАЦИЯ – Load-Deformation Curve is a graphical representation of the relationship between the change in dimension (in the direction of the applied force) of the specimen resulting from the application of an external load, and the magnitude of that load. The load may be expressed in units of weight (such as pounds or kilograms) and the deformation in either units of length (such as inches or millimeters) in tension or compression tests, or degrees in shear tests. In a tension test, a load-deformation curve becomes a load-elongation curve.

LOAD DEVICE = УСТРОЙСТВО ЗАГРУЗКИ – Load Device is a physical device operated by a load agent and used jointly by a purse holder and the load agent to transfer value to the purse holder's electronic purse.

LOAD DURATION = ПРОДОЛЖИТЕЛЬНОСТЬ НАГРУЗКИ – Load Duration is the period of continuous application of a specified load, or the aggregate of periods of intermittent applications of the same load. / Период непрерывного воздействия .

LOADED LEG = ГАЛС (или ОТРЕЗОК МАРШРУТА) В ГРУЗУ (или С/ПОД НАГРУЗКОЙ)) – Loaded Leg is a subdivision of a ship's voyage during which the ship is carrying cargo.

LOAD–ELONGATION CURVE = КРИВАЯ НАГРУЗКА–УДЛИНЕНИЕ – The Load-Elongation Curve:- when the load on a specimen is plotted against elongation, an extremely important curve is produced. This curve describes the behavior of the specimen from zero load and elongation up to the breaking point. A close study of this curve can yield further important information like initial Young's Modulus, work of rupture, yield point etc. See also Stress-Strain Curve.

LOADEN VESSEL = ЗАГРУЖЕННОЕ СУДНО (или СУДНО В ГРУЗУ) – Loaden Vessel is a vessel where cargo has been put on board. / Загруженное Судно или Судно В Грузу – то судно, которое приняло груз на свой борт.

LOAD FACTOR = КОЭФФИЦИЕНТ НАГРУЗКИ – (1) Load Factor is the ratio of average load to peak load during a specific period of time, expressed as a percent. The load factor indicates to what degree energy has been consumed compared to maximum demand or the use of units relative to total system capability. An system's load factor shows the variability in all customers' demands. / Отношение средней нагрузки к пиковой нагрузке в течение определенного периода времени, выраженное в процентах. Коэффициент нагрузки отражает уровень потребления энергии в сравнении с максимальным потреблением, либо степень использования мощностей относительно общего потенциала системы. Коэффициент нагрузки системы отражает изменчивость совокупного потребления клиентами.

(2) Load Factor is the ratio of average to peak usage for gas customers for a time period, i.e. one day, one hour, etc. The higher the load factor, the smaller the difference between average and peak demand. / .

(3) Load Factor is the factor applied to a specified load that, for the limit state under consideration, takes into account the variability of the loads and load patterns as applied to Limit States Design. / при Расчёте Предельного Состояния.

(4) Load Factor (in air transport):- revenue tonne-kilometers divided by available tonne-kilometers.

LOAD FOLLOWING = ОТДАВАЕМАЯ НАГРУЗКА (или ВЫРАБАТЫВАЕМАЯ НАГРУЗКА, или ВЫРАБАТЫВАЕМАЯ МОЩНОСТЬ, или ОТДАВАЕМАЯ МОЩНОСТЬ) – Load Following:- the daily varying of power output by a generator to meet system load. / Объём электроэнергии, вырабатываемой генератором для поддержания нагрузки в сети и изменяющийся в течение суток. Рабочая Мощность Электроэнергетической Системы – располагаемая мощность электроэнергетической системы за вычетом мощности агрегатов, выведенных в ремонт. Располагаемая Мощность Электроэнергетической Системы – установленная мощность электроэнергетической системы за вычетом неиспользуемой мощности, обусловленной ограничениями по режимам работы оборудования электростанций и пропускной способности электрической сети. Установленная Мощность Электроэнергетической Системы – суммарная номинальная активная электрическая мощность агрегатов всех электростанций электроэнергетической системы в целом.

LOADING ALLOWANCE = ПОПРАВКА НА НАГРУЗКУ – Loading Allowance:- a reduced rate that carriers offer to shippers and/or consignees who load and/or unload LTL (less than truckload or less than load) or AQ (any quantity) shipments.

LOADING OPERATOR = ОПЕРАТОР ПОГРУЗКИ – Loading Operator is an organization, which operates load devices. It collects, processes and forwards all applicable transaction details to the purse provider. Also known as Loading Agent.

LOADING PORT = ПОРТ ПОГРУЗКИ – Loading Port is the port where the cargo is loaded onto the exporting vessel. This port must be reported on the Shipper's Export Declaration. / Порт Погрузки – порт, в котором груз загружается в вывозящее из страны судно. Этот порт должен быть отмечен в Вывозной Декларации Отправителя (или Экспортной Декларации Отправителя (Shipper's Export Declaration)).

LOAD LIMIT LINE = ПРЕДЕЛЬНАЯ ЛИНИЯ ЗАГРУЗКИ – Load Limit Line is a red line in refrigerated containers that indicates the maximum stowage height of the load to allow sufficient air circulation below the roof.

LOAD LINE = ГРУЗОВАЯ МАРКА – The Load Line, sometimes called the Plimsoll Line, or 'Marks', indicates the depth in the water down to which a ship may be loaded; the position of these marks is governed by international convention and is calculated by a Classification Society surveyor. A Load Line is the line on a vessel indicating the maximum depth to which that vessel can sink when loaded with cargo. A series of horizontal lines, corresponding to the seasons of the year and fresh or saltwater, painted on the outside of a ship marking the level which must remain above the surface of the water for the vessel's stability. Also known as Marks, and Plimsoll Line. See also International Load Line Certificate. / Грузовая Марка, называемая иногда Линией Плимсэла (Plimsoll Line). Под Грузовой Маркой понимается знак в виде ряда горизонтальных линий на обоих бортах судна в середине его длины, показывающий предельно допустимое погружение судна в море или реке в зависимости от времени года и района плавания. Под Грузовой Маркой понимается знак предельной осадки, наносимый на обоих бортах морского судна в середине его длины. Положение грузовой марки по высоте определяется размером установленного правилами минимального надводного борта, который зависит от назначения, размеров и архитектурноконструктивных особенностей судна и удостоверяется Свидетельством о Грузовой Марке, выдаваемым классификационным обществом. Для уменьшения регистровой вместимости при перевозке грузов с большим удельным погрузочным объёмом морские грузовые суда могут иметь Тоннажную Марку, которая показывает наибольшую осадку судна в морской и пресной воде. Грузовая Марка, знак предельной осадки, наносимый на обоих бортах морского судна в середине его длины. Грузовую марку изображают в виде круга, пересечённого по центру горизонтальной линией, которая показывает наибольшую допустимую осадку судна в морской воде (в летнее время в зоне умеренного климата), и ряда горизонтальных линий, показывающих предельное погружение его в море или реке в зависимости от времени года и района плавания. Над грузовой маркой наносят Палубную Линию. Положение грузовой марки по высоте определяется величиной минимального надводного борта, регламентируемой Международной Конвенцией О Грузовой Марке (1966) либо национальными правилами, в зависимости от назначения, размеров и конструктивных особенностей судна, и удостоверяется Свидетельством о Грузовой Марке, выдаваемым Классификационным Обществом. Для уменьшения регистровой вместимости при перевозке грузов с большим удельным погрузочным объёмом морские грузовые суда могут иметь ниже второй палубы Тоннажную Марку – равносторонний треугольник, вершиной касающийся горизонтальной линии с уступом, которая показывает наибольшую осадку судна в морской и пресной воде. Под Маркой Углубления на судне понимаются горизонтальные линии, наносимые через 10 см на наружной обшивке с обоих бортов судна в районе форштевня, ахтерштевня, а на больших судах и на миделе, с числом против каждой, обозначающим углубление судна – отстояние от ватерлинии до нижней кромки горизонтального киля. Марки углубления позволяют оценить посадку судна в эксплуатационных условиях. Грузовая Марка, знак предельной осадки, наносимый на обоих бортах морского судна в середине его длины. Грузовую марку изображают в виде круга, пересечённого по центру горизонтальной линией, которая показывает наибольшую допустимую осадку судна в морской воде (в летнее время в зоне умеренного климата), и ряда горизонтальных линий, показывающих предельное погружение его в море или реке в зависимости от времени года и района плавания. Над грузовой маркой наносят палубную линию. Положение грузовой марки по высоте определяется величиной минимального надводного борта, регламентируемой Международной Конвенцией О Грузовой Марке (1966) либо национальными правилами, в зависимости от назначения, размеров и конструктивных особенностей судна, и удостоверяется Свидетельством о Грузовой Марке, выдаваемым классификационным обществом. Для уменьшения регистровой вместимости при перевозке грузов с большим удельным погрузочным объёмом морские грузовые суда могут иметь ниже второй палубы тоннажную марку – равносторонний треугольник, вершиной касающийся горизонтальной линии с уступом, которая показывает наибольшую осадку судна в морской и пресной воде. Грузовые Марки на бортах судов, соответствующие сезону года и зоне или району плавания, не должны быть погружены на протяжении всего времени, когда судно выходит в море, находится в плавании и приходит в порт за исключением погружения на величину поправки в пресной воде или временного погружения на величину соответственно весу топлива и всех других материалов, используемых судном во внутренних водах перед выходом в море. В тех случаях, когда плотность воды отличается от единицы, поправка должна быть пропорциональна разнице между 1.025 и действительной плотностью. Судно подлежит:- (i) первоначальному освидетельствованию перед вводом в эксплуатацию; (ii) периодическому освидетельствованию – через 5 лет, чтобы удостовериться, что судно полностью отвечает требованиям Конвенции; и (iii) промежуточному – ежегодному, плюс/минус три месяца – что не производилось изменений, влияющих на расчёт определения места нанесения Грузовых Марок и что устройства и средства для закрытия отверстий, штормовых портиков и доступа в помещения команды содержатся в надлежащем состоянии. На основании результатов освидетельствования судну выдаётся Международное Свидетельство о Грузовой Марке (International Load Line Certificate). Свидетельство теряет силу (аннулируется):- (i) при просрочке периодического освидетельствования, ежегодного подтверждения; (ii) при существенных изменениях в корпусе и надстройке судна, влияющих на надводный борт; (iii) при содержании в ненадлежащем состоянии устройств и средств для закрытия ВНЗ; (iv) снижении прочности конструкций корпуса ниже допустимых пределов; и (v) при передаче судна под Флаг другого Государства. Грузовая Марка – знак предельной осадки, наносимый на обоих бортах морского судна в середине его длины (грузовая ватерлиния). Грузовую марку изображают в виде круга, пересечённого по центру горизонтальной линией, которая показывает наибольшую допустимую осадку судна в морской воде (в летнее время в зоне умеренного климата), и ряда горизонтальных линий, показывающих предельное погружение его в море или реке в зависимости от времени года и района плавания. Английские моряки называют грузовую марку Диском Плимсэла, которая на основании правил международной конвенции наносится на борта каждого спущенного на воду торгового судна, если его тоннаж превышает сто пятьдесят регистровых тонн. Впервые такую грузовую марку предложил Самьюэл Плимсэл (Samuel Plimsoll; 1824–1898), Английский политик, социальный реформатор и пивовар из города Дерби, который не имел никакого отношения к судоходству. Применяются следующие грузовые марки:- (i) летняя грузовая марка – Л (S); (ii) зимняя грузовая марка – З (W); (iii) зимняя грузовая марка для Северной Атлантики – ЗСА (WNA); (iv) тропическая грузовая марка – Т (T); (v) грузовая марка для пресной воды – П (F); и (v) тропическая марка для пресной воды – ТП (TF). Для каждого судна грузовую марку размечают по международным правилам, которые обязательны для всех морских держав мира. Поэтому форма грузовой марки везде одинакова. Единственное отличие – в буквах. Обозначение организации, назначившей грузовую марку, наносится над горизонтальной линией, проходящей через центр кольца знака (Диск Плимсэла). Обозначение Регистра Судоходства Российской Федерации – РС, L и R = Регистр Лойда, A и B = Американское Бюро Судоходства и так далее. Различают грузовые марки для лесовозов, пассажирских и парусных судов. Грузовая марка, соответствующая сезону, не должна быть погружена в воду на протяжении всего периода от момента выхода из порта до прихода в следующий порт. Судам, на борта которых нанесены грузовые марки, выдаётся Международное Свидетельство о Грузовой Марке (International Load Line Certificate) на срок не более чем на 5 лет. На каждом судне хранится свидетельство на надводный борт, и если осадка больше, чем это допускается грузовой маркой, то его капитан не имеет права выйти в море. В случае перегрузки портовые власти, ответственные за выход судна в рейс, вправе потребовать удаления лишнего груза и даже задержать судно в порту. Марки углубления ни в коем случае нельзя путать с грузовой

маркой, так как они служат только для измерения фактической носовой и кормовой осадки на данный момент. Применение:- Согласно Международной Конвенции о Грузовой Марке судну запрещён выход в море на международный рейс, если ему не была нанесена грузовая марка и не выдано Международное Свидетельство о Грузовой Марке или, когда необходимо, Международное Свидетельство об Изъятии для Грузовой Марки. Настоящая конвенция применяется ко всем судам кроме:- (i) военных кораблей; (ii) новых судов длиной менее 24 метров (79 футов); (iii) существующих судов валовой вместимостью менее 150 регистровых тонн; (iv) прогулочных яхт, не занимающихся коммерческими перевозками; и (v) рыболовных судов. Ничто в настоящей Конвекции не применяется к судам, совершающим плавание исключительно:- (а) по Великим Озёрам Северной Америки и по Реке Святого Лаврентия в пределах, ограниченных на Востоке прямой линией, проведённой от Мыса Розье до Мыса Вест Пойнт на Острове Антикости, и далее прямой линией, проведённой от Острова Антикости в Северном направлении по меридиану 63° Западной долготы; (б) в Каспийском Море; (в) по рекам Ла-Плата, Парана и Уругвай в пределах, ограниченных на Востоке прямой линией, проведённой между Пунта Раза (Кабо Сан Антонио), Аргентина, и Пунта дель Эсте, Уругвай. Международная Конвенция о Грузовой Марке (International Convention on Load Lines), кратко именуемая КГМ, подписанная 05 Апреля 1966 в Лондоне по инициативе Международной Морской Организации (ИМО). В 1988 специальным Протоколом в неё были внесены изменения, позднее, в 2003 дополненные Комитетом по Безопасности на Море ИМО. Изменённая Конвенция о Грузовой Марке (КГМ-66/88) вступила в силу 01 Января 2005. Конвенция запрещает выход в море судна в международный рейс, если оно не было соответствующим образом освидетельствовано, ему не была нанесена грузовая марка и не выдано Международное Свидетельство о Грузовой Марке или, когда необходимо, Международное Свидетельство об Изъятии для Грузовой Марки. В Приложениях к Конвенции устанавливаются правила определения грузовых марок, условия назначения и величины надводного борта, модификации конвенционных требований по зонам, районам и сезонным периодам, а также приводятся формы Международного Свидетельства о Грузовой Марке. В 1988 был принят Протокол к Конвенции о Грузовой Марке, вступивший в силу в 2000. Этим Протоколом требования Конвенции 1966 относительно освидетельствования и выдачи международных свидетельств были приведены в соответствие с требованиями Международной Конвенции по Предотвращению Загрязнения с Судов (МАРПОЛ 73/78) и Международной Конвенции по Охране Человеческой Жизни на Море (СОЛАС).

LOAD LINES = ЛИНИИ ЗАГРУЗКИ (или УРОВЕНЬ ЗАГРУЗКИ) – Load Lines are the centimeter graduations by which the level of grain in a railcar is measured.

LOAD MANAGEMENT = УПРАВЛЕНИЕ НАГРУЗКОЙ (или РЕГУЛИРОВАНИЕ НАГРУЗКИ) – Load Management is the management of load patterns in order to better use the system. Generally, load management attempts to shift load from peak use periods to other periods of the day or year. / Управление динамикой или распределением или графиком нагрузки в целях повышения эффективности использования системы. В целом, управление нагрузкой сводится к попыткам перераспределить нагрузку с пиковых периодов на другие периоды в течение суток или года.

LOADMASTER = МАСТЕР ПОГРУЗКИ – Loadmaster is a device (calculator or computer) designed for a vessel approved by a classification bureau for the calculation of the vessel's stability.

LOAD PORT = ПОРТ ПОГРУЗКИ – Load Port is a port where cargo is actually loaded on vessel. / Порт Погрузки – порт, в котором груз был фактически погружен на судно.

LOAD RATIO = СООТНОШЕНИЕ С НАГРУЗКОЙ – Load Ratio is the ratio of loaded miles to empty miles.

LOAD RATIO SHARE = ДОЛЯ СООТНОШЕНИЯ С НАГРУЗКОЙ – Load Ratio Share:- ratio of a Transmission Customer's Network Load to the Transmission Provider's total load computed in accordance with Sections 11.2 and 11.3 and calculated on a rolling twelve month basis.

LOAD–RETENTION CAGE = ГРУЗОПОДДЕРЖИВАЮЩАЯ КЛЕТЬ – Load-Retention Cage is a cage made from vertical sides, slatted or mesh, placed on a pallet to secure the load to two or more sides. / Грузоподдерживающий Сетчатый Поддон (Load-Retention Cage) – поддон, имеющий вертикальные решетчатые или сетчатые стенки, устанавливаемые на него, для поддержания груза с двух или более сторон.

LOAD SECURE APPLICATION MODULE = НАДЁЖНЫЙ МОДУЛЬ ПРИЛОЖЕНИЯ ДЛЯ ЗАГРУЗКИ – Load Secure Application Module (LSAM or Load SAM) is a SAM installed at the Loading Operator's Side, providing the necessary security for the communication between the Loading Operator and the Purse Provider. / коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо).

LOAD–SECURING FOAM = ПРЕДОХРАНЯЮЩАЯ ГРУЗ ПЕНА – Load-Securing Foam:- foams which are used as fillers, generally made from PE or PU. They are used to fill gaps in the container, and thus to ensure tight fit and firm securing of the load.

LOAD–SERVING ENTITY = ХХ – Load-Serving Entity (LSE):- load-serving entities provide electricity to retail customers. Load-serving entities include traditional distribution utilities and new entrants into the competitive power markets.

LOAD SHAPE = ПРОФИЛЬ НАГРУЗКИ – Load Shape:- variations in the power load over a daily, weekly or annual period. / Изменение нагрузки электроэнергии на суточной, недельной или годовой основе.

LOAD TENDER = КОНКУРС НА ПОГРУЗКУ – Pick-Up Request:- an offer of cargo for transport by a shipper. Load tender terminology is primarily used in the motor industry.

LOAD TRANSACTION = ТРАНЗАКЦИЯ ЗАГРУЗКИ (или ОПЕРАЦИЯ ЗАГРУЗКИ) – Load Transaction is the transaction performed using a load device whereby electronic value is transferred to an electronic purse.

LOAD–WEAR INDEX = ИНДЕКС НАГРУЗКА–ИЗНОС (или УКАЗАТЕЛЬ ПО НАГРУЗКЕ–ИЗНОСУ) – Load-Wear Index (LWI) is a measure of the relative ability of a lubricant to prevent wear under applied loads; it is calculated from data obtained from the Four Ball extreme pressure (EP) Method. Formerly called mean Hertz Load. / Четырёхшариковый Метод для сверхвысокого давления.

LOAEL = LOWEST OBSERVED ADVERSE EFFECT LEVEL

LOAFER = ЛОДЫРЬ (или ПРАЗДНОШАТАЮЩИЙСЯ) – Loafer is a trademark used for a low step-in shoe. Loafer is a slip-on shoe with a separate sole and heel. Loafers:- also referred to as Moccasins, they are slip-on shoes noted for their comfort. The shoe's construction tends to be simple and 'roomy'.

LOAN = ССУДА – Loan is a sum of money lent at interest. § 607 of the German Civil Code defines a Loan as the handing over of money or other fungible objects, with an obligation on the part of the borrower to repay the loan, or return objects of the same kind, quality and quantity at a later date. Generally speaking, a loan is understood to be a long-term credit. Contract whereby one entity

grants another the right to use a certain sum of money for a specified period, at a certain cost (or interest). Loan is a specified sum of money lent by a creditor or lender (such as a bank) to a person or entity (borrower). Repayment is made either at a predetermined due date or after notice of repayment has been given, and often at an agreed rate of interest. So-called amortization loans are repaid in instalments. Other designations in the banking field for loans are fixed advances, lendings, etc. Also known as Credit. / выплата (repayment) либо в заранее определённую надлежащую (причитающуюся) дату или после уведомления о выплате . В Гражданском Праве под Ссудой понимается операция по кредитованию. Ссуда является синонимом Займа. В Гражданском Праве под Ссудой понимается вид договора займа, предоставляемого в денежной или натуральной форме. Путём выдачи целевых срочных денежных сумм национальным и другими банками производится кредитование организаций и предприятий. Денежные ссуды гражданам в установленном порядке выдают банки, кассы взаимопомощи, ломбарды, фонды творческих союзов и другие. Ссуда, в гражданском праве вид договора займа, предоставляемого в денежной или натуральной форме. Путём выдачи целевых срочных денежных сумм Госбанком и другими банками Союза Советских Социалистических Республик (СССР) производится кредитование государственных организаций, колхозов и иных кооперативных, а также общественных организаций (смотрите Банковская Ссуда, и Кредит). Денежные ссуды гражданам в установленном порядке выдают банки, кассы взаимопомощи, ломбарды, фонды творческих союзов. Банковская Ссуда, денежные средства банка, предоставленные в кредит с уплатой процента. По срокам различают краткосрочные, среднесрочные и долгосрочные банковские ссуды, а также по видам:- платёжные, учёт векселей, под товарные документы и ценные бумаги, для инвестиций и так далее. Ссудный Счёт в банке. Ссудодатель, Ссудополучатель, Договор Ссуды. Ссуда – это не займ. Банковская Ссуда – денежные средства, предоставленные банком во временное пользование юридическим и физическим лицам обычно с уплатой процента (смотрите Процент). Наиболее распространённая форма кредитных отношений в народном хозяйстве. Источником банковской ссуды служат банковские ресурсы, которые включают в себя как собственные средства банка, так и привлечённые. При капитализме банковская ссуда – основная форма предоставления ссудного капитала банками государству и функционирующим капиталистам. В зависимости от срочности различают:- Краткосрочные, Среднесрочные и Долгосрочные Банковские Ссуды. (i) Краткосрочные Банковские Ссуды (до 1 года):- платёжные ссуды, так называемый Овердрафт (оплата банком претензий к клиенту сверх остатков на его текущем счёте в пределах согласованных лимитов); учёт коммерческих и банковских векселей, а также ссуды под обеспечение товарных документов и ценных бумаг. (ii) Среднесрочные Банковские Ссуды (до 5–10 лет) – ссуды, предоставляемые в соответствии с кредитными соглашениями, предусматривающими их целевую направленность и сроки погашения. Широко используются для кредитования инвестиций. (iii) На Долгосрочные Банковские Ссуды (от 10 лет и выше) и среднесрочные ссуды в 1960–70-е спрос возрастал, что связано с расширением и углублением инфляции, обострением конкуренции, расширением международного экономического сотрудничества. При социализме посредством банковских ссуд планово перераспределяются средства для обеспечения непрерывного процесса социалистического воспроизводства, выполнения плановых заданий, повышения эффективности общественного производства, а также для контроля Рублём за хозяйственной и финансовой деятельностью предприятий и производственных объединений. В бывшем СССР банковские ссуды выдавались только на определённые цели, предусмотренные народно-хозяйственным планом (на покрытие сезонных производственных затрат, на сезонное накопление товарно-материальных ценностей, для расширения основных фондов, для обслуживания расчётов в народном хозяйстве и другое). Банковские ссуды предоставлялись в виде краткосрочных и долгосрочных (свыше 1 года). На 01 Января 1975 объём задолженности по краткосрочным ссудам Госбанка СССР составлял 149.3 миллиардов Рублей и по долгосрочным ссудам Госбанка и Стройбанка СССР 39.4 миллиарда Рублей. В конце 1960 – начале 1970-х в связи с тем что в качестве источников капитальных вложений всё шире использовались банковские ссуды, значительно возрос объём задолженности по долгосрочным ссудам (за 1971–75 на 117.7% при росте задолженности по краткосрочным ссудам на 38%). Краткосрочные ссуды выдавались государственным предприятиям под вложения в оборотные средства; по способу предоставления они делились на Ссуды По Остатку (выдаются под запасы товарно-материальных ценностей) и Ссуды По Обороту (на текущие расходы). Долгосрочные банковские ссуды предоставлялись колхозам, государственным (на нецентрализованные и централизованные капитальные вложения, то есть для расширения основных фондов) и кооперативным предприятиям, а также жилищно-строительным кооперативам (ЖСК) и населению. При кредитовании нецентрализованных капитальных вложении банковские ссуды использовались главным образом на внедрение новой техники, увеличение производства товаров народного потребления (на срок до 6 лет), улучшение бытового обслуживания населения (до 10 лет). Банковские ссуды на централизованные капитальные вложения направлялись на строительство новых предприятий (если затраты могли быть возмещены в течение 5 лет со дня ввода предприятия в эксплуатацию), на реконструкцию и расширение действовавших предприятий (если у них недоставало собственных средств для проведения работ), а также в значительной степени на оплату поставок оборудования. В отдельных случаях долгосрочные ссуды выдавались на пополнение оборотных средств государственных предприятий (например, на срок до 3 лет на расходы будущих периодов). ЖСК долгосрочные банковские ссуды выдавались на срок 10–15 лет в городах и посёлках городского типа и до 20 лет в ряде отдельных районов страны. Населению банковские ссуды предоставлялись на срок до 10 лет на строительство индивидуальных жилых домов, проведение их капитального ремонта, присоединение их к сети водопровода и канализации. Хорошо работавшие предприятия (производственные объединения) при получении банковских ссуд пользовались льготами (расширение объектов кредитования, удлинение сроков ссуд). К плохо работавшим применяются кредитные санкции в виде повышения процента, сокращения срока пользования ссудой, частичное или полное прекращение кредитования.

LOAN AGAINST PLEDGE = ССУДА ПОД ЗАКЛАД (или ССУДА ПОД ЗАЛОГ) – Loan Against Pledge is a loan secured by the pledging of collateral, such as securities, merchandise, etc. / Ссуда, гарантированная закладом обеспечения, такого как ценные бумаги, товар и тому подобное.

LOAN AGAINST PLEDGED BILL = ССУДА ПОД ЗАКЛАДЫВАЕМЫЙ ВЕКСЕЛЬ – Loan Against Pledged Bill is a loan by the bank in exchange for a bill of exchange as pledge, blank endorsed by the customer.

LOAN CAPITAL = ССУДНЫЙ КАПИТАЛ – In the United Kingdom, Loan Capital is a part of a firm's capital employed that is (i) not equity capital, (ii) earns a fixed rate of interest instead of dividends, and (iii) must be repaid within a specified period, irrespective of the firm's financial position. It may be obtained from a bank or finance company as long-term loans, or from debt-equity investors in the form of debentures or preferred stock (preference shares), and is usually secured by a fixed and/or floating charge on the firm's assets. Unlike debt capital, it does not include short-term loans (such as overdraft). Also called Borrowed Capital. Also known as Long-Term Debt in the United States. This is the amount of money currently still owed on the mortgage. A form of long-term borrowing such as a debenture. / Под Ссудным Капиталом понимается денежный капитал, предоставляемый в ссуду предприятиям или государству за плату в виде ссудного процента. Образование временно свободных денежных капиталов и превращение их в ссудный капитал происходит на основе кругооборота капитала. Источником ссудного капитала служат также доходы и сбережения всех классов и слоёв капиталистического общества, прежде всего рантье, землевладельцев, высшего чиновничества и других. Ссудный капитал является наиболее паразитической формой капитала, поскольку его собственник, не выполняя никаких

функций по руководству и управлению предприятием, присваивает часть прибавочной стоимости. Ссудный Капитал – денежный капитал, предоставляемый в ссуду капиталистам за плату в виде процента, источником которого служит неоплаченный труд наёмных рабочих. Особая историческая форма капитала, порождённая капиталистическим способом производства. Предшественник ссудного капитала – Ростовщический Капитал. Источники Ссудного Капитала:- образование ссудного капитала обусловлено закономерностями кругооборота капитала в процессе воспроизводства:- на одних участках временно высвобождаются денежные средства, на других – временно возникает дополнительная потребность в них. Временно высвобождающиеся в процессе кругооборота капитала денежные средства служат важнейшим источником ссудного капитала. К ним относятся:- (i) денежные средства, предназначенные для восстановления основного капитала и накапливаемые по мере перенесения его стоимости по частям на создаваемые товары в форме амортизации; (ii) часть оборотного капитала, высвобождаемая в денежной форме в связи с несовпадением времени продажи изготовленных товаров и времени покупки нового сырья, топлива и материалов, необходимых для продолжения процесса производства; (iii) переменный капитал, временно свободный в промежутке между поступлением денежных средств от реализации товаров и выплатой заработной платы; (iv) предназначенная для капитализации прибавочная стоимость, накапливаемая при расширенном воспроизводстве до определённой величины, зависящей от масштабов капиталистических предприятий и их технического уровня. Источником ссудного капитала служат также доходы и сбережения личного сектора (включающего все классы и слои капиталистического общества). К ним относятся прежде всего доходы эксплуататорских классов:- буржуазии, и особенно рантье, а также землевладельцев. После Второй Мировой Войны (1939–45) рантье утратили самостоятельную роль кредиторов главным образом в связи с хронической инфляцией, обесценивающей их капиталы. Вместе с тем в качестве источника ссудного капитала стали широко использоваться доходы ‘рантье по совместительству’ – слоя высокооплачиваемых лиц:- высшего чиновничества, духовенства, лиц свободных профессий и других обеспеченных слоёв общества. В качестве источника ссудного капитала используются и сбережения трудящихся. В годы после Второй Мировой Войны этому способствует некоторое повышение номинальной зарплаты под давлением забастовочного движения, изменения в структуре потребления – увеличение доли предметов длительного пользования, расходов на жилищное строительство, обучение детей. Необеспеченность будущего, неуверенность в перспективах экономического положения также заставляют трудящихся делать сбережения за счёт сокращения текущего потребления. Эти средства используются монополиями как капитал с помощью кредитных учреждений и служат одной из замаскированных форм эксплуатации трудящихся. Небольшие доходы, выплачиваемые трудящимся в виде процентов и дивидендов, выступают средством привлечения их сбережений. Источником ссудного капитала служат денежные накопления капиталистического государства, размеры которых определяются масштабами государственной собственности и величиной национального дохода, перераспределяемого через государственный бюджет. Аккумуляция временно свободных денежных капиталов и части доходов населения и превращение их в ссудный капитал происходят на рынке ссудных капиталов. Бездействие денежных средств противоречит природе капитализма, и собственники средств ищут сферы их прибыльного приложения. В ходе же капиталистического воспроизводства постоянно возникает потребность в заёмных средствах. Это обусловлено различиями в величине и сроках возврата денежных средств, авансированных в производстве, необходимостью одновременной инвестиции крупных денежных средств для функционирования основного капитала, а также для расширения производства. Особенности Ссудного Капитала:- ссудный капитал – особый вид капитала, отличающийся от промышленного капитала и торгового капитала. С его образованием произошло раздвоение капитала на капитал-собственность, который передаётся во временное пользование с целью получения процентов, и капитал-функцию, который вкладывается в предприятия с целью извлечения прибыли. Ссудный капитал – своеобразный товар, потребительная стоимость которого состоит в способности приносить доход в форме процента. В отличие от цены обычных товаров, представляющей денежное выражение стоимости, цена ссудного капитала как товара – процент – является оплатой этой его способности. Ссудный капитал как товар имеет специфическую форму отчуждения. В отличие от купли-продажи, где стоимость одновременно перемещается от продавца к покупателю (товар – деньги) и от покупателя к продавцу (деньги – товар), при сделке ссуды стоимость передаётся односторонне:- сначала при предоставлении ссуды – от кредитора к заёмщику, затем при её погашении – от заёмщика к кредитору с уплатой процента. Движение ссудного капитала отличается от движения функционирующего капитала. Ссудный капитал постоянно находится в денежной форме, так как связан с предоставлением денежного капитала в ссуду и её возвратом с процентами (Д – Д’). Он представляет наиболее фетишистскую форму капитала. Создаётся видимость, будто деньги по своей природе могут приносить прибыль. В действительности источником прибыли и процента как её части является прибавочная стоимость. Ссудный капитал – наиболее паразитическая форма капитала. Его собственник практически не выполняет никаких функций по руководству и управлению предприятием, но участвует в эксплуатации наёмного труда совместно с функционирующими капиталистами. Закономерности движения ссудного капитала обусловлены циклическими колебаниями капиталистического производства. Вместе с тем между динамикой ссудного капитала и торгово-промышленного капитала имеются различия. В период оживления и промышленного подъёма, с расширением производства и товарооборота спрос на ссудный капитал и норма процента возрастают, объём ссудного капитала уменьшается. Во время кризиса избыток действительного (товарного и производительного) капитала сочетается с дефицитом ссудного капитала, резко возрастает норма процента. Этому способствуют массовое изъятие вкладов из банков и повышенный спрос на ссуду денег для уплаты долговых обязательств во избежание банкротства. В период депрессии, когда часть производительного капитала принимает денежную форму, накопление ссудного капитала обгоняет накопление действительного капитала, что ведёт к понижению нормы процента. Таким образом, в ходе промышленного цикла ‘... движение ссудного капитала, как оно выражается в колебаниях процентной ставки, в целом протекает в направлении, обратном движению промышленного капитала’ (Карл Хайнрихь Маркс, смотрите Карл Маркс и Фридрих Энгельс, Сочинения, 2 Издание, Том 25, Часть 2, С. 32). Ссудный капитал, имея денежную форму, отличается не только от функционирующего капитала, но и от денег. Ссудный капитал – это одна из форм самовозрастающей стоимости; деньги же, выступая всеобщим эквивалентом, сами не дают прироста стоимости. Масса ссудного капитала значительно превышает количество денег в обращении, так как одна и та же денежная единица может многократно выступать как ссудный капитал. Например, в США внутренняя задолженность, отражающая массу ссудного капитала, в 1974 достигла 2.5 триллиона Долларов (в том числе 1 триллион Долларов – задолженность корпораций, 600 миллиардов Долларов – ипотечная задолженность, более 500 миллиардов Долларов – государственный долг, свыше 200 миллиардов Долларов – потребительский кредит), а денежная масса в обращении (банкноты и бессрочные депозиты) – 264 миллиарда Долларов. С развитием капитализма рост массы ссудного капитала обгоняет накопление действительного капитала. На определённых фазах цикла, а также в связи с использованием на непроизводительные цели возникает временный и относительный избыток ссудного капитала. Карл Маркс связывал проблему избытка ссудного капитала с цикличным развитием капиталистического производства, но подчёркивал одновременно и роль внецикличных факторов (увеличение источников ссудного капитала, особенно доходов личного сектора и государства, развитие кредитной системы). Особенности Движения Ссудного Капитала В Эпоху Общего Кризиса Капитализма:- главная особенность – концентрация всё возрастающих масс ссудного капитала в руках крупнейших банков и других кредитно-финансовых институтов и использование подавляющей его части монополиями.

Движение ссудного капитала происходит преимущественно в форме банковского кредита за счёт сокращения коммерческого кредита. Ссудный капитал служит мощным средством сращивания банковского капитала с промышленным, образования и укрепления финансового капитала. Растущая интернационализация производственных связей, развитие капиталистической интеграции ведут к ещё большей монополизации ссудного капитала. С углублением международного разделения труда ссудный капитал выходит за рамки национальных государств, формируется международный рынок ссудного капитала, рынок Евродолларов и Еврозаймов. С развитием валютного кризиса усиливается перемещение 'блуждающих' ссудных капиталов из одних стран в другие в поисках менее рискованных и наиболее прибыльных сфер приложения, что обостряет неустойчивость экономики капитализма. Для периода общего кризиса капитализма характерен рост непроизводительного использования ссудного капитала, что обусловлено перерастанием монополистического капитала в государственно-монополистический и вызывается в первую очередь милитаризацией экономики. Ссудный капитал в значительной мере используется для операций с ценными бумагами, частными и особенно государственными, для спекулятивных сделок с движимым и недвижимым имуществом, земельными участками. В условиях современного капитализма наблюдается относительный избыток краткосрочных ссудных капиталов. В то же время растет спрос на средне- и долгосрочные капиталы в условиях научно-технической революции, усиления конкуренции, развития международного экономического сотрудничества. Например, в 1970-х во Франции 3/4 привлечённых кредитными учреждениями ресурсов составляли краткосрочные капиталы, в то время как 3/4 предоставленных этими учреждениями средств – долгосрочные кредиты. Государственно-монополистическое регулирование финансово-кредитного механизма позволяет использовать краткосрочные вложения как источники долгосрочных кредитов (путём предоставления гарантий, налоговых льгот и тому подобного). Это усиливает инфляцию, ослабляет ликвидность денежно-кредитной системы и обостряет противоречия капитализма. На рынке ссудных капиталов возрастает роль государства как кредитора, должника и гаранта. На основе перераспределения через государственный бюджет значительной части национального дохода создаётся государственно-монополистический фонд ссудного капитала. Монополии перекладывают на государство малорентабельные и представляющие риск ссудные операции. Они используют государственный ссудный фонд для воздействия на конъюнктуру и структурные сдвиги в экономике. Этому служит, в частности, кредитное стимулирование капиталовложений, жилищного строительства, продажи товаров длительного пользования в рассрочку, развития инфраструктуры, поощрение вывоза (или экспорта) определённых видов товаров и так далее. Государственно-монополистический фонд ссудного капитала всё в большей степени становится составным элементом капиталистического программирования экономики. На базе сращивания монополий с государством формируется сложный механизм централизованного государственно-монополистического контроля за движением ссудного капитала от источников к сферам приложения. Путём дифференциации процентных ставок и других условий кредита государство стимулирует преимущественное кредитование предприятий, деятельность которых наиболее соответствует общенациональным программам экономического развития, способствует перераспределению ссудного капитала в пользу монополий за счёт мелких и средних предпринимателей. Однако государственно-монополистическое регулирование движения ссудного капитала наталкивается на границы частной собственности на средства производства. Оно не в состоянии преодолеть цикличность развития капитализма, разрешить его коренные противоречия. Рынок Ссудных Капиталов, особая сфера экономических отношений при капитализме, где формируется спрос и предложение на ссудный капитал. В качестве 'продавцов' капитала на рынке ссудных капиталов выступают денежные капиталисты (собственники ссудного капитала), представленные разветвлённой системой кредитно-финансовых институтов (коммерческие и инвестиционные банки, страховые компании, пенсионные фонды, инвестиционные компании и другие), в качестве 'покупателей' – частные коммерческие учреждения, государство или отдельные лица (население). Рынок ссудных капиталов делится на Рынок Краткосрочного Кредита (Капитала) – денежный рынок, где покупаются и продаются коммерческие и казначейские векселя, и Рынок Долгосрочного Кредита. Последний подразделяется на Рынок Долгосрочного Капитала и Рынок Фиктивного Капитала, где продаются и покупаются акции и облигации частных предприятий и облигации центральных и местных органов власти (смотрите также Рынок). На рынке долгосрочного капитала кредитно-финансовые институты предоставляют займы на длительные сроки (от 20 до 100 лет). В условиях домонополистического капитализма рынок ссудных капиталов был развит слабо вследствие ограниченности предложения и спроса на денежный капитал. Это было связано с рядом причин. Кредитная система ещё не могла широко осуществлять накопление денежного капитала и денежных сбережений населения, так как она была представлена в основном банками, а другие формы кредитно-финансовых учреждений только зарождались. Спрос на денежный капитал, главным образом краткосрочный, предъявляли отдельные предприятия, тогда как государство и население обращались к рынку ссудных капиталов крайне редко. Наконец, рынок фиктивного капитала только зарождался. Толчок развитию рынка ссудных капиталов дал монополистический капитализм. Создание акционерных обществ, высокая концентрация и централизация производства, развитие новых отраслей на базе научно-технических открытий, усиление роли государства в экономике и ряд других причин вызвали огромный спрос на ссудный капитал. Государственно-монополистический капитализм создал предпосылки для дальнейшего роста рынка ссудных капиталов. Правительства капиталистических стран активно участвуют в формировании экономической политики, в том числе кредитной (смотрите Кредитная Политика). Государство воздействует на рынок ссудных капиталов посредством установления учётной ставки центральных банков, регулируя таким путём спрос и предложение на ссудный капитал. Создание государственных кредитных учреждений привело к тому, что государство выступает на рынке ссудных капиталов как 'покупатель' и как 'продавец'. В конце 1960-х – начале 1970-х широкое распространение получила практика заключения между кредитно-финансовыми учреждениями и торгово-промышленными монополиями долгосрочных соглашений (credit line), определяющих величину займа и срок, в течение которого корпорация может прибегать к займу у банка или другого кредитно-финансового учреждения. Такие соглашения особенно характерны для Соединённых Штатов Америки (США), обладающих мощным рынком ссудных капиталов и разветвлённой сетью кредитно-финансовых учреждений.

LOAN COLLATERAL = ОБЕСПЕЧЕНИЕ ССУДЫ (или ЗАЛОГ ПО ССУДЕ) – Loan Collateral:- measures, agreements or objects intended to secure the repayment of a loan. In Germany a distinction is made between accessory and non-accessory or fiduciary collateral. Accessory (subsidiary) collateral is tied to the principal obligation, for example, guarantees, liens on movable assets and on claims, and mortgages. Non-accessory or fiduciary collateral has no direct legal connection between the scope of the security and the scope of the claim being secured. Examples here are assignments as security, assignments and land charges. Furthermore, a distinction can be made between collateral secured by real property and personal liability.

LOAN DEFICIENCY PAYMENT = ССУДНЫЙ КОМПЕНСАЦИОННЫЙ ПЛАТЁЖ (или ССУДНЫЙ НЕДОСТАЮЩИЙ ПЛАТЁЖ) – Loan Deficiency Payment (LDP) is direct payment that producer can receive in lieu of placing cotton in the US Commodity Credit Corporation (CCC) loan and redeeming cotton at adjusted world price (AWP). Loan Deficiency Payment (LDP) means a payment made in lieu of a marketing assistance loan (MAL) when the CCC-determined value (CCC is the short for the Commodity Credit Corporation of the US Department of Agriculture), which is based on the current local price in a county, is below the applicable county loan rate. The payment is the difference between the two rates times the eligible quantity. Cotton LDPs:- (a) In order to be eligible to receive such

LDPs the producer of the upland cotton must:- (1) Comply with all of the upland cotton MAL eligibility requirements under this subpart; (2) Agree to forgo obtaining such loans unless denied an LDP due to payment limitation; (3) Submit, on a form prescribed by CCC, to the FSA (short for the Farm Service Agency of the United States Department of Agriculture) county office on or before beneficial interest is lost in such quantity and before the final loan availability date for the commodity:- (i) An indication of their intentions to receive an LDP on the identified commodity, or (ii) A completed request for an LDP for a quantity of eligible cotton under § 1427.5(a); (4) Provide warehouse receipts or, as determined by CCC, a list of gin bale numbers for such cotton showing, for each bale, the net weight established at the gin; (5) For LDPs requested before ginning of the cotton based on a locked-in adjusted world price, provide identifying numbers for modules or other storage units that will correspond to the gin-assigned numbers of the bales produced from the unginned cotton; and (6) Otherwise comply with all program requirements. (b) The LDP applicable to a crop of cotton will be computed by multiplying the applicable LDP rate, as determined under paragraph (c) of this section, by the quantity of the crop the producer is eligible to pledge as collateral for a loan, excluding any quantity for which the producer obtains a MAL. (c) The LDP rate for a crop of upland cotton will be the amount by which the loan rate determined for a bale of such crop exceeds the adjusted world price, as determined by CCC under § 1427.25, in effect on the day the request is received by the FSA county office, loan servicing agent, or cotton commercial bank. In no case will the LDP rate for a bale exceed the value of the bale had it been pledged as collateral for a MAL. (d) The total amount of any LDPs that a person may receive is subject to AGI and payment limitation requirements specified in part 1400 of this chapter. (e) If the producer enters into an agreement with CCC on or before the date of ginning a quantity of eligible upland cotton, and the producer has the beneficial interest in such quantity as specified under § 1427.5(c) on the date the cotton was ginned, and the producer meets all the other requirements in paragraph (a) of this section on or before the final date to apply for an LDP under § 1427.5, the LDP rate applicable to such cotton will be:- (1) Based on the date the cotton was ginned, which CCC will consider to be the date of the LDP request, if payment application is made in the manner prescribed by CCC for obtaining such rate; (2) Based on the date of request for lock-in of the adjusted world price if payment application is made in the manner prescribed by CCC for obtaining such rate; or (3) Based on the date a completed request including production evidence is submitted in the manner prescribed by CCC for obtaining such rate. (f) In the event that Thursday is a non-workday, such applications for loan deficiency payments will not be accepted beginning at 7 a.m. Eastern time the next workday until an announcement of the adjusted world price for the succeeding weekly period has been made under § 1427.25(e). (67 FR 64459, October 18, 2002, as amended at 71 FR 32427, June 06, 2006; 73 FR 65722, November 05, 2008; 80 FR 135, 139, January 02, 2015).

LOAN DISCOUNT = ССУДНЫЙ ДИСКОНТ (или ДИСКОНТ ПО ССУДЕ) – Loan Discount is a difference between the nominal amount of a loan, or other form of debt, and the actual loan amount paid out to the borrower. Net interest is calculated by applying the nominal interest rate to the lower disbursement amount. See also Discount.

LOAN GUARANTEE = ГАРАНТИЯ ПО ССУДЕ (или ССУДНАЯ ГАРАНТИЯ) – Loan Guarantee supports the repayment of a credit or credit facility including amortization and interest. The guarantee applies from the date the loan is made until it has been repaid. / выплата (repayment) .

LOAN NOTE GUARANTEE = ГАРАНТИЯ ССУДНОГО БИЛЕТА – Loan Note Guarantee:- provided to secure the payment of loan notes or other commercial paper, in cases of company take overs/buyouts. Normally valid for a number of years, depending on the terms of the company sale agreement.

LOAN PROGRAM = ПРОГРАММА ПРЕДОСТАВЛЕНИЯ ССУД – Loan Program is a federal program in which the government lends money at preannounced rates to farmers and allows them to use the crops they plant for the upcoming crop year as collateral. Default on these loans is the primary method by which the government acquires stocks of agricultural commodities.

LOAN RATE = СТАВКА ПО ССУДЕ (или ССУДНЫЙ ПРОЦЕНТ) – (1) Loan Rate is a rate of interest charged for a loan, often expressed as a certain percentage above base rate. / Под Ссудным Процентом понимается часть прибавочной стоимости, передаваемая функционирующим предприятием (ссудополучателем) денежному (ссудодателю) в уплату за пользование ссудным капиталом. Под Ссудным Процентом понимается плата, получаемая кредитором от заёмщика за пользование денежной ссудой. Процент составляет часть прибыли, которую заёмщик уплачивает кредитору за пользование ссудным капиталом. Источник процента – прибавочная стоимость. Смотрите Процент. Под Ссудным Процентом, от Латинского слова Procentum, означающее За Сто), понимается плата, получаемая кредитором от заёмщика за пользование отданными в ссуду деньгами. В докапиталистических формациях, когда кредит выступал в форме ростовщического, источником процента был прибавочный и частично необходимый труд мелких производителей или рабов. При капитализме процент составляет лишь часть произведённой прибавочной стоимости, или прибыли. Прибыль на капитал делится на процент, присваиваемый ссудным капиталистом, и предпринимательский доход, присваиваемый функционирующим капиталистом. На поверхности явлений процент выступает как плод самого капитала, что маскирует капиталистическую эксплуатацию. Он принимает форму цены капитала, как товара, при потреблении которого стоимость и потребительная стоимость не только сохраняются, но и увеличиваются, в то время как потребительная стоимость других товаров в конце концов потребляется. При социализме процент – часть прибыли социалистического предприятия или часть дохода юридического или физического лица, уплачиваемая за пользование денежными средствами в форме ссуды, вклада и тому подобного. Устанавливая его, социалистическое государство исходит из необходимости обеспечить наиболее полное и эффективное использование денежных ресурсов, укрепление режима экономии и хозяйственного расчёта. Процент выплачивается по банковским ссудам социалистическими предприятиями и организациями, начисляется по вкладам предприятий, организаций, населения в банках и сберегательных кассах.

(2) Loan Rate (price support rate):- the price per unit (bushel, bale, pound, or hundredweight) at which the US Commodity Credit Corporation (CCC) will provide loans to farmers enabling them to hold their crops for later sale. Loan Rate is the amount lent per unit of a commodity to farmers. Loan Rate:- the commodity price at which the Commodity Credit Corporation (CCC) offers nonrecourse loans to participating farmers. The crops covered by the programme are used as collateral for these loans. The loan rate serves as a floor price, with the effective level lying somewhat above the announced rate, for participating farmers in the sense that they can default on their loan and forfeit their crop to the CCC rather than sell it in the open market at a lower price. Loan Rate is the national loan rate for base quality upland cotton and the national average rate for extra long staple (ELS) cotton adjusted by any premiums and discounts determined by the Commodity Credit Corporation of the US Department of Agriculture (CCC). / Сумма, одалживаемая (или суживаемая, или предоставляемая) взаймы фермерам за единицу сырья.

LOAN RATIO = ССУДНОЕ СООТНОШЕНИЕ (или СООТНОШЕНИЕ С ЗАЙМОМ, или КОЭФФИЦИЕНТ ЗАИМСТВОВАНИЯ) – In business, Loan Ratio is a ratio of shareholders' equity to long-term capital. The loan ratio measures a company's borrowing capacity based on its balance sheet. A loan ratio below 0.5 indicates that the business entity's borrowing capacity is stretched to the limit.

LOAN RECEIPT = СССУДНАЯ РАСПИСКА (или РАСПИСКА В ПОЛУЧЕНИИ ССУДЫ) – Loan Receipt is a document signed by the assured where he acknowledges receipt of money advanced by the insurance company as an interest-free loan (instead of payment of a loss) repayable to the insurance company only if the loss is recovered from a third party and then only to the extent of the recovery.

LOANS AND ADVANCES = ССУДЫ И АВАНСЫ – In accounting, Loans And Advances comprise fixed-term loans and notice accounts. Fixed-term loans are designated as held at fair value through profit and loss. Notice accounts are designated as loans and receivables and are included as cash and cash equivalents. These are very short-term financial assets, typically having a notice period of three days or less. These are included in the balance sheet at amortised cost. Loan is a sum of money lent at interest for a fixed period of time or an act of lending. In the United Kingdom, personal loans granted to regular income earners namely in a discounted form. Also known as Lendings in the United States. Loans and advances to customers included receivables with regard to securities which have been acquired in reverse repurchase transactions related to the banking operations.

LOAN SERVICING AGENT = АГЕНТ, ОБСЛУЖИВАЮЩИЙ ССУДУ – Loan Servicing Agent means a legal entity that enters into a written agreement with the Commodity Credit Corporation of the US Department of Agriculture (CCC) to act as a loan servicing agent for CCC in making and servicing Form A cotton loans. The loan servicing agent may perform, on behalf of CCC, only those services which are specifically prescribed by CCC including, but not limited to, the following:- (1) Preparing and executing loan and loan deficiency payment (LDP) documents; (2) Disbursing loan and LDP proceeds; (3) Accepting loan repayments; (4) Handling documents involved with forfeiture of loan collateral to CCC; and (5) Providing loan, LDP, and accounting data to CCC for statistical purposes.

LOAN–TO–VALUE RATIO = СООТНОШЕНИЕ ССУДЫ–СО–СТОИМОСТЬЮ – The Loan-To-Value Ratio designates that percentage of a collateral asset's market value which a lender is prepared to accept as collateral in a financing transaction. The size of this loan-to-value ratio (expressed in per cent) depends on the nature of the collateral and the lender's risk propensity. In the case of loans secured against real estate, mortgage banks finance 60% of market value, savings and loan associations 80% and commercial banks, as a rule, 80% to 90% of market value. If the customer has a very high credit rating, financings in excess of those percentages are possible.

LOBE = ЛОПАСТЬ – Lobe is partial rounded portion of a leaf or other organ, separated from the whole by a deep indentation that does not break the continuity of the structure. Lobe is a rounded projection generally of a leaf, hence lobed. / Лопасть – частично округлённая часть листа или иного органа, . Лист является органом высших растений, выполняющим функции фотосинтеза, транспирации и газообмена. Лист состоит из листовой пластинки и основания, представленного листовой подушечкой или расширенным влагалищем. Между пластинкой и основанием часто имеется черешок. Мякоть листа (мезофилл), в толще которой проходят жилки, покрыта эпидермой с кутикулой. Зелёная окраска листа обусловлена хлорофиллом. Форма листа – видовой признак. Нередко листы превращаются в колючки, усики, чешуи. Размер листа у разных растений может изменяться в пределах от нескольких миллиметров до 20 метров. Продолжительность жизни листа составляет менее одного года, реже до 2–5 лет, очень редко – 25 и более лет (у Ели Шренка).

LOBED = ЛОПАСТНОЕ (или ДОЛЬЧАТОЕ, или РАЗДЕЛЁННОЕ НА ЛОПАСТИ) – Lobed:- partially divided into usually rounded or obtuse segments but not deeply enough to form separate entities.

LOBED FLOWER = ДОЛЬЧАТЫЙ ЦВЕТОК (или РАЗДЕЛЁННЫЙ НА ЛОПАСТИ ЦВЕТОК) – Lobed Flower is a tubular or funnel-shaped flower opening into petal-like segments. / цветок – трубчатый цветок (tubular flower) или воронкообразный цветок (funnel-shaped flower), раскрывающийся в сегменты, похожие на лепестки.

LOBED LEAF = ЛОПАСТНЫЙ ЛИСТ – Lobed Leaf has divisions that do not arrive the center of half blade.

LOC = LETTER OF CREDIT

LOC = LOST OPPORTUNITY COST

LOCAL = ЛОКАЛЬНЫЙ (или МЕСТНЫЙ) – Local is a member of a US exchange who trades for his own account and/or fills orders for customers and whose activities provide market liquidity. Local is an exchange member who buys or sells futures and/or options for his own account. Local is an individual with exchange trading privileges who trades for his own account, traditionally on an exchange floor, and whose activities provide market liquidity. See also E-Local. Local is a floor broker who usually executes trades only for his own account or fills orders for customers. Also known as Floor Trader. / Брокер на полу, который обычно исполняет сделки только за свой собственный счёт или выполняет распоряжения для Заказчиков. Известен также как Торговец на Полу (Floor Trader). Локальный, от Латинского слова Localis, означающее Местный.

LOCAL AGENT = ЛОКАЛЬНЫЙ АГЕНТ (или МЕСТНЫЙ АГЕНТ) – Local Agent is a local custodian that provides custody services to nonresident trade counterparties and settlement intermediaries. Also known as Agent Bank, and Sub-Custodian.

LOCAL AREA NETWORK = СЕТЬ ЛОКАЛЬНОГО (или МЕСТНОГО) ЗНАЧЕНИЯ (или СЕТЬ ЛОКАЛЬНОЙ ОБЛАСТИ) – Local Area Network is a network linking two or more computers and peripheral devices in a specific geographic area. Local Area Network (LAN) is a communications network that serves users within a confined geographical area, and made up of servers, workstations, a network operating system and a communications link.

LOCAL AUTHORITY BILLS = ВЕКСЕЛЯ МЕСТНЫХ ОРГАНОВ ВЛАСТИ – Local Authority Bills:- short dated debt securities issued by UK local authorities. The investment characteristics are similar to Treasury Bills but yields are slightly higher due to the lower marketability and marginally higher risk of default.

LOCAL BILL = ЛОКАЛЬНЫЙ ВЕКСЕЛЬ (или МЕСТНЫЙ ВЕКСЕЛЬ) – Local Bill is a bill of exchange accepted by a bank for collection or discounting and which is payable at the place where the accepting bank is located.

LOCAL CARGO = ЛОКАЛЬНЫЙ ГРУЗ (или МЕСТНЫЙ ГРУЗ) – Local Cargo is a cargo delivered to/from the carrier where origin/destination of the cargo is in the local area.

LOCAL CHECK = ЛОКАЛЬНАЯ ПРОВЕРКА – Local Check or Local Control is a farmer's variety or method. Used in experiments as a check in a specific place or community, in Rice production.

LOCAL CHECK = ЛОКАЛЬНЫЙ ЧЕК (или МЕСТНЫЙ ЧЕК) – In the United States, a Local Check means a check payable by a local paying bank. A local paying bank is a paying bank located in the same Federal Reserve check processing region as the bank of first deposit.

LOCAL CONTROL = ЛОКАЛЬНЫЙ КОНТРОЛЬ – Local Check or Local Control is a farmer's variety or method. Used in experiments as a check in a specific place or community, in Rice production.

LOCAL CUSTODIAN = ЛОКАЛЬНЫЙ ДОВЕРИТЕЛЬНЫЙ УПРАВЛЯЮЩИЙ (или МЕСТНЫЙ ДОВЕРИТЕЛЬНЫЙ УПРАВЛЯЮЩИЙ) – Local Custodian provides custody services for securities traded and settled in the country in which the custodian is located.

LOCAL DISTORTION = МЕСТНОЕ СКРУЧИВАНИЕ (или ЛОКАЛЬНОЕ ИСКРИВЛЕНИЕ, или ЛОКАЛЬНОЕ ПЕРЕКАШИВАНИЕ, или ЛОКАЛЬНОЕ ИСКАЖЕНИЕ, или ЛОКАЛЬНАЯ ДИСТОРСИЯ (растра), или ЛОКАЛЬНОЕ ПЕРЕДЁРГИВАНИЕ) – Local Distortion is a distortion that occurs when there is displacement of warp and/or weft threads from their normal position. Causes:- (i) the emery roll is worn out; and (ii) in filament fabric having low reed picks. Mending:- this defect can be corrected by combing in both directions using a metallic comb. Local Distortion:- distortion occurs when there is displacement of warp and/or weft threads from their normal position. Weaving Defect. Local Distortion:- it occurs when there is displacement of warp and/or weft threads from their normal position which occurs due to variation in tension of both yarns. Minor Defect Classification:- <= 0.5 cm. Major Defect Classification:- > 0.5 cm.

LOCAL DISTRIBUTION COMPANY = МЕСТНАЯ РАСПРЕДЕЛИТЕЛЬНАЯ КОМПАНИЯ (или МЕСТНАЯ СБЫТОВАЯ КОМПАНИЯ) – In the United States, Local Distribution Company (LDC) is a company that operates or controls the retail distribution system for the delivery of natural gas or electricity. Company that distributes natural gas primarily to end-users. A gas utility. / Компания, распределяющая природный газ, главным образом, конечным потребителям. Газораспределительная станция.

LOCAL ENVIRONMENT = ЛОКАЛЬНАЯ ОКРУЖАЮЩАЯ СРЕДА – Local Environment is an MeT-defined (mobile electronic transactions – defined) environment in which the personal trusted device (PTD) accesses content via local or personal area network.

LOCAL RATE = ЛОКАЛЬНАЯ СТАВКА (или МЕСТНАЯ СТАВКА) – Local Rate is a rate published between two points served by one carrier.

LOCAL TAXES = МЕСТНЫЕ НАЛОГИ – Local Taxes are the taxes levied by municipal or local governments, such as real estate taxes, taxes on personal and business property, and business license taxes. / Налоги, взыскиваемые муниципальными или местными властями, такие как налоги на недвижимость, налоги на личное имущество и имущество предприятия, и налоги по разрешению на ведение дела. Под Местными Налогами подразумеваются налоги, поступающие в доходы местных органов государственной власти и расходуемые ими.

LOCATION = ЛОКАЦИЯ (или МЕСТОПОЛОЖЕНИЕ) – (1) Location:- any named geographical place, recognized by a competent national body, with permanent facilities used for goods movements associated with international trade, and used frequently for these purposes. Location is a geographical place such as a port, an airport, an inland freight terminal, a container freight station, a container yard, a container depot, a terminal or any other place where customs clearance and/or regular receipt or delivery of goods can take place. / Под Локацией, от Латинского слова Locatio, означающее Размещение или Распределение, понимается определение местоположения объекта. В зависимости от методов может быть звуковая локация (смотрите Звуковая Локация, Гидролокация), оптическая локация, радиолокация. Свойством локации обладают многие животные (смотрите Локация у животных).

(2) Location is an area, e.g., in a warehouse, marked off or designated for a specific purpose. Location:- each product has a specific location in the warehouse. / Зона, например, на складе, помеченная или предназначенная для какой-то особой цели.

(3) Location is a delivery point for a futures contract. / Пункт Поставки для фьючерсного контракта.

(4) Location:- xxxxx. / Локация у животных, способность животных определять положение какого-либо объекта по отношению к себе или своё положение в пространстве; то же, что Биолокация.

(5) Location:- xxxxx. / Локация звуковая, определение направления на объект и местоположения объекта по создаваемому им звуковому полю (пассивная локация) или по отражению от него звука, создаваемого специальными устройствами (активная локация). При активной локации пользуются как импульсными, так и непрерывными источниками звука. При локации в импульсном режиме расстояние до объекта определяется по времени запаздывания отражённого эхо-сигнала. При локации в непрерывном режиме можно использовать частотно-модулированный сигнал и определять расстояние по разности частот посылаемого и отражённого сигнала. Пассивная локация шумящих объектов производится узконаправленными приёмниками звука при работе в узкой полосе частот или с помощью корреляционного метода приёма при работе с широкополосными источниками. Локация широко применяется в диапазоне частот от инфра- до ультразвуков при распространении их в воздухе, земле, воде и металлах. Инфразвуковые частоты (от долей Герц (Гц) до десятков Гц) применяются для локализации землетрясений, для обнаружения скоплений нефти и газа при сейсморазведке, в системе дальнего обнаружения кораблей, терпящих бедствие в открытом океане (по взрывным источникам звука). На звуковых и ультразвуковых частотах (сотни Гц – десятки килоГерц (кГц)) работают гидролокаторы, шумопеленгаторы и эхолоты. Ультразвуковыми частотами (сотни кГц и МГц) пользуются в ультразвуковой дефектоскопии. Локация у животных и человека. Способностью определять направление на источник звука обладают все живые существа в результате бинаурального эффекта. Некоторые животные в процессе эволюции приобрели способность к активной локации. К ним относятся Летучие Мыши, Дельфины и Киты, некоторые Виды Птиц, например, Птица Гуахаро. Летучие Мыши излучают звуковые импульсы в несколько миллисекунд (мсек), заполненные высокочастотными колебаниями (10–150 кГц). Одни Виды Летучих Мышей (например, Подковоносы) излучают импульсы почти чистых тонов, другие – широкополосные импульсы; наиболее распространённые Виды излучают частотно-модулированные сигналы. Для всех Видов Летучих Мышей частота повторения импульсов зависит от расстояния до цели и возрастает с 10–20 Гц вдали от цели до 250 Гц при приближении к цели. Дельфины издают поскрипывающие звуки длительностью несколько мсек, причём частота повторения также зависит от расстояния до цели (1–2 Гц до сотен Гц). Животные, пользующиеся локацией, обладают способностью обнаруживать слабые полезные сигналы на фоне мешающих отражений и множества подобных сигналов других особей. Обнаружение препятствий по звуковому эхо в некоторой степени присуще и человеку:- выяснено, что слепые чувствуют приближение к препятствию по отражениям звука шагов или ударов тросточки.

LOCATIONAL MARGINAL PRICING = XX ЦЕНООБРАЗОВАНИЕ – Locational Marginal Pricing (LMO) or Locational-Based Marginal Pricing (LBMP) is the calculated price of electric energy at every location on a given electric system. It is a market-pricing approach used to manage the efficient use of the transmission system, especially when congestion occurs on the bulk power grid. LMP provides market participants a clear and accurate signal of the price of electricity at a node, load zone, reliability region, or a hub. These prices, in turn, reveal the value of locating new generation, upgrading transmission, or reducing electricity consumption- elements needed in a well-functioning market to alleviate constraints, increase competition, and improve the system's ability to meet power demand. Why does this matter? Besides contributing to market efficiency through transparency and as a price signal, any customers buying via an indexed product structure are buying energy at the LMP. LMP trends can also impact forward prices that drive fixed price offerings for future terms.

LOCATION AUDIT = АУДИТ РАСПОЛОЖЕНИЯ – Location Audit is the routine audit of location records to ensure that records are compatible with actual placement of product within the warehouse.

LOCATION CLAUSE = ОГОВОРКА О МЕСТОНАХОЖДЕНИИ (ГРУЗА) – Location Clause is a clause in a cargo insurance contract limiting insurance cover at any location during transit when the goods are not on the oversea vessel. The intention is to restrict accumulation of risk in one location, and normally applies to open cover conditions. Used in cargo open covers this limits underwriters' liability in any one location. A clause in an open cover limiting the insurers' liability on property in one location prior to shipment.

LOCATOR SYSTEM = ЛОКАТОРНАЯ СИСТЕМА (или СИСТЕМА ЛОКАТОРА) – Locator Systems allow for more effective inventory-tracking. Product can be stored in a way that makes sense for the warehouse, such as high demand product in more accessible locations. Locator systems assist in better accuracy with inventory tracking and control as well because it is all computerized.

LOCK = ДОЛЬКА – Lock is the major, individual, internal section of a Cotton boll in which seed and lint development take place; four or sometimes five locks per boll are typical. The seed and lint produced in a locule. See also Boll, and Locule. / Семя и волокно, получаемые из доли. Смотрите также Коробочка (Boll), и Доля (Locule).

LOCK = КОСИЧКА – Lock is a tuft or group of wool fibers that cling naturally together in the fleece.

LOCK = ШЛЮЗ – For marine purposes, Lock is a space, enclosed at the sides by walls and at each end by gates, by which a vessel can be floated up or down to a different level. / Под Шлюзом, от Голландского слова Sluis, означающее Судоходный, от Латинского слова Exclude, означающее Исключаю или Отделяю или Удерживаю, понимается сооружение для подъёма или опускания судов с одного уровня воды (реки, канала) на другой. Наиболее крупные шлюзы имеют ширину свыше 30 метров и длину до нескольких сотен метров. Судоходный Шлюз, гидротехническое сооружение, расположенное между водоёмами с различными уровнями, через которое проходят суда (или плоты). Шлюзы возводят в речных гидроузлах, каналах и в морских портах, акватории которых подвергаются приливам и отливам с большой амплитудой колебаний уровней. Схематичный чертёж шлюза найден в материалах Леонардо да Винчи. Шлюзы начали строить в Западной Европе в XVI веке, в России в XVIII веке (на Вышневолоцкой Системе). В бывшем Союзе Советских Социалистических Республик (СССР) много крупных шлюзов было построено в гидроузлах на реках Волхов, Днепр, Свирь, Волга, Кама, на многих судоходных каналах, водохранилищах. Значительное число крупных шлюзов построено в США (на реках Огайо, Миссисипи, Святого Лаврентия и других) и в Западной Европе. В состав шлюза входят камеры, головные части (головы) и подходы. Камера, в которой размещаются поднимаемые (опускаемые) суда, образуется двумя продольными стенами и днищем, выполняемыми, как правило, из железобетона; с торцов она ограничена металлическими воротами (затворами), расположенными в пределах соответствующих головных частей. По числу последовательно расположенных камер (зависящему от величины падения уровня и рельефа местности) различают шлюзы однокамерные и многокамерные (многоступенчатые). Для увеличения пропускной способности шлюза устраивают параллельно две (или более) нитки камер. Основные размеры камер (длину и ширину) выбирают при проектировании шлюза в зависимости от категории водного пути, перспективного грузооборота на нём, размеров наибольшего расчётного судна или состава (каравана) судов, одновременно пропускаемых через шлюз. Камеры наиболее крупных шлюзов имеют ширину до 33 метров (м), длину до 400 м при глубинах на порогах от 5 до 15 м (на морских шлюзах). Наполнение и опорожнение камер осуществляется с помощью оборудованных затворами водопроводных устройств (системы питания шлюза) в течение заданного времени (от 5 до 15 минут (мин)). В головных частях (обычно массивных напорных сооружениях), кроме ворот, поддерживающих разность уровней воды и обеспечивающих пропуск судов при выровненных уровнях смежных бьефов, размещаются водопроводные галереи с затворами, устройства для гашения энергии воды, ремонтные и аварийные заграждения, механизмы для управления оборудованием и системы автоматического регулирования. Примыкающие к верхним и нижним головным частям подходы представляют собой каналы или участки акватории с причальными сооружениями и устройствами для швартовки судов, ожидающих шлюзования, и направляющими сооружениями – для безопасного входа судов в шлюз. Процесс пропуска судов через шлюз, называется Шлюзованием, состоит из ряда последовательных операций (открывание и закрывание ворот и затворов, наполнение камер водой и опорожнение их, ввод и вывод судов и другие), выполняемых по командам с центрального пульта. Число шлюзований в течение суток (при непрерывной работе шлюза) определяет пропускную способность шлюза.

LOCKAGE = ШЛЮЗОВАНИЕ (или ПРОХОЖДЕНИЕ ЧЕРЕЗ ШЛЮЗ) – Lockage is the movement thru a lock of either vessel(s) or extraneous matter such as debris, manatees, etc. Each lockage has a unique ID. / Шлюзование судов:- Процесс пропуска судов через шлюз, называется Шлюзованием, состоит из ряда последовательных операций (открывание и закрывание ворот и затворов, наполнение камер водой и опорожнение их, ввод и вывод судов и другие), выполняемых по командам с центрального пульта. Число шлюзований в течение суток (при непрерывной работе шлюза) определяет пропускную способность шлюза. Смотрите также статью Судоходный Шлюз. Шлюзование рек, увеличение глубин на отдельных участках рек путём возведения на них ряда гидроузлов, повышающих уровни воды по сравнению с имеющимися в естественных условиях. Шлюзование рек осуществляется в транспортных целях (для улучшения условий судоходства) и для комплексного использования водных ресурсов; в этих случаях в состав сооружаемых гидроузлов входят и судопропускные сооружения. Транспортное шлюзование рек обеспечивается низконапорными гидроузлами с разборными плотинами, подпорные уровни которых не выходят из русла реки; применяется в случаях, когда пойменные земли застроены или представляют ценность в сельскохозяйственном отношении (например, на реках Москва, Ока, Дон). При комплексном использовании водных ресурсов рек (например, энергетическо-транспортном, с регулированием речного стока водохранилищами) шлюзование рек осуществляется как воднотранспортная часть комплекса, которая должна обеспечить заданные судоходные глубины на подходах к вышерасположенным гидроузлам.

LOCKAGES COMMERCIAL = ШЛЮЗОВАНИЯ КОММЕРЧЕСКИЕ (или ПРОХОЖДЕНИЯ ЧЕРЕЗ ШЛЮЗ КОММЕРЧЕСКИЕ) – Lockages Commercial is the total number of commercial lockages. A commercial vessel includes tows, cargo carrying vessels, commercial fishing boats, lightboats (tows without barges) and commercial passenger vessels/ferries using the lock chamber. / использующих камеру шлюза.

LOCKAGES OTHER = ШЛЮЗОВАНИЯ ПРОЧИЕ (или ПРОХОЖДЕНИЯ ЧЕРЕЗ ШЛЮЗ ПРОЧИЕ, или ПРОХОЖДЕНИЯ ЧЕРЕЗ ШЛЮЗ ИНЫЕ) – Lockages Other is the total number of 'other' lockages. Other lockages are counted when the following vessels or group of vessels use the lock chamber at the same time and include US Government vessels and Government-Nonfederal vessels. For these reports, a lockage used to pass thru something besides a vessel (manatee, debris, ice, etc) is also considered an 'other' lockage.

LOCKAGES RECREATION = ШЛЮЗОВАНИЯ ПРОГУЛОЧНЫЕ (или ПРОХОЖДЕНИЯ ЧЕРЕЗ ШЛЮЗ ПРОГУЛОЧНЫЕ) – Lockages Recreation is the total number of recreation lockages. A recreation lockage is counted each time a recreational vessel or group of recreational vessels uses the lock chamber at the same time.

LOCKAGES TOTAL = ИТОГО ШЛЮЗОВАНИЙ (или ИТОГО ПРОХОЖДЕНИЙ ЧЕРЕЗ ШЛЮЗ) – Lockages Total is the total number of commercial, recreational, and other lockages at a lock chamber. / в камере шлюза.

LOCK CLOSURES – AVG TIME = ЗАКРЫТИЯ ШЛЮЗА – СРЕД. ВРЕМЯ – Lock Closures – Avg Time is the average time a lock chamber was closed or unavailable. This average time is expressed in hours and is based on the total lock closure time (i.e. unavailable time) divided by the total number of closures.

LOCK CLOSURES – FREQ. TOTAL = ЗАКРЫТИЯ ШЛЮЗА – ЧАСТ. ИТОГО – Lock Closures – Freq. Total is the total number of times the lock was unavailable for navigation.

LOCKED–IN = БЛОКИРОВАННОЕ – Locked-In:- a hedged position that cannot be lifted without offsetting both sides of the hedge (spread). Also refers to being caught in a limit price move. See also Hedging. Investors are said to be locked in when they have profit on a security they own but do not sell because their profit would immediately become subject to the capital gains tax.

LOCKED LIMIT = БЛОКИРОВАННЫЙ ЛИМИТ – Locked Limit is a price that has advanced or declined the permissible limit during one trading session, as fixed by the rules of an exchange. Also known as Limit Move.

LOCKED MARKET = БЛОКИРОВАННЫЙ РЫНОК – Locked Market is a market where prices have reached their daily trading limit and trading can only be conducted at that price or prices which are closer to the previous settlement price.

LOCKED ROTOR AMPERES = АМПЕР ПРИ ЗАМКНУТОМ РОТОРЕ (или АМПЕР ПРИ ОСТАНОВЛЕННОМ РОТОРЕ) – Locked Rotor Amperes (LRA) is the current that a motor would require if the rotor were locked in place and prevented from rotating and rated nameplate voltage and frequency were applied to its terminals. This is also the current that could appear briefly during motor starting. While the motor comes up to speed this current gradually drops off and when the speed approaches running rpm this current rapidly falls to the LRA value. Often the starting current is less than the LRA value because the voltage at the motor terminals dips during starting. This LRA value is important when sizing a generator because the generator's surge rating must be large enough to handle it.

LOCKING BAR = ЗАПИРАЮЩИЙ СТЕРЖЕНЬ (или ЗАПИРАЮЩАЯ ШТАНГА) – Locking Bar is a device which secures container doors at top and bottom. / Устройство, которое закрепляет двери контейнера вверху и внизу.

LOCKING COIL = ПРИПИРАЮЩИЙ МОТОК – Locking Coil:- coils (rolls of steel sheet) are generally loaded athwartships with their winding axis fore and aft. They are stowed from the side walls inwards, so that one or two spaces are left in the center that are too small for a further coil. The locking coil(s) is (are) placed in this (these) space(s). The opening angle leads to significant lateral pressure. This pressure forces the other coils towards the ship's sides, thus stabilizing the stow/row of coils. Locking coils must not protrude down into the cantlines of the lower tier by more than one-third of the diameter of the locking coil, since if they protrude any further, the increased lateral pressure can lead to damage to the coils.

LOCKOUT = ЛОКАУТ – Lockout:- shut-down of a plant or other production facility by an employer in an attempt to force workers to accept the employer's decisions. Lockouts were first used as a weapon against labor unions, but lost much of their effectiveness with the passing of legislation entitling locked-out workers to unemployment compensation. / Отказ нанимателя обеспечить работой своих сотрудников. Под Локаутом, от Английского слова Lock Out, означающее Запирать, понимается форма борьбы работодателей против рабочих, выражающаяся в закрытии предприятий и массовом увольнении рабочих с целью оказания на них экономического давления, предотвращения и подавления забастовок. Под Локаутом, от Английского слова Lock Out, означающее буквально Запирать Дверь Перед Кем-Либо или Не Впускать, понимается одна из форм классовой борьбы буржуазии против рабочего класса, выражающаяся в закрытии капиталистами своих предприятий и массовом увольнении рабочих для оказания на них экономического давления. Путём локаута предприниматели пытаются предотвратить готовящуюся или подавить уже начавшуюся забастовку. Буржуазные государства, активно противодействуя забастовкам, фактически не чинят препятствий локаутам. Правда, в некоторых законодательных актах, ограничивающих или запрещающих забастовки, содержатся также ограничения или даже запрещение локаутов. Например, в тех странах, где установлен принудительный арбитраж (в Австралии, Новой Зеландии), обычно запрещаются и забастовки, и локауты, ставящие своей целью изменить условия труда, установленные решением организованного государством третейского суда, но в отношении локаутов эти ограничения и запреты носят чисто формальный характер. Одна из форм борьбы рабочего класса против локаутов – организованный отказ уволенных рабочих покинуть закрываемое предприятие и самостоятельное продолжение работы вопреки объявленому предпринимателем локауту.

LOCK PRONG INTERFERES = XX – (1) Lock Prong Interferes:- indicated by pull-tab not staying in locked position or slider not moving freely after being released from locked position. Closure defects, and namely – Zippers:- Slider Defects. / Порок или дефект застёжки.

(2) Lock Prong Interferes:- indicated by slider not moving freely downward from locked position. Closure defects, and namely – Nylon Spiral Zipper:- Slider Defects. / Порок или дефект застёжки. Найлан^{T3} (Nylon^{TM}).

LOCKRAM = ЛОКРЭМ (или ГРУБЫЙ ХОЛСТ) – Lockram is a coarse plain-woven linen formerly used in England.

LOCO = ЛОКО (или НА МЕСТЕ НАХОЖДЕНИЯ) – Loco is the place at which gold is held and to which a delivery price applies. London is the common denominator world-wide and represents the basis for international trading and settlement in gold and silver. Loco is the place – location – at which a commodity, e.g., loco London gold, is physically held. / Под Локо, от Латинского слова Locus, означающее Место, понимается .

LOCO LONDON = ЛОКО ЛОНДОН – Loco London is a concept that is perhaps the most important aspect of the London bullion market as it represents the basis for international trading and settlement in gold and silver. As with London Good Delivery, it has evolved over time. In the second half of the XIX century, London developed as the center through which gold from the mines of California, South Africa and Australia was refined and then sold. With this business as a base, and supported by the increasing acceptance of the London Good Delivery List, London bullion dealing houses established global client relationships. These clients opened bullion accounts with individual London trading houses. It soon became evident that these 'loco London' accounts, while used to settle transactions between the bullion dealer and client, could also be used to settle transactions with other parties by transfers of bullion in London. Today, all such third party transfers on behalf of clients of the London bullion market are effected through the London Bullion Clearing, which is organised and administered by the London Precious Metals Clearing Limited. As a result, the loco London price has become the common denominator amongst dealers around the world. The settlement process can be likened to that in international foreign exchange markets, where settlement is effected by debits and credits over currency nostro accounts in the relevant banking systems. A credit balance on a loco London account with the London Bullion Market Association (LBMA) member represents a holding of gold or silver in the same way that a credit balance in the relevant currency represents a holding of Dollars on account with a New York bank or Yen with a Tokyo bank. In fact, because of these advantages, nearly all global OTC gold and silver

trading is cleared through the London bullion market clearing system. The platinum and palladium markets operate on a very similar basis, except that delivery may be effected on either a loco London or Zurich basis, although Zurich is the principal settlement location.

LOCULE = ДОЛЯ – Locule is individual compartment of an anther, ovary or fruit. A seed chamber of which 3–5 make up a cotton boll. Locule is a cell. / Полость внутри завязи, 3–5 штук из которых составляют коробочку Хлопчатника.

LOCULICIDAL = ВСКРЫВАЮЩИЙСЯ ВДОЛЬ ДОРСАЛЬНОЙ СТВОРКИ (или РАСКРЫВАЮЩИЙСЯ ВДОЛЬ ДОРСАЛЬНОЙ СТВОРКИ) – Loculicidal:- longitudinally dehiscent along the capsule wall between the partitions of the locule so as to split it into two parts, as in the fruits of Liliaceae. / О плоде.

LOCUS = ЛОКУС – Locus is the position of a gene on a chromosome. / Под Локусом, от Латинского слова Locus, означающее Место, понимается место локализации (местоположение) определённого гена на генетической карте хромосомы. Локус хромосомы, линейный участок хромосомы, занимаемый одним геном. С помощью генетических и цитологических методов можно определить локализацию гена, то есть установить, в какой именно хромосоме расположен данный ген, а также положение его локуса по отношению к локусам других генов, лежащих в этой же хромосоме (смотрите Генетические Карты Хромосом). Как показано на некоторых микроорганизмах, гены, контролирующие определённую последовательность биохимических реакций, находятся в соседних локусах, причём локусы располагаются в том же порядке, в котором протекают реакции биосинтеза; для высших организмов это правило не установлено. Термин Локус в генетической литературе иногда употребляют как синоним терминов Ген и Цистрон.

LODEN = ЗАЩИТНОЕ (или ГРУБОШЁРСТНОЕ) – Loden:- a variable color averaging a dull grayish green.

LODEN = ЛОДЭН (или ПЛОТНАЯ ШЕРСТЬ) – Loden is a water-resistant material for clothing made from sheep's wool and used in heavy coatings. Loden is a thick woolen cloth used for outer clothing. / Под Лодэн, от Немецкого слова Loden, означающее Грубошёрстное Нестриженое Сукно, понимается . Лоден:- эта шерстяная ткань ещё лет десять назад была в большой моде. Она напоминала сукно, но была мягче его и тоньше.

LODEN CLOTH = ПОЛОТНО ЛОДЭН (или ГРУБОШЁРСТНОЕ НЕСТРИЖЕНОЕ ПОЛОТНО) – Loden Cloth is a thick, heavy, napped fleecy coating fabric woven of coarse grade wool in Austria and the German Tyrol. It is similar to düffel cloth if made of wool or the occasional man-made fibers. Since the wool has some grease, it is naturally water-repellent. It is usually a light forest green color, called Loden, from which it (gets its name. Loden cloth moves in and out of fashion everywhere except in those parts of Germany and Austria where loden jackets, suits, and coats are considered basic dress. Loden cloth is sometimes gray in color. See also Düffel Cloth. / Смотрите также Байковое Полотно (Düffel Cloth).

LODGE, LODGING = ПОЛЕГАТЬ, ПОЛЕГАНИЕ – Lodge, Lodging:- the falling down of Rice plants in the field due to wind, rain, flooding, pest damage, or because the stems are too tall or too weak to stand erect during the grain-filling stage, usually causing yield loss.

LODICULE = ЛОДИКУЛА – Lodicule:- the two scalelike structures adjoining to the base of the palea which control the opening of the lemma and palea during anthesis. Lodicules are the two scalelike structures which are adnate to the base of the palea. They represent the rudiments of the perianth (calyx and corolla). / Под Лодикулами, от Латинского слова Lodicula, означающее Одеяльце, понимаются чешуйки в цветке большинства Злаков у основания завязи. Набухая во время цветения, способствуют раскрыванию цветка. Лодикулы, околоцветные плёнки, чешуйки, набухающие во время цветения и способствующие раскрыванию цветка; характерны для большинства Злаков.

LOEC = LOWEST OBSERVED EFFECT CONCENTRATION

LOFT = УПРУГОСТЬ – Loft:- high loft is thick and fluffy, low loft is thin and dense. The higher the loft, the better the insulation characteristic. Loft:- the properties of firmness, resilience, and bulk of a fiber batting, yarn, fabric, or other textile material. Loft:- the springiness or fluffiness of a fiber. / эластичность (или спружинивание, или доукрепление) (springiness) или пушистость (или пышность) (fluffiness) волокна. Упругость, свойство макроскопических тел сопротивляться изменению их объёма или формы под воздействием механических напряжений. При снятии приложенного напряжения объём и форма упруго деформированного тела восстанавливаются. Упругость тел обусловлена силами взаимодействия атомов, из которых они построены. В твёрдых телах при температуре абсолютного нуля в отсутствии внешних напряжений атомы занимают равновесные положения, в которых сумма всех сил, действующих на каждый атом со стороны остальных, равна нулю, а потенциальная энергия атома минимальна. Кроме сил притяжения и отталкивания, зависящих только от расстояния между атомами (центральные силы), в многоатомных молекулах и макроскопических телах действуют также угловые силы, зависящие от так называемых валентных углов между прямыми, соединяющими данный атом с различными его соседями. При равновесных значениях валентных углов угловые силы также уравновешены. Энергия макроскопического тела зависит от межатомных расстояний и валентных углов, принимая минимальное значение при равновесных значениях этих параметров. Под действием внешних напряжений атомы смещаются из своих равновесных положений, что сопровождается увеличением потенциальной энергии тела на величину, равную работе внешних напряжений по изменению объёма и формы тела. После снятия внешних напряжений конфигурация упруго деформированного тела с неравновесными межатомными расстояниями и валентными углами оказывается неустойчивой и самопроизвольно возвращается в равновесное состояние, точнее, атомы колеблются около равновесных положений. Запасённая в теле избыточная потенциальная энергия превращается в кинетическую энергию колеблющихся атомов, то есть в тепло. Пока отклонения межатомных расстояний и валентных углов от их равновесных значений малы, они пропорциональны действующим между атомами силам, подобно тому как удлинение или сжатие пружины пропорционально приложенной силе. Поэтому тело можно представить как совокупность атомов-шариков, соединённых пружинами, ориентации которых фиксированы другими пружинами. Константы упругости этих пружин определяют Модули Упругости материала, а упругая деформация тела пропорциональна приложенному напряжению, то есть определяется Законом Гука, который является основой теории упругости и сопротивления материалов. При конечных температурах (ниже температур плавления) даже без приложения и снятия внешних напряжений атомы совершают малые тепловые колебания около положений равновесия. Это приводит к тому, что модули упругости материала зависят от температуры, но не меняет существа рассмотренных явлений. В жидкости тепловые колебания имеют амплитуду, сравнимую с равновесным расстоянием r_0, вследствие чего атомы легко меняют своих соседей и не сопротивляются касательным напряжениям, если они прикладываются со скоростью, значительно меньшей скорости тепловых колебаний. Поэтому жидкости (как и газы) не обладают упругостью формы. В газообразном состоянии средние расстояния между атомами или молекулами значительно больше, чем в конденсированном. Упругость газов (паров) определяется тепловым движением молекул, ударяющихся о стенки сосуда, ограничивающего объём газа.

LOFTY WOOL = УПРУГАЯ ШЕРСТЬ – Lofty Wool is a wool that is open, springy, and bulky in comparison to its weight. This type of wool is desirable.

Log = LOGARITHM

LOG = БРЕВНО (или КРЯЖ, или ЧУРАК) – A Log is the trunk of a tree with the bark removed and branches lopped. / Бревно – это ствол дерева с удалённой корой и отрубленными сучками. Кряж это толстый короткий отрезок ствола дерева, используемый для изготовления лыж, тары, фанеры, шпона и так далее. Под Кряжем понимается сравнительно короткий отрезок ствола дерева, преимущественно лиственных пород, реже – хвойных. Кряж используется для изготовления облицовочного шпона, фанеры, тары, лыж, спичек и так далее. В деревообработке под Чураком понимается заготовка для изготовления лущёного шпона на лущильном станке:- круглый лесоматериал, по периметру и длине соответствующий технологическим параметрам станка. Перед лущением подвергается гидротермической обработке с целью достижения высокого качества шпона.

LOGARITHMIC (PERCENTAGE) SCALING = ЛОГАРИФМИЧЕСКОЕ (ПРОЦЕНТНОЕ) МАСШТАБИРОВАНИЕ – Logarithmic (Percentage) Scaling:- on a logarithmic scale chart, the vertical spacing between two points corresponds to the percentage change between those numbers. Thus, on a log scale chart, the vertical distance between 10 and 20 (a 100% increase) is the same as the vertical distance between 50 and 100. Because these charts show percentage relationships, logarithmic scaling is also called Percentage Scaling. It is also called Semi-Log Scaling because only one of the axes (the vertical one) is scaled logarithmically.

LOGBOOK = ВАХТЕННЫЙ ЖУРНАЛ – Logbook (maritime term):- a book containing the official record of a ship's activities together with remarks concerning the state of the weather, etc.

LOGISTICS = ЛОГИСТИКА – Logistics is the management of freight and information throughout the total supply chain from the original raw material source to the ultimate consumer of the finished product, encompasing factories, assembly and packing plants, warehouses, distribution centers and retail outlets. Support services to stevedores and the storage and supply of cargoes on the port. Logistics is the process of planning, implementing, and controlling procedures for the efficient and effective storage of goods, services, and related information from the point of origin to the point of consumption for the purpose of conforming to customer requirements. This definition includes inbound, outbound, internal, and external movements. Logistics are the processes and services associated with planning and implementing flow of storage and shipments in a 3rd party operation required to meet the customers' needs in an efficient manner. / Под Логистикой, от Греческого слова Logistike, означающее Искусство Вычислять или Искусство Рассуждать, понимается:- (1) синоним (несколько архаический) термина Математическая Логика. (2) Наименование этапа в развитии математической логики, представленного работами Британского философа, математика и историка Бётчрэнда Асо Вильэма Расэла (Bertrand Arthur William Russell; 1872–1970) и его школы (смотрите Логицизм). В античной математике Логистикой называли 'искусство' вычислений и геометрических измерений, противопоставлявшееся 'теоретической' математике. Немецкий математик и философ Готфрид Вильхэльм Ляйбниц (Gottfried Wilhelm Leibniz; 1646–1716) употреблял термины Logistica и Logica Mathematica как синонимы для разрабатывавшегося им Calculus Ratiocinator – исчисления умозаключений, идеи которого получили впоследствии более полное воплощение в современной математической логике. Термин Логистика имеет ряд производных:- логистический метод (способ изложения формальной логики посредством построения формализованных языков), логистическая система (то же, что формальная система, исчисление) и другие. Логистика – это наука о планировании, контроле и управлении транспонированием, складированием и другими материальными и нематериальными операциями, совершаемыми в процессе доведения сырья, материалов и покупных изделий до производственного подразделения предприятия; управление материальными потоками при внутризаводской переработке сырья, материалов и полуфабрикатов, а также доведение готовой продукции до потребителя в соответствии с интересами и требованиями последнего, включая передачу, хранение и обработку соответствующей информации.

LOGISTICS CHANNEL = ЛОГИСТИЧЕСКИЙ КАНАЛ – Logistics Channel is the network of intermediaries engaged in transfer, storage, handling, and communications functions that contribute to the efficient flow of goods. / коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо).

LOGISTICS COSTS = ЗАТРАТЫ ПО ЛОГИСТИКЕ – Logistics Costs:- the factors associated with the acquisition, storage, movement, and disposition of goods. / Факторы, ассоциированные с приобретением, хранением, перемещением, и размещением товаров.

LOGNORMAL DISTRIBUTIONS OF PRICE = ЛОГАРИФМИЧЕСКИЕ РАСПРЕДЕЛЕНИЯ ЦЕНЫ – Lognormal Distributions Of Price:- the natural logarithm of the price has a normal distribution. Because prices that are lognormally distributed never have negative values, they sometimes are closer to reality than normal distributions. / Логарифмические Распределения Цены:- натуральный логарифм цены имеет обычное распределение. В силу того, что логарифмически распределённые цены никогда не имеют отрицательных значений, они, иногда, находятся ближе к реальности, нежели цены с обычным распределением.

LOGROLLING = СДЕЛКА С ИНТЕРЕСОМ – Logrolling is the trading of favors, or quid pro quo, such as vote trading by legislative members to obtain passage of actions of interest to each legislative member. It is also the 'cross quoting' of papers by academics in order to drive up reference counts. The Nuttall Encyclopedia describes log-rolling as 'mutual praise by authors of each other's work'. American frontiersman Davy Crockett was one of the first to apply the term to legislation:- the first known use of the term was by Congressman Davy Crockett, who said on the floor (of the US House of Representatives) in 1835, 'my people don't like me to log-roll in their business, and vote away pre-emption rights to fellows in other states that never kindle a fire on their own land'. The widest accepted origin is the old custom of neighbors assisting each other with the moving of logs. If two neighbors had cut a lot of timber which needed to be moved, it made more sense for them to work together to roll the logs. In this way, it is similar to a barn-raising where a neighbor comes and helps build your barn and then you go and help build his. Here is an example of the term's original use:- 'a family comes to sit in the forest', wrote an observer in 1835. 'Their neighbors lay down their employments, shoulder their axes, and come in to the log-rolling. They spend the day in hard labor, and then retire, leaving the newcomers their good wishes, and an habitation. Though most sources support the above etymology, another possible origin is from the sport by the same name in which two contestants try to topple each other into the water by standing on a log. Each must keep up with the other or risk taking a spill, so it appears to be cooperative. Spy Magazine ran a feature entitled 'Logrolling in Our Time' that cited suspicious or humorous examples of mutually admiring book jacket blurbs by pairs of authors. Private Eye magazine regularly draws attention to alleged logrolling by authors in 'books of the year' features published by British newspapers and magazines. Logrolling is a practice common in the US Congress and in many other legislative assemblies in which two (or more) legislators agree for each to trade his vote on one bill he cares little about in exchange for the other's vote on a bill that is personally much more important to him. Logrolling is especially common when the legislators are relatively free of control by their national party leaders and are trying to secure votes for bills that will concentrate sizable benefits on their own home districts while spreading most of the costs out over taxpayers in the rest of the country. Local projects such as Federally funded dams, bridges, highways, housing projects, VA hospitals, job-training centers, military bases

and the like are often pushed through by logrolling. / Конгрессмен Дэйви Крокет (Congressman Davy Crockett). Логроллинг – практика торговли голосами среди членов законодательных органов.

LOI = LETTER OF INDEMNITY

LOI = LIMITING OXYGEN INDEX

LOINCLOTH = ПОЛОТНО ДЛЯ КУШАКОВ (или XX, или НАБЕДРЕННАЯ ПОВЯЗКА) – Loincloth is a cloth worn about the loins often as the sole article of clothing in warm climates.

LO/LO VESSEL = LIFT ON, LIFT OFF VESSEL

LOMBARD LOAN = ЛОМБАРДНАЯ ССУДА – A Lombard Loan is a loan granted by banks against collateral, in particular, securities. The Lombard rate is one of the interest rates set by the central bank, and it is the rate at which banks can obtain short-term liquidity from the central bank by liens on securities. In Germany before 1999, the Lombard rate was set by the Deutsche Bundesbank. It was mostly one percentage point above the discount rate. Upon the transfer of responsibility for monetary policy to the European Central Bank, the interest rate for main refinancing operations (MRO) replaced the Lombard rate. In the United Kingdom, Lombard Loan is a loan granted against the pledging of securities as collateral (broker's loan) or against the pledging of goods (advance against goods as security). The costs of a lombard loan are calculated on the basis of the official or private lombard rate (rate for advances against collateral). Also known as Collateral Loan or Collateralized Loan in the United States. Lombard Loans or Lombard Credits:- some banks offer you the possibility to obtain loans, subject to the pledge of fiduciary deposits, equities or bonds. This service gives you the opportunity to obtain the necessary liquidities without having to sell securities at times when it might be inconvenient to do so. / ссуды под закладывание ценных бумаг.

LOMBARD RATE = ЛОМБАРДНАЯ СТАВКА – (1) Lombard Rate is the interest rate for lombard loans granted to the commercial banks by the central bank against the pledging of securities eligible for discounting (official lombard rate). Interest rate set by banks in Germany and charged on a loan against the security of pledged paper. Used primarily with reference to the German Bundesbank, which normally maintains its Lombard Rate at about 0.5 percent above its discount rate. / К Немецкому Бундэсбанку (Bundesbank).

(2) Lombard Rate is the interest rate applied by the commercial banks to lombard (collateral) loans granted to their customers. / Процентная ставка, применяемая коммерческими банками при выдаче своим клиентам ломбардных (обеспеченных) суд.

LOMÉ CONVENTION = ЛОМЕНСКАЯ КОНВЕНЦИЯ – The Lomé Convention is an international aid and trade agreement between the ACP (African Caribean and Pacific Countries) group and the European Union aimed at supporting the ACP states' efforts to achieve comprehensive, self reliant and self-sustained development. Four such Conventions have been signed to date. The first Convention (Lome I) was signed on February 28, 1975. Lome II and III were signed in 1979 and 1985 respectively. The current Convention, the Lome IV covers the period from 1990 to 2000 and is the most extensive development co-operation agreement between North and Southern countries both in term of scope (aid and trade) and the number of signatories. The convention states that ACP cooperation is to be based on partnership, equality solidarity and mutual interest. The convention also recognises the principal of soveignty and the right of each ACP states to define its own development strategies and policies, affirming development centred on people, respect and promotion of human, political, social and economic rights. Lome IV covers a broad range of sectors eligible for support under the development finance cooperation chapters of the convention. These include the environment, agriculture, food security and rural development, fisheries, commodities, industry, mining and energy,enterprise (private sector) development, services, trade, cultural and social cooperation and regional cooperation. Lome also has extensive provisions for trade cooperation which provides preferential treatment to ACP exports to the European Union. In 1994, Lome IV underwent a mid-term review which resulted in approval of the 8th environment development fund to cover the five year period between 1995–2000. Sources:- Liaison Commitee of Development NGOs to the European Union; Background document for Europe and Africa:- Defining a new partnership, Conference held in Brussels from 28–29 April, 1995. Lomé Convention is a 1975 agreement between the European Community (EC) and 62 African, Caribbean and Pacific (ACP) states (mostly former colonies of the EC members). The agreement covers some aid provisions as well as trade and tariff preferences for the ACP countries when shipping to the EC. Lome grew out of the 1958 Treaty of Rome's 'association' with the 18 African colonies/countries that had ties with Belgium and France. The ACP members are:- Angola, the Bahamas, Barbados, Benin, Botswana, Burkina Faso, Burundi, Cameroon, Cape Verde, Central African Republic, Chad, the Comoros, Congo, Cote d'Ivoire, Djibouti, Dominica, Equatorial Guinea, Ethiopia, Fiji, Gabon, Gambia, Ghana, Grenada, Guinea, Guinea-Bissau, Guyana, Jamaica, Kenya, Lesotho, Liberia, Madagascar, Malawi, Mali, Mauritius, Mauritania, Mozambique, Namibia, Niger, Nigeria, Papua New Guinea, Rwanda, St Lucia, St Vincent, Samoa, Sao Tome and Principe, Senegal, the Seychelles, Sierra Leone, Solomon Islands, Somalia, Sudan, Suriname, Swaziland, Tanzania, Togo, Trinidad and Tobago, Uganda, Zaire, Zambia and Zimbabwe. / Ломе, Toro. Lomé is the capital of Togo. The Lomé Conventions are agreements laying down the framework for cooperation on development policy, economic poliucy, trade and industry between the EU and what are known as the ACP countries (countries in Africa, the Caribbean and the Pacific). On 23 June 2000, the Lomé Conventions were replaced by the so-called Cotonou Agreement, which entered into force on 01 April 2003. Ever since the foundation of the Community, cooperation with ACP countries has formed an important part of EU development policy. Since 1975, the framework for this cooperation has been laid down in a special intergovernmental agreement called the Lomé Convention. This agreement has been renegotiated several times, and the fourth and last in the series (Lomé IV) was signed in 1989, with a life of 10 years. On 23 June 2000, the Lomé Conventions were replaced by a new 20-year partnership agreement between the EU Member States on the one hand, and the ACP countries on the other, which was signed in the capital of Benin, Cotonou – hence the Cotonou Agreement. The Cotonou Agreement continues the experiences of the Lomé Conventions, but also adds some new elements. The objectives of the Cotonou Agreement are to reduce and, in time, eradicate poverty, and also to promote sustainable development and the progressive integration of the ACP countries into the global economy. The focus of cooperation between EU Member States and ACP countries is on economic/trade-policy cooperation and development cooperation, with an additional political dimension. The Agreement was amended in 2005. A revision clause, article 95 of the Cotonou Agreement, foresees that the Agreement is adapted every five years (with the exception of the economic and trade provisions, for which there is a special review procedure). The amendment negotiations were launched at the ACP-EU Council of Ministers in Gaborone in May 2004 and were concluded on 23 February 2005. The amendments were limited to technical or minor adjustments focused on improving implementation of the Agreement. As part of trade cooperation, the EU has made a number of the goods exported by ACP countries duty free, while ACP countries have been granted permission to retain their tariffs on goods from the EU. The Cotonou Agreement brings changes in trade cooperation, in that regional economic partnership agreements are to be established between the EU and various combinations of ACP countries with a view to improving the ACP countries' market access to the EU and, at the same time, reinforcing regional cooperation among the ACP countries. The partnership agreements under the Cotonou Agreement are to enter into force no later than 01 January 2008. Delays in the ratification process for the Cotonou Agreement meant that it could not enter into force until 01 April 2003. The fourth and last Lomé Convention expired on 29 February 2000, and so ACP cooperation was regulated by a series of transitional measures until the entry into force of the Cotonou Agreement. The main objective

of development cooperation is reducing poverty. The Cotonou Agreement lays down new principles for the distribution of resources based on need and on the realisation of the objectives of development cooperation. The main source of funding for the development cooperation under the Cotonou Agreement is the European Development Fund. EUR15.2 billion has been set aside for this cooperation over a five-year period commencing 01 March 2000. / , от Латинского слова Affirmo, означающее Утверждаю, .

THE LONDON BULLION MARKET ASSOCIATION = ЛОНДОНСКАЯ АССОЦИАЦИЯ РЫНКА СЛИТКОВ – The LBMA is the London-based trade association that represents the wholesale gold and silver bullion market in London. London is the focus of the international Over-the-Counter (OTC) market for gold and silver, with a client base that includes the majority of the central banks that hold gold, plus producers, refiners, fabricators and other traders throughout the world. The LBMA was formally incorporated in 1987 in close consultation with the Bank of England. The LBMA Good Delivery List is now widely recognised as representing the de facto standard for the quality of gold and silver bars, in large part thanks to the stringent criteria for assaying standards and bar quality that an applicant must satisfy in order to be listed. The assaying capabilities of refiners on the Good Delivery List are periodically checked under the LBMA's Proactive Monitoring programme. The ongoing work of the Association encompasses many areas, among them refining standards, trading documentation and the fostering of good trading practices. Some examples:- (i) In the refining industry, the LBMA Good Delivery List is widely recognized as representing the de facto standard for the quality of gold and silver bars, in large part thanks to the stringent criteria that an applicant must satisfy before being listed. In January 2004 the LBMA introduced proactive monitoring of refiners on the List, an important initiative which further enhances the reputation of the List and the refiners on it. (ii) In conjunction with the foreign exchange and money markets in London, the Association has developed the Non-Investment Products Code, which provides a code of conduct by which all Members and Associates are required to abide. (iii) The LBMA's annual Precious Metals Conference is now the premier professional forum for the world's bullion market. The London Bullion Market Association (LBMA) acts as the coordinator for activities conducted on behalf of its members (Market-Making Members, Ordinary Members, Associates) and other participants in the London Bullion Market, and it is the principal point of contact between the market and its regulators. The London Bullion Market Association (LBMA) was formally incorporated on 14 December 1987 to represent the interests of the participants in the wholesale bullion market and to encourage the development of the London market. Website:- http://www.lbma.org.uk. The London Bullion Market Association (LBMA) acts as the coordinator for activities conducted on behalf of its members and other participants in the London Bullion Market, and it is the principal point of contact between the market and its regulators. The global bullion market is based on expertise and liquidity in London. Origins of the London Bullion Market:- The world's trade in bullion is London-based with a global reach of activity and participants. The roots of the London Bullion Market can be traced to the partnership between Moses Mocatta and the East India Company, who started shipping gold together towards the end of the XVII century. Shortly afterwards, while Sir Isaac Newton was master of the Royal Mint, gold in England was overvalued so it became more freely circulated than silver. This increased circulation quickly led to England having a gold based coinage, whereas the rest of Europe remained silver based until the 1850s. The First Gold Rush:- the first gold rush of 1697 brought gold from Brazil into London, partly transported on ships owned by the East India Company which had a Royal Charter from Queen Elizabeth I. This inflow of gold led to demand for a purpose-built London vault, which the Bank of England duly set up. Their 'bullion warehouse' served the whole of the European market, as it does now, and was further stocked by the influx to London from the subsequent gold rushes in California, Australia and South Africa. The refineries that were set up to process this gold were located close to the Bank of England (who owned the St Luke's refinery) which played a key role in being a custodian, regulator and facilitator of lending and selling of gold by other banks. The Good Delivery List:- in 1750 the Bank set up the London Good Delivery List, which formally recognised those refineries who produced gold bars of a certain standard and could therefore be allowed to enter the London market. Today this list is regarded as the only globally accepted accreditation for the bullion market, ensuring that the wholesale bullion bars traded in the market meet standards and quality required by Good Delivery. By 1850, the five companies – Nathan Mayer Rothschild & Sons, Mocatta & Goldsmid, Pixley & Abell, Samuel Montagu & Co. and Sharps Wilkins – that 150 years later would form the London Gold Market Fixing Company, were already established and flourishing. The term London Gold Market refers to these five companies who formed to oversee the operation of the gold market in London. In 1919, it set up the first Gold Price fix at Rothschild's offices. The London Gold Market was also responsible for Good Delivery accreditations and the maintenance of the resulting List of Acceptable Melters and Assayers, as the List was originally known. The fact that London was at the centre of international time zones has always facilitated it being the perfect place from which to operate the market. The Market's five members remained essentially unchanged for most of its history. But by the 1980s the development of the market was such that the Bank of England recognised that the custody, maintenance and regulation of the Good Delivery List required an independent body. This was the catalyst for the founding of the London Bullion Market Association in 1987. / К 1850 пять компаний – Нэйсэн Мэйо Росчайлд Энд Санз (или Натан Майа Ротшильд Энд Санз; Nathan Mayer Rothschild & Sons), Мэката Энд Голдзмид (Mocatta & Goldsmid), Пиксли Энд Эйбэл (Pixley & Abell), Самьюэл Монтэгю Энд Ко. (Samuel Montagu & Co.) и Шапс Вылкинз (Sharps Wilkins) – .

THE LONDON GOLD FIXING = ЛОНДОНСКАЯ ФИКСАЦИЯ ЗОЛОТА – The London Gold Fixing:- the global physical gold market is a large and opaque over-the-counter market that operates alongside exchange-based gold derivative markets. Investors can buy and sell gold in the spot market, and (much more often) trade gold-based futures contracts and options. In the United States, most gold futures contracts and options trade on the COMEX. The London Gold Fixing was established to determine a daily benchmark price for gold at predetermined times during the trading day. In the physical gold market there is not a central price at any given time. Instead, all of the gold market making banks – including Defendants – and dealers provide competing bid and ask quotes directly to their clients and customers. As such, the Fixing price was supposed to provide buyers and sellers a benchmark that isolated either party from the noise of the trade day, or the bias of any one market maker. The benchmark rate issued by the London Gold Fixing fixes the price of 'Good Delivery' gold. Good Delivery is a set of rules for physical gold bars issued by the London Bullion Market Association (LBMA). The Good Delivery rules lay out the physical specifications for gold bars and provide a verifiable chain of custody, beginning with the refiner and assayer, and continuing through storage in LBMA recognized gold vaults. Good Delivery gold bars are the type normally traded in the financial markets, held to back futures contracts and other gold derivatives, held in private vaults, and held in the vaults of sovereign nations, central banks, and the International Monetary Fund. Most buyers and sellers of gold will not deal in anything but Good Delivery gold. The benchmark rate for 'Good Delivery' gold issued by the London Gold Fixing is used by gold producers (miners, refiners), gold consumers (jewelers, industrials), investors, futures and options traders, central banks, and others to buy, sell, and value gold, and is accordingly the dominant price benchmark for the world's gold trading. The London Gold Fixing fixed its first gold price on September 12, 1919. The Fixing began after the Bank of England negotiated an agreement with seven South African mining houses to ship their gold to London for refining. These mining houses agreed to sell all of their gold through London-based Nathan Mayer Rothschild & Sons at prices agreed to by the largest London gold bullion traders and refiners of the time (the Fixing's original members):- Nathan Mayer Rothschild, Mocatta & Goldsmid, Pixley & Abell, Samuel Montagu & Co., and Sharps & Wilkins. Meetings of the London Gold Fixing were held originally at Nathan Mayer Rothschild's offices in St. Swithin's Lane, London. Nathan Mayer Rothschild, the last remaining original member, sold its seat to Barclays in 2004. The contemporary London Gold Fixing is now administered by London Gold Market Fixing Ltd., the five members of which are the Defendants here. The London Gold Fixing occurs

twice each business day, at 10:30 am and 03 pm, London time, via conference call. The PM Fixing was introduced in 1968 to overlap with the opening of the financial markets in the United States. The fixing process typically lasts 10–15 minutes or less, depending on the trade conditions of the day, but on a few occasions has lasted more than an hour. The London Gold Fixing is purported to proceed through what is known as a 'Walrasian' Auction:- the designated chairman (a position that rotates annually among the Defendants and is currently held by Société Générale) provides a figure which is supposed to be the then-prevailing United States Dollar spot price for gold. Prior to the beginning of the Fixing, market participants funnel their orders through the Defendants (who consolidate their respective client orders with orders from their own proprietary trading desks) to determine whether each Defendant would be a buyer or seller at a given spot price. Each Defendants' trading room is in constant communications with clients who are interested in dealing in gold if the price is right. Once the chairman declares the opening price, the other members declare how many bars of gold they wish to buy or sell at that price based on the orders of their clients and their own proprietary positions. Fixing members are required to declare their interest in increments of five gold bars. If there is no buying or selling interest, the chairman may announce the initial price as 'fixed', thus concluding the call. If, however, the opening price elicits solely selling interest or solely buying interest – or a disproportionate amount of one or the other – the chair can adjust the opening price up or down until the offers to buy and sell are closer to even. Generally, when the offers are within 50 bars of each other, the chair will declare the price to be 'fixed'. Once the benchmark rate has been 'fixed', the call concludes and the price is transmitted to the LBMA for publication. Like most commodities, the price of gold at the London Gold Fixing is driven – or at least is supposed to be driven – by supply and demand. The London Gold Fixing is meant to find the equilibrium price at which the demand for gold equals supply for gold by surveying the leading gold bullion banks. Because the supply of gold is relatively fixed, the main factor affecting the price of gold is demand. There are three main sources of demand:- demand for gold by central banks and the International Monetary Fund; demand for gold as an investment to hedge against financial stress such as inflation, deflation or currency devaluation; and demand for gold as a material for use in jewelry or industrial uses. Some of the international demand for gold is met through spot contracts on the over-the-counter market. A spot contract is a contract where a buyer and seller agree to settlement (payment and delivery) on a spot date, which is normally two business days after the trade date. The settlement price is called the Spot Price. Many spot contracts – such as contracts for the sale of raw gold by miners – are tied to the London Gold Fixing price. / Нэйсэн Мэйо Росчайлд Энд Санз (или Натан Майа Ротшильд Энд Санз; Nathan Mayer Rothschild & Sons), Мэката Энд Голдзмид (Mocatta & Goldsmid), Пиксли Энд Эйбэл (Pixley & Abell), Самьюэл Монтэгю Энд Ко. (Samuel Montagu & Co.) и Шапс Вылкинз (Sharps Wilkins). 'Волрэйжэнский' Аукцион ('Walrasian' Auction). Сосьетэ Жэнераль (Société Générale).

LONDON GOLD LEASE RATE = ЛОНДОНСКАЯ СТАВКА АРЕНДЫ ЗОЛОТА – Indicative mid-market London Gold Lease Rates (LGLR) based on GOFO (Gold Offered Forward Rate) means are published on Reuters page LGLR. Generally speaking, gold swaps are quoted in the market with a bid/offer spread of approximately 20 basis points (bp). Furthermore, when a gold lease is calculated, the spread on the currency deposit component must also be taken into account; this has been taken as 12.5 basis points. The sum of the two midpoints – 16.25 basis points – is rounded to 16. Therefore, the gold lease mid-rates are calculated by the following formula:- USDLIBOR – (GOFO + 16 bp) = Gold lease mid-rate. / Ройтас (Reuters). (более известная в Англоязычном звучании как ЛАЙБО или ЛИБО (LIBOR)).

LONDON GOLD MARKET = ЛОНДОНСКИЙ РЫНОК ЗОЛОТА – A term London Gold Market refers to the five dealers who set (fix) the gold price in London:- Johnson Matthey, Mocatta & Goldsmid, Nathan Mayer Rothschild & Sons, Samuel Montagu & Co., and Sharps Pixley. Refers to the dealers who set (fix) the gold price in London. See also Gold Fixing. Records trace bullion transactions in London back to the XVII century with the formation of the oldest original member of the market, Mocatta and Goldsmid, in 1684. It was, however, the introduction of the London Silver Fixing in 1897 and the London Gold Fixing in 1919 that marked the beginnings of the market's structure and of the co-operation between members that has created the marketplace as it is today. The five members of the London Gold Fixing dominated the UK marketplace until 1980 when gold soared to USD850 per ounce and silver to over USD50 per ounce, fuelled by oil price inflation and spiralling international tension. The level of activity and profitability, combined with increasing global attention, resulted in an influx of international players to London and set the market on course to become the center of the international arena that it is today. The growth in the number and type of market participants in the early 1980s, combined with the introduction of the Financial Services Act in 1986, brought about the formation of the London Bullion Market Association (LBMA) on 14 December 1987. Members of the London precious metals markets trade with each other and with their clients on a principal-to-principal basis, which means that all risks, including those of credit, are between the two parties to a transaction. This is known as an 'Over The Counter' (OTC) Market as opposed to an exchange traded environment. While transactions between members tend to be in standard dealing amounts, when dealing with clients, a dealer will provide a tailor-made service – offering quotes for variable quantities, qualities and types of precious metal as well as for various value dates and delivery destinations. The London precious metals markets are wholesale markets, where minimum traded amounts for clients are generally 1 000 ounces of gold, 50 000 ounces of silver, 1 000 ounces for both platinum and palladium when traded in the telephone market or 500 ounces for each when traded in the electronic market. Unlike a futures exchange, where trading is based around standard contract units, settlement dates and delivery specifications, the OTC market allows flexibility. It also provides confidentiality, as transactions are conducted solely between the two principals involved. See also Gold Fix, and Gold Fixing. / Дьжонсэн Маси (Johnson Matthey). Нэйсэн Мэйо Росчайлд Энд Санз (или Натан Майа Ротшильд Энд Санз; Nathan Mayer Rothschild & Sons), Мэката Энд Голдзмид (Mocatta & Goldsmid), Пиксли Энд Эйбэл (Pixley & Abell), Самьюэл Монтэгю Энд Ко. (Samuel Montagu & Co.) и Шапс Вылкинз (Sharps Wilkins). Под Лондонским Рынком Золота понимается особый центр, где происходит регулярная продажа золота. Он представлен объединениями банков и специализированных фирм по торговле золотом, его очистке и изготовлению слитков. Цена золота на этом рынке выступает как его мировая цена.

LONDON GOOD DELIVERY = ДОЛЖНАЯ ЛОНДОНСКАЯ ПОСТАВКА (или ПОДОБАЮЩАЯ ЛОНДОНСКАЯ ПОСТАВКА) – London Good Delivery (LGD):- historically, the members of the London bullion market compiled lists of accredited melters and assayers whose gold and silver bars they would accept without question, in settlement against transactions conducted between each other and with other acceptable counterparties. Such bars earned the distinction of London Good Delivery status. Likewise the London Platinum and Palladium Market (LPPM) has its London/Zurich Good Delivery List for platinum and palladium plates and ingots that are accepted without question in settlement of transactions conducted in the market. Today, refiners of gold and silver have to satisfy the Physical Committee of the London Bullion Market Association (LBMA) that their bars meet the stringent requirements set by the Association, whilst refiners of platinum and palladium have to similarly satisfy the Management Committee of the LPPM. LBMA and LPPM Good Delivery accreditation has become the internationally accepted standard of product and refinery quality. Given the status that Good Delivery has attained, both the LBMA and the LPPM take very seriously the assessment of applications for inclusion in their Good Delivery Lists. The ongoing review and maintenance of these Lists is one of the core functions of both Associations. In 2004, the LBMA introduced Proactive Monitoring, a system of monitoring the quality of the production and assaying ability of refiners on the Good Delivery List as well as their financial status and recent production history. This involves refiners providing on request a dip sample from a normal production melt, which is check-assayed by one of the LBMA's referees. Special arrangements apply to gold refiners

which only produce and market 'four-nines' gold. Normally refiners are subject to monitoring once every three years. Details of the standards required for inclusion on the LBMA London Good Delivery List are published by the LBMA in the 'Good Delivery Rules for Gold and Silver Bars'. The List itself is available on the LBMA web site or from the Association. The LPPM also publishes its procedures for inclusion on its Good Delivery List for Platinum and Palladium Plates and Ingots, which is available on the LPPM website. Unit for Delivery of Loco London Gold is the London Good Delivery gold bar. It must have a minimum fineness of 995.0 and a gold content of between 350 and 430 fine ounces with the bar weight expressed in multiples of 0.025 of an ounce (which is the smallest weight used in the market). Bars are generally close to 400 ounces or 12.5 kilograms. The LBMA document The Good Delivery Rules for Gold and Silver Bars describes the rules for weighing bars and how the numbers can be rounded. Gold bars are weighed using a beam balance. When weighing a gold bar, it must 'turn the scale' when the correct weight is placed on the scale: this means that the indicator needle on the beam balance moves at least two divisions of 0.001 ounce each in favor of the bar. If a bar does not 'turn the scale', then the recorded weight is reduced by 0.025 of an ounce. Unit for Delivery of Loco London Silver is the London Good Delivery silver bar. It must have a minimum fineness of 999 and a weight range between 750 and 1 100 ounces, although it is recommended that ideally bars should be produced within the range of 900 to 1 050 ounces. Bars generally weigh around 1 000 ounces. For silver bars, the bar weight is expressed in multiples of 0.1 of an ounce (which is the smallest weight used for a beam balance). Suitable electronic scales can also be used. When using a beam balance, the bar must 'turn the scale' when the correct weight is placed on the scale:- this means that the indicator needle on the beam balance moves at least two divisions of 0.002 ounce each in favor of the bar. If a bar does not 'turn the scale,' then the recorded weight is reduced by 0.1 of an ounce. Both gold and silver Good Delivery bars must conform to the specifications for Good Delivery set by the LBMA. Other Bullion Bars:- a variety of smaller exact weight bars is available for sale to wholesale clients in addition to Good Delivery bars. For example, a kilo bar weighs just that – one kilogramme (which is, strictly, 32.150 746 5 ounces). The fine gold content of exact weight gold bars is determined by their fineness. For example, it is accepted as a convention that a kilo bar of fineness 999.9 contains 32.148 ounces of fine gold. A client pays only for the fine gold content. Silver kilo bars are produced and sold as one kilo of 999 fine silver. A list of standard small bar types and weights available in the market, together with their Troy weight equivalent and fine gold content appears at the end of the Guide. Unit for Delivery of Loco London/Zurich Platinum and Palladium:- this is the Good Delivery platinum or palladium plate or ingot. It must have a minimum fineness of 999.5 and a weight of between 1 kilogram (32.151 Troy ounces) and 6 kilograms (192.904 Troy ounces). The weight of the plate or ingot if in grams must be expressed to one decimal place and if in Troy ounces to three decimal places. Both platinum and palladium Good Delivery plates or ingots must conform to the specifications for Good Delivery set by the LPPM. Currency Unit:- the market is generally quoted in US Dollars per ounce. Quotations in other currencies are available upon negotiation. In addition to a US Dollar price, the London Gold, Silver, Platinum and Palladium Fixings offer benchmark prices in both Pounds Sterling and Euros. Settlement and Delivery:- the basis for settlement of the loco London bullion quotation is delivery of a standard London Good Delivery bar at the London vault nominated by the dealer who made the sale, whereas for platinum or palladium the basis for settlement is delivery of a standard Good Delivery plate or ingot at the London or Zurich vault nominated by the dealer who made the sale. While currency settlement or payment for a transaction will generally be in US Dollars over a Dollar account in New York, delivery of metal against transactions in gold, silver, platinum and palladium are in practice made in a number of ways. These include physical delivery at the vault of the dealer or elsewhere, by credit to an 'allocated account' or through the London Bullion Clearing or the London / Zurich Clearing to the 'unallocated account' (see below) of any third party. In addition to delivery at its own vault, a dealer may, by agreement, arrange delivery of physical metal to any destination around the world and in any form of bar, plate or ingot size or fineness. Many dealers maintain consignment stocks of physical bullion around the world to facilitate efficient and speedy delivery in active bullion centers.

LONDON INSURANCE MARKET NETWORK = СЕТЬ ЛОНДОНСКОГО РЫНКА СТРАХОВАНИЯ – London Insurance Market Network is an electronic data transfer system embracing a network of computers. This system is designed to reduce the flow of paperwork and improve the flow of information within the London insurance market. / Электронная система передачи данных, охватывающая сеть компьютеров. Эта система предназначена для сокращения бумагопотока в работе и усовершенствования потока информации на Лондонском рынке страхования.

THE LONDON INTERBANK BID RATE = ЛОНДОНСКАЯ МЕЖБАНКОВСКАЯ СТАВКА СПРОСА – The London Interbank Bid Rate is the interbank rate paid by a first-rate bank on time deposits of another first-rate bank. Also known as LIBID. Rate of interest that banks use to buy from and sell funds to each other. Key interest rate at which major banks in the London Interbank Market are willing to borrow funds from each other, as opposed to the lending rate, or the London Interbank Offered Rate (LIBOR). The bid rate is the lower of the two interest rates. / (более известная в Англоязычном звучании как ЛАЙБО или ЛИБО (LIBOR)).

THE LONDON INTERBANK MEAN RATE = ЛОНДОНСКАЯ МЕЖБАНКОВСКАЯ СРЕДНЕАРИФМЕТИЧЕСКАЯ СТАВКА – Arithmetical mean of bid and asked rates (LIBID and LIBOR) on the London market for interbank rates. the London Interbank Mean Rate is the average of the London Interbank Bid Rate (LIBID) and the London Interbank Offered Rate (LIBOR). / Лондонская Межбанковская Среднеарифметическая Ставка – среднеарифметическое значение ставок (более известная в Англоязычном звучании как ЛАЙБО или ЛИБО (LIBOR)).

THE LONDON INTERBANK OFFERED RATE = ЛОНДОНСКАЯ МЕЖБАНКОВСКАЯ СТАВКА ПРЕДЛОЖЕНИЯ – The Dollar Libor (London Interbank Offered Rate) Rate is the rate that banks pay to borrow Dollar funds from each other in the London markets. The London Interbank Offered Rate (LIBOR) is a daily reference rate based on the interest rates at which banks borrow unsecured funds from other banks in the London wholesale money market (or interbank market). LIBOR is the reference interest rate set daily as part of the interbank lending business. It is determined on the basis of the interest rates at which banks lend money to each other in the London money market. It serves as a reference rate for floating rate notes, swaps, etc. A Eurodollar time deposit is a US Dollar deposit in a London banks, and the interest rate quoted on such deposits is called the London Interbank Offered Rate (LIBOR). Since different banks may offer different rates on deposits of the same maturity, the settlement rate is based on an average of rates across banks. The London Interbank Offered Rate (LIBOR) is the rate of interest at which banks borrow funds from each other, in marketable size, in the London interbank market. BBA (short for the British Bankers' Association) LIBOR is the most widely used benchmark or reference rate for short term interest rates. It is compiled by the BBA in conjunction with Reuters and released to the market shortly after 11:00 am London time each day. BBA LIBOR is the primary benchmark for short term interest rates globally. It is used as the basis for settlement of interest rate contracts on many of the world's major futures and options exchanges (including LIFFE, Deutsche Terminbörse, Chicago Mercantile Exchange, Chicago Board of Trade, SIMEX and TIFFE) as well as most over-the-counter (OTC) and lending transactions. BBA LIBOR fixings are provided in ten currencies:- Australian Dollar (AUD), Canadian Dollar (CAD), Danish Krona (DKK), Euro (EUR), Japanese Yen (JPY), New Zealand Dollar (NZD), Pound Sterling (GBP), Swedish Krona (SEC), Swiss Franc (CHF), and US Dollar (USD). BBA EUR LIBOR is the successor BBA LIBOR fixing for the eurozone legacy currencies, which ceased to be fixed at the beginning of 1999. BBA LIBOR is compiled each London Business day by Reuters and distributed live via a number of data vendors including Reuters, Thomson Financial, Bloomberg, Quick, Infotec, Class Editori, IDC, Proquote and Telekurs. BBA LIBOR

fixings did not commence officially before 1986-January-01, although before that some rates have been fixed for a trial period commencing in December 1984. Due to the specific methodology of calculating BBA LIBOR it is not possible to reconstruct rates before the official fixings commenced. The London Interbank Offered Rate (LIBOR), the interest rate that major international banks charge each other for large-volume loans of Eurodollars or Dollars on deposit outside the United States. LIBOR is one of the market rates. LIBOR rates come from the British Bankers' Association (BBA, http://www.bba.org.uk) and are fixed at 11:00 am GMT. The interest rate at which banks in London place Eurocurrency/Eurodollar deposits with each other for specified, fixed periods of time, most commonly six months. The London Interbank Offered Rate (LIBOR) is the interest rate paid on interbank deposits in the international money markets (also called Eurocurrency Markets). Because Eurocurrency deposits priced at LIBOR are almost continually traded in highly liquid markets, LIBOR is commonly used as a benchmark for short-term interest rates in setting loan and deposit rates and as the floating rate on an interest rate swap. Interbank rate. It is a reference point used in IRS transactions for setting the floating side of derivative deals. It is used as the reference point for most trades around the globe. Interest rate at which banks in London are willing to lend Eurodollars to each other. The London Interbank Offered Rate (LIBOR) is used to determine the interest rate charged to credit-worthy borrowers. LIBOR rates are based on daily quotes at 11:00 am London time from five major London banks, and are fixed rates quoted for specific maturities. The rate of interest at which banks borrow funds from other banks, in marketable size, in the London Interbank market. LIBOR (London Interbank Offered Rates) rates are disseminated by the British Bankers Association. Some interest rate futures contracts, including Eurodollar futures, are cash settled based on LIBOR. The London Interbank Offered Rate (LIBOR) is the main benchmark for pricing short-term interest rates around the world. London Inter-Bank Offered Rate (LIBOR) is the interest rate banks charge each other for short-term money, up to a 12-month term. LIBOR is commonly used as the underlying for the floating leg of a Swap. The British Bankers' Association (BBA) sets the rates daily. / Ройтас (Reuters), Томсэн Файнэншэл (Thomson Financial), Блумбёг Эл.Пи. Чикагской Палаты Торговли (Чикагского Табло Торговли, если быть более точными). Средние ставки предложений по межбанковским депозитам в Долларах США на Лондонском рынке, основанные на котировках пяти основных банков. Дойчэ Тэминбёрзэ (Deutsche Terminbörse). (Примечание:- в Русском языке нет точного соответствия звуку при произношении буквы Ö Немецкого алфавита. Разные источники по-разному интерпретируют его. Буквосочетание ЫО может более менее точно передавать произношение буквы Ö лишь при быстром и кратком их произношении, напоминая в отдалении произношение буквы Ё Русского алфавита.) . Лондонской Международной Биржи Финансовых Фьючерсов и Опционов (London International Financial Futures and Options Exchange; сокращённо – ЛМБФФО или ЛАЙФ или Эл.Ай.Эф.Эф.И. (LIFFE)). (более известная в Англоязычном звучании как ЛАЙБО или ЛИБО (LIBOR)). ЛАЙБО – процентная ставка, по которой происходит заимствование денежных средств между банками на Лондонском межбанковском рынке. Ставки ЛАЙБО устанавливаются Ассоциацией Британских Банкиров (British Bankers Association) ежедневно около 11:00 по Лондонскому времени по 6 валютам (Евро, Доллар США, Английский Фунт, Японская Йена, Швейцарский Франк, Канадский Доллар и Австралийский Доллар) на сроки overnight, 1 неделя, 2 недели, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11 и 12 месяцев.

THE LONDON INTERNATIONAL FINANCIAL FUTURES AND OPTIONS EXCHANGE = ЛОНДОНСКАЯ МЕЖДУНАРОДНАЯ БИРЖА ФИНАНСОВЫХ ФЬЮЧЕРСОВ И ОПЦИОНОВ – The London International Financial Futures and Options Exchange (LIFFE) was established in the United Kingdom in 1982 to trade futures on financial instruments. In May 1984, LIFFE began to list futures on the FT-SE® 100 Index in the United Kingdom. Standardized financial futures have been traded on this exchange since 1982. The London International Financial Futures and Options Exchange (LIFFE) was established in 1982, following the removal of foreign exchange controls in the United Kingdom. The creation of LIFFE initially offered market participants a better means of managing their exposure to both foreign exchange and interest rate volatility. LIFFE has since developed a diverse range of financial instruments (known collectively as Derivatives). These products can be categorised under the following headings:- bonds, commodities, equities, short term interest rates (STIRs), and swaps. LIFFE was originally set up as a financial futures and options exchange. In its first ten years it offered contracts on interest rates denominated in most of the world's major currencies. In 1992 LIFFE merged with the London Traded Options Market (LTOM), adding equity options to its product range. In 1996, it merged with the London Commodity Exchange (LCE), and, as a result, a range of soft and agricultural commodity contracts was added to its financial portfolio. Trading on LIFFE was originally conducted by 'open outcry'. Traders would physically meet in the Exchange building to transact their business. Each product was traded in a designated area or pit, where traders would stand and shout the price at which they were willing to buy or sell. In 1998, LIFFE embarked on a programme to transfer all its contracts from the traditional method of trading, to an electronic platform, LIFFE CONNECT®. Today this is the most sophisticated electronic derivatives trading platform in the world. LIFFE initiated a wide-ranging restructuring programme to address the needs of the wholesale market customer, and at the same time meet the requirements of an increasingly technologically driven and competitive marketplace. The first steps in this process were the launch of LIFFE CONNECT® in November 1998, and the reinvention of LIFFE as a commercial entity. In February 1999, LIFFE completed the second stage of its programme with its shareholders voting unanimously for a corporate restructuring, providing LIFFE with the right framework to become a profit-oriented, commercial organization. To achieve this. membership and the right to trade were split from shareholding, which simplified a complex share structure. This enabled non-members and third parties for the first time to invest in LIFFE purely for a financial return because, under the new structure, a shareholder was not required to become a member of the market. In June 2000, following the successful transition of all of its financial and equity futures and options on to LIFFE CONNECT®, the Exchange announced its intention to become a market leader by building two complementary businesses. These businesses were founded on LIFFE's established skills and expertise in running a successful exchange, and in developing the state-of-the-art technology of LIFFE CONNECT®. The Exchange continued to focus on the core business of providing the products required to manage exposure to financial markets in a cost effective, efficient environment. In parallel, a new technology business was set up to provide technology and associated services to exchanges around the world. In January 2002 the purchase of LIFFE by Euronext was completed. LIFFE's focus on short term interest rate derivatives closely complemented Euronext's expertise in a range of equity products. The derivatives businesses of Euronext and LIFFE have now been combined as Euronext.liffe. Euronext.liffe is creating a single market for derivatives, by bringing all its derivatives products together on a single electronic trading platform, LIFFE CONNECT®. Starting with the Brussels and Paris markets in 2003, and continuing with the transfer of the Lisbon and Amsterdam markets, the replacement of multiple trading venues with a single market supported by a state-of-the-art electronic trading system will reduce costs for both Euronext.liffe itself and its customers, and make cross-border trading easier and cheaper. See also Euronext NV. London International Financial Futures and Option Exchange (LIFFE):- founded in 1982, it is the oldest European exchange for financial futures. In January 2002, Euronext took over LIFFE and changed its name to Euronext.liffe. LIFFE CONNECT® is a leading global derivatives trading system, offering low latency, high flexibility and advanced functionality to its global customer base. At the time of writing, LIFFE CONNECT® is distributed to 825 client sites in 31 countries. LIFFE CONNECT® was designed and developed by the London International Financial Futures and Options Exchange (LIFFE), to replace its open outcry trading floor. Following the success of the initial migrations of the Equity Options, Bond and Index Futures, STIR (Short Term Interest Rate Futures) and Financial Options, LIFFE became a fully electronic exchange in 2000, with the migration of its Commodity Products onto LIFFE CONNECT®. Liffe is the international derivatives business of the NYSE

Euronext Group, (excluding the Arca options market), comprising the Amsterdam, Brussels, Lisbon, London and Paris derivatives markets. LIFFE CONNECT® is arguably the world's most advanced derivatives trading system, offering unrivalled facilities for implied spreading, delta hedging, market making and risk management. Its state-of-the-art design and open system architecture allows customers to build or purchase trading applications to suit specific business needs, and to integrate those applications into other lines of business and business systems. The London International Future and Options Exchange (LIFFE):- the derivative counter-part to the London Stock Exchange. It trades in futures and options where the underlying are shares or interest rates etc. / ЛИФ КЭНЭКТ® (LIFFE CONNECT®). Акэ (Arca). НЙФБ® или Эн.Уай.Эс.И.® (NYSE®). Лондонская Международная Биржа Финансовых Фьючерсов и Опционов (London International Financial Futures and Options Exchange; сокращённо – ЛМБФФО или ЛИФ или ЛАЙФ или Эл.Ай.Эф.Эф.И. (LIFFE)). Смотрите также Юроунэкст Эн.Фэй. (Euronext NV). Лондонская Международная Биржа Финансовых Фьючерсов и Опционов (ЛМБФФО) – крупнейший в Великобритании рынок фьючерсов. На нём представлены фьючерсные и опционные контракты на долгосрочные и краткосрочные процентные ставки, деноминированные в мировых валютах:- трёхмесячные контракты на Фунт Стерлингов ('короткий' Стерлинг); трёхмесячные Евродолларовые контракты; трёхмесячные контракты в Немецких Евромарках (Euromark); трёхмесячные контракты в Швейцарских Еврофранках (Euroswiss); трёхмесячные процентные фьючерсные контракты в Евролирах; трёхмесячные фьючерсы в ЭКЮ; фьючерсные и опционные контракты на долгосрочные Британские облигации. Сделки по облигациям включают фьючерсы и опционы на Немецкие правительственные облигации – бунд (bund), фьючерсы и опционы на облигации Итальянского правительства (BTP), фьючерсы на облигации правительства Японии (JOB) и среднесрочные облигации правительства Германии (Bobl). На ЛМБФФО заключаются сделки на базе двух индексов:- индекса по фьючерсам и опционам FT-SE 100 и индекса по фьючерсам и опционам FT-SE 250, а также на 71 опцион на акции, включающие акции Бритиш Пэтчролиэм (British Petroleum), Ар.Ти.Зэд. (RTZ), Хэнсэн (Hanson), Юниливё (Unilever). Торги проходят с Понедельника по Пятницу, с 07:30 до 16:15. Фьючерсные контракты на базе 'коротких' Стерлингов, контракты в Швейцарских Франках, контракты на долгосрочные Британские облигации в Евромарках, на облигации правительства Германии и среднесрочные облигации правительства Германии продаются после закрытия биржи через Automated Pit Trading (APT) с 16:20 до 20:00, облигации правительства Японии продаются с 07:00 до 16:00. Сделки по фьючерсным и опционным контрактам на облигации связаны со сделками в Чикагской Палате Торговли (Chicago Board of Trade). Торговцы биржи ЛМБФФО могут продавать фьючерсы и опционы Чикагской Палаты Торговли на облигации Казначейства США, облигации со сроком погашения 10 и 5 лет в утренние (по Лондонскому времени) часы до открытия Чикагской Палаты Торговли. Фьючерсы и опционы ЛМБФФО на Немецкие правительственные облигации, облигации Итальянского правительства и долгосрочные Британские государственные облигации могут продаваться в Чикагской Палате Торговли во время дневной и на протяжении всей вечерней сессии.

LONDON METAL EXCHANGE (LIMITED) = ЛОНДОНСКАЯ БИРЖА МЕТАЛЛОВ (ЛИМИТИД) – The origins of the London Metal Exchange Limited (LME) can be traced as far back as the opening of the Royal Exchange in 1571. This is where metal traders first began to meet on a regular basis. However, it was in 1877 that the London Metal Market and Exchange Company was formed as a direct result of Britain's industrial revolution of the XIX century. This led to a massive increase in the UK's consumption of metal, which required the import of enormous tonnages from abroad. Merchant venturers were investing large sums of money in this activity and were exposed to great risk, not only because the voyages were hazardous but also because the cargoes could lose value if there was a fall in price during the time it took for the metal to reach Britain. Merchants began meeting in coffee houses where they traded with each other in order to protect themselves against this latter risk by selling the cargoes as forward contracts. The LME was formed to bring order to this activity with the establishment of a single marketplace, recognised times of trading and standardised specifications for the contracts. As the Exchange developed, its forward contracts were utilised by all aspects of industry in order to protect against price risk. This activity is referred to as Hedging. The London Metal Exchange is the world's premier non-ferrous metals market with highly liquid contracts and a worldwide reputation. It is innovative while maintaining its traditional strengths and remains close to its core users by ensuring its contracts continue to meet the high expectations of industry. As a result, it is highly successful with a turnover in excess of USD4 500 billion per annum. It also contributes to the UK's invisible earnings to the sum of more than £250 million in overseas earnings each year. From January 2000, The London Metal Exchange Limited became a wholly owned subsidiary of a new company – LME Holdings Limited. The former members of The London Metal Exchange Limited retained their membership of the Exchange and were offered shareholdings in LME Holdings Limited on a scaled basis according to the type of member. The Exchange has a membership of around 80 major firms, 11 of which take part in ring dealing (open outcry). Another thirty-one broker members join them in the trading of futures and options through the telephone market and LME Select. The LME is one of the leading international commodity, futures and options exchanges. It specializes in nonferrous metals – Copper, Primary Aluminium, Lead, Zinc, Nickel, Tin, Aluminium Alloy, Silver and an index contract – LMEX, which tracks the six primary metals traded. the origins of the London Metal Exchange can only be traced back as far as the opening of the Royal Exchange in London in 1571 during the reign of Queen Elizabeth I. It was there that traders in metal and a range of other commodities began to meet on a regular basis. At first the traders merely dealt in physical metal for the domestic market but because Britain soon became a major exporter of metals, European merchants arrived to join in these activities. In the early XIX century there were so many commodity traders, ship charterers and financiers using the Royal Exchange that it became impossible to do business and individual groups of traders set up shop in the nearby city coffee houses. The Jerusalem Coffee House off Cornhill became a favorite of the metal trading community. There the tradition of the Ring was born. A merchant with metal to sell would draw a circle in the sawdust on the floor and call out 'Change' at which point all those wishing to trade would assemble around the circle and make their bids. In the early part of the XIX century the Uunited Kingdom was self sufficient in copper and tin and quoted prices remained fixed for long periods. Everything changed with the advent of the Industrial Revolution when, almost overnight, the United Kingdom became the most technologically advanced country in the world, importing large tonnage's from abroad. The metal traders were now faced with a real problem because, having bought ores and concentrates from as far away as Chile and Malaya, they had no way of knowing what the price would be at the time of the ships arrival some months later. The import of large tonnages from overseas at irregular intervals put merchants and consumers seriously at risk. Technology came to their aid with the invention of the telegraph. Inter continental lines of communication were established between the countries of the world and the change from sail to steam ships made arrival dates more predictable. Now merchants were able to anticipate the time of arrival of a cargo of metal and were able to sell it forward for delivery on a fixed date, thus protecting themselves against a fall in price during the voyage. In 1869 the opening of the Suez Canal reduced the delivery time of tin from Malaya to match the three months delivery time for copper from Chile and this gave rise to LME's unique system of daily trading dates for up to three months forward which still exists to this day. As delivery tonnages grew to meet the increasing demands of British industry, more and more merchants were attracted to the trade and it became necessary to find premises where they could convene each day. They first moved to the Lombard Exchange and Newsroom but once again the intrusion of other traders drove them to find new premises. In 1877 they formed the London Metal Exchange Company and moved into their first premises over a hat shop in Lombard Court. Telegraphic links were set up and a company secretary was appointed to handle the administration. Membership increased rapidly and, after surpassing the three hundred mark, the decision was taken to move to a purpose built Exchange in Whittington Avenue, where it remained for 98 years. Then, after a period of 14 years at Plantation House in Fenchurch Street, the

Exchange moved in 1994 to its current, prestigious home in Leadenhall Street. Throughout its history the LME flourished, though never more so than today in terms of trading volume. The world of metals and base metal trading has changed dramatically over the last century, the LME continually adapting to these changes. New metals have been introduced as demand dictated. Copper and tin have traded on the LME since the beginning. The copper contract was upgraded to high grade copper in November 1981 and again to today's Grade-A contract which began trading in June 1986. Tin's present (99.85%) contract began in June 1989, following a brief cessation due to the collapse of the International Tin Council. Lead and zinc were officially introduced in 1920, but were traded unofficially before that. The lead contract has remained virtually unchanged, certainly since its reintroduction in October 1952 following the closure of the Exchange brought about by the second World War. Zinc, on the other hand, has undergone a number of upgradings, most recently with the introduction of the special high grade 99.995% contract in June 1986. Primary aluminium was introduced as a 99.50% contract in December 1978 and today's 99.7% high grade contract began trading in August 1987. Nickel commenced trading on the Exchange the year after primary aluminium, in April 1979, aluminium alloy in October 1992 and in May 1999, a silver contract was launched. An index contract – LMEX – based on the six primary metals traded on the exchange was introduced on 2000-April-10. This base metals index is specifically designed to provide investors access to futures and traded options contracts based on non-ferous metals without the physically delivery, storage and transactions costs associated with the underlying commodity contracts. London Metal Exchange launched the first metal (lead) futures contract in October 1952. / коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо). Лондонская Биржа Металлов (ЛБМ) – крупнейший рынок основных металлов. На ЛБМ продаются металлы и трёхмесячные контракты на поставку алюминия, меди, никеля, свинца, цинка, олова и алюминиевых сплавов. Торги проводятся с голоса в два раунда. Возможно заключение опционов на фьючерсные контракты. Взаиморасчёты осуществляются через Лондонский Клиринговый Дом Лтд (London Clearing House Ltd).

LONDON OPTION = ЛОНДОНСКИЙ ОПЦИОН – London Option is a generic term sometimes used to describe options on physical commodities or on futures contracts traded abroad (typified by options on London commodity markets). These options, which often had nothing whatsoever to do with legitimate foreign markets, gained notoriety – prior to their ban in the United States in 1978 – because of the sales practices and fraud allegations associated with the American dealers who sold them. / Лондонский Опцион является обобщённым термином, используемым иногда для описания опционов на реальное сырьё или на фьючерсные контракты, торгуемые за рубежом (он олицетворяется опционами на Лондонских рынках сырья). Эти опционы, часто не имеющие ничего .

THE LONDON PLATINUM AND PALLADIUM MARKET = ЛОНДОНСКИЙ РЫНОК ПЛАТИНЫ И ПАЛЛАДИЯ – The London Platinum And Palladium Market (LPPM):- Trading:- operating as principals and issuing their own contracts, market making members quote buying and selling prices for spot delivery. Since these prices move in response to worldwide supply and demand and members compete with each other, keen prices are always available. Trading takes place during working hours in London and Zurich. Prices:- prices are normally expressed in US Dollars per troy ounce gross, for spot settlement two business days after the date of the contract, but quotations in other convertible currencies are usually available. Units of Trading:- platinum and palladium are normally traded in multiples of 500 to 1 000 Troy ounces of Good Delivery metal. Variations in quantity and/or quality are subject to negotiation. Delivery:- deliveries usually take place at a vault specified by the member unless other arrangements have been made with the consent of both parties. Some members are prepared to arrange physical shipments on behalf of their customers and will, upon request, arrange for shipments to most destinations throughout the world. Charges for this service, including freight and insurance, are subject to negotiation. Storage:- facilities exist for the safekeeping of platinum and palladium in high security vaults. Rates for storage and insurance are subject to negotiation. Both metals can be held on unallocated or allocated accounts. Many customers do not wish to take delivery of their metal and request members to open metal accounts in their name. In such unallocated accounts specific bars are not set aside and the customer has a general entitlement to the metal. This is the most convenient and cheapest way of holding the metals and is the one most commonly used. Allocated accounts are opened when a customer requires their metal to be physically segregated and needs a detailed list of weights and assays. Forward Trading:- although prices quoted are normally for spot delivery, producers and industrial consumers in volatile market conditions may seek to hedge their future commitments. To meet these needs forward prices are quoted for specific maturity dates. Margin requirements on these deals are a matter of negotiation. This facility has also proved attractive to investors and other customers throughout the world. The Fixing price represents the matching of orders from customers throughout the world. The Fixings make it possible for any interested party, be they supplier, consumer, dealer or investor, to trade at the price at which every current interest is satisfied. The system of Fixings is recognized as providing a valuable reference point, which is of particular benefit in volatile market conditions. All deals are based on the published Fixing price. The Fixing price is immediately transmitted by the international news agencies and is a respected reference price used by industrialists and producers worldwide. Above all, the Fixing procedure is simple, easy to understand and ensures the broadest possible participation in the market. The Fixings commence at 09:45 am and 02:00 pm London time and take place on every day on which members are open for dealing in London. They are conducted by telephone. Dealing is in respect only of brands acceptable as good delivery under the London/Zurich Good Delivery list for platinum and palladium as in effect from time to time. The Fixing members elect a chairman, who presides over the Fixing. At the commencement of each Fixing the chairman announces an opening price which is relayed to the members' dealing rooms. This is in turn relayed to the customers of members and, on the basis of orders received, members declare as a buyer or seller. Provided both buying and selling interests are declared, members are then asked to state the amount in which they wish to trade. If the amounts of buying and selling do not balance, the same procedure is followed again at higher or lower prices until a balance is achieved. The Fixing price should be the price at which all buying and selling orders declared by members at the Fixing can be matched and it is the responsibility of the Chairman of the Fixing to determine when this occurs. A feature of the Fixings is that customers may be kept advised of price changes throughout and may alter their instructions at any time until the price is fixed. If all orders cannot be balanced at any price the Fixing price shall be determined by the Chairman of the Fixing, at his discretion, having due regard to prevailing bids and offers. Exceptionally a pro-rata settlement may be necessary. Buying and selling orders are expressed in US Dollars per Troy ounce. Fixing members' customers who sell at the Fixing receive the Fixing price without deduction of commission. The commission payable by Fixing members' customers who purchase at the Fixing is by negotiation. Unless otherwise agreed by the parties, settlement shall be made two business days after the date of the contract and for settlement purposes Saturdays, Sundays and Public Holidays in London, Zurich and/or New York are to be considered non- working days. Unless otherwise agreed delivery shall be made at the vaults of the member, in London or Zurich. To qualify as 'good delivery' metal must conform to the following specifications:- (1) Platinum:- form:- plate or ingot; weight:- the maximum weight permitted is 6 kilograms (192.904 Troy ounces), the minimum weight permitted is 1 kilogram (32.151 Troy ounces); purity:- at least 99.95% Platinum; markings:- each plate or ingot must bear:- the producer's recognized mark, the letters PT or PLATINUM with a stamp indicating the purity, an individual number or mark, year of manufacture, the weight in grams, kilograms or Troy ounces (if in grams to one decimal place, if in kilograms to four decimal places and if in troy ounces to three decimal places); and appearance:- smooth, free from cavities and easy to handle. (2) Palladium:- form:- plate or ingot, weight:- the maximum weight permitted is 6 kilograms (192.904 Troy ounces), the minimum weight permitted is 1 kilogram (32.151 Troy ounces), purity:- at least 99.95% Palladium, markings:- each plate or ingot must bear:- the producer's recognized mark, the letters PD or PALLADIUM with a stamp indicating the purity, an individual number or mark, year of manufacture,

the weight in grams, kilograms or Troy ounces (if in grams to one decimal place, if in kilograms to four decimal places, or if in Troy ounces to three decimal places); and appearance:- smooth, free from cavities and easy to handle. The London Platinum and Palladium Market (LPPM) was formalized by a Deed of Establishment in 1987 and represents the interests of the participants in the wholesale platinum and palladium markets and encourages the development of the London and Zurich markets. Website:- http://www.lppm.com. Platinum and palladium have a very recent history, unlike gold and silver, which have been known since the earliest civilizations. Platinum was only categorized as a precious metal in 1751 and palladium was isolated as a separate metal less than 200 years ago. In this relatively short period and despite only limited availability of the metals, they have made major contributions to modern scientific progress. London has always been an important centre for the metals. Trading was established in the early decades of this century, usually alongside the longer established bullion metals. In 1973 the London Platinum Quotation was introduced. It was the forerunner of the fixings; a twice-daily indication of the market price for spot platinum, reported by some of the principal companies dealing in the metal. In 1979 the leading London and Zurich dealers reached an agreement to standardize the specifications and provenance of metal which they would accept as good delivery. In 1987 the informal trading which had taken place for many years on a principal to principal basis was formalized via a Deed of Establishment into the London Platinum and Palladium Market. In 1989 the London Platinum and Palladium Quotations were expanded and upgraded to full Fixings. The Market has three categories; Full, Associate and Affiliate. Associate membership is open to companies in the UK which are recognized by the Management Committee as being currently engaged in trading and dealing in platinum and palladium and have an appropriate level of net assets and experience. Full membership of the Market is open to those companies in the UK currently engaged in trading and dealing in platinum and palladium as above and are recognized by the Management Committee as offering additional services in the UK to the market, including market-making, clearing services, refining or manufacturing. All Founder members of the Market are Full Members. Affiliation is open to those companies which fail to meet the normal requirements of Full or Associate membership as above but are recognized by the LPPM as being involved with or offering support to the global platinum and palladium markets. The Market is managed by a Chairman and Management Committee, elected annually by members. Leading organizations dealing in platinum and palladium in major centers worldwide are represented on the London Market.

THE LONDON STOCK EXCHANGE (PLC) = ЛОНДОНСКАЯ ФОНДОВАЯ БИРЖА (ПИ.ЭЛ.СИ.) – The organization established in London's Threadneedle Street in 1773, hence its nickname:- the Old Lady of Threadneedle Street. Today is third in size in the world, after New York and Tokyo, but still the largest in Europe, especially since the large increase in trade in non-UK shares. All trading is done electronically using computer screens and telephones. The London Stock Exchange PLC is one of the world's oldest stock exchanges and can trace its history back more than 300 years. Starting life in the coffee houses of XVII century London, the Exchange quickly grew to become the City's most important financial institution. Over the centuries following, the Exchange has consistently led the way in developing a strong, well-regulated stock market and today lies at the heart of the global financial community. Here are some of the milestones in the story of the London Stock Exchange:- 1698 – (i) John Castaing begins to issue 'at this Office in Jonathan's Coffee-house' a list of stock and commodity prices called 'The Course of the Exchange and other things'. It is the earliest evidence of organized trading in marketable securities in London; and (ii) stock dealers are expelled from the Royal Exchange for rowdiness and start to operate in the streets and coffee houses nearby, in particular in Jonathan's Coffee House in Change Alley. 1720 – the wave of speculative fever known as the 'South Sea Bubble' bursts. 1748 – fire sweeps through Change Alley, destroying most of the coffee houses. They are subsequently rebuilt. 1761 – a group of 150 stock brokers and jobbers form a club at Jonathan's to buy and sell shares. 1773 – the brokers erect their own building in Sweeting's Alley, with a dealing room on the ground floor and a coffee room above. Briefly known as 'New Jonathan's', members soon change the name to 'The Stock Exchange'. 1801 – on March 03, the business reopens under a formal membership subscription basis. On this date, the first regulated exchange comes into existence in London, and the modern Stock Exchange is born. 1802 – the Exchange moves into a new building in Capel Court. 1812 – the first codified rule book is created. 1836 – the first regional exchanges open in Manchester and Liverpool. 1845 – more speculative fever – this time 'Railway mania' – sweeps the country. 1854 – the Stock Exchange is rebuilt. 1876 – a new Deed of Settlement for the Stock Exchange comes into force. 1914 – The Great War means the Exchange market is closed from the end of July until the new year. The Stock Exchange Battalion of Royal Fusiliers is formed – 1 600 volunteered, 400 never returned. 1923 – The Exchange receives its own Coat of Arms, with the motto 'Dictum Meum Pactum' (My Word is My Bond). 1939 – The start of World War Two. The Exchange is closed for 6 days and reopens on 07 September. The floor of the House closes for only one more day, in 1945 due to damage from a V2 rocket – trading then continues in the basement. 1972 – Her Majesty the Queen opens the Exchange's new 26-storey office block with its 23 000 sq ft trading floor. 1973 – first female members admitted to the market. The 11 British and Irish regional exchanges amalgamate with the London exchange. 1986 – Deregulation of the market, known as 'Big Bang':- (i) ownership of member firms by an outside corporation is allowed; (ii) all firms become broker/dealers able to operate in a dual capacity; (iii) minimum scales of commission are abolished; (iv) individual members cease to have voting rights; (v) trading moves from being conducted face-to-face on a market floor to being performed via computer and telephone from separate dealing rooms; and (vi) the Exchange becomes a private limited company under the UK Companies Act of 1985. 1991 – The governing Council of the Exchange is replaced with a Board of Directors drawn from the Exchange's executive, customer and user base. The trading name becomes 'The London Stock Exchange'. 1995 – we launch AIM – our international market for growing companies. 1997 – SETS (Stock Exchange Electronic Trading Service) is launched to bring greater speed and efficiency to the market. The CREST settlement service is launched. 2000 – we transfer our role as UK Listing Authority with HM Treasury to the Financial Services Authority (FSA). Shareholders vote to become a public limited company:- London Stock Exchange PLC. 2001 – we list on our own Main Market in July. We begin our 200th anniversary celebrations. 2003 – we create EDX London, a new international equity derivatives business, in partnership with OM Group. We acquire Proquote Limited, a new generation supplier of real-time market data and trading systems. 2004 – we move to brand new headquarters in Paternoster Square, close to St Paul's Cathedral. 2007 – The London Stock Exchange mergers with Borsa Italiana, creating Europe's leading equity platform. / пузырь (bubble). Дьжон Кастэйн (John Castaing). Новый Дьжонэсэнский ('New Jonathan's'). Проквот Лимитид (Proquote Limited). Патёностё Сквэа (Paternoster Square).

LONG = ПОКУПАТЕЛЬ – Long is someone who has bought a futures or options contract to establish a long market position and who has not yet closed this position with an offsetting sale, or who owns an inventory of commodities. In the case of a futures contract, long denotes, in principle, ownership of an asset. In the case of an option, it simply denotes possession of the option, regardless of whether the option is to buy or to sell. The opposite of Short. Someone who has bought cotton futures or other cotton, is said to be long until he sells his contracts to another or accepts delivery of the cotton at the maturity date of the contract. Long is a trader who has purchased physical commodities, financial instruments or futures contracts and has not yet offset that transaction with a sale. Long can also be used as an adjective to describe such an open position. / Покупатель – тот, кто купил на бирже фьючерсный или опционный контракт, установив тем самым длинную рыночную позицию (или позицию покупки на рынке), и кто ещё не закрыл данную позицию зачитывающей продажей, или кто владеет запасами сырья. В случае с фьючерсным контрактом покупатель, в принципе, означает владение активом. В случае с опционом покупатель просто означает посэссию опционом независимо от того должен ли опцион быть куплен или продан. В противовес Продавцу (Short). Покупатель:- о том, кто купил фьючерсы на

хлопок или иной хлопок, говорят он находится в длинной позиции до тех пор, пока не продаст эти фьючерсные контракты или иной хлопок или пока не акцептует поставку хлопка по дате истечения срока действия контракта.

LONG = ПОКУПКА (или ДЛИННАЯ ПОЗИЦИЯ, или РЕПОРТ) – Long:- in commodities trading vocabulary long is synonymous with buy. If a trader buys futures or options, or owns a cash commodity, she is going long. Opposite of Short. Signifies ownership of assets. 'I am long 100 December Cotton futures' means the speaker owns 100 December Cotton futures contracts. A market position that obligates the holder to take delivery of the underlying asset. The opposite of Short. A term Long refers to owning a futures contract or a cash commodity. Traders are said to be long when they have contracted to buy more of a commodity or instrument than they have contracted to sell. Long:- purchased futures contracts that have not been offset by sold contracts or delivery. / Считается, что у торговца появилась длинная позиция, если он заключил контракты на покупку большего количества сырья или биржевых инструментов, и чем он обязался продать по заключённым им же контрактам. Под Репортом, от Французского слова Report, понимается спекулятивная биржевая сделка на срок, заключаемая биржевыми дельцами в расчёте на повышение курса ценных бумаг или иных биржевых инструментов с целью получения курсовой разницы. Противоположна Депорту.

LONG BOND = ДЛИТЕЛЬНАЯ ОБЛИГАЦИЯ – Long Bonds are bonds with longer overall or remaining periods until redemption, usually more than eight years. In contrast to 'short bonds', long-term bond prices are more volatile. Investors prefer them, in particular, during phases of falling interest rates in light of the chances of rising prices. It is the longest-term bond issued by the US Treasury. Because Treasury bonds are regarded as safe, the long bond interest rate reflects only the risk of inflation. Also known as the 30-Year Treasury Bond. / Под Длительными Облигациями понимаются облигации с самым максимальным сроком действия, выпускаемые Казначейством США. В силу того, что облигации Казначейства воспринимаются всеми в качестве надёжных, процентные ставки по длительным облигациям отражают в себе лишь риск инфляции. Известны также как 30-Летние Облигации Казначейства (30-Year Treasury Bond).

LONG BUTTERFLY = ПОКУПКА БАБОЧКИ (или ПОКУПКА БАТТЕРФЛЯЙ) – When to use:- one of the few positions which may be entered advantageously in a long-term options series. Enter when, with one month or more to go, cost of the spread is 10 percent or less of B – A (20 percent if a strike exists between A and B). This is a rule of thumb; check theoretical values. Profit characteristics:- maximum profit occurs if a market is at B at expiration. That profit would be B – A – net cost of spread. This profit develops, almost totally, in the last month. Loss characteristics:- maximum loss, in either direction, is cost of spread. A very conservative trade, break-evens are at A + cost of spread and at C – cost of spread. Decay characteristics:- decay negligible until final month, during which distinctive pattern of butterfly forms. Maximum profit growth is at B. If you are away from (A-C) range entering the last month, you may wish to liquidate position. Category:- precision. Long call A, short 2 calls B, long call C. Long put A, short 2 puts B, long put C. Note:- B – A generally is equal to C – B. / Одна из стратегий торговли опционами.

LONG CALL = ПОКУПКА ОПЦИОНА НА ПОКУПКУ – When to use:- when you are bullish to very bullish on the market. In general, the more out-of-the-money (higher strike) calls, the more bullish the strategy. Profit characteristics:- profit increases as market rises. At expiration, break-even point will be call option exercise price A + price paid for call option. Loss characteristics:- loss limited to amount paid for option. Maximum loss realized if market ends below option exercise A. Decay characteristics:- position is a wasting asset. As time passes, value of position erodes toward expiration value. Category:- directional. Synthetics:- long instrument, long put. / Одна из стратегий торговли опционами.

LONG CASH POSITION = ДЛИННАЯ ПОЗИЦИЯ ПО РЕАЛЬНОМУ СЫРЬЮ (или ПОЗИЦИЯ ПОКУПКИ ПО РЕАЛЬНОМУ СЫРЬЮ) – A Long Cash Position implies the physical commodity is owned.

LONGCLOTH = ДЛИННОЕ ПОЛОТНО – Longcloth is a fine, soft, cotton cloth woven of softly twisted yarns. It is similar to nainsook but slightly heavier, with a duller surface. Longcloth is so called because it was one of the first fabrics to be woven in long rolls. It is also a synonym for muslin sheeting af gaod quality. The fabric is used for underwear and linings. See also Muslin Sheeting, and Nainsook. / Плотнотканая, опалённая бельевая хлопчатубумажная ткань мягкой отделки.

LONG DRAW = ДЛИННОЕ ВЫТЯГИВАНИЕ (или ДЛИННАЯ ВЫТЯЖКА, или ВЫСОКАЯ ВЫТЯЖКА) – Long Draw is the spinning technique used to create woolen yarns. It is spun from carded rolags. It is generally spun from shorter stapled fibers. Long draw spun yarns are light, lofty, stretchy, soft, and full of air, thus they are good insulators, and make good knitting yarns. Long draw spinning is most often contrasted to the short draw technique used to spin worsted yarns. The first step to spin a true woolen yarn is to card the fiber into a rolag using handcarders. The rolag is spun without much stretching of the fibers from the cylindrical configuration. The hand holding the fiber is the active hand, and the one closer to the wheel is passive. The passive hand smooths yarn, picks out vegetable matter, and pulls out extra bits of fluff, but that is all. The work of drafting is done by the active hand, and most of the regulation and smoothing of yarn is done by twist and tension. Drafting is done by pinching off a short section of the rolag, and then pulling back while twist is added to it. The active hand pulls back until the yarn is the desired thickness. The passive hand controls how much twist is allowed in the drafting yarn:- too much twist and the yarn won't draft; too little and the yarn will break. Twist concentrates in the thin areas of the yarn, solidifying these. Thus the tension doesn't stretch these parts thinner, but instead drafts the thicker parts until all the yarn is approximately the same thickness. This has the effect of automatically thinning out the thicker parts, which is what allows this technique to work. Once the yarn is the desired thickness, enough twist is added to make the yarn strong. In effect, this is done by releasing the passive hand. Next the yarn is wound onto the bobbin, and the process starts again. Most handspinners make a blend of a woolen and worsted yarn, using techniques from both categories, and thus ending up with a mix, named a semi-worsted yarn. Long Draw:- this is a woolen-spinning technique. / строчка с защипами (pinching) – порок.

LONG–DURATION VARIETIES = ПОЗДНЕСПЕЛЫЕ РАЗНОВИДНОСТИ – Long-Duration Varieties are the Varieties that mature in 150 days or more.

LONGER–TERM INTEREST RATES = БОЛЕЕ ДОЛГОСРОЧНЫЕ ПРОЦЕНТНЫЕ СТАВКИ – Longer-Term Interest Rates are interest rates or yields on interest-bearing financial assets with a relatively long time to maturity. Often the yields on government bonds with 10 years to maturity are used as a benchmark for longer-term interest rates.

LONGER–TERM REFINANCING OPERATION = БОЛЕЕ ДОЛГОСРОЧНАЯ ОПЕРАЦИЯ РЕФИНАНСИРОВАНИЯ – Longer-Term Refinancing Operation is a monthly open market operation, conducted by the Eurosystem, with a usual maturity of three months. The operations are conducted as variable rate tenders with pre-announced allotment volumes.

LONG FORM BILL OF LADING = КОНОСАМЕНТ ПОЛНОЙ ФОРМЫ (или ПОЛНОЦЕННЫЙ КОНОСАМЕНТ) – Long Form Bill Of Lading is the B/L form with all Terms & Conditions written on it. Most B/L's are short form which incorporate the long form clauses by reference. / форма коносамента со всеми Порядками И Условиями, прописанными на нём.

LONG–FORM CONFIRMATION = ПОЛНОЦЕННАЯ КОНФИРМАЦИЯ (или ПОЛНОЦЕННОЕ ПОДТВЕРЖДЕНИЕ) – Long-Form Confirmation is a confirmation that includes key legal provisions from a master agreement. When no master agreement has been

executed between the counterparties, use is sometimes made of a long-form confirmation or of a confirmation that incorporates by reference the standard terms of a master agreement. / головного соглашения.

LONG FUTURES = ПОКУПКА ФЬЮЧЕРСА – When to use:- when you are bullish on the market and uncertain about volatility. You will not be affected by volatility changing. However, if you have an opinion on volatility and that opinion turns out to be correct, one of the other strategies may have greater profit potential and/or less risk. Profit characteristics:- profit increases as market rises. Profit is based strictly on the difference between the exit price and the entry price. Loss characteristics:- loss increases as market falls. Loss is based strictly on the difference between the exit price and the entry price. Decay characteristics:- none. Category:- directional. Synthetics:- Long call A, short put A. / Одна из стратегий торговли.

LONG GLUME = ДЛИННАЯ КОЛОСКОВАЯ ЧЕШУЯ – Long Glume (g):- the sterile lemmas ('outer glumes') exceed one-third the length of the lemma and palea. Another dominant gene, Gm, controls the sterile lemmas which are longer than the lemma and palea. The two sterile lemmas may have unequal length. / .

LONG GRAIN BROWN RICE FOR PROCESSING = ДЛИННОЗЁРНЫЙ БУРЫЙ РИС ДЛЯ ПЕРЕРАБОТКИ – Long-Grain Brown Rice For Processing shall consist of brown Rice for processing which contains more than 25.0 percent of whole kernels of brown Rice and not more than 10.0 percent of whole or broken kernels of medium- or short-grain Rice. / 'Длиннозёрный Бурый Рис Для Переработки' должен состоять из бурого Риса для переработки, который содержит более 25.0 процентов целиковой зерновки (целых ядер) бурого Риса и не более 10.0 процентов целиковой или битой зерновки (целых или битых ядер) средне- или короткозёрного Риса.

LONG GRAIN MILLED RICE = ДЛИННОЗЁРНЫЙ ОБРУШЕННЫЙ РИС – In the Rice industry of the United States, Long Grain Milled Rice shall consist of milled Rice which contains more than 25.0 percent of whole kernels of milled Rice and in US Nos. 1 through 4 not more than 10.0 percent of whole or broken kernels of medium or short grain Rice. US No. 5 and US No. 6 long grain milled Rice shall contain not more than 10.0 percent of whole kernels of medium or short grain milled Rice (broken kernels do not apply). / В рисовой индустрии Соединённых Штатов Америки, 'Длиннозёрный Обрушенный Рис' должен состоять из обрушенного Риса, который содержит более 25.0 процентов целиковой зерновки (целых ядер) обрушенного Риса, а в Американских сортах с Номера 1 по Номер 4 – не более 10.0 процентов целиковой или битой зерновки (целых или битых ядер) средне- или короткозёрного Риса. Американские Номера 5 и 6 длиннозёрного обрушенного Риса содержат не более 10.0 процентов целиковой зерновки (целых ядер) средне- или короткозёрного обрушенного Риса (битая зерновка (битые ядра) не учитываются). Длиннозёрный Рис является наиболее популярным Сортом Риса в мире. При варке он поглощает умеренное количество жидкости, зёрна сохраняют свою форму и не слипаются, что придаёт готовому блюду прекрасный внешний вид. Универсальность длиннозёрного Риса позволяет использовать его в качестве гарнира к любому блюду из мяса, рыбы, птицы, а также для приготовления различных салатов. Чтобы всегда иметь гарнир под рукой, готовый Рис можно хранить в холодильнике в течение одной недели, а в морозильной камере – до шести месяцев. Способ приготовления двух порций:- требуется 125 г риса и 250 мл воды. В кастрюлю с кипящей водой засыпать Рис, довести до кипения и плотно закрыть крышкой. Варить на медленном огне 20 минут, пока Рис не впитает в себя всю воду. Чтобы улучшить вкус и аромат рисовых гарниров, варите длиннозёрный Рис в курином или говяжьем бульоне. По желанию горячий отварной Рис можно подавать в смеси с хрустящими обжаренными кусочками бекона или украсить разрезанным на тонкие полоски омлетом и тёртым сыром.

LONG GRAIN RICE = ДЛИННОЗЁРНЫЙ РИС – Long Grain Rice has a long, slender kernel, four to five times longer than its width. Cooked grains are separate, light and fluffy.

LONG GRAIN ROUGH RICE = ДЛИННОЗЁРНЫЙ РИС–СЫРЕЦ – Long Grain Rough Rice shall consist of rough Rice which contains more than 25 percent of whole kernels and which after milling to a well-milled degree, contains not more than 10 percent of whole or broken kernels of medium or short grain Rice. / 'Длиннозёрный Рис-Сырец' должен состоять из Риса-сырца, который содержит более 25.0 процентов целиковой зерновки (целых ядер) и который после .

LONG HEDGE = ХЭДЬЖ ПОКУПКОЙ (или ДЛИННЫЙ ХЭДЬЖ) – Long Hedge is a buying futures contracts to protect against possible upward trending prices of commodities that will be purchased in the future. Also known as Buying Hedge. See also Hedging; and Short Hedge. Long Hedge is the purchase of futures or other paper contracts, against the sale of physicals (to reduce exposure to a price rise). Long Hedge is the purchase of a futures contract to reduce the risk of a price increase. A long hedge is used to protect against rising input prices, such as Corn for a livestock feeding operation. Purchase of futures against the future market price purchase or fixed price forward sale of a cash commodity to protect against price increases. Purchase of a futures contract in anticipation of a cash market purchase. It is generally used to protect against a rise in the cash price. Also known as Buying Hedge. See also Purchasing Hedge. / Операция, проводимая на рынке фьючерсов и опционов путём покупки фьючерсного контракта лицом, продающим реальный товар на рынке. Если цена на продаваемый реальный товар повысится, то фьючерсный контракт станет дороже цены покупки, что компенсирует потери от продажи реального товара по низкой цене. Известен также как Хэдьж Покупкой (Buying Hedge или Buy Hedge). Смотрите также Хэдьж Приобретением (Purchasing Hedge).

LONG HEDGER = ХЭДЬЖЭР ПОКУПКИ – A Long Hedger is someone that will need to buy a commodity in the future and protects its futures cost by buying futures. A long hedger benefits from a weakening basis.

LONG IRON BUTTERFLY = ПОКУПКА ЖЕЛЕЗНОЙ БАБОЧКИ (или ПОКУПКА ЖЕЛЕЗНОЙ БАТТЕРФЛЯЙ) – When to use:- when the market is either below A or above C and the position is underpriced with a month or so left. Or when only a few weeks are left, market is near B, and you expect an imminent breakout move in either direction. Profit characteristics:- maximum profit equals (B – A) less the net debit to create the position. Occurs when market, at expiration, is below A or above C. Loss characteristics:- maximum loss occurs if market is at B at expiration. Amount of that loss is net debit to create the position. Break-evens are at B + and – initial debit. Decay characteristics:- decay negligible until final month, during which distinctive pattern of butterfly forms. Maximum loss is at B. If you are away from (A – C) range entering last month, you may wish to hold the position. Category:- precision. Long straddle B, short strangle at AC. Short put A, long put B, long call B, short call C. Note:- B – A generally is equal to C – B. / Одна из стратегий торговли.

LONGITUDE = ДОЛГОТА – Longitude:- the angular distance of a position on the equator east or west of the standard Greenwich meridian up to 180° east or west. / Под Долготой понимается одна из координат в ряде систем сферических координат, определяющая положение точек на поверхности Земли, Солнца, планет и на небесной сфере относительно Гринвичского меридиана – начального меридиана. Долгота – угловая величина, определяющая положение точек на сфере, в том числе на земной поверхности. Под долготой понимается двугранный угол между плоскостью нулевого (Гринвичского) меридиана и плоскостью данного меридиана.

LONGITUDINAL = ПРОДОЛЬНАЯ – Longitudinal:- yarns which run in the 0° direction of the fabric (warp direction). Can refer to yarns in a 3-D weave, 3-D braid, triaxiai braid, or multi-axial warp knit.

LONGITUDINAL = ПРОДОЛЬНАЯ СВЯЗЬ (или ПРОДОЛЬНАЯ БАЛКА, или СТРИНГЕР) – Longitudinal (maritime term):- a fore and aft strength member of a ship's structure.

LONG JOHNS = ДЛИННЫЕ ДЬЖОНЫ (или КАЛЬСОНЫ) – Long Johns:- long underwear. / длинное нижнее бельё.

LONG KNOT = ДЛИННЫЙ УЗЕЛ – Long Knot:- in raw silk, knots which have loose ends from 3 to 25 mm in length. Fabrics defect. / Длинный Узел – дефект чистоты нити шёлка-сырца в виде неправильно связанного узла или узла с концами.

LONG–LEGGED DOJI = ДЛИННОНОГИЙ ДОДЗИ – Long-Legged Doji:- this candlestick has long upper and lower shadows with the Doji in the middle of the day's trading range, clearly reflecting the indecision of traders. / В техническом анализе биржевых рынков, Додзи (Doji).

LONG POSITION = ДЛИННАЯ ПОЗИЦИЯ (или ПОЗИЦИЯ ПОКУПКИ, или РЕПОРТ) – Long Position:- because of the complexity of trading positions, especially when trading in futures and options, traders avoid the terms buy and sell, and refer to long and short positions. Going long means buying an asset, a call option or a futures contract with a view to profiting from a rise in the price of the underlying asset. Going short means selling an asset, buying a put option, selling a call option, or entering a futures contract with a view to profiting from a decline in the price of the underlying asset. Short-selling requires that you borrow stock for delivery, as you have sold an asset you do not own. The intention is to buy later, when the price has fallen, in order to repay the borrowed stock. Short positions are normally only of a few days duration and should only be attempted by experienced traders with the assistance of their broker. If you are only trading the long side of the market, short signals should be interpreted as a signal to close any long position. Entry = Open a long or short position. Exit = Quit a long or short position. Take profits = Reduce a long or short position. A market position that obligates the holder to take delivery. Long describes the position of someone who has bought commodity, futures or option contracts and has not yet offset that transaction with a sale or delivery of the commodity. The status of owning or holding more of a given security or commodity than one has contracted to deliver in future. It is a market position where the client has bought a financial instrument he previously did not hold/own. If a trader is 'long USD' that means that he owns US Dollars. Purchase of bonds, futures, indexes, options, stocks or other instruments by an investor who is expecting a rise in prices or is holding the investment for income. Long Position is the market position of a futures contract buyer whose purchase obligates him to accept delivery unless he liquidates his contract with an offsetting sale. The act of buying and holding (as a new position) an instrument in the belief prices will rise in the future. The opposite of Short Position. A Long Position is created through the purchase of a contract or a security. The investor anticipates increasing exchange prices. A Long Position means the purchase and retention of an asset. A Long Position in an asset means having an economic exposure to the asset. In futures and forward dealing the long party is the one who has contracted to take delivery of the asset in the future.

LONG PUT = ПОКУПКА ОПЦИОНА НА ПРОДАЖУ – When to use:- when you are bearish to very bearish on the market. In general, the more out-of-the-money (lower strike) the put option strike price, the more bearish the strategy. Profit characteristics:- profit increases as markets fall. At expiration, break-even point will be option exercise price A – price paid for option. For each point below break-even, profit increases by additional point. Loss characteristics:- loss limited to amount paid for option. Maximum loss realized if market ends above option exercise A. Decay characteristics:- position is a wasting asset. As time passes, value of position erodes toward expiration value. Category:- directional. Synthetics:- short instrument, long call. / Одна из стратегий торговли.

LONG RISK REVERSAL = ПОКУПКА С РИСКОМ РАЗВОРОТА – (Split Strike). When to use:- when you are bullish on the market and uncertain about volatility. Normally this position is initiated as a follow-up to another strategy. Its risk/reward is the same as a Long Futures except that there is a flat area of little or no gain/loss. Profit characteristics:- profit increases as market rises above the long call strike price. Profit at expiration is open-ended and is based on the exercise price of B +/– price received or paid to initiate position. Loss characteristics:- loss increases as market falls below the short put. Loss at expiration is open-ended and is based on the exercise price of A +/– premium received or paid to initiate position. Decay characteristics:- time decay characteristics vary according to the relationship of the call strike price, put strike price and the underlying futures price at the time the position is established. The position is time decay neutral (not affected) if the futures price is exactly mid-way between the call and put strike prices; long time decay (benefits from time decay) when the futures price is closer to the call than the put strike price and short time decay (time decay erodes the value of the position) when the futures price is closer to the put than the call strike price. Also known as Combos or Squash. Category:- directional. Long call B, short put A. / Одна из стратегий торговли.

LONG–RUN MARGINAL COSTS = ПРЕДЕЛЬНЫЕ ИЗДЕРЖКИ ДЛИТЕЛЬНОГО ПЕРИОДА – Long-Run Marginal Costs are all costs associated with the lowest cost incremental unit including variable production costs and capital costs. / Все издержки, ассоциированные с наименьшей затратной приростной единицей объёма продукции, включая переменные производственные издержки и капитальные затраты.

LONGS = (1) LONG POSITIONS, (2) BUYERS, (3) LONG TERM

LONGSHOREMAN = ПОРТОВЫЙ ГРУЗЧИК – Longshoreman (maritime term):- a laborer who works at loading and discharging cargo. Longshoreman is an individual employed in a port to load and unload ships. Longshoreman is a worker who loads and unloads a ship. Terminal operator who is designed to facilitate the operation of loading and discharging vessels, as well as other terminal activities. Also known as Stevedore.

LONG SLUG = ДЛИННАЯ (ТОЛСТАЯ) ПРИСУЧКА – Long Slug:- in raw silk, a slug which exceeds 10 mm (1/2 in.) in length or which is very much larger in diameter than the yarn. Fabrics defect.

LONG SMUT = КРУПНОПУЗЫРЧАТАЯ ГОЛОВНЯ – Long Smut (Tolyposporium penicillariae):- immature, green fungal bodies (sori) larger than the seed develop on panicles during grain fill. A single fungal body (sorus) develops per floret. As grain matures, sori change in color from green to dark brown. Sori are filled with dark spores. Infection takes place at temperature range of between 21 and 31 °C, and at relative humidity greater than 80%. The disease is spread by wind-borne spores and rain. What to do:- (i) plant resistant varieties, if available; (ii) rotate with non-cereals; (iii) plough deep; and (iv) practise good field sanitation. Long Smut is a common name for Tolyposporium erhenbergii. / Под Головнёй понимается болезнь Растений, вызываемая Головнёвыми Грибами. Несколько видов:- пузырчатая, пыльная, стеблевая, твёрдая. Наиболее вредоносна для Злаков (Кукуруза, Пшеница, Рожь и другие). Колосья, метёлки, початки, стебли и листья превращаются в тёмную споровую массу.

LONG STAPLE = ДЛИННЫЙ ШТАПЕЛЁК – Long Staple is a long fiber. In reference to cotton, long staple indicates a fiber length of not less that 1-1/8 inches. In reference to wool, the term indicates fiber 3 to 4 inches long suitable for combing.

LONG STAPLE COTTON = ДЛИННОШТАПЕЛЬКОВЫЙ ХЛОПЧАТНИК (или ХЛОПЧАТНИК С ДЛИННЫМ ШТАПЕЛЬКОМ, или ДЛИННОВОЛОКНИСТЫЙ ХЛОПЧАТНИК) – Long Staple Cotton:- the staple is the length of the Cotton fiber, and longer fiber length results in the finer, smoother yarn that is used to weave high quality fabrics. A term Long Staple Cotton is a long fiber. In reference to cotton, long staple indicates a fiber length of not less that 1-1/8 inches. A term Long Staple Cotton refers to Cotton fibers whose length ranges from 1-1/8 inches to 1-3/8 inches. Fibers whose length is 1-3/8 inches or more are known as Extra-Long Staple (ELS) Cotton. See also Short Staple Cotton. / Смотрите также Короткоштапельковый Хлопчатник или Хлопчатник С Коротким Штапельком или Коротковолокнистый Хлопчатник (Short Staple Cotton).

LONG STRADDLE = ПОКУПКА СТРЭДЛ (или ДЛИННЫЙ СТРЭДЛ, или СТРЭДЛ НА ПОКУПКЕ, или РАЗНИЦА НА ПОКУПКЕ) – Long Straddle is a straddle in which a long position is taken in both a put and a call option. Also known as Bull Straddle. The opposite of Short Straddle. Purchase or sales contract for the same number of puts and calls of the same basic security at different dates, different commodities and at different stock exchanges. A Long Straddle position is constructed by purchasing both a put and a call at an exercise price at or near the current price of the underlying asset. For example, if you buy 10 XYZ June 60 call options and buy 10 XYZ June 60 put options. A straddle in which a long position is taken in both a put and a call option. Also known as Bull Straddle. The opposite of Short Straddle. When to use:- if market is near A and you expect it to start moving but are not sure which way. Especially good position if market has been quiet, then starts to zigzag sharply, signaling potential eruption. Profit characteristics:- profit open-ended in either direction. At expiration, break-even is at A, +/– cost of spread. However, position is seldom held to expiration because of increasing time decay with passage of time. Loss characteristics:- loss limited to the cost of spread. Maximum loss occurs if market is at A at expiration. Decay characteristics:- time decay accelerates as options approach expiration. Position is generally liquidated well before expiration. Category:- precision. Long call A, long put A. Synthetics:- long 2 calls A, short instrument; long 2 puts A, long instrument. All done to initial delta neutrality. A delta neutral spread is a spread established as a neutral position by using the deltas of the options involved. The neutral ratio is determined by dividing the delta of the purchased option by the delta of the written option. Holding an equal number of Puts and Calls of an asset with the same strike price and the same expiry date Holding an equal number of Puts and Calls of an asset with the same strike price and the same expiry date. Long Straddle:- the purchase of call and put options with the same exercise price and expiry date. The investor expects a significant increase in volatility; direction of prices is not of prime importance. / Одна из стратегий торговли. Сочетание покупки опциона на покупку и покупки опциона на продажу на один и тот же биржевой инструмент или актив по одной цене исполнения и с одной и той же датой прекращения признания.

LONG STRANGLE = ПОКУПКА СТРЭНГЛ (или ДЛИННЫЙ СТРЭНГЛ) – When to use:- if market is within or near (A-B) range and has been stagnant. If market explodes either way, you make money; if market continues to stagnate, you lose less than with a long straddle. Also useful if implied volatility is expected to increase. Profit characteristics:- profit open-ended in either direction. Break-even levels are at A – cost of spread and B + cost of spread. However, spread is usually not held to expiration. Loss characteristics:- loss limited. Loss is equal to net cost of position. Maximum loss occurs if, at expiration, market is between A and B. Decay characteristics:- decay accelerates as options approach expiration but not as rapidly as with long straddle. To avoid largest part of decay, the position is normally liquidated prior to expiration. Category:- precision. Long put A, long call B. Generally done to initial delta neutrality. / Одна из стратегий торговли.

LONG SYNTHETIC FUTURES = ПОКУПКА СИНТЕТИЧЕСКОГО ФЬЮЧЕРСА (или ПОКУПКА ИСКУССТВЕННОГО ФЬЮЧЕРСА) – Long Synthetic Futures:- When to use:- when you are bullish on the market and uncertain about volatility. You will not be affected by volatility changing. However, if you have an opinion on volatility and that opinion turns out to be correct, one of the other strategies may have greater profit potential and/or less risk. May be traded into from initial long call or short put position to create a stronger bullish position. Profit characteristics:- profit increases as market rises. Profit is based strictly on the difference between the exit price and the synthetic entry price. Loss characteristics:- loss increases as market falls. Loss is based strictly on the difference between the exit price and the synthetic entry price. Decay characteristics:- none. Category:- directional. Long call A, short put A. / Одна из стратегий торговли.

LONG TAIL INSURANCE = СТРАХОВАНИЕ С ДЛИТЕЛЬНЫМ СРОКОМ ПРИЁМА ПРЕТЕНЗИЙ – Long Tail Insurance:- this refers to a type of insurance where claims may be made many years after the period of the insurance has expired. Liability insurance is an example of long tail business. The opposite of long tail business is short tail business.

LONG TERM = ДОЛГОСРОЧНЫЙ (или ДОЛГИЙ СРОК) – Long Term:- in the technical analysis, a period of time that is greater than both the short term and intermediate term. Must be defined by each trader based on personal preference and trading style. A good rule of thumb is everything greater than 1 month. Weekly charts are best used as a trading vehicle.

LONG–TERM ASSETS = ДОЛГОСРОЧНЫЕ АКТИВЫ – In a balance sheet (IFRS), Long-Term Assets consist of:- Intangible Assets; Property, Plant and Equipment; Investments Accounted for Using the Equity Method; Other Financial Assets; Deferred Taxes; Other Receivables and Miscellaneous Long-Term Assets.

LONG–TERM CAPITAL = ДОЛГОСРОЧНЫЙ КАПИТАЛ – Long-Term Capital:- total funds available to a business entity on a long-term or permanent basis. Long-term capital or long-term debt and current liabilities (all recorded as liabilities in the balance sheet) make up the total capital available to a business entity. Long-term capital includes shareholders' equity plus debt maturing in more than one year, as well as certain provisions and equipment subsidies received by the company.

LONG–TERM CONSERVATION = ДОЛГОСРОЧНАЯ КОНСЕРВАЦИЯ (или ДОЛГОСРОЧНОЕ СОХРАНЕНИЕ) – Long-Term Conservation is a long-term storage for maintenance of viability and purity of germplasm for up to 25 years for annual crops.

LONG–TERM DEBT = ДОЛГОСРОЧНАЯ ЗАДОЛЖЕННОСТЬ (или ДОЛГОСРОЧНЫЙ ДОЛГ) – In the United States, Long-Term Debt is the debt having a maturity of more than one year from the date it was issued. Also known as Loan Capital in the United Kingdom. Long Term Debt shows the total value of money borrowed that is to be repaid at least one year in the future. Also known as Long Term Liability or Long Term Debt.

LONG–TERM EQUITY ANTICIPATION SECURITIES = ДОЛГОСРОЧНЫЕ ЦЕННЫЕ БУМАГИ НА УЧАСТИЕ В КАПИТАЛЕ КОМПАНИИ – Long-Term Equity AnticiPation Securities (LEAPS) are long-term option contracts that allow investors to establish positions that can be maintained for a period of up to three years. CBOE® lists LEAPS on Equity and Index products. The development and introduction of LEAPS by CBOE® in 1990 added a whole new range of options possibilities, many suited for conservative stock investors. Current options investors are using LEAPS, as are stock investors, because of the similarities between LEAPS and shares of stock, and the more conservative nature afforded to LEAPS by their long-term expirations. Equity LEAPS Benefits:- (i) Equity LEAPS calls can provide long-term stock market investors an opportunity to benefit from the growth of large capitalization companies without having to make outright stock purchases; (ii) Equity LEAPS puts can provide a hedge for stock investors against substantial declines in underlying equities; and (iii) current equity options users may also find LEAPS appealing if they desire to take a longer term position of up to three years in some of the same options they currently trade. Index LEAPS Benefits:- (i) Index LEAPS let you trade, hedge or

invest in the 'entire' stock market or select industry sectors for a time that can be measured in years; (ii) Index options let you take a bullish or bearish position on the entire market; (iii) Index options let you hedge your investments against adverse market moves; and (iv) Index LEAPS let you do all this over a longer time period. Long-Term Equity Anticipation Securities (LEAPS) – a longer-term call or put contract that can extend out up to almost three years. The Long-Term Equity Anticipation Securities (LEAPS) are publicly traded options contracts with expiration dates that are longer than one year. Structurally, LEAPS are no different than short-term options, but the later expiration dates offer the opportunity for long-term investors to gain exposure to prolonged price changes without needing to use a combination of shorter-term option contracts. The premiums for LEAPs are higher than for standard options in the same stock because the increased expiration date gives the underlying asset more time to make a substantial move and for the investor to make a healthy profit. LEAPS are an excellent way for a longer-term trader to gain exposure to a prolonged trend in a given security without having to roll several short-term contracts together. The ability to buy a call/put option that expires one or two years in the future is very alluring because it gives the holder exposure to the long-term price movement without the need to invest the larger amount of capital that would be required to own the underlying asset outright. These long-term options can be purchased not only for individual stocks, but also for equity indexes (such as the S&P 500). / СИБО® (CBOE®). осуществить неотложные приобретения ценных бумаг; (ii) .

LONG–TERM LIABILITIES = ДОЛГОСРОЧНЫЕ ОБЯЗАТЕЛЬСТВА – In a balance sheet (IFRS), Long-Term Liabilities consist of:- Provisions for Pensions and Similar Obligations; Other Provisions; Deferred Taxes; Financial Indebtedness; Other Liabilities. See also Long Term Debt.

LONG–TERM LIABILITIES OTHER THAN DEBT AND SPECIFIC ACCOUNTS PAYABLE = ДОЛГОСРОЧНЫЕ ОБЯЗАТЕЛЬСТВА ИНЫЕ, НЕЖЕЛИ ДОЛГ (или ЗАДОЛЖЕННОСТЬ) И СПЕЦИФИЧЕСКАЯ КРЕДИТОРСКАЯ ЗАДОЛЖЕННОСТЬ – In the United States, . Long-Term Liabilities is an amount owed for leases, bond repayment, and other items due after 1 year. Other Long-Term Liabilities is a value of leases, future employee benefits, deferred taxes, and other obligations not requiring interest payments that must be paid over a period of more than one year. Long-Term Liabilities are liabilities of a business that are due in more than one year. An example of a long-term liability would be a mortgage payable. Long-Term Liabilities are debts of a company that are not due for repayment in the next accounting period. Also known as Provisions in the United Kingdom. Long-Term Liability is liabilities, usually loans, which can be satisfied over a period of time greater than one year. / выплата (repayment) .

LONG TERM LOAN = ДОЛГОСРОЧНАЯ ССУДА – Long Term Loan is a form of debt that is paid off over an extended time frame that exceeds one year in duration. Obtaining a long term loan provides a business with working capital that it can use to purchase assets, inventory or equipment which can then be used to create additional income for the business. See also Long Term Debt. Long-Term Loan is a type of loan that has an extended time period for repayment usually lasting between three and 30 years. Car loans and home mortgages are examples of long-term loans.

LONG–TERM RATE = ДОЛГОСРОЧНАЯ СТАВКА – In the United States, the Long-Term Rate applies only to interest on Series EE savings bonds with issue dates from 1995-May-01, through April 1997 and then only to interest earnings after the date these bonds are 5 years old. See also Short-Term Rate concerning interest earned up to the date these bonds are 5 years old. Bid yields for the most actively traded Treasury bills, notes, and bonds in the government securities market are used to create a yield curve. This curve relates the yield on a security to its time to maturity. Yields at particular points on the curve are referred to as 'Constant Maturity Yields'. From the yield curve, 5-year Treasury securities yields as of the close of business for each business day of the 6 months prior to May 01 and November 01 are compiled, and the monthly average is calculated for each month (with each monthly average being rounded to the nearest one-hundredth of one percent). The 'long-term rate' is 85% of the average of 5-year Treasury securities yields over those 6 months. The May 01 rate reflects market yields during the preceding November through April. The November 01 rate reflects market yields during the preceding May through October.

LONG THE BASIS = В ДЛИННОЙ ПОЗИЦИИ ПО БАЗИСУ (или ПОКУПКА С ХЭДЬЖИРОВАНИЕМ) – Being Long The Basis means to have a long actuals position (you own the commodity or you will own it in the future), hedged with a short futures position. Short hedgers want the basis to remain the same or to strengthen. A person or firm that has bought the spot commodity and hedged with a sale of futures is said to be 'Long The Basis'. See also Buy Basis. Long The Basis is a trading strategy in which an investor who owns or has bought a commodity hedges their investment, or gives themselves a little buffer against potential market fluctuations, by selling futures contracts on that commodity. Taking such action provides a guaranteed price at which they may sell their commodities if the market price moves against their underlying position. Key Takeaways:- (i) Long the basis is a trading strategy in which an investor who owns or has bought a commodity hedges their investment, or gives themselves a little buffer against potential market fluctuations, by selling futures contracts on that commodity. (ii) Long the basis means there is a floor or guaranteed price at which an investor can sell the commodities, regardless of whether the market has moved up or down. (iii) Long the basis implies that the trader is betting on the instrument's ultimate rise and wants to hedge their bets, in case there is a short-term decline. Understanding Long The Basis:- Long The Basis, by definition, means the investor must be bullish on a particular commodity and usually is looking to hedge their bullish position. For instance, a gold-mining company maintains a significant position in the precious metal. However, the price of gold is susceptible to market pressures and is likely to fluctuate at times. To hedge against adverse changes, the company may choose to buffer its bullish stance through the sale of futures contracts and thus lock in a guaranteed range of value. In contrast, a trader who is bearish on a commodity may enter into a short the basis trade. Shorting the basis implies the investor will be taking a short position in the commodity and a long position in the futures contract. This strategy is used to hedge a position by locking in a future spot or cash price and thereby removing the uncertainty of rising prices. Both the long-the-basis and the short-the-basis trades are basis trading strategies. Basis trading relates to a trading strategy in which a trader believes that two similar securities are mispriced relative to each other, and the trader will take opposing long and short positions in the two securities to profit from the convergence of their values. Fast Fact:- A bullish investor looking to hedge their position would be considered long the basis; a bearish investor looking to hedge would be considered short the basis. Example Of Long The Basis:- It is August at the Smith family farm, and the Smiths have agreed to sell their Soybean crop to a wholesaling group, Soy Tofu. The contracted price is USD400 a ton, which is the current cash price. The wholesalers think they have gotten a good deal, believing that Soybean prices will rise in the coming months. However, they also are a bit concerned about what it would mean for their profit, at resale, if bean prices were to fall. As a result, Soy Tofu decides to sell Soybean futures at USD425 per ton. The wholesalers are now long the basis, meaning they are long Soybeans and short Soybean futures. If the price falls, being long the basis will guarantee a favorable price at which they can resell. Their cost basis, in this case, is negative USD25, or cash of USD400, minus futures of USD425. The wholesalers are making a trade-off, however. They are exchanging price risk for basis risk – that is, the risk that the price of Soybeans and Soybean futures will not move in lockstep. The wholesalers will profit if the differential between Soybean and Soybean futures prices narrows. However, a widening of this differential will result in a loss. Rather than for hedging purposes, the wholesalers may also choose to go long the basis by speculating about the price differential between Soybeans and Soybean futures. Perhaps they believe local prices for soybeans will rise. If the price reaches USD450 while the futures price advances only to USD430, their net proceeds due to the narrowing of the basis will be USD25 on the Soybeans, and negative USD5 on the Soybean futures, for a total of USD20. Their bullish bet will have paid off. However, if the price of

Soybeans stays at USD400, while the futures price rises to USD435, the basis will be negative USD35. The widening of the basis from the previous negative USD25 will result in a loss of USD10 per ton. Notably, it is also possible for the Smith family to go long on the basis, as well. To do so, they would hold their Soybeans in storage and sell Soybean futures. The family may choose to do this if they think local soybean prices will rise. The purchase of a cash commodity and the sale of a futures against unsold inventory to provide protection against a price decline in the cash market. / О лице или фирме, которая купила физическое сырьё для поставки в будущем и захэдьжировала эту покупку продажей фьючерсов, говорят, что он или она, соответственно, находятся 'в длинной позиции по базису' ('long the basis'). Покупка физического сырья для поставки в будущем и продажа фьючерсов в противовес непроданному инвентарю с целью защиты от снижения цены на реальном рынке данного сырья.

LONG THE MARKET = В ДЛИННОЙ ПОЗИЦИИ ПО РЫНКУ – Long The Market:- having a market bullish stance. A speculative strategy that profits from an increase of prices. Opposite of Short the Market.

LONG TON = ДЛИННАЯ ТОННА – A Long Tonne (LT or lt) or ton is a unit of mass used in the United Kingdom as part of the Imperial System. Long tonne (ton) = 1 016.047 kg = 2 240 lb. In the United Kingdom, Long Ton is equivalent to 2 240 pounds (lb), or 1 016.047 kilograms (kg). / Применяемая в Соединённом Королевстве Длинная Тонна равна 2 240 фунтам, или 1 016.047 килограммам (кг).

LONG TWISTED KERNEL = СКРУЧЕННАЯ ДЛИННАЯ ЗЕРНОВКА (или СКРУЧЕННОЕ ДЛИННОЕ ЯДРО) – Long Twisted Kernel (tk) is a long caryopsis with a slight twist in the middle portion.

LONG WOOL = ДЛИННАЯ ШЕРСТЬ – Long Wool is a wool from such breeds as the Lincoln, Leicester, and Cotswold. It is large in diameter and up to 12:15 in. in length.

LOOKALIKE OPTION = ОПЦИОН ДВОЙНИК – Lookalike Option is an over-the-counter option that is cash settled based on the settlement price of a similar exchange-traded futures contract on a specified trading day.

LOOKALIKE SWAP = СВОП ДВОЙНИК – Lookalike Swap is an over-the-counter swap that is cash settled based on the settlement price of a similar exchange-traded futures contract on a specified trading day.

LOOKBACK OPTION = ОПЦИОН С ОГЛЯДКОЙ НА ПРОШЛОЕ – Lookback Option:- a history-dependent option where the settlement at maturity is reliant not only on whether the option is in-the-money at expiry, but also on the maximum or minimum price achieved by the underlying asset during at least some part of the option life. An exotic option whose payoff depends on the minimum or maximum price of the underlying asset during some portion of the life of the option. Lookback Options give the holder to right at expiry to exercise the option at the most favorable rate or price reached by the underlying over the life of the option. As with average options, the strike may be either fixed or floating. With an optimal rate lookback option, the strike is fixed at the outset and the option will pay out against the highest (for a call) or lowest spot rate (for a put) reached over the life of the option, irrespective of the spot rate at expiry. The option will usually be settled in cash. Since the option is likely to have a larger pay-out than the corresponding plain vanilla option, it commands a larger premium. The strike for an optimal strike lookback option, on the other hand, is not fixed until expiry, when it is set to be the highest (for a put) or lowest spot rate (for a call) over the option's life and exercised for cash or physical against the spot rate prevailing at expiry. / Экзотический опцион, окупаемость которого зависит от минимальной или максимальной цены соответствующего актива в течение некоторого промежутка жизни данного опциона.

LOOKOUT = НАБЛЮДАТЕЛЬ – Lookout is a member of the crew stationed on the forecastle, or on the bridge, whose duty it is to watch for any dangerous objects or for any other vessels heaving into sight. Lookout (maritime term):- the man stationed aloft or in the bows for observing and reporting objects seen.

LOOM = ВАЛЁК – Loom (maritime term):- the part of an oar between the blade and handle. / Часть распашного весла между кожей и рукоятью.

LOOM = НЕЯСНОЕ ОЧЕРТАНИЕ (или ПУЧНОСТЬ) – Loom:- the reflection of a light below the horizon due to certain atmospheric conditions. / Неясные очертания земли на горизонте; мираж; отблеск.

LOOM = ТКАЦКИЙ СТАНОК – A Loom is a machine or device for weaving thread or yarn into textiles. Looms can range from very small hand-held frames, to large free-standing hand looms, to huge automatic mechanical devices. In practice, the basic purpose of any loom is to hold the warp theads under tension to facilitate the interweaving of the weft threads. The precise shape of the loom and its mechanics various, but the basic function is the same. Loom is a machine for weaving cloth. It is aperated either by hand or by machine. Loom is a machine for weaving fabric by interlacing a series of vertical, parallel threads (the warp) with a series of horizontal, parallel threads (the filling). The warp yarns from a beam pass through the heddles and reed, and the filling is shot through the 'shed' of warp threads by means of a shuttle or other device and is settled in place by the reed and lay. The woven fabric is then wound on a cloth beam. The primary distinction between different types of looms is the manner of filling insertion. The principal elements of any type of loom are the shedding, picking, and beating-up devices. In shedding, a path is formed for the filling by raising some warp threads while others are left down. Picking consists essentially of projecting the filling yarn from one side of the loom to the other. Beating-up forces the pick, that has just been left in the shed, up to the fell of the fabric. This is accomplished by the reed, which is brought forward with some force by the lay. Loom is a machine used for weaving fabrics. Loom is a machine which weaves fabric by interlacing a series of lengthwise (vertical) parallel threads, called Warp Threads, with a series of crosswise (horizontal) parallel threads, called Filling Threads. Machines that weave cotton yarns into fabrics. A Loom is a machine or device for weaving thread or yarn into textiles. Looms can range from very small hand-held frames, to large free-standing hand looms, to huge automatic mechanical devices. In practice, the basic purpose of any loom is to hold the warp theads under tension to facilitate the interweaving of the weft threads. The precise shape of the loom and its mechanics various, but the basic function is the same. Types of looms:- (i) warp-weighted; (ii) ground looms; (iii) frame looms; (iv) backstrap looms; (v) foot-treadle floor looms; (vi) haute lisse looms; (vii) power looms; and (vii) the Jacquard looms. Warp-weighted:- the earliest looms were probably vertical warp-weighted looms, with the warp threads suspended from a branch or piece of wood and weighted or attached to the ground. The weft threads would be pushed into place by hand or a stick that would eventually become the shuttle. At first, it was necessary to raise and lower every warp thread one at a time, which was a time-consuming and laborious process. Basic techniques, such as the insertion of a rod, were developed to produce a shed, the space between warp threads (perhaps every other thread would be alternately raised and lowered), so that the weft thread or shuttle could pass through the entire warp at once. Ground looms:- on a horizontal ground loom, the warp would be strung between two rows of pegs. The weaver would have to lean over in order to work, so pit looms were developed, with the warp strung over a pit, so the weaver could sit with his or her legs underneath and would then be on a level with the loom. Frame looms:- frame looms followed basically the same principles as ground looms. The loom was constructed out of sticks and boards attached at right angles (producing a box-like shape), which meant that it was portable and could even be held in the weaver's lap. Frame looms are still in use today, usually as a portable, less expensive, and compact alternative to a table or floor loom. Backstrap looms:-

backstrap looms, as the name implies, are tied around the weaver's waist on one end and around a stationary object such as a tree, post, or door on the other. Tension can be adjusted simply by leaning back. Backstrap looms are very portable, since they can simply be rolled up and carried. Foot-treadle floor looms:- handweavers today tend to use looms with at least four shafts or harnesses. Each shaft contains a set of heddles through which yarn can be threaded (and attached, through a variety of mechanisms, to the front and back beams of the loom), and by raising the harnesses in different combinations, a variety of patterns can be achieved. Looms with two such shafts are called Rigid Heddle Looms and variants with eight or more shafts are available. The shafts on a floor loom are controlled by a series of foot pedals (called Treadles). This is an important development, since it keeps the weaver's hands free to manipulate the shuttle and it is easy to raise and lower warp threads in selected combinations. As the material is woven, it can be wrapped around the front beam, as unwoven yarn is unrolled from the front beam, so length is not limited by the size of the loom. A table loom is similar, but, as the name suggests, it is smaller and equipped with levers rather than treadles, since it is made to sit on a stand or on top of a table. Haute lisse looms:- looms used for weaving traditional tapestry are classified as haute lisse looms, where the woof is suspended vertically between two rolls, and the basse lisse looms, where the woof extends horizontally between the rolls. Power looms:- the first power loom was built by the Englishman Edmund Cartwright in 1785. Originally, powered looms were shuttle-operated but in the early part of the XX century the faster and more efficient shuttleless loom came into use. Today, advances in technology have produced a variety of looms designed to maximize production for specific types of material. The most common of these are air-jet looms and water-jet looms. Computer-driven looms are now also available to individual (non-industrial) weavers. The Jacquard loom was the first machine to use punch cards. It uses punched cards to control the pattern being woven. See also Jacquard. Loom is a machine for producing cloth by the interlacing of two sets of threads substantially at right angles to each other. A Loom is a device used to weave cloth. The basic purpose of any loom is to hold the warp threads under tension to facilitate the interweaving of the weft threads. The precise shape of the loom and its mechanics may vary, but the basic function is the same. Etymology:- the word 'Loom' is derived from the Old English 'Geloma' formed from ge-(perfective prefix) and loma, a root of unknown origin; this meant utensil or tool of any kind. In 1404 it was used to mean a machine to enable weaving thread into cloth. By 1838 it had gained the meaning of a machine for interlacing thread. Types of Looms:- (1) Back Strap Loom:-a back strap loom with a shed-rod. A simple loom which has its roots in ancient civilizations comprising two sticks or bars between which the warps are stretched. One bar is attached to a fixed object and the other to the weaver usually by means of a strap around the back. On traditional looms, the two main sheds are operated by means of a shed roll over which one set of warps pass, and continuous string heddles which encase each of the warps in the other set. The weaver leans back and uses his or her body weight to tension the loom. To open the shed controlled by the string heddles, the weaver relaxes tension on the warps and raises the heddles. The other shed is usually opened by simply drawing the shed roll toward the weaver. Both simple and complex textiles can be woven on this loom. Width is limited to how far the weaver can reach from side to side to pass the shuttle. Warp faced textiles, often decorated with intricate pick-up patterns woven in complementary and supplementary warp techniques are woven by indigenous peoples today around the world. They produce such things as belts, ponchos, bags, hatbands and carrying cloths. Supplementary weft patterning and brocading is practiced in many regions. Balanced weaves are also possible on the backstrap loom. Today, commercially produced backstrap loom kits often include a rigid heddle. (2) Warp-Weighted Loom:- the warp-weighted loom is a vertical loom that may have originated in the Neolithic period. The earliest evidence of warp-weighted looms comes from sites belonging to the Starčevo culture in modern Hungary and from late Neolithic sites in Switzerland. This loom was used in Ancient Greece, and spread north and west throughout Europe thereafter. Its defining characteristic is hanging weights (loom weights) which keep bundles of the warp threads taut. Frequently, extra warp thread is wound around the weights. When a weaver has reached the bottom of the available warp, the completed section can be rolled around the top beam, and additional lengths of warp threads can be unwound from the weights to continue. This frees the weaver from vertical size constraints. (3) Drawloom:- a drawloom is a hand-loom for weaving figured cloth. In a drawloom, a 'figure harness' is used to control each warp thread separately. A drawloom requires two operators, the weaver and an assistant called a 'Drawboy' to manage the figure harness. (4) Handloom:- a handloom is a simple machine used for weaving. In a wooden vertical-shaft looms, the heddles are fixed in place in the shaft. The warp threads pass alternately through a heddle, and through a space between the heddles (the shed), so that raising the shaft raises half the threads (those passing through the heddles), and lowering the shaft lowers the same threads – the threads passing through the spaces between the heddles remain in place. (5) Flying Shuttle:- hand weavers could only weave a cloth as wide as their armspan. If cloth needed to be wider, two people would do the task (often this would be an adult with a child). John Kay (1704–79) patented the flying shuttle in 1733. The weaver held a picking stick that was attached by cords to a device at both ends of the shed. With a flick of the wrist, one cord was pulled and the shuttle was propelled through the shed to the other end with considerable force, speed and efficiency. A flick in the opposite direction and the shuttle was propelled back. A single weaver had control of this motion but the flying shuttle could weave much wider fabric than an arm's length at much greater speeds than had been achieved with the hand thrown shuttle. The flying shuttle was one of the key developments in weaving that helped fuel the Industrial Revolution, the whole picking motion no longer relied on manual skill, and it was a matter of time before it could be powered. (6) Haute-Lisse and Basse-Lisse Looms:- looms used for weaving traditional tapestry are classified as haute-lisse looms, where the warp is suspended vertically between two rolls, and the basse-lisse looms, where the warp extends horizontally between the rolls. (7) Traditional Looms:- several other types of hand looms exist, including the simple frame loom, pit loom, free-standing loom, and the pegged loom. Each of these can be constructed, and provide work and income in developing societies. (8) Power Looms:- Edmund Cartwright built and patented a power loom in 1785, and it was this that was adopted by the nascent cotton industry in England. The silk loom made by Jacques Vaucanson in 1745 operated on the same principles but wasn't developed further. The invention of the flying shuttle by John Kay was critical to the development of a commercially successful power loom. Cartwright's loom was impractical but the ideas behind it were developed by numerous inventors in the Manchester area of England; where by 1818 there were 32 factories containing 5 732 looms. Horrocks loom was viable, but it was the Roberts Loom in 1830 that marked the turning point. Incremental changes to the three motions continued to be made. The problems of sizing, stop-motions, consistent take-up, and a temple to maintain the width remained. In 1841, Kenworthy and Bullough produced the Lancashire Loom which was self-acting or semi-automatic. This enables a youngster to run six looms at the same time. Thus, for simple calicos, the power loom became more economical to run than the hand loom with complex patterning that used a dobby or Jacquard head, jobs were still put out to handloom weavers until the 1870s. Incremental changes were made such as the Dickinson Loom, culminating in the Keighley-born inventor Northrop, who was working for the Draper Corporation in Hopedale producing the fully automatic Northrop Loom. This loom recharged the shuttle when the pirn was empty. The Draper E and X models became the leading products from 1909. They were challenged by synthetic fibers such as rayon. From 1942 the faster and more efficient shuttleless Sulzer looms and the rapier looms were introduced. Modern industrial looms can weave at 2 000 weft insertions per minute. Weft Insertion:- different types of looms are most often defined by the way that the weft, or pick, is inserted into the warp. Many advances in weft insertion have been made in order to make manufactured cloth more cost effective. There are five main types of weft insertion and they are as follows:- (i) Shuttle:- the first ever powered looms were shuttle type looms. Spools of weft are unraveled as the shuttle travels across the shed. This is very similar to projectile methods of weaving with the exception that the weft spool is stored on the shuttle. These looms are considered obsolete in modern industrial fabric manufacturing because these machines can only reach a maximum of 300 picks per minute. (ii) Air Jet:- an air

jet loom uses short quick bursts of compressed air to propel the weft through the shed in order to complete the weave. Air jets are the fastest traditional method of weaving in modern manufacturing and they are able to achieve up to 1 200 picks per minutes. However, the amounts of compressed air required to run these looms as well as the complexity in the way the air jets are positioned makes them more costly than other looms. (iii) Water Jet:- water jet type looms use the same principle as air jet looms, however, they take advantage of pressurized water to propel the weft. The advantage of this type of weaving is that water power is cheaper where water is directly available on site. Picks per minute can reach as high as 1 000. (iv) Rapier:- (A Picanol rapier loom):- this type of weaving is very versatile in that rapier looms can weave using a large variety of threads. There are several different types of rapiers, however they all use a hook system attached to a rod or metal band to pass the pick across the shed. These machines regularly reach 700 picks per minute in normal production. (v) Projectile:- projectile looms utilize an object that is propelled across the shed, usually by spring power, and is guided across the width of the cloth by a series of reeds. The projectile is then removed from the weft fibre and it is returned to the opposite side of the machine so it can get reused. Multiple projectiles are in use in order to increase the pick speed. Speeds max out on these machines at 1 050 ppm. (9) A Dobby Loom is a type of floor loom that controls the whole warp threads using a dobby head. Dobby is a corruption of 'draw boy' which refers to the weaver's helpers who used to control the warp thread by pulling on draw threads. A dobby loom is an alternative to a treadle loom, where multiple heddles (shafts) were controlled by foot treadles- one for each heddle. (10) The Jacquard Loom is a mechanical loom, invented by Joseph Marie Jacquard in 1801, that simplifies the process of manufacturing textiles with complex patterns such as brocade, Damask and matelasse. The loom is controlled by punched cards with punched holes, each row of which corresponds to one row of the design. Multiple rows of holes are punched on each card and the many cards that compose the design of the textile are strung together in order. It is based on earlier inventions by the Frenchmen Basile Bouchon (1725), Jean Baptiste Falcon (1728) and Jacques Vaucanson (1740) To call it a loom is a misnomer, a Jacquard head could be attached to a power loom or a hand loom, the head controlled which warp thread was raised during shedding. Multiple shuttles could be used to control the colour of the weft during picking. (11) A Circular Loom is used to create a seamless tube of fabric for products such as hosiery, sacks, clothing, fabric hose (such as fire hose) and the like. Circular looms can be small jigs used for hand knitting or large high speed machines for modern garments. A good example of the circular loom's work is the seamless woman's stocking. A Loom is a machine that weaves fabrics, using such natural fibers as cotton, wool, and silk. Looms with shuttles:- method of inserting weft yarn:- the weft yarn is inserted through the back-and-forth motion of the shuttle. Characteristics:- Great all purpose loom. Vibration and noise are severe problems and high speed operation is difficult. There are looms without shuttles and namely:- (i) gripper loom, (ii) rapier loom, (iii) water jet loom, and (iv) air jet loom. / уточина. Жакь Вокансон (Jacques Vaucanson). Дьжон Кэй (John Kay). Эдмэнд Катрайт (Edmund Cartwright) в 1785. Ткацкий станок Хорэкса (Horrocks loom) был жизнеспособный, но это был ткацкий станок Робётса (Roberts Loom) в 1830. Кэнвози (Kenworthy) и Булох (Bullough). Дикинсэн (Dickinson Loom), изобретатель Носроп (Northrop), который работал на Дрэйпё Корпорэйшэн (Draper Corporation). Сульца (Sulzer). Жозеф-Мари Жакяр (Joseph Marie Jacquard) в 1801. Француз Базиль Бушо (Basile Bouchon) (1725), Жон Батист Фалькон (Jean Baptiste Falcon) (1728) и Жакь Вокансон (Jacques Vaucanson) (1740). Приводный Ткацкий Станок (Power Loom). Автоматический Ткацкий Станок (Auto Loom). Подножки (Treadles). Челнок, рабочий орган ткацкого станка, прокладывающий уточную (поперечную) нить (уток) между нитями основы при выработке ткани, и содержащий её в количестве, достаточном для длительной работы станка. Челноки изготовляют из твёрдых пород древесины; на концах имеет металлические мыски. Машина Жаккарда была изобретена Фрунцузским изобретателем Жозефом-Мари Жакяром (Joseph-Marie Jacquard; 1752–1834) в период 1804–05, а в 1806 объявлена общественным достоянием. Она представляла собой зевообразовательный механизм ткацкого станка для выработки крупноузорчатых тканей (декоративных тканей, ковров, скатертей и тому подобного). Эта машина даёт возможность раздельно управлять каждой нитью основы или небольшой их группой. Под Ткацким Станком понимается машина для выработки текстильных тканей. Ткацкие станки различают:- по способу прокладывания уточной нити – бесчелночные и челночные станки; по способу смены утка – автоматические и механические с ручной сменой уточных паковок; по виду зевообразовательного механизма – жаккардовые, кареточные и эксцентриковые; по числу челноков – одночелночные и многочелночные; и так далее. Ручной ткацкий станок – одно из наиболее древних орудий труда человека. Механический ткацкий станок был изобретён во второй половине XVIII века. Ткацкий Станок – машина ткацкого производства для выработки тканей. На ткацком станке основа (end), состоящая из многих параллельно расположенных нитей, натягивается вдоль станка и медленно движется, сматываясь с большой катушки – навоя (beam). В центре ткацкого станка находится зевообразовательный механизм, который разделяет нити основы, образуя ромбовидное пространство – так называемый зев (shed). В зев с помощью челнока (shuttle), прокладчика утка, рапир и тому подобного прокладываются поперечные нити утка (picks), которые после прокладывания продвигаются (прибиваются) к опушке ткани бёрдом (гребнем), совершающим возвратно-качательное движение. По мере выработки готовая ткань отводится из рабочей зоны и наматывается на товарный валик (cloth roll). Ткацкие станки бывают ручные (hand), механические и автоматические, одно- и многочелночные. Перспективны бесчелночные станки. Ручной ткацкий станок – одно из наиболее древних орудий труда человека. Механический ткацкий станок изобретён во второй половине XVIII века. Ткацкий станок сыграл наряду с механическими прядильными машинами решающую роль в становлении машинной техники. Составные схемы ткацкого станка:- навой, нити основы, скало (whip roll), ламели, вершник, бёрдо (reed), челнок (прокладывающий нить утка), грудница, направляющий валик, вальян, товарный валик (cloth roll), подбатанный вал, лопасти батана, батан (lay), ремизка (harness), глазок галева (heddle eye) батан. Бёрдо (reed) – один из основных рабочих органов ткацкого станка в виде гребня с узкими металлическими пластинками, закреплёнными обоими концами в деревянных или металлических планках. Продольные нити ткани (основа) продеваются между зубьями бёрдо. Таким образом достигается равномерное их распределение по ширине ткани. Перемещая бёрдо вдоль нитей основы, прибивают проложенную нить утка к опушке ткани. Бесчелночный Станок – ткацкий станок, в котором уточная нить вводится в зев (пространство между нитями основы) не челноком, а с помощью прокладчика утка, рапир, игл, водяной или воздушной струи, выходящей из сопла под давлением. После каждого прокладывания уточной нити она обрезается. Благодаря повышению скорости прокладывания утка существенно возрастает производительность ткачества. Узловязальная Машина – машина для связывания (привязки) нитей основы в процессе заправки ткацкого станка. Различают узловязальные машины стационарные (привязывают нити вне ткацкого станка), передвижные (работают непосредственно на ткацком станке) и универсальные. Основная часть узловязальной машины – каретка, состоящая из механизмов, выполняющих отбор нитей новой и старой основ, зажим их, обрезание, подачу к узловязателю, связывание, затягивание узла, обрезание концов. Под Ламельным Прибором или Основонаблюдателем понимается устройство для автоматической остановки ткацкого станка при обрыве нитей основы. На каждую нить основы надевается плоская пластинка – ламель, которая при обрыве нити опускается, что вызывает остановку станка. Прибой – продвижение ('прибивание') уточной нити к опушке ткани после введения её в зев (пространство между нитями основы). Прибой выполняется пластинками ('зубьями') бёрда ткацкого станка. На многозевных ткацких машинах прибой осуществляется специальными дисками сложного профиля. Скало (whip roll) – деталь ткацкого станка в виде пустотелого цилиндра, поверх которого проходят нити основы при их сматывании с ткацкого навоя. От положения скало зависит натяжение нитей основы. Прокладчик Утка – устройство бесчелночного станка для прокладывания уточной нити между нитями основы. Ремизка (harness) – деталь ткацкого станка, состоящая из двух металлических или

деревянных планок, между которыми натянуты галева (heddles) – проволочки, пластинки или кручёные нити с отверстием посредине для продевания через них нитей основы. Ремизки, перемещаясь вверх или вниз, поднимают или опускают нити основы, образуя зев (shed), в который прокладываются нити утка. Набор ремизок на станке называется Ремизом. Ткацкий Станок вырабатывает из нитей (основы и утка) различные виды тканей текстильных; основная машина ткацкого производства. Классификация ткацких станков:- в зависимости от способа образования ткани станки бывают двух типов:- (i) Станки С Прерывным Образованием Ткани (челночные и бесчелночные); и (ii) Станки С Непрерывным Многоместным Образованием Ткани (многозевный ткацкий станок). По конструкции различают:- (i) Плоские Станки и (ii) Круглые Станки (используют только для выработки специальных тканей, например рукавных). Наиболее распространены плоские челночные станки. В зависимости от используемой пряжи, вида и назначения ткани ткацкие станки предназначаются для выработки хлопчатобумажных, шёлковых, шерстяных, стеклянных, металлических и других тканей. Станки могут быть узкими (вырабатывают ткань шириной до 100 см) и широкими, предназначаться для лёгких, средних и тяжёлых тканей. Для переработки утка различных видов (по цвету, крутке и так далее) применяются многочелночные станки. В зависимости от устройства зевообразовательного механизма станки бывают:- (i) Эксцентриковые (для тканей простых переплетений); (ii) Кареточные (для мелкоузорчатых тканей); и (iii) Жаккардовые (для тканей с крупным, сложным узором). Основные рабочие органы станка:- ремизка, челнок (прокладчик утка) и бёрдо. Нити основы, сматываемые с навоя, огибают направляющий валик (скало) и принимают горизонтальное или наклонное положение. Далее они проходят через отверстия ламелей и через глазки галев ремизок, перемещающих нити основы в вертикальном направлении для образования зева. В зев челноком или прокладчиком утка другого типа вводится уточная нить, которая продвигается (прибивается) к опушке ткани бёрдом, совершающим возвратно-поступательное движение вместе с батаном. У опушки ткани нити основы, переплетаясь с нитью утка, образуют ткань, которая огибает грудницу, вальян, направляющий валик и навивается на товарный валик. Порядок чередования перемещений ремизок обеспечивает изготовление тканей различного переплетения нитей. Число зубьев, приходящихся на единицу длины бёрда, и число нитей, проходящих через просветы между зубьями, обусловливают плотность ткани по основе, а перемещение (отвод) ткани, приходящееся на одну уточную нить, определяет плотность ткани по утку. На Челночных Ткацких Станках уточная нить прокладывается в зеве челноком, который несёт в себе паковку (шпулю) с пряжей и совершает возвратно-поступательное движение со скоростью 10–18 м/сек (в зависимости от ширины станка). Смена шпуль производится автоматически. Масса челнока с уточной паковкой составляет от 0.25 до 5 кг. Переменная скорость движения челнока и его большая масса – основные причины малой производительности челночных ткацких станков. Указанные недостатки устранены в Бесчелночных Ткацких Станках, которые с середины XX века стали внедряться в ткацкое производство. На этих станках применяется уточная паковка больших размеров (бобина), которая размещается на станине станка; после каждого продвижения прокладчика утка нить обрезается. В зависимости от способа прокладывания уточной нити различают:- (i) Бесчелночные Станки С Малогабаритным Прокладчиком Утка, (ii) Пневматические, (iii) Гидравлические, (iv) Рапирные и (v) Пневморапирные. Получили распространение ткацкие станки с малогабаритным прокладчиком утка. Прокладчик пружинным зажимом захватывает конец уточной нити, сходящей с бобины, и, перемещаясь в направляющей гребёнке, прокладывает нить в зеве со скоростью 23–25 м/сек. Масса прокладчика около 40 грамм. Производительность такого станка примерно в 2.5 раза выше по сравнению с челночным станком; на нём можно изготовлять ткани из всех видов волокон, а также их смесей; уток может быть 4 видов. На Пневматических и Гидравлических Ткацких Станках прокладывание уточной нити, сходящей с бобины, осуществляется струёй сжатого воздуха или капельной струёй воды. Сжатый воздух подаётся под давлением до $3 \cdot 10^5$ Н/м^2 (3 кгс/см^2); на гидравлических станках капельная струя воды выбрасывается из сопла под давлением $15 \cdot 10^5$ Н/м^2 (15 кгс/см^2). Скорость прокладывания уточной нити на этих станках достигает 35 м/сек. Пневматические станки применяются для изготовления хлопчатобумажных и шёлковых тканей, гидравлические – для изготовления тканей из синтетических нитей (они не смачиваются водой). На Рапирном Ткацком Станке уточная нить вводится в зев захватами, укреплёнными на концах стержней (рапир) или гибких металлических лент, которые совершают возвратно-поступательное движение с 2 сторон станка. Рапирные станки применяются в основном для изготовления суконных тканей и тканей с утком различного вида (цвета). Выпускаются ткацкие станки с комбинированным (пневматическим и рапирным) способом прокладывания уточной нити в зеве (так называемые Пневморапирные Станки). На этих станках справа и слева вводятся в зев 2 полые рапиры, которые образуют воздушный канал. В правую рапиру сжатым воздухом под давлением около $0.4 \cdot 10^5$ Н/м^2 (0.4 кгс/см^2) вдувается уточная нить. Одновременно из левой рапиры воздух отсасывается, что обеспечивает большую надёжность продвижения нити в каналах рапир. После прокладывания утка (со скоростью 18–20 м/сек) рапиры выходят из зева и бёрдо прибивает уточную нить к опушке ткани. В Многозевных Ткацких Станках (опытные образцы имелись в 1974 в бывших СССР и ЧССР) переплетение нитей выполняется челноками в нескольких участках по ширине основы, так как расстояние между челноками значительно меньше ширины ткани. Ремизка станка состоит из отдельных секций шириной 2–4 см. Эти секции перемещаются независимо друг от друга с помощью кулачкового механизма, образуя так называемый Волновой (или Ступенчатый) Зев. В каждой волне зева движется челнок с уточной нитью. Перемещение челноков происходит с помощью роликов цепного конвейера, расположенного под нитями основы. Прибой каждой уточной нити производится синхронно с движением челнока и может выполняться, например, с помощью дисков, установленных на валу. Между дисками имеются промежутки, в которых проходят нити основы. При вращении вала уточная нить захватывается дисками и прижимается к опушке ткани. Зарядка челноков осуществляется мотальными головками, которые после выхода челнока из работы наматывают на его катушку нить длиной на одну прокладку. Скорость движения челноков 2 м/сек. Дальнейшее совершенствование ткацких станков направлено в основном на повышение скорости прокладывания утка и, следовательно, скорости работы станка. Перспективно широкое использование многозевных ткацких станков. Ткацкий Станок:- назначение ткацкого станка заключается в том, чтобы путём переплетения основных и уточных нитей получить ткань. Это достигается в результате согласованных действий различных механизмов и рабочих органов станка. Основные рабочие органы ткацкого станка:- (i) ремизки – образуют зев, в который прокладывается уточная нить; (ii) челнок (рапира, микропрокладчик) – для прокладывания утка в образовавшемся зеве; (iii) бёрдо – прибивает уточную нить к опушке ткани; и (iv) вальян – вал, который отводит наработанную ткань. Рабочие органы станка приводятся в действие специальными механизмами. В зависимости от назначения все механизмы делятся на три группы:- (1) Основные Рабочие Механизмы:- они обеспечивают выполнение основных технологических операций в процессе образования ткани. К ним относятся:- (i) Механизм Привода Станка – включает в себя электродвигатель, фрикционную муфту и передачу, приводящую в движение главный вал ткацкого станка; (ii) Зевообразовательный Механизм – включает в себя ремизки и механизм, управляющий движением ремизок. Зевообразовательные механизмы бывают эксцентриковые (управляют 2–10 ремизками), кареточные (управляют 2–36 ремизками), жаккардовые (управляют движением каждой нити основы персонально); (iii) Боевой Механизм – прокладывает уточную нить через зев; (iv) Батанный Механизм – прибивает бёрдом уточную нить к опушке ткани; (v) Механизм Натяжения и Отпуска Основы, который отпускает основу с ткацкого навоя и поддерживает её натяжение. Эти механизмы делятся на две основные группы:- (a) Основные Тормоза – натяжение поддерживается за счёт силы трения тормоза, препятствующего вращению навоя, а отпуск основы (поворот навоя) происходит тогда, когда натяжение основы в рабочей зоне превысит силу

торможения; (b) Основные Регуляторы – сами поворачивают навой, отпуская основу в зависимости от натяжения основы в рабочей зоне станка. Эти механизмы используют в качестве датчика натяжения подпружиненное скало. И в зависимости от его положения поворачивают навой на большую или меньшую величину за каждый оборот главного вала поддерживая натяжение основы постоянно; (vi) Механизм Отвода и Навивания Ткани – отводит наработанную ткань и перемещает основу в продольном направлении. Этот механизм включает в себя товарный валик и его привод; вальян и привод вальяна. Привод вальяна имеет устройство (сменные шестерни), которые позволяют изменять скорость вращения вальяна. Изменением скорости вращения регулируют плотность вырабатываемой ткани по утку (плотность ткани – число нитей на 10 сантиметров ткани (в бывшем Советском Союзе) или на дюйм (как во всём текстильном мире за пределами бывшего СССР)). В то время как плотность ткани по основе задаётся номером бёрда и определённым видом проборки в бёрдо определённого количества нитей. (2) Дополнительные Рабочие Механизмы:- эти механизмы не принимают непосредственного участия в технологическом процессе образования ткани и устанавливаются на станке для повышения производительности и добавления новых возможностей, например, механизм смены уточных паковок; механизм смены цвета утка. (3) Предохранительные Механизмы:- они осуществляют контроль за работой ткацкого станка и в случае её нарушения останавливают станок, предупреждая возникновение пороков ткани и поломок станка. К ним относятся:- (i) Основной Контроллер – останавливает станок при обрыве основной нити; (ii) Уточный Контроллер – останавливает станок при обрыве уточной нити; (iii) Замочный Механизм – останавливает станок (раньше момента прибоя) если челнок не пролетел в челночную коробку. Основные Рабочие Органы Ткацкого Станка:- ремизка, челнок (прокладчик утка) и бёрдо. Нити основы, сматываемые с навоя, огибают направляющий валик (скало) и принимают горизонтальное или наклонное положение. Далее они проходят через отверстия ламелей и через глазки галев ремизок, перемещающих нити основы в вертикальном направлении для образования зева. В зев челноком или прокладчиком утка другого типа вводится уточная нить, которая продвигается (прибивается) к опушке ткани бёрдом, совершающим возвратно-поступательное движение вместе с батаном. У опушки ткани нити основы, переплетаясь с нитью утка, образуют ткань, которая огибает грудницу, вальян, направляющий валик и навивается на товарный валик. Порядок чередования перемещений ремизок обеспечивает изготовление тканей различного переплетения нитей. Число зубьев, приходящихся на единицу длины бёрда, и число нитей, проходящих через просветы между зубьями, обусловливают плотность ткани по основе, а перемещение (отвод) ткани, приходящееся на одну уточную нить, определяет плотность ткани по утку.

LOOM ABRASION = ИСТИРАНИЕ ТКАЦКИМ СТАНКОМ – Loom Abrasion is caused due to temple ring or temple cover. Abrasion is also caused due to burrs on cloth support, if any things struks on emery rolls. All blunt spikes rings of temples are changed and covers are also checked for burrs. They are made smooth and are chrome plated. Cloth support is also checked and made smooth, if found not proper are changed. Grey white piece strips are checked in UV light and after strip dyeing to confirm for loom abrassion. Weaving defect. Loom Abrasion:- due to burs in cloth support bar, burs in temple cover burs at fabric gives abrasion, Some metallic piece fell and stick on to emery and pills out on fabric surface due to any abrasion on loom. / Порок или дефект ткачества.

LOOM BAR = XX (или ПОЛОСКА) ОТ ТКАЦКОГО СТАНКА – Defect Name:- Loom Bar. Defect Type:- weft lines, horizontal lines. Fabric Type:- Bottomweights – Twill Derivatives. Description:- Loom Bar:- This is a defect characterized by a change of shade due to a build up of tension in the loom shuttle just before a filling change. There is always a difference in tension between a full bobbin and an almost empty one; however, this condition can be accentuated by a restriction in the shuttle eye, a weak or badly worn shuttle spring, a bobbin not ringing properly, a crooked bobbin, etc. It can be repetitive at each filling change or isolated depending on the exact cause. Severity:- Major. Loom Bar:- a change in shade across the width of a fabric, resulting from a build up of tension in the shuttle before a filling change. / до смены уточины.

LOOM BARRÉ = ПОЛОСАТОСТЬ ОТ ТКАЦКОГО СТАНКА – Loom Barré is a repeated unevenness in the fabric, usually running from selvage to selvage, and caused by uneven let-off or take-up or by a loose crank arm. Loom Barre:- repetitive selvedge-to-selvedge unevenness in woven fabric usually attributed to a mechanical defect in the let-off or the take-up motion. / поводок или плечо кривошипа (crank arm).

LOOM DAMAGE = ПОВРЕЖДЕНИЕ ТКАЦКИМ СТАНКОМ – Loom Damage:- while weaving fabric torn due to some reasons called Loom Damage. Weaving defect. Loom Damage:- workers negligence, excessive warp tension. Some metallic piece fell and stick on to emery cause damage to fabric. Also, during maintenance work if any excessive damage to fabric takes place causes cuts and holes in fabrics. / Порок или дефект ткачества.

LOOM–FIGURED FABRICS = СФИГУРИРОВАННЫЕ ТКАЦКИМ СТАНКОМ ТКАНИ – Loom-Figured Fabrics are the fabrics that have the design or pattern woven or knitted in as opposed to those which, for instance, have patterns printed on finished cloth.

LOOM–FINISHED = ГОТОВАЯ ТКАНЬ СО СТАНКА – Loom-Finished is a term describing fabric that is sold in the condition in which it comes from the loom. See also Greige. Loom-Finished is a material sold in the same condition in which the goods came from the loom – duck, webbing, canvas, burlap, etc. Loom Finished is a term referring to certain fabrics soid without most of the steps mentioned in the entry under finishing. Loom finished fabrics are relatively rare because the consumer has grown accustomed to finished fabrics. See also Finishing. / Готовая Ткань Со Станка – ткань с ткацкого станка без аппретирования и отделки.

LOOM FLY = ТКАЦКИЙ ПУХ (или ПУХ С ТКАЦКИХ СТАНКОВ) – Loom Fly:- waste fibers that are inadvertently woven into a fabric. Fabrics defect. Loom Fly:- waste fibers created during weaving that are woven into a fabric. Synonym:- Flyer. / Ткацкий Пух – угары ткачества.

LOOM STAIN = РАЗВОД ОТ ТКАЦКОГО СТАНКА (или ПОТЁК ОТ ТКАЦКОГО СТАНКА) – Loom Stain:- greasy or oily or black dark stain that is observed in grey perch. Weaving defect. Loom Stains:- (i) leakages of oil from machine; (ii) leakages of oil from both side of telescopic shaft; (iii) accumulation of oily fluff/fiber dust at tuck in needle both side of machine; and (iv) wastage embedded in sley coupling which leads damage of oil seal. / Порок или дефект ткачества.

LOOM STATE = СОСТОЯНИЕ СО СТАНКА (или ГОТОВАЯ ТКАНЬ СО СТАНКА БЕЗ АППРЕТИРОВАНИЯ И ОТДЕЛКИ) – Loom State:- fabric as it comes from the loom, usually unbleached, containing size, and maybe a bit dirty. Loom state is essentially synonymous with greige or grey. Sometime it may imply that the fabric has not been inspected for flaws.

LOOM WASTE = ОТХОДЫ ТКАЦКОГО СТАНКА (или XX) – Defect Name:- Loom Waste. Defect Type:- weft lines, horizontal lines. Fabric Type:- Shirting and Dress Goods – Chambray. Description:- Loom Waste:- This is the result of accumulated fly waste having been blown into or pulled into the loom shed by the shuttle or filling yarn. Severity:- Minor.

LOOP = ВЕТКА – Loop:- a delivery and a pickup from a common point to a common point. / Доставка и приёмка из общего пункта в общий пункт.

LOOP = ПЕТЛЯ (или ПЕТЕЛЬКА, или УШКО, или СКОБКА) – (1) Loops:- higher warp entanglement, worker negligence, faulty worn out temples, shedding timing are not proper. During Mending repair if after filling end or pick is not properly relaxed. (1) Loops:-

higher warp entanglement, worker negligence, faulty worn out temples, shedding timing are not proper. Weaving defect. (2) Loops:- during mending repair if after filling end or pick is not properly relaxed. Mending defect. Loop in warp. Possible Cause:- due to a slack end, the warp might get pulled and form a loop in the construction of the fabric. Minor defect, the loop can be cut and removed from the fabric surface without leaving any trace behind. Weaving defect. / уточина. продольная или поперечная нить . Порок или дефект ткачества. Порок или дефект штопки (mending defect).

(2) Loop:- any material (braid, fabric, and so forth) that is shaped into an oval and topstitched to a garment or encased into a seam and used as a buttonhole.

LOOPED FILLING = ПЕТЛИСТАЯ УТОЧИНА – Looped Filling is a woven-in loop caused by the filling sloughing off the quill or by the shuttle rebounding in the box.

LOOPED PILE = ПЕТЛИСТЫЙ ВОРС – Looped Pile is a pile surface made of uncut looped yarns.

LOOPED YARN = ПЕТЛИСТАЯ ПРЯЖА (или ЗАПЛЕТЁННАЯ ПРЯЖА) – Looped Yarn:- Bouclé, or Looped, yarns are created by loosely looping an effect yarn around a base yarn. They can be made of any type of fiber and are usually composed of three plies, or strands, wrapped around each other. The texture is created by spinning one of the three plies more loosely than the other two. Fiber artists who choose to create projects in bouclé yarn must use extra care because if not handled carefully, the loose strand may split and snag on the knitting needles or crochet hook. See also Kink. Fabrics defect. / Букле (Bouclé). Крошэ, от Французского слова Crochet, означающее Крючок, . Смотрите также Сукрутина (Kink).

LOOP ELONGATION = УДЛИНЕНИЕ ПЕТЛИ (или ВЫТЯЖКА ПЕТЛИ) – Loop Elongation is the maximum extension of a looped yarn at maximum load, expressed as a percentage of the original gauge length.

LOOP FOLD = СЛОЖЕНИЕ ПЕТЛИ (или ХХ) – Loop Fold (Label):- finishing should be employed if a label is to be installed by sewing across the top edge only. By doubling the fabric, loop folded labels allow for the application of designs or lettering on two sides. The back surface of a loop folded label is commonly used for fiber composition and washing instructions which eliminates the need for 2 labels (care label and garment label). This form of finishing is recommended for Poly/Rayon woven labels which will be subjected to over dye processing as all open ends are very well protected and the possibility of fray is virtually eliminated.

LOOPING = ПЕТЛЕОБРАЗОВАНИЕ (или КЕТЛЁВКА) – Generally, Looping is a method of uniting knit fabrics by joining two courses of loops on a machine called a Looper. / Петлеобразование (Looping) – процесс, выполняемый вязальными машинами при выработке трикотажного полотна или изделия; заключается в изгибании нити в петли и продевании новых петель сквозь ранее образованные. Цель петлеобразования – превращение нитей в трикотаж. Различают два способа петлеобразования:- трикотажный и вязальный. При трикотажном способе нить сначала прокладывается и изгибается на иглах машины, а затем протаскивается сквозь образовавшиеся петли. Размер петель фиксируется ещё до их формирования, при изгибании нити. При вязальном способе нить, захваченная иглой, протягивается сквозь старую петлю, и новая петля формируется в момент протягивания без предварительной подготовки (изгибания) нити. Размер петли зависит от величины протягивания, натяжения нити и натяжения ранее образованных петель.

LOOPING BAR = ПЕТЛЯЮЩАЯ ПОЛОСА (или ПЕТЛЯЮЩАЯ ПОЛОСКА) – Looping Bar is a bar inserted in the bottom of an extrusion metier around which the dried filaments pass as they leave the spinning cabinet. / Экструзия или Выдавливание (Extrusion).

LOOP–KNOT = УЗЕЛ–ПЕТЛЯ (или СУКРУТИНА) – Loop-Knot:- in reference to knots, loop may refer to:- (i) one of the fundamental structures used to tie knots. Specifically, it is a full circle formed by passing the working end over itself. (ii) A type of knot used to create a closed circle in a line. See also Kink. / Порок пряжи. Смотрите также Сукрутина (Kink).

LOOP PILE = ВЫТЯЖНОЙ ВОРС (или БУЛАВЧАТЫЙ ВОРС, или ПЕТЛИСТЫЙ ВОРС) – Loop Pile:- carpet construction in which the tufts are formed into loops from the supply yarn.

LOOP TENACITY = (УДЕЛЬНАЯ) ПРОЧНОСТЬ С ПЕТЛЁЙ – Loop Tenacity is the strength of a compound strand formed when one strand of yarn is looped through another strand, then broken. It is the breaking load in grams divided by twice the measured yarn denier or decitex. Loop tenacity, when compared with standard tenacity measurements, is an indication of the brittleness of a fiber.

LOOP YARN = ПРЯЖА С ПЕТЕЛЬКАМИ – Loop Yarns are obtained by exposing a composite yarn to a jet of air at the moment it passes through the orifice of a device to which air is supplied under pressure. In the former USSR, the term Aeron is used for such yarns; it is analogous to the trade name 'Taslan' used abroad. See also Textured Yarns. Loop Yarn:- the slack-twisted strand is twisted to form loops or curls. This strand is held in place by one or two binder yarns. / Пряжа С Петельками – пряжа фасонной крутки.

LOOPY EDGE = ПЕТЛИСТЫЙ КРАЙ (или ПЕТЛИСТАЯ ЗАКРАЙКА, или ПЕТЕЛЬЧАТЫЙ КАНТ) – Loopy Edge or Loopy Selvedge:- a selvedge beyond which loops of weft yarns protrude. Note:- this defect is often caused by the yarn tension in the shuttle being too low. See also Loopy Selvage. Fabrics defect. / Петлистая Закрайка; Петлистая Кромка (loopy edge; loopy selvedge):- порок кромки ткани; кромка, за которую выступают петли уточной пряжи. Примечание:- этот порок вызывается неправильным натяжением и отмериванием уточной нити.

LOOPY PILE = ПЕТЛИСТЫЙ ВОРС – Loopy Pile:- loops in a terry fabric that are longer than adjacent normal loops. Note:- this defect is commonly caused by interference with the formation of individual pile loops, as the result of incorrect shedding, drawing-in, etc. / Ворсовые Петли (loopy pile):- порок ткани; петли в махровой ткани, более длинные, чем смежные обычные петли. Примечание:- этот порок обычно вызывается образованием отдельных ворсовых петель, как результат сброса петель, неправильной проборки и так далее.

LOOPY SELVAGE = ПЕТЛИСТАЯ КРОМКА (или ПЕТЕЛЬЧАТАЯ КРОМКА) – Loopy Selvage is an improperly woven selvage of uneven width or a selvage containing irregular filling loops extending beyond the outside edges. Synonym Beaded Selvage, Corded Selvage, Loopy Edge, and Rough Selvage. Fabrics defect. Loopy Selvage is a weaving defect at the selvage of excessive thickness or irregular filling loops that extend beyond the outside selvages. / уточные петли, . Петлистая Кромка – порок ткани. Петельчатая Кромка для прорезиниваемых тканей.

LOOPY YARN = ПРЯЖА С ПЕТЕЛЬКАМИ (или ПЕТЛИСТАЯ ПРЯЖА) – Loopy Yarn is a great new yarn consisting of a wool core surrounded by rayon boucle. The wool is dyed one solid color, and then the rayon is dyed in multi-colors. While it makes a very nice fabric just knitted, once it is felted the real magic happens! The wool core shrinks considerably, forming a nice dense felt, and the rayon loops are contracted and captured, obscuring the individual rows and stitches. The over-all feel is that of Persian Lamb. See also Textured Yarns. / Пряжа С Петельками – пряжа фасонной крутки с петельками.

LOOSE = ОТВЯЗЫВАТЬ (или ОТДАВАТЬ) – Loose (maritime term):- to unfurl.

LOOSE = РЫХЛАЯ – Loose:- an uncompacted soil. Spreading panicles. / Рыхлая – почва.

LOOSE = СВОБОДНЫЙ (или НЕЗАКРЕПЛЁННЫЙ, или ШАТАЮЩИЙСЯ, или НЕУПАКОВАННЫЙ) – (1) Loose:- without packing. / Без упаковки.

(2) Loose:- a product remainder in a specific location or layer.

LOOSE CLOSURE = ОСЛАБЛЕННАЯ ЗАСТЁЖКА – Loose Closure:- attaching equipment is fitted with an adjustable feature permitting secure application of hook and eye to either light or heavy-weight goods. If closures seem too tight, then one should immediately check the attaching equipment for proper adjustment. Closure defects, and namely – Hooks and Eyes. / Порок или дефект застёжки.

LOOSE CONSTRUCTION = ОСЛАБЛЕННАЯ КОНСТРУКЦИЯ (или СЛАБОЕ ПЕРЕПЛЕТЕНИЕ) – Loose Construction:- Possible Cause:- several slack ends in the warp can lead to a loose construction of the fabric. This is a major defect as it foils the appearance of the fabric leaving open spaces in the construction and also makes it weak. Weaving Defect.

LOOSE COURSE = ОСЛАБЛЕННЫЙ КУРС (или ОСЛАБЛЕННЫЙ РЯД ПЕТЕЛЬ) – Loose Course:- in knitted fabrics, a row of loops in the widthwise direction that is larger, looser, or longer than the stitches in the main body of the fabric. Fabrics defect.

LOOSE COVER = РЫХЛОЕ ОДЕЯЛО – (1) Loose Cover is another term for Slipcover. See also Slipcover.

(2) Loose Cover:- the gloss, sheen, or shine of a fiber, yarn, or fabric.

LOOSE EDGE = РЫХЛЫЙ (или ОСЛАБШИЙ) КРАЙ – Loose Edge:- xxxxx. Fabrics defect. See also Slack Selvage.

LOOSE END = СЛАБОНАТЯНУТАЯ ПРОДОЛЬНАЯ НИТЬ (или ОСЛАБШАЯ ПРОДОЛЬНАЯ НИТЬ) – Loose Ends:- looped or curled warp ends observed on the face of a fabric. Often found in the first cut of cloth from the entire warp length on the loom. At this time it is apparent that warp tensions have not been made perfect. Loose ends may also occur between the warp beam and the back of the warp motion drop-wires. In fact, broken ends may be looked for in this same area. Because of less tension on particular warp end, which will be classified as loose end. Loose Ends:- lower yarn tension levels, variations in tension at warping creel, guiding of ends if improper – causes loose ends. Extra yarn package added at backside of weaving machine generates loose ends. Loose End:- because of less tension on particular warp end, which will be classified as loose end. Weaving defect. Loose Ends:- lower yarn tension levels, variations in tension at warping creel, guiding of ends if improper – causes loose ends. Extra yarn package added at backside of weaving machine generates loose ends. See also Tight Or Loose End. / :- более низкие уровни натяжения пряжи, вариации в натяжении сновальной катушечной рамы, . Порок или дефект ткачества.

LOOSE FILLING = ОСЛАБШАЯ УТОЧИНА (или СЛАБОНАТЯНУТАЯ УТОЧИНА) – Loose Filling is a fabric defect that is usually seen as short, loose places in the filling caused by too little tension on the yarn in the shuttle or by the shuttle rebounding in the box. Loose filling can often be felt by an examiner when passing a hand over the surface of the fabric.

LOOSE KNOT = ВЫПАДАЮЩИЙ СУЧОК – Loose Knot is a knot which is not held firmly in place by growth or position and which cannot be relied upon to remain in place. / Выпадающий Сучок это такой сучок, который не имеет срастания с окружающей древесиной и который держится в ней неплотно. К выпадающим сучкам относят и отверстия от выпавших сучков.

LOOSEN, LOOSENING = РАЗРЫХЛЁННАЯ (или ВЗРЫХЛЁННАЯ), РАЗРЫХЛЕНИЕ (или ВЗРЫХЛЕНИЕ) – Loosen, Loosening:- to break up, to not be compacted. Decreasing soil bulk density and increasing porosity due to the application of mechanical forces to the soil. / пористость или рыхлость (porosity).

LOOSE PICK = ОСЛАБШАЯ ПОПЕРЕЧНАЯ НИТЬ (или СЛАБОНАТЯНУТАЯ ПОПЕРЕЧНАЯ НИТЬ) – Loose Picks:- actual loose picks that have not been woven into the goods in the proper manner. Caused by irregular filling motion or shuttle action or by poor or faulty winding of the yarn prior to weaving. Uneven diameter yarn is also a cause for loose picks. See also Slack Pick. Less weft tension causes loose pick. The effect like stitches or weft loops observed on fabric. Loose Picks:- tension variation in weft package, compensator working is not proper, tensioners at picking side not functioning properly, shoe break at receiving side worn out or it's setting. Loose Pick:- less weft tension causes loose pick. The effect like stitches or weft loops observed on fabric. Weaving defect. Loose Picks:- tension variation in weft package, compensator working is not proper, tensioners at picking side not functioning properly, shoe break at receiving side worn out or it's setting. / Порок или дефект ткачества.

LOOSE SMUT = ПЫЛЬНАЯ ГОЛОВНЯ (или ЛЕТУЧАЯ ГОЛОВНЯ) – Loose Smut is a fungal disease. Loose Smut is probably the most obvious of all Wheat diseases. At flowering, all parts of the head and grain except the rachis (backbone) are replaced by black spore masses. This disease occurs throughout the world and reduces yields proportionate to the incidence of smutted heads. The disease does not cause complete yield loss, but losses as high as 27% have been reported, and more commonly, losses of 15% are recorded. This disease is more prevalent in Western Australia than the rest of Australia and especially in Barley. In contrast to seed borne bunts, loose smut has little effect on seed quality. Life Cycle:- the loose smut fungus survives as a dormant fungal thread inside the embryo of wheat seed. The pathogen is activated when the infected seed germinates, and it extends toward the growing point of the plant. Evident from flowering onwards when the plant begins to form the head, the fungus invades all of the young head tissue except for that of the rachis (backbone). Production of plant growth hormones by the fungus results in infected plant heads reaching flowering earlier than healthy heads. The head produced by the infected plant contains black spore masses in place of the grain. The spores are loosely held and are easily spread by wind onto neighboring healthy plants. Because flowering of infected heads occurs earlier than healthy heads, production and release of spores occurs when the rest of the crop is flowering. Spores are blown by the wind into the flowers of the healthy plants. The spores enter the ovaries and become part of the developing grain. In this way, seed for the following year becomes infected. / Под Головнёй понимается болезнь растений, вызываемая головнёвыми грибами. Несколько видов:- пузырчатая, пыльная, стеблевая, твёрдая. Наиболее вредоносна для злаков (Кукуруза, Пшеница, Рожь и другие). Колосья, метёлки, початки, стебли и листья превращаются в тёмную споровую массу.

LOOSE THREADS = ОСЛАБШИЕ НИТКИ (или СЛАБОНАТЯНУТЫЕ НИТКИ) – Loose Threads:- can be caused either by malformed stitching or poor trimming techniques. Sewing Room Defects. Loose Thread:- this fault is due to any hanging thread on the face of the fabric. / втачивание (stitching). Порок или дефект швейного производства.

LOOSE THREAD TENSION = ОСЛАБЛЕННОЕ НАТЯЖЕНИЕ НИТКИ – Loose Thread Tension:- tensions not adjusted correctly by operator. Sewing Room Defects. / Порок или дефект швейного производства.

LOOSE TWIST = РЫХЛАЯ КРУТКА – Loose Twist:- twist variation, bullets etc causes due to operator's mistake or waste accumulated at the spindle of Two For One Twisting m/c. Bullets are caused when the initial start yarn length of the feed yarn package on TFO m/c, i.e. bunching length which do not have twist is not removed mannualy. / Порок или дефект.

LOOSE WARP ENDS = ОСЛАБШИЕ (или СЛАБОНАТЯНУТЫЕ) КОНЦЫ ОСНОВЫ – Loose Warp Ends which appear like a reed mark are caused by loose ends which start to feed in just a trifle faster than the rest of the warp. Weaving defect. / Порок или дефект ткачества.

LORCS = LEAGUE OF RED CROSS AND RED CRESCENT SOCIETIES

LORO = ЛОРО (или ИХ) – Loro:- from the Latin, meaning Theirs. In banking, names given to the accounts of another bank in its books (loro). See also Nostro. / Под Лоро, от Латинского слова Loro, означающее Их, в банковском обслуживании понимаются наименования, данные счетам другого банка в его бухгалтерских книгах. Смотрите также Ностро или Наш (Nostro).

LORO ACCOUNT = СЧЁТ ЛОРО – Loro Account is a banking term used in Eurocheque clearing to describe a bank account held by one bank for another bank. For instance, if bank X holds an account for bank Y, when X talks to Y, X refers to the account that they hold for Y as a loro account. See also Vostro Account. / Банковский термин, используемый при расчётах по Еврочекам (Eurocheque), для описания банковского счёта, удерживаемого одним банком для другого банка. Например, если банк X удерживает счёт для банка Y, тогда X говорит Y, что X относится к данному счёту, который удерживается для Y как счёт лоро. Смотрите также Счёт Востро или Ваш Счёт У Нас (Vostro Account). Счёт Лоро – счёт банка корреспондента, открытый в уполномоченном банке.

LORRY = ГРУЗОВОЙ АВТОМОБИЛЬ (или ГРУЗОВИК) – In the United Kingdom, Lorry is a motor truck used for transport of goods. See also Truck. / В Соединённом Королевстве, грузовой автомобиль, используемый для перевозки грузов. Грузовой Автомобиль характеризуется конструктивной схемой, грузоподъёмностью, видом перевозок, колёсной формулой и компоновкой (расположением кабины по отношению к передней оси). По конструктивной схеме различают одиночные грузовые автомобили и автопоезда (тягач с прицепом, седельный тягач с полуприцепом). По грузоподъёмности грузовые автомобили делят на следующие классы:- особо малой грузоподъёмности (до 0.5 тонн), малой грузоподъёмности (0.5–2 тонн), средней грузоподъёмности (2–5 тонн), большой грузоподъёмности (5–15 тонн), особо большой грузоподъёмности (свыше 15 тонн – так называемый внедорожный автомобиль). По виду перевозок различают универсальные и специализированные (контейнеровозы, самосвалы, фургоны, цистерны и прочие) грузовые автомобили. Наиболее распространённые компоновочные схемы грузовых автомобилей – 'кабина за двигателем' и 'кабина над двигателем'; последняя получает всё большее распространение на грузовых автомобилях большой грузоподъёмности. Грузовой Автомобиль характеризуется грузоподъёмностью, типом кузова, колёсной формулой и компоновкой (расположением кабины по отношению к передней оси). Вместе с грузоподъёмностью указывают возможный полный вес (силу тяжести) буксируемого прицепа. Для буксировки прицепов грузовые автомобили оборудуют сцепными приборами (буксирный крюк) и быстродействующими соединительными устройствами для световой сигнализации и привода в действие тормозной системы прицепа. По грузоподъёмности грузовые автомобили делят на следующие классы:- особо малой грузоподъёмности – до 1 тонны (т); малой грузоподъёмности – 1–2 т; средней грузоподъёмности – 2–5 т; большой грузоподъёмности – свыше 5 т, особо большой грузоподъёмности (внедорожный автомобиль) – свыше предела, установленного дорожными габаритами и весовыми ограничениями автомобиля. Для безопасности движения на дорогах и в городах по габаритным ограничениям длина двухосного грузового автомобиля не должна превышать 11 метров (м) и 12 м – автомобиля с количеством осей более двух (автопоезда до 22 м); ширина – 2.5 м, а высота – 3.8 м. Повышение грузоподъёмности грузового автомобиля достигается увеличением числа осей (3- и 4-осные) или применением прицепов (полуприцепов). В бывшем Союзе Советских Социалистических Республик (СССР) для грузовых автомобилей и автопоездов был рекомендован ряд грузоподьёмностей:- 0.5; 1; 1.5; 3; 5; 8; 10; 12; 14; 16; 25; 40; 60; 100 т. По типу кузова грузовые автомобили разделяют на автомобили общего назначения с кузовами в виде грузовой платформы с открывающимися задним и боковыми бортами и специализированные – с кузовами специального назначения (самосвалы, фургоны, рефрижераторы и тому подобные). Грузовые автомобили и автопоезда со специализированными кузовами обычно приспособлены для перевозки одного или нескольких однородных видов груза, и в зависимости от назначения их называют Мебелевозами, Бензовозами, Цементовозами, Лесовозами, Контейнеровозами и тому подобными. Для облегчения погрузочно-разгрузочных работ некоторые грузовые автомобили оборудуют различными механизмами для подъёма и опускания груза, кузова или бортов, перемещения груза внутри кузова и других операций. Конструкция грузового автомобиля характеризуется компоновочной схемой, применяемым двигателем, трансмиссией, ходовой частью, механизмами управления (смотрите Автомобиль). Наиболее распространённые компоновочные схемы грузового автомобиля – 'кабина за двигателем' и 'кабина над двигателем'. Последняя получает всё большее распространение, особенно на грузовых автомобилях большой грузоподъёмности, так как позволяет осуществить наиболее правильное распределение общего веса по осям как в нагруженном, так и в порожнем состоянии, а также получить кузов наибольшей длины при минимальной общей длине автомобиля. Для более полного соответствия грузового автомобиля роду перевозимого груза обычно одна модель выпускается в нескольких модификациях, отличающихся базой (расстоянием между осями) и, следовательно, длиной кузова. Шасси с самой короткой базой применяется под кузовы самосвалов, предназначенных для перевозки сыпучих грузов с большой объёмной массой, а также для седельных тягачей. На шасси с длинной базой ставят кузовы больших размеров, в которых можно достаточно хорошо использовать грузоподъёмность даже при перевозке легковесных грузов. Грузовые автомобили особо малой грузоподъёмности (фургон и пикап) выполняют, как правило, на шасси легковых автомобилей или на базе их агрегатов и узлов. Грузовые автомобили малой и средней грузоподъёмности имеют обычно бензиновый карбюраторный двигатель (смотрите Двигатель Внутреннего Сгорания), механическую трансмиссию с одинарной или двойной главной передачей, тормоза с гидравлическим или гидропневматическим приводом, подвеску переднего и заднего мостов в виде листовых рессор, рулевое управление без усилителя. На грузовых автомобилях большой и особо большой грузоподъёмности чаще устанавливают дизельные двигатели (смотрите Дизель), применяют механические, гидромеханические и электромеханические трансмиссии, тормоза с пневматическим или пневмогидравлическим приводом и тормоза-замедлители, рулевое управление с гидравлическими усилителями. В бывшем СССР грузовые автомобили выпускались автомобильными заводами:- Ульяновским (УАЗ), Горьковским (ГАЗ), Московским (ЗИЛ), Уральским ('Урал'), Минским (МАЗ), Кутаисским (КАЗ), Кременчугским (КрАЗ), Белорусским (БелАЗ) и другими (смотрите Автомобильная Промышленность). К основным моделям грузовых автомобилей, выпускавшихся Советскими заводами, относились:- грузовой автомобиль УАЗ-451 ДМ (грузоподъёмность 1 т), ГАЗ-53А (4 т), ЗИЛ-130 (5 т), 'Урал-377' (7.5 т), МАЗ-500 (8 т), КАЗ-608 (седельный тягач), КрАЗ-257 (12 т). На их базе выпускались большое количество модификаций (самосвалов, автомобилей с повышенной проходимостью, седельных тягачей и других). Белорусский автозавод выпускал карьерные автомобили-самосвалы особо большой грузоподъёмности БелАЗ-540 (27 т), БелАЗ-548 (40 т), БелАЗ-549 (65 т). Развитие конструкции грузовых автомобилей идёт по пути наибольшего приспособления к условиям эксплуатации. Для грузовых автомобилей малой

и средней грузоподъёмности основное внимание уделяется улучшению манёвренности, интенсивности разгона, снижению погрузочной высоты и другому. Для грузовых автомобилей большой грузоподъёмности наблюдается стремление к максимальному повышению грузоподъёмности в пределах существующих весовых ограничений автомобиля, а также обеспечению подъездной работы с прицепами не меньшей грузоподъёмности, чем у самого автомобиля. Совершенствование силовой установки осуществляется применением более мощных и экономичных двигателей небольшого веса. Всё большее распространение получают быстроходные дизели, а на грузовых автомобилях большой грузоподъёмности имеются попытки применить газовую турбину. Использование атомной энергии (атомоходы) затруднено из-за необходимости применения сложной физиологической защиты. Некоторое распространение начинают получать автоматические трансмиссии и дизель-электрические передачи с использованием электродвигателей на всех колёсах (мотор-колесо). Это уменьшает загрязнённость воздушных бассейнов городов токсичными веществами продуктов сгорания. Большое внимание уделяется облегчению управления (усилители рулевого управления), безопасности движения (эффективные тормоза, обзорность, сигнализация), уменьшению трудоёмкости работ по техническому обслуживанию и ремонту и повышению надёжности конструкций.

LOSS = УБЫТОК – Loss is an excess of expenditures over revenue for a period or activity. Also, for tax purposes, an excess of basis over the amount realized in a transaction. See also Net Income. / Убыток это превышение издержек над выручкой за какой-то период или от какой-то деятельности. Для налоговых целей это также относится к превышению базиса над суммой реализации от какой-то операции. Смотрите также Чистый Доход (Net Income).

LOSS = УБЫТОК (или УЩЕРБ, или УРОН) – (1) Loss:- this term generally refers to some injury, harm, damage or financial deteriment that a person sustains. Losses may be insured or uninsured. Whether a loss is covered by a policy or certificate of insurance depends on the terms of that document and local law. / Как правило, этот термин относится к некоторым видам ущерба, вреда, повреждений или финансового неблагополучия, которым подвергается какое-то лицо. Убытки могут быть застрахованы или не застрахованы. Покрывается ли убыток полисом или свидетельством о страховании (страховым сертификатом), это зависит от положений данных документов и местного законодательства. В гражданском праве под Убытками понимается ущерб, выраженный в денежной форме, причинённый одному лицу противоправными действиями другого. К убыткам относятся расходы, произведённые кредитором, утрата или повреждение его имущества, а также доходы, которые он получил бы при отсутствии правонарушения (упущенная выгода).

(2) In reference to insurance, loss is another term for a claim. / В отношении страхования этот термин служит ещё одним обозначением для требования (иска). Термин Убыток имеет в практике страхования несколько значений:- (i) подлежащий возмещению страховщиком ущерб, причинённый застрахованному имуществу в результате страхового случая; (ii) уменьшение или утрата стоимости, особенно в том случае, если они вызваны наступлением застрахованной опасности; (iii) основа претензии для получения возмещения от страховщика или возмещения убытков другим лицам; (iv) сумма, на которую уменьшается стоимость имущества страхователя в результате наступления застрахованной опасности; (v) сумма, полученная страхователем (застрахованным лицом) по претензии или выплаченная страховщиком от его имени в соответствии с договором страхования; и (vi) дело, заводимое страховщиком по соответствующему страховому случаю; дело с документами по такому случаю.

LOSS ADJUSTER = ПЕРЕОЦЕНЩИК УБЫТКА (или КОМИССАР ПО УБЫТКАМ, или ДИСПАШЕР ПО УБЫТКАМ, или АДЖАСТЕР ПО УБЫТКАМ, или ДИСПАШЕР УЩЕРБА, или АДЖАСТЕР УЩЕРБА) – Loss Adjuster is a person who is appointed to investigate the circumstances of a claim under an insurance policy and to advise on the amount that is payable to the policyholder in order to settle that claim. Loss adjusters are generally appointed by underwriters but sometimes policyholders appoint their own loss adjusters to negotiate claims on their behalf. / Диспашер составляет диспашу с расчётом убытков по авариям.

LOSS ADJUSTMENT EXPENSE = РАСХОДЫ ПО ПЕРЕОЦЕНКЕ УБЫТКА – Loss Adjustment Expense is all expenditures of an insurer associated with its adjustment, recording, and settlement of claims, other than the claim payment itself. The term encompasses both allocated loss adjustment expenses (ALAE) which are loss adjustment expenses identified by a claim file in the insurer's records, such as attorney's fees; and unallocated loss adjustment expenses (ULAE), which are operating expenses not identified by claim file, but functionally associated with settling losses, such as salaries of claims department.

LOSS ASSESSOR = АСЕССОР ПО УБЫТКАМ – Loss Assessor is the person specializing in compiling and negotiating settlement of claims on behalf of the insured, by whom they are paid. / Под Асессором, от Латинского слова Assessor, означающее Заседатель, в Древнем Риме, в средневековой Европе и в некоторых буржуазных государствах (например, в Германии) понимается судебное должностное лицо, заседатель; в России должность Асессор была введена Петром I в штаты Сената, Синода, судов и других коллегий, во 2-й половине XIX века эта должность постепенно была ликвидирована (дольше всего сохранялась в губернских правлениях), соответствовавший же ей чин – коллежский асессор – существовал до свержения царизма (1917) как гражданский чин восьмого класса по росписи чинов (так называемоу табели о рангах).

LOSS DEVELOPMENT = РАЗВИТИЕ УЩЕРБА (или РАЗВИТИЕ УБЫТКА) – Loss Development is the difference between the original loss as originally reported to the reinsurer and its subsequent evaluation at a later date or at the time of its final disposal. A serious problem to reinsurers who, being involved in the more serious cases, must frequently wait many years for the final disposition of a loss. / Развитие Ущерба – разница в сумме ущерба в начале и в конце определённого периода времени; разница между суммой первоначально оцененного страховщиком ущерба и суммой убытка, которая была заявлена страховщику после фактической оценки, проведённой позднее.

LOSSES ON RECEIVABLES = УБЫТКИ ПО ДЕБИТОРСКОЙ ЗАДОЛЖЕННОСТИ – Losses On Receivables:- losses on claims, receivables or loans, e.g., through bankruptcy, fruitless attachment or distraint or composition agreement if the dividend obtained is insufficient. / Убытки по требованиям, дебиторской задолженности или ссудам, например, вследствие банкротства, изъятия имущества или наложения ареста на имущество в обеспечение долга или соглашения о компромиссе, если полученный дивиденд является недостаточным.

LOSS EVENT = СТРАХОВОЙ СЛУЧАЙ (или СОБЫТИЕ, ВЫЗЫВАЮЩЕЕ УЩЕРБ) – In reinsurance, Loss Event is the total losses to the ceding company or to the reinsurer resulting from a single cause such as a windstorm. The event which causes a loss, for example a fire or hurricane. / Событие, которое вызывает ущерб, например, пожар или ураган.

LOSS OF SPECIE = УТРАТА ЦЕННОСТИ – Loss Of Specie:- a change in the character of cargo which, in insurance terms, is effectively an actual total loss.

LOSS OF USE INSURANCE = СТРАХОВАНИЕ НА СЛУЧАЙ НЕВОЗМОЖНОСТИ ИСПОЛЬЗОВАНИЯ – Loss Of Use Insurance:- insurance against loss due to the inability to use property because of its damage or destruction. / Страхование против убытков, которые могут возникнуть вследствие невозможности использования имущества из-за его повреждения или разрушения.

LOSS PAYABLE CLAUSE = ОГОВОРКА ОБ ОПЛАЧИВАЕМОМ УЩЕРБЕ (или ОГОВОРКА ОБ ОПЛАЧИВАЕМЫХ УБЫТКАХ, или ОГОВОРКА ОБ УБЫТКЕ, ПОДЛЕЖАЩЕМ ОПЛАТЕ) – Loss Payable Clause is a clause in an insurance policy to specifically identify interested parties (the insured, mortgagees, trustees, lienholders, etc).

LOSS RATIO = СООТНОШЕНИЕ С УБЫТКОМ – In reinsurance, Loss Ratio is a proportionate relationship of incurred losses to earned premiums expressed as a percentage.

LOSS–SHARING AGREEMENT = СОГЛАШЕНИЕ ОБ УЧАСТИИ В ВОЗМЕЩЕНИИ УЩЕРБА (или СОГЛАШЕНИЕ ОБ УЧАСТИИ В ВОЗМЕЩЕНИИ УБЫТКОВ) – Loss-Sharing Agreement is an agreement among participants in a clearing or settlement system on how to allocate losses arising from the default of a participant in the system or from the default of the system itself.

LOSS–SHARING POOLS = ПУЛЫ, УЧАСТВУЮЩИЕ В ВОЗМЕЩЕНИИ УЩЕРБА (или ПУЛЫ, УЧАСТВУЮЩИЕ В ВОЗМЕЩЕНИИ УБЫТКОВ) – Loss-Sharing Pools:- cash, securities, or other assets that are provided by the participants in advance and are held by the system to ensure that commitments arising from loss-sharing agreements can be met.

LOST END = ЗАТЕРЯННАЯ ПРОДОЛЬНАЯ НИТЬ (или СХОД НИТЕЙ) – Lost End is an end on a section or tricot beam that has been broken at some stage in warping and has not been repaired by a knot. / Затерянная Продольная Нить – отсутствующая в полотне или кромке нить основы. Сход Нитей – порок шлихтовки или перегонки основы.

LOST OPPORTUNITY COST = ЗАТРАТА НА УПУЩЕННУЮ ВОЗМОЖНОСТЬ – Lost Opportunity Cost:- the difference in net compensation from the energy market between what a unit receives when providing regulation or spinning reserve and what it would have received for providing energy output.

LOST OR NOT LOST = ПОГИБЛО ИЛИ НЕ ПОГИБЛО (или НЕЗАВИСИМО ОТ ТОГО, ПОГИБЛО ИЛИ НЕТ, или УТРАЧЕНО ИЛИ НЕ УТРАЧЕНО) – Lost Or Not Lost:- a clause used in ocean marine insurance under which the company will pay even if the loss insured against has occurred prior to the effective date of the insurance. The company would, of course, not be liable if the policyholder knew that the loss had occurred when he/she bought the insurance. In days past, a ship could easily be lost or damaged and the owner would not find out about it until later, during which time he might want to insure it.

LOST TIME INJURY = УВЕЧЬЕ, ПРИВЕДШЕЕ К НЕТРУДОСПОСОБНОСТИ – Lost Time Injury:- an accident/injury forcing the employee/contractor to remain away from his/her work beyond the day of the accident. / Под Увечьем понимается вид тяжкого телесного повреждения.

LOT = ЛОТ (или ПАРТИЯ) – (1) Lot is a number of units of a single commodity, identifiable by its homogeneity of composition, origin etc, forming part of a consignment. Lot is the unit of trading. See also Even Lot, Job Lot, and Round Lot. Any definite quantity of a futures commodity of uniform grade; the standard unit of trading. This term means the par quantity of the commodity deliverable under a particular commodity contract. Lot is all the products of one defined type and homogeneous quality delivered to one customer against one dispatch note. Note:- the term lot is sometimes used for the whole consignment and sometimes for a part of a consignment. See also Consignment. Any group of bales identified by one mark or one countermark. Lot is the unit of production or a group of other units or packages that is taken for sampling or statistical examination, having one or more common properties and being readily separable from other similar units. / Любая группа кип, идентифицированных одной маркой (партией) или одним контрольным клеймом. Определённое количество однородного по качеству хлопкового материала, оформленное одним сопроводительным документом.

(2) Lot means commodity in each consignment, and the sampling officer knows or assumes that the commodity is consistent in terms of origin, producer, type, packer, packaging material, mark and transporter. Lot is a group of product with the same run or manufacturing date. / Под Партией понимаются товары, направляемые в адрес одного получателя по одному транспортному документу (накладной, коносаменту и так далее) в соответствии с транспортными правилами, а также пересылаемого по одной почтовой накладной или перемещаемые в ручной клади и багаже одного лица, следующего через границу.

(3) Lot is the alternative term for a futures contract. A Lot is a commonly used word for a standard futures contract. / Под Лотом или Партией понимается альтернативный термин для обозначения стандартного фьючерсного контракта.

LOT NUMBER = НОМЕР ЛОТА – Lot Number is the identification number assigned to specific product for tracking purposes that is usually tied to a date or a production run.

LOT NUMBER TRACEABILITY = КОНТРОЛЕПРИГОДНОСТЬ (или ОТСЛЕЖИВАЕМОСТЬ) НОМЕРА ЛОТА – Lot Number Traceability is the ability to trace items through their lot number. This is helpful when a specific product is needed or information about a specific product is required.

LOUNGER = ПОВСЕДНЕВНОЕ (или ПРАЗДНОЕ, или ШЕЗЛОНГ) – Lounger is an article of clothing designed for comfort and leisure use.

LOUNGE SUIT = ПРАЗДНЫЙ КОСТЮМ (или КОСТЮМ ДЛИННОГО ПОКРОЯ) – Lounge Suit:- (chiefly British) business suit.

LOUNGE WEAR = ОДЕЖДА ДЛЯ ОТДЫХА (или ОДЕЖДА ДЛЯ УЕДИНЕНИЯ) – Lounge Wear is the intimate apparel that includes robes, housecoats, and bed jackets. Loungewear is an informal clothing usually designed to be worn at home.

LOVIBOND® TINTOMETER = ТИНТОМЕТР ЛАВИБОНД® (или КОЛОРИМЕТР ЛАВИБОНД®, или ЦВЕТОМЕР ЛАВИБОНД®) – Lovibond® Tintometer is an instrument for evaluating the colors of materials by visual comparison with the colors of glasses of the Lovibond® color system.

LOW = МИНИМУМ – The daily Low is the lowest price traded during the trading day for a particular asset. It normally reflects the lowest price that occurred during all trading sessions for the day. The bar's or candle's low is the lowest price received during each time interval. / Суточный Минимум – это самая низкая цена сделки, состоявшейся в течение суток торговли по конкретному активу. Обычно он отражает самую низкую цену, имевшую место в течение всех торговых сессий одного дня торговли. Штриховой или свечной минимум – это самая низкая цена, имевшая место в течение каждого временного интервала.

LOWBOY = КОРОТЫШ (или КОРОТЫШКА) – Lowboy is a trailer or semi-trailer with no sides and with the floor of the unit close to the ground. Special trailer used to accommodate over height cargo with flat bed, approximately 12' above ground. A term 'Low Boy' is a slang for a tank transporter, also called Dragon Wagon. A Low Boy is a semi-trailer with no sides and with floor of the unit close to the ground. Usually used in the transportation of heavy machinery or large objects. / Коротыш или Коротышка – низкорамный прицеп-тяжеловоз или низкорамный полуприцеп-тяжеловоз.

LOW COUNTRIES = НИЗМЕННЫЕ СТРАНЫ – History of the Low Countries from prehistoric times to 1579. For historical purposes, the name Low Countries is generally understood to include the territory of what is today Belgium, Luxembourg, and The Netherlands, as well as parts of northern France. However, Belgium, although it was not constituted as an independent kingdom until 1831, became a distinct entity after 1585, when the southern provinces were definitively reconquered by Spain and separated from the northern sector. For a brief period, from 1814 to 1830, an attempt was made to unite the Low Countries into one kingdom again, but both regions by this time had developed cultures too different to form a single entity under a central government. Here, therefore, the history of the Low Countries will be surveyed as a whole to the late XVI century. The later individual histories of The Netherlands, Belgium, and Luxembourg are treated in the separate articles on those countries. Low Countries:- coastal region of northwestern Europe, consisting of Belgium, The Netherlands, and Luxembourg. The Low Countries are bordered by Germany to the east and France to the south. The Low Countries are so called because much of their land along the North Sea coast and for some distance inland is either below sea level or just slightly above it. More than a quarter of the total land area of The Netherlands is below sea level, for instance. Natural sand dunes and a system of man-made sea walls and dikes protect the polders (artificially drained flat country largely below sea level) from flooding. The Prince Alexander Polder north of Rotterdam is the lowest point in the Low Countries and lies 6.7 m (22 feet) below sea level. The principal rivers of the Low Countries include the Schelde, Meuse (Maas), and branches of the lower Rhine. An extensive network of shipping canals and waterways links the major rivers. More than 8 000 square km (3 000 square miles) of fertile farmland have been reclaimed from the deltas of the Schelde, Meuse, and Rhine rivers and from the Zuiderzee, which was formerly a shallow arm of the North Sea cutting deep into the northwestern coast of The Netherlands. Ethnically, the Low Countries form a transitional zone between the ancient Germanic and Latin heritages of western Europe. Netherlandic (a Germanic language) is spoken in The Netherlands (where it is known as Dutch) and in northern Belgium (where it is known as Flemish), while French (a Romance language) and its Walloon dialects are spoken in southern Belgium. In Luxembourg, Letzenburgish, a German dialect, is the spoken language of the majority. Most of the population of Belgium and Luxembourg is Roman Catholic, while religious adherence in The Netherlands is equally divided between Roman Catholics and Protestants. The population density of the Low Countries is among the highest in Europe and in the world. All three countries are highly urbanized, and some nine-tenths of the region's total population resides in cities or urbanized communities. Brussels and Antwerp (in Belgium) and Amsterdam, Rotterdam, and The Hague (in The Netherlands) are among Europe's major cities. Also known as Benelux Countries. See also Benelux. / Принц Александэр Полдэ (Alexander Polder). Смотрите также Бенилюкс (Benelux).

LOWER 48 = НИЖЕ 48–ОЙ (ШИРОТЫ) – Lower 48:- the mainland states of the US excluding Alaska. / Североамериканские штаты, за исключением Аляски, расположенные на большой земле.

LOWER TEMPERATURE LIMIT = НИЖНИЙ ЛИМИТ ТЕМПЕРАТУРЫ – Lower Temperature Limit:- temperatures below this limit lead to quality degradation, e.g., chilling.

LOWEST OBSERVED ADVERSE EFFECT LEVEL = САМЫЙ НИЗКИЙ ОБНАРУЖИВАЕМЫЙ УРОВЕНЬ ВРЕДНОГО ВОЗДЕЙСТВИЯ – The Lowest Observed Adverse Effect Level (LOAEL) is the lowest concentration or amount of a substance, found by experiment or observation, which causes an adverse alteration of morphology, functional capacity, growth, development, or life span of a target organism distinguishable from normal (control) organisms of the same species and strain under defined conditions of exposure.

LOWEST OBSERVED EFFECT CONCENTRATION = САМАЯ НИЗКАЯ ОБНАРУЖИВАЕМАЯ КОНЦЕНТРАЦИЯ ВОЗДЕЙСТВИЯ – The Lowest Observed Effect Concentration (LOEC) is the lowest test concentration at which a chemical is observed to have a 'statistically significant' effect on test organisms.

LOW EXERCISE PRICE OPTION = ОПЦИОН С НИЗКОЙ ЦЕНОЙ ИСПОЛНЕНИЯ – A Low Exercise Price Option (LEPO) is a call option with an exercise price set deep in-the-money. The limiting case, a zero exercise price option, is when the strike price is zero. It is virtually certain to be exercised and the value and performance of its intrinsic value is effectively identical to that of the underlying equity. These features are designed to allow participation in the performance of an equity price where there are legal or financial obstacles to purchasing the underlying directly. If the Lepo is cash-settled, the buyer profits to the same extent as with a direct holding in the underlying, but without having to transact in it. However, a Lepo holder does not earn dividends or have voting rights over the equity. Low Exercise Price Options (LEPOs) are European exercise, European style options with a strike price of 1 cent, in the case of stock LEPOs, or 1 point, in the case of index LEPOs.

LOW–INCOME ECONOMIES IN TRANSITION = НИЗКОДОХОДНЫЕ ЭКОНОМИКИ В ПЕРЕХОДНОМ ПЕРИОДЕ – Low-Income Economies In Transition (in 2012):- WTO members (3):- Armenia, Kyrgyz Republic, and Moldova (Republic of).

LOWLAND FIELD = НИЗМЕННОЕ ПОЛЕ (или НИЗИННОЕ ПОЛЕ) – Lowland Field is a land area surrounded with dikes or levees to impound rain or irrigated water. An irrigated field surrounded by levees.

LOWLAND RICE = НИЗМЕННЫЙ РИС (или НИЗИННЫЙ РИС) – Lowland Rice is a Rice grown on fields where water is held by bunds. About 30% of the world's Rice is grown as rainfed lowland; about 45% as irrigated lowland. Some areas are flooded lowlands.

LOWLAND VS UPLAND SOILS = НИЗМЕННЫЕ (или НИЗИННЫЕ) ПРОТИВ ВОЗВЫШЕННЫХ ПОЧВ – Lowland vs Upland Soils:- terms commonly used in connection with Rice culture to denote flooded (paddy) vs unflooded conditions.

LOWLAND WOOL = ШЕРСТЬ ИЗ НИЗМЕННОСТЕЙ (или ШЕРСТЬ ИЗ НИЗИН) – Lowland Wool:- these breeds are characterized by producing wool that is generally coarser, and only wavy or quite straight, and of longer staple (over 4 inches). These wools are especially suited for the production of combed yarns, which are worked up into worsted fabrics. / The Lowlands (of Scotland) – южная, менее гористая часть Шотландии.

LOW MELT FIBER = НИЗКОПЛАВКОЕ ВОЛОКНО – Low Melt (or Fusion) Fiber (LMF) is produced by bicomponent spinning of general polyester and modified polyester, can be melted at lower temperautre(110–200 degree Celsius (°C)) than normal fiber and bonded with other fibers. Advantages:- (i) Excellent Bonding Properties:- LMF provides diverse melting points generated through controlling seath part(modified polyester); (ii) Excellent Durability:- the bonding strength after being combined with other fibers hold out semipermanently; (iii) Easy Mixing properties with other fibers:- homogeneous properties between LMF and various fibers make blending easy on line; (iv) Excellent Resilience:- the formation of non-woven fabric made with LMF is simple and excellent; and (v) LMF can be recycled. Usage:- (i) non-woven:- for bedding, non-glue cotton, furniture; (ii) industries:- for building, filter, garments; and others. Specification:- (i) Denier:- 1.5/ 2/ 4/ 6/ 10/ 15D; (ii) Length:- 3/ 6/ 9/ 12/ 38 / 51 / 64 / 76 / 102 mm; (iii) Color:- raw white / dope dyed black; and (iv) Melt Point:- 110 / 130 / 150 / 180 / 200 degree Celsius. Low Melt Polyester Fiber is a polyester fiber has a melting point of about 257 °C. Low melt polyester fiber, on the other hand, has a much lower melting point in the range of 110–150 °C. Low Melting Fiber (LMF) is a typical industrial fiber from Huvis (headquartered in Seoul, Republic of Korea) can be melted at lower temperature(100–200 °C), thus making it possible to be bonded with other fibers, unlike normal polyester fiber which is melted at higher

temperature of more than 280 °C. Thanks to this quality, the Huvis LMF is an ideal alternative to harmful adhesives. With less usage of adhesives needed, it also contributes to environmental sustainability by generating less carbon dioxide and heat. Its applications vary from automotive car interiors (door trims, ceiling materials, head liners, etc), to furniture, construction, and other industrial use. Currently, the world's largest LM fiber maker, Huvis produces about 40% of the world's low melting fiber and exports to 80 countries, including Europe and the USA. Huvis, the largest chemical material company in Korea, has an annual production capacity of 400 000 tons of Polyester Staple Fiber, 100 000 tons of Polyester Filament Yarn and 100 000 tons of Polyester Chip as well as production of Super Fiber such as Meta-Aramid and PPS Fiber. These products are highly popular in overseas markets, being exported to 100 countries. LMF, produced by bicomponent spinning of general polyester and modified polyester, can be melted at lower temperature than normal fiber and bonded with other fibers. Applications:- (i) mattress, padding, interlining; (ii) sanitary and medical goods; (iii) filtration and nonwovens for industry use; (iv) insulating material for buildings and automotives; and (v) spinning. BOMAX Low-Melt Thermal-Bonding Fiber is a bi-component fiber with co-polyester sheath and polyester core. This fiber has low melting point, thermoplastics and self-adhesible properties. This fiber when blending with regular polyester fiber and converted into web, thermal-bonding fiber help to bond fiber with each other and make non-wovens soft touch, wash fastness, easy care and with no environmental contamination. There are 3 different melting points of BOMAX Low-melt thermal-bonding fiber:- 110 °C, 140 °C, 180 °C. Low Melt or thermal bonding incorporates a special low melt fiber as part of the fiber blend. This special low melt fiber melts in the web forming process and sticks to the fibers around it forming a bond which holds the product together. This process allows the product to be 100% polyester while still being durable and resilient. / филаментная (комплексная) пряжа (filament yarn).

LOW POLE = НИЖНИЙ СТОЛБИК – Low Pole:- a situation on a Point And Figure chart occurs when a down column that falls 3 boxes or more reverses to an up column. The reversal retraces more than 50% of a down move that has an odd number of '0's', or retraces more than 62.5% of a down move that has an even number of '0's'. Because it is not an actual Point & Figure chart's buy signal but offers a good probability of leading to one, this formation is considered a 'buy alert'. / В техническом анализе биржевых рынков, .

LOW PRESSURE SIDE = УЧАСТОК НИЗКОГО ДАВЛЕНИЯ – Low Pressure Side:- the portion of the process following the gin stand (including lint cotton cleaning and batt formation process) in which material is conveyed by low pressure air, and exhausts are typically controlled by condensers.

LOW–PRICED SHARES = ДЕШЁВЫЕ АКЦИИ (или НИЗКО СТОИМОСТНЫЕ АКЦИИ) – In Switzerland, Low-Priced Shares are the shares with a low market value (e.g., about CHF100.00 to CHF300.00) and held widely by many shareholders. / В Швейцарии, акции с низкой рыночной стоимостью (например, от 100.00 до 300.00 Швейцарских Франков (CHF)) и повсеместно удерживаемые многими владельцами ценных бумаг.

LOW ROWS = НИЗКИЕ РЯДЫ – Low Rows is a carpet defect characterized by rows of unusually low pile height across the width of the goods.

LOW SULPHUR FUEL SURCHARGE = НАДБАВКА ЗА МАЛОСЕРНИСТОЕ ТОПЛИВО (или ДОПЛАТА ЗА МАЛОСЕРНИСТОЕ ТОПЛИВО) – Low Sulphur Fuel Surcharge, Baltic Sea Ports As customers may be aware, under the requirements of the Marpol 73/78 convention, the Baltic Sea is designated as a special area as from 2006-May-19. This means that vessels operating in this area must use fuel oils with a sulphur content not exceeding 1.5%. Freight surcharges are no longer updated by conferences. Please refer to shipping line agents or freight forwarders for their values.

LOW TEMPERATURE FLEXIBILITY = ГИБКОСТЬ НИЗКОЙ ТЕМПЕРАТУРЫ – Low Temperature Flexibility:- increased kink resistance achieved by adding plasticizer to synthetic plastics.

LOW–TEMPERATURE REFRIGERATED CONTAINERS = НИЗКО–ТЕМПЕРАТУРНЫЕ РЕФРИЖЕРАТОРНЫЕ КОНТЕЙНЕРЫ – Low-Temperature Refrigerated Containers are the refrigerated containers that enable goods to be transported at temperatures as low as –60 °C.

LOW–TENSILE YARNS = СЛАБО НАТЯНУТЫЕ (или РАСТЯНУТЫЕ) ПРЯЖИ – Low-Tensile Yarns differ from high-tensile yarns in their greater bulk, high crimp, and fluffiness, with little elastic elongation. In the USSR, low-tensile yarns produced from Capron (polyamide) fibers are called Meron, and those made from Lavsan (polyester) fibers are called Melan; abroad, the trade names 'Saaba' and 'Astralon' are often used. Such yarns are produced by additional heat treatment of high-textile yarns. / Капрон (Capron) Мерон (Meron), Лавсан (Lavsan) Мелан (Melan), Саабо (Saaba) и Астралон (Astralon).

LOW VISCOSITY INDEX = НИЗКИЙ ИНДЕКС ВЯЗКОСТИ – Low Viscosity Index (LVI):- typically below 40 VI units. See also Viscosity Index.

LOW WATER IMMERSION = ИММЕРСИЯ В НИЗКОЙ ВОДЕ (или ОКУНАНИЕ В НИЗКУЮ ВОДУ) – Low Water Immersion (LWI) is a dyeing technique where the liquor ratio is very low, with the intent of producing nonuniform mottled appearance. LWI is popular for fabrics for quilting. Typically, a piece of fabric is stuffed fairly snugly into a container, and enough dye solution to barely wet the fabric is poured in. The container and contents are set aside to batch for some time. Sometimes multiple colors are used. This is an art dyeing technique that is not used commercially.

LOW WOOL = НИЗШАЯ ШЕРСТЬ – Low Wool is a wool of low 1/4 blood or lower in quality. Same as Coarse Wool.

LOX PROCEDURES = LARGE ORDER EXECUTION PROCEDURES

LP = LIMITED PARTNERSHIP

LP = LOW POLE

LPG = LIQUEFIED PETROLEUM GAS

LPPM = THE LONDON PLATINUM AND PALLADIUM MARKET

LR = LARGE/LONG RANGE TANKER

LR = LEAF ROLLING

LR = LIBERIA

LRA = LOCKED ROTOR AMPERES

LRD = LIBERIAN DOLLAR

LRDC = LAND RESOURCES DEVELOPMENT CENTRE

LRP = LESS REACTIVE PHOSPHATE

LS = LESOTHO

LS = LUMP SUM

LSA = LINER SHIPPING AGREEMENT

LSAM = LOAD SECURE APPLICATION MODULE

LSc = LEAF SCALD

LSD = LEAST SIGNIFICANT DIFFERENCE

LSE = LOAD–SERVING ENTITY

LSE = LONDON STOCK EXCHANGE

LSF = LOW SULPHUR FUEL

LSFO = LOW SULPHUR FUEL OIL

LSL = LAMINATED STRAND LUMBER

LSL = LESOTHO LOTI

LSS = LITERATURE SEARCH SYSTEM

LSWR = LOW SULPHUR WAXY RESIDUE

LT = LITHUANIA

LT = LONG TON

L/T = LONG TON

LTCCE = LONG–TERM CONTINUOUS CROPPING EXPERIMENT

LTD = LAST TRADING DATE

LTD = LIMITED

LTE = LONG–TERM EMERGENCY

LTFE = LONG–TERM FERTILITY EXPERIMENT

LTFL = LESS THAN FAIR VALUE

LT–IBDS = LOW TEMPERATURE IN–BIN DRYING AND STORAGE

LTL = LESS THAN TRUCK LOAD

LTL = LITHUANIAN LITAS

LTM = LAST TWELVE MONTHS

LTM = LEVERAGE TRANSACTION MERCHANT

LTR = LIGHT TRANSMISSION RATIO

LTV RATIO = LOAN–TO–VALUE RATIO

LU = LUXEMBOURG

LUANA = ЛУАНА – Luana is a fabric characterized by a crosswise rib effect, usually made with a filament yarn warp and a spun yarn filling. Luana is of Hawaiian origin, and the meaning of Luana is ‘Enjoyment’. / Луана – ткань, характеризуемая xxxxx (crosswise rib effect), выработанная, как правило, по основе из филаментной (комплексной) пряжи (filament yarn) и по утку из спряденой пряжи уточины. Название Луана имеет Гавайское происхождение и означает Наслаждение (Enjoyment).

LUBBER LINE = КУРСОВАЯ ЧЕРТА – Lubber Line (maritime term):- the black line parallel with ship’s keel marked on the inner surface of the bowl of a compass, indicating the compass direction of the ship’s head.

LUBRICANT = СМАЗКА (или СМАЗОЧНЫЙ МАТЕРИАЛ) – Lubricant is any substance interposed between two surfaces in relative motion for the purpose of reducing the friction and/or the wear between them. Lubricants are hydrocarbons produced from distillate or residue. They are mainly used to reduce friction between bearing surfaces. This category includes all finished grades of non-synthetic lubricating oil, from spindle oil to cylinder oil, and those used in greases, including motor oils and all grades of lubricating oil base stocks. See also Lubrication; Way Lubricant. Lubricants are oils, base oils, packaged oils, etc. Lubricant is a material used to reduce friction between surfaces. Lubricants are often applied to yarns that are used for knitted fabrics such as Jersey. They help protect the yarn from damage and the machinery from wear. Lubricants can interfere with dye uptake and must be removed by thorough scouring. Lubricant is a chemical composition such as a fatty or waxy substance applied to a yarn in order to reduce friction in subsequent textile operations, such as knitting. Lubricant is an oil or emulsion finish applied to fibers to prevent damage during textile processing or to knitting yarns to make them more pliable. / от износа. К Смазкам или Смазочным Материалам относятся углеводороды, полученные из нефтяного дистиллята или нефтяных остатков и которые по консистенции делятся на пластичные, полужидкие, твёрдые (после отверждения) и пасты. Они используются, главным образом, для уменьшения трения между соприкасающимися поверхностями. Эта категория включает все товарные сорта несинтетических смазочных масел, от литола (масло для осей) до масла для цилиндров (поршней), и тех, которые используются в смазках, включая моторные масла и все сорта продуктов на базе смазочных масел. К Смазкам или Смазочным Материалам относятся:- базовые масла, основы масел, фасованные масла и так далее. Смазка в технике, термин, имеющий различные значения:- (i) режимы трения деталей машин (смазывание); (ii) материалы, облегчающие трение и процессы; (iii) обработки металлов резанием и давлением; (iv) подача смазочных материалов в узлы трения; и (v) материалы, служащие для защиты поверхностей от коррозии и уплотнения соединений деталей машин. (1) Смазывание – смазочное действие смазочного материала на поверхности трения, в результате чего уменьшаются трение и изнашивание поверхностей. Между трущимися поверхностями создаётся смазочный слой, обеспечивающий минимальное сопротивление тангенциальному сдвигу и достаточно большое сопротивление

нормальным нагрузкам (смотрите также Внешнее Трение). Наиболее благоприятные режимы смазки обеспечиваются подбором оптимальных смазочных материалов, подачей их к трущимся поверхностям в необходимых количествах, рациональной конструкцией узлов трения, а также выбором правильной технологии. (2) Смазочные Материалы – вещества, используемые для предотвращения задира и заедания, уменьшения и упорядочения износа взаимно перемещающихся поверхностей. Особая группа смазочных материалов – смазочно-охлаждающие жидкости, например, применяемые при обработке металлов резанием, Технологические Масла, используемые при обработке металлов давлением (ковке, прокатке, волочении и тому подобном). (3) Способы подачи смазочного материала к трущимся поверхностям определяются свойствами материала, функциями и условиями работы узла трения. Для масел характерны картерная и циркуляционная системы смазки. В первом случае узел трения помещают в герметичный картер, на дно которого наливают масло. В циркуляционных системах масло из картера или бака насосом по маслопроводу подаётся в узел трения, откуда самотёком или принудительно возвращается в картер. Циркуляционная система смазки включает в себя фильтры, сепараторы, отстойники, радиаторы, контрольно-измерительную аппаратуру. Существуют фитильная и капельная подача смазочных масел, смазка масляным туманом и тому пдодбные. Пластичные смазки закладывают непосредственно в узлы трения при изготовлении машин или пропрессовывают их в узел через устройства, называемые пресс-маслёнками, с помощью ручных или механических шприцев. Для смазки применяют также колпачковые, пружинные и другие маслёнки. Некоторые машины (например, прокатные станы, шагающие экскаваторы) имеют централизованные системы смазки. (4) Консервационные (защитные) материалы – вещества, служащие для предотвращения коррозионного разрушения металлических изделий и деталей машин при их хранении (консервации) и эксплуатации. Обычно для этого используют углеводородные пластичные смазки – Вазелины. Находят применение жидкие консервационные масла и твёрдые покрытия. Для получения твёрдого покрытия на защищаемую поверхность наносят раствор парафина и церезина с ингибиторами коррозии в летучих нефтепродуктах. После испарения растворителя на поверхности остаётся твёрдое покрытие толщиной около 0.1 миллиметра (мм). (5) Уплотнительные Материалы – вещества, используемые для герметизации вакуумных систем, трубопроводной арматуры, резьбовых соединений труб и тому подобного. Уплотнительные материалы применяют также для облегчения монтажа и разборки резьбовых и других соединений. Обычно применяют пластичные смазки, содержащие до 20% порошка графита, дисульфида молибдена, мягких металлов и тому подобного. Турбинные Масла, нефтяные и синтетические смазочные масла для опорных подшипников и подпятников главного вала и вспомогательных механизмов паровых и водяных турбин, турбокомпрессоров и другого. Цилиндровые Масла, дистиллятные и остаточные нефтяные смазочные масла, используемые главным образом в паровых машинах для снижения трения и предотвращения прорыва пара между цилиндром и поршнем. Под Смазочными Материалами понимаются вещества, обладающие смазочным действием. Основными смазочными материалами являются пластичные смазки, смазочные масла, твёрдые смазки и смазочно-охлаждающие жидкости. Трансмиссионные или Редукторные Масла:- (i) Смазочные Масла, нефтяные и синтетические масла, используемые в качестве смазочных материалов. Различают индустриальные, моторные, приборные, трансмиссионные масла и другие. (ii) Редукторные Масла, смазочные нефтяные и синтетические масла с противоизносными присадками, используемые в зубчатых передачах. Смазочные Материалы делятся на:- Жидкие (Смазочные Масла) и Полужидкие (Пластичные Смазки). Чтобы удовлетворить требования производителей машин к качеству смазочных материалов, в их состав включается, как правило, несколько видов основных масел и до 30% химических соединений, называемых Присадками. В свою очередь, полужидкая консистенция смазок достигается за счёт дополнительного включения в их состав химических соединений, называемых Загустителями. Смесь нескольких основных масел называется Базовым Маслом. Базовые масла могут состоять из основных масел одного типа или являться смесью основных масел, принадлежащих к разным группам. По типу основных масел различают:- Минеральные, Полусинтетические и Синтетические Базовые Масла. Присадки, улучшающие качество базового масла, можно разделить на следующие группы:- (i) повышающие вязкость и индекс вязкости – модификаторы вязкости; (ii) понижающие температуру текучести – депрессоры; (iii) ингибиторы коррозии и ржавления; (iv) детергенты и диспергенты; (v) эмульгаторы; (vi) противопенные присадки; (vii) ингибиторы окисления масляной основы; (viii) дезактиваторы металлов; (ix) противоизносные (AW) и противозадирные (EP) присадки; и (x) модификаторы трения (FM). В зависимости от назначения смазочного материала в его состав могут входить только некоторые присадки из приведённого списка. В качестве Загустителей для пластичных смазок чаще всего используются мыла (кальциевые, литиевые, алюминиевые и натриевые). Другими популярными загустителями являются бентониты, силиконы, полиуретаны, полиэтилены, полиизобутилены и производные мочевины. Выбор загустителя определяет консистенцию и оказывает большое влияние на ряд качественных признаков смазки, таких как водостойкость и диапазон рабочих температур. С точки зрения физико-химических параметров и эксплуатационных свойств оба типа смазочных материалов обладают характерными преимуществами, обуславливающими их применение. По сравнению с маслами смазки обладают рядом эксплуатационных преимуществ:- (i) ограничивают износ смазываемых элементов благодаря наличию смазок в узлах трения даже тогда, когда устройство не работает, что предотвращает возникновение сухого трения; (ii) меньше подвержены вытеканию из негерметичных узлов трения; (iii) слои смазки, находящиеся в контакте с уплотнениями, сами работают как уплотнители, предотвращая попадание воды и пыли как в глубокие слои смазочного материала, так и в узел трения; и (iv) существует возможность улучшения качества смазок путём введения твёрдых присадок (графит, двусернистый молибден), которые при включении их в состав масел осаждаются на фильтрах. В свою очередь, к эксплуатационным преимуществам масел перед смазками относятся:- (i) лучше отводят тепло; (ii) обеспечивают меньшие потери энергии (меньший коэффициент трения); (iii) обладают способностью непрерывного переноса загрязнений из узла трения в масляные фильтры; (iv) можно с гораздо большей точностью контролировать потери смазочного масла в условиях эксплуатации; (v) замена масла (по сравнению с заменой смазки) выполняется гораздо быстрее и проще; (vi) легче отобрать для анализа репрезентативную пробу работающего масла. Вследствие развития технологии технического обслуживания спрос на смазочные масла в настоящее время значительно превосходит спрос на пластичные смазки. Доля смазок в общем производстве смазочных материалов не превышает 5%. Смазки применяются практически только тогда, когда невозможно использование смазочных масел, а именно для смазывания:- (i) подшипников скольжения и качения; (ii) не уплотнённых передач; (iii) шарниров; и (iv) направляющих.

LUBRICATION = СМАЗЫВАНИЕ (или СМАЗКА) – Lubrication:- the control of friction and wear by the introduction of a friction-reducing film between moving surfaces in contact. The lubricant used can be a fluid, solid, or plastic substance. See also Lubricant. Lubrication is the reduction of friction and wear using a friction-reducing layer. This layer can be liquid, solid or plastic. / трения и износа посредством . Смазывание заключается в заполнении зоны трения смазочным материалом, благодаря чему сухое трение сменяется жидкостным. Толщина и характер смазочного слоя определяют вид смазки. Граничная Смазка:- толщина смазочного слоя мала по сравнению с шероховатостью поверхностей. Сопротивление трения при этом виде смазки зависит только от вида поверхностей и смазочных свойств масла. Жидкостная Смазка:- толщина смазочного слоя многократно превышает толщину граничного слоя и суммарную шероховатость обеих поверхностей. Это приводит к их полному разделению, требующему возникновения в смазочном зазоре давления, уравновешивающего внешнюю нагрузку. Для возникновения такого давления должны выполняться следующие условия:- (i) разница относительных скоростей трущихся

поверхностей в узле трения должна быть достаточно велика; (ii) смазочный материал должен обладать соответствующей вязкостью; (iii) должны быть условия для образования масляного клина; и (iv) должна присутствовать перпендикулярная к поверхности скольжения нагрузка, не превышающая гидродинамическую несущую способность смазочного материала. По способу возникновения давления в смазочном зазоре жидкостная смазка может быть Гидродинамической или Гидростатической. При гидродинамической смазке давление в смазочном зазоре возникает вследствие относительного движения трущихся поверхностей и вязкости смазочного материала, причём, чем больше вязкость смазочного масла и выше относительные скорости поверхностей, тем выше давление. Разновидностью гидродинамической смазки является эласто-гидродинамическая смазка, при которой разделение трущихся поверхностей происходит вследствие увеличения вязкости смазочного материала и упругих деформаций поверхностей, вызванных высоким давлением в узле трения. При гидростатической смазке давление в смазочном зазоре создаётся при помощи внешнего, по отношению к системе, насоса. Помимо собственно смазывания смазочные материалы выполняют также функции защиты от коррозии, уплотнения, охлаждения и содержания в чистоте узлов трения. Смазка в технике, термин, имеющий различные значения:- (i) режимы трения деталей машин (смазывание); (ii) материалы, облегчающие трение и процессы; (iii) обработки металлов резанием и давлением; (iv) подача смазочных материалов в узлы трения; и (v) материалы, служащие для защиты поверхностей от коррозии и уплотнения соединений деталей машин. (1) Смазывание – смазочное действие смазочного материала на поверхности трения, в результате чего уменьшаются трение и изнашивание поверхностей. Между трущимися поверхностями создаётся смазочный слой, обеспечивающий минимальное сопротивление тангенциальному сдвигу и достаточно большое сопротивление нормальным нагрузкам (смотрите также Внешнее Трение). Наиболее благоприятные режимы смазки обеспечиваются подбором оптимальных смазочных материалов, подачей их к трущимся поверхностям в необходимых количествах, рациональной конструкцией узлов трения, а также выбором правильной технологии. (2) Смазочные Материалы – вещества, используемые для предотвращения задира и заедания, уменьшения и упорядочения износа взаимно перемещающихся поверхностей. Особая группа смазочных материалов – смазочно-охлаждающие жидкости, например, применяемые при обработке металлов резанием, Технологические Масла, используемые при обработке металлов давлением (ковке, прокатке, волочении и тому подобном). (3) Способы подачи смазочного материала к трущимся поверхностям определяются свойствами материала, функциями и условиями работы узла трения. Для масел характерны картерная и циркуляционная системы смазки. В первом случае узел трения помещают в герметичный картер, на дно которого наливают масло. В циркуляционных системах масло из картера или бака насосом по маслопроводу подаётся в узел трения, откуда самотёком или принудительно возвращается в картер. Циркуляционная система смазки включает в себя фильтры, сепараторы, отстойники, радиаторы, контрольно-измерительную аппаратуру. Существуют фитильная и капельная подача смазочных масел, смазка масляным туманом и тому пдодбные. Пластичные смазки закладывают непосредственно в узлы трения при изготовлении машин или пропрессовывают их в узел через устройства, называемые пресс-маслёнками, с помощью ручных или механических шприцев. Для смазки применяют также колпачковые, пружинные и другие маслёнки. Некоторые машины (например, прокатные станы, шагающие экскаваторы) имеют централизованные системы смазки. (4) Консервационные (защитные) материалы – вещества, служащие для предотвращения коррозионного разрушения металлических изделий и деталей машин при их хранении (консервации) и эксплуатации. Обычно для этого используют углеводородные пластичные смазки – Вазелины. Находят применение жидкие консервационные масла и твёрдые покрытия. Для получения твёрдого покрытия на защищаемую поверхность наносят раствор парафина и церезина с ингибиторами коррозии в летучих нефтепродуктах. После испарения растворителя на поверхности остаётся твёрдое покрытие толщиной около 0.1 миллиметра (мм). (5) Уплотнительные Материалы – вещества, используемые для герметизации вакуумных систем, трубопроводной арматуры, резьбовых соединений труб и тому подобного. Уплотнительные материалы применяют также для облегчения монтажа и разборки резьбовых и других соединений. Обычно применяют пластичные смазки, содержащие до 20% порошка графита, дисульфида молибдена, мягких металлов и тому подобного.

LUBRICATOR = СМАЗЧИК (или СМАЗЫВАТЕЛЬ, или СМАЗОЧНЫЙ ПРИБОР, или ЛУБРИКАТОР) – Lubricator is a device which adds controlled or metered amounts of lubricant into a pneumatic system.

LUBRICITY = СМАЗЫВАЕМОСТЬ (или СМАЗЫВАЮЩАЯ СПОСОБНОСТЬ, или МАСЛЯНИСТОСТЬ) – Lubricity is an ability of an oil or grease to lubricate. Also called Film Strength. / Смазывающая Способность (Lubricity):- свойство жидкости сводить к минимуму трение между поверхностями и их повреждение при относительном движении этих поверхностей под нагрузкой. Пояснение:- в настоящем методе смазывающую способность жидкости определяют пятном износа (Wear Scar) (мм), получаемым на нагруженном стационарном шарике при контакте с вращающимся цилиндрическим испытательным кольцом, смоченным жидкостью, в строго определённых и контролируемых условиях.

LUCC = LAND–USE/COVER CHANGE

LUDIGOL® = ЛЮДИГОЛЬ® – Ludigol® is the BASF tradename for sodium m-nitrobenzenesulfonic acid. BASF SE headquartered in Ludwigshafen, Germany. 2001-May-22:- BASF confirmed on Tuesday it has ceased production of Ludigol® granules, which are used in the production of textiles, following an explosion at its Ludwigshafen site yesterday. The Ludigol® plant, whose capacity was not disclosed, will remain closed while BASF investigates the cause of the explosion and fire, a company spokeswoman said. The explosion took place in a facility for drying Ludigol®. Production of the granules has stopped, said BASF, but Ludigol® will still be available in other forms, such as a liquid. BASF said the Ludigol® plant was severely damaged by the explosion and fire. The cost of repair has not yet been determined but is expected to be well over EUR500 000 (USD438 000), the company said. A team consisting of experts from the German authorities, BASF and an external specialist have been brought in to determine the cause of the incident. The fire which followed the explosion at 12.30 local time (14:30 GMT) on Monday, was put out within 30 minutes by 50 fire-fighters of the BASF fire department. Some 74 BASF employees and around 50 children from a nearby school were treated for mild irritation of the eyes and airways after being affected by gases from the fire. Local residents and police officers were also treated. All have been discharged. Ludigol® (sodium salt of m-nitrobenzene sulfonic acid) is a mild oxidising agent used in combination with textile dyes to produce intense color. Ludigol® is a registered trademark used for chemicals for use as textile assistants in kier boiling, vat reserving, or in bucking or scouring dyed textile material and owned by Rhodia Inc., Rhone-Poulenc Surfactants & Specialties, LP. Full trade mark registration details, registered images and more information below:- Last Applicant(s)/Owner(s) of Record:- Rhodia Inc., Cranbury, State of New Jersey (NJ), the United States; and Rhone-Poulenc Surfactants & Specialties, LP, Monmouth Junction, NJ, the United States. / Бе.А.Эс.Эф. (BASF). Людвигсхафэн (Ludwigshafen). Родиа Инк. (Rhodia Inc.), Рон-Пулякь Сюрфэктэнз Энд Спэшлтиз Эл.Пи. (Rhone-Poulenc Surfactants & Specialties, LP).

LUF = LUXEMBOURGISH FRANC

LUFFING CRANE = КОНСОЛЬНЫЙ КРАН (или С ИЗМЕНЯЮЩИМСЯ ВЫЛЕТОМ СТРЕЛЫ) – Luffing Crane is a crane with which the load can be moved to or from the crane horizontally. / Кран, у которого груз может перемещаться к или от крана в

горизонтальной плоскости. Под Консольным Краном (Cantilever Crane) понимается передвижной или стационарный грузоподъёмный кран с поворотной либо неподвижной консолью, по которой передвигается грузовая тележка или таль. Передвижные консольные краны перемещаются по рельсам, расположенным один за другим. Консольный Кран (Cantilever Crane) – передвижной или стационарный грузоподъёмный кран с поворотной либо неповоротной консольной фермой, по которой передвигается грузовая тележка или таль, перемещая грузы в вертикальном и горизонтальном направлениях. У консольных кранов с неповоротной фермой грузовая тележка передвигается по консоли, подкрановый путь не занимает площади больше цеха, поэтому такие краны нашли применение на различных промышленных предприятиях. Консольные краны с поворотной фермой имеют много конструктивных вариантов. К ним относятся велосипедный кран, кран на колонне, кран-укосина, мачтовый кран и другие. Передвижные консольные краны перемещаются по рельсам, расположенным один под другим. Консольные краны широко используются на машиностроительных заводах, стройках и в портах. Грузоподъёмность консольного крана 4–10 тонн.

LUI = LAND UTILIZATION INDEX

LUMBER = ПИЛОМАТЕРИАЛ (или ПИЛОПРОДУКЦИЯ, или КРУГЛЯК) – In Canada, Lumber is a general term which includes boards, dimension lumber, and timber. The product is manufactured by sawing logs into rough size lumber or cants (square timbers) which are edged, resawn to final dimension and cut to length. The lumber products are used for structural framing. In the context of North American construction materials, it usually refers to wood originating from softwood species of trees. In the smaller sizes it is known as 'Dimension Lumber', and in the larger sizes as 'Timbers'. The product of the saw and planing mill not further manufactured than by sawing, resawing, passing lengthwise through a standard planing machine, cross-cutting to length, and grading. Lumber is a term used to describe wood, either standing or that has been processed for use, from the time trees are felled, to its end product as a material suitable for industrial use, as structural material for construction or wood pulp for paper production. In the United Kingdom and Australia, timber is a term also used for sawn wood products (that is, boards), whereas generally in the United States and Canada, the product of timber cut into boards is referred to as Lumber. In the United States and Canada sawn wood products of five inches (127 millimeters) diameter or greater (4-1/2-inch (114.3 millimeters) nominal size) are sometimes called Timbers. Lumber is supplied either rough or finished. Rough lumber is the raw material for furniture making and other items requiring additional cutting and shaping. It is available in many Species, usually hardwoods. Finished lumber is supplied in standard sizes, mostly for the construction industry, and is primarily one of a few Coniferous (Needle-Bearing) Species such as Pine, Cedar, Hemlock, Fir or Spruce. Dimensional lumber is a term used in North America for lumber that is finished/planed and cut to standardized width and depth specified in inches. See also Dimension Lumber, and Timber. Lumber is a wood product manufactured from logs by sawing all 4 sides. A common size for lumber is nominally 2 inches thick by 4 inches wide. A load of random length (all lumber cash prices used in this publication are courtesy of Random Lengths Publications, Inc) lumber has various lengths, usually in even 2-foot increments. This differs from a load of stud lumber which has all the same length. Both random and stud lumber are used in framing walls inside buildings with random lumber used for the horizontal pieces and studs used for the vertical pieces. The Random Length Lumber:- the lumber is generally classified into several primary types, based on thickness:- 1 inch thick are boards, 2 to 4 inches thick are called Dimension, 5 inches or thicker are timbers. Within these classifications, the lumber is typically sawn in widths from 2 inches to 12 inches, in 2-inch increments, i.e. 2 inches wide, 4 inches wide, 6 inches wide, etc. The futures contract is based on dimension lumber that is 2 inches thick by 4 inches wide, the item that is the most widely produced in North America. Lastly, lumber lengths usually range from 8 feet to 20 feet, in even number increments. The rules of the Chicago Mercantile Exchange specify the percentages for these lengths when lumber is to be delivered against a futures contract. The basic manufacturing process for lumber is as follows:- trees are felled, branches are removed and logs are cut in the forest so that trucks can move them to a sawmill for further processing. At the mill, logs are debarked and moved through a series of saws. The logs are cut into various sizes of lumber depending on market prices and existing purchase orders. The lumber is typically dried, via a kiln, to remove moisture from the wood after which a planer is used to smooth the lumber surfaces. The lumber is then graded. Since dimension lumber is primarily used in structural applications, the grading for it is based on the strength characteristics of the manufactured piece. Dimension lumber grades conform to national grading rules that ensure that all grading specifications are the same across the United States and Canada. Lumber is the product of the saw and planing mill not further manufactured than by sawing, resawing, passing lengthwise through a standard planing machine, cross- cutting to length, and grading. / виды (species). строгание (planing). В Канаде пиломатериал относится к общему термину, подразумевающему под собой доски, размерные заготовки/пиломатериалы и строительные пиломатериалы. Продукт, изготовленный распиливанием брёвен на пиломатериал чернового размера или окантованные брусы/окантовку (cants) (строительный пиломатериал прямоугольного сечения), в дальнейшем обрезается (edged), заново распиливается до конечного размера и обрезается по длине. Пиломатериалы в качестве продуктов деятельности используются для формирования корпуса/каркаса в строительных работах. В контексте с Северо-Американскими строительными материалами, он обычно относится к древесине мягких пород деревьев. В самых малых размерах он известен как Мерный Пиломатериал/Размерные Заготовки/Размерный Пиломатериал (Dimension Lumber), а в самых крупных размерах – как Строительные Пиломатериалы (Timbers). Продукт распиловки и строгания (planning) древесины в цехах, который, однако, не подвергался последующей распиловке или повторной распиловке, не пропускался через стандартный строгальный станок для продольной обработки, не подверался поперечной обрезке и сортировке). Пиломатериал является термином, используемым при описании древесины либо сохранённой, либо переработанной для использования, полученной из взрослых деревьев, которые были спилены и из которых был получен конечный материал, пригодный для промышленного использования, в качестве каркасного материала для строительства или древесной целлюлозы (wood pulp) для производства бумаги. В Соединённых Штатах Америки и в Австралии термин Строительный Пиломатериал (Timber) используется также для распиленных древесных продуктов (то есть в отношении досок (boards)), тогда как в общем смысле в США и Канаде продукт из строительного пиломатериала, разрезанного на доски (product of timber cut into boards), относится к Пиломатериалу (Lumber). В Соединённых Штатах Америки и Канаде распиленные древесные продукты диаметром в 127 миллиметров (5 дюймов) и более (с номинальным размером в 114.3 миллиметров (4-1/2 дюйма)) иногда называют Строительным Пиломатериалом (Timber). Пиломатериал поставляется либо в качестве полуфабриката (чернового пиломатериала), либо как готовая продукция. Черновой пиломатериал служит необработанным материалом в производстве мебели и иных изделий, требующих дополнительной обрезки и придания формы. Пиломатериалы производятся из многих видов деревьев, обычно же твёрдых пород. Готовые пиломатериалы поставляются в стандартных размерах, главным образом для строительной промышленности, и в большинстве своём принадлежат к нескольким хвойным (увешанным иголками/хвоей) породам деревьев, таких как сосна (pine), кедр (cedar), тсуга (hemlock), сосна (fir) или ель (spruce). Мерный Пиломатериал/Размерные Заготовки/Размерный Пиломатериал (Dimension Lumber) является термином, используемым в Северной Америке для описания пиломатериала, который был отделан/остроган/обстроган и обрезан до стандартизованной ширины и толщины, обозначаемой в дюймах. Смотрите также Мерный Пиломатериал/Размерные Заготовки/Размерный Пиломатериал (Dimension Lumber), и Строительный Пиломатериал (Timber). Под Пиломатериалами понимаются материалы из древесины, получаемые распиловкой или фрезерованием брёвен вдоль волокон. Различают

пиломатериалы радиальной, тангенциальной и смешанной распиловки. Пиломатериалы с опиленными кромками называются обрезными, с неопиленными – необрезными. Пиломатериалы, подвергшиеся после пиления дальнейшей обработке (для сглаживания поверхностей или фасонной профилировки), называются строганными. Пиломатериалы делят на пиломатериалы общего назначения, специальные, столярные, строительные, тарные, вывозные (или экспортные). Основными видами пиломатериалов являются:- брус (двух-, трёх- и четырёхкантный), брусок, горбыль, доска (необрезная, чисто обрезная, обрезная с тупым и острым обзолом), обапол (горбыльный и дощатый), пластина, четвертина, шпала (необрезная и обрезная). Под Лесоматериалами понимаются материалы из древесины, сохранившие её природную физическую структуру и химический состав. Лесоматериалы подразделяют на необработанные и обработанные. Необработанные (круглые) лесоматериалы, или сортименты, получают из спиленных деревьев после очистки их от ветвей и раскряжёвки (разделения) ствола (хлыста) на части требуемых длин и толщин. Круглые сортименты после окорки применяются в строительстве, в качестве опор и столбов, крепёжного материала при подземных работах (рудничные стойки), как дрова и так далее. Как сырьё круглые лесоматериалы используются в лесопильном, целлюлозно-бумажном, лесохимическом производствах. К обработанным лесоматериалам относятся пиломатериалы (бруски, брусья, доски, шпалы), колотые лесоматериалы, строганный и лущёный шпон. К лесоматериалам относятся также пнево-корневые массы, сучья, неодревесневшие побеги и ветви, кора, опилки, щепа и другое. Обапол – пиломатериал, полученный из боковой части бревна. Если выпуклая сторона обапола не пропилена или пропилена менее чем на 1/2 длины, обапол называют горбыльным. Если выпуклая сторона пропилена более чем на 1/2, обапол называют дощатым. Обапол идёт на изготовление строительных лесов, опалубки, крепления горных выработок и так далее. Под Пороками Древесины понимаются недостатки, снижающие качество древесины и ограничивающие её использование. Пороки древесины, изменяющие внешний вид древесины, нарушающие её целостность, правильность строения и другие, возникают как в растущем дереве, так и в срубленной древесине во время её хранения и переработки. Терминология и методы измерения пороков древесины, встречающиеся в лесоматериалах, стандартизованы. Основной сортообразующий порок – сучки, часто встречаются трещины, гнили и другое. При продаже пиломатериалов особое внимание уделяется наличию следующих пороков:- засмолок, кармашек, крень, наклон волокон древесины, прорость, рак древесины, свилеватость, синева древесины, сучковатость и червоточина. Синева Древесины – порок древесины в виде местной ненормальной сине-серой или сине-зелёной окраски заболони (наружных молодых слоёв древесины). Синева портит внешний вид древесины и снижает её сопротивляемость ударным нагрузкам. Подтоварник – круглый лесоматериал (тонкие брёвна) диаметром в верхнем отрезе 6–13 см у хвойных, 8–11 см у лиственных пород древесины. Подтоварник применяется для вспомогательных и временных построек различного назначения. Прорость – порок древесины в виде зарастающей или заросшей раны, содержащей кору и омертвелую древесину. Различают прорость открытую и закрытую. Рак Древесины – порок древесины в виде углубления или вздутия, возникающий на поверхности ствола растущего дерева при поражении его паразитными Грибами или Бактериями. Свилеватость – порок древесины в виде волнистого или путаного расположения волокон. В пиломатериалах понижает сопротивляемость древесины изгибу, сжатию и растяжению, затрудняет механическую обработку. При использовании древесины в качестве декоративного материала свилеватость создаёт красивую текстуру древесины. Пилопродукция установленных размеров и качества, имеющая, как минимум, две плоско-параллельные пласти. В основном, пиломатериалы делятся на следующие виды:- (i) Пиловочник – иногда его называют кругляк, представляет собой брёвна, круглый лес. (ii) Лафет – с двух сторон имеющее плоскости бревно, которое пройдено один раз на пилораме. От подобной обработки получившиеся попутные материалы называются необрезная доска и горбыль. (iii) Обрезной материал – доска, обрезанная с четырёх сторон. Такой пиломатериал получается в результате распиловки лафета. Он делится на обрезную доску, брус и мелкий брусок. (iv) Строганный погонаж – это евровагонка и вагонка, то есть обшивочная доска, может быть доска для пола, фальцовка, такие мелкие погонажные материалы, как штапик, наличник, плинтус и так далее. Они могут быть как естественной влажности, так и сухими. (v) К клеёным пиломатериалам относится клеёный брус и другие подобные изделия. Пиломатериалы являются достаточно дорогостоящим продуктом. Выход такой продукции составляет всего 65%. А остальные 35% составляют отходы – 14% горбыли, 12% опилки, 9% обрезки и мелочь.

LUMEN = ЛЮМЕН – Lumen is the SI measurement of light output (or luminous flux) used to label light sources as a measure of total light output. 1 lumen (lm) = 0.001 46 W. A unit of luminous flux equal to the amount of light given out through a solid angle of 1 steradian by a point source of 1 candela intensity radiating uniformly in all directions. Lumen (lm) is the SI unit for measuring the flux of light being produced by a light source or received by a surface. The intensity of a light source is measured in candelas. One lumen represents the total flux of light emitted, equal to the intensity in candelas multiplied by the solid angle in steradians (1/(4·pi) of a sphere) into which the light is emitted. Thus the total flux of a one-candela light, if the light is emitted uniformly in all directions, is 4·pi lumens. ‘Lumen’ is a Latin word for light. / Под Люменом, от Латинского слова Лумэн или Люмэн (Lumen), означающее Свет, понимается единица светового потока СИ. Обозначение:- лм (lm). 1 лм – световой поток, испускаемый точечным источником в телесном угле 1 ср при силе света 1 кандела (кд). Люмен, единица светового потока в Международной Системе Единиц. Сокращённое обозначение:- Русское лм, международное lm. 1 Люмен – световой поток, испускаемый точечным изотропным источником в телесном угле 1 стер при силе света в 1 свечу.

LUMEN = ЛЮМЕН (или ЖИЛА, или (ВНУТРЕННИЙ) КАНАЛ ВОЛОКНА) – The Lumen is the hollow canal that runs the length of the fiber. It is filled with living protoplast during- the growth period. After the fiber matures and the boll opens, the protoplast dries up and the lumen will naturally collapse. This leaves a large central void or pore space in each fiber. / Под Люменом, от Латинского слова Lumen, означающее Свет, понимается .

LUMEN = ЛЮМЕН (или ПОЛОСТЬ) – Lumen is:- (i) a pore or passage through a tubular structure; and (ii) an internal cavity, space or void, e.g., cavity within the plant cell cell wall. Lumen:- (Latin:- Lumen = Cavity) pores in the structure of wood, cavities in vegetable fibers. Lumen is the open structure or canal from which the protoplasm has disappeared.

LUMEN WALL = ВНУТРЕННЯЯ СТЕНКА (или ТРЕТИЧНАЯ СТЕНКА) – The Lumen Wall separates the secondary wall from the lumen and appears to be more resistant to certain reagents than the secondary wall layers (also called the S Layer). / слой или прослойка . Внутреннюю сторону волокна иногда называют третичной стенкой, края содержит незначительное, количество целлюлозы, пропитанной протоплазмой. Толщина третичной стенки достигает 70–80 нм. Из-за высокого содержания лигнина она прочна и химически устойчива.

LUMINESCENCE = ЛЮМИНЕСЦЕНЦИЯ – Luminescence:- emission of light not caused by incandescence but rather by physiological processes, chemical action, friction or electrical action. See also Fluorescence, and Phosphorescence. Luminescence is the emission of light ascribable to nonthermal excitation. / Смотрите также Флуоресценция (Fluorescence), и Фосфоресценция (Phosphorescence). Под Люминесценцией, от Латинских слов Lumen (Luminis), означающее Свет, и –escent – суффикс, означающий Слабое Действие, понимается неравновесное излучение света телами, избыточное над их тепловым излучением и имеющее длительность τ после прекращения действия возбудителя люминесценции, во много раз превышающую период световых волн (τ » 10^{-14} с). Люминесценция объясняется испусканием света атомами (молекулами, ионами) вещества при их

так называемых излучательных переходах обычно из состояний с повышенной энергией (возбуждённые состояния) в состояния с меньшей энергией. По длительности люминесценцию условно разделяют на Флуоресценцию (Fluorescence; кратковременное свечение) и Фосфоресценцию (Phosphorescence; длительное свечение). Способностью к люминесценции обладают газы, многие жидкости и твёрдые тела. Искусственно приготовленные вещества, способные давать яркую люминесценцию, называют Люминофорами. По способу возбуждения люминесценцию различают:- (i) Ионолюминесценцию – люминесценцию, вызываемую ударами ионов; (ii) Катодолюминесценцию – люминесценцию, возбуждаемую ударами электронов; (iii) Радиолюминесценцию и Рентгенолюминесценцию – люминесценцию под действием радиоактивных излучений и рентгеновских лучей; (iv) Триболюминесценцию – люминесценцию при трении и разламывании некоторых кристаллов; (v) Фотолюминесценцию – люминесценцию, возбуждаемую светом; (vi) Хемилюминесценцию (и её частный вид – Биолюминесценцию) – люминесценцию, возбуждаемую химическими реакциями; и (vii) Электролюминесценцию – люминесценцию, возбуждаемую электрическим полем. Основная энергетическая характеристика люминесценции – величина, называемая Энергетическим Выходом Люминесценции, которая показывает, какая доля энергии, поглощаемой веществом, преобразуется в энергию люминесцентного излучения. Для характеристики фотолюминесценции вводится понятие Квантового Выхода Люминесценции, равного отношению числа испускаемых фотонов к числу поглощаемых фотонов. Люминесценция используется для изучения строения и свойств молекул, при химическом анализе (люминесцентный анализ); в электроннолучевых приборах (кинескопах, осциллографах и других); в люминесцентных лампах и газосветных трубках; для обнаружения, исследования и использования невидимых УФ и рентгеновского излучений; при регистрации α-, β- и γ– излучений радиоактивных препаратов и так далее.

LUMP = КОМОК (или БУГОРОК, или НАЛЁТ) – Lump:- xxxxx. See also Slub, and Slug. Fabrics defect.

LUMPER = ПОДСОБНИК (или СОЕДИНЯЮЩИЙ, или МЕЛКИЙ ПОДРЯДЧИК, или ПОРТОВЫЙ ГРУЗЧИК) – Lumper (colloquial):- one who takes a broad view of a genus, combining variant forms into individual species. Lumper is a contracted worker who assists in the loading and unloading process. / род (genus).

LUMPING = СОСРЕДОТОЧЕНИЕ (или ОБЪЕДИНЕНИЕ В БЛОКИ) – Lumping is the act of assisting a motor carrier owner-operator in the loading and unloading of property; quite commonly used in the food industry. / Действие по оказанию помощи владельцу-оператору, являющемуся автоперевозчиком, при погрузке и выгрузке имущества; вполне обычное явление в пищевой индустрии.

LUMPS = LUMPSUM FREIGHT

LUMP SUM = ЛАМП САМ (или ПАУШАЛЬНАЯ СУММА, или ЕДИНОВРЕМЕННАЯ ВЫПЛАТА) – (1) Lump Sum is an agreed sum of money, which is paid in full settlement at one time. This term is often used in connection with charter parties. / Оговорённая денежная сумма, выплачиваемая при полном расчёте одним платежом. Этот термин часто используется в отношении сторон чартера.

(2) Lump Sum is a freight rate which is inclusive of all charges. / Ставка фрахта, включающая в себя все сборы.

LUMP SUM CHARTER = ПАУШАЛЬНЫЙ ЧАРТЕР – Lump Sum Charter is a voyage charter whereby the shipowner agrees to place the whole or a part of the vessel's capacity at the charterer's disposal for which a lump-sum freight is being paid.

LUMPSUM FREIGHT = ПАУШАЛЬНЫЙ ФРАХТ – Lumpsum Freight is a fixed freight rate, regardless of how much cargo is loaded. Money paid to shipper for a charter of a ship (or portion) up to stated limit irrespective of quantity of cargo. / Фиксированная ставка фрахта независимо от того, как много груза загружено.

LURCH = ВНЕЗАПНЫЙ КРЕН – Lurch (maritime term):- the sudden heave of the ship.

LUREX® = ЛЮРЭКС® – Lurex® is the brand name for a type of yarn with a metallic appearance. The twine is most commonly a synthetic fiber, onto which an aluminium layer has been vaporised. 'Lurex' may also refer to fabric created with the yarn. Lurex® has, for decades, been known as a byword for quality metallic yarns; it is a household name, but it is also a registered trademark. A feature of the production is a dye resistant range of metallic yarns, which leaves the color and brilliance intact despite high temperature and chemical treatment. Lurex® is a trademark used for a yarn made of plastic-coated aluminum filaments. Lurex® has, for decades, been known as a byword for quality metallic yarns; it is a household name, but it is also a registered trademark with a unique international reputation for quality, service and innovative development. Production takes place on high-speed computer controlled primary slitter and creeling machines capable of making various bobbin sizes to a very high standard. A feature of the production is a dye resistant range of metallic yarns, which leaves the color and brilliance intact despite high temperature and chemical treatment. The Lurex Company Limited headquartered in London, the United Kingdom. Lurex® is a trademark used for metallic yarn or thread. Lurex® is the yarn and thread comprised either in whole or in part of laminated film having a metallic appearance, including gimp comprised of a filament or yarn spirally over wrapped with coated or laminated foil which has been slit to a narrow width, said overwrapping imparting a metallic appearance. / Люрэкс Кампэни Лимитид (Lurex Company Limited). Люрэкс® – это нить в виде тонкой полоски блестящей плёнки (металлизированной или покрытой фольгой). Такое определение дают большинство толковых словарей. В некоторых из них также значится, что люрэксом можно называть блестящую ткань, которая состоит из таких нитей. Люрэкс® добавляется в пряжу для создания эффекта 'металлического блеска'. Самостоятельно не используется никогда из-за жёсткости и непрочности. История:- одежда с люрэксом была невероятно популярной в эпоху диско (1970-е и 1980-е). Бил Гиб (Bill Gibb) – культовый дизайнер 1970-х годов, впервые продемонстрировал трикотажные топы с добавлением люрэкса. В 1980-е годы люрекс и пайетки были хитовыми элементами в одежде, ведь синтетический блеск – характерная особенность моды эпохи диско. Люрэкс® Сегодня:- мода на люрэкс® периодически возвращается. Причём сегодня одежда с люрэксом – это необязательно цитаты 1970-х и 1980-х. Сегодня люрэкс® можно часто видеть в шикарных вечерних платьях, в деловых костюмах, шарфах, шапках и даже чулках. Люи Вито (Louis Vuitton), Гуччи (Gucci), Дианэ фон Фюрстэнбэрг (Diane Von Furstenberg), Макс Мара (Max Mara), Сальваторэ Фэррагамо (Salvatore Ferragamo), Оскар дэ ля Рэнта (Oscar de La Renta) – одни из современных Модных Домов, которые часто демонстрируют в своих коллекциях одежду с добавлением люрэкса. Производство Люрэкса:- волокно для люрэкса может быть получено из алюминиевой, медной, латунной или никелевой фольги. Обычно это довольно дорогая технология, и прочностью полученные волокна не отличаются. В последнее время для создания люрэкса всё чаще используются нити из химической плёнки, покрытой цветным клеем. Таким образом достигается разнообразие цвета и прочность. Люрэкс® придаёт изделиям эффект блеска, яркость которого можно варьировать. Сегодня люрэксовое волокно широко применяется в вязании. В составе пряжи люрэкс® смешивается с акрилом, вискозой и другими волокнами. Выбор Звёзд:- одежда с люрэксом очень популярна среди знаменитостей. И это неудивительно, ведь она всегда выглядит нарядно, при этом её можно носить как в повседневной жизни, так и на торжествах.

LURID = ХХ (или БУРОЕ, или МЁРТВЕННО–БЛЕДНОЕ, или МРАЧНОЕ) – Lurid:- any of several light or med grayish colors ranging in hue from yellow to orange.

LUSTER = БЛЕСК (или ГЛЯНЕЦ, или ЛОСК, или ЛЮСТР, или СИЯНИЕ, или ГЛАЗУРЬ) – Luster:- the quality of shining with reflected light. With reference to textile materials, the term is frequently associated with the adjectives bright or dull to distinguish between varieties of manufactured fibers. Luster is the gloss, sheen, or shine of a fiber, yarn, or fabric. Luster is the appearance characteristic of a surface that reflects more in some directions than it does in other directions, but not of such high gloss as to form clear mirror images.

LUSTER = БЛЕСТЯЩАЯ МАТЕРИЯ (или ЛОЩЁНКА) – Luster:- a fabric with cotton warp and filling of wool, mohair, or Alpaca (chiefly British). / ткани с хлопчатобумажной основой и уточиной из гребенной блестящей шерсти или из Ангорской козьей шерсти.

LUSTERING = ЛОЩЕНИЕ – Lustering is the finishing of yarn or fabric by means of heat, pressure, steam, friction, calendering, etc, to produce luster. / Лощение кож, технологическая операция, применяемая при отделке поверхности кож хромового дубления, казеинового покрытия и юфти. Лощение выполняют на лощильной машине приглаживанием лицевой стороны воздушно-сухой кожи (влажностью 15–19%) гладким полированным роликом из стекла, стали, агата, яшмы, перемещающимся по замкнутой кривой. При лощении плёнка покрывной краски распределяется на коже более равномерно, что придаёт ей зеркальную поверхность и блеск. Давление ролика уплотняет кожу, толщина её уменьшается на 8–16%, понижается воздухопроницаемость, предел прочности при растяжении увеличивается, площадь кожи остаётся почти неизменной. В связи с уменьшением производства кож казеинового покрытия лощение заменяют прессованием.

LUSTER RUGS = ЛОСНЯЩИЕСЯ КОВРИКИ – Luster Rugs are the rugs that are chemically washed to give them sheen. They may be Wilton, Axminster machine-made rugs with oriental designs or velvet construction, and are frequently referred to as Sheen-Type Rugs.

LUSTRE = ЛЮСТРОВОЕ (или ОСОБЕННО СИЛЬНЫЙ БЛЕСК, или ЛОСНЯЩЕЕСЯ) – Lustre:- the natural gloss or sheen characteristic of the fleeces of long-wool breeds.

LUTEOUS = ЛЮТИТОВОЕ (или ГЛИНИСТОЕ) – Luteous:- yellow tinged w/green or brown.

LUTESCENS = ЛЮТЕСЦЕНС (или ЛЮТЭССЭНС, или ЖЕЛТОВАТОЕ) – The species name Lutescens is the Latin term for ‘growing yellow’ and it alludes to this palm’s yellow petioles or stems. Lutescens:- yellowish. Lutescens or Lutescans:- in Latin for ‘marshy, living in the marshes’, from lutum ‘marsh, swamp, mud’. / Термин Лютэссэнс в переводе с Латинского языка означает Желтоватое. Лютесценс (Lutescens), разновидность мягкой Пшеницы с белым безостым неопушённым колосом и красным зерном. Одна из наиболее распространённых на земном шаре, особенно в Европе и Северной Америке. Многочисленны озимые и яровые Сорта, относящиеся к разным экологическим группам. Распространённые Сорта:- озимые – Мироновская 808, Безостая 1, Мироновская юбилейная, Кавказ, Аврора и другие; яровые – Саратовская 29, Саратовская 36 и другие. Новые перспективные сорта:- озимые – Донецкая 74, Пржевальская; яровые – Зарница, Московская 35, Надзея, Бригантина. К разновидности Лютесценса относится и старый сорт Лютесценс 62, широко районированный (впервые в 1929) в 1930–50-е во всех зонах возделывания Пшеницы в бывшем СССР. Лютесценс (Lutescens), разновидность мягкой Пшеницы с белым безостым неопушённым колосом и красным зерном. Одна из наиболее распространённых разновидностей Пшеницы, особенно в Европе и Северной Америке. В бывшем Союзе Советских Социалистических Республик (СССР) Сорта Лютесценс занимали свыше 50% площади этой культуры (1971). Из яровых Сортов возделывали Саратовскую 29 (в 1971 свыше 16 миллионов гектаров (га), или более 36% посева яровой Пшеницы в стране), Лютесценс 758 и другие; из озимых – Безостую 1 и Мироновскую 808 (соответственно 8.3 и 9.5 миллионов га, или более 40% и более 45% посева озимой Пшеницы) и другие.

LUTESCENT = ЛЮТЕПРИМАНКА (или ЛЮТЕСЦЕНТ) – Lutescent (lu):- said of seedlings that are normally green at first, but in which the chlorophyll gradually disappears and the plant ultimately dies.

LUTESTRING = ХХ (или ЛЮТЕСТРИН) – Lutestring:- a plain glossy silk formerly much used for women’s dresses and ribbons.

LUXEMBOURG INTERBANK PAYMENT SYSTEM – GROSS SETTLEMENT SYSTEM = СИСТЕМА ВАЛОВЫХ РАСЧЁТОВ ЛЮКСЕМБУРГСКОЙ СИСТЕМЫ МЕЖБАНКОВСКИХ ПЛАТЕЖЕЙ – There is one main clearing system in Luxembourg – LIPS-Gross, Luxembourg’s TARGET-linked RTGS system. The majority of non-urgent payments are processed through the EBA’s (Euro Banking Association) STEP2 system. LIPS-Gross (Luxembourg Interbank Payment System – Gross Settlement) was developed in 1996. This real-time gross settlement (RTGS) system operates in Luxembourg since 1999-January-04. It is a component of TARGET (Trans-European Automated Real-time Gross settlement Express Transfer system), which connects the RTGS systems of the European Union members and the EPM (the European Central Bank Payment Mechanism). In this system, only payment orders (credit transfers) in Euro are accepted. They are either national or cross-border. Their settlement is executed:- (i) one by one (for the gross amount, i.e. the amount mentioned in the payment order); (ii) in real time and continuously; and (iii) in central bank money (that it to say recorded on the books of the central bank). Payments settled in this way are irrevocable and unconditional:- they are considered as final. The settlement finality is important because it contributes to one of the Central bank’s objectives:- the maintenance of the financial stability. / Система валовых расчётов в режиме реального времени (ВРРРВ) действует в Великом Герцогстве Люксембург с 4 Января 1999. ТАСВРРУП (Трансевропейская Автоматизированная Система Валовых Расчётов в Режиме Реального Времени по Ускоренным Переводам) или ТАСВРРЭП (Трансевропейская Автоматизированная Система Валовых Расчётов в Режиме Реального Времени по Экспресс Переводам).

LUXURY UPTAKE = БУЙНОЕ ПОГЛОЩЕНИЕ (или ГУСТОЕ УСВОЕНИЕ) – Luxury Uptake is the absorption by plants of nutrients in excess of their need for growth.

LV = LATVIA

LVI = LOW VISCOSITY INDEX

LVL = LAMINATED VENEER LUMBER

LVL = LATVIAN LATS

LW = LIVE WEIGHT

L:W = LENGTH–TO–WIDTH RATIO

LWD = LEAF WATER POTENTIAL

LWI = LOAD–WEAR INDEX

LWI = LOW WATER IMMERSION

LY = LIBYAN ARAB JAMAHIRIYA

LYART = ЛАЙЁТ (или XX) – Lyart:- streaked w/gray; gray (chiefly Scottish). From Old French Liart or Latin Liardus. Lyart:- (of a horse) having dappled white and grey spots. / белые и серые пятна.

LYCRA® = ЛАЙКРА® – Lycra® fiber is a man-made elastane fiber. It is never used alone, but always blended with other fibers. It has unique stretch and recovery properties. LYCRA® fiber adds comfort, fit, shape retention, durability and freedom of movement. This is achieved thanks to the unique properties of the fiber, which can be stretched up to seven times its initial length before springing back to the original position once tension is released. Any natural or man-made fibers can be mixed with LYCRA® fiber. Very small amounts of LYCRA® fiber can transform the performance of a fabric – the amount of LYCRA® fiber in a material can be as little as 2%. There are various ways of integrating LYCRA® fiber with other fibers to provide fabrics for all uses. Lycra® is a trademark used for a spandex synthetic fiber.

LYD = LIBYAN DINAR

LYE = ЩЁЛОК – Lye is a sodium hydroxide; rarely potassium hydroxide. Strong alkali used with vat dyes such as Indigo. Always add Lye to cold water! / гидрат окиси калия. Щёлочь (Alkali).

LYLE GUN = ЛИНЕМЕТ – Lyle Gun (maritime term):- a gun used in the life-saving services to throw a life line to a ship in distress or from ship to shore and used when a boat cannot be launched.

LYOCELL = ЛЮОЦЭЛЬ (или ЛАЙОСЭЛ) – Lyocell fiber is a manufacturing cellulose fiber made by direct dissolution of wood pulp in an amine oxide solvent, N-methylmorpholine-N-oxide. The clear solution is extruded into a dilute aqueous solution of amine oxide, which precipitates the cellulose in the form of filaments. The fiber is then washed before it is dried and finished. The solvent spinning process for making lyocell fiber is considered to be environmentally friendly because the non-toxic spinning solvent is recovered, purified, and recycled as an integral part of the manufacturing process. No chemical intermediates are formed, the minimal waste in not hazardous, and energy consumption is low. Wood pulp is a renewable resource, and the fiber is biodegradable. Characteristics:- Lyocell fiber is stronger than other cellulosic fibers. It is inherently absorbent, having a water imbibition of 65–75%. Lyocell retains 85% of its dry tenacity when wet, making it stronger when wet than cotton. The fiber has a density of 1.15 g/cm^3. End Uses:- Lyocell fiber is suitable for blending with cotton or other manufactured fibers. Because of its molecular structure, lyocell has the tendency to develop surface fibrils that can be beneficial in the manufacture of hydroentabled and other nonwovens, and in specialty papers. For apparel uses, the fiber's unique fibrillation characteristic has enabled the development of fabrics with a soft luxurious hand. The degree of fibrillation is controlled by cellulose enzyme treatment. Lyocell is a cellulosic fiber obtained by an organic solvent spinning process. It is understood that:- (i) an 'organic solvent' means essentially a mixture of organic chemicals and water; and (ii) 'solvent spinning' means dissolving and spinning withoutthe formation of a derivative. Alphabetic code – CLY; and relevant commercial allowance – 13.00. During the 1990s, a number of new textile fibers have been introduced onto the market, which are not yet generally known. Since the mid-1990's, lyocell fibers have increasingly come onto the textile market, whereby Lenzing AG (Lenzing, Austria) sells its fibers under the name of Lenzing Lyocell, and Courtaulds under the name of Tencel (Tencel is the world's leading lyocell staple fiber. It is produced from the natural cellulose in harvested woodpulp using a solvent spinning technique, and the solvent can be totally recycled, thus eliminating harmful effluent problems. The resultant fiber combines exceptional strength, launderability and low fabric shrinkage with all the benefits of handle, drape, color intensity, lustre, absorbency and biodegradability normally associated with cellulosics). Since the takeover of the Tencel segment by Lenzing, Tencel is the only trademark that still exists in the textile industry, the labeling must of course be 'Lyocell'. The generic name given to a new family of cellulosic fibers and yarns that have been produced by solvent spinning. The process is widely regarded as being environmentally-friendly, and the product offers a number of advantages over traditional cellulosic fibers. Lyocell is a modern fiber. Lyocell consists of cellulose, which is obtained from beech, pine or spruce timber. It can also be manufactured from other species of timber or used textiles. Although by definition a manmade fiber, lyocell is a natural product. Production is environmentally friendly, since the solvent used to dissolve the cellulose directly is recovered after the spinning process. In 2003 this fiber accounts for some 5–7% of total cellulose production, i.e. about 80 000 tons/year. Well-known brands of lyocell are Tencel™, produced by company of the Acordis Group (Germany), Lyocell by Lenzing Lyocell GmbH & Co KG (Lenzing, Austria), and Alceru™ by Alcery Schwarza. Lyocell has similar fiber properties to cotton and the following advantages:- biodegradable natural product, high strength, and wet strength of up to 90% of dry strength (its wet strength is approximate 20% higher than of viscose, cosy handle of textile fabric, high dimensional stability of textile fabric, good temperature insulation properties, good dyeing affinity and color brilliance, little or no electrostatic charge, easily modifiable due to fibrillation properties (peach skin effect). The fibers consist of individual, longitudinally oriented fibrils and elongated cavities. The molecular structure features very high crystallinity and orientation. Lyocell Fiber is a manufactured fiber composed of regenerated cellulose. Lyocell has a similar hand and drape as rayon, but is stronger, more durable, and in many cases machine washable. It has a subtle luster and is rich in color. Lyocell possesses low shrinkage characteristics, as well as good absorbency and wrinkle resistant qualities. On the contrary, the Lyocell staple fiber shows specific product characteristics which clearly distinguish it from viscose staple fiber (VSF). These product characteristics are, in particular, its high tenacity in both wet and dry state and its low shrinkage in water which allows to minimise finishing losses and shrinkage in laundering. Lyocell is often used as a blending fiber, in connection with other fibers such as viscose, linen, cotton, polyamide or polyester. So far, its particular properties have primarily been exploited by producers of branded quality textiles even though lyocell is currently priced much higher than any other of the fibers considered. Indeed, for luxury jeans, one of the most prominent applications of lyocell, VSF is considered entirely unsuitable. Similarly, textile applications may serve to illustrate the distinctiveness of lyocell towards cotton. Despite its significantly higher price, lyocell is used, for instance, in certain types of jeans because it can add a specific touch and drape to the product. Moreover, Lyocell's dry tenacity and water retention are also superior to those of cotton. As compared with synthetic fibers, it is the cellulosic character of lyocell that provides for its high moisture absorbency and leads, in textile applications, to high wearing comfort which cannot be matched by synthetics. Furthermore, Lyocell's biodegradability, which it has in common with other cellulosic and natural fibers, clearly distinguishes it from any of the synthetic fibers mentioned as a substitute. Biodegradability is a relevant factor particularly in disposable nonwovens and has been mentioned as such in response to the EU Commission's market investigation. Finally, lyocell has a very particular characteristic which it does not share with any of the conventional fibers:- its tendency to fibrillate. On the one hand, this tendency can constitute a disadvantage as it requires special spinning and dyeing techniques and contributes to the effect of 'greying' after repeated washing. On the other hand, the fibrillating character of the Lyocell fiber can be exploited to create unique fabrics with exceptional drape and soft touch – the so-called 'Peach-Skin Effect'. No other fiber can produce this effect to any comparable extent. Lyocell filament yarn is currently not being produced commercially. Therefore, the term Lyocell in this article exclusively refers to Lyocell staple fibers, except in Lyocell production technology, where it refers to both Lyocell staple fiber production technology and lyocell filament production technology. Lyocell is a

fabric most know better by its brand name Tencel®. It has a soft finish, packs light and is made from cellulose (vegetable matter), or wood pulp. This pulp may be a mix of hardwood trees like oak and birch, although Tencel® branded lyocell is made from eucalyptus trees. This makes it a natural fabric, and it is noted for its durability and strength, in addition to its eco-friendly manufacturing techniques. The first fabrics made with wood pulp were made as far back as the mid XIX century. They were not universally accepted or very profitable. At the end of the XIX century, a method for creating rayon out of wood cellulose became popular, and rayon became one of the first manmade fibers, as a silk substitute, and an inspiration to later produce lyocell. Success of rayon particularly in the latter XX century fueled interest in making other products from wood pulp. Lyocell is made by chipping wood, breaking down the wood fibers with the non-toxic chemical amine oxide, and then placing the material in a spinneret. The spinneret produces long fibers, which are then dried and woven into cloth. The company Lenzing Fibers Inc. is the manufacturer of the Tencel® fibers – the only company in the United States that currently makes these fibers. Other companies throughout the world do make lyocell, and though you might commonly associate the material with fabrics for clothing, there are several other uses for lyocell. Since the fabric is durable, it's been used for items like conveyor belts and for special bandages in the medical field. The manufacturing process for lyocell is more expensive than cotton or rayon, although prices are dropping. In clothing, you'll find lyocell in number of styles and finishes. Some lyocell clothing looks like denim material, while others approximate the look of suede, usually called Moleskin or Peach Skin. Lyocell can also be made to look like wool, cotton, rayon or poly/silk blends. Garments made of lyocell can be more expensive than other manufactured fabrics such as rayon, not only because of manufacturing, but because only one company distributes the fabric in the United States. Those who enjoy lyocell say the extra expense is worth it. The fabric is extremely durable, and is perfect for vacationing. It tends not to wrinkle and many forms of it are easy care, and can be machine-washed. Most do require drip-drying, but as improvements in lyocell continue, no doubt manufacturers will attempt to address this issue. Lyocell is a regenerated cellulose fiber made from wood pulp. Lyocell is produced with a process that is environmentally friendly in that the chemicals used are nearly completely recoverable and reusable in the process. It is stronger, both wet and dry, than other regenerated cellulose fibers such as viscose rayon, and is also stronger than cotton. In general, lyocell can be dyed much like any other cellulosic fiber. Tencel® is one brand-name lyocell fiber. Lyocell is produced from cellulose, the main material in plant cells, and constitutes a new fiber for clothing, hygiene, medical and technical applications. The production process for Lyocell is extremely environmentally friendly the fiber has all the advantages of a natural material and is 100% bio-degradable. Lyocell was developed by Courtaulds Fibers (now Acordis Cellulosic Fibers), an international supplier of rayon. It entered the consumer market in 1991. The properties and production processes were unique enough for the Federal Trade Commission to designate it as a separate fiber group. The trade name for lyocell produced by Acordis is Tencel®. Lenzing Fibers, another major manufacturer of rayon, has also entered the lyocell market. This product is marketed as Lenzing lyocell. An improved fiber, in terms of performance and properties, lyocell is also friendly to the environment. Virtually all of the chemicals used in the production process are reclaimed. The resulting fiber, lyocell, is both biodegradable and recyclable. Lyocell is a manufactured fiber, but it is not synthetic. It is made from wood pulp harvested from tree farms for this purpose. Because it is made from a plant material, it is cellulosic and possesses many properties of other cellulose fibers, such as cotton, linen, ramie, and rayon – another manufactured but non-synthetic fiber. Lyocell fibers is a form of rayon, it consists of cellulose fiber, made from dissolving pulp and then reconstituting it by dry jet-wet spinning. The fiber is used to make textiles for clothing and other purposes. Lyocell is a manmade fiber derived from cellulose, better known in the United States under the brand name Tencel®. Though it is related to rayon, another cellulosic fabric, lyocell is created by a solvent spinning technique, and the cellulose undergoes no significant chemical change. It is an extremely strong fabric with industrial uses such as in automotive filters, ropes, abrasive materials, bandages and protective suiting material. It is primarily found in the garment industry, particularly in women's clothing. / Ге.эм.бе.Ха.. Сродство (Affinity). филаментная (комплексная) пряжа (filament yarn). осадок (precipitate). Люоцэль или Лайосэл это современное волокно. Люоцэль состоит из целлюлозы, получаемой из древесины Бука, Ели или Сосны. Оно может быть также произведено из других видов древесины или текстильного утиля. К широко известным фирменным знакам (брэндам), занимающимся Люоцэль, относятся Тэнцэль® (Tencel®), произведённый фирмой из группы компаний Акордис Груп (Acordis Group, Германия), Люоцэль (Lyocell) от Ленцинь (Lenzing) и Алсэру (Alceru) от Алсэру Шварца (Alceru Schwarza). , то есть .

LYON = LIQUID YIELD OPTION NOTE

LYONS VELVET = ЛИОНСКИЙ БАРХАТ – Lyons Velvet is a velvet originally made of silk in Lyons, France. Lyons is a thick, stiff velvet with a very short pile. Today, this type of velvet (often called Lyons-type) is made of man-made fibers. It is used for home furnishings as well as for evening wear. Lyons Velvet is a stiff, thick pile velvet. Used for hats, coat collars, also for suits, coats and dresses, when thick velvets are fashionable.

LYOTROPIN POLYMER = ЛИОТРОПИНОВЫЙ ПОЛИМЕР (или ПОЛИМЕР ЛИОТРОПИН) – Lyotropin Polymer:- polymers that decompose before melting but that form liquid crystals in solution under appropriate condition. They can be extruded from high concentration dopes to give fibers of high modulus and orientation for use in advanced composites, tire cord, ballistic protective devices, etc. / от Греческих слов Лýо, означающее Растворяю, и Тгоре, означающее Перемена или Поворот, понимается .

LYSINE = ЛИЗИН – Lysine is an essential amino acid in seed protein. / Под Лизином, $C_6H_{14}N_2O_2$, понимается диаминомонокарбоновая кислота с выраженными свойствами основания. Входит в состав белков. Незаменимая аминокислота. Синтетический лизин применяют для обогащения кормов и пищевых продуктов.

- M -

M = ЭМ. – M is fifth letter of a NASDAQ® stock symbol specifying that the issue is the company's fourth class of preferred shares. / НЭЗДЭК® (NASDAQ®) .

M&A = MERGERS AND ACQUISITIONS

M&L = MATCHED AND LOST

M0 = M0 (или НАЛИЧНЫЕ ДЕНЬГИ В ОБРАЩЕНИИ) – M0 is defined as notes and coins in circulation and in bank tills, plus the operational balances that banks place with the central bank. M0 is the narrowest category and is sometimes called Narrow Money. See also Monetary Aggregate, and Money Supply. / и иногда называется Объёмом Денежной Базы в Узком Определении или Узкой Денежной Массой (Narrow Money). Смотрите также Монетарный Агрегат или Денежный Агрегат (Monetary Aggregate), и Денежная Масса В Обращении (Money Supply).

M1 = M1 – In the United States, M1 is a measure of the US money stock that consists of currency held by the public, travelers checks, demand deposits and other checkable deposits including NOW (short for negotiable order of withdrawal) and ATS (short for automatic transfer service) account balances and share draft account balances at credit unions. M1 is defined as notes and coins in circulation and money deposited in bank current accounts. It is the best gauge of money immediately available for exchange. In the European Union, M1 comprises currency in circulation and overnight deposits. See also Monetary Aggregate, and Money Supply. / Смотрите также Монетарный Агрегат или Денежный Агрегат (Monetary Aggregate), и Денежная Масса В Обращении (Money Supply). Денежная База – наличные деньги в обращении (вне центрального банка) плюс средства кредитных организаций на счетах в центральном банке и иные обязательства центрального банка перед кредитными организациями.

M_1, M_2, M_3 = ЭМ.$_1$, ЭМ.$_2$, ЭМ.$_3$ – M_1, M_2, M_3 are first, second, and third generations following exposure to a mutagenic agent.

M2 = M2 – Measure of the US money stock that consists of M1, savings deposits (including money market deposit accounts), time deposits in amounts of less than USD100 000.00, and balances in retail money market mutual funds. Excludes individual retirement account (IRA) and Keough balances at depository institutions and retail money funds. In the European Union, M2 is the sum of M1, deposits with an agreed maturity of up to two years and deposits redeemable at notice of up to three months. In the United States, M2 is a measure of the US money stock that consists of M1, certain overnight repurchase agreements and certain overnight Eurodollars, savings deposits (including money market deposit accounts), time deposits in amounts of less than USD100 000.00 and balances in money market mutual funds (other than those restricted to institutional investors). M2 is an obsolete definition of the money supply. It includes notes and coin in circulation and in bank current accounts, together with the funds saved in deposit accounts maintained with the clearing banks, central bank banking department, and discount houses. In the United States, M2 includes M1 plus balances that generally are similar to transaction accounts and that, for the most part, can be converted fairly readily to M1 with little or no loss of principal. The M2 measure is thought to be held primarily by households. The components of M2 are:- (i) M1; (ii) savings deposits and money market deposit account; (iii) small time deposits (time deposits in amounts of less than USD100 000.00, excluding balances in individual retirement account (IRA) and Keogh accounts at depository institutions); and (iv) retail money market mutual fund balances (excludes balances held in IRA and Keogh accounts with money market mutual funds). See also Monetary Aggregate, and Money Supply. In the United States, M2 is one measure of the nation's supply of money, defined as M1 (currency in circulation, demand deposits, travelers' checks, and other checkable deposits) plus noninstitutional money market funds and small time and savings deposits. Source:- Board of Governors of the Federal Reserve System. Frequency:- Weekly and monthly. Availability:- H.6 report. Weekly data released each Thursday afternoon after 4:30 pm. Monthly data released in either the second or third week of the month. Reason:- While the strength of the relationship has weakened over time, many people believe there is a link between growth of the supply of money and growth of nominal GDP. / , определённые однодневные расчётные соглашения об откупе и . Кио (Keogh). Смотрите также Монетарный Агрегат или Денежный Агрегат (Monetary Aggregate), и Денежная Масса В Обращении (Money Supply).

M3 = M3 – In the European Union, M3 is the sum of M2, repos (where represented by liabilities on the balance sheets of monetary financial institutions (MFIs)), money market fund (MMF) shares/units, and debt securities, including money market paper, issued by MFIs with a maturity of up to two years. Measure of the US money stock that consists of M2, time deposits of USD100 000.00 or more at all depository institutions, repurchase agreements in amounts of USD100 000.00 or more, Eurodollars, and balances held in institutional money market mutual funds. In the United States, M3 is a measure of the US money stock that consists of M2, time deposits of USD100 000.00 or more at all depository institutions, term repurchase agreements in amounts of USD100 000.00 or more, certain term Eurodollars and balances in money market mutual funds restricted to institutional investors. M3 is defined as M2 plus interest-bearing non-sterling deposit accounts held by residents, and other certificates of deposit. M3 is the broadest definition of the money supply and may also be known as Broad Money. In the United States, M3 includes M2 plus certain accounts that are held by entities other than individuals and are issued by banks and thrift institutions to augment M2-type balances in meeting credit demands; it also includes balances in money market mutual funds held by institutional investors. The components of M3 are:- (i) M2; (ii) large time deposits; (iii) institutional money market mutual fund balances; (iv) repurchase agreements; and (v) Eurodollars. See also Monetary Aggregate, and Money Supply. / , срочные соглашения об откупе на суммы в USD100 000.00 и более, . Объём Денежной Базы В Широком Определении (Broad Money). Смотрите также Монетарный Агрегат или Денежный Агрегат (Monetary Aggregate), и Денежная Масса В Обращении (Money Supply).

MACAULAY DURATION– = ПРОДОЛЖИТЕЛЬНОСТЬ ПО МЭКОЛИ (или МЭКОЛИВСКАЯ ДЮРАЦИЯ) – (1) Macaulay (or Mean) Duration- First MD or FMD- (also known as the Discounted Mean Term or Effective Mean Term):- the mean (average) duration of a series of cash flows after discounting these cash flows, where the cash flows are assumed positive, i.e. where the cash flows are either all in or out and each cash flow is weighted by its present value. (Named after the Canadian economist of the Institutionalist School

Frederick Robertson Macaulay (1882–1970), son of T.B. Macaulay, FIA, Actuary of Sun Life of Canada). / Фрэдэрик Робэтсэн Мэколи (Frederick Robertson Macaulay; 1882–1970).

(2) Macaulay (or Mean) Duration- Second MD or SMD-:- the mean of the square of the durations of a series of discounted cash flows, i.e. where the cash flows are either all 'in' or 'out' and each cash flow is weighted by its present value. The SMD is a measure of the convexity of the cash flows. Also known as the Convexity Of The Cash Flows.

MACCLESFIELD SILK = МЭКЭЛСФИЛДСКИЙ ШЁЛК – Macclesfield Silk is a hand-woven silk or rayon fabric with small overall Jacquard patterns. Macclesfield, England, is the town of origin. Today, the name applies to small, yarn dyed, dobby designs used in men's neckties. See also Spitalfields. / Жакяр (Jacquard).

MACD = MOVING AVERAGE CONVERGENCE AND DIVERGENCE

MACD HISTOGRAM = ГИСТОГРАММА ЭМ.ЭЙ.СИ.ДИ. (или ГИСТОГРАММА МЭКДИ) – The MACD indicator was invented by Gerald Appel, and it stands for Moving Average Convergence-Divergence. It consists of three exponential moving averages (EMA) of price and can be calculated for any time frame, such as daily, weekly, or monthly. You can use the MACD histogram as an aid in making decisions for intermediate-term market direction. To obtain the MACD histogram, subtract the Signal line from the MACD line and display the result as an histogram. When a top forms on the histogram (the most recent column is shorter than the prior one), a SELL Signal results, and a BUY Signal is given when the histogram form a bottom. The MACD is a price trend following indicator and by tracking the weekly MACD we can get an idea when the intermediate-term trend may be getting ready to change. In technical analysis, a visual representation of the difference between the MACD line and the MACD signal line. The plot of this difference is presented as a histogram, making the centerline crossovers and divergences easily identifiable. MACD (short for Moving Average Convergence Divergence) is a powerful refinement of the two moving averages system, providing reliable signals of trend changes. The MACD Histogram (Moving Average Convergence Divergence Histogram) provides far earlier and more responsive signals than the original MACD. Unfortunately it is also more volatile. MACD (short for the Moving Convergence / Divergence Momentum Indicator):- usually the difference between the 26-day and 12-day exponential moving averages, although these parameters can be altered. A positive MACD indicates the 12-day average is above the 26-day average and highlights a positive period / trend. The opposite holds true for a negative reading and a downtrend. / В техническом анализе биржевых рынков, индикатор МЭКДИ (MACD) .

MACE SNAG TEST = ТЕСТ НА ЗАЦЕПКУ БУЛАВОЙ – Mace Snag Test is a test for evaluation of snagging performance. A fabric sample is mounted on a revolving drum in contact with a miniature mace that tracks randomly across the sample. The spikes of the mace effect the snagging. The test predicts results in actual wear.

MACHINERY DAMAGE ADDITIONAL DEDUCTIBLE CLAUSE = ОГОВОРКА О ПОДЛЕЖАЩЕМУ ДОПОЛНИТЕЛЬНОМУ ВЫЧЕТУ ПРИ ПОВРЕЖДЕНИИ МАШИННОГО ОБОРУДОВАНИЯ (или ОГОВОРКА О ДОПОЛНИТЕЛЬНОЙ ФРАНШИЗЕ ПРИ ПОВРЕЖДЕНИИ МАШИННОГО ОБОРУДОВАНИЯ) – Machinery Damage Additional Deductible Clause is an Institute clause available for use in a policy covering hull and machinery that provides for an additional deductible to be applied to claims for damage to machinery which is attributable to negligence of master, officers or crew. / хозяина (или капитана), .

MACHINE DIRECTION = НАПРАВЛЕНИЕ МАШИНЫ – Machine Direction is the long direction within the place of the fabric, i.e. the direction in which the fabric is being produced by the machine.

MACHINE STOP = ОСТАНОВ СТАНКА (или XX) – Defect Name:- (Print) Machine Stop. Defect Type:- Printing Defects. Fabric Type:- Print Goods. Description:- (Print) Machine Stop:- This is the result of excess print paste smudging the fabric during the machine stop. Severity:- Major.

MACHINE STRESS–RATED LUMBER = ПИЛОМАТЕРИАЛ МАШИННОЙ СОРТИРОВКИ – Machine Stress-Rated Lumber is a lumber which has been mechanically evaluated to determine its stiffness and bending strength. / Пиломатериал, который был оценён механическим путём с целью определения его жёсткости и прочности на изгиб. Пиломатериалы, рассортированные с помощью механического устройства, действие которого основано на зависимости между модулем упругости и пределом прочности при изгибе, растяжении.

MACHINE TWIST = МАШИННАЯ КРУТКА – Machine Twist is a hard-twist sewing thread, usually of 3-ply construction spun with S twists and plied with Z twist, especially made for use in sewing machines. / Швейные нитки.

MACKAY = МЭКЭЙ – Mackay is a checked pattern of stripes of blue on light green. / Мэкэй = Настоящая Вещь или Отличная Штука.

MACKINAW = МЭКИНО – Mackinaw is a thick, heavy, usually coarse fabric with a certain degree of natural water repellency. It was originally made of wool, but other fibers such as acrylics are being used today. It was named for the blankets made by the Mackinaw Indians in Michigan. Mackinaw and similar fabrics are extremely popular for hunting jackets and are usually plaid or checked. Mackinaw is also spelled Mackinac. Mackinaw:- wool. Ordinary grade of wool and often has shoddy re-used or remanufactured wool mixed in. Sometimes a cotton warp is used. Very heavily felted and napped on both sides to conceal the weave. Much of the fabric is in a plaid or large check design or brightly colored, or different colors on each side. Heavy and thick, very similar to melton. Named for MacKinac Island, Michigan. Also called Ski Cloth or Snow Cloth. Miners, lumbermen, hunters, trappers, fishermen, and cowboys use much of the fabric for jackets, mackinaws and coats. Also used for blankets, shirts, and some heavy sportswear, windbreakers. / Мэкинэк (Mackinac). Пальтовый драп в пёстротканую клетку.

MACKINTOSH = МАКИНТОШ (или НЕПРОМОКАЕМЫЙ ПЛАЩ) – Mackintosh is (chiefly British) a raincoat. A lightweight waterproof fabric originally of rubberized cotton. / прорезиненная плащевая материя.

MACRAMÉ = МАКРАМЕ – Macramé is an ancient method of forming open fabrics by knotting string, yarn, or other threads. Macramé can be used to make anything from delicate trimmings to sturdy items such as hammocks. Recently, wall hangings of macramé have also become popular. Macramé:- a coarse lace or fringe made by knotting threads or cords in a geometrical pattern.

MACROCENTRA = МАКРОСЭНТРА – Macrocentra:- with a large central spine. / , от Греческого слова Makrós, означающее Большой или Длинный, . Centro – Колюче- или Колючко- или Колючковато- .

MACROECONOMICS = МАКРОЭКОНОМИКА – Macroeconomics:- the subdivision of the discipline of economics that studies and strives to explain the functioning of the economy as a whole – the total output of the economy, the overall level of employment or unemployment, movements in the average level of prices (inflation or deflation), total savings and investment, total consumption and so on. The focus of much of macroeconomic theory is analysis of the ways in which conscious government policies (and the unintended secondary consequences of these policies) can influence the overall 'economic health' of the country for good and for ill. Term used for modern economic analyses of aggregate data pertaining to large groups of persons or products. Used in conjunction with analysis of

individual sectors, called Microeconomics. Study of broad or aggregate economics. Macroeconomics concerns itself with the relationship between such major aggregates as prices, incomes, total consumption and total production, together with interest and exchange rates, savings and investment. See also Microeconomics. Macroeconomics is the study of economics in terms of whole systems with reference to general levels of output and income and to the interrelations among sectors of the economy. A term Macroeconomics refers to the economics of an entire country or countries. It studies the phenomena of economic growth, unemployment, national income, price levels, production, output, etc. / выработка (output). Макроэкономика:- анализ экономики страны в целом с использованием таких агрегированных показателей, как уровни цен, безработицы, инфляции и промышленного производства. Смотрите также Микроэкономика (microeconomics).

MACRO FUND = МАКРО ФОНД – Macro Fund is a hedge fund that specializes in strategies designed to profit from expected macroeconomic events. / Хэдьж фонд, специализирующийся на использовании стратегий, рассчитанных на получение прибыли от проявления предполагаемых макроэкономических событий.

MACROLATTICE = МАКРОРЕШЁТКА – Macrolattice is a repeating structure in very small microfibrils of alternating crystalline and amorphous regions. Yarn properties are thought to be governed by morphology at the macrolattice scale.

MACROMERIS = МАКРОМЭРИС (или КРУПНОМЕРНОЕ, или ДЛИННОМЕРНОЕ) – Macromeris:- with long or large divisions. / , от Греческого слова Makrós, означающее Большой или Длинный, .

MACROMOLECULAR DYES = МАКРОМОЛЕКУЛЯРНЫЕ КРАСИТЕЛИ – Macromolecular Dyes:- a group of inherently colored polymers. They are useful both as polymers and as dyes with high color yield. The chromophores fit the recognized CI classes, i.e. azo, anthraquinone, etc, although not all CI classes are represented. Used for mass dyeing, hair dyes, writing inks, etc.

MACROMOLECULE = МАКРОМОЛЕКУЛА – Macromolecule is a large molecule formed by hooking together many small molecule units. The term is used synonymously with polymolecule or polymer. See also Polymer. / Макромолекула, буквально – большая молекула, молекула полимера; построена по принципу повторения идентичных (у макромолекул гомополимера) или различных (у макромолекул сополимера) структурных единиц – мономерных (повторяющихся) звеньев. В линейных макромолекулах эти звенья соединены ковалентно в цепочку, длина которой характеризуется степенью полимеризации (то есть числом повторяющихся звеньев) или молекулярной массой. Совокупность макромолекул данного полимера, в отличие от молекул низкомолекулярного вещества, представляет собой набор цепей, в случае, например, гомополимеров, имеющих одинаковую химическую структуру, но разную длину. Для гомополимеров этот набор количественно описывается функцией распределения по степеням полимеризации (или молекулярно-массовым распределением). Для гомологического ряда сополимеров одинакового среднего состава наблюдается также композиционная неоднородность макромолекул (собственно неоднородность состава) и конфигурационная неоднородность (различное чередование звеньев разных типов). Будучи построенной из большого числа (от сотен до миллионов) элементарных звеньев, каждая отдельная макромолекула представляет собой миниатюрный статистический ансамбль, подчиняющийся законам термодинамики малых систем и проявляющий такие свойства макроскопических физических тел, как изменчивость размеров (геометрических) и формы, не связанные с химическими превращениями. Последняя особенность связана с одним из главных свойств макромолекул – их гибкостью, то есть способностью полимерных цепей изменять свою конформацию в результате внутримолекулярного, микроброунового теплового движения звеньев (в случае так называемой Термодинамической Гибкости) или же под влиянием внешних механических, в частности гидродинамических, факторов (Кинетическая Гибкость). Гибкость обусловлена возможностью вращения атомов цепи и звеньев в целом вокруг простых (одинарных) связей. Гибкость макромолекулы следует отличать от подвижности, которую ограничивают внешние факторы – взаимодействие с растворителем или соседними макромолекулярными цепями. Непосредственной мерой гибкости является величина потенциала торможения внутреннего вращения атомов и звеньев, который зависит от структуры повторяющихся звеньев и имеет квантовомеханическую природу. Термодинамическая гибкость макромолекулы определяется по их геометрическим размерам, стереохимическим и некоторым другим характеристикам. Основной стереохимической характеристикой макромолекул является конфигурация – полное пространственное распределение атомов, образующих макромолекулу, которое определяется длинами соответствующих связей и величинами валентных углов и не может быть изменено без разрыва химических связей. Как известно, при одной и той же общей конфигурации макромолекула может принимать несколько конформаций; таким образом, конформация представляет собой переменную статистическую величину – она характеризует распределение в пространстве атомов и атомных групп при неизменных валентных углах, но переменных ориентациях связей. Изменение ориентации происходит вследствие относительных поворотов этих атомов и групп под действием теплового движения звеньев. В отсутствие взаимодействий с другими макромолекулами (например, в разбавленном растворе) вытянутая поначалу гипотетическая полимерная цепь в результате ряда элементарных поворотов приобретает конформацию так называемого Статистического Клубка. Размеры такого клубка выражаются, например, через среднеквадратичное расстояние между его концами. Сопоставление этих размеров с теми, которые макромолекула приобрела бы при отсутствии торможения внутреннего вращения (они рассчитываются теоретически), позволяет оценить термодинамическую гибкость. Размеры макромолекулы, необходимые для расчётов гибкости, могут быть найдены дифракционными или гидродинамическими методами, а некоторые конфигурационные характеристики – динамо- или электрооптическими (двойное лучепреломление в потоке, Эффект Керра). В отличие от термодинамической, или равновесной, гибкости, кинетическая гибкость не является постоянной характеристикой макромолекулы, а зависит от скорости внешнего деформирующего воздействия. Учесть влияние скорости воздействия на кинетическую гибкость макромолекулы можно, зная её релаксационный спектр (смотрите Релаксационные Явления В Полимерах). Между равновесной и кинетической гибкостью имеется определённая связь, ибо в конечном счёте обе эти характеристики определяются потенциалом торможения. С позиций статистической физики способность макромолекулы к деформациям можно характеризовать конформационным набором, который называется также Статистическим Весом (или Конформационной Энтропией). С уменьшением степени полимеризации уменьшается и число возможных конформаций. Относительно короткие макромолекулы олигомеров, или мультимеров, вообще почти не деформируемы, но лишь потому, что в них мало число звеньев, а потенциал торможения – конечная мера гибкости – тот же, что в длинных цепях. Статистическим весом можно характеризовать и конфигурацию, что становится вполне очевидным в случае сополимеров. Число возможных способов распределения разных звеньев вдоль цепи определяет конфигурационную энтропию макромолекулы; отрицательное значение этой величины представляет собой меру информации, оторую может содержать макромолекула. Способность макромолекулы к хранению информации является одной из самых важных их характеристик, значимость которой стала понятна лишь после открытия Генетического Кода. С равновесной и кинетической гибкостью макромолекулы связаны уникальные механические свойства полимеров, в частности высокоэластичность (смотрите Высокоэластическое Состояние). С конформационной энтропией полиэлектролитов и сополимеров связана возможность превращения химической энергии в механическую (смотрите Хемомеханика). С конфигурационной энтропией связана способность макромолекулы к образованию устойчивых вторичных молекулярных

структур, достигающих высокой степени совершенства и обладающих специфическими свойствами в макромолекулах важнейших биополимеров – белков и нуклеиновых кислот. Применительно к биополимерам можно вместо конфигурационной энтропии пользоваться термином Конфигурационная Информация, которая, в соответствии со сказанным выше, определяет единственность (то есть нестатистичность, в отличие от синтетических макромолекул) конформаций белковых макромолекул, предопределяющую их способность быть ферментами, переносчиками кислорода и тому подобное. В синтетических сополимерах вторичные молекулярные структуры возникают вследствие избирательных взаимодействий определённым образом расположенных вдоль цепи звеньев разных типов; эти структуры лишь умеренно специфичны, но могут служить простейшими моделями запоминания на уровне макромолекул.

MACRONUTRIENT = МАКРОПИТАТЕЛЬНОЕ ВЕЩЕСТВО (или МАКРОЭЛЕМЕНТ) – Macronutrient is a nutrient element absorbed by the plant in large amounts, often more than 0.1% of its dry weight. The following are considered macroelements: carbon, hydrogen, oxygen, nitrogen, phosphorus, potassium, calcium, magnesium, and sulfur.

MACRO PAYMENT = МАКРО ПЛАТЁЖ (или ПЛАТЁЖ КРУПНОЙ СУММОЙ) – Macro Payment:- in the European Union, typically those payments above €25.00 (EUR25.00). See also Medium Payment, adn Micro Payments.

MACROPHYTES = МАКРОФИТЫ – Macrophytes are large plants, as opposed to microphytes such as algae and fungi. / Под Макрофитами, от Греческих слов Makrós, означающее Большой или Длинный, и Phytón, означающее Растение, понимается .

MACRORHIZA = МАКРОРИЗА – Macrorhiza:- with long or large roots. / с длинными или крупными корнями. Под Макроризой, от Греческих слов Makrós, означающее Большой или Длинный, и Rhíza, означающее Корень, понимается .

MACROS = MODULES FOR ANNUAL CROP SIMULATION

MACRS = MODIFIED ACCELERATED COST RECOVERY SCHEDULE

MACULA = МАКУЛА (или ПЯТНО, или ПЯТНЫШКО) – Macula is a spot or blotch. Hence Adj. maculate = with spots or blotches.

MAD = MOROCCAN DIRHAM

MADA = MUDA AGRICULTURAL DEVELOPMENT AUTHORITY

MADDER = МАРЕНА (или ЕСТЕСТВЕННЫЙ АЛИЗАРИН) – (1) Madder is the roots of Rubia tinctorum used in vegetative (natural) dyeing to get a red. Kind of a reddish brown. Madder is a root from which a vegetable dye called Alizarin was obtained originally. It is now produced synthetically. See also Alizarin Dye. / крашение мареной; сушёный корень марены; естественный ализарин. Крапп Марена, Rubia (красящее вещество красного цвета из корней Марены). Под Мареной (Rubia) понимается род растений семейства Мареновых. Многолетние травы, полукустарники или невысокие кустарники. Листья цельные, накрест супротивные, с межчерешковыми прилистниками, по форме сходными с листьями. Цветки мелкие, в верхушечных или пазушных полузонтиках, часто собранных в сложные метельчатые или реже кистевидные соцветия. Около 55 видов в умеренных областях Азии и в Средиземноморье, немногие в Средней Европе и в Африке, около 15 видов в Средней и Южной Америке; в бывшем СССР около 20 видов, большая часть в Средней Азии. Подземные органы нескольких видов Марен содержат красящие вещества. Марена Красильная, или Крапп (Rubia Tinctorum), с глубокой древности возделывалась ради яркой стойкой краски (в зависимости от методов обработки окрашивает ткани в красный, фиолетовый, оранжевый, канареечно-жёлтый или другой цвет). После открытия (в 1860-е) синтетического ализарина культура Марены Красильной сохранилась лишь в немногих странах Азии, где её используют для окраски ковров.

(2) Madder:- a moderate to strong red. / Марена – ализариновый корень.

MADE GOOD = ДЕНЕЖНЫЕ СРЕДСТВА, СООТВЕТСТВУЮЩИЕ СТОИМОСТИ ТОВАРА – Made Good:- the sums paid to a general average fund to make good losses incurred by the general average act.

MADRAS = МАДРАССКАЯ (или МАДРАСКА) – Madras, from the famous city in India, is a fabric with a silk warp and cotton weft, in bright colors, used to make scarves, squares, etc. Madras fabric is a light, cotton fabric that is typically associated with summer clothing. The name is based on the initial inventors of the Madras fabric style, the Eastern Indians and especially on the black and red check fabric that was exported from Madras, India. Madras fabric is now made in a variety of checked patterns, for example turquoise and pink checks were popular in the 1980s preppy style. It was enjoyed as a ‘preppy lock’ much earlier, and is referenced in Susan Eloise Hinton (born July 22, 1948; an American writer best known for her young-adult novels) novel, The Outsiders as preferred by the rich kids. Early Madras fabric was not always colorfast, which actually some people enjoyed, since the look of the fabric changed each time it was washed. This enjoyment might be slightly less for people who washed early Madras fabric with white shirts or other light colored clothing. You could easily end up with pink or grey underwear or socks if you weren’t careful. Today’s Madras fabric tends to be colorfast, but still has an unfortunate tendency to shrink slightly. If you’re trying to decide on a size in a shirt, shorts, or skirt, consider sizing up if you plan to dry the Madras fabric in the clothes dryer. Otherwise, be sure to only wash Madras fabric on a cold water cycle and hang it to dry. In warm summer months, the lightness of the fabric can easily dry it within a day or even sooner if the fabric is dried outdoors on a clothesline. You can buy some versions of Madras fabric that contain polyester. True Madras fabric should be 100% cotton, though. Adding polyester can create a more durable, colorfast, and less easy to shrink garment, but it also takes away from the lightness of the fabric and will not keep you as cool when you wear it. True Madras fabric should always be made of 100% cotton, and you’ll find most of the designers who use the fabric prefer pure cotton. Madras fabric never truly goes out of style. You’ll find it just about every summer reflecting the current fashion trends. When crop pants became popular in the 2000s, summer styles introduced Madras crop pants, often with a simple elasticized and drawstring waist. Very thin Madras can be somewhat see-through, so if you’re choosing it for dresses, or skirts, do consider a garment that is lined or consider adding a slip underneath the skirt. You can also find some Madras fabric made with seersucker, essentially plaid with puckered seams that promote even more comfort. Seersucker Madras fabric is probably some of the coolest fabric you can wear on the hottest days of the year. Occasionally, the cheerful checks and colors of Madras fabric are used to fill other household fabric needs. Madras plaids can made for curtains in a kid’s room. The fabric tends not to be used for upholstery, since its lightweight nature contributes to less durability. Madras is a lightweight plain weave cotton fabric with a striped, plaid, or checked pattern. A true Madras will bleed when washed. This type of fabric is usually imported from India. End-uses are men’s and women’s shirts and dresses. Madras:- composed of all cotton or cotton and silk, and is a single cloth fabric, having excellent wearing qualities. It has been on the market for many years and is considered a staple in the cotton goods line. It is a narrow fabric sold at 27 inches width, and is made of varying grades, weighing from two ounces to three ounces per yard, and is used at all seasons of theyear. It is used by the ladies for summer skirts, shirt-wait suits, etc; by men for shirts, shirt bosoms and four-in-hand and bow neckties. It is also used as a drapery in workmen’s homes for windows, etc. It is known by the plain white ground and fancy colored narrow stripe warp effects and is made of cotton yarns ranging from 1/26’s to 1/80’s warp and filling, and from 50 to 100 or more ends per inch. The knowledge of the utility of Madras being common among most all classes of people, permits of the greatest

scope in creating both harmonious and contrasting color and weave combinations, simplicity in color arrangement being generally the keynote to success in producing an elegant, good-selling line. Colors:- those colors most in demand, which have been adapted to this fabric, are rich and delicate shades of blue, rose, green, linen, tan, lavender, ecru and bright red. For prominent hair line effects use black, navy blue, dark green, royal blue and cherry red. Good fast color is necessary in making madras as it is a wash fabric, the feature of which Is the fine colored stripe effect running warp ways. If inferior colors are used, they will surely spread during the finishing process, and will cause a clouded stripe where a distinct one was intended, thereby causing a pile of seconds. Madras used in making men's stiff bosom shirts is made entirely with a plain weave. Sometimes the colored stripe is developed by doubling up in the heddle and reed (by drawing in two or more ends in one heddle, and the threads of several heddles in one split in the reed). Today's Madras fabric tends to be colorfast, but still has an unfortunate tendency to shrink slightly. Madras is a lightweight, plain weave fabric with a striped, checked, or plaid pattern. True Madras is 'guaranteed to bleed'. Madras:- originated in Madras, India and is one of the oldest staples in the cotton trade. The fabric is made on a plain background which may be colored or white, with stripes, cords or small checks to form the pattern. Made on a plain loom. Plain dobby or Jacquard loom is used to make some of the shirting, while Madras curtain cloth is made on a leno loom from a gauze or doup weave. When cotton is used it is usually Arizona or Egyptian, carded or combed, dependent on the quality fabric desired; 2/80's or 1/40's are popular counts of yarn used. Textures run from 68 to 76 in both directions. Madras is a fine plain-woven shirting and dress fabric usually of cotton with varied designs (as plaid) in bright colors or in white; a light open usually cotton fabric. Originated in Madras, India and it is a very old cloth. Much of it has a plain colored background with stripes, plaid, checks, or designs. Made with combed or carded yarns depending on the quality. Some is mercerized to make it lustrous and durable. Often the dyes are not fast and with each washing, color changes take place. Madras:- called Indian Madras. A fine, hand-loomed cotton imported from Madras, India. The US Federal Trade Commission (FTC) has ruled that it is deceptive to apply this term to a fabric that does not meet this description. In addition, the FTC definition requires that any dyes used on this fabric must be vegetable dyes that will bleed (the colors run into each other). The fact that the FTC felt called upon to make such a definition is some indication of the popularity of Madras and imitation Madras fabrics in recent years. The authentic Madras and its imitations usually have checked or plaid designs. / основа и уточина . Американская писательница Сюзэн Элоис Хинтчэн (Susan Eloise Hinton; 1948–). Жакяр (Jacquard). Туркуаз (в переводе с Французского языка – Бирюза или Бирюзовое). ткацкий станок для тканей с полотняным переплетением или одночелночный ткацкий станок (plain loom). ткацкий станок для тканей с перевивочным переплетением (leno loom) перевивочное переплетение (leno weave or gauze weave or doup weave).

THE MADRID AGREEMENT = МАДРИДСКОЕ СОГЛАШЕНИЕ – The full name of the Madrid Agreement is the 'Madrid Agreement Concerning the International Registration of Marks' of April 14, 1891 (as revised at Brussels on 1900-December-14, at Washington on 1911-June-02, at The Hague on 1925-November-06, at London on 1934-June-02, at Nice on 1957-June-15, and at Stockholm on 1967-July-14, and as amended on 1979-September-28). The Madrid Agreement concerns the international filing of registration applications for trademarks. It enables registration of a trademark in the World Intellectual Property Organization's (WIPO's) International Bureau in Geneva, Switzerland, in much the same way as the Patent Cooperation Treaty provides for international filing of patent applications. WIPO acts as the administering agency for actions taken under the Paris Convention. Once registered with WIPO, a trademark is protected in each member country. Therefore, the protection obtained is governed by the national laws of the individual member countries and is limited by national laws. See also The Berne Convention, The European Patent Convention, The Madrid Protocol, The Paris Convention, The Patent Cooperation Treaty, and Trade-Related Aspects of Intellectual Property Rights. Madrid Agreement concerning the international registration of marks. The system of international registration of marks is governed by two treaties:- (i) the Madrid Agreement Concerning the International Registration of Marks, which dates from 1891, and (ii) the Protocol Relating to the Madrid Agreement, which was adopted in 1989, entered into force on 1995-December-01, and came into operation on 1996-April-01. Common Regulations under the Agreement and Protocol also came into force on that date. The system is administered by the International Bureau of WIPO, which maintains the International Register and publishes the WIPO Gazette of International Marks. The objectives of the system are two-fold. Firstly, it facilitates the obtaining of protection for marks (trademarks and service marks). The registration of a mark in the International Register produces, in the contracting parties designated by the applicant, the effects described in paragraph 31, below. Further contracting parties may be designated subsequently. Secondly, since an international registration is equivalent to a bundle of national registrations, the subsequent management of that protection is made much easier. There is only one registration to renew, and changes such as a change in ownership or in the name or address of the holder, or a limitation of the list of goods and services, can be recorded in the International Register through a single simple procedural step. On the other hand, if it is desired to transfer the registration for only some of the designated contracting parties, or for only some of the goods or services, or to limit the list of goods and services with respect to only some of the designated contracting parties, the system is flexible enough to accommodate this. International registration has several advantages for the owner of the mark. After registering the mark, or filing an application for registration, with the Office of origin, he has only to file one application, in one language, and pay one fee instead of filing separately in the trademark Offices of the various contracting parties in different languages and paying a separate fee in each Office. Moreover, the holder does not have to wait for the Office of each contracting party in which protection is sought to take a positive decision to register the mark; if no refusal is notified by an Office within the applicable time limit, the mark is protected in the contracting party concerned. In some cases, the holder does not even have to wait the expiry of this time limit in order to know that the mark is protected in a contracting party, since he may, before the expiry of the time limit, receive a statement of grant of protection from the Office of that contracting party. A further important advantage is that changes subsequent to registration, such as a change in the name or address of the holder, or a change (total or partial) in ownership or a limitation of the list of goods and services may be recorded with effect for several designated contracting parties through a single simple procedural step and the payment of a single fee. Moreover, there is only one expiry date and only one registration to renew. International registration is also to the advantage of Trademark Offices. They do not need to examine for compliance with formal requirements, or classify the goods or services, or publish the marks. Moreover, they are compensated for the work that they perform; the individual fees collected by the International Bureau are transferred to the contracting parties in respect of which they have been paid, while the complementary and supplementary fees are distributed annually among the contracting parties not receiving individual fees, in proportion of the number of designations made of each of them. An international registration is effective for 10 years. It may be renewed for further periods of 10 years on payment of the prescribed fees. The International Bureau sends a reminder to the holder and to his representative (if any) six months before renewal is due. The international registration may be renewed in respect of all the designated contracting parties or in respect of only some of them. It may not however be renewed in respect of only some of the goods and services recorded in the International Register; if therefore the holder wishes, at the time of renewal, to remove some of the goods and services from the international registration, he must separately request cancellation in respect of those goods and services. / Всемирная Организация Интеллектуальной Собственности.

THE MADRID PROTOCOL = МАДРИДСКИЙ ПРОТОКОЛ – Signatories to the Madrid Agreement and other countries are negotiating a new agreement referred to as the Madrid Protocol. The Madrid Protocol aims to obtain protection for trademarks through international recognition, and is to be policed by the World Intellectual Property Organization, which will maintain records of all applications. It is

proposed that each registration will be effective for 10 years, although this period would be indefinitely extendable on request for additional 10-year terms. The 'Protocol Relating to the Madrid Agreement Concerning the International Registration of Marks' (The Madrid Protocol) is an international treaty that allows a trademark owner to seek registration in any of the countries that have joined the Madrid Protocol by filing a single application, called an 'International Application'. Protocol Relating to the Madrid Agreement Concerning the International Registration of Marks:- adopted at Madrid, Spain on 1989-June-27. The Madrid Protocol enables owners of trademark applications and registrations to extend their rights to dozens of other member countries. Filing these International applications can be accomplished without the appointment of a local agent in the designated countries. Thus, proceeding through the Protocol is much less expensive than filing nationally. These International rights are sought through the applicants' home office using either the English or French language. A single filing fee is payable in the applicant's home currency. This eliminates the need to process multiple bills fromdifferent countries. Over 65 countries are currently within the system including the United States, Australia, China, the European Union, France, Germany, Japan and the United Kingdom. The United States became a party to the Protocol on 2003-November-02, after many years of deliberations about acceding. The European Union became a party less than a year later, on 2004-October-01. See also The Berne Convention, The European Patent Convention, The Madrid Agreement, The Paris Convention, The Patent Cooperation Treaty, and Trade-Related Aspects of Intellectual Property Rights.

MAESTRO® CARD = КАРТА МАЭСТРО® (или КАРТА МЭЙСТЧРО®) – Maestro® is a part of MasterCard's family of brands. Maestro is backed by MasterCard International Maestro® is the debit card from MasterCard. It provides PIN-based, direct cash access from your bank account at home as well as abroad. What's the difference between a Maestro® card and a credit card? Your Maestro® card is linked to your bank account, and the amount of your purchases is deducted directly from that account. Generally, you enter your PIN on a keypad when you want to purchase an item with Maestro®. Currently, in some countries you may be requested to sign a receipt to complete your Maestro transaction rather than enter your PIN. A credit card allows you to pay via instalments and/or a revolving line of credit, with the limit set by the issuer. Your monthly payment can range from a minimum amount, set by your bank, to your entire outstanding balance. Generally, if you pay the entire bill at the end of the month, no interest is charged. If a balance is outstanding, you will be charged interest at a predetermined annual percentage rate (APR), which differs from issuer to issuer. Automatic teller machine cards with Maestro functions are debit cards with which you can either withdraw money worldwide from teller machines or also at many banking machines. Over the past couple of years, Switch has been migrating to Maestro®, MasterCard's global debit brand and during this time, the Maestro® name and logo has gradually been replacing Switch on customers' cards and in shop windows. Switch has largely disappeared from most shop windows and will totally disappear by mid 2007. / Маэстро® (или Мэйстчро®; Maestro®). МэстчёКард® (MasterCard®).

MAE WEST = МЭЙ ВЭСТ (или XX) – Mae West is an inflatable life jacket in the form of a collar extending down the chest worn by fliers in World War II.

MAFF = MINISTRY OF AGRICULTURE, FORESTRY, AND FISHERIES

MAFI = MINISTRY OF AGRICULTURE AND FOOD INDUSTRIES

MAFI TRAILER = ПРИЦЕП МАФИ – MAFI Transport-Systeme GmbH (Tauberbischofsheim, Germany) is a worldwide leading manufacturer of tractors for in-plant transportation in seaports, industry, logistic and distribution centers. For in-plant transportation in ports, industry and distribution MAFI supplies industrial and heavy-duty trailers, cargo/rolltrailers and container chassis. MAFI offers the right trailer system for your specific application. Both the basic as well as the customized trailers feature all the advantages of the MAFI product. MAFI Trailer is the German brand name of a roll trailer used for RoRo purposes. Also known as Roll Trailer. MAFI offers cargo/rolltrailers for the transport of standard ISO containers and heavy loads in ports and industry. The cargo/rolltrailers are suited for payloads up to 120 t and for container sizes up to 60'. Depending on your requirements the rolltrailers can be designed for other container dimensions and loads and be equipped with fixed gooseneck, parking brakes, lightning, lashings and safety beams. Different kinds of tyres, loading platform covers as well as locating pins, collapsible twistlocks, container guides and stanchions are also available on request. German brand name trailer with solid rubber wheels used for RoRo purposes. / МАФИ Транспот-Систэме Ге.эм.бе.Ха. (MAFI Transport-Systeme GmbH). Немецкое фирменное название перекатываемого прицепа, используемого при погрузке или выгрузке методом закатить/выкатить. Известен также как Трал или Волокуша (Roll Trailer).

MAGENTA = КРАСНОВАТО–ЛИЛОВОЕ (или ФУКСИН) – Magenta is a bluish-red color. Magenta is the 'official' subtractive reddish color. (Comments paralleling those for cyan apply.) In the MX reactive dye family, Red MX-8B and Red MX-5B are good magentas. Many dye sellers in the textile arts market call this 'Fuchsia'. Magenta:- deep purplish red. / Фуксин – анилиновая малиновая краска.

MAGGOT = ЛИЧИНКА – Maggot is a larval stage of the Order Diptera (Fly). / Личинка, стадия индивидуального развития многих беспозвоночных и некоторых Позвоночных Животных (Рыб и Земноводных), у которых запасы питательных веществ в яйце недостаточны для завершения зародышевого развития. Организм на стадии личинки ведёт самостоятельную жизнь, обычно имеет специальные органы, не свойственные взрослой форме, и лишён многих органов, присущих последней. У многих животных стадия личинки обусловлена различным образом их жизни на ранних этапах развития и во взрослом состоянии:- так, характерная для Многощетинковых Червей и многих Моллюсков личинка – трохофора ведёт свободноплавающий образ жизни, тогда как взрослые формы обитают на дне. Иногда наличие личинки связано со сменой среды обитания во время развития. Например, у многих Земноводных личинка приспособлена к жизни в воде (смотрите Головастик), а взрослое животное – к условиям суши. У морских сидячих или малоподвижных животных плавающая личинка обеспечивает их расселение. Таковы личинки Губок и Кишечнополостных – паренхимула, амфибластула и планула, а также личинки Иглокожих и Кишечнодышащих – диплеурула. Превращение личинки во взрослое животное (смотрите Метаморфоз) заключается в перестройке организации, тем более глубокой, чем сильнее личинка отличается от закончившего своё развитие организма. Особенно резкие изменения происходят при метаморфозе личинки некоторых Беспозвоночных (Немертин, Иглокожих, Насекомых). Например, у высших Насекомых на стадии куколки, следующей за стадией личинки, почти все личиночные органы разрушаются, а органы взрослого животного формируются заново из особых зачатков – имагинальных дисков. Личинки некоторых Животных сохраняют черты строения предковых форм, что указывает на происхождение этих Животных. Подобное филогенстическое значение придают, например, личинки Губок и Кишечнополостных (паренхимуле и плануле), а также хвостатой личинке асцидий, которая напоминает по строению свободноплавающего предка.

MAGNETIC FILTER = МАГНИТНЫЙ ФИЛЬТР – Magnetic Filter is a filter element that, in addition to its filter medium, has a magnet or magnets incorporated into its structure to attract and hold ferromagnetic particles. See also Filter.

MAGNETIC INK CHARACTER RECOGNITION LINE = ШТРИХ РАСПОЗНАВАНИЯ, НАНОСИМЫЙ МАГНИТНЫМИ ЧЕРНИЛАМИ – In the United States, the terms 'MICR Line' and 'Magnetic Ink Character Recognition Line' mean the numbers, which may include the bank routing number, account number, check number, check amount, and other information, that are printed near the bottom of a check in magnetic ink in accordance with generally applicable industry standards. / Магнитные Чернила представляют

собой суспензию или мастику, содержащую красящее вещество и микроскопические магнитные частицы. Запись производится на обыкновенной бумаге перьевой или шариковой ручкой, а считывание – с помощью магнитной головки, состоящей из ферромагнитного сердечника с одной или несколькими обмотками. Магнитные чернила применяются при оформлении накладных, счетов, чеков и так далее.

MAGNETIC INK CHARACTER RECOGNITION LINE PRESENTMENT = ПРЕДСТАВЛЕНИЕ ШТРИХА РАСПОЗНАВАНИЯ, НАНОСИМОГО МАГНИТНЫМИ ЧЕРНИЛАМИ – In the United States, Magnetic Ink Character Recognition (MICR) Line Presentment means electronic check presentment when only the MICR line of the check is included in the data sent to the paying bank. Under MICR line presentment, the delivery of paper checks to the paying bank is not necessary for legal presentment.

MAGNETIC PLUG = МАГНИТНЫЙ СЕРДЕЧНИК (или МАГНИТНАЯ ПРОБКА) – Magnetic Plug:- strategically located in the flow stream to collect a representative sample of wear debris circulating in the system:- for example, engine swarf, bearing flakes, and fatigue chunks. The rate of buildup of wear debris reflects degradation of critical surfaces. / остатки (debris).

MAGNETIC SEAL = МАГНИТНОЕ УПЛОТНЕНИЕ – Magnetic Seal is a seal that uses magnetic material (instead of springs or a bellows) to provide the closing force that keeps the seal faces together. See also Seal.

MAGNETIC SEPARATOR = МАГНИТНЫЙ СЕПАРАТОР – Magnetic Separator is a separator that uses a magnetic field to attract and hold ferromagnetic particles.

MAGUEY = МАГУЭЙ (или ТЁМНО–ЗЕЛЁНАЯ АГАВА) – Maguey is the Agave or century plant, especially Agave Americana but includes several other species. Also applied to cordage and fabrics made from fibers of the Maguey plant. / Американская Агава (Agave Americana).

MAHOGANY = МАХАГОНИЕВОЕ (или КРАСНОЕ ДЕРЕВО) – Mahogany:- a moderate reddish brown.

MAIDEN = ДЕВИЦА (или ДЕВА, или ДЕВУШКА) – Maiden is the name for the posts that support the flyer on a spinning wheel. Maiden and the base that supports them is called the Mother-Of-All.

MAIDEN TRIP = ПЕРВОЕ ПЛАВАНИЕ (или ПЕРВЫЙ РЕЙС, или ПОЕЗДКА ДЕВЫ) – Maiden Trip is a first voyage of a vessel after delivery to her owner(s). / Первый рейс судна после доставки его владельцу.

MAIL = ПОЧТА – Mail:- dispatches of correspondence and other objects tendered by and intended for delivery to postal administrations. A term Mail means United States mail and foreign transit mail. / Под Почтой, от Польского слова Poczta, или Почтовой Связью понимается один из видов связи; в обиходе почтой называют почтамты (предприятия, осуществляющие все виды почтовой, телеграфной и телефонной связи), узлы и отделения связи, а также пересылаемые ими почтовые отправления (периодические издания, письма, посылки, денежные переводы).

MAILLOT = МАЙО (или КУПАЛЬНИК, или ТРИКО, или МАЙКА, или ФУТБОЛКА) – Maillot is a one-piece, typically strapless, woman's bathing suit. Maillot:- tights for dancers or gymnasts; Jersey; a woman's one-piece bathing suit. / Под Майо, от Французского слова Maillot, означающее Купальник или Майка или Трико или Футболка, понимается .

MAIN = MID–AMERICA INTERCONNECTED NETWORK

MAIN DECK = ГЛАВНАЯ ПАЛУБА – Main Deck:- the main continuous deck of a ship running from fore to aft; the principle deck; the deck from which the freeboard is determined.

MAIN LINE OPERATOR = ОПЕРАТОР ГЛАВНЫХ ЛИНИЙ – Main Line Operator is a carrier employing vessel(s) in the main or principal routes in a trade but not participating within a consortium. / Перевозчик, обслуживающий судно(а) на главных или основных торговых маршрутах, но не участвующий в консорциуме.

MAIN REFINANCING INSTRUMENT = ОСНОВНОЙ ИНСТРУМЕНТ РЕФИНАНСИРОВАНИЯ – Main Refinancing Instrument is the major monetary policy instrument of the European Central Bank (ECB). Via interest rates and money supply made available, the central bank uses this instrument to influence consumption and investment levels, which in turn have an impact on the overall economic situation. As part of the main refinancing operations (open market operations) commercial banks borrow money from the central bank against the deposit of collateral with the central bank.

MAIN REFINANCING OPERATIONS = ОСНОВНЫЕ ОПЕРАЦИИ ПО РЕФИНАНСИРОВАНИЮ – Main Refinancing Operations are regular open market operations executed by the Eurosystem in order to provide the banking system with the appropriate amount of liquidity. They take the form of weekly auctions in which the banks can bid for liquidity. Main Refinancing Operation is a weekly open market operation conducted by the Eurosystem. On 09 March 2004 the maturity of these operations was reduced from two weeks to one week, following a Governing Council decision of 2003. The operations are conducted as variable rate tenders with a pre-announced minimum bid rate.

MAIN STEM = ГЛАВНЫЙ СТЕБЕЛЬ – Main Stem is the central axis of the plant consisting of a terminal meristem and a series of internodes with nodes and one main-stem leaf at each node. A normal branching pattern associated with main-stem nodes would consist of inactive nodes at the first 2–4 nodal positions, monopodia on the next 1–3 positions, and sympodia at all subsequent nodes. In Cotton, the nodes, main-stem leaves and associated sympodial branches arise in a 3/8 phyllotaxy around the main stem, i.e. a new leaf or branch arises every 3/8ths of the circumference of the main-stem.

MAIN–STEM NODE = УЗЕЛ ГЛАВНОГО СТЕБЛЯ – Main-Stem Node is the part of the stem at which a main-stem leaf is attached. In the axil of the leaf a monopodial or sympodial branch arises from an axillary bud. A second axillary bud also exists in the axil and occasionally generates a second branch from the main-stem node. The highest main-stem node for practical counting purposes is considered to be where the most recent main-stem leaf has unfolded.

MAINTAINER LINE = ЗАКРЕПИТЕЛЬНАЯ ЛИНИЯ (или ЛИНИЯ ЗАКРЕПИТЕЛЬ) – Maintainer Line is a pollinator variety used to pollinate the male sterile line and produce progenies which still retain male sterility. If there is no maintainer line, the male sterile line cannot be maintained and multiplied generation after generation. A Maintainer Line is similar to a CMS (short for the cytoplasmic male sterility) line except that it has viable pollen grains and normal seed setting. The maintainer line is used as a pollinator for maintaining a CMS line. The maintainer is also called the B Line. The B line cannot restore fertility to the F1 generation when it is crossed with a CMS line. Panicles exsert fully out of the flag leaves. Anthers are yellow, plump, and shed pollen. The B line flowers 2–3 days earlier than the CMS line. Flowering lasts for about 5 days. / В генетике под Линией, от Латинского слова Linea, понимаются размножающиеся половым путём родственные организмы, которые происходят, как правило, от одного предка или одной пары общих предков и воспроизводят в ряду поколений одни и те же наследственно устойчивые признаки. Линия – основа для получения высокопродуктивных гибридов в растениеводстве и животноводстве.

MAINTENANCE APPLICATION = ПРОФИЛАКТИЧЕСКОЕ (или ПОДДЕРЖИВАЮЩЕЕ) ВНЕСЕНИЕ – Maintenance Application is an application of fertilizer materials in amounts and at intervals to ensure a certain minimum level of an available nutrient.

MAINTENANCE FEES = ВОЗНАГРАЖДЕНИЯ ЗА ПОДДЕРЖАНИЕ – Maintenance Fees are the fees for maintaining in force a patent based on an application filed on or after December 12, 1980. / вознаграждения за поддержание в силе патента, .

MAINTENANCE GUARANTEE = ГАРАНТИЯ ПОДДЕРЖАНИЯ (или ГАРАНТИЯ (ТЕХНИЧЕСКОГО) ОБСЛУЖИВАНИЯ) – Maintenance Guarantee supports remedies and any defects which become apparent after delivery of the goods or after completion of a plant.

MAINTENANCE LEVEL = ПОДДЕРЖИВАЕМЫЙ УРОВЕНЬ – The term Maintenance Level means the minimum amount of original margin and option margins a carrying member is required to maintain in a customer account at all times, as provided in the rules of the exchange.

MAINTENANCE MARGIN = МАРЖА ЗА УДЕРЖИВАНИЕ (или ПОДДЕРЖИВАЕМАЯ МАРЖА) – Maintenance Margin is a set minimum margin per every outstanding futures contract that a customer must maintain in his margin account to retain the futures position. The maintenance margin is typically less than the initial margin, and also differs by contract. If a customer's equity in any futures position drops to or below the level of maintenance margin because of adverse price movement, the broker must issue a Margin Call to restore the customer's equity. If the customer wish to continue to hold the position, customer will be required to restore his/her account to the full initial margin level (not to the maintenance margin level). Also known as the Maintenance Performance Bond. See also Margin, Initial Margin, Margin Call, Security Deposit, and Variable Limit Margins. Maintenance Margin, also known as Minimum Margin, is the lowest level to which an investor's account can drop before additional funds are required. Maintenance margin requirements are determined by the board of directors of an exchange and are based on the volatility and price of the futures contract. Maintenance Margin is the margin deposit required by the exchange to keep equity in your futures or options (if selling options) position. It is required when the initial margin has been depleted by adverse price movement. Maintenance Margin is a special minimum amount of margin money that must be maintained. / Установленная минимальная маржа за каждый остающийся незакрытым встречной сделкой фьючерсный контракт, которую заказчик должен поддерживать на своём маржинальном счёте для удерживания открытой позиции по данному фьючерсу. Поддерживаемая маржа обычно меньше первоначальной маржи и её размер в зависимости от конкретного контракта различен. Как правило, размер поддерживаемой маржи соответствует размеру первоначальной маржи для хэдьжирования. После покупки или продажи фьючерсного контракта заказчик обязан будет поддерживать на своём маржинальном счёте сумму, не менее определённого процента от суммы первоначальной маржи. Это связано с тем, что по фьючерсным контрактам клиринговые расчёты (расчёты прибыли или убытка) проводятся ежедневно по окончании торговой сессии по установившейся расчётной цене, и это, соответственно, отражается на состоянии маржинального счёта заказчика. Поддерживаемая маржа формируется в качестве остатка после расчёта через клиринговую палату по дневным или разнодневным прибылям и убыткам между фирмами, являющимися клиринговыми членами. Фактически, при оставлении позиции открытой на следующий день и более, клиринговая палата в конце рабочего дня, в который была открыта позиция, высвобождает из залога (суммы первоначальной маржи) за каждый фьючерсный контракт часть денежных средств. Этими средствами торговец вправе распоряжаться по своему собственному усмотрению. Остающиеся в залоге за каждый фьючерс денежные средства и составляют поддерживаемую маржу. Если свободные денежные средства заказчика по любой позиции по фьючерсу сокращаются до или оказываются ниже уровня средств поддерживаемой маржи из-за неблагоприятного поведения цены, брокер должен будет выставить заказчику Маржинальное Требование пополнить счёт свободными денежными средствами. В этом случае, при желании заказчика и далее удерживать данную позицию, ему придётся восстановить сумму на счёте до уровня первоначальной, а не поддерживаемой маржи. Известна также как Поддерживаемое Обязательство Исполнения (Maintenance Performance Bond). Смотрите также Маржа (Margin), Маржинальное Требование (Margin Call), Залоговый Депозит (Security Deposit), и Изменяемые Лимиты Маржи (Variable Limit Margins).

MAINTENANCE PERIOD = ПЕРИОД ПОДДЕРЖАНИЯ – Maintenance Period is the period over which credit institutions' compliance with reserve requirements is calculated. Since 10 March 2004 the maintenance period has begun on the settlement day of the first main refinancing operation following the meeting of the Governing Council at which the monthly assessment of the monetary policy stance is pre-scheduled. The European Central Bank (ECB) publishes a calendar of the reserve maintenance periods at least three months before the start of the year.

MAJOR(S) = КРУПНЯК (или ПЕРВОСТЕПЕННЫЕ, или МАЖОРИТАРИИ) – Majors:- these companies were called 'Majors' because each was large enough to influence international oil supplies and prices, operated in more than one country, and were active in virtually every stage of the oil production process – from crude oil exploration to refining and distribution. The US equivalent of a blue chip company; a very large company within its market sector. A term broadly applied to those multinational oil companies which by virtue of size, age, or degree of integration are among the preeminent companies in the international petroleum industry. / Термин может быть использован в качестве жаргона для обозначения крупных компаний, основных валют и тому подобное. От Латинского слова Major, означающее Больший или Старший.

MAJOR CARRIER = КРУПНЫЙ ПЕРЕВОЗЧИК – Major Carrier is a for-hire certificated air carrier that has annual operating revenues of USD1 billion or more. Such carrier usually operates between major population centers. / Нанимаемый сертифицированный воздушный перевозчик, который имеет ежегодную операционную выручку в размере одного и более миллиардов Долларов США. Такой перевозчик обычно действует между крупными населёнными центрами.

MAJOR GENE = ГЛАВНЫЙ ГЕН (или ОСНОВНОЙ ГЕН) – Major Gene is a gene that determines major characteristics.

MAJOR GENE RESISTANCE = РЕЗИСТЕНТНОСТЬ ГЛАВНОГО ГЕНА – Major Gene Resistance is a resistance in which genes show clear-cut and discrete segregation in the F_2 or later generations of crosses between resistant and susceptible parents. Effects are thus qualitative. / Сегрегация или Выделение или Зейгерование или Разделение По Крупности (Segregation).

MAJORITY = БОЛЬШИНСТВО – Majority is more than 50 percent; commonly used as the percentage of votes required to approve certain corporate actions. / Большинство составляет более 50 процентов; обычно используется как процент голосов, требуемых для одобрения определённых корпоративных действий.

MAJORITY INTEREST = МАЖОРИТАРНЫЙ ПАКЕТ (или КОНТРОЛЬНЫЙ ПАКЕТ) – Majority Interest:- ability of one business to control another through ownership of a majority of its stock. It is not necessary to own more than 50% of a company's stock to have a controlling interest in it. See also Controlling Interest, and Minority Interest.

MAJORITY SHAREHOLDER = МАЖОРИТАРНЫЙ АКЦИОНЕР (или МАЖОРИТАРИЙ) – Majority Shareholder is a shareholder who owns more than 50% of the outstanding shares of a firm.

MAJOR PESTS = ГЛАВНЫЕ (или КРУПНЫЕ) ВРЕДИТЕЛИ – Major Pests are the unwanted organisms, such as Insects, pathogens, Weeds, small Animals, etc that compete with people for food and shelter, threaten their health, comfort, and welfare and cause serious problems.

MAKE COLORS = РАЗУКРАШИВАТЬ (или ПОДНИМАТЬ ФЛАГИ) – Make Colors (maritime term):- hoisting the ensign at 08 am and down at sunset.

MAKER = СОЗДАТЕЛЬ – Maker is:- (1) a person who signs a check or promissory note, which makes him/her responsible for payment; and (2) a person who endorses a check or note over to another person before it is delivered, making the endorser obligated to pay until it is delivered. See also Drawer. A term Maker is applied to one who makes a promissory note and promises to pay it when due. He who makes a bill of exchange is called the Drawer, and frequently in common parlance and in books of Reports we find the word drawer inaccurately applied to the maker of a promissory note. See also Promissory Note.

MAKE THE COURSE GOOD = БРАТЬ КУРС ХОРОШИЙ (или ИДТИ КУРСОМ ХОРОШИМ, или ДЕРЖАТЬ КУРС ХОРОШИЙ) – Make The Course Good (maritime term):- steering; keeping the ship on the course given (no lazy steering).

MAKE THE LAND = ОТКРЫВАТЬ БЕРЕГ (или ПРИБЛИЖАТЬСЯ К БЕРЕГУ) – Make The Land (maritime term):- landfall. To reach shore.

MAKE WATER = ИМЕТЬ ТЕЧЬ (или ТЕЧЬ) – Make Water (maritime term):- to leak; take in water.

MALE FLOWER = МУЖСКОЙ ЦВЕТОК – Male Flower is a flower with functional stamens but no ovary. / с функциональными тычинками (stamens) .

MALE PARENT = РОДИТЕЛЬ МУЖСКОГО ПОЛА (или ОТЦОВСКАЯ ОСОБЬ, или МУЖСКАЯ ОСОБЬ, или ОТЦОВСКАЯ ФОРМА) – Male Parent is the plant which is the source of pollen used in hybridization.

MALE STERILE = СТЕРИЛЬНОЕ ПО МУЖСКОЙ ЛИНИИ (или БЕСПЛОДНОЕ ПО МУЖСКОЙ ЛИНИИ) – Male Sterile is a plant having no pollen grains or nonfunctional pollen grains and therefore is unable to fertilize the embryo.

MALFORMED PIECE = УРОДЛИВАЯ ШТУКА (или КУСОК) – Malformed Piece:- results from machine fault and/or adjustment or failure of operator to position piece properly. Machinery defects, and namely – Part Forming Machines. / Порок или дефект от машинного оборудования.

MALICIOUS DAMAGE CLAUSE = ОГОВОРКА О НАРОЧИТОМ (или УМЫШЛЕННОМ, или ЗЛОНАМЕРЕННОМ) ПОВРЕЖДЕНИИ – Malicious Damage Clause is a clause published by the Institute of London Underwriters for use in a cargo policy that is subject to the Institute Cargo Clauses (1982) B or C. It adds the risks of malicious acts, vandalism and sabotage to the cargo policy. Malicious Damage Clause is a clause published by the Institute of London Underwriters for use in a cargo policy that is subject to the Institute Cargo Clauses (1982) B or C. It adds the risks of malicious acts, vandalism and sabotage to the cargo policy. The clause may be used with any of the Institute trades clauses that are based on the ICC B or C conditions. / Оговорка, публикуемая Институтом Лондонских Расписчиков (Андеррайтеров).

MALINE = МАЛИН – Maline is a gauze-like veiling of net used to trim hats. See also Net. Malines:- a fine stiff net with a hexagonal mesh that is usually made of silk or rayon and that is often used for veils; also, maline. / Под Малин, от Французского слова Maline, означающее Лукавый или Хитрый, понимается .

MALLORY FATIGUE TEST = ТЕСТ НА УСТАЛОСТЬ ПО МЭЛЛОРИ – Mallory Fatigue Test is a test to measure the endurance properties of tire cord. Frank Burr Mallory (1862–1941) was an American pathologist at the Boston City Hospital and Professor of Pathology at Harvard Medical School. / Фрэньк Бёр Мэлэри (Frank Burr Mallory).

MALPRACTICE = ЗЛОУПОТРЕБЛЕНИЕ ДОВЕРИЕМ – Malpractice:- a carrier giving a customer illegal preference to attract cargo. This can take the form of a money refund (rebate); using lower figures than actual for the assessment of freight charges (undercubing); misdeclaration of the commodity shipped to allow the assessment of a lower tariff rate; waiving published tariff charges for demurrage, CFS handling or equalization; providing specialized equipment to a shipper to the detriment of other shippers, etc.

MALT = СОЛОД – Malt is sprouted and steamed whole grain from which the radicle has been removed. Though malted grains may look like the unprocessed grain from which they are derived, their processing can be determined through handling:- the grains will be sticky and lighter or have a strong, distinctive odor that grain that has not been malted will not have. / Солод – проращённое и пропаренное целиковое зерно у которого был удалён зародышевый корень. несмотря на то, что солодовые зёрна могут выглядеть как непереработанное зерно, из которого они были произведены, их переработка может быть определена посредством ручного перебора:- зёрна будут клейкими и более лёгкими или будут иметь сильный, отличный запах, которого не имеется у зерна, не подвергавшегося процессам переработки в солод. Под Солодом понимается продукт проращивания зёрен злаков (овса, пшеницы, ржи, ячменя). Применяется в производстве дрожжей, кваса, пива, спиртных напитков и так далее. Солодовые Ростки – ростки проращённого зерна овса, пшеницы, ржи, ячменя, получаемые при производстве солода. Богаты протеином и витамином Е. Используются в кормлении сельскохозяйственных животных.

MALWARE = ВРЕДОНОСНАЯ ПРОГРАММА – In computing terms, a Malware:- much like a virus, malware (also known as Malicious Software) is designed with the sole purpose of causing damage to or disrupting the operation of a system or computer. Viruses technically fall under the umbrella of the term Malware, as do programs called Trojan Horses. A Trojan horse is malware that appears to be a harmless application. The primary difference between a virus and a Trojan horse is that viruses replicate themselves, while Trojan horses do not. See also Virus. Malware is a portmanteau word combining MALicious and softWARE, malware is used as an umbrella term to cover all forms of malicious code, regardless of how that code spreads or is installed, how it targets or identifies computer systems, or what sort of damage it causes.

MAMILLA = СОСОК – Mamilla is nipple-shaped tubercle with an areole at its tip.

MAMILLATE = СОСКОВОЕ (или ИМЕЮЩЕЕ СОСКИ, или ПОКРЫТОЕ СОСОЧКАМИ, или УСЕЯННОЕ БУГОРКАМИ, или ПУЗЫРИСТОЕ) – Mamillate:- with breast or nipple shaped projections.

MANAGED ACCOUNT = УПРАВЛЯЕМЫЙ СЧЁТ – Managed Account is the investment account managed for a depositor by a bank's investment department. A (generally sizeable) securities safekeeping account managed by the bank on the basis of a mandate awarded by the client. The bank is authorized to perform all operations regarded as expedient within the generally accepted definition of asset management, e.g., the adjustment of securities weightings in line with market conditions and the reinvestment of freed-up resources. Also known as Managed Portfolio. An arrangement by which the holder of the account gives written power of attorney to a person, often his broker, to make trading decisions. See also Controlled Account, and Discretionary Account. Managed Accounts offer

many benefits not offered by traditional mutual funds. For example, in a typical mutual fund, assets are pooled on behalf of all investors, shareholders jointly own the investments and each shares an equal ownership percentage of the funds assets. In separately managed accounts, investors are provided with:- a tax-aware/risk-managed investment opportunity, direct access to investment managers, portfolios customized to meet specific investment objectives, and securities that are personally owned. Another attractive feature of a managed account is the fee structure – in separately managed accounts fees for brokerage commissions, investment counseling, portfolio management and administration are combined, or 'wrapped', into one transparent asset-based fee. / , например, . Счёт Ответственного Хранения (Safekeeping Account). Управляемый Счёт – инвестиционный счёт, на котором находятся средства, доверенные управляющему одним или более клиентами, который принимает решения относительно того, когда и куда их инвестировать. Подобный счёт может вести трастовый отдел банка или инвестиционная консультационная фирма. С клиентов взимается вознаграждение за управление средствами, кроме того, они делят прибыли и убытки пропорционально участию.

MANAGED FUND = УПРАВЛЯЕМЫЙ ФОНД – Managed Fund:- (1) an investment contract by means of which an insurance company offers participation in one or more pooled funds. (2) an arrangement where the assets are invested on similar lines to unit trusts by an external investment manager.

MANAGED FUNDS ASSOCIATION = АССОЦИАЦИЯ УПРАВЛЯЕМЫХ ФОНДОВ – Managed Funds Association is the trade association for the managed funds industry. / Торговая ассоциация для представителей отрасли управляемых фондов.

MANAGED FUTURES = УПРАВЛЯЕМЫЕ ФЬЮЧЕРСЫ – The term Managed Futures describes an industry comprised of professional money managers known as Commodity Trading Advisors (CTAs). These trading advisors manage client assets on a discretionary basis using global futures markets as an investment medium. Trading advisors take positions based on expected profit potential. In the last 10 years (end of 2008), assets under management for the managed futures industry have grown an unprecedented 700%. Managed futures have been used successfully by investment management professionals for more than 30 years. Institutional investors looking to maximize portfolio exposure continue to increase their use of managed futures as an integral component of a well-diversified portfolio. With the ability to go both long and short, managed futures are highly flexible financial instruments with the potential to profit from rising and falling markets. Moreover, managed future funds have virtually no correlation to traditional asset classes, enabling them to enhance returns as well as lower overall volatility. Recent growth in managed futures has been substantial. In 2002, it was estimated that more than USD45 billion was under management by managed futures trading advisors. By the end of 2007, that number had grown to more than USD200 billion. The benefits of managed futures within a well-balanced portfolio include:- (i) potential to lower overall portfolio risk; (ii) opportunity to enhance overall portfolio returns; (iii) broad diversification opportunities; (iv) opportunity to profit in a variety of economic environments; and (v) limited losses due to a combination of flexibility and discipline. By their very nature, managed futures provide a diversified investment opportunity. Trading advisors can participate in more than 150 global markets; from grains and gold to currencies and stock indices. Many funds further diversify by using several trading advisors with different trading approaches. In this example, the overall risk is reduced by almost 82 percent from –41.0 percent to –7.5 percent and the return also increases almost 20 percent from +7.4 percent to +8.9 percent. This is mainly due to the lack of correlation and, in some cases, negative correlation between some of the portfolio components in the diversified portfolio. There is even negative correlation between stocks and managed futures as the two markets move independently from each other. Typically managed by professional money managers using technical analysis, Managed Futures accounts involve going long or short in futures contracts in areas such as metals, grains, equity indexes and commodities of all types. Currency futures are also commonly traded. Only qualified investors with diverse investment strategies should consider adding managed futures investments to a portfolio. Represents an industry comprised of professional money managers known as Commodity Trading Advisors who manage client assets an a discretionary basis, using global futures markets as an investment medium. Benefits to Institutional Investors:- Managed Futures provide institutional investors with a variety of liquid, transparent investment programs that do not exhibit correlation to traditional or alternative investments, and oftentimes, one another. Though not a hedge, they often provide robust performance in unfavorable environments for equities and most alternative investments. The exchange-listed nature of the underlying instruments traded facilitates risk management and mitigates many of the dangers associated with model risk. Additionally, institutional investors who access the space via separately managed accounts substantially minimize operational risks and the possibility of fraud, maintain custody of assets, and have access to full transparency of positions. This section attempts to shed insight into other intrinsic features of managed futures which enable institutional investors to capitalize on these desirable characteristics. One of the unique advantages managed futures offer institutional investors is the ability to notionally fund investments, allowing investors to efficiently deploy cash to gain increased exposure or for allocation elsewhere in the portfolio. Due to the low margin requirements for most futures contracts, only a small fraction of the cash deposited at the manager's futures commission merchant is deployed as margin for trading. The remainder sits in cash equivalent instruments, earning interest and serving as a reserve in the event of trading losses. Rather than allowing cash to sit idle, many futures investors prefer to deploy part of this cash to increase their trading level and notional exposure. For instance, if an investor buys a theoretical futures contract with a notional value of USD100 000 and a margin requirement of USD10 000, USD10 000 will be deployed as margin and USD90 000 will remain in cash. If the investor chooses to do so, he could double his notional exposure from USD100 000 to USD200 000 by posting an additional USD10 000 as margin on the purchase of a second futures contract. The investor now holds a notional position of USD200 000 on his USD100 000 cash. This position will be able to withstand losses of 40 percent before all of the investor's cash is consumed, triggering a margin call (a 40 percent loss on two USD100 000 contracts equals USD80 000. Any losses surpassing this level would dip below the margin requirement on this position of USD20 000). Managed futures have evolved tremendously since the first iterations of long-term trend following in the late 1940s. Advances in technology, computing power, and telecommunications have opened up heretofore inconceivable possibilities in futures trading, not only for quantitative or systematic managers, but also for niche and discretionary experts whose access to critical information has been facilitated by these developments. Quantitative scientists and researchers have been able to apply highly technical and sophisticated methods to the markets for the first time since the clean, high quality data which they require has only recently become available at accessible prices. Shortterm traders are scouring tick databases which took years to build for persistent statistical aberrations whose exploitation has been made possible by the meteoric ascent of electronic markets and decreased transactions costs. Short-term traders are at the frontiers of interfacing trading with technology. Trend following has emerged from its naive, primarily rules-based beginnings to a highly sophisticated group of strategies whose ability to generate robust returns has been enhanced, while more closely controlling risk and drawdown. Some trend followers employ armies of scientists and mathematicians, and have formed alliances with top universities. If these developments are any indication, the future of managed futures is bright and incredible opportunities lay ahead for the next generation of traders and investors alike. CTAs of all persuasions offer institutional investors virtually limitless potential sources of uncorrelated returns to enhance the diversification of portfolios. The fact that managed futures strategies as a whole have historically performed well in environments that tend to be difficult for most other investments provides additional benefits to portfolios. While it is important to remember that managed futures are not a portfolio hedge, the mechanics of trend following, short-term trading, discretionary macro, and statistical pattern recognition explain their respective intrinsic proclivities

for different kinds of volatile markets. The prolonged dislocation in the global financial markets of 2007 and 2008 serves as only the latest example in a canon of many. While the growth of managed futures has been impressive, it has paled in comparison with that of other alternative investments (hedge funds that are non-managed futures, private equity, and real estate). There are hedge funds on the entire liquidity continuum between mutual funds and private equity funds, and managed futures should be regarded as liquid alpha, as opposed to the more limited characterization of simple trend follower. The space of managed futures is rich and fertile, with a very broad range of strategies and styles. The liquidity and transparency of the underlying instruments substantially mitigate the hidden risks which often accompany investing in hedge funds and alternative investments. Price discovery takes place constantly in futures markets, and settlements on all futures contracts are determined by the various exchanges at the end of each trading day, facilitating the pricing of portfolios and the measurement and management of risk. The value of liquidity is often under-estimated, and the performance of hedge funds that trade illiquid instruments have under-performed hedge funds that have better liquidity terms. Indeed one might argue that the space of managed futures has become so diverse with so many different types of risk-adjusted return possibilities to legitimately target, that it is perhaps questionable why anyone would invest in alternatives that have onerous lock-ups and trade illiquid or non-exchange traded instruments. A portfolio manager who is performing his or her fiduciary duty must justify that the investments that they are making are getting a proper liquidity premium. This in turn means that if they make an investment in an illiquid vehicle, then they are in essence stating that they could not have achieved that risk-adjusted return through more liquid investments in managed funds. The excellent breadth and liquidity of CTAs, or portfolios of CTAs, lends itself well as the engine of structured products. It is important to realize that due diligence is needed in selecting good CTAs. Like anything else, there are both good and bad CTAs, and only rigorous and proper due diligence will help to differentiate them. The propensity of managed futures toward positively skewed distributions of returns also suggests that few trading programs are susceptible to the risk of infrequent, potentially catastrophic losses. The mean-variance framework and Sharpe ratio rarely capture these effects, suggesting that deep analysis of the higher statistical moments or the application of the Omega function present superior approaches to the assessment of investment performance, risk, and return. As the institutional investment community reacquaints itself with managed futures – or as the case may well be, truly discovers it for the first time – it should consider it an eclectic amalgamation of liquid alpha strategies. Managed futures offers institutional investors actively managed exposure to a truly global and diversified array of liquid, transparent instruments. The returns of many of these do not display correlation and do not appear to be easily explained by traditional or alternative investments, and oftentimes, one another. Institutional investors should view managed futures not only as means to enhance portfolio diversification, but also as absolute return vehicles with intuitive risk management. / коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо). Являются представителями отрасли, состоящей из профессиональных управляющих денежными средствами, известными как Советниками по Торговле Сырьём (Commodity Trading Advisors), которые управляют активами клиентов на основе своего собственного усмотрения и использующие глобальные рынки фьючерсов в качестве инвестиционного средства.

MANAGED MONEY TYPES = ТИПЫ УПРАВЛЯЕМЫХ ДЕНЕЖНЫХ СРЕДСТВ – Managed Money Types:- a reference to the funds whereby a Commodity Trading Advisor (CTA) or Pool Operator makes trading decisions for speculative capital that has been raised for a specific reason.

MANAGEMENT = ПРАВЛЕНИЕ (или МЭНЭДЬЖМЕНТ) – Management:- control and supervision of a company, asset or operation; the group of people who control and administer a company, as distinct from the workforce. The effectiveness of a firm's management is often of vital importance to its performance, and management is therefore sometimes taken as a factor of production. Task of planning, organizing and controlling a business firm or other entity. / Правление или Мэнэдьжмент – комбинированная область науки и практики, включающая вопросы политики и управления. Также относится к лицам, принимающим решения и осуществляющим контроль, необходимый для реализации целей владельцев коммерческого предприятия, обеспечения его стабильности и роста. Формулирование политики требует анализа всех факторов, влияющих на краткосрочные и долгосрочные прибыли. Реализацией выработанной политики управляет главный исполнительный директор (chief executive officer), его непосредственные подчинённые, а также любые иные лица, которые имеют на это право. Таким образом, число управляющих может варьировать от одного в небольшой организации до многоуровневых управленческих иерархий в крупных сложных организациях. Высший управленческий персонал подотчётен владельцу фирмы; в крупных корпорациях председатель правления (chairman of the board), президент (president), а иногда и ключевые старшие управляющие работники подотчётны совету директоров (board of directors), куда входят выбранные представители акционеров. Применение научных принципов в процессе принятия решений называется научным управлением.

MANAGEMENT AUTHORIZATION = ВОЗЛОЖЕНИЕ ПОЛНОМОЧИЙ НА ПРАВЛЕНИЕ – Management Authorization is the limited authorization empowering the bank to manage only the administrative aspects of a client's securities safekeeping account. The bank has no authority to freely dispose of securities holdings. Also known as Management Mandate. See also Managed Account. / счёт ответственного хранения (safekeeping account) ценных бумаг клиента.

MANAGEMENT BOARD = СОВЕТ ПРАВЛЕНИЯ – Management Board is a management body that manages and represents a joint stock company. The management board usually comprises several persons elected by the supervisory board for a maximum of five years.

MANAGEMENT BUYOUT = ВЫКУП ПРАВЛЕНИЕМ (или ВЫКУП МЭНЭДЬЖМЕНТОМ) – A Management Buyout is a transaction by which the target's managers and additional equity and debt investors, such as banks or private equity funds, jointly acquire the shares of the target company. The buyers normally seek to finance the acquisition through the company's assets and to service the company's loans from future earnings. This is achieved usually by the formation of an acquisition company, which purchases the shares and is merged into the target after a certain period of time, although tax authorities have become increasingly reluctant to accept interest as financing expenses which can be offset against operating income. While debt investors expect a regular interest payment and a (partial) repayment of the loans and sometimes an option to purchase shares (in the event of mezzanine facilities), equity investors hope to achieve an appropriate return in view of the company's expected development and the prospects of a share sale. Purchase of a company's entire share capital (or a controlling percentage) by managers already active in the firm. Frequently combined with changes in the management structure and legal form of the company. Management Buy-Out (MBO) is a takeover of a company by managers who already work for the company. This is often the case with companies that are experiencing difficulties and the previous owners are not willing to make further commitments. If management's takeover is financed primarily through debt financing, this is also called a Leveraged Management Buy-Out. As a result, the company retains management's know-how. / выкупная операция. управляющими . выплата (repayment) . Выкуп Правлением или Выкуп Мэнэдьжментом – выкуп всех обращающихся акций компании её управляющими и превращение компании в частную. Как правило, управляющие должны будут заплатить премию к текущей рыночной цене акций, чтобы заставить акционеров пойти на сделку. Если управляющие для финансирования сделки делают крупный заём, то такая операция называется выкупом с 'финансовым рычагом' (leveraged buyout (LBO)). Управляющие могут купить свою компанию по разным причинам, например в целях предотвращения

поглощения, когда захватчик предполагает сменить управляющих, или для избежания тщательного исследования финансового состояния компании, которое неизбежно при статусе публичной компании. Ещё одной причиной может быть уверенность управляющих в том, что они смогут заработать больше денег для себя, если приобретут значительную часть акций компании. И, в конце концов, многие управляющие считают, что они всегда получат прибыль в случае обратного выкупа компании акционерами (revers leveraged buyout).

MANAGEMENT COMMITTEE = УПРАВЛЯЮЩИЙ КОМИТЕТ – Management Committee is a group of persons appointed by the board of directors to manage a corporation. / Группа лиц, назначенных советом директоров для управления корпорацией.

MANAGEMENT COMPANY = УПРАВЛЯЮЩАЯ КОМПАНИЯ – Management Company is a company created for the purpose of managing another company. / Компания, созданная с целью управления другой компанией.

MANAGEMENT FEE = ВОЗНАГРАЖДЕНИЕ ЗА УПРАВЛЕНИЕ (или ВОЗНАГРАЖДЕНИЕ ЗА МЭНЭДЬЖМЕНТ) – Management Fee is the fee paid to a company for managing an investment portfolio. / Вознаграждением за Управление является вознаграждение, выплаченное компании за управление инвестиционным портфелем. Вознаграждение за Управление – сбор, взимаемый из активов инвестора за управление портфелем вложений в открытый или закрытый взаимный фонд (mutualfund), а также за такие услуги, как обеспечение взаимоотношений с акционерами или административное управление. Эта плата, как указывается в проспекте (prospectus), равна фиксированному проценту стоимости активов фонда, как правило, 1% или менее в год. Плата также взимается за ведение Управляемого Счёта (managed account).

MANAGEMENT'S SHARE OF PROFIT = ДОЛЯ ПРИБЫЛИ ПРАВЛЕНИЯ (или ДОЛЯ ПРИБЫЛИ МЭНЭДЬЖМЕНТА) – Management's Share Of Profit:- share of net earnings paid to a company's management, or members of the board of directors. / Доля чистых заработков, выплаченных правлению компании или членам совета директоров.

MANAGERIAL COSTS = УПРАВЛЕНЧЕСКИЕ ЗАТРАТЫ (или УПРАВЛЕНЧЕСКИЕ РАСХОДЫ, или УПРАВЛЕНЧЕСКИЕ ИЗДЕРЖКИ) – Managerial Costs are the costs that are categorized so they can be used in decision making. See also Fixed Costs, and Variable Costs.

MANAGERS = УПРАВЛЯЮЩИЕ – In the United States, Managers are the individuals who are responsible for the maintenance, administration and management of the affairs of a limited liability company (LLC). In most states, the managers serve a particular term and report to and serve at the discretion of the members. Specific duties of the managers may be detailed in the articles of organization or the operating agreement of the LLC. In some states, the members of an LLC may also serve as the managers.

MANAGING AGENT = УПРАВЛЯЮЩИЙ АГЕНТ – At the Corporation of Lloyd's, Managing Agent is an underwriting agent which has permission from Lloyd's to manage a syndicate and carry on underwriting and other functions for a member. Managing agent is an underwriting agent responsible for managing a syndicate. / Корпорэйшэн оф Лойдз (Corporation of Lloyd's).

MANDAMUS = МАНДАМУС – A writ of mandamus or simply mandamus, which means 'we order' in Latin, is the name of one of the prerogative writs and is a court order directing someone, most frequently a government official, to perform a specified act. Mandamus is a writ issued by a court; requires that specific things be done. an extraordinary writ commanding an official to perform a ministerial act that the law recognizes as an absolute duty and not a matter for the official's discretion; used only when all other judicial remedies fail. / В переводе с Латинского языка – 'Мы Приказываем'. экстраординарное . Под Мандамусом, от Латинского слова Mandamus, означающее Мы Приказываем, в странах Англо-Саксонской системы права понимается судебный приказ, предписывающий тому или иному лицу (обычно должностному лицу) совершить действие, к которому его обязывает закон. Одно из конституционных средств судебной защиты прав и свобод человека. Мандамус в странах Англосаксонской правовой системы судебный приказ, предписывающий обычно какому-либо должностному лицу совершение действия, которое оно по закону обязано совершить.

MANDARIN COLLAR = МАНДАРИНСКИЙ ВОРОТНИК – Mandarin Collar is a small (two- to three-inch deep) collar standing on a high, close neckline. Mandarin Collar is a narrow stand-up collar usually open in front. / Мандарин, от Португальского слова Mandarim, от Санскр. Мантрин, означающее Советник), данное Португальцами название чиновников (Китайское слово Гуань) феодального Китая, перешедшее из Португальского в Русский и Западно-Европейские языки. В современных Советской и иностранной научной литературе слово Мандарин не употребляется.

MANDATORY EXCHANGE TRADING RULE = ОБЯЗАТЕЛЬНОЕ ПРАВИЛО БИРЖЕВОЙ ТОРГОВЛИ – Mandatory Exchange Trading Rule:- requirement that during trading hours exchange members (e.g., on the Swiss Exchange) settle all orders up to a pre-agreed size (limit) via the exchange. / Требование чтобы в течение торговых часов биржевые члены, например, на Швейцарской Бирже, рассчитывали все распоряжения до предварительно оговорённого размера (лимита) через биржу.

MANDATORY IASP = ОБЯЗАТЕЛЬНАЯ ПРАКТИКА МЕЖДУНАРОДНОГО АКТУАРНОГО СТАНДАРТА – Mandatory IASP:- a class 1 International Actuarial Standard of Practice (IASP). This is a standard of practice which is mandatory, in the sense that all actuaries are obliged to comply with it, or in the sense that IAA (short for International Actuarial Association) Member Associations are required to adopt it or endorse it. National associations of Actuaries may issue mandatory standards, for example where they are a surrogate for legislation. At the international level a mandatory standard would need to be adopted by each IAA Member Association and imposed by them as mandatory on their individual members.

MANDATORY INTERRUPTIBLE LOAD = ОБЯЗАТЕЛЬНАЯ БЕСПЕРЕБОЙНАЯ НАГРУЗКА (или ХХ) – Mandatory Interruptible Load (MIL) is retail customer load in ComEd (Commonwealth Edison Company) that can be interrupted at the request of PJM (PJM Interconnection LLC (Pennsylvania New Jersey Maryland Interconnection LLC). PJM members commit to reduce load by a fi xed MW (MegaWatt) amount or to a certain MW load or to initiate cycling of end-use equipment when called upon by PJM. The account of the load-serving entity (LSE) which nominated the customer's load drop is credited the MW amount committed. The credit can either be traded or used to meet the member's capacity obligation. Performance is measured, and penalties are charged for under compliance and payments are made for over compliance. / Эдэсэн (Edison). Пи.Дьжей.Эм. Интёконэкшэн Эл.Эл.Си. (PJM Interconnection LLC или Пэнсэлвэйниэ Ню Дьжози Мэрилэнд Интёконэкшэн Эл.Эл.Си. (Pennsylvania New Jersey Maryland Interconnection LLC)).

MANDATORY NATIONAL LAW = ОБЯЗАТЕЛЬНОЕ НАЦИОНАЛЬНОЕ ЗАКОНОДАТЕЛЬСТВО – Mandatory National Law means any statutory law concerning carriage of goods the provisions of which cannot be departed from by contractual stipulation to the detriment of the consignor.

MANDRELL = ПРОБОЙНИК (или ТОКАРНАЯ БАБКА) – Mandrell is the core around which the impregnated filaments are placed to form a specified shape in composite manufacture. The mandrel constitutes the internal shape of the composite.

MANGROVE = МАНГРОВОЕ – Mangrove:- tropical or subtropical vegetation (mainly trees) typical of tidal swamps. / Мангровые (Mangrove) Леса, низкоствольные (5–10 метров (м)) вечнозелёные леса, произрастающие на илистых тропических побережьях, защищённых от прибоя, но заливаемых во время прилива. Для деревьев мангровых лесов характерны ходульные корни, укрепляющие их в полужидком иле, и воздушные корни (пневматофоры), торчащие в виде столбиков из ила и снабжающие деревья кислородом. Листья часто мясистые, с водяными устьицами, через которые удаляется избыток солей; в старых листьях имеются резервуары с пресной водой. Плоды снабжены воздухоносной тканью, благодаря чему могут плавать в воде. Видовой состав мангровых лесов небогат:- чаще всего они состоят из представителей Родов Rhizophora, Avicennia, Aegiceras, Sonneratia, Bruguiera. Многие из них – живородящие растения. Внутренняя полоса мангровых лесов служит переходом к влажным тропическим лесам материка и состоит из Пальм Nipa Fruticans, Phoenix Paludosa и других. В мангровых лесах встречаются эпифиты – главным образом Луизианский Мох и другие Бромелиевые. Мангровые леса сосредоточены по плоским Восточным побережьям Африки, на Мадагаскаре, Сейшельских и Маскаренских островах, по берегам Южной Азии и Австралии, встречаются по Атлантическим побережьям Африки, Центральной и Южной Америки, а также по Тихоокеанскому берегу Америки от Южной Калифорнии до 4° Северной широты. Особенно пышны и богаты видами мангровые леса Малайского Архипелага.

MANGROVE RICE CULTIVATION = МАНГРОВАЯ КУЛЬТИВАЦИЯ РИСА – Mangrove Rice Cultivation is the use of the cleared mangrove forest land for Rice production.

MANGROVE SWAMPS = МАНГРОВЫЕ ЛЕСНЫЕ БОЛОТА – Mangrove Swamps are low-lying coastal swamps where mangrove trees grow. / Под Болотом понимается избыточно увлажнённый участок земной поверхности, заросший влаголюбивыми растениями. В болоте обычно происходит накопление неразложившихся растительных остатков и образование торфа. В основном в Северном полушарии; общая площадь около 350 миллионов га. Под Трясиной или Зыбуном понимаются участки зарастающих водоёмов, покрытые растительностью толщиной до 1–2 метров.

MANHOLE = ЛАЗ – Manhole (maritime term):- an opening into a tank or compartment designed to admit a man.

MANIFEST = МАНИФЕСТ – Manifest is a document giving the description of a ship's cargo or the contents of a railcar, truck, or container. Manifest (in the UK, 1840's), in commercial navigation, is a document signed by the master, containing the name or names of the places where the goods on board have been laden, and the place or places for which they are respectively destined; the name and tonnage of the vessel, the name of the master, and the name of the place to which the vessel belongs; a particular account and description of all the packages on board, with the marks and numbers thereon, the goods contained in such packages, the names of the respective shippers and consignees, as far as such particulars are known to the master, etc. A separate manifest is required for tobacco. The manifest must be made out, dated, and signed by the captain, at the place or places where the goods, or any part of the goods, are taken on board. For maritime and air transport, Manifest is the document listing the cargo on board the means of transport. The document may be used for customs purposes, subject to prior authorisation, when it contains the necessary particulars, in particular with regard to the customs status of the goods and their identification. Manifest:- this document lists in detail all the bills of lading issued by a vessel or its agent or master, i.e. a detailed summary of the total cargo of a vessel, which is used principally for customs purposes. Entire listing of all cargo on board a vessel as required by the relevant local authorities, e.g., customs. Manifest is a document that lists in detail all the bills of lading issued by a carrier or its agent or master for a specific voyage. A detailed summary of the total cargo of a vessel. Used principally for customs purposes. A cumulative list of Bills of Lading for official and administrative purposes, drawn up by the agents in the place of loading. Manifest is a document listing the contents, value, origin, destination, carrier and time a cargo is shipped. Also known as Cargo Manifest, and Shipping Manifest. Manifest is a document containing a full list of the ship's cargo, extracted from the bills of lading. Manifest is a document that lists all of the products being transported; used when loads are combined. The Manifests (Loading and Driver) are generated by transportation in Phoenix. A loading Manifest will be printed to the Warehouse so that they know who will be picking up the load and how to properly load the trailer. A Driver Manifest will be auto-faxed to the carrier so that they know the order of the stop(s), the address and shipping requirements of the client(s). / хозяин (или капитан). Известен также как Грузовой Манифест (Cargo Manifest), и Отгрузочный Манифест (Shipping Manifest). , то есть . В грузоперевозках под Манифестом, от позднелатинского слова Manifestum, означающее Призыв, понимается документ, содержащий в себе . Под Манифестом, от позднелатинского слова Manifestum, означающее Призыв, от Латинского слова Manifesto, означающее Открываю или Показываю, понимается:- (1) торжественное обращение, декларация какой-либо организации, содержащие изложение политических взглядов; или (2) Акт главы государства или высшего органа власти, обращённый к народу в связи с каким-либо крупным политическим событием (реформа системы власти, воцарение нового монарха и так далее).

MANIFEST TONNE = МАНИФЕСТНАЯ ТОННА – Manifest Tonne:- a cargo tonnage measurement. It is the greater of tons weight or cubic meters. In most cases, volume is greater than weight.

MANIFOLD = ПАТРУБОК (или КОЛЛЕКТОР, или ГРЕБЁНКА, или РАСПРЕДЕЛИТЕЛЬНАЯ МАГИСТРАЛЬ, или РАЗВЕТВЛЁННЫЙ ТРУБОПРОВОД) – Manifold:- a filter assembly containing multiple ports and integral relating components which services more than one fluid circuit. / Патрубок, небольшой отрезок трубы, присоединённый (ввальцованный, приклёпанный, приваренный) к трубопроводу, резервуару и другим конструкциям, служащий для подключения к ним трубопроводов и арматуры. В зависимости от принятого вида соединения свободный конец патрубка снабжают фланцем, резьбой или раструбом. Патрубок называется Переходным Патрубком, когда он имеет неодинаковые по размеру и форме концы. Патрубки – также соединительные трубопроводы, служащие для транспортировки рабочих тел под действием разности давлений. Под Коллектором, от позднелатинского слова Collector, означающее Собиратель, понимается название некоторых технических устройств (смотрите Электромашинный Коллектор, Канализационный Коллектор и другое).

MANIFOLD FILTER = РАЗДАТОЧНЫЙ ФИЛЬТР (или РАСПРЕДЕЛИТЕЛЬНЫЙ ФИЛЬТР) – Manifold Filter is a filter in which the inlet and outlet port axes are at right angles, and the filter element axis is parallel to either port axis. See also Filter.

MANILA = МАНИЛЛА (или МАНИЛЬСКАЯ ПЕНЬКА, или ТЕКСТИЛЬНЫЙ БАНАН, или МАНИЛЬСКОЕ) – Manila is a fiber obtained from the leaf stalks of the Abaca Plant. It is generally used for cordage. / Манильская Пенька или Манилла или Абака, волокно, извлекаемое из влагалищ листьев многолетнего тропического растения – Текстильного Банана, или Абаки, родом с Филиппинских островов, где культура его наиболее распространена. Реже культивируется в других тропических областях Азии, Африки и Южной Америки. Для выделения Манильской пеньки растение срезают у корня, удаляют листовые пластинки (содержащие слабые волокна, используемые для производства бумаги) и отделяют пучки волокон от мякоти листовых влагалищ. С одного растения получают в среднем 0.5 килограмма (кг) Манильской пеньки. Элементарные волокна имеют длину от 2 до 12 миллиметров (мм). Идущие в переработку технические (комплексные) волокна состоят из склеенных элементарных волокон. Они имеют длину от 1 до 5 метров (м), грубы и жёстки, хорошо окрашиваются, равномерны по тонине, прочны и очень гигроскопичны. Манильскую пеньку применяют в качестве материала для морских канатов, так как она

сравнительно слабо разрушается от действия морской воды. Из Манильской пеньки изготовляют также верёвки, шпагат, рыболовные сети, мешки и другие изделия. Пенька – грубое лубяное волокно, полученное из стеблей Конопли. На заводах и пунктах первичной обработки в результате мятья и трепания тресты (вымоченных стеблей Конопли) получают пеньку (длиной более 700 мм) и отходы (короткое пеньковое волокно). Выделяют пеньку пенькотрёпальными машинами. Пенька – сырьё для изготовления канатов, хозяйственной верёвки, сноповязального и упаковочного шпагата, брезента, парусины, пожарных рукавов и тому подобного. Изделия из пеньки устойчивы к гниению. Пенькой называют также лубяные волокна, извлекаемые из растений других ботанических видов, например, Манильская Пенька или Абака (из листьев прядильного Банана), Бомбейская Пенька (из стеблей Кроталярии).

MANILA = МАНИЛЬСКОЕ – Manila (maritime term):- rope made from the fibers of the Abaca Plant. / Манильский Трос.

MANIPULATION = МАНИПУЛЯЦИЯ (или МАХИНАЦИЯ, или ПОДТАСОВКА) – Manipulation is any planned operation, transaction, or practice that causes or maintains an artificial price. Specific types include Corners and Squeezes as well as unusually large purchases or sale of a commodity or security in a short period of time in order to distort prices, and putting out false information in order to distort prices. An illegal operation. Buying or selling an asset for the purchase of creating false or misleading appearance of active trading or for the purpose of raising or depressing the price to induce purchase or sale by others. / Под Манипуляцией, от Французского слова Manipulation, от Латинских слов Manipulus, означающее Горсть или Пригоршня, и Manus, означающее Рука, понимается любая незаконная спланированная операция, с целью . Под Манипуляцией, от Французского слова Manipulation, от Латинских слов Manipulus, означающее Горсть или Пригоршня, и Manus, означающее Рука, понимается:- (1) движения руки или обеих рук, связанные с выполнением определённых процессов (например, при управлении каким-либо устройством); сложный приём в ручной работе, требующий большой точности. (2) Ловкая проделка, ухищрение, подтасовка фактов для достижения неблаговидной цели; то же, что Махинация. Манипуляция – покупка или продажа ценных бумаг для создания неверного впечатления об активной торговой деятельности и влияния на решения инвесторов относительно покупки или продажи ценных бумаг. Это может быть сделано одним лицом или группой действующих согласованно лиц. Лица, которые были признаны виновными в манипуляции, подлежат уголовному и гражданскому наказанию.

MANMADE FIBERS = ИСКУССТВЕННЫЕ ВОЛОКНА – Manmade Fibers are the industrially produced fibers, as contrasted with such natural fibers as cotton, silk, and wool. Examples are acetate, acrylics, nylon, olefin, polyester, and rayon. See also Manufactured Fiber. A fiber which is manufactured rather than occurring naturally. Man-made fibers can be further divided into cellulosic or artificial fibers, which are made from naturally occurring polymers such as wood pulp; and synthetic fibers, which are made from chemically derived polymers. Manmade Fibers are classified into two groups:- organic and inorganic, and three classes:- those made from natural polymers, those made from synthetic polymers and those made from inorganic materials. Fibers from natural polymers:- the most common natural polymer fiber is Viscose (fiber code – CV or VI), which is made from the polymer cellulose obtained mostly from farmed trees. Other cellulose-based fibers are Acetate (CA or AC), Cupro (CUP or CU), Lyocell (CLY), Modal (CMD or MD) and Triacetate (CTA or TA). Less common natural polymer fibers are made from rubber (Elastodiene – ED, previously called Elastofibers), alginic acid (Alginate – ALG) and regenerated protein. Fibers from synthetic polymers:- there are very many synthetic fibers, i.e. organic fibers based on petrochemicals. The most common are Acrylic (PAN), Modacrylic (MAC), Polyamide (PA, often called Nylon), Polyester (PES), Polypropylene (PP, sometimes called Polyolefins), the segmented Polyurethanes which are elastic fibers known as Elastanes (EL, or Spandex in the USA), and speciality fibers such as the high performance Aramids (AR). There are also Chlorofibers (CLF), Elastodiene (ED), Fluorofibers (PTFE), Polyethylene (PE), Polyimide (PI), Pinylal (PVAL). Fibers from inorganic materials:- the inorganic man-made fibers are fibers made from materials such as Carbon (CF), Ceramic (CEF), Glass (GF) and Metal (MTF). These fibers are very often used to reinforce plastics to form composites. See also Synthetic Fibers. A Man-Made Fiber, e.g., viscose, rayon. Also known as Manufactured Fiber. Man-Made Fibers is an overall term referring to all fibers not found naturally. This includes rayon and acetate made from cellulose, a natural product. The term synthetic fibers also ap plies only to man-made fibers made entirely in the laboratory from such things as petroleum (polyester). In 50 years (on 2014-December-19), since the publication of the first yearbook, the share of man-made fibers in global fiber production grew from 26% in 1963 (4.4 KT) to 70% (63.2 KT) in 2013, as explained. This shows the neverending success of man-made fibers. Man-made fibers account for 82% of all textiles fibers processed in Europe. The principal enduses are in clothing, carpets, household textiles and a wide range of technical products – tyres, conveyor belts, fillings for sleeping bags and cold-weather clothing, filters for improving the quality of air and water in the environment, hygiene products, fire-resistant materials, reinforcement in composites used for advanced aircraft production, and much else. Fibers are precisely engineered to give the right combination of qualities required for the end-use in question:- appearance, handle, strength, durability, stretch, stability, flame retardancy, warmth, protection, easy care, breathability, moisture absorption and value for money, for example. In many cases, they are used in blends with natural fibers such as cotton and wool. Man-made fibers come in two main forms:- continuous filament, used for weaving, knitting or carpet production; and staple, discontinuous lengths of fiber which can be mechanically spun into yarn or incorporated in unspun uses such as fillings or non-wovens. / Найлан^{T3} (Nylon^{TM}). Смотрите также Изготовленное Волокно (Manufactured Fiber). Вискоза, Ацетатное, Купровое (Медное), Лайосэльное, Модальное и Триацетатное. (Эластодиен, эластоволокна), альгиновая кислота (Альгинат) и регенерированный протеин. Акриловое, Модакриловое, Полиамидное (Найлан^{T3} (Nylon^{TM})), Сложное Полиэфирное, Полипропиленовое (Полиолефинами), сегментированное Полиуретановое, Эластаны (или Спандэкс в США), и Арамиды. Существуют также Хлорволокна (ХЛВ), Эластодиены (ЭД), Фторволокна (например, ПТФЭ, сокращённо от политетрафторэтилена, Тефлон^{T3}), Полиэтиленовые (ПЭ), Полиимидные (ПИ), Пинилальные. Углеродные, Керамические, Стеклянные (или стекловолокна) и Металловолокна. Элементы засорённости:- замасливатели, антистатики и так далее. , то есть . Искусственные волокна (главным образом вискозные) получают из продуктов химической переработки природных полимеров. Искусственное Волокно (Нить) – химическое волокно (нить), изготовленное в результате производственного процесса из волокнообразующих веществ. Под Искусственными Волокнами понимаются химические волокна, получаемые из природных органических полимеров. К искусственным волокнам относятся:- ацетатные волокна, белковые искусственные волокна, вискозные волокна и медноаммиачные волокна. Для получения белковых волокон используют белки растительного и животного происхождения, например, зеин, казеин. Вискозные и медноаммиачные волокна, состоящие из гидратцеллюлозы, называются также гидратцеллюлозными. Впервые выпуск искусственных волокон в промышленном масштабе был организован во Франции в 1891. Сырьём для производства ацетатных, вискозных и медноаммиачных волокон служит целлюлоза, выделяемая из древесины; ацетатные и медноаммиачные волокна часто получают из хлопковой целлюлозы (хлопкового пуха и подпушка). Искусственные волокна формуют из растворов полимеров по сухому и мокрому способу и выпускают в виде текстильной или кордной нити, а также штапельного волокна. К недостаткам белковых, вискозных и медноаммиачных волокон относятся значительная потеря прочности в мокром состоянии и лёгкая сминаемость. Однако благодаря хорошим гигиеническим свойствам, дешевизне и доступности исходного сырья производство вискозного волокна продолжает развиваться. Растёт также выпуск ацетатных волокон, обладающих рядом ценных качеств (несминаемость, хороший внешний вид). Белковые волокна вырабатываются в небольших количествах, и выпуск их постепенно уменьшается (данные на 1991). Мировое

производство искусственных волокон в 1968 составляло 3 527 200 тонн (около 48.4% от общего выпуска химических волокон). Смотрите также Белковые Волокна, Вискозные Волокна, Медноаммиачные Волокна, Синтетические Волокна, Текстильные Волокна и Химические Волокна. Под Искусственными Волокнами или Химическими Волокнами понимаются волокна, получаемые из продуктов химической переработки природных полимеров (искусственного волокна) или из синтетических полимеров (синтетического волокна). Производство, так называемое формование, заключается в продавливании раствора или расплава полимера через отверстия фильеры в среду, которая вызывает затвердевание образовавшихся тонких волокон. Такой средой при формовании из растворов служит горячий воздух ('сухой' способ) или специальный раствор, так называемая осадитная ванна ('мокрый' способ), а из расплавов – холодный воздух. Химические волокна выпускаются в виде мононити, штапельного волокна или пучка из многих тонких нитей, соединённых путём крутки.

MANNING SCALES = КОЛИЧЕСТВО ПЕРСОНАЛА ДНЕВНОЙ СМЕНЫ – Manning Scales:- the minimum number of officers and crew members that can be engaged on a ship to be considered as sufficient hands with practical ability to meet every possible eventuality at sea.

MANOFAST = МЭНЭФАСТ – Manofast is a trade name for chemical name:- thiourea dioxide. Other common names are:- Formamidine Sulphinic Acid; and Amino Imino Methane Sulphinic Acid ($CH_4N_2O_2S$). Molecular weight:- 108.12. Manofast is a white crystalline powder which is stable indefinitely if stored in a cool dry place, but which deteriorates rapidly under warm, moist conditions. However, it has been found that the perfectly dry powder can be heated at 80 °C for an hour or left exposed to oxygen gas for several days at room temperature without serious deterioration, but such treatment is not recommended. Manofast is slightly soluble in water, giving an acid solution, the pH of a 1% aqueous solution being approximately 3. Aqueous solutions at 20 °C decompose slowly, e.g., a 0.5% aqueous solution is 10% decomposed in 11 days and 30% decomposed in 15 days. At temperature greater than 60 °C decomposition is rapid and accurate determination of solubility at such temperatures is difficult. The solubility of Manofast is increased in the presence of sulphuric acid, e.g., in 15N sulphuric acid the solubility at 20 °C is 20.5 parts Manofast per 100 parts solvent. Manofast is insoluble in almost all organic solvents, including ethyl alcohol, acetone, ether and benzene and other hydrocarbons. Hardman & Holden Limited, Manchester, the United Kingdom. Manofast is a stable reducing agent under acid conditions. This gives Manofast a very important advantage over both sodium hydrosulphite and sodium formaldehyde sulphoxylate, which are instantly decomposed by acid. Manofast is also a strong reducing agent under alkaline conditions. Its reducing action being even stronger than that of sodium hydrosulphite. Many metal salts are reduced by alkaline solutions of Manofast directly to the metal, e.g., cadmium and silver. Uses and Suggested Applications:- (1) Reducing agent for the printing and dyeing with vat dyestuffs of fibers (e.g., cellulose acetate, cellulose triacetate, wool, real silk, nylon, Terylene, Acrilan, Courtelle and mixtures of these fibers), which may be alkalisensitive and for which acid leuco-derivatives have affinity. (2) For the treatment of wool and other keratinous fibers to reduce the disulphide linkages to sulphydryl groups, in order to produce altered fibers with improved properties (3) In photography. (4) For preventing discoloration of substituted phenols. (5) Emulsion polymerisation of vinyl acetate and other vinylidene monomers. Further applications of Manofast will no doubt be apparent from consideration of its reducing properties under the required conditions. Storage and Handling:- to minimise the risk of decomposition, Manofast should be stored under cool, dry conditions (less than 77 °F). Scoops and other utensils which are used to handle the material should be clean and dry and the lid of the drum should be replaced immediately after use. Also, care should be taken that oxidising agents or caustic alkalis are not allowed to contaminate Manofast in the drum. Adequate standards of personal hygiene should be maintained (frequent washing of the hands, use of a suitable barrier cream, use of rubber gauntlets, etc), and workers who are susceptible to dermatitis should take care to avoid skin contact, particularly when handling printing pastes containing Manofast. Workers who suffer from nasal irritation when weighing Manofast should use gauze dustmasks. Packaging:- Manofast is packed in 56 lb (25 kg) drums of 24 gauge metal. These drums are of a full aperture type fitted with 'Snaplock' ring closures. The lid is rubber sealed and the drums are varnished inside and painted light gray outside. They are 14" in diameter and 19" high. / Мэнэфаст . Найлан^{T3} (Nylon^{TM}). Формамидин Сульфиновая Кислота (Formamidine Sulphinic Acid); и Амино Имино Метан Сульфиновая Кислота (Amino Imino Methane Sulphinic Acid ($CH_4N_2O_2S$)). диоксид тиомочевины (thiourea dioxide). MAN ROPES = ЛЕЕРЫ (или ФАЛРЕПЫ, или XX) – Man Ropes (maritime term):- ropes hung and used for assistance in ascending and descending. / Под Леером, от Голландского слова Leier, понимается судовой трос, служащий для подъёма косых парусов, ограждения палубных отверстий или открытых палуб в местах, не защищённых комингсом или фальшбортом, подвески шлангов при передаче жидкого топлива на ходу и другого. На современных судах постоянное или съёмное леерное ограждение состоит из металлических стоек высотой не менее 1 метра (м), через отверстия которых пропускаются в 2–3 ряда лееры.

MANTA = МАНТА (или XX) – Manta is a square piece of cloth or blanket used in southwestern United States and Latin America usually as a cloak or shawl. / .

MANTEAU = МАНТО (или ПЛАЩ, или ШИНЕЛЬ, или ПАЛЬТО) – Manteau is a loose cloak, coat, or robe. / .

MANTELET = МАНТЁЛЕ (или КОРОТКИЙ ПЛАЩ) – Mantelet is a very short cape or cloak. / короткая женская накидка.

MANTILLA = МАНТИЙА (или МАНТИЛЬЯ) – Mantilla is a light scarf worn over the head and shoulders especially by Spanish and Latin-American women; a short light cape or coat. Mantilla is a lace scarf worn over the head. / Головной кружевной шарф.

MANTLE = МАНТИЯ (или НАКИДКА) – Mantle is a loose sleeveless garment worn over other clothes, cloak. / Под Мантией, от среднегреческого слова Mantion, означающее Плащ или Покрывало, понимается широкая, ниспадающая до земли одежда, надеваемая поверх другого платья; парадное одеяние царей, Папы Римского, высших служителей православной церкви. В некоторых странах (например, в Великобритании) мантии надевают судьи и адвокаты, в торжественных случаях – члены учёных обществ и академий.

MANTUA = МАНТУА (или МАНТУЯ) – Mantua is a usually loose-fitting gown especially in the XVII and XVIII centuries. / .

MANUAL RATES = СТАВКИ 'РУКОВОДСТВА ПО ОЦЕНКЕ СТРАХОВЫХ ПРЕМИЙ' (или СТАВКИ ИЗ ПОСОБИЯ) – Manual Rates:- usually the published rate for some unit of insurance. An example is the Workers Compensation Manual where the rates shown apply to each USD100.00 of the payroll of the insured, USD100.00 being the unit.

MANUFACTURED FIBER = ИЗГОТОВЛЕННОЕ ВОЛОКНО – Manufactured Fiber is a class name for various genera of fibers (including filaments) produced from fiber-forming substances which may be:- (1) polymers synthesized from chemical compounds, e.g., acrylic, nylon, polyester, polyethylene, polyurethane, and polyvinyl fibers; (2) modified or transformed natural polymers, e.g., alginic and cellulose-based fibers such as acetates and rayons; and (3) minerals, e.g., glasses. The term Manufactured usually refers to all

chemically produced fibers to distinguish them from the truly natural fibers such as cotton, wool, silk, flax, etc. See also Manmade Fibers, and Rayon Fiber. Manufactured Fibers:- for thousands of years, the use of fiber was limited by the inherent qualities available in the natural world. Cotton and linen wrinkled from wear and washings. Silk required delicate handling. Wool shrank, was irritating to the touch, and was eaten by moths. Then, a mere century ago, rayon – the first manufactured fiber – was developed. The secrets of fiber chemistry for countless applications had begun to emerge. Manufactured fibers now are put to work in modern apparel, home furnishings, medicine, aeronautics, energy, industry, and more. Fiber engineers can combine, modify and tailor fibers in ways far beyond the performance limits of fiber drawn from the silkworm cocoon, grown in the fields, or spun from the fleece of animals. The Early Attempts:- the earliest published record of an attempt to create an artificial fiber took place in 1664. English naturalist Robert Hooke suggested the possibility of producing a fiber that would be 'if not fully as good, nay better' than silk. His goal remained unachieved for more than two centuries. The first patent for 'artificial silk' was granted in England in 1855 to a Swiss chemist named Georges Audemars. He dissolved the fibrous inner bark of a mulberry tree, chemically modifying it to produce cellulose. He formed threads by dipping needles into this solution and drawing them out – but it never occurred to him to emulate the silkworm by extruding the cellulosic liquid through a small hole. In the early 1880's, Sir Joseph Wilson Swan (1828–1914), an English chemist and electrician, was spurred to action by Thomas Edison's new incandescent electric lamp. He experimented with forcing a liquid similar to Audemars solution through fine holes into a coagulating bath. His fibers worked like carbon filament, and they found early use in Edison's invention. It also occurred to Swan that his filament could be used to make textiles. In 1885 he exhibited in London some fabrics crocheted by his wife from his new fiber. But electrical lamps remained his main interest, and he soon abandoned work on textile applications. First Commercial Production:- The first commercial scale production of a manufactured fiber was achieved by French chemist Count Hilaire de Chardonnet (Louis-Marie-Hilaire Bernigaud de Grande; 1839–1924). In 1889, his fabrics of 'artificial silk' caused a sensation at the Paris Exhibition. Two years later he built the first commercial rayon plant at Besancon, France, and secured his fame as the 'father of the rayon industry'. Several attempts to produce 'artificial silk' in the United States were made during the early 1900's but none were commercially successful until the American Viscose Company, formed by Samuel Courtaulds and Co., Ltd., began production its production of rayon in 1910. In 1893, Arthur D. Little of Boston, invented yet another cellulosic product – acetate – and developed it as a film. By 1910, Camille and Henry Dreyfus were making acetate motion picture film and toilet articles in Basel, Switzerland. During World War I, they built a plant in England to produce cellulose acetate dope for airplane wings and other commercial products. Upon entering the War, the United States government invited the Dreyfus brothers to build a plant in Maryland to make the product for American warplanes. The first commercial textile uses for acetate in fiber form were developed by the Celanese Company in 1924. In the meantime, US rayon production was growing to meet increasing demand. By the mid-1920's, textile manufacturers could purchase the fiber for half the price of raw silk. So began manufactured fibers' gradual conquest of the American fiber market. This modest start in the 1920's grew to nearly 70% of the national market for fiber by the last decade of the century. Nylon – The 'Miracle' Fiber:- In September 1931, American chemist Wallace Carothers reported on research carried out in the laboratories of the DuPont Company on 'giant' molecules called Polymers. He focused his work on a fiber referred to simply as '66', a number derived from its molecular structure. Nylon, the 'miracle fiber' was born. The Chemical Heritage Foundation is currently featuring an exhibit on the history of nylon. By 1938, Paul Schlack of the I.G. Farben Company in Germany, polymerized caprolactam and created a different form of the polymer, identified simply as nylon '6'. Nylon's advent created a revolution in the fiber industry. Rayon and acetate had been derived from plant cellulose, but nylon was synthesized completely from petrochemicals. It established the basis for the ensuing discovery of an entire new world of manufactured fibers. An American Romance:- DuPont began commercial production of nylon in 1939. The first experimental testing used nylon as sewing thread, in parachute fabric, and in women's hosiery. Nylon stockings were shown in February 1939 at the San Francisco Exposition – and the most exciting fashion innovation of the age was underway. American women had only a sampling of the beauty and durability of their first pairs of nylon hose when their romance with the new fabric was cut short. The United States entered World War II in December 1941 and the War Production Board allocated all production of nylon for military use. Nylon hose, which sold for USD1.25 a pair before the War, moved in the black market at USD10. Wartime pin-ups and movie stars, like Betty Grable, auctioned nylon hose for as much as USD40 000 a pair in war-effort drives. During the War, nylon replaced Asian silk in parachutes. It also found use in tires, tents, ropes, ponchos, and other military supplies, and even was used in the production of a high-grade paper for US currency. At the outset of the War, cotton was king of fibers, accounting for more than 80% of all fibers used. Manufactured and wool fibers shared the remaining 20%. By the end of the War in August 1945, cotton stood at 75% of the fiber market. Manufactured fibers had risen to 15%. The Post-War Industry:- after the war, GI's came home, families were reunited, industrial America gathered its peacetime forces, and economic growth surged. The conversion of nylon production to civilian uses started and when the first small quantities of postwar nylon stockings were advertised, thousands of frenzied women lined up at New York department stores to buy. In the immediate post-war period, most nylon production was used to satisfy this enormous pent up demand for hosiery. But by the end of the 1940's, it was also being used in carpeting and automobile upholstery. At the same time, three new generic manufactured fibers started production. Dow Badische Company (today, BASF Corporation) introduced metalized fibers; Union Carbide Corporation developed modacrylic fiber; and Hercules, Inc. added olefin fiber. Manufactured fibers continued their steady march. By the 1950's, the industry was supplying more than 20% of the fiber needs of textile mills. A new fiber, 'acrylic', was added to the list of generic names, as DuPont began production of this wool-like product. Meanwhile, polyester, first examined as part of the Wallace Carothers early research, was attracting new interest at the Calico Printers Association in Great Britain. There, J.T. Dickson and J.R. Whinfield produced a polyester fiber by condensation polymerization of ethylene glycol with terephthalic acid. DuPont subsequently acquired the patent rights for the United States and Imperial Chemical Industries for the rest of the world. A host of other producers soon joined in. A Wash and Wear Revolution:- In the summer of 1952, 'wash and wear' was coined to describe a new blend of cotton and acrylic. The term eventually was applied to a wide variety of manufactured fiber blends. Commercial production of polyester fiber transformed the 'wash and wear' novelty into a revolution in textile product performance. Polyester's commercialization in 1953 was accompanied by the introduction of triacetate. The majority of the XX century's basic manufactured fibers now had been discovered, and the industry's engineers turned to refining their chemical and physical properties to extend their use across the American economy. In the 1960's and 1970's consumers bought more and more clothing made with polyester. Clotheslines were replaced by electric dryers, and the 'wash and wear' garments they dried emerged wrinkle free. Ironing began to shrink away on the daily list of household chores. Fabrics became more durable and color more permanent. New dyeing effects were being achieved and shape-retaining knits offered new comfort and style. Endless Possibilities:- in the 1960's, manufactured fiber production accelerated as it was spurred on by continuous fiber innovation. The revolutionary new fibers were modified to offer greater comfort, provide flame resistance, reduce clinging, release soil, achieve greater whiteness, special dullness or luster, easier dyeability, and better blending qualities. New fiber shapes and thicknesses were introduced to meet special needs. Spandex, a stretchable fiber; aramid, a high-temperature-resistant polyamide; and para-aramid, with outstanding strength-to-weight properties, were introduced into the marketplace. In the early 1960's, manufactured fiber accounted for nearly 30% of American textile mill consumption. By 1965, the manufactured fiber industry was providing over 40% of the nation's fiber needs. One dramatic new set of uses for manufactured fibers came with the establishment of the US space program. The industry provided special fiber for uses ranging from clothing for the astronauts to spaceship nose cones. When Neil Armstrong took 'One small step for man, one giant

leap for mankind', on the moon on July 20, 1969, his lunar space suit included multi-layers of nylon and aramid fabrics. The flag he planted was made of nylon. Today, the exhaust nozzles of the two large booster rockets that lift the space shuttle into orbit contain 30 000 pounds of carbonized rayon. Carbon fiber composites are used in as structural components in the latest commercial aircraft, adding strength and lowering weight and fuel costs. Safety and Energy Challenges:- the early 1970's saw a wave of consumer protection demands, most notably one for a mandated Federal flammability standard for children's sleepwear. The manufactured fiber industry spent USD20 million on flammability research and development in 1972 and 1973, and manufactured fiber fabrics became predominant in this market. Flammability standards were also issued for carpet and other products. In the US carpet market, 99% of all surface fibers are now manufactured fibers. In late 1973, when the Nation was struck by a severe energy crisis, the manufactured fiber industry reduced the energy required to produce a pound of fiber by 26%. By then, the industry was using but 1% of the Nation's petroleum supply to provide two-thirds of all fibers used by American textile mills. Today:- innovation is the hallmark of the manufactured fiber industry. Fibers more numerous and diverse than any found in nature are now routinely created in the industry's laboratories. Nylon variants, polyester, and olefin are used to produce carpets that easily can be rinsed clean – even 24 hours after they've been stained. Stretchable spandex and machine-washable, silk-like polyesters occupy solid places in the US apparel market. The finest microfibers are remaking the world of fashion. For industrial uses, manufactured fibers relentlessly replace traditional materials in applications from super-absorbent diapers, to artificial organs, to construction materials for moon-based space stations. Engineered non-woven products of manufactured fibers are found in applications from surgical gowns and apparel interfacing to roofing materials, road bed stabilizers, and floppy disk envelopes and liners. Non-woven fabrics, stiff as paper or as soft and comfortable as limp cloth, are made without knitting or weaving. As they always have, manufactured fibers continue to mean, 'life made better'. / Найлан^{TЗ} (Nylon^{TM}). Робэт Хук (Robert Hooke). Одэмар (Audemars). MANUFACTURED GAS = ГЕНЕРАТОРНЫЙ ГАЗ – Manufactured Gas is a gas obtained by destructive distillation of coal, by the thermal decomposition of oil, or by the reaction of steam passing through a bed of heated coal or coke. Examples are coal gases, coke or oven gases, producer gas, blast furnace gas, blue (water) gas, or carbureted water gas. / Генераторный Газ, газообразное топливо, производимое посредством газификации топлив, таких как древесина, мазут, сланцы, торф, уголь и других. Этот процесс ведётся в газогенераторах окислением топлива при высокой температуре воздухом (образуется воздушный газ), водяным паром (водяным газом). По виду дутья различают водяной, воздушный, смешанный (паровоздушный), парокислородный генераторный газ. За счёт комбинации окислителей могут быть получены смешанные газы, например, полуводяной. Под давлением и при использовании парокислородной смеси из угля образуется, так называемый городской газ, содержащий до 15% метана. Генераторный газ содержит на 1 моль (или объём) оксида углерода 2 моля (или объёма) азота, небольшое количество диоксида углерода и метана. Водяной генераторный газ (теплота сгорания 10–13.4 МДж/м^3) применяется для получения химических продуктов, например, метанола (метилового спирта) или углеводородов. Воздушный генераторный газ (теплота сгорания 3.8–4.5 МДж/м^3) применяется обычно в качестве топлива промышленных печей.

MANUFACTURED PAYMENT = ОСУЩЕСТВЛЁННЫЙ ПЛАТЁЖ – Manufactured Payment is a payment from a borrower of securities compensating the lender of the securities for dividends or other income the lender would have received from the loaned securities. / Платёж от заёмщика ценных бумаг, компенсирующий займодавцу ценных бумаг дивиденды или иной доход займодавца, который мог бы быть получен им от заимствованных ценных бумаг.

MANUFACTURED PRODUCTS = ИЗГОТОВЛЕННЫЕ ПРОДУКТЫ – Manufactured Products are materials other than grain cleanings and includes materials such as malted, crushed, or ground grain which cannot be assigned a grade. Inspection may be performed on request. Certificates issued have only the composition endorsed on the back, providing the identification of the components is unquestionable; for example, 80% crushed Wheat, 15% crushed Barley, 5% whole Wheat. On the face of the certificate, Manufactured Product is indicated.

MANUFACTURER'S DATA PLATE = ТАБЛИЧКА С ДАННЫМИ ОБ ИЗГОТОВИТЕЛЕ (или ПРОИЗВОДСТВЕННАЯ МАРКА, или ШИЛЬД) – Manufacturer's Data Plate is a plate mounted on the container indicating the name and the address of the container manufacturer, giving details of gross and tare weights and external dimensions. / Табличка, закреплённая на контейнере, указывающая наименование и адрес изготовителя этого контейнера, и дающая сведения о брутто весе, весе тары и внешних габаритах. Под Производственной Маркой или Шильдом понимается клеймо (штамп), проставляемое на изделии или его упаковке в целях индивидуализации изготовителя.

MANUFACTURERS PLATE = ТАБЛИЧКА ИЗГОТОВИТЕЛЯ (или ПРОИЗВОДСТВЕННАЯ МАРКА, или ШИЛЬД) – Manufacturers Plate is a plate indicating the name and address of the container manufacturer and particulars of the container. / Табличка, указывающая наименование и адрес изготовителя этого контейнера, а также характеристики этого контейнера.

MANUFACTURING COMPANIES = ИЗГОТАВЛИВАЮЩИЕ КОМПАНИИ (или ПРОИЗВОДСТВЕННЫЕ КОМПАНИИ) – Manufacturing Companies:- in national accounting, aggregate of economic units that produce goods and services which are not financial in nature. / В национальном бюджетном процессе, агрегат хозяйствующих субъектов, которые производят товары и оказывают услуги, не являющиеся сами по себе финансовыми. В Соединённых Штатах Америки (США) не все производственные компании относятся к числу изготавливающих.

MAN–UP = МЕХАНИЧЕСКИЕ ПОДЪЁМНИКИ – Man-Up:- lift trucks that raise the operator as well as the load. Two types of man-up lift trucks are turret trucks and order selectors.

MANURE = НАВОЗ (или ОРГАНИЧЕСКОЕ УДОБРЕНИЕ) – Manure is a material used as fertilizer, e.g., organic material and excreta. / Под Навозом понимается органическое удобрение из твёрдых и частично жидких экскрементов животных обычно в смеси с подстилочным (солома, торф) материалом. Применяют на разных почвах (особенно эффективен в нечернозёмной зоне) под различные сельскохозяйственные культуры (наиболее отзывчивы Капуста, Картофель, Конопля, Кукуруза, Огурец и другие). Содержит азот, калий, фосфор и микроэлементы. Используется также для приготовления теплично-парниковых почвосмесей, в компостах и как биотопливо.

MANY–TO–MANY = ОТ МНОГИХ МНОГИМ – A term Many-To-Many refers to a trading platform in which multiple participants have the ability to execute or trade commodities, derivatives, or other instruments by accepting bids and offers made by multiple other participants. In contrast to one-to-many platforms, many-to-many platforms are considered trading facilities under the US Commodity Exchange Act. Traditional exchanges are many-to-many platforms. / Относится к торговой платформе, в которой многочисленные участники имеют возможность исполнять или торговать различными видами сырья, производными инструментами (деривативами), или иными инструментами посредством принятия предложений на покупку и оферт, сделанных другими многочисленными участниками. В отличие от платформ от одного многим (one-to-many platforms), платформы от многих многим рассматриваются в качестве приемлемых торговых систем в соответствии с Актом США о Сырьевых Биржах (the US Commodity Exchange Act). Традиционные биржи являются платформами от многих многим.

MANZANA = МАНЗАНА (или МАНФАНА) – Manzana is a traditional unit of land area in Central America. The manzana is the area of a square 100 varas on a side; it thus varies according to the length of the vara. The Costa Rican manzana equals 0.698 896 hectares or about 1.727 acres. Very similar units are used in Guatemala, Honduras, and Nicaragua. The Spanish word manzana means an apple, but the unit is probably related to Spanish word manzanar, orchard. / Манзана – традиционная мера площади земельного участка в Центральной Америке. Манзана – это площадь квадрата со стороной, равной 100 варам (varas), исходя из этого, она и изменяется в зависимости от длины вара (по-Испански дословно – трость). В Коста Рике манзана равна 0.698 896 гектара или приблизительно 1.727 акра. Весьма схожие меры применяются в Гватемале, Гондурасе и Никарагуа. Испанское слово манзана обозначает яблоко, но название самой меры связано, скорее, с Испанским словом манзанар (manzanar), обозначающим яблоневый сад.

MAP = КАРТА (или КАРТОГРАММА) – Map:- diagrams showing physical features, roads, town, etc. The ordered arrangement of genes or molecular markers of an organism, indicating the position and distance between the markers and loci. / Под Географическими Картами понимаются карты земной поверхности, показывающие размещение, состояние и связи различных природных и общественных явлений, их изменения во времени, развитие и перемещения. Подразделяются по территориальному охвату (мировые, материков, государств и другие), по содержанию (общегеографические и тематические), по масштабу – крупно- (1:200 000 и крупнее), средне- (от 1:200 000 и до 1:1 000 000 включительно) и мелкомасштабные (мельче 1:1 000 000), а также по назначению (справочные, учебные, туристские) и другим признакам. Под Картами, от Греческого слова Chártēs, означающее Лист или Свиток Папируса Для Письма, понимаются:- (1) уменьшенные, математически определённые и обобщённые изображения на плоскости земной поверхности, звёздного неба или их частей, содержащие данные в соответствии с темой и назначением карты. (2) Бланк с перечнем каких-либо сведений (санаторно-курортная карта и тому подобные). (3) Игральные карты, создание которых приписывается народам Востока. Под Картограммой понимается карта, показывающая штриховкой (различной густоты) или окраской (различной степени насыщенности) среднюю интенсивность какого-либо показателя в пределах каждой единицы нанесённого на карту территориального деления, например, плотность населения по областям.

MAPLE LEAF = КЛЕНОВЫЙ ЛИСТ – Canadian Maple Leaf Gold Bullion Coins:- guaranteed by the Government of Canada and traded in world markets since 1979, gold Canadian Maple Leaf coins have become some of the most desirable bullion coins in the world today. Available in four sizes of, one-ounce, half-ounce, quarter-ounce and one-tenth ounce, all are beautifully struck with a gold purity of .9999 (24 carat gold). As a government issued gold bullion coin, it was the second to become available, after the South African Krugerrand. Coin and face value:- 1 Troy oz – CAD50.00; 1/2 Troy oz – CAD25.00; 1/4 Troy oz – CAD10.00; 1/10 Troy oz – CAD5.00; and 1/20 Troy oz – CAD5.00. Market Value:- Canadian Maple Leaf pricing is based on the current market 'spot price' plus a premium per coin. The spot price of gold (and all precious metals) is reported every business day in all major newspapers, network television and radio and online. Coin Purity:- the Royal Canadian Mint pioneered the concept of minting a gold coin without the need for a strengthening alloy in order to produce the gold Maple Leaf in such high purity. Such purity proved to be extremely popular with collectors and investors worldwide. A few years after its initial introduction, the Maple Leaf gold coin was outselling the Krugerrand. Coin Design:- the classic design of the gold Maple Leaf coin is virtually unchanged from its introduction. The bust of Queen Elizabeth II appears on the obverse side of the coin, gracefully aging across various vintage coins in a design by Arnold Machin. Several other small changes can be found. The reverse depicts a single Canadian Maple Leaf, the national symbol of Canada. The finely detailed design has a proof-like strike. Maple Leaf is the Canadian gold coin with a fineness of 999.9 or platinum coin with a fineness of 999.5. The Platinum Maple Leaf is the platinum bullion coin from the Royal Canadian Mint. The coins were first introduced in 1988 and were minted until 1999 when the rising price of platinum caused demand for platinum bullion coins to fall. The coin was later minted in 2002. The series was revived once again in 2009, as one of the few world platinum bullion coins produced. The obverse of the Platinum Maple Leaf features an image of Queen Elizabeth II. For different years of the series, different images of the Queen have been used. The obverse inscriptions include 'Elizabeth II', '50 Dollars' (Canadian), and the date. The reverse of the coin features the Maple Leaf, which is the national symbol of Canada. The reverse inscriptions include 'Canada', '9995 Fine Platinum', '9995 Platine Pur' and the weight. This is the same design used by the other Maple Leaf coins such as the Gold Maple Leaf and Silver Maple Leaf. Each coin contains a purity of .9995 platinum and contains the stated weight in pure platinum. Throughout the series, the Royal Canadian Mint has produced the coin in 1 oz, 1/2 oz, 1/4 oz, 1/10 oz, 1/15 oz, and 1/20 oz sizes. Different face values in Canadian Dollars were used of CAD50.00, CAD25.00, CAD10.00, CAD5.00, CAD2.00, and CAD1.00 for weight, respectively. Coin Specifications:- (i) dates:- 1988–1999, 2002, 2009; (ii) mint:- Royal Canadian Mint; (iii) weight:- varies by denomination; (iv) composition:- 99.95% platinum; (v) platinum content:- stated value for denomination; (vi) diameter:- varies by denomination; and (vii) thickness:- varies by denomination. / Анэлд Мэкин (Arnold Machin).

MAPP = MID–CONTINENT AREA POWER POOL

MARABOU = МАРАБУ – Marabou:- short, fluffy feathers now taken from domesticated fowl, usually dyed to match the garments on which they are used as trimming. They were originally taken from the stork. Marabou is a fabric made of marabou silk, namely a thrown silk usually dyed in the gum.

MARC = MACHINE READABLE CATALOGING

MARCHÉ À TERME INTERNATIONAL DE FRANCE (SA) = МАРШЕ А ТЭРМ ЭТЭРНАСЬЁНАЛЬ ДЁ ФРАНС (ЭС.А.) (или ФРАНЦУЗСКИЙ МЕЖДУНАРОДНЫЙ СРОЧНЫЙ РЫНОК (СА)) – Marché à Terme International de France SA (MATIF SA) or in English:- the French International Term Market is the French futures exchange. Headquartered in Paris, France. Bonds, notes, interest rates, Rapeseed, Wheat, Corn, Sunflower seeds, stock indexes. The MATIF and MONEP websites have been integrated into the Euronext.com website. Efforts by the Finance Ministry to modernise the Paris market resulted in the launch of a futures exchange, Marché à Terme International de France SA (MATIF SA), on 1986-February-20, to trade contracts on government bonds. A year later on, 1987-September-10, an equity options exchange, Marché des Options Négotiable de Paris SA (MONEP SA) was launched. In 1988, the MATIF added commodity contracts to its range of products. On 1999-June-01, France's four market operators – Société des

Bourses Françaises (SBF), MATIF SA, Monep SA and Société du Nouveau Marché – merged to form a new company, ParisBourse[SBF] SA. On 2000-September-22, the Amsterdam, Brussels and Paris bourses merged to create Euronext NV, the first pan-European exchange. Euronext subsequently expanded to include the Portuguese stock exchange and London's International Financial Futures and Options Exchange (LIFFE). A securities and commodities' futures market in France. MATIF SA (Marché à Terme International de France) is a private corporation which is both a futures exchange and a clearing house in France. It was absorbed in the merger of the Paris Bourse with Euronext NV to form Euronext Paris. Derivatives formerly traded on the Matif and other members of Euronext are traded on LIFFE Connect, the electronic trading platform of the London International Financial Futures Exchange. LIFFE is an affiliate of Euronext. Products include interest rate futures and options on the Euro notional bond, five year Euro, and three month PIBOR (Paris Interbank Offered Rate), and futures on the 30-year Eurobond and two-year E-note; futures on the CAC 40 Index, STOXX Europe 50, EURO STOXX 50; and futures and options on European rapeseed and futures on rapeseed meal, European rapeseed oil, milling wheat, corn and sunflower seeds. MATIF is also the name by which the French regulators name any market where futures contracts are traded under French Law. International options and financial futures exchange based in Paris, France. Marché à Terme International de France (MATIF), established on 1986-February-20 by the French Treasury, now Euronext Paris SA, is France's futures exchange. MATIF was absorbed in the merger of the Paris Bourse with Euronext NV. A specialized financial institution governed by French banking law, Euronext Paris SA is the operational managing body of MATIF. A fully electronic market, all Euronext Paris SA products are traded on an electronic trading platform called LIFFE CONNECT, originally the platform of the London International Financial Futures Exchange (LIFFE), an exchange also under the umbrella of the all-encompassing Euronext mergers. Futures and options on Euronext Paris include interest rate products (e.g., 3-month PIBOR-Paris Interbank Offered Rate; 5-year Euro) and commodities, and MONEP, equity and index futures and options (most notably the the CAC 40, an index that represents a capitalization-weighted measure of the 40 most significant values among the 100 highest market caps on the Paris Bourse). Trading hours are 09 am to 05:30 pm, Paris time, Monday through Friday, and all clearing is done through LCH.Clearnet. / ЮРОУ СТАКС 50 (EURO STOXX 50). ЛАЙФ или Эл.Ай.Эф.Эф.И. (LIFFE). Французский Международный Срочный Рынок (СА) (ФМСР (СА)) или, как это звучит на Французском языке по месту регистрации, Марше а Тэрм Этэрнасьёналь дё Франс (Эс.А.) (МАТИФ (Эс.А.); Marché à Terme International de France SA (MATIF SA)) – это Французская биржа фьючерсов, созданная 20 Февраля 1986. В обращении на данной бирже находились:- фьючерсные контракты на ноты, облигации, процентные ставки, фондовые индексы, а также сырьевые фьючерсы на Кукурузу, Пшеницу, семена Подсолнечника и семена Рапса. Штабквартира располагалась в Париже, Франция. Марше дэз Опсьён Негосьябль дё Пари Эс.А. (МОНЭП Эс.А.; Marché des Options Négotiable de Paris SA (MONEP SA)). Общество Французских Бирж (ОФБ) или, как это звучит на Французском языке по месту расположения, Сосьете дэ Бурс Франсэз (Эс.Бэ.Эф.; Société des Bourses Françaises (SBF)), МАТИФ Эс.А. (MATIF SA), МОНЭП Эс.А. (MONEP SA) и Сосьете дю Нуво Марше (Société du Nouveau Marché) сформировав новую компанию ПариБурс[Эс.Бэ.Эф.] Эс.А. (ParisBourse[SBF] SA). Лондонской Международной Биржи Финансовых Фьючерсов и Опционов (London International Financial Futures and Options Exchange; сокращённо – ЛМБФФО или ЛАЙФ или Эл.Ай.Эф.Эф.И. (LIFFE)). Юроунэкст Эн.Фэй. или Юронэкст Эн.Ви. (Euronext NV). Французский Международный Срочный Рынок – биржа фьючерсов. Торги на ней проводятся как с голоса (с 09:00 до 16:30), так и через электронную систему Globex system (с 16:30 до 09:00). На бирже продаются фьючерсы и опционы на облигации, фьючерсы и опционы на облигации в ЭКЮ, трёхмесячные фьючерсы и опционы на основе ПАЙБО (PIBOR; круглосуточно), фьючерсные и опционные контракты на базе CAC 40 Index (круглосуточно). Валютные опционы на Доллары США и Немецкие Марки, на Доллары США и Французские Франки продаются с голоса (с 09:15 до 17:00) и через Глобэкс® (Globex®) и телефонную систему THS после закрытия биржи (с 17:00 до 09:15). На бирже продаются с голоса три вида сырьевых фьючерсов:- фьючерсы на белый сахар (с 10:45 до 13:00 и с 15:00 до 19:00), фьючерсы на картофель (с 10:30 до 12:45 и с 14:00 до 16:00) и фьючерсы на рапсовое семя (с 11:00 до 13:00 и с 15:30 до 18:30). Marché des Options Négotiable de Paris SA (МОНЭП Эс.А. (MONEP SA)) – подразделение Парижской Биржи (Paris Bourse), постоянно торгующее акциями и опционами на основе индексов. Индекс КАК 40 (CAC 40 Index) был разработан в качестве индекса, лежащего в основе торговли на МОНЭП Эс.А. (MONEP SA) и МАТИФ Эс.А. (MATIF SA). Торги проходят с 10:00 до 17:00, кроме Субботы и Воскресенья, либо автоматизированно, либо путём прямого контакта участников сделки. МОНЭП торгует опционами на основе индекса CAC 40, краткосрочными (Американский стиль) и долгосрочными (Европейский стиль), а также опционами на основе акций.

MARDI = MALAYSIAN AGRICULTURAL RESEARCH AND DEVELOPMENT INSTITUTE

MAREN POLICY FORM = ФОРМА МОРСКОЙ ПОЛИС (или ФОРМА МАРЕН ПОЛИС) – MAREN Policy Form is a policy form used in the London marine insurance market to evidence a renewed long term contract where there are no security or other substantial changes from the conditions in the expiring contract.

MARGIN = КРАЙ – Margin is the edge of a leaf or other organ, e.g., margin entire or margin serrate of a leaf. / Край листовой пластинки – окраек листа или иного органа, например, цельный край (margin entire) или пильчатый край (margin serrate) листа.

MARGIN = МАРЖА – (1) Margin is the amount or percentage by which the collateral's value exceeds the value of securities on loan. Margin sometimes refers to the total value of collateral as a percentage of the loan value, e.g., 102 percent. Margin serves to reduce replacement cost exposures resulting from changes in market prices. Initial margin is deposited at the start of the transaction. Variation margin is called during the life of the loan if the value of the collateral falls below the initial margin requirement. Original or Initial Margin is the total amount of margin per contract required by the broker when a futures position is opened by a customer. A Margin is the amount of money or collateral deposited by a customer with his broker, or by a broker with a clearing member, or by a clearing member with the clearing organization, as required by the exchange and/or clearing organization for open futures positions and for the purpose of insuring the broker or clearing organization against loss (in case of adverse price movement) on open futures contracts. The margin is not a partial payment on a purchase. Levels of margins for each futures contract are set by the exchange based on its analysis of price risk volatility in the market at that time; but the Futures Commission Merchants may require their customers to post margin at higher levels than those specified by the exchange. Futures margin is determined by the SPAN margining system, which takes into account all positions in a customer's portfolio. Also known as Performance Bond. See also Clearing Margin, Customer Margin, Initial Margin, Maintenance Level, Maintenance Margin, Option Margin, Original Margin and Variation Margin. Margin is a deposit, or collateral, required as security against open positions in futures, forwards or options markets. Also called Initial Margin or Original Margin. Margin is a good-faith deposit or collateral (usually a small percentage of the contract's full value) deposited by a client with his broker, or by a broker with the clearing house to ensure that market participants will meet their contractual obligations against open futures contracts. The margin is not a partial payment on a purchase. Because the exchanges' clearing house guarantees contract performance to its members, the exchanges and the clearing house establish minimum margin levels for each market and periodically adjust them to reflect market activity, especially price volatility. If a customer's equity in any futures position drops under the level because of adverse price action, the broker must issue a margin call to restore the customer's equity. A cash amount of funds that a customer must deposit with the broker for each contract as a sign of his good faith in fulfilling the contract terms. It is not considered

partial payment of purchase. Margin is the amount of money (or sometimes stocks or bonds) an exchange requires an investor to have on deposit in an account in order to open and maintain positions in futures contracts. That amount of money will cover, at least in part, the potential liability from adverse price changes to the investor's futures position. Margin is not a 'down payment', it is a collateral. Margin is a collateral payments (performance bond) to the clearing and settlement agent for futures and forward contracts. See also Risk-Based Margin, Variation Margining. Margin is the deposit required to open or maintain a position. Margin can be either 'free' or 'used'. Used margin is that amount which is being used to maintain an open position, whereas free margin is the amount available to open new positions. With a USD1 000 margin balance in your account and a 1% margin requirement to open a position, you can buy or sell a position worth up to a notional USD100 000. This allows a trader to leverage his account by up to 100 times or a leverage ratio of 100:1. If a trader's account falls below the minimum amount required to maintain an open position, he will receive a 'margin call' requiring him to either add more money into his or her account or to close the open position. Most brokers will automatically close a trade when the margin balance falls below the amount required to keep it open. The amount required to maintain an open position is dependent on the broker and could be 50% of the original margin required to open the trade. Margin is an amount of money deposited by both buyers and sellers of futures contracts and by sellers of options contracts to ensure performance of the terms of the contract (the making or taking delivery of the commodity or the cancellation of the position by a subsequent offsetting trade). Margin in commodities is not a down payment, as in securities, but rather a performance bond. Margin is the amount of money or collateral deposited by a client with his broker, or by a broker with a clearing member, or by a clearing member with the clearing house, for the purpose of insuring the broker, clearing member or clearing house against loss on open futures contracts. The margin is not a partial payments on a purchase. (1) Original Margin or Initial Margin is the total amount of margin per contract required by the broker when a futures position is opened. (2) Maintenance Margin is a sum which must be maintained on deposit at all times. If a customer's equity in any futures position drops to or under the level because of adverse price action, the broker must issue a Margin Call to restore the customer's equity. See also Variable Limit Margins. Margin is an amount of money deposited to guarantee the performance of a futures contract. It is required of both buyers and sellers of futures contracts and writers of options. See also Initial Margin; Maintenance Margin; and Margin Call. / , например, . Маржа:- в торговле фьючерсами:- депозит 'доброй воли', который инвестор должен сделать при покупке или продаже контракта. Если цены на фьючерсы движутся в противоположном направлении, то инвестор должен вложить больше денег для обеспечения требования к марже (margin requirements).

(2) With regard to securities, this term refers to a fractional amount of full value, or the equity outlay (down payment) required for an investment in securities purchased on credit. Margin is the amount paid by the customer when using a broker's credit to buy or sell a security. Under US Federal Reserve regulations, the initial margin required since 1934 has ranged from 40% of the purchase price up to 100%. Since 1974 the current rate of 50% has been in effect. See also Broker's Loans and Equity. / Маржа:- в общем значении:- сумма, которую клиент депонирует у брокера при получении от него займа на покупку ценных бумаг. В соответствии с правилами Совета Управляющих Федерального Резерва (Federal Reserve Board), первоначальный размер маржи, начиная с 1945, составлял от 50 до 100% цены покупки ценных бумаг. В середине 1980-х минимум составлял 50% цены покупки или продажи в короткую наличными или одобренными для использования в качестве залога ценными бумагами, стоимостью минимум в 2 000 Долларов. После этого были введены требования о минимальной сумме, необходимой для поддержания счёта (minimum maintenance), Национальной Ассоциацией Дилеров по Ценным Бумагам (NASD) и Нью Йоркской Фондовой Биржей (в середине 1980-х она составляла уже 25% рыночной стоимости приобретаемых под залог ценных бумаг) и отдельными брокерскими фирмами, требования которых, как правило, значительно выше.

(3) Margin is a difference between the lending and deposit rates of a bank (interest margin or spread). / Маржа:- в банковском обслуживании:- разница между текущей рыночной стоимостью обеспечения для гарантирования займа и номинальной стоимостью самого займа. Например, при займе в 100 000 Долларов и обеспечении 50 000 Долларов разница (маржа) составляет 50 000 Долларов.

(4) Margin is a lending limit for lombard (collateral) loans.

(5) Margin is the price difference between related products and/or related markets. Margin is the difference between the cost of purchasing, producing and/or marketing a product and its sales price. / Разница в ценах между сопоставляемыми продуктами и/или сопоставляемыми рынками.

(6) Margin is the number of percentage points the lender adds to the index rate to calculate the adjustable-rate mortgage (ARM) interest rate at each adjustment. / Число процентных пунктов, которые при каждой переоценке добавляет займодавец к индексируемой ставке для калькулирования процентной ставки по закладной с переоцениваемой ставкой (ЗПС; adjustable-rate mortgage (ARM)).

(7) Margin:- this is the portion of total revenue that results in a profit, usually but not always, expressed as a percentage (see also Profit Margin and Gross Margin). Used by itself, it may be ambiguous (unless used in context). It is better to refer to a gross, net, or net after-tax margin. In another context, margin refers to the process of borrowing money against securities held in a brokerage account. For example, on blue chip stocks, a stockbroker may allow a client to buy shares on margin, by putting up only a percentage of the price of the stock. / Маржа:- в корпоративных финансах:- разница между стоимостью реализованной продукции и услуг (брутто-прибылью) и издержками их производства. Также известна как брутто-прибыль (gross profit margin).

MARGINAL = КРАЕВОЕ (или МАРГИНАЛЬНОЕ) – Marginal:- along the margin or edge. / Краевой:- вдоль края или окраека. Под Маржинальным, от Французского слова Marginal, означающее Предельный, .

MARGINAL = МАРЖИНАЛЬНОЕ (или ПРЕДЕЛЬНОЕ) – (1) Marginal:- adjective describing a good or economic entity that is on the fringes of a uniform whole. / Под Маржинальным, от Французского слова Marginal, означающее Предельный, .

(2) In the general sense, the term is commonly used in reference to a precarious situation, on the fringes of a group.

(3) In economic theory, it applies to the last additional unit added to a uniform whole. In economics, the difference between two figures, e.g., a marginal unit is the last unit produced, or the first unit supplied, and is defined as the smallest additional amount that is economically viable to produce or buy.

MARGINAL ANALYSIS = МАРЖИНАЛЬНЫЙ АНАЛИЗ – Marginal Analysis is a concept employed constantly in microeconomic theory (and quite frequently in macroeconomic theory as well) is that of the marginal change in some economic variable (such as quantity of a good produced or consumed), or even the ratio of the marginal change in one variable to the marginal change in another variable. A marginal change is a proportionally very small addition or subtraction to the total quantity of some variable. Marginal analysis is the analysis of the relationships between such changes in related economic variables. Important ideas developed in such analysis include marginal cost, marginal revenue, marginal product, marginal rate of substitution, marginal propensity to save, and so on. In microeconomic theory, 'marginal' concepts are employed primarily to explicate various forms of 'optimizing' behavior. Consumers

are seen as striving to maximize their utility or satisfaction; and firms are seen as striving to maximize their profits. The maximum value of such a variable is found by identifying a value of the independent variable such that either a marginal increase or a marginal decrease from that value causes the value of the dependent variable being maximized to fall. The student of mathematics may recognize the opportunity to apply concepts from differential calculus here, with the various marginal concepts being special names given to first derivatives of particular functions. The valuation of the benefits (utility) and the costs of any good is determined 'at the margin'. For the (individual or collective) decision maker pondering how many units of a good to consume or provide to the market, net total benefits (benefits minus costs) will always be maximized at that level of consumption (or provision to the market) where the marginal benefit derived from adding the last unit equals the marginal addition to total costs of producing or acquiring that last additional unit. / Маржинальный Анализ – это анализ, основанный на использовании предельных величин (относительных приростов) для исследования экономических процессов. Согласно маржинальной доктрине хозяйственные индивиды принимают решения, исходя из стремлений достичь максимальной предельной полезности (приращение полезности на единицу затрачиваемых ресурсов). Сущность Маржинального Анализа заключается в анализе соотношения объёма продаж (выпуска продукции), себестоимости и прибыли на основе прогнозирования уровня этих величин при заданных ограничениях. В его основе лежит деление затрат на переменные и постоянные. Значения удельных маржинальных доходов для каждого конкретного вида продукции важны для управляющего. Если данный показатель отрицателен, то выручка от реализации продукта не покрывает даже переменных затрат. Исчисление маржинального дохода позволяет определить влияние объёма производства и сбыта на величину прибыли от реализации продукции, работ, услуг и тот объём продаж, начиная с которого предприятие получает прибыль.

MARGINAL COST = ПРЕДЕЛЬНАЯ СТОИМОСТЬ (или ПРЕДЕЛЬНЫЕ ИЗДЕРЖКИ, или ПРЕДЕЛЬНАЯ ЗАТРАТА, или МАРЖИНАЛЬНАЯ ЗАТРАТА, или МАРГИНАЛЬНАЯ ЗАТРАТА) – Marginal Cost is a cost incurred in raising the level of output beyond the original target. Marginal cost calculations are used to justify going beyond that target or, indeed, not doing so. The cost to produce one additional unit of output; the change in total variable cost resulting from a one-unit change in output. Marginal Cost is the increase in variable cost which occurs in changing from one production alternative to another; it is often measured relative to adding a marginal unit of input. / выработка (output). Предельные Издержки – увеличение или уменьшение совокупных издержек коммерческого предприятия в результате увеличения или уменьшения объёма конечной продукции на одну единицу. Также называется средневзвешенными (приростными) издержками (incremental cost) или дифференциальными издержками (differential cost). Определение предельных издержек важно для принятия решения о том, следует ли изменять объём производства. В большинстве производственных компаний предельные издержки снижаются по мере увеличения объёма конечной продукции вследствие экономии от масштаба, которая включает такие факторы, как оптовые скидки на сырьё, специализация труда и более эффективное использование оборудования. В определённый момент, однако, приходится сталкиваться с ростом затрат при дальнейшем увеличении объёмов, когда предельные издержки тоже начинают расти. Рост издержек при дальнейшем увеличении объёма производства включает такие факторы, как более интенсивный управленческий контроль за большим числом рабочих, более высокие расходы на материалы вследствие истощения ресурсов местных поставщиков и в целом менее эффективное вложение средств. Кривая предельных издержек, как правило, имеет форму буквы U. Компания действует при оптимальном уровне производства, когда предельные издержки совпадают со средними совокупными издержками на единицу продукции. Таким образом, если эффективность производства ниже оптимального уровня, то увеличение объёмов производства приведёт к тому, что предельные издержки будут ниже, чем средние совокупные издержки на единицу продукции. Когда эффективность производства превысит некоторый оптимальный уровень, это приведёт к тому, что предельные издержки будут выше, чем средние совокупные издержки на единицу продукции. Иными словами, продажа по цене, превышающей предельные издержки на единицу продукции, увеличит чистую прибыль производителя, даже если цена продажи не покрывает средних совокупных издержек на единицу продукции. Предельные издержки являются, таким образом, той минимальной ценой, по которой продажа только и может быть совершена без увеличения убытков производителя или уменьшения его прибылей.

MARGINAL COST PRICING = ЦЕНООБРАЗОВАНИЕ ПО ПРЕДЕЛЬНЫМ ИЗДЕРЖКАМ – Marginal Cost Pricing is a system of pricing designed to ignore all costs except those associated with producing the next increment of power generation. Sometimes referred to as Incremental Cost Pricing. / Система ценообразования, в рамках которой игнорируются все затраты, за исключением связанных с выработкой приростных единиц электроэнергии. Иногда на него ссылаются как на ценообразование на основе приростных издержек.

MARGINAL LENDING FACILITY = ОБЕСПЕЧЕНИЕ ПРЕДЕЛЬНОГО ЗАИМСТВОВАНИЯ (или ПОДДЕРЖКА ПРЕДЕЛЬНОГО ЗАИМСТВОВАНИЯ, или СИСТЕМА ПРЕДЕЛЬНОГО ЗАИМСТВОВАНИЯ) – Marginal Lending Facility is a standing facility of the European Central Bank (ECB) which commercial banks in the Euro area can use to obtain short-term (overnight) liquidity by pledging collateral (securities) eligble for rediscount by central banks at a pre-specified interest rate. Marginal Lending Facility is a standing facility of the Eurosystem which counterparties may use to receive overnight credit from an national central bank at a pre-specified interest rate against eligible assets. See also Key ECB Interest Rates. / для получения однодневного расчётного кредита (кредита овернайт) .

MARGINAL NET BENEFIT = ПРЕДЕЛЬНАЯ ЧИСТАЯ ВЫПЛАТА – Marginal Net Benefit is the increase in net benefit which can be obtained by changing from one production alternative to another; it is often measured relative to adding a marginal unit of input.

MARGINAL PRODUCTIVITY = ПРЕДЕЛЬНАЯ ПРОДУКТИВНОСТЬ – Marginal Productivity:- the value of output (goods and services) produced per unit of input (productive resources) used. Thus an increase in productivity means producing more goods and services with the same amount of resources, or producing the same goods and services with fewer resources, or some combination of these two possibilities. While productivity is often measured or referred to only in terms of the productivity of labor (output per man-hour), a more precise and complete view of the sources of productivity incorporates the effects of all inputs to production, including capital, land and materials. The principal means of increasing overall productivity are:- (i) greater specialization and a more complex division of labor (often involving a geographical or territorial expansion of the relevant market area, incorporating new people with different skills and endowments of natural resources); (ii) investment in increasing the stock of capital goods; (iii) investment in so-called Human Capital, for example, teaching workers new or more efficient production skills; and (iv) technological innovation that creates new ways of combining somewhat different inputs of the factors of production to produce the same goods at lower costs. The concept of the marginal productivity of an input in a productive process is a particularly important idea in economic analysis, because under competitive conditions, the equilibrium price of a factor of production (including wages, interest etc) will tend toward equality with its marginal productivity. Marginal productivity is the increase in the value of output that can be produced by adding in one more unit of the particular input while holding other inputs constant. Thus the higher the productivity of a factor of production, the higher the income that may be expected to accrue to its providers, and anything that raises overall levels of productivity within a society may be expected to increase the average overall prosperity of the society as a whole.

MARGINAL UNIT = МАРЖИНАЛЬНАЯ УСТАНОВКА (или ХХ) – Marginal Unit (in electricity):- the last generation unit to supply power under a merit order dispatch system.

MARGINATE = ОКАЙМЛЁННОЕ (или ОТОРОЧЕННОЕ) – Marginate:- with a distinct margin.

MARGIN CALL = МАРЖИНАЛЬНОЕ ТРЕБОВАНИЕ (или ТРЕБОВАНИЕ К МАРЖЕ) – Margin Call is a notice that additional margin money is required to keep equity in your futures or options (if selling options) position. Margin calls may result from a loss in the futures or options position (if selling options) or from increased exchange requirements resulting from a higher price level or unusual market volatility. Margin Call is (1) a request from a brokerage firm to a customer to bring margin deposits up to minimum levels; or (2) a request by the clearing house to a clearing member to bring clearing margins back to minimum levels required by the clearing house rules. A Margin Call is made when the amount of money (stocks or bonds) in an investor's account drops below the maintenance margin required. The investor must deposit enough cash or securities in order to bring the account to initial margin levels required for the contract before the next trading day. Margin Call is a call for additional margin payments (variation margin) to bring original margin deposits up to required minimum level following adverse price change in the market. See also Variation Margin. A Margin Call is a demand for additional funds or collateral, following the marking to market of securities involved in a loan, if the market value of the underlying collateral falls below a certain level relative to the loaned asset. If the value of the underlying collateral, following its revaluation, exceeds the agreedupon margin, the lender may be required to return some of the collateral. Demand for payment made by a broker to a client to advance money, either to finance an initial purchase or to maintain minimum margin requirements. A Margin Call is a request from a brokerage firm to a customer to bring margin deposits up to initial levels; or a request by the clearing organization to a clearing member to make a deposit of original margin, or a daily or intra-day variation margin payment because of adverse price movement, based on positions carried by the clearing member. Fluctuations in the futures market result in daily debits or credits in the margin account of a futures contract holder and cause margin calls. A demand for additional margin funds when futures prices move adverse to a trader's position, or if margin requirements are increased. A Margin Call is a demand upon a customer to put money or securities with the broker. The call is made when a purchase is made; also if a customer's equity in a margin account declines below a minimum standard set by the exchange or by the firm. Margin Call is the request for additional funds to cover losses on forward or futures contracts where the price has moved against a client. Margin Call is a demand from a clearing house to a clearing member, or from a brokerage firm to a customer to bring margin deposits up to a minimum level required to support the position held, normally because of losses resulting from an adverse price move. This can be done by either depositing more funds or offsetting some or all of the positions held. See also Maintenance Margin. Margin Call:- money that is called for from the client during the life of the transaction to cover exposure resulting from an adverse price movement. Margin Call:- when shares are purchased on margin, i.e. by putting up only part of the purchase price, there is the risk of a 'margin call' in case the price of the shares declines. This means that the broker has insufficient collateral in the security and the client is asked to put up additional cash in order to maintain the required margin. Margin Call is a call from a brokerage firm to a customer to bring margin deposits up to the required minimum after a loss has occurred in futures trading. / Требование клиринговой палаты к клиринговому члену или брокерской фирмы к клиенту пополнить маржинальные депозиты до минимального уровня, требуемого для поддержания удерживаемой позиции, обычно при убытках на маржинальном счёте, вызванных противоположным движением цены. Оно может быть удовлетворено либо размещением дополнительных денежных средств, либо зачётной сделкой по части или всем удерживаемым позициям. Смотрите также Поддерживаемая Маржа (Maintenance Margin). Флуктуации (колебания) на рынке фьючерсов . Маржинальное Требование – требование о том, чтобы клиент внёс достаточную сумму деньгами или ценными бумагами для того, чтобы счёт с маржей соответствовал требованиям о внесении первоначальной маржи (initial margin), или о минимально необходимой для поддержания счёта сумме (minimum maintenance). Если клиент не исполняет требования, то ценные бумаги, находящиеся на его счёте, могут быть проданы.

MARGIN CLASSES = КЛАССЫ МАРЖИ – Margin Classes:- in order to group a portfolio's futures and options contracts with similar risks, they are bundled according to their underlying instruments in what are called Margin Classes, e.g., one margin class for DAX® products. Potential profits and losses on contracts in the same margin class are offset against each other. This procedure is known as Cross-Margining. It saves liquidity, as the offsetting of risks that cancel each other out leads to a much lower overall performance bond (margin payment) than if the sum of all individual margins had to be paid. If two or more margin classes whose underlying instruments are similar in terms of their risk structure are combined, this is called a Margin Group. Cross-margining, i.e. the offsetting of risks that counteract each other, is also possible within a margin group.

MARGIN DEPOSIT = МАРЖИНАЛЬНЫЙ ВКЛАД (или МАРЖИНАЛЬНЫЙ ДЕПОЗИТ) – Margin Deposit is a 'good faith' deposit made by you with the brokerage house and deposited with the futures exchange. The money is held on account to insure against losses on open futures contracts and options (if selling options). A margin deposit is not a down payment, but rather a performance bond. The minimum margin is determined by the exchange and is usually lower for hedgers than for speculators.

MARGIN FOR RISK AND UNCERTAINTY = МАРЖА ЗА РИСК И НЕОПРЕДЕЛЁННОСТЬ – Margin For Risk And Uncertainty:- the margin that is included in the assumptions used in a MODEL (a framework for analysis) to provide for risks and uncertainty inherent in the issue about which assumptions are made.

MARGIN PERCENTAGE = МАРЖИНАЛЬНЫЙ ПРОЦЕНТ – The Margin Percentage is established as the cash deposit relative to the commodity. The margin percentage can be calculated in two ways:- (i) the investment margin per unit divided by the unit price of the commodity; and (ii) the total margin investment amount divided by the total futures contract value.

MARGIN REQUIREMENTS = МАРЖИНАЛЬНЫЕ ТРЕБОВАНИЯ (или ТРЕБОВАНИЯ К МАРЖЕ) – Margin Requirements:- in the United States, buying on margin refers to buying stocks or securities with borrowed money (usually borrowed from a brokerage firm or bank). The margin requirement is the minimum amount (expressed as a percentage) the buyer must put up (rather than borrow). The Federal Reserve Board sets margin requirements. Legal requirements regulating the amount of credit that may be extended by a broker, exchange or other entity in margin trading. / Законодательные требования, регулирующие сумму кредита, который может быть предоставлен брокером, биржей или иным юридическим лицом при торговле под маржу. Требование к Марже – минимальная сумма, которую клиент должен внести на счёт с маржей деньгами или приемлемыми ценными бумагами, сделки с которыми могут совершаться по счетам с маржей в соответствии с Предписанием Ти (Regulation T) Совета Управляющих Федерального Резерва (Federal Reserve Board). Предписание Ти требует либо внести минимальную сумму в 2 000 Долларов, либо 50% покупной цены приобретаемых по счёту с маржей приемлемых ценных бумаг, либо 50% суммы, полученной при продаже в короткую. Также называется Первоначальной Маржёй (initial margin).

MARGIN STOCK = МАРЖИНАЛЬНАЯ АКЦИЯ – In the United States, Margin Stock is any stock listed on a national securities exchange, any over-the-counter security approved by the Securities and Exchange Commission (SEC) for trading in the national market system, or appearing on the Board's list of over-the-counter margin stocks and most mutual funds. / одобренная Комиссией

по Ценным Бумагам и Биржам (The Securities and Exchange Commission; сокращённо – КЦББ или СЭК (SEC), в Англоязычном произношении) для торговли .

MARGIN TO THE MARKET = МАРЖА ПО РЫНКУ – Margin To The Market is the opposite of a margin call. When a profit accrues to your futures or options (when selling options) account, you may withdraw money from the account, reducing the balance to the minimum maintenance margin deposit requirement.

MARI = MAROS AGRICULTURAL RESEARCH INSTITUTE

MARIF = MALANG RESEARCH INSTITUTE FOR FOOD CROPS

MARINE = МОРСКОЕ – Marine:- in the past, marine underwriters, fire underwriters and casualty underwriters had different ideas about what constituted 'marine' insurance. To resolve the resulting confusion, committees were formed to work with state insurance departments in creating a standard definition of marine insurance. A Joint Committee of Interpretation and Complaint was formed for the purpose of interpreting this definition as it applied to specific cases, which were submitted from time to time by interested parties. Insurance departments have, in general, adopted the findings of this committee as their own rules. Marine:- of the sea or saline water. See also Maritime.

MARINE CARGO INSURANCE = МОРСКОЕ СТРАХОВАНИЕ ГРУЗОВ – Marine Cargo Insurance is the insurance protection for goods in transit whether moving via ocean, air, rail or truck. Broadly, insurance covering loss of, or damage to, goods at sea. Marine insurance typically compensates the owner of merchandise for losses in excess of those which can be legally recovered from the carrier that are sustained from fire, shipwreck, piracy, and various other causes. Three of the most common types of marine insurance coverage are All Risks Coverage, Free of Particular Average (FPA), and With Average (WA).

MARINE CARGO POLICY = МОРСКОЙ ПОЛИС НА ГРУЗ – Marine Cargo Policy:- Ocean Marine Insurance is designed to cover various hazards related to the movement of goods. The first and obvious protection that can be provided is for the cargoes themselves. This protection can be provided to the seller/shipper or to the buyer. Where ownership of and responsibility for the cargo are assumed is crucial in determining what coverage is needed. This used to be a simpler exercise than at present – as a limited number of shipping terms existed, e.g., FOB, CIF etc. In 1990 the International Shipping Agency agreed on an expanded set of terms, which allow transfer of ownership and responsibility at various points along the transit route, including at customs borders. Risks are unavoidable in the shipment of goods. Goods are loaded and transshipped. Travel on the ocean provides its own set of perils. These risks require that the shipper take reasonable steps to ensure the safety of his goods while in transit, for instance with proper packaging and/or containerizing, and shipping on a vessel appropriate for the goods in question. Goods are generally handled many times during shipment, and Marine Insurance is designed to provide coverage throughout this process. Goods are first loaded at the origination point onto a land vehicle (truck or train, for instance). They are held in a port prior to loading onto a ship. They may be unloaded at an intermediate port, and held for transshipment on a second vessel. Upon arrival in the destination country, they must be cleared through customs, then loaded onto land carriers for transfer to the buyer's premises. (There may also be transfers between land transports on either the buyer's or the seller's end – during which time the goods are under the control of warehouse depot operators, and additional trucking or rail companies). The marine policy may be scripted to meet a variety of situations and desired coverages. Generally, the policy covers perils of the sea, fire, assailing thieves, jettison, barratry of the master, explosion, defects in the ship that cause damage, and other perils. Exclusions in the policy are important, and should be reviewed with a qualified risk manager, such as your insurance agent. These typically include damage due to dampness, breakage, delay or loss of market, acts of war, confiscation, etc, strikes, riots or civil commotions. / хозяина (или капитана).

MARINE ENVIRONMENT PROTECTION COMMITTEE = КОМИТЕТ ПО ЗАЩИТЕ МОРСКОЙ ОКРУЖАЮЩЕЙ СРЕДЫ – Marine Environment Protection Committee (MEPC) is a major committee within the International Maritime Organization.

MARINE EXTENSION CLAUSE = ОГОВОРКА О ПРОДЛЕНИИ МОРСКОГО СТРАХОВАНИЯ – Marine Extension Clause is a cargo insurance policy clause that continues coverage on goods during deviation, delay, re-shipment, and transshipment, or any other variation in normal transit beyond the assured's control. / Оговорка в страховом полисе на груз, которая продлевает покрытие по товарам в течение отклонения, задержки, доотправки, и перегрузки, или в любом ином сочетании, возможном во время обычного транзита и выходящего за пределы контроля застрахованного лица.

MARINE INSURANCE = МОРСКОЕ СТРАХОВАНИЕ – Marine Insurance covers goods in transit, by any mode, sea, air or land. Broadly, insurance covering loss or damage of goods at sea. Marine insurance typically compensates the owner of merchandise for losses sustained from fire, shipwreck, etc, but excludes losses that can be recovered from the carrier. Marine Insurance is actually transportation insurance. After insurance coverage on ocean voyages had been developed, it was a natural step to offer insurance on inland trips. This branch of insurance became known as Inland Marine. In many policy forms, the distinction between inland and ocean marine has disappeared; it is common to cover goods from the time they leave the warehouse of the shipper, even if this warehouse is situated at a substantial distance from the nearest seaport, until they reach the warehouse of the buyer, which likewise may be located far inland. Marine Insurance:- the object is to indemnify the insured against losses incident to marine adventure. Marine Insurance is a line of insurance which includes coverage for property in transit (cargo), means of transportation (except aircraft and motor vehicles), offshore installations and valuables, as well as liabilities associated with marine risks and professions. Types of marine insurance:- (i) hull insurance:- insurance of the vessel with its gear; (ii) cargo insurance:- insurance of goods carried by sea; (iii) insurance against the liability of the carrier:- protection and indemnity; compulsory insurance, e.g., CLC'69 (short for Civil Liability Convention 1969), HNS'96 (short for Carriage of Hazardous and Noxious Substances by Sea 1996); voluntary insurance, e.g., liability for cargo; and (iv) other types of marine insurance, e.g., freight, salvage expenses, general average contributions. / Линия страхования, которая включает в себя покрытие по имуществу в транзите (грузу), средств перевозки (за исключением самолётов и автотранспорта), строениям и ценностям в морских прибрежных рубежах, а также обязательствам, связанным с морскими рисками и профессиями. К типам морского страхования относятся:- (i) страхование корпуса судна:- страхование судна вместе с его оснащением; (ii) страхование груза:- страхование товаров, перевозимых по морю; (iii) страхование против обязательства перевозчика:- защита и возмещение; обязательное страхование, например, в соответствии с Конвенцией о Гражданской Ответственности от 1969 (КГО'69; CLC'69 (Civil Liability Convention 1969)) или конвенцией о Перевозке Морем Опасных и Вредных Веществ от 1996 (ОВВ'96; HNS'96 (Carriage of Hazardous and Noxious Substances by Sea 1996)); добровольное страхование, например, ответственность за груз; и (iv) иные типы морского страхования, например, фрахта, расходов по спасанию, контрибуций по общей аварии. Морское Страхование – страхование, обеспечивающее владельцу груза при морских перевозках возмещение потерь, которые на законном основании нельзя взыскать с перевозчика. Такой вид страхования охватывает также воздушные перевозки. Морское Страхование – общий термин, используемый для обозначения совокупности видов страхования, связанных с использованием морского транспорта. Включает в себя все виды страхования океанских и морских перевозок; совокупность всех видов страхования, обеспечивающих страховую защиту имущественных интересов участников морского

предприятия от рисков, связанных с опасностями и случайностями, которым подвергаются судно, груз и фрахт, а также виды страхования внутренних перевозок (на основе правил морского страхования). К морскому страхованию относится также страхование ответственности судовладельцев. Ответственность страховщика, взаимоотношения сторон до и после наступления убытка и так далее определяются соответствующими условиями страхования. Морское Страхование – страхование судов или перевозимых на них грузов от специфических, связанных с морским судоходством убытков или ущерба. С годами значение этого термина было расширено и включило транзит грузов по земле в каждом из концов его пути, а термин Судно теперь охватывает суда, находящиеся в процессе постройки или ремонта. Морское Страхование – подотрасль имущественного страхования, охватывающая широкий спектр имущественных интересов, связанных с морским судоходством и морской перевозкой грузов. Морское страхование включает страхование судов, а также страхование фрахта, грузов и ответственности судовладельцев перед третьими лицами.

MARINE LEG = МОРСКОЙ ЗАГРУЗЧИК (или МОРСКОЙ (ЗЕРНОВОЙ) МЕТАТЕЛЬ, или МОРСКОЙ ЗЕРНОПОГРУЗЧИК) – A Marine Leg is a mechanical device used to offload bulk grain from the hold of a vessel, normally from a laker into a transfer elevator. / Морской Загрузчик – механическое устройство, используемое для выгрузки наваленного зерна из трюма судна, обычно из озёрного судна в перевалочный элеватор. Зернометатель, машина для загрузки зерносклада, формирования и перелопачивания бунтов зерна на току и в зерноскладах, перемещения (переброски) и погрузки зерна. Использовавшийся в бывшем Союзе Советских Социалистических Республик (СССР) метатель ЗМ-ЗО состоял из транспортёра с питателем, метательного конвейера, механизмов подъёма и самопередвижения, электропривода. Питатель подаёт зерно к транспортёру, который высыпает его в конвейер, а последний выбрасывает зерно через направляющую трубу. Производительность зернометателя на Пшенице 30 тонн в час (т/ч); максимальная дальность бросания 10 метров (м); высота бросания 10 м; потребная мощность 7 килоВатт (кВт). Зернопогрузчик, машина непрерывного действия для погрузки зерна в транспортные средства, перелопачивания его, формирования бунта, загрузки хранилища. Основные рабочие органы зернопогрузчика – питатель и транспортёр. Питатель подаёт зерно из бунта на транспортёр, который поднимает зерно на высоту до 2.5 метров (м). Зернопогрузчики могут быть самопередвижными или навесными. По типу рабочих органов различают зернопогрузчики скребковые, шнековые и комбинированные – со шнековыми или планчатыми питателями. В бывшем Союзе Советских Социалистических Республик (СССР) широко применялись самопередвижные скребковые погрузчики ЗПС-60. Привод рабочих органов этого зернопогрузчика – от электродвигателя мощностью 7 килоВатт (кВт). Производительность его 60 тонн в час (т/ч). Рабочая скорость 40 метров в час (м/ч).

MARINE PERILS = МОРСКИЕ УГРОЗЫ – Maritime Perils:- (i) perils of the seas = fortuitous accidents or casualties of the sea (heavy weather, sinking, stranding, collision, contact), not including the ordinary actions of the winds and waves; (ii) fire, war perils, pirates, rovers, thieves, barratry, etc. The element of fortuity is of crucial importance. Also:- (iii) the Inchmaree clause = the scope of this clause is to cover loss or damage to the subject matter insured caused by the bursting of boilers, breakage of shaft or any latent defect in the machinery or hull; negligence of the master, officers, crew or pilot; negligence of repairers or charterers, provided they are not insured under the policy; and barratry of master, officers, or crew. (iv) Pollution hazards. (v) Collision liability (The Running Down Clause). Also know as Maritime Perils. Marine Perils are the perils which are insured against in an ocean marine insurance policy. / хозяина (или капитана). Угрозы, которые были застрахованы посредством приобретения полиса океанского морского страхования.

MARINE SERVICES = МОРСКИЕ УСЛУГИ – Marine Services are the on-water services, such as piloting, towing and line handling for vessels as they arrive, depart or are moved between berths. / Надводные услуги, такие как пилотирование, буксирное и линейное обслуживание для прибывающих, отправляющихся или меняющих причалы судов.

MARINE SURVEYOR = МОРСКОЙ ИНСПЕКТОР (или МОРСКОЙ СЮРВЕЙЕР) – Marine Surveyor is a specialist who determines the nature, extent and clause of loss and/or damage. / Специалист, определяющий природу, размер, и статью убытка и/или повреждения.

MARINE SYNDICATES = МОРСКИЕ СИНДИКАТЫ – Marine Syndicates are the groups of companies acting in common to insure certain ocean marine classes. Also, a term used to describe groups which make inspections and surveys and institute standards for the construction of vessels. / Группы компаний, действующие сообща с тем, чтобы с уверенностью гарантировать океанские морские классы. Этот термин используется также для описания групп, которые осуществляют инспекции и осмотры и создают институальные стандарты для постройки судов.

MARITIME = ОТНОСЯЩИЙСЯ К МОРЮ (или ПРИМОРСКИЙ, или МОРСКОЙ) – Maritime:- business pertaining to commerce or navigation transacted upon the sea or in seaports in such matters as the court of admiralty has jurisdiction. Maritime:- of the sea, coastal. See also Marine.

MARITIME ADMINISTRATION = МОРСКАЯ АДМИНИСТРАЦИЯ – Maritime Administration (MarAd):- oversees subsidy programs to the United States Merchant Marine. Assigns routes to subsidized liners.

MARITIME LIEN = МОРСКОЕ ЗАЛОГОВОЕ ПРАВО (или МОРСКОЕ УДЕРЖАНИЕ) – Maritime Lien:- the claim a master and crew have on the vessel for the payment of wages due. The terms may be applied, also, to the rights of a salvor in regard to property that is subject to a salvage award; also, to the rights of a carrier in regard to cargo that is liable for a general average contribution. / хозяин (или капитан) и экипаж (или команда).

MARITIME SAFETY COMMITTEE = КОМИТЕТ ПО БЕЗОПАСНОСТИ НА МОРЕ – Maritime Safety Committee (MSC) is a major committee within the International Maritime Organization.

MARITIME SECURITY PROGRAM = ПРОГРАММА БЕЗОПАСНОСТИ НА МОРЕ – Maritime Security Program (MSP), established by the Maritime Security Act of 1996, is designed to maintain a nucleus fleet of militarily useful US-flag vessels.

MARITIME TRANSPORT = МОРСКАЯ ПЕРЕВОЗКА – Maritime Transport:- shipment of goods by sea. / отгрузка товаров морем.

MARK = МАРКА (или ОТМЕТИНА, или МЕТКА) – Mark is any sign or symbol placed on a bale as identification. / В хлопковой отрасли под Маркой, от Немецкого слова Marke, означающее Знак или Метка, понимается любой знак или символ, размещённый на кипе с целью идентификации.

MARK = МЕТКА – Mark is an official stamp or brand, internationally recognized, applied to a regulated article to attest its phytosanitary status. / Маркировка – международно признанная официальная печать или клеймо на подкарантинном материале, удостоверяющая его фитосанитарный статус.

MARKDOWN = СНИЖЕНИЕ (или СКИДКА, или СНИЖЕННЫЕ ЦЕНЫ, или ПРОДАЖА ПО СНИЖЕННЫМ ЦЕНАМ) – (1) A term Markdown refers to a discount on a product. For example, a product may be originally priced at USD150, but during a sale, the product is marked 25 percent off to attract more consumers. You can determine the sale price once you know what the markdown is.

Calculating the markdown and analyzing how the profits are affected will help you determine the best pricing strategy for your product. This will ultimately help you manage your business better and maintain profitability. Learn how to calculate markdown with the simple formula below:- (1) determine the original price of the product; (2) decide on what the discount rate will be based on your analysis of sales, expenses and profit. For example, if you want to determine what a profitable discount rate would be for a product that costs you USD130 and that you sell for USD150, you can analyze how a 10, 15 and 20 percent discount rate affects your profitability. (3) Multiply the original price by the discount rate. In our example of a USD150 product with a 10 percent discount, the markdown would be USD15 (USD150 x .10). To determine the sale price, subtract the markdown from the original price. In this example, the sales price would be USD135 (USD150 minus USD15). (4) Calculate the markdown using the other rates in a similar manner:- (i) 15 percent – Markdown is USD22.50 (USD150 x .15) and the sale price is USD127 (USD150 minus USD22.50); (ii) 20 percent – Markdown is USD30 (USD150 x .20) and the sale price is USD120 (USD150 minus USD30). From this analysis, you can see that it would not be profitable to discount the product at 15 or 20 percent because the sale price would be USD127 and USD120, respectively, while your cost is USD130 for the product. You would be losing money. Hence, the best discount rate to use is 10 percent. Markdown is a price cut. Reduction of original pricing. / Снижение или Скидка или Продажа по Сниженным Ценам:- (1) Сумма, вычитаемая из цены продажи, когда клиент продаёт ценные бумаги дилеру на внеучётном рынке (over the counter). Если бы ценные бумаги приобретались у дилера, клиент должен был бы заплатить надбавку (markup) или сумму, добавляемую к цене покупки. Правила добросовестной конкуренции (Rules affair Practice) Национальной Ассоциации Дилеров по Ценным Бумагам устанавливают 5% в качестве разумной рекомендуемой надбавки или скидки, хотя в связи с влиянием многих факторов исключения являются довольно частыми. (2) Сниженная цена, при которой андеррайтеры предлагают муниципальные облигации после того, как рынок продемонстрировал отсутствие интереса при первоначальной цене. (3) Переоценка ценных бумаг в направлении снижения цены банками и инвестиционными фирмами в связи со спадом рыночных котировок. (4) Снижение первоначальной цены продажи в розничной торговле, которое было определено на основе добавления процентного коэффициента, называемого торговой наценкой, к стоимости товара. Всё, добавленное к торговой наценке, называется Надбавкой, и термин ‘Скидка’ не используется, пока цена не опустится ниже уровня первоначальной цены продажи.

(2) In foreign exchange, a term Markdown refers to a situation where currency can be bought more cheaply at a future date than for immediate delivery. For example, if USD1 buys FF4 for delivery now, while it buys FF5 for delivery twelve months hence, then the franc is said to be at a discount against the US Dollar. Also known as Discount For Foreign Exchange.

MARKED TO MARKET = УЧИТЫВАЕМЫЙ ПО РЫНКУ – Marked To Market:- daily cash flow system used by US futures exchanges to maintain a minimum level of margin equity for a given futures or options contract position by calculating the gain or loss in each contract position resulting from changes in the price of the futures or options contracts at the end of each trading day. Calculating the profit or loss on an open position using the most recent market price. Typically done by Futures Commission Merchants to calculate margin calls or account balances. Also known as Mark To Market. / Подсчёт прибыли или убытка по открытым позициям, используя самую последнюю рыночную цену. Обычно рассчитывается Торговцами Фьючерсами за Комиссию для расчёта суммы маржинального требования или остатков на счёте. Известен также как Учитывать По Рынку (Mark To Market).

MARKER = МАРКЁР (или РАЗМЕТЧИК) – In the floor coverings industry, Marker is a distinctive threadline in the back of a carpet that enables the installer to assemble breadths of carpet so that the pile lays in one direction or so that patterns match. / Под Маркёром, от Французского слова Marqueur, от Marquer, означающее Отмечать, или Разметчиком, понимается приспособление для вождения посевного или посадочного агрегата с образованием стыковых междурядий запланированной ширины. Маркёр состоит из раздвижной штанги, шарнирно присоединяемой к сеялке или сцепке. На наружном конце штанги свободно вращается косо поставленный диск, который, двигаясь по поверхности поля, оставляет на незасеянном участке бороздку. По бороздке при следующем проходе агрегата направляют переднее правое колесо или внутренний обрез правой гусеницы трактора. Обычно агрегаты работают с правым и левым маркёрами. Вылет (М) маркёра определяют по формулам:- $М_{пр}$ = ((В – а) / 2) + С и $М_{лев}$ = ((В + а) / 2) + С.

MARKER GENE = ГЕН МАРКЁР – Marker Gene is a gene with a clear-cut phenotype (and often a known location on a chromosome) that is used as a point of reference when mapping or selecting another gene at a nearby locus. / Под Маркёром, от Французского слова Marquer, означающее Отмечать, понимается .

MARKER OR PERFORATOR = МАРКЁР ИЛИ ПЕРФОРАТОР – Marker or Perforator:- not stapled or stencilled on lay to catch both edges, causing parts to miss in cutting. Too tight or too loose, distorting dimensions of garment. Perforated stencil not powdered, or inked, sufficiently to show distinct lines, notches and punch marks. Cutting Room Defects, and namely – Cutting Defects. / Порок или дефект раскроя.

MARKER TOO NARROW = МАРКЁР СЛИШКОМ УЗКИЙ – Marker Too Narrow:- results In wasted material; Cutting Room Defects, and namely – Marking Defects. / Порок или дефект раскроя.

MARKER TOO WIDE = МАРКЁР СЛИШКОМ ШИРОКИЙ – Marker Too Wide:- parts will not catch in lay, causing skimpy garments or requiring recuts; Cutting Room Defects, and namely – Marking Defects. / Порок или дефект раскроя.

MARKET = РЫНОК – Market (in the UK, 1840’s), a public place in a city or town, where provisions are sold. No market is to be kept within 7 miles of the city of London; but all butchers, victuallers, etc may hire stalls and standings in the flesh-markets there, and sell meat and other provisions. Every person who has a market is entitled to receive toll for the things sold in it; and, by ancient custom, for things standing in the market, though not sold; but those who keep a market in any other manner than it is granted, or extort tolls or fees where none are due, forfeit the same. Market:- in its original meaning, a physical coming together of a sizable number of merchants and prospective customers at a pre-arranged time and place (in medieval Europe, typically once a week on the main square of the largest village in the vicinity) for the purpose of striking deals to buy and sell a variety of goods and services. Large numbers of customers came to such organized markets because they found it convenient to be able to make many of their necessary purchases on the same day in one central location (minimizing their total travel time and other travel costs) and because the presence of many merchants offering similar wares made it much more practical to comparison shop for the best deals in terms of quality and price. Merchants were often attracted from considerable distances to participate in such markets because of the opportunity to sell so many of their wares to such large numbers of potential customers in such a short time. Modern day flea markets, farmers’ markets, gun shows and crafts fairs are fairly close to the original concept. In the language of modern industrial society, and especially in the language of professional economists, the concept of a market has been generalized and abstracted far beyond the original rather concrete and localized meaning of the term. In the more modern sense of the term, a market is the generalized name tag for the whole process that gets under way whenever a sizable number of people free to buy and/or sell a particular kind of good or service are in more or less close communication with each other (either personally and directly or else through the mediation of advertising, catalogs, news reports, postal carriers, telephone systems, computer networks, etc) so that information about the terms of recent transactions and current offers to buy or sell is generally available to a large number of interested parties at relatively low cost – regardless of the

participants' physical proximity or distance. Such technological innovations of the industrial age as ever cheaper and more rapid transportation and communications over increasing distances both have dramatically increased the size of the areas from which buyers and sellers may be brought together to do business and have greatly reduced the need for them actually to meet face-to-face in one place in order to strike a bargain. The markets for many consumers' durable goods like automobiles or TVs and major agricultural and industrial commodities like oil, natural gas, Wheat, beef, steel, forest products and computer chips are now literally world-wide in extent. (Of course, for many markets there do still exist central gathering places or locations that play an especially important role in the local, national or even worldwide networks of buyers and sellers – for example, the New York Stock Exchange, the Chicago Commodities Exchange, the seasonal women's fashions shows in Paris and Milan, regional baseball card collectors conventions and so on – but in nearly all such cases, it is not really necessary for an individual buyer or seller actually to travel to the relevant marketplace in order to participate in the broader markets of which these are nowadays only a part.) Where markets exist and are allowed to function reasonably freely, there are certain predictable consequences for the way the economy will operate. Elaboration of these consequences is the primary purpose of most of the research in the theoretical subfield of microeconomics. / коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо). Рынок:- (1) Открытое для всех место, где покупаются и продаются товары или услуги, напрямую или через посредников. Также называется Рыночным Местом (Markertplace). (2) Так иногда говорят собирательно о людях, имеющих возможность продавать и желание покупать товары или услуги; понятие эквивалентно понятию Спрос. (3) Рынки ценных бумаг в совокупности или Нью Йоркская Фондовая Биржа, в частности. (4) Сокращение, использующееся вместо термина Рыночная Стоимость (market value), то есть оценка активов на основе цены, которую они получили бы на открытом рынке, обычно определяемая рыночной ценой (market price), по которой аналогичные активы недавно продавались и покупались. (5) В качестве глагола значит Продавать.

(1) In general, Market is a place where goods and services are bought and sold, either directly or indirectly through an intermediary. Retail store, particularly where groceries are sold (supermarket, meat market). / В общем смысле, место где напрямую или косвенно через посредника покупаются и продаются товары и услуги. Розничный магазин в частности относится к месту, где продаются бакалейные товары, например, супермаркет, или мясной магазин. Рынок, сфера товарного обмена; в политико-экономическом значении – предложение и спрос на товары в масштабе мирового хозяйства (внешний рынок, мировой рынок), страны (внутренний рынок, национальный рынок) и её отдельного района (местный рынок). Рынком также называется определённое место, где происходит торговля.

(2) Market:- demand for a product or service, for example, the market for cotton. / Спрос на продукт или услугу, например, рынок для хлопка.

(3) Market:- in economic theory, buyers and sellers of any good or service and their interaction. Markets are generally classified in terms of their structure (size, number of buyers and sellers, product differentiation, ease of entry), which determines the kind of competition and the price-setting in that market. / В экономической теории покупатели и продавцы любого товара или услуги и их взаимодействие. Обычно рынки классифицируются по условиям их структуры (размер или объём, количество покупателей и продавцов, дифференцирование продуктов, лёгкость входа в рынок), которые определяют разновидность соперничества и ценообразования или ценоутверждения на данном рынке. Рынок, сфера товарного обмена. С точки зрения территориальных границ рынка и его масштабов различают Местный Рынок, Национальный (Внутренний) Рынок и Мировой (Внешний) Рынок. Рынок выступает господствующей и определяющей формой связи товаропроизводителей на основе общественного разделения труда. При простом капиталистическом товарном производстве через рынок происходит стихийное приспособление структуры производства товаров к объёму и структуре общественных потребностей. На рынке осуществляется окончательное признание общественного характера затрат труда отдельных товаропроизводителей, обнаруживается и устанавливается, какие условия производства являются общественно необходимыми и определяют величину стоимости товаров, рыночную стоимость. Основные элементы рыночного механизма – цена, спрос и предложение. Величина спроса, отражающая уровень общественных потребностей, ограничена размерами доходов покупателей, то есть покупательной способностью населения. Предложение характеризует динамику общественного производства и представляет собой совокупность товаров, поступающих для окончательной реализации на рынке (рыночные фонды). Соотношение спроса и предложения оказывает непосредственное воздействие на формирование определённого уровня цен. Движение цен на рынке в конечном счёте отражает изменения в производительности труда, объёме и пропорциях общественного производства, динамику денежных доходов. Формирование рынка – длительный исторический процесс, органически связанный с развитием и углублением общественного разделения труда и хозяйственной обособленности производителей. Российский революционер, политик и политический теоретик Владимир Ильич Ленин (1870–1924) отмечал, что 'внутренний рынок появляется, когда появляется товарное хозяйство; он создаётся развитием этого товарного хозяйства, и степень дробности общественного разделения труда определяет высоту его развития' (Владимир Ильич Ленин, Полное Собрание Сочинений, 5 Изданик, Том 3, Страница 60). На первых этапах товарного обмена рыночные связи носили случайный характер. Эволюция форм стоимости, переход от случайных, эпизодических меновых сделок к регулярному производству для продажи повлекли за собой образование местных рынков. Однако расширение структуры и ёмкости рынков в условиях докапиталистических общественно-экономических формаций ограничивалось господством натурального хозяйства. Докапиталистические способы производства основывались на рутинной технике, отличались низким уровнем специализации труда и не создавали благоприятных возможностей для интенсивного развития рынков. В подавляющей массе на рынок поступали товары потребительского назначения, и он не оказывал сколько-нибудь значительного воздействия на процессы воспроизводства в системе натурального хозяйства. Наибольшего развития рынок достигает при капитализме. Быстрый рост производительных сил, погоня за прибавочной стоимостью стимулировали развитие рыночных форм связи. 'Как только мануфактура до некоторой степени окрепла, она, – а ещё больше крупная промышленность, – сама создаёт себе рынок, завоёвывает его своими товарами' (Немецкий философ, социолог, экономист, политический теоретик и писатель Карл Хайнрихь Маркс (Karl Heinrich Marx; 1818–1883); смотрите Карл Маркс и Фридрих Энгельс, Соч., 2 Изд., Т. 25, Ч. 1, Ч. 369). Развитие внутреннего рынка при капитализме характеризуется обострением социально-экономических противоречий. На одном полюсе происходит концентрация общественного богатства в руках буржуазии, на другом – рост пролетариата, лишённого средств производства и вынужденного продавать свою рабочую силу. Общественное воспроизводство в условиях капитализма обслуживается системой рынков – рынками товаров, рабочей силы, капиталов (смотрите также Рынки Золота, Рынок Ссудных Капиталов). По своему функциональному назначению рынок товаров делится прежде всего на рынок средств производства и рынок предметов потребления. Переход части товаропроизводителей с развитием капитализма в ряды буржуазии создаёт рынок главным образом средств производства; разорение мелких товаропроизводителей и превращение их в пролетариев создаёт рынок предметов потребления. Особое место занимает рынок рабочей силы. Характерная его особенность – постоянное превышение предложения рабочей силы над спросом на неё (смотрите Безработица), что даёт возможность капиталистам оплачивать рабочую силу ниже её стоимости. На капиталистических рынках действуют законы анархии и конкуренции. При империализме борьба монополий за рынки сырья, сбыта и сферы приложения капитала

усиливает цикличность капиталистического воспроизводства. С развитием крупной машинной индустрии производство перерастает национальные рамки, создаётся мировой капиталистический рынок. Мощным стимулом развития внешних рынков стала обостряющаяся проблема реализации производимой продукции, относительная узость внутреннего рынка вследствие углубления основного противоречия капитализма между общественным характером производства и частной формой присвоения. Движение товаров и услуг на мировом рынке осуществляется на базе мировых цен, отличающихся от уровня цен в отдельных странах. Мировой капиталистический рынок представляет собой арену ожесточённой конкурентной борьбы, характеризуется неустойчивостью и скачкообразностью развития. Структура и направление потоков товаров и услуг на мировом капиталистическом рынке отражает господство монополий, эксплуатацию посредством неэквивалентного обмена развивающихся стран со стороны индустриально развитых империалистических государств. С возникновением мировой системы социализма после 2-й Мировой Войны (1939–45) произошёл распад единого мирового капиталистического рынка. Обострение межимпериалистических противоречий привело к усилению интеграционных процессов на мировом капиталистическом рынке, к созданию замкнутых торговых блоков. При социализме наличие товарно-денежных отношений делает необходимым сохранение рынка. Планомерная организация общественного хозяйства и господство общенародной собственности существенно меняют назначение, сферу действия и характер рынка. Из рыночного оборота изъяты природные ресурсы и основные фонды (заводы, электростанции и тому подобное), исчез рынок рабочей силы. Рынок перестаёт служить орудием стихийного учёта общественного труда, он выступает составным элементом планового ведения хозяйства. Общество в лице государственных плановых органов определяет объём и структуру производства средств производства и предметов потребления. В плановом порядке устанавливаются задания по росту производительности труда, заработной платы, розничного товарооборота и другому. Вместе с тем сохраняется проблема реализации продукции хозрасчётных предприятий, выступающих на рынке в качестве относительно обособленных товаропроизводителей. Рынок выполняет функцию контрольного механизма, информирующего плановые органы о наметившихся тенденциях в соотношении производства и потребления, о точности плановых расчётов и заданий. На внутреннем социалистическом рынке товары реализуются по плановым оптовым и розничным ценам. Внутренний рынок обслуживает государственную, кооперативную и колхозную торговлю, а также систему государственных заготовок сельскохозяйственных продуктов и материально-технического снабжения средствами производства. С образованием мировой системы социализма и развитием международного социалистического разделения труда формируется мировой социалистический рынок, принципиально отличный от мирового капиталистического рынка. Экономические отношения на мировом социалистическом рынке основываются на принципах эквивалентности и взаимной выгоды. Товарооборот осуществляется на основе экспортно-импортных планов, являющихся составными частями народно-хозяйственных планов социалистических стран. Обмен между ними происходит на основе государственной монополии внешней торговли и валютной монополии посредством долгосрочных и краткосрочных торговых соглашений. Мировой социалистический рынок способствует углублению международного разделения труда, налаживанию экономического механизма социалистической интеграции, координации народно-хозяйственных планов, развитию межгосударственной специализации и кооперирования. Использование рынка в социалистическом обществе ничего общего не имеет с идеями ‘рыночного социализма’. Формально не отрицая роли централизованного планирования, сторонники ‘рыночного социализма’ утверждают, что плановая деятельность общества эффективнее всего реализуется через действие закона стоимости, а проблема оптимизации народно-хозяйственных пропорций решается на основе рыночных форм связи между агентами социалистического производства. Концепция ‘рыночного социализма’ игнорирует высокий уровень реального обобществления социалистической экономики, действие закона планомерного развития народного хозяйства, механически переносит на почву социализма законы и принципы системы свободной конкуренции. С появлением двух мировых рынков – капиталистического и социалистического – не исчезает единый мировой рынок. Складываясь в результате взаимодействия двух противоположных по своей природе рынков, мировой рынок является экономической основой мирного сосуществования двух социальных систем, между которыми происходит экономическое соревнование.

MARKETABLE = СПОСОБНЫЕ К ОБРАЩЕНИЮ НА РЫНКЕ – Marketable:- securities or other assets which can be readily sold or otherwise disposed of for cash. / Способные К Обращению На Рынке:- ценные бумаги или иные активы, которые без труда могут быть проданы или от которых можно было бы иным способом избавиться в обмен на наличные.

MARKETABLE COLLATERAL = СПОСОБНОЕ К ОБРАЩЕНИЮ НА РЫНКЕ ОБЕСПЕЧЕНИЕ – Marketable Collateral:- security pledged as collateral which can be easily sold or otherwise realized (such as stocks and bonds listed on a stock exchange).

MARKETABLE SECURITIES = ЦЕННЫЕ БУМАГИ, СПОСОБНЫЕ К ОБРАЩЕНИЮ НА РЫНКЕ – Marketable Securities are investment securities with maturities of 1 year or less that can be readily redeemed or sold. Securities which can be sold on the open market. Negotiable instruments representing a claim on capital. Examples of marketable securities are bonds, mortgage-backed securities, and stocks. / Ценные Бумаги, Способные к Обращению на Рынке – ценные бумаги, которые легко продаются. В бухгалтерском балансе корпорации они являются активами, которые легко конвертируются в наличные средства, например, это могут быть государственные ценные бумаги, банковские акцепты и документы краткосрочного коммерческого кредита. В соответствии с консервативным подходом к бухгалтерскому учёту они учитываются по стоимости приобретения или по рыночной стоимости в зависимости от того, какая оценка ниже.

MARKET ACCESS = ДОСТУП НА РЫНОК – Market Access refers to the openness of a national market to foreign products. Market access reflects a government’s willingness to permit imports to compete relatively unimpeded with similar domestically produced goods. Market Access:- governed by provisions of the Uruguay Round Agreement on Agriculture which refer to concessions contained in the country schedules with respect to bindings and reductions of tariffs and to other minimum import commitments. / Доступ на рынок относится к открытости национального рынка перед иностранными продуктами. Доступ на рынок отражает благосклонность правительства к разрешению ввоза для относительно беспрепятственного конкурирования с аналогичными товарами, произведёнными на внутреннем рынке.

MARKET AUTHORITY = РЫНОЧНОЕ ВЕДОМСТВО – Market Authority is a Regulatory Authority, a Self-Regulatory Organisation (SRO), a Regulated Market or Exchange, or a clearing organisation (as the context requires).

MARKET–BASED INTEREST RATE = ОСНОВАННАЯ НА РЫНКЕ ПРОЦЕНТНАЯ СТАВКА – In the United States, Market-Based Interest Rate, officially known as the ‘Market-Based Variable Investment Yield’, it is relevant only to interest earnings for Series E and EE savings bonds and savings notes that are at least 5 years old, earned interest on and after 1987-November-01, and have issue dates prior to 1995-May-01. Bid yields for the most actively traded Treasury bills, notes, and bonds in the government securities market are used to create a yield curve. This curve relates the yield on a security to its time to maturity. Yields at particular points on the curve are referred to as ‘Constant Maturity Yields’. From the yield curve, five-year Treasury securities yields as of the close of business for each business day of each of the six months prior to May 01 and November 01 are compiled, and the monthly average is calculated for each month (with each monthly average being rounded to the nearest one hundredth of one percent). For each 6-month period,

starting with the 6-month period that began on 1982-May-01, the average of the monthly averages is determined. The six-month averages applicable over the entire life of an eligible bond – i.e. the period from the base date (a bond's issue date or the first date the bond or note increased in value during the period 1982-November-01 through 1983-April-01, whichever date occurred later) – are averaged. That average is discounted by 15%, i.e. 85% of the average is computed) and the result is rounded to the nearest one hundredth of one percent. If the bond or note is now in an original or extended maturity period that started before May 1989, the rounding is to the nearest one quarter of one percent, rather than the nearest one-hundredth of one percent, until the end of that period. For each date an eligible bond or note is due to increase in value, the resulting percentage is then used to re-calculate anew starting over from the base date (as defined above) what the eligible bond or note is possibly worth.

MARKET BASED RATE = ОСНОВАННАЯ НА РЫНКЕ СТАВКА – Market Based Rate (MBR) has different meanings, depending on context. In one instance, MBRs are rates for power or electric service that are established in an unregulated, competitive market. These rates can be established through competitive bidding or through negotiations between the buyer and seller, rather than set by a regulator. The Federal Energy Regulatory Commission grants market-based rate authorization for wholesale sales of electric energy, capacity, and ancillary services by sellers that can demonstrate that they and their affiliates lack or have adequately mitigated market power. MBR may also refer to a customer default rate used in lieu of a fixed contract rate. In this instance, the cost of energy fluctuates with current market prices. A customer would pay their energy provider a varying rate based on market conditions at any given point in time. This is usually considered risk-prone because future prices are unknown. Why does this matter? As portions of the electric industry become less regulated, market prices are increasingly important for making business decisions. With the first definition, MBRs may afford a customer to buy power below the local regulated utility's price with the possibility of realizing substantial savings in their energy costs. With the second definition, MBRs create uncertainty and present considerable risk, as projecting future energy costs becomes near impossible, given the unpredictability of energy market prices.

MARKET CAPITALIZATION = РЫНОЧНАЯ КАПИТАЛИЗАЦИЯ – Market Capitalization is a measure of the size and value of a corporation, security, fund, or index as determined by the market price of its issues and outstanding common stock. Market capitalization is calculated as the product of market price and shares outstanding = (stock price) x (shares outstanding). Float-adjusted market capitalization is calculated by adjusting shares outstanding to reflect the amount of stock available for trading. Market price of an entire company or market found by multiplying the number of issued shares by the share price. The total number of shares on issue multiplied by their market price. This can be applied to work out the market value of one company or of the value of all companies listed on the exchange. The ongoing value of a corporation as determined by the market value of its entire issued share capital (capital stock). Calculated by multiplying the number of shares (or participation certificates) issued by the stock market price of such shares. It is total market value of a company (number of shares outstanding multiplied by the price of the stock). For example, a company with 1 million shares outstanding and a stock price of USD10.00 would have a market capitalization of USD10 million. Also known as Market Cap. Total value of all securities issued by a corporation, determined by their listed price on the stock market. The term applies to shares of stock in companies that are listed on the exchange. Market capitalization is the amount of money that would be needed to buy up all shares of that stock on the stock market at any given time. Market Capitalization or Market Cap is a measure of the market value of the company, i.e. it is the current share price times the number of issued shares. If you were to buy 100% of all of the company's shares at current market price, this is what the company would cost you. Of course, you couldn't actually do this. You'd likely have to pay more (know why?). Market Capitalization is the current value of the company on the Stock Exchange. Therefore it is the total number of issued stocks times their current market price. / Смотрите также Капитализация (Capitalization). Рыночная Капитализация – стоимость компании, определяемая рыночной ценой выпущенных и находящихся на руках акционеров обыкновенных акций. Она подсчитывается путём умножения числа находящихся на руках акционеров акций на текущую рыночную цену акции. Организации-инвесторы часто используют рыночную капитализацию в соответствии с рыночными котировками в качестве одного из инвестиционных критериев, требуя, например, чтобы компания имела рыночную капитализацию в 100 миллионов Долларов или чтобы она могла быть объектом инвестиций. Аналитики рассматривают рыночную капитализацию в отношении к балансовой, или учётной, стоимости как отражение оценки инвесторами перспектив компании. Рыночная Капитализация компании рассчитывается как количество её акций, умноженное на их текущую рыночную стоимость. В целях классификации взаимных фондов агентство Монингста (Morningstar) рассчитывает капитализацию 5 000 крупнейших компаний США. 5% компаний, занимающих верхние позиции по величине капитализации, классифицируются как компании с высокой капитализацией, следующие 15% – как компании со средней капитализацией, а оставшиеся 80% (а также компании, не вошедшие в число 5 000 крупнейших компаний) – как компании с низкой капитализацией. Затем Монингста классифицирует фонды в зависимости от средневзвешенной рыночной капитализации компаний, акции которых входят в состав их портфелей, относя их к группам фондов высокой, средней или низкой капитализации.

MARKET CLASS = РЫНОЧНЫЙ КЛАСС – Market Class is the grouping of animals according to the use to which they will be put, such as slaughter or feeder.

MARKET–CLEARING PRICE = РАСЧИТЫВАЕМАЯ РЫНКОМ ЦЕНА (или ХХ) – Market-Clearing Price is the price that is paid by all load and paid to all suppliers.

MARKET CORRECTION = КОРРЕКЦИЯ РЫНКА – Market Correction is a drop in the price of a security when that security has been overbought and therefore overpriced. Market corrections are usually short-term and are necessary for the stability of the security. But this is no time to panic. Market corrections are an opportunity to upgrade the quality of a portfolio on the cheap. In panics, everything gets whacked. Only later, as they sift through the carnage, do investors discover that plenty of good stuff has been thrown out with the bad. The truly bad, meanwhile, gets worse. If you've been prudent, you've built up some cash to take advantage of a correction that has been widely predicted. If not, the time to act is now. You don't need to take drastic action:- A correction is short-lived by its nature, and stocks remain the likeliest assets to perform well in the next few years. In technical analysis, a small reversal in prices following a significant trending period. Market Correction is a temporary decrease in a bull, or rising market. A 10% or more decrease in a stock index is the generally accepted definition of a correction. The opposite of this, i.e. a temporary increase in a bear market is called a Bear Market Rally. / В техническом анализе биржевых рынков, небольшой разворот в ценах, следующий за длительным периодом проявления тенденции на повышение.

MARKET DATA SYSTEM = СИСТЕМА РЫНОЧНЫХ ДАННЫХ – Market Data System:- captures and displays, worldwide, trade and volume information continuously generated by trading floor activity. Market Data System is the core of the New York Stock Exchange international communications network. / коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо).

MARKET DISCOUNT RATE = РЫНОЧНАЯ СТАВКА ДИСКОНТА – Market Discount Rate is a rate at which banks discount bank acceptances and first-rate commercial paper. Also known as Prime Rate in the United States, and Private Discount Rate.

MARKET DISRUPTION = ПОДРЫВ РЫНКА – Market Disruption refers to the situation which is created when a surge of imports in a given product line causes sales of domestically produced goods in a particular country to decline to an extent that the domestic producers and their employees suffer major economic hardship.

MARKET DISRUPTION EVENTS = СОБЫТИЯ ПО ПОДРЫВУ РЫНКА – The Market Disruption Events are events that, if applicable to a derivative governed by the ISDA® Master Agreement, will give rise to an alternative basis for determining the ongoing floating price under the derivative or, possibly, the termination of the derivative. / Международная Ассоциация по Свопам и Деривативам, Инк. (МАСД®; The International Swaps And Derivatives Association, Inc. (ISDA®)). Головное Соглашение.

MARKET ECONOMY = РЫНОЧНАЯ ЭКОНОМИКА – Market Economy is an economy in which scarce resources are all (or nearly all) allocated by the interplay of supply and demand in free markets, largely unhampered by government rationing, price-fixing or other coercive interference. In classifying real historical economies, the level of 'marketization' is not primarily an either/or issue but rather a matter of degree. The greater the proportion of the goods and services produced in the society that are allocated by market processes (rather than by government edict or the operation of unchangeable custom), the more meaningful it is to refer to its economy as a market economy – and the more useful is the abstract economic theory of the operation of markets likely to be for understanding and even predicting economic behavior within that society. Probably the most critical single distinction between 'basically market' and 'basically non-market' (socialist, feudal, hunter-gatherer, etc) economies is whether or not the determinations of what is to be produced and of the corresponding allocation of producers' goods (land, raw materials, machinery, and other 'capital', as well as the services of labor) are accomplished primarily through free markets rather than primarily through government command or unalterable custom. The concept of a market presupposes the existence of certain sorts of property relations in the society involved. At least some goods and services must be legally or socially regarded as alienable property – that is, there must be ascertainable individuals (or group representatives) who are recognized as having not just the right to use particular scarce economic resources for their own purposes but also the discretionary authority permanently to transfer such rights of use to someone else in exchange for some mutually agreeable quid pro quo, such as money or other goods or services. Not all human societies have recognized any such rights to transfer ownership, and most historical human societies have forbidden or placed stringent limits on the transferability of at least certain kinds of recognized property rights. In many societies (including most of Europe during the Middle Ages), individual or family rights to the perpetual use of particular plots of land were well established and protected by law – but such rights only rarely could legally be sold to someone else because the land was socially regarded as fundamentally the inalienable property of either the local community as a whole or of the tribe or clan or church or perhaps of the reigning royal family. And even in the USA since 1865, while each person's ownership of his or her own body is well established, the law will still not allow you to make a binding contract to sell yourself into slavery or even to auction off your spare bodily organs for purposes of a surgical transplant.) It is worth noting for clarity's sake that the concept of a market does not logically presuppose the existence of 'private property in the means of production' in the sense that private individuals or family households are the owners of land and capital and thus the recipients of profits, interest, rent etc. One may at least theoretically conceive of an economy of market socialism, in which workers' collectives, consumers' cooperatives, village communes or even autonomous state agencies leased from the state or held actual title to land, mines, factories, machinery and so forth – so long as the socialist production organizations were free to buy and sell their output and and the use of their assigned land or capital assets to each other at freely negotiated prices responsive to conditions of supply and demand (assuming, of course, they are allowed to keep effective control of the bulk of the proceeds). There are, of course, both theoretical and practical problems with market socialism, and the costs and benefits of capitalist markets cannot be uncritically attributed to such a system. The larger point is that socialist economies have historically included varying proportions of 'remnant' market elements in their make-up, and the theoretical possibilities for additional 'hybrid' forms are numerous.

MARKETED PRODUCTION = ТОВАРНАЯ ПРОДУКЦИЯ – In the US natural gas reports, gross withdrawals less gas used for repressuring, quantities vented and flared, and nonhydrocarbon gases removed in treating or processing operations. Includes all quantities of gas used in field and processing operations. Gross withdrawals less gas used for repressuring, quantities vented and flared, and nonhydrocarbon gases removed in treating or processing operations. Includes all quantities of gas used in field and processing plant operations.

MARKETER = СБЫТОВИК (или РЫНОЧНИК) – In the US oil and gas industry, Marketer is a company engaged in maintaining a network of retail outlets, usually associated with a common brand-name. Marketers buy product at a wholesale price, and either resell to individual dealers or directly operate retail outlets. / В нефтегазовой отрасли США компания, вовлечённая в поддержание сети розничных точек продаж, обычно ассоциируемая с общеизвестным товарным знаком. Сбытовики покупают продукт по оптовой цене и либо перепродают его отдельным дилерам, либо под непосредственным контролем организуют его продажу через розничные точки.

MARKET FACTOR = РЫНОЧНЫЙ ФАКТОР – Market Factor:- a specified interest rate, financial instrument price, commodity price, foreign exchange rate, index of prices or rates, credit rating, credit index, or other variable, provided that in the case of a non-financial variable the variable is not specific to a party to the contract.

MARKET IF TOUCHED ORDER = РАСПОРЯЖЕНИЕ ПО РЫНКУ ПРИ ДОСТИЖЕНИИ (или ПОРУЧЕНИЕ ПО РЫНКУ, ЕСЛИ ДОСТИГНЕТ) – A Sell Market If Touched Order (MIT) is placed above the market, a Buy Market If Touched Order is placed below the market. Also known as Board Order. See also Stop Order. Market If Touched Order is an order that automatically becomes a market order when a particular price is reached. / Распоряжение клиента, которое автоматически становится распоряжением 'по рынку', когда цена дошла до определённого уровня. Распоряжение по Рынку при Достижении (РПД) заданной цены – распоряжение о немедленной покупке или продаже ценных бумаг или товарно-сырьевой продукции при достижении цены, указанной в распоряжении, когда распоряжение становится распоряжением по рынку (market order). Если Кукуруза продаётся по 4.75 Долларов за бушель, можно отдать распоряжение о покупке, когда цена достигнет 4.50 Долларов. Как только цена припадёт до 4.50 Долларов, контракт покупается от имени покупателя по той рыночной цене, которая превалирует на момент исполнения распоряжения.

MARKET INFORMATION DATA INQUIRY SYSTEM = СИСТЕМА ЗАПРОСА ИНФОРМАЦИОННЫХ ДАННЫХ ПО РЫНКУ – Historical Chicago Board of Trade price, volume, open interest data and other market information accessible by computers within the Chicago Board of Trade building. / Исторические данные Чикагской Палаты Торговли (Chicago Board of Trade; Чикагского Табло Торговли, если быть более точными) в отношении цены, объёма, открытого интереса и иной рыночной информации доступные посредством компьютеров внутри здания Чикагской Палаты Торговли.

MARKETING = ИЗУЧЕНИЕ РЫНКА (или МАРКЕТИНГ) – Marketing is an analyzing a market to identify potential outlets and customers for production in the near or long term (prospecting), given existing or expected demand, to identify ways to adapt to this demand, and to promote and sell products. / Под Маркетингом понимается одна из современных систем управления и организации деятельности крупной корпорации по разработке новой продукции, производству и сбыту товаров или

предоставлению услуг. Цель маркетинга, основанного на комплексном учёте процессов, происходящих на рынке, – получение монопольной прибыли. Основными функциями маркетинга являются:- изучение спроса, вопросов ценообразования, рекламы, стимулирования сбыта, планирование товарного ассортимента и другие. Под Маркетингом, от Английского слова Market, означающее Рынок, понимается одна из систем управления капиталистическим предприятием, предполагающая тщательный учёт процессов, происходящих на рынке для принятия хозяйственных решений. Возникла в начале XX века в Соединённых Штатах Америки (США), наибольшее распространение получила в 1950-60-х в связи с обострением проблемы сбыта и широким применением новых, так называемых неценовых методов конкурентной борьбы (реклама, конкуренция качества, дифференциация продукта и другие). Подавляющее большинство крупнейших корпораций США придерживается маркетинга. В начале 1970-х в США функционировало около 400 частных исследовательских фирм, выполнявших по контрактам с монополиями исследования по проблемам маркетинга. Оборот крупнейших из них (например, Эй.Си. Нилсэн (AC Nielsen), Нью Йорк, США) составлял десятки миллионов Долларов в год. В странах Западной Европы подобных организаций в эти годы было более 200. Существуют международные организации маркетинга – Европейский Комитет Маркетинга и Международная Ассоциация Маркетинга. Цель маркетинга – создать условия для приспособления производства к общественному спросу, требованиям рынка, разработать систему организационно-технических мероприятий по изучению рынка, интенсификации сбыта, повышению конкурентоспособности товаров с целью получения максимальных прибылей. Основные функции маркетинга:- изучение спроса, вопросов ценообразования, рекламы и стимулирования сбыта, планирование товарного ассортимента, сбыта и торговых операций, деятельность, связанная с хранением, транспортировкой товаров, управлением торгово-коммерческим персоналом, организацией обслуживания потребителей. Некоторые деятели и пропагандисты маркетинга утверждают, что он способствует социальному перерождению капиталистического строя в экономическую систему, в центре которой стоит потребитель, его вкусы, желания, запросы. В действительности, маркетинг – это попытка в рамках индивидуального капитала ликвидировать такие противоречия капитализма, как противоречия между возрастающими возможностями производства и относительно сужающимся потреблением, между растущей тенденцией к планомерной организации производства и сбыта в рамках отдельного предприятия, фирмы, монополистического объединения и анархией производства в масштабе общества. Маркетинг:- продвижение товаров и услуг от производителя к потребителю. Включает разработку и производство продукции, исследования, распространение, рекламу, расширение сбыта и создание общественного имиджа, а также анализ рынка для определения подходящих рынков сбыта.

MARKETING ALLOTMENTS = МАРКЕТИНГОВЫЕ РАЗМЕЩЕНИЯ – Marketing Allotments (US sugar program):- marketing allotments designate how much sugar can be sold by sugar millers and processors on the US internal market and were established by the Farm Security and Rural Investment Act of 2002 (2002 FSRI Act) as a way to guarantee the US sugar loan program operates at no cost to the Federal Government.

MARKETING COST = ЗАТРАТА НА ИЗУЧЕНИЕ РЫНКА (или ХОЗЯЙСТВЕННЫЙ РАСХОД) – Marketing Cost:- expenses directly associated with the preparation and implementation of the strategies designed to encourage participation in a Demand-Side Management (DSM) program. The category excludes general market and load research costs.

MARKETING LOAN = МАРКЕТИНГОВАЯ ССУДА (или ХОЗЯЙСТВЕННЫЙ ЗАЁМ) – Marketing Loan:- in the United States, a major new provision of the 1985 Farm Security Act. It provides for a loan repayment plan if the basic loan rate is not competitive on world markets. Two plans have been used under the 1985 Act. Plan A, which applied in 1986, allowed farmers to repay their loans at a price below the loan rate, thereby encouraging them to redeem the loan and sell their cotton on the open market. Plan B was used in 1987–89. It allowed farmers to repay their loans at a rate tied to the adjusted world price (AWP). A Marketing Loan is a variation of the non-recourse loan whereby, for specified commodities, a producer may repay a loan at a lower rate than the loan rate, equivalent to the prevailing world market price. Under the 1985 Food Security Act, marketing loans were implemented for Cotton, Rice and honey; under the Farm Act of 1990, they were implemented for Soybeans and other oilseeds, some Cotton and Rice, and are now mandatory for Wheat and feed grains; the 1996 FAIR Act (short for the Federal Agricultural Improvement and Reform Act of 1996) retained the provisions for some commodities. / выплата (repayment) .

MARKETING PLAN = ХОЗЯЙСТВЕННЫЙ ПЛАН (или МАРКЕТИНГОВЫЙ ПЛАН) – Marketing Plan is a written plan for each commodity produced. It specifies production costs, price goals, potential price outlook, production and price risk, and a strategy for marketing the commodity. Marketing Plan is a plan of when and how a farmer will sell grain.

MARKETING POOL = ХОЗЯЙСТВЕННЫЙ ПУЛ (или МАРКЕТИНГОВЫЙ ПУЛ) – Marketing Pools are a popular marketing alternative among Texas Cotton growers. Marketing pools are typically farmer cooperatives which, among other services, provide marketing services for the pooled production of the co-op members. A 2001 article in Progressive Farmer listed 13 regional cotton marketing pools in the United States, but there are many smaller pools consisting of groups of gins. Advantages:- The advantages of marketing pools are that, in theory, they should have a stronger bargaining position in selling large volumes of cotton to buyers relative to an individual farmer's position. Another significant advantage of marketing pools for growers is that pools are usually available, easy to use, guarantee market access, and basically provide an average price received for the season (although the latter could also be seen as a disadvantage). In short, pools provide 'a home' for cotton and free growers from the task of locating and negotiating with buyers. The marketing pools that are organized as grower cooperatives (as most of them are) have another legal advantage of being able to place their cotton into the USDA's Commodity Credit Corporation (CCC) loan program which creates storage advantages when markets prices are below the loan rate. Finally, there are enough marketing pools around to provide competition with each other as well as with local merchants. Growers should be the beneficiaries of this competition in terms of either higher offers from local merchants or the best terms offered by pools. Disadvantages:- The main disadvantages of pools are analogous to forward contracts. It is very difficult to get comparative marketing performance information from pools to choose among them. Also, as with forward contracting, there is no free lunch. The marketing services will come at a cost such as agent fees, limits on pricing flexibility, limits on quality premiums, or simply in getting an average price instead of being in the upper third. Considerations:- In considering marketing pools, growers should inquire about the requirements and provisions regarding the level of production that must be committed, the pricing flexibility (Note:- For example, a marketing pool may offer growers a choice of a 'seasonal pool' where the marketing pool makes all the pricing, hedging, and farm program decisions, or a 'call pool' where the grower has some choices.), and any premiums offered for quality attributes. Growers should also make sure that the pool they are considering is reputable and has financial integrity.

MARKETING PRICE OBJECTIVE = XX (или ХОЗЯЙСТВЕННАЯ ЦЕНОВАЯ ЦЕЛЬ) – Marketing Price Objective is the price a producer sets as an acceptable price for selling or buying grain. / цена, которую производитель устанавливает в качестве приемлемой цены для продажы или покупки зерна.

MARKETING QUOTA = МАРКЕТИНГОВАЯ КВОТА (или ХОЗЯЙСТВЕННАЯ КВОТА, или ТОРГОВАЯ КВОТА) – Marketing Quota:- quotas authorized by the Agricultural Adjustment Act of 1938 to regulate the marketing of some commodities when supplies are or could become excessive. A quota represents the quantity the Secretary estimates to be required for domestic use and exports

during the year. Marketing quotas are binding upon all producers if two-thirds or more of the producers holding allotments for the production of a crop vote for quotas in a referendum. When marketing quotas are in effect, growers, who produce more of a commodity than their farm acreage allotments, are subject to marketing penalties on the excess production and are ineligible for government price support loans.

MARKETING YEAR = ХОЗЯЙСТВЕННЫЙ ГОД (или ТОРГОВЫЙ ГОД, или СЕЗОН) – Marketing Year:- the crop year is from August 01 to July 31 of the following year, as defined in the Canada Grain Act. The Governor in Council may, by order, vary the period of a crop year to another period of not less than three hundred and sixty-five days. Also known as Crop Year. Marketing Year is the twelve month period during which a crop normally is marketed. For example, the marketing year for the current Corn crop is from September 01 of the current year to August 31 of the next year. The year begins at harvest and continues until just before harvest of the following year. The year in which a crop is planted. Also the Cotton marketing year, which is the year beginning August 01 and ending July 31. Marketing Year (MY; Foreign Agricultural Service of the United States Department of Agriculture (FAS USDA)):- the time span from one harvest to the next harvest for agricultural commodities. The crop marketing year varies slightly with each ag commodity, but it tends to begin at harvest and end before the next year's harvest, e.g., the marketing year for Cotton begins August 01 and ends July 31, for Soybeans begins September 01 and ends August 31, for Wheat begins June 01 and ends May 31, etc. The futures contract month of November represents the first major new-crop marketing month, and the contract month of July represents the last major old-crop marketing month for Soybeans. The new marketing year for soybean cake and meal, soybean oil, sunflowerseed oil, cottonseed cake and meal, and cottonseed oil begins October 01 and ends September 30. The period of time from one harvest or storage cycle to the next; varies with each commodity. In the United States, the new Marketing Year (MY) for Corn, Grain Sorghum and Soybeans begins September 01 each year and ends on August 31 of the following year. Outstanding 2019/20 sales of these commodities will be carried forward by reporting exporters for delivery in the 2020/21 marketing year. Special tables showing summary data for the 2019/20 marketing year will be published at the end of this report (US Export Sales Reports dated 2020-September-11). In the United States, the new Marketing Year for Wheat, Wheat products, Barley, Rye, Oats, Flaxseed and linseed oil began June 01. The new Marketing Year for Cottonseed, Cotton and Rice began August 01, 2020. Outstanding 2019/20 sales of these commodities will be carried forward by reporting exporters for delivery in the 2020/21 marketing year. Special tables showing summary data for the 2019/20 marketing year will be published at the end of this report (US Export Sales Reports dated 2020-August-13; Note:- Readings include carryover from the last marketing year as identified in carryover tables at). In the United States, Marketing Year is the Cotton marketing year (MY) that begins August 01 each year and ends on July 31 of the following year. Also known as Crop Year. The new Marketing Year for Soybean cake and meal, Soybean oil, Sunflowerseed oil, Cottonseed cake and meal, and Cottonseed oil began October 01, 2020. Outstanding 2019/20 sales of these commodities will be carried forward by reporting exporters for delivery in the 2020/21 marketing year. Special tables showing summary data for the 2019/20 marketing year are published at the end of this report (US Export Sales Reports dated 2020-October-08). Marketing Year (MY) for protein meals:- refers to the marketing year beginning 01 October. The new Marketing Year for Wheat, Wheat products, Barley, Rye, Oats, flaxseed and linseed oil began June 01, 2020. Outstanding 2019/20 sales of these commodities were carried forward by reporting exporters and included with other sales for delivery in the 2020/21 marketing year. Special tables showing summary data for the 2019/20 marketing year are published at the end of this report (US Export Sales Reports dated 2020-June-11). Marketing Year (MY) for vegetable oils:- refers to the marketing year beginning 01 October. In the United States, the new Marketing Year for cattle hides and skins, beef, and pork began January 01 each year and ends on December 31 of the year. Outstanding 2020 sales of these commodities will be carried forward by reporting exporters for delivery in the 2020 marketing year. Special tables showing summary data for the 2020 marketing year are published at the end of this report (US Export Sales Reports dated 2021-January-07). Cotton Marketing Season (in the Republic of South Africa), which is the year beginning April 01 and ending March 31. Marketing Year:- it is common to compare crop production across 'marketing years', which are defined so that one season's harvest is not artificially split up across different calendar years. In this Outlook, international marketing years are mostly defined starting with their harvest in major supply regions, as follows:- Wheat:- 01 June; Cotton:- 01 August; Maize and other coarse grains:- 01 September; Sugar, Soybeans, other oilseeds, protein meal, vegetable oils:- 01 October; New Zealand meat:- year ended September; Australia meat:- year ended June. Whenever the text refers to, for example, the marketing year 2020, this is short for 2020/21 for the above commodities. For all other commodities, the marketing year is equal to the calendar year. / Период времени от одного до следующего урожая или цикла хранения; различается для каждого конкретного товара. В Соединённых Штатах, Хозяйственный Год (ХГ) или Торговый Год (ТГ) или Сезон для Хлопка начинается 01 Августа каждого года и заканчивается 31 Июля следующего года. Известен также как Сезон или Год Урожая (Crop Year). В бывшем Союзе Советских Социалистических Республик (СССР) Хозяйственный Год совпадал с календарным годом и начинался с 01 Января, а заканчивался 31 Декабря. Однако в период с 1921 по 1930 он исчислялся с 01 Октября текущего года и заканчивался 30 Сентября последующего года. Во многих странах мира хозяйственный год в промышленности совпадает с календарным годом, а в сельском хозяйстве определяется периодом сельскохозяйственного года.

MARKET INTEREST RATES = РЫНОЧНЫЕ ПРОЦЕНТНЫЕ СТАВКИ – Market Interest Rates are the rates of interest determined by the interaction of the supply of and demand for funds in freely functioning markets. Market Interest Rates are the rates of interest paid on deposits and other investments, determined by the interaction of the supply of and demand for funds in the money market.

MARKET LIQUIDITY = ЛИКВИДНОСТЬ РЫНКА – Market Liquidity is defined by the number of participants in that market. The more the number of participants, the more liquid the market. Illiquid or thin markets, by contrast, have fewer participants. High liquidity commodity markets posses higher efficiency, which means that prices reflect more realistic values, and positions can be established or closed without causing price volatility.

MARKET MAKER = ТВОРЕЦ РЫНКА (или СОЗДАТЕЛЬ РЫНКА) – Market Makers are the participants in the market who provide binding offer and bid price quotes (e.g., for shares, bonds, foreign currencies, options) and who thus ensure market liquidity. At the Frankfurter Wertpapierbörse (FWB® or Frankfurt Stock Exchange) market makers are known as Designated Sponsors. Broker or dealer who makes a market to buy and sell a stock for his own account. Market makers can have a major influence on trading. Market Makers, also known as Locals, provide critical liquidity in the futures and options markets by risking their own capital while seeking to profit from the market fluctuations during the trading day. Market makers compete in the market alongside floor brokers who act on behalf of customers. This differs from a specialist market maker which is an exchange-designated trader who provides liquidity to a designated market by facilitating any trade within an established bid/ask spread and accepting all limit orders that it is required to execute. Market Maker is a principal that supplies prices to create a market by supplying an offer and a bid price, thereby running a trading book. Market Maker is a person who stands ready to execute buy and sell orders on behalf of customers or is own account. Market makers assume trading risk by taking possession of the asset traded, and execute transactions at publicly quoted prices. Also known as Counter Demand or Counter Offer in the United Kingdom. An independent trader or trading firm which is prepared to buy and sell futures or options contracts in a designated market. Market makers provide a two-sided (bid and ask) market and greater liquidity. Market Maker is a professional securities dealer or person with trading privileges on an exchange who has an obligation to buy when

there is an excess of sell orders and to sell when there is an excess of buy orders. By maintaining an offering price sufficiently higher than their buying price, these firms are compensated for the risk involved in allowing their inventory of securities to act as a buffer against temporary order imbalances. In the futures industry, this term is sometimes loosely used to refer to a floor trader or local who, in speculating for his own account, provides a market for commercial users of the market. Occasionally a futures exchange will compensate a person with exchange trading privileges to take on the obligations of a market maker to enhance liquidity in a newly listed or lightly traded futures contract. See also Specialist System. Market Maker is an organisation which buys and sells securities on its own account. Market makers quote buying and selling prices for those shares in which they are prepared to deal. / Эф.Ве.Бе.® (FWB®; Франкфота Вертпапиабёрзэ (Frankfurter Wertpapierbörse) или Франкфуртская Фондовая Биржа (Frankfurt Stock Exchange)). флуктуаций (колебаний) рынка в течение торгового дня.

MARKET MAKING = СОЗДАНИЕ РЫНКА – Market Making is a price making and trading by specialized traders. In the warrants market, this is often carried out by the issuers themselves, although in this context price smoothing plays a big role ('fair' price making, narrow bid/ask spreads).

MARKET MIX = РЫНОЧНОЕ СОЧЕТАНИЕ (или РЫНОЧНАЯ СМЕСЬ) – Market Mix is the description of the four P's of marketing, i.e. Price, Place (Distribution), Product, and Promotion as it applies to a particular commercialization plan. / Рыночная Смесь – описание для четырёх Англоязычных Пи. (**P**) – составных элементов исследования рынка, а именно Цена (**P**rice), Место (Распределение) (**P**lace (Distribution)), Продукт (**P**roduct), и Продвижение (**P**romotion) в применении к конкретному плану коммерциализации.

MARKET NEUTRAL = НЕЙТРАЛЬНАЯ В ОТНОШЕНИИ РЫНКА (или НЕЙТРАЛЬНАЯ К РЫНКУ) – Market Neutral strategies can be seen as the limiting case of equity long short, in which the long and short portfolios of the fund are balanced with great care so that a very high degree of hedging is achieved. Strictly, 'Market neutrality' just refers to hedging out market risk, which can be managed through the use of derivatives such as futures on market indexes. However, market neutral funds usually seek to hedge against most or all predictable risk exposures. As a result they are among the least volatile hedge funds. In the context of hedge funds, a style of management that has long and short equity exposure with nearly exposure on average to fluctuations in the market. However, the on average qualification is important. The risk of the longs and the shorts could fluctuate through time leading to negative returns when the market falls sharply. Market Neutral:- an investment strategy or portfolio is considered market neutral if it seeks to entirely avoid some form of market risk, typically by hedging. In order to evaluate market neutrality, it is first necessary to specify the risk being avoided. For example, convertible arbitrage attempts to fully hedge fluctuations in the price of the underlying common stock. A portfolio is truly market neutral if it exhibits zero correlation with the unwanted source of risk. Market neutrality is an ideal which is seldom possible in practice. A portfolio which appears to be market neutral may exhibit unexpected correlations as market conditions change. The risk of this occurring is called Basis Risk. An hedge fund investing strategy wherein the manager will take established positions in the market to take advantage of mispricings of correlated or semi-correlated assets. Using this strategy for equity funds, the manager will have a portfolio equally divided between long and short positions. / флуктуациям (колебаниям) на рынке.

MARKET ON CLOSE ORDER = РАСПОРЯЖЕНИЕ ПО РЫНКУ ПРИ ЗАКРЫТИИ – Market On Close (MOC) Order is an order to buy or sell at the end of the trading session at a price within the closing range of prices. See also Stop-Close-Only Order. / Распоряжение купить или продать в конце торговой сессии по цене, находящейся в диапазоне цен периода закрытия. Смотрите также Распоряжение на Фиксацию Только При Закрытии (Stop-Close-Only Order). Распоряжение по Рынку при Закрытии (РПЗ) – распоряжение о покупке или продаже акций, фьючерсных и опционных контрактов перед самым закрытием биржи. Такие распоряжения могут быть лимитными распоряжениями (limit order), которые не были исполнены в течение дня.

MARKET ON OPENING ORDER = РАСПОРЯЖЕНИЕ ПО РЫНКУ ПО ОТКРЫТИИ – Market On Opening Order is an order to buy or sell at the beginning of the trading session at a price within the opening range of prices. / Распоряжение купить или продать в начале торговой сессии по цене, находящейся в диапазоне цен периода открытия.

MARKET ORDER = РЫНОЧНОЕ РАСПОРЯЖЕНИЕ (или ПОРУЧЕНИЕ 'ПО РЫНКУ') – In contrast to limit orders, Market Orders are executed immediately at the current market prices. An order to buy or sell at the best available price at the market. The most common way of executing trades. Market Order is an order to buy or sell a security at the prevailing market price. Sometimes referred to as 'At The Market', these orders are usually filled immediately by the market maker. A sell order placed at the market will most likely be filled at the bid price, and a buy order will be filled at the ask price. An order to buy or sell a futures contract at whatever price is obtainable at the time it is entered in the ring, pit, or other trading platform. See also At-The-Market Limit Order. Market Order is an order for immediate execution given to a broker to buy or sell at the best price currently available on the trading floor. Also known as At The Market Order. Market Order (MO) is an order to buy or sell that can be executed regardless of the price. Market Order is an order given to a dealer for immediate execution, to buy or sell at the best prevailing price. Also known as 'At Best' or 'At Market'. Market Order is a buy or sell order to obtain the best price possible when the order reaches the trading floor. / Распоряжение, переданное брокеру, на немедленное исполнение покупки или продажи по самой лучшей цене, имеющейся в данный момент времени на торговом полу. Данное распоряжение гарантирует его исполнение, но не гарантирует цену исполнения. Известно также как Распоряжение 'По Рынку' (At The Market Order). Рыночное Распоряжение – распоряжение на покупку или продажу ценных бумаг по наилучшей возможной цене. Большую часть распоряжений, исполняемых на биржах, составляют распоряжения на выполнение операций по рыночной цене в момент исполнения распоряжения.

MARKET OUTPUT = ВЫПУСК ПРОДУКЦИИ ДЛЯ РЫНКА (или ТОВАРНЫЙ ВЫПУСК, или ТОВАРНАЯ ПРОДУКЦИЯ) – Market Output consists of all products disposed of on the market or intended for disposal on the market, either through sale or barter. Products that fall into this category include those that are:- (i) sold at economy-significant prices; (ii) bartered; (iii) used for payment in kind (including compensation of employees in kind and mixed income in kind); (iv) supplied by one production unit of a company to another, either for intermediate or final use; and (v) added to the inventories of finished goods and work-in-progress intended for any of the above uses – this includes the natural growth of animal and vegetable products. Market Output is an output of goods and services sold at economically significant prices. Market Output consists of output that is disposed of on the market or intended to be disposed of on the market. Market output includes:- (i) products sold at economically significant prices; (ii) products bartered; (iii) products used for payments in kind (including compensation of employees in kind and mixed income in kind); (iv) products supplied by one local kind-of-activity unit (KAU) to another within the same institutional unit to be used as intermediate inputs or for final uses; and (v) products added to the inventories of finished goods and work-in-progress intended for one or other of the above uses (including natural growth of animal and vegetable products and uncompleted structures for which the buyer is unknown).

MARKET PARTICIPANT = УЧАСТНИК РЫНКА – Market Participant (in electricity in United States) is a PJM (PJM Interconnection LLC (Pennsylvania New Jersey Maryland Interconnection LLC) market participant can be a market supplier, a market buyer or both. Market buyers and market sellers are members that have met reasonable creditworthiness standards as established by the PJM Office of the Interconnection. Market buyers are otherwise able to make purchases and market sellers are otherwise able to make sales in the

PJM Energy or Capacity Credit Markets. / Пи.Дьжей.Эм. Интёконэкшэн Эл.Эл.Си. (PJM Interconnection LLC или Пэнсэлвэйниэ Ню Дьжози Мэрилэнд Интёконэкшэн Эл.Эл.Си. (Pennsylvania New Jersey Maryland Interconnection LLC)).

MARKET PERFORMANCE COMMITTEE = КОМИТЕТ ФУНКЦИОНИРОВАНИЯ РЫНКА – Market Performance Committee (MPC) is a committee, consisting of members and allied members of the New York Stock Exchange (NYSE®) who monitor the specialists' effectiveness in assuring an orderly market for their stocks. The Market Performance Committee has the additional responsibility of assigning new or existing issues to the specialists. A specialist shall be required to attend an informal meeting with the Market Performance Committee if they have had poor performance to discuss possible ways assuring better performance in the future. The Market Performance Committee will also review potential applicants who want to become specialists for particular stocks. Market Performance Committee (MPC) is a group of NYSE® market oversight specialists who monitor specialists' efficiency in maintaining fair prices and orderly markets. Market Performance Committee focuses primarily on evaluating and seeking to strengthen the performance of New York Stock Exchange (NYSE®) specialist organizations, administering trading procedures, and recommending to the Quality of Markets Committee (QOMC) ways to improve NYSE® markets' quality and competitiveness. Members include specialists, nonspecialist floor members, allied members, and institutional traders. / (НЙФБ® или Эн.Уай.Эс.И.® (NYSE®)). Комитет Функционирования Рынка (КФР) – группа специалистов Нью Йоркской Фондовой Биржи (New York Stock Exchange (NYSE®)). В него входят члены биржи и ассоциированные члены (allied members). КФР контролирует то, как специалисты поддерживают справедливые цены и организованный рынок, и уполномочен поручать и перепоручать размещение новых и существующих выпусков ценных бумаг специалистам в зависимости от их функций.

MARKET PRACTICE = РЫНОЧНАЯ ПРАКТИКА – Market Practice is established trade or business practices among market traders designed to facilitate the conduct of business. Today, these market practices are generally set out in writing and have been largely standardized.

MARKET PRICE = РЫНОЧНАЯ ЦЕНА – Market Price is the prevailing price of shares traded on the Australian Securities Exchange (ASX). May be the last price at which the shares traded, or the most recent price offered or bid for the shares. The last reported price at which the stock or bond sold, or the current quote. See also Quote. Market Price is the price of an asset or product as determined by supply and demand. How It Works/Example:- in the broadest sense, an item's market price lies at the point of intersection between the available supply of the good or service and market demand for it. Any shift in the supply or demand affects an item's market price. If demand is held constant, a decline in supply results in a rise in its market price and vice versa. Likewise, if supply is held constant, a rise in the demand for an item results in a rise in its market price and vice versa. Why It Matters:- the market price is the price at which a good or service is bought and sold most efficiently. However, in the real world, there is a great deal of enthusiasm for policies that impact market prices. Rent control laws in New York City, production quotas adopted by OPEC nations and trade barriers enacted by national governments are all example of policies that affect market prices in the real world. Market Price is the price at which a security (share or bond, etc) is traded on the stock exchange. The market price changes independently of the par value, if any, of the security in response to supply and demand. Market Price is the current price at which an asset or service can be bought or sold. Economic theory contends that the market price converges at a point where the forces of supply and demand meet. Shocks to either the supply side and/or demand side can cause the market price for a good or service to be re-evaluated. For example, suppose that the market price for a widget has been USD10 for a number of years. Suddenly, the market price shifts to USD20 when it is announced that only half of this year's widgets will be sold in stores. In this case, a drop in supply causes the market price to increase. In regard to stocks, the market price of a stock is the most recent price at which the stock was traded. It does not guarantee that an investor will receive the same price upon buying the stock afterward. For example, suppose that a company's stock has been halted from trading because it was planning to release some material news in the next hour. While the market price of the stock at the time will be the last price at which the stock traded, buying the stock when trading resumes will definitely yield a different price. / Рыночная Цена – последняя зарегистрированная цена, по которой ценные бумаги продавались на бирже. Для акций и облигаций, продающихся на внеучётном рынке (over the counter), – это комбинация цен спроса и предложения на конкретный момент времени для тех, кто контролирует цены на рынке данных акций. Для ценных бумаг, операции с которыми ведутся неактивно, оценщики и иные аналитики могут определить рыночную цену в случае необходимости, например для разрешения спора о завещании. В коммерческой деятельности понятие 'рыночная цена' относится к цене, согласованной между покупателями и продавцами за товар или услуги в соответствии со спросом и предложением.

MARKET PRICE REPORTING AND INFORMATION SYSTEM = СИСТЕМА ОТЧЁТА И ИНФОРМАЦИИ О РЫНОЧНЫХ ЦЕНАХ – Market Price Reporting And Information System is the Chicago Board of Trade's computerized price-reporting system. / Компьютеризированная система Чикагской Палаты Торговли (Чикагского Табло Торговли, если быть более точными), служащая для отчёта о ценах.

MARKET PRICE SUPPORT PAYMENT = ПЛАТЁЖ В ПОДДЕРЖКУ РЫНОЧНОЙ ЦЕНЫ – Market Price Support (MPS) Payment is an indicator of the annual monetary value of gross transfers from consumers and taxpayers to agricultural producers arising from policy measures creating a gap between domestic market prices and border prices of a specific agricultural commodity, measured at the farm gate level. Conditional on the production of a specific commodity, MPS includes the transfer to producers associated with both production for domestic use and exports, and is measured by the price gap applied to current production. The MPS is net of financial contributions from individual producers through producer levies on sales of the specific commodity or penalties for not respecting regulations such as production quotas (Price Levies), and in the case of livestock production is net of the market price support on domestically produced coarse grains and oilseeds used as animal feed (Excess Feed Cost).

MARKET PROFILE® = ПРОФИЛЬ РЫНКА® – Market Profile® is a registered trademark of the Chicago Board of Trade (CBOT®). The Market Profile® is a time proven trading tool for reading and understanding market generated information. The Market Profile® was developed in the early 1980's by The Chicago Board of Trade®, Peter Steidlmayer and the work of Michael Boyle as an analytical decision support tool to organize and display market generated information. The Market Profile's® key components are time, price, and volume which are then combined and displayed in a horizontal and vertical distribution much like a statistical bell-shaped curve to reveal pricing patterns and value. The Market Profile® is not a trading system, it does not give buy, sell, entry, exit, overbought or oversold indicators. The trader makes trading decisions based on an independent evaluation of market price and value information. The Market Profile® trader, through study and experience, can learn to identify the market's underlying dynamics and structure (trending versus trading range) and then initiate, manage and exit trades accordingly. This differs from traditional technical analysis which primarily measures price movement using indicators and oscillators. The primary benefits of the Market Profile® for you rest in your ability to identify and quantify:- (i) the market's multiple-timeframe, attempted directions; (ii) the current session's probability of a trend or balancing session; (iii) the potential for continuation or change; (iv) market excess and it's potential ramifications as to current and future market activity; and (v) value (past and current) and value area relationships. Market Profile® charts – one of the most effective 'tool' used by traders and investors to read and understand market generated information:- (i) what's above and what's below

the current market activity; (ii) what's the market is currently doing and what it's trying to do; (iii) what the market achieved and what it failed to achieve; and (iv) the 'why's' behind the displayed information. Caveat:- developing your ability to become proficient in the interpretation of the information provided via the Market Profile® requires a significant investment of study time, energy, and money in education. MARKET PROFILE® – begin categorizing market generated data the way professional traders have for the past 25 years. Market Profile® provides a graphic that is statistically based and provides a very good way of organizing market data into distributions. As a session progresses, learn to determine who is attempting to influence the market – the 'other time frame' participant or the 'day time frame' participants. As traders become more aware of specific Market Profile® patterns and setups, it becomes obvious how useful the profile can become at providing traders with a structure with which to organize market behavior. Every trader has heard of standard deviations, bell curves & normal distributions at some point along their learning curve. Market Profile® provides a market structure from which traders can make statistically relevant decisions based on how the market has been trading during the sessions, week, or month. You don't have to be an intraday trader to use Market Profile®. Market Profile chart types may be referred to as TPO charts (TPO = 'time-price opportunity') or Market Profile charts by other programs and services. Market Profile® helps determine WHERE to trade and MarketDelta® helps determine WHEN to trade. Many traders use Market Profile® to display the overall structure of the market and gauge value. MarketDelta® compliments this by gauging volume and order flow to help determine whether or not what you are witnessing on the profile can be trusted. You can then use MarketDelta® to assist in more timely entries and exits and monitor volume at critical levels, e.g., order flow representing volume occurring at the ask (aggressive buying) and volume occurring at the bid (aggressive selling). / Профиль Рынка® является зарегистрированным товарным знаком Чикагской Палаты Торговли (ЧПТ; Чикагского Табло Торговли (ЧТТ), если быть более точными; СИБАТ® (СВОТ®)). Профиль Рынка® является проверенным временем торговым инструментом для считывания и понимания генерируемой рынком информации. Профиль Рынка® был разработан в начале 1980-х Чикагской Палатой Торговли, при участии Питёра Штайдльмайэра (Peter Steidlmayer) и Майкэла Бойла (Michael Boyle), в качестве инструмента аналитической поддержки при принятии решения для создания и отображения генерируемой рынком информации. Основополагающими компонентами Профиля Рынка® являются время, цена и объём сделок, которые комбинируются и отображаются на графике в виде горизонтальной и вертикальной развёртки, напоминающей статистическую параболическую кривую, отражающую различные модели ценообразования и их оценку. Профиль Рынка® не является торговой системой, не выдаёт сигналов на покупку, продажу, вход или выход из рынка и не свидетельствует о перекупленности или перепроданности рынка. Торговец принимает решения о сделках, основываясь на независимой оценке поведения цены на рынке и анализе информации. Путём изучения и практики, торговец, пользующийся Профилем Рынка®, способен научиться определять незаметную с первого взгляда динамику развития рынка и его структуру (отношение тенденций развития цен к диапазону торговли) и затем, наиболее эффектно и эффективно входить в рынок, поддерживать открытые позиции и выходить из рынка. Это отличает Профиль Рынка® от традиционного технического анализа, в котором, в первую очередь, с помощью индикаторов и осцилляторов характеризуется изменение цен. Основные достоинства Профиля Рынка® лежат в его возможностях определения качества и интенсивности:- (i) возможных направлений развития рынка в том или ином, или во всех возможных временных диапазонах; (ii) возможностей проявления тенденций либо их полного отсутствия в течение текущей сессии; (iii) потенциала к продолжению или изменению; (iv) избыточности рынка и возможности его расширения или сужения по отношению к текущей и прогнозируемой активности рынка; и (v) ценности рынка (прошлой и настоящей) для торговца и взаимосвязей между составляющими данной ценности. Графики Профиль Рынка® являются наиболее эффективным инструментом, которым пользуются и торговцы и инвесторы для считывания и понимания генерируемой рынком информации:- (i) из чего складывается данная ситуация на рынке; (ii) что происходит на данном рынке и к чему он стремится; (iii) чего удалось добиться данному рынку и что не удалось; и (iv) почему ситуация на рынке развивается именно так, как она развивается. Однако, развитие способностей торговца или инвестора пользоваться всеми достоинствами Профиля Рынка® потребует от него значительного вложения времени, энергии, денежных средств. Профиль Рынка® – начинает подразделять генерируемые рынком данные как это делали профессиональные торговцы на протяжении последних 25 лет. Профиль Рынка® предлагает график, основанный на статистических данных, и очень хороший способ раскладывания по полочкам данных формирующегося рынка. По мере продвижения торговой сессии, необходимо определить кто пытается воздействовать на рынок – будь-то участники с краткосрочным интересом или некий участник с долгосрочным интересом. По мере того, как торговцы знакомятся со специфическими моделями и установками графика Профиль Рынка®, им становится яснее на сколько полезным оказывается данный профиль в обеспечении торговцев информацией при выработке стратегии поведения на данном рынке. На определённых этапах изучения кривых каждый торговец несомненно слышал о стандартных отклонениях, параболических кривых и нормальном распределении. Профиль Рынка® предлагает такую структуру графика, анализируя которую торговцы могут составить для себя статистически обоснованное мнение о том, как вёл себя рынок на протяжении торговых сессий, недель и даже месяцев. Для использования Профиля Рынка® необязательно быть внутрисуточным торговцем. Типы графика Профиля Рынка®, по большому счёту, есть не что иное, как графики СЦВ (Соотношения Цены и Времени ('time-price opportunity')). Иными словами, для создания своих графиков Профиль Рынка® использует другие известные программы и услуги. Профиль Рынка® помогает определить на каком уровне войти или выйти из рынка, а ДельтаРынка® помогает определить когда именно совершить сделку. Многие торговцы пользуются ДельтойРынка® для отображения общей структуры рынка и оценки показателей. ДельтаРынка® достигает этого путём оценки объёмов и потока распоряжений, что помогает определить на графике Профиля Рынка® те позиции, которым можно доверять. Кроме того, ДельтаРынка® может использоваться для уточнения своевременности входов и выходов из рынка и отслеживания объёма сделок на критических уровнях развития данного рынка, а именно, при выраженном в виде усиления потока распоряжений на покупку повышенном спросе (агрессивной покупке) и повышенном предложении (агрессивной продаже) - в виде усилении потока распоряжений на продажу.

MARKET PROFILE® CHARTS = ГРАФИКИ ПРОФИЛЯ РЫНКА® – A Chicago Board of Trade information service that helps technical traders analyze price trends. Market Profile consists of the Time and Sales ticker and the Liquidity Data Bank. Market Profile® Charts use alphabetical characters to plot the price activity that occurs during each 30-minute time interval (default for electronic trading system of some vendors). The Market Profile® assigns successive letters to each 30-minute time interval. The assigned letter is plotted on the Market Profile® chart at each price traded during the 30-minute period. The resulting price distribution, and distributions for other trading days, can be analyzed to determine market strength and weakness. / Информационная служба Чикагской Палаты Торговли (Чикагского Табло Торговли, если быть более точными), помогающая торговцам, использующим технический анализ для определения тенденций движения цен на рынке. Профиль Рынка® включает в себя значения цен в определённый момент времени и Базу Данных Ликвидности, другими словами интенсивность операций в данный момент времени. Графики Профиля Рынка® используют буквы алфавита для формирования графика активности цены, происходившей в течение каждого 30-минутного временного интервала (некоторые разработчики электронных торговых систем используют этот интервал в качестве интервала по умолчанию). Профиль Рынка® присваивает последовательные буквы каждому 30-минутному временному интервалу. Присваиваемая буква формируется на графике Профиля Рынка® по цене каждой сделки,

совершаемой в течение 30-минутного периода. Полученное распределение цены и распределения цены по другим дням торговли могут быть использованы для анализа при определении силы или слабости рынка.

MARKET PROMOTION PROGRAM = ПРОГРАММА СОДЕЙСТВИЯ РЫНКУ – In the United States, the Market Promotion Program (MPP) was authorized by the Food, Agriculture, Conservation and Trade Act of 1990 and is administered by the US Department of Agriculture's Foreign Agricultural Service. Under the MPP, surplus stocks or funds from the Commodity Credit Corporation are used to partially reimburse agricultural organizations conducting specific foreign market development projects for eligible products in specified countries. Proposals for MPP programs are developed by trade organizations and private firms. Activities financed by the programs vary from commodity to commodity, and include activities such as market research, construction of a three-story wood demonstration building, construction of a model feed mill, and consumer promotion activities. MPP is similar to the Targeted Export Assistance (TEA) program which was repealed by the 1990 Farm Bill. / сохранение (conservation).

MARKET REPORTER = РЕПОРТЁР ПО РЫНКУ – Market Reporter is a person, employed by the exchange and located in or near the trading pit or ring, who records prices as they occur during trading. Also known as Price Observing Reporter. / Лицо, нанятое биржей и находящееся непосредственно в или вблизи торговой ямы или ринга, которое записывает цены по мере того, как они появляются при сделках. Известен также как Репортёр, Следящий За Ценой (Price Observing Reporter).

MARKET RISK = РЫНОЧНЫЙ РИСК – (1) The Market Risk is understood to mean the risk of disadvantageous changes in market prices or in parameters, which influence market prices. A differentiation is made between risks from changes in interest rates, from currencies, from share prices, from credit spread, and other risks. Consideration is given to the market price risks for all interest, currency and share-related products, including the corresponding derivates. The risk that a banking organization may incur losses due to the change in market value of an asset or liability on its balance sheet. Market Risk:- exposure to a change in the value of some market variable, such as interest rates or foreign exchange rates, equity or commodity prices. For holders of a derivatives position, market risk may be passed through from a change in the value of the underlying to the price of the derivative, or may arise from other sources, such as implied volatility or time decay. Exposure to changes in market prices. See also Systematic Risk. If the market value of an investment declines, assets are reduced. Credit, country and interest-rate risks in particular have an impact in the form of price fluctuations. All investments are exposed to this risk. The risk of a decline in the total value of the bank's assets and liabilities due to adverse changes in such market variables as interest rates, exchange rates and gold prices. The main components of the bank's Market Risk are:- (i) gold price risk, (ii) currency risk and (iii) interest rate risk. The bank incurs market risk primarily through the assets relating to the management of its equity. The bank measures market risk using the value-at-risk (VaR) methodology, and by computing sensitivities to certain market risk factors. VaR expresses the statistical estimate of the maximum potential loss on the current portfolio assuming a specified time horizon and measured to a specified level of confidence. Market risk economic capital is measured and managed on an aggregated market risk basis. The bank's management limits the bank's market risk economic capital usage within a framework set by the Board of Directors. Market Risk is the risk of a general decline in the market. Market Risk is the risk arising from changes in the value of a portfolio due to movements in stockmarket values, i.e. risk due to volatility of share prices. / флуктуации (колебания) цены. Рыночный Риск – риск возникновения у кредитной организации убытков вследствие неблагоприятного изменения рыночной стоимости финансовых инструментов торгового портфеля и производных финансовых инструментов кредитной организации, а также курсов иностранных валют и (или) драгоценных (благородных) металлов. Рыночный риск включает в себя фондовый риск, валютный и процентный риски.

(2) Part of the total risk inherent in buying a stock, which depends on market movements as a whole rather than on the particular characteristics of the stock itself; e.g., during a market crash, the share prices of many sound companies whose earning prospects remain unchanged may fall in line with less sound stock. This illustrates the market risk, rather than the specific risk inherent in stock market dealings. Market Risk is the risk relating to changes in the value of a portfolio due to movements in the market value of the assets held.

MARKET SEGMENTATION = СЕГМЕНТАЦИЯ РЫНКА – Market Segmentation:- market segmentation theory says that yields at each term to redemption are determined by supply and demand from investors with liabilities of that term.

MARKET SPREAD = РЫНОЧНАЯ КУРСОВАЯ РАЗНИЦА (или РЫНОЧНЫЙ СПРЭД) – The Market Spread measures the spread in % between the best bid and the best offer compared to the mid price.

MARKET THEORIES = РЫНОЧНЫЕ ТЕОРИИ – Market Theories:- principles or models used for predicting future stock market performance or for explaining past price trends. / Рыночные Теории:- принципы и модели, используемые для предсказания поведения фондового рынка в ближайшем будущем или для объяснения ранее существовавших тенденций движения цены.

MARKET THRESHOLD = РЫНОЧНЫЙ ПОРОГ (или XX) – Market Threshold (in electricity in the United States):- in the context of the PJM (PJM Interconnection LLC (Pennsylvania New Jersey Maryland Interconnection LLC) economic planning process, each market threshold represents the level of unhedgeable congestion costs that triggers the start of a one-year 'market window' for the development of market solutions to unhedgeable congestion. Market threshold values are specific to the transmission Voltage of the affected facility. / Пи.Дьжей.Эм. Интёконэкшэн Эл.Эл.Си. (PJM Interconnection LLC или Пэнсэлвэйниэ Ню Дьжози Мэрилэнд Интёконэкшэн Эл.Эл.Си. (Pennsylvania New Jersey Maryland Interconnection LLC)).

MARKET–TO–LIMIT ORDER = РАСПОРЯЖЕНИЕ ОТ 'ПО РЫНКУ' ДО ЛИМИТНОГО – Market-To-Limit Order (MTLO) is an order to buy or sell that is entered to be executed at the current best market price.

MARKET TREND = РЫНОЧНАЯ ТЕНДЕНЦИЯ (или НАПРАВЛЕНИЕ РЫНКА) – Market Trend is a general direction of prices, without regard to short-term fluctuations. Market Trend is the general direction of prices, either up or down. / Рыночная Тенденция или Направление Рынка – общее направление в движении цен, игнорирующее их краткосрочные колебания.

MARKET USER INTERFACE = ИНТЕРФЭЙС ПОЛЬЗОВАТЕЛЯ РЫНКА (или XX) – Market User Interface:- a thin client application allowing generation marketers to provide and to view generation data, including bids, unit status and market results.

MARKET VALUE = РЫНОЧНАЯ СТОИМОСТЬ – Market Value is the price for an object (such as a real estate property or a security) obtained on the open market under ordinary circumstances. The market price generally differs from the income-producing value. Market Value is the amount a seller can expect to receive on the open market for merchandise, services or securities. Market Value is the cost that would be incurred or the gain that would be realised if an outstanding contract were replaced at current market prices. Also known as Replacement Value. Market Value (of assets):- the market value of a life insurance company's assets represents what they are worth in the open market, given a willing buyer and a willing seller. / Под Рыночной Стоимостью понимается стоимость произведённого товара, определяемая затратами общественно необходимого труда и регулирующая рыночную цену товара. Смотрите также Стоимость. Рыночная Стоимость в общем значении:- цена, по которой покупатели и продавцы совершают сделки с одним и тем же товаром на открытом рынке. При отсутствии рынка это – наивысшая цена, которую покупатель

гарантированно может заплатить, а продавец гарантированно примет при условии, что обе стороны имеют полную информацию и действуют добровольно. Инвестиции:- текущая рыночная цена ценных бумаг, зафиксированная в последней зарегистрированной сделке. Бухгалтерский учёт:- техническое определение, используемое при оценке материальных производственных запасов или пользующихся спросом на рынке ценных бумаг в соответствии с консервативным методом бухгалтерского учёта 'по низшей из оценок себестоимости или рыночной стоимости'. В то время как себестоимость является просто ценой приобретения, рыночная стоимость представляет собой оценку стоимости хранения, продажи и доставки и в случае полуфабрикатов – расходы, необходимые для завершения производства. Рыночная стоимость, подсчитываемая таким образом, не может быть ниже себестоимости, при которой может быть получена нормальная прибыль.

MARKET VALUE CLAUSE = ОГОВОРКА О РЫНОЧНОЙ СТОИМОСТИ – Market Value Clause:- a provision that may be used in property damage insurance form covering some risks which obligates the insurance company, in the event of loss, to pay the established cash selling price of the destroyed or damaged stock, rather than the actual case value as provided in the Standard Fire Policy.

MARKET VALUE MARGIN = МАРЖА РЫНОЧНОЙ СТОИМОСТИ – Market Value Margin is a monetary amount that represents the market's assessment of risk and uncertainty incorporated in relevant transaction prices. / Денежная сумма, представляющая собой рыночную оценку риска и неопределённости, заложенную в цены соответствующих операций.

MARKET VOLATILITY INDEX = ИНДЕКС ПО ЛИХОРАДОЧНОСТИ РЫНКА – The Market Volatility Index (VIX) measures the volatility of the market. It was created in 1933. A recent news story described it as 'the options market's gauge of investor fear'. Traders use VIX as a general inverse indicator of market volatility and sentiment. High numbers mean that there's excess bearishness, and low numbers indicate excess bullishness. The VIX is updated intraday by the Chicago Board Options Exchange, Inc. (CBOE®), using Standard & Poor's 500 Index (SPX) bid/ask quotes. / Индекс по Лихорадочности Рынка (ИЛР или Ви.Ай.Экс. (VIX), в Англоязычном произношении) измеряет уровень лихорадочности рынка. Он был изобретён в 1933. Современная новостная история описывает его как 'показатель страха инвесторов на рынке опционов'. Торговцы используют ИЛР в качестве обычного обратного индикатора лихорадочности и чувствительности рынка. Высокие значения индекса означают избыточное наличие на рынке медвежьих настроений, в то время как низкие значения индекса указывают на избыточное наличие на рынке бычьих настроений. ИЛР в течение всего дня обновляется Биржей Опционов при Чикагской Палате (The Chicago Board Options Exchange, Inc.; сокращённо – БОЧП или СИБО® (CBOE®), в Англоязычном произношении) на основе использования котировок спроса и предложения по Индексу по 500 от Стэндод энд Поз по акциям компаний с крупной капитализацией (Standard & Poor's 500 Index (SPX)).

MARKET WINDOW = РЫНОЧНОЕ ОКНО (или ХХ) – Market Window (in electricity):- in the context of the PJM (PJM Interconnection LLC (Pennsylvania New Jersey Maryland Interconnection LLC) economic planning process, the period of time during which PJM allows for the development of market solutions to unhedgeable congestion associated with an affected facility. / Пи.Дьжей.Эм. Интёконэкшэн Эл.Эл.Си. (PJM Interconnection LLC или Пэнсэлвэйниэ Ню Дьжози Мэрилэнд Интёконэкшэн Эл.Эл.Си. (Pennsylvania New Jersey Maryland Interconnection LLC)).

MARKING = МАРКИРОВКА – Marking:- letters, numbers, and other symbols placed on cargo packages to facilitate identification. Also known as Marks. / Буквы, цифры и иные символы, нанесённые на упаковки груза для обеспечения идентификации. Известны также как Знаки (Marks). Под Маркировкой, от Немецкого слова Markieren, означающее Отмечать или Ставить Знак, понимаются буквы, цифры, надписи, условные знаки на продукции, её частях, ярлыках, упаковке. Кроме потребительской, существует также транспортная маркировка, содержащая обычно адреса отправителя и получателя груза, надписи и (или) знаки, относящиеся к способам обращения с перевозимой продукцией. Маркировка – текст, условные обозначения, рисунок, нанесённые на упаковку и/или товар, а также другие вспомогательные средства, предназначенные для идентификации товара или отдельных его свойств, доведения информации до потребителей об изготовителях, количественных и качественных характеристиках товара. Основными функциями маркировки являются:- (i) Информационная Функция маркировки является основной. Наибольший удельный вес в маркировке приходится на основополагающую и потребительскую информацию, меньший – на коммерческую. При этом основополагающая информация на маркировке дублирует тот же вид информации в ТСД. Маркировка для основной массы потребителей является практически единственно доступным средством товарной информации, поэтому в ней удельный вес коммерческой информации значительно меньше. (ii) Идентифицирующая Функция маркировки обусловлена определением терминов 'идентификация' и 'маркировка'. 'Идентификация товара – установление соответствия наименования товара, указанного в маркировке и/или в сопроводительных документах, предъявляемых к нему требованиям'. (iii) Эмоциональная и Мотивационная Функции маркировки взаимозависимы. Красочно оформленная маркировка, поясняющие тексты, применение общепринятых символов вызывают у потребителей положительные эмоции и служат важной мотивацией для принятия решения о покупке товара. Идентифицирующая функция маркировки обусловлена определением терминов 'идентификация' и 'маркировка'. 'Идентификация товара – установление соответствия наименования товара, указанного в маркировке и/или в сопроводительных документах, предъявляемых к нему требованиям'. Эмоциональная и мотивационная функции маркировки взаимозависимы. Красочно оформленная маркировка, поясняющие тексты, применение общепринятых символов вызывают у потребителей положительные эмоции и служат важной мотивацией для принятия решения о покупке товара. (1) Производственная Маркировка:- в зависимости от места нанесения различают маркировку производственную и торговую. Производственная маркировка – текст, условные обозначения или рисунок, нанесённые изготовителем (исполнителем) на товар и (или) упаковку и (или) другие носители информации. Носителями производственной маркировки могут быть этикетки, вкладыши, ярлыки, бирки, контрольные ленты, клейма, штампы кольеретки и другие. (2) Торговая Маркировка – текст, условные обозначения или рисунок, нанесённые продавцом на товарные или кассовые чеки, упаковку и товар. Носителями торговой маркировки служат ценники, товарные и кассовые чеки, счета, меню, штампы, а также упаковка. В отличие от производственной торговая маркировка наносится не на товар, а на указанные носители или эксплуатационные документы. Другое отличие торговой маркировки заключается в том, что её идентифицирующая функция в большей мере связана с указанием данных о продавце, в меньшей – с информацией о товаре. Это обусловлено особенностями носителей торговой маркировки:- небольшие размеры, заполнение для каждого товара или покупки, большие затраты ручного труда на маркирование, ограниченные технические возможности для нанесения информационных данных; а также её назначением – довести информацию о торговой фирме. Благодаря идентифицирующей функции отдельные носители торговой маркировки служат основанием для предъявления претензий продавцу в случае выявления дефектов товаров и нанесения ущерба потребителю. Требования, предъявляемые к содержанию торговой маркировки, регламентируются постановлением Совета Министров Правительства Российской Федерации 'О Правилах Продажи Отдельных Видов Продовольственных И Непродовольственных Товаров' (Пункт 51 – Требования к товарному чеку, выдаваемому при покупке радиотоваров и электробытовых товаров) и Положением По Применению Контрольно-Кассовых Машин При Осуществлении Денежных Расчётов С Населением (Пункт 5 – Реквизиты кассового чека). Предусматриваются

следующие требования к содержанию основных носителей торговой маркировки. Товарный Чек:- (i) наименование товара; (ii) сведения о продавце; (iii) дата продажи; (iv) количество; и (v) цена товара, а также проставляется подпись представителя продавца.

MARKING OFF = НАЛЁЖКА (или ЗАТЁК КРАСИТЕЛЯ, или МАРКОСТЬ, или ОТМЕТКА, или РАЗМЕТКА) – Marking Off:- Fabric:- faille taffeta dress goods; Construction:- (i) Count:- 174 x 72; (ii) Warp:- 74/34 bright acetate rayon; (iii) Filling:- 300/80 dull acetate rayon; Finish:- plain dyed lavender. Defect:- fabric showed light streaks or 'mark-offs' when fingernail was rubbed across surface, or if fabric was crushed. Analysis:- it is not uncommon to find a condition of this kind caused by finish on rayon fabrics, and it was at first suspected that this was the cause of the ease with which this material showed 'mark-offs' or crush marks. However, laboratory scouring did not eliminate the fault, which proved that the finish was not responsible for the condition. Close examination disclosed the fact that the filling yarns were dyed much lighter in shade than the warp yarns, which was to be expected when it was learned that the fabric was woven with dull yarns in the filling and bright-luster yarns in the warp. The marking off was evidently due to a disturbance or re-arrangement of the warp, which resulted in the lighter dyed filling's showing through unevenly. While some shades would show the condition more than others. the basic fabric construction was considered responsible for this defect. / Уточина:- . фай тафта (faille taffeta).

MARKING TO MARKET = УЧЁТ ПО РЫНКУ – Marking To Market is the revaluation of open positions in financial instruments at current market prices and the calculation of any gains or losses that have occurred since the last valuation. To debit or credit on a daily basis a margin account based on the close of that day's trading session. In this way, buyers and sellers are protected against the possibility of contract default. The practice of revaluing securities and financial instruments using current market prices. / Практика переоценки ценных бумаг и финансовых инструментов, использующая текущие рыночные цены.

MARKOWITZ MODEL = МОДЕЛЬ МАРКОВИЦА – Markowitz Model:- in the 1950s he developed a theory of Portfolio Choice, which allows investors to analyze risk as well as their expected return. For this work Markowitz, a professor at Baruch College at the City Univ. of New York, shared the 1990 Nobel Memorial Prize in Economic Sciences with William Sharpe and Merton Miller. A Nobel prize winning economist who devised the modern portfolio theory in 1952. Markowitz's theories emphasized the importance of portfolios, risk, the correlations between securities and diversification. His work changed the way that people invested. Prior to Markowitz's theories, emphasis was placed on picking single high-yield stocks without any regard to their effects on portfolios as a whole. Markowitz's portfolio theory would be a large stepping stone towards the creation of the capital asset pricing model. Harry M. Markowitz (born 1927), American economist. He shared a 1990 Nobel Prize for contributions to financial economics. The Capital Asset Pricing Model (CAPM) is used in finance to determine a theoretically appropriate required rate of return (and thus the price if expected cash flows can be estimated) of an asset, if that asset is to be added to an already well-diversified portfolio, given that asset's non-diversifiable risk. The CAPM formula takes into account the asset's sensitivity to non-diversifiable risk (also known as Systematic Risk or Market Risk), in a number often referred to as Beta (β) in the financial industry, as well as the expected return of the market and the expected return of a theoretical risk-free asset. The model was introduced by Jack Treynor, William Sharpe, John Lintner and Jan Mossin independently, building on the earlier work of Harry Markowitz on diversification and modern portfolio theory. Sharpe received the Nobel Memorial Prize in Economics (jointly with Harry Markowitz and Merton Miller) for this contribution to the field of financial economics. See also Modern Portfolio Theory. / Модель Марковица:- Американский экономист Хэри Мэкс Марковиц (Harry Max Markowitz; 1927–), Профессор Колледжа Баруха при Городском Университете Нью Йорка разработал теорию . Американские экономисты Дьжяк Лорэнс Трэйно (Jack Lawrence Treynor; 1930–2016), Американский экономист Вилъйэм Фосайс Шарп (William Forsyth Sharpe; 1934–), Дьжон Вёдьжэл Лынтнё (John Virgil Lintner; 1916–1983) и Норвежский экономист Ян Мосин (Jan Mossin; 1936–1987). Американские экономисты Хэри Мэкс Марковиц (Harry Max Markowitz; 1927–) и Мётчэн Хавод Мило (Merton Howard Miller; 1923–2000).

MARKS = МАРКИ (или МЕТКИ) – Marks are letters, numbers, and/or characters placed on a package for purposes of identification. / Буквы, цифры и/или символы, размещённые на упаковке с целью идентификации.

MARKS AND NUMBERS = МЕТКИ И ЧИСЛА – Marks and Numbers:- the identifying details on or of a package or the actual markings that appear on the packages.

MARKS OF ORIGIN = МАРКИ О ПРОИСХОЖДЕНИИ (или МЕТКИ О ПРОИСХОЖДЕНИИ) – Marks Of Origin:- the physical markings on a product that indicate the country of origin where the article was produced. Customs rules require marks of origin of most countries.

MARK TO MARKET = УЧИТЫВАТЬ ПО РЫНКУ – Mark-To-Market:- valuation at an appropriate market price, set at arms length between informed, knowledgeable parties, with unrealized profit and losses reflected in income or equity depending on the classification of the instrument. Daily adjustment of (mostly exchange-traded) derivative contracts to calculate daily gains or losses on the relevant position. Mark-To-Market:- it is a method that values the client's books at the end of each working day, i.e. to debit or credit on a daily basis the clients margin account based on the close of that day's trading session. It protects against the possibility of contract default. To debit or credit on a daily basis a margin account based on the close of that day's trading session. In this way, buyers and sellers are protected against the possibility of contract default. Mark-To-Market:- daily cash flow system used by US futures exchanges to maintain a minimum level of margin equity for a given futures or option contract position by calculating the gain or loss in each contract position resulting from changes in the price of the futures or option contracts at the end of each trading session. Also known as Marked To Market. To revalue futures/option positions using current market prices to determine profit/loss. The profit/loss can then be paid, collected or simply tracked daily. Mark-To-Market means measuring the value of financial assets at their market value. This method plays an important role in the valuation of postions on the futures market. The revaluation of a position at current market price levels. To Mark-To-Market is to calculate the value of a financial instrument (or portfolio of such instruments) based on the current market rates or prices of the underlying. Marking-to-market on a daily (or more frequent) basis is often recommended in risk management guidelines. / , то есть . Переоценка фьючерсных/опционных позиций с использованием текущих рыночных цен для определения прибыли/убытка. Прибыль/убыток могут подлежать выплате, взысканию, либо просто ежедневно отслеживаться. Учитывать по Рынку – переоценка активов или позиций в соответствии с текущими рыночными ценами. (1) Корректировка оценки ценных бумаг или портфеля для отражения текущей рыночной стоимости. Например, маржинальные счета (margin accounts) корректируются для обеспечения соответствия требованиям по поддержанию счёта. Опционы и фьючерсы корректируются в конце года, когда производится оценка в целях налогообложения нереализованной прибыли или убытков (paper profit or loss). (2) Во взаимном фонде ежедневная оценка стоимости чистых активов, о которой сообщается акционерам, является результатом корректировки оценки текущего портфеля фонда в соответствии с текущими рыночными ценами.

MARK–UP = НАКИДКА – Markup is the percentage applied to cost to determine the retail. Mark-Up is the percentage added to the cost price to give the selling price. / Процент, добавляемый к цене издержек при формировании цены продажи (цены реализации).

MARKUSH DOCTRINE = ДОКТРИНА МАРКУША – Markush Doctrine:- when materials recited in a claim are so related as to constitute claiming the members of the claimed group in the alternative, such as 'selected from the group consisting of A, B and C'. The members of a Markush group must have at least one property that is mainly responsible for their membership in the group. Markush Doctrine is principle applicable to Patent laws which permits a claimant to use an alternative, subgeneric phrase when there is no applicable, commonly accepted generic expression. It is an exception to the policy against using alternative language in claims. Generally a claimant cannot use the specific alternative phrase but can use a generic phrase that would cover effectively the desired alternatives. For example, instead of specific alternative phrase like 'glass or plastic' a generic phrase like 'impervious transparent material' can be used. However according to the doctrine a claimant can use phrase like 'selected from the group consisting of A, B and C'. It originally used with organic chemical compounds as there were no suitable phrase to cover the alternatives. The term Markush comes from Dr. Eugene A. Markush, who was granted a dye-preparation patent in 1923. / Доктор Юдьжин Эй. Маркуш (Dr. Eugene A. Markush).

MARL = XX (или МЕРГЕЛЬ) – Marl is a technical term that refers to a yarn made of different colored fibers. The word is used descriptively for fabrics to indicate randomly or uniformly colored slubs that appear on the surface giving added textural and design interest to the fabric. / Мергель, от Немецкого слова Mergel, от Латинского слова Marga, – осадочная глинисто-карбонатная горная порода. Содержит 50–75% (по объёму) карбонатных минералов (кальцита, реже доломита) и 25–50% – глинистых. Применяется главным образом для производства цемента, отчасти для улучшения почв (туковая известь).

MARLINSPIKE = СВАЙКА – Marlinspike (maritime term):- pointed iron implement used in separating the strands of rope in splicing, marling, etc.

MARL YARN = XX ПРЯЖА (или МЕРГЕЛЬНАЯ ПРЯЖА) – Marl Yarn is the yarn made from two rovings of contrasting colors drafted together, then spun. Provides a mottled effect. Marl Yarn is the yarn consisting of two or more single ends of different colors plyed together. / Мергель (Marl). Двухцветная однониточная пряжа, спряденная из двух ровниц – белой и чёрной.

MAROCAIN = XX (или МАРОКЕН) – Marocain is a ribbed crêpe fabric used in women's clothing. / торговое название плательной ткани с мелким волнистым рубчиком по ширине из креповой пряжи.

MAROON = КАШТАНОВОЕ – Maroon:- a variable color averaging a dark red.

MAROON = МАРОН (или ВЫСАЖИВАТЬ НА НЕОБИТАЕМЫЙ ОСТРОВ, или ВЗРЫВНОЕ СИГНАЛЬНОЕ УСТРОЙСТВО) – Maroon (maritime term):- to put a person ashore with no means of returning.

MARPOL 73/78 = МАРПОЛ 73/78 (или МОРЗАГ 73/78) – Marpol 73/78:- the International Convention for the Prevention of Pollution from Ships, 1973, as modified by the Protocol of 1978.

MAR POLICY FORM = ФОРМА МОР ПОЛИС – Mar Policy Form is a market term for the form of marine policy used by Lloyd's and the London company market. It is a basic contract form to which the conditions agreed by the insurers subscribing a marine insurance contract are attached. Mar Policy Form is a simplified form of marine insurance policy that was introduced in the Lloyd's marine insurance market to replace the SG policy form (the 'Ships Goods' policy form). A similar form of policy was introduced by the Institute of London Underwriters, for use by member companies, at the same time. The new policy form was introduced in 1982 for cargo insurance and in 1983 for hull insurances. / была представлена Институтом Лондонских Расписчиков (Андеррайтеров). Лойдз (Lloyd's).

MARQUISETTE = МАРКИЗЕТ (или МАКВИЗЭТ) – Marquisette:- a silk, cotton, rayon, synthetics. A sheer meshed fabric used for clothing, curtains, and mosquito nets. Very lightweight, open, sheer, mesh fabric. Wears very well and launders very well. Comes in white, solid colors and novelty effect. Sometimes with a swivel dot or clip spot. Marquisette is a lightweight, open-mesh fabric made of cotton, silk, or manufactured fibers in a leno, doup, or gauze weave. Marquisettes are used for curtains, dresses, mosquito nets, and similar end uses. Marquisette is a light, strong, sheer, open-textured curtain fabric in leno weave, often with dots woven into the surface. The thread count varies from 48 x 22 to 60 x 40. Marquisette, extremely popular for curtains and mosquito netting, is made of cotton, rayon, acetate, nylon, polyester, acrylic, glass, silk, or mixtures. / пятно. Найлан^{T3} (Nylon^{TM}). Маркизет – прозрачная бумажная или шёлковая ткань из высококачественных кручёных нитей. Родом из Франции, где 'маркизой' называется наружный навес у окна для защиты от солнца (его делают из бумажной ткани). Маркизет:- прозрачная мерсеризированная лёгкая ткань, изготовляемая из очень тонкой, скрученной из двух нитей пряжи дорогих сортов. Маркизет:- лёгкая, тонкая, прозрачная хлопчатобумажная или шёлковая ткань полотняного переплетения, вырабатываемая из очень тонкой кручёной пряжи. Маркизет выпускается главным образом набивным (с рисунком), реже белым, гладкокрашеным. Хлопчатобумажный маркизет при отделке мерсеризуется, благодаря чему приобретает шёлковистость и блеск. Идёт на шитьё блузок, детского и женского белья. Маркизет, от Французского слова Marquisette, лёгкая, тонкая, прозрачная хлопчатобумажная или шёлковая ткань полотняного переплетения, вырабатываемая из очень тонкой кручёной пряжи. Маркизет выпускается главным образом набивным (с рисунком), реже белым, гладкокрашеным. Хлопчатобумажный маркизет при отделке мерсеризуется, благодаря чему приобретает шёлковистость и блеск. Из маркизета шьют летние платья, блузки, женское бельё и другое.

MARRED OR DEFACED = XX – Marred Or Defaced:- this may be caused by improper finishing in button manufacturing process, by overloading of hoppers on attaching machine or by improper attaching dies. Closure defects, and namely – Metal Buttons, Snap Fasteners, Rivets and Burrs. / Порок или дефект застёжки.

MARRIED FIBER CLUMP = XX – Married Fiber Clump is a defect that occurs in converter top. It consists of a group of unopened, almost coterminous fibers with the crimp in register.

MARRY = СОСТЫКОВЫВАТЬ (или СОЕДИНЯТЬ, или СПЛЕСНИВАТЬ, или СВЯЗЫВАТЬ ПОПАРНО) – Marry (maritime term):- to temporarily sew the ends of two ropes together for rendering through a block. Also to grip together parts of a fall to prevent running out. To marry strands to prepare for splicing.

MARRYING PRICE = СВЯЗАННАЯ ЦЕНА – Marrying Price is a price quoted on the stock exchange and used by the stock exchange dealer to offset purchases and sales within the bank. / Цена, котируемая на фондовой бирже и используемая дилером этой фондовой биржи для зачёта покупок и продаж в банке.

MARS = MACHINE ASSISTED REFERENCE SECTION

MARSEILLES = МАРСЕЙСКАЯ (или МАРСЕЛЬСКАЯ) – Marseilles is a firmly woven reversible fabric with raised geometric designs. Marseilles was originally made of cotton, but is now usually made from man-made fibers or blends. Marseilles is a firm cotton fabric that is similar to piqué. / Марсельская или Марсейская (Marseilles).

MARSH = МАРШ – Marsh is a frequently or continually inundated wetland characterized by grasslike and other emergent vegetation adapted to saturated soil conditions. A Marsh is a type of wetland that is dominated by herbaceous rather than woody plant species. Marshes can often be found at the edges of lakes and streams, where they form a transition between the aquatic and terrestrial ecosystems. They are often dominated by grasses, rushes or reeds. If woody plants are present they tend to be low-growing shrubs. This form of vegetation is what differentiates marshes from other types of wetland such as swamps, which are dominated by trees, and bogs, which are wetlands that have accumulated deposits of acidic peat. Marshes provide habitat for many types of plants and animals that have adapted to living in flooded conditions. The plants must be able to survive in wet mud with low oxygen levels. Many of these plants therefore have aerenchyma, channels within the stem that allow air to move from the leaves into the rooting zone. Marsh plants also tend to have rhizomes for underground storage and reproduction. Familiar examples include cattails, sedges, papyrus and sawgrass. Aquatic animals, from fish to salamanders, are generally able to live with a low amount of oxygen in the water. Some can obtain oxygen from the air instead, while others can live indefinitely in conditions of low oxygen. Marshes provide habitat for many kinds of invertebrates, fish, amphibians, waterfowl and aquatic mammals. Marshes have extremely high levels of biological production, some of the highest in the world, and therefore are important in supporting fisheries. Marshes also improve water quality by acting as a sink to filter pollutants and sediment from the water that flows through them. Marshes (and other wetlands) are able to absorb water during periods of heavy rainfall and slowly release it into waterways and therefore reduce the magnitude of flooding. The pH in marshes tends to be neutral to alkaline, as opposed to bogs, where peat accumulates under more acid conditions. Types of Marshes:- there are a number of different types of marshes depending mainly on their location and salinity. Both of these factors greatly influence the range and scope of animal and plant life that can survive and reproduce in these environments. The three main types of marsh are salt marshes, freshwater tidal marshes, and freshwater marshes. These three can be found worldwide and each contains a different set of organisms. (1) Salt Marshes:- salt water marshes are found around the world in mid to high latitudes, wherever there are sections of protected coastline. They are located close enough to the shoreline that the motion of the tides affects them and, sporadically, they are covered with water. They flourish where the rate of sediment buildup is greater than the rate that the land level is sinking at. Salt marshes are dominated by specially adapted rooted vegetation, primarily salt-tolerant grasses. Salt marshes are most commonly found in lagoons, estuaries and on the sheltered side of shingle or sandspit. The currents there carry the fine particles around to the quiet side of the spit and sediment begins to build up. These locations allow the marshes to absorb the excess nutrients from the water running through them before they reach the oceans and estuaries. These marshes are slowly declining. Coastal development and urban sprawl has caused significant loss of these essential habitats. (2) Fresh Water Tidal Marshes:- this form of marsh is defined by the fact that although it is a freshwater marsh, it is still affected by the tides. Without the stresses of salinity that is undergone by its salt water counterpart, the diversity of the plants and animals that live in and use these marshes is much higher than salt marshes. The most serious threats to this form of marsh are the increasing size and pollution of the cities surrounding them. (3) Fresh Water Marshes:- Freshwater marshes are the most diverse form of marsh in the three groups and range greatly in both size and geographic location. They make up the most common form of wetland in North America. Some examples of freshwater marsh types in North America follow:- (i) Wet Meadows:- wet meadows occur in areas such as shallow lake basins, low-lying depressions, and the land between shallow marshes and upland areas. They also occur on the edges of large lakes and rivers. They often have very high plant diversity, and high densities of buried seeds. Although they are regularly flooded, in the summer, they are often dry. (ii) Vernal Pools:- vernal pools are a type of marsh found only seasonally in shallow depressions in the land. They can be covered in shallow water, but in the summer and fall, they can be completely dry. In western North America, vernal pools tend to form in open grasslands, whereas in the east they often occur in forested landscapes. Further south, vernal pools form in pine savannas and flatwoods. Many amphibian species depend upon vernal pools for spring breeding; these ponds provide habitat that is free from fish which eat eggs and young of amphibians. An example is the endangered gopher frog (Rana sevosa). Similar temporary ponds occur in other world ecosystems, where they may have local names. However, the term vernal pool can be applied to all such temporary pool ecosystems. (iii) Playa Lakes:- playa lakes are a form of shallow freshwater marsh that occurs in the southern high plains of the United States. Like vernal pools, they are only present at certain times of the year and generally have a circular shape. As the playa dries during the summer, conspicuous plant zonation develops along the shoreline. (iv) Prairie Potholes:- prairie potholes are found in the northern parts of North America. This landscape was once covered by glaciers and as a result shallow depressions were formed in great numbers. These depressions fill with water in the spring. They provide important breeding habitat for many species of waterfowl. Some pools only occur seasonally while others retain enough water to be present all year. (v) Riverine Wetlands:- many kinds of marsh occur along the fringes of large rivers. The different types of marsh are produced by factors such as water levels, nutrients, ice scour, and waves. Restoration:- some areas of the world have already lost 90 percent of their wetlands, including marshes. Often they were drained to create agricultural land, or filled to accommodate urban sprawl. Restoration is the process of returning marshes to the landscape to replace those lost in the past. Restoration can be done on large scales, say, by allowing rivers to naturally flood in the spring. It can also be done in smaller areas to return wetlands to more urban landscapes. Marsh is a swampy waterlogged area, either fresh or saline. Marsh is the type of wetland ecosystem characterized by poorly drained mineral soils and by plant life dominated by grasses. The latter characteristic distinguishes a marsh from a swamp (q.v.), whose plant life is dominated by trees. Marshes are common at the mouths of rivers, especially where extensive deltas have been built. The river brings a steady supply of water. The gradient of the river approaches zero at the sea, where flow is sluggish. Because the delta is deposited by sediment settling from the river water, the land that is built will be poorly drained at its driest and will often be underwater. Sediment supplied by the river has often been eroded from the surface soils of the drainage basin and is thus very rich. The combination of water supplied steadily at a low rate over a waterlogged but rich soil creates a perfect environment for marsh grasses. Fibrous-rooted grasses bind the muds together and further hinder water flow, thus encouraging the spread of both the delta and the marsh. Marshes occur in the deltas of most of the world's great rivers. In Europe well-known river-mouth marshes include those of the Camargue in the Rhône Delta, the Guadalquivir in Spain, and the Danube in Romania, all of which are famous as bird sanctuaries. In the Middle East, both the Nile Delta and the delta of the Tigris-Euphrates have extensive marshes of historical importance. The marsh dwellers of the Iranian marshes have developed a unique culture adapted to life in the wetlands. Marshes occur in the deltas of the Mekong in Vietnam and the Amazon in Brazil. In the United States, the most extensive delta marshes are those of the Mississippi River. Some low-lying areas with poor drainage at the heads of more extensive drainage patterns contain wetlands. A well-known example is the Pripet Marshes and fens that historically have served as the natural boundary between Poland and Russia. In some places basin-like depressions in the Earth's surface trap waters and make wetlands. Most such areas are drained someplace along their rim by a river that is impeded at that point sufficiently to dam water at times of high flow and create marshes and swamps. The world's two largest rivers, the Amazon and the Congo, fall into this category. Both of the great basins named after these rivers have extensive wetlands. The papyrus marshes of the upper Nile in Southern Sudan lie above dams of resistant rocks of the cataracts. The Okavango Marshes East of the Kalahari desert in Botswana are perhaps the best example of marshes formed in an interior, closed basin that has no drainage. Other basins without outlets like that of the Great Salt Lake in Utah have accumulated too much salt for marsh growth. The Florida Everglades constitutes a unique marsh-swamp combination growing on a limestone base. Because the region is near sea level the water from the abundant rains does not drain but remains on the surface. The Everglades is similar to a huge, shallow, slowly flowing river. The area is an ideal marsh habitat

but the Everglades is different from usual marshes. The soils are alkaline because of the limy base, and the water is clear. Some areas, such as the northern Great Plains of the United States, have so many small marshes that they are a characteristic of the landscape. These small marshes formed because the landscape left by the retreat of glacial ice was so irregular and so poorly drained that countless little depressions were filled with water each spring. As snow melted, the depressions supported the growth of temporary marshes, which then dried up during the summer. Larger depressions were occupied by ponds. These gradually became marshy as they filled in with sediment. The number of plant species in marshes is few compared to the numbers that grow on well-watered but not waterlogged land. Grasses, grasslike sedges, and reeds or rushes are of major importance. Wild rice is of some commercial importance, but true rice is undoubtedly by far the most important marsh plant and supplies a major portion of the world's grain. Salt marshes, which are extensive along the east coast of the United States and are also common in the Arctic, northern Europe, Australia, and New Zealand, are formed by seawater flooding and draining, which exposes flat areas of intertidal land. Salt-marsh grasses will not grow on permanently flooded flats; growth is also prevented where the flooded land is subject to strong currents and is therefore unstable. Animals have adapted to the limited supplies of oxygen in salt-marsh water in various ways. Rat-tailed maggots (Tubifera), for example, survive in shallow marshes by means of a telescoping, tail-breathing tube that they extend to the water surface for air. Some larvae of shore flies (Ephydridae) and some nematodes take advantage of the air spaces in plants and obtain oxygen from that source. Many small marsh animals have great resistance to lack of oxygen; for example, many nematodes can live indefinitely in the complete absence of oxygen. This ability is essential for such minute animals that would otherwise be limited in distribution to a thin layer a fraction of an inch deep at the mud surface. Salt-marsh animals living at or in the ground are largely derived from marine ancestors and have a problem in resisting fresh water from rains rather than salt. Some, such as worms, merely hide in the mud until the freshwater has run off the marsh surface. Others, such as fiddler crabs, have developed the ability to control their osmotic concentration in freshwater for periods of up to several days. Insects are the principal land animals found on marshes. Although they can withstand short periods of saltwater immersion, they often avoid saltwater by moving up the plants or flying away. Salt marshes are among the most productive natural systems. Productivities of more than 3 000 grams per square meter per year have been reported for the most productive parts of salt marshes, the tall Spartina alterniflora stands growing along tidal creeks. These values correspond to nearly 30 tons per acre per year and are equal to the highest values that have been achieved in agriculture. / Марш – это болотистый (или заболоченный, или топкий) ареал, либо пресноводный, либо засолённый. пресноводное или солёное болото (засолённый марш). Марш – плодородная низменность. Под Маршем, от Немецкого слова Marsch, понимается низменная полоса морского побережья, затопляемая во время наиболее высоких приливов или нагонов морской воды. Сложен обычно илистыми или песчано-илистыми наносами, на которых формируются богатые гумусом почвы. Вытянуты обычно полосой (шириной, как правило, не более 30 километров), обрамляющей Ватты, подвергающиеся, в отличие от маршей, регулярному воздействию приливов и отливов. Иногда располагаются ниже уровня моря, отделяясь от последнего полосой дюн. Марши типичны для побережий Северного Моря, имеются в Великобритании, Германии, Дании, Нидерландах, во Франции, на Востоке и Юге Соединённых Штатов Америки (США); в бывшем Союзе Советских Социалистических Республик (СССР) аналогами маршей являлись Лайды, распространённые по побережьям морей Северного Ледовитого Океана. В естественном состоянии заняты обычно высокопроизводительными лугами, нередко используемыми в сельском хозяйстве.

MARSHAL = СУДЕБНЫЙ ПРИСТАВ – Marshal:- the beginning of the US Marshals Service (USMS):- the Judiciary Act of 1789 set up the 13 offices (today there are 94 offices) of the US Marshals. They are nominated by the President and approved by the Congress. The US Marshals serve as officers of the federal courts, and are responsible for:- (i) making sure the federal courts are free to work fairly; (ii) taking care of security for federal courts; (iii) keeping order in courtrooms and other court areas; and (iv) carrying out court orders. The Marshals Service also responds to emergency situations, such as:- (i) civil disturbances that break federal law or threaten federal property; and (ii) enforcement of voting right laws. The United States Constitution established three separate branches of the federal government. These branches are:- (i) Legislative:- includes the Congress – they make federal laws. (ii) Executive:- includes the President and other departments and agencies – they enforce federal laws and the federal court's decisions. The United States Marshals Service is in this branch. (iii) Judicial:- includes the federal courts – they understand the law and settle differences. Even though these three branches have separate powers and duties, they work together to protect the rights of all Americans (this refers to 'checks and balances'). Historical Timeline:- the US Marshals Service is the nation's oldest and most versatile federal law enforcement agency. Since its inception, the US Marshals have served the country through a variety of vital law enforcement activities. 1789 – Congress passed the Judiciary Act, providing US Marshals to support the federal courts and to carry out all lawful orders by judges, Congress, or the President. 1789–1865 – Until the creation of the Secret Service in 1865, Marshals were frequently called upon to pursue counterfeiters. Pursuing Counterfeiters. 1790–1870 – US Marshals were required by Congress to take the national census every ten years. 1801 – President Jefferson designated US Marshals as the collection and disbursal agents of the Federal court system. By this time US Marshals were also involved in hiring and supervising jails for Federal prisoners and executing court martials. 1815 – US Marshals work as police against pirates and the territory gained through the Louisiana Purchase that later became a state. Louisiana Purchase. 1865–1900 – The various labor disputes of the late 1800's caused civil disturbances where US Marshals were called upon to maintain law and order as an alternative to military intervention. 1882 – US Marshals tried to keep law and order in the old west. Four Deputy US Marshals Virgil Earp, Morgan Earp, Wyatt Earp and Doc Holiday participated in a gunfight at the OK Corral. 1888 – Animosities between Republicans and Democrats peaked in violent outbreaks at the polls and tampering with ballots. US Marshals upheld the Constitution by controlling disturbances at voting sites and preserving the citizen's right to vote. 1889 – US Marshals helped maintain law and order in the Oklahoma Territory. 1894 – During the Pullman strike, US Marshals were ordered by the federal courts and the Cleveland administration to keep the trains rolling. 1896 – The Justice Department created salaries for Marshals. Before that, a Marshal received USD2.00 for any outlaw he brought in alive. However, if an outlaw were killed during his capture, the Marshal received no compensation and was responsible for the burial fee for the dead prisoner. 1920 – Until the Treasury Department created the Bureau of Prohibitions in 1927, the US Marshals were the enforcing agents of the Prohibition laws that forbid liquor. Prohibition. 1957 – Marshals help protect African American people trying obtaining equal treatment. 1960 – Marshals provide security to James Meredith and Ruby Bridges when they become integrated in public education facilities. Segregation. 1967 – Marshals help protect the rights to lawfully protest as well as stop violence during public protest. 1971 – The Witness Security Program was established as a division within the USMS. Also, the Special Operations Group (SOG) was established to provide a well trained, self-sufficient, mobile group of deputies capable of responding anywhere within a few hours. 1973 – Marshals and FBI agents contained the uprising at Wounded Knee, South Dakota. Wounded Knee. 1979 – The USMS assumed the responsibility for the apprehension of federal fugitives. 1981 – The first of the Fugitive Investigation Strike Team (FIST) operations was established to operate as a multi-agency taskforce to apprehend federal, state, and local fugitives. FIST Information. 1985 – US Marshals assumed the responsibility for managing and disposing of properties seized and forfeited by federal law enforcement agencies and US Attorneys nationwide. 1996 – US Marshals assumed the responsibility for the Justice Prisoner and Alien Transportation System (JPATS), which merged the air fleets of the Marshals Service and the Immigration and Naturalization Service (INS). In addition, as a result of the bombings and threats against abortion clinic, US Marshals were responsible for protecting the clinics and doctors. 1997 – US Marshals provided security for the Timothy McVeigh and Terry Nichols trials, convicted of bombing the Alfred P. Murrah Federal Building in Oklahoma City. 1998 – US

Marshals established a foreign investigative presence in the US Embassy, Mexico City, Mexico, with the assignment of two criminal investigators. 1999 – US Marshals signed a Memorandum of Understanding with the US Customs giving the USMS responsibility to investigate the majority of their fugitive warrants. US Marshals Service Duties:- the United States Marshals Service has a long history of protecting and supporting the United States Federal courts to make sure individuals conducting judicial business are safe and can perform their duties fairly. The federal judicial process has procedures that deputy marshals must follow. For example, a court official gives warrants (written orders) directing deputy marshals to:- (i) search (a place); (ii) seize (take possession); (iii) arrest (hold a person for court); and (iv) execute a judgment (deliver a court's final decision). Deputy marshals also:- (i) secure (keep safe) all places where federal judicial business is conducted; (ii) protect judges, jurors, witnesses and other persons whose safety may be threatened (danger of being hurt) because of their duties; and (iii) safely move prisoners to and from court, make sure they are fed, receive medical treatment and are confined (jailed). The Marshals Service has various programs to help protect everyone involved in the different stages of the judicial process. The larger programs include:- (i) Fugitive Investigations; (ii) Judicial Security; (iii) Witness Security; (iv) Prisoner Services; (v) Asset Forfeiture; and (vi) Special Operations Support. The federal judicial process has procedures that deputy marshals must follow. For example, a court official gives warrants (written orders) to deputy marshals directing them to do a search (a place), seizure (take possession) or arrest (bring to jail) or to execute a judgment (deliver a court's final decision). Deputy marshals also secure (keep safe) all places where federal judicial business is conducted. Deputy marshals protect judges, jurors, witnesses and other persons whose safety may be threatened (danger of being hurt) because of their duties. Deputies safely move prisoners to and from court, make sure they are fed, receive medical treatment and are confined (jailed). Many United States Marshals become famous for carrying out their duties while supporting the federal courts. The bravery deputy marshals show while capturing criminals are stories told in numerous books, television shows and movies. / Сегрегация или Выделение (Segregation). наём (hiring). Президент Дьжефёсэн (Jefferson). Вёдьжэл Оп (Virgil Earp), Моргэн Оп (Morgan Earp), Вайэт Оп (Wyatt Earp) и Дак Халыдэй (Doc Holiday). Пэлмэна (Pullman strike). Дьжеймз Мэрэдис (James Meredith) и Руби Бридьжиз (Ruby Bridges). Тимэси МэкВэй (Timothy McVeigh) и Тэри Николз (Terry Nichols) Алфрэд Пи. Мурра (Alfred P. Murrah).

MARSHALLING YARD = СОРТИРОВОЧНЫЙ ДВОР – Marshalling Yard is a location for parking trailers awaiting further movement. / Под Грузовым Двором понимается часть территории железнодорожной станции, где производят приём, погрузку и выгрузку грузов, их хранение. На грузовом дворе расположены склады, весы, погрузочно-разгрузочные средства, платформы и грузовые площадки (в том числе для переработки контейнеров, тяжёлых грузов).

MARSHALL PLAN = ПЛАН МАРШЭЛА – Marshall Plan is a program conducted from 1948 to 1951 to aid the recovery of Western Europe following World War II. The plan was named after US Secretary of State George C. Marshall, who proposed it. Also known as European Recovery Program. / Программа, осуществлявшаяся с 1948 по 1951 с целью поддержки в восстановлении Западной Европы после окончания Второй Мировой Войны. План был назван в честь Американского Госсекретаря Дьжодьжа Си. Машэла, который и предложил её. Известен также как Европейская Программа Восстановления (European Recovery Program). План Маршэла или, так называемая программа восстановления и развития Европы после Второй Мировой Войны путём предоставления ей Американской экономической помощи. Этот план был выдвинут Дьжодьжем Си. Маршэлом в 1947, а вступил в действие в Апреле 1948. В осуществлении плана участвовали 17 Европейских стран, включая Западную Германию. План Маршэла в какой-то мере ставил целью укрепление гегемонии Соединённых Штатов Америки (США) в Западной Европе, создание объединённого фронта против Союза Советских Социалистических Республик (СССР) и складывавшейся в те времена мировой системы социализма в некоторых Европейских странах, оставшихся после Второй Мировой Войны под, своего рода, протекторатом СССР. В 1951 План Маршэла был заменён Законом о Взаимном Обеспечении Безопасности, предусматривавшем одновременное предоставление экономической и военной помощи.

MART = MARKET

MARTINGALE = МАТИНГЭЙЛ (или XX) – Martingale is a loose half belt or strap placed on the back of a garment, such as a coat or blazer.

MARUBOZU = МАРУБОДЖЮ – In technical analysis, a candlestick with no shadow extending from the body at either the Open, the Close or at both. The name means close-cropped or close-cut in Japanese, though other interpretations refer to it as Bald or Shaven Head. / В техническом анализе биржевых рынков, тело свечи, у которого отсутствуют фитили (тени) будь-то с момента формирования цены открытия или до момента формирования цены закрытия, либо при том и при другом одновременно для соответствующего данной свече временного интервала торговли. Само название означает в Японском языке дословно Коротко Подстриженный или Коротко Подрезанный, хотя иные интерпретации относят его к Лысой или Побритой Голове.

MARY JANE = МЭРИ ДЬЖЕЙН – Mary Jane is a low-heeled girl's or woman's pump with a strap across the instep and a rounded toe. / Мэри Дьжейн .

MAS = MYANMAR AGRICULTURAL SERVICE

MASK = МАСКА (или XX) – Mask is a cover or partial cover for the face used for disguise.

MASK WORK = ТОПОЛОГИЯ (ИНТЕГРАЛЬНОЙ МИКРОСХЕМЫ) – Mask Work:- this is a new type of intellectual property. It is, in essence, the design of an electrical or integrated circuit, the pattern of which is transferred and fixed in a semiconductor chip during the manufacturing process. Mask Work:- images that are used to create the layers of a semiconductor chip product. / электрической или интегральной микросхемы топологий полупроводниковых интегральных микросхем. в течение процесса изготовления. Под Интегральной Схемой (ИС) или Интегральной Микросхемой (ИМС) или Микросхемой понимается микроминиатюрное электронное устройство с высокой плотностью упаковки связанных между собой (как правило, электрически) элементов (диодов, конденсаторов, резисторов, транзисторов и других), изготовленное на основе групповой технологии. Она предназначена для выполнения определённых функций приёма, обработки или передачи информации, представленной в виде непрерывных или дискретных электрических, оптических и других сигналов. По способу объединения (интеграции) элементов различают монолитные ИС, в которых все элементы и межэлементные соединения выполнены на одной полупроводниковой или диэлектрической подложке, и гибридные интегральные схемы, в которых используются навесные дискретные электронные приборы. По числу содержащихся в ИС элементов они делятся на малые, средние и большие (БИС) и сверхбольшие (СБИС); по виду обрабатываемых сигналов – на цифровые интегральные схемы и аналоговые интегральные схемы.

MASS = МАССА – The International System of units (SI) replaces the notion of weight by that of Mass to describe a quantity of matter. See also Weight. See also Commercial Mass, Gross Mass, Invoice Mass, Net Mass, Oven-Dry Mass, Tare, and Tolerance Of Invoice Mass. / Под Массой, от Латинского слова Massa, означающее Глыба или Кусок или Масса, понимается одна из основных физических характеристик материи, являющаяся мерой её инерционных и гравитационных свойств. В классической механике Ньютона масса тела равна сумме масс всех малых частей тела (материальных точек) и не зависит от скорости его движения.

Инертность тела проявляется в том, что под действием внешней силы оно изменяет своё движение постепенно, приобретая конечное ускорение. Масса, входящая в выражение второго Закона Ньютона, характеризует инертность тела и называется его инертной массой. Масса, входящая в выражение ньютоновского закона тяготения, характеризует гравитационные свойства тела и называется его гравитационной (тяжёлой) массой. При соответствующем выборе гравитационной постоянной можно считать, что для каждого тела гравитационная и инертная массы равны; для определения массы тела можно пользоваться рычажными весами. В теории относительности масса тела m зависит от скорости v его движения:- $m = m_0 / \sqrt{(1 - v^2 / c^2)}$, где $c \approx 3 \cdot 10^8$ м/с – скорость света в вакууме, называется релятивистской массой тела. При малых скоростях ($v << c$) $m \approx m_0$, то есть в согласии с классической механикой Ньютона, масса тела практически не зависит от скорости его движения. Массой обладают не только частицы вещества и образованные из них тела, но также и поля, например, электромагнитное поле. Согласно закону взаимосвязи массы и энергии, полная энергия E любой системы прямо пропорциональна массе m этой системы:- $E = mc^2$. Из этого соотношения и закона сохранения энергии следует закон сохранения массы:- при любых процессах, происходящих в термодинамически изолированной системе. Масса этой системы не изменяется. Единица массы (в СИ) – килограмм (кг). Под Массой понимается одна из основных физических характеристик материи, определяющая её инертные и гравитационные свойства. В классической механике масса равна отношению действующей на тело силы к вызываемому ею ускорению (2-й Закон Ньютона) – в этом случае масса называется инертной; кроме того, масса создаёт поле тяготения – гравитационная, или тяжёлая, масса. Инертная и тяжёлая масса равны друг другу (принцип эквивалентности).

MASS–COLORED = КРАШЕНОЕ В МАССЕ – Mass-Colored is a term to describe a manufactured fiber (yarn, staple, or tow) that has been colored by the introduction of pigments or insoluble dyes into the polymer melt or spinning solution prior to extrusion. Usually, the colors are fast to most destructive agents. / Экструзия или Выдавливание (Extrusion).

MASS OF COATING = МАССА ПОКРЫТИЯ – Mass Of Coating is the quantity of covering layer applied to the surface of the filament.

MASS REARING = МАССОВОЕ РАЗВЕДЕНИЕ – Mass Rearing is a rearing large numbers of insects, which serve as test organisms in varietal resistance studies.

MASS RISKS = МАССОВЫЕ РИСКИ – Mass Risks are an official term used in the European Economic Area (EEA) insurance regulation. It means any risk that is not a 'large risk'. / Официальный термин, используемый в регулировании страхования в Европейской Экономической Области (ЕЭО). Он означает любой риск, который не является 'крупным риском'.

MASS SCREENING = МАССОВЫЙ ОТБОР (или МАССОВЫЙ СКРИНИНГ, или МАССОВАЯ ВЫБОРКА) – Mass Screening is a screening a large number of varieties in preliminary studies. Varieties selected as resistant in the mass screening trial are retested to confirm their resistance.

MASS SELECTION = МАССОВАЯ СЕЛЕКЦИЯ – Mass Selection is a breeding method wherein a large number of plants having the desirable traits are harvested individually from a standing crop. The seeds from all selections are then bulked. From the bulk, a seed sample is taken and used to plant a population from which desirable plants are selected at maturity. The procedure is repeated for several cycles until the population becomes uniform and homogeneous. A variety developed by mass selection is fairly uniform and contains fewer genotypes than the original population. / Под Селекцией, от Латинского слова Selectio, означающее Выбор или Отбор, понимается:- (1) раздел агрономии и зоотехнии, изучающий методы создания сортов и гибридов сельскохозяйственных растений и пород животных с нужными человеку признаками. (2) Отрасль сельскохозяйственного производства, занимающаяся выведением сортов и гибридов сельскохозяйственных культур, пород животных. Основные направления селекции:- (i) растений на урожайность или животных на продуктивность; (ii) на качество продукции; (iii) растений – на зимостойкость, засухоустойчивость, устойчивость к болезням и вредителям, приспособленность к высоким дозам удобрений и другого; (iv) животных – на плодовитость и другое. Методы селекции:- отбор, гибридизация, мутагенез.

MASSTONE = МАССОВЫЙ ТОН (или ОСНОВНОЙ ТОН) – Masstone:- in paint technology, a pigment-vehicle mixture containing a single colorant only. Discussion:- at times colorants are developed or recycled that contain more than one pigment, but that are tested and used as if they contained only a single pigment. This definition is meant to include such colorants.

MASTER = ХОЗЯИН (или НАЧАЛЬНИК, или КОРМЧИЙ, или ПОВЕЛИТЕЛЬ, или МАСТЕР) – Master is a term for the captain, a holdover from the days when the captain was literally, and legally, the 'Master' of the ship and crew. His word was law. The admiralty law term for the captain of a ship. A Master or Captain is the highest officer aboard ship. Oversees all ship operations. Keeps ships records. Handles accounting and bookkeeping. Takes command of vessel in inclement weather and in crowded or narrow waters. Handles communications. Receives and implements instructions from home office. The commander of a commercial vessel. Master, in relation to a vessel, includes:- (i) the person who for the time being has the command, charge or management of the vessel; (ii) in relation to a vessel the subject of a hiring agreement that has not expired or a hiring agreement that has expired without the owner of the vessel resuming possession thereof-the person who has taken, or took, the vessel on hire; (iii) in relation to a vessel to which is attached a motor that is the subject of a hiring agreement that has not expired or a hiring agreement that has expired without the owner of the motor resuming possession thereof-the person who has taken, or took, the motor on hire, and (iv) in relation to a vessel being towed or pushed by another vessel – the master for the time being of the other vessel unless he or she is subject to the instructions of a person on board the vessel being towed or pushed. / коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо). Руководитель торгового судна. наём (hiring). Сам термин Хозяин используется у моряков в качестве жаргона для обозначения термина Капитан. В Русском языке для обозначения должности Капитан используются жаргонные термины:- Кэп (в торговом флоте) и Батя (в военно-морском флоте). Кормчий – управляющий судном.

MASTER ACCOUNT = ГОЛОВНОЙ СЧЁТ – Master Account is an account with reserve and clearing balances on the books of a Reserve Bank. Master accounts do not contain book-entry securities.

MASTER AGREEMENT = ГОЛОВНОЕ СОГЛАШЕНИЕ (или РУКОВОДЯЩЕЕ СОГЛАШЕНИЕ, или ПОВЕЛЕВАЮЩЕЕ СОГЛАШЕНИЕ) – (1) Master Agreement is an agreement that sets forth the standard terms and conditions applicable to all or a defined subset of transactions that the parties may enter into from time to time, including the terms and conditions for close-out netting. The 1992 ISDA® Master Agreement ('the master agreement') contemplates that all or a defined subset of OTC (over-the-counter) derivatives transactions between the two parties ('covered transactions') will be governed by the terms and conditions set forth in the master agreement and the confirmations with respect to such transactions. The master agreement consists of two parts:- the body (i.e. pre-printed form) and the schedule. The body contains the standard terms and conditions that will apply to all covered transactions and the relationship generally, and provides for a number of options. The schedule contains the parties' elections with respect to the options contained in the body and other terms that they have negotiated to accommodate their credit, tax and legal concerns. A confirmation contains economic terms of a particular transaction and other terms, if any, that the parties have negotiated in connection with the transaction. The master agreement provides that the provisions in the schedule prevail over any inconsistent provisions in the body,

and the provisions in a confirmation prevail over any inconsistent provisions in the master agreement. One key benefit of using the master agreement is the potential for reducing counterparty credit risk on the covered transactions through close-out netting. Another major benefit is that it reduces the inefficiencies associated with negotiating legal and credit terms transaction by transaction. The master agreement provides the parties with flexibility as to the types of product that are covered. The parties may either specify that the master agreement covers a single product or, to achieve the maximum reduction in credit exposure, specify a broad range of products. Each party can specify that the master agreement governs transactions entered into by one or more offices designated by the party. If multi-branch offices are specified, in the event of default of a specified office, the non-defaulting party may assert a claim against the head office of the defaulting party if so agreed. An agreement that sets the standard terms and conditions on a securities lending transaction. Today, most over-the-counter (OTC) derivatives transactions are documented through the Master Agreement. The Master Agreement is published as a preprinted form by the International Swaps and Derivatives Association, Inc (ISDA®). The market practice is not to amend the pre-printed form but instead set out negotiated modifications to the standard form in a further pre-printed form, the ISDA® Schedule. The Master Agreement sets out the important boilerplate contractual terms and falls into three distinct areas:- (i) clauses 1 to 4 cover the basic mechanics of entering into the transaction (interpretation; obligations; representations; and agreements); (ii) clauses 5 to 7 cover events of default, termination events and early termination of the transaction. These provisions set out when and by whom transactions can be terminated before their stated date of maturity and related quantum and method of calculation of any payments between the parties; and (iii) clauses 8 to 14 cover the administrative side of the transaction:- transfer of derivatives contracts; the contractual currency; miscellaneous provisions such as the survival obligations on the termination of a transaction, offices, expenses and notices; governing law; and jurisdiction. The Schedule is also a preprinted form and allows the parties to tailor their Master Agreement. It contains a number of choices that the parties may make in relation to the Master Agreement (including whether certain provisions should apply to both parties, to one party or to neither) and allows parties to modify and add provisions. The Schedule is divided into three parts:- part 1 deals with termination provisions; part 2 covers agreements to deliver documents; and part 3 deals with miscellaneous matters such as addresses for notices; governing law; and netting. In Part 4 the parties amend and delete various provisions of the Master Agreement as well as incorporating additional provisions:- for example, that all agreements between the parties will terminate on a change of control of a counterparty, if a counterparty disposes of a substantial portion of its assets, or if its credit rating is downgraded. The Confirmation sets out the terms of the transaction, its key dates, various amounts and mechanics and administrative details such as bank accounts, which are not set out in the Schedule. Depending on the type of derivative being documented, different sets of definitions are incorporated into the Confirmation (this allows for many Confirmations to be only a few pages long), namely:- the 2000 ISDA® Definitions; the 2004 Commodity Derivatives Definitions; the 2002 Equity Derivatives Definitions; the 2003 Credit Derivatives Definitions and the 2004 Inflation Derivatives Definitions. Each set of definitions has standard provisions that apply to the particular type of derivative. For example, in a credit derivative transaction, the definition of each credit event will be defined in the 2003 Credit Derivatives Definitions, as will the standard provisions for cash and physical settlement. The parties can, of course, amend or disapply any of the provisions that they see fit in the relevant Confirmation. / взаиморасчёт или сведение (netting) . Международная Ассоциация по Свопам и Деривативам, Инк. (МАСД®; The International Swaps And Derivatives Association, Inc. (ISDA®)) . порядки и условия .

(2) In the United States, a Master Agreement is the contract entered into between the Federal Deposit Insurance Corporation (FDIC) and a participating entity in the Debt Guarantee Program that sets out the terms and conditions of taking part in the program. / порядки и условия .

MASTER BOOT RECORD = XX – Master Boot Record (MBR):- located in the very first sector at the beginning of a hard disk, the Master Boot Record is a combination of a program code and data used by that program (the so-called Partition Table). The master boot record code examines the partition table to determine how many logical drives (or additional partitions) the hard disk drive contains – even if it is just one – and which one to go to in order to load the operating system. The master boot record is the first piece of code that a PC BIOS executes after performing its P.O.S.T. (power-on self-test) and as such can be the target of viruses which replace it in order to gain control of the computer before the operating system loads. See also Boot Sector, and Boot Sector Virus.

MASTERCARD = КАРТА МАСТЕР (или МЭСТЧЁКАРД) – MasterCard Worldwide is a driving force at the heart of commerce, enabling global transactions and building economic connections to make commerce faster, more convenient, more secure, and more valuable to everyone involved. As a technology-driven, global payments company, MasterCard provides a critical link between consumers, financial institutions, and millions of businesses and merchants worldwide. Our customers include approximately 22 000 financial institutions and other entities in more than 210 countries and territories. We provide our customers with innovative services enabling them to use electronic forms of payment instead of cash and checks to make everyday commerce activities such as shopping, traveling, running a business and managing finances easier. Powered by the MasterCard Worldwide Network – the fastest payment processing network in the world – MasterCard processes more than 23 billion transactions each year. The network has the capacity to handle more than 160 million transactions per hour, with an average network response time of 130 milliseconds and a 99.9 percent reliability rate. Our brand is among the most recognized in the world, and we have established and enforced a common set of standards to ensure efficient and secure use of our payment card network. MasterCard offers a wide range of payment solutions, including credit, debit, prepaid and related payment programs, through a family of well-known brands, including MasterCard®, Maestro® and Cirrus®. MasterCard generates revenue based on the volume of activity on cards that carry our brands, the number of transactions we process for our customers as well as other payment-related services that we provide. As it looks to the future, MasterCard is committed not only to continuing to deliver value to consumers and other stakeholders, but also to promoting the advantages of electronic payments, accelerating the displacement of cash and checks, and advancing commerce across the globe. Key Facts:- 1966:- founded as the Interbank Card Association (ICA). 1969:- 'Master Charge' purchased by the California Bank Association. 1979:- renamed MasterCard to reflect a commitment to international growth. 1985:- acquired an interest in EuroCard (predecessor to Europay International). 1988:- acquired the Cirrus® ATM Network. 1991:- launched Maestro®, the world's first online point-of-sale debit network. 1997:- launched the 'Priceless' advertising campaign. 2001:- launched MasterCard Advisors, the largest global consultancy focused on the payments industry. 2002:- merged with Europay International. 2002:- converted from a membership association to a private share corporation. 2006:- transitioned to a public company with a new corporate governance and ownership structure:- (i) MasterCard begins trading on the New York Stock Exchange under ticker symbol MA; and (ii) Introduced new corporate name, MasterCard Worldwide, and adopted a new corporate signature and tagline, The Heart of Commerce™. 2008:- launch of IPS (Integrated Processing Solution) global platform for debit and prepaid issuer processing. 2008:- acquired Orbiscom, Ltd., a leading payments solutions software provider for major financial institutions. 2010:- Ajay Banga is named CEO. 2010:- MasterCard launches MasterCard Labs to promote greater innovation in electronic payments. 2010:- MasterCard acquires DataCash Group PLC, to expand e-Commerce payment solutions. 2011:- MasterCard completes acquisition of the prepaid card program management operations of Travelex (now referred to as Access Prepaid Worldwide). Global Headquarters are in Purchase, New York, the United States. Employees:- approximately 5 600 (located in offices around the world as of 2010-December-31). Global Regions:- MasterCard is organized geographically into the following regions:- Asia Pacific, Middle East and Africa (APMEA); Canada; Europe; Latin America & Caribbean; and the United States. Key

Operational Statistics:- the gross dollar volume of purchases and cash transactions made on MasterCard-branded cards in 2010 increased 9.1% percent, on a local currency basis, to approximately USD2.7 trillion. Processed transactions grew 2.9% from 22.4 billion to 23.1 billion. As of 2010-December-31, the company's customers had issued approximately 1.6 billion MasterCard and Maestro-branded cards. MasterCard cardholders can use their cards at more than 30 million acceptance locations around the world. Key Financial Statistics:- revenues for 2010 were USD5.5 billion, an increase of 2.6% over 2009. The company also generated net income of USD1.8 billion for the year, or USD14.05 per share, adjusted for special items, compared with USD1.5 billion or USD11.19 per share in 2009, adjusted for special items. For more details, please refer to MasterCard's 10-K on the Investor Relations page on http://www.mastercard.com. / МэстчёКард (MasterCard). Мэстчё Чадьж (Master Charge). ЮроКард (EuroCard (predecessor to Юропэй Интёнэшэнэл (Europay International))). Сирас (Cirrus®). Маэстро® (или Мэйстчро®; Maestro®). МэстчёКард Эдвайзорз (MasterCard Advisors). Орбискэм, Эл.ти.ди. (Orbiscom, Ltd.). ДэйтчэКэш Груп Пи.Эл.Си. (DataCash Group PLC). Адьжэй Бэнгя (Ajay Banga).

MASTER CARTON = ГОЛОВНОЙ (или КАРТОННЫЙ) КОРОБ – Master Carton is a large carton that is used to hold and protect smaller cartons or packages of product. Using a master carton reduces handling as one larger piece instead of multiple small pieces.

MASTER CLEANER = ОСНОВНОЙ ОЧИСТИТЕЛЬ – Since cotton of lesser grades is useful for non-wovens, a conventional cleaning system does not suffice. This might include a coarse wire carding, called Cotton Master Cleaners, for cleaning the cotton. In spinning process, Master Cleaner and chute feeder as a group is used to process all type of cotton and wool nil. After initial opening in this machine, fiber is carded further by clothing into single fiber. Impurities are removed from fibers to filter chamber through automatic suction system. Fibers are sent to next process through transport by master cleaner, they are basically clean and fully opened. / В прядильном производстве. Сорные примеси удаляются из волокон .

MASTER MASTER AGREEMENT = ОСНОВОПОЛАГАЮЩЕЕ ГОЛОВНОЕ СОГЛАШЕНИЕ (или ОСНОВОПОЛАГАЮЩЕЕ РУКОВОДЯЩЕЕ СОГЛАШЕНИЕ) – Master Master Agreement is an umbrella agreement that provides for close-out netting of transactions governed by different master agreements. For example, where the parties have used separate master agreements to cover different types of OTC (over-the-counter) derivatives transaction, the parties may enter into a master master agreement in an effort to achieve a greater reduction of credit risk. / взаиморасчёт или сведение (netting) .

MASTER NETTING AGREEMENT = ГОЛОВНОЕ СОГЛАШЕНИЕ О ХХ – Master Netting Agreement is an agreement that permits netting of amounts owed under transactions governed by different agreements, often including one or more ISDA Master Agreements. Master netting agreements take different forms and may permit netting of payments to be made under a variety of master or other trading agreements between the same parties and often between their affiliates that may have master or other trading agreements in place between one another.

MASTER PACK = ГОЛОВНАЯ УПАКОВКА – Master Pack is a carton containing a specific number of product or multiple case quantities.

MASTER'S PROTEST = ПРОТЕСТ ХОЗЯИНА (или ПРОТЕСТ КАПИТАНА СУДНА) – Master's Protest is a sworn statement by captain describing any unusual happening during the voyage. / Клятвенное заявление от имени капитана судна, описывающее любые необычные события и происшествия, имевшие место во время выполненного рейса.

MASTER TRUST = ГОЛОВНОЙ ТРАСТ (или РУКОВОДЯЩИЙ ТРАСТ) – Master Trust is an investment vehicle that enables individual investors or small superannuation funds to channel money into one or more underlying investments.

MASTHEAD = ТОП МАЧТЫ (или СТЕНЬГА) – Masthead (maritime term):- the top part of the mast.

MASTHEAD LIGHT = ТОПОВЫЙ ОГОНЬ (или ФОНАРЬ ТОПА МАЧТЫ, или МАЧТОВЫЙ ОГОНЬ, или КЛОТИКОВЫЙ ОГОНЬ) – Masthead Light is a white light positioned over the fore and aft centerline of the vessel. Masthead Light (maritime term):- the white running light carried by steam vessel underway on the foremast or in the forepart of the vessel.

MAST STEP = СТЕПС МАЧТЫ – Mast Step (maritime term):- the frame on the keelson of boat (does not apply on ships) to which the heel of a mast is fitted.

MAT = MATURITY DURATION

MAT = МАТОВОЕ (или МАТИРОВАННОЕ, или ТУСКЛОЕ) – Mat is another spelling for matte. See also Matte. / Matte = Матт (Французское слово) или Мэт или Маска или Каше или Виньетка или Штейн (металлическое).

MATCH = ПОДБИРАТЬ (или ГАРМОНИРОВАТЬ, или ПАРА) – Match:- to provide, by selection, formulation, adjustment, or other means, a trial color that is indistinguishable from, or within specified tolerances of, a specified standard color under specified conditions.

MATCHED LUMBER = ПОДОГНАННЫЙ ПИЛОМАТЕРИАЛ – Matched Lumber:- a lumber that is edge dressed and shaped to make a close tongue and groove joint at the edges or ends, when laid edge to edge, or end to end. / пиломатериал, который строган по . жёлоб или паз (groove).

MATCHED SALE–PURCHASE TRANSACTIONS = СОВПАДАЕМЫЕ ТРАНЗАКЦИИ КУПЛИ–ПРОДАЖИ (или УРАВНОВЕШИВАЕМЫЕ ОПЕРАЦИИ КУПЛИ–ПРОДАЖИ) – Matched Sale-Purchase Transactions:- a transaction in which the Federal Reserve sells a government security to a dealer or a foreign central bank and agrees to buy back the security on a specified date (usually within seven days) at the same price (the reverse of a repurchase agreement). Such transactions allow the Federal Reserve to temporarily absorb excess reserves from the banking system, limiting the ability of banks to make new loans and investments. / по той же самой цене (противоположность соглашения об откупе). Уравновешиваемая Операция Купли-Продажи – сделка, состоящая в продаже и обратной на ту же сумму покупке. Процедура Комитета по Операциям на Открытом Рынке (Federal Open Market Committee), в рамках которой Нью Йоркский Банк Федерального Резерва продаёт государственные ценные бумаги за краткосрочные федеральные фонды (federal funds) небанковскому дилеру с немедленной поставкой с условием обратной покупки в определённый день по той же цене. Соглашение о сделке требует, чтобы дилер продал ценные бумаги до указанной даты, которая варьирует от одного до 15 дней. ФРС выплачивает дилеру процентную ставку, равную ставке дисконта. Эти сделки также называются соглашениями об обратной продаже ценных бумаг с последующим выкупом, они снижают объём денежной массы в течение ограниченных периодов времени путём сокращения банковских балансов дилера и его избыточных резервов. ФРС, таким образом, имеет возможность регулировать необычный рост денежного рынка вследствие сезонного или иных факторов.

MATCHED SET = СОБРАННЫЙ КОМПЛЕКТ (или КОМПЛЕКТ В СБОРЕ) – Matched Set is a combination of a highway chassis and a sea container. Also known as Matched Unit.

MATCHER = ПОДБОРЩИК ПАРЫ – Matcher is a component of the Swiss Exchange system which matches bids and offers in the order book to bring about trades.

MATCH–HEAD SQUARE = БУТОН РАЗМЕРОМ СО СПИЧЕЧНУЮ ГОЛОВКУ (или ПОДЦВЕТНИК РАЗМЕРОМ СО СПИЧЕЧНУЮ ГОЛОВКУ) – Match-Head Square:- early stage of growth when the flower bud (excluding the outer bracts) reaches approximately the size of a large kitchen match head. / Ранняя стадия роста, когда бутон цветка (за исключением наружного прицветничка) достигает размера приблизительно с крупную головку кухонной спички.

MATCHING = ПРИВЕДЕНИЕ В СООТВЕТСТВИЕ (или СООТНЕСЕНИЕ, или ПОДГОНКА, или СОВПАДЕНИЕ) – Matching is an arranging assets and liabilities so that the cash flows generated by the assets can be expected to meet the liability payouts, either because the assets generate income of the right amount at the right time or because the market values of the assets are linked to the market values of the liabilities appropriately. Matching is the process for comparing the trade or settlement details provided by counterparties to ensure that they agree with respect to the terms of the transaction. Also called Comparison. A term Matching refers to the relationship – by size and incidence – between the cash-flows from the assets and those from the liabilities. The assets and liabilities of a life insurance company are said to be (absolutely) matched if the two cash flows cancel out. Otherwise, the company is said to be mismatched. In practice, absolute matching is almost impossible to attain, except in very special circumstances, and some degree of mismatching is therefore inevitable. In foreign trade, and particularly in loan guarantees, meeting credit terms offered by competing lenders. Matching is the process by which an intermediary compares the trade or settlement details provided by the broker-dealer with those of its customer. If the details match, the intermediary affirms the trade and a confirmation is generated. The US Securities and Exchange Commission (SEC) has interpreted matching as a 'clearing agency function' according to the definition of a clearing agency in the Securities Exchange Act of 1934. See clearing agency, confirmation/affirmation process. / , от Латинского слова Affirmo, означающее Утверждаю, . Комиссия по Ценным Бумагам и Биржам (The Securities and Exchange Commission; сокращённо – КЦББ или СЭК (SEC), в Англоязычном произношении).

MATCHING LININGS = XX – Matching Linings:- wrong size or wrong material. Cutting Room Defects, and namely – Take Off and Bundling Defects. / Порок или дефект раскроя.

MATCHMAKER EVENTS = ВСТРЕЧИ (или СОБЫТИЯ) С ЗАИНТЕРЕСОВАННЫМИ ЛИЦАМИ – Matchmaker trade delegations are organized and led by the US International Trade Administration to help new-to-export and new-to-market firms meet prescreened prospects who are interested in their products or services in overseas markets. Matchmaker delegations usually target two major country markets in two countries and limit trips to a week or less. This approach is designed to permit US firms to interview a maximum number of prospective overseas business partners with a minimum of time away from their home office. The program includes US embassy support, briefings on market requirements and business practices, and interpreters' services. Matchmaker events, based on specific product themes and end-users, are scheduled for a limited number of countries each year.

MATCH TRISTIMULUS VALUES = ПОДОБРАННЫЕ (или ПОДОГНАННЫЕ, или ГАРМОНИРУЮЩИЕ) ТРЁХЦВЕТНЫЕ (или ТРИСТИМУЛЬНЫЕ) ИНТЕНСИВНОСТИ (или ВЕЛИЧИНЫ) – Match Tristimulus Values are the amounts of the three specified human response stimuli required to match a color.

MATELASSÉ = СТЁГАНОЕ (или МАТЭЛЯССЕ) – The French word, Matelassé means 'Quilted', 'Padded', or 'Cushioned', and in usage with fabric, refers to hand quilted textiles. It is meant to mimic the style of hand-stitched Marseilles type quilts made in Provence, France. Matelassé fabric can be either hand-stitched to create the decorative features of the fabric, or woven on a Jacquard loom for the appearance of quilting. Matelassé fabric is a heavy, thick textile that appears to be padded, but actually has no padding within the fabric. Matelassé fabric is commonly made in 100% cotton, but can be found in cotton/polyester blends and chenille as well. Designs range from simple, graphic square designs, or fancier floral motifs. Matelassé fabric can be very elegant, but is also favored for its comfortable, casual design that seems to improve with every washing. The textile is a favorite for shabby chic and French provincial décor for nearly every room of the house. Matelassé fabric is used on upholstery for slip covers and throw pillows, and in bedding, for coverlets, duvet covers and pillow shams. It is also used in crib bedding and children's bedding sets. In the 1960s, Oscar de la Renta designed suits and dresses using matelassé fabric. Handbags are also designed utilizing the unique quilted fabric. Matelassé fabric is typically woven in solid colors, with only the relief of the pattern for its decoration, but some makers create beautiful designs in bold colors to compliment the existing quilting. The National Geographic store sells the Kashmir Paisley Matelassé coverlet woven in a rich design featuring vibrant colors. The catalog company Lands End imports matelassé bedding woven by master weavers from Portugal. Coverlets and bedding are often made with a scalloped edging, but are also available in a simple hemmed edge. Antique and heirloom blankets made in matelassé fabric can be found in antique stores and online through individual collectors. Sewing enthusiasts can make their own matelassé fabric with basic quilting skills – it can be as simple or intricately designed as the seamstress is willing to make it. Because there is such a range in quality of matelassé fabric, cost varies from extremely affordable to very pricey, depending on the material used and where it is imported from. Matelassé is a medium to heavyweight luxury fabric made in a double cloth construction to create a blistered or quilted surface. Common end-uses are upholstery, draperies, and evening dresses. Matelassé is a soft double or compound fabric with a quilted appearance. One of the fabrics that, like cloque, has a blistered or quilted look to the design. Officially, the word matelassé implies the use of two different yarns that, when finished, react differently to the finishing resulting in a puckered effect in the fabric. In practice, the term Matelassé is usually applied to luxury fabrics for evening wear, while a word such as cloque is used for a similar fabric made from cotton. The heavier type is used in draperies and upholstery, whereas crêpe matelassé is popular in dresses, semiformal and formal suits and wraps, and trimmings. Matelassé is a soft, double or compound fancy-woven fabric with a quilted appearance. Heavier types are used as draperies and upholsteries. Crêpe matelassé is used for dresses, wraps, and other apparel. Matelassé is usually woven on a Jacquard loom. Matelassé:- French for 'Cushioned or Padded'. Fabric woven on Jacquard or dobby loom, in double cloth weave. The pattern stands out and gives a 'pouch' or 'quilted' effect to the goods. Crêpe yarn in double weave shrinks during finishing causing a blistering effect. In upholstery, coarse yarns cause blistering. Comes in colors, novelty effects, and some with metallic yarns. Gives good wear and drapes well. If washable, it must be laundered with care. It is very attractive and suits quite plain styles. / Жакяр (Jacquard). Сложное Пике; ткань с выпуклым узором сложноузорчатого переплетения. Марсельский или Марсейский (Marseilles). Под Матэляссе, от Французского слова Matelassé, означающее Стёганая, понимается . Матэляссе – ткань из натурального или искусственного шёлка с жаккардовым рисунком наподобие стёжки на ватине. По способу изготовления и внешнему виду напоминает клоке.

MATERIAL = МАТЕРИАЛ (или МАТЕРИЯ) – Material is another word for Fabric. See also Fabric. Fibers 1" to 11" long.

MATERIAL BALANCE = МАТЕРИАЛЬНЫЙ БАЛАНС (или БАЛАНС МАТЕРИАЛА) – Material Balance is a mathematical representation of material flow through a reaction system. The input material is accounted for throughout its various transformations.

MATERIAL BREACH = СУЩЕСТВЕННОЕ НАРУШЕНИЕ – Material Breach is a breach serious enough to destroy the value of the contract and to give a basis for an action for breach of contract. Breach of contract – a breach of a legal duty; failure to do something that is required in a contract.

MATERIAL CIRCUMSTANCES = СУЩЕСТВЕННЫЕ ОБСТОЯТЕЛЬСТВА – Material Circumstances are any circumstances that would affect a prudent underwriter in deciding whether or not to accept an insurance contract and in assessing the correct premium to charge. / Любые обстоятельства, которые могли бы повлиять на предусмотрительного расписчика (андеррайтера), принимающего решение о заключении или отказе в заключении договора страхования и определении правильного размера подлежащей оплате премии.

MATERIAL FACT = СУЩЕСТВЕННЫЙ ФАКТ – Material Fact:- this refers to any fact which would influence the judgment of a prudent underwriter in deciding whether to accept an insurance/reinsurance risk and the terms on which he would be willing to grant cover. Anything affecting an insurance contract significant enough to change the agreement between the insurance company and the policyholder. Material Fact is any fact that could influence an underwriter in their acceptance of the risk, or calculating the premium.

MATERIAL HANDLING = ПЕРЕВАЛКА МАТЕРИАЛА – Material Handling:- the services and processes the warehouse must utilize to move, store and otherwise handle materials.

MATERIAL REPRESENTATION = ПРЕДОСТАВЛЕНИЕ СУЩЕСТВЕННОЙ ИНФОРМАЦИИ (или ОТОБРАЖЕНИЕ СУЩЕСТВЕННЫХ ОБСТОЯТЕЛЬСТВ) – Material Representation:- a statement that is made to an underwriter during the negotiation of cover or the amendment or renewal of cover which would have influenced the judgment of a prudent underwriter in deciding whether to accept an insurance/reinsurance risk and the terms on which he would be willing to grant cover.

MATERIAL SAFETY DATA SHEET = ЛИСТ ДАННЫХ О БЕЗОПАСНОСТИ МАТЕРИАЛА – A Material Safety Data Sheet (MSDS), Safety Data Sheet (SDS), or Product Safety Data Sheet (PSDS) is an important component of product stewardship and occupational safety and health. These are required by agencies such as OSHA (short for the US Occupational Safety and Health Administration) in its Hazard Communication Standard, 29 C.F.R. 1910.1200. It provides workers with ways to allow them to work in a safe manner and gives them physical data (melting point, boiling point, flash point, etc), toxicity, health effects, first aid, reactivity, storage, disposal, protective equipment, and spill-handling procedures. The MSDSs differ from country to country, as different countries have different regulations. In some jurisdictions, it is compulsory for the SDS to state the chemical's risks, safety, and effect on the environment. The SDSs are a commonly used classification for logging information on chemicals, chemical compounds, and chemical mixtures. The SDSs often include the safe use of the chemical and the hazardous nature of the chemical. Anytime chemicals are used these data sheets will be found. There is a need to have an internationally recognized symbol when describing hazardous substances. Labels can include hazard symbols such as the European Union standard black diagonal cross on an orange background, used to denote a harmful substance. The purpose of an SDS is not so that the general public will have a knowledge of how to read and understand it, but more so that it can be used in an occupational setting to allow workers to be able to work with it. Material Safety Data Sheet (MSDS) is a reasonably detailed specification for the possible safety hazards associated with a product. They are prepared by the manufacturer of the product. Unfortunately, they are often not available for products that are regarded as 'consumer' products, even if the product poses serious safety hazards. For an excellent Internet resource for MSDS and other safety information, try http://www.siri.org/msds or http://www.hazard.com/msds. A Material Safety Data Sheet (MSDS) is a document that contains information on the potential hazards (health, fire, reactivity and environmental) and how to work safely with the chemical product. It is an essential starting point for the development of a complete health and safety program. It also contains information on the use, storage, handling and emergency procedures all related to the hazards of the material. The MSDS contains much more information about the material than the label. MSDSs are prepared by the supplier or manufacturer of the material. It is intended to tell what the hazards of the product are, how to use the product safely, what to expect if the recommendations are not followed, what to do if accidents occur, how to recognize symptoms of overexposure, and what to do if such incidents occur. In Canada, every material that is controlled by WHMIS (Workplace Hazardous Materials Information System) must have an accompanying MSDS that is specific to each individual product or material (both the product name and supplier on the MSDS must match the material in use). There are nine (9) categories of information that must be present on an MSDS in Canada. These categories are specified in the Controlled Products Regulations and include:- (i) Product Information:- product identifier (name), manufacturer and suppliers names, addresses, and emergency phone numbers; (ii) Hazardous Ingredients; (iii) Physical Data; (iv) Fire or Explosion Hazard Data; (v) Reactivity Data:- information on the chemical instability of a product and the substances it may react with; (vi) Toxicological Properties:- health effects; (vii) Preventive Measures; (viii) First Aid Measures; and (ix) Preparation Information:- who is responsible for preparation and date of preparation of MSDS. The Controlled Products Regulations prescribes what information must be present in more detail. Material Safety Data Sheet (MSDS):- formal document containing important information about the characteristics and actual or potential hazards of a substance. It identifies the manufacturer of the material (with name, address, phone, and fax number) and usually includes:- (1) chemical identity, (2) hazardous ingredients, (3) physical and chemical properties, (4) fire and explosion data, (5) reactivity data, (6) health hazards data, (7) exposure limits data, (8) precautions for safe storage and handling, (9) need for protective gear, and (10) spill control, cleanup, and disposal procedures. Mandated by the US Occupational Safety and Health Administration (OSHA), it is used also in many other countries in one form or the other. A Material Safety Data Sheet (MSDS) is a document that contains information on the potential health effects of exposure to chemicals, or other potentially dangerous substances, and on safe working procedures when handling chemical products. It is an essential starting point for the development of a complete health and safety program. It contains hazard evaluations on the use, storage, handling and emergency procedures related to that material. The MSDS contains much more information about the material than the label and it is prepared by the supplier. It is intended to tell what the hazards of the product are, how to use the product safely, what to expect if the recommendations are not followed, what to do if accidents occur, how to recognize symptoms of overexposure, and what to do if such incidents occur. In compliance with the American ANSI Z400.1-1998 standard (official title 'Standard for Hazardous Industrial Chemicals – Material Safety Data Sheets – Preparation'), European Directive 91/155/EEC on 'defining and laying down the detailed arrangements for the system of specific information relating to dangerous preparations in implementation of Article 10 of Directive 88/379/EEC', and following amendments, and International Standard ISO 11014-1 ('Safety data sheet for chemical products – Part 1:- Content and order of sections'), each MSDS must contain sixteen sections:- (i) Product Information:- product identifier (scientific name, common name), name of the manufacturer and supplier, addresses, emergency phone numbers; (ii) Composition / Information on Ingredients; (iii) Hazards Identification:- data on flammability, reactivity, chronic hazards, ...; (iv) First-Aid Mesures:- description of recommended first-aid mesures in case an incident occurs, for example, in case of ingestion or inhalation of the substance, or in case of contact of the chemical product with eyes or skin; (v) Fire Fighting Mesures:- recommended fire fighting apparatus, methods and products, flash point of the substance, fire-fighting class, upper and lower flammable limit (ULF – LFL), dangerous combustion products, recommendations for preventing explosions and fires; (vi) Accidental Release Mesures:- mesures to be taken in case of the accidental release of the chemical substance or mixture into the environment: soil, rivers, waterways, sources of potable and non potable water, see, etc; (vii) Information on Recommanded Handling

and Storage Conditions:- recommended procedures for the handling, storage and usage of the chemical substance or mixture; (viii) Exposure Controls / Personal Protection:- this section often contains the exposure limits per country (classified by form of exposure or overexposure), as well as the personal protection equipment (PPE) recommended or required by law (respiratory protection, skin protection, eye protection, face mask, etc); (ix) Physical and Chemical Properties:- product properties such as vapor pressure, vapor density, specific weight, water solubility, appearance, odor type, boiling point, pH value, viscosity, evaporation rate, freezing point, ...; (x) Stability and Reactivity Data:- information on the stability of the substance, conditions to avoid, incompatibility with other substances or materials, hazardous decomposition products, etc; (xi) Toxicological Information:- information on the acute and chronic toxicity of the chemical substance, possibly data on the known carcinogenic properties, or labo tests; (xii) Ecological Information:- information on the ecotoxicity of the chemical product, analysis of its components, biodegradability in different environments, etc; (xiii) Disposal Considerations:- this section often contains references to local legal requirements regarding the disposal of hazardous chemical products; (xiv) Transport Information:- shipping name, hazard class, UN number, package group; (xv) Regulatory Information:- classification of the substance according to TSCA, SARA, CERCLA, ..., S- and R-Phrases; (xvi) Other Information:- this section often presents a list of abbreviations used in the MSDS, references to EU Directives en European or international (ISO) standards, version management of the MSDS, a disclaimer, ... Employers must make sure that all controlled products have an up-to-date (less than three years old) MSDS when they enter the workplace. The MSDS must be readily available to the workers who are exposed to the controlled product, and to the health and safety committee or representative. If an MSDS in English is not completely understood by non-native speakers, the MSDS in question requires to be translated in the native tongue of the personnel handling the hazardous materials. The employer has a duty to make an understandable MSDS for all hazardous products. Also, according to the 'downstream flow' principle, any importer, supplier, or reseller of a product containing substances requiring the provision of an MSDS, is under a legal obligation to provide the relevant safety sheets in the language of the importing country, so often an MSDS translation will be needed. In case of accidents, contamination or spillages, an MSDS can be a life insurance for workers handling hazardous substances. Material Safety Data Sheet (MSDS) is a reasonably detailed specification for the possible safety hazards associated with a product. They are prepared by the manufacturer of the product. Unfortunately, they are often not available for products that are regarded as 'consumer' products, even if the product poses serious safety hazards. For an excellent Internet resource for MSDS and other safety information, try http://www.siri.org/msds or http://www.hazard.com/msds. A Material Safety Data Sheet (MSDS) is a document that provides health and safety information about products, substances or chemicals that are classified as hazardous substances or dangerous goods. MSDS's provide information on:- (i) the manufacturer or importing supplier; (ii) the product (its name, ingredients and properties); (iii) how the product can affect your health; (iv) precautions for using or storing it safely. Who Prepares And Provides MSDSs? Manufacturers and importers of dangerous goods and hazardous substances must:- (i) prepare an MSDS for each of their products; (ii) provide the current MSDS to employers or occupiers of premises where the product is used or stored; (iii) review and revise each MSDS as often as necessary and at least every 5 years to make sure that the information is accurate and up to date. Downstream suppliers of dangerous goods and hazardous substances must also provide MSDSs developed by the manufacturer or importer. This does not apply to suppliers who are retailers (for example, hardware stores). Employers' Responsibilities:- employers using or storing dangerous goods or hazardous substances on their premises must ensure that:- (i) they obtain an up to date MSDS for each of these products; (ii) their employees, contractors and emergency services personnel have access to the MSDS. Information To Be Included On An MSDS:- the Australian Safety & Compensation Council (ASCC) has developed a National Code of Practice for the Preparation of Material Safety Data Sheets. The Code sets out minimum standards for the content, format and layout of an MSDS. Under Victorian legislation, the MSDS must be written in English, be legible and include the following information:- the product name of the dangerous goods or hazardous substance; the name, address and telephone number of the Australian manufacturer or importing supplier; Australian telephone number for information in the event of an emergency; the date the MSDS was prepared or last reviewed; a statement that the substance is a hazardous substance (if applicable); the proper shipping name, UN number, class, subsidiary risk and packing group for dangerous goods; the hazard classification for hazardous substances; the risk and safety phrases for hazardous substances; the chemical or generic names of the individual ingredients in the hazardous substance or dangerous goods as required by the Victorian legislation; the proportion or proportion ranges of the ingredients required to be identified with a chemical or generic name; first aid measures; emergency procedures; any relevant health hazard information; the chemical and physical properties of the substance or its ingredients including any hazardous decomposition products likely to be generated during normal use; precautions for the safe use of the substance, including engineering controls and personal protective equipment; precautions for the safe storage and disposal of the substance; the exposure standard (if any) for a hazardous substances or its ingredients; and information on the health effects of the substance or its ingredients. Material Safety Data Sheet (MSDS):- a publication containing health and safety information on a hazardous product (including petroleum). The Occupational Safety And Health Administration (OSHA) Hazard Communication Standard requires that an MSDS be provided by manufacturers to distributors or purchasers prior to or at the time of product shipment. An MSDS must include the chemical and common names of all ingredients that have been determined to be health hazards if they constitute 1% or greater of the product's composition (0.1% for carcinogens). An MSDS also included precautionary guidelines and emergency procedures. A Material Safety Data Sheet (MSDS) is an important document containing a chemical product's physical data, potential hazards, handling and required safety precautions. The information is used as a starting point when developing complete safety and health programs. It is a requirement for every manufacturer to include this information with every chemical product. The material safety data sheet is intended to provide workers with safe handling and usage procedures for a chemical product. It also warns about related hazards and steps that should be taken in case of an accident. Material safety data sheets vary in length (usually between one and ten pages), content and format. However, most of the basic and critical information must be included on all. A typical material safety data sheet must contain between 8 and 16 sections:- (i) Product Information:- manufacturer's name and contact information, product name, addresses and emergency phone numbers; (ii) Hazardous ingredients/identification information; (iii) Physical data:- melting, boiling and flash points; (iv) Fire or explosion hazard data; (v) Reactivity data:- chemical instability of a product and the substances it may react with; (vi) Toxicological properties/health effects; (vii) Preventive measures/precautions for safe handling and use:- storage, protective gear, handling spills, disposal of the product and associated packaging; (viii) First aid measures/control measures:- emergency procedures in case of accident and recognizing symptoms of overexposure; (ix) Preparation information:- preparation date and person responsible. The MSDS on corrosive acids, bases and chemicals helps to warn people handling them on their burning effect on the skin if it comes into contact, health problems if inhaled and corrosive effects on metals. The MSDS for particular corrosive chemicals also specify the metal types it corrodes as well as other materials, such as wood or plastics, that it can attack. See also Product Data Sheet; and Technical Data Sheet. A Safety Data Sheet (SDS), Material Safety Data Sheet (MSDS), or Product Safety Data Sheet (PSDS) are documents that list information relating to occupational safety and health for the use of various substances and products. SDSs are a widely used system for cataloging information on chemicals, chemical compounds, and chemical mixtures. SDS information may include instructions for the safe use and potential hazards associated with a particular material or product, along with spill-handling procedures. The older MSDS formats could vary from source to source within a country depending on national requirements; however, the newer SDS format is internationally standardized. An SDS for a substance is not primarily intended for use by the general consumer, focusing instead on the hazards of working with the material in an

occupational setting. There is also a duty to properly label substances on the basis of physico-chemical, health, or environmental risk. Labels can include hazard symbols such as the European Union standard symbols. The same product (e.g., paints sold under identical brand names by the same company) can have different formulations in different countries. The formulation and hazard of a product using a generic name may vary between manufacturers in the same country.

MATERIALS–AND–SUPPLIES INVENTORY = ИНВЕНТАРЬ МАТРИАЛЫ И ПОСТАВКИ – In the official statistics of US Census Bureau, Materials-And-Supplies Inventory:- all unprocessed raw and semifabricated commodities and supplies for which you have title.

MATERIALS MANAGEMENT = УПРАВЛЕНИЕ МАТЕРИАЛАМИ – Materials Management:- the procurement, movement and management of materials and products from acquisition through to production.

MATERIALS OVERHEAD = XX – Materials Overhead:- the costs of indirect materials (supplies, such as glue or solder, that are used in small quantities in many products); also includes the costs related to the procurement and movement of materials, such as the salaries of purchasing, receiving, and stockroom personnel.

MATERIAL TRANSFER AGREEMENT = СОГЛАШЕНИЕ О ПЕРЕДАЧЕ МАТЕРИАЛА – Material Transfer Agreement (MTA):- a document developed by the originator or plant breeder setting forth terms of restricted use of plant materials, populations, varieties, elite and raw germplasm, brands, and other plant propagules.

MATERIAL–VALUE CLAUSE = ОГОВОРКА О МАТЕРИАЛЬНОЙ ЦЕННОСТИ – Material-Value Clause is a clause in a bond loan agreement linking the amount of the nominal claim to a material substance or assets or to changes in the price of real (material) values. Depending on the type of link, a distinction is made, for instance, between a gold clause and an index clause.

MATE'S RECEIPT = ШТУРМАНСКАЯ РАСПИСКА (или РАСПИСКА ПОМОЩНИКА) – This is a temporary receipt issues for goods, which have been delivered to the vessel. The ocean B/L is issued in exchange for the Mate's Receipt. A receipt signed by the mate to say the cargo has been received on board in good order and condition. The Mate's Receipt is a receipt signed by a mate of the vessel, acknowledging receipt of cargo by the vessel. The individual in possession of the mate's receipt is entitled to the bill of lading which in due course is issued in exchange for that receipt. An archaic practice. An acknowledgement of cargo receipt signed by a mate of the vessel. The possessor of the mate's receipt is entitled to the bill of lading, in exchange for that receipt. Mate's Receipt is a document signed by the chief officer of a vessel acknowledging the receipt of a certain shipment on board. Remarks can be made as to the order and condition of the consignment. / Штурманская Расписка – судовой документ о принятии груза к перевозке, выдаваемый судовой администрацией грузоотправителю после погрузки товара на судно.

MATIF (SA) = MARCHE A TERME INTERNATIONAL DE FRANCE (SA)

MATRIX = МАТРИЦА (или МАТРИКС) – Matrix is a medium in which something is embedded. / средство (или среда), в которое что-либо заливается. Матрица – тело или форма, по которым образуется новое тело или новая форма. Под Матрицей, от Латинского слова Matrix, означающее Матка, . Под Матриксом, от Латинского слова Mater, означающее Основа или буквально Мать, понимается мелкозернистое полужидкое вещество, заполняющее внутриклеточные структуры (митохондрии, пластиды, ядра и другие органоиды) и пространства между ними.

MATRIX FIBER = МАТРИЧНОЕ ВОЛОКНО – Matrix Fiber is a manufactured fiber that is essentially a physical combination or mixture of two or more chemically distinct constituents or components combined at or prior to the time of extrusion (i.e. produced in fiber form), which components if separately extruded would each fall within different definitions of textile fiber. Mean Fiber is a multicomponent fiber in which discrete and discontinuous portions of one or more polymers are embedded in a matrix of another polymer. Matrix Fiber is:- (1) a manufactured fiber that is essentially a physical combination or mixture of two or more chemically distinct constituents or components combined at or prior to the time of extrusion (i.e. produced in fiber form), which components if separately extruded would each fall within different definitions of textile fiber. Matrix fibril fibers have the fibril constituent randomly arranged across the cross section of the matrix. When the fibril component is in high concentration it may actually form a fibrillar network in the matrix. (2) In aerospace textiles, a thermoplastic fiber used with reinforcing fiber to form a composite after consolidation with heat and pressure. (3) In nonwovens manufacture, fibers that are blended with low-melt fibers to form a thermally bonded fabric. / Экструзия или Выдавливание (Extrusion).

MATRIX FIBRIL FIBER = МАТРИЧНОЕ ВОЛОКНО ФИБРИЛ – A Matrix-Fibril Fiber called 'Source' is produced by Allied Chemicals Ltd (an India-based company). The fiber is based on PET fibrils embedded in a matrix of Nylon 6. The presence of PET fibrils is supposed to increase the modulus of the fiber, to reduce moisture regain, to reduce the dye ability, improve the texturing ability and give the fiber a unique lustrous appearance. Matrix Fibril Fibers have the fibril constituent randomly arranged across the cross section of the matrix. When the fibril component is in high concentration it may actually form a fibrillar network in the matrix. See also Matrix Fiber. / Найлан^{T3} (Nylon^{TM}). Алайд Кемикэлз Эл.ти.ди. (Allied Chemicals Ltd). влагопоглощательная способность (moisture regain).

MATTE = МАТТ (или МЭТ, или XX) – (1) Matte is a dull surface on a fabric. Since one of the characteristics of fabrics made from man-made fibers is a shiny surface, mattefinished fabrics have become popular and matte looks for man-made fabrics are achieved in yarn processing or finishing. See also Finishing. / Matte = Матт (Французское слово) или Мэт или Маска или Каше или Виньетка или Штейн (металлическое).

(2) Matte:- lacking luster or gloss. Synonymous with Flat in paint terminology.

MATTED STAPLE = СВАЛЕННЫЙ ШТАПЕЛЬ (или СПУТАННЫЙ ШТАПЕЛЬ) – Matted Staple is a fiber in the bale that is compressed and entangled in a manner indicating that the fiber was either too wet at the baling operation or that excessive baling pressure was used.

MATTED WOOL = МАТИРОВАННАЯ ШЕРСТЬ (или СВАЛЕННАЯ ШЕРСТЬ, или СПУТАННАЯ ШЕРСТЬ) – Matted Wool:- it seems that the more you brush it, the more knotted it gets. See also Cotted. The Cause of Matted Wool:- every sheep owner and wool buyer is very familiar with the sight of a matter or 'cotted' fleece, and-such wool is in no sense good to deal with. These fleeces cannot be combed, as the staples refuse to be opened out or to part each other's company; hence they have to be broken up by being wilted, or put through the 'devil', this process disintegrating the wool every quickly. But such fleeces when broken up are still sadly deficient, and are never fit to be used in the ordinary way, and for regular made fabrics. These fleeces have always to be put to the 'cast' fleeces, and there to be used for something of a very secondary kind. The reason for this is that such wool is always badly grown; is usually rough in texture, even if off merino sheep; is always tender, and there is a want of that life and vitality which is so essential in ail well grown wool. When these characteristics are wanting, there is pronounced weakness and deficiency in the staple and stock. The matting or cottint of the sheep's wool is one of the many disagreeable points connected with the sheep-farming industry (writes S.B. Hollings, in the 'Live Stock Journal'), and always means a loss to the owner. The cause of this matting is interesting to inquire into. It is

customary to lay the blame upon wet weather, poor feed, or a hereditary tendency, but the real root of the evil lies in the failure of the sheep to produce a sufficient quantity of yolk, which acts as a lubricant or pomatum, and prevents the serrated edges of the fiber from inter locking and felting together. In Individual cases the tendency may arise from any of the following causes:- (1) Poor-bred sheep are always more liable than well bred ones, because the hair is much coarser and the production or exudation of yolk up the core or pith of the fiber is much less. This is especially noticeable when the sire is of poor breeding, and one that is a poor thriver should never be used. We have seen some English farmers use sires that had half their coat off their back, the wool literally having fallen off on account of the low condition of the animal. There is no wonder that such sires will get inferior stock and perpetuate the evils arising out of poor thriving and low condition. The peculiarities here are hereditary. In the long-woolled sheep It is also more noticeable than in merinos and southdowns, because the production of yolk in the short-woolled sheep is much greater in proportion than the long woolled, and the fleece is more impervious to water, which is also a strongly predisposing agent. (2) As already said, wet weather may also influence and cause this, because it washes out the yolk, which is more or less soluble in water, and this leaves the fiber in, a condition most ready to mat. The same thing, applies to damp and marshy ground. If the sheep are washed too frequently, and at times and seasons when they cannot dry, the mattings almost sure to take place; butin these days fleece washing Is a thing of the past, except among English farmers, who still river wash their sheep eight or ten days before shearing. (3) A poor feed has the same result, because a loss in condition means poverty of coat. It is then that the fiber becomes dry, harsh, and brittle, there is not that soft, supple, and elastic feel; and, in addition to this, the sheep will probably be more restless, so increasing the tendency to mat or felt. I attach great importance to the feeding of sheep, my experience leading me to affirm that among a lot of poorly fed sheep the most matted fleeces arise, simply because the animals do not derive that nourishment that is required to feed both carcase and fleece. (4) If dipplng has not been properly per formed, and the sheep are infected with vermin, ticks, scab, and other skin disFix this text eases, it renders the sheep restless, and at the same time checks the production of yolk, and prevents it being evenly distributed over the fleece. Careful attention to the food, health, and shelter of sheep is therefore necessary, especially in these days when wool buyers can pick and choose in almost any market in the world. Let the fleece be grown as near perfection as possible. / Матовая (Cotted). , от Латинского слова Affirmo, означающее Утверждаю, .

MATT EFFECT = МАТОВЫЙ ЭФФЕКТ (или МАТИРОВАННЫЙ ЭФФЕКТ, или ТУСКЛЫЙ ЭФФЕКТ) – Matt Effect:- xxxxx. See also Basket Weave.

MATTER OTHER THAN CEREAL GRAINS = ЗЕРНОВАЯ ПРИМЕСЬ (или ПРИМЕСЬ ДРУГИХ ЗЛАКОВЫХ ЗЕРНОВЫХ КУЛЬТУР) – Matter Other Than Cereal Grains is a type of foreign material. It includes large seeds and seeds of such grains as Buckwheat, Peas, Corn and Beans, and may include coarse vegetable matter. / У Ячменя к Сорной Примеси относят:- (i) весь проход, полученный при просеивании навески зерна через сито с отверстиями диаметром 1.5 мм (полотно № 1 – 15); (ii) в остатке на сите с отверстиями диаметром 1.5 мм; (iii) минеральную примесь – гальку, комочки земли, частицы шлака, руды и тому подобное; (iv) органическую примесь – части стеблей и стержней колоса, ости, плёнки и тому подобное; (v) семена дикорастущих растений; (vi) семена культурных растений, не отнесённые к зерновой примеси; (vii) испорченные зёрна Ячменя, Пшеницы, Полбы, Ржи и Овса:- загнившие, заплесневевшие, поджаренные, обуглившиеся – все с испорченным эндоспермом от коричневого до чёрного цвета, а также со светлым, но рыхлым, легко рассыпающимся эндоспермом; (viii) зёрна Ячменя, Пшеницы, Полбы, Ржи и Овса с полностью выеденным эндоспермом; и (ix) вредную примесь – спорынью, головню, зёрна, поражённые нематодой, плевел опьяняющий, горчак ползучий, софору лисохвостную, термопсис ланцетный (мышатник), вязель разноцветный, гелиотроп опушённоплодный, триходесму седую. У Ячменя к Зерновой Примеси относят зёрна Ячменя:- (i) битые и изъеденные независимо от характера и размера повреждений, давленые, с нарушенной оболочкой и открытым эндоспермом; (ii) недозрелые:- сильно недоразвитые – щуплые, а также зёрна зелёные, деформирующиеся при надавливании шпателем; (iii) проросшие – с вышедшим наружу корешком или ростком; (iv) повреждённые самосогреванием или сушкой, с изменённым цветом оболочки и эндоспермом от кремового до светло-коричневого цвета; и (v) зёрна Пшеницы, Полбы, Ржи и Овса целые и повреждённые, не отнесённые по характеру повреждений к сорной примеси.

MAT–UP = XX (или КОЛТУН НА ЛИЦЕВОЙ СТОРОНЕ) – Defect Name:- Mat-Up. Defect Type:- Isolated Defects. Fabric Type:- Shirting and Dress Goods – Plain Weave. Description:- Mat-Up:- This defect is the result of several ends breaking and entangling so as to interfere with the proper interlacing of ends and picks. Severity:- Major.

MATURE = ЗРЕЛОЕ (или СОЗРЕВШЕЕ) – Mature:- applied to cells and tissues that have differentiated into their final adult form assuming the function or form characteristic of cells or tissues found in a fully developed part of the plant.

MATURED FIBERS = ЗРЕЛЫЕ ВОЛОКНА – Matured Fibers are fibers, the cell walls of which have developed sufficiently so that, upon swelling, they become unconvoluted and almost rod-like in shape. The wall width is equal to or greater than one-fourth of its maximum width.

MATURE GRAIN = ЗРЕЛОЕ ЗЕРНО (или СОЗРЕВШЕЕ ЗЕРНО) – Mature Grain is the stage when the Rice grains in the panicle are yellow, fully developed, hard, and capable of sprouting.

MATURITY = ЗРЕЛОСТЬ – Maturity:- pertains to the thickness of the fiber wall in speaking of Cotton. Maturity depends upon the degree to which the lumen (stalk tube) has been obliterated by the cellulose which constitutes the walls. Maturity is a fiber characteristic which expresses the relative degree of thickening of the fiber wall. it is the measure of primary and secondary wall thickness. Maturity is a term used to describe the completion of natural growth and development. (1) Boll:- A mature boll is one that has sufficient nutrition (carbohydrates and mineral nutrients) to open normally if the subtending leaf is removed. The boll slicing technique may be used to determine if a boll is mature. A boll that resists cross-sectional slicing by a sharp knife (due to fiber development) is considered mature. A dark seed coat is also an indication of boll maturity. (2) Crop:- A crop maturity is related to a field population of Plants (in relation to environmental potential) that has developed to the point that no additional inputs are required. Crop maturity is indicated by nodes above white flower (NAWF). / заращён/сплюснут целлюлозой, которая составляет стенки. Зрелость – характеристика накопления хлопковой целлюлозы в стенках волокон, проявляющаяся изменением толщины клеточной стенки и внутренней структуры в процессе созревания Хлопчатника.

MATURITY = ПОГАШЕНИЕ – The term Maturity is used in various contexts, e.g.,:- (i) period between the disbursal of a loan and its specified repayment; (ii) for fixed-interest securities, the time between the issue of a security and its redemption; and (iii) in forward transactions (e.g., options, warrants and futures), the time between concluding the forward contract or issue up to the maturity or expiry date. Maturity is the date when a futures contract that has not been offset by an opposite position must be settled by delivery of physical metal. / Наступление Срока (погашения) или Зрелость:- (1) Дата, когда долговой инструмент должен быть оплачен. По облигации, срок погашения которой наступает 01 Января 2012, её держатель в срок погашения получит выплату в размере основной стоимости облигации и последних процентных платежей. Доход по облигации часто рассчитывается на базе доходности к погашению (yield-to-maturity). (2) Когда этот термин употребляют относительно компании или экономики, то это означает, что состояние этой компании или экономики стабильно и они не имеют возможностей для дальнейшего динамичного

роста. Например, экономисты могут сказать, что промышленно развитая экономика достигла зрелости. Аналитики фондового рынка могут сказать, что рынок компании является зрелым, если спрос на её продукцию не растёт.

(2) Maturity is the time when a note, bond or other investment option comes due for payment to investors. / Погашение – это момент времени, когда нота, облигация или иной инвестиционный опцион становится должным к оплате инвесторам.

(3) Maturity is the period when a futures contract can be settled by delivery of the actual commodity or through cash settlement if that is an alternative to delivery. Maturity is the date on which a futures contract ceases to exist. Period within which a futures contract can be settled by delivery of the actual commodity.

MATURITY DATE = ДАТА ПОГАШЕНИЯ – Maturity Date is a time when a debt or other obligation becomes due. With a bond it is the date that it can be redeemed. The date that a bond comes due and must be paid off. / Дата Погашения (займа, векселя, облигации):- (1) Дата, на которую основная сумма простого или переводного векселя, банковского акцепта, облигации или иного кредитного документа подлежит оплате. Также дата прекращения или погашения, на которую заём, выплачиваемый путём периодических взносов, должен быть полностью выплачен. (2) При факторинге (factoring) срок полного урегулирования разновременных платежей между должником и кредитором, когда долги покупателей переводятся продавцу ежемесячно по дебиторским счетам.

MATURITY DEGREE = СТЕПЕНЬ ЗРЕЛОСТИ – The notion of Maturity Degree is defined as relative thickness of fiber wall. The maturity degree accepted in Russia is a parameter defined as relation of external diameter (D) of fiber, before drying to diameter (d) of its lumen, or as a relation of fiber width (E) after drying to width (e) of its lumen. The method of determination of maturity degree is based on the comparison of fiber image with fiber standards of different maturity degrees. The observations of fibers were carried out on biological light microscope and on scanning electron microscope. / обсервация (наблюдение).

MATURITY RATIO = СООТНОШЕНИЕ СО ЗРЕЛОСТЬЮ (или КОЭФФИЦИЕНТ ЗРЕЛОСТИ) – Maturity Ratio is the ratio of the degree of wall thickening to a standard degree of thickening selected arbitrarily to equal 0.577. / Соотношение степени толщины стенки со стандартной степенью толщины, выбранной арбитражем и равной 0.577.

MATY = MATURITY

MAUND = МОНД (или МАУНД) – Maund is a traditional unit of weight in India and throughout South Asia. The maund varied considerably, but during the period of British rule in India it was standardized at about 82.286 pounds or 37.324 2 kilograms. The maund is divided into 40 seers. Since 1980, Pakistan has used a metric version of the maund equal to exactly 40 kilograms or 88.185 pounds, thus making the seer equal to the kilogram. / Монд – традиционная мера веса в Индии и странах Южной Азии. В этих странах Монд имел значительные различия, но в течение Британского правления в Индии он постепенно стандартизировался в значение 82.286 фунтов или 37.324 2 килограмм. Монд состоит из 40 сиэ (seers). С 1980 Пакистан стал использовать метрическую версию монда, точно равную 40 килограммам или 88.185 фунтам, приведя при этом 1 сиэ к 1 килограмму.

MAUVE = МОВ (или РОЗОВАТО–ЛИЛОВОЕ) – Mauve:- moderate purple, violet, or lilac; a strong purple.

MAVERICK COCOA BEAN = БОБ КАКАО МАВЭРИК – ‘Maverick’ varieties:- our list must also include the ‘mavericks’ found in South America, which cannot be classified with the three main varieties. The most important of these is Ecuador’s ‘national’ Cocoa tree, with its large, green, wrinkled pods and its large purple beans. Less well known is the Forastero Cocoa tree of Surinam. The ‘national’ Cocoa of Ecuador, otherwise known as ‘Arriba’ is highly aromatic; it is, however, much more tannic than Criollo and darker in color.

MAWATA = MABATA – Mawata:- silk cocoons that have been simmered and opened onto a wooden frame. This is how to make Mawatas, or Silk Hankies. Each hankie is a single Bombyx mori cocoon attenuated (spread out) into a large square; these are easy to spin, and can also be used in textile arts such as papermaking and felting. The original name, Mawata, comes from Japanese, and means ‘to spread around’. This form of silk was originally used as padding inside winter kimonos and other garments, as well as being spun into yarn. To begin, the cocoons are placed in a crock pot for about 30 to 45 minutes, in a solution of 1 gallon water, 1/4 cup Orvus paste, and 1/4 cup washing soda. The cocoons will want to float; it helps to dunk them a few times to get them good and wet. The solution dissolves the sericin, or silk gum, that holds the cocoons together. The cocoons are done when they can be easily squished out of shape, but take them out before they become formless blobs. Be careful handling the cooked cocoons, as they are hot, and sometimes filled with hot water. It can squirt out and surprise you. Ask me how I know, eh? Then, I begin to stretch out and attenuate the cocoon. I can’t show the part where I hook one corner on a post sticking out of the frame, then spread it out to hook on all the other posts, because I’m taking these pictures myself and it’s a two-handed operation. Here’s a stack of about a dozen cocoons that I’ve spread out on the frame, one on top another. The frame that I’m using is made from 4 eight-inch stretcher bars, used for stretching canvas, and four little picture-hanger pegs that are like a nail on both ends. This is a side view; you can see the thickness it builds up. After I’ve made a good stack of them (usually about ten or so) I rinse them in the sink with clean water until they stop sudsing, then rinse with a solution of citric acid in water to remove any traces of the alkaline washing soda, and then I rinse with Milsoft, a special silk fabric softener. The acid and Milsoft rinses are easiest to do with a bowl and a cup; I hold the frame over the bowl, and pour the solutions through the hankies using the cup. When rinsing, be careful not to rub the stack of hankies, as it can tangle the fibers between the layers. I don’t have a photo of the next step yet. I turn the frame hankies-down on a piece of absorbent toweling (I use one of those Super-Shammy cloths, but paper towels work too) and free the hankies from the frame. I use a dinner fork to pry the stack of hankies off the prongs of the frame, keeping the whole stack together. Once all the corners are free, I lift the frame off, and put another layer of toweling on top of the hankies, and roll and squeeze them to help them dry. Then, I hang the completed stack up to dry thoroughly. This is a single mawata (one cocoon worth), after it’s dried. The patch that didn’t spread out smoothly is the cradle – the last bit of silk that the worm spun before changing its skin inside the cocoon. My mawatas aren’t quite as smoothly spread out as the commercial version; the commercial ones are a lot more consistently spread than this, and the edges are thinner. The difference is pretty much impossible to tell once they’re spun up. As with many textile techniques, practice helps a lot. A few suggestions and variations:- (i) You can use vinegar instead of citric acid. I like citric acid because it has no smell. I use about a tablespoon to a two-quart bowl; if you use vinegar, use about a 1/4 cup ‘glug’. (ii) You can replace the Milsoft with regular fabric softener, but the Milsoft is really great stuff. It gives the silk back a lot of the silky handle you want for it to have. I get it from Dharma Trading Company. (iii) It’s crucial for the stack to come off the frame to dry. This prevents the corners from being weakened as the silk shrinks on drying. It also frees up the frame for the next stack! This was one of those things that nobody told me, but I figured out eventually through trial and error. (iv) Although the Milsoft helps, these are just snaggy. They will catch on any slightly rough spot on your hands. Working over your hands with a salt scrub, or with a pumice stone, and using plenty of non-greasy lotion will help. Silk caps are a very similar preparation, but instead of being spread on a square, they are stretched over a bamboo hoop. In order to spin from hankies, separate out a single layer, then put your hands through the center. Stretch the hankie out into a big donut of fiber, and then keep pre-drafting it out until it’s as thin as you like. Roll the fiber into a little bird’s-nest, make up as many as you like, and then you’re ready to go! It is difficult to draft this fiber if even a hint of twist works its way into the drafting zone, because the fibers are so long. Hankies are excellent

as a carry-around project, because the fibers don't fly away and get on things like many silk preparations can. Hankies naturally make a slightly textured yarn, with occasional slubs and a lower sheen. Amy Singer of Knitty.com shows how to spin silk hankies here – with a link to wormspit.com! Carol Weymar has an excellent tutorial on spinning from silk caps here; the technique is very similar. If you have hankies that have been dyed (or if you dye your own!) you can preserve the colorways by stretching the hankie horizontally in one whole piece instead of punching through the center. If a hankie is dyed in striped areas of color, stretching opposite of the stripes will keep patches of separate colors in the roving, while stretching in the direction of the stripes will blend the colors more. / Щелочное (Alkaline). Орвэс (Orvus). Сьюпэ-Щэми (Super-Shammy). Дарма Тчрэйдинь Кампэни (Dharma Trading Company). Милсафт (Milsoft). Эми Синё (Amy Singer) из Нити.дат.кам (Knitty.com). Кэрол Вэймо (Carol Weymar).

MAX = MAXIMUM

MAX = MIDWEST EXCHANGE AUTOMATED EXECUTION SYSTEM

MAXI = МАКСИ – Maxi is a long skirt, dress, or coat.

MAXIMUM ACHIEVABLE TURN RATE = МАКСИМАЛЬНО ДОСТИГАЕМАЯ СТАВКА ОБОРАЧИВАЕМОСТИ – Maximum Achievable Turn Rate is the maximum Inventory Turn Rate that could be achieved by reducing Inventory to no more than floor samples (no backup product in the warehouse).

MAXIMUM CARGO HEIGHT = МАКСИМАЛЬНАЯ ВЫСОТА ГРУЗА – Maximum Cargo Height:- frozen goods are packed using the block stowage method merely for protection against the effects of external heat, so it must be ensured that subzero temperatures are maintained in the floor, side and ceiling areas. A free space of at least 8–10 cm must be left for the return air between the top of the cargo block and the container roof. This maximum cargo height is indicated in the containers.

MAXIMUM CROPPING = МАКСИМАЛЬНОЕ ЗЕМЛЕДЕЛИЕ (или МАКСИМАЛЬНОЕ ВОЗДЕЛЫВАНИЕ) – Maximum Cropping is a cropping to attain the greatest possible production per unit area in a given time without regard for the cost involved. / .

MAXIMUM DAILY PRICE FLUCTUATION = МАКСИМАЛЬНАЯ СУТОЧНАЯ ФЛУКТУАЦИЯ ЦЕНЫ (или МАКСИМАЛЬНОЕ СУТОЧНОЕ КОЛЕБАНИЕ ЦЕНЫ) – Maximum Daily Fluctuation is the maximum amount the contract price can change up or down during one trading session, as fixed by exchange rules. / Как зафиксировано уставом биржи, максимальная сумма изменения цены контракта вверх или вниз в течение одной торговой сессии. Под Флуктуацией, от Латинского слова Fluctuatio, означающее Колебание, понимается случайные отклонения от средних значений, вызываемые общей ситуацией на рынке.

MAXIMUM DEMAND = МАКСИМАЛЬНОЕ ПОТРЕБЛЕНИЕ (или МАКСИМАЛЬНЫЙ СПРОС) – Maximum Demand is the greatest of all demands of the load that has occurred within a specified period of time.

MAXIMUM PRICE FLUCTUATION = МАКСИМАЛЬНАЯ ФЛУКТУАЦИЯ ЦЕНЫ (или МАКСИМАЛЬНОЕ КОЛЕБАНИЕ ЦЕНЫ) – Maximum Price Fluctuation:- a commodity exchange's established maximum limits for fluctuations in futures prices during any one trading session. See also Daily Price Limit, Limit Down, Limit Up, Maximum Daily Price Fluctuation, and Price Limit. / Флуктуация (Колебание) Цены. Под Флуктуацией, от Латинского слова Fluctuatio, означающее Колебание, понимается случайные отклонения от средних значений, вызываемые общей ситуацией на рынке.

MAXIMUM SECURING LOAD = ТЕХНИЧЕСКАЯ НОРМА ЗАГРУЗКИ (или МАКСИМАЛЬНО ДОПУСТИМАЯ НАГРУЗКА) – Maximum Securing Load (MSL) is the strength of a material to resist a tensile load without suffering plastic/permanent deformation. The MSL is extremely important for cargo securing, since materials which are liable to suffer permanent deformation must not be used for securing cargoes. Cargo securing materials must therefore be dimensioned to ensure that they are loaded no further than their MSL. / В строительной механике под Нагрузками понимаются силовые воздействия, вызывающие изменения напряжённо-деформированного состояния конструкций зданий и сооружений. По характеру изменений во времени различают:- (i) динамические нагрузки; и (ii) статические нагрузки. Статические нагрузки подразделяются на:- (a) временные нагрузки, в свою очередь делящиеся на неподвижные нагрузки (например, вес стеллажей и бункеров в складских помещениях) и подвижные нагрузки; и (b) постоянные нагрузки. По характеру приложения к телу, на которое они воздействуют, различают:- (i) распределённые нагрузки, прилагаемые ко всей поверхности (линии) или части её; и (ii) сосредоточенные нагрузки, прилагаемые к весьма малой площадке (точке). Распределённую нагрузку постоянной интенсивности называют равномерно-распределённой нагрузкой, а нагрузку, точки приложения которой непрерывно заполняют всю данную площадь (или отрезок), – сплошной нагрузкой. При расчёте строительных конструкций нагрузки подразделяют на:- (i) нормативные, отвечающие нормальным условиям эксплуатации; и (ii) расчётные – максимальные, определяемые умножением нормативных нагрузок на коэффициент надёжности по нагрузкам. При действии нескольких нагрузок в расчёте учитывают наименее выгодные их сочетания. Нормативные Нагрузки – наибольшие нагрузки, отвечающие нормальным условиям эксплуатации зданий и сооружений. Они используются при расчёте конструкций по предельным состояниям.

MAXIMUM SUM MORTGAGE = ЗАКЛАДНАЯ МАКСИМАЛЬНОГО ЗНАЧЕНИЯ – Maximum Sum Mortgage is a mortgage where the underlying real estate property provides collateral in an amount not exceeding the sum entered in the Land Register (in contrast to a Capital Mortgage). / поземельная книга .

MAXIMUM WORKING LOAD = МАКСИМАЛЬНАЯ РАБОЧАЯ НАГРУЗКА – Maximum Working Load is a greatest payload that a pallet may be permitted to carry in a specific loading and support condition. Note:- this will vary according to the type, distribution, arrangement and means of stabilization of the load and the system of support. It may be above or below the nominal load (see ISO/TS 8611-2 [1]). / Максимальная Рабочая Нагрузка:- наибольшая полезная нагрузка, допустимая для поддона в конкретном состоянии нагружения и крепления (опирания). Примечание:- она зависит от типа, распределения, устройства и средств обеспечения устойчивости нагрузки и системы крепления (опирания) и может быть меньше или больше номинальной нагрузки (стандарт ISO/TS 8611-2 [1]).

MAYAHUEL = МАЙЯУЭЛЬ – Mayahuel is Aztec Goddess of Maguey (Agave), fertility, alcohol and pulque. Drawing of Mayahuel. / Майяуэль, в мифологии Ацтеков первоначально одна из Богинь плодородия, а затем Богиня Агавы и изготовлявшегося из неё опьяняющего напитка октли. Изображалась в виде женщины с 400 грудями.

MCCLELLAN OSCILLATOR = ОСЦИЛЛЯТОР МЭКЛЭЛЛЭНА – The exact calculation of the McClellan Oscillator is covered below, but it is basically the result of subtracting a 39-day exponential average of advances minus declines (5% Index) from a 19-day exponential average (10% Index). The McClellan Oscillator is an intermediate-term indicator, but it can also be used for short-term timing when it bottoms in oversold territory – in the area of –100 and below. When the McClellan Oscillator moves below the Zero Line a SELL Signal is rendered, and a BUY Signal results when it moves above zero; however, these are general guide lines not hard rules guaranteed to result in profitable trading. A 'typical' McClellan Oscillator pattern series consists of consecutive formation of a Complex Bottom, a Middle Spike, and a Buy Spike. The typical Complex Bottom is a bowl-shaped series of oscillations below the Zero Line while the market is declining. This is followed by a move above well above zero which begins the formation of the Middle Spike – a stalactite between the move above zero and the move back below zero. The Middle Spike signals the beginning of an intermediate-term up move, but it is usually followed by another down move, possibly to lower lows. After the down leg of the Middle Spike has concluded, we can expect a Buy Spike, which as the name implies signals a new up trend in the market. Buy Spikes are normally formed in oversold territory (–80 and below), but rising series of Buy Spikes is also a possibility. While this is a typical series of chart formations that will help us identify changes in market direction and determine current market status, unfortunately, they may not appear in the specified order ... or at all. The McClellan Summation Index is a cumulative total of the daily McClellan Oscillator readings. It is normally posted on the chart as a series of dots so that we can observe the acceleration in breadth as represented by the space between the dots. The McClellan Oscillator and Summation Index are a breadth-based indicator, which means it is derived from the daily advances minus declines on the New York Stock Exchange. These indicators were invented in the 1960's by Sherman and Marion McClellan, and since then they have proven to be some of the most useful analysis tools in existence. A breadth indicator derived from each day's net advances (the number of advancing issues less the number of declining issues). Similar to MACD, the McClellan Oscillator is a momentum indicator that is applied to the advance/decline statistics. As a momentum indicator, the McClellan Oscillator attempts to anticipate positive and negative changes in the AD statistics for market timing. Buy and sell signals are generated as well as overbought and oversold readings. Traders may also look for positive or negative divergences to time their trades. / В техническом анализе биржевых рынков, . Аналогично МЭКДИ (MACD), Осциллятор МэКлэллэна (McClellan Oscillator) является индикатором момента, который .

MCCLELLAN SUMMATION INDEX = ИНДЕКС ПО СУММИРОВАНИЮ ОТ МЭКЛЭЛЛЭНА – McClellan Summation Index:- the Summation Index is a long-term indicator which oscillates in relation to a Zero Line. The normal range of movement is between Zero and +2 000. Movement below the Zero Line is considered bearish, while movement above +2 000 is considered bullish. Historical extremes are approximately +4 000 and –2 000. The direction of Summation Index movement, up or down, is an indication of whether money is moving in or out of the market. When the Summation Index moves below the Zero Line it is an extremely negative sign for the market and indicates that a long-term down trend is in progress and is likely to become more severe; however, it is also likely that a significant market bottom is a few weeks or months away. Once the Summation Index drops below the Zero Line, we should anticipate a bottom in the area of –1 000 or below. Once that oversold Summation Index bottom has formed, it provides strong evidence that a major market bottom is in place. There are instances where Summation Index oversold bottoms have formed and were followed by continued selling in the market and lower Summation Index lows, so you should look at our historical charts, which track this index back to 1926, to get an idea of its various configurations. The McClellan Oscillator and Summation Index are a breadth-based indicator, which means it is derived from the daily advances minus declines on the New York Stock Exchange. These indicators were invented in the 1960's by Sherman and Marion McClellan, and since then they have proven to be some of the most useful analysis tools in existence. A popular market breadth indicator that is ultimately derived from the number of advancing and declining stocks in a given market. Many people regard it as an excellent indicator of the overall 'health' of the market and the market's current trend. It was developed by Sherman and Marian McClellan and first presented in their book 'Patterns For Profit' (available from McClellan Financial Publications, Inc., Lakewood, WA, the United States of America). / В техническом анализе биржевых рынков, . Шёмэн (Sherman) и Мэриэн МэКлэллэн (Marian McClellan). МэКлэллэн Файнэншэл Пабликэйшэнз, Инк. (McClellan Financial Publications, Inc.), Лэйквуд, Штат Вашингтон, Соединённые Штаты Америки.

MCD = MULTIPLE CROPPING DEPARTMENT

MCF = THOUSAND CUBIC FEET

MCF = ТКФ – MCF is a traditional symbol for 1 000 (not one million) cubic feet, a unit of volume equal to about 28.317 cubic meters. / Сокращение ТКФ (MCF) (от тысяч кубических футов) является традиционным символом для 1 000 (не одного миллиона) кубических футов; единица объёма равна приблизительно 28.317 кубическим метрам.

MCI = MULTIPLE CROPPING INDEX

MCM = THOUSAND CUBIC METERS

M–COMMERCE = MOBILE COMMERCE

MCP = MARKET–CLEARING PRICE

MCTF = MARITIME CABOTAGE TASK FORCE

MCX = MULTI COMMODITY EXCHANGE OF INDIA LIMITED

M–D = MAN–DAYS

MD = MOBILE DEVICE

MD = MOLDOVA

MD = MONTHS AFTER DATE

MDA = MULTIPLE DISCRIMINANT ANALYSIS

MDAX® = СДАКС® – Deutsche Börse's MDAX® (mid-cap index) covers the liquid securities of the 'second level'. It comprises the 50 largest companies from classic sectors in the Prime Standard segment of FWB (Frankfurt Stock Exchange) that rank below the DAX® shares in terms of market capitalization and trading volume. The base date for the index is 1987-December-30 = 1 000 points. The criteria for including a share in the MDAX® are trading volume and market capitalization on the basis of the number of shares in free float as well as a representative postion in the sector. The composition of the index is reviewed on a semi-annual basis and adjusted in March and September. Decisions on changes to the MDAX® are taken by the Executive Board of Deutsche Börse AG based on proposals of the Working Committee for Stock Indices. / Немецкая Биржа АО или Дойчэ Бёрзэ А.Ге. (Deutsche Börse AG).

MDC = MODIFICATION DETECTION CODE

MDL = MOLDOVAN LEU

MDS = MARKET DATA SYSTEM

MDS = MINIMUM DATA SET

MEA = MULTILATERAL ENVIRONMENT AGREEMENT

MEAL = МУКА ПРОСТОГО ПОМОЛА – Meal is a grain which has been ground or otherwise reduced in particle size. / Мука Простого Помола – это зерно, которое было истолчёно или уменьшено в размере частиц иным образом.

MEAN = СРЕДНЕЕ – Mean is the average of a series of observations or measurements. The expected value of a statistical distribution. Mean is the arithmetic average.

MEANDER = МЕАНДР (или ИЗЛУЧИНА) – Meander is a loop-like bend in a river with a cliff or bluff on the outer curve and a gently shelving slope on the inner side of the bend. One of a series of approximately sinuous curves or windings in the course of a river or creek. / Под Меандром понимается древнегреческое название извилистой Реки Большой Мендерес, в Турции. Название меандр стало нарицательным для обозначения речных излучин – меандров.

MEAN FIBER DIAMETER = СРЕДНИЙ ДИАМЕТР ВОЛОКНА – Mean Fiber Diameter is the average diameter (thickness) of a group of fibers from an animal.

MEAN LENGTH = СРЕДНЯЯ ДЛИНА – Mean Length is the arithmetic mean of the lengths of staple fibers. Note:- in the case of square cut staple fibers this mean is limited to the 'central' section of the frequency distribution. See also Fiber Length.

MEAN SQUARE = СРЕДНИЙ КВАДРАТ – Mean Square is the sum of the squares divided by the corresponding degrees of freedom.

MEASUREMENT CARGO = ОБМЕРНЫЙ ГРУЗ – Measurement Cargo is a cargo on which the transportation charge is assessed on the basis of measurement. Freight on which transportation charges are calculated on the basis of volume measurement. / Фрахт, по которому расходы за транспортировку рассчитаны на основе показаний объёма груза. Под Удельным Объёмом понимается объём, занимаемый единицей массы вещества, а также величина, обратная плотности.

MEASUREMENT TON = ОБМЕРНАЯ ТОННА – Measurement Ton (MTON or MT) is a unit of volume used for measuring the cargo of a ship, truck, train, or other freight carrier, equal to exactly 40 cubic feet, or approximately 1.132 6 cubic meters. This unit was traditionally called a Freight Ton, but that term now means a metric ton of freight in most international usage. However, the confusion seems impossible to dispel; some shippers are now using Measurement Ton to mean a metric ton of freight. The way out of this dilemma is simple:- measure volume in cubic meters and weight in metric tons. 40 cubic feet – used in water transportation ratemaking. One Measurement Ton or Freight Ton is equal to 40 cubic feet (1.133 m^3), but historically it has had several informal definitions. It is sometimes abbreviated as MTON. The freight ton represents the volume of a truck, train or other freight carrier. In the past it has been used for a cargo ship but the register ton is now preferred. It is correctly abbreviated as FT but some users are now using freight ton to represent a weight of 1 tonne (1 000 kg; 2 205 lb), thus the more common abbreviations are now M/T, MT, or MTON (for measurement ton), which still cause it to be confused with the tonne, or even the Megatonne. A ton of one cubic meter water. / Тонна одного кубического метра воды. Обмерная Тонна – применяемая в линейном судоходстве единица объёма, за которую взимается ставка тарифа. Величина обмерной тонны устанавливается условиями применения линейных тарифов и составляет обычно 40 $фут^3$, или 1.132 6 $м^3$. В тарифах за судовладельцем обычно оговаривается право расчёта провозной платы по его выбору за обмерную тонну или тонну массы груза. Если укладочная кубатура груза менее обмерной тонны, установленной тарифами, провозная плата взимается по массе груза; если же она превышает этот объём, плата взимается за каждую обмерную тонну. Определение обмерной тонны не из объёма тонны груза, а исходя из объёма грузового помещения, занятого грузом, компенсирует перевозчику неравномерную укладку (broken stowage), то есть потерю кубатуры между отдельными грузовыми местами, которая была бы использована при перевозке грузов навалочных. Например, при перевозке промышленного оборудования и транспортных средств объём занимаемой ими кубатуры определяется путём перемножения их максимальных линейных размеров, в результате чего все выступающие части оказываются внутри расчётного параллелепипеда, объём

которого служит основой для определения размера провозной платы. Под Обмером в архитектуре, понимаются точные измерения всех элементов архитектурного сооружения или комплекса с последующей фиксацией их размеров на чертеже. Обмер – один из основных источников для реставрации или воссоздания произведений архитектуры. В архитектуроведении обмер – важный материал для анализа закономерностей построения архитектурной формы.

MEASURING GAP = ОЦЕНИВАЮЩИЙ РАЗРЫВ (или ПРИКИДОЧНЫЙ РАЗРЫВ, или ИЗМЕРЯЮЩИЙ РАЗРЫВ) – Measuring Gap:- also known as Runaway Gap, a Measuring gap is formed usually in the half way of a price move. It is not associated with the congestion area, it is more likely to occur approximately in the middle of rapid advance or decline. It can be used to measure roughly how much further ahead a move will go. Runaway gaps are not normally filled for a considerable period of time. Caution:- it is quite possible that confusion between measuring gap and exhaustion gap can cause an investor to position himself incorrectly and to miss significant gains during the last half of a major uptrend. Keeping an eye on the volume can help to find the clue between measuring gap and exhaustion gap. Normally, noticeable heavy volume accompanies the arrival of exhaustion gap. Measuring Gap:- also called Mid-Way Gaps. These are found in the middle of a sharp run in prices. Many traders believe that end of the trend can be projected by measuring the length from the breakout to the mid-way gap, and then swinging this count forward for a final objective. At the time the gap is first created, it is hard to distinguish between a measuring gap and a potential exhaustion gap. Also known as Continuation Gap, or Runaway Gap. See also Breakaway Gap, Common Gap, Down Gap, Exhaustion Gap, Gap, Runaway Gap, and Up Gap.

MEBA = MARINE ENGINEERS BENEFICIAL ASSOCIATION

MECHANICAL ADJUSTMENT = МЕХАНИЧЕСКАЯ ПЕРЕОЦЕНКА – Mechanical Adjustment:- trade is referred to as a mechanical adjustment (MA) transaction. It is a series of trades used to correct a cleared trade.

MECHANICAL DERANGEMENT = МЕХАНИЧЕСКАЯ НЕИСПРАВНОСТЬ – (1) Definition:- Failure of equipment to perform, such as a computer or other electronic equipment, upon delivery despite no outward sign of damage to the item(s) or packaging. / Под Повреждением понимается одно из понятий теории надёжности; событие, заключающееся в нарушении исправности изделия. Повреждение может быть существенным и являться причиной нарушения работоспособности (отказа) и несущественным, при котором работоспособность изделия сохраняется. Под Неисправностью или Неисправным Состоянием понимается состояние изделия (устройства), при котором оно не соответствует одному или нескольким требованиям, предъявляемым как в отношении основных параметров, характеризующих его способность выполнять заданные функции, так и в отношении удобств эксплуатации, внешнего вида, комплектности и тому подобного. Неисправность – более общее понятие, чем неработоспособность (неработоспособное состояние). Неисправность возникает вследствие повреждения.

(2) Discussion:- Mechanical and/or Electrical Derangement is an insurance industry term to describe malfunction, or non-function, of an appliance for reasons other than obvious external damage. From time to time, an electronic or mechanically operated item will prove to be inoperable upon arriving at its destination. Unless there are clear signs of damage to the item or its shipping container, however, the standard policy will not cover this loss. That is because the insurer has no way of knowing if the equipment worked when the policy was first placed. This situation appears most frequently with computer equipment, stereo systems or other devices where intricate components or circuitry are affected by the constant motion of an international shipment. Purchasing 'Mechanical Derangement' coverage extends standard policy wordings to include those items without visible damage, assuming they have been properly packed. It is often mandatory to provide independent proof that covered item(s) were working at time transit begins.

MECHANICAL DERANGEMENT EXCLUSION = ИСКЛЮЧЕНИЕ МЕХАНИЧЕСКОЙ НЕИСПРАВНОСТИ – Typical Mechanical Derangement Clauses:- excluding loss or damage due to mechanical, electrical or electronic breakdown or derangement unless caused by a peril insured against under the terms of this policy and there is evidence of an external damage.

MECHANICAL FINISHES = МЕХАНИЧЕСКИЕ ОТДЕЛЫВАТЕЛИ – Mechanical Finishes:- those finishing processes done by copper plates, roller brushes, perforated cylinders, tenter frames, or any type of mechanical equipment.

MECHANICAL FINISHING = ЗАКЛЮЧИТЕЛЬНАЯ МЕХАНИЧЕСКАЯ ОТДЕЛКА – Mechanical Finishing is a changing the appearance or physical properties of a fabric by a mechanical process such as calendering, embossing, bulking, compacting, or creping.

MECHANICALLY VENTILATED CONTAINER = ВЕНТИЛИРУЕМЫЙ КОНТЕЙНЕР С МЕХАНИЧЕСКИМ ПРИВОДОМ – Mechanically Ventilated Container is a container fitted with a means of forced air ventilation. / Контейнер, оснащённый средствами принудительной вентиляции воздуха.

MECHANICAL PICKER = МЕХАНИЧЕСКИЙ СБОРЩИК – Mechanical Picker is a device with vertical drums equipped with spindles that remove the cotton from the boll.

MECHANICAL SEAL = МЕХАНИЧЕСКОЕ УПЛОТНЕНИЕ – Mechanical Seal is a device which works to join together systems or mechanisms in order to prevent leakage, contain pressure or exclude contamination. See also Seal.

MECHANICAL WEEDING = МЕХАНИЧЕСКАЯ ПРОПОЛКА – Mechanical Weeding is a removing weeds with the use of a mechanized interrow cultivator or other machines.

MECHANIC'S LIEN = УДЕРЖАНИЕ УЧАСТНИКОМ СТРОИТЕЛЬСТВА (или ПРАВО УЧАСТНИКА СТРОИТЕЛЬСТВА НА ОБРАЩЕНИЕ ВЗЫСКАНИЯ НА ИМУЩЕСТВО) – Mechanic's Lien is the legal enforceable claim which a person who has performed work or provided materials is permitted to make against title to the property or as a preferential person in the event the estate or business is liquidated. A claim against real estate made by a contractor, subcontractor, or supplier of building materials who contributed to improvements built on the real estate. A mechanic's lien, if enforced, permits the party who filed the claim to force a sale of the real estate to pay the claim. / сделанная подрядчиком, субподрядчиком, или поставщиком строительных материалов . Право Исполнителя на Удержание имущества заказчика (в качестве обеспечения выплаты долга). Право удержания имущества (lien) – зданий или иных построек, – предоставляемое в некоторых штатах подрядчикам, рабочим и поставщикам материалов, использованных при их строительстве или ремонте. Право удержания действует до тех пор, пока этим людям не будут полностью выплачены все причитающиеся им суммы, причём они имеют преимущество перед другими кредиторами.

MECHANISMS OF RESISTANCE = МЕХАНИЗМЫ РЕЗИСТЕНТНОСТИ (или МЕХАНИЗМЫ УСТОЙЧИВОСТИ, или МЕХАНИЗМЫ СОПРОТИВЛЕНИЯ) – Mechanisms Of Resistance are the processes involved in the resistance of a Plant to an Insect, including nonpreference, antibiosis, and tolerance.

MECHLIN = МЕХЛИН (или МЕХЛИНСКОЕ) – Mechlin is a delicate bobbin lace used for dresses and millinery. Mechlin lace is an old bobbin lace originally produced in Mechelen. Its history goes back to the Brabant laces. This type of lace is use for female clothing, and was popular until the first decade of the XX century. It is one of the best known Flemish laces. It is fine, transparent, and looks best

when worn over another color. It was made in Mecheln, Antwerp, Lier and Turnhout. It was used for coiffures de nuit (evening hair-styling), garnitures de corset (corset trims), ruffles and cravats. This type of lace was worn at court during summer, in winter needle lace was prescribed. Mechlin lace is known for its floral patterns, fine twisted-and-plaited, hexagonal ground, and its outlined designs. It looks much like Brussels lace, however it is made all at once, with the réseau or ground made at the same time as the pattern on the pillow. Also, the plait is shorter, and the mesh smaller than those of Brussels lace. All Mechlin laces are outlined with a loosely spun silk cord used to define the pattern, whereas Valenciennes lace isn't. Mechlin lace is also more expensive than Valenciennes lace, as it takes more time to make because of the different réseau. Sometimes Mechlin is grounded with an ornamental réseau, instead of the usual hexagons. In the regular hexagonal réseau, the two sides parallel to the long axis of the lace are plaited three times, and the other four sides crossed. The same threads pass across the whole width, and thus form both the ground and the pattern. Mechlin net is a machine imitation of the Mechlin lace ground. Originally the term 'Mechlin Lace' was used for any bobbin lace from Flanders. Mechlin lace grew in popularity throughout the late XVII century and the XVIII century, and was mentioned several times. The 1657 inventory of the Maréchal de la Motte included 'a pair of Mechlin ruffles'. Jean-François Regnard, when visiting Flanders in 1681, wrote of the lace and lace-makers. When the English prohibition was removed in 1699, Mechlin lace became the grand fashion in England, and it was advertised in the London Gazette. It was very popular at this time in France and Holland as well. The earliest with a réseau (open net) ground wasn't made until 1720, and at this point the term became specific to this lace with the open net. In 1755 Mechlin lace went into decline in England, and by 1834 there were only eight manufacturers left. Machine-made Mechlin lace started to be produced in 1819. Another machine was invented in 1847 which exactly followed the hand movements a lace-maker would make. Manufacture has since died out. Mechlin lace was also very popular with the English royalty. Queen Mary II, in spite of the prohibition against imported laces, purchased two yards of knotted fringe for her Mechlin ruffles in 1694. Queen Anne purchased quite a bit of it – 83 yards in 1713. George I had a Mechlin cravat, and it was a favorite of Queen Charlotte and Princess Amelia. / Брабо (Brabant). гарнитюр дё корсэ (garnitures de corset). куафюр дё нюи (coiffures de nuit). резо (réseau). Марешаль дё ля Мот (Maréchal de la Motte). Жан-Франсуа Рэняр (Jean-François Regnard). резо (réseau). Королева Мэри II (Mary II). Королева Эн (Anne) – 83 ярда в 1713. Дьжодьж (George) Королева Шалэт (Charlotte) и Принцесса Эмилиэ (Amelia).

MED = MEDITERRANEAN

MEDALLION = МЕДАЛЬОН – Medallion:- a large medal minted of metal in coin form but without a face value or a legally stipulated value. Medallions cannot be used as a payment medium but are merely collectors' items. Unlike coins, they can also be produced by private organizations. / Большая медаль, отлитая из металла в форме монеты, но без лицевой стоимости или юридически обусловленной цены. Медальоны не могут быть использованы в качестве средства платежа, но являются всего лишь предметами для коллекционеров. В отличие от монет, они могут быть изготовлены также частными организациями.

MEDAVAC SERVICE = УСЛУГА МЭДЭВЭК – Medavac Service describes the type of service an air ambulance company conducts. Quite frequently the Medavac Service is also referred to as Medflights, Medical Flights, Aeromed flights, Aeromedical, Angel Medflights, Lifeguards, Care flight, Critical Care Medflights, Advanced Air Ambulances, medevacs or jet rescue/Air ICU (intensive care unit). Medavac is commonly refered to a fixed-wing aircraft, or helicopter used as an air ambulance providing state of the art medical care in route. This permits the rapid transport of seriously injured persons, particularly trauma patients, from facility to another. Air Ambulance Network has been providing medavac services since 1971. Air Ambulance Network, has been providing medavac services worldwide since 1971 and is a leader of medavac providers. They have performed the most medavacs worldwide, offering medavac service to more countries then any other air ambulance service. Xxxxx. Medavac Service:- Air Ambulance Network has been providing reliable and efficient medevac services since 1971. Medevac is the safest, fastest, and most reliable way to transport an individual from either a hospital to a hospital, or residence to residence, when they are sick or injured. Medevac that requires a long distance uses a fixed-wing aircraft, configured as an air ambulance to provided rapid transport of seriously injured persons, particularly trauma patients, to the hospital. Most patients transported by medevac are taken to a hospital. Medavac Service describes the type of service an air ambulance company conducts. Quite frequently the Medavac Service is also referred to as Medflights, Medical Flights, Aeromed flights, Aeromedical, Lifeguards, Care flight, Critical Care Medflights, Advanced Air Ambulances, medavacs or jet rescue /Air ICU (intensive care unit). Air Ambulance Network has provided Medevac since 1971. Air Ambulance Network uses Fixed Wing aircraft to help medevac patients from point A to point B. This is one of the most reliable and fastest means of transportation. Air Ambulance Network has been assisting with Medevac since 1971.

MÉDECINS SANS FRONTIÈRES = ВРАЧИ БЕЗ ГРАНИЦ – Médecins Sans Frontières (MSF, in French; or Doctors Without Borders) is an international, independent, medical humanitarian organization that delivers emergency aid to people affected by armed conflict, epidemics, natural disasters and exclusion from healthcare. MSF offers assistance to people based on need, irrespective of race, religion, gender or political affiliation. Our actions are guided by medical ethics and the principles of neutrality and impartiality. A Worldwide Movement:- MSF was founded in Paris, France in 1971. Its principles are described in the organization's founding charter. It is a non-profit, self-governed organization. Today, MSF is a worldwide movement of 23 associations, bound together as MSF International, based in Switzerland. Thousands of health professionals, logistical and administrative staff – most of whom are hired locally – work on programmes in some 70 countries worldwide. Humanitarian Action:- MSF's work is based on humanitarian principles. We are committed to bringing quality medical care people caught in crisis, regardless of race, religion or political affiliation. MSF operates independently. We conduct our own evaluations on the ground to determine people's needs. More than 90 per cent of our overall funding comes from millions of private sources, not governments. MSF is neutral. We do not take sides in armed conflicts, we provide care on the basis of need, and we push for independent access to victims of conflict as required under international humanitarian law. Bearing Witness and Speaking Out:- MSF medical teams often witness violence and neglect in the course of their work, largely in regions that receive scant international attention. At times, MSF may speak out publicly in an effort to bring a forgotten crisis to public attention, to alert the public to abuses occurring beyond the headlines, to criticise the inadequacies of the aid system, or to challenge the diversion of humanitarian aid for political interests. Quality Medical Care:- MSF rejects the idea that poor people deserve third-rate medical care and strives to provide high-quality care to patients. In 1999, when MSF was awarded the Nobel Peace Prize (in recognition of its members' continued efforts to provide medical care in acute crises, as well as raising international awareness of potential humanitarian disasters), the organization announced the money would go towards raising awareness of and fighting against neglected diseases. Through the Access Campaign, and in partnership with the Drugs for Neglected Diseases initiative, this work has helped lower the price of HIV/AIDS treatment and stimulated research and development for medicines to treat malaria and neglected diseases like sleeping sickness and kala azar (Hindi for 'black fever'). Headquartered in Geneva, Switzerland. Médecins Sans Frontières (MSF) is a worldwide movement of current and former field staff, grouped into national and regional associations. Collectively, they make sure that MSF stays true to its mission and principles. MSF Associations:- currently (May 2013), there are 23 associations. All are independent legal entities, and each elects its own board of directors and president. Most associations have an executive office that raises funds and recruits staff for MSF's operations. Operational Structure:- the associations are attached to five operational directorates, which manage MSF's humanitarian assistance programmes. Other units, including supply

centers and medical units, also support our activities. MSF offices, units, directorates and associations interconnect and work together in various ways, and are formally bound as one movement by a shared name, a shared commitment to the MSF Charter and principles, and shared membership of MSF International. MSF International:- all 23 MSF associations, as well as individuals and the International President, are members of MSF International, the association that safeguards the identity of the MSF Movement. The highest authority of MSF International, the annual MSF International General Assembly (IGA) is made up of representatives of each association as well as of the individual membership, and the International President. The International President is elected by the IGA, and is currently Dr Unni Karunakara. Each representative, and the International President, has one independent vote on issues brought to the assembly for decision. The IGA is responsible for safeguarding MSF's medical humanitarian mission, and provides strategic orientation to all MSF entities. It delegates duties to the International Board, and holds the board accountable for those tasks. The International Board is made up of representatives of the operational directorates as well as a group elected by the IGA, and is chaired by the International President. Based in Geneva, MSF International's executive provides coordination, information and support to the MSF movement, and implements international projects and initiatives as requested. Its costs are paid by MSF's national executive offices. Jérôme Oberreit is the current Secretary General of MSF International. Médecins Sans Frontières is an international organization made up of 23 associations. Our running person logo (in 14 languages) was introduced in 1995. It conveys our essence:- we are a medical and humanitarian organisation working in situations of crisis. We all use the same basic logo, but you will find translations of our name across the globe:- Doctors Without Borders, etc. We're often just called 'MSF'. Médecins Sans Frontières (MSF) is an international, independent, medical humanitarian organization that delivers emergency aid to people affected by armed conflict, epidemics, exclusion from healthcare and natural disasters. Founded in Paris, France in 1971, MSF is a non-profit self-governed organization. MSF was awarded the Nobel Peace Prize in 1999. Independent humanitarian action:- MSF offers assistance to people based on need and irrespective of race, religion, gender or political affiliation. MSF's actions are guided by medical ethics and the principles of independence and impartiality. Bearing Witness:- the principles of impartiality and neutrality are not synonymous with silence. When MSF witnesses extreme acts of violence against individuals or groups, the organization may speak out publicly. We may seek to bring attention to extreme need and unacceptable suffering:- when access to lifesaving medical care is hindered, when medical facilities come under threat, when crises are neglected, or when the provision of aid is inadequate or abused. Financial Independence and Accountability:- more than 4.5 million individual private donors around the world provide more than 90 per cent of our funding. The remaining funds come from governments and international organisations. More than 80 per cent of these resources are allocated to our humanitarian activities. The remaining 20 per cent is spent on management and administration, and reinvested in fundraising. MSF's International Financial Report and national audited accounts are all publicly available. MSF Field Teams:- MSF teams are made up of doctors, nurses, surgeons, anaesthetists, epidemiologists, psychiatrists, pharmacists, technicians, logisticians, water and sanitation engineers, administrators and a host of other support staff. More than 90 per cent of staff are hired locally and they work with a small number of international staff. Organizational Structure:- MSF is an international movement of 23 associations. All are independent legal entities and most have an executive office that raises funds and recruits staff for MSF's operations. The associations are attached to five operational directorates, which manage MSF's humanitarian assistance programmes. MSF offices, units, directorates and associations are formally bound as one movement by a shared name, a shared commitment to the MSF Charter and principles, and shared membership of MSF International. Medical Research:- MSF created Epicentre in 1987 to provide epidemiological support to MSF field teams. Its scientists and health professionals conduct mortality surveys in war zones and nutritional surveys during famines, and help MSF respond to disease outbreaks in remote corners of the world. Today Epicentre also performs important clinical research into better treatment and diagnostics for the diseases that MSF teams combat. MSF and Epicentre findings are published in medical journals such as JAMA, The Lancet, and PLoS. In 1996, Epicentre became a World Health Organization Collaborating Centre for Research in Epidemiology and Response to Emerging Diseases. Access Campaign:- based on its field experience, MSF is addressing obstacles that prevent people in the developing world from obtaining affordable, effective treatments for diseases such as HIV/AIDS, malnutrition, malaria, tuberculosis, kala azar and sleeping sickness. Through its Access Campaign, MSF is pushing for lower drug prices, more research and development of new treatments, and the removal of trade and other barriers to accessing treatment. MSF Snapshot 2011:- in 2011, MSF provided humanitarian assistance in 68 countries. Close to 32 000 MSF staff worked in 436 programmes. MSF spent 900 million Euros:- 82 per cent was spent on humanitarian activities while 18 per cent was spent on management and fundraising. Almost 90 per cent of our income came from more than 4.5 million private donors. Almost 70 per cent of activities were carried out in settings of armed conflict or instability. Teams also brought assistance to tsunami victims, earthquake survivors and people affected by flooding. Most programmes (62 per cent) were in Africa, while 25 per cent were in Asia and the Middle East, and 11 per cent in the Americas. / Жером Обэрэй (Jérôme Oberreit). Врачи Без Границ (ВБГ) или Медэсэн Сан Фронтьэр (Эм.Эс.Эф.), как это звучит на Французском языке по месту регистрации, (ВБГ; Médecins Sans Frontières (MSF)) – это международная независимая некоммерческая медицинская гуманитарная организация, которая оказывает чрезвычайную медицинскую помощь населению, пострадавшему в результате военных конфликтов, голода, эпидемий, вынужденной миграции, природных катастроф более чем в 70 странах мира. ВБГ была основана группой Французских врачей и журналистов в 1971 с целью оказания медицинской помощи людям, оказавшимся в острой кризисной ситуации, без какого-либо различия и дискриминации. ВБГ также выступает с публичными свидетельствами о тяжёлом положении тех людей, которым она помогает. Когда ВБГ оказывает помощь? (i) войны и вооружённые конфликты; (ii) природные и техногенные катастрофы; (iii) беженцы и вынужденные переселенцы; (iv) эпидемии; (v) доступ к здравоохранению; (vi) психическое и психологическое здоровье; и (vii) доступ к основным лекарствам. Помощь в Чрезвычайных Ситуациях:- ВБГ оказывает медицинскую помощь населению, оказавшемуся в кризисной ситуации, независимо от времени и места, если сама жизнь этих людей под угрозой, или у них нет доступа к услугам здравоохранения. Помощь, предоставляемая ВБГ, может быть следующего рода:- первичная медицинская помощь, восстановление больниц и клиник, хирургия, эпидемиологический контроль, кампании по вакцинации, терапевтическое питание для истощённых детей, помощь в области психического здоровья. При необходимости, ВБГ также занимается восстановлением здоровья и нормальных условий проживания, налаживая стабильное снабжение чистой водой и пищей и обеспечивая людям кров и соблюдение должных мер санитарии. ВБГ также проводит и долгосрочные программы, пытаясь решить проблемы здравоохранения, явившиеся последствиями большого экономического или социального неравенства, например, лечение больных туберкулёзом, сонной болезнью, ВИЧ/СПИД и другими; оказание медицинской и психологической помощи маргинализованным группам населения, таким как беженцы или беспризорные дети. Независимая Беспристрастная Гуманитарная Деятельность:- решение организации начать программу оказания помощи в той или иной стране или при возникновении какой-либо кризисной ситуации основано исключительно на независимой оценке нужд населения, а не на каких-либо политических, экономических или религиозных интересах. ВБГ не принимает чью-либо сторону в конфликте и не ставит оказываемую организацией помощь в зависимость от требований правительства или воюющих сторон. Эта автономность в принятии решений и деятельности ВБГ принципиально основывается на приверженности организации к финансовой независимости. С момента создания ВБГ тридцать лет назад, миллионы частных жертвователей по всему миру сделали взносы для организации, и около 80% средств, на которые существует организация, поступает из частных источников. Свидетельствование (Témoignage):- 'Мы не уверены в том, что слова всегда могут спасти жизни, но мы

точно знаем, что молчание способно убить', – Доктор Филипп Биберсон, Президент ВБГ-Франция, на вручении Нобелевской Премии Мира в 1999. Свидетельствование, термин, используемый для обозначения такого компонента деятельности ВБГ как непосредственное присутствие рядом с пострадавшими:- быть вместе с нуждающимися, оказывать им медицинскую помощь, выслушивать их и понимать их. Свидетельствование может включать в себя истории этих людей, публичные высказывания в попытке улучшить их ситуацию (например, осуждение отсутствия защиты для вынужденных переселенцев или беженцев), опубликование отчётов с целью привлечения внимания, или осуществление других видов защитной деятельности, основанной на медицинских данных, полученных из проектов ВБГ. Международное Движение:- Врачи Без Границ – это международное движение с девятнадцатью офисами в разных странах. Движение Врачи Без Границ – это ассоциация, членами которой являются, прежде всего, добровольцы, работавшие ранее или работающие в настоящее время в миссиях ВБГ. Руководство ВБГ осуществляется советом, избранным членами ассоциации во время ежегодной генеральной ассамблеи. ВБГ принимает на работу специалистов со всего мира. Добровольцы, работающие в организации, получают лишь базовую компенсацию ежедневных расходов и должны твёрдо следовать фундаментальным принципам, отражённым в хартии ВБГ. Каждый год более 3 тысяч иностранных сотрудников – врачей, медсестёр, других специалистов в области медицины, экспертов-логистиков, специалистов в области водоснабжения и санитарии, администраторов, присоединяются к более чем 22.5 тысячам местных сотрудников для оказания медицинской помощи по всему миру. В 1999 ВБГ была удостоена Нобелевской Премии Мира. Критика:- Министр Информации Союзной Республики Югославия (СРЮ) в правительстве Милошевича Горан Матич в 1999 обвинил неправительственную организацию Врачи Без Границ в шпионаже и незаконной контрабанде. По его словам, сотрудник Французских спецслужб, 'убивший две тысячи человек', являлся также сотрудником ВБГ, а глава гражданской миссии ООН в Косово был активистом ВБГ и занимался 'шпионажем'.

MEDIA MIGRATION = МИГРАЦИЯ СРЕДЫ – Media Migration:- material passed into the effluent stream composed of the materials making up the filter medium.

MEDIAN = МЭДИАНА (или МЕДИАНА, или МЕДИАННОЕ, или СРЕДНЕЕ, или СРЕДИННОЕ) – Median is the middle observation in a set of data such that half of the observations are larger and half smaller than it. Median:- in the middle or axial plane. Median is the midpoint of data values. Half the values are above and half below the median. / Под Мэдианой или Медианой, от Латинского слова Mediana, означающее Средняя, понимается:- (1) отрезок, соединяющий вершину треугольника с серединой противоположной стороны. (2) В статистике – значение варьирующего признака, которое делит ряд распределения на две равные части по объёму частот или частостей. Сумма абсолютных величин линейных отклонений от медианы минимальна. (3) В теории вероятностей – одна из характеристик распределения значений случайной величины Икс. (X). Медиана – такое число m, что X принимает с вероятностью 1/2 как значения большие m, так и меньшие m.

MEDIATION = МЕДИАЦИЯ (или ПОСРЕДНИЧЕСТВО) – Mediation is a voluntary process in which the parties to a futures-related dispute work with a neutral third party to find a mutually acceptable solution.

MEDICAL AIR = МЕДИЦИНА НА ВОЗДУХЕ – Medical Air describes the type of service a company provides. Medical Air companies specialize in providing air ambulance service. They must be specifically licensed to provide air medical transports. Medical Air companies use an array of business size aircraft in providing air medical, such as twin engine, turbo prop and jet aircraft. For most long distance medical air, a jet is used. Typically, the Lear Jet is the workhorse of air medical air industry. Air Ambulance Network has been providing medical air services since 1971. Air Ambulance Network is one of the first medical air providers and has led the industry ever since it inception. Today, Air Ambulance Network is a leader in the medical air industry.

MEDICAL AIR TRANSPORT = ТРАНСПОРТ МЕДИЦИНЫ НА ВОЗДУХЕ (или МЕДИЦИНСКИЙ АВИАТРАНСПОРТ) – Air Ambulance Network has been a medical air transport company since 1971. We use fixed wing aircraft that has been designed to transport patients in need of a Medical Air transport. These fixed wing medical air transports are medically configured with a stretcher, oxygen, and a critically trained medical air transport team. Air ambulance Network only uses critically licensed medical air transport team members. Air Ambulance Network's medical air transport provides rapid transport of seriously injured patients to a medical facility. Most patients transported by medical air transport are taken to a hospital. Quite frequently the Medical Air Transport Service is also referred to as Medflights, Medical Flights, Aeromed flights, Aeromedical, Lifeguards, Care flight, Critical Care Medflights, Advanced Air Ambulances, medavacs or jet rescue /Air ICU (intensive care unit). has provided Medevac since 1971. A medical air transport is usually performed in a fixed wing aircraft, complete with a minimum staff of a critical care nurse and a critical care paramedic. Air Ambulance Network is one of the oldest companies that have been providing medical air transport since 1971. We are the most reliable medical air transport company today.

MEDICAL AIR TRANSPORTATION = МЕДИЦИНСКАЯ ТРАНСПОРТИРОВКА НА ВОЗДУХЕ (или МЕДИЦИНСКАЯ АВИАПЕРЕВОЗКА) – Air Ambulance Network has been a medical air transportation company since 1971. We use fixed wing aircraft that has been designed to provide medical air transportation services to patients in need of a Medical Air transport. These fixed wing medical air transportation aircrafts are medically configured with a stretcher, oxygen, and a critically trained medical air transportation team. Air ambulance Network only uses critically licensed medical air transportation team members. Air Ambulance Network's medical air transportation service provides rapid transportation of seriously injured patients to a medical facility. Most patients transported by medical air transportation are taken to a hospital. Quite frequently the Medical Air Transportation Services are also referred to as Medflights, Medical Flights, Aeromed flights, Aeromedical, Lifeguards, Care flight, Critical Care Medflights, Advanced Air Ambulances, medavacs or jet rescue/Air ICU (intensive care unit). A medical air transportation services are usually performed in a fixed wing aircraft, complete with a minimum staff of a critical care nurse and a critical care paramedic. Air Ambulance Network is one of the oldest companies that have been providing medical air transportation services since 1971. We are the most reliable medical air transportation service company today.

MEDICAL FLIGHT GUIDE = ПОСОБИЕ ПО МЕДИЦИНСКОМУ ПОЛЁТУ – A Medical Flight Guide provides a comprehensive guide that leads you through the air medical process, this is a step-by-step guide and is usually printable form to assist those inquiring about any air medical transportation service; Air Ambulance, Commercial Escort or a Commercial Stretcher Service. Air Ambulance Network provides a comprehensive medical flight guide on their website:- http://www.airambulancenetwork.com. Air Ambulance Network, has compiled a medical flight guide to assist those inquiring about any air medical transportation services; Air Ambulance, Commercial Escort or a Commercial Stretcher Service. This printable medical flight guide provides helpful information needed by the patient, family members, social workers, and/or case managers in order to allow the flight coordinator to provide the available options for the level of services available for the patient, family and other concerned individuals. The medical flight guide asks such questions as patient's name, date of birth, medical condition along with other key information needed to provide a timely medical transfer. This information will be used by the flight coordinator assesses each situation fully to provide an accurate quote and timeline for the patient, Air Ambulance Network has written and made available a printable medical flight guide. Using the information provided as outlined in the medical flight guide Ambulance Networks' Medical staff will obtain a detailed medical report from the medical caregivers and confirm the receiving

facility's and discharging facility's information; if leaving or going to another inpatient facility. Air Ambulance Network has been using the medical flight guide since 1971 leading the industry in providing outstanding patient care.

MEDICAL FLIGHTS = МЕДИЦИНСКИЕ ПОЛЁТЫ (или МЕДИЦИНСКИЕ РЕЙСЫ) – Medical Flights describes the type of service a company provides. Medical Flight companies specialize in providing air ambulance service. They must be specifically licensed to provide medical flights. Medical Flights companies use an array of business size aircraft in providing medical flights, such as twin engine, turbo prop and jet aircraft. For most long distance medical air, a jet is used. Typically, the Lear Jet is the workhorse of air medical flights industry. Air Ambulance Network has been providing medical flights since 1971. Air Ambulance Network is one of the first medical flights providers and has led the industry ever since it inception. Today, Air Ambulance Network is a leader in the medical flights industry.

MEDICAL FLIGHTS MEDEVAC = МЕДИЦИНСКИЕ ПОЛЁТЫ МЭДЭВЭК – Medical Flights Medevac describes the type of service a company provides. Medical flights medevac companies specialize in providing air ambulance service. They must be specifically licensed to provide medical flights. Medical flights medevac that requires a long distance uses a fixed-wing aircraft, configured as an air ambulance to provided rapid transport of seriously injured persons, particularly trauma patients, to the hospital. Medical flights medevac companies use an array of business size aircraft in providing medical flights medevac that requires a long distance uses a fixed-wing aircraft, configured as an air ambulance to provided rapid transport of seriously injured persons, particularly trauma patients, to the hospital, such as twin engine, turbo prop and jet aircraft. Air Ambulance Network has been providing medical flights medevac flights since 1971. For most long distance Medical flights medevac, a jet is used. Typically, the Lear Jet is the workhorse of air Medical flights medevac industry. Air Ambulance Network is one of the first medical flights medevac providers and has led the industry ever since it inception. Air Ambulance Network has been providing reliable and efficient medical flights medevac services since 1971.Today, Air Ambulance Network is a leader in the medical flights medevac industry.

MEDICAL LICENSES = ЛИЦЕНЗИИ НА МЕДИЦИНСКОЕ ОБСЛУЖИВАНИЕ – Only individuals with a current valid Medical License granted by a specified government-approved professional association or a government agency are authorized to practice medicine. Medical Licenses are not granted automatically to all graduates with medical degrees. A medical school graduate must receive a medical license to practice medicine, a procedure that usually requires testing, or examinations by a state medical board. The medical license is the documentation of authority to practice medicine within a certain state. The purpose of medical licenses is to protect health care consumers using licensing and regulation of physicians, surgeons, and certain allied health care professions and through enforcement to promote access to quality medical care through the medical licensing functions. All of Air Ambulance Network's medical staff holds current medical licenses. All air ambulance providers are required to have medical licenses; these licenses are sometimes called Inter-Facility Transfer Licenses. The individual states Emergency Medical Transport (EMS) agency often issues and administrates the required licenses. It is always a good idea to ask for a copy of all current licenses whenever talking to a medical transport company. Air Ambulance Network is a fully licensed medical transport company and has been since 1971. Air Ambulance Network operates under the State of Florida Department of Health, Office of Emergency Medical Services, as an Inter-facility Air Ambulance service for Basic (BLS) and Advanced Life Support (ALS).

MEDICAL RESCUE = МЕДИЦИНСКОЕ СПАСЕНИЕ – Medical Rescue means to set free from any situation that is not in the best interest of the patient. This can relate to the current medical care or family wishes. Medical rescue typically describes a type of rescue that involves not only the rescue of an individual in trouble but also involves the care and treatment of that individual when they are hurt or injured. Medical rescue can also refer to the rescue of a patient from one country or facility to another. Air Ambulance Network provides medical rescue services. Quite frequently the Medical Rescue Services are also referred to as Medflights, Medical Flights, Aeromed flights, Aeromedical, Lifeguards, Care flight, Critical Care Medflights, Advanced Air Ambulances, medavacs or jet rescue/Air ICU (intensive care unit). Medical Rescue typically involves the use of fixed wing air ambulances. Medical rescue services use an array of business size aircraft in providing air medical, such as twin engine, turbo prop and jet aircraft. For most long distance medical air, a jet is used. Typically, the Lear Jet is the workhorse of medical rescue industry. Air Ambulance Network has been a leader in the medical rescue service. Medical Rescue services can also be in the form of medical rescue escorts. Medical rescue escorts occur where patients are escorted on a Commercial Airlines with a critically trained medical staff. These patients must have Commercial Airlines approved medical staff for the escort air with them during the trip. All Air Ambulance Networks medical rescue escorts staff are licensed and approved by the Airlines. Air Ambulance Network has been providing fix wing air ambulances and medical escorts for medical rescue since 1971 and is a leading in the medical rescue service industry. Whether the medical rescue is for the most acute patient or to the most basic medical rescue needs Air Ambulance Network has been there since 1971.

MEDITERRANEAN FRUIT FLY = ПЛОДОВАЯ СРЕДИЗЕМНОМОРСКАЯ МУХА – Mediterranean Fruit Fly (Ceratitis capitata) is a quarantine pest which particularly attacks citrus fruits.

MEDIUM = СРЕДА – (1) Medium is a substrate used for culture of fungi, calli, etc.

(2) Medium:- the porous material that performs the actual process of filtration. The plural of this word is 'Media'. / Среда или Фильтрующая Среда (Filter Medium).

MEDIUM GRAIN BROWN RICE FOR PROCESSING = СРЕДНЕЗЁРНЫЙ БУРЫЙ РИС ДЛЯ ПЕРЕРАБОТКИ – In the Rice industry of the United States, Medium-Grain Brown Rice For Processing shall consist of brown Rice for processing which contains more than 25.0 percent of whole kernels of brown Rice and not more than 10.0 percent of whole or broken kernels of long-grain Rice or whole kernels of short-grain Rice. / В рисовой индустрии Соединённых Штатов Америки к Среднезёрному Бурому Рису Для Переработки относится Бурый Рис для переработки, который содержит более 25.0 процентов целиковой зерновки (целых ядер) Бурого Риса и не более 10.0 процентов целиковой или битой зерновки длиннозёрного Риса или целиковой зерновки короткозёрного Риса.

MEDIUM GRAIN MILLED RICE = СРЕДНЕЗЁРНЫЙ ОБРУШЕННЫЙ РИС – In the Rice industry of the United States, Medium Grain Milled Rice shall consist of milled Rice which contains more than 25.0 percent of whole kernels of milled Rice and in US Nos. 1 through 4 not more than 10.0 percent of whole or broken kernels of long grain Rice or whole kernels of short grain Rice. US No. 5 and US No. 6 medium grain milled Rice shall contain not more than 10.0 percent of whole kernels of long or short grain milled Rice (broken kernels do not apply). / В рисовой индустрии Соединённых Штатов Америки к Среднезёрному Обрушенному Рису относится обрушенный Рис, который содержит более 25.0 процентов целиковой зерновки (целых ядер) обрушенного Риса, а .

MEDIUM GRAIN RICE = СРЕДНЕЗЁРНЫЙ РИС – Medium Grain Rice has a shorter, wider kernel (two to three times longer than its width) than long grain Rice. Cooked grains are more moist and tender, and have a greater tendency to cling together than long grain.

MEDIUM GRAIN ROUGH RICE = СРЕДНЕЗЁРНЫЙ РИС–СЫРЕЦ – In the Rice industry of the United States, Medium Grain Rough Rice shall consist of rough Rice which contains more than 25 percent of whole kernels and which after milling to a well-milled degree,

contains not more than 10 percent of whole or large broken kernels of long grain Rice or whole kernels of short grain Rice. / В рисовой индустрии Соединённых Штатов Америки к Среднезёрному Рису-Сырцу относится Рис-сырец, который содержит более 25.0 процентов целиковой зерновки (целых ядер) и который после рушения до .

MEDIUM HUB AIRPORT = АЭРОПОРТ СО СРЕДНИМ (РАЗВЯЗОЧНЫМ) УЗЛОМ – Medium Hub Airport means a commercial service airport (as defined in section 47102) that has at least 0.25 percent but less than 1.0 percent of the passenger boardings.

MEDIUM PAYMENT = СРЕДНИЙ ПЛАТЁЖ – Medium Payment:- in the European Union, typically those payments between €2 (EUR2.00) and €25 (EUR25.00). See also Macro Payment, and Micro Payments.

MEDIUMS = MEDIUM TERM

MEDIUM TERM = СРЕДНЕСРОЧНЫЙ – Medium Term:- 2–10 years, usually used in reference to bonds. When used in technical analysis, usually a few weeks to a few months. Also called Intermediate-Term.

MEDIUM–TERM FINANCING = СРЕДНЕСРОЧНОЕ ФИНАНСИРОВАНИЕ – Medium-Term Financing is often used for projects that have a definite life cycle. In other words, this funding will help a business by providing funds for equipment or projects that have a foreseeable ending date when the capital will be returned. The financing may come from a bank or lending institution but for bigger corporations this debt will be brought to public markets for greate funding. Also known as Financial Loan. Medium Term Finance is defined as money raised for a period from one to five years. The medium term funds are required by a business mostly for the repair and modernizing of the machinery. Medium term sources of securing finance, heavy advertising etc. The main sources of securing medium term funds are as under:- (i) Commercial Banks:- commercial banks are now the most important source of providing medium term loans. Loans are generally given against some security of assets. Generally, the loan is credited to the account of the borrower. He can withdraw the whole amount once or in instalments. Tradionally, the banks were mainly concentrating on providing short term loans. Now-a-days, the term loans exceeding one year are being provided by the banks. (ii) Debentures:- a company may raise a part of medium term capital by issuing debentures. A debenture is on instrument issued by a company acknowledge debt under its common seal. The terms and conditions of loan are written on the back of the document. Under Islamic modes of financing, debentures have been replaced by Term Finance Certificates (TFC). (iii) Loans from Specialized Credit Institutions:- medium term loans are also provided to the business concerns by specialized credit institutions like Pakistan Industrial Credit and Investment Corporation (PICIC), Industrial Development Bank of Pakistan (IDBP), The Investment Corporation of Pakistan (ICP), National Development Finance Corporation (NDFC), Empower Pakistan Entrepreneurs (EPE), Bankers Equity Limited (BEL) etc. / Известно также как Финансовая Ссуда или Заём Финансов (Financial Loan).

MEDIUM–TERM FIXED–RATE NOTES = СРЕДНЕСРОЧНЫЕ БИЛЕТЫ С ФИКСИРОВАННОЙ СТАВКОЙ (или СРЕДНЕСРОЧНЫЕ НОТЫ С ФИКСИРОВАННОЙ СТАВКОЙ) – Medium-Term Fixed-Rate Notes are fixed-interest rate bonds issued by public sector authorities and banks with a maximum term of four years.

MEDIUM–TERM NOTE = СРЕДНЕСРОЧНЫЙ БИЛЕТ (или СРЕДНЕСРОЧНАЯ НОТА) – Medium-Term Notes (MTNs) are bearer bonds that can be issued on a revolving basis within the framework of a program unrestricted by time (issued on an ongoing basis). The notes have minimum maturities of 2 years and are sold in small tranches by banks appointed as agents through private placements with institutional investors. Embody a medium-term money claim on a domestic issuer (borrower). Depending on the market situation, they offer a higher return than other forms of fixedinterest investment. Medium-term certificate of indebtedness issued continuously by banks on demand with lives of 2 to 8 years. Source of funds used by banks in Switzerland for the financing of mortgages. A debt instrument with medium maturity. See also Eurobonds. A Medium Term Note (MTN) is a debt note that usually matures (is paid back) in 5–10 years, but the term may be less than one year or as long as 50 years. They can be issued on a fixed or floating coupon basis. Floating rate medium term notes can be as simple as paying the holder a coupon linked to Euribor +/– basis points or can be more complex structured notes linked, for example, to swap rates, treasuries, indices, etc. When they are issued to investors outside the USA, they are called 'Euro Medium Term Notes'. Issuance of MTNs to investors based in the USA requires a separate US MTN program. MTNs can be issued with a fixed maturity date (noncallable) or can be issued with embedded call or put options and triggers where the notes will redeem early based on certain parameters. MTNs are most commonly issued as senior, unsecured debt of investment grade credit rated entities which have fixed rates. MTNs offer more flexibility to the issuer and investor both in terms of structure and documentation. / Казначейки (Treasuries). ЮРИБО (или ЮРАЙБО; EURIBOR). Среднесрочные Ноты (ССН) – облигации, выпущенные корпорациями и распространяемые инвестиционными банками, выступающими в качестве агентов; сходны с краткосрочными коммерческими бумагами (commercial paper).

MEDIUM WOOLS = СРЕДНЯЯ ШЕРСТЬ (или ШЕРСТИ С ПРЕОБЛАДАНИЕМ 3/8 КРОВИ И 1/4 КРОВИ) – Medium Wools:- usually 1/4, 3/8, and 1/2 blood wools, or wools grading 50's to 62's, or wools with an 24 to 31 micron count.

MEDULLA = МЭДУЛЛА (или МЕДУЛЛА, или СЕРДЦЕВИНА) – Medulla is the hollow, rounded cells which are found along the center of the main axis of a fiber. They may run continuously along the length of the fiber. Medulla is soft internal tissues such as pith. Medulla:- (Latin:- medulla – marrow) the medulla is responsible for feeding the wool fiber. Medulla is a honeycombed cellular section found in medium and coarse wools. / Мозг (Marrow). Под Мэдуллой, от Латинского слова Medulla, означающее Костный Мозг или Мякоть или Нутро или Сердцевина или Суть, понимается .

MEDULLATED FIBERS = ВОЛОКНА С МОЗГОВЫМ КАНАЛОМ – Medullated Fibers are fibers having more medulla (center cell area); such fibers are coarse and uneven in diameter, harsh, low in elasticity. See also Kemp. / , от Латинского слова Medulla, означающее Костный Мозг, .

MEFF = MERCADO DE FUTURES FINANCIEROS

MEG = MONOETHYLENE GLYCOL

MEGA = МЕГА – (1) Mega:- million. Mega- (M-) is a metric prefix meaning 10^6, or one million. (The form Meg- is often used before a vowel, as in MegaOhm for one million Ohms.) The prefix is also common in ordinary language, meaning Very Large, as in Megabucks or Megadose. The prefix is derived from Megas the Greek word for Large. / Под Мега..., от Греческого слова Mégas, означающее Большой, понимается:- (1) часть сложных слов, указывающая на большой размер чего-либо, например, мегалиты; или (2) приставка для образования наименований кратных единиц, по размеру равных 10^6 исходных единиц. Сокращённое обозначение:- Русское М, международное М. Пример:- 1 МВт (мегаВатт) = 10^6 Вт.

(2) Mega- (M-):- in measuring the storage capacity of a computer, the prefix mega- often means 2^{20} = 1 048 576 instead of an even one million. By a 1998 resolution of the International Electrotechnical Commission, the new prefix mebi- (Mi-) is supposed to replace Mega- for 2^{20}.

MEGABARREL = МЕГАБАРРЕЛЬ – Megabarrel (Mbbl, Mbo, MMb, or Mb) is a unit of volume used in the energy industry, equal to one million barrels of oil. One Megabarrel equals 42 million US gallons, which is about 158.987 Megaliters (Ml).

MEGABASE = МЕГАБАЗА (или МЕГАОСНОВАНИЙ) – Megabase (Mb) is a unit of genetic information equal to the information carried by 1 million pairs of the base units in the double-helix of DNA; also used as a unit of relative distance equal to the length of a strand of DNA containing 1 million base pairs. In humans, one Megabase corresponds approximately to a gene separation of one centimorgan. Megabase (Mb) is one million basepairs of DNA.

MEGABYTE = МЕГАБАЙТ – Megabyte (Mb) is the unit of information is very common in the computer world, but it is poorly defined. Often it means 1 000 000 bytes, but sometimes it means 220 = 1 048 576 bytes. As if that weren't confusing enough, the 1.44 megabytes stored on 'high density' floppy disks are actually Megabytes of 1 024 000 bytes each. This uncertainty is a major reason for the recent decision of the International Electrotechnical Commission to establish new binary prefixes for computer science.

MEGAHERTZ = МЕГАГЕРЦ – MegaHertz (MHz) is a common unit of frequency equal to one million per second. Frequencies of radio waves are commonly stated in MegaHertz.

MEGAJOULE = МЕГАДЖОУЛЬ – MegaJoule (MJ) is a common metric unit of work or energy. The MegaJoule equals one million Joules, which is approximately 737 562 foot pounds, 947.817 Btu, 238.846 (kilogram) Calories, or 0.277 778 kiloWatt hours.

MEGAOHM = МЕГАОМ – MegaOhm (MegOhm) is a common unit of electric resistance equal to one million Ohms. The spelling MegOhm is also used.

MEGAPASCAL = МЕГАПАСКАЛЬ – MegaPascal (MPa, MP) is a common metric unit of pressure or stress equal to one million Pascals or one Newton per square millimeter. One MegaPascal equals 10 bars or approximately 145.038 pounds per square inch (lbf/in^2 or psi) or 20 885.5 pounds (10.443 US tons) per square foot. The symbol MP is used fairly commonly in engineering, but it is not correct:- use MPa.

MEGAPIXEL = МЕГАПИКСЕЛЬ – Megapixel is a unit used to describe the size or resolution of an image or of a digital camera. One megapixel is one million pixels (picture elements, or 'dots'). For example, a rectangular image 1 000 pixels by 1 000 pixels is comprised of one Megapixel.

MEGASPORANGIA = МЕГАСПОРАНГИЯ (или МЕГАСПОРАНГИЙ) – Megasporangia is the receptacle in which macrospores (female spores) are developed. / макроспоры . Под Мегаспорангием, от Греческих слов Mégas, означающее Большой, Sporá, означающее Посев или Семя, и Angéion, означающее Сосуд, понимается .

MEGAWATT = МЕГАВАТТ – MegaWatt (MW) is a common metric unit of power. One MegaWatt is equal to one million Watts or 1 000 kiloWatts, about 1 341.02 horsepower, or 947.817 Btu per second. Abbreviation:- MW. / Обычная метрическая единица измерения энергии. Один МегаВатт равен одному миллиону Ватт, около 1 341.02 лошадиных сил, или 947.817 Британских единиц теплоты (Б.е.т.) в секунду. Обозначение:- МВт. Ватт, единица мощности в Международной Системе Единиц СИ. Названа в честь Шотландского изобретателя Дьжеймза Вота (James Watt; 1736–1819). Обозначение:- Вт (W). 1 Вт = 10^7 эрг/с = 0.102 кгс·м/с = $1.36 \cdot 10^3$ лс. В технике широко применяют кратные единицы, такие как килоВатт (1 кВт = 10^3 Вт) и МегаВатт (1 МВт = 10^6 Вт).

MEGAWATT–DAY = МЕГАВАТТ–СУТКИ – MegaWatt-Day:- one MW of energy flow or capacity for one day.

MEGAWATT HOUR = МЕГАВАТТ–ЧАС – MegaWatt hour (MW·h) is a metric unit of energy, especially electrical energy. One MegaWatt hour equals exactly 3.6 GigaJoules (GJ), about 3.412 million Btu, or about 2.655 billion foot pounds. Amount of electricity needed to light ten thousand 100-Watt light bulbs for a one-hour period. One million Watts used for one hour. Megawatt Hour (MWh):- one MWh is a MegaWatt produced or consumed for one hour. MegaWatthour (MWh) is one million Watt-hours. / Количество электроэнергии, необходимое для работы десяти тысяч 100 Ваттных лампочек в течение одного часа. Один миллион Ватт, используемый в течение одного часа. Ватт-Час является внесистемной единицей работы и энергии. Обозначение:- Вт·ч. 1 Вт·ч = 3 600 Дж; 1 кВт·ч = $3.6 \cdot 10^6$ Дж.

MEGAWATT–YEAR = МЕГАВАТТ–ГОД – MegaWatt-Year:- one MW of energy flow or capacity for one calendar year.

MEGC = MULTIPLE–ELEMENT GAS CONTAINER

MEIACANTHA = МЭЙАКАНТА – Meiacantha:- with smaller or fewer spines. / с более маленькими или .

MEIOCYTE = МЕЙОЦИТ – Meiocyte is any cell in which the nucleus divides by meiosis. / Мейоцит – клетка, в которой происходит мейоз.

MEIOSIS = МЕЙОЗ (или РЕДУКЦИОННОЕ ДЕЛЕНИЕ) – Meiosis is a specialized cell division associated with gamete production. It consists of two divisions, one of which is reductional in terms of chromosome number and the other, equational. Meiosis produces genetically different gametes in a heterozygote having one-half of the genetic material of the original cell. Meiosis is a special type of cell division at the sexual stage of a life-cycle when the diploid or other normal chromosome number is halved in the production of haploid gametes. Compare with Mitosis. / Под Мейозом, от Греческого слова Méiosis, означающее Уменьшение, понимается способ деления клетки, в результате которого происходит уменьшение (редукция) числахромосом в дочерних клетках; основное звено образования половых клеток. В ходе мейоза одна диплоидная клетка (содержит 2 набора хромосом) после двух последовательных делений даёт начало 4 гаплоидным (содержат по одному набору хромосом) половым клеткам. При слиянии мужских и женских половых клеток диплоидный набор хромосом восстанавливается. Сравните с Митозом (Mitosis). Мейоз (от Греческого слова Méiosis, означающее Уменьшение), редукционное деление, деления созревания, способ деления клеток, в результате которого происходит уменьшение (редукция) числа хромосом в два раза и одна диплоидная клетка (содержащая два набора хромосом) после двух быстро следующих друг за другом делений даёт начало 4 гаплоидным (содержащим по одному набору хромосом). Восстановление диплоидного числа хромосом происходит в результате оплодотворения. Мейоз – обязательное звено полового процесса и условие формирования половых клеток (гамет). Биологическое значение мейоза заключается в поддержании постоянства кариотипа в ряду поколений организмов данного Вида и обеспечении возможности рекомбинации хромосом и генов при половом процессе. Мейоз – один из ключевых механизмов наследственности и наследственной изменчивости. Поведение хромосом при мейозе обеспечивает выполнение основных законов наследственности (смотрите Законы Менделя). В зависимости от места мейоза в жизненном цикле организмов различают 3 типа мейоза:- (1) Гаметный, или Терминальный, Мейоз (у всех Многоклеточных Животных и ряда Низших Растений), происходит в половых органах и приводит к образованию гамет. (2) Зиготный, или Начальный, Мейоз (у многих Грибов и Водорослей), происходит в зиготе сразу после оплодотворения и приводит к образованию гаплоидного мицелия или таллома, а затем спор и гамет. (3) Споровый, или Промежуточный, Мейоз (у Высших Растений), имеет место

накануне цветения и приводит к образованию гаплоидного гаметофита, в котором позднее образуются гаметы. У Простейших (Protozoa) встречаются все 3 типа мейоза. Перед мейозом происходит удвоение количества ДНК в клетке. В ходе двух делений мейоза ДНК делится поровну между 4 клетками. В результате первого (редукционного) деления мейоза пары гомологичных хромосом разъединяются и члены пар расходятся в 2 клетки (редукция числа хромосом). Каждая хромосома сохраняет две продольные половины – хроматиды. В результате второго (эквационного) деления хроматиды расходятся в разные клетки и каждая из 4 сестринских клеток получает по одной хроматиде. Таким образом, первое деление мейоза принципиально отличается от митоза, а второе – это митоз в клетках с гаплоидным числом хромосом. Во время мейоза, перед редукцией числа хромосом, происходит обмен участками гомологичных хромосом – кроссинговер, приводящий к перераспределению аллельных генов (смотрите Аллели). Мейоз длится много дольше митоза:- например, у Пшеницы он продолжается 24 часа, у Лилии – 9–12 суток, у Мыши – 11–14 суток, у Человека – 24. У ряда Животных и Человека во время образования женских половых клеток (смотрите Оогенез) мейоз останавливается на срок до нескольких лет и завершается только во время оплодотворения. Первая фаза мейоза – профаза I, наиболее сложная и длительная (у Человека 22.5, у Лилии 8–10 суток), подразделяется на 5 стадий. Лептотена – стадия тонких нитей, когда хромосомы слабо спирализованы и наиболее длинны, видны утолщения – хромомеры. Зиготена – стадия начала попарного, бок о бок соединения (синапсиса, конъюгации) гомологичных хромосом; при этом гомологичные хромомеры взаимно притягиваются и выстраиваются строго друг против друга. Пахитена – стадия толстых нитей; гомологичные хромосомы стабильно соединены в пары – биваленты, число которых равно гаплоидному числу хромосом; под электронным микроскопом видна сложная ультраструктура в месте контакта двух гомологичных хромосом внутри бивалента:- так называемый Синаптонемальный Комплекс, который начинает формироваться ещё в зиготене; в каждой хромосоме бивалента обнаруживаются 2 хроматиды; таким образом, бивалент (тетрада, по старой терминологии) состоит из 4 гомологичных хроматид; на этой стадии происходит кроссинговер, осуществляющийся на молекулярном уровне; цитологические последствия его обнаруживаются на следующей стадии. Диплотена – стадия раздвоившихся нитей; гомологичные хромосомы начинают отталкиваться друг от друга, но оказываются связанными, обычно в 2–3 точках на бивалент, где видны хиазмы (перекресты хроматид) – цитологическое проявление кроссинговера. Диакинез – стадия отталкивания гомологичных хромосом, которые по-прежнему соединены в биваленты хиазмами, перемещающимися на концы хромосом (терминализация); хромосомы максимально коротки и толсты (за счёт спирализации) и образуют характерные фигуры:- кресты, кольца и другие. Следующая фаза мейоза – метафаза I, во время которой хиазмы ещё сохраняются; биваленты выстраиваются в средней части веретена деления клетки, ориентируясь центромерами гомологичных хромосом к противоположным полюсам веретена. В анафазе I гомологичные хромосомы с помощью нитей веретёна расходятся к полюсам; при этом каждая хромосома пары может отойти к любому из двух полюсов, независимо от расхождения хромосом других пар. Поэтому число возможных сочетаний при расхождении хромосом равно 2^n, где n – число пар хромосом. В отличие от анафазы митоза, центромеры хромосом не расщепляются и продолжают скреплять 2 хроматиды в хромосоме, отходящей к полюсу. В телофазе I у каждого полюса начинается деспирализация хромосом и формирование дочерних ядер и клеток. Далее следует короткая интерфаза без редупликации ДНК – интеркинез, и начинается второе деление мейоза Профаза II, метафаза II, анафаза II и телофаза II проходят быстро; при этом в конце метафазы II расщепляются центромеры, и в анафазе II расходятся к полюсам хроматиды каждой хромосомы. Эта классическая схема мейоза имеет исключения. Например, у Растений Рода Ожика (Luzula) и Насекомых Семейства Кокцид (Coccidae) в первом делении мейоза расходятся хроматиды, а во втором – гомологичные хромосомы, однако и в этих случаях в результате мейоза происходит редукция числа хромосом. Различия между сперматогенезом и оогенезом у Животных и образованием микроспор и мегаспор у Растений не отражаются на поведении хромосом в ходе мейоза, хотя размеры и судьбы сестринских клеток оказываются разными. Известны аномалии мейоза. У межвидовых гибридов все хромосомы, а у анеуплоидов (смотрите Анеуплоидия) непарные хромосомы не способны конъюгировать и остаются в виде унивалентов; у автополиплоидов (смотрите Автополиплоидия) образуются объединения более чем из 2 хромосом – так называемые Мультиваленты. В каждом из этих случаев невозможна правильная редукция числа хромосом в анафазе I; образующиеся гаметы (с несбалансированными наборами хромосом) либо сами нежизнеспособны, либо дают нежизнеспособное или уродливое потомство (смотрите Хромосомные Болезни). Отсутствие хиазм (ахизматия) обычно приводит к тем же результатам, однако у самцов некоторых Видов Мух, в том числе у Дрозофилы, хиазмы всегда отсутствуют, хотя гаметы образуются нормальные. Причины перехода клеток от деления путём митоза к мейозу в жизненном цикле каждого организма, а также молекулярные механизмы конъюгации гомологичных хромосом и кроссинговера исследуются.

MELAMINE = МЕЛАМИН – Melanine is a synthetic fiber composed of at least 50% by mass of cross-linked macromolecules made up of melamine methylol polycondensate. Alphabetic code – MF; and relevant commercial allowance – . / Под Меламином понимается 2,4,6-триамино-1,3,5-триазин, бесцветные кристаллы, $t_{пл}$ 354 °C. Применяют для получения меламино-формальдегидных смол, дубителей, ингибиторов коррозии гексахлормеламина (дегазирующего вещества). Меламин, 1, 3, 5-триамино-2, 4, 6-триазин; бесцветные кристаллы; $t_{пл}$ 354 °C (с разложением); практически нерастворим в холодной воде и большинстве органических растворителей. Меламин – основание, с кислотами образует соли ($C_3H_6N_6$xHCl и другие), разлагающиеся при нагревании. Получают меламин из дициандиамида ($NH_2 – C^9N)_2$ при температуре 180–500 °C и давлении 4–20 МН/м^2 (40–200 кгс/см^2). Применяют в производстве меламино-формальдегидных смол (пластмассы, клеи, лаки), ионообменных смол, дубителей, гексахлормеламина, используемого в производстве красителей и гербицидов.

MELAMINE RESINS = МЕЛАМИНОВЫЕ СМОЛЫ – Melamine Resins are the finishes used to give wrinkle resistance and other desirable qualities (including a degree of shrinkage resistance) to fabrics, primarily those made from natural fibers. Melamine resins are chlorine retentive which means that if fabrics with these finishes are bleached with a chlorine bleach, they will keep both the color and the odor of the chlorine.

MELANACANTHUS = МЭЛАНАКАНТУС – Melanacanthus:- with black spines.

MELDED FABRIC = XX ТКАНЬ – Melded Fabric is a nonwoven fabric of a base fiber and a thermoplastic fiber. The web is hot-calendered or embossed at the softening point of the thermoplastic fiber to form the bond.

MELIGHTON = XX – Melighton is a heavy smooth woolen fabric with short nap.

MELT = РАСПЛАВ (или РАСПЛАВЛЕННАЯ МАССА) – Melt is a material in the molten state.

MELT BLEND = СМЕСЬ РАСПЛАВА (или СМЕСЬ ПЛАВКИ, или СМЕСЬ В РАСПЛАВЕ) – Melt Blend:- xxxxx. See Biconstituent Fiber. A Melt-Blend resin composition prepared by melt-blending includes from 60 parts to 99 parts per hundred weight resin in the blend of an amorphous cycloolefin polymer composition exhibiting a glass transition temperature in the range of from 30 °C to 200 °C; and from 40 parts to 1 part per hundred weight resin in the blend of a partially crystalline, cycloolefin elastomer of norbornene and ethylene preferably having a glass transition temperature in the range of from –10 °C to 15 °C and a crystalline melting temperature in

the range of from 60 °C to 125 °C and a % crystallinity by weight in the range of from 5% to 40%. The partially crystalline, cycloolefin elastomer optionally has a second glass transition temperature at less than –90 °C.

MELT BLOWING = ВЫДУВАНИЕ ПРИ ПЛАВКЕ (или ДУТЬЁ РАСПЛАВА, или РАЗДУВ РАСПЛАВА, или ПРОДУВКА РАСПЛАВА) – Melt Blowing is the formation of a nonwoven by extruding molten polymer through a die then attenuating and breaking the resulting filaments with hot, high-velocity air or steam. This results in short fiber lengths. The short fibers are then collected on a moving screen where they bond during cooling.

MELT–DYED = КРАШЕНОЕ ПРИ ПЛАВКЕ – Melt-Dyed:- the synthetic component is melt-dyed with a masterbatch, e.g., in gray, green or olive tones, so that the infra-red reflection properties are similar to those of chlorophyll. The camouflage pattern is applied to the blend by printing, e.g., in black, brown, olive or green tones, using vat or sulfur dyes. See also Dyeing, Mass-Colored. A method of melt spinning solution dyed polypropylene filaments, with quicker color changes, comprises passing solution dyed polypropylene melt of a first color at a temperature below 400 °F the range 350 horizontally disposed cavities in a spin pack. Each cavity contains a set of horizontally disposed mesh screens which occupies at least one-third of the depth thereof, the melt passing through all of the sets of mesh screens and occupying only a low internal volume in the spin pack as it passes therethrough and is extruded therefrom. Then, when it is needed to change color, natural polypropylene melt is passed through the spin pack and natural filaments extruded. Thereafter, solution dyed melt of a second color is passed through the spin pack and filaments of the second color extruded, the color change from the first color to the second color being effected quickly and completely by purging through the spin pack.

MELT INDEX = ИНДЕКС ПЛАВКИ (или УКАЗАТЕЛЬ ПЛАВКИ) – A common measurement used to characterize thermoplastic polymers is called Melt Index. It is essentially an indirect, and inversely proportional, measure of the viscosity of the polymer when molten. One measures the mass of polymer melt which will flow through an orifice in a given amount of time under defined conditions of temperature, pressure, and geometry. The larger the melt index value, the lower is its viscosity, and therefore, the average molecular weight of the polymer is lower. Higher molecular weight polymers will be more viscous and less will flow under the same conditions so the melt index will be a smaller number. The melt index is typically expressed in terms of grams of polymer which flow out in a ten minute period, thus g/10 min or dg/min. Different polymer types often report melt index at differing conditions. For example, polyethylenes typically report melt index at 190 degrees Centigrade whereas polypropylenes are typically reported at 230 degrees, due in part to their differing melting points. Therefore, melt index values are not always directly comparable between polymer types. There are standardized methods for melt index under ASTM and ISO, for example, ASTM D1238. Such standard methods specify the geometry and other constraints on the device used as well as the combinations of conditions. The device is essentially an upright, narrow cylindrical barrel fitted with a plunger and a removable (for cleaning) orifice at the bottom. The barrel is temperature controlled and a defined weight is placed on the plunger to provide the prescribed force and thus pressure on the plunger, which drives the polymer melt through the orifice. Typically, polymer pellets are loaded into the barrel and allowed to come to the measurement temperature, well above the polymer melting point, then the weight is applied to the plunger, forcing polymer through the orifice. The extrudate is measured via literal weighing or by volumetric methods (plunger travel) using known melt density. Different weights may be used on the plunger for different polymer types or for different molecular weight ranges within products of a given type. For example, blow molding grades of HDPE (short for high-density polyethylene) might report a melt index value using a 21.6 kg weight, due to the high viscosity of such grades, while blown film extrusion grades of LLDPE (short for linear low density polyethylene) or LDPE (short for low-density polyethylene) generally use a 2.16 kg weight. Terminology also varies among polymer types and can be a source of confusion. Melt index, melt flow index, and melt flow rate are generally synonymous but often connote different measurement conditions and are frequently associated with different polymer type. Ratios of melt flows measured using two different weight loadings are also sometimes used to characterize the degree of shear-thinning behavior of the polymer. As the force increases, the apparent viscosity decreases and the flow is higher than expected, thus the melt flow ratio can differ between two polymers when expressed as the ratio of melt index measured at high loading to that at low load for each polymer. Changes in melt flow ratios usually reflect differences in molecular weight distribution and/or levels of long chain branching between polymer grades. Melt indices are useful for comparing different grades and average molecular weights for the same polymer type. Suitability of a particular grade for a particular processing method can often be stated in terms of the range of melt index values suitable for use in that method, such as for injection molding versus blown film extrusion. For example, for polyethylenes, typical melt index values for blown film extrusion might range from 0.5 to 2 dg/min, for cast film extrusion from 2 to 6, for extrusion coating from 6 to 20, and for injection molding from 20 to 60, all measured at 190 C using a 2.16 kg weight. Thus, a common metric for understanding ethylene vinyl acetate copolymers (EVA) is the melt index, which is inversely related to the average molecular weight. As discussed in an earlier post, the molecular weight of EVA can be varied over a rather wide range, so the range of attainable melt index values is large. That product envelope spans the melt viscosity range necessary to process the polymer in a wide variety of methods from blow molding to extrusion to injection molding and all the way to those applicable to handling hot melt adhesives, up to and including your ‘hot glue gun’ used for arts and crafts at home. Melt Index is the weight in grams of a thermoplastic material that can be forced through a standard orifice within a specified time. American Society for Testing and Materials (ASTM). / Американское Общество по Испытаниям и Материалам (АОИМ).

MELTING POINT = ТОЧКА ПЛАВЛЕНИЯ – Melting Point is the temperature at which the solid and liquid states of a substance are in equilibrium; generally, the temperature at which a substance changes from a solid to a liquid.

MELTON = МЭЛТОН (или МЭЛТОНСКОЕ) – Melton, usually called Melton Cloth, is a thick, heavily felted or fulled wool fabric in a twill or satin weave, with clipped surface nap, felt-like in feeling, and lustrous, similar to a dull broad cloth. The close weave means that the fabric appears to be completely smooth. Melton was originally made of all wool or cotton and wool, but today is made of other fibers. It is used extensively for coats and also for uniforms. See also Nap. Melton is a heavily fulled, hard, plain coating fabric that was originally all wool but is now also seen in wool blends. Melton Fabric, woven in 100% wool and is suitable for upholstery and for drapes. Because of the microscopic scaly cell structure of wool, it has the ability, in finishing, to be matted into a Melton fabric. It requires a combination of abrasion and water with heat and pressure. The scales of the wool fibers enmesh together to create a fabric with unique properties such as warmth and cushioning. It is available in 23 colors and has all advantageous qualities of wool. The fabric is also durable as it achieves 30 000 rubs. Melton is a heavyweight, dense, compacted, and tightly woven wool or wool blend fabric used mainly for coats. Melton:- wool, sometimes combined with synthetics. Twill or satin weave. Thick well fulled or felted wool with a smooth surface. Napped and very closely sheared. Coarse meltons are similar to makinaws but made of finer yarns and finished with a smoother, more lustrous surface – used for ‘under collar cloth’ in lighter weights. Very solid cloth due to the finishing processes that completely conceal the weave. It wears very well. Wind resistant. If made in tan or buff color in a coarse quality, it is called ‘Box Cloth’. It is classed with kersey, beaver, and broadcloth. Originated in Melton, Mowbray, England, which is a fox hunting report in england. It was first made as a hunting cloth. Looks like wool felt – pressed flat. Mostly used for men in over coating, uniform cloth of all kinds (army, navy, etc, as well as polie and firemen), pea jackets, regal liverly. Used for heavy outer sports garments and coats for women. Melton is a heavyweight, thickset, compact and tightly woven wool or wool-blend fabric, most commonly used for coats. Melton fabric is a thick, tight and heavy fabric which is composed of 5% nylon and 95% of wool for added durability and strength. Melton fabric

is available in different colors and can also be found in warm and insulating coats. Melton is a heavy smooth woollen fabric with a short nap, used esp for overcoats. Melton fabric is made of 70% Wool and 30% Acrylic. This fabric is a tightly woven fabric and has many uses due to its weight. The wide of this fabric is 60 or 150 cm. The wool is treated with heat and pressure to bind fibers together; this produces a felted fabric giving it a smooth surface which is very dense and wind-resistant. Melton is a heavily fulled cloth, often of wool, tightly constructed and finished with a smooth face concealing the weave, used for overcoats, hunting jackets, etc. Also called Melton Cloth. Origin:- 1815–25; after Melton Mowbray, town in Leicestershire, England – a former center for making this cloth. / Найлан^{Т3} (Nylon^{TM}). Тяжёлое сукно с низко остриженным ворсом и матовой отделкой.

MELT SELVEDGES = СПЛАВЛЕННЫЕ КРОМКИ – Melt Selvedges:- this type of selvedge is also known as Fused Selvedge. The formation of this selvedge requires outermost ends of thermoplastic filament yarns, e.g., polyester, polyamide polyolefin etc; with this method the edge ends are plasticized by means of an incandescent pin or ultrasonic and stuck together to produce a firm neat edge which does not curl up. This type of selvedge can be used with all types of weaving machines. This also requires dummy selvedge, so the wastages are high up to 2–4% depending upon the number of ends and width of fabrics. See also Fused Selvedges, Leno Selvedges, Selvedge, and Tucked-In Selvedges. / филаментная (комплексная) пряжа (filament yarn).

MELT SPINNING = ПРЯДЕНИЕ ИЗ РАСПЛАВА (или ПРЯДЕНИЕ ПЛАВЛЕНИЕМ) – Melt Spinning is the process in which the fiber-forming substance is melted and extruded into air or other gas, or into a suitable liquid, where it is cooled and solidified, as in the manufacture of polyester or nylon. See also Spinning. In Melt Spinning, plastics such as polyethylene, polypropylene, polyvinyl, polyamide, or thermoplastic polyesters are melted and forced out the spinneret. As the filaments hit the air, they solidify and are passed through other conditioners. There are four types of spinning for polymers- wet spinning, dry spinning, melt spinning, and gel spinning. Melt Spinning:- is used for the polymeric fibers or the polymers that can be melted. The polymer is melted and then pumped through a spinneret. The cooled and solidified molten fibers get collected on a take-up wheel. The fibers, when stretched in both, the molten and solid states, facilitate orientation of the polymer chains along the fiber axis. Melt spun fibers can be forced through the spinneret in different cross-sectional shapes such as round, trilobal, pentagonal, octagonal among others. Trilobal-shaped fibers are capable of reflecting more light which give a sparkle to the fabrics. Pentagonal-shaped and hollow fibers are soil and dirt resistant and as such are used for making carpets and rugs. Octagonal-shaped fibers offer glitter-free effects whereas hollow fibers trap air, creating insulation. Polymers like polyethylene terephthalate and nylon 6,6 are melt spun in high volumes. Nylon fiber, olefin fiber, polyester fiber, saran fiber, etc are also manufactured through melt spinning. Manufacture of at least two filaments or groups of filaments by melt-spinning thermoplastic polymer with incorporation of different coloring material wherein molecular weight is adjusted additively to reduction caused by coloring material to give same molecular weight of polymer in filaments. A process for the manufacture of at least two groups of polyester filaments, each group being differently colored and comprising polymer having substantially the same predetermined average molecular weight, by a process in which each group is prepared by separate melt-spinning of portions of polymer having the same average molecular weight and at least one portion further comprises a coloring material that reduces the average molecular weight of the polymer during melt spinning. / Найлан^{Т3} (Nylon^{TM}).

MELT VISCOSITY = ВЯЗКОСТЬ РАСПЛАВА – Melt Viscosity is the resistance of molten polymer to shear deformation. It is primarily a factor of intrinsic viscosity and temperature. It is an apparent polymer viscosity measurement in that it is only true at a specific shear stress and shear rate combination.

MEMBER = ЧЛЕН (или УЧАСТНИК) – (1) In the United States, Members are the owner(s) of a limited liability company (LLC). Unless the articles of organization or operating agreement provide otherwise, management of an LLC is vested in the members in proportion to their ownership interest in the company.

(2) In banking, a Member is a bank which is a paid member of SWIFT and permitted to make use of SWIFT services. / Банк, оплативший своё членство в Сообществе по Всемирной Межбанковской Финансовой Дальней Связи (СВМФДС; The Society for Worldwide Interbank Financial Telecommunication (SWIFT)) и получивший разрешение на пользование услугами СВМФДС. коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо).

MEMBER BANK = БАНК ЧЛЕН (или БАНК УЧАСТНИК) – The term Member Bank means any national bank, State bank, or bank or trust company which has become a member of one of the reserve banks created by the Federal Reserve Act (12 USC 221 et seq.). Member banks shall open and maintain pass-through digital Dollar wallets for all persons, including persons eligible to receive payments from the United States pursuant to a Federal law relating to the Coronavirus disease 2019 (COVID–19), who elect to deposit funds into pass-through digital Dollar wallets. Each member bank shall establish and maintain a separate legal entity for the exclusive purpose of holding all assets and maintaining all liabilities associated with pass-through digital wallets. See also Pass-Through Digital Dollar Wallets. Member Banks are the state-chartered banks that are members of the Federal Reserve System. In the United States, a Member Bank is the depository institution that is a member of the Federal Reserve System. All federally chartered banks (national banks) are automatically members of the System. State-chartered banks are divided into those that are members of the System (state member banks) and those that are not (nonmember banks). / В Соединённых Штатах Америки, Банком Членом или Банком Участником считается депозитарное учреждение, которое является членом или участником Федеральной Резервной Системы. Все декретированные на федеральном уровне банки (национальные банки) автоматически являются членами данной Системы. Банки, декретированные на уровне штата подразделяются на те, которые являются членами данной Системы (штатовские банки члены), и те, которые не являются таковыми (банки не члены или банки не участники). Банки Члены или Банки Участники – банки Федеральной Резервной Системы США. В число банков членов ФРС включены все зарегистрированные на федеральном уровне банки, а также банки, зарегистрированные штатами. Банки члены ФРС должны приобретать акции у Федерального Резервного Банка (Federal Reserve Bank) в своем районе. Половина их вложений хранится в качестве активов в банке члене ФРС; другая половина может быть отозвана от ФРС в любой момент. Банки члены ФРС также должны сохранять у себя на депозитах в районных банках ФРС определённый процент вкладов в качестве наличных резервов. Эти резервы позволяют осуществлять широкий спектр операций по переводу средств и предоставлять иные услуги с использованием Федеральной сети коммуникаций (Fed Wire) для осуществления связи между банками, находящимися в различных районах страны.

MEMBER RATE = СТАВКА ДЛЯ ЧЛЕНОВ (или СТАВКА ДЛЯ УЧАСТНИКОВ) – Member Rate is a commission charged for the execution of an order for a person who is a member of or has trading privileges at the exchange. / Комиссия, взимаемая за исполнение распоряжения для лица, которое является членом биржи или имеет на ней привилегии в торговле.

MEMBERSHIP CERTIFICATE = СВИДЕТЕЛЬСТВО О ЧЛЕНСТВЕ (или СЕРТИФИКАТ О ЧЛЕНСТВЕ) – In the United States a Membership Certificate is an evidence of ownership of and membership in a limited liability company. / В Соединённых Штатах Америки Сертификат о Членстве служит доказательством владения и членства в компании с ограниченной ответственностью.

MEMBER SYSTEM = СИСТЕМА ЧЛЕНОВ (или СИСТЕМА УЧАСТНИКОВ) – Member System:- an eligible customer operating as a part of a lawful combination, partnership, association, or joint action agency composed exclusively of eligible customers.

MEMBRANE = МЕМБРАНА – (1) Membrane is a thin, soft material made from a polymer which is laminated to the fabric to provide properties such as strength, water-proofing or wind-proofing to enhance the fabric's performance. / Под Мембраной, от Латинского слова Membrana, означающее Перепонка, понимается:- (i) в теории упругости – закреплённая по контуру бесконечно тонкая плёнка, модуль упругости которой в перпендикулярном поверхности направлении равен нулю; (ii) в технике – тонкая плёнка или пластинка (обычно закреплённая по контуру), используемая в манометрах, микрофонах, гидравлических реле, для разделения объёмов и тому подобного; (iii) в биологии – белковолипидные структуры молекулярных размеров (не более 100 Å толщиной), расположенные на поверхности клеток (плазматическая мембрана) и внутриклеточных частиц – ядра, митохондрий и другие; обладая избирательной проницаемостью, регулируют в клетках концентрацию аминокислот, сахаров, солей и других продуктов обмена веществ; и (iv) в музыке – кожа, натянутая на корпус барабана.

(2) Membrane is:- (i) a thin pliable sheet of material that separates and forms the interface between two environments; (ii) a thin flexible sheet of tissue connecting, covering, lining, or separating various parts or organs; and (iii) a thin (10 nm) structured bi-layer of phospholipid and protein molecules surrounding every biological cell and intracellular organelles such aschloroplasts, mitochondriaand the cell nucleus. Functionally distinct proteins floating in the membranes of cells and organelles control the passage of substances into and out of the enclosed space, catalyse chemical reactions at the membrane surface and allow cell-cell recognition.

MEMBRANE FILTER = МЕМБРАННЫЙ ФИЛЬТР – Membrane Filters are very thin and are usually cast or extruded in a variety of proprietary processes. Membrane filters retain over 90% of the particles to be removed on the surface of the filter due to the fact that the well-defined holes or pores are smaller than the particle being retained. Membrane filters tend to have lower porosity than typical depth filters requiring higher operating pressures and they typically achieve lower flow rates. During the casting and curing processes pores are formed that are uniform in size, shape and length. A bubble point or diffusional flow test can be performed to confirm the actual opening size of the largest pore in the filter being tested. This type of test confirms the pore size without exposing the filter to the actual particle or organism and is called a Non-Destructive Test. Membrane filters can be integrity tested multiple times, and in most cases, are tested prior to, and after use to verify that the filter maintained integrity during the entire time it was in use. See also Filter.

MEMBRANOUS = МЕМБРАНОВИДНОЕ (или ПЕРЕПОНЧАТОЕ, или ПЛЁНЧАТОЕ) – Membranous:- thin, soft and pliable, often partly transparent.

MEMO BILL OF LADING = УСЛОВНЫЙ (или ОТЧЁТНЫЙ, или СПРАВОЧНЫЙ, или СЛУЖЕБНЫЙ) КОНОСАМЕНТ – Memo Bill Of Lading is abridged form of a B/L that does not show freight amount, and serves only as a receipt for cargo. An in-house bill of lading. A duplicate copy. Memo Bill Of Lading is a bill of lading issued for in-house purposes for cargo short shipped or loaded in advance of issuance of full bill of lading. Unfreighted bill of lading (B/L) with no charges listed. / Memo от Memorandum.

MEMORANDUM BILL OF LADING = КОНОСАМЕНТ МЕМОРАНДУМ (или УСЛОВНЫЙ КОНОСАМЕНТ) – A Memorandum Bill of Lading is the third part of a multiple set bill of lading. Memorandum Bill Of Lading:- the triplicate copy of an inland/domestic bill of lading. / Под Меморандумом, от Латинского слова Memorandum, означающее буквально То, О Чём Следует Помнить, понимается документ, излагающий фактическую, документальную или юридическую сторону какого-либо вопроса. Обычно вручается лично представителю другой стороны.

MEMORANDUM INVOICE = СЧЁТ–ФАКТУРА МЕМОРАНДУМ (или УСЛОВНЫЙ СЧЁТ–ФАКТУРА, или ОТЧЁТНЫЙ СЧЁТ–ФАКТУРА, или СПРАВОЧНЫЙ СЧЁТ–ФАКТУРА, или СЛУЖЕБНЫЙ СЧЁТ–ФАКТУРА) – Memorandum Invoice:- sometimes a memo (sent by the exporter to the importer in order to place a specific shipment and/or value on record) ends up being accepted as the final and correct statement of amount due and/or purchase or shipment made.

MEMORANDUM OF ASSOCIATION = МЕМОРАНДУМ ОБ АССОЦИАЦИИ (или УЧРЕДИТЕЛЬНЫЙ ДОГОВОР) – In the United Kingdom, Memorandum Of Association is a document that has to be registered and filed at Companies House, giving details of a company's particulars and aims. It is accompanied by the articles of association, which sets up the internal regulations of the company's operations, and states, among other things, the powers of the directors. In Australia, a part of a company's constitution, the formal document subscribed by those wishing to form a company and giving details of the company, e.g., its name, objects and particulars of capital. The document and any subsequent alterations must conform to the requirements of the Corporations Act 2001. / В Австралии, Меморандум об Ассоциации (или Учредительный Договор) – это один из уставных документов компании; официальный документ, подписанный теми лицами, которые желают сформировать компанию, и несущий все сведения о компании, например, её название, цели и подробности о капитале. Этот документ и любые последующие изменения должны удовлетворять требованиям Акта о Корпорациях от 2001.

MEMORANDUM OF UNDERSTANDING = МЕМОРАНДУМ О ПОНИМАНИИ – The Regional Plant Protection Organizations (RPPOs) of the Americas:- The Plant Protection Committee of the Southern Cone (COSAVE); the Caribbean Plant Protection Commission (CPPC); The General Secretariat of the Andean Community (CA); the North American Plant Protection Organization (NAPPO); and the International Regional Organization for Plant and Animal Health (OIRSA). Considering:- (i) that they are part of the International Plant Protection Convention (IPPC), which is the phytosanitary standard setting organization referenced in the Sanitary and Phytosanitary Measures Agreement of the World Trade Organization (WTO); (ii) that Article VIII of the revised text of the IPPC, approved by the FAO Conference, establishes a more active and participative role for RPPOs in promoting interregional cooperation in the elaboration and harmonization of international phytosanitary standards, to regulate international trade in plants, plant products and other regulated articles; (iii) that these organizations do not at this time have a formal coordinating mechanism that leads to phytosanitary harmonization in the hemisphere in line with the initiatives to promote international trade; and (iv) that since 1987 the RPPOs of the Americas have established an ad hoc group named the Inter-American Coordinating Group in Plant Protection (ICGPP), the formalization of which is considered necessary to carry out the intentions expressed above. Agree to:- (i) formally establish the ICGPP with the purpose of coordinating interregional actions of the Regional Plant Protection Organizations of the Americas; and (ii) define its structure and functions through a Constitution and Bylaws that will be considered to be an integral part of this document. Signed:- 1998-March-23. Memorandum of Understanding (MOU) is a formal document that specifies the responsibilities and areas of cooperation mutually understood and agreed to by the parties involved. For an example of an MOU, see Special Programs – Federal-State Cooperative Program. / для данного случая (ad hoc).

MEMORY DUMP = РАЗГРУЗКА ПАМЯТИ (или ХХ) – In computer industry, Memory Dump is a copy of the system memory), mostly used for application troubleshooting and debugging. Memory dumps often occur automatically at the time of a system crash (blue screen of death), however, they can also be performed manually without a crash. / Разгрузка Памяти (в компьютерной отрасли) – копия системной памяти, используемая главным образом для устранения неисправностей и наладки приложений. Разгрузка

памяти часто возникает автоматически во время сбоя системы (голубой экран смерти), однако, они могут выполняться вручную и без сбоя системы.

MEMU = MOBILE EXPLOSIVES MANUFACTURING UNIT

MENDELIAN CHARACTER = МЕНДЕЛИРУЙЩИЙ ПРИЗНАК (или МЭНДЭЛЬСКИЙ ПРИЗНАК) – Mendelian Character is the expressed character (defined) due to one or some pairs of genes that have a major effect which can be dominant, recessive or intermediate.

MENDEL'S LAWS = ЗАКОНЫ МЕНДЭЛЯ – Gregor Johann Mendel discovered that when crossing white flower and purple flower plants, the result is not a blend. Rather than being a mix of the two, the offspring was purple flowered. He then conceived the idea of heredity units, which he called 'Factors', one of which is a recessive characteristic and the other dominant. Mendel said that factors, later called Genes, normally occur in pairs in ordinary body cells, yet segregate during the formation of sex cells. Each member of the pair becomes part of the separate sex cell. The dominant gene, such as the purple flower in Mendel's plants, will hide the recessive gene, the white flower. After Mendel self-fertilized the F_1 generation and obtained the 3:1 ratio, he correctly theorized that genes can be paired in three different ways for each trait:- AA, aa, and Aa. The capital 'A' represents the dominant factor and lowercase 'a' represents the recessive. The last combination listed above, Aa, will occur roughly twice as often as each of the other two, as it can be made in two different ways, Aa or aA. Mendel stated that each individual has two factors for each trait, one from each parent. The two factors may or may not contain the same information. If the two factors are identical, the individual is called Homozygous for the trait. If the two factors have different information, the individual is called Heterozygous. The alternative forms of a factor are called Alleles. The genotype of an individual is made up of the many alleles it possesses. An individual's physical appearance, or phenotype, is determined by its alleles as well as by its environment. An individual possesses two alleles for each trait; one allele is given by the female parent and the other by the male parent. They are passed on when an individual matures and produces gametes: egg and sperm. When gametes form, the paired alleles separate randomly so that each gamete receives a copy of one of the two alleles. The presence of an allele doesn't promise that the trait will be expressed in the individual that possesses it. In heterozygous individuals the only allele that is expressed is the dominant. The recessive allele is present but its expression is hidden. Mendel summarized his findings in two laws:- the Law of Segregation and the Law of Independent Assortment. (i) The Law of Segregation (The 'First Law') states that every individual possesses a pair of genes for any particular trait and that each parent passes a randomly selected copy of only one of these to its offspring. The offspring then receives its own pair of genes for that trait. Whichever of the two genes in the offspring is dominant determines how the offspring expresses that trait, e.g., the color of a plant, the color of an animal's fur, the color of a person's eyes. More precisely the law states that when any individual produces gametes, the copies of a gene separate so that each gamete receives only one copy. A gamete will receive one allele or the other. The direct proof of this was later found following the observation of meiosis by two independent scientists, the German botanist, Oscar Hertwig in 1876, and the Belgian zoologist, Edouard Van Beneden in 1883. In meiosis, the paternal and maternal chromosomes get separated and the alleles with the traits of a character are segregated into two different gametes. Or:- The two coexisting alleles of an individual for each trait segregate (separate) during gamete formation so that each gamete gets only one of the two alleles. Alleles again unite at random fertilization of gametes. (ii) The Law of Independent Assortment (The 'Second Law'), also known as 'Inheritance Law' states that separate genes for separate traits are passed independently of one another from parents to offspring. That is, the biological selection of a particular gene in the gene pair for one trait to be passed to the offspring has nothing to do with the selection of the gene for any other trait. More precisely the law states that alleles of different genes assort independently of one another during gamete formation. While Mendel's experiments with mixing one trait always resulted in a 3:1 ratio between dominant and recessive phenotypes, his experiments with mixing two traits (dihybrid cross) showed 9:3:3:1 ratios. But the 9:3:3:1 table shows that each of the two genes are independently inherited with a 3:1 phenotypic ratio. Mendel concluded that different traits are inherited independently of each other, so that there is no relation, for example, between a cat's color and tail length. This is actually only true for genes that are not linked to each other. Independent assortment occurs during meiosis I in eukaryotic organisms, specifically metaphase I of meiosis, to produce a gamete with a mixture of the organism's maternal and paternal chromosomes. Along with chromosomal crossover, this process aids in increasing genetic diversity by producing novel genetic combinations. Of the 46 chromosomes in a normal diploid human cell, half are maternally-derived (from the mother's egg) and half are paternally-derived (from the father's sperm). This occurs as sexual reproduction involves the fusion of two haploid gametes (the egg and sperm) to produce a new organism having the full complement of chromosomes. During gametogenesis – the production of new gametes by an adult – the normal complement of 46 chromosomes needs to be halved to 23 to ensure that the resulting haploid gamete can join with another gamete to produce a diploid organism. An error in the number of chromosomes, such as those caused by a diploid gamete joining with a haploid gamete, is termed aneuploidy. In independent assortment the chromosomes that end up in a newly-formed gamete are randomly sorted from all possible combinations of maternal and paternal chromosomes. Because gametes end up with a random mix instead of a pre-defined 'set' from either parent, gametes are therefore considered assorted independently. As such, the gamete can end up with any combination of paternal or maternal chromosomes. Any of the possible combinations of gametes formed from maternal and paternal chromosomes will occur with equal frequency. For human gametes, with 23 pairs of chromosomes, the number of possibilities is 223 or 8 388 608 possible combinations. The gametes will normally end up with 23 chromosomes, but the origin of any particular one will be randomly selected from paternal or maternal chromosomes. This contributes to the genetic variability of progeny. Mendel's Laws:- (1) law of independent segregation:- hereditary traits are determined by discrete factors (now known as Genes) that appear in pairs, one of each pair being inherited from each parent. During meiosis, the pairs of factors are separated or segregated. Hence, each gamete that is produced by an offspring at maturity contains only one member of each pair that the offspring produces. (2) Law of independent assortment:- when two pairs of alleles are brought together in a hybrid combination, they will segregate independently from each other in the F_2 itself. Gregor Johann Mendel (July 20, 1822 – January 06, 1884) was an Austrian scientist and Augustinian friar who gained posthumous fame as the founder of the new science of genetics. Mendel demonstrated that the inheritance of certain traits in pea plants follows particular patterns, now referred to as the laws of Mendelian inheritance. Although the significance of Mendel's work was not recognized until the turn of the XX century, the independent rediscovery of these laws formed the foundation of the modern science of genetics. / Немецкий ботаник Оскар Хэртвихь (Oscar Hertwig) в 1876, и Бельгийский зоолог Эдвар ван Бенэдэн (Edouard Van Beneden) в 1883. Сегрегация или Выделение или Зейгерование или Разделение По Крупности (Segregation). Под Законами Мендэля или Правилами Мендэля понимаются сформулированные Грэгоа Йоханом Мендэлем (Gregor Johann Mendel) в 1866 закономерности распределения в потомстве наследственных факторов, названных позднее Генами. Включают:- (i) закон единообразия гибридов первого поколения; (ii) закон расщепления гибридов второго поколения; и (iii) закон независимого комбинирования признаков (точнее закон независимого расщепления). Законы Мендэля получили полное подтверждение и объяснение на основе хромосомной теории наследственности. Грэгоа Йохан Мендэль (1822–1884), Австрийский естествоиспытатель, основоположник учения о наследственности (мендэлизм). Применив статические методы для анализа результатов по гибридизации сортов гороха (1856–63), сформулировал закономерности наследственности. Мендэлизм – учение о закономерностях наследственности, положившее начало генетике как науке. Возникновение мендэлизма связывают с обнаружением и подтверждением в 1900

Нидерландским ботаником Хуго Де Фризом (Hugo Marie de Vries; 1848–1935), Немецким ботаником Карлом Эрихом Коррэнсом (Carl Erich Correns; 1864–1933) и Австрийским генетиком Эрихом Чэрмаком-Зэйзэнэггом (Erich Tschermak-Seysenegg; 1871–1962) забытой работы Грэгоа Йохана Мендэля 'Опыты над Растительными Гибридами' (1866). Мендэлизм сыграл революционизирующую роль в биологии, доказав, что наследственные факторы имеют корпускулярную, дискретную природу, а их переход от поколения к поколению определяется статистическими закономерностями. Законы Мендэля (Mendel's Laws):- некоторые источники формулируют два закона Мендэля:- (i) закон сегрегации:- в процессе мейоза только один участник из каждой гомологичной пары хромосом переходит в одну гамету. Другая формулировка этого закона:- при мейозе в каждую гамету переходит только один из двух аллелей гена, ответственного за признак; (ii) независимое распределение (assortment): при мейозе члены различных гомологичных пар хромосом распределяются независимо между гаметами, например, AA' и BB' гомологичные пары могут давать возможные сочетания AB, AB' A'B или A'B' гаметах. Другая формулировка:- при мейозе аллели разных генов (ответственных за разные признаки) сегрегируют независимо друг от друга при условии, что гены находятся на разных хромосомах. В других источниках формулируется три закона. Два выше перечисленных рассматриваются как второй и третий, тогда как в качестве первого рассматривается принцип доминантности:- в гетерозиготах, как правило, признак определяется только одним аллелем. В результате из двух вариантов полиморфного признака, проявляющихся у двух гомозиготных родителей, в первом поколении потомства реализуется только один вариант – доминантный. Этот 'закон' часто не соблюдается и поэтому его, как правило, исключают из рассмотрения.

MENDING = ШТОПКА – Mending is a process in woven fabric manufacture in which weaving imperfections, tears, broken yarns, and similar defects are repaired after weaving; especially on woolen and worsted fabrics to prepare them for dyeing, finishing, or other processing.

MENDING SOIL MARK = ОТМЕТИНА ОТ ЗАПАЧКИВАНИЯ ПРИ ШТОПКЕ – Mending Soil Mark:- the gray fabric is directly kept on the floor or pushed from one place to other place – wipe out the soil/dust of the floor. Mending defect. / Порок или дефект штопки (mending defect).

MENSWEAR = МУЖСКАЯ ОДЕЖДА – Menswear is a clothing for men.

MEPC = MARINE ENVIRONMENT PROTECTION COMMITTEE

THE MERC = CHICAGO MERCANTILE EXCHANGE®

MERCANTILE AGENCY = ТОРГАШЕСКОЕ АГЕНТСТВО (или МЕРКАНТИЛЬНОЕ АГЕНТСТВО, или АГЕНТСТВО КРЕДИТНЫХ ИСТОРИЙ, или РАСЧЁТНОЕ АГЕНТСТВО) – Mercantile Agency is an organization that supplies credit information to business and to financial institutions in response to a request for a credit history on an individual or business. Dun & Bradstreet is the oldest mercantile agency. Mercantile agencies supply information on debt repayment and credit history. The information is collected voluntarily from a large number of reporting companies. / выплата (repayment) . Дан Энд Брэдстрит (Dun & Bradstreet). Меркантильное, от Французского и Итальянского слова Mercantile, означающее Корыстный или Торгашеский, понимается излишне расчётливое, торгашество или своекорыстие.

MERCANTILE EXCHANGE = ТОРГАШЕСКАЯ БИРЖА (или МЕРКАНТИЛЬНАЯ БИРЖА) – Mercantile Exchange is an exchange where financial futures, foreign currency futures, commodity futures, and futures options are traded. Mercantile:- of or relating to merchants or trade. See also Commodity Exchange. From Latin Mercari 'To Trade', from Merx, Merc- 'Merchandise'. / Биржа, на которой торгуются сырьевые и финансовые фьючерсы, фьючерсы на иностранную валюту, а также опционы на эти фьючерсы. Меркантильный:- от или связанный с коммерсантами или торговлей. Смотрите также Сырьевая Биржа (Commodity Exchange).

MERCANTILISM = МЕРКАНТИЛИЗМ – Mercantilism is a economic theory and practice common in Europe from the XVI to the XVIII century that promoted governmental regulation of a nation's economy for the purpose of augmenting state power at the expense of rival national powers. It was the economic counterpart of political absolutism. Its XVII-century publicists – most notably Thomas Mun in England, Jean-Baptiste Colbert in France, and Antonio Serra in Italy – never, however, used the term themselves; it was given currency by the Scottish economist Adam Smith in his Wealth of Nations (1776). Mercantilism contained many interlocking principles. Precious metals, such as gold and silver, were deemed indispensable to a nation's wealth. If a nation did not possess mines or have access to them, precious metals should be obtained by trade. It was believed that trade balances must be 'favorable', meaning an excess of exports over imports. Colonial possessions should serve as markets for exports and as suppliers of raw materials to the mother country. Manufacturing was forbidden in colonies, and all commerce between colony and mother country was held to be a monopoly of the mother country. A strong nation, according to the theory, was to have a large population, for a large population would provide a supply of labor, a market, and soldiers. Human wants were to be minimized, especially for imported luxury goods, for they drained off precious foreign exchange. Sumptuary laws (affecting food and drugs) were to be passed to make sure that wants were held low. Thrift, saving, and even parsimony were regarded as virtues, for only by these means could capital be created. In effect, mercantilism provided the favorable climate for the early development of capitalism, with its promises of profit. Later, mercantilism was severely criticized. Advocates of laissez-faire (French:- 'allow to do') argued that there was really no difference between domestic and foreign trade and that all trade was beneficial both to the trader and to the public. They also maintained that the amount of money or treasure that a state needed would be automatically adjusted and that money, like any other commodity, could exist in excess. They denied the idea that a nation could grow rich only at the expense of another and argued that trade was in reality a two-way street. laissez-faire, like mercantilism, was challenged by other economic ideas. Organized economic and political doctrine holding that national wealth should be founded on the accumulation of reserves in the form of precious metals and maintaining a favorable balance of trade. Mercantilism prevailed in England from about 1550 to 1850. Mercantilism is an economic theory which holds that the prosperity of a state is dependent upon its supply of capital; that the global volume of international trade is 'unchangeable'; and that one party may benefit only at the expense of another. 'Unchangeable' in this sense may be taken to mean that the European and global economies are seen as zero-sum games, though that economic concept did not yet exist in the mercantilist period. During it, economic assets (or capital) were represented by bullion (gold, silver, and trade value), which was best increased through a positive and healthy balance of trade with other states (exports minus imports). The theory assumes that wealth and monetary assets are identical. Mercantilism suggests that the ruling government should advance these goals by playing a protectionist role in the economy by encouraging exports and discouraging imports, notably through the use of subsidies and tariffs respectively. The theory dominated Western European economic policies from the XVI to the late-XVIII century. Mercantilism was the dominant school of thought in Europe throughout the late Renaissance and early modern period (from the XV–XVIII century). Mercantilism encouraged the many intra-European wars of the period and arguably fueled European expansion and imperialism – both in Europe and throughout the rest of the world – until the XIX century or early XX century. Most of the European economists who wrote between 1500 and 1750 are today generally considered mercantilists; this term was initially used solely by critics, such as Mirabeau and Smith, but was quickly adopted by historians. Originally the standard English term was 'Mercantile System'. The word 'Mercantilism' was introduced into English from German in the early XIX century. The bulk of what is commonly called 'Mercantilist Literature' appeared in the 1620s in Great Britain.

Smith saw English merchant Thomas Mun (1571–1641) as a major creator of the mercantile system, especially in his posthumously published Treasure by Foreign Trade (1664), which Smith considered the archetype or manifesto of the movement. Perhaps the last major mercantilist work was James Steuart's Principles of Political Economy published in 1767. The mercantillists argued that a large population was a form of wealth, making it possible to create bigger markets and armies, as opposed to the doctrine of physiocracy that predicted that mankind would outgrow its resources. Scholars debate over why mercantilism dominated economic ideology for 250 years. One group, represented by Jacob Viner, argues that mercantilism was simply a straightforward, common-sense system whose logical fallacies could not be discovered by the people of the time, as they simply lacked the required analytical tools. The second school, supported by scholars such as Robert B. Ekelund, contends that mercantilism was not a mistake, but rather the best possible system for those who developed it. This school argues that mercantilist policies were developed and enforced by rent-seeking merchants and governments. Merchants benefited greatly from the enforced monopolies, bans on foreign competition, and poverty of the workers. Governments benefited from the high tariffs and payments from the merchants. Whereas later economic ideas were often developed by academics and philosophers, almost all mercantilist writers were merchants or government officials. Monetarism offers a third explanation for mercantilism. European trade exported bullion to pay for goods from Asia, thus reducing the money supply and putting downward pressure on prices and economic activity. The evidence for this hypothesis is the lack of inflation in the English economy until the Revolutionary and Napoleonic wars when paper money was extensively used. A fourth explanation lies in the increasing professionalisation and technification of the wars of the era, which turned the maintenance of adequate reserve funds (in the prospect of war) into a more and more expensive and eventually competitive business. / Томэс Ман (Thomas Mun) в Англии, политик Жо-Батистэ Кольбэр (Jean-Baptiste Colbert; 1619–1683) во Франции, и Антонио Сэрра (Antonio Serra) в Италии. Мирабу (Mirabeau) и Смис (Smith). Британский писатель и экономист Томэс Ман (Thomas Mun; 1571–1641). Британец Дьжеймз Стюэт (Sir James Steuart; 1707–1780). Канадский экономист Дьжейкоб Вайнё (Jacob Viner; 1892–1970). Робёт Би. Иклэнд (Robert B. Ekelund). Laissez-Faire = Представьте Делу Идти Своим Порядком; Позиция Невмешательства или Недоговорённости (на Французском). 'Лесэ-Фэр' (от Французского словосочетания Laissez-Faire, означающее Позволить Осуществлять или Разрешить Осуществлять или Оставить В Покое). Под Меркантилизмом, от Итальянского слова Mercante, означающее Купец или Торговец, понимается первая школа буржуазной полит-экономии, а точнее экономическая теория и практика периода раннего капитализма, выражавшаяся в активном вмешательстве государства в хозяйственную жизнь и проводившаяся в интересах купцов. Для раннего меркантилизма (последняя треть XV – середина XVI веков; основные представители Гаспаро Скаруффи (Gasparo Scaruffi, 1519–1584; Италия) и Вильэм Стэфод (William Stafford, 1554–1612, Англия), считавший деньги основной формой богатства) была характерна теория денежного баланса, которая обосновывала политику, направленную на увеличение денежного богатства чисто законодательным путём. Главным элементом позднего меркантилизма, достигшего рассвета в XVII веке, являлась система активного торгового баланса. Основными представителями этого направления были Томэс Ман (Thomas Mun, 1571–1641, Англия), Антонио Сэрра (Antonio Serra, 1568–16XX, Италия) и Отван дё Мукрэтья (или Монкретьен; Antoine de Montchrétien, 1575–1621, Франция), первым употребивший термин 'Политическая Экономия'. Они выдвигали принцип:- покупать дешевле, продавать дороже. Политика меркантилизма заключалась в активном протекционизме, в поддержке экспансии торгового капитала, поощрении развития отечественной промышленности, особенно мануфактурной.

MERCERIZATION = МЕРСЕРИЗАЦИЯ – Mercerization is a treatment of cotton yarn or fabric with a strong solution of sodium hydroxide; named after its inventor, John Mercer. Mercerizing cotton can significantly improve its dye uptake, especially if there are immature fibers present. If yarn or fabric is held under tension during the process, a sheen will be imparted. 'Slack' mercerizing, which does not require tension, but causes the fabric to shrink, can be done at home, but requires a great deal of care because of the caustic used. Typically it is done using about 20% to 25% sodium hydroxide solution at around 20 °C. Fabric becomes very stiff and hard to handle until the solution is all washed out. Mercerisation is a treatment of cotton yarns or fabrics with caustic alkali, in which the fibers are swollen and stretched to increase the lustre in the finished product. Mercerization or Mercerisation is a treatment for cotton fabric and thread that gives fabric or yarns a lustrous appearance and strengthens them. The process is applied to cellulosic materials like cotton or hemp. The process was devised in 1844 by John Mercer (1791–1866) of Great Harwood, Lancashire, UK, who treated cotton fibers with sodium hydroxide. The treatment caused the fibers to swell, which in Mercer's version of the process shrank the overall fabric size and made it stronger and easier to dye. The process did not become popular, however, until Horace Arthur Lowe (1869–1930) improved it into its modern form in 1890. By holding the cotton during treatment to prevent it from shrinking, Lowe found that the fiber gained a lustrous appearance. Mercerisation alters the chemical structure of the cotton fiber. The structure of the fiber inter-converts from alpha-cellulose to a thermodynamically more favorable beta-cellulose polymorph. Mercerising results in the swelling of the cell wall of the cotton fiber. This causes increase in the surface area and reflectance, and gives the fiber a softer feel. An optional last step in the process is passing the thread over an open flame; this incinerates stray fibers, improving the fabric's appearance. This is known as 'Gassing The Thread' due to the gas burner that is typically used. The modern production method for mercerised cotton, also known as 'Pearl' or 'Pearle' Cotton, gives cotton thread (or cotton-covered thread with a polyester core) a sodium hydroxide bath that is then neutralized with an acid bath. This treatment increases lustre, strength, affinity to dye, resistance to mildew, but also increases affinity to lint. Cotton with long staple fiber lengths responds best to mercerisation. Mercerised thread is commonly used to produce fine crochet. Mercerization is a treatment of cotton yarn or fabric to increase its luster and affinity for dyes. The material is immersed under tension in a cold sodium hydroxide (caustic soda) solution in warp or skein form or in the piece, and is later neutralized in acid. The process causes a permanent swelling of the fiber and thus increases its luster. Mercerization is the treatment of cotton with a strong caustic alkaline solution in order to improve the luster, hand and other properties, was names after its discoverer, John Mercer. Mercerization leads to a number of changes in fiber and fabric properties:- (i) a more circular fiber cross-section; (ii) increased luster; (iii) increased tensile strength, a major factor for technical textile fabrics; (iv) increased apparent color depth after dyeing; (v) improved dyeability of immature cotton (greater uniformity of appearance); (vi) increase in fiber moisture regain; (vii) increase in water sorption; and (viii) improved dimensional stability. Types of mercerization:- Mercerization is widely used, and in the mercerization of different kinds of cellulose products, including blended products, the machine used and the treatment conditions must be selected in accordance with the type of fiber, the form that it is in and its properties, and also in accordance with the aims and the timing of the mercerization. The wide range of treatment methods can approximately be broken down into the following divisions. Parentheses denote established terminology. (1) Classification according to the form of the product:- (a) Yarn mercerization:- Batch:- Hank mercerization; Cheese mercerization; Continuous:- Single end mercerization; Tow mercerization; and Warp mercerization. (b) Knit Mercerization:- Open mercerization; and Closed mercerization (Round mercerization, tubular knit mercerization). (c) Cloth mercerization:- Chainless mercerization (Roller mercerization); Chain mercerization (Stenter mercerization); and Batch-up mercerization. (2) Classification according to the marcerizing conditions:- (a) Water content:- Dry mercerization and Wet mercerization. (b) Tension:- Fixed-length mercerization; Tension mercerization; and Tensionless mercerization. (c) Alkaline concentration:- Low-concentration alkaline mercerization; High-concentration alkaline mercerization; and Two-step mercerization. (d) Temperature:- Ambient-temperature mercerization; High-temperature mercerization; and Low-temperature mercerization. (3) Classification according to timing:- Gray mercerization; Pre-dyeing mercerization; and Post-dyeing mercerization. (4) Classification according to the number of

treatments:- Single mercerization and Double mercerization. (5) Classification according to the type of alkali used:- (a) Caustic soda mercerization; (b) Ammonia mercerization. Liquid ammonia treatment is a highly effective and well-controlled alternative to caustic soda mercerisation, but the high capital cost of the necessary equipment for recovery and reuse of the ammonia as well as the application step limits the adoption of this sophisticated approach more widely. The effect of liquid ammonia treatment on the dyeing of cotton depends on the way that the ammonia is removed. Aqueous washing gives a product almost as dyeable as mercerised cotton. As with mercerising, treated yarns and fabrics appear more deeply dyed than untreated material having the same amount of dye present. (6) Other:- (a) Alkali pad-dry method; (b) Alkali pad-steam method. While other variations are also used, mercerization in industry is generally implemented according to a combination of the basic factors as listed above. Fabric Mercerising Machine/Chain Mercerizing Machines:- In order to make up for the shortcomings of the roller mercerizing machine, a clip stenter is used for post-mercerization treatment, in which a widthwise tension is applied then most alkali is showered off the fabric kept on the stenter, followed by thorough alkali removal and neutralization using an open-width washing machine. Chainless Mercerising Process:- this method of mercerization running fabric through a number of rollers without the use of a clip stenter is also called Roller Mercerization. The machine used has a number of stainless rollers, or stainless and rubber rollers, of a relatively-large diameter tiered zigzag in close contact to each other inside a long trough, with the lower tier designed to submerge in alkaline solution for mercerization. Hot Mercerization:- main steps in hot mercerising process are:- (1) Saturation with mercerising-strength caustic soda solution at a temperature close to its boiling point; (2) Controlled hot stretching for a brief dwell period; (3) Controlled cooling and dilution of the caustic liquor; and (4) Traditional tension-controlled washing and final rinsing. Advantages of Hot Mercerising:- The main chemical and physical changes to achieve the desired improvement in fabric properties do not take place at the high temperature of the saturator but when the cooling fabric passes through the traditional caustic dilution and washing-off stages:- (1) Shortening of the process sequence to provide cost savings; (2) Increased efficiency and reproducibility; (3) Use of chain or chainless mercerisers with fewer problems related to fabric width control; (4) Improved lustre, tensile strength and dimensional stability because greater stretching of the fabric is practicable; (5) Increased dye uptake at moderate tension, but excessive stretching can result in lower dyeability; (6) Improved results from fabric qualities containing lower-grade cotton; (7) Flash scouring effect obtained; (8) Good desizing action; and (9) Enhanced penetration of the fiber by the hot caustic liquor. Foam Mercerizing:- Mercerizing strength sodium hydroxide may be foamed and this foam applied to cotton by conventional methods. Application of foamed sodium hydroxide offers the possible advantages of savings in sodium hydroxide and dyes as well as ability to treat selectively given areas of the fabric. This technology may be useful in areas other than mercerization. The following advantages has been claimed by the experts in this area are:- (1) No specialized machinery is required; (2) Less consumption of alkali; (3) Better control of fabric dimensions; (4) Preferential treatment of one face of fabric when needed; (5) Penetration of lye in pile fabrics with less lye; (6) Possibility of printing with sodium hydroxide; and (7) Possibility of better coverage of dead cotton and resulting into uniform dyeing. Slack Mercerizing:- loose mercerizing or mercerizing without tension. Slack mercerizing is done by exhaust. The fabric is slacked and treated with NaOH solution by this process of mercerizing no luster is obtained but absorption is increased. Slack mercerization is different than normal mercerizing that it must be planned in advance and will result into a stretch fabric. Fabric to be slack mercerized is woven with enough space left between the yarns to crimp up knowing it will be slack mercerized. Once the fabric is slack mercerized it will become tighter and narrower while at the same time giving a permanently crimp that makes for 100% stretch cotton. It's like giving hair a perm. It is possible to get up to 15% comfort stretch and in a twill utility stretch. Mercerizing is a treatment used to increase luster and improve strength and dye affinity in cotton. The treatment consists of impregnating the fabric with cold concentrated sodium solution. Invented by John Mercer. Mercerization is a process of treating a cotton yarn or fabric, in which the fabric or yarn is immersed in a caustic soda solution and later neutralized in acid. The process causes a permanent swelling of the fiber, resulting in an increased luster on the surface of the fabric, an increased affinity for dyes, and increased strength. Mercerization is a finish applied to cotton yarn or fabric or to a blend of cotton and other fibers to make it stronger, more absorbent, and to give the fabric additional luster and increased ability to take dye. Mercerization can be done at the yarn stage or the fabric stage. In common with several other textile processes, mercerization involves the use of caustic soda (sodium hydroxide or lye). / влагопоглощательная способность (moisture regain). Щёлочь (Alkali). Щелочное (Alkaline). Сродство (Affinity). каустическая сода или едкий натр (caustic soda). Хорэс Арсо Лоу (Horace Arthur Lowe; 1869–1930). Крошэ, от Французского слова Crochet, означающее Крючок, . Под Мерсеризацией понимается обработка хлопчатобумажных или целлюлозных материалов концентрированным водным раствором щёлочи (обычно при 15–18 (в других источниках 20–25) °C). Придаёт блеск, повышает гигроскопичность и способность окрашиваться, увеличивает сопротивление разрыву. Названа от имени Английского изобретателя Дьжона Мёсёра (John Mercer; 1791–1866). Мерсеризация, от имени Английского изобретателя Дьжона Мёсёра (John Mercer; 1791–1866):- (1) одна из стадий в производстве вискозы; заключается в обработке целлюлозы концентрированным водным раствором NaOH при 20–60 °C с целью получения так называемой щелочной целлюлозы. Процесс осуществляют в аппаратах периодического (ванны-прессы) или непрерывного действия. Ванна-пресс – металлическая ёмкость, в которой листы целлюлозы после обработки щёлочью подвергаются отжиму поршнем. Аппарат рассчитан на загрузку 250–500 кг целлюлозы; цикл работы около 2 часов. Производительность аппаратов непрерывной мерсеризации обычно 25 т/сут. (2) Обработка хлопчатобумажных тканей или других целлюлозных волокнистых материалов концентрированным йодным раствором NaOH (обычно при 15–18 °C) с целью придания им блеска, повышения способности окрашиваться и увеличения прочности. Процесс проводится на машинах, осуществляющих пропитку раствором NaOH, отжимание и промывку обрабатываемого материала. Такие машины имеют приспособления для растягивания тканей, сужающихся после обработки. Ткани мерсеризуют в суровом виде, после отварки или беления. Мерсеризация заключается в обработке в течение 10–60 секунд находящейся под натяжением ткани концентрированным раствором NaOH при температуре 16–20° с последующей промывкой горячей и холодной водой. При мерсеризации под воздействием щёлочи волокно хлопка набухает, стенки его становятся толще, канал уменьшается. При этом волокно стремится сократиться по длине. Но этому препятствует натяжение ткани:- в результате возникающих напряжений волокно теряет свою извитость, ткань приобретает приятный блеск, мягкость, шелковистость, улучшается её способность к окрашиванию. Мерсеризации под натяжением подвергаются главным образом бельевые, платьевые и сорочечные ткани из гребенной пряжи (шифон, поплин, сатин и другие). В некоторых случаях для получения эффектов в виде гофре ткани подвергают местной мерсеризации. Мерсеризованные участки могут быть в виде продольных полос или иметь другую форму.

MERCERIZE = МЕРСЕРИЗАЦИЯ – Mercerize is a finishing process for combed cotton that increases the fiber's luster and affinity for dyes.

MERCERIZED VESTING = МЕРСЕРИЗОВАННЫЙ ЖИЛЕТ (или НАТЕЛЬНАЯ РУБАШКА) – Mercerized Vesting is either a light or heavy weight cotton wash fabric weighing from 5 to 8 ounces per yard, finished, and is made of one, two or three warps and one or two fillings. When made of one warp and filling, a light weight can be produced in case the warp and filling are both mercerized yarns. The warp for the face of the cloth ranges from 2-20's to 2-60's mercerized cotton, and the filling from 1-10's to 1-16's cotton. The styles range from granite and basket weave effects in solid white, to the more elaborate figured patterns, such as are created by forming

spots on the face of the cloth, from warp effect diamond, cross and curved twill weaves, so arranged as to scatter the design in regular formation, in imitation of Jacquard designs. / основа и уточина . Жакяр (Jacquard).

MERCHANDISE BEAM = ТОВАРНЫЙ НАВОЙ (или ТОВАРНЫЙ ВАЛИК) – Merchandise Beam is synonymous with Cloth Beam. / Товарный Валик (Cloth Beam). Товарный Валик ткацкого станка.

MERCHANDISER = ХХ (или ТОРГАШ, или ПРОДАВЕЦ) – A Merchandiser is a person or company that sells goods to the public. A Merchandiser is a business that purchases inventory and resells it to customers for a profit. Retailers and wholesalers are good examples of merchandisers because they typically buy goods from manufacturers to market and sell them to the public consumers. What Does Merchandiser Mean? It is uncommon, but some manufacturers also act as merchandisers. Apple, for instance, pioneered the idea of making a computer manufacturing company into a retail store. Other computer manufacturers, like Dell, focused on merchandising efforts in the mail order and direct marketing areas. Nonetheless, both of these companies can be considered manufacturers and merchandisers. Example:- Since most merchandisers have to purchase their inventory from other companies, there is a standard operating cycle that takes place every period. Depending on the type of business, the merchandiser operating cycle can occur once an accounting period or several times. Every cycle includes these three steps. First, the merchandiser purchases products to sell to customers. These products are recorded to the merchandise inventory account with a debit when they are purchased. Second, the inventory is marketed and sold to customers either on account or in cash. Cash sales are recorded with a debit to cash and a credit to revenues. Sales on account are recorded with a debit to accounts receivable until the cash is actually paid. When the customer pays off his or her account, the cash account is debited. Third, some of the cash from the inventory sales is used to purchase more inventory. This is probably the most important part of the entire cycle. Controlling inventory turnover is extremely important for all merchandisers. Buying too much could lead to cash flow shortages and buying too much can create dissatisfied customers. Managers usually use the merchandise purchases budget to help make buying decisions.

MERCHANDISE TRADE BALANCE = ТОРГОВЫЙ БАЛАНС ТОВАРОВ – In Japan, the Merchandise Trade Balance is a measure of 'visible' trade, which is trade in goods like cars and electronics. Specifically it is the difference between Japan's imports of goods and exports of goods, excluding services. A positive value indicates a trade surplus (exports exceed imports) while a negative value indicates a trade deficit (imports exceed exports). Movements in the Merchandise Trade Balance reflect altered demand for Japanese Yen, which can move the value of the currency. Positive growth in the trade balance may lead to a future appreciation of the Yen due to steady demand in exchange for Japanese exports. The Merchandise Trade report itself gives insight into changing trends regarding Japanese trade. Such developments are especially important for Japan, which is an export-oriented economy that has historically experienced large trade surpluses, any affect on this could have dramatic affect on the domestic economy. The headline figure is expressed as a percentage change from the last equivalent period, and a positive percentage change can indicate that export growth has exceeded import growth. See also Balance Of Payment.

MERCHANDISING = ПЛАНИРОВАНИЕ ПРОДАЖ (или МЁЧЭНДАЙЗИН) – Merchandising is a planning for the effective sale of goods to customers. Usually refers to retail selling and promotion, i.e. selling to the end user. / Планирование эффективной продажи товаров заказчикам. Обычно относится к розничной продаже, то есть продаже конечному потребителю.

MERCHANT = КОММЕРСАНТ (или КУПЕЦ) – (1) Merchant is a person or company involved in wholesale trade, especially one dealing with foreign countries or supplying goods to a particular trade; e.g., 'a builders' merchant' or 'a tea merchant'. In historical contexts, Merchant is a person involved in trade or commerce; e.g., 'prosperous merchants and clothiers had established a middle class'. Origin:- Middle English:- from Old French Marchant, based on Latin Mercari 'To Trade', from Merx, Merc- 'Merchandise'. Shipper and/or consignee and anyone acting on their behalf, owning or entitled to possession of the goods. A Merchant is someone who works in or owns a retail business and sells goods. In Paris you can stroll from Merchant to Merchant, buying a loaf of bread in one shop and a wedge of cheese in another. The noun Merchant has its Latin roots in the word Merchari, meaning To Trade. Other words from the same root include Market, Merchandise, and Mercantile. In some areas, independent merchants have banded together to combine advertising Dollars and compete against malls and big box stores. You should ask your neighborhood book merchant if they've considered joining a group like this. Merchant is a dealer in physical metal who sources stocks and markets for customers but neither produces nor consumes metal for his own use. Merchant is a wholesaler or retailer who may buy goods from any or all sources for resale to anyone and everyone for profit. In law, a merchant is held to a higher standard of duty of care than a non-merchant because he or she is deemed to have expert knowledge about the goods he or she deals in. / Коммерсант – человек, занимающийся коммерцией. Коммерция – торговля, торговые операции. Купец:- (1) богатый торговец, владелец торгового предприятия; (2) устаревший термин для обозначения Покупателя.

(2) Merchant:- a professional (or body) that is authorised to receive funds in exchange for the delivery of goods or services and that has established an agreement with a bank for accepting the said funds (means of payment). A merchant may operate a server (merchant's server), which may enable a customer to choose a means of payment and which stores the transaction for eventual compensation.

MERCHANT BANK = ТОРГОВЫЙ БАНК – Merchant Bank is a banking institution whose financial business gradually evolved from its merchant business. The merchant bankers' local knowledge of the countries with which they traded made them specialists in estimating the creditworthiness of their customers, which in turn enabled them to accept bills of exchange and arrange loans at the request of foreign traders. Their business has now extended beyond normal banking transactions to include dealings in foreign exchange, the issue of long-term loans for governments and companies abroad, acting as company advisors, underwriting new issues, managing takeover bids, and engaging in insurance business and investment trust management, etc. These are monetary financial institutions whose main business is primarily concerned with corporate finance and acquisitions. / Торговый Банк:- (1) Европейский коммерческий институт, занимающийся инвестиционными банковскими операциями, предоставлением консультаций и ведением переговоров относительно слияния и поглощения компаний, а также оказывающий множество иных услуг, включая управление портфелями ценных бумаг для своих клиентов, страхование, приём (акцепт) иностранных векселей, осуществление сделок со слитками драгоценных металлов, участие в коммерческих проектах. Депозитные вклады в тоговых банках являются незначительными, но репутация таких людей, как Ротшильд, Лазард, Баринг и Хамброу, выступавших в качестве консультантов при ведении переговоров относительно крупномасштабных поглощений, слияний компаний и тому подобных операций, говорит о серьезной роли этих банков. (2) Часть Американского банка (American bank), занимающаяся инвестиционной банковской деятельностью, такой, как предоставление клиентам рекомендаций относительно слияний и поглощений компаний, размещения выпусков ценных бумаг, привлечения кредитов или участия в капитале. Федеральная Резервная Система позволяет коммерческим банкам распространять корпорационные кредитные обязательства и заключать сделки с обыкновенными акциями. (3) Американский банк, который принимает у торговцев расписки по сделкам с кредитными картами, обрабатывает их и депонирует средства, взимая комиссионные.

MERCHANT HAULAGE = ПОДВОЗ КОММЕРСАНТОМ (или ДОСТАВКА КОММЕРСАНТОМ) – Merchant Haulage:- inland transport of cargo in shipping containers arranged by the merchant. It includes empty container-moves to and from hand-over points in

respect of containers released by the carrier to merchants. Inland transportation performed by an inland carrier contracted by and for the account of the shipper or consignee. Merchant Haulage:- inland transport of cargo in containers arranged and paid by the merchant under merchant's responsibility. / Подвоз Коммерсантом:- наземная перевозка груза в контейнерах, организованная и оплаченная коммерсантом под ответственность коммерсанта.

MERCHANT INSPIRED CARRIER HAULAGE = ИНСПИРИРОВАННЫЙ ПЕРЕВОЗЧИКОМ ПОДВОЗ ДЛЯ КОММЕРСАНТА (или ИНСПИРИРОВАННАЯ ПЕРЕВОЗЧИКОМ ДОСТАВКА ДЛЯ КОММЕРСАНТА) – Merchant Inspired Carrier Haulage:- a carrier haulage by a carrier, which is nominated by the shipper or receiver of the goods, but paid by the carrier.

MERCHANT MARINE PERSONNEL ADVISORY COMMITTEE = СОВЕЩАТЕЛЬНЫЙ КОМИТЕТ ПО ТОРГОВОМУ МОРСКОМУ ПЕРСОНАЛУ – Merchant Marine Personnel Advisory Committee (MERPAC) is an industry advisory body to the US Coast Guard of the US Department of Homeland Security. MERPAC advises the Commandant of the Coast Guard on matters relating to the training, qualification, licensing, certification, and fitness standards for seamen serving in the US merchant marine. Originally Formed:- January 23, 1992. Original Status:- Discretionary Committee. Original Authority:- Federal Advisory Committee Act (F ACA). Current Status:- Statutory Committee (Beginning December 18, 2014). Current Authority:- Section 310 of the Howard Coble Coast Guard and Maritime Transportation Act of 2014 (Codified as 46 USC 8108). Function:- MERPAC acts solely in an advisory capacity to the Secretary of Homeland Security through the Commandant of the Coast Guard on matters relating to personnel in the United States Merchant Marine including training, qualifications, certification, documentation, and fitness standards and other matters, as assigned. Meetings:- Meets not less than twice each year, usually once in the DC (Disctrict of Columbia) area, once throughout the country to provide access to the public. Composition:- 19 Members (Term Length 3 years):- (1) Nine United States citizens with active licenses or certificates issued under chapter 71 or merchant mariner documents issued under chapter 73, including:- (i) Three deck officers who represent the viewpoint of merchant marine deck officers, of whom:- (a) Two shall be licensed for oceans any gross tons; (b) One shall be licensed for inland river route with a limited or unlimited tonnage; (c) Two shall have a master's license or a master of towing vessels license; and (d) One shall have significant tanker experience; and to the extent practicable:- one shall represent the viewpoint of labor; and another shall represent a management perspective. (ii) Three engineering officers who represent the viewpoint of merchant marine engineering officers, of whom:- (a) Two shall be licensed as chief engineer any horsepower; and (b) One shall be licensed as either a limited chief engineer or a designated duty engineer; and to the extent practicable:- one shall represent a labor viewpoint; and another shall represent a management perspective. (iii) Two unlicensed seamen, of whom:- (a) One shall represent the viewpoint of able-bodied seamen; and (b) another shall represent the viewpoint of qualified members of the engine department; and (iv) One pilot who represents the viewpoint of merchant marine pilots. (2) Six marine educators, including:- (i) Three marine educators who represent the viewpoint of maritime academies, including:- (a) Two who represent the viewpoint of State maritime academies and are jointly recommended by such State maritime academies; and (b) One who represents either the viewpoint of the State maritime academies or the United States Merchant Marine Academy; and (ii) Three marine educators who represent the viewpoint of other maritime training institutions, one of whom shall represent the viewpoint of the small vessel industry. (3) Two individuals who represent the viewpoint of shipping companies employed in ship operation management. And (4) Two members who are appointed from the general public. Headquartered in Washington, DC, USA.

MERCHANT SOLUTION = РЕШЕНИЕ КОММЕРСАНТА (или ХХ) – Merchant Solution (in electricity):- in the context of the PJM (PJM Interconnection LLC (Pennsylvania New Jersey Maryland Interconnection LLC) economic planning process, a solution proposed to reduce or to eliminate unhedgeable congestion on an affected facility. / Решение Коммерсанта (в Американской сфере электроэнергетики):- в контексте с процессом экономического планирования Пи.Дьжей.Эм. Интёконэкшэн Эл.Эл.Си. (PJM Interconnection LLC или Пэнсэлвэйниэ Ню Дьжози Мэрилэнд Интёконэкшэн Эл.Эл.Си. (Pennsylvania New Jersey Maryland Interconnection LLC)), решение, предложенное с целью уменьшения или устранения нехедьжируемой перегруженности на воздействуемую электроустановку.

MERCOSUR = МЭРКОСУР – Mercosur or Mercosul, officially the Common Market of the South, Latin American trade organization established in 1991 to increase economic cooperation among the countries of South America. It is commonly known as Mercosur or Mercosul from the Spanish and Portuguese names, respectively, for the organization. Full members now include Argentina, Brazil, Paraguay, Uruguay, and (contigent on ratification by the other members) Venezuela; Bolivia, Chile, Colombia, Ecuador, and Peru are associate members. The headquarters are in Montevideo, Uruguay. Mercosur is gradually eliminating tariffs between member states and at the same time aiming for a low common external duty, and trade between its members has greatly expanded since 1991. A Mercosur parliament was established in 2007. In the middle of the 1980's a movement between Argentina and Brazil – the two biggest countries of the Southern Cone – turned up. From the beginning it appeared to revert several decades of mutual distrust that up to that moment had ruled the foreign policy of the Latin American countries. In order to deepen their relationship, both countries sealed their approach with the subscription of 24 bilateral protocols, symbolizing the appearance of a new world political and economical reality. For both countries it represented the start of a new kind of relation much deeper than ever before in their history. In August 1990, Paraguay and Uruguay requested the incorporation of their countries to the agreement that was promulgated between the two South American giants. On 1991-March-26, the Treaty of Asuncion put the Southern Common Market in force. The Treaty signed in Asuncion set the decision of 'building a common market' which had to be agreed upon by 1994-December-31. On 1991-March-26 Brazil, Argentina, Uruguay and Paraguay signed the Treaty of Asuncion (Tratado de Asunción) to create a customs union with a common external tariff by December of 1994 that will eventually evolve into a common market. This agreement, Mercado Común del Sur, or MERCOSUR was derived from integration efforts of the 1960's. It became more intense when Brazil and Argentina created the bilateral Programa de Integracion y Cooperacion Argentino-Brasileno known as PICAB in 1985 which set a timetable for a bilateral common market. Presidents Carlos Menem of Argentina and Fernando Collor de Melo of Brazil took the initiative to speed up the process by lowering bilateral tariffs and beginning negotiations with Paraguay and Uruguay. MERCOSUR was strategically oriented to develop the economies of its constituents making them more internationally competitive so that they will not have to rely on the closed market arena. MERCOSUR was viewed as a remarkable development. It brought nations with a long standing rivalries together. The MERCOSUR constituents compose nearly half of the wealth created in all of Latin America as well as 40 percent of the population. These four nations also posses one third of all trade in Latin America. Although MERCOSUR is an economic trade initiative it was also designed with clear political goals. MERCOSUR is committed to the consolidation of democracy and the maintenance of peace throughout the southern cone. Also MERCOSUR took strides to reach agreements between Brazil and Argentina in the nuclear field. Currently there has been a move to expand MERCOSUR with Chile and also to integrate with NAFTA, North American Free Trade Agreement creating a Free Trade Agreement of the Americas (FTAA), which would dispell both NAFTA and MERCOSUR. Mercosur (in Spanish; Mercosul in Portuguese; or Southern Common Market) is comprised of Argentina, Brazil, Paraguay, and Uruguay. Mercosur is scheduled to enter into force in December 1994 for Argentina and Brazil and to enter into force in December 1995 for Paraguay and Uruguay. Mercosur, modeled similarly to the European Community's Treaty of Rome, will establish a common external tariff and eliminate barriers to trade in services. While in the Southern Cone, Chile has not sought entry to Mercosur, but does have an

agreement with Argentina which will provide for some similar benefits. Mercosur or Mercosul (Spanish:- Mercado Común del Sur, Portuguese:- Mercado Comum do Sul, Guarani:- Ñemby Ñemuha, English:- Southern Common Market) is a Regional Trade Agreement (RTA) among Argentina, Brazil, Paraguay and Uruguay founded in 1991 by the Treaty of Asunción, which was later amended and updated by the 1994 Treaty of Ouro Preto. Its purpose is to promote free trade and the fluid movement of goods, people, and currency. Mercosur origins trace back to 1985 when Presidents Raúl Alfonsín of Argentina and José Sarney of Brazil signed the Argentina-Brazil Integration and Economics Cooperation Program or PICE (Spanish:- Programa de Integración y Cooperación Económica Argentina-Brasil; Portuguese:- Programa de Integração e Cooperação Econômica Argentina-Brasil). The program also proposed the Gaucho as a currency for regional trade. Bolivia, Chile, Colombia, Ecuador and Peru currently have associate member status. Venezuela signed a membership agreement on 2006-June-17, but before becoming a full member its entry has to be ratified by the Paraguayan and the Brazilian parliaments. The founding of the Mercosur Parliament was agreed at the December 2004 presidential summit. It should have 18 representatives from each country by 2010. WTO members (4):- Argentina, Brazil, Paraguay, Uruguay. Headquartered in Montevideo, Uruguay. / В состав Мэркосур (по-Испански; Mercosur), Мэркосул (по-Португальски; Mercosul) или Общего Южного Рынка (Southern Common Market) входят Аргентина, Бразилия, Парагвай и Уругвай. Южного Конуса. Республика Аргентина, Федеративная Республика Бразилия, Республика Парагвай и Восточная Республика Уругвай 26 Марта 1991 подписали в столице Парагвая Асунсьонский Трактат или, как это звучит на Испанском языке, Тратадо дэ Асунсион (Tratado de Asunción), целью которого было создание Общего Рынка Юга, сокращённо – МЭРКОСУР по начальным буквам Испаноязычного названия – эль Мэркадо Комун дэль Сур (el Mercado Común del Sur (MERCOSUR)). Четыре государства участника, которые до образования МЭРКОСУР составляли единое сообщество ценностей, которые находят своё отражение в их демократических, плюралистических обществах, защитниках основных свобод, прав человека, защите окружающей среды и устойчивом развитии, а также их приверженности к консолидации демократии, безопасности права, борьбе с бедностью и социально-экономическому развитию на справедливой основе. С этой фундаментальной базой совпадений партнёры стремились расширить измерения своих соответствующих национальных рынков посредством интеграции, которая является фундаментальным условием ускорения процессов их экономического развития с социальной справедливостью. Таким образом, основной целью Асунсьонского Трактата является интеграция четырёх государств участников посредством свободного обращения товаров, услуг и производственных факторов, установление общего внешнего тарифа (Arancel Externo Común (AEC)) и адаптация единой общей коммерческой политики, координация макроэкономической и отраслевой политики и гармонизация законодательства в соответствующих областях. На встрече президентов стран в Ору Прету (Ouro Preto), состоявшейся в Декабре 1994, был принят Дополнительный Протокол к Асунсьонскому Трактату (Protocolo Adicional al Tratado de Asunción) – Ору Претувский Протокол (Protocolo de Ouro Preto), в котором была установлена институциональная структура МЭРКОСУР и предоставлена международно-правовая единица. В результате на встрече в Ору Прету было подтверждено завершение переходного периода, и были приняты основные инструменты общей коммерческой политики, характеризующие Таможенный Союз (Unión Aduanera). Таким образом государства участники намеревались начать новый этап с целью создания единого рынка, который обеспечил бы больший экономический рост для государств участников за счёт использования производственной специализации, экономии за счёт масштаба, коммерческого дополнения и большей возможности договориться о блоке с другими блоками или странами.

MERE DESCRIPTIVENESS = ПРОСТАЯ ОПИСАТЕЛЬНОСТЬ – Mere Descriptiveness:- statutory basis (Trademark Act Section 2(e)(1), 15 USC Section 1052(e)(1), TMEP 1209 et seq) for refusing registration of trademarks and service marks because the proposed mark merely describes an ingredient, quality, characteristic, function, feature, purpose or use of the specified goods or services. With regard to trademark significance, matter may be categorized along a continuum, ranging from marks that are highly distinctive to matter that is a generic name for the goods or services. The degree of descriptiveness can be determined only by considering it in relation to the specific goods or services. At one extreme are marks that are completely arbitrary or fanciful. Next on the continuum are suggestive marks, followed by merely descriptive matter. Finally, generic terms for the goods or services are at the opposite end of the continuum from arbitrary or fanciful marks. The major reasons for not protecting descriptive marks are:- (1) to prevent the owner of a mark from inhibiting competition in the sale of particular goods or services; and (2) to maintain freedom of the public to use the language involved, thus avoiding the possibility of harassing infringement suits by the registrant against others who use the mark when advertising or describing their own products. See also Descriptive Mark.

MERGE = XX (или ПЕРЕХОДИТЬ, или ПОГЛОЩАТЬСЯ, или РАССЕИВАТЬСЯ, или РАСТВОРЯТЬСЯ, или СЛИВАТЬСЯ) – Merge is a group to which fiber production is assigned based on properties and dyeability. All fibers within a merge can be expected to behave uniformly, and for this reason, can be mixed or used interchangeably.

MERGER = СЛИЯНИЕ – Merger is business combination that occurs when one entity directly acquires the assets and liabilities of one or more entities and no new corporation or entity is created. See also Consolidation. Merger is the absorption of an estate, corporation, contract, or an interest in another. Fusion of two or more companies, as distinct from the take-over of one company by another. Mergers may be undertaken for various reasons, notably to improve the efficiency of two complementary companies by rationalizing output and taking advantage of economies of scale, and to fight off unwelcome take-over bids from other large companies. The companies involved form one new company and their respective shareholders exchange their holding for shares in the new concern at an agreed rate. The amalgamation of two or more businesses into a single economic entity. Contrast Takeover. Merger is a combination of two or more companies. Merging companies appoint an Exchange Agent to exchange all outstanding shares of one or both companies for shares in the newly formed company or for cash. The combining of two or more separate companies into one. In Switzerland, mergers are governed by Articles 748 and 749 of the Swiss Code of Obligations. A special form of merger is the leveraged buyout. Merger is the union of two or more formerly independent business entities under a single ownership, through complete acquisition of one company's stock by another. The acquired company disappears as a separate entity and usually becomes a subsidiary of the acquiring company. The acquiring company then issues new shares to replace old ones held by shareholders of the merged entities. Combination of two or more corporations. Merger is the statutory combination of two or more corporations in which one of the corporations survives and the other corporations cease to exist. Merger:- when two companies combine in order to form one entity. / выработка (output). Реорганизация компании в форме присоединия. Стороны реорганизации:- присоединяющее лицо и присоединённое лицо. Слияние – объединение двух или более компаний либо путём объединения долевого участия (pooling of interests), когда происходит объединение счетов, либо путём приобретения, когда уплаченная сумма в размере балансовой стоимости и сверх неё вносится в книги бухгалтерского учёта покупателя как 'репутация' (goodwill), либо путём консолидации, когда создаётся новая компания для приобретения объединённых чистых активов консолидируемых компаний. Строго говоря, только такое объединение, при котором одна из компаний продолжает существовать в качестве юридического лица, называется слиянием или, более точно следуя букве закона, объединением уставов; таким образом, консолидация, или консолидация уставов, с технической точки зрения не является слиянием, хотя часто по отношению к подобным сделкам употребляется термин 'Слияние'. Слияния, удовлетворяющие юридическим критериям объединения долевого участия, когда обыкновенные акции обмениваются на другие обыкновенные акции, не облагаются налогом и называются безналоговыми

слияниями. Если имеет место приобретение путём покупки активов или акций с использованием наличных средств или кредитных обязательств, слияние компаний облагается налогом на прирост капитала, взимаемым с продающей компании или её акционеров. Однако существуют и определённые положительные стороны, связанные с подобными облагаемыми налогом приобретениями. Они заключаются в том, что приобретающая компания может амортизировать активы приобретаемой компании на ту сумму, на которую рыночная стоимость активов превышает балансовую. Эта разница затем может быть включена в общую амортизацию, что предоставляет законную возможность списания налогов. Слияния компаний также могут быть классифицированы в терминах их экономической функции. Так, при горизонтальном слиянии (horizontal merger) происходит объединение прямых конкурентов, производящих одни и те же изделия и действующих на одних и тех же рынках; при вертикальном слиянии (vertical merger) объединяются потребитель и компания или поставщик и компания; при слиянии, расширяющем рынок (market extension merger), объединяются компании, продающие один и тот же продукт на разных рынках; при слиянии компаний в целях расширения ассортимента (product extension merger) происходит объединение компаний, продающих различные, но взаимосвязанные изделия на одном и том же рынке; при конгломератном слиянии (conglomerate merger) происходит объединение компаний, не имеющих никаких из вышеперечисленных связей или общих черт.

MERGER ACCOUNTING = БУХГАЛТЕРСКИЙ УЧЁТ СЛИЯНИЯ – In the United Kingdom, Merger Accounting is a method of accounting which regards the business combination as the acquisition of one company by another. The identifiable assets and liabilities of the company acquired are included in the consolidated balance sheet at their fair value at the date of acquisition, and its results included in the profit and loss account from the date of acquisition. The difference between the fair value of the consideration given and the fair values of the net assets of the entity acquired is accounted for as goodwill. Also known as Pooling Of Interests in the United States. / Реорганизация компании в форме присоединия. Стороны реорганизации:- присоединяющее лицо и присоединённое лицо.

MERGER ARBITRATION = АРБИТРАЖИРОВАНИЕ СЛИЯНИЯ – In the context of hedge funds, Merger Arbitration is a style of management that involves the simultaneous purchase of stock in a company being acquired and the sale of stock in its acquirer. / Реорганизация компании в форме присоединия. Стороны реорганизации:- присоединяющее лицо и присоединённое лицо.

MERGERS AND ACQUISITIONS = СЛИЯНИЯ И ПОГЛОЩЕНИЯ – Mergers And Acquisitions (M&A) comprise all of the activities in connection with the takeover of companies or parts of companies by another company or the merger of such units. Investment banks offer agency and advisory services to the acquiring or target company. The Mergers And Acquisitions (M&A) package of services that commercial and investment banks offer companies acquiring major shareholdings or entire companies usually embraces consultancy, locating suitable investments, engineering the actual transaction, and financing. Merger And Acquisition activity has increased greatly in recent years. The bulk of this activity involved US and European companies. Takeover waves like this one tend to occur in periods of risking stock market valuations, which occurred in the decade of the 1990s. M&A activity may also be a side effect of more reliance on the capital market for financing. As the size, liquidity and efficiency of capital markets increase, the demand for firm-specific information increases and regulatory bodies generally play a larger role. The increasing efficiency and trustworthiness of markets promotes the rise of sophisticated institutional investors. These factors all work toward promoting the growth of both debt and equity capital markets. A term Merger and Acquisition (M&A) refers to the buying an selling of businesses by merging them with an existing one or simply having one firm acquiring another firm. / Реорганизация компании в форме присоединия. Стороны реорганизации:- присоединяющее лицо и присоединённое лицо.

MERGERS/TAKEOVERS = СЛИЯНИЯ/ПОГЛОЩЕНИЯ – Mergers/Takeovers:- the merger of two or more companies under a single corporate structure or the acquisition of one of more companies by another company. Payments may be in the form of shares of the resulting company, cash, or a combination of the two. A name change may also be involved. / Реорганизация компании в форме присоединия. Стороны реорганизации:- присоединяющее лицо и присоединённое лицо.

MERINO = МЕРИНО (или МЕРИНОС) – (1) Merino is a breed of sheep, originally from Spain, yielding the finest wool. (2) Merino is a fine and narrow cotton fabric, used for dresses in the Philippines. (3) Merino is a French shawl made with two-ply merino wool warp and wool or silk filling. (4) Merino is the knit goods made of mixture of cotton and wool. (5) Merino is a woolen fabric, made in England of shoddy, obtained from soft woolen or worsted dress goods. (6) Merino is a twilled English worsted fabric, made of very fine single merino yarn, either face and back alike or with twilled face and plain back. Merino cloth was first made in 1804 at Reims; that year in the factory of Robert Lucas & Cie., managed by Benoist Malot, it was found that the warp intended for the manufacture of shawls was too weak, and upon the advice of the elder Terneau, one of the partners, it was used as filling with great success and the process patented on December 04, 1804. This fabric was originally called Shale (French for Shawl) until 1808 and only since that time merino and for a time warps were handspun and the filling machine spun for this fabric; in 1831 handspun warp for merino was discontinued entirely (Glossary of 1924). Merino is a soft wool or wool and cotton clothing fabric resembling cashmere. Merino:- a wool from the Merino sheep that produces a short staple fiber of extremely high quality. Merino sheep are raised in the United States, Australia, South Africa, and South America. Occasionally, the term merino is used as a synonym for Botany. See also Botany. Merino is:- (1) a wool from purebred Merino sheep. Merino wool usually has a mean fiber diameter of 24 microns or less. (2) A yarn of blended wool and cotton fibers. Merino is a type of wool that originates from pure-bred Merino sheep. The best Merino wool comes from Italy. The highest, finest and best wool obtained anywhere in the world. This fiber is used only in the best of woolen and worsted fabrics, billiard cloth, etc. / уточина. Бенуа Малё (Benoist Malot). Под Мериносами, от Испанского слова Мэринос (Merinos), понимаются породы овец с однородной тонкой шерстью белого цвета. Разводят в большинстве стран. Наибольшее поголовье в Австралии (Австралийский Меринос). В бывшем Союзе Советских Социалистических Республик (СССР) (Алтайская, Асканийская, Грозненская, Казахская тонкорунная, Сальская, Ставропольская и другие породы). Натуральное волокно:- Мериносовая Шерсть является натуральным волокном, которое состоит из кератина, того же самого протеина, что и наши волосы. Биологическая Разложимость:- в соответствующих условиях мериносовая шерсть разлагается всего лишь за несколько лет. Обновление:- каждый год Австралийские мериносы дают новое руно, которое состригают, не причиняя животным никакого вреда. Извитость Волокна:- Мериносовая шерсть имеет природную извитость, которая позволяет вырабатывать объёмные, но в то же время лёгкие ткани. Упругость Волокна:- Мериносовая шерсть после сминания или вытягивания возвращается в первоначальное состояние, что позволяет одежде после носки или стирки восстанавливать свою исходную форму. Мягкость:- Австралийские мериносы славятся своим тончайшим волокном, благодаря чему изделия из мериносовой шерсти отличаются непревзойдённой мягкостью и плавностью очертаний. Комфорт:- Мериносовая шерсть реагирует на изменения температуры и влажности:- гигроскопическая масса шерстяного волокна способна поглощать до 35% влаги (пара) от собственного веса, что позволяет отводить и испарять влагу от тела. По своему названию и внешнему виду Австралийские мериносы происходят от знаменитых Испанских Королевских Мериносов, которые было завезены в Австралию Европейскими поселенцами свыше 200 лет назад. Австралия – крупнейший в мире производитель мериносовой шерсти. В 2010/11 Австралийское стадо в 70 миллионов овец дало настриг в 345 миллионов килограмм шерсти. Как правило, Австралийская шерсть идёт на производство одежды; при этом 54% настрига в сезоне 2010/11 составили волокна тоньше 20.6 микрон. Чем меньше диаметр, тем извитее и

мягче волокно. Извитость, или волнистость штапеля шерсти, влияет на объём и лёгкость шерстяных тканей. Исследование волокна под микроскопом показывает структуру чешуек, которая влияет на технологические свойства шерсти:- так, например, чешуйки являются причиной её свойлачивания. Свойлачивание – это взаимное сцепление отдельных волокон при активном механическом воздействии (таком, как стирка). Ранняя стадия свойлачивания, называемая подвалкой, является важным способом создания уникальной фактуры и мягкости многих видов шерстяных тканей. Диаметр шерстяного волокна в ткацком производстве является фунд аментальным технологическим фактором. Диаметр волокна в супер-тонких и ультра-тонких камвольных тканях можно определить по системе, разработанной Международной Организацией Шерстяного Текстиля (IWTO), которая известна как 'Super S'. Компания Зэ Вулмарк Кампэни Пи.ти.Уай. Лимитид (The Woolmark Company Pty Limited; Sydney, Australia) руководит практическим применением системы Super S. Указанные в ней цифровые значения напрямую характеризуют средний диаметр волокна в общей массе ткани, от Super 80's (<19.75 микрон) до Super 250's (<11.25 микрон). Чем тоньше волокно, тем тоньше может быть пряжа. В принципе, мягкость и объём тканей возрастают по мере убывания диаметра волокна. Это справедливо как для аппаратных, так и для гребенных пряж. Попытки получить тонкую пряжу из слишком толстого волокна порождают массу проблем. Полотно не только теряет мягкость, но и пряжа становится неравномерной, оказывая негативное воздействие на внешний вид и потребительские свойства готовых тканей. Не рисунке показан образец этикетки предприятий-лицензиатов компании Woolmark, имеющих право на применение как символа системы Super S, так и знака Woolmark. Шерсть для валяния Меринос (Merino) – натуральная тонкорунная шерсть Мериносовой Овцы элитных пород. Меринос (Мерино, Merino) – шерсть породы высокогорных тонкорунных Овец – Мериносов. Основой выведения Австралийских тонкорунных Овец послужили Мериносовые овцы, завезённые в XVIII веке из Англии, Испании и Германии. Позднее для скрещивания использовались Французские Рамбулье и Американские Вермонты. В настоящее время наибольшее поголовье Мериносовых Овец находится в Австралии. Породе Мериносов характерно высокое качество чёсаной (камвольной) шерсти. Толщиной Мериносового волокна – 14–25 мкм. В свою очередь группу Мериносовой шерсти условно делят 4 основные подгруппы:- Подгруппа 1 – 'Мерино' – мериносовый волос толщиной 20–22.5 мкм. Доля этого типа шерсти составляет около 80% мирового производства Мериносовой шерсти. В основном используется для изготовления пряжи для машинного вязания. По мере вырождения стада толщина волоса Овцы увеличивается и достигает 28–30 мкм. Получается интересная ситуация, когда шерсть, состриженная с Мериносовой Овцы, является 'Мерино' только по типу животного, с которого она получена, а не по своим параметрам. Именно эта шерсть используется в производстве высококачественной пряжи для ручного вязания. Остальные три подгруппы Мерино не используются в пряже для ручного вязания из-за очень высокой стоимости, во-первых. А во-вторых – добиться проявлений уникальных достоинств этого сырья в готовом изделии в домашних условиях практически невозможно. Шерсть из этих подгрупп нашла своё применение в валянии. Подгруппа 2 – 'Супер Тонкая' (Super Fine). Толщина волоса супер тонкого Мериноса 18–20 мкм. Объём производства – до 15%. Подгруппа 3 – 'Экстра Тонкая' (Extra Fine). Толщиной волоса особо тонкого мериноса 16–17 мкм. Объём производства – 5–7%. Подгруппа 4 – так называемая 'Летняя Шерсть'. Толщина её волокна 14–15.5 мкм. Объём производства этой шерсти крайне мал (порой до 0.1% мирового производства Мериносовой шерсти). 'Летний Меринос' используется исключительно для производства самых дорогих тканей и трикотажа. Ежегодно на аукционе внутри этой подгруппы выделяется наилучшая по цвету, мягкости и многим другим параметрам партия, называемая Золотой Кипой (Golden Bale). Даже в лучшие годы вес этой партии не превышает нескольких сотен килограмм. Волокна Мериносовой шерсти для валяния имеют тонкую извитую структуру, высокую прочность и пышность. Такие уникальные свойства обеспечивают воздушную и упругую фактуру, способную сохранить свои качества и внешний вид изделий в течение долгого времени. До сих пор не создан аналог овечьей шерсти, способный в точности повторить её уникальные свойства термического стабилизатора. Именно поэтому изделия как комфортны в жару, так и хорошо защищают от холода. Специальная промывка шерсти и её расчёсывание придают волокну необыкновенную мягкость. Современные технологии производства шерсти позволяют донести до нас природную силу шерсти в максимально естественном состоянии. Шерсть практична в эксплуатации и обладает бесценными оздоравливающими свойствами. Благоприятное влияние на организм заключается в стимулировании кровообращения, в облегчении болей в суставах и мышцах, ревматических заболеваний. Ланолин, который содержится в шерсти, благотворно влияет на организм человека при остеохондрозе, ортопедических, ревматических заболеваниях, бронхиальных недугах, для снижения отёчности. Ещё в старину люди избавлялись от зубной и головной боли, обматывая голову шерстяным платком. Шерсть имеет такие достоинства:- (i) позволяет телу дышать; (ii) нейтрализует ядовитые вещества, выделяющиеся вместе с потом человека; (iii) содержит тело в сухом тепле; (iv) высокоэластична; и (v) имеет свойство длительное время оставаться чистой. Природные свойства шерсти в сочетании с щадящими методами ухода создают долговечные и стойкие в эксплуатации изделия. Меринос – шерстяная ткань саржевого переплетения, обычно однотонная, пряжу для которой изготавливали из шерсти тонкорунных овец – Мериносов. Использовали для женского платья, верхней одежды и так называемых Персидских и Турецких шалей в XIX веке. При смешивании мериносной пряжи с шерстью других сортов или с другими волокнами получали полумеринос или новые сорта смесовых тканей.

MERISTEM = МЕРИСТЕМА (или ОБРАЗОВАТЕЛЬНАЯ ТКАНЬ) – Meristem is the growing tissue comprised of stem cells capable of repeated division and differentiation into permanent structures. The Cotton plant has Meristems, or growing points, at the top of the main stem and on its fruiting branches. These meristems allow the plant to simultaneously grow upward and outward. Meristem:- cells at the growing tips of stems or roots that are dividing and are undifferentiated but later become different parts of the plant. Region of actively dividing cells in plants. / на растущих остриях стеблей и корней, которые . Меристема – образовательная ткань растений. Хлопчатник имеет Меристемы или точки роста на верхушке основного стебля и на его плодоносящих ветвях. Эти меристемы обеспечивают одновременный рост растения как вверх, так и вширь. Под Меристемой, от Греческого слова Meristós, означающее Делимый, понимается ткань растений, сохраняющая в течение всей жизни способность к образованию новых клеток. За счёт меристемы растения растут, образуют новые органы (корни, листья, стебли, цветки). Из производных меристемы образуются постоянные ткани растений (покровные, проводящие и другие).

MERIT GOOD = НЕСОМНЕННО ХОРОШИЙ – Merit Good:- a good (or service) which some 'outside analyst' considers to be intrinsically desirable, uplifting or socially valuable for other people to consume, independently of the actual desires or preferences of the consumer himself. In the case of such goods, it is sometimes held that free consumer choice is inappropriate, and therefore that if many consumers left to themselves are unwilling to purchase 'appropriate' quantities of such goods, they should be encouraged or even compelled to consume them anyway. Such arguments are often employed in an effort to justify government intervention in the market place to provide such alleged merit goods to the citizenry, either through direct government provision of the good at no cost to the consumer or through payment of tax-financed government subsidies that enable private providers to sell the good far below its true costs of production. Typical examples of alleged merit goods might include various forms of 'higher culture' often ignored by 'lowbrows' (grand opera and ballet performances, museums, uplifting documentaries or talking heads shows on PBS TV stations), the services of the clergy of The One True Religion, schoolroom instruction for children, etc.

MERLE = МЭРЛЬ (или ДРОЗДОВОЕ, или ДРОЗД) – Merle:- a bluish or reddish gray mixed with splotches of black that is the color of coats of some dogs. / .

MERPAC = MERCHANT MARINE PERSONNEL ADVISORY COMMITTEE

MERRY WIDOW = ВДОВА МЭРИ – Merry Widow is a strapless corset or bustier usually having garters attached.

MESCAL = МЭСКАЛ – Mescal is a strong alcoholic liquor, similar to Tequilla, made by distillation of a fermented preparation of the starchy core of Agave angustifolia and other species. Also a common Mexican name for certain Agaves.

MESCALINE = МЭСКАЛИН – Mescaline is a halucinogenic alkaloid found in Lophophora Williamsii and other Species of Cactus traditionally used in native American Indian religous ceremonies and medicine. / Мэскалин был впервые выделен в 1886 из так называемой Мэскалиновой Кнопки, надземной части Кактуса Пейота (Lophophora Williamsii), и был назван в честь этой части растения. Мэскалин является наиболее изученным веществом из всех психоактивных растительных компонентов. В период между 1886 и 1950 было проведено и опубликовано более ста исследований мэскалина. В ходе исследований этого алкалоида было установлено, что мэскалин является компонентом многих Кактусов. А также, вполне возможно, что мэскалин производится в пробирке из дофамина. Дозировка мэскалина:- Немецкий фармаколог и химик Артуа Карл Вильхэльм Хэфта (Arthur Carl Wilhelm Heffter; 1859–1925) был первым человеком, который проверил выделенный элемент Кактуса Пейота на себе. Классическая дозировка Хеффтера состояла из 150 миллиграммов (мг) мэскалина гидрохлорида. Психоделической дозировкой в настоящее время считается от 178 до 256 мг мэскалина или от 200 до 400 мг сульфата мэскалина. Максимальной дозировкой считается до 1 500 мг мэскалина. Галлюциногенной дозой считается употребление чистого мэскалина во внутрь с расчётом по 5 мг/кг. В токсикологической литературе, нет никаких упоминаний о летальной дозе мэскалина, в случае приёма вещества во внутрь. Эффекты мэскалина:- в западной психиатрии использование психотропных препаратов началось с XIX столетия. Мэскалин был первым веществом, которое протестировали и применили в психиатрии. В то время, применение мэскалина здоровым человеком, исследователи расценили, как то, что вещество вызывает состояние, которое свойственно только психопатическим пациентам. Это привело к идее формирования фармакологически индуцированной модели психоза. Эффекты мэскалина (а также псилоцибина) были описаны как интоксикация, токсический экстаз, помутнение сознания, галлюцинации, бред, наркотическое опьянение, выделение в пространстве, мечтание. Только в последние годы произошёл сдвиг в мышлении исследователей и учёных и признание того, что психоделические состояния и психозы не имеют ничего общего. Преобладающие эффекты мэскалина – усиление отдельных чувств и, прежде всего, визуальных оргий. Опьянение веществом мэскалин впервые было описано Немецким психиатром, невропатологом и патопсихологом Куртом Беринграром (Kurt Beringer; 1893–1949) в 1927. Как правило, после употребления мэскалина сообщают, что во время опьянения веществом происходило целое визуальное/галлюциногенное событие:- ‘Моё понимание предмета и объекта исчезло, я чувствовал себя расторгнутым и погружался в оркестр звуков. Для меня это было одно из самых ярких событий в жизни. Всё, что происходило, было прекрасно, я чувствовал себя счастливым’. Существует предположение, что синтетический мэскалин можно употреблять вместо Кактуса Пейота, и что эффекты являются идентичными. Однако, большинство любителей Кактуса Пейота утверждают, что эффекты от употребления синтетического мэскалина вообще не стоит сравнивать с эффектами от употребления Кактуса Пейота. Кактусы, содержащие мэскалин:- Гимнокалициум Горбатый (Gymnocalycium Gibbosum (Haw.) Pfeiffer); Гимнокалициум Лееанум (Gymnocalycium Leeanum (Hook.) Br. et R.); Лофофора Дифуса (Lophophora Diffusa); Лофофора Жорданиана (Lophophora Jourdaniana); Лофофофра Вильэмса (Lophophora Williamsii); Миртиллокактус Геомертизанс (Myrtillocactus Geometrizans); Опунция Басиларна (Opuntia Basilaria Engelm. et Bigel.); Опунция Цилиндрическая (Opuntia Cylindrical (Lam.) S.-D.); Опунция Эхинокарпа (Opuntia Echinocarpa Engelm. et Bigel.); Опунция Крупноколючковая (Opuntia Ficus-Indica (L.) Mill.); Опунция Имбриката (Opuntia Imbricata (Haw.) DC.); Опунция Спиносиор (Opuntia Spinosior (Engelm.) Toumey); Пелецифора Моркацевидная (Pelecyphora Aselliformis Ehrenb.); Переския/Пейреския (Pereskia Corrugata Cutak); Переския/Пейреския (Pereskia Tampicana Web.); Перескиопсис (Pereskiopsis Scandens Br. et R.); Миртиллокактус Ченде (Polaskia Chende (Gossel.) Gibs.); Стеноцереус Бенеке (Stenocereus Beneckei (Ehrenb.) Buxbaum); Стеноцереус Ерука (Stenocereus Eruca (Brand.) Gibs, et Horak); Стеноцереус Стеллатус (Stenocereus Stellatus (Pfeiffer) Rice); Стеноцереус Трелеасей (Stenocereus Treleasei (Br. et R.) Backeb.); Стетсония (Stetsonia Coryne (SD.) Br. et R.); Трихоцереус Бриджеси (Trichocereus Bridgesii (SD.) Br.et R.); Трихоцереус Кускский (Trichocereus Cuscoensis Br. et R.); Трихоцереус Фульвинанус (Trichocereus Fulvinanus Ritt.); Трихоцереус Макрогонус (Trichocereus Macrogonus (SD.) Ricc.); Трихоцереус Сан-Педро (Trichocereus Pachanoi Br. et R.); Трихоцереус Перуанский (Trichocereus Peruvianus Br. et R.); Трихоцереус Спахианус (Trichocereus Spachianus (Lem.) Ricc.); Трихоцереус Стригосус (Trichocereus Strigosus (SD.) Br. et R.); Трихоцериус Таквимбаленсис (Trichocereus Taquimbalensis Card.); Трихоцереус Терсчеки (Trichocereus Terscheckii (Parm.) Br. et R.); и Трихоцереус Валидус (Trichocereus Validus (Monv.) Backbg.).

MESH = ЯЧЕЙКА (или ПЕТЛЯ, или СЕТКА) – Mesh is a type of fabric characterized by its net-like open appearance, and the spaces between the yarns. Mesh is available in a variety of constructions including wovens, knits, laces, or crocheted fabrics. Mesh is a woven, knit, or knotted material of open texture with evenly spaced holes. Mesh is a term for a large class of open fabrics made by almost all methods except felting. It can be made of any fiber, mixture, or blend. Mesh fabrics are used for bags, summer sport shirts, under wear, foundation garments, and hosiery. Mesh hosiery is knitted in such a pattern that, when one yarn is snagged, the stocking will not develop a long, vertical run, but a hole instead. Mesh stockings and panty hose are believed to wear better than other constructions. / Крошэ, от Французского слова Crochet, означающее Крючок, .

MESH FABRICS = ЯЧЕИСТЫЕ ТКАНИ (или ТКАНИ С АЖУРНЫМ РИСУНКОМ, или СЕТЧАТЫЕ ТКАНИ) – Mesh Fabrics is a broad term for fabric characterized by open spaces between the yarns. Mesh fabrics may be woven, knit, lace, net, crochet, etc. / Крошэ, от Французского слова Crochet, означающее Крючок, .

MESH SIZE = РАЗМЕР МЕШ (или РАЗМЕР ЯЧЕЙКИ) – Mesh Size is the size of the openings in a sieve, expressed as the number of such openings per linear inch. / Меш – число ячеек сита на единицу длины.

MESOCOTYL = МЕЗОКОТИЛЬ (или ПОДСЕМЯДОЛЬНОЕ КОЛЕНО) – Mesocotyl is the internode between the coleoptile node and the point of union of the culm and the root in the young seedling. The mesocotyl pushes the coleoptile above the soil surface. Mesocotyl is the internode between the scutellar node and the coleoptile in the embryo. In the young seedling, mesocotyl is the internode between the coleoptile node and the point of union of the culm and root. Its length can be measured only when the seedlings are grown in the dark or from the underground portion of the seedling. / и корень в молодом . Под Мезокотилем, от Греческого слова Mésos, означающее Промежуточный или Средний, и , означающее , понимается .

MESOMORPHIC = МЕЗОМОРФНЫЙ – Mesomorphic:- adapted to conditions that are neither very wet nor especially dry. / Под Мезоморфным, от Греческих слов Mésos, означающее Промежуточный или Средний, и Morphē, означающее Форма, понимается промежуточное состояние .

MESOPHILIC MICROORGANISMS = МЕЗОФИЛЬНЫЕ МИКРООРГАНИЗМЫ – Mesophilic Microorganisms (humidity):- (Greek:- mesos – middle; philos – love) (1) Microorganisms thriving above 86% relative humidity. (2) Microorganisms thriving at medium temperatures.

MESOPHYLL = МЕЗОФИЛЛ – Mesophyll:- the photosynthetic layer of tissue of a green plant underneath the epidermis. / Под Мезофиллом, от Греческих слов Mésos, означающее Промежуточный или Средний, и Phýllon, означающее Лист, понимается основная фотосинтезирующая ткань листовой пластинки растений; состоит из тонкостенных клеток, содержащих хлорофилл.

MESOPHYLL TISSUES = МЕЗОФИЛЬНЫЕ ТКАНИ – Mesophyll Tissues:- the soft tissue of a leaf between the top and bottom epidermis (outermost layer of cells or protective covering of a plant or plant part). / Под Мезофиллом, от Греческих слов Mésos, означающее Промежуточный или Средний, и Phýllon, означающее Лист, понимается основная фотосинтезирующая ткань листовой пластинки растений; состоит из тонкостенных клеток, содержащих хлорофилл.

MESSAGE = СООБЩЕНИЕ – Message is a collection of data in SWIFT format, consisting of a header (and optionally, text and footers) sent by a user or by SWIFT. / Подборка данных в формате СВМФДС (Сообщество по Всемирной Межбанковской Финансовой Дальней Связи; SWIFT (The Society for Worldwide Interbank Financial Telecommunication)), состоящая из заголовка (и возможно, текста и колонтитулов), отправленная пользователем или СВМФДС. коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо).

MESSAGE AUTHENTICATION CODE = КОД АУТЕНТИФИКАЦИИ СООБЩЕНИЯ (или КОД УДОСТОВЕРЕНИЯ ПОДЛИННОСТИ СООБЩЕНИЯ) – The Message Authentication Code (MAC) is a code contained in a message between a sender and receiver used to validate the source and part or all of the text of the message. The code is the result of an agreed calculation.

MESSAGE CATEGORY = КАТЕГОРИЯ СООБЩЕНИЯ – Message Category is a group of message types in SWIFT relating to a particular class of transaction, as indicated by the first digit of the MT (Message Type) number. / Группа типов сообщений в системе СВМФДС (Сообщество по Всемирной Межбанковской Финансовой Дальней Связи; SWIFT (The Society for Worldwide Interbank Financial Telecommunication)), относящаяся к конкретному классу операций и обозначаемая первой цифрой номера ТС (Типа Сообщения). коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо).

MESSAGE PRIORITY = ПРИОРИТЕТ СООБЩЕНИЯ – In SWIFT, Message Priority is a one-letter code assigned by the sender of a message to indicate the priority of the message. Possible values are:- S (System), U (Urgent), and N (Normal). / В системе СВМФДС (Сообщество по Всемирной Межбанковской Финансовой Дальней Связи; SWIFT (The Society for Worldwide Interbank Financial Telecommunication)), однобуквенный код, присваемый отправителем сообщения для указания приоритета данного сообщения. Возможными кодами оценки являются:- S (Системное от Английского слова System), U (Срочное от Английского слова Urgent) и N (Обычное от Английского слова Normal). коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо).

MESSAGE TEXT STANDARD = СТАНДАРТ ТЕКСТА СООБЩЕНИЯ – Message Text Standard:- the rules laid down for the format and content of a particular SWIFT message. / Сообщество по Всемирной Межбанковской Финансовой Дальней Связи (СВМФДС; The Society for Worldwide Interbank Financial Telecommunication (SWIFT)). коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо).

MESSAGE TYPE = ТИП СООБЩЕНИЯ – The specification of each SWIFT message by a three–digit number showing the major area (category), the function (group), and the specific details (format). There is a set of rules for each message type. / Спецификация каждого сообщения в системе СВМФДС (Сообщество по Всемирной Межбанковской Финансовой Дальней Связи; SWIFT (The Society for Worldwide Interbank Financial Telecommunication)) посредством трёхцифрового номера, отражающего основную зону (категорию), функцию (группу), и специфические сведения (формат). Существует комплект правил по каждому типу сообщения. коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо).

MESSAGE USER REFERENCE = ССЫЛКА ПОЛЬЗОВАТЕЛЯ СООБЩЕНИЯ – In a SWIFT message, Message User Reference is a free-format field in the optional user header, allowing the sender to add its own reference of up to 16 characters. / В сообщении в системе СВМФДС (Сообщество по Всемирной Межбанковской Финансовой Дальней Связи; SWIFT (The Society for Worldwide Interbank Financial Telecommunication)) поле свободного формата в факультативном заголовке пользователя, позволяющее отправителю добавить свою собственную ссылку, которая может состоять максимум из 16 знаков. коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо).

MESSALINE = МЭСЭЛЫН – Messaline is a soft lightweight silk dress fabric with a satin weave.

MESS DRESS = ПАРАДНОЕ ПЛАТЬЕ – Mess Dress is the military term for the formal evening dress worn by military officers in the mess or at other formal occasions. It is also known as Mess Uniform and Mess Kit. It frequently consists of a mess jacket and trousers worn with a formal shirt and other formal accessories, though the exact form varies depending on the uniform regulations for each service. This style of military dress is largely restricted to the British, Commonwealth of Nations and United States (US) armed forces, though it is also sometimes worn by members of civilian uniformed services and members of a Royal Household. The French, Imperial German, and other navies adopted their own versions of mess dress during the late XIX century, influenced by the Royal Navy. While predominantly a uniform worn by commissioned officers for whom it is mandatory, it may also be worn as an optional uniform by senior enlisted personnel in the US Navy and US Air Force, and by non-commissioned officers in the British Army and Royal Air Force.

MESSENGER = МЭСЭНДЬЖЁ (или ПРОВОДНИК, или КАБАЛЯР, или БРОСАТЕЛЬНЫЙ КОНЕЦ) – Messenger (maritime term):- a light line used for hauling over a heavier rope or cable. / Мессенджер Трала; Проводник (трос); Кабаляр.

MESSENGER RNA = ИНФОРМАЦИОННАЯ РНК (или МАТРИЧНАЯ РНК) – Messenger RNA (mRNA) is a chain of single-stranded ribonucleotides that codes for a specific protein. Product from DNA by transcription which serves as the information carrier for translation into proteins in the ribosomes. / (мРНК).

MESS GEAR = СТОЛОВЫЕ ПРИБОРЫ (или КАМБУЗНЫЕ ПРИНАДЛЕЖНОСТИ) – Mess Gear (maritime term):- equipment used for serving meals.

MESS JACKET = ПАРАДНЫЙ ЖАКЕТ – Mess Jacket is a fitted waist-length man's jacket worn especially as part of a dress uniform.

MESSMAN = РАЗНОСЧИК ПИЩИ – Messman (maritime term):- a member of the steward's department who served meals to officers and crew.

MET = MOBILE ELECTRONIC TRANSACTION

META = META – Meta is a chemical prefix, usually abbreviated m, that denotes that two substituents on a benzene ring are separated by one carbon atom. / Под Мета, от Греческого слова Meta, означающее За или После, понимается .

METABOLISM = МЕТАБОЛИЗМ (или ОБМЕН ВЕЩЕСТВ) – Metabolism is the physical, chemical or biochemical processes in living organisms for maintaining growth, development, and reproduction. A collective term for all chemical changes in living cells. / Под Метаболизмом, от Греческого слова Metabolē, означающее Перемена или Превращение, понимается:- (1) то же, что Обмен Веществ – совокупность всех химических изменений и всех видов превращений веществ и энергии в организмах, обеспечивающих развитие, жизнедеятельность и самовоспроизведение организмов, их связь с окружающей средой и адаптацию к изменениям внешних условий. Основу обмена веществ составляют взаимосвязанные процессы анаболизма и катаболизма, направленные на непрерывное обновление живого материала и обеспечение его необходимой энергией. Анаболические и катаболические процессы осуществляются путём последовательных химических реакций с участием ферментов. Для каждого вида организмов характерен особый, генетически закреплённый тип обмена веществ, зависящий от условий его существования. Интенсивность и направленность обмена веществ в клетке обеспечивается путём сложной регуляции синтеза и активности ферментов, а также в результате изменения проницаемости биологических мембран. В организме человека и животных имеет место гормональная регуляция обмена веществ, координируемая центральной нервной системой. Любое заболевание сопровождается нарушением обмена веществ; генетически обусловленные нарушения обмена веществ служат причиной многих наследственных болезней. (2) В более узком смысле слова метаболизм – промежуточный обмен, то есть превращение определённых веществ внутри клеток с момента их поступления до образования конечных продуктов, например, метаболизм белков, метаболизм глюкозы, метаболизм лекарственных препаратов.

METABOLITE = МЕТАБОЛИТ – Metabolite:- chemicals that are end-products resulting from a natural sequence of biochemical reactions. Breakdown products. / в результате естественной последовательности биохимических реакций. Под Метаболитом понимается промежуточный продукт обмена веществ в живых клетках. Многие метаболиты оказывают регулирующее влияние на проходящие в организме биохимические и физиологические процессы.

METAL = МЕТАЛЛ – Metal is any of a class of substances characterized by high electrical and thermal conductivity as well as by malleability, ductility, and high reflectivity of light. Approximately three-quarters of all known chemical elements are metals. The most abundant varieties in the Earth's crust are aluminum, iron, calcium, sodium, potassium, and magnesium. The vast majority of metals are found in ores (mineral-bearing substances), but a few such as copper, gold, platinum, and silver frequently occur in the free state because they do not readily react with other elements. Metals are usually crystalline solids. In most cases, they have a relatively simple crystal structure distinguished by a close packing of atoms and a high degree of symmetry. Typically, the atoms of metals contain less than half the full complement of electrons in their outermost shell. Because of this characteristic, metals tend not to form compounds with each other. They do, however, combine more readily with nonmetals (e.g., oxygen and sulfur), which generally have more than half the maximum number of valence electrons. Metals differ widely in their chemical reactivity. The most reactive include lithium, potassium, and radium, whereas those of low reactivity are gold, silver, palladium, and platinum. The high electrical and thermal conductivities of the simple metals (i.e. the non-transition metals of the periodic table) are best explained by reference to the free-electron theory. According to this concept, the individual atoms in such metals have lost their valence electrons to the entire solid, and these free electrons that give rise to conductivity move as a group throughout the solid. In the case of the more complex metals (i.e. the transition elements), conductivities are better explained by the band theory (q.v.), which takes into account not only the presence of free electrons but also their interaction with so-called d electrons. The mechanical properties of metals, such as hardness, ability to resist repeated stressing (fatigue strength), ductility, and malleability, are often attributed to defects or imperfections in their crystal structure. The absence of a layer of atoms in its densely packed structure, for example, enables a metal to deform plastically, and prevents it from being brittle. Semimetals:- the semimetals antimony, arsenic, and bismuth have a structure type distinct from the simple-packed spheres of the metals. In these semimetals, each atom is positioned closer to three of its neighbouring atoms than to the rest. The structure of antimony and arsenic, composed of spheres that intersect along flat circular areas, is shown in Figure 9B. The covalent character of the bonds joining the four closest atoms is linked to the electronegative nature of the semimetals, reflected by their position in the periodic table. Members of this group are fairly brittle, and they do not conduct heat and electricity nearly as well as the native metals. The bond type suggested by these properties is intermediate between metallic and covalent; it is consequently stronger and more directional than pure metallic bonding, resulting in crystals of lower symmetry. Metals:- gold, silver, and copper are members of the same group (column) in the periodic table of elements and therefore have similar chemical properties. In the uncombined state, their atoms are joined by the fairly weak metallic bond. These minerals share a common structure type, and their atoms are positioned in a simple cubic closest-packed arrangement. Gold and silver both have an atomic radius of 1.44 angstroms (Å), which enables complete solid solution to take place between them. The radius of copper is significantly smaller (1.28 Å), and as such copper substitutes only to a limited extent in gold and silver. Likewise, native copper contains only trace amounts of gold and silver in its structure. Owing to their similar crystal structure, the members of the gold group display similar physical properties. All are rather soft, ductile, malleable, and sectile; gold, silver, and copper serve as excellent conductors of electricity and heat and exhibit metallic lustre and hackly fracture. These properties are attributable to their metallic bonding. The gold-group minerals crystallize in the isometric system and have high densities as a consequence of cubic closest packing. In addition to the elements listed above, the platinum group also includes the rarer mineral alloys platiniridium and iridosmine. The members of this group are harder than the metals of the gold group and also have higher melting points. The iron-group metals are isometric and have a simple cubic packed structure. Its members include pure iron, which is rarely found on the surface of the Earth, and two species of nickel-iron (kamacite and taenite), which have been identified as common constituents of meteorites. The atomic radii of iron and nickel are both approximately 1.24 Å, and so nickel is a frequent substitute for iron. The terrestrial core is thought to be composed largely of such iron-nickel alloys. / твёрдость (hardness). Металлы, простые вещества, обладающие в обычных условиях характерными свойствами:- высокой электропроводностью и теплопроводностью, отрицательным температурным коэффициентом электропроводности, способностью хорошо отражать электромагнитные волны (блеск и непрозрачность), пластичностью. Металлы в твёрдом состоянии имеют кристаллическое строение. В парообразном состоянии металлы одноатомны. Перечисленные выше характерные свойства металлов обусловлены их электронным строением. Атомы металлов легко отдают внешние (валентные) электроны. В кристаллической решётке металлов не все электроны связаны со своими атомами. Некоторая их часть (~1 на атом) подвижна. Эти электроны могут более или менее свободно перемещаться по металлу. Существование свободных электронов (электронов проводимости) в металлах объясняется зонной теорией (смотрите Твёрдое Тело). Металл можно представить себе в виде остова из положительных ионов, погруженного в 'электронный газ'. Последний компенсирует силы электростатического отталкивания между положительными ионами и тем самым связывает их в твёрдое тело (металлическая связь). Из известных (в 1974) 105 химических элементов 83 – металлы и лишь 22 – неметаллы. Если в длинном или 'полудлинном' варианте периодической системы элементов Менделеева провести прямую линию от бора до астата, то можно считать, что неметаллы расположены на этой линии и справа от неё, а металлы – слева. Не следует, однако, абсолютизировать ни свойства, характерные для металлов, ни их отличия от неметаллов. Металлический блеск присущ

только компактным металлическим образцам. Тончайшие листки Ag и Au (толщиной 10^{-4} миллиметра (мм)) просвечивают голубовато-зелёным цветом. Мельчайшие порошки металлов часто имеют чёрный или чёрно-серый цвет. Некоторые металлы (Цинк Zn, Сурьма Sb, Висмут Bi) при комнатной температуре хрупки и становятся пластичными только при нагревании. Вся совокупность перечисленных выше свойств присуща типичным металлам (например, Медь Cu, Золото Au, Серебро Ag, Железо Fe) при обычных условиях (атмосферном давлении, комнатной температуре). При очень высоких давлениях (~10^5–10^6 атмосфер (ам)) свойства металлов могут существенно измениться, а неметаллы приобрести металлические свойства. Многие простые вещества по одним свойствам можно отнести к металлам, по другим – к неметаллам. Особенно много такого рода ‘нарушений’ имеет место вблизи границы, проведённой в периодической системы элементов Менделеева, о которой упоминалось ранее. Так, Германий Ge по внешнему виду – металл, в химическом отношении проявляет себя скорее как металл (легче отдаёт электроны, чем принимает), а по величине и характеру электропроводности Ge – полупроводник. Сурьма Sb имеет электросопротивление слишком большое для металла, однако температурный коэффициент сопротивления у Sb положительный и большой, как у металла; по способности отдавать электроны Sb также относится к металлам. Мышьяк As, Сурьма Sb и Висмут Bi иногда называют полуметаллами. Полоний Po по внешнему виду – металл, в химическом отношении ему присущи свойства и металла, и неметалла – наряду с положительной валентностью (точнее окислительным числом) проявляется и отрицательная (–2). Металлические сплавы по свойствам имеют много общего с металлами, поэтому в физической, технической и экономической литературе нередко к металлам относят также и сплавы. Историческая Справка:- Термин ‘Металл’ произошёл от Греческого слова Métallon, от Metalléuo, означающее Выкапываю или Добываю Из Земли, которое означало первоначально копи, рудники (в этом смысле оно встречается у Геродота, V века до Нашей Эры). То, что добывалось в рудниках, Платон называл Metalléia. В древности и в средние века считалось, что существует только 7 металлов:- Золото Au, Серебро Ag, Медь Cu, Олово Sn, Свинец Pb, Железо Fe, Ртуть Hg (смотрите Химические Знаки). По алхимическим представлениям, металлы зарождались в земных недрах под влиянием лучей планет и постепенно крайне медленно совершенствовались, превращаясь в серебро и золото (смотрите Алхимия). Алхимики полагали, что металлы – вещества сложные, состоящие из ‘начала металличности’ (ртути) и ‘начала горючести’ (серы). В начале XVIII века получила распространение гипотеза, согласно которой металлы состоят из земли и ‘начала горючести’ – флогистона. Российский учёный Михаил Васильевич Ломоносов (1711–1765) насчитывал 6 металлов (Золото Au, Серебро Ag, Медь Cu, Олово Sn, Железо Fe, и Свинец Pb) и определял металлы как ‘светлое тело, которое ковать можно’. В конце XVIII века Французский учёный Отуан-Люро дё Лявуозье (Antoine-Laurent de Lavoisier; 1743–1794) опроверг гипотезу флогистона и показал, что металлы – простые вещества. В 1789 Лявуозье в руководстве по химии дал список простых веществ, в который включил все известные тогда 17 металлов (Сурьма Sb, Серебро Ag, Мышьяк As, Висмут Bi, Кобальт Co, Медь Cu, Олово Sn, Железо Fe, Марганец Mn, Ртуть Hg, Молибден Mo, Никель Ni, Золото Au, Платина Pt, Свинец Pb, Вольфрам W, Цинк Zn). По мере развития методов химического исследования число известных металлов возрастало. В 1-й половине XIX века были открыты спутники Платины Pt, получены путём электролиза некоторые щелочные и щёлочноземельные металлы, положено начало разделению редкоземельных металлов, открыты неизвестные металлы при химическом анализе минералов. В 1860–63 методом спектрального анализа были открыты Цезий Cs, Рубидий Rb, Талий Tl, Индий In. Блестяще подтвердилось существование металлов, предсказанных Российским учёным Дмитрием Ивановичем Менделеевым (1834–1907) на основе его периодического закона. Открытие радиоактивности в конце XIX века повлекло за собой поиски природных радиоактивных металлов, увенчавшиеся полным успехом. Наконец, методом ядерных превращений начиная с середины XX века были искусственно получены радиоактивные металлы, в частности трансурановые элементы. В конце XIX–начале XX веков получила физико-химическую основу металлургия – наука о производстве металлов из природного сырья. Тогда же началось исследование свойств металлов и их сплавов в зависимости от состава и строения (смотрите Металловедение, Металлофизика). Химические Свойства:- В соответствии с местом, занимаемым в периодической системе элементов, различают металлы главных и побочных подгрупп. Металлы Главных Подгрупп (подгруппы а) называют также Непереходными Металлами. Эти металлы характеризуются тем, что в их атомах происходит последовательное заполнение s- и p-электронных оболочек. В атомах Металлов Побочных Подгрупп (подгруппы б), называют Переходными Металлами, происходит достраивание d- и f-оболочек, в соответствии с чем их делят на d-группу и две f-группы – лантаноиды и актиноиды. В подгруппы а входят 22 металла:- Литий Li, Натрий Na, Калий K, Рубидий Rb, Цезий Cs, Франций Fr (I а); Бериллий Be, Магний Mg, Кальций Ca, Стронций Sr, Барий Ba, Радий Ra (II а); Алюминий Al, Галлий Ga, Индий In, Таллий Tl (III а); Германий Ge, Олово Sn, Свинец Pb (IV а); Сурьма Sb, Висмут Bi (V а); Полоний Po (VI а). В подгруппы б входят:- (1) 33 переходных металла d-группы (Медь Cu, Серебро Ag, Золото Au (I б), Цинк Zn, Кадмий Cd, Ртуть Hg (II б); Скандий Sc, Иттрий Y, Лантан La, Актиний Ac (III б); Титан Ti, Цирконий Zr, Гафний Hf, Курчатовий (Ku; известный в мире как Резерфордий Rf) (IV б); Ванадий V, Ниобий Nb, Тантал Ta, элемент с Z = 105 (Дубний Db) (V б); Хром Cr, Молибден Mo, Вольфрам W (VI б); Марганец Mn, Теллур Te, Рений Re (VII б); Железо Fe, Кобальт Co, Никель Ni, Рутений Ru, Родий Rh, Палладий Pd, Осмий Os, Иридий Ir, Платина Pt (VIII б)); (2) 28 металлов f-группы (14 лантаноидов и 14 актиноидов). Электронная структура атомов некоторых d-элементов имеет ту особенность, что один из электронов внешнего уровня переходит на d-подуровень. Это происходит при достройке этого подуровня до 5 или 10 электронов. Поэтому электронная структура валентных подуровней атомов d-элементов, находящихся в одной подгруппе, не всегда одинакова. Например, Хром Cr и Молибден Mo (подгруппа VI б) имеют внешнюю электронную структуру соответственно $3d^5 4s^1$ и $4d^5 5s^1$, тогда как у Вольфрама W она $5d^4 6s^2$. В атоме Палладия Pd (подгруппа VIII б) два внешних электрона ‘перешли’ на соседний валентный подуровень, и для атома Pd наблюдается d^{10} вместо ожидаемого $d^8 s^2$. Металлам присущи многие общие химические свойства, обусловленные слабой связью валентных электронов с ядром атома:- образование положительно заряженных ионов (катионов), проявление положительной валентности (окислительного числа), образование основных окислов и гидроокисей, замещение водорода в кислотах и так далее. Металлические свойства элементов можно сравнить, сопоставляя их электроотрицательность (способность атомов в молекулах (в ковалентной связи) притягивать электроны, выражена в условных единицах); элементу присущи свойства металлов тем больше, чем ниже его электроотрицательность (чем сильнее выражен электроположительный характер). В периодической системе элементов Менделеева в пределах каждого периода, начиная со 2-го, с увеличением атомного номера электроотрицательность возрастает от 2 до 7, начиная со щелочного металла и кончая галогеном (переход от металлов к неметаллам). В пределах подгрупп (а и б) с увеличением атомного номера электроотрицательность в общем уменьшается, хотя и не всегда последовательно. В семействах лантаноидов и актиноидов она сохраняется примерно на одном уровне. Если расположить металлы в последовательности увеличения их нормальных потенциалов, получим так называемый Ряд Напряжений или Ряд Активностей. Рассмотрение этого ряда показывает, что по мере приближения к его концу – от щелочных и щёлочноземельных металлов к Платине Pt и Золоту Au – электроположительный характер членов ряда уменьшается. Металлы от Лития Li по Натрий Na вытесняют H_2 из H_2O на холоду, а от Магния Mg по Таллий Tl – при нагревании. Все металлы, стоящие в ряду выше H_2, вытесняют его из разбавленных кислот (на холоду или при нагревании). Металлы, стоящие ниже H_2, растворяются только в кислородных кислотах (таких, как концентрированная H_2SO_4 при нагревании или HNO_3), а Платина Pt, Золото Au – только в царской водке (Иридий Ir нерастворим и в ней). Металлы от Лития

Li по Натрий Na легко реагируют с O_2 на холоду; последующие члены ряда соединяются с O_2 только при нагревании, а Иридий Ir, Платина Pt, Золото Au в прямое взаимодействие с O_2 не вступают. Окислы металлов от Лития Li по Алюминий Al и от Лантана La по Цинк Zn трудно восстановимы; по мере продвижения к концу ряда восстановимость окислов увеличивается, а окислы последних его членов разлагаются на металлы и O_2 уже при слабом нагревании.

METAL = МЕТАЛЛИЧЕСКОЕ – Metal or Metallic Fiber is inorganic fiber obtained from metal. Fibers can be coated with metals, in which case they are described as Metallized Fibers and not Metal Fibers. Alphabetic code – MTF; and relevant commercial allowance – 2.00 (refers to European Union Directives on Textile Labelling). See also Metallic Fiber. Metallic is an inorganic fiber made from minerals and metals, blended and extruded to form fibers. The fiber is formed from a flat ribbon of metal, coated with a protective layer of plastic, which reduces tarnishing. Metal used in apparel fabric is purely decorative. / Металлическое Волокно – волокно, полученное из металла.

METAL ACCOUNT = МЕТАЛЛИЧЕСКИЙ СЧЁТ – Metal Account is a precious metal account managed by a bank giving the accountholder a claim to a specified quantity of precious metal or a specified number of precious metal coins but not yet conferring title to the assets as the time they are credited. See also Allocated Account, and Unallocated Account. / Смотрите также Счёт Ответственного Хранения (Allocated Account); и Обезличенный Счёт (Unallocated Account). В России банки предлагают своим клиентам открытие обезличенных Металлических Счетов. Одной из целей открытия такого счёта (по мнению банка) может быть снижение рисков потерь, связанных с негативными изменениями на финансовых рынках. Металлические счета позволяют клиентам диверсифицировать их инвестиционный портфель вложениями в благородные металлы:- золото, палладий, платина и серебро. Обезличенный металлический счёт открывается для учёта движения металла в обезличенной форме, на котором отражается металл в граммах без указания индивидуальных признаков (количества слитков, пробы, производителя, серийного номера и другого). Российские банки позиционируют следующие возможные преимущества металлических счетов:- (i) возможность сохранения и преумножения денежных средств за счёт роста стоимости благородных металлов; (ii) доступность – бесплатное открытие и ведение счёта; (iii) возможность покупки благородного металла минимальным размером – от 0.1 грамма для золота, палладия и платины и от 1 грамма для серебра; и (iv) высокая ликвидность – ежедневные операции по покупке и продаже банком металла. Однако, они ничего не говорят, что рост финансов на таком счёт возможен лишь во время длительных тенденций роста цен на благородные металлы, а это встречается достаточно редко. Обезличенный Металлический Счёт принципиально отличается от металлического счёта ответственного хранения. Открывая его, вы не становитесь владельцем реального физического металла. Его в хранилищах банка может не быть ни грамма. По сути дела, вы покупаете обязательство банка заплатить вам определённую денежную сумму, размер которой будет зависеть от текущей стоимости золота. Если на счету у вас 100 граммов золота, то это значит, что вы в любой момент можете получить денежную стоимость этих 100 граммов золота по цене покупки банка на текущий момент. Кроме того, обычно вы можете получить эти 100 граммов и в виде слитка. Но для этого вам придётся заплатить дополнительные 18% НДС. В большинстве случаев вам также придётся заказывать получение слитка за какой-то срок. Преимущества обезличенных металлических счетов:- (i) на сегодняшний день (в 2011) разница между курсом покупки и продажи золота для обезличенного металлического счёта гораздо меньше, чем для золотых монет. При покупке золота вы не платите НДС. (ii) Это ликвидная собственность. Вы в любой момент можете перевести этот счёт в деньги. (iii) У вас нет проблем и расходов, связанных с хранением монет и слитков золота. (iv) Некоторые банки начисляют на золотые счета проценты. (v) Некоторые банки позволяют открывать счета на минимальные суммы. Недостатки обезличенных металлических счетов:- (i) Надёжность этого вложения полностью зависит от надёжности банка. На металлические счета даже не распространяется система страхования денежных вкладов. (ii) Условия функционирования таких счетов могут ухудшиться при соответствующих изменениях в законодательстве. (iii) Цена покупки и продажи золота определяется самим банком. Этот разрыв в момент продажи вами золота может оказаться больше, чем в момент покупки. (iv) Возможность получить золото по обезличенному счёту в момент ажиотажного спроса может оказаться трудно реализуемой даже в силу физического отсутствия достаточного числа слитков. (v) Условия договора открытия обезличенного металлического счёта потенциально могут содержать скрытые дополнительные риски. Если ваша главная задача – абсолютная надёжность вложения, то вам лучше приобретать физическое золото в слитках или монетах. Если вы планируете очень долговременные вложения (на многие годы), то хранение в слитках и монетах на сегодняшний день для большинства ситуаций тоже выглядит более привлекательным. Если вложенные в золото средства могут понадобиться вам в ближайшее время, то лучше воспользоваться обезличенными металлическими счетами (если вообще инвестировать в золото). Если ваша главная задача – заработать на росте стоимости золота в ближайшие месяцы, в ближайший год, то обезличенные счета могут быть вам полезны. Но при этом необходимо быть крайне осторожным и тщательно отслеживать текущую ситуацию. Эти счета можно размещать только в самых надёжных банках. Следует тщательно изучать условия договоров на открытие металлического счёта и, в частности, описание возможности получения по нему золота в слитках. Если неожиданно оказывается, что банк не так надёжен, как вам казалось, то средства с этого счёта, скорее всего, лучше снять. Если получить слитки или вывести деньги из банка уже невозможно, но лицензия банка ещё не отозвана, то вам нужно хотя бы перевести средства на обычный денежный счёт, чтобы на них распространялась гарантия по вкладам. Особенно внимательным нужно быть в случае стремительного повышения цены золота. Если резкий подъём произойдет в очень короткие сроки, то следует иметь в виду вариант частичного или полного перевода обезличенного счёта в слитки. В каких-то ситуациях может оказаться разумным продать золото со счёта и зафиксировать полученную прибыль в денежной форме. Как уже говорилось выше, у банка, скорее всего, нет физического золота в обеспечение вашего обезличенного металлического счёта. Его способность отвечать по своим обязательствам перед вами поэтому будет зависеть от того, много ли у него таких обязательств по золоту, и от того, учитывал ли банк риски повышения его цены, страховался ли от них. Но даже если надёжность вашего банка абсолютно не пострадает, возможное развитие ажиотажа среди частных покупателей может привести к острому физическому дефициту слитков и, следовательно, большим задержкам с их получением.

METAL COMPLEX DYE = МЕТАЛЛОКОМПЛЕКСНЫЙ КРАСИТЕЛЬ – Application of 1:1 Metal-Complex Dyes is carried out at pH 1.8–2.5 with sulphuric acid or at pH 3–4 with formic acid, in the presence of sodium sulphate (5–10%) and other organic levelling agents. Owing to these particular operative conditions, this class of dyestuffs is particularly suitable for piece-dyeing of carbonised wool. 1:2 metal-complex dyes form the most important group in this class and may be divided into two sub-groups:- weakly polar and strongly polar 1:2 complexes. Application is usually carried out in moderately acidic conditions:- (i) pH range 4–7 (acetic acid) in the presence of ammonium acetate, for weakly polar complexes; and (ii) pH range 5–6 (acetic acid) in the presence of ammonium sulphate, for strongly polar complexes. The use of levelling agents is very common when dyeing with metal-complex dyes. The groups of substances used for acid dyes also apply in this case. Metal Complex Dyes is a class of dyestuffs that is ionic and premetallized (chemically coupled with nickel, copper, and cobalt salts to make the dye on the fiber). Metal Complex Dye or Metallized Dye is a dye in which typically one or two dye molecules form a close permanent association or ‘complex’ with a metal atom. The metal associated with the dye is held by what is more or less electrical charge attraction of more than one part of the dye molecule for the electrons of

the metal atom. The metal is often copper, chromium or cobalt. Metal complex dyes are found in many application classes such as direct, reactive and acid. See also Premetallized Dye. / или Металлсодержащий Краситель (Metallized Dye) – краситель, в котором . муравьиная кислота (formic acid).

METAL CONNECTOR PLATE = XX (или СОЕДИНИТЕЛЬНАЯ МЕТАЛЛИЧЕСКАЯ ПЛАСТИНА) – Metal Connector Plate is a light-gauge flat metal plate with protruding teeth or barbs which are pressed into wood to connect two components or repair a broken pallet component. See also Pallet. / Соединительная Металлическая Пластина (Metal Connector Plate):- металлическая пластина с выступающими зубцами, применяемая для соединения двух элементов поддона или для восстановления повреждённых элементов поддона. Смотрите также Поддон (Pallet).

METALLIC CLOTH = МЕТАЛЛИЧЕСКОЕ ПОЛОТНО (или ПРОВОЛОЧНОЕ ПОЛОТНО) – Metallic Cloth is any fabric, such as lame, woven with gold, silver, tinsel, or other metal threads. Metallic is a fabric made with metallic fiber, namely a fiber or yarn made of or coated with metal.

METALLIC FIBER = МЕТАЛЛИЧЕСКОЕ ВОЛОКНО – Metallic Fiber is a manufactured fiber composed of metal, plastic-coated metal, metalcoated plastic, or a core completely covered by metal. They are available in 'yarn' form as well as in staple form for spinning with other fibers. A core yarn with a metal surface is produced by twisting a strip of metal around yarn of natural or manufactured fibers. The most important characteristic of metallic fiber and the chief reason for its use in textiles is glitter. Metallic fibers are used as a decorative accent in fabrics for apparel, bedspreads, towels, draperies, and upholstery. A relatively new application for metallic fibers is in carpet pile, where they are being used in small percentages for control of static electricity. See also Metal. Metallic is a generic name for a manufactured fiber that may be metal, metal coated with a synthetic, or a man-made fiber core covered with metal. When the metal is coated with a man-made film, the metal does not tarnish. / Металлическое Волокно – волокно, полученное из металла.

METALLIC STANDARD = МЕТАЛЛИЧЕСКИЙ СТАНДАРТ – Metallic Standard is a tying the value of currency to the market value of precious metals. / Металлический Стандарт привязывает стоимость валюты к рыночной стоимости благородных металлов.

METALLIZED DYES = МЕТАЛЛСОДЕРЖАЩИЕ КРАСИТЕЛИ – Metallized Dyes is a class of dyes that have metals in their molecular structure. They are applied from an acid bath. See also Dyes. Metal-Containing Dyes:- these dyes are being used increasingly widely. They represent a logical development from the mordant dyes, the dye-metal complex (usually with chromium or copper) being formed during the manufacturing process rather than on the fiber during dyeing. Dyes of this type are now available both as direct dyes for cellulosic fibers or as neutral dyeing acid dyes for wool and other basic fibers. They have good fastness properties. / Металлсодержащие Красители – кислотные красители (преимущественно азокрасители), содержащие в молекуле атом хрома, кобальта или меди. Образуют неяркие окраски, устойчивые к действию света и мокрым обработкам. Применяются для крашения шерсти (водорастворимые металлсодержащие красители) и полиамидных волокон (нерастворимые металлсодержащие красители).

METALLOGRAPHY = МЕТАЛЛОГРАФИЯ – Metallography:- the XX century has seen metallurgy change progressively, from an art or craft to a scientific discipline and then to part of the wider discipline of materials science. In extractive metallurgy, there has been the application of chemical thermodynamics, kinetics, and chemical engineering, which has enabled a better understanding, control, and improvement of existing processes and the generation of new ones. In physical metallurgy, the study of relationships between macrostructure, microstructure, and atomic structure on the one hand and physical and mechanical properties on the other has broadened from metals to other materials such as ceramics, polymers, and composites. This greater scientific understanding has come largely from a continuous improvement in microscopic techniques for metallography, the examination of metal structure. The first true metallographer was Henry Clifton Sorby of Sheffield, Eng., who in the 1860s applied light microscopy to the polished surfaces of materials such as rocks and meteorites. Sorby eventually succeeded in making photomicrographic records, and by 1885 the value of metallography was appreciated throughout Europe, with particular attention being paid to the structure of steel. For example, there was eventual acceptance, based on micrographic evidence and confirmed by the introduction of X-ray diffraction by William Henry and William Lawrence Bragg in 1913, of the allotropy of iron and its relationship to the hardening of steel. During subsequent years there were advances in the atomic theory of solids; this led to the concept that, in nonplastic materials such as glass, fracture takes place by the propagation of preexisting cracklike defects and that, in metals, deformation takes place by the movement of dislocations, or defects in the atomic arrangement, through the crystalline matrix. Proof of these concepts came with the invention and development of the electron microscope; even more powerful field ion microscopes and high-resolution electron microscopes now make it possible to detect the position of individual atoms. Another example of the development of physical metallurgy is a discovery that revolutionized the use of aluminum in the XX century. Originally, most aluminum was used in cast alloys, but the discovery of age hardening by Alfred Wilm in Berlin about 1906 yielded a material that was twice as strong with only a small change in weight. In Wilm's process, a solute such as magnesium or copper is trapped in supersaturated solid solution, without being allowed to precipitate out, by quenching the aluminum from a higher temperature rather than slowly cooling it. The relatively soft aluminum alloy that results can be mechanically formed, but, when left at room temperature or heated at low temperatures, it hardens and strengthens. With copper as the solute, this type of material came to be known by the trade name Duralumin. The advances in metallography described above eventually provided the understanding that age hardening is caused by the dispersion of very fine precipitates from the supersaturated solid solution; this restricts the movement of the dislocations that are essential to crystal deformation and thus raises the strength of the metal. The principles of precipitation hardening have been applied to the strengthening of a large number of alloys. American Society for Testing and Materials (ASTM). Metallography and Metal Testing:- the properties of an alloy of a given composition can change markedly with the microscopic arrangement of its crystalline grains, i.e. its microstructure. To evaluate and control the microstructure of a sample, various types of microscope are used, and the field is called Metallography. (i) Optical Microscopy:- the simplest, and oldest, type of metallography (though hardly a century old) involves polishing the surface to a mirrorlike finish and examining light reflected from it at magnifications of 50 to 1 500x. If the surface is lightly etched in an appropriate solution (often an acid), the grain boundaries, matrix, and constituent phases will be attacked at different rates and will be discernible. This makes it possible to establish which phases are present as well as their shape, size, and distribution. Similarly, grain size and shape can be observed. With this information it is possible to infer the history of the sample and predict its behaviour. Metallography is of particular value in the analysis of samples that have failed or performed in an unexpected manner. (ii) Electron Microscopy:- great progress has been made in using finely focused beams of energetic electrons to examine metals. Electron microscopes are basically of two types, transmission and scanning. Transmission electron microscopes require the preparation of films so thin that they are transparent to a beam of electrons with energies of roughly 200 kiloelectron Volts. This means the film must have a thickness of only one, or a few, hundred nanometers (10^{-9} meter). Films of lighter elements, such as aluminum, can be thicker, while films of heavier elements, such as gold, must be thinner. Contrast between neighbouring regions is best developed by differences in their diffraction of the electron beam, although differences in density can also be used. Spatial resolution is excellent, going down to atomic resolution in special microscopes, and orientation
