RICE STEMBORER = РИСОВЫЙ СТЕБЛЕВОЙ ТОЧИЛЬЩИК – Rice Stemborers:- General Information:- (i) Stemborers belonging to the Orders Diptera and Lepidoptera are the most serious pests of Rice in Sub-Saharan Africa. (ii) They are internal stem feeders and larval feeding causes damage to rice tillers during the vegetative and reproductive stages. Stem borer attack is most damaging when it occurs after tillering is completed. Symptoms:- (i) early symptoms:- (a) deadhearts:- attack of young plants at the vegetative stages (seedlings to panicle initiation) results in the destruction of the growing point, typically referred to as 'Deadhearts' caused by the drying up of the central shoots (dead inner leaves); and (b) larval damage by Maliarpha Separatella within the stem results in reduced plant vigour, fewer tillers and many unfilled grains. The larva does not produce deadhearts because the growing apical portion of the plant is not cut from the base. Thus, panicles can be initiated at the last node. (ii) Late symptom:- (c) whiteheads:- attack of plant bearing panicles at the flowering stage results in a white or dry empty panicle called 'Whitehead'. Causes of stemborer outbreaks:- (i) favorable climate; (ii) presence of alternative hosts in and around Rice fields; (iii) crop residues (what's left after harvest), ratoons (tillers that sprout from Rice stubble) and volunteers (self-seeded Rice Plants that grow up from shed or spilt seeds) are ideal places for borers to survive and multiply; (iv) planting with high-yielding Varieties – Varieties that are unfortunately susceptible to attack; and (v) wide range of planting dates. Control:- (i) cultural practices such as early sowing, narrow spacing of plants and maintaining weed-free fields have been observed to minimize diopsid infestation; (ii) synchronized planting over a large area has been used to allow the most susceptible stage of Rice to escape from Chilo Zacconius damage; (iii) management of stubble by burning, plowing and flooding after harvest destroys diapausing larvae of Maliarpha Separatella; (iv) strip- and inter-cropping of maize with NERICA (New Rice for Africa is one of Cultivars) was found to be effective in reducing stem borer damage on Rice because Maize and Rice share some common stemborer Species; (v) carabids, reduviids, dragonflies and spiders are known predators of Chilo Zacconius; (vi) the braconids Rhaconotus Scirpophagae Wilk. and Bracon Antennatus Granger are gregarious endoparasitoids of Maliarpha Separatella in Nigeria; and (vii) the braconid Cotesia (= Apanteles) Sesamiae Cameron and the eulophid Pediobus Furvus Gahan are the most important wasps attacking Sesamia Spp. / Диптэра (Diptera) и Лэпидоптэра (Lepidoptera). (a) мёртвое сердцевины (deadhearts):-. Малиарфа Сэпаратэлла (Maliarpha Separatella). (ii) Поздний симптом:- (c) белые метёлки (whiteheads):- . от повреждения Хило Заккониус (Chilo Zacconius). ; (vi) the braconids Раконотус Сцирпофагэ Вилк. (Rhaconotus Scirpophagae Wilk.) и Бракон Антэннатус Грангэр (Bracon Antennatus Granger) являются скученными эндопаразитоидами Малиарфа Сэпаратэлла (Maliarpha Separatella) в Нигерии; и (vii) Котэзиа (= Апантэлэс) Сэзамиэ (Cotesia (= Apanteles) Sesamiae) Пэдиобус Фурвус Гахан (Pediobus Furvus Gahan) являются наиболее значимыми Осами, атакующими Виды Сэзамиа (Sesamia Spp.).

RICE TRANSPLANTER = РИСОПОСАДЧИК (или РИСОВЫЙ РАССАДОПОСАДЧИК) – Rice Transplanter is:- (1) a person transplanting Rice. (2) A machine used for transplanting Rice. / сеялка точного высева (planter).

RICE WEEVIL = РИСОВЫЙ ДОЛГОНОСИК – Rice Weevil (Sitophilos Oryzae (Linnaeus)):- adults and larvae feed on a wide variety of grains and a female can deposit up to 150 eggs. A single egg is laid in each grain after boring a hole inside. The egg stays in the grain until it becomes an adult, and this completely damages the grain. The life cycle takes approximately 35 days under good conditions such as 28 °C and 70% relative humidity. / Рисовый Долгоносик, систематическое положение:- Отряд Жуки, или Жесткокрылые, Семейство Долгоносики (Curculionidae). Распространён в Южных регионах России. С партиями зерна попадает в Северные регионы, но здесь может развиваться только в отапливаемых помещениях. Повреждает те же культуры, что и Амбарный Долгоносик. Жук длиной 2–2.8 мм, тёмно-коричневый, матовый; переднеспинка в густых крупных точках; на надкрыльях четыре рыжеватых пятна; задние крылья хорошо развиты; летает. Зимуют жуки, личинки и куколки. Цикл развития и характер повреждения зерна аналогичны таковым Амбарного Долгоносика. Плодовитость самки свыше 500 яиц. Развивается при температуре 13.5–35 °C и влажности зерна не менее 8%. При оптимальных условиях (температура воздуха 28–30 °C и влажность зерна 18%) продолжительность развития составляет около 26 дней. Рисовый Долгоносик менее устойчив к холоду. При нулевой температуре все фазы развития погибают через 17 суток, при –5 °C – через 12 суток. В зависимости от экологических условий даёт от двух до пяти генераций. Рисовый Долгоносик (Calandra (Sitophilus) Oryzae), Жук Семейства Долгоносиков; вредитель зерна (главным образом Риса) и зернопродуктов. Коричневый, длина 2.1–3.5 мм. Распространён широко.

RICE WHORL MAGGOT = ЛИЧИНКА РИСОВОЙ МУТОВКИ – Rice Whorl Maggot:- dull gray in color, Hydrellia Sp. is widespread in the Philippines. The maggots feed on the unopened whorl of the leaf by remaining in the center of the whorl and nibbling the innermost margin of the leaf. The symptoms manifest as small chewed discolored areas on the innermost margin of the central whorl. Severe infestation stunts the plant and reduces tillers in a given hill. The infestation and damage are limited to vegetative stages of the crop.

RICHARDS BAY COAL = РИЧАДЗ БЭЙСКИЙ УГОЛЬ – Richards Bay Coal is coal shipped at the Richards Bay terminal in South Africa, the largest export coal terminal in the world, with a design capacity of 91 million tons annually. Richards Bay coal futures are traded at the ICE Futures Europe® under ticker symbol AFR. Contract size is 1 000 tons quoted in US Dollars and Cents per ton. Contract is financially settled based in coal loaded at the Richards Bay terminal in South Africa. It is cash settled against API 4 Index (All Published Index number 4) as published in the Argus/McCloskey Coal Price Index Report. The API 4 index is the benchmark price for coal exported out of South Africa's Richards Bay terminal. It is calculated as an average of the Argus fob Richards Bay assessment and McCloskey's fob Richards Bay marker. The API 4 index is the benchmark price reference for coal exported out of South Africa's Richards Bay terminal and is used in physical and over-the-counter (OTC) contracts. This is calculated as an average of the Argus fob Richards Bay assessment and McCloskey's FOB Richards Bay marker. Richards Bay Coal Terminal (RBCT; Richards Bay, South Africa) is the single largest export coal terminal in the world. Opened in 1976 with an original capacity of 12 million tons per annum, it has grown into an advanced 24-hour operation with a design capacity of 91 million tons per annum. Positioned at one of the world's deep sea ports, RBCT is able to handle large ships and subsequent large volumes. As such, it has gained a reputation for operating efficiently and reliably. The 276 hectare site currently boasts a quay 2.2 kilometers long with six berths and four ship loaders, with stockyard capacity of 8.2 million tons. RBCT shares a strong co-operative relationship with South Africa's national utility, Transnet, which provides the railway services linking the coal mines to the port, and the shipping coordination of more than 700 ships per annum. / Аргас (Argus). МэКлоски FOB Ричадз Бэй (McCloskey's FOB Richards Bay).

RICH FEN = ОБОГАЩЁННОЕ НИЗИННОЕ БОЛОТО (или ТОПЬ, или ТРЯСИНА) – Rich Fen is a type of fen that is rich in calcium, with a pH around 6–8, but nutrient poor. These special conditions have given the rich fens a specialized and species rich flora, which often consists of orchids, sedges and mosses. The rich fens are often classified into the categories moderately rich fen and extremely rich fen. The extremely rich fens have a higher pH and more vascular plants. Historically rich fens have been used as meadows and pastures, but the practices ceased during the XX century. Many wetland areas, among them the rich fens, were drained in the XIX and XX century to create new agricultural land or to increase productivity in the forestry. There are several other threats though, that might cause degradation and loss of rich fens such as acidification, eutrophication and overgrowth by trees and bushes because of lack of management. Habitat fragmentation is an ongoing threat that leads to reduced connectivity within the landscape. Small and isolated fragments hold in general fewer species than larger and less isolated areas. One reason is that it is more difficult for the species to disperse between the isolated fragments. .

RICHTER SCALE = ШКАЛА РИХТЕРА – The Richter Magnitude Scale:- seismic waves are the vibrations from earthquakes that travel through the Earth; they are recorded on instruments called Seismographs. Seismographs record a zig-zag trace that shows the varying amplitude of ground oscillations beneath the instrument. Sensitive seismographs, which greatly magnify these ground motions, can detect strong earthquakes from sources anywhere in the world. The time, locations, and magnitude of an earthquake can be determined from the data recorded by seismograph stations. The Richter magnitude scale was developed in 1935 by Charles F. Richter of the California Institute of Technology as a mathematical device to compare the size of earthquakes. The magnitude of an earthquake is determined from the logarithm of the amplitude of waves recorded by seismographs. Adjustments are included for the variation in the distance between the various seismographs and the epicenter of the earthquakes. On the Richter Scale, magnitude is expressed in whole numbers and decimal fractions. For example, a magnitude 5.3 might be computed for a moderate earthquake, and a strong earthquake might be rated as magnitude 6.3. Because of the logarithmic basis of the scale, each whole number increase in magnitude represents a tenfold increase in measured amplitude; as an estimate of energy, each whole number step in the magnitude scale corresponds to the release of about 31 times more energy than the amount associated with the preceding whole number value. At first, the Richter Scale could be applied only to the records from instruments of identical manufacture. Now, instruments are carefully calibrated with respect to each other. Thus, magnitude can be computed from the record of any calibrated seismograph. Earthquakes with magnitude of about 2.0 or less are usually called Microearthquakes; they are not commonly felt by people and are generally recorded only on local seismographs. Events with magnitudes of about 4.5 or greater – there are several thousand such shocks annually – are strong enough to be recorded by sensitive seismographs all over the world. Great earthquakes, such as the 1964 Good Friday earthquake in Alaska, have magnitudes of 8.0 or higher. On the average, one earthquake of such size occurs somewhere in the world each year. The Richter Scale has no upper limit. Recently, another scale called the Moment Magnitude Scale has been devised for more precise study of great earthquakes. The Richter Scale is not used to express damage. An earthquake in a densely populated area which results in many deaths and considerable damage may have the same magnitude as a shock in a remote area that does nothing more than frighten the wildlife. Large-magnitude earthquakes that occur beneath the oceans may not even be felt by humans. Richter Scale is widely used quantitative measure of the magnitude of an earthquake, introduced in 1935 by the seismologists Beno Gutenberg and Charles Francis Richter. The scale was originally devised to measure the magnitude of local earthquakes in southern California as recorded by a certain kind of seismograph. The weakest earthquakes that had been detected up to that time were assigned scale values close to zero, and the scale was arranged so that each increase of one unit represents a 10-fold increase in the magnitude of an earthquake (i.e. the numbers on the Richter Scale are proportional to the common (base 10) logarithms of the magnitudes). Later and more sensitive seismographs can detect earthquakes even fainter than the ones that were originally chosen to define magnitude zero; their magnitudes are accommodated on the Richter Scale by the use of negative numbers. Although the scale has no theoretical upper limit, the largest earthquakes have not exceeded a scale value of 9. The scale was refined by Richter and Beno Gutenberg to remove the restrictions of distance and type of seismograph used. Richter Scale is widely used quantitative measure of the magnitude of an earthquake, devised in 1935 by American seismologist Charles F. Richter. Richter Scale of Earthquake Magnitude:- (1) Magnitude Level – (2) Category – (3) Effects – (4) Earthquakes Per Year:- (i) Less Than 1.0 to 2.9 – Micro – generally not felt by people, though recorded on local instruments – more than 100 000; (ii) 3.0–3.9 – Minor – felt by many people; no damage – 12 000–100 000; (iii) 4.0–4.9 – Light – felt by all; minor breakage of objects – 2 000–12 000; (iv) 5.0–5.9 – Moderate – some damage to weak structures – 200–2 000; (v) 6.0–6.9 – Strong – moderate damage in populated areas – 20–200; (vi) 7.0–7.9 – Major – serious damage over large areas; loss of life – 3–20; and (vii) 8.0 and Higher – Great – severe destruction and loss of life over large areas – fewer than 3. The Richter scale was originally devised to measure the magnitude of local earthquakes in southern California as recorded by a specific kind of seismograph. Current scientific practice has replaced the original Richter scale with other scales, including the body-wave magnitude scale and the moment magnitude scale, which have no restrictions regarding distance and type of seismograph used. Nevertheless, the Richter scale is still commonly cited in news reports of earthquake severity. On the original Richter scale the smallest earthquakes measurable at that time were assigned values close to zero. Since modern seismographs can detect seismic waves even smaller than those originally chosen for zero magnitude, the Richter scale now measures earthquakes having negative magnitudes. Each increase of one unit on the scale represents a 10-fold increase in the magnitude of an earthquake – in other words, numbers on the Richter scale are proportional to the common (base 10) logarithms of maximum wave amplitudes. In theory the scale has no upper limit, but in practice no earthquake has ever been registered above magnitude 9. Charles Francis Richter (1900–1985) is an American physicist and seismologist who helped develop the Richter Scale for measuring the magnitude of earthquakes. With Beno Gutenberg (1889–1960), a German-born Caltech professor, he developed in 1935 the scale that came to be

associated with his name, replacing an older 'Mercalli Scale', which unreliably measured an earthquake's intensity at the seismic measuring station rather than at the epicentre of the earthquake. Richter also mapped out quake-prone areas in the United States but tended to disparage attempts at earthquake prediction. He wrote (with Beno Gutenberg) Seismicity of the Earth and Associated Phenomena (1949; revised edition 1954) and Elementary Seismology (1958). The Richter Scale is the best known scale for measuring the magnitude of earthquakes. The magnitude value is proportional to the logarithm of the amplitude of the strongest wave during an earthquake. A recording of 7, for example, indicates a disturbance with ground motion 10 times as large as a recording of 6. The energy released by an earthquake increases by a factor of 30 for every unit increase in the Richter scale. The table below gives the frequency of earthquakes and the effects of the earthquakes based on this scale. Richter Scale No. – No. of Earthquakes Per Year – Typical Effects of This Magnitude:- (i) < 3.4 – 800 000 – detected only by seismometers; (ii) 3.5–4.2 – 30 000 – just about noticeable indoors; (iii) 4.3–4.8 – 4 800 – most people notice them, windows rattle; (iv) 4.9–5.4 – 1 400 – everyone notices them, dishes may break, open doors swing; (v) 5.5–6.1 – 500 – slight damage to buildings, plaster cracks, bricks fall; (vi) 6.2–6.9 – 100 – much damage to buildings:- chimneys fall, houses move on foundations; (vii) 7.0–7.3 – 15 – serious damage:- bridges twist, walls fracture, buildings may collapse; (viii) 7.4–7.9 – 4 – great damage, most buildings collapse; and (ix) > 8.0 – one every 5 to 10 years – total damage, surface waves seen, objects thrown in the air. These effects are assuming a shallow earthquake in a populated area. Earthquakes of large magnitude do not necessarily cause the most intense surface effects. The effect in a given region depends to a large degree on local surface and subsurface geologic conditions. An area of unstable ground (sand, clay, or other unconsolidated materials), for example, is likely to experience much more noticeable effects than an area equally distant from an earthquake's epicentre but underlain by firm ground such as granite. / Шкала Рихтера, классификация землетрясений по магнитудам, основанная на оценке энергии сейсмических волн, возникающих при землетрясениях. Соотношение между магнитудой землетрясения по Шкале Рихтера и его силой в эпицентре по 12-бальной шкале зависит от глубины очага. Шкала была предложена в 1935 Американским сейсмологом Чарлзом Фрэнсисом Рихтёром (Charles Francis Richter; 1900–1985), теоретически обоснована совместно с Бэно Гутэнбэргом (Beno Gutenberg; 1889–1960) в 1941–45.

RICIN = РИЦИН – Ricin is an extremely toxic protein found in the seed of the castor oil plant Ricinus communis, a member of the Euphorbiaceae, grown commercially for the oil content of the seed and sometimes grown as an ornamental garden annual. Less than a milligram of ricin injected into the blood stream can be fatal. / Рицин – чрезвычайно токсичный белок, находящийся в семени Клещевины Обыкновенной (castor oil plant; Ricinus Communis), члене Молочаев (Euphorbiaceae), выращиваемой на коммерческой основе вследствие содержания в её семенах масла, а иногда выращиваемых в качестве декоративных садовых однолетников. Менее миллиграмма рицина, введённого в кровоток, может быть смертельным.

RICKRACK = ТЕСЬМА ЗИГЗАГООБРАЗНОЙ ВЫРАБОТКИ – Rickrack:- flat braid in a zig-zag formation. Made from several types if fibers, it is used for many kinds of trimming on apparel. Rick Rack is a flat braid in zig-zag formation. It is produced by applying different tensions to individual threads during manufacture. Rick-Rack is a flat braid woven in a zigzag, serpentine shape. It is available in several widths and is an extremely popular and inexpensive trimming.

RICO ACT = RACKETEER INFLUENCED AND CORRUPT ORGANIZATION ACT

RID = REGULATIONS CONCERNING THE INTERNATIONAL CARRIAGE OF DANGEROUS GOODS BY RAIL

RIDE = НЕПОДВИЖНЫЙ – Ride:- a container which remains in the same position on a ship until reaching ultimate destination. / В морских контейнерных грузоперевозках это относится к контейнеру, который остаётся в одном и том же месторасположении на судне вплоть до достижения конечного места назначения.

RIDE = СТОЯТЬ (или ИДТИ, или ИМЕТЬ ОСАДКУ) – Ride (maritime term):- to lie at anchor; to ride out; to safely weather a storm whether at anchor or underway. / ; отстаиваться на якоре; .

RIDER = ДОПОЛНЕНИЕ (или ДОБАВЛЕНИЕ) – (1) Rider is an addition to a document that follows logically from what has gone before.

(2) Rider is an endorsement to an insurance policy that modifies clauses and provisions of the policy, adding or excluding coverage(s).

RIDGE = ГРЕБЕНЬ (или БОРОЗДА) – Ridge is the relatively higher part of floodplain landscapes (in contrast to basins and channels). Raised strips of plowed ground, rows of soil lying between furrows. / Под Бороздой понимается канавка, образованная почвообрабатывающим или другим орудием, для отвода воды с полей при избыточном увлажнении, поливе в орошаемом земледелии и для посева сельскохозяйственных культур. Борозда, канавка, образованная почвообрабатывающим или другим орудием. В зонах избыточного увлажнения служит для отвода воды с полей, в орошаемом земледелии – для полива. Бороздной посев защищает семена и всходы от выдувания.

RIDGE PLANTING = ГРЕБНЕВАЯ ПОСАДКА (или БОРОЗДНАЯ ПОСАДКА) – Ridge Planting is a method of planting crops on ridges formed through tillage operations or banked by hand tools. / Под Посадкой понимается размещение рассады (Капусты, Табака, Томата), саженцев плодовых, декоративных и лесных культур, клубней Картофеля, луковиц Лука, Тюльпана и других по площади поля с заделкой в почву. Проводят рассадо-посадочными машинами, картофелесажалками и вручную.

RIDGY BEAM = ХХ НАВОЙ – Ridgy Beam is a beam of yarn on which the ends are not evenly distributed across the barrel, causing a profile of peaks (ridges) and valleys. A ridgy beam can give poor removal characteristics.

RIDGY CLOTH = ЗАЗУБРЕННОЕ (или ОСТРОКОНЕЧНОЕ, или КОНЬКОВОЕ, или НЕРОВНОЕ) ПОЛОТНО – Ridgy Cloth:- xxxxx. See also Baggy Cloth.

RIDING THE YIELD CURVE = ИГРАТЬ НА КРИВОЙ ДОХОДНОСТИ – Trading in an interest rate futures contract according to the expectations of change in the yield curve. / Торговля фьючерсными контрактами на процентную ставку в соответствии с ожиданиями изменения кривой доходности.

RIFCB = RESEARCH INSTITUTE FOR FOOD CROP BIOTECHNOLOGY

RIFFLE = НАНОС – Riffle is a deposit of sand or gravel on the channel floor of a river.

RIFLER = RESEARCH INSTITUTE FOR LEGUMES AND ROOT CROPS

RIFSA = RESEARCH INSTITUTE FOR FOOD CROPS IN SWAMPY AREAS

RIFT SAWING = РАСПИЛОВКА ПЕРПЕНДИКУЛЯРНО ГОДИЧНЫМ КОЛЬЦАМ (или ДОЛЕВАЯ РАСПИЛОВКА) – Rift Sawing:- this is similar to quarter sawing but the angle of the cut is changed slightly to 30-degrees or greater so that fewer saw cuts are parallel to the medullary rays, which are responsible for the flake effect; boards are narrower. This type of lumber is available in limited quantities and species. Rift-sawn boards are often favored for fine furniture and other applications where matching grain is important. /

Виды (Species). В деревообработке под Распиловкой или Распиливанием понимается процесс последовательного раскроя пилами стволов на круглые сортименты (брёвна, кряжи), брёвен на пиломатериалы и пиломатериалов на заготовки. Различают распиловку:- относительно направления древесных волокон – продольную и поперечную, относительно годичных слоёв – тангенциальную (по касательной к годичным слоям) и радиальную. При раскрое врёвен на брусья и доски различают:- распиловку вразвал, при которой вначале формируется толщина обрезных досок, а затем их ширина; распиловка с брусовкой, при которой бревно раскраивается на двухкантный брус по высоте, соответствующий ширине обрезных досок, и боковые доски заданной толщины, а затем брус раскраивается на доски нужной толщины, а боковые доски обрезаются по ширине. Для выработки досок тангенциальным или радиальным пропилами распиловку производят специальными способами (развально-сегментным, брусово-сегментным, секторным).

RIFT SAWN = РАСПИЛЕННЫЙ ПЕРПЕНДИКУЛЯРНО ГОДИЧНЫМ КОЛЬЦАМ (или РАДИАЛЬНО РАСПИЛЕННЫЙ, или СКОС ПРОПИЛА) – Rift Sawn:- the cut is at a slightly different angle than quarter sawn. / нежели радиально распиленное (quarter sawn).

RIG = ОСНАСТКА (или СНАРЯЖЕНИЕ, или ОСНАЩЕНИЕ, или ВООРУЖЕНИЕ) – Rig (maritime term):- a general description of a vessel's upper: works; to fit out.

RIGGING = ТАКЕЛАЖ (или ВАНТЫ) – Rigging (maritime term):- a term applied to ship EUR(TM)s ropes generally. Rigging comprises the system of ropes, cables and chains, which support a sailing ship or sail boat's masts – standing rigging, including shrouds and stays – and which adjust the position of the vessel's sails and spars to which they are attached – the running rigging, including halyards, braces, sheets and vangs. Rigging is divided into two classes, standing, which supports the mast (and bowsprit), and running, which controls the orientation of the sails and their degree of reefing. Configurations differ for each type of rigging, between fore-and-aft rigged vessels and square-rigged vessels. Etymology:- according to the Encyclopædia Britannica Eleventh Edition 'Rigging' derives from Anglo-Saxon 'Wrigan' or 'Wringing', 'To Clothe'. The same source points out that 'Rigging' a sailing vessel refers to putting all the components in place to allow it to function, including the masts, spars, sails and the rigging. / Такелаж (от Голландского слова Takelage):- (1) совокупность снастей для крепления рангоута, грузоподъёмных работ и управления парусами. Стоячий Такелаж – ванты, штаги и другое – служит для удержания частей рангоута (мачт, стеньг и тому подобного). Оба конца снасти стоячего такелажа, состоящей из стальных тросов, цепей или прутков и приспособлений для натягивания (талрепов), закрепляются наглухо. Бегучий Такелаж используется для подъёма и спуска сигналов, шлюпок, стрел, груза и тому подобного, а на парусных судах – для управления парусами и подвижными частями рангоута. Один конец снасти бегучего такелажа, обычно изготовляемой из тросов, цепей, закрепляется либо постоянно (неподвижно), либо к подвижному элементу (например, к грузовому гаку), а второй подаётся на тяговый механизм или временно закрепляется. К бегучему такелажу рангоута парусных судов относятся, например, фалы для подъёма реев, брасы и топенанты для разворачивания реев в горизонтальной и вертикальной плоскостях; к бегучему такелажу парусов – фалы, шкоты, гитовы, галсы и другое. Прочность и эксплуатационное состояние снастей для ответственных частей такелажа, используемых для подъёма грузов и в судовых устройствах, которые обеспечивают безопасность судна и людей (например, в швартовном или спасательном устройствах), регламентируются классификационными обществами. (2) Тросы, стропы, цепи, применяемые совместно с грузоподъёмными устройствами для подъёма тяжёлых грузов, оборудования при монтажных, строительных и других работах. Ванты (от Голландского слова Want):- (1) снасти судового стоячего такелажа, раскрепляющие к бортам мачты и стеньги (смотрите Рангоут). (2) Гибкий растянутый элемент (растяжка), обычно в виде стального троса, для крепления висячих конструкций, радиомачт, антенн и другого.

RIGHT = ВЫРАВНИВАТЬ (или СПРЯМЛЯТЬ) – Right (maritime term):- to return to a normal position, as a vessel righting after heeling over.

RIGHT OF FIRST REFUSAL = ПРАВО ПЕРВООЧЕРЕДНОГО ОТКАЗА (или ПРАВО ПЕРВОГО ОТКАЗА) – Right Of First Refusal (ROFR) usually gives a party to an agreement, e.g., a shareholder or investor, the right to buy more shares before shares are offered to other parties.

RIGHT OF PREEMPTION = ПРЕИМУЩЕСТВЕННОЕ ПРАВО – Right Of Preemption is the right to purchase either in preference to others or before an offer is made to others. / Право приобрести либо с преференцией по отношению к другим, либо до того, как оферта будет выставлена другим.

RIGHT OF RECOURSE = ПРАВО РЕГРЕССА (или ПРАВО РЕГРЕССНОГО ИСКА, или ПРАВО ОБРАТНОГО ТРЕБОВАНИЯ) – Right Of Recourse is a right of claiming compensation against party at fault; consignees must preserve the right of recourse of their underwriters by sending registered claim letter to faulty carriers.

RIGHTS = ПРАВА – Rights:- privilege of buying new securities at a price that is usually lower than the market price, or subscription price. A right is given to shareholders in proportion to the amount of shares they own, or in the form of a coupon (or warrant), and is an option to purchase shares of a new stock issue. Powers or privileges granted by an agreement or law. When a company wants to raise more funds by issuing additional securities, it may give its stockholders the opportunity, ahead of others, to buy the new securities in proportion to the number of shares each owns. The piece of paper evidencing this privilege is called a Right. Because the additional stock is usually offered to stockholders below the current market price, rights ordinarily have a market value of their own and are actively traded. In most cases they must be exercised within a relatively short period. Failure to exercise or sell rights may result in monetary loss to the holder. See also Warrant.

RIGHTS ISSUE = ПРИВИЛЕГИРОВАННЫЙ ВЫПУСК – Rights Issue:- practice of offering existing shareholders the opportunity to buy more shares, i.e. subscribe more capital, in order to raise additional capital. Rights issues act as a protection for the shareholder, in that the total number of shares issued increases without decreasing the percentage holding of each shareholder. A privilege granted to shareholders to buy new shares in the same company, usually below the prevailing market price. Rights Issue:- an offering allowing existing shareholders to purchase newly issued stock by means of rights which can be traded, exercised, or allowed to expire. The number of rights offered to each shareholder is calculated by inserting the shareholder's existing holding in a predetermined formula. In most cases, the price per share available to shareholders is lower than the market price. A Rights Issue is where a company issues further shares, at a given price, to existing shareholders in proportion to their existing shareholdings. For example, a 1-for-5 rights issue allows each shareholder to buy one new share for each five currently held. The purpose is for the issuing company to raise more money.

RIGHTS OFFERING = ПРЕДЛОЖЕНИЕ ПРИВИЛЕГИРОВАННОЙ ПОДПИСКИ – Rights Offering:- distribution to existing shareholders of rights to purchase additional shares as part of a primary offering. A company uses a rights offering when it raises capital by selling new shares to existing shareholders rather than to the entire investment community. The number of rights a

shareholder receives is based on the number of shares the holder owns. Rights offerings are generally public offerings unless offered only to sophisticated investors or QIBs in a private placement.

RIGHT TO INFORMATION = ПРАВО НА ИНФОРМАЦИЮ – A shareholder has a Right To Information from the management of the joint stock corporation in which he/she is a shareholder. The place at which this information must be given is at the annual general meeting. According to the German Stock Corporation Act, the management board of the joint stock corporation is required to give information on business, financial or personal matters, provided the information is needed for an objective assessment of the agenda of the annual general meeting.

RIGHT TO VOTE = ПРАВО ГОЛОСА – Right To Vote is the right of common stockholders to vote on matters of corporate policy at an annual stockholder's meeting. The impact of a stockholder's vote is proportionate to the amount of stock owned.

RIGHT–TO–WORK LAWS = ЗАКОНЫ О ПРАВЕ НА РАБОТУ – Right-To-Work Laws are state laws that make it illegal for labor unions and employers to enter into contracts that provide for a business to employ only union members in the jobs covered by the contract. One typical version of a right-to-work law reads 'No person may be denied employment, and employers may not be denied the right to employ any person, because of that person's membership or non-membership in any labor organization'. Labor union leaders typically seek the repeal of right-to-work laws because much lower percentages of workers choose to join unions and pay dues in states where such laws are in effect. Defenders of right-to-work laws tend to argue that workers who refuse to join unions mainly do so because they just do not value the collective bargaining services that unions perform and/or because they disagree with the political causes that unions support with their dues money. Opponents of right-to-work laws tend to see refusal to join a union mainly as attempting to be a free rider who enjoys the very real benefits of union representation without having to pay his fair share of the cost. About 20 US states have some version of such a law presently in effect.

RIGHT–WING = ПРАВОЕ КРЫЛО – Right-Wing, rightist:- a general descriptive term for any of several otherwise rather different, conservative, reactionary or fascist political ideologies, the common denominator of which is their qualified or enthusiastic support for the main features of the current social and economic order, accepting all (or nearly all) of its inequalities of wealth, status and privilege (or even in some cases support for a return to an earlier, even more inegalitarian and hierarchical political-economic order). Right wing ideologies tend to emphasize the values of order, patriotism, social cohesion, and a personal sense of duty that makes the individual citizen who 'knows his place' responsive to discipline from his political and social superiors. In America, the term has a somewhat more derogatory flavor than in Europe.

RIL = RECOMBINANT INBRED LINES

RIMC = RESEARCH INSTITUTE FOR MAIZE AND OTHER CEREALS

RIN = RENEWABLE IDENTIFICATION NUMBERS PRICES

RIND = КОРКА (или КОЖУРА, или КОЖИЦА) – Rind is an external covering or coat such as the bark of a tree over the cambium layer, the tough outer skin of a fruit. / коры дерева над слоем камбия, внешняя кожица плода. У древесных растений под Коркой понимается наружный защитный слой коры на старых стеблях и корнях, состоящий из прослоек перидермы и луба. Периодически слущивается или разрушается с поверхности.

RING = КОЛЬЦО (или ПЕТЛЯ, или ЗВЕНЕТЬ, или ГЛАЗОК РЕМИЗКИ, или УШКО РЕМИЗКИ) – Ring is:- (1) a narrow band around hosiery appearing different from the rest of the hose. Principal causes:- variations in yarn size, dye, absorption, or luster. Ring:- in hosiery, a narrow, visually different horizontal band.

(2) Ring is the device that carries the traveler up and down the package in ring spinning. See also Revolving Ring Spinning, and Ring Spinning. / Петли (rings) – дефект чистоты нити шёлка-сырца.

(3) Ring is a circlet usually of precious metal worn on the finger..

RING = РИНГ (или АРЕНА) – Circular counter around which the so-called ring representatives gather to transact buying and selling contracts during the trading sessions by calling out bid and asked quotations (a la criee). Shares are traded at the stock trading ring and bonds at the bond trading ring. Recently replaced by an electronic trading system. Ring is a circular area on the trading floor of an exchange where traders and brokers stand while executing futures trades. Some exchanges use pits rather than rings. Ring Trading is so called because the London Metal Exchange (LME) uses a 'ring' with the traders sitting at fixed points around the circle. Trading takes place throughout the day with each LME contract traded in specific five minute periods known as 'Rings'. The LME system of fixed points clearly helps with the identification of the firms trading, but it is only feasible because the Exchange has a small number of members permitted to take part in ring trading. At present there are 12 Ring dealing members, and all business which is required to be dealt 'across the floor' must be passed through one of these members. A significant proportion of all LME non-ferrous and steel contracts are traded in the ring sessions, including the kerb, or as a result of that trading. The balance, goes through the telephone market and LMEselect. The ring sessions, and especially the second morning rings from which Official Prices for non-ferrous metals and steel emerge, concentrate liquidity because the physical trade requires prices as close as possible to the daily and monthly settlement prices. This concentration of liquidity ensures both transparency of pricing, and more representative prices than may be obtained through inter-office trading. The ring itself is about 6 m in diameter, with two large display boards above it showing the official prices. There is a special booth where the Exchange's staff monitor the prices and input bids, offers, spreads and trades made into a computer system. This is instantly sent to the various news vendor services, who display LME prices. Behind each firm's ring seat is a place for assistants to stand in order to pass orders into the ring and to give commentaries to customers about current market conditions. Ring is a period of 5 minutes in which a metal is traded at the LME and a settlement quotation is fixed.

RING BANK = БАНК НА РИНГЕ – Ring Bank is a bank licensed to trade securities on a stock market ring. The bank is represented on the ring by its ring trader(s). See also Stock Exchange Bank. / Банк На Ринге – банк, имеющий лицензию на торговлю ценными бумагами на ринге фондового рынка. Банк представлен на ринге своими торговцами на ринге. Смотрите также Банк Фондовой Биржи (Stock Exchange Bank).

RINGBOLT = РЫМ–БОЛТ – Ringbolt (maritime term):- a bolt fitted with a ring through its eye, used for securing, running, rigging, etc. / Рым (от Голландского слова Ring, означающее Кольцо), металлическое кольцо, соединённое шарнирно или жёстко с цилиндрическим стержнем, имеющим на конце резьбу. Нарезанную часть стержня ввёртывают в крышку машины, корпус двигателя и тому подобное. Рым служит для строповки изделий при погрузочно-разгрузочных операциях, сборке и разборке машин. Рымом называют также металлическое кольцо у причальной стенки портов для швартовки судов.

RINGER = СХОД НИТИ – Ringer:- (1) on a section beam, ringer is a term used for one or more filaments that have left the parent end; as the beam revolves, the filaments continue to unwind, wrapping around the beam (hence the word 'Ringer'). The severity of a ringer

is dependent upon the number of filaments contained therein at the time the filaments break. (2) In slashing, the term ringer is often used when an end breaks on the slasher can, adheres to the can, and continues to wrap around it. This condition should not be confused with ringers on the section beam. / Сход Нити – порок сновки.

RING LUBRICATION = КОЛЬЦЕВОЕ СМАЗЫВАНИЕ (или СМАЗЫВАНИЕ КОЛЬЦОМ) – Ring Lubrication is a system of lubrication in which the lubricant is supplied to the bearing by an oil ring. See also Lubrication. / Смазывание Кольцом – смазывание, при котором смазочный материал подводится к поверхностям трения кольцом, увлекаемым во вращение валом. Примечание:- кольцо может быть закреплено на валу.

RING NAIL = РЫМ–ГВОЗДЬ (или КОЛЬЦЕВОЙ ГВОЗДЬ) – Ring Nail or Annularly Threaded Nail is a threaded nail on which the threaded portion has multiple ring-like threads rolled completely round the shank. See also Pallet. / Кольцевой Гвоздь (Ring Nail или Annularly Threaded Nail):- нарезной гвоздь, имеющий на нарезной части составную кольцеобразную резьбу, образующую окружность. Смотрите также Поддон (Pallet).

RINGS = КОЛЬЦА – Rings are the circular metallic elements that ride in the grooves of a piston and provide compression sealing during combustion. Also used to spread oil for lubrication.

RING SPINNING = КОЛЬЦЕВОЕ ПРЯДЕНИЕ – Ring Spinning is a system of spinning using a ring-and-traveler takeup wherein the drafting of the roving and twisting and winding of the yarn onto the bobbin proceed simultaneously and continuously. Ring frames are suitable for spinning all counts up to 150's, and they usually give a stronger yarn and are more productive than mule spinning frames. The latest innovation in ring spinning involves the use of a revolving ring (see also Revolving Spinning Ring) to increase productivity. Ring spinning equipment is also widely used to take-up manufactured filament yarns and insert producer-twist at extrusion. Ring Spinning is a system of continuous spinning of staple fiber. A method of spinning cotton and worsted roving into yarn. The roving, after it has passed between the sets of drawing rollers, is guided in a downward direction through the traveler, a small inverted U-shaped device which is flanged onto its respective ring in the ring rail of the machine. It travels around the ring at the rate of 4 000 to 12 000 revolutions per minute. As the spindle revolves to wind the yarn the latter has to pass through the traveler and carries it around on the ring at this rapid pace. The narrower the width of the traveler, the finer is the diameter of the yarn and the higher its count or size. The up-and-down motion of the ring rail causes the winding of the yarn onto its bobbin at the nose, body, and heel. The spindles are driven by means of cotton friction banding. One endless belt drives two spindles on each side of the frame, four in all. Ring Spinning is a system of spinning, using a ring spinning frame that drafts the roving, twists the yarn, and winds it on the bobbin continuously and simultaneously on one operation. Modern ring frames are suitable for spinning all counts up to 150s. Process Stages In Ring Spinning Operations:- bale lay-down, blowroom, card, drawframe, comber, roving frame, spinning frame, winding machine. / филаментная (комплексная) пряжа (filament yarn). Экструзия или Выдавливание (Extrusion). Под Веретеном или Шпинделем, от Немецкого слова Spindel, означающее Веретено, понимается . При выработке тонкой пряжи в гребенной системе прядения хлопка обычно применяют два перехода ровничных машин:- на первом вырабатывают ровницу из ленты со второго перехода ленточных машин, а на втором – тонкую, более равномерную, ровницу, применяя сложение двух ровниц.

RING SPINNING FRAME = КОЛЬЦЕВАЯ ПРЯДИЛЬНАЯ РАМА (или КОЛЬЦЕПРЯДИЛЬНАЯ МАШИНА) – Ring Spinning Frame is a machine containing the ring, traveler, and bobbin used in spinning yarn. See also Spinning Frame.

RING–SPINNING MACHINE = КОЛЬЦЕВАЯ ПРЯДИЛЬНАЯ МАШИНА (или КОЛЬЦЕПРЯДИЛЬНАЯ МАШИНА) – Ring-Spinning Machine is a machine for drawing out cotton or other fibers to their final spun size, twisting them to impart strength, and winding the yarn onto bobbins. The type of spinning frame used for making cotton yarn. / На кольцевой прядильной машине осуществляется конечный этап прядильного производства – непосредственное прядение. Машина для выработки кольцевой пряжи. На кольцевых прядильных машинах вырабатывается конечный продукт прядильного производства – пряжа, которая по своим свойствам должна отвечать требованиям соответствующих стандартов качества. На этих машинах осуществляются следующие процессы:- вытягивание, кручение и наматывание. Если требуется изготовить особо равномерную пряжу, то можно использовать сложение двух ровниц на выходе вытяжного прибора. Кольцевые прядильные машины обычно двусторонние с симметричным расположением рабочих органов. Катушки с ровницей на подвесках или шпильках устанавливают в питающую рамку. Каждая ровница заправляется в водилку и поступает в вытяжной прибор. Применяют два типа вытяжных приборов:- двухремешковый и одноремешковый с изогнутым полем вытягивания. Основной конструктивной особенностью этих приборов является наличие ремешков в основной зоне вытягивания. Ремешки контролируют движение волокон в основной зоне по первой предельной схеме. Минимальная неконтролируемая длина мычки между зажимом выпускной пары вытяжного прибора и устьем ремешков составляет не более 16–17 миллиметров. Хороший контроль движения волокон обеспечивает выработку достаточно равномерной пряжи при вытяжке в вытяжном приборе до 60. Питающая зона вытяжного прибора между средней вытяжной и питающей парами предназначена для предварительного вытягивания ровницы (вытяжка не более 1.3–2.5). Эту вытяжку выбирают такой, чтобы в основной зоне в зависимости от равномерности волокон по длине и линейной плотности вырабатываемой пряжи вытяжка составляла 20–30 для пряжи средней линейной плотности и 25–35 – малой линейной плотности. При высокой частной вытяжке в выпускной зоне устанавливают плавающие мычкоуловители. В двухремешковых вытяжных приборах верхние ремешки находятся в металлических клеточках со сменными клипсами (упорами), которые позволяют устанавливать определённый зазор между ремешками. В зазоре создаётся необходимое усилие зажима мычки в устье ремешков в зависимости от числа волокон в поперечном сечении мычки. В одноремешковом вытяжном приборе средний нажимной валик увеличенного диаметра вынесен вперёд относительно оси среднего цилиндра, что создаёт изогнутое поле вытягивания и обеспечивает контроль движения волокон, находящихся между ремешком и нажимным валиком. Ремешок надет на качающуюся клеточку с натяжным роликом, что создаёт эластичный зажим волокон в изогнутом поле и свободный сдвиг длинных волокон в процессе вытягивания без их обрыва. Нагрузка на нажимные валики маятниковая навесная индивидуальная, осуществляется с помощью цилиндрических пружин и обеспечивает регулировку положения нажимных валиков относительно цилиндров. Выходящая из вытяжного прибора мычка подвергается кручению и превращается в пряжу, которая наматывается на шпулю или патрон, образуя початок. При обрыве пряжи мычка засасывается в отверстие мычкоуловителя. Кручение и наматывание на машине осуществляются одновременно одним крутильно-наматывающим механизмом. Крутильно-наматывающий механизм представляет собой быстровращающееся веретено с надетым на него початком, кольцо и бегунок. Кольца укреплены на кольцевой планке, которая совершает возвратно-поступательное движение вдоль конуса початка, раскладывая пряжу. Веретена приводятся во вращение тесьмой, огибающей приводной барабан. Одной тесьмой приводятся во вращение два веретена на одной сторонке машины и два веретена на другой. Пряжа заправляется под бегунок и наматывается в початок, вследствие этого бегунок вращается по кольцу, но с меньшей скоростью, чем веретено. Разность частот вращения бегунка и веретена является одним из условий наматывания пряжи. Пряжа наматывается слоями на коническую часть початка и раскладывается витками с шагом слоя при движении кольцевой планки снизу вверх (наматывается слой) и шагом прослойка

при обратном движении (наматывается прослоек). Обычно шаг слоя меньше шага прослойка, а диаметр початка на 1–2 миллиметра меньше диаметра кольца. При наматывании слоя и прослойка с разным шагом намотки витки перекрещиваются и пряжа легко сматывается с початка без заклинивания витков и обрывов, например, при перематывании в ткацком производстве. Пряжа с прядильных машин обычно при дальнейшей переработке перематывается в паковки другой структуры. Поэтому к структуре початка предъявляют определённые требования:- лёгкость сматывания пряжи при большой скорости с неподвижного початка; возможно большая длина пряжи в початке; прочная структура початка, пригодная для транспортировки початков без повреждений. Початок на кольцевой прядильной машине формируется мотальным механизмом, который сообщает движение кольцевой планке по определённому закону. Мотальный кулачок, профиль которого спроектирован в соответствии с законом изменения скорости кольцевой планки при наматывании слоя и прослойка пряжи, взаимодействует с мотальным рычагом. На мотальном рычаге установлен блок, который может поворачиваться храповиком, передающим движение червяку и червячной шестерне. Блок цепью соединён с двойным блоком, который цепью связан с рычагом. На рычаг опираются колонки кольцевой планки. Для уменьшения усилий, возникающих в цепи при подъёме кольцевой планки, на рычаге установлен противовес, уравновешивающий массу кольцевой планки. При вращении мотального кулачка и изменении его радиуса от минимального значения до максимального мотальный рычаг опускается, а кольцевая планка поднимается вверх вдоль конуса початка и наматывается слой пряжи. При изменении радиуса кулачка от максимального значения до минимального мотальный рычаг поднимается вверх, а кольцевая планка опускается вниз и наматывается прослоек пряжи на коническую часть початка. Угол поворота кулачка при наматывании прослойка пряжи примерно в 3–4 раза меньше, чем при наматывании слоя пряжи, поэтому средняя скорость, кольцевой планки в этом случае выше и шаг между витками пряжи в прослойке больше. При движении мотального рычага вверх храповик также поднимается и собачка, подвешенная на гибкой связи, соскальзывает на 1–2 зуба. При опускании мотального рычага, когда кольцевая планка движется вверх, собачка поворачивает храповик, который в свою очередь поворачивает блок, и цепь немного наматывается на него, что вызывает поворот двойного блока против часовой стрелки, отклонение рычага и смещение кольцевой планки вверх на определённую величину. Следующий слой будет наматываться на коническую часть початка выше предыдущего на данную определённую величину. Величина смещения слоёв оказывает влияние на диаметр початка:- чем больше значение этой определённой величины, тем меньше диаметр початка. Он обычно на 1.5–2 миллиметра меньше диаметра кольца. Устанавливая определённый угол поворота храповика с помощью винта, регулируют диаметр початка. Пряжа наматывается в початок, приводит в движение бегунок. При этом пряжа натягивается, так как преодолевает силу трения бегунка о кольцо и другие силы сопротивления, которые возникают на пути движения пряжи от выпускной пары до бегунка. На современных кольцевых прядильных машинах рабочая частота вращения веретён может достигать 18 000 мин$^{-1}$ и скорость бегунка относительно кольца составляет около 37 м/с. При большой скорости бегунка создаётся большая центробежная сила, вызывающая силу трения, которую и преодолевает пряжа. При вращении бегунка по кольцу вращается и участок пряжи между нитепроводником и бегунком, образуя тело вращения, называемое баллоном, который вызывает дополнительное натяжение пряжи. На нить в баллоне действуют различные силы:- центробежная, Кориолиса, сопротивление воздуха, тяжести нити. Однако баллон выполняет и положительную функцию – он является амортизатором случайных резких колебаний натяжения пряжи, которые могут возникнуть при прохождении соринок, узелков и других пороков пряжи под бегунком, вызывающих заклинивание бегунка и резко повышающих натяжение. При большом натяжении пряжи увеличиваются плотность намотки и длина пряжи в початке, что является положительным фактором, но при этом повышается и вероятность обрыва пряжи, что приводит к снижению производительности труда и оборудования. На натяжение пряжи влияет также и коэффициент трения между бегунком и кольцом. Для уменьшения силы трения кольца электрополируют. Для выравнивания натяжения пряжи применяют регуляторы частоты вращения веретён. Когда натяжение пряжи увеличивается при наматывании на малый диаметр початка, частота вращения веретён уменьшается, и наоборот. При использовании регулятора снижается обрывность пряжи, увеличивается производительность труда прядильщиков и фронт их обслуживания, поскольку обрывность не только снижается, но и более равномерно распределяется по времени. Для изменения крутки пряжи изменяют число зубьев сменной крутильной шестерни, которая влияет на скорость выпуска пряжи. Интенсивность вытягивания ровницы в вытяжном приборе регулируют, устанавливая новые сменные вытяжные шестерни. В двухзонных вытяжных приборах таких шестерен две для раздельного изменения частных вытяжек в каждой зоне. Для регулирования шага витков пряжи в слое и прослойке початка предусмотрена сменная мотальная шестерня, которая позволяет изменять частоту вращения мотального кулачка и, следовательно, скорость подъёма и опускания кольцевой планки. Производительность кольцевой прядильной машины выражается количеством выработанной пряжи в килограммах или километрах 1 000 веретёнами за 1 час. Производительность машины тем больше, чем выше частота вращения веретён и меньше крутка пряжи. С увеличением частоты вращения веретён не только повышается скорость выпуска пряжи, но и увеличивается натяжение пряжи, что в свою очередь приводит к повышению обрывности и снижению производительности труда и оборудования. Современные кольцевые прядильные машины работают уже практически на предельной частоте вращения веретён, и дальнейшее увеличение скорости становится мало вероятным. Повышение производительности этих машин возможно ещё за счёт автоматизации процессов присучивания пряжи, съёма початков с веретён и пуска машины. В настоящее время кольцевые прядильные машины оснащают мычкоуловителями, пухообдувателями и пухосборниками, автоматами съёма початков.

RING SPUN = КОЛЬЦЕВОЕ ПРЯДЕНИЕ (или КОЛЬЦЕПРЯДЕНИЕ) – Ring Spun:- a spinning system in which twist is inserted in a yarn by using a revolving traveller. This method gives a tighter twist than the more modern, faster and usually cheaper open end spinning process.

RING STICKING = ПРИГОРАНИЕ КОЛЬЦА – Ring Sticking:- freezing of a piston ring in its groove in a piston engine or reciprocating compressor due to heavy deposits in the piston ring zone. Ring Sticking occurs when the piston ring sticks into the groove due to excess contamination. / Пригорание поршневого кольца.

RING TRADER = ТОРГОВЕЦ НА РИНГЕ – Ring Trader is the ring representative of a ring bank licensed to trade securities on a stock exchange where trading is conducted according to the ‘a la criee’ method.

RING WASTE = ОТХОДЫ КОЛЬЦЕПРЯДЕНИЯ – Ring Waste is a waste of any sort that collects around the rings of ring-spinning frames. Specifically it refers to the odds-and-ends of roving which gather in the rolls of a ring-spinning frame.

RIO GROUP = ГРУППА РИО – The Rio Group is an international organization of Latin American and some Caribbean states. It was created on 1986-December-18 in the Brazilian city of Rio de Janeiro by means of the Declaration of Rio de Janeiro, signed by Argentina, Brazil, Colombia, Mexico, Panama, Peru, Uruguay and Venezuela (the members of the Contadora Group and the Contadora Support Group). To some extent it was perceived by some observers as an alternative body to the Organization of American States during the Cold War, since that body was dominated by the United States. The Rio Group does not have a secretariat or permanent body, and instead relies on yearly summits of heads of states. Current (in 2011) 23 member states/organizations in alphabetical order by column:- Argentina, Belize, Bolivia, Brazil, Chile, Colombia, Costa Rica, Cuba, Dominican Republic, Ecuador,

Guatemala, Guyana, Haiti, Honduras, Jamaica, Mexico, Nicaragua, Panama, Paraguay, Peru, El Salvador, Uruguay, and Venezuela. The Rio Group is a consultation mechanism on regional Latin American issues. / Консультационный механизм для обсуждения и решения региональных проблем и вопросов среди стран Латинской Америки.

RIP = ROLLING INJECTION PLANTER

RIP = РАСПИЛ ВДОЛЬ ВОЛОКОН (или ДЕЛИТЕЛЬНЫЙ РАЗРЕЗ) – Rip is a cut made lengthwise in a wood member, parallel to the grain. / В деревообработке под Распиловкой или Распиливанием понимается процесс последовательного раскроя пилами стволов на круглые сортименты (брёвна, кряжи), брёвен на пиломатериалы и пиломатериалов на заготовки. Различают распиловку:- относительно направления древесных волокон – продольную и поперечную, относительно годичных слоёв – тангенциальную (по касательной к годичным слоям) и радиальную. При раскрое врёвен на брусья и доски различают:- распиловку вразвал, при которой вначале формируется толщина обрезных досок, а затем их ширина; распиловка с брусовкой, при которой бревно раскраивается на двухкантный брус по высоте, соответствующий ширине обрезных досок, и боковые доски заданной толщины, а затем брус раскраивается на доски нужной толщины, а боковые доски обрезаются по ширине. Для выработки досок тангенциальным или радиальным пропилами распиловку производят специальными способами (развально-сегментным, брусово-сегментным, секторным).

RIP = ТОЛЧЕЯ (или СУЛОЙ) – Rips (maritime term):- a disturbance of surface water by conflicting current or by winds.

RIPARIAN = ОБИТАЮЩЕЕ ПО БЕРЕГАМ ВОДОЁМОВ – Riparian:- of plants growing along the side or on the bottom of a watercourse, or in other aquatic areas.

RIPE NCC = RÉSEAUX IP EUROPÉENS NETWORK COORDINATION CENTRE

RIPENING = ПРЕДСОЗРЕВАНИЕ (или ОТЛОЖЕНИЕ) – Ripening:- hydrolysis of cellulose acetate after acetylation to obtain the desired acetyl value. This is generally accomplished by heat and agitation of the acid cellulose acetate solution under controlled conditions of time, temperature, and acidity. Rapid ripening is accomplished by using increased temperature for the reaction. / ацетат целлюлозы или ацетилцеллюлоза (cellulose acetate). Предсозревание алкалицеллюлозы – процесс снижения вязкости алкалицеллюлозы во времени от окислительной деструкции целлюлозы. Отложение целлюлозы на стенках трубочки хлопкового волокна.

RIPENING PHASE = ФАЗА СОЗРЕВАНИЯ (или ФАЗА ВЫЗРЕВАНИЯ) – Ripening Phase:- (syn. maturity phase, grain-filling phase) the period from milky stage of the grain to maturity. / Под Фазой, от Греческого слова Phásis, означающее Появление, понимается .

RIP OUT = СПОРОТОЕ (или РАСПОРОТОЕ) – Rip Out:- burst out with a violent or profane utterance; ‘ripped out a vicious oath’; ‘ripped out with an oath’. See also Pick-Out Mark.

RIPPED SEAM = РАСПОРОТЫЙ ШОВ – (1) Ripped Seam:- results from machine malfunction or improper handling by operator. Machinery defects, and namely – Part Forming Machines. (2) Ripped Seams:- faulty adjustment of stackers or work moving equipment. Machinery defects, and namely – Work Handling Equipment. / Порок или дефект от машинного оборудования.

RIPPED SELVAGE = РАСПОРОТАЯ (или НАДПОРОТАЯ, или РВАНАЯ) КРОМКА – Ripped Selvage or Burst Selvedge:- three or more adjacent selvedge yarns, including the outermost, or catch, yarn, which are severed. Note:- this defect is often caused by poor construction of selvedge or by undue strains imposed during weaving or finishing. See also Cut Selvage.

RIPPLED EFFECT = ЭФФЕКТ ОЧЁСА (или МЫКАТЬ ЭФФЕКТ, или ЭФФЕКТ РЯБИ) – Rippled Effect:- Fabric:- cotton-twill raincoat fabric; Construction:- (i) Count:- 96 x 60; (ii) Warp:- 30/1 combed cotton; (iii) Filling:- 40/1 combed cotton; Finish:- plain dyed olive drab. Defect:- peculiar rippled effect in the filling, starting and stopping at shuttle changes. Analysis:- it was found that the filling yarn in the faulty-appearing sections was finer than normal with somewhat more twist. The single yarn sized 60/1 with 17.8 turns S, as compared with 39/1 and 15.1 turns S in one of the normal bands. Although laboratory wetting out and hand ironing restored the normal appearance in the faulty sections, the defect was attributed to the off-size filling yarn, which caused differences in compressive warp shrinkage in those places during Sanforizing. / Уточина:- 40/1 гребенная хлопковая; .

RIPPLER = ЧЕСАЛКА (или ГРУБЫЙ ГРЕБЕНЬ) – Rippler:- the coarse comb used for removing seeds from flax fiber. The next step would be ‘hackling’. The preceeding step would be scrutching. / грубый гребень, использованный для удаления семян из льняного волокна.

RIPPLING = РЯБЛЕНИЕ (или МЫКАНИЕ) – Rippling is the process in flax production that removes the seed pods. The tool used is a ‘rippler’. After this step of flax fiber preparation, the fibers are ‘retted’. Rippling is the threshing of flax to strip the seeds or bolls from the plant. This process may be done by hand or by machine. / Рябление – отделение от стеблей семенных головок. Очёсывание Льна.

RIP–STOP NYLON = НАЙЛАН, УСТОЙЧИВЫЙ НА РАЗДИРАНИЕ – Rip-Stop Nylon is a lightweight, nylon fabric that is woven with coarse, strong warp and filling yarns spaced at intervals so that tears will not spread. It is produced in a range of weights and textures, waterproof, water resistant, fire resistant, zero porosity (will not allow air or water through), lightweight, mediumweight and heavyweight. Textures range from soft and silk-like to crisp or stiff that sounds like a paper bag when they are moved. Rip-stop nylon is often used in yachts for sails and spinnakers, hot air balloons, kites, parachutes, camping equipment, such as lightweight tents and sleeping bags, flags, banners and many other applications which require a strong lightweight fabric. Rip-stop reinforcement can also be incorporated into heavier fabrics which require extreme durability, such as those used in the manufacture of luggage and Nomex-protective clothing for riot police. Rip-Stop Nylon is a lightweight, wind resistant, and water resistant plain weave fabric. Large rib yarns stop tears without adding excess weight to active sportswear apparel and outdoor equipment such as sleeping bags and tents. Cloth used originally for parachutes and sails, now finding favor in fashion and accessories. / Найлан[Т3] (Nylon[TM]). основные и уточные пряжи. пористость или рыхлость (porosity).

RIR = REGIONAL INTERNET REGISTRY

RISE = RESPONSE–INDUCING SUSTAINABILITY EVALUATION

RISE = ВОЗВЫШЕНИЕ (или ПОДЪЁМ, или СТРЕЛА, или ПРОВИСАНИЕ, или СБЕГ) – Rise is the length of trouser from the top of the waistband at the fly opening, around the crotch, to the top of the back waistband at the center.

RISE AND SHINE = ПОДЪЁМ И СИЯНИЕ (или ВСПЛЫТИЕ И СИЯНИЕ, или ПОДЪЁМ!, или ВСТАВАЙ И ЗА ДЕЛО!, или ПРОСНИСЬ И ПОЙ) – Rise And Shine (maritime term):- a call to turn out of bunks.

RISER = ПОДНИМАЮЩАЯСЯ СЕКЦИЯ – Riser:- in textile fabric designing, a colored or darkened square on the design paper which indicates that the warp end is over the filling pick at that point. The opposite of riser is Sinker. / уточная поперечная нить в .

RISING THREE METHOD = ПОВЫШЕНИЕ ПО МЕТОДУ ТРЁХ – In technical analysis, Rising Three Method is a bullish continuation pattern. A long white body is followed by three small body days, each fully contained within the range of the high and low of the first day. The fifth day closes at a new high. / В техническом анализе биржевых рынков, бычья модель продолжения, состоящая из длинного белого тела, за которым следуют маленькие тела трёх дней, каждое из которых находится внутри диапазона максимума и минимума первого дня, при этом пятый день закрывается на новом максимуме с образованием длинного белого тела.

RISK = РИСК – Risk is a term used to denote the physical units of property at risk or the object of insurance protection and not Perils or Hazard. Reinsurance by tradition permits each insurance company to frame its own rules for defining units of Risks. The word is also defined as chance of loss or uncertainty of loss. Risk is the possibility of loss on an investment. A fortuity, it does not embrace inevitable loss. The term is used to define causes of loss covered by a policy. A fortuity. A term used to designate an insured of a peril insured against. It does not embrace inevitable loss. The term is used to define causes of loss covered by a policy. Used in an abstract sense to indicate a condition of the real world in which there is a possibility of loss; also used by insurance practitioners to indicate the property insured or the peril insured against. Element of uncertainty that may affect the activities of an economic unit or the conclusion of an economic transaction. Exposure to damage or financial loss, e.g., a fall in the price of a security, or insolvency on the part of a creditor (high risk = high probability and/or high loss potential). Financial market theory measures the risk exposure of an investment terms of the degree of earnings fluctuation (variance and standard deviation). Risk and return are in direct mutual correlation:- the higher the risk exposure, the more substantial the long-term return on an investment. The main risk categories are:- country, credit, price and interest rate, settlement, and transfer risk. Risks are hedged with positions charged to the profit and loss account. Hedging products available from banks include financial futures, forward and repurchase transactions, and options. In an effort to reduce settlement risks the main Forex houses have set up joint continuous clearing systems. That element of general market risk which can be neither reduced nor eliminated is also referred to as Systematic Risk. Exposure to uncertain change, most often used with a negative connotation of adverse change. This term may variously refer to:- (i) the possibility of some event occurring which causes injury or loss; (ii) the subject-matter of an insurance or reinsurance contract; or (iii) an insured peril. In insurance, Risk is the probability of an insured loss occurring. What is Risk? And how should we manage it? Running a business of any kind involves a certain amount of risk. There is a risk that your premises will be damaged in a fire. There is a risk that one of your employees will trip and have an accident. There is a risk that the goods you export will be left stuck on a dockside somewhere due to a dock workers' strike. Should any of these risks happen, they will have a financial impact on your business but they could also have wider implications. Take a factory fire, for instance. Not only would there be the cost of repairing any damage done by the fire, but what has happened to your orders while the repairs were being made? Perhaps one of your competitors has taken advantage of the situation and stolen some of your regular customers. Risks are inevitable but they are also manageable. Any business owner takes steps to manage the impact of a risk. In the example of fire risk, this means installing smoke alarms and sprinkler systems as well as training staff to spot and prevent fire hazards. Business owners will also look to reduce the financial consequences of a risk happening, and this is where insurance comes in. A good insurance policy will cover the business for many of the costs they have to meet as a result of the risk occurring. In effect, the business is looking to transfer the risk away from themselves and onto someone else for the payment of a fee. And the need to transfer risk is not only relevant to businesses. It is also relevant to individuals. For example, as individuals, there is a risk that we may damage our cars in an accident. There is also a risk that we will become unwell and need medical treatment or that our houses will get damaged in a storm. Of course, we hope these things will never happen and, fortunately, most of the time it never does. But when things go wrong it can be expensive and so for many of these eventualities insurance is there to take the financial risk on our behalf. This transfer of risk is the basis of all insurance, and is something that Lloyd's has been doing for more than 300 years. Risk is the occurrence in various parameters which can be qualified on the basis of probability analysis. Risk:- the exposure to adverse market movements, mischance or the possibility of losing money. / , например, . Элемент неопределённости, который может воздействовать на осуществление хозяйственной деятельности хозяйствующего субъекта или . уровень флуктуации (колебания) заработков . Под Риском понимается вероятное событие или совокупность событий, на случай наступления которых проводится страхование. Обязанность страховщика возместить ущерб возникает только при наступлении оговорённого в полисе события – страхового случая. Осмотр риска. Застрахованный риск. Риск – измеряемая вероятность понести потери или не получить прибыль. Риск 15-800 отличается от неопределённости, которую нельзя измерить. Среди часто встречающихся видов риска можно назвать следующие:- (i) актуарный риск (actuarial risk) – риск, покрываемый страховщиком, в обмен на страховые взносы, например риск преждевременной смерти; (ii) валютный риск (exchange risk) – вероятность убытков при обмене валюты; (iii) инфляционный риск (inflation risk) – вероятность того, что ценность активов или дохода будет падать по мере того, как инфляция обесценивает валюту страны; (iv) процентный риск (interest rate risk) – вероятность того, что кредитные обязательства с фиксированным процентом упадут в цене в результате роста процентных ставок; (v) инвентарный риск (inventory risk) – вероятность изменения цены, устаревания или иных факторов, которые могут снизить ценность товарного запаса (inventory); (vi) риск ликвидности (liquidity risk) – вероятность того, что инвестор будет не в состоянии купить или продать товарно-сырьевую продукцию или ценные бумаги достаточно быстро или в достаточном количестве, поскольку возможности покупки или продажи ограничены; (vii) политический риск (political risk) – вероятность национализации (nationalization) или иных неблагоприятных действий правительства; (viii) риск невозврата кредита (repayment (credit) risk) – вероятность того, что заёмщик или иной должник не сможет погасить кредит; (ix) риск принципала (risk of principal) – вероятность того, что инвестированный капитал обесценится; (x) риск гарантийный (underwriting risk) – принимаемый на себя инвестиционным банкиром (investment banker) риск того, что новый выпуск ценных бумаг, приобретённый андеррайтером сразу после его выхода, не найдёт покупателя при реализации в открытой продаже и/или того, что его рыночная цена упадёт в период размещения.

RISK–ADJUSTED RETURN ON CAPITAL = ОТДАЧА ОТ КАПИТАЛА, ПЕРЕОЦЕНИВАЕМАЯ В ЗАВИСИМОСТИ ОТ РИСКА – Risk-Adjusted Return On Capital (RAROC) is a ratio for measuring the risk/return ratio of a banking transaction. Here the risk-adjusted return, i.e. net income minus standard risk costs, is measured against necessary or allocated risk capital. The necessary risk capital is determined on an individual basis from the credit, market and operative risks associated with the respective transaction. The RAROC concept can be used to compare the attractiveness of various business activities within a bank.

RISK ARBITRAGE = РИСКОВЫЙ АРБИТРАЖ – Risk Arbitrage is a strategy of taking opposite positions in the shares of a takeover candidate and its likely buyer. Highly speculative investment technique. Practice of buying in to a take-over bid in the expectation that share prices will rise. / Рисковый Арбитраж – арбитраж, связанный с риском, например, при одновременном приобретении акций покупаемой компании и продаже акций предполагаемого покупателя, приобретающего эту компанию. Также называется как Takeover Arbitrage (Арбитраж на Поглощении Компании). Арбитражные торговцы (arbitrageurs) стремятся получить

прибыль при поглощении компаний (takeovers), вкладывая наличность в ожидаемый рост акций приобретаемой компании и играя на понижение акций приобретающей компании. Если план поглощения компании срывается, торговцы могут потерпеть огромные убытки. Рисковый арбитраж отличается от безрискового арбитража, если прибыль получается в результате разницы в цене на ценные бумаги или товарно-сырьевую продукцию, операции с которой проводятся на различных биржах.

RISK BASED CAPITAL = ОСНОВАННЫЙ НА РИСКАХ КАПИТАЛ – Risk Based Capital:- at the Corporation of Lloyd's, the determination of a member's capital requirement according to the spread of syndicates in which he participates and the nature of business that those syndicates underwrite. / Корпорэйшэн оф Лойдз (Corporation of Lloyd's).

RISK BASED MARGIN = МАРЖА, ОСНОВАННАЯ НА РИСКАХ – Risk-Based Margining covers the entire process of measuring, calculating and settling margins payable on all open futures and options positions on Eurex® Frankfurt to cover any risks arising from market trades. Margins are intended to ensure that all open positions can be settled within a short period. The daily margin amount is determined by the overall risk of the account to be settled. / Ойрэкс® или Юрэкс®.

RISK CAPITAL = РИСКОВЫЙ КАПИТАЛ – Risk Capital is a capital invested in a company, or security, that presents a risk, i.e. the possibility of loss or, indeed, gain. Also known as Venture Capital. / Капитал, инвестированный в компанию или акции, и который подвержен риску, то есть возможности получения убытка или наоборот прибыли. Известен также как Венчурный Капитал (Venture Capital). Рисковый Капитал – капитал, инвестированный в высокорисковые или относительно рисковые ценные бумаги и предприятия в ожидании соответствующих высоких прибылей (венчурный капитал).

RISK CONTROLLING = КОНТРОЛИРОВАНИЕ РИСКОВ – Risk Controlling:- department at banks and companies that monitors defined risk policy and handles the respective reporting functions.

RISK FACTOR = ФАКТОР РИСКА – (1) Risk Factor is a variable that affects the value of financial instruments or an entire portfolio. The most common market risk factors are interest rates, foreign exchange rates, equity prices and commodity prices. See also Delta, and Delta Value.

(2) Risk Factors:- required information on possible risks for the transport, handling and storage processes, available from TIS (Transport Information Service; http://www.tis-gdv.de).

RISK MANAGEMENT = УПРАВЛЕНИЕ РИСКАМИ (или РИСК МЭНЭДЬЖМЕНТ) – (1) The identification and acceptance or offsetting of the risks threatening the profitability or existence of an organization. With respect to foreign exchange involves among others consideration of market, sovereign, country, transfer, delivery, credit, and counterparty risk. Risk Management:- Control and limitation of the risks faced by an organization due to its exposure to changes in financial market variables, such as foreign exchange and interest rates, equity and commodity prices or counterparty creditworthiness. This may be because of the financial impact of an adverse move in the market variable (market risk), because the organization is ill-prepared to respond to such a move (operational risk), because a counterparty defaults (credit risk), or because a specific contract is not enforceable (legal risk). Market risks are usually managed by hedging with financial instruments, although a firm may also reduce risk by adjusting its business practices (see natural hedge). While financial derivatives lend themselves to this purpose, risk can also be reduced through judicious use of the underlying assets (for example, by diversifying portfolios). Management tool for the comprehensive identification and assessment of risks based on knowledge and experience in the fields of natural sciences, technology, economics and statistics. Management tool designed to broadly and systematically identify, quantify and manage banking-related risk exposure. Risk Management is a process of identifying and monitoring business risks in a manner that offers a risk/return relationship that is acceptable to an entity's operating philosophy. Risk Management is a systematic management of risks. This may involve general business risks or specific financial risks. Banks distinguish between operational risks (e.g., due to IT failure), borrower risks (i.e. due to borrower defaults), counterparty risks (i.e. due to the default of securities trading partners), liquidity risks (liquid assets are insufficient to make due payments) and market risks. Market risks include currency risks, exchange rate risks and interest rate risks.

(2) Measures adopted to minimize financial risk, e.g., through hedging, insurance or spreading the risk. Service package provided by banks to commercial clients to help them limit risk exposure through the use of hedging instruments. Risk Management is the identification, measurement and economic control of risks that threaten the assets of a business or other enterprise.

RISK MANAGEMENT OPTIONS = ОПЦИОНЫ УПРАВЛЕНИЯ РИСКАМИ – Risk Management Options are risk reduction actions that may be selected, alone or in combination, to reduce identified pest risk to an acceptable level.

RISK OF COUNTERPARTY DEFAULT = РИСК НЕСОСТОЯТЕЛЬНОСТИ КОНТРАГЕНТА (или РИСК НЕСОСТОЯТЕЛЬНОСТИ ВСТРЕЧНОЙ СТОРОНЫ) – Risk Of Counterparty Default is the risk of counterparty default is understood to mean possible losses in value as the result of the default or worsening creditworthiness of a customer. The risk of counterparty default is classified in more detail into:- (i) credit risk:- potential loss in value from commercial loan operations; (ii) counterparty settlement risk:- the risk of possible losses in value from pending transactions; (iii) country risk:- transfer and conversion risks from financial transactions with foreign partners; and (iv) participation risk:- the risk of a loss as the result of a change in the value or creditworthiness of an affiliated enterprise or participation.

RISK OF LARCENY/THEFT = РИСК ХИЩЕНИЯ/КРАЖИ – Risk Of Larceny/Theft is a risk of the illegal removal or appropriation of goods or objects. A distinction is made between simple larceny, i.e. without the use of force; and compound larceny, i.e. with forced entry by breaking and entering or by copued keys. / Риск незаконного изъятия или апроприации товаров или объектов. При рассмотрении таких случаев необходимо принимать в расчёт различие между простым хищением, то есть хищением без использования силы/предварительного намерения; и сложным хищением, то есть с преднамеренным доступом посредством взлома и проникновения или с использованием дубликатов ключей. Под Хищением понимается умышленное противоправное изъятие чужого имущества с целью обращения его в свою пользу или распоряжения им как своим собственным. Под Кражей понимается тайное похищение имущества какого-либо лица. Под Разбоем понимается нападение с целью завладения чужим имуществом, соединённое с насилием или угрозой насилия, опасным для жизни и здоровья лица, подвергшегося нападению.

RISK PAPER = РИСКОВАЯ БУМАГА – Risk Paper:- xxxxx. Also known as Share. / Известна также как Акция (Share).

RISK/REWARD RATIO = СООТНОШЕНИЕ РИСК/ОТДАЧА – The relationship between the probability of loss and profit. This ratio is often used as a basis for trade selection or comparison. Risk-to-Reward Ratio (RRR):- your risk-to-reward ratio is all about how much risk we are willing to take for an amount of profit. Question:- You and I place a bet; I will toss a coin 100 times. If it lands on heads you win USD100 if tails you lose USD90. Do you take the trade? Yes! Statistically the coin will land on heads 50% of the time and with this risk reward ratio of 1:1. 11 we can be sure that we will make money. By entering a trade with 1:3 risk-to-reward ratio, we can take a trading system that is only right 40% of the time and still make money from it. Keep in mind that different trading styles require different ratios. For example, a scalper can't afford to take a high risk reward ratio because of volatility and the spread, so he may take a ratio of

1:1. 2 but a long term trader will look for something more along the lines of 1:4. The formula for the risk-to-reward ratio is as follows:- Total profit to be made / Amount of money that can be lost = Risk Reward ratio.

RISK SPREAD = РАЗРАСТАНИЕ РИСКОВ – Risk Spread:- distributing the risks of losses or reductions in income by spreading the capital investments or the loans granted to third parties among a number of investment objects or borrowers. The aim is to minimize risk exposure by scattering investments (or loans) widely among different countries and regions, currencies, individual companies and industries. See also Diversification.

RITC = REINSURANCE TO CLOSE

RIVERRAIN GRASSLANDS = ПРИРЕЧНЫЕ ЛУГА (или ПРИРЕЧНЫЕ ПАСТБИЩА) – Riverrain Grasslands:- extensive, flat grassy floodplains which flood deeply during the rainy season, owing to congestion near the river mouth. / Под Пастбищами понимаются земельные угодья с травянистой растительностью, используемые для пастьбы животных. Различают пастбища природные, или естественные, и сеяные, или искусственные (культурные).

RIVEST SHAMIR ADLEMAN = РИВЭСТ ШАМИР ЭЙДЛМЭН – In cryptography, RSA (which stands for Rivest, Shamir and Adleman who first publicly described it) is an algorithm for public-key cryptography. It is the first algorithm known to be suitable for signing as well as encryption, and was one of the first great advances in public key cryptography. RSA is widely used in electronic commerce protocols, and is believed to be secure given sufficiently long keys and the use of up-to-date implementations. Clifford Cocks, a British mathematician working for the UK intelligence agency GCHQ, described an equivalent system in an internal document in 1973, but given the relatively expensive computers needed to implement it at the time, it was mostly considered a curiosity and, as far as is publicly known, was never deployed. His discovery, however, was not revealed until 1998 due to its top-secret classification, and Rivest, Shamir, and Adleman devised RSA independently of Cocks' work. Adi Shamir, one of the authors of RSA:- Rivest, Shamir and Adleman. The RSA algorithm was publicly described in 1978 by Ron Rivest, Adi Shamir, and Leonard Adleman at the Massachusetts Institute of Technology (MIT); the letters RSA are the initials of their surnames, listed in the same order as on the paper. MIT was granted US Patent 4 405 829 for a 'Cryptographic communications system and method' that used the algorithm in 1983. The patent would have expired on 2000-September-21 (the term of patent was 17 years at the time), but the algorithm was released to the public domain by RSA Security on 2000-September-06, two weeks earlier. Since a paper describing the algorithm had been published in August 1977, prior to the December 1977 filing date of the patent application, regulations in much of the rest of the world precluded patents elsewhere and only the US patent was granted. Had Cocks' work been publicly known, a patent in the US might not have been possible. Rivest Shamir Adleman (RSA are the names of the inventors) public key cryptosystem that may be used either to produce and verify digital signature or for confidentiality. RSA was published initially in 'Communications of the ACM, 21 (1978)'. / Британский математик Клифод Какс (Clifford Cocks), работавший в исследовательском агентстве СК Дьжи.Си.Эйч.Кью. (GCHQ), описал эквивалентную систему во внутреннем документе в 1973, но . В криптографии алгоритм под сокращением Ар.Эс.Эй. (RSA; появилось по первым буквам фамилий изобретателей Ран Ривэст (Ron Rivest), Ади Шамир (Adi Shamir) и Лэнад Эйдлмэн (Leonard Adleman)) используется для . коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо). Работа Какса (Had Cocks) была общеизвестной, а патент в США мог быть недоступен.

RIVET = ЗАКЛЁПКА (или КЛЁПКА) – Rivet is a metal tack or burr originally invented by Mr. Levi (Levi's) for securing the pocket sides. / Ливай (или Леви (Levi)).

RIVIERE = КОЛЬЕ (или ОЖЕРЕЛЬЕ) – Riviere is a necklace of precious stones, as diamonds, especially having more than one string. / Колье – шейное украшение с подвесками спереди, например, колье с бриллиантами. Ожерелье – шейное украшение.

RIX = РИКС – The RIX system, the settlement system owned and operated by the Riksbank, is the hub of the Swedish payment system. The system, developed during 1988–90 and implemented in 1990, operates on an Real-Time Gross Setlement (RTGS) basis. The RIX system settles payments in both Swedish Kronor and Euros. Until 1998-December-31, the system was used exclusively for Swedish Kronor. Even though Sweden is not fully participating in the Economic and Monetary Union (EMU), the RIX system was adjusted to handle Euro payments as well when the member states participating in EMU introduced the Euro as a common currency on 1999-January-01. The RIX system therefore consists of two parallel but separate systems, K-RIX for settlement in Swedish Kronor and E-RIX for settlement in Euros. The two main systems for retail payments are the Postgirot and Bankgirot systems. The Postgirot is essentially an in-house system for credit transfers between accounts held at the Postgirot Bank, recently purchased by Nordea. It handles payments ranging from low-value payments to and from households and firms to large-value government payments. The Bankgirot is an ACH managed by Bankgirocentralen (BGC) and owned by the banks. It is an open payment system in which customers can transfer payments from an account with one bank to an account with another bank. The Bankgirot system mainly handles retail payments, but also processes certain large-value payments. Bankgirot payments are settled on a bilateral net basis in the RIX system. The Riksbank's central interbank payment system. Sveriges Riksbank, the central bank of Sweden, owns and runs the RTGS system, RIX, which started operating in 1990. Since 1999 the RIX system has consisted of two parallel but separate systems:- K-RIX for settlement in Swedish kronor and E-RIX for settlement in Euros. Via E-RIX, the RIX system is linked to the ESCB's TARGET system. RIX, the Riksbank's (Sveriges Riksbank (Central Bank of Sweden)) system for the settlement of payments. Procurement of a Funds Transfer Real Time Gross Settlement System. The RIX system will serve as Sweden's future Real Time Gross Settlement System. From user and operator perspectives, RIX will offer services and functions that meet the participants' and the Riksbank's requirements. In addition, the system will meet the requirements of the Core Principles for Systemically Important Payment Systems, BIS 2002. There are three main clearing systems in Sweden – RIX, Bankgirot and PlusGirot. RIX is Sweden's RTGS system, operated by the Riksbank. Bankgirot is owned by the Swedish banks and operated by BGC AB (Bankgirocentralen AB). PlusGirot, the former Post Office payment system, was purchased by Nordea as part of its acquisition of Postgirot Bank. Bankgirot and PlusGirot process the overwhelming majority of non-urgent payments in Sweden. / Ко.-РИКС (K-RIX) Э.-РИКС (E-RIX). Банкйиэрусэнтрален (Бэ.Гэ.Сэ.; Bankgirocentralen (BGC)). Постйиэру (Postgiro) и Банкйиэру (Bankgiro). Шведский Государственный Банк или Свэриес Риксбанк (Sveriges Riksbank). Нодэя (Nordea). ПлюсЙиэрут (PlusGirot). ТАСВРРУП (Трансевропейская Автоматизированная Система Валовых Расчётов в Режиме Реального Времени по Ускоренным Переводам) или ТАСВРРЭП (Трансевропейская Автоматизированная Система Валовых Расчётов в Режиме Реального Времени по Экспресс Переводам).

RKM = REISSKILOMETER

RKN = ROOT KNOT NEMATODE

RI = RAGGED LEAVES

RL = RAINFED LOWLAND

RL = RELATIVE LOW

RL = ROLLED LEAF

RL = ROOT LENGTH

RLA = RUNNING LOAD AMPERES

RLCU = REACTIVE LAYER COATED UREA

RLH = RELATIVE LESION HEIGHT

RLIN = RESEARCH LIBRARIES INFORMATION NETWORK

RLL = RALATIVE LESION LENGTH

RLR = RAINFED LOWLAND RICE

RLREP = RAINFED LOWLAND RICE ECOSYSTEMS PROGRAM

RLRRC = RAINFED LOWLAND RICE RESEARCH CONSORTIUM

RM = RICE MILL

RMCP = REGULATION MARKET CLEARING PRICE

RMD = RELAY, MANUAL, DELAYED

RMD = REQUIRED MINIMUM DISTRIBUTION

RMG CRANE = RAIL–MOUNTED GANTRY CRANE

RMI = RELATIVE MOMENTUM INDEX

RMM = RELATIVE MOLECULAR MASS

RMP = RELAY, MANUAL, PROMPT

RMP = RESISTANCE MANAGEMENT PLAN

RMS = ROOT–MEAN–SQUARE

RN # = REGISTERED IDENTIFICATION NUMBER

RNA = RIBONUCLEIC ACID

RNAM = REGIONAL NETWORK FOR AGRICULTURAL MACHINERY

RNDI = REAL NATIONAL DISPOSABLE INCOME

RNQP = REGULATED NON–QUARANTINE PEST

RNR = RATE NOT REPORTED

RO = RECEIVING OFFICE

RO = ROMANIA

ROA = RETURN ON ASSETS

ROACE = RETURN ON AVERAGE CAPITAL EMPLOYED

ROAD RAILER = РОУДРЕЙЛЕР (или КОНТРЕЙЛЕР, или СЪЁМНЫЙ АВТОМОБИЛЬНЫЙ КУЗОВ) – Road Railer is a semitrailer specially designed to travel both on highway and on rails. A standard 45’ dry van fitted with a hydraulically adjusted bogie between the rear axles. The unit is thus bi-modal and can operate on either rail or road. / Под Контрейлером, от сочетания Латинского слова Con (Cum), означающее Вместе или Заодно, и Английского слова Trailer, означающее Волочащий или Тащущий, понимается контейнер, оборудованный колёсами с пневматическими шинами и предназначенный для перевозки грузов на железнодорожных платформах и их перемещения при помощи автотягача по шоссейным дорогам. Грузоподъёмность контрейлеров находится в диапазоне от 6 до 30 тонн. Под Контрейлером понимается контейнер, оборудованный колёсным ходом с пневматическими баллонами автомобильного типа. Предназначен для смешанных (комбинированных) автомобильно-железнодорожных, автомобильно-водных или автомобильно-водно-железнодорожных перевозок грузов. Контрейлер изготовляется, как правило, в виде автомобильного полуприцепа с закрытым или открытым кузовом (универсальным или специализированным) ёмкостью свыше 15 кубических метров ($м^3$) и грузоподъёмностью от 6 до 30 тонн (т). Буксировка по автомобильным дорогам, а также установка и снятие контрейлеров с железнодорожных платформ и специальных судов производятся автотягачами седельного типа. Контрейлеры бывают с постоянной и подкатной ходовой частью (тележкой), которая может быть одноосной, двухосной и трёхосной. Контрейлеры с постоянной ходовой частью на железнодорожных платформах крепятся специальными устройствами; контрейлеры со съёмными тележками крепления, как правило, не требуют. Разновидность контрейлеров – Стриктейнеры – контейнеры с сочленёнными кузовами. Известны также транспортные средства с комбинированной ходовой частью, приспособленной для движения по автомобильным дорогам и рельсовым путям (что достигается взаимозаменяемостью железнодорожных и автомобильных колёс или укреплением специальных стальных бандажей с ребордами на автомобильных колёсах). Их нередко называют Роудрейлерами. Массовое развитие перевозок грузов в крупнотоннажных контейнерах показало, что их применение более экономично и перспективно, чем применение контрейлеров.

ROAD SHOW = ДОРОЖНОЕ ШОУ (или РЕКЛАМНАЯ КАМПАНИЯ) – Road Show is a public relations/marketing event in the securities industry which acts as an informational forum between the issuer and potential investors to generate interest in the issuer’s shares. Road shows generally occur in the 30 day period preceding an offering of Depositary Receipts. / Гастрольное Представление (Road Show) – способ презентации эмитентом ценных бумаг и достоинств эмиссии потенциальным покупателям. Руководство компании, выпускающей акции или облигации, проделывает ‘гастрольное представление’ по стране, предоставляя финансовую информацию и рассказывая о перспективах компании, а также отвечая на вопросы аналитиков, управляющих фондами, и других потенциальных инвесторов. Известно также как Выставка Собак и Пони (Dog and Pony Show).

ROAN = ГНЕДОЕ (или САВРАСОЕ, или ЧАЛОЕ) – Roan:- the color of a roan horse, especially when red. / Гнедое:- о масти Лошадей:- красновато-рыжий (обычно с чёрными хвостом и гривой). Саврасое:- о масти Лошадей:- светло-гнедой с чёрными

гривой и хвостом. Чалое:- о масти животного с белыми вкраплениями в шерсти основной окраски (обычно серой), а также (о Лошади) светлый с чёрными гривой и хвостом или чёрный со светлыми гривой и хвостом.

ROARING FORTIES = РЕВУЩИЕ СОРОКОВЫЕ (или БУРНЫЕ СОРОКОВЫЕ) – Roaring Forties (maritime term):- that geographical belt located approximately in 40 degrees south latitude in which are encountered the prevailing or stormy westerlies.

ROASTERS = ОБЖИГОВЫЕ ПЕЧИ (или ОБЖИГАТЕЛЬНЫЕ ПЕЧИ, или МУФЕЛИ) – Roasters:- each of the above processes can be carried out in specialized roasters. The types most commonly in use are fluidized-bed, multiple-hearth, flash, chlorinator, rotary kiln, and sintering machine (or blast roaster). Fluidized-bed roasters have found wide acceptance because of their high capacity and efficiency. They can be used for oxidizing, sulfatizing, and volatilizing roasts. The roaster is a refractory-lined, upright cylindrical steel shell with a grate bottom through which air is blown in sufficient volume to keep fine, solid feed particles in suspension and give excellent gas-solid contact. The ore feed can be introduced dry or as a water suspension through a downpipe into the turbulent layer zone of the roaster. Discharge of the roasted calcines is through a side overflow pipe. Multiple-hearth roasters also have found wide acceptance in that they can be used for oxidizing, sulfatizing, chloridizing, volatilizing, reducing, and calcining processes. The roaster is a refractory-lined, vertical cylindrical steel shell in which are placed a number of superimposed refractory hearths. A slowly rotating central shaft turns rabble arms on each hearth both to stir the roasting material and to push it into drop holes leading to the hearth below. Feed material is fed to the top hearth, and, as it follows a zig-zag path across the hearths and downward, it meets the rising gas stream that effects the roasting. The calcines are discharged from the bottom hearth. Flash roasters are used only for oxidizing roasts and are, in effect, multiple-hearth roasters with the central hearths removed. This design came with the realization that much of the oxidizing takes place as the particles are actually dropping from hearth to hearth. Chlorinators are used for roasting oxides to chlorides. They are tall, circular steel shells lined with refractory brick to prevent chlorine attack on the steel. The top of each chlorinator has a sealed hopper for periodic feed charging, and gaseous or liquid chlorine is added at the bottom of the unit. Heat is supplied by electrical resistance through the shell wall and by any exothermic reaction that may occur. The product depends on the chloridizing reaction taking place, with magnesium dichloride, for example, forming as a watery liquid and titanium tetrachloride coming off as a gas. Calcination of carbonates to oxides is done in a horizontal rotary kiln, which is a mild-steel circular shell lined with refractory material and having a length 10 to 12 times the diameter. Sloping slightly downward from feed to discharge ends, the kiln slowly rotates while fuel-fired burners located inside the kiln provide the required heat. A sintering machine, or blast roaster, can conduct oxidizing or reducing roasts and then agglomerate the roasted calcines, or it can be used for agglomeration alone. Agglomeration is the fusing of fine feed material into larger chunks that can be fed into a blast furnace or retort, eliminating the problem of losing the fine feed in the hot air blast. The oxidizing or reducing reaction is exothermic, but in order for agglomeration alone to be conducted, a fuel such as fine coke must be mixed with the charge. The sintering machine consists of an endless belt of moving metal pallets with grate bottoms on which a fine feed charge is spread and passed under a burner. As the charge ignites, the pallet passes over a suction wind box, so that air being drawn through the feed layer causes combustion (i.e. oxidation) of sulfur or carbon to continue from top to bottom. Because the temperature is high and there is no agitation of the feed, a partial fusion takes place on the surface of the particles, leaving them adhering together in the form of a porous, cellular clinker known as Sinter. / окислительные, сульфатизирующие обжиги и обжиги с возгонкой (volatilizing roasts). окислительные обжиги (oxidizing roasts) или восстановительные обжиги (reducing roasts). Кальцинирование или Прокаливание или Обезвоживание (Calcination).

ROASTING = ОБЖИГ – Roasting is a treatment of ore by heat and air, or oxygen enriched air, or other reagent, to eliminate volatile substances and bring about chemical change such as oxidation of sulfides. Roasting:- as stated above, for those instances in which a metal-bearing compound is not in a chemical form that permits the metal to be easily and economically removed, it is necessary first to change it into some other compound. The preliminary treatment that is commonly used to do this is roasting. Processes:- there are several different types of roast, each one intended to produce a specific reaction and to yield a roasted product (or calcine) suitable for the particular processing operation to follow. The roasting procedures are:- (1) Oxidizing Roasts, which remove all or part of the sulfur from sulfide metal compounds, replacing the sulfides with oxides. The sulfur removed goes off as sulfur dioxide gas. Oxidizing roasts are exothermic. (2) Sulfatizing Roasts, which convert certain metals from sulfides to sulfates. Sulfatizing roasts are exothermic. (3) Reducing Roasts, which lower the oxide state or even completely reduce an oxide to a metal. Reducing roasts are exothermic. (4) Chloridizing Roasts, or chlorination, which change metallic oxides to chlorides by heating with a chlorine source such as chlorine gas, hydrochloric acid gas, ammonium chloride, or sodium chloride. These reactions are exothermic. (5) Volatilizing Roasts, which eliminate easily volatilized oxides by converting them to gases. (6) Calcination, in which solid material is heated to drive off either carbon dioxide or chemically combined water. Calcination is an endothermic reaction. / (1) Окислительные Обжиги (Oxidizing Roasts). (2) Сульфатизирующие Обжиги (Sulfatizing Roasts). Восстановительные Обжиги (Reducing Roasts). Хлорирующие Обжиги (Chloridizing Roasts). (5) Обжиги С Возгонкой (Volatilizing Roasts). (6) Кальцинирование или Прокаливание или Обезвоживание (Calcination). Под Обжигом понимается нагрев и выдержка при высокой температуре различных материалов с целью придания им необходимых свойств (например, твёрдости, прочности) или удаления примесей. Окислительный обжиг применяют для удаления из руд серы, летучих веществ и других примесей, а восстановительный обжиг – для перевода слабомагнитных минералов железных руд в магнитные с целью последующего обогащения магнитной сепарацией. В цветной металлургии обжиг используют для отгонки ценных составляющих; иногда обжиг совмещают со спеканием для облегчения последующей обработки. В силикатной промышленности посредством обжига получают кирпич из глины, вяжущие материалы, глиняную, керамическую, фарфоровую, фаянсовую посуду, санитарно-технические изделия, детали машин и аппаратов. Обжиг осуществляется в обжиговых печах. Под Обжигом понимается нагрев и выдержка при высокой температуре (в обжиговых печах) различных материалов для придания им необходимых свойств или удаления примесей, например, обжиг руды, глины, огнеупоров, керамики, фарфора, фаянса.

ROBE = РЯСА (или ОДЕЯНИЕ, или МАНТИЯ) – Robe is a long flowing outer garment, especially one used for ceremonial occasions or as a symbol of office or profession; a loose garment, as a bathrobe, for informal wear especially at home.

ROBE DE CHAMBRE = РОБ ДЁ ШАМБР (или ДОМАШНИЙ ХАЛАТ) – Robe De Chambre:- dressing gown. / .

ROB ROY = РОБ РОЙ – Rob Roy is a classic hunting jacket pattern of red and black checks.

ROBUSTA COFFEE BEANS = ЗЁРНА КОФЕ РОБУСТА – Robusta Coffee (Coffea Canephora; syn. Coffea Robusta) is a variety of Coffee, which has its origins in central and western sub-Saharan Africa. It is a species of flowering plant in the Rubiaceae family. Though widely known as Coffea Robusta, the plant is scientifically identified as Coffea Canephora, which has two main varieties – Robusta and Nganda. Description:- the plant has a shallow root system and grows as a Robust tree or shrub to about 10 meters. It flowers irregularly, taking about 10–11 months for cherries to ripen, producing oval-shaped beans. The Robusta plant has a greater crop yield than that of Coffee Arabica, and contains more caffeine 2.7% compared to Arabica's 1.5%. As it is less susceptible to pests and disease, Robusta needs much less herbicide and pesticide than Arabica. Originating in upland forests in Ethiopia, Coffee Canephora grows indigenously in Western and Central Africa. It was not recognized as a species of Coffea until the XIX century, about

a hundred years after Coffea Arabica. Cultivation and Use:- approximately 20% of the Coffee produced in the world is Robusta. It is mostly grown in Vietnam, where French colonists introduced it in the late XIX century, though it is also grown in Africa and Brazil, where it is often called Conilon. In recent years, Vietnam, which produces mostly Robusta, has surpassed Brazil, India, and Indonesia to become the world's single largest exporter of Robusta Coffee. Brazil is still the biggest producer of Coffee in the world, producing one-third of the world's Coffee, though 80% of that is Coffee Arabica. Robusta is easier to care for and has a greater crop yield than the other major species of Coffee, Coffee Arabica, so is cheaper to produce. Roasted Robusta beans produce a strong, full-bodied Coffee with a distinctive earthy flavour, but usually with more bitterness than Arabica due to its pyrazine organic compound. Since Arabica beans are believed to have smoother (some people consider Arabica too acidic though) taste with a richer flavour, they are often considered superior, while the harsher Robusta beans are mostly used as a filler in lower-grade coffee blends. However, the powerful flavour can be desirable in a blend to give it perceived 'strength' and 'finish', noticeably in Italian Coffee culture. Good-quality Robusta beans are used in traditional Italian espresso blends, to provide a full-bodied taste and a better foam head (known as Crema). Robusta has about twice as much caffeine as Arabica. Robusta Coffee beans have a slightly bitter taste and contain more caffeine than its Arabica counterpart. Low quality blends consists of a mix of Arabica and Robusta beans or entirely of Robusta beans. Countries that produce Robusta Coffee beans include:- Brazil, India, Nigeria, Cameroon, Gabon, Democratic Republic of Congo, Uganda, Angola, Madagascar, Sri Lanka, Sumatra, Java, Bali, Timor, Borneo, Vietnam, and Celebes. Robusta Coffee futures are traded under ticker symbol RC at the NYSE Liffe London. / НЙФБ® или Эн.Уай.Эс.И.® (NYSE®) ЛАЙФ или Эл.Ай.Эф.Эф.И. (LIFFE). кофейные зёрна. Робуста – один из двух наиболее популярных и значимых сортов кофе (после Арабики). Робуста – вид кофейного дерева, высотой до десяти метров, выращиваемого в экваториальных лесах Африки и Азии. Кофе Робуста – другое его название – Конголезский Кофе. Этот вид кофейных деревьев произрастает в экваториальных лесах, в бассейне реки Конго. Слово Робуста переводится как Сильный, так как растёт в таких условиях, в которых Арабика прижиться не может. Робуста представляет собой кофейное дерево высотой от двух до десяти метров. У Робусты более крупные листья, чем у Арабики. Цветки бело-розовые. Плоды Робусты созревают 10–12 месяцев, диаметр плода в результате получается больше, чем у Арабики на 0.5–0.7 сантиметра. Качество Робусты, как отмечают дегустаторы, ниже, чем у Арабики. Но у Робусты есть и преимущества. Этот вид более урожайный и более устойчивый к болезням, и, кроме того, кофе Робуста дешевле. Кофе Робуста получил распространение с начала XX столетия, после опустошительного уничтожения плантаций арабики болезнью, называемой Листовая ржавчина. В 1900 Робуста был впервые привезён на Яву из Конго и в настоящее время стал важной хозяйственной культурой для многих тропических стран. Робуста устойчив к болезням и более урожаен, чем Арабика (до 3.5 т/га). Плантации Робусты располагаются главным образом на нижних частях склонов, где не выживает более прихотливый Арабика. Робусте требуется тёплый влажный климат, он хорошо растёт на нижних склонах и в долинах при среднегодовой температуре 22–26 градусов С и хорошей влажности. Дерево погибает при температуре ниже +10 градусов С. Робусту выращивают в основном в Азии и Африке, а, например, в Колумбии и Коста-Рике её выращивание запрещено законом. Робуста по праву занимает почётное второе место по употреблению во всем мире после Арабики. Секрет этого прост:- Робуста уступает Арабике по вкусовым качествам. Кофе из зёрен Робусты имеет весьма специфический сильный вкус. Горечь удаётся смягчить только при смешивании с другими видами кофейных зёрен. А также специфический вкус робусты удаётся нивелировать при приготовлении растворимых напитков. Собственно поэтому в баночках с растворимым кофе мы чаще всего встречаем именно Робусту. Однако есть ценители, предпочитающие именно вкус кофейных зёрен Робусты – горький, острый, даже, можно сказать, грубый. Кофе из зёрен Робусты получается таким из-за особенностей сорта, а ещё потому, что Робуста очень богата кофеином. Эту особенность Робусты часто используют для придания сорту кофе особенной крепости. Робуста – это вид кофейного дерева. В диком виде кофейные деревья Робусты могут достигать в высоту десяти метров. Но, понятно, что для промышленного выращивания Робусту обрезают. То есть кофейное дерево Робусты формируют в виде небольшого деревца или куста. Цветы Робусты нежно-розовые, листья довольно большие в диаметре, а плоды округлые, в коричневатых, зеленоватых или сероватых тонах. Робуста впервые была найдена в Африке, в бассейне реки Конго. Сегодня кофейные деревья Робусты выращивают в тропическом климате Африки и Азии. Крупнейшим производителем робусты считается Вьетнам. Плантации Робусты расположены преимущественно на равнинах. Весьма редко Робусту выращивают в горах, выше 1-ой тысячи метров над уровнем моря. Робусту весьма просто выращивать. Он не предъявляет особых требований ни к климату, ни к расположению плантации, ни к составу почвы. Робуста очень хорошо переносит как переувлажнение, так и засуху. Он прекрасно растёт при сильных колебаниях температуры, хотя и весьма теплолюбив. Робуста также очень устойчив к болезням, редко поражается вредителями. К тому же Робуста весьма легко размножается – укоренением черенков. Кофейные зёрна Робусты созревают примерно 9–11 месяцев. В год с одной плантации кофейных деревьев Робусты производители собирают от 12 до 15 урожаев. Количество урожаев, которые даёт робуста в год, зависит от техники ухода за кофейными деревьями, климата и расположения плантации. Из-за того, что Робуста прост в выращивании, легко размножается и даёт такое большое количество урожаев, выращивать его довольно выгодно. И это даже притом, что Робуста в целом стоит дешевле, чем арабика. Торговля Робустой производится на кофейной бирже Лондона. Единицей веса кофе является тонна. Денежной единицей, используемой при расчётах за Робусту, является Фунт Стерлингов Соединённого Королевства. Самые крупные склады кофейных зёрен Робусты расположены в Лондоне. Именно из Лондона Робуста начинает своё путешествие по всему миру. Различия между Арабикой и Робустой очень заметны. В Робусте по сравнению с Арабикой почти в два раза больше кофеина, аминокислот и хлорогеновых кислот. Хлорогеновые кислоты добавляют к вкусу Робусты вяжущую ноту. В Арабике на 60% больше различных масел. Многие ароматические летучие соединения, образующиеся в процессе обжарки, растворяются в маслах, выступающих на поверхность зерна. При приготовлении напитка они высвобождаются и участвуют в формировании яркого аромата и вкуса Арабики. Зелёные зёрна Робусты подвергают специальной обработке, чтобы смягчить его вяжущий вкус и горечь. В крупных хозяйствах ведётся селекционная работа по выведению новых сортов с уменьшенным количеством кофеина и улучшением вкусовых качеств. В основном Робусту применяют для изготовления коммерческих кофейных смесей и растворимого кофе. Робуста, от Латинского слова Robustus, означающее Крепкий или Надёжный или Основательный, название ботанического сорта кофе указывает на его вкусовые характеристики. Кофейное дерево Робуста было открыто лишь в 1860 недалеко от Озера Виктория в Уганде. Вкус кофе из зёрен Робусты отличается от Арабики:- если вкус Арабики мягкий, нежный, то напиток из Робусты более грубый, острый; если Арабика чуть-чуть, едва заметно, кислит, то в Робусте ощущается горечь; наконец, привычно маслянистый напиток из Арабики получается более насыщенным и ароматным, чем водянистый из Робусты. Однако есть у Робусты и особенность, ставшая причиной появления определённого числа любителей этого сорта кофе, – в Робусте содержится много кофеина (от 1% до 2.5%). 100 мл кофе из зёрен Робусты фактически содержит так называемую медицинскую дозу кофеина.

ROBUST WOOL = ОСОБОПРОЧНАЯ ШЕРСТЬ (или ЖЁСТКАЯ ШЕРСТЬ, или ПРОЧНАЯ ШЕРСТЬ) – Robust Wool is a wool possessing a strong hand and bulky nature.

ROC = RETURN ON CAPITAL

ROCE = RETURN ON CAPITAL EMPLOYED

ROCHET = РОШЭ (или СТИХАРЬ, или МАНТИЯ) – Rochet is a white linen vestment resembling a surplice with close-fitting sleeves worn especially by bishops and privileged prelates. / Стихарь с узкими рукавами; короткая туника в средние века.

ROD = КАТАНКА – Rod mills are similar to bar mills at the front end, but the finishing end is different. Rods have a smaller section (5.5 to 15 millimeters in diameter) and are always coiled, while bars are normally shipped in cut length. The final rolling in rod mills often takes place in a close-coupled set of 10 pairs of small rolls (200 and 150 millimeters in diameter); these are all installed in a block, with their axes at a 45° angle and arranged in an alternating fashion like the vertical and horizontal rolls in a continuous bar mill. Exit speed of small-diameter rods can go up to 100 meters per second. The rod is immediately coiled by quickly rotating laying heads and cooled before bundling. For enhanced production, two strands are often rolled simultaneously. Such high-speed operation requires cooling of the rod and almost every rolling-mill component. The cooling condition of the bars and rods is also carefully controlled to meet metallurgical specifications. Computers are used for designing roll passes and for scheduling and controlling the complex operations. Bar and rod mills produce 150 000 to 750 000 tons per year. The largest mills are housed in buildings up to 600 meters long. The most space-consuming part of these manufacturing facilities (and the source of most bottlenecks) is the finishing and shipping area, which handles the many different lightweight shapes that are produced in various steel grades, heat treatments, and surface conditions and are made to many specific customer orders. / прокатка (rolling). Под Катанкой понимается горячекатаная проволока обычно круглого сечения диаметром от 5 до 10 миллиметров (мм). Получают на проволочных или проволочно-сортовых станах. Основная масса катанки идёт на производство холоднотянутой проволоки диаметром до 0.01 мм. Из стальной катанки изготовляют также пружины и арматуру для железобетона.

RODENTS = ГРЫЗУНЫ – Rodents are Rats, Mice, and Guinea Pigs. / Под Грызунами понимается наиболее многочисленный Отряд Млекопитающих – около 1 600 Видов (свыше 1/3 всех Млекопитающих). В бывшем Союзе Советских Социалистических Республик (СССР) насчитывалось около 150 Видов, из Семейств:- Беличьи, Дикообразы, Летяги, Мыши, Слепыши, Сони, Тушканчики и другие. Зубы приспособлены к питанию твёрдыми растительными кормами. Резцы сильно развиты (по 1 паре на каждой челюсти), растут в течение всей жизни животного. Размеры от 5 сантиметров (Мышовки) до 1.3 метра (Водосвинка). Многие грызуны – вредители лесного и сельского хозяйства; могут быть переносчиками возбудителей ряда опасных инфекций (туляремии и других). Ряд Видов – объекты пушного промысла (Белка, Ондатра и другие).

ROD WEEDING = ШТАНГОВАЯ (или ПРУТКОВАЯ) ПРОПОЛКА – Rod Weeding is control or eradication of Weeds by means of pulling a longitudinally rotating rod below the soil surface. / Под Прополкой понимается уничтожение Сорных Растений в посевах и посадках сельскохозяйственных и лесных культур:- механически (боронами, культиваторами, лущильниками и тому подобным), химически (гербицидами) и вручную.

ROE = RATE OF EXCHANGE

ROE = RETURN ON EQUITY

ROFR = RIGHT OF FIRST REFUSAL

ROGUE = УДАЛЕНИЕ НЕТИПИЧНЫХ ФОРМ (или СОРТОВАЯ ПРИМЕСЬ) – Rogue:- to remove and destroy infected or abnormal plants from within a crop or plot in order to prevent either further spread of the disease to nearby healthy plants or increased contamination of the site. Rogue is a plant that is different from the standard variation or strain. / контаминация .

ROGUEING = СОРТОВАЯ ПРОЧИСТКА – Rogueing is the judicious removal of infected and undesirable individuals from a pure population (Variety) to prevent spread of disease and to purify the stock. / Сортовая Прочистка или Выпалывание Сортовой Примеси – удаление нетипичных форм из сортовых посевов или семян.

ROI = RETURN ON INVESTMENT

ROL = REDUCTION–OPTION LOAN

ROL = ROMANIAN LEU

ROLAG = СКРУТКА – A Rolag (Scottish Gaelic:- Roileag) is a roll of fiber generally used to spin woollen yarn. A rolag is created by first carding the fiber, using handcards, and then by gently rolling the fiber off the cards. If properly prepared, a rolag will be uniform in width, distributing the fibers evenly. The word derives from the Scottish Gaelic word for a small roll. Animal fibers have traditionally been used to create rolags, but today's spinners use many different fiber materials, including manufactured and plant fibers. Rolag:- the cigar-shapped roll of carded fiber, losely rolled off of the hand cards, used as the fiber source when spinning woolen yarn. / (Roileag). , от Французского слова Rôlage, означающее Скручивание или Свёртывание Листков Табака, понимается .

ROLL = ПЕРЕНОС – Roll:- to re-book cargo to a later vessel. See also Advance. / Перебронировать груз на более позднее судно. Смотрите также Опережение или Предварение (Advance).

ROLL ANGLE = УГОЛ БОРТОВОЙ КАЧКИ (или КРЕН ПРИ БОРТОВОЙ КАЧКЕ) – The Roll Angle is an angle at which a ship moves around its longitudinal axis. / Угол, на который судно смещается вокруг своей продольной оси. Под Тангажем, от Французского слова Tangage, понимается угловое движение судна или летательного аппарата, например, самолёта, относительно главной поперечной (горизонтальной) оси инерции. Угол тангажа – угол между продольной осью летательного аппарата и горизонтальной плоскостью.

ROLLBACK = ОТКАЗ (или ОТКАТ) – (1) Rollback refers to an agreement among Uruguay Round participants to dismantle all trade-restrictive or distorting measures that are inconsistent with the provisions of the GATT (short for the General Agreement on Tariffs and Trade). Measures subject to rollback would be phased out or brought into conformity within an agreed time frame, no later than by the formal completion of the negotiations. The rollback agreement is accompanied by a commitment to 'standstill' on existing trade-restrictive measures. Rollback is also used as a reference to the imposition of quantitative restrictions at levels less than those occurring in the present. See also Standstill. / Отказ относится к соглашению среди участников Уругвайского Раунда отказаться от всех мер ограничения торговли или предвзятости, которые потиворечат положениям Генерального Соглашения о Тарифах и Торговле (ГСТТ или, как это произносится на Английском языке, ГЯТ (GATT)). Меры, от которых подлежит отказаться, будут отменены или приведены в соответствие в пределах оговариваемых временных рамок, но не позднее чем формальное завершение переговоров. Соглашение об отказе сопровождается остановкой существующих мер ограничения торговли. Отказ используется также в качестве рекомендации по наложению количественных ограничений на более низких уровнях, нежели тех, что существовали на данный момент времени.

(2) Rollback:- a container not loaded aboard a vessel due to an incomplete shipment or incomplete documentation. / Контейнер, не загруженный на борт судна вследствие неполноты грузовой партии или неполного комплекта сопроводительной документации.

ROLL COLLAR = XX ВОРОТНИК (или МЯГКИЙ ВОРОТНИК) – Roll Collar is a collar that rises from the neckline then folds over (or rolls) so that the edge of the collar touches the garment.

ROLLED ENDS = ВАЛЬЦОВАННЫЕ ПРОДОЛЬНЫЕ НИТИ – Rolled Ends:- (1) on a section beam, rolled ends are adjacent ends that do not unwind parallel to each other. Rolled ends can be caused by such factors as uneven tension, ridgy beams, and static. (2) The ends can also roll behind the hook reed in slashing and can tangle with each other, resulting in broken ends and ends doubling.

ROLLED GOLD = ПРОКАТАННОЕ ЗОЛОТО (или КАТАНОЕ ЗОЛОТО, или НАКАТАННОЕ ЗОЛОТО) – Rolled Gold:- a hybrid material, consisting of a thin layer of gold that's mechanically bonded or heat-fused to one or both sides of a base metal (often brass or copper), then rolled out into sheets to create jewelry; the thickness of the gold layer can vary, but is generally at least 5% of the total metal weight (vs gold-plated, which uses a thinner sheet of gold); patented in England in 1817, it became a prime source for semi-precious and better-quality costume jewelry in the Victorian era; saw a renewed surge of popularity in 1920s and 1930s, especially in utilitarian objects such as watches and fountain pens. English and American XIX-century rolled gold articles might be stamped 'Gilt'. Designations such as '1/20 12K G.F.' or '12 Kt. Gold Filled' indicate a later, XX-century piece. Also known as Gold-Filled (a later designation, indicating that the amount of gold be $1/20^{th}$ of the total weight, as mandated by law), rolled gold plate (generic, can also apply to gold-plated materials containing less than 5% gold). Example:- the 1932 Bulova wristwatch had a beautiful rolled-gold band which, 80 years later, still gleamed with the luster of solid gold. The process in which a layer of carat gold alloy is mechanically bonded to another metal. / Бьюловэ (Bulova).

ROLLED LEAF = СКРУЧЕННЫЙ ЛИСТ – Rolled Leaf (RL) is a condition in which the leaf blade margins are incurved, forming a half cylinder; sometimes as a result of underdeveloped midrib or absence of midrib or blade.

ROLLED SELVAGE = СКРУЧЕННАЯ (или СВЁРНУТАЯ, или ВАЛЬЦОВАННАЯ) КРОМКА – Rolled Selvage is a curled selvage. See also Curled Selvage.

ROLLER BEARING = РОЛИКОВЫЙ ПОДШИПНИК (или РОЛИКОПОДШИПНИК) – Roller Bearing is an antifriction bearing comprising rolling elements in the form of rollers. See also Bearing. / Роликовый Подшипник или Роликоподшипник – подшипник качения с роликами в качестве тел качения. Роликоподшипник – подшипник качения, у которого телами качения являются цилиндрические или конические ролики.

ROLLER BLINDS = РУЛОННЫЕ ЗАНАВЕСИ (или РУЛОННЫЕ ЖАЛЮЗИ) – Roller Blinds are the shades wound around a toller or dowel when the window is exposed. Originally made only in neutral colors, today these shades often are made in colors or matched and coordinated with the draperies in a room.

ROLLER CARD = ВАЛИЧНАЯ КАРДОЧЁСАЛЬНАЯ МАШИНА – Roller Card:- generally, any type of card in which rollers do the carding. Usually this refers to a woolen card with a main cylinder and four to seven stripper rolls and worker rolls working in pairs.

ROLLER COATING = НАНЕСЕНИЕ ПОКРЫТИЯ ВАЛИКОМ – Roller Coating:- in this method, a roller is used to apply the coating to the moving substrate fabric. Various roll configurations can be used.

ROLLER CONVEYOR = РОЛИКОВЫЙ КОНВЕЙЕР (или РОЛИКОВЫЙ ТРАНСПОРТЁР, или РОЛЬГАНГ) – Roller Conveyor is a conveyer that uses rollers to move product either by gravity or automation.

ROLLER GIN = ВАЛИЧНЫЙ ВОЛОКНООТДЕЛИТЕЛЬ (или ВАЛИЧНЫЙ ДЖИН) – Long fiber Cottons must be ginned in a Roller Gin because saw gins can damage their delicate fibers. The roller gin was invented in India centuries ago and this concept is still used in modern gins. Long staple Cottons, like Pima, separate from the seed more easily than Upland Varieties. A roller gin uses a rough roller to grab the fiber and pull it under a rotating bar with gaps too small for the seed to pass. With Roller Ginning, the seed cotton passes between two roller that squeeze the seeds out from the fibers. It is used for Cotton types in which the fibers are less attached to the seeds, as for instance Pima Long/Extra Long Staple Cotton. The major advance is that the process is more gentle to the cotton than a saw gin but, on the other hand, the process is much slower. / Джин с барабанным механизмом для отделения волокон от семян Хлопчатника. Волокноотделитель или Джин, машина для отделения хлопкового волокна от семян. Валичные волокноотделители работают по методу зажима пучка волокон и отрыва его от семени. Валичными волокноотделителями пользуются при обработке слабо опушённых семян с длинными и нежными, сравнительно легко отделяемыми волокнами (современные длинноволокнистые или так называемые длинноштапельковые или тонковолокнистые Хлопчатники). Хлопок с валичных волокноотделителей – напоминает руно, состоящее из плотных прядок.

ROLLER GINNING = ВАЛИЧНОЕ ВОЛОКНООТДЕЛЕНИЕ (или ВАЛИЧНОЕ ДЖИНИРОВАНИЕ) – Roller Ginning is the original Hindu method of ginning, still used in some world areas. The cotton comes in contact with a rough leather apron as it comes from a bin or hopper. The fibers adhere to the apron, and as the latter revolves, the fibers are drawn around the surface. Pressing against the roller is the steel doctor knife or blade. This arrangement permits the fibers to continue on their course, but will prevent the seeds from doing so. This gin is not built for production, and poor results occur often because of the cumbersome method of separating seed from fiber.

ROLLER PRINTING = ПЕЧАТАНИЕ ВАЛАМИ (или НАБИВКА ВАЛАМИ) – Roller Printing is the application of designs to fabric, using a machine containing a series of engraved metal rollers positioned around a large padded cylinder. Print paste is fed to the rollers and a doctor blade scrapes the paste from the unengraved portion of the roller. Each roller supplies one color to the finished design, and as the fabric passes between the roller and the padded cylinder, each color in the design is applied. Most machines are equipped with eight rollers, although some have sixteen rollers. Roller Printing may be the most important method of printing today. The design is etched onto a toller through which the fabric is passed. For each color in the design a different toller is used. High speed can be obtained in toller printing. Roller Printing:- this technique is used whenever long runs of fabric are to be printed with the same design. The modern machine, based on one originally devised in 1783, consists of a large central cast-iron cylinder over which passes a thick endless blanket providing a resilient support for the fabric. Backing fabrics, called Back Grays, are placed between the blanket and the fabric to prevent undue staining of the blanket. Although formerly made of cotton fabric, most modern back grays are continuous belts of nylon. The blanket and back gray are appropriately tensioned, so that the fabric moves through the machine as the central cylinder rotates. Engraved printing rollers, one for each color, press against the fabric and the central cylinder. The pattern on the roller is etched on the surface of a copper shell supported on a mandrel. High-quality engraving is essential for good printing. Each printing roller is provided with a rotating color-furnishing roller, partially immersed in a trough of printing paste. Finely ground blades (doctor blades) remove excess color paste from the unengraved areas of these rollers, and each also has a lint blade. The printed fabric passes from the main cylinder and through a drying and steaming chamber to fix the color. Although this machine prints only one side of the fabric, the Duplex roller machine, essentially a combination of two roller machines, prints both sides. Modern printing machines are smooth-running precision machines fitted with carefully designed roller bearings and hydraulic or pneumatic mechanisms to ensure uniform pressure and flexibility. Pressure is regulated from an instrument panel, and each roller is controlled independently.

Automatic registration is effected by electromagnetic push-button control, and modern electric motors provide smooth-running, variable-speed drives. The washing of back grays and printer's blankets has also been automated. Spray printing is the application of color from spray guns through stencils and has limited but occasionally profitable use. Roller Printing is a method of printing textiles that uses a series of engraved metal rollers each of which contains the parts of the pattern to be printed in one color. See also Printing. Roller Printing, also called Cylinder Printing or Machine Printing, on fabrics is a textile printing process patented by Thomas Bell of Scotland in 1783 in an attempt to reduce the cost of the earlier copperplate printing. This method was used in Lancashire fabric mills to produce cotton dress fabrics from the 1790s, most often reproducing small monochrome patterns characterized by striped motifs and tiny dotted patterns called 'Machine Grounds'. Improvements in the technology resulted in more elaborate roller prints in bright, rich colors from the 1820s; Turkey red and chrome yellow were particularly popular. Roller printing supplanted the older woodblock printing on textiles in industrialized countries until it was resurrected for textiles by William Morris in the mid-XIX century. / Найлан^{ТЗ} (Nylon^{TM}). Печатание ткани на цилиндрической печатной машине. Загустка (print paste). Томэс Бэл (Thomas Bell). Вильэм Морис (William Morris).

ROLLER SHADES = РУЛОННЫЕ ЗАНАВЕСИ (или РУЛОННЫЕ ЖАЛЮЗИ) – Roller Shades is another name (synonym) for Roller Blinds. / Рулонные Шторки (Roller Blinds).

ROLLER SKATE = РОЛИКИ (или РОЛИКОВЫЙ КОНЁК, или ХХ) – Roller Skate:- a shoe with a set of wheels attached for skating over a flat surface.

ROLL GOODS = ТОВАРЫ В РУЛОНАХ – Roll Goods:- fabric rolled up on a core after it has been produced. It is described in terms of weight and width of the roll and length of the material on the roll.

ROLLING = ПРИКАТЫВАНИЕ (или КАТКОВАНИЕ) – Rolling is a secondary tillage operation which crushes clods and compacts or firms and smoothes the soil by the action of ground-driven, rotating cylinders. / Под Прикатыванием понимается выравнивание и уплотнение поверхности предварительно вспаханной или разрыхлённой почвы полевыми катками. Применяют для более равномерной заделки семян, капиллярного поднятия влаги в верхний слой почвы, дружного появления всходов.

ROLLING CARGO = КОЛЁСНЫЙ ГРУЗ – Rolling Cargo:- a cargo which is on wheels, such as truck or trailers, and which can be driven or towed on to a ship. / Груз, который размещён на колёсах, такой как грузовик или прицепы, и который может быть завезён или отбуксирован на борт судна.

ROLLING ELEMENT BEARING = ПОДШИПНИК С РОЛИКОВЫМИ ЭЛЕМЕНТАМИ (или ПОДШИПНИК С РОЛИКОВЫМИ ТЕЛАМИ КАЧЕНИЯ) – Rolling Element Bearing is a friction-reducing bearing that consists of a ring-shaped track that contains free-revolving metal balls. A rotating shaft or other part turns against such a bearing. See also Bearing.

ROLLING HOOP = ОТВАЛЬЦОВАННЫЙ ОБОД (или ОБРУЧЬ, или БАНДАЖ, или БУГЕЛЬ) – The extruded rims fabricated on drums for structural strength and ease of handling.

ROLLING INSTALMENTS = НАРАЩИВАЕМЫЕ ВЫПУСКИ (или НАРАЩИВАЕМЫЕ ВЗНОСЫ) – Rolling Instalments are a type of instalment, having a much longer life (up to 10 years) with a periodic Reset Date (usually yearly). On the Reset Date, the issuer may adjust the exercise price (often called the 'Loan Amount' of the Instalment) with the objective of maintaining a desired gearing level.

ROLLING OIL = ПРОКАТЫВАЮЩЕЕ МАСЛО (или МАСЛО ДЛЯ ПРОКАТКИ) – Rolling Oil is an oil used in hot- or cold-rolling of ferrous and non-ferrous metals to facilitate feed of the metal between the work rolls, improve the plastic deformation of the metal, conduct heat from the metal, and extend the life of the work rolls. Because of the pressures involved, a rolling oil may be compounded or contain extreme pressure (EP) additives. In hot rolling, the oil may also be emulsifieable. / присадки для сверхвысокого давления.

ROLLING THE HEDGE FORWARD = ХХ – Rolling the Hedge Forward is liquidation of the original futures contract and the simultaneous purchase (long hedge) or sale (short hedge) of a more distant futures contract to maintain the hedge without holding it into the delivery month.

ROLL LAPPING = ЛЕНТОСОЕДИНЕНИЕ ВАЛИКАМИ – Roll Lapping:- a condition in which groups of fibers attach themselves to the drafting rolls instead of following the normal path through the drafting system. These fibers cause the trailing fibers to wind around the rolls and to bread the end down completely. Cleaning of the rolls is required to remove the accumulated fiber.

ROLL–OFF CLEANLINESS = ХХ ЧИСТОТА – Roll-Off Cleanliness:- the fluid system contamination level at the time of release from an assembly or overhaul line. Fluid system life can be shortened significantly by full-load operation under a high fluid contamination condition for just a few hours. Contaminant implanted and generated during the break-in period can devastate critical components unless removed under controlled operating and high performance filtering conditions.

ROLL ON ROLL OFF = ВКАТЫВАЙ ВЫКАТЫВАЙ (или ГОРИЗОНТАЛЬНАЯ ГРУЗООБРАБОТКА, или ГОРИЗОНТАЛЬНЫЙ МЕТОД ГРУЗООБРАБОТКИ) – Roll On Roll Off (Ro/Ro or RORO):- a method of ocean cargo service using a vessel with ramps which allows wheeled vehicles to be loaded and discharged without cranes. System of loading and discharging a vessel whereby the cargo is driven on and off by means of a ramp. Principle of loading and discharging a vessel whereby the cargo is rolled on and off by means of a ramp. / Погрузка накатом на их собственных колёсах быть погруженными и разгруженными без кранов.

ROLL ON, ROLL OFF VESSEL = РОЛКЕР (или НАКАТНИК, или НАКАТНОЕ СУДНО, или СУДНО С ГОРИЗОНТАЛЬНОЙ ГРУЗООБРАБОТКОЙ) – Roll-On, Roll-Off Vessel is a freight ship or ferry with facilities for vehicles to drive on and off (roll-on roll-off); a system of loading and discharging a ship whereby the cargo is driven on and off on ramps. Equipped with large openings at bow and stern and sometimes also in the side, the ship permits rapid loading and discharge with hydraulically operated ramps providing easy access. Fully loaded trucks or trailers carrying containers are accommodated on the deck. Vessel used for carrying cars and light trucks. Vehicles are driven on and driven off, as opposed to being loaded with cranes or other external equipment. Such vessels usually have stern ramps (but may have side doors) that permit cargo to be driven on and off on regular trailers, or special low-profile trailers. Some vessels combine both ro/ro and cellular containership features. Ships specially designed to carry wheeled containers or trailers using interior ramps. Roll-On, Roll-Off Vessel is a ship which has a ramp allowing cargo to be driven on and off. Cargo which is driven on and off is RORO Cargo. This term refers to vessels that can carry drive on – drive off vehicles and their cargoes, such as trains and trucks. An example of this can be seen with the ferry service. Ro/Ro Ship (short for the Roll-On/Roll-Off Ship) is a cargo ship on which the mobile cargo can be rolled directly on and off board (by lorry, trailer, etc) by means of bow, stern and side doors (ramps). In contrast to this, cargo loaded and discharged on other cargo ships by means of their own or external loading tackle (vertical handling). Also known as RO/RO Ship. / быструю погрузку и разгрузку с . Под Ролкером понимается теплоход для перевозки автомобилей, контейнеров, леса, проката металлов и других грузов с горизонтальным способом погрузки-выгрузки, то есть транспортное средство въезжает на судно, например, через откидывающуюся корму. Известен также как Судно РО/РО (RO/RO Ship). Ролкер или Судно С Горизонтальной Грузообработкой – судно для перевозки грузовых автомобилей, трейлеров

и другой колёсной техники, а также любых штучных грузов (контейнеров, пакетов), погрузка и выгрузка которых может производиться с помощью автопогрузчиков и специальных платформ с тягачами через носовые, бортовые или кормовые ворота судна по аппарелям. Под Трейлерным Судном понимается сухогрузное судно с горизонтальной грузообработкой для перевозки грузов в автомобильных прицепах (трейлерах). Нагружают и разгружают трейлерные суда тягачами через ворота в корме или в носу, иногда – через герметически закрывающиеся вырезы в бортах (грузовые порты). Перемещение трейлеров с палубы на палубу осуществляется с помощью вертикальных подъёмников или по наклонным скатам – аппарелям.

ROLL OSCILLATION = БОРТОВАЯ КАЧКА – A Roll Oscillation is the oscillation due to rolling. This is the name given to the movement of a ship around its longitudinal axis. / Под Качкой судна понимаются колебания судна под воздействием внешних сил (ветра и волн). Различают бортовую качку (угловые наклонения на правый и левый борт), килевую качку (угловые наклонения на нос и корму) и вертикальную качку (периодические перемещения судна по вертикали). Качка отрицательно сказывается на работе судовых механизмов и приборов, ходкости судна, сохранности грузов, эффективности боевых средств и на самочувствии экипажа. На период и амплитуду качки влияют размеры и соотношения главных размерений судна, форма обводов (очертаний наружной поверхности корпуса) судна и распределение на нём грузов. Для уменьшения амплитуды качки применяют успокоители качки.

ROLLOVER = ПЕРЕНОС (или ВОЗОБНОВЛЕНИЕ ПОЗИЦИИ) – (1) Rollover is a special futures straddle trading procedure involving the shift of one delivery month of a straddle into another future month while holding the other delivery month of the original spread position. The shift can take place in either the long or short straddle month. It is a situation where a deal is rolled forward to another value date based on the differential of the interest rates of two currencies involved.

(2) Rollover:- lifting a near futures position that is not part of a spread and simultaneously re-establishing it in a more deferred delivery month. The transfer of a position from one futures period to another involving the purchase (sale) of the nearby month and simultaneous sale (purchase) of a further-forward month. / Перенос позиции из одного будущего периода в другой; при этом осуществляется покупка (продажа) на ближайший месяц и одновременная продажа (покупка) на более отдалённый будущий месяц.

ROLL–OVER CREDIT = ПЕРЕСМАТРИВАЕМЫЙ КРЕДИТ – Medium- to long-term credit with a floating interest rate which is usually reset every 3, 6 or 12 months. The basis for the periodic interest rate adjustment is, for instance, the London Interbank Offered Rate (LIBOR) for short-term borrowing on the Euromarket. Eurodollar term loan, maturing in over one year and less than five years. The interest rate is periodically adjusted to a market index rate, usually the London Interbank Offered Rate (LIBOR). Roll-Over Credits are medium to long-term credits whose interest rate is adjusted to market developments – usually every six-months. This type of financing is used mainly on the Euromarket. Borrowers are large companies and governments. Larger loans are granted by a consortium/syndicate of several banks. For refinancing, six-month deposits are generally raised on international money markets. Accordingly, the bank providing the loan sets the interest rate at regular intervals; the applicable money-market rate in London or Frankfurt is generally used as a basis. To this is added a fixed surcharge which, among other things, is determined by the borrower's creditworthiness. / (более известная в Англоязычном звучании как ЛАЙБО или ЛИБО (LIBOR)).

ROLL TRAILER = ТРАЛ (или ПРИЦЕП ВОЛОКУША) – Roll Trailer is a special trailer for terminal haulage and stowage on board of Roll-on Roll-off vessels. Also known as Mafi Trailer. / Специальный прицеп для подвоза на терминале и штивки (укладки) на борту так называемых ролкеров (известных также как накатников, накатных судов или судов с горизонтальной грузообработкой (roll-on roll-off vessels)). Известен также как Прицеп Мафи (Mafi Trailer).

ROLL–UP CREASES = XX (или СВЁРНУТЫЕ СГИБЫ (или СКЛАДКИ, или МОРЩИНЫ)) – Defect Name:- Roll-Up Creases. Defect Type:- Finishing Defects. Fabric Type:- Bottomweights – Sateen Derivatives. Description:- Roll-Up Creases:- These creases were introduced in the final roll-up operation by the operator not properly fitting the fabric to the tube. Severity:- Major.

ROMAN COLLAR = РИМСКИЙ ВОРОТНИК (или КОЛОРАТКА) – Roman Collar is the clerical collar.

ROMAN CRÊPE = РИМСКИЙ КРЭП (или РОМЭН КРЭП) – Roman Crêpe or Crêpe Romain (in French) is a semisheer fabric of abraded yarns in warp and filling. It is made of rayon and acetate ar wool and is used tot street and dressy dresses. See also Crêpe. Roman Crêpe is airy, midweight woollen fabric, grainy to the touch and produced from fine single, sharp-twisted crêpe yarn in Panama weave. / в основе и уточине.

ROMAN NUMERALS IN CHEMICAL NAMES = РИМСКИЕ ЧИСЛА В ХИМИЧЕСКИХ НАЗВАНИЯХ – Roman Numerals In Chemical Names:- many ions can assume different electrical charges in different compounds. For example, iron can have a charge of +2 or +3. For example, in old use, iron chloride ($FeCl_2$) where the iron has a charge of +2, would be called 'Ferrous Chloride', while $FeCl_3$, where the iron has a charge of +3, would be called 'Ferric Chloride'. In modern use, $FeCl_2$ would be called 'Iron (II) Chloride' (read as iron two chloride) and $FeCl_3$ would be called 'Iron (III) Chloride' (read as iron three chloride). The Roman numerals directly indicate the charge. In dyeing, this is most likely to be found in aluminum, chromium, copper, iron, tin and zinc compounds.

ROMAN SHADES = РИМСКИЕ ОТТЕНКИ – Roman Shades are the shades similar to Austrian shades. When the window is exposed, the fabric of Roman shades hangs in graceful folds at the top of the window. Austrian shades are shirred throughout when they cover the window, but Roman shades hang straight and only form folds when drawn up to uncover the window.

ROMAN STRIPES = РИМСКИЕ ПОЛОСКИ (или РИМСКИЕ ДОРОЖКИ) – Roman Stripes are the narrow, multicolored stripes that cover an entire fabric. The colors may be as vivid as those of blazer stripes or as subtle as soft ombré shadings. See also Blazer Stripes, and Ombré. / Омбре (Ombré) – с переходом тонов. Смотрите также Полоски На Блэйзёре или Полосы На Броской Куртке (Blazer Stripes), и Омбре (Ombré).

ROMEO = РОМЭО – Romeo (pronunciation:- ROH-me-oh) or R is international nautical signal flag meaning:- (i) International:- None. (ii) Navy:- (a) At sea:- Preparing to replenish; and (b) In port:- Ready duty ship. Meaning:- the way is off my ship. You may feel you way past me. Inport:- ready duty ship. At Sea (flown on engaged side) at the dip:- preparing to replenish. Closed up:- ready to receive you, or commencing approach. Hauled down (both ships):- messenger line in hand. International Meaning:- the way is off my ship. With one or more numerals, distance in nautical miles.

ROMPER = КОМБИНЕЗОН (или ШИРОКИЙ КОСТЮМ, или ПЕСОЧНИК) – Romper is a garment especially for children with the lower part shaped like bloomers. Usually used in plural.

RONGALIT C® = РОНГАЛИТ ЦЭ.® – Rongalit C® is a BASF tradename for sodium formaldehyde sulfoxylate; sometimes seen spelled 'Rongalite'. / Бе.А.Эс.Эф. (BASF) формальдегид сульфоксилат натрия (sodium formaldehyde sulfoxylate).

ROOED = XX – Rooed:- the process where fleece is plucked off of Shetland sheep during the spring. This works with Shetland fleece as the sheep produce a weak spot earlier in the season. Sometimes called Rooing.

ROOF BOWS = ДУГИ КРЫШИ – Main support of container roof. Roof Bows:- steel or aluminum frame construction in conjunction with removable wooden/aluminum gates that hold the tarpaulin of a truck, trailer, semi-trailer or a swap body. This type of open-sided construction is sometimes known as a Tarpaulin Truck.

ROOF TRUSS = СТРОПИЛЬНАЯ ФЕРМА (или ПЕРЕКРЫТИЕ) – Roof Truss:- the basic components of a roof truss are the top and bottom chords and the web members. The top chords serve as roof rafters. The bottom chords act as ceiling joists. The web members run between the top and bottom chords. The truss parts are usually made of 2 by 4 inch or 2 by 6 inch material and are fastened together with special metal connector/nail plates. Roof Trusses are common and are designed and produced in a variety of shapes and sizes. The most commonly used roof trusses, are in light-frame construction and are the king-post, the W-type, and the scissors Trusses. The most simple type of truss used in frame construction is the king-post truss. It is mainly used for spans up to 22 feet. The most widely used truss in light-frame construction is the W-type Truss. The W-type truss can be placed over spans up to 50 feet. The scissors, or cathedral truss is used for buildings with sloping ceilings. Generally, the slope of the bottom chord equals one-half the slope of the top chord. It can be placed over spans up to 50 feet. See also Truss.

ROOM–TEMPERATURE SETTING ADHESIVE = ЗАТВЕРДЕВАЮЩЕЕ ПРИ КОМНАТНОЙ ТЕМПЕРАТУРЕ СВЯЗУЮЩЕЕ – Room-Temperature Setting Adhesive is an adhesive that sets in the temperature range of 20 to 30 °C (68 to 86 °F). / Связующее, которое затвердевает при температуре от 20 до 30 °C (от 68 до 86 °Ф).

ROOT = КОРЕНЬ – Root is the underground part of a seed plant body that originates usually from the hypocotyl, and functions as an organ of absorption, aeration, and food storage or as a means of anchorage and support. Types:- (i) primary:- the root developing from the radicle that first appear from the seed; (ii) secondary:- developing from the primary root; branch roots; and (iii) tap:- a primary root that enlarges and grows downward. Root is a structure usually providing a plant with anchorage and a means of absorbing water and nutrients from the substrate. Many Cactaceae have a widespread shallow fibrous root system, in addition to any taproot or tuber. This is an adaptation for scavenging water before it evaporates. See also Aerial Root. Roots are the organs of absorption and anchorage, growing opposite the shoot, comprising the short-lived seminal roots and adventitious secondary roots which arise from the lower nodes of the culm. / обычно из гипокотиля (hypocotyl), и . Типы:- (i) первичный корень:- развивающийся из корешка, который первым появляется из семени; (ii) придаточный корень:- развивающийся из первичного корня; боковые корни; и (iii) главный или стержневой корень:- первичный корень, который расширяется и растёт вниз. Многие Кактусовые (Cactaceae) имеют неглубокую фиброзную корневую систему, в дополнение к любому стержневому (главному) корню или клубню (tuber). Смотрите также Воздушный Корень или Надземный Корень или Пневматофор (Aerial Root). Под Корнем понимается один из основных органов растений, служащий для укрепления в почве, поглощения воды, минеральных веществ, синтеза органических соединений, а также для выделения некоторых продуктов обмена. Корень может быть местом хранения запасных веществ (например, у Моркови, Свёклы), органом вегетативного размножения (у Осины, Сирени и других). Многие корни съедобны. Корни, содержащие крахмал, масла, красящие и другие ценные вещества, применяются в промышленности и медицине.

ROOT BED = КОРНЕВОЕ ЛОЖЕ – Root Bed:- the soil profile modified by tillage or amendments for more effective use by plant roots.

ROOT CAP = КОРНЕВОЙ ЧЕХЛИК – Root Cap or Rootcap is the loose mass of epidermal cells covering the apex of most roots, serving to protect the meristematic cells behind it. The root cap is a section of tissue at the tip of a plant root. It is also called Calyptra. Root caps contain statocytes which are involved in gravity perception in plants. If the cap is carefully removed the root will grow randomly. The root cap protects the growing tip in plants. It secretes mucilage to ease the movement of the root through soil, and may also be involved in communication with the soil microbiota. The purpose of the root cap is to enable downward growth of the root, with the root cap covering the sensitive tissue in the root. Also, the root cap enables geoperception or gravitropism. This allows the plant to grow downwards (with gravity) or upwards (against gravity). The root cap is absent in some parasitic plants and some aquatic plants, in which a sac-like structure called the Root Pocket may form instead.

ROOT GALL = КОРНЕВОЙ ГАЛЛ – Root Gall is abnormal enlargement of the roots caused by root-knot nematode. / Под Галлами, от Латинского слова Galla, означающее Чернильный Орешек, или Цецидиями понимаются патологические разрастания на органах растений, вызываемые бактериями, вирусами, грибами, клещами, насекомыми, нематодами. Ослабляют растение и могут привести к его гибели. Галлы на Дубе, Сумахе и Фисташке богаты дубильными веществами.

ROOT HAIR = КОРНЕВОЙ ВОЛОСОК – Root Hairs are small hairs that grow from a main root. The tubular or filamentous outgrowth of epidermal cell or root that has immediate contact with soil particles assisting in the absorption of water and minerals on the surface of the root. The root hair is short-lived and replaced. Root Hair is a trichome on the root epidermis made from an extension of an epidermal cell which assists with absorption of nutrients. / или нитевидная . Корневой Волосок – трихома (от Греческого слова Trichōma, означающее Волосы; вырост эпидермиса у растений в виде волосков, чешуек, щетинок и тому подобного) на . Под Корневыми Волосками понимаются выросты клеток поверхностной ткани (эпиблемы) молодого корня растения. Увеличивают всасывающую поверхность корня, выделяют продукты обмена.

ROOTKIT = XX (или КОРНЕВОЙ НАБОР) – Rootkit is a program or suite of programs (‘Kit’) intended to escalate privileges (‘get root’) and/or maintain covert access and control of a system, i.e. without the knowledge of its owner. Malware uses rootkit techniques for stealth purposes, that is, so as to be invisible on the infected machine to security programs using conventional detection methods. See also Malware.

ROOTLETS = КОРЕШКИ – Rootlets are the lateral roots that grow indigenously from the mature roots.

ROOT–MEAN–SQUARE = СРЕДНЕКВАДРАТИЧНОЕ – Root-Mean-Square (rms), a method of computing the effective value of a time-varying electrical wave. For example, an ac current is said to have an effective or rms value of one ampere when it produces heat in a certain resistance at the same average rate as a continuous (or dc) current of one ampere would in the same resistance. rms – ‘root-mean-square’, a method of computing the effective value of a time-varying electrical wave. For example, an ac current is said to have an effective or rms value of one ampere when it produces heat in a certain resistance at the same average rate as a continuous (or dc) current of one ampere would in the same resistance. rms – ‘root-mean-square’, a method of computing the effective value of a time-varying electrical wave. For example, an ac current is said to have an effective or rms value of one ampere when it produces heat in a certain resistance at the same average rate as a continuous (or dc) current of one ampere would in the same resistance. In mathematics, the Root Mean Square (abbreviated RMS or rms), also known as the Quadratic Mean, is a statistical measure of the magnitude of a varying quantity. It is especially useful when variates are positive and negative, e.g., sinusoids. RMS is used in various fields, including electrical engineering. It can be calculated for a series of discrete values or for a continuously varying function. The

name comes from the fact that it is the square root of the mean of the squares of the values. It is a special case of the generalized mean with the exponent p = 2. / Под Квадратичным Средним понимается величина s, равная корню квадратному из среднего арифметического квадратов данных величин a_1, a_2, …, a_n:- $s = \sqrt{((a_1^2 + a_2^2 + \ldots + a_n^2) / n)}$. Среднеквадратичное Значение:- (i) в математике – величина, получаемая определением среднего значения множества возведённых в квадрат величин. Предоставляет значение периодически изменяющейся величины и была разработана в начале XX века. (ii) Для точного измерения гальванического и электрического тока, среднеквадратическая погрешность аппроксимации также используется в уравнениях, предназначенных для предсказания результатов, таких как прогнозы погоды.

ROOT NODULES = КОРНЕВЫЕ КЛУБЕНЬКИ – Root Nodules are the small enlargement or swelling on roots of legumes produced as a result of infection by nitrogen-fixing Bacteria.

ROOT PRESSURE = КОРНЕВОЕ ДАВЛЕНИЕ – Root Pressure is the pressure in the xylem as a result of metabolic activity in the root.

ROOT PRUNING = ОБРЕЗКА КОРНЕЙ – Root Pruning is the reduction of the root mass that can occur by either mechanical (cultivation) or chemical means. / Обрезка Корней:- корни обрезаются для ослабления роста дерева и для стимулирования образования плодовых почек. Весной выкопайте вокруг дерева траншею примерно в 1.5 метра от ствола (или дальше, если дерево большое). Отгибайте тонкие мочковатые корни, чтобы добраться до более толстых. Укоротите последние ножовкой. Мочковатые корни расправьте по траншее. Засыпьте её и примните почву. Вбейте опорный кол высотой чуть ниже нижней ветви. Подвяжите дерево к колу. Замульчируйте перепревшим навозом или компостом площадь, занятую корнями. Летом обильно поливайте. Сильнорастущее дерево моложе пяти лет можно выкопать для обрезки корней (эта операция почти никогда не бывает успешной:- при выкопке дерева значительная часть корней остается в почве. После посадки такое дерево долго страдает и часто не может продуктивно плодоносить). Сделать это надо осенью и укоротить корни, уходящие в глубину и ширину. Посадите в прежнюю яму или на новое место. Подвяжите к опорному колу. Летом в сухую погоду обильно поливайте. Обрезка Корней (в мире бонсай):- корни всегда подрезают при замене земли, что позволяет добиться оптимального соотношения между их массой и массой листьев. Делают это для того, чтобы корни снабжали листья водой и питательными веществами. В свою очередь листья обеспечивают их энергией, получаемой при фотосинтезе. Непропорциональность соотношения между корнями и кроной становится заметной только при ошибках в формировании бонсай. Например, если корень был слишком слабым либо в жаркую погоду произошло пересушивание корневой системы, часть кроны может засохнуть. Если корни слишком мощные, крона поставляет энергию в недостаточном объёме, особенно в пасмурные дни или в слабоосвещённом месте. В результате происходит отмирание отдельных корней. Растение перестаёт сопротивляться болезням и теряет силы. Его поражают вредители и грибы. Дерево даже может погибнуть. Регулярная обрезка корней способствует формированию плотной разветвленной кроны дерева; происходит активное развитие корневой системы. Такие корни обладают высокой жизнеспособностью и могут обеспечивать весьма разветвлённую крону водой и питательными веществами в необходимом объёме. Многократная обрезка оказывает влияние как на развитие более мощных корней, расположенных на поверхности субстрата, так и на образование корней мочковатых. При наличии корней различной толщины подрезать следует только более толстые. Таким образом, слабые корни получают возможность со временем увеличивать свою толщину. Так они обеспечивают растения питанием, и его развитие идёт гораздо быстрее. Формируя корневую систему, в первую очередь удаляют стержневой корень, являющийся продолжением ствола. Наиболее мощные боковые корни подрезают не более чем на 1/3. Весна – лучшее время для формирования корневой системы. Однако многие растения можно пересаживать в домашних условиях и в другие сезоны, выполняя одновременно обрезку корней и следя за тем, чтобы растения в последующие две недели были защищены от воздействия прямых солнечных лучей, сильного ветра и сухого воздуха.

ROOTS AND TUBERS = КОРНИ И КЛУБНИ – Roots and Tubers:- Plants that yield starch, either derived from their roots (e.g., Cassava, Sweet Potato and Yams) or stems (e.g., Potatoes and Taro). They are destined mainly for human food (as such or in processed form) but can also be used for animal feed or for manufacturing starch, ethanol and fermented beverages. Unless they are processed, they become highly perishable once harvested, which limits opportunities for trade and storage. Roots and tubers contain large amounts of water:- all quantities in this publication refer to dry weight to increase comparability.

ROOT SERVERS = КОРНЕВЫЕ СЕРВЕРЫ – The Root Servers contain the IP addresses of all the TLD registries – both the global registries such as .com, .org, etc and the 244 country-specific registries such as .fr (France), .cn (China), etc. This is critical information. If the information is not 100% correct or if it is ambiguous, it might not be possible to locate a key registry on the Internet. In DNS parlance, the information must be unique and authentic. / Корневые Серверы содержат IP-адреса всех реестров ДВУ:- адреса глобальных реестров, таких как .com, .org и тому подобные; адреса 244 реестров стран, таких как .fr (Франция), .cn (Китай) и тому подобных. Это критически важная информация. Если информация неверна или двусмысленна, поиск ключа реестра в Интернете невозможен. Если использовать терминологию СДИ, информация должна быть уникальной и аутентичной.

ROP = REGISTERED OPTIONS PRINCIPAL

ROPE = КАНАТИК (или КАНАТ, или ВЕРЁВКА, или ЖГУТ, или ТРОС) – Rope is:- (1) a heavy, strong cord, made from either natural or manufactured fibers or from wire, in a wide range of diameters. Yarns are twisted together to form strands. These strands are then twisted together in the opposite direction to form the rope. The fact that the twist directions alternate at different stages of rope assembly assures that the rope will be twist-stable and will not kink during use. Also called Cord. (2) Fabric in process without weft tension, thus having the appearance of a thick rope. / Известен также как Шнур (Cord). Под Канатом понимается гибкое изделие, изготовленное из нитей, пряжи (каболок) из волокон растительного, синтетического или минирального происхождения, а также из стальной проволоки. По способу изготовления канаты подразделяются на кручёные или витые, невитые, плетёные. Стальные канаты изготовляют из проволок диаметром 0.5–2 мм круглого или фасонного сечения. Витые круглые канаты могут иметь одинарную (спиральную), двойную (тросовую), тройную (кабельтовую) свивку. Комбинированные витые канаты изготовляют чаще всего из пеньки и стали. Невитые канаты состоят из плотно уложенных групп стальных проволок или спиральных кабелей, обжатых спиральной обмоткой или зажимами. Плетёные канаты изготовляют из чётного числа (обычно четырёх) переплетённых прядей. Неметаллические канаты свивают из волокон асбеста, капрона (принятое в СССР торговое название поликапроамида и волокон из него), Найлана^{T3} (Nylon^{TM}), пеньки, полипропилена, хлопка и других.

ROPE MARK = ОТМЕТИНА ОТ ЖГУТА – Rope Mark:- a fabric defect consisting of long, irregular, longitudinal markings on dyed or finished goods. A principal cause is abrasion while wet processing the fabric in rope form. Rope marks are often related to overloading of the fabric during wet processing. Rope Mark:- in dyed or finished fabrics, a long irregularly shifting longitudinal mechanically induced streak. The Rope Marks are the long crease marks in dyed or finished goods running approximately in the warp direction. The rope marks are caused during wet processing in the rope form and may be the result of the formation of creases along which abrasion or

felting may occur, or imperfect penetration or circulation of the processing liquors. Rope Marks:- in dyed or finished fabrics, a long irregularly shifting longitudinal mechanically induced streak. Rope Marks:- long, irregularly shifting, longitudinal markings on dyed or finished fabrics. Note:- this defect is frequently caused by overloading machinery for wet processing fabric in rope form, resulting in uneven liquor penetration or the formation of creases along which abrasion or felting may occur. Rope Mark:- ridges or furrows running parallel to the sheet direction and of a relatively constant width. Rope or chain marks occur where a soft spot in the roll is present with a hard spot beside it. / Жгутовые Заломы (rope marks):- порок заключительной отделки ткани в виде длинных, неравномерно сдвинутых, продольных вмятин (складок). Примечание:- этот порок возникает вследствие перегрузки оборудования при влажной обработке полотна в форме жгута, что приводит к неравномерному впитыванию раствора или образованию складок, вдоль которых будет наблюдаться истирание или свойлачивание.

ROPE RUB MARK = ОТМЕТИНА ОТ НАТИРАНИЯ ЖГУТОМ – Rope Rub Mark:- shining due to mechanical friction on the fabric, it known as Rope Rub Mark. Dyeing defect. / Порок или дефект крашения.

ROPY HEM = ЗАЖГУЧЕННЫЙ ПОДРУБЛЕННЫЙ ШОВ – Ropy Hem is where hem is not laying flat and is skewed in appearance. Recommended Solutions for ropy hems:- (1) usually caused by poor operator handling. Instruct the sewing operator to make sure they get the hem started correctly in the folder before they start sewing. Also, make sure the don't hold back excessively as the seam is being sewn. (2) Use minimum roller or presser foot pressure. Fabrics defect.

ROQUELAURE = РОКЛЁР (или РЭКЁЛЁР, или ПЛАЩ, или ДЛИННЫЙ СЮРТУК) – Roquelaure is a knee-length cloak worn especially in the XVIII and XIX centuries. / короткий мужской плащ.

RORO VESSEL = ROLL–ON ROLL–OFF VESSEL

ROS = RETURN ON SALES

ROSE = РОЗОВОЕ (или РОЗА, или ХХ) – Rose:- a variable color averaging a moderate purplish red.

ROSEATE = РОЗОВОЕ (или ХХ) – Roseate:- resembling a rose, especially in color.

ROSE PINK = РОЗА РОЗОВАЯ (или БЛЕДНО–РОЗОВОЕ) – Rose Pink:- a moderate pink.

ROSETTE = РОЗЕТКА – Rosette is a tight cluster of leaves that are arranged around a central apex and grow outward to form a radially symmetrical pattern. Rosette is a cluster of radiating leaves, usually arising at or close to the ground. / Розетка листьев. В ботанике под Розеткой, от Французского слова Rosette, означающее буквально Розочка, понимается группа листьев, скученно расположенных на подземном или надземном стебле с укороченными междоузлиями, например, у Одуванчика, Пальм, Подорожника, древовидных Папоротников. Розетка у растений, группа листьев, скученно расположенных на укороченном, лишь немного возвышающемся над землёй вертикальном побеге. Листья в розетке раздельно расходятся во все стороны; верхние обычно мельче, с более короткими черешками, что способствует меньшему затенению нижних листьев. Растения, имеющие розетки, произрастают главным образом в жарких, сухих местах, а также в полярных странах, обычно на скалах. Один из факторов, влияющих на образование розетки, – испарение; некоторые растения, для которых характерны розетки, при культуре в условиях повышенной влажности воздуха развивают вместо неё побеги с удлинёнными междоузлиями и со спирально расположенными листьями. Розетка имеется у многих Растений Семейства Толстянковых, Крестоцветных, Сложноцветных, Подорожниковых и других.

ROSTRATE = РОСТРА (или РОСТРАЛЬНОЕ, или ИМЕЮЩЕЕ РОСТРУМ, или ИМЕЮЩЕЕ КЛЮВ, или С ЗАГНУТЫМ В ВИДЕ ПТИЧЬЕГО КЛЮВА КОНЦОМ, или СНАБЖЁННЫЙ РОСТРОМ, или СНАБЖЁННЫЙ ТАРАНОМ) – Rostrate:- with a beak-like projection. / Под Рострой, от Латинского слова Rostra, от Rostrum, означающее Нос Корабля, понимается . Под Ростарми, от Голландского слова Rooster, означающее Решётка, понимаются ряд бимсов, между рубкой и стойками по борту судна. Поверх бимсов обычно устраивают настил. На рострах размещают спасательные и рабочие шлюпки, самолёты. На парусных судах ростарми называется место хранения запасных мачт, стеньг, стрел, люковых решёток на верхней палубе между фок- и грот-мачтами.

ROSULATE = РОЗЕТЧАТОЕ (или РОЗЕТОЧНОЕ) – Rosulate:- forming a rosette, like a ring around the stem. Rosulate:- with leaves in a rosette. / :- с листьями в розетке. Листорасположение – расположение листьев на стебле. По мере роста стебля, листья располагаются на нём в определённом порядке, который обусловливает оптимальный доступ к свету. В сущности, листья появляются на стебле по спирали, по либо против часовой стрелки, под определённым углом расхождения. Розеточное – листья, расположенные в розетке (пучок листьев, расположенных по кругу из одного общего центра). Розетчатым – один узел, в котором находятся несколько листьев. Розеточность растений или Мелколистность, распространённая болезнь плодовых культур (Яблони, Груши, Вишни, Айвы, Сливы) и некоторых древесно-кустарниковых пород (Клёна, Боярышника и других), характеризующаяся появлением мелких, узких листьев (в 10–30 раз мельче нормальных), а на верхушке побегов – розеток из 10–20 нормальных листьев (отсюда и название болезни). Встречается во многих странах, в том числе в бывшем Союзе Советских Социалистических Республик (СССР) (главным образом в районах Поволжья). Одни исследователи относят розеточность растений к вирусным, другие рассматривают её как функциональный патологический процесс, обусловленный нарушением режима минерального питания деревьев, главным образом дефицитом цинка. Наиболее сильно поражается Яблоня в плодоносящих садах. Розеточность может охватывать отдельные ветви, часть кроны или всю крону дерева. Симптомы болезни чётко проявляются после цветения, в период роста побегов. Розеточность растений снижает возбудимость почек и побеговосстановительную способность, вследствие чего наряду с укороченными приростами в кроне возникают неразветвлённые, оголённые тонкие ветви-хлысты. Сильно поражённые растения не плодоносят. Многолетняя розеточность приводит к усыханию ветвей и гибели дерева. Наиболее устойчивы к розеточности растений Сорта Яблони:- Антоновка Обыкновенная, Боровинка, Мальты и другие. Меры борьбы:- своевременная выбраковка больных растений в питомнике и заготовка высококачественного прививочного материала; опрыскивание поражённых деревьев сернокислым цинком по спящим почкам ранней весной или сразу же после цветения; в поливных садах – посев в междурядьях Люцерны или других Бобовых Трав, подкисляющих почву и улучшающих усвоение растениями цинка.

ROTARY CUT VENEER = ЛУЩЁНЫЙ ШПОН (или ШПОН, ПОЛУЧАЕМЫЙ РОТОРНЫМ СРЕЗОМ, или ШПОН, ПОЛУЧАЕМЫЙ ЛУЩЕНИЕМ) – Rotary Cut Veneer is the veneer cut in a lathe which rotates a log, chucked in the center, against a knife. / Под Шпоном, от Немецкого слова Span или Spon, понимаются тонкие листы древесины, получаемые на лущильных, шпоностругальных или фанеропильных станках. Применяется в производстве фанеры, для фанерования и так далее. Лущение – рабочий процесс дереворежущего лущильного станка; поперечное резание цилиндрической заготовки из древесины (чурака) плоским ножом с прямолинейной режущей кромкой. Результирующей траекторией резания является спираль, а стружка (лущёный шпон) имеет вид непрерывной ленты постоянной толщины. Для повышения качества шпона при лущении применяется дополнительный инструмент – прижимная линейка. Лущильный Станок – специализированный

(используется преимущественно в производстве фанеры) дереворежущий станок для получения способом лущения листового полуфабриката из натуральной древесины – лущёного шпона. Наибольшая длина чурака – 900–2 700 мм, наибольший диаметр чурака – 450–1 300 мм, диапазон толщин шпона – 0.1–6 мм. Лущильный станок используется также в производстве спичек, мебели, тары. Лущильный Станок служит для получения тонкой поперечной стружки (шпона) из коротких брёвен. Режущий инструмент – нож, срезающий по всей длине вращающегося чурака слой древесины в виде ленты. Под Шпоном, от Немецкого слова Span, означающее Щепка, понимаются тонкие листы древесины определённой толщины (обычно в диапазоне 0.35–4 миллиметров (мм)), используемые для производства слоистой клеёной древесины (древеснослоистых пластиков, клеёных заготовок, фанеры) и для облицовывания изделий или сборочных единиц из древесины и древесных материалов с целью улучшения их механических свойств и внешнего вида. Различают:- (i) лущёный шпон, полученный лущением на лущильном станке; и (ii) строганный шпон, полученный строганием на шпонострогальном станке. Лущёный шпон изготовляют из древесины Берёзы, Бука, Дуба, Ели, Кедра, Клёна, Липы, Лиственницы, Ольхи, Осины, Пихты, Сосны, Тополя и Ясеня; строганный шпон – из Бархатного Дерева, Берёзы, Бука, Вяза, Граба, Груши, Дуба, Ивы, Ильма, Карагача, Каштана, Клёна, Красного Дерева, Липы, Лиственницы, Ольхи, Ореха, Осины, Сосны, Тополя, Ясеня. Строганный шпон отличается красивой текстурой, используется как ценный облицовочный материал. В деревообработке под Чураком понимается заготовка для изготовления лущёного шпона на лущильном станке:- круглый лесоматериал, по периметру и длине соответствующий технологическим параметрам станка. Перед лущением подвергается гидротермической обработке с целью достижения высокого качества шпона. Различают Лущёный и Строганый Шпон.

ROTARY DAMAGE = ПОВРЕЖДЕНИЕ ЦИЛИНДРАМИ – Rotary Damage:- any damage due to any particles goes inside the machine. Finishing defect. / Порок или дефект заключительной отделки.

ROTARY HOEING = РОТОРНОЕ РЫХЛЕНИЕ (или РОТОРНОЕ ОКАПЫВАНИЕ, или РОТОРНОЕ МОТЫЖЕНИЕ) – Rotary Hoeing is a tillage operation employing ground-driven rotary motion of the tillage tool to shatter and mix soil and control small weed seedlings.

ROTARY SCREEN PRINTING = ПЕЧАТАНИЕ ЦИЛИНДРИЧЕСКИМ ЭКРАНОМ (или НАБИВКА ЦИЛИНДРИЧЕСКИМ ЭКРАНОМ) – Rotary Screen Printing is so named because it uses a cylindrical screen that rotates in a fixed position rather than a flat screen that is raised and lowered over the same print location. Rotary presses place the squeegee within the screen. These machines are designed for roll-to-roll (web) printing on flexible materials ranging from narrow web films to wide-format roll textiles. In rotary printing, the web travels at a consistent speed between the screen and a steel or rubber impression roller immediately below the screen. The impression roller serves the same function as the press bed on a flatbed press. As the web passes through the rotary unit, the screen spins at a rate that identically matches the speed of substrate movement. The squeegee on a rotary press is in a fixed position with its edge making contact with the inside surface of the screen precisely at the point where the screen, substrate, and impression roller come together. Ink is automatically fed into the center of the screen and collects in a wedge-shaped 'well' formed by the leading side of the squeegee and the screen's interior surface. The motion of the screen causes this bead of ink to roll, which forces ink into stencil openings, essentially flooding the screen without requiring a floodbar. The squeegee then shears the ink as the stencil and substrate come into contact, allowing the ink to transfer cleanly to the material. In short, rotary printing is a continuous, stepless image-transfer method. The geometry of the screen and the position of the squeegee within the screen combine to provide both the screen-flooding and image-transfer functions in a single smooth operation that repeats with every revolution of the screen. Rotary Screen Printing is integrated into some firm's machines. Screen printing equipment can work equally well in combination with letterpress printing, flexographic printing, offset printing and hot foil embossing with a variety of processing functions. The printing units can be easily interchanged, thereby enabling reconfiguration of the system for each job. See also Printing. Rotary Screen Printing is a combination of roller and screen printing in which a perforated cylindrical screen is used to apply color. Color is forced from the interior of the screen onto the cloth.

ROTARY SEAL = РОТАЦИОННОЕ УПЛОТНЕНИЕ – Rotary Seal is a mechanical seal which rotates with a shaft and is used with a stationary mating ring. See also Seal.

ROTARY TILLER = ПОЧВОФРЕЗА (или ВРАЩАЮЩАЯСЯ НОЖЕВАЯ БОРОНА) – Rotary Tiller:- (1) an implement that accomplishes primary and secondary tillage in one operation. (2) A tillage operation employing power-driven rotary motion of the tillage tool to loosen, shatter, and mix the soil.

ROTATE = КОЛЕСОВИДНОЕ (или С ПЛОСКИМИ РАСПРОСТРЁРТЫМИ ЧАСТЯМИ) – Rotate:- radiating horizontally like the spokes of a wheel. / , от Латинского слова Rotator, означающее Вращатель, .

ROTATE = ЧЕРЕДОВАТЬ – Rotate:- to move around, to grow crops in succession or in a regular sequence.

ROTATING EQUIPMENT = РОТАЦИОННОЕ ОБОРУДОВАНИЕ (или ВРАЩАЮЩЕЕСЯ ОБОРУДОВАНИЕ) – Rotating Equipment is an equipment that moves liquids, solids or gases through a system of drivers (turbines, motors, engines), driven components (compressors, pumps), transmission devices (gears, clutches, couplings) and auxiliary equipment (lube and seal systems, cooling systems, buffer gas systems). / , трансмиссионные устройства ((зубчатые) передачи, муфты сцепления, соединительные муфты).

ROTATING PRESSURE VESSEL OXIDATION TEST = ИСПЫТАНИЕ НА ОКСИДИРОВАНИЕ ВО ВРАЩАЮЩЕМСЯ ПОД ДАВЛЕНИЕМ СОСУДЕ (или ИСПЫТАНИЕ НА ОКИСЛЕНИЕ XX) – The Rotating Pressure Vessel Oxidation Test (RPVOT) measures an oil's oxidation stability. The oil sample is placed in a vessel containing a polished copper coil. The vessel is then charged with oxygen and placed in a bath at a constant temperature of 150 degrees Celsius. Stability is expressed in terms of the time it takes to achieve a pressure drop of 25.4 pounds per square inch (psig) pressure drop from maximum pressure.

ROTATION = РОТАЦИЯ (или ЧЕРЕДОВАНИЕ) – Rotation is a cropping system using the rotation of different Plant Species on the same plot of land. See also Crop Rotation. / Под Ротацией Севооборота, от Латинского слова Rotatio, означающее Круговращение, понимается период (обычно 4–10 лет), в течение которого все сельскохозяйственные культуры и пар занимают последовательно (согласно схеме их чередования) каждое поле севооборота. Период, в течение которого культуры и пар в установленной последовательности проходят через каждое поле севооборот, называется Ротацией.

ROTOFLEX = XX – Rotoflex is a fatigue or endurance test developed by Goodyear for industrial yarns or cords. / Годьйэ (Goodyear).

ROTOR SPINNING = РОТОРНОЕ ПРЯДЕНИЕ (или АППАРАТНОЕ ПРЯДЕНИЕ) – Rotor Spinning is a method of open end spinning which uses a rotor (a high speed centrifuge) to collect and twist individual fibers into a yarn. See also Open-End Spinning. Rotor Spinning has been characterized from the outset by incomparably higher production potential than ring spinning. This potential has been steadily increased by the continuous rise in rotor and winding speeds. Rotor-spun yarns have therefore always been successful where they could be manufactured more cheaply than ring-spun yarns and proved suitable for the range of application in

question.Rotor spinning combines two process stages – spinning and winding – in a single machine. Saleable cross-wound packages could therefore be produced immediately, without first having to wind small spinning cops. Integrated yarn monitoring systems and auxiliary devices for waxing the yarns at each spinning position also eliminate the need for a subsequent rewinding process. The production of rovings, which is required for ring spinning, is also eliminated, since the rotor spinning system is able to process carded or drawframe slivers directly. Last but not least, the rotor spinning system has benefited from the fact that operator functions on the rotor spinning machine were much easier to automate than those on the ring spinning machine. Automation of all operator functions is now standard on high-performance rotor spinning machines, automated can and package transport is already an essential feature in many textile mills. The technological challenge – not only when launching rotor spinning – has always been to separate the assessment criteria for rotor-spun yarn from the structural features of ring-spun yarns. The dominance of rotor-spun yarns, for example in woven denim fabrics and knitted fabrics, shows that this has been successful in some important end product segments. New ranges of application are still continuously being developed for rotor-spun yarns, on the one hand through selective modification of yarn properties, and on the other through continuous improvements in spinning stability. The essential feature of the rotor spinning system is the separation of the functional stages of fiber sliver opening and yarn formation, respectively imparting twist and winding up the yarn. In order to achieve this fiber bundle has to be interrupted at one point at least. This occurs between the functional stages of opening the drawframe or card sliver into individual fibers and subsequently combining these fibers in the collecting groove of the spinning rotor, the twisting device of the rotor spinning system. Since the individual fibers are released from a compact fiber bundle during transport between the opening roller and the rotor collecting groove and are only combined again in the rotor groove, we can here refer to an open yarn end.

ROTOR SPINNING MACHINE = РОТОРНАЯ ПРЯДИЛЬНАЯ МАШИНА – Rotor Spinning Machine is an economical alternative for producing quality yarns in the yarn count range from Ne 2 to Ne 40. A Rotor Spinning Machine has a plurality of spinning stations, each of which comprises an opening roller and a draw-in roller for supplying sliver to the opening roller and each of which is equipped with control devices for individual drives of the draw-in rollers. The control devices each have a connection mechanism, to which an additional control card can be attached for producing effect or novelty yarn with predetermined effects. The control card comprises a processor, which meets the elevated computing power requirements for producing effect or novelty yarn and can be activated via a data bus system. / Роторная Прядильная Машина предназначена для выработки пряжи линейной плотности 84–222 текс из ленты. На этой машине осуществляются те же процессы, что и на камерной пневмомеханической прядильной машине типа БД, но в отличие от неё, в роторной пневмомеханической прядильной машине используется вращающийся ротор для формирования на его поверхности волокнистого диска и превращения его в пряжу при кручении. От зубчатого барабанчика дискретизирующего устройства волокна транспортируются воздушным потоком к сборной поверхности ротора. Волокна, поступающие на сборную поверхность ротора, прижимаются к ней набегающей струёй воздуха. Удерживаются волокна на поверхности ротора штырьками, расположенными по его окружности. В трубку ротора вводится конец пряжи, он прижимается к сборной поверхности и вращается вместе с ней. К концу пряжи прикручивается волокно из волокнистого диска, расположенного на роторе. В этой зоне из волокон формируется пряжа, крутка которой сообщается за счёт прижима пряжи шариком в гнезде входного отверстия трубки ротора. Воздух из камеры крутильного органа отсасывается пневмосистемой, унося с собой пух, сор и незаработанные волокна, что обеспечивает выработку более чистой пряжи по сравнению с пряжей кольцевого прядения из того же сырья. Частота вращения ротора 12 500–20 000 мин$^{-1}$, скорость выпуска пряжи до 65 м/мин, длина перерабатываемого волокна до 40 мм. Линия заправки машины идёт сверху вниз, машина односторонняя. В прядильном производстве, машина для выработки пневмомеханической (роторной) пряжи.

ROT RESISTANT = ГНИЛОСТОЙКОСТЬ – Rot Resistant is the ability of textile materials to resist physical deterioration resulting from the action of bacteria and other destructive agents such as sunlight or sea water.

ROTTED KERNELS = ГНИЛАЯ ЗЕРНОВКА (или ИСПОРЧЕННАЯ ЗЕРНОВКА, или ГНИЛЫЕ ЯДРА, или ИСПОРЧЕННЫЕ ЯДРА) – Rotted Kernels are decomposed or decayed because of bacteria or fungi. Rot is usually indicated by blackening, discoloration and softening of all or part of the kernel. / К Гнилой Зерновке относятся разложившаяся или загнившая зерновка вследствие воздействия бактерий или грибков. Гниль, как правило, проявляется в виде почернения, изменения цвета и размягчения всей или части зерновки.

ROTTERDAM COAL = РОТТЕРДАМСКИЙ УГОЛЬ – Rotterdam Coal is coal delivered at the port of Rotterdam in the Netherlands. Rotterdam Coal is traded at the ICE Futures Europe® under ticker symbol ATW. Contract size is 1 000 tons quoted in US Dollars and Cents per ton. Contract is cash-settled at an amount equal to the monthly average API 2 index (All Published Index number 2) as published in the Argus/McCloskey's Coal Price Index Report. The API 2 index is the standard reference price benchmark for coal imported into northwest Europe. It is calculated as an average of the Argus cif Rotterdam assessment and McCloskey's northwest European steam coal marker. The API 2 index is the benchmark price reference for coal imported into northwest Europe. It is calculated as an average of the Argus CIF ARA assessment and McCloskey's northwest European steam coal marker. The Argus component of the price is published each day in Argus Coal Daily International. The Argus/McCloskey's Coal Price Index report is published every Friday and includes daily, weekly and monthly average prices. Daily prices are also available as a data feed. The API 2 price is the primary price reference for physical and over-the-counter (OTC) coal contracts in northwest Europe. Some 90% of the world's derivatives are priced against the Argus/McCloskey API 2 and API 4 indexes. The Argus/McCloskey's Coal Price Index service also includes the API 4 index, which is the benchmark for coal exported out of Richards Bay in South Africa. The API 2 benchmark is an average of Argus CIF ARA and McCloskey's northwest European steam coal marker prices. To understand how Argus calculates its prices, read the market-appropriate methodology for Argus Coal Daily International. The API 2, API 4 and API 6 indexes are published exclusively through the Argus/McCloskey's Coal Price Index service. API 2 – the standard reference price benchmark for coal imported into North-West Europe. It is an average of the Argus CIF Rotterdam assessment and McCloskey's North-West European steam coal marker. API 4 – the benchmark price for coal exported out of South Africa's Richards Bay terminal. The API 4 index is calculated as an average of the Argus FOB Richards Bay assessment and McCloskey's FOB Richards Bay marker. API 6 – an average of Argus and McCloskey's FOB Newcastle assessments for coal exported out of Australia. The Argus McCloskey coal indices are used as the settlement prices in 90% of the world's coal derivative contracts. Historical data is also available for long term trend analysis and planning purposes. Spot and historical data can be accessed in numerous ways, including online and via FTP (short for the File Transfer Protocol). Argus is a leading provider of price assessments, business intelligence and market data on the global coal, crude and products, natural gas, electricity, emissions and transportation industries. It is headquartered in London and has offices in Houston, Washington, New York, Portland, Calgary, Johannesburg, Dubai, Singapore, Tokyo, Beijing, Sydney, Moscow, Astana, Kiev, Santiago and other key centres of the energy industry. Argus was founded in 1970 and is a privately held UK-registered company. IHS McCloskey is a leading source of news and analysis on the international coal industry. Produced by a team of industry experts, the IHS McCloskey news and forecasting services are widely considered to be the most accurate and reliable in the business. Known for providing valuable market information and insights, the group's suite of publications, including the McCloskey Coal Report, is

recognized globally for accurate and reliable price reporting. Every day, many of the major deals in the international market are executed using McCloskey prices as a reference. The group also hosts a number of highly regarded coal conferences throughout the world, and the consultancy practice continues to advise many of the world's leading producers and consumers on a wide range of issues. API 2 and API 4 are trade marks of Argus Media Limited and IHS Global Limited. / МэКлоски (McCloskey). Аргас Мидиа Лимитид (Argus Media Limited) и Ай.Эйч.Эс. Глоубэл Лимитид (IHS Global Limited).

THE ROTTERDAM RULES = РОТТЕРДАМСКИЕ ПРАВИЛА – The Rotterdam Rules:- United Nations (UN) Convention on Contracts for the International Carriage of Goods Wholly or Partly by Sea (New York, 2008). Adopted by the General Assembly on 11 December 2008, the Convention establishes a uniform and modern legal regime governing the rights and obligations of shippers, carriers and consignees under a contract for door-to-door carriage that includes an international sea leg. The Convention builds upon, and provides a modern alternative to, earlier conventions relating to the international carriage of goods by sea, in particular, the International Convention for the Unification of Certain Rules of Law relating to Bills of Lading (Brussels, 25 August 1924) (The Hague Rules), and its Protocols (The Hague-Visby Rules), and the United Nations Convention on the Carriage of Goods by Sea (Hamburg, 31 March 1978) (The Hamburg Rules). The Rotterdam Rules provide a legal framework that takes into account the many technological and commercial developments that have occurred in maritime transport since the adoption of those earlier conventions, including the growth of containerization, the desire for door-to-door carriage under a single contract, and the development of electronic transport documents. The Convention provides shippers and carriers with a binding and balanced universal regime to support the operation of maritime contracts of carriage that may involve other modes of transport. On 11 December 2008 the UN General Assembly adopted the Convention on Contracts for the International Carrying of Goods Wholly or Partly by Sea during a signing ceremony for the Convention which was held in Rotterdam, recommending the new Convention to be known as The Rotterdam Rules. The Convention extends and modernizes the existing international rules relating to contract of maritime carriage of goods. The aim is that the Convention will replace The Hague Rules, The Hague-Visby Rules and the Hamburg Rules and that it will achieve uniformity of law in the field of maritime carriage. / 11 Декабря 2008 в Роттердаме, Нидерланды Генеральная Ассамблея ООН приняла Конвенцию по Контрактам для Международной Перевозки Товаров по Морю Полностью или Частично (Convention on Contracts for the International Carriage of Goods Wholly or Partly by Sea), известную как Роттердамские Правила (The Rotterdam Rules). Эта конвенция расширила и модернизировала существовавшие ранее международные правила, касающиеся контрактов морской перевозки товаров. Целью принятия новой конвенции была замена устаревших Гаагских Правил (The Hague Rules), Гаагско-Висбийских Правил (The Hague-Visby Rules) и Гамбургских Правил (The Hamburg Rules) для достижения единообразия законодательства в сфере морской перевозки.

ROU = RADIO OFFICERS' UNION

ROUGH = ГРУБАЯ (или НЕОБРАБОТАННАЯ, или ШЕРОХОВАТАЯ, или ШЕРШАВАЯ) – Rough:- a fabric condition in which the surface resembles sandpaper. Principal causes are the shuttle rebounding in the box, jerky or loose shuttle tension, an incorrectly timed harness, and wild twist in the filling. Rough (adj) is a descriptive term for a fabric surface which has the feel of sandpaper. / в уточине.

ROUGHAGE = ОРГАНИЧЕСКАЯ ПРИМЕСЬ – Roughage is a type of foreign material found in grains. It includes chaff, loose hulls, empty seed pods, knuckles, etc, that are readily removable by aspiration, handpicking, or other cleaning procedures. / Органической Примесью является тип инородного материала, обнаруженный в зерне. Она включает в себя колосковую чешую, облетевшую плодовую оболочку, пустые семенные стручки, межфаланговые суставы, и тому подобное, что является легко удаляемым посредством аспирации, ручного разбора или иных процедур очистки.

ROUGH BROKEN LAND = ГРУБО РАЗБИТАЯ ЗЕМЛЯ – Rough Broken Land is a land with very steep topography and numerous intermittent drainage channels but usually covered with vegetation.

ROUGH CRÊPE = ГРУБЫЙ КРЭП – Rough Crêpe is a heavy fabric of rayon, acetate, or mixtures made with alternately twisted fillings, two right and two left (2 x 2). See also Crêpe. / уточины, .

ROUGH FACE AND SHORT STREAKS = ГРУБАЯ ЛИЦЕВАЯ СТОРОНА И КОРОТКИЕ ЗАТАСКИ (или ПОЛОСКИ, или ЧЕРТЫ) – Rough Face And Short Streaks:- Fabric:- satin dress goods; Construction:- (i) Count:- 212 x 68; (ii) Warp:- 100/40 bright acetate rayon; (iii) Filling:- same as warp; Finish:- plain dyed blue. Defect:- rough and uneven face, with short streaks throughout. The finisher claimed some irregularity in the weave or some other gray-goods fault. Analysis:- microscopic examination showed that the short 'streaks' did not follow the filling threads exactly, but were definite deformations of the warp threads. They were made to disappear almost completely by holding under tension, the streaks pulling out like small, hard creases. Laboratory wetting out and ironing likewise resulted in almost complete removal of the crimped places. It was concluded that this defect was probably caused by impression marks from the calender roll, producing a mechanical distortion and small crimps in the fabric. / Уточина:- такая же как основа. Затаск от печати, не более 2 см. Размер порока – до 0.5 см. Размер порока определяют по наибольшей протяжённости.

ROUGH LUMBER = НЕОБРАБОТАННЫЙ ПИЛОМАТЕРИАЛ (или ЧЕРНОВОЙ ПИЛОМАТЕРИАЛ, или НЕОСТРУГАННЫЙ ПИЛОМАТЕРИАЛ, или НЕСТРУГАНЫЙ ПИЛОМАТЕРИАЛ) – Rough Lumber is a lumber that has not been dressed (surfaced) but which has been sawed, edged, and trimmed. / пиломатериал, который не строган (), но который был распилен, обрезан, и оторцован/откалиброван. строганый (dressed).

ROUGH OR DULL SURFACES = ГРУБЫЕ (или НЕОБРАБОТАННЫЕ, или ШЕРОХОВАТЫЕ, или ШЕРШАВЫЕ) или МАТОВЫЕ (или ТУСКЛЫЕ) ПОВЕРХНОСТИ – Rough Or Dull Surfaces:- this is not a serious fault except in cases of extreme roughness or poor surface appearance. Closure defects, and namely – Pearl and Plastic Buttons. / Порок или дефект застёжки.

ROUGH RICE = РИС–СЫРЕЦ – Rough Rice:- called Paddy, threshed, unmilled or whole Rice grain, or caryopsis. Syn.:- Paddy Rice. Rough Rice is the Rice as it comes from the field. Rice kernels are still encased in an inedible, protective hull. Also known as Paddy Rice. Rough (Paddy) Rice:- kernels still within the hull. Before the Rice can be packaged or cooked, the outer hull or husk must be removed. / . Зерновка (ядра) Риса .

ROUGH SELVAGE = ГРУБАЯ (или НЕОБРАБОТАННАЯ, или ШЕРОХОВАТАЯ, или ШЕРШАВАЯ) КРОМКА – Rough Selvage:- xxxxx. Fabrics defect. See also Loopy Selvage.

ROUNDABOUT = КУРТКА (или КАРУСЕЛЬ) – Roundabout is a short close-fitting jacket worn by men and boys especially in the XIX century. / короткая куртка.

ROUNDELLE = БУСИНА (или РУНДЭЛЬ) – Roundelle is a donut shaped fabric stuffed head dress worn with a veil by women in the XIV and XV centuries. / .

ROUNDING BOTTOM = ЗАКРУГЛЯЮЩАЯСЯ ВПАДИНА – Rounding Bottom:- in visual analysis, it is a reversal chart pattern representing a long consolidation period that turns from a bearish bias to a bullish bias. Also known as Saucer Bottom. / В техническом анализе биржевых рынков, Закругляющаяся Впадина представляет собой разворотную графическую модель, характеризующуюся длительным периодом консолидации, которая разворачивает направление пристрастий с медвежьих на бычьи. Известна также как (Saucer Bottom).

ROUNDING TOP/BOTTOM = ЗАКРУГЛЯЮЩАЯСЯ ВЕРШИНА/ВПАДИНА – In visual analysis, Rounding Top/Bottom is a trend change pattern that is very slow to develop and resembles a curving series of price movements on lower volume generally. Sometimes referred to as a Saucer Top/Bottom. / В техническом анализе биржевых рынков, Закругляющаяся Вершина/Впадина.

ROUND LOT = КРУГЛЫЙ ЛОТ (или ПОЛНЫЙ ЛОТ, или СТАНДАРТНЫЙ ЛОТ, или ЦЕЛИКОВАЯ ПАРТИЯ) – Round Lot is the unit of trading, generally 100 shares. On the NYSE® the unit of trading is generally 100 shares. In some inactive stocks, the unit of trading is 10 shares. Standard unit of securities trading. Fractions of a round lot are called Odd Lots. Round Lot is a quantity of a commodity equal in size to the corresponding futures contract for the commodity, as distinguished from a job lot, which may be larger or smaller than the contract. See also Even Lot. / НЙФБ® или Эн.Уай.Эс.И.® (NYSE®). Полный Лот или Стандартная (Минимальная) Сделка – партия акций, которую обычно принимают на бирже для проведения торговых операций. На Нью Йоркской Фондовой Бирже (New York Stock Exchange), например, полный лот составляет 100 акций, а стандартная сделка по облигациям имеет нарицательную стоимость 1 000 или 5 000 Долларов. Для неактивных акций полный лот составляет 10 акций. Все большее хождение в торговых операциях между организациями-инвесторами получают полные лоты в 500 акций. Торговые операции с депозитными сертификатами (certificates of deposit) крупной деноминации ведутся на внебиржевом рынке (over the counter market) партиями на сумму 1 миллион Долларов. Инвесторы, которые осуществляют торговые операции с полными лотами, не должны платить разницу (differential), взимаемую при операциях с неполными лотами (Odd Lots).

ROUND LOT ORDER = ПОРУЧЕНИЕ ПО КРУГЛОМУ ЛОТУ (или РАСПОРЯЖЕНИЕ ПО КРУГЛОМУ ЛОТУ, или РАСПОРЯЖЕНИЕ ПО ПОЛНОМУ ЛОТУ, или РАСПОРЯЖЕНИЕ ПО СТАНДАРТНОМУ ЛОТУ) – Round Lot Order is an order to buy or sell in multiples of 100 shares. / Распоряжение купить или продать акции из расчёта 100 штук на одну партию.

ROUNDS = РАУНДЫ – Rounds are the cycles of multilateral trade negotiations under GATT (short for the General Agreement on Tariffs and Trade), culminating in simultaneous agreements among participating countries to reduce tariff and non-tariff trade barriers. 1st Round:- 1947, Geneva, Switzerland (adoption of the GATT). 2nd Round:- 1949, Annecy, France (tariff reduction). 3rd Round:- 1951, Torquay, the United Kingdom (accession and tariff reduction). 4th Round:- 1956, Geneva, Switzerland (accession and tariff reduction). 5th Round:- 1960–62, Geneva, Switzerland ('Dillon' Round; revision of GATT; addition of more countries; Trade negotiations that took place under the aegis of GATT from 1960 to 1962, named after Douglas Dillon, then the US under secretary of state, who publicly proposed the negotiations). 6th Round:- 1964–67, Geneva, Switzerland ('Kennedy' Round; tariff reduction; GATT negotiation rules; The popular name for the sixth and at that time the most ambitious 'Round' of trade negotiations under the aegis of GATT. The Kennedy Round, which lasted from 1963 to 1967, yielded agreements reducing prevailing tariff levels maintained by developed countries on industrial products by about one-third, an 'Anti-Dumping Code', and a short-lived International Wheat Agreement which was intended to stabilize world Wheat prices. (The Wheat Agreement replaced the latest in a series of International Wheat Agreements going back to the 1950s). 7th Round:- 1973–79, Tokyo, Japan ('Tokyo' Round; overall reduction of tariffs to an average level of 35% and 5–8% among developed nations; non-tariff barrier codes including:- (i) antidumping, (ii) customs valuation, (iii) government procurement, (iv) import licensing, (v) standards, and (vi) subsidies and countervailing measures; The Tokyo Round of Multilateral Trade Negotiations, formally initiated by the 1973 Tokyo Declaration, was the most comprehensive effort up to that time to eliminate, reduce or control non-tariff barriers that restrict non-agricultural trade, and was especially notable for having negotiated several codes of conduct designed to curtail the use of non-tariff barriers as instruments of protection. More countries participated in these negotiations than in any previous Round, including more than 20 developing countries that were not GATT members and several countries of Eastern Europe. The Tokyo Round was carried out in Geneva and concluded there in 1979). 8th Round:- September 1986 – April 1994, Geneva, Switzerland ('Uruguay' Round; broadening of GATT, including:- (i) intellectual property, (ii) limit agricultural subsidies, and (iii) services trade; and establishment of the WTO (World Trade Organization)). 9th Round:- Doha, Qatar, in November 2001 ('Doha' Round). Also known as GATT Rounds. / Генерального Соглашения о Тарифах и Торговле (ГСТТ или ГЯТ (GATT)) .

(1) The first version of GATT (short for the General Agreement on Tariffs and Trade), developed in 1947 during the United Nations Conference on Trade and Employment in Havana, Cuba, is referred to as 'GATT 1947'. On 1948-January-01 the agreement was signed by 23 countries:- Australia, Belgium, Brazil, Burma, Canada, Ceylon, Chile, the Republic of China, Cuba, the Czechoslovak Republic, France, India, Lebanon, Luxembourg, Netherlands, New Zealand, Norway, Pakistan, Southern Rhodesia, Syria, South Africa, the United Kingdom, and the United States. 45 000 tariff concessions were made influencing over USD10 billion in trade which comprised 20% of the total global market at the time. The GATT, as an international agreement, is similar to a treaty. Under United States law it is classified as a congressional-executive agreement. Based on the Reciprocal Trade Agreements Act it allowed the executive branch negotiating power over trade agreements with temporary authority from Congress. At the time it functioned as a provisional, but promising trade system. The agreement is based on the 'unconditional most favored nation principle'. This means that the conditions applied to the most favored trading nation (i.e. the one with the least restrictions) apply to all trading nations. In the United States, there was large opposition against the International Trade Organization (which had been ratified in several countries, including Australia), and thus President Truman never even submitted it to Congress. This caused other countries to lose interest and left the orphaned GATT as the world's only multilateral trade agreement, coming into force on 1948-January-01. 1947 October – 23 countries sign the General Agreement on Tariffs and Trade (Gatt) in Geneva, Switzerland, to try to give an early boost to trade liberalisation. 1947 November – Delegates from 56 countries meet in Havana, Cuba, to start negotiating the charter of a proposed International Trade Organisation. 1948-January-01 – GATT agreement comes into force. 1948 March – Charter of International Trade Organisation signed but US Congress rejects it, leaving GATT as the only international instrument governing world trade. / , то есть . Генерального Соглашения о Тарифах и Торговле (ГСТТ или ГЯТ (GATT)) .

(2) The second round took place in 1949 in Annecy, France. The main focus of the talks was more tariff reductions, around 5,000 total. 1949 – Second Gatt round of trade talks held at Annecy, France, where countries exchanged some 5 000 tariff concessions.

(3) The third round occurred in Torquay, England in 1951. 8 700 tariff concessions were made totaling the remaining amount of tariffs to three-fourths of the tariffs which were in effect in 1948. 1950 – Third GATT round held in Torquay, England, where countries exchanged some 8 700 tariff concessions, cutting the 1 948 tariff levels by 25%. / Генерального Соглашения о Тарифах и Торговле (ГСТТ или ГЯТ (GATT)) .

(4) The fourth round returned to Geneva in 1955 and lasted until May 1956. USD2.5 billion in tariffs were eliminated or reduced. 1955-56 – The next trade round completed in May 1956, resulting in USD2.5 billion in tariff reductions.

(5) The fifth round occurred once more in Geneva and lasted from 1960 to 1962. The talks were named after Under Secretary of State General of the US, Douglas Dillon, who first proposed the talks. Along with reducing over USD4.9 billion in tariffs, it also yielded discussion relating to the creation of the European Economic Community (EEC). 1960–62 – Fifth GATT round named in honour of US Under Secretary of State Douglas Dillon who proposed the negotiations. It yielded tariff concessions worth USD4.9 billion of world trade and involved negotiations related to the creation of the European Economic Community. / Генерального Соглашения о Тарифах и Торговле (ГСТТ или ГЯТ (GATT)) .

(6) The sixth round was the last to take place in Geneva from 1964 until 1967 and was named after the late US President Kennedy in his memory. Concessions were made on USD40 billion worth of tariffs. Some of the GATT negotiation rules were also more clearly defined. 1964–67 – The Kennedy Round, named in honour of the late US president, achieves tariff cuts worth USD40 billion of world trade. / Шестой раунд был последним, который имел место в Женеве с 1964 до 1967. Он был назван в память об убитом 35-том Президенте США Дьжоне Фицдьжерэлде Кенэди (John Fitzgerald Kennedy; 1917–1963). . Генерального Соглашения о Тарифах и Торговле (ГСТТ или ГЯТ (GATT)) .

(7) The seventh round of GATT took place in Tokyo from 1973 until 1979. The talks managed to reduce several trade barriers in addition to USD300 billion in tariffs. Negotiations covered a range of topics including government procurement, customs valuation, subsidies, countervailing measures, antidumping, standards and import licensing. 1973–79 – The seventh round, launched in Tokyo, Japan, sees GATT reach agreement to start reducing not only tariffs but trade barriers as well, such as subsidies and import licensing. Tariff reductions worth more than USD300 billion achieved. / Седьмой раунд Генерального Соглашения о Тарифах и Торговле (ГСТТ или ГЯТ (GATT)) имел место в Токио, Япония с 1973 по 1979. Все разговоры сводились к снижению некоторых торговых барьеров в дополнение к 300 миллиардам Долларов США в тарифах. Переговоры касались ряда тем, включая государственные (правительственные) поставки, таможенную оценку, субсидии, компенсирующие меры, антидемпинга, стандартов и лицензирования привоза (или импорта).

(8) The Uruguay Round began in 1986. It was the most ambitious round to date, hoping to expand the competence of the GATT to important new areas such as services, capital, intellectual property, and agriculture. Agriculture was essentially exempted from previous agreements as it was given special status in the areas of import quotas and export subsidies, with only mild caveats. However, by the time of the Uruguay round, many countries considered the exception of agriculture to be sufficiently glaring that they refused to sign a new deal without some movement on agricultural products. These fourteen countries came to be known as the 'Cairns Group', and included mostly small and medium sized agricultural exporters such as Australia, Brazil, Canada, Indonesia, and New Zealand. In 1994 the GATT was updated (GATT 1994) to include new obligations upon its signatories. One of the most significant changes was the creation of the World Trade Organization (WTO). The 75 existing GATT members and the European Communities became the founding members of the WTO on 1995-January-01. The other 52 GATT members rejoined the WTO in the following two years (the last being Congo in 1997). Since the founding of the WTO, 21 new non-GATT members have joined and 28 are currently negotiating membership. Of the original GATT members, only the SFR Yugoslavia has not rejoined the WTO. Since FR Yugoslavia, (renamed to Serbia and Montenegro and with membership negotiations later split in two), is not recognised as a direct SFRY successor state; therefore, its application is considered a new (non-GATT) one. The contracting parties who founded the WTO ended official agreement of the 'GATT 1947' terms on 1995-December-31. Whereas GATT was a set of rules agreed upon by nations, the WTO is an institutional body. The WTO expanded its scope from traded goods to trade within the service sector and intellectual property rights. Although it was designed to serve multilateral agreements, during several rounds of GATT negotiations (particularly the Tokyo Round) plurilateral agreements created selective trading and caused fragmentation among members. WTO arrangements are generally a multilateral agreement settlement mechanism of GATT. 1986–93 – GATT trade ministers launch the Uruguay Round in Punta Del Este, Uruguay, embarking on the most ambitious and far-reaching trade round so far. The round extended the range of trade negotiations, leading to major reductions in agricultural subsidies, an agreement to allow full access for textiles and clothing from developing countries, and an extension of intellectual property rights. 1994 – Trade ministers meet for the final time under GATT auspices at Marrakesh, Morocco to establish the World Trade Organization (WTO) and complete the Uruguay Round. 1995 – The World Trade Organization is created in Geneva. 1999 – At least 30 000 protesters disrupt WTO summit in Seattle, US; New Zealander Mike Moore becomes WTO director-general. / Генерального Соглашения о Тарифах и Торговле (ГСТТ или ГЯТ (GATT)) .

(9) The Doha Development Round of World Trade Organization negotiations aims to lower trade barriers around the world, permitting free trade between countries of varying prosperity. As of 2006, talks have stalled over a divide between the developed nations led by the European Union, the United States and Japan and the major developing countries (represented by the G20 developing nations), led and represented mainly, however, by India, Brazil, China and South Africa. The Doha round began with a ministerial-level meeting in Doha, Qatar in 2001, with subsequent ministerials in Cancún, Mexico (2003), and Hong Kong, China (2005). Related negotiations have taken place in:- Geneva, Switzerland; Paris, France; and again Geneva. The Doha round of WTO negotiations began in November 2001. This round was to have begun at the 3rd ministerial conference in Seattle in 1999, and was to have been called 'The Seattle Round' but severe demonstrations disrupted those meetings, and this round's beginning was put off until the meetings at the more secure and controllable Doha, Qatar. The purpose was to agree on the Doha Development Agenda, and from there negotiate opening agricultural and manufacturing markets. The intent of the round, according to its proponents, was to make trade rules fairer for developing countries. Opponents charged that the round would expand a system of trade rules that were bad for development and interfered excessively with countries' domestic 'policy space'. The 2003 Cancún talks – Intended to forge concrete agreement on the Doha round objectives – collapsed after four days during which the members could not agree on farm subsidies and access to markets. Negotiations focused upon four key areas:- agriculture, industrial goods, trade in services, and updated customs codes. The North-South divide was most prominent on issues of agriculture. Rich countries' farm subsidies (both the EU's Common Agricultural Policy and the US government agro-subsidies) became a major sticking point. The developing countries were seen as finally having the confidence to reject a deal that they viewed as unfavorable. This is reflected by the new trade bloc of developing and industrialized nations:- the G20. Since its creation, the G20 has had fluctuating membership, but is spearheaded by the G4 (People's Republic of China, India, Brazil & South Africa), and overall accounts for approximately 65% of the world population, 72% of its farmers and at least 2/3 of its agricultural output. The August 2004 Geneva talks achieved a framework agreement on opening global trade. The United State, the Eropean Union, Japan and Brazil agreed to end export subsidies, reduce agricultural subsidies and lower tariff barriers. Developing nations agreed to reduce tariffs on manufactured goods, but gain the right to specially protect key industries. The agreement also provides for simplified customs, and stricter rules for rural development aid. Trade negotiators wanted to make tangible progress before the December 2005 WTO meeting in Hong Kong, and hoped to agree to the deal before 2007 when US fast-track legislation expires. Without fast-track, it will be much harder to get a ratification from the US Senate. Paris talks were hanging over a few issues:- France protested moves to cut subsidies to farmers, while the United States, Australia, the European Union, Brazil and India failed to agree on issues relating to chicken, beef and rice. Most of the sticking points were small technical issues, making trade negotiators fear that agreement on large politically risky issues will be substantially harder. By July-August an agreement was needed

in order to finalize negotiations for agreement in Hong Kong. Oxfam charged the EU with 'delaying tactics' which have threatened to spoil the round. The Sixth WTO Ministerial Conference took place in Hong Kong, December 13 to 18, 2005. Trade ministers representing most of the world's governments reached a deal that sets a deadline for eliminating subsidies of agricultural exports by 2013. The final declaration from the talks, which resolved several issues that have stood in the way of a global trade agreement, also requires industrialized countries to open their markets to goods from the world's poorest nations, a goal of the United Nations for many years. The declaration gives fresh impetus for negotiators to try to finish a comprehensive set of global free trade rules by the end of 2006. Pascal Lamy, Director General of the WTO, said, 'I now believe it is possible, which I did not a month ago'. As many as 2000 protestors demonstrated outside the Hong Kong Convention and Exhibition Centre, the location of the talks. Clashes with the police left at least 116 people injured, including 56 officers, although there were no critical injuries according to the authorities. The July 2006 talks in Geneva failed to reach an agreement about reducing farming subsidies and lowering import taxes, and continuation of the negotiations will take months to resume. A successful outcome of the Doha round has become increasingly unlikely, because the broad trade authority granted under the Trade Act of 2002 to US president George Walker Bush expires in 2007. Any trade pact will then have to be approved by the US Congress with the possibility of amendments, which creates an additional burden on the US negotiators and decreases the willingness of other countries to participate. Hong Kong offered to mediate the collapsed trade liberalisation talks. Director-General of Trade and Industry, Raymond Young, says the territory, which hosted the last round of Doha negotiations, has a 'moral high-ground' on free trade that allows it to play the role of 'honest broker'. Xxxxx. 2001 November – WTO members meeting in Doha, Qatar, agree on the Doha Development Agenda, the nineth trade round which is intended to open negotiations on opening markets to agricultural, manufactured goods, and services. 2001 December – China formally joins the WTO. Taiwan is admitted weeks later. 2002 August – WTO rules in favor of the EU in its row with Washington over tax breaks for US exporters. The EU gets the go-ahead to impose USD4 billion in sanctions against the US, the highest damages ever awarded by the WTO. 2002 September – Former Thai Deputy Prime Minister Supachai Panitchpakdi begins a three-year term as director-general. He is the first WTO head to come from a developing nation. 2003 September – WTO announces deal aimed at giving developing countries access to cheap medicines, hailing it as historic. Aid agencies express disappointment at the deal. 2003 September – World trade talks in Cancun, Mexico collapse after four days of wrangling over farm subsidies, access to markets. Rich countries abandon plans to include so-called 'Singapore Issues' of investment, competition policy and public procurement in trade talks. 2003 December – WTO rules that duties imposed by the US on imported steel are illegal. US President Bush repeals the tariffs to avoid a trade war with the EU. 2004 April – WTO rules that US subsidies to its cotton farmers are unfair. 2004 August – Geneva talks achieve framework agreement on opening up global trade. US and EU will reduce agricultural subsidies, while developing nations will cut tariffs on manufactured goods. 2005 March – Upholding a complaint from Brazil, WTO rules that US subsidies to its cotton farmers are illegal. 2005 May – WTO agrees to start membership talks with Iran. 2005 September – Frenchman Pascal Lamy takes over as WTO director-general. He was formerly the EU's trade commissioner. 2005 October – US offers to make big cuts in agricultural subsidies if other countries, notably EU do the same. EU responds, but France opposes more concessions. 2005 November – WTO approves membership for Saudi Arabia. 2005 December – World trade talks in Hong Kong begin amid widespread belief that they will not succeed in making a breakthrough. 2007 January – Vietnam becomes the 150th WTO member state. / выработка (output). Президент США Дьюдьж Вокё Бош (George Walker Bush; 1946–). Генеральный Директор по Торговле и Промышленности, Рэймэнд Ян (Raymond Young). Паскаль Лями (Pascal Lamy).

ROUND TRIP = КРУГОВОЙ РЕЙС (или КРУИЗ ПО ЗАМКНУТОМУ КРУГУ) – Round Trip is a voyage, journey, etc to a certain place, port or country and back again. A voyage to a certain port or country and back again.

ROUND TRIP TRADING = ФИКТИВНАЯ (или СОМНИТЕЛЬНАЯ, или ОТМЫВОЧНАЯ, или СДЕЛКИ С ЗАИНТЕРЕСОВАННОСТЬЮ) ТОРГОВЛЯ В ОБЕ СТОРОНЫ – The purchase and sale of a security within a short period of time. The term Round Trip Trade means a transaction, or combination of transactions, in which a person or any other entity:- (i) enters into a contract or other arrangement to purchase from, or sell to, any other person or other entity electric energy at wholesale; (ii) simultaneously with entering into the contract or arrangement described in paragraph (1), arranges a financially offsetting trade with such other person or entity for the same such electric energy, at the same location, price, quantity and terms so that, collectively, the purchase and sale transactions in themselves result in no financial gain or loss; and (iii) enters into the contract or arrangement with a specific intent to fraudulently affect reported revenues, trading volumes, or prices. See also Wash Trading. Round Trip Trading:- an action that attempts to inflate transaction volumes through the continuous and frequent purchase and sale of a particular security, commodity or asset. Round-trip trading can be used to refer to the practice of a business selling an unused asset to another company while agreeing to buy back the same asset for about the same price, which has been seen in the energy and telecom business. This is a market-manipulation practice used to misrepresent the number of transactions occurring on any given day. Round-trip trading artificially inflates volume and revenues, but in reality adds no profit. Enron was a company that engaged in round-trip trading, and, by doing so, was able to increase revenues (and expenses) without changing its net income. / в бизнесе в сфере энергетики и дальней связи.

ROUND TURN = ЗАМКНУТАЯ (или ЗАМКНУТЫЙ ЦИКЛ, или ПОЛНОСТЬЮ ЗАВЕРШЁННАЯ СДЕЛКА) – Round Turn:- the completion of both a purchase and sale of a commodity futures contract. The long or short position of an individual is offset by an opposite transaction or by accepting or making delivery of the actual commodity. A completed transaction involving both a purchase and a liquidating sale, or a sale followed by a covering purchase. Round Turn:- the complete transaction of a closed out futures contract, i.e. both the buying and selling operations. Commission rates are sometimes quoted on a round turn basis. Round Turn:- a complete buy and sell transaction for futures or option contracts. / Законченная сделка, включающая в себя как приобретение, так и ликвидационную продажу, или продажу с последующим покрывающим приобретением. Процедура, в ходе которой производится зачёт длинной или короткой позиции посредством проведения противоположной сделки либо принятия или осуществления поставки реального финансового инструмента или физического товара.

ROUND TURN = ШЛАГ ТРОСА – Round Turn:- hawsers, ropes or belts wound around an item. On the one hand as a basis for forming a knot, on the other hand as a method of lashing. Unfortunately, round turn lashing is a widespread securing method. It is absolutely unsuitable for securing a cargo as the cargo can move freely in the loop and no securing effect is thus achieved. / Шлаг троса, обнесённого на шпиль или кнехт .

ROUNDUP READY® COTTON = ХЛОПЧАТНИК РАУНДАП РЭДИ® – Roundup Ready® is the name for Monsanto's transgenic technology providing herbicide resistance. This technology is owned by Monsanto and is protected by a labyrinth of international patents. To be able to plant transgenic seed in a given area a farmer must first receive a license for that area from Monsanto. Roundup Ready is a trademark term applied to varieties that have been genetically altered to be tolerant to the herbicide glyphosate. / Раундап

Рэди® – это зарегистрированное название для трансгенной технологии компании Монсэнто (Monsanto), обеспечивающей сопротивляемость гербицидам. Эта технология принадлежит компании Монсэнто и защищена серией международных патентов. Для использование трансгенных семян для посева на какой-то территории фермер, в первую очередь, должен получить от Монсэнто лицензию для конкретной территории.

ROUNDUP READY FLEX™ COTTON = ХЛОПЧАТНИК РАУНДАП РЭДИ ФЛЭКС™ – Roundup Ready Flex™ from Monsanto is an improvement over the Roundup Ready® singly or in stacked gene varieties. It has been designed to enhance reproductive tolerance to glyphosate. It will provide improved flexibility to treat past the 4-leaf growth stage when due to some reasons it was not possible to control weeds at an early stage. Roundup Ready Flex can be sprayed on the Roundup Ready Flex Cotton up to the 14-leaf stage and in two to three times higher quantities to control tougher weeds. Roundup Ready Flex™ (RRF) Cotton is the Cotton that is tolerant to Over the Top applications of registered glyphosate formulations such as Roundup Ready Herbicide with PLANTSHIELD by Monsanto. / Хлопчатник Раундап Рэди Флэкс™ от Американской компании Монсэнто (Monsanto) .

ROUNDVOYAGE = КРУГОВОЙ РЕЙС (или ВОЯЖ В ОБА КОНЦА) – Roundvoyage is a voyage involving two legs, the second of which brings the ship back to the first port. Also known as Round Trip Voyage.

ROUND WOOD = КРУГЛЯК (или БРЕВНО, или ПИЛОВОЧНИК, или ДЕЛОВАЯ ДРЕВЕСИНА) – Round Wood is a wood not sawn longitudinally, carrying its natural rounded surface, with or without bark. / Древесина, не распиленная продольно, остающаяся со своей естественной округлённой поверхностью, как с корой, так и без коры. Круглый Лесоматериал:- материалы из древесины, получаемые из спиленных деревьев путём очистки их от ветвей, окорки древесины и распиловки поперёк на части требуемой длины (смотрите также Лесоматериалы).

ROUTE = МАРШРУТ – The manner in which a shipment moves; i.e. the carriers handling it and the points at which the carriers interchange. / , то есть . Под Маршрутом, от Немецкого слова Marschrute, от Французских слов Marche, означающее Движение Вперёд или Ход, и Route, означающее Дорога или Путь, понимается заранее намеченный или установленный путь следования, направление, порядок пути.

ROUTING = ВЫБОР МАРШРУТОВ (или ВЫБОР ПУТЕЙ, или МАРШРУТИЗАЦИЯ) – Routing is the process of determining how a shipment will be moved between Shipper and Consignee – between place of receipt and place of delivery.

(1) Routing is the determination of the most efficient route(s) that people, goods, materials and or means of transport have to follow. / Определение наиболее эффективного маршрута(ов), по которому должны следовать люди, товары, материалы или средства перевозки.

(2) Routing is the process of determining how a shipment will be moved between consignor and consignee or between place of acceptance by the carrier and place of delivery to the consignee.

(3) Routing is the process of aiding a vessel's navigation by supplying long range weather forecasts and indicating the most economic and save sailing route.

ROVING = РОВНИЦА – (1) Roving is an indefinitely long assembly of staple fibers, substantially parallel, with slight twist, capable of being drafted in the later or final stages of preparation for spinning. See also Sliver. Thinner strands are produced by the roving (slubbing) process, in which the sliver is converted to roving by being pulled and slightly twisted. Finally, the roving is transferred to a spinning frame, where it is drawn further, twisted on a ring spinner, and wound on a bobbin as yarn. A collection of relatively fine fibrous strands used in the later or final processes of preparation for spinning. Roving is an intermediate stage of yarn making between sliver and yarn; the last operation before spinning into yarn. A slightly twisted, soft and thick rope, more drawn out and twisted than the slubbing. The soft strand from which natural fiber yarns are made. In the carding process the last card in a set is where cotton is condensed to roving form, one step removed from finished spun yarn. Roving is delivered to the spinning frame and cones out in yarn form. It is finer in diameter than sliver or slubbing but is greater in diameter than yarn. Roving may be considered as a condensed sliver and slubbing which has been drawn, drafted, twisted, attenuated, doubled, and redoubled, as well as being made free of foreign matter. Roving is the soft strand of carded fiber that has been twisted, attenuated, and freed of foreign matter preparatory to spinning. In spun yarn production, Roving is an intermediate state between sliver and yarn. Roving is a condensed sliver that has been drafted, twisted, doubled, and redoubled. The product of the first roving operation is sometimes called Slubbing. / Ровница, пушистый толстый жгут (лента) из волокон; полуфабрикат прядильного производства, из которого изготовляется пряжа. Волокна в ровнице несколько распрямлены, расположены по её длине сравнительно равномерно и уплотнены путём небольшого скручивания на ровничной машине или сучения. Ровница, полуфабрикат прядильного производства, из которого изготовляется пряжа. Представляет собой промежуточный продукт между лентой и пряжей. Волокна в ровнице несколько распрямлены и расположены по её длине достаточно равномерно. Ровница формируется на ровничных машинах путём небольшого скручивания (в прядении хлопка, лубяных волокон, в гребенном прядении длинной шерсти) или сучения (в аппаратном прядении и гребенном прядении тонкой шерсти) волокнистой ленты. При этом продукт приобретает вид толстой нити, уплотняется и получает прочность, необходимую для намотки и разматывания, позволяющую вместе с тем вытягивать ровницу на прядильных машинах (без повреждения волокон). Основное требование к ровнице – равномерность по толщине и структуре. При производстве пряжи на кольцевых прядильных машинах с вытяжными приборами высокой вытяжки (200 и более) можно вырабатывать пряжу из ленты со второго перехода ленточных машин. Однако в этом случае усложняется конструкция вытяжного прибора, в результате чего затрудняется обслуживание сложного многозонного вытяжного прибора, увеличиваются габаритные размеры машины, труднее добиться выпуска равномерной пряжи по линейной плотности. Поэтому при кольцевом способе формирования пряжи сначала на ровничной машине из ленты получают более тонкий продукт – ровницу, а из неё на кольцевой прядильной машине вырабатывают пряжу требуемой линейной плотности. Ровница формируется сучением – уплотнением волокнистой ленточки. При сучении волокнистая ленточка зажимается между двумя транспортирующими поверхностями, совершающими одновременно непрерывное движение в направлении оси ленточки и возвратно-поступательное – перпендикулярно её оси. Ровница – полуфабрикат прядильного производства; уплотнённая сучением или кручением волокнистая ленточка, из которой изготовляется пряжа. Вырабатывается из ленты на ровничных машинах. Текстильная Ровница (Roving) – совокупность продольно ориентированных штапельных волокон заданной линейной плотности с подкруткой, предназначенная для последующей механической обработки путём вытягивания.

(2) Roving is the operation of producing roving. / Операция по производству ровницы. Предпрядение:- Получение Ровницы:- цель предпрядения – получение из ленты более тонкого продукта, называемого Ровницей. Ровница – нить, имеющая рыхлое строение, сравнительно высокую ровноту и определённую толщину. Ровницу получают из лент. Ленты по своей структуре неоднородные и недостаточно равномерны по толщине. Толщина лент по сравнению с ровницей и пряжей очень велика. В связи с этим при выработке ровницы ленты проходят ряд машин, на которых продолжается постепенное выравнивание и утонение продукта в 5–20 и более раз, достигаемое сложением и вытягиванием. На первых переходах машин ровничного

отдела волокна замасливают эмульсией. Замасливание повышает скольжение волокна при вытягивании, уменьшает их наэлектризованность и увеличивает выход ровницы вследствие уменьшения обрывности волокон и отходов. Раньше, из-за отсутствия приборов высокой вытяжки, для получения тонкой пряжи применяли последовательную обработку полуфабриката на трёх-четырёх ровничных машинах. Причём с первой (тазовой) машины получали толстую ровницу, а с последующих переходов – перегонную, тонкую и экстратонкую. В настоящее время благодаря применению приборов высокой вытяжки на ровничных и прядильных машинах стало возможным вырабатывать пряжу малой и средней толщины, с одним переходом ровничных машин или однопроцессным методом прядения непосредственно из ленты.

(3) Roving:- in the manufacture of composites, continuous strands of parallel filaments. Roving is a by-product during yarn manufacturing juncture. A texture slightly twisted sliver or roll of cotton generated by spinning mills. It is generated during the process which straightens the fibers. Combining slivers as such is a tedious as it produces a very thick rope of cotton fibers. Existence of this complications dealt carefully by separating the slivers into roving directly combining. This process leads to the post usage of roving in spinning process effectively. Finally to make it effective, Roving waste is supplied to the clients in pressed bales.

ROVING BALL = ШАРИК РОВНИЦЫ (или РОВНИЧНАЯ КАТУШКА) – Roving Ball:- the supply package offered to the winder, consisting of a number of ends or strands wound to a given outside diameter onto a length of cardboard tube. Usually designated by either fiber weight or length in yards.

ROVING CLOTH = ЖГУТОВОЕ ПОЛОТНО (или РОВНИЧНОЕ ПОЛОТНО) – Roving Cloth is a textile fabric, coarse in nature, woven from rovings.

ROVING FRAME = РОВНИЧНАЯ МАШИНА – Roving Frame:- one of the machines in yarn manufacture whose object is to reduce or attenuate the stock such as sliver, slubbing, or other roving to a suitable size for spinning. The four standard roving frames are slubber, intermediate, fine, and jack. All roving frames draft the stock by means of rollers, twist it by means of a flyer, and wind it onto a wooden bobbin. Also known as Fly Frame. Roving Frame is a machine that puts a loose twist in the drawn-out sliver. Roving Frame is a general name for all of the machines used to produce roving, different types of which are called Slubber, intermediate, fine, and jack. Roving frames draft the stock by means of drafting rolls, twist it by means of a flyer, and wind it onto a bobbin. / Ровничная Машина, применяется в прядильном производстве для получения ровницы. В зависимости от вида волокна и толщины ровницы ровничные машины различаются устройством вытяжных приборов, размерами рогулек, веретён и катушек, а также способом формирования ровницы (кручение веретеном или сучение). Схема ровничной машины для хлопка:- лента из тазов, огибая питающий вал, вводится в вытяжной прибор, затем проходит через глазок, полую ветвь и лапку рогульки, надетой на веретено, и наматывается на катушку в виде ровницы. Частота вращения веретена до 800 оборотов в минуту (об/мин). В тонкогребенной системе прядения шерсти ровница обрабатывается сучильными рукавами. В прядильном производстве под Ровничной Машиной понимается машина, формирующая из ленты ровницу – более тонкий слегка кручёный продукт, и паковку. Основными частями ровничной машины служат вытяжной прибор и крутильно-мотальный механизм. Ровничная Машина располагается на промежуточном этапе прядильного производства, называемом предпрядением. Задачей ровничной машины является формирование из ленты более тонкого слегка кручёного продукта – ровницы и формирование паковки. На этих машинах осуществляется вытягивание, кручение и наматывание, а также и сложение. При выработке тонкой пряжи в гребенной системе прядения хлопка обычно применяют два перехода ровничных машин:- на первом вырабатывают ровницу из ленты со второго перехода ленточных машин, а на втором – тонкую, более равномерную, ровницу, применяя сложение двух ровниц. В зависимости от линейной плотности получаемой ровницы машины изготавливают с различным расстоянием между веретёнами, обеспечивающими выработку ровницы с максимальной скоростью выпуска. Тазы с лентой с последнего перехода ленточной машины помещают сзади ровничной машины. Для уменьшения натяжения ленты, извлекаемой из таза, и уменьшения скрытой вытяжки на машине устанавливается медленно вращающийся вал. Ленты, обогнув его, поступают в вытяжной прибор. Каждая лента направляется в вытяжной прибор водилкой, совершающей возвратно-поступательное движение по определённому закону вдоль нажимного валика и цилиндра питающей пары вытяжного прибора. На выходе из вытяжного прибора вытянутая ленточка скручивается и превращается в ровницу. Крутка ленточке сообщается вследствие вращения веретена с рогулькой. Ровница поступает в отверстие верхней части рогульки, надетой на быстровращающееся веретено, проходит внутри полой ветви рогульки, выходит из неё, огибает лапку рогульки и наматывается на вращающуюся катушку. Ветвь рогульки используется для уравновешивания. Ровница наматывается на катушку вследствие разности скоростей катушки и веретена с рогулькой. Раскладывание витков ровницы по высоте катушки цилиндрическими слоями происходит в результате движения катушек вверх и вниз вместе с подвижной верхней кареткой, соединённой с рейкой, которая находится в зацеплении с шестернёй, установленной на подъёмном валу. Подъёмный вал периодически изменяет направление вращения. В верхней каретке находятся катушечный вал и шестерни, передающие движение катушкам. В нижней неподвижной каретке расположен веретённый вал и шестерни, передающие движение веретёнам с рогульками. Чтобы на ровничной машине данной длины разместить большее число веретён, их устанавливают в два ряда, при этом веретена одного ряда располагают между веретёнами другого ряда. Мычка, выходящая из вытяжного прибора, представляет собой плоскую тонкую ленточку, которая воспринимая крутящий момент от веретена, закручивается, превращаясь в ровницу. Мычка имеет малое число волокон в поперечном сечении и прочность её недостаточна, чтобы намотать на катушку. Для придания мычке определённой прочности её подвергают кручению. Сущность кручения заключается в том, что волокна продукта, располагаясь примерно по винтовым линиям, растягиваются и под действием сил упругости волокон продукт уплотняется, увеличивается давление и силы трения между волокнами, вследствие чего прочность кручёного продукта повышается. Кручение осуществляется для образования из сравнительно коротких волокон продукта, обладающего почти круглой формой поперечного сечения и соответствующими прочностью, растяжимостью и упругостью. На равничных машинах прменяется однозонный способ кручения, совмещённый с наматыванием. Наматывание ровницы на катушку происходит вследствие различия частот вращения катушки и веретена. На ровничных машинах хлопкопрядильного производства применяют способ наматывания ровницы с опережающей катушкой. На катушку ровница наматывается слоями, расположенными параллельно друг другу вдоль катушки. Витки ровницы в каждом цилиндрическом слое укладываются, образуя сплошной слой, шаг намотки. Каждый последующий слой ровницы на катушке уменьшается по высоте на постоянную величину. Благодаря этому катушка ровницы получает форму цилиндра, ограниченного сверху и снизу конусами. Ровница наматывается на катушку под натяжением, особенно большое натяжение ровницы в месте контакта ровницы с лапочкой рогульки. Это обусловливает плотную намотку ровницы на катушку. Но с увеличением диаметра намотки давление лапочки на катушку уменьшается, что вызывает уменьшение плотности намотки. Толщина слоя ровницы несколько увеличивается. Это увеличение зависит от крутки и линейной плотности ровницы. На Ровничных Машинах обеспечивается дальнейшее утонение продукта (чесальной или гребнечёсальной ленты) и получение удобной паковки – катушки. Устройство и работа ровничных машин в гребенной системе прядения подобны устройству и работе таких же машин в кардной системе прядения.

ROVINGS = КОНЦЫ РОВНИЦЫ (или РОВНИЧНЫЕ КОНЦЫ) – Rovings:- from the drawing frame the slivers are moved to the roving frames, sometimes called Fly Frames, to go through a series of machines, beginning with the slubber. Waste from processing consists of ends of the slightly twisted rope-like strands, which are now called Rovings. Waste is also known as Rovings. / Концы Ровницы или Ровничные Концы – прядомые отходы. Концы Ровницы или Ровничные Концы:- из ленточной машины (drawing frame) ленты подаются на ровничные машины (roving frames), иногда называемые fly машины (fly frames), с тем, чтобы пройти через серию машин, начиная с формировщика мычки (slubber). Отходы переработки состоят из концов слегка скрученных и напоминающих канат прядей (strands), которые в данный момент называются уже концами ровницы или ровничными концами. Отходы известны также как Концы Ровницы или Ровничные Концы (Rovings).

ROW = РЯД – (1) Rows are the lengthwise rows. Row numbers of the aft bay of a ship:- the container tiers are numbered with numbers, starting from the amidships (the middle row is numbered 00). The conventional way is start with 00 in the hold and then count up with 01, 02, etc (full numbering from port to starboard:- 16, 14, 12, 10, 08, 06, 04, 02, 00, 01, 03, 05, 07, 09, 11, 13, 15). The rows of containers on a ship are numbered with even numbers from the center leftward and odd numbers from the center rightward. Right-hand row 15 is designed only for on deck occupation, and is still free in this bay. Left-hand row 16, which is designed to be filled with containers only on deck, and rows 14, 12, 10, 08, 06, which may be filled both on deck and in the holds. Rows 04, 02, 00, 01 and 03 are likewise designed to be occupied in the hold and on deck. See also Bay, and Tier. A vertical division across a vessel, used as a part of the indication of a stowage place for containers. A vertical division of a vessel from starboard to portside, used as a part of the indication of a stowage place for containers. The numbers run from midships to both sides. / Под Рядом понимаются контейнеры, сложенные в ряд по длине судна. Смотрите также Пролёт (Bay), и Ярус (Tier).

(2) Row:- the lines along which a number of plants are planted or arranged. / Под Рядом в ботанике понимается применяемая таксономическая категория; то же, что Серия.

(3) Rows:- in pile floor covering, the average number of tufts or loops per inch in the warpwise direction.

ROW MARKER = РЯДОВОЙ МАРКЁР – Row Marker is a marker or device used for seeding in rows or aerial seeding of large areas using satellite marking. / Под Маркёром, от Французского слова Marquer, означающее Отмечать, понимается сельскохозяйственное орудие или приспособление, образующее на поле бороздки, по которым направляют посевной или посадочный агрегат для сохранения прямолинейности движения и заданной ширины стыкового междурядья.

ROW RATIO = СООТНОШЕНИЕ С РЯДАМИ – Row Ratio is the proportion of seed parent and pollen parent rows planted to maintain cytoplasmic male sterile line or to produce F_1 hybrid seed in a seed production plot.

ROW SEEDING = РЯДОВОЙ ПОСЕВ – Row Seeding or Row Sowing:- to be sown in rows and not broadcast by hand. / Рядовой Посев, обычный сплошной посев, размещение семян на поле рядками с междурядьями от 10 до 25 сантиметров (см). Наиболее распространённый способ посева зерновых культур. При рядовом посеве семена высевают в бороздки, образуемые сошниками сеялки, и равномерно заделывают рыхлой почвой на заданную глубину. Это обеспечивает дружные всходы и развитие растений, одновременное созревание урожая. Недостаток рядового посева – чрезмерная сближенность растений в рядке и относительно большое расстояние между рядками. Под Рядовым Посевом понимается размещение семян в почве параллельными рядками. Под Посевом понимается заделка семян в верхние слои почвы для их прорастания. Способы:- квадратно-гнездовой, перекрёстный, разбросной, рядовой (ленточный, узкорядный, широкорядный) и другие. Проводится сеялками, иногда с самолёта.

ROWS TO THE INCH = РЯДОВ НА ДЮЙМ – Rows To The Inch:- rows of yarn tufts to the inch lengthwise.

ROYAL BLUE = КОРОЛЕВСКОЕ ГОЛУБОЕ – Royal Blue:- a vivid purplish blue.

ROYAL PURPLE = КОРОЛЕВСКОЕ ПУРПУРНОЕ – Royal Purple:- a dark reddish purple.

ROYALTY = ОТЧИСЛЕНИЯ (или ГОНОРАР, или РОЯЛТИ) – Payment for the right to use intellectual property. Payment made by licensees to the holder of a patent on a licensed invention or process, or the payments made by publishers to authors for the privilege of publishing and selling their works. / за право пользования интеллектуальной собственностью. / Роялти или Компенсация или Авторский Гонорар или Плата за Право – компенсация, выплачиваемая владельцу прав на использование собственности:- патента, материалов, защищённых авторским правом, или природных ресурсов. Например, изобретатель может получать согласованный процент за производство и продажу своего изобретения. Авторы могут получать гонорар за продажу написанных ими книг. Землевладельцы, сдающие свою собственность в аренду нефте- и газодобывающим компаниям, могут получать согласованный заранее, на основе количества нефти или минералов, добытых на их участке земли, процент от доходов коммерческого использования прав на их собственность.

ROYALTY = КОРОЛЕВСКАЯ ПРИВИЛЕГИЯ И ПРЕРОГАТИВА (или ФИКСИРОВАННЫЙ (РЕНТНЫЙ) ПЛАТЁЖ) – Slang in energy industries. The term ‘Royalty’ refers to the ownership rights of a mineral property (oil, gas, or coal). The owner is entitled to a share of the money made from oil, gas, or coal production on the property. Payment for the right to use natural resources. Payments made by mine or oil well operators to land owners under mineral leases. Fee paid in exchange for certain rights, such as mineral rights, author’s rights or patent rights. Royalty is the owner’s share of production or revenues retained by government or freehold mineral rights holders. The royalty is usually based on a percentage of the total production and the rate may vary according to the selling price. / Жаргон в отраслях энергетики. Фиксированные (Рентные) Платежи при социализме – форма изъятия в государственный бюджет части прибыли государственных предприятий, не зависящей от деятельности коллектива; один из первоочередных платежей из прибыли, посредством которого изымается в бюджет чистый доход, образующийся в силу особо благоприятных природных, транспортных или технико-экономических условий производства. В добывающей промышленности важный фактор, влияющий на уровень издержек производства и рентабельности, – естественные природные условия:- местонахождение полезных ископаемых, глубина их залегания, мощность пласта, процент содержания металла в руде и тому подобное. Поэтому при единых оптовых ценах, по которым реализуется добытое сырьё, геологические факторы являются основой получения доходов, имеющих рентное происхождение. Для предприятий добывающих отраслей (добыча нефти, газа, железной и хромитовой руды, асбеста и другого) устанавливаются рентные платежи, которые носят характер дифференциального чистого дохода (смотрите Дифференциальная Рента). В обрабатывающей и перерабатывающей промышленности уровень издержек и рентабельность производства во многом зависят от технико-экономических условий:- различий в технологии и масштабах производства, степени технического оснащения, видах сырья и стоимости производственных фондов. В этих отраслях промышленности для предприятий, у которых рентабельность выше, чем в среднем по отрасли, по независящим от них причинам, устанавливаются фиксированные (рентные) платежи, имеющие стабильный характер. Во всех отраслях производства уровень рентабельности зависит также от расстояния, на которое перевозятся сырьё и готовая продукция. В бывшем Союзе Советских Социалистических Республик (СССР) фиксированные

(рентные) платежи были введены в ходе экономической реформы на основании постановления Центрального Комитета Коммунистической Партии Советского Союза (ЦК КПСС) и Совета Министров СССР от 04 Октября 1965 'О Совершенствовании Планирования И Усилении Экономического Стимулирования Промышленного Производства'. В 1975 они составили около 5% балансовой прибыли промышленности и примерно 8% платежей из прибыли в бюджет. Около 2/3 фиксированных (рентных) платежей поступает от добывающих отраслей промышленности. Основную сумму уплачивают предприятия нефтедобывающей (свыше 40%), лёгкой (свыше 25%) и газовой (около 20%) промышленности. Фиксированные (рентные) платежи выполняют 3 взаимосвязанные функции:- распределительную, являющуюся одним из элементов распределения прибыли между предприятиями (отраслью) и государственным бюджетом; регулирующую, используемую для относительного выравнивания уровня рентабельности предприятий отрасли (подотрасли, группы), выпускающих однородную продукцию; стимулирующую, связанную с усилением заинтересованности предприятий в более полном выявлении резервов хозяйства. Предприятия добывающих отраслей промышленности вносят фиксированные (рентные) платежи, как правило, в твёрдых суммах с единицы реализованной продукции (с 1 тонны (т) нефти, руды или 1 000 кубических метров ($м^3$) газа и тому подобного), а предприятия обрабатывающих и перерабатывающих отраслей – в процентах от стоимости реализованной продукции (в оптовых ценах) или в процентах от балансовой прибыли. При определении размера фиксированных (рентных) платежей предприятию обеспечивается рентабельность не ниже среднеотраслевой. Размеры фиксированных (рентных) платежей устанавливались в СССР Государственным Комитетом Цен и Министерством Финансов СССР по согласованию с соответствующими министерствами, как правило, на ряд лет. Фиксированные (рентные) платежи применялись также в некоторых других социалистических странах (в Монгольской Народной Республике (МНР) – фиксированные платежи, в Венгерской Народной Республике (ВНР) – производственный налог, в Польской Народной Республике (ПНР) – бюджетная разница). В большинстве капиталистических стран непосредственно в доход бюджета обращается часть капиталистической прибыли в форме рентных платежей (например, нефтяная рента и другие).

RP = RECURRENT PARENT (FOR BACKCROSS)

RP = REGIONAL PROCESSOR

RP = REPO = REPURCHASE AGREEMENT

RPA = RICE POLISH AGAR

RSEP = REGISTRY SERVICES EVALUATION PROCESS

RSHT = ROUTINE SEED HEALTH TEST

RSI = RELATIVE STRENGTH INDEX

RSI = RESIDUAL SUPPLY INDEX

R SQUARED = АР. В КВАДРАТЕ – R Squared:- in statistics, the coefficient of determination R^2 is the proportion of variability in a data set that is accounted for by a statistical model. In this definition, the term 'Variability' is defined as the sum of squares. There are equivalent expressions for R^2 based on an analysis of variance decomposition. Adjusted R-square is a modification of R-square that adjusts for the number of terms in a model. R-square always increases when a new term is added to a model, but adjusted R-square increases only if the new term improves the model more than would be expected by chance. R^2 or R Square – square of the correlation coefficient. The proportion of the variability in one series that can be explained by the variability of one or more other series a regression model. A measure of the quality of fit. 100% R-square means perfect predictability. The measure of diversification that determines how closely a particular fund's performance parallels an appropriate market benchmark over a period. The market is understood to have an R Squared of 100%. Therefore, a fund with an R Squared of 95% contains 95% of the market's diversification and risk. The remaining 5% is unique to the fund manager's actions. / R-Квадрат показывает процентную долю колебаний стоимости портфеля взаимного фонда, объясняемых колебаниями индекса, компоненты которого представлены в портфеле фонда. Значение R-квадрат может находиться в диапазоне от 0 до 100. Значение R-квадрат, равное 100, указывает на то, что все колебания фонда полностью объясняются колебаниями базового индекса. Индексный фонд, который инвестирует только в акции, являющиеся компонентами S&P 500, имеет показатель R-квадрат, очень близкий к 100. Напротив, низкое значение R-квадрат показывает, что лишь небольшую долю колебаний стоимости портфеля можно объяснить колебаниями базового индекса. Поэтому R-квадрат может использоваться для определения значения показателей бета или альфа. Как правило, более высокое значение R-квадрат фонда означает, что показатель бета данного фонда более значимый. Если же значение R-квадрат фонда низкое, его показатель бета является менее значимым при оценке результатов этого фонда. При R-квадрат, равном 100, означающем, что все колебания портфеля фонда полностью объясняются колебаниями базового индекса, этот базовый индекс считается индексом наилучшего соответствия, то есть лучшим инструментом для сравнения результатов фонда, исходя из специализации последнего. Для выявления индекса наилучшего соответствия Morningstar проводит регрессионный анализ ежемесячной избыточной доходности фонда в сравнении с ежемесячной избыточной доходностью нескольких хорошо известных рыночных индексов. Индексом наилучшего соответствия является тот индекс, который характеризуется самым высоким показателем R-квадрат при сравнении с портфелем фонда.

RSR = ROW SEEDED RICE

RSRP = REFINED SUGAR RE–EXPORT PROGRAM

RSU = RESTRICTED STOCK UNIT

RSV = RAGGED STUNT VIRUS

RTD = READY–TO–DRINK

RTD = RICE TUNGRO DISEASE

RTEPP = REGIONAL TRANSMISSION EXPANSION PLANNING PROTOCOL

RTG CRANE = RUBBER TYRED GANTRY CRANE

RTGS = REAL–TIME GROSS SETTLEMENT

RTGS OPERATOR = ОПЕРАТОР ВРРРВ – RTGS Operator:- a function assumed by a person or persons in each Real-Time Gross Settlement (RTGS) system participating in TARGET/EPM (Trans-European Automated Real-time Gross settlement Express Transfer/European Central Bank Payment Mechanism), who is/are responsible for the daily operation of the domestic and/or cross-border RTGS system. / системе Валовых Расчётов в Режиме Реального Времени (ВРРРВ). ТАСВРРУП (Трансевропейская Автоматизированная Система Валовых Расчётов в Режиме Реального Времени по Ускоренным Переводам) или ТАСВРРЭП (Трансевропейская Автоматизированная Система Валовых Расчётов в Режиме Реального Времени по Экспресс Переводам).

RTGS PARTICIPANTS = УЧАСТНИКИ ВРРРВ – RTGS Participants:- credit institutions which have satisfied the access criteria for obtaining a settlement account in the Real-Time Gross Settlement (RTGS) system. / Кредитные учреждения, которые удовлетворяют критериям доступа для получения расчётного счёта в системе Валовых Расчётов в Режиме Реального Времени (ВРРРВ).

RTGS^{plus} = ВРРРВ^{плюс} – RTGS is abbreviation for the Real-Time Gross Settlement. The Deutsche Bundesbank launched its RTGS^{plus} system for large-value payments on 2001-November-05. RTGS^{plus} participants changed over from the old Electronic Access Frankfurt (EAF) system and the Euro Link System (ELS) in a 'big bang' scenario. Consequently, the EAF was shut down once RTGS^{plus} was opened for business. RTGS^{plus} is an innovative system which has been completely developed from scratch. Its new infrastructure represents a paradigm shift:- now only the internationally widely used SWIFT standards are being used for the exchange of payments and communications. Those standards did not play any role in domestic payment operations in the past. In addition, RTGS^{plus} has added a real innovation to the payments landscape:- real-time gross settlement and consistently liquidity-saving elements have been integrated into the advanced RTGS^{plus} design. RTGS^{plus} also offers participants the opportunity of efficient liquidity management based on state-of-the-art information technology. RTGS^{plus} represents a modernization of the German access to TARGET, the association of EU real-time gross systems. RTGS^{plus} will be used to settle around onethird of the total volume of cross-border payments in TARGET. The greater efficiency of RTGS^{plus} will enhance the stature of Germany as a financial center. / инновация . обозначение . Дойчэ Бундэсбанк (Deutsche Bundesbank). коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо). ВРРРВ является сокращённым обозначением для Валовых Расчётов в Режиме Реального Времени. Сообщество по Всемирной Межбанковской Финансовой Дальней Связи (СВМФДС; The Society for Worldwide Interbank Financial Telecommunication (SWIFT)). ТАСВРРУП (Трансевропейская Автоматизированная Система Валовых Расчётов в Режиме Реального Времени по Ускоренным Переводам) или ТАСВРРЭП (Трансевропейская Автоматизированная Система Валовых Расчётов в Режиме Реального Времени по Экспресс Переводам).

RTGS SYSTEM COMMUNICATION COMPONENT = КОМПОНЕНТ СВЯЗИ В СИСТЕМЕ ВРРРВ – The RTGS System Communication Component is a component within the Real-Time Gross Settlement (RTGS) system used for implementing the communication process with its participants. / в системе Валовых Расчётов в Режиме Реального Времени (ВРРРВ). коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо).

RTGS SYSTEM PROCESSING COMPONENT = КОМПОНЕНТ ОБРАБОТКИ В СИСТЕМЕ ВРРРВ – The RTGS System Processing Component is a component within the Real-Time Gross Settlement (RTGS) system used for implementing the processing of payments at the domestic level. / в системе Валовых Расчётов в Режиме Реального Времени (ВРРРВ).

RTK = REVENUE TONNE–KILOMETER

RTM = RESIN TRANSFER MOLDING

RTO = RECOVERY TIME OBJECTIVE

RTO = REGIONAL TRANSMISSION ORGANIZATION

RTO = REVERSE TAKE–OVER

RT–PCR = REVERSE TRANSCRIPTION–POLYMERASE CHAIN REACTION

RTSV = RICE TUNGRO SPHERICAL VIRUS

RTTM = REAL–TIME TRADE MATCHING

RTV = RICE TUNGRO VIRUS

RTW = RIGHT TO WORK

RU = THE RUSSIAN FEDERATION

RUANA = РУАНА (или ХХ, или БУРКА) – Ruana:- a woolen covering resembling a poncho. / Руана – шерстяная накидка, схожая с пончо.

RUB = RUSSIAN ROUBLE

RUB = ПРОТИР – Rub is an area where a fabric has been damaged by friction. See also Abrasion Mark.

RUBBER = КАУЧУК (или РЕЗИНА) – Rubber is the generic name of man-made fibers in which the fiber-forming substance is natural or synthetic rubber. Rubber (Caoutchouc) is an organic (polyterpene) component of the latex produced within the bark of large trees in the Family Euphorbiaceae (Spurges) notably the Pará Rubber Tree (Hevea Brasiliensis) native to the Amazonian rain forest in South America. Seeds from the Rubber Tree were sent in 1876 to Kew gardens, London, England by Henry Wickham, a local planter. Following germination of the seeds in the tropical herbarium at Kew, seedlings were exported to Ceylon (Sri Lanka) and a year later sent from Ceylon to Singapore where the method of tapping the tree for latex was developed. This avoided felling the tree to obtain latex. The rubber tree is grown commercially in Malaysia, Thailand, Indonesia, and Sri Lanka but only to a very limited extent in South America. The latex from the rubber tree is an aqueous emulsion, also containing various proteins, and is generally coagulated by heat to produce natural rubber. Most of this is vulcanized by heating with sulphur to cross-link the polymer chains and harden the product. See also Caoutchouc. Natural Rubber is obtained from the milky secretion (latex) of various plants, but the only important commercial source of natural rubber (sometimes called Pará Rubber) is the tree Hevea Brasiliensis. The only other plant under cultivation as a commercial rubber source is Guayule (Parthenium Argentatum), a shrub native to the arid regions of Mexico and the SW United States. To soften the rubber so that compounding ingredients can be added, the long polymer chains must be partially broken by mastication, mechanical shearing forces applied by passing the rubber between rollers or rotating blades. Thus, for most purposes, the rubber is ground, dissolved in a suitable solvent, and compounded with other ingredients, e.g., fillers and pigments such as carbon black for strength and whiting for stiffening; antioxidants; plasticizers, usually in the form of oils, waxes, or tars; accelerators; and vulcanizing agents. The compounded rubber is sheeted, extruded in special shapes, applied as coating or molded, then vulcanized. Most Pará rubber is exported as crude rubber and prepared for market by rolling slabs of latex coagulated with acid into thin sheets of crêpe rubber or into heavier, firmly pressed sheets that are usually ribbed and smoked. Rubber is an elastic hydrocarbon polymer which occurs as a milky colloidal suspension (known as Latex) in the sap of several Varieties of Plants. Rubber can also be produced synthetically. Synthetic rubber is made through the polymerization of a variety of monomers to produce polymers. These form part of a broad study covered by polymer science and rubber technology. Its scientific name is polyisoprene. The major commercial source of natural latex used to create rubber is the Para rubber tree, Hevea brasiliensis (Euphorbiaceae). This is largely because it responds to wounding by producing more latex. Henry Wickham gathered thousands of seeds from Brazil in 1876 and they were germinated in Kew Gardens, England. The seedlings were sent to Colombo, Indonesia, Singapore and British Malaya. Malaya was later to become the biggest producer of rubber. Liberia is another source of rubber. Other plants containing latex include Figs (Ficus Elastica), Euphorbias, and the common Dandelion. Although these have not been major sources of rubber, Germany attempted to use such sources during World War II when it was cut off from rubber supplies. These attempts were later supplanted by the development of synthetic rubber. Today Asia is the main source of natural rubber, accounting for around 94% of output in 2005. The three largest producing countries (Indonesia, Malaysia and Thailand) together accounts for around 72% of all natural rubber production. The use of rubber is wide spread, ranging from household to industrial products, entering the production stream at the intermediate stage or as final products. Tyres and tubes are the largest consumers of rubber, accounting for around 56% total consumption in 2005. The remaining 44% are taken up by the general rubber goods (GRG) sector, which are all products except tyres and tubes. Other significant users of rubber are hoses, belts and dampners for the automobile industry in what is known as the 'Under The Bonnet' Products. Gloves (medical, household and industrial) are also large consumers of rubber, although the type of rubber used is that of the concentrated latex. Significant tonnage of rubber is used as adhesives in many manufacturing industries and products, although the two most noticeable are the paper and the carpet industry. / выработка (output) в 2005. , например, . Под Натуральным Каучуком (НК), от Французского слова Caoutchouc, возникшего в качестве словосочетания двух слов на языке Южноамериканских Индейцев Тупи – Кау, означающее Дерево, и Учу, означающее Плакать или Течь, понимается природный полимер $[–CH_2CH(CH_3)=CHCH_2–]_n$, обладающий при обычных температурах высокоэластичными свойствами и используемый для получения резины. Он содержится преимущественно в млечном соке (латексе) Каучуконосных Растений; добывается главным образом из Бразильской Гевеи. Латекс извлекают подсочкой коры дерева; каучук выделяют коагуляцией с помощью муравьиной или уксусной кислот. Важнейшие типы – рифлёный смокед-шит (продукт светло-янтарного цвета) и светлый креп (продукт светло-кремового цвета). Основная составная часть НК (91–96%) – углеводород, рассматриваемый как полиизопрен $(C_5H_8)_n$, в котором 98–100% звеньев изопрена присоединены в положении 1.4–цис. Плотность 910–920 кг/м^3. Стоек к действию воды, хорошо растворим во многих органических растворителях, сильно набухает в маслах. При длительном хранении ниже

10 °C, а также при растяжении кристаллизуется, что обусловливает высокую прочность при растяжении ненаполненных резин (~30 МПа). Резины характеризуются также высокой эластичностью (относительное удлинение 600–900%), износо- и морозостойкостью; сравнительно невысокой атмосферостойкостью. Основные области применения – производство шин. Используется также для изготовления конвейерных лент, приводных ремней, амортизаторов. Значительную часть НК применяют в виде латекса. Натуральный Каучук представляет собой эластичный материал, получаемый коагуляцией латекса Каучуконосных Растений, главным образом Бразильской Гевеи. Вообще же Каучуконосные Деревья, к которым относятся Бразильская Гевея, Каучуконосный Фикус и некоторые Виды Рода Ландольфия, чаще всего называются Каучуковыми Деревьями. Основным компонентом каучука является полиизопрен. Вулканизацией натурального каучука получают прочную и эластичную резину. Натуральный каучук применяется в производстве шин, амортизаторов, изделий санитарии и гигиены и много другого. В 1979 мировое производство натурального каучука составляло порядка 3.9 миллионов тонн. Под Синтетическим Каучуком (СК) понимаются синтетические полимеры, которые подобно натуральному каучуку, обладают при обычных температурах высокоэластичными свойствами и могут быть переработаны в резину. Все СК делят обычно на каучуки общего и специального назначения. Каучуки общего назначения применяют в производстве изделий, в которых реализуется основное свойство резины – высокая эластичность (шины, конвейерные ленты и другие), каучуки специального назначения – в производстве изделий, которые наряду с эластичностью должны обладать специфическими свойствами (атмосферо-, бензо-, масло-, морозо-, теплостойкостью и другими). Применение СК специального назначения позволяет получать резиновые изделия с такими техническими свойствами, которые отсутствуют у резин на основе натурального каучука. Особые группы СК – синтетические и искусственные латексы, жидкие каучуки, термоэластопласты. Основные методы получения СК – эмульсионная и стереоспецифическая полимеризация . Синтетический Каучук представляет собой эластичный синтетический полимер, который может быть переработан в резину. Синтетические каучуки общего назначения, например, бутадиеновые или изопреновые, применяют в тех же резиновых изделиях, что и натуральный каучук. Синтетические каучуки специального назначения применяют в изделиях, которые должны обладать масло- и бензо-стойкостью, например, бутадиен-нитрильные каучуки; тепло- и морозостойкостью, например, кремнийорганические каучуки; или другими свойствами, отсутствующими у натурального каучука. Из синтетических каучуков изготовляют изделия около 50 000 наименований. Крупнейшим потребителем синтетических каучуков является шинная промышленность. В 1983 мировое производство синтетических каучуков составляло порядка 8 миллионов тонн. Резина или Вулканизат – продукт вулканизации резиновой смеси (композиции, содержащей каучук, вулканизирующие агенты, наполнители, пластификаторы, антиоксиданты и другие ингредиенты). Конструкционный материал, обладающий комплексом уникальных свойств. Важнейшее из них, характерное для всех резин, – высокая эластичность, то есть способность к большим обратимым деформациям растяжения в широком интервале температур. К числу ценных специальных свойств резины, которые определяются в первую очередь типом каучука, относят тепло-, масло-, бензо-, морозостойкость, стойкость к воздействию радиации, агрессивных сред (кислот, щёлочей, кислорода, озона и других), газонепроницаемость. Механические свойства резины (прочность при растяжении, напряжение при заданном относительном удлинении, твёрдость, износостойкость, усталостная выносливость и другие) в значительной степени зависят от состава резин, смеси, прежде всего от типа наполнителя. Резины подразделяют на две группы:- (i) резины общего назначения, применяемые в производстве основного ассортимента шин, конвейерных лент, ремней, рукавов, изделий бытового назначения и так далее; и (ii) резины специального назначения, используемые для получения разнообразных изделий, которые должны обладать одним или одновременно несколькими специальными свойствами. Под Резиной, от Латинского слова Resina, означающее Смола, понимается вулканизат, эластичный материал, образующийся в результате вулканизации каучука. На практике получают из резиновой смеси, содержащей помимо каучука и вулканизующих агентов, наполнители, пластификаторы, порообразователи, стабилизаторы и другие компоненты. Основная масса резины используется в производстве шин (свыше 50%) и резинотехнических изделий (около 22%). В середине 1980-х мировое производство резины составляло около 20 миллионов тонн в год. Губчатая Резина или Пористая Резина – пористый материал на основе твёрдых каучуков или латексов, обладающий амортизационными, тепло-, звукоизоляционными и герметизирующими свойствами. Губчатую резину из твёрдых каучуков получают с применением порообразователей, губчатую резину из латексов (пенорезину) – механическим вспениванием латексной смеси. Размер пор, которые могут быть открытыми (сообщающимися), замкнутыми или смешанными, – от 0.4 микрометра (мкм) (микропористая резина) до 0.2–0.4 миллиметра (мм). Применяется в производстве мягких сидений, уплотнительных прокладок, амортизаторов, синтетических ковров, искусственной кожи, подошвы обуви.

RUBBER = РЕЗИК (или КАУЧУКОВОЕ, или РЕЗИНОВОЕ) – Rubber:- a rubber overshoe. / резиновый бот (или галоша).

RUBBER COVERAGE ADHESION = АДГЕЗИЯ РЕЗИНОВОГО ПОКРЫТИЯ – Rubber Coverage Adhesion is a ratio between the wire surface covered by rubber and total embedded surface after the adhesion pull out test. / соотношение между поверхностью проволоки, покрытой резиной, и .

RUBBER FILAMENT = РЕЗИНОВАЯ ЭЛЕМЕНТАРНАЯ НИТЬ – Rubber Filament is a filament extruded from natural or synthetic rubber and used as the core of some elastic threads.

RUBBER–TYRED GANTRY CRANE = КОЗЛОВЫЙ КРАН НА ПНЕВМОКОЛЁСНОМ ХОДУ (или КОЗЛОВЫЙ КРАН НА КОЛЁСАХ С РЕЗИНОВЫМИ ПОКРЫШКАМИ, или (КОНСОЛЬНЫЙ) ПЕРЕГРУЖАТЕЛЬ НА КОЛЁСАХ С РЕЗИНОВЫМИ ПОКРЫШКАМИ, или ПНЕВМОКОЛЁСНЫЙ КОЗЛОВЫЙ КРАН) – Rubber-Tyred Gantry Cranes (RTGs) are the specialized equipment for loading and unloading standard containers. They are used in both container terminals and specialized container storage yards. A piece of mobile equipment that is capable of lifting containers within its own framework. / Служит в качестве причального и тылового перегружателя контейнеров. Козловый Кран (Gantry Crane) – грузоподъёмный кран в виде моста на жёстких опорах (козлах), передвигающийся по наземному рельсовому пути или бетонному основанию. Пролётное строение (мост) козлового крана перекрывает при движении прямоугольную пощадь, на которой производят погрузочно-разгрузочные работы (на открытых складских и монтажных площадках, а также на заводских территориях). На мосту устанавливается и передвигается грузовая тележка или таль с грузозахватным приспособлением. Применяют для обслуживания открытых складов и в строительстве. Грузоподъёмность 3–50 тонн, иногда до 800 тонн, пролёты кранов общего назначения 4–40 метров, иногда до 170 метров. Под Консольным Краном (Cantilever Crane) понимается передвижной или стационарный грузоподъёмный кран с поворотной либо неподвижной консолью, по которой передвигается грузовая тележка или таль. Передвижные консольные краны перемещаются по рельсам, расположенным один за другим. Консольный Кран (Cantilever Crane) – передвижной или стационарный грузоподъёмный кран с поворотной либо неповоротной консольной фермой, по которой передвигается грузовая тележка или таль, перемещая грузы в вертикальном и горизонтальном направлениях. У консольных кранов с неповоротной фермой грузовая тележка передвигается по консоли, подкрановый путь не занимает площади больше цеха, поэтому такие краны нашли применение на различных промышленных предприятиях. Консольные краны с поворотной фермой имеют много конструктивных вариантов. К ним относятся велосипедный кран, кран на колонне, кран-укосина, мачтовый кран и другие.

Передвижные консольные краны перемещаются по рельсам, расположенным один под другим. Консольные краны широко используются на машиностроительных заводах, стройках и в портах. Грузоподъёмность консольного крана 4–10 тонн. Пневмоколёсный Кран – стреловой самоходный кран на пневмоколёсном ходу (пневматических шинах) с приводом от дизеля, расположенного на поворотной платформе, реже – на одноосном тягаче (кран в виде прицепа к тягачу). От автомобильного крана отличается ходовой частью, двигателем и общей компоновкой. Пневмоколёсные краны эффективны при частых перебазировках. Проходимость по грунтовым дорогам ограничена. Используется на строительно-монтажных работах, а также для погрузки и разгрузки штучных, реже – сыпучих грузов. В бывшем СССР выпускали пневмоколёсные краны грузоподъёмностью 16–100 тонн, высота подъёма 5–50 метров, вылет стрелы 4–25 метров, скорость передвижения собственным ходом 7–65 км/ч.

RUBIOUS = РУБИНИСТОЕ (или ХХ) – Rubious:- red, ruby. / красный, рубиновый.

RUB MARKS = ОТМЕТИНЫ ОТ ПРОТИРАНИЯ – Rub Marks:- abrasion or rubbing mainly from rope scouring or from NIKKI Press machine. Finishing defect. / истирание или протирание (или стирание, или натирание). Порок или дефект заключительной отделки.

RUBY = РУБИНОВОЕ (или РУБИН, или ЯРКО–КРАСНОЕ) – Ruby:- the dark red color of the ruby. / тёмно-красный цвет рубина .

RUCHE = РЮШ – Ruche (or Ruching) is a decorative strip, edge or trim piece of gathered, pleated, fluted, ruffled or frilled fabric on a garment Or, a pleating or gathering of cloth on a garment or drapes. A Ruche is a ruffle. / Рюш – это оборка.

RUDDER POST = РУДЕРПОСТ – Rudder Post (maritime term):- that part of a rudder by which it is pivoted to the sternpost.

RUDDY = РУМЯНОЕ (или РУМЯНЦЕВОЕ, или ХХ) – Ruddy:- red, reddish. / красное, красноватое.

RUDIMENTARY = РУДИМЕНТАРНОЕ (или ЗАЧАТОЧНОЕ, или НЕДОРАЗВИТОЕ) – Rudimentary:- a development that is arrested at an early stage or imperfectly developed. Rudimentary:- developed only to a primitive or early stage. / Под Рудиментарными Органами или Рудиментами или Остаточными Органами, от Латинского слова Rudimentum, означающее Зачаток или Первооснова, понимаются органы, утратившие в процессе эволюции своё основное значение, например, глаза у крота и слепыша, хвостовые позвонки, волосяной покров туловища, аппендикс у человека.

RUDIMENTARY AURICLES = РУДИМЕНТАРНЫЕ УШКИ (ЛИСТА) – Rudimentary Auricles (au) are auricles reduced to protuberances with 1 or 2 cilia or without cilia. / cilia – реснички (эпителия). Под Рудиментарными Органами, от Латинского слова Rudimentum, означающее Зачаток или Первооснова, понимаются органы, утратившие в процессе эволюции своё основное значение, например, глаза у крота и слепыша, хвостовые позвонки, волосяной покров туловища, аппендикс у человека.

RUDIMENTARY GLUMES = РУДИМЕНТАРНЫЕ КОЛОСКОВЫЕ ЧЕШУЙКИ – Rudimentary Glumes:- the laterally enlarged cuplike apex of the pedicel; they are beneath the sterile lemmas. Rudimentary Glumes (synonym:- Glumes, Vestigial Glumes, First and Second Glumes, and Facet) are the true glumes of a typical grass spikelet which are reduced to minute lobes in Rice, opposite one another at the tip of the pedicel. / Под Рудиментарными, от Латинского слова Rudimentum, означающее Зачаток или Первооснова, понимается .

RUF = REVOLVING UNDERWRITING FACILITY

RUFESCENT = РЫЖЕЕ (или РУМЯНОЕ) – Rufescent:- tinged with red or becoming red; reddish. / Румяное:- красноватое. Используется в обозначении животных и птиц, например, Рыжая Приния (Prinia Rufescent или Prinia Rufescens).

RUFF = ОТЛОЖНОЙ ВОРОТНИК – Ruff is a wheel-shaped collar made of several layers of fabric (usually lace) in S-shaped folds. Ruff is a large round collar of pleated muslin or linen worn in the late XVI and early XVII centuries. / Широкий Отложной Воротник.

RUFFLE = ОБОРКА (или РЮШ) – Ruffle is a piece of fabric gathered along one edge. Ruffles are narrow and are used to trim necklines, sleeves, hems, and the edges of home furnishings items such as pillows and slipcovers. Ruffle is a strip of frilled or closely pleated fabric used for trimming or decoration. / Узкое кружево с гофрированной кромкой.

RUFOUS = КРАСНОВАТО–КОРИЧНЕВОЕ (или ЦВЕТА РЖАВЧИНЫ, или РЫЖЕЕ) – Rufous:- with a reddish coloring.

RUG = RIJKSUNIVERSITEIT GENT = STATE UNIVERSITY OF GHENT

RUGOSE = СКЛАДЧАТОЕ (или МОРЩИНИСТОЕ, или СМОРЩЕННОЕ) – Rugose:- wrinkled. / Складчатое:- морщинистое или сморщенное или складчатое.

RUK = RUSSIA, UKRAINE AND KAZAKHSTAN

RULE–OF–72 = ПРАВИЛО 72–Х – Rule-Of-72:- this is a very handy ‘rule’ that lets you mentally calculate how long it takes you to double an investment (i.e. compounding), given a particular interest rate. You divide 72 by the interest rate in order to get the number of years. For example, a 7% interest rate would require just over 10 years for an investment to double in value. A 15% interest rate would take between 4 and 5 years to double, and so on. Rule Of 72 is a formula used to determine the amount of time it will take for invested money to double at a given compound interest rate, which is 72 divided by the interest rate.

RULES = ПРАВИЛА (или РЕГЛАМЕНТ) – Rules are the principles for governing an exchange. In some exchanges, rules are adopted by a vote of the membership, while in others, they can be imposed by the governing board. Charter, Certificate of Incorporation, By-Laws, rules, resolutions, interpretations, statements of policy, decisions, directives and orders of the corporation, or by other words the standards and requirements to which participants who are required to be a members of the corporation must subscribe and conform. / Устав (Charter), Сертификат об Инкорпорировании или Свидетельство о Регистрации (Certificate of Incorporation), Регламенты (By-Laws), правила, интерпретации .

RUN = РАСПУСКАНИЕ (или СБЕГАНИЕ) – Defect Name:- Run. Defect Type:- warp lines, vertical lines. Fabric Type:- Single Knit Fabrics. Description:- Run:- This a vertical line of unformed stitches resulting from a broken needle or jack. Severity:- Major. Run:- in knitted fabrics, a series of dropped stitches. See also Dropped Stitch. Synonym:- Ladder. Fabrics defect. Fabric Run:- a break in the yarn of a fabric that causes the stitch to run along the needle line or a void caused by a missing warp yarn. All fabric runs should be considered defective. / в вязаных тканях, серия спущенных петель. Смотрите также Спущенная Петля (Dropped Stitch). Распускание (или Сбегание) петли в трикотаже вызывается разрушением нити в петлях в результате истирания или повреждения.

RUNAWAY GAP = РАЗРЫВ УСКОРЕНИЯ – Runaway Gap is a price gap that usually occurs around the middle point of an important market trend. For that reason, it is also called a Measuring or Continuation Gap. / В техническом анализе биржевых рынков, под

Разрывом Ускорения понимается ценовой разрыв, который возникает приблизительно на половине пути важной тенденции на рынке. По этой причине его называют также Прикидочным или Оценивающим Разрывом (Measuring Gap) или Разрывом Продолжения (Continuation Gap). Разрыв Ускорения имеет место, когда любая из тенденций резко ускоряется. Этот разрыв является характерной чертой сильного рынка быков или медведей. На особенно мощных рынках быков или медведей разрывы ускорения могут происходить изо дня в день.

RUN DAYS = ДНИ УСКОРЕНИЯ – Run Days are the days with a pronounced trend. They are identified using the following criteria:- (i) True High of the run day should be higher than the highest true high of the previous N days; and (ii) True Low of the run day should be lower than the lowest true low of the following N days. / В техническом анализе биржевых рынков, под Днями Ускорения понимаются дни, в которые на рынке ярко выражена та или иная тенденция. По существу, большинство дней ускорения являются более сильной версией дней разгона, но не исключено, что критериям дня ускорения будет отвечать день, который и не является днём разгона. Дни ускорения невозможно распознать, пока не пройдёт N дней после их появления. Дни ускорения чаще всего возникают при ускорении тенденции – отсюда и название. Появление дней ускорения вверх, особенно группами, может рассматриваться как свидетельство того, что рынок находится в бычьей фазе. Аналогичным образом, преобладание дней ускорения вниз является подтверждением того, что рынок находится в медвежьей фазе.

RUN DOWN = ИДТИ ВДОЛЬ (или НАВАЛИВАТЬСЯ, или СТАЛКИВАТЬСЯ) – Run Down (maritime term):- to collide with a vessel head on. / Наваливаться, например, на судно. Сталкиваться с судном, стоящем на якоре или имеющим преимущественное право идти прежним курсом.

RUN DOWN DAY = СУТКИ УСКОРЕНИЯ ВНИЗ – Run Days are the days with a pronounced trend. They are identified using the following criteria:- (i) True High of the run day should be higher than the highest true high of the previous N days; and (ii) True Low of the run day should be lower than the lowest true low of the following N days. / В техническом анализе биржевых рынков, Сутками Ускорения считаются сутки . Такие сутки должны удовлетворять следующим двум критериям:- во-первых, истинный минимум суток ускорения должен быть ниже низшего истинного минимума за N предшествующих суток (например, N = 5 суток); и во-вторых, истинный максимум суток ускорения должен быть выше наивысшего истинного максимума за N последующих суток.

RUNLESS = НЕРАСПУСКАЕМОСТЬ (или НЕСБЕГАЕМОСТЬ) – Runless is a type of seamless nylon hosiery in a lock-stitch mesh. / Найлан^{T3} (Nylon^{TM}).

RUNNER = БЕГУН (или ПОБЕГ, или ОТПРЫСК, или ОТВОДОК) – Runner is a slender, trailing stem rooting at the nodes. / укоренения стебля в узлах. Под Побегом понимается стебель с расположенными на нём листьями и почками; один из основных органов высших растений. У однолетних растений побеги живут один сезон; у многолетних – несколько лет. Многолетние подземные побеги нередко видоизменены в клубни, корневища, луковицы, а надземные – в колючки, усики. Под Отпрыском понимается побег, отходящий от пня или корня. Под Побегом (Cormus) понимается стебель с расположенными на нём листями и почками; один из основных органов высших растений. Побег – единый орган:- листья и стебли обладают единой проводящей системой и формируются из общего конуса нарастания. У однолетних растений побеги живут один сезон, у многолетних – несколько лет. Многолетние подземные побеги нередко видоизменены в корневища, клубни, луковицы, наземные побеги – в усики, колючки. Отпрыск – это боковой побег, надземный или подземный, образующийся из почки в районе корневой шейки. Отпрыски, формирующиеся у большинства растений, как, например, у Молодило, укореняются медленно. Чтобы ускорить размножение, отпрыски обычно весной отделяют от материнского растения и высаживают либо в открытый грунт, либо в горшки. Для посадки используют почвенную смесь для черенкования с добавлением песка – субстрат должен иметь хороший дренаж и способствовать быстрому разрастанию корневой системы. В тех случаях, когда отпрыски развиваются слабо, удаляют верхушки растения. Эта операция, как и удаление верхушечной почки, стимулирует развитие отпрысков. Хотя термин Отпрыск обычно используется для обозначения растения, отделившегося в процессе роста от материнского куста, он нередко применяется и для обозначения медленно растущих боковых побегов, которые образуются преимущественно у однодольных растений вроде Юкки. Со временем эти побеги развиваются настолько, что их уже можно отсаживать от материнского растения. При созревании соплодия у Ананаса образуются отпрыски, которые можно использовать для размножения. В зависимости от положения на стебле их называют Корневыми Отпрысками, Волчками или Отростками. Срезайте те отпрыски, которые расположены как можно ближе к основанию соплодия, и сразу же высаживайте. Очень часто для размножения Ананаса используют и верхушечную розетку. Многие клубнелуковичные и луковичные растения вроде Рябчиков ежегодно образуют у своего основания миниатюрные луковички или клубнелуковички, которые часто называют Детками, Зубками и тому подобным. Отпрыск – так называется стебель, развившийся из придаточной почки корня. Отпрыск встречаются в виде корневых побегов как у травянистых растений, так и кустарников (Малина, Роза) и деревьев (Тополь, Вяз, Груша). Отпрыск – мелкое растение, образуемое рядом с родительским. Корневой Отпрыск (soboles), надземный побег растения, развивающийся из корневой придаточной почки. Служит для вегетативного размножения преимущественно двудольных растений – Осины, Сирени, Вишни, Осота и других. Корневой Отпрыск – побег, развившийся из придаточной почки, эндогенно возникшей на корнях. Корнеотпрысковое возобновление – один из способов вегетативного размножения высших растений. Для некоторых кустарников корневой отпрыск – важное эволюционное приспособление, ведущее к биологическому омоложению растений. Под Отводком понимается часть наземного стебля с почками, отделённая от материнского растения и посаженная самостоятельно путём засыпания землёю для получения нового растения. Один из простых и старейших способов вегетативного размножения. Размножение отводками применяется при разведении Земляники, Крыжовника, Фикуса и других растений. Под Отводком понимается часть наземного стебля с почками, не отделяемая от материнского растения на период укоренения. Стебель с почками пригибают к земле и присыпают почвой. После его укоренения получают корнеспособные растения, которые сохраняют все биологические признаки материнской особи. Их отрезают и пересаживают на постоянное место. Используют в садоводстве, в том числе декоративном, лесоводстве.

RUNNER = ПОСЫЛЬНЫЙ (или ГОНЕЦ) – Runner:- messengers who rush orders received by phone clerks to brokers for execution in the trading pits or rings. / Разносчики, которые быстро доставляют брокерам в торговую яму или ринг распоряжения, полученные клерками по телефону, для их непосредственного исполнения.

RUNNER = СПУЩЕННАЯ ПЕТЛЯ (или БЕГУНОК, или НАБЕГАНИЕ) – Runner:- usually caused by broken needle. The runner will appear as vertical line. Most machines have a stopping device to stop machine when a needle breaks. Knitted fabric defect. Runner:- a break in the yarn of a knit fabric that causes the stitch to ‘run’ along the needle line (wale) in a vertical direction. See also End Out. / Спущенная Петля в трикотажном изделии. Порок или дефект. Бегунок – деталь (в виде скобы), обеспечивающая совмещённый процесс кручения и намотки нити на кольцепрядильных и кольцекрутильных машинах.

RUNNER = XX (или БЕГУН, или ДОРОЖКА) – Runner is a rectangular piece of fabric used with placemats to decorate and protect the dining table. It is placed in the center of the table under condiments (salt, pepper, mustard) and any decorations such as flowers or candles. Runners frequently match the placemats and are also used on chests of drawers to protect the top from spills. / Дорожка –

прямоугольный кусок ткани, используемый в подложках для украшения и защиты обеденного стола. Она располагается в центре стола под приправами (соль, перец, горчица) и любыми украшениями, такими как цветы или свечи. Дорожки часто соответствуют подложкам и используются также на комодах для зазиты верхней части от разливов.

RUNNER LENGTH = ДЛИНА СПУЩЕННОЙ ПЕТЛИ (или ДЛИНА ЗАПРАВНОЙ НИТИ, или ДЛИНА РАСПУСКАНИЯ, или ДЛИНА СБЕГАНИЯ, или УРАБОТКА НИТИ) – Runner Length:- in knitting, the number of inches of yarn from a warp to make one rack of fabric. Runner Length:- in warp knitting the number of inches of yarn needed to knit one rack of fabric.

RUNNING AND QUICK–START CAPABILITY = ДЕЙСТВУЮЩАЯ И БЫСТРО ПУСКОВАЯ СПОСОБНОСТЬ – Running And Quick-Start Capability is the net capability of generating units that carry load or have quick-start capability. In general, quick-start capability refers to generating units that can be available for load within a 30-minute period.

RUNNING BALE = ИСХОДЯЩАЯ КИПА (или ФАКТИЧЕСКАЯ КИПА) – In the Cotton industry, Running Bale is any bale of varying lint weight as it comes from the gin.

RUNNING DOWN CLAUSE = ОГОВОРКА ОБ ОТВЕТСТВЕННОСТИ ПРИ СТОЛКНОВЕНИИ – Running Down Clause (RDC) is a clause in an ocean marine insurance contract that eliminates the policyholder's legal liability in the event of a collision. It is distinct from hull insurance in that it covers damage to (and a lawsuit by) another party, not damage to the ship itself. A term sometimes used in market practice to define the collision liability clause in a hull policy. The RDC, or 'Running Down' Clause, provides coverage for legal liability of either the shipper or the common carrier for claims arising out of collisions. Collision loss to the vessel itself is part of the hull coverage. The RDC clause covers negligence of the carrier or shipper that results in damage to the property of others. A companion clause, the protection and indemnity clause (P and I), covers the carrier or shipper for negligence that causes bodily injury to others. Running Down Clause is an ocean marine hull policy clause adding legal liability coverage for damage done to another ship or its cargo resulting from a collision with, and caused by, the insured vessel.

RUNNING LOAD AMPERES = АМПЕР ПРИ ДЕЙСТВУЮЩЕЙ (или НАБЕГАЮЩЕЙ) НАГРУЗКЕ – Running Load Amperes, also sometimes abbreviated FLA for full load Amperes. This is the current in Amperes that a motor requires to produce rated nameplate horsepower output when rated nameplate voltage and frequency is provided to it's terminals.

RUNNING SAMPLE = ТОЧЕЧНАЯ ПРОБА (или ТЕКУЩАЯ ПРОБА, или ИСХОДЯЩАЯ ПРОБА) – A Running Sample is a sample obtained while grain is being conveyed on a belt or as it flows from a spout. / К Точечной Пробе относится проба, взятая из зерна в момент его транспортировки на транспортёрной ленте или в момент его движения из семяпровода (или зернослива, или желоба, или выгрузного рукава). В России под Точечной Пробой понимается небольшое количество зерна, отобранного из одного места за один приём для составления объединённой пробы.

RUNNING STITCH = СМЕТОЧНЫЙ СТЕЖОК – Running Stitch is the basic sand stitch. The needle is inserted into the fabric and then moved in and out, joining two sections of fabric together. The stitches formed are ideally of the same length on both the top and the bottom layer of the fabric. / Прошивка стежками одинаковой длины на лице и на изнанке.

RUNNING STRIPE SHEDDING = ПРОЛИВ БЕГУЩЕЙ ПОЛОСКИ – Running Stripe Shedding:- in the solid color dyed fabric sometime narrow stripe like color shedding affect is observed due to dyeing fault is known as Running Stripe Shedding. Fabrics defect.

RUNNING YIELD = НАБЕГАЮЩАЯ ДОХОДНОСТЬ (или ХХ) – Running Yield:- the annual income on an investment divided by its current market value. Important examples are the flat yield on gilts, the gross dividend yield on equities and the rental yield on property.

RUN–OFF = СТОК – Run-Off is the overflow of water from a field carrying with it dissolved nutrient or nutrient-containing soil particles. / В гидрологии под Стоком понимается стекание в моря и понижения рельефа дождевых, талых и подземных вод, происходящее как по земной поверхности (поверхностный сток), так и в толще земной коры (подземный сток). Сток – составное звено влагооборота на Земле. Различают сток русловой и склоновый (вне русла). Сток в гидрологии, отекание в моря и понижения рельефа дождевых и талых вод, происходящее как по земной поверхности – поверхностный сток, так и в толще почв и горных пород – подземный сток. Процесс стока – составное звено круговорота воды на Земле. Таким образом, сток, являясь прежде всего продуктом климата, влияет на формирование рельефа, геохимические процессы в земной коре, развитие почвенного покрова, распределение растительности и тому подобное; в свою очередь величина и режим стока зависят от количества и режима осадков, испарения, температурных условий, характера рельефа и геологического строения, почвенного покрова и растительности территории. Со стоком связаны эрозия, естественный дренаж и орошение, перенос и отложение продуктов денудации. Образующая сток доля атмосферных осадков, не израсходованных на испарение и потребление растениями, находится в обратной зависимости от величины средней температуры воздуха. На равнинах максимум стока наблюдается, как правило, в наиболее увлажнённых лесных зонах на Западных и Восточных побережьях материков, в горах величина стока возрастает до определённой высоты преимущественно на склонах хребтов, обращённых к влажным воздушным потокам. Характерные периоды формирования стоков:- половодье, паводок, межень (летняя и зимняя). Величину стока в течение какого-либо периода времени (года, сезона, месяца и тому подобного) выражают:- высотой слоя стёкшей воды (в миллиметрах (мм) или сантиметрах (см)), суммарным её объёмом, средним её расходом, модулем стока, модульным коэффициэнтом стока. Суммарный объём стока (в кубических метрах ($м^3$), кубических километрах ($км^3$)) – количество воды, протекающей через гидрометрический замыкающий створ бассейна. Суммарный объём стока обычно определяют графически, строя график изменения во времени t расходов Q за год, который называется Гидрографом. Пользуясь последним, можно построить интегральную кривую стока, дающую представление о последовательном накоплении объёма воды (например, в водохранилище) с течением времени. Модуль стока – объём стока в единицу времени с единицы площади водосбора; обычно выражается в литрах в секунду через квадратный километр ($л/(сек·км^2)$) или в литрах в секунду на гектар ($л/(сек·га)$). Модульный коэффициент стока – отношение изменяющейся во времени величины стока к своему среднему значению. Коэффициент стока показывает отношение величины стока к количеству осадков, выпавших на территории за тот же период времени, то есть какая часть осадков расходуется на образование стока. Кроме стока воды (жидкий сток), определяют сток взвешенных и влекомых по дну наносов (твёрдый сток). Для изучения процесса стока и количественного определения всех влияющих на него факторов ведутся наблюдения на гидрологических постах и станциях и экспериментальные исследования на стоковых площадках и в лабораториях. Определение численных параметров стока, в том числе при его регулировании, осуществляемое с помощью водохранилищ, является задачей гидрологических расчётов, а также гидрологических прогнозов. Суммарный объём годового стока рек в Мировой океан составляет 35 000–40 000 кубических километров ($км^3$), из этого объёма около 1/3 формируется за счёт подземных вод, дренируемых речными долинами (некоторая часть подземного стока поступает непосредственно в океан). Объём годового стока рек в замкнутой части суши составляет около 750 $км^3$ (из них около 320 $км^3$ приходится на долю Средней Азии и бассейн Каспийского Моря). Суммарная величина годового стока рек бывшего Союза Советских Социалистических Республик (СССР) около 4 700 $км^3$,

значительны также сток рек Бразилии (3 200 км^3), Китая (2 600 км^3), Соединённых Штатов Америки (США) (2 100 км^3). Смотрите также статьи Водные Ресурсы, Водный Баланс, Гидрологические Карты.

RUNOFF = СТОК (или ОТТОК) – Runoff:- used for listed equity securities. Series of trades printed on the ticker tape that occur on the NYSE® before 04:00 pm, but are not reported until afterwards due to heavy trading that makes the tape late. / НЙФБ® или Эн.Уай.Эс.И.® (NYSE®).

RUN–OFF ACCOUNT = ПРОДЛЁННЫЙ СЧЁТ (или ВЫПАВШИЙ СЧЁТ) – At the Corporation of Lloyd's, a year of account which has not been closed as at the date at which it would normally have been closed and which remains open. / Корпорэйшэн оф Лойдз.

RUN OFFS = СБЕГАНИЯ (или СХОДЫ) – Run Offs:- operator not following marking or not using mechanical aids such as edge guides to assure uniform stitching. Sewing Room Defects. / втачивание (stitching). Порок или дефект швейного производства.

RUN–OFF SYNDICATE = ПРОДЛЁННЫЙ СИНДИКАТ (или ВЫПАДАВШИЙ СИНДИКАТ) – At the Corporation of Lloyd's, Run-Off Syndicate is a syndicate with one or more run-off years of account. / Корпорэйшэн оф Лойдз.

RUN–OF–THE–MILL = ХХ – Run-Of-The-Mill (adjective):- ordinary, average, or undistinguished in quality, character, or nature; not special or excellent. See also Mill Run. Run-Of-The-Mill:- not special or outstanding; average. Run-Of-The-Mill (adjective):- not special in any way; 'run-of-the-mill boxing'; 'your run-of-the-mine college graduate'; 'a unexceptional an incident as can be found in a lawyer's career'.

RUN OR LADDER = РАСПУСКАНИЕ ПЕТЛИ (или СБЕГАНИЕ ПЕТЛИ, или СПУСК ПЕТЕЛЬ) ИЛИ СПУЩЕННАЯ ПЕТЛЯ (или СТРЕЛКА) – A Run or Ladder indicates a row of dropped stitches in the wale. Knitted fabric defect, and namely:- stitch defect. / Распускание (или Сбегание) петли в трикотаже вызывается разрушением нити в петлях в результате истирания или повреждения.

RUN–OUT FLEECE = РУНО С РАЗБЕЖКОЙ (или РУНО С ИЗНОСОМ) – Run-Out Fleece is a fleece that varies greatly in quality, lacks character, and carries a large percentage of britch wool and possibly kemp.

RUN–PROOF = УСТОЙЧИВАЯ К РАСПУСКАНИЮ – Run-Proof:- a knitted construction in which the loops are locked to prevent runs.

RUN–RESISTANT = НЕ РАСПУСКАЮЩЕЕСЯ (или УСТОЙЧИВОЕ К РАСПУСКАНИЮ) – Run-Resistant:- a type of knitting stitch that reduces runs. Run-Resistant is a knitted fabric constructed to make runs difficult. See also Interlock Knitting.

RUN UP DAY = СУТКИ УСКОРЕНИЯ ВВЕРХ – Run Days are the days with a pronounced trend. They are identified using the following criteria:- (i) True High of the run day should be higher than the highest true high of the previous N days; and (ii) True Low of the run day should be lower than the lowest true low of the following N days. Run-Up – a substantial increase over a relatively short period of time; 'a runup in interest rates'; 'market runups are followed by corrections'. / В техническом анализе биржевых рынков, Сутками Ускорения Вверх считаются сутки .Такие сутки должны удовлетворять следующим двум условиям:- во-первых, истинный максимум суток ускорения выше наивысшего истинного максимума за N предшествующих суток (например, N = 5 суток); во-вторых, истинный минимум суток ускорения ниже самого низкого истинного минимума за N последующих суток.

RUP = RATIONAL UNIFIED PROCESS

RUPTURE = ПРОРЫВ (или РАЗРЫВ, или ТРЕЩИНА) – Rupture:- to burst open along irregular lines.

RUR = RUSSIAN ROUBLE

RUSSELL 1000® INDEX = ИНДЕКС ПО 1000 ОТ РАСЭЛА® – The Russell 1000® Index measures the performance of the large-cap segment of the US equity universe. It is a subset of the Russell 3000® Index and includes approximately 1 000 of the largest securities based on a combination of their market cap and current index membership. The Russell 1000® represents approximately 92% of the US market. The Russell 1000® Index is constructed to provide a comprehensive and unbiased barometer for the large-cap segment and is completely reconstituted annually to ensure new and growing equities are reflected. The Russell 1000® Index is a trademark/service mark of the Frank Russell Company, and tracks shares of 1 000 the US companies with large capitalization. Russell 1000® Index is an index of approximately 1 000 of the largest companies in the US equity markets, the Russell 1000® is a subset of the Russell 3000® Index. The Russell 1000® (maintained by the Russell Investment Group) comprises over 90% of the total market capitalization of all listed US stocks, and is considered a bellwether index for large cap investing. The Russell 1000® is a market capitalization-weighted index, meaning that the largest companies constitute the largest percentages in the index and will affect performance more than the smallest index members. The Russell 1000® is a much broader index than the often quoted Dow Jones Industrial Average (DJIA) and Standard & Poor's 500 Index (S&P 500), although all three are considered large cap stock benchmarks. Many institutional managers prefer the Russell 1000® as a barometer for large cap investments as a whole; the average market cap of a Russell 1000® company is over USD80 billion, and all of the index members are considered highly liquid stocks. An ETF representing the Russell 1000® can be purchased for a minimal expense ratio; the ETF is called the iShares Russell 1000® Index and trades on the New York Stock Exchange (NYSE®) under the ticker IWB. Russell 1000® is a market capitalization-weighted benchmark index made up of the 1 000 highest-ranking US stocks in the Russell 3000®. Russell Investments is the owner of the trademarks, service marks and copyrights related to its indexes. Russell Investment Group is a Washington, USA corporation, which operates through subsidiaries worldwide, including Russell Investments, and is a subsidiary of The Northwestern Mutual Life Insurance Company. / НЙФБ® или Эн.Уай.Эс.И.® (NYSE®). Дау Дьжонз (Dow Jones). Индекс по 1000 от Расэла® отслеживает ситуацию с ценами на акции 1 000 крупных компаний США. Стэндод энд Поз (Standard & Poor's). Индексы от Расэла – индексы, взвешенные по рыночной капитализации, публикуемые компанией Фрэньк Расэл Кампэни (Frank Russell Company; штабквартира в Такоме, Штат Вашингтон, США). Индекс по 3000 от Расэла® состоит из 3 000 крупнейших Американских акций по рыночной капитализации. Суммарная рыночная стоимость акций, входящих в индекс, лежит в диапазоне от 91 миллиона Долларов до 85 миллиардов Долларов при среднем показателе 1.5 миллиарда Долларов; 1 000 акций, имеющих более высокие котировки, входят в Индекс по 1000 от Расэла®, который плотно коррелирует с индексом Standard and Poor's 500 (S&P 500), их средняя рыночная стоимость 4 миллиарда Долларов. Акции самой маленькой компании, входящей в индекс, стоят около 672 миллионов Долларов. Индекс по 2000 от Расэла® состоит из остальных 2 000 акций и представляет приблизительно 11% общей рыночной стоимости акций, входящих в Индекс по 3000 от Расэла®, со средней капитализацией акций 255 миллионов Долларов. Акции самой большой компании в Индексе по 2000 от Расэла® стоят около 672 миллионов Долларов. Индекс по 2000 от Расэла® является популярным критерием рыночных цен акций малых компаний. Индекс по 2500 от Расэла® состоит из последних 800 ценных бумаг, входящих в Индекс по 1000 от Расэла®, рыночная капитализация акций самой большой компании составляет около 4.6 миллиардов Долларов. Индекс Russell Top 200 состоит из 200 крупнейших ценных бумаг, входящих в Russell 1000, индекс 'голубых фишек' (blue chip) со средней рыночной капитализацией в 13 миллиардов Долларов. Самая маленькая акция

в индексе имеет рыночную капитализацию 4.5 миллиарда Долларов. Четыре индекса, основанные на индексах Russell 1000 к Russell 2000, построены на акциях со специализированным темпом роста. Индекс Russell 1000 Value и индекс Russell 2000 Value содержат ценные бумаги, которые имеют низкий темп роста. Акции таких компаний обычно имеют низкое отношение (кратность) цены и балансовой стоимости и цены и прибыли, высокие дивидендные доходы и низкие прогнозируемые темпы роста. Средняя рыночная капитализация по этим индексам составляет 3.9 миллиарда Долларов и 126 миллионов Долларов соответственно. Индекс Russell 1000 Growth и Индекс Russell 2000 Growth содержат те ценные бумаги, которые имеют показатели роста выше средних и обычно высокое соотношение (кратность) цены и балансовой стоимости и цены и прибыли на акцию. Средняя рыночная капитализация этих акций составляет 4.1 миллиарда Долларов и 129 миллионов Долларов соответственно.

RUSSELL 2000® INDEX = ИНДЕКС ПО 2000 ОТ РАСЭЛА® – The Russell 2000® Index measures the performance of the small-cap segment of the US equity universe. The Russell 2000® is a subset of the Russell 3000® Index representing approximately 10% of the total market capitalization of that index. It includes approximately 2 000 of the smallest securities based on a combination of their market cap and current index membership. The Russell 2000® Index is constructed to provide a comprehensive and unbiased small-cap barometer and is completely reconstituted annually to ensure larger stocks do not distort the performance and characteristics of the true small-cap opportunity set. The Russell 2000® Index tracks shares of 2 000 smaller the US companies. Russell 2000® Index is an index measuring the performance approximately 2 000 small-cap companies in the Russell 3000® Index, which is made up of 3 000 of the biggest US stocks. The Russell 2000® serves as a benchmark for small-cap stocks in the United States. The weighted average market capitalization for companies in the Russell 2000® is about USD1.3 billion and the index itself is frequently used as a benchmark for small-cap mutual funds. This index measures the smallest 2 000 of the 3 000 largest publicly traded companies. Russell 2000® is a market capitalization-weighted benchmark index made up of the 2 000 smallest US companies in the Russell 3000®. / Индекс по 2000 от Расэла® отслеживает ситуацию с ценами на акции 2 000 более мелких из всех крупных компаний США. Этот индекс измеряет ситуацию с ценами на акции более мелких 2 000 из 3 000 крупных компаний США, акции которых находятся в обращении на биржах.

RUSSELL 3000® INDEX = ИНДЕКС ПО 3000 ОТ РАСЭЛА® – The Russell 3000® Index measures the performance of the largest 3 000 US companies representing approximately 98% of the investable US equity market. The Russell 3000® Index is constructed to provide a comprehensive, unbiased, and stable barometer of the broad market and is completely reconstituted annually to ensure new and growing equities are reflected. The Russell 3000® Index tracks shares of 3 000 the US companies. Russell 3000® Index is a market capitalization weighted equity index maintained by the Russell Investment Group that seeks to be a benchmark of the entire US stock market. More specifically, this index encompasses the 3 000 largest US-traded stocks, in which the underlying companies are all incorporated in the United States. Stocks within the Russell 3000® Index are reconstituted once a year (typically around May or June). At this time, the underlying companies are reranked based on their market capitalizations for that year. Furthermore, if a member is somehow rendered ineligible for continued membership during the year (such as by going private, being acquired or going bankrupt), no replacement is named until the next scheduled reconstitution. Of the 3 000 stocks in the index, there are two very popular sub indexes that are followed to track the progress of the market. The largest 1 000 stocks become the Russell 1000® Index (large cap index) and the subsequent 2 000 are known as the Russell 2000® Index (small-cap index). Russell 3000® is a market capitalization-weighted benchmark index made up of the 3 000 largest US stocks, which represent about 98% of the US equity market. / Индекс по 3000 от Расэла® отслеживает ситуацию с ценами на акции 3 000 компаний США.

RUSSET = БУРОЕ (или КРАСНОВАТО–КОРИЧНЕВОЕ, или МОСТОВЬЁ) – Russet:- a variable color averaging a strong brown. Coarse homespun usually reddish brown cloth. / красновато–коричневое полотно.

RUSSIAN EXPORT BLEND CRUDE OIL = РОССИЙСКАЯ ВЫВОЗНАЯ СМЕШАННАЯ НЕФТЬ (или РОССИЙСКАЯ ЭКСПОРТНАЯ НЕФТЯНАЯ СМЕСЬ) – Russian Export Blend Crude Oil (REBCO) (Physical) futures are an outright crude oil contract between a buyer and a seller. The contract:- (i) provides price discovery, market transparency, and financial protection against the risk of counterparty default; and (ii) offers a dependable pricing basis for crude shipped via pipeline or from other ports of export. Things to know about the contracts:- (i) traded electronically on the CME Globex® platform; and (ii) physically delivered at the year-round Baltic Sea port of Primorsk, Russia. About Russian Export Blend Crude Oil (REBCO):- Russia is the world's second largest producer of crude oil and also one of the world's top oil exporters. Russian export blend crude oil (REBCO) is a medium gravity sour crude that accounts for exports of approximately 4 million barrels per day into the Atlantic Basin or to other nearby refining markets. NYMEX®, the world's largest energy marketplace, developed the REBCO futures contract in collaboration with Expertica Ltd and the Russian oil industry. 2008-November-07:- CME Group, the world's largest and most diverse derivatives exchange, today announced that it will launch a Russian Export Blend Crude Oil (REBCO) financial futures contract, on the CME Globex® electronic trading platform and the ClearPort® electronic clearing and trading platform, beginning November 23 for trade date November 24. The contract (commodity code:- R2) will be financially settled based on Argus Media's Urals FOB Primorsk assessment. It will be listed for up to 48 consecutive months, beginning with the January 2009 contract. Russian Export Blend Crude Oil (REBCO), also known as Urals Oil, is a medium gravity sour crude. It is a mix of heavy oil from the Urals and the Volga region with light oil of Western Siberia, set for delivery at storage and terminal installations at the port of Primorsk in Russia. It is an oil brand used as a basis for pricing for Russian oil exports. REBCO futures are traded at the NYMEX® under ticker symbol RE. Contract size is 1 000 barrels with a contract price quoted in US Dollars and Cents per barrel. Delivery dates take place every month of the year. Settlement Type:- physical delivery of Russian Export Blend Crude Oil (REBCO), which is also known as Urals Crude Oil, occurs at Load Port Primorsk in Russia. This contract shall be governed by and construed in accordance with English Law (without reference to its Conflict of Laws Rules). Matched parties must fulfill their delivery obligations via the substantive term of the standard REBCO cash forward contract, in conformity with cash market practices, which are contained in Appendix A to Rule Chapter 206 of the CME® rulebook. 2006-October-10:- REBCO, Russia's new export blend crude oil, should replace Urals blend as the basis for calculating supply prices, export duties and mineral extraction tax, a deputy economics minister said Monday. 'There is a possibility of shifting from Urals to REBCO in (calculating) mineral extraction tax and export duties in 2008, and of making REBCO Russia's price index', Kirill Androsov told a news conference. Earlier on Monday, Economics Minister German Gref announced plans to launch REBCO futures on the New York Stock Exchange on October 20. 'We plan to launch Russian REBCO futures on the New York Mercantile Exchange (NYMEX®) from October 20 under an agreement with the NYSE', Gref said, adding that trade in futures contracts for Russian oil would eventually be transferred to Russian floors. Androsov said the price of REBCO, to be pumped into Europe via Baltic pipelines, should be higher than that of Urals, generally priced at a USD5–6/bbl discount to Brent. 'In terms of sulfur content and viscosity, this blend meets requirements of refineries in Western and Eastern Europe'. He said REBCO will also appear on CME GLOBEX®, operated jointly by the NYMEX® and the Chicago Mercantile Exchange, on October 22. Speaking of the Russian government's plans to launch a domestic oil derivatives exchange by the year's end, Androsov said a corresponding resolution, currently in the making, will oblige state-owned companies to make at least 25% of their annual refined oil purchases on that market. The lower limit 'has to be high enough to motivate sellers and buyers', he explained.

President Vladimir Putin said in his state-of-the-nation address on May 10 that Russia, as a leading oil exporting nation, should set up domestic markets to trade crude oil and derivatives in the national currency, the Rouble. 2006-October-20:- The sale of Russia's new export blend crude oil, REBCO, in New York will bring in a total of USD3 billion for Russian oil producers annually, a senior Russian government official said Friday. REBCO futures were launched on the New York Mercantile Exchange earlier in the day. The new blend, a third crude brand to trade on the NYMEX®, after WTI and Brent, will replace Urals as Russia's price index used for calculating supply prices, export duties and mineral extraction tax. It is expected to fetch a higher price than Urals, generally priced at a USD5–6/bbl discount to Brent, as its quality is much nearer to Western standards. 'Russian companies' aggregate receipts from the introduction of fair pricing will come to some USD3 billion', Deputy Economics Minister Kirill Androsov said. 'Russian budget revenues will, naturally, increase as well'. On Sunday, REBCO will be launched on CME GLOBEX®, a trading floor operated by the Chicago Mercantile Exchange. 2006-October-23:- REBCO futures were launched on the New York Mercantile Exchange (NYMEX®) on October 20, Deputy Economics Minister Kirill Androsov reported according to AK&M. The contract having RE-code implies FOB delivery of Russia's export blend crude oil from the port terminal in Primorsk. The contract volume is 1 thousand barrels in USA Dollars and cents per barrel. The new blend, a third crude brand to trade on the NYMEX®, after WTI and Brent, will replace Urals as Russia's price index used for calculating supply prices, export duties and mineral extraction tax. It is expected to fetch a higher price than Urals, generally priced at a USD5–6/bbl discount to Brent, as its quality is much nearer to Western standards. According to Kirill Androsov, Economics Ministry jointly with Expertica company and Russia's oil companies have carried out preliminary work through 2006 resulting in agreements with the management of international exchange NYMEX® as regards launching of REBCO futures. Successful launching and functioning of new futures is to facilitate implementation of the project on Russia's Commodities and Raw Materials Exchange. 2006-October-23 (Bloomberg) Russian Oil Futures in US May See Little Demand, Traders Say:- The New York Mercantile Exchange (NYMEX®), the world's largest energy futures market place, may see lack of demand for a new Russian crude oil contract offered on the Globex electronic trading system, some traders said. Nymex began trading Russian export blend crude oil, or Rebco, at 06 pm yesterday in New York. Each contract is for 1 000 barrels of oil on a free-on-board basis at the Russian Baltic Sea port of Primorsk, according to the exchange's Web site. So far, the contract hasn't traded, Nymex spokeswoman Anu Ahluwalia said in an e-mail at 11:46 am in New York. 'Americans don't know much about this contract and are mostly interested in West Texas Intermediate oil futures', Dimitri Chumakov, a commodity futures trader at The Invar Group, said today by phone from Ivanovo, Russia. 'Russians may have no interest because of the contract's low liquidity on the exchange'. Nymex is competing in energy trading with Intercontinental Exchange Inc., based in Atlanta. The New York exchange has also been considering a contract based on Omani crude oil, after failing to attract users to a previous Middle East contract several years ago. 'Historically, exchanges had many dead projects and contracts', said Stanislav Nazarati, a trader at Letofin AS in Estonia. 'They were offered for trading, but they just didn't go'. Reaching Out:- NYMEX®, which is owned by Nymex Holdings Inc., began listing its physically delivered energy futures, its biggest contracts, on the Chicago Mercantile Exchange's Globex electronic trading system last month, in an effort to reach more screen-based users. That followed a rapid expansion in oil trading earlier this year at its main rival, Intercontinental's ICE Futures exchange. 'Europe imports more crude oil from Russia than from the UK and Norway', Olivier Jakob, the managing director at Petromatrix GmbH in Zug, Switzerland, wrote last week in a report. 'So a move to Rebco futures could be the best attempt from Nymex to eat into the ICE market share'. Russia, the world's largest oil supplier after Saudi Arabia, exported 5.45 million barrels a day of crude in September, little changed from the same month a year earlier. The new contract for Rebco, also commonly known as Urals Crude Oil Blend, has the code RE, with prices designated in US Dollars per barrel, NYMEX® said. The exchange will list contracts for 72 months, beginning with January 2007. Unfair Price:- President Vladimir Putin last year called the price difference between Urals and Brent, the benchmark crude traded in London, 'very unfair'. Urals, composed of oil from various fields in Russia, contains more sulfur, and therefore needs additional cleaning before it can be used in Europe. Brent crude oil for December settlement fell 95 cents to USD58.73 a barrel on the ICE Futures exchange at 04:53 pm in London. Urals traded in the Baltic Sea fell 56 cents to USD53.98 a barrel at 03:22 pm London time. 'Russian producers will receive a fair price for supplies', Alexei Kuzmitchev, a non-executive director of Alfa Group, a shareholder in TNK-BP, Russia's third-largest oil company, said in an e-mail. In turn, 'consumers in western countries will secure a significant advantage in risk management'. Russia lacks a legal framework for futures trading and describes it as similar to gambling, according to Invar's Chumakov, who trades oil future through US-based brokers. The future contacts are not enforceable under Russian law and can't be disputed in civil courts in case of violations. 2006-October-27:- Russia plans to start trading futures for Russian oil delivered to Europe via the Druzhba oil pipeline, Alfa Group supervisory council member Alexei Kuzmichyov told Interfax. Expertica Ltd, which organised the trading of Russian Export Blend Crude Oil (Rebco) futures on NYMEX®, is negotiating with Russia's Transneft in order to create a future contract for Russian pipeline oil, Kuzmichyov said. 'This will be a second contract, which might be launched within the next few months', he said. A future contract for Russian pipeline oil is 'very important for determining a fair price for the Russian oil', Russian Deputy Economic Development and Trade Minister Kirill Androsov told Interfax. 'We are grateful to Alfa Group for helping us to sort out complicated relations between the traders on this line; this is where transparency is really required', he said. 'Now practically all oil in the Transneft system is distributed between the seller and the bidder. We have to create a certain free amount of oil in the export pipe in order to use it for sales on the exchange', he said. Rosneft, Gazpromneft and TNK-BP was due to provide oil for the supplies on future contracts on Rebco, which will start trading on NYMEX® at 06 pm Moscow time on October 23. 2006-October-30:- Russian Economy Minister German Gref is convinced that Russia's new export blend crude oil REBCO futures contract has a great future. 'The market has received REBCO very positively', Gref told reporters on Monday. First REBCO deals have already been made, according to the Economy Minister. Any new brand needs time for promotion and recognition, Gref said commenting on the slow reaction of the market to REBCO. He said the Economy Ministry expected this, and that so far 'everything goes to plan'. The Russian Export Blend Crude Oil (REBCO) futures contract was launched by the New York Mercantile Exchange (NYMEX®) on 20 October 2006.The contract features physical delivery of REBCO on a free-on-board (FOB) basis at the Russian port of Primorsk on the Baltic Sea. The contract size will be 1 000 barrels denominated in US Dollars per barrel. The last day of trading will be three business days before the 15th calendar day before the first day of the delivery month. NYMEX® will list the contract for 72 consecutive months beginning with the January 2007 contract. Experts say REBCO is set to replace Urals contracts, tied to the price of Brent crude oil. REBCO's price is calculated based on the market conditions. Given the growing demand for energy and high oil prices, shifting to REBCO will allow Russian companies to boost their profits, which means higher tax revenues. According to Deputy Economy Minister Kirill Androsov, moving to the new oil pricing mechanism will increase budget revenues by about USD3 billion a year. / РЭБКО (REBCO). НАЙМЭКС® (NYMEX®). Си.Эм.И. ГЛОБЭКС® (CME GLOBEX®). НЙФБ® или Эн.Уай.Эс.И.® (NYSE®). Блумбёг Эл.Пи. (Bloomberg LP). Наиболее широкое распространение в России получил сорт Юрэлз (Urals), также представляющий собой вывозную смешанную нефть (или экспортную нефтяную смесь), получаемую в результате смешения тяжёлой высокосернистой нефти, добываемой на Уральских и Поволжских месторождениях, с лёгкой Западносибирской нефтью. Содержание серы в нефти марки Юрэлз превышает 1.2% при плотности в градусах по API, равной 32. Российская экспортная нефтяная смесь марки Юрэлз на Нью Йоркской Товарной Бирже НАЙМЭКС® (NYMEX®) известна как РЭБКО (REBCO (Russian Export Blend Crude Oil)). Несмотря на то, что явной привязки стоимости нефти марки Юрэлз к более качественному сорту Брэнт (Brent) – маркерному сорту добываемой в Северном Море сорту – нет, фактически стоимость Российской нефти

обычно определяется дисконтированием цены на Brent. С начала 2009 существенно сократился и до сих пор (Ноябрь 2009) не меняется дисконт мировой цены нефти Юрэлз к нефти Брэнт. Если в докризисном 2007 Юрэлз стоила на 5% дешевле, чем Брэнт, то в 2008 дисконт упал до 3%. За первые три квартала 2009 дисконт составил всего 1.3%. Уменьшение дисконта в большей степени связано со структурными изменениями мирового рынка нефти, нежели с изменениями в относительном качестве двух сортов. Скорее всего, оно обусловлено расширением географии поставок Российской нефти на смежные рынки из-за дисбаланса, вызванного кризисом. В пользу этого предположения свидетельствует то, что в первом полугодии 2009 Россия впервые после распада бывшего Союза Советских Социалистических Республик (СССР) вышла на первое место по объёмам вывоза (или экспорта) нефти в мире, обогнав Саудовскую Аравию. Итак, дисконт сократился именно благодаря относительному росту спроса на Юрэлз, в то время как нефть Брэнт была частично вытеснена с рынка. Основными рынками сбыта вывозимой (или экспортируемой) Российской нефти является Европа (через Порт Роттердам с Севера и порты Средиземноморья с Юга), а также США. Условия поставки отечественных углеводородов, как правило, CIF (продажа в порту доставки) или FOB (продажа в порту отправления). Россия вывозит (или экспортирует) на мировой рынок только четыре торговые марки нефти:- (i) Urals (Юрэлз) – основная вывозная (или экспортная) марка нефти России, поставляемая через Новороссийск и по системе нефтепроводов Дружба. Она представляет собой плотную высокосернистую смесь (плотность ≈0.865–0.874 кг/м^3, содержание серы ≈2.5%), получающуюся смешением тяжёлой высокосернистой нефти Урала, Поволжья и Татарстана с лёгкой Западносибирской нефтью. Основные производители нефти Юрэлз – компании Роснефть, Лукойл, Сургутнефтегаз, Газпром Нефть, ТНК-ВР и Татнефть. (ii) Siberian Light – вывозной (или экспортный) сорт лёгкой нефти (плотность ≈0.820–0.825 кг/м^3, содержание серы ≈0.57%), которая представляет собой смесь из нефти, добываемой в Ханты-Мансийском Автономном Округе (ХМАО) Тюменской Области. Основные производители нефти Siberian Light – компании Роснефть, Лукойл, Сургутнефтегаз, Газпром Нефть, ТНК-ВР, её вывозные (или экспортные) поставки осуществляются через Порт Туапсе. (iii) REBCO (Russian Export Blend Crude Oil) – Российская экспортная нефтяная смесь, по параметрам близкая к марке Urals (плотность 0.858–0.870 кг/м^3, содержание серы – 1.3%), поставляемая через Порт Приморск. (iv) Сокол (Sokol) – Российская экспортная марка нефти, плотность которой составляет 0.825–0.829, а содержание серы ≈0.23%. Её добыча осуществляется в рамках проекта Сахалин-1, а отгрузка – через порт в Де-Кастри в Хабаровском Крае. Как видно, Российская нефть на разных месторождениях, разбросанных по огромной территории страны, совершенно разного качества:- в недрах Западной Сибири добывается наиболее дорогая лёгкая нефть с минимальным содержанием серы, а на Урале и в Поволжье залегают главным образом тяжёлые сорта с избыточным содержанием серы, которые на рынке ценятся куда меньше, ведь каждые дополнительные 0.1% серы снижают её стоимость на 0.25 Доллара за баррель. В нефтепроводах (в том числе прокачивающих сырьё на вывоз (или экспорт)) все сорта нефти смешиваются, и на выходе получается общероссийская смесь Юрэлз. Таким образом, Российские компании за баррель нефти любого качества получают одну и ту же цену – цену барреля смеси Юрэлз. Однако львиная доля добываемой в России нефти не уступает по качеству марке Брэнт (Brent). Лишь 1/10 часть – та самая вязкая, тяжёлая нефть, которая, попав в общую трубу, сильно снижает качество всей Российской вывозимой (или экспортируемой) нефти. В связи с этим Правительство России обсуждает вопрос о создании нового – пятого Российского сорта нефти для смеси, которая будет транспортироваться в Азию по нефтепроводу Восточная Сибирь – Тихий Океан (ВСТО). Её рабочее название – ESPL Blend (Смесь ВСТО). Целью создания данной марки является отделение ценообразования на нефть в трубопроводе ВСТО от нефти марки Юрэлз. Пока неизвестно, будут ли привязаны цены на ESPL Blend к ценам на Брэнт, но точно ясно, что новая марка, для которой должен быть заведён отдельный ГОСТ, будет значительно дороже Юрэлз из-за отсутствия в её составе высокосернистой нефти, а, значит, более высокого качества.

RUSSIAN LEATHER = РОССИЙСКАЯ КОЖА – Russian Leather is a common name in leather for the hide of an animal with the fur removed.

RUST = РЖАВЧИНА – Rust is a disease caused by a Fungus. Called rust because it releases reddish-brown powdery masses of uredospores. / Ржавчина растений, вредоносная распространённая болезнь многих растений, вызываемая ржавчинными Грибами и характеризующаяся образованием на поражённых органах пустул различной формы и величины, из которых при растрескивании высыпается ‘ржавый’ порошок, состоящий из спор гриба. Поражаются хлебные злаки, технические культуры, декоративные растения, лесные древесно-кустарниковые породы, дикорастущие травы. Возбудители ржавчины растений развиваются на надземных частях растений, питаются содержимым только живых клеток, распространяются спорами. У больных растений нарушаются обмен веществ, водный баланс, снижается энергия фотосинтеза, уменьшается прирост. Ржавчина растений ухудшает качество плодов и семян, хлебопекарные свойства Пшеницы, Ржи. Наиболее вредоносны ржавчины:- линейная Злаков (возбудитель Puccinia Graminis), бурая Пшеницы (Puccinia Triticina, промежуточные Растения – Василистник и Лещица), бурая Ржи (Puccinia Dispersa, промежуточные Растения – Кривоцвет и Румянка), жёлтая Злаков (Puccinia Striiformis), карликовая Ячменя (Puccinia Hordei, промежуточное Растение – Птицемлечник), корончатая Овса (Puccinia coronifera, промежуточное Растение – Крушина), Кукурузы (Puccinia Sorghi, промежуточное Растение – Кислица), Подсолнечника (Puccinia Helianthi), Льна (Melampsora liniusitatissimi), сахарной Свёклы (Uromyces Betae), Малины (Phragmidium Rubi), Груши, Яблони (возбудитель Gymnosporangium Sabinae, промежуточное Растение – Обыкновенный Северный Можжевельник), бокальчатая или столбчатая Крыжовника и Смородины (возбудители соответственно Puccinia Ribesii Caricis, Cronatrium Ribicola, промежуточные Растения – Осоки, Сибирская Кедровая Сосна или Веймутова Сосна). Древесным породам существенный вред может причинять пузырчатая ржавчина Сосны (серянка), хвои Лиственницы и листьев Берёзы (Melampsoridium Betulae), хвои Ели (Chrysomyxa Ledi или Abietis), хвои Сосны (возбудители – Виды Грибов Рода Coleosporium). Меры борьбы:- уничтожение промежуточных хозяев ржавчины растений, пространственная изоляция посевов или посадок от них; глубокая перепашка поля для уничтожения зимующих уредо- и телейтоспор; повышение устойчивости растений проведением агротехнических мероприятий (сроки сева, повышенные дозы фосфорных и калийных удобрений и так далее); очистка, сортировка и протравливание семян фунгицидами (ржавчина Подсолнечника, Льна, сахарной Свёклы); опрыскивание фунгицидами сразу после распускания листьев с двукратным повторением через 15 суток (сут) (ржавчина Крыжовника и Смородины, Яблони, Груши, хвои Сосны, Ели); районирование сортов, устойчивых к видам ржавчины растений.

(2) Rust:- xxxxx. / Под Ржавчиной понимается слой частично гидратированных оксидов железа, образующийся на поверхности железа и некоторых его сплавов в результате коррозии, вызванной действием кислорода и влаги.

RUST = РЖАВЧИННОЕ (или РЖАВОЕ, или ЗАРЖАВЕЛОЕ) – Rust:- a strong brown.

RUST AND OXIDATION INHIBITED = ЗАМЕДЛЕННЫЕ РЖАВЧИНА И ОКИСЛЕНИЕ – Rust and Oxidation Inhibited (R&O) is a term applied to highly refined industrial lubricating oils formulated for long service in circulating lubrication systems, compressors, hydraulic systems, bearing housing, gear boxes, etc. The finest R&O oils are often referred to as Turbine Oils. / , коробках передач и тому подобном.

RUSTBUCKET = РЖАВОЕ КОРЫТО (или СТАРОЕ КОРЫТО) – Rustbucket (maritime term):- sailors' term for an old ship that needed a lot of paint and repairs.

RUST INHIBITOR = ИНГИБИТОР РЖАВЧИНЫ (или ЗАМЕДЛИТЕЛЬ КОРРОЗИИ) – Rust Inhibitor is a type of corrosion inhibitor used in lubricants to protect surfaces against rusting. See also Inhibitor. Rust Inhibitor is an antioxidant that inhibits the formation of rust. What is the difference between a rust inhibitor and rust preventative? Rust Inhibitor is a water based, clear product that is typically used to keep parts from rusting in between processes. Rust inhibitors offer short term protection up to 30 days, however ambient humidity levels can play a factor in actual life of protection. In most cases no additional cleaning is required prior to painting or secondary operations. To apply a rust inhibitor the part is either sprayed or dipped. Rust preventative is a petroleum oil based product which will provide protection for 6 months to a year. The part is typically run through a dipping operation to apply the preventative. Drying times are part and application dependent. In most cases Rust Preventatives need to be removed prior to painting and secondary operations.

RUSTLE = ШОРОХ (или ШЕЛЕСТ) – Rustle is another word for Scroop, the rustle that certain fabrics such as silk taffeta have. Scroop is considered a desirable characteristic in luxury fabrics. / Хруст (Scroop).

RUST OXIDATION AND DISCOLORATION = ОКСИДИРОВАНИЕ С ОБРАЗОВАНИЕМ РЖАВЧИНЫ И ИЗМЕНЕНИЕМ ЦВЕТА – Rust Oxidation And Discoloration is a damage to metal caused by exposure to ocean air. An insurance exclusion applied to steel and other metal shipments. / Под Ржавчиной понимается слой частично гидратированных оксидов железа, образующийся на поверхности железа и некоторых его сплавов в результате коррозии, вызванной действием кислорода и влаги.

RUST PREVENTION TEST = ИСПЫТАНИЕ НА ПРЕДОТВРАЩЕНИЕ РЖАВЧИНЫ (или РЖАВЛЕНИЯ) – Rust Prevention Test (turbine oils) is a test for determining the ability of an oil to aid in preventing the rusting of ferrous parts in the presence of water.

RUST–RED FLOUR BEETLE = РЖАВО–КРАСНЫЙ МУЧНОЙ ХРУЩАК (или БУЛАВОУСЫЙ МАЛЫЙ МУЧНОЙ ХРУЩАК) – Rust-Red Flour Beetle (Tribolium Castaneum):- the red flour beetles primarily attacks milled grain products. Both adults and larvae feed only on the grain dust and broken kernels and do not attack the undamaged whole kernels. Infestation leads to persistent and disagreeable odors of the Rice. The optimum temperature for reproduction is 35 °C and a relative humidity of 75%. The red flour beetle can lay up to 500 eggs and has a life cycle of 20 days under optimum conditions. / Ржаво-Красный Мучной Хрущак или Булавоусый Малый Мучной Хрущак:- систематическое положение:- Отряд Жуки, или Жесткокрылые, Семейство Чернотелки (Tenebrionidae). Распространены преимущественно в Южных регионах страны. Повреждает зерно, муку, крупы, комбикорма, семена подсолнечника, сухофрукты. Жук длиной 3–4 мм, светло-коричневый; три последних членика усиков заметно шире и образуют булаву; летает. Личинка длиной до 7 мм, жёлтая. Зимуют жуки. Самки откладывают в среднем до 350 яиц (максимально – 1 000). Жуки живут до двух лет. Поколение развивается за 31–47 дней. Нижний порог развития 15.2 °C. Наиболее благоприятная температура для его развития и размножения 27–30 °C. Чувствителен к низким температурам:- при температуре 0 °C все особи погибают через 17 суток, при –5 °C – через 5 суток. В течение года даёт два–три поколения, в отапливаемых помещениях развивается непрерывно.

RUST STAINS = РЖАВЧИННЫЕ РАЗВОДЫ (или РЖАВЧИННЫЕ ПОТЁКИ, или РЖАВЫЕ РАЗВОДЫ, или РЖАВЫЕ ПОТЁКИ) – Rust Stains:- Garment:- man's ivory gabardine sport shirt; Fabric Construction:- (i) Count:- 96 x 50; (ii) Warp:- 20 1 1 ' L . - i 1 1 . 1%-den. bright viscose rayon; (iii) Filling:- same as warp. Complaint:- very small rust stains were detected in a new shirt offered for sale by a retailer. Analysis:- examination indicated that the rust stains were around the edges of pinholes, and it was concluded that they were caused by the rusting of pins put into the shirt by the garment manufacturer. It was later learned that the shirt had been in stock for a considerable length of time in a shop in Florida, close to the seacoast. Chemical analysis of similar pins showed that they were made of nickel-coated steel and that the protective metal surface was occasionally broken so that the under metal was exposed. On their immersion in salt water, to simulate their exposure to salt air. which was assumed to have occurred where the shirt had been kept by the retailer, it was found that the pins rusted very badly. This rusting would not have taken place, except after unusually long periods of exposure, if the shirt had been in a different atmosphere, or if the protective nickel coating had not been defective. The use of pins made of brass or some other nonrusting metal would have averted such damage. / Уточина:- такая же как основа.

RUSTY = РЖАВЧАТОЕ (или РЖАВЧИННОЕ) – Rusty:- of the color rust. A mixture between orange, red, and brown. Yes, this word is relevant to the fashion industry. All color is relevant to fashion.

RUTHENIUM = РУТЕНИЙ – Ruthenium; chemical symbol Ru. Its specific gravity is 12.20 and its melting point is 2 500 °C. / Под Рутением, от позднелатинского слова Ruthenia, означающее Россия, Латинское название Ruthenium (символ Ru), понимается химический элемент VIII группы Периодической Системы Менделеева. Атомный номер 44, атомная масса 101.07. Относится к платиновым металлам. Был открыт Русским химиком Карлом Карловичем Клаусом (1796–1864) в 1844. Рутений – серовато-белый металл; плотность 12 370 кг/м^3, $t_{пл}$ 2 250 °C, $t_{кип}$ около 4 200 °C. В природе встречается вместе с другими платиновыми металлами. Значительные количества рутения образуются при делении урана в ядерных реакторах. Химически очень стоек. Входит в состав сплавов, обладающих высокой твёрдостью и стойкостью против истирания. Из них изготовляют наконечники перьев, ювелирные изделия, лабораторную посуду, фильеры для стекловолокна и другое. Рутений катализирует многие химические реакции. Диоксид рутения RuO_2 – резисторный материал в электронике, в смеси с диоксидом титана – покрытие электродов при производстве хлора и щёлочей. Рутений (Латинское название Ruthenium), Ru, химический элемент VIII группы Периодической Системы Менделеева, атомный номер 44, атомная масса 101.07; один из платиновых металлов.

R/V = ROUNDVOYAGE

RVDB = RICE VIRUSES DATA BASE

RVIG = RICE VARIETAL IMPROVEMENT GROUP

RVNX = RELEASED VALUE NOT EXCEEDING

R–W = RICE–WHEAT

RW = RWANDA

RWA = RETURNED WITHOUT ACTION

S&P 500® DIVIDEND YIELD = ДОХОДНОСТЬ ПО ДИВИДЕНДАМ ОТ ЭС.ЭНДПИ. 500® – The S&P 500® Dividend Yield, as calculated by the S&P 500® Dividends Per share TTM divided by the S&P 500® close price for the month, reflects the dividend-only return on the S&P® 500 index. The S&P 500® index is a basket of 500 large US stocks, weighted by market cap, and is the most widely followed index representing the US stock market. After the financial crisis of 2008 the yield value decreased from a peak of 3.86% in 2008, to hovering around 2%, on average, for the next 10 years. S&P 500® Dividend Yield is at 1.53% (on February 28, 2021), compared to 1.57% last month (on January 31, 2021) and 1.97% last year (all 2020). This is lower than the long term average of 1.87%. 10-Year Treasury Yield Catching Up To S&P 500® Dividend (2021-February-23; Source:- Reuters):- A historically hefty advantage that the S&P 500® Dividend Yield has held over the benchmark US Treasury Note is on the verge of disappearing, a year after the collapse in interest rates set the stage for Wall Street's recovery from the pandemic sell-off. Investor concerns that measures to restore a US economy hammered by the global pandemic could also spark inflation lifted the yield on the 10-year note as high as 1.394% overnight, the highest since February 2020. The yield was last at 1.365% late on Monday (2021-February-22). That compares with the S&P 500's dividend yield of about 1.46%, according to Refinitiv's Datastream. That yield has gradually declined as the index hit record highs for the past several months, fueled by low interest rates that have made stocks more attractive. 'This is a return to the normal pattern of things, where dividend yields are less than the 10-year Treasury', said S&P Dow Jones Indices Senior Index Analyst Howard Silverblatt. Treasury yields have moved steadily higher in recent weeks as Democrats push a USD1.9 trillion coronavirus relief package through Congress, spending that is viewed by many as necessary to boost the economy, but also seen as potentially stirring inflation as the country begins to recover. The Fed's ongoing loose monetary policy also has some investors worried about inflation. More gains in Treasury yields could put pressure on stocks with the highest valuations, Jefferies analysts wrote in a report on Sunday. Treasury yields tumbled in February 2020 as the coronavirus pandemic shocked global financial markets and crippled much of the world's economy. Simultaneously, falling stock prices created a spike in the S&P 500® dividend yield, even as many companies suspended payouts to shareholders. The S&P 500® dividend yield in late March reached 2.76%, a historically large premium over the 10-year Treasury yield of 0.76% at that time, according to Datastream. Since then, companies have largely resumed their dividends, with many even increasing their shareholder payouts. After total S&P 500® dividend payments dipped less than 1% last year to USD483 billion, total dividends in 2021 are on track to rise by about 5%, Silverblatt said. / Ройтас (Reuters). Вол Стрит. Рэфинитив'з Дэйтэстчрим (Refinitiv's Datastream). Хавод Силвёблэт Старший Индексный Аналитик по Индексам Эс.ЭндПи. и Дау Дьжонз (S&P Dow Jones Indices Senior Index Analyst Howard Silverblatt). Дьжефёриз (Jefferies).

S&P 500® EARNINGS YIELD = ДОХОДНОСТЬ ПО ЗАРАБОТКАМ ОТ ЭС.ЭНДПИ. 500® – The S&P 500® Earnings Yield, reflects the sum of the underlying S&P 500® companies' earnings for the previous year, divided by the S&P 500® index level at the end of the year. The S&P 500® index is a basket of 500 large US stocks, weighted by market cap, and is the most widely followed index representing the US stock market. As a broad market index earnings yield, one can compare this to the 10 year treasury rate to determine valuation of the US stock market relative to the bond market, as well as price forecasting. After the financial crisis of 2008 the yield value hovered around 5% on average for the 10 years following. For example, S&P 500® Earnings Yield is at 2.92% (on September 30, 2020 (end of third quarter)), compared to 3.20% last quarter (on June 30, 2020 (end of second quarter)) and 4.46% last year (all 2019). This is lower than the long term average of 4.77%.

S&P 500® INDEX = THE STANDARD AND POOR'S LARGE CAP 500 INDEX

S&P 600® INDEX = THE STANDARD AND POOR'S SMALLCAP 600 INDEX

S&P GLOBAL PLATTS = ЭС.ЭНД.ПИ. ГЛОБЭЛ ПЛАТС – S&P Global Platts is the leading independent provider of information, benchmark prices and analytics for the energy and commodities markets. For over 100 years, we've brought clarity and transparency to the energy and commodities markets, enabling companies, governments and individuals to act with conviction. We know that data is key to decision making, but information alone isn't informative: it can be interpreted in many ways and inform drastically different decisions. The knowledge and experience of our people makes the difference, offering insight that helps customers in 190 countries to interpret fluctuations, uncover new commercial opportunities and gain a competitive edge. A division of S&P Global, S&P Global Platts is headquartered in London and employs over 1 000 people in more than 19 offices worldwide located in global business and energy centers on five continents. We employ only the best in the market, and each member of our team is committed to providing an unbiased perspective to help our customers monitor market movements, value commodities, recognize opportunities, mitigate risk, and plan with greater confidence. Our Coverage:- From an original focus on petroleum, we now cover oil, natural gas, LNG, power, coal, shipping, petrochemicals, metals, and agriculture. Each day we publish news, commentary, fundamental market data and analysis, and thousands of daily price assessments that are widely used as benchmarks in the physical and futures markets. Our Products And Services:- The markets are constantly changing, but our real-time news, market reports, analysis, price assessments and fundamental data always provide a valuable reference point. We're constantly investing in our products and services, and following a series of key acquisitions, including Bentek Energy, cFlow, Eclipse Energy, Kingsman, Petromedia, PIRA Energy Group, RigData and SBB, we've strengthened our Analytics team. We've enhanced our forecasts, data sets and tools, and now provide the most robust analytics offering available to ensure our customers can maximize value in their chosen markets. Our Customers:- Traders, analysts, risk managers, purchasing agents and other professionals at more than 12 000 public and private sector organizations in over 190 countries benefit from S&P Global Platts services. These organizations range from exploration companies, miners and refiners to end-users such as utilities, airlines, steel companies and auto manufacturers. They also include government agencies, financial institutions and professional service firms in law, engineering, consulting and asset management. Market Engagement:- We engage with customers, market participants, industry organizations and regulators every day through forums, training sessions and one-on-one meetings. We actively consult to develop methodologies that meet the markets' needs, and ensure that the IOSCO (short for the International Organization of Securities Commissions; headquartered in Madrid, Spain) principles are central to our approach. Each year we host high-profile industry events, such as the prestigious S&P Global Platts Global Energy Awards, to celebrate success and provide a platform for our customers to exchange ideas and make valuable connections. Our Part Of A Wider Business:- S&P Global Platts is a division of S&P Global, the world's foremost provider of ratings, benchmarks and analytics in the global capital and commodity markets. Our other divisions include:- (i) S&P Global Ratings, which provides credit ratings, research and insights essential to driving growth and transparency; (ii) S&P Global Market Intelligence, which provides insights into companies, markets and data so that business and financial decisions can be made with conviction; and (iii) S&P Dow Jones Indices, the world's largest resource for iconic and innovative indices, which helps investors pinpoint global opportunities. S&P Global has a proud 150+ year heritage as a trusted source of information to the business community – bringing transparency and cutting edge research and analytics to markets worldwide. Integrity, excellence, and relevance remain at the center of everything we do. See also Argus Media Ltd; Platts; and Standard And Poor's. S&P Global Platts is a provider of energy and commodities information and a source of benchmark price assessments in the physical energy markets. The business was started with the foundation in 1909 of the magazine National Petroleum News by Warren C. Platt. S&P Global Platts and Argus Media are recognized as the two most significant price reporting agencies for the oil market. Overview:- from an original focus on the oil industry, S&P Global Platts gradually expanded its purview to include metals, shipping, and all energy-related markets – oil, coal, natural gas, electricity, nuclear power, petrochemicals, renewables, and emissions. S&P Global Platts is a division of S&P Global, Inc., (NYSE:- SPGI), a provider of ratings, benchmarks and analytics to the global capital and commodity markets. The firm is sister to brands like S&P Global Ratings, S&P Global Market Intelligence and S&P Dow Jones Indices. It had been part of the Commodities & Commercial group of S&P Global, but that group saw all its assets, besides Platts, slowly sold off. It is now considered a stand-alone division of S&P Global, though its President Martin Fraenkel reports into Mike Chinn, the head of S&P Global's Market Intelligence group. / Бэнтэк Энодьжи (Bentek Energy), си.Флоу (cFlow), Иклипс Энодьжи (Eclipse Energy), Киньзмэн (Kingsman), Пэтчромидиа (Petromedia), Пи.Ай.Ар.Эй. Энодьжи Груп (PIRA Energy Group), РигДэйтча (RigData) и Эс.Би.Би. (SBB). Эс.ЭндПи. Дау Дьжонз (S&P Dow Jones). Ворэн Каминь Плат (Warren Cumming Platt). Аргас Мидиа Эл.ти.ди. (Argus Media Ltd). S&P/TSX60 = ЭС.ЭНД.ПИ./ТИ.ЭС.ЭКС.60 – S&P/TSX60:- this is an index of 60 blue chip companies comprising the Standard and Poor's Toronto Stock Exchange Index. / Стэндод энд Поз (Standard & Poor's).

S&T = SCIENCE AND TECHNOLOGY

S_0 = ЭС.$_0$ – S_0 is a symbol used to designate the original selfed plant.

S_1, S_2 = ЭС.$_1$, ЭС.$_2$ – S_1, S_2, etc are symbols designating first-selfed generation (progeny of S_0 plant), second-selfed generation (progeny of S_1 plant), etc.

SA = SAUDI ARABIA

SA = SOCIEDAD ANONIMA

SA = SOCIÉTÉ ANONYME

SA 8000 = CO 8000 – Standard for Social Accountability (SA) based on international workplace norms in the International Labour Organisation (ILO) conventions and the UN's Universal Declaration of Human Rights and the Convention on Rights of the Child. / Стандарт для Социальной Ответственности (СО), основанный на.

SAA = SPECIAL ARBITRAGE ACCOUNT

SAARC = SOUTH ASIAN ASSOCIATION FOR REGIONAL COOPERATION

SAB = SPECIAL ASSESSMENT BOND

SABLE = ХХ (или ВОРОНОЕ, или СОБОЛЬЕ, или СОБОЛИНОЕ, или ТРАУРНОЕ) – Sable:- black; dark brown color of the fur of the sable; a grayish yellowish brown.

SABOT = САБО (или ДЕРЕВЯННЫЙ БАШМАК) – Sabot is a European wooden shoe; a shoe having a sabot strap, namely a strap across the instep in a sandal type shoe. / Сабо – Европейская деревянная обувь; обувь, имеющая .

SABRAO = SOCIETY FOR THE ADVANCEMENT OF BREEDING RESEARCHES IN ASIA AND OCEANIA

SACCAR = SOUTHERN AFRICAN CENTRE FOR COOPERATION IN AGRICULTURAL RESEARCH AND TRAINING

SACCHARIN = САХАРИН – Saccharin is a low calorie, artificial sweetener used as a substitute for sugar mainly in beverage preparations. / Под Сахарином понимается, имид о-сульфобензойной кислоты, бесцветные кристаллы жгуче-сладкого вкуса, плохо растворимые в воде (1: 250) и спирте (1: 40); $t_{пл}$ 228–229 °C. Кристаллогидрат натриевой соли сахарин так называемая Кристаллоза, растворима в воде лучше, чем сахарин (1:1.5). Получают сахарин в промышленности окислением о-толуолсульфамида. Ранее сахарин в значительных количествах применялся в пищу как заменитель сахара (сахарин слаще сахара в 400–500 раз, организмом не усваивается и выводится с мочой). Сахарин используют для подслащивания различных изделий (например, зубных паст), как добавку в гальванотехнике.

SACK = САК (или ПЛАТЬЕ–РУБАШКА, или ХХ) – Sack is a woman's loose-fitting dress; a short usually loose-fitting coat for women and children.

SACKCLOTH = ТАРНАЯ ТКАНЬ (или МЕШОЧНОЕ ПОЛОТНО, или ДЕРЮГА, или ГРУБЫЙ ХОЛСТ) – Sackcloth is a garment of sackcloth, namely a coarse cloth of camel's hair or cotton, worn as a sign of mourning or penitence. A coarse cloth of goat or camel's hair or of flax, hemp, or cotton.

SACK COAT = ПОЛУПАЛЬТО (или САККО, или САК, или ХХ) – Sack Coat is a man's jacket with a straight back.

SACKING = МЕШКОВИНА (или ДЕРЮГА, или ПАРУСИНА, или ТАРНАЯ ТКАНЬ) – Sacking is a material for sacks:- esp. a coarse fabric (as burlap or gunny).

SACQUE = САК (или САКЕ, или РАСПАШОНКИ) – Sacque is an infant's usually short jacket that fastens at the neck. / .

SACRIFICE = ПОЖЕРТВОВАНИЕ (или ПРИНОШЕНИЕ В ЖЕРТВУ, или ЖЕРТВОПРИНОШЕНИЕ) – Sacrifice is an act accomplished for the welfare of all interests, such as throwing part of a cargo overboard to keep a ship from sinking. Sacrifice is the deliberate destruction or jettisoning of property to prevent greater loss. See also General Average.

SACU = SOUTHERN AFRICAN CUSTOMS UNION

SAD = SINGLE ADMINISTRATIVE DOCUMENT

SADC = SOUTHERN AFRICAN DEVELOPMENT COMMUNITY

SADDLE–BAG = СЕДЕЛЬНЫЙ ВЬЮК (или ПЕРЕМЁТНАЯ СУМА) – Saddlebag is a pouch-like purse with a flap that folds over the top opening.

SADDLE SHOE = ОБУВЬ СО ВСТАВКОЙ В ОБЛАСТИ ПОДЪЁМА (или СЕДЛОВИДНАЯ ОБУВЬ) – Saddle Shoe is an Oxford-style shoe having a saddle of contrasting color or leather. Also called as Saddle Oxford. / Двухцветные туфли. Полуботинок (Oxford).

SAE = SOCIETY OF AUTOMOTIVE ENGINEERS

SAE GRADES = СОРТА ПО САИ – SAE Grades:- SAE stands for the Society of Automotive Engineers. The SAE classification system is a way of defining how thin or how thick an oil is. This is known as an oil's viscosity. The classifications are listed here in order of increasing thickness: SAE 75W, SAE 80W, SAE 85W, SAE 90, SAE 140, SAE 250.

SAE NUMBER = ЧИСЛО ПО САИ (или НОМЕР ПО САИ) – Society of Automotive Engineers (SAE) Number of the oil indicates its viscosity based on classification involving two temperatures. Every lubricating oil comes with a specific SAE number. The Society of Automotive Engineers is responsible for the classification of SAE numbers. SAE Number is a number in a standard series from 10 to 70 for grading lubricating oil as to viscosity. The higher the SAE number the greater the viscosity.

SAE PORT = ОТВЕРСТИЕ ПО САИ – Society of Automotive Engineers (SAE) Port is a straight thread port used to attach tube and hose fittings. It employs an 'O' ring compressed in a wedge-shaped cavity. A standard of the Society of Automotive Engineers J514 and ANSI/B116.1. / используемое для присоединения арматуры трубопроводов и шлангов. в клиновидной раковине (или полости или впадине).

SAE VISCOSITY = ВЯЗКОСТЬ ПО САИ – Society of Automotive Engineers (SAE) Viscosity is the viscosity classification of a motor oil according to the system developed by the Society of Automotive Engineers (SAE) and now in general use. 'Winter' grades are defined by viscosity measurements at low temperatures and have 'W' as a suffix, while 'Summer' grades are defined by viscosity at 100 °C and have no suffix. Multigrade oils meet both a winter and a summer definition and have designations such as SAE 10W-30, etc. See also Viscosity.

SAFA = SUSTAINABILITY ASSESSMENT OF FOOD AND AGRICULTURE SYSTEMS

SAFARI BAG = СУМКА ДЛЯ САФАРИ (или ОХОТНИЧИЙ РЮКЗАК) – Safari Bag is a soft leather purse with a curved rectangular shape, a buckled center strap, two outside pockets with buckled flaps, and two strap handles.

SAFARI JACKET = ЖАКЕТ ДЛЯ САФАРИ (или ОХОТНИЧИЙ ЖАКЕТ) – Safari Jacket is a usually belted shirt jacket with pleated expansible pockets.

SAFE = SECURE APPLICATION FILED ELECTRONICALLY

SAFE = SIMULATION ANALYSIS OF FINANCIAL EXPOSURE

SAFE = СЕЙФ – Safe:- also called Safe Deposit Box which banks lease to their customers in burglarproof and fireproof vaults. The purpose of bank safes is the safe storage of valuables. / Сейф, от Английского слова Safe, означающее буквально Безопасный или Надёжный или Невредимый, стальной несгораемый ящик или шкаф для хранения документов, денег и материальных ценностей. Иногда сейфом называют банковские помещения-хранилища, имеющие стальные или железобетонные стены и бронированные двери с секретными запорами, оснащённые системами автоматической сигнализации.

SAFE CUSTODY ACCOUNT = СЧЁТ БЕЗОПАСНОГО ДЕПО (или СЧЁТ БЕЗОПАСНОГО ДОВЕРИТЕЛЬНОГО УПРАВЛЕНИЯ) – Safe Custody Account:- securities can be deposited with banks for safekeeping and administration. A safe custody account (the counterpart of an account for money transactions) is set up for each customer; it indicates the types, nominal amounts or quantities, code numbers etc of the securities deposited, as well as the name and address of the depositing party (custody account-holder). These regulations apply to jacket custody and analogously to collective custody. For checking purposes, banks maintain two types of safe custody ledgers:- personal custody accounts and asset custody accounts. The former classification is by name of the custody account-holder, the latter by type of security. Asset custody accounts are especially important for the administrative work carried out by banks. Special types of custody accounts include joint or trustee securities accounts. Collective custody is more efficient and less costly than jacket custody. The German Safe Custody Act (DepotG) constitutes the legal basis for the safekeeping and administration of securities

by banks. It serves to protect persons who deposit their securities with banks, particularly in the event of bankruptcy of the depository bank.

SAFE CUSTODY CHARGES = СБОРЫ ЗА БЕЗОПАСНОЕ ДЕПО (или СБОРЫ ЗА БЕЗОПАСНОЕ ДОВЕРИТЕЛЬНОЕ УПРАВЛЕНИЕ) – Safe Custody Charges:- the price banks charge their customers for managing their securities portfolios. This includes, above all, safe custody and administrative services. The latter includes expenses incurred in connection with interest and dividend payments as well as capital repayments. The related costs are charged to custody account-holders as safe custody charges on a quarterly or annual basis.

SAFE DEPOSIT BOX = ДЕПОЗИТНАЯ СЕЙФОВАЯ ЯЧЕЙКА – The Safe Deposit Box is a convenient place to store important items that would be difficult or impossible to replace. The safe deposit box also offers privacy (only you know what is inside) and security. Although many people like to keep valuables close by in a closet, safe or file cabinet at home or in the office, these places probably are not as resistant to fire, water or theft. Also, some insurance companies charge lower insurance premiums on valuables kept in a bank's safe deposit box instead of at home. Lockable deposit box which is located in the vault and can be leased out to the bank's customers. See also Vault. Items you should protect:- (i) valuables (jewellery and family heirlooms); (ii) collectibles (gold or silver coins, porcelain, watches or rare stamps); (iii) documents (title deeds, professional certificates); and (iv) receipts (especially those for high value items). Safe Deposit Box is strictly confidential and only accessible by authorized customer. Also known as Safety Deposit Box. / Смотрите также Депозитарий или Хранилище (Vault). Многие крупные банки предлагают своим клиентам хранить драгоценности, ценные бумаги, важные документы и прочее в специально предназначенных для этого ячейках в банке. Для этих целей в банке выделяется специальное помещение – хранилище, оснащённое современным оборудованием, системой охраны и средствами пожарной сигнализации, и имеющее ограниченный доступ лиц. Именно в этом хранилище и размещаются депозитные сейфовые ячейки для клиентов. Данные ячейки в форме сейфа в зависимости от нужд клиентов могут быть разных размеров, кроме того ячейка может быть оборудована дополнительным внутренним контейнером для хранения особых ценностей. Клиенты могут воспользоваться такими ячейками в любое время, когда банк открыт для клиентов. Открытие арендованной депозитной сейфовой ячейки производится клиентом совместно с ответственным сотрудником банка. Для открытия ячейки сотрудник банка осуществляет её разблокировку с помощью электронной системы контроля доступа или механического ключа. По желанию клиента банк может предоставить доступ к арендованной депозитной сейфовой ячейке его деловым партнёрам, клиентам или родственникам. Для этого необходимо оформить дополнительное соглашение или оформить на данных лиц соответствующую доверенность, заверенную нотариусом. Развивая данную услугу, ряд банков стал предлагать своим клиентам надёжное хранение в таких ячейках, размещённых в банковском хранилище ценностей клиентов, расположенном, например, в аэропорте. В этом случае банк использует высоконадёжные сейфы в бронированном корпусе. Вылетая в другой город или страну, клиент банка может оставить свои ценности в автоматизированном хранилище банка, расположенном в изолированном помещении, оборудованном системой доступа с использованием магнитной карты. Такое хранилище работает, как правило, в режиме самообслуживания, а клиент имеет круглосуточный тоступ к своей ячейке. Следует иметь в виду, что в большинстве случаев в соответствии с законодательством в банковских ячейках запрещается хранить взрывчатые, легковоспламеняющиеся, токсичные, радиоактивные, наркотические и другие вещества, способные оказать вредное воздействие на человека и окружающую среду, огнестрельное оружие, боеприпасы и имущество, изъятое из гражданского оборота.

SAFEGUARDING INTERESTS = ЗАЩИЩАЯ ИНТЕРЕСЫ – Safeguarding Interests:- rider used in securities trading for large 'at best' orders. The notation authorizes the broker (depending on stock market price developments) to temporarily abstain from buying or selling if the immediate and complete execution of the order would adversely affect the price of the securities to the disadvantage of the customer.

SAFEGUARDS = ЗАЩИТНЫЕ МЕРЫ – The GATT (short for the General Agreement on Tariffs and Trade) permits two forms of multilateral Safeguards:- (a) a country's right to impose temporary import controls or other trade restrictions to prevent commercial injury to domestic industry, and (b) the corresponding right of exporters not to be deprived arbitrarily of access to markets. Article XIX of the GATT permits a country whose domestic industries or workers are adversely affected by increased imports to withdraw or modify concessions the country had earlier granted, to impose, for a limited period, new import restrictions if the country can establish that a product is 'being imported in such increased quantities as to cause or threaten serious injury to domestic producers', and to keep such restrictions in effect for a such time as may be necessary to prevent or remedy such injury. / Генерального Соглашения о Тарифах и Торговле (ГСТТ или ГЯТ (GATT)) .

SAFEKEEPING = ОТВЕТСТВЕННОЕ ХРАНЕНИЕ (или ЗАКРЫТЫЙ СПОСОБ УЧЁТА ЦЕННЫХ БУМАГ, или БЕРЕЖЕНЬЕ) – (1) Safekeeping is a custodian's or depository's holding of physical (certificated) or immobilized securities. Safekeeping Fees:- from 2% to 4% based on the type of assets. / Под Закрытым Способом Учёта Ценных Бумаг понимается способ учёта прав на ценные бумаги, при котором депозитарий обязуется принимать и исполнять поручения клиента (депонента) в отношении любой конкретной ценной бумаги, учтённой на его счёте депо, или ценных бумаг, учтённых на его счёте депо и учёта ценных бумаг, удостоверенных конкретным сертификатом. Под Ответственным Хранением понимается хранение груза в случае отказа от него получателем. Во времена бывшего Союза Советских Социалистических Республик (СССР) под Ответственным Хранением понималось хранение покупателем (получателем, заказчиком) поступивших к нему, но ещё не оплаченных им товаров.

(2) In the United States, a Safekeeping is a benefit offered to active duty military members who purchase savings bonds through the payroll savings plan. This benefit allows the military members to have their bonds held by their branch of service instead of having the bonds issued and mailed directly to them. Note:- Treasury is phasing out the issuance of paper savings bonds through traditional employer-sponsored payroll savings plans. As of 2010-September-30, federal employees will no longer be able to purchase paper savings bonds through payroll deduction. The end date for all other (non-federal) employees is 2011-January-01.

SAFEKEEPING ACCOUNT = СЧЁТ ОТВЕТСТВЕННОГО ХРАНЕНИЯ – Safekeeping Account is an account used to safeguard valuables or securities. In a sealed safekeeping account, the valuables are surrendered for safe custody, wrapped or sealed. This kind of account is suitable for valuables which do not require management or administration, such as jewelry or documents. In an open safekeeping account the safe custody function is combined with an agreement with the bank to manage or administer the contents, usually securities. Also known as Custody Account. See also Managed Account.

SAFEKEEPING ACCOUNT ANALYSIS = АНАЛИЗ СЧЁТА ОТВЕТСТВЕННОГО ХРАНЕНИЯ – Safekeeping Account Analysis is an analysis of a securities safekeeping account according to market value, income and industry-, country- and currency-specific risk exposure. Also known as Custody Account Analysis.

SAFEKEEPING ACCOUNT BOOKKEEPING = УЧЁТ ПО СЧЁТУ ОТВЕТСТВЕННОГО ХРАНЕНИЯ – Safekeeping Account Bookkeeping:- keeping a record of all securities deposited with a bank by safekeeping account number and within the safekeeping accounts by securities number.

SAFEKEEPING ACCOUNT CHARGES = СБОРЫ ЗА СЧЁТ ОТВЕТСТВЕННОГО ХРАНЕНИЯ – Safekeeping Account Charges are the annual fees charged by banks for the custody and administration of securities. Also known as Custody Charges. / Ежегодные вознаграждения, взимаемые банками за доверительное управление и администрирование ценными бумагами. Известны также как Сборы За Доверительное Управление (Custody Charges).

SAFE TO TRANSPORT = БЕЗОПАСЕН ДЛЯ ПЕРЕВОЗКИ (или НАДЁЖЕН ДЛЯ ТРАНСПОРТИРОВКИ) – Safe To Transport:- cargo is secured appropriately if it is loaded, stowed and secured in such a way that it cannot be damaged by events that can be reasonably expected during carriage.

SAFETY CLOTHS = БЕЗОПАСНЫЕ ПОЛОТНА (или НАДЁЖНЫЕ ПОЛОТНА) – Safety Cloths:- fireproof.

SAFETY STOCK = НЕПРИКОСНОВЕННЫЙ ТОВАРНЫЙ ЗАПАС (или ТОВАРНЫЙ ЗАПАС ПРОЗАПАС, или МАТЕРИАЛЬНЫЕ ЦЕННОСТИ ПРОЗАПАС) – Safety Stock:- used to ensure availability of stock in case of deviations in supply or demand. These are calculated by using past deviations. To determine the optimal safety stock level, a required service level multiplier is needed.

THE SAFFIR–SIMPSON HURRICANE SCALE = ШКАЛА САФИРА–СИМПСЭНА ПО МОЩИ УРАГАНОВ – The Saffir-Simpson Hurricane Scale is a 1–5 rating based on the hurricane's present intensity. This is used to give an estimate of the potential property damage and flooding expected along the coast from a hurricane landfall. Wind speed is the determining factor in the scale, as storm surge values are highly dependent on the slope of the continental shelf and the shape of the coastline, in the landfall region. Note that all winds are using the US 1-minute average. (i) Category One Hurricane:- Winds 74–95 mph (64–82 kt or 119–153 km/hr). Storm surge generally 4–5 ft above normal. No real damage to building structures. Damage primarily to unanchored mobile homes, shrubbery, and trees. Some damage to poorly constructed signs. Also, some coastal road flooding and minor pier damage. Hurricane Lili of 2002 made landfall on the Louisiana coast as a Category One hurricane. Hurricane Gaston of 2004 was a Category One hurricane that made landfall along the central South Carolina coast. (ii) Category Two Hurricane:- Winds 96–110 mph (83–95 kt or 154–177 km/hr). Storm surge generally 6–8 feet above normal. Some roofing material, door, and window damage of buildings. Considerable damage to shrubbery and trees with some trees blown down. Considerable damage to mobile homes, poorly constructed signs, and piers. Coastal and low-lying escape routes flood 2–4 hours before arrival of the hurricane center. Small craft in unprotected anchorages break moorings. Hurricane Frances of 2004 made landfall over the southern end of Hutchinson Island, Florida as a Category Two hurricane. Hurricane Isabel of 2003 made landfall near Drum Inlet on the Outer Banks of North Carolina as a Category 2 hurricane. (iii) Category Three Hurricane:- Winds 111–130 mph (96–113 kt or 178–209 km/hr). Storm surge generally 9–12 ft above normal. Some structural damage to small residences and utility buildings with a minor amount of curtainwall failures. Damage to shrubbery and trees with foliage blown off trees and large trees blown down. Mobile homes and poorly constructed signs are destroyed. Low-lying escape routes are cut by rising water 3–5 hours before arrival of the center of the hurricane. Flooding near the coast destroys smaller structures with larger structures damaged by battering from floating debris. Terrain continuously lower than 5 ft above mean sea level may be flooded inland 8 miles (13 km) or more. Evacuation of low-lying residences with several blocks of the shoreline may be required. Hurricanes Jeanne and Ivan of 2004 were Category Three hurricanes when they made landfall in Florida and in Alabama, respectively. (iv) Category Four Hurricane:- Winds 131–155 mph (114–135 kt or 210–249 km/hr). Storm surge generally 13–18 ft above normal. More extensive curtainwall failures with some complete roof structure failures on small residences. Shrubs, trees, and all signs are blown down. Complete destruction of mobile homes. Extensive damage to doors and windows. Low-lying escape routes may be cut by rising water 3–5 hours before arrival of the center of the hurricane. Major damage to lower floors of structures near the shore. Terrain lower than 10 ft above sea level may be flooded requiring massive evacuation of residential areas as far inland as 6 miles (10 km). Hurricane Charley of 2004 was a Category Four hurricane made landfall in Charlotte County, Florida with winds of 150 mph. Hurricane Dennis of 2005 struck the island of Cuba as a Category Four hurricane. (v) Category Five Hurricane:- Winds greater than 155 mph (135 kt or 249 km/hr). Storm surge generally greater than 18 ft above normal. Complete roof failure on many residences and industrial buildings. Some complete building failures with small utility buildings blown over or away. All shrubs, trees, and signs blown down. Complete destruction of mobile homes. Severe and extensive window and door damage. Low-lying escape routes are cut by rising water 3–5 hours before arrival of the center of the hurricane. Major damage to lower floors of all structures located less than 15 ft above sea level and within 500 yards of the shoreline. Massive evacuation of residential areas on low ground within 5–10 miles (8–16 km) of the shoreline may be required. Only 3 Category Five Hurricanes have made landfall in the United States since records began:- The Labor Day Hurricane of 1935, Hurricane Camille (1969), and Hurricane Andrew in August, 1992. The 1935 Labor Day Hurricane struck the Florida Keys with a minimum pressure of 892 mb – the lowest pressure ever observed in the United States. Hurricane Camille struck the Mississippi Gulf Coast causing a 25-foot storm surge, which inundated Pass Christian. Hurricane Katrina, a category 5 storm over the Gulf of Mexico, was still responsible for at least 81 billion Dollars of property damage when it struck the US Gulf Coast as a category 3. It is by far the costliest hurricane to ever strike the United States. In addition, Hurricane Wilma of 2005 was a Category Five hurricane at peak intensity and is the strongest Atlantic tropical cyclone on record with a minimum pressure of 882 mb. See also Hurricane. (i) Tropical Storm:- winds 39–73 mph. (ii) Category 1 Hurricane:- winds 74–95 mph (64–82 kt). No real damage to buildings. Damage to unanchored mobile homes. Some damage to poorly constructed signs. Also, some coastal flooding and minor pier damage. Examples:- Irene 1999 and Allison 1995. (iii) Category 2 Hurricane:- winds 96–110 mph (83–95 kt). Some damage to building roofs, doors and windows. Considerable damage to mobile homes. Flooding damages piers and small craft in unprotected moorings may break their moorings. Some trees blown down. Examples:- Bonnie 1998, Georges (FL & LA) 1998 and Gloria 1985. (iv) Category 3 Hurricane:- winds 111–130 mph (96–113 kt). Some structural damage to small residences and utility buildings. Large trees blown down. Mobile homes and poorly built signs destroyed. Flooding near the coast destroys smaller structures with larger structures damaged by floating debris. Terrain may be flooded well inland. Examples:- Keith 2000, Fran 1996, Opal 1995, Alicia 1983 and Betsy 1965. (v) Category 4 Hurricane:- winds 131–155 mph (114–135 kt). More extensive curtainwall failures with some complete roof structure failure on small residences. Major erosion of beach areas. Terrain may be flooded well inland. Examples:- Hugo 1989 and Donna 1960. (vi) Category 5 Hurricane:- winds 156 mph and up (135+ kt). Complete roof failure on many residences and industrial buildings. Some complete building failures with small utility buildings blown over or away. Flooding causes major damage to lower floors of all structures near the shoreline. Massive evacuation of residential areas may be required. Examples:- Andrew (FL) 1992, Camille 1969 and Labor Day 1935. The Saffir-Simpson Hurricane Scale (definitions and effects) in its current form, as applied to storms in the Atlantic and eastern North and Central Pacific basins, includes storm surge ranges and flooding references. On an experimental basis for the 2009 Tropical Cyclone Season, these storm surge ranges and flooding references will be removed from the definition/effects for each category (1–5). The revised content will be included experimentally this year in a scale called the 'Saffir-Simpson Hurricane Wind Scale'. The current Saffir-Simpson Hurricane Scale (SSHS) dates to 1975 and is based on expected

hurricane wind speed, but includes storm surge ranges and other storm-related information. The inclusion of storm surge information is scientifically inaccurate because surge is a product of many factors not considered in the scale such as storm size and forward speed, and bathymetry and characteristics of the coastline in the landfall location. Storm surge values for each category are frequently incorrect. A most recent example of this is Hurricane Ike in 2008. The storm made landfall with Category 2 winds. However, the storm surge at Galveston was equivalent to what is currently defined for the Category 4–5 storm range. The National Hurricane Center (NHC) and Weather Forecast Office (WFO) Houston provided deterministic forecasts in their products on the extreme storm surge, but reports from Emergency Managers came back with many residents stating they would not evacuate because the storm was only a SSHS Category 2 or 3. Other examples include:- Hurricane Charley in 2004, a Category 4 storm at landfall on the SSHS for winds but with storm surge equivalent to the Category 2 range; and Hurricane Katrina in 2005, a Category 3 storm at landfall for winds but with storm surge equivalent to the Category 5 storm range. More precise expected storm surge for individual storms are contained in other NWS products issued from NHC and the Central Pacific Hurricane Center (CPHC) (Tropical Cyclone Discussion, Tropical Cyclone Public Advisory), from NHC only, (Graphical Tropical Cyclone Storm Surge Probabilities), and from Local Weather Forecast Offices (Hurricane Local Statement, Area Forecast Discussion, Special Weather Statements, and Coastal Hazard Message). NWS has solicited preliminary customer feedback on taking the storm surge information out of the current SSHS at venues, including the Subcommittee for Disaster Reduction (20 Federal departments/agencies), interagency meetings, conferences and training centers, and non-governmental and private organizations. NWS will make a decision on whether or not to make this an operational change for the 2010 tropical cyclone season after additional feedback is received. Comments will be accepted throughout the 2009 Tropical Cyclone Season – June 01, 2009 through November 30, 2009. All Hurricanes are dangerous, but some are more so than others. The way storm surge, wind and other factors combine determines the hurricanes destructive power. To make comparisons easier and to make the predicted hazards of approaching hurricanes clearer to emergency managers, National Oceanic and Atmospheric Administration's hurricane forecasters use a disaster-potential scale which assigns storms to five categories. This can be used to give an estimate of the potential property damage and flooding expected along the coast with a hurricane. The scale was formulated in 1969 by Herbert Saffir, a consulting engineer, and Dr. Bob Simpson, director of the National Hurricane Center. The World Meteorological Organization was preparing a report on structural damage to dwellings due to windstorms, and Dr. Simpson added information about storm surge heights that accompany hurricanes in each category. / Айк (Ike) в 2008. Чарли (Charley) в 2004. Кэтчрина (Katrina) в 2005. Примеры:- Айрин 1999 (Irene 1999) и Алисэн (Allison 1995). Примеры:- Бани 1998 (Bonnie 1998), Дьжодьжес 1998 (Georges (FL & LA) 1998) и Глориа (Gloria 1985). Примеры:- Кис 2000 (Keith 2000), Фрэн 1996 (Fran 1996), Опэл 1995 (Opal 1995), Элища 1983 (Alicia 1983) и Бэтси 1965 (Betsy 1965). Примеры:- Хьюго (Hugo 1989) и Дана 1960 (Donna 1960). Примеры:- Examples:- Эндрю 1992 (Andrew (FL) 1992), Камий 1969 (Camille 1969) и (Labor Day 1935). Доктор Баб Симпсэн (Dr. Bob Simpson).

SAFFIR–SIMPSON HURRICANE WIND SCALE = ШКАЛА САФИРА–СИМПСЭНА ПО МОЩИ УРАГАННЫХ ВЕТРОВ – The Saffir-Simpson Hurricane Wind Scale is a 1 to 5 categorization based on the hurricane's intensity at the indicated time. The scale provides examples of the type of damages and impacts in the United States associated with winds of the indicated intensity. In general, damages rise by about a factor of four for every category increase. The maximum sustained surface wind speed (peak 1-minute wind at 10 m (33 ft)) is the determining factor in the scale. The historical examples (one for the US Gulf Coast and one for the US Atlantic Coast) provided in each of the categories correspond with the intensity of the hurricane at the time of landfall in the location experiencing the strongest winds, which does not necessarily correspond with the peak intensity reached by the system during its lifetime. The scale does not address the potential for such other hurricane-related impacts, as storm surge, rainfall-induced floods, and tornadoes. These wind-caused impacts are to apply to the worst winds reaching the coast and the damage would be less elsewhere. It should also be noted that the general wind-caused damage descriptions are to some degree dependent upon the local building codes in effect and how well and how long they have been enforced. For example, recently enacted building codes in Florida, North Carolina and South Carolina are likely to somewhat reduce the damage to newer structures from that described below. However, for a long time to come, the majority of the building stock in existence on the coast will not have been built to higher code. Hurricane wind damage is also dependent upon such other factors as duration of high winds, change of wind direction, amount of accompanying rainfall, and age of structures. Earlier versions of this scale – known as the Saffir-Simpson Hurricane Scale – incorporated central pressure and storm surge as components of the categories. The central pressure was utilized during the 1970s and 1980s as a proxy for the winds as accurate wind speed intensity measurements from aircraft reconnaissance were not routinely available for hurricanes until 1990. Storm surge was also quantified by category in the earliest published versions of the scale dating back to 1972. However, hurricane size (extent of hurricane force winds), local bathymetry (depth of near-shore waters), and topographic forcing can also be important in forecasting storm surge. Moreover, other aspects of hurricanes – such as the system's forward speed and angle to the coast – also impact the storm surge that is produced. For example, the very large Hurricane Ike (with hurricane force winds extending as much as 125 mi from the center) in 2008 made landfall in Texas as a Category 2 hurricane and had peak storm surge values of 15–20 ft. In contrast, tiny Hurricane Charley (with hurricane force winds extending at most 25 mi from the center) struck Florida in 2004 as a Category 4 hurricane and produced a peak storm surge of only 6–7 ft. These storm surge values were substantially outside of the ranges suggested in the original scale. Thus to help reduce public confusion about the impacts associated with the various hurricane categories as well as to provide a more scientifically defensible scale, the storm surge ranges, flooding impact and central pressure statements are being removed from the scale and only peak winds are employed in this revised version – the Saffir-Simpson Hurricane Wind Scale. Categories:- (i) Category One Hurricane:- sustained winds 74–95 mph (64–82 kt or 119–153 km/hr). Damaging winds are expected. Some damage to building structures could occur, primarily to unanchored mobile homes (mainly pre-1994 construction). Some damage is likely to poorly constructed signs. Loose outdoor items will become projectiles, causing additional damage. Persons struck by windborne debris risk injury and possible death. Numerous large branches of healthy trees will snap. Some trees will be uprooted, especially where the ground is saturated. Many areas will experience power outages with some downed power poles. Hurricane Cindy (2005, 75 mph winds at landfall in Louisiana) and Hurricane Gaston (2004, 75 mph winds at landfall in South Carolina) are examples of Category One hurricanes at landfall. (ii) Category Two Hurricane:- Sustained winds 96–110 mph (83–95 kt or 154–177 km/hr). Very strong winds will produce widespread damage. Some roofing material, door, and window damage of buildings will occur. Considerable damage to mobile homes (mainly pre-1994 construction) and poorly constructed signs is likely. A number of glass windows in high rise buildings will be dislodged and become airborne. Loose outdoor items will become projectiles, causing additional damage. Persons struck by windborne debris risk injury and possible death. Numerous large branches will break. Many trees will be uprooted or snapped. Extensive damage to power lines and poles will likely result in widespread power outages that could last a few to several days. Hurricane Erin (1995, 100 mph at landfall in northwest Florida) and Hurricane Isabel (2003, 105 mph at landfall in North Carolina) are examples of Category Two hurricanes at landfall. (iii) Category Three Hurricane:- Sustained winds 111–130 mph (96–113 kt or 178–209 km/hr). Dangerous winds will cause extensive damage. Some structural damage to houses and buildings will occur with a minor amount of wall failures. Mobile homes (mainly pre-1994 construction) and poorly constructed signs are destroyed. Many windows in high rise buildings will be dislodged and become airborne. Persons struck by windborne debris risk injury and possible death. Many trees will be snapped or uprooted and block numerous roads. Near total power loss is expected with outages that could last from several days to weeks. Hurricane Rita (2005, 115 mph landfall in east Texas/Louisiana) and Hurricane Jeanne (2004, 120

mph landfall in southeast Florida) are examples of Category Three hurricanes at landfall. (iv) Category Four Hurricane:- Sustained winds 131–155 mph (114–135 kt or 210–249 km/hr). Extremely dangerous winds causing devastating damage are expected. Some wall failures with some complete roof structure failures on houses will occur. All signs are blown down. Complete destruction of mobile homes (primarily pre-1994 construction). Extensive damage to doors and windows is likely. Numerous windows in high rise buildings will be dislodged and become airborne. Windborne debris will cause extensive damage and persons struck by the wind-blown debris will be injured or killed. Most trees will be snapped or uprooted. Fallen trees could cut off residential areas for days to weeks. Electricity will be unavailable for weeks after the hurricane passes. Hurricane Charley (2004, 145 mph at landfall in southwest Florida) and Hurricane Hugo (1989, 140 mph at landfall in South Carolina) are examples of Category Four hurricanes at landfall. (v) Category Five Hurricane:- sustained winds greater than 155 mph (135 kt or 249 km/hr). Catastrophic damage is expected. Complete roof failure on many residences and industrial buildings will occur. Some complete building failures with small buildings blown over or away are likely. All signs blown down. Complete destruction of mobile homes (built in any year). Severe and extensive window and door damage will occur. Nearly all windows in high rise buildings will be dislodged and become airborne. Severe injury or death is likely for persons struck by wind-blown debris. Nearly all trees will be snapped or uprooted and power poles downed. Fallen trees and power poles will isolate residential areas. Power outages will last for weeks to possibly months. Hurricane Camille (1969, 190 mph at landfall in Mississippi) and Hurricane Andrew (1992, 165 mph at landfall in Southeast Florida) are examples of Category Five hurricanes at landfall. Categories:- (i) Tropical Storm – winds 39–73 mph. (ii) Category 1 Hurricane – winds 74–95 mph (64–82 kt). No real damage to building structures. Damage primarly to unanchored mobile homes, shrubbery, and trees. Some damage to poorly constructed signs. Also, some coastal road flooding and minor pier damage. Examples:- Irene 1999 and Allison 1995. (iii) Category 2 Hurricane – winds 96–110 mph (83–95 kt). Some damage to building roofs, doors and windows. Considerable damage to vegetation, mobile homes, and piers. Coastal and low-lying escape routes flood 2–4 hours before arrival of center. Small craft in unprotected anchorages break moorings. Flooding damages piers and small craft in unprotected moorings may break their moorings. Some trees blown down. Examples:- Bonnie 1998, Georges (FL & LA) 1998 and Gloria 1985. (iv) Category 3 Hurricane – winds 111–130 mph (96–113 kt). Some structural damage to small residences and utility buildings with a minor amount of curtainwall failures. Large trees blown down. Mobile homes and poorly built signs destroyed. Flooding near the coast destroys smaller structures with larger structures damaged by floating debris. Terrain continuously lower than 5 feet ASL may be flooded well inland 8 miles or more. Examples:- Keith 2000, Fran 1996, Opal 1995, Alicia 1983 and Betsy 1965. (v) Category 4 Hurricane – winds 131–155 mph (114–135 kt). More extensive curtainwall failures with some complete roof structure failure on small residences. Major erosion of beach areas. Major damage to lower floors of structures near the shore. Terrain continuously lower than 10 feet ASL may be flooded requiring massive evacuation of residential areas inland as far as 6 miles. Examples:- Hugo 1989 and Donna 1960. (vi) Category 5 Hurricane – winds 156 mph and up (135+ kt) (greater than 155 mph). Complete roof failure on many residences and industrial buildings. Some complete building failures with small utility buildings blown over or away. Flooding causes major damage to lower floors of all structures near the shoreline or located less than 15 feet ASL and within 500 yards of the shoreline. Massive evacuation of residential areas on low ground within 5 to 10 miles of the shoreline may be required. Examples:- Andrew (FL) 1992, Camille 1969 and Labor Day 1935. / Примеры:- Айрин 1999 (Irene 1999) и Алисэн (Allison 1995). Примеры:- Бани 1998 (Bonnie 1998), Дьжодьжес 1998 (Georges (FL & LA) 1998) и Глориа (Gloria 1985). Примеры:- Кис 2000 (Keith 2000), Фрэн 1996 (Fran 1996), Опэл 1995 (Opal 1995), Элища 1983 (Alicia 1983) и Бэтси 1965 (Betsy 1965). Примеры:- Хьюго (Hugo 1989) и Дана 1960 (Donna 1960). Примеры:- Examples:- Эндрю 1992 (Andrew (FL) 1992), Камий 1969 (Camille 1969) и (Labor Day 1935).

SAFFRON = ШАФРАН (или ШАФРАНОВОЕ) – Saffron:- moderate orange to orange yellow. Black clothing worn in mourning. Usually used in plural. / Шафрановое – жёлто-оранжевое с коричневым оттенком, цвета шафрана.

SAGARPA = SECRETARIA DE AGRICULTURA, GANADERIA, DESARROLLO RURAL, PESCA Y ALIMENTACION

SAGGING OR ROLLING POCKETS = ПРОВИСАЮЩИЕ ИЛИ ЗАКРУЧИВАЮЩИЕСЯ КАРМАНЫ – Sagging Or Rolling Pockets:- where the pocket does not lay flat and rolls over after laundering. Setting the front pocket with a re-enforcement tape. Minimizing sagging or rolling front & back pockets:- (1) make sure the sewing operators are not holding back excessively when setting the front pocket; (2) make sure the hem is formed properly and that excessive fabric is not being put into the folder that will cause the hem to roll over; (3) check to make sure pocket is cut properly and that pocket curve is not too deep; (4) use a reinforcement tape on the inside of the pocket that may help prevent the front panel from stretching along the bias where the front pocket is set; and (5) the type and weight of denim, along with the fabric construction, may contribute to this problem. Contact your fabric supplier for assistance. Note:- in some cases the rolling may be an inherent characteristic of the fabric. Fabrics defect.

SAGITTATE = САГИТТАЛЬНОЕ (или СТРЕЛЬЧАТОЕ, или СТРЕЛОВИДНОЕ) – Sagittate:- like an arrowhead; triangular, with basal lobes pointing down toward the earth. Sagittate:- shaped like an arrow head with two lobes pointing backwards. / В анатомии под Сагиттальным (Sagittalis), от Латинского слова Sagitta, означающее Стрела, понимается расположенный в переднезаднем направлении, например, сагиттальный шов, сагиттальная ось, сагиттальные плоскости (мнимые) проходят вертикально спереди назад вдоль тела; только срединная сагиттальная плоскость делит его на симметричные половины. Под Сагиттарией или Стрелолистом понимается Род Многолетних Водных или Болотных Трав Семейства Частуховых. Около 20 Видов, в Евразии, Америке; в бывшем Союзе Советских Социалистических Республик (СССР) было 4 Вида. Некоторые Сагиттарии в клубневидных образованиях содержат крахмал; Стрелолист трёхлистный возделывают в Китае и Японии.

SAHEL = САХИЛЬ (или САХЕЛЬ, или САЭЛЬ, или СОХЭЛ) – Sahel is an East-West zone of semidesert along the Southern fringes of the Sahara, frequently drought-stricken, with an erratic annual rainfall ranging from 150 to 500 mm; also a vegetation zone in which the savanna tropical grasslands grade first into scrubland and then desert. The Sahel is the ecoclimatic and biogeographic zone of transition in Africa between the Sahara to the North and the Sudanian Savanna to the South. Having a semi-arid climate, it stretches across the South-central latitudes of Northern Africa between the Atlantic Ocean and the Red Sea. The name is derived from the Arabic word Sāḥil meaning 'Coast' or 'Shore' in a figurative sense (in reference to the southern edge of the vast Sahara), while the name Swahili means 'Coastal (Dweller)' in a literal sense. The Sahel part of Africa includes (from west to east) parts of Northern Senegal, Southern Mauritania, central Mali, Northern Burkina Faso, the extreme South of Algeria, Niger, the extreme North of Nigeria, central Chad, central and Southern Sudan, the extreme North of South Sudan, Eritrea, Cameroon, Central African Republic and the extreme North of Ethiopia. Historically, the western part of the Sahel was sometimes known as the Sudan region. This belt was roughly located between the Sahara and the coastal areas of West Africa. / Сахель (на Арабском языке означает Берег или Край), узкая (320–480 километров (км)) полоса полупустынь и опустыненных саванн в Африке, переходных от пустынь Сахары к типичным ландшафтам Судана. Протягивается от Мавритании и Сенегала на Запад через Мали, Верхнюю Вольту и Нигер до Чада и границ Судана. Площадь свыше 4 миллионов квадратных километров ($км^2$). Границы Сахель в разные годы то расширяются, то сужаются в зависимости от количества выпадающих за год осадков (от 100–350 миллиметров (мм) на Севере до 300–600 мм на Юге). Дожди выпадают летом (за период от 2–3 недель (нед) до 3 месяцев (мес)), причём 80–90% влаги испаряется. Сахель периодически подвержена катастрофическим засухам (1941–42, 1972–75), когда почти вся территория превращается в

необитаемую пустыню. В Северном Сахель преобладает разреженная полупустынная растительность (дернинные злаки, кустарники и низкорослые деревья, главным образом Акации), здесь обитают кочевники-скотоводы (разводят крупный рогатый скот, овец, коз). В Южном Сахель господствуют колючие редколесья и рощи Пальм (Дум, Ронье), а также Баобабы; наряду с кочевниками встречаются поселения оседлых земледельцев (посевы Проса, Арахиса).

SAID TO CONTAIN = СОДЕРЖИМОЕ СО СЛОВ – Said To Contain (STC) is a term in a bill of lading (B/L) signifying that the master and the carrier are unaware of the nature or quantity of the contents of, e.g., a carton, crate, container or bundle and are relying on the description furnished by the shipper. Said To Contain (STC) is a disclaimer on ocean bills of lading indicating that the ocean carrier did not verify the type, quantity, or condition of the cargo when the ocean carrier received the loaded and sealed container to transport. / хозяин (или капитан) , например, .

SAIF = SAVINGS ASSOCIATION INSURANCE FUND

SAILCLOTH = ПАРУСИНА (БРЕЗЕНТОВАЯ) (или МОРСКОЙ ПАРУС) – Sailcloth is any heavy, strongly made woven canvas of cotton, linen, jute, polyester, nylon, aramid, etc, that is used for sails. Laminated fabrics are also finding use in this market. Sailcloth is used for apparel, particularly sportswear. Sailcloth:- cotton, linen, nylon. Plain weave, some made with a crosswise rib. A strong canvas or duck. The weights vary, but most often the count is around 148 x 60. Able to withstand the elements (rain, wind and snow). Sailcloth for clothing is sold frequently and is much lighter weight than used for sails. Sailcloth is any heavy, plain-weave canvas fabric, usually made of cotton, linen, polyester, jute, nylon, etc that is used for sails and apparel, i.e. bottomweight sportswear. Originally, Sailcloth is a firmly woven cotton canvas used for making sails. Today, sailcloth is a very heavy, strong, plain-weave fabric made of cotton, linen, jute, nylon, or palyester. It comes in many qualities and weights. In common usage, the terms duck, sailcloth, and canvas often are used interchangeably. Sailcloth can be used for sportswear, slipcovers and upholstery, and curtains and draperies. See also Canvas, and Duck. / Найлан^{T3} (Nylon^{TM}). Морской Парус – высокий сорт брезента. Под Парусиной понимается тяжёлая плотная льняная или полульняная ткань из толстой пряжи. Первоначально употреблялась для парусов. Применяется неотделанная или пропитанная составами для изготовления брезента, верха обуви, а также для пошива специальной одежды. Парусина – тяжёлая плотная льняная или полульняная ткань, вырабатываемая полотняным переплетением из толстой пряжи. Первоначально употреблялась для парусов (отсюда название). Парусина применяется неотделанной или пропитанной для технических целей (паруса, брезенты, верх обуви и другое), а также для пошива производственной и специальной одежды. Брезент – грубая, плотная, непромокаемая ткань, пропитанная особым составом, применяется при изготовлении непромокаемой одежды.

SAILING CARDS = КАРТЫ ПЛАВАНИЯ – Sailing Cards issued by shipbrokers to their customers, giving particulars of the ship, or ships they are about to load, the loading berth, date of departure, etc.

SAILING FREE = ХОД ПОЛНЫМ ВЕТРОМ (или ИДТИ В БАКШТАГ) – Sailing Free (maritime term):- sailing other than close; hauled or into the wind (wind astern).

SAILOR = МАТРОСКА (или ХХ) – Sailor is a stiff straw hat with a low flat crown and straight circular brim. / соломенная шляпа с низкой дульёй и узкими полями.

SAILOR COLLAR = МАТРОССКИЙ ВОРОТНИК – Sailor Collar is a collar that is V-shaped in front with a deep square or rectangle in back. Sailor Collar is a broad collar having a square flap across the back and tapering to a V in the front.

SAK = SWIFT ACKNOWLEDGEMENT

SAL = SALINITY

SALARY = ЖАЛОВАНЬЕ – Salary is a fixed amount of money paid to a worker, usually measured on a monthly or annual basis, not hourly; as opposed to 'Wages'. Implies a degree of professionalism and/or autonomy. In the United Kingdom, Salary is the money paid to an employee, normally expressed as so much per year, but usually paid by check or directly into the employee's bank account on a monthly basis. In the United States, the distinction between periodic Salaries (which could be paid regardless of hours worked) and hourly Wages (meeting a minimum wage test and providing for overtime) was first codified by the Fair Labor Standards Act of 1938. At that time, five categories were identified as being 'exempt' from minimum wage and overtime protections, and therefore salariable. In 1991, some computer workers were added as a sixth category. The tests for all six categories were revised effective on 2004-August-23. The six categories of salaried workers exempt from overtime provisions are:- (i) Executive Employees, who hire, fire and direct others; (ii) Administrative Employees, exercising discretion as part of office work; (iii) Learned Professional Employees, such as doctors, lawyers, professors; (iv) Creative Professional Employees in an artistic field; (v) Computer Employees, who must meet certain threshold tests; and (vi) Outside Sales Employees, who must work away from an employer's place of business. Some of the 2004 exemption tests depend on being paid a weekly salary of greater than USD455.00, even though no hourly minimum wage is required or maximum number of hours worked is established. A Salary is a form of periodic payment from an employer to an employee, which is specified in an employment contract. From the point of view of running a business, salary can also be viewed as the cost of acquiring human resources for running operations, and is then termed personnel expense or salary expense. In accounting, salaries are recorded in payroll accounts. Regular Wages received by an employee from an employer on a weekly, biweekly, or monthly basis. Many salaries also include such employee benefits as health and life insurance, savings plans, and Social Security. Salary income is taxable by the federal, state, and local government, where applicable, through payroll withholding. Money paid for work done. Salary is a form of pay given to employees at regular intervals in exchange for the work they have done. Traditionally, a salary is a form of remuneration given to professional employees on a monthly basis. In modern usage, the word refers to any form of pay that employees receive on a regular basis. A salary is normally paid straight into an employee's account. Fixed compensation for services, paid to a person on a regular basis. The difference between a Wage and a Salary:- wage is a terminology used for daily allowances rendered to a worker or a laborer. This is more in use for blue collar type jobs which are temporary. Salary is administered on a monthly basis to permanent employees in an organization. See also Wage. A Wage is better because you get paid for how many hours you work, while, with a salary, you get a set amount of payment. An example of a job that gets a salary is a teacher. It doesn't matter how much homework they grade over weekends and vacations, they get the same amount of money. / В Соединённом Королевстве под Salary понимается стандартная ставка заработной платы каждый месяц; обычно у конторских служащих. Жалованье – денежное вознаграждение за службу, работу. Смотрите также Зарплата или Заработная Плата (Wage).

SALARY ACCOUNT = СЧЁТ ПО ЖАЛОВАНЬЮ (или СЧЁТ ПО ЗАРПЛАТЕ) – Salary Account is bank account onto which employers makes regular salary or wage payments for their employees; also referred to as Giro Account, Current Account or Personal Account. Current account for persons regularly receiving a wage/salary or retirement benefit. Salary accounts carry higher interest rates than regular current accounts. / Текущий счёт для лиц, регулярно получающих заработную плату/жалование или

пенсионные выплаты. Счёта по заработной плате предусматривают более высокие процентные ставки, нежели обычные текущие счета.

SALE = ПРОДАЖА – Sale is an agreement by which one of the contracting parties, called the Seller, gives a thing and passes the title to it, in exchange for a certain price in current money, to the other party, who is called the Buyer or Purchaser, who, on his part, agrees to pay such price. This contract differs from a barter or exchange in this, that in the latter the price or consideration, instead of being paid in money, is paid in goods or merchandise, susceptible of a valuation. It differs from accord and satisfaction, because in that contract, the thing is given for the purpose of quieting a claim, and not for a price. An onerous gift, when the burden it imposes is the payment of a sum of money, is, when accepted, in the nature of a sale. When partition is made between two or more joint owners of a chattel, it would seem, the contract is in the nature of a barter. To constitute a valid sale there must be:- (1) Proper parties; (2) A thing which is the object of the contract; (3) A price agreed upon; and (4) The consent of the contracting parties, and the performance of certain acts required to complete the contract. These will be separately considered. As a general rule all persons sui juris may be either buyers or sellers. But to this rule there are several exceptions:- (i) There is a class of persons who are incapable of purchasing except sub modo, as infants, and married women; and (ii) Another class, who, in consequence of their peculiar relation with regard to the owner of the thing sold, are totally incapable of becoming purchasers, while that relation exists; these are trustees, guardians, assignees of insolvents, and generally all persons who, by their connexion with the owner, or by being employed concerning his affairs, have acquired, a knowledge of his property, as attorneys, conveyancers, and the like. There must be a thing which is the object of the sale, for if the thing sold at the time of the sale had ceased to exist it is clear there can be no sale; if, for example, Paul sell his horse to Peter, and, at the time of the sale the horse be dead, though the fact was unknown to both parties:- or, if you and I being in Philadelphia, I sell you my house in Cincinnati, and, at the time of the sale it be burned down, it is manifest there was no sale, as there was not a thing to be sold. It is evident, too, that no sale can be made of things not in commerce, as the air, the water of the sea, and the like. When there has been a mistake made as to the article sold, there is no sale; as, for example, where a broker, who is the agent of both parties, sells an article and delivers to the seller a sold note describing the article sold as ‘St. Petershurg clean hemp’, and bought note to, the buyer, as ‘Riga Rhine hemp’, there is no sale. There must be an agreement as to the specific goods which form the basis of the contract of sale; in other words, to make a perfect sale, the parties must have agreed the one to part with the title to a specific article, and the other to acquire such title; an agreement to sell one hundred bushels of wheat, to be measured out of a heap, does not change the property, until the wheat has been measured. To constitute a sale there must be a price agreed upon; but upon the maxim id certum est quod reddi certum potest, a sale may be valid although it is agreed that the Rice for the thing sold shall be determined by a third person. The price must have the three following qualities, to wit:- (i) It must be an actual or serious price; (ii) It must be certain or capable of being rendered certain; and (iii) It must consist of a sum of money. The price must be an actual or serious price, with an intention on the part of the seller, to require its payment; if, therefore, one should sell a thing to another, and, by the same agreement, he should release the buyer from the payment, this would not be a sale but a gift, because in that case the buyer never agreed to pay any price, the same agreement by which the title to the thing is passed to him discharging him from all obligations to pay for it. As to the quantum of the price that is altogether immaterial, unless there has been fraud in the transaction. (2) The price must be certain or determined, but it is sufficiently certain, if, as before observed, it be left to the deterimination of a third person. And an agreement to pay for goods what they are worth, is sufficiently certain. (3) The price must consist in a sum of money which the buyer agrees to pay to the seller, for if paid for in any other way, the contract would be an exchange or barter, and not a sale, as before observed. The consent of the contracting parties, which is of the essence of a sale, consists in the agreement of the will of the seller to sell a certain thing to the buyer, for a certain price, and in the will of the buyer, to purchase the same thing for the same, price. Care must be taken to distinguish between an agreement to enter into a future contract, and a present actual agreement to make a sale. This consent may be shown:- (1) By an express agreement; and (2) By all implied agreement. The consent is certain when the parties expressly declare it. This, in some cases, it is requisite should be in writing. By the 17tth section of the English statute, 29 Car. II. c. 3, commonly called the Statute of Frauds, it is enacted, ‘that no contract for the sale of any goods, wares, or merchandise, for the price of £10 or upwards, shall be allowed to be good, except the buyer shall accept part of the goods so sold, and actually receive the same, or give something in earnest to bind the bargain, or in part payment, or some note or memorandum in writing of the said bargain be made and signed by the parties to be charged by such contract or their agents thereunto lawfully authorized’. This statute has been renacted in most of the states of the Union, with amendments and alterations, It not unfrequently happens that the consent of the parties to a contract of sale is given in the course of a correspondence. To make such contract valid, both parties must concur in it at the same time. An express consent to a sale may be given verbally, when it is not required by the statute of frauds to be in writing. When a party, by his acts, approves of what has been done, as if he knowingly uses goods which have been left at his house by another who intended to sell them, he will, by that act, confirm the sale. The consent must relate:- (i) To the thing which is the object of the contract; (ii) To the price; and (iii) To The Sale Itself:- 1st. Both parties must agree upon the same object of the sale; if therefore one give consent to buy one thing, and the other to sell another, there is no sale; nor is there a sale if one sells me a bag full of oats, which I understand is full of wheat; because there is no consent as to the thing which is the object of the sale. But the sale would be valid, although I might be mistaken as to the quality of the tiling sold. 2nd. Both parties must agree as to the same price, for if the seller intends to sell for a greater sum than the buyer intends to give, there is no mutual consent; but if the case were reversed, and the seller intended to sell for a less price than the buyer intended to give, the sale would be good for the lesser sum. 3rd. The consent must be on the sale itself, that is, one intends to sell, and the other to buy. If, therefore, Peter intended to lease his house for three hundred dollars a year for ten years, and Paul intended to buy it for three thousand Dollars, there would not be a contract of sale nor a lease. In order to pass the property by a sale, there must be an express or implied agreement that the title shall pass. An agreement for the sale of goods is prima facie a bargain and sale of those goods; but this arises merely from the presumed intention of the parties, and if it appear that the parties have agreed, not that there shall be a mutual credit by which the property is to pass from the seller to the buyer, and the buyer is bound to pay the price to the seller, but that the exchange of the money for the goods shall be made on the. spot, no property is transferred, for it is not the intention of the parties to transfer any. But, on the contrary, when the making of part payment, or naming a day for payment, clearly shows an intention in the parties that they should have some time to complete the sale by payment and delivery, and that they should in the meantime be trustees for each other, the one of the property in the chattel, and the other in the price. As a general rule, when a bargain is made for the purchase of goods, and nothing is said about payment and. delivery, the property passes immediately, so as to cast upon the purchaser all future risk, if nothing remains to be done to the goods, although he cannot take them away without paying the price. Sales are absolute or conditional. An absolute sale is one made and completed without any condition whatever. A conditional sale is one which depends for its validity upon the fulfilment of some condition. Sales Are Also Voluntary Or Forced, Public Or Private:- (1) A Voluntary Sale is one made without constraint freely by the owner of the thing sold; to such the usual rules relating to sales apply. (2) A Forced Sale is one made without the consent of the owner of the property by some officer appointed by law, as by a marshal or a sheriff in obedience to the mandate of a competent tribunal. This sale has the effect to transfer all the rights the owner had in the property, but it does not, like a voluntary sale of personal property, guaranty a title to the thing sold it merely transfers the rights of the person as whose property it has been seized. This kind of a sale is sometimes called a Judicial Sale. (3) A Public Sale is one made at auction to the highest bidder. Auction sales sometimes are voluntary, as when the

owner chooses to sell his goods in this way, and then as between the seller and the buyer the usual rules relating to sales apply; or they are involuntary or foreed when the same rules do not apply. (4) Private Sales are those made voluntarily and not at auction. The above rules apply to sales of personal property. The sale of real estate is governed by other rules. When a contract has been entered into for the sale of lands, the legal estate in such lands still remains vested in the vendor, and it does not become vested in the vendee until he shall have re-ceived a lawful deed of conveyance from the vendor to him; and the only remedy of the purchaser at law, is to bring an action on the contract, and recover pecuniary damages for a breach of the contract. In equity, however, after a contract for the sale, the lands are considered as belonging to the purchaser, and the court will enforce his rights by a decree for a specific performance; and the seller will be entitled to the purchase money. In general, the seller of real estate does not guaranty the title; and if it be desired that he should, this must be done by inserting a warranty to that effect.

SALE–LEASEBACK = ПРОДАЖА С ПОСЛЕДУЮЩЕЙ АРЕНДОЙ – (1) Sale of an asset, usually real property, to a purchaser who then leases it back to the former owner on a long-term basis. Also known as Sale And Leaseback. Sale of a property where the buyer agrees to lease the property back to its original owner. In this way, the seller is able to turn the property into liquid capital while at the same time remaining in situ. / на месте установки (in situ).

(2) Sale and Leaseback transaction is a special form of leasing whereby a company sells assets to a leasing company and immediately leases them back for further use. With the proceeds received from the sale the company frees up capital and increases its liquidity in the short term while retaining the use of the asset. The regular leasing payments may have a negative effect over time. Moreover, the company is no longer the owner and thus no longer benefits from future increases in value unless the company has an option to buy the asset at its residual book value for tax purposes at the end of the leasing period and exercises this option. Frequently, a company's aim is to disclose hidden reserves to improve its earnings. Sale and leaseback transactions are usually carried out in the real estate sector as a means of avoiding paying the normal rate of inheritance tax or gift tax to the tax authorities when the property is transferred, e.g., to the next generation.

SALES = ПРОДАЖИ – (1) Sales:- revenue recognition from the delivery of merchandise or for rendering a service in exchange for payment in the form of cash, cash equivalent or other property. Also known as Turnover in the United Kingdom. See also Revenues. Sales is the net value of sales made to customers during the period. May also be shown as Revenues.

(2) Sales:- the amount of kilowatt-hours sold in a given period of time; usually grouped by classes of service, such as residential, commercial, industrial, and other. Other sales include public street and highway lighting, other sales to public authorities and railways, and interdepartmental sales.

(3) Sales (in the financial newspapers):- number of shares, in hundreds, that traded hands.

SALES FOR RESALES = ПРОДАЖИ ДЛЯ ПЕРЕПРОДАЖ (или ПРОДАЖИ ДЛЯ РОЗНИЧНЫХ ПРОДАЖ) – Sales For Resale:- energy supplied to other electric utilities, cooperatives, municipalities, and Federal and State electric agencies for resale to ultimate consumers.

SALES, GENERAL, AND ADMINISTRATIVE COSTS = ЗАТРАТЫ ПО ПРОДАЖАМ, ОБЩИЕ И АДМИНИСТРАТИВНЫЕ – Sales, General, and Administrative (SGA) Costs, or SGA Expense, include all the indirect expense of the firm, including the salaries for executives, salespeople, the accounting department, and other general overhead such as insurance and real estate costs for administrative offices.

SALES PER EMPLOYEE = ПРОДАЖИ НА РАБОТНИКА – Sales Per Employee are the average level of sales income earned per employee.

SALES PRODUCTIVITY INDEX = ИНДЕКС ПО ПРОДУКТИВНОСТИ ПРОДАЖ – Sales Productivity Index is the average Dollar amount purchased by every Customer Asset, or UP, which comes into the store during a specified period of time. This indicator can be calculated by sales person, store or entire company. This index is an overall measurement of sales performance. Also known as Performance Index. The Sales Productivity Benchmark:- rate your sales force against World class. Sales management must produce a sales strategy based on an understanding of their sales force strengths and weaknesses. A sales consulting firm can assess your go to market strategy utilizing benchmarks to determine where you should invest in sales performance improvement projects.

SALES REPRESENTATIVE = ПРЕДСТАВИТЕЛЬ ПО ПРОДАЖАМ (или ТОРГОВЫЙ ПРЕДСТАВИТЕЛЬ) – Sales Representative is an agent who distributes, represents, services or sells goods on behalf of foreign sellers. / Агент, который распределяет (организует сбыт), предоставляет, обслуживает или продаёт товары от имени иностранных продавцов.

SALES/TOTAL ASSETS = ПРОДАЖИ/ИТОГО АКТИВОВ – Sales/Total Assets is the value of sales divided by the total asset value. Therefore it is a key measure of the efficiency of the use of the company's capital resources. It is particularly significant in high fixed-cost companies. It is also called Asset Turn.

SALE YARN = ТОВАРНАЯ ПРЯЖА – Sale Yarn:- some mills specialize in the manufacture of yarns for many uses in the trade, such as for braiders, knitters, or weavers. / Некоторые фабрики специализируются на изготовлении пряжи для различного использования в своей дальнейшей торговле, например, для строчевышивальных фабрик, а также ткачей или трикотажников.

SALINE = СОЛЕВОЕ (или ЗАСОЛЁННОЕ, или СОЛЁНОЕ, или СОЛЯНОЕ, или СОЛОНЧАК, или СОЛОНЧАКОВОЕ) – Saline:- containing salt. Saline:- salty.

SALINE–SODIC SOIL = СОЛОНЦЕВАТО–СОДОВАЯ ПОЧВА (или ЗАСОЛЁННАЯ НАТРИЕВАЯ ПОЧВА) – Saline-Sodic Soil is a soil containing soluble salts with sufficient exchangeable sodium to interfere with the growth of most crop plants. Soil whose saturation extract has an electrical conductivity greater than 4 deciSiemens/meter (dS/m), sodium adsorption ratio greater than 15, and pH less than 8.5. See also Saline Soil and Sodic Soil or Alkali Soil.

SALINE SOIL = ЗАСОЛЁННАЯ ПОЧВА – Saline Soil is a soil that contains sufficient salt in the root zone to impair plant growth. Its electrical conductivity is greater than 4 deciSiemens/meter (dS/m) and exchangeable sodium percentage is less than 15. / в корневой зоне . Под Засолёнными Почвами понимаются почвы засушливых зон с повышенным (более 0.25%) содержанием легкорастворимых в воде минеральных солей (сульфатов, хлоридов, карбонатов натрия, кальция и магния). Солончаки (сильно засолённые), солончаковые (менее засолённые) и солончаковатые (засолённые ниже пахотного слоя). Засолённые Почвы, почвы с повышенным (более 0.25%) содержанием легкорастворимых в воде минеральных солей. Встречаются преимущественно в Южных засушливых областях многих стран (Пакистан, Индия, Китай, АРЕ (Арабская Республика Египет) и другие), часто пятнами среди незасолённых почв. В бывшем Союзе Советских Социалистических Республик (СССР) площадь засолённых почв составляла 52.3 миллиона гектаров (га), или 2.4% всех почв страны; они были распространены на Юге Украинской Советской Социалистической Республики (УССР), в Поволжье, Средней Азии (засолено около половины всех

распаханных земель) и других районах. Содержат главным образом соли серной (сернокислые натрий, кальций и магний), соляной (хлористые натрий, кальций и магний) и угольной (натриевая в двух формах:- углекислой соли, или нормальной соды, и двууглекислой соли, или питьевой соды) кислот. Иногда в засолённых почвах встречаются натриевая и кальциевая соли азотной кислоты. В зависимости от количества содержащихся в почве солей, характера их распределения по почвенным горизонтам засолённые почвы подразделяются на солончаки (1–3% солей и более), солончаковые (менее засолённые) и солончаковатые (засолённые ниже пахотного слоя). Для установления степени их засолённости определяют сумму токсичных солей, связанных с ионами хлора и сульфата. От засолённых почв отличают солонцеватые, содержащие поглощённый натрий (смотрите Солонцы); иногда солонцеватость сочетается с солончаковатостью. Обычно более токсичны хлористые соли. Помимо токсического действия, легкорастворимые соли повышают осмотическое давление почвенного раствора и создают так называемую физиологическую сухость, при которой растения страдают так же, как и от почвенной засухи. Избыток воднорастворимых солей в почве приводит к изреженности растительного покрова и появлению особой группы дикорастущих видов растений, так называемых Солянок, или Галофитов, приспособленных к жизни на засолённых почвах. Засолённые почвы образуются в результате накопления солей в почве и почвенно-грунтовых водах, а также от затопления суши морской солёной водой. Обязательными факторами накопления солей на суше и засоления ими почв являются засушливый климат и затруднённый отток поверхностных и подпочвенных вод. На орошаемых землях часто наблюдается так называемое вторичное засоление, если в подпочвах или грунтовых водах много солей. При орошении бессточных равнин происходит подъём уровня солёных грунтовых вод, что и приводит к засолённости почвы. Правильным ведением хозяйства можно устранить неблагоприятное течение процессов засоления, изменив его естественную направленность. Достигается это сочетанием промывок почвы и искусственным оттоком грунтовых и промывных вод с помощью дренажа. Промывать засолённые почвы лучше осенью или зимой, так как в это время сокращается испарение, способствующее возврату солей.

SALINITY = ЗАСОЛЁННОСТЬ (или СОЛЁНОСТЬ, или ОСОЛОНЁННОСТЬ) – Salinity is the state of consisting of or containing salt. / Засолённость Почвы; Солёность Воды.

SALINITY SYMPTOMS IN RICE = СИМПТОМЫ ЗАСОЛЁННОСТИ (или СОЛЁНОСТИ, или ОСОЛОНЁННОСТИ) В РИСЕ – Salinity Symptoms In Rice:- leaves usually become whitish or chlorotic, growth is stunted and uneven, tillering is reduced.

SALINIZATION = ЗАСОЛЕНИЕ – Salinization is the process whereby soluble salts accumulate in the soil. / Засоление почвы.

SALLET = САЛЭТ (или РЫЦАРСКИЙ ШЛЕМ, или САЛЕТ, или САЛАТНОЕ) – Sallet:- without a visor and with a projection over the neck. The Sallet (also called Celata, Salade and Schaller) was a war helmet that replaced the bascinet in Italy, western and northern Europe and Hungary during the mid-XV century. In Italy, France and England the armet helmet was also popular, but in Germany the sallet became almost universal. The origin of the sallet seems to have been in Italy where the term Celata is first recorded in an inventory of the arms and armour of the Gonzaga family dated to 1407. In essence the earliest sallets were a variant of the bascinet, intended to be worn without an aventail or visor. To increase protection to the face and neck, that the abandonment of the visor and aventail would have exposed, the sides of the helmet were drawn forward at the bottom to cover the cheeks and chin and the rear was curved out into a flange to protect the neck. The Barbute or Barbuta was a related helmet appearing in Italy at much the same time as the sallet. Unlike the sallet, the fully developed barbute consciously copied elements of the Classical Corinthian helmets of ancient times. / Салэт (Sallet) (называемый также Чэлята (Celata), Саляд (Salade) и Шаля (Schaller) .

SALLOPED SELVAGE = XX КРОМКА – Salloped Selvage is a fabric defect consisting of an abrupt, narrow place along the selvage. Principal cause is the failure of the clip on the tenter frame to engage or hold the fabric.

SALMON = XX (или ЛОСОСЬ, или ЛОСОСЁВОЕ, или ОРАНЖЕВО–РОЗОВОЕ, или СОМОН) – Salmon:- the variable color of salmon's flesh averaging a strong yellowish pink.

SALMONELLOSIS = САЛЬМОНЕЛЛЁЗ – Salmonellosis:- infectious, febrile intestinal and general diseases caused by Salmonellae. / возбудители – Сальмонеллы (Salmonellae). Сальмонеллёзы, острые кишечные инфекции животных и человека, вызываемые сальмонеллами. Сальмонеллёзы У Человека рассматривают как определённое заболевание (нозологическую форму), отличая его от брюшного тифа и паратифов. Основной источник инфекции – больные животные, но в отдельных случаях источником заражения может быть человек (больной или бактерионоситель). Заражение происходит через инфицированные пищевые продукты, как правило, животного происхождения (мясо и мясные продукты, молоко, яйца, особенно утиные и гусиные, студень), при вынужденном, неправильном убое животных, нарушении правил хранения и приготовления продуктов (соприкосновение готовой и сырой продукции, недостаточная термическая обработка продуктов перед употреблением и так далее). Сальмонеллёз развивается в тех случаях, когда в организм попадают накопившиеся в продуктах живые сальмонеллы. Клинические проявления сальмонеллёза разнообразны – от бессимптомного носительства возбудителя инфекции до тяжёлых септических форм. Инкубационный период колеблется от 2–6 часов до 2–3 суток. Различают несколько клинических форм сальмонеллёза. При желудочно-кишечной форме заболевание обычно начинается остро, обильной рвотой и поносом (стул водянистый, часто с зеленью, зловонный). Наблюдаются боли, урчание и вздутие живота, слабость, головная боль, головокружение, озноб, повышение температуры до 38–40 °С, боли в мышцах и суставах, судороги мышц конечностей. Длительность заболевания обычно 3–7 суток. Такое же начало имеет тифоподобная форма, но для неё характерны лихорадка в течение 10–14 суток, увеличение печени и селезёнки, более выраженные симптомы общей интоксикации (головная боль, вялость), иногда появляется сыпь. При септической форме после короткого начального периода развивается картина сепсиса. В 15–17% случаев сальмонеллёза в периоде реконвалесценции наблюдается кратковременное бактерионосительство. Возможны 'транзиторное' носительство (однократное выделение сальмонелл без клинических проявлений) и хроническое бактерионосительство. Диагноз сальмонеллёз ставят на основании клинических и эпидемиологических данных и результатов бактериологического исследования кала, мочи, крови, дуоденального содержимого, рвотных масс и промывных вод желудка, остатков пищи, а также серодиагностики. Лечение:- промывание желудка и кишечника, обильное горячее сладкое питье; при более тяжёлом течении введение солевых растворов (борьба с обезвоживанием); спазмолитические средства; антибиотики. Важное значение имеет диета:- механически и химически щадящая пища (молоко исключается) – в первые дни болезни; исключение вредных для деятельности желудочно-кишечного тракта факторов (переедание, употребление алкоголя и продуктов, богатых грубой клетчаткой, консервов и копчёностей, острых, пряных и жирных блюд) в течение всего периода заболевания и не менее 1 месяца после выздоровления. Профилактика:- ветеринарно-санитарный надзор за убоем скота и обработкой туш; выполнение санитарных правил приготовления, хранения и реализации пищевых продуктов; обследование поступающих на работу на предприятия общественного питания и торговли, детские учреждения. Сальмонеллёзы У Животных (тиф, паратиф) вызываются различными видами сальмонелл. Болеют Лошади, крупный рогатый скот, Свиньи, Овцы и Козы, пушные звери, птицы, Пчёлы и другие. Сальмонеллёзы распространены на всех континентах. Для сальмонеллёза животных характерны лихорадка, аборты, нарушение деятельности желудочно-кишечного тракта, органов дыхания и кровообращения, поражение центральной нервной системы, суставов, большой отход молодняка. Сальмонеллёзы развиваются быстрее и

протекают тяжелее у животных, страдающих хроническими заболеваниями желудочно-кишечного тракта. У бактерионосителей сальмонеллы могут активизироваться при изменении микробной флоры кишечника под действием антибиотиков. Способствуют заболеванию недостаточное и неполноценное кормление, холод, сырость, плохая вентиляция, скученное содержание, утомительные перегоны и тому подобное. Диагноз ставят на основании клинических, эпизоотологических, патологоанатомических данных, результатов бактериологических и серологических исследований. Для лечения применяют иммунные сыворотки в комбинации с антибиотиками, нитрофурановые препараты, симптоматические средства. Профилактика:- соблюдение зоогигиенических и ветеринарных санитарных мероприятий, изолирование (в ряде случаев убой) больных животных, вакцинация.

SALMON PINK = ЛОСОСЁВО–РОЗОВОЕ (или ОРАНЖЕВО–РОЗОВОЕ, или XX) – Salmon Pink:- a strong yellowish pink.

SALT = СОЛЬ – Salt is an ionic compound that is formed by a neutralization reaction (reaction of an acid with a base). The best known salt, common salt, or sodium chloride (NaCl) is extensively used as an electrolyte in dyeing. Sodium sulfate is also used for this purpose. Many of the chemicals used in dyeing are technically salts, including many dyes. / Под Солями понимаются продукты замещения атомов водорода кислоты на металл или групп OH основания на кислотный остаток. При полном замещении образуются средние, или нормальные, соли (NaCl, K_2SO_4 и другие), при неполном замещении атомов H – кислые (например, $NaHCO_3$), неполном замещении групп OH – основные (например, $(C_{17}H_{35}COO)Al(OH)_2$). Различают также двойные соли (например, $KCl{\cdot}MgCl_2$) и комплексные. В обычных условиях соли – кристаллы с ионной структурой. Большинство солей растворимо в полярных растворителях, особенно в воде; в растворах диссоциируют на катионы и анионы. Многие минералы – соли, образующие залежи, например, NaCl, KCl. Соли, класс химических соединений; кристаллические в обычных условиях вещества, для которых типична ионная структура. Согласно теории электролитической диссоциации, соли являются химическими соединениями, которые в растворах диссоциируют на положительно заряженные ионы – катионы (в основном металлов) и отрицательно заряженные ионы – анионы. Существуют соли следующих типов:- средние (или нейтральные), кислые, основные, двойные, смешанные и комплексные. Наиболее обычный лабораторный способ получения соли – взаимодействие кислот и оснований друг с другом, также кислот и во многих случаях (в соответствии с рядом напряжений) самих солей с металлами. Характерное свойство солей – растворимость их в полярных растворителях, особенно в воде. В природе скопления соли образуются в основном путём осаждения из водных растворов, которое происходит в замкнутых морских бассейнах (Аральское, Мёртвое море и другие) или в почти отделённых от моря заливах (Кара-Богаз-Гол), а также в бессточных континентальных озёрах (Эльтон, Баскунчак). Соли были известны в глубокой древности. Помимо традиционного использования для пищевых целей и в медицине, соли стали применяться по мере развития промышленности в химической, стекольной, кожевенной, текстильной, металлургической и других её отраслях; некоторые соли используются в качестве минеральных удобрений. О номенклатуре солей смотрите Химическую Номенклатуру. Соли природные, общее условное название в быту и в промышленности группы минералов, образующих осадочные соляные месторождения; обладают способностью легко или заметно растворяться в воде и имеют солёный или горько-солёный вкус. Химический состав – хлориды и сульфаты (гидратированные и негидратированные) натрия, калия, магния. Важнейшие соли:- каменная соль (галит), сильвин, карналлит, каинит, полигалит, лонгбейнит (смотрите Калийные Соли), мирабилит, тенардит. В зависимости от условий и времени образования месторождения соли разделены на три типа. Ископаемые осадочные месторождения, образовавшиеся в одну из предшествующих геологических эпох, представлены мощными пластовыми или штоко- и куполообразными залежами твёрдых солей, находящихся на большей или меньшей глубине от поверхности (смотрите Соляная Тектоника). Примерами этого типа месторождений являются:- в бывшем Союзе Советских Социалистических Республик (СССР) – Шумковское и Славянско-Артёмовское (Бахмутское), Верхнекамское (Соликамское) и Старобинское (Белорусская Советская Социалистическая Республика (БССР)); за рубежом – крупнейшие Штасфуртское (Германская Демократическая Республика (ГДР)), Саскачеванское (Канада) и многие другие. На долю месторождений этого типа приходится около 30% мировой добычи соли. Соляные источники и рассолы образуются в результате выщелачивания подземными водами соли на глубине (смотрите Рассолы). Из этих месторождений путём осаждения получают свыше 50% добычи каменной соли. Современные соляные месторождения (солёные озёра, заливы или лагуны) по размерам и запасам значительно уступают ископаемым месторождениям, но благодаря своей большей распространённости на земном шаре и более лёгкой доступности для разработки иногда представляют промышленный интерес (озёра Баскунчак и Эльтон, Залив Кара-Богаз-Гол и озёра Западной Сибири и Казахстана). К этому же типу относятся современные моря и океаны (иногда соли извлекаются из морской воды путём выпаривания или вымораживания). Из современных соляных месторождений получают около 20% соли.

SALT–AFFECTED SOIL = ВТОРИЧНО ЗАСОЛЁННАЯ ПОЧВА – Salt-Affected Soil is a soil that has been adversely modified for the growth of most crop plants by the presence of soluble salts, exchangeable sodium, or both.

SALT AND PEPPER = СОЛЬ И ПЕРЕЦ – Salt And Pepper is a fabric made of a combination of white and black yarns. The term usually is used to describe tweed fabrics. See also Tweed.

SALT BALANCE = СОЛЕВОЙ БАЛАНС – Salt Balance is the relation between the quantity of dissolved salts carried to an area by irrigation water and the quantity of dissolved salts removed by drainage water.

SALTIE = СОЛЕВИК (или СОЛТИ, или СУДНО ДЛЯ СОЛЁНЫХ ВОД) – (1) A Saltie is a vessel designed for ocean navigation. / судно, разработанное для океанской навигации.

(2) Saltie:- Canadian slang for an ocean-going sailor. / Канадский жаргон в отношении моряка, ходящего по океанам.

(3) Saltie:- informal (Austral) a saltwater crocodile.

SALT LINKAGE = СОЛЯНОЙ МОСТИК (или XX) – Salt Linkage in protein:- two molecules can be joined together by salt linkage in which the basic part and the acid part are held together by an electrovalent bond. This bond results due to electrostatic attraction of positively and negatively charged ions. In keratin molecule, arginine and lysine side chains have free amino groups. On the other hand, glutamic acid and aspartic acid side chains have free carboxyl groups. When the basic and acidic groups of these side chains will come closer, they will neutralize each other and form a salt. The acidic part will be negatively charged, the basic part will be positively charged and they will be connected together by electrostatic forces, i.e. electrovalent bond. See also Ionic Bond. According to the Salt-Linkage hypothesis (a part of the association-induction hypothesis), the binding of alkali-metal ions on isolated proteins may be low as a result of the masking of cation-binding fixed anionic groups by the formation of ‘salt linkages’ between them and fixed cationic groups. This hypothesis has been verified in a quantitative manner by the measurement of free and adsorbed Na^+ in solutions of bovine hemoglobin titrated with increasing concentration of NaOH. In addition this communication presents data indicating (1) wide variability in the extent of Na^+ adsorption among different isolated proteins and even among different samples of the same protein, (2) auto-cooperativity in the pH titration and Na^+ adsorption, and (3) selectivity of the liberated fixed anionic groups for different alkali-metal ions

in the rank order Na greater than Li greater than K greater than Rb, Cs. / Щёлочь (Alkali). Смотрите также Ионная Связь (Ionic Bond). глутаминовая кислота (glutamic acid) и аспарагиновая кислота (aspartic acid). коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо). аргинин (arginine). лизин (lysine) боковые цепи или побочные цепи или ответвления (side chains).

SALT TOLERANCE = УСТОЙЧИВОСТЬ ПОЧВЫ (или ТОЛЕРАНТНОСТЬ ПОЧВЫ) – Salt Tolerance is an ability of a plant to maintain productivity as salinity increases beyond and the electrical conductivity (EC; soil extract) of 4 deciSiemens/meter (dS/m). / Под Толерантностью, от Латинского слова Tolerantia, означающее Терпение, понимается .

SALTY CHARACTER = ПРОСОЛЕНЫЙ ХАРАКТЕР (или БЫВАЛЫЙ, или МОРЕХОДНЫЙ ФАРВАТЕР) – Salty Character (maritime term):- a nautical guy, often a negative connotation.

SALVAGE = СПАСЕНИЕ – Salvage (maritime term):- to save a vessel or cargo from total loss after an accident; recompense for having saved a ship or cargo from danger.

SALVAGE = СПАСЁННОЕ ИМУЩЕСТВО – (1) Salvage is the property which has been recovered from a wrecked vessel, or the recovery of the vessel herself. Salvage may refer to:- (i) property that is rescued from danger on land or at sea; or (ii) an award that is paid to someone for voluntarily rescuing property at sea from a marine peril. Property taken over by an insurer to reduce its loss. Property saved from loss. The saving or rescue of a vessel and/or the cargo from loss and/or damage at sea. Salvage is:- (i) a contractual or voluntary service rendered by a third party for assistance at sea in saving vessel or cargo from peril; (ii) the monetary award for rendering such service; see also Salvage Award; and (iii) vessel or cargo which is saved from loss at sea. The saving or rescue of a vessel and/or the cargo from loss and/or damage from perils of the sea. Salvage is a right of the insured which, under the terms of the policy, automatically transfer to the insurer upon settlement of a loss. Salvage applies to any proceeds from the repaired, recovered, or scrapped property. See also Subrogation. / Товарно-материальные ценности, которые были спасены страхователем или третьим лицом (спасателем) в результате наступления страхового случая. Спасённое имущество может иметь неповреждённый вид или частичные повреждения (которые могут быть устранены), не исключающие его дальнейшего использования по первоначальному назначению. Стоимость неповреждённого спасённого имущества вычитается из суммы ущерба, подлежащего возмещению (в пределах страховой суммы). Расходы по спасанию, в том числе спасателю за оперативные и самоотверженные действия в условиях чрезвычайной ситуации, включаются в сумму ущерба, подлежащего возмещению со стороны страховщика. Обоснованность произведённых расходов на спасание может быть проверена аджастером.

(2) Salvage:- salvaged merchandise refers to products that can no longer be sold ‘as new’. There is a large percentage of merchandise that is damaged while in transit to retail stores. For instance, a pallet of toys may have packaging damage. The retailer cannot sell the toys as new because the individual boxes show wear or tear. This merchandise gets set to the side and labeled ‘Salvage’. Salvage can also refer to merchandise that has been returned to the store for any number of reasons. Salvage can also include 2nd quality merchandise produced at the factory level.

SALVAGE ADJUSTMENT = ПЕРЕОЦЕНКА СПАСЁННОГО ИМУЩЕСТВА (или КОРРЕКТИРОВКА С УЧЁТОМ СПАСЁННОГО ИМУЩЕСТВА) – Salvage Adjustment:- a compromised settlement on a cargo policy, usually when the adventure has been terminated short of destination and damaged goods are sold at the intermediate port. The underwriter pays the difference between the sum insured by the policy and the proceeds of the sale.

SALVAGE ASSOCIATION = АССОЦИАЦИЯ ПО СПАСАНИЮ (или СПАСАТЕЛЬНАЯ АССОЦИАЦИЯ) – Salvage Association is an association, closely connected with the London insurance market, whose functions is to take instructions from interested parties (e.g., underwriters) to investigate casualties and to make recommendations for the preservation and protection of property; also to determine the extent and proximate cause of loss when required. / Полное наименование Ассоциация по Защите Коммерческих Интересов в Отношении Потерпевшего Крушение и Повреждённого Имущества (The Association for the Protection of Commercial Interests as respect Wrecked and Damaged Property). Ассоциация функционирует под руководством корпорации Лойда и является компетентным и авторитетным в международном масштабе органом, к услугам которого прибегает большое количество страховых компаний мира. Ассоциация сама не производит спасательных работ, а её основные функции состоят в осмотре повреждённого имущества, ведение дел по убыткам, наблюдение за ходом спасательных операций и ремонтом судов, защищая при этом общие интересы страховщиков.

SALVAGE AWARD = ВОЗНАГРАЖДЕНИЕ ЗА СПАСАНИЕ – Salvage Award:- an amount awarded to a salvor for services rendered in the salvage of property in peril at sea. The award may be made by a court or by arbitration, depending on the terms of the salvage contract. Underwriters contribute towards a salvage award insofar as the award is in respect of insured property in peril from an insured risk, subject to any restrictions imposed by the policy (e.g., a policy deductible) and, except where the policy provides otherwise, subject to reduction to reflect under-insurance, if any.

SALVAGE CHARGES = РАСХОДЫ ПО СПАСАНИЮ – Salvage Charges:- the award due to a salvor for services rendered in saving the insured property. Salvage Charge is the cost incurred by a third party in saving, preserving, and reclaiming cargo or vessel from a loss at sea. Charges recoverable under maritime law by a salvor independently of contracts.

SALVAGE LOSS = УЩЕРБ ПОСЛЕ СПАСАНИЯ (или УБЫТКИ ОТ УМЕНЬШЕНИЯ СТОИМОСТИ СПАСЁННОГО ИМУЩЕСТВА) – Salvage Loss:- where goods insured under a marine policy are damaged and as a result of the damage are sold short of destination for less than their insured value there is said to be a salvage loss. The insurer must pay the difference between the insured value and the proceeds, after deduction of sale charges and survey fee, of the sale. Occurs when the underwriter agrees to settle a cargo claim by paying the difference between the insured value and the proceeds realised by selling the damaged goods. / Разница между стоимостью спасённого имущества с вычетом расходов по спасению и первоначальной стоимостью застрахованного имущества.

SALVAGE STOCK = ОСТАТКИ ЗАПАСОВ – Salvage Stock:- unused material that has a market value and can be sold.

SALVAGE TITLE = XX – In the United States, a Salvage Title is a form of vehicle title branding, which notes that the vehicle has been severely damaged and/or deemed a total loss by an insurance company that paid a claim on it. The criteria for determining when a salvage title is issued differ considerably by state. In a minority of states, regulations require a salvage title for stolen vehicles; but, in others, it is issued only for losses due to damage. Under some circumstances, a salvage title denotation may be removed or replaced with a Rebuilt Salvage designation; and cars imported to, or exported from, the United States may be issued a clean title regardless of history. Because a salvage title can be issued to a vehicle with easy repairable problems or no damage whatsoever, the low cost of the salvaged motorcycle or car is appealing to some investors.

SALVAGE VALUE = СТОИМОСТЬ СПАСЁННОГО ИМУЩЕСТВА – Salvage Value:- the estimated cash amount that would be received if damaged property were to be sold.

SALVE ERRORE ET OMISSIONE = САЛЬВЭ ЭРРОРЭ ЭТ ОМИССИОНЭ – Salve Errore Et Omissione:- in Latin, Errors and Omissions Excepted. Request addressed to the customer to examine the bank statement carefully, with the bank reserving the right to correct omissions and errors at a subsequent date. Also known as SE&O. / Выражение 'Сальвэ Эррорэ эт Омиссионэ' в переводе с Латинского языка означает 'Ошибки и Упущения Исключены'.

SALWAR = САЛЬВАР – Salwar:- wide loose pants with a reinforced cuff and a drawstring usually worn with a long tunic. The Salwar was first worn by the desert women as a cover to shield their legs from the blistering heat. It was made from coarse cotton and had no aesthetic value whatsoever. It was only during the reign of the Moguls that the concept of anything like a Salwar came about. It was a time to be lavish and clothing became a symbol of social status. The fabric employed to tailor clothes ranged from the finest silks, velvets, chiffons and muslins and it was at this time that lehenga, the sherara and the churidar also took birth. The Salwar came to India with the invasion of the Aryans. They settled in Punjab and the locals adapted the salwar as their traditional dress. It was in Punjab that the concept of the Salwar as we know it today really came about. One only has to look at portraits of Maharaja Ranjit Singh, a fearless Sikh chieftain, to see that the Salwar was popular in the Punjab district. Hence today when you think of the Salwar you automatically think about Punjab and Punjabi culture. As symbols of Punjabi culture the Salwar is only second to bhangra. It is the staple dress of Punjabi women and is worn throughout the year in various fashions from the simple day to day styles to the more elaborate styles reserved for celebrations such as weddings and especially Vasakhi.

SAM = SUSTAINING ASSOCIATE MEMBER

SAMARA = КРЫЛАТКА (или САМАРА) – Samara is a winged fruit containing a single seed. (Latin:- Samara = Elm Seed). / В переводе с Латинского языка Samara означает Семя Ильма (Elm Seed). Самара – крылатый плод, содержащий одно семя. Под Крылаткой понимается сухой односемянный плод растений (орешек или ореховидный; или семянка или семянковидный) с кожистым околоплодником, образующим крыловидные выросты, способствующие распространению семян ветром, например, у Берёзы. Формируется из верхнего (Вяз, Ясень) или нижнего (Берёза, Ольха) синкарпного гинеция. Крылатка свойственна главным образом высокоствольным деревьям и лианам, у которых плоды планируют, отдаляясь от растения (особенно при ветре) на значительное расстояние. Из верхнего синкарпного гинецея формируется также двукрылатка клёна (Disamara), относящаяся к дробным плодам (при созревании семян она распадается на две крылатки).

SAM BROWNE = ПОРТУПЕЯ (или СЭМ БРАУН) – Sam Browne or Sam Browne Belt is a leather belt for a dress uniform supported by a light strap passing over the right shoulder. The Sam Browne belt is a wide belt, usually leather, which is supported by a narrower strap passing diagonally over the right shoulder. It is most often seen as part of a military or police uniform. Sam Browne VC (short for the Victoria Cross) was a British army officer serving in India in the XIX century. In those days officers always carried a sword into battle. It hung from a small metal clip on the waistbelt, called a 'Frog'. However, the scabbard tended to slide around a lot when they charged the enemy, meaning that it had to be steadied with the left hand before being drawn. During the Indian Rebellion of 1857 in India, Captain Sam Browne was serving with the 2nd Punjab Irregular Cavalry. On 31 August 1858, Captain Browne was involved in the fighting near Seerporah. As he charged a cannon being reloaded, he was attacked by one of its crew. Browne received two sword cuts, one on the left knee and one which severed his left arm at the shoulder. He survived the injuries but, without a left hand, he found that he was now unable to control or draw his sword. Browne came up with the idea of wearing a second belt which went over his right shoulder and held the scabbard in just the spot he wanted. This would hook into a heavy leather belt with 'D-rings' for attaching accessories. It also securely carried a pistol in a flap-holster on his right hip and included a binocular case with a neck-strap. Other cavalry officers in the Indian Army began wearing a similar rig and soon it became part of the standard uniform. During the Boer War, the rig was copied by Imperial and Commonwealth troops and eventually became standard issue. Infantry officers wore a variant that used two suspender-like straps instead of the cross-belt. It was supposedly invented in 1878 by Lieutenant Sir Basil Templer Graham-Montgomery, 5th Baronet of the 60th Rifles while serving in India. There has been a great deal of discussion as to whether Browne modified Graham-Montgomery's design or vice-versa. Since there were no patents issued for either design and both camps have accounts backing up their claims, it may never be decided. Due to its former use as equipment for carrying a sword, it is traditionally only worn by those to whom a sword would historically have been issued, namely officers and Warrant Officers (snr NCOs). Throughout most of its modern history, however, its main function has been to carry a pistol, and it was found to be particularly useful with the heavy pistols typically used during the first part of the XX century. Rifle Belt:- a different arrangement from the traditional Sam Browne belt consists of a similar wide belt with two vertical supporting straps, one over each shoulder. The design put the burden of the gear, with its heavy ammo pouches on the belt and straps, on both shoulders. It was worn by the officers of British and Commonwealth Rifle Regiments, who had to carry a rifle as their service arm rather than a pistol. It was also worn by big game hunters in Africa and India in the late-XIX and mid-XX centuries. It is often seen worn in movies or TV shows as part of the costume of explorers or big game hunters. Its invention is falsely attributed to Sam Browne. It was actually invented by Lieutenant Basil Templer Graham-Montgomery of the 60th Rifles while he was on service in India. Although a case of simultaneous development, Graham-Montgomery was seen as a plagiarist. The Sam Browne belt has been proposed as a solution to occupational safety and health concerns about injury due to the weight of equipment on police officers' belts. However, others have expressed concern that the vertical design of the belt could enable criminals to gain physical control of law enforcement officers in an altercation. / Крест Победы (Victoria Cross). Лейтенант Бэзл Тчэмплё Грээм-Мантгамёри (Lieutenant Basil Templer Graham-Montgomery). Сэм Браун (Sam Browne).

SAME CONDITION DRAWBACK = ВОЗВРАТ НА ТЕХ ЖЕ УСЛОВИЯХ – Same Condition Drawback:- duties are refunded on imported material which is subsequently exported in the same condition as when imported, or when destroyed under Customs supervision. The material must not have been used within the United States. However, incidental operations such as testing, cleaning, inspecting and repacking are permitted. The materials must be exported or destroyed within 3 years of importation. Substitution Same Condition Drawback allows claimants to file for drawback on imported material even if the imported material is not the exact material which is exported. However, exported material must be fungible with the designated material. Fungible merchandise is merchandise which is for commercial purposes identical and interchangeable in all situations. See also Direct Identification Drawback, Drawback, and Substitution Drawback. / привоз (importation).

SAME DAY FUNDS = ОДНОДНЕВНЫЕ СРЕДСТВА (или ФОНДЫ ТОГО ЖЕ ДНЯ) – Same Day Funds are the money balances that the recipient has a right to transfer or withdraw from an account on the day of receipt.

SAME–DAY SETTLEMENT = РАСЧЁТ ТЕМ ЖЕ ДНЁМ – Same-Day Settlement is a settlement of a trade on the same business day. The clearing company Clearstream for example settles orders between business partners the same day if it receives the orders by 10:00 am via paperless data transfer.

SAMITE = ПАРЧА (или АКСАМИТ, или XX) – Samite is a rich medieval silk fabric interwoven with gold and silver.

SAMPLE = ОБРАЗЕЦ (или ПРОБА, или ВЫБОРКА) – (1) Sample is the one of a number of things showing the characteristics of the whole. In statistics, a random sample is a limited amount of data selected from a population haphazardly. / Количество нештучной продукции, отобранное из контролируемой совокупности для принятия решения. Выборка – одна или несколько выборочных единиц, взятых из генеральной совокупности и предназначенных для получения информации о ней. Примечание:- выборка может служить основой для принятия решений о генеральной совокупности или процессе, который её формирует.

(2) Sample is a representative portion of a lot of material or of a consignment for testing or for record purposes.

(3) In the Cotton industry, Samples of lint, linters, waste, cottonseed cake, and cottonseed meal, of the amount and character usually required for trade purposes.

(4) A Sample is the portion of a population collected in a prescribed manner upon which a judgment is made about the entire population. Sample is a finite series of observations taken from a population; a portion of a population. Individuals taken from a population to represent it.

SAMPLE = ПРОБА – In the grains industry, a Sample is a portion of grain taken to represent an entire truckload, carload or cargo. The size of a sample to be analysed for the presence of specific grading factors is established for each class of grain in its section. The term approximate is often used, allowing inspectors to take into consideration the concentration of the grading factor in the sample. Types of samples include:- average sample, cargo sample, composite sample, consecutive sample, official carlot unload sample, official sample, processed sample, running sample, standard sample, submitted sample, and unprocessed sample.

SAMPLE GRADE = СОРТ ПО ОБРАЗЦУ (или ПРОБНЫЙ СОРТ) – Sample Grade:- usually the lowest quality of a commodity, too low to be acceptable for delivery in satisfaction of futures contracts. / Как правило, самое низкое качество сырья, слишком низкое, но которое, тем не менее, должно быть приемлемым для поставки в удовлетворение фьючерсных контрактов.

SAMPLE INTERVAL = ИНТЕРВАЛ ОТБОРА ПРОБ – A Sample Interval is the time between the repeated sample-capturing action of a sample method or device.

SAMPLE PREPARATION = ПОДГОТОВКА ВЫБОРКИ – Sample Preparation:- fluid factors that can enhance the accuracy of the particulate analysis. Such factors include particle dispersion, particle settling, and sample dilution.

SAMPLE SALE = ПРОДАЖА ОБРАЗЦОВ – Sample Sale is a special event providing clothing companies a method to sell off the samples from their showrooms. This provides the public with designer clothes (and non designer brand clothing) directly from the designer and clothing companies at wholesale or below wholesale prices. These fabulous clearance events quite often take place in the designer's own showroom. The prices at these sample sales are typically far better than what you would find in an outlet store.

SAMPLE SALVAGE = ОБРАЗЕЦ СПАСЁННОГО (ЗЕРНА) – Sample Salvage:- any grain salvaged from a wreck in transit containing over 2.5% by weight of stones or any other conspicuous ground material, removable or not, is graded (class of grain), Sample Salvage. For example, Wheat, Sample Salvage. / Любое зерно, спасённое после крушения .

SAMPLE SITE = УЧАСТОК ДЛЯ ПРОБЫ – Sample Site:- Location in the field where samples are to be taken. Usually four or more sample sites will be randomly selected for each field or stratum.

SAMPLE SIZE = РАЗМЕР ОБРАЗЦА (или РАЗМЕР ПРОБЫ, или ВЕЛИЧИНА ВЫБОРКИ) – Sample Size is the number of sampling units to be measured per plot, e.g., number of plants to be measured per unit area.

SAMPLING = ОТБОР ПРОБ (или ОТБОР ОБРАЗЦОВ, или ОТБОР ВЫБОРКИ) – (1) Sampling covers actual sampling by the inspection company or witnessing by the inspection company of the sampling executed by other parties. Sampling can be performed manually or utilizing mechanical sampling installations automated to different extents. The object of sampling is to obtain a representative quantity from all or part of a consignment as required. The final prepared sample should be suitable for analysis. / засвидетельствование (witnessing). Отбор Выборки – процесс извлечения или составления выборки.

(2) Sampling:- the withdrawal of a representative portion of a grain from a container or carrier by use of a specialized probe in order to conduct a grain inspection. For example in the Rice industry, sampling procedures for paddy aromatic Rice, brown aromatic Rice and white aromatic Rice shall be carried out in such a way to obtain the best representative samples of the lot. Sampling shall be done at random increments distributed throughout the lot to collect primary samples. The collected primary samples shall be mixed thoroughly, and then its quantity is reduced until getting a suitable sample size for analysis. Numbers of primary samples from various increments of the lot in different forms of transportation shall not be less than those requirements as prescribed in corresponding standards.

(3) Sampling is a process of selecting a subset of the field population of plants to monitor for estimating the status of the entire field. Usually a fixed number of consecutive plants with relevant properties (e.g., white flowers in the first fruiting position) are sampled at each sample site.

(4) To pick samples at random for a fair testing or examination of a lot of cotton by means of a portion or specimen. Sampling:- at the gin, Cotton fibers are separated from the seed, cleaned to remove plant residue and other foreign material, and pressed into bales of about 480 pounds (218 kg). A sample of at least 4 ounces (115 grams) is taken from each side of the bale by a licensed sampling agent and the 8 ounce (230 grams) total sample is delivered by the agent or designated hauler to the United States Department of Agriculture (USDA) classing facility serving the area. Gin and warehouse operators serve as licensed sampling agents and perform this function under USDA supervision. / При джинировании хлопковые волокна отделяются от семени, очищаются посредством удаления частиц растения и других инородных материалов и прессуются в кипы весом приблизительно 480 фунтов (218 килограмм). С каждой стороны кипы лицензированным агентом по отборке берутся образцы (всего два), по крайней мере, в 4 унции (115 грамм) и эти 8 унций (230 грамм) доставляются этим агентом или назначенным перевозчиком в классёрскую лабораторию Департамента Сельского Хозяйства США (ДСХ США; USDA classing facility), обслуживающую данный регион. Хлопкоочистительные компании и складские операторы действуют в качестве лицензированных агентов по отборке и выполняют эту функцию под надзором ДСХ США. Отбор проб может производиться также на процентной основе классёром по поручению покупателя или продавца хлопка.

(5) Sampling:- the testing of a representative portion of a commodity delivery for grade and classification purposes.

(6) In statistics, Sampling is a collection of a sample from a population.

SAMPLING = ОТБОР ПРОБ (или ОПРОБОВАНИЕ) – Sampling is the selection of a small but representative part of an ore body or process material for analysis.

SAMPLING ERROR = ОШИБКА ВЫБОРКИ (или ОШИБКА ВЫБОРОЧНОГО РАСПРЕДЕЛЕНИЯ) – Sampling Error is a deviation of a sample value from the true value owing to the limited size of sample or wrong sampling.

SAMPLING FRAME = РАМА (или КОСТЯК) ОТБОРА ПРОБ – Sampling Frame is a list of the numbers of a population from whom a sample will be taken. A frame placed over a section of crop to define the area sampled.

SAMPLING UNIT = ЕДИНИЦА ПРОБЫ (или ПРОБООТБОРНИК) – Sampling Unit is the unit designated within the experimental plot for the measurement of a character to be made. A good sampling unit must be uniform, easy to identify, and easy to measure. / свойство (character) .

SAMURAI BOND = ОБЛИГАЦИЯ САМУРАЙ – Samurai Bond is a Yen-denominated bond issued in Tokyo by a non-Japanese company and subject to Japanese regulations. Other types of Yen-denominated bonds are Euroyens issued in countries other than Japan. Samurai bonds give issuers the ability to access investment capital available in Japan. The proceeds from the issuance of samurai bonds can be used by non-Japanese companies to break into the Japanese market, or it can be converted into the issuing company's local currency to be used on existing operations. Samurai bonds can also be used to hedge foreign exchange rate risk. Samurai Bonds are the Japanese Yen-denominated bonds issued in Japan by foreign borrowers. Samurai Bonds are corporate bonds issued in Japan by a non-Japanese company. Samurai bonds are Yen-denominated bonds issue in Japan by a foreign company. The bonds are subject to Japanese bond regulations, attracting buyers (i.e. investors) from Japan and provide capital to a foreign issuer. Samurai bonds are identical to a bond issue in the US which is denominated in Dollars. These bonds give the company issuer the opportunity to gain access to the Japanese market which is a large world investment market, or to avoid the capital markets in the company's own country which may not be developed or stable. Samurai bonds also give the company an opportunity to expand into the Japanese market without the currency risks normally associated with a foreign investment. The investment (and the obligation to repay the debt) is already in Yen. Samurai Bond is a foreign bond issued in Japanese Yen in the Tokyo bond market. / Деноминированные в Иене облигации, выпускаемые в Японии иностранными заёмщиками. Для Российских компаний и крупнейших банков в Японии теоретически есть два инструмента. Во-первых, это Облигации Самураи – Йеновые облигации, которые обращаются на внутреннем рынке Японии, и так называемые Евройены. Самураи интересны тем, что дают лучший доступ к инвесторам в Японии, но существенно более сложны с точки зрения подготовки документации и соответствия требованиям, которые есть в Японии по организации выпуска таких бумаг. Поэтому реальным вариантом для Российских компаний является выпуск Еврооблигаций, номинированных в Йенах. Просто брать Йены и конвертировать их в другую валюту нет смысла. Это все равно что занять в Долларах или Евро. Займы в Йенах интересно и выгодно делать, в первую очередь, когда есть какой-то объём кредитного портфеля в Йенах.

SAN = STORAGE AREA NETWORK

SANBENITO = САНБЭНИТО (или ХХ) – Sanbenito is a sackcloth, namely, a coarse cloth of camel's hair or cotton, coat worn by penitents on being reconciled to the church; a Spanish inquisition garment resembling a scapular and being either yellow with red crosses for the penitent or black with painted devils and flames for the impenitent condemned to an auto-da-fé. / ото-да-фе (auto-da-fé).

SANCTION = САНКЦИЯ – Sanction is an embargo imposed by a government against another country. / Эмбарго, налогаемое правительством против другой страны. Под Санкцией, от Латинского слова Sanctio, означающее Строжайшее Постановление, понимаются:- (i) мера воздействия, важнейшее средство социального контроля; различают негативные санкции, направленные против отступлений от социальных норм, и позитивные санкции, стимулирующие одобряемые обществом, группой отклонения от норм; формальные санкции налагаются официальным общественным или государственным органом, неформальные санкции – реакция членов группы, друзей и так далее; (ii) государственная мера, применяемая к нарушителю установленных норм и правил; (iii) часть правовой нормы, содержащая указание на меры государственного воздействия в отношении нарушителя данной нормы; (iv) в международном праве – меры воздействия, применяемые к государству при нарушении им своих международных обязательств или норм международного права; и (v) утверждение чего-либо высшей инстанцией, разрешение.

SAND = ПЕСОК – Sand:- used as a filter medium in fiber manufacture, particularly used in spinning packs for nylon or polyester production. / Найлан^{T3} (Nylon^{TM}).

SAND = ПЕСОК (или ПЕСОЧНОЕ) – Sand:- a variable color averaging a yellowish gray.

SANDAL = САНДАЛИЯ (или БОСОНОЖКА) – Sandal is a shoe consisting of a sole strapped to the foot; a low-cut shoe that fastens by an ankle strap; a rubber overshoe cut very low.

SAND BAR = ПЕСЧАНАЯ ОТМЕЛЬ (или ПЕСЧАНЫЙ ПЕРЕКАТ, или ПЕСЧАНЫЙ ДОННЫЙ ПОРОГ, или ПЕСЧАНЫЙ БАР) – Sand Bar is a bank or ridge of sand deposited in a river channel. / Песчаный Перекат в русле реки. Под Перекатом понимается мелководный участок реки, часто имеющий вид вала, сложенного рыхлыми отложениями и пересекающего русло. Под Порогом понимается короткий участок реки с относительно большим падением уровня воды и повышенной скоростью течения. Образуется обычно в местах выхода на поверхность трудно-размываемых горных пород. Под Баром понимается гряда в прибрежной полосе морского дна, образованная наносами. Различают береговой, островной, подводный и приустьевый бар.

SAND–BLASTING = ПОВРЕЖДЕНИЕ ПЕСКОМ (или ПЕСЧАНЫЙ ЗАНОС) – Sand-Blasting:- the combination of lighter soil types and strong winds blowing across adjacent bare fallow fields or along rows may result in sand-blasting. Symptoms are obvious on one side of the plant. Affected cotyledons or leaves become desiccated and may shrivel up. The exposed side of stems and branches may also become dry and brown. Sandblasting can significantly exacerbate development of bacterial blight on susceptible varieties. / Семядоли или листья, оказавшиеся под таким воздействием, становятся высохшими и могут сморщиться. Повреждение – одно из понятий теории надёжности; событие, заключающееся в нарушении исправности изделия. Повреждение может быть существенным и являться причиной нарушения работоспособности (отказа) и несущественным, при котором работоспособность изделия сохраняется.

SANDING SEALER = ЗАЩИТНОЕ ПОКРЫТИЕ ШЛИФОВКОЙ (или ЗАЩИТНАЯ ОБРАБОТКА ПЕСКОСТРУЙНОЙ ОЧИСТКОЙ) – Sanding Sealer is a preparation coating which seals the wood in preparation for topcoating and which is easy to smooth by sanding. / .

SAND ROLL (TAKE–UP ROLL) = ВАЛЬЯН С НАЖДАЧНЫМ ПОКРЫТИЕМ (ОТТЯЖНОЙ ВАЛИК) – Sand Roll (Take-Up Roll) is a roll at the front of a loom which is generally covered with some rough material (crêpe rubber, sandpaper, cork, etc) and which grips the cloth roll during weaving.

SAND SHOE = ХХ ОБУВЬ – Sand Shoe:- (chiefly Australian and New Zealand) tennis shoe.

SANDWASH = ПРОМЫВКА ПЕСКОМ – Sandwash:- the soft peachskin finish obtained by blasting a fabric with fine sand.

SANDWICH BLEND = СМЕШЕНИЕ СЭНДВИЧ (или ПОСЛОЙНОЕ СМЕШЕНИЕ) – Sandwich Blend is a method of preparing fiber mixtures by layering them horizontally in alternating layers with all elements in the proper proportion. Vertical sections are cut and fed to the next machine in the process, where blending is effected.

SANDY = ПЕСЧАНИСТОЕ (или ХХ) – Sandy:- the color of sand.

S AND Z TWIST = КРУТКА S И Z (или ЛЕВАЯ И ПРАВАЯ КРУТКА) – S and Z Twist:- these terms are in general usage to designate the twist direction in single or plied yarns. In S-twist yarns, the angle of twist when viewing the yarn in a vertical position runs from top left to bottom right, resembling the diagonal of the letter S. In Z-twist yarns, the angle of twist runs from top right to bottom left, resembling the diagonal of the letter Z. The Twist direction is a pitch direction of the fibre in the yarn in a screw line, it can be in Z or in S direction:- (i) Z-Twist:- single fibers in the yarn and the yarns in the ply yarn, hold vertical, lie in direction of the letter Z; and (ii) S-Twist:- single fibers in the yarn and the yarn in the ply yarn lie in a thread, hold vertical, in direction if the letter S.

SANFORIZATION = СЭНФОРИЗАЦИЯ – Sanforization:- most sewers and consumers today take for granted that shrinkage is not a washday problem. But there are those who remember the tragedies of no pre-shrunk fabrics, guessing how many times garments would continue to shrink after repeated washings and who during the 1930s–60s searched for labels or tags on garments and yardage stating pre-shrunk or Sanforized before purchasing. We all owe a debt of gratitude to Sanford L. Cluett, a man of remarkable curiosity and talents in various fields with more than 200 patents to his credit. He changed the way America looked. He helped put an end to exposed wrists and ankles, constricted waistlines and bursting buttons. The invention which bears his name, Sanforized, made it possible to wash clothes over and over again without shrinkage. In 1919 when he was 45, Sanford joined Cluett, Peabody & Co., his uncles' Arrow shirt collar company in Troy NY and which had been in business since 1851. At that time Troy factories were producing three million detachable collars a week and shipping them all over the world. But by the late 1920s people were getting used to wearing soft collars attached to shirts and collar sales fell drastically. The company, which had a process called Clupeco-shrunk for its collars, tried to manufacture collar-attached shirts but had to deal with the defect of shrinkage when they were washed. No one wanted to buy pre-washed shirts. Sanford's clinical mind decided there was a need to find a way to shrink shirts before they were washed. This line of thought led him to develop a standardized process for pre-shrinking or what the textile industry refers to as Controlled Compressive Shrinking. Basically, he designed a machine on which cloth passed over a contracting elastic felt blanket where the pulling action during manufacturing was adjusted by a pushing action. This process was named Sanforized in his honor (the d was dropped), registered in 1930 and ultimately became a worldwide famous trademark. Initially the process was so successful that Cluett Peabody dropped Arrow detachable collars and replaced them with Arrow shirts. In the 1940s the company introduced Arrow pre-shrunk underwear and began licensing the name and process to other manufactures. As a result, many brands appeared on the market advertising their own Sanforized underwear. Other Cluett trademarks introduced following WWII were Sanforset or Sanfor Set (liquid ammonia treatment) which guaranteed rayon fabrics or garments would not shrink or stretch more than 2%; Sanforlan which signified that wool was treated to render it permanently non-felting and would not shrink out of fit; Sanfor Plus (with resin finishing) for wash and fabrics and garments for retaining smoothness, crease recovery and tensile and tear strength; and Sanfor Plus 2 (blended fabrics with resin finishing) for durable press garments made only from approved pre-cured or post-cured fabrics which met Cluett standards. Modern technology has replaced all but Sanforized with Sanfor-Knit, invented by Herman J. Joy, head of Cluett's creative development, for highest standards of shrinkage control and easy-care performance in 100% cotton and cotton-blend knit fabrics and garments, and Sanfor-Set for woven cotton or cotton-blend fabric which conform to precise standards of shrinkage control and easy-care performance. When Sanford died in 1968, Sanforized was licensed for manufacture by 448 mills in 58 countries. Today the trademarks Sanfor (Europe), Sanforizado (Latin America) and Sanforized (rest of the world) are registered in more than 100 countries worldwide for cotton and cotton blend fabrics. The Sanforized Division of Cluett Peabody International owns sole rights to the process. Sanforizing process in a nutshell Sanforized means that fabrics which carry the famous Sanforized label are tested according to the severe test methods required by the Sanforized Company. These tests conform to test standards specified by the US government. The company's test is a guarantee that these fabrics will not shrink more than 1% (Sanforized Standard) in either warp or weft. Sanford's premise was that yarns and/or fabrics are not fixed materials. They consist of separate, stretchable fibers which submit to the continuous tension during spinning, weaving, bleaching, dyeing and the various finishing processes. In other words, fabrics do stretch in length and width. The tension within the yarns, which is caused by this stretching, can be eliminated when the friction within the fabric is reduced. This reduction in friction occurs during laundering where both water and soap act as a lubricant. The lubricant, along with the mechanical action of the washer, helps the fibers relax and contract to their original length before the elongation takes place. A full-width sample is wash tested according to a prescribed test method. After the lengthwise and widthwise shrinkage has been determined, the compressive shrinkage machine can be adjusted accordingly. This means that the fabric shrinks and recaptures its original equilibrium. It should be noted that the preshrinking process is by no means exclusive to The Sanforized Company. Others guaranteeing less than 1% shrinkage for cottons with their patents were Nashua Mfg. Co. which stamped Pre-Shrunk in its Indian Head selvages as early as 1934; Springshrunk by Spring Mills, Rigmel by Bradford Dyeing Association, Pak-nit for cotton knits by Compax Corporation and Redmanized and Permasized by F.R. Redman Co., also for knits. For wool there were Drisol, Harriset, Hypol, Kelpie, Kroy, Lanaset, McFee Method, Pacifixed, Protonizing, Resloom, Schollerizing, Stevens H_2O and Wurlan. Long wear guaranteed for this rugged work jacket. National Bella Hess catalog, 1946-47 Licensing in a nutshell Universally, the Sanforized label is recognized as dimensional stability for garments made up of Sanforized-labeled fabrics. The company claims that its license program is unique and without parallel in the textile and apparel industries. Manufacturers which meet special test requirements and conform to a precise standard of shrinkage established by The Sanforized Company may label their merchandise Sanforized. This is uniformly true everywhere in the world wherever cotton and cotton-blend merchandise is produced and sold because the same processing, testing and inspection procedures are carried out with each and every licensee. Label denoting fabric is an authentic Sanforized checked standard of shrinkage. Mills are required to identify each piece of their Sanforized fabrics with this label that states they are in compliance with Cluett's standards. Top quality – Wilson Brothers shirts of Dan River broadcloth are Sanforized – Colliers, Aug. 27, 1949. To insure that a uniform standard is maintained, Sanforized technical service representatives perform constant inspection and check-testing at the plants of textile mills licensed to produce Sanforized fabrics. The end result is that retailers and consumers are assured that a garment so labeled will not shrink out of fit. There are specific requirements for those using the Sanforized label:- licensed textile mills are required to identify their Sanforized fabrics with a label which must be applied to end of each piece of fabric. Label is to state that Sanforized is a checked standard of shrinkage. Mills can also stamp Sanforized at intervals on cloth selvage. Fruit of the Loom also used the Sanforizing process to denote additional quality of its cloth. Shown in Montgomery Ward catalog, 1957. Licensed manufacturers which make garments wholly of Sanforized fabric identify their garments as Sanforized. The right to use this trademark is from the standard label which appears on each roll of fabric the garment is made from. In addition the invoice for the fabric must state Sanforized. There are many different ways in which manufacturers label their garments as Sanforized – for instance, inclusion of

the trademark on the manufacturer's own sew-in neck label or hang-tag, separate hang-tags, gummed tickets, gummed labels, etc. Retailers purchasing garments identified as Sanforized may use the trademark in advertisements, on counter cards, in bill stuffers and all other material employed to promote the sale of the garment. To protect themselves against receiving illegal use of trademark, retailers require Sanforized identification of their purchase orders. The Man Behind the Invention – Sanford Cluett 1874–1968 Perhaps this observation made by Sanford helps to sum up the heart and mind of this inventive person:- 'If more people would get curious and open their eyes and ears and minds, they would be much happier and incidentally, more successful'. He had a wide range of interests and successful careers in several fields. The scientific mind was evident in childhood when at 10 he surveyed and mapped Raquette Lake in the Adirondack Mountains using a carpenter's level, some metal screw eyes and a music stand. During his teens he lived in Florida due to ill health but didn't let that dampen his investigative enthusiasm. He hunted swamps for alligators, befriended the Seminoles and learned their language, and became an expert marksman. Deciding not to pursue a career in medicine, he enrolled at Rensselaer Polytechnic Institute (Troy) to study ballistics. While a student, he invented a bubble sextant for celestial navigation. He was inducted into the Institute's Hall of Fame established in 1998. Upon graduation, he enlisted in the military for the Spanish-American War and was assigned to the engineering corps. Afterwards, he provided much of the key engineering design work for the Big Sandy River Dam project in Kentucky, where he reportedly was almost shot by suspicious mountain folk who thought he was a revenuer. Sanforization is a process of treatment used for cotton fabrics mainly and most textiles made from natural or chemical fibers, invented by Sanford Lockwood Cluett (1874–1968) in 1933. It is a method of stretching, shrinking and fixing the woven cloth in both length and width, before cutting and producing to reduce the shrinkage which would otherwise occur after washing. The cloth is continually fed into the sanforizing machine and therein moistened with either water or steam. A rotating cylinder presses a rubber band against another heated rotating cylinder, thereby the rubber band briefly gets compressed and afterwards shrinks to its final size. The cloth to be treated is transported between rubber band and heated cylinder and is forced to follow this brief expansion and recontraction and thus gets shrunk. The bigger the pressure applied to the rubber band the bigger the shrinking afterwards. The aim of the process is a cloth which does not shrink during clothes production by cutting, sewing or by wearing and washing the finished clothes. For technical application cloth may be specified to have a shrink-proof value of under 1%. / Хёмэн Дьжей. Дьжой (Herman J. Joy). Зэ Сэнфорайзд Кампэни (The Sanforized Company). Нашуа Маньюфакшэрин Ко. (Nashua Mfg. Co.) При-Шранк (Pre-Shrunk); Сприншранк (Springshrunk) компанией Сприн Милз (Spring Mills), (Rigmel) Брэдфордской Ассоциацией Крашения (Bradford Dyeing Association), (Pak-nit) для хлопкового трикотажа компанией Кампэкс Корпорэйшэн (Compax Corporation) и Рэдмэнайзд (Redmanized) и Пёмэсайзд (Permasized) компанией Эф.Ар. Рэдмэн Ко. (F.R. Redman Co.), также для трикотажа. (Drisol), Аррисэт (Harriset), Хайпол (Hypol), Кэлпи (Kelpie), Крой (Kroy), Ляназэт (Lanaset), Метод МэкФи (McFee Method), Пэсификст (Pacifixed), Протанайзин (Protonizing), Рэслум (Resloom), Шолярайзин (Schollerizing), Стивэнз Эйч.Тчу.Оу. (Stevens H_2O) и (Wurlan). Национальный каталог Бэллы Хэс (National Bella Hess catalog). Вилсэн Бразёз (Wilson Brothers) Дэн Ривё (Dan River). пузырь (bubble). Порок или дефект. Сэнфоризация это процесс обработки, применяемый главным образом для тканей из хлопка и большого количества текстиля, произведённого из натуральных и химических волокон, изобретённый в 1933 Американцем Сэнфодом Лаквудом Клюэтом (Sanford Lockwood Cluett; 1874–1968). Этот метод состоит из растяжения, усадки и фиксации сотканной ткани и по длине и по ширине, до момента раскроя (cutting) и производства, и цель его заключается в том, чтобы уменьшить усадку, которая могла бы возникнуть вследствие стирки. Ткань непрерывно подаётся в сэнфоризующую машину, в которой увлажняется с помощью воды или пара. Вращающийся вал прижимает резиновую ленту к другому разогретому вращающемуся валу; таким образом, резиновая лента ненадолго становится натянутой, а впоследствии усаживается до своего конечного размера. Предназначенная к данной обработке ткань подаётся между резиновой лентой и нагретым валом, где она подвергается этому растяжению и повторному стягиванию и таким образом получает усадку. Чем сильнее натяжение резиновой ленты, тем больше уровень получаемой усадки. Данный процесс предназначен для того, чтобы ткань не усаживалась ни в процессе её производства при раскрое, пошиве или при носке и стирке готовых изделий. Применение данного процесса при обработке ткани допускает её возмужную усадку в дальнейшем на уровне не более 1%. В России данный процесс и технология известны под названием Термоусадка. Термофиксация Тканей – стабилизация тканей, придание материалам из синтетических волокон и нитей устойчивых размеров, уменьшение сминаемости, улучшение внешнего вида. Для этого производится нагрев тканей (в сухой среде до температуры 220 °C, во влажно-паровой – до 130 °C), а затем быстрое охлаждение. Длительность стабилизации составляет 10–90 секунд. При использовании для отделки различных тканей синтетических термореактивных смол под термофиксацией. понимают также обработку при температурах 140–170 °C материалов, предварительно пропитанных смолой.

SANFORIZE = СЭНФОРАЙЗ – Sanforize is a process of preshrinking fabric to leave a residual shrinkage of less than 1%, a desirable characteristic. See also Residual Shrinkage.

SANFORIZED® = СЭНФОРИЗОВАНАЯ® – Sanforized® is a trademark of Cluett, Peabody & Co., Inc., denoting a controlled standard of shrinkage performance. Fabrics bearing this trademark will not shrink more than 1% because they have been subjected to a method of compressive shrinkage involving feeding the fabric between a stretched blanket and a heated shoe. When the blanket is allowed to retract, the cloth is physically forced to comply. Sanforized® is a registered trademark of Cluett, Peabody & Co. for fabrics processed by machine so that residual shrinkage will not exceed 1% in either direction (according to the US's standard wash test CCC-T-191a), despite repeated washings. The Sanforized trademark was first registered in the United States of America in 1930. Today the trademark is registered in over 100 countries worldwide. Our extensive network of global licensees uses the trademark on both 100% cotton and cotton-blend fabrics which meet special test requirements and conform to a precise standard of shrinkage established by The Sanforized Company. Manufacturers of garments made of these fabrics may label their merchandise Sanforized. Thus the retailer and the ultimate consumer can tell at a glance that the fabric in a garment so labeled will not shrink out of fit. This is uniformly true everywhere in the world, wherever cotton and cotton-blend merchandise is produced and sold, because the same processing, testing and inspection procedures are carried out with each and every licensee. Sanforized technical service representatives perform constant inspection and check-testing at the plants of textile mills licensed to produce 'Sanforized' fabrics. This insures that a uniform standard is maintained. The Sanforized trademarks are known at both trade and consumer levels worldwide because of their universal assurance of quality. Textile users – manufacturers, retailers, and consumers – have confidence in Sanforized. They ask for it. They have been asking for it for more than 70 years. The Sanforized license program is unique and without parallel in the textile and apparel industries. Our leadership and expertise in quality shrinkage control are well-known in every major textile market of the world. During spinning, weaving, bleaching, dyeing and the various finishing processes, yarns and cloth are under a continuous tension. Yarns and/or fabrics are not fixed materials. They consist of separate, stretchable fibers which submit to the tension. In other words, fabrics do stretch in length and width. The tension within the yarns, which is caused by this stretching, can be eliminated when the friction within the fabric is reduced. This reduction in friction occurs during laundering where both water and soap act as a lubricant. The lubricant, along with the mechanical action of the washer, helps the fibers relax and contract to their original length before the elongation takes place. This means that the fabric shrinks and recaptures its original equilibrium. The internationally well-known and most important shrinking process today dates back more than 70 years. Though the correct expression for this process is Controlled Compressive Shrinkage,

the average person knows it as Sanforized. The process is a purely mechanical treatment without any addition of chemicals. The word Sanforized is derived from the first name of the inventor of the compressive shrinkage process, Mr. Sanford L. Cluett (born in 1874 in Troy, NY, USA – died in 1968 in Florida, USA). The Sanforized Company, a division of GTB Holding Corp., New York, USA, is sole owner of the registered trademarks Sanforized, Sanfor and Sanforizado. The Sanforized label means dimensional stability for garments made up of Sanforized labeled fabrics. The purpose of the process is to shrink fabrics in such a way that textiles made up of these fabrics do not shrink during washing. The amount of potential wash shrinkage must be determined prior to shrinking. A full width sample is wash-tested according to the test method. After the lengthwise and widthwise shrinkage has been determined, the compressive shrinkage machine can be adjusted accordingly. The process can be described by the following schematic:- Fabric (F) passes through the skyer (S) or other moistening device and is moistened by water and/or steam. This will lubricate the fibers and promote shrinkability within the fabric. Normally, a fabric must be moistened in such a way that every single thread achieves a moisture content of approximately 15%. This allows compression of the fabric with very little resistance. When the fabric passes through the clip expander (C), we obtain the required width. The clip expander also transports the fabric to the most important part of the machine: the rubber belt unit (indicated by arrows in above figure). In the close-up of fig. 1, we see the endless rubber belt (R). By squeezing rubber belt (R) between pressure roll (P) and rubber belt cylinder (RB), we obtain an elastical stretching of the rubber belt surface. The more we squeeze the rubber belt, the more the surface is stretched. This point of squeezing is known as the Pressure Zone, or the Nip Point. Fabric (F) is now fed into the pressure zone. When leaving the pressure zone, the rubber belt recovers itself and the surface returns to its original length carrying the fabric with it. The effect of this action is a shorting of the warp yarn which packs the filling yarns closer together. At this actual moment, shrinkage occurs. After compaction within the rubber belt unit, the fabric enters the dryer (D). Here the fibers are locked in their shrunken state by removing the moisture from the fabric. After the compressive shrinkage process is completed, another sample of the fabric is taken. This sample is also wash-tested. The final result of this test must meet the Sanforized Standard, in length and width before it may carry the Sanforized label. All Sanforized Licensees are contractually obligated to follow the required test method and meet the standards set forth by The Sanforized Company. The Sanforized® and Sanfor® trademarks are registered trademarks of GTB Holding Corp., New York, USA. Cluett joined his uncles' business in 1919. Troy factories were cranking out 3 million detachable collars a week then, shipping them all over the world. But in the 1920's, people were getting used to wearing soft collars attached to shirts. Collar sales were plummeting. The company tried to get into collar-attached shirts but had to deal with the defect of shrinkage when they were washed. No one would buy pre-washed shirts. Cluett needed to find a way to shrink the shirts before they were washed. Cluett concluded the cause of shrinkage was the stretching of fabric in the manufacturing process. When the fabric was washed, it returned to its normal state. He developed a 'compressive shrinkage process' that soon carried the trademark 'Sanforized', named for its inventor. Cluett Peabody & Co., Inc. licensed the process and made it available to everybody in the textile industry. Suddenly, people could be sure when they bought a garment that it would fit them for as long as they owned it. Previously, fitting new clothes was mostly guesswork. The only certainty was the garment was going to shrink. The innovation launched 'Cluett, Peabody & Co., Inc.' into its second generation as Arrow collars were replaced by Arrow shirts. / уточные пряжи . Порок или дефект. Г-н Сэнфод Эл. Клуэт (Mr. Sanford L. Cluett). За Сэнфорайзд Кампэни (The Sanforized Company), подразделение Дьжи.Ти.Би. Холдинь Корп. (GTB Holding Corp.). Клуэт, Пибади Энд Ко., Инк. (Cluett, Peabody & Co., Inc.).

SANFORIZED CORRUGATION = СЭНФОРИЗОВАНАЯ ГОФРИРОВКА – Defect Name:- Sanforized Corrugation. Defect Type:- Finishing Defects Fabric Type:- Bottomweights – Twill Derivatives. Description:- Sanforized Corrugation:- This is the result of the sanforizer blanket not properly controlling the compacting of the fabric. Generally, it is caused by the blanket not being tight enough or a soft place in the blanket. Severity:- Major.

SANFORIZED PUCKER = СЭНФОРИЗОВАНАЯ МОРЩИНКА (или СКЛАДКА, или ВЗДУТИЕ) – Defect Name:- Sanforized Pucker. Defect Type:- Finishing Defects. Fabric Type:- Bottomweights – Twill Derivatives. Description:- Sanforized Pucker:- This is the result of uneven wetting-out on the sanforizer, generally caused by faulty spray heads. Severity:- Major. See also Sanforize Pucker.

SANFORIZED ROUGHNESS = СЭНФОРИЗОВАНАЯ НЕРОВНОСТЬ – Defect Name:- Sanforized Roughness. Defect Type:- Finishing Defects. Fabric Type:- Bottomweights – Twill Derivatives. Description:- Sanforized Roughness:- This is the result of over-sanforization giving the fabric a very coarse texture. Severity:- Major.

SANFORIZE PUCKER = СЭНФОРИЗОВАНАЯ МОРЩИНКА (или СКЛАДКА, или ВЗДУТИЕ) – Sanforize Pucker:- results from uneven wetting out on sanforize; usually caused by defective spray heads. Fabric will appear wavy or puckering when spread on cutting table. Difficult to detect while inspecting on inspection machine with fabric under roller tension. See also Sanforized Pucker.

SANFORIZING MARK = ОТМЕТИНА ОТ СЭНФОРИЗАЦИИ – Sanforizing Mark is a crimped, rippled, wavy, pebbled, or cockled place showing distortion of the texture. Synonym:- Blanket Mark.

SANFOR–SET® = СЭНФОР–СЭТ® – Sanforset® or Sanfor Set® or Sanfor-Set® is a trademark of Cluett, Peabody & Co., Inc., denoting a controlled standard of shrinkage performance originally developed for denims. Fabrics bearing this trademark will not shrink under home-wash, tumble-dry conditions because they have been subjected to a liquid ammonia treatment and compressive shrinkage. / Клуэт, Пибади Энд Ко., Инк. (Cluett, Peabody & Co., Inc.).

SANGUINE = СЭНГВИН (или РУМЯНОЕ) – Sanguine:- blood red; ruddy. / кроваво-красное; .

SAN–JOSÉ SCALE = САН–ХОСЭВСКАЯ ЩИТОВКА – San-José Scale (Aspidiotus Perniciosus) is a quarantine pest that attacks stone fruit, pomaceous fruit and berries, as well as decorative woods und structural lumber.

SAP = SPECIFIC AMPLICON POLYMORPHISM

SAP = SWIFT ACCESS POINT

SAP = СОК (или ЖИВИЦА) – Sap is the watery fluid that circulates through a tree carrying the chemical food that enables the tree to grow. / Под Живицей или Терпентином понимается светло-жёлтая вязкая жидкость, выделяющаяся при ранении хвойных деревьев. Сырьё для получения канифоли и скипидара.

SAP GREEN = СОЧНО–ЗЕЛЁНОЕ – Sap Green:- a strong yellow green.

SAPONIFICATION = ОМЫЛЕНИЕ – Saponification:- specifically in relation to manufactured fibers, saponification is the process of removing part or all of the groups from acetate or triacetate fiber, leaving regenerated cellulose. Saponification is the chemical process by which cellulose acetate rayon is partially or completely converted to regenerated cellulose by a splitting off of the acid acetyl groups (acetic acid). This is usually accomplished by treatment with alkaline solutions at elevated temperatures. Saponification, it should be noted, results in a loss in weight and tensile strength of the original acetate rayon. It makes possible the dyeing or printing of the fabric with the direct-type dyestuffs normally used on viscose-rayon or cotton fabrics. It is not uncommon practice to partially saponify

cellulose acetate rayon materials to permit the application of such dyestuffs or in preparation for discharge printing, particularly when the fabric contains a blend of visa and acetate-type rayons.

SAPONIFICATION NUMBER = ЧИСЛО ОМЫЛЕНИЯ – Saponification Number is the number of milligrams of potassium hydroxide (KOH) that combine with one gram of oil under conditions specified by test method ASTM D 94. Saponification number is an indication of the amount of fatty saponifiable material in compounded oil. Caution must be used in interpreting test results if certain substances – such as sulfur compounds or halogens – are present in the oil, since these also react with KOH, thereby increasing the apparent Saponification number. American Society for Testing and Materials (ASTM). / Американское Общество по Испытаниям и Материалам (АОИМ).

SAPONIFIED RAYON = ОМЫЛЕННОЕ РЭЙОН (или ОМЫЛЕННОЕ ГИДРАТЦЕЛЛЮЛОЗНОЕ ВОЛОКНО) – Saponified Rayon is a type of rayon made from cellulose acetate filaments, sirnilar to the kind used in making acetate. These fibers are treated in a special way to prodtrce a rayon that is very strong. Fortisan is an example of saponified rayon. / (Fortisan).

SAPPHIRE = САПФИР (или САПФИРОВОЕ, или ХХ) – Sapphire:- a deep purplish blue color.

SAPROPHYTE = САПРОФИТ – Saprophyte is an organism deriving its nourishment from decaying or non-living organic material. An organism that lives and multiplies on dead or dying organic matter. Saprophyte is an organism that subsists on dead organic matter and inorganic materials; nonpathogenic. / Организм, который живёт и размножается в мёртвой или умирающей органической материи. Под Сапрофитами, от Греческих слов Saprós, означающее Гнилой, и Phytón, означающее Растение, понимаются Бактерии, Грибы и Растения, питающиеся органическим веществом отмерших организмов. Таким образом, они разлагают выделения и трупы Животных, а также растительные остатки.

SAPROPHYTIC = САПРОФИТНОЕ – Saprophytic:- of a free-living organism obtaining all nutrients from non-living organic sources. / Под Сапрофитным, от Греческих слов Saprós, означающее Гнилой, и Phytón, означающее Растение, понимается .

SAP ROT = ЗАБОЛОННАЯ ГНИЛЬ – Sap Rot is a decay of dead wood by saprobic organisms. Some fungi can decay sapwood in living trees. Sap Rot may refer to saprobic decays or to those that develop in the sapwood. Usually sapwood decays extensively only in dead trees. But there are some fungi that commonly decay sapwood in living trees, usually causing cankers. Also keep in mind that saprobic fungi can and do decay heartwood in dead trees. Here we use the term stem decay for all diseases where the primary symptom is decay of stem wood, largely because 'heart rot' is thought by some some to imply that decay is restricted to heartwood, which is frequently not the case. / гниение или загнивание мёртвой древесины под воздействием сапрофитных организмов. Заболонная Гниль это гниль, возникающая в заболони срубленной древесины, с желтовато-бурыми или розовато-бурыми оттенками у хвойных пород; с пёстрой окраской, напоминающей рисунок мрамора – у лиственных пород. На поперечных разрезах наблюдается в виде пятен разной величины и формы или сплошного поражения заболони, на продольных разрезах – в виде вытянутых пятен, полос или сплошного поражения заболони. Развивается при длительном и неправильном хранении, чаще в круглых лесоматериалах, у лиственных пород обычно следует за побурением и может переходить в ядро. Твёрдая Заболонная Гниль это заболонная гниль, близкая по твёрдости к окружающей древесине. Мягкая Заболонная Гниль это заболонная гниль с пониженной твёрдостью древесины.

SAPS = SINGLE AREA PAYMENT SCHEME

SAP STAIN = ЗАБОЛОННАЯ (ГРИБНАЯ) ОКРАСКА – When wood is exposed to slow drying conditions, it is likely that the sapwood will become infected with a fungus that results in discoloration of the lumber. This discoloration is called Sap Stain, or Blue Stain. The typical coloration is blue, gray or black. The color is actually due to the color of the fungus itself, rather than a color change within the wood cells or chemicals. Although the fungus does not appreciably affect the strength of the wood, it does create color problems for wood that will be finished with light-colored or clear finishes. Prevention and control of blue stain is easily achieved either through better drying or chemical treatments. Also known as Blue Stain. The term Sapstain and Blue Stain is used in many articles concerning rot and wood preservation. One should understand this term as a first step in understanding wood degradation and rot. A tree consists of many parts, but for this short treatise two terms, heart wood (physiologically dead wood located near the center of the tree) and sap wood, which are located on the outer periphery of the tree (physiologically active) will suffice. The sap wood carries water and nutrients up though the tree and thus is a perfect environment for sapstain growth. When a board or timber is cut from a log, mold spores can come in contact with the nutrient rich wood with its inherent high moisture content and they begin to multiply and spread over the face of the lumber. As they spread they create a stain which is normally blue, but can actually be different colors. Throughout the years I have seen not only blue, but also black, red and yellow. If this mold/stain is not checked, it can penetrate into the wood with tendrils and take the infection deep into the lumber or timbers. They will eventually emit enzymes which will break down the wood and then you have the start of serious decay. We are talking about lumber which is wet (unseasoned) and in a nutrient rich environment. Many people talk of dry rot; but in reality there is no such thing. This is a misnomer. since wood needs to be between 30 and 60-percent moisture content for it to begin the decay cycle. To prevent sapstain from discoloring the lumber and to prevent further degradation through decay, many mills will dip the product into a fungicide to deter mold from attacking the lumber. This is particularly important in the humid areas of the United States and its use is highly recommended for high quality, valuable lumber. Lumber which has a high propensity of sapstain will not take a finish evenly. The area which has the sap- stain will absorb wood finishes more than unaffected areas. Thus, when finishing a piece of lumber so infected, one will have to use a number of wood finish coats to even out the look. For high quality products such as furniture or mouldings, the lumber infected with sapstain is discarded. If one is installing wood which has mildew present, it should be washed thoroughly before applying any type of finish. We are talking about a surface coating of mildew, not a stain that has penetrated deep into the wood. Use a mixture of three quarts of water, one quart of household bleach, and 1/4 cup of liquid dishwasher detergent which does not contain ammonia. Never mix bleach and ammonia as it will give off hazardous fumes. This formulation can be sprayed on using a pump sprayer. After 15 to 30 minutes, it can be washed off using a power washer. Remember that once the stain goes deep into the wood, it cannot be removed with bleach or any other product. It is there to stay. Always remember not to play chemist and experiment by mixing various chemicals as they could give off hazardous fumes ... and more! / изменение цвета. Известна также как Синева Древесины или Синева (Blue Stain). опрыскиватель (sprayer). Под Заболонными Грибными Окрасками понимаются ненормально окрашенные участки заболони без понижения твердости древесины, возникающие в срубленной древесине под воздействием деревоокрашивающих грибов, не вызывающих образования гнили. Они распространяются вглубь древесины от торцов и боковых поверхностей. На торцах наблюдаются в виде пятен разной величины и формы или сплошного поражения заболони, на боковых поверхностях – в виде вытянутых пятен, полос или сплошного поражения заболони. Такие окраски свойственны всем древесным породам, но в наибольшей степени – хвойным. Под Синевой Древесины или Синевой понимается серая окраска заболони с синеватыми или зеленоватыми оттенками. Кроме того, по цвету заболонная грибная окраска может проявляться в виде Цветных Заболонных Пятен – оранжевой, жёлтой, розовой (до светло-фиолетовой) и коричневой окраски заболони; а по степени окраски они могут быть в виде (i) Светлых Заболонных Грибных Окрасок, окрашивающих древесину в бледные тона, не маскирующие её

структуру; и (ii) Тёмных Заболонных Грибных Окрасок, окрашивающих древесину в густые тона, маскирующие её структуру. В зависимости от расположения они подразделяются на:- (i) Поверхностные Заболонные Грибные Окраски, проникающие в древесину на глубину не более 2 мм; (ii) Глубокие Заболонные Грибные Окраски, проникающие в древесину на глубину более 2 мм; и (iii) Подслойные Заболонные Грибные Окраски, расположенные на некотором расстоянии от поверхности сортимента.

SAPWOOD = ЗАБОЛОНЬ (или ЗАБОЛОННАЯ ДРЕВЕСИНА) – Sapwood is the outer part of the wood (xylem), usually distinguished from the heartwood by its lighter color, in which parenchyma are alive and active conduction of water takes place. The wood of pale color near the outside of the log. Under most conditions sapwood is more susceptible to decay than heartwood. / . Заболонь. гниению или загниванию, нежели сердцевинная древесина. Под Заболонью понимаются наружные молодые, физиологически активные слои древесины, примыкающие к камбию. Она отличается от ядра древесины более светлой окраской. Синева Древесины (Blue Stain) – порок древесины в виде местной ненормальной сине-серой или сине-зелёной окраски заболони (наружных молодых слоёв древесины). Синева портит внешний вид древесины и снижает её сопротивляемость ударным нагрузкам. Рак Древесины – порок древесины в виде углубления или вздутия, возникающий на поверхности ствола растущего дерева при поражении его паразитными грибами или бактериями.

SAR = SAUDI ARABIAN RIYAL

SARAN^{TM} FIBER = ВОЛОКНО САРАН^{T3} (или ВОЛОКНО СОРЭН^{T3}) – Saran^{TM} Fiber is a manufactured fiber in which the fiber-forming substance is any long chain synthetic polymer composed of at least 80% by weight of vinylidene chloride units (–CH_2–CCl_2–). Saran fiber has excellent resistance to sunlight and weathering and is used in lawn furniture, upholstery, and carpets. Saran^{TM} Fiber is a manufactured fiber which has an excellent resistance to sunlight and weathering, and is used in lawn furniture, upholstery, and carpets. Saran^{TM} is manufactured by the melt spinning of a copolymer composed primarily of vinylidene chloride. Saran^{TM} Fiber has excellent physical and chemical properties. Features:- (i) Excellent Flame Resisting:- Saran^{TM} fiber is inherently self-extinguishing, making the addition of flame-retardants unnecessary. This means consistent, uniform flame-retardant properties, free from variations which occur during flame-retardant compounding. Saran^{TM} fiber plays an important role in applications requiring high flame-retardant properties; (ii) Superior Chemical Resistance:- Saran^{TM} fiber is resistant to acids and alkalis, and is insoluble in oils and most organic solvents, making it suitable for use in applications involving exposure to chemicals. (Note that it is soluble in some solvents such as tetrahydrofuran and cyclohexanone.); (iii) Fast Color and Excellent Gloss:- Because pigment is added before fiber spinning, Saran^{TM} fiber has vivid color with excellent colorfastness, retaining its translucence and luster even with exposure to sunlight and weather; (iv) Extremely Low Moisture Regain:- With a moisture regain of less than 0.1%, its physical properties are almost completely unaffected by absorbed water. This makes Saran^{TM} fiber well-suited for use underwater, outdoors exposed to rain, and even in demanding fields such as wastewater treatment and undersea applications; (v) Freedom from Mold, Bacteria Damage:- Saran^{TM} fiber is nearly impervious to mold, bacteria, and insects, so its properties are not degraded in highly humid environments or mud. Saran^{TM} fiber is often used underground and in contactor with sludge; (vi) High Elastic Recovery:- With a high elastic recovery, Saran^{TM} fiber resists, Saran^{TM} fiber resists wrinkling and creasing. This enables the production of a 3-dimensional fabric using Saran^{TM} monofilament. Physical properties of Saran^{TM} Fibers:- (i) Tensile Strength:- 1.3÷2.0 cN/dtex (1.4÷2.2 g/d) (at room temperature); (ii) Tensile Elongation:- 20÷40% (at room temperature); (iii) Knot Strength:- 0.89÷1.4 cN/dtex (1.0÷1.6g/d); (iv) Knot Elongation:- 10÷12%; (v) Young's Modulus:- 1.2÷1.8 GPa (120÷180 kg/mm^2); (vi) Elastic Recovery:- over 95% (at 3% elongation); (vii) Specific Gravity:- 1.7; (viii) Moisture Regain:- below 0.1%; (ix) Melting Point:- approximately 160 °C. Manufacturer:- Asahi Kasei Home Products Corporation (Tokyo, Japan). Saran^{TM} is the generic name for a man-made fiber derived from vinylidene chloride. Saran is strong, resists common chemicals, sunlight, and weather. It is used primarily in the fabric field for upholstery on public transportation vehicles and for garden furniture. / Торговое название синтетического моноволокна – сополимера винила и хлорполивинилидена. Волокно Саран имеет очень низкую гигроскопичность (при относительной влажности воздуха 65% сорбирует менее 0.1% влаги) и более высокую термостойкость, чем поливинилхлоридное волокно. При кипячении в воде волокно саран не усаживается. Этот вид синтетического волокна обладает такой же хемостойкостью, как и другие волокна, получаемые на основе поливинилхлорида.

SARBANES OXLEY ACT = АКТ САРБЭЙНЗА АКСЛИ – Sarbanes Oxley Act is an Act passed in the USA to ensure that corporations meet prescribed accounting and reporting standards. It was legislated as a response to corporate misappropriations and malfeasance. It is supposed to better protect investors although it is doubtful that it will make dishonest people honest. It merely adds to the bureaucratic burden and cost of running a company. Senators Paul Sarbanes (D–MD) and Rep. Michael G. Oxley (R–OH), the co-sponsors of the Sarbanes-Oxley Act. The Sarbanes-Oxley Act of 2002 (Pub.L. 107–204, 116 Stat. 745, enacted July 30, 2002), also known as the 'Public Company Accounting Reform and Investor Protection Act' (in the Senate) and 'Corporate and Auditing Accountability and Responsibility Act' (in the House) and more commonly called Sarbanes-Oxley, Sarbox or SOX, is a United States federal law that set new or enhanced standards for all US public company boards, management and public accounting firms. It was named after sponsors US Senator Paul Sarbanes (D-MD) and US Representative Michael G. Oxley (R-OH). As a result of SOX, top management must individually certify the accuracy of financial information. In addition, penalties for fraudulent financial activity are much more severe. Also, SOX increased the independence of the outside auditors who review the accuracy of corporate financial statements, and increased the oversight role of boards of directors. The bill was enacted as a reaction to a number of major corporate and accounting scandals including those affecting Enron, Tyco International, Adelphia, Peregrine Systems and WorldCom. These scandals cost investors billions of dollars when the share prices of affected companies collapsed, and shook public confidence in the US securities markets. The act contains 11 titles, or sections, ranging from additional corporate board responsibilities to criminal penalties, and requires the Securities and Exchange Commission (SEC) to implement rulings on requirements to comply with the law. Harvey Pitt, the 26th chairman of the SEC, led the SEC in the adoption of dozens of rules to implement the Sarbanes–Oxley Act. It created a new, quasi-public agency, the Public Company Accounting Oversight Board, or PCAOB, charged with overseeing, regulating, inspecting and disciplining accounting firms in their roles as auditors of public companies. The act also covers issues such as auditor independence, corporate governance, internal control assessment, and enhanced financial disclosure. The nonprofit arm of Financial Executives International (FEI), Financial Executives Research Foundation (FERF), completed extensive research studies to help support the foundations of the act. The act was approved by the House by a vote of 423 in favor, 3 opposed, and 8 abstaining and by the Senate with a vote of 99 in favor, 1 abstaining. President George Walker Bush signed it into law, stating it included 'the most far-reaching reforms of American business practices since the time of Franklin D. Roosevelt. The era of low standards and false profits is over; no boardroom in America is above or beyond the law'. In response to the perception that stricter financial governance laws are needed, SOX-type regulations were subsequently enacted in Canada (2002), Germany (2002), South Africa (2002), France (2003), Australia (2004), India (2005), Japan (2006), Italy (2006), Israel and Turkey. Debate continued as of 2007 over the perceived benefits and costs of SOX. Opponents of the bill have claimed it has reduced America's international competitive edge against foreign financial service providers, because it has introduced an overly complex regulatory environment into US financial markets. A study commissioned by NYC Mayor Michael Bloomberg and US Senator Charles Schumer, (D-NY), cited this as one reason America's financial sector is losing market share to other financial centers worldwide. Proponents of the measure said that SOX

has been a ‘godsend’ for improving the confidence of fund managers and other investors with regard to the veracity of corporate financial statements. The 10th anniversary of SOX coincided with the passing of the Jumpstart Our Business Startups (JOBS) Act, designed to give emerging companies an economic boost, and cutting back on a number of regulatory requirements. / Энрон (Enron), Тайко Интёнэшэнэл (Tyco International), (Adelphia), Пэрэгрин Систэмз (Peregrine Systems) и ВорлдКам (WorldCom). Хави Пит (Harvey Pitt). Президент Дьжодьж Вокё Бош (George Walker Bush; 1946–) Президент США Фрэньклын Дэлано Розэвэлт (Franklin Delano Roosevelt; 1882–1945). Мэр города Нью Йорк Майкэл Блумбёг (NYC Mayor Michael Bloomberg) и Американский Сенатор Чарлз Шума (US Senator Charles Schumer). Разработчики и инициаторы закона Сенатор – Демократ от Штата Мэриленд Пол Сарбэйнз (Paul Sarbanes) и Конгрессмен – Республиканец от Штата Огайо Майкэл Дьжи. Аксли (Michael G. Oxley). 30 Июля 2002 Президент Буш подписал Акт Сарбэйнза-Акслэй (Sarbanes-Oxley Act, SOX), который представляет собой одно из самых значительных событий по изменению федерального законодательства США по ценным бумагам за последние 60 лет. Закон значительно ужесточает требования к финансовой отчётности и к процессу её подготовки – результат многочисленных корпоративных скандалов, связанных с недобросовестными управляющими крупных корпораций. Закон применяется для всех эмитентов (issuers) – в данном случае:- для всех компаний, ценные бумаги которых зарегистрированы Комиссией по Ценным Бумагам и Биржам США (SEC) – вне зависимости от места регистрации и деятельности компании (то есть от того, торгуются ли ценные бумаги на Нью Йоркской Фондовой Бирже, НЭЗДЭК® (NASDAQ®), или на любой другой Американской бирже; зарегистрированы ли в качестве долговых обязательств в США (с листингом или без него); принадлежат ли компании, проходящей регистрацию для выпуска ценных бумаг в США. В соответствии с данным Актом, для акционерных обществ открытого типа:- (i) создаётся новый режим контроля и регулирования финансовой деятельности; и (ii) происходят существенные изменения в области управления и требований к раскрытию информации. Акт, получивший название от имен создателей – Сенатора Пола Сарбэйнза (Демократическая Партия, Штат Мэрилэнд) и члена Палаты Представителей Майкэла Аксли (Республиканская Партия, Штат Огайо) – состоит из 11 разделов. Рассматриваются вопросы независимости аудиторов, корпоративной ответственности, полной финансовой прозрачности, конфликта интересов, корпоративной финансовой отчётности и другое. Согласно положениям Акта, в каждой публичной компании должен быть создан Комитет по Аудиту. Кодекс Корпоративного Поведения (Статья 406) – это набор стандартов, которые предназначены для противодействия злоупотреблениям и продвижения ряда принципов честного ведения бизнеса. Каждый эмитент в своих периодических отчётах должен указывать на то, что он принял Кодекс Корпоративного Поведения для высших финансовых сотрудников компании. Предполагается расширить это положение и на другое руководство. При изменении положений Кодекса необходимо немедленно сообщать об этом. Подписание всех докладов в Комиссию по Ценным Бумагам и Биржам США Исполнительным Директором (CEO) и Финансовым Директором (CFO):- Статьей 906 Акта предусматривается подписывание руководителями эмитента всех периодических докладов в Комиссию, включающих финансовые отчёты. Директора должны подтвердить, что представляемые отчёты ‘полностью соответствуют’ требованиям SEC, а представленная в них информация ‘справедливо отражает во всех существенных аспектах финансовое состояние и результаты работы эмитента’. Этой же статьей за нарушение порядка предусматривается уголовная ответственность – штраф от 1 до 5 миллионов Долларов и тюремное заключение от 10 до 20 лет. Запрет предоставления займов и ссуд директорам и должностным лицам компании:- Статьей 402 Акта Американским и иностранным компаниям, работающим на фондовом рынке США (а также проходящим регистрацию в SEC для первичного публичного размещения) запрещается предоставлять большинство личных ссуд (personal loans) директорам и должностным лицам компании, кроме отдельных потребительских и жилищных займов, которые Американские банки и брокеры (дилеры) могут при определённых условиях предоставлять своим сотрудникам. (‘Авансовые платежи для ведения бизнеса’ считаются допустимыми, так как не являются ‘личной ссудой’.) Лишение директоров и должностных лиц компании права на поощрительные вознаграждения или ценные бумаги:- в том случае, если компания вынуждена будет представить повторный финансовый отчёт вследствие ‘существенного несоответствия эмитента любому из требований финансовой отчётности, проявившегося в результате должностного преступления’ – её Главный Исполнительный Директор (CEO), а также Главный Финансовый Директор (CFO) лишаются права на поощрительные вознаграждения или ценные бумаги, а также на доходы от продаж ценных бумаг эмитента – в течение 12 месяцев со дня опубликования повторного финансового отчёта (Статья 304 Акта). В том случае, если указанные должностные лица за период 12 месяцев после опубликования или подачи документа в SEC уже получили перечисленные вознаграждения, они обязаны вернуть их эмитенту. Неподобающее влияние на аудиторов:- запрещается любому сотруднику или директору (или любому другому человеку, действующему по их указанию) предпринимать любые действия по воздействию путём обмана, принуждать, манипулировать или вводить в заблуждение аудиторов с целью получения аудиторских финансовых заключений, имеющих существенные искажения действительности (Статья 303 Акта). Защита информаторов:- корпоративные информаторы (whistle blowers) (сотрудники, которые сообщают о недостатках в работе компании) получают существенную защиту от мер возмездия со стороны руководства компании. (Статьи 806, 1107 Акта). Сокращение времени для предоставления отчётов:- в соответствии со Статьей 403 Акта, директора, должностные лица компании, а также акционеры, владеющие более 10% акций, обязаны предоставлять отчёт о всех операциях с акциями (Форма 4) на второй рабочий день после завершения этих операций. Эти отчёты (начиная с 30 Августа 2003) должны представляться в SEC в электронном виде и выкладываться на Интернет-сайт компании. Надзор за ведением бухгалтерии и аудит:- в соответствии с Актом создан ‘Наблюдательный Совет по Ведению Финансовой Отчётности Публичных Компаний’ (Статьи 101–109 Акта). Новая роль для аудиторов и Комитетов по Аудиту:- аудиторы подчиняются и докладывают свои результаты не руководству компании, а Комитету по Аудиту. Комитет по Аудиту обязан предварительно одобрить все услуги (аудиторские и не аудиторские) которые предоставляются аудиторской компанией. Аудитор обязан докладывать Комитету по Аудиту всю новую информацию:- основные положения бухгалтерского учёта, которые будут использоваться при аудите; различные варианты оценки финансовой информации по GAAP, которые обсуждались руководством компании; расхождения в мнениях по финансовому учёту, которые выявились между аудитором и руководством компании; а также все другие важные моменты общения аудиторов с руководством. Ведущий партнер по аудиту и его партнер по подготовке заключения должны для каждой публичной компании заменяться через 5 лет. Бухгалтерская фирма не может осуществлять аудит для публичной компании в том случае, если один из её руководителей (CEO, CFO, Главный Бухгалтер) работал в фирме и осуществлял аудит компании в течение последнего года. Проблемы:- подтверждение о корректности со стороны правления компании не может быть одномоментным и требует значительных усилий со стороны всей компании, а не только подразделений, отвечающих за подготовку финансовой отчётности. В целом, не стоит воспринимать SOX, как проект. Это процесс, требующий ‘приведения в порядок’ всех сфер деятельности компании, которые имеют отношение к подготовке финансовой отчётности.

SARCENET = САРСНЕТ (или САСНИТ) – Sarcenet:- a soft thin silk in plain or twill weaves. A garment made of sarcenet fabric, namely a soft thin silk in plain or twill weaves. Sarcenet or Sarsenet is a fine soft silk fabric formerly from Italy and used for clothing, ribbons, etc. Etymology:- XV century, from Old French Sarzinet, from Sarrazin (Saracen).

SARCODY = САРКОДИЯ – Sarcody is a hyperplastic symptom in which swellings occur above and below portions of organs that are tightly encircled, as a stem might be 'choked' by a tight tie or binding or by a twining vine.

SAREC = SWEDISH AGENCY FOR RESEARCH COOPERATION WITH DEVELOPING COUNTRIES

SARI = САРИ – Sari is a piece of fabric twelve to sixteen feet long used by Hindu women to drape and cover the body. The fabric is often silk with silver or gold threads forming a border design. Sari or Saree:- lightweight cloth draped so that one end forms a skirt or pajama and the other a head or shoulder covering. A piece of fabric about 6 yards in width and 44" in. length which worn wrapped strategically around the body over a skirt petticoat and a choli. Worn by Indian and south Asian women. Saree (sari):- nothing identifies a woman as being Indian so strongly as the sari – the quintessential Indian female garment. The 6 yard, unstitched, fluid garment over and around the body, adjusted with little tucks and pulls is one of the most graceful pictures ever. 'The sari undoubtedly is the most sensuous garment ever'. 'And the best thing about it is that it conceals as much as it reveals'. The sari is one of the most feminine outfits ever. And that's the secret behind its survival through various fashion eras like bell-bottoms, drainpipe and now low-rise jeans'. The origin of this fabulous garment is a bit obscure due to lack of proper historical records in India but one thing's for sure – the sari boasts the oldest existence in the sartorial world. It is more than 5000 years old and is mentioned in the Vedas. Sari (original – Chira in Sanskrit for cloth) is of varied length. From 5 yards to 9.5 yards tied loosely, folded and pleated, it can be turned into a working dress or party wear with manual skill. For the day-to-day dressing of middle class women, a 5–6 yard is comfortable today. The material and the print on the sari can vary according to your choice and the occasion. The common materials for a sari are silks, cottons, chiffons, organzas and georgettes, and the common types of saris are Kanjeevaram (a traditional South Indian sari), Paithani (a typical peacock and parrot motif sari from Maharashtra), Banarasi, Bhagalpuri, Orissa Ikkat, Maheshwari, Chanderi, Gujrati Patola, and Jaipuri Leheriya. 'I feel that a chiffon, a georgette and a nice Kanjeevaram is a must-have for every woman'. The chiffon is appropriate for a kitty party, lunch or dinner at the club or at the race course, or even for shopping. The georgette can be worn for a cocktail or small party, while the Kanjeevaram can be worn at weddings or extremely formal affairs'. Saris are beautiful, and it is up to the wearer to bring out the best in them. The styles of wearing a sari vary according to the region. There are about 10 to 15 types of drapes in India. So, you have the Bengali, Gujarati, Coorgi, Malayali and other styles of draping. / и жоржэты (georgettes). Сари – плательная хлопчатобумажная ткань с набивной каймой.

SARIF = SUKARAMI RESEARCH INSTITUTE FOR FOOD CROPS

SARK = НИЖНЯЯ НОЧНАЯ РУБАШКА (или ХХ, или САК) – Sark:- (dialectical and chiefly British) shirt.

SARONG = САРОНГ – Sarong is a loose garment made of a long strip of cloth wrapped around the body and worn as a skirt or dress by men and women chiefly of the Malay archipelago and the Pacific islands. Sarong – also called a Pareo, a Wraparound, Pareau (Tahiti), Pakome (Thailand), Lava-Lava (Samoa), Kain (Indonesia), Sulu (Fiji), Canga (Brazil), Malo (Tonga), Lunghi, etc – is a piece of fabric, approximately 45 x 75 inches (120 x 190 cm). It is the traditional clothing for both women and men in Indonesia and is also worn every day on islands all over the South Pacific and in many countries of South-east Asia – especially Malaysia and Thailand. Sarongs are generally produced by the Batik process. / (Pareau), (Pakome), (Lava-Lava), Кайн (Kain), Сулю (Sulu), Канга (Canga), , Люнги (Lunghi).

SARP = SYSTEMS ANALYSIS AND SIMULATION FOR RICE PRODUCTION

SAS = SUBJECT TO APPROVAL OF SAMPLE

SAS 70 = STATEMENT OF ACCOUNTING STANDARD NO. 70

SASE = STRESS AT SPECIFIED ELONGATION

SASH = КУШАК (или ПОЯС) – Sash is a soft fabric or a ribbon tied at the waist as a heil. Sash is a band worn about the waist or over one shoulder and used as an accessory or emblem of a military order.

SATCHEL = МОШНА (или САЧЭЛ) – Satchel is a large rectangular purse with a buckled, snapped, or clasped flap and a wide shoulder strap. Satchel is a small bag often with a shoulder strap.

SATEEN = САТИН – Sateen fabric is a fabric made from yarns with low luster, such as cotton or other staple length fibers. The fabric has a soft, smooth hand and a gentle, subtle luster. Sateen fabrics are often used for draperies and upholstery. Sateen is a satin weave cotton fabric. Sateen:- this cloth is made with a 5-end or an 8-shaft satin weave in warp-face or filling-face effects. Filling-face sateen requires a great many more picks than ends per inch in the goods while the reverse is true in the warp-face material. Carded or combed cotton yarns are used, and cloth of the former comes in heavy weights; it may serve as work clothing, for use in the apparel trades, etc. Combed yarn sateens are usually mercerized and have a very smooth, lustrous surface effect. These are used chiefly for linings. Sateen is a cotton fabric made in a sateen weave. Sateen is a strong, lustrous, mercerized, satin-weave fabric made of cotton, blends of cotton with polyester, or spun-yarn fabrie characterized by floats running in the filling direction. Sateen Is also used to distinguish between cotton satin-weave fabrics and satin-weave fabrics made of silk or man-made fibers. It is used for linings, draperies, and comforters. See also Satin Weave, and Weaving. Sateen is a smooth, lustrous cotton normally woven with four threads over, one under. The four yarns line-up on the surface, giving sateen its characteristic silky shine, drape, and feel. Sateen:- cotton, some also made in rayon. Sateen, 5-harness, filling-face weave. Lustrous and smooth with the sheen in a filling direction. Carded or combed yarns are used. Better qualities are mercerized to give a higher sheen. Some are only calendared to produce the sheen but this disappears with washing and is not considered genuine sateen. May be bleached, dyed, or printed. Difficult to make good bound buttonholes on it as it has a tendency to slip at the seams. Sateen:- a satin weave construction, usually made of mercerized combed cotton, where the weave and quality of cotton give the fabric a wonderful shine and softness. / в направлении уточины. или 8-ремизное атласное переплетение (8-shaft satin weave) с эффектами . Под Сатином, от Французского слова Satin, понимается хлопчатобумажная или из химического волокна ткань с гладкой блестящей лицевой поверхностью. Из сатина шьют женские и детские платья, мужские сорочки, бельё и тому подобное. Под Сатином, от Французского слова Satin, от Арабского слова Зайтуни, от Зайтун, означающее старинное Арабское название Китайской Гавани Цюаньчжоу, откуда вывозилась эта ткань), ткань сатинового переплетения нитей из хлопчатобумажного или химического волокна. Имеет гладкую, шёлковистую лицевую поверхность, на которой преобладают уточные нити; выпускается в основном гладкокрашеной, набивной и отбелённой. Применяется для изготовления платьев, мужских рубашек, как подкладочная ткань и так далее.

SATEEN SHIRTING = САТИНОВАЯ СОРОЧЕЧНАЯ ТКАНЬ – Sateen Shirting is a fast colored narrow-stripe cotton shirting fabric made with a satin weave for the stripe effect and plain weave for the ground which is white or some cast of white. A five-shaft satin is used for the stripe construction. Texture is about 86 x 70, and yarn counts are 2/40's in the warp and 1/30's or 2/30's in the filling. / Сатиновая Сорочечная Ткань:- . Для создания полосок используется 5-ремизное атласное переплетение. Текстура у него примерно следующая:- количество нитей на дюйм:- 86 x 70, номера пряжи:- в основе:- 2/40's и в уточине:- 1/30's или 2/30's.

SATEEN WEAVE = САТИНОВОЕ ПЕРЕПЛЕТЕНИЕ – Sateen Weave is a variation of the satin weave, produced by floating fill yarns over warp yarns. See also Float, Plain Weave, Satin Weave, Twill Weave, and Weave. Sateen Weave:- characterized by floats running filling-wise. / В Сатиновом (Атласном) Переплетении перевязка основы с утком осуществляется посредством одиночных основных или уточных перекрытий, которые равномерно располагаются в пределах раппорта переплетения, не соприкасаясь друг с другом. В результате такого построения одиночные перекрытия одной системы нитей делаются незаметными среди настилов другой системы нитей, что придает ткани блестящий вид. В том случае, когда на лицевой стороне ткани преобладают уточные настилы, переплетение называют Сатином; если же на лицевой стороне ткани преобладают основные перекрытия, переплетение называют Атласом. Для усиления застилостости и увеличения блеска поверхности ткани сатины вырабатывают с плотностью по утку в 1.5–2 раза большей, чем плотность по основе; атласы – с плотностью по основе в 1.5–2 раза большей, чем плотность по утку. Раппорт сатинового переплетения обозначается простой дробью, в которой числитель показывает число нитей в раппорте, а знаменатель – величину сдвига одиночных перекрытий. У сатинов указывается сдвиг вдоль утка (слева направо), а у атласов – сдвиг вдоль основы (снизу вверх). Одиночные перекрытия размещаются в раппорте переплетения с одинаковым сдвигом S, который находится в переделах $1 < S < R - 1$. Кроме того сдвиг и раппорт переплетения должны быть взаимно простыми числами, то есть не иметь общего множителя. Исходя из этого минимально возможный раппорт сатина (атласа) равен 5. При построении сатиновых переплетений можно заметить, что имеются особые формы расположения одиночных перекрытий. При соединении четырёх соседних одиночных перекрытий получаются ромбы, прямоугольники, параллелограммы, квадраты. Аналитически это возможно в двух случаях:- $S_o = S_y$ и $S_o + S_y = R$. При $S_o = S_y$ сатины (атласы) равносдвижные, которые делятся на ромбические и прямоугольные. Раппорт таких сатинов определяется по следующей формуле:- $R = (S_o^2 - 1) / m$, где S_o – величина сдвига по основе. При $m = 1$ сатины всегда ромбические, а при $m \geq$ 2 сатины становятся прямоугольными. При $S_o + S_y = R$ сатины (атласы) получаются квадратные. Раппорт квадратных сатинов определяется по формуле:- $R = (S_o^2 + 1) / m$. Квадратные сатины (атласы) дают наиболее равномерное расположение одиночных перекрытий по поверхности ткани, что повышает, при прочих равных условиях, гладкость и застилостость сатинов (атласов). Наименее удачным будет расположение одиночных перекрытий по вершинам параллелограмма или прямоугольника. Такие сатины будут напоминать саржу. К квадратным относятся сатины 5/2, 5/3, 10/3 и 10/7. Исходя из ограничений, накладываемых на величину сдвига, нельзя построить 4-х и 6-ти ремизные сатины (атласы). Но на практике вырабатывают сатины с раппортом равным 4 и 6. Такие сатины получили название неправильных, вследствие того, что имеют переменный сдвиг одиночных перекрытий. Можно построить только один 4-х ремизный сатин. 6-ти ремизных сатинов на практике существует несколько вариантов. При разработке и выработке тканей сатинового (атласного) переплетения целесообразно учитывать следующие правила:- (i) с увеличением раппорта переплетения ткань становится более мягкой и блестящей, но менее прочной; величина настилов не должна превышать 3–4 мм (для хлопка); (ii) величина сдвига должна быть близкой к половине величины раппорта, что обеспечивает более равномерное расположение одиночных перекрытий, исключает появление полосатости ткани; (iii) во избежание полосатости ткани необходимо, чтобы нити основы в атласах и утка в сатинах имели направление крутки обратное направлению расположения одиночных перекрытий в ткани; (iv) для получения лучшей застилостости и блеска в сатинах необходимо, чтобы уточные нити имели наименьшую крутку и были равномерными по толщине и крутке, в противном случае создаётся полосатость ткани после отделки; (v) чем меньше линейная плотность нитей основы и утка, тем сильнее блеск поверхности ткани; (vi) чем больше плотность сатина по утку и атласа по основе, тем сильнее блеск ткани, и наоборот. Ткани сатинового (атласного) переплетения пробираются в ремиз рядовой проборкой. В атласах при большом раппорте переплетения применяется рассыпная проборка. В зуб бёрда пробирают по 2, 3 или 4 нити.

SATELLITE ACCOUNTS = ВСПОМОГАТЕЛЬНЫЕ СЧЕТА (или САТЕЛЛИТНЫЕ СЧЕТА) – Satellite Accounts describe areas or activities not dealt with by core economic accounts. These areas/activities are considered to require too much detail for inclusion in the core accounts or they operate with a different conceptual framework. Internal satellite accounts re-present information within the production boundary. External satellite accounts present new information not covered by the core accounts. / Под Сателлитом, от Латинского слова Satelles, родительный падеж Satellitis, означающее Спутник или Телохранитель, понимается .

SATELLITE DNA = САТЕЛЛИТНАЯ ДНК – Satellite DNA is short sequences in eucaryotic DNA that are present in large numbers of repetitive copies, differ in base composition and therefore density from most of the DNA and are generally not transcribed. Often associated with the centromere. / эукариотной ДНК, которая представлена .

SATELLITE FIELD = ВСПОМОГАТЕЛЬНЫЙ ПРОМЫСЕЛ (или ВТОРОСТЕПЕННЫЙ ПРОМЫСЕЛ) – Satellite Field is a separate accumulation of oil onshore or offshore which is tied back to a central processing facility.

SATELLITE VIRUS = ВИРУС САТЕЛЛИТ (или СОПУТСТВУЮЩИЙ ВИРУС) – Satellite Virus is of a small virus associated with tobacco necrosis virus (TNV), which is dependent upon the TNV genome for its own replication. Of a defective virus associated functionally with another virus which it depends on for replication. / вирус некроза табака (ВНТ; tobacco necrosis virus (TNV)), который зависит от генома ВНТ за свою собственную репликацию.

SATIN = АТЛАС (или САТА) – Satin fabric is a traditional fabric utilizing a satin weave construction to achieve a lustrous fabric surface. Satin is a traditional fabric for evening and wedding garments. Typical examples of satin weave fabrics include:- slipper satin, crêpe-back satin, faille satin, bridal satin, moleskin, and antique satin. Satin:- silk, rayon, synthetics. Originated in China (Zaytoun, China – now Canton – a port from which satins were exported during the Middle Ages). Became known in Europe during the XII, and XIII centuries in Italy. Became known in England by the XIV century. It became a favorite of all court life because of its exquisite qualities and feel. Usually has a lustrous surface and a dull back. The lustre is produced by running it between hot cylinders. Made in many colors, weights, varieties, qualities, and degrees of stiffness. A low grade silk or a cotton filling is often used in cheaper cloths. Satin is a cotton fabric made in a satin weave. Satin is a cloth that typically has a glossy surface and a dull back. It is a warp-dominated weaving technique that forms a minimum number of interlacings in a fabric. If a fabric is formed with a satin weave using filament fibers such as silk, nylon or polyester, the corresponding fabric is termed a 'satin'. If the yarns used are short-staple yarns, such as cotton, the fabric formed is considered a sateen. A satin-woven fabric tends to have a high luster due to the high number of 'floats' on the fabric. Floats are 'missed' interlacings, where the warp yarn lies on top of the weft yarn, or vice versa. The floats tend to make the fabric look glossier, as well as give it a smoother 'hand' in most cases. / шёлковая или хлопковая уточина . , фай атлас, . Найлан^{T3} (Nylon^{TM}). Под Атласом, в переводе с Арабского буквально Гладкий, плотная шёлковая, полушёлковая или хлопчатобумажная мягкая ткань с гладкой блестящей лицевой поверхностью. Атлас – (буквально Гладкий) – шёлковая или полушёлковая (с введением шерстяного или льняного утка) ткань атласного переплетения с глянцевитой лицевой поверхностью. Позднее появился хлопчатобумажный атлас. Соотношение одного хода утка к основе начинается от 1:5, то есть уток выходит на поверхность не менее, чем через пять нитей основы, а затем снова исчезает, чем и достигается особая гладкость ткани. Атласный тип переплетения нитей был изобретён в Китае и позднее вместе с технологией выращивания тутового шёлкопряда и обработки шёлка-сырца был вывезен по Великому Шёлковому Пути через Среднюю Азию на Ближний Восток и в Европу, где в эпоху

Возрождения было налажено собственное производство атласа. Тем не менее, в Европе даже в новое время широко использовался Китайский атлас – Акинфа. Наивысшего качества изготовление атласа достигло в Иране XVI–XVII веках. Известны гладкие и узорчатые, муаровые, тяжёлые и другие сорта атласов. В России во времена Бориса Годунова ткани атласного переплетения были известны под названием Отлас. Известны атласы гладкие – без узоров; узорчатые, муаре, тяжёлые, лёгкие и так далее. Атлас использовали для изготовления одежды, платков, галстуков, занавесей, обивки мебели, отделок на дорогие церковные облачения. В первое десятилетие XIX века атлас почти не носили женщины, хотя в мужской одежде того времени он находил применение. Но начиная с 1920-х вплоть до конца XX столетия атлас не выходил из моды, появляясь то в одном, то в другом качестве.

SATIN–BACK = АТЛАСНОЕ С ИЗНАНКИ (или АТЛАСНАЯ ИЗНАНКА) – Satin-Back:- satin on one side and anything on the other, e.g., very good velvet ribbon has velvet on one side and satin on the other.

SATIN–BACK CRÊPE = КРЭП С АТЛАСНОЙ ИЗНАНКОЙ – Satin-Back Crêpe is a reversible cloth with satin on one side and crêpe on the other.

SATIN BROCADE = АТЛАСНАЯ ПАРЧА – Satin Brocade is a satin with a raised woven-n design. It resembles a fine embroidered pattern. See also Brocade, and Satin.

SATIN CRÊPE = АТЛАСНЫЙ КРЭП (или САТАКРЭП) – Satin Crêpe is a heavy reversible fabric with satin on one side and crêpe on the other. It is used in fall and winter dresses and linings. See also Crêpe, and Satin.

SATINET = САТИНЕТ (или САТИНЭТ) – Satinet is a thin silk satin or imitation satin. / Сатинэт – тонкая хлопчатобумажная или шерстяная (с шёлком) материя, преимущественно с мелкими полосками. Сорт тонкого сатина.

SATIN FAÇONNÉ = САТА ФАСОНЭ (или УЗОРЧАТЫЙ АТЛАС) – Satin Façonné:- Jacquard figured fabric with an all-satin weave background. Various types of striping effects are obtained. Jacquard figure on a satin ground. / Жакяр (Jacquard).

SATIN WEAVE = АТЛАСНОЕ ПЕРЕПЛЕТЕНИЕ – Satin Weave is a more flexible type of weave than the plain weave but it is more complicated. In this weave construction, the interlacing of the threads are arranged in such a way that the face of the cloth is covered with the warp yarn or filling yarn and no twill line is distinguishable. It is made by 'floating' warp or weft yarns across many yarns to bring them to the surface. The interlacing float over 4 or more than 4 yarns before a single interlacing like 4/1, 7/1 or 11/1. If filament fibers are used such as silk or nylon, the resulting fabric is termed as 'satin'. If the short-staple yarns are used like cotton, the corresponding fabric is said to be a 'sateen'. In satin, the float is in warp direction where as in sateen, it is in the filling direction. Characteristics of Satin Weave:- (i) it is flat and lustrous with a smooth surface; (ii) the surface slides easily for linings; (iii) the long floats like 7/1 or 11/1 and filament fabrics are subject to snagging and is poor resistant to abrasion; and (iv) the shorter floats like 4/1 or 1/4 and spun fabrics may be tough, compact and durable with low luster. Satin Weave is a basic weave, characterized by long floats of yarn on the face of the fabric. The yarns are interlaced in such a manner that there is no definite, visible pattern of interlacing and, in this manner, a smooth and somewhat shiny surface effect is achieved. The shiny surface effect is further increased through the use of high luster filament fibers in yarns which also have a low amount of twist. A true satin weave fabric always has the warp yarns floating over filling yarns. Satin is a type of textile weave that makes a glossy fabric. Though this method is most classically used with silk thread, it can also be used with other materials like polyester, acetate, nylon, and rayon. There are several different variations on this weave, notably sateen. Despite the fact that it's a method for making fabric, the term 'Satin' is also used as a descriptor to refer to specific types of fabric. A Specific Pattern:- to be considered a true satin, a fabric must be woven in a very specific manner. The material must have at least four threads brought to the surface of the fabric to 'float' over a single thread running perpendicularly to them. The threads on the top are called Warp Strands, which run vertically, while the one on the bottom is called a Weft Strand, which runs horizontally. This process is called Floating, and allows large portions of thread to reflect light, which makes the fabric shiny and glossy on one side. Some satins, called Double-Faced Satins, are made to be shiny on both sides by using two sets of warp strands. Different Types:- fabrics made with this weave can vary in terms of texture and appearance according to the type of thread used and variations in the weave pattern. For instance, a fabric made with a mixture of silk and rayon is sometimes called Duchesse Satin. There are also several materials that are made with one weave or material on the back and another on the front, including Canton satin, which has a crêpe weave on the back, and slipper satin, which has cotton on the back. There is also ciré satin, which is treated with a coating of wax to make it extremely shiny. This process also makes it stiff, which makes it good for use in ribbons. Another common variation is charmeuse, which is made with one warp strand passing over at least three weft strands. A few other variations on the weave are sateen and satinet. Sateen is woven similarly, but has the opposite set of threads on top – satin has the warp threads floating, but sateen has the weft threads floating. It is also more commonly made from cotton or rayon than from silk. Satinet is a very thin material that's usually made of inferior materials, usually cotton or synthetic threads. Uses:- these fabrics are used to make a wide variety of materials, but are most commonly found in formal dresses, bedding, and lingerie. Satin-weave fabrics made with synthetic fibers can also be used to back other things like wool crêpe and velvet, eliminating the need for a slip, camisole, or undershirt. Additionally, people use these fabrics for formal shoes and slippers. In this case, the fabric is sometimes dyed to match the rest of an outfit, particularly for a prom or wedding. Variations on the fabric are also used on ballet shoes. Compared to Other Weaves:- satin is one of the three main types of weaves in textile making, which also includes plain and twill weaves. A plain weave consists of warp and weft threads alternatively overlapping and going under each other, while a twill weave floats at least three warp threads per weft. Though its construction makes satin the smoothest and most durable fabric of all three, it is also the most likely to shrink if treated improperly, and it stretches very little. It also resists wrinkling and generally drapes the best of any of the weaves. The extent to which any of these properties are present in a fabric depends on the tightness of the weave, and sometimes on the materials used. Cleaning Satin:- the safest bet when cleaning these fabrics is to dry clean them, particularly those made with very fine materials or lots of floating threads. Less delicate items can usually be hand washed in cold water with a gentle detergent, though it's important not to wring them out to dry, since this can misshape them. There are products available specifically for cleaning satin shoes as well, though for light staining a damp cotton ball followed up by a dry cloth can often work. Satin Weave is one of the basic weaves, plain, satin, and twill. The face of the fabric consists almost completely of warp or filling floats produced in the repeat of the weave. The points of intersection are distributed evenly and widely separated as possible. Satin-weave fabric has a characteristic smooth, lustrous surface and has a considerably greater number of yarns in the set of threads, either warp or filling, that forms the face than in the other set. See also Plain Weave, Sateen Weave, Twill Weave, and Weave. Although Satin-Weave drafts superficially resemble those of twills, satin weave does not have the regular step in each successive weft that is characteristic of twills. Thus, there is no strong diagonal line, and the fabric is smooth faced, with an unbroken surface made up of long floating warp yarns. A true satin must have at least five warp and weft yarns in each complete weave repeat and thus requires at least five harnesses. Most satin fabrics are made of smooth, lightly twisted yarns that heighten the effect of light unbroken by visible crosswise bindings. The limited number of interlacings allows the weaver to use a proportionately large number of warp yarns and thus produce a heavy textured cloth that can be arranged in smooth, shadowed folds. Satins, having long floats, are susceptible to the wear caused by rubbing and snagging and are, therefore, generally regarded as luxury

fabrics. Among the variations of satin weave are damask and sateen, a weft-faced satin. Damask is the most important variation of basic satin weave. Classic damask is a patterned, solid-colored fabric with figures in warp-faced satin and background in weft-faced satin weave. The pattern is created by the difference in light reflection between the warp-faced and weft-faced areas. Silk damasks probably originated in China and came to Europe through Italy, the center of European silk manufacture between the XIII and XVII centuries. During this period drawloom weavers from the Netherlands and Belgium also developed the art of linen damask weaving. Pictorial linen damasks, unlike most silk damasks of the time, often consisted of a single large repeat, picturing biblical scenes, contemporary events, or the arms of nobles and kings. Satin Weave:- characterized by a smooth surface caused by floats running warp-wise. Satin is one of the basic weaves. A shiny, smooth silk, acetate, rayon, or other man-made fiber combination woven in satin weave made with a cotton filling. It has a smooth, lustrous surface because the warp floats. It is used for linings of coats, jackets, facings, and ties. It is also used for draperies, upholstery, bedspreads, and sheets. Satin weave has proved so popular that various types of satin-weave fabrics have developed. Following is a listing of many of the types of satin fabrics. See also Sateen, and Weaving. Satin Weave is a weave that produces a very smooth surfaced fabric. It is made by passing the filling threads under several warp threads before passing over one warp thread. Satin weave is used to make sateens in which cotton filling thread goes over several cotton warps, then under one warp. Satin Weave is made by 'floating' the warp or weft yarns across several yarns to bring them to the surface. Bringing the yarns to the surface gives the fabric sheen because light is reflected off the yarn surface, not absorbed by the intersections of yarns such as in a plain weave. / основная пряжа или уточная пряжа . Найлан^{T3} (Nylon^{TM}). протирание или притирка (rubbing). и слабая устойчивость к истиранию. Сире или Воск (Ciré); Cirure in French – Вощение или Лощение. В Сатиновом (Атласном) Переплетении перевязка основы с утком осуществляется посредством одиночных основных или уточных перекрытий, которые равномерно располагаются в пределах раппорта переплетения, не соприкасаясь друг с другом. В результате такого построения одиночные перекрытия одной системы нитей делаются незаметными среди настилов другой системы нитей, что придает ткани блестящий вид. В том случае, когда на лицевой стороне ткани преобладают уточные настилы, переплетение называют Сатином; если же на лицевой стороне ткани преобладают основные перекрытия, переплетение называют Атласом. Для усиления застилостости и увеличения блеска поверхности ткани сатины вырабатывают с плотностью по утку в 1.5–2 раза большей, чем плотность по основе; атласы – с плотностью по основе в 1.5–2 раза большей, чем плотность по утку. Раппорт сатинового переплетения обозначается простой дробью, в которой числитель показывает число нитей в раппорте, а знаменатель – величину сдвига одиночных перекрытий. У сатинов указывается сдвиг вдоль утка (слева направо), а у атласов – сдвиг вдоль основы (снизу вверх). Одиночные перекрытия размещаются в раппорте переплетения с одинаковым сдвигом S, который находится в переделах $1 < S < R - 1$. Кроме того сдвиг и раппорт переплетения должны быть взаимно простыми числами, то есть не иметь общего множителя. Исходя из этого минимально возможный раппорт сатина (атласа) равен 5. При построении сатиновых переплетений можно заметить, что имеются особые формы расположения одиночных перекрытий. При соединении четырёх соседних одиночных перекрытий получаются ромбы, прямоугольники, параллелограммы, квадраты. Аналитически это возможно в двух случаях:- $S_o = S_y$ и $S_o + S_y = R$. При $S_o = S_y$ сатины (атласы) равносдвижные, которые делятся на ромбические и прямоугольные. Раппорт таких сатинов определяется по следующей формуле:- $R = (S_o^2 - 1) / m$, где S_o – величина сдвига по основе. При $m = 1$ сатины всегда ромбические, а при $m \geq 2$ сатины становятся прямоугольными. При $S_o + S_y = R$ сатины (атласы) получаются квадратные. Раппорт квадратных сатинов определяется по формуле:- $R = (S_o^2 + 1) / m$. Квадратные сатины (атласы) дают наиболее равномерное расположение одиночных перекрытий по поверхности ткани, что повышает, при прочих равных условиях, гладкость и застилостость сатинов (атласов). Наименее удачным будет расположение одиночных перекрытий по вершинам параллелограмма или прямоугольника. Такие сатины будут напоминать саржу. К квадратным относятся сатины 5/2, 5/3, 10/3 и 10/7. Исходя из ограничений, накладываемых на величину сдвига, нельзя построить 4-х и 6-ти ремизные сатины (атласы). Но на практике вырабатывают сатины с раппортом равным 4 и 6. Такие сатины получили название неправильных, вследствие того, что имеют переменный сдвиг одиночных перекрытий. Можно построить только один 4-х ремизный сатин. 6-ти ремизных сатинов на практике существует несколько вариантов. При разработке и выработке тканей сатинового (атласного) переплетения целесообразно учитывать следующие правила:- (i) с увеличением раппорта переплетения ткань становится более мягкой и блестящей, но менее прочной; величина настилов не должна превышать 3–4 мм (для хлопка); (ii) величина сдвига должна быть близкой к половине величины раппорта, что обеспечивает более равномерное расположение одиночных перекрытий, исключает появление полосатости ткани; (iii) во избежание полосатости ткани необходимо, чтобы нити основы в атласах и утка в сатинах имели направление крутки обратное направлению расположения одиночных перекрытий в ткани; (iv) для получения лучшей застилостости и блеска в сатинах необходимо, чтобы уточные нити имели наименьшую крутку и были равномерными по толщине и крутке, в противном случае создаётся полосатость ткани после отделки; (v) чем меньше линейная плотность нитей основы и утка, тем сильнее блеск поверхности ткани; (vi) чем больше плотность сатина по утку и атласа по основе, тем сильнее блеск ткани, и наоборот. Ткани сатинового (атласного) переплетения пробираются в ремиз рядовой проборкой. В атласах при большом раппорте переплетения применяется рассыпная проборка. В зуб бёрда пробирают по 2, 3 или 4 нити. Атласное Переплетение – один из видов переплетения нитей в тканях.

SATK = SUBSCRIBER IDENTIFICATION MODULE APPLICATION TOOLKIT

SATURATE = НАСЫЩАТЬ (или ПРОПИТЫВАТЬ) – Saturate:- (1) to be totally wet, to fill all the voids between soil particles with a liquid; (2) to fill completely or load to capacity.

SATURATION = НАСЫЩЕНИЕ (или НАСЫЩЕННОСТЬ, или ПРОПИТКА) – Saturation is:- (1) the maximum intensity or purity of a color. If the color is as brilliant as possible, it is at saturation; if the color is subdued or grayed, it is dull, weak, and low in intensity. (2) The upper limit concentration of a solute in a solvent, i.e. no more solute can be dissolved at a fixed temperature and pressure. Saturation:- the attribute of color perception that expresses the degree of departure from the gray of the same lightness. All grays have zero saturation. Commonly used as a synonym for chroma especially in graphic arts.

SATURATION BONDING = СКРЕПЛЕНИЕ ПРОПИТКОЙ (или СВЯЗЫВАНИЕ ПРОПИТКОЙ) – Saturation Bonding is used in conjunction with processes which require rapid binder addition, such as card-bond systems, and for fabric applications which require strength, stiffness, and maximum fiber encapsulation, such as carrier fabrics. Fiber encapsulation is achieved by totally immersing the web in a binder bath or by flooding the web as it enters the nip point of a set of pressure rolls. Excess binder is removed by vacuum or roll pressure. Three variations of saturation bonding exist:- screen, dip/squeeze, and size-press. Screen saturation is used for medium-weight nonwovens, such as interlinings. Dip/squeeze saturation is used for web structures with strength sufficient to withstand immersion without support, such as spunbonds. Size-press saturation is used in high speed processes, such as wet-laid nonwovens. Drying and curing may be carried out on steam-heated drying cans or in thru-air ovens or perforated-drum dryers. Binder addition levels range from 20% to 60%. Two techniques:- single screen saturator and applicator roll technique. Advantages of this method are simplicity, controllable tensile strength and softness by choice and amount of binders. The disadvantages are the great influence of

binders on softness, and the limitation in loftiness. See also Bonding (2). Saturation Bonding is a process of binding fibers into a nonwoven fabric by soaking the web with an adhesive.

SATURATION CONTENT = НАСЫЩЕННОСТЬ (или СОДЕРЖАНИЕ НАСЫЩЕНИЯ) – Saturation Content:- depending on its temperature, air can absorb different quantities of water vapor until it is saturated (100% relative humidity).

SATURATION EXTRACT = НАСЫЩЕННЫЙ ЭКСТРАКТ (или НАСЫЩЕННАЯ ВЫТЯЖКА, или УПАРЕННАЯ ВЫТЯЖКА) – Saturation Extract is an increment of solution obtained from a saturated soil paste.

SATURATION LEVEL = УРОВЕНЬ НАСЫЩЕНИЯ – Saturation Level is the amount of water that can dissolve in a fluid.

SATURATION REGAIN = ДОСТИЖЕНИЕ НАСЫЩЕНИЯ – Saturation Regain is the moisture in a material at 95% or % relative humidity.

SATURATION VALUE = ВЕЛИЧИНА НАСЫЩЕНИЯ – Saturation Value is the maximum amount of dye that can be absorbed by a textile fiber under defined conditions.

SAVANNA = САВАННА – Savanna is a plant community dominated by grasses with occasional scattered trees. / Под Саванной, от Испанского слова Sabana, понимается тип биома, распространённый между тропическими лесами и пустынями. В Африке занимает около 40% площади материка. Аналоги Африканской саванны встречаются в Южной Америке (кампос, льянос), на Северо-Востоке Австралии и в Южной Азии. Характеризуется сочетанием травяного покрова (бородачи, слоновая трава) с одиночными деревьями и кустарниками (баобаб, зонтиковидные акации и другие). Для Африканской саванны характерно обилие крупных травоядных (антилопы, бегемоты, жирафы, слон и другие) и хищных (гепард, лев и другие) животных. Сильно изменена человеком.

SAVINGS = СБЕРЕЖЕНИЯ – (1) Savings are all income of households (and firms) that is neither immediately spent on goods and services for final consumption nor taken by the government as taxes. Such savings may be held as balances in bank accounts or as cash on hand. Savings may be held for the purpose of subsequent investment or for some other purpose, such as accumulating sufficient funds for future consumption spending on big ticket items, maintaining an emergency reserve against the possibility of unpredicted consumption expenses, providing for post-retirement consumption spending, or even for the perverse psychological pleasures of hoarding in the miserly tradition of Silas Marner. The balance on the use of income account. It is that part of disposable income which is not spent on final consumption, and may be positive or negative. Amount of unconsumed income at a given time. Amount which an individual or entity sets aside from current income for hoarding, investment, lending or direct capital expenditure. According to British economist John Maynard Keynes (1883–1946), total saving equals total income minus total consumption, and total saving equals total investment, although the savers and investors are not necessarily the same. In modern market economies, savers and investors are brought together by financial markets and financial institutions, so that savings can be used to finance investments made by others. Saving represents a flow over a period of time, while savings is the amount of unconsumed income at a given point in time.

(2) In national accounting, aggregate gross saving is the change in the wealth of economic units over a given period, usually one year. It does not include increases or decreases in the book value of assets or casualty losses. Net saving is equal to gross saving less depreciation. / В национальном бюджетном процессе, в экономическом состоянии хозяйствующих субъектов .

SAVINGS ACCOUNT = СБЕРЕГАТЕЛЬНЫЙ СЧЁТ – Savings deposits managed in the form of a bank account offering special legally defined protection (preferred claim under bankruptcy). Reflecting the savings nature of the account, withdrawal options are more restricted than with a personal account but the interest is usually higher. Savings Account is a service depository institutions offer whereby people can deposit their money for future use and earn interest. Savings Account is an account with a bank or building society in which people invest personal savings and earn interest. Often notice of withdrawal must be given. / Сберегательный Счёт – депозитный счёт в коммерческом или сберегательном банке или в ссудо-сберегательной ассоциации, на который выплачиваются проценты за период с первого дня размещения депозита до дня его изъятия. Финансовые институты могут платить по сберегательным счетам любые проценты, но норма начислений чаще всего устанавливается на основе процентных ставок участвующих на денежных рынках банков и их базовой ставки по краткосрочным кредитам первоклассным заёмщикам (prime rate). Обычно владельцам сберегательных счетов выдают сберегательные книжки (passbooks), но с недавних пор кредитование счетов и начисление процентов производится также с помощью автоматических кассовых машин (automatic teller machines (ATM)), ежемесячных выписок счетов и телефонных банковских услуг. Если сберегательные счета депонированы в банках Федеральной Корпорации Страхования Депозитов (Federal Deposit Insurance Corporation (FDIC)) или ссудо-сберегательных ассоциациях, каждый (не превышающий 100 000 Долларов) страхуется в Страховом Фонде Сберегательных Ассоциаций (Savings Association Insurance Fund (SALT)).

SAVINGS ACCOUNT FOR VESTED PENSION BENEFITS = СБЕРЕГАТЕЛЬНЫЙ СЧЁТ ДЛЯ НАЧИСЛЕНИЯ ПЕНСИОННЫХ ВЫПЛАТ – Savings Account For Vested Pension Benefits is a preferential rate savings account for occupational pension assets. Principal and interest are tax-free until paid out; interest is exempt from withholding tax. Benefits paid out are subject to a reduced tax rate. Principal may be used to purchase residential property for the beneficiary's own use or to amortize mortgages.

SAVINGS ACCOUNT FOR YOUNG PEOPLE = СБЕРЕГАТЕЛЬНЫЙ СЧЁТ ДЛЯ МОЛОДЫХ ЛЮДЕЙ – Savings Account For Young People offering a preferential rate of interest, a special youth card, and extra benefits. / Сберегательный Счёт для Молодых Людей, предлагающий привилегированную процентную ставку, особую молодёжную карточку, и дополнительные выгоды.

SAVINGS AND LOAN ASSOCIATION = АССОЦИАЦИЯ ПО СБЕРЕЖЕНИЯМ И ЗАЙМАМ (или ССУДНО–СБЕРЕГАТЕЛЬНАЯ АССОЦИАЦИЯ) – Savings And Loan Association:- in the United States, a state or federally chartered financial institution that accepts savings and checkable deposits from the public and invests them primarily in mortgage loans. A savings and loan association may be either a mutual or capital stock institution and may also make loans to businesses and consumers. Historically, depository institution that accepted deposits mainly from individuals and invested heavily in residential mortgage loans; although still primarily residential lenders, S&Ls now have many of the powers of commercial banks. Savings And Loan Association is a type of bank with business activities defined in the German Act concerning Savings and Loan Associations as comprising the taking of deposits from customers, on the basis of whose accumulated deposits loans are subsequently granted for the financing of homebuilding measures. Savings and loan associations are banks pursuant to § 1 German Banking Act (Kreditwesengesetz (KWG)). / Ссудо-Сберегательная Ассоциация – принимающая вклады финансовая организация, действует на основании лицензии федерального или штатовского органа. Большую часть активов получает в виде сбережений клиентов и держит большую часть своих активов в жилищных ипотечных займах. Несколько подобных специализированных институтов было организовано в XIX веке и зарегистрировано на уровне штатов, но при минимальном регулировании со стороны властей. В ответ на кризис банковской и строительной отраслей, усугублённый Великой депрессией, Конгресс США в 1932 принял Федеральный закон о банках жилищного кредита, в

соответствии с которыми была создана Федеральная Система Банков Жилищного Кредита (Federal Home Loan Bank System) для дополнения ресурсов заёмных средств зарегистрированных штатами ссудо-сберегательных ассоциаций (S&Ls). Закон об ипотечном кредите домовладельцам 1933 (Hote Owners' Loan Act) создал систему федерального лицензирования ссудо-сберегательных ассоциаций под надзором Федерального Совета Банков Жилищного Кредита. Вклады в федеральные ссудо-сберегательные ассоциации были застрахованы после организации Федеральной Корпорации Страхования Ссудо-Сберегательных Ассоциаций (Federal Savings and Loan Insurance Corporation (FSLIC)) в 1934. Вторая волна реструктурирования этой системы прокатилась в 1980-х. Акт о Дерегулировании Депозитных Учреждений и Денежно-Кредитном Контроле от 1980 (Depository Institution Deregulation and Monetary Control Act of 1980) установил шестилетний период для устранения 'потолков' процентных ставок, включая требование о том, чтобы процентные ставки по займам, предоставляемым ссудо-сберегательными ассоциациями, обязательно превышали на одну четверть пункта лимит, установленный для процентных выплат по сберегательным счетам в коммерческих банках. Этот акт также открыл ограниченный доступ ссудо-сберегательных ассоциаций на некоторые рынки, доступные ранее только коммерческим банкам (коммерческих займов, неипотечных потребительских займов, трастовых услуг), а также разрешил взаимным ассоциациям (mutual associations) выпускать инвестиционные сертификаты (investment certificates). На практике паритет процентных ставок был достигнут к концу 1982. Закон о Депозитных Учреждениях Гарна-Ст. Жермена от 1982 (Garn-St. Germain Depository Institutions Act of 1982) ускорил ликвидацию ограничений и предоставил Федеральному Совету Банков Жилищного Кредита реальную свободу в выборе методов укрепления финансового положения ссудо-сберегательных организаций, ослабленных рекордно высокими процентными ставками на пакеты старых ипотечных займов с фиксированным процентом. Закон от 1982 также способствовал созданию акционерных ссудо-сберегательных ассоциаций и переводу существующих взаимных ассоциаций в акционерную форму, что предоставило ассоциациям ещё одну возможность воспользоваться ресурсами рынков капитала и таким образом увеличить свой нетто-капитал. В 1989 в качестве ответной меры после волны массовых банкротств, вызванной неправильным управлением, коррупцией и экономическими факторами, Конгресс США принял законодательное решение о 'спасении от банкротства' (bailout bill) ссудо-сберегательных ассоциаций, которое полностью изменило структуру регулирования этой отрасли, подчинив её новому агентству – Управлению Надзора за Сберегательными Учреждениями (Office of Thrift Supervision (OTS)). Согласно этому закону была распущена Федеральная Корпорация Страхования Ссудо-Сберегательных Ассоциаций (Federal Savings and Loan Insurance Corporation (FSLIC)) и создан Страховой Фонд Сберегательных Ассоциаций (Savings Association Insurance Fund (SAIF)) для страхования вкладов под управлением Федеральной Корпорации Страхования Депозитов (Federal Deposit Insurance Corporation (FDIQ)). В соответствии с Законом были также созданы Трастовая Корпорация для Урегулирования (Resolution Trust Corporation (RTC)) и Финансовая Корпорация для Урегулирования (Resolution Funding Corporation (REFCORF)); их задача – работа с несостоятельными институтами. Федеральный Совет Банков Жилищного Кредита был заменён Федеральным Финансовым Советом по Жилищным Вопросам (Federal Housing Finance Board (FHFB)), который в настоящее время контролирует деятельность Федеральной системы банков жилищного кредита.

SAVINGS BANK = СБЕРЕГАТЕЛЬНЫЙ БАНК – In Germany, Savings Banks are public sector banks pursuant to § 1 German Banking Act (Kreditwesengesetz (KWG)) which, on the basis of the savings bank laws of the federal states and the corresponding articles of association issued for each savings bank, generally conduct all standard banking transactions with private clients, companies, local authorities and institutional customers. Guarantors of savings banks are local authorities (cities, administrative districts) or public sector unions. Depository financial institution that mainly accepts interest-bearing savings deposits of varying amounts. Savings Bank is a depository institution historically engaged primarily in accepting consumer savings deposits and in originating and investing in securities and residential mortgage loans; now may offer checking-type deposits and make a wider range of loans. Compare Commercial Bank. / Под Сберегательным Банком понимается кредитное учреждение, выполняющее функции сберегательных касс. Сберегательный Банк – сберегательный финансовый институт, основная деятельность которого заключается в принятии вкладов от клиентов и предоставлении жилищных ипотечных кредитов. Исторически сберегательные банки функционировали как взаимные фонды (находящиеся в собственности вкладчиков) и регистрировались только в 16 штатах США; большинство сберегательных банков было расположено в штатах Новой Англии, в Нью Йорке и в Штате Нью Джерси. До принятия Акта о Депозитарных Учреждениях Гарна – Ст. Жермена в 1982 (Garn – St. Germain Depository Institutions Act of 1982) вклады в зарегистрированных штатами банках были застрахованы, как и вклады в коммерческие банки, Федеральной Корпорацией Страхования Депозитов (Federal Deposit Insurance Corporation (FDIC)). Акт о Депозитарных Учреждениях Гарна – Ст. Жермена от 1982 предоставил сберегательным банкам право регистрироваться на федеральном уровне, переходить из формы взаимного владения к акционерной форме. Надзор за деятельностью сберегательных банков осуществляет Федеральный Совет Банков Жилищного Кредита, а страхование – Федеральная Корпорация Страхования Ссудо-Сберегательных Ассоциаций (Federal Savings and Loan Insurance Corporation (FSLIC)). В 1989 Федеральный Совет Банков Жилищного Кредита был заменён Федеральным Финансовым Советом по Жилищным Вопросам (Federal Housing Finance Board (FHFB)), а FSLIC была заменена Страховым Фондом Сберегательных Ассоциаций (Savings Association Insurance Fund (SAIF)), подразделением FDIC.

SAVINGS BOND = СБЕРЕГАТЕЛЬНАЯ ОБЛИГАЦИЯ – Savings Bonds were created to finance World War I, and were originally called Liberty Bonds. In 2002, the Treasury Department started to gut the savings bond program by lowering interest and closing its marketing offices, although the program was very well known previously. Money market instrument in the United States issued in bill-like form with maturities of three to five years. May only be acquired by US citizens. Short-term or intermediate-term fixed-interest bearer bond issued by a government credit institution or commercial bank. Savings bonds are used by banks, corporations and governments to borrow short-term funds, often from each other. They differ from corporate bonds in that they are issued for a shorter term and are not part of a series issued on the same date and maturing at the same time, but may be issued at any time. In the United States, Savings Bond is a nontransferable, registered bond issued by the US government in denominations of USD50.00 to USD10 000.00. A nonmarketable debt obligation of the US government. Savings bonds are available in both paper and book-entry form and can be purchased with an initial investment of as little as USD25.00. Investors can purchase paper savings bonds in person from many depository institutions, by mail from a Reserve Bank or the Treasury, or online. Book-entry bonds are available from the Treasury online. Savings Bond is a savings security issued by the US Treasury or an authorized agent showing that money has been loaned to the US Government and is payable to the person to whom it is registered. A 'savings bond' is designated as such in the regulations offering the bonds for sale. The bond is a contract between the Government and the bond owner. Each bond is a registered security for which a record is maintained by the Bureau of the Public Debt. / Сберегательная Облигация – облигация правительства США стоимостью (face value) от 50 до 10 000 Долларов. С 1941 по 1979 государство выпускало облигации серии E (series Ebonds). Начиная с 1980 выпускались облигации серий EE и НИ. Стоимость облигаций серии EE, выпускаемых со скидкой в размере половины номинальной стоимости, варьирует от 50 до 10 000 Долларов; цена облигаций серии НН, по которым выплачиваются проценты, варьирует от 500 до 10 000 Долларов. Облигации серии EE могут приносить проценты в течение 30

лет; серии НН – 20 лет. Облигации серии ЕЕ, если их сохранять в течение 5 лет, принесут 85% среднего дохода по 5-летним Казначейским Векселям. Облигации серии НН, которые можно получить только путём обмена облигаций серии J или ЕЕ на сумму не менее 500 Долларов, приносят фиксированный доход в 4%, выплачиваемый два раза в год. В течение многих лет государство гарантировало минимальный доход по сберегательным облигациям, и этот доход снизился сначала с 7.5 до 6%, а затем и до 4%. В 1995 эта гарантия была отменена. Вместо этого облигации, выпущенные 01 Мая 1995 или позже и сохраняемые в течение 5 лет, приносят 85% среднего дохода по ценным бумагам Казначейства США. Дважды, в год – 01 Мая и 01 Ноября – в размер дохода вносятся поправки. Проценты по сберегательным облигациям исключаются из налогообложения штата и местного налога, федеральный налог на облигации серии ЕЕ не выплачивался вплоть до погашения облигаций. Владельцы облигаций, желающие отсрочить свои налоговые обязательства по облигациям серии ЕЕ, по которым наступает срок погашения, могут обменять их на облигации серии НН. Налогоплательщики, имеющие определённый уровень дохода, могут рассматривать облигации серии ЕЕ как сбережения на оплату высшего образования детей, полностью или частично освобождённые от федеральных налогов. Это относится к лицам, у которых общий доход возрос с 45 500 до 60 500 Долларов, а для супружеских пар, совместно заполняющих налоговую декларацию, – с 68 250 до 98 250 Долларов. В эти уровни дохода ежегодно вносятся поправки на инфляцию.

SAVINGS BOOK = СБЕРЕГАТЕЛЬНАЯ КНИЖКА (или СБЕРКНИЖКА) – Savings Book is the most common form of saving in Germany. The interest rate (basic savings rate) is variable but can be fixed for a certain period through an agreement between the customer and the bank. Interest is credited to the account at the end of each calendar year or upon closure of the account. The bank can pay over funds with debt-discharging effect to any person presenting the savings book. The bank, however, is not obliged to pay over funds without checking that person's identity. Banks can grant customers the right to withdraw a maximum of EUR2 000.00 per calendar month without observing a period of notice. If in individual cases banks allow customers to withdraw sums above the agreed limit, an early withdrawal penalty is charged. Savings books are increasingly being replaced by so-called Sparcards. Savings account maintained in book form. Previously quite common. / Сберегательный счёт, поддерживаемый в форме книжки. Когда-то имел широкое распространение.

SAVINGS CERTIFICATE = СБЕРЕГАТЕЛЬНОЕ СВИДЕТЕЛЬСТВО (или СБЕРЕГАТЕЛЬНЫЙ СЕРТИФИКАТ) – A Savings Certificate is a fixed-income investment product offered by banks. Terms range up to ten years. Interest rates are fixed over the entire term and thus fixed in advance. In the case of savings certificates with normal interest rates, savers invest a certain amount for which interest is credited annually. With discounted savings certificates, interest and compound interest for the entire term is added to the purchase price, as a result of which the purchase price is significantly below its face value (repayment amount). It is generally not possible to return savings certificates prior to maturity.

SAVINGS NOTE = СБЕРЕГАТЕЛЬНЫЙ БИЛЕТ (или СБЕРЕГАТЕЛЬНАЯ НОТА) – Savings Notes are accrual-type, United States savings securities issued in conjunction with Series E bonds from May 1967 through October 1970. These notes are also called 'Freedom Shares'. They had an original maturity period of 4 years and 6 months and have a total interest-earning life span of 30 years. Like savings bonds, they are nontransferable. They were purchased on a discount basis at 81 percent of face value in denominations of USD25.00, USD50.00, USD75.00, and USD100.00. Regulations governing these securities are in Title 31 Code of Federal Regulations Part 342, also published as Department of the Treasury Circular, Public Debt Series No. 3.67.

SAVINGS STAMPS = СБЕРЕГАТЕЛЬНЫЕ МАРКИ – In the United States, Savings Stamps:- from at least the early 1940's until it was ended on 1970-June-30, the savings stamp program focused first on funding US participation in World War II and later primarily upon encouraging thrift among the nation's youth by persuading them to save small sums. Stamps were sold in denominations (face values or amounts) of USD0.10, USD0.25, USD0.50, USD1.00, and USD5.00. Stamps were acquired from post offices and sold in schools to students. Albums and patriotic materials were made available to schools to promote the program. When as little as USD18.75 had been saved, a USD25.00 (face amount) Series E savings bond could be purchased. Stamps were non-interest bearing and unregistered.

SAVONNIERIE = САВОНЬЕРИ (или СТРИЖЕНЫЙ КОВЁР) – Savonnierie is a French rug made to imitate Oriental knotted rugs with rococo patterns.

SAWAH = SIMULATION ALGORITHM FOR WATER FLOW IN AQUEOUS IN HABITATS

SAW DELINTING SYSTEM = СИСТЕМА ПИЛЬНОГО ВОЛОКНООТДЕЛЕНИЯ – Saw Delinting System is a full line of cottonseed and oilseeds processing machinery. / Система Пильного Волокноотделения:- полная линия оборудования, перерабатывающего хлопок-сырец с целью отделения волокна от семян пильным (пильчатым) способом джинирования.

SAWFLY DAMAGE = ПОВРЕЖДЕНИЕ ПИЛИЛЬЩИКАМИ – Sawfly Damage:- the Wheat stem Sawfly has caused serious harvest losses to spring Wheat in the prairie region. It attacks the base of stems causing tillers of mature plants to break off. Early swathing can reduce spring Wheat harvest losses, but the most effective means of managing this insect pest has been the production of resistant cultivars. / Пилильщик стеблей Пшеницы, так называемый Хлебный Пилильщик . Пилильщики, общее название ряда Семейств Подотряда Сидячебрюхих Перепончатокрылых Насекомых. Яйцеклад похож на пилку (отсюда и само название). Свыше 5 000 Видов, распространены широко, обычно в лесах. Некоторые – Вредители, например, Красноголовые (длиной около 1 см), Рапсовые, Вишнёвые, Хлебные Пилильщики. Повреждение – одно из понятий теории надёжности; событие, заключающееся в нарушении исправности изделия. Повреждение может быть существенным и являться причиной нарушения работоспособности (отказа) и несущественным, при котором работоспособность изделия сохраняется.

SAW GIN = ПИЛЬНЫЙ ВОЛОКНООТДЕЛИТЕЛЬ (или ПИЛЬНЫЙ ДЖИН) – Saw Gin:- Cotton varieties with shorter staple or fiber length are ginned with saw gins. This process involves the use of circular saws that grip the fibers and pull them through narrow slots. The seeds are too large to pass through these openings, resulting in the fibers being pulled away from the seed. One of the greatest of all-time inventions is the saw gin invented by Eli Whitney, 1793. Its principles are still used today. It consists of a set of rapidly moving circular saws, the teeth of which protrude through slots in a grill on which the cotton is laid. The teeth of the saws catch the cotton, pull it away from the seeds, and draw the fiber back through a space too small to admit the seeds. Also known as Saw Engine. Saw Gin grabs the fibers and breaks them away from the seed. An advantage is its relatively high speed. A disadvantage is that the process leads to a relatively high damage to the cotton fibers. See also Gin. / Илай Витни. Джин с пильчатым механизмом для отделения волокон от семян Хлопчатника. Волокноотделитель, машина для отделения хлопкового волокна от семян. В пильных волокноотделителях прядка волокон в её средней части захватывается зубом пилы и отрывается от семени протаскиванием сквозь щель. Они применяются для сильно опушённых семян с прочно прикреплёнными волокнами (современные средневолокнистые хлопки). Хлопок с пильных волокноотделителей – рыхлый и пушистый.

SAWN VENEER = ПИЛЁНЫЙ ШПОН – Sawn Veneer is a veneer produced by sawing. / Шпон, произведённый распиловкой (распиливанием).

SAWN WOOD = ПИЛЁНАЯ ДРЕВЕСИНА (или РАСПИЛЕННАЯ ДРЕВЕСИНА) – Sawn Wood is a wood sawn longitudinally, with or without its natural rounded surface with or without bark. / Древесина, распиленная продольно, со своей остающейся естественной округлённой поверхностью (горбыль) или без неё, как с корой, так и без коры. В деревообработке под Распиловкой или Распиливанием понимается процесс последовательного раскроя пилами стволов на круглые сортименты (брёвна, кряжи), брёвен на пиломатериалы и пиломатериалов на заготовки. Различают распиловку:- относительно направления древесных волокон – продольную и поперечную, относительно годичных слоёв – тангенциальную (по касательной к годичным слоям) и радиальную. При раскрое врёвен на брусья и доски различают:- распиловку вразвал, при которой вначале формируется толщина обрезных досок, а затем их ширина; распиловка с брусовкой, при которой бревно раскраивается на двухкантный брус по высоте, соответствующий ширине обрезных досок, и боковые доски заданной толщины, а затем брус раскраивается на доски нужной толщины, а боковые доски обрезаются по ширине. Для выработки досок тангенциальным или радиальным пропилами распиловку производят специальными способами (развально-сегментным, брусово-сегментным, секторным). К Горбылю относится пиломатериал, получаемый путём среза наружной части бревна с пропилом на всю длину с одной стороны и горбом с другой.

SAW–TOOTHED GRAIN BEETLE = ПИЛЬЧАТЫЙ ЗЕРНОВОЙ ЖУК (или СУРИНАМСКИЙ МУКОЕД) – Saw-Toothed Grain Beetle (Oryzaephilus Surinamensis (Linnaeus)):- eggs are usually laid, either singly or in small masses in a crevice in the grain but in products such as flour they are laid freely. / Пильчатый Зерновой Жук или Суринамский Мукоед:- систематическое положение:- Отряд Жуки, или Жесткокрылые, Семейство Плоскотелки (Cucujidae). Распространён в Южных регионах. Повреждает муку, крупы, сухофрукты и зерно с повышенной влажностью. Жук длиной 3–3.5 мм, красно-бурый; переднеспинка с двумя продольными желобками и шестью зубцами по бокам. Личинка длиной до 4 мм, кремовая, с двумя тёмными пятнами на грудных сегментах. Зимуют жуки и личинки. Вид теплолюбивый. В оптимальных условиях (при температуре 31–37 °C и относительной влажности воздуха около 65%) поколение развивается за 25 дней. При температуре ниже 16 °C мукоед прекращает развитие и при температуре 0 °C погибает в течение 22 дней. Самка откладывает 100–300 яиц (максимально – 600) на пищевой субстрат. Отродившиеся личинки питаются этим субстратом. В течение года развиваются два–пять поколений.

SAXONY = САКСОНСКАЯ – Saxony is a heavyweight, napped coating fabric, traditionally made from merino wool. Saxony originated in Saxony, Germany. See also Merino. Saxony:- originally a high grade coating fabric made from Saxony Merino wool raised in Germany. Saxony is:- (1) a high-grade fabric for coats, made from Saxony Merino wool. (2) A soft woolen with fancy yarn effects, used in sport-coat fabric. (3) A highly twisted worsted knitting yarn. (4) A term describing a cut-pile carpet having highly twisted, evenly sheared, medium-length pile yarns. Saxony is a fine soft woolen fabric. / Саксония, Германия.

SAXONY WHEEL = САКСОНСКОЕ КОЛЕСО – Saxony Wheel is three-legged ‘standard wheel’ featuring a side-by-side arrangement with the flyer to the left of the drive wheel.

SAYBOLT UNIVERSAL SECOND = СЕКУНД ПО СЭЙБОЛТУ УНИВЕРСАЛУ (или СЕКУНДА ПО УНИВЕРСАЛЬНОМУ ВИСКОЗИМЕТРУ СЭЙБОЛТА) – Saybolt Universal Seconds (SUS) or Saybolt Seconds Universal (SSU) is a measure of lubricating oil viscosity in the oil industry. The measuring apparatus is filled with specific quantity of oil or other Fluid and its flow time through standatized offrice is measured in Seconds. Fast flowing fluids (low viscosity) will have low value. Slow flowing fluids (high viscosity) will have high value. Saybolt Seconds Universal (SSU) or Saybolt Universal Seconds (or SUS) or SSU, a unit of measure used to indicate viscosity, e.g., SSU @ 37.8 °C (100 °F). Saybolt Universal Second (SSU or SUS) and Saybolt Furol Second (SSF or SFS):- units of kinematic viscosity given by readings on Saybolt viscometers. The Saybolt Universal viscometer is used for liquids having viscosities below 1 000 centiStokes (or 10 Stokes). The Saybolt Furol viscometer is used for more viscous road and fuel oils (Furol is an acronym for Fuel and Road Oils). In both cases the reading is the time, in seconds, for 60 milliliters of a sample to flow through the device. The Furol viscosity readings are roughly 1/10 the Universal readings. For liquids whose viscosity exceeds 50 centiStokes at 37.8 °C (100 °F) one SSU is approximately 0.215 8 centiStokes or 0.215 8 mm^2/s. For very viscous liquids (viscosity exceeding 500 centiStokes) at 50 °C (122 °F), one SSF is approximately 2.120 centiStokes or 2.120 mm^2/s. Exact equations were published in 1996 by the American Society for Testing and Materials (ASTM practice D2161). The Saybolt seconds are considered obsolete, but they have been used traditionally in the petroleum industry and are common in technical articles. Saybolt Universal Viscometer or Saybolt Viscosimeter is the viscosimeter began as a scientific instrument for laboratory use in the 1830s. In time, due to increased industrial production, demand for quality control, and use of mineral-based oils, it gained real-world importance. The favored form for petroleum products measured the time it took for a certain volume of fluid to empty out of a container. The standard American design was developed by George M. Saybolt, unveiled in the 1880s, and manufactured by the C.J. Tagliabue Mfg. Co. for the Standard Oil Company in New York. It resembled the viscosimeters designed by Boverton Redwood in Great Britain and by Karl Engler in Germany. Tagliabue brought the basic Saybolt viscosimeter to the open market in 1905. An improved form adapted for steam, gas, or electric heating, appeared in 1914. It cost USD82 with a stopwatch, and USD75 without. Following Saybolt’s death in 1924, the New York Times implied that the viscosimeter was largely responsible for his US100 000 estate. PresentedIt was made after Saybolt applied for a patent in 1914, and before the patent was issued in 1915. / Дьжордьж Эм. Сэйболт (George M. Saybolt; 1853–1924). Изготовлен Си.Дьжей. Тчаглиабу Эм.эф.дьжи. Ко. (C.J. Tagliabue Mfg. Co.) для Стэндод Оил Кампэни (Standard Oil Company) из Нью Йорка. Бовэтчэном Рэдвудом (полное имя Сэр Томэс Бовэтчэн Рэдвуд (Sir Thomas Boverton Redwood); 1846–1919) в Великобритании и Карлом Энгля (полное имя Карл Освальд Викто Энгля (Carl Oswald Viktor Engler); 1842–1925) в Германии. Американское Общество по Испытаниям и Материалам (АОИМ). в секундах по универсальному вискозиметру Сэйболта.

SAYBOLT UNIVERSAL VISCOSITY = ВЯЗКОСТЬ ПО СЭЙБОЛТУ УНИВЕРСАЛУ – Saybolt Universal Viscosity (SUV) or Saybolt Universal Seconds, (SUS):- the time in seconds required for 60 cubic centimeters of a fluid to flow through the orifice of the Standard Saybolt Universal Viscometer at a given temperature under specified conditions. (ASTM Designation D 88); American Society for Testing and Materials (ASTM). / Американское Общество по Испытаниям и Материалам (АОИМ). в секундах по универсальному вискозиметру Сэйболта.

SC = SINGLE CROSS

SC = STRIPPER COMBINE

SCA = SPECIFIC COMBINING ABILITY

SCAA = SPECIALTY COFFEE ASSOCIATION OF AMERICA

SCAB = ПАРША (или СТРУП) – Scab is a hyperplastic symptom of disease characterized by rough, crusty lesions formed by excessive cork production. A disease in which such lesions form. / Струп или Парша – гиперпластический симптом болезни, характеризуемой грубыми, коркоподобными поражениями, сформированными чрезмерным образованием пробки. Болезнь, при которой формируются такие формы поражений. Под Паршей понимается болезнь растений, вызываемая патогенными грибами, иногда актиномицетами и бактериями. Наиболее вредоносны парша Груши (Pear Scab), Картофеля (Potato Scab или Corky Scab of Potato), Яблони (Apple Scab) и Цитрусовых (Citrus Scab). На стеблях, листьях, клубнях, плодах бородавки, пустулы, пятна, язвы; покровные ткани шелушатся. Под Струпом понимается корка, покрывающая ссадину, ожоговую поверхность, рану. После отпадения струпа образуется язва или поверхностный рубец (заживление под струпом).

SCAB DAMAGE = ПОВРЕЖДЕНИЕ ПАРШЕЙ – Scab Damage refers to kernels of Wheat that have been severely affected by fusarium. Scab damage is included in and assessed as Fusarium damage for grade assessment. The percentage concentration of scab damage may be recorded for specific markets upon request. Scab kernels must be completely dull, lifeless, with a chalky appearance, and must have no semblance of soundness and no visible natural Wheat color, and scab kernels must have a white or pinkish fibrous growth. Note:- if there is any natural Wheat color, the kernel is not to be considered as scab damage. See also Scab. / от парша . Повреждение Паршей относится к зерновке (ядрам) пшеницы, которые в серьёзной степени подверглись воздействию . Под Паршей растений понимается болезнь, вызываемая патогенными грибами, иногда актиномицетами и бактериями. Наиболее вредоносны парша Груши, Картофеля, Цитрусовых и Яблони. На стеблях, листьях, клубнях, плодах пятна, язвы, пустулы, бородавки; покровные ткани шелушатся. Повреждение – одно из понятий теории надёжности; событие, заключающееся в нарушении исправности изделия. Повреждение может быть существенным и являться причиной нарушения работоспособности (отказа) и несущественным, при котором работоспособность изделия сохраняется.

SCABROUS = ШЕРОХОВАТОЕ (или СКАБРЁЗНОЕ, или ШЕРШАВОЕ, или БОРОДАВЧАТОЕ, или ЧЕШУЙЧАТОЕ) – Scabrous:- of a leaf, roughened by tubercles, hairs or other structures on its surface. Scabrous:- rough.

SCAC = STANDARD CARRIER ALPHA CODE

SCAE = SPECIALTY COFFEE ASSOCIATION OF EUROPE

SCALD = ОЖОГ (или ОМЕРТВЕНИЕ, или ВЫГОРАНИЕ) – Scald is a leaf disease in Rice incited by a Fungus known as Rhynchosporium Oryzae. The lesion occurs very often at the margin or tip of the leaf. The typical lesions form characteristic zonations or bands as they spread and enlarge on leaves of susceptible varieties. Rice Varieties with broad leaves appear to be more susceptible to leaf scald. / Под Ожогом понимается повреждение тканей организма, вызванное действием высокой температуры или некоторых химических веществ (кислот, солей тяжёлых металлов, щёлочей и других). Различают 4 степени ожога:- покраснение кожи, образование пузырей, омертвление всей толщи кожи, обугливание тканей. Особая форма – лучевые ожоги (Рентгеновские, Солнечные и другие).

SCALE = ОКАЛИНА (или ШЕЛУШИТЬСЯ, или ШКАЛА, или МАСШТАБ) – Scale (maritime term):- to climb up. A formation of rust over iron or steel plating. / Окалина, продукт окисления поверхности металла при взаимодействии с внешней средой. Обычно окалиной называют продукт окисления лишь железа и его сплавов. В широком смысле слова окалиной можно считать образующиеся на поверхности любого металла химического соединения его не только с кислородом, но и с другими окислителями, например, серой, азотом и так далее (смотрите Окисление Металлов). Тонкие слои окалины, часто называемые окисными плёнками, прозрачны (при толщине до 40 нм) или окрашены в тот или иной цвет побежалости (при изменении толщины от 40 до 500 нм). При толщине свыше 500 нм окалина имеет постоянную окраску, зависящую от химического состава (смотрите также Оксидирование).

SCALE = ЧЕШУЙКА (или ЧЕШУЯ) – (1) Scales are cuticle cells form a scale-like formation on the surface of the fiber, resembling shingles on a roof. These scales on the surface of the fiber open from base to tip, causing an interlocking or felting action when fibers are randomly mixed during processing. Scales are the protective covering of the wool fiber.

(2) Scale is a small leaf like structure. A narrow, triangular or spine-like lower perianth segment often found on the ovary or flower tube surface. See also Scale Insect. Scale is a highly modified leaf, usually sessile and dry. / Под Чешуйками понимаются:- (i) выросты кожицы (эпидермиса) у Растений, например, на листьях Облепихи, или видоизменённые листья, например, чешуйки в цветках; выполняют защитную функцию; и (ii) мелкие хитиновые пластинки на теле некоторых членистоногих, главным образом Насекомых; часто окрашены, например, у Чешуекрылых, Комаров, некоторых Перепончатокрылых. Под Чешуёй понимаются твёрдые пластинки (чаще костные или роговые) на коже позвоночных Животных – Рыб, пресмыкающихся Птиц (на цевке) и некоторых Млекопитающих (обычно на хвосте). Предохраняет кожу от повреждения и высыхания.

SCALE = ШКАЛА – Scale:- the range of damage ratings, based on a numerical system, usually 0–9 where 0 = no plant damage and 9 = severe damage (all plants killed).

SCALE DOWN TRADE = МАСШТАБНАЯ ТОРГОВЛЯ ПРИ ПОНИЖЕНИИ – Scale Down buying by the trade and mills is a trading strategy where commodity futures are bought or purchased as prices move lower, for example cotton futures are bought initially at a price of 50 cents, as prices move to 49.90 more cotton is purchased, at 49.80 more and so on. It may be an order to buy at a series of prices, for example to buy 10 at 50 cents, 10 more at 49.95, 10 more at 49.90, etc. See Scale Up Trade. To purchase or sell on scale down means to buy or sell at regular price intervals in a declining market.

SCALE INSECT = ЧЕШУЙЧАТОЕ НАСЕКОМОЕ (или ЧЕРВЕЦЫ, или ЩИТОВКИ, или КОКЦИДЫ) – Scale Insect is a small flat Insect Pest, with a waxy dorsal shield, that adheres to the plant epidermis and feeds from the plant sap. / Под Чешуйчатыми понимается Отряд Пресмыкающихся. 3 Подотряда:- Амфисбеновые (2 Семейства – Амфисбены и Трогонофисы), Змеи и Ящерицы. Около 6 600 Видов, на всех континентах, кроме Антарктиды.

SCALE–LIKE LEAF = ЧЕШУЙЧАТЫЙ ЛИСТ – Scale-Like Leaf:- small appressed leaf or bract, e.g., Juniperus.

SCALE ORDER = РАСПОРЯЖЕНИЕ С РАЗГРАНИЧЕНИЯМИ – Scale Order is an order to buy (or sell) a security, that specifies the total amount to be bought (or sold) at specified price variations.

SCALE UP TRADE = МАСШТАБНАЯ ТОРГОВЛЯ ПРИ ПОВЫШЕНИИ – Scale Up Trade:- to purchase or sell on scale up means to buy or sell at regular price intervals as the market advances. Scale Up selling by the trade and mills is a trading strategy where commodity futures are sold as prices move higher, for example cotton futures are sold initially at a price of 49.80 cents, as prices move to 49.90 more cotton is sold, at 50 more and so on. It may be an order to sell at a series of prices, for example to sell 10 at 49.80 cents, 10 more at 49.95, 10 more at 50, etc. See also Scale Down Trade.

SCALING TRADE = МАСШТАБИРУЮЩАЯ ТОРГОВЛЯ – Scaling Trades:- a popular strategy for growing profits aggressively is when a trader adds to a position when the movement goes in the desired direction. Many traders will 'scale in' additional positions as the move progresses and this, interestingly enough, can also help reduce risk if the trade turns bad later on. Other traders believe that catching the initial momentum of a move is where the real profits are made and add on positions immediately once the move has revealed itself. A compromise is called Pyramiding or Scaling in new positions.

SCALLOPED SELVAGE = ФЕСТОНЧАТАЯ КРОМКА – Scalloped Selvage is an abrupt, narrow indentation in the selvage. Synonym:- Misclip. Fabrics defect.

SCALLOPS = ФЕСТОНЫ (или ЗУБЦЫ, или ДУЖКИ, или ВЫЕМКИ) – Scallops are the decorative semicircular curves usually used as edge trimming. They are popular clothing accents and offen are used on cafe curtains. See also Cafe Curtains, Curtains, and Draperies. Scallops:- the edges of a fabric exhibiting approximately sinusoidal waveforms of short wavelengths in the plane of the fabric. Note:- this defect often appears in a fabric which has been stretched excessively widthways during stentering. / Фестоны (scallops):- порок заключительной отделки ткани; края ткани, синусоидальной формы на плоскости ткани. Примечание:- этот порок часто появляется на ткани, которая была значительно вытянута по ширине во время растягивания (ширения).

SCALP = СКАЛЬПИРОВАТЬ (или ОТСЕЯТЬ, или ШЕЛУШИТЬ) – Scalp:- to trade for small gains. Involves establishing and liquidating a position quickly, within the same day, hour or minute. / Торговать с малыми прибылями. Заключается в быстрой покупке и продаже в пределах одного и того же дня, часа или минуты. Скальпировать:- ведение быстрых торгов с целью получения небольшой прибыли от использования минимальных колебаний цен. Скальпирование предполагает создание и ликвидацию позиций в течение одного дня, часа или даже нескольких минут. Необходимый уровень прибыли обеспечивается за счёт большого объёма сделок.

SCALPER = СКАЛЬПИРОВЩИК (или ОТСЕИВАТЕЛЬ, или ШЕЛУШИТЕЛЬ) – Scalper is a speculator on the trading floor of an exchange who buys and sells rapidly, with small profits or losses, holding his positions for only a short period of time during a trading session, rarely carrying the positions overnight. Typically, scalpers stand ready to buy at the minimum price change (tick) below the last transaction price and to sell at a tick above, thus creating market liquidity. Scalper is a trader who attempts to buy at a bid price and sell at an asking price. Scalpers will buy and sell on minimum price fluctuations and trade in and out of thousands of bushels of grain a day. / Спекулянт на торговом полу биржи, часто покупающий или продающий с малой прибылью или убытком, удерживая при этом свои позиции только в течение короткого периода времени в пределах одной торговой сессии и редко перенося их на следующий торговый день. Как правило, скальпировщики занимают готовность купить при минимальном изменении цены (пункт) ниже цены последней сделки и продать на пункт выше, тем самым создавая ликвидность рынка. Скальпировщик (scalper) – спекулянт, совершающий в течение одной торговой сессии множество сделок на покупку и на продажу с целью заработать деньги. В большинстве случаев скальпер – это мелкий спекулянт, играющий на незначительных колебаниях цены. Иногда, правда, ему случается поймать и относительно большие колебания. Известный Американский торговец фьючерсами Люис Дьжей. Борсэлино (Lewis J. Borsellino) в своей Рабочей Книге Курса Внутрисуточного Торговца (The Day Trader's Course Workbook) рассказывает, как в 1987 во время резкого падения рынка, ему удалось буквально за минуту заработать USD1.3 миллиона. В России в 1998 один скальпировщик на РБ в течение получаса сделал 500 000 Долларов США. Скальпировщики как крупные игроки встречаются довольно редко. Очень часто скальпировщик теряет деньги. Об этом всегда следует помнить. Кроме того, если в ходе торговой сессии биржевой делец совершил много сделок, но это были только покупки или только продажи, то на бирже про него не скажут, что он скальпировщик.

SCALPING = СКАЛЬПИРОВАНИЕ (или ОТСЕИВАНИЕ, или ШЕЛУШЕНИЕ) – Scalping is the practice of trading in and out of the market on very small price fluctuations. A person who engages in this practice is known as a Scalper. Spreading rumours or making stock recommendations for one's own gain. A Scalping is a strategy in which the trader intends to take a quick profit. For example, if a trader bought a pullback in a bull trend in Apple when it was around USD600, the trader might use a USD1 profit-taking limit order while risking USD1. Many traders would do this using an order cancel order (OCO), using a protective stop USD1 below the entry price and a profit-taking limit order USD1 above; once one order gets filled, the other is cancelled automatically. When scalping, traders usually do not want to see a pullback. They often will allow one pullback lasting for a single bar, but if the pullback follows a strong signal bar against their trade, they usually will exit and not wait for their stops to get hit. Because the reward is small on scalp trades – usually about the size of the risk – traders should scalp only when they are highly confident that the trade will be successful. To be profitable as scalpers, they need a high probability of success on each trade when the reward is relatively small. Because the risk also is relatively small, most scalpers trade larger positions when they scalp than when they swing trade. / Торговая практика, заключаемая в покупке и продаже каких-либо биржевых инструментов при очень малых флуктуациях (колебаниях) цены. Лицо, вовлечённое в такую практику, известно как скальпировщик.

SCALPING = ОТСЕИВАНИЕ (или ШЕЛУШЕНИЕ) – Scalping refers to the removal of roughage material in a sieving process. / Термин Отсеивание или Шелушение относится к удалению грубого материала в процессе просеивания.

SCANDENT = ЛАЗАЮЩЕЕ – Scandent:- climbing. / Лазающее:- вьющееся или ползущее.

SCANNING ELECTRON MICROSCOPE = РАСТРОВЫЙ ЭЛЕКТРОННЫЙ МИКРОСКОП (или СКАНИРУЮЩИЙ ЭЛЕКТРОННЫЙ МИКРОСКОП) – Scanning Electron Microscope (SEM) is an electron microscope in which a beam of focused electrons moves across the object and the electrons scattered by the object being collected to form a three-dimensional image on a cathode-ray tube. / Под Электронным Микроскопом понимается прибор, в котором для получения увеличенного изображения используется электронный пучок. Разрешающая способность электронного микроскопа в сотни раз превышает разрешающую способность оптического микроскопа.

SCANTIES = СКЭНТИЗ (или XX) – Scanties are very small underwear, combining scant and panties. An example of scanties are the tiny thongs which are worn by the models in the underwear catalog. Scanties:- abbreviated panties for women. Particularly arousing underpants, i.e. thongs, g-strings, etc. Scandalous + Panties = Scanties. My girlfriend left her scanties hanging on my desk lamp. / очень короткие женские трусики.

SCANTLING = РАЗМЕР (ПОПЕРЕЧНОГО СЕЧЕНИЯ СВЯЗЕЙ) (или НАБОР, или ТОЛЩИНА СВЯЗЕЙ) – The thickness of a steel plate in a ship. Scantling is a measurement of prescribed size, dimensions, or cross sectional areas. In shipbuilding, the scantling refers to the collective dimensions of the various parts, particularly the framing and structural supports. The word is most often used in the plural to describe how much structural strength in the form of girders, I-beams, etc is in a given section. The scantling length refers to the structural length of a ship. In shipping, a 'full scantling vessel' is understood to be a geared ship, that can reach all parts of its own cargo spaces with its own gear. / Толщина стальной обшивки корабля.

SCAPE = (БЕЗЛИСТНЫЙ) СТЕБЕЛЬ (или СТЕРЖЕНЬ) – Scape is a long flower stalk arising directly from a root. Adj. scapose-borne on scapes. / длинная ножка цветка, вырастающая непосредственно из корня. Стебельковый – родившийся на стеблях.

SCAPULAR = НАПЛЕЧНИК (или СКАПУЛЯРИЙ) – Scapular is a long wide band of cloth worn front and back over the shoulders as part of a monastic habit. / Скапулярий – наплечник, элемент монашеского одеяния.

SCAR = SEQUENCE–CHARACTERIZED AMPLIFIED REGION

SCARCITY = НЕХВАТКА (или НЕДОСТАТОК, или ДЕФИЦИТ) – Scarcity is a condition where there is less of something available than at least some people would like to have if they could have them at no cost to themselves. Note that this technical economic definition of 'Scarcity' differs greatly from the notion of scarcity as 'unusual rarity' that predominates in most ordinary language. For example, automobiles are not currently 'scarce' in Los Angeles in the sense of being rare or unusual to see, but they are definitely 'scarce' in the economic sense because many Angelenos would certainly take more of them if they were being given away for free. Because the total quantity of goods and services that people would like to have always far exceeds the amount which available economic resources are capable of producing in all known human societies, people as individuals and/or as members of larger social units must constantly be making choices about which desires to satisfy first and which to leave less than fully satisfied for the time being. That is, they must constantly decide how best to allocate (apportion or distribute) the scarce resources available to them among the various alternative uses to which they can be put. Thus scarcity is the fundamental condition that gives rise to the patterns of choosing behavior whose study constitutes the main focus of the academic discipline of economics. Insufficiency of a resource to meet a need. In economics, scarcity exists only insofar as it relates to an objective and expressed need or demand. See also Shortage.

SCARF = ШАРФ (или КАШНЕ) – Scarf is a military or official sash usually indicative of rank; (Archaic) tippet; a broad band of cloth worn about the shoulders, around the neck, or over the head; a military or official sash usually indicative of rank.

SCARF JOINT = СОЕДИНЕНИЕ ВНАПУСК (или СОЕДИНЕНИЕ ВНАКЛАДКУ, или СОЕДИНЕНИЕ ВПРИТЫК, или СОЕДИНЕНИЕ В КОСОЙ НАКЛАДНОЙ ЗАМОК, или СОЕДИНЕНИЕ ПО КРОМКЕ) – A Scarf Joint is a method of joining two members end to end in woodworking or metalworking. The scarf joint is used when the material being joined is not available in the length required. It is an alternative to other joints such as the butt joint and the splice joint and is often favored over these in joinery because it yields a barely visible glue line. The joint is formed by cutting opposing tapered ends on each member which are then fitted together. When working with wood, this gives better long grain to long grain gluing surface, which yields a stronger joint than would be achieved with a simple butt joint. The tapers are generally cut at an angle between 1:8 to 1:10. The ends of a plain scarf are feathered to a fine point which aids in the obscuring of the joint in the finished work, while in other forms of scarf the ends are frequently cut to a blunt 'nib' which engages a matching shoulder in the mating piece. Where scarfed joints are used in the restoration of vintage aircraft most developed countries will only issue an airworthyness certificate if all such joints have used an angle no less than 1:8. Also known as Scarph Joint. An end joint formed by joining with adhesive the ends of two pieces that have been tapered or beveled to form sloping plane surfaces. / обработка металла (metalworking).

SCARIFICATION = СКАРИФИКАЦИЯ (или НАСЕЧКА, или НАДРЕЗ, или ШРАМИРОВАНИЕ) – Scarification is a mechanical abrasive seed treatment which helps to break down a hard or impervious seed coat as an aid to germination. Scarification is a treatment to rupture the seed coat sufficiently to permit entry of water to initiate germination. / Скарификация семян. Под Скарификацией, от Латинского слова Scarifico, означающее Надрезываю или Царапаю, понимается:- (i) поверхностное повреждение твёрдых оболочек семян Донника, Клевера, Люпина и других (перетиранием с песком, металлическими опилками, в машинах-скарификаторах) для ускорения их прорастания; или (ii) в медицине органическое повреждение поверхностных слоёв кожи с диагностическими, лечебными и профилактическими целями, например, при оспопрививании. Скарификация Семян:- поверхностное повреждение твёрдых оболочек семян Клевера, Донника, Люпина и других растений (смотрите Твёрдые Семена), один из приёмов подготовки семян к посеву. После скарификации высеянные семена лучше впитывают воду, быстрее набухают и прорастают. Для скарификации семян применяют машины – скарификаторы. Скарифицировать семена можно также перетиранием с песком, железными опилками и другими материалами.

SCARIFY = СКАРИФИЦИРОВАТЬ (или ВЗРЕЗАТЬ ПОЧВЕННЫЙ ПОКРОВ) – Scarify:- to loosen the topsoil aggregates by means of raking the soil surface with a set of sharp teeth harrows or other instrument.

SCARIOUS = ПЛЁНЧАТОЕ – Scarious:- applied to leaves or leaflike parts that are not green, but thin, dry, membranous, and often more or less translucent. Scarious:- having a dry membranous appearance.

SCARLET = АЛОЕ (или ПУНЦОВОЕ, или ЯРКО–КРАСНОЕ, или ПУРПУРНОЕ, или БАГРЯНОЕ, или БАГРОВОЕ) – Scarlet:- any of various bright reds. Scarlet cloth.

SCATTERING = РАССЕЯНИЕ – Scattering is the diffusion or redirection of radiant energy encountering particles of different refractive index; scattering occurs at any such interface, at the surface, or inside a medium containing particles.

SCATTERING TINTING STRENGTH = ИНТЕНСИВНОСТЬ РАССЕИВАЮЩЕЙ ПОДЦВЕТКИ (или ПОДЦВЕЧИВАНИЯ, или ОКРАШИВАНИЯ) – Scattering Tinting Strength:- relative change in the scattering properties of a standard black material (with no scattering colorant present) when a specified amount of a white or chromatic scattering colorant is added to it.

SCC = SUEZ CANAL CHARGE

SCC = SYSTEM CONTROL CENTER

SCD = SECURE CRYPTOGRAPHIC DEVICE

SCENARIO = СЦЕНАРИЙ – Scenario is a model-generated set of market projections based on alternative assumptions than those used in the baseline. Used to provide quantitative information on the impact of changes in assumptions on the outlook.

SCENTED KERNEL = ПАХУЧАЯ ЗЕРНОВКА (или ПАХУЧЕЕ ЯДРО) – Scented Kernel:- grains containing aromatic substances in the endosperm which give a strong aroma when the polished Rice is cooked.

SCHAPPE = ЩЯПЭ (или ШАПП) – Schappe is a yarn or fabric of spun silk; also:- an imitation of it (as in rayon or nylon). Origin of Schappe:- German dial. (Swiss) Schappe – raw silk waste or waste silk. Schappe is the yarn from partly degummed silk waste. / Найлан^{T3} (Nylon^{TM}). Шапп – неполностью обесклеенные шёлковые отходы.

SCHÄTZE = ЩАТЦЭ (или ФЕДЕРАТИВНЫЕ КАЗНАЧЕЙСКИЕ БИЛЕТЫ, или ФЕДЕРАТИВНЫЕ КАЗНАЧЕЙСКИЕ НОТЫ) – In Germany, Schätze are the federal Treasury notes with a maturity of 1 and 2 years. See also Bobls, and Bunds. / Щатцэ (Schätze) это общепринятое сокращение от Немецкого слова Бундэсщатцэ (Bundesschätze или Bundesschaetze), означающее Федеративные Казначейские Ценные Бумаги. В Германии, билеты федерального Казначейства со сроком погашения в 1 и 2 года. Смотрите также Боблс или Федеративные Билеты (Bobls), и Бундс или Федеративные Облигации (Bunds).

SCHEDULE = ПЕРЕЧЕНЬ – In reference to insurance, Schedule is a policy section setting out the main details of the insured, their business activities, the period of cover the application of any special terms or restrictions, together with other details specific to the particular insurance and premium.

SCHEDULE = СОСТАВЛЕНИЕ ГРАФИКА ПОСТАВКИ – Schedule:- in reference to electricity, the act of buyer and seller arranging to deliver electricity. / По отношению к электричеству, действия покупателя и продавца по согласованию поставок электричества.

SCHEDULED OPERATIONS = XX ОПЕРАЦИИ (или ЗАПЛАНИРОВАННЫЕ ОПЕРАЦИИ) – Scheduled Operations are the Aircraft flights operated on a pre-determined schedule.

SCHEDULED OUTAGE = УТВЕРЖДЁННЫЙ ГРАФИКОМ ПРОСТОЙ (или ЗАПЛАНИРОВАННЫЙ ПРОСТОЙ) – Scheduled Outage is the shutdown of a generating unit, transmission line, or other facility, for inspection or maintenance, in accordance with an advance schedule. / Под производственным Простоем понимается временная приостановка работы по вине работника или по не зависящим от него причинам, например, из-за отсутствия сырья.

SCHEDULE OF CREDITORS = СПИСОК КРЕДИТОРОВ (или ПЕРЕЧЕНЬ КРЕДИТОРОВ) – Schedule of creditor ranking, prepared by the bankruptcy trustee or the debt collection office.

SCHEDULING = РАЗРАБОТКА ГРАФИКА (или СОСТАВЛЕНИЕ РАСПИСАНИЯ) – Scheduling:- logistics involves daily shipments of stock into and out of the Logistics Depot Distribution Centers. There are a limited number of docks/doors where outbound vehicles can be loaded and inbound vehicles unloaded. There also may be limited people and equipment to handle these tasks. Consequently, resources (people and equipment) and vehicle traffic must be managed to avoid bottlenecks and inactivity. This can be achieved through the use of the Appointment Log in the Phoenix System (RE.01).

SCHENGEN AGREEMENT = ШЕНГЕНСКОЕ СОГЛАШЕНИЕ – Schengen Agreement:- during the 1980s, a debate began over the meaning of free movement of persons. Some Member States felt the concept should apply to European Union (EU) citizens only, which would involve keeping internal border checks in order to distinguish between citizens of the EU and non-EU nationals. Others argued in favor of free movement for everyone, which would mean an end to internal border checks altogether. Since Member States could not reach agreement, France, Germany, Belgium, Luxembourg and the Netherlands decided in 1985 to create a territory without internal borders. This became known as the ‘Schengen Area’, after the town in Luxembourg where the first agreements were signed. Following the signing of the Treaty of Amsterdam, this intergovernmental cooperation was incorporated into the EU framework on 1999-May-01. The first agreement between the five original group members was signed on 1985-June-14. A further convention was drafted and signed on 1990-June-19. When it took effect in 1995, it abolished checks at the internal borders of the signatory states and created a single external border where immigration checks for the Schengen area are carried out in accordance with identical procedures. Common rules regarding visas, right of asylum and checks at external borders were adopted to allow the free movement of persons within the signatory states without disrupting law and order. Accordingly, in order to reconcile freedom and security, this freedom of movement was accompanied by so-called ‘Compensatory’ Measures. This involved improving cooperation and coordination between the police and the judicial authorities in order to safeguard internal security and, in particular, to fight organised crime. With this in mind, the Schengen Information System (SIS) was set up. SIS is a sophisticated database used by authorities of the Schengen member countries to exchange data on certain categories of people and goods. The Schengen area gradually expanded to include nearly every Member State. Italy signed the agreements on 1990-November-27, Spain and Portugal joined on 1991-June-25, Greece followed on 1992-November-06, then Austria on 1995-April-28 and Denmark, Finland and Sweden on 1996-December-19. The Czech Republic, Estonia, Latvia, Lithuania, Hungary, Malta, Poland, Slovenia and Slovakia joined on 2007-December-21 and the associated country Switzerland on 2008-December-12. Bulgaria, Cyprus and Romania are not yet fully-fledged members of the Schengen area; border controls between them and the Schengen area are maintained until the EU Council decides that the conditions for abolishing internal border controls have been met. Key rules adopted within the Schengen framework include:- (i) removal of checks on persons at the internal borders; (ii) a common set of rules applying to people crossing the external borders of the EU Member States; (iii) harmonisation of the conditions of entry and of the rules on visas for short stays; (iv) enhanced police cooperation (including rights of cross-border surveillance and hot pursuit); (v) stronger judicial cooperation through a faster extradition system and transfer of enforcement of criminal judgments; and (vi) establishment and development of the Schengen Information System (SIS). At the heart of the Schengen mechanism, an information system was set up. It allows national border control and judicial authorities to obtain information on persons or objects. Member States supply information to the system through national networks (N-SIS) connected to a central system (C-SIS). This IT system is supplemented by a network known as SIRENE (Supplementary Information Request at the National Entry), which is the human interface of the SIS. A protocol attached to the Treaty of Amsterdam incorporates the developments brought about by the Schengen Agreement into the EU framework. The Schengen area is now within the legal and institutional framework of the EU. Thus, it comes under parliamentary and judicial scrutiny, and attains the objective of free movement of persons enshrined in the Single European Act of 1986, while ensuring democratic parliamentary control and giving citizens accessible legal remedies when their rights are challenged (Court of Justice and/or national courts, depending on the area of law). In order to make this integration possible, the Council of the EU took a number of decisions. First, as set out in the Treaty of Amsterdam,

the Council took the place of the Executive Committee created under the Schengen Agreements. With its Decision 1999/307/EC of 1 May 1999, the Council established a procedure for incorporating the Schengen Secretariat into the General Secretariat of the Council, including arrangements relating to Schengen Secretariat staff. Subsequently, new working groups were set up to help the Council manage the work. One of the Council's most important tasks in incorporating the Schengen area was to choose those provisions and measures taken by the signatory states that formed a genuine acquis, or body of law, and that could serve as a basis for further cooperation. A list of the elements that make up the acquis, setting out the corresponding legal basis for each of them in the Treaties (EC Treaty or the Treaty on the European Union), was adopted by Council Decisions 1999/435/EC and 1999/436/EC of 1999-May-20. Most of these acts are published in the Official Journal. Since then, the Schengen legislation has been further developed. For example, some articles of the Schengen Convention have been replaced by new EU legislation (e.g., the Schengen Borders Code). Although Denmark has signed the Schengen Agreement, it can choose whether or not to apply any new measures taken under Title IV of the EC Treaty within the EU framework, even those that constitute a development of the Schengen acquis. However, Denmark is bound by certain measures under the common visa policy. In accordance with the protocol to the Treaty of Amsterdam, Ireland and the United Kingdom can take part in some or all of the Schengen arrangements, if the Schengen Member States and the government representative of the country in question vote unanimously in favor within the Council. In March 1999, the United Kingdom asked to cooperate in some aspects of Schengen, namely police and judicial cooperation in criminal matters, the fight against drugs and the SIS. The Council Decision 2000/365/EC approving the request by the United Kingdom was adopted on 2000-May-29. In June 2000, Ireland too asked to take part in some aspects of Schengen, roughly corresponding to the aspects covered by the United Kingdom's request. The Council adopted the Decision 2002/192/EC approving Ireland's request on 2002-February-28. The Commission had issued opinions on the two applications, stressing that the partial participation of these two Member States should not reduce the consistency of the acquis as a whole. After evaluating the conditions that must precede implementation of the provisions governing police and judicial cooperation, the Council consented with its Decision 2004/926/EC of 2004-December-22 that this part of the Schengen acquis could be implemented by the United Kingdom. The gradual expansion of the Schengen area to include all EU Member States has led third countries that have particular relations with the EU to take part in Schengen cooperation. The precondition for association with the Schengen acquis by non-EU countries is an agreement on free movement of persons between those states and the EU (this is provided for by the Agreement on the European Economic Area in the cases of Iceland, Norway and Liechtenstein and by the Agreement on the free movement of persons in the case of Switzerland). For these countries this participation involves:- being included in the area without checks at internal borders; applying the provisions of the Schengen acquis and of all Schengen-relevant texts adopted pursuant to it; being involved in decisions relating to Schengen-relevant texts. In practice, this involvement takes the form of mixed committees that meet alongside the working parties of the EU Council. They comprise representatives of the Member States' governments, the Commission and the governments of third countries. Associated countries therefore participate in discussions on the development of the Schengen acquis, but do not take part in voting. Procedures for notifying and accepting future measures or acts have been laid down. Together with Sweden, Finland and Denmark, Iceland and Norway belong to the Nordic Passport Union, which has abolished internal border checks. Iceland and Norway have been associated with the development of the Schengen Agreements since 19 December 1996. Although they did not have voting rights in the Schengen Executive Committee, they were able to express opinions and formulate proposals. To extend this association, the agreement on Iceland's and Norway's association with the implementation, application and development of the Schengen acquis, as based on the Council Decision 1999/439/EC of 1999-May-17 1999, was signed between Iceland, Norway and the EU on 1999-May-18. An agreement approved by the Council on 1999-June-28 covers relations between Iceland and Norway on the one hand, and Ireland and the United Kingdom on the other, in the areas of the Schengen acquis applying to Iceland and Norway (Official Journal L 15 of 2000-January-20). The Council Decision 2000/777/EC of 1 December 2000 provides for the application of the Schengen acquis arrangements to the five countries of the Nordic Passport Union as from 2001-March-25. The EU concluded an agreement with Switzerland on its participation in the Schengen area (Official Journal L 53 of 2008-February-27); consequently, Switzerland joined on 12 December 2008. It has the same associate status as Norway and Iceland. A protocol on the participation of Liechtenstein in the Schengen area was signed on 28 February 2008. As the SIS has been operational since 1995, work is in progress on a new system with enhanced functionalities and based on new technology. This new system (SIS II) is currently undergoing extensive tests in cooperation with Member States. The Council adopted two legislative instruments on 06 December 2001:- Regulation (EC) No 2424/2001 and Decision 2001/886/JHA, making the Commission responsible for developing SIS II and providing for the related expenditure to be covered by the general budget of the EU. These instruments were modified in 2006, extending the period of their validity until 31 December 2008. The Commission published a communication (COM(2001) 720) on 2001-December-18 examining ways of creating and developing SIS II. Following studies and discussions relating to the architecture and functionalities of the future system, the Commission presented three proposals for legislative instruments in 2005. Two of the instruments in this package (Regulation (EC) No 1987/2006 on 1st pillar aspects of the establishment, operation and use of SIS II and Regulation (EC) No 1986/2006 on access to SIS II by the services responsible for issuing vehicle registration certificates) were adopted on 20 December 2006. The third instrument (Decision 2007/533/JHA determining 3rd pillar aspects of the establishment, operation and use of SIS II) was adopted on 2007-June-12. The Justice and Home Affairs Council of December 2006 endorsed the SISone4all project (a joint effort by Member States coordinated by Portugal). SISone4all was a temporary solution, which enabled nine EU Member States that joined the EU in 2004 to connect to the current SIS system (SIS1+), with some technical adjustments. The successful completion of SISone4all, in conjunction with the positive Schengen evaluations, allowed the lifting of internal border controls with these new countries at the end of 2007 for land and sea borders and in March 2008 for air borders. The lifting of internal border controls paved the way for implementing alternative and less risky approaches for migrating from SIS1+ to SIS II. Following requests by the Member States to allow more time for testing the system and to adopt a less risky strategy for migration from the old system to the new one, the Commission presented proposals for a regulation and a decision defining the tasks and responsibilities of the various parties involved in preparing for the migration to SIS II (including testing and any further development work needed during this phase). These proposals were adopted by the Council on 2008-October-24. On 1995-March-26, the Schengen Agreement takes effect in seven countries – Belgium, Germany, Spain, France, Luxembourg, the Netherlands and Portugal. Travellers of any nationality can travel between all these countries without any passport control at the frontiers. Other countries have since joined the passport-free Schengen area. The Schengen area and cooperation are founded on the Schengen Agreement of 1985. The Schengen area represents a territory where the free movement of persons is guaranteed. The signatory states to the agreement have abolished all internal borders in lieu of a single external border. Here common rules and procedures are applied with regard to visas for short stays, asylum requests and border controls. Simultaneously, to guarantee security within the Schengen area, cooperation and coordination between police services and judicial authorities have been stepped up. Schengen cooperation has been incorporated into the European Union (EU) legal framework by the Treaty of Amsterdam of 1997. However, all countries cooperating in Schengen are not parties to the Schengen area. This is either because they do not wish to eliminate border controls or because they do not yet fulfil the required conditions for the application of the Schengen acquis. Schengen Agreement is an agreement initially ratified by Belgium, France, Germany, Luxembourg, and the Netherlands on June 19, 1990. The agreement exempts the citizens of signatory nations from

customs inspections. Other countries have since ratified the agreement. / коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо).

SCHIFFLI EMBROIDERY = ЧЕЛНОЧНОЕ ВЫШИВАЛЬНОЕ – Schiffli Embroidery:- originated in Switzerland, the word, Schiffli, means 'Boat', identifiable with the boat-shaped shuttle used in the frame. The lace effect is made by embroidering the motifs on a net ground. / (Schiffli).

SCHOOL = КОСЯК – School (maritime term):- a large body of fish. / Косяк – стая рыб.

SCHREINER CALENDER = КАЛАНДР ШРАЙНА (или СЕРЕБРИСТЫЙ КАЛАНДР) – Schreiner Calender is a type of calender in which the healed rolls through which a fabric passes to produce a characteristic surface finish are engraved with fine lines of predetermined number per inch, angle, and depth.

SCHUFA = SCHUTZGEMEINSCHAFT FÜR ALLGEMEINE KREDITSICHERUNG

SCHUTZGEMEINSCHAFT FÜR ALLGEMEINE KREDITSICHERUNG = ШУТЦГЭМАЙНШАФТ ФЮА АЛЬГЭМАЙНЭ КРЭДИТСИХЕРУНГ (или СООБЩЕСТВО ПО ЗАЩИТЕ В ОТНОШЕНИИ ВСЕОБЪЕМЛЮЩЕГО ОБЕСПЕЧЕНИЯ КРЕДИТОВ) – The Schutzgemeinschaft für allgemeine Kreditsicherung (SCHUFA) Holding AG, a German credit rating agency, is a joint institution of Germany's banking industry. It provides information to its contract partners to protect them against losses in consumer credit transactions and mortgage loans. However, it also serves to protect consumers against excessive debt. Details concerning the granting of current accounts, credit and non-contractual behaviour resulting from such contracts are stored at the SCHUFA and made available to the contract partners. By signing the so-called SCHUFA clause, the customer consents to the transfer of data. Headquartered in Hannover, Germany. Founded in 1927 in Berlin, SCHUFA is the oldest credit information agency in Germany and one of the first in the world. Within the past 80 years, SCHUFA has consistently developed and enhanced its know-how, products and services. Today it is not only the market leader in the field of credit data and score card development in Germany, but is also an innovative and reliable information service provider for the financial and credit market. In addition to its national business activities, SCHUFA is also active on a global level. Through our membership in ACCIS (short for the Association of Consumer Credit Information Suppliers), the association of European credit rating agencies, we regularly share our experience with international credit rating agencies. The goal is to promote our common interests and to generate information on the differences between countries. Through this comprehensive network, we are always informed of the most recent developments in the international finance and credit market. / или, как это звучит на Немецком языке по месту регистрации, Шутцгэмайншафт фюа альгэмайнэ Крэдитсихерунг (ШУФА; Schutzgemeinschaft für allgemeine Kreditsicherung (SCHUFA)) Холдинь А.Ге. (AG).

SCION = ОТПРЫСК (или ПОБЕГ) – Scion is the top part of a graft. / верхняя часть привоя. Под Отпрыском понимается побег, отходящий от пня или корня. Под Побегом понимается стебель с расположенными на нём листьями и почками; один из основных органов высших растений. У однолетних растений побеги живут один сезон; у многолетних – несколько лет. Многолетние подземные побеги нередко видоизменены в клубни, корневища, луковицы, а надземные – в колючки, усики.

SCISSORS OR KNIFE CUT = РАССЕЧКА НОЖНИЦАМИ ИЛИ НОЖОМ – Scissors or Knife Cut:- self-explanatory. Sewing Room Defects. / Порок или дефект швейного производства.

SCLEROPHYLL = СКЛЕРОФИЛЛ – Sclerophyll (Greek = Hard-Leaved) is a woody plant with small, leathery, evergreen leaves that retain water and typically found in hot, dry climates such as Australia. / Под Склерофиллом, от Греческих слов Sklērós, означающее Жёсткий или Твёрдый, и Phýllon, означающее Лист, понимается .

SCLEROTIA = СКЛЕРОЦИЯ (или СКЛЕРОЦИАЛЬНАЯ ГНИЛЬ, или СКЛЕРОТИНИОЗ) – Sclerotia (sclerotium, sing.) is dark colored or black resting bodies of the Fungi Sclerotinia and Claviceps. Thick-skinned, survival structures (usually black), produced within or on infected tissue by some Fungi. Sclerotia vary in size from a few cells (microscopic microsclerotia) up to 5 to 10 cm across and enable the Fungus to survive for long periods in the soil or in crop residues or during adverse weather conditions. Sclerotia are hard, compact masses of fungal mycelium that serve as resting or survival structures. One type of sclerotia is the mass of fungal tissue produced by the soil-borne Fungus Sclerotinia Sclerotiorum, which attacks crops such as Sunflower and Canola. Infections result in yield loss. While it does not attack cereal crops, sclerotia may be found as contaminants in samples of cereal grains from infected fields. / в пробах злаковых зерновых культур. Склероций, затвердевшая масса, в которую превращается вегетативное тело миксомицетов (слизевиков) при неблагоприятных условиях. Склеротиниоз – сухая склероциальная гниль. Склеротиниозы, болезни растений, вызываемые патогенными Грибами, в цикле развития которых имеются склероции. Наиболее вредоносны белая гниль Подсолнечника, Моркови, Капусты (особенно в период хранения), рак Клевера, склеротиниоз озимых Злаков, вызываемый патогенным Грибом Sclerotinia Graminearum. Возбудитель склеротиниоза озимых Злаков поражает озимую Пшеницу, Рожь, многолетние Травы – Тимофеевку, Лисохвост, Мятлик, Овсяницу, Райграс, Ежу, Костер и многие Сорняки Семейства Злаковых; живёт в почве. Весной у больных растений листья желтеют, покрываются серым хлопьевидным налётом. Под эпидермисом таких листьев развиваются чёрные склероции. Сильно заражённые растения гибнут или дают небольшой урожай. Осенью склероции прорастают в апотеции, а развивающиеся в них аскоспоры заражают растения. Южный склеротиниоз (возбудитель Sclerotinia Roefsii, поражает Арахис, Табак, Картофель и другие культуры) и углистая склероциальная гниль (возбудитель Sclerotinia Bataticola, поражает Люцерну, Хлопчатник, Кукурузу и другие) вызываются Грибами, в цикле развития которых имеются только склероции и грибница (нет никаких спороношений). Меры борьбы с склеротиниозами направлены на создание условий, обеспечивающих хороший рост растений:- глубокая зяблевая вспашка, известкование кислых почв, оптимальные сроки сева озимых, отвод с полей талой застоявшейся воды, удаление отмерших растений, склероциев и уничтожение их сжиганием и тому подобное.

SCLEROTINIA = СКЛЕРОТИНИЯ – Sclerotinia is a Genus name which includes the Fungus Sclerotinia Sclerotiorum which produces sclerotia. Canola is only infrequently infected, and the sclerotia, unlike sclerotia of ergot, are usually associated within the stem of the plants. / в отличие от склероции Спорыньи, . Род Сумчатых Грибов из Группы Дискомицетов, вызывающие склеротиниозы. Свыше 50 Видов, преимущественно Паразиты Высших Растений. Склеротиния (Sclerotinia), Род Сумчатых Грибов Порядка Гелоциевых (Helotiales) из Группы Дискомицетов. Виды Склеротиний проходят склероциальную и сумчатую стадии развития. В первой стадии образуются покоящиеся структуры – склероции, во второй – мицелий или плодовые тела – апотеции (в виде блюдца или бокала), на которых развиваются сумки с аскоспорами. Большинство Видов Склеротиний размножается конидиями, и в зависимости от типа спороношения их относят к двум Родам Несовершенных Грибов – Монилии (Monilia) или Ботритис (Botrytis). Наиболее вредоносны Sclerotinia Sclerotiorum (Sclerotinia Libertiana), Sclerotinia Fuckeliana, Sclerotinia Cinerea, Sclerotinia Fructigena, поражающие многие культурные и дикорастущие растения, в том числе Подсолнечник, Капусту, Морковь, Картофель, Фасоль, Горох, плоды фруктовых деревьев и другие.

SCLEROTIUM = СКЛЕРОЦИЙ – Sclerotium is a compact mass of fungal hyphae with or without host tissue, usually with a darkened rind, and capable of surviving under unfavorable environmental conditions. / Склероций, затвердевшая масса, в которую превращается вегетативное тело миксомицетов (слизевиков) при неблагоприятных условиях. Под Склероцием, от Греческого слова Skleros, означающее Твёрдый, понимается покоящаяся стадия Гриба, образующаяся в неблагоприятных условиях; округлое или продолговатое тело, образуемое тесным сплетением гиф у некоторых сумчатых, базидиальных и несовершенных Грибов – Спорыньи, Склеротинии, Бразильского Трутовика, Монилии и других. Размеры Склероция – обычно от долей миллиметра (мм) до 2 сантиметров (см), иногда более (так, у Трутовика диаметр склероция достигает 30 см и масса 20 килограммов (кг)). Наружная часть склероция состоит из толстостенных и тёмноокрашенных клеток, внутренняя – из тонкостенных бесцветных клеток. Склероций беден водой (5–10%) и богат питательными веществами. В благоприятных условиях склероций прорастает, образуя плодовые тела (у Сумчатых или Базидиальных Грибов) или грибницы с конидиями (у несовершенных Грибов). Жизнеспособность склероция может сохраняться несколько лет. Склероции Спорыньи содержат алкалоиды (эрготоксин, эргомстрин, эрготамин и другие), используемые в медицине как родовспомогательные и кровоостанавливающие (при маточных кровотечениях) средства.

SCM = STANDARD CUBIC METER

SCO = SENIOR COMMERCIAL OFFICER

SCO = SUPPLEMENTAL COVERAGE OPTION

SCOOP NECK = УГЛУБЛЁННЫЙ ВЫРЕЗ (или ЛОПАТНАЯ ГОРЛОВИНА) – Scoop Neck is a neckline in the shape of the letter U.

SCOPE = SCIENTIFIC COMMITTEE ON PROBLEMS OF THE ENVIRONMENT

SCOPE = ОХВАТ – Scope:- what is included – as in the scope of a claim.

SCORCH = ОЖОГ (или ЗАПАЛ, или ВЫГОРАНИЕ) – Scorch is dry brown discoloration giving a 'burnt' appearance to leaf margins as a result of infection or exposure to unfavorable environmental conditions. / Ожог или Запал листьев. Под Ожогом понимается повреждение тканей организма, вызванное действием высокой температуры или некоторых химических веществ (кислот, солей тяжёлых металлов, щёлочей и других). Различают 4 степени ожога:- покраснение кожи, образование пузырей, омертвление всей толщи кожи, обугливание тканей. Особая форма – лучевые ожоги (рентгеновские, солнечные и другие). Выгорание Растений, преждевременное засыхание растений вследствие длительной почвенной и атмосферной засухи. Наиболее широко распространено в острозасушливых районах на солонцовых и каштановых почвах, иногда наблюдается в засушливой чернозёмной степи и более Северных районах. Обычно посевы выгорают пятнами, очень редко большими массивами. У Хлебных Злаков выгорание растений наблюдается обычно в первой половине лета, до начала формирования зерна. Засыхание растений, как правило, начинается с нижних листьев, так как верхние листья обладают большей засухоустойчивостью. Основные приёмы борьбы с выгоранием растений – накопление влаги в почве (снегозадержание, задержание талых вод, чёрные и ранние пары, ранняя зябь, применение фосфорно-калийных удобрений и другие агротехнические приёмы), а также посев засухоустойчивых сортов.

SCORCH = ОПАЛКА (или ПРИГОРАНИЕ, или ПОДГОРАНИЕ, или ПРЕЖДЕВРЕМЕННАЯ ВУЛКАНИЗАЦИЯ) – (1) Scorch:- machine temperature too high for fabric, or operator failure to remove piece at proper time. Machinery defects, and namely – Part Forming Machines. (2) Scorch:- equipment temperature too high for fabric; garment subjected to pressing beyond specified limits, or not conditioned properly prior to pressing. Machinery defects, and namely – Pressing Equipment. / Порок или дефект от машинного оборудования. Под Опалённым Местом понимается местный порок в виде участков, повреждённых опалкой.

SCORCHING = ОПАЛКА (или ПРИГОРАНИЕ, или ПОДГОРАНИЕ, или ПРЕЖДЕВРЕМЕННАЯ ВУЛКАНИЗАЦИЯ) – Scorching is the tendering of a fiber surface by heat so as to change the color and texture of the surface.

SCORE = SPECIAL CLAIM ON RESIDUAL EQUITY

SCORE = SUPPLEMENTAL COMPLEX REPOSITORY FOR EXAMINERS

SCOREX = SECURITIES COMMUNICATIONS ORDER REPORT AND EXECUTION SYSTEM

SCORIA = МЕТАЛЛИЧЕСКИЙ ШЛАК – Scoria is crushed volcanic rock.

SCORING = ЗАДИР – Scoring:- distress marks on sliding metallic surfaces in the form of long, distinct scratches in the direction of motion. Scoring is an advanced stage of scuffing. / Задир:- xxxxx. Задир является стадией, прешествующей Истиранию (или Срабатыванию (Scuffing)). Задир – повреждение поверхности трения в виде широких и глубоких борозд в направлении скольжения.

ИСТИРАНИЕ (или СРАБАТЫВАНИЕ

S CORPORATION = ЭС. КОРПОРАЦИЯ (или КОРПОРАЦИЯ ТИПА ЭС.) – In the United States, S Corporation is a corporation granted a special tax status as specified under the Internal Revenue Code. The code is very explicit on how and when this election is made and the number of shareholders this type of corporation can have. Since this type of corporation pays no income tax, all gains and losses of the S Corporation pass through to the individual shareholders in proportion to their holdings. An 'S-Corporation' is a regular corporation that has between 1 and 100 shareholders and that passes-through net income or losses to shareholders under in accordance with Internal Revenue Code, Chapter 1, Subchapter S. Corporations must meet specific eligibility criteria, and they must notify the US Internal Revenue Service (IRS; government agency responsible for tax collection and tax law enforcement) of their choice to be taxed as an S-Corporation within a certain period of time. Taxation of Regular Corporations:- a regular corporation, sometimes called a 'C' Corporation (after Subchapter C of the Internal Revenue Code), is taxed as a separate business entity. Corporations have their own tax form (1120) and their own tax rates (C Corp tax rates). Corporations may choose to retain their profits and earnings as part of their operating capital, or they may choose to distribute some or all of their profits and earnings as dividends paid to shareholders. Dividends paid to shareholders are essentially taxed twice. They are taxed once at the corporate level (on the corporation's Form 1120), and again at the individual level (on the person's Form 1040). Taxation of S-Corporations:- an S-Corporation is not subject to corporate tax rates. 'Generally, an S corporation is exempt from federal income tax other than tax on certain capital gains and passive income', according to the Internal Revenue Service. Instead, an S-Corporation passes-through profit (or net losses) to shareholders. The business profits are taxed at individual tax rates on each shareholder's Form 1040. The pass-through (sometimes called Flow-Through) nature of the income means that the corporation's profits are only taxed once – at the shareholder level. The IRS explains it this way:- 'On their tax returns, the S corporation's shareholders include their share of the corporation's separately stated items of income, deduction, loss, and credit, and their share of nonseparately stated income or loss'. S-Corporations therefore avoid the so-called 'Double Taxation' of dividends. S-Corporations, like regular C Corporations, can decide to retain their net profits as

operating capital. However, all profits are considered as-if they were distributed to shareholders. Thus an S-Corporation shareholder might be taxed on income they never received. (Whereas a shareholder of C-corporation is taxed on dividends only when those dividends are actually paid out.) Eligibility Criteria for S-Corporations:- a corporation may choose to be taxed as an S-Corporation if it meets the following criteria:- (i) The company is (a) a domestic corporation, or (b) a domestic entity eligible to elect to be treated as a corporation that timely files Form 2553 and meets all the other tests listed below. If Form 2553 is not timely filed, see Rev. Proc. 2004-48, 2004-32 IRB 172. (ii) The company has no more than 100 shareholders. (A husband and wife and their estates are treated as one shareholder for this test. A member of a family can choose to treat all members of the family as one shareholder for this test. All other persons are treated as separate shareholders.) (iii) The only shareholders are individuals, estates, certain exempt organizations, or certain trusts. (vi) The company has no nonresident alien shareholders. (That is, the only shareholders are US citizens and resident aliens.) (v) The company has only one class of stock. Generally, a corporation is treated as having only one class of stock if all outstanding shares of the corporation's stock confer identical rights to distribution and liquidation proceeds. (vi) It is not one of the following ineligible corporations:- (a) a bank or thrift institution that uses the reserve method of accounting for bad debts under section 585; (b) an insurance company subject to tax under subchapter L of the Code; (c) a corporation that has elected to be treated as a possessions corporation under section 936; and (d) a domestic international sales corporation (DISC) or former DISC. (vii) It has or will adopt or change to one of the following tax years:- (a) a tax year ending December 31; (b) a natural business year; (c) an ownership tax year; (d) a tax year elected under section 444; (e) a 52–53-week tax year ending with reference to a year listed above; and (f) any other tax year (including a 52-53-week tax year) for which the corporation establishes a business purpose. (viii) Each shareholder consents to the S-Corporation election. See also C Corporation.

SCOTCH TENSION = НАТЯЖЕНИЕ ТОРМОЖЕНИЯ (или ЗАКЛИНИВАНИЯ) – Scotch Tension:- a single band drives the flyer. The bobbin has an adjustable friction band to slow it. When tension on the yarn is released, the bobbin rotations is stopped by the break band and the flyer winds the yarn onto the bobbin. Because this only involves one simple adjustment, many 'beginner' wheels use Scotch Tension. A well-known example of this would be the Ashford Traditional.

SCOTOPIC = СКОТОПИЧЕСКОЕ (или СУМЕРЕЧНОЕ) – Scotopic:- pertaining to vision at sufficiently low levels of illumination that only the retinal rods are stimulated. / Скотопическое Зрение (от Греческих слов Skotos Opsis, означающее Зрение) – 'сумеречное зрение', зрение в условиях низкого освещения, при котором оптические ощущения обеспечиваются палочками сетчатки. Характеризуется тем, что:- (а) не различаются цветовые оттенки, это зрение в чёрно-белых тонах; (б) низким порогом яркости, в сравнении с фотопическим зрением, которое, в свою очередь, обеспечивается колбочками сетчатки; (в) максимальной чувствительностью к электромагнитным волнам длиною около 510 нм с быстро уменьшающейся чувствительностью к более длинным и более коротким волнам; и (г) маленькой резкостью зрения, поскольку палочки в центральной ямке (фовеа) отсутствуют. Синонимы:- Скотопсия и Скотоопсия.

SCOTTISH TWEED = ШОТЛАНДСКИЙ ТВИД (или ШОТЛАНДСКОЕ ГРУБОШЁРСТНОЕ СУКНО) – Scottish Tweed is a term often used for tweed originally made in Scotland and woven with very nubby yarns, often with white warp and colored filling. Similar to Irish tweed. See also Tweed. / с белой основой и цветной уточиной.

SCOUR = ПРОМЫВКА (или ЧИСТКА, или ОЧИСТИТЕЛЬ, или ОМЫВАТЕЛЬ) – Scour:- essentially, thoroughly washing fibers or fabric to remove contaminants. Yarns and fabrics may be dirty, contain natural waxes or oils, or have been treated with size or lubricants used in spinning, weaving or knitting. These can all interfere with dyeing, often leading to non-level results. Scouring is a large topic, and the process used depends on the fiber type and its condition. 'True' scouring of greige cellulosic fabrics is typically done, after desizing, at the boil or at higher temperature in pressure vessels, with as much as 10 grams sodium hydroxide per liter of water, plus surfactants, and the process may last for several hours. Commercial scouring of wool may use solvents, similar to dry cleaning, as part of the process. White fabrics sold at retail have normally be scoured at the mill; 'natural' fabrics usually have not (some 'natural' fabrics have been scoured but not bleached). Art dyeing literature often refers to what amounts to laundering as scouring. This is inadequate for greige fabrics, but often quite acceptable for 'white goods'. A long machine wash with the hottest water possible, about a gram of soda ash per liter of water (about a teaspoon per gallon) and some (preferably optical brightener free) detergent, followed by two rinses is usually acceptable. Sodium hexametaphosphate may be helpful if the water is hard. Woven white cottons often contain starch that will not be removed by such a limited process. / Оптический Блескообразователь или Оптический Отбеливатель (Optical Brightener). Гексаметафосфат Натрия (Sodium Hexametaphosphate).

SCOURING = ПРОМЫВКА (или ОТВАРКА, или ПРОТИРКА, или МОЙКА, или ВЫВАРИВАНИЕ (КЛЕЯ ИЗ ПРЯЖИ), или ОЧИЩЕНИЕ, или РАЗМЫВ, или ОБДИРКА, или ШАБРОВКА, или МЕЗДРЕНИЕ (КОЖИ), или СТЕКЛЕНИЕ) – Scouring is the process of washing or cleansing wool of grease, soil, and suint in a water/soap/alkali solution. When scouring is done commercially, a normal fleece goes through at least three washings. During the scouring process, a fleece may loose up to 50% of its original weight. Scouring is an operation to remove the sizing and tint used on the warp yarn in weaving and, in general, to clean the fabric prior to dyeing. Scouring:- when applied to gray goods, scouring removes substances that have adhered to the fibers during production of the yarn or fabric, such as dirt, oils, and any sizing or lint applied to warp yarns to facilitate weaving. Scouring is a finishing process for removing oil, sizing, dirt, grease, and swint from wool and other fabrics. / Щёлочь (Alkali). Отварка Тканей – варка хлопчатобумажных и льняных тканей в растворах щёлочей при атмосферном или повышенном давлении с целью удаления примесей и подготовки к белению, крашению и набивке. Наиболее эффективен так называемый ходовой способ варки, выполняемый при атмосферном давлении и температуре около 90 °C, с непрерывным движением ткани в растворе, который содержит едкий натр, бисульфит натрия и силикат натрия.

SCOURING DAMAGE = ПОВРЕЖДЕНИЕ ПРИ ПРОМЫВКЕ – Scouring Damage:- any type of damage due to scouring rolls or any other particles inside the machine. Finishing defect. / Порок или дефект заключительной отделки.

SCOUT = СКАУТ (или РАЗВЕДЧИК) – Scout is an individual trained to collect information about Cotton insect and plant populations; scouts are not responsible for interpreting data or providing recommendations.

SCOUTING = СКАУТИЗМ (или РАЗВЕДЫВАНИЕ) – Scouting is the procedures followed by a scout.

SCP = STANDING COMMITTEE ON THE LAW OF PATENTS

SCP = SYSTEM CONTROL PROCESSOR

SCR = SELECTIVE CATALYTIC REDUCTION

SCR = SEYCHELLOIS RUPEE

SCRAP GOLD = ЗОЛОТО В ЛОМЕ – Scrap Gold is the broad term for any gold which is sent back to a refiner or processor for recycling.

SCRAPING THE BOTTOM = СКОБЛЕНИЕ (или ВЫСКАБЛИВАНИЕ) ДНИЩА – Scraping The Bottom is a removing weed and incrustation from the underside of a ship. Not covered by a hull policy; not even when necessary to repair damage recoverable under the policy.

SCREEN = ГРОХОЧЕНИЕ (или ГРОХОТ, или РЕШЕТО) – Screen is a process of accepting or rejecting Rice Cultivars or breeding lines for future use. See also Evaluation. / Смотрите также Вычисление (Evaluation). Под Грохотом понимается устройство для механической сортировки (грохочения) сыпучих материалов по крупности частиц (кусков) просеиванием их через колосники или решётки, установленные неподвижно, а также сита (вибрирующие, вращающиеся или качающиеся). Применяются для разделения по классам крупности руд, угля, щебня и тому подобного, а также обезвоживания продуктов мокрого обогащения. Решето – рабочая часть сельскохозяйственных машин, предназначенная для разделения зерна, семян, клубней картофеля и другого по размерам на фракции. Решёта бывают штампованные, проволочные (плетёные или тканые) и роликовые. На решётах с круглыми отверстиями зерновой материал разделяют по ширине зёрен, а на решётах с продолговатыми отверстиями – по толщине. Решёта крепят в решётных станах. При колебаниях стана сортируемый материал движется по решётам, мелкие семена и примеси проходят через отверстия, а крупные идут сходом.

SCREEN = ЭКРАН (или ШИРМА, или ЩИТ, или СЕТКА, или СИТО, или ГРОХОТ, или РЕШЕТО) – Screen is:- (1) a hollow, cylindrical, coarse-mesh wire device used in pickers and certain openers to form the loose staple stock into a sheet, or lap. The screen is mounted horizontally on a shaft on which it revolves freely. (2) A stencil used in screen printing. It is made of fine cloth, usually of silk or nylon, finely perforated in areas to form a design and mounted on a frame. The paste containing the dye is forced through the perforations onto the fabric, leaving the design. A series of screens, one for each color, is used for multicolored designs. See also Printing. / Найлан^{T3} (Nylon^{TM}).

SCREENHOUSE = ХХ (или РЕШЕТЧАТЫЙ ДОМ) – Screenhouse is a structure consisting of wire mesh (screen) walls and roof in which plants are grown for varietal resistance studies. The materials used prevent the entrance of Birds, Rats, and Insects.

SCREENING = ГРОХОЧЕНИЕ (или ПРОСЕИВАНИЕ, или ОЧИСТКА (ОТ ПРИМЕСЕЙ) НА РЕШЁТАХ или СИТАХ, или ОТСЕИВАНИЕ, или БРАКОВКА, или ОТБОР, или СКРИНИНГ, или СХОД С РЕШЁТ, или ВЫСЕВКИ) – Screening is an evaluation of Varieties or breeding lines for resistance where the resistant ones are selected for further studies and possible use as donors in the breeding program and the susceptible are eliminated. / вычисление разновидностей или .

SCREENINGS = ВЫСЕВКИ – (1) In Canadian Wheat industry, Screenings is dockage material that has been removed by cleaning from a parcel of grain. Screenings qualify for Class IV grades. / В Канадской пшеничной индустрии, к Высевкам относятся легко отделяемые примеси, которые были выделены из кучки зерна посредством очистки.

(2) In Rice industry, Screenings is the portion of total milled Rice consisting of broken pieces about 1/4 to 1/2 the length of a whole kernel. / В рисовой индустрии, к Высевкам относится часть полностью обрушенного Риса, состоящая из битых частиц, составляющих приблизительно от 1/4 до 1/2 целиковой зерновки (целого ядра).

SCREENINGS AND ADMIXTURE = ВЫСЕВКИ И ПРИМЕСИ – Wheat:- Screenings are undersized grains and Admixture comprises impurities, e.g., chaff, weed seeds and earth, which must be removed before milling marketable flour. Screenings and Admixture represent a loss to the miller, so a maximum of 2% is normally allowed. Screenings and admixture are measured using standard slotted 3.5 mm and 2 mm sieves.

SCREENINGS MILLED RICE = ВЫСЕВКИ ОБРУШЕННОГО РИСА – In the Rice industry of the United States, 'Screenings Milled Rice' shall consist of milled Rice which, when determined in accordance with §868.303, contains:- (i) not more than (a) 25.0 percent of whole kernels, (b) 10.0 percent of broken kernels removed by a 5 plate, and (c) 0.2 percent of broken kernels passing through a 4 sieve (southern production); or (ii) not more than (a) 25.0 percent of whole kernels and (b) 15.0 percent of broken kernels passing through a 51/2 sieve; and more than (c) 50.0 percent of broken kernels passing through a 61/2 sieve and (d) 10.0 percent of broken kernels passing through a 6 sieve (western production). / (i) не более, чем (a) 25.0 процентов целиковой зерновки (целого ядра), (b) с решёт № 5 .

SCREEN OUT = ПОКРОВ ОТСУТСТВУЕТ (или СЕТКА ОТСУТСТВУЕТ) – Screen Out:- the appearance of a colored separation line in a printed design. Fabrics defect.

SCREEN PRINTING = ЭКРАННОЕ (или СЕТЧАТОЕ, или СВЕТОВОЕ) ПЕЧАТАНИЕ – Screen Printing is a printing technique that uses a woven mesh to support an ink-blocking stencil. The attached stencil forms open areas of mesh that transfer ink or other printable materials which can be pressed through the mesh as a sharp-edged image onto a substrate. A fill blade or squeegee is moved across the screen stencil, forcing or pumping ink into the mesh openings for transfer by capillary action during the squeegee stroke. Basically, it is the process of using a stencil to apply ink onto another material. Screen printing is also a stencil method of print making in which a design is imposed on a screen of polyester or other fine mesh, with blank areas coated with an impermeable substance. Ink is forced into the mesh openings by the fill blade or squeegee and onto the printing surface during the squeegee stroke. It is also known as Silkscreen, Serigraphy, and Serigraph Printing. A number of screens can be used to produce a multicolored image. There are various terms used for what is essentially the same technique. Traditionally the process was called Screen Printing or Silkscreen Printing because silk was used in the process prior to the invention of polyester mesh. Currently, synthetic threads are commonly used in the screen printing process. The most popular mesh in general use is made of polyester. There are special-use mesh materials of nylon and stainless steel available to the screen printer. Encyclopedia references, encyclopedias and trade publications also use an array of spellings for this process with the two most often encountered English spellings as, screenprinting spelled as a single undivided word, and the more popular two word title of screen printing without hyphenation. Screen printing is a form of stenciling that first appeared in a recognizable form in China during the Song Dynasty (960–1279 AD). It was then adapted by other Asian countries like Japan, and was furthered by creating newer methods. Screen printing was largely introduced to Western Europe from Asia sometime in the late XVIII century, but did not gain large acceptance or use in Europe until silk mesh was more available for trade from the east and a profitable outlet for the medium discovered. Early in the 1910s, several printers experimenting with photo-reactive chemicals used the well-known actinic light activated cross linking or hardening traits of potassium, sodium or ammonium Chromate and dichromate chemicals with glues and gelatin compounds. Roy Beck, Charles Peter and Edward Owens studied and experimented with chromic acid salt sensitized emulsions for photo-reactive stencils. This trio of developers would prove to revolutionize the commercial screen printing industry by introducing photo-imaged stencils to the industry, though the acceptance of this method would take many years. Commercial screen printing now uses sensitizers far safer and less toxic than bichromates. Currently there are large selections of pre-sensitized and 'user mixed' sensitized emulsion chemicals for creating photo-reactive stencils. A group of artists who later formed the National Serigraphic Society coined the word Serigraphy in the 1930s to differentiate the artistic application of screen printing from the industrial use of the process. 'Serigraphy' is a combination word from the Latin word 'Seri' (silk) and the Greek word 'Graphein' (to write or draw). The Printer's National Environmental Assistance Center says

‘Screenprinting is arguably the most versatile of all printing processes’. Since rudimentary screenprinting materials are so affordable and readily available, it has been used frequently in underground settings and subcultures, and the non-professional look of such DIY (literally meaning ‘Do It Yourself’) culture screenprints have become a significant cultural aesthetic seen on movie posters, record album covers, flyers, shirts, commercial fonts in advertising, in artwork and elsewhere. Credit is generally given to the artist Andy Warhol for popularising screen printing identified as serigraphy, in the United States. Warhol is particularly identified with his 1962 depiction of actress Marilyn Monroe screen printed in garish colors. American entrepreneur, artist and inventor Michael Vasilantone would start to use, develop, and sell a rotary multicolor garment screen printing machine in 1960. Vasilantone would later file for patent on his invention in 1967 granted number 3 427 964 on February 18, 1969. The original rotary machine was manufactured to print logos and team information on bowling garments but soon directed to the new fad of printing on T-shirts. The Vasilantone patent was licensed by multiple manufacturers, the resulting production and boom in printed T-shirts made the rotary garment screen printing machine the most popular device for screen printing in the industry. Screen printing on garments currently accounts for over half of the screen printing activity in the United States. In June 1986, Marc Tartaglia, Marc Tartaglia Jr. and Michael Tartaglia created a silk screening device which is defined in its US Patent Document as, ‘Multi-colored designs are applied on a plurality of textile fabric or sheet materials with a silk screen printer having seven platens arranged in two horizontal rows below a longitudinal heater which is movable across either row’. This invention received the patent number 4 671 174 on June 09, 1987, however the patent no longer exists. Graphic screenprinting is widely used today to create many mass or large batch produced graphics, such as posters or display stands. Full color prints can be created by printing in CMYK (cyan, magenta, yellow and black (‘key’)). Screen printing lends itself well to printing on canvas. Andy Warhol, Rob Ryan, Blexbolex, Arthur Okamura, Robert Rauschenberg, Roy Lichtenstein, Harry Gottlieb, and many other artists have used screen printing as an expression of creativity and artistic vision. Printing Technique:- a screen is made of a piece of mesh stretched over a frame. A stencil is formed by blocking off parts of the screen in the negative image of the design to be printed; that is, the open spaces are where the ink will appear on the substrate. Before printing occurs, the frame and screen must undergo the pre-press process, in which an emulsion is ‘scooped’ across the mesh and the ‘exposure unit’ burns away the unnecessary emulsion leaving behind a clean area in the mesh with the identical shape as the desired image. The surface (commonly referred to as a Pallet) that the substrate will be printed against is coated with a wide ‘pallet tape’. This serves to protect the ‘pallet’ from any unwanted ink leaking through the substrate and potentially staining the ‘pallet’ or transferring unwanted ink onto the next substrate. Next, the screen and frame are lined with a tape. The type of tape used in for this purpose often depends upon the ink that is to be printed onto the substrate. These aggressive tapes are generally used for UV and water-based inks due to the inks’ lower viscosities. The last process in the ‘pre-press’ is blocking out any unwanted ‘pin-holes’ in the emulsion. If these holes are left in the emulsion, the ink will continue through and leave unwanted marks. To block out these holes, materials such as tapes, specialty emulsions and ‘block-out pens’ may be used effectively. The screen is placed atop a substrate. Ink is placed on top of the screen, and a floodbar is used to push the ink through the holes in the mesh. The operator begins with the fill bar at the rear of the screen and behind a reservoir of ink. The operator lifts the screen to prevent contact with the substrate and then using a slight amount of downward force pulls the fill bar to the front of the screen. This effectively fills the mesh openings with ink and moves the ink reservoir to the front of the screen. The operator then uses a squeegee (rubber blade) to move the mesh down to the substrate and pushes the squeegee to the rear of the screen. The ink that is in the mesh opening is pumped or squeezed by capillary action to the substrate in a controlled and prescribed amount, i.e. the wet ink deposit is proportional to the thickness of the mesh and or stencil. As the squeegee moves toward the rear of the screen the tension of the mesh pulls the mesh up away from the substrate (called Snap-Off) leaving the ink upon the substrate surface. There are three common types of screenprinting presses. The ‘flat-bed’, ‘cylinder’, and the most widely used type, the ‘rotary’. Textile items printed with multi-color designs often use a wet on wet technique, or colors dried while on the press, while graphic items are allowed to dry between colors that are then printed with another screen and often in a different color after the product is re-aligned on the press. Most screens are ready for recoating at this stage, but sometimes screens will have to undergo a further step in the reclaiming process called Dehazing. This additional step removes haze or ‘ghost images’ left behind in the screen once the emulsion has been removed. Ghost images tend to faintly outline the open areas of previous stencils, hence the name. They are the result of ink residue trapped in the mesh, often in the knuckles of the mesh (the points where threads cross). While the public thinks of garments in conjunction with screenprinting, the technique is used on tens of thousands of items, including decals, clock and watch faces, balloons, and many other products. The technique has even been adapted for more advanced uses, such as laying down conductors and resistors in multi-layer circuits using thin ceramic layers as the substrate. Screenprinting is more versatile than traditional printing techniques. The surface does not have to be printed under pressure, unlike etching or lithography, and it does not have to be planar. Different inks can be used to work with a variety of materials, such as textiles, ceramics, wood, paper, glass, metal, and plastic. As a result, screenprinting is used in many different industries, including:- balloons; clothing; decals; medical devices; printed electronics, including circuit board printing; product labels; signs and displays; snowboard graphics; textile fabric; and thick film technology. In screen printing on wafer-based solar photovoltaic (PV) cells, the mesh and buses of silver are printed on the front; furthermore, the buses of silver are printed on the back. Subsequently, aluminum paste is dispensed over the whole surface of the back for passivation and surface reflection. One of the parameters that can vary and can be controlled in screen printing is the thickness of the print. This makes it useful for some of the techniques of printing solar cells, electronics etc. One of the most critical processes to maintain high yield. Solar wafers are becoming thinner and larger, so careful printing is required to maintain a lower breakage rate. On the other hand, high throughput at the printing stage improves the throughput of the whole cell production line. To print multiple copies of the screen design on garments in an efficient manner, amateur and professional printers usually use a screen printing press. Many companies offer simple to sophisticated printing presses. Most of these presses are manual. A few that are industrial-grade-automatic printers require minimal manual labor and increase production significantly. See also Printing. Screen Printing is an easy way to make a unique T-shirt. Screen Printing may be a hand operation or an automatic machine process. The cloth is first laid on a printing table, gummed in position or pinned to a back gray, and then the design is applied through a screen made of silk or nylon gauze stretched over a wooden or metal frame, on which the design for one color has been reproduced. This is usually a photographic process, although hand painting with a suitably resistant blocking paint is an alternative. A screen is placed over the fabric on the table against registration stops, ensuring accurate pattern fitting. Print paste is poured on to the screen edge nearest the operator and is spread with a squeegee over the surface of the screen so that color is pushed through the open parts. The screen is moved until one color has been applied to the cloth. For application of other colors, the process is repeated with different screens. With the growing importance of screen printing, the hand operation has been largely replaced by mechanical methods. In some machines, the screens are flat, as in hand printing; others employ rotary screens. Screen Printing is a method of printing similar to using a stencil. The areas of the screen through which the coloring matter is not to pass are filled with a waterproof material. The printing paste which contains the dye is then forced through the untreated portions of the screen onto the fabric below. In Screen Printing, a sheer fabric, such as silk or nylon gauze, is stretched over a wood or metal frame to form a screen. The entire screen, except for the design area to be printed, is coated with a substance that closes the pores of the fabric screen. The dye is poured onto the screen and forced through the uncoated design areas onto the fabric below. A different screen must be used for each cotor in the print. / Найлан^{T3} (Nylon^{TM}). Закалка или Упрочнение (Hardening). Фотофильмпечать – световая печать – набивка тканей сетчатыми шаблонами фотохимическим

способом. Аббревиатура CMYK образована из названий четырёх красок – cyan, magenta, yellow, black (голубая, пурпурная, жёлтая, чёрная), которые используются при обычной печати. Эти четыре краски иногда называют триадными. К – это сокращение для чёрной краски (black), поскольку было время, когда вместо cyan (голубая) использовали название blue (синяя), а вместо magenta (пурпурная) – red (красная), так что литера B теряет однозначность. Кое-где в типографиях названия blue и red всё ещё используются как синонимы для cyan и magenta. В этой книге blue и red означают именно синий и красный цвета. Цвета, воспроизводимые на печатной машине с помощью триадных красок, выражаются в процентах. Так, цвет 70C 0M 100Y означает, что в нём содержится 70% от максимально допустимого количества голубой краски, максимум жёлтой, а пурпурная полностью отсутствует. Если значение чёрной краски равно нулю, оно опускается.

SCREW = ШУРУП (или XX) – Screw is a straight, slender, pointed and headed fastener with a thread along a portion of the shank and with a slot or other indentation in the head to facilitate turning for insertion. See also Pallet. / Шуруп (Screw):- прямой, небольших размеров элемент, с конусообразным остроконечным стержнем, с резьбой вдоль стержня и щелью или другим углублением в головке для облегчения ввинчивания. Смотрите также Поддон (Pallet).

SCREW FEEDS = ВИНТОВЫЕ (или ЧЕРВЯЧНЫЕ) ПИТАТЕЛИ (или ПОДАЧИ) – Screw Feeds:- feed systems in which the action of the screw generates pressure that causes flow. The system usually consists of a container with a closely fitting screw unit.

SCREW MELTER = ВИНТОВОЙ (или ЧЕРВЯЧНЫЙ) РАСТОПИТЕЛЬ (или РАСПЛАВИТЕЛЬ) – Screw Melter is:- (1) screw extruder in which frictional forces between the screw and the heated barrel contribute to rapid melting of solid polymer. This configuration is capable of high throughput. (2) System in which a screw feed is used to feed polymer to a melt grid and to maintain a constant pressure at the grid.

SCRIM = КАНВА (или ЗАНАВЕСОЧНАЯ ТКАНЬ) – Scrim is:- (1) a lightweight, open-weave, coarse fabric; the best qualities are made with two-ply yarns. Cotton scrim usually comes in white, cream, or ecru and is used for window curtains and as backing for carpets. Fabric with open construction used as base fabric in the production of coated or laminated fabric. (2) Fabric with open construction used as base fabric in the production of coated or laminated fabrics. Scrim is a durable plain-woven usually cotton fabric for use in clothing, curtains, building, and industry. Scrim is a loose woven, flimsy-looking cloth, composed entirely of two-ply cotton yarn, both warp and filling, and resembles a fine meshed fish net. Scrim is usually made in bright colored stripe and plaid effects. It is peculiarly adapted to the draper's art, as it is a light-weight creation, therefore soft and pliable; it is also used as a fly net for horses in the summer time. Scrim is made of 2/20's cotton, dry color, in both warp and filling, and as a fabric requires nothing in the nature of a finish except being run through a hot press, simply to smooth the wrinkles which may occur during the process of weaving. By using 3/10's and 4/10's cotton warp and filling, and of course in proper proportions, we produce hammocks and material for laundry bags with this same scrim weave, or, to be correct, gauze weave. Scrim can be woven in any power loom, but best results are obtained by using a light running loom such as Bridesburg or Mutual. Scrim Weave or Lacy Effect:- can be produced by using a regular doupe set of harness, but the best, quickest and cheapest method is by using an attachment known as the Ashoff Motion, which is an improved set of harness or heddle and heddle shafts built especially for this kind of effects in cloth. This motion consists of two heavy wooden frames built similar to heddle frames and suspended in the loom from the top roller, in the manner in which old roller looms were equipped for weaving gingham. In place of heddles these frames are filled with a coarse reed, in accordance with number of splits per inch required for fabric; these reed dents are plugged with lead, alternately top and bottom, and two ends are drawn straight through both harnesses. The Ashoff Motion makes a shed in the regular roller loom style or by treddle or cam, and has likewise a sideway movement, which is obtained by placing a small eccentric on the bottom loom shaft. Near the side of loom this eccentric is connected by a one-half inch iron rod with a pair of bevel gears which are fastened on the loom frame at a point equal to the centre of the shed. These gears are in turn coupled by smaller rods to the heddle frames, and create the side motion, which allows the threads to operate in a sort of rolling motion or, in other words, each thread rolls half-way round its mate thread and the filling pick, binding it in, and on the next pick the roll is reversed, and this creates the lacy effect. Use regular 2/20's cotton yarns and set the warp about 44 inches in the reed, 20 ends and 20 picks per inch; will weigh about 1% ounces and measure about 36 inches wide from loom. Scrim is an open, plain-weave, mesh fabric used for curtains, bunting, and as a supporting fabric for some laminated fabrics. Scrim was traditionally made of cotton, but today usually is made of nylon or other man-made fibers. See also Bunting. / и основа и уточина . Найлан[T3] (Nylon™). Смотрите также Ткань Для Флагов (Bunting). Под Канвой, от Французского слова Canevas, понимается сетчатая хлопчатобумажная (реже льняная) сильно аппретированная ткань. Применяется как основа или трафарет для вышивания, иногда как прокладочный материал в одежде. Канва, от Французского слова Canevas, сетчатая сквозная хлопчатобумажная, реже льняная ткань из кручёной пряжи, отбеленная или подкрашенная, сильно аппретированная. Вырабатывается полотняным или перевивочным переплетением. Применяется как основа или трафарет для вышивания, иногда в качестве прокладочного материала в одежде.

SCRIMP = ЗАЛОМ (или МОРЩИНА) – Defect Name:- Scrimp. Defect Type:- Printing Defects. Fabric Type:- Print Goods. Description:- Scrimp:- This is the result of fabric going through a print machine in a creased condition. When the creases are opened, the pattern is broken. Severity:- Major. Scrimp:- the result of fabric being folded or creased when passing through tenter frames. / Под Заломом понимается местный порок в виде неустранимых следов складок. Размер порока – по всему куску.

SCRIP CERTIFICATE = ПОДПИСНОЙ СЕРТИФИКАТ – A Scrip is a document issued after the founding of a joint stock company or after a capital increase in place of, and prior to, the issue of the final shares. A Scrip is understood to be the actual security certificate, e.g., the share or bond. In exchange, the investor receives the sheet with the interest or dividend coupons and the renewal coupon (talon). Written obligation on the part of the bank acting as paying agent to hand over the definitive certificates to the subscriber as soon as they have been issued. Scrip Certification is the US expression for a certificate indicating that the bearer is entitled to some right or privilege which he has not yet actually received. A Scrip Certificate is issued in place of fractional shares if a stock dividend has been declared. Also provisional receipt for partial payment made by shareholders on shares which have not been fully paid in.

SCRIP ISSUE/CAPITALISATION BONUS ISSUE = ПОДПИСНОЙ ВЫПУСК/КАПИТАЛИЗАЦИОННЫЙ БОНУСНЫЙ ВЫПУСК (или XX) – Scrip Issue/Capitalisation Bonus Issue:- a scrip issue is a further issue of new shares to existing equity shareholders. They receive free a number of shares in proportion to their holdings.

SCRIPOPHILY = СКРИПОФИЛИЯ – Scripophily is a term coined in the mid-1970s to describe the hobby of collecting antique bonds, stocks and other financial instruments. Values are affected by beauty of the certificate and the issuer's role in world finance and economic development. / Скрипофилия – это коллекционирование старинных и вышедших из обращения ценных бумаг, в основном акций и облигаций. Это слово произошло от Греческих слов Scrip, означающее Документ, и Philos, означающее Любить. Зарождение этого увлечения обусловлено развитием мирового фондового рынка и, как следствие, заменой первоначальных бумажных акций и облигаций на их более дешёвые электронные варианты. В настоящее время около 200 тысяч человек во всем мире коллекционируют старинные акции и облигации. В большинстве стран Европы существуют десятки салонов по продаже старинных акций и облигаций, регулярно проводятся аукционы, посвящённые ценным бумагам.

Коллекционеры ценных бумаг объединены в три международные ассоциации. Многие приходят к коллекционированию старинных ценных бумаг через бонистику – так как большинство облигаций государственных займов, особенно в России, имело хождение как полноценные денежные знаки. Но есть ещё ряд веских причин быстрого распространения данного вида коллекционирования.

SCRIP SHARE = ПОДПИСНАЯ АКЦИЯ – New shares issued in a capital increase from company funds are known as Scrip Shares or bonus shares. They are issued to a company's shareholders at a certain ratio to existing shares for no consideration. In the balance sheet, reserves are converted into share capital; this transfer between positions under shareholders' equity has no effect on the company's overall equity situation. Existing shareholders are not given something for nothing as a result of this corporate action alone, because they already participated in the reserves beforehand with their shares. The frequently used term 'Bonus Share' is therefore a little misleading. The price of the shares existing before the corporate action is reduced by this issue of new shares under the capital increase. In purely arithmetic terms, however, the value of a shareholder's shareholding remains unchanged after the transaction. However, the shareholder does profit from the capital adjustment if he receives an unchanged percentage dividend on the new shares. In this case, owing to the higher return, the price of the shares could increase after the scrip share issue. Often, though, the optical reduction of the share price connected with the share split is enough to cause an increase in the share price.

SCROOP = ХРУСТ (или СКРИП) – Scroop:- the peculiar scrunching or rustling sound silk acquires when treated with certain organic acids (such as acetic and formic acid). Scroop is a characteristic rustling or crunching sound acquired by silk that has been immersed in solutions of acetic or tartaric acid and dried without rinsing. It is probably caused by acid microcrystals in the ribers rubbing against each other. It is also the rustle that certain fabrics such as silk taffeta have. Scroop is considered a desirable characteristic in luxury fabrics. Scroop is the rustleing sound produced when some silk is compressed. Scroop is the sound of rustle or crunch that is characteristic of silk. Scroop is a natural property of silk, but may be induced in other fabrics to a degree by various treatments. / с определёнными органическими кислотами, такими как уксусная кислота (acetic acid) и муравьиная кислота (formic acid). Хруст:- ощущение характерного хруста, достигаемое обработкой искусственного волокна химическим способом.

SCROTIFORM = ГНЕЗДООБРАЗНОЕ (или МОШНООБРАЗНОЕ) – Scrotiform:- shaped like a hollow pouch or sac. / мешочек или карман (pouch) или сак (сачок).

SCRUB = СКРАБ (или КУСТАРНИК, или КУСТАРНИКОВАЯ ЗАРОСЛЬ) – Scrub is a plant community dominated by low shrubs. / низкими кустами. Скраб – формация склерофильных кустарников.

SCRUBBED = СОСКОБЛЕННОЕ (или СОСКРЕБЁННОЕ) – Scrubbed:- xxxxx. See also Scrubbing.

SCRUBBING = СОСКРЕБЫВАНИЕ – Scrubbing is another name for the brushing method of raising a nap. Scrubbed denim, for example, means napped denim. See also Napping.

SCRUTCHING = ТРЕПАНИЕ – Scrutching:- this is a mechanical operation which, by breaking and beating the retted flax straw, separates the textile fibers in the stem of the plant from the woody matter and the bark. The next step would be 'hackling'. / Под Трепанием понимается обработка волокнистых материалов (льна, хлопка, шерсти и других) на трепальных машинах с целью разрыхления (разделения на мелкие клочки и пучки волокон) и очистки его от примесей. Трепание – один из основных процессов прядения, а также первичной обработки лубяных волокон.

SCSFA = SHORT CHAIN SATURATED FATTY ACID

SCU = SULFUR–COATED UREA

SCUFF = ДОМАШНЯЯ ТУФЛЯ (или ХХ) – Scuff is a flat-soled slipper without quarter or heel strap. Compare Mule. / heel = каблук или пятка. Домашняя Туфля без задника.

SCUFFING = ИСТИРАНИЕ (или СРАБАТЫВАНИЕ) – Scuffing:- abnormal engine wear due to localized welding and fracture. It can be prevented through the use of antiwear, extreme-pressure and friction modifier additives. See also Scoring. / ненормальный износ двигателя вследствие . противоизносных, для сверхвысокого давления и . Смотрите также Задир (Scoring).

SCUFFING PARTICLES = ЧАСТИЦЫ ОТ ИСТИРАНИЯ – Scuffing Particles:- large twisted and discolored metallic particles resulting from adhesive wear due to complete lubricant film breakdown. / адгезивный износ вследствие .

SCULPTURED = СКУЛЬПТУРНЫЙ – Sculptured is a term describing a carpet with areas of contrasting depth produced by mixing cut pile and loops.

SCULPTURED RUG = СКУЛЬПТУРНЫЙ КОВРИК – Sculptured Rug is a floor covering in which the pile is cut in different lengths to form a Jacquard design made with different heights. / Жакяр (Jacquard).

SCUPPER = ШПИГАТ (или ПОРТИК) – Scuppers (maritime term):- openings in the side of a ship to carry off water from the waterways or from the drains. / Под Шпигатом, от Голландского слова Spiegat, Spuigat, от Spuiten, означающее Брызгать или Лить и Gat, означающее Отверстие, понимаются отверстия в палубе или фальшборте для удаления воды. Шпигат снабжают решёткой и отводной (шпигатной) трубой. Некоторые шпигаты оборудуются сифонами или запорными клапанами (например, шпигат бань). Для предотвращения обратного потока воды при ударе волны отводную трубу у борта закрывают невозвратным клапаном. На парусных судах Шпигатом называют отверстие для проводки снастей.

SCURFY = МЕЛКОЧЕШУЙЧАТОЕ (или ШЕРОХОВАТОЕ, или ШЕЛУШАЩЕЕСЯ, или СТРУПОВАТОЕ, или ПОКРЫТОЕ МЕЛКИМИ ЧЕШУЙКАМИ) – Scurfy:- scaly or a scaly coating.

SCUTCHING = ТРЕПАНИЕ – Scutching is the separation of the outer covering of the flax stalk from the usable fibers. / Под процессом Трепания понимается отделение .

SCUTELLUM = СКУТЕЛЛУМ (или ЩИТОК, или ЩИТ) – Scutellum is a shield-shaped organ of the embryo of grass. It is often viewed as a highly modified cotyledon in monocotyledons. Scutellum (syn. Cotyledon) is the portion of the embryo partly surrounding the embryonic axis, containing oil and protein for the germinating plant. It serves as an absorbing organ to transfer nutrients from the endosperm to the young seedling. / Щиток зерна злаков. Под Щитком понимается:- (1) соцветие, в котором нижние цветоножки (простой щиток) или ветви (сложный щиток) длиннее верхних, а цветки располагаются в одной плоскости, например, у Тысячелистника и других. (2) Первый (семядольный) лист зародыша злаков, прилегающий к эндосперму и использующий его питательные вещества.

SCUTTLE = КИНГСТОН – Scuttle (maritime term):- to sink a vessel by boring holes in her bottom or by opening sea valves. / Под Кингстоном, от Английского словосочетания Kingston Valve, означающее Забортный Клапан, понимается клапан на подводной

части наружной обшивки судна. Через кингстоны, присоединяемые к приёмным или отливным патрубкам судовых систем (балластной, противопожарной, охлаждения конденсаторов или двигателей, затопления артиллерийских погребов и других) заполняют трубопроводы или отсеки судна забортной водой и отливают воду за борт.

SCUTTLE BUTT = БОЧКА ДЛЯ ПРЕСНОЙ ВОДЫ (или ЛАГУН ДЛЯ ПИТЬЕВОЙ ВОДЫ, или ПИТЬЕВОЙ ФОНТАНЧИК) – Scuttle Butt (maritime term):- the container of fresh water for drinking purpose used by the crew; formerly it consisted of a cask.

SCUTTLE BUTT STORY = СПЛЕТНЯ (или НЕВЕРОЯТНАЯ ИСТОРИЯ) – Scuttle Butt Story (maritime term):- an unauthoritative story (a tall story).

SD = SEA DAMAGE

SD = SIGHT DRAFT

SD = SPOT DATE

SD = STANDARD DEDUCTION

SD = STANDARD DEVIATION

SD = SUDAN

SDAX® = СДАКС® (или ЭС.ДАКС®) – The SDAX® is the index comprising 50 small companies, so-called Small Caps, which have a lower trading volume and market capitalization than the shares listed in the MDAX®. The index is continually calculated by Deutsche Börse each trading day as a price and performance index. The composition of the SDAX® is reviewed semiannually and adjusted if necessary. / Немецкая Биржа АО или Дойчэ Бёрзэ А.Ге. (Deutsche Börse AG).

SDB = SPECIAL DISTRICT BOND

SDBL = SIGHT DRAFT, BILL OF LADING ATTACHED

SDC = SOCIETY OF DYERS AND COLOURISTS

SDC = SWISS DEVELOPMENT COOPERATION

SDD = SUDANESE DINAR

SDI = STRESS DAY INDEX

SDM = SHOOT DRY MATTER

SDM = SYSTEM DEVELOPMENT MANAGER

SDRs = SPECIAL DRAWING RIGHTS

SDS = SODIUM DODECYL SULFATE

SDS–PAGE = SODIUM DODECYL SULFATE–POLYACRYLAMIDE GEL ELECTROPHORESIS

SDW = SEEDLING DRY WEIGHT

SE = SHAREHOLDERS' EQUITY

SE = SWEDEN

SE & O = SALVE ERRORE ET OMISSIONE

SEA = SECRETARIA DE AGRICULTURA

SEA = SINGLE EUROPEAN ACT

SEA–AIR MARKET = РЫНОК МОРЕ–ВОЗДУХ – Sea-Air Market is a market in which cargo is transported from origin to destination by sea and air, taking advantage of the lower cost by ship between seaports and the speed of air over landmasses to balance time and cost.

SEA ANCHOR = ПЛАВУЧИЙ ЯКОРЬ (или МОРСКОЙ ЯКОРЬ) – Sea Anchor (maritime term):- a drag (drogue) thrown over to keep a vessel to the wind and sea.

SEABEE = МОРСКОЙ РАБОТЯГА – SEABEE:- sea-barge, a barge carrier design similar to 'LASH' but which uses rollers to move the barges aboard the ship; the self-propelled loaded barges are themselves loaded on board as cargo and are considerably larger than those loaded on LASH ships.

SEABOOT = БРОДНИКИ (или ХХ) – Seaboot is a very high waterproof boot used especially by sailors and fishermen.

SEACELL® = СИЦЭЛЬ® (или СИСЭЛ®) – SeaCell®:- a new chapter in textile history opened with the development of fabrics containing active health-promoting substances that survive the manufacturing process and remain in the fiber even after repeated washing. Basically, SeaCell® textile fiber is the result of a simple idea:- the natural cellulose-based Lyocell fiber acts as the carrier for a natural, health-promoting substance – seaweed. The minerals contained in seawater accumulate in seaweed. This explains the high concentration of trace elements, vitamins and minerals found in seaweeds and which make it particularly suited for medical applications and cosmetic products. Cosmetic products based on seaweed improve the blood supply to the skin and activate the skin cell metabolism, ensuring that the skin remains fresh, firm, and smooth. Medicines that contain seaweed accelerate the healing of skin inflammations caused by infections or allergic reactions. The porous, open structure of the SeaCell® textile fibers promote humidity intake and release, and a healthful interaction between the fiber and the skin. The garment absorbs what your skin expels, while your skin absorbs the healthful elements carried in the fibers. Even after numerous washings, the health-promoting, beneficial effects of the fiber remain unaffected. SeaCell® is a cellulosic fiber with incorporated active substances of seaweed. First, a cellulose based fiber is produced using the eco-friendly Lyocell process. The resulting fiber then serves as the supporting material for the seaweed. This wonderfully silky fiber is perfect on it's own or used for blending with other fibers. SeaCell® is about 4" long and very strong. Here's a little bit of information on this wonderful fiber. SeaCell® pure is a cellulose fiber containing seaweed, e.g., Ascophyllum nodosum. The idea behind SeaCell® pure is actually quite simple:- the natural raw materials cellulose and seaweed represent the basis for the manufacture of the SeaCell® pure fiber, employing the 'Lyocell Process'. The cellulose fibers act as functional substrate for the seaweed:- (i) breathable; (ii) soft; (iii) supports skin blood flow; (iv) stimulates skin cell regeneration; and (v) pleasant touch,

comfortable feel. Seaweed is added as the active substance for a good reason. The fact that this marine plant is rich in various minerals, trace elements, carbohydrates, fats and vitamins, has been well-known since the times of Chinese medicine. Moreover, seaweed has been proved to protect the skin and exhibit anti-inflammatory properties, which also unfold in the SeaCell® pure fiber. The SeaCell® pure fiber offers the manifold properties of seaweed and its health-promoting substances. The structure of SeaCell® pure facilitates an active exchange of substances between fiber and skin. The natural body moisture releases the constituents when the fabric is worn. The effect of SeaCell® pure remains unchanged even after numerous washing cycles. Numerous tests, carried out by various institutes and organizations, examined the fiber properties and confirmed the durability of the SeaCell® pure effect. In cooperation with the Fresenius Institute in Berlin, it was demonstrated that, in the humid environment of the skin surface, the SeaCell® pure fiber is able to release its active ingredients as required. The SeaCell® pure fiber is non-cytotoxic (cytotoxic refers to the property of substances or certain cells to destroy other cells) and hence well tolerated by the skin. Patch tests (skin test to examine allergic reactions to substances), carried out by Friedrich Schiller University Jena, demonstrated that the SeaCell® pure fiber does not cause any allergic reactions and irritations on sensitive skin. / Люоцель (Lyocell). Йенский Университет Фридриха Шиля (Friedrich Schiller University Jena). Волокно СиЦэль® или СиСэл® (SeaCell®):- последняя разработка фирмы Цима А.Ге. (Zimmer AG) – волокно целлюлозы с новой сферой применения. Это специальное волокно разработано с помощью так называемого Люоцель (Lyocell), при котором целлюлозу и морскую водоросль используют как возобновляемые ресурсы. Это совершенно новый подход использования волокна Люоцель в качестве ‘функционального носителя’ для натуральных веществ таких как морская водоросль. Морская Водоросль содержит минералы моря. Это объясняет почему большинство различных химических элементов могут быть найдены в веществе морской Водоросли. Кроме того, морская Водоросль содержит углеводы, аминокислоты, жиры и витамины. Для того, чтобы сохранить эластичность и упругость кожи, в косметике используется морская Водоросль, которая улучшает кровообращение кожи, активизирует обмен веществ. Таким образом, морские Водоросли способствуют восстановлению кожного покрова. В волокно СиСэл включены активные ингридиенты морской Водоросли. При контакте с кожей эти ингридиенты могут выделиться в организм. Вещество морской Водоросли Ascophyllum Nodosum содержит в основном углеводы, например, – альгиновую кислоту, ламинарин, минералы и белки. Минералы, содержащиеся в морской воде, накапливаются в морской Водоросли. Это объясняет содержание большого разнообразия химических элементов, найденных в веществе морской Водоросли, например, – соды, магния, кальция, калия, хлоридов и серы. Химический анализ морских Водорослей Ascophyllum Nodosum:- (i) Углеводы – альгиновая кислота, ламинарин, маннитол; (ii) Аминокислоты – аргинин, аспарагиновая кислота, валин; (iii) Витамины – аскорбиновая кислота, каротин, токоферол; и (iv) Минералы – алюминий, кальций, хлорид, флуорид, марганец, магний, фосфор, калий, атрий, сера. Тестирование на окрашивание на оборудовании (обрабатывающее выбранные волокна) показало, что волокно СиСэл совершенно пригодно для производства нитей и проявляет стандартные свойства окрашивания. При дальнейшей обработке все качества волокон сохраняются. Несмотря на существенные отличия в структуре волокон, механические свойства – прочность (разрывная нагрузка) – остаются на таком же высоком уровне, что и стандартные волокна Lyocell. Кальций и магний – основные минералы, содержащиеся в волокне СиСэл. Даже после полной 72 часовой элюции с демирализованной водой, основная часть содержащегося кальция и магния всё ещё остаётся в волокне. В Центре Исследования Белка (Zentrum fur Proteinalyse, ZPA) Технического Колледжа в Биргэне волокно СиСэл было подвергнуто анализу на наличие аминокислоты. Данные отразили спектр аминокислоты первичных материалов, то есть коричневые морские водоросли Ascophylum nodosum сравнили со спектром СиСэл волокна и с конечной СиСэл тканью. Найденные в сырье аминокислоты могут быть обнаружены как в волокне, так и в ткани в той же пропорции, что и в морской Водоросли. В сотрудничестве с Институтом Фрэзэниус в Берлине морская Водоросль, СиСэл волокно, водяной экстракт и пробы ткани, изготовленные из СиСэл волокна были проанализированы на содержание витаминов С, Е и каротиноида. Несмотря на то, что растворимый в воде витамин С был найден только в сыром веществе морской Водоросли, витамин Е и каротиноиды, которые не растворимы в воде, были неожиданно найдены не только в СиСэл волокне и тканях, но также и в водном элюате (24 часа взбалтывания). Из результатов тестирования можно сделать вывод, что во влажной среде волокно СиСэл способно полноценно активизировать свои ингридиенты.

SEA CHEST = КИНГСТОННАЯ (ПРИЁМНАЯ) КОРОБКА (или МОРСКАЯ КОРОБКА) – Sea Chest (maritime term):- a sailor’s trunk; the intake between the ship’s side and a sea valve. / Кингстонная (Приёмная) Коробка на всасывающем трубопроводе.

SEADAG = SOUTHEAST ASIAN DEVELOPMENT ADVISORY GROUP

SEA DOG = МОРСКОЙ ПЁС (или МОРСКОЙ ВОЛК, или БЫВАЛЫЙ МОРЯК) – Sea Dog (maritime term):- an old sailor.

SEAFDEC = SOUTHEAST ASIAN FISHERIES DEVELOPMENT CENTRE

SEA GOING = МОРЕХОДНОЕ – Sea Going (maritime term):- capable of going to sea. / способное к выходу в море.

SEA GREEN = МОРСКОЕ ЗЕЛЁНОЕ (или ХХ) – Sea Green:- a moderate green or bluish green; a moderate yellow green.

SEA ISLAND COTTON = ОСТРОВНОЙ ХЛОПЧАТНИК (или ХЛОПЧАТНИК С МОРСКИХ ОСТРОВОВ) – Sea Island Cotton is the finest commercial variety of Cotton, the superiority of which is due to the length, strength and remarkable uniformity of the fiber, developed by a system of careful selection. The name is from the fact that the best grades are grown on a number of islands off the shores of Georgia and South Carolina. It is believed by some authorities that the plant had come originally from Persia to the Bahamas and from the latter place it was introduced into Georgia in 1786. As early as in 1786 its cultivation was attempted by Mrs Kinsey Burden in South Carolina. See also American-Egyptian Cotton, Extra Long Staple Cotton, Pima Cotton, Supima®, and Upland Cotton. Sea Island Cotton is a Cotton with especially long silky fiber. The very finest and most expensive Cotton, in very limited supply, with a fiber length greater than 1-1/2”. The romance Cotton of the United States. It was first grown on the islands along the Southern coastal area – Saint Helena, Edisto, Port Royal, James and John of South Carolina, Saint Simeon, and Cumberland off Georgia, and many of the smaller islands. The first crops came into notice around 1790, at the time that much thought was being given to ginning of cotton. As the years rolled by, and mainland cottons supplanted Sea Island staple, the interest waned. The cost of raising and transportation could not compete with the cottons that were more adjacent to markets. By 1928, this Cotton had vanished from America because of the economic conditions entailed in raising the staple. The decline of this Cotton is noted from the following tabulation:- 1917:- 125 000 bales; 1922:- 2 000 bales, 1926:- 100 bales, 1927:- 12 bales. The background and tradition, however, of Sea Island cotton has always remained dear to the heart of the Southern Cotton planter in the United States. Sea Island is raised successfully in Mexico, the Central American countries, and the Northern areas of Colombia and Venezuela. Fine, long staple Cotton grown in the West Indies. Sea Island Cotton is the finest of all Cotton, very white and silk-like with staple of 1.5” or better. Before the American Civil War, this type of Cotton was raised on the islands of the Carolinas and Georgia. No longer raised in the United States today, it is raised in Mexico and Central America and goes into fine, expensive dress goods and men’s shirtings. Seeds of Anguilla Cotton from the island of Anguilla were planted on the Sea Islands off the coast of Georgia in the 1780’s by Mr James Spaulding of Charleston, State of South Carolina (SC), the United States. It is from these early plantings that Sea Island Cotton, the best in the world, is obtained. Sea Island Cotton is an

extra-long staple (ELS) Cotton first grown in the United States in about 1786 from seed received from the Bahamas Islands. Sea Island Cotton was relatively unimportant as a commercial crop until the XIX century. Produced in the coastal areas of South Carolina, Georgia, and Florida until the early 1920's, when US production virtually ceased because of increasing competition from foreign growths of ELS Cotton, the growing American-Egyptian Cotton industry in the Western States, and production problems associated with Sea Islands Cotton. Commonly about 1-1/2 inches in length but ranged up to 2 inches. Sea Island Cotton:- the very finest and most expensive Cotton, in very limited supply, with a fiber length greater than 1-1/2". Sea Island Cotton:- a valuable species ... having the world's longest staple, sometimes attaining a length of 2-1/2 inches, but commonly about 1-1/2 inches. ... Grown in the West Indies, and was cultivated rather extensively in Eastern South Carolina, Georgia and Northwestern Florida and the islands adjacent to those states, until about 1920 when the Boll Weevil made its culture unprofitable. / Кинзи Бёдэн (Mrs Kinsey Burden). сеялка точного высева (planter). Дьжеймз Сполдин (James Spaulding). Хлопчатник с большой штапельной длиной волокна, выращенный в Вест Индии.

SEAL = XX (или КОТИК) – Seal is a common name in leather for the hide of an animal with the fur removed.

SEAL = XX (или ТЮЛЕНЬ, или КОТИКОВОЕ) – Seal:- a dark brown.

SEAL = ПЛОМБА (или ПЕЧАТЬ) – Seal is a device that must be broken before the container can be opened. The seal is generally secured to the container by the shipper. A device used for containers, lockers, trucks or lorries to proof relevant parties that they have remained closed during transport. Seal is a numbered locking device used for containers, lockers, trucks or lorries providing proof to relevant parties that they have remained closed during transport. / Под Пломбой, от Немецкого слова Plombe от Латинского слова Plumbum, означающее Свинец, понимается кусочек свинца или другого пластичного материала с оттиском печати, навешиваемый на закрытые двери, приборы, аппараты, товары и так далее так, что без повреждения оттиска нельзя открыть двери, использовать опломбированный предмет и так далее.

SEAL = УПЛОТНЕНИЕ – Seal is a device designed to prevent the movement of fluid from one area to another, or to exclude contaminants. See also Bellows Seal; Cartridge Seal; Double Seal; Dynamic Seal; Externally Pressurized Seal; Face Seal; Inside-Mounted Seal; Lip Seal; Magnetic Seal; Mechanical Seal; Outside-Mounted Seal; Pusher Seal; Rotary Seal; Static Seal; Stationary Seal; and Unbalanced Seal. / Уплотнение – приспособление для предотвращения или уменьшения утечки жидкости или газа через зазоры между деталями. Необходимость уплотнений определяется тем, что в местах соединения деталей даже после самой тщательной механической обработки остаются неровности, образующие зазоры. Различают уплотнения для неподвижного контакта деталей (обычно Прокладки или Кольца из эластичного материала) и уплотнения для подвижного контакта деталей, которое осуществляется заполнением зазоров набивкой (смотрите Сальник), смазкой, замазкой или устройством лабиринтных уплотнений.

SEAL ASSEMBLY = КОМПЛЕКТ УПЛОТНЕНИЯ – Seal Assembly:- a group of parts, or a unitized assembly, that includes sealing surfaces, provisions for initial loading, and a secondary sealing mechanism that accommodates the radial and axial movement necessary for installation and operation. See also Seal.

SEA LAWYER = МОРСКОЙ ПРАВОВЕД (или МОРСКОЙ ПРИДИРА) – Sea Lawyer (maritime term):- a seaman who is prone to argue, especially against recognized authority (big mouth).

SEAL CHAMBER = КАМЕРА УПЛОТНЕНИЯ – Seal Chamber is the area between the seal chamber bore and a shaft in which a mechanical seal is installed. See also Seal.

SEALED MOTOR BEARING = УПЛОТНЁННЫЙ МОТОРНЫЙ ПОДШИПНИК (или ЗАПЕЧАТАННЫЙ МОТОРНЫЙ ПОДШИПНИК) – Sealed Motor Bearing:- these bearings have rubbing seals that seal against recesses in the inner ring shoulder. They are lubricated for life. Under extreme conditions, their life can be short. See also Bearing. / Моторный Подшипник С Уплотнением (Sealed Bearing) против вытекания масла.

SEALED PACKAGE = ЗАПЕЧАТАННАЯ УПАКОВКА – Sealed Package:- packaging impervious to water vapor used to store goods at risk of corrosion. Desiccants are used in sealed packages to maintain an artificial atmosphere with a relative humidity of <40%. No corrosion is possible below this threshold.

SEALED SAFEKEEPING ACCOUNT = ОПЕЧАТАННЫЙ СЧЁТ ОТВЕТСТВЕННОГО ХРАНЕНИЯ – Sealed Safekeeping Account is the safekeeping account where valuables or documents are deposited, as a rule wrapped and sealed, exclusively for safe custody. Also known as Closed Safekeeping Account. The opposite of Open Safekeeping Account.

SEAL FACE = ТОРЕЦ (или ЛИЦЕВАЯ ЧАСТЬ) УПЛОТНЕНИЯ – Seal Face:- it is either of the two lapped surfaces in a mechanical seal assembly forming the primary seal. See also Seal.

SEAL FACE WIDTH = ШИРИНА ТОРЦА (или ЛИЦЕВОЙ ЧАСТИ) УПЛОТНЕНИЯ – Seal Face Width is the radial distance from the inside edge to the outside edge of the sealing face. See also Seal.

SEAL OF QUALITY = ЗНАК КАЧЕСТВА (или ПЕЧАТЬ КАЧЕСТВА) – Seal Of Quality is a distinctive stamp or label of a professional association, laboratory or semi-governmental organization affixed to a product that is sold to the public, which serves as a guarantee of quality or an indication of conformity to specific manufacturing standards. See also Standardization, and Trademark.

SEAL RING = КОЛЬЦО С ПЕЧАТЬЮ (или УПЛОТНИТЕЛЬНОЕ КОЛЬЦО) – Seal Ring is a finger ring engraved with a seal; signet ring.

SEALSKIN = КОТИКОВЫЙ МЕХ (или АНГОРСКИЙ ПЛЮШ, или ВЫСОКОВОРСНЫЙ ПЛЮШ) – Sealskin is a garment, as a jacket, coat, or cape, of sealskin.

SEAL SWELL = НАБУХАНИЕ (или РАЗБУХАНИЕ) УПЛОТНЕНИЯ – Seal Swell (rubber swell):- the swelling of rubber (or other elastomers) gaskets, or seals when exposed to petroleum, synthetic lubricants, or hydraulic fluids. Seal materials vary widely in their resistance to the effect of such fluids. Some seals are designed so that a moderate amount of swelling improves sealing action. See also Seal.

SEAM = ШОВ (или СШИВКА, или СПАЙ, или ПАЗ) – (1) Seam (book/booking):- the raw edge hem done on a blindstitch machine, usually sewn in the side ans back seam outlets, and on the bottom turn-up. / outlet = припуск сверх шва. Под Швом понимается:- (1) место соединения деталей одежды, обуви и тому подобного (клеевой, ниточный, или сварной шов); (2) место скрепления деталей сооружений, конструкций, например, заклёпочный шов металлоконструкций, растворный шов каменной кладки, сварной шов металлоконструкций; (3) конструктивный шов (деформационный, осадочный и другие) – постоянный разрез, разделяющий части сооружения и допускающий некоторое взаимное их перемещение для исключения перенапряжений; (4) в

анатомии – основной способ соединения костей черепа (кроме нижней челюсти, слуховых косточек, подъязычной кости); и (5) в хирургии – способ соединения рассечённых при операциях тканей шовным материалом (шёлк, льняные нити, лавсан, кетгут) вручную (с помощью иглы) или сшивающим аппаратом. Существуют ручные и машинные виды швов в шитье. Первые чаще всего используют для сметывания деталей кроя и для окончательной отделки необработанных краёв ткани. Для этого два отрезка ткани складывают и шьют слева направо через край. Стежки при этом делаются мелкие, а материал захватывается иглой почти у края. При этом шов не должен стягивать ткань, иначе при глажке может образоваться рубец. Виды ручных швов:- (i) Шов вперёд иголку:- это самый простой вид. Игла ведётся вперёд и через равные промежутки в 2–3 мм прокалывает ткань. Стежки при сметывании деталей делаются длиной от 7 до 10 мм. Чаще всего такие швы используют для приметывания отделок, собирания ткани в сборку, временного соединения деталей и обозначения середины. (ii) Шов за иголку:- иглу выводят на лицевую сторону с изнаночной, а затем, отступив назад 2–3 мм, прокалывают ткань. С изнаночной стороны делают стежок, который в 2 раза длиннее верхнего, то есть от 4 до 6 мм и выводят иглу снова на лицевую сторону. Такой шов применяют, чтобы временно плотно соединить детали кроя. (iii) Кромочный шов:- совмещают срезы деталей, а затем через край, шёлковой тонкой нитью, делают мелкие стежки, захватывая две-три нити кромки. Раскладывают соединённые детали на обе стороны, после чего проутюживают. Обычно применяется, когда на выкроенной детали со стороны кромки не хватает маленького кусочка. (iv) Копировальные стежки:- не затягивая нить, сметочные стежки длиной от 7 до 10 мм, прокладывают по контурам деталей. Затем их разъединяют и разрезают нити шва ножницами. (v) Потайные стежки:- перегибают срез припуска для подшивки, а затем приметывают на расстоянии от края 1–2 мм. Прокладывая шов, необходимо проводить иглу и нить внутри подгибки – должен получиться стежок длиной от 3 до 5 мм. Выведя иглу наружу, нужно захватить 1 или 2 нити ткани, а затем снова провести иглу внутрь сгиба. Сметочная нить после завершения не должна быть видна ни с изнаночной, ни с лицевой стороны. (vi) Выворотный шов:- сшивают материал швом за иголку на расстоянии 2 мм от края. После выворачивают наизнанку, край подравнивают, и, складывая шов гармошкой, аккуратно его заправляют и повторно прострачивают. Перед тем как строчить, нужно проложить наметку на расстоянии 3 мм при первом шве и 5 мм при втором. Такой шов применяется при пошиве из ситца, батиста, сатина и других подобных тканей. (vii) Запошивочный шов:- отрезки ткани лицевой стороной складывают вовнутрь так, чтобы один из них выступал на 5 мм, сшивают, выравнивают шов и выступающий край подворачивают на 3 мм, прометывают, затем приметывают и прострачивают. Машинные виды швов:- (i) Выстрочные виды швов делают на 2-х и 4-х игольчатых машинах, под низ подкладывая для выпуклости полоску мягкого драпа или ватина. Предварительно намечают положение первой строчки. Чтобы шов получился более рельефным, вниз помещают тонкую подкладочную ткань, а затем между слоем ткани и строчками протягивают шнур. Чтобы получить шов без шнура, делают выступ на игольной пластине и для выгибания материала – паз в подошве лапки. (ii) Застрочные выполняются застрачиванием по лицевой (можно по изнаночной) стороне детали, перегнутой по надсечкам. От строчки до перегиба расстояние составляет от полутора до двух миллиметров. (iii) Вытачные размечают одной линией на изнаночной стороне. Затем деталь перегибают по намеченной линии лицевой стороной внутрь, подкладывая полоску ткани, застрачивают в полутора-двух миллиметрах от линии перегиба. После шов или разутюживают или заутюживают. (iv) Настрочные виды швов выполняют с полоской ткани и без. Линия шва намечается с лицевой стороны. Затем подкладывают с изнанки полоску ткани и по ней выполняется соединительная строчка. Деталь лицевой стороной перегибается внутрь и застрачивается на расстоянии полутора-двух сантиметров от строчки. Перегибают полоску ткани и кладут её с другой стороны строчки. Отгибают деталь на полоску и застрачивают; (v) Швы с кантом:- эти виды швов подразделяются на соединительные и краевые. (vi) Складки:- подразделяются на соединительные, отделочные, двусторонние, односторонние, стачные, мягкие, застрочные и настрочные.

(2) Seam (french):- a closure between two pieces of material, made by stitching, turning, and restitching, so as to conceal all raw edges. / втачивание (stitching).

(3) Seam (open gorge):- both the collar and the facing are turned under, basted, and then the seam is felled (edges folded together) from the outside.

(4) Seam (raised):- a seam resulting after two pieces of fabric have been joined; one piece is folded back, and a second row of stitching is placed adjacent to the folded edge. / втачивание (stitching).

SEAM BINDING = СКРЕПЛЕНИЕ ШВА (или УЗКАЯ ТЕСЬМА) – Seam Binding is a flat, narrow twilled ribbon, used to cover raw edges of seams to protect them from ravelling. / Узкая Тесьма для обшивки края.

SEAM GRIN = ОСКАЛ ШВА – Seam Grin:- improper adjustment of tensions. Machinery defects, and namely – Sewing Machines and Attachments. / Порок или дефект от машинного оборудования.

SEAMING = СШИВКА (или СТАЧКА, или СПАЙ) – Seaming is the joining the overlap of two pieces of fabric, usually near their edges.

SEAMLESS = БЕЗ ШВА (или БЕСШОВНЫЙ, или КРУГЛОВЯЗАЛЬНЫЙ) – Seamless is a self-explanatory term. A seamless garment has no seams or fewer seams than the ordinary cut-and-sewn garment of its type. The word Seamless is used primarily for garments that are given their final shape by heat-setting (called Boarding in the case of hosiery) or molding. See also Boarding, Cut-And-Sewn, Heat-Setting, and Molding. Seamless is a term that describes a tubular knit fabric without seams, e.g., seamless hosiery or seamless woven tube. / ткань без шва, например, в чулочно-носочных изделиях.

SEAMLESS KNITTING = БЕСШОВНЫЙ ТРИКОТАЖ (или КРУГЛОВЯЗАЛЬНЫЙ ТРИКОТАЖ) – Seamless Knitting is a unique process of circular knitting, done on either Santoni or Sangiacomo knitting machines (Following to the merging of the company Sangiacomo S.p.A. (Brescia, Italy) into Santoni S.p.A. (Brescia, Italy), starting from July 01, 2007 Santoni S.p.A. has assumed the legal ownership). This circular knitting process essentially produces finished garments with no side seams, which require only minimal sewisng to complete the garment. Seamless knitting can transform yarn into complete garments in a fraction of the time it takes for traditional garment manufacturing, by minimizing the traditional labor-intensive steps of sutting and sewing. / Сантони (Santoni) или комо (Sangiacomo). комо Эсэ.пи.А. (Sangiacomo S.p.A.) Сантони Эсэ.пи.А. (Santoni S.p.A.). вязальные машины.

SEAMLESS TECHNOLOGY = БЕСШОВНАЯ ТЕХНОЛОГИЯ – Seamless Technology:- this term can refer to either ‘seamless knitting’ (see also Seamless Knitting), or ‘welding/bonding technology’, which uses a bonding agent to attach two pieces of fabric together, and eliminates the need for sewing threads. See also Welding.

SEAM–LINE POCKETS = КАРМАНЫ ПО ЛИНИИ ШВА – Seam-Line Pockets are the pockets set into a seam and hidden behind the garment fabric.

SEAM MARK = ОТМЕТИНА ОТ ШВА – Seam Mark is a particular type of pressure mark in the finished fabric. It is produced during finishing operations by the thickness of the seam used to join pieces for processing. Seam Mark:- in finished cloth, a pressure mark caused by the thickness of the seam being pressed against the cloth.

SEAM SLIPPAGE = XX – Seam Slippage is a defect consisting of separated yarns occurring when sewn fabrics pull apart at the seams. Seam slippage is more prone to occur in smooth-yarn fabrics produced from manufactured filament yarns. / филаментная (комплексная) пряжа (filament yarn).

SEAM TEARS = РАЗРЫВЫ ШВОВ – Seam Tears:- frequently caused by the turning equipment used to reverse garments in finishing. Finishing department defects, and namely – Trimming Defects. / Порок или дефект заключительной обработки.

SEAM WELDING = СПАЙ ШВА – Seam Welding:- any stitchless procedure for joining fabrics based on the use of thermoplastic resins or the direct welding of thermoplastic materials. Seam welding is an alternative to conventional needle-and-thread seaming operations that is extremely popular in the nonwoven field.

SEA PAINTER = БАКШТОВ – Sea Painter (maritime term):- a line leading from forward on the ship and secured to a forward inboard thwart of the boat in such a way as to permit quick release.

SEAPPO = SOUTHEAST ASIA AND PACIFIC PLANT PROTECTION ORGANIZATION

SEAQ SYSTEM = STOCK EXCHANGE AUTOMATED QUOTATION SYSTEM

SEARCA = SOUTHEAST ASIAN REGIONAL CENTER FOR GRADUATE STUDY AND RESEARCH IN AGRICULTURE

SEARCH = ПОИСК (или ИССЛЕДОВАНИЕ) – Search:- after a trademark application is filed, the United States Patent and Trademark Office (USPTO) will conduct a Search of USPTO records for conflicting marks as part of the official examination process. The official search is not done for the applicant but rather to determine whether the mark applied for can be registered. The USPTO advises applicants and/or their representatives to search the records before filing the application. A search may be conducted through the Trademark Electronic Search System (TESS), or by visiting the Trademark Public Search Library, between 08:00 am and 08:00 pm at Madison East, 1st Floor, 600 Dulany Street, Alexandria, VA 22313, the United States. Use of the Public Search Library is free to the public. Also, certain information may be searched at a Patent and Trademark Depository Library. These libraries have CD-ROMS containing the database of registered and pending marks, and Internet access to the TESS. However, the CD-ROMS do not contain images of the design marks.

SEARCH AND INFORMATION RESOURCES ADMINISTRATION = АДМИНИСТРАЦИЯ ПО ПОИСКУ (или ИССЛЕДОВАТЕЛЬСКИМ) И ИНФОРМАЦИОННЫМ РЕСУРСАМ – In the United States, the Search and Information Resources Administration (SIRA) is an organizational unit of the Patent business area. The Search and Information Resources Administration (SIRA) supports examination processes by working closely with the Office of the Chief Information Officer in managing Patent IT activities. SIRA also implements and maintains classification schemes for the efficient retrieval of patent information and other documents residing in the search files. Additionally, SIRA acquires, maintains, and provides access to scientific and technical literature from multiple sources.

SEARCH COPY = ПОИСКОВАЯ КОПИЯ (или ИССЛЕДОВАТЕЛЬСКАЯ КОПИЯ, или ИССЛЕДОВАТЕЛЬСКИЙ ЭКЗЕМПЛЯР) – In the US patent law, a Search Copy is a copy of an international application filed under the Patent Cooperation Treaty maintained by the International Searching Authority.

SEAS = SECURE ENVIRONMENT ACCESS SOLUTION

SEASONAL CREDIT = СЕЗОННЫЙ КРЕДИТ – The Federal Reserve's Seasonal Credit program is designed to help small depository institutions manage significant seasonal swings in their loans and deposits. Seasonal credit is available to depository institutions that can demonstrate a clear pattern of recurring swings in funding needs throughout the year – usually institutions in agricultural or tourist areas. Borrowing longer-term funds from the discount window during periods of seasonal need allows institutions to carry fewer liquid assets during the rest of the year and make more funds available for local lending. The seasonal credit rate is based on market interest rates. It is set on the first business day of each two-week reserve maintenance period as the average of the effective federal funds rate and the interest rate on three-month certificates of deposit over the previous reserve maintenance period. See also Primary Credit, and Secondary Credit. Seasonal Credit is a credit allowing corporate or farm borrowers to finance operations during a manufacturing or sales cycle, or growing season. In the United States, Seasonal Credit is a credit extended by a Federal Reserve Bank to depository institutions that have difficulty raising funds in national money markets to help meet temporary needs for funds resulting from regular, seasonal fluctuations in loans and deposits. The interest rate charged is based on market rates. / Сезонные флуктуации (колебания) в ссудах и вкладах (депозитах). Кредит, позволяющий корпоративным заёмщикам или фермерам финансировать операции в течение производственного цикла или цикла продаж, или в период созревания сельскохозяйственной культуры.

SEASONALITY = СЕЗОННОСТЬ – Seasonality:- price patterns that tend to be repetitive each year due to an analysis of a long period of time. Agricultural markets may get most of the seasonality focus, but many other industrial commodities show good seasonal patterns of strength or weakness. There is also a seasonality to some of the Commitments Of Traders (COT) data due to the buying and selling patterns of commercial traders during certain parts of the year. All energy futures markets are affected to some extent by an annual seasonal cycle or 'Seasonality'. This seasonal cycle or pattern refers to the tendency of market prices to move in a given direction at certain times of the year. In the survey, 'seasonality' in gas delivery is the ratio between gas consumption in the peak and the lowest month of a given year. / Сезонность Производства – неравномерность выработки продукции в течение года, связанная с Сезоном. Выражается в подъёме, сокращении или полном прекращении производства в отдельные периоды года. Сезонность существует в ряде отраслей промышленности:- мясной, молочной, рыбной, пищевой, лесной, а также в строительстве, и сельском хозяйстве. Сезонность ппроизводства, хотя и возникает под влиянием климатических условий, в решающей степени зависит от способа производства. По мере развития техники и транспортных связей создаются возможности для преодоления сезонности производства. В капиталистических странах в форме сезонного производства проявляется хроническая недогрузка производственых мощностей. В дореволюционной России большинство отраслей промышленности носило сезонный характер. При социализме сезонность производства успешно преодолевалась. Так, в бывшем СССР лёгкая промышленность выпускала разнообразную продукцию в зависимости от сезона, вместе с тем её предприятия работали на протяжении всего года. Уменьшалась сезонность производства в пищевой промышленности бывшего СССР (сахарной, консервной, масложировой, винодельческой и других). Плодоовощная консервная промышленность, кроме традиционного летнего ассортимента продукции, вырабатывала обеденные, заправочные консервы и другие полуфабрикаты из овощей и плодов, сохраняемых в осенний и зимний периоды. Это позволяло организовать круглогодовую работу консервных предприятий и снизить себестоимость продукции. Практически нет сезонности в хлебопекарной, кондитерской, макаронной и других отраслях пищевой промышленности, использующих сырьё, прошедшее промышленную переработку. Сезонность производства в сахарной промышленности связана с техникой хранения Сахарной Свёклы. Удлинение периода переработки увеличивает потери её сахаристости. В этой отрасли сезонность уменьшилась в связи с переработкой тростникового сахара-сырца, ввозимого с Кубы, использованием в ряде районов замороженной Свёклы.

Сезонность производства существует в отдельных отраслях пищевой промышленности в связи с неравномерным потреблением готовой продукции (безалкогольных напитков, минеральной воды, пива, мороженого). В соляной, рыбной промышленности, а также в переработке рыбы сезонность производства зависит от климатических условий и уменьшается по мере развития транспортных средств и техники производства. Уменьшается сезонность в строительстве, лесной и других отраслях промышленности. Преодоление сезонности производства позволяет увеличить выпуск продукции, полнее использовать трудовые ресурсы и основные фонды. (2) Сезонность Производства в сельском хозяйстве – зависимость производственного цикла от периодов года (сезонов), обусловленная биологическими особенностями культивируемых растений и разводимых сельскохозяйственных животных. В разные сезоны для выполнения сельскохозяйственных работ требуется различное количество труда; возникает неодинаковая потребность в рабочей силе. Сезонность производства наиболее характерна для отраслей земледелия, где различают следующие сезоны:- зимний, весеннего сева, ухода за растениями и сеноуборки, уборки зерновых, уборки поздних сельскохозяйственных культур и вспашки зяби. В животноводстве, где различают 2 сезона – зимний и летний, сезонность производства выражена слабее. В этой отрасли можно регулировать во времени определённые биологические процессы:- размножение, рост и развитие животных; организовать содержание в одном месте больших групп скота и птицы с учётом половых и возрастных признаков и хозяйственного назначения; создать условия для одновременного (параллельного) выполнения работ по уходу за животными и получению животноводческой продукции. Сезонность производства в сельском хозяйстве бывшего СССР уменьшали рациональным сочетанием отраслей, комбинированием производства, механизацией трудоёмких работ, созданием аграрно-промышленных объединений, организацией производства продуктов на промышленной основе.

SEASONALIZATION = СЕЗОННОСТЬ (или ХХ) – Seasonalization is the merging of seasonal colors. Current practice dictates that particular color ranges are appropriate based on the season in which the garment is worn. Seasonalization contends that ‘all’ colors should be available to consumers on a year round basis, regardless of the calendar season.

SEASONAL LOAN = СЕЗОННАЯ ССУДА – Seasonal Loan is a credit granted to bridge seasonal needs for funds as experienced by certain types of enterprises, e.g., fashion houses. Special form of working capital credit. / Кредит, предоставленный в качестве мостика под сезонные нужды, причём денежные средства квалифицируются по определённым типам предприятий, например, дома моды.

SEASONAL POOL = СЕЗОННЫЙ ПУЛ – Seasonal Pool:- delivery alternative for national Australian Cotton growers whereby they commit either a specified quantity of Cotton or the production from a specified area to a particular marketing organization. Each grower who delivers to this pool subsequently receives the average price the organization obtains for all the Cotton delivered to the pool during the same season (with adjustments to reflect quality differences).

SEASONALS = SEASONAL GOODS

SEASONAL VARIATION = СЕЗОННАЯ ВАРИАЦИЯ – Seasonal Variation is the statistical variations that occur during a particular season. These variations are often taken into account when calculating, e.g., unemployment figures and trends. In these cases the figures are said to be seasonally adjusted. Recurring pattern of change in a statistical variable related to a manufacturing or sales cycle, or season, i.e. one which occurs repeatedly during the same cycle. / , то есть .

SEASONING = ЕСТЕСТВЕННАЯ СУШКА (или ВЫДЕРЖИВАНИЕ) – Seasoning is the process of drying lumber either naturally, or in a kiln, to a moisture content appropriate for the conditions and purposes for which it is to be used. / Сушка – удаление влаги из древесины.

SEAT = МЕСТО – Seat is an instrument granting trading privileges on an exchange. A seat may also represent an ownership interest in the exchange. The traditional term for the right to trade on the trading floor of the New York Stock Exchange (NYSE®). The owners of seats are considered members of the NYSE®. / Традиционный термин в отношении права торговать на торговом полу Нью Йоркской Фондовой Биржи (НЙФБ® или Эн.Уай.Эс.И.®; the New York Stock Exchange (NYSE®)). Владельцы мест рассматриваются как члены НЙФБ®.

SEAT = СИДЕНЬЕ (или ГНЕЗДО, или СЕДЛО, или МЕСТО УСТАНОВКИ, или ОПОРА, или ПОДУШКА) – Seat is the circumference of a pant, measured perpendicular to the fly opening and from the base of the fly.

SEA TRIALS = ХОДОВЫЕ ИСПЫТАНИЯ В МОРЕ – Sea Trials are a series of trials conducted by the builders during which the owner’s representatives on board act in a consulting and checking capacity to determine if the vessel has met the specifications.

SEATS = STOCK EXCHANGE’S AUTOMATED TRADING SYSTEM

SEA WAYBILL = МОРСКАЯ НАКЛАДНАЯ – Sea Waybill means a document, other than a bill of lading, that:- (i) is issued by the carrier of the goods; and (ii) is a receipt for the goods; and (iii) contains or evidences a contract for the carriage of the goods by sea; and (iv) identifies the person to whom delivery of the goods is to be made by the carrier in accordance with the contract. Sea Waybills are commonly used where:- (i) the sea voyage is short and the B/Ls may not get to the consignee in time; and (ii) when delivery is to a named party. A sea waybill is a promise by the carrier to the shipper to deliver his cargo to the person identified by him as entitled to delivery. The shipper retains the sea waybill and delivery is made upon appropriate proof of identity being furnished by the party seeking delivery. It is not a document of title and is non-negotiable. The main difference between a sea waybill and a bill of lading is that a waybill is not a document of title; this enables the consignee to obtain delivery without surrender of an original carriage document. Sea Waybill is a type of bill of lading (B/L) used for port-to-port or combined transport carriage. A waybill is identical to a negotiable bill of lading except that it is not a document of title. There are no originals issued for this type of document. In some jurisdictions, such as the USA, a waybill is deemed the equivalent of a (straight) consigned bill of lading. A non-negotiable document, which can only be made out to a named consignee. No surrender of the document by the consignee is required. See also Bill Of Lading R 300, and Bill Of Lading R 302. Sea Waybill is a receipt for cargo that contains or evidences a contract for the carriage of goods by sea and which identifies the person to whom the carrier is to deliver that cargo. A waybill or sea waybill differs from a bill of lading in that it lacks transferability and in that the designated consignee thus is not required to produce the waybill in order to obtain delivery of the cargo. Since a waybill is not a document of title, it will not attract the mandatory application of the Hague-Visby Rules as a matter of English law. However, sea waybills are within the ambit of the Carriage of Goods by Sea Act 1992. Also known as Waybill. / Морская Накладная – необоротный документ, который подтверждает наличие договора перевозки груза морским путём и принятие или погрузку груза перевозчиком и в соответствии с которым перевозчик обязуется доставить груз грузополучателю, указанному в документе.

SEAWORTHINESS = МОРЕХОДНОСТЬ (или ГОДНОСТЬ (СУДНА) К ПЛАВАНИЮ, или МОРЕХОДНЫЕ КАЧЕСТВА) – Seaworthiness:- the fitness of a ship to encounter the hazards of the sea with reasonable safety. In addition to having a sound hull the ship must be fully and competently crewed and sufficiently fuelled and provisioned for the next stage of voyage. All her equipment must

be in proper working order and, if she carries cargo, she must be cargoworthy and properly trimmed and stowed. The Marine Insurance Act (MIA) 1906, incorporates an implied warranty in a hull voyage policy which requires the ship to be seaworthy at the commencement of the voyage and, if the voyage is in stages, at the commencement of each stage of the voyage. Breach of this warranty is not held covered, so in such case, the underwriters are discharged from all liability under the policy as from the date the ship sails in an unseaworthy condition. A similar implied warranty applies to seaworthiness of the carrying vessel in regard to a cargo policy; but underwriters waive breach of the warranty in this case, provided the assured and their servants are not privy thereto. The warranty in the MIA does not apply to a hull time policy, but if the ship sails in an unseaworthy condition, with the privity of the assured, the underwriter is not liable for any loss that is attributable to the unseaworthiness. The fitness of a vessel for its intended use. The sufficiency of a vessel in materials construction, equipment, crew and outfit for the trade in which it is employed. Any sort of disrepair to the vessel by which the cargo may suffer – overloading, untrained officers, etc, may constitute a vessel unseaworthy. Term depicting the fitness of a vessel to travel in the open seas mostly related to a particular voyage with a particular cargo. / ручательство (warranty). в открытом море . Под Мореходными Качествами судна понимается совокупность характеристик судна, определяющих его поведение в эксплуатационных условиях плавания, – всхожесть на волну, непотопляемость, остойчивость, плавучесть, управляемость, ходкость и тому подобное. Мореходные качества определяют возможность эксплуатации судна в бассейнах с различными гидрометеорологическими условиями – на реках, водохранилищах, портовых акваториях, рейдах, в определённых морских районах или без ограничения района плавания. Мореходные качества зависят от размеров и соотношений главных размерений судна, от формы обводов (очертаний наружной поверхности корпуса) и распределения масс по длине и высоте. Под Живучестью понимается способность судна при получении повреждений сохранять свои экспуатационные и мореходные качества. Обеспечивается непотопляемостью, пожаробезопасностью, надёжностью технических средств, подготовленностью экипажа. Под Ходовыми Качествами судна понимается совокупность свойств, характеризующих подвижность судна (ходкость, инерцию, управляемость, устойчивость на курсе, потери скорости при волнении). Ходовые качества военных кораблей характеризует также дальность плавания при различных скоростях хода. Ходовые качества судна оценивают путём модельных испытаний в опытовом бассейне и проверяют во время ходовых испытаний судна. Под Плавучестью судна понимается способность судна с грузом на борту плавать в заданном положении относительно водной поверхности; одно из важнейших мореходных качеств судна. Плавучесть характеризуется водоизмещением и запасом плавучести, который определяется размером надводного борта и соответствует непроницаемому для воды надводному объёму судна, расположенному выше грузовой ватерлинии и включающему помещения, ограниченные верхней палубой, а также водонепроницаемые надстройки и рубки.

SEAWORTHINESS CERTIFICATE = СВИДЕТЕЛЬСТВО О ГОДНОСТИ (СУДНА) К ПЛАВАНИЮ (или СВИДЕТЕЛЬСТВО О МОРЕХОДНОСТИ) – Seaworthiness Certificate is a certificate issued by a classification society surveyor to allow a vessel to proceed after she has met with a mishap that may have affected its seaworthiness. It is frequently issued to enable a vessel to proceed, after temporary repairs have been effected, to another port where permanent repairs are then carried out.

SEAWORTHINESS WARRANTY = РУЧАТЕЛЬСТВО МОРЕХОДНОСТИ (или РУЧАТЕЛЬСТВО ГОДНОСТИ (СУДНА) К ПЛАВАНИЮ) – Seaworthiness Warranty is an implied warranty in every voyage policy that the ship must be seaworthy at the commencement of the insured voyage or, if the voyage is carried out in stages, at the commencement of each stage of the voyage. To be seaworthy, the ship must be reasonably fit in all respects to encounter the ordinary perils of the contemplated voyage, property crewed, fuelled and provisioned, and with all her equipment in proper working order. Cargo policies waive breach of the warranty, except where the assured or their servants are privy to the unseaworthiness. Breach of the warranty is not excused in a hull voyage policy, literal compliance therewith being required. Although there is no warranty of seaworthiness in a hull time policy, claims arising from unseaworthiness may be prejudiced if the ship sails in an unseaworthy condition with the knowledge of the assured.

SEAWORTHY = МОРЕХОДНОЕ (или ГОДНОЕ К ПЛАВАНИЮ, или ОБЛАДАЮЩЕЕ ХОРОШИМИ МОРЕХОДНЫМИ КАЧЕСТВАМИ) – Seaworthy (maritime term):- capable of putting to sea and able to meet sea conditions. Seaworthy is the sound condition of a vessel's hull and equipment, machinery, crew, and stowage of cargo, so it is reasonably fit to successfully meet all the varying conditions of sea, wind, and weather normally to be expected on the intended voyage.

SEB = SINGLE END BREAK

SEC = THE SECURITIES AND EXCHANGE COMMISSION

SECANT MODULUS = СЕКАНС МОДУЛЬ (или СЕКУЩИЙ МОДУЛЬ) – Secant Modulus is the ratio of change in stress to change in strain between two points on a stress-strain diagram, particularly the points of zero stress and breaking stress. The Secant Modulus is a special case of chord modulus:- starting at zero.

SECO = STATE SECRETARIAT FOR ECONOMIC AFFAIRS

SECONDARIES = АКЦИИ ВТОРОГО ЭШЕЛОНА (или АКЦИИ ДОПОЛНИТЕЛЬНОЙ ЭМИССИИ, или ВТОРИЧКА) – Secondaries:- as with a primary offering, secondaries are usually handled by investment bankers, acting alone or as a syndicate, who purchase the shares from the seller at an agreed price, then resell them, sometimes with the help of a selling group, at a higher public offering price, making their profit on the difference, called the Spread. Sea also Secondary Shares.

SECONDARY ADVENTITIOUS ROOTS = ВТОРИЧНЫЕ ПРИДАТОЧНЫЕ КОРНИ – Secondary Adventitious Roots are roots arising from the nodes at the base of the plant.

SECONDARY BACKING = ВТОРИЧНАЯ ПОДКЛАДКА – Secondary Backing is a layer of material, usually woven jute, polypropylene, vinyl, or latex foam, laminated to the underside of a carpet to improve body and dimensional stability.

SECONDARY COLORS = ВТОРИЧНЫЕ ЦВЕТА – Secondary Colors:- green, orange, and violet, each of which is obtained by mixing two primary colors.

SECONDARY CREDIT = ВТОРИЧНЫЙ КРЕДИТ – In the United States, Secondary Credit is a credit extended to depository institutions ineligible for primary credit, at a rate above the primary credit rate, either on a very short-term basis (when consistent with a timely return to market sources of funds) or for a longer term (to facilitate the orderly resolution of serious financial difficulties). Secondary Credit is available to depository institutions that are not eligible for primary credit. It is extended on a very short-term basis, typically overnight. Reflecting the less-sound financial condition of borrowers of secondary credit, the rate on secondary credit has typically been 50 basis points above the primary credit rate, although the spread can vary as circumstances warrant. Secondary credit is available to help a depository institution meet backup liquidity needs when its use is consistent with the borrowing institution's timely return to a reliance on market sources of funding or with the orderly resolution of a troubled institution's difficulties. Secondary credit may not be used to fund an expansion of the borrower's assets. Loans extended under the secondary credit program entail a higher level of Reserve Bank administration and oversight than loans under the primary credit program. A Reserve Bank must have sufficient

information about a borrower's financial condition and reasons for borrowing to ensure that an extension of secondary credit would be consistent with the purpose of the facility. Moreover, under the Federal Deposit Insurance Corporation Improvement Act of 1991, extensions of Federal Reserve credit to an FDIC-insured depository institution that has fallen below minimum capital standards are generally limited to 60 days in any 120-day period or, for the most severely undercapitalized, to only five days. See also Primary Credit, and Seasonal Credit.

SECONDARY CREEP = ВТОРИЧНАЯ ПОЛЗУЧЕСТЬ (или ВТОРИЧНАЯ ТЕКУЧЕСТЬ) – Secondary Creep is the nonrecoverable component of creep. See also Delayed Deformation.

SECONDARY DISTRIBUTION = ВТОРИЧНОЕ РАЗМЕЩЕНИЕ – Secondary Distribution is the redistribution of a block of stock some time after it has been sold by the issuing company. The sale is handled off the New York Stock Exchange by a securities firm or group of firms and the shares are usually offered at a fixed price related to the current market price of the stock. Usually the block is a large one, such as might be involved in the settlement of an estate. The security may be listed or unlisted. Also known as Secondary Offering. See also Investment Banker, and Primary Distribution. / Смотрите также Инвестиционный Банкир (Investment Banker), и Первичное Размещение (Primary Distribution).

SECONDARY INFECTION = ВТОРИЧНАЯ ИНФЕКЦИЯ – Secondary Infection:- colonization of an established lesion by saprophytic organisms that grow rapidly and reproduce abundantly on the dead and/or dying plant tissue produced as a result of pathogen activity. Secondary Infection is an infection resulting from inoculum arising from a primary infection. Secondary Infection is a contamination caused as a result of microorganisms (durable spores) from previous contaminated loads that are able to attack a subsequent cargo.

SECONDARY MARKET = ВТОРИЧНЫЙ РЫНОК – Secondary Market is the counterpart of the primary market referring to the market for outstanding securities, above all equities and bonds. The stock exchanges are the most important secondary markets. A market in which holders of financial instruments can re-sell all or part of their holding. The larger and more effective the secondary market for any particular financial instrument the more liquid that instrument is to the holder. In Australia, the Secondary Market refers to the trading of a share or a warrant on the Australian Securities Exchange (ASX) trading system SEATS after the primary issue by a company or a warrant issuer. For example, after a company has listed on ASX and issued shares to investors, the shares can then be sold to other investors on the sharemarket. Although it is referred to as the secondary market function of the sharemarket, the daily trading of shares in listed companies is the main activity of the sharemarket. The market where existing securities are traded among investors through an intermediary, such as an organized exchange like the NYSE®, AMEX® and NASDAQ®. When stocks or bonds are traded or resold, they are said to be sold on the secondary market. The majority of all securities transactions takes place on the secondary market. Market where previously issued securities are bought and sold. Market for trading in securities (e.g., Eurobonds) subsequent to the initial placement during the issuing period (primary market). / , например, . НЙФБ® или Эн.Уай.Эс.И.® (NYSE®), АФБ® или АМЭКС® (AMEX®) и НЭЗДЭК® (NASDAQ®) .

SECONDARY METAL = ВТОРИЧНЫЙ МЕТАЛЛ – Secondary Metal is a scrap metal that has been recycled. / Полученный из отходов и скрапа. Под Вторичным Металлом понимается металл, полученный в результате переплавки металлического лома и отходов производства. Под Вторичным Металлом понимается металл, который после первоначального использования (износа) может применяться повторно в производстве как исходное сырьё. Лом, отходы чёрных, цветных и драгоценных металлов относятся ко вторичному сырью.

SECONDARY OFFERING = ВТОРИЧНОЕ ПРЕДЛОЖЕНИЕ – Secondary Offering:- public sale of previously issued securities held by large investors, usually corporations, institutions, or other affiliated persons, as distinguished from a new issue or primary distribution, where the seller is the issuing corporation. As with a primary offering, secondaries are usually handled by investment bankers, acting alone or as a syndicate, who purchase the shares from the seller at an agreed price, then resell them, sometimes with the help of a selling group, at a higher public offering price, making their profit on the difference, called the Spread. Since the offering is registered with the Securities and Exchange Commission, the syndicate manager can legally stabilize – or peg – the market price by bidding for shares in the open market. Buyers of securities offered this way pay no commissions, since all costs are borne by the selling investor. If the securities involved are listed, the consolidated tape will announce the offering during the trading day, although the offering is not made until after the market's close. Among the historically large secondary distributions were the Ford Foundation's offering of Ford Motor Company stock in 1956 (approximately USD658 million) handled by 7 firms under a joint management agreement and the sale of Howard Hughes' TWA shares (USD566 million) through Merrill Lynch, Pierce, Fenner & Smith in 1966. A similar form of secondary distribution, called the Special Offering, is limited to members of the New York Stock Exchange and is completed in the course of the trading day. Secondary Offering:- new public offering of corporate equity already listed on the stock exchange. This typically involves placing shares of major shareholders, family members or other privately held shares with new shareholders. Secondary Offering is:- (1) the issuance of new stock for public sale from a company that has already made its initial public offering (IPO). Usually, these kinds of public offerings are made by companies wishing to refinance, or raise capital for growth. Money raised from these kinds of secondary offerings goes to the company, through the investment bank that underwrites the offering. Investment banks are issued an allotment, and possibly an overallotment which they may choose to exercise if there is a strong possibility of making money on the spread between the allotment price and the selling price of the securities. This sort of secondary public offering is a way for a company to increase outstanding stock and spread market capitalization (the company's value) over a greater number of shares. Secondary offerings in which new shares are underwritten and sold dilute the ownership position of stockholders who own shares that were issued in the IPO. (2) A sale of securities in which one or more major stockholders in a company sell all or a large portion of their holdings. The proceeds of this sale are paid to the stockholders that sell their shares. Often, the company that issued the shares holds a large percentage of the stocks it issues. Typically, such an offering occurs when the founders of a business (and perhaps some of the original financial backers) determine that they would like to decrease their positions in the company. This kind of secondary offering is common in the years following an IPO, after the termination of the lock-up period. Owners of closely held companies sell shares to loosen their position – usually gradually, so that the company's share price doesn't plummet as a result of high selling volume. This kind of offering does not increase the number of shares of stock on the market, and it is most commonly performed in the case of a company that is very thinly traded. Secondary offerings of this sort do not dilute owners' holdings, and no new shares are released. There is no 'new' underwriting process in this kind of offering. / Фод Мотор Кампэни (Ford Motor Company) Хавод Хьюз (Howard Hughes) брокерской фирмой Мёрл Лынч, Пирс, Фэна Энд Смис (Merrill Lynch, Pierce, Fenner & Smith) в 1966.

SECONDARY PANICLE BRANCHES = ВЕТВИ ВТОРИЧНОЙ МЕТЁЛКИ (или ВЕТВИ ВТОРОГО ПОРЯДКА) – Secondary Panicle Branches are the branches that bear the spikelets arising from the primary branch of the panicle. / В ботанике под Метёлкой понимается ложное соцветие, многократно ветвящееся и несущее на концах ветвей простые соцветия – кисти (Сирень), колоски (у злаков), корзинки (у сложноцветных).

SECONDARY PESTS = ВТОРИЧНЫЕ ВРЕДИТЕЛИ – Secondary Pests are Pests which because of natural control agents normally have low populations and do not require chemical applications for control.

SECONDARY PURCHASE = ВТОРИЧНОЕ ПРИОБРЕТЕНИЕ – Secondary Purchase is a purchase of investments from the portfolio of a venture capital firm by another private equity company. This is how venture capital funds sell portfolio companies that are not performing according to plan and which would otherwise have to be written off completely. In some cases, the entire (residual) portfolio of the venture capital firm is sold if a follow-on financing is uncertain. Typically, the buyer acquires holdings that are in a mature stage, avoiding the riskier early stage of financing. For the startup company, a secondary purchase usually entails significant risks but, in some cases, is its only chance of survival.

SECONDARY RECOVERY = ВТОРИЧНАЯ ДОБЫЧА – Secondary Recovery:- methods of increasing the percentage of oil recovered from oil fields using natural gas or water injection. It is the simplest form of Enhanced Oil Recovery (EOR) and is often initiated with primary recovery.

SECONDARY SHARES = АКЦИИ ВТОРОГО ЭШЕЛОНА (или ВТОРИЧНЫЕ АКЦИИ) – Secondary Share is a share of a company, which is well managed and has good markets, but does not have the financial muscle or history of profits of the blue chips. These are sometimes referred to as Growth Stocks, because they have the potential to become blue chips at some future stage. You should expect a secondary share to double its market price within the next 2 to 3 years, and for this reason they form an important middle area in your portfolio between blue chips and speculative shares. Secondary Shares are shares in a stock offering in which proceeds go to other investors rather than the issuing company. Secondary shares have been previously traded and will not result in an increase shares outstanding. Compare Primary Shares.

SECONDARY SHARES = АКЦИИ ДОПОЛНИТЕЛЬНОЙ ЭМИССИИ (или ВТОРОСТЕПЕННЫЕ АКЦИИ) – In an initial public offering (IPO), Secondary Shares (in contrast to primary shares) refer to existing shares of common stock that are sold to investors in an offering. The selling of these secondary shares may be from existing shareholders, or may be newly registered shares from the company. In the case of newly registered shares, the offering is referred to as 'dilutive' (to earnings per share (EPS)) due to the increase in the number of outstanding shares. In the case of selling shares of already registered stock (from an institutional block or from insider shares), the offering is considered 'non-dilutive'. In an IPO, Secondary Shares, in contrast to primary shares, refer to existing shares of common stock that are sold to new investors. The cash generated from the sale of secondary shares is given to the selling stockholder, rather than the company. See also Primary Share.

SECONDARY STOCKS = ВТОРИЧНЫЕ ЗАПАСЫ – In oil industry, Secondary Stocks are stocks in small bulk plants (marketing facilities below a certain capacity, e.g., 50 000 bl in United States, which receive their product by rail or truck) and retail establishments. Petroleum stocks held by power stations, minor bulk plants and wholesalers. / Запасы нефтепродуктов, поддерживаемые электростанциями, небольшими заводами и оптовыми торговцами.

SECONDARY TILLAGE = ВТОРИЧНАЯ ВСПАШКА (или ПРЕДПОСЕВНАЯ ОБРАБОТКА ПОЧВЫ) – Secondary Tillage is the cultivation that follows primary tillage; it breaks clods, incorporates plant materials into the soil, and levels the soil. It is often called Harrowing or Hoeing. / Под Боронованием (Harrowing) понимается рыхление поверхностного слоя почвы боронами и вращающимися мотыгами. Предохраняет почву от высыхания, выравнивает её поверхность, разрушает почвенную корку, уничтожает сорняки.

SECONDARY TILLERS = ВТОРИЧНЫЕ ПОЧВОФРЕЗЫ (или МАШИНЫ ДЛЯ ПРЕДПОСЕВНОЙ ПОЧВООБРАБОТКИ) – Secondary Tillers are tillers that arise from the primary tillers.

SECONDARY TRISOMIC = ВТОРИЧНЫЙ ТРИСОМИК – Secondary Trisomic is a trisomic in which the extra chromosome is the isochromosome for one of the chromosome arms of the complement. / Трисомик – клетка с двумя нормальными наборами хромосом. Трисомное. .

SECONDARY WALL = ВТОРИЧНАЯ СТЕНКА – The Secondary Wall consists of concentric layers of cellulose which constitute the main portion of the cotton fiber (also called the S, Layer). After the fiber has attained its maximum size during the growth period, a new layer of cellulose is added to the secondary wall. The fibrils are deposited at angles of 70 to 80 degrees with points where the angles are reversed along the length of the fiber. The fibrils are packed close together again forming small capillaries. / слой или прослойка, фибриллы . Под Первичной Стенкой залегает основная вторичная – из целлюлозы. Она имеет значительную по сравнению с первичной стенкой толщину (5–10 мк) и определяет механические свойства волокна. Слой целлюлозы образуется в процессе роста волокна в толщину, причем её накопление происходит от первичной стенки внутрь. При разрушении вторичной стенки видны тончайшие нити – фибриллы, диаметр от 60 до 400 А. Они расположены по винтовой линии под большим углом (30–35) к оси волокна. Вторичная Клеточная Стенка наиболее утолщена и образует большую часть клеточной стенки. Она состоит главным образом из целлюлозы и представляет собой множество концентричных слоёв параллельно расположенных вдоль оси микрофибрилл целлюлозы. Вторичный слой определяет форму клетки и её механические свойства.

SECOND ASSISTANT ENGINEER = ВТОРОЙ ПОМОЩНИК МЕХАНИКА (или ВТОРОЙ ПОМОЩНИК ИНЖЕНЕРА) – Second Assistant Engineer (engineer department (licensed)):- in charge of twelve to four watch. On steam vessels has responsibility for the boilers, on diesels, the evaporators and the auxiliary equipment.

SECOND CUT LINTERS = ЛИНТ ВТОРОГО СЪЁМА – Second Cut Linters means the fibrous growth resulting from the second cut of cottonseed in the cotton oil mill.

SECOND CUTS = ВТОРОЙ СЪЁМ (или ЛИНТ ПОСЛЕ ВТОРОГО ПУХООТДЕЛЕНИЯ) – Second Cuts:- fibers, or short lengths of wool resulting from cutting wool fibers twice in careless shearing. An excessive number of second cuts decreases the average fiber length, and depreciates spinning quality. See also Noils.

SECOND GROWTH = ВТОРОЙ РОСТ – Second Growth:- xxxxx. See also Regrowth.

SECOND HEAD MILLED RICE = ВТОРОЙ СЬЁМ (или ВТОРОЙ СХОД) ОСНОВНОГО ЗЕРНА ОБРУШЕННОГО РИСА – In the Rice industry of the United States, 'Second Head Milled Rice' shall consist of milled Rice which, when determined in accordance with §868.303, contains:- (i) not more than (a) 25.0 percent of whole kernels, (b) 7.0 percent of broken kernels removed by a 6 plate, (c) 0.4 percent of broken kernels removed by a 5 plate, and (d) 0.05 percent of broken kernels passing through a 4 sieve (southern production); or (ii) not more than (a) 25.0 percent of whole kernels, (b) 50.0 percent of broken kernels passing through a 61/2 sieve, and (c) 10.0 percent of broken kernels passing through a 6 sieve (western production). / (i) не более, чем (a) 25.0 процентов целиковой зерновки (целого ядра), (b) 7.0 процентов битой зерновки (битых ядер), выделенных решетом № 6, (c). Под Помолом понимается:- (i) измельчение материала (например, зерна, извести, угля и другого) механическим способом; (ii)

качество измельчения какого-либо материала (грубый и тонкий помолы); и (iii) совокупность технологических процессов переработки зерна в муку.

SECOND HEADS = ВТОРОЙ СЬЁМ (или ВТОРОЙ СХОД) ОСНОВНОГО ЗЕРНА – Second Heads is the portion of total milled Rice consisting of broken kernels at least half as long as a whole one. Second Heads characteristics:- can be used alone or in combination with whole kernels. Applications:- (i) hot-and-ready-to-eat cereals; (ii) rice pudding; (iii) meat extenders; (iv) fillings, stuffings; (v) crisped rice for confections; (vi) production of rice flour; and (vii) pet foods. / Ко второму съёму относится часть полностью обрушенного риса, состоящая из битой зерновки (битых ядер), которая даже в половину длины, схожа с полной длиной. Под Помолом понимается:- (i) измельчение материала (например, зерна, извести, угля и другого) механическим способом; (ii) качество измельчения какого-либо материала (грубый и тонкий помолы); и (iii) совокупность технологических процессов переработки зерна в муку.

SECOND LEAF = ВТОРОЙ ЛИСТ – Second Leaf (of a seedling) is the first differentiated leaf, with a blade and sheath. / Второй Лист – лист, образующийся над семядолей или первичными листьями.

SECOND LINERS = АКЦИИ ВТОРОГО ЭШЕЛОНА

SECOND MATE = ВТОРОЙ ПОМОЩНИК – Second Mate:- in charge of twelve to four watch. Ship's navigation officer. Keeps charts (maps) up to date and monitors navigation equipment on bridge.

SECOND MORTGAGE = ВТОРИЧНАЯ ЗАКЛАДНАЯ – Second Mortgage is a mortgage that follows a first mortgage in order of claim. Granted in Switzerland usually with lending values of around 65–80% of the underlying property's market value and subject to amortization, unlike first mortgages, which in Switzerland are generally not amortized. The interest rate on second mortgages is higher than on first mortgages. See also First Mortgage. Additional mortgage on a property that is already mortgaged, granted only if the property has sufficient value to act as security for both loans.

SECOND–ORDER TRANSITION TEMPERATURE = ТЕМПЕРАТУРА (ФАЗОВОГО) ПЕРЕХОДА ВТОРОГО ПОРЯДКА – Second-Order Transition Temperature is the temperature at which the noncrystalline (amorphous) portions of polymer melt or become plastic. An inflection point or change is stress-strain properties occurs at this point; however, for most fibers, this change is small.

SECOND PARTY LOGISTIC MODEL = МОДЕЛЬ ВТОРОЙ СТОРОНЫ ЛОГИСТИКИ (или ДВУХСТОРОННЯЯ МОДЕЛЬ ЛОГИСТИКИ) – Second Party Logistic (2PL) Model:- the manufacturer hires a carrier or warehouse manager as a subcontractor for the operational execution of a clearly defined transport or logistic task. The organisation and follow-up remain the responsibility of the manufacturer. The relation supplier is often only cost-driven and short-term, with the logistic actor doing what the client instructs, and being paid accordingly.

SECONDS = НИЗКОСОРТНЫЕ (или ВТОРОСТЕПЕННЫЕ, или ВТОРОСОРТНЫЕ) – Seconds are:- (1) imperfect fabrics (woven or knitted) containing flaws in the weave, finish, or dyeing, and sold as 'seconds'. (2) See also Yarn Quality.

SECRETARY = СЕКРЕТАРЬ – Secretary is a secretary of the Commission appointed pursuant to Article XII (The International Plant Protection Convention (IPPC)). / Под Секретарём, от позднелатинского слова Secretarius, означающее Доверенное Лицо, понимается:- (i) служащий, ведающий делопроизводством учреждения, отдельного лица; (ii) составитель протокола собрания, заседания; или (iii) выборный руководитель партийной или общественной организации.

SECRET KEY = СЕКРЕТНЫЙ КЛЮЧ – Secret Key is a key used with symmetric cryptographic techniques and usable only by a set of specified entities. / Ключ, используемый в симметричной криптографической технике и который может быть использован только рядом определённых лиц.

SECTION 8 = РАЗДЕЛ 8 – In the United States, Section 8 is a program of the Department of Housing and Urban Development (HUD) that provides rental assistance to low- and very low-income families. HUD pays the difference between the market rent of a unit and the amount that the tenant is able to pay. / В Соединённых Штатах Америки, Раздел 8 подразумевает под собой программу Министерства Жилищного Строительства и Городского Развития (МЖСГР) .

SECTION 8 DECLARATION OF CONTINUED USE = РАЗДЕЛ 8 ДЕКЛАРАЦИЯ НЕПРЕРЫВНОГО ИСПОЛЬЗОВАНИЯ – In the US trademark law, a Section 8 Declaration of Continued Use is a sworn statement, filed by the owner of a registration that the mark is in use in commerce. Section 8 of the Trademark Act, 15 USC §1058. It must be filed by the current owner of the registration and the United States Patent and Trademark Office (USPTO) must receive it during the following time periods:- (1) at the end of the 6th year after the date of registration (or the date of publication under 15 USC §1062(c) for registrations issued under the Acts of 1905 or 1881 that have claimed the benefits of the Act of 1946); and (2) at the end of each successive 10-year period after the date of registration. There is a six-month grace period. If these rules and deadlines are not met, the USPTO will cancel the registration.

SECTION 8 DECLARATION OF EXCUSABLE NONUSE = РАЗДЕЛ 8 ДЕКЛАРАЦИЯ ПРОСТИТЕЛЬНОГО НЕИСПОЛЬЗОВАНИЯ – In the US trademark law, a Section 8 Declaration of Excusable Nonuse is a sworn statement, filed by the owner of a registration, that the mark is not in use in commerce due to special circumstances that excuse such nonuse and is not due to any intention to abandon the mark. Section 8 of the Trademark Act, 15 USC 1058. It must be filed by the current owner of the registration and the United States Patent and Trademark Office (USPTO) must receive it during the following time periods:- (1) at the end of the 6th year after the date of registration (or the date of publication under 15 USC §1062(c) for registrations issued under the Acts of 1905 or 1881 that have claimed the benefits of the Act of 1946); and (2) at the end of each successive 10-year period after the date of registration. There is a six-month grace period. If these rules and deadlines are not met, the USPTO will cancel the registration. Once the USPTO accepts the Section 8 Declaration of Excusable Nonuse, the owner of the registration is not required to file another Section 8 Declaration until the next statutory filing period.

SECTION 9 RENEWAL APPLICATION = РАЗДЕЛ 9 ВОЗОБНОВЛЁННОЕ ЗАЯВЛЕНИЕ – In the US trademark law, a Section 9 Renewal Application is a sworn document, filed by the owner of a registration, to avoid the expiration of a registration. Federal trademark registrations issued on or after November 16, 1989, remain in force for 10 years, and may be renewed for 10-year periods. Trademark registrations issued or renewed prior to November 16, 1989 remain in force for 20 years, and may be renewed for 10-year periods. Trademark owners have a total of 18 months to file a §9 Renewal Application. The §9 Renewal Application may be filed one year prior to the registration expiration date or during the 6-month grace period immediately after the date of expiration. If the §9 Renewal Application is not filed or is filed after the grace period ends, the registration will expire. Because the due date of the 10-year §8 Declaration coincides with the due date of the §9 Renewal Application, the United States Patent and Trademark Office (USPTO) created a form entitled 'Combined Declaration of Use in Commerce and Application for Renewal of Registration of a Mark Under Sections 8 & 9'.

SECTION 15 DECLARATION OF INCONTESTABILITY = РАЗДЕЛ 15 ДЕКЛАРАЦИЯ НЕОСПОРИМОСТИ – In the US trademark law, a Section 15 Declaration of Incontestability is a sworn statement, filed by the owner of a mark registered on the Principal Register, claiming 'incontestable' rights in the mark for the goods/services specified. An 'incontestable' registration is conclusive evidence of the validity of the registered mark, of the registration of the mark, of the owner's ownership of the mark and of the owner's exclusive right to use the mark with the goods/services. The claim of incontestability is subject to certain limited exceptions set forth in §§15 and 33(b) of the Trademark Act, 15 USC §§1065 and 1115(b). 15 USC §1065. Filing a Section 15 Declaration is optional. However, there are certain rules governing when one may be filed. A §15 Affidavit may not be filed until the mark has been in continuous use in commerce for at least five consecutive years subsequent to the date of registration for marks registered under the Act of 1946 (and subsequent to the date of publication under §12(c) of the Trademark Act, 15 USC §1062(c), for marks registered under the Acts of 1905 and 1881 for which the benefits of the Act of 1946 have been claimed). The §15 Affidavit must be executed and filed within one year following a 5-year period of continuous use of the mark in commerce. Marks registered on the Supplemental Register are not eligible for claims of incontestable rights under §15.

SECTION 337 = РАЗДЕЛ 337 – Section 337 of the US Tariff Act of 1930 requires investigations of unfair practices in import trade. Under this authority, the International Trade Commission applies US statutory and common law of unfair competition to the importation of products into the United States and their sale. Section 337 prohibits unfair competition and unfair importing practices and sales of products in the US, when these threaten to:- (i) destroy or substantially injure a domestic industry, (ii) prevent the establishment of such an industry, or (iii) restrain or monopolize US trade and commerce. Section 337 also prohibits infringement of US patents, copyrights, registered trademarks, or mask works. / привоз (importation).

SECTION BEAM = ТКАЦКИЙ НАВОЙ С ЛЕНТОЧНОЙ СНОВАЛЬНОЙ МАШИНЫ (или СНОВАЛЬНЫЙ ВАЛИК ПАРТИОННОЙ СНОВКИ) – Section Beam is:- (1) a large, flanged roll upon which warp yarn is wound at the beam warper in preparation for slashing. (2) Small flanged or unflanged beams assembled side-by-side on the shaft of a warp beam for further processing.

SECTION MARKS = ОТМЕТИНЫ ОТ СЕКЦИЙ – Section Marks:- section wise mark on fabric due to overlapping of sections during warping. Weaving defect. Section Mark:- overall lapping of sections of excessive distance between two sections. Improper traverse and cone height of section drum. Section Mark:- in woven fabrics, warp bands of different color, texture, or luster. Section Mark is a fabric defect consisting of marks running warpwise in an evenly repeating pattern, caused by the improper setting of sections in silk system (or indirect) warping. / Порок или дефект ткачества. Полосатость по длине ткани от неправильной ленточной сновки. Полосатость По Основе (section marks):- порок заключительной отделки ткани; полосы по ширине, окраска которых темнее, чем у основного полотна. Примечание:- этот порок возникает либо в результате неравномерного натяжения полотна во время секционного снования, либо является следствием неправильного окрашивания или изменения линейной плотности пряжи.

SECTOR = SECURITIES TELECOMMUNICATIONS ORGANIZATION

SECTOR = СЕКТОР (или ОТРАСЛЬ) – Sector:- in national accounting, area of the economy defined by the goods and services and capital that flow between it and other areas of the economy. The US Department of Commerce divides the US economy into four sectors:- (i) business, (ii) government (public sector), (iii) personal, and (iv) rest-of-the-world. The rest-of-the-world sector includes flows of exports, imports, and capital to and from foreign countries. See also Business Sector, and Government Sector. A group of companies that generate revenue in similar ways, and tend to rise and fall with the economic cycle. Sectors are commonly broken down into smaller groups called Industries. The sectors tracked by the Standard And Poor's Index are Basic Industries, Consumer Services, Consumer Staples, Energy, Financials, Industrials, Technology, Transport/Cyclicals, and Utilities. Sector investors watch for strength or weakness in the various sectors before making investment decisions. The relationship between sector strength/weakness and the business cycle is called Sector Rotation. In the economic accounts the economy is split into different institutional sectors, i.e. groupings of units according broadly to their role in the economy. The main sectors are nonfinancial corporations, financial corporations, general government, households and non-profit institutions serving households (NPISH). The Rest of the world is also treated as a sector for many purposes within the accounts. / В национальном бюджетном процессе, . Стэндод энд Поз (Standard & Poor's) . Под Сектором, от позднелатинского слова Sector, означающее Отделяющий или Рассекающий, от Латинского слова Seco, означающее Разделяю или Разрезаю, понимается часть народного хозяйства, имеющая определённые экономические и социальные признаки.

SECTOR FUND = ОТРАСЛЕВОЙ ФОНД (или СЕКТОРНЫЙ ФОНД) – Sector Fund is the investment fund investing in an individual industry. / Инвестиционный фонд, инвестирующий в конкретную отрасль экономики. Секторный Фонд – взаимный фонд, сфера инвестиционной деятельности которого ограничена определённым сегментом рынка (сектором или отраслью). Секторные фонды наращивают капитал за счёт роста отдельного сектора, и, следовательно, являются менее диверсифицированными, чем фонды, отслеживающие рынок в целом. В то же время, сосредотачивая свои ресурсы в конкретной отрасли или секторе, инвестор секторного фонда получает возможность диверсификации внутри данной отрасли (сектора), чего он вряд ли смог бы достичь самостоятельно. Фонд достигает этого, вкладывая средства множества инвесторов в акции большого количества различных компаний отрасли. Секторные фонды способны получать огромные прибыли или нести не менее огромные потери в зависимости от динамики избранного ими сектора. Поэтому они являются более рискованными, чем фонды, отслеживающие рынок в целом.

SECURE = КРЕПИТЬ (или ЗАКРЕПЛЯТЬ, или ЗАДРАИВАТЬ, или ОТБОЙ) – Secure (maritime term):- to make fast; safe; the completion of a drill or exercise on board ship.

SECURE CRYPTOGRAPHIC DEVICE = СРЕДСТВО КРИПТОГРАФИЧЕСКОЙ ЗАЩИТЫ – A Secure Cryptographic Device (SCD) is a physically and logically protected hardware device that provides a secure set of cryptographic services. In assessing the physical security of any device, the operational environment is an important consideration.

SECURED CREDIT = ОБЕСПЕЧЕННЫЙ КРЕДИТ (или КРЕДИТ ПОД ЗАЛОГ) – Secured Credit is a credit granted on the basis of security or collateral pledged or deposited to assure repayment. The security may take the form of a pledge of securities, an assignment, a guarantee, a surety or real and personal collateral. The opposite of Unsecured Credit. / выплата (repayment) .

SECURED DEBT = ОБЕСПЕЧЕННЫЙ ДОЛГ (или ОБЕСПЕЧЕННАЯ ЗАДОЛЖЕННОСТЬ) – Secured Debt could include a mortgage, debt backed by real property. Equipment trust receipts are backed by purchase of equipment, such as transportation equipment. Lenders can attach covenants to a bond to protect themselves from default. For example, the company may be required to provide regular financial statements or maintain minimum debt coverage ratios. Or, the company might be prohibited from selling assets or borrowing additional money without the lender's approval.

SECURED LOAN = ОБЕСПЕЧЕННАЯ ССУДА – Secured Loan is a loan, advance or any other form of receivable which is secured within the meaning of US Commodity Futures Trading Commission Regulation by readily marketable collateral that is:- (i) money or

securities that may be deposited as original margin or option margin pursuant to rules; (ii) negotiable warehouse receipts issued by a warehouse or depository licensed or otherwise approved by any contract market; or (iii) any security that has a loan value for general accounts carried by securities brokers or dealers under Regulation T issued by the Board of Governors of the Federal Reserve System.

SECURED LOAN STOCK = КАПИТАЛ ОБЕСПЕЧЕННОЙ ССУДЫ – Secured Loan Stock is the same as debenture. See also Deventure.

SECURED PARTY = ОБЕСПЕЧЕННАЯ СТОРОНА – Secured Party is a party that holds collateral that secures its claims on a debtor.

SECURE FOR SEA = КРЕПИТЬ ПО ПОХОДНОМУ – Secure For Sea (maritime term):- prepare for going to sea, extra lashing on all movable objects.

SECURITIES = ЦЕННЫЕ БУМАГИ – Securities are the paper certificates (definitive securities) or electronic records (book-entry securities) evidencing ownership of equity (stocks) or debt obligations (bonds). Securities are the instruments that signify an ownership position in a corporation (stocks or shares), a creditor relationship with a corporation or government body (bonds), or rights to ownership such as those embodied in options or subscription rights. Tradeable or potentially tradeable financial instruments. Documents or certificates representing an ownership interest in (stock) or claim on (bond) a corporation or other entity, and which are bought and sold on the stock exchange. See also Marketable Securities. / Под Ценными Бумагами понимаются документы, содержащие какое-либо имущественное право, реализация которого возможна только при условии их предъявления (акции, векселя, облигации и другие). Ценные Бумаги – денежные или товарные документы, дающие их обладателю имущественные права и право на получение определённых денежных сумм, доходов. К денежным ценным бумагам относят облигация, векселя, денежные чеки. К товарным ценным бумагам, закрепляющим вещественные права их обладателей, права собственности, относятся коносаменты (товарные накладные), складские свидетельства. Особое место среди ценных бумаг занимают акции, которые предоставляют как денежные, так и имущественные права. Ценные бумаги могут быть объектом купли-продажи. Ценная Бумага – документ:- (i) удостоверяющий с соблюдением установленной формы и обязательных реквизитов имущественные права её владельца; и (ii) приносящий доход её владельцу. Различают:- (i) денежные ценные бумаги, удостоверяющие денежные права; (ii) товарные ценные бумаги, удостоверяющие вещные права; и (iii) акции, удостоверяющие и денежные и вещные права владельца. Ценные бумаги являются объектом купли/продажи. К ценным бумагам относятся:- государственная облигация, облигация, вексель, чек, депозитный и сберегательный сертификаты, банковская сберегательная книжка на предъявителя, коносамент, акция, приватизационные ценные бумаги и другие документы, которые законами о ценных бумагах или в установленном ими порядке отнесены к числу ценных бумаг.

SECURITIES ACCOUNT = СЧЁТ ПО ЦЕННЫМ БУМАГАМ – The bank Securities Account offers you the greatest security possible for the safekeeping of your securities and at the same time guarantees that they will be professionally administered and your interests protected. The securities account provides access to other bank services, such as investment and financial advisory services, asset valuations for tax purposes and collateral loans. If you want to spend a minimum of your time administering your securities but still prefer to take your own decisions on where and when to invest, and if you'd like to be sure that your securities are subject to the highest safety standard possible, then the bank securities account is the account for you. In order to open a securities account, you must already have an account at the bank. What are the practical advantages of the bank securities account? You have access to the bank's comprehensive range of advisory services and will be provided with written investment proposals on request. You automatically receive a detailed statement at the end of every year and can request others for any specific period or with any given frequency. Your securities account statements list all the securities you currently own with the latest prices and values. In the case of capital increases, bank's officers will exercise your subscription rights or sell them for you. Bank's officers advise you of any drawings by lot, calls for redemption or premature redemptions. Bank's officers also provide you with details of any forthcoming capital transactions. Bank's officers will notify you in good time of any securities that are due to mature and present them for redemption. Bank's officers will also collect any interest and dividend payments for you. You choose the most convenient way of placing your buy or sell orders:- in writing, by phone or electronically via 24h-banking. Bank's officers will carry out all your transactions, both in your country and abroad, as well as monitoring the receipt of the securities you purchase and with drawing those you sell from your account. Naturally, bank's officers will also ensure that the appropriate account entries for all your transactions are carried out without delay. If you need to finance secutities purchases or other types of transactions, you don't need to sell any of your existing securities. You can borrow from bank, using your portfolio as collateral. If required, bank's officers will provide you with a portfolio valuation for tax purposes specifying securities prices as of year-end and the income on which you are liable to pay tax. In first class banks you also receive separate summaries of your securities for tax credit purposes and withholding taxes, for example, in the United States. Securities Account is an account at a Reserve Bank containing book-entry securities.

SECURITIES ACQUISITION AND TAKEOVER ACT = АКТ ОБ АКВИЗИЦИИ И ПОГЛОЩЕНИИ ЦЕННЫХ БУМАГ – In Germany, the Securities Acquisition and Takeover Act (Wertpapiererwerbs- und Übernahmegesetz (WpÜG)), which took effect on 2002-January-01, regulates offers to acquire shares or comparable securities at joint stock companies or partnerships limited by shares domiciled in Germany. The Act distinguishes between simple acquisition offers, takeover bids and mandatory bids. Takeover bids are defined as bids aimed at exceeding a control threshold of 30% of voting rights. Whoever exceeds the control threshold of 30% without having made a takeover bid in advance must make a mandatory bid. Special rules apply to takeover and mandatory bids, among other things, on the consideration of the bidder, the bid price and the scope for action of the management board of the target company.

SECURITIES ADMINISTRATION = АДМИНИСТРИРОВАНИЕ ЦЕННЫМИ БУМАГАМИ – Securities Administration is the service (generally provided by banks) that includes looking after an investor's securities and the associated paperwork. Also known as Custody Services. / Услуга, (предоставляемая, главным образом, банками) которая предусматривает присмотр за ценными бумагами инвестора и связанное с этим документальное обеспечение. Известно также как Услуги Доверительного Управления (Custody Services).

SECURITIES ANALYSIS = АНАЛИЗ ЦЕННЫХ БУМАГ – Securities Analysis is the systematic assessment of securities as a basis for investment strategy. The fundamental analysis deals mainly with the general financial situation of a company and its earning power, as opposed to the technical analysis of movements on the stock market, price trends, sales, etc of individual securities.

THE SECURITIES AND EXCHANGE COMMISSION = КОМИССИЯ ПО ЦЕННЫМ БУМАГАМ И БИРЖАМ – In the United States, Securities and Exchange Commission (SEC) is an independent, nonpartisan, quasi-judicial regulatory agency with responsibility for administering the federal securities laws. The purpose of these laws is to protect investors and to ensure that investors have access to disclosure of all material information concerning publicly traded securities. The Commission also regulates firms engaged in the purchase or sale of securities, people who provide investment advice, and investment companies. Created in 1934, the Securities And Exchange Commission (SEC) is empowered to issue regulations and to enforce provisions of the federal securities laws and its own

regulations, including regulations governing the disclosure of information in connection with securities being offered for sale to the public. The SEC is also responsible for regulating the activities of securities traders. The SEC sees that investors are fully informed about securities being offered for sale and prevents misrepresentations, deceit and other types of fraud involved with securities transactions. The Securities And Exchange Commission (SEC) is a watch-dog Federal agency established by US Congress in 1934 to monitor the securities industry, enforce punishments of those that violate the industry's regulations and help protect investors. The SEC administers the Securities Act of 1933, the Securities Exchange Act of 1934, the Securities Act Amendment of 1975, the Trust Indenture Act, the Investment Company Act, the Investment Advisers Act, and the Public Utility Holding Company Act. All US companies with stock must abide by the SEC rules and regulations and are required to file quarterly status reports. It reviews the financial statements of corporations which offer securities for sale to the public and has the legal authority to require specific accounting methods and standards of financial disclosure of these companies. The SEC also supervises all national securities exchange, registers all issues of securities offered in interstate commerce or through the mail, registers brokers who engage in over-the-counter trading, and regulates mutual funds and other investment companies, investment advisers, and most other individuals and firms engaged in the investment business. The SEC is an operationally independent federal agency headed by a bipartisan five-member commission, comprised of the chairman and four commissioners, who are appointed by the President and confirmed by the Senate for staggered five-year terms. By law, no more than three of the commissioners may belong to the same political party. All SEC Commissioners and staff are subject to the federal criminal law conflict of interest statutes including a specific prohibition from participating personally and substantially in particular matters that would have a direct and predictable effect on their financial interests or one that is imputed to them. The Exchange Act also expressly prohibits any commissioner from engaging in any other business, vocation, or employment than that of a commissioner. There are matters of regulatory policy which require consultation with or approval by other authorities, such as the requirement for joint rule-making with the Federal Reserve in connection with the implementation of the Gramm-Leach-Bliley Act (GLBA). Where consultation is required, the process is clear and the criteria are transparent. Despite these requirements to consult, the SEC has the authority to make day-to-day decisions on technical matters without the need to consult with other government authorities. The SEC's budget is part of the federal budget that is prepared by the President and submitted to Congress annually. The budget estimate is subject to review and approval by the Office of Management and Budget (OMB) before it is forwarded to Congress as part of the overall budget request of the President. The budget is subject to review and recommendation at several levels, including House and Senate committees and must be adopted by Congress annually. The budget has not kept pace with the growth in the securities market. Presently, in light of the events in the financial markets over the past year, the SEC, the Administration, and US Congress are reexamining the SEC's need for more resources. The SEC chairman, in her recent appropriations testimony, presented the SEC's fiscal 2010 budget request with specific reference to the need for additional resources to match significant growth in the size and complexity of the securities industry, including the Broker Dealer (BD) and Investment Adviser (IA) industries. Statute law and various principles of sovereign and qualified immunity provide significant protection to the SEC, commissioners, and staff. All commissioners, including the chairman are appointed by the President and confirmed by the Senate. The chairman is designated by the President and can be replaced as chairman at any time, but would then complete the remainder of his/her term as a commissioner should he/she choose to do – which seems unlikely. There are no statutory provisions governing removal of a commissioner. However, there is case law regarding independent regulatory agencies that says a commissioner may only be removed for cause. The SEC is subject to the oversight by committees of Congress and the Senate. It also provides information to Congress and the President, including information on pending enforcement matters of interest to Congress or the Executive. The SEC's receipt and use of funds are subject to regular audit by the Government Accountability Office (GAO) and the SEC's Office of Inspector General (OIG). The OIG is an independent office inside the SEC; the Inspector General is appointed by the SEC chair, but can only be removed by Congress. There are 19 staff members. The OIG has investigative powers and staff members are required to cooperate with investigations. The results of these audits are reported to agency management, made available to Congress and the Office of Management and Budget (OMB) and generally are made public on the Internet. The SEC must comply with the APA (see the description above under the Commodity Futures Trading Commission (CFTC)). The securities laws themselves also require the SEC to issue orders in its administrative proceedings. Final orders of the SEC may be appealed to the courts. The agency also has extensive rules of procedure to ensure fairness in the conduct of hearings and other administrative activities. The US Securities and Exchange Commission (SEC) is a member of the International Organisation of Securities Commissions (IOSCO). The Securities and Exchange Commission (SEC), created by federal law in 1934, is the securities and market regulator in the United States. Its tasks comprise monitoring the integrity and regularity of trading as well as compliance with exchange regulations. The SEC has extensive control and sanction powers. / Акт Грама-Лича-Блайли (АГЛБ; Gramm-Leach-Bliley Act (GLBA)). Комиссия по Ценным Бумагам и Биржам (The Securities and Exchange Commission; сокращённо – КЦББ или СЭК (SEC), в Англоязычном произношении), созданная в 1934 в соответствии с федеральным законодательством, является в Соединённых Штатах Америки регулятором ценных бумаг и рынка. Её задачи заключаются в мониторинге .

THE SECURITIES AND FUTURES AUTHORITY LIMITED = УПРАВЛЕНИЕ ПО ЦЕННЫМ БУМАГАМ И ФЬЮЧЕРСАМ ЛИМИТИД – The Securities and Futures Authority Limited (SFA) was responsible for the regulation of investment business in the United Kingdom. On 2001-November-30:- The SFA regulated about 1 300 firms involved in all the organized City investment markets – i.e. the stock market, Eurobond, financial futures, commodity futures markets – and also corporate finance specialists and off-market traders. About half SFA's firms are overseas-owned. It was superseded by the Financial Services Authority (FSA®) in 2001 when The Financial Services & Markets Act 2000 (FSMA) came into force. Headquartered in London, the United Kingdom. The SFA was incorporated as ISRO (Formation) Limited under company registration number 01998622 on 1986-March-11, changed its name to The Securities Association Limited (TSA) on 1987-January-27, changed its name to The Securities and Futures Authority Limited on 1991-April-01 and was dissolved on 2003-January-15.

SECURITIES CLEARING = КЛИРИНГ ПО ЦЕННЫМ БУМАГАМ – Securities Clearing is the reciprocal settlement (clearing) of the securities transactions of banks or brokers via common clearing houses. This not only facilitates the technical processing of securities trades but also reduces book and account entries to a minimum. See also CEDEL, Euroclear, and SEGA. Keeping securities in collective custody with central securities depositories is a secure, efficient and convenient way of administering securities. However, securities must be registered and authorized for collective custody. Transfer of title is carried out by book transfer, i.e. without physical delivery. The safe-custody accountholder is entitled to a certain share of the collective securities holdings. / Юроклыэ (Euroclear).

SECURITIES CLEARING AND DEPOSIT BANK = БАНК ПО ВКЛАДАМ И КЛИРИНГУ ПО ЦЕННЫМ БУМАГАМ – Securities Clearing and Deposit Bank is a specialized bank for the technical settlement of securities clearing transactions and the collective safekeeping of securities (collective custody).

SECURITIES CLEARING TRANSACTIONS = ТРАНЗАКЦИИ КЛИРИНГА ПО ЦЕННЫМ БУМАГАМ (или ОПЕРАЦИИ КЛИРИНГА ПО ЦЕННЫМ БУМАГАМ) – Securities Clearing Transactions:- keeping securities in collective custody with central securities depositories is a secure, efficient and convenient way of administering securities. However, securities must be registered and

authorized for collective custody. Transfer of title is carried out by book transfer, i.e. without physical delivery. The safe-custody accountholder is entitled to a certain share of the collective securities holdings.

SECURITIES COMMISSION = КОМИССИЯ ПО ЦЕННЫМ БУМАГАМ – Securities Commission is a regulatory body that oversees corporate affairs with a view to protecting shareholders' interests. For example, the BC Securities Commission (the Province of British Columbia (BC)) or the US Securities and Exchange Commission (SEC). Securities laws are policed and enforced by such agencies. These are usually government agencies.

SECURITIES CREDIT = КРЕДИТ ПОД ЦЕННЫЕ БУМАГИ – Securities Credit:- in the United States, The Securities Exchange Act of 1934 requires the Federal Reserve to regulate the extension of credit used in connection with the purchase of securities. Through its regulations, the Board establishes the minimum amount the buyer must put up when purchasing a security. This minimum amount is known as the Margin Requirement. In fulfilling its responsibility under the act, the Federal Reserve limits the amount of credit that may be provided by securities brokers and dealers (Regulation T) and the amount of securities credit extended by banks and other lenders (Regulation U). These regulations generally apply to credit-financed purchases of securities traded on securities exchanges and certain securities traded over the counter when the credit is collateralized by such securities. In addition, Regulation X prohibits borrowers who are subject to US laws from obtaining such credit overseas on terms more favorable than could be obtained from a domestic lender. In general, compliance with the Federal Reserve's margin regulations is enforced by several federal regulatory agencies. The federal agencies that regulate financial institutions check for Regulation U compliance during examinations. The Federal Reserve checks for Regulation U compliance on the part of securities credit lenders not otherwise regulated by federal agencies. Compliance with Regulation T is verified during examinations of broker-dealers by the securities industry's self-regulatory organizations under the general oversight of the SEC.

SECURITIES DEPOSIT ACT = АКТ О ВКЛАДАХ ЦЕННЫХ БУМАГ – Securities Deposit Act is an act governing the safekeeping and acquisition of securities. The Securities Deposit Act serves to protect depositors' securities ownership rights in the course of safekeeping business and to promote securities ownership.

SECURITIES DEPOSITORY = ДЕПОЗИТАРИЙ ЦЕННЫХ БУМАГ – A Securities Depository is a system for the central handling of securities where all securities of any particular class or series of any issuer deposited within the system are treated as fungible and may be transferred or pledged by bookkeeping entry without physical delivery of the securities. See also Central Securities Depository.

SECURITIES FUND = ФОНД, СПЕЦИАЛИЗИРУЮЩИЙСЯ НА ЦЕННЫХ БУМАГАХ (или ФОНД ВЛОЖЕНИЙ В ЦЕННЫЕ БУМАГИ) – Securities Fund is a fund which invests in securities and loan stock rights traded on an exchange or another regulated market open to the public.

SECURITIES IDENTIFICATION NUMBER = ИДЕНТИФИКАЦИОННЫЙ НОМЕР ЦЕННЫХ БУМАГ – Securities Identification Number is identification number that allows a clear identification of securities and thus facilitates securities trading. In Germany the securities identification number (Wertpapierkennnummer (WKN) in German) is a six-figure number. The International Security Identification Number (ISIN) is a worldwide classification index that was also introduced as a standard in Germany in 2003. The WKN is included in the German ISIN. The twelve-digit ISIN is made up of a two-digit country code, a nine-digit national code and a verification code. The WKN is included in the sixth to eleventh digit.

THE SECURITIES INDUSTRY AND FINANCIAL MARKETS ASSOCIATION = АССОЦИАЦИЯ ИНДУСТРИИ ЦЕННЫХ БУМАГ И ФИНАНСОВЫХ РЫНКОВ – The Securities Industry and Financial Markets Association (SIFMA) is a non-profit association that represents the shared interests of participants in global financial markets. SIFMA members include international securities firms, US-registered brokerdealers and asset managers. Headquartered in New York, State of New York and in Washington, District of Columbia, the United States. SIFMA brings together the shared interests of hundreds of securities firms, banks and asset managers. These companies are engaged in communities across the country to raise capital for businesses, promote job creation and lead economic growth. SIFMA's mission is to develop policies and practices which strengthen financial markets and which encourage capital availability, job creation and economic growth while building trust and confidence in the financial industry. SIFMA, with offices in New York and Washington, DC, is the US regional member of the Global Financial Markets Association (GFMA). The origins of the Securities Industry and Financial Markets Association (SIFMA) go back to 1912 with the founding of the Investment Bankers Association of America (IBA) two years after the American Bankers Association rejected a request by a group of members to start an investment banking section. In 1971, IBA merged with the Association of American Stock Exchange Firms (ASEF) to form the Securities Industry Association (SIA) and unify the voices of the related interests. Following the merger, the Public Securities Association (PSA), comprised of IBA's Municipal Securities and Government Bonds Committees (est. 1918), incorporated as an independent organization representing securities firms and banks in the municipal, Treasury and federal agency securities markets. The name of the PSA was changed to The Bond Markets Association (TBMA) in 1997. In 2006, the SIA and TBMA merged, bringing together the shared interests of their memberships. By representing the many segments of the financial industry, SIFMA has become the voice of the financial industry that is uniquely suited to provide trusted and expert information to policymakers, regulators, media, industry participants and the general public about the financial industry.

SECURITIES INDUSTRY ASSOCIATION = АССОЦИАЦИЯ ИНДУСТРИИ ЦЕННЫХ БУМАГ – The Security Industry Association (SIA):- Our Vision:- to be the primary resource for the global security industry. Our Mission:- to be a catalyst for growth within the global security industry through information, insight and influence. The Security Industry Association protects and advances our members' interests by:- (i) advocating pro-industry policies and legislation on Capitol Hill and throughout the 50 states; (ii) producing leading-edge global market research; (iii) creating open industry standards that enable integration; (iv) advancing industry professionalism through education and training; and (v) opening global market opportunities. We deliver on this promise by:- (i) Advocating pro-industry policies and legislation on Capitol Hill and throughout the 50 states:- SIA advocates for policies and legislation that drive business opportunities in a wide range of vertical markets, including healthcare, ports, transit, and education. The industry's premier public policy event, SIA's annual Government Summit, brings policy makers and stakeholders together to address federal and state initiatives affecting the security industry. (ii) Producing leading-edge global market research:- SIA delivers trusted research and analysis that keeps members informed of market and industry trends. This market intelligence helps our members build and sustain profitable, growth-oriented businesses. (iii) Creating open industry standards that enable integration:- an ANSI-accredited standards developer (ANSI (short for the American National Standards Institute) is a national federation of standards developers), SIA creates standards that are open, enable easy integration of diverse components, and provide a means to establish predictable levels of performance. Participants shape the future of the industry, acquire industry intelligence, and enable rapid acceptance of products in new markets. (iv) Advancing industry professionalism through education and training:- SIA professional and technical programs include project management and central station operator training, online courses, and skills assessment tools. These resources provide members and their channel partners with the skills and knowledge to succeed. (v) Opening global market opportunities:- SIA's strategic alliances with industry trade organizations across the globe reveal new opportunities in established and emerging markets, including Brazil, Russia, India, and

China. As sole sponsor of the ISC Expos, the world's largest security trade shows and conferences, we ensure members have access to top-level buyers and influencers. Securities Industry Association (SIA) represents the collective business interests of more than 500 brokerages and investment banking firms. Membership includes most New York Stock Exchange member organizations, major firms of all US and Canadian exchanges, and the over-the-counter market. Headquartered in Silver Spring, State of Maryland, the United States. Founded in 1969, the Security Industry Association is a non-profit international trade association. Its member companies manufacture, specify, distribute, install and support electronic and physical security products and systems. SIA works closely with its members to promote and advance the industry by driving initiatives in education, research, technical standards and through representation and defense of its members' interests on Capital Hill. SIA staff and member companies appreciate the opportunity to meet you at ISC and look forward to learning more about your business and how we may be able to help it grow.

SECURITIES INDUSTRY AUTOMATION CORPORATION = КОРПОРАЦИЯ ПО АВТОМАТИЗАЦИИ ИНДУСТРИИ ЦЕННЫХ БУМАГ – The Securities Industry Automation Corporation (SIAC) is a subsidiary of the NYSE Euronext. Its purpose is to provide technical services for the exchanges themselves, members and other financial institutions. In this role, SIAC provides the computers and other systems required to run the exchanges. It also owns communication lines and hardware to provide real-time quotes and transaction information to all market participants from the Consolidated Tape/Ticker System (CTS), Consolidated Quotation System (CQS), and Options Price Reporting Authority (OPRA). SIAC was created on 1972-July-17 as a wholly owned subsidiary of the NYSE® and American Stock Exchange® (AMEX®). The NYSE® owned two thirds of SIAC, while the AMEX® owned one third. On 2006-November-01, NYSE Euronext purchased AMEX's stake for USD40 million. Headquartered in Brooklyn, State of New York, the United States. The Securities Industry Automation Corporation (SIAC), an independent organization established by the New York and American stock exchanges as a jointly owned subsidiary to provide automation, data processing, clearing and communication services. The New York Stock Exchange affiliated organization the Securities Industry Automation Corporation operates New York and American stock exchange automation and communications systems; supporting trading, market data reporting, and surveillance activities. SIAC also supports NSCC's nationwide clearance and settlement systems, and is the systems processor for industry-wide National Market System components, such as the Consolidated Tape Association, Consolidated Quotation System, Options Price Reporting Association, and the Intermarket Trading System. The Securities Industry Automation Corporation is separately managed by an independent board of directors. Securities Industry Automation Corporation (SIAC) provides a variety of technology services for financial institutions and market exchanges, including data network management, data center operations, disaster recovery, and network connectivity. It also processes virtually every US equity and security trade on behalf of the Depository Trust & Clearing Corporation. Formed in 1972, SIAC was acquired by the NYSE® in November 2006. Securities Industry Automation Corporation (SIAC), a wholly owned subsidiary of NYSE Group, provides data processing and software development services and is a registered securities information processor under the Exchange Act. Formed in 1972 as a New York business corporation, SIAC:- (i) plans, develops, implements and operates a variety of automated information-handling and communication systems that support order processing, trading, and market data reporting, as well as trade comparison, for a broad range of securities; (ii) provides systems support for essential regulatory and administrative activities; and (iii) operates and manages the Secure Financial Transaction Infrastructure℠ (SFTI℠) network, which provides resilient and reliable communications within the financial services industry. Historically, SIAC has been operated as a cost-recovery utility. As a result, it provides its services to its customers on an at-cost, non-profit basis. SIAC's wholly owned for-profit subsidiary, Sector, Inc, offers an array of communications and data processing services, primarily to the broker-dealer community. These services include email archiving, other books and record storage solutions, facilities management, data center hosting, disaster recovery, enterprise services and network and data distribution services. The telecommunications services include traditional point-to-point voice circuits and network management. In addition, TransactTools, which was acquired in January 2007, provides enterprise messaging solutions for the security trading industry. SIAC provides data processing services to the NYSE®. In addition, SIAC operates the Intermarket Trading Systems and provides services to the Intermarket Surveillance Group Participants, the Consolidated Tape Association (CTA) Plan and Consolidated Quotation (CQ) Plan and the Options Price Reporting Authority. SIAC also provides services to Sector and the American Stock Exchange® (AMEX®) pursuant to separate agreements. / НЙФБ® или Эн.Уай.Эс.И.® (NYSE®). АМЭКС® (AMEX®). коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо).

SECURITIES INVESTMENT FUND = ФОНД ИНВЕСТИЦИЙ В ЦЕННЫЕ БУМАГИ – Securities Investment Fund is the investment fund whose assets are invested in stocks, bonds and/or other securities. / Инвестиционный фонд, активы которого инвестируются в акции, облигации и/или иные ценные бумаги.

SECURITIES INVESTOR PROTECTION CORPORATION = КОРПОРАЦИЯ ПО ЗАЩИТЕ ИНВЕСТОРОВ ЦЕННЫХ БУМАГ – The role of the US Securities Investor Protection Corporation (SIPC):- SIPC is the first line of defense in the event a brokerage firm fails owing customers cash and securities that are missing from customer accounts. Although not every investor is protected by SIPC, no fewer than 99 percent of persons who are eligible get their investments back from SIPC. From its creation by Congress in 1970 through December 2011, SIPC advanced USD1.8 billion in order to make possible the recovery of USD117.5 billion in assets for an estimated 767 000 investors. When a brokerage is closed due to bankruptcy or other financial difficulties and customer assets are missing, SIPC steps in as quickly as possible and, within certain limits, works to return customers' cash, stock and other securities, and other customer property. Without SIPC, investors at financially troubled brokerage firms might lose their securities or money forever … or wait for years while their assets are tied up in court. However, because not everyone, and not every loss, is protected by SIPC, you are urged to read this whole brochure carefully to learn about the limits of protection. How we help:- understanding the rules is the key to protecting yourself … and your money. When SIPC gets involved:- when a brokerage firm fails owing customers cash and securities that are missing from customer accounts, SIPC usually asks a federal court to appoint a trustee to liquidate the firm and protect its customers. With smaller brokerage firm failures, SIPC sometimes deals directly with customers. Investors eligible for SIPC help:- SIPC aids most customers of failed brokerage firms when assets are missing from customer accounts. Investments protected by SIPC:- the cash and securities – such as stocks and bonds – held by a customer at a financially troubled brokerage firm are protected by SIPC. Among the investments that are ineligible for SIPC protections are commodity futures contracts (unless in portfolio margining accounts and defined as customer property under the Securities Investor Protection Act), fixed annuity contracts, and currency, as well as investment contracts (such as limited partnerships) that are not registered with the US Securities and Exchange Commission under the Securities Act of 1933. Terms of SIPC help:- customers of a failed brokerage firm get back all securities (such as stocks and bonds) that already are registered in their name or are in the process of being registered. After this first step, the firm's remaining customer assets are then divided on a pro rata basis with funds shared in proportion to the size of claims. If sufficient funds are not available in the firm's customer accounts to satisfy claims within these limits, the reserve funds of SIPC are used to supplement the distribution, up to a ceiling of USD500 000 per customer, including a maximum of USD250 000 for cash claims. Additional funds may be available to satisfy the remainder of customer claims after the cost of liquidating the brokerage firm is taken into account. How account transfers work:- in a failed brokerage firm with accurate records, the court-appointed trustee and SIPC may arrange to have some or all customer accounts tranferred to another brokerage firm. Customers whose accounts are transferred are notified promptly and then

have the option of staying at the new firm or moving to another brokerage of their choosing. How claims are valued:- typically, when SIPC asks a court to put a troubled brokerage firm in liquidation, the financial worth of a customer's account is calculated as of the 'filing date'. Wherever possible, the actual stocks and other securities owned by a customer are returned to him or her. To accomplish this, SIPC's reserve funds will be used, if necessary, to purchase replacement securities (such as stocks) in the open market. It is always possible that market changes or fraud at the failed brokerage firm (or elsewhere) will result in the returned securities having lost some – or even all – of their value. In other cases, the securities may have increased in value. Court deadline:- the time set by the bankruptcy court for filing of customer claims is usually 60 days after the date the notice of the proceeding is published, but could be as little as 30 days after the publication date. The deadline appears in the published notice and a copy of the notice is mailed to customers along with claim forms and instructions that also prominently display the date. Pay close attention to the deadline set forth in the notice and be certain the trustee receives your claim in a timely manner. Federal law deadline:- if your completed claim form is received by the trustee after the date set by the bankruptcy court but no later than six months after public notice is published, the claim is subject to delayed processing and, possibly, limited payment. The six-month deadline is set out in the federal law governing SIPC. The federal deadline absolutely bars any claim that is received more than six months after the publication date. Except for some very narrow exceptions, there are no grounds for time extensions beyond the deadline. SIPC urges all investors to understand the dangers of investment fraud and where to turn for help if swindled. That is why SIPC works with regulatory and self-regulatory agencies, consumer groups, and other concerned parties to increase investor awareness about scams. A nonprofit membership corporation established by US Congress in 1970 to protect investors' securities and cash held by broker-dealers in the event of liquidation. SIPC derives its annual assessments from US-registered broker-dealers who are legally required to join. The Securities Investor Protection Corporation (SIPC) either acts as trustee or works with an independent court-appointed trustee in a missing asset case to recover funds. The statute that created SIPC provides that customers of a failed brokerage firm receive all non-negotiable securities that are already registered in their names or in the process of being registered. All other so-called 'Street Name' securities are distributed on a pro rata basis. At the same time, funds from the SIPC reserve are available to satisfy the remaining claims of each customer up to a maximum of USD500 000. This figure includes a maximum of USD250 000 on claims for cash. Recovered funds are used to pay investors whose claims exceed SIPC's protection limit of USD500 000. SIPC often draws down its reserve to aid investors. Recovered funds are used to replenish SIPC's reserve in the event that the reserve is tapped in the early stages of a liquidation proceeding. Why Was SIPC Created? SIPC is an important part of the overall system of investor protection in the United States. While a number of federal, self-regulatory and state securities agencies deal with cases of investment fraud, SIPC's focus is both different and narrow:- Restoring funds to investors with assets in the hands of bankrupt and otherwise financially troubled brokerage firms. The Securities Investor Protection Corporation was not chartered by Congress to combat fraud. The SIPC Mission:- when a brokerage firm is closed due to bankruptcy or other financial difficulties and customer assets are missing, SIPC steps in as quickly as possible and, within certain limits, works to return customers' cash, stock and other securities, and other customer property. Without SIPC, investors at financially troubled brokerage firms might lose their securities or money forever or wait for years while their assets are tied up in court. Although not every investor is protected by SIPC, no fewer than 99 percent of persons who are eligible get their investments back from SIPC. From its creation by Congress in 1970 through December 2011, SIPC advanced USD1.8 billion in order to make possible the recovery of USD117.5 billion in assets for an estimated 767 000 investors. Why We Are Not the FDIC:- 'insurance' for investment fraud does not exist in the United States. The Federal Trade Commission, Federal Bureau of Investigation, state securities regulators and other experts have estimated that investment fraud in the US ranges from USD10–40 billion a year. In the case of microcap stock fraud, the toll on investors has been estimated as USD1–3 billion annually. With a reserve of slightly more than USD1 billion, SIPC could not keep its doors open for long if its purpose was to compensate all victims in the event of loss due to investment fraud. It is important to understand that SIPC is not the securities world equivalent of FDIC (short for the Federal Deposit Insurance Corporation). Congress specifically considered creating a Federal Broker-Dealer Insurance Corporation, but lawmakers wisely concluded that such a designation would be both misleading and out of step in the risk-based investment marketplace that is so different from the world of banking. Headquartered in Washington, District of Columbia, the United States. The SIPC provides funds for use, if necessary, to protect customer's cash and securities that may be on deposit with a SIPC member firm in the event the firm fails and is liquidated under the provisions of the SIPC Act. The SIPC is not a Government Agency. It is non-profit membership corporation created, however, by an Act of Congress. A safeguard for investors capital created by US Congress. The Securities Investor Protection Corporation (SIPC) insures that cash and securities on deposit with a brokerage are insured up to USD500 000.00 per customer, in the event that the brokerage goes out of business.

SECURITIES LENDING AND BORROWING = ПРЕДОСТАВЛЕНИЕ В КРЕДИТ (или ССУЖИВАНИЕ) И ЗАИМСТВОВАНИЕ ЦЕННЫХ БУМАГ – In Securities Lending, owners of securities lend their securities or bonds on condition that, upon expiry of a typically very short lending period of a few days, securities of the same type and quality are returned. The borrower pays the lender a fee in return. During the lending period, the lender can use the securities to meet his own delivery obligations while the borrower can boost the performance of his securities account. The lending of securities for an indefinite or definite period of time against collateral and at a discount. This form of financial transaction is especially suitable for large clients. In Europe, CEDEL and Euroclear provide administrative and technical services for securities lending operations. In the United States, the Federal Reserve has a securities lending program designed to provide a secondary and temporary source of securities to the market in order to promote the smooth clearing of Treasury securities. Under this program, securities from the portfolio are offered for loan to primary dealers through an auction process each day at noon. The total amount available for an individual security is a fraction of the Federal Reserve's total holdings, and there are limits on the amount of securities that can be lent to a single dealer. As collateral, the dealer gives the Federal Reserve other securities, not cash; therefore, the Federal Reserve's lending operations do not affect the supply of Federal Reserve balances and are not considered open market operations. / Юроклыэ (Euroclear).

SECURITIES MOVEMENT AND CONTROL = ПЕРЕМЕЩЕНИЕ И КОНТРОЛЬ ЗА ЦЕННЫМИ БУМАГАМИ – Securities Movement And Control (SMAC):- a written or computerized set of rules designed to ensure the safe movement of certificates or book-entry securities. Computerized SMAC systems are used as a control for book-entry securities and to monitor the purchases and sales of physical securities from the time a trade is executed until the securities arrive at the bank or leave it, or until the securities are transferred on the books of the depository. SMAC systems will generally contain security master files and client master files.

SECURITIES PORTFOLIO = ПОРТФЕЛЬ ЦЕННЫХ БУМАГ – Securities Portfolio is the total security holdings of an individual customer for whose account they are deposited at the bank. / Полный набор ценных бумаг индивидуального заказчика, на счёт которого они депонированы в банке.

SECURITIES PURCHASED UNDER RESALE AGREEMENTS = ЦЕННЫЕ БУМАГИ, ПРИОБРЕТЁННЫЕ ПО СОГЛАШЕНИЯМ О ПЕРЕПРОДАЖЕ (или ЦЕННЫЕ БУМАГИ, ПРИОБРЕТЁННЫЕ ПО ОБРАТНЫМ РИПО) – Securities Purchased Under Resale Agreements ('reverse repurchase agreements') are transactions under which the bank places a fixed-term deposit with a counterparty which provides collateral in the form of securities. The rate on the deposit is fixed at the beginning of the transaction, and there is an irrevocable commitment to return the equivalent securities subject to the repayment of the deposit. During the term of the agreement

the fair value of collateral is monitored, and additional collateral is obtained where appropriate to protect against credit exposure. / Ценные бумаги, приобретённые по соглашениям о перепродаже (обратные соглашения об откупе или обратные рипо) . выплата (repayment) .

SECURITIES REPURCHASE AGREEMENTS = СОГЛАШЕНИЯ ОБ ОТКУПЕ ЦЕННЫХ БУМАГ – Securities Repurchase Agreements:- the purchase of securities eligible as collateral by the central bank with simultaneous agreement on repurchase at a specific future date. The securities in question must be listed on a stock exchange in official trading or the regulated market. A monetary policy tool:- the central bank can, among other things, steer the allocation of central bank funds to banks through securities repurchase agreements. In the allocation of securities repurchase agreements, a distinction is made between fixed and variable rate tenders.

SECURITIES SETTLEMENT SYSTEM = СИСТЕМА РАСЧЁТА ПО ЦЕННЫМ БУМАГАМ – Securities Settlement System (SSS) is a system which permits the holding and transfer of securities or other financial assets, either free of payment or against payment (delivery versus payment). A system in which stocks, bonds and other assets are exchanged. Securities Settlement System is the full set of institutional arrangements for confirmation, clearance, and settlement of securities trades and safekeeping securities. A system, frequently a central securities depository, in which the settlement of securities takes place. Sometimes called a Clearing System.

SECURITIES SUPERVISION = НАДЗОР ЗА ЦЕННЫМИ БУМАГАМИ – Securities Supervision:- in Germany, securities are regulated according to a three-tier structure:- the Federal Financial Supervisory Authority BaFin) as the highest authority, the stock exchange supervisory authorities of the federal states and the trading supervisory offices of the stock exchanges. Their aim is to ensure the viability of the German market for securities and derivatives trading in accordance with the Securities Trading Act (Wertpapierhandelsgesetz (WpHG)). This is done, for example, by fighting insider trading and creating greater transparency.

SECURITIES TELECOMMUNICATIONS ORGANIZATION = ОРГАНИЗАЦИЯ ДАЛЬНИХ СВЯЗЕЙ В СФЕРЕ (или НА РЫНКЕ) ЦЕННЫХ БУМАГ – The New York Stock Exchange affiliated organization SECTOR (abbreviation for the Securities Telecommunications Organization) provides the financial industry with communications lines. An industry-wide policy board oversees mutualized operations of this Securities Industry Automation Corporation division. / коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо).

SECURITIES TRADER = ТОРГОВЕЦ ЦЕННЫМИ БУМАГАМИ – Securities Trader is a person or company commercially engaged in buying and selling securities on the exchange. For tax law purposes, the issuers of securities are also classified as traders. Also known as Securities Dealer. / Лицо или компания, коммерчески вовлечённое в покупку и продажу ценных бумаг на бирже. Для целей налогового законодательства, эмитенты ценных бумаг также классифицируются в качестве торговцев. Известен также как Дилер Ценных Бумаг (Securities Dealer).

SECURITIES TRADING ACT = АКТ О ТОРГОВЛЕ ЦЕННЫМИ БУМАГАМИ – The Securities Trading Act (Wertpapierhandelsgesetz (WpHG)) regulates the securities industry and securities trading in Germany. Among other things, it defines ad hoc rules and insider trading rules. The Federal Financial Supervisory Authority (BaFin) is responsible for monitoring compliance with the rules. / для данного случая (ad hoc).

SECURITIES TRADING STATEMENT = ОТЧЁТ О ТОРГОВЛЕ ЦЕННЫМИ БУМАГАМИ (или ВЫПИСКА О СДЕЛКАХ С ЦЕННЫМИ БУМАГАМИ) – Securities Trading Statement is a statement listing data on the sales or purchases of securities, such as the buying or selling prices, numbers and types of securities, taxes and brokerage charged, and payment or credit dates.

SECURITISATION ENTITY = ЛИЦО ДЛЯ ОБЕЗОПАСИВАНИЯ – Securitisation Entity:- the special purpose entities created, typically by financial institutions, as vehicles to aggregate a package of financial assets, such as loans or mortgages, for sale to investors.

SECURITIZATION = СЭКЬЮРИТИЗАЦИЯ (или СЕКЬЮРИТИЗАЦИЯ) – Securitization is the process of packaging and selling similar financial instruments, such as loans and other receivables, in the form of 'asset-backed' securities that can be traded on secondary markets. Securitization allows financial institutions to transfer some of the risks of ownership to parties more willing or able to manage them. The process of aggregating similar instruments, such as credit portfolios or catastrophe risks, and marketing them to investors as a negotiable security. The growing trend of corporate borrowers to issue marketable securities on the financial markets as opposed to raising bank loans and credit from other financial institutions. Issue of marketable securities by a lending institution in exchange for certain loans in its portfolio, which are transferred to the securities buyer. Securitization is a creation of tradable securities from loan claims, deposit positions and ownership rights in the wider sense. Examples of securitized rights are asset-backed securities and mortgage-backed securities (MBS). Rights are often evidenced through so-called SPVs (Special Purpose Vehicles), companies whose sole purpose is to issue these securities and whose assets are comprised of the ownership rights contributed to the company. Tendency of companies to use security markets to raise finance rather than the more traditional financial intermediaries such as banks.

SECURITY = ГАРАНТИЯ – (1) Security is anything, usually property, which is pledged as collateral for a loan, or the document that sets out the terms of such collateral. Amount that might be requested by the customs authorities to ensure payment of customs debt.

(2) In Customs, Security is that which ensures to the satisfaction of the Customs that an obligation to the Customs will be fulfilled. Security is described as 'general' when it ensures that the obligations arising from several operations will be fulfilled. Security usually takes the form of a deposit or of a legal obligation (a bond). A surety to the bond is usually required.

SECURITY = ЗАЩИТА – A term Security means used to protect against the unauthorized use of and prevent unauthorized access to digital information. / Средство, используемое для предохранения от несанкционированного (неавторизованного) использования и предотвращения несанкционированного (неавторизованного) доступа к цифровой информации.

(2) Security is a term used in marine insurance to define the insurers with whom a policy has been effected.

SECURITY = ЦЕННАЯ БУМАГА – Security is an investment instrument, other than an insurance policy or fixed annuity, issued by a corporation, government, or other organization which offers evidence of debt or equity. The official definition, from the Securities Exchange Act of 1934, is:- 'Any note, stock, treasury stock, bond, debenture, certificate of interest or participation in any profit-sharing agreement or in any oil, gas, or other mineral royalty or lease, any collateral trust certificate, preorganization certificate or subscription, transferable share, investment contract, voting-trust certificate, certificate of deposit, for a security, any put, call, straddle, option, or privilege on any security, certificate of deposit, or group or index of securities (including any interest therein or based on the value thereof), or any put, call, straddle, option, or privilege entered into on a national securities exchange relating to foreign currency, or in general, any instrument commonly known as a 'Security'; or any certificate of interest or participation in, temporary or interim certificate for, receipt for, or warrant or right to subscribe to or purchase, any of the foregoing; but shall not include currency or any note, draft, bill of exchange, or banker's acceptance which has a maturity at the time of issuance of not exceeding nine months, exclusive of days of grace, or any renewal thereof the maturity of which is likewise limited'. A broad term that refers to stocks, bonds and other investment

tools. Security is a document evidencing a private right through possession of that document in order to assert the right. Securities are, for example, banknotes, cheques, bills of exchange, shares, bonds, mortgage certificates, etc. Transfer of the rights requires the presentation or submission of the security. More strictly speaking, securities are marketable securities, including debt securities, shares and investment certificates. Usually refers to a stock but can be any tradable asset. Generally, a transferable instrument representing an ownership interest in a corporation (equity security or stock) or the debt of a corporation, municipality, or sovereign. Other forms of debt such as mortgages can be converted into securities. Certain derivatives on securities (e.g., options on equity securities) are also considered securities for the purposes of the securities laws. Security Futures Products are considered to be both securities and futures products. Futures contracts on Broad-Based Securities Indexes are not considered securities. Security is any kind of transferable certificate of ownership including equity securities and debt securities. Security is an instrument for capital raising and capital investment purposes. The term Securities generally refers to fungible (marketable) securities. Securities can be in the form of equities, bonds and other debt instruments. Securities do not include banknotes, bills of exchange and cheques, for instance. A securities trade is understood to be the purchase or sale of securities for own or third-party account. Common or Preferred Stock; a bond of a corporation, government, or quasi-government body. A term 'Security' means:- (1) a share of stock in a corporation; (2) a right to subscribe for, or to receive, a share of stock in a corporation; or (3) a bond, debenture, note, or certificate, or other evidence of indebtedness to pay a fixed or determinable sum of money, which has been issued with interest coupons or in registered form by a domestic or foreign corporation or by any government or political subdivision thereof. Security:- normally refers to an investment which you buy on the stockmarket, e.g., Question:- What securities do you hold? Answer:- I hold 10 BP shares, 55 Microsoft shares and £100 nominal of Treasury 9% Stock. See also Stock. / Би.Пи. (BP), Майкрософт (Microsoft). , например, . Ценные Бумаги – документы (акции, облигации, аккредитивы, векселя, чеки, коносаменты и другие), выражающие какое-либо имущественное право, условием реализации которого является обязательное их предъявление. Подразделяются на:- (i) Именные, составленные на имя определённого лица; (ii) Ордерные, выписанные на имя первого приобретателя и 'его приказу' (это означает, что указанное в ценной бумаге лицо вправе передать её путём Индоссамента); и (iii) Предъявительские, не содержащие имени лица, которому ценная бумага выдана. С утратой ценной бумаги, как правило, утрачивается и возможность осуществить выраженное в ней право. Но в некоторых случаях предусматриваются меры охраны прав управомоченного лица. Так, бывшее Советское законодательство устанавливало порядок восстановления прав при утрате сберегательной книжки на предъявителя. В капиталистическом обществе главными видами ценных бумаг являются акции и облигации капиталистических предприятий и облигации государственных займов. Особая разновидность облигации – Закладные Листы, выпускаемые ипотечными банками под залог земельных участков, домов и других недвижимостей. Ценные бумаги являются свидетельством участия в капитале предприятия или предоставления денег в ссуду и дают право на регулярное получение дохода в виде дивиденда или процента. Выпуск:- ценная бумага – одна из важнейших операций финансового капитала, используется монополиями в целях извлечения максимальной прибыли (например, огромная учредительская прибыль от выпуска ценных бумаг вновь организуемых акционерных компаний). В связи с тем что ценные бумаги приносят доход своим владельцам, они являются предметом купли-продажи на фондовой бирже по определённому курсу. Ценная Бумага – документ, удостоверяющий – с соблюдением установленной формы и обязательных реквизитов – имущественные права, осуществление или передача которых возможны только при его предъявлении. С передачей ценной бумаги переходят все удостоверяемые ею права. В случаях, предусмотренных законом или в установленном им порядке, для осуществления и передачи прав, удостоверенных ценной бумагой, достаточно доказательств их закрепления в специальном реестре (обычном или компьютеризованном). В России в соответствии со Статьёй 143 Гражданского Кодекса Российской Федерации к ценным бумагам относятся:- государственная облигация, облигация, вексель, чек, депозитный и сберегательный сертификаты, банковская сберегательная книжка на предъявителя, коносамент, акция, приватизационные ценные бумаги и другие документы, которые законами о ценных бумагах или в установленном ими порядке отнесены к числу ценных бумаг. Виды прав, которые удостоверяются ценной бумагой, обязательные реквизиты ценной бумаги и другие необходимые требования определяются законом или в установленном им порядке. Отсутствие обязательных реквизитов или несоответствие ценной бумаги установленной для неё форме влечет её ничтожность. Права, удостоверенные ценной бумагой, могут принадлежать:- (а) предъявителю ценной бумаги (ценная бумага на предъявителя); (б) названному в ценной бумаге лицу (именная ценная бумага); и (в) названному в ценной бумаге лицу, которое может само осуществить эти права или назначить своим распоряжением (приказом) другое управомоченное лицо (ордерная ценная бумага). Порядок выпуска и обращения некоторых видов ценных бумаг регулируется также Федеральным Законом 'О Рынке Ценных Бумаг' от 22 Апреля 1996. Ценные Бумаги – денежные или товарные документы, дающие их обладателю имущественные права и право на получение определённых денежных сумм, доходов. К денежным ценным бумагам относят облигация, векселя, денежные чеки. К товарным ценным бумагам, закрепляющим вещественные права их обладателей, права собственности, относятся коносаменты (товарные накладные), складские свидетельства. Особое место среди ценных бумаг занимают акции, которые предоставляют как денежные, так и имущественные права. Ценные бумаги могут быть объектом купли-продажи.

SECURITY AND STABILITY ADVISORY COMMITTEE = СОВЕЩАТЕЛЬНЫЙ КОМИТЕТ ПО БЕЗОПАСНОСТИ И СТАБИЛЬНОСТИ (или КОНСУЛЬТАТИВНЫЙ КОМИТЕТ ПО БЕЗОПАСНОСТИ И СТАБИЛЬНОСТИ) – Security And Stability Advisory Committee (SSAC):- the President's standing committee on the security and stability of the Internet's naming and address allocation systems. Their charter includes a focus on risk analysis and auditing. SSAC consists of approximately 20 technical experts from industry and academia as well as operators of Internet root servers, registrars, and Top-Level Domain (TLD) registries. / Совещательный Комитет По Безопасности И Стабильности (СКБС) – комитет по вопросам безопасности и стабильности систем распределения имён и адресов Интернета при президенте Корпорации Интернета по Распределению Имён и Номеров (КИРИН). Основной задачей комитета является анализ риска и аудит. В состав СКБС входят около 20 технических экспертов, представляющих частные фирмы и научные организации отрасли, а также операторов корневых серверов Интернета, регистраторов и реестров ДВУ.

SECURITY CENTER = ЦЕНТР БЕЗОПАСНОСТИ – In reference to electricity in the United States, Security Center is a group responsible for maintaining reliability over a control area or group of control areas. / В Соединённых Штатах Америки по отношению к электричеству под Центром Безопасности понимается группа, ответственная за поддержание безопасности в пределах одной или нескольких зон контроля.

SECURITY CHARGE = СБОР ЗА БЕЗОПАСНОСТЬ – Security Charge is imposed by shipping lines for additional security measures in checking cargoes prior to uplift. Freight surcharges are no longer updated by conferences. Please refer to shipping line agents or freight forwarders for their values. / Фрахтовые надбавки или доплаты (freight surcharges) .

SECURITY COUNCIL = СОВЕТ БЕЗОПАСНОСТИ – The UN Charter assigns to the Security Council primary responsibility for the maintenance of international peace and security. The Security Council originally consisted of 11 members – five permanent and six nonpermanent – elected by the General Assembly for two-year terms. From the beginning, nonpermanent members of the Security

Council were elected to give representation to certain regions or groups of states. As membership increased, however, this practice ran into difficulty. An amendment to the UN Charter in 1965 increased the council's membership to 15, including the original five permanent members plus 10 nonpermanent members. Among the permanent members, the People's Republic of China replaced the Republic of China (Taiwan) in 1971, and the Russian Federation succeeded the Soviet Union in 1991. After the unification of Germany, debate over the council's composition again arose, and Germany, India, and Japan each applied for permanent council seats. The nonpermanent members are chosen to achieve equitable regional representation, five members coming from Africa or Asia, one from eastern Europe, two from Latin America, and two from western Europe or other areas. Five of the 10 nonpermanent members are elected each year by the General Assembly for two-year terms, and five retire each year. The presidency is held by each member in rotation for a period of one month. Each Security Council member is entitled to one vote. On all 'procedural' matters – the definition of which is sometimes in dispute – decisions by the council are made by an affirmative vote of any nine of its members. Substantive matters, such as the investigation of a dispute or the application of sanctions, also require nine affirmative votes, including those of the five permanent members holding veto power. In practice, however, a permanent member may abstain without impairing the validity of the decision. A vote on whether a matter is procedural or substantive is itself a substantive question. Because the Security Council is required to function continuously, each member is represented at all times at the UN's headquarters in New York City. Any country – even if it is not a member of the UN – may bring a dispute to which it is a party to the attention of the Security Council. When there is a complaint, the council first explores the possibility of a peaceful resolution. International peacekeeping forces may be authorized to keep warring parties apart pending further negotiations. If the council finds that there is a real threat to the peace, a breach of the peace, or an act of aggression (as defined by Article 39 of the UN Charter), it may call upon UN members to apply diplomatic or economic sanctions. If these methods prove inadequate, the UN Charter allows the Security Council to take military action against the offending country. In addition to several standing and ad hoc committees, the work of the council is facilitated by the Military Staff Committee, sanctions committees for each of the countries under sanctions, peacekeeping forces committees, and an International Tribunals Committee. / , от Латинского слова Affirmo, означающее Утверждаю, . для данного случая (ad hoc). Совет Безопасности является важнейшим постоянно действующим органом ООН. Устав ООН возлагает на него главную ответственность за поддержание международного мира и безопасности. Состоит из 15 членов:- 5 постоянных (Великобритания, Китай, Россия (ранее СССР), США и Франция), 10 избираются на 2 года Генеральной Ассамблеей ООН. Решения Совета Безопасности принимаются на основе принципа единогласия и обязательны для всех членов ООН. Под принципом единогласия в ООН понимается один из важнейших принципов Устава ООН, согласно которому для принятия Советом Безопасности решений по всем вопросам (кроме процедурных) необходимо, чтобы за них были поданы голоса 9 членов Совета Безопасности, включая совпадающие голоса всех его постоянных членов. В случае наложения вето хотя бы одним из постоянных членов решение по непроцедурным вопросам считается непринятым. Совет Безопасности ООН определяет наличие любой угрозы миру, его нарушения или акта агрессии и обладает широкими полномочиями для их устранения, вплоть до применения вооружённой силы. На Совет Безопасности ООН возложены также функции по мирному урегулированию споров между государствами и другое. Совет Безопасности является одним из главных органов Организации Объединённых Наций (ООН). Он состоит из пятнадцати членов ООН. Китайская Народная Республика, Российская Федерация (в качестве правопреемника Союза Советских Социалистиеских Республик), Соединённое Королевство Великобритании и Северной Ирландии, Соединённые Штаты Америки, и Республика Франция являются постоянными членами Совета Безопасности. Генеральная Ассамблея избирает десять других членов ООН в качестве непостоянных членов Совета Безопасности, уделяя, в особенности, должное внимание, в первую очередь, степени участия членов ООН в поддержании международного мира и безопасности и в достижении других целей ООН, а также справедливому географическому распределению. Непостоянные члены Совета Безопасности избираются на двухгодичный срок. При первых выборах непостоянных членов, после увеличения числа членов Совета Безопасности с одиннадцати до пятнадцати, два из четырёх дополнительных членов избираются на срок в один год. Выбывающий член Совета Безопасности не подлежит немедленному переизбранию. Каждый член Совета Безопасности имеет одного представителя и имеет один голос в голосованиях. Любой член ООН, который не является членом Совета Безопасности, может принять участие, без права голоса, в обсуждении любого вопроса, внесённого в Совет Безопасности, во всех тех случаях, когда Совет Безопасности находит, что интересы этого члена ООН специально затронуты. Любой член ООН, который не состоит членом Совета Безопасности, или любое государство, не состоящее членом ООН, если они являются сторонами в споре, рассматриваемом Советом Безопасности, приглашаются принять участие, без права голоса, в обсуждении, относящемся к этому спору. Совет Безопасности ставит такие условия для участия государства, не состоящего членом ООН, какие он найдёт справедливыми. Совет Безопасности организуется таким образом, чтобы он мог функционировать непрерывно. Для этой цели каждый член Совета Безопасности должен быть всегда представлен в месте пребывания Организации Объединённых Наций. Решения Совета Безопасности по вопросам процедуры считаются принятыми, когда за них поданы голоса девяти членов Совета. Решения Совета Безопасности по всем другим вопросам считаются принятыми, когда за них поданы голоса девяти членов Совета, включая совпадающие голоса всех постоянных членов Совета, причём сторона, участвующая в споре, должна воздержаться от голосования при принятии решения на основании положений Устава ООН. Совет Безопасности представляет на рассмотрение Генеральной Ассамблеи ежегодные доклады и, по мере надобности, специальные доклады. Члены ООН соглашаются, в соответствии со своим Уставом, подчиняться решениям Совета Безопасности и выполнять их. Совет Безопасности может учреждать такие вспомогательные органы, какие он найдёт необходимыми для выполнения своих функций. Для обеспечения быстрых и эффективных действий Организации Объединённых Наций её члены возлагают на Совет Безопасности главную ответственность за поддержание международного мира и безопасности и соглашаются в том, что при исполнении его обязанностей, вытекающих из этой ответственности, Совет Безопасности действует от их имени. При исполнении этих обязанностей Совет Безопасности действует в соответствии с целями и принципами Объединённых Наций. Определённые полномочия, предоставленные Совету Безопасности для выполнения этих обязанностей, изложены в главах VI, VII, VIII и XII Устава ООН. Стороны, являющиеся членами ООН и участвующие в любом споре, продолжение которого могло бы угрожать поддержанию международного мира и безопасности, должны прежде всего стараться разрешить спор путём переговоров, обследования, посредничества, примирения, арбитража, судебного разбирательства, обращения к региональным органам или соглашениям или иными мирными средствами по своему выбору. Государства, которые не являются членами ООН, могут довести до сведения Совета Безопасности и Генеральной Ассамблеи ООН о любом споре, в котором они являются стороной, если они примут на себя заранее в отношении этого спора обязательства мирного разрешения споров, предусмотренные в Уставе ООН. Совет Безопасности ООН, когда он считает это необходимым, требует от сторон разрешения их спора при помощи таких средств. Он уполномочивается расследовать любой спор или любую ситуацию, которая может привести в международным трениям или вызвать спор, для определения того, не может ли продолжение этого спора или ситуации угрожать поддержанию международного мира и безопасности. Совет Безопасности уполномочивается в любой стадии таких споров или ситуаций подобного же характера рекомендовать надлежащую процедуру или методы урегулирования. Совет принимает во внимание любую процедуру для разрешения этого спора, которая уже была принята сторонами. Делая

рекомендации на основании Устава ООН, Совет Безопасности принимает также во внимание, что споры юридического характера должны, как общее правило, передаваться сторонами в Международный Суд Справедливости в соответствии с положениями Статута этого суда. Если стороны в таких спорах не разрешат их при помощи ранее указанных в Статье 33 Устава ООН средств, они передают его в Совет Безопасности. Если Совет Безопасности считает, что продолжение данного спора в действительности могло бы угрожать поддержанию международного мира и безопасности, он решает, действовать ли ему на основании Статьи 36 или рекомендовать такие условия разрешения спора, какие он найдёт подходящими. Совет Безопасности определяет существование любой угрозы миру, либо нарушения мира или акта агрессии и делает рекомендации или решает о том, какие меры следует предпринять в соответствии со Статьями 41 и 42 Устава ООН для поддержания или восстановления международного мира и безопасности. Чтобы предотвратить ухудшение ситуации, Совет Безопасности уполномочивается, прежде чем сделать рекомендации или решить о принятии мер, предусмотренных Статьёй 39, потребовать от заинтересованных сторон выполнения тех временных мер, которые он найдёт необходимыми или желательными. Такие временные меры не должны наносить ущерба правам, притязаниям или положению заинтересованных сторон. Совет Безопсаности должным образом учитывает невыполнение этих временных мер. Совет Безопасности уполномочивается решать, какие меры, не связанные с использованием вооружённых сил, должны применяться для осуществления его решений, и он может потребовать от членов ООН применения этих мер. Эти меры могут включать полный или частичный перерыв экономических отношений, железнодорожных, морских, воздушных, почтовых, телеграфных, радио или других средств сообщения, а также разрыв дипломатических отношений. Если Совет Безопасности сочтёт, что данные меры могут оказаться недостаточными или уже оказались недостаточными, он уполномочивается предпринимать такие действия воздушными, морскими или сухопутными силами, какие окажутся необходимыми для поддержания или восстановления международного мира и безопасности. Такие действия могут включать демонстрации, блокаду и другие операции воздушных, морских или сухопутных сил членов ООН. Все члены Организации Объединённых Наций для того, чтобы внести свой вклад в дело поддержания международного мира и безопасности, обязуются предоставлять в распоряжение Совета Безопасности по его требованию и в соответствии с особым соглашением или соглашениями необходимые для поддержания международного мира и безопасности вооружённые силы, помощь и соответствующие средства обслуживания, включая право прохода. Такое соглашение или соглашения определяют численность и род войск, степень их готовности и их общее расположение и характер предоставляемых средств обслуживания и помощи. Переговоры о заключении соглашения или соглашений предпринимаются в возможно кратчайший срок по инициативе Совета Безопасности. Когда Совет Безопасности решил применить силу, то прежде чем потребовать от члена ООН, не представленного в Совете, предоставления вооружённых сил, во исполнение обязательств, принятых им на основании Статьи 43 Устава ООН, Совет Безопасности приглашает этого члена Организации Объединённых Наций, если последний этого пожелает, принять участие в решениях Совета Безопасности относительно использования контингентов вооружённых сил данного члена ООН. В целях обеспечения для Организации Объединённых Наций возможности предпринимать срочные военные мероприятия, члены ООН должны держать в состоянии немедленной готовности контингенты национальных военно-воздушных сил для совместных международных принудительных действий. Численность и степень готовности этих контингентов и планы их совместных действий определяются Советом Безопасности с помощью Военно-Штабного Комитета (Military Staff Committee) в пределах, указанных в особом соглашении или соглашениях, упомянутых в Статье 43. Планы применения вооружённых сил составляются Советом Безопасности ООН с помощью Военно-Штабного Комитета. Создаётся Военно-Штабной Комитет для того, чтобы давать советы и оказывать помощь Совету Безопасности по всем вопросам, относящимся к военным потребностям Совета Безопасности в деле поддержания международного мира и безопасности, к использованию войск, предоставленных в его распоряжение, и к командованию ими, а также к регулированию вооружений и к возможному разоружению. В целях содействия установлению и поддержанию международного мира и безопасности с наименьшим отвлечением мировых людских и экономических ресурсов для дела вооружения, Совет Безопасности несёт ответственность за формулирование, при помощи Военно-Штабного Комитета, указанного в статье 47 Устава ООН, планов создания системы регулирования вооружений для предоставления их членам Организации Объединённых Наций. Военно-Штабной Комитет состоит из Начальников Штабов постоянных членов Совета Безопасности или их представителей. Любой член ООН, не представленный постоянно в Комитете, приглашается Комитетом сотрудничать с ним, если эффективное осуществление обязанностей Комитета требует участия этого члена ООН в работе Комитета. Военно-Штабной Комитет, находясь в подчинении Совета Безопасности, несёт ответственность за стратегическое руководство любыми вооружёнными силами, предоставленными в распоряжение Совета Безопасности. Вопросы, относящиеся к командованию такими силами, должны быть разработаны позднее. Военно-Штабной Комитет может, с разрешения Совета Безопасности и после консультации с надлежащими органами, учреждать свои региональные подкомитеты. Члены Организации Объединённых Наций должны объединяться для оказания взаимной помощи в проведении мер, о которых принято решение Советом Безопасности. Если Советом Безопасности принимаются превентивные или принудительные меры против какого-либо государства, всякое другое государство, независимо от того, состоит ли оно членом ООН, перед которым встанут специальные экономические проблемы, возникшие из проведения вышеупомянутых мер, имеет право консультироваться с Советом Безопасности на предмет разрешения таких проблем. Вместе с тем, Устав ООН ни в коей мере не затрагивает неотъемлемого права на индивидуальную или коллективную самооборону, если произойдёт вооружённое нападение на члена ООН, до тех пор пока Совет Безопасности не примет мер, необходимых для поддержания международного мира и безопасности. Меры, принятые членами ООН при осуществлении этого права на самооборону, должны быть немедленно сообщены Совету Безопасности и никоим образом не должны затрагивать полномочий и ответственности Совета Безопасности, в соответствии с Уставом ООН, в отношении предпринятия в любое время таких действий, какие он сочтёт необходимыми для поддержания или восстановления международного мира и безопасности. К сожалению, практика последних лет показывает неэффективность действий Совета Безопасности. Дело в том, что большинство высокоразвитых в экономическом плане, а также просто крупных стран мира в проводимой политике в силу каких-либо геополитических интересов используют двойные стандарты в отношении разрешения или освещения тех или иных вопросов. Порой это доходит до полного абсурда, но несмотря на это власти конкретной страны или стран упрямо и тупо продолжают отстаивать занятую позицию. Такое поведение полностью подрывает доверие к принимаемым решениям Совета Безопасности ООН.

SECURITY DEPOSIT = ЗАЛОГОВЫЙ ДЕПОЗИТ – Security Deposit is the amount of funds that must be deposited by a customer with his broker for each futures contract as a guarantee of fulfillment of the contract. It is not considered part payment of purchase. Used interchangeably with margin. Also known as Margin. / Залоговый Депозит:- сумма средств, которые клиент должен депонировать на маржинальный счёт у своего брокера за каждый фьючерсный контракт в качестве гарантии исполнения этого контракта. Он не рассматривается как часть платежа за покупку, и используется лишь как маржа в качестве временного залога. В целом, понятия ‘Залоговый Депозит’ и ‘Маржа’ являются взаимозаменяемыми. Известен также как Маржа (Margin).

SECURITY DEPOSIT CALL = ТРЕБОВАНИЕ ПО ЗАЛОГОВОМУ ДЕПОЗИТУ – Security Deposit Call is a demand for additional cash funds because of adverse price movement. See also Maintenance Margin. / Требование о выделении дополнительных денежных средств, вызванном неблагоприятным движением цены. Смотрите также Поддерживаемая Маржа (Maintenance Margin).

SECURITY FUTURES = ФЬЮЧЕРС НА ЦЕННУЮ БУМАГУ – The Security Futures is the term used to collectively describe futures on individual stocks and futures on narrow-based indices. The security futures is a contract for the sale or future delivery of a single security or of a narrow-based security index. A security futures contract is a legally binding agreement between two parties to purchase or sell in the future a specific quantity of shares of a single stock equity, exchange-traded fund (ETF), or narrow-based index, at a specific price. / Фьючерс На Ценную Бумагу является собирательным термином, используемым для описания фьючерса на отдельные акции и фьючерса на усечённые индексы. Фьючерс на ценную бумагу является контрактом на продажу или будущую поставку отдельной ценной бумаги или усечённого индекса по ценным бумагам. Фьючерсный контракт на ценную бумагу является юридически обязывающим соглашением между двумя сторонами о приобретении или продаже в каком-то обозримом будущем определённого количества акций из собственных средств отдельного уставного капитала, пая, торгуемого на бирже (ПТБ), или усечённого индекса, по определённой цене.

SECURITY FUTURES PRODUCT = ПРОДУКТ В ВИДЕ ФЬЮЧЕРСА НА ЦЕННУЮ БУМАГУ – In December 2000, Congress established a framework for joint regulation by the CFTC and the Securities and Exchange Commission (SEC) of the trading of futures on single securities and futures on narrow-based security indexes. Collectively, these products are called Security Futures Products or SFPs. SFPs have features of both securities and futures. A security future or any put, call, straddle, option, or privilege on any security future. Security Futures Products include futures on single stocks and futures on narrow-based security indexes. Before a board of trade may list for trading a security futures product, the board of trade must meet a number of requirements and make a filing to the CFTC. Security futures products may be traded on any CFTC-designated contract market or CFTC-registered derivatives transaction execution facility that also is notice registered with the Securities and Exchange Commission (SEC) as a securities exchange. In addition, security futures products may be traded on any SEC-registered national securities exchange, national securities association, or alternative trading system that is notice designated as a contract market by the CFTC. As their name suggests, 'Security Futures' are financial instruments that are both securities and futures. There are two types of security futures:- futures on individual securities and futures on narrow-based security indexes. Security futures can be traded on both securities and futures exchanges.

SECURITY INTEREST = ПРОЦЕНТ ОБЕСПЕЧЕНИЯ – Security Interest is a form of interest in property which provides that the property may be sold on default in order to satisfy the obligation covered by the security interest. Security Interest is the creditor's right to take property or a portion of property offered as security. Security Interest means an interest in real estate or personal property created by contract or conveyance which secures payment or performance of an obligation. The term includes a lien created by a mortgage, deed of trust, trust deed, security deed, contract for deed, land sales contract, lease intended as security, assignment of lease or rents intended as security, pledge of an ownership interest in an association, and any other consensual lien or title retention contract intended as security for an obligation. 'First Security Interest' shall mean and refer to a security interest in a lot (physical portion of the Common Interest Community = Property) prior to all other security interests except the security interest for real property taxes and assessments made by Weld County, State of Colorado, or other governmental authority having jurisdiction over the Common Interest Community. If stated in your credit agreement, a creditor's, lessor's, or assignee's legal right to your property (such as your home, stocks, or bonds) that secures payment of your obligation under the credit agreement.

SECURITY MEASURES = МЕРЫ БЕЗОПАСНОСТИ – Security Measures are the internationally agreed measures to improve security on board ships and in port areas to prevent unlawful acts against passengers and crews on board ships.

SECURITY NUMBERING SYSTEM = СИСТЕМА НУМЕРАЦИИ ЦЕННЫХ БУМАГ – Security Numbering System is a complete list of security code numbers. In Switzerland, maintained and updated by Telekurs AG. / Система Нумерации Ценных Бумаг – полный список номеров кодов ценных бумаг. В Швейцарии, поддерживается и обновляется компанией Тэлекурс А.Ге. (Telekurs AG).

SED = SHIPPER'S EXPORT DECLARATION

SEDAR = SYSTEM FOR ELECTRONIC DOCUMENT ANALYSIS AND RETRIEVAL

SEDGES = ОСОКИ – Sedges are members of the Family Cyperaceae. They bear a close resemblance to the grasses and can be distinguished by a thin triangular stem, the absence of ligules, and the fusion of leaf sheaths forming a tube around the stem. / Под Осокой понимается Род Многолетних Трав Семейства Осоковых. Около 2 000 Видов, преимущественно в умеренном и холодном поясах; в бывшем Союзе Советских Социалистических Республик (СССР) насчитывалось свыше 400 Видов, повсеместно по сырым местам, некоторые Виды на песках. Многие Осоки – декоративные, кормовые, лекарственные Растения.

SEDIMENT = ОТЛОЖЕНИЕ (или НАНОС) – Sediment:- solid particles transported and deposited by water, glaciers and wind.

SEDOL = STOCK EXCHANGE DAILY OFFICIAL LIST

SEED = СЕМЯ – (1) Seed is a sexually-produced embryo, consisting of an axis (root and stem, or hypocotyl and epicotyl) and in Cactaceae two cotyledons, with its associated protective and nutritive structures capable of developing into a plant. A mature fertilized plant ovule consisting of an embryo and its food source and having a protective coat or testa. Seed:- the fertilized and ripened ovule of a seed plant, comprising a miniature plant usually accompanied by a supply of food (endosperm) enclosed in a protective seed coat, often accompanied by auxiliary structures, and capable, under suitable conditions, of independent development into a plant similar to the one that produced it. In Rice, the grain is the common form of seed; the caryopsis is the true seed. Seed is the mature, fertilized egg including the seed coat, embryo and endosperm. In Rice, the seed coat is firmly adhered to the maternal pericarp. Therefore, the seed is an inseparable part of the fruit (caryopsis). The term seed, as used in seeding or sowing, actually refers to the grain. / Семя растения (Semen), орган семенных растений, выполняющий функции их воспроизведения, расселения и переживания неблагоприятных условий. В ходе эволюции разноспоровых высших растений семя возникло в связи с изменением условий существования (климатических и других) как фаза в онтогенезе между половым процессом, происходящим внутри мегаспорангия (семязачатка, семяпочки), и взрослым растением. Поэтому семя развивается обычно после оплодотворения (иногда, вторично, без оплодотворения – апомиксис), а число семян, образующихся на одном растении, не может превышать число мегаспорангиев, возникших в результате бесполого размножения. У первых семенных растений – семенных Папоротников – семя развивалось, вероятно, на концах или в пазухах теломов. У голосеменных растений семена возникают на открытых спорофиллах (семенных чешуях), у покрытосеменных – в плоде, образованном главным образом замкнутыми плодолистиками. Тип семени определяется типом семяпочки, из которой образуется семя, и её ориентировкой, хотя в некоторых случаях после оплодотворения из-за неравномерного роста молодого семени его тип может отличаться от типа

семяпочки. На поверхности семени обычно можно различить семенной рубчик – место отделения зрелого семени от семяножки, след микропиле на корневом конце в виде ямки, след халазы на семенодольном конце в виде отличающегося по окраске пятна, бугорка или ямки, и семяшов между семенным рубчиком и халазой (у анатропных семян), возникающий в результате прирастания к семяпочке верхней части семяножки. Нередко семя имеет выросты – ариллус (кровельку, присемекник), ариллоиды, строфиоли, обеспечивающие мирмекохорию. Поверхность семени бывает гладкой и блестящей (Горох), сетчато-ямчатой (Белена), шиповатой (Куколь), бугорчатой (Ясколка), чешуйчатой (Борец) и так далее. У некоторых семян образуются крылья (Эремурус, Бигнония), волоски по всей поверхности (Хлопчатник). Семя состоит из семенной кожуры (спермодермы), зародыша (молодого спорофита) и у многих растений из тканей с запасными питательными веществами, развивающихся вне зародыша, – перисперма или эндосперма. Кожура семени образуется из покровов семяпочки (интегументов), служит для защиты зародыша и часто содействует расселению семян. При развитии двух интегументов в семенной кожуре часто различают наружную (у Граната и Крыжовника – сочная) и внутреннюю семенные оболочки; при одном интегументе или разрушении второго в процессе развития семени она одинарная, но состоит обычно из нескольких слоёв клеток. Твёрдость кожуры повышается вследствие склерификации тканей. Тонкая кожура характерна для семян паразитных растений (Заразиховые) и Орхидных, а также для семян, заключённых в односемянные невскрывающиеся плоды (например, орехи). Семена без кожуры встречаются у Санталовых, Ремнецветных и других так называемых полупаразитов. Зародыш образуется обычно из зиготы – оплодотворённой яйцеклетки, иногда также из других клеток зародышевого мешка или даже клеток нуцеллуса семяпочки (полиэмбриония). По положению относительно кожуры, перисперма и эндосперма, а также по форме зародыши могут быть различными. Развитие зародыша в семени происходит за счёт питательных веществ, которые накапливаются в эндосперме и перисперме или в семядолях. Эндосперм у голосеменных представляет собой вегетативную часть женского заростка, а у покрытосеменных – новообразование, возникающее в результате слияния второго спермия со вторичным ядром зародышевого мешка (двойное оплодотворение); перисперм – остатки ткани нуцеллуса или ядра семяпочки. В семени могут находиться и эндосперм, и перисперм (Перечные, Кувшинковые), только эндосперм (Лютиковые) или только перисперм (Гвоздичные), или же в семени нет ни того, ни другого (Бобовые). В последнем случае перисперм не развивается, эндосперм целиком поглощается развивающимся зародышем, питательные вещества запасаются в клетках семядолей. Семя с эндоспермом часто неправильно называют ‘белковым’. Наличие в семени эндосперма и перисперма считается примитивным признаком. Прогрессивным является отложение питательных веществ в теле зародыша. Запасные вещества семени – белки, жиры, крахмал, сахара, витамины, гемицеллюлозы; из форменных включений – протеиновые зёрна, нередко с кристаллами белка и глобоидами двойной соли инозитгексафосфорной кислоты, кристаллы оксалата кальция и другие. Признаки внешней формы и внутреннего строения семени наследственно постоянны и используются в систематике растений. Размеры и масса семян различны – от мелких, как пыль, у Орхидей (например, у Goodyera repens семя весит 0.002 мг, у Dendrobium attenuatum – 0.005 мг) до огромных у пальм (семя Сейшельской Пальмы, например, весит до 9 кг). Число семян в одном плоде варьирует от сотен тысяч и даже миллионов (у некоторых Орхидных) до одного (Злаки, Сложноцветные). Число семян у одной особи бывает огромным (у Ширицы до полумиллиона, у Гулявника до 750 тысяч). Длительность сохранения всхожести семян различна у разных видов и зависит от условий хранения. Так, семена Ивы могут прорастать только в течение нескольких суток, но в замкнутых сосудах при 12–13 °С не теряют всхожести до 150–320 суток. Твёрдые семена некоторых Бобовых могут прорастать через 100 лет, а у Лотоса оказались всхожими семена, пролежавшие в слое торфа несколько сотен лет. Семена используются человеком для посева при культуре растений, в пищу или как приправа к пище, для получения масел, крахмала, красящих, лекарственных и других веществ. Семена многих растений, мука из них, а также жмых, состоящий из остатков семян, – корм для скота и птиц. Волоски семян Хлопчатника используют как текстильное сырьё, в медицине (гигроскопическая вата) и так далее. Часто семенем неправильно называют сухие невскрывающиеся односемянные плоды (Злаков, Гречихи, Конопли и других), целые соплодия (Свёкла), служащие посевным материалом, и даже клубни (Картофеля), используемые для посадки. Науку о семенах называют Семеноведением. В ботанике под Семенем понимается орган воспроизведения, расселения и переживания неблагоприятных условий у семенных растений. Семя развивается из особого образования – семяпочки (семязачатка), обычно после оплодотворения. В семени различают зародыш, кожуру (оболочку) и у многочисленных растений ткани с запасными питательными веществами (эндосперм, перисперм); при отсутствии этих тканей, например, у бобовых, запасные питательные вещества откладываются в семядолях зародыша. У покрытосеменных растений семя заключено в плоде, у голосеменных – формируется открыто на семенных чешуях в мегастробилах (шишках). Вес семени может варьироваться от 0.002 мг (у некоторых Орхидей) до 9 кг (у некоторых Пальм). Признаки внешнего и внутреннего строения семени используются в систематике растений. Семя может быть сырьём для изготовления продуктов питания, технических масел, красок, лекарственных и других веществ. Семена – средство размножения большинства овощных культур. Важнейшим условием повышения урожайности и улучшения качества получаемой продукции является высокое качество семян, используемых при выращивании овощных культур. Качество семян определяется двумя показателями:- сортовой чистотой и посевными качествами. Сортовая Чистота характеризует степень соответствия семян определённому сорту. Сортовая чистота (в %) определяется апробацией в полевых условиях. Она показывает, какую долю от общего количества растений составляют растения данного сорта. Сортовая чистота снижается при наличии в семенных растениях других сортов, разных гибридов и отклонений от сорта. По сортовым качествам семена овощных и бахчевых культур делят на первую, вторую и третью сортовые категории. В семенах первой и второй категории не должно быть примесей других сортов и резких гибридов. В качестве примесей допускаются только отклонения от основного сорта. В семенах третьей категории допускается примесь сортов и резких гибридов в зависимости от культуры от 1 до 3 %. Посевные Качества – это совокупность свойств семян, характеризующих степень их пригодности для посева и хранения. По посевным качествам семена овощных, бахчевых культур и кормовых корнеплодов делят на семена 1-го и 2-го класса. К посевным качествам семян относятся такие показатели, как энергия прорастания, всхожесть, жизнеспособность, чистота, масса 1 000 штук семян, влажность, заражённость болезнями и вредителями, долговечность. Масса 1 000 штук семян – один из важнейших показателей качества семян. Она связана с выполненностью семян и количеством запасных веществ в эндосперме или семядолях. С массой семян связаны их способность к быстрому прорастанию, интенсивному росту и продуктивность растений. Влажность Семян – количество воды в семенах, выраженное в процентах к массе семян. Влажность семян определяют в семеноводческом хозяйстве при сушке и обработке семян, перед помещением на склад и перед сдачей образца в контрольно-семенную инспекцию. В контрольно-семенной инспекции ёе определяют не позже чем через двое суток с момента поступления пробы в лабораторию методом высушивания в сушильном шкафу (основной метод) или при помощи влагомера. При определении влажности высушиванием две навески по 5 г высушивают в сушильном шкафу при температуре 105 °С до постоянного веса. Разницу между величинами массы сырой и сухой навески вычисляют в процентах к массе сырой навески. В семенах, предназначенных для хранения, кондиционная влажность не выше 9–11%. Заражённость Болезнями – определяют видовой состав возбудителей грибных и бактериальных болезней, степень заражения ими семян из образца, отобранного для определения влажности семян. Пробу для определения заражённости семян болезнями во влажной камере и на питательных средах отбирают в размере 20 г. Результаты анализа в зависимости от культуры и вида болезни выражают в процентах как

отношение массы заражённых семян к общей массе семян в пробе. Заселённость Семян вредителями устанавливают по пробе, отобранной для определения влажности. Заселённость вредителями, находящимися внутри семян (зерновки, семяеды), можно определять по пробе, представленной для определения чистоты и всхожести. Результаты анализа выражают в процентах как отношение массы заселённых вредителями семян к общей массе семян в пробе. Долговечность Семян – это продолжительность периода, в течение которого они сохраняют способность к прорастанию со времени созревания их на материнском растении. Способность семян сохранять всхожесть при хранении определяется прочностью семенных оболочек, степенью зрелости и влажности, химическим составом запасных питательных веществ, накопленных в семени, и условиями хранения. Семена, имеющие твёрдую оболочку, сохраняют всхожесть дольше, чем имеющие рыхлую оболочку. Посевные качества семян устанавливают Государственные Семенные Инспекции методом лабораторного анализа среднего образца семян от каждой партии семян в соответствии с ГОСТ 'Семена сельскохозяйственных культур. Методы определения качества' 12038-84, 12042-80, 12041-82, 12037-81. Партия Семян – это определённое количество однородных семян (одной культуры, сорта, репродукции, года урожая, одного происхождения), занумерованное и удостоверенное соответствующими документами. Предельная величина отдельной партии или её части, от которой отбирают один средний образец для определения качества семян, называют Контрольной Единицей. Для разных культур она различна. Средний Образец (Проба) – это количество семян, которое отбирают из контрольной единицы и передают для анализа в Государственную Семенную Инспекцию. Отбор производят с помощью щупа в виде выемок из мешков с семенами (количество семян, извлекаемых щупом за один приём). Число выемок определяется размером контрольной единицы:- из 10 и менее мешков (мест) выемки берут из каждого в трёх точках (верх, середина, низ), из каждого последующего – одну, чередуя место отбора. После объединения и перемешивания всех проб семена разравнивают слоем до 1.5 см для мелкосеменных культур и до 5 см – для крупносеменных. Затем при помощи планки её делят по диагонали на 4 треугольника. Семена двух противоположных треугольников объединяют для составления первой пробы, а семена двух оставшихся треугольников объединяют для выделения из них второй и третьей проб. Так поступают до тех пор, пока в двух треугольниках не будет получено примерно такое количество семян, которое необходимо для средней пробы; например, средняя проба для капусты, моркови, салата должна составлять не менее 50 г, огурца и дыни – 100 г. Одну среднюю пробу, предназначенную для определения посевных качеств семян, помещают в мешочек и пломбируют, вторая идёт для определения влажности семян и заражённости вредителями. Её кладут в стеклянные банки с притёртыми пробками или в бутылки с корковыми пробками, залитыми сургучом, парафином или воском. На каждый образец заполняют этикетку в двух экземплярах для укладки вовнутрь и наклеивания снаружи. Отбор среднего образца оформляют 'Актом отбора средних образцов для определения посевных качеств семян', который подписывают лица, производившие отбор образца. Его составляют в двух экземплярах (один остаётся в хозяйстве, другой сопровождает средний образец). В течение суток образцы должны быть доставлены в Государственную Инспекцию для анализа при Россельхознадзоре. Здесь их внимательно изучают, устанавливают состояние их упаковки и соответствие документам, взвешивают, регистрируют и нумеруют. Для анализа посевных качеств семян из среднего образца отбирают навески определённой массы. У голосеменных растений Семяпочка расположена на поверхности семенных чешуек в шишках; у покрытосеменных растений семяпочка расположена в полости завязи. В центральной части семяпочки (нуцеллусе, или мегаспорангии) формируются мегаспоры. Снаружи семяпочка прикреплена семяножкой к плаценте.

(2) In Cotton industry, Seed is a cottonseed from which the lint has been removed. / В индустрии хлопка под Семенем понимается семя Хлопчатника, у которого было отделено волокно.

SEED BANK = БАНК СЕМЯН – Seed Bank is the number of seeds, accumulated over time, present in the soil. / Кубанский Генетический Банк Семян был построен в 1976 во Всероссийском НИИ Растениеводства имени Николая Ивановича Вавилова (ВИР) собрана одна из самых крупных в мире и богатых по видовому представительству коллекция мирового генетического разнообразия растений, которая насчитывает около 400 000 образцов. Большая часть этой коллекции хранится в контролируемых условиях (+4.5 °C) в подземном хранилище филиала института Кубанский Генетический Банк Семян. В ВИРе накоплен огромный фактический и экспериментальный материал по изучению мировых растительных ресурсов в разных эколого-географических зонах, что обеспечивает ежегодно создание сотен новых сортов и гибридов. Всемирный Банк Семян:- гигантское хранилище семян, открытое в 2008 на Острове Шпицберген (Норвегия), насчитывает уже полмиллиона образцов. Здесь на случай вселенской катастрофы припасены семена всех наиболее значимых растений Земли. Устойчивая к плесени Фасоль, Немецкий Розовый Помидор, который привёз в Америку в 1883 Баварский иммигрант, а также дикая Земляника, сорванная со склонов Российского вулкана, – вот лишь некоторые из культур, семена которых попали на прошлой неделе (17 Марта 2010) в Норвежское глобальное хранилище. С этими новыми 'депозитами' уникальная коллекция расширилось до полумиллиона сортов. Всего же здесь могут храниться 4.5 миллиона образцов семян, или примерно два миллиарда зёрен. Своеобразный гигантский холодильник, который был официально открыт 26 Февраля 2008, призван защитить разнообразие мировых растительных культур на случай экологической или техногенной катастрофы, вселенского неурожая, а также других глобальных стихийных бедствий. Предполагаемая продолжительность хранения образцов – до 10 000 лет. В случае исчезновения всех растений на Земле их впоследствии можно будет воспроизвести благодаря запасам зарезервированных семян. Это позволит обеспечить людей продовольствием и спасти человечество.

SEEDBED = СЕМЕННОЕ ЛОЖЕ (или ГНЕЗДО, или ЛУНКА, или ГРЯДКА) – Seedbed is the bed on which Rice seeds are sown, consisting of soil (wetbed method) or banana leaves, plastic sheets or concrete floor (dapog method).

SEED–BORNE = ПЕРЕДАЮЩЕЕСЯ С СЕМЕНАМИ – Seed-Borne:- carried within, by, or through the seed.

SEED BOX = СЕМЕННОЙ ЯЩИК – Seed Box is a rectangular box specially constructed with the open top filled with good soil for germinating seeds.

SEEDBOX SCREENING = ПРОСЕИВАНИЕ или ОТСЕИВАНИЕ или ГРОХОЧЕНИЕ СЕМЕННОГО ЯЩИКА (или БРАКОВКА СЕМЕННОГО ЯЩИКА) – Seedbox Screening is a term used primarily for Leafhopper and Planthopper screening where test entries are screened as seedlings in seedboxes in the greenhouse.

SEED CAPITAL = СЕМЕННОЙ КАПИТАЛ – Seed Capital is an equity capital invested in business start-ups by venture capital firms or wealthy individuals to finance research and development to lead a product or service to market maturity. / Жаргонный термин Семенной Капитал означает венчурное, рисковое финансирование на самой ранней, зародышевой стадии осуществления проекта; первый вклад инвестора в создание новой компании в форме кредита, приобретения акций или конвертируемых облигаций.

SEED CLASSES = КЛАССЫ СЕМЯН – The Seed Classes pre-basic, basic (1 and 2), certified (1 and 2) and commercial seed used in this programme are defined as follows:- (i) Pre-basic is either grown using tubers from selected plants and multiplied under intensive selection and laboratory testing procedures, or using tubers from in-vitro plantlets produced in a protected environment (screen house)

which thereafter are multiplied under strict controlled conditions. The tolerance for virus diseases and bacterial diseases are zero. (ii) Basic-1 seed is grown from pre-basic seed. The tolerance for virus diseases is 0.01% and for the bacterial diseases zero. (iii) Basic-2 seed is grown from basic-1 seed (or a higher class). The tolerance for virus diseases is 0.03% and for the bacterial diseases zero. (iv) Certified-1 seed is grown from Basic-1 seed (or a higher class).The tolerance for virus diseases is 1–2% and for the bacterial diseases zero. (v) Certified-2 seed is grown from Basic-2 seed (or a higher class).The tolerance for virus diseases is 2% and for the bacterial diseases zero. (vi) Commercial seed is grown from certified seed (or a higher class). The tolerance for virus diseases is 8–10% and for the bacterial diseases zero or in special cases 0.01%. / Под Классами Семян понимаются качественные группы семян разной ценности. Семена Зерновых, Зернобобовых и Масличных культур в зависимости от их посевных качеств в соответствии с требованиями ГОСТов делят на 3 класса. Из посевных качеств семян стандартом нормируются содержание семян основной культуры (в процентах по массе), отход основной культуры и примеси (в процентах по массе), содержание семян других растений (в штуках на 1 килограмм), в том числе семян Сорных Растений, всхожесть и влажность семян. Например, всхожесть и чистота семян Мягкой Озимой Пшеницы I Класса – 95 и 99%, II Класса – соответственно 92 и 98.5%, Кукурузы I Класса – 96 и 99.8%, II Класса – 92 и 99.5%. Не допускаются к посеву семена при обнаружении в них семян карантинных и ядовитых Сорняков, галлов пшеничной нематоды, живых Вредителей и их личинок, повреждающих семена данной культуры, за исключением Клещей, наличие которых в семенах III Класса не должно превышать 20 штук на 1 килограмм семян. Семена III Класса допускают к посеву в виде исключения только на общих площадях колхозов или совхозов при отсутствии семян I и II классов. Семена, не удовлетворяющие хотя бы по одному показателю качества нормам ГОСТов на сортовые семена, принято называть Некондиционными Семенами. Семенной Материал – посевной материал, семена, плоды, соплодия и части сложных плодов, используемые для посева. Иногда к семенному материалу относят также части растений, употребляемые для размножения вегетативным путём (клубни Картофеля, луковицы и другие). В бывшем Союзе Советских Социалистических Республик (СССР) на посевные (всхожесть, чистота, заражённость болезнями и вредителями, влажность и масса 1 000 семян) и сортовые (сортовая чистота и для некоторых культур типичность) качества семенного материала были установлены государственные стандарты; к посеву допускались кондиционные семена, отвечавшие их требованиям. Посевные и сортовые качества семенного материала устанавливали Государственные Семенные Инспекции, проводя лабораторный анализ (смотрите Семенной Контроль), грунтовый контроль и апробацию посевов (смотрите Сортовой Контроль). В зависимости от посевных качеств и в соответствии со стандартами семенной материал делят на 3 класса. Для каждого из них нормируют содержание семян основной культуры, отход основной культуры, примеси, количество семян других растений, в том числе сорных, всхожесть и влажность. Для мягкой Пшеницы (озимой и яровой) установлены следующие нормы семян основной культуры (в %):- 1-й Класс – 99, 2-й Класс – 98.5, 3-й Класс – 97; всхожести (в %) соответственно:- 95, 92 и 90. На посев используют семена 1-го и 2-го классов. Семена 3-го класса допускаются к посеву в виде исключения и только на производственных площадях хозяйств. В соответствии с сортовыми качествами семенного материала делят на 3 категории, характеризуемые предельными нормами (в %) сортовой чистоты. Для большинства зерновых (в том числе Зернобобовых) культур 1-я Категория – 99.5%; 2-я Категория – 98%; 3-я Категория – 95%. На семенные посевы допускаются семена 1-й категории; на производственные посевы – также 2-й и 3-й категорий. Семенной материал перед засыпкой на хранение в хозяйствах очищают и сортируют (смотрите Очистка И Сортирование Семян), если нужно – сушат, а перед посевом подвергают различным приёмам подготовки семян к посеву. В каждом хозяйстве сведения о посевных и сортовых качествах семенного материала записывают в шнуровую книгу учёта семян.

SEED CLASSIFICATION = КЛАССИФИКАЦИЯ СЕМЯН – Seed Classification is based on the number of generations from pre basic seed and on the observed quality of seed plots and seed lots. Various names are used to classify seed:- a.o. breeders seed, pre-basic seed, basic seed, super-elite, elite, foundation seed, certified seed, approved seed, registered seed, commercial seed. These names are neither uniformly used nor are they often always clearly defined. In this programme we use:- (i) pre-basic seed; (ii) basic seed (1 and 2); (iii) certified seed (1 and 2); and (iv) commercial seed. In generative multiplied crops there is an emphasis on the number of generations for classification of the seed, whereas in vegetative multiplied crops in this respect the contamination of the seed with diseases is more pre-dominant. Number of generations and contamination with diseases:- seed becomes more and more contaminated (degenerates) with diseases, each time it is multiplied. The degeneration rate caused by pathogens depends on:- (i) infection sources present; (ii) number of vectors which transmit pathogens; and (iii) plant resistance to pathogens. Tolerances for diseases are specified for each generation:- in the first generations the tolerances are low (or zero). The virus tolerances in the lower generations are higher. For quarantine diseases (e.g., ring rot and brown rot) the lower classes also have a zero tolerance. Flush through (out) system:- to guarantee a regular use of healthy seed, after each field generation seed stocks are automatically downgraded to the next class.The classification of a certain seed lot thus depends on the number of generations from pre-basic seed and the quality found during inspections. In the past in seed programmes most emphasis was given to virus diseases. It is now more and more realized that quarantine diseases need more emphasis.

SEED COAT = СЕМЕННАЯ ОБОЛОЧКА – In Rice industry, the Seed Coat or Testa is firmly adhered to the maternal pericarp as one of the protective layers of the seed kernel. / В индустрии Риса Семенная Оболочка или Теста .

SEED COAT FRAGMENTS WITH FIBER = ЧАСТИЦЫ КОЖИЦЫ СЕМЯН С ВОЛОКНОМ – Seed Coat Fragments With Fiber are the fragments of cottonseed that remain in cotton bales after ginning. These seed coat fragments (SCF) can cause the yarn to break resulting in costly down time in the mill. In addition, when the yarn or fabric is dyed, the SCF absorb the dye differently than the cotton lint and cause discoloration that is undesirable in the finished product. These SCF were shown to originate from immature and normal seed that were damaged or completely destroyed in the gin stand. Small/immature seed were more likely to form SCF as they passed through the gin stand. Seed destroyed in the gin stand was the major source of seed coat fragments (SCF), followed by seed that were only damaged in the gin stand. Seed Coat Fragments that remain in fiber after the ginning process cause problems during the spinning process and ultimately affect the quality of finished goods. With all harvesting methods, however, the cotton seed, together with the fibers, always gets into the ginning plant where it is broken up into trash and seed-coat fragments. This means that ginned cotton is always contaminated with trash and dust particles and that an intensive cleaning is only possible in the spinning mill. Seed cotton (consisting of cotton fiber (lint) attached to cottonseed plus plant foreign matter). Seed damage can also result from increasing the ginning rate, especially when the seeds are dry. High ginning rates and low seed moisture cause seed damage ranging from 2 to 8 percent in gin stands. Thus, it is paramount to maintain the gin stand in good mechanical condition, to gin at recommended moisture levels, and to not exceed the capacity of the gin stand or other components. Seed coat, the covering of a seed. Seed Coat Fragments originate from the cotton plant and their numbers are influenced by the method of ginning and cleaning and the species of Cotton. Seed coat fragments are particularly troublesome in that they are a major source of yarn defects. The number of these particles per unit weight provide useful information to the grower about seed-to-fiber tenacity, to the ginner about the aggressiveness of the seed removal process and to the processor about the quality of the raw material. / виды (species). и стать причиной изменения цвета, которое явно нежелательно в готовом продукте. порок или дефект пряжи. Частицы кожицы семян (площадью до 2 квадратных

миллиметров (мм^2)) с оставшимся на ней волокном разной длины и пухом. Этот порок относится к особо вредным, поскольку в пряже он образует галочки – тёмные соринки, которые не удается полностью удалить при отделке изделий.

SEED COTTON = ХЛОПОК–СЫРЕЦ – Seed Cotton is a raw Cotton that has been harvested but not ginned, containing the lint, seed, and foreign matter. Picked bolls, fibers and seeds not yet separated. Seed Cotton is a raw cotton, containing lint, seed, and some waste material, as it comes from the field. Harvested cotton that is still attached to the seeds; cotton prior to ginning. This term Seed Cotton refers to the raw product which has been harvested but not ginned, and exactly picked cotton or cotton bolls containing lint, seed, and some foreign matter, as it comes from the field. The chief by-products of cotton approximate the following:- linters (15 per cent), cake and meal (30 per cent), hulls (40 per cent) and cottonseed oil (about 15 per cent). Approximate estimates as to what one ton of cottonseed will produce are lint (30 pounds = 13.6 kg), meal (675 pounds = 306.2 kg), hull (950 pounds = 430.9 kg), oil (40 gallons = 151.6 liters). Seed Cotton is a Cotton before ginning and containing the seeds just as gathered. / Термин Хлопок-Сырец относится к непереработанному продукту, собранному, но не джинированному, а если точнее, то к собранному урожаю Хлопчатника или коробочкам Хлопчатника, содержащим волокно, семя и некоторые инородные примеси, то есть к тому виду и состоянию, в котором они поступают с полей. Перед джинированием хлопок-сырец на две-трети веса состоит из семян, которые удаляются в процессе джинирования. В процессе джинирования от семян Хлопчатника отделяется покрывающее их волокно. В ходе дальнейшей переработки из поступившего хлопка-сырца получают в приблизительных пропорциях следующие побочные продукты:- линт (15%), жмых и шрот (30%), кожура (40%) и масло из семян Хлопчатника (приблизительно 15%). В весовом исчислении на одну тонну хлопка-сырца это будет выглядеть приблизительно так:- волокно (30 фунтов = 13.6 кг), шрот (675 фунтов = 306.2 кг), кожура (950 фунтов = 430.9 кг), масло (40 галлонов = 151.6 литров).

SEED DELINTER = СЕМЕОГОЛИТЕЛЬ – Seed Delinter:- an apparatus for delinting cottonseed employing an abrasive surface rotor having a wire mesh drum coaxially mounted therearound defining an annular space therebetween and both mounted for rotation relative to each other, means for forcing cottonseeds into said annular space and in contact with said abrasive surface to remove lint therefrom and out of a controlled seed outlet, and an air stream passing through said annular space and out of said apparatus with lint entrained within it and means for trash to drop through spacings of the wire mesh drum onto a conveyor. / барабан с проволочными петлями. Машина для оголения семян Хлопчатника.

SEED DISTRIBUTION = РАСПРОСТРАНЕНИЕ СЕМЯН – Seed Distribution is a dispatch of seed to other users. The way in which seed is distributed on the soil.

SEED DORMANCY = ПОКОЙ СЕМЯН – Seed Dormancy is a physical or physiological condition of a viable seed that prevents germination even under favorable germination conditions.

SEED DRESSING = ПРОТРАВЛИВАНИЕ СЕМЯН – Seed Dressing is an application of chemicals or fungicides to cover and protect seeds from parasites, pathogens, or adverse environmental conditions that cause damage to the seed or seedling.

SEEDER = СЕЯЛКА – Seeder is a machine that plants the seed in the field. Small seeders are used for small experiments; very large seeders are used on large farms. / Под Сеялкой понимается машина для посева семян сельскохозяйственных и древесных культур и внесения удобрений. Сеялки различают:- по способу посева – гнездовые, пунктирные, разбросные, рядовые; по виду тяги – конные и тракторные; по назначению – комбинированные (для одновременного высева семян и внесения минеральных удобрений), специализированные (кукурузные, овощные, туковые и другие), универсальные (для посева семян различных культур).

SEED HEALTH = ЗДОРОВЬЕ СЕМЯН – A term Seed Health refers primarily to conditions of the seeds or seedlots as planting materials which may be affected by the presence of pathogens, Insects and contaminants such as Weeds.

SEED INCUBATION = ИНКУБАЦИЯ СЕМЯН – Seed Incubation is a process by which moisture, temperature, and/or light is provided to ensure optimum conditions for seed germination. / Под Инкубацией Семян, от Латинского слова Incubatio, означающее Высиживание Яиц, понимается процесс .

SEEDING = ВЫСЕВ (или ПОСЕВ) – Seeding is a planting of the seed with machine or by hand. / Под Посевом понимается заделка семян в верхние слои почвы для их прорастания. Способы:- квадратно-гнездовой, перекрёстный, разбросной, рядовой (ленточный, узкорядный, широкорядный) и другие. Проводится сеялками, иногда с самолёта. Посев в растениеводстве, распределение семян в верхнем слое почвы для их прорастания; важнейший агротехнический приём при возделывании многих сельскохозяйственных культур. Способы посева выбирают с учётом требований сельскохозяйственных культур к площади питания, освещению, снабжению влагой, необходимости механизировать уход за посевами и прежде всего обработку междурядий. Разбросной Посев самый примитивный. Семена попадают на поверхность почвы и заделываются бороной на разную глубину, вследствие чего всходы появляются неодновременно. Рядовой Посев (междурядья 10–25 сантиметров (см), чаще 15 см) применяют при выращивании главным образом зерновых культур. Рядовая сеялка укладывает семена на дно бороздки и закрывает их рыхлым слоем почвы, что способствует дружному появлению всходов. Узкорядный Посев (междурядья 7–8 см) и Перекрёстный Посев зерновых, трав, Льна и других более совершенны, чем рядовой, так как дают возможность размещать семена по площади более равномерно. Широкорядный Посев (междурядья более 25 см) применяют для пропашных культур (Кукурузы, Сахарной Свёклы, Подсолнечника, Гречихи, кормовых и столовых корнеплодов и других). При Ленточном Посеве (Моркови, Редиса и других) широкие междурядья между лентами (группа рядов) чередуют с узкими между рядами. Гнездовым Посевом семена высевают по нескольку штук в каждую лунку (гнездо). Если гнёзда размещены по углам квадрата, то такой способ называется Квадратно-Гнездовым Посевом; при квадратном посеве в каждый угол квадрата высевают одно семя. При Пунктирном Посеве семена высевают по одному на заданном расстоянии одно от другого. В районах с малоснежными суровыми зимами для озимых культур применяют Бороздной Посев:- семена высевают на дно борозд, в них задерживается снег и предохраняет всходы от вымерзания. Гребневой Посев проводят по вершинам гребней, лучше прогреваемых Солнцем; распространён в районах избыточного увлажнения и полярного земледелия. Посев проводят сеялками, иногда с самолёта (например, посев лесных культур). В зависимости от сроков различают весенний посев яровых культур, осенний – озимых культур, летний – для получения второго урожая (смотрите Повторные Посевы), подзимний посев – для получения более ранних всходов. Для каждого растения существуют оптимальные сроки посева В Европейской части бывшего Союза Советских Социалистических Республик (СССР) ранний посев яровых обеспечивал лучшее использование ими весенней влаги, питательных веществ и света. Дружный рост растений даёт возможность заглушить сорняки и снижает повреждаемость болезнями и вредителями. В Сибири и Северном Казахстане яровые культуры высевают позднее, так как при раннем посеве (например, зерновых) они сильнее страдают от Июньской засухи и сорняков. В республиках Средней Азии, в Азербайджане и других посев ранних яровых (особенно Ячменя) возможен зимой (Февраль и даже Январь). Для поздних яровых культур срок сева определяют в зависимости от температуры почвы и воздуха. Срок сева озимых устанавливают с таким расчётом, чтобы до наступления заморозков всходы их могли достаточно развиться и

окрепнуть:- в Северных районах бывшего СССР – в Августе, на Юге (Краснодарский Край, Крымская Область и другие) – во 2-й декаде Сентября и заканчивают к началу Октября. Большое значение имеет сокращение продолжительности посева. Выращивание скороспелых и позднеспелых сортов одной и той же культуры позволяет без ущерба для урожая несколько растянуть сроки посева. Глубина заделки семян зависит от биологических особенностей растений, механического состава почвы. В качестве общей закономерности установлено, что чем крупнее семена, тем глубже их нужно заделывать, например, Кукурузу на 10–12 см, зерновые колосовые на 4–6 см, злаковые травы, Махорку на 1–2 см. На тяжёлых суглинках и глинистых почвах семена заделывают мельче, чем на лёгких супесях и суглинках. Учитывают также влажность почвы:- семена не должны располагаться в сухом слое. Иногда глубину заделки приходится увеличивать, чтобы предохранить семена от птиц (Кукуруза, Горох) и выдувания. Норму высева семян устанавливают с учётом почвенно-климатических условий местности, хозяйственного назначения культуры, требований растений к площади питания, времени и способов посева, окультуренности почвы и другого. Подготовку к посеву начинают с заготовки и засыпки семян, проверки качества семенного материала на всхожесть, чистоту и тому подобного (смотрите Подготовка Семян К Посеву). В каждом хозяйстве составляют план посева, предусматривающий расстановку посевных агрегатов, сроки и порядок выполнения работ. При оценке качества посева проверяют своевременность его, равномерность глубины заделки семян, соблюдение норм высева, прямолинейность рядков и правильность квадратов. Посевом называют также поле, занятое сельскохозяйственной культурой.

SEEDING RATE = НОРМА ВЫСЕВА (или ПОСЕВНАЯ НОРМА, или НОРМА РАСХОДА СЕМЯН) – Seeding Rate is the amount of seed planted per unit area of land. / Под Нормой Высева Семян понимается количество (в миллионах штук или килограммах) высеваемых на 1 га семян, обеспечивающее нормальную густоту всходов и полноценный урожай. Под Посевом понимается заделка семян в верхние слои почвы для их прорастания. Способы:- квадратно-гнездовой, перекрёстный, разбросной, рядовой (ленточный, узкорядный, широкорядный) и другие. Проводится сеялками, иногда с самолёта.

SEED LEAF = ЩИТОК (или ЛИСТ СЕМЕНИ, или СЕМЯДОЛЯ) – Seed Leaf is the leaf formed in a seed and present on a seedling at germination. Also known as Cotyledon. / Первый лист зародыша семенных растений. Смотрите также Семядоля или Семенодоля или Котиледон (Cotyledon). Под Щитком понимается первый (семядольный) лист зародыша злаков, прилегающий к эндосперму и использующий его питательные вещества.

SEEDLING = ВСХОД (или ПРОРАСТАНИЕ, или СЕЯНЕЦ) – Seedling is the stage of the plant after seed germination until the development of the fifth leaf.

SEEDLING BLIGHT = ФУЗАРИОЗ ВСХОДОВ – Seedling Blight is a Rice disease caused by Sclerotium Rolfsii or Drechslera Oryzae and characterized by yellowing, wilting, and finally, drying of seedlings in seedbeds. White mycelia and/or sclerotia are sometimes observed at the base of infected seedlings or germinating seeds.

SEEDLING DISEASES = ЗАБОЛЕВАНИЯ ВСХОДОВ (или БОЛЕЗНИ ВСХОДОВ) – Seed rot and pre- and post-emergent damping off can be caused by several fungi, including Pythium and Rhizoctonia, which are common soil inhabitants. Thin or patchy plant stands and/or weakened root systems may result. Seedling diseases are most likely when cool, wet weather occurs soon after planting and when there is a carryover of legume residues from a previous crop. To minimise losses:- (i) prepare the seed-bed early so that plant residues have ample time to decompose; (ii) avoid planting too early in the season when soil temperatures are too low; (iii) do not plant seed deeper than necessary; and (iv) use seed treatments which control both Pythium and Rhizoctonia. Seedling Disease is caused by several weak pathogens that are present in most soils. It is favored by cool wet weather and most plants become infected to some degree. Seedlings can die before or after emergence, as single plants or in patches. Patterns of seedling death can occur across rows. Pythium usually causes a soft rot and stem collapse while Rhizoctonia causes sunken red/brown spots on the lower stem and roots. Seedling Disease Complex:- pest type:- disease; crops affected:- Cotton; scientific name:- Pythium Spp., Fusarium Spp., Thielaviopsis Basicola, Rhizoctonia Solani. Symptoms:- these seedling diseases are very important in cotton production, and any of these pathogens can cause one or more of these symptoms. Pythium causes water-soaked lesions on the roots or hypocotyl. Those lesions may collapse and turn light brown. Girdled plants often fall over and die. Pythium may also rot seeds and seedlings before emergence. Common symptoms of these diseases include seed decay, decay of seedlings before emergence, girdling of emerged seedling stems, and seedling root rot. Seed and seedling disease is characterized by a soft, watery rot. Damaged seedlings that emerge are pale, stunted, slower growing, and sometimes die within a few days. With seedling root rot, the taproot is often destroyed, and only shallow-growing lateral roots remain to support the plant. The key symptom of sore shin is oval- to irregularly-shaped, reddish brown, sunken lesions on the hypocotyl, leaving a stem-girdling lesion at the base of the stem; and the girdled plants often die. Disease Cycle:- Cotton seedling diseases are caused by soilborne fungi common in most cultivated soils. These diseases are more severe during cool, damp weather which slows seedling growth; and these pathogens may occur alone or several together. Control Measures:- if infestations are severe, growers can rotate cotton with sorghum, small grains, or other crops for at least two years. Timely planting and planting high quality seed are key lines of defense. Avoid poor seedbed preparation and planting too deep. Compacted soil and insect infestations may increase this problem, i.e. other stresses on the cotton seedlings can enhance these diseases. Fungicides, both seed treatments and in-furrow treatments, can be very effective in controlling seedling diseases. / Ризоктониоз. в то время как Ризоктония вызывает впалые красно/коричневые пятна на прикорневой части стебля (lower stem) и корнях. Под Ризоктониозом понимается болезнь Растений, вызываемая почвенными Грибами. Вредоносны ризоктониозы Картофеля (чёрная парша), Свёклы и других. На корнях и прикорневой части стебля серо-свинцовые пятна с чёрными точками.

SEEDLING EMERGENCE = ПОЯВЛЕНИЕ ВСХОДОВ (или ПОЯВЛЕНИЕ РОСТКОВ, или ВСХОЖЕСТЬ) – Seedling Emergence:- coming up of the seedling from the surface of the soil or water.

SEEDLING HEIGHT = ВЫСОТА ПРОРАСТАНИЯ – Seedling Height is the height of a seedling from the base of the shoot to the tip of the tallest leaf blade.

SEEDLING RATE = НОРМА ВСХОДОВ (или ТЕМП ПРОРАСТАНИЯ) – Seedling Rate is the number of seedlings planted per unit area of land.

SEEDLING RESISTANCE = СОПРОТИВЛЯЕМОСТЬ ПРОРАСТАНИЮ – Seedling Resistance is the characteristically vertical resistance of plants in the seedling stage.

SEEDLING STAGE = СТАДИЯ (ПОЯВЛЕНИЯ) ВСХОДОВ (или ФАЗА ПРОРАСТАНИЯ) – Seedling Stage is the period when approximately the first five leaves and tillers begin to develop.

SEEDLING VIGOR = ВСХОЖЕСТЬ (или ДРУЖНОСТЬ ВСХОДОВ, или МОЩНОСТЬ ПРОРОСТКОВ) – Seedling Vigor is seedling properties which determine the potential for rapid growth and development of uniform plants under a wide range of environmental conditions. / Мощность Проростков в единицах веса. Под Всхожестью Семян понимается способность семян

давать за установленный срок нормальные проростки или всходы. Определяется отношением (в %) числа проростков (лабораторная всхожесть семян) или всходов (полевая всхожесть семян) к числу высеянных семян.

SEED MULTIPLICATION = ПРОИЗВОДСТВО СЕМЯН (или РАЗМНОЖЕНИЕ СЕМЯН) – Seed Multiplication is a growing the seed of a particular variety on a large scale for sale to farmers or for use in experiments.

SEED PHYSIOLOGY = ФИЗИОЛОГИЯ СЕМЯН – Seed Physiology is the study of processes involved with seed development, in germination and its control, and in the utilization of seed reserves during the early stages of seedling growth. / Под Физиологией Семян, от Греческих слов Phýsis, означающее Природа, и Lógos, означающее Слово или Учение, понимается наука о жизнедеятельности .

SEED PLANT = СЕМЕННОЕ РАСТЕНИЕ – Seed Plant is any plant that reproduces by means of seeds:- a gymnosperm or angiosperm. Seed Plant (in United States) is any plant bearing seeds, as an angiosperm or a gymnosperm. The Spermatophytes, which means 'Seed Plants', are some of the most important organisms on Earth. Life on land as we know it is shaped largely by the activities of seed plants. Soils, forests, and food are three of the most apparent products of this group. Seed-producing plants are probably the most familiar plants to most people, unlike mosses, liverworts, horsetails, and most other seedless plants which are overlooked because of their size or inconspicuous appearance. Many seedplants are large or showy. Conifers are seed plants; they include Pines, firs, Yew, Redwood, and many other large trees. The other major group of seed-plants are the flowering plants, including plants whose flowers are showy, but also many plants with reduced flowers, such as the Oaks, Grasses, and Palms.

SEED POTATO CERTIFICATION = СЕРТИФИКАЦИЯ СЕМЕННОГО КАРТОФЕЛЯ (или СЕРТИФИКАЦИЯ ПОСАДОЧНОГО КАРТОФЕЛЯ) – Seed Potato Certification is an officially adopted scheme for the production of potato propagative materials that meet prescribed requirements for potato pest freedom and varietal purity.

SEED POTATOES = СЕМЕННОЙ КАРТОФЕЛЬ (или ПОСАДОЧНЫЙ КАРТОФЕЛЬ) – Seed Potatoes are potato plantlets, plants, microtubers, minitubers, tubercles and tubers.

SEED PURITY = ЧИСТОТА СЕМЯН – Seed Purity is the seed being free of contamination from other genotypes, dirt, or foreign matter. / Чистота – процент семян основной культуры в отобранной для анализа пробе. Этот показатель качества семян важен для окончательного определения нормы высева на единицу площади. Ведь в любой партии семян могут присутствовать живой сор (семена сорняков и других культур) и мёртвый сор (растительные остатки, песок, земля и другое), дефектные семена. Чистота семян характеризуется массой семян основной культуры, выраженной в процентах к навеске, взятой для анализа. Чистоту семян определяют по двум навескам установленного размера.

SEED QUALITY = КАЧЕСТВО СЕМЯН – Seed Quality:- (1) the properties of the seed such as cleanliness, germination percentage, moisture content, shape, purity, and desirable characters for research. (2) The export qualities of the seed, the size, shape, moisture content, protein content, color, chalkiness, and other properties as desired by the millers or traders. / свойства (characters) .

SEED ROT = ГНИЛЬ СЕМЕНИ – Seed Rot is a brown to black 'rotting' of the seed coat and adjacent lint that develops prior to opening of the boll. The condition is often confined to one lock in a boll and affected seeds are sometimes hollow. When the boll opens the affected lock does not fluff out and remains in the boll. Similar symptoms have been attributed to the activity of sucking Insects attacking young developing bolls. A condition known as Seed Rot has also been described in the United States. All varieties appear susceptible and the cause has yet to be determined. / гниение или загнивание от бурого до чёрного цвета .

SEEDS = СЕМЕНА – Seeds is a commodity class for seeds for planting or intended for planting and not for consumption or processing. See also Grain. / Семенной Материал – посевной материал, семена, плоды, соплодия и части сложных плодов, используемые для посева. Иногда к семенному материалу относят также части растений, употребляемые для размножения вегетативным путём (клубни Картофеля, луковицы и другие). В бывшем Союзе Советских Социалистических Республик (СССР) на посевные (всхожесть, чистота, заражённость болезнями и вредителями, влажность и масса 1 000 семян) и сортовые (сортовая чистота и для некоторых культур типичность) качества семенного материала были установлены государственные стандарты; к посеву допускались кондиционные семена, отвечавшие их требованиям. Посевные и сортовые качества семенного материала устанавливали Государственные Семенные Инспекции, проводя лабораторный анализ (смотрите Семенной Контроль), грунтовый контроль и апробацию посевов (смотрите Сортовой Контроль). В зависимости от посевных качеств и в соответствии со стандартами семенной материал делят на 3 класса. Для каждого из них нормируют содержание семян основной культуры, отход основной культуры, примеси, количество семян других растений, в том числе сорных, всхожесть и влажность. Для мягкой Пшеницы (озимой и яровой) установлены следующие нормы семян основной культуры (в %):- 1-й Класс – 99, 2-й Класс – 98.5, 3-й Класс – 97; всхожести (в %) соответственно:- 95, 92 и 90. На посев используют семена 1-го и 2-го классов. Семена 3-го класса допускаются к посеву в виде исключения и только на производственных площадях хозяйств. В соответствии с сортовыми качествами семенного материала делят на 3 категории, характеризуемые предельными нормами (в %) сортовой чистоты. Для большинства зерновых (в том числе Зернобобовых) культур 1-я Категория – 99.5%; 2-я Категория – 98%; 3-я Категория – 95%. На семенные посевы допускаются семена 1-й категории; на производственные посевы – также 2-й и 3-й категорий. Семенной материал перед засыпкой на хранение в хозяйствах очищают и сортируют (смотрите Очистка И Сортирование Семян), если нужно – сушат, а перед посевом подвергают различным приёмам подготовки семян к посеву. В каждом хозяйстве сведения о посевных и сортовых качествах семенного материала записывают в шнуровую книгу учёта семян. Подготовка Семян К Посеву, применение различных приёмов обработки семян и проверка их посевных качеств перед засыпкой на хранение и перед посевом. Перед засыпкой на хранение проводят сушку, очистку и сортирование семян. Перед посевом в целях оздоровления семян их проветривают, подвергают воздушно-тепловому и солнечному обогреву, протравливанию. Для улучшения питания растений семена обрабатывают микроэлементами (солями марганца, бора, молибдена и другого). Семена овощных культур, Сахарной Свёклы и злаковых трав для облегчения их высева и обогащения питательными веществами подвергают дражированию (смотрите Дражирование Семян), а для ускорения прорастания – предпосевному замачиванию. В целях получения дружных всходов семена некоторых культур (например, Кориандра) перед посевом ферментируют; семена Бобовых трав при наличии твёрдокаменности скарифицируют (смотрите Скарификация Семян); медленно прорастающие семена некоторых лекарственных, плодовых, древесных и других культур стратифицируют (смотрите Стратификация Семян). В районах с засушливыми условиями для семян некоторых растений применяют предпосевное закаливание (смотрите Засухоустойчивость Растений). Проверку качества семян осуществляют государственные семенные инспекции по средним образцам, присылаемым хозяйствами. Перед засыпкой на хранение проверяют все посевные качества, а перед посевом – главным образом всхожесть семян, если ранее семена были доведены до требуемых кондиций.

SEED SETTING = ЗАВЯЗЫВАНИЕ СЕМЯН (или ОБРАЗОВАНИЕ СЕМЯН, или ЗАЛОЖЕНИЕ СЕМЯН) – Seed Setting is the production of seeds after pollination.

SEED TREATMENT = ОБРАБОТКА СЕМЯН – Seed Treatment is the process of coating or impregnating seeds with a chemical.

SEED VIABILITY = ПОСЕВНАЯ ГОДНОСТЬ СЕМЯН (или ЖИЗНЕСПОСОБНОСТЬ СЕМЯН) – Seed Viability is the ability of seeds to germinate under favorable conditions and develop normal seedlings. / Посевная Годность Семян – хозяйственная годность семян, количество (в процентах) пригодных для посева семян в семенном материале. Посевная годность семян устанавливают на основании показателей чистоты и всхожести семян (выраженных в процентах) путём их перемножения и деления на 100 (результат округляют до целых чисел). Посевная годность семян служит основанием для уточнения норм высева семян, которые для различных культур приняты из расчёта 100%-ной посевной годности. Используемые же на посев семена редко имеют посевную годность 100%, поэтому, вводя поправку на посевную годность семян, норму их высева увеличивают.

SEED VIGOR = ЭНЕРГИЯ ПРОРАСТАНИЯ СЕМЯН – Seed Vigor is a seed property that determines its potential for rapid uniform emergence and development under a wide range of field conditions. / Энергия Прорастания – очень важный показатель, характеризующий дружность прорастания и в значительной степени влияющий на качество полевой всхожести этих семян. Он показывает процент проросших семян в сроки более короткие, чем для определения всхожести.

SEED YARN = СЕМЕННАЯ ПРЯЖА – Seed Yarn is a very small nub often made of dyed man-made fibers applied to a dyed or natural-base yarn.

SEEDY WOOL = ШЕРСТЬ, ЗАСОРЁННАЯ СЕМЕНАМИ СТЕПНОЙ ТРАВЫ – Seedy Wool is a wool containing numerous seeds or an appreciable amount of vegetable matter.

SEEP = SOCIAL ENVIRONMENTAL AND ECONOMIC PERFORMANCE

SEEPAGE = ПРОСАЧИВАНИЕ (или ПРОПИТЫВАНИЕ) – Seepage is the lateral flow of water into or from a soil, as from a body of water into neighboring soil, or the reverse.

SEERSUCKER = СИЭСАКЁ (или ЛЁГКАЯ ПОЛОСАТАЯ ТКАНЬ) – Seersucker is a woven fabric which incorporates modification of tension control. In the production of seersucker, some of the warp yarns are held under controlled tension at all times during the weaving, while other warp yarns are in a relaxed state and tend to pucker when the filling yarns are placed. The result produces a puckered stripe effect in the fabric. Seersucker is traditionally made into summer sportswear such as shirts, trousers, and informal suits. Seersucker is a lightweight fabric, made of cotton or manufactured fiber, having crinkled stripes made by weaving some of the warp threads slack and others tight. Woven seersucker is more expensive than imitations made by chemical treatment. Seersucker:- cotton, rayon, synthetics. Term derived from the Persian ‘Shirushaker’, a kind of cloth, literally ‘milk and sugar’. Crêpe-stripe effect. Colored stripes are often used. Dull surface. Comes in medium to heavy weights. The woven crinkle is produced by alternating slack and tight yarns in the warp. This is permanent. Some may be produced by pressing or chemicals, which is not likely to be permanent – called Plissé. Durable, gives good service and wear. May be laundered without ironing. Can be bleached, yarn dyed, or printed. Some comes in a check effect. Seersucker is a thin, all-cotton fabric, commonly striped, used to make clothing for spring and summer wear, usually suits, slacks and children’s clothing. / когда уточные пряжи . В Индии, плательная или декоративная лёгкая полосатая ткань. Seer – Пророк или Провидец. Лёгкая плательная ткань крепового переплетения в полоску. Может быть выработана из хлопка или льна, и быть в клетку. Плиссе или Складчатое (Plissé).

SEGA = СЭГА – The Swiss Securities Clearing Corporation. Founded in 1970 as a collective securities depositary for the Swiss banks. The Swiss company SIS SegaInterSettle AG came into being in May 1999 through the merger of SEGA (SEGA Securities Clearing Corporation, 1970) and INTERSETTLE (Swiss Corporation for International Securities Settlements, 1989). SIS SegaInterSettle’s core business comprises the settlement of securities transactions and the custody of securities in Switzerland and abroad. The respective corporate actions are carried out securely and competently. Indeed, security and efficiency are the hallmarks of the company. SIS SegaInterSettle offers its clients tailor-made services in respect of their transactions in securities (e.g., INSET) and securities-related products (e.g., securities lending and borrowing, repo). The company owes its success to a highly diversified service offering and fair pricing. It is furthermore a technology frontrunner in domestic and international securities business. SIS Swiss Financial Services Group AG. / Эс.И.Эс. СэгаИнтёСэтл А.Ге. (SIS SegaInterSettle AG). , например, .

SEGMENT REPORTING = СЕГМЕНТНАЯ ОТЧЁТНОСТЬ – Segment Reporting is a component of company financial reporting. Provides information on a company’s key businesses and its environment. Apart from providing information on the company’s asset, financial and earnings situation, risks and opportunities are also addressed. Segment reporting is primarily based on the operative segments of the company and reflects the company’s internal organizational and reporting structure. See also Operating Segments. The International Accounting Standards Board issued IFRS 8, ‘Operating Segments’ in November 2006. The standard replaces IAS 14 (short for International Accounting Standard No. 14), ‘Segment reporting’. It applies to annual reporting periods beginning on or after 2009-January-01. Early adoption is permitted. The key implementation issues are as follows:- (i) The IASB did not intend to change the range of entities required to present segment information, but we believe IFRS 8 has a wider scope than IAS 14. It applies to entities whose equity or debt securities are publicly traded or that issue, or are in the process of issuing, any class of instrument in a public market. The scope also includes entities that file financial statements with a regulatory organisation for purpose of issuing any instruments in a public market. We believe this means that some entities whose equity and debt securities are not traded publicly and were not within the scope of IAS 14 will have to provide segment disclosures. (ii) The standard introduces a ‘management approach’ to identifying and measuring the financial performance of an entity’s operating segments. Reported segment information will be based on the information used internally by management. This means that:- (a) the way entities identify segments and measure and present segment information could change; (b) there will be more diversity in reported segment information; (c) segment information may not be measured in accordance with IFRS – entities are required to reconcile segment financial information to the consolidated financial statements; and (d) entities will no longer need to prepare two sets of information for internal and external reporting. (iii) Reportable segments are no longer limited to those that earn a majority of revenue from sales to external parties, so entities may now be required to report the different stages of vertically integrated operations as separate segments. IFRS 8 applies to entities that prepare financial statements, and:- (i) whose equity or debt securities are traded in a public market, or (ii) that file, or are in the process of filing, financial statements with a securities commission or other regulatory organisation for the purposes of issuing any class of instruments in a public market. IFRS 8 applies to annual reporting periods beginning on or after 2009-January-01. It may be early adopted, as long as that fact is disclosed in the notes to the financial statements. IFRS 8 requires disclosures that enable users to evaluate the nature and financial effects of the business activities in which it engages and the economic environment in which it operates. An operating segment is a component of an entity:- (i) that engages in business activities from which it may earn revenues and incur expenses; (ii) whose operating results are regularly reviewed by the entity’s chief operating decision maker (CODM) to make decisions about resources to be allocated to the segment and assess its performance; and (iii) for which discrete financial information is available. / МСБУ 14 (сокращение для Международного Стандарта Бухгалтерского Учёта № 14) – .

SEGREGANT = СЕГРЕГАНТ – Segregant is any plant from a segregating population (F_2 or F_4 generations). / Под Сегрегантом, от позднелатинского слова Segregatio, означающее Отделение, понимается индивид, появившийся в результате скрещивания и отличающийся от обоих родителей.

SEGREGATED ACCOUNT = СЕГРЕГИРОВАННЫЙ СЧЁТ (или ОБОСОБЛЕННЫЙ СЧЁТ, или ОТДЕЛЬНЫЙ СЧЁТ) – Segregated Account is a separate account used by brokers to keep their customers' money separate from the firm's money. This is done for a few reasons, including creating a clear separation between the two groups of money so neither is used for the wrong purpose, and also to insure that the money can be easily identified as belonging to customers in case anything happens to the firm (such as bankruptcy). Segregated Account is a special account used to hold and separate customer's assets from those of the broker or firm. A Segregated Account is an individual portfolio of securities held at a custodian. Importantly, the client is still invested in the fund vehicle of the underlying hedge funds (as opposed to a 'managed account') and can still be anonymous vis-à-vis the hedge funds as these are bought/sold using a nominee name. The investment manager is then given the right to trade relevant securities on behalf of the client. When re-thinking their investment method, long-term investors should consider the benefits of segregated account investing. / Сегрегированный Счёт – это счёт, который используется брокерской фирмой для хранения клиентских средств отдельно от основного капитала самой фирмы. Вклад клиента брокера будет находится на сегрегированном счёте брокера в клиринговом банке. То есть все клиентские вклады брокера собраны в один счёт. И этот счёт застрахован от мошенничества со стороны брокера (если брокер решит сбежать с деньгами клиентов или будет проводить какие-то мошеннические операции). Этот счёт застрахован Федеральной Корпорацией США по Страхованию Вкладов (Federal Deposit Insurance Corporation (FDIC)), то есть правительство США гарантирует что клиент брокера, торгующего фьючерсами, не пострадает от банкротства этого брокера.

SEGREGATION = СЕГРЕГАЦИЯ (или ОТДЕЛЕНИЕ, или ВЫДЕЛЕНИЕ) – (1) Segregation is the separation of alleles that occurs typically during meiosis. / В эмбриологии под ооплазматической Сегрегацией, от позднелатинского слова Segregatio, означающее Отделение, понимается возникновение различий в составе и свойствах разных участков цитоплазмы в период роста ооцита, а также в оплодотворённом яйце. Основа для последующей дифференцировки зародыша.

(2) Segregation is the optional or compulsory separation of a participant's own securities from those held on behalf of its customers. / На праве выбора или обязательное отделение собственных ценных бумаг участника от тех ценных бумаг, которые удерживаются им от имени своих заказчиков.

SEHK = STOCK EXCHANGE OF HONG KONG

SEIGNIORAGE = СЭНЬЙОРИДЬЖ (или ПОШЛИНА) – Seigniorage is the profit which results from the difference between the cost of making coins and currency and the exchange value of coin and currency in the market. / Под Сэньйоридьжем понимается прибыль, возникающая в результате разницы между расходами на чеканку монет и выпуск банкнот и стоимостью обмена монет и банкнот на рынке.

SEISMONASTIC = СЕЙСМОНАСТИЧЕСКОЕ – Seismonastic:- a movement response to a shock stimulus. Of the movement of the stamens towards the pistil when touched. / О движении тычинок (stamens) . Сейсмонастическое движение растения, вызываемое сотрясением или вибрацией. Под Сейсмонастическим, от Греческих слов Seismós, означающее Землетрясение или Колебание, и Nastós, означающее Уплотнённый, понимается . Под Сейсмонастией понимается движение органов растений (например, листьев Мимозы стыдливой) в ответ на прикосновение или сотрясение.

SEIZE = НАЙТОВИТЬ (или КЛАСТЬ, или (НАКЛАДЫВАТЬ) БЕНЗЕЛЬ) – Seize (maritime term):- to bind with small rope.

SEK = SWEDISH KRONA

SELECTED ENTRIES = ОТБОРНЫЕ ХХ – Selected Entries are Varieties or breeding lines that are resistant in initial screening tests and are selected for further screening in replicated tests to confirm the resistance.

SELECTION = СЕЛЕКЦИЯ (или ОТБОР) – Selection:- (1) in genetics, discrimination among individuals in the number of offspring contributed to the next generation with a defined target. (2) In plant breeding, the process that favors or induces the survival and perpetuation of one kind of organism in competition with others. / Под Селекцией, от Латинского слова Selectio, означающее Выбор или Отбор, понимается:- (1) раздел агрономии и зоотехнии, изучающий методы создания сортов и гибридов сельскохозяйственных растений и пород животных с нужными человеку признаками. (2) Отрасль сельскохозяйственного производства, занимающаяся выведением сортов и гибридов сельскохозяйственных культур, пород животных. Основные направления селекции:- (i) растений на урожайность или животных на продуктивность; (ii) на качество продукции; (iii) растений – на зимостойкость, засухоустойчивость, устойчивость к болезням и вредителям, приспособленность к высоким дозам удобрений и другого; (iv) животных – на плодовитость и другое. Методы селекции:- отбор, гибридизация, мутагенез.

SELECTION ADVANCEMENT = ПРОДВИЖЕНИЕ СЕЛЕКЦИИ (или ПРОДВИЖЕНИЕ ОТБОРА) – Selection Advancement is the changes from one generation to another in the value of the character being selected for. / свойство (character).

SELECTION DIFFERENTIAL = СЕЛЕКЦИОННЫЙ ДИФФЕРЕНЦИАЛ – Selection Differential is a measurement of selection intensity taking the difference between the average value of a character as compared with the value of the selection in a population. / свойство (character) .

SELECTION PRESSURE = ДАВЛЕНИЕ ОТБОРА (или ДАВЛЕНИЕ СЕЛЕКЦИИ) – Selection Pressure is the proportion or ratio of plants selected to the total number of plants, the process is used to measure the effectiveness of natural selection in altering the genetic composition of a population.

SELECTIVE CATALYTIC REDUCTION = ХХ – Selective Catalytic Reduction (SCR):- nitrogen oxide (NOx) reduction equipment usually installed on combinedcycle generators.

SELECTIVE HERBICIDE = СЕЛЕКТИВНЫЙ ГЕРБИЦИД (или ИЗБИРАТЕЛЬНЫЙ ГЕРБИЦИД, или ГЕРБИЦИД ИЗБИРАТЕЛЬНОГО ДЕЙСТВИЯ) – Selective Herbicide is a herbicide that kills or stunts some Plant Species but causes little or no injury to others. Selective Herbicide is a chemical that is more toxic to some Plant Species than to others. / Химикат, который более токсичен к некоторым Видам Растений, нежели к остальным. Гербициды Избирательного Действия или Селективные Гербициды используются на конкретных культурах, не повреждая саму культуру, а только подавляя нежелательную сорную растительность, произрастающую на том же поле, что и культурные растения, конкурирующую с ними за питательные вещества, свет и влагу. При отсутствии борьбы с сорной растительностью потери урожая могут составлять от 40 до 100% в зависимости от видового состава и численности сорняков, а также от способности культуры противостоять им. Сорные растения создают и другие проблемы, являясь переносчиками болезней и вредителей, осложняя процесс уборки и повышая

затраты на очистку и сушку продукции. До середины XIX века трудоёмкая и часто неэффективная ручная обработка была единственным способом борьбы с сорными растениями. Позднее стали применять механическую обработку. Но только в XX веке открытие гербицидов избирательного действия дало возможность отказаться от нехимических способов контроля во многих странах. Применение гербицидов способствовало значительному увеличению урожайности и качества конечной продукции. Химический контроль за сорными растениями следует осуществлять не нанося вреда основной культуре. Это главное отличие 'избирательного' контроля над сорными растениями. Селективные гербициды представлены веществами различных химических классов с разными механизмами действия. В некоторых случаях применяется антидот, исключающий фитотоксичность гербицида по отношению к культуре. Гербициды характеризуются различными механизмами действия, разными способами проникновения в растение и, вследствие этого, различными типами избирательности:- (i) Биохимическая Избирательность основана на способности культурных растений разрушать гербицид до нетоксичных соединений. Классический пример биохимической, а также естественной избирательности можно наблюдать на растениях Кукурузы. Даже на стадии прорастания растение Кукурузы способно нейтрализовать гербицид, внесенный в токсичной для сорняков дозе. (ii) Морфологическая Избирательность основана на различиях во внешнем строении видов культурных растений (например, вертикальное положение листьев у колосовых зерновых), особенности поверхности (восковой налет, опушенность, плотная волосистость), которые защищают растения от проникновения гербицида. (iii) Топографическая Избирательность, основана на том, что внесённый гербицид фиксируется в верхних слоях почвы в результате абсорбции коллоидными почвенными частицами (частицы глины, гумус) и тем самым не достигает корневой зоны культурного растения. При этом уничтожаются сорняки, прорастающие в верхних слоях почвы. На сегодняшний день гербициды избирательного действия являются составной частью сельскохозяйственной практики во всем мире. Они обеспечивают высокоэффективные, экономичные, гибкие методы борьбы с сорными растениями.

SELECTIVE MARKER = СЕЛЕКТИВНЫЙ МАРКЁР – Selective Marker is a marker that permits the selection of recombinants over the parental types.

SELECTIVE PESTICIDE = СЕЛЕКТИВНЫЙ ПЕСТИЦИД (или ИЗБИРАТЕЛЬНЫЙ ПЕСТИЦИД, или ПЕСТИЦИД ИЗБИРАТЕЛЬНОГО ДЕЙСТВИЯ) – Selective Pesticide is a pesticide that kills a certain Pest or group of Pests and causes little or no injury to others.

SELECTIVITY = СЕЛЕКТИВНОСТЬ (или ИЗБИРАТЕЛЬНОСТЬ) – Selectivity is the quality of being able to select, to take what you want. / Под Селективностью или Избирательностью понимается .

SELF–BELT = СВОЙ ПОЯС (или СВОЙ РЕМЕНЬ) – Self-Belt is a belt made of the same fabric as the clothing with which it is worn. It may simply be a sash or a stiff belt with a buckle. Self-Belt is a belt made of the same material as the garment with which it is worn. / ремень, произведённый из того же материала, что и само швейное изделие, с которым он одевается.

SELF FEEDERS = САМОСТОЯТЕЛЬНЫЕ ЕДОКИ – Self Feeders:- a container that enables sheep to access supplementary food, such as grains, without direct human intervention. These can either be manual or mechanical and used in extensive or intensive production systems.

SELF–FERTILIZATION = САМООПЛОДОТВОРЕНИЕ – Self-Fertilization is a fusion of male and female gametes from the same plant. / Под Самооплодотворением понимается слияние мужских и женских гамет от одного и того же растения.

SELF–FINANCING = САМОФИНАНСИРОВАНИЕ – Self-Financing:- provision of funds by a company for capital investment in plant and equipment or for acquisition purposes out of self-generated sources (net profit and cash flow). / Под Самофинансированием понимается финансирование предприятий за счёт собственных средств в отличие от финансирования за счёт привлечённых средств (банковские ссуды, дотации, государственные субсидии и другие). Источники самофинансирования:- амортизационные отчисления и нераспределённая прибыль.

SELF–GOODS = СВОИ ВЕЩИ – Self-Goods:- when the same material is used as a pocket lining, or in a waistband, collar and fly construction. Also called Shell.

SELF–HEATING = САМОНАГРЕВАНИЕ – Self-Heating:- temperature increase within an organic solid without external heat input.

SELF–INCOMPATIBILITY = САМОНЕСОВМЕСТИМОСТЬ – Self-Incompatibility is the genetic or physiological reason that fruit cannot be formed by selfing (fertilization).

SELF–INSURANCE = САМОСТРАХОВАНИЕ – In reinsurance, Self-Insurance is a setting aside of funds by an individual or organization to meet his or its losses, and to absorb fluctuations in the amount of loss, the losses being charged against the funds so set aside or accumulated.

SELF–POLLINATION = САМООПЫЛЕНИЕ – Self-Pollination is a pollination between the pollen and stigma within the same flower of the same plant. Self-Pollination by natural or artificial means. / Под Опылением понимается перенос пыльцы из пыльника на рыльце пестика у цветковых растений или на семязачаток у голосеменных. Предшествует оплодотворению. Опыление в пределах одного цветка или одного растения называется самоопылением, при переносе пыльцы на цветки других растений – перекрёстным опылением.

SELF–PROPELLED BARGE = САМОХОДНАЯ БАРЖА (или БАРЖА–САМОХОДКА) – Self-Propelled Barge is a barge which has its own engine.

SELF–REGULATION = САМОРЕГУЛИРОВАНИЕ – Self-Regulation is the way in which the securities industry monitors itself to create a fair and orderly trading environment. / Способ, посредством которого индустрия ценных бумаг наблюдает сама за собой с целью формирования справедливой и организованной среды для торговли.

SELF–REGULATORY ORGANIZATION = САМОРЕГУЛИРУЕМАЯ ОРГАНИЗАЦИЯ – The Self Regulatory Organisations (SROs) were established under the Financial Services Act of 1986 to carry out the regulation of most institutions involved in investment activities in the United Kingdom. Under the Financial Services and Markets Act 2000 (FSMA), the role played by the SROs was taken over by the FSA in 2001. Self-Regulatory Organization (SRO):- exchanges and registered futures associations that enforce financial and sales practice requirements for their members. In the United States, this term describes a national exchange, registered securities association or registered clearing agency authorized by the Securities Exchange Act of 1934 to regulate the conduct and activities of its members, subject to oversight by a specified government regulatory agency. Self-regulatory organization enforce minimum financial and sales practice requirements for their members. See also Designated Self-Regulatory Organization. Self-Regulatory Organizations (SROs) are the nongovernment organizations that have statutory responsibility to regulate their own members such as the New York Stock Exchange (NYSE®) and National Association Of Securities Dealers (NASD). Self-Regulatory Organisation or SRO is an

organization that has been given the power or responsibility to regulate itself, whose rules are subject to meaningful sanctions regarding any part of the securities market or industry. This authority may be derived from a statutory delegation of power to a non-governmental entity or through a contract between an SRO and its members as is authorized or recognized by the governmental regulator. Associations of broker-dealers or others that have responsibility, under the oversight of the Securities and Exchange Commission, to regulate their own members through the adoption and enforcement of rules of conduct for fair, ethical, and efficient practices. Examples include the National Association of Securities Dealers and the New York Stock Exchange. / (НЙФБ® или Эн.Уай.Эс.И.® (NYSE®)). Комиссия по Ценным Бумагам и Биржам (The Securities and Exchange Commission; сокращённо – КЦББ или СЭК (SEC), в Англоязычном произношении).

SELF–SCHEDULED GENERATION = XX – Self-Scheduled Generation:- units scheduled to run by their owners regardless of system dispatch signal. Self-scheduled units do not follow system dispatch signal and are not eligible to set locational marginal price (LMP). Units can be submitted as a fixed block of MW that must be run, or as a minimum amount of MW that must run plus a dispatchable component above the minimum.

SELF–SUSTAINED VESSEL = САМООБСЛУЖИВАЕМОЕ СУДНО – Self-Sustained Vessel is a containership which has her own crane for loading and discharging shipping containers enabling the ship to serve ports which do not have suitable lifting equipment. Vessel equipped with cranes/derricks that does not require shore equipment to load/unload cargo.

SELF–SUSTAINING SHIP = САМООБСЛУЖИВАЮЩЕЕСЯ СУДНО – Self-Sustaining Ship is a containership which has her own crane for loading and discharging shipping containers enabling the ship to serve ports which do not have suitable lifting equipment.

SELF–TRIMMING SHIP = СУДНО С АВТОМАТИЧЕСКОЙ ШТИВКОЙ (или СУДНО С САМОРАЗРАВНИВАНИЕМ (ГРУЗОВ В ТРЮМАХ)) – Self-Trimming Ship is a ship whose holds are shaped in such a way that the cargo levels itself.

SELF–TWIST YARN = САМОСКРУЧИВАЕМАЯ ПРЯЖА – Self-Twist Yarn is an inherently twist-stable, two-ply structure having a ply twist that is alternately S- and Z-directed along the yarn.

SELF–UNLOADER = САМОРАЗГРУЖАЮЩЕЕСЯ СУДНО (или СУДНО С УСТРОЙСТВОМ ДЛЯ РАЗГРУЗКИ) – Self-Unloader is a bulk carrier which is equipped with gear for unloading cargo.

SELL = ПРОДАТЬ (или ПРОДАВАТЬ) – Sell:- to place an opening trade at the bid price of a spread in anticipation of the underlying market falling, commonly referred to as a 'Down Trade', 'Taking A Short Position', or 'Going Short'. You can also sell at the bid price to close an existing long position.

SELL BASIS = ПРОДАВАТЬ БАЗИС – Sell Basis:- the basis level quoted to buyers. See also Buy Basis.

SELLER = ПРОДАВЕЦ – (1) Seller is a person who exchanges goods or services for money. / Лицо, которое обменивает товары или услуги на деньги.

(2) In option trading, Seller is an individual who sells or grants or writes any exchange option, establishing a short position. He is obligated to deliver the underlying asset if the option is exercised. Also known as Grantor or Writer. Writer or Seller or Grantor is an individual who sells an option, establishing a short position. / В торговле опционами, частное лицо, продающее или предоставляющее, или выписывающее любой биржевой опцион и устанавливающее, тем самым, короткую позицию. Он обязан поставить соответствующий актив в случае исполнения опциона. Известен также как Выписавший (Writer) или Предоставивший (Grantor).

SELLER'S CALL = ВОСТРЕБОВАНИЕ ПРОДАВЦОМ – Seller's Call, also referred to as Call Purchase, is the same as the buyer's call except that the seller has the right to determine the time to fix the price. The opposite of Buyer's Call.

SELLER'S DELIVERY COMMITMENT = ОБЯЗАТЕЛЬСТВО ПРОДАВЦА ПО ПОСТАВКЕ – Seller's Delivery Commitment is the written notice given by the seller of his intention to make delivery against the short futures position on delivery day.

SELLER'S MARKET = РЫНОК ПРОДАВЦА – A Seller's Market is considered to exist when goods cannot easily be secured and when the economic forces of business tend to be priced at the vendor's estimate of value. In other words, a state of trade favorable to the seller, with relatively great demand and high prices of something for sale. Seller's Market is a market where grain is in short supply and sellers can obtain higher prices. Seller's Market is a condition of the market in which there is a scarcity of goods available and hence sellers can obtain better conditions of sale or higher prices. The opposite of Buyer's Market.

SELLER'S OPTION = ОПЦИОН ПРОДАВЦА – Seller's Option is the right of a seller to select, within the limits prescribed by a contract, the quality of the commodity delivered and the time and place of delivery. A special transaction on the New York Stock Exchange, that gives the seller the right to deliver the stock or bond at any time within a specified period, ranging from no less that two business days to no more than 60 days.

SELLER'S POINTS = ПУНКТЫ ПРОДАВЦА – In reference to a loan, Seller's Points consist of a lump sum paid by the seller to the buyer's creditor to reduce the cost of the loan to the buyer. This payment is either required by the creditor or volunteered by the seller, usually in a loan to buy real estate. Generally, one point equals one percent of the loan amount. See also Point.

SELLING CLIMAX = КУЛЬМИНАЦИЯ ПРОДАЖ – Selling Climax is a sudden drop in security prices as sellers dump their holdings. Selling Climax is the point at which a security becomes so oversold at high trading volume that it precipitates an upward market correction. It is an example of a market bottom that precedes a rally. See also Buying Climax, and Reversal Spike. Selling Climax is a period of very high volume and sharp downward movement in the stock market. A selling climax generally signals the end of a prolonged bear market. Climax is a market condition that is characterized by very high trading volume and a dramatic downward or upward movement in price. High volume and downward price movement indicate a selling climax, while high volume and upward price movement indicate a buying climax. Either type of climax signals the end of a trend. Selling into a climax run can be a good exit strategy, because by selling during a period of euphoria, investors can lock in dramatic gains. A buying climax can bid a stock's price up to levels it will never reach again, or that it will not reach again for at least a decade. At the end of a buying climax, prices can fall sharply as investors realize the stock has been overbought. / осадок (precipitate).

SELLING COMMISSION = КОМИССИЯ ЗА ПРОДАЖУ – Selling Commission:- remuneration for the banks participating in the underwriting or placement of shares or bonds (placement commission).

SELLING, GENERAL AND ADMINISTRATIVE (EXPENSES) = ЗАТРАТЫ НА ПРОДАЖУ, ОБЩИЕ И АДМИНИСТРАТИВНЫЕ (РАСХОДЫ) – Selling, General and Administrative (SGA) is the sum of:- (i) general and administrative expenses (such as salaries of nonsales personnel, rent, heat and light); (ii) direct selling expenses (that is, expenses that can be directly tied to the sale of a specific unit, such as credit, warranty and advertising expenses); and (iii) indirect selling expenses (that is, expenses which cannot be directly

tied to the sale of a specific unit but which are proportionally allocated to all units sold during a certain period, such as:- telephone, interest and postal charges). / ручательство (warranty).

SELLING GROUP = ПРОДАЮЩАЯ ГРУППА – Selling Group is a group of dealers invited by a syndicate manager to act as agents for other underwriters in selling a new or secondary issue to the public.

SELLING HEDGE = ХЭДЬЖ ПРОДАЖЕЙ – Selling Hedge:- selling futures contracts against a long cash market position to protect against possible decrease in the price of a commodity. Selling futures contracts to protect against possible declining prices of commodities that will be sold in the future. At the time the cash commodities are sold, the open futures position is closed by purchasing an equal number and type of futures contracts as those that were initially sold. Also known as Short Hedge. See also Hedging.

SELL–OFF = ПРОДАВАТЬ СО СКИДКОЙ (или РАСПРОДАВАТЬ) – Sell-Off:- downward price trend after an advance caused by traders selling previously established long positions.

SELL ON CLOSE = ПРОДАТЬ ПРИ ЗАКРЫТИИ – Sell On Close:- to sell at the end of the trading session at a price within the closing range. / Продать при закрытии торговой сессии по цене, складывающейся в период закрытия сессии.

SELL ON OPENING = ПРОДАТЬ ПО ОТКРЫТИИ – Sell On Opening:- to sell at the beginning of the trading session at a price within the opening range. / Продать в начале торговой сессии по цене, складывающейся в период открытия сессии.

SELL SHORT = ПРОДАЖА В КОРОТКУЮ (или ПРОДАЖА БЕЗ ОБЕСПЕЧЕНИЯ, или ПРОДАЖА БЕЗ ПОКРЫТИЯ, или ДЕПОРТ) – Selling Short is a forward transaction in which the seller sells securities that he does not own. He hopes to be able to cover the securities by the performance date at a cheaper price than at the closing of the contract and thus to take in the difference as profit. Stock market term for selling a security one does not own but intends to buy later at a lower price to cover the sale. Until the purchase to close the transaction has been made, the trader is said to be short on the particular stock or security. Traders taking advantage of falling prices to go short are known as Bears. Sell Short:- practice of making a bargain to sell securities or commodities the seller does not own. The seller does this in the hope that that before settlement is due, the price of the item will go down and he or she will be able to buy enough to cover the bargain at a lower price, thereby making a profit. Also known as Shorting, and Short Selling. / Под Депортом, от Французского слова Déport, понимается спекулятивная биржевая сделка на срок, заключаемая биржевыми дельцами в расчёте на понижение курса ценных бумаг или иных биржевых инструментов с целью получения курсовой разницы. Противоположна Репорту.

SELL SIDE = ПРОДАЮЩАЯ СТОРОНА – Sell Side:- a broker/dealer who sells expertise in research, order execution or any other service to an individual or institution. Those people who are on the market to sell, rather than to buy.

SELL SIGNAL = СИГНАЛ К ПРОДАЖЕ – Sell Signal is a condition that indicates a good time to sell a stock. The exact circumstances of the signal will be determined by the indicator that an analyst is using. For example, it's often considered a sell signal when the RSI crosses down through the 50 level. In technical analysis, a chart pattern which indicates a key reversal downwards in price.

SELL–STOP = ФИКСАЦИЯ ПРОДАЖЕЙ – Sell-Stop:- a type of futures market order that is placed below the current price and becomes a 'market order' when touched. Sell-stops tend to accumulate just below important support levels. These orders are primarily used to exit the market, although they can be used for new position entry. Many traders believe the 'market' goes looking for these pockets of sell-stops in order to get them executed, only to then reverse direction.

SELVAGE = КРОМКА – Selvage is the edge of woven fabrics, consisting either of one or more stronger cords or a narrow border, usually of a different weave from the body, serves to strengthen the fabric and to prevent warp threads from fraying. The selvedge is called fast when it is enclosed by all or part of the picks and not fast when the filling threads are cut off at the edge of the fabrics after every pick; the selvedge of such fabrics, usually split goods, consists either of leno or in the cheapest grades the fabric is simply sized along the edges to prevent fraying. See also Selvedge. Actual part of the cloth running in the warp direction along both edges of cloth. Its purpose is to keep the edges of cloth true, straight, even, and parallel. Width of selvage varies from 1/4 to about 1 inch. In the dressmaking and pattern trades the term is usually spelled as Selvedge. Also known as List, or Selvedge. A Selvage, or Selvedge, is a type of edge on a piece of fabric that prevents individual stitches from unraveling or fraying. The term is derived from the phrase 'self-edge', because the formation of a selvage is a natural result of how the fabric is made. Historically, selvages were only found on woven fabric, but in modern times the term has also come to apply to self-finishing edges on knitted fabric. In both weaving and knitting, these finished edges help to create seams that are evenly aligned. Creating a selvage in woven fabric is usually accomplished by securing horizontal weft threads along the side edges of the fabric. This can be done by reversing the direction of the weft threads at the end of each row of weaving, and then wrapping the threads under and over the vertical warp threads that run lengthwise through the fabric. The type of thread and weave used to make selvages may be the same or different from those used to make the rest of the fabric. With woven fabrics that use a different weave or thread to create finished edges, the selvage is often discarded before individual pattern pieces of a garment are seamed together. One type of woven fabric that incorporates these finished edges is called Selvage Denim, which is a type of denim with a distinct self-finished edge that is often used for making jeans. Selvage denim is woven by hand using a shuttle loom, which is a type of loom that stores the weft thread in an oblong tool called a Shuttle. Fabric woven on this type of loom is narrower than fabric woven on looms that do not use a shuttle, so makers of jeans must compensate for the lack of width by using extra length. The most economical way to make a pair of jeans with this type of denim is to use as much of the woven fabric as possible, including the self-finished edges, which usually fall on the outer leg seams of a finished pair of jeans. In knitting, selvages are created by using a different stitch pattern for the stitches closest to the edges of the knit fabric. This creates edges that are firm, neat, and will not unravel. A knit selvage is often used to facilitate seaming, although it can also be used to make a finished edge on a piece that does not require seams, such as a scarf. This type of finished edge is useful for securing the sides of knit pieces made from slick, smooth yarns that may slide out of place due to wear or repeated washing, such as silk or bamboo yarns. Selvage or Selvedge is the thin compressed edge of a woven fabric which runs parallel to the warp yarns and prevents raveling. It is usually woven, utilizing tougher yarns and a tighter construction than the rest of the fabric. Selvage or Selvedge is the narrow edge of woven fabric that runs parallel to the warp. It is made with stronger yarns in a tighter construction than the body of the fabric to prevent raveling. A fast selvage encloses all or part of the picks, and a selvage is not fast when the filling threads are cut at the fabric edge after every pick. See also Selvedge. Selvage is the long, outer, finished edge of both sides of a woven fabric that does not ravel because the filling yarns wrap around the warp yarns. It may also be called Self-Edge or Selvedge. Selvage:- the warp yarns woven at the extreme edges of a piece of fabric, generally in greater density (yarns per inch) or differing from the remainder of the warp in composition, twist, or ply. to provide the greater strength needed for support in weaving. / когда уточные нити . Ткань имеет фон и кромку. Фон – ничто иное как сама ткань, ограничиваемая по краям кромками. Кромки формируют края ткани и предохраняют её от чрезмерного сужения в процессе формирования и отделки. Кромка материала образуется в результате процесса ткачества или вязания трикотажного полотна. Внешний вид кромки зависит от способа получения материала, она может быть лохматой или гладкой. Кромка не должна попадать на детали кроя, поэтому она срезается перед раскроем или лекала раскладываются так, чтобы

кромка ткани попала в отходы. Срезать следует одинаковую ширину вдоль всего куска ткани. В некоторых изделиях (например, простыни) допускается использовать кромку в качестве края изделия при условии, что она гладкая, ровная и красивая. Достаточно часто встречается дефект – стянутая кромка. Такую стянутую кромку в обязательном порядке следует срезать перед раскроем, иначе неизбежны дефекты при раскрое деталей изделия. Если кромка стягивает ткань не сильно, то можно не срезать кромку, а сделать вдоль всего куска ткани надрезы.

SELVAGE DOUBLING = СДВАИВАНИЕ КРОМКИ – Selvage Doubling:- lengthways streak immediately adjacent to the selvedge, characterized by a difference in color from that of the body of the fabric, by surface disturbance, or by both. This defect is caused by the selvedge having folded over, thus shielding the edge of the usable fabric during processing. / Удвоение Кромки; Подгиб Кромки (selvage doubling; selvedge turndown):- порок заключительной отделки ткани, характеризующийся разницей цветов с основной тканью или искажением поверхности, прилегающий к кромке. Примечание:- этот порок вызван заворотом кромки, таким образом заслоняющей край пригодной ткани во время обработки.

SELVAGE MARK = ОТМЕТИНА ОТ КРОМКИ – Selvage Mark:- in finished cloth, a lengthwise crease mark along the selvage caused by an edge being folded or doubled.

SELVAGE (SLACK or WAVY) = (ОСЛАБЛЕННАЯ или ВОЛНИСТАЯ) КРОМКА – Defect Name:- Selvage (Slack or Wavy). Defect Type:- Finishing Defects. Fabric Type:- Bottomweights – Twill Derivatives. Description:- Selvage (Slack or Wavy):- This is the result of the edge of the fabric being longer than the center, causing it to wave or pucker when laid on the cutting table. This can result from mishandling where the selvage is stretched or from uneven wetting-out during sanforization. Severity:- Major.

SELVAGE TORN = РАЗРЫВ КРОМКИ – Defect Name:- Selvage Torn. Defect Type:- Finishing Defects. Fabric Type:- Bottomweights – Plain Weave Derivatives. Description:- Selvage Torn:- This is the result of the fabric rupturing under excessive tension while being processed through the tenter frame. Severity:- Major.

SELVAGE TURNDOWN = XX КРОМКИ – Defect Name:- Selvage Turndown. Defect Type:- Finishing Defects. Fabric Type:- Bottomweights – Twill Derivatives. Description:- Selvage Turndown:- This is the result of a selvage having been folded under and going through squeeze rolls somewhere in the dyeing or finishing processes. The turndown has been removed; however, the tell-tale discoloration remains. Severity:- Major.

SELVEDGE = КРОМКА – Selvedge is special hooked needle driven by a cam which produces, after cutting, the insertion of the protruding thread end into the subsequent shed, thus forming a stronger edge. The basic function of any selvedge is to lock the outside warp threads of a piece of cloth and so prevent fraying. The selvedge should be strong enough to withstand the strains of the stenter in the finishing process. The selvedge should have a neat and uniform appearance. This system is generally used for light to middle weight fabrics, when weave and fabric density permit. There are also available tuck-in selvedge motions which are entirely controlled by pneumatic or mixed pneumatic and mechanical devices. Three kinds of selvedges can be formed:- (i) tucked-in selvedges; (ii) leno selvedges; and (iii) fused selvedges. See also Fused Selvedges, Leno Selvedges, Melt Selvedges, and Tucked-In Selvedges. See also Selvage. Selvedge is the narrow edge of woven fabric that runs parallel to the warp. It is often made with stronger yarns, or in a tighter spacing, to prevent raveling. A fast selvedge encloses all of the picks. a selvedge is not considered fast when the filling threads are cut at the fabric edge after every pick. Selvage or Selvedge Defects:- the selvedge is the most important for any fabric appearance. Selvedge must be strong enough to withstand the tension of the finishing processes. (i) Waviness of Selvages occurs in the offside of a wide loom weaving narrow fabrics, on account of long length of weft being left between the selvage and the shuttle box. (ii) Too strong temples may cause Curly or Wavy Selvage. This defect may be overcome by adjusting the position of the temple and the selvages, and by allowing the selvage to run a little oblique. Tension of ground and selvage ends must always remain uniform to minimize selvage defects. (iii) Weft Breaks at the selvages may be due to wrong drafting or denting, wrong timing of selvage motion, damaged or rusty reed, uneven tensioning, or ends running oblique. (iv) Loops in the selvage are formed by insufficient tension in weft winding, by shuttle rebounding, and by strong picking. If loops are very bid, they are driven inside the shed in the next pick Corded Selvage. (v) Faulty temples cause Streaks at one or both sides. (vi) If the teeth of the temples are long, they cannot freely release the cloth without showing temple marks. Ring temples may injure the selvages of delicate fabrics. Selvedges or Selvages are extra ends on the sides of the warp, used to strengthen the edges of the cloth and aid in keeping it at a uniform width. / когда уточные нити . раскрой (cutting). Кромки тканей на станке типа СТБ (закладные кромки) образуются кромкообразующими приборами, которые заводят концы обрезанных уточных нитей в последующий зев, за счёт этого плотность ткани по утку в кромках увеличивается в 2 раза по сравнению с плотностью ткани по утку фона. Это вызывает её упрочнение. Плотность кромки по основе не увеличивается, а в некоторых случаях уменьшается по сравнению с плотностью фона. Ширина кромки определяется конструкцией кромкообразующего прибора и может быть равной 2.6–3.5 сантиметра (см), то есть от 1.3 до 1.75 см с каждой стороны. Формирование кромки на станках типа АТПР может осуществляться двумя способами:- (i) при помощи брошюровочной нити; или (ii) при помощи кромкообразующего прибора (по типу СТБ – закладная кромка). Брошюровочный способ не обеспечивает прочного закрепления края ткани, поэтому плотность кромочных нитей в 1.5–2 раза больше плотности основы в фоне. Ширина кромок составляет 1–1.5 см. Образующаяся бахрома (кончики утка, выходящие из ткани по краям кромок) из уточных нитей длиной, равной 0.3–1 см с каждой стороны, ограничивает возможность использования данных тканей. На станках типа АТПР кромочные нити не отличаются от нитей фона по линейной плотности и по виду сырья. В этом случае кромочные нити считают нитями фона. Если кромка ткани отличается по виду пряжи от нитей фона, то кромочные нити в фон не переводятся и в дальнейших расчётах учитываются отдельно. Кромка – плотный край по длине ткани, который не даёт ей осыпаться. При производстве тканей вдоль краёв полотен формируются уплотнённые полосы, которые предохраняют ткань от деформации и осыпания. Вид кромки может быть гладкий или с бахромой. Поскольку текстура ткани в местах расположения кромки изменена, нельзя допускать, чтобы детали кроя попадали на край – кромка должна идти в отходы. Кромку срезают на одинаковую ширину по всей длине куска ткани. Для изготовления постельного белья допускается использовать иногда кромку как край изделия, но при условии, что она красивая и ровная. Во многих видах тканей встречается такой дефект как стянутая кромка. Деформированную кромку надо обязательно срезать ещё до начала раскладки деталей кроя. В случае небольшой деформации возможно не срезать кромку, а сделать на ней надрезы. Сторону ткани можно часто определить по кромке – на лицевой стороне она более яркая с чётким переплетением. Часто для придания прочности краю изделия создаётся искусственная кромка при помощи определённых отделочных швов, подгибки ткани, тесьмы, лент, кружев, бахромы и так далее. Такой вид отделки очень декоративен и износостоек. Для создания отделочной кромки могут использоваться как контрастные цвета, так и в тон основной ткани. Кромкой называют также материалы для облицовки торцов мебельных плит. Мебельная кромка может быть образована приклеенным шпоном из натуральной древесины или быть нанесена при помощи термоклеющейся ленты.

SELVEDGE DEFECT = ПОРОК КРОМКИ (или ДЕФЕКТ КРОМКИ) – Selvedge Defect:- these are different defects appearing at the selvedge. Weaving Defect.

SEM = SCANNING ELECTRON MICROSCOPE

SEMAPHORE = СЕМАФОР – Semaphore (maritime term):- flag signaling with the arms.

SEMBS = STOCK EXCHANGE MONEY BROKERS

SEMI–ANNUAL = ПОЛУГОДОВОЕ – Semi-Annual:- refers to Plants whose life cycle is completed twice a year.

SEMI–ANNUAL CHARTS = ПОПОЛУГОДОВЫЕ ГРАФИКИ (или ПОПОЛУГОДИЧНЫЕ ГРАФИКИ) – The term Semi-Annual Charts is used to describe those charts that are constructed of semi-annual bars or candles. Each semi-annual bar or candle chart contains the open, high, low and close that occurred during each 6-month time interval. / Термин Пополугодовые Графики используется для описания таких графиков, которые строятся с использованием средних полугодовых штрихов или свечей. Каждый пополугодовой штриховой или свечной график содержит средние цены открытия, максимумов, минимумов и закрытия, имевшие место в течение каждого 6-месячного временного интервала.

SEMI–BRIGHT WOOL = ПОЛУБЛЕСТЯЩАЯ ШЕРСТЬ – Semi-Bright Wool is a grease wool that lacks brightness due to the environment under which it is produced, though it is white after scouring.

SEMICONDUCTOR = ПОЛУПРОВОДНИК – Semiconductor is the generic name for discrete devices and integrated circuits that can control the flow of electrical signals. Silicon is the basic material on which semiconductors are fabricated.

SEMI–CONTAINERSHIP = ПОЛУКОНТЕЙНЕРОВОЗ – Semi-Containership:- semi-container vessels are suitable for carrying both normal general cargo and containers. Hold dimensions, deck loading values, the load-carrying capacity of the loading gear, etc are tailored to the carriage of standard shipping containers. Such vessels have tween decks generally with flush-closing mechanical hatch covers. A conventional general cargo ship with one or two holds fitted with vertical cells. In most configurations, additional holds can be converted to cell stowage, if container traffic demands. Nonstandard cargo containers and/or break bulk cargo is carried in the conventional holds and tween decks. Also known as Partial Containership.

SEMI–FASHIONED = ПОЛУМОДНОЕ – Semi-Fashioned is a hosiery term for seamless hosiery that has had a fake seam added so it will resemble full-fashioned hosiery. See also Full-Fashioned.

SEMIFINISHED PRODUCT = ПОЛУФАБРИКАТ (или ПОЛУГОТОВЫЙ ПРОДУКТ) – Semifinished Product (Semi):- steel products that have already been shaped by hot-rolling or continuous casting processes and which are then subjected to further shaping to produce finished products. These include:- rough-rolled blocks (blooms with round or square cross-sections), slabs, billets, boards and ingots. / слябы, болванки, и чушки.

SEMI KNOCKED–DOWN CARS = ПОЛУРАЗОБРАННЫЕ АВТОМОБИЛИ – Semi Knocked-Down (SKD) Cars:- for export to countries which apply high levels of customs duty to luxury goods, automobiles are shipped in completely knocked down (CKD) or semi/part knocked down (SKD, PKD) form. In this case, the package sizes for the individual components are adapted precisely to the container in which they are transported, which means that the cargo is secured by tight fit.

SEMI–LOGARITHMIC (PERCENTAGE) SCALING = ПОЛУЛОГАРИФМИЧЕСКОЕ (ПРОЦЕНТНОЕ) МАСШТАБИРОВАНИЕ – Semi-Logarithmic (Percentage) Scaling:- on a logarithmic scale chart, the vertical spacing between two points corresponds to the percentage change between those numbers. Thus, on a log scale chart, the vertical distance between 10 and 20 (a 100% increase) is the same as the vertical distance between 50 and 100. Because these charts show percentage relationships, logarithmic scaling is also called ‘Percentage’ Scaling. It is also called ‘Semi-Log’ Scaling because only one of the axes (the vertical one) is scaled logarithmically. See also Logarithmic (Percentage) Scaling. / Смотрите также Логарифмическое (Процентное) Масштабирование (Logarithmic (Percentage) Scaling).

SEMINAL ROOT = ЗАРОДЫШЕВЫЙ КОРЕНЬ (или КОРЕШОК ЗАРОДЫША) – Seminal Root is a root that develops from the radicle. Sparsely branched roots that replace the radicle and are later replaced by secondary adventitious roots. / вторичными придаточными корнями.

SEMISOLID = ПОЛУТВЁРДОЕ ТЕЛО (или ПОЛУТВЁРДОЕ) – Semisolid:- any substance having the attributes of both a solid and a liquid. Similar to semiliquid but being more closely related to a solid than a liquid. More generally, any substance in which the force required to produce a deformation depends both on the magnitude and on the rate of the deformation.

SEMISUBMERSIBLE RIG = ПОЛУПОГРУЖНАЯ БУРОВАЯ УСТАНОВКА – In oil industry, Semisubmersible Rig is a seadrill rig system that can extract oil at different water depths. Semisubmersible Rig is one of the most common deepwater rigs in use. A ‘semi’ is larger than a jack-up rig and can operate in much deeper waters farther out at sea. Water dept up to 1 800 meters. See also Drillship, Jack-Up Rig, Semitender Rig, and Tender Rig. / Полупогружная Буровая Установка (ПБУ). Смотрите также Буровое Судно (Drillship), Самоподъёмная Буровая Установка или Буровая Установка На Выдвижных Сваях (Jack-Up Rig), Полупогружная Платформа С Буровой Установкой На Сваях (Semitender Rig или Tender Rig). Плавучая Буровая Установка (ПБУ) – буровая установка для бурения нефтяных и газовых скважин в открытом море. Бурение производится с ПБУ, опирающейся на морское дно при помощи мощных колонн (при глубинах до 70 метров); с заякоренной ПБУ (от 60 до 300 м); с ПБУ с динамической стабилизацией (более 250–300 м).

SEMI–SYNTHETIC FIBERS = ПОЛУСИНТЕТИЧЕСКИЕ ВОЛОКНА – Semi-Synthetic Fibers:- after treated with chemical agents, natural materials such as cellulose or protein are re-generated into fibers. Acetate fibers, promix fibers, and triacetate fibers are the semi-synthetic fibers. / Полусинтетические Волокна:- волокна, восстановленные после обработки естественных матриалов, таких как целлюлоза или белок, химическими веществами. Ацетатные волокна, промиксные волокна, и триацетатные волокна являются полусинтетическими волокнами.

SEMITENDER RIG = ПОЛУПОГРУЖНАЯ ПЛАТФОРМА С БУРОВОЙ УСТАНОВКОЙ НА СВАЯХ (или БУРОВАЯ УСТАНОВКА С МАЛОЙ ОСТОЙЧИВОСТЬЮ) – Semitender Rig:- in oil industry, a seadrill rig system that can extract oil at different water depths. Semitender rig is lowered from a ship and then is tethered to the ocean floor with legs. The ship contains living quarters for the crew and houses equipment. Water dept up to 2 000 meters. See also Drillship, Jack-Up Rig, Semisubmersible Rig, and Tender Rig. / Смотрите также Буровое Судно (Drillship), Самоподъёмная Буровая Установка или Буровая Установка На Выдвижных Сваях (Jack-Up Rig), Полупогружная Буровая Установка (Semisubmersible Rig), Полупогружная Платформа С Буровой Установкой На Сваях (Tender Rig). Плавучая Буровая Установка (ПБУ) – буровая установка для бурения нефтяных и газовых скважин в открытом море. Бурение производится с ПБУ, опирающейся на морское дно при помощи мощных колонн (при глубинах до 70 метров); с заякоренной ПБУ (от 60 до 300 м); с ПБУ с динамической стабилизацией (более 250–300 м).

SEMI–TRAILER = ПОЛУПРИЦЕП – A Semi-Trailer is a vehicle without motive power designed to be drawn by another vehicle and so constructed in a manner that part of its weight and that of its load rests upon or else carried by a towing vehicle. Also known as Van in the United States and Canada. Semitrailer is a trailer with a rear axle assembly that is pulled by a towing tractor or truck tractor. There are two different kinds of trailer:- (i) semitrailers that are also permitted in road traffic, and (ii) roll trailers (cargo trailers) that are pulled by towing tractors and are used only in ro-ro operations. These towing tractors are permitted only in terminal operations, and not allowed to be used on public roads. Containers or flatbed freight trailers pulled behind tractors or lorries. A Semi-Trailer is a trailer without a front axle. A large proportion of its weight is supported either by a tractor or by a detachable front axle assembly known as a Dolly. A semi-trailer is normally equipped with legs which can be lowered to support it when it is uncoupled, and such semi-trailers are known as Contrailers. / Полуприцеп это прицеп, но без передней оси, буксируемый седельным тягачом. Большая часть его веса поддерживается либо тягачом, либо присоединяемой передней осью, именуемой в водительской среде, как Тележка (Dolly). Полуприцепы обычно оборудуются ногами (legs), которые могут быть опущены для поддержки полуприцепа в отсоединённом от тягача состоянии, и такие полуприцепы известны как Контрейлеры (Contrailers). Под Полуприцепом понимается одно- или двухосная (иногда трёхосная) повозка, буксируемая седельным тягачом с помощью опорно-сцепного устройства и передающая на него часть своего веса. Полуприцеп предназначен для перевозки грузов или пассажиров либо для нетранспортных работ, например, полуприцеп-мастерская. Под Полуприцепом понимается одно- или 2-осная (редко 3-осная) безмоторная повозка, буксируемая седельным тягачом с помощью опорно-сцепного устройства и передающая на него часть своего веса. Полуприцепы предназначаются для перевозки грузов или пассажиров (транспортные полуприцепы) либо для выполнения нетранспортных работ (специальные полуприцепы), производимых при помощи установленных на полуприцепе машин, аппаратов или оборудования (автолавки, мастерские и другие).

SEMI–TRAILER TRUCK = ТЯГАЧ С ПОЛУПРИЦЕПОМ – A Semi-Trailer Truck or Tractor-Trailer (colloquially known as an Big-Big, Semi, or 18-Wheeler in the United States, a Semi in Australia and Canada, and as an Artic, Articulated Lorry, or Truck and Trailer in Ireland, New Zealand, and the United Kingdom) is an articulated truck or lorry consisting of a towing engine (Tractor in the United States, Prime Mover in Australia, Truck in New Zealand and the United Kingdom), and a trailer that carries the freight. In the United Kingdom, the term Juggernaut is sometimes used for especially large articulated lorries. Also known as Tractor-Trailer. / (Juggernaut).

SEMI–WORSTED YARN = ПОЛУГРЕБЕННАЯ ШЕРСТЯНАЯ ПРЯЖА (или ПОЛУКАМВОЛЬНАЯ ПРЯЖА) – Semi-Worsted Yarn is the yarn spun from sliver carded (not combed) and pin-drafted on worsted spinning system machines. / Пряжа, спряденая из кардной (не гребенной) .

SEMRY = SOCIETY FOR THE EXPANSION AND MODERNIZATION OF RICE IN YAGOVA

SEN = SENATOR

SENDER = ОТПРАВИТЕЛЬ – Sender is the party sending a SWIFT message as identified by its registered SWIFT address in the header of the message. By other words, originator of the message currently being referred to. / Отправитель:- сторона, отправляющая сообщение в системе Сообщества по Всемирной Межбанковской Финансовой Дальней Связи (СВМФДС; The Society for Worldwide Interbank Financial Telecommunication (SWIFT)), и которая идентифицирована в заголовке данного сообщения своим зарегистрированным в СВМФДС адресом. Другими словами, это инициатор сообщения, на которое в данный момент обращено внимание. коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо).

SENDER'S CORRESPONDENT = КОРРЕСПОНДЕНТ ОТПРАВИТЕЛЯ – Sender's Correspondent is a financial institution, which holds the sender's account. It is a field name in a SWIFT message:- use only where there are multiple account relationships in the currency of the transaction, between the 'Sender' and the 'Receiver' and one of these accounts is to be used for reimbursement. / Корреспондент Отправителя:- это название поля в сообщении Сообщества по Всемирной Межбанковской Финансовой Дальней Связи (СВМФДС; The Society for Worldwide Interbank Financial Telecommunication (SWIFT)). коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо).

SENDER'S CORRESPONDENT ACCOUNT = КОРРЕСПОНДЕНТСКИЙ СЧЁТ ОТПРАВИТЕЛЯ – In banking, Sender's Correspondent Account is the sender's account at sender's correspondent. / В банковском обслуживании под Корреспондентским Счётом Отправителя понимается счёт отправителя у корреспондента отправителя.

SENDERS OR RECEIVERS CHARGES = СБОРЫ ОТПРАВИТЕЛЕЙ ИЛИ ПОЛУЧАТЕЛЕЙ – Senders Or Receivers Charges:- it is a field name in a SWIFT message:- (i) currency and amount of the transaction charges deducted by the 'Sender' and by previous banks in the transaction chain; and (ii) currency and amount of the transaction charges due to the 'Receiver'. / Сообщество по Всемирной Межбанковской Финансовой Дальней Связи (СВМФДС; The Society for Worldwide Interbank Financial Telecommunication (SWIFT)). коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо).

SENDER'S REFERENCE = ССЫЛКА ОТПРАВИТЕЛЯ – In a SWIFT message, Sender's Reference is the sender's unique reference for a batch. / В сообщениях Сообщества по Всемирной Межбанковской Финансовой Дальней Связи (СВМФДС; The Society for Worldwide Interbank Financial Telecommunication (SWIFT)) это относится к уникальной ссылке отправителя для партии. коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо).

SENDER'S TRANSACTION CHARGE = СБОР С ОТПРАВИТЕЛЯ ЗА ТРАНЗАКЦИЮ (или СБОР С ОТПРАВИТЕЛЯ ЗА ОПЕРАЦИЮ) – In a SWIFT message, Sender's Transaction Charge is a charge levied on the sender side in respect of a specific payment transfer transaction. / В сообщении Сообщества по Всемирной Межбанковской Финансовой Дальней Связи (СВМФДС; The Society for Worldwide Interbank Financial Telecommunication (SWIFT)) сбор, взимаемый со стороны отправителя в отношении конкретной операции по переводу платежа. коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо).

SENDER TO RECEIVER INFORMATION = ИНФОРМАЦИЯ ОТПРАВИТЕЛЯ ПОЛУЧАТЕЛЮ – In a SWIFT message, Sender To Receiver Information is an additional information for the receiver. / В сообщениях Сообщества по Всемирной Межбанковской Финансовой Дальней Связи (СВМФДС; The Society for Worldwide Interbank Financial Telecommunication (SWIFT)) это относится к дополнительной информации для получателя. коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо).

SENDING BANK = ОТПРАВЛЯЮЩИЙ БАНК (или БАНК ОТПРАВИТЕЛЬ) – The Sending Bank transmits a message, via a secure system (such as SWIFT or Fedwire), to the receiving bank, requesting that it effect payment according to the instructions given. See also Sender. / СВИФТ (SWIFT) или Фэдвайэ (Fedwire). Смотрите также Отправитель (Sender). коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо).

SENESCENCE = СТАРЕНИЕ (или ОДРЯХЛЕНИЕ) – Senescence is the phase of plant growth that extends from full maturity to actual death; characterized by an accumulation of metabolic products, increase in respiratory rate, and a loss in dry weight especially in leaves and fruits.

SENESCENCE = УВЯДАНИЕ – Senescence:- yellowing or reddening and death of plant tissue as a result of advanced maturity / old age. The stage in the life of a plant or plant part from maturity to death, in which metabolic products accumulate, respiratory rate increases and dry weight decreases. / Стадия в жизни растения или части растения в период между зрелостью и омертвлением, в которую накапливаются метаболиты, усиливается респираторная норма и снижается сухой вес. Увядание внешне проявляется в поникании листьев, стеблей и других органов растений. В большинстве случаев оно связано с потерей тургора клеток и тканей вследствие недостатка воды. Причиной этого могут быть также закупорка сосудов растений патогенами или поражение их токсинами. Нередко растение увядает при поражении корней и стеблей как патогенами, так и вредителями. Причиной увядания могут быть и абиотические факторы внешней среды.

SENIOR = СЭНИОР (или СТАРШИЙ) – Senior:- being in a position, rank, or grade above others of the same set or class. Higher in rank; longer in length of tenure or service; a senior officer. / Под Сэниором, от Латинского слова Senior, означающее Старший, понимается . Старшее должностное лицо.

SENIOR COMMERCIAL OFFICER = СТАРШЕЕ КОММЕРЧЕСКОЕ ДОЛЖНОСТНОЕ ЛИЦО (или СТАРШИЙ КОММЕРЧЕСКИЙ СОТРУДНИК) – The Senior Commercial Officer (SCO) is the senior US and Foreign Commercial Officer at an embassy and reports in-country to the Ambassador. At major posts, this position carries the title of Commercial Counselor; in key posts, Minister Counselor. Usually reporting to the SCO are a Commercial Attache and Commercial officers. The latter are sometimes assigned to subordinate posts throughout the country.

SENIORITY (OF A US REPRESENTATIVE OR SENATOR) = СТАРШИНСТВО (ПРЕДСТАВИТЕЛЯ ИЛИ СЕНАТОРА США) – Seniority (of a US Representative or Senator) is ehe number of years of unbroken service that a member of a standing Congressional committee has on that committee. The Rules of the House and Senate (and the rules of the Democratic and Republican caucusses within each chamber) have always given great weight to differences in seniority in allocating power and privileges among their members. The majority party committee member with the most seniority will almost invariably be selected as chairman of the committee and thus be awarded the power to hire and fire most of the committee's staff employees, to set meeting times, to determine which majority party members will be appointed to which subcommittees, to control what bills will be taken up for consideration, and so on. The minority party member of the committee with most seniority is designated the ranking minority member of the committee and thus gets to pick the minority party members of subcommittees, hire and fire the minority's (much smaller) share of the committee staffers, and generally act as his party's main spokesperson on committee matters to the chairman, as well as the mass media, etc. When bills drafted in the committee are reported out for debate by the whole House or the whole Senate, the Chairman and the ranking minority member get to decide which members of their party will be recognized to speak in the debate, and for how many minutes. All the other members of the committee are ranked according to their years of membership, and such matters as the order in which they get to speak during committee meetings or hearings, chairmanships of subcommittees and many other privileges are normally determined largely or entirely on the basis of their seniority within their party's ranks. Since a Representative's or a Senator's degree of power and influence over the content of the legislation produced by the committee are very largely determined by seniority, and since they have to start all over in accumulating seniority if they change committee assignments, members of the US Congress normally wish to stay on the same committees year after year – at least after the first few years in office. (A member or two may have to be booted out of his committee assignment involuntarily if the latest election results resulted in a sizable shift in the party balance within the chamber as a whole, resulting in the losing party losing some of its slots on all the committees. But if that happens, it is the least senior member of the losing party on the committee that has to give up his membership.) Following the principle of seniority creates a well-established 'pecking order' within the Congressional committees and the party caucusses and thus probably helps to avoid a lot of acrimonious conflict over perks and status that might otherwise make it harder for committee members to work together on more substantive legislative issues. The premium placed on seniority probably also tends to ensure that committee members (or at least the most influential ones of them) develop an enormous amount of expertise and detailed knowledge about the policy issues and the administrative problems connected with them in the area of policy supervised by the particular committee. On the negative side, the seniority rule gives disproportionate power to Congressmen and Senators from 'safe' districts and thus tends to minimize the impact of shifts in the voters' choices, since pretty much the same old players will still be dominating the committee's deliberations after the election as before almost regardless of the outcome.

SENNA KNOT = КАССИЙСКИЙ УЗЕЛ – Senna Knot is a type of knot used to make pile in Persian hand-tied rugs.

SENNIT = ПЛЕТЁНКА (или ХХ) – Sennit is a braided cord or fabric (as of plaited rope yarns).

SENSITIVE PERIOD = ЧУВСТВИТЕЛЬНЫЙ ПЕРИОД – Sensitive Period is the plant's growing period when it is most affected by the prevailing environmental factors such as daylength and disease or Insect attack.

SENSORY TEST/EVALUATION = СЕНСОРНЫЙ ТЕСТ/ВЫЧИСЛЕНИЕ – Sensory Test/Evaluation is a method for the assessment of cooked Rice 1 hour after cooking by judges or panel members. The characteristics assessed are aroma, flavor or taste, tenderness or hardness, cohesiveness or stickiness, appearance, and color using a six-point scoring scale. / твёрдость (hardness).

SENTIMENT INDICATORS = ИНДИКАТОРЫ ЧУВСТВ (или ИНДИКАТОРЫ ОЩУЩЕНИЙ) – Sentiment Indicators are the psychological indicators that attempt to measure the degree of bullishness or bearishness in a market. These are contrary indicators and are used in much the same fashion as overbought or oversold oscillators. Their greatest value is when they reach upper or lower extremes.

SEP = SIMPLIFIED EMPLOYEE PENSION PLAN

SEPA = THE SINGLE EURO PAYMENTS AREA

SEPAL = ЧАШЕЛИСТИК – Sepal is one of the separate perianth leaves of the calyx. Sepal is a segment of the calyx, usually green. / Чашелистик – один из отдельных листочков околоцветника чашечки. Чашелистик – сегмент чашечки, обычно зелёный. Под Чашелистиками понимаются листочки (обычно зелёные), образующие вокруг венчика в цветке чашечку.

SEPARATE = ОТДЕЛЬНОЕ (или РАЗДЕЛЬНОЕ, или ЕДИНИЧНОЕ, или ХХ) – Separate is an article of dress worn interchangeably with others to form various combinations. For example, a suit separate. Usually used in plural.

SEPARATE CUSTODY = РАЗДЕЛЬНОЕ ДОВЕРИТЕЛЬНОЕ УПРАВЛЕНИЕ – Separate Custody:- securities held in separate custody are kept separate from holdings of the bank or third parties. Securities are held in separate custody if they are not admitted to collective custody by a securities clearing and deposit bank, or at the depositor's request. The name of the owner is noted on the strip

of paper wrapped around the securities. The advantage of separate custody for the customer is that he can receive the original of the securities deposited with the bank. See also Jacket Custody. Opposite:- Collective Custody.

SEPARATE CUSTODY OF SECURITIES = РАЗДЕЛЬНОЕ ДОВЕРИТЕЛЬНОЕ УПРАВЛЕНИЕ ЦЕННЫМИ БУМАГАМИ – Separate Custody Of Securities:- the safeguarding of securities separate from the customer's holdings of other types of securities or from the securities of other customers (so-called Jacket Custody). The opposite of Collective Custody.

SEPARATELY DERIVED SYSTEM = РАЗДЕЛЬНО ВЫВОДИМАЯ (или РАЗВЕТВЛЁННАЯ) СИСТЕМА – Separately Derived System (SDS) is an electrical system whose power is provided by a stand-alone generator, transformer, or converter and which has no direct electrical connection or ground connection to another source (such as the utility). The US National Electrical Code (NEC) contains special grounding and bonding requirements for such systems. A Separately Derived System is a premises wiring system with no direct electrical connection to conductors originating from another system. All transformers, except autotransformers, are separately derived because the primary circuit conductors do not have any direct electrical connection to the secondary circuit conductors. Generators that supply a transfer switch that opens the grounded neutral conductor would be considered separately derived.

SEPARATELY TRADED INTEREST AND PRINCIPAL SERVICE = УСЛУГА РАЗДЕЛЬНОЙ ТОРГОВЛИ ОСНОВНОЙ СУММОЙ И КУПОНАМИ – In 1985, the Federal Reserve Bank of New York (FRBNY) began offering its STRIPS service (Separately Traded Interest and Principal Service). The original service included the use of generic security numbers for interest payments. Generic security numbers means that a single number is used to identify all payments having the same issuer, payment date, payment type (e.g., interest or principal), payment currency, and no distinguishing features. Later, several other countries began offering similar services. Under these services, the securities depository holds the underlying bonds and the strip bonds are created only as electronic ledger entries on the records of the depository. Once created, the strip bonds are held and transferred only within the depository system. / , например, .

SEPARATE TRADING OF REGISTERED INTEREST AND PRINCIPAL OF SECURITIES = РАЗДЕЛЕНИЕ ТОРГОВЛИ МЕЖДУ ЗАРЕГИСТРИРОВАННЫМИ ПРОЦЕНТАМИ И ОСНОВНЫМИ СУММАМИ ЦЕННЫХ БУМАГ (или РАЗДЕЛЬНАЯ ТОРГОВЛЯ ОСНОВНОЙ СУММОЙ И КУПОНАМИ) – Separate Trading of Registered Interest and Principal of Securities (or STRIPS) are T-Notes, T-Bonds and TIPS whose interest and principal portions of the security have been separated, or 'stripped'; these may then be sold separately (in units of USD1 000.00 face value) in the secondary market. The name derives from the days before computerization, when paper bonds were physically traded; traders would literally tear the interest coupons off of paper securities for separate resale. The government does not directly issue STRIPS; they are formed by investment banks or brokerage firms, but the government does register STRIPS in its book-entry system. They cannot be bought through TreasuryDirect, but only through a broker. STRIPS are used by the Treasury and split into individual principal and interest payments, which get resold in the form of zero-coupon bonds. Because they then pay no interest, there is not any interest to re-invest, and so there is no reinvestment risk with STRIPS. Separate Trading of Registered Interest and Principal of Securities (STRIPS) program. Treasury STRIPS are fixed-income securities sold at a significant discount to face value and offer no interest payments because they mature at par. Backed by the US Government, STRIPS, which were first introduced in 1985, offer minimal risk and some tax benefits in certain states, replacing TIGRs and CATS as the dominant zero-coupon US security. Although you receive no tangible income, you typically still have to pay federal income tax on the bond's accretion for the year. A book-entry system operated by the US Federal Reserve permitting separate trading and ownership of the principal and coupon portions of selected treasury securities. It allows the creation of zero coupon Treasury securities from designated whole bonds. / Стрипы (STRIPS) – ценная бумага, образовавшаяся при разбиении купонной облигации на несколько ценных бумаг, представляющих собой процентные платежи (interest-only strip) или номинал (principalonly strip) и обращающихся независимо друг от друга.

SEPARATION = СЕПАРАЦИЯ (или СЕПАРИРОВАНИЕ) – Separation:- chill haze. / Дымка или Мгла, или Туман от заморозки. Под Сепарацией, от Латинского слова Separatio, означающее Отделение, понимается:- (i) отделение жидких или твёрдых частиц от газа, твёрдых – от жидкости; или (ii) разделение на составные части твёрдых или жидких смесей. Сепарация применяется в горном деле (для обогащения полезных ископаемых), в газовой (для осушки газов) и пищевой (для получения сливок, очистки молока, осветления пива и так далее) промышленности и других.

SEPARATION OF POWERS = РАЗДЕЛЕНИЕ ПОЛНОМОЧИЙ – Separation Of Powers is one of the most important of the basic principles that guided the framers of the US Constitution in their design for America's future governance was the idea that the root cause and essence of tyrranical government is the concentration of control over all the powers and functions of government in the hands of the same individual or narrow political faction. The corollary the Framers drew from this was the separation of powers principle:- that free popular government can best be sustained by dividing the various powers and functions of government among separate and relatively independent governmental institutions whose officials would be selected at different intervals and through different procedures by somewhat different constituencies so as to make it unlikely that the same small faction could gain control of them all at the same time. Thus, in the American federal republic the Framers designed, 'the power surrendered by the people is first divided between two distinct governments (the Federal government and the governments of the several states), and then the portion allotted to each subdivided among distinct and separate departments (the executive, the legislative, and the judicial)'. (Madison, The Federalist #51). The idea that concentrated political power is a mortal danger to civil liberties and popular rights remains to this day one of the most persistent and characteristic features of American ideologies and popular thinking about politics. In comparison with other advanced industrial countries, the United States possesses one of the most complex governmental structures and perhaps the most broadly diffused distribution of governmental authority among independent agencies. Not only do American governmental arrangements still allocate power to separate executive, legislative and judicial branches at both the state and federal levels, but they also feature a great variety of forms of relatively autonomous and geographically overlapping governmental bodies at the local level – including not only general purpose county and municipal governments but also a wide variety of functionally specialized mini-governments such as elected district school boards, flood control district boards, water resource planning boards, transit authority boards and the like.

SEPARATOR = СЕПАРАТОР – In the cotton gin, Separator is a mechanical device, e.g., wire screen with rotary rake, that separates seed cotton from conveying air. Separators can be used at various points in a gin plant to separate seed cotton from its conveying air, or to provide additional cleaning. Most commonly separators are used as part of a seed cotton unloading system, or used to reintroduce excess seed cotton back into the ginning process from an overflow system. Separators' traits:- available in 6 & 8 ft widths; 145° screen area; 2 15/16" shafting; rugged construction; engineered for ease of maintenance; and optional drive arrangements (traditional v-belt drive or gear reducer driven. / В хлопковом волокноотделителе (или джине), механическое устройство, например, проволочный экран с вращающимися лопаточками, которое выделяет хлопок-сырец из воздушного потока. Под Сепаратором, от Латинского слова Separator, означающее Отделитель, понимается аппарат для сепарации. Принцип действия сепаратора основан на различии физических свойств компонентов смеси. Наиболее распространены:- (i) магнитные

сепараторы, в которых магнитные частицы (например, железной, кобальтовой и некоторых других руд) отделяются от немагнитных (например, пустой породы) или менее магнитных в результате разделения потоков разных частиц под действием электромагнита; (ii) отстойные сепараторы для разделения двух несмешивающихся жидкостей путём отстаивания в резервуаре с двумя отводными трубами:- верхней – для лёгкой жидкости и нижней – для тяжёлой; и (iii) центробежные сепараторы (центрифуги), в которых более тяжёлая жидкость или взвесь твёрдых частиц в жидкости отжимается под действием центробежной силы к периферии сепаратора, откуда и удаляется (например, сепаратор молочный). Имеются сепараторы и других типов, работающие на основе различных физических принципов, например, коронные или электростатические.

SEPIA = СИПИА (или ХХ) – Sepia:- a brownish gray to dark olive brown.

SEPTATE = СЕПТАТНОЕ (или ИМЕЮЩЕЕ ПЕРЕГОРОДКИ, или РАЗДЕЛЁННОЕ ПЕРЕГОРОДКАМИ) – Septate:- having cross walls. Divided into cells or segments by partitions.

SEPTUM = СЕПТА (или ПЕРЕГОРОДКА) – Septum is:- (1) a cross wall in a fungal hypha or spore. (2) The cross-sectional layer inside the node which separates adjoining internodes. / в грибной гифе или споре.

SEQUENCE = ПОСЛЕДОВАТЕЛЬНОСТЬ – Sequence (in biotechnology):- linear order of the 4 nucleotide bases along a DNA or RNA molecule.

SEQUENCE = СЕКВЕНЦИЯ (или ПОРЯДОК, или ПОСЛЕДОВАТЕЛЬНОСТЬ) – Sequence is a group of fields. / Группа полей. Под Секвенцией, от позднелатинского слова Sequentia, означающее Последовательность, понимается .

SEQUENCE–CHARACTERIZED AMPLIFIED REGION = ПОСЛЕДОВАТЕЛЬНО ХАРАКТЕРИЗУЕМЫЙ УСИЛЕННЫЙ РЕГИОН – Sequence-Characterized Amplified Region (SCAR) is a useful molecular marker which may be generated by the partial sequencing of Arbitrarily Primed Polymerase Chain Reaction (AP-PCR), DNA amplification fingerprinting (DAF), or Random Amplified Polymorphic DNA (RAPD) band or an restriction fragment length polymorphism (RFLP) clone. Resultant PCR primers that provide specificity.

SEQUENCE–TAGGED SITE = ПОСЛЕДОВАТЕЛЬНО БИРКОВАННЫЙ УЧАСТОК – Sequence-Tagged Site (STS) is a region of DNA on a chromosome with known sequences used as a signpost for molecular gene mapping approaches.

SEQUENCING = СЕКВЕНИРОВАНИЕ – Sequencing is the determination of the order of amino acids in a peptide, polypeptide chain, or protein, or the determination of bases (nucleotides) in a nucleotide, polynucleotide strand, or nucleic acid. / Секвенирование – определение первичной структуры макромолекул.

SEQUENTIAL CROPPING = ПОСЛЕДОВАТЕЛЬНОЕ ВОЗДЕЛЫВАНИЕ – Sequential Cropping is a growing two crops in rapid sequence, planting one immediately after the harvest of the first, on the same piece of land.

SEQUENTIAL POLYACRYLAMIDE GEL ELECTROPHORESIS = ПОСЛЕДОВАТЕЛЬНЫЙ ПОЛИАКРИЛАМИД ГЕЛЬ ЭЛЕКТРОФОРЕЗ – SPAGE (short for the Sequential Polyacrylamide Gel Electrophoresis) was carried out as described by Flores (1986). This technique consists first, electrophoresis of extraction products on a native polyacrylamide gel (5%). When the dye bromophenol reaches the bottom of the gel, staining with ethidium bromide is performed. Second, the viroid zone delimited by two marker corresponding to the smallest known viroid and one of the greatest viroid respectively, Avocado Sun Blotch Viroid (ASBVd) 246 nt and Citrus Exocortis Viroid (CEVd) 375 nt, is cut. Then placed on the top of a denaturant gel (8M Urea). After the second running, the gel was stained with silver nitrate. Sequential PAGE (sPAGE) provides a better separation of viroid RNAs, and it has also been successfully used for diagnosis in field samples. sPAGE analysis of nucleic acids extracted from field samples and partially purified by CF-11 cellulose chromatography is fast, sensitive and reliable for viroid detection. In winter and spring, viroid concentration is very low and sPAGE analysis unsuitable for diagnosis.

SEQUENTIAL VARIETAL RELEASE = ПОСЛЕДОВАТЕЛЬНЫЙ СОРТОВОЙ ВЫПУСК – Sequential Varietal Release is a breeding technique that aims at incorporating different resistance gene(s) into similar improved varietal backgrounds and releasing them sequentially, enabling farmers to choose the variety on the basis of biotype/race identified. As the biotype/pathogen population shifts and the variety becomes susceptible, a new variety with a different gene is released.

SEQUESTERING AGENT = СВЯЗЫВАЮЩИЙ АГЕНТ (или ПАССИВАТОР) – Sequestering Agent or Sequestrant is a chemical compound that tends to bind some ‘species’ such as metal ions and keep them from being available to participate in other chemical reactions; also called Chelating Agents. Chemicals such as sodium hexametaphosphate, citric acid or EDTA (short for the Ethylenediaminetetraacetic Acid), the choice depending on considerations such as pH and dye type, are used to sequester hardness ions such as calcium and magnesium and metal ions such as iron and copper. Care must be taken with pre-metallized dyes, since some powerful sequestering agents can actually remove the metal from the dye complex. Sequestering Agents:- they disperse and suspend dirt. In aqueous solutions, these compounds combine with metal ions, like Calcium, to substantially inactivate the ion. Calcium, and other hard water ions, readily combine with surfactants in the detergents and reduce their cleaning effectiveness. By inactivating the ion with a sequestering agent, the other detergent ingredients are better able to clean clothes. / твёрдость (hardness). хелатообразователь (chelating agent). Гексаметафосфат Натрия (Sodium Hexametaphosphate).

SEQUESTRANT = СЕКВЕСТРАНТ (или КОМПЛЕКСООБРАЗОВАТЕЛЬ, или ЛИГАНД) – Sequestrant is any compound that will inactivate a metallic ion by forming a water-soluble complex in which the metal is held in a nonionizable form. This results in prevention of the usual precipitation reactions of the metal.

SEQUESTRATION = СЕКВЕСТРАЦИЯ – Sequestration, originally a legal term referring generally to the act of valuable property being taken into custody by an agent of the court and locked away for safekeeping, usually to prevent the property from being disposed of or abused before a dispute over its ownership can be resolved. But the term has been adapted by Congress in more recent years to describe a new fiscal policy procedure originally provided for in the Gramm-Rudman-Hollings Deficit Reduction Act of 1985 – an effort to reform Congressional voting procedures so as to make the size of the Federal government’s budget deficit a matter of conscious choice rather than simply the arithmetical outcome of a decentralized appropriations process in which no one ever looked at the cumulative results until it was too late to change them. If the dozen or so appropriation bills passed separately by Congress provide for total government spending in excess of the limits Congress earlier laid down for itself in the annual Budget Resolution, and if Congress cannot agree on ways to cut back the total (or does not pass a new, higher Budget Resolution), then an ‘automatic’ form of spending cutback takes place. This automatic spending cut is what is called ‘Sequestration’. Under sequestration, an amount of money equal to the difference between the cap set in the Budget Resolution and the amount actually appropriated is ‘sequestered’ by the Treasury and not handed over to the agencies to which it was originally appropriated by Congress. In theory, every agency has the same percentage of its appropriation withheld in order to take back the excessive spending on an ‘across the board’ basis. However, Congress has chosen to exempt certain very large programs from the sequestration process (for example, Social Security and certain parts of the

Defense budget), and the number of exempted programs has tended to increase over time – which means that sequestration would have to take back gigantic shares of the budgets of the remaining programs in order to achieve the total cutbacks required, virtually crippling the activities of the unexempted programs. The prospect of sequestration has thus come to seem so catastrophic that Congress so far has been unwilling actually to let it happen. Instead, Congress has repeatedly chosen simply to raise the Budget Resolution spending caps upward toward the end of the legislative session in order to match the actual totals already appropriated, thus largely wiping out the incentives that the reformed budget procedures were expected to provide for Congress to get better control of the budget deficit. / домогательство (abuse). Акт Грэма-Радмэна-Халыньза О Снижении Дефицита от 1985 (Gramm-Rudman-Hollings Deficit Reduction Act of 1985). Под Секвестрацией, от Латинского слова Sequestro, означающее Отделяю или Ставлю Вне, понимается .

SEQUINS = БЛЁСТКИ (или ПАЙЭТКИ, или ПАЙЕТКИ) – Sequins are the disk-shaped beads used for decorative purposes. They are available in a wide variety of colors and geometrical shapes. Sequins are commonly used on clothing, jewelry, bags and other accessories to add interest. Sequin is a shiny, usually metallic, decoration or spangle. Sequins are sewn to clothing, especially evening dresses because they shimmer and sparkle in the light. Sequins usually have a single, central hole for fastening to the garment or fabric. Sequins are also known as Paillettes. Fabric covered with sequins is available by the yard. / бисеринки или бусинки (beads). известны также как Блёстки или Пайэт (Paillettes, на Французском языке).

SERAPE = СЭРАПЭ (или ХХ) – Serape is a colorful woolen shawl worn over the shoulders often found worn in Mexico. / .

SERC = SOUTHEASTERN ELECTRIC RELIABILITY COUNCIL

SERIES (OF OPTIONS) = СЕРИИ (ОПЦИОНОВ) – Series (Of Options):- options of the same type (i.e. either puts or calls, but not both), covering the same underlying futures contract or physical commodity, having the same strike price and expiration date.

SERGE = СЕРЖ (или САРЖА) – Serge is a type of twill fabric which has been classically used in uniforms and suiting for centuries. Like other twills, serge has a distinctive weave which creates a pattern of diagonal ridges in the fabric, and it is known for being extremely sturdy and resilient. It also drapes and hangs well, flattering a variety of body types in an assortment of weights. Many department stores stock serge garments, and serge can also be purchased from fabric suppliers for custom work. The origins of serge appear to be quite ancient. The word is derived from the Greek Serikos, which means 'Silken', suggesting that serge was probably brought to Europe from China. By the VIII century CE, people were certainly using serge, but the fabric was available primarily to the upper classes. Europeans also developed wool serge, with serge production being centered in France by the 1500s, typically using high-quality English wool. Wool serge is excellent for uniforms and suits, and it is possible to produce wool serge in both light and heavy weights, for a variety of climates. Because serge is a very flexible, resilient fabric, it tends to cope very well with crumpling and pressing, making it convenient for extended wear. When a suit is cut well, serge also drapes very nicely, complementing the figure of the wearer quite effectively. Silk serge is primarily used as a lining, because it is more fragile than wool serge. The soft texture of silk serge makes it very pleasant when worn against the skin, and the natural flexibility of the fabric makes it ideal for the often rumpled and highly stressed linings of things like coats and jackets. The raised diagonal pattern in the fabric tends to be very subtle, so the serge will not chafe. Many people associate serge with quality garments, because serge has classically been costly and of very high quality. The sturdiness of serge makes it appealing for things like military uniforms, while the range of weights and versatility of the fabric make it suitable for formal suits, great coats, and other fancy dress. When purchasing a garment made from serge, it pays to take the time to try the garment on and inspect it carefully. Good serge will last a lifetime, so the garment should be carefully fitted and inspected for flaws. It is also a good idea to go with a more classic cut, ensuring that the garment can be worn years in the future without looking dated. Serge is a fabric with a smooth hand that is created by a two-up, two-down twill weave. Serge is any smooth-faced cloth made with a two-up and two-down twill weave. See also Twill. / Серж – шерстяная костюмная ткань. Под Саржей, от Французского слова Serge, означающее Саржа, понимается . Под Саржей, от Латинского слова Sericus, означающее Шёлковый, понимается хлопчатобумажная или из химического волокна ткань с наклонными рубчиками на лицевой поверхности. Саржу употребляют для подкладок и тому подобного. Под Саржей, от Итальянского слова Sargia, Французского слова Serge, от Латинского слова Sericus, означающее Шёлковый, понимается:- (1) ткань саржевого переплетения нитей из натуральных или химических волокон; вырабатывается в основном гладкокрашеной и набивной. Используется как подкладочная, платьевая, техническая и тому подобная ткань. (2) Сокращённое название саржевого переплетения. Саржа, от Итальянского слова Sargia, от Французского слова Serge, от Латинского слова Sericus, означающее Шёлковый, понимается ткань саржевого переплетения нитей из натуральных или химических волокон; вырабатывается в основном гладкокрашеной и набивной. Используется как подкладочная, платьевая, техническая и тому подобная ткань.

SERGE WORSTED = САРЖА КАМВОЛЬНАЯ (или ХХ) – Serge Worsted:- unfinished worsted, wool, cotton, silk, rayon, and synthetics. A very distinct twill (2 up/2 down) which shows on both sides of the fabric. On the face, the distinct diagonal runs from the lower left to the upper right – piece dyed. Has a smooth, hard finish that wears exceptionally well but will shine with use. The shine cannot ne removed permanently. It is a good cloth in tailoring as it drapes and clings very well. Made in various weights. Unfinished worsted and wool are not quite as clear on the surface. French Sere is made of very fine soft yarns and has a very fine twill. It is used for dresses or very soft suits.

SERGING = ОБВЯЗЫВАНИЕ – Serging:- an overcasting technique done on the cut edge of a fabric to prevent raveling. Serging is:- (1) overcasting the cut edge of a fabric to prevent raveling. (2) Finishing the edge of a carpet by oversewing rather than binding. Generally, the sides of a carpet are serged and the ends bound.

SERIAL BOND = ПЕРИОДИЧЕСКАЯ ОБЛИГАЦИЯ (или СЕРИЙНАЯ ОБЛИГАЦИЯ) – Serial Bond is an issue that matures in part at periodic stated intervals. / Выпуск, который погашается частями по окончании указанных интервалов или временных периодов.

SERIAL EXPIRATION = ПЕРИОДИЧЕСКОЕ ПРЕКРАЩЕНИЕ ПРИЗНАНИЯ (или СЕРИЙНОЕ ПРЕКРАЩЕНИЕ ПРИЗНАНИЯ) – Serial Expiration:- options on the same underlying futures contract which expire in more than one month. For example, NYMEX® Division platinum options have serial expiration.

SERIAL LOANS = СЕРИЙНЫЕ ЗАЙМЫ (или ПОРЯДКОВЫЕ ЗАЙМЫ) – Serial Loans are the bond issues placed on the market in succession. / Выпуски облигаций, подряд размещённые на рынке.

SERIAL NUMBER = СЕРИЙНЫЙ НОМЕР – (1) Serial Number is a number assigned to a single item in order to identify and differentiate it from others.

(2) In the US patent law, a Serial Number is a number assigned to a patent application when it is filed. A serial number is usually used together with a two digit series code to distinguish between applications filed at different times.

SERIAL OPTIONS = ПЕРИОДИЧЕСКИЕ ОПЦИОНЫ (или СЕРИЙНЫЕ ОПЦИОНЫ) – In additional to regular option listings for the corresponding underlying futures month some ICE Futures US® (former NYBOT®) markets also list Serial Options. Serial options are short-life options designed to offer additional trading opportunities by having options expire monthly. The underlying futures contract for serial option is the next expiring futures contract. See also Flexible Options. / НАЙБЭТ® (NYBOT®). Смотрите также Гибкие Опционы (Flexible Options).

SERICEOUS = СЕРИЦИНОВОЕ (или ШЕЛКОВИСТОЕ, или ШЁЛКОВОЕ) – Sericeous:- silky. / Покрытое шелковистыми волосками. Под Серициновым, от Латинского слова Sericum, означающее Шёлк, понимается .

SERICIN = СЕРИЦИН – Sericin (also called Silk Gum) is a sticky protein material that coats the fiber filaments as they are extruded from the silkworm's spinnerets. This gum bonds the filaments of silk together and aids in the formation of the cocoon. Sericin or Silk Gum is the gummy material holding the silk filaments together. Sericin is a Silk gum. The gelatinous protein that cements the fibroin filaments in a silk fiber. It is removed in the process called Degumming. / Под Серицином, $C_{15}H_{25}N_5O_8$, от Латинского слова Sericum, означающее Шёлк, понимается белок, составляющий вместе с фиброином всю массу натурального шёлка-сырца.

SERICULTURE = СЕРИКУЛЬТУРА (или СЕРИЦИКУЛЬТУРА) – Sericulture is the raising of silkworms and production of silk. / Под Серикультурой или Серицикультурой, от Латинских слов Sericum, означающее Шёлк, и Cultura, означающее Культура или Обработка, понимается разведение тутовых деревьев и шелковичных червей, шелководство.

SERIES = СЕРИИ – (1) Series:- the designation assigned to multiple issues of preferred stock or multiple classes of common stock issued by the same corporation, such as Series A. Shares with similar characteristics, such as voting rights, par values, or dividend yields. / Под Серией, от Латинского слова Series, означающее Ряд, понимаются:- (i) группа или ряд предметов, однородных или обладающих общим признаком; или (ii) разряд, категория ценных бумаг (например, серия облигаций), документов (например, серия паспорта), обозначаемых цифрами.

(2) Series are all options of the same class (i.e. either puts or calls, but not both), covering the same underlying futures contract or other underlying instrument, having the same strike price and expiration date. Options of the same class, strike price, and maturity. Also called Option Series or Series Of Options. In relation to exchange traded options (ETOs), a series is all contracts of the same class having the same expiry date and the same exercise price. Series are the all options of the same class which share a common strike price. / , то есть . Серии – опционные контракты одного класса, имеющие одинаковую дату и цену исполнения.

SERIES A = СЕРИИ А – A term Series A usually refers to a class of shares subscribed for by venture capitalists. These shares usually carry specified privileges and attributes required by professional venture investors.

SERRATED = ПИЛЬЧАТОЕ (или ПИЛОВИДНОЕ) – Serrated:- bearing straight-sided teeth. Hence Serrate – with edges like a saw blade. Serrated:- saw-toothed. / С мелкими пиловидными рубчиками. с краями как у лезвия пилы.

SERRATE LEAF = ПИЛЬЧАТЫЙ ЛИСТ – Serrate Leaf has little bent teeth like those of a saw. / Пильчатые:- простые не расчленённые листья разделяются по краю листовой пластинки на пильчатые – похож на зубчатый, но острые зубцы наклонены в одну сторону, к верхушке листа.

SERRATIONS = ЗАЗУБРИНЫ (или ЗУБЧАТОСТИ) – Serrations:- the outer or epidermal scaly edges on the wool fiber which can be seen under a microscope. Usually the finer the wool the greater the number of serrations. Serrations assist in felting by interlocking.

SERVED YARN = XX ПРЯЖА – Served Yarn:- in aerospace textiles, a reinforcing yarn such as graphite or glass around which two different yarns are wound, i.e. one in the Z direction and one in the S direction, etc, for protection or compaction of the yarn bundle.

SERVER = СЕРВЕР (или ГЛАВНЫЙ УПРАВЛЯЮЩИЙ КОМПЬЮТЕР В ЛОКАЛЬНОЙ СЕТИ) – Server is a computer program that provides services to other computer programs in the same or other computers. Server is a computer that stores digital information to be 'served' to other computers or workstations through a network or dial-up access. / Компьютер, который сохраняет цифровую информацию, которая, в свою очередь, должна быть доступна другим компьютерам или рабочим станциям посредством рабочей сети или наборного доступа.

SERVICE = ОБСЛУЖИВАНИЕ – Service:- this expression refers to the punctual payment of an interest or capital debt relating to fixed-income securities. Service in this sense also covers redemption. Interest payments are mostly annual, sometimes semi-annual or made in one sum at the end of the maturity.

SERVICE = УСЛУГА (или СЛУЖБА) – Service:- the equipment and conductors that transmit electricity from the utility supply system to the building being served.

SERVICEABILITY LIMIT STATES = ПРЕДЕЛЬНЫЕ СОСТОЯНИЯ ЭКСПЛУАТАЦИОННОЙ НАДЁЖНОСТИ – Serviceability Limit States are those states which restrict the intended use and occupancy of the structure including deflection, joint slip, vibration, and permanent deformation as applied in Limit States Design. / в Расчёте Предельных Состояний. В строительной механике под Предельным Состоянием называется состояние конструкции (сооружения), при котором она перестаёт удовлетворять эксплуатационным требованиям.

SERVICE AGREEMENT = СОГЛАШЕНИЕ ОБ ОКАЗАНИИ УСЛУГ (или СОГЛАШЕНИЕ ОБ ОБСЛУЖИВАНИИ) – Service Agreement:- private contracts between one or more carriers and one or more shippers to transport cargo between specified points under terms and conditions of carriage agreed and listed in the contract. It often allows for particular rates based on volume over a specified period of time. Also known as Service Contract. Service Agreement (in electricity) is the initial agreement and any supplements thereto entered into by the Transmission Customer and the Transmission Provider for service. / порядки и условия .

SERVICE CAP = СЕРВИСНАЯ ШЛЯПКА (или ПИЛОТКА) – Service Cap is a flat-topped visor cap worn as part of a military uniform. Compare Garrison Cap.

SERVICE CERTIFICATE = СВИДЕТЕЛЬСТВО ОБСЛУЖИВАНИЯ (или СЕРТИФИКАТ УСЛУГИ) – Service Certificate certifies that a public-private key pair is valid for a specific service.

SERVICE CHARGE = СБОР ЗА ОБСЛУЖИВАНИЕ (или СБОР ЗА УСЛУГИ) – Service Charge is a component of some finance charges, such as the fee for triggering an overdraft checking account into use. / Сбор За Обслуживание является компонентом некоторых финансовых сборов, таких как вознаграждение за возможность использования овердрафта по чековому счёту.

SERVICE COMPONENT = СЛУЖЕБНЫЙ КОМПОНЕНТ – Service Component is a self contained business process or service with predetermined functionality that may be exposed through a business or technology interface. Service Component is a contractual component that would be a service contract if it were a separate contract.

SERVICE CONTRACT = КОНТРАКТ НА ОКАЗАНИЕ УСЛУГ (или КОНТРАКТ НА ОБСЛУЖИВАНИЕ) – As provided in the Shipping Act of 1984, Service Contract is a contract between a shipper (or a shipper's association) and an ocean common carrier (or conference) in which the shipper makes a commitment to provide a certain minimum quantity of cargo or freight revenue over a fixed time period, and the ocean common carrier or conference commits to a certain rate or rate schedule as well as a defined service level (such as assured space, transit time, port rotation or similar service features). The contract may also specify provisions in the event of nonperformance on the part of either party.

SERVICE CONTRACT = КОНТРАКТ НА СЛУЖБУ – Service Contract is the contractual agreement governing the performance by a reporting entity of an agreed task over an agreed period of time. / Контрактное соглашение, обязывающее исполнение подотчётным лицом оговорённого задания в течение оговорённого периода времени.

SERVICE EQUIPMENT = СЕРВИСНОЕ ОБОРУДОВАНИЕ – Service Equipment:- the circuit breaker or fused switch located near where the service conductors enter the building which is intended as the primary means of disconnecting the supply. / (1) Аппаратура Абонентского Ввода – главный выключатель и предохранители абонентской установки. (2) Абонентское Оборудование.

SERVICE MARK = ЗНАК ОБСЛУЖИВАНИЯ – Trademarks and Service Marks are primarily intended to indicate the source of goods and services and to distinguish those goods and services from those of others. They also symbolize the quality of the goods or services with which they are used. Most trademarks and service marks (called Marks) are words, but they can be almost anything that can distinguish one product or service from another, such as symbols, logos, sounds, designs or even distinctive nonfunctional product configurations. While virtually all countries recognize and offer protection for trademarks, many but not all countries recognize and protect service marks. In some countries, protection for a mark is acquired by using the mark on goods or services. In other countries, the owner must register the mark with the national trademark office before protection in that country is granted. The duration of protection afforded a mark varies greatly from country to country. Registrations are issued for finite periods of time. However, because of the fundamental purposes of these marks – namely avoiding public confusion, encouraging competition and protecting the owners' goodwill – registrations may be renewed and thus extend indefinitely as long as the marks are used. The owner of a mark may preclude others from using a similar mark if such use is likely to cause confusion in the minds of purchasers. Determining whether two marks are so similar as to be confusing usually involves a multi-factor analysis that compares the parties' marks, their goods or services, their advertising and trade channels, the defendant's intent in choosing its mark, and the presence or absence of actual confusion. As with all intellectual property, trademark and service mark laws are national in origin. Some countries grant rights to the first person to use the mark in the course of business, while other countries grant rights to the first person to obtain a registration in that country. In 'first-to-use' countries, rights may subsist without registering the mark with the national trademark office. However, registration is still desirable because it is presumptive evidence of the validity of the mark and the owner's right to use the mark. It also appears on the national register of marks providing notice to the world of the owner's use and claim of ownership. Some countries require that the mark be used in commerce prior to the issuance of a registration, while other countries permit registration based on the intent of the applicant to use the mark in the future. Following the use or registration of a trademark, the owner must use the mark or it may become subject to attack by others on the ground that the owner has abandoned it. At a minimum, most countries require that a mark be distinctive, i.e. capable of distinguishing the goods or services of the owner of the mark from the goods or services of others. To determine whether a mark meets this test, one must determine the 'strength' of the mark. A mark's strength is usually measured across a spectrum. This spectrum includes, from weakest to strongest, terms that are generic, descriptive, suggestive, arbitrary and fanciful. At the weakest end of the spectrum lie words, symbols or devices that are not capable of distinguishing goods because they are common terms used to identify the goods themselves, e.g., book, table, chair. Such terms are called Generic Terms and are not protectable as trademarks. The next category is comprised of descriptive terms. A mark is descriptive if it describes the intended purpose, function, physical characteristic, laudatory quality or end use of the product. Examples of descriptive marks include SAVMOTOR for an engine oil additive intended to prolong the life of an automobile engine, MICRO for wheel weights that are very small, and SUPREME for wine allegedly of superior quality. Because they are not inherently distinctive, a desriptive term cannot be protectable as a mark until, through extensive sales and advertising, the term has come to identify the source of the goods bearing the mark. In the United States, when a descriptive mark achieves this level of distinctiveness, it is said to have acquired a 'secondary meaning'. In contrast to descriptive marks, suggestive marks do not immediately describe the goods with which the mark is used, but rather require thought, imagination or perception to reach a conclusion about the nature of the goods. Suggestive marks are considered inherently distinctive and protectable without first acquiring secondary meaning. Examples of suggestive marks may include HERO for hire extinguishers or GREYHOUND (Greyhound Lines, Inc.) for bus transportation services. Arbitrary marks are words, symbols, and devices that are in common use but, when used on the goods of the trademark owner, neither describe nor suggest the quality of those goods. Examples of arbitrary marks include ARROW (Arrow Liqueurs Corporation) for liqueurs, APPLE (Apple Computer, Inc.) for computers, and CAMEL (R.J. Reynolds Tobacco) for cigarettes. Like suggestive marks, arbitrary marks are inherently distinctive and secondary meaning need not be proven. The most distinctive marks are fanciful marks. A fanciful mark is a 'coined' word or symbol invented or selected for the sole purpose of functioning as a mark. Examples of fanciful marks include EXXON (Exxon Mobil Corporation) for gasoline, KODAK (Eastman Kodak Company) for photographic supplies, XEROX (Xerox Corporation) for photocopying equipment, and CLOROX (The Clorox Company) for bleach. Fanciful marks are traditionally afforded the greatest scope of protection. See also Trade Mark. Service Mark is a word, name, symbol or device that is to indicate the source of the services and to distinguish them from the services of others. A service mark is the same as a trademark except that it identifies and distinguishes the source of a service rather than a product. The terms Ttrademark and Mark are often used to refer to both trademarks and service marks. / Термины Товарный Знак и Знак часто используются при упоминании как товарных знаков, так и знаков обслуживания. , то есть . , например, . СЭВМОТОР (SAVMOTOR) для , МАЙКРО или МИКРО (MICRO) для , и СЮПРЭМЭ (SUPREME). ХИРО (HERO) для hire extinguishers или ГРЭЙХАУНД (Грэйхаунд Лайнз, Инк.; GREYHOUND (Greyhound Lines, Inc.)) для услуг автобусных перевозок. ЭРОУ (Эроу Ликьёз Корпорэйшэн; ARROW (Arrow Liqueurs Corporation)) для ликёров, ЭПЛ (Эпл Компьютё, Инк.; APPLE (Apple Computer, Inc.)) для компьютеров, и КЭМЭЛ (Ар.Дьжей. Рэйнолдз Тобэко; CAMEL (R.J. Reynolds Tobacco)) для сигарет. ЭКСАН (Эксан Мобл Корпорэйшэн; EXXON (Exxon Mobil Corporation)) для бензина (газолина), КОДАК (Истмэн Кодак Кампэни; KODAK (Eastman Kodak Company)) для фотографических предложений, ЗИРОКС (Зирокс Корпорэйшэн; XEROX (Xerox Corporation)) для фотокопирующего оборудования, и КЛОРОКС (Зэ Клорокс Кампэни; CLOROX (The Clorox Company)). Знак Обслуживания предназначен, главным образом, для указания источника и качества услуг, а также их отличия от аналогичных услуг иных компаний. Обычно под знаком обслуживания предполагается какое-то слово, но кроме этого также могут быть использованы символы, лого, дизайны, звуки и тому подобное. Под Знаком Обслуживания понимается знак, которым предприятия, предоставляющие различные виды услуг, пользуются для индивидуализации своей деятельности, например, фирменные бланки, пакеты, этикетки и так далее. Сходные или Суггестивные Знаки (Suggestive Marks).

SERVICE REFERENCE MODEL = МОДЕЛЬ СПРАВКИ ПО УСЛУГАМ – Service Reference Model (SRM):- also known as a Service Component Reference Model is a business and performance-driven, functional framework that classifies Service Components with

respect to how they support business and/or performance objectives; structured across horizontal and vertical service domains that, independent of the business functions, can provide a leverage-able foundation to support the reuse of applications, application capabilities, components, and business services.

SERVICES = УСЛУГИ – Services are the activities provided to accommodate the needs of an individual or group, and not involving the transfer of ownership of a material good. See also Goods And Services. Something provided, usually for a fee, that may not be classed as manufacturing or production in any form; such as agency services, brokerage, legal advice, etc.

SERVICIO DE LIQUIDACIÓN DEL BANCO DE ESPAÑA = СЭРВИСИО ДЭ ЛИКИДАСЬЁН ДЭЛЬ БАНКО ДЭ ЭСПАНЬА (или СЛУЖБА ЛИКВИДАЦИИ ПРИ БАНКЕ ИСПАНИИ) – Servicio de Liquidación del Banco de España (SLBE) is the Banco de España Settlement Service. Spain used to have three payment systems:- two for large value and one for small payments. The large value payment systems were:- the Gross Settlement System of Spain (Servicio de Liquidación del Banco de España – SLBE) managed by the central bank, and the Interbank Payment System (Servicio Español de Pagos Interbancario – SEPI). The SEPI was a private clearing house for large value payments in Euros, domestic and cross border, managed by the Servicio de Pagos Interbancarios (SPI). Small value payments were processed through the National Electronic Clearing System (Sistema Nacional de Compensación Electrónica – SNCE), managed by the Banco de España (BE). A reform of the payment system was introduced in December 2004. The SPI was reorganized and legally transformed into a new private company called Sociedad Española de Sistemas de Pago, SA (SESP) and its functions as a large value payment system manager were eliminated (thus the SLBE is the only large value payment system). The SNCE is no longer managed by the central bank. The SESP is in charge of the management of the SNCE, and is overseen by the BE who approves the rules of the system. Servicio de Liquidación del Banco de España (SLBE) is Spain's Real-Time Gross Settlement (RTGS) system. There is one large-value interbank payment system:- the Servicio de Liquidación del Banco de España (SLBE). It is the only systemically important payment system, given the high individual value payments it handles and that it is used for the settlement of the transactions of all relevant systems, like the stock exchange and the low-value payment system. The SLBE is a Real-Time Gross Settlement (RTGS) system owned, operated, and controlled by the BE. It is the Spanish component of the TARGET, and settles both domestic and cross-border operations. It was created in 1997 with the transformation of the Servicio Telefónico del Mercado de Dinero (STMD). The SLBE is one of the payment systems legally recognized by the Settlement Finality Law. Therefore, payment orders processed by this system are irrevocable and have finality, there is not retroactivity in case of insolvency ('zero hour') and the BE has rights over the collateral pledged in the system in case of default. The BE regulates the SLBE through circulars, technical applications (Aplicaciones Técnicas), and communications. Circulars are published in the Official Gazette (Boletín Oficial del Estado) and at Banco de España's website. / или, как это звучит на Испанском языке по месту расположения, Сэрвисио дэ Ликидасьён дэль Банко дэ Эспанья (Эс.Эль.Бэ.Э.; Servicio de Liquidación del Banco de España (SLBE)) является Испанской системой Валовых Расчётов в Режиме Реального Времени (ВРРРВ). ТАСВРРУП (Трансевропейская Автоматизированная Система Валовых Расчётов в Режиме Реального Времени по Ускоренным Переводам) или ТАСВРРЭП (Трансевропейская Автоматизированная Система Валовых Расчётов в Режиме Реального Времени по Экспресс Переводам). коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо). Сосьедад Эспаньола дэ Систэмас дэ Паго, Эсэ.А. (Эсэ.Э.Эсэ.Пэ.; Sociedad Española de Sistemas de Pago, SA (SESP)). Апликасьён Текника (Aplicaciones Técnicas). Болетин Офисиаль дэль Эстадо (Boletín Oficial del Estado).

SERVITUDE = СЕРВИТУТ – Servitude is an obligation on the owner of real property to render a specified service, such as maintaining a road through the property. / Обязательство владельца недвижимости оказывать определённую услугу, такую как содержание дороги, проходящей через это владение. Начиная с Римского, затем в феодальном и буржуазном праве под Сервитутом, от Латинского слова Servitus, означающее Подчинённость или Рабство, понимается ограниченное право пользования чужим имуществом, например, право прохода по земельному участку соседа.

SERVOVALVE = СЕРВОКЛАПАН – Servovalve is a valve which modulates output as a function of an input command. See also Valve.

SES = STANDARD EVALUATION SYSTEM FOR RICE

SESSILE = СИДЯЧЕЕ (или БЕСЧЕРЕШКОВОЕ) – Sessile:- resting on a main stem or branch without an intervening stalk. Sessile:- stalkless, immobile, e.g., of a flower with no stalk but attached directly to the stem. Sessile (or Unstalked) Leaves do not possess a petiole. The blade expands itself directly from the stem. / Сидячее:- бесчерешковое, . Листья с черешками – черешковые, без черешка – сидячие (Одуванчик, Алоэ, Гвоздика). У некоторых сидячих листьев основание листа разрастается и охватывает стебель, который как бы вкладывается (влагается) в лист. Такой лист называется влагалищным (Пшеница, Рожь).

SESTA = STOCK EXCHANGE AND SECURITIES TRADING ACT

SET = SECURITIES EXCHANGE OF THAILAND

SETACEOUS = ЩЕТИНИСТОЕ (или ЩЕТИНКОВИДНОЕ) – Setaceous:- bearing bristles. / :- покрытое щетинками.

SET–IN POCKETS = ОБРАБОТАННЫЕ ПО ПОЛОЧКЕ (или ЗАКРЕПЛЁННЫЕ) КАРМАНЫ – Set-In Pockets or Slash Pockets are the pockets made by cutting an opening in the garment and stitching the pocket to the inside of the garment so only the opening is visible. / или Прорезные Карманы (Slash Pockets) .

SET MARK = ОТМЕТИНА ОТ ПУСКА В ХОД (или ОТМЕТИНА ОТ ПЕРЕЗАПРАВКИ, или НЕДОСЕКА) – Set Mark is a fabric defect consisting of narrow bars or bands across the full width of the fabric that may appear either as a tight, loose, or corduroy effect caused by loom stops improperly reset by the weaver. Set marks are sometimes caused by the weaver ripping out filling yarn and then not properly adjusting the pick wheel to obtain the proper relation between the fell of the cloth and the reed. Fabrics defect. Set Marks (Start-Ups):- narrow fillingwise bands where there are more than the normal number of picks per inch. Set Mark:- defect in woven fabric resulting from prolonged loom stoppage. Because of the humid weather and the fine dust present in the atmosphere, the cloth exposed shall get slightly different color and also some relaxation takes place. A combined effect gives a line in weft direction. Set Mark is a stop mark resulting from a prolonged loom shutdown. Set Mark or Starting Place or Start-Up Place:- a prominent band of greater or lower weft density that has a clearly defined beginning and which gradually merges away to normal fabric. This defect is caused by restarting a loom without sufficient care on the part of the weaver, or after standing. / уточина. Недосека; Отправная Точка; Место Запуска (set mark; starting place; start-up place):- порок утка в виде полосы на всю ширину ткани из-за пониженной плотности ткани по утку. Примечание:- этот порок вызывается неправильным перезапуском ткацкого станка ткачом или запуском станка после простоя. Недосека с разрежением плотности свыше двух до четырёх нитей в 1 см. Размер порока – за каждое место. Под Недосеками понимается дефект суровой ткани в виде поперечных полос с пониженным числом уточных нитей на 1 дм ткани, причина разладка основного регулятора или товарного механизма. Недосечка – поперечные полосы по всей ширине ткани, возникающие из-за пониженной плотности ткани по утку.

SET–OFF = ВОЗМЕЩЕНИЕ (или КОМПЕНСАЦИЯ) – Set-Off is a method of cancelling or offsetting reciprocal obligations and claims (or the discharge of reciprocal obligations up to the amount of the smaller obligations). Set-off can operate by force of law or pursuant to a contract.

SETOSE = ЩЕТИНИСТОЕ (или ПОКРЫТОЕ ЩЕТИНОЙ) – Setose:- terminating gradually in a fine sharp bristle.

SET POINT = ЗАДАННОЕ ЗНАЧЕНИЕ – Set Point is an input in process control that defines the desired value or range of values of the variable that is being controlled.

(2) Set Point is a specific temperature that a refrigerated container has been set to keep. Ideally, the set point and the actual temperature should be identical throughout the voyage.

SETT = ПЛОТНОСТЬ – Sett is a term used to define the weft or warp density of a woven fabric, usually in terms of a number of threads per inch. / В текстильной промышленности под Плотностью понимается термин для определения плотности сотканной ткани по основе и утку, обычно в порядке числа нитей на дюйм.

SET THE COURSE = ЗАДАВАТЬ КУРС (или БРАТЬ КУРС, или ПРОКЛАДЫВАТЬ КУРС) – Set The Course (maritime term):- to give the steersman the desired course to be steered.

SETTING THE TWIST = УСТАНАВЛИВАНИЕ КРУЧЕНИЯ (или УСТАНОВКА КРУЧЕНИЯ) – Setting The Twist:- after you have plyed your wool, you need to set the twist. There are several approaches to this. One school of thought says that you wash your yarn and then dry it under tension. This approach is fairly popular with weavers. Another approach says that you wash your yarn and don't dry it under tension. This approach is more popular with knitters. Yet another approach, promoted by Judith MacKenzie, says, really shock your wool and let it do what it's going to do. This is done by washing in alternating hot and cold baths. / Устанавливание Кручения.

SETTLE = ОСЕДАТЬ (или САДИТЬСЯ, или ПОГРУЖАТЬСЯ) – Settle (maritime term):- to lower, sink deeper.

SETTLE = РАСЧЁТНАЯ – Settle:- amounts and terms of payment. See also Settlement Price. Settle Price is an average of the trading prices in the futures market during the last few minutes of trading. Settle Price is the last price for an option or futures transaction on a derivatives exchange in a given trading day. It is calculated by averaging the last bid and offer, the final sale price, and a weighted average of the transaction prices over the last few minutes of trading. Clearing houses use the settle price to determine whether or not margin accounts and other accounts are current. It is also called a Settlement Price. / Смотрите также Расчётная Цена (Settlement Price).

SETTLEMENT = РАСЧЁТ – (1) Settlement:- the actual fulfillment of the payment order, i.e. the remittance of the payment from the dispatching bank to the recipient bank. This remittance is carried out via a central partner. It has a debt liberating effect on the payment creditor. In banking, the process of recording the debit and credit positions of two parties in a transfer of funds. Also, the delivery of securities by a seller and the payment by the buyer. / , то есть перечисление платежа из .

(2) Settlement is an act of paying in full for goods or services received, or of repaying a debt. / Действие, выражающееся в полной оплате полученных товаров или услуг, или полной оплате долгового обязательства.

(3) Settlement is an act that discharges obligations in respect of funds or securities transfers between two or more parties. The completion of a securities transaction between participants. A trade has settled when the participants discharge their contractual obligations and exchange funds for securities. The process by which a trade is entered into the books and records of the counterparts to a transaction. The settlement of currency trades may or may not involve the actual physical exchange of one currency for another. The act of fulfilling the delivery requirements of the futures contract. Conclusion of a securities transaction when a customer pays a broker/dealer for securities purchased or delivers securities sold and receives from the broker the proceeds of a sale. See also Cash Sale, and Regular Way Delivery.

(4) A Settlement is an execution of a financial transaction, in particular a forward contract. A distinction is made between cash settlement (settlement by cash payment of the difference between the strike price and the market price of the underlying asset) and physical settlement (delivery of the underlying asset).

SETTLEMENT ACCOUNT = РАСЧЁТНЫЙ СЧЁТ – Settlement Account is any account you wish to have funds settled into at the end of the transaction. Settlement accounts should be used to account for differences in the time of recording of (1) purchase or sale of financial assets, on the trade dates when change of ownership occur and (2) the subsequent payments for the financial assets on the settlement dates. A Settlement accounts within other accounts payable should show a corporation's obligations for payments on future settlement dates for assets that were purchased on trade dates. An account which is only used for TARGET/RTGS (Trans-European Automated Real-time Gross settlement Express Transfer/Real-Time Gross Settlement) payments. / Счёт, который используется только для платежей в системе /ВРРРВ (Валовых Расчётов в Режиме Реального Времени). ТАСВРРУП (Трансевропейская Автоматизированная Система Валовых Расчётов в Режиме Реального Времени по Ускоренным Переводам) или ТАСВРРЭП (Трансевропейская Автоматизированная Система Валовых Расчётов в Режиме Реального Времени по Экспресс Переводам).

SETTLEMENT BANK = РАСЧЁТНЫЙ БАНК – Settlement Bank is the entity that maintains cash accounts used to settle payment obligations associated with securities transactions. The settlement bank may be either a commercial bank, the settlement system itself, or a central bank.

SETTLEMENT CURRENCY = ВАЛЮТА РАСЧЁТА – In the insurance, Settlement Currency is a currency in which a premium or claim is settled. Depending on the circumstances, this could be any of the, so called, 'Hard' Currencies, i.e. Sterling, USD or CAD. / В страховании, под Валютой Расчёта понимается валюта, в которой рассчитывается премия или претензия. В зависимости от обстоятельств, она может быть любой из так называемых 'твёрдых' валют, то есть Фунт Стерлингов (Sterling или GBP) Соединённого Королевства, Доллар США (USD) или Канадский Доллар (CAD).

SETTLEMENT CYCLE = РАСЧЁТНЫЙ ЦИКЛ – The Settlement Cycle is an amount of time that elapses between the trade date (T) and the settlement date. Typically measured relative to the trade date. For example, in a T + 3 settlement cycle settlement occurs on the third business day following the trade date. / Временной интервал, длящийся между датой сделки (Т) и датой расчёта. Типично оценивает некую увязку с датой сделки. Например, в расчётном цикле Т + 3 расчёт осуществляется на третий рабочий день, следующий за датой сделки.

SETTLEMENT DATE = ДАТА РАСЧЁТА – The Settlement Date is a date by which an executed trade order must settle or fail, or the date that the parties to a securities transaction agree that settlement is to take place. See also Contractual Settlement. The date on which a contract is scheduled for delivery and payment. Spot settlement in the bullion market is two days after the bargain has been

struck. Prespecified days (towards the end of the month) on which the forward and futures transactions concluded previously are paid and delivery is made on the exchanges (liquidation date). Settlement Date is the date on which a contract must be fully paid for and delivered. It is the general practice in international precious metals markets for settlement to take place two business days after the transaction date, i.e. spot.

SETTLEMENT DAY = РАСЧЁТНЫЙ ДЕНЬ – Settlement Day is a specified day in the stock exchange calendar which occurred at the end of the two week accounting period when the accounts were settled. With the introduction of the rolling settlement system, this no longer exists. Also known as Declaration Day, and Reference Day.

(1) In financial statements, Settlement Day is a cut-off date. / В случае с финансовыми отчётами – крайняя дата подачи отчёта.

(2) In exchange trading, Settlement Day is the day on which liabilities arising from forward transactions have to be settled. / В биржевой торговле, день, когда, обязательства, вытекающие из заключённых срочных сделок, должны быть исполнены или зачтены.

(3) In dividend distributions, Settlement Day is the day on which shareholders become entitled to a dividend. / В распределении дивидендов, день, начиная с которого учредители могут получить дивиденды.

SETTLEMENT INSTITUTION = РАСЧЁТНОЕ УЧРЕЖДЕНИЕ (или РАСЧЁТНЫЙ ИНСТИТУТ) – In banking, Settlement Institution is a financial institution through which reimbursement is (to be) effected. / В банковском обслуживании, под Расчётным Учреждением или Расчётным Институтом понимается финансовое учреждение (заведение), через которое производится или должно производиться рамбурсирование (или возмещение, или выплата).

SETTLEMENT MANAGER = УПРАВЛЯЮЩИЙ РАСЧЁТАМИ – Settlement Manager:- a function assumed by a person or persons in each real-time gross settlement (RTGS) system participating in TARGET/EPM (Trans-European Automated Real-time Gross settlement Express Transfer/European Central Bank Payment Mechanism) who has/have overall responsibility for all decisions relating to TARGET day-to-day operation and management within the system concerned. / в каждой системе валовых расчётов в режиме реального времени (ВРРРВ) . ТАСВРРУП (Трансевропейская Автоматизированная Система Валовых Расчётов в Режиме Реального Времени по Ускоренным Переводам) или ТАСВРРЭП (Трансевропейская Автоматизированная Система Валовых Расчётов в Режиме Реального Времени по Экспресс Переводам).

SETTLEMENT PRICE = РАСЧЁТНАЯ ЦЕНА – In futures markets, Settlement Price is the price that is set by the exchange committee at the end of each trading day and which is used by the clearing house to market open positions and assess margin calls. Settlement Price is the daily price at which the Clearing House settles a trade. Settlement prices are used to determine account values, margin calls, and invoice prices for deliveries. It is also called the Clearing Price. Contract settlements are based on the weighted average of trades during the closing range so the settlement and last trade usually will not be identical. The daily price at which the clearing organization clears all trades and settles all accounts between clearing members of each contract month. Settlement prices are used to determine both margin calls and invoice prices for delivery. The term also refers to a price established by the exchange to even up positions which may not be able to be liquidated in regular trading. In futures and options trading, a Settlement Price is the price used to calculate the contract value determined by the stock exchange at the end of each trading day. Settlement Price is the price established by the exchange settlement committee at the close of each trading session as the official price to be used by the clearing house in determining net gains or losses, margin requirements, and the next day's price limits. The term 'Settlement Price' is often used as an approximate equivalent to the term 'Closing Price'. The close in futures trading refers to a brief period at the end of the day, during which transactions frequently take place quickly and at a range of prices immediately before the bell. Therefore, there frequently is no one closing price, but a range of prices. The settlement price is derived by calculating the weighted average of prices during that period. The official closing price of a futures contract for the session, although not necessarily the last trade. In addition to margin purposes and account valuation, the settlement price is used in most technical studies as the key price level with which to base indicators on. Also known as Settling Price. The last daily price of an asset as determined by the exchange on any day for the purpose of meeting margin requirements on such day. At this price the clearing house each day clears all trades and settles all accounts between clearing members for each open position in each contract month of each futures and options contract. It is based on the closing range of that day's trading by averaging those prices and is the basis for open trade equity, margin calls and (if applicable) the next day's price limits. Settlement prices are used also to determine invoice prices for deliveries. Also known as Settle Price, or Closing Price. Settlement Price is the market price of a future at the end of each trading day. Settlement Price is the daily price at which a clearing house clears all trades. It is based on the closing range of that day's trading and is the basis for both margin calls and (if applicable) the next day's price limits. Settlement Price is the midpoint of the closing price range. / Последняя посуточная цена актива, определяемая биржей в любой день с целью удовлетворения требований по марже для такого дня. По этой цене клиринговая палата каждый день просчитывает все сделки и выставляет счета клиринговым членам по каждой открытой позиции в каждом контрактном месяце каждого фьючерсного контракта или опциона. Она базируется на уровне закрытия состоявшейся дневной торговой сессии посредством усреднения имевших место цен и служит базисом для определения свободных торговых средств, маржинального требования, и (если это подходит) к ценовым ограничениям следующего дня. Известна также как Цена Расчёта (Settle Price) или Цена Закрытия (Closing Price). Расчётная Цена – показатель, рассчитываемый на основе диапазона цен при закрытии биржи и применяемый для определения прибылей, убытков, размеров дополнительных гарантийных депозитов, а также фактурных цен при поставке.

SETTLEMENT RISK = РАСЧЁТНЫЙ РИСК – Settlement Risk is the risk that the seller of a security or funds delivers its obligation but does not receive payment or that the buyer of a security or funds makes payment but does not receive delivery. In this event, the full principal value of the securities or funds transferred is at risk. Also known as Principal Risk. See also Credit Risk. Settlement Risk is a general term used to designate the risk that settlement in a transfer system will not take place as expected. This risk may comprise both credit and liquidity risk. The risk of failure of the settlement or clearing of financial transactions where the exchange of cash, securities or other assets is not simultaneous. The bank minimises settlement risk by:- (i) using established clearing centers; (ii) where possible settling transactions only once both parties have fulfilled their obligations (the delivery versus payment settlement mechanism); (iii) where possible requiring net settlement of payments on derivative financial instruments; (iv) using cash correspondent banks with the ability to stop payments at short notice; (v) in respect of foreign exchange transactions, ensuring where possible that these take place subject to setoff arrangements that would apply should a counterparty fail to deliver the counter-currency to such a transaction; and (vi) calculating and limiting the settlement risk on a counterparty basis. Settlement Risk is the risk that arises when payments are not exchanged simultaneously, generally arising due to time differences. One party to a transaction must effect payment or delivery in an earlier time zone without having confirmation of the receipt of a reciprocal asset in a later time zone.

SETTLEMENT SPREAD PRICE = КУРСОВАЯ РАЗНИЦА РАСЧЁТНЫХ ЦЕН (или СПРЭД НА РАСЧЁТНЫЕ ЦЕНЫ) – Settlement Spread Price shall mean the mathematical result of subtracting the settlement price of the second (2^{nd}) delivery month of the underlying

futures contract in the spread option from the settlement price of the first (1st) delivery month of the underlying futures contract in the spread option. / Расчётная разница в ценах должна означать математический результат вычитания расчётной цены соответствующего фьючерсного контракта со вторым (2-м) месяцем поставки, вовлечённого в данный опцион на курсовую разницу, из расчётной цены соответствующего фьючерсного контракта с первым (1-м) месяцем поставки, также вовлечённого в данный опцион на курсовую разницу.

SETTLING AGENT = АГЕНТ ПО УРЕГУЛИРОВАНИЮ РАСЧЁТОВ (или РАСЧЁТНЫЙ АГЕНТ) – Settling Agent is an insurance company's representative in a foreign country who is authorized to settle claims and make payment on behalf of the insurance company. An underwriter's overseas representative authorized to investigate and pay claims. / Агент по урегулированию расчётов (или расчётный агент) – представитель страховой компании в иностранном государстве, который уполномочен урегулировать расчёты по претензиям и производить платёж от имени страховой компании. Зарубежный представитель расписчика, уполномоченный проводить расследования и оплату по претензиям.

SETTLING TANK = ОТСТОЙНИК – Settling Tank is a tank in which liquid is stored until particles suspended in the liquid sink to the bottom. / Отстойники – резервуары или бассейны для выделения из жидкости взвешенных примесей осаждением их под действием силы тяжести при пониженной скорости потока (смотрите Отстаивание). Отстойники применяются для очистки воды в системах гидроузлов и ирригационных сооружений, водоснабжения, канализации, а также для очистки масел, бензина и тому подобного в машинах и технологических установках. Отстойники гидросиловых и ирригационных систем служат для предотвращения проникновения взвесей в турбины ГЭС и в оросительные каналы. На ГЭС и насосных станциях отстойники предохраняют лопасти гидротурбин и насосов от истирания их твёрдыми примесями (с размером частиц от 0.25 миллиметров (мм) и более), которое может привести к понижению коэффициента полезного действия (кпд) турбин и насосов. В ирригационных системах отстойники предохраняют каналы от заиления; в оросительную сеть с водой попадают только мелкие частицы, которые могут служить удобрением. Такие отстойники различают:- по характеру работы – непрерывного или периодического действия; по способу удаления наносов – с гидравлическим промывом, с механической очисткой и комбинированные; по числу камер – однокамерные и многокамерные. Скорость течения воды в камерах отстойников (в зависимости от характера и количества наносов) – от 0.25 до 0.5 метров в секунду (м/сек). Отстойники систем водоснабжения бывают горизонтальные, вертикальные и радиальные – в зависимости от направления основного потока воды в них. Горизонтальные отстойники применяют для удаления взвеси:- коагулированной – на водопроводных очистных станциях производительностью 30 000–50 000 кубических метров в сутки ($м^3$/сут) и некоагулированной – на станциях любой производительности. Удаление осадка из горизонтальных отстойников обычно осуществляется с помощью перфорированных коробов или труб, укладываемых по дну отстойников. Вертикальные отстойники служат для осаждения коагулированной взвеси на очистных станциях производительностью до 3 000 $м^3$/сут. Радиальные отстойники обычно применяют на крупных водоочистных станциях для предварительного осветления очень мутных вод (мутность более 2 грамма на литр (г/л)), а также для очистки воды в системах оборотного промышленного водоснабжения; они оборудуются скребковыми механизмами для непрерывного удаления выпавшей взвеси. Отстойники Очистных Сооружений (Канализационные):- по технологической схеме и принципам работы канализационные отстойники близки к водопроводным с некоторым усложнением вспомогательных устройств, обусловленным большим количеством осадка, выпадающего из сточной воды. Первичные отстойники служат для выделения взвесей на этапе механической очистки, вторичные – для отделения активного ила при биологической очистке. В качестве вторичных отстойников после Аэротенков обычно используются радиальные отстойники с илососами. Длительность пребывания сточных вод в отстойниках 1.5–2 часа (ч).

SETTLOR = УЧРЕДИТЕЛЬ ТРАСТА (или ДОВЕРИТЕЛЬ) – Settlor is the person who owns property conveyed to an estate. A testator makes a will, a declarant makes a living will, a settlor makes a trust. A person who makes a settlement or creates a trust of property. A person transferring assets to a Trust for valuable consideration is not a Settlor. That person only becomes a Settlor upon making a gift in reduction of the debt owed by the Trustees to that person. Anyone who gives something to the Trustees upon the terms of the Trust is a Settlor. This will include the original Settlor named in the Trust deed, but it will also include people who subsequently make gifts to the Trustees eg by forgiveness of debt owed by the Trustees. The person who creates a trust by donating property to be managed and administered by a trustee with the profits going to a beneficiary. Also known as Donor, Grantor, or Trustor.

SET UP RIGGING = ОБТЯГИВАТЬ ВТУГУЮ СНАСТИ – Set Up Rigging (maritime term):- to take in the slack and secure the standing rigging.

SET YARN = УСТАНОВОЧНАЯ ПРЯЖА – Set Yarn is a textured yarn that is heat relaxed to reduce torque. Set yarns are not stretch yarns. Set Yarns are the false-twist yarns stabilized to produce bulk.

SEVERABILITY = ВОЗМОЖНОСТЬ РАЗГРАНИЧЕНИЯ – Severability is a clause which provides that in the event that one or more provisions of the agreement are declared void or unenforceable the balance of the agreement remains in force. Such provisons may also be referred to as Separability Clauses.

SEVERAL LIABILITY = ДОЛЕВОЕ ОБЯЗАТЕЛЬСТВО – Several Liability:- at the Corporation of Lloyd's, each member underwrites for his own account and is liable accordingly for his share of all claims and expenses that are incurred by the syndicates in which he participates. / Корпорэйшэн оф Лойдз (Corporation of Lloyd's).

SEVERELY DAMAGED = ПОВРЕЖДЁННЫЕ В СЕРЬЁЗНОЙ СТЕПЕНИ (или СУЩЕСТВЕННО ПОВРЕЖДЁННЫЕ) – Kernels are considered to be Severely Damaged when:- (i) the kernel is severely shriveled or distorted due to weather, insect, fungal and/or other reason; and (ii) in Wheat, the cheeks and/or back of the kernel are ruptured. / Считается, что зерновка (ядра) были повреждены в серьёзной степени, если:- (i) зерно в серьёзной степени подвергалось сушке по причине погодного воздействия, воздействия насекомых, грибков и/или по иной причине; и (ii) в пшенице бока и/или задняя часть ядра имеют сколы.

SEVERELY SPROUTED KERNELS = СУЩЕСТВЕННО ПРОРОСШАЯ ЗЕРНОВКА (или СУЩЕСТВЕННО ПРОРОСШИЕ ЯДРА) – Kernels are considered Severely Sprouted Kernels when:- (i) sprouts extend beyond the normal contours of the germ; and (ii) kernels are severely degenerated as an apparent result of advanced sprouting.

SEVERE SLIDING = ЖЁСТКОЕ СКОЛЬЖЕНИЕ – Severe Sliding:- large ferrous particles which are produced by sliding contacts. Trend is important to determine whether abnormal wear is taking place. / ненормальный износ .

SEVERITY = ТЯЖЕСТЬ – Severity:- the intensity or extent of symptoms or the proportion of tissue with symptoms, on each plant or boll. The severity of leaf spot diseases may be expressed as the percentage of leaf area affected. Disease severity may also be described and assessed using an arbitrary scale, e.g., a scale of 0–5 where 0 = no symptoms, 1 = minor symptoms, 2 = obvious symptoms, 4 = severe symptoms and 5 = complete death.

SEWING–KNITTING MACHINE = ШВЕЙНО–ВЯЗАЛЬНАЯ МАШИНА – Sewing-Knitting Machine is the latest machine for making fabrics. In the best known of these, the malimo machine, the warp thread is placed on top of the filling thread and the two are stitched together with a third thread. / уточной нити и две .

SEWING PROCESS = ПРОЦЕСС ПОШИВА (или ПРОЦЕСС ШИТЬЯ) – Sewing Process:- the basic process of sewing involves fastening of fabrics, leather, furs or similar other flexible materials with the help of needle and threads. Sewing is mainly used to manufacture clothing and home furnishings. In fact, sewing is one of the important processes in apparel making. Most of such industrial sewing is done by industrial sewing machines. The cut pieces of a garment are generally tacked, or temporarily stitched at the initial stage. The complex parts of the machine then pierces thread through the layers of the cloth and interlocks the thread. Industrial Sewing:- although it seems to be a simple process, industrial sewing is quite a complex process involving many preparations and mathematical calculations for the perfect seam quality. Good quality sewing also depends on the sound technical knowledge that goes into pattern designing and making. Flat sheets of fabric having holes and slits into it can curve and fold in three-dimensional shapes in very complex ways that require a high level of skill and experience to manipulate into a smooth, wrinkle-free design. Aligning the patterns printed or woven into the fabric also complicates the design process. Once a clothing designer, with the help of his technical knowledge, makes the initial specifications and markers, the fabric can then be cut using templates and sewn by manual laborers or sewing machine. While handling the fabric and in the process of sewing, the cloth must be held stiff and unwrinkled. The seam quality is very sensitive to cloth tension that varies from time to time in the whole sewing process. These undesirable variations in the cloth tension affect the product quality. Therefore, there arises the need of strict control over the whole process. The work of sewing is focused on the handling of fabrics lying on the working table and guide them towards the sewing machines needle along the seam line. The attention is equally focused on the control of appropriate tensional force so as to maintain high quality seam. Pre Sewing Functions:- before the actual task of sewing begins, there are certain other tasks that have to be taken care of which can be termed as fabric handling functions:- Ply separation; Placing the fabric on working table; Guiding the fabric towards sewing needle; and tension control of fabric during the sewing process. While ply separation, stacks of fabric plies are sequentially positioned with the help of some feeding apparatus in an unloading position. The uppermost ply in such a stack is individually and sequentially separated from the stack. In the process, an edge of the separated fabric is presented between the jaws of a gripping device. A proximity switch determines the spacing between the gripper jaws. When this spacing confirms that only one fabric ply is in place between the jaws, the single ply is transferred over onto the receiving end of a conveyor for further processing. In aerodynamic technique, the uppermost ply of fabric is lifted by suction from the remainder of the stack. When the fabric is placed on the working table, the tasks that are performed before the sewing process include – recognizing the fabric's shape, edges that will be sewn, planning of the sewing process and identification of the seam line. Recognizing The Fabric's Shape:- the appropriate tensional force depends on the fabric properties. So the fabrics have to be identified into categories like knitted fabrics, woven fabrics etc. depending on their physical properties. Various shapes of the fabrics such as, convex, non-convex, with straight or curve edges, also have to be considered and each of them require different handling strategies. In brief, the sewing methods done by automatic systems require classification of fabrics into various categories and certain preliminary scheme of the path that the fabric must follow so as to produce the required stitches. Fabric Edges To Be Sewn:- there are two basic types of stitches:- one is that are for joining two parts of cloth together and the second one is done for decorative purposes. Sometimes, both types of stitching have to be done on some parts of cloth, for example, a pocket has to be joined on three sides with the apparel as well as it may be given some decorative stitches too. At what points and which type of stitching has to be done – all such information is stored digitally on automated devices through Computer-Aided Design (CAD) and accordingly sewn. Planning of Sewing Process:- sequence of seams to be stitched is determined before the sewing starts. Which part will be joined first, what stitches will follow one another, etc are decided. However, some stitches have to be necessarily done before or after another stitch. In the example above, the decorative stitches must be done first followed by the joining stitches. Embroidered patterns also follow the same sequence but sometimes in clothing items like hats, decorative stitches or embroidery is done after the production of hats and with the help of embroidery machine. Identification of Seam Lines:- sewing process is performed on seam lines situated inside the fabric edges, some millimeters inside the fabric's outer line. For the straight lines, the seam line is found by transferring the outer lines inside the fabrics and the intersection of these lines makes the vertices of the seam line. Therefore, the seam line is parallel to the outer edge and the distance between the two has to be determined as it is different for different parts of the cloth. This distance is greater for trousers legs than for a shirt sleeves. Seam allowance is the area between the edge of the fabric and the line of stitching. It is usually 1.5 cm away from the edge of the fabric. Seam allowance is usually 2.5 cm or more for standard home dressmaking. Industry seam allowances vary but they are usually 0.6 cm. Sewing Fabrics:- the sewing process consists of mainly three functions:- (i) guiding fabric towards needle; (ii) sewing of the fabric edge; and (iii) rotation around the needle. The fabric is guided along the sewing line with a certain speed that is in harmony with the speed of sewing machine. The orientation error is either manually monitored or if monitored automatically then error is fed to the machine controller so that the machine corrects the orientation of the fabrics. When one edge of seam line is sewed, the fabric is rotated around the needle till the next edge of the seam line coincides with the sewing line. The sewing process is thus repeated until all the edges of seam line planned for sewing, are sewed. Significant Aspects of Sewing:- there are certain aspects that have to be carefully considered while the sewing process as they are very crucial for high quality sewing. Thread Tension and Consumption:- correct balancing of the stitch and the tension given to the threads is very important for quality stitch formation. Thread consumption, which is closely associated with correct stitch geometry and thread tension, is usually measured by digital encoders. Presser-Foot Displacement and Compressing Force:- presser-foot is the part of the sewing machine that holds the fabric in place as it is being sewn and fed through by the feed dogs. The feeding system is one of the most important constituting systems of the sewing machine. If this system is not efficient then it results into irregular seams and many other defects, especially when running on high speed. To evaluate feeding efficiency, the force on the presser foot is measured with the help of electric or other sensors. Needle Penetration Force Measurement:- the interaction of needle with fabric is very crucial. Fault-free needle penetration depends chiefly on the properties of fabric and needle choice. Needle penetration force is one of the variables whose measurement is important for the analysis of quality problems or 'sewability testing' and also quality monitoring. It takes various factors into consideration, such as the needle geometry (including the point angle and point length of the needle), the friction between the needle and the fabric, the friction between the needle eye and the thread along with fabrics' property, and the sewing conditions.

SEWING THREAD = ШВЕЙНАЯ НИТКА – Sewing Thread is a fine yarn for stitching fabric. See also Thread.

SEX RATIO = СООТНОШЕНИЕ ПОЛОВ – Sex Ratio is the number of males in relation to the number of females.

SEXUAL = ПОЛОВОЕ (или СЕКСУАЛЬНОЕ) – Sexual:- of reproduction through the merging of male and female gametes to form a zygote which develops into a new plant. / Под Половым Размножением понимается способ размножения, при котором новая особь развивается обычно из зиготы, образующейся в результате слияния женских и мужских половых клеток (оплодотворения). Характерно для всех эукариот, не установлено у прокариот. К половому размножению относят и Партеногенез.

SEXUAL DIMORPHISM = ПОЛОВОЙ ДИМОРФИЗМ – Sexual Dimorphism is a condition wherein the male and female adult Insects differ in appearance, as in Yellow Stem Borers.

SEXUAL REPRODUCTION = ПОЛОВОЕ РАЗМНОЖЕНИЕ – Sexual Reproduction is a reproduction involving the union of two compatible gametes. / Под Половым Размножением понимается способ размножения, при котором новая особь развивается обычно из зиготы, образующейся в результате слияния женских и мужских половых клеток (оплодотворения). Характерно для всех эйкариот, не установлено у прокариот. К половому размножению относят и партеногенез.

SEYDEL CONVERTER = ЗАЙДЭЛЬСКИЙ ПРЕОБРАЗОВАТЕЛЬ – Seydel Converter is a tow-to-top processing equipment. Seydel combines the prestretching and breaking process in one machine. Seydel Maschinenfabrik GmbH (Bielefeld, Germany). / Зайдэль Машиненфабрик Ге.эм.бе.Ха. (Биэлефэльд, Германия).

Индэстриз Инк. (JPS Industries Inc.).

SG POLICY = SHIP AND GOODS POLICY

SGX = SINGAPORE EXCHANGE

SH = SAINT HELENA

SH = STANDARD HETEROSIS

SHACKLE = СКОБА – Shackle (maritime term):- a U-shaped piece of iron or steel with eyes in the end closed by a shackle pin.

SHADE = ОТТЕНОК (или ТЕНЬ, или ТОН, или ТЕНЕВОЕ) – Shade is:- (1) a color produced by a dye or pigment mixture including black dye or pigment. (2) An expression of color difference from a reference dyeing such that another dye must be added to produce a match. (3) A color slightly different from a reference color. / Оттенок – цвет, получаемый из чистого цвета добавлением белого или чёрного, а также – в небольших количествах других цветов..

SHADE = ОТТЕНЯТЬ – Shade:- to adjust the color of a test specimen to be a closer color match to the standard.

SHADE BAR = ОТТЕНОЧНАЯ (или ТЕНЕВАЯ) ПОЛОСА – Shade Bar:- a distinct shade change of short duration across the width of the fabric. This is normally due to a mix up of weft with different property. Shade Bar is a change in shade with in a short duration across the width of the fabric. See also Filling, and Mixed End. / Смотрите также Уточина (Filling), и .

SHADE CHANGE = ИЗМЕНЕНИЕ ОТТЕНКА (или ТЕНИ) – Defect Name:- Shade Change. Defect Type:- warp lines, vertical lines. Fabric Type:- Shirting and Dress Goods – Chambray. Description:- Shade Change:- This fabric has a natural warp and dyed filling. The change is due to filling shade variation. Severity:- Major. / :- эта ткань имеет естественную основу и крашеную уточину.

SHADE CHANGE IN SHIRT COLLAR = ИЗМЕНЕНИЕ ОТТЕНКА (или ТЕНИ) НА РУБАШЕЧНОМ ВОРОТНИЧКЕ – Shade Change In Shirt Collar:- Garment:- one new blue cotton shirt; Fabric Construction:- (i) Count:- 136 x 60; (ii) Warp:- 40/1 combed cotton; (iii) Filling:- same as warp. Complaint:- the garment manufacturer claimed that the collar changed shade when the shirt was cut and sewed. Analysis:- analysis showed that the shirt collar contained a large amount of starch, whereas the fabric in the body of the shirt contained none. When the starch was removed by desizing and scouring in the laboratory, it was found that there was actually no difference in shade between the collar and the remainder of the garment. Evidently the presence of the starch caused a slightly different light reflection, particularly noticeable in certain shades. Under the circumstances, the supplier of the fabric could not be

considered responsible for this condition, because there was obviously no fault in the gray or the dyed goods. It was suggested that the shirt manufacturer try to obtain a similar stiffening by the use of some other type of starch or gum which would not cause such a marked change in appearance, or by the use of a sized interlining in the collar. / ; Конструкция Ткани:- (i) Расчёт:- 136 x 60; (ii) Основа:- 40/1 гребенная хлопковая; (iii) Уточина:- такая же как основа.

SHADECLOTH = ЗАТЕМНЯЮЩЕЕ ПОЛОТНО (или ЭКРАННАЯ ТКАНЬ) – Shadecloth is a plain-weave cotton or linen fabric that is heavily sized and is often given oil treatment to make it opaque. The fabric is used for curtains and shades. Shadecloth is a name for any fabric used to make window shades.

SHADED FILLING = ОТТЕНЁННАЯ УТОЧИНА – Shaded Filling is a defect consisting of a bar running across the fabric caused by a difference in appearance of the filling yarn, and occurring at a quill change or knot.

SHADED PARTS = ОТТЕНЁННЫЕ ЧАСТИ – Shaded Parts:- all component parts not included in same section; Cutting Room Defects, and namely – Marking Defects. / Порок или дефект раскроя.

SHADES = ТЕНИ (или ЭКРАНЫ) – Shades:- a window covering that plays a double role. Shades provide:- both light control and privacy and can also lend a decorative accent. Shades range from the traditional roller blinds, available in versions that exclude light completely to those that permit some light to come in, to some with a more decorative purpose such as Austrian shades. Following is a listing of some of the popular types of shades. The term Blind is a synonym for Shade.

SHADE SORTING = СОРТИРОВКА (или РАЗБОР) ПО ОТТЕНКУ (или ТЕНИ, или ТОНУ) – Shade Sorting is a process of grouping together, often by instrumental measurement, similarly colored materials so that the materials within each group may be used together in a finished product without perceived color variation.

SHADE VARIATION = ВАРИАЦИЯ ОТТЕНКОВ (или ВАРИАЦИЯ НЮАНСОВ, или ВАРИАЦИЯ ТЕНИ) – Shade Variation in collar. One panel of the color is has a yellow tinge to it. Possible Cause:- the color was probably stitched off a cloth from a different lot. The variation in shade was probably not apparent when the garment was made but appeared later due to different characteristics of the dye. The clearly visible variation in color makes this a major defect. Stitching defect. Shade Variation:- Fabric:- spun-rayon poplin dress goods; Construction:- (i) Count:- 104 x 44; (ii) Warp:- 30/1 1 1%-in. 1%-den. bright viscose rayon; (iii) Filling:- 15/1 1%-in. 1%-den. bright viscose rayon; Finish:- plain dyed navy. Defect:- shade variation in pieces said to have been dyed together. Analysis:- inspection showed that some of the pieces were redder in cast than others with which they were supposedly dyed in the same lot. Analysis of the thread count, yarn size, twist, and fiber content indicated that samples of two of the pieces which wore different in shade were identical in construction and composition. Laboratory stripping with sodium hydrosulphite and redyeing in the same bath resulted in both cuttings' coming up to the same shade. The dyer insisted that the pieces had been dyed together and was unwilling to accept the laboratory's findings, claiming that in the gray goods there was some difference of fiber content and that the hydrosulphite used in stripping the color presumably had a leveling effect on the dyeing. Further laboratory investigation was carried out and it was discovered that, when the original dyed goods were immersed in chlorine bleach ('chemic'), one sample came down to a reddish shade, whereas the other became a dirty tan color. It was obvious that the components of the dyestuff in the two pieces were not identical, and the dyer was at fault. Shade Variation:- Garment:- man's new white sport shirt; Fabric Construction:- (i) Count:- 114 x 52; (ii) Warp:- 150/40 dull acetate rayon; (iii) Filling:- 300/80 dull acetate rayon. Complaint:- a shirt manufacturer complained of the fact that the fabric in the collar and cuffs appeared whiter than the balance of the shirt. Analysis:- swatches of the fabric taken from the shirt body and parts of the collar and cuffs and inspected under the same light source showed them to be identical. Examination of the cotton liner fabric in the collar and cuffs, under the same conditions, showed it to be blue-white in color, as compared with the shirt material, which was of a more creamy-white shade. This defect was due to the use of liner fabric which was different in shade and showed through sufficiently to give the two-tone effect. It was suggested that the manufacturer select his lining material to match the shirting fabric in shade. / Уточина:- 15/1 .

SHADING = ОТТЕНЕНИЕ – (1) Shading:- bending or crushing of the surface yarn so that the side of fibers, smooth or glossy, will reflect light, giving a lighter hue to the color than the flat, dull fiber ends. From one direction the crushed area will appear lighter and from the opposite side darker in color. Shading is a crushing of the pile of a rug so that it seems to have light and dark spots in it.

(2) Shading:- (i) noticeable color difference between the same color (GMT-GMT); (ii) noticeable color difference between the same color (Panel-Panel); (iii) finishing streaks. Shading that can be seen during visual inspection should be viewed with lightbox. If shading is visible under Cool White Fluorescent (CWF) lighting or daylight, product should be considered defective. Machinery defects, and namely – Part Forming Machines. Shading:- in cut-pile fabrics, an apparent change in color when the pile is bent, caused by differences in the way light is reflected off the bent fibers. This phenomenon is a characteristic of pile fabrics, not a defect. Shading:- a side-to-side across the width of a fabric. Note:- this defect is caused by uneven concentration of dyestuffs or by temperature variations during dyeing and finishing. Shading is an important defect to catch prior to production. The bundler has the responsibility to check for shade problems prior to allowing the bundles to be put into the line. Both rolls and cuts should be checked for shading problems. (i) A 4 inch square swatch from every roll received should be cut. (It is important to obtain a sample from every roll so that the rolls are checked 100%. (ii) All samples should be laid out and grouped by shade. This area must be well lit in order to properly shade the rolls. (iii) Rolls should be grouped together accordingly by shade. Shading:- where temperature of machine changes color of fabric. / Порок или дефект от машинного оборудования. Нюансировка Цветов (shading):- порок заключительной отделки ткани; изменение цвета от края к краю по ширине ткани. Примечание:- этот порок вызван неравномерной концентрацией красителя или изменением температуры во время окрашивания или отделки.

SHADOW PRICE = XX – Shadow Price:- the constraint shadow price represents the incremental reduction in congestion cost achieved by relieving a constraint by 1 MW. The shadow price multiplied by the flow (in MW) on the constrained facility during each hour equals the hourly gross congestion cost for the constraint.

SHADOW PRINTING = ПЕЧАТАНИЕ ОТТЕНЕНИЕМ (или ПЕЧАТАНИЕ НА ОСНОВЕ) – Shadow Printing is a printing method in which only the warp yarns are printed with a design before the fabric is woven. The resulting fabric has a wavy, shadowy effect. It is also called Warp Printing. See also Printing, and Warp Printing.

SHADOW STRIPES = ТЕНЕВЫЕ ПОЛОСЫ – Shadow Stripes are the faint impressions of stripes achieved by using yarns of the same color but different twists in weaving a fabric. The shadow effect comes from the way in which the light strikes the yarns of varying twists. See also Twist. / Теневые Полосы – полосы вдоль ткани, полученные применением в основе пряжи разных направлений крутки.

SHAFT = РЕМИЗКА (или ВАЛИК) – Shaft is:- (1) a term often used with reference to satins indicating the number of harnesses employed to produce the weave. (2) See also Harness.

SHAFT = ШАХТНЫЙ СТВОЛ (или ШАХТА) – Vertical openings are Shafts and Raises:- the principal means of access to an underground ore body is a vertical opening called a Shaft. The shaft is excavated, or sunk, from the surface downward to a depth somewhat below the deepest planned mining horizon. At regular intervals along the shaft, horizontal openings, called Drifts, are driven toward the ore body. Each of these major working horizons is called a Level. The shaft is equipped with elevators (called Cages) by which workers, machines, and material enter the mine. Ore is transported to the surface in special conveyances called Skips. Shafts generally have compartments in which the media lines (e.g., compressed air, electric power, or water) are contained. They also serve as one component in the overall system of ventilating the mine. Fresh air may enter the mine through the production shaft and leave through another shaft, or vice versa. Another way of gaining access to the underground is through a ramp – that is, a tunnel driven downward from the surface. Internal ramps going from one level to another are also quite common. If the topography is mountainous, it may be possible to reach the ore body by driving horizontal or near-horizontal openings from the side of the mountain; in metal mining these openings are called Adits. Ore that is mined on the different levels is dumped into vertical or near-vertical openings called Ore Passes, through which it falls by gravity to the lowest level in the mine. There it is crushed, stored in an ore bin, and charged into skips at a skip-filling station. In the head frame on the surface, the skips dump their loads and then return to repeat the cycle. Some common alternative techniques for ore transport are conveyor belts and truck haulage. Vertical or near-vertical openings are also sometimes driven for the transport of waste rock, although most mines try to leave waste rock underground. Vertical or subvertical connections between levels generally are driven from a lower level upward through a process called Raising. Raises with diameters of two to five meters and lengths up to several hundred meters are often drilled by powerful raise-boring machines. The openings so created may be used as ore passes, waste passes, or ventilation openings. An underground vertical opening driven from an upper level downward is called a Winze; this is an internal shaft. Horizontal openings are Drifts. Shaft is a vertical or inclined conduit providing access from the surface to underground ore bodies. Except for the Chinese, who may have mined coal underground, all the early coal seams were worked from the surface, in fully exposed outcroppings. In the later Middle Ages, however, exhaustion of outcrop coal in many places forced a change from surface to underground, or shaft, mining. Early shaft mines were little more than wells widened as much as miners dared in the face of danger of collapse. Shafts were sunk on high ground, with adits – near-horizontal tunnels – for drainage driven into the side of the hill. In England some shallow mine shafts were exhausted as early as the XIV century, making it necessary to go deeper and expand mining at the shaft bottoms. These remained small operations; a record of 1684 shows 70 mines near Bristol, employing 123 workers. Greater depth created many problems. First, water could no longer simply be drained away. Crude methods were devised to lift it to the surface. A bucket-and-chain device was first powered by men and later by horses; a continuous belt of circular plates was drawn up through a pipe. Windmills were used for pumps. But shafts had to be restricted to depths of 90 to 105 meters (300 to 350 feet) and a mining radius of 180 meters. It was not until 1710 that the water problem was eased by Thomas Newcomen's steam atmospheric engine, which supplied a cheap and reliable power source for a vertical reciprocating lift pump. / к подземным рудным телам. Под Шахтой, от Немецкого слова Schacht, понимается горнопромышленное предприятие по добыче полезного ископаемого при помощи подземных горных выработок. Включает наземные сооружения и горные выработки. Глубина подземных разработок до 3.5–4 км (в 1984). Под Шахтой понимается производственная единица горного предприятия, ведущего подземную добычу полезного ископаемого. Шахта включает наземные сооружения (копры, надшахтные здания, склады, административно-бытовые комбинаты и другое) и подземные горные выработки. Годовая производственная мощность наиболее крупных шахт достигает нескольких миллионов тонн полезного ископаемого; срок службы шахт, отрабатывающих мощные месторождения, составляет десятки лет. Глубина шахт колеблется в широких пределах – от сотен метров до нескольких километров; наиболее глубокие в мире шахты расположены в Южной Африке и Индии, их глубина около 4 километров. Под Шахтным Стволом понимается вертикальная или наклонная горная выработка с постоянной горной крепью, предназначенная для транспортной связи подземных разработок с поверхностью. Слепой шахтный ствол не имеет непосредственного выхода на поверхность и служит для связи нижних горизонтов с верхними. Шахтные стволы бывают разведочные, эксплуатационные и специальные (для подземных сооружений). Эксплуатационные шахтные стволы разделяются на главные (подъём полезного ископаемого из шахты), вентиляционные и вспомогательные – водоотливные и другие.

SHAFT ALLEY = КОРИДОР ВАЛА – Shaft Alley (maritime term):- covered tunnels within a ship through which the tail shafts pass.

SHAFT HOLD = УДЕРЖИВАНИЕ РЕМИЗКИ (или ВАЛИКА) – Shaft Hold:- wrong lifting of healed shafts, or healed shafts are not lifted as per fabric design shafts are operated by dobby. Weaving defect. Shaft Hold:- (i) condition of dobby card joint; (ii) any additional hole formation in card; (iii) dobby card cylinder setting; and (iv) slip of card during its rotation. / Порок или дефект ткачества.

SHAFT MARK = ОТМЕТИНА ОТ РЕМИЗКИ (или ВАЛИКА) – Shaft Mark is a fabric defect characterized by a number of floating ends, usually caused by a broken harness strap on the loom.

SHAFTY WOOL = СИЛЬНАЯ ШЕРСТЬ – Shafty Wool is a wool of extra good length, sound, and well grown. / Под Сильной Шерстью понимается густая, длинная и хорошего роста шерсть.

SHAG = ХХ (или ПЛЮШ, или ДЛИННЫЙ ГРУБЫЙ ВОРС) – Shag is a floor covering with relatively long, loose wool or man-made fibered plie. / половое покрытие с относительно длинным, .

SHAG CARPET = КОВЁР С ДЛИННЫМ И ГРУБЫМ ВОРСОМ (или ПЛЮШЕВЫЙ КОВЁР, или ЧЕПРАЧНЫЙ КОВЁР) – Shag Carpet is a loosely tufted carpet construction with cut pile 1 to 5 inches in length and with greater than normal spacing between tufts.

SHAKE = (ОТЛУПНАЯ) ТРЕЩИНА – (1) Shake is a separation along the grain usually occurring between the rings of annual growth. / Разделение волокон, обычно возникающее между годичными кольцами прироста. Отлупная Трещина (Shake):- трещина, проходящая между годичными слоями, возникающая в ядре растущего дерева. Она увеличивается в срубленной древесине при сушке. Наблюдается на торцах в виде дугообразных и кольцевых трещин, на боковых поверхностях – в виде продольных трещин.

(2) Shake:- a western red cedar roofing and sidewall product made by splitting blocks of cedar, as opposed to shingles which are manufactured by sawing. / расщеплением чурбанов из Кедра, тонкая дощечка/гонт/дранка (shingle).

SHAKE A LEG = ШЕВЕЛИСЬ (или НОГИ В РУКИ) – Shake A Leg (maritime term):- an order to make haste.

SHAKEDOWN CRUISE = ПРОБНЫЙ РЕЙС – Shakedown Cruise (maritime term):- a cruise of a new ship for the purpose of testing out all machinery, etc. / Пробный Рейс судна перед сдачей заказчику.

SHAKEOUT = СБРОС (или ВСТРЯСКА, или ИЗМЕНЕНИЕ, или РАЗОРЕНИЕ) – (1) In the United States, Shakeout is the process of 'natural selection', when a market cannot support the number of suppliers it has attracted, many of the less profitable suppliers leave the market, with only the more healthy operators remaining.

(2) In exchange trading, Shakeout is one of trading traps. The Shakeout is tricks of the trade:- a market professional may want to accumulate a large position in a stock that is trending strongly; either for his own account or for a major client. How does he/she do this? If he starts placing buy orders in the pool, he will chase the stock up sky high, without being able to build a big enough line. The golden rule is: buy into weakness. The professional bides his time, waiting for the stock to consolidate or start a short-term correction. He knows that trading will be quiet during this phase: buyers lose interest for a while and look elsewhere. He also knows where most traders have their stops. Adjusting Stops:- in a strong-trending stocks, most traders will seek to lock in profits by placing their stops below the previous short-term (or intermediate) low. In a consolidation they tend to move their stops up to just below the base. A few well-placed sell orders on a quiet day will drive the stock below its' support level. Stops are triggered, sending a flood of sell orders into the market. Everyone takes fright while our market professional steps forward and scoops the pool; buying in the face of the correction. Selling dries up when the stops are filled and the stock soon recovers back into its normal trading range. Everything returns to normal; except that our market professional now has a sizeable parcel of stock, accumulated at bargain-basement prices; and a group of punters curse their luck while the stock soars into the stratosphere. Example:- Unitab Limited holds various gambling monopolies in Australia. The stock had been in a strong up-trend for several years before a consolidation around AUD6.00. After a brief low (at (1) on the chart below) the stock consolidated for 2 months around the AUD6.00 mark before stops were triggered at (2) by a fall below AUD5.80. There was a flurry of selling, quickly scooped up by the market pros, with the stock retreating back above the support level before the close. A further support level was established at AUD6.00, by lows at (3) and (4), before another shakeout at (5). A situation where many scared investors exit their positions due to unfavorable news or uncertainty regarding the stock or industry. The dot-com bust was characterized by numerous shakeouts causing many to abandon their dot-com positions, often at great losses.

(3) Shakeout is the reorganization of a company, e.g., after a take-over, when the employee numbers are reduced and operations streamlined.

SHAKO = КИВЕР (или ШАКО) – Shako is a stiff military hat with a high crown and plume. A Shako is a tall, cylindrical military cap, usually with a visor, and sometimes tapered at the top. It is usually adorned with some kind of ornamental plate or badge on the front, metallic or otherwise, and often has a feather, plume (see Hackle), or pompom attached at the top. The word Shako originated from the Hungarian name Csákó for the peak, which Hungarian border soldiers (Grenz-Infanterie) added around 1790 to their previously visorless stovepipe-style hats. Originally these hats were part of the clothing commonly worn by shepherds, before being added to the uniform of the Hungarian hussar in the early XVIII century. Other spellings include Chako, Czako, Schako and Tschako. From 1800 on, the shako became a common military headdress, worn by the majority of regiments in the armies of Europe and the Americas. Replacing in most instances the light bicorne, the shako was initially considered an improvement. Made of heavy felt and leather, it retained its shape and provided some protection for the soldier's skull, while its visor shaded his eyes. The shako retained this pre-eminence until the mid-XIX century, when spiked helmets began to appear in the army of Prussia, which influenced armies of the various German states, and the more practical Kepi replaced it for all but parade wear in the French Army. The Imperial Russian Army substituted a spiked helmet for the shako in 1844–45 but returned to the latter headdress in 1855, before adopting a form of kepi in 1864. Following the Franco-Prussian War of 1870, military fashions changed and cloth or leather helmets based on the German headdress began to supersede the shako in many armies. Although the mid-XIX century shako was impressive in appearance and added to the height of the wearer, it was also heavy and by itself provided little protection against bad weather as most models were made of cloth or felt material over a leather body and peak. Many armies countered this by utilising specially designed oilskin covers to protect the shako and the wearer from heavy rain while on campaign. The shako provided little protection from enemy action as the most it could offer was in giving partial shielding of the skull from enemy cavalry sabres. During the period of general peace that followed the Napoleonic Wars, the shako in European armies became a showy and impractical headdress that was best suited for the parade ground. As an example, the 'Regency' officers' shako of the British Army of 1822 was 8-1/2 inches (22 cm) in height and 11 inches (28 cm) across at the crown, with ornamental gold cords and lace. Lieutenant Colonel George Anthony Legh Keck can be seen in a portrait from 1851 wearing a 'broad-topped' shako that was topped by a 12-inch (30 cm) white plume and held in place by bronze chin scales. The 'Regency' shako was followed in the British Army by a succession of models – 'Bell-topped', 'Albert', 'French' and 'Quilted' – until the adoption of the Home Service helmet, in 1877. Modern Use:- In Europe, the infantry of the French Republican Guard, cadets at Saint-Cyr, cadets at the Belgian Royal Military Academy, cadets at the Portuguese Colégio Militar and Pupilos do Exército military schools, the Italian Horse Guards Corps, Horse Artillery and cadets at the Military Academy of Modena, the Danish Guard Hussar Regiment, and the Spanish Royal Guard and 1st King's Immemorial Infantry Regiment all have shakos as part of their respective ceremonial uniforms. Various Latin American armies, including those of Venezuela, Mexico, Brazil, Peru, Ecuador, Uruguay and Argentina, retain shakos for ceremonial guard or military academy uniforms. In Russia, the historic Kiver has been reintroduced for wear by the Kremlin Guards for ceremonial occasions. In India the Madras Sappers & Miners of the Madras Engineer Group wear dark-blue visorless shakos as part of their ceremonial uniform. An Indonesian ceremonial unit as well as the cadet corps of the military academies of the Philippines and South Korea also use shakos. In the United States, shakos are still worn as full-dress headgear by cadets of West Point (where it is known colloquially as a Tarbucket), Virginia Military Institute, The Citadel, Marion Military Institute, New York Military Academy, and Valley Forge Military Academy and College (in a modified form) with their Full Dress Grey uniforms. Many college and high-school marching bands feature shakos as part of their dress uniform. In the Canadian Forces, Les Voltigeurs de Québec are authorized to wear dark green shakos with full-dress uniforms. Non-Military Use:- In the US and the Philippines, shakos are frequently worn by civilian marching bands and drum corps. In the latter country, the cadets of some civilian institutions such as the Philippine National Police Academy, and some colleges and high schools, also use the shako, although peaked 'service cap' styles have become more popular in recent years. Those shako styles still in use in marching bands are generally quite tall and have elaborate plumes. For example, at the University of Notre Dame in South Bend, Indiana, the kilted Irish Guard wear tall black fur shakos with bright yellow plumes, bringing their total height in uniform to almost 8 feet (240 cm) tall. These shakos are typical of marching band drum majors, however the Irish Guard shako is unique in its size, color, and design. In drum corps and corps-style marching bands, the chin strap is rarely worn under the chin; instead, it is worn just under the lower lip, in the style of cadets at West Point. In Canada the shako is worn by volunteers in various historical forts wearing XIX century period uniforms. / от Венгерского слова Чако (Csákó), означающее . Британский Полковник Дьжёдьж Антчони Ли Кек (George Anthony Legh Keck; 1774–1860), Член Парламента (Member of Parliament (MP)), . Кивер:- военный головной убор цилиндрической формы с плоским верхом, с козырьком, подбородным ремешком, часто с украшением в виде султана. Был распространён в большинстве Европейских армий в начале и середине XIX столетия. Кивера появились в большинстве армий начиная с 1801. Впоследствии, их форма и внешний вид неоднократно менялись. Из особо интересных можно выделить Английский 'Bell Top' (Колокол), существовавший в 1830-х, и введённый в 1860-х в Испании, так называемый 'Ros', с высоким прямым передом и дном, переходящим в закруглённый зад. Ближе к середине XIX столетия кивер стал преобретать иной вид. Вместо прямого цилиндра или распространенного 'ведра' кивер стал иметь форму конуса с прямой передней стороной, наклонной задней, и уменьшенным донышком. А уже уменьшенный и от того облегчённый вариант такого кивера называется Шако. В Русской гвардии и армии кивера впервые были введены в 1805. Эти головные уборы были высокие, тяжёлые и весьма неудобные, зато берегли голову

солдата от непрямого сабельного удара. При Николае I кивера доходили до 5.5 вершка высоты; во время парадов они украшались султанами в 11 вершков длиной, так что весь головной убор был высотой 16.5 вершка (около 73.5 см). В 1844 (а у гусар – в 1862) они были заменены кожаными касками. В 1855, при Александре II, кивера были вновь введены в армию, претерпели изменения в 1857, и просуществовали до 1862, когда их заменили на кепи. В 1908 кивера были снова возвращены частям гвардии, военно-учебным заведениям и генералам. В первые годы Советской власти царские киверы донашивали бойцы Рабоче-Крестьянской Красной Армии (РККА), что зафиксировано на фотокарточках тех лет. 'Так, красные курсанты Инженерных Курсов носили одно время юнкерские мундиры с киверами, на которых царские орлы были закрыты суконными красными звёздами, причём все это 'чудо' носилось вместе с защитными брюками. Также в Красной Армии имелся ряд подразделений, носивший комплекты гусарской униформы ... Красный 1-й Оренбургский Кавполк получил в Москве со склада новенькую гусарскую форму и был отправлен в ней на Восточный фронт'. Курсанты в гусарских шапках (Лейб-Гвардии Гусарского Полка) участвовали в похоронах Моисея Соломоновича Урицкого (псевдоним Борецкий; 1873–1918), политического деятеля России – Председателя Петроградской Чрезвычайной Комиссии (ЧК) по Борьбе с Контрреволюцией и Саботажем.

SHALE GAS = СЛАНЦЕВЫЙ ГАЗ – Shale Gas is a natural gas produced from shale rock formations where the gas was sourced from within the shale itself. Shale is very fine-grained rock, characterized by low porosity and extremely low permeability. Production of shale gas normally requires formation stimulation such as the use of hydraulic fracturing (pumping a fluid-sand mixture into the formation under high pressure) to help produce the gas. / В недрах Земли газ может быть сконцентрирован в следующих качествах:- в виде скоплений метана в угольных пластах, газовых образованиях в пластовых условиях, попутного газа (смесь пропана и бутана) с месторождениями нефти, в толще жёстких песков, в сланцевых пластах, а также в виде кристаллических газогидратов в толще морского дна. Природный газ в свою очередь является смесью газов, большая их часть относится к метану, меньшая – к его гомологам, тяжёлым углеводородам:- этану, бутану, пропану. В состав природного газа также входят неуглеродные соединения:- сероводород, водород, диоксид углерода, гелий, азот. Каждое месторождение имеет свой уникальный химический состав газа, наиболее ярко выраженными свойствами, вызывающими парниковый эффект, обладает метан. Сланцевый Газ – это газ, который добывают глубоко под землей из материнской породы – сланца, для добычи которого используется технология гидроразрыва (фрекинг (fracking)), которая является не только очень дорогостоящей, но и наносит огромный вред окружающей среде, при этом очищенный сланцевый газ по своим свойствам уступает природному газу не только по стоимости его добычи, но и своим физическим свойствам. Данный газ будет рентабелен только при наличии спроса на него и высоких цен на газ. Сланцевый Газ – это разновидность природного газа, хранящегося в виде небольших газовых образований в толще сланцевого слоя осадочной породы Земли, который встречается на всех континентах. Этот энергоресурс совмещает в себе качество ископаемого топлива и возобновляемого источника и встречается во всём мире, таким образом, практически любая энергозависимая страна может себя обеспечить данным энергоресурсом. Для добычи сланцевого газа используют горизонтальное бурение, гидроразрыв пласта и сейсмическое моделирование. Вместо гидроразрыва пласта (фрекинга) в качестве эксперимента может использоваться более дорогой безводный пропановый фрекинг. Сланцевый Газ – это альтернативный вид топлива, добываемый из горючих сланцев. Одни считают сланцевый газ могильщиком нефтегазового сектора Российской экономики, а другие – грандиозной афёрой планетарного масштаба. Сланцевый Газ – это природный газ, добываемый из сланца – материнской породы. Материнская порода в свою очередь формировалась на протяжении миллионов лет из органических останков Растений и Животных. Первые экспериментальные разработки в области газодобычи из сланца начали проводиться компанией Мичэл Энодьжи Энд Дивэлэпмэнт Корпорэйшэн (Mitchell Energy & Development Corporation) во главе с Дьжодьжем Файдиэсом Мичэлом (George Phydias Mitchell; 1919–2013) с 1980 в США. Эта компания в 2001 была куплена компанией Дэвэн Энодьжи Корпорэйшэн (Devon Energy Corporation) за 3.5 миллиарда Долларов США. Полигоном для испытаний технологии горизонтального бурения Дьжодьжем Файдиэсом Мичэлом стало месторождение Бонэт Щейэл (Barnett Shale). В этом направлении с 1989 работал также Тчом Эл. Вод (Tom L. Ward) и его компания Чэсэпик Энодьжи Корпорэйшэн (Chesapeake Energy Corporation). История Происхождения Сланцевого Газа:- То, что в сланцах, обогащённых органикой, есть газ, было известно ещё в XIX веке, а первая скважина в сланцевых пластах была пробурена в США в 1821 во Фредонии, Штат Нью Йорк (Fredonia, State of New York). Однако сланцевые пласты игнорировались многими промышленниками, так как сланец считался слишком твёрдым, чтобы вскрыть при помощи традиционных способов бурения. Xxxxx. Первый действующий источник для добычи газа был обнаружен на территории США. Произошло это в 1821, открывателем стал Вилъйэм Эй. Хат (William A. Hart; 1797–1865). Активистами по изучению обсуждаемого вида газа в Америке выступали известные специалисты Дьжодьж Файдиэс Мичэл и Тчом Эл. Вод. Грандиозное производство рассматриваемого газа начала компания Дэвэн Энодьжи Корпорэйшэн. В 1970-х в США были проведены разведочные работы, в ходе которых выявлены четыре огромных сланцевых бассейна – Бонэт Щейэл (Barnett Shale), Фейэтвил Щейэл (Fayetteville Shale), Хейнсвил Щейэл (Haynesville Shale), и Морсэлас Щейэл (Marcellus Shale) площадью в десятки тысяч квадратных километров и, по-видимому, содержащие гигантские запасы природного газа. На тот момент эти резервы оказались недоступными, а разработка соответствующих технологий добычи была прервана после падения цен на нефть в 1980-х. В 1990-х ряд небольших компаний, крупнейшей и наиболее активной из которых была Чэсэпик Энодьжи Корпорэйшэн, решили вернуться к идее извлечения газа из сланцевых пластов. Исследователи предложили применить для добычи сланцевого газа технологии, которые были разработаны ещё десятилетия назад, но в то время не имели широкого применения. Одной из них было горизонтальное бурение, заключавшееся в том, что уже внутри пласта бур постепенно отклонялся от вертикали, пока это отклонение не достигало 90 градусов, а затем продолжал движение уже параллельно кровли пласта. Впервые эта технология была применена ещё в 1940-х, но затем от неё отказались из-за дороговизны. Теоретическая база технологии гидроразрыва пласта была разработана в бывшем Союзе Советских Социалистических Республик (СССР) в 1953 Академиком Сергеем Алексеевичем Христиановичем (1908–2000) совместно с Юрием Петровичем Желтовым (1925–2002) в Институте Нефти Академии Наук (АН) СССР. Ситуация стала меняться в конце 1990-х, когда новые технологии горизонтального бурения и более интенсивные гидравлические разрывы пластов позволили извлекать газ из сланца и схожих по твёрдости геологическим месторождениям. Но масштабное промышленное производство сланцевого газа было начато в США компанией Дэвэн Энодьжи Корпорэйшэн лишь в 2002, когда на месторождении Бонэт Щейэл была впервые пробурена горизонтальная скважина. Резкий рост добычи этого сырья получил название 'Газового Переворота' или 'Газовой Революции', активно подхваченной вкладчиками капитала. В первом полугодии 2010 крупнейшие мировые топливные компании потратили 21 миллиард Долларов США на активы, связанные с добычей сланцевого газа. Сейчас, с открытием новых технологий по разработке сланцевого газа, во многих странах электроэнергетическая политика меняется. В частности, в США за последние три года цена на газ упала в три раза, с 8 до 2.5 Долларов США.

SHALE OIL = СЛАНЦЕВОЕ МАСЛО (или НЕФТЕПОДОБНАЯ СМОЛА) – Shale Oil or Kerogen Oil is an unconventional oil produced from oil shale by pyrolysis, hydrogenation, or thermal dissolution. These processes convert the organic matter within the rock (kerogen) into synthetic oil and gas. The resulting oil can be used immediately as a fuel or upgraded to meet refinery feedstock specifications by adding hydrogen and removing impurities such as sulfur and nitrogen. The refined products can be used for the same

purposes as those derived from crude oil. Oil shale was one of the first sources of mineral oil used by humans. Its earliest recorded use was in Switzerland and Austria in the early XIV century. In 1596, the personal physician of Frederick I, Duke of Württemberg wrote of its healing properties. Shale oil was used to light the streets of Modena, Italy at the turn of the XVII century. The British Crown granted a patent in 1694 to three persons who had 'found a way to extract and make great quantities of pitch, tarr, and oyle out of a sort of stone'. Later sold as Betton's British Oil, the distilled product was said to have been 'tried by divers persons in Aches and Pains with much benefit'. Modern shale oil extraction industries were established in France during the 1830s and in Scotland during the 1840s. The oil was used as fuel, as a lubricant, and as lamp oil; the Industrial Revolution had created additional demand for lighting. It served as a substitute for the increasingly scarce and expensive whale oil. During the late XIX century, shale oil extraction plants were built in Australia, Brazil and the United States. China (Manchuria), Estonia, New Zealand, South Africa, Spain, Sweden, and Switzerland produced shale oil in the early XX century. The discovery of crude oil in the Middle East during mid-century brought most of these industries to a halt, although Estonia and Manchuria maintained their extraction industries into the early XXI century. Worldwide exploitation of oil shale peaked in 1980 when 47 million tons were mined, over 70% of it in Estonia. In response to rising petroleum costs at the turn of the XX century, extraction operations have commenced, been explored, or been renewed in the United States, China, Australia, and Jordan. Shale oil is extracted by pyrolysis, hydrogenation, or thermal dissolution of oil shale. The pyrolysis of the rock is performed in a retort, situated either above ground or within the rock formation itself. As of 2008, most oil shale industries perform the shale oil extraction process after the rock is mined, crushed, and transported to a retorting facility, although several experimental technologies perform the process in place (in-situ). The temperature at which the kerogen decomposes into usable hydrocarbons varies with the time-scale of the process; in the above-ground retorting process decomposition begins at 300 °C (570 °F), but proceeds more rapidly and completely at higher temperatures. Decomposition takes place most quickly at a temperature between 480 °C/900 °F and 520 °C/970 °F. Hydrogenation and thermal dissolution (reactive fluid processes) extract the oil using hydrogen donors, solvents, or a combination of these. Thermal dissolution involves the application of solvents at elevated temperatures and pressures, increasing oil output by cracking the dissolved organic matter. Different methods produce shale oil with different properties. A critical measure of the viability of extraction of shale oil lies in the ratio of the energy produced by the oil shale to the energy used in its mining and processing, a ratio known as 'Energy Returned on Energy Invested' (EROEI). A 1984 study estimated the EROEI of the various known oil-shale deposits as varying between 0.7–13.3 although known oil-shale extraction development projects assert an EROI between 3 to 10. Royal Dutch Shell has reported an EROEI of three to four on its in situ development, Mahogany Research Project. The amount of oil that can be recovered during retorting varies with the oil shale and the technology used. About 16% of the Green River Formation oil shales yield 25 to 100 US gallons (95 to 380 l; 21 to 83 imp gal) of shale oil per ton of oil shale; about 33% yield 10 to 25 US gallons (38 to 95 l; 8.3 to 21 imp gal) per ton; and about 50% yield 5 to 10 US gallons (19 to 38 l; 4.2 to 8.3 imp gal) per ton. The properties of raw shale oil vary with the shale's composition and the extraction technology from aromatic to aliphatic. Typically it contains 0.5 to 1% oxygen, 1.5 to 2% nitrogen, and 0.15 to 1% sulfur. Mineral particles are often present as well. The oil is less fluid than crude oil, becoming pourable at temperatures between 75 °F (24 °C) and 80 °F (27 °C), while conventional crude oil is pourable at temperatures between −60 °C (−76 °F) to 30 °C (86 °F); this property affects shale oil's ability to be transported in existing pipelines. Although raw shale oil can be immediately burnt as a fuel oil, many of its applications require that it be upgraded. The differing properties of the raw oils call for correspondingly various pre-treatments before it can be sent to a conventional oil refinery. Particulates in the raw oil clog downstream processes; sulfur and nitrogen create air pollution. Sulfur and nitrogen, along with the arsenic and iron that may be present, also destroy the catalysts used in refining. Olefins form insoluble sediments and cause instability. The oxygen within the oil, present at higher levels than in crude oil, lends itself to the formation of destructive free radicals. Hydrodesulfurization and hydrodenitrogenation can address these problems and result in a product comparable to benchmark crude oil. Phenols can be first be removed by water extraction. Upgrading shale oil into transport fuels requires adjusting hydrogen-carbon ratios by adding hydrogen (hydrocracking) or removing carbon (coking). Shale oil produced by some technologies, such as the Kiviter process, can be used without further upgrading as an oil constituent and as a phenolic compound. Distillate oils from the Kiviter process can also be used as diluents for petroleum-originated heavy oils and as an adhesive-enhancing additive in bituminous materials such as asphalt. Before World War II, most shale oil was upgraded for use as transport fuels. Afterwards, it was used as a raw material for chemical intermediates, pure chemicals and industrial resins, and as a railroad wood preservative. As of 2008, it is primarily used as a heating oil and marine fuel, and to a lesser extent in the production of various chemicals. Shale oil's concentration of high-boiling point compounds is suited for the production of middle distillates such as kerosene, jet fuel, and diesel fuel. Additional cracking can create the lighter hydrocarbons used in gasoline. Global technically-recoverable oil shale reserves have recently been estimated at about 2.8–3.3 trillion barrels of shale oil, with the largest reserves in the United States, which is thought to have 1.5–2.6 trillion barrels. Worldwide production of shale oil was estimated at 11 600 barrels per day (1 840 m^3/d) in 2002. The leading producers were Estonia (5 500 barrels per day (870 m^3/d)), Brazil (3 100 barrels per day (490 m^3/d)), and China (2 000 barrels per day (320 m^3/d)). In 2008, China led production with 470 million liters (ml), followed by Estonia (445 ml) and Brazil (250 ml). The production of shale oil has been hindered because of technical difficulties and costs. Oil extracted by heat from clays which are impregnated with oil. / Щел (Shell). Фенольное (Phenolic). Нефть, полученная посредством тепловой обработки горючих (битуминозных) сланцев, насыщенных нефтью. Горючие (Битуминозные) Сланцы используют главным образом как сырьё для перегонки на газ и Нефтеподобную Смолу (Сланцевое Масло), а также в качестве твёрдого топлива.

SHALLOON = ЩЭЛУН (или ШЕРСТЯНАЯ ПОДКЛАДОЧНАЯ САРЖА) – Shalloon:- a lightweight twilled fabric of wool or worsted used chiefly for the linings of coats and uniforms. / лёгкая шерстяная подкладочная ткань саржевого переплетения.

SHAM = НАВОЛОЧКА (или ХХ) – Sham:- which has the same meaning of pillow, but for usage on top of a comforter or quilt.

SHANGHAI COMPOSITE INDEX = ШАНХАЙСКИЙ СВОДНЫЙ ИНДЕКС – The Shanghai Stock Exchange Composite (SSEC; also known as Shanghai Composite) Index is a capitalization-weighted index. The index tracks the daily price performance of all A-shares (listed stocks denominated in RMB in Mainland China) and B-shares (listed stocks denominated in foreign currency (USD) in Mainland China) listedon the Shanghai Stock Exchange. The index was developed on 1990-December-19 with a base value of 100. Index trade volume on Q is scaled down by a factor of 1000. The Base Day for the SSE Composite Index is 1990-December-19. The Base Period is the total market capitalization of all stocks of that day. The Base Value is 100. The index was launched on 1991-July-15. At the end of 2006, the index reaches 2 675.47. Other important indexes used in the Shanghai Stock Exchanges include the SSE 50 Index, SSE 180 Index, and others. The Shanghai Stock Exchange (SSE) Indices are all calculated using a Paasche weighted composite price index formula (after the German economist Hermann Paasche), similar to the CSI 300 Index. This means that the index is based on on its base period for its calculations as compared to certain other exchanges, like the DAX, which base their calculations on the previous period (the Laspeyres price index calculation; index developed by German economist Étienne Laspeyres (1834–1913)). Composite Indices and Sector Indices are weighted by shares. The formula is:- Current Index = Current Total Market Cap Of Constituents x Base Value / Base Period; Total Market Capitalization = ∑ (Price x Shares Issued). The B share stocks are generally denominated in US Dollars for calculation purposes. For calculation of other indices, B share stock prices are converted to RMB at the applicable exchange rate (the middle price of US Dollar on the last trading day of each week) at China Foreign Exchange Trading Center and then published

by the exchange. The total number of companies on the composite index is 872. / Хэрман Пашо (Hermann Paasche). Этьен Ляспэр (Etienne Laspeyres). Шанхайский Сводный Индекс или Сводный Индекс от Шанхайской Фондовой Биржи (Shanghai Stock Exchange Composite Index) отслеживает стоимость акций A и B (эти акции деноминированы в иностранной валюте, и торговать ими могут как жители Китая, так и иностранцы) на крупнейшей бирже Китая – Шанхайской Фондовой Бирже (ШФБ; Shanghai Stock Exchange (SSE)).

SHANGHAIED = ШАНХАЙНУТОЕ (или XX) – Shanghaied (maritime term):- the practice of obtaining a crew by means of force. Crews were hard to get for long voyages, and when the unwilling shipmate regained consciousness, he found himself bound for some remote port, such as Shanghai. One who is forced to do something against his will.

SHANGHAI FUTURES EXCHANGE = ШАНХАЙСКАЯ БИРЖА ФЬЮЧЕРСОВ – The Shanghai Futures Exchange (SHFE) is organized under relevant rules and regulations. A self-regulated entity, it performs functions that are specified in its bylaws and state laws and regulations. It is regulated by the China Securities Regulatory Commission (CSRC). At present, futures contracts underlying commodities, i.e. gold, copper, aluminum, steel rebar, steel wire rod, natural rubber, fuel oil and zinc, are listed for trading. Guided by the Concept of Scientific Development, Shanghai Futures Exchange commits itself to promoting the opening-up and continued progress of the capital market and construction of a harmonious market environment. SHFE adheres to the guidelines that are generalized as 'legislation, supervision, self-regulation and standardization', with stability, development and innovation as a priority. The exchange organizes trading activities strictly according to the laws and rules, and fulfills its functions as a front-line regulator. SHFE endeavors to develop itself into a regulated, efficient, transparent and product-inclusive internationalized futures exchange that focuses on the metal, energy and chemical-related industrial products and the corresponding derivatives. In order to realize the functions of the futures market as price discovery and risk hedging, and serve the development of the national economy, Shanghai Futures Exchange is establishing a secure, orderly, efficient market mechanism and an open, fair, equitable and transparent market environment. There are over 200 members now in Shanghai Futures Exchange, among which about 80% are futures brokerage firms. And the exchange has already set up more than 250 distant trading terminals nationwide. 2015-January-07:- The China Securities Regulatory Commission (CSRC) has issued draft rules for allowing foreign investors to trade in some of China's commodities futures, potentially starting with crude oil futures on the Shanghai Futures Exchange, Reuters reported. The crude futures would be limited to qualified foreign investors participating through approved overseas or local brokerages, though traders could also apply for a direct trading license with the board itself. Presently, foreign companies are only allowed to trade via brokers after setting up a locally registered non-financial unit, which requires considerable registered capital. Shanghai Futures Exchange now list eight futures products including copper, aluminum, zinc, steel wire rod, rebar, natural rubber, fuel oil and gold. They are all traded from 09:00 am ÷ 11:30 am and 01:30 pm ÷ 03:00 pm. All of the trading on SHFE is executed electronically. Shanghai Futures Exchange has more than 200 member firms (in 2011). There are two categories of membership. One is brokerage membership that includes all the futures commission merchants that are registered as SHFE members. The other is proprietary membership that includes the enterprises that only trade on their own accounts. Only the trading orders through or by the members can be accepted by SHFE for matching. The markets of Shanghai Futures Exchange maintain a sound and established risk management system, in which there is margining system, price limit system, position limit system, large position reporting system, etc. You can find the details in SHFE regulations and the other futures trading rules. Shanghai Futures Exchange adopts the physical delivery mechanism. The goods must be registered in SHFE designated warehouses or delivery points as warrants before they are recognized valid for delivery. At present the Chinese regulations stipulate that only the companies or organizations that are organized and registered on Mainland China or Mainland citizens are allowed to participate in the trading of local futures markets. All the trading is executed in Chinese Renminbi, or RMB. Can such an entity like this trade on SHFE? First of all, the subsidiary must have a status as a legal person. A representative office or a branch office cannot be allowed to trade. For a legal person foreign-owned PRC subsidiary, it can only trade on SHFE as a customer of any SHFE brokerage member. It shall identify a futures commission merchant that has SHFE membership, sign related documents, set up a settlement account and deposit sufficient funds in the account. Under the approval of broker and exchange, it can start trading futures. The Shanghai Futures Exchange (SHFE) was formed in December 1999. Website:- http://www.shfe.com. The SHFE was formed in 1998 as part of the restructuring of China's futures industry, which was revived in 1990 after a 60-year hiatus, but saw the government close many of the 40-plus exchanges which emerged because of widespread price manipulation. The Shanghai Futures Exchange was formed from the merger of the Shanghai Metal Exchange, Shanghai Cereals and Oil Exchange and Shanghai Commodity Exchange. It is one of three surviving entities alongside the the Zhengzhou Commodity Exchange and the Dalian Commodity Exchange, though a Shanghai-based financial derivatives exchange is being developed. The Shanghai Futures Exchange was ranked the world's tenth-largest derivative exchange by contract volume in 2009, one rung ahead of Chinese rival the Dalian Commodity Exchange, according to the annual Futures Industry Association's survey of the world's leading derivatives exchanges. The FIA report, published in early April 2010, notes that the number of futures and options traded on SHFE more than trebled from 2008 to 2009 to reach a volume of 434.9 million. The SHFE's leading contract by volume in 2009 was its Fuel Oil Futures, which rose almost 50% on 2008 to rank as the FIA's fifth-largest energy derivatives contract by volume. All contracts are settled by physical delivery. Trading hours are from 09:00 am to 11:30 am and 01:30 pm to 03:00 pm. The SHFE is a self-regulated, non-profit organization, overseen by the China Securities Regulatory Commission, with 219 members, including 183 brokerage firms. It also hosts more than 250 distant terminals. Headquartered in Shanghai, China. / Ройтас (Reuters).

SHANGHAI GOLD EXCHANGE = ШАНХАЙСКАЯ БИРЖА ЗОЛОТА – The Shanghai Gold Exchange (SGE thereafter), approved by the State Council and founded by the People's Bank of China, performs the regulated functions stipulated by Management Rules of Gold Exchange and organizes gold transactions with the principle of openness, fairness, justness and honesty. As a non-profit and self-managing legal entity, SGE carries out the following fundamental functions:- (i) provide place, facilities and related services for gold transaction; (ii) draw up and implement business regulation of SGE and normalize the transaction; (iii) organize and supervise transaction, settlement, delivery and transportation of precious metals including gold, silver, platinum, etc; (iv) set up the system of risk management to control risk of the market; (v) set reasonable price and issue market information; (vi) supervise the normal operation for its members' gold business and the timely fulfillment of contract, investigate and treat its members' violations of laws or regulations of SGE; (vii) supervise gold business of assigned delivery warehouses; (viii) connect international gold market with domestic gold market and strengthen the communication with international gold industry; and (ix) other functions stipulated by the People's Bank of China. Membership:- SGE adopts a membership system. Its members consist of qualified commercial banks, corporations registered in People's Republic of China, examined and approved by the People's Bank of China to produce, smelt, process, wholesale, import and export precious metals including gold, silver, platinum, etc. and products of precious metals. All the legal entities mentioned above should have fine credit and reputation. If any wants to apply for the membership of SGE, conditions mentioned below should be possessed:- (i) registered corporation in the People's Republic of China; (ii) accepting Charters and all business regulations of SGE; (iii) possessing at least RMB5 000 000 yuan net capital; (iv) boasting fine credit and operating history and no record of severely violation of laws in the past 3 years; (v) having complete organization, financial management system and gold transaction management system; (vi) fixing operating place and necessary facilities; (vii) paying membership fee and annual fee of SGE; and (viii) other

conditions stipulated by the People's Bank of China and SGE. Categories of Membership:- (i) Financial Membership:- conduct its own business or act as agent and other approved business; (ii) General Membership:- conduct its own business or act as agent; and (iii) Principal Membership:- conduct its own self business. Relative Charges:- Membership Fee & Annual Fee:- SGE draws up relevant membership fee and annual fee in accordance with distinct member categories, rights and obligation:- (i) financial membership:- membership fee is RMB800 000 yuan and annual fee is RMB50 000 yuan; (ii) general membership:- membership fee is RMB500 000 yuan and annual fee is RMB40 000yuan; and (iii) self-managing membership:- membership fee is RMB300 000 yuan, annual fee is RMB30 000 yuan. Transaction Procedure Fee:- Transaction Procedure fee of SGE is set temporarily 0.06%. Transportation Fee and Stock Fee:- related charges (including transportation fee and insurance fee, etc) of transportation of real gold under the delivery application of members is taken based on volume of real delivery gold. In addition, assigned warehouses charge fees under the regulations of SGE. Trading Manner:- during the early period of the operation of SGE, its transaction tool is spot transaction. SGE follows the principle of 'price priority, time priority' in making deal and employs the transaction manner of free quotation, computer matching, centralized settlement and delivery. In addition, its members can choose either trade on the spot or distant trade. Species and Price:- SGE employs normalized transaction and the gold used for transaction should meet the standard regulated by SGE. At present stage, SGE conducts transaction of the following two types:- Au99.99 and Au99.95. The standard weights of bullion, gold bar and gold coin are 50 gram, 100 gram, 1 kilogram and 3 kilogram respectively. The unit of quotation is RMB yuan/gram. The smallest transaction unit of bullion is kilogram and the fewest delivery amount is 6 kilograms. Trading Hour:- from Monday to Friday (except China's legal holidays):- 10:00 am–11:30 pm 13:30–15:30. Clearing:- currently, SGE assigns the Industrial & Commercial Bank of China, the Bank of China, China Construction Bank and the Agricultural Bank of China as its capital settlement banks and conducts the settlement under the principle of concentration, directness and net valuation. The settlement speed is 'T+0'. Stock and Delivery:- SGE follows the principle of 'choosing stock and delivery warehouses', setting up 41 assigned warehouses in 34 cities all over the country to facilitate members' stocking and taking delivery of gold. SGE conducts gold maneuver consolidatedly, ensuring the delivery of gold within 3 days after the completion of the deal. The delivery speed is T+0. Quality Test:- SGE appoints quality examination institutions to conduct qualification examination for gold quality standard and ratify refine factory and grade attestation. Quality examination institutions also conduct examination and arbitration for dispute on quality. Only gold produced by the accredited corporations which could provide standard bullion and gold bar in accordance with standard regulated by SGE could be traded and the qualified smelting works shall pay lifelong guarantee for the quality of their products. Tax Principle:- for all standard gold transacted through the Exchange, SGE keeps the principle of immediate collection and return of value-added tax approved by Treasury Department of the State and the Tax Bureau. Member Service:- SGE will actively safeguard and guarantee the legal rights of its members during the transaction and will regard members as fundaments while providing wholehearted and first-rate service for its members. System platform:- SGE provides convenient, fast, safe and reliable trade system with advanced techniques, proper design and complete function to satisfy the need of its future member in gold transaction. Quality Guarantee:- SGE consigns authorized quality examination institutions to conduct quality supervision and selective examination, drawing up quality management rules and ensures quality of gold for transaction. Capital Safety:- SGE conducts capital settlement through national branches of assigned settlement banks and consolidatedly manages capital account to ensure safe, convenient and fast movement of capital. Sharing Information:- its members can receive and consult through SGE the simultaneous information and quotation of the Exchange and the transaction conditions of international precious metals, commentaries and related reports. The establishment of SGE enables the construction of a complete financial market system of our country by combining Chinese gold market with currency, share and foreign exchange market together. The Shanghai Gold Exchange was founded in 2002-October-30 (a date of the official opening). Headquartered in Shanghai, the People's Republic of China. Website:- http://www.sge.sh. In May 2010, the exchange announced it was planning to offer gold exchange-traded funds (ETFs). The possibility of ETFs is driven in part by strong Chinese demand for gold. Gold demand, in the first quarter of 2011, more than doubled, surpassing India as the largest market for gold coins and bars, according to the World Gold Council. In March of 2008 the China Banking Regulatory Commission (CBRC) issued permits allowing Chinese commercial banks to trade gold futures on the Shanghai Futures Exchange (SHFE). Commercial banks are required to be members of the SGE and the SHFE before conducting gold futures trading through the SHFE. Moreover, banks must have a capital adequacy ratio of over eight percent, the CBRC announced. The People's Bank of China gave approval to the Shanghai Gold Exchange in mid-2007 to accept foreign banks as members. Foreign banks applying to be accepted as members of China's Shanghai Gold Exchange should be locally incorporated. / коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо). Выплавка или Плавление (Smelting).

THE SHANGHAI METAL EXCHANGE = ШАНХАЙСКАЯ БИРЖА МЕТАЛЛОВ – The Shanghai Metal Exchange (SHME), one of the national level futures exchanges of China, was established on 1992-May-28. SHME is a non-profit, self-regulating corporation. The exchange was created for trading in non-ferrous metals and currently contracts for several non-ferrous metals including copper, aluminum, lead, zinc, tin, and nickel. SHME is located in the city of Shanghai and its geographical location bridges the time gap between London Metal Exchange and New York Mercantile Exchange markets, thus enabling traders across the world to have a 24-hour access to futures contracts of non-ferrous metals. SHME is currently the largest non-ferrous metals futures exchange in China and the third largest exchange of its kind in the world. See also Shanghai Futures Exchange. It is a Chinese national exchange for non-ferrous metals futures, trading on a trial basis by authority of the State Council. With its unique geographic location amid major Asiatic cities, SHME manages to bridge the time gap between the London and New York metal markets, facilitating uninterrupted 24-hour global trading. SHME is currently the largest non-ferrous metals futures exchange in China. Shanghai Metal Exchange (SHME) was established on 1992-May-28, focusing on non-ferrous metals futures trading. In October, 1992, the State Council gave it conditional approval as one of the country's first 15 futures exchanges. SHME is a non-profit, self-regulating corporation. Under the leadership of the Members' Conference and the Board of Directors, SHME provides its member companies with overall services and regulatory control. The listed futures contracts now include Aluminium, Copper, Lead, Nickel, Tin and Zinc. SHME has adopted clearing system and fair trading regulations for the conduct of all its transactions. SHME's futures contracts have developed within the Chinese futures markets and are in line with international markets. In 1995 and 1996, the government adopted SHME's prices as the basis for state-allotted metals pricing, so SHME's metals prices act very much as a gauge of the current domestic physical market. SHME has been effectively engaged in the full implementation of such futures markets' mechanisms as hedging and pricing discovery. Since its establishment, SHME has maintained stable operating policies in the fields of risk management, market analysis and education, and innovation. It has gained its reputation as an exceptional organization by emphasizing business ethics, social morality and service quality. In August, 1995, SHME reformed its structure to comply with international conventions regulating participation in futures trading; as a result, its legal status, organizational framework and membership practices have been greatly improved. With new operating procedures now in place, SHME has reassumed its position at the forefront of China's futures market. It is continuously expanding its business operations and enhancing its market risk management strategies. Current indicators and a commitment to long-term growth portend an exciting future for Shanghai Metal Exchange. Headquartered in Shanghai, China. / инновация .

THE SHANGHAI STOCK EXCHANGE = ШАНХАЙСКАЯ ФОНДОВАЯ БИРЖА – The Shanghai Stock Exchange (SSE) was founded on 1990-November-26 and in operation on December-19 the same year. It is a non-profit-making membership institution directly governed by the China Securities Regulatory Commission (CSRC). The SSE bases its development on the principle of 'legislation, supervision, self-regulation and standardization' to create a transparent, open, safe and efficient marketplace. The SSE endeavors to realize a variety of functions:- providing marketplace and facilities for the securities trading; formulating business rules; accepting and arranging listings; organizing and monitoring securities trading; regulating members and listed companies; managing and disseminating market information. After several years' operation, the SSE has become the most preeminent stock market in Mainland China in terms of number of listed companies, number of shares listed, total market value, tradable market value, securities turnover in value, stock turnover in value and the T-bond turnover in value. December 2004 ended with over 37.87 million investors and 837 listed companies. The total market capitalization of SSE hit RMB2.6 trillion. In 2004, Capital raised from SSE market surpassed RMB45.7 billion. As at the end of 2009, SSE boasted 1 351 listed securities and 870 listed companies, with a combined market capitalization of RMB18 465.523 billion and a total of 89.654 3 million trading accounts. In 2009, listed companies raised RMB334.315 billion on SSE through IPO and new share placement. A large number of companies from key industries, infrastructure and high-tech sectors have not only raised capital, but also improved their operation mechanism through listing on Shanghai stock market. Entering the new century, SSE is faced with great opportunities as well as challenges to further boost the market construction and regulation. Combining the cutting-edge hardware facilities and favorable policy conditions in Pudong, exemplary role of Shanghai economy, SSE is fully committed to the goal of state-owned industrial enterprises reform and developing Shanghai into an international financial center with great confidence. Headquartered in Shanghai, China.

SHANK = ВЕРЕТЕНО – Shank (maritime term):- the main piece of the anchor having the arms at the bottom and the Jew's harp at the top.

SHANTUNG = ШАНТУНГ (или ЧЕ–СУ–ЧА, или ЧЕСУНЧА) – Shantung is a heavy fabric that is often made with either silk fibers or some form of synthetic fibers that are meant to be substitutes for cotton filaments. Sometimes referred to as Spun Wild Silk, the texture of shantung is somewhat rough but not unpleasant to the touch. Here are some basic facts about shantung fabric, including a few examples of common uses for the material. One of the characteristics that give shantung its reputation as a rough fabric is found in the weave of the material. Instead of some sort of intricate weave, shantung employs as very simple plain weave design with a ribbed effect. What allows the plain weave to produce the raised or ribbed sections of the fabric is the fact that slubbed yarns are used in the warp of the material. The use of raw silk fibers in the weave of the shantung is sometimes produced with similar results by using nylon or rayon blends that are geared toward imitating the look and feel of slubbed cotton fibers. Whether produced with spun silk or synthetic blends, shantung is a durable nubby fabric that has both texture and visual attraction. One of the more common uses of this rough silk fabric is in the production of men's suits and jackets that are considered heavy enough for wear in cooler weather. Ideal for the spring and autumn seasons, shantung jackets can be the perfect compliment to a pair of dress slacks or a pair of jeans. Equally at home in the workplace and as casual wear for an evening on the town, these shantung sports jackets do require dry cleaning. However, shantung is also a stain resistant material, which can cut back on trips to the dry cleaners. Along with attire for men, shantung can also be used for dresses and skirts for women. As a material that is heavy enough to drape nicely but not heavy enough to feel cumbersome, shantung can be used with pleated designs, A line skirts, and just about any length that is desired. Like the men's suits and sports jackets, shantung dresses and skirts require dry cleaning, but are also resistant to many types of staining. The crisp texture of shantung goes a long way toward giving any garment made with the material a sharp look that manages to retain a playful air as well. Shantung has lately begun to make the rounds in household textiles as well. As simple drapery panels, shantung holds color well and often does not require liners to keep from fading. The material also works well for Cornice boards and swags. As a casual linen option, shantung can also be employed as table covers and in runners to dress up sideboards and other furniture. As a moderately heavy fabric option, shantung may soon be found around the home more often, and in some new applications. Shantung is a medium-weight, plain weave fabric, characterized by a ribbed effect, resulting from slubbed yarns used in the warp or filling direction. End-uses include dresses and suits. Shantung (Silk) is a douppioni type of silk that comes from Shantung province in China. This fabric is woven from wild silk, and comes with slubs and a subtle sheen. Shantung is a plain-weave fabric with unevenly ribbed surface and crisp texture. Shantung is a silk similar to pongee in that it, too, is made with slubbed yarns, but in shantung the unevenness of the yarns is even greater. Shantung is one of the fabrics that originated in silk and has been imitated extensively in the man-made fibers. Shantung is a mediumweight, plain-weave fabric with an unevenly ribbed surface and a plain texture. It is usually used for dresses and suits, and is similar to Dupioni silk, except with a more refined appearance. Shantung is a plain weave fabric (cotton, silk, rayon, synthetics) having a slightly irregular surface due to uneven slubbed filling yarns. It is a raw silk made from Tussah silk or silk waste, depending on the quality. It is quite similar to pongee, but has a more irregular surface, heavier, and rougher. Most of the slubs are in the filling direction. Wrinkles quite a bit. Underlining helps to prevent this as well as slipping at the seams. Do not fit too tightly, if long wear is expected. Comes in various weights, colors and also printed. / в направлении основы или уточины. Найлан^{T3} (Nylon^{TM}). Шантунг – провинция в Китае, славящаяся шёлком дубовых шёлкопрядов.

SHAPE A COURSE = ПРОКЛАДЫВАТЬ КУРС – Shape A Course (maritime term):- to ascertain the proper course to be steered to make the desired point or port.

SHAPED YARNS = ПРЯЖИ ОПРЕДЕЛЁННОЙ ФОРМЫ (или ФИГУРНЫЕ ПРЯЖИ) – Shaped Yarns (polyamide, polyester, and other types) are formed by spinnerets with shaped orifices rather than round ones. As a result, yarns with various cross sections or with internal channels are produced. With ordinary stretchability, they have a lower weight for a given volume, a matte finish, and increased hygroscopicity. Yarns similar in appearance and properties to natural yarn can be obtained by this method. See also Textured Yarns.

SHARE = АКЦИЯ (или ДОЛЯ, или ПАЙ) – The Share is a security which embodies an equity ownership right in a company. Shares are issued by joint stock corporations (Aktiengesellschaft (AG)) or limited partnerships based on shares (Kommanditgesellschaft auf Aktien (KGaA)). In its external form, the share consists of a share certificate and a dividend coupon sheet with talon. The owner of a share, the so-called 'Shareholder', owns a share of the company's share capital – in percentage terms or in the nominal amount printed on the share. The rights securitized by a share are regulated in the Stock Corporation Act and in the respective company's Articles of Association. A shareholder's basic rights include the right to attend the annual general meeting (AGM), the right to vote at the AGM, the right to a share of the companys profits, the right to subscribe to new shares (pre-emptive right), the right to information and the right to a share of liquidation proceeds. A Share is the unit into which the ownership interest in a corporation is divided. / Акциэнгэзэльшафт (А.Ге.; Aktiengesellschaft (AG)) Командитгэзэльшафт ауф Акциэн (Ка.Ге.а.А; Kommanditgesellschaft auf Aktien (KGaA)). Акция в тысячу рублей. Акция – доля участия в акционерном обществе; доля основного капитала. Бывают Винкулированные Акции = Связанные Акции; Обыкновенные Акции = Простые Акции; Многоголосые Акции. Распространяются путём Подписки На Акции, включая Публичной Подписки На Акции. Под Акцией, от Голландского слова Aktie, от Немецкого слова Aktie), ценная бумага, представляющая собой свидетельство о вложении определённой доли капитала или средств в акционерное общество и дающая право на получение некоторой части его прибыли в виде дивиденда. По буржуазному акционерному праву и уставам

акционерных обществ акции выпускаются в равных долях акционерного капитала и круглых суммах (например, 100, 50, 25, 10, 5 Долларов). По характеру распоряжения ими акции делятся на Именные и Предъявительские, причём первые обычно выпускаются в крупных, вторые в меньших, а иногда и совсем в мелких купюрах. Купюра предъявительских акций зависит от акционерной политики и возможности действительных хозяев акционерных обществ ввести акции в оборот фондовой биржи для привлечения средств широких кругов населения. Так, Англо-Американское право и практика привели к выпуску предъявительских акций в мелких и мельчайших купюрах (до 1 Доллара и 1 Фунта Стерлинга). Напротив, право и практика акционерных обществ России ограничивали, как правило, минимальную купюру акции 100 Рублями. Для 'ограждения' интересов мелких капиталистов и 'сберегателей' в России, в отличие от Запада, устанавливалось предельное число голосов, которые мог иметь один акционер на общем собрании акционерного общества. Правда, эти юридические пределы легко обходились банками и крупными капиталистами путём раздачи своего пакета акций служащим, которые являлись на собрании формально владельцами акций, а практически голосовали по команде своих хозяев. По размерам приносимого дохода различают Обыкновенные и Привилегированные Акции, причём фактически преимущества предоставляются владельцам обыкновенных акций (смотрите Акционерное Общество). Правовые преимущества привилегированных акций выражаются в первоочередном праве на получение дивиденда и вложенных в акции (по их номинальной цене) средств в случае ликвидации акционерного общества, но после удовлетворения прав владельцев облигаций, которые всегда обеспечены имуществом акционерного общества. Далее акционерное право и практика в разных странах расходятся. В Федеративной Республике Германия (ФРГ) и Франции после выплаты дивиденда установленного размера по привилегированным акциям выплачивается в том же проценте дивиденд по обыкновенным акциям. Остаток суммы, предназначенной на выплату дивиденда, распределяется затем в равных долях по обыкновенным и привилегированным акциям. Этот основной порядок применяется с различными модификациями в разных странах; причём владельцы обоих видов акций имеют равное право голоса на общем собрании. В практике акционерных обществ в Соединённых Штатах Америки (США) первоочередное право привилегированных акций на дивиденд сведено к 4–6% от их номинала и они лишены права голоса на общем собрании. Это фактически приближает привилегированные акции к облигациям с той лишь разницей, что дивиденд по ним несколько выше процента, но не гарантируется при недостаточной рентабельности акционерного общества. Особым видом привилегированных акций являются так называемые Многоголосые Акции (1920-е в Германии). Название явно неточное, так как появившийся в условиях восстановления монополиями США военного потенциала Германии новый вид акций не был многоголосым. Наоборот, акции пользовались заниженным правом голоса по сравнению со старыми, которые находились во владении Германских магнатов монополистического капитала. Тем самым старые акции стали как бы многоголосыми и дали возможность Германским монополиям не допустить Американских партнёров в число хозяев акционерных обществ крупной промышленности и банков. Под Акциями, от Голландского слова Actie, от Немецкого слова Aktie, понимаются ценные бумаги, выпускаемые акционерными обществами без установленного срока обращения. Акция удостоверяет внесение её владельцем доли в акционерный капитал (уставный фонд) общества. Акция даёт следующие права:- (i) на получение части прибыли в виде дивидендов; (ii) на продажу на рынке ценных бумаг; (iii) на участие в управлении акционерным обществом; (iv) имущественное право. Акция – эмиссионная ценная бумага, выпущенная акционерным обществом (АО) без установленного срока обращения. Акция удостоверяет внесение её владельцем доли в акционерный капитал (уставный фонд) общества. Акция предоставляет владельцу права:- (i) на получение части прибыли в виде дивидендов; (ii) на продажу на рынке ценных бумаг; (iii) на участие в управлении АО; и (iv) на долю имущества при ликвидации АО. Акция:- эмиссионная ценная бумага, закрепляющая права её владельца (акционера) на получение части прибыли акционерного общества в виде дивидендов, на участие в управлении акционерным обществом и на часть имущества, остающегося после его ликвидации. Выпуск акций на предъявителя разрешается в определённом отношении к величине оплаченного уставного капитала эмитента в соответствии с нормативом, установленным Российской Федеральной Комиссией по Рынку Ценных Бумаг. Акционерное общество вправе размещать обыкновенные акции, а также один или несколько типов привилегированных акций. Номинальная стоимость всех обыкновенных акций общества должна быть одинаковой. Номинальная стоимость размещённых привилегированных акций не должна превышать 25 процентов от уставного капитала общества. При учреждении общества все его акции должны быть размещены среди учредителей. Все акции общества являются именными. Акции, поступившие в распоряжение общества, не предоставляют права голоса, не учитываются при подсчёте голосов, по ним не начисляются дивиденды. Такие акции должны быть реализованы не позднее одного года с момента их поступления в распоряжение общества, в противном случае общее собрание акционеров должно принять решение об уменьшении уставного капитала общества путём погашения указанных акций.

SHARE ALLOCATION = ВЫДЕЛЕНИЕ АКЦИЙ – Share Allocation is the single most misused, neglected, and damaging aspect of trading. Allocation and leverage are synonymous. Careless share size allocation is what kills off most traders and blows out accounts. Whether this results from filtered intraday scalping, swing trading, investing, or the desperate all-in, hall mary desperation trade – size kills. A trader's job is to identify fertile market environments with solid setups and take advantage with the proper leverage and allocation. A week's profit can be made on a single trade if you filter properly. As you evolve as a trader, you will understand the term 'Squandered Opportunity'. Only at these levels can you understand what Sun Tzu meant when he said, 'A skilled fighter puts himself in a situation where defeat is impossible, yet never misses the opportunity to defeat the enemy'. / Сан Тза (Sun Tzu; 544–496 до Нашей Эры; Китайский генерал, военный стратег, писатель и философ).

SHARE–BASED PAYMENT = ПЛАТЁЖ, ОСНОВАННЫЙ НА АКЦИИ (или ПЛАТЁЖ, БАЗИРУЮЩИЙСЯ НА ДОЛЕ) – IFRS 2 (short for the International Financial Reporting Standards No. 2) Share-Based Payment – the objective of this IFRS is to specify the financial reporting by an entity when it undertakes a share-based payment transaction. In particular, it requires an entity to reflect in its profit or loss and financial position the effects of share-based payment transactions, including expenses associated with transactions in which share options are granted to employees. The IFRS requires an entity to recognise share-based payment transactions in its financial statements, including transactions with employees or other parties to be settled in cash, other assets, or equity instruments of the entity. There are no exceptions to the IFRS, other than for transactions to which other Standards apply. This also applies to transfers of equity instruments of the entity's parent, or equity instruments of another entity in the same group as the entity, to parties that have supplied goods or services to the entity. The IFRS sets out measurement principles and specific requirements for three types of share-based payment transactions:- (a) equity-settled share-based payment transactions, in which the entity receives goods or services as consideration for equity instruments of the entity (including shares or share options); (b) cash-settled share-based payment transactions, in which the entity acquires goods or services by incurring liabilities to the supplier of those goods or services for amounts that are based on the price (or value) of the entity's shares or other equity instruments of the entity; and (c) transactions in which the entity receives or acquires goods or services and the terms of the arrangement provide either the entity or the supplier of those goods or services with a choice of whether the entity settles the transaction in cash or by issuing equity instruments. For equity-settled share-based payment transactions, the IFRS requires an entity to measure the goods or services received, and the corresponding increase in equity, directly, at the fair value of the goods or services received, unless that fair value cannot be estimated reliably. If the entity

cannot estimate reliably the fair value of the goods or services received, the entity is required to measure their value, and the corresponding increase in equity, indirectly, by reference to the fair value of the equity instruments granted. Furthermore:- (a) for transactions with employees and others providing similar services, the entity is required to measure the fair value of the equity instruments granted, because it is typically not possible to estimate reliably the fair value of employee services received. The fair value of the equity instruments granted is measured at grant date. (b) for transactions with parties other than employees (and those providing similar services), there is a rebuttable presumption that the fair value of the goods or services received can be estimated reliably. That fair value is measured at the date the entity obtains the goods or the counterparty renders service. In rare cases, if the presumption is rebutted, the transaction is measured by reference to the fair value of the equity instruments granted, measured at the date the entity obtains the goods or the counterparty renders service. (c) for goods or services measured by reference to the fair value of the equity instruments granted, the IFRS specifies that vesting conditions, other than market conditions, are not taken into account when estimating the fair value of the shares or options at the relevant measurement date (as specified above). Instead, vesting conditions are taken into account by adjusting the number of equity instruments included in the measurement of the transaction amount so that, ultimately, the amount recognised for goods or services received as consideration for the equity instruments granted is based on the number of equity instruments that eventually vest. Hence, on a cumulative basis, no amount is recognised for goods or services received if the equity instruments granted do not vest because of failure to satisfy a vesting condition (other than a market condition). (d) the IFRS requires the fair value of equity instruments granted to be based on market prices, if available, and to take into account the terms and conditions upon which those equity instruments were granted. In the absence of market prices, fair value is estimated, using a valuation technique to estimate what the price of those equity instruments would have been on the measurement date in an arm's length transaction between knowledgeable, willing parties. (e) the IFRS also sets out requirements if the terms and conditions of an option or share grant are modified (eg an option is repriced) or if a grant is cancelled, repurchased or replaced with another grant of equity instruments. For example, irrespective of any modification, cancellation or settlement of a grant of equity instruments to employees, the IFRS generally requires the entity to recognise, as a minimum, the services received measured at the grant date fair value of the equity instruments granted. For cash-settled share-based payment transactions, the IFRS requires an entity to measure the goods or services acquired and the liability incurred at the fair value of the liability. Until the liability is settled, the entity is required to remeasure the fair value of the liability at each reporting date and at the date of settlement, with any changes in value recognised in profit or loss for the period. For share-based payment transactions in which the terms of the arrangement provide either the entity or the supplier of goods or services with a choice of whether the entity settles the transaction in cash or by issuing equity instruments, the entity is required to account for that transaction, or the components of that transaction, as a cash-settled share-based payment transaction if, and to the extent that, the entity has incurred a liability to settle in cash (or other assets), or as an equity-settled share-based payment transaction if, and to the extent that, no such liability has been incurred. The IFRS prescribes various disclosure requirements to enable users of financial statements to understand:- (a) the nature and extent of share-based payment arrangements that existed during the period; (b) how the fair value of the goods or services received, or the fair value of the equity instruments granted, during the period was determined; and (c) the effect of share-based payment transactions on the entity's profit or loss for the period and on its financial position. Transactions where an entity receives, typically, services from its employees, which entitles the employee to receive, typically, equity instruments of the entity, provided they meet any applicable specified vesting conditions. / порядки и условия .

SHARE CAPITAL = АКЦИОНЕРНЫЙ КАПИТАЛ (или УСТАВНЫЙ КАПИТАЛ) – Share Capital:- the maximum amount with which a company gets registration/incorporation is called Authorized Share Capital of that company. This capital can be increased with the prior approval of security and exchange commission. This capital is further divided in to smaller denominations called Shares. Each share usually has a face value equal to USD0.01. According to Companies Ordinance, this face value can be increased but can not be decreased. The value of share written on its face is called Face Value. Shares are issued for cash as well as for any asset. For example, if any member of the company sell his/her land to the company. In return, company issue him/her fully paid shares instead of paying cash. Those shares are also part of paid up capital because company has received the benefit of that amount. In the United Kingdom, Share Capital is the company's authorised capital. In the United Kingdom, Share Capital is a capital raised by a company through an issue of shares. Share Capital is the company's issued and paid-up capital. In the United States, the portion of a corporation's equity obtained from issuing shares in return for cash or other considerations. Also known as Equity Financing. Shares issued to or available to be issued to shareholders. Issued share capital is the value of shares issued to and held by shareholders. Authorised Share Capital is the value of the shares available to be issued. Issued share capital cannot exceed authorised share capital. Money put into a business by its owners for use by the business in acquiring assets and retained profits. Common shares outstanding. Share Capital is a subscribed capital of a joint-stock company, divided up into equity shares. The statutory nominal capital is at least 50 000 Euros, but is usually much higher. The par value indicates the fraction of a company's nominal capital represented by a single share. No-par shares, on the other hand, securitize ownership in proportion of the number of shares owned to the company's total number of shares. Share capital can only be raised or decreased with the approval of the General Meeting. / Основной капитал акционерного общества, размер которого определяется его уставом. Акционерный капитал формируется за счёт выпуска акций. Под Уставным Капиталом понимается первоначальная сумма капитала предприятия (фирмы), определённая его уставом и формируемая в основном за счёт выручки от продажи акций. Под Уставным Капиталом понимается первоначальная сумма капитала предприятия (фирмы), необходимая для начала его деятельности и определённая его уставом или договором об основании предприятия, акционерного общества, компании, корпорации или иного объединения предпринимателей. Уставный капитал формируется в основном за счёт выручки от продажи акций, а также вложений частных капиталов или государственных средств. Для обозначения уставного капитала употребляются также термины Акционерный Капитал, Основной Капитал, Разрешённый Капитал. Законодательством ряда стран (Германия, Франция) устанавливается обязательный размер уставного капитала, при наличии которого предприятия и объединения регистрируются как действующие. В Великобритании и Соединённых Штатах Америки размер уставного капитала законодательством не лимитируется. Уставный капитал значительно меньше привлечённого в форме кредитов, инвестиций и облигаций и тому подобного капитала. Вместе с резервным капиталом он составляет собственные средства предприятия. Так как соответствие уставного капитала общему объёму хозяйственной деятельности считается признаком финансовой устойчивости, при высоких темпах инфляции предприятия и банки регулярно увеличивают размер уставного капитала путём размещения вновь выпускаемых акций.

SHARE CERTIFICATE = СЕРТИФИКАТ АКЦИИ (или СВИДЕТЕЛЬСТВО О ВЛАДЕНИИ АКЦИЯМИ) – Share Certificate is the evidence of ownership of the number of shares held by a member of the company. When a company issue more than one share to its member, it does not issue that number of shares to him/her. Instead, it issues a certificate under the stamp of the company that a particular number of shares are issued to member of the company. A document with an identifying number that states that the person is a registered holder of a number of securities. In Australia, replaced by electronic holding statement in January 1999. Also known as Scrip. / Документ с идентифицирующим номером, который указывает на то, что данное лицо является зарегистрированным

держателем определённого количества ценных бумаг. В Австралии, в Январе 1999 был заменён на электронную выписку об удержании. Известен также как Подписной Сертификат (Scrip). Акционерный Сертификат (Share Certificate) – документ, удостоверяющий юридическое право собственности на акции акционерного общества. Если акция зарегистрирована в форме сертификата, то дивиденды переводятся владельцу по почте. После перепродажи акций трансфер-агент акционерного общества переводит право собственности на покупателя и выдаёт новый сертификат. Акционерный сертификат – неотчуждаемый финансовый документ.

SHARE CLASSES = КЛАССЫ АКЦИЙ – Share Classes:- a company's ownership can be represented by various share classes, e.g., Class A, B, etc, Preferred shares, Cumulative Preferred, Series A...B...etc, etc. Each class has defined rights and privileges associated with it. This can get complex and many companies are getting away from having too many different classes. Suffice it to say that 'common shares' define the ownership and it is these common shares that we generally see traded and listed in the newspapers' stock market lists. / Класс Акций – совокупность акций акционерной компании с идентичными правами и обязанностями:- обыкновенные акции, привилегированные акции и другие. Классы Акций:- фонды с нагрузкой часто предлагают инвесторам акции нескольких типов, или классов, каждый из которых характеризуется определённым сочетанием 'нагрузки' и коэффициента расходов, таким образом, предоставляя инвесторам возможность дополнительного выбора. Одни и те же классы акций разных фондов могут отличаться друг от друга. Основными характеристиками классов акций являются следующие:- (i) Класс А (Class A) – имеет 'начальную' нагрузку; в ряде случаев могут взиматься комиссионные 12b-1 в размере до 0.5%. (ii) Класс В (Class B) – имеет 'конечную' нагрузку; по этому классу взимаются комиссионные 12b-1, которые могут доходить до 1%. Акции класса В в конечном счёте конвертируются в акции класса А, и в этом случае размер комиссионных 12b-1 снижается. (iii) Класс С (Class C) – этот класс характеризуется высокими комиссионными 12b-1, как правило, составляющих 1%, (что определяет более высокий коэффициент расходов), но не имеет нагрузки. Акции класса С никогда не конвертируются в акции класса А.

SHARE DRAFT = ПАЕВОЙ ПРОЕКТ – Share Draft is a form of consumer cooperative that makes short-term personal loans to its members, usually at lower interest rates than are available from commercial banks. Its funds consist of members' deposits, which are regarded as purchases of shares. Members may withdraw funds in cash or by using share drafts, which are similar to checks. In the United States, most credit unions are formed by the employees of a given organization. Federally chartered credit unions are regulated by the National Credit Union Administration (NCUA). Also known as Credit Union or Credit Cooperative in the United Kingdom.

SHARE EXCHANGE = ОБМЕН АКЦИЙ – In the United States, Share Exchange is a statutory form of business combination in which some or all of the shares of one corporation are exchanged for some or all of the shares of another corporation and neither corporation ceases to exist.

SHAREHOLDER = АКЦИОНЕР (или ДОЛЬЩИК, или ПАЙЩИК) – In the United States, Shareholders are the owners of a corporation based on their holdings. They own an interest in the corporation rather than specific corporate property. Person who holds shares in a company. Shareholders are generally entitled to receive or inspect the business report, including the financial statements, the directors' annual report, the audit report and the board's proposal for profit appropriation at the company's head offices and branches at least 20 days before the ordinary general meeting takes places, which must be held within six months of the balance sheet date. In practice, these documents are sent to the shareholders or made available on the Internet. Part-owner of a corporation by virtue of holding one or a number of shares in it. Shareholder is the owner of shares is referred to as the Shareholder. He has certain membership rights, which are regulated in detail in the Stock Corporation Act. His most important rights include the right to attend the annual general meeting (AGM), the right to vote, certain rights to information, the right to subscribe to new shares (pre-emptive right), and the right to a share of liquidation proceeds. In addition, the shareholder is entitled to a share of the company's profits, provided the profits are not excluded from distribution to the shareholders by legislation, the articles of association (e.g., the obligation to form reserves) or by a resolution passed by the shareholders in general meeting. The shareholder has no direct influence on the management of the company. However, he can be invited by the management board to participate in decisions taken by the annual general meeting on specific questions of management. He acquires membership by subscribing to, or purchasing, the shares and he reliquishes ownership by selling his shares. Only his investment is liable for the company's financial obligations. Owner of a share representing part of a company's capital. The shareholder's liability is limited to the loss of its shares. Also known as Stockholder. / Физическое или юридическое лицо, владеющее акциями данного акционерного общества. Акционер – владелец акции; лицо, обладающее акцией и пользующееся всеми вытекающими из этого правами. Под Акционером, от Французского слова Actionnaire, означающее Владелец Акций, понимается юридическое или физическое лицо, являющееся собственником акций акционерного общества. Акционер – совладелец акционерного общества. Акционер отвечает по имущественным обязательствам общества только в пределах своего личного вклада в капитал. Акционер не вправе требовать от общества возврата его вклада, за исключением случаев, предусмотренных нормативными документами или уставом общества.

SHAREHOLDERS' EQUITY = СОБСТВЕННЫЕ СРЕДСТВА АКЦИОНЕРОВ (или СОБСТВЕННЫЙ АКЦИОНЕРНЫЙ КАПИТАЛ, или ДОЛЯ АКЦИОНЕРОВ) – Shareholders' Equity is ownership interest of common and preferred stockholders in a company. The difference between the assets and liabilities of a company which is sometimes called Net Worth. Equity divided by the number of shares outstanding gives equity per share. In the United States, a portion of a corporation's assets owned by the holders of its common and preferred stock rather than by the corporation itself. Shareholder's equity is shown on the liabilities side of the balance sheet, and is equal to the excess of a firm's assets over its liabilities, or net worth. Also known as Equity Shareholders' Funds in the United Kingdom, and Stockholders' Equity in the United States. Shareholders' Equity completes the equity side of the balance sheet. The presentation of shareholders' equity can be confusing since it includes three parts:- (i) par value; (ii) additional paid-in capital; and (iii) accumulated retained earnings or deficit. Par value is a stated value for the stock that is legally required. It does not have any relationship to the stock's actual market value. Since the par value is the lowest value at which a share of stock can trade, it is usually set at one cent (USD0.01). Thus, the balance sheet lists the stock's par value as the number of issued shares of stock times the par value. Shareholders Equity is the value of the company as determined by deducting Liabilities from Assets. Also known as Net Worth. Shareholders' Equity is an item on the liabilities side of the balance sheet. It includes subscribed capital (share capital), additional paid-in capital, retained earnings, profit or loss brought forward, and the net income or loss for the year. Without equity capital it is virtually impossible to obtain debt financing as lenders require borrowers to have sufficient liable capital.

SHAREHOLDERS' FUNDS = ФОНДЫ АКЦИОНЕРОВ – In accounting, Shareholders' Funds are the total of share capital and reserves. / В бухгалтерском учёте, итоговая сумма акционерного капитала и резервов.

SHAREHOLDERS' FUNDS PER SHARE = ФОНДЫ АКЦИОНЕРОВ НА АКЦИЮ – Shareholders' Funds Per Share is the ratio Shareholders' Funds Per Share = Shareholders' Funds / Total Issued and Fully Paid Shares at End of the Year.

SHAREHOLDER VALUE = СТОИМОСТЬ ПО ОЦЕНКЕ АКЦИОНЕРАМИ – Shareholder Value refers to the benefit (capital gains and dividends) accruing to shareholders from their investment. The shareholder value approach contains all aspects of company

management aimed at increasing the long-term value of the company. Corporate value kept as high as sustainably possible in the shareholders' interests. See also Stakeholder Value. / Смотрите также Стоимость По Оценке Дольщиками или Стоимость По Оценке Пайщиками (Stakeholder Value).

SHARE INDEX = ФОНДОВЫЙ ИНДЕКС (или ИНДЕКС ПО АКЦИЯМ) – Share Index is an indicator that shows the average change in value of a number of individual shares or groups of shares on the stock market. Share indexes therefore give an overall guide to movements in the financial markets. Examples include the Dow Jones Industrial Average (DJIA), the Financial Times Stock Exchange 100 Index (FTSE® or FT-SE® or Footsie®, which is calculated and maintained by FTSE International Ltd to illustrate the performance of various sectors of the UK and European markets) and the Nikkei-Dow Average. In Switzerland the most commonly used equity price indices are the Swiss Performance Index (SPI) and the Swiss Market Index (SMI). International indices can also be calculated by weighting the individual indices and stating the figures in terms of a standard currency. A Share Index is a key figure showing the development of share prices in a certain segment of the stock market. Its purpose is to document on a representative basis the development of this sub-section of the global financial market. Share indices can be sub-divided into 'all share' indices, 'selection' indices or 'sector' indices. Among the best known indices are the DAX®, the Dow Jones Industrial Average Index and the Standard & Poor's 500 Index in the United States of America, the Financial Times Index in the United Kingdom and the Nikkei Index in Japan. In general, share indices are a simple, but useful, gauge of sentiment (stock market barometer) for business activity in national economies or for the development of certain industries or sectors of the economy. / Дау Дьжонз (Dow Jones). Стэндод энд Поз (Standard & Poor's). Индекс от Никкэй (Nikkei Index).

SHARE OPTION = ОПЦИОН НА АКЦИИ – Share Option is the UK scheme that gives the employees the option to buy shares of their company at attractive prices, normally well below market price, at a specific future date. / В Соединённом Королевстве схема, предоставляющая служащим опцион на покупку акций своей компании по привлекательным ценам, как правило, ниже рыночной цены, на конкретную дату в будущем.

THE SHARE OPTION PLAN = ПЛАН ОПЦИОНА НА АКЦИИ – The company Share Option Plan, a closed plan approved by shareholders on listing or IPO (Initial Public Offering) and adopted to provide maximum flexibility in the design of incentive arrangements over the long term.

SHARE PREMIUM ACCOUNT = СЧЁТ ПРЕМИЙ ПО АКЦИЯМ – In the United Kingdom, Share Premium Account:- where shares are issued at a premium, the excess of the consideration over the nominal value must, in most circumstances, be transferred to a share premium account. The share premium account may not be distributed and can only be used to:- (i) issue fully paid bonus shares; (ii) write off preliminary expenses; (iii) write off the expenses of share or debenture issues; (iv) write off any discount allowed on a debenture issue; and (v) provide the premium payable on the redemption of debentures. In the United Kingdom, Share Premium Account is the special reserve in a company's balance sheet to which share premiums are credited. Expenses associated with the issue of shares may be written off to this account. Also known as Additional Paid-In Capital Relating To Proceeds Of Sale Of Stock In Excess Of Par Value or Paid-In Surplus (Not Distributable). Shares Premium can be defined as the amount paid by the shareholders of the company exceeding the nominal value of the shares they acquire. If a company issues shares above par, i.e. at a price above their nominal value, the excess between the nominal value of the shares (to be recorded in the liabilities side of the balance sheet) and the amount of cash received (which is part of the assets of the company) should be booked under a separate account, in the liabilities side of the balance sheet. According to general accounting principles, such account should be considered as part of the own funds of the company. Share Premium is an excess amount received by a firm over the par value of its shares. This amount forms a part of the non-distributable reserves of the firm which usually can be used only for purposes specified under corporate legislation. When a company has a good reputation and earns good profits, the demand of its shares increases in the market. In that case, the company is allowed to issue shares at a higher price than their face value. Such an issue is called Shares Issued at Premium. The amount received; in excess of the face value of the shares is transferred to an account called 'Share Premium Account'. This account is used to:- (i) write off Preliminary Expenses of the company; (ii) write off the balance amount, in issuing shares on discount; and (iii) issue fully paid Bonus Shares.

SHARE REGISTER = АКЦИОНЕРНЫЙ РЕЕСТР (или РЕЕСТР АКЦИОНЕРОВ) – Share Register is a register of shareholders that is held by a company, giving names, addresses, details of shareholding, etc. List of the owners of registered shares. Entry in the share register requires a certificate evidencing the acquisition of the shares for ownership or verifying the establishment of a usufruct. In relations with the company, only shareholders whose shares are entered in the share register are considered to have ownership or usufructory rights.

SHARE REGISTRY = АКЦИОНЕРНЫЙ РЕГИСТРАТОР – Share Registry is an organization which, on behalf of a company, records changes in share ownership, issues share holding statements, and makes adjustments for dividend payments, bonus and rights issues.

SHARES = АКЦИИ (или ДОЛИ, или ПАИ) – In the United Kingdom, Shares represent ownership of a company. When an individual buys shares in your company, they become one of the owners of the company. Shareholders choose who runs a company and are involved in making key decisions, such as whether a business should be sold. While shares are most obviously associated with the stock market, the majority of small businesses don't go near a stock market in their lifetime. They are more likely to issue shares in their company in return for a lump sum investment. This may either be from friends and family or, for businesses that are looking for capital to fund high growth, through formal equity funding finance. There are four main types of shares:- (i) ordinary shares, (ii) preference shares, (iii) cumulative preference shares and (iv) redeemable shares. See also Cumulative Preference Shares, Ordinary Shares, Preference Shares, Redeemable Shares, and Share. Form of security that represents the shareholder's stake in a business. Income on shares is in the form of a dividend rather than interest and is declared depending on the company's performance over the year. Also known as Common Stock in the United States. Shares:- a form of security representing a portion of the nominal capital of a company entitling the owner to a proportion of distributed profits and of the residual value if the company goes into liquidation. Shares further entitle the holder to vote at General Meetings and elect directors (equity paper). Shares represent part-ownership in a company. They can be ordinary shares, preference shares or partly-paid (contributing) shares. Share is the unit of ownership in a corporation, represented by a stock certificate naming the company and the owner. The capital of a corporation is divided into equal shares so that a prospective buyer may acquire the desired number of shares. The shares may be listed on the stock market or traded on the over-the-counter market, in which case their trading price is determined by the supply and demand for those shares. See also Common Stock, and Preferred Stock. (domestic and foreign, bearer, registered, ordinary, preference/priority, voting share). Equity instruments embodying a share in a public limited company, thus entitling the holder to participate directly in the success ofthe company, e.g., in the form of capital gains. If you are investing in the share market it is important to understand the difference between types of shares:- (i) Ordinary Shares; (ii) Preference Shares; (iii) Contributing Shares; and (iv) Company Issued Options. / , например, . Под Акциями понимаются ценные бумаги, свидетельствующие о внесении пая в капитал акционерного общества. Акции предоставляют их владельцу право на присвоение части прибыли в форме дивиденда. Акция в тысячу рублей.

SHARES IN ISSUE = АКЦИИ В ЭМИССИИ – In the United Kingdom, Shares In Issue amount, is the current number of ordinary shares in issue and it is expressed in millions. Also known as Shares Outstanding in the United States. For example, the total current number of ordinary 0.1 pence shares in issue:- 192 062 303. The percentage that is not publicly held is estimated to be:- 40.53%. The number of our shares in issue and our outstanding ordinary shares at the end of each quarter. In UK number of shares in issue:- The Company's issued share capital consists of 43 520 720 ordinary shares with a nominal value of 1 pence each ('Ordinary Shares'), each share having equal voting rights. As of 2008-June-06, in so far as the Company is aware, the percentage of the Company's issued share capital that is not in public hands is 32.61%. / с номинальной стоимостью в 1 пенс каждая ().

SHARES OUTSTANDING = АКЦИИ В ОБРАЩЕНИИ (или НЕРЕАЛИЗОВАННЫЕ АКЦИИ, или РАЗМЕЩЕНИЕ АКЦИЙ) – In the United States, common shares outstanding as reported by the company on the 10Q or 10K reports. Also known as Shares In Issue in the United Kingdom.

SHARE SPLIT = ДРОБЛЕНИЕ АКЦИЙ (или РАСПЫЛЕНИЕ АКЦИЙ) – In a Share Split of, for example, 1 for 5, a shareholder receives five new shares for one share without having to pay consideration. The part of share capital represented by the share, however, is reduced in accordance with the split ratio. In the case of shares with a nominal value, the nominal value of the share is reduced accordingly. A share split is often carried out to make a share appear cheaper and therefore to encourage investors to buy it. The shareholder's share of ownership in the company is unchanged after the share split. The company's share capital is simply spread out over more shares than before the split. See also Share. Share Split:- in a share split existing shares are split into two shares of half the original nominal value. No new money is raised and no reserves are capitalized. If the market price of a share is thought to be too high, a company may decide to issue extra shares to its holders, known as a Bonus Issue, increasing the number of shares on the market, and thus decreasing the price of each share. This process is known as a Share Split.

SHARKSKIN = АКУЛЬЯ КОЖА (или СВЕТЛОСЕРОЕ КОСТЮМНОЕ ТРИКО) – Sharkskin fabric has long been considered a highly desirable material that works well for all sorts of applications, some of them practical and some purely cosmetic. Known for having a smooth finish and unique weave, sharkskin fabric may be used for everything from sporting and marine equipment to clothing and accessories. Here is some information about the manufacture of sharkskin fabric, as well as some examples of how sharkskin is often used today. In most cases, sharkskin can be defined as a woven blend of smooth wool. More correctly, it is a smooth worsted fabric that often has a soft texture and a two-toned woven appearance to the worsted fabric. Usually, this two tone appearance is achieved by employing what is referred to as a Basketweave, and can use both white and colored fibers. This creates a pattern where the different colored threads run diagonal to each other. Typically, sharkskin fabric is made with the use of rayon or acetate, or as a blend of the two. Because both fabric options already have a relatively smooth texture, the combination results in the finish that sharkskin fabric is known for. Also, this creates a fabric option that can be laundered at home with the greatest of ease. Sharkskin fabric definitely has a place around the home. When it comes to house linens, sharkskin fabric is especially popular when it comes to curtains and other forms of window treatments. The material does not wrinkle easily and will hang very well, which makes the curtains low maintenance and ideal for anyone that wants a nice look to the windows without a lot of upkeep. Sharkskin fabric also works well for tablecloths, napkins and overlays for end tables as well. When it comes to clothing, sharkskin fabric is popular for both men's and women's worsted suits. Light winter jackets and coats for men are also often made with sharkskin fabric. Sportswear for women is another common application of sharkskin fabric, since the material is lightweight and launders so easily. One lesser known use of sharkskin fabric is as a liner in diving suits and wetsuits in general. The smooth texture of the sharkskin feels good against the skin and also has a tendency to stay in place as the suit is put on or taken off. The sharkskin liner also does not slip during wear, which means the diver will feel much more comfortable than with some other types of liners. Sharkskin is a hard-finished, low lustered, medium-weight fabric in a twill-weave construction. It is most commonly found in men's worsted suitings; however, it can also be found in a plain-weave construction of acetate, triacetate, and rayon for women's sportswear. Sharkskin is:- (1) a heavy weight, fairly lustrous cotton, linen, silk, or man-made fiber fabric with a sleek, hard-finished, crisp, and pebbly surface and a chalky luster. Today, it is almost always made of acetate or triacetate. Filament yarns, when used, are twisted and woven tightly in a plain-weave or basket-weave construction, depending on the effect desired. Staple fiber yarns are handled in the same manner, except for wool. Sharkskin is best known in its stark white color especially popular for tennis outfits and for permanently pleated white skirts when they are in fashion. (2) A wool fabric in twill weave, originally made of yarns of two colors. Sharkskin is:- (1) a hard-finished, twill fabric, woolen or worsted, made of simple weaves with a two-color arrangement of warp and filling yarns. (2) A plain-weave sportswear fabric made of dull-luster acetate or triacetate yarns. Sharkskin:- Worsted. Some wool. Also made in rayons and synthetics (particularly Arnel) but they are quite different. (1) rayon (acetate), synthetics, particularly Arnel. A smooth crisp fabric with a dull finish made usually of rayon in basket weave. It is very smooth and slippery. Has a flat look. It is mostly made in white but some also comes colored. It wears well and launders well particularly in Arnel. Has a tendency to turn yellow with age, but the Arnel remains pure white. (2) Worsted. Some wool:- 2 x 2 twill weave (1 white, 1 black up and same down). The yarns in both the warp and filling are alternately white (or very light yarns) and colored. The combination of weave and color results in colored lines running diagonally to the left opposite to the twill lines in a 'step' effect. Has a very sleek, smooth, feel and appearance. Although it is fairly light in weight, it has a very substantial feel. Gives excellent wear and sheds dirt readily. Has many variations. Used for men's and women's suits, lightweight coats and sportswear. / Пряжи и в основе и в уточине . филаментная (комплексная) пряжа (filament yarn).

SHARK'S MOUTH = ПАСТЬ АКУЛЫ – Shark's Mouth (maritime term):- the opening in an awning around the mast. / полукруглый вырез в тенте, например, для мачты.

SHARP EDGES = ОСТРЫЕ КРАЯ – Sharp Edges:- vitally important not to have sharp edges if automatic feed is used. Closure defects, and namely – Pearl and Plastic Buttons. / Порок или дефект застёжки.

SHARPE RATIO = СООТНОШЕНИЕ ШАРПА – Sharpe Ratio:- many traders and investment managers want to measure and compare commodity trading advisors (CTAs) or trading systems. While there are many ways to measure an investment's performance, risk-adjusted returns are one of the most important measures to consider because, given the inherent free leverage of the futures markets, more return can be earned by taking more risk. The most popular measure of risk-adjusted performance is the Sharpe ratio. While the Sharpe ratio definitely is the most widely used, it is not without its issues and limitations. Because of the way the Sharpe ratio is calculated, it tends to punish upside volatility in a trading program. We believe the Sortino ratio improves on the Sharpe ratio in a few areas. The purpose of this article is to review the Sortino ratio's definition and present how to calculate it properly, because we have seen its calculation often done incorrectly. The Sharpe ratio is a metric that aims to measure the desirability of an investment by dividing the average period return in excess of the risk-free rate by the standard deviation of the return generating process. Devised in 1966 by Stanford Finance Professor William F. Sharpe as a measure of performance for mutual funds, it undoubtedly has some value as a measure of investment 'quality', but it has a few limitations also. The most glaring flaw is that it does not distinguish between upside and downside volatility. In fact, high outlier returns can have the effect of increasing the value of the denominator (standard deviation) more than the value of the numerator, thereby lowering the value of the ratio. For some positively skewed return distributions

such as that of a typical trend-following CTA strategy, the Sharpe ratio can be increased by removing the largest positive returns. This is nonsensical because investors generally welcome large positive returns. Additionally, to the extent that the distribution of returns is non-normal, the Sharpe ratio falls short. It is a particularly poor performance metric when comparing positively skewed strategies like trend-following to negatively skewed strategies like option selling. In fact, for positively skewed return distributions, performance actually is achieved with less risk than the Sharpe ratio suggests. Conversely, standard deviation understates risk for negatively skewed return distributions, i.e. the strategy actually is more risky than the Sharpe ratio suggests. Typical long-term, trendfollowing CTAs, especially those with longer track records, generally have Sharpe ratios in the 0.50–0.90 range. However, negatively skewed programs (convergent strategies) like option writing will produce high Sharpe ratios, 3.0 and above, up until a devastating drawdown. The Sharpe ratio often misses the inherent risk of convergent strategies. See also Sortino Ratio. Sharpe Ratio is a measurement of trading performance calculated as the average return divided by the variance of those returns; named after William P. Sharpe. The most popular measure of riskadjusted performance for investments is the Sharpe Ratio. When using annual returns and an annual standard deviation of returns, the Sharpe ratio may be interpreted as the annual risk premium that the investment earned per percentage point in annual standard deviation. In this case, the investment's return exceeded the riskless rate by 35 basis points for each percentage point in standard deviation. In an analysis of past data, the mean return of the portfolio is used as an estimate of its expected return, and the historical standard deviation of the sample is used as an estimate of the asset's true risk. Throughout the remainder of this analysis of performance measures, the analysis may be viewed as interchangeable between using historical estimates and expectations. Obviously, both the numerator and denominator of the Sharpe ratio should be measured in the same unit of time, such as quarterly or annual values. But the resulting Sharpe ratio is sensitive to the length of the time period used to compute the numerator and the denominator. Note that the numerator is proportional to the unit of time, ignoring compounding. Thus the excess return expressed as an annual rate will be two times larger than a semiannual rate and four times larger than a quarterly rate, ignoring compounding. However, the denominator is linearly related to the square root of time, assuming that returns are statistically independent through time:- $\sigma T = \sigma 1 \sqrt{T}$ where σT is the standard deviation over T periods, $\sigma 1$ is the standard deviation over one time period, such as one year, and T is the number of time periods. This formula assumes that the returns through time are statistically independent. Thus, a one-year standard deviation is only $\sqrt{2}$ times a semiannual standard deviation, and a one-year standard deviation is only twice ($\sqrt{4}$) the quarterly standard deviation. Thus switching from quarterly returns to annualized returns roughly increases the numerator fourfold but increases the denominator only twofold, resulting in a twofold higher ratio. For example, ignoring compounding for simplicity, and assuming statistically independent returns through time, the Sharpe ratios based on semiannual returns and quarterly returns are shown, using the same annual values as illustrated earlier:- (i) Annual:- (10% – 3%)/20% = 0.350; (ii) Semiannual:- [(10% − 3%) / 2] / 20% $\sqrt{0.5}$= 0.247; and (iii) Quarterly:- [(10% − 3%) / 4] / 20% $\sqrt{0.25}$= 0.175 Note that the Sharpe ratio declines from 0.350 to 0.175, which is a 50% decrease, as the time interval for measurement is reduced by 75% from annual to quarterly. If returns were correlated perfectly through time, the Sharpe ratio would not be sensitive to the time unit of measurement; it would be dimensionless. However, in a perfect financial market, returns are expected to be statistically independent through time and, in practice, returns usually are found to be somewhat statistically independent through time. The point is that Sharpe ratio comparisons must be performed using the same return intervals. Sharpe ratios should be computed and compared consistently with the same unit of time, such as with annualized data. They then can be easily intuitively interpreted and compared across investments. However, Sharpe ratios ignore diversification effects and are primarily useful in comparing returns only on a standalone basis. This means that they typically should be used when examining total portfolios rather than evaluating components that will be used to diversify a portfolio. Of course, if the investments being compared are well-diversified portfolios, then the Sharpe ratio is appropriate because systematic risk and total risk are equal in well-diversified portfolios. It should be noted that a well-diversified portfolio is traditionally defined as containing only trivial amounts of diversifiable risk. Finally, a Sharpe ratio is only as useful as volatility is useful in measuring risk. In the case of normally distributed returns, the volatility fully describes the dispersion in outcomes. But in many alternative investments with levels of skew and kurtosis that deviate from the normal distribution, volatility provides only a partial measure of dispersion. Thus, the Sharpe ratio is a less valuable measure of risk-adjusted performance for asset returns with non-normal distributions. The Sharpe ratio should be used with caution when measuring the performance of particular investments, such as options and option-like strategies, which have return distributions that are skewed or contain the potential for non-linear payof. Now, there are also Sortino Ratio and Treynor Ratio as a measure of risk-adjusted performance for investments, and Jensen's Alpha as a direct measure of the absolute amount by which an asset is estimated to outperform. Sharpe Ratio is a measure of risk-adjusted performance for investments; annual risk premium that the investment earned per percentage point in annual standard deviation. Formula:- $SR = [E(R_p) – R_f] / p$, where:- SR is the Sharpe ratio for portfolio p; $E(R_p)$ is the expected return for portfolio p; R_f is the riskless rate; and p is the standard deviation of the returns of portfolio p. Example:- a portfolio that earns 10% per year and has an annual standard deviation of 20% when the risk-free rate is 3%. The Sharpe ratio is (10% – 3%) / 20%, or 0.35. / Измерение торговой деятельности, просчитываемое как усреднённый заработок, разделённый на разницу таких заработков. Назван по имени Вилъйэма Фосайса Шарпа (William Forsyth Sharpe; 1934–). Соотношение Сортино (Sortino Ratio) и Соотношение Трэйнёра (Treynor Ratio). Альфа Дьженсэна (Jensen's Alpha).

SHATTERING = ОСЫПАНИЕ (ЗЕРНА) – Shattering is a separation of grains from the panicle. Grain shattering or easy threshing are partly correlated with the degree of development of the abscission layer between the spikelet and the facet of the pedicel.

SHAWL = ШАЛЬ – Shawl is a triangular or oblong piece of cloth worn around the shoulders. Shawl is a square or oblong usually fabric garment or wrapper used especially as a covering for the head or shoulders.

SHAWL COLLAR = ШАЛЕВЫЙ ВОРОТНИК – Shawl Collar is a collar formed by cutting the lapel and collar in one continuous piece. Shawl Collar is an attached collar rolled back in a continuous tapering line that follows the surplice neckline of a garment.

SHB = SHEATH BLIGHT

SHEARING = СТРИЖКА – (1) Shearing is a dry finishing operation in which projecting fibers are mechanically cut or trimmed from the face of the fabric. Woolen and worsted fabrics are almost always sheared. Shearing is also widely employed on other fabrics, especially on napped and pile fabrics where the amount varies according to the desired height of the nap or pile. For flat-finished fabrics such as gabardine, a very close shearing is given. / Стрижка тканей – удаление с поверхности ткани выступающих кончиков нитей, узелков, ворсинок и уравнивание длины ворса для улучшения внешнего вида. Помимо тканей, стрижке подвергается также ворсованное трикотажное полотно. Выполняется на стригальных машинах двух типов:- продольно-стригальных (основной тип машин) и поперечно-стригальных, служащих для стрижки концов ткани. Рабочим органом машин любого типа является стригальный механизм, состоящий из цилиндра, на котором укреплены спиральные ножи (перья), плоского стального ножа, стола, направляющих роликов. Быстро вращающийся цилиндр и неподвижный плоский нож образуют как бы ножницы, которые при движении ткани через стригальный механизм осуществляют стрижку.

(2) Shearing is a method of removing the hair from an animal (the wool from sheep, for example) without injuring the animal. Shearing also refers to trimming the pile on a fabric to a desired height. Shearing is the process of removing the fleece of wool from the sheep by means of hand shears or machine clippers.

SHEARING DAMAGE = ПОВРЕЖДЕНИЕ ПРИ СТРИЖКЕ – Shearing Damage is any type of damage from cutter of shearing. Finishing defect. / Порок или дефект заключительной отделки.

SHEAR RATE = ТЕМП (или ВЕЛИЧИНА, или СТАВКА) СДВИГА – Shear Rate is a rate at which adjacent layers of fluid move with respect to each other, usually expressed as reciprocal seconds.

SHEAR STRESS = НАПРЯЖЕНИЕ СДВИГА – Shear Stress:- frictional force overcome in sliding one 'layer' of fluid along another, as in any fluid flow. The shear stress of a petroleum oil or other Newtonian fluid at a given temperature varies directly with shear rate (velocity). The ratio between shear stress and shear rate is constant; this ratio is termed viscosity of a Newtonian fluid, the greater the shear stress as a function of rate of shear. In a non-Newtonian fluid ... In a Newtonian fluid, the relation between the shear stress and the strain rate is linear (and if one were to plot this relationship, it would pass through the origin), the constant of proportionality being the coefficient of viscosity. In a non-Newtonian fluid, the relation between the shear stress and the strain rate is nonlinear, and can even be time-dependent. Therefore a constant coefficient of viscosity can not be defined. A ratio between shear stress and rate of strain (or shear-dependent viscosity) can be defined, this concept being more useful for fluids without time-dependent behavior. Shear Stress, force tending to cause deformation of a material by slippage along a plane or planes parallel to the imposed stress. The resultant shear is of great importance in nature, being intimately related to the downslope movement of earth materials and to earthquakes. Shear stress may occur in solids or liquids; in the latter it is related to fluid viscosity.

SHEARWALL = СТЕНА–ДИАФРАГМА ЖЁСТКОСТИ – Shearwall is a wall or partition designed to transfer lateral loads (wind and earthquake loads) from abutting walls and roof to the foundation. / устойчивость (abutting).

SHEATH = ВЛАГАЛИЩЕ (или ОБВЁРТКА) – Sheath is the lower part of the leaf enclosing the stem, originating from the node and wrapping around the culm above the node. / Под Влагалищем понимается обкладка, окружение некоторых органов у животных и растений, например, влагалище сухожилия, листа.

SHEATH = ОБЛЕГАЮЩЕЕ ПЛАТЬЕ (или ШИС) – Sheath is a woman's close-fitting dress usually work without a belt.

SHEATH BLIGHT = РИЗОКТОНИОЗ ВЛАГАЛИЩА – Sheath Blight is a disease caused by the Fungus Rhizoctonia Solani/Thanatephorus Cucumeris. The disease is characterized by ellipsoidal, necrotic lesions occurring initially at the leaf sheaths near the water line. Lesions may enlarge and spread on leaves and ultimately on panicles.

SHEATH BLOTCH = ВЛАГАЛИЩНАЯ ПЯТНИСТОСТЬ – Sheath Blotch is a disease incited by Pyrenochaeta Oryzae, symptoms are brown blotches on the leaf sheath, leaf blade, and glumes.

SHEATH–CORE FIBERS = ВОЛОКНА С ОБВЁРТКОЙ СЕРДЕЧНИКА – Sheath-Core Fibers are the bicomponent fibers of either two polymer types, or two variants of the same polymer. One polymer forms a core and the other surrounds it as a sheath.

SHEATH–CORE YARN = ПРЯЖА С ОБВЁРТКОЙ СЕРДЕЧНИКА – Sheath-Core Yarn is a bulky yarn of synthetic fibers consisting of a core of fine denier fibers with considerable shrinkage and a cover or wrapping of coarse denier relaxed fibers.

SHEATH PULVINUS = ВЛАГАЛИЩНАЯ (ЛИСТОВАЯ) ПОДУШЕЧКА – Sheath Pulvinus is the swelling at the base of the leaf sheath just above the node, often mis-termed as the node. Sheath Pulvinus (syn. Sheath Joint) is a small swelling at the base of the leaf sheath just above its point of insertion on the culm. Often mistermed the node.

SHEATH ROT = ЭНЗООТИЧЕСКИЙ БАЛАНОПОСТИТ (или ВЛАГАЛИЩНАЯ ГНИЛЬ) – Sheath Rot is a fungal disease caused by Acrocylindrium Oryzae. Rotting occurs on the uppermost leaf sheaths enclosing the young panicles. The lesions start as oblong or somewhat irregular spots, 0.5–1.5 cm long, with brown margins and gray centers, or they may be grayish brown throughout. Powdery growths may be found inside affected sheaths. / в листовом влагалище .

SHEAVE = ШКИВ – Sheave (maritime term):- the wheel of the block over which the fall of the block is rove. / Под Шкивом, от Голландского слова Schijf, понимается вращающаяся деталь ремённой передачи или канатной передачи, выполненная в виде колеса, охватываемого гибкой связью. Передающие вращающий момент рабочие шкивы (ведущий и ведомый) закрепляют на валах посредством шпоночных соединений, зубчатых соединений и прочего. Не передающие вращающего момента шкивы (холостые шкивы, натяжные ролики) свободно вращаются на валах или осях. Конструкции шкивов отличаются большим разнообразием. Шкивы малых диаметров выполняют монолитными, шкивы средних и больших диаметров имеют ступицу и обод, связанные диском или спицами. Крупные шкивы иногда выполняют из двух половин, соединённых болтами. Изготовляют шкивы из чугуна, стали, лёгкого сплава, пластмассы, иногда дерева. Шкивы под плоские ремни имеют цилиндрическую или слегка выпуклую рабочую поверхность для предохранения ремня от сбегания, с той же целью шкивы иногда снабжаются ребордами. Шкивы под клиновые и поликлиновые ремни имеют канавки трапецеидального профиля. Шкивы под ремень круглого сечения снабжают канавкой со скруглённым дном. Шкивы зубчаторемённых передач имеют зубья, идущие в осевом направлении, и реборды. Ступенчатые шкивы применяют в передачах с регулированием передаточного отношения путём перевода ремня с одной ступени на другую. Раздвижные конические шкивы в бесступенчатых передачах с широким клиновым ремнем выполняют с одним или обоими подпружиненными передвижными конусами, а также с принудительным перемещением одного или обоих конусов.

SHED = ЗЕВ – Shed is the V-shaped opening slightly in back of the raceplate of the loom that is formed when some of the warp ends are raised and others are lowered by their respective harnesses. It is the opening through which the shuttle passes laying the loose pick. Forming the shed is the first action in weaving, followed by picking and lastly, beating – the actual beating of the pick into cloth by means of the reed action. Shed is the opening between warp yarns through which filling yarns are passed. Shed is a path through and perpendicular to the warp in the loom. It is formed by raising some warp threads by means of their harnesses while others are left down. The shuttle passes through the shed to insert the filling. / уточина.

SHED = ОСЫПАНИЕ – Shed or Shedding:- Separation of a leaf, square or boll from the mother plant by natural shedding, usually induced by some stress on the plant. Occasionally, when referring to squares or bolls, the term abortion is used in the same context.

SHED = ШЕД (или НАВЕС) – A Shed is generally a modest structure, usually constructed of wood in a back garden or on an allotment, used for storage and as a workshop and very often as a retreat in which to relax and pursue hobbies, especially gardening and light engineering. Sheds are often highly individual and personalized, and the larger shed will be made comfortable by adapting worn out furniture. See also Warehouse. A structure used for storage. / Шедовая конструкция или шедовая система. Под Шедом, от Английского слова Shed, от Shade, означающее Навес или Тень, понимается постройка для содержания пушных зверей.

Представляет собой навес с двускатной крышей, под которым в несколько рядов (2, 4 или 6) установлены клетки. Несущая конструкция шеда – каркас из деревянных, стальных или железобетонных рам. Кровля шиферная или черепичная. Служебные проходы между рядами клеток асфальтируют. В районах с большими снежными заносами клетки устанавливают на сваях и делают закрытые коридоры.

SHED = УКРЫТИЕ (или УКРЫВАТЬ) – Shed:- to drop or disperse pollen grains or the falling of unharvested Rice grains from the panicles.

SHEDDING = ЗАТЕНЕНИЕ (или СГОН, или ЛИНЬКА, или ВЫПАДЕНИЕ) – Shedding:- when a role of fabric is dyed, depth of shade of color may vary from one place to another place along the length of the fabric is known as Shedding. Fabrics defect.

SHEDDING = ЗЕВООБРАЗОВАНИЕ (или ПОТЕРЯ (2)) – Shedding is the first of the three motions of a loom in weaving cloth. Picking and beating-up are the other two chief motions. Shedding is the raising and lowering of the warp ends by means of the harnesses and heddles to form the shed of the loom so that the filling bobbin in the shuttle may pass through it from one side of the loom to the other side. As the shuttle passes through the shed it lays the loose filling pick between the raised and the lowered warp ends. Shedding is:- (1) the operation of forming a shed in weaving; and (2) a loss of nominal length staple at any process in a staple yarn plant. Shedding is the raising and lowering of the warp ends by means of the harness and heddles to form the shed (passage) for the filling yarn to pass through from one side of the loom to the other. / уточная поперечная нить между .

SHED–SPLIT = XX – (1) Defect Name:- Shed-Split. Defect Type:- weft lines, horizontal lines. Fabric Type:- Bottomweights – Plain Weave Derivatives. Description:- Shed-Split (face side):- This is the result of a shuttle having been deflected, splitting the shed and passing over certain warp ends of this four-harness weave. It shows up as short filling floats on the face and corresponding warp floats on the back of the fabric. Severity:- Major. (2) Defect Name:- Shed-Split. Defect Type:- weft lines, horizontal lines. Fabric Type:- Bottomweights – Plain Weave Derivatives. Description:- Shed-Split (back side):- This is the result of a shuttle having been deflected, splitting the shed and passing over certain warp ends of this four-harness weave. It shows up as short filling floats on the face and corresponding warp floats on the back of the fabric. Severity:- Major.

SHED–SPLITTING or FILLING FLOATS = XX или XX ПО УТОЧИНЕ – Defect Name:- Shed-Splitting or Filling Floats. Defect Type:- Weft lines, horizontal lines. Fabric Type:- Shirting and Dress Goods – Oxford or Basket. Description:- Shed-Splitting or Filling Floats:- This defect is the result of a harness not being properly set. With the shed not being clearly defined, the shuttle passes over ends contrary to the design of the fabric. This condition may vary in intensity and affect as much as one-third of the width of the fabric. Severity:- Major. See also Filling, and Shed. / Смотрите также Зев (Shed), Уточина (Filling).

SHED SQUARE = ОСЫПАВШИЙСЯ БУТОН (или ОСЫПАВШИЙСЯ ПОДЦВЕТНИК) – Shed Square is a square that has shed or abscised either because of a physiological stress to the plant or Insect damage to the square. See also Abscission, and Square.

SHEEN = БЛЕСТЯЩЕЕ (или БЛЕСК, или ЛОСК, или СИЯНИЕ) – Sheen:- a textile exhibiting notable sheen.

SHEEN = ОТБЛЕСК (или СИЯНИЕ, или БЛЕСК) – Sheen:- the specular gloss at a large angle of incidence for an otherwise matte specimen (used in textiles).

SHEEP = ОВЦА – Sheep:- Ovis Aries and other members of the Genus Ovis.

SHEEPSKIN = ОВЧИНА (или БАРАНИЙ ОПОЕК) – (1) Sheepskin is the wool still on the pelt or skin.

(2) Sheepskin is a garment made of or lined with sheepskin.

SHEER = ПРОЗРАЧНОЕ (или ПРОСВЕЧИВАЮЩЕЕ) – Sheer:- the opposite of opaque. Sheer fabrics are usually made in an open weave to create fabrics with varying degrees of transparency. Batiste, organdy, and voile are examples of sheer fabrics. See batiste, organdy, and voile. Sheer is an article of clothing of sheer fabric. Mostly plain but could be various weaves. Any very light-weight fabric, e.g., chiffon, georgette, voile, sheer crêpe. Usually has an open weave Sheer.

SHEER = РЫСКАНИЕ (или РЕЗКОЕ ОТКЛОНЕНИЕ ОТ КУРСА) – Sheer (maritime term):- a sudden change. The longitudinal dip of the vessel's main deck.

SHEER CURTAINS = ПРОЗРАЧНЫЕ ЗАНАВЕСКИ (или ПРОСВЕЧИВАЮЩИЕ ЗАНАВЕСКИ) – Sheer Curtains:- thin fabrics of polyester, cotton, and blends that hang next to the window glass.

SHEERS = ШИЭЗ – Sheers are the transparent, lightweight fabrics of different constructions and yarns, especially those of silk and manufactured fibers. Examples are chiffons, some crêpes, georgette, and voile. / , жоржэт (georgette), и . Торговое название прозрачных, лёгких тканей типа 'Органди'.

SHEET = ПРОСТЫНЯ – Sheet is a rectangular piece of fabric used to cover and protect the top and sides of a mattress. This is usually referred to as a Bottom Sheet. A top sheet is placed on top of a bottom sheet to protect the skin from a sometimes scratchy blanket and to protect the blanket from soil. Traditionally, sheets were made of linen or cotton.

SHEET = ШКОТ – Sheet (maritime term):- the rope used to spread the clew of head sails and to control the boom of boom sails.

SHEETING = ПРОСТЫННОЕ ПОЛОТНО (или ПОСТЕЛЬНАЯ ТКАНЬ) – Sheeting is a plain weave carded or combed cloth which comes in light, medium and heavy weights. Sheeting for converting purposes was usually about 40 inches wide. There are four types at present:- (i) 64 x 64 (64-square), usually made from 20's or 21's yarn; (ii) 68 x 76, made from 25's yarn; (iii) 84 x 92, made from 30's to 40's yarn; and (iv) 96 x 108, made from 40's yarn, upwards. Laundries buy sheeting in the following sizes:- (i) 99" long by 36" wide; (ii) 99" by 72"; (iii) 99" by 81"; (iv) 108" by 72"; and (v) 108" by 81". It may be unbleached, semibleached, fullbleached or colored. Sheeting is a sturdy, plain-woven cloth usually made of cotton that can be found in mediumweights or heavyweights, suitable for forming into bedsheets. The term 'Sheeting' means plain weave fabrics, whether or not napped, of the following types:- (i) fabrics weighing not more than 200 grams per square meter, of square construction, containing more than 33 warp ends and filling picks per square centimeter, of average yarn number 68 or lower number, but not including printcloth; and (ii) fabrics weighing more than 200 grams per square meter, but does not include:- (a) fabrics of which the warp or filling consists of multiple (folded) or cabled yarns, of average yarn number 26 or lower number; and (b) fabrics of average yarn number 27 or higher number, not of square construction. / 33 основных продольных нитей и уточных поперечных нитей на квадратный сантиметр, . Бязь – толстая хлопчатобумажная ткань полотняного переплетения, отбеленная, гладкокрашеная или набивная. Появилась в России в XVI веке, использовалась для опашней, кафтанов и другой верхней одежды как подкладка. В XVIII–XX веках отбеленная бязь служила для пошива нижнего солдатского белья, так как была дешевле миткаля. В торговой среде отбеленная бязь имела название Шиля. Гладкокрашеную бязь использовали для подкладки и дублирования костюмных и пальтовых тканей, набивную – для женского и детского лёгкого платья. В настоящее время используется в основном как ткань для постельного белья.

SHELF LIFE = СРОК ГОДНОСТИ – Shelf Life is the period of time some product can be stored 'on the shelf' before it degrades to some point of reduced effectiveness. Some chemicals, including dyes, have limited shelf life. They degrade over time, eventually becoming completely useless for their intended purpose. Useful shelf life may range from hours to hundreds of years. For example, an enzyme used for desizing might be specified as losing about 10% of its strength after storage at 20 °C for six months – it is still very useful, just slightly weaker. Shelf life is generally maximized by storage at low temperature (sometimes even freezing, but this can damage some products). Chemicals should also usually be protected from long exposure to bright light, and dry chemicals should be protected from humidity by storage in tightly closed moisture-proof containers. / Срок Годности при хранении.

SHELL = КОРПУС (или ОБОЛОЧКА, или КОЖУХ, или НАРУЖНАЯ ОБШИВКА) – Shell (maritime term):- the casing of a block within which the sheave revolves.

SHELL = ОБОЛОЧКА (или ОБЕЧАЙКА) – Shell is a fabric from which the garment is made.

SHELL = ФЕСТОН (или ХХ) – Shell is a plain usually sleeveless blouse or sweater.

SHELL JACKET = (ПАРАДНЫЙ) МУНДИР (или ПАНЦИРЬНЫЙ ЖАКЕТ, или КОРОТКАЯ ТУЖУРКА) – Shell Jacket is a short tight military jacket worn buttoned up the front; mess jacket.

SHELL PINK = ЖЕЛТОВАТО–РОЗОВОЕ (или ХХ) – Shell Pink:- a light yellowish pink.

SHEPHERD'S CHECK = ПАСТУШЬЯ КЛЕТКА (или МЕЛКАЯ ЧЁРНО–БЕЛАЯ КЛЕТКА) – Shepherd's Check is a fabric woven in shepherd's check pattern, namely a pattern of small even black-and-white checks. / мелкий шашечный рисунок на твидах и костюмных тканях.

SHETLAND = ШЭТЛЭНДКА (или ШЭТЛЭНДСКАЯ) – (1) Shetland:- wool from Shetland Sheep in Scotland. Sheep have a coarse outer coat and a very fine undercoat which gives added warmth. The best is the undergrowth. It is not shorn but pulled out by hand in the spring. Other wools sometimes called Shetland if they have a similar appearance. Has a very soft hand and a shaggey finish of protruding fibers. A pulled wool; the soft undergrowth of the Shetland Sheep. Very lightweight and warm. Much is made by hand and comes in distinctive soft coloring. Often the natural colors ranging from off-white, various greys to almost black and brown are used and not dyed. Real Shetland wools are expensive, high quality products. In the same family group as homespun, tweed and cheviot. (2) Shetland:- wool yarn spun from Shetland wool. / Шэтлэндская шерсть с Шэтлэндских Островов Шотландии. Английская мясо-сальная порода Овец.

SHIBORI = ЩИБОРИ – Shibori is a Japanese tie-dyeing technique. In shibori, fabric, usually silk, is folded or twisted or tied or wrapped around a bamboo pole (often substituted with PVC or ABS pipe), and dye is directly applied. This simple statement does not do justice to the craft and its beautiful results.

SHIELDED SPRAYS = ЗАЩИТНЫЕ СПРЭИ (или ЗАЩИТНЫЕ ОПРЫСКИВАНИЯ) – Shielded Sprays are herbicides applied to the interow areas, beneath a protective shield.

SHIER = ХХ (или ШАЙЭ) – Shier is a short length of a single pick that appears to be cut out of the plane of the fabric. Fabrics defect. Shier:- in woven fabrics, fine fillingwise cracks randomly distributed across the fabric width. Synonym:- Shire. Compare Crack Mark, and Let-Off Mark.

SHIFT = СМЕНА – Shift is a part of the work-programme of a stevedoring company (a working day may have up to 3 shifts (3 x 8 = 24 hours)). / Смена – часть рабочего цикла стивидорной компании (рабочий день может состоять из 3 смен (3 x 8 = 24 часа)).

SHIFT = СОРОЧКА (или ШИФТ) – Shift is a woman's slip or chemise; a woman's usually loose-fitting or semifitted dress. / или шомиз (chemise).

SHIFTING = СМЕЩЕНИЕ – Shifting:- this refers to movements or changing positions of cargo from one place to another. This can easily endanger the seaworthiness or cargoworthiness of the ship. / Это относится к перемещениям или смене положений груза с одного на другое. Это может запросто угрожать мореходности или приспособленности данного корабля для перевозки груза.

SHIFTING CULTIVATION = СМЕННАЯ КУЛЬТИВАЦИЯ (или ЧЕРЕДУЮЩАЯСЯ КУЛЬТИВАЦИЯ) – Shifting Cultivation is a farming system in which crops are planted on a piece of land for 2–3 years and the land is left fallow for several years to regain soil fertility while farming is continued on another piece of land at a different location.

SHIFT–STAMP MARK = ОТМЕТИНА ОТ ОТСТУПА ПЛОМБЫ (или СМЕЩЁННОЙ ПЛОМБЫ) – Shift-Stamp Mark:- Fabric:- brassiere satin; Construction:- (i) Count:- 300 x 84; (ii) Warp:- 75/20 bright acetate rayon; (iii) Filling:- 150/40 dull acetate rayon; Finish:- plain dyed tea rose. Defect:- D/N shift stamp not removed in finishing. Analysis:- it is common practice in a weave room to use a fugitive ink stamp mark to indicate on a piece of goods during weaving the change in shift of the weaver. In this case, the mill employed a stamp with the letters D/N on the back of the fabric. Laboratory scouring tests on a finished cutting showed that the mark could not be eliminated in normal processing. Similar tests made on a gray cutting confirmed the fact that it was possible to remove the mark only with considerable agitation in a beaker containing a hot soap solution. Since this type of fabric receives a jig boil-off, the agitation and scouring procedure are comparatively mild, and the mill was considered at fault. It was later learned that the ink on one of the stamp pads in the weave room had been badly contaminated and aged through use over a long period of time, and the marking was no longer fugitive, particularly when too heavy an impression was made. / Уточина:- 150/40 .

SHIFU = ЩИФУ – Shifu is a thread made from paper is an old Japanese tradition and has been used historically in clothing.

SHIKI = ЩИКИ – Shiki is a heavy rayon, acetate, and cotton, or other mixtures identified by wavy filling-wise cords. It is used for draperies.

SHIMMY = ШИМИ (или ЖЕНСКАЯ СОРОЧКА, или ХХ) – Shimmy:- chemise. / шомиз (chemise).

SHINE OR GLASS FINISH = ЛОСНЯЩАЯСЯ (или БЛЕСТЯЩАЯ) ИЛИ ЗАСТЕКЛЕНЕЛАЯ ЗАКЛЮЧИТЕЛЬНАЯ ОТДЕЛКА – Shine Or Glass Finish:- incorrect combination of heat, pressure and press covering. Machinery defects, and namely – Pressing Equipment. / Порок или дефект от машинного оборудования.

SHINER = ПЕРЕТЯЖКА – Shiner is a relatively short streak caused by a lustrous section of a filament yarn. The principal cause is excessive tension applied to a yarn during processing. Fabrics defect. Shiners:- filling rayon yarn that appears to be abnormally lustrous, owing to its being under excessive tension, which results in a smoother surface than normal and a reduction in crimp, all of which produce greater light reflection and give a shiny appearance. Shiner is a streak, usually short caused by a lustrous section of filament yarn. / филаментная (комплексная) пряжа (filament yarn). уточина. Перетяжка По Утку (shiner):- порок утка;

филаментарная пряжа более высокого коэффициента отражения, чем смежные нити пряжи. Примечание:- этот порок вызван филаментарной уточной пряжей, вотканной при более высоком натяжении, чем смежная уточная пряжа.

SHIP = КОРАБЛЬ (или СУДНО) – Ship is any large floating vessel capable of crossing open waters, as opposed to a boat, which is generally a smaller craft. The term formerly was applied to sailing vessels having three or more masts; in modern times it usually denotes a vessel of more than 500 tons of displacement. Submersible ships are generally called Boats regardless of their size. Ship includes every description of vessel used in navigation not propelled by oars. See also Barge Carrier, Bulk Carrier, Combination Passenger And Cargo Ship, Freighter, Full Containership, General Cargo Carrier, Partial Containership, Roll On, Roll Off Vessel, Tanker, and Vessel. Unless the context otherwise requires, 'Ship' includes every description of vessel used in navigation. Whether a vessel comes within that meaning of a ship depends on the facts of each case; the statutory definition is intended to enlarge the meaning of 'ship'. To be a ship a vessel must be used in navigable waters, either inland or at sea, and, although she must be constructed for navigation, it is not necessary to the definition that she should be able to navigate under her own power. The presence of a rudder and the manning of the vessel with a crew are important as showing that a vessel is a ship, but the absence of either does not mean that a vessel is not a ship. The purpose for which a vessel has been and is being used is also material when considering whether she is used in navigation. Also known as Vessel. Ship is a general term for a large seagoing vessel of considerable size. It is not the type, construction, rig, machinery, equipment, or means of propulsion that makes a ship, but rather the purpose of marine transportation (either military or commercial). Pleasure vessels are called 'Yachts'. A ship becomes a subject of admiralty jurisdiction from the moment its keel first touches the water. / Под Кораблём, от Греческого слова Kárabos, понимается то же, что и Судно. В парусном флоте корабль – трёхмачтовое судно с полным парусным вооружением. В современном Русском языке кораблями называют военные суда. Иногда воздушным кораблём называют крупный самолёт, дирижабль. Космический корабль – пилотируемый космический аппарат. Под Судном понимается плавучее сооружение для перевозки грузов и пассажиров, для водного промысла, добычи полезных ископаемых, спортивных состязаний и прочего, а также для военных целей. Судно для военных целей принято называть Кораблём. Основные части судна:- корпус, механизмы и оборудование (судовые навигационные средства, судовые системы, судовые средства связи, судовые устройства и другие). Специфические свойства судна называют мореходными качествами и характеризуют поведение судна в плавании и его безопасность. Размеры судна определяют главные размерения (линейные размеры судна, такие как:- длина, ширина, высота борта на середине длины, осадка и так далее), водоизмещение и вместимость, а грузовых судов – также грузоподъёмность и грузовместимость. Важные характеристики судна:- автономность, дедвейт, живучесть, мореходные качества, надёжность, ремонтопригодность и другие. Наибольшие суда – танкеры (длиной более 350 метров (м), дедвейт более 500 000 тонн (т)). По характеру передвижения суда делятся на самоходные (атомоходы, газотурбоходы, пароходы, теплоходы, электроходы) и несамоходные (буксируемые, гребные, парусные); по положению относительно поверхности воды при движении – надводные (водоизмещающие, глиссирующие, на воздушной подушке и на подводных крыльях) и подводные. По типу главной энергетической установки (ЭУ) суда разделяются на атомоходы, газотурбоходы (газотурбинная ЭУ), пароходы (котломашинная или котлотурбинная ЭУ) и теплоходы (дизельная ЭУ). По назначению суда подразделяют на военные, обслуживающие, промысловые, промышленно-добывающие, спортивно-туристические, транспортные и другие. Обслуживающие суда обеспечивают работу судов другого назначения (буксирные, бункеровочные, гидрографические, дноуглубительные, спасательные суда, ледоколы, плавучие доки, плавучие маяки). Промысловые суда оборудуют для ловли рыбы, добычи морского зверя, крабов, а также для переработки добычи. К промышленно-добывающим судам относятся, например, золотодобывающие драги, кабельные, лесосплавные, нефтебуровые суда. Среди спортивно-туристических судов различают гребные, моторные и парусные суда, гоночные, прогулочные, тренировочные. На транспортных судах перевозят грузы (грузовые суда), пассажиров (пассажирские суда), иногда – одновременно грузы и пассажиров (грузопассажирские суда). Грузовые суда делят на наливные (танкеры), сухогрузные и сухогрузно-наливные. Для сухогрузных судов характерна узкая специализация по роду перевозимого груза и грузообработке:- контейнеровозы, рефрижераторы, суда с горизонтальной грузообработкой и так далее. Судно или Корабль – плавучее сооружение, предназначенное для выполнения определённых хозяйственных и военных задач, научных исследований, водного спорта и другого. Классификация Судов:- По назначению различают суда:- транспортные, промысловые, промышленно-хозяйственные, административно-служебные, военные, научно-исследовательские, судообслуживающие. Транспортные суда подразделяют на грузовые, пассажирские и грузопассажирские. Промысловые суда делятся на добывающие (рыболовные, китобойные, краболовные, водороследобывающие и другие), добывающе-перерабатывающие (например, траулеры-рыбозаводы, морозильные траулеры) и суда обслуживания промысла. Промышленно-хозяйственные суда включают:- промышленно-добывающие (рудодобывающие, нефтепромышленные, драги, соледобывающие снаряды и другие), подъёмно-монтажные (например, портостроительные суда, плавучие краны), дноуглубительные (землечерпательные и землесосные снаряды, грунтоотвозные и другие), лесопромышленные (сплоточные, лесосплавные и другие), сельскохозяйственные (дождевальные, водоподъёмные и другие), энергоснабжающие (плавучие электростанции, компрессорные, трансформаторные), суда связи (кабелеукладочные, кабелеремонтные, радиосвязные и другие), для очистки акваторий (нефтемусоросборщики и другие). Административно-служебные суда включают инспекторские (рыбонадзорные, суда для охраны заповедников), милицейские, пограничные, таможенные суда, правительственные яхты. Военные суда подразделяются на боевые корабли (смотрите Военный Корабль), военно-транспортные и обеспечивающие (так называемые вспомогательные) суда. В число научно-исследовательских входят суда для комплексных океанических исследований и для проведения специальных исследований (геофизических, гидробиологических и других). К судообслуживающим судам относятся:- буксирные, перегрузочные (например, плавучие зерноперегружатели, нефтеперекачивающие и зачистные станции), снабженческо-приёмные (бункеровщики, суда-водолеи, суда для приёма загрязнённой воды, мусора и другого), причальные (плавучие пристани, дебаркадеры), ледоколы (линейные и портовые), навигационные (гидрографические, плавучие маяки и другие), спасательные, ремонтные (плавучие мастерские, доки, дегазационные станции и другие), посыльно-разъездные (например, лоцманские) и учебные. Отдельную группу составляют спортивные суда, медико-санитарные (госпитальные, дезинфекционные и другие), оздоровительные (плавучие дома отдыха и тому подобные), бытовые (плавучие общежития, гостиницы, склады и другие), культурно-просветительные (суда-музеи, суда-выставки, суда-клубы и другие). По району плавания суда подразделяют на морские, внутреннего и смешанного плавания. Морские суда бывают неограниченного и ограниченного плавания (с установлением района эксплуатации или допустимого расстояния от берега, порта-убежища). Категорией ледовых подкреплений определяются допустимый район и возможность плавания морских судов во льдах с ледоколом или без него. По конструктивному типу морские суда подразделяют на полнонаборные суда, допускающие приём грузов до осадки, соответствующей минимальному надводному борту, и суда с избыточным надводным бортом; разновидность последних – шельтердечные суда. Суда внутреннего плавания делят на 4 категории:- для малых рек, больших рек, водохранилищ и крупных озёр, морских заливов. Суда смешанного морского и внутреннего плавания сочетают прочность корпуса и мореходные качества, необходимые морским судам, с малой осадкой судов внутреннего плавания. Суда бывают самоходные (с механическим двигателем, парусные, гребные) и несамоходные (буксируемые). Самоходные суда по типу энергетической установки делят на атомные, дизельные (теплоходы),

паротурбинные и газотурбинные (паро- и газотурбоходы), суда с паровой машиной (пароходы), суда с приводом гребного винта от электродвигателя – электроходы. По принципу движения на воде различают суда плавающие (водоизмещающие), глиссирующие, на подводных крыльях и на воздушной подушке. Суда, способные погружаться для работы под водой, называются подводными, все остальные – надводными. Историческая Справка:- В глубокой древности возникла необходимость преодолевать водные преграды и использовать реки, озёра, моря как охотничьи угодья и как удобные пути для передвижения и перевозки грузов. Вначале в качестве плавучих средств применялись древесные стволы и другие плавающие предметы. Первыми судами, по-видимому, можно считать примитивные плоты из скреплённых друг с другом стволов или обломков деревьев. Связанные деревья не переворачивались в воде, на них можно было плавать достаточно долго и безопасно; плоты-катамараны из брёвен до сих пор используются во многих странах. В течение тысячелетий на озёрах Титикака и Чад, а также в Древнем Египте применялись плоты из камыша и папируса. В Ассирии для преодоления водных преград пользовались надутыми мешками из шкур животных (бурдюками); такие средства продолжали использоваться и в XX веке, например, в Далмации (Югославия). К каменному веку восходит искусство постройки лодок из древесных стволов, которые выдалбливали или выжигали изнутри и обтёсывали снаружи (челны-однодеревки). В Северных странах издавна применяются лёгкие и манёвренные челноки, изготовляемые из коры, на каркасе (наиболее известны берестяные каноэ Индейцев Северной Америки) или из натянутых на каркас шкур (например, Алеутские каяки). В Междуречье в VIII веке до Нашей Эры были известны круглые лодки (корзины, обтянутые кожей или покрытые снаружи смолой); грузоподъёмность таких судов достигала 100 тонн (т). В Восточной Бенгалии делали круглые лодки – тигары из обожжённой глины. Развивающееся судоходство требовало увеличения размеров судов. На челны-однодеревки прилаживали по бокам один или несколько рядов досок, которые защищали от волн и увеличивали вместимость; так строились на территории Восточной Европы так называемые Набойные Лодьи (IV век), насады (XI век), казацкие чайки (XVI век), Астраханские бударки (XIX век). Однако только конструирование судов из 113 деревянных частей с отдельным каркасом (так называемом Набором) и обшивкой позволило значительно увеличить их размеры; при этом стало возможным изменять форму корпуса и соотношения главных размерений судов, улучшая их мореходность. В Древнем Египте в 3-м тысячелетии до Нашей Эры строили суда из пригнанных, проконопаченных и просмолённых по швам кусков дерева, образующих обшивку и набор. Суда Финикийцев уже в X веке до Нашей Эры имели основные элементы конструкции современных судов (киль, шпангоуты, штевни, наружную обшивку); деревянные внутренние крепления сделали ненужными обычные для Египетских судов натяжные сооружения из канатов и балок, укрепляемые над палубой и вдоль бортов. Обшивка судов выполнялась из досок, сначала тёсаных, а затем пилёных. Отдельные части обшивки и деревянного набора скреплялись деревянными гвоздями, шипами, а впоследствии – медными и железными скобами и гвоздями. Первые плавучие средства передвигались по течению или с помощью простейших судовых движителей – шестов и вёсел. Паруса были известны с 3-го тысячелетия до Нашей Эры, они изготовлялись из шкур, тростниковых циновок, деревянных планок. Долгое время паруса выполняли вспомогательную роль, их ставили только при попутном ветре, а при безветрии суда двигались и маневрировали с помощью вёсел. Вёсла на гребных судах располагали по всей длине судов в 1, 2 и 3 яруса (например, Римские униремы, биремы, триремы), каждое весло обслуживало до 10 гребцов. В VII веке появились универсальные гребные суда – галеры, а в XVI веке более крупные галеасы, на которых уже значительную роль играли паруса. Узкие и манёвренные гребные суда использовались ещё в XVIII веке, главным образом в качестве военных кораблей (смотрите Военно-Морской Флот, Гребной Флот). На широких и вместительных грузовых судах более эффективным движителем был парус. Чисто парусные суда появились в X–XIII веках в Средиземноморье, Скандинавии, Китае. С развитием техники управления парусами и лавирования суда получили возможность двигаться и против ветра, меняя галсы. Для управления гребными и парусными судами использовали широкие рулевые вёсла (с одного или обоих бортов) или одно рулевое весло в кормовой части, где впоследствии был установлен руль. С XII–XIII веков в Западной Европе строились пригодные для океанских плаваний нефы, каравеллы и другие парусные суда. Наивысшего развития парусные суда достигли во 2-й половине XIX века; длина их составляла 90 метров (м), ширина 15–17 м, грузоподъёмность 5 000 т, скорость 33 км/ч и более (смотрите также Парусный Флот). Для предохранения деревянной подводной части судна от разрушения Финикийцы обшивали её металлом (свинцовыми пластинами), с начала XVIII века нижнюю часть корпуса покрывали тонкими медными листами. Предложения применять в судостроении железо вместо дерева относятся к середине XVII века, но только 09 Июля 1787 Англичанин Дьжон ‘Чокнутый на Металле’ Вилкинсэн (John ‘Iron-Mad’ Wilkinson; 1728–1808) построил первое железное судно (iron boats) Зэ Тчрайэл (The Trial) – речную баржу длиной 21.5 м и толщиной железа 8 миллиметров (мм). Со 2-й половины XIX века железо как судостроительный материал начало уступать место более прочной стали. Изготовление корпусов судов целиком из металла позволило увеличить их прочность и уменьшило относительную массу (по отношению к водоизмещению). Корпуса крупных стальных судов стали разделять на водонепроницаемые отсеки, устраивать двойное дно, что повысило их безопасность. Переход от клёпки к сварке ещё более повысил прочность, надёжность и долговечность судов. В XVIII веке делались попытки использовать для движения судов энергию пара. Первый речной деревянный пароход Клэмэнт (Clermont) с паровой машиной в качестве главного судового двигателя и гребными колёсами по бортам был построен в 1807 в США инженером и изобретателем Робэтом Фултчэном (Robert Fulton; 1765–1815) и адвокатом, политиком и дипломатом Робэтом Робэтом Ливиньгстэном (Robert Robert Livingston; 1746–1813). В России в 1815 регулярные рейсы между Кронштадтом и Петербургом стало совершать деревянное паровое судно Елизавета. Колёсный 20-метровый пароход из железа Вулкан (The Vulcan) был спущен со стапелей в 1818 в Великобритании. В 1-й половине XIX века на морских пароходах стали устанавливать гребные винты, которые на волнении оказались значительно эффективнее гребных колёс. На рубеже XIX и XX веков в качестве судовых двигателей начали использовать паровые турбины (02 Августа 1894 в Великобритании был построен турбоход Турбиния (Turbinia)) и двигатели внутреннего сгорания (в 1903 в России был спущен на воду дизель-электроход Вандал). К середине XX века появились суда с энергетическими установками, работающими на ядерном топливе (смотрите Атомный Флот, Атомный Ледокол Ленин). Устройство И Типы Судов:- Важнейшая характеристика судна – его эксплуатационные качества, которые численно выражают эксплуатационно-технические характеристики, или тактико-технические данные:- скорость, район и дальность плавания, автономность, энерговооружённость, уровень автоматизации производственных процессов, надёжность, ремонтопригодность, обитаемость и другие, а для транспортных – также грузоподъёмность, грузо- и пассажировместимость, регистровая вместимость и приспособленность к грузовым операциям (для грузовых судов). Специфические свойства судов как плавучих сооружений – так называемые мореходные качества (плавучесть, остойчивость, качка, ходкость, управляемость, непотопляемость). Учёт этих свойств при создании судна связан с выполнением комплекса научно-исследовательского и конструкторских работ (обоснование технико-эксплуатационных требований, проектирование, модельные испытания). При создании судна используются:- теория проектирования судна, теория корабля, строительная механика корабля, теория судовых механизмов и машин, технология постройки, экономика судостроительного производства, а также действующие правила постройки, определяемые классификационными обществами, и так далее. Обоснование и создание нового судна длится несколько лет. Важнейшие технико-эксплуатационные характеристики судна определяются основными элементами:- главными размерениями (длиной, шириной, высотой борта на середине длины судна и так далее), дедвейтом,

водоизмещением, типом и мощностью главных двигателей, вместимостью. Самоходное судно состоит из корпуса с надстройками и рубками, судовых устройств и систем, энергетической установки с движителями, навигационного оборудования, средств связи. Корпус судна разделяется палубами, поперечными и продольными переборками на отсеки, в которых располагают энергетические установки, трюмы, твиндеки и так далее. На морских судах междудонное пространство в корпусе используется для хранения топлива и пресной воды, а также водяного балласта. Корпуса судов изготовляются из стали, лёгких сплавов, дерева, железобетона, пластмасс и других конструкционных материалов. Надстройки и рубки размещаются на верхней палубе и содержат каюты для экипажа и пассажиров, общественные, хозяйственные и служебные помещения. В рубках (рулевой, штурманской и радиорубке) устанавливаются навигационное оборудование и судовые средства связи, сигнализации и управления, обеспечивающие безопасное плавание судна, определение его местоположения, связь с берегом и так далее. Внешняя форма и принципиальная компоновка определяют архитектурно-конструктивный тип судна, в частности его характеризуют:- форма носовых и кормовых обводов (смотрите Корма, Нос), размеры и расположение судовых надстроек и рубок, продольная погибь верхней палубы (седловатость), место расположения энергетической установки, число палуб и трюмов, число и размеры грузовых люков, бортовых, носовых и кормовых портов. Судовые устройства и судовые системы обеспечивают безопасную эксплуатацию судна и сохранность перевозимых грузов, комфортабельные условия для экипажа и пассажиров. Энергетическая установка состоит из главных и вспомогательных механизмов и аппаратов и предназначена для обеспечения движения судна, снабжения электроэнергией, паром, водой, сжатым воздухом судовых механизмов, устройств и систем, а также средств управления. Наибольшее распространение получили дизельные энергетические установки. Автоматизированные энергетические установки работают без постоянной вахты в машинном отделении; управление и контроль за работой ведётся дистанционно, в том числе из рулевой рубки. Основной тип применяемых на судне движителей – гребные винты. Развитие судов идёт по пути их универсализации и специализации, причём специализация, например, транспортного судна, обусловливается не только видом перевозимого груза, но и технологией его перегрузки. Например, сухогрузные суда в целях сокращения времени и ликвидации ручного труда при погрузке и выгрузке, удобной укладки грузов строятся с большим раскрытием трюмов, с грузовыми устройствами или без них; судно универсального назначения – с 1–3 грузовыми люками по ширине судна, с кранами грузоподъёмностью около 25–30 т. Широкое развитие получили суда для перевозки пакетов или контейнеров с унифицированными размерами – контейнеровозы, трейлерные суда и другие. Принципиально новый вид транспортных судов – лихтеровозы, перевозящие лихтеры (плавучие контейнеры с одним трюмом грузоподъёмностью до 1 000 т). Лихтеровозы бывают одно и трёхпалубные, двухкорпусные; снабжаются мощными грузоподъёмниками. Самые крупные из сухогрузных судов – суда для перевозки навалочных и насыпных грузов. Среди них универсальные навалочники и узкоспециализированные рудовозы, цементовозы, углевозы. Жидкие грузы наливом (нефть, жидкое топливо, смазочные масла, сжиженные газы и тому подобное) перевозят в танкерах, наибольшие из которых по размерам превосходят все другие суда. Получают применение составные суда для транспортировки навалочных грузов, леса, нефти и другого в прибрежном и океанском плавании. Грузоподъёмность составных судов 5 000–50 000 т, скорость до 30 км/ч, мощность главных двигателей достигает 10 МегаВатт (МВт). Составное судно включает грузовую и энергетическую секции с жёстким или гибким счальным устройством. Грузовая секция – несамоходная баржа с якорным, швартовным, а иногда и грузовым устройством, балластно-осушительной системой; управление устройствами и системами – дистанционное (с энергетическими секциями). Современные пассажирские суда, игравшие до середины XX века большую роль в перевозке пассажиров на дальние расстояния (например, из Западной Европы в Австралию), использовались главным образом для многодневных туристических рейсов (круизов), кратковременных прогулок и местного сообщения. Туристические суда – комфортабельные и, как правило, крупные суда, рассчитанные на несколько сотен пассажиров. Суда местного сообщения отличаются быстроходностью, многие из них – суда на подводных крыльях и суда на воздушной подушке. Повышение провозоспособности судов достигается в первую очередь увеличением их грузоподъёмности и скорости, обусловливаемым интенсификацией обработки судов в портах, снижением удельных эксплуатационных расходов и прочим. Наиболее быстро растёт грузоподъёмность судов для перевозки массовых грузов (нефти, сжиженных газов, руды, удобрений и других), увеличение размеров танкеров и навалочных судов ограничивается глубинами в портах, каналах и проливах. Снижение энергозатрат обеспечивается совершенствованием обводов, движительно-рулевого комплекса и энергетической установки. Весьма интенсивный рост производительности грузовых операций обусловлен значительным повышением грузоподъёмности и скорости контейнеровозов, лихтеровозов и судов с горизонтальным способом грузовых операций. К 1970-ым для водоизмещающих судов почти достигнут рациональный предел скорости. Наибольшие перспективы роста скорости (до 100–200 километров в час (км/ч)) у судов на подводных крыльях и воздушной подушке.

SHIP = ОТГРУЖАТЬ (или ОТПРАВЛЯТЬ) – Ship (maritime term):- to enlist; to send on board cargo; to put in place; to take on board.

SHIP AGENT = СУДОВОЙ АГЕНТ – Ship Agent is a liner company or tramp ship operator representative who facilitates ship arrival, clearance, loading and unloading, and fee payment while at a specific port. / Судовой Агент – представитель линейной компании или оператора трампового судна, который обеспечивает прибытие судна, очистку, погрузку и выгрузку, и оплату соответствующих услуг при нахождении в конкретном порту.

SHIP AND GOODS POLICY = ПОЛИС НА СУДНО И ТОВАРЫ – Ship And Goods (SG) Policy is the policy form adopted by Lloyd's, in 1779, as a standard for all marine insurance business. The form covered both ship and goods on a specified voyage and required considerable adaptation to be used for modem hull and cargo business. The London company market adopted separate policy forms for hull and cargo business, but these were very similar to Lloyd's SG form and still required adaptation. In January, 1982, the London cargo insurance market replaced the SG form with the MAR form of policy. The London hull insurance market took the same measure in October 1983. The Institute clauses published for use with the SG form and its company counterpart have been withdrawn. / Лойдз (Lloyd's).

SHIP AND INSURANCE BROKERS = СУДОВЫЕ И СТРАХОВЫЕ БРОКЕРЫ – Ship And Insurance Brokers (in 1844):- the chief employment of this class of brokers is in the buying and selling of ships, in procuring cargoes on freight, and adjusting the terms of charterparties, settling with the master for his salary and disbursements, &c. Their charge as ship brokers is about 2 per cent. on the gross receipts. When they act as insurance brokers, they charge 5 per cent. on the premium, eclusive of a discount allowed them on settling with the underwriter. The merchant looks to the broker for the regularity of the contract, and a proper selection of underwriters. To him also the underwriters look for a fair and candid disclosure of all material circumstances affecting the risk, and for payment of their premiums. From the importance of their employment, ship and insurance brokers ought to be, and indeed generally are, persons of respectability and honour, in whom full confidence may be reposed. A ship broker is not within the various acts for the regulation and admission of brokers.

SHIP BROKER = СУДОВОЙ БРОКЕР (или СУДОВОЙ МАКЛЕР) – Ship Broker is a firm that serves as a go-between for the tramp ship owner and the chartering consignor or consignee. Ship Broker acts as intermediary between shipowners or carriers on the one hand and cargo interests on the other.

SHIP CHANDLER = СУДОВОЙ ПОСТАВЩИК – Ship Chandler is an individual or company selling equipment and supplies for ships.

SHIP CRANE = КОРАБЕЛЬНЫЙ КРАН (или СУДОВОЙ КРАН) – Ship Crane is a crane permanently attached to the vessel for the purpose of loading and unloading of vessel. / Кран, укреплённый на судне на постоянной основе с целью погрузки и выгрузки судна.

SHIP DEMURRAGE = СУДОВОЙ ДЕМЕРЕДЖ (или СУДОВОЙ СБОР ЗА ЗАДЕРЖКУ СВЕРХ СРОКА СТАЛИИ) – Ship Demurrage is a charge for delaying a steamer beyond a stipulated period. / Сбор за задержку парохода сверх обусловленного периода.

SHIPLAPPED LUMBER = ПИЛОМАТЕРИАЛ С СОЕДИНЕНИЕМ КРОМОК ДОСОК В ЧЕТВЕРТЬ или ВЗАКРОЙ – Shiplapped Lumber:- a lumber that is edge dressed to make a lapped joint. / пиломатериал, который строган по для создания соединения внахлёстку/внапуск.

SHIPMENT = ОТПРАВКА (или ОТГРУЗКА) – Shipment is:- (i) the act or an instance of shipping goods; or (ii) a quantity of goods or cargo that are shipped together. The tender of one lot of cargo at one time from one shipper to one consignee on one bill of lading. Shipment:- a freight that is transported from one location, such as a regional distribution center (RDC) or manufacturing site, to another, such as a consignee. Shipment is a separately identifiable collection of merchandise to be carried. Shipment:- as a working definition for export certification purposes, shipment means one exportation of commodities, from one exporter, to one consignee, in one country, on one means of conveyance (7 CFR 353; (short for the US Code of Federal Regulations:- Title 7)). In most cases, only one export certificate is issued per shipment. See also Consignment. / вывоз (exportation).

SHIPMENT ORDER SLIP = КВИТАНЦИЯ ОРДЕРА НА ОТГРУЗКУ – The Shipment Order Slip is given by the terminal elevator operator to the inspector in charge. It indicates the quantity and grade of grain ordered for shipment.

SHIPMENTS = ОТГРУЗКИ – In the official statistics of US Census Bureau, Shipments:- manufacturers' shipments measure the Dollar value of products sold by manufacturing establishments and are based on net selling values, FOB (free on board) plant, after discounts and allowances are excluded. Freight charges and excise taxes are excluded. Where the products of an industry are customarily delivered to distributors or consumers by the manufacturing establishment (such as in certain foods industries – fluid milk, bakery, soft drinks), the value is based on delivered price rather than FOB plant price. Multi-industry companies report value information for each industry category as if it were a separate economic unit. Thus, products transferred from one plant to another are valued at their full economic value.

SHIP MORTGAGE = ЗАКЛАДНАЯ НА СУДНО – Ship Mortgage:- claim or receivable which is secured by a mortgage or lien on a ship pledged as collateral.

SHIP OPERATOR = ОПЕРАТОР СУДНА – A Ship Operator is either the shipowner or the legal person responsible for the de-facto management of a vessel and its crew.

SHIPOWNER = СУДОВЛАДЕЛЕЦ (или ФРАХТОВЩИК) – Shipowner is one who owns or operates a ship, whether a person, a corporation or other legal entity, and any person acting on behalf of the owner or operator. Shipowner is the legal person officially registered as such in the vessel's certificate of registry. Shipowner:- the (legal) person officially registered as such in the certificate of registry where the following particulars are contained:- (i) name of vessel and port of registry; (ii) details contained in surveyors certificate; (iii) the particulars respecting the origin stated in the declaration of ownership; and (iv) the name and description of the registered owner, if more than one owner the proportionate share of each. / в судовом свидетельстве .

SHIPPED BILL = КОНОСАМЕНТ НА ПОГРУЖЕННОЕ – A Bill of Lading that acknowledges the goods have been loaded on the ship. Shipped Bill is a bill of lading containing an acknowledgement by the carrier that the cargo covered has been loaded on board a vessel. Also known as On Board Bill, and Shipped On Board Bill.

SHIPPED ON BOARD = ПОГРУЖЕНО НА БОРТ – Shipped On Board is an endorsement on a Bill of Lading (B/L) confirming loading of goods on the vessel.

SHIPPER = ОТПРАВИТЕЛЬ – Shippers are individuals or businesses who purchase transportation services for their goods or commodities. The owner and/or manufacturer of the cargo or the individual authorized to act as an agent for the supplier. Shipper is a legal entity or person named on the bill of lading or waybill as shipper and/or who (or in whose name or on whose behalf) a contract of carriage has been concluded with a carrier. The person or company who is usually the supplier or owner of commodities shipped. Also known as Consignor or Sender. A Shipper is the party who supplies the goods to be transported. The merchant with whom a contract of carriage of goods has been concluded with a Carrier. Shipper is:- (1) person who consigns something, e.g., the goods of an individual shipment; or/and (2) legal entity or person named on the bill of lading or waybill as shipper and/or who (or in whose name or on whose behalf) a contract of carriage has been concluded with a carrier. Also known as Consignor. Shipper is the person or company who is usually the supplier or owner of commodities shipped.

SHIPPER LOAD AND COUNT = ЗАГРУЗКА И ПОДСЧЁТ ОТПРАВИТЕЛЕМ – Shipper Load and Count:- the process by which the shipper places goods into carrier's trailer at his own site. With shipper load and count there is no opportunity for joint check of the goods by shipper and carrier. The shipper is responsible for the proper loading and verification of the goods being shipped.

SHIPPER PACKED = УПАКОВАНО ОТПРАВИТЕЛЕМ – Shipper Packed:- contents of containers as loaded (stuffed), stowed (packed/braced), weighed and/or counted by or for the shipper, usually a CY load.

SHIPPERS AGENT = АГЕНТ ОТПРАВИТЕЛЕЙ – Shippers Agent is a firm that primarily matches up small shipments, especially single-traffic piggyback loads, to permit shippers to use twin-trailer piggyback rates.

SHIPPER'S ASSOCIATION = АССОЦИАЦИЯ ОТПРАВИТЕЛЕЙ – Shipper's Association is a non-profit entity that represents the interests of a number of shippers. The main focus of shippers associations is to pool the cargo volumes of members to leverage the most favorable service contract rate levels.

SHIPPER'S COUNCIL = СОВЕТ ОТПРАВИТЕЛЕЙ – Shipper's Council is an organization of shippers formed to collectively negotiate rates and services with the conferences of ship operators.

SHIPPER'S EXPORT DECLARATION = ВЫВОЗНАЯ ДЕКЛАРАЦИЯ ОТПРАВИТЕЛЯ (или ЭКСПОРТНАЯ ДЕКЛАРАЦИЯ ОТПРАВИТЕЛЯ) – In the United States, the Shipper's Export Declaration (SED) is used to control exports and compile trade statistics and must be prepared and submitted to the customs agent for shipments by mail valued at more than USD500.00 and for shipments by means other than mail valued at more than USD2 500.00. An SED must be prepared for all shipments covered by an individual validated license, regardless of value. Shipper's Export Declaration (SED) is generally required by the US Census Bureau for US exports that contain a single commodity's value exceeding USD2 500.00. All SED information is provided to the US Census Bureau and is used for export compliance and governmental reporting.

SHIPPERS INDEMNITY = ВОЗМЕЩЕНИЕ (или КОМПЕНСАЦИЯ) ОТПРАВИТЕЛЯМ – Shippers Indemnity is an indemnity given by the beneficiary of a letter of credit to the negotiating bank to induce payment despite any discrepancies that may exist in the documents.

SHIPPER'S LETTER OF INSTRUCTIONS FOR ISSUING AIR WAYBILL = ПИСЬМО ОТПРАВИТЕЛЯ С ИНСТРУКЦИЕЙ ОБ ОФОРМЛЕНИИ АВИАГРУЗОВОЙ НАКЛАДНОЙ – Shipper's Letter Of Instructions For Issuing Air Waybill:- this document is required by the carrier or freight forwarders in order to obtain (besides the data needed) authorization to issue and sign the air waybill in the name of the shipper.

SHIPPER'S LOAD AND COUNT = ПОГРУЗКА И ПОДСЧЁТ ОТПРАВИТЕЛЕМ – Shipper's Load And Count is a term denoting that the contents of a container when loaded and counted by the shipper and not checked or verified by the transportation line. / Термин, указывающий на то, что содержимое контейнеро было погружено и подсчитано грузоотправителем и не проверялось или не сверялось транспортировочной линией.

SHIPPING ACT OF 1916 = АКТ О СУДОХОДСТВЕ ОТ 1916 – Shipping Act of 1916 is the act of the US Congress (1916) that created the US Shipping Board to develop water transportation, operate the merchant ships owned by the government, and regulate the water carriers engaged in commerce under the flag of the United States. As of 1984-June-18, applies only to domestic offshore ocean transport.

SHIPPING ACT OF 1984 = АКТ О СУДОХОДСТВЕ ОТ 1984 – Shipping Act of 1994:- effective 1984-June-18, describes the law covering water transportation in the US foreign trade.

SHIPPING ACT OF 1998 = АКТ О СУДОХОДСТВЕ ОТ 1998 – Shipping Act of 1998 amends the Act of 1984 to provide for confidential service contracts and other items.

SHIPPING CERTIFICATE = ПОГРУЗОЧНЫЙ СЕРТИФИКАТ – Shipping Certificate is a negotiable instrument used by several futures exchanges as the futures delivery instrument for several commodities, e.g., Soybean meal, plywood, and white Wheat. The shipping certificate is issued by exchange-approved facilities and represents a commitment by the facility to deliver the commodity to the holder of the certificate under the terms specified therein. Unlike an issuer of a warehouse receipt, who has physical product in store, the issuer of a shipping certificate may honor its obligation from current production or through-put as well as from inventories. / , например, .

SHIPPING MARK = ОТГРУЗОЧНАЯ МАРКИРОВКА – Shipping Mark is a part of the marking on packages. The shipping mark comprises:- (i) identification mark, e.g., initial letters of recipient or shipper; (ii) identification number, e.g., the recipient's order number; (iii) total number of items in the complete consignment; (iv) sequential number of the package in the consignment; and (v) final destination and port of destination. See also Markings. / Часть маркировки на упаковках. Отгрузочная маркировка состоит из:- (i) идентификационной маркировки, например, первоначальных букв получателя или грузоотправителя; (ii) идентификационного номера, например, номера заказа получателя; (iii) общего числа изделий во всей грузовой партии; (iv) последовательного номера упаковки в данной грузовой партии; и (v) конечного пункта назначения и порта назначения.

SHIPPING NOTE = ТОВАРНО–ТРАНСПОРТНАЯ НАКЛАДНАЯ (или НОТА ОТГРУЗКИ, или НОТА ОТПРАВКИ) – Shipping Note is a document provided by the shipper or his agent to the carrier, multimodal transport operator, terminal or other receiving authority, giving information about export consignments offered for transport, and providing for the necessary receipts and declarations of liability.

SHIPPING ORDER = ЗАКАЗ НА ПЕРЕВОЗКУ – Shipping Order is an equivalent of booking and contract of carriage evidencing the agreement to transport goods. A Shipping Order is the carrier's copy of the bill of lading.

SHIPPING PALLET = ПЕРЕВОЗОЧНЫЙ ПОДДОН – Shipping Pallet is a pallet designed to be used for a single one-way trip from shipper to receiver; it is then disposed. See also Expendable Pallet.

SHIPPING PERMIT = РАЗРЕШЕНИЕ НА ОТГРУЗКУ – The Shipping Permit, issued by a shipping or carrier company, authorizes the receiving clerk at pier, dock, warehouse, or airport, or on board, to receive a stipulated amount of goods or materials from a specified firm.

SHIPPING WEIGHT = ОТГРУЖАЕМЫЙ ВЕС – Shipping Weight represents the gross weight in kilograms of shipments, including the weight of moisture content, wrappings, crates, boxes, and containers (other than cargo vans and similar substantial outer containers).

SHIP PLANNING MESSAGE DEVELOPMENT GROUP = ПЛАНИРУЮЩАЯ ГРУППА ПО РАЗРАБОТКЕ СООБЩЕНИЙ ДЛЯ СУДОВ – Ship Planning Message Development Group (SMDG) is the user group for shipping lines and container terminals. SMDG develops and promotes UN/EDIFACT EDI messages for the maritime industry and is an official Pan European User Group recognized by the UN/EDIFACT Board. SMDG is a non-profit foundation, run by and on behalf of companies and organizations working in the maritime industry, like container terminals, ocean carriers and related companies and organizations. SMDG develops and promotes UN/EDIFACT EDI-messages for the Maritime Industry and is an official Pan European User Group, recognized by the UN/EDIFACT Board. Since its inception the group has held numerous meetings across the globe. The first was held in London on 17 September 1987, since then other locations have included Europe, Australia, China, Curacao, Dubai, Japan, Singapore, South Africa, USA. The SMDG meetings occur twice yearly in April and October. The original objective of the group was to agree a standard format for the exchange of ship stowage planning information. This became known as the BAPLIE (short for the UN/EDIFACT United Nations Standard Message (UNSM) Bayplan/Stowageplan Occupied And Empty Locations Message) message which defines the position of containers in a vessel. The initial development process was slow, reflecting the wide range of interests involved as well as their geographical spread. However, since implementation of the first version of BAPLIE its use has grown rapidly across the world. Most carriers and deep-sea container terminals are now dependent on its use for accurate and timely information. Experience has brought refinement and further development with the latest BAPLIE version 3.0 now being introduced. The advantages of Electronic Data Interchange (EDI) have been underlined by BAPLIE implementation and the group has since looked at other operational messages for stowage instructions (MOVINS), the so called Container Messages and Terminal Performance Reporting (TPFREP). These messages are now in use worldwide. Plenary SMDG meetings are normally attended by between 20-30 people representing many different

companies and organizations. Topics discussed in the meetings include, experiences with EDI messages, network services and costs, interchange agreements, development work on messages in the maritime business. New topics include presentations and discussions about the application of new technology in the Maritime Industry, like RFID (short for the Radio Frequency Identification), electronic seals and container tags, Automatic gate systems, etc. SMDG depends on donations from its members. However, SMDG documentation can be downloaded by any interested party 'free-of-charge' from the SMDG website. Headquartered in Barendrecht, The Netherlands.

SHIP'S AGENT = СУДОВОЙ АГЕНТ (или МОРСКОЙ АГЕНТ) – Ship's Agent is a person or firm who transacts all business in a port on behalf of shipowners or charterers. Also known as Shipping Agent.

SHIP'S ARTICLES = ДОГОВОР О НАЙМЕ НА СУДНО – Ship's Articles is a written agreement between the master of a ship and the crew concerning their employment. It includes rates of pay and capacity of each crewman, the date of commencement of the voyage and its duration. The agreement between the master and his crew, giving details of conditions and terms. / Соглашение между хозяином (или капитаном) судна и его экипажем, предоставляющее сведения об условиях и порядках.

SHIP'S CHAIRMAN (SHOP STEWARD) = СУДОВОЙ НАЧАЛЬНИК (МАГАЗИННЫЙ СТЮАРД) – Ship's Chairman (Shop Steward) (deck department (unlicensed)):- in charge of union business for unlicensed personnel. Handles grievances.

SHIP'S CHANDLERS = СУДОВЫЕ ПОСТАВЩИКИ – Ship Chandler is an individual or company selling equipment and supplies for vessels. Suppliers of stores/provisions (various items) to the vessel. / Поставщики припасов/провизии на судно.

SHIP'S DELIVERY ORDER = ДОЛЕВОЙ КОНОСАМЕНТ СУДНА (или ПОРУЧЕНИЕ ПОСТАВКИ СУДНА) – Ship's Delivery Order means a document, other than a bill of lading or a sea waybill, that:- (i) is given in association with a contract for the carriage of goods by sea, including goods to which the document relates; and (ii) contains an undertaking by the carrier to deliver the goods to which the document relates to a person identified in the document. Ship's Delivery Order (SDO) is an undertaking given by a carrier, pursuant to a contract for the carriage by sea of the cargo to which the undertaking relates, to the person so identified, to deliver that cargo to a person identified therein, i.e. not a bill of lading. SDOs generally are issued when the shipper of a bulk cargo covered by a single bill of lading wishes to split the bulk cargo and to deliver distinct parcels to a number of consignees. SDOs will be issued to avoid problems potentially faced in procuring the surrender of the initial original bill of lading and issuing a number of different original bills of lading in substitution.

SHIP'S EQUIPMENT = ОБОРУДОВАНИЕ СУДНА – Ship's Equipment:- articles, other than ship's spare parts, on board a ship for use thereon, which are removable but not of a consumable nature, including accessories such as lifeboats, life-saving devices, furniture, ship's apparel and similar items.

SHIPS GOODS POLICY FORM = ФОРМА ПОЛИСА И НА СУДНО И НА ТОВАРЫ – The 'Ships Goods' (SG) Policy Form adopted by Lloyd's, in 1779, as a standard for all marine insurance business. The form covered both ship and goods on a specified voyage and required considerable adaptation to be used for modern hull and cargo business. The London company market adopted separate policy forms for hull and cargo business, but these were very similar to Lloyd's SG form and still required adaptation. In January, 1982, the London cargo insurance market replaced the SG form with the MAR form of policy. The London hull insurance market took the same measure in October 1983. The Institute clauses published for use with the SG form and its company counterpart have been withdrawn. / Лойдз (Lloyd's).

SHIP'S HUSBAND = УПРАВЛЯЮЩИЙ СУДНОМ (или МУЖ ШХУНЫ) – Ship's Husband is the shipowner's agent who superintends the vessel when in port. / Агент владельца судна, который руководит судном, находящимся в порту.

SHIPSIDE = ПО БОРТУ – Shipside:- cargo located alongside the vessel. / Груз, размещённый вдоль борта судна.

SHIP'S MANIFEST = СУДОВОЙ МАНИФЕСТ – Ship's Manifest is a statement listing the particulars of all shipments loaded for a specified voyage. A list, signed by the captain of a ship, of the individual shipments constituting the ship's cargo. When all bills of lading are processed a ship's manifest is prepared by the steamship line. This summarizes all cargo aboard the vessel by port of loading and discharge. / Он суммирует весь груз на борту судна портом погрузки и разгрузки. Под Манифестом, от позднелатинского слова Manifestum, означающее Призыв, от Латинского слова Manifesto, означающее Открываю или Показываю, понимается.

SHIP'S PROTEST = МОРСКОЙ ПРОТЕСТ (или СУДОВОЙ ПРОТЕСТ) – Statement of the master of a vessel before (in the presence of) competent authorities, concerning exceptional events which occurred during a voyage. Ship's Protest is a statement of the master concerning exceptional events which occurred during a voyage of a vessel which is lodged with the competent authorities. / хозяина (или капитана) судна . Под Морским Протестом понимается письменное заявление капитана судна о наличии общей или частной аварии, о столкновении судов, или иного происшествия, которое может явиться основанием для предъявления судовладельцу имущественных требований, оформленное в установленном порядке, удостоверенное актом уполномоченного органа государственного управления и направленное на обеспечение доказательств для защиты прав и законных интересов судовладельца. Акт Морского Протеста, составленный нотариусом или должностным лицом консульского учреждения, при определённых обстоятельствах служит юридическим основанием для освобождения от таможенных платежей.

SHIP'S SPARE PARTS = ЗАПАСНЫЕ ЧАСТИ СУДНА – Ship's Spare Parts:- articles of repair or replacement nature for incorporation into the ship in which they are carried.

SHIP'S STABILITY = ОСТОЙЧИВОСТЬ СУДНА – Ship's Stability is the seaworthiness of a ship regarding the centrifugal force which enables her to remain upright. / Под Остойчивостью Судна понимается способность судна, отклонённого внешним моментом от положения равновесия, возвращаться в исходное положение после прекращения действия этого момента; одно из важнейших мореходных качеств судна. Различают остойчивость поперечную и продольную (при наклонениях судна соответственно в поперечной и продольной плоскостях), а по характеру противодействия внешним силам – статическую и динамическую. Мерами остойчивости служат метацентрическая высота, восстанавливающий момент при статическом наклонении и работа восстанавливающего момента при динамическом наклонении.

SHIP'S STORES = ПРИПАСЫ СУДНА (или КЛАДОВЫЕ СУДНА, или БАТАЛЕРКИ) – Ship's Stores:- goods for use in the ship, including consumable goods, goods carried for sale to passengers and crew members, fuel and lubricants, but excluding ship's equipment and ship's spare parts.

SHIP'S TACKLE = ТАКЕЛАЖ СУДНА (или ОСНАСТКА СУДНА, или СУДОВЫЕ ТАЛИ) – (1) Ship's Tackle:- all rigging, cranes, etc, utilized on a ship to load or unload cargo. / Вся оснастка, краны, и прочее, используемые на судне для погрузки или выгрузки груза. Под Такелажем, от Голландского слова Takelage, понимаются:- (1) совокупность судовых снастей (прутки, тросы, цепи) для крепления рангоута, управления парусами, грузоподъёмных работ. Различают:- (i) стоячий (неподвижный) такелаж –

ванты, штаги и прочее, служащий для удержания частей рангоута (мачт, стеньг и тому подобного); и (ii) бегучий (подвижный) такелаж – топенанты, фалы, шкоты и прочее, используемый для подъёма и спуска грузов, сигналов, стрел, шлюпок и тому подобного, а на парусных судах – для управления парусами и подвижными частями рангоута. Оба конца снасти стоячего такелажа, состоящей из стальных тросов, цепей или прутков и приспособлений для натягивания (талрепов), закрепляются наглухо. Один конец снасти бегучего такелажа, обычно изготовляемой из тросов, цепей, закрепляется либо к подвижному элементу, например, к грузовому гаку, а второй подаётся на тяговый механизм или временно закрепляется. К бегучему такелажу рангоута парусных судов относятся, например, фалы для подъёма реев, брасы и топенанты для разворачивания реев в горизонтальной и вертикальной плоскостях; к бегучему такелажу парусов – фалы, шкоты, гитовы, галсы и другое. Прочность и эксплуатационное состояние снастей для ответственных частей такелажа, используемых для подъёма грузов и в судовых устройствах, которые обеспечивают безопасность судна и людей, например, в швартовном или спасательном устройствах, регламентируются классификационными обществами. Талреп, от Голландского слова Taliereep, приспособление для натягивания снастей стоячего такелажа, лееров, крепления (по-походному) различных предметов на палубе и тому подобного. Талрепы бывают металлические (винтовые) и тросовые. Винтовые талрепы (наиболее распространены) состоят из 2 стержней с нарезкой и вилки. На талрепы ставят клеймо с указанием рабочей нагрузки. Под судовым Леером, от Голландского слова Leier, понимается съёмное (тросовое) или постоянное (из металлических труб, прутков) ограждение вдоль бортов, вокруг люков и тому подобного на судах. Спасательным леером называют трос, подвешенный на бортах спасательной шлюпки. Леером называют также тросы для постановки некоторых парусов. Леер – судовой трос, служащий для подъёма косых парусов, ограждения палубных отверстий или открытых палуб в местах, не защищённых комингсом или фальшбортом, подвески шлангов при передаче жидкого топлива на ходу и другого. На современных судах постоянное и съёмное леерное ограждение состоит из металлических стоек высотой не менее 1 метра, через отверстия которых пропускаются в 2–3 ряда лееры.

(2) Ship's Tackle:- any system of leverage using pulleys, as a combination of ropes and blocks for hoisting, lowering, and shifting objects. When two or more blocks are employed to move a single weight, they, with their ropes, constitute a purchase. Tackle:- an assemblage of ropes and pulleys arranged to gain mechanical advantage for hoisting and pulling. Tackle:- any ropes, cables, or chains used to support (standing rigging) or control (running rigging) masts, spars, or sails. / Стропы, тросы, цепи, применяемые совместно с грузоподъёмными устройствами для подъёма тяжёлых грузов, оборудования при монтажных, строительных и других работах.

SHIP'S TIME = СУДОВОЕ ВРЕМЯ – Ship's Time (maritime term):- ship's time was counted by the half hour, starting at midnight. A half hour after twelve was one bell; one o'clock, two bells; and so on until four o'clock, which was eight bells. The counting then started over again, with 4:30 being one bell.

SHIP TO = ОТГРУЗИТЬ ПО АДРЕСУ (или ОТГРУЗИТЬ В) – Ship To:- delivery address for the consignee.

SHIRE = ШАЙЭ (или ТОНИНА) – Shire:- xxxxx. See also Shier. / Тонина в пряже.

SHIRRING = ХХ (или ПОСАДКА ТКАНИ ПРИ ДВУХ ПАРАЛЛЕЛЬНЫХ ЛИНИЯХ СТРОЧКИ) – Shirring is a method of gathering fabric to create decorative fullness. Shirring consists of three or more parallel rows of stitching, placed about 1/4" to 1' apart, and drawn up (gathered) together to form bands of controlled gathers. Shirring is used in clothing and in items of home furnishings. Shirring is a gathering of fabric. To gather cloth into decorative rows by parallel stitching.

SHIRT = РУБАШКА (или СОРОЧКА) – Shirt is a garment for the upper part of the body; a cloth garment usually having a collar, sleeves, a front opening, and a tail long enough to be tucked inside trousers or a skirt; undershirt.

SHIRTDRESS = ПЛАТЬЕ–РУБАШКА (или ХХ) – Shirtdress is a tailored dress patterned after a shirt and having buttons down the front. / платье спортивного покроя.

SHIRTING = СОРОЧЕЧНАЯ ТКАНЬ – The term Shirting is now called Chemise. There are men's shirts for cuterwear; women's for underwear. Some shirting on the market today includes broadcloth, Cheviot, dress shirting, Jacquard, Jersey, Madras, Oxford, plain, Russian cord, satin striped and work shirting. Shirting Textures and Sizes:- (i) Broadcloth – 100 to 136 by 60 to 64; (ii) Madras – 80 to 84 by 72 to 80; (iii) Oxford – 88 to 90 by 40 to 50; and (iv) Common Print Cloth – 80 square by 68 to 72. Sizes range from 13 1/2 to 18; sleeve length – from 31 inches to 37 inches; chest – from 39 1/2 inches to 57 1/2 inches; waist – from 36 1/2 inches to 55 1/2 inches. Standard construction of the gray fabric in Japan:- 100% cotton, 30's x 36's, 72 x 69 threads per inch, 38" or 44". Shirting is any lightweight fabric appropriate for shirts or blouses. The term top-weight (its opposite is bottom-weight) is often om-weight) is often used for this type of fabric instead of the word shirting. Some crêpes and satins, as well as voile and Oxford cloth, are examples of shirting fabrics although there are many others. Shirting is a fabric used in making men's shirts. Shirting is a fabric suitable for shirts. / Жакяр (Jacquard). Шомиз (Chemise). , Чэвиот или Шэвьё (Cheviot), .

SHIRTING FLANNEL = СОРОЧЕЧНАЯ ФЛАНЕЛЬ – Shirting Flannel is a plain- or twill-woven fabric used for shirting. Characterized by its nap, the material may be plain or colored either by dyeing or printing. Made of wool, worsted, cotton, rayon staple, blends, etc.

SHIRT JACKET = РУБАШКА–КУРТКА (или РУБАШКА–ЖАКЕТ) – Shirt Jacket is a jacket designed in the style of a shirt. Also called as Shirt-Jac.

SHIRTWAIST = ХХ (или БЛУЗКА С ДЛИННЫМ РУКАВОМ) – Shirtwaist is a woman's tailored garment, as a blouse or dress, with details copied from men's shirts.

SHIT KICKERS = ГОВНОСТУПЫ – Shit Kickers is a slang term for boots with steel toes.

SHIVES = ОРГАНИЧЕСКИЕ ПРИМЕСИ – Shives:- all vegetable matter, except burrs, found entangled in the cotton lint. See also Dirt, and Neps. / Все примеси растительного происхождения, за исключением створок коробочек (burrs), .

SHMP = SODIUM HEXAMETAPHOSPHATE

SHOCK = ШОК – Shock is unanticipated or unusual event that has a noticeable impact on the economy or a financial system. / Непредвиденное или необычное событие, которое имеет заметное воздействие на экономику или финансовую систему.

SHOCK ABSORBER = МОЩНЫЙ ПОГЛОТИТЕЛЬ – Shock Absorber:- a temporary restriction in the trading of certain stock index futures contracts that becomes effective following a significant intraday decrease in stock index futures prices. Designed to provide an adjustment period to digest new market information, the restriction bars trading below a specified price level. Shock absorbers are generally market specific and at tighter levels than circuit breakers. See also Circuit Breakers.

SHOCK AND/OR TILT INDICATORS = ИНДИКАТОРЫ ШОКА И/ИЛИ ГРУЗОВИКА – Shock and/or Tilt Indicators:- these indicators are attached to sensitive loads for monitoring purposes. They indicate whether specified threshold values have been exceeded either in terms of acceleration or tilt.

SHOCKING PINK = ШОКИРУЮЩЕЕ РОЗОВОЕ (или СВЕТЛО–МАЛИНОВОЕ) – Shocking Pink:- a striking, vivid, bright, or intense pink.

SHODDY = ШОДИ (или ЛОСКУТ, или ЛОСКУТНАЯ) – Shoddy:- wool fibers recovered from either new or used woven or felted cloth and which must be designated as reprocessed or reused. Wool fibers included in this classification usually run 0.5 in. or more in length. Of longer fiber length than mungo fibers. Shoddy:- (1) wool obtained from unfelted cloth rags and knit goods by tearing them apart; often contains other fibers besides woll. (2) Short silk fibers recovered from goods; usually contains other fibers. There is no infallible rule by which wool shoddy can always be recognized, although in most instances, when viewed under microscope, it shows either a variety of colors in the individual fibers (in case the fabric has not been redyed), or it shows fibers with ragged ends and the scales rubbed off. The chemical tests are necessarily the same for virgin wool and shoddy. Certain grades of shoddy have longer fibers than virgin wool in some cases. Shoddy was first introduced by Benjamin Law, of Batley, England, in 1813; the first American shoddy mill opened in Ulster County, New York, in 1831, but the article was not used in the States extensively until the Civil War. In the public mind the word 'Shoddy' became synonymous with cheap, inferior, substitute article. Shoddy is a fabric often of inferior quality manufactured wholly or partly from reclaimed wool. Shoddy:- originally, a fabric made from reprocessed wool. Today, the word is used for a fabric – or anything else, for that matter – that is poorly made or made of inferior materials. See reprocessed fibers and reused wool. / Шоди – регенерированная шерсть. Шоди – торговое название лоскута из чулочно-трикотажных изделий из кросс-бредной шерсти.

SHOE = ТУФЛЯ – Shoe is an outer covering for the human foot typically having a thick or stiff sole with an attached heel and an upper part of lighter material, as leather. / heel = каблук или пятка.

SHOE FOLD = СЛОЖЕННАЯ БАШМАЧКОМ – Shoe Fold is a manner of folding fabric. The piece is folded from both ends into twelve or sixteen folds. The length of the fold depends upon the length of the piece. / Уборка торгового куска ткани в 12 или 16 складок от концов к середине.

SHOEPAC = ТУФЛЯ ТИПА МОКАСИН (или САПОЖНЫЙ ХХ) – Shoepac is a waterproof laced boot worn especially over heavy socks in cold weather. / непромокаемый сапог.

SHOGGED STITCH = СДВИНУТЫЙ СТЕЖОК (или СДВИНУТАЯ ПЕТЛЯ) – Shogged Stitch or Rack Stitch:- an arrangement of a sideways displaced stitch that lies across a stitch formed in the same course on the opposite set of needles. The racked stitch is created when one set of needles is displaces in relation to another set. See also Racked Stitch.

SHOGUN BONDS = ОБЛИГАЦИИ ЩЁГУН (или ОБЯЗАТЕЛЬСТВА ЩЁГУН) – Shogun Bonds are the foreign bonds issues placed in Japan which are not denominated in Yen. / Выпуски иностранных облигаций, размещённые в Японии, но не деноминированные в Йенах.

SHOOK = ЗАГОТОВКА (или ТАРНОЕ, или ШАШКА, или БОБЫШКА) – Shook:- cut-to-size pallet parts to be assembled into pallets.

SHOOK GRADE = СОРТ ЗАГОТОВОК (или ТАРНЫЙ СОРТ, или СОРТ ШАШЕК) – Shook Grade is the classification of the quality of pallet parts relative to performance characteristics based on size and distribution of defects, independent of wood species. / Сорт Хxxxx – классификация качества частей поддонов относительно характеристик исполнения, основанных на размере и распределении дефектов, независимо от видов древесины.

SHOOT = ПОБЕГ – Shoot:- the vegetative parts (leaves, stem) of a plant above the ground level. / Под Побегом понимается стебель с расположенными на нём листьями и почками; один из основных органов Высших Растений. У Однолетних Растений побеги живут один сезон; у Многолетних Растений – несколько лет. Многолетние подземные побеги нередко видоизменены в корневища, клубни, луковицы, надземные – в усики, колючки. Под Черенком понимается отрезок зелёного или одревеснevшего побега с почками, используемый для вегетативного размножения Растений – укоренения, прививок. Черенки заготавливают с высококачественных растений, называемых Маточными. Полученные черенки сохраняют их свойства и признаки. Различают черенки стеблевые, листовые и корневые. Стеблевые черенки, взятые после опадения листьев, называются Зимними, а облиственные черенки – Летними или Зелёными. Зимние черенки (длиной 20–30 см) обычно заготавливают Осенью, чаще от однолетних приростов, высаживают Осенью или хранят прикопанными в подвале или в снегу и высаживают в грунт ранней Весной. Для летних черенков используют облиственные побеги, разрезая их на части длиной 5–10 см; иногда срезают часть коры с древесиной и одной почкой. Корневые черенки обычно заготавливают Осенью, разрезают на части длиной 10–15 см и хранят прикопанными в песке или торфе; высаживают Весной. В стеблевых и корневых черенках различают морфологически нижний, или базальный, конец, образующий корни, и верний, или апикальный, образующий побеги.

SHOOT = ПРОКИДКА (или УТОЧИНА) – Shoot is another term for Filling, Weft, Woof, and Shute. The crosswise thread that interlaces with the warp threads on a woven fabric. / для Уточины (Filling), Утка (Weft), .

SHOOTING = СТЕБЛЕВАНИЕ (или ОБРАЗОВАНИЕ ПОБЕГОВ, или ПРОРАСТАНИЕ) – Shooting:- significant stem elongation preceding flowering.

SHOOTING STAR = ПАДАЮЩАЯ ЗВЕЗДА – In technical analysis, Shooting Star is a single day pattern that can appear in an uptrend. It opens higher, trades much higher, then closes near its open. It looks just like the Inverted Hammer except that it is bearish. / В техническом анализе биржевых рынков, Падающая Звезда представляет собой однодневную модель, которая может возникнуть при тенденции на повышение. Она открывается выше, в ходе торгов поднимается ещё выше, но закрывается практически на уровне открытия. Эта модель напоминает Перевёрнутый Молот с той лишь разницей, что отражает медвежий настрой на рынке.

SHORE CLAUSE = ОГОВОРКА О БЕРЕГЕ – Shore Clause is a marine cargo policy clause covering an ocean shipment against named perils while on land – necessary because the policy provides protection from warehouse to warehouse. Shore Clause provides coverage while on docks, wharves or elsewhere on shore and/or during land transportation and includes the risks of collision, derailment, over-turning or other accident to the conveyance, fire, lightning, sprinkler leakage, cyclones, hurricanes, earthquakes, floods (meaning the rising of navigable waters), and/or collapse or subsidence of docks or wharves.

SHORE CRANE = БЕРЕГОВОЙ КРАН – Shore Crane is a crane located on land adjacent to the vessel for the purposes of loading and unloading. / Кран, размещённый на суше и примыкающий к судну с целью погрузки и выгрузки.

SHORE LEAVE = ОТПУСК НА БЕРЕГ – Shore Leave:- permission for a crew member to be ashore during the ship's stay in port within such geographical or time limits, if any, as may be decided by the public authorities.

SHORT = ПРОДАВЕЦ – Short is the someone who has sold a futures or options contract to establish a short market position and who has not yet closed this position with an offsetting purchase or plans to purchase a cash commodity. In the case of a futures contract, short denotes an obligation, in principle, to supply an asset at the maturity date of the contract. In the case of an option, it simply denotes being subject to the purchaser's right to exercise the option, regardless of whether the option is to buy or to sell. The short in the options market is obliged to take a futures position if he is assigned for exercise. The opposite of Long. A trader whose net position in the futures market shows an excess of open sales over open purchases. Short is a trader who has sold physical commodities, financial instruments or futures contracts and has not yet offset that transaction with a purchase. Short can also be used as an adjective to describe such an open position. Short is one who has sold the contract.

SHORT = ПРОДАЖА (или КОРОТКАЯ ПОЗИЦИЯ, или ДЕПОРТ) – Short is a market position that obligates the holder to make delivery of the underlying asset. The opposite of Long. Traders are said to be short when they have contracted to sell more than they contracted to buy. In commodities trading vocabulary Short is synonymous with sell. If a trader sells futures or options, he is going short. Short is a sale of a contract. A term Short refers to selling a futures contract or purchasing a cash commodity. Short:- sold futures contracts that have not been offset by purchased contracts or delivery. / Рыночная позиция, которая обязывает её владельца осуществить поставку соответствующего актива. Считается, что у торговца возникла короткая позиция, если он заключил контракты на продажу большего количества биржевых инструментов, чем принял на себя обязательств по приобретению таких инструментов в рамках заключённых им же контрактов. Под Депортом, от Французского слова Déport, понимается биржевая сделка на срок, заключаемая спекулянтами, играющими на фондовой бирже на понижение курса ценных бумаг с целью получения курсовой разницы. Противоположна Репорту.

SHORT = ТРУСЫ (или ШОРТЫ, или ТРУСИКИ) – Short:- knee-length or less than knee-length trousers; short drawers, shorts. A jam is also a form of a short. Generally the jam is longer in length than a short.

SHORTAGE = НЕДОСТАЧА (или АМАНКО) – Shortage is the difference between actual available or delivered quantity and the required/documented quantity. / Разница между фактически доступным или поставленным количеством и требуемым/задокументированным количеством.

SHORTAGE = НЕХВАТКА (или АМАНКО) – Shortage:- in general, widespread lack of a good or service in a local, regional or national market. See also Scarcity.

SHORT BUTTERFLY = ПРОДАЖА БАБОЧКИ (или ПРОДАЖА БАТТЕРФЛЯЙ) – Short Butterfly:- when to use:- when the market is either below A or above C and position is overpriced with a month or so left. Or when only a few weeks are left, market is near B, and you expect an imminent move in either direction. Profit characteristics:- maximum profit equals the credit at which spread is established. Occurs when market, at expiration, is below A or above C, thus making all options in-the-money or all options out-of-the-money. Loss characteristics:- maximum loss occurs if market is at B at expiration. Amount of that loss is B – A – credit received when setting up position. Break-evens are at A + initial credit and C – initial credit. Decay characteristics:- decay negligible until final month, during which distinctive pattern of butterfly forms. Maximum loss acceleration is at B. Category:- precision. Short call A, long 2 calls B, short call C. Short put A, long 2 puts B, short put C. Note:- B – A generally is equal to C – B. / Одна из стратегий торговли.

SHORT CALL = ПРОДАЖА ОПЦИОНА НА ПОКУПКУ – Short Call:- when to use:- when you are bearish on the market. Sell out-of-the-money (higher strike) puts if you are less confident the market will fall, sell at-the-money puts if you are confident the market will stagnate or fall. Profit characteristics:- profit limited to premium received. At expiration, break-even is exercise price A + premium received. Maximum profit realized if market settles at or below A. Loss characteristics:- loss potential is open-ended. Loss increases as market rises. At expiration, losses increase by one point for each point market is above break-even. Because risk is open-ended, position must be watched closely. Decay characteristics:- position benefits from time decay. The option seller's profit increases as option loses its time value. Maximum profit from time decay occurs if option is at-the-money. Category:- directional. Synthetics:- short instrument, short put. / Одна из стратегий торговли.

SHORT CASH POSITION = КОРОТКАЯ ПОЗИЦИЯ ПО РЕАЛЬНОМУ СЫРЬЮ (или ПОЗИЦИЯ ПРОДАЖИ ПО РЕАЛЬНОМУ СЫРЬЮ) – A Short Cash Position implies the hedger will receive cash now, owing the delivery of the commodity at a later date. The hedger will need to purchase the commodity before it can be delivered.

SHORT CIRCUIT = КОРОТКОЕ ЗАМЫКАНИЕ – Short Circuit is abnormal connection of low resistance between two points of a circuit that usually causes a high, potentially damaging current to flow. To protect against damage, devices such as a fuse or a circuit breaker are used. Short Circuit:- a low resistance connection unintentionally made between points of an electrical circuit which may result in current flow far above normal levels. / Под Коротким Замыканием (КЗ) понимается не предусмотренное нормальными условиями работы соединение точек электрической цепи, имеющих различные потенциалы, друг с другом или с другими цепями через пренебрежимо малое сопротивление, например, при касании неизолированных проводов электрической сети между собой. В сети переменного тока КЗ может быть между фазами (2- и 3-фазное) или вследствие замыкания фазы на землю (однофазное). В сети постоянного тока КЗ бывает между полюсами или между полюсом и землёй. КЗ возникает из-за нарушения изоляции частей электрической установки и обычно сопровождается значительным увеличением силы тока в цепи, что создаёт опасность повреждения электрооборудования. У потребителей при КЗ резко снижается электрическое напряжение. Для предотвращения опасных последствий КЗ применяют токоограничивающие реакторы, секционирование электрической сети, устройства для быстрого автоматического отключения участков с КЗ (релейную защиту, автоматические выключатели и другие).

SHORT COVERING = КОРОТКОЕ ПОКРЫТИЕ (или ПОКРЫТИЕ ПРОДАЖ) – Short Covering:- when a person is selling short, the purchase of the financial instrument concerned in order to cover the bargain. Short Covering is the closure of short positions. Buying stock to return stock previously borrowed to make delivery on a short sale. See also Cover. The act of buying back asset which has previously been sold short. Buying to offset an existing short position. / Покупка с целью соответствующей ликвидации открытой ранее короткой позиции.

SHORT COVERING RALLY = ПОВЫШЕНИЕ ПОКРЫТИЕМ ПРОДАЖ – Short Covering Rally is a short-lived rise in prices caused by traders buying back previously established short positions.

SHORT–CUT STAPLE = КОРОТКО НАРЕЗАННЫЙ ШТАПЕЛЁК – Short-Cut Staple is a staple fiber less than 0.75-ingh long. Typically used in wet-laid nonwoven processes to make fabrics, or as reinforcement in plastics, concrete, asphalt, and other materials.

SHORT–DATED VS. LONG–DATED = КРАТКО–ДАТИРОВАННЫЕ ПРОТИВ ДОЛГО–ДАТИРОВАННЫХ – Short-Dated Vs. Long-Dated:- for the purposes of this article, listed futures contracts 1 through 12 – approximately one calendar year into the future – is considered short-dated, and futures contract months 13 and longer is considered long-dated. Long-dated futures contracts' trading volume and open interest are lower than short-dated futures contracts primarily because most participants – such as money managers or trading companies – can meet their financial management needs using the first few months of the futures curve. Crude oil producers that use the futures market to hedge future planned production often use the long-dated portions of the futures curve.

SHORT–DAY PLANT = РАСТЕНИЕ КОРОТКОГО ДНЯ – Short-Day Plant is a Plant that needs shorter daylight to flower.

SHORT DELIVERY = НЕДОПОСТАВКА (или ПОСТАВКА С НЕДОСТАЧЕЙ) – Short Delivery:- rhe quantity of cargo delivered is less than the bill of lading quantity.

SHORT–DURATION VARIETIES = СКОРОСПЕЛЫЕ РАЗНОВИДНОСТИ – Short-Duration Varieties are Varieties that mature within 105 days or less. / Разновидности, которые созревают в течение 105 дней или менее.

SHORT FORM BILL OF LADING = КОНОСАМЕНТ КРАТКОЙ ФОРМЫ – The short form simply refers to the main contract as an existing document. Short Form Bill Of Lading is a bill of lading (B/L) with fairly standard face format, but which includes a clause that incorporates the carrier's standard conditions, and with a blank reverse, e.g., BIMCO's Blank Back Bill. / Коносамент без Оборотной Стороны (Blank Back Bill).

SHORT FUTURES = ПРОДАЖА ФЬЮЧЕРСА – Short Futures:- when to use:- when you are bearish on the market and uncertain about volatility. You will not be affected by volatility changing. However, if you have an opinion on volatility and that opinion turns out to be correct, one of the other strategies may have greater profit potential and/or less risk. Profit characteristics:- profit increases as market falls. Profit is based strictly on the difference between the entry price and the exit price. Loss characteristics:- loss increases as market rises. Loss is based strictly on the difference between the entry price and the exit price. Decay characteristics:- none. Category:- directional. Synthetics:- long put A, short call A. / Одна из стратегий торговли.

SHORT GRAIN BROWN RICE FOR PROCESSING = КОРОТКОЗЁРНЫЙ БУРЫЙ РИС ДЛЯ ПЕРЕРАБОТКИ – In the Rice industry of the United States, Short-Grain Brown Rice For Processing shall consist of brown Rice for processing which contains more than 25.0 percent of whole kernels of brown Rice and not more than 10.0 percent of whole or broken kernels of long-grain Rice or whole kernels of medium-grain Rice. / В рисовой индустрии Соединённых Штатов Америки, под 'Короткозёрным Бурым Рисом Для Переработки' подразумевается бурый Рис для переработки, который содержит более 25.0 процентов целиковой зерновки (целых ядер) бурого Риса и не более 10.0 процентов целиковой или битой зерновки (целых или битых ядер) длиннозёрного Риса или целой зерновки (целых ядер) среднезёрного риса.

SHORT GRAIN MILLED RICE = КОРОТКОЗЁРНЫЙ ОБРУШЕННЫЙ РИС – In the Rice industry of the United States, Short Grain Milled Rice shall consist of milled Rice which contains more than 25.0 percent of whole kernels of milled Rice and in US Nos. 1 through 4 not more than 10.0 percent of whole or broken kernels of long grain Rice or whole kernels of medium grain Rice. US No. 5 and US No. 6 short grain milled Rice shall contain not more than 10.0 percent of whole kernels of long or medium grain milled Rice (broken kernels do not apply). / В рисовой индустрии Соединённых Штатов Америки, под 'Короткозёрным Обрушенным Рисом' подразумевается обрушенный Рис, который содержит более 25.0 процентов целиковой зерновки (целых ядер) обрушенного Риса, а в Американских Номерах с 1 по 4 – не более 10.0 процентов .

SHORT GRAIN RICE = КОРОТКОЗЁРНЫЙ РИС – Short Grain Rice belongs to the Japonica (short-grain) category and has short, round, and plumpy kernel. When cooked, short-grained Rice is stick together, although not as much as glutinous Rice. In Japanese and Korean cuisine, short-grained Rice is primary consumed in every meal. Short Grain Rice has a short, plump, almost round kernel. Cooked grains are soft and cling together. / Японика (Japonica). и имеет короткое, округлённое, и набухшее ядро. При приготовлении пищи.

SHORT GRAIN ROUGH RICE = КОРОТКОЗЁРНЫЙ РИС–СЫРЕЦ – Short Grain Rough Rice shall consist of rough Rice which contains more than 25 percent of whole kernels and which, after milling to a well-milled degree, contains not more than 10 percent of whole or large broken kernels of long grain Rice or whole kernels of medium grain Rice. / Под Короткозёрным Рисом-Сырцом подразумевается Рис-сырец, который содержит более 25 процентов целиковой зерновки (целых ядер), и который после .

SHORTHANDED = НЕУКОМПЛЕКТОВАННОЕ – Shorthanded (maritime term):- without sufficient crew.

SHORT HEDGE = ХЭДЬЖ ПРОДАЖЕЙ (или КОРОТКИЙ ХЭДЬЖ) – Short Hedge:- sale of futures against the purchase of physicals (to reduce exposure when a price decline or bearish trend is perceived). Selling of a futures contract in anticipation of a cash market sale. It is usually used to protect against a decline in the cash price. Selling futures contracts against a long cash market position to protect against a decrease in the price of an asset. Also known as Selling Hedge. Short Hedge is the sale of a futures contract to protect against the risk of a decrease in the price of the physical commodity to be sold in the cash market at a later date. Short Hedge is a selling futures contracts to protect against possible downward trending prices of commodities that will be sold in the future. Also known as Selling Hedge. See also Hedging; and Long Hedge. / Операция, проводимая на рынке фьючерсов и опционов, путем продажи фьючерсного контракта лицом, покупающим реальный товар на рынке. Если цена на покупаемый реальный товар повысится, то обусловленные этим потери окупятся выгодой от продажи фьючерсного контракта. Хэдьж Продажей:- продажа срочного контракта в ожидании последующей продажи базисных активов на наличном рынке. Используется для устранения или снижения риска, связанного с возможным падением стоимости финансовых инструментов или товаров, лежащих в основе контракта. Смотрите также Хэдьж Покупкой (Long Hedge).

SHORT HEDGER = ХЭДЬЖЭР ПРОДАЖИ – A Short Hedger owns a commodity and protects its futures sales price by selling futures. A short hedger benefits from a strengthening basis.

SHORTIE GLOVE = XX ПЕРЧАТКИ – Shortie Glove is a wrist-length glove with a side or center palm opening that can be snapped or buttoned.

SHORT IRON BUTTERFLY = ПРОДАЖА ЖЕЛЕЗНОЙ БАБОЧКИ (или ПРОДАЖА ЖЕЛЕЗНОЙ БАТТЕРФЛЯЙ) – Short Iron Butterfly:- when to use:- enter when the Short Iron Butterfly's net credit is 80 percent or more of C – A, and you anticipate a prolonged period of relative price stability where the underlying will be near the mid-point of the C – A range close to expiration. This is a rule of thumb; check theoretical values. Profit characteristics:- maximum profit occurs if a market is at B at expiration. Profit would be equal to short straddle premium minus long strangle premium. This profit develops, almost totally, in the last month. Loss characteristics:- maximum loss, in either direction, net premium collected minus (B – A). This is a very conservative trade, break-evens are at B + and – net premium collected. Decay characteristics:- decay negligible until final month, during which distinctive pattern of butterfly forms. Maximum profit growth is at B. If you are away from (A – C) range entering the last month, you may wish to liquidate position.

Category:- precision. Short 1 call and 1 put at B, buy 1 put at A, buy 1 call at C or sell straddle at strike price B and buy strangle at AC for protection. Note:- B – A generally is equal to C – B. / Одна из стратегий торговли.

SHORT LANDED = ВЫГРУЖЕННЫЙ В МЕНЬШЕМ КОЛИЧЕСТВЕ, ЧЕМ УКАЗАНО В ДОКУМЕНТАХ (или ВЫГРУЖЕНО С НЕДОСТАЧЕЙ) – Short Landed:- When part or all of a consignment, which has been completely shipped, has not arrived at destination. It may have a different meaning to the term Short Shipment. Short Landed:- cargo volume count (at delivery destination) less than originally shipped. Short Landed refers to a situation when only a part of the entire cargo has arrived at the destination even though the whole shipment was loaded/shipped together.

SHORT–LANDING CERTIFICATE = СВИДЕТЕЛЬСТВО XX (или СЕРТИФИКАТ XX) – Short-Landing Certificate is a xxxxx. See also Certificate.

SHORT–LIQUOR DYEING = КРАШЕНИЕ НЕПОЛНОЦЕННЫМ ЩЁЛОКОМ – Short-Liquor Dyeing is a term used to describe any yarn or piece dyeing in which the liquor ration has been significantly reduced. The technique was designed to save water and energy. See also Dyeing. Short Liquor Dyeing process for piece goods made from cellulose fibers in rope form.

SHORT MESSAGE PEER TO PEER = КРАТКИЕ СООБЩЕНИЯ ТОЧКА – ТОЧКА (или КРАТКИЕ СООБЩЕНИЯ ОДНОГО УРОВНЯ или РАНГА) – Short Message Peer to Peer (SMPP) is an open, industry standard messaging protocol designed to simplify integration of data applications with wireless mobile networks.

SHORT MESSAGE SERVICE = УСЛУГА КРАТКИХ СООБЩЕНИЙ – Short Message Service (SMS) is the exchange of short messages between mobile trusted devices and possibly even computers in ‘store and forward’ mode.

SHORT POSITION = КОРОТКАЯ ПОЗИЦИЯ (или ПОЗИЦИЯ ПРОДАЖИ, или ДЕПОРТ) – Short Position:- because of the complexity of trading positions, especially when trading in futures and options, traders avoid the terms buy and sell, and refer to long and short positions. Going long means buying an asset, a call option or a futures contract with a view to profiting from a rise in the price of the underlying asset. Going short means selling an asset, buying a put option, selling a call option, or entering a futures contract with a view to profiting from a decline in the price of the underlying asset. Short-selling requires that you borrow stock for delivery, as you have sold an asset you do not own. The intention is to buy later, when the price has fallen, in order to repay the borrowed stock. Short positions are normally only of a few days duration and should only be attempted by experienced traders with the assistance of their broker. If you are only trading the long side of the market, short signals should be interpreted as a signal to close any long position. Entry = Open a long or short position. Exit = Quit a long or short position. Take profits = Reduce a long or short position. The market position of a futures contract seller whose sale obligates him to deliver the commodity unless he liquidates his contract by an offsetting purchase. In securities trading, a sold position which has not yet been closed by the purchase of an opposite position. An investor is said to be in a short position if following a short sale he needs to buy in securities to meet his obligations. On assignment, the writer of an options contract undertakes to deliver (call) or buy (put) the underlyings. The opposite of Long Position. It is a market position where a trader sells an asset that he does not already own. If a trader is ‘short US Dollars’ then he sold at a certain price level expecting to buy later when the price level declines. Stock options, or futures contracts sold short and not covered as of a particular date. On the New York Stock Exchange, a tabulation is issued once a month listing all issues on the exchange in which there was a short position of 5 000 or more shares and issues in which the short position had changed by 2 000 or more shares in the preceding month. Short position also means the total amount of stock an individual has sold short and has not covered, as of a particular date. The act of selling and holding (as a new position) a futures contract or an asset in the belief price will fall and it may be bought at a lower price in the future. Short Position is the position held by an investor that involves the borrowing of shares, to be sold immediately, and this loan of shares to be re-paid at a later date with the same number of shares, preferably purchased at a lower price than when the shares were borrowed. Traders can also ‘short’ a financial instrument via buying put options, which profit as the financial instrument drops in value and carry far less risk than an actual short position. A Short Position means the sale of an asset not yet owned. By selling a security that he does not (yet) own, the seller has a short position in that paper. This transaction is based on the speculation that the price of the security will fall. Someone, for example, sells a share he does not own in order to buy it more cheaply on the market. The concept of ‘going short’ is also referred to as Short Selling. Opposite:- Long Position. A Short Position in an asset means having a negative economic exposure to the asset. In futures and forward dealing the short party is the one who has contracted to deliver the asset in the future. / Короткая Позиция – позиция, при которой количество проданных контрактов определённой серии превосходит количество купленных контрактов. Обладатель такой позиции является чистым продавцом срочных контрактов. Смотрите также Длинная Позиция (Long Position).

SHORT PUT = ПРОДАЖА ОПЦИОНА НА ПРОДАЖУ – Short Put:- when to use:- if you firmly believe the market is not going down. Sell out-of-the-money (lower strike) options if you are only somewhat convinced, sell at-the-money options if you are very confident the market will stagnate or rise. If you doubt market will stagnate and are more bullish, sell in-the-money options for maximum profit. Profit characteristics:- profit limited to premium received from put option sale. At expiration, break-even point is exercise price A – premium received. Maximum profit realized if market settles at or above A. Loss characteristics:- loss potential is open-ended. Loss increases as market falls. At expiration, losses increase by one point for each point market is below break-even. Because risk is open-ended, position must be watched closely. Decay characteristics:- position benefits from time decay. The option seller’s profit increases as option loses its time value. Maximum profit from time decay occurs if option is at-the-money. Category:- directional. Synthetics:- long instrument, short call. / Одна из стратегий торговли.

SHORT RATE = УСЕЧЁННАЯ СТАВКА – Short Rate:- cancellation of an insurance contract at the request of the policyholder with a refund of premiums to the policyholder less than would be given under pro-rata consideration.

SHORT–RATE CANCELLATION = РАСТОРЖЕНИЕ НА ОСНОВЕ УСЕЧЁННОЙ СТАВКИ – Short-Rate Cancellation:- when an insurance contract is terminated prior to its expiry date by the insured any return premium that is payable will usually be calculated on a time on risk basis. The result is that the insured will receive less return premium than would be the case if the return premium was calculated on a pro rata basis (see Pro Rata Cancellation).

SHORT RISK REVERSAL = ПРОДАЖА С РИСКОМ РАЗВОРОТА – Short Risk Reversal:- (Split Strike) when to use:- when you are bearish on the market and uncertain about volatility. Normally this position is initiated as a follow-up to another strategy. Its risk/reward is the same as a Short Futures except that there is a flat area of little or no gain/loss. Profit characteristics:- profit increases as market falls below the long put strike price. Profit at expiration is open-ended and is based on the exercise price of A +/– premium received or paid to initiate position. Loss characteristics:- loss increases as market rises above the short call. Loss at expiration is open-ended and is based on the exercise price of B +/– premium received or paid to initiate position. Decay characteristics:- time decay characteristics vary according to the relationship of the call strike price, put strike price and the underlying futures price at the time the position is established. The position is time decay neutral (not affected) if the futures price is exactly mid-way between the call and put strike prices; long time decay (benefits from time decay) when the futures price is closer to the put than the call strike price and short time

decay (time decay erodes the value of the position) when the futures price is closer to the call than the put strike price. Also known as Combos or Squash. Category:- directional. Long put A, short call B. / Одна из стратегий торговли.

SHORTS = (1) SHORT POSITIONS, (2) SELLERS, (3) SHORT TERM

SHORTS = КОРОТЫШИ (или БРАК, или ОТБРОСЫ) – Shorts:- short pieces or locks of fiber that are dropped out while fibers are being sorted.

SHORT SALE = ПРОДАЖА В КОРОТКУЮ (или КОРОТКАЯ ПРОДАЖА, или ДЕПОРТ) – Short Sale is a sale of an item before it is purchased. A person entering into a short sale believes the price of the item will decline between the date of the short sale and the date he or she must purchase the item to deliver the item under the terms of the short sale. Short Sales entail the sale of shares which one does not own. It is perfectly legal and legitimate for someone to short 1 000 shares of Company X. This means that they are selling stock which they don't own because they think the price will go down. When the price does go down, they buy the shares thereby closing out the short position. This may be risky, because if the shares rise in price, they may still have to buy them back at a higher price in which case they lose money. Brokers can handle short sales by 'borrowing' shares from their clients' inventories. The action of contracting to sell for future delivery more of a commodity or security than is currently held in the hope that the price will fall and the short seller can buy the balance before the delivery date and so make a gain. Short Sale is a transaction by a person who believes a security will decline and sells it, though the person does not own the security. For instance:- you instruct your broker to sell 100 shares of XYZ. Your broker borrows the stock so delivery of the 100 shares can be made to the buyer. The money value of the shares borrowed is deposited by your broker with the lender. Sooner or later you must cover your short sale by buying the same amount of stock you borrowed for return to the lender. If you are able to buy XYZ at a lower price than you sold it for, your profit is the difference between the two prices – not counting commission and taxes. But if you have to pay more for the stock than the price you received, that is the amount of your loss. Stock exchange and US federal regulations govern and limit the conditions under which a short sale may be made on a national securities exchange. Sometimes people will sell short a stock they already own in order to protect a paper profit. This is known as Selling Short Against the Box.

SHORT SELLING = ПРОДАЖА В КОРОТКУЮ (или КОРОТКАЯ ПРОДАЖА, или ДЕПОРТ) – Short Selling is the process of selling a stock with the hope of buying it back at a lower price (sell high, buy low). Short sellers are bearish and believe the price will decline. Short selling involves borrowing stock (usually from the broker) to sell short and using margin to finance the borrowing. If the price of the stock in question advances too far, the short seller will receive a margin call and be required to put up more money. A short squeeze occurs when the price advances so fast that short sellers are forced to cover their positions (buy the stock back), which drives prices even higher. Selling a futures contract or other instrument with the idea of delivering on it or of buying it back to offset at a later date. / Продажа контракта с идеей его обратного приобретения спустя какой-то срок. Продавец такого контракта не владеет при этом соответствующим активом или товаром для возможной его поставки покупателю.

SHORT SHIPMENT = ОТГРУЗКА С НЕДОСТАЧЕЙ (или ПЕРЕВОЗКА С НЕДОСТАЧЕЙ) – Short Shipment:- when the full amount intended to be shipped has not been shipped.

SHORT SHIPPED = ОТГРУЖЕНО С НЕДОСТАЧЕЙ (или ПЕРЕВЕЗЕНО С НЕДОСТАЧЕЙ) – Short Shipped:- cargo missing vessel that originally intended for due to carrier's option. Short Shipped:- cargo missing a vessel that it was originally intended for.

SHORT SQUEEZE = ПРИНУЖДЕНИЕ К ПОКРЫТИЮ КОРОТКИХ ПОЗИЦИЙ – Short Squeeze is a situation in which a lack of supplies tends to force those who have sold to cover their positions by offsetting them in the futures market rather than by delivery. See also Squeeze. / Короткое Сжатие:- ситуация, при которой продавцы в короткую (short sellers) ощущают давление со стороны существенного подъёма цен, угрожающего им растущими потерями, и вынуждены срочно покупать финансовые инструменты, по которым у них открыты короткие позиции, чтобы покрыть эти позиции и ограничить убытки. Следствием 'короткого сжатия' часто бывает дальнейшее повышение цен в течение короткого периода времени, возникающие вследствие мощного роста спроса.

SHORT STAPLE COTTON = КОРОТКОШТАПЕЛЬКОВЫЙ ХЛОПЧАТНИК (или ХЛОПЧАТНИК С КОРОТКИМ ШТАПЕЛЬКОМ, или КОРОТКОВОЛОКНИСТЫЙ ХЛОПЧАТНИК) – Short Staple Cotton:- in the United States any Cotton having a staple length of less than 1-1/8 inches. In foreign countries other lengths are taken as a dividing line, e.g., 1 inch or 7/8 inch. See also Long Staple Cotton. / Смотрите также Длинноштапельковый Хлопчатник или Хлопчатник С Длинным Штапельком или Длинноволокнистый Хлопчатник (Long Staple Cotton).

SHORT STAY = КОРОТКИЙ ШТАГ – Short Stay (maritime term):- when the scope of chain is slightly greater than the depth of water.

SHORT STRADDLE = ПРОДАЖА СТРЭДЛ (или КОРОТКИЙ СТРЭДЛ) – Short Straddle is an options strategy carried out by holding a short position in both a call and a put that have the same strike price and expiration date. The maximum profit is the amount of premium collected by writing the options. If a trader writes a straddle with a strike price of USD25 and the price of the stock jumps up to USD50, the trader would be obligated to sell the stock for USD25. If the investor did not hold the underlying stock he or she would be forced to buy it on the market for USD50 and sell it for USD25. The short straddle is very a risky strategy an investor uses when he or she believes that a stock's price will not move up or down significantly. Because of its riskiness, the short straddle should be employed only by advanced traders due to the unlimited amount of risk associated with a very large moves up or down. Writing an equal number of Puts and Calls with the same strike price and the same expiry date. When to use:- if market is near A and you expect market is stagnating. Because you are short options, you reap profits as they decay – as long as market remains near A. Profit characteristics:- profit maximized if market, at expiration, is at A. In call-put scenario (most common), maximum profit is equal to the credit from establishing position; break-even is A +/– total credit. Loss characteristics:- loss potential open-ended in either direction. Position, therefore, must be closely monitored and readjusted to delta neutral if market begins to drift away from A. Decay characteristics:- because you are only short options, you pick up time-value decay at an increasing rate as expiration approaches. Time decay is maximized if market is near A. Category:- precision. Short call A, short put A. Synthetics:- short 2 calls A, long instrument; Short 2 puts A, short instrument. All done to initial delta neutrality. A straddle in which a short position is taken in both a put and a call option. Also known as Bear Straddle. The opposite of Long Straddle. Short Straddle is the sale of a call and put option with the same exercise price and expiry date. The investor has a neutral view of the underlying asset and expects limited price fluctuation. / Одна из стратегий торговли. Сочетание продажи опциона на покупку и продажи опциона на продажу на один и тот же актив с одной сходной ценой и с одной и той же датой прекращения признания.

SHORT STRANGLE = ПРОДАЖА СТРЭНГЛ (или КОРОТКИЙ СТРЭНГЛ) – Short Strangle:- when to use:- if market is within or near (A-B) range and, though active, is quieting down. If market goes into stagnation, you make money; if it continues to be active, you have a bit less risk then with a short straddle. Profit characteristics:- maximum profit equals option premium collected. Maximum profit realized if market, at expiration, is between A and B. Loss characteristics:- at expiration, losses occur only if market is above B + option

premium collected (for put-call) or below A – that amount. Potential loss is open-ended. Although less risky than short straddle, position is risky. Decay characteristics:- because you are short options, time value decays at an increasing rate as the option expiration date approaches; maximized if market is within (A-B) range. Category:- precision. Short put A, short call B. All done to initial delta neutrality. / Одна из стратегий торговли.

SHORT SUPPLY = НЕДОСТАТОЧНОЕ ПРЕДЛОЖЕНИЕ – Commodities in short supply may be subject to export controls to protect the domestic economy from the excessive drain of scarce materials and to reduce the serious inflationary impact of satisfying foreign demand. Two commodities which the US controls for short supply purposes are crude oil and unprocessed western red cedar.

SHORT SYNTHETIC FUTURES = ПРОДАЖА СИНТЕТИЧЕСКОГО ФЬЮЧЕРСА (или ПРОДАЖА ИСКУССТВЕННОГО ФЬЮЧЕРСА) – Short Synthetic Futures:- when to use:- when you are bearish on the market and uncertain about volatility. You will not be affected by volatility changing. However, if you have an opinion on volatility and that opinion turns out to be correct, one of the other strategies may have greater profit potential and/or less risk. May be traded into from initial short call or long put position to create a stronger bearish position. Profit characteristics:- profit increases as market falls. Profit is based strictly on the difference between the synthetic entry price and the exit price. Loss characteristics:- loss increases as market rises. Loss is based strictly on the difference between the synthetic entry price and the exit price. Decay characteristics:- none. Category:- directional. Long put A, short call A. / Одна из стратегий торговли.

SHORT–TAIL = С НЕБОЛЬШИМ СРОКОМ ПО ОКОНЧАНИИ (или С ОСТАТОЧНЫМ ПЕРИОДОМ) – Short-Tail:- a type of insurance where claims are usually made during the term of the policy or shortly after the policy has expired. Property insurance is an example of short tail business. The opposite of short tail business is long tail business.

SHORT TERM = КРАТКОСРОЧНЫЙ – (1) Short Term:- in exchange trading, a period of time that is less than both the intermediate term and long term. Must be defined by each trader based on personal preference and trading style. A good rule of thumb is everything less than 8–10 hours of exchange trading. Intra-day charts are best used as a trading vehicle.

(2) Short Term:- in insurance, a time policy effected for a period of less than 12 months. / В страховании, срочный полис, действующий менее 12 месяцев.

SHORT–TERM ASSETS = КРАТКОСРОЧНЫЕ АКТИВЫ – In a balance sheet (IFRS), Short-Term Assets consist of:- Inventories; Account Receivable, Trade; Other Receivables and Miscellaneous Short-Term Assets; Marketable Securities; Cash and Cash Equivalents; Assets of Disposal Groups.

SHORT TERM BILL OF LADING = КРАТКИЙ КОНОСАМЕНТ – Short Term Bill Of Lading (B/L):- a B/L without the Terms & Conditions written on it. Opposite of Long Form Bill of Lading. Also known as a Short Form Bill of Lading. The terms are incorporated by reference to the long form B/L.

SHORT–TERM BONDS = КРАТКОСРОЧНЫЕ ОБЛИГАЦИИ – Short-Term Bonds:- they are understood to be fixed-interest securities with maturities of up to four years. They have less price volatility than long-term bonds, which is why investors prefer them, in particular, during phases of uncertain or rising interest rate trends.

SHORT–TERM BORROWINGS = КРАТКОСРОЧНЫЕ ЗАИМСТВОВАНИЯ (или КРАТКОСРОЧНЫЕ ЗАЁМЫ, или КРАТКОСРОЧНЫЕ ЗАЙМЫ) – (1) Short-Term Borrowings:- loans that a borrower needs to pay back within 12 months.

(2) In the financial statements, Short-Term Borrowings:- (i) the average amount of short-term borrowings outstanding for the reporting period (calculated with an averaging period not to exceed one month) and the weighted average interest rate on those borrowings; (ii) the amount of short-term borrowings outstanding at the end of a reporting period and the weighted average interest rate on those borrowings; and (iii) the maximum month-end amount of short-term borrowings outstanding during the reporting period. See also Overdraft & Short-Term Loans. Short-Term Borrowings are the amounts payable for short-term obligations that are (1) federal funds purchased and securities sold under agreements to repurchase, (2) commercial paper, (3) borrowings from banks, (4) borrowing from factors or other financial institutions, and (5) any other short-term borrowings reflected on a registrant's balance sheet.

SHORT–TERM CROPS = КРАТКОСРОЧНЫЕ КУЛЬТУРЫ – Short-Term Crops are crops that grow for three months or less.

SHORT–TERM DEBT = КРАТКОСРОЧНЫЙ ДОЛГ (или КРАТКОСРОЧНАЯ ЗАДОЖЕННОСТЬ) – (1) Short-Term Debt:- Loans and financial obligations lasting over one year. Long-term debt for a company would include any financing or leasing obligations that are to come due in a greater than 12-month period. Such obligations would include company bond issues or long-term leases that have been capitalized on a firm's balance sheet. In the United Kingdom, long-term debts are known as Long-Term Loans. Bank loans and financing agreements, in addition to bonds and notes that have maturities greater than one year, would be considered long-term debt. Other securities such as repos and commercial papers would not be long-term debt, because their maturities are typically shorter than one year. Short-Term Debt is a debt with a short maturity, usually one year or less.

(2) Short-Term Debt:- an account shown in the current liabilities portion of a company's balance sheet. This account is comprised of any debt incurred by a company that is due within one year. The debt in this account is usually made up of short-term bank loans taken out by a company. See also Overdraft & Short-Term Loans. Short-Term Debt:- a part of a company's balance sheet within the current liabilities section. Short-term debt is usually due within one year. If a company has more short-term debt than available cash or investments to cover the debt's payments, the company could be forced to take on additional debt and could be in poor financial health.

SHORT–TERM EMPLOYEE BENEFITS = КРАТКОСРОЧНЫЕ ВЫПЛАТЫ РАБОТНИКАМ – Short-Term Employee Benefits are employee benefits (other than termination benefits) which fall due wholly within twelve months after the end of the period in which the employees render the related service. When an employee has rendered service to an entity during an accounting period, the entity shall recognise the undiscounted amount of short-term employee benefits expected to be paid in exchange for that service:- (a) as a liability (accrued expense), after deducting any amount already paid. If the amount already paid exceeds the undiscounted amount of the benefits, an entity shall recognise that excess as an asset (prepaid expense) to the extent that the prepayment will lead to, for example, a reduction in future payments or a cash refund; and (b) as an expense, unless another accounting standard requires or permits the inclusion of the benefits in the cost of an asset (see, for example, IAS 2 (short for International Accounting Standard No. 2) Inventories and IAS 16 Property, Plant and Equipment). See also Employee Benefits. / МСБУ 16 (сокращение для Международного Стандарта Бухгалтерского Учёта № 16) – . Смотрите также Выплаты Работникам (Employee Benefits).

SHORT–TERM INTEREST RATES = КРАТКОСРОЧНЫЕ ПРОЦЕНТНЫЕ СТАВКИ – Short-Term Interest Rates are the interest rates on loan contracts or debt instruments such as Treasury bills, bank certificates of deposit or commercial paper-having maturities of less than one year. Often called Money Market Rates.

SHORT–TERM INVESTMENTS = КРАТКОСРОЧНЫЕ ИНВЕСТИЦИИ – In the balance sheet, Short-Term Investments include term deposits with banks with original maturities between three and twelve months. These investments are carried at fair value. Gains and losses resulting from such investments are included as a component of other financial income/(expense) in the statement of operations.

SHORT–TERM LIABILITIES = КРАТКОСРОЧНЫЕ ОБЯЗАТЕЛЬСТВА – In a balance sheet (IFRS), Short-Term Liabilities consist of:- Accounts Payable, Trade; Provisions; Tax Liabilities; Financial Indebtedness; Other Liabilities; Liabilities of Disposal Groups. See also Overdraft And Short-Term Loans.

SHORT–TERM RATE = КРАТКОСРОЧНАЯ СТАВКА – In the United States, the Short-Term Rate applies only to interest on Series EE savings bonds with issue dates from 1995-May-01, through April 1997 and only to interest earnings up to the date these bonds are 5 years old. See also 'Long-term Rate' concerning interest earned after these bonds are 5 years old. Bid yields for the most actively traded Treasury bills, notes, and bonds in the government securities market are used to create a yield curve. This curve relates the yield on a security to its time to maturity. Yields at particular points on the curve are referred to as 'Constant Maturity Yields'. From the yield curve, 6-month Treasury securities yields as of the close of business for each business day of the 3 months prior to May 1 and November 1 are compiled, and the monthly average is calculated for each month (with each monthly average being rounded to the nearest one-hundredth of one percent). The 'Short-term rate' is then 85% of the average of 6-month Treasury securities yields during the preceding February, March, and April. The November 1 rate reflects market yields during the preceding August, September, and October. See also Long-Term Rate.

SHORT THE BASIS = ПРОДАЖА БАЗИСА (или В КОРОТКОЙ ПОЗИЦИИ ПО БАЗИСУ, или ПРОДАЖА С ХЭДЬЖИРОВАНИЕМ) – A hedger is said to be Short The Basis when he/she has a short cash position hedged with a long futures position. Long hedgers want to protect the price of a later cash commodity purchase or a short actuals position by hedging with a long futures position. Long hedgers want the basis to weaken since it will reduce the effective price of purchasing the commodity in the cash market at a later date. The purchase of futures as a hedge against a commitment to sell in the cash or spot markets. Short The Basis is a position in which a person sells a cash commodity and buys futures thus locking in the basis. This seller retains ownership by buying futures, hoping to share in rising prices but vulnerable to declining prices. The forward sale of a cash commodity hedged by the purchase of a futures against the cash position. See also Hedging. / Продажа Базиса:- позиция, в которой лицо продаёт наличное сырьё и покупает фьючерс, тем самым блокируя базис. Этот продавец удерживает владение покупкой фьючерсов, в надежде воспользоваться ростом цен, но при этом остаётся уязвимым в случае снижения цен.

SHORT THE MARKET = ПРОДАЖА РЫНКА (или В КОРОТКОЙ ПОЗИЦИИ ПО РЫНКУ) – Short The Market:- having a bearish stance. Engaged in a bearish option or futures spread. The opposite of Long The Market.

SHORT TON = КОРОТКАЯ ТОННА – The Short Ton is a unit of mass equal to 2 000 lb (exactly 907.184 74 kilograms (kg)). In the United States it is often called simply Ton without distinguishing it from the metric ton (or ton) and the long ton – rather, the other two are specifically noted. Short Ton is a unit of weight equal to 2 000 pounds. A Short Tonne or ton is a unit of mass used in North America. Short tonne (ton) = 907.184 74 kg = 2 000 lb. 1 short ton equals 6.65 barrels of oil (average API gravity). Barrels per ton vary from origin to origin. / Равна 2 000 фунтам, или 907.184 74 килограммам.

SHORT WIDTH = КОРОТКАЯ ШИРИНА – Short Width:- fabric, which is short in width. Finishing defect. / Порок или дефект заключительной отделки.

SHOT = СМЫЧКА – Shot (maritime term):- a short length of chain, usually 15 fathoms (90 feet). (Method of measuring chain). / Смычка якорной цепи.

SHOT = УТОЧНАЯ ПРОКИДКА (или УТОК ПО–ШОТЛАНДСКИ, или ПРОЛЁТ ЧЕЛНОКА, или КИДКА ЧЕЛНОКА) – Shot is another name for iridescent and changeable fabric. Fabric woven with yarns of one color in the warp and another color in the filling so that the fabric seems to change color as the light strikes it. Shot:- in woven pile floor coverings, the number of filling yarns per row of tufts. / уточина. Число уточных нитей, приходящееся на один ряд ворсовых пучков.

SHOT TAFFETA = УТОЧНАЯ ТАФТА (или ТАФТА ШАНЖАН) – Shot Taffeta:- usually plain weave, woven with one color in the warp and another color in the filling, which gives the fabric an iridescent look. If fabric is moved in the light this color changes. Silk version of chambray. / в уточине, .

SHOULD = ДОЛЖЕН – Should:- make all reasonable efforts.

SHOULDER BAG = РЮКЗАК (или ЗАПЛЕЧНЫЙ МЕШОК) – Shoulder Bag is any type of purse with shoulder straps. Shoulder Bag is a handbag looped over the shoulder by a strap. / Под Рюкзаком, от Немецкого слова Rucksack, означающее Заплечный Мешок, понимается специализированная сумка для переноски на спине снаряжения, продуктов питания, личных вещей и тому подобного. Снабжён двумя лямками. При ношении рюкзака нагрузка ложится на плечи и спину, а руки остаются свободными. Рюкзак удобен для длительной переноски относительно больших грузов.

SHOULDER PAD = ПОДПЛЕЧНИК (или ПОДПЛЕЧНАЯ ПОДУШЕЧКА) – Shoulder Pad is a support placed in the shoulder area of a garment to give a wider look to the shoulder when this look is in style. A thinner version known as a Shoulder Shape is used in coats and suits to maintain shape and give support in the shoulder area. Shoulder pads and shoulder shapes are available in notions departments and in fabric stores. See also Findings. / Смотрите также (Швейные) Приклады (Findings).

SHOVE IN YOUR OAR = ВМЕШИВАТЬСЯ В ВАШ СПОР (или МЕШАТЬ, или БЫТЬ ПОМЕХОЙ) – Shove In Your Oar (maritime term):- to break into a conversation.

SHOVEL HAT = ШЛЯПА ШАВЭЛ – Shovel Hat is a shallow-crowned hat with a wide brim curved up at the sides that is worn by some clergymen. / шляпа с полями, загнутыми с боков.

SHOWER CURTAIN = ДУШЕВОЙ ЗАНАВЕС – A Shower Curtain is a length of fabric hung around a bathroorn shower or shower-tub combination to keep water from splashing out onto the floor. Shower curtains should be waterproof. When decorative, nonwaterproof shower curtains are used, a waterproof liner, usually made of plastic, should be placed inside.

SHOWERPROOF = ВОДОНЕПРОНИЦАЕМОЕ (или ВОДОУПОРНОЕ, или ВОДООТТАЛКИВАЮЩЕЕ) – Showerproof is one of the many terms used to describe varying degrees of imperviousness to water. A showerproof fabric will repel water to a limited extent, but is not waterproof. See also Waterproof.

SHP = SAINT HELENA POUND

SHR = SHEATH ROT

SHREDDING = ИЗМЕЛЬЧЕНИЕ – Shredding is the separation of compressed fibers in pulp sheets prior to acetylation in acetate manufacture. / Измельчение волокнистых материалов.

SHRIMP PINK = КРЕВЕТОЧНО–РОЗОВОЕ (или ХХ) – Shrimp Pink:- a deep pink.

SHRINKAGE = СНИЖЕНИЕ – Shrinkage is the reduction in volume of wet natural gas due to the extraction of some of its constituents, such as hydrocarbon products, hydrogen sulphide, carbon dioxide, nitrogen, helium and water vapor.

SHRINKAGE = УБЫЛЬ – Shrinkage is a reduction in inventory measurement (often referred to as a Result Of Loss or Theft). Shrinkage is inventory losses from theft, damage, loss and accounting errors. In retailing, a euphemism for theft of goods or stock by employees. / В розничных продажах, эвфемизм для обозначения хищения товаров или запасов работниками данного предприятия.

SHRINKAGE = УВАЛ (или УСАДКА, или УБЫЛЬ, или УСУШКА, или НЕДОСТАЧА) – Shrinkage is the loss of weight in wool resulting from the removal of the yolk and other foreign matter in scouring or carbonization.

SHRINKAGE = УСАДКА – (1) Shrinkage:- elongation on any machine may cause if fabric is wetted in hot detergent solution. Finishing defect. Shrinkage is the contraction in the dimension of the fabric due to usage. Cotton fabric suffers from two main disadvantages of shrinking and creasing during subsequent washing. Creasing is overcome by the resin finishing whereas the shrinking is prevented by a special finishing known as Sanforising and the machine used for that purpose is known as Zero-Zero pre shrinking. Cotton is mainly selected for apparel purposes because of their durability, ability to withstand the rough laundering treatment especially under alkaline conditions, good perspiration, absorption characteristics, and comfort during wear and ability to take up a wide range of dye stuffs. But the main problem with the cotton fabric is shrinkage during washing or laundering. Shrinkage is undesirable property to the apparels. So the material has to be either shrink resistant or shrink recoverable. The main objective of anti-shrink finish is to keep the fabric smooth and free from undesirable shrinkage. So this finish is referred as Anti-shrink or Shrink resistant or shrink recovery finish. This finish is purely chemical and permanent finish. Usually cotton, linen, viscose and cuprammonium rayon are finished with resin. The finishing process by which the cotton knitted fabrics are made not to shrink is known as 'Anti-Shrink Treatment'. Different type of knitted fabrics such as single Jersey, interlock and flat back rib were treated with Resil CLS using pad-dry-cure technique. Also dosage of the chemical and pH were also changed to study their effect on the treated fabric. The chemically treated knitted fabric is also tested for dimensional stability, spirality, bursting strength and formaldehyde content as per the standard test methods. Dimensional stability and spirality has found to be improved compared to that of untreated fabric. Resil CLS treated fabric resulted in a strength loss of 15%, it is comparatively less than that of other cross linking agents. It was found that only 4.05 ppm (parts per million) of formaldehyde was released from the fabric which is acceptable and negligible as per the standards. Shrinkage is a widthwise or lengthwise contraction of a fiber, yarn, or fabric, usually after wetting a redrying or on exposure to elevated temperature. / Сэнфоризация или Сэнфорайзин (Sanforising). Си.Эл.Эс. (Resil CLS). Порок или дефект заключительной отделки.

(2) Shrinkage is the decrease in length of a test specimen caused by a specified treatment, expressed as a percentage of the length of the untreated test specimen. The lengths are measured before and during or after treatment under specified tensions. There are the following types of shrinkage:- (i) boiling water shrinkage; (ii) hot water shrinkage; (iii) hot air shrinkage, after treatment; and (iv) hot air shrinkage, during treatment. / Под Усадкой при испытаниях, например, текстильной продукции, понимается реакция материала, проявляемая в уменьшении размера образца.

SHRINKAGE = УСУШКА – Radial Shrinkage and Tangential Shrinkage. Shrinkage is the decrease in the dimension of wood resulting from a decrease of moisture content and generally occurring to the greatest extent between about 20 and 30 percent moisture content. / Уменьшение древесины в размерах в результате снижения в ней уровня влаги. Это происходит в значительной мере при изменении уровня влаги в диапазоне с 30 до 20 процентов. Усушка по толщине (radial shrinkage) и усушка по ширине или тангентальная усушка (tangential shrinkage).

SHRINKAGE ALLOWANCE = ДОПУСК НА УСУШКУ – A Shrinkage Allowance is deducted from the gross weight of grain delivered, to adjust for the normal loss of weight, sometimes called Invisible Losses, during handling of grain. / Допуск На Усушку принимается в расчёт и вычитается из брутто веса поставленного зерна с целью переоценки по обычной потере веса, называемой иногда невидимыми потерями, в процессе перевалки зерна. Под Допуском понимается разность между наибольшим и наименьшим предельными значениями (размерами) какого-либо параметра.

SHRINKAGE–CONTROLLED FABRIC = ТКАНЬ С КОНТРОЛЬНОЙ УСАДКОЙ – Shrinkage-Controlled Fabric is a fabric treated in some way to prevent it from shrinking more than a specified amount. Unfortunately, the term shrinkage-controlled is an arbitrary standard and varies from rnanufacturer to manufacturer and gives the consumer no true measure of quality. Shrinkage-control is usually achieved by shrinking the fabric in the finishing steps or by the addition of finishing agents to the fabric.

SHRINKAGE FORCE = СИЛА УСАДКИ – Shrinkage Force is the force generated by thermoplastic materials when they are subjected to elevated temperatures.

SHRINKAGE IN MASS = УБЫЛЬ В МАССЕ (или УБЫЛЬ В ВЕСЕ, или ПОТЕРЯ В МАССЕ) – Shrinkage In Mass is a loss of volume, for instance with leather goods as a result of drying out.

SHRINKAGE/SHORTAGE = УБЫЛЬ/НЕДОСТАЧА – Shrinkage/Shortage is a loss in volume, reduction (weight loss) of goods during transport or storage.

SHRINK WRAP = УСАДОЧНАЯ ПЛЁНКА – Shrink Wrap:- polyethylene or similar substance heat-treated and shrunk into an envelope around several units, thereby securing them as a single pack for presentation or to secure units on a pallet. See also Pallet. / Термоусадочная Плёнка (Shrink Wrap):- плёнка из полиэтилена, полипропилена и других полимеров, обладающая свойствами усадки. Усадка плёнки происходит при нагревании. Применяется для укрытия грузовых единиц на поддоне с целью обеспечения большей устойчивости штабеля и обеспечения безопасности.

'SHRINKWRAP' AGREEMENT = СОГЛАШЕНИЕ ОБ УСАДОЧНОЙ ПЛЁНКЕ – 'Shrinkwrap' Agreement is the method by which electronic information providers establish the terms under which users may gain access to the information without any negotiation with the user. The term developed in connection with the purchase of software. Ordinarily, software is provided in a box enclosed in a plastic wrap known as 'Shrinkwrap'. The box would state that by removing the shrinkwrap from the box, the purchaser of the software was agreeing to the terms of a licensing agreement included inside the box. The term has been expanded to include the presentation of licensing agreements to software buyers and information users before the program will permit use of the product or information. Known also as 'Click-On' Licenses or 'Click-Through' Licenses, this process requires users to affirmatively click on a button indicating their acceptance of the licensing agreement before they can install the software or view the information. While the issue is not settled in all jurisdictions, the trend in the law has been to consider such agreements enforceable and binding, provided that the user has the

opportunity to return the product for a full refund in the event that he or she does not wish to be bound by the terms of the agreement. / , от Латинского слова Affirmo, означающее Утверждаю, .

SHRINK WRAPPING = ОБТЯЖКА УСАДОЧНОЙ ПЛЁНКОЙ – Shrink Wrapping:- heat treatment that shrinks a layer of clear material over the cargo or the pallet, thus binding them into a single module. Plastic wrapping around a consignment, usually a pallet, whereby a plastic film is heat-treated so as to fit snugly around the entire consignment. Shrink Wrapping involves enclosing the package contents in shrink film (flat or tubular film), heat sealing any unsealed portions and separating the package from the film web or covering the package contents with a shrink cover. Depending upon the shape and weight of the package contents, the shrink material used should be PE or plasticized PVC film of a thickness of 0.01 to 0.2 mm, with PE films being particularly suitable for heavy items. The film is heated from the outside in a shrink-wrap oven or with hand-held heat gun, thus releasing the captive tension in the film. Shrink films are produced in either monoaxial (in a single direction) or biaxial (in two directions) orientation. As the film cools down, it shrinks around the package contents, applying a very low pressure per unit area. / плёнка из полиэтилена (ПЭ или PE) или пластичного (plasticized) поливинилхлорида (ПВХ или PVC) толщиной от 0.01 до 0.2 мм, с .

SHROUDS = ВАНТЫ – Shrouds (maritime term):- side stays from the masthead to the rail.

SHRUB = КУСТ – Shrub is a horticultural term for a low bushy plant with multiple stems normally branching from the base, rather than having a single stem branching higher up as in the case of a tree. Shrub is a small Perennial Tree with no main trunk. A woody plant with spreading branches arising from the base. / Кустарник (Bush) – жизненная форма. Под Кустом понимается . Кустарники – растения менее 5 метров высотой и, чаще всего, имеющие не один, а несколько стволов, среди которых невозможно выделить главный. Кустарнички отличаются от кустарников и меньшими размерами, до 60 см высотой, и меньшей продолжительностью жизни, 5–10 лет, одревесневшие побеги не имеют выраженного главного ствола. Полукустарники – растения с многочисленными побегами, которые деревенеют лишь снизу, в верхней части они травянистые.

SHRUG = КОРОТКИЙ СВИТЕР (или ШРАГ, или ЖАКЕТИК–БОЛЕРО) – Shrug is a woman's small waist-length or shorter jacket.

SHRUNKEN AND BROKEN KERNELS = ЩУПЛАЯ И БИТАЯ ЗЕРНОВКА (или ЩУПЛЫЕ И БИТЫЕ ЯДРА) – In the Wheat industry, shrunken and broken kernels are all matter that passes through a 0.064 x 3/8 oblong-hole sieve after sieving according to procedures prescribed in the US Federal Grain Inspection Service (FGIS) instructions.

SHRUNKEN KERNELS = ЩУПЛАЯ ЗЕРНОВКА (или ЩУПЛЫЕ ЯДРА) – Shrunken Kernels in Wheat are whole kernels that pass through a No. 4.5 slotted sieve. See also Thin And Shrunken.

SHS = SHEATH SPOT

SHUTE = ПРОКИДКА (или УТОЧИНА) – Shute is another term for Weft, Woof, Shoot, and Filling. The crosswise thread that interlaces with the warp threads on a woven fabric. / Уток (Weft), , , и Уточина (Filling).

SHUT OUT = ОТВЕРГНУТЫЙ (или НЕПРИНЯТЫЙ) – Shut Out:- a container which was not loaded aboard the vessel due to an overbooked situation or by an action initiated by carrier. / Контейнер, не погруженный на борт судна вследствие перебора или в связи с действиями, инициированными перевозчиком.

SHUTTLE = ЧЕЛНОК – (1) Shuttle is the boat-like devise on weaving machines, which carries the filling yarn wound on the bobbin. The shuttle moves from the shuttle box on one side of the loom, through the shed, and onto the shuttle box at the other side of the loom. Shuttle is a device used in weaving to carry the woof thread back and forth between the warp threads. Shuttle is a boat-shaped device, usually made of wood with a metal tip that carries filling yarns through the shed in the weaving process. It is the most common weft-insertion device. The shuttle holds a quill, or pirn, on which the filling yarn is wound. It is equipped with an eyelet at one end to control rate. The filling yarn is furnished during the weaving operation. Shuttle is a bobbin-like device used in weaving for passing the weft thread between the warp threads. Shuttle is the part of the weaving machine (loom) that carries the filling yarn over and under the warp yarns. / уточная пряжа. челнок удерживает уточный патрон (quill) или уточную шпулю (pirn), на которой намотана уточная пряжа. Челнок – рабочий орган ткацкого станка, служащий для прокладывания уточной нити (утка) и содержащий её в количестве, достаточном для длительной работы станка. Челнок изготовляют из твёрдых пород древесины; на концах имеет металлические мыски.

(2) Shuttle is a small bobbin-like device used to hold the thread in a sewing machine or in tatting, knitting, etc. Shuttle is a device for holding the thread in tatting and netting and in a sewing machine. The lock stitch sewing machine was invented by Walter Hunt in 1833. His machine used an eye-pointed needle (with the eye and the point on the same end) carrying the upper thread and a shuttle carrying the lower thread. The curved needle moved through the fabric horizontally, leaving the loop as it withdrew. The shuttle passed through the loop, interlocking the thread. The feed let the machine down – requiring the machine to be stopped frequently and reset up. Hunt eventually lost interest in his machine and sold it without bothering to patent it. In 1842, John Greenough patented the first sewing machine in the United States. Isaac Merritt Singer has become synonymous with the sewing machine. Trained as an engineer, he saw a rotary sewing machine being repaired in a Boston shop. He thought it to be clumsy and promptly set out to design a better one. His machine used a flying shuttle instead of a rotary one; the needle was mounted vertically and included a presser foot to hold the cloth in place. It had a fixed arm to hold the needle and included a basic tensioning system. Meanwhile Allen B. Wilson had developed a reciprocating shuttle, which was an improvement over Singer's and Howe's. However, John Bradshaw had patented a similar device and was threatening to sue. Wilson decided to change track and try a new method. He went into partnership with Nathaniel Wheeler to produce a machine with a rotary hook instead of a shuttle. This was far quieter and smoother than the other methods, and the Wheeler and Wilson Company produced more machines in 1850s and 1860s than any other manufacturer. / Волтё Хант (Walter Hunt). Дьжон Гринау (John Greenough). Айзэк Мэрит Сингё (Isaac Merritt Singer). Элэн Би. Вилсэн (Allen B. Wilson) Сингёз энд Хауз (Singer's and Howe's). Дьжон Брэшо (John Bradshaw). Нэсэниэл Вилё (Nathaniel Wheeler). Вилё энд Вилсан Кампэни (Wheeler and Wilson Company). Швейная машина с закрытым или челночным стежком была изобретена Волтёром Хантом (Walter Hunt) в 1833. Челнок – рабочий инструмент в швейной машине с двуниточным (челночным) швом, образующий переплетение ниток в стежке.

(3) Shuttle is a load transported from one customer-related facility to another; does not include product shipped to a consignee.

SHUTTLE AND BOBBIN = ЧЕЛНОК И БОБИНА (или УТОЧНАЯ ШПУЛЯ, или СНОВАЛЬНАЯ КАТУШКА) – Shuttle And Bobbin:- the shuttle passes through the warp shed formed by the raising and lowering of the ends in the warp. The filling yarn is wound on a bobbin which sets in the shuttle. This yarn is unwound and left in the shed as the shuttle passes through in going from the shuttle box on the one side of the loom to the shuttle box on the other side. The reed then beats the loose pick in the shed into the cloth. / Уточная пряжа наматывается на бобину, .

SHUTTLE BREEDING = ЧЕЛНОЧНОЕ РАЗВЕДЕНИЕ (или ЧЕЛНОЧНЫЙ БРИДИНГ) – Shuttle Breeding is any breeding system where generations undergo sequential evaluations at different locations. / вычисления в различных . Под Разведением сельскохозяйственных животных понимается наука о размножении сельскохозяйственных животных и улучшении их наследственных качеств, совершенствовании существующих и выведении новых пород; раздел зоотехнии; производственная деятельность по осуществлению этих задач. Разрабатывает теорию и практические приёмы племенной работы применительно ко всем видам сельскохозяйственных животных. Важнейшие методы разведения сельскохозяйственных животных – чистопородное разведение, скрещивание и гибридизация при тщательном отборе и подборе животных. Тесно связано с генетикой.

SHUTTLE CAR = ЗАКОЛЬЦОВАННЫЙ АВТОМОБИЛЬ (или ЧЕЛНОЧНЫЙ АВТОМОБИЛЬ) – Shuttle Car is a rubber-tired haulage vehicle that is unloaded by a built-in conveyor. / средство подвоза, которое .

SHUTTLE CHAFE MARK = ОТМЕТИНА ОТ ХХ – Shuttle Chafe Mark is a fabric defect that is usually seen as groups of short, fine lines across the fabric, often running for some distance in the piece and usually in the same area. Although these marks run in the direction of the filling, they are actually caused by the shuttle rubbing across and damaging the warp ends, producing a dull, chalky appearance. / в направлении уточины, протирание или притирка (rubbing).

SHUTTLE FLYING = ВЫЛЕТ ЧЕЛНОКА – Shuttle Flying:- fibrous yarns, knots with long tail ends, slack warp, uneven race board, small sheds, bottom line too high, worn pickers, swells giving twist to the shuttle as it leaves the box, early picking, late shedding, unbalanced shuttle, box spindle not set properly, box front not set properly and missing shuttle guard are the main reasons for shuttle flying.

SHUTTLELESS LOOM = БЕСЧЕЛНОЧНЫЙ ТКАЦКИЙ СТАНОК – Shuttleless Loom is a loom in which some device other then a shuttle is used for weft insertion. Looms without shuttles include:- (i) gripper loom, (ii) rapier loom, (iii) water jet loom, and (iv) air jet loom. See also Loom, and Weft Insertion. Shuttleless Loom is a machine that carries the filling yarns through the shed by the use of air or water jets and grippers. / уточные пряжи . Бесчелночный Ткацкий Станок – ткацкий станок, в котором уточная нить вводится в зев (пространство между нитями основы) не челноком, а с помощью прокладчика утка, рапир, игл, водяной или воздушной струи, выходящей из сопла под давлением. После каждого прокладывания уточной нити она обрезается. Благодаря повышению скорости прокладывания утка существенно возрастает производительность ткачества.

SHUTTLE MARK = ОТМЕТИНА ОТ ЧЕЛНОКА (или ПОДНЫРКИ) – Shuttle Marks:- widthwise warp yarns due to abrasion of warp yarns by shuttle. Weaving defect. Shuttle Mark:- in woven fabrics, a fine fillingwise line caused by damage to a group of warp yarns by shuttle abrasion. Synonym:- Box Mark. / вследствие истирания основной пряжи . Порок или дефект ткачества. Подныpки не более 5 см. Размер порока – до 1 см. Под Подныpками понимается дефект суровой ткани, когда уточные нити на коротких участках не переплетаются с основными, а выступают в виде скобочек или петель сверху или снизу полотна; причины – нечистый зев, несвоевременный ввод уточной нити в зев, провисание нитей основы, излишне высокое или низкое расположение шпаруток и другое.

SHUTTLER = ЧЕЛНОЧНИК (или МАРШРУТЧИК) – Shuttler is a driver who moves containers from one location to another location.

SHUTTLE SMASH = УДАР ЧЕЛНОКА (или ОТРЫВ ЧЕЛНОКА, или ОБРЫВ ЧЕЛНОКА) – Shuttle Smash is caused when many ends break consequent to a shuttle trap. The important causes of shuttle trap are:- wrong timing of shedding, soft picking, insufficient checking of shuttle in the boxes, severe slough off, and damaged or broken picking accessories. Fabric defect. Shuttle Smash:- ruptured cloth structure characterized by many broken warp ends and floating picks. Causes:- (i) improper timing; (ii) insufficient picking force; and (iii) slack ends in certain portion; the sagging ends obstructs shuttle flight. Mending:- non mendable. Smashes:- in mill parlance warp ends broken in the loom. Smash is a place in a piece of cloth, still in the loom, where a large number of warp ends have become broken. It is caused by the lay beating up the shuttle while the latter is still in the shed, because of some irregularity made on the spur of the moment or by two shuttles coming together in the same shed because of the weaver putting a shuttle in the wrong box before starting up his loom after a stoppage. Smashes hinder production greatly as time has to be taken to tie or twist in the broken ends. Harness skips and slivers on shuttles will tend to break out ends of the warp. / Отрывы (Float) – обрыв большого количества нитей основы с последующей неудовлетворительной их приработкой. На ткани видна поперечная полоса по месту отрыва и приработки. Обрывы основы могут возникать при зажиме челнока в зеве.

SHUTTLE TRAIN = ВЕРТУШКА (или ЗАКОЛЬЦОВАННЫЙ СОСТАВ) – Shuttle Train is a train with a destination of station to station. / Поезд, циркулирующий между двумя станциями.

SHUTTLE TRAPS = ЗАМИНЫ ЧЕЛНОКА – Shuttle Traps:- entangled warp ends due to fluff falling on the warp, broken warp end entangled to adjacent end, knot with a long tail resulting in entanglement, snarls in yarn getting entangled, too much hairiness in yarns, weak picking, faulty shuttle checking, gear wheels slipping due to broken teeth, loose stop rod finger, and uneven joint of flat belt are the normal reasons for shuttle trap. / Замины Челнока в зеве.

SHUTTLE TRAP MARK = ОТМЕТИНА ОТ ЗАМИНА ЧЕЛНОКА – Shuttle Trap Mark:- a disturbance of the weave or a localized pucker of the fabric that extends over an area corresponding to the dimensions of a shuttle. This defect is caused by an incomplete cycle of the picking motion, causing a trapping of the shuttle between the reed and the fell of the cloth. / Замин Челнока (shuttle trap mark):- порок ткани; нарушение процесса ткачества, вызванное замином челнока между бёрдом и грудницей станка и вызывающей обрыв основных нитей. Примечание:- этот порок вызван неполным циклом прокладки утка.

SHY FEEDER = ОТПРЯНУВШИЙ ЕДОК (или ОТКАЗАВШИЙСЯ ЕДОК) – Shy Feeder:- sheep in a feedlot that do not eat and drink sufficiently.

SI = SLOVENIA

SI = LE SYSTÈME INTERNATIONAL D'UNITÉS

SIA = SECURITIES INDUSTRY ASSOCIATION

SIAC = SECURITIES INDUSTRY AUTOMATION CORPORATION

SIAMOISE = СИАМСКАЯ (или СЬЯМУАЗ) – Siamoise, a linen and cotton blend, striped, checked, sometimes with wool brocade. / Сиамская – ткань из смеси льна и хлопка, полосатая, клетчатая, иногда с шерстяной парчой.

SIB–CROSSING = СКРЕЩИВАНИЕ СИБСОВ – Sib-Crossing is a crossing lines derived from the same two parents.

SIBS = СИБСЫ – Sibs are the offsprings related by descent. Progeny of the same parents. / Сибсы – приплоды или потомства, связанные своим происхождением. Потомки одних и тех же родителей. Под Сибсами понимаются потомки одних родителей, родные братья и сёстры. Термин используется в генетике человека и животных.

SIC = STANDARD INDUSTRIAL CLASSIFICATION

SIC = THE SWISS INTERBANK CLEARING SYSTEM

SICA = SECURITIES INDUSTRY COMMITTEE ON ARBITRATION

SICAF = SOCIÉTÉ D'INVESTISSEMENT À CAPITAL FIXE

SICAV = SOCIÉTÉ D'INVESTISSEMENT À CAPITAL VARIABLE

SIC/IFRIC = STANDING INTERPRETATIONS COMMITTEE/INTERNATIONAL FINANCIAL REPORTING INTERPRETATIONS COMMITTEE

SIDA = SWEDISH INTERNATIONAL DEVELOPMENT AUTHORITY

SIDE = БОК (или БОКОВАЯ СТЕНКА, или СТОРОНА) – Side is a vertical face of the pallet which corresponds to the length. See also Pallet. / Боковая Стенка (Side):- вертикальная поверхность поддона, расположенная по длине поддона. Смотрите также Поддон (Pallet).

SIDE–DRESSING = МЕЖДУРЯДНАЯ ПОДКОРМКА (или ПОДКОРМКА СО СТОРОН) – Side Dressing:- fertilizer usually applied near, beside, or in between the plants. Fertilizer or granular insecticide incorporated into the soil near a growing plant. / Удобрения или гранулы инсектицидов, внесённые в почву вблизи растущего растения.

SIDE LIFTER = БОКОВОЙ ПОДЪЁМНИК – Side-lifting forklift truck. Side Lifter is a skeletal road trailer, normally drawn by a prime-mover, which is fiited with lifting equipment (cranes) to lift an ISO shipping container on/off itself. t may be of either 20' or 40' configuration of be adjustable for either.

SIDE LIGHTS = БОРТОВЫЕ (ОТЛИЧИТЕЛЬНЫЕ) ОГНИ (или БОРТОВЫЕ ИЛЛЮМИНАТОРЫ) – Side Lights (maritime term):- the red and green running lights, carried on the port and starboard sides respectively, of vessels under-way.

SIDE LOADER = БОКОВОЙ ПОГРУЗЧИК (или ПОГРУЗЧИК С БОКОВЫМ РАСПОЛОЖЕНИЕМ ГРУЗОПОДЪЁМНИКА) – Side Loader is a lift truck fitted with lifting attachments operating to one side for handling containers. / Погрузчик – машина периодического или непрерывного действия для погрузки, выгрузки, транспортирования грузов на небольшие расстояния. Применяется на складах, в цехах, портах и так далее. Погрузчик может оснащаться сменными рабочими органами (навесным оборудованием):- вилочным захватом, ковшом, бадьёй, специальными захватами для пакетов и так далее. По роду привода различают автопогрузчики и электропогрузчики. В различных отраслях экономики используют специальные погрузчики:- в горной промышленности на базе врубовой машины – погрузчики для транспортирования горных пород, в сельском хозяйстве – картофелепогрузчики, свеклопогрузчики, машины для погрузки сена, минеральных удобрений, торфа и так далее.

SIDE MIDDLE BLOCK = БОКОВАЯ СРЕДИННАЯ ШАШКА (или ТОРЦЕВАЯ СРЕДНЯЯ ШАШКА) – Side Middle Block is a middle block on the side of the pallet. See also Pallet. / Торцевая Средняя Шашка (Side Middle Block):- Средняя крайняя шашка, расположенная на торцевой стороне поддона. Смотрите также Поддон (Pallet).

SIDE OPENING = БОКОВОЕ ОТКРЫТИЕ – Side Opening is an opening created by the facing tacked onto the swing pockets. It allows the wearer access to his trouser pockets. Typically found on coveralls.

SIDETRACKING = ЗАРЕЗКА БОКОВОГО СТВОЛА – Sidetracking is the use of an existing well bore to drill an additional bore laterally.

SIDING = ПУТЬ (или ВЕТКА) – Siding is a short railroad track connected with a main track by a switch to serve a warehouse or an industrial area. / Короткая железнодорожная ветка, соединённая с основной железной дорогой посредством стрелки, для обслуживания склада или промышленной зоны. Под железнодорожным Путём понимается комплекс сооружений и устройств, образующих дорогу с направляющей рельсовой колеёй. Состоит из верхнего строения (рельсов, шпал, стрелочных переводов, мостовых брусьев, балластного слоя), земляного полотна (насыпей, выемок) с дренажными устройствами, а также искусственных сооружений (мостов, путепроводов, тоннелей и так далее). Оборудуется сигнальными знаками (указательными и пикетными столбиками и тому подобными).

SIDO = SMALL INDUSTRIES DEVELOPMENT ORGANIZATION

SIERRA = СИЭРА – Sierra (pronunciation:- see-AIR-ah) or S is international nautical signal flag meaning:- (i) International:- Moving astern. (ii) Navy:- Conducting flag hoist drill. (iii) Sailing Regatta:- Shorten Course. Meaning:- my engines are going full speed astern. International Meaning:- I am operating astern propulsion. With one or more numerals, speed in knots.

SIEVE = СИТО – In the Wheat industry of the United States, Sieve is 0.064 x 3/8 oblong-hole sieve. A metal sieve 0.032 inch thick with oblong perforations 0.064 inch by 0.375 (3/8) inch. Sieve is a meshed device through which material is strained to separate particles of different sizes. Sieves used in dockage assessment and grading procedures are listed in the Canada Grain Regulations. The accuracy of sieves used by the Canadian Grain Commission (CGC) is regularly monitored. / Сито – устройство для разделения по крупности частиц различных сыпучих продуктов и материалов просеиванием через сетки. Различают:- барабанные (вращающиеся) и плоские сита (вибрационные, качающиеся). Применяют главным образом при грохочении (механическом разделении материала на фракции (классы, сорта) по крупности на грохотах) и в мукомольном производстве. Под Ситом понимается устройство для разделения сыпучих масс по размеру частиц просеиванием через сетки. Ситовый Анализ – способ определения крупности измельчённых материалов просеиванием через набор стандартных сит с отверстиями разных размеров.

SIEVE NO. 7 = СИТО № 7 – In the Rice industry, sieve means round hole metal sieve No. 7, that is 0.79 mm (0.031 inch) thick and with hole diameter of 1.75 mm (0.069 inch).

SIEVERT = СИВЭ (или ЗИВЕРТ) – Sievert (Sv) is the SI derived unit used for measuring the effective (or 'equivalent') dose of radiation received by a human or some other living organism. Various kinds of radiation have different effects on living tissue, so a simple measurement of dose as energy received, stated in Grays (the Gray was named after the British physicist Louis Harold Gray) or rads (radiation absorbed doses), does not give a clear indication of the probable biological effects of the radiation. The equivalent dose, in Sieverts, is equal to the actual dose, in Grays, multiplied by a 'quality factor' which is larger for more dangerous forms of radiation.

An effective dose of one Sievert requires 1 Gray (Gy) of beta or gamma radiation but only 0.05 Gray of alpha radiation or 0.1 Gray of neutron radiation. One sievert equals 100 rem. The Sievert is a large unit, so radiation doses are often measured in milliSieverts (mSv). The unit honors the Swedish radiation medical physicist Professor Rolf Maximilian Sievert (was born in Stockholm on 06 May 1896 – was died in Stockholm on 03 October 1966), who worked over many years to measure and standardize the radiation doses used in cancer treatment. The unit reflects the biological effects of the ionizing radiation absorbed. It is used to express both the equivalent dose and the effective dose. The Sievert is a very large dose of radiation. A more useful unit is the milliSievert (mSv). This is one-thousandth of a Sievert. Sievert is an unit of radiation absorption in the International System of Units (SI). The Sievert has been recommended by the International Commission on Radiation Units and Measurements (ICRU) as a substitute for the rem, the long-standing special unit for measuring biological absorption of radiation. Like the rem, the Sievert takes into account the relative biologic effectiveness (RBE) of ionizing radiation, since each form of such radiation – e.g., X rays, gamma rays, neutrons – has a slightly different effect on living tissue. Accordingly, one Sievert is generally defined as the amount of radiation roughly equivalent in biologic effectiveness to one Gray (or 100 rads or radiation absorbed doses) of gamma radiation. The Sievert is inconveniently large for various applications, and so the milliSievert (mSv), which equals 1/1 000 Sievert, is frequently used instead. One milliSievert corresponds to 10 ergs of energy of gamma radiation transferred to one gram of living tissue. Sievert (Sv) is the unit of radiation damage used in radiotherapy. The Unit Sievert:- to honor Rolf Sievert, the CGPM-conference (short for the Conférence Générale des Poids et Mesures or the General Conference on Weights and Measures) of 1979 accepted the Sievert, Sv, as the unit for equivalent dose and efficient dose. 1 Sv = 1 J/kg. The unit for equivalent dose and efficient dose, the Sievert. / Британский физик Луис Хэролд Грэй (Louis Harold Gray). Зиверт, специальное наименование единицы эквивалентной дозы излучения в СИ – Джоуля на килограмм (Дж/кг). Обозначение:- Зв (Sv). Названа в честь Шведского учёного физика Профессора Рольфа Максимилиана Сивэ (Rolf Maximilian Sievert). 1 Зв = 1 Дж/кг = 10^2 бэр.

SIEVE TUBE = СИТОВИДНАЯ ТРУБКА – Sieve Tube is a tube consisting of an end to end series of thin-walled living cells characteristic of the phloem, having no nucleus when mature, and believed to function chiefly in translocation of organic solutes. / Под Ситовидными Трубками понимаются проводящие элементы флоэмы цветковых растений в виде однорядных тяжей из удлинённых клеток с ситовидными отверстиями на конечных стенках. По ситовидным трубкам происходит транспорт органических веществ, главным образом сахаров. Смотрите также Флоэма (Phloem).

SIFMA = THE SECURITIES INDUSTRY AND FINANCIAL MARKETS ASSOCIATION

SIFO = SILVER FORWARD

SIGHT AND NOTICE DEPOSITS = ДЕПОЗИТЫ ДО ВОСТРЕБОВАНИЯ И ДО УВЕДОМЛЕНИЯ – Sight And Notice Deposits are very short-term financial liabilities, typically having a notice period of three days or less. They are designated as loans and receivables and are included in the balance sheet at amortised cost.

SIGHT DEPOSIT = ВКЛАД ДО ВОСТРЕБОВАНИЯ (или ДЕПОЗИТ ДО ВОСТРЕБОВАНИЯ) – Sight Deposit is a money at call. Also known as Demand Deposit. In banking, Sight Deposit is:- (i) a bank deposit withdrawable immediately; or (ii) a bank deposit against which the depositor can immediately make a withdrawal.

SIGHT DRAFT = ТРАТТА ПО ПРЕДЪЯВЛЕНИИ – Sight Draft (S/D) is a draft so drawn as to be payable upon presentation to the drawee or at a fixed or determination date thereafter. Sight Draft is a draft payable on demand upon presentation. Written demand for payment of a specified amount addressed to a named party, called the Drawee, and signed by the drawer. A draft may demand payment immediately upon presentation (at sight) or on a specified maturity date and must also specify a party to be paid (the payee). Most drafts are negotiable, meaning the payee's right to payment can be transferred by the payee to another party by endorsement and delivery of the draft. A draft which is payable upon presentation to the drawee. Draft that demands payment 'at sight', or immediately, as opposed to a time draft, which may be payable '90 days after sight' or '30 days after bill of lading date'. A bill of exchange endorsed 'on demand'. It does not require payment on a definite date but is payable immediately on presentation. It has to be presented within one year after drawing if no other period is stipulated. Also known as Sight Bill. / Вексель по Предъявлении (Sight Bill) – вексель простой или переводный, в тексте которого не обусловлен срок его погашения либо прямо оговорено, что он оплачивается по предъявлению. В таких случаях предполагается, что вексель подлежит погашению при его предъявлении в место платежа.

SIGHTING THE BOTTOM = НАБЛЮДЕНИЕ ЗА ДНИЩЕМ – Sighting The Bottom:- examining the underside of a ship for damage following an accident. The Institute hull clauses provide that the underwriters will pay the cost of sighting the bottom without applying the policy deductible and even if no damage is found, but only when the cost is incurred specially to examine the bottom following stranding. Otherwise, these costs are included in a claim for damage to the ship's bottom but are subject to the policy deductible.

SIGNAL LINE = СИГНАЛЬНАЯ ЛИНИЯ – Signal Line:- it is a moving average of another indicator that is used to generate simple buy and sell signals. Probably the most used signal line is the one that is built into the MACD Indicator display. The signal line is the exponential moving average of the MACD line. A buy signal is generated when the MACD line crosses above the signal line and a sell signal is generated when the MACD line crosses below the signal line. Also known as Trigger Line. / В техническом анализе биржевых рынков, . в дисплэй Индикатора МЭКДИ (MACD).

SIGNALS = СИГНАЛЫ – Signals:- a recommendation to either enter, exit or reinforce a trade. Signals contain the conditions that are applied to each issue listed in a portfolio. A signal can be an individual condition or it can be a combination of conditions, bar values, study operators, mathematical operators, and Boolean operators. / Рекомендация либо входить, выходить, либо усиливать торговлю. Сигналы содержат условия, применимые к каждому активу в портфеле. Сигнал может быть как самостоятельным условием, так и комбинацией условий, штриховых значений, показателей технических индикаторов, математических вычислений и интуитивных догадок.

SIGNATORY = ПОДПИСАНТ – Signatory is a person who holds a signature-creation device and acts either on his own behalf or on behalf of the natural or legal person or entity he represents.

SIGNATURE = ПОДПИСЬ – Signature:- the digital or electronic signature is required for the identification of different communication partners which are exchanging information electronically. The data is transmitted in coded form and can thus be read only by the addressees (through the use of the correct key). Signature includes a signature by stamp, symbol, facsimile, perforation or other mechanical means; and 'forged signature' includes a signature by the wrongful or unauthorized use of such means. / коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо).

SIGNATURE CARD = КАРТОЧКА С ОБРАЗЦАМИ ПОДПИСЕЙ – Signature Card:- the document deposited at the bank which bears the signature of the account or deposit holder, together with those of the authorized agents. It also defines powers of signature. /

Документ, размещённый в банке, который содержит подпись владельца счёта или вклада (депозита) совместно с подписями таких же уполномоченных агентов. Он также определяет полномочия подписи.

SIGNATURE–CREATION DATA = ДАННЫЕ ДЛЯ СОЗДАНИЯ ПОДПИСИ – Signature-Creation Data:- unique data, such as codes or private cryptographic keys, which are used by the signatory to create an electronic signature. / Уникальные данные, такие как коды или частные криптографические ключи, которые используются подписантом для создания электронной подписи.

SIGNATURE–CREATION DEVICE = УСТРОЙСТВО СОЗДАНИЯ ПОДПИСИ – Signature-Creation Device:- configured software or hardware used to implement the signature-creation data. / Сконфигурированный программный продукт или техническое устройство, используемое для претворения в жизнь данных для создания подписи.

SIGNED LINE = ПОДПИСАННЫЙ ПРЕДЕЛ УДЕРЖАНИЯ (или ПОДПИСАННАЯ ДОЛЯ УДЕРЖАНИЯ) – Signed Line:- this refers to the amount of a given risk that an underwriter has agreed to accept. It may be the same as the underwriter's written line or, if there is signing down, a lower amount. The amount of a syndicate's signed line should be shown in a table in the policy, where one is issued.

SIGNET RING = КОЛЬЦО С ПЕЧАТКОЙ (или ПЕРСТЕНЬ) – Signet Ring is a finger ring engraved with a signet, seal, or monogram; seal ring.

SIGNIFICANCE = ЗНАЧИТЕЛЬНОСТЬ (или ЗНАЧИМОСТЬ) – Significance is the clear difference between that observed and that expected.

SIGNIFICANT DIFFERENCE = ЗНАЧИТЕЛЬНОЕ РАЗЛИЧИЕ (или СУЩЕСТВЕННОЕ РАЗЛИЧИЕ) – Significant Difference is a statistical reality used to determine the differences among plant comparisons; usually expressed to have a certain level of probability of being wrong due to chance.

SIGNIFICANT INFLUENCE = ЗНАЧИТЕЛЬНОЕ ВЛИЯНИЕ (или СУЩЕСТВЕННОЕ ВОЗДЕЙСТВИЕ) – Significant Influence is the power to participate in the financial and operating policy decisions of an entity, but is not control over those policies.

SIGNIFICANT OPERATIONS = ЗНАЧИТЕЛЬНЫЕ ОПЕРАЦИИ (или СУЩЕСТВЕННЫЕ ОПЕРАЦИИ) – In the United States (US), Significant Operations:- under EESA (short for the Emergency Economic Stabilization Act of 2008. The Emergency Economic Stabilization Act of 2008 was signed into law on 2008-October-03. The Act authorized the Treasury to spend up to USD700 billion to purchase troubled assets and make capital injections), a financial institution must have significant operations in the US in order to be eligible to participate. Treasury has not provided guidance on the definition of 'significant operations'. This limit was likely originally intended to prevent US taxpayer funds from going to foreign banks with only tangential US operations. Both large and small US banks and bank holding companies have participated in the Capital Purchase Program (CPP was established by Treasury in October, 2008 pursuant to EESA to inject capital into certain qualifying financial institutions through the purchase of newly issued preferred stock and warrants). Thus the 'Significant Operations' limit has had no real meaning or effect on domestic entities.

SIGNING DOWN = УЦЕНКА (или СПИСАНИЕ) – Signing Down:- where a risk is oversubscribed, which is to say that the underwriters' written lines exceed 100% then, absent some contrary instruction, those lines will be proportionally reduced ('Signed Down') by the broker until they total 100%. An underwriter may insist on preserving his written line in which event the written lines of the other underwriters will be proportionally reduced until they total 100% when added to the preserved written line of the other underwriter.

SILAGE = СИЛОС – Silage is fermented, high-moisture fodder that can be fed to ruminants (cud-chewing animals such as cattle and sheep) or used as a biofuel feedstock for anaerobic digesters. It is fermented and stored in a process called Ensiling or Silaging, and is usually made from grass crops, including Maize, Sorghum or other cereals, using the entire green plant (not just the grain). Silage can be made from many field crops, and special terms may be used depending on type (oatlage for Oats, haylage for Alfalfa – but see below for the different British use of the term Haylage). Silage is made either by placing cut green vegetation in a silo, by piling it in a large heap covered with plastic sheet, or by wrapping large bales in plastic film. Silage must be made from plant material with a suitable moisture content, about 50% to 60%, depending on the means of storage, the degree of compression, and the amount of water that will be lost in storage. For Maize, harvest begins when the whole-plant moisture is at a suitable level. For pasture-type crops, the grass is mowed and allowed to wilt for a day or so until the moisture content drops to a suitable level. The plant material is collected, chopped into pieces about 0.5 in (1.3 cm) long and packed. In the early days of mechanized agriculture, stalks were cut and collected manually using a knife and horsedrawn wagon, and fed into a stationary machine called a 'Silo Filler' that chopped the stalks and blew them up a narrow tube to the top of a tower silo. Current technology uses mechanical forage harvesters that collect and chop the plant material, and deposit it in trucks or wagons. These forage harvesters can be either tractor-drawn or self-propelled. Harvesters blow the silage into the wagon via a chute at the rear or side of the machine. Silage may also be emptied into a bagger, which puts the silage into a large plastic bag that is laid out on the ground. In North America, Australia, northwestern Europe, and frequently in New Zealand, silage is placed in large heaps on the ground and rolled by tractor to push out the air, then wrapped in plastic covers held down by reused tires or tire ring walls. In New Zealand and Northern Europe, the silo or 'pit' is often a bunker built into the side of a bank, usually made out of concrete or old wooden railroad ties (railway sleepers). The chopped grass can then be dumped in at the top, to be drawn from the bottom in winter. This requires considerable effort to compress the stack in the silo to cure it properly. Again, the pit is covered with plastic sheet and weighed down with tire weights. In an alternative method, the cut vegetation is baled, making balage (North America) or silage bales (UK). The grass or other forage is cut and partly dried until it contains 30–40% moisture (much drier than bulk silage, but too damp to be stored as dry hay). It is then made into large bales which are wrapped tightly in plastic to exclude air. The plastic may wrap the whole of each cylindrical or cuboid bale, or be wrapped around only the curved sides of a cylindrical bale, leaving the ends uncovered. In this case, the bales are placed tightly end to end on the ground, making a long continuous 'sausage' of silage, often at the side of a field. The wrapping may be performed by a bale wrapper, while the baled silage is handled using a bale handler or a front-loader, either impaling the bale on a flap, or by using a special grab. The flaps do not hole the bales. In the UK, baled silage is most often made in round bales about 4 feet by 4 feet, individually wrapped with four to six layers of 'bale wrap plastic' (black, white or green 25 micrometer stretch film). The dry matter can vary a lot but can be from about 20% dry matter upwards. The continuous 'sausage' referred to above is made with a special machine which wraps the bales as they are pushed through a rotating hoop which applies the bale wrap to the outside of the bales (round or square) in a continuous wrap. The machine places the bales on the ground after wrapping by moving forward slowly during the wrapping process (search for 'tube liner' various makes). Haylage is a name for high dry matter silage of around 45% to 75%. Horse haylage is usually 55% to 75% dry matter, made in small bales or larger bales. Handling of wrapped bales is most often with some type of gripper that squeezes the plastic-covered bale between two metal parts to avoid puncturing the plastic. Simple fixed versions are available for round bales which are made of two shaped pipes or tubes spaced apart to slide under the sides of the bale, but when lifted will not let it slip through. Often used on the tractor rear three-point linkage, they incorporate a trip tipping mechanism which can flip the bales over on to the flat side/end for storage on the thickest plastic layers. Storing silage:- silage must be firmly packed to minimize the oxygen content, or it will spoil.

Silage goes through four major stages in a silo:- (i) Presealing, which, after the first few days after filling a silo, enables some respiration and some dry matter (DM) loss, but stops; (ii) Fermentation, which occurs over a few weeks; pH drops; there is more DM loss, but hemicellulose is broken down; aerobic respiration stops; (iii) Infiltration, which enables some oxygen infiltration, allowing for limited microbial respiration; available carbohydrates (CHOs) are lost as heat and gas; and (iv) Emptying, which exposes surface, causing additional loss; rate of loss increases. Silage is a useful feedstock for anaerobic digestion. Here silage can be fed into anaerobic digesters to produce biogas that, in turn, can be used to generate electricity and heat. Silos are hazardous, and deaths occur in the process of filling and maintaining them. There is a risk of injury by machinery or from falls. When a silo is filled, fine dust particles in the air can become explosive because of their large aggregate surface area. Also, fermentation presents respiratory hazards. The ensiling process produces 'silo gas' during the early stages of the fermentation process. Silage gas contains nitric oxide (NO), which will react with oxygen (O_2) in the air to form nitrogen dioxide (NO_2), which is toxic. Lack of oxygen inside the silo can cause asphyxiation. Molds that grow when air reaches cured silage can cause organic dust toxic syndrome. Collapsing silage from large bunker silos has caused deaths. Silage itself poses no special danger. The ensiled product retains a much larger proportion of its nutrients than if the crop had been dried and stored as hay or stover. Bulk silage is commonly fed to dairy cattle, while baled silage tends to be used for beef cattle, sheep and horses. Since silage goes through a fermentation process, energy is used by fermentative bacteria to produce volatile fatty acids (VFAs), such as acetic, propionic, lactic, and butyric, which preserve the forage. The result is that the silage is lower in energy than the original forage, since the fermentative bacteria use some of the carbohydrates to produce VFAs. Thus, the ensiling process preserves forages, but does not improve the quality or the nutrient value. Although it does not increase the nutrient level of the plant matter ensiled, it does increase the digestibility and utilization of nutrient by ruminants. Silage may be composed by one of the following:- Alfalfa; Corn (Maize); Grass-legume mix; Sorghums; and Oats. / Под Силосом понимается законсервированная в процессе силосования зелёная масса Кукурузы, Подсолнечника и других силосных культур. Сочный корм для сельскохозяйственных животных всех видов, по питательности близок к зелёным кормам. Под Силосом, от Испанского слова Silos, множественное число от Silo, означающее Подземное Помещение или Яма Для Хранения Зерна, понимается сочный корм, приготовленный консервированием без доступа воздуха (смотрите Силосование). В зависимости от сырья различают силос кукурузный, картофельный, подсолнечниковый, викоовсяный и другие. По питательности силос близок к силосуемой массе; в нём сохраняются каротин и витамин С, содержится несколько меньше водо-растворимых сахаров, но присутствуют органические кислоты – молочная (до 2%), уксусная (до 0.6%), в некоторых видах силоса пропионовая, валериановая и другие; а при нарушении технологии силосования и неправильном хранении – масляная. Кормовые достоинства силоса зависят от вида растений, фазы их развития к моменту уборки, технологии приготовления и условий хранения. В 100 килограммах (кг) подсолнечникового силоса около 16 кормовых единиц, 1.4 кг переваримого протеина, 350 граммов (г) кальция, 160 г фосфора и 1 500 миллиграммов (мг) каротина; в 100 кг кукурузного силоса – около 20 кормовых единиц, 1.4 кг переваримого протеина, 150 г кальция, 50 г фосфора, 1 500 мг каротина; в 100 кг люцернового силоса – 18 кормовых единиц, 2.9 кг переваримого протеина, 600 г кальция, 60 г фосфора и 2 500 мг каротина. Цвет хорошего силоса светло-оливковый, желтоватый; тёмно-коричневый цвет имеет сильно прогревшийся силос. Запах напоминает запах квашеной капусты, мочёных яблок, иногда фруктовый; при сильном самосогревании – свежеиспечённого хлеба или мёда, при порче – порченой селёдки, навозный. Структура силоса должна быть рыхлой; мажущаяся консистенция указывает на порчу. При влажности около 70% pH (водородный показатель) хорошего силоса – 4.2; при влажности 65% – допускается несколько выше. Скармливание силоса улучшает пищеварение, способствует лучшему использованию других кормов, особенно грубых. Кормят силосом всех сельскохозяйственных животных. В рационах молочного и откормочного крупного рогатого скота силос может составлять по питательности до 50%, в рационах свиней – до 20%. Для телят, свиней и птицы готовят специальный силос:- для телят из Бобовых трав, мягких Злаков и Бобово-Злаковых травосмесей ранних фаз развития; для свиней – комбинированные, основными компонентами которых являются сахарная Свёкла, Морковь, фуражный Картофель, Бахчевые, початки Кукурузы и другие; для птицы – из Бобовых трав, витаминной Тыквы, Моркови, Ботвы, корнеплодов сахарной Свёклы и других. Скармливают силос зимой, а в засушливых районах и летом. В бывшем Союзе Советских Социалистических Республик (СССР) в 1965 расход силоса для скота и птицы составлял 166.7 миллионов тонн (т), в 1974 – 185.3 миллионов т.

SILENCE CLOTH = ПРОТИВОШУМНОЕ ПОЛОТНО – Silence Cloth is a cloth put on a dining table to protect it and (as the name suggests) to prevent the clatter of dishes against the table. A silence cloth is usually a napped, fairly heavy fabric. Silence cloths are placed beneath tablecloths and are also called Silencers. / Противошумное Полотно – ткань, задерживающая звуковые колебания как внутренние, так и внешние.

SILENCER = БЕСШУМКА – Silencer is another name for Silence Cloth. See also Silence Cloth, and Table Pad.

SILENT CONFIRMATION = МОЛЧАЛИВЫЙ АКЦЕПТ (или МОЛЧАЛИВОЕ ПОДТВЕРЖДЕНИЕ, или ПОДТВЕРЖДЕНИЕ ПО УМОЛЧАНИЮ) – Term Silent Confirmation is used for a bank's commitment to negotiate (i.e. purchase) documents under a letter of credit without recourse at a future date. A silent confirmation is not a confirmation in the true sense, and will not use the word 'confirm', but is rather an equivalent form of protection for the beneficiary. The bank will require that the letter of credit be negotiable or payable by itself in order to be able to establish holder-in-due-course rights equivalent to those of a confirming bank. Expression used in connection with letters of credit. A notifying bank appends its confirmation to a transaction without being instructed to do so by the opening bank. See also Documentary Credit. / , то есть .

SILENT PARTNER = БЕЗМОЛВНЫЙ (или МОЛЧАЛИВЫЙ, или СПЯЩИЙ, или ТЕНЕВОЙ, или БЕЗДЕЙСТВУЮЩИЙ) КОМПАНЬОН (или ПАРТНЁР) – Silent Partner is an individual who invests funds in a partnership but takes no other part in the business, leaving the management to others. Also known as Dormant Partner in the United Kingdom.

SILHOUETTE = СИЛУЭТ – Silhouette:- literally, shadow or outline. Silhouette refers to the shape of a garment. When the silhouette is soft, soft drapeable fabrics are popular.

SILICA GEL = СИЛИКАГЕЛЬ – Cargo DryPak (a product of Interteck Packaging company, the United States) is a specially formulated desiccant product designed to lower the dew point inside shipping and storage containers. By lowering the dew point, Cargo DryPak protects cargo from moisture damage while goods are in transport. Available in two sizes:- (i) 500 gram (30 per box); and (ii) 1 500 gram (10 per box). One box protects one 20' container. Cargo DryPak has many advantages:- ship goods without the threat of 'Container Rain'; inhibits the formation of mold, mildew, rust and corrosion; absorbs up to 100% of its weight in moisture; provides 50 days or more of moisture protection; prevents weak cartons and loose labels caused by moisture; and environmentally safe and can be disposed of as normal waste. Cargo DryPak has many applications:- ocean, truck, rail & air shipping containers; protection of textiles, leather goods, shoes, furniture, food products, grains, feeds, pet food, canned goods and bottled products; protection of industrial products such as auto parts, machinery, metal products, paper and cardboard boxes; and ideal for boats & RV's as well as long term storage applications. The early design of an effective packaging system reduces longterm moisture damage when used in conjunction with Cargo DryPak. Interteck's trained personnel welcome the opportunity to assist customers in developing the correct packaging

solutions. Silica Gel, Manufactured from sodium silicate and sulfuric acid, silica gel is a non hazardous hard porous form amphorus silica. Through its large number of microscopic pores, silica gel can adsorb up to 40% of its weight in moisture and has the highest absorption capacity of any commercially used desiccant. Adsorbent Silica Gel suited to various applications including:- (i) maintenance of dry atmosphere in Electronics, Storage, Packaging, Engineering, Food, Pharmaceuticals, and Leather industries; (ii) protection of export consignments from moisture in salty and humid environment of ocean shipments; (iii) protection of moisture damage to your electronic and communication equipment and components; (iv) drying and storage of flowers, seeds and grains; and (v) other applications where you need to control the moisture levels. Synonyms:- Amorphous Silica, Amorphous Silicon Dioxide, and Synthetic Amorphous Silica. Silica gel is an amorphous form of silicon dioxide, which is synthetically produced in the form of hard irregular granules (having the appearance of crystals) or hard irregular beads. A microporous structure of interlocking cavities gives a very high surface area (800 square meters per gram). It is this structure that makes silica gel a high capacity desiccant (drying agent). Water molecules adhere to the gels surface because it exhibits a lower vapor pressure than the surrounding air. When an equilibrium of equal pressure is reached, no more adsorption occurs. Thus the higher the humidity of the surrounding air, the greater the amount of water that is adsorbed before equilibrium is reached. It is in these higher humidity conditions (above 50% Relative Humidity) that stored or in-transit items are susceptible to damage. The beauty of silica gel is the physical adsorption of water vapor into its internal pores. There is no chemical reaction, no by products or side effects. Even when saturated with water vapor, silica gel still has the appearance of a dry product, its shape unchanged. Silica gel has many other properties that recommend it as a desiccant:- (i) It will adsorb up to one third of its own weight in water vapor. This adsorption efficiency is approximately 35% greater that typical desiccant clays, making silica gel the preferred choice where weight or efficiency are important factors. (ii) It has an almost indefinite shelf life if stored in airtight conditions. (iii) It can be regenerated and reused if required. Gently heating silica gel will drive off the adsorbed moisture and leave it ready for reuse. (iv) It is a very inert material, it will not normally attack or corrode other materials and with the exception of strong alkalis and hydrofluoric acid is itself resistant to attack. (v) It is non-toxic and non-flammable. (vi) It is most frequently and conveniently used packed in a breathable sachet or bag. These are available in a wide range of sizes suitable for use with a wide range of applications. Standard white silica gel is referred to as being non-indicating. As it adsorbs moisture it remains physically unchanged. Non-indicating silica gel is both cheap and effective, available loose in bulk packs or packed in sachets. Self-indicating silica gels are colored gels whose color changes as they adsorb moisture. / продукт компании Интётэк Пэкэдьжин (Interteck Packaging). Щёлочь (Alkali). коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо). гранулы или бисеринки или бусинки или шарики (beads). Под Силикагелем понимается микропористое тело, получаемое прокаливанием геля поликремниевой кислоты. Силикагель состоит из SiO_2. Его применяют для осушки, очистки и разделения хладонов, спиртов, аминокислот, антибиотиков, витаминов и другого, как абсорбент в хроматографии, носитель катализаторов.

SILICONE = СИЛИКОН (или КРЕМНИЙОРГАНИЧЕСКИЙ ПОЛИМЕР) – Silicone is one of a group of polymeric organic silicon compounds obtained as oils, greases, or plastics and applied to textile material as water- and heat-resistant lubricants and finishes. Silicone is a generic name for certain compounds obtained, from silicon, a component of sand. Silicones are used in fabric finishing to impart stain and wrinkle resistance. See also Finishing. / развод (или потёк (stain)). Силиконы, то же что Кремнийорганические Полимеры. Кремнийорганические Полимеры, высокомолекулярные соединения, содержащие атомы кремния, углерода и других элементов в элементарном звене макромолекулы. В зависимости от химического строения основной цепи кремнийорганические полимеры делят на 3 основные группы:- (1) с неорганическими главными цепями макромолекул, которые состоят из чередующихся атомов кремния и других элементов (O, N, S, Al, Ti, B и других); при этом углерод входит лишь в состав групп, обрамляющих главную цепь; (2) с органонеорганическими главными цепями макромолекул, которые состоят из чередующихся атомов кремния и углерода, а иногда и кислорода; (3) с органическими главными цепями макромолекул. Наиболее подробно изучены и широко применяются полиорганосилоксаны, а также полиметаллоорганосилоксаны и полиорганосилазаны. В зависимости от строения главной полимерной цепи кремнийорганические полимеры, подобно другим полимерам, можно разделить на линейные, разветвлённые, циклолинейные (лестничные) и сшитые (в том числе циклосетчатые). Полиорганосилоксаны:- многие особенности механических и физико-химических свойств этих полимеров связаны с высокой гибкостью их макромолекул и относительно малым межмолекулярным взаимодействием. Высокая гибкость силоксановой цепи утрачивается при переходе от линейной структуры к лестничной. Линейные и разветвлённые полиорганосилоксаны с невысокой молярной массой – вязкие бесцветные жидкости. Высокомолекулярные линейные полиорганосилоксаны – эластомеры, а сшитые и разветвлённые – эластичные или хрупкие стеклообразные вещества. Линейные, разветвлённые и лестничные полимеры растворимы в большинстве органических растворителей (плохо – в низших спиртах). Полиорганосилоксаны устойчивы к действию большинства кислот и щёлочей; разрыв силоксановой связи Si–O вызывают лишь концентрированные щёлочи и концентрированная серная кислота. Полиорганосилоксаны характеризуются высокой термостойкостью, обусловленной высокой энергией связи Si–O, а также отличными диэлектрическими характеристиками. Так, сшитый полидиметилфенилсилоксан при 20 °C имеет тангенс угла диэлектрических потерь $(1–2)\cdot10^{-3}$, диэлектрическая проницаемость 3–3.5 (при 800 Гц), удельное объёмное электрическое сопротивление 10^3 ТОм·м (10^{17} Ом·см) и электрическая прочность 70–100 кВ/мм при толщине образца 50 мкм. Механическая прочность полиорганосилоксанов невысока по сравнению с прочностью таких высокополярных полимеров, как, например, полиамиды. Полиорганосилоксаны получают следующими методами:- (1) Гидролитическая Поликонденсация Кремнийорганических Соединений – важнейший промышленный метод синтеза кремнийорганических полимеров. Он основан на том, что многие функциональные группы, связанные с кремнием (алкокси-, ацилокси-, аминогруппы, галогены), легко гидролизуются, например:- $R_2SiC_2 + 2H_2O \rightarrow R_2Si(OH)_2 + 2HCl$. Образующиеся органосиланолы немедленно вступают в поликонденсацию с образованием циклических соединений $nR_2Si(OH)_2 \rightarrow [–SiR_2–O–]_n + H_2O$, которые затем полимеризуются по катионному или анионному механизму. В зависимости от функциональности мономеров образуются полимеры линейной, разветвлённой, лестничной или сшитой структуры. (2) Ионная Полимеризация Циклических Органосилоксанов; применяется для синтеза каучуков с молярной массой ~600 000 и более, а также лестничных и разветвлённых полимеров. (3) Гетерофункциональная Поликонденсация Кремнийорганических Соединений, содержащих различные функциональные группы, например:- $n^{R'}{}_2SiCl_2 + nR_2Si(OCOCH_3)_2 \rightarrow Cl[–SiR_2–O–SiR_2–O–]_nCOCH_3 + CH_3COCl$. (4) Реакция Обменного Разложения, при которой натриевые соли органосиланолов реагируют с органохлорсиланами или с галогенсодержащими солями металлов. Метод нашёл практическое использование для синтеза полиметаллоорганосилоксанов. Полиорганосилоксаны применяют в производстве различных электроизоляционных материалов (смотрите Кремнийорганические Лаки, Полимерные Компаунды), а также теплостойких пластмасс (в частности, стеклопластиков) и кремнийорганических клеёв. Широкое применение в технике находят кремнийорганические каучуки и кремнийорганические жидкости. Полиэлементоорганосилоксаны:- введение атомов металлов в полимерную силоксановую цепь существенно меняет физические и химические свойства полимеров. Полиалюмофенилсилоксан и полититанфенилсилоксан, содержащие 1 атом металла на 3–10 атомов кремния, не размягчаются при нагревании и имеют термомеханические кривые, типичные для сшитых полимеров, но сохраняют растворимость в органических растворителях. При введении пластификаторов (совола, минерального масла) эти полимеры приобретают текучесть при 120–150 °C. Такое своеобразное сочетание свойств

объясняется лестничной структурой макромолекул, обладающих большой жёсткостью и потому имеющих температуру плавления значительно выше температуры разложения. Связь Si–O–Э в полиметаллоорганосилоксанах более полярна, чем связь Si–O–Si, вследствие чего эти полимеры легче разлагаются под действием воды в присутствии кислот, чем полиорганосилоксаны. При уменьшении содержания гетероэлемента в цепи полиэлементоорганосилоксаны приближаются по свойствам к полиорганосилоксанам, но влияние гетероатома на свойства полимера ещё сказывается в том случае, когда на 100–200 атомов кремния приходится 1 гетероатом. Так, полибордиметилсилоксан с элементарным звеном при n = 100–200 не вулканизуется перекисями в условиях, обычных для полидиметилсилоксанов, и сохраняет способность к самосклеиванию. Полибордиметилсилоксаны проявляют способность к упругим деформациям при кратковременном приложении нагрузки с одновременным сохранением пластических свойств при длительном действии нагрузки. При введении в полидиметилсилоксановые цепи титана в сочетании с некоторыми другими элементами, в частности с фосфором, термоокислительная стабильность полимера значительно возрастает. Это явление наблюдается уже при содержании 1 атома Ti на 100–300 атомов Si. Основные методы получения полиэлементоорганосилоксанов – реакция обменного разложения и гетерофункциональная поликонденсация (смотрите выше). Практическое значение имеют:- (1) полибороорганосилоксаны, которые применяют для изготовления клеёв и самосклеивающихся резин; (2) полиалюмоорганосилоксаны – теплостойкие материалы в прецизионном литье металлов, катализаторы полимеризации при получении полиорганосилоксанов, а также плёнкообразующие для приготовления лаков, дающих термостойкие покрытия; (3) полититанорганосилоксаны – термостойкие материалы и герметики. Полиорганосилазаны:- линейные полимеры – вязкие продукты, хорошо растворимые в органических растворителях, полимеры полициклической структуры – твёрдые бесцветные хрупкие вещества, имеющие температуру плавления от 150 до 320 °C. Полиорганосилазаны устойчивы к действию воды в нейтральной и слабощелочной средах, но в кислой среде разлагаются; при нагревании со спиртом подвергаются алкоголизу. Полимеры низкой молярной массы получают аммонолизом алкилхлорсиланов аммиаком или первичными аминами, например:- n $(CH_3)_2SiCl_2$ + (2n–1)NH_3 → $H_2N–Si(CH_3)_2[–NH–Si(CH_3)_2–]_{n–1}NH_2$ + 2NH_4Cl. Эта реакция сопровождается образованием циклических соединений. Полимеры с молярной массой до 5 000 получают ионной полимеризацией органоциклосилазанов. Полиорганосилазаны находят практическое применение как гидрофобизаторы для различных строительных материалов и тканей, а также в качестве отвердителей кремнийорганических полимеров, эпоксидных смол и полимерных компаундов. Полиорганоалкиленсиланы:- эти полимеры обладают довольно высокой термостойкостью, так как полимерная цепь полиорганоалкиленсиланов содержит только связи Si–C и C–C, они отличаются высокой гидролитической устойчивостью и стойкостью к действию щёлочей и кислот. Высокомолекулярные полимеры этого класса получают полимеризацией силациклоалканов в присутствии металлоорганических катализаторов или взаимодействием гидросиланов с дивинилсиланами в присутствии H_2PtCl_6, органических перекисей или третичных аминов. Полиорганоалкиленсиланы пока не нашли практического применения из-за относительно высокой стоимости соответствующих мономеров. Прочие Полимеры:- полиорганосиланы отличаются невысокой химической и термоокислительной стойкостью, так как связь Si–Si при действии щёлочей или окислителей легко разрывается с образованием силанольной группировки Si–OH. Поэтому практическое значение полиорганосиланов является проблематичным. Кремнийорганические Полимеры с органическими главными цепями макромолекул имеют меньшее практическое значение, чем, например, полиорганосилоксаны, так как они не обладают высокой теплостойкостью, присущей последним.

SILIQUE = СТРУЧОК (или БОБ) – Silique is a narrow elongated 2-valved usually many-seeded capsule that is characteristic of the Mustard Family, opens by sutures at either margin, and has two parietal placentas. Origin of Silique:- Latin term Siliqua is a pod or husk, a very small weight or measure; compare French term Silique. See also Legume, and Pod. The Silique is an elongate fruit composed of two carpels separated by a seed-bearing partition. The silicle is very similar except it is much shorter (less than twice as long as broad). Siliques and silicles have parietal placentation. They are the characteristic fruits of the Mustard Family (Brassicaceae). Some members of the Mustard Family have siliques that do not split longitudinally into two separate carpels. For example, fruits of the Radish (Raphanus Sativus) split transversely into seed-bearing sections (joints). The overlapping seeds of Bitter Cress (Cardamine) are connected to alternate edges of the septum within each locule. The minute seeds are attached to both margins of the central septum. This revelation requires the skillful use of a dissecting microscope. In the Jepson Flora of California (1993), this genus keys out under ‘one row of seeds in each locule’, without mentioning the alternating seed attachments along both edges of the septum. Apparently, the superficial appearance of the overlapping seeds in a single file is the defining character for the key. A Species of Bitter Cress (Cardamine) collected along the damp seepage area of a lawn in Northern San Diego County. It is an annual with a fibrous root system (without rhizomes). The leafy stems are erect or ascending (curving upward from the base). The leaves are odd pinnate with 2 or three pairs of leaflets. This Species of Bitter Cress greatly resembles the European annual Cardamine Flexuosa With. Another native Species reported for San Diego County (Cardamine Oligosperma Torrey & A. Gray) has similar compound leaves; however, it has a distinct basal leaf rosette that is lacking in this Species. It is interesting to note that Cardamine Flexuosa With. has now been added to the San Diego Natural History Museum on-line Checklist of Vascular Plants of San Diego County. Silique is a long dry fruit (seed capsule), length more than twice the width, typical to cruciferous Plants and consisting of two fused carpels that separate when ripe. The Pod of Plants of the Crucifer Family, with two valves that fall away from a thin membrane bearing the seeds. Silique is a dehiscent elongated fruit, characteristic of the Mustard Family, having two valves that fall away leaving a central partition as the fruit dries. Silique is an elongated dry dehiscent seed pod that is the characteristic fruit of the Mustard Family. The two sides split off at maturity and leave a central partition to which the seeds are attached. Silique is the long two-valved seed vessel or pod of plants belonging to the Mustard Family. See also Pod. A Silique or Siliqua (plural Siliques or Siliquae) is a type of fruit (seed capsule) having two fused carpels with the length being more than three times the width. When the length is less than three times the width of the dried fruit it is referred to as a Silicle. The outer walls of the ovary (the Valves) usually separate when ripe, leaving a persistent partition (the Replum). This classification includes many members of the Brassicaceae Family, but some Species have a shorter fruit of similar structure, in which case the fruit is called Silicle. Some Species closely related to Plants with true siliques have fruits with a similar structure that do not open when ripe; these are usually called Indehiscent Siliques (compare Dehiscence). / Под Стручком понимается плод Растений, раскрывающийся двумя опадающими створками, после чего остаётся перегородка с семенами. Характерен для Крестоцветных (Горчица, Капуста). Стручок (Siliqua), сухой ложнодвугнёздный паракарпный плод большинства Растений Семейства Крестоцветных, образующийся из двух плодолистиков и обычно вскрывающийся от основания к вершине двумя опадающими створками. На растении остаётся рамка с плацентами и более или менее прозрачной ложной перегородкой. Реже встречаются невскрывающийся стручок (Редька Посевная) и членистый стручок (Редька Дикая). Под Бобом понимается одногнёздный плод Растений Семейства Бобовых, обычно вскрывающийся от вершины к основанию двумя створками. В быту бобом неправильно называют семена Бобовых. Боб, плод Растений Порядка Бобовых; образуется из верхней завязи одним плодолистиком. Чаще всего это сухой плод, раскрывающийся от вершины к основанию двумя створками (Горох, Фасоль, Вика и другие). У некоторых Видов боб – нераскрывающийся (Донник, Клевер). Бобы Арахиса созревают в почве и не растрескиваются. У ‘Цареградских Рожков’ (Ceratonia Siliqua) боб сочный и сладкий. Боб содержит чаще несколько семян, прикреплённых короткими семяножками к брюшному шву. Размер, форма и строение бобов

разнообразны:- у большей части видов они прямые, более или менее плоские (Горох, Фасоль и другие), у других – округлые, согнутые или свёрнутые спиралью (Люцерна Посевная). У некоторых Видов бобы распадаются на односемянные части. У диких Видов Бобовых Растений створки мгновенно скручиваются и разбрасывают семена. В быту бобами называют семена бобовых, а сами бобы называют стручками. Это неправильно, так как стручок имеет другие признаки и характерен для Семейства Крестоцветных. Типы бобов:- (i) раскрывающийся двумя створками (Гороха); (ii) членистый раскрывающийся (Мимозы); (iii) завитой боб (Люцерны); (iv) боб-орешек (Астрагала); (v) двусемянный боб (Арахиса).

SILK = ШЁЛК – Silk is a transparent fiber, composed of two filaments (brins) encased in gum when in natural state, having an even diameter. It is very strong, elastic and hydroscopic. It is the product of cocoons made by the silk worm which feeds on the leeves of the Mulberry tree. The color of the cocoons is white or yellow from the gum secreted by the worm. After the gum is removed by boiling in soap and water the color of the silk will be white or pale cream. The Wild Silk, the worm of which feeds on certain Oak trees in China, India and Japan, is ecru colored even after the gum has been removed. The chrysalides are killed by heat and certain number of cocoons, depending upon the count of thread required, are placed in a basin of hot water, which softens the gum. The broken outside fibers are removed and after the ends are collected they are passed through a guide and wound on a reel, a cocoon yielding from 400 yards to 1 200 yards of silk fiber. The gum will hold the different fibers together as it cools down and dries. This is the raw or reeled silk, its size being expressed by the denier, 233-1/3 deniers of this reeled silk making one ounce avoirdupois and the number of the deniers comprised in a hank or skein (476 meters or 520 yards) expresses the count of the yarn. Different from the reeled silk is the spun silk, made of pierced cocoons and of the waste from the reeled silk. The cocoons or the waste are first degummed, then opened and combed, lapped, put through the drawing and the roving frames and then spun intosingles, then doubled and twisted again, gassed and wound on reels or spools. In numbering spun silk the French system takes as a basis the number of 1 000 meters of singles contained in one kilo (2.2 lb) thus 90 singles has 90 000 meters in a kilo, while number 2-80 has 40 000 kilos. The English system of counting spun silk is the number of hanks (840 yards) contained in one pound avoirdupois, thus number 40 would have 33 600 yards per pound. Before dyeing the silk is degummed by boiling in water and soap, then rinsed in cold water, after which the silk is often weighted with tin salts, iron or other foreign matter. Certain yarns are dyed in the gum, and others, called suples, with only part of the gum removed. The luster of the silk is increased by diluted acids and suffers when treated by diluted alkalies. Silk is rapidly dissolved in zinc chloride, nitric acid, hot solution of caustic soda, chromic acid solution, etc. It has affinity for metallic salts, and tannic acid, the latter being used in ‘weighting’. The action of concentrated acids (after brief treatment only) produces a crêpe effect on silks. Official classification of raw silks in New York is European:- Grand Extra, Extra Classical, Best Classical, Classical, Best No. 1, No. 1, Realina. Japan silks:- (1) Filatures:- Double Extra, Extra, Sinshui Extra, Best No. 1 to Extra, Best No. 1, Hard Nature No. 1, No. 1, No. 1–1½, No. 1½–2, No. 2. (2) Rereels:- Extra, No. 1, No. 1–1½, No. 1½, No. 1½–2, No. 2, No. 2–2½, No. 2½, No. 3. (3) Kakeda:- Best Extra, Extra, No. 1, No. 2, No. 3. The best grade of reeled silk furnishes the organzine, while tram is obtained from inferior silk. Some of the most important qualities of raw silk taken into account in classification are evenness, cleanliness, hardness, color, luster, strength, feel. The loss of weight suffered by the raw silk in the boiling out process differs greatly and is as follows in the average:- Indian tussah 11 per cent, Japanese 18 per cent, North Chinese steam filatures 19 per cent, Chinese tussah 21 per cent, Canton silks 22 per cent, Japan high grade filatures 30 per cent, pale cream Italian 23 per cent, yellow Italian from 25 per cent to 30 per cent, Levantine 22 per cent, Balkan silks 20 per cent to 22 per cent. China is regarded as the home of the mulberry tree and for this reason, of the silk worm and according to Chinese tradition Empress Siling is credited with establishing silk culture and reeling. The oldest Vedic works do not mention silk at all and owing to the care the Chinese guarded the secrets of silk industry it spread into foreign countries only centuries later, although silk fabrics from China were exported all over Asia and Europe. Japan learned the art of silk raising and manufacture only in the III or IV century of our era. A little later the industry became known along the Brahmaputra valley, India, although it was only in 1827 that the first effort was made, by European settlers in India, to establish mulberry silk culture. The art spread westward to Persia, Central Asia, Asia Minor and the Aegean Islands. The first eggs were taken to Constantinople about 550 AD. Under Saracenic influence in Southern Spain, especially Almeria, and in Sicily the silk industry soon developed into very high art. By the XV century Italy is the center in Europe for the finest silks, silk brocades and silk velvets but the industry was begun about 1480 at Tours, France, and silk worm raising about 1520 along the Rhone Valley and by the middle of the XVII century France became the leader. The revocation of the Edict of Nantes in 1685 scattered a large number of French silk weavers over various foreign countries, many of them settling at Spitalfields, near London, where they established the greatest English silk manufacturing center. The industry there was still further stimulated by the introduction of silk throwing by Lombe, who learned it in Italy. In the New World, not counting the uneffective effort of Cortez about 1522 to introduce silk culture in Mexico, the history of silk begins at 1607 when King James I instructed the Earl of Southampton to urge the cultivation of Silk Worms in the Colony of Virginia in preference to tobacco, whereupon in 1623 the colonists were directed by the Colonial Assembly to plant mulberry trees. In 1656 silk culture in Virginia is mentioned as the most profitable commodity of the country and because of this success all penalties and rewards connected with the silk culture were removed in 1666. Shortly after 1732 silk culture is started in Georgia, the first shipment of 8 pounds sent from Savannah, having been made into a grown for the Queen. The first public silk filature was erected in 1751 in Georgia, and by 1759 the yearly export was about ’10 000 weight’ of raw silk, selling from 2 to 3 shillings higher a pound than silk from any other country. In 1755 a quantity of excellent raw silk raised in the vicinity of Charleston, SC, was sent to England. Silk culture began about 1771 in New Jersey and Pennsylvania, but ended with the Revolutionary War. In 1760 Nathaniel Aspinwall began to raise silk worms in Connecticut. In 1838 a curious speculation broke out especially in Pennsylvania and New Jersey with South Sea Islands mulberry trees, the boom collapsing the following year. By 1840 silk manufacture was well established in Paterson, NJ. About 1814 Samuel Chidsey began the manufacture of sewing silk by machinery in Cayuga County, NY. (1924). Silk is the product of the Silkworm. The cocoon thread is of indefinite length but exceedingly fine and lustrous. Continuous protein filament produced by the larvae of various Insects, especially the caterpillar when constructing its cocoon. The chief portion of commercial silk is produced in Japan and China. Characteristics:- resiliency, aesthetics, elasticity and strength, warm in winter, cool in summer. See also Reeled Silk and Doupioni. The fine, strong, lustrous filament produced by various insect larvae, generally to form their cocoon or nest. The filaments obtained from the larvae of certain moths (Тутовая Пяденица – бабочка Семейства Пядениц), raised for commercial purposes, will range from about 300 yards to about 1 600 yards. The middle third of the filament is even in diameter, while the beginning and end are rather uneven and often split and coarse. Caterpillars of the genus Bombyx and allied Bombycidea family spin the cocoons from which is reeled most of the silk that forms the basis of the commercial yarn. The domesticated member of this is the Bombyx Mori or common silkworm, a native of China. It feeds on mulberry leaves and their juices. The undomesticated Silkworms belong to the Yama-Mai or other Species and develop what is known as Tussah or Wild Silk. They are inferior in all respects to true silk and they feed on partically any type of leaf with which they come in contact. The word Silk is of Chinese origin, and for centuries has been linked with China. The very early name for China was Seres; sericulture is the raising of silkworms for market. Silk is a natural filament (fiber of indefinite length) that man with all his ingenuity has never really been able to duplicate for beauty of fabrics, fineness and texture. Silk is truly ‘The Cloth of Milady, the Queen of Fabrics’. It is one of the strongest, most lustrous, and most expensive of textile fibers with the exception of vicuna, the specialty hair from South America. The raw silk thread of commerce, which may be said to be the backbone of China and Japan, is made from five to ten cocoons (ten to twenty filaments). Each cocoon emits two filaments when spinning the cocoon. These are known as Fibroin. A single filament is known

as a Brins. The fibroin is cemented together, as it comes from the silkworm and emerges in the air, by what is known as Sericin or Silk Gum. The brins, fibroin, and sericin combined are known as the Bave. Silk is a natural filament fiber produced by the Silkworm in the construction of its cocoon. Most silk is collected from cultivated worms; Tussah silk, or wild silk, is a thicker, shorter fiber produced by worms in their natural habitat. All silk comes from Asia, primarily China. Silk Fiber is a fine, strong, continuous filament produced by the larva of certain Insects, especially the Silkworm, when constructing its cocoons. The Silkworm secretes the silk as a viscous fluid from two large glands in the lateral part of the body. The fluid is extruded through a common spinneret to form a double filament cemented together. This double silk filament, which is composed of the protein fibroin, ranges in size from 1.75 to 4.0 denier, depending upon the species of worm and the country of origin. The filament of the cocoon is softened and loosened by immersion in warm water and is then reeled off. Although raw silk contains 20 to 30% of sericin, or silk glue, and is harsh and stiff, silk is soft and white when all of the glue has been removed by steeping and boiling in soap baths. Ecru is harsher, as it has only about 5% of the sericin removed. Silk is noted for its strength, resiliency, and elasticity. The major sources of commercial silk are Japan and China. Silk is a natural protein fiber, some forms of which can be woven into textiles. Silk is smooth, glossy and beautiful. It is also strong and vulnerable to fading and stains. Silk Manufacturing Process:- silk is a natural protein fiber produced by certain caterpillars in order to encase themselves in the form of cocoons. The making of silk is different from that of other natural fibers. There are many steps involved in silk manufacturing:- (i) Cultivation of Cocoons (Sericulture); (ii) Filature Operations; (iii) Manufacturing of Silk Yarns; and (iv) Finishing of Silk Fabrics. Sericulture:- Sericulture is the cultivation of cocoons for their filaments. The best raw silk is obtained from the species of moth called Bombyx mori. Breeding of silkworm occurs once in a year but under scientific conditions, they may be hatched three times a year. The female moth lays around 350 to 400 eggs and the moths die soon after. As they are subject to hereditary infection, the eggs from infected moths are destroyed which results into production of fine silk. Larvae of about 3 mm are hatched from the eggs. For about 20 to 30 days, they are carefully nurtured and are fed five times a day on chopped mulberry leaves. In the meantime, the larvae change their skin for four times and are formed into caterpillar of about 9 cm long. Now they are ready to spin cocoon for which racks, clusters of twigs or straw are provided. The caterpillar have small openings under their jaws called spinnerets through which they secret a protein like substance. This substance solidifies when it comes in contact with air and the filament thus formed is spun around the silkworm in the figure resembling the digit 8. In three days the cocoon gets completed which is about a peanut shell's size. The filament is held together by sericin or silk gum. The life of the worm is ended by the process of 'stoving' or 'stifling' in which the cocoons are heated. Some of the cocoons are preserved so that the pupa or chrysalis inside them develop into moths for further breeding. Filature Operations:- the raw silk is unwound from cocoons and are collected into skeins in the factories known as Filature. Here the cocoons are sorted based on their color, size, shape and texture. Then they are immersed in hot and cold water to soften the sericin so that filament could be unwound into one continuous thread. The whole of the seracin is not removed at this stage as it protects the delicate filament in further operations. 'Reeling' is the process of unwinding the filament from the cocoon. Three to ten filaments are together reeled for producing the desired diameter of raw silk thread. Manufacturing of Silk Yarns:- the reeled silk is formed into silk yarn or silk thread through the process called 'Throwing'. It corresponds the spinning process of other natural fibers. The raw silk skeins are sorted according to their color, size, length or quantity and washed in warm water with soap or oil for softening the seracin. After drying the skeins, they are placed on reels from where the silk is wound on bobbins. During winding, the silk strands are given desired amount of twist. The strands may be doubled and then given twist in similar or opposite directions. To get equal diameter throughout the length, the yarn is run through rollers. Many kinds of silk yarns are manufactured by giving different amount of twists. Still remaining sericin is removed from silk yarn by the process of 'Degumming' in which the yarn is washed with soap and water for bringing out its natural shine and the soft feel. Kinds of Silk Yarns:- (i) Thrown Singles:- three to eight silk filaments are twisted together in only one direction to make 'Singles'; (ii) Tram:- a slight twist is given to two to four untwisted singles. Trams are used exclusively as filling yarns. (iii) Crêpe:- individual raw silk filaments are twisted together, one in S direction and the other in opposite Z direction. They are then twisted around each other in S direction. (iv) Organzine:- two or more singles having twist in Z direction are combined by twisting them around each other in the opposite S direction. Organzine is mainly used for warp yarns. Finishing of Silk Fabrics:- many finishing processes are applied to different silk fabrics in order to improve their appearance, durability and feel. Calendering and Cireing is done to enhance luster, singeing is done to make them smooth, and steaming is done for raising pile weaves. Pressing and lustering removes wrinkles from the finished fabric. It is done with heated rollers and then soaking in dilute acid to bring luster. One finish that is unique to silk fabric is 'Weighting'. The weight of silk is lost during the process of demugging. The manufacturer purchases silk by weight and to make up his loss, he does weighting of silk fabric with metallic substances such as stannic chloride, sodium phosphate, iron salt, logwood etc. Weighting is done during the dyeing process. Weighted silk is less compactly woven when compared to the unweighted silk and lesser silk is used in the fabric construction. Apart from lowering the cost of silk, weighting gives it crispness, luster and a firm feel. Silk is a garment made of silk; a distinctive gown worn by a King's or Queen's Counsel; (plural) the colored cap and blouse of a jockey or harness horse driver made in the registered racing color of the employing stable. Thread, yarn, or fabric made from silk filaments. Silk is a filament fiber produced in nature as a protein by Bombyx mori, the mulberry silk moth. Mulberry Morus spp. is a perennial cultivated mainly for foliage production, but it is also the only source of nutrition for the mulberry silkworm. According to the International Sericulture Commission, four types of natural silks are commercially produced in the world. Among them mulberry silk is the most important and accounts for as much as 90% of world production. Thus the term 'Silk' generally refers to the silk of the Mulberry Silkworm. It is reported that 60% of the cost of cocoon production goes into the cultivation of the Mulberry leaf. Silk quality also depends on the quality of the Mulberry leaves and on Silkworm seed production. Mulberry is grown in the fields as an agricultural crop. The leaves are harvested and brought to the Silkworm rearing facilities where they are fed to the Silkworms in separately erected platforms or trays. After a gestation period of about four weeks, the mature worms are gathered and transferred into the montages for spinning the cocoons. The spinning process will be completed within three days and the cocoons can be harvested for marketing after five days. About 70–75% of world silk in produced in China, about 15% in India and the rest in some 15 other countries around the world. Silk is the product of the Silk Worm and the only natural filament fiber (it is produced in a long thread). Silk was the leading luxury fiber for thousands of years. There were many types of Silk and many ways of making it into cloth. Today, man-made fibers have to a very large extent replaced Silk, but the traditional names for certain Silk fabrics are still used. Silk:- The Animal:- Silk is produced by the Silkworm (Bombyx Mori). Fed on Mulberry leaves, it produces liquid Silk that hardens into filaments to form its cocoon. The larva is then killed, and heat is used to soften the hardened filaments so they can be unwound. Single filaments are combined with a slight twist into one strand, a process known as Filature or Silk Reeling. The Fiber:- A Silk filament is a continuous thread of great tensile strength measuring from 500 to 1 500 meters in length, with a diameter of 10–13 microns. In woven Silk, the fiber's triangular structure acts as a prism that refracts light, giving Silk cloth its highly prized 'natural shimmer'. It has good absorbency, low conductivity and dyes easily. Silk:- Developed in ancient China, where its use was reserved for royalty, silk remains the 'queen of fabrics'. Uses Of Silk:- Silk's natural beauty and other properties – such as comfort in warm weather and warmth during colder months – have made it sought after for use in high-fashion clothes, lingerie and underwear. It is used in sewing thread for high quality articles, particularly Silk apparel, and in a range of household textiles, including upholstery, wall coverings and rugs and carpets. It is also being used as surgical sutures – Silk does not cause inflammatory reactions and is absorbed or degraded after wounds heal. Other promising medical uses are as biodegradable microtubes for repair of blood vessels, and as moulded inserts for bone, cartilege and teeth reconstruction. Producers:-

Silk is produced in more than 20 countries. While the major producers are in Asia, sericulture industries have been established in Brazil, Bulgaria, Egypt and Madagascar. Sericulture is labor-intensive. About 1 million workers are employed in the Silk sector in China. Sericulture provides income for 700 000 households in India, and 20 000 weaving families in Thailand. Production And Trade:- Global Silk production rose from around 100 000 tons in 2000 to 150 000 tons in 2006, thanks mainly to growth of China's output. China produces about 70% of the world's Silk, followed by Brazil, India, Thailand and Viet Nam, with minor production in Turkmenistan and Uzbekistan. India, Italy and Japan are the main importers of raw Silk for processing. The unit price for raw Silk is around twenty times that of raw Cotton. Market Pressures On An Ancient Art:- In India, economic recession threatens the livelihoods of hundreds of thousands of handloom weavers, who make 90% of Indian Silk products. Silk has a long history in India, where it is considered a symbol of royalty and prestige, a 'pure fabric' used for all religious, ritual and ceremonial occasions. The first Indian Silk, spun as early as 1725 BC, was produced not by the domesticated Bombyx Mori (Silkworm), fed on Mulberry leaves, but from the cocoons of indigenous Tussah, Eri and Muga moths. Today, India is the world's second largest producer of Silk, the largest consumer of Silk and Silk products, and the largest importer of raw Mulberry Silk. However, domestic silk textile producers are facing intense competition from China, and India's share in global trade in Silk has been declining. The ongoing global economic recession has taken a further toll on the industry, with orders of Silk goods from Europe and the USA reportedly down by almost 50% in 2008. Age-Old Designs:- The downturn affects hundreds of thousands of handloom Silk weavers across the country. An estimated 90% of India's Silk products are made on handlooms, using age-old designs and styles distinctive to different geographical locations. Among them are Pochampalli Silk saris, produced in the village of Pochampalli and surrounding areas in the Nalgonda district of Andhra Pradesh, where weavers are participating in a project aimed at modernizing production practices and strengthening their links to markets. The 10 000 weavers in Nalgonda district are famous for their tie-and-dye designs, which are hand woven using a technique called Ikat. Their main products are Silk and Cotton saris, Cotton bed sheets, dress material, furnishings and body wraps. After showing steady growth for more than half a century, the local handloom weaving industry entered a crisis early this decade. Unable to compete in an increasingly free market following China's admission to the World Trade Organisation, a large number of weavers lost their livelihoods. As part of the project with Oxfam India, the Non-Governmental Organization Chetana Society identified key factors that were impeding market access for Pochampalli weavers. First, there was a 'design gap' – the weavers were producing fabrics with obsolete designs and with no reference to seasonal fashion forecasts. They also had little contact with the Ministry of Textiles' Weavers Services Centres, which help transfer technological advances to the handloom sector, or with India's National Institute of Fashion Technology. There was little sharing of market information or bulk purchasing of inputs. Pochampalli's handloom technology was outdated and labor-intensive, making it difficult to maintain uniform quality, which led to overpriced fabrics and low productivity. The low level of value addition meant that most weavers earned subsistence wages. In addition, weavers were completely dependent on intermediaries called Master Weavers, who stifled entrepreneurship and discouraged young people from joining the weaving profession. Product Development:- Through the project, the Pochampalli weavers have been organized into groups and cooperatives for training courses that upgrade their skills in design, dyeing, pre-loom, post-loom and quality processes, and have been linked to the government Weavers Services Centres. A company – Chenetha Colour Weaves – has been established with Oxfam assistance to support product development and to market the Silk and Cotton products of some 280 weaving families. The company says its strategy has broken the 'stranglehold' of Master Weavers on the industry, and allowed the emergence of local leaders, 50% them women. A crucial component of the project is 'advocacy for change', which enhances the market for handloom products by raising consumer awareness and presses for Government policies that promote the handloom sector. To revive India's silk industry, the Ministry of Textiles' Central Silk Board has increased technology cooperation with Japan, plans to raise raw silk production from the current 18 000 tons to 26 000 tons by the end of 2012, and has launched a 'Silk Mark' as a quality assurance label for pure Indian Silk products. India's Other Silks:- India produces all five commercial types of Silk – not only that from Mulberry Silkworms, but four other types extracted from silkmoth cocoons often collected in the wild:- (ii) Tussah:- produced by the Moth Antheraea Mylitta, is extracted from the cocoon after the moth has left; (iii) Oak Tussah:- produced by the Moth Antheraea Pernyi originally from Southern China; (iii) Eri:- produced by the Moth Philosamia Ricini in Northeast India; and (v) Muga:- produced in Assam by the Moth Antheraea Assama, has a shimmering golden color. / как уточные пряжи. Компания Чэнэсэ Кала Вивз (Chenetha Colour Weaves). Щёлочь (Alkali). Сродство (Affinity). каустическая сода или едкий натр (caustic soda). твёрдость (hardness). Дубильная Кислота или Дигалловая Кислота (Tannic Acid). Дьжеймз (James). Виды (Species). и намотанное на мотовило (reel). грена – кладка яиц тутового шёлкопряда, гренаж . Гусеницы завивают шёлковичные коконы. Под Шёлком, от древнескандинавского слова Silki, понимается натуральная текстильная нить животного происхождения – продукт выделения шёлкоотделительных желёз гусениц Шёлкопрядов при завивке Коконов. Промышленное значение в основном имеет шёлк Тутового Шёлкопряда, разводимого в шёлководческих хозяйствах. Гусеницы выделяют шёлк в виде 2 элементарных нитей (Шёлковин), состоящих из белкового вещества – фиброина (по массе 70–80%), окружённого другим белковым веществом – серицином (20–30%), который их склеивает в так называемую Коконную Нить. В нитях, кроме фиброина и серицина, присутствуют воски и жиры (1–1.5%), а также минеральные вещества – соли калия, натрия, кальция и так далее (1–1.5%). Из коконной нити гусеница формирует плотную шёлковую оболочку – Кокон, который является сырьём для получения шёлка. Шёлк отличается тониной, большой гигроскопичностью, лёгкой накрашиваемостью, приятным умеренным блеском. Он обладает хорошими механическими свойствами:- разрывное напряжение – порядка 40 кгс/мм^2 (1 кгс/мм^2 = 107 Н/м^2); разрывное удлинение 14–18%. Во влажном состоянии первое падает на 10%, второе на столько же растёт. Шёлк малоустойчив к действию щёлочей (в 5%-ном растворе NaOH быстро разрушается); более устойчив к действию минеральных кислот. В обычных органических растворителях не растворяется. К действию света устойчивость шёлка невелика. Уже за 200 часов (ч) инсоляции теряет половину прочности. При размотке коконов (кокономотании) получают непрерывную шёлковую нить длиной до 1 200 метров (м). Однако коконные нити, получаемые размоткой одиночных коконов, слишком тонки и поэтому в промышленности не применяются. Технической нитью являются нити шёлка-сырца. Неразматываемые коконы (бракованные, оставшиеся после выхода бабочки), а также отходы всех процессов шёлкового производства разрываются на короткие участки; эти волокна перерабатываются в шёлкопрядении. Получение шёлка связано с большими трудовыми затратами, что делает его одним из наиболее дорогих текстильных материалов. Поэтому при выработке ряда тканей (в особенности подкладочных и технических), чулок и так далее шёлк вытеснен различными химическими волокнами. Мировое производство шёлка (1976) 49 тысяч тонн (т), из которых около 10% вырабатывалось в бывшем Союзе Советских Социалистических Республик (СССР). Шёлк-Сырец – нити, получаемые при размотке коконов, – употребляется непосредственно или после скручивания главным образом для выработки тканей – платьевых, бельевых, технических и других. Расщипыванием шёлковых отходов получают шёлковые волокна, перерабатываемые в пряжу; из неё изготовляют полотна, ворсовые ткани. Шёлк-сырец – техническая нить. Тутовая Пяденица, бабочка Семейства Пядениц; Вредитель Шелковицы и плодовых культур в районах выращивания Шелковицы. Крылья у самцов серые, у самок недоразвиты. Питаются (гусеницы) почками и листьями. Тутоводство, отрасль растениеводства, выращивание Шелковицы (Тутового дерева). Развивается в сочетании с шёлководством. Урожайность листа Шелковицы при высокой агротехнике 9–10 тонн с 1 гектара (га) кустовых плантаций и 10–15 килограмм с 1 взрослого растения. Тутовый Шёлкопряд или Шёлковичный Червь, одомашненное Насекомое Отряда Чешуекрылых Семейства Настоящих Шёлкопрядов. Гусеницы завивают шёлковичные коконы.

Шёлкопряды, общее название ряда Семейств Бабочек (Берёзовые Шёлкопряды, Настоящие Шёлкопряды, Походные Шёлкопряды и другие), гусеницы которых изготавливают для окукливания кокон из выделяемой ими шёлковины. Шёлкопрядами называют также Бабочек из Семейства Волнянок (например, Непарный Шёлкопряд), Коконопрядов (например, Сосновый Шёлкопряд), Павлиноглазок (например, Китайские и Японские Дубовые Шёлкопряды). Шёлководство, отрасль сельского хозяйства; разведение Шёлкопрядов с целью получения шёлковичных коконов – сырья для изготовления натурального шёлка. Шелководство известно в Китае с третьего тысячелетия до Нашей Эры. Развито в Бразилии, Индии, Италии, Китае, Турции, Японии, в бывшем СССР и других странах. Шелковица или Тутовое Дерево, Род Деревьев Семейства Тутовых. Несколько Видов (по другим данным свыше 20), в Восточной и Юго-Восточной Азии, Америке, Африке. На территории бывшего СССР 1 дикорастущий Вид и 2 в культуре. Некоторые Виды Шёлковицы культивируют ради съедобных плодов (тутовая ягода). Листья Шёлковицы служат основным кормом Тутового Шёлкопряда. Древесину используют в бочарном производстве. Шёлковица или Тут или Тута или Тутовое Дерево (Morus) – Род Деревьев Семейства Тутовых (Moraceae). Высота 16–35 метров (м), крона шарообразная, широкояйцевидная, очень плотная. Кора бурая, трещиноватая. Листья с рано опадающими прилистниками, яйцевидные, по краю лопастные или городчатые, голые или опушённые. Растения обычно двудомные, реже однодомные. Цветки раздельнополые, собраны в серёжковидные соцветия. Плод – ложная сложная сочная костянка, так называемая Тутовая Ягода, длиной от 1 до 5 сантиметра (см), белая, розовая, тёмно-фиолетовая, почти чёрная. Около 24 видов, в Восточной и Юго-Восточной Азии, и на Юге Европы, в южной части Северной Америки и Северо-Западной части Южной Америки, частично в Африке; в бывшем СССР – 4 Вида на Юге Европейской части и в Средней Азии. Выращивают Шёлковицу ради получения листьев для выкормки Шёлковичного Червя, а также плодов. Плоды сладкие или кисло-сладкие (10% сахара и более), используют в пищу в свежем и сушёном виде, а также для приготовления вин. Древесина Шёлковицы плотная, упругая, тяжёлая, применяется как строительный и поделочный материал в столярном и бондарном производствах. Для выкормки Тутового Шёлкопряда в бывшем СССР культивировали Шёлковицу Белую (Morus alba), Шёлковицу Шёлкопрядную (Morus bombycus), Шёлковицу Многостебельчатую (Morus multicaulus), а для получения плодов также Шёлковицу Чёрную (Morus nigra). В бывшем СССР в кормовых насаждениях использовали местные формы Шёлковицы – Хасак-Тут, Кайчи-Тут, Джир-Тут, а также новые высокоурожайные сорта – САНИИШ-5, САНИИШ-6, САНИИШ-7, САНИИШ-14, САНИИШ-15 и САНИИШ-17, Таджикскую Бессемянную, Иртышар, Узбекскую, Пионерскую, Иверия, Тбилисури, Украинскую-9 и Украинскую-107 и другие. Значительная часть кормовых насаждений была заложена улучшенными гибридными сортами. Для весенней выкормки Тутового Шёлкопряда с Шёлковицы ежегодно срезают годовалые ветки, а для летне-осенней – верхнюю треть вновь выросших побегов. Через каждые 4–5 лет Шёлковице предоставляют год отдыха. Шёлковица засухоустойчива, относительно малотребовательна к почвам, солеустойчива, не выносит заболачивания. Размножают Шёлковицу семенами, черенками и отводками. Наиболее распространённые заболевания Шёлковицы:- бактериоз, цилиндроспориоз, мучнистая роса, корневая гниль, курчавая мелколистность; вредители:- Тутовая Пяденица, Червец Комстока, Медведка, Хрущи, Проволочник, Тутовый Усач, Паутинный Клещик. Шёлк, натуральная текстильная комплексная нить животного происхождения; продукт выделения желез гусениц шелкопрядов. Состоит из двух элементарных нитей из белкового вещества фиброина, склеенных между собой белковым веществом серицином. При совместной размотке нескольких коконов получают шёлк-сырец, из которого кручением вырабатывают кручёный шёлк, используемый в трикотажном производстве для получения швейных ниток. Отходы перерабатываются в пряжу, из которой изготовляют крепдешин, парашютное полотно и так далее. Кручёный шёлк применяется для выработки тканей, трикотажа, для технических целей и прочего, небольшая часть – непосредственно в виде ниток; шёлковая пряжа используется в основном для изготовления тканей. Кокономотание – получение шёлка-сырца путём одновременной размотки нескольких (3–10) коконов ввиду недостаточной прочности одной коконной нити. Для размотки применяют кокономотальные аппараты. Волокно Натурального Шёлка является единственным природным волокном неклеточного строения. Шёлк является продуктом жизнедеятельности Насекомого Тутового или Дубового Шёлкопряда. Через специальные железы, выполняющие роль фильеры, червь выпускает две бесконечные шёлковые нити (белок фиброин), покрытые снаружи и скреплённые шёлковым клеем (белок серицин). В организме насекомого фиброин и серицин находятся в жидком состоянии. Пройдя через железы, белки отверждаются и служат материалом для кокона. Активность гусеницы как прядильщицы продолжается 24–72 часа, затем гусеница превращается в куколку, а далее в бабочку. Человек использует коконы для производства натурального шёлка. Для этого куколки подвергаются специальной тепловой обработке, облегчающей размотку кокона. После размотки получают шёлк-сырец (75% фиброина и 25% серицина), который проходит все стадии механической переработки – кручение, прядение, ткачество. На стадии отделки серицин удаляют, и готовые текстильные материалы содержат только фиброин. По своим химическим свойствам шёлк мало отличается от шерсти. Фиброин проявляет амфотерные свойства. Он также прекрасно впитывает влагу, интенсивно набухает в воде, теряет прочность при кипячении, более устойчив к действию кислоты и менее – к щёлочи. Имея более плотную структуру и не имея дисульфидных связей, фиброин более, чем кератин, устойчив к действию окислителей. Вместе с тем шёлк – одно из самых нестойких к свету волокон. Шёлк, в отличие от шерсти, не разрушается восстановителями, так как у него нет дисульфидных связей и более термически устойчив:- термодеструкция наступает при температуре 240–280 °C. Шёлк – натуральное волокно, получаемое из кокона Тутового Шёлкопряда, сырье для изготовления пряжи для ткачества. Длина нити одного кокона – приблизительно 2 тысячи метров. По мнению Конфуция, шёлководство появилось в Китае в III тысячелетии до Нашей Эры и до VI века секрет его сохранялся в тайне. В Европу шёлк поступал в виде готовых тканей, в античном мире стал известен при Александре Великом, захватившем шёлковые знамена в войне с Персами. Известно много сортов шёлка:- Ливанский биротин, Китайский пеламс, тонкий Французский гласе, Индийский матабис, штоф, муслин, газ и так далее. Свойства и внешний вид шёлковой ткани определяются качеством сырья, видом переплетения, способом обработки.

SILKALINE = СИЛКЭЛИН (или XX) – Silkaline is a soft light cotton fabric with a smooth lustrous finish like that of silk. / ткань лощёной отделки, имитирующая шёлковую.

SILK BROADCLOTH = ШЁЛКОВОЕ ШИРОКОЕ ПОЛОТНО – Silk Broadcloth is a soft spun-silk fabric in plain weave, used for shirts, blouses, and sports dresses.

SILK CULTURE = ШЁЛКОВАЯ КУЛЬТУРА (или РАЗВЕДЕНИЕ ШЁЛКА, или ШЁЛКОВОДСТВО) – Silk Culture is the care of the worm that produces silk fiber, from the egg to the moth. / Шёлководство – отрасль сельского хозяйства; разведение Шёлкопрядов для получения шёлковичных коконов – сырья для изготовления натурального шёлка. В бывшем Союзе Советских Социалистических Республик (СССР) разводили одомашненного Тутового Шёлкопряда, в других странах используют также коконы некоторых диких Шёлкопрядов (Дубового, Айлантового, Клещевинного и других). Разведением Тутового Шёлкопряда для получения шёлка начали заниматься в Китае около 5 тысяч лет назад. На территории бывшего СССР шёлководство возникло в районах Средней Азии и Закавказья в V–VII веках. В России выкормки Шёлковичных Червей (обычно небольшие – 10–15 г грены) были сосредоточены в основном в крестьянских хозяйствах. В бывшем СССР впервые в истории мирового шёлководства были созданы крупные специализированные шёлководческие совхозы. Построены государственные гренажные заводы, базы первичной обработки коконов, шёлкомотальные фабрики; организованы государственные и колхозные тутовые

питомники; создана единая государственная система селекционно-племенной работы, заготовок и первичной обработки коконов. Советскими учёными были выведены высокопродуктивные белококонные породы и гибриды Шёлкопряда, высокоурожайные сорта Шёлковицы и разработаны более эффективные приёмы её агротехники. Всё это обеспечивало получение средней урожайности 56–57 килограммов (кг) коконов с 1 коробки грены, содержащей 29 г яиц. Производство коконов в 1965 составило 34.8 тысяч тонн (т), в 1976 – 45.0 тысяч т; шёлка-сырца 2.6 и 3.4 тысяч т. Производственные процессы в шёлководстве:- выращивание Шёлковицы, являющейся единственным кормовым растением для гусениц Тутового Шёлкопряда; производство грены; инкубация грены – оживление яичек Шёлкопряда; выкормка гусениц; первичная обработка коконов – морка и сушка. Инкубацию проводят в инкубаториях, рассчитанных на 150–200 коробок грены, и приурочивают к появлению на Шёлковице первых 5–6 листьев. Для выкормки оставляют наиболее жизнеспособных гусениц, полученных в течение первых 3 суток (сут) массового выхода. Выкормку проводят в специальных помещениях – червоводнях, где поддерживают температуру и влажность, рекомендуемые для гусениц разного возраста. Гусениц первых трёх возрастов выкармливают резаными листьями и молодыми побегами. Для получения 1 кг коконов расходуют 17–18 кг листа, в передовых хозяйствах – 11–12 кг. В период ‘сна’ и линьки кормление прекращают, температуру несколько повышают. Продолжительность выкормки около 35 сут; передовые хозяйства проводят выкормку в течение 22–25 сут. Основную часть коконов получают от весенней выкормки; в некоторых хозяйствах Украины, Молдавии и Северного Кавказа проводят повторные выкормки, используя грену наиболее выносливых пород и гибридов Шёлкопряда и подготавливая насаждения Шёлковицы для получения молодого листа в летне-осенний период. Селекция в шёлководстве направлена на выведение новых высокопродуктивных пород. Достижение в селекции Тутового Шёлкопряда – выведение генетическими методами пород, при скрещивании которых самки откладывают жизнеспособные яйца только мужского пола, дающие более Шёлконосные коконы. Благодаря этому исключается трудоёмкая операция по отбраковке яиц женского пола. Большую роль в развитии селекции шёлководства сыграли работы Б.Л. Астаурова по регуляции пола и получению полиплоидных линий Тутового Шёлкопряда, внедрению промышленной гибридизации, использованию биологического действия тепловых шоков для прижизненного обеззараживания грены, заражённой возбудителем нозематоза. Селекционную работу по шёлководству вели Среднеазиатский Научно-Исследовательский Институт Шёлководства (Ташкент, Узбекистан), Азербайджанский Научно-Исследовательский Институт Шёлководства (Кировабад), Грузинский Сельскохозяйственный Институт, некоторые институты Академии Наук (АН) бывшего СССР и Союзных республик, опытные станции. Размножением пород Шёлкопряда, улучшением их хозяйственных качеств занимаются племенные Шёлководческие станции или соответствующие цеха гренажных заводов. Мировое производство коконов Шёлкопрядов в 1938 – 438.7 тысяч т, в 1974 – 270 тысяч т. Основные их производители:- Япония (в 1974 – 106 тысяч т). Китай (90 тысяч т), Индия (30 тысяч т); развито шёлководство также в Корее, в странах Индокитая и Южной Европы, в Бразилии.

SILK DYEING = КРАШЕНИЕ ШЁЛКА – Silk Dyeing:- silk is dyed with the same dyes as wool, excluding 1:1 metal complex dyes. In addition, direct dyes can be used. The dyeing pH is slightly higher than with wool. For reactive dyeing 20–60 g/l of salt and 2–5 g/l of soda ash is needed for fixation. For more a detailed description, reference is made to the Wool Dyeing.

SILK FABRIC = ШЁЛКОВАЯ ТКАНЬ – Silk Fabric was first developed in ancient China, with some of the earliest examples found as early as 3500 BC. Legend gives credit for developing silk to a Chinese empress, Leizu (Hsi-Ling-Shih, Lei-Tzu). Silks were originally reserved for the Emperors of China for their own use and gifts to others, but spread gradually through Chinese culture and trade both geographically and socially, and then to many regions of Asia. Silk rapidly became a popular luxury fabric in the many areas accessible to Chinese merchants because of its texture and lustre. Silk was in great demand, and became a staple of pre-industrial international trade. In July 2007, archeologists discovered intricately woven and dyed silk textiles in a tomb in Jiangxi province, dated to the Eastern Zhou Dynasty roughly 2 500 years ago. Although historians have suspected a long history of a formative textile industry in ancient China, this find of silk textiles employing ‘complicated techniques’ of weaving and dyeing provides direct evidence for silks dating before the Mawangdui-discovery and other silks dating to the Han Dynasty (202 BC – 220 AD). The first evidence of the silk trade is the finding of silk in the hair of an Egyptian mummy of the 21st dynasty, c.1070 BC. The silk trade reached as far as the Indian subcontinent, the Middle East, Europe, and North Africa. This trade was so extensive that the major set of trade routes between Europe and Asia came to be known as the Silk Road. The Emperors of China strove to keep knowledge of sericulture secret to maintain the Chinese monopoly. Nonetheless sericulture reached Korea around 200 BC, about the first half of the I century AD had reached ancient Khotan, and by AD 140 the practice had been established in India. In the ancient era, silk from China was the most lucrative and sought-after luxury item traded across the Eurasian continent, and many civilizations, such as the ancient Persians, benefited economically from trade. Fabrics that are often made from silk include charmeuse, habutai, chiffon, taffeta, crêpe de chine, dupioni, noil, shantung, tussah, and shantung, among others. / Шёлковая Ткань – текстильная ткань из натурального шёлка или химических волокон. Изготовление шёлковых тканей из натурального шёлка возникло в Китае около 5 тысяч лет назад. В странах Средиземноморья производство шёлковых тканей получило распространение только после 555, когда в Константинополь впервые доставили из Китая грену Тутового Шёлкопряда. В средние века шёлковое дело становится одной из главных отраслей промышленности в Венеции (XIII век), Генуе и Флоренции (XIV век), Милане (XV век) и так далее. В XVIII веке в Западной Европе, особенно в Италии и Франции, имеется уже развитая шёлковая промышленность. В России производство шёлковых тканей возникло при Петре I. К 1762 число шёлкоткацких фабрик достигло 44. Однако производство шёлковых тканей развивалось в отрыве от сырьевой базы (80% потребляемого шёлка-сырца в 1913–14 ввозилось из-за границы). В бывшем СССР объём производства шёлковых тканей (из натурального шёлка, искусственных и синтетических волокон) составлял 1.6 миллиарда м^2 (1977), а их ассортимент насчитывал около 600 артикулов. Структура шёлковых тканей весьма разнообразна из-за различия используемых нитей (мононити, комплексные, кручёные, текстурированные, фасонные, разрезные нити и пряжа), а также в силу многообразия ткацких переплетений нитей. Шёлковые ткани выпускают отбелёнными, окрашенными, набивными, пёстроткаными, меланжевыми. Они могут подвергаться тиснению, лощению. В отделке их поверхность может приобрести рельефность. Шёлковые ткани могут быть обработаны несминаемой, безусадочной, водоотталкивающей и другими пропитками. По назначению шёлковые ткани можно условно разделить на следующие группы:- платьевые, сорочечные, подкладочные, плащевые, костюмные и пальтовые, галстучные, для предметов женского туалета (корсетные) и галантерейных изделий. Кроме того, вырабатываются штучные изделия – платки, скатерти, покрывала, а также технические ткани. Платьевые Ткани (ПТ) (масса 1 м^2 30–200 г) очень разнообразны по сырьевому составу, структуре, оформлению и свойствам. ПТ из натурального шёлка – крэпдешин, крэп-шифон, крэп-жоржет. ПТ из ацетатных и триацетатных комплексных и текстурированных нитей вырабатывают полотняным, саржевым, атласным, мелкоузорчатым и крупноузорчатым (жаккардовым) переплетением. Выпускают набивными, пёстроткаными, отбелёнными и гладкокрашеными. ПТ из полиамидных комплексных и текстурированных нитей вырабатывают полотняным переплетением. Они бывают гладкокрашеными и набивными. ПТ из полиэфирных текстурированных нитей выпускают набивными и пёстроткаными. ПТ из вискозной пряжи вырабатывают полотняным переплетением с набивными рисунками, а из смешанной пряжи (из вискозного и синтетического волокна) – в пёстротканом и набивном виде. Изготовляются также ворсовые ПТ. Сорочечные Ткани (масса 1

м^2 70–200 г) вырабатывают из вискозной пряжи, смешанной пряжи (67% полиэфирного и 33% вискозного волокна) и из сочетания их с вискозными и полиамидными нитями полотняным, мелкоузорчатым и комбинированным переплетением. Выпускают отбелёнными, гладкокрашеными, набивными, пёстротканым, меланжевыми, а также с несминаемой и малоусадочной отделкой. Все эти ткани обладают достаточной гигроскопичностью и воздухопроницаемостью. Специальные отделки несколько ухудшают эти свойства. Подкладочные Ткани (масса 1 м^2 60–150 г) изготовляют из вискозных, полиамидных нитей или из вискозных, ацетатных или полиамидных нитей в основе и хлопчатобумажной или вискозной пряжи в утке. При изготовлении используют полотняное, саржевое, атласное, комбинированное и крупноузорчатое переплетение. Выпускают отбелёнными, гладкокрашеными, пёстротканым и набивными, а также с малоусадочной пропиткой. Имеют гладкую лицевую поверхность. Обладают малым коэффициентом тангенциального сопротивления, высокой устойчивостью к истиранию, хорошей гигроскопичностью. Плащевые Ткани (масса 1 м^2 50–200 г) объединяют ткани для плащей, курток и зонтов. Вырабатывают двух типов:- (i) из полиамидных нитей (переплетение полотняное, гладкокрашеные, пёстротканые или набивные, с водоотталкивающей пропиткой и плёночным покрытием); и (ii) из полиэфирно-вискозной или полиамидно-вискозной пряжи (переплетение полотняное или саржевое, гладкокрашеные, с водоотталкивающей пропиткой). Костюмные и Пальтовые Ткани (масса 1 м^2 200–300 г):- ткани для костюмов изготовляют чаще всего из смешанной (например, полиэфирно-вискозной) пряжи полотняным, саржевым и комбинированным переплетением. Обладают хорошей гигроскопичностью и достаточной воздухопроницаемостью. Иногда их обрабатывают специальными пропитками для снижения усадок и сминаемости. Для женских летних нарядных пальто используют двухслойные ткани крупноузорчатого переплетения с рельефной поверхностью из вискозных и полиамидных нитей. Выпускают гладкокрашеными и пёстротканым. Галстучные Ткани вырабатывают из вискозных, триацетатных и полиэфирных нитей мелкоузорчатым и крупноузорчатым переплетением. Выпускают пёстротканым и набивными. Корсетные Ткани вырабатывают атласным переплетением из вискозных и полиэфирных нитей в сочетании с вискозной и смешанной пряжей, отбелёнными, гладкокрашеными и набивными. Ткани Для Косынок и Платков изготовляют из натурального шёлка, ацетатных, триацетатных и полиамидных нитей разнообразными переплетениями. Выпускают гладкокрашеными, пёстротканым и набивными.

SILK GRASS = ШЁЛКОВИСТАЯ ТРАВА (или ПОЛЕВИЦА) – Silk Grass is a general term applied to many lustrous fibers of the pineapple or other plants, especially the white strong and silky fiber yielded by the Furcroea Cubensis, in tropical America. Silk Grass, lustrous bast fibers usually found in the Central and South American countries. The Silk Grass or Henequen (Furcroea Cubensis), the bowstring hemps. / Фуркрея Кубэнсис (Кубинская) (Furcroea Cubensis). Silt Grass:- Хэнэквэн или Хэнэкен (Henequen) Паспалум Влагалищный (Paspalum Vaginatum), Юкка Нитчатая (Yucca Filamentosa).

SILK HAT = ШЁЛКОВАЯ ШЛЯПА – Silk Hat is a hat with a tall cylindrical crown and a silk-plush finish worn by men as a dress hat.

SILK ILLUSION = ИЛЛЮЗИЯ ШЁЛКА (или ШЁЛКОВАЯ ОБМАНКА) – Silk Illusion is a net similar to tulle but even finer in mesh, used primarily for bridal veils.

SILK NOIL = ШЁЛКОВЫЙ ОЧЁС – Silk Noil:- short ends of silk fibers used in making rough, textured, spun yarns or in blends with cotton or wool. / Шёлковый Очёс или Шёлковые Очёски представляют собой короткие концы шёлковых волокон, используемые в .

SILK ROAD = ШЁЛКОВАЯ ДОРОГА (или ШЁЛКОВЫЙ ПУТЬ) – The Silk Road is the most well-known trading route of ancient Chinese civilization. Trade in silk grew under the Han Dynasty (202 BC – AD 220) in the I and II centuries AD. Origins:- originally, the Chinese trade silk internally, within the empire. Caravans from the empire's interior would carry silk to the western edges of the region. Often small Central Asian tribes would attack these caravans hoping to capture the traders' valuable commodities. As a result, the Han Dynasty extended its military defenses further into Central Asia from 135 to 90 BC in order to protect these caravans. Chan Ch'ien, the first known Chinese traveler to make contact with the Central Asian tribes, later came up with the idea to expand the silk trade to include these lesser tribes and therefore forge alliances with these Central Asian nomads. Because of this idea, the Silk Road was born. The route grew with the rise of the Roman Empire because the Chinese initially gave silk to the Roman-Asian governments as gifts. Spanning Two Continents:- the 7 000 mile route spanned China, Central Asia, Northern India, and the Parthian and Roman Empires. It connected the Yellow River Valley to the Mediterranean Sea and passed through places such as Chinese cities Kansu and Sinkiang and present-day countries Iran, Iraq and Syria. Northwestern Indians who lived near the Ganges River played prominent roles as middlemen in the China-Mediterranean silk trade because as early as the III century AD, they understood that silk was a lucrative product of the Chinese Empire. The trading relationship between the Chinese and the Indians grew stronger with increased Han expansion into Central Asia. The Chinese would trade their silk with the Indians for precious stones and metals such as jade, gold, and silver, and the Indians would trade the silk with the Roman Empire. Silk proved to be an expensive import for the Roman Empire since its trade across Indian and Central Asia was heavily controlled by the Parthian Empire. Social Consequences of the Silk Road:- while the Chinese silk trade played a minor role in the Chinese economy, it did increase the number of foreign merchants present in China under the Han Dynasty, exposing both the Chinese and visitors to their country to different cultures and religions. In fact, Buddhism spread from India to China because of trade along the Silk Route, similar to the way Islam spread along trans-Saharan routes in medieval West Africa. The Silk Road's Decline:- by 760 AD, during the T'ang Dynasty, trade along the Silk Road had declined. It revived tremendously under the Sung Dynasty in the XI and XII centuries when China became largely dependent on its silk trade. In addition, trade to Central and Western Asia as well as Europe recovered for a period of time from 1276–1368 under the Yuan Dynasty when the Mongols controlled China. The Chinese traded silk for medicines, perfumes, and slaves in addition to precious stones. As overland trade became increasingly dangerous, and overseas trade became more popular, trade along the Silk Road declined. While the Chinese did maintain a silk-fur trade with the Russians north of the original Silk Route, by the end of the XIV century, trade and travel along the road had decreased. The Silk Road, or Silk Route, is a name given to an interconnected series of trade routes through various regions of the Eurasian continent mainly connecting Chang'an (today's Xi'an) in China, with Asia Minor and the Mediterranean. It extends over 8 000 km (5 000 miles) on land and sea. / Под Шёлковым Путём понимается общее название (до XVI века) торговых караванных путей из Китая в Переднюю Азию через Среднюю Азию, по которым привозились шёлковые ткани. Шёлковый Путь – название караванных торговых путей, связывавших со II века до Нашей Эры до XVI века Нашей Эры Китай (через Среднюю Азию) с Передней Азией и далее с Европой. Главным товаром, провозимым по Шёлковому Пути, был Китайский шёлк. Шёлковый путь начинался в центральных районах Китая и через Ланьчжоу шёл на Дуньхуан, где раздваивался. Южный путь проходил через города Хотан, Яркенд, Балх и Мерв; северный – через Турфан, Кашгар, Самарканд, Мерв. Далее шёлковый путь проходил через Нису, Гекатомпил, Экбатану, Багдад к портам Средиземного Моря Тиру и Антиохии. В первые века существования шёлкового пути между Римом и Парфией велась борьба за преобладание в посреднической торговле. В V–VI веках значительная часть шёлкового пути находилась в руках Иранских и Согдийских, а с VII века – Арабских купцов. В XIV веке в связи с развитием мореходства значение шёлкового пути упало.

SILK SPINNING = ШЁЛКОПРЯДЕНИЕ – Silk Spinning:- the aggregate of production processes used in converting silk waste obtained in sericulture and various branches of the silk industry (such as cocoon reeling and silk throwing) into yarn. Three systems of spinning are used: comb spinning without carding, card and comb spinning, and condenser spinning. Comb spinning without carding is used to produce yarns up to 2.8 tex. The raw material is sorted, scoured to remove gum and fat, separated, and stapled, after which it is combed on circular carding machines. From three to four machine transfers are usually used, during which the combings from the first machine enter the second and so on. The output from the carding machines is fed to a cross folder, where it is drawn out and formed into sliver, which is wound onto a drum. The sliver is then drawn out and doubled in several transfers on two-stage drawing frames, after which it is fed to roving frames. The roving frames produce spun roving, which is processed into twisted roving on roving machines with spindles. Spinning is accomplished on ring spinning frames. In card and comb spinning, combings from the last carding machine are processed into yarn. The combings are sorted, separated, and carded on carding machines equipped with roller cards. The sliver is then successively processed on drawing frames, a machine that joins several slivers together, and a combing machine. The combed sliver is processed on drawing, roving, and ring spinning frames into yarn up to 6.7 tex. Condenser spinning consists in processing the combings obtained by card and comb spinning. The combings are separated, cleaned, oiled, and carded on carding machines. The roving is then processed into yarn on ring spinning frames. Blends of silk wastes and chemical fibers can also be processed into yarns. See also Spinning. / Шёлкопрядение – совокупность технологических процессов, используемых при переработке в пряжу шёлковых отходов, полученных в шёлководстве и в различных производствах шёлковой промышленности (кокономотании, шёлкокручении и других). В шёлкопряжении используют 3 системы прядения:- гребенную без кардочесания, гребенную с кардочесанием (угарную) и аппаратную. (i) Гребенная без кардочесания система прядения используется для получения пряжи до 2.8 текс. В этой системе исходное сырьё сортируется, отваривается с целью его обесклеивания и обезжиривания, разрыхляется и штапелируется, после чего подвергается чесанию на круглых чёсальных машинах. Обычно применяют 3–4 перехода таких машин, причём очёсы с первой машины поступают на вторую и так далее. Прочёс с чёсальных машин подаётся на раскладочную машину, где вытягивается и формируется в ленту, которая наматывается на барабан. Далее лента подвергается вытягиванию и сложению на нескольких переходах двупольных ленточных машин, после чего она поступает на ровничные машины, на которых вырабатывается сучёная ровница, перерабатываемая в кручёную ровницу на ровничных машинах с веретёнами. Прядение осуществляется на кольцевых прядильных машинах. (ii) В гребенной с кардочесанием системе перерабатывают в пряжу очёсы с последней чёсальной машины. При этом они подвергаются сортировке, разрыхлению и чесанию на валичных чёсальных машинах. Далее лента обрабатывается на ленточных машинах, лентосоединительной и гребнечёсальной машине. Гребенная лента перерабатывается на ленточных, ровничных и кольцевых прядильных машинах в пряжу до 6.7 текс. (iii) В аппаратной системе перерабатывают очёсы, получаемые в гребенной системе с кардочесанием. Очёсы подвергают разрыхлению и очистке, замасливанию и чесанию на чёсальных аппаратах. Далее ровницу перерабатывают в пряжу на кольцевых прядильных машинах. В шёлкопрядении возможна переработка в пряжу смеси шёлковых отходов и химических волокон. Смотрите также Прядение (Spinning). Шёлкокручение – совокупность технологических процессов, посредством которых шёлк-сырец или некручёные химические нити перерабатывают в кручёные нити. По назначению различают кручёные шёлковые и химические нити для ткачества, трикотажно-вязального производства, для широкого потребления (швейные и вышивальные нити) и для технических целей (хирургические, изоляционные и другие). По структуре кручений шёлк делится на шёлк простой, сложной и фасонной крутки. В шёлкокручении мотки шёлка-сырца замачивают в мыльно-жировой эмульсии для размягчения серицина, что способствует лучшему разъединению нитей при сматывании, придаёт им гладкость и гибкость. Одновременно повышается гигроскопичность нитей и снижается способность их к электризации. Химические нити вместо замачивания подвергают шлихтованию – проклеиванию для придания им большей прочности и гладкости, а также для снижения электризуемости. После замачивания или шлихтования мотки шёлка-сырца или химических нитей отжимают, расправляют и сушат. Мотки шёлка-сырца перед сушкой подвергают расщипыванию с целью разъединения нитей и устранения их перепутывания. После сушки мотки разматывают на мотальных машинах, что позволяет проконтролировать непрерывность нити и намотать её на катушки или бобины, удобные для последующей обработки. Во время разматывания удаляются слабые и дефектные места нитей. Для получения более толстой нити проводят трощение (соединение нескольких нитей в одну), чаще всего – на тростильно-крутильных машинах с одновременным слабым скручиванием нитей. Это уменьшает обрывность нитей в последующем процессе кручения, который осуществляется на этажных или кольцевых крутильных машинах. Для придания кручёным нитям равновесности, то есть уменьшения способности их раскручиваться, нити обрабатывают паром (запаривание) в специальных камерах. После этого проводят так называемую уборку, то есть перематывание кручёных нитей в паковки, удобные для их последующей переработки. Кручёный шёлк обычно вырабатывается в несколько (2–5) вместе сложенных нитей с различными крутками (от 50 до 3 000 кручений на 1 метр (м)).

SILK THREAD = ШЁЛКОВАЯ НИТЬ – Silk Thread is a classic sewing thread for fine work and for sewing silks and woolens. It has more give than other natural fiber threads, but less than polyester or nylon. It is used primarily for sewing on silk fabrics. / Найлан^{T3} (Nylon^{TM}). Шёлк-Сырец – техническая нить натурального шёлка, получаемая в кокономотании соединением нескольких (чаще 5–10) продольно сложенных коконных нитей в одну; при этом нити прочно склеиваются серицином. Шёлк-сырец должен обладать равномерностью по тонине, чистотой (отсутствием на коротких участках нити утолщений или расщеплений), связностью (склеенностью) шёлковин. Механические свойства шёлка-сырца выше, чем у коконной нити (разрывное напряжение – на 15%, разрывное удлинение – на 10–15%). Более половины шёлка-сырца перерабатывается в кручёный шёлк. Выпускается шёлк-сырец обычно в мотках с крестовой намоткой. Шёлк-сырец идёт на изготовление плательных тканей, швейных ниток и других изделий.

SILO PALLET = БУНКЕРНЫЙ ПОДДОН – Silo Pallet is a sealed, four-sided box pallet fitted with a sealable lid and an emptying device in the deck. Note 1:- a silo pallet is commonly used for carrying dry powders or granules. Note 2:- some types of silo pallets can also be called Intermediate Bulk Containers (IBCs). Definitions concerning IBCs can be found in ISO 15867 [4]. / Бункерный Поддон – ящичный поддон с четырьмя неразборными стенками и крышкой, с запорным и разгрузочным устройствами в основании. Примечание 1:- поддон применяют для сыпучих и гранулированных грузов. Примечание 2:- эти типы бункерных поддонов можно применять как крупнотоннажные контейнеры (intermediate bulk containers (IBCs)). Определения, касающиеся контейнеров (IBCs) приведены в стандарте ISO 15867 [4].

SILT = ИЛ (или ИЛИСТЫЙ ОСАДОК) – Silt:- contaminant particles 5 μm and less in size. Silt is a soil separate consisting of particles between 0.05 and 0.002 mm in diameter. / Под Илом понимается тонкозернистый осадок океанов, морей, озёр, водохранилищ, рек, содержащий 30–50% частиц диаметром меньше 0.01 миллиметра. Ил – тонкозернистый мягкий осадок на дне водных бассейнов, не преобразованный диагнезом. Содержит от 30 до 50% частиц менее 0.01 миллиметра (мм). В естественных условиях находится в текучем состоянии, при высушивании приобретает свойства твёрдого тела. На дне морей и континентальных водоёмов (озёр, рек, прудов) распространены илы, состоящие из тонкозернистых продуктов разрушения горных пород (терригенный ил, глинистый ил, известковый ил) и из микроскопических раковин или скелетных остатков морских

организмов (глобигериновый ил, диатомовый ил, радиоляриевый ил, птероподовый ил и другие). Выделяют илы, обогащённые вулканическим пеплом (вулканический ил). Иногда илы обогащены органическим веществом (сапропель), разложение которого вызывает сероводородное заражение или развитие гнилостных процессов (‘гнилой ил’). Некоторые илы (озёрный, прудовый, лагунный) применяют как удобрение и для минеральной подкормки сельскохозяйственных животных, а также в медицине, для грязелечения.

SILTING = ЗАИЛЕНИЕ – Silting is a failure generally associated with a valve which movements are restricted due to small particles that have wedged in between critical clearances, e.g., the spool and bore. / .

SILVER = СЕРЕБРО – Silver is a chemical element with the symbol Ag (in Latin, Argentum). A soft white lustrous transition metal, it has the highest electrical and thermal conductivity for a metal, and occurs as a free metal, and in minerals such as argentite and chlorargyrite. Most silver is produced as a by-product of copper, gold, lead, and zinc mining. Silver has been known since antiquity. It has long been valued as a precious metal and used in currency, ornaments and jewelry, as well as utensils (hence the term silverware). Today, it is also used in photographic film, electrical contacts, and mirrors. Elemental silver is also used to catalyze chemical reactions. Silver has certain antimicrobial activity. In the past, dilute solutions of silver nitrate were used as disinfectants, though this has been supplanted by other treatments. In alternative medicine, there has been increasing interest in the use of colloidal silver as remedies for a wide range of ailments, though these claims are disputed. The consumption of large amounts of silver can lead to a darkening of the skin known as Argyria. Silver Bullion, available in .999 fine bullion bars (1 000 ounce units), the standard industry form. Each bar is hallmarked to certify weight and purity. Delivery of silver bullion bars can also be taken in the form of ten 100-ounce bars. Today, the US Mint issues American Silver Eagle coins, offering a .999 fine investment grade purity alternative to the 90% junk silver coin bags. Many analysts feel that silver, and specifically silver coins, presents an outstanding investment opportunity. (i) American Silver Eagles, available in units of 500 one-ounce coins for personal delivery only. Each coin is .999 fine silver with a face value of USD1.00. Obverse of coins feature the Walking Liberty design. Struck by the US Mint since 1986. (ii) Canadian Silver Maple Leafs, available in units of 200 one-ounce coins for personal delivery only. Each coin is .999 fine silver with a face value of CAD5.00. Futures contracts are firm commitments to make or accept delivery of a specified quantity or quality of a commodity during a specific month in the futures at a price agreed upon at the time the commitment is made. Approximately 1% of silver futures contracts traded each year result in delivery of the underlying commodities. Instead, traders generally offset their futures positions before their contracts mature. The difference between the initial purchase or sale price and the price of the offsetting transaction represents the realized profit or loss. Trading in COMEX® Division of NYMEX® silver futures is conducted for delivery during the current calendar month, any January, March, May, and September thereafter falling within a 23-month period and any July and December falling within a 60-month period, beginning with the current month. Silver:- Latin name Argentum. The chemical symbol is Ag, specific gravity is 10.49 and the melting point is 960°C. Silver is a lustrous, white, malleable and ductile precious metal, with remarkable electrical and thermal, light-reflecting, bacteria-killing, wear resistant, photosensitive and other qualities. / КОМЭКС® (COMEX®). Серебро, наряду с золотом, платиной и металлами платиновой группы, составляет благородные металлы. Серебро, на Латинском языке Аргэнтум (Argentum), символ Ag, химический элемент I группы периодической системы Менделеева. Атомный номер 47, атомная масса 107.868 2; плотность 10 500 кг/м^3, $t_{пл}$ 961.9 °C. Серебро – металл сверкающего белого цвета, ковкий, пластичный. Один из дефицитных элементов. Имеет наивысшую среди металлов электрическую проводимость, теплопроводность и лучшую отражательную способность, очень стойко химически. Химически малоактивно, в присутствии сероводорода чернеет. В природе встречается в виде самородков и соединений (серебряный блеск Ag_2S, хлораргирит AgCl). Однако и те и другие редки, и основную массу серебра получают из комплексных руд попутно при добыче других металлов – главным образом свинца и меди, в меньшей степени – из серебряных руд. Серебряные руды:- главные минералы:- аргентит, пираргирит, полибазит, прустит, серебросодержащий галенит, стефанит. Минимальное содержание Ag в руде 45–350 г/т. Из серебряной руды извлекают около 20% Ag, остальное – попутно из комплексных руд. Главными добывающими странами являются Австралия, Канада, Мексика, Перу, США. Серебро применяется в основном в виде сплавов для чеканки монет, изготовления ювелирных и бытовых изделий, электрических контактов, припоев, лабораторной посуды, а также для футеровки химической аппаратуры, для покрытия радиодеталей, производства серебряно-цинковых аккумуляторов и так далее. Основные потребители серебра:- кинофотопромышленность, электронная и электротехническая промышленности, производство ювелирных изделий. Галогениды серебра (AgBr, AgI) применяют в производстве фотоматериалов, как твёрдые электролиты с ионной проводимостью, коллоидное серебро, а также его соединения (например, ляпис $AgNO_3$) – в медицине. Серебро обладает бактерицидными свойствами:- ионы Ag^+ стерилизуют воду, уничтожая бактерии и уже в незначительной концентрации стерилизуют питьевую воду. По мере развития товарного производства серебро в силу своих естественных свойств – делимость, однородность, портативность, сохраняемость – наряду с золотом стало выступать денежным товаром. Серебро играло роль всеобщего эквивалента, то есть денег. С XVI до конца XIX века серебро преобладало в денежном обращении Европейских стран (серебряный монометаллизм или биметаллизм). С конца XIX века большинство стран перешло к золотому монометаллизму. Серебряная валюта сохранялась до 1930-х в Афганистане, Иране, Китае. Самородное Серебро – минерал класса самородных элементов. Примеси золота, ртути, висмута и других. Цвет на свежей поверхности серебристо-белый, на воздухе самородное серебро постепенно тускнеет из-за образования чёрной плёнки сульфида серебра. Твёрдость по минералогической шкале 2.5–3; плотность (10 500 ± 500) кг/м^3. Важный рудный минерал серебра.

SILVER = СЕРЕБРЯНОЕ – Silver:- a nearly neutral slightly brownish medium gray.

SILVER FIXING = ФИКСИРОВАНИЕ ЦЕНЫ СЕРЕБРА (или УСТАНОВЛЕНИЕ ЦЕНЫ СЕРЕБРА) – Silver Fixing:- the first Silver Fixing took place in 1897 at the office of Sharps & Wilkins. For over 110 years we have been fixing the price of silver providing market users with the opportunity to buy and sell silver at a single quoted price. It also provides a published benchmark price that is widely used as a pricing medium by producers, consumers and investors. The fix is carried out once a day at 12 noon by the 3 members via telephone conference. At the start of each fixing, the Chairman announces an opening price to the other 2 members, who report that price back to their dealing rooms. They in turn relay this price to their customers, and based on orders received from them, instruct their representatives to declare themselves as buyers or sellers at that price. Provided there are both buyers and sellers at the price, members are then asked to state the number of ounces they wish to trade. If at the opening price there are only buyers or only sellers, or if the numbers of ounces to be bought or sold does not balance, the price is moved and the same procedure is followed until a balance is achieved. The Chairman then announces that the price is fixed. It should be noted that the Fix is said to balance if the buy amount and the sell amount are within 300 000 ozs of each other. The Fixing will last as long as it is necessary to establish a price that satisfies both buyers and sellers. Customers may leave orders in advance of the Fixings. Alternatively, they may choose to be kept advised of price changes throughout the Fixing and may alter their orders accordingly at any time until the price is fixed. To ensure that any order change is communicated quickly to the Chairman, each representative has a verbal flag, which he raises immediately upon hearing of the change from his dealing room. As long as any flag is raised, the Chairman may not declare the price fixed. Silver market where purchases and sales are settled with exchange-like price fixing. Benefits are:- (i) international benchmark; (ii) published price;

(iii) narrow dealing spread; (iv) any quantity may be dealt; and (v) anonymity. Members are:- Deutsche Bank AG (headquarters are in Frankfurt am Main, Germany), HSBC Holdings PLC (headquarters are in London, the United Kingdom), and Scotia Mocatta (member of The Bank of Nova Scotia; headquarters are in Toronto, ON, Canada). The London Silver Market has developed over the Last three hundred years. The first recorded deal was entered into by a Market Member in 1676 when Mocatta started trading with the East India Company. The price at that time was 63 pennies per Troy ounce of standard Silver. Towards the end of the XVIII century the next Member entered the arena. Originally known as Sharps and Pickup, they shortly became Sharps and Wilkins. During most of the XVIII century, and for the first part of the XIX century, much of the business transacted in the Silver Market took place in one of the original London coffee shops. Although the firms concerned had individual offices, much of the gathering of information took place in coffee shops, making them a natural venue in which to transact business. 1852 saw the entry of Pixley and Haggard, who, five years later; became Pixley and Abell. This was followed one year later in 1853 by the founding of Samuel Montagu & Co.. The price of Silver in 1853 was 61½ pennies per ounce of standard Silver. The daily Silver Fixing commenced in 1897, although it is believed that a system of agreeing a daily spot price had evolved by the use of runners between the four houses a few years earlier. The first Fixing was attended by all four Members – Mocatta & Goldsmid, Sharps & Wilkins, Pixley & Abell, and Samuel Montagu & Co.. Within a very short time two prices were 'fixed' daily – cash (up to seven days) and two months forward. The cash price of Silver in 1897 was 27 9/16 pennies. The Silver Fixing has continued until the present day. Starting in 1967 the format of the Silver Fixing was amended, whereby the price was fixed for spot, three, six and twelve months forward, and at the same time the US Dollar equivalent was officially published. In 1999 The Fixing further evolved into a telephone based process with spot prices for US Dollar, Sterling and Euros. The Silver Fixing continues unchanged to this date, and has proved to be the most acceptable pricing mechanism for producers, consumers, arbitragers and speculators. Silver Fixing is held each working day at 12:00 pm in the City of London. The Silver Fixing:- three Market-Making Members of the LBMA conduct the Silver Fixing meeting under the chairmanship of The Bank of Nova Scotia – ScotiaMocatta by telephone at 12:00 noon each working day. The other two members of the Silver Fixing are Deutsche Bank AG London and HSBC Bank USA NA London Branch. The process then follows a similar pattern to gold, arriving at a fixing price when buying and selling orders are matched. Fixing prices for gold and silver are published immediately by the various news agencies. Historical data for Gold and Silver Fixings may be found on the LBMA website (http://www.lbma.org.uk). The London Silver Market Fixing Ltd (C/O ScotiaMocatta, 33 Finsbury Square, London, EC2A 1BB, the United Kingdom; http://www.silverfixing.com). / Шарпс энд Пикап (Sharps and Pickup). Моката Энд Голдзмид (Mocatta & Goldsmid), Шарпс Энд Вилкинз (Sharps & Wilkins), Пиксли Энд Эйбл (Pixley & Abell), и Сэмъюэл Мантэгю Энд Ко. (Samuel Montagu & Co.). через полномочных представителей Лондонских офисов следующих банков:- Дойчэ Банк А.Ге. (Deutsche Bank AG; со штабквартирой во Франкфурте на Майне, Германия), Эйч.Эс.Би.Си. Холдиньгз Пи.Эл.Си. (HSBC Holdings PLC; со штабквартирой в Лондоне, Соединённое Королевство), и Скоша Моката (Scotia Mocatta (член Зэ Бэньк оф Нова Скоша (The Bank of Nova Scotia); со штабквартирой в Торонто, ОН, Канада). Рынок серебра, на котором покупки и продажи осуществляются посредством фиксирования с увязкой к биржевой цене.

SILVER FORWARD = ФОРВАРД НА СЕРЕБРО – SIFO is the Silver Forward Mid Rate and provides indicative forward rates for silver based on the midmarket rates (the midpoint between the bid and offer sides of the swap). As these are only indicative rates, the London Bullion Market Association (LBMA) does not recommend that they be used as benchmarks to settle any transactions.

SILVERSHOOT = СЕРЕБРИСТЫЙ ПОБЕГ – Silvershoot is a symptom of gall midge infestation, the growing points and tillers elongate and form like a white tube.

SILVER STAINING = СЕРЕБРИСТОЕ ОКРАШИВАНИЕ – Silver Staining is a procedure by which DNA, proteins, or polysaccharides are visualized using silver complexes.

SIM = SUBSCRIBER IDENTIFICATION MODULE

SIM APPLICATION TOOLKIT = SUBSCRIBER IDENTIFICATION MODULE APPLICATION TOOLKIT

SIMEX = SINGAPORE INTERNATIONAL MONETARY EXCHANGE

SIMPLE = ПРОСТОЙ – Simple:- of a leaf with an undivided blade, although it may be lobed. Of a fruit developed from a single ovary. / Простой:- о листе с неразделяемой пластинкой, .

SIMPLE GUARANTEE = ПРОСТАЯ ГАРАНТИЯ – Simple Guarantee:- an obligor can demand payment from a simple guarantor only if the principal debtor has become bankrupt or has received payment respite under a composition agreement, or certain other conditions have been met. Where the claim so guaranteed has been secured by pledge, the simple guarantor may call on the obligor to have primary recourse to the pledge, unless the principal debtor has become bankrupt or has received payment respite. Also known as Ordinary Guarantee. In accordance with Art. 495 para. 1 of the Swiss Code of Obligations, the obligee can require the simple guarantor to pay under the following conditions:- (i) if the principal obligor – after the surely has been issued – has become insolvent; (ii) if the principal obligor has been granted protection from creditors; (iii) if proceedings are initiated against the principal obligor by the obligee, observing all necessary diligence and resulting in the issuance of a definitive certificate of unsatisfied claims; (iv) if the principal obligor has transferred his or her domicile abroad and claims can no longer be made against him or her in Switzerland; and (v) if it becomes extremely difficult to instigate legal proceedings against the principal obligor because he or she has transferred his or her domicile abroad. If pledges or mortgages exist for the guaranteed claim, the guarantor can demand that the obligee satisfy the debt first from such pledges or mortgages unless the principal obligor has become insolvent or has been granted protection from creditors (Art. 495 para. 2 OR).

SIMPLE INTEREST = ПРОСТОЙ ПРОЦЕНТ – Simple Interest is the interest that is paid only on the original amount borrowed for the length of time the borrower has use of the credit. The amount borrowed is referred to as the Principal. In the simple interest rate calculation, interest is computed only on that portion of the original principal still owed. Simple Interest is the compensation which is paid for the use of the principal (sum lent), at a certain rate made by law. / Простой процент это компенсация, которая выплачивается за использование принципала (основной заимствованной суммы), по определённой ставке, утверждённой в законодательном порядке.

SIMPLE LEAF = ПРОСТОЙ ЛИСТ – Simple Leaf:- not compound, not divided into secondary units, e.g., Cercis canadensis. Simple Leaves show an undivided blade or, in case it has divisions, they do not reach the midrib.

SIMPLE MOVING AVERAGE = ПРОСТАЯ СКОЛЬЗЯЩАЯ СРЕДНЯЯ ВЕЛИЧИНА (или ПРОСТОЕ СКОЛЬЗЯЩЕЕ СРЕДНЕАРИФМЕТИЧЕСКОЕ) – The Simple Moving Average (SMA) is the easiest to construct. A 5 day SMA takes the sum of the last 5 days prices and divides by 5. Easy but not always accurate:- the indicator has a tendency to 'bark twice'. Consider this example:- (i) Day 1, 2, 3, 4, 5, 6, 7, 8, 9; (ii) Price (USD) 16, 17, 17, 10, 17, 18, 17, 17, 17; and (iii) 5 Day SMA no, no, no, no, 15.4, 15.8, 15.8, 15.8, 17.2. You can see that on day 9 there is a big step in the simple moving average, but price has been constant at USD17. This distortion is caused by the low price on day 4 -dropped from the SMA on day 9. A moving average that gives equal weight to each

day's price data. A Simple Moving Average (SMA) is calculated by adding the closing price of a security for a number of time periods and then dividing this total by the number of time periods. This illustrates the average price of the issue over a set number of periods. The moving average smooths the data series and makes it easier to spot trends. See also Exponential Moving Average, and Moving Averages. / В техническом анализе биржевых рынков, .

SIMULATED LINEN FABRICS = ТКАНИ, ИМИТИРУЮЩИЕ ЛЁН – Simulated Linen Fabrics:- various rayons, cottons, synthetics, and blends are woven with threads of uneven thickness to simulate linen. They lack the cool, firm, yet soft feel of linen. Their irregularities are too even when seen beside real linen.

SIMULATED SPUN YARN = ПРЯЖА С ИМИТИРОВАННЫМ ПРЯДЕНИЕМ – Simulated Spun Yarns are the filament yarns that have been modified to have aesthetics similar to those of spun yarns. Simulated spun yarn have looped or hairy surfaces. / филаментная (комплексная) пряжа (filament yarn).

SIMULATION = СИМУЛЯЦИЯ – (1) Simulation is the statistical process or act of resembling or having the characteristics of something. / Под Симуляцией, от Латинского слова Simulatio, означающее Притворство, понимается .

(2) Simulation (Crop Simulation):- Use of computer models, such as GOSSYM/COMAX, to mimic crop development. Used to aid in predictions and management decisions.

SIMULATION ANALYSIS OF FINANCIAL EXPOSURE = АНАЛИЗ ИМИТАЦИИ (или МОДЕЛИРОВАНИЯ, или СИМУЛЯЦИИ) ФИНАНСОВОЙ УЯЗВИМОСТИ – Simulation Analysis Of Financial Exposure:- a sophisticated computer risk-analysis program that monitors the risk of clearing members and large-volume traders at the Chicago Board of Trade. It calculates the risk of change in market prices or volatility to a firm carrying open positions. / в Чикагской Палате Торговли (Чикагском Табло Торговли, если быть более точными).

SINE WAVE = СИНУСОИДА (или СИНУСНАЯ ВОЛНА) – Sine Wave:- in ideal electric systems, the characteristic shape of the alternating voltage or current wave. This shape matches the trigonometric sine function of the acute angle in a right triangle and equals the ratio of the side opposite the angle to the hypotenuse.

SINGAPORE COMMODITY EXCHANGE (LIMITED) = СИНГАПУРСКАЯ СЫРЬЕВАЯ БИРЖА (ЛИМИТИД) – The Singapore Commodity Exchange Limited (SICOM):- traders have been here since the British founded Singapore in the early XIX century, buying commodities like rubber, spices, timber, coffee and palm oil from this region. While they continue to do so today, their business has grown in scope and sophistication. The modern traders are involved in a wide range of offshore trading activities and, increasingly, 'paper trading' to hedge all kinds of risk exposure. Their activities have made Singapore an important center for international commodity trading. Mega-traders have been attracted to establish trading operations here. Their presence has linked Singapore even more closely with major commodity trading centers like Tokyo, London, New York and Chicago. The Singapore Commodity Exchange Limited (SICOM) is the answer to traders' growing demand for risk management tools for trading in commodities. Singapore is already a major market for rubber futures and the world's largest natural rubber trading center. Rubber futures have been traded in Singapore since the 1920s. Clearing facilities for the futures transactions were then provided by the Singapore International Chamber of Commerce Rubber Association. These were subsequently taken over by the Rubber Association of Singapore, which was privatised in 1992 as the RAS Commodity Exchange. This was in turn renamed the Singapore Commodity Exchange Ltd in February 1994 to better reflect its mission to be a broad-based commodity exchange. Xxxxx. Established in 1992, Singapore Commodity Exchange (SICOM) provides a highly trusted and efficient marketplace for commodity futures trading and clearing in Singapore. As a supervisory body, SICOM has a robust and market-oriented regulatory framework and adheres to high regulatory standards aligned to the interest of our stakeholders. SICOM oversees the supervision of its Members on rule compliance and maintain surveillance on all trading activities. It also administers the process of the physical delivery of exchange-traded rubber contracts and is the arbitration centre for the resolution of trade disputes. SICOM traces its roots back to the 1920s when rubber futures were first traded in Singapore. Clearing facilities for the futures transactions were then provided by the Singapore International Chamber of Commerce Rubber Association (SICCRA). This function was subsequently taken over by the Rubber Association of Singapore (RAS), which was privatized in 1992 as the RAS Commodity Exchange (RASCE). In February 1994, it was renamed Singapore Commodity Exchange (SICOM) to better reflect its mission to be a broad-based commodity exchange. As an established trading and commodity hub, Singapore boasts an open economy, a thriving port, a business-friendly environment, a strong regulatory framework, and an excellent communication infrastructure. Geographically situated among the region's largest producers and consumers, Singapore is the ideal place to provide a neutral stand for fair market practice. Positioned as the premier commodity exchange, SICOM serves as the pricing benchmark for regional and global rubber producers, traders and consumers. SICOM offers market participants the trading of two rubber futures contracts, the RSS3 (Ribbed Smoked Sheet) and TSR20 (Technically Specified Rubber), on its electronic platform, e-SICOM. Trading through e-SICOM, a fully integrated clearing and settlement system that is scalable and reliable, participants conveniently gain access to greater transparency, price discovery and liquidity in the market. SICOM has established a global footprint, boasting more than 120 corporate and individual members who trade through the Exchange. Member companies include renowned tyre manufacturers who use SICOM for their hedging needs:- Goodyear, Bridgestone, Michelin (SMPT), Hankook, Pirelli and Continental. In serving the marketplace, SICOM is a recognized leader and provides a strong foundation in market integrity, financial security and fair trade execution for all transactions. SICOM protects the financial integrity of the market by serving as the counterparty to every trade, thus, eliminating credit risk. In doing so, SICOM provides a reliable marketplace to participants for price discovery and risk management. SICOM formulates and enforces by-laws of its trading contract terms and acts as the arbitration centre for settlement of disputes. SICOM also provides facilities for cooperation in all matters affecting trades and to safeguard the interests of its members. SICOM strictly abides by the codes of standards and disclosures regulated by the Monetary Authority of Singapore (MAS). Integrity in trading and financial practices is assured and safeguarded through the Exchange membership criteria and trading rules. SICOM offers a diverse category of memberships that includes Clearing, Non-Clearing, Remote Non-Clearing, Trade and Associate Members. SICOM continues to expand its membership base and welcome partners with a keen interest to develop the commodity industry in Asia and to tap into the resources available to them in the world's largest rubber market. / коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо). Гудиэр (Goodyear), Бридьжстоун (Bridgestone), Мишэлын (Michelin (SMPT)), Хэнкук (Hankook), Пирэлли (Pirelli) и Кантынэнтэл (Continental).

SINGAPORE EXCHANGE (LIMITED) = СИНГАПУРСКАЯ БИРЖА (ЛИМИТИД) – The Singapore Exchange Limited (SGX) is Asia-Pacific's first demutualised and integrated securities and derivatives exchange. SGX was inaugurated on 1999-December-01, following the merger of two established and well-respected financial institutions – the Stock Exchange of Singapore (SES) and the Singapore International Monetary Exchange (SIMEX). On 2000-November-23, SGX became the first exchange in Asia-Pacific to be listed via a public offer and a private placement. Listed on our own bourse, the SGX stock is a component of benchmark indices such as the MSCI Singapore Free Index and the Straits Times Index. Home to Singapore's leading listed companies, SGX is also at the forefront of exchanges globally in attracting international issuers and is rapidly emerging as Asia's offshore risk management center for

international derivatives. Singapore Exchange Limited (SGX) is the stock exchange in Singapore. SGX was formed on 1999-December-01, following the merger of two established and well-respected financial institutions – the Stock Exchange of Singapore (SES) and the Singapore International Monetary Exchange (SIMEX). It is the Asia-Pacific's first demutualised and integrated securities and derivatives exchange. Singapore Exchange Limited (SGX) is Asia-Pacific's first demutualised and integrated securities and derivatives exchange. SGX was inaugurated on 1999-December-01, following the merger of two established and well-respected financial institutions – the Stock Exchange of Singapore (SES) and the Singapore International Monetary Exchange (SIMEX). On 2000-November-23, SGX became the first exchange in Asia-Pacific to be listed via a public offer and a private placement. Listed on our own bourse, the SGX stock is a component of benchmark indices such as the MSCI Singapore Free Index and the Straits Times Index. Home to Singapore's leading listed companies, SGX is also at the forefront of exchanges globally in attracting international issuers and is rapidly emerging as Asia's offshore risk management centre for international derivatives. SGX offers a diverse and exciting suite of securities and derivatives products via a global network of broking members. They provide market participants with convenient access to these products through an array of distribution channels. We aim to offer a highly trusted securities and derivatives marketplace for capital raising, risk transfer, trading, clearing and settlement, and to serve our stakeholders. The Singapore Exchange Limited (SGX) was inaugurated on 01 December 1999, following the merger of the Stock Exchange of Singapore (SES) and the Singapore International Monetary Exchange (SIMEX). Website:- http://www.sgx.com. / САЙМЭКС (SIMEX).

SINGAPORE INTERNATIONAL MONETARY EXCHANGE = СИНГАПУРСКАЯ МЕЖДУНАРОДНАЯ ВАЛЮТНАЯ БИРЖА – The Singapore International Monetary Exchange (SIMEX) is the oil and currencies futures exchange in Singapore. It was founded in 1984. On 1999-December-01 it was merged with the Stock Exchange of Singapore (SES) to form the Singapore Exchange Limited (SGX). The Singapore International Monetary Exchange (SIMEX) was established in 1983 from an alliance between the Gold Exchange of Singapore and the International Money Market (IMM) in Chicago. / Сингапурская Международная Валютная Биржа (СМВБ или САЙМЭКС (SIMEX); Singapore International Monetary Exchange), созданная в Сингапуре в 1984, служила площадкой для торговли фьючерсами на валюту и нефть. 01 Декабря 1999 она была поглощена Фондовой Биржей Сингапура (ФБС; Stock Exchange of Singapore (SES)). Результатом этого поглощения стало образование новой биржи – Сингапурской Биржи Лимитид (СБЛ; Singapore Exchange Limited (SGX)).

SINGEING = ОПАЛИВАНИЕ (или ОПАЛКА) – Singeing is the process of burning off protruding fibers from yarn or fabric by passing it over a flame or heated copper plates. Singeing gives the fabric a smooth surface and is necessary for fabrics that are to be printed and for fabrics where smooth finishes are desired. Singeing is a process of burning off protruding fibers from fabrics to give the fabric a smooth surface. Also called Gassing, Singeing is a process applied to both yarns and fabrics to produce an even surface by burning off projecting fibers, yarn ends, and fuzz. This is accomplished by passing the fiber or yarn over a gas flame or heated copper plates at a speed sufficient to burn away the protruding material without scorching or burning the yarn or fabric. Singeing is usually followed by passing the treated material over a wet surface to assure that any smoldering is halted. Singeing is a removing surface fibers and lint from a cloth with hot copper plates or gas flames. Singeing is an industrial defibrillation process where rapidly-moving fabric passes over a flame or a very hot plate in order to burn away fibers poking up from the surface. Also see Gassing. Singeing is a process in which unwanted surface fibers are removed by passing the fabric through a flame, or by using infra-red radiations or by burning against hot plate. The process generally takes place before bleaching or finishing. / Опаливание – процесс удаления с поверхности суровой ткани выступающих кончиков волокон, которые не только придают ей некрасивый вид, но и способствуют образованию дефектов при печатании. Опаливают ткань на плитной, цилиндровой и газовой опальных машинах. Не опаливают только те ткани, которые в дальнейшем подвергаются ворсованию, а также полотенечные ткани и некоторые другие. После опаливания ткань проходит паровой искрогаситель или ванну с водой. Опаливанию подвергают ткани, выработанные из пряжи различных видов. В суровом виде поверхность этих тканей покрыта пушком выступающих концов волоконец, незакрученных при кручении пряжи. Если их не удалить, то после крашения или печатания ворсистая поверхность будет выглядеть изношенной, а окраска покажется неровной. Кроме того, шероховатая поверхность скорее истирается в процессе эксплуатации. Чтобы сделать поверхность ткани гладкой, удалить пушок и ворсинки и улучшить внешний вид тканей в готовом виде и их эксплуатационные показатели, перед проведением технологических операций в красильном производстве ткани пропускают через опаливающую машину. Тонкие волоконца и пушинки на поверхности ткани над пламенем горелок при определённых условиях полностью сгорают, тогда как сама ткань сохраняет неизмененными свою структуру и прочностные показатели. Скорость прохождения ткани, сшитой в непрерывную ленту, по системе направляющих роликов над пламенем газовых горелок (двух или четырёх) – значительная, порядка 150–180 м/мин. Ткань по выходе из последней горелки должна иметь температуру не выше 150 °С. В зависимости от характера материала опаливание осуществляется на лицевой или на лицевой и изнаночной сторонах. Конструкция газоопаливающей машины обеспечивает подъём ворсинок в ткани перед вводом последней в пламя горелок и равномерность высоты пламени по всей ширине опаливаемой ткани. Чтобы устранить прилипание волоконец к поверхности ткани, в машине предусмотрено специальное устройство механического или электростатического действия, поднимающее их перед проходом в зону опаливания. Значительные трудности возникают при опаливании тканей, которые выработаны из пряжи, содержащей синтетические штапельные волокна (полиамидные или полиэфирные) как в чистом виде, так и в смеси с хлопковым или вискозным штапельным волокном. Дело в том, что синтетические волоконца, находящиеся на поверхности ткани, при опаливании не сгорают, а плавятся; кроме того, эти волоконца, будучи электростатически заряженными, прилипают к ткани. Для полного их сгорания необходима более высокая температура, которая может оказать вредное воздействие на самую ткань. По имеющимся данным, для полного сжигания полиэфирного волокна необходима температура около 485 °С. Оплавившиеся комочки волоконец не устраняют шероховатости поверхности ткани, они даже являются причиной образования в процессе эксплуатации ткани ворсистой поверхности (с пиллингом). Согласно литературным данным, наличие на ткани даже небольших количеств некоторых солей – таких, как карбонат калия (поташ) – способствует быстрому сгоранию полиэфирных волоконец при сравнительно невысокой температуре, в условиях обычного опаливания. При соответствующей автоматической регулировке состава горючей смеси, подаваемой в горелку (соотношение газа и воздуха 1:5), и давлении газа и воздуха во время прохождения ткани в верхней трети язычка окислительного пламени может быть достигнут требуемый эффект опаливания, когда волоконца будут полностью сгорать, а не плавиться. Новейшие газоопаливающие машины с горелками специальной конструкции и автоматической регулировкой параметров подачи газовой смеси обеспечивают высокий эффект опаливания тканей из полиэфирной штапельной пряжи в чистом виде и в смеси с другими волокнами. Дефектами, возникающими при опаливании тканей, являются:- неравномерность опаливания, которая проявляется в виде участков ткани с различной степенью ворсистости поверхности. Этот дефект может появиться при неравномерной высоте и интенсивности пламени горелки по ширине ткани; прожоги – подпалённые участки (из-за местного перегрева); пожелтение поверхности ткани как результат её общего перегрева. Причина перегрева – нарушение процесса опаливания.

SINGEING BAND = ПОЛОСА ОТ ОПАЛКИ – Singeing Band:- improper burning of fibers from fabric surface due to fold in the fabric or problem in flame. Finishing defect. / Порок или дефект заключительной отделки. Под Опалённым Местом понимается местный порок в виде участков, повреждённых опалкой.

SINGLE ADMINISTRATIVE DOCUMENT = ЕДИНЫЙ АДМИНИСТРАТИВНЫЙ ДОКУМЕНТ – In the European Union, the Single Administrative Document (SAD) is a multi-copy form which is used throughout the Community and EFTA countries for the control of imports, exports and goods in transit. The Single Administrative Document (SAD) used throughout the EC for making import and export customs declarations. Also known as Form C88 in the United Kingdom. Produced by SITPRO (Simplification of International Trade Procedures), this document was introduced to the EEC in 1988. It is part of the 'aligned series' for the improvement of trade procedures and embraces, within a single document, the functions of some 70, previously used, Customs forms.

SINGLE AUTHENTICATION = ЕДИНАЯ АУТЕНТИФИКАЦИЯ – In banking, Single Authentication is the process, whereby, during a transaction (and for every step in an incremental Purchase Transaction), the European Electronic Purse (EEP) is authenticated by the terminal but the terminal is not authenticated by the EEP.

SINGLE–AXLE BOGIE = ОДНООСНАЯ ТЕЛЕЖКА – Single-Axle Bogie is an assembly consisting of two wheels, axles, suspension system and overhead mounting for securing and supporting one 20' container. The bogie also carries rear lights, licence plates and mud guard flaps. / Сборное транспортное средство, состоящее из двух колёс, осей, системы подвески и навесных приспособлений для закрепления и удерживания одного 20-футового контейнера. У тележки имеются также задние огни, таблички о допуске к использованию и брызговики.

SINGLE–BREASTED = ОДНОБОРТНОЕ – Single-Breasted:- a garment that closes down the center front with only one row of buttons or other type of closure.

SINGLE CASH PRICE = ОТДЕЛЬНАЯ НАЛИЧНАЯ ЦЕНА – Single Cash Price is a price calculated only once per trading day, usually halfway through the exchange session, for shares in the Official Market segment. This price is determined primarily for stocks which, owing to their small trading volume, are not admitted to continuous trading. The lead broker collects all buy and sell orders on any given day and establishes the single cash price (or cash settlement price) that allows the greatest number of shares to change hands (principle of highest volume transacted). Single cash prices are also determined for stocks admitted to continuous trading if there are orders that cannot be executed for lack of a suitable counterparty at the time the single cash price is fixed.

SINGLE–COPY SEQUENCE = ПОСЛЕДОВАТЕЛЬНОСТЬ ИЗ ЕДИНСТВЕННЫХ КОПИЙ – Single-Copy Sequence is a sequence of nucleotides that occurs only once in a genome.

SINGLE CROPPING = ВОЗДЕЛЫВАНИЕ ОДНОЙ ЕДИНСТВЕННОЙ КУЛЬТУРЫ – Single Cropping is the growing of only one crop in a given place in one year.

SINGLE CROSS = ОДНОСТОРОННЕЕ СКРЕЩИВАНИЕ (или СКРЕЩИВАНИЕ ДВУХ ИНБРЕДНЫХ ЛИНИЙ) – Single Cross is a cross between two genotypes, usually two inbred lines.

SINGLE–CURRENCY INTEREST RATE CONTRACT = КОНТРАКТ НА ПРОЦЕНТНУЮ СТАВКУ ПО ОДНОЙ ВАЛЮТЕ – In the over-the-counter (OTC) market, Single-Currency Interest Rate Contracts is a category that includes derivatives transactions in which there is exposure to only one currency's interest rate. This category, therefore, includes all fixed and/or floating single-currency interest rate contracts including forwards, swaps and options.

SINGLE–DECK PALLET = ОДНОНАСТИЛЬНЫЙ ПОДДОН – Single-Deck Pallet is a flat pallet where the lower bearing surface area is less than the percentage specified in ISO 6780:2003 (4.6). / Однонастильный Поддон:- поддон с одним настилом для размещения груза.

THE SINGLE EURO PAYMENTS AREA = ЕДИНАЯ ОБЛАСТЬ ПЛАТЕЖЕЙ В ЕВРО – The Single Euro Payments Area (SEPA) is an area in Europe where individuals, companies and other organizations can make and receive noncash payments in Euro, both within and across national borders, under the same basic conditions, rights and obligations, regardless of their location. SEPA works as a single domestic payments market and enables customers to make payments as easily and inexpensively as in their hometown. The SEPA initiative is being run by the European Payments Council, which was established in 2002. It is the decision-making and coordination body of the European banking industry in relation to payments. Single Euro Payments Area is an initiative being developed by the European Payments Council to deliver an area where citizens, companies and other economic actors will be able to make and receive payments in Euros, across the European Union (EU). This would apply to payments both between Member States or payments made domestically inside individual countries, under the same basic conditions, rights and obligations. On 28 January 2008, the Single Euro Payments Area (SEPA) was launched in Europe with the SEPA credit transfer. Gradually, this should allow all Euro payments in the SEPA to be settled using the new pan-European instruments – SEPA credit transfers, direct debits and card payments – as easily, efficiently and securely as domestic payments today. The Bundesbank supports SEPA, acts as the link between the German banking industry and the Eurosystem and has adjusted its own payment systems to meet the requirements of the SEPA. The SEPA credit transfer payment scheme launched in January 2008 affects all cross-border and domestic Euro payments in SEPA countries. Under SEPA, the maximum execution timeframe for a basic credit transfer in Euro is three banking days (this maximum execution time will be cut to one banking day as from 2012). Payments will be made using the BIC (Bank Identifier Code) and IBAN (International Bank Account Number) to identify the beneficiary's account. SEPA (Single Euro Payments Area):- Specifically for Euro payments where the accounts of the originator and beneficiary are within the EU (and the expanded European Economic Area – EEA and voluntary adopters such as Switzerland), this payment scheme was developed with the intention of replacing all existing national Euro ACH systems in Europe. There are several Clearing and Settlement Mechanisms (CSMs) offering banks a service, and this is a further step toward ensuring that payments across Europe can be handled in the same way as domestic (national) transactions.

SINGLE EURO PAYMENTS AREA CREDIT TRANSFER = КРЕДИТНЫЙ ПЕРЕВОД ЕДИНОЙ ОБЛАСТИ ПЛАТЕЖЕЙ В ЕВРО – The Single Euro Payments Area (SEPA) Credit Transfer payment scheme launched in January 2008 affects all cross-border and domestic Euro payments in SEPA countries. Under SEPA, the maximum execution timeframe for a basic credit transfer in Euro is three banking days (this maximum execution time will be cut to one banking day as from 2012). Payments will be made using the BIC (Bank Identifier Code) and IBAN (International Bank Account Number) to identify the beneficiary's account.

SINGLE EUROPEAN ACT = ЕДИНЫЙ ЕВРОПЕЙСКИЙ АКТ – The Single European Act (SEA) was the first major revision of the Treaty of Rome. There was a tremendous amount of discontent among European Community members in the 1980s. Leaders from the business and political worlds were eager to harmonize laws between countries and resolve policy discrepancies. A commission formed to analyze whether a common market was possible in Europe, and further, what steps would need to be taken to achieve that goal. The commission put forth the proposals that became the Single European Act. The goal was to remove remaining barriers between countries, increase harmonization, thus increasing the competitiveness of European countries. It reformed/refined the operating procedures of the institutions (which now has 12 rather than 6 members) and Qualified Majority Voting was extended to new areas. An aim of a single market by 1992 was set. The act also formally introduced the concept of the European Political Cooperation which was the forerunner of the European Union's later Common Foreign and Security Policy. The act was signed at Luxembourg on 1986-

February-17, and at The Hague on 1986-February-28. It went into effect on 1987-July-01, under the Delors Commission (Jacques Delors). The Single European Act (SEA), which entered into force in 1987, provides the legal and procedural support for achievement of the single European Market by 1992. The act revised the EEC Treaty and, where not already provided for in the Treaty, majority decisions were introduced for numerous votes facing the Council of Ministers, particularly those affecting establishment of the single European Market and the European financial common market. The role of the European Parliament was strengthened; decisions on fiscal matters remained subject to unanimity. See also Delors Committee. / Жак Дёлёр (Jacques Delors).

SINGLE–FACE PALLET = ОДНОСТОРОННИЙ ПОДДОН – Single-Face Pallet (often referred to as a Skid):- most used – one deck only. / Односторонний Поддон (часто упоминамый как ростр (skid)):- используется, главным образом, лишь один настил.

SINGLE FARM PAYMENT = ОДИНАРНЫЙ (или ЕДИНЫЙ, или РАЗОВЫЙ) ПЛАТЁЖ ФЕРМЕ – Single Farm Payment (SFP):- with the 2003 Common Agricultural Policy (CAP) reform, the EU introduced a farm-based payment largely independent of current production decisions and market developments, but based on the level of former payments received by farmers. To facilitate land transfers, entitlements are calculated by dividing the reference amount of payment by the number of eligible hectares (including forage area) in the reference year. Farmers receiving the new SFP are obliged to keep their land in good agricultural and environmental condition and have the flexibility to produce any commodity on their land except fruits, vegetables and table potatoes.

SINGLE FERTILIZERS = ОДНОСТОРОННИЕ УДОБРЕНИЯ – Single Fertilizers are fertilizers that contain only one of the major fertilizer elements.

SINGLE FLOWER = ОТДЕЛЬНЫЙ ЦВЕТОК – Single Flower is a flower with but one set of petals, as a wild rose. Flower is defined as the part of a Plant that is often brightly colored and provides the pollen that is moved from plant to plant for pollination. In its most common sense as ‘a colorful conspicuous structure’, the word Flower includes many structures which are not anatomically flowers in the botanical sense. Sunflowers and daisies, for example, are structurally clusters of many small flowers that together appear to be a Single Flower (a Capitulum, a form of Pseudanthium), but these are considered to be Flowers in the general sense. Likewise, the botanical definition of Flower includes many structures that would not be considered a flower by the average person, such as the catkins of a willow tree or the downy flowers found atop a cattail stalk.

SINGLE KNIT = ОДИНАРНОЕ ВЯЗАНИЕ (или ХХ) – Single Knit, made on a weft knitting machine, is another term for Plain Knit.

SINGLE–KNIT FABRIC = ХХ ТКАНЬ – Single-Knit Fabric:- also called Plain Knit, a fabric constructed with one needle bed and one set of needles.

SINGLE KNOT = ОДИНОЧНЫЙ УЗЕЛ – Single Knot:- a break in the individual ply which has been rejoined. Thread defects, and namely – Spinning. / Порок или дефект ниток.

SINGLE MECHANICAL CONNECTION = ОДИНОЧНОЕ МЕХАНИЧЕСКОЕ ПРИСОЕДИНЕНИЕ – In reference to electricity, a term Single Mechanical Connection refers to the three discrete joints, each joint between two electrical components in a single phase of a three phase electrical system. Usually all three joints are within close proximity, between similar electrical components, but each in a separate phase of the three phase circuit. / По отношению к электричеству, относится к трём разным соединениям, каждое из которых между двумя электрическими компонентами в одной фазе трёхфазной электрической системы. Обычно все три соединения расположены очень близко друг к другу между подобными электрическими компонентами, но каждый из них находится в отдельной фазе трёхфазной сети.

SINGLE OR DOUBLE COVERED YARN = ПРЯЖА С ОДИНАРНЫМ ИЛИ ДВОЙНЫМ ПОКРЫТИЕМ – Single or Double Covered Yarn is the elastic yarn with bare and twistless elastane core and one or more relatively inelastic yarns wrapped around the core with continuous turns in one or opposite directions.

SINGLE OWNER = ЕДИНСТВЕННЫЙ СОБСТВЕННИК (или ЕДИНСТВЕННЫЙ ХОЗЯИН) – In the United States, Single Owner is the person designated on the face of the bond as the only person entitled to redeem the bond during his or her lifetime. Also referred to as Sole Owner.

SINGLE–PASS TEST = ХХ ИСПЫТАНИЕ (или ОДНОЦИКЛОВОЕ ИСПЫТАНИЕ, или ОДНОПРОХОДНОЕ ИСПЫТАНИЕ) – Single-Pass Test:- filter performance tests in which contaminant which passes through a test filter is not allowed to recirculate back to the test filter. Single Pass Test is a simple test where the lab takes a section of media and passes contaminant in fluid through it. The media is weighed before the test, contaminant is ‘weighed’, and then after the test, the media is weighed again. The results give you a ‘weighted average efficiency’ by determining the amount – by weight – of what the section of the media didn’t trap in one pass. The contaminant particles have a certified count before the test by size. The difference is:- Single Pass is conducted on a sample of the media; and Multi-Pass is conducted on the finished filter.

SINGLE–PHASE = ОДНОФАЗНАЯ – Single-Phase:- an ac electric system or load consisting of at least one pair of conductors energized by a single alternating voltage. This type of system is simpler than three-phase but has substantial disadvantages when large amounts of power have to be delivered.

SINGLE ROLLER CLEANER = ОДНОБАРАБАННЫЙ ОЧИСТИТЕЛЬ – Single Roller Cleaner:- in spinning process, the main functions of the opening and cleaning machines are the further separation of the fiber flocks and the removal of contamination particles and dust from the cotton. High fiber throughput with as little fiber damage as possible is desired. With the working principle free beat the flocks are caught in free fall and accelerated by cleaning elements. The opening is created by the interaction of forces of acceleration and inertia. Contaminating particles resulting from the effect of centrifugal and gravity forces can be separated by grids. There are machines with one roller (single-roller cleaner) or with two rollers (double-roller cleaner). With the restricted beat the flocks are ‘squeezed’ between two feed rollers or between one feed plate and one feed roller during the operation of the beaters. Depending on the degree of opening, the beaters are nose beater, pins, or saw teeth. Because of the squeezed position of the fibers, the effect of opening with the restricted beat is more intense, but also more aggressive compared to the free beat. This may lead to fiber damage if the flocks have not been sufficiently preopened. Contaminants are removed by centrifugal forces with grids and knifes. The ‘knifes’ can be a sharp edge positioned very closely to the toothed roller surface. While fibers stay in the air stream rotating with the roller owing to their small mass and high air resistance, dirt particles are carried to the outside due to their high mass and small air resistance and can then be removed at the knife. The cleaning effect depends on the machine model and the fiber material. / В прядильном производстве.

SINGLES = ОДИНОЧКИ – Singles:- the individual unit of yarn. Referring to a ‘single ply’ this is almost guaranteed to make experienced spinners cringe. Singles:- a strand of several filaments held together by twist. / Одиночная Нить (Singles Yarn) – нетрощёная некручёная нить или нетрощёная кручёная нить, получившая крутку за одну операцию.

SINGLE–SEED DESCENT = ПОКОЛЕНИЕ ОДНОГО СЕМЕНИ – Single-Seed Descent is a method of breeding sometimes used in autogamous (self-fertilizing) species to ensure that the range of genotypes in the F_2 population will also be present in the future generations. This method aims to maintain the broadest possible representation of genotypes in the base population until selection is practiced, and to retain genetic variation in advanced generation progenies.

SINGLE SEQUENCE REPEAT = ПОВТОРЕНИЕ ЕДИНСТВЕННОЙ ПОСЛЕДОВАТЕЛЬНОСТИ – Single Sequence Repeat (SSR):- also called Microsatellite. These are repeats of two or three nucleotides, sometimes found repeated up to 30 times. External Polymerase Chain Reaction (PCR) primers may detect length variation, which can be mapped.

SINGLE SIM PAYMENT SOLUTION = SINGLE SUBSCRIBER IDENTIFICATION MODULE PAYMENT SOLUTION

SINGLE STOCK FUTURES = ФЬЮЧЕРС НА ОТДЕЛЬНУЮ АКЦИЮ – Single-Stock Futures are an agreement between two parties that commits one party to buy a stock and one party to sell a stock at a given price and on a specified date. They are similar to existing futures contracts for gold, crude oil, bonds, and stock indices. Unlike actual stock, there is no ownership or voting rights contained in a SSF. See also Security Future, Security Futures Product, and Universal Stock Futures. A futures contract on a single stock. Single Stock Futures (SSF) were illegal in the US prior to the passage of the Commodity Futures Modernization Act. Single Stock Futures are futures contracts on an eligible underlying equity interest. A single stock futures contract is an agreement for delivery of shares of a specific equity interest at a designated date in the future, called the Maturity Date. The size of a single stock futures contract typically is 100 shares of the underlying equity interest. / Фьючерс На Отдельную Акцию (ФОА) – фьючерсный контракт на отдельную ценную бумагу. Фьючерсы На Отдельную Акцию считались в Соединённых Штатах Америки вне закона до принятия Акта О Модернизации Фьючерсов На Сырьё (Commodity Futures Modernization Act).

SINGLE SUBSCRIBER IDENTIFICATION MODULE PAYMENT SOLUTION = ЕДИНОЕ РЕШЕНИЕ ОПЛАТЫ МОДУЛЯ ИДЕНТИФИКАЦИИ ПОДПИСЧИКА – Single Subscriber Identification Module Payment Solution is a payment solution in which part or all of the banking data and sometimes of the banking application necessary to perform a payment resides on the Subscriber Identification Module (SIM).

SINGLES YARN = ОДИНОЧНАЯ ПРЯЖА (или ПРЯЖА ОДНОНИТКА) – Singles Yarn is the simplest strand of textile material suitable for operations such as weaving and knitting. A singles yarn may be formed from fibers with more or less twist; from filaments with or without twist; from narrow strips of material such as paper, cellophane, or metal foil; or from monofilaments. When twist is present, it is all in the same direction. See also Yarn. / мононить (monofilament). Одиночная Нить (Singles Yarn) – нетрощёная некручёная нить или нетрощёная кручёная нить, получившая крутку за одну операцию.

SINGLET = СИНГЛЕТ (или КОМБИНАШКА, или ТЕЛЬНЯШКА) – Singlet is (chiefly British) an athletic Jersey, undershirt.

SINGLE–WING PALLET = ПОДДОН С ВЫСТУПОМ НА ВЕРХНЕМ НАСТИЛЕ (или ОДНОКРЫЛЬНЫЙ ПОДДОН) – Single-Wing Pallet is a pallet with the top deckboards extending beyond the edges of the stringers or stringer-boards with the bottom deckboards flush (if present). Single-Wing Pallet is a pallet with top deck extending beyond the outer edges of, and with bottom deck flush with, stringers, blocks, posts or stringerboards. / Поддон С Выступом На Верхнем Настиле:- плоский поддон, имеющий выступ на верхнем настиле, при этом детали нижнего настила расположены на одном уровне с продольными брусьями, шашками или продольными досками.

SINGLE YARN = ОДИНОЧНАЯ ПРЯЖА (или ОДНОНИТОЧНАЯ ПРЯЖА, или ПРЯЖА В ОДНУ НИТЬ) – Single Yarn is the yarn composed of staple fibers (spun yarn), a single filament (monofilament) or several filaments (multifilament), with or without twist. Yarn that has not been plied; the result of drawing, twisting, and winding a mass of fibers into a coherent yarn. A single or one-ply yarn. One ply is rarely applied to yarn. Describes the ply of yarn. A single is the most popular ply and means, raw cotton twisted into a single thread. Single Yarn is one strand of fibers or filaments grouped or twisted together. See also Singles. Single Yarn is a spun yarn or filament yarn. / филаментная (filament yarn) мононить (monofilament) или мультифиламентная (или комплексная) пряжа. Термин служит для описания кручения пряжи. Кручение пряжи в одну нить является наиболее встречаемым и означает, что хлопковое волокно скручено в одну нить.

SINGLING = ОБОРВАННЫЙ КОНЕЦ – Singling is a yarn defect caused by the breaking of one or more strands in a plying operation with resulting unevenness in the finished product. / Оборванный Конец в процессе кручения пряжи.

SING OUT = КРИКНУТЬ (или ЗАКРИЧАТЬ) – Sing Out (maritime term):- to call out.

SINICA (JAPONICA) RACE = СИНИКА (ЯПОНИКА) РАСА – Sinica (Japonica) Race is a Rice grown in temperate zones and subtropics. Japonica sometimes also called Sinica or Keng. Another race, the temperate zone Sinica (formerly known as Japonica), is found only in east China, Korea, Japan, and the USSR. A small number of Sinica Varieties were introduced into Island Southeast Asia rather recently but had little significance in the region.

SINKER = КУЛИРНАЯ ПЛАТИНА (или КЛИНОК ДЛЯ ПРИБОРА ВУДКРОФТА В ТКАЦКОМ СТАНКЕ, или ЭКСЦЕНТРИКОВАЯ НАКЛАДКА ДЛЯ ОПУСКАНИЯ, или ГРУЗИЛО) – Sinker:- in weave design, a blank square indicating a filling thread over a warp thread at the point of intersection. / уточная нить основная нить в .

SINKING FUND = ФОНД ПОГАШЕНИЯ – Sinking Fund:- money regularly set aside by a company to redeem its bonds, debentures or preferred stock from time to time as specified in the indenture or charter.

SINKING FUND BONDS = ОБЛИГАЦИИ С ФОНДОМ ПОГАШЕНИЯ – Sinking Fund Bonds are the bonds whose indenture stipulates that set amounts of income will be paid each year into a sinking fund (custodial account) to provide for the redemption of the bond issue.

SINTERED MEDIUM = СПЁКШАЯСЯ СРЕДА – Sintered Medium is a metallic or nonmetallic filter medium processed to cause diffusion bonds at all contacting points.

SINTERING = ОКАЛИВАНИЕ (или ШЛАКОВАНИЕ) – Sintering is a forming a bonded mass or fiber by heating the constituents of the mass or fiber without melting. Sintering:- physical changes in materials caused by high temperatures; applied in particular to metals, ceramics and minerals/rock.

SINUATE = ВЫЕМЧАТОЕ – Sinuate:- wavy-edged. / Выемчатое:- с волнистым краем.

SINUATE LEAF = ВЫЕМЧАТЫЙ ЛИСТ (или ГОРОДЧАТЫЙ ЛИСТ) – Sinuate Leaf has little curves with smooth edges like waves. / Простые не расчленённые листья разделяются по краю листовой пластинки на:- (i) городчатые – зубцы тупые и закруглённые, выемки между ними острые; и (ii) волнистые – волнистый край.

SINUOUS NECK = ШЕЙКА С ИЗВИЛИСТЫМИ КРАЯМИ (или ШЕЙКА С СИЛЬНО ЗАВЁРНУТЫМИ КРАЯМИ, или ИЗВИТАЯ ШЕЙКА) – Sinuous Neck (SN) is the portion of the uppermost internode of the culm below the panicle base which is curved and wavy; opposed to straight neck.

SIP = SIPA PUMP

SIP = STREAMLINED INSPECTION PROGRAM

SIP1 = 6–INCH DIAMETER SIPA PUMP

SIP2 = 7.5–INCH DIAMETER SIPA PUMP

SIP3 = 10–INCH DIAMETER SIPA PUMP

SIP4 = 4–INCH DIAMETER SIPA PUMP

SIPA = SECURITIES INVESTOR PROTECTION ACT

SIPC = SECURITIES INVESTOR PROTECTION CORPORATION

SIR = STATUTORY INVENTION REGISTRATION

SIRA = SEARCH AND INFORMATION RESOURCES ADMINISTRATION

SIREX WASP = ОСА СИРЭКС – Sirex Wasp (Urocerus Gigas L.) is a giant wood wasp. When using packaging made of wood for marine transport to Australia and New Zealand, the appropriate treatment and certification of the wood must be observed.

SIROSPUN = XX (или СИРОСПАН) – Sirospun:- two-ply Sirospun yarns are made by spinning and twisting two strands together in a single operation. They are more elastic, less hairy and more compact than conventional two-ply yarns.

SISAL = СИСАЛЬ (или СИЗАЛЬ) – Sisal:- The Plant:- Sisal fiber is obtained from Agave Sisalana, a native of Mexico. The hardy plant grows well in a variety of hot climates, including dry areas unsuitable for other crops. After harvest, its leaves are cut and crushed in order to separate the pulp from the fibers. The average yield of dried fibers is about 1 tons per hectare, although yields in East Africa reach 2.5 tons. The Fiber:- Lustrous and creamy white, Sisal fiber measures up to 1 meter in length, with a diameter of 200 to 400 microns. It is a coarse, hard fiber unsuitable for textiles or fabrics. But it is strong, durable and stretchable, does not absorb moisture easily, resists saltwater deterioration, and has a fine surface texture that accepts a wide range of dyes. Uses Of Sisal:- Sisal is used in twine and ropes, but competition from polypropylene has weakened demand. But other markets are emerging – today, Sisal can be found in speciality paper, filters, geotextiles, mattresses, carpets and wall coverings. It is used as reinforcement in plastic composite materials, particularly in automotive components, but also in furniture. Another promising use is as a substitute for asbestos in brake pads. (It is also the best material for making dartboards.) By-products from Sisal extraction can be used for making bio-gas, pharmaceutical ingredients and building material. Producers:- Sisal is cultivated for fiber in Brazil, China, Cuba, Kenya, Haiti, Madagascar, and Mexico. Production patterns differ between counties. In Tanzania and Kenya Sisal is predominantly a plantation crop, while production in Brazil is largely small-scale. Production And Trade (in 2008):- World production of Sisal and a similar Agave Fiber, Henequen, is estimated at around 300 000 tons, valued at USD75 million. The major producers are Brazil (120 000 tons), Tanzania (30 000) and Kenya (25 000). Brazil exports around 100 000 tons of raw fiber and manufactured goods, particularly rope to the USA. Kenya exports around 20 000 tonnes and Tanzania 15 000 tons. Very strong, smooth, yellowish leaf fiber yielded by the Agave rigida of Central America and the West Indies; used for cordage. It was first imported to the United States about 1860. (1924). Sisal is raised in British East Africa and in Indonesia. It comes from the same family group as the century plant and belongs to the agave species. Sisal is ideal in the manufacture of rope. Salt water, however, will quickly destroy the fiber, thereby limiting its use for maritime purposes. Binder twine, small diameter rope, and some hard-fiber twine are other uses of this fiber. The binder twine is a favorite with workers in the grain fields, since it is ideal for bundling and tying. Fibers are obtained from the leaves. Sisal is a vegetable fiber that is made into strong, coarse twine. It is used for binder twine, but should not be used to tie fleeces. Sisal is a plant name Agave Sisalana and the fiber obtained from its leaves, used for hard fiber cordage. Sisal is one of a group of fibers obtained from the leaves of plants. It is obtained from a plant that belongs to the Agave Family and is raised in Mexico, especially in the Yucatan peninsula. The fiber is also cultivated in Africa, Java, and areas of South America. Sisal can be dyed bright colors, by means of both cotton dyes and acid dyes normally used for wool. It is important in the manufacture of such items as matting, rough handbags, ropes and cordage and carpeting. The fiber has also been called Sisal Hemp. Sisal is a strong, white, bast fiber produced from the leaves of the Agave plant, which is found in the West Indies, Central America, and Africa. Sisal is used chiefly for cordage and twine. In 1893, a far-sighted German agronomist smuggled 66 samples of the succulent Plant Agave Sisalana (Sisal) out their native Yucatan peninsula in Mexico and took them to Germany's East African colony of Tanganyika. The hardy Agave, which produces some of nature's longest and strongest plant fibers, thrived in the country's hot tropical climate and by the early XX century was producing the ropes of the German naval fleet. Under German, then British, administrators, Sisal fiber became the colony's main export commodity, highly prized for use in cordage and carpets worldwide. When the United Republic of Tanzania was born in 1961, it was the world's biggest Sisal grower, with fiber production of 200 000 tons a year. Sisal was the country's main foreign exchange earner and its cultivation and processing employed more than one million people. Output Shrinks:- Then, in 1967, most of the Sisal industry was nationalized, leading to severe disruption of its efficiency and output. Around the same time, Sisal fiber was targeted by the manufacturers of synthetic substitutes, who were often supported by restrictive trade policies and subsidies. In less than 15 years, polypropylene textiles and twine claimed more than half of Sisal's market, dealing a heavy blow to production in Tanzania, China and Mexico. By 1998, Tanzania's Sisal output had shrunk to 19 000 tons, less than 10 percent of its peak in 1964, and Brazil had emerged as the world's leading Sisal supplier. That same year, sisal began to make its comeback in Tanzania. The Sisal industry was re-privatized, mainly into the hands of Tanzanian businessmen, and investors and development agencies joined efforts to revitalize Sisal production. 'Sisal has huge potential', says Salum Shamte, Managing Director of Katani Ltd., one of the country's leading Sisal producers. 'It can be grown throughout the year, even on marginal land and in semi-arid areas, and inputs such as mineral fertilizers and pesticides are not a pre-requisite. Those are serious advantages for an agricultural product, especially in poor areas where agriculture is the mainstay of the economy'. Renewing Tanzania's Sisal industry requires diversification from traditional products to newer applications where strong, plastic non-synthetic materials are needed. 'Traditional products such as twines, ropes and bags must be improved to combat competition', says Shamte. 'But we must also intensify efforts to produce and market those products where Sisal has technological, environmental, geographical and cost advantages – in specialty paper, padding for cars, insulation material, roofing tiles and fibreboard, and in environmentally friendly composite materials'. Cash Crop:- Tanzania's small-scale farmers will play an important part in Sisal's future. Katani Ltd has launched a Sisal outgrower scheme on five of its estates in Tanzania's Tanga Region, allocating more than 12 000 hectares to 2 500 farm families. The company provides loans, extension advice and technical services that have allowed the farmers to grow Sisal as a cash crop along with traditional food crops such as Maize and Beans. According to Katani, Sisal farmers' income has increased to an

average of USD320 a month, earned throughout the year, compared to less than USD40 a month among subsistence Maize farmers. Agave Sisalana offers a range of other uses. The biomass left after fibers have been removed represents as much as 98 percent of the plant, and most is now flushed away as waste. To exploit the economic value of this material – amounting to some 15 million tons annually – the Common Fund for Commodities, UNIDO and the Tanzanian Sisal industry have funded the first commercial plant to use Sisal residues to produce biogas, electricity process heat and fertilizer. Ongoing evaluation of the plant indicates that 75% of the energy produced could be distributed to rural homes and 25 percent used in Sisal processing. Sisal is too coarse for clothing and upholstery, Sisal is replacing glass fibers in composite materials used to make cars and furniture. New Applications For Sisal:- (i) Sisal Cloth – strong enough to polish metal but soft enough not to scratch; (ii) Sisal Pulp And Paper – very strong substitute for wood fibers; (iii) Sisal Textiles – can substitute or enhance fibreglass used to reinforce plastic in automobiles, boats, furniture, water tanks and pipes; and (iv) Sisal-Based Bricks, roofing tiles, insulation material and fibreboard. / Xxxxx (Salum Shamte), Управляющий Директор (Managing Director) Кэтчани Эл.ти.ди. (Katani Ltd.). Виды (Species). Сисаль или Сизаль, грубое лубяное волокно (bast fiber), получаемое из листьев растения Агава (Agave:- Agava Cisalana, Agave Fouraroydes), произрастающего в Африке, Западных Индах (West Indies) и Центральной Америке. Из Сисаля изготовляют снасти для судов, бечёвку, канаты, сети, щётки и прочее. Иногда Сисалем называют и само растение. Сизаль, от названия Мексиканского порта Сисаль (Sisal), – волокна, получаемые из листьев многолетних тропических растений – Агав. Длина технического (комплексного) волокна Сизаль 75–130 миллиметров (мм), а элементарного 2–40 мм. Из сизаля вырабатывают верёвки, канаты, шпагат. Сизаль (правильнее Сисаль, по названию Мексиканского порта Сисаль (Sisal) на Полуострове Юкатан), жёсткое, грубое натуральное волокно, получаемое из листьев Агавы (Agava Sisolana); иногда сизалем называют само растение. Волокна выделяют из свежих листьев без какой-либо специальной обработки (выход около 3.5%). Элементарные волокна сизаль имеют длину 2–2.5 миллиметра (мм), технические – 0.6–1.5 метра (м); блестящие, желтоватого цвета. По прочности Сизаль уступает Манильской Пеньке и характеризуется большей ломкостью, чем Пенька. Идёт на изготовление канатов, сетей, щёток и тому подобного. Мировое производство Сизаля (в 1972 около 604 000 тонн (т)) постепенно сокращается, так как Сизаль вытесняется синтетическим волокном; главные экспортёры – Танзания, Кения, Ангола, Бразилия. Из листьев близкого вида Agava Fourcroydes добывают так называемый Мексиканский Сизаль (Хенекен, или Генекен), производимый в Мексике и на Кубе.

SISAL STRAW = СИСАЛЬСКАЯ СОЛОМА (или СИЗАЛЬСКАЯ СОЛОМА) – Sisal Straw is a type of straw used for rugs and ropes.

SISTEMA DE PAGAMENTOS DE GRANDES TRANSACÇÕES = СИСТЭМА ДЭ ПАГАМЭНТОС ДЭ ГРАНДЭШ ТРАНСАСЬЁНС (или СИСТЕМА ПЛАТЕЖЕЙ ПО КРУПНЫМ ОПЕРАЦИЯМ) – Sistema de Pagamentos de Grandes Transacções (SPGT) is the Portuguese large-value real-time gross settlement (RTGS) system became fully operational on 1996-September-30. In view of Stage Three of the Economic and Monetary Union (EMU), the Banco de Portugal then worked on connecting the SPGT to the TARGET system. / Система Платежей по Крупным Операциям (СПКО), или, как это звучит на Португальском языке по месту расположения, Систэма дэ Пагамэнтос дэ Грандэш Трансасьёнс (Эс.Пэ.Джэ.Тэ.) является Португальской системой крупных валовых расчётов в режиме реального времени (ВРРРВ). ТАСВРРУП (Трансевропейская Автоматизированная Система Валовых Расчётов в Режиме Реального Времени по Ускоренным Переводам) или ТАСВРРЭП (Трансевропейская Автоматизированная Система Валовых Расчётов в Режиме Реального Времени по Экспресс Переводам).

SISTER CELL = СЕСТРИНСКАЯ КЛЕТКА – Sister Cell is a cell formed from an original or preexisting cell. / Сестринские Клетки – продукт деления одной материнской клетки.

SISTER HOOKS = СЕСТРИНСКИЕ ГАКИ (или СКЛАДНОЙ ГАК, или ХРАП, или ХРАПЦЫ) – Sister Hooks (maritime term):- two iron flatsided hooks reversed to one another.

SISTERSHIP CLAUSE = ОГОВОРКА ОБ ОДНОТИПНОСТИ (или ОГОВОРКА О СУДАХ, ПРИНАДЛЕЖАЩИХ ОДНОМУ СУДОВЛАДЕЛЬЦУ) – Sistership Clause:- in the event of a collision between two vessels owned by the same assured, this clause in the hull policy confers on the assured the same rights as if the two vessels were separately owned and separately insured. Sistership Clause is a clause in a hull policy whereby the underwriters agree to treat sisterships as if they were separately owned (and capable of legal liability, one to the other) in regard to collision liability claims and claims for salvage charges.

SISTER SHIPS = ОДНОТИПНЫЕ СУДА – A Sister Ship is a ship of the same class as, or of virtually identical design to, another ship. Sister Ships are ships built on the same design.

SIT = SLOVENIAN TOLAR

SIT = STERILE INSECT TECHNIQUE

SITC = STANDARD INTERNATIONAL TRADE CLASSIFICATION

SITE = САЙТ – As used in a licensing agreement, a Site is a physical location affiliated with the licensee where the licensee may permit access to digital information to authorized users. / Как используется в лицензионном соглашении, Сайт это физическое месторасположение, зависимое от или аффилированное с лицензиатом (лицензеполучателем), в котором данный лицензиат (лицензеполучатель) может разрешить доступ к цифровой информации уполномоченным пользователям (авторизованным пользователям).

SITE = УЧАСТОК – In ecology, Site is an area described or defined by its biotic, climatic, and soil conditions as related to its capacity to produce vegetation.

SITE LICENSE = ЛИЦЕНЗИЯ НА САЙТ – Site License is a particular type of licensing agreement that permits access and use of digital information at a specific site. / Особый тип лицензионного соглашения, который разрешает доступ и использование цифровой информации на конкретном сайте.

SITP = STRATEGIC INFORMATION TECHNOLOGY PLAN

SITPRO = SIMPLIFICATION OF INTERNATIONAL TRADE PROCEDURES

SIU = SEAFARERS INTERNATIONAL UNION

SIXTH FREEDOM = ШЕСТАЯ СВОБОДА – Sixth Freedom is the right to carry passengers or cargo from a second country to a third country by stopping in one's own country.

SIZE = ПАКЕТ (или РАЗМЕР, или КОЛИЧЕСТВО) – Size is the number of shares immediately available to buy (bid) or sell (ask). For example, a bid of USD54.00 with a size of 500 would indicate an order to buy 500 shares at USD54.00; an ask of USD55.00 with a size of 1 000 would indicate an order to sell 1 000 shares at USD55.00. / Количество акций, доступных в данный момент к покупке (предложение на покупку) или продаже (предложение на продажу). Например, предложение на покупку по цене USD54.00 с

размером в 500 могло бы указывать на распоряжение купить 500 акций по цене в USD54.00; а предложение на продажу по цене USD55.00 с размером в 1 000 могло бы указывать на распоряжение продать 1 000 акций по цене в USD55.00.

SIZE = ШЛИХТА – In textiles Size or Sizing is a material applied to yarns or fabrics to make them stiffer or temporarily bind fibers together. Sizing is used extensively, especially for cellulose fibers, to make them easier to process or protect them from damage during high-speed weaving or the like. A wide variety of compounds, including starches and other plant derivatives, and synthetic organic compounds, such as polyvinyl alcohol, are used for sizing. Sizing materials can interfere with dyeing, so it is important that they are removed by desizing, usually prior to scouring but sometimes as part of the scouring process. Size is any of various gelatinous or glutinous preparations made form glue, starch, etc, used for coating the threads. See also Sizing. Size is a chemical composition in solution or dispersion applied before weaving normally to warp, but sometimes to weft, to facilitate the weaving operations. / Под Шлихтой, от Немецкого слова Schleifen, означающее Гладить, понимается клейкий раствор, употребляемый на фабриках для пропитывания нитей основы грубых материй. Приготовление Шлихты:- шлихту готовят (варят) в специальном помещении – клееварке. Клееварку обычно располагают выше шлихтовальных машин. Шлихту варят в баках цилиндрической или овальной формы ёмкостью 1 000 литров. Устройство бака для получения шлихты. Бак сделан в виде термоса. Он имеет двойные стенки с теплоизоляцией. Внутри бака возле дна расположен змеевик с соплами, через которые подаётся пар, подогревающий шлихту в процессе варки до температуры 70–90 градусов Цельсия. Внутри бака установлены две мешалки, вращающиеся в противоположных направлениях со скоростью 25–30 об/мин. Варка шлихты:- (i) в бак наливают 900 литров воды; (ii) постепенно загружают ПВС (16–30 килограмм концентрацией 1.6–3%), перемешивая смесь 5–10 минут; (iii) пускают пар и доводят температуру смеси до 80 градусов Цельсия; (iv) добавляют воду до получения объёма шлихты 1 000 литров (с учётом конденсата от пара) и после 5 минут перемешивания шлихта готова к потреблению; и (v) готовая шлихта перекачивается в распределительный бак или непосредственно к шлихтовальным машинам. Шлихтовальные материалы:- (i) клеящие материалы – являются основой шлихты. Они проклеивают пряжу и покрывают её плёнкой. В качестве клеящих материалов применяют:- (a) пищевые – крахмал, мука, животный клей; (b) химические – поливиниловый спирт (ПВС); карбометилцеллюлоза (КМЦ); полиакриламид (ПАА); полиакрилнитрил (ПАН); (ii) расщепительные материалы – химические реагенты, расщепляющие зёрна крахмала. Используются кислоты, щёлочи, соли; (iii) смягчители (нейтрализаторы) – жировые добавки, которые смягчают плёнку шлихты после расщепления крахмала кислотой или щёлочью (в противном случае плёнка получается хрупкая). Применяют хлопковые и касторовые масла; (iv) антисептики – противогнилостные материалы, уничтожающие плесень при использовании крахмала, муки, животного клея. Обычно используются – медный купорос, фенол, хлорамин; (v) смачиватели – применяют для увеличения смачивающей способности шлихты (сульфанол, этиленгликоль, ализариновое масло). Однако, при их применении образуется пена, что отрицательно сказывается на шлихте; и (vi) вода – растворитель при изготовлении шлихты как из пищевых, так и из химических материалов. Вода занимает наибольший объём в составе шлихты. Используют мягкую воду. Примечание:- из анализа шлихтовальных материалов можно сделать вывод, что шлихта на основе химических клеящих материалов может состоять всего из двух компонентов – вода и ПВС.

SIZE MARK = ОТМЕТИНА ОТ ШЛИХТЫ – Size Mark is a fabric defect that consists of a rough or frosted spin caused by uneven application or drying of the size.

SIZES OF LUMBER = РАЗМЕРЫ ПИЛОМАТЕРИАЛА – For metric measure, Lumber Size is based on actual size rounded to the nearest millimeter. For Imperial measure, lumber size is usually expressed in terms of nominal size which is the size before surfacing. The dressed size is usually 12 to 19 mm (1/2 to 3/4") less than the nominal or rough size. For example, a 2" x 4" stud after dressing measures about 1-1/2" x 3-1/2". / Строганый размер (dressed) обычно от 12 до 19 миллиметров (от 1/2 до 3/4" (дюйма)).

SIZE SPECS = РАЗМЕРНЫЕ СПЕЦИФИКАЦИИ (или СПЕЦИФИКАЦИИ РАЗМЕРОВ) – Size Specs is short for 'size specifications'. The size spec document is occasionally referenced to as a Spec Sheet or Spec Sheets. This document or file is basically a guide for clothing factories to follow for garment measurements and sewing techniques. The file contains garment manufacturing specifications that help the factory produce the garment as per the buyers requirement. The specifications are intended as a list of instructions for a garment factory to following in order to maintain consistency during the bulk production of clothing and fashion accessories. The size spec files may also contain information regarding the garments trim requirements. The spec sheet will indicate the button sizes, twill tape lengths, zippers, waistband widths, draw cord length etc. Size specs, may also contain a design sketch to help the factory view a complete rendering of the intended garment. The file may also include brand label and care label requirements for the product. Size specs are typically provided to factories as an instructional tool to follow when manufacturing clothing or fashion accessories. The size spec document includes points of measure as well as detailed sewing instructions. For example, the spec file may include a hem measurement as well as indicate the stitching to utilize on the hem. For example, 1" hem, 1/14" cover stitch. This instructs the factory how to create the hem of the pant. The spec sheets help assure a consistent garment fit. A well developed spec package may include a how to measure guide. If it is not included on the spec file, the factory should at least be provided with a separate manual providing them with clear indication of how you wish for them to manage the point of measure. The 'how to measure' guide is intended to ensure that all manufacturers are using the same methods of measurement. Here are a few examples of a point of measurement method:- (1) Bust/Chest – Lay the garment flat and measure the garment straight across one inch below the armhole. (Note:- it is important to indicate location below the armhole or from another point so that the person taking the measurement has a specific starting point). (2) Waist – Relax or extended measure from side to side along the center of the waistband or waist seam. For extended measurements – measure as above with elastic or knit fully extended. (3) Inseam – lay one entire leg flat measure from the top of the garment to the bottom of the leg following the side seam. All measurements should be taken with a plastic or fabric tape measure. Generally all measurements are to be taken with the garment laid on a flat surface with all wrinkles gently smoothed out. Measurements should be taken with zippers or buttons fully closed unless otherwise stated. Below are a few examples of the the wording you may see on a size spec file. Sample:- Front Length (From HPS); Front Length (From Shoulder Seam); Neck Width (Edge to Edge); Front Neck Drop (Imag. Line to Edge); Back Neck Drop (Imag. Line to Edge); Chest / Bust (1" Below Armhole); Across Shoulder; Across Front 6" From HPS; Across Back 6" From HPS; Armhole (Follow Curve); Waist (15" Below HPS); Sweep; Sweep (Above Side Slits or Shirt Tails); Sleeve Length (From Cap); Sleeve Inseam Length; Muscle Width (1" Below Armhole); Elbow (Below Armhole); Short Sleeve Opening Width; Long Sleeve Opening Width; Shoulder Slope (From HPS); Single Shoulder Width; Side Slit/Vent Height; Shirt Tail Height; Facing Height at CB; Pocket Height; Pocket Width; Pocket (From HPS); Pocket (From CF); Placket Length; and Placket Width. When indicating a measurement, most companies also provide what is refered to as an Available Tolerance. For example, if you are supposed to have a 34 inch waist, the buyer may give you a 1/4 inch tolerance. If you have a quater inch tolerance for a 34 inch waist, this means that if the garment waist measures 34 1/4 inches or 33 3/4 inches, you will be approved. Because you are within the tolerance that they allow, you will be fine. Therefore, when reading the size spec file, you should read the measurements but also be certain to check the tolerance permitted. Each buyer may provide a different tolerance. Size spec files are important to clothing factories, fashion merchandisers, pattern makers, etc. You will find that many product development management (PDM) packages and pattern making software provides methods to manage size spec files in a fashion

software environment. If you are a small start up company, you can create your spec packages on programs such as excel or any other similar software.

SIZING = ШЛИХТА – Sizing is a generic term for compounds that are applied to warp yarn to bind the fiber together and stiffen the yarn to provide better abrasion resistance during weaving. Starch, gelatin, oil, wax, and manufactured polymers such as polyvinyl alcohol, polystyrene, polyacrylic acid, and polyacetates are employed. Also known as Size. Sizing:- starch, gelatin, glue, wax, casein, or clay added to fabrics in the finishing stages to give fabric additional body, a smoother appearance, and more weight. Cotton fabrics are those most commonly treated in this manner. At one time, sizing had to be replaced after each cleaning. Today, with more advanced finishing techniques, sizing is rarely used and fabrics usually retain their initial appearance through cleaning. A few fabrics such as needlepoint canvas are still sized so that they can be handled more easily. This in no way affects their final performance. Sizing also refers to the starch that is applied to the warp yarns to help prevent abrasion during the weaving process. This sizing is usually removed from the fabric in one of the finishing steps. / для обеспечения устойчивости к истиранию в процессе ткачества.

SIZING = ШЛИХТОВАНИЕ (или ШЛИХТОВКА) – Sizing is the process of applying sizing compounds. See also Desizing, and Slashing. Sizing is the act or processing of applying 'size'. Sizing is the application of a size mixture to warp yarn. The purpose of this is to make the yarn smoother and stronger to withstand the strain of weaving, to provide an acceptable hand in the woven gray goods, and to increase fabric weight. / В ткачестве под Шлихтованием понимается пропитывание нитей основы (в основном из натуральных волокон) клеящим раствором – шлихтой (смесь крахмала, синтетических препаратов и тому подобного) с последующим высушиванием. Шлихтование повышает износостойкость за счёт использования в шлихте смеси крахмала, синтетических препаратов и тому подобного. Шлихтование – нанесение на нити основы тонкого слоя клеющего состава (шлихты) для увеличения сопротивляемости нитей истиранию и многократному растяжению в процессе ткачества. При приготовлении шлихты применяют как химические (поливиниловый спирт, акрил и другие) так и пищевые (например, крахмал) клеящие материалы; растворителем служит вода. Шлихтование выполняется на шлихтовальных станках. Нити основы, сматываемые со сновальных валиков, погружают в ванну со шлихтой, отжимаются между валами и поступают в сушильный аппарат для удаления избытка влаги, а затем наматываются на ткацкий навой. Шлихтование, от Немецкого слова Schlichte, означающее Шлихта, нанесение на нити основы тонкого слоя клеющего состава (шлихты) для увеличения сопротивляемости нитей истиранию и многократному растяжению в процессе ткачества. При шлихтовании отдельные элементарные волокна, образующие нить основы, склеиваются друг с другом. При приготовлении шлихты применяют как химические (поливиниловый спирт, полиакриламид и другие), так и пищевые (например, крахмалы) клеющие материалы; растворителем служит вода. Шлихтование выполняется на шлихтовальных машинах. Нити основы, сматываемые со сновальных валиков, погружаются в ванну со шлихтой, отжимаются между валами и поступают в сушильный аппарат для удаления избытка влаги, а затем наматываются на ткацкий навой. Шлихтованию обычно не подвергаются кручёные нити, а также нити из синтетических волокон и натурального шёлка, имеющие достаточную гладкость и прочность. Шлихтование основной пряжи:- цель процесса перематывания – уменьшение обрывности нитей основы в процессе ткачества (увеличив в несколько раз стойкость к истиранию) и получение ткацкого навоя путём объединения нитей с нескольких сновальных валиков и навивки на единую паковку – ткацкий навой. Сущность процесса шлихтования заключается в нанесении на нити тонкого слоя клеящего вещества (шлихты), которая приклеивает кончики волокон к стволу нитей и покрывает поверхность тонкой плёнкой, предохраняя волокна от истирания. Требования к процессу шлихтования:- (i) ошлихтованная пряжа должна обладать достаточной прочностью, гладкостью и эластичностью; (ii) в процессе шлихтования должно быть обеспечено равномерное нанесение требуемого количества шлихты (то есть определённого приклея); (iii) натяжение нитей основы при шлихтовании должно быть одинаковым и постоянным за всё время сматывания её со сновальных валиков; (iv) вытяжка пряжи и потеря её удлинения должны быть в пределах нормы; (v) получаемый на шлихтовальной машине навой должен иметь цилиндрическую форму необходимую плотность навивки (гамма) и расчётную длину пряжи; и (vi) процесс шлихтования должен быть производительным, экономичным и обеспечивать получение качественного навоя. Шлихтование:- пороки и отходы пряжи при шлихтовании:- в процессе шлихтования пряжи образуются пороки и отходы. (1) Отходы пряжи при шлихтовании:- (i) малоклеенная основа – получается при малой концентрации шлихты (мшица на станке, большая обрывность); (ii) переклеенная основа – получается при слишком густой шлихте и слабом отжиме (основа жёсткая, ломкая, шлихта осыпается, увеличенная обрывность); (iii) недосушенная основа – получается при слишком большой скорости шлихтования и недостаточной температуре сушки (нити склеиваются на навое, большая обрывность в ткачестве); (iv) пересушенная основа – получается при чрезмерной температуре сушки, малой скорости шлихтования и при останове машины (нити хрупкие и ломкие); (v) неправильная намотка основы на навой (при неправильной раскладке в рядок); (vi) неправильная длина основы – из-за неисправности счётчика; и (vii) чрезмерная вытяжка основы. (2) Отходы пряжи при шлихтовании:- (i) клеенные концы – образуются при заправке машины, когда часть основы переклеивается и пересушивается (её отрезают в отходы, длина концов 15–20 метров); (ii) мягкие концы – образуются при доработке партии, так как со сновальных валиков пряжа сходит не одновременно (на одном валике пряжа закончилась, тогда со всех остальных сматывают остаток, длина 15–30 метров); (iii) хомуты – образуются на сновальных валиках при обрыве нитей; (iv) общее количество угаров шлихтования составляет 0.1–0.2% от массы пряжи поступившей в шлихтование из сновального отдела. Шлихтование пряжи:- Основные параметры шлихтования – вытяжка, приклей.

SIZING = КАЛИБРОВКА (или ИЗМЕРЕНИЕ, или ОПРЕДЕЛЕНИЕ РАЗМЕРА) – Sizing is the process of weighing sample lengths of yarn to determine the count.

SIZING CONTENT = СОДЕРЖИМОЕ ШЛИХТЫ – Sizing Content is the percent of the total strand weight made up by the sizing; usually determined by burning off or dissolving the organic sizing.

SIZING STAINS = РАЗВОДЫ ОТ ШЛИХТОВАНИЯ (или ПОТЁКИ ОТ ШЛИХТЫ) – Sizing Stains is the measure source of sizing. The causes of this problem are:- (i) drops, which falls down over the fabric from the sheet above the drying cylinders; and (ii) the pressure gun, when the worker does not place the pressure on the exact position then grease falls onto the fabric.

SJ = SVALBARD AND JAN MAYEN

SK = SLOVAKIA

SKATE = РОЛИКОВЫЙ КОНЁК (или ХХ) – Skate is a roller skate; ice skate.

SKATE WHEEL CONVEYOR = ПОДШИПНИКОВЫЙ КОНВЕЙЕР – Skate Wheel Conveyor is a conveyer that moves product using wheels.

SKD = SHIKIMATE DEHYDROGENASE

SKD CARS = SEMI KNOCKED–DOWN CARS

SKEIN = ПАСЬМА – Skein is an appreciable length of yarn or thread that has been wound onto a reel or swift from some machine or device. The circumference of a skein varies usually from 44 inches to 54 inches. Skeins may be reeled, twisted, and put into commercial form for handling by the operatives in the mill's winding department. While skeins may be made any desired length for definite purposes, many of them are 120 yards long. Skein is a length of yarn taken from the reel. See also Hank. Skein:- long coils of yarn or hair intended for weaving, dyeing, or heat setting. Bulk yarn is sold in skeins that often need to be re-wound into spools or balls depending on the application. A skein is not a specific unit of length. / Пасьма – значительная длина пряжи или нити, которая была намотана на мотовило (reel) или баран мотовила (swift) из какой-то машины или устройства. Окружность пасьмы обычно заключается в диапазоне от 44 до 54 дюймов. Пасьмы могут быть верчёными, скрученными, и выложенными в коммерческой форме для обращения станочниками в мотальном цехе комбината. В то время как пасьмы могут быть сделаны любой желаемой длины для определённых целей, многие из них составляют 120 ярдов в длину. Пасьма хлопчатобумажной пряжи равна 120 ярдам или 109.7 метрам. Пасьма – единица длины пряжи. Пасьма льняной пряжи (300 ярдов или 274.2 метра); пасьма хлопчатобумажной пряжи для определения номера и крепости (80 оборотов по 1.5 ярда каждый или 109.7 метров); пасьма пряжи по Метрической системе, равная 100 метрам.

SKEIN = ПАСЬМА (или МОТОК, или ТАЛЬКА, или КУФТА) – Skein is a continuous strand of yarn or cord in the form of a collapsed coil. It may be of any specific length and is usually obtained by winding a definite number of turns on a reel under prescribed conditions. The circumference of the reel on which yarn is wound is usually 45 to 60 inches. See also Hank. Skein is a ready to use put up of yarn. Skeins can take various shapes, each wound so that the innermost end can be pulled from the center. Skein is a coil of yarn, which, unlike a spool of thread, has no center supporting object. The terms Skein and Hank are sometimes considered synonyms. See also Hank. / Моток:- ровно смотанные, намотанные на что-нибудь нитки, пряжа, проволока, например, шерсть в мотках. Пасма – часть мотка пряжи.

SKEIN BREAK FACTOR = ФАКТОР РАЗРЫВА ПАСЬМЫ – Skein Break Factor:- the comparative breaking load of a skein of yarn adjusted for the linear density of the yarn expressed in an indirect system. It is the product of the breaking load of the skein and the yarn number expressed in an indirect system, e.g., pounds times cotton count. A statement of the skein break factor must indicate the number or wraps in the skein, if this is not otherwise apparent. Without specifying the number of wraps, a statement of the skein break factor is meaningless.

SKEIN BREAKING TENACITY = РАЗРЫВАЮЩАЯ (УДЕЛЬНАЯ) ПРОЧНОСТЬ ПАСЬМЫ – Skein Breaking Tenacity:- the skein breaking load divided by the product of the yarn number in a direct numbering system and the number of strands placed under the tension (twice the number of wraps in the skein); preferably expressed in newtons per tex.

SKEIN DYEING = КРАШЕНИЕ В ПАСЬМАХ (или КРАШЕНИЕ В МОТКАХ) – Skein Dyeing (pronounced 'skane') is a dyeing yarn in skein form is used for small lots. Yarn is unwound from cokes to skeins and then are mounted and immersed into a large hot dye vat. After dyeing and drying the yarn is rewound onto cones. See also Dyeing. Skein Dyeing is the dyeing of yarn in the form of skeins, or hanks. Skein (Hank) Dyeing:- the yarns are loosely arranged in skeins or coils. These are then hung over a rung and immersed in a dyebath in a large container. In this method, the color penetration is the best and the yarns retain a softer, loftier feel. It is mostly used for bulky acrylic and wool yarns. In Skein Dyeing the yarns are loosely wound into hanks or skein and then dyed. The yarns have good dye penetration, but the process is slow and comparatively more expensive.

SKEINING = УБОРКА В ПАСЬМЫ (или УБОРКА В МОТКИ) – Skeining is the processing of winding a skein of yarn.

SKEIN WINDER = ПАСЬМОВОЕ МОТАЛЬНОЕ УСТРОЙСТВО – Skein Winder is a traditional, low-tech way to wind a skein and measure yarn. The Le Clerc site has an image of a skein winder. See also Niddy-Noddy.

SKELETONIZING = СКЕЛЕТИРОВАНИЕ (или ПРЕПАРИРОВАНИЕ СКЕЛЕТА) – Skeletonizing is a type of Insect damage characterized by Insect feeding on leaf areas between veins; it can result in a lacy appearance to the leaf. See also Windowpaning.

SKELETON TRAILER = ПРИЦЕП СКЕЛЭТАН (или СКЕЛЕТ, или КОНТЕЙНЕРНАЯ ПЛОЩАДКА, или АВТОМОБИЛЬНЫЙ КОНТЕЙНЕРОВОЗ) – Skeleton Trailer is a road trailer, normally drawn by a prime-mover, which has no floor but only struts fitted with locks to hold ISO shipping containers in either 20' and/or 40' configuations. Road trailer consisting of a frame and wheels, specially designed to carry containers. Also known as Skeletal Trailer. / Автомобильный Контейнеровоз специализированный полуприцеп для перевозки контейнеров по автомобильным дорогам. Грузоподъёмность от 5 до 30 тонн. В бывшем Союзе Советских Социалистических Республик (СССР) наибольшую распространённость имели контейнеровозы грузоподъёмностью 5 тонн. Их широко применяли при перевозках универсальных контейнеров брутто 2.5 и 5 тонн, а также автомобильных контейнеров брутто 0.625 и 1.25 тонн. В Соединённых Штатах Америки, Японии и других странах в это же самое время широко внедрялись контейнеровозы грузоподъёмностью 20 тонн для перевозок крупнотоннажных контейнеров брутто 20 тонн. Аналогичные контейнеровозы были созданы и в СССР. Они представляют собой полуприцеп рамной конструкции с двухосной тележкой, без настила, оснащённый устройствами для крепления контейнеров. Такой контейнеровоз был приспособлен для буксировки автотягачами типа МАЗ-504В. Для перевозки крупнотоннажных контейнеров брутто 30 тонн за рубежом нередко изготовляют контейнеровоз с трёхосной тележкой, в которой две оси являются самоуправляемыми.

SKEW = НАИСКОСОК (или КОСО, или НАИСКОСЬ, или КОСОЙ) – Skew is a fabric condition resulting when filling yarns or knitted courses are angularly displaced from a line perpendicular to the edge or side of the fabric. Fabrics defect. Skew:- distortion in the construction of the fabric, i.e. in the yarn that constitute the fabric. / когда уточные пряжи или .

SKEWED FABRIC = ПЕРЕКОШЕННАЯ ТКАНЬ (или КОСАЯ ТКАНЬ) – Skewed Fabric:- the shape of the fabric is distorted. Wales and courses are angular. Possible Cause:- this can be a result of uneven take down roller settings. It is a generic feature of circular knits because of the spiral movement of the needles. This is a minor defect and can be fixed in subsequent processing. Knitting defect.

SKEWING = ИСКАЖЕНИЕ (или СКОС, или СКАШИВАНИЕ, или ПЕРЕКАШИВАНИЕ) – Skewing effect is seen as a line or design running at a slight angle across the cloth. Knitted fabric defect. Skewing:- courses that are straight but at an excessively oblique angle to the fabric edges. Note:- this defect is caused by uneven take-down during knitting or a failure to line up the fabric edges during openwidth finishing.

SKEWNESS = ПЕРЕКОС (или КРИВИЗНА, или СКОШЕННОСТЬ, или СКОС) – Skewness is the distance measured parallel to and along a selvage between the point at which a filling yarn meets this selvage and a perpendicular to the selvage from the point at which the same filling yarn meets the other selvage. Skewness may be expressed directly in inches or as a percentage of the width of the fabric at the point of measurement. / уточная пряжа .

SKI BOOT = ЛЫЖНЫЙ БОТИНОК – Ski Boot is a rigid padded shoe that extends just above the ankle, is securely fastened to the foot, as with laces, buckles, or clasps, and is locked into position in a ski binding.

SKID = XX – Skid is a special frame, usually metallic, to permit handling, lifting, stowing, etc of pieces of odd shape or size, and generally heavy. / специальная рама, как правило, металлическая, .

SKIDS = ПОЛОЗКИ (или ПОЛОЗЬЯ, или СЛЕГИ, или САЛАЗКИ, или РОСТРЫ, или ПОДКЛАДКИ) – Skids:- battens, or a series of parallel runners, fitted underneath frames, boxes or packages to raise them off the floor and allow easy access of forklift blades or other handling equipment. Skids:- a low, movable wooden platform which facilitates the handling of cargo, i.e. as with the forklift. Skids:- a pair or series of parallel runners, fitted beneath boxes or packages to raise them clear of the floor to permit easy access of forklift blades or other handling equipment. Skids are sled-like bases used to facilitate ground conveyance of/securing of, for example, heavy machinery and machine parts. Skid is a wooden platform upon which wood pellet bags are stacked and wrapped. Wood pellets skids are packaged in different weights, and can have anywhere from 50 bags (1.0 ton) to 75 bags (1.5 tons) per skid. Also known as Pallet. Skid is a pallet having no bottom deck. Skids (maritime term):- beams sometimes fitted over the decks for the stowage of heavy boats or cargo. / Низкая, перемещаемая деревянная платформа, которая облегчает обработку грузов, то есть возможность использования техники, оснащённой вилами. Рейки (battens) или ряд параллельно выложенных полозов (или полозьев или подкладных башмаков или направляющих рельсов или направляющих ползушек (runners)), размещаемых под рамами, ящиками или пакетами с целью приподнятия их от пола, удерживания в таком положении и обеспечения лёгкого доступа для лопастей вильчатого подъёмника или иного оборудования для обработки грузов. Слеги для разгрузки бочек. Под Ростраами, от Голландского слова Ростэр (Rooster), означающее Решётка, понимаются площадки, обычно решётчатые, над палубой между рубкой и бортом судна для установки шлюпок, самолётов и другого. На судах парусного флота ростры (или росторы, или ростеры) – место для хранения запасных частей рангоута (мачты, стеньги и тому подобное), а также решёток, которыми покрывались люки.

SKIFF = СКИФ (или ЯЛИК) – Skiff is a small, hand-propelled rowboat. Sometimes called a Yawl. / Скиф или Ялик – гребная шлюпка (rowboat). Иногда называемая Ял или Йол (Yawl). Под Скифом понимается спортивная гоночная лодка для академической гребли. Предельная лёгкость конструкции, обводы округлые, соотношение длины с шириной от 25 : 1 до 35 : 1. Под Ялом, от Голландского слова Jol, понимается относительно короткая и широкая гребно-парусная судовая шлюпка с транцевой кормой. В зависимости от числа вёсел (от 2 до 8) их сокращённо называют ‘Восьмёрка’, ‘Шестёрка’ и тому подобное. Парусное вооружение яла одномачтовое, рейковое. Двойки парусного вооружения не имеют. На судах ялы используются для работ и учебных целей.

SKI MASK = ЛЫЖНАЯ МАСКА – Ski Mask is a knit fabric mask that covers the head, has openings for the eyes, mouth, and sometimes the nose, and is worn especially by skiers for protection from the cold.

SKIMMER = СКИМЁ (или XX) – Skimmer is a usually straw flat-crowned hat with a wide straight brim; a fitted sleeveless dress with a flaring skirt. / женская шляпа с низкой тульёй и широкими полями.

SKIMPY MARKING = ТЕСНАЯ МАРКИРОВКА (или СКУДНАЯ МАРКИРОВКА) – Skimpy Marking:- marker did not use outside perimeter of pattern. Pattern moved after partially marked to fit into space; Cutting Room Defects, and namely – Marking Defects. / Порок или дефект раскроя.

SKIN BACK = XX – Skin Back or Buttons:- balls of fiber that encircle the warp yarns and are woven into the fabric. Note:- this defect is often caused by the chafing of the warp yarns by the reed, heald eyes, or drop wires and is usually found in unsized or low-twisted yarns. See also Broken Filament. Fabrics defect.

SKIN IRRITATION FROM HOSIERY AND OTHER APPAREL = РАЗДРАЖЕНИЕ КОЖИ ОТ ЧУЛОЧНО-НОСОЧНЫХ ИЗДЕЛИЙ И ПРОЧИХ ПРЕДМЕТОВ ОДЕЖДЫ – Skin Irritation From Hosiery And Other Apparel:- Complaint:- in the early days of women’s nylon hosiery, widespread attention was given to several reports claiming that nylon hosiery was responsible for an outbreak of rashes or skin irritation on the wearers’ legs. Analysis:- impartial investigators learned that the reports were correct and that many wearers were suffering from dermatitis traced to nylon hosiery, but analysis proved conclusively that the nylon itself was not at fault. A rosin finish applied by several dyers to enhance the appearance of the stockings and, at the same time, reduce snagging contained adiepic acid, which is a skin irritant. With the elimination of this finish, all complaints of this nature ceased. At about the same time, there were cases reported of severe dermatitis resulting from a similar finish applied to cotton woven fabrics used for men’s shorts. Textile finishers and the manufacturers of chemical materials used as finishes now make certain that any new products developed for application to textile materials which may come in contact with the wearer’s skin are thoroughly tested for possible danger of causing such skin irritations. Dermatitis is not uncommon among industrial workers and general consumers. Instances are frequently reported of people who develop skin irritations when handling or wearing fabrics composed of certain fibers. Although some chemicals may be responsible for specific conditions, there is no way of guaranteeing absolute immunity to every individual. There are standard, accepted procedures whereby products are tested on large groups of individuals, and it must naturally be assumed that, where the incidence of the development of a skin irritation is of a very low order, those materials may be classed as harmless. There is no reason why the manufacturer of such products which come in contact with the skin can be hcM responsible for the peculiar allergies of a few individuals in the population, any more than a fruit or a vegetable dealer can he considered responsible for the sale of foodstuffs which ‘disagree’ with certain consumers. / Найлан^{T3} (Nylon^{TM}).

SKIP = ПОДНЫРКА – Skip:- a blemish in woven goods when a filling yarn skips over several warp threads by mistake. Usually caused by harness skips, snapped yarn, small holes, etc. See also Float. Fabrics defect. / когда уточная пряжа . Подныpка – порок ткани. Подныpки не более 5 см. Размер порока – до 1 см. Под Подныpками понимается дефект суровой ткани, когда уточные нити на коротких участках не переплетаются с основными, а выступают в виде скобочек или петель сверху или снизу полотна; причины – нечистый зев, несвоевременный ввод уточной нити в зев, провисание нитей основы, излишне высокое или низкое расположение шпаруток и другое.

SKIPPED STITCH = ПРОПУЩЕННЫЙ СТЕЖОК (или ПРОПУЩЕННАЯ ПЕТЛЯ) – (1) Skipped Stitch:- caused by faulty looper, needle, hook, incorrect tensions or machine timing. See also Skip Stitch. Machinery defects, and namely – Sewing Machines and Attachments. / Порок или дефект от машинного оборудования.

(2) Skipped Stitches:- caused by machine malfunction or excessive needle heat due to friction. Sewing Room Defects. Skipped Stitches:- where the stitch forming device misses the needle loop or the needle misses the looper loop. Skips are usually found where one seam crosses another seam and most of the time occurs right before or right after the heavy thickness. Minimizing skipped stitches:- (1) use corespun thread; (2) use minimum thread tension to get a balanced stitch; (3) use the ideal foot, feed and plate that helps to minimize flagging; (4) training sewing operators not to stop on the thickness; (5) make sure the machine is feeding properly without stalling; and (6) make sure the machine is not backfeeding. Fabrics defect. / Порок или дефект швейного производства.

SKIPPER = ШКИПЕР – Skipper (maritime term):- the captain. / Шкипер:- (1) капитан несамоходного судна; устаревший термин для капитана торгового (или коммерческого) судна. (2) На морских судах:- лицо, ответственное за палубное имущество.

SKIP–ROW PLANTING = РЯДОВОЙ ПОСЕВ С ПРОПУСКОМ РЯДА – Skip-Row Planting is the practice of planting one or more rows in iniform space, then skipping one or more rows, to conserve moisture in dryland areas or to increase yields on land actually planted, or both. / Рядовой Посев (междурядья 10–25 сантиметров (см), чаще 15 см) применяют при выращивании главным образом зерновых культур. Рядовая сеялка укладывает семена на дно бороздки и закрывает их рыхлым слоем почвы, что способствует дружному появлению всходов. Под Рядовым Посевом понимается размещение семян в почве параллельными рядками. Ленточный Посев относится к рядовому посеву крупяных, овощных и других культур. Ленты из 2–3 и более сближенных рядков растений (строчек) чередуются с широкими междурядьями. Ленточный Посев, рядовой посев, при котором широкие междурядья между лентами (группа рядов) чередуются с узкими между рядами. В зависимости от числа рядов (строчек) в ленте различают ленточные посевы 2-, 3-строчные и так далее. Расстояние между строчками в ленте 7.5–15 сантиметров (см), между лентами 45–60 см и более. Ленточный посев применяют для культур с небольшой площадью питания, например, Лук, Морковь, Просо, Редис или столовая Свёкла. Проводят ленточные посевы рядовыми сеялками при соответствующей расстановке сошников. Широкорядный Посев, рядовой посев пропашных культур (Картофель, Кукуруза, сахарная Свёкла, Хлопчатник, многие овощные и другие) с междурядьями шириной более 25 см. Узкорядный Посев относится к рядовому посеву зерновых, Льна-Долгунца, многолетних трав, Редиса, Салата и других культур с междурядьями не более 10 сантиметров. Пунктирный Посев, рядовой посев сельскохозяйственных растений с одиночным распределением семян в рядке на одинаковом расстоянии одно от другого.

SKIP STITCH = ПРОПУЩЕННЫЙ СТЕЖОК (или ПРОПУЩЕННАЯ ПЕТЛЯ) – Defect Name:- Skip Stitch. Defect Type:- Pattern Defects. Fabric Type:- Double Knit Fabrics. Description:- Skip Stitch:- This is the result of a stuck jack failing to actuate the needle, thus skipping a stitch. When the yarn is picked up for the next stitch, a float is formed on the face of the fabric. Severity:- Major. See also Skipped Stitch.

SKIRT = ЮБКА – Skirt is a separate free-hanging outer garment or undergarment usually worn by women and girls covering some or all of the body from the waist down.

SKIRTING = ОТДЕЛЕНИЕ – Skirting is the practice of removing from the edges of the whole fleece at shearing time of all stained and inferior parts. See also Belly Wool, Britch, and Tags. / Отделение – практика забора из . Отделение, например, от рун низших сортов шерсти.

SKIRTING = ЮБОЧНАЯ ТКАНЬ – Skirting is a fabric suitable for skirts.

SKIRTINGS = ОБОР – Skirtings:- the inferior quality wool that has been removed from the fleece. / Обор – грязные края, отделённые от руна.

SKITTERINESS = КРАПЧАТОСТЬ (или РАЗНООТТЕНОЧНОСТЬ) – Skitteriness:- an undesired speckled effect in a fabric or in a yarn within a fabric. Note:- this defect is caused by differences in the depth of dyeing between adjacent fibers or portions of the same fiber. / Крапчатость (skitteriness):- порок заключительной отделки ткани; нежелательный крапчатый (пёстрый) эффект в полотне или пряже с лицевой стороны полотна. Примечание:- этот порок возникает при наличии разницы в глубине крашения между соседними участками полотна.

SKIVER = ТОНКАЯ КОЖА – Skiver is a common name in leather for the hide of an animal with the fur removed.

SKIVVY = СКИВИ (или СЛУЖАНКА) – Skivvy:- men's underwear; especially a T-shirt and briefs or shorts (usually used in plural).

SKI WEAR = ЛЫЖНАЯ ОДЕЖДА (или ОДЕЖДА ДЛЯ ЛЫЖНИКОВ) – Ski Wear is a clothing suitable to wear while skiing, such as warm, waterproof pants, jackets, and so forth. Skiwear is a clothing suitable for wear while skiing.

SKK = SLOVAK KORUNA

SKORT = ЮБКА–ШОРТЫ (или ХХ) – Skort:- this design features shorts covered by a front-wrap (and sometimes a back-wrap also) skirt panel. Basically, the garment is a 'short' that also takes the appearance of a 'skirt'. / юбка, комбинированная с шортами.

SKU = STOCK KEEPING UNIT

SKULLCAP = ТЮБЕТЕЙКА (или ХХ) – Skullcap is a close-fitting cap, especially a light cap without brim for indoor wear.

SKY BLUE = НЕБЕСНОГОЛУБОЙ (или ЛАЗУРНЫЙ) – Sky Blue:- a variable color averaging pale to light blue.

SKYLIGHT = СВЕТОВОЙ ЛЮК – Skylight (maritime term):- a covering, either permanent or removable, to admit air and light below decks.

SKY LINE SHADES = ОТТЕНКИ НЕБЕСНЫХ ЛИНИЙ – Sky Line Shades is another name for Roman Shades.

SKY PILOT = НЕБЕСНЫЙ ЛОЦМАН – Sky Pilot (maritime term):- a chaplain. / священник.

SL = SHOOT LENGTH

SL = SICK LEAVE

SL = SIERRA LEONE

SL = SOLD

SL = SPAN LENGTH

SLAB = СЛЯБ – Slabs and Blooms:- cast ingots, sometimes still hot, arrive at slabbing and blooming mills on railroad cars and are charged upright by a special crane into under-floor soaking pits. These are gas-fired rectangular chambers, about 5 meters deep, in which four to eight ingots are simultaneously heated to about 1 250 °C (2 300 °F). An ingot used for conversion into a slab can be 1.5 meters wide, 0.8 meter thick, and 2.5 meters high and can weigh 23 tons. The soaking pits are highly computerized for scheduling, firing rates, heating times (which can last 8 to 18 hours), and rolling programs. After heating, a tiltable transfer buggy brings a hot ingot to a two-high reversing mill, which takes one pass after another, reversing the rolls and roller table each time the ingot has passed through. Because each pass reduces the slab by only about 50 millimeters, it may take 21 passes, including several edge passes with the slab standing upright on its edges, to obtain a slab measuring 0.2 meter thick, 1.5 meters wide, and 10 meters long. The rolls usually have a diameter of about 1.2 meters; each is driven by one or two electric motors totaling 7 000 to 12 000 horsepower. The two roller tables, situated in front and in back of the stand, have movable manipulators that guide the slab into the rolls and turn it onto its

edges when required. High-pressure water nozzles remove surface scale, and a crop-shear discards the ends and cuts the slab into proper length. Some slabbing mills place a pair of heavy vertical rolls next to the horizontal rolls for edge rolling; this avoids the time-consuming turning of the slab into an upright position. Such an arrangement is called a Universal Mill. For making long products, blooms some 250 millimeters square are rolled from ingots in a similar fashion on the same type of mill. Slab:- cuboid half-finished steel products that are hot-rolled into sheets at the rolling mill. A Slab is a length of metal that is rectangular in cross-section. It is created directly from continuous casting or indirectly by rolling an ingot. Slabs are usually further processed via flat rolling, skelping, and pipe rolling. Common final products include sheet metal, plates, strip metal, pipes, and tubes. / прокатка (rolling). Слябы и Блюмы (Blooms):- . Под Слябом понимается полупродукт металлургического производства, который представляет собой плоскую стальную заготовку прямоугольного сечения с большим отношением ширины к высоте (до 15), получаемую на машинах непрерывного литья или обжатием слитка на слябинге (реже блюминге или блюминге-слябинге). Ширина сляба от 400 до 2 500 мм, высота (толщина) от 75 до 600 мм. Слябы предназначены преимущественно для производства листового проката.

SLACK = ПРОВИСАНИЕ (или СЛАБИНА) – Slack (maritime term):- the part of a rope hanging loose; the opposite of taut.

SLACK = ШИРОКИЕ БРЮКИ (или ШТАНЫ, или СЛЭК) – Slack:- trousers especially for casual wear (usually used in plural tense).

SLACK END = ОСЛАБЛЕННАЯ (или ПРОВИСШАЯ) ПРОДОЛЬНАЯ НИТЬ – Slack End is a warp yarn woven under insufficient tension. Synonym:- Slack Thread, and Slack Warp. (1) Defect Name:- Slack End. Defect Type:- warp lines, vertical lines. Fabric Type:- Denim Bottomweights – Piece Dyed. Description:- Slack End:- This is the result of an end broken far back on the loom beam being woven into the cloth without tension. This tends to pucker the yarn as it is woven. Severity:- Major. (2) Defect Name:- Slack End. Defect Type:- warp lines, vertical lines. Fabric Type:- Denim Bottomweights – Indigo Dyed. Description:- Slack End:- This is the result of an end broken far back on the loom being woven into the cloth without tension. This tends to pucker the yarn as it is woven. Severity:- Major. Slack End:- insufficient warp tension. Woven fabric defect. Slack End is an end woven under insufficient tension. / Порок или дефект ткачества. Слабина Основной Нити (slack end):- порок основы; основная пряжа, которая кажется складчатой. Примечание:- этот порок вызван пряжей основы, сотканной при более низком натяжении, чем смежная пряжа основы.

SLACK ENDS = ОСЛАБЛЕННЫЕ (или ПРОВИСШИЕ) ПРОДОЛЬНЫЕ НИТИ – Defect Name:- Slack Ends. Defect Type:- Warp lines, vertical lines. Fabric Type:- Denim Bottomweights – Piece Dyed. Description:- Slack Ends:- This shows the effect of a warp running out on a loom, resulting in a large number of ends weaving slack. Severity:- Major.

SLACK FILLING = ОСЛАБЛЕННАЯ УТОЧИНА (или ПРОВИСШАЯ УТОЧИНА, или НЕНАТЯНУТАЯ УТОЧИНА) – Slack Filling or Slack Pick or Slack Weft:- a weft yarn that appears slightly puckered in relation to the adjacent weft yarns. Note:- this defect is caused by a weft yarn having been inserted under a lower tension than that of the adjacent weft yarns. See also Slack Pick. / Слабина Утка; Ненатянутая Уточина; Слабая Уточная Нить (slack filling; slack pick; slack weft):- порок утка; уточная пряжа, которая кажется, немного собранной в сборку относительно смежной уточной пряжи. Примечание:- этот порок вызван уточной пряжей, затканой при более низком натяжении, чем смежная уточная пряжа.

SLACK MERCERIZATION = ОСЛАБЛЕННАЯ МЕРСЕРИЗАЦИЯ – Slack Mercerization is a process for producing stretch in cellulosic fabrics.

SLACK PICK = ОСЛАБЛЕННАЯ (или ПРОВИСШАЯ, или НЕНАТЯНУТАЯ) ПОПЕРЕЧНАЯ НИТЬ – Slack Pick is a single filling yarn woven under insufficient tension. Fabrics defect. Slack Pick is a single filling yarn woven under insufficient tension. Synonym:- Loose Pick, and Slack Filling. / уточная пряжа, .

SLACK SELVAGE = ОСЛАБЛЕННАЯ КРОМКА – Slack Selvage is a self-descriptive fabric defect caused by incorrect balance of cloth structure between the ground and selvage or by the selvage ends being woven with insufficient tension. Fabrics defect. Slack Selvage:- slack ends in the fabric edge. Synonym:- Baggy Selvage, Loose Edge, Stringy Selvage, and Wavy Selvage.

SLACK THREAD = СЛАБИНА (или ОСЛАБЛЕННАЯ НИТЬ, или ПРОВИСШАЯ НИТЬ, или НЕНАТЯНУТАЯ НИТЬ) – Slack Thread:- yarn that appears slightly puckered in relation to the adjacent yarns. See also Slack End. / Слабины – провисающие или ослабнувшие нити при размотке сновального валика и ткацкого навоя.

SLACK TWIST = ОСЛАБЛЕННАЯ КРУТКА – Slack Twist:- insufficient twist in thread. Thread defects, and namely – Spinning. / Порок или дефект ниток.

SLACK WARP = ОСЛАБЛЕННАЯ (или ПРОВИСШАЯ, или НЕНАТЯНУТАЯ) ОСНОВА – Slack Warp is a warp yarn that appears puckered as the result of having been woven under less tension than the adjacent warp yarns. When handling slack warp threads, the first tendency of weavers is to hang something on those threads to immediately tighten them. However, the opposite is more effective – as you have done here. Once a weight is hung from a warp thread, it begins to stretch more than its neighbors and causes trouble to the end of the warp. The late Al Fannin (textile professor at Syracuse University) once said, a loom is not a Christmas tree to hang baubles from. The first course of action is to weave carefully if the slack is minor. Sometimes within inches the tension returns to an acceptable point and you can simply keep on weaving. If the slack is great enough to form a loop as pictured above, pull the thread tight and pin to the web the same as with a mended warp break, fasten with a straight sewing pin. This slack can be worked in after wet finishing. As you have done, waiting until a cutting break in the fabric will result in the least amount of visibility in the finished cloth. Other than that, take note that while sectional warping is generally regarded as an excellent way to reduce warp tension issues, it is not failsafe. Fabrics defect. See also Slack End.

SLACK WATER = СМЕНА ВОД – Slack Water (maritime term):- the condition of the tide when there is no horizontal motion. / Смена Вод при приливе.

SLAMMING = СЛЭМИНЬ – Slamming:- impact of water on the bows of the ship. / Воздействие воды на носовые курсовые углы судна. Слэмин или Слэминг – гидродинамический удар о носовую часть днища судна при продольной качке. Способность судна не ударяться о воду при выходе из воды при качке характеризует одно из его мореходных качеств – умеренность слэминга.

SLAM–OFF = СЛЁТ (или ОТСКОК) – Slam-Off:- in woven fabrics, a distortion due to the entrapment of the filling carrier in the shed. Compare Smash. See also Smash. / уточина в зеве.

SLASHER = ШЛИХТОВАЛЬНАЯ МАШИНА – Slasher is a machine used to apply size to the warp ends, while transferring the warp yarns from section beams to the loom beam. Slasher is the machine used in a weaving mill for ‘slashing’, or the application of sizing mixture to the warp yarn prior to weaving. Slasher is a machine for sizing, drying, and finishing warp-yarns. A slasher includes a moistening unit for moistening warp yarns by spraying water on the warp yarns, a squeezing unit for squeezing the moistened warp of the warp yarns, and a sizing unit for sizing the moistened and squeezed warp yarns. The moistening unit sprinkles water on the warp

yarns to moisten the warp yarns. The warp yarns absorb part or all of the water sprinkled thereon. The warp yarns are not immersed in water during moistening to avoid excessive moistening. The squeezing unit squeezes the moistened warp yarns so that moisture infiltrates the warp yarns and the warp yarns is moistened uniformly. The moisture moistening the warp yarns is replaced and mixed with size liquor while the warp yarns are being passed through size liquor, so that the warp yarns can be easily and uniformly sized.

SLASHER SIZING = ШЛИХТА ШЛИХТОВАЛЬНОЙ МАШИНЫ – Slasher Sizing is the mostly used sizing process. About all types of yarns can be sized by slasher sizing process. In this process the warp is passed through a size liquor bath then through a separating unit and cooling unit. See also Slashing. Slasher Sizing Machine:- this really is the many chosen sizing task. Regarding all kinds of yarns is sized by slazer sizing task. In this procedure the warp is passed from the size liquor shower then by the separating device plus cooling device. The Slasher Sizing Machine consists of the following 7 units:- (1) Back Beam Device:- in single end sizing yarns are taken from a creel rather than from a beam. This device contains 7 to 12 carriers from where yarn is supplied. Indirect and direct process of yarn supply is frequently used for spun yarns. In case of indirect method beam creel is used. This beam creel can be arranged in various ways. (2) Sizing Device:- in this device a size box is used to apply size to the yarn. The warp sheet is guided through the solution means of the immersion roller and then through the squeeze roller where the yarns are pressed to maintain the required size to up percentage by the yarn. The size box temperature is controlled by flowing steam through pipe. (3) Drying Device:- two or more heated cylinder consists of drying device. This device is required to dry the wet sized yarn rapidly, thoroughly and uniformly. A two cylinder dryer is too slow and it is difficult to maintain by it. But a multi-cylinder dryer is a good one to main in such a way that after drying. Yarn contains 6% water. (4) Cooling Device:- in this device there is cooling fan and a guide roller. The cooling fan supplies cool air which extinguish the yarn temperature and also remove the moisture. (5) Dividing Unit/Separating Device:- in order to prevent adhesion between the yarns. It is necessary to separate each sized end from the others. For this lease rod or breaker rods are used to divide the main warp sheet into single end. (6) Measuring plus Marking Unit:- this unit consists of coloring bowl which contains easily removable color. This color is used for marking on sized yarn. Also there is a measuring roller which measures the length of sized warp yarn. And (7) Beaming Unit:- finally the sized warp is wound on weavers beam.

SLASHING = ШЛИХТОВКА (или ПРОКЛЕИВАНИЕ ОСНОВЫ В РАСПРАВКУ) – Slashing is a process of sizing warp yarns on a slasher. See also Sizing (1), and Slasher. Slashing is employed when non twisted yarn is used. Warp sizing is applied to the yarns to facilitate handling and to provide protection during the weaving process. This operation involves (i) sizing single-fiberglass warp yarns with a specially compounded chemical formulation, (ii) drying the yarns, and (iii) winding the desired number of ends on the loom beam through the combination of section beams.

SLASH ROT = ГНИЛЬ РАЗРЕЗА (или ГНИЛЬ НАДРЕЗА, или ГНИЛЬ СРЕЗА) – Slash Rot, is a term simply referring to decay of dead material, particularly branches, tops, and stumps after logging. / Гниль Разреза/Надреза/Среза – термин, относящийся к гниению или загниванию мёртвого материала, в частности ветвей, верхушек, и клейм после лесозаготовки.

SLATE = ШИФЕРНОЕ (или АСПИДНОЕ, или СЛАНЕЦ) – Slate:- a dark purplish gray.

SLATE BLACK = АСПИДНО–ЧЁРНОЕ (или ШИФЕРНОЧЁРНОЕ) – Slate Black:- a nearly neutral slightly purplish black.

SLATE BLUE = ШИФЕРНОГОЛУБОЕ (или АСПИДНО–ГОЛУБОЕ) – Slate Blue:- a grayish blue color.

SLAUGHTER CATTLE = УБОЙНЫЙ КРУПНЫЙ РОГАТЫЙ СКОТ (или КРУПНОРОГАТЫЙ СКОТ ДЛЯ УБОЯ) – A term Slaughter Cattle refers to Cattle grazing on pasture and suitable for slaughter. Sex differentiation (e.g., heifers, steers and/or bulls) should be indicated on product labeling. See also Feeders, Stockers, and Weaned Cattle.

SLAVE PALLET = ЖЕРТВЕННЫЙ ПОДДОН (или ПОДДОН–ПЛАТФОРМА) – Slave Pallet is a pallet, platform or single, thick panel used as a support base for a palletized load in rack-storage facilities or production systems. See also Pallet. Slave Pallet is a rigid pallet or platform consisting of a single, thick panel used as a support base for palletized loads in rack storage facilities or production systems. / Поддон-Платформа (Slave Pallet):- жёсткий поддон или платформа, состоящая из единой толстой панели, применяемые для пакетирования грузов на складах или в производственных помещениях. Смотрите также Поддон (Pallet).

SLBE = SERVICIO DE LIQUIDACIÓN DEL BANCO DE ESPAÑA

SLEAZY = РЕДКОЕ (или ТОНКОЕ, или НЕДОСТАТОЧНО ПРОЧНОЕ) – Sleazy:- thin, lacking firmness, open-meshed; usually describes poor-grade fabrics.

SLEEPER = ЛЕЖЕНЬ (или ЛЕЖАК, или СПАЛЬНИК) – Sleeper is a sleeping compartment mounted behind a truck cab, sometimes attached to the cab or even designed to be an integral part of it. / Спальный отсек, монтируемый позади кабины грузовика, иногда прикрепляемый к кабине или даже разработанный таким образом, что является её неотъемлемой частью.

SLEEPERS = ЛЕЖАКИ – Sleepers are the loaded containers moving within the railroad system that are not clearly identified on any internally generated reports.

SLEEPSHEET = ХХ СХЕМА (или КАРТА) – Sleepsheet is a method of loading packages in a container via a thin liner board and forklift.

SLEEPWEAR = ОДЕЖДА ДЛЯ СНА – Sleepwear is nightclothes.

SLEEVE BEARING = ПОДШИПНИК СКОЛЬЖЕНИЯ (или ВТУЛОЧНЫЙ ПОДШИПНИК, или ПОДШИПНИК С ВКЛАДЫШЕМ) – Sleeve Bearing is a machine bearing in which the axle or shaft turns in a sleeve that is often grooved to facilitate distribution of lubricant to the bearing. Sleeve Bearing is a journal bearing, usually a full journal bearing. See also Bearing. Sleeve Bearing (also called a Journal Bearing) is a simple device for providing support and radial positioning while permitting rotation of a shaft. It is the oldest bearing device known to man. In the broad category of sleeve bearing can be included a great variety of materials, shapes, and sizes. Materials used include an infinite number of metallic alloys, sintered metals, plastics, wood, rubber, ceramic, solid lubricants, and composites. Types range from a simple hole in a cast-iron machine frame to some exceedingly complex gas-lubricated high-speed rotor bearings. Sleeve bearings do have a number advantages over rolling element bearings, as well as some disadvantages. Advantages are:- (i) inherently quiet operation because there are no moving parts; (ii) if properly seleted and maintained, they do not fail suddenly; (iii) wear is gradual, allowing scheduling of replacement; (iv) well suited to oscillating movement of the shaft; (v) with proper material selection, excessive moisture and submersion can be tolerated; and (vi) with proper material selection, extreme temperatures can be accommodated. Disadvantages are:- (i) high coefficient of friction; (ii) for the same boundary plan, much less load capacity; and (iii) life is not predictable except through experience. In the application of sleeve bearings, the most important factor is the selection of the actual bearing material. The three most common industrial materials are Babbitt, bronze, and cast iron. After these, there is an amazing variety of different bearing materials, often specialized for a particular application. In most cases, the details of

selection are unique and assistance should be obtained from the manufacturer of the sleeve material. The load carrying ability of a sleeve bearing is usually expressed in pounds per square inch (psi).

SLEEVE CAP = СКАТ РУКАВА – Sleeve Cap is the top part of the sleeve at the shoulder that may be set flat (smooth), pleated, or shirred (gathered).

SLEEVE LENGTH = ДЛИНА РУКАВА – Sleeve Length:- relax arm, and measure from the center of the back of the neck, over the shoulder and down to the outer wrist. Sleeve (for men):- with elbow bent, measure from center of neck (backside) to elbow and down to wrist. Sleeve Length:- the sleeves measured from the center of the neckline in the back to the end of the sleeve or cuff. / рукава (sleeve) или манжеты или обшлага (cuff). Длина Рукава – измеряется по внешней стороне рукава от его вершины до низа. Длина Рукава От Горловины – измеряется от основания горловины или воротника до низа рукава.

SLEEVELESS = БЕЗРУКАВКА – Sleeveless is a top that does not have sleeves.

SLEEVELET = НАРУКАВНИК – Sleevelet is a covering for the forearm to protect clothing from wear or dirt.

SLEEVE LINING IN DIFFERENT COLOR = ОБТАЧКА РУКАВОВ РАЗНЫМ ЦВЕТОМ – Sleeve Lining In Different Color:- the rest of the pieces in the lot had pink lining whereas one had green. Possible Cause:- stitching of different color, in order to complete the product, due to lack of required material. This is a minor defect. Though the product is markedly different from what was originally intended, it can still be sold as a perfectly good article. Stitching defect. / Обтачка – отдельно выкраиваемая деталь для обработки срезов, всегда повторяющая форму среза. Поэтому для обтачки не даётся, как правило, отдельная выкройка – она переснимается с конструктивной детали выкройки как отдельная деталь. Направление долевой нити обтачки и основной нити обычно совпадают. Цельнокроенная обтачка – если подлежащий обработке срез прямой, обтачку можно выкроить вместе с основной деталью и отвернуть на изнаночную сторону.

SLEEVE TACKING = ПРИМЕТКА РУКАВА (или СМЕТКА РУКАВА, или ПОДШИВКА РУКАВА) – Sleeve Tacking:- stitches which attach the sleeve to the lining along the sleeve inseams and elbow seams. / стежки, которые .

SLEEVE VENT = ШЛИЦА РУКАВА (или РАЗРЕЗ РУКАВА) – Sleeve Vent:- a finished slit or opening in the sleeve. Vents are usually secured by snaps or buttons at the base of the cuff.

SLEEVING = XX (или ИЗДЕЛИЕ В ВИДЕ ЧУЛКА, или ИЗДЕЛИЕ В ВИДЕ РУКАВА) – Sleeving is a braided, knit, or woven product or fabric in tubular or cylindrical form that is less than 4 inches in width, i.e. 8 inches in circumference.

SLEY = ПАСМА (или БЁРДО; или ЧИСЛО ОСНОВНЫХ НИТЕЙ НА ЕДИНИЦУ ДЛИНЫ В СУРОВОЙ ТКАНИ, или ПЛОТНОСТЬ СУРОВОЙ ТКАНИ ПО ОСНОВЕ) – Sley is the number of warp yarns per inch in a woven cloth on or off the loom. Sley is the number of warp ends per inch in a cloth. Sley is the number of ends per inch in the cloth, provided each dent in the reed in which it was made contained an equal number of ends.

SLEY REED = ОСНОВНЫЙ БЁРДО (или БЁРДО НА ... ПАСМ) – Sley Reed is a reed that will produce a given sley in the cloth, provided two ends are drawn in each dent. / Бёрдо на какое-то количество пасм.

SLICED VENEER = СТРОГАНЫЙ ШПОН – Sliced Veneer is a veneer that is sliced from a log with a knife. / Шпон, который срезан с бревна в процессе его строгания с помощью специального ножа. Под Шпоном, от Немецкого слова Span, означающее Щепка, понимаются тонкие листы древесины определённой толщины (обычно в диапазоне 0.35–4 миллиметров (мм)), используемые для производства слоистой клеёной древесины (древеснослоистых пластиков, клеёных заготовок, фанеры) и для облицовывания изделий или сборочных единиц из древесины и древесных материалов с целью улучшения их механических свойств и внешнего вида. Различают:- (i) лущёный шпон, полученный лущением на лущильном станке; и (ii) строганный шпон, полученный строганием на шпонострогальном станке. Лущёный шпон изготовляют из древесины Берёзы, Бука, Дуба, Ели, Кедра, Клёна, Липы, Лиственницы, Ольхи, Осины, Пихты, Сосны, Тополя и Ясеня; строганный шпон – из Бархатного Дерева, Берёзы, Бука, Вяза, Граба, Груши, Дуба, Ивы, Ильма, Карагача, Каштана, Клёна, Красного Дерева, Липы, Лиственницы, Ольхи, Ореха, Осины, Сосны, Тополя, Ясеня. Строганный шпон отличается красивой текстурой, используется как ценный облицовочный материал.

SLICKER = ПЛАЩ ИЗ КЛЕЁНКИ или НЕПРОМОКАЕМОЙ ТКАНИ (или ДОЖДЕВИК) – Slicker:- oilskin; broadly, a raincoat.

SLIDER = ТОЛКАЧ (или XX) – Slider is an ornament that slides up and down a chain.

SLIDE WASTE = ПОЛЗУЧИЙ ОТХОД – Slide Waste is a yarn defect that is similar in appearance to a slub. It consists of a mass of fiber encircling the yarn end and can be slid freely along the end.

SLIDING SCALE = СКОЛЬЗЯЩАЯ ШКАЛА – (1) Sliding Scale is a scale of charges that is based on the value of the thing upon which the charges are to be made. / Шкала сборов, которая основывается на стоимости вещи, по которой и должны быть начислены сборы.

(2) Sliding Scale:- rates based on number of containers moving over a period of time. The higher the cargo volume, the lower the rate. / Ставка, основанная на количестве контейнеров, перемещаемых за определённый период времени. Чем выше объём грузов, тем ниже размер ставки.

SLIDING SCALE COMMISSION = КОМИССИЯ ПО СКОЛЬЗЯЩЕЙ ШКАЛЕ – In reinsurance, a Sliding Scale Commission is a ceding commission which varies inversely with the loss ratio under the reinsurance agreement. the scales are not always one to one:- for example, as the loss ratio decreases by 1%, the ceding commission might increase only 5%.

SLIDING TANDEM = БУКСУЮЩИЙ (или ПРОСКАЛЬЗЫВАЮЩИЙ, или СКОЛЬЗЯЩИЙ) ТАНДЕМ (или ПОСЛЕДОВАТЕЛЬНО РАСПОЛОЖЕННЫЕ) (или ДВИЖЕНИЕ СУДНА ВПЕРЁД С БОКОВЫМ СНОСОМ И ИЗМЕНЕНИЕМ КУРСА) – Sliding Tandem:- an undercarriage with a subframe having provision for convenient fore and aft adjustment of its position on the chassis/semi-trailer. The purpose being to be able to shift part of the load to either the king pin or the suspension to maximize legally permitted axle loads (road cargo). / поворотный шкворень или палец прицепного механизма прицепа (king pin) .

SLIMES = ШЛАМЫ – Slimes:- the fine fraction of waste material discharged from the mill after valuable minerals have been recovered or the metallic compounds left in the bath during electrolytic refining of metals. / электролитическое рафинирование (electrolytic refining) металлов. Под Шламом, от Немецкого слова Schlamm, означающее буквально Грязь, понимается:- (1) Илистый осадок или тонкая взвесь мелких (до 10–40 мм) классов полезных ископаемых (например, руды или угля) в воде. Образуется в процессе измельчения при обогащении либо при бурении горных пород с водой или промывочным раствором. (2) Нерастворимые отложения (из воды) в паровых котлах в виде ила и твёрдых кусков. Для удаления шлама производят

периодическую продувку котла. Применяют также термосифонное удаление шлама. (3) Порошкообразный продукт, содержащий обычно благородные металлы, выпадающие в осадок при электролизе меди, цинка и других металлов. (4) Осадок в виде мелких частиц, выделяющихся при отстаивании или фильтрации жидкости. (5) Нефелиновый Шлам или Белитовый Шлам в производстве цемента.

SLIM WEDGES = XX – Slim Wedges:- xxxxx. See also Tapered Blocks.

SLING = СТРОП – Sling is a wire or rope contrivance placed around cargo and used to load or discharge it to/from a vessel. Chains, ropes, or straps used for cargo handling purposes. / и используемые для погрузки его на или разгрузки его из судна. Под Стропом, от Голландского слова Strop, означающее Петля, понимается простейшее грузозахватное приспособление, выполняемое обычно из каната или цепи (одна или несколько ветвей), снабжённое на конце захватными крюками, скобами, кольцами и тому подобным. В качестве стропа используют также ленты, полотнища, сетки и тому подобное. Строп может быть оборудован устройствами для автоматической застропки (захвата) грузов. Такой строп называется автостропом и служит для зачалки и расчалки грузов в труднодоступных местах. Он находит применение для захвата контейнеров, пакетов и тому подобного. Стропами называют также элементы аэростатов и парашютов. Строп – устройство для подвешивания грузов к крюкам, скобам, траверсам – отрезок троса или цепи, замкнутый в кольцо или образующий петлю. Автоматические приспособления для захвата и освобождения груза называют автостропами. Подвесы в виде траверсы с поворотными замковыми устройствами.

SLINGBACK = БОСОНОЖКА (или XX) – Slingback is a category of footwear. A slingback is a pump with an open back and a strap behind the foot.

SLINGING = ЗАСТРОПКА (или СТРОПОВКА) – Term Slinging describes the process of attaching slinging equipment (for example, ropes, chains or webbing slings) to a load in order for it to be lifted/transshipped safely using lifting gear, for example, a crane. / при подъёме стропом.

SLING LOSS = ПОТЕРИ ПРИ ЗАСТРОПКЕ (или ПОТЕРИ ПРИ СТРОПОВКЕ) – Sling Loss:- cargo lost by falling from ship's lifting tackle during loading or unloading. / Груз, потерянный вследствие его падения из подъёмных снастей судна в процессе погрузки или выгрузки.

SLINKY KNIT = ТРИКОТАЖНОЕ ПОЛОТНО В ОБТЯЖКУ – Slinky Knit is a fabric with four-way stretch for ideal comfort. It drapes well, washes easily and is not vulnerable to wrinkling.

SLIP = КВИТАНЦИЯ (или ТАЛОН) – In securities dealing, Slip is a confirmation attached to a security which documents an additional feature, e.g., declaration concerning non-enemy property, official export license, or interest in arrears. See also Affidavit. / В сделках с ценными бумагами, подтверждение, приложенное к ценной бумаге, которое уведомляет о дополнительных особенностях, например, о декларации, касающейся собственности, непринадлежащей противоположной стороне, об официальной вывозной (или экспортной) лицензии или об участии в задолженности. Смотрите также Аффидевит (Affidavit).

SLIP = КОМБИНАЦИЯ – Slip is an undergarment made in dress length with shoulder straps.

SLIP = ОТВЯЗЫВАТЬ (или СНИМАТЬСЯ, или ОТДАВАТЬ) – Slip (maritime term):- to let go by unshackling, as a cable.

SLIP = СЛИП – Slip is a vessel's berth between two piers. / Место стоянки судна между двумя пирсами. Под Слипом, от Английского слова Slip, означающее буквально Скольжение, понимается:- (1) сооружение для подъёма судов на берег с целью их осмотра, ремонта или отстоя. Слип представляет собой наклонную площадку с уходящими в воду рельсовыми путями, по которым передвигаются тележки с установленным на них судном. После подъёма судно перемещается на рабочую горизонтальную площадку. Сооружаются слипы на берегах судоходных рек и морских портах. (2) Наклонная площадка в кормовом отверстии рыбопромышленного судна, по которой добычу, например, трал с рыбой, втаскивают на палубу. Под Слипом понимается:- (i) наклонная береговая площадка для спуска судов со стапеля на воду или подъёма их из воды (судно перемещается на рельсовых тележках с помощью лебёдок). Слипы бывают продольные (судно поднимают и спускают носом или кормой вперёд) и поперечные (судно поднимают и спускают бортом к воде); или (ii) наклонный скат палубы в кормовой оконечности промыслового судна (доходит до ватерлинии) для подъёма добычи, например, трала с уловом, на палубу. Под Стапелем, от Голландского слова Stapel, понимается место постройки судов, представляющее собой наклонную к воде бетонную площадку, на которой располагаются опоры для судна (кильблоки).

SLIP = СЛИП (или КАРТОЧКА) – Slip is a binder often including more than one reinsurer. At Lloyd's of London, the slip is carried from underwriter to underwriter for initialing and subscribing to a specific share of the risk. There are two types of underwriting slip:- a placing slip and a signing slip. A Placing Slip is a document created by a broker that contains a summary of the terms of a proposed insurance or reinsurance contract which is then presented by the broker to selected underwriters for their consideration. Underwriters may delete, amend or add terms on a slip as they consider appropriate for the purpose of providing an indication or a quotation. A Signing Slip is a document that is created by a Lloyd's broker after a quotation has been accepted for the purpose of processing premiums under the contract that is evidenced by the placing slip. It is a cleaned up version of the final placing slip and shows underwriters' stamps, signed lines and underwriting references, these details being inserted by each underwriter at the request of the broker. Provided that it shows the underwriters' stamps, signed lines and underwriting references a placing slip may be used as a signing slip. In insurance, the details of a risk for which insurance is sought. The Slip placing system:- the slip sets out a brief and abbreviated statement of the subject matter of the risk and the proposed insurance conditions; the slip is first presented to a lead underwriter, then to the subsequent underwriters. Amended slip = counter offer. Where a slip is subscribed to by more than one underwriter, there is established a distinct and separate contract with each underwriter (no joint or joint and several liability). An oversubscribed slip:- signing down. A discrepancy between the slip and the marine policy:- prima facie the primary document is the slip, because it is the basis of the contract of marine insurance. See also LMP Slip or London Market Principles Slip. / брокером Лойдз (Lloyd's). сразу или на первый взгляд (prima facie).

SLIPCOVER = ЧЕХОЛ (или СТЁГАНОЕ ОДЕЯЛО) – Slipcover is an unattached covering for a sofa or chair. Slipcovers are made with openings so they can be removed for cleaning. They are also called Loose Covers.

SLIP–ON = НАКИДКА (или XX, или ЛЁГКИЕ КЕДЫ БЕЗ ШНУРОВКИ) – Slip-On is an article of clothing that is easily slipped on or off; a glove or shoe without fastenings; a garment, as a girdle, that one step into and pulls up; pullover.

SLIP–OVER = БЕЗРУКАВКА (или XX) – Slip-Over is a garment or cover that slips on and off easily, specifically a pullover sweater. / пуловер.

SLIPPAGE = РАЗДВИЖКА – Slippage is a sliding or slipping of the filling threads over the warp ends (or vice versa), which leaves open spaces in the fabric. Slippage results from a loose weave or unevenly matched warp and filling. / уточных нитей основными продольными нитями (или), . Раздвижка – порок ткани.

SLIPPAGE = ПРОЛЁТ (или ПРОСКАЛЬЗЫВАНИЕ, или ПРОБУКСОВЫВАНИЕ, или ПРЕДЕЛ ЦЕНЫ) – (1) Slippage is the difference between estimated transaction costs and the amount actually paid. The difference usually represents revisions to price difference or spread and commission costs. Slippage is usually attributed to a change in the spread. In futures, Slippage is the difference between estimated transaction costs and the amount actually paid. Brokers not being effective enough at executing orders, as well as market-impacted, liquidity, and frictional costs may contribute.

(2) Broadly speaking, a term Slippage refers to a failure to meet expectation with regard to the execution of an order. Slippage reflects the extent to which an orders fill price differs negatively from the price level at which it was entered. For example if a sell stop loss order was placed at 1.2762 in the EUR/USD and the order was filled at 1.2755, one would have experienced 7 pips of slippage on the order. / В клиентском распоряжении брокеру на фиксацию, разница между ценой фиксации и предельно допустимой, по которой может быть исполнено распоряжение, поскольку не всегда бывает возможность исполнить распоряжение по указанной цене фиксации. Правил ограничения предела цен нет, за исключением этического правила Up Tick – Down Tick, обязывающего брокеров сообщать клиентам цену, не хуже цены первого снижения на пункт (Down Tick) при исполнении фиксации покупкой (Buy Stop), и повышения на пункт (Up Tick) – при исполнении фиксации продажей (Sell Stop).

SLIPPED SEAM = СМЕЩЁННЫЙ ШОВ – Slipped Seam:- caused by stitches too long, insufficient seam margin. Machinery defects, and namely – Sewing Machines and Attachments. / Порок или дефект от машинного оборудования.

SLIPPED SPOOL = СМЕЩЁННАЯ ШПУЛЬКА – Slipped Spool:- common mostly to spools rather than cones. Body of thread not secure against spool or cone. Thread defects, and namely – Winding. / Порок или дефект ниток.

SLIPPER = ТАПОЧКА (или ТАПКА, или ПОЛЗУШКА) – Slipper is a light low-cut shoe that is easily slipped on the foot.

SLIPPER SATIN = АТЛАС ДЛЯ ШЛЁПАНЕЦ – Slipper Satin is a tightly woven satin fabric, usually lighter in weight than duchesse satin, and used for many purposes including evening shoes or slippers. Slipper Satin:- strong, compactly woven with quite a bit of body. It is used chiefly for footwear. Textures are high and the material comes colored, black or white, or richly brocaded effects. Shiniest satin.

SLIP POLICY = СЛИП ПОЛИС (или ПОЛИС КАРТОЧКА) – Slip Policy is a signed slip which is agreed to be a policy where the insured or the reassured does not require a separate policy. See also LMP Slip or London Market Principles Slip.

SLIP SHEET = СКОЛЬЗЯЩАЯ ПОДКЛАДКА – Slip Sheet is the similar to a pallet, the slip sheet, which is made of cardboard or plastic, is used to facilitate movement of unitized loads. Slip Sheet is a sheet of cardboard on which product is stacked; used instead of a pallet.

SLIP SHEET ATTACHMENT = НАВЕСКА ДЛЯ РАБОТЫ С ХХ – Slip Sheet Attachment is an attachment to the front end of a forklift that is used to handle product on a slip sheet.

SLIT = ПРОРЕЗЬ (или ПРОДОЛЬНЫЙ РАЗРЕЗ, или ЩЕЛЬ) – Slit in garment. Possible Cause:- careless cropping leads to scissors slicing through the garment leading to a cut. Depending on the size and location of the slit the defect can be classified as major or minor. In this case with a fairly obvious slit the defect can be labeled major. Stitching/Cropping defect.

SLIT–FILM YARN = ПРЯЖА ИЗ РАЗРЕЗАННОЙ ПЛЁНКИ – Slit-Film Yarn is a yarn of a flat, tape-like character produced by slitting an extruded film. / пряжа из плоской, типа ленты, произведённая нарезкой экструдированной плёнки.

SLIT STRIP = НАРЕЗАННЫЙ ШТРИПС – Slit Strip:- rolled sheets are produced in relatively wide strips (e.g., > 600 mm), also called Wide Strip. In order to be able to offer narrower strips, the strips are cut to slit strip in a slitting unit.

SLIT TAPE = РАЗРЕЗАННАЯ ЛЕНТА – Slit Tape is a fabric, 12 inches or less in width, made by cutting wider fabric to the desired width. Slit tapes are made primarily of cotton, linen, jute, glass, or asbestos and are used principally for functional purposes.

SLIVER = ЛЕНТА – Sliver is an indefinitely long assembly of staple fibers, substantially parallel, without twist, capable of being drafted in preparation for spinning. Top is a synonym for sliver. Sliver is an assemblage of fibers in continuous form without twist. In the spinning, a strand or rope of fibers without twist. In yarn manufacture, a sliver is formed by the carding machine and is of greater diameter than the strand created during roving. A soft untwisted rope of cotton fibers formed after they have been cleaned and straightened at the textile mill. The term Sliver comes from medieval Anglo-Saxon words Sleave, Slive, meaning to Split or Slit. Sliver has no twist and is the product of the carding process and drawing process on the cotton system. Sliver consists of a continuous rope of parallel fibers of cotton, wool, rayon, or some other material, with no twist applied. The term is also used in worsted yarn manufacture on similar operations. Combed sliver, when compared with carded sliver, is stronger, cleaner, more parallel, and has a greater tensile strength. A continuous rope of loose, untwisted cotton or wool fibers, the output of the card. Sliver is a continuous bundle of loosely assembled untwisted fibers. These are fibers that are drawn from the card by the drawing frames, and are eventually twisted into a yarn during the sliver knitting process. Sliver is the strand of loose, roughly parallel, untwisted fibers produced in carding. See also Roving, and Top. Sliver is a continuous strand of loosely assembled fibers without twist. Sliver is delivered by the card, the comber, or the drawing frame. The production of sliver is the first step in the textile operation that brings staple fiber into a form that can be drawn (or reduced in bulk) and eventually twisted into a spun yarn. See also Carded Sliver, Combed Sliver, Roving, and Top. Sliver is a filmy sheet of fibers resulting from carding. / выработка (output). Под Лентой, от Немецкого слова Linte, от Латинского слова Linteus, означающее Льняной или Полотняный, понимается полуфабрикат прядильного производства. Волокна в ленте распрямлены и ориентированы вдоль её оси. Ленту получают с чёсальных, ленточных, гребнечёсальных и штапелирующих машин. Смотрите также Кардная Лента или Чёсальная Лента (Carded Sliver) и Гребенная Лента (Combed Sliver). Текстильная Лента (Sliver or Top) – совокупность продольно ориентированных штапельных волокон заданной линейной плотности без крутки, предназначенная для последующей механической обработки путём вытягивания.

SLIVER KNITTING = ЛЕНТОЧНОЕ ВЯЗАНИЕ (или ЛЕНТОЧНЫЙ ТРИКОТАЖ) – Sliver Knitting is a circular knitting coupled with the drawing-in of a sliver by the needles to produce a pile-like fabric, usually for high-pile coats or heavy linings. Sliver Knitting is a type of circular knitting in which a high pile fabric is knitted by the drawing-in of the sliver by the knitting needles.

SLIVERS = КОНЦЫ ЛЕНТЫ – Slivers:- any waste from the drawing frame consists of tail-ends of the slivers and is known as Slivers. / Концы Ленты – прядомые отходы.

SLL = SIERRA LEONEAN LEONE

SLMA = STUDENT LOAN MARKETING ASSOCIATION = SALLIE MAE

SLO = STOP–LIMIT ORDER

SLO = STOP–LOSS ORDER

SLOP CHEST = СУДОВОЙ ЛАРЁК (или МУСОРНЫЙ ЯЩИК) – Slop Chest (maritime term):- stock of merchandise, such as clothing, tobacco, etc, maintained aboard merchant ships for sale to the crew. / Судовой Ларёк – жаргон.

SLOPE = НАКЛОН (или УКЛОН) – Slope is a simple indicator equal to the change in price divided by the number of time periods. A positive slope begins low and rises over time with a steeper rise illustrating a greater slope. A negative slope begins high and declines over time with a steeper decline illustrating a more negative slope. / простой индикатор, равный изменению цены, поделённому на число временных периодов. .

SLOPE OF GRAIN = НАКЛОН (ДРЕВЕСНЫХ) ВОЛОКОН (или КОСОСЛОЙ) – Slope Of Grain is the angle between the direction of the grain and the axis of a piece of lumber, expressed as a ratio. / Под Наклоном Волокон или, так называемым Косослоем древесины, понимается порок строения древесины, характеризующийся отклонением направления волокон от продольной оси лесоматериала, иными словами – винтообразным (косым) расположением волокон в стволе дерева. В круглых лесоматериалах наклон волокон обусловлен спиральным расположением волокон. Различают:- (i) Радиальный Наклон Волокон; и (ii) Тангентальный Наклон Волокон или Тангенциальный Наклон Волокон. Радиальный Наклон Волокон – наклон волокон в радиальной плоскости, обнаруживаемый в пилопродукции, деталях и шпоне на радиальных поверхностях по непараллельности годичных слоёв продольной оси сортимента, а на тангентальных поверхностях – по несимметричному рисунку выклинивания и перерезания годичных слоёв. Радиальный наклон волокон характерен для пилопродукции, деталей и шпона, выработанных из круглых лесоматериалов со сбежистостью, закомелистостью или кривизной. Он возникает также при неправильной распиловке прямослойной древесины. Тангентальный Наклон Волокон или Тангенциальный Наклон Волокон – наклон волокон в тангентальной плоскости сортимента. В пилопродукции, деталях и шпоне тангентальный наклон волокон встречается у всех пород и появляется на тангентальных поверхностях по непараллельности сердцевинных лучей, смоляных ходов, трещин и полосок грибных поражений продольной оси сортимента, а также прочерчиванием вдоль волокон линий тонким, но не режущим инструментом. Наклон волокон древесины снижает механические свойства древесины, особенно сопротивление её растяжению вдоль волокон и статическому изгибу. Наклон волокон измеряют в наиболее типичном месте боковой поверхности сортимента по величине отклонения направления волокон от линии, параллельной оси сортимента, которое определяют по направлению волокон древесины – на окорённых сортиментах, или бороздок коры – на неокорённых сортиментах на протяжении 1 метра, и выражают в процентах или целых сантиметрах. В комлевых брёвнах наклон волокон измеряют не ближе 1 метра от нижнего торца. Допускается измерять наклон волокон на верхнем торце по соответствующей величине отклонения волокон от линии, параллельной продольной оси сортимента на протяжении 1 метра от этого торца (в сантиметрах или долях диаметра верхнего торца). В пилопродукции и деталях наклон волокон измеряют в наиболее типичном месте общего направления волокон на протяжении не менее двойной ширины сортимента по величине отклонения волокон от продольной оси сортимента, не считая небольшие местные отклонения, и выражают в процентах.

SLOPE (PITCH) = (ПИТЧ, или ШАГ) НАКЛОН (или УКЛОН (лестницы), или СКОС, или УКОС, или ПОКАТОСТЬ, или ТАНГАЖ, или СКАТ (крыши)) – Slope (Pitch):- the ratio of vertical rise to horizontal run for inclined members (generally expressed as 3/12, 4/12, 5/12 etc). / В геодезии под Уклоном понимается показатель крутизны склона; отношение превышения местности к горизонтальному протяжению, на котором оно наблюдается, например, уклон, равный 0.015, соответствует подъёму 15 метров на 1 000 метров расстояния.

SLOP TANK = ОТСТОЙНАЯ ЦИСТЕРНА – Slop Tank is a tank in a tanker into which slops are pumped. These represent a residue of the ship's cargo of oil together with the water used to clean the cargo tanks. They are left to separate out in the slop tank.

SLOT = КОНТЕЙНЕРНОЕ МЕСТО (или ПАЗ, или КАНАВКА, или ЖЕЛОБОК) – Slot is the space on board a vessel, required by one TEU, mainly used for administrative purposes. The space on board a vessel, required by one 20' or 40' container.

SLOT CHARTER = ЧАРТЕР С КОНТЕЙНЕРНЫМИ МЕСТАМИ – Slot Charter:- a carrier's chartering of slots/spaces on other carrier's vessels. Slot Charter is a voyage charter whereby the shipowner agrees to place a certain number of container slots (TEU and/or FEU) at the charterer's disposal.

SLOT POSITION = КОНТЕЙНЕРНОЕ МЕСТО ПОЛОЖЕНИЕ – Slot Position specifies the position of the container on board the ship, for example using the Bay Row Tier system. / Определяет место расположения контейнера на борту судна, например, с использованием системы (Bay Row Tier).

SLOT RATE = СТАВКА ЗА КОНТЕЙНЕРНОЕ МЕСТО – Slot Rate is a rate used to calculate the cost of renting a slot for transporting a single container on board a ship.

SLOTTING = ПОДБОРКА – Slotting:- approach used to determine the best placement and locations for products in the warehouse depending on its dimensions and how often the item is picked.

SLOUCH HAT = ШЛЯПА С ОПУЩЕННЫМИ ПОЛЯМИ – Slouch Hat is a soft usually felt hat with a wide flexible brim.

SLOUGH = ТОПЬ (или БОЛОТО) – Slough is a swamp or shallow lake system. / или мелкая озёрная система.

SLOUGHED FILLING = СЛЕТЕВШАЯ УТОЧИНА (или СПУЩЕННАЯ УТОЧИНА) – (1) Defect Name:- Sloughed Filling. Defect Type:- weft lines, horizontal lines. Fabric Type:- Shirting and Dress Goods – Oxford or Basket. Description:- Sloughed Filling:- This defect is the result of several winds of filling slipping from the bobbin or package and being wound with insufficient tension or too much power on the picker-stick of the loom. Severity:- Major. (2) Defect Name:- Sloughed Filling. Defect Type:- weft lines, horizontal lines. Fabric Type:- Denim Bottomweights – Indigo Dyed. Description:- Sloughed Filling:- This defect is the result of several winds of filling slipping from the bobbin or package and being wound with insufficient tension or too much power on the picker-stick of the loom. Severity:- Major. See also Looped Filling.

SLOUGHED–OFF WEFT = СЛЕТЕВШИЙ (или СПУЩЕННЫЙ) УТОК – Sloughed-Off Weft:- several thicknesses of weft yarn appearing in the position intended for one weft yarn for a limited width. Note:- this defect is caused by one or more coils of weft yarn slipping from a loosely wound pirn and being woven into the fabric. / Сброшенные Уточные Нити (sloughed-off weft):- порок утка; несколько уточных нитей, пучком стянутых с уточной паковки и проложенных в полотно на ограниченной ширине. Примечание:- этот порок вызван одной или более нитями уточной пряжи, соскальзывающими с уточной паковки и затканными в ткань.

SLOUGHING OFF = ОБРУШЕНИЕ (или ОТВАЛИВАНИЕ, или СПОЛЗАНИЕ) – Sloughing Off:- the release of contaminant from the upstream side of a filter element to the upstream side of the filter enclosure.

SLOUGH OFF = СПУСК (или СЛЁТ) – Slough Off:- bunches of weft woven on fabric called Slough Off, mostly cause due to soft weft packages. Slough Off:- weft yarn has slipped from the pirn. Proper monitoring of strength and chase in pirn winding can solve this problem. Weaving defect. Slough-Off:- soft build packages, overfilled packages, low tension, package faults, faulty setting of accumulator. Non-working of tensionsers or accumulators functioning. Bulk of weft yarns which slips off the pirn and get entangled into fabric caused due the loose winding of pirn. Slough-Off:- in woven fabrics, a defect caused by several coils of yarn slipping off the filling bobbin simultaneously and being woven into the fabric in a group. Slough-Off is the act of a yarn loosely slipping off a filling bobbin or other package before or during weaving. A Slough-Off is a bunch of weft woven into the fabric. Causes:- (i) improper winding of the yarn onto the weft pirn; (ii) improper shape and size of the pirn; and (iii) harsh picking. Mending:- the bulk yarn can be pulled out by means of plucker. Combing in both direction with help of metallic comb can fill up the resultant bare patch. Slough Off is a bunch of weft woven into the fabric. Slough Off:- this defect is due to a bunch of weft woven into the fabric. The removal of slough off during grey mending will form a hole in the fabric. The cause for this is softly wound pirns, improper weft package characteristics and poor humidity. Minor Defect Classification:- Not prominent. Major Defect Classification:- Prominent. / уток. Спуск, Слёт – порок или дефект ткачества, проявляющийся в виде заработанных в полотно уточных петель.

SLOUGH–OFF WEFT = УТОК, ДАЮЩИЙ СПУСКИ И СЛЁТЫ – Slough-Off Weft:- weft yarn slips from pirn. Woven fabric defect. / Уток, Дающий Спуски И Слёты – порок или дефект ткачества, проявляющийся когда с початка сдёргиваются кольца и целые слои намотки.

SLOW–RELEASE FERTILIZER = МЕДЛЕННОДЕЙСТВУЮЩЕЕ УДОБРЕНИЕ – Slow-Release Fertilizer is a fertilizer that releases the wanted element at a slow rate. A term used interchangeably with delayed release, controlled release, controlled availability, slow acting, and metered release to designate a rate of dissolution (usually in water) much less than is obtained for completely water-soluble compounds.

SLUB = НЕПРОПРЯДКА (или ШИШКА, или СЛЁТ, или ТОЛСТАЯ ПРИСУЧКА) – Slub is a yarn defect consisting of a lump or thick place on the yarn caused by lint or small lengths of yarn adhering to it. Generally, in filament yarn, a slub is the result of broken filaments that have stripped back from the end to which they are attached. Spinning defect. Slubs:- abnormal thick places over a short length. Inadequate individualization carding, drafting. Lack of fiber control at each drafting stage also generate it. Also, lack of individualization and parellisation at gilling causes Slubs. Slubs:- abnormal thick places over a short length. (1) Slub (woven fabric):- usually caused by an extra piece of the yarn that is woven into the fabric. It can also be caused by fly waste being spun in yarn in the spinning process. Woven fabric defect. (2) Slub:- thickness of yarn. Knitted fabric defect. Slub (knit fabric):- usually caused by a thick or heavy place in yarn, or by lint getting onto yarn feeds. (3) Slubs:- a short section in the spinning where the cotton is not properly spun. Thread defects, and namely – Spinning. Slub:- in a yarn, a thickened place having tapering ends and a diameter several times that of the adjacent normal yarn. Note:- this defect is often caused by the presence in the yarn of fragments of undrafted roving or stubbing that have not been cleared during winding. Slub is an abruptly thickened place in a yarn. Synonym:- Lump, Piecing, Slough-Off, and Slug. Compare Cockles. Slub is a bunch of yarn having less twist or no twist and has a wider diameter compared to normal spun yarn. Causes:- (i) improper carding/combing; and (ii) broken tooth in the chain of gear system. Mending:- the slub should be cut with the clipper from both the ends. The resultant bare patch can be corrected by combing with a metallic comb or by insertion of a separate thread with the help of fine needle. Slub:- an abruptly thickened place in a yarn. A Slub yarn could be made out of short staple fibers. A slub can infact be a fancy yarn. If a slub is introduced in the yarn during ring spinning, it is promptly removed during autowinding. The same goes for thin places in yarn. However, thin places may not be visible to the naked eye but may lead to yarn breakages during subsequent processing leading to defects which will only become apparent after certain stages. Slubs are the thick places in spun yarns. Slub:- in a yarn, a thickened place having tapering ends and a diameter several times that of the adjacent normal yarn. This defect is often caused by the presence in the yarn of fragments of undrafted roving or slubbing that have not been cleared during winding. Slub is a bunch of fibers having less twist or no twist and has a wider diameter compared to normal spun yarn. Yarn Defect. Minor Defect Classification:- 2 slubs in weft < 1 cm. Major Defect Classification:- > 2 slubs in weft of size > 1 cm. Defect Name:- Slub. Defect Type:- Isolated Defects. Fabric Type:- Single Knit Fabrics. Description:- Slub:- This defect is the result of short, thick, or heavy place in the yarn commonly referred to as a slub. Severity:- Minor. See also Slubs. / филаментная (комплексная) пряжа (filament yarn). Порок или дефект. Непропрядка – Слёт Утка – короткий утолщённый участок по утку, возникающий в том случае, если уточная нить слетает пакетиком с конца початка и в таком виде зарабатывается в ткань. Непропряды более пятикратной до восьмикратной толщины включительно. Размер порока – за каждое место. Непропряды более восьмикратной толщины. Непропрядка – порок или дефект пряжи, представляющий собой утолщённые рыхлые участки. Непропрядки – утолщения, малокрученные участки нити. Узелки (slub):- порок пряжи в тканых полотнах в виде связанных концов нитей, заметных на лицевой стороне полотна. Примечание:- этот порок вызывается тем, что при связывании оборванных нитей не были обрезаны их концы.

SLUBBED YARN = ПРЯЖА ВИГОНЬ (или АППАРАТНАЯ ПРЯЖА, или СУКОННАЯ ПРЯЖА, или ВОРСИСТАЯ ПРЯЖА, или НЕПРОПРЯДЕНАЯ ПРЯЖА) – Slubbed Yarn:- yarns with a deliberately uneven surface. See also Novelty Yarn. / Тип пряжи с преднамеренно неравномерной поверхностью. Смотрите также Фасонная Пряжа (Novelty Yarn). Вигонь это рыхлая пушистая пряжа, изготовленная преимущественно из хлопка и его отходов с примесью отходов шерстопрядильного производства (шерстяных очёсов).

SLUBBER = ТАЗОВАЯ РОВНИЧНАЯ МАШИНА – Slubber is a machine used in textile processes prior to spinning that reduces the sliver and inserts the first twist.

SLUBBING = МЫЧКА – Slubbing is the form of stock produced by the slubber machine in cotton manufacturing; it is the ropelike form that follows the sliver in making of yarn. It is about the size of a lead pencil in diameter, and may be spoken of as an attenuated sliver. The fibers are more parallel in slubbing than in sliver, as well as being smoother in feel. Worsted slubbing, much larger in diameter than cotton slubbing, is called Top. Slubbing is produced by drawing, drafting, doubling, redoubling and attenuating of the fibers. Slubbing is the product of the slubber, it is the intermediate stage between sliver and roving. / размером с графитовый карандаш в диаметре . утонщённая лента.

SLUBBING FRAME = ТАЗОВАЯ РОВНИЧНАЯ МАШИНА – A Slubbing Frame is a machine used to straighten out the fibers in cotton prior to spinning. It was a secondary stage in the preparation of cotton for spinning, after it had initially passed through a drawing frame. The finer the cotton thread required, the greater the number of times the cotton was passed through slubbing frames, to make it as refined as possible. This frame was made in 1901 by the Platt Brothers of Oldham, Lancashire. Slubbing Frame:- in cotton manufacturing, the first fly-frame machine which takes the sliver from the drawing-frame. See also Slubber. / Плат Бразёз (Platt Brothers).

SLUBBY FILLING = XX УТОЧИНА – Defect Name:- Slubby Filling. Defect Type:- weft lines, horizontal lines. Fabric Type:- Bottomweights – Twill Derivatives. Description:- Slubby Filling:- This results from a filling yarn package that contains numerous slubs. Severity:- Major.

SLUB CATCHER = НИТЕОЧИСТИТЕЛЬ ОТ УТОЛЩЁННЫХ МЕСТ – Slub Catcher is a mechanical or electronic device designed to aid in the detection and removal of slubs or neps in yarns, usually during coning.

SLUB/KNOT = НЕПРОПРЯДКА (или ШИШКА, или СЛЁТ, или ТОЛСТАЯ ПРИСУЧКА)/УЗЕЛ – Slub/Knot:- thick uneven spot(s) in the fabric caused by lint or small lengths of yarn adhering to it, or where two yarn ends are tied together. / пятно. Непропрядка – Слёт Утка – короткий утолщённый участок по утку, возникающий в том случае, если уточная нить слетает пакетиком с конца початка и в таком виде зарабатывается в ткань. Непропряды более пятикратной до восьмикратной толщины включительно. Размер порока – за каждое место. Непропряды более восьмикратной толщины.

SLUBS = НЕПРОПРЯДКИ (или ШИШКИ, или СЛЁТЫ, или ТОЛСТЫЕ ПРИСУЧКИ) – (1) Defect Name:- Slubs. Defect Type:- Isolated Defects. Fabric Type:- Shirting and Dress Goods – Plain Weave. Description:- Threshold Scale for Slubs:- These graduations of slubs are designed to facilitate determination of thresholds-for-penalty in point grading. Scale of 1 to 5 with 1 being the lowest penalty and 5 being the highest penalty. Severity:- Minor. (2) Defect Name:- Slubs. Defect Type:- Isolated Defects. Fabric Type:- Shirting and Dress Goods – Plain Weave. Description:- Threshold Scale for Slubs:- These graduations of slubs are designed to facilitate determination of thresholds-for-penalty in point grading. Value of 1. Severity:- Minor. (3) Defect Name:- Slubs. Defect Type:- Isolated Defects. Fabric Type:- Shirting and Dress Goods – Plain Weave. Description:- Threshold Scale for Slubs:- These graduations of slubs are designed to facilitate determination of thresholds-for-penalty in point grading. Value of 2. Severity:- Minor. (4) Defect Name:- Slubs. Defect Type:- Isolated Defects. Fabric Type:- Shirting and Dress Goods – Plain Weave. Description:- Threshold Scale for Slubs:- These graduations of slubs are designed to facilitate determination of thresholds-for-penalty in point grading. Value of 3. Severity:- Minor. (5) Defect Name:- Slubs. Defect Type:- Isolated Defects. Fabric Type:- Shirting and Dress Goods – Plain Weave. Description:- Threshold Scale for Slubs:- These graduations of slubs are designed to facilitate determination of thresholds-for-penalty in point grading. Value of 4. Severity:- Minor. (6) Defect Name:- Slubs. Defect Type:- Isolated Defects. Fabric Type:- Shirting and Dress Goods – Plain Weave. Description:- Threshold Scale for Slubs:- These graduations of slubs are designed to facilitate determination of thresholds-for-penalty in point grading. Value of 5. Severity:- Minor. See also Slub.

SLUB YARN = ПРЯЖА С РЫХЛЫМИ ШИШКАМИ (или ПРЯЖА ВИГОНЬ, или АППАРАТНАЯ ПРЯЖА, или СУКОННАЯ ПРЯЖА, или ВОРСИСТАЯ ПРЯЖА, или НЕРАВНОМЕРНАЯ ПРЯЖА) – Slub Yarn:- a yarn which is made with slubs or lumps – possibly of various materials or colors – at various distances apart, according to the type of yarn desired. This is being done on purpose, and consistently, as opposed to when you first start spinning. It's not fair to call your first yarn produced a 'slub yarn'. Slub Yarn is any type of yarn that is irregular in diameter; the irregularity may be purposeful or the result of error. See also Novelty Yarn, Nub Yarn, and Slub. Slub Yarn:- a yarn which is thicker than the desired count or has a thick place in it. Possible Cause:- due to hand joint in roving or rejoining of yarn in ring spinning. Slubs depending on frequency and size are a major defect. In this case a slub has been deliberately incorporated in a low grade fabric. On its own if it occurs due to the given reasons, it is a defect. / Пряжа фасонной крутки с шишками.

SLUDGE = ОТСТОЙ (или ШЛАМ, или ОСАДОК, или ВЗВЕСЬ) – Sludge is the insoluble material formed as a result either of deterioration reactions in an oil or of contamination of an oil, or both. See also Acid Sludge. Sludge is a thick, soft, wet mud or a similar viscous mixture of liquid and solid components, especially the product of an industrial or refining process. Sludge is a semi-solid slurry and can be produced as sewage sludge from wastewater treatment processes or as a settled suspension obtained from conventional drinking water treatment and numerous other industrial processes. The term is also sometimes used as a generic term for solids separated from suspension in a liquid; this 'soupy' material usually contains significant quantities of 'interstitial' water (between the solid particles). Industrial wastewater treatment plants produce solids that are also referred to as Sludge, whether generated from biological or physical-chemical processes. Sludge is a semi-liquid residue from industrial processes and treatment of sewage and wastewater. Sludge is:- (1) semisolid material such as the type precipitated by sewage treatment. (2) Mud, mire, or ooze covering the ground or forming a deposit, as on a riverbed. (3) Finely broken or half-formed ice on a body of water, especially the sea. (4) A semisolid mass composed of an aggregation of cells (such as red blood cells in blood vessels) or particulate matter (such as cholesterol crystals and calcium salts in bile). / либо в результате реакций старения в масле, либо из-за засорения масла, или и из-за того и другого вместе. Смотрите также Кислый Гудрон (Acid Sludge). Под Шламом, от Немецкого слова Schlamm, означающее буквально Грязь, понимаются:- (1) порошкообразный продукт, содержащий обычно благородные металлы, выпадающие в осадок при электролизе меди, цинка и других металлов; (2) нерастворимые отложения (из воды) в паровых котлах в виде ила и твёрдых кусков; для удаления шлама производят периодическую продувку котла; применяют также термосифонное удаление шлама; (3) илистый осадок каменного угля или руды при мокром обогащении; и (4) осадок в виде мелких частиц, выделяющихся при отстаивании или фильтрации жидкости.

SLUG = ШИШКА (или НЕПРОПРЯДКА, или ТОЛСТАЯ ПРИСУЧКА, или УТОЛЩЕНИЕ) – (1) Slug is a thick place in a yarn or a piece of lint entangled in yarn, cord, or fabric. Slugs:- when the weft yarn is unclean and contains slugs and its diameter is irregular, the defect appearing on the cloth is known as Slugs. Fabrics defect. Slug:- in glass, unattenuated particles of glass of substantially larger diameter than the average filament diameter. Synonym:- Lump, Piecing, Slough-Off, and Slub. / Непропрядка – Слёт Утка – короткий утолщённый участок по утку, возникающий в том случае, если уточная нить слетает пакетиком с конца початка и в таком виде зарабатывается в ткань. Непропряды более пятикратной до восьмикратной толщины включительно. Размер порока – за каждое место. Непропряды более восьмикратной толщины.

(2) Slug:- in raw silk, a thickened place several times the diameter of the yarn three millimeters (1/8 in.) or over in length.

SLUGGY FILLING = XX УТОЧИНА – Defect Name:- Sluggy Filling. Defect Type:- weft lines, horizontal lines. Fabric Type:- Bottomweights – Sateen Derivatives. Description:- Sluggy Filling:- This defect is the result of fly waste being spun into the yarn during the spinning process. Severity:- Major.

SLURRY = СУХАЯ СМЕСЬ – Dry commodities that are made into a liquid form by the addition of water or other fluids to permit movement by pipeline. Slurry is a watery or solvent suspension, e.g., titanium dioxide mixed with water for addition to polymers.

SLUSH = САЛО (или XX) – Slush (maritime term):- white-lead and tallow used on standing rigging.

SLW = SPECIFIC LEAF WEIGHT

SM = SAN MARINO

SM = SERVICE MARK

SMA = SIMPLE MOVING AVERAGE

SMA = SOCIETY OF MANAGEMENT ACCOUNTANTS

SMA = SPECIAL MISCELLANEOUS ACCOUNT

SMAC = SECURITIES MOVEMENT AND CONTROL

SMALL BROKENS C1 = МЕЛКАЯ ДРОБЛЁНКА СИ.1 (или МЕЛКАЯ СЕЧКА СИ.1, или (КРУПЯНАЯ) МЕЗГА СИ.1, или ИЗМЕЛЬЧЁННОЕ ЗЕРНО СИ.1) – Small Brokens C1 mean small broken kernels that pass through round hole metal sieve No. 7. / Мелкая Дроблёнка Си.1 означает мелкую битую зерновку (мелкие дроблёные ядра), которая проходит через отверстие № 7 в металлотканом сите.

SMALL BUSINESS = МАЛОЕ ДЕЛО (или МАЛЫЙ БИЗНЕС) – Small Business (in the United States):- Everyone knows that there is a big size difference between a major corporation such as General Motors and the locally-owned convenience store on the corner. But where does your business fit in? Is it 'small', and if so, what happens when your business grows? When does it cease to be small? The designation is important when you begin to deal with the Department of the Treasury and other federal and state governments. Because many of the programs and services we offer are targeted specifically toward 'small' businesses, a definition of the possible participants is necessary. The Small Business Administration (SBA) has taken the lead in defining what constitutes a small business in the eyes of the federal government, and the SBA's definition is the most widely used. This body of definitions is called 'Size Standards' and can be found in Title 13 of the Code of Federal Regulations (CFR), Part 121. Small business is defined using size guidelines for the different categories of business enterprises, which include agricultural production, communications, manufacturing, retail, service, transportation and warehousing, and wholesale. Subcategories are included under each of these headings. Size is determined by the amount of average annual receipts or by the number of employees. Service businesses generally have a size standard that would be determined by averaging your gross annual receipts for the last three years. This average is then linked to the North American Industrial Classification System (NAICS) code for the procurement you are looking to compete under. If your average annual receipts falls under the amount designated for that NAICS code, then your firm is considered to be small by definition. For example, if you were selling Computer Programming Services under NAICS code 541511 your average annual receipts over the past three years would have to be below USD21.0 million to qualify as a small business concern. For most manufacturing NAICS codes, the number of employees will be used as a size standard. For example, a mining firm is considered 'small' if it has fewer than 500 employees. Because the body of definitions is complex and constantly changing, expert advice is essential to determine whether your business is 'small'.

SMALL BUSINESS ADMINISTRATION = АДМИНИСТРАЦИЯ МАЛОГО ДЕЛА (или АДМИНИСТРАЦИЯ МАЛОГО БИЗНЕСА) – Since its founding on 1953-July-30, the US Small Business Administration (SBA) has delivered millions of loans, loan guarantees, contracts, counseling sessions and other forms of assistance to small businesses. SBA provides assistances primarily through its four programmatic functions:- (i) Access to Capital (Business Financing):- SBA provides small businesses with an array of financing for small businesses from the smallest needs in microlending – to substantial debt and equity investment capital (venture capital). (ii) Entrepreneurial Development (Education, Information, Technical Assistance & Training):- SBA provides free individual face-to-face, and internet counseling for small businesses, and low-cost training to nascent entrepreneurs and established small businesses in over 1 800 locations throughout the United States and US territories. (iii) Government Contracting (Federal Procurement):- In keeping with the mandate of Section 15(g) of the Small Business Act, SBA's Office of Government Contracting sets goals with other federal departments and agencies to reach the statutory goal of 23 percent in prime contract Dollars to small businesses. This office also provides small businesses with subcontracting procurement opportunities, outreach programs, and training. (iv) Advocacy (Voice for Small Business):- created in 1978, this Office reviews Congressional legislation and testifies on behalf of small business. It also assesses the impact of the regulatory burden on behalf of small businesses. Additionally, it conducts a vast array of research on American small businesses and the small business environment. The Chief Counsel of this office is appointed by the President of the United States. Headquartered in Washington, DC, the United States. In the Small Business Act of July 30, 1953, Congress created the Small Business Administration, whose function was to 'aid, counsel, assist and protect, insofar as is possible, the interests of small business concerns'. The charter also stipulated that SBA would ensure small businesses a 'fair proportion' of government contracts and sales of surplus property. By 1954, SBA already was making direct business loans and guaranteeing bank loans to small businesses, as well as making loans to victims of natural disasters, working to get government procurement contracts for small businesses and helping business owners with management and technical assistance and business training. The Investment Company Act of 1958 established the Small Business Investment Company (SBIC) Program, under which SBA licensed, regulated and helped provide funds for privately owned and operated venture capital investment firms. They specialized in providing long-term debt and equity investments to high-risk small businesses. Its creation was the result of a Federal Reserve study that discovered, in the simplest terms, that small businesses could not get the credit they needed to keep pace with technological advancement. In 1964, SBA began to attack poverty through the Equal Opportunity Loan (EOL) Program. The EOL Program relaxed the credit and collateral requirements for applicants living below the poverty level in an effort to encourage new businesses that had been unable to attract financial backing, but were nevertheless sound commercial initiatives. SBA has grown significantly in terms of total assistance provided. and its array of programs have been tailored to encourage small enterprises in all areas. SBA's programs now include financial and federal contract procurement assistance, management assistance, and specialized outreach to women, minorities and armed forces veterans. SBA also provides loans to victims of natural disasters and specialized advice and assistance in international trade. US Small Business Administration (SBA) is an independent federal agency that seeks to aid, counsel, assist and protect the interests of small business concerns. Term Asset-Backed Securities Loan Facility (TALF) supports the issuance of asset-backed securities collateralized by loans guaranteed by the SBA. The US Small Business Administration (SBA) dedicates its energy and resources to providing support to small businesses and small-business owners across the nation. SBA helps businesses across the country through what we call the '3 C's' of our service:- (i) Capital:- we work with about 5 000 banks to provide SBA loans to deserving small businesses; (ii) Contracts:- we work to ensure that 23% of federal contract Dollars go to small businesses; and (iii) Counseling:- 14 000 SBA-affiliated counselors are ready when you need small business guidance.

SMALL BUSINESS CONCERN = МАЛЫЙ ДЕЛОВОЙ КОНЦЕРН (или КОНЦЕРН МАЛОГО ДЕЛА) – In the US patent law, a term 'Small Business Concern' (for purposes of small entity determination per MPEP 509.02) any business concern meeting the size standards set forth in 13 CFR (short for the US Code of Federal Regulations) Part 121 to be eligible for reduced patent fees. Questions related to size standards for a small business concern may be directed to:- Small Business Administration, Size Standards Staff, 409 Third Street, SW, Washington, DC 20416.

SMALL CAPS = АКЦИИ КОМПАНИЙ С МАЛОЙ КАПИТАЛИЗАЦИЕЙ – Small Caps:- shares issued by companies which have a relatively low market capitalization and are not broadly known to the public. Trading is usually thin. The opposite of Large Caps. / Акции, выпущенные компанией, которая имеет относительно низкую капитализацию на рынке и не особо известна публике.

Сделки с такими акциями осуществляются, как правило, достаточно редко. В противоположность Акциям Компании С Большой Капитализацией (Large Caps).

SMALLCLOTHES = ИСПОДНЕЕ (или БЕЛЬЕВАЯ МЕЛОЧЬ, или КОРОТКИЕ ШТАНЫ) – Smallclothes:- close-fitting knee breeches worn in the XVIII century; small garments, as underwear or handkerchiefs.

SMALL DRAWBACK = XX – (1) Defect Name:- Small Drawback. Defect Type:- warp lines, vertical lines. Fabric Type:- Denim Bottomweights – Indigo Dyed. Description:- Small Drawback:- This defect is the result of a mat-up behind the harness that causes the ends to run taut and force the undyed filling to dominate the cover of the fabric. Severity:- Minor.

(2) Defect Name:- Small Drawback. Defect Type:- warp lines, vertical lines. Fabric Type:- Denim Bottomweights – Piece Dyed. Description:- Small Drawback:- This is a similar defect but in a piece-dyed fabric. In both cases, the mat-up is removed before an end ruptures. There is always a corresponding slackness of ends when the restriction is removed. Severity:- Minor.

SMALL ENTITY = МАЛОЕ ЮРИДИЧЕСКОЕ ЛИЦО – In the US patent law, a term 'Small Entity' (for purposes of small entity determination per MPEP 509.02) means an independent inventor, a small business concern, or a nonprofit organization eligible for reduced patent fees. See also Small Business Concern.

SMALL HUB AIRPORT = АЭРОПОРТ С МАЛЫМ (РАЗВЯЗОЧНЫМ) УЗЛОМ – Small Hub Airport means a commercial service airport (as defined in section 47102) that has at least 0.05 percent but less than 0.25 percent of the passenger boardings.

SMALL OILSEEDS = МЕЛКИЕ МАСЛИЧНЫЕ СЕМЕНА – Small Oilseeds include flaxseed, canola and domestic mustard seed. / Мелкие масличные семена включают в себя, семена Льна, Кэнолы и местной Горчицы.

SMALL ORDER EXECUTION SYSTEM = СИСТЕМА ИСПОЛНЕНИЯ МЕЛКИХ РАСПОРЯЖЕНИЙ – Small Order Execution System is a computer network that automatically executes trades in NASDAQ® market securities and some NASDAQ® SmallCap securities. This allows individual investors to execute trades in fast moving markets. / Компьютерная сеть, которая автоматически исполняет все распоряжения по купле-продаже рыночных ценных бумаг на площадке НЭЗДЭК® (NASDAQ®) и некоторых ценных бумаг компаний с малой капитализацией на той же площадке НЭЗДЭК®. Она позволяет частным инвесторам осуществлять купле-продажу на быстро движущихся рынках.

SMALL POWER PRODUCER = МЕЛКИЙ ПРОИЗВОДИТЕЛЬ МОЩНОСТИ – Small Power Producer (SPP):- under the Public Utility Regulatory Policies Act (PURPA), a small power production facility (or small power producer) generates electricity using waste, renewable (water, wind, and solar), or geothermal energy as a primary energy source. Fossil fuels can be used, but renewable resource must provide at least 75 percent of the total energy input.

SMALL ROUND WOOD = МАЛАЯ КРУГЛАЯ ДРЕВЕСИНА (или МАЛЫЙ КРУГЛЯК) – Small Round Wood (SRW):- small trunk or branch wood of diameter 7–14 cm.

SMALL SEEDS = МЕЛКИЕ СЕМЕНА – Small Seeds are considered foreign material in some classes of grain. It includes all seeds removable through a No. 4.5 round-hole sieve. / Мелкие Семена в некоторых классах зерна рассматриваются в качестве инородного материала или примеси. К ним относятся все семена, удаляемые при прохождении через сито с отверстиями размерного номера 4.5.

SMALL TRADER = МЕЛКИЙ ТОРГОВЕЦ – Small Trader:- traders who hold or control positions in futures or options that are below the reporting level specified by the exchange or the US Commodity Futures Trading Commission. A futures trader that does not carry a reportable position. This trader group is tracked by the Commitments Of Traders Report data and can be either a speculator or a hedger. The small trader is thought to be the 'scared money' as wide swings in prices can force liquidation of positions due to the inability or desire to meet margin calls.

SMALL, VULNERABLE ECONOMIES = МАЛЫЕ, УЯЗВИМЫЕ (или БЕЗЗАЩИТНЫЕ) ЭКОНОМИКИ – Small, Vulnerable Economies (SVEs):- WTO members (15):- Barbados, Bolivia, Plurinational State of, Cuba, Dominican Republic, El Salvador, Fiji, Guatemala, Honduras, Maldives, Mauritius, Mongolia, Nicaragua, Papua New Guinea, Paraguay, Trinidad and Tobago.

SMALL WEFT LOOPS = МАЛЕНЬКИЕ УТОЧНЫЕ ПЕТЛИ – Small Weft Loops is a weft loom protruding from the cloth surface. Generally, the length of the yarn in the loop is not sufficient to permit snarling. These loops may protrude from both faces of the fabric. Early shedding, increasing warp tension within workable limits, use of good temples and adequate size pick of about 12% or higher – these measures can be used to prevent the occurrence of phurkies.

SMART = STANDARDS, MENTOR, ATTEMPT, REVIEW, TRANSITION

SMART = СМЫШЛЁНОЕ (или РЕЗВОЕ) – Smart (maritime term):- snappy, seamanlike; a smart ship is an efficient one.

SMART MONEY = СМЫШЛЁНЫЕ ДЕНЬГИ (или ВЕРНЫЕ ДЕНЬГИ) – Smart Money is a phrase used to describe the commercial trader based on this trader group's inside knowledge of the cash market underlying the futures. Sometimes large speculators heavily involved with a market will be referred to in the same manner. / Фраза, используемая для описания коммерческого торговца, полагающегося на знания информации для служебного пользования о реальном рынке соответствующих фьючерсов, имеющейся у данной группы торговцев. Иногда крупных спекулянтов, вовлечённых в большие объёмы на данном рынке, также ассоциируют с этим термином.

SMART REEFER = СМЫШЛЁНЫЙ ИЗОТЕРМИЧЕСКИЙ КОНТЕЙНЕР (или СМЫШЛЁНЫЙ ТЕРМОС) – Smart Reefer is a type of refrigerated container (trade name).

SMART TEXTILES = СМЫШЛЁНЫЕ ВИДЫ ТЕКСТИЛЯ – Smart Textiles are textiles that can sense and react to changes in the environment, such as changes from mechanical, thermal, chemical, magnetic and other sources.

SMASH = XX (или ОТРЫВ) – Smash:- caused by a number of ruptured warp or filling yarns or on package dyed yarn. Defect Name:- Smash. Defect Type:- Isolated Defects. Fabric Type:- Shirting and Dress Goods – Chambray. Description:- Smash:- This is where a large number of ruptured warp ends have been repaired. Severity:- Major. Woven fabric defect. Smash:- incorrect timing of shedding and picking sychronization, improper projectile checking, entanglement of warp end in heald zone, due to warp breakage, sudden break down of loom parts. Weaving defect. Smash is:- (1) a relatively large hole in fabric characterized by many broken warp ends and floating picks. One cause is the breaking of one or both harness straps, permitting the harness to drop and break out warp ends. (2) The breaking of many yarn ends in a beaming operation, usually as a result of mechanical failures. Fabrics defect. Smash:- in woven fabrics, a relatively large hole characterized by broken warp ends and floating picks. Synonym:- Breakout. Compare Slam-Off. This defect is caused by several heald wires breaking or by a defective picking motion. Smash:- a relatively large hole in a fabric

characterized by many broken warp ends and floating picks, or a prominent mark left behind after repairing such a hole. Smash:- caused by a number of ruptured warp ends that have been repaired. Smash:- this fault is characterized by the broken ends and floating picks. The defect is caused when many ends break consequent to the shuttle trap. Causes for this may be improper timing of shedding and picking motion, improper care to start the loop after rest. Minor Defect Classification:- Not reckoned. Major Defect Classification:- Noticeable. Smash:- ruptured cloth structure characterized by many broken warp ends and floating picks. Weaving Defect. Smashes:- daggers not working, frog spring ineffective, bad shuttle, improper boxing of shuttle, worn out picker, worn out transfer hammer, damaged pirn and entanglements are main causes of smashes. / основных или уточных пряж или . (1) Отрыв – порок или дефект ткачества, происходящий от одновременного обрыва большого количества основных нитей. (2) Одновременный обрыв большого числа нитей в процессе сновки. Отрыв (smash):- порок ткани, при котором разрушена целостность полотна. Примечание:- этот порок вызван несколькими порывами основных нитей или неправильным движением челнока.

SMB = SOIL MICROBIAL BIOMASS

SMBS = STRIPPED MORTGAGE BACKED SECURITY

SMDG = SHIP PLANNING MESSAGE DEVELOPMENT GROUP

SMELTING = ПЛАВКА (или ВЫПЛАВКА, или ПЛАВЛЕНИЕ) – Smelting is the process of melting ores or concentrates to separate out the metal content from impurities. Smelting is the process of melting ores or concentrates to separate out gold or silver from impurities. Smelting is a process that liberates the metallic element from its compound as an impure molten metal and separates it from the waste rock part of the charge, which becomes a molten slag. There are two types of smelting, reduction smelting and matte smelting. In reduction smelting, both the metallic charge fed into the smelter and the slag formed from the process are oxides; in matte smelting, the slag is an oxide while the metallic charge is a combination of metallic sulfides that melt and recombine to give a homogeneous metallic sulfide called Matte. (i) Reduction Smelting:- many types of furnace are used for reduction smelting. The blast furnace is universally used in the reduction of such compounds as iron oxide, zinc oxide, and lead oxide, though there are great differences between the furnace designs used in each case. Iron, found naturally in the oxide ores hematite and magnetite, is smelted in a tall, circular, sealed blast furnace. A sintered or pelletized feed consisting of coke (for fuel), limestone (as a flux for slag making), and iron oxide is charged into the top of the furnace through a double bell or rotating chute, and heated air is blown in through nozzles, or tuyeres, close to the furnace bottom. In the ensuing combustion reaction, oxygen in the air combines with carbon in the coke, generating enough heat to melt the furnace charge and forming carbon monoxide, which, in turn, reduces the iron oxide to metallic iron. The furnace is sealed to prevent the escape of carbon monoxide gas, which is recovered and burned as fuel to heat the tuyere air. In the hearth at the furnace bottom, molten slag and iron collect in two layers, the lighter slag on top. Both are periodically drawn off, with the slag being discarded and the iron going on to be refined into steel. The zinc blast furnace also is a sealed furnace, with a charge of sintered zinc oxide and preheated coke added through a sealed charging bell. The furnace is rectangular, with a shorter shaft than the iron blast furnace. A blast of hot air through the tuyeres provides oxygen to burn the coke for heat and to supply carbon monoxide reducing gas. The reduced zinc passes out of the furnace as vapour, and this is drawn off to a spray bath of molten lead and condensed to liquid zinc metal. Slag and any lead present in the charge are tapped as liquids from the furnace hearth. The lead blast furnace is similar in size and shape to the zinc blast furnace, but it is not a sealed furnace, and it does not use preheated tuyere air. A charge of lead oxide sinter, coke, and flux is poured into the open top of the furnace, and the strong reducing atmosphere in the furnace shaft reduces the oxide to metal. Liquid lead and slag collect in two layers in the furnace hearth, with the lead in the bottom layer and slag above. Two newer processes for the direct reduction of unroasted lead sulfide concentrate are the QSL (Queneau-Schuhmann-Lurgi) and the KIVCET (a Russian acronym for ‘flash-cyclone-oxygen-electric smelting’). In the QSL reactor a submerged injection of shielded oxygen oxidizes lead sulfide to lead metal, while the KIVCET is a type of flash-smelting furnace in which fine, dried lead sulfide concentrate combines with oxygen in a shaft to give lead metal. (ii) Matte Smelting:- The primary purpose of matte smelting is to melt and recombine the charge into a homogeneous matte of metallic copper, nickel, cobalt, and iron sulfides and to give an iron and silicon oxide slag. It is done in many types of furnace on both roasted or unroasted sulfide feed material. The reverberatory furnace is essentially a rectangular refractory-brick box equipped with end-wall burners to provide heat for melting. The furnace is relatively quiet, and it does not blow out much fine feed (which is added through roof ports) with the exhaust gases. The matte is tapped periodically from a centre taphole, while the slag runs off continuously at the furnace flue end. Oxygen lances inserted through the roof, or oxygen added through the burners, can increase smelting capacity considerably. Electric furnaces are similar to reverberatory furnaces except for the method of heating – in this case a row of electrodes projecting through the roof into the slag layer on the furnace hearth and heating by resistance. Flash smelting is a relatively recent development that has found worldwide acceptance. It is an autogenous process, using the oxidation of sulfides in an unroasted charge to supply the heat required to reach reaction temperatures and melt the feed material. The most widely used furnace has a vertical reaction shaft at one end of a long, low settling hearth and a vertical gas-uptake shaft at the other end. Fine, unroasted feed is blown into the reaction shaft along with preheated air; these react instantaneously, and liquid droplets fall onto the settling hearth, separating into layers of slag and matte. The off-gas, high in sulfur dioxide, is ideal for sulfur-recovery processes. The second stage of matte smelting is converting the sulfides to metal. For many years the standard vessel for this operation has been the Peirce-Smith converter. This is a rotatable, refractory-lined, horizontal steel drum with an opening at the centre of the top for charging and discharging and a row of tuyeres across the back through which air, oxygen-enriched air, or oxygen can be blown into the liquid bath. Molten matte from the smelting furnace is poured into the converter, after which gas is blown through the tuyeres to oxidize first iron and then sulfur. The sulfur goes off as sulfur dioxide gas and the iron as iron oxide slag, leaving semipure metal. Considerable heat is generated by this exothermic reaction, keeping the bath liquid and maintaining the required reaction temperature. More recent processes take advantage of exothermic heat evolution to accomplish both the smelting of unroasted sulfides and the conversion of matte in one combined operation. These are the Noranda, TBRC (top-blown rotary converter), and Mitsubishi processes. The Noranda reactor is a horizontal cylindrical furnace with a depression in the center where the metal collects and a raised hearth at one end where the slag is run off. Pelletized unroasted sulfide concentrate is poured into the molten bath at one end, where tuyeres inject an air-oxygen mixture. This causes an intense mixing action that aids the melting, smelting, and oxidation steps, which follow one another in sequence, by taking advantage of the exothermic heat. The TBRC also is cylindrical in shape but is inclined at 17° to the horizontal, has an open mouth at the high end for charging and pouring, and revolves at 5 to 40 rotations per minute. A lance inserted through the mouth can give any combination of oxygen, air, or natural gas to impinge on the molten bath and create the conditions required for smelting and oxidizing. The combination of surface blowing and bath rotation improves the performance of the converter. The Mitsubishi process is a continuous smelting-converting operation that uses three stationary furnaces in series. The first furnace is for smelting, with oxygen lances and a fuel-fired burner inserted through the roof. Slag and matte flow from here to a slag-cleaning furnace (heated by electric arc), and high-grade matte flows from this to the converting furnace, where oxygen-enriched air is blown into the bath through roof lances. Exothermic heat produced here is sufficient to keep the bath up to reaction temperature. (iii) Electrolytic Smelting:- smelting is also carried out by the electrolytic dissociation, at high temperatures, of a liquid metallic chloride compound (as is done with magnesium) or of a metallic oxide powder dissolved in

molten electrolyte (as is done with aluminum). In each case, electric current is passed through the bath to dissociate the metallic compound; the metal released collects at the cathode, while a gas is given off at the anode. The magnesium smelting cell consists of a steel pot that serves as the cathode; two rows of graphite electrodes are inserted through a refractory cover as anodes. The electrolyte is a mixture of chlorides, with magnesium chloride making up 20 percent, and the cell is maintained at 700 °C (1 300 °F). The passage of current breaks down the magnesium chloride into chlorine gas and magnesium metal, which go to the anode and cathode, respectively. In the Hall-Héroult smelting process, a nearly pure aluminum oxide compound called Alumina is dissolved at 950 °C (1 750 °F) in a molten electrolyte composed of aluminum, sodium, and fluorine; this is electrolyzed to give aluminum metal at the cathode and oxygen gas at the anode. The smelting cell is a carbon-lined steel box, which acts as the cathode, and a row of graphite electrodes inserted into the bath serves as anodes. / Кюно-Шуман-Логи (Queneau-Schuhmann-Lurgi). Мицубищи (Mitsubishi). Оль-Эру (Hall-Héroult). Восстановительная Плавка (Reduction Smelting) и Плавка На 'Штейн' (Matte Smelting). (iii) Электролитическая Плавка (Electrolytic Smelting). Matte = Матт (Французское слово) или Мэт или Маска или Каше или Виньетка или Штейн (металлическое). Под Плавкой понимается:- (1) процесс переработки материалов (главным образом металлов) в плавильных печах с получением конечного продукта в жидком виде. В металлургии применяется для извлечения металла из руд (доменная плавка); передела твёрдой или жидкой металлической шихты (плавка в мартеновских и электрических печах и конвертерах, рафинирование ферросплавов и цветных металлов); получения сплавов; расплавления твёрдого металла для получения слитков или фасонного литья и тому подобного. (2) Отдельный разовый цикл процесса плавки, а также полученный в результате этого продукт. Под Плавлением понимается переход твёрдого кристаллического вещества в жидкое состояние (фазовый переход первого рода). При постоянном внешнем давлении плавление чистого вещества происходит при постоянной температуре ($t_{пл}$), называемой температурой плавления; $t_{пл}$ при атмосферном давлении называется точкой плавления вещества. Под Плавлением понимается переход вещества из кристаллического состояния в жидкое, происходящий с поглощением теплоты. При постоянном внешнем давлении плавление происходит при определённой температуре, называемой температурой плавления и зависящей от природы вещества и давления. Теплота, затрачиваемая на переход единицы массы вещества из кристаллического состояния в жидкое при температуре плавления, называется удельной теплотой плавления. Для данного вещества плавление возможно только при давлениях, которые больше давления в тройной точке. Плавление сплава обычно происходит в некотором интервале температур (начала и конца плавления), зависящих от состава сплава и давления.

SMF = SWISS MARKET FEED

SMI = SWISS MARKET INDEX

SMIC = SORGHUM AND MILLET INFORMATION CENTRE

SMM = SPECIAL SAFEGUARD MECHANISM

SMOCK = РАБОЧИЙ ХАЛАТ (или СПЕЦОДЕЖДА, или ХХ) – Smock is a light loose garment worn especially for protection of clothing while working.

SMOCK FROCK = СПЕЦОВКА (или РАБОЧИЙ ХАЛАТ, или ЗАДЫМЛЁННОЕ ПЛАТЬЕ) – Smock Frock is a loose outer garment worn by workmen especially in Europe.

SMOCKING = УКРАШЕНИЕ СБОРКАМИ – Smocking:- rows of shirring done in a pattern to add some give (stretch) to a garment and for decoration. A common pattern of smocking is to gather the fabric with stitches that cross each other diagonally, forming a honeycomb-like pattern. It is often done with colored embroidery thread and gives an effect similar to shirring. See also Shirring.

SMOKE = ДЫМЧАТОЕ (или КОПЧЁНОЕ, или ХХ) – Smoke:- a pale blue.

SMOKE CHAMBER TEST = ТЕСТ В ДЫМНОЙ КАМЕРЕ – Smoke Chamber Test:- the release of smoke generated by the combustion of plastic materials can be determined by several methods. The most common static test procedure is the National Bureau of Standards (NBS) smoke chamber method, stanardize in the United States as ASTM E 662. This test was originally developed to determine the smoke generating characteristics of plastic materials used in aircraft construction. Additionally, the NBS test has also been used to specify smoke generation in materials for train/subway interiors and industrial flooring. The NBS smoke chamber measures smoke density accumulated when a specimen of specified form and thickness is exposed to a radiant heat sourse of 25 kW/m^2. Depending on the application, either the maximum smoke density or the smoke density at a set time (usually 4 minutes) can be specified. The test can be run with or without the application of a pilot flame (flaming and smoldering mode, respectively). In addition to smoke, the concentration of toxic gases can also be measured. See also Flammability Tests. Smoke Chamber Test:- this method assesses the smoke generating characteristics of a sample due to pyrolysis and combustion by measuring the attenuation of a light beam by smoke accumulating in a closed chamber under controlled conditions. Results are expressed in terms of specific optical density. American Society for Testing and Materials (ASTM). / Американское Общество по Испытаниям и Материалам (АОИМ). Смотрите также Тесты На Воспламеняемость (Flammability Tests).

SMOKING JACKET = ЖАКЕТ ДЛЯ КУРЕНИЯ – Smoking Jacket is a loose-fitting jacket or short robe for wear at home. / мужской домашний жакет.

SMOTHERING LINES = ЛИНИИ ОБЪЁМНОГО ПОЖАРОТУШЕНИЯ – Smothering Lines (maritime term):- pipe lines to a compartment for smothering a fire by steam or by a chemical.

SMOULDERING = ТЛЕНИЕ – Smouldering is a slow, flameless, smoking burning of a fabric.

SMP = SKIM MILK POWDER

SMPP = SHORT MESSAGE PEER TO PEER

SMS = SHORT MESSAGE SERVICE

SMT = SOIL MOISTURE TENSION

SMUDGE = ЯЗВА – Smudge refers to dark discolorations caused by fungal or bacterial infection. The discoloration may be brown, black, or reddish. It occurs mainly in Wheat and Barley. If discoloration occurs on more than one-half of the surface, or infection extends into the crease, then the kernel is considered smudge-damaged. If discoloration occurs on less than one-half of the bran surface, no discoloration in the crease, then the kernel is considered blackpoint-damaged. See also Penetrated Smudge, Red Smudge, and Superficial Discoloration. / Язва относится к изменению цвета в виде потемнения, вызываемого грибковой или бактериальной инфекцией. Изменение цвета может иметь бурую, чёрную или красноватую окраску. Если изменение цвета

проявляется для более чем половины поверхности, или если инфекция распространяется в , . после этого зерновка (ядро) считается повреждённой язвой.

SMUGGLING = НЕЗАКОННЫЙ ПРОВОЗ (или КОТРАБАНДА) – Smuggling is importation or exportation of foreign products by unauthorized means. Smuggling is resorted to for total evasion of customs duties, as well as for the importation of contraband items. A smuggler does not have to pay any customs duty since the products are not routed through an authorized customs port, and therefore are not subjected to declaration and payment of duties and taxes. / привоз (importation) или вывоз (exportation) иностранных продуктов .

SMUT = ГОЛОВНЯ – Smut is a disease caused by Fungi of the Order Ustilaginales; in Rice smut, the grains turn into black masses of spores which can be disseminated by wind, rain, and contact. / в чёрные массы спор, которые могут быть . Под Головнёй понимается болезнь Растений, вызываемая Головнёвыми Грибами. Несколько видов:- пузырчатая, пыльная, стеблевая, твёрдая. Наиболее вредоносна для Злаков (Кукуруза, Пшеница, Рожь и другие). Колосья, метёлки, початки, стебли и листья превращаются в тёмную споровую массу. Головня, широко распространённая болезнь многих Растений, вызываемая Головнёвыми Грибами. Наибольший вред приносит злаковым культурам, причиняя огромный ущерб сельскому хозяйству. Особенно значительными были потери зерновых в дореволюционной России, в бывшем Союзе Советских Социалистических Республик (СССР) они сильно сократились, но вред от головни всё ещё велик. Головня поражает также Растения Семества Лилейных, Гвоздичных, Гречишных, Сложноцветных, Зонтичных, Маковых и других. Разрушает полностью или частично различные органы, но преимущественно завязи, колоски, метёлки, початки, а также стебли, листья, корневые шейки, которые превращаются в тёмную споровую массу. Головнёвые Грибы – специализированные паразиты; их отдельные Виды приспособлены к определённым Видам Растений. Наиболее вредоносны следующие виды головни:- (i) твёрдая (мокрая, вонючая, покрытая) головня Пшеницы и Ржи. Паразит разрушает завязь и сохраняется в виде ‘головнёвых мешочков’ или отдельных спор, распылённых на семенах; (ii) каменная головня Ячменя и твёрдая Овса. Споры заполняют завязи, причём метёлки и колосья не разрушаются, плотная чёрная масса спор просвечивает сквозь колосковые плёнки; (iii) пыльная головня Пшеницы, Ячменя, Овса, Проса и Кукурузы. Паразит разрушает колосья, метёлки и початки, превращая их в чёрную пылящуюся массу; (iv) стеблевая головня Ржи и Пшеницы, поражающая стебли (отчасти и листья); (v) пузырчатая головня Кукурузы, образующая на разных частях растений желваки, покрытые оболочкой и наполненные спорами. Головнёвые Грибы паразитируют и на других зерновых культурах:- на Рисе, Чумизе, Могаре, Пайзе, Сорго. Из других видов головни следует отметить головню Лука, вызывающую гибель Лука-Севка и других. Одни из Головнёвых Грибов заражают Растения в почве обычно до появления всходов (твёрдая головня Пшеницы, стеблевая головня Ржи и другие), другие – во время выколашивания или цветения (пыльная головня Пшеницы, пыльная головня Ячменя), третьи – молодые и нежные ткани в течение всего периода вегетации (головня Лука, пузырчатая головня Кукурузы). Меры Борьбы:- использование устойчивых сортов; высокая агротехника, обеспечивающая выращивание выносливых и здоровых растений; выбраковка семенных посевов, сильно поражённых головнёй; очистка семян и их обеззараживание химическими препаратами (смотрите Протравливание) или термическим способом; воздушно-тепловой или Солнечный обогрев семян и другое.

SMUTTY BROWN RICE FOR PROCESSING = ПОРАЖЁННЫЙ ГОЛОВНЁЙ БУРЫЙ РИС ДЛЯ ПЕРЕРАБОТКИ – Smutty Brown Rice For Processing shall be Rice which contains more than 3.0 percent of smutty kernels. / Поражённый Головнёй Бурый Рис Для Переработки – это Рис, который содержит более 3.0 процентов поражённой головнёй зерновки (поражённых головнёй ядер).

SMUTTY KERNELS = ПОРАЖЁННАЯ ГОЛОВНЁЙ ЗЕРНОВКА (или ПОРАЖЁННЫЕ ГОЛОВНЁЙ ЯДРА, или ГОЛОВНЁВОЕ ЗЕРНО) – Smutty Kernels are whole or broken kernels of rice which are distinctly infected by smut. / К Поражённой Головнёй Зерновке (Поражённым Головнёй Ядрам) относятся целые или битые ядра Риса, у которых чётко выражено поражение головнёй.

SMUTTY ROUGH RICE = ПОРАЖЁННЫЙ ГОЛОВНЁЙ РИС–СЫРЕЦ – Smutty Rough Rice shall be rough Rice which contains more than 3.0 percent of smutty kernels. / Поражённый Головнёй Рис-Сырец – это Рис-сырец, который содержит более 3.0 процентов поражённой головнёй зерновки (поражённых головнёй ядер).

SMUTTY WHEAT = ПОРАЖЁННАЯ ГОЛОВНЁЙ ПШЕНИЦА – Smutty Wheat is a Wheat that contains, in a 250-gram portion, smut balls, portions of smut balls, or spores of smut in excess of a quantity equal to 30 smut balls of average size. / К Поражённой Головнёй Пшенице относится Пшеница, в 250-граммовой порции которой шарики головни, части шариков головни, или споры головни превышают количество, равное 30 шарикам головни среднего размера.

SN = SENEGAL

SN = SINUOUS NECK

SN = SOURCE NURSERY

SN = SPOT NEXT

SN = STOCK NUMBER

SNA = SYSTEM OF NATIONAL ACCOUNTS

SNAG = ЗАТЯЖКА (или ЗАЦЕПКА) – Snags:- usually caused by careless handling or faulty equipment. Machinery defects, and namely – Work Handling Equipment. Snag is a pulled thread in knits. It is in the wale direction in warp knits and in the course direction in weft knits. Fabrics defect. Snag is a pulled thread in the fabric. All snags should be considered defective. Snag:- in fabrics, a yarn or part of a yarn pulled or plucked from the surface. Snag:- the yarn, or fibers or filaments from a yarn, standing out from the fabric as a long loop. Note:- this defect is caused by a yarn, or fibers or filaments from a yarn, catching on a sharp projection and being drawn out from the structure. Snag is a pulled thread in knits. It is in the wale direction in warp knits and in the course direction in weft knits. / Порок или дефект от машинного оборудования. Затяжка:- местный порок трикотажного полотна в виде стянутых петель в петельном ряду или петельном столбике. Затяжка – дефект структуры трикотажного полотна, который характеризуется вытянутыми элементарными волокнами и нитями и стягиванием петель в направлении петельного ряда. Спущенная Петля (snag):- порок ткани; нить на поверхности ткани, которая выглядит как длинная петля. Примечание:- этот порок вызван пряжей, или волокнами, или нитями пряжи, захваченными острыми зубцами и вытянутыми из ткани.

SNAP = SUPPLEMENTAL NUTRITION ASSISTANCE PROGRAM

SNAP = XX (или СРЫВ, или ЗАЛОМ, или ТРЕЩИНА) – Defect Name:- Snap. Defect Type:- Printing Defects. Fabric Type:- Print Goods. Description:- Snap:- This is the result of a hard particle lodged under the doctor blade of a roller print machine holding the blade away from the engraved roll, thus allowing color to escape on either side of the particle. Severity:- Major.

SNAP–BRIM = ЗАСТЁЖКА (или ЗАЖИМ, или СНЭП–БРИМ) – Snap-Brim is a usually felt hat with brim turned up in back and down in front and with a dented crown. / фетровая шляпа с полями, загнутыми спереди вниз, а сзади – вверх.

SNAP FITTING = ХХ (или СКРЕПЛЯЮЩАЯ ЗАСТЁЖКА) – Snap Fitting is a connection of interlocking clips formed by pressing two components together. See also Pallet. / Скрепляющая Застёжка (Snap Fitting):- с помощью скрепок осуществляют присоединение двух элементов поддона друг к другу. Смотрите также Поддон (Pallet).

SNAPPED COTTON = ОБОРВАННЫЙ ВРУЧНУЮ ХЛОПОК – Snapped Cotton is a Cotton gathered by hand by snapping the entire boll off the plant. Before ginning it must be run through an attachment to burst and remove the bolls.

SNAPPING = СРЫВАНИЕ (или ОБРЫВ, или ОТДЕЛЕНИЕ) ВРУЧНУЮ – Snapping is a method of testing the individual locks of raw wool. This is done by holding the two ends of a lock of wool and pulling your hands quickly apart. There should be a audible snapping sound – but no damage to the lock. This is also done, on a very different scale, with a just-washed skein of yarn. For this situation, put your arms through a skein and 'pop' the skein. This will even out most kinks in the skein.

SNARLED SINGLE = СПУТАННАЯ (или ЗАВИТАЯ) ХХ – Snarled Single:- one component of double yarn had different twist than other causing snarling effect in only one component of the Double yarn. This is due to mixing up to low steamed or un steamed yarn and variation in tension during winding at ply winding. Spinning defect. / Порок или дефект прядения.

SNARLS = СУКРУТИНЫ (или ПЕТЛИ, ЗАТЯНУТЫЕ ДО ОТКАЗА) – Snarl is a short length of warp or filling yarn that has twisted on itself because of lively twist or insufficient tension. The snarling may occur during or prior to the weaving process. Snarls are small, curly or 'kinked' places in yarns. Snarl:- a short unbroken length of yarn which is doubled-up in the fabric. Note:- this defect is often caused by a yarn under insufficient tension twisting about itself, either prior to or during knitting, and by twist liveliness. Fabrics defect. See also Kink. Snarl:- it is a length of the weft yarn which has spontaneously doubled back on itself due to insufficient tension. If the portion of the weft yarn has over twisted zone it may snarl when it is loose. Another cause may be, if the weft in shuttle has inadequate tension then excess yarn released from the pirn turns around itself and forms a snarl. Minor Defect Classification:- Not prominent. Major Defect Classification:- Prominent ≥ 15 cm. Snarls:- a short length of yarn, mainly the weft which has spontaneously doubled back on itself results in snarls. Weaving Defect. / короткая длина основной или уточной пряжи, которая . Сукрутины – маленькие перекрученные или 'запутанные' места в пряже. Порок или дефект пряжи. Под Петлёй понимается местный порок в виде нежелательных петель, выступающих на поверхности ткани из-за ненатянутой уточной нити. Сукрутина (snarl):- порок ткани, представляющий собой скрученный в виде петли участок кручёной текстильной нити. Примечание:- этот порок возникает вследствие неравновесного состояния текстильной нити.

SNATCH BLOCK = КАНИФАС–БЛОК – Snatch Block (maritime term):- a single block fitted so that the shell or hook hinges to permit the bight of a rope to be passed through.

SNEAK = ПОДХАЛИМ (или СТУКАЧ, или ЯБЕДНИК, или СПЛЕТНИК) – Sneak:- sneaker. / Sneaker = обувь с текстильным верхом на резиновой подошве; спортивная тапочка.

SNG = SYNTHETIC NATURAL GAS

SNOOD = СНЮД (или СЕТКА (ДЛЯ ВОЛОС)) – Snood:- (Scottish) a fillet or band for a woman's hair; a net or fabric bag pinned or tied on at the back of a woman's head for holding the hair.

SNOW BALL = СНЕЖНЫЙ ШАРИК (или СНЕЖНЫЙ КОМ) – Snow Ball:- xxxxx. See also Balling Up, and Fuzz Ball.

SNOWSUIT = СНЕЖНЫЙ КОСТЮМ – Snowsuit is a one-piece or two-piece lined garment for winter wear by children.

SNUB = ГАСИТЬ ИНЕРЦИЮ ХОДА (или РЕЗКО ОСТАНАВЛИВАТЬ, или РЕЗКО ЗАДЕРЖИВАТЬ) – Snub (maritime term):- to check suddenly.

SNY = ХХ – Sny (maritime term):- a small toggle used on a flag. / небольшой хлястик, используемый на флаге.

SO = SOMALIA

SOAK = ЗАМАЧИВАТЬ (или РАЗМАЧИВАТЬ, или ПРОПИТЫВАТЬ) – Soak:- to be completely covered by water for a determined length of time or until the object is saturated.

SOAKING = НАМАЧИВАНИЕ (или ВЫМАЧИВАНИЕ, или ЗАМОЧКА, или ЗАМАЧИВАНИЕ) – Soaking is a treatment of rayon yarns in a lubricating and sizing solution preparatory to hard twisting.

SOAMA = SOCIÉTÉ D'ANDAPA MAMOKATRA = SOCIETY FOR THE DEVELOPMENT OF ANDAPA REGION

SOAP = МЫЛО – Soap cleans by reducing surface tension and loosening, dispersing, and suspending soils. Soap also softens fabrics naturally. Soap is a cleansing or emulsifying agent made by reacting an alkali with a combination of fats and oils at high temperatures. Soap is the detergent obtained by the formation of a sodium or potassium salt of a fatty acid or mixture of fatty acids. / Щёлочь (Alkali). Под Мылами понимаются соли высших жирных кислот, а также нафтеновых и смоляных кислот. Получают из животных и растительных жиров, нафтеновых кислот, канифоли, таллового масла. Растворимые в воде мыла (обычно натриевые и калиевые) обладают моющим действием и составляют основу туалетного, хозяйственного и технического мыла. Мыла применяют для стабилизации эмульсий, синтетических латексов, пен, в качестве присадок, структурирующих добавок.

SOAPING = МЫЛОВКА (или ЗАМЫЛИВАНИЕ, или ОБМЫЛИВАНИЕ) – Soaping or Soaping Off:- with respect to dyeing, the process of washing dyed fabric with very hot (often boiling) water with surfactants, rarely actually soap, to remove dye that is not fixed to the fiber. Soaping off is important particularly with some reactive dyes, since a good deal of hydrolyzed dye is loosely bonded to the fabric, and must be removed to avoid staining of other garments or fabric in laundering. Soaping is also important in vat dyeing, where there are actual changes, including in hue, in the dye in the fiber. Though surfactants are often used, they may actually contribute almost nothing to the effectiveness of the process. / Замыливание – замачивание ткани валочным раствором.

SOB = SHIPPED ON BOARD

SOC = SOIL ORGANIC CARBON

SOCIAL ACCOUNTING = БУХГАЛТЕРСКИЙ УЧЁТ СОЦИАЛЬНОЙ СФЕРЫ – The reporting of the cost incurred in complying with anti-pollution, safety and health and other socially beneficial requirements, and, more generally, the impact of a business entity on, and its endeavours to protect, society, its amenities and the environment. Also known as Social Report.

SOCIAL ENGINEERING = СОЦИАЛЬНЫЙ ИНЖЕНЕРИНГ – Social Engineering is a term applied to a wide range of techniques for causing a desired change in behavior or gaining some advantage by psychological manipulation of an individual or group. As used in security it almost invariably involves some form of deception, malice or fraud. Social engineering is a way of gaining personal information by deception. Various social engineering techniques exist, commonly making use of the telephone or the Internet, and exploiting the gullibility by masquerading as a trustworthy business or institution. The specific goals of the social engineering can be, for example, to gain personal information or to persuade end-users to execute malware.

SOCIALISM = СОЦИАЛИЗМ – Socialism is a class of ideologies favoring an economic system in which all or most productive resources are the property of the government, in which the production and distribution of goods and services are administered primarily by the government rather than by private enterprise, and in which any remaining private production and distribution (socialists differ on how much of this is tolerable) is heavily regulated by the government rather than by market processes. Both democratic and non-democratic socialists insist that the government they envision as running the economy must in principle be one that truly reflects the will of the masses of the population (or at least their 'true' best interests), but of course they differ considerably in their ideas about what sorts of political institutions and practices are required to ensure this will be so. In practice, socialist economic principles may be combined with an extremely wide range of attitudes toward personal freedom, civil liberties, mass political participation, bureaucracy and political competition, ranging from Western European democratic socialism to the more authoritarian socialisms of many third world regimes to the totalitarian excesses of Soviet-style socialism or communism. / В бывшем Союзе Советских Социалистических Республик (СССР) Социализм считался первой, или низшей, фазой коммунизма. Впервые победил в России в результате Октябрьского государственного переворота в 1917 и установления так называемой Диктатуры Пролетариата (поскольку реально власть так и не была передана ему). После Второй Мировой Войны образовалась мировая система социализма. Под Социализмом, от Латинского слова Socialis, означающее Общественный, понимаются различные учения, теории, ставящие целью обоснование социалистического идеала и путей его достижения; политические движения, выступающие за реализацию социализма на практике; общество, образованное в соответствии с определённым пониманием социалистического идеала. Социалистическая идеология получила распространение в виде широкого спектра теоретических идей, включающих:- научный социализм как систему взглядов Немцев Карла Маркса (1818–83), Фридриха Энгельса (1820–95) и Россиянина Владимира Ильича Ульянова-Ленина (1870–1924), обосновывающую историческую необходимость установления коммунистической общественно-экономической формации, пути её созидания и принципы организации; социал-демократические концепции социализма, генетически тесно связанные с марксизмом, но ныне развивающиеся на основе такой системы представлений о природе социализма и методах социалистического переустройства общества, в которых марксизм является лишь одной из составных частей (демократический социализм, этический социализм); леворадикальные концепции социализма (неомарксизм, 'новые левые', экосоциализм, Франкфуртская Школа и другие); различные социалистические учения, возникшие на базе национально-освободительного движения ('исламский социализм', 'Африканский социализм' и другие); многообразные концепции, сложившиеся в истории общественной мысли прошлого, но сохранившие влияние и в современном мире (утопический социализм, христианский социализм). В рамках каждой из этих концепций развивались собственные представления о социалистическом идеале и путях его достижения. Однако при всём различии их взглядов относительно сущности социализма общим для всех выдающихся мыслителей-социалистов прошлого было то, что под социализмом они имели в виду общество, в котором осуществлены социальное равенство и социальная справедливость, где средства производства находятся под контролем или во владении общества, вся жизнь организована на коллективистских началах, отсутствует эксплуатация человека человеком. Некоторые из этих элементов присутствуют уже в воззрениях мыслителей древности (например, у древнегреческого философа-идеалиста Платона (428/427–348/347 до Нашей Эры)) и ранних христиан. В значительно более глубоком и систематизированном виде они представлены в трудах социалистов-утопистов XVI–XVIII веков – Англичанина Томаса Мора (1478–1535), Итальянца Томмазо Кампанеллы (1568–1639), Немца Томаса Мюнцера (около 1490–1525), Француза Жана Мелье (1664–1729), Француза Гракха Бабёфа и других и в особенности в произведениях великих мыслителей XIX века – Француза Клода Анри Сен-Симона (1760–1825), Француза Франсуа Мари Шарль Фурье (1772–1837), Англичанина Роберта Оуэна (1771–1858), Россиянина Александра Ивановича Герцена (1812–70), и Россиянина Николая Гавриловича Чернышевского (1828–89). От этих идей отталкивались Немцы Карл Маркс и Фридрих Энгельс, создавая и развивая научный социализм как учение об освобождении человечества от всех видов социального угнетения. Опираясь на обоснованное ими материалистическое понимание истории и диалектическую методологию, Маркс и Энгельс стремились освободить социалистическую идеологию от утопических иллюзий, представить социализм как закономерный результат прогресса цивилизации и истрического творчества рабочего класса, трудящихся масс. Одновременно они чётко отделили научный социализм от грубого, уравнительного, 'казарменного' социализма, связав становление нового общества с высшим уровнем развития материального производства, демократии и личности. Объективный исторический смысл социализма основатели научного социализма видели в том, что новый строй вслед за правовым и политическим равенством, которое было достигнуто в определённой степени в ходе буржуазных государственных переворотов XVII–XIX веков, обеспечил бы равенство в сфере экономической и социальной, открыл простор для унивесального развития человека. Для достижения этого, полагали они, необходимо уничтожить частную собственность, порождающую эксплуатацию и отчуждение, утвердить приоритет общественной собственности на средства производства. В отличие от социалистов-утопистов Маркс и Энгельс не пытались дать детальную картину будущего общественного устройства, полагая, что это задача людей, партий, которым выпадет практическая работа по созиданию нового строя. Вместе с тем они в самой общей форме очертили его контуры и основные принципы. Согласно их представлениям, это будет планово-регулируемое, самоуправленческое и бестоварное общество, где нет паразитических слоёв, трудящиеся объединены на основе совместного владения, распоряжения и пользования средствами производства, а государство постепенно перерастёт в самоуправление народа. Эти представления о социализме в новых исторических условиях развил Ленин, обогатив их анализом изменений, происшедших в мировом капитализме, опытом так называемого 'Великого Октября', последующей практики социалистических преобразований. Кризис политики 'военного коммунизма', основывавшейся на свёртывании товарно-денежных отношений, тотальном огосударствлении и внеэкономических методах управления, побудил его к отказу от догматического истолкования идей основоположников научного социализма, выдвижению положений, в совокупности означавших 'коренную перемену всей точки зрения нашей на социализм'. В работах Владимира Ульянова-Ленина 1921–23 были сформулированы черты нового подхода к теории и практике социализма:- восстановление товарно-денежных отношений; признание того факта, что отмирание государства есть длительный исторический процесс, в течение которого необходимо сохранение сильного, компетентного и гибкого аппарата управления, выполняющего в том числе экономико-коммерческие функции и находящегося под контролем народа; признание возможности при социализме многообразия форм собственности, в частности кооперации как социалистической формы собственности и хозяйствования; утверждение принципа оплаты по количеству и качеству труда. Ленин подчёркивал, что действительное присвоение средств производства людьми начинается не там, где средства производства превращаются в государственную собственность, а там, где трудящиеся ставятся в такое положение, при котором они не только совладеют, но и распоряжаются этими средствами.

Им была выдвинута идея хозрасчёта как метода строительства социализма не на энтузиазме только, а при помощи энтузиазма, рождённого государственным переворотом (так называемой революцией), и материальной заинтересованности труженика. Практическая реализация Ленинской концепции социализма в бывшем СССР отмечалась как историческими достижениями, так и негативными явлениями, драматическими ошибками. Разрыв с гуманистическим и демократическим содержанием социалистического идеала, произвол и репрессии периода Сталинизма, деформации социализма в годы застоя привели к формированию в стране авторитарно-бюрократической системы, чуждой социализму. Выход из кризисной ситуации, возникшей на рубеже 1970–80-х, реальное движение к такому экономическому, социальному, политическому и духовному устройству, в центре которого должен был находиться человек, развёртывалась в русле начатой в стране по инициативе Коммунистической Партии Советского Союза (КПСС) перестройки (называемой также Горбачёвской Перестройкой) – процесса революционного обновления всех сторон жизни общества на принципах демократического, гуманного социализма, который может реально возникнуть и развиваться только путём усвоения всего лучшего в мировой цивилизации. Демократический, гуманный социализм призван выступить именно как новый общественный строй, создающий наилучшие условия для материального и духовного благосостояния всего народа. Однако, этим утопическим идеям не суждено было сбыться – Советский Союз с его социализмом потерпел полное фиаско, развалившись в 1991. Социализм – политико-экономическая доктрина, которая в отличие от капитализма (capitalism), основанного на конкуренции, стремится к кооперации в обществе. Средства производства и распределения принадлежат государству или являются коллективной собственностью народа.

SOCIAL SECURITY CONTRIBUTIONS = КОНТРИБУЦИИ НА СОЦИАЛЬНОЕ ОБЕСПЕЧЕНИЕ (или ВЗНОСЫ НА СОЦИАЛЬНУЮ ЗАЩИТУ) – In Switzerland, Social Security Contributions are levied on partnership income and income of employees. While those who are self-employed must contribute between 5.1 and 9.5 per cent of their annual income (depending on total earnings), the payroll deduction for employees is 5.05 plus 1.25 or 0.5 per cent (depending on the amount of unemployment insurance to be paid), with the same amount to be matched by the employer.

SOCIÉTÉ ANONYME = СОСЬЕТЭ АНОНИМ (или (ОТКРЫТОЕ) АКЦИОНЕРНОЕ ОБЩЕСТВО) – Société Anonyme (SA) is the French equivalent of a Public Limited Company (PLC) in the United Kingdom. / Сосьетэ Аноним (Société Anonyme; сокращённо – Эс.А. (SA)) – это Французский аналог Открытого Акционерного Общества или Публичной Компании (Public Limited Company; сокращённо – Пи.Эл.Си. (PLC)) в Соединённом Королевстве.

SOCIÉTÉ D'INVESTISSEMENT À CAPITAL FIXE = СОСЬЕТЭ ДАВЭСТИСМО А КАПИТАЛЬ ФИКС – In France, Société d'Investissement à Capital Fixe (SICAF) is investment company with fixed capital. Société d'Investissement à Capital Fixe (SICAF) is closed-end investment fund with the status of a legally independent joint stock company. Abbreviation:- SICAF. Société d'Investissement à Capital Fixe (SICAF) ia the closed-end investment fund. / Сосьетэ Давэстисмо а Капиталь Фикс (Эс.И.Сэ.А.Эф.; Société d'Investissement à Capital Fixe (SICAF)) – инвестиционный фонд закрытого типа со статусом юридически независимой акционерной компании. Обозначение:- Эс.И.Сэ.А.Эф. или СИКАФ (SICAF).

SOCIÉTÉ D'INVESTISSEMENT À CAPITAL VARIABLE = СОСЬЕТЭ ДАВЭСТИСМО А КАПИТАЛЬ ВАРЪЯБЛЬ – In France, Société d'Investissement à Capital Variable (SICAV) is equal to the unit trust in the United Kingdom, or mutual fund in the United States of America. Société d'Investissement à Capital Variable (SICAV) is investment company with variable capital. Société d'Investissement à Capital Variable (SICAV) is open-end investment fund with the status of a legally independent joint stock company. Units are issued in the form of shares. SICAV – an open-ended investment company (OEIC) with a variable capital. / Сосьетэ Давэстисмо а Капиталь Варъябль (Эс.И.Сэ.А.Ви. или СИКАВ; Société d'Investissement à Capital Variable (SICAV)).

SOCIETY FOR WORLDWIDE INTERBANK FINANCIAL TELECOMMUNICATION = СООБЩЕСТВО ПО ВСЕМИРНОЙ МЕЖБАНКОВСКОЙ ФИНАНСОВОЙ ДАЛЬНЕЙ СВЯЗИ – Society for Worldwide Interbank Financial Telecommunication (SWIFT) based in La Hulpe, Belgium. As the name indicates, an international cooperative of banks, founded in 1973, that maintains a telecommunications network (SWIFT network) for the exchange of messages among banks, brokerages, stock exchanges and other financial institutions. In these messages, one bank for example informs another bank that it has a wire transfer for a customer, asking the beneficiary bank to collect the equivalent amount at a specified date from the specified clearing account and to forward the amount to the beneficiary. SWIFT settles financial transactions of approximately 7 800 financial institutions in more than 200 countries, achieving daily trading volumes of six billion Dollars (4.8 billion Euros). The Society for Worldwide Interbank Financial Telecommunication (SWIFT) is a Belgian non-profit corporation created in 1976 to provide an information exchange network for international financial transactions. Banks in many countries belong to the system. Society for Worldwide Interbank Financial Telecommunication (SWIFT) is a cooperative organized under Belgian law providing the following services to participating financial institutions:- letters of credit (opening and transmission), money transfers, payment security settlements. Other businesses participating in SWIFT are:- security brokers and dealers, clearing and depository institutions, security exchanges and travellers cheques issuers. A bank-owned organization providing secure messaging services to thousands of banks in nearly 200 countries, SWIFT is also officially designated by the International Organization for Standardization (ISO) to maintain message standards within the securities industry. In 1973 forty square meters of office space in the center of Brussels, a handful of people and an ambitious idea. Supported by 239 banks in 15 countries, the Society for Worldwide Interbank Financial Telecommunication (SWIFT) starts the mission of creating a shared worldwide data processing and communications link and a common language for international financial transactions. In 1977 Albert, Prince of Belgium and now King, sends the first message. The initial group of members has grown to 518 commercial banks in 22 countries. SWIFT's on-going success is confirmed as the accumulated total of processed messages passes 10 million after less than 12 months of activity. Even the most optimistic of growth forecasts is exceeded. In 1985 SWIFT installs a high-volume satellite link between its Operating Centres to support traffic growth. In 1987 SWIFT's membership votes to expand the user base by including broker dealers, exchanges, central depositories and clearing institutions. In 1992 after the successful completion of the pilot scheme during the first half of the year, the Interbank File Transfer (IFT) service goes live on July 01. By year end, 65 banks have signed up for the service to handle a range of bulk data transfers including mass payments, cheque truncation and internal reporting. The number of SWIFT customers increase by 11% and operational countries grew 15% compared to the previous year. Society for Worldwide Interbank Financial Telecommunication (SWIFT) supplies secure messaging services and interface software to wholesale financial entities. SWIFT is a cooperative society under Belgian law, owned by its member financial institutions. That is, it is owned by the banks that use it. SWIFT has offices around the world. SWIFT headquarters are located in La Hulpe, Belgium, near Brussels. It was founded in Brussels in 1973, supported by 239 banks in 15 countries. It started to establish common standards for financial transactions and a shared data processing system and worldwide communications network. Fundamental operating procedures, rules for liability, etc, were established in 1975 and the first message was sent in 1977. The Society for Worldwide Interbank Financial Telecommunication (SWIFT) operates a worldwide financial messaging network. Messages are securely and reliably exchanged between banks and other financial institutions. SWIFT also markets software and services to financial institutions, much of it for use on the SWIFTNet Network. The majority of international interbank messages use the SWIFT network. As of April 2006 SWIFT linked almost 8 000 financial institutions in 205 countries. Domiciled in Brussels, Belgium, the company operates a computer-guided communications system to

rationalize international payment transfers. Society for Worldwide Interbank Financial Telecommunication (SWIFT) is a message writing system that connects worldwide participating banks, primarily for the purpose of communicating payment information. Frequently, the SWIFT message is only part of an international payment. / коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо). Сообщество по Всемирной Межбанковской Финансовой Дальней Связи (СВМФДС; The Society for Worldwide Interbank Financial Telecommunication (SWIFT)) было образовано в 1973 в соответствии с Бельгийским законодательством в качестве кооперативного сообщества, первоначальными учредителями и владельцами которого выступили финансовые институты, а точнее 239 банков из 15 стран. Штабквартира этого сообщества расположена в городке Ля Хюлп, Бельгия близ Брюсселя (La Hulpe, Belgium, near Brussels). Сообщество приступило к деятельности с разработки общего финансового языка общения, единых стандартов по исполнению финансовых операций и создания компьютерной системы обработки, учёта и распределения данных (shared data processing system), а также с создания всемирной сети дальней связи (worldwide communications network). В 1975 сообщество утвердило фундаментальные операционные процедуры и правила по ответственности сторон. В 1977 Принц Альбэр, ныне Король Бельгии (Albert, Prince of Belgium and now King), отправил по созданной системе связи первое официальное сообщение. К этому времени среди своих членов сообщество насчитывало уже 518 коммерческих банков из 22 стран. Столь стремительно прогрессирующий успех сообщества подтверждался ещё и тем фактом, что меньше, чем за 12 месяцев своей начавшейся работы оно обработало порядка 10 миллионов сообщений. И это при том, что все сообщения обладали надёжной степенью защиты информации. Такой успех превзошёл все предполагаемые перспективы роста организации. В 1985 для поддержания роста потока сообщений между своими Операционными Центрами, располагавшимися в различных частях света, СВМФДС установило спутниковую связь с большой пропускной способностью. В 1987 сообщество решило расширить состав участников за счёт привлечения в свои ряды брокеров, дилеров, бирж, центральных депозитариев и клиринговых (расчётных) институтов. Международная Организация по Стандартизации (МОС; International Organization for Standardization, сокращённо – ISO) официально назначила СВМФДС поддерживать стандарты сообщений в индустрии ценных бумаг. С 01 Июля 1992 после успешного окончания пилотного проекта, длившегося в течение первого полугодия, заработала услуга по Межбанковскому Переводу Файлов (МПФ; Interbank File Transfer, сокращённо – IFT). К концу года 65 банков подписались на эту услугу по обработке серий переводов массы данных, включающих массовые платежи, усечённый порядок инкассирования чеков (cheque truncation; упрощённая процедура инкассирования чеков без пересылки оригинала банку-трассанту) и внутреннюю отчётность. В результате внедрения этой услуги количество участников увеличилось ещё на 11%, а стран – на 15% в сравнении с показателями предыдущего года. В настоящее время СВМФДС разрабатывает, модернизирует и обеспечивает своих участников новейшими компьютерными программами и разработками для высокоэффективного использования своей сети SWIFTNet Network. К Апрелю 2006 сообщество связывало между собой уже порядка 8 000 финансовых институтов из 205 стран мира.

SOCIETY OF AUTOMOTIVE ENGINEERS = СООБЩЕСТВО АВТОТРАКТОРНЫХ ИНЖЕНЕРОВ – Society of Automotive Engineers (SAE) is an organization serving the automotive industry. SAE is a non-profit educational and scientific organization dedicated to advancing mobility technology to better serve humanity. Over 90 000 engineers and scientists, who are SAE members, develop technical information on all forms of self-propelled vehicles including automobiles, trucks and buses, off-highway equipment, aircraft, aerospace vehicles, marine, rail, and transit systems. SAE disseminates this information through its meetings, books, technical papers, magazines, standards, reports, professional development programs, and electronic databases. SAE Vision:- international body of mobility engineers and practitioners serving society through interaction, creativity, timely response to change, social and economic responsibility and user satisfaction. Relevant, timely consensus standards available internationally. Life-long learning, education, networking and career development opportunities for mobility engineers and practitioners. Scope of Standards Developing Activity:- The Technical Committees of SAE – the heart of the organization's consensus standards program – have been primary in moving forward many SAE partnerships, the work of SAE affiliate organizations, consortia driven standards capabilities and more. Comprised of the most impressive rosters of industry professionals and representatives from regulatory agencies and government groups worldwide, some 10 000 volunteers serve on more than 700 committees, subcommittees and working groups. SAE Technical Committees are also at the helm for developing new programs and capabilities for products and services beyond the traditional SAE standard such as supplier certification programs, cooperative research initiatives, maintenance training and more. The standards development programs of SAE are overseen by the organization's Technical Standards Board (TSB), a who's who list of industry executives. They oversee the various SAE Councils whose members direct the technical committee operations. The TSB ensures, too, that SAE meets the guidelines established by the World Trade Organization for the development of international standards. Today's SAE standards and related programs serve every aspect of industry – from design/integrate to build/manufacture to operate/maintain in both the commercial and military sectors – worldwide. SAE is committed to providing ... and partnering to provide ... the globally harmonized solutions needed for the future of the mobility industry. Headquartered in Warrendale, State of Pennsylvania (PA), Troy, State of Michigan (MI), and Washington, District of Columbia (DC), the United States of America. SAE International, initially established as the Society of Automotive Engineers (SAE), is a US-based, globally active professional association and standards developing organization for engineering professionals in various industries. Principal emphasis is placed on transport industries such as automotive, aerospace, and commercial vehicles. SAE International has more than 127 000 members globally. Membership is granted to individuals, not through companies. Aside from its standardization efforts, SAE International also devotes resources to projects and programs in STEM (short for the Science, Technology, Engineering and Mathematics) education, professional certification, and collegiate design competitions. History:- in the early 1900s there were dozens of automobile manufacturers in the United States, and many more worldwide. Auto manufacturers and parts companies joined trade groups that promoted business. A desire to solve common technical design problems and develop engineering standards was emerging. Engineers in the automobile business expressed a desire to have 'free exchange of ideas' in order to expand their individual technical knowledge base. Two magazine publishers, Peter Heldt of The Horseless Age, and Horace Swetland of The Automobile were advocates of the concepts for SAE. Heldt wrote an editorial in June 1902 in which he said, 'Now there is a noticeable tendency for automobile manufacturers to follow certain accepted lines of construction, technical questions constantly arise which seek solution from the cooperation of the technical men connected with the industry. These questions could best be dealt with by a technical society. The field of activity for this society would be the purely technical side of automobiles'. Horace Swetland wrote on automotive engineering concerns, and became an original SAE officer. About two years after Heldt's editorial, the Society of Automobile Engineers was founded in New York City. Four officers and five managing officers volunteered. In 1905 Andrew L. Riker served as president, and Henry Ford served as the society's first vice president. The initial membership was engineers with annual dues of USD10. Over the first 10 years SAE membership grew steadily, and the society added full-time staff and began to publish a technical journal and a comprehensive compilation of technical papers, previously called SAE Transactions, which still exist today in the form of SAE International's Journals. By 1916 SAE had 1 800 members. At the annual meeting that year, representatives from the American Society of Aeronautic Engineers, the Society of Tractor Engineers, as well as representatives from the power boating industry made a pitch to SAE for oversight of technical standards in their industries. Aeronautics was a fledgling industry at that time. Early supporters of the concept of a society to represent aeronautical

engineers were Thomas Edison, Glenn Curtiss, Glenn Martin, and Orville Wright. Out of the meeting in 1916 came a new organization, to represent engineers in all types of mobility-related professions. SAE member Elmer Sperry created the term 'Automotive' from Greek Autos (Self), and Latin Motivus (Of Motion) origins to represent any form of self powered vehicle. The Society of Automobile Engineers became the Society of Automotive Engineers. Charles Kettering presided over SAE during World War I and saw membership pass the 5 000 mark. During this time, SAE emphasized the importance of developing member activity through local chapters – called Sections. After World War II, the Society established links with other standards bodies and automotive engineering societies worldwide, and since then has founded sections in countries including:- Brazil, India, China, Russia, Romania, and Egypt. By 1980, membership surpassed 35 000 and over the next two decades the society, like the industries and individuals it serves, became larger, more global, more diverse, and more electronic. By the mid-1980s, membership edged close to 50 000; by the end of the 1990s, membership topped 80 000 with members in more than 80 countries. As of 2016, the society serves more than 127 000 members, with more than a quarter from outside of North America. Technical Standards:- SAE International provides a forum for companies, government agencies, research institutions and consultants to devise technical standards and recommended practices for the design, construction, and characteristics of motor vehicle components. SAE documents do not carry any legal force, but are in some cases referenced by the US National Highway Traffic Safety Administration (NHTSA) and Transport Canada in those agencies' vehicle regulations for the United States and Canada. Outside North America, SAE documents are generally not a primary source of technical provisions in vehicle regulations; the United Nations' World Forum for Harmonization of Vehicle Regulations includes expert working parties to devise technical prescriptions. Ongoing harmonization efforts seek to bridge gaps between North American SAE technical prescriptions and the UN standards in use outside North America. Ground Vehicle Standards:- SAE publishes more than 1 600 technical standards and recommended practices for passenger cars and other roadgoing vehicles. These provide industry references for measurement of engine power, motor oil classification, tool and fastener sizes, and onboard diagnostic connectors and codes. SAE also publishes standards and recommended practices for headlamps and other vehicular lighting, brakes, automatic transmission fluid, communication networks, electric vehicle charging systems, vehicle ergonomics, and numerous other aspects of vehicle design, construction, performance, and durability. Aerospace Standards:- SAE publishes over 6 400 technical documents for the aerospace industry. These include Aerospace Standards (AS), Aerospace Recommended Practices (ARP), and Aerospace Information Reports (AIR). Aerospace Standards apply to missile, airframe, ground-support equipment, propulsion, propeller, and accessory equipment. Aerospace Material Standards are a subset of Aerospace Standards governing materials science and engineering for aerospace applications. Aerospace Recommended Practices are recommendations for engineering practice. Aerospace Information Reports contain general accepted engineering data and information. Events, Conferences, Meetings And Symposia:- SAE organizes or administers more than 25 international meetings and exhibitions each year that cover all aspects of technology related to design, manufacture, and total life cycle technology for the automotive, aerospace, off-highway, truck and bus, fuels and lubricants, and other related mobility industries. These events bring engineers and technical experts from around the world together to share information and network. Each of the three industry sectors has a primary congress:- (i) SAE World Congress and Exhibition held annually for the passenger car industry; (ii) SAE Commercial Vehicle Engineering Congress held annually for the trucking, construction and agricultural industry; and (iii) SAE AeroTech Congress & Exhibition, held biennially for the aerospace industry. Other notable conferences include Convergence, the premier transportation electronics event (held biennially) and International Conference on Environmental Systems, focusing on manned space systems (held annually). SAE Symposia are one-day to three-day events focused on emerging technologies, new applications to emerging technologies or other expanded technical subjects. Additional activities and events are organized at the regional level through sections and collegiate chapters. Professional Development:- The SAE mission statement emphasizes the organization's commitment to lifelong learning. In addition to conferences and meetings, SAE also offers more than 450 separate professional development events every year. Offerings include seminars, engineering academies and webinars, offered in the classroom and online. All seminars are approved for IACET (short for the The International Association for Continuing Education And Training) Continuing Education Units (CEUs) and Professional Development Hours (PDHs) for the professional engineer. Encouraging Students In Science, Technology, Engineering & Math:- In 1986, SAE International established the SAE Foundation to support science and technology education. One of the most pressing issues facing industry today is the decline of students enrolling in science and technology programs. This decline and its impact threaten the ability to meet future workforce demands. The SAE Foundation encourages and supports the development of skills related to science, technology, engineering and mathematics. A World In Motion is a teacher-administered, industry volunteer-assisted program that brings science, technology, engineering and math (STEM) education to life in the classroom for students in Kindergarten through Grade 12. Benchmarked to the national standards, AWIM incorporates the laws of physics, motion, flight and electronics into age-appropriate hands on activities that reinforce classroom STEM curriculum. The SAE Collegiate Design Series provides an opportunity for college students to go beyond textbook theory and replicates the process of engineering design and manufacturing. In the Control and Dynamical Systems (CDS) program, a company wants to sell a product for a specific market segment, for example a radio controlled airplane, a single seat off-road vehicle, or a single seat Formula style race car. Instead of doing all the design, manufacturing and testing in house, the customer chooses to contract out those processes to a supplier, and sends their requirements out for bid. Student teams act as the suppliers and design, build and test a prototype vehicle that they believe meets the customer's specifications. Each team then presents its prototype to the customer at the annual competitions and is judged on several criteria. The team with the highest points essentially wins the contract. Each year, these design competitions host more than 4 500 students from 500 universities around the world. The SAE Collegiate Design Series competitions include the following:- (i) SAE Aero Design; (ii) Baja SAE; (iii) eBaja SAE; (iv) SAE Clean Snowmobile Challenge; (v) Formula SAE; (vi) Formula Hybrid; and (vii) SAE Supermileage. Publications:- SAE International has been publishing technical information since 1906. Industry magazines published monthly include:- Automotive Engineering International, Aerospace Engineering and Manufacturing, Off Highway Engineering, Truck & Bus Engineering, SAE Vehicle Engineering, e-newsletters, Momentum magazine for student members, and various journals. SAE also produces the monthly Update newsletter for its members and publishes more than 100 books a year in print and electronic formats. Ranging from compilations on various technical subjects, to textbooks, to historical and enthusiast-oriented books, SAE's titles cater to a variety of readers. In April 2007, MIT (short for the Massachusetts Institute of Technology) canceled its subscription to SAE because of required Digital Rights Management (DRM) technology implemented on SAE web-based database of technical papers. SAE International removed the DRM restrictions for colleges, universities, and other academic institutions. / Пита Хэльдт (Peter Heldt) из Зэ Хослэс Эйдьж (The Horseless Age), и Хорэс Свэтлэнд (Horace Swetland) из Зэ Отэмобил (The Automobile). В 1905 Эндрю Лорэнс Райкё (Andrew Lawrence Riker), и Хэнри Фод (Henry Ford) . были Томэс Эдэсэн (Thomas Edison), Глэн Кёртис (Glenn Curtiss), Глэн Матин (Glenn Martin), и Овил Райт (Orville Wright). Элмё Спэри (Elmer Sperry) создал термин 'Automotive', от Греческого слова Autos (Self), и Латинского слова Motivus (Of Motion) . Чарлз Кетчэрин (Charles Kettering). Сообщество Автотракторных Инженеров (САИ) – источник технической информации и опыта, используемого в разработке, производстве, обслуживании и управлении транспортных средств для использования на земле или море, в воздухе или космосе.

SOCIETY OF DYERS AND COLOURISTS = СООБЩЕСТВО КРАСИЛЬЩИКОВ И КОЛОРИСТОВ – The Society of Dyers and Colourists (SDC) is the world's leading independent, educational charity dedicated to advancing the science and technology of color

worldwide. Established in 1884, we have been representing our members and our industry for over 100 years. The SDC is a professional, chartered society. We are also a global organisation, with our Head Office in Bradford, UK, we have an international network of regions and activities. Our mission is to communicate the science of color in a changing world. SDC is a professional, chartered society. Our services and activities include:- (i) Membership – open to everyone, with a range of diffferent membership types for individuals, colleges, companies and students; (ii) Professional Coloration Qualifications – accredited qualifications that are recognised by industry worldwide. SDC is the only organisation in the world that can award Chartered Colourist status. (iii) Bursaries – available to students (rules apply); (iv) Awards – our annual presentation of diplomas, medals and awards recognise achievement in color science and color technology; (v) Training – industry-proven courses; (vi) Publications – including Coloration Technology, The Colourist and text books; (vii) SDC Technology Transfer – environmentally friendly, cost-saving solutions for dyeing and finishing; (viii) Standards – SDC holds the secretariat for the BSI committee TC1/81 and ISO committee TC38/SC1 which have responsibility for the 105 series of test methods for Colour Fastness and Colour Measurement; (ix) Colour Index – the definitive reference for all dyes and pigments; (x) Events – regional, national and international events on topics of interest to the textile industry; (xi) Competitions – open to students and others; (xii) Colour Experience – we work with groups of all ages, particularly children; and (xiii) SDC Enterprises – our wholly owned subsidiary. SDC Enterprises manufacture premium quality color fastness testing consumables for use in BS, EN and ISO test procedures. In 1962 SDC became a registered educational charity, and in 1963 SDC was granted a Royal Charter and became the only organization in the world that can award the Chartered Colourist Status in recognition of individual professionalism. The Royal Charter in its original form includes a Schedule detailing the By-Laws the Society operates under. These By-Laws have been revised over the years and at the top right of this page is a link to the current By-Laws in force, which should be the ones referred to and not the original Royal Charter Schedule. Amendments to the Royal Charter and By-Laws must be undertaken via and agreed by the Privy Council. The Rules however are set by the Board of Trustees and agreed at the AGM. Becoming a member gives access to SDC's Professional Coloration Qualifications including the elite Chartered Colourist status. We have an international network of regions and activities. Headquartered in Bradford, West Yorkshire, the United Kingdom.

SOCIETY OF LLOYD'S = СООБЩЕСТВО ЛОЙДА – Unlike most other insurance brands, Lloyd's is not a company, it's a market where our members join together as syndicates to insure and reinsure risk. Lloyd's is the world's leading specialist insurance market, conducting business in over 200 countries and territories worldwide – and is often the first to insure new, unusual or complex risks. We bring together an outstanding concentration of specialist expertise and talent, backed by excellent financial ratings which cover the whole market. Lloyd's is the world's leading specialist insurance market which offer an unrivalled concentration of specialist underwriting expertise and talent The market is home to over 50 managing agents and over 80 syndicates (in 2011), which offer an unrivalled concentration of specialist underwriting expertise and talent. Lloyd's is the world's best known – but probably least understood – insurance brand. This is because Lloyd's is not an insurance company but a society of members, both corporate and individual, who underwrite in syndicates on whose behalf professional underwriters accept risk. Supporting capital is provided by investment institutions, specialist investors, international insurance companies and individuals. Lloyd's brokers bring business to the market. The risks placed with underwriters originate from clients and other brokers and intermediaries all over the world. Together, the syndicates underwriting at Lloyd's form one of the world's largest commercial insurers and a leading reinsurer. The market structure encourages innovation, speed and better value, making it attractive to policyholders and participants alike. Immediate access to decision-makers means that answers on whether a risk can be placed are made quickly, enabling the broker to provide fast, good value solutions. The Corporation of Lloyd's oversees the market, establishing standards and providing services to support its activities. It also manages Lloyd's worldwide licences. The Corporation's Executive Team exercises the day-to-day powers and functions of the Council and the Franchise Board. The Corporation (including its subsidiaries) had 886 employees worldwide, as at 31 December 2009. As well as providing cost-effective services to aid the smooth running of the market, the Corporation strives to raise the standards and improve the performance. The Corporation's work is split into two main areas:- (i) Overall risk and performance management of the market:- (a) setting the level of capital Lloyd's members must provide to support their proposed underwriting; (b) overseeing the market's business activities by operating a minimum standards framework and monitoring the performance of syndicates in areas such as exposure management, cycle management, claims management and operational risk management; (c) working with the managing agents of underperforming syndicates to improve performance, intervening if stronger action is required; and (d) managing financial and regulatory reporting for the market, including the production of its results and the Financial Services Authority (FSA) return. (ii) Maintaining and developing the attractiveness of the market's capital providers, distributors and clients while preserving Lloyd's diversity and London based business model:- (a) managing and developing Lloyd's global network of licences and the Lloyd's brand; and (b) taking action in the long-term interests of the market. Today Lloyd's is the world's leading insurance market, housed in an award-winning modern building in Lime Street in the City of London. Its origins, however, lay in the more modest surroundings of a XVII century coffee house. In the XVII Century London's importance as a trade centre led to an increasing demand for ship and cargo insurance. Lloyd's coffee house became recognised as the place for obtaining marine insurance. From its first beginnings in Edward Lloyd's Coffee House in 1688, Lloyd's has been a pioneer in insurance. Starting with its roots in marine insurance, Lloyd's has grown over 300 years to become the world's leading market for specialist insurance. From XVII century shipping and Lord Nelson's victory at the Battle of Trafalgar, through the devastation of the San Francisco earthquake in 1906, and on to the emergence of space satellite technology in the late XX century, the story of Lloyd's is both a long and an interesting one. The Society incorporated by Lloyd's Act 1871 by the name of Lloyd's. Lloyd's vision is to be the 'market of choice for insurance and reinsurance buyers and sellers to access and trade specialist property and casualty risks'. The strategy is centred around the need for continued underwriting discipline, and remains the means to tackle these difficult external circumstance. The Lloyd's market insures complex and specialist risks – from oil rigs to celebrity body parts. With our syndicates under one roof in the Underwriting Room, brokers are able to find individual and innovative cover, whatever their challenge may be. (i) Casualty:- casualty risks are particularly specialist and complex and the US accounts for a large proportion of this business. This market includes professional indemnity, medical malpractice, accident and health, directors' & officers' liability and general and employers' liability. Casualty makes up 20% of Lloyd's business. (ii) Property:- the property sector is hugely varied, encompassing everything from supporting the building of the new World Trade Center to protecting holiday resorts against storm damage. It's also highly competitive with capacity increasing as many insurers look to diversify away from the catastrophe business. Property makes up 23% of Lloyd's business. (iii) Marine:- this is where the Lloyd's story began over 300 years ago. Today it is a smaller but still significant part of our business. Most of the cover in this area is for hull, cargo, marine, liability and specie (the insurance of highly valued items such as fine art while in transit). Marine makes up 7% of Lloyd's business. (iv) Energy:- this market is steadily evolving, from onshore and offshore property, oil rigs and refineries to emerging renewable energy ventures. Energy makes up 6% of Lloyd's business. (v) Motor:- in this competitive sector, Lloyd's is focused on company fleet business and non-standard risks. This includes high value, vintage and collectors' vehicles, high risk drivers and affinity groups. Lloyd's has insured numerous land speed record attempts and Sir Malcolm Campbell, the first man to break 300mph on land, was a Lloyd's broker. Motor makes up 5% of Lloyd's business. (vi) Aviation:- Lloyd's is an industry leader within the global aviation market. This includes airline, general aviation, products, war and terrorist coverage, airports and satellite business. Since 9/11, this sector's loss experience has been well below the industry's long-term average, thanks to new safety systems, increased security and improved regulation.

Aviation makes up 3% of Lloyd's business. (vii) Reinsurance:- the reasons for reinsurance tend to fall into four categories:- (a) to protect an insurer against very large claims; (b) to reduce exposure to peaks and troughs; (c) to obtain an international spread of risk; and (d) to increase the capacity of the direct insurer. Reinsurance makes up 36% of Lloyd's business. Headquartered in London, the United Kingdom. Starting with its roots in marine insurance, Lloyd's has grown over 300 years to become the world's leading market for specialist insurance. How does Lloyd's fit into this increasingly risk conscious world. In an increasingly risk-conscious world? Hundreds of good ideas would never get off the ground without a way to reduce risk. Risk can't be eliminated but it can be managed and reduced. At its simplest that is what insurance helps you do. But what happens to risks that are hard to price, large or otherwise difficult to quantify and understand? Lloyd's specialises in exactly these risks. You would be hard pressed to find more expertise and know-how on this subject. Understanding and pricing complex risk is the heart of the Lloyd's market. Over 300 years ago Lloyd's started out in Edward Lloyd's Coffee House as a place where people with exposure to risks could meet people with capital who, for a price, would agree to insure them. That's exactly what Lloyd's is today:- a face-to-face market, with all the dynamism and imagination that a market generates. Today the Lloyd's market covers some of the world's largest, most individual and complicated risks. From oil rigs and bridges to celebrity body parts, from airlines and sporting events to global banks, millions of people at home and at work are covered at Lloyd's. / Сродство (Affinity). Сообщество, инкорпорированное в соответствии с Актом о Лойдз от 1871, и носящее имя Лойдз. Сэр Мэлком Кэмбэл (Sir Malcolm Campbell). Лорд Нэлсан (Lord Nelson).

SOCIETY OF TRIBOLOGIST AND LUBRICATION ENGINEERS = СООБЩЕСТВО ТРИБОЛОГИСТОВ И ИНЖЕНЕРОВ ПО СМАЗЫВАНИЮ – Society of Tribologist and Lubrication Engineers (STLE), formerly the American Society of Lubrication Engineers (ASLE). STLE, one of the largest professional societies in the field, serves 15 000 industry professionals worldwide. Headquartered in Park Ridge, IL, The United States of America. The Society of Tribologists and Lubrication Engineers (STLE) is the premier technical society serving the needs of more than 13 000 individuals and 250 companies and organizations that comprise the tribology and lubrication engineering business sector. STLE members are experts who research, develop and market the methods and products that make industry more successful and that enhance the well-being of people worldwide. Our members are employed by the world's leading corporations and academic institutions and by governmental agencies dealing with science and technology. STLE supports these distinguished men and women with a variety of professional education and certification programs. Lubrication Engineering relates to the reduction of friction and wear between relatively moving parts. The term Tribology describes the study of interacting moving surfaces. Tribology encompasses aspects of physics, chemistry, applied mathematics, metallurgy, material science, mechanical engineering, chemical engineering and applied mechanics. Studies estimate that as much as one-third of all usable, device-produced energy is lost to friction and wear. This costs industry and consumers billions each year. In addition to energy waste, friction and wear greatly affect product reliability, maintainability, safety, life and environmental factors. / Американское Сообщество Инженеров по Смазыванию (АСИС).

SOCK = САНДАЛИЯ АКТЁРА (или СТЕЛЬКА) – Sock:- (Archaic) a low shoe or slipper; a knitted or woven covering for the foot usually extending above the ankle and sometimes the knee; a shoe worn by actors in Greek and Roman comedy. / Вкладная Стелька.

SOD = SUPEROXIDE DISMUTASE

SODA ASH = ЗОЛА СОДЫ (или КАЛЬЦИНИРОВАННАЯ СОДА) – Soda Ash:- Sodium Carbonate. Use as an alkali fixative for reactive dyes. Soda Ash is an antiquated but much-used term. / Карбонат Натрия. Кальцинированная Сода, Na_2CO_3. Щёлочь (Alkali).

SODEMO = SOCIÉTÉ DE DÉVELOPPEMENT DE LA PLAINE DE MORONDAVA = SOCIETY FOR THE DEVELOPMENT OF THE PLAIN OF MORONDAVA

SODICATION = НАТРИФИКАЦИЯ – Sodication is the process whereby the exchangeable sodium content of a soil is increased. / процесс, посредством которого повысилось содержимое обменного натрия в почве.

SODICITY = СОДИСТОСТЬ (или СОДЕРЖАНИЕ НАТРИЯ) – Sodicity is the quality or degree of having sodium as a component. / количество или степень наличия натрия как компонента.

SODIUM ACETATE = АЦЕТАТ НАТРИЯ (или УКСУСНОКИСЛЫЙ НАТРИЙ) – Sodium Acetate, CH_3COONa, is a buffer. In dyeing, sodium acetate is almost always used together with acetic acid in moderately acid processes (that is, sodium acetate is rarely used without acetic acid, but acetic acid may often be used without sodium acetate).

SODIUM ACETATE or SODIUM ACETATE CRYSTALS = АЦЕТАТ НАТРИЯ (или УКСУСНОКИСЛЫЙ НАТРИЙ) или КРИСТАЛЛЫ АЦЕТАТА НАТРИЯ – Sodium Acetate or Sodium Acetate Crystals is an acid-forming salt that acts as a leveling agent for Sabraset/Lanaset dyes. / Забразэт/Ляназэт.

SODIUM ADSORPTION RATIO = СООТНОШЕНИЕ С ПОГЛОЩЕНИЕМ НАТРИЯ (или СТЕПЕНЬ СОЛОНЦЕВАТОСТИ) – Sodium Adsorption Ratio (SAR) is a relation between soluble sodium and soluble divalent cations which can be used to predict the exchangeable sodium percentage of soil equilibrated with a given solution.

SODIUM BICARBONATE = БИКАРБОНАТ НАТРИЯ (или ДВУУГЛЕКИСЛЫЙ НАТРИЙ, или КИСЛЫЙ УГЛЕКИСЛЫЙ НАТРИЙ) – Sodium Bicarbonate, $NaHCO_3$ is more properly called Sodium Hydrogen Carbonate; also called Sodium Acid Carbonate, and most commonly, Baking Soda. Sodium bicarbonate is used as a weak base (alkali) in some dyeing processes, often with reactive dye that is padded onto fabric, then batched for many hours. It has limited stability in solution, decomposing to sodium carbonate, carbon dioxide and water, especially at high temperature, so solutions generally should be made shortly before use. Sometimes this decomposition is used deliberately, usually with highly reactive dyes such as MX. A print paste made with sodium bicarbonate will have a pH around 8, and at this pH the dye will not hydrolyze rapidly and hence become useless. When the printed fabric is steamed, the sodium bicarbonate will decompose and the pH will rise to around 11, facilitating reaction of the dye with the fiber. Sodium Bicarbonate is a bicarbonate of soda or baking soda. A weak alkali used to set reactive dyes by steaming or ironing. / слабое основание (weak base) (щёлочь (alkali)). загустка (print paste). бикарбонат натрия (или двууглекислый натрий, или кислый углекислый натрий (sodium bicarbonate)) (пищевая сода (baking soda)).

SODIUM BISULFATE = БИСУЛЬФАТ НАТРИЯ – Sodium Bisulfate, $NaHSO_4$ is also called Sodium Hydrogen Sulfate or Sodium Acid Sulfate. Sodium bisulfate hydrolyzes in water solution, and acts much like sulfuric acid. It can sometimes be used as substitute for sulfuric acid, and because it is a dry chemical, it can be safer to handle, though care is still necessary. Sodium bisulfate is often the basis for etchant pastes for devoré of cotton. 'pH Down' for spas and swimming pools is usually sodium bisulfate. Do not confuse this with sodium bisulfite. Sodium Bisulfate is a Sodium acid sulfate. Colorless to white crystals that form a very strong acid when dissolved in water. Use with the Kiton acid dyes or to burn out cellulose from cotton and cotton blend fabrics. It is corrosive to skin and eyes in solution. / Сильная Кислота (Strong Acid). Под Бисульфатами или Гидросульфатами понимаются кислые соли серной кислоты H_2SO_4. Devoré:- (1) Дэворе; (2) Пожирать; (3) Съедать.

SODIUM BISULFITE = БИСУЛЬФИТ НАТРИЯ (или КИСЛЫЙ СЕРНИСТОКИСЛЫЙ НАТРИЙ) – Sodium Bisulfite, $NaHSO_3$ is a mild reducing agent, most used in dyeing as an antichlor; often actually sodium metabisulfite ($Na_2S_2O_5$), which behaves the same way. As an antichlor, sodium (meta) bisulfite reacts with sodium hypochlorite and hypochlorous acid, to almost immediately stop bleaching action. The product of the reaction is two acids which need to be thoroughly rinsed from the fabric. Typical use is about a gram (approximately 1/4 tsp) per liter of room-temperature water. Solutions should be prepared shortly before use (preferably within an hour) and with gentle stirring, since oxygen dissolved in the solution will destroy its effectiveness. Discard used solutions. Do not confuse this chemical with sodium bisulfate. Caution! Some people develop very serious sensitivity to sulfite compounds. / Под Бисульфитами или Гидросульфитами понимаются кислые соли сернистой кислоты H_2SO_3.

SODIUM CARBONATE = КАРБОНАТ НАТРИЯ (или УГЛЕКИСЛЫЙ НАТРИЙ) – Sodium Carbonate is a soda ash; Na_2CO_3; a weak base. Sodium carbonate is an extensively-used alkali in textile preparation and dyeing. It is typically used to adjust the pH of solutions to about 11. It is also used in scouring cellulose fibers. The most common industrial form is the anhydrous type. Sodium carbonate monohydrate ($Na_2CO_3 \cdot H_2O$) is the most common form sold for photographic use. Washing soda, if 'pure', is usually sodium carbonate decahydrate ($Na_2CO_3 \cdot 10H_2O$). Soda ash is hygroscopic, so it should be stored in a tightly-closed moisture-proof container. If so protected, it will keep indefinitely. See also Hydration State, and pH Up. / безводное (anhydrous). Щёлочь (Alkali). слабое основание (weak base). десятиводный гидрат карбоната натрия (sodium carbonate decahydrate). Под Карбонатами понимаются соли и эфиры угольной кислоты H_2CO_3.

SODIUM CHLORATE = ХЛОРАТ НАТРИЯ (или ХЛОРНОВАТОКИСЛЫЙ НАТРИЙ) – Sodium Chlorate, $NaClO_3$, is an oxidizing agent, sometime used as a resist salt to protect dyes from reduction in printing processes under acid conditions. / Под Хлоратами понимаются соли хлорноватой кислоты $HClO_3$. Кристаллы; при обычной температуре устойчивы, при нагревании взрывоопасны. Важны:- хлорат калия или Бертоллетова соль, хлорат натрия $NaClO_3$ и хлорат магния $Mg(ClO_3)_2$. Хлораты применяют как окислители, гербициды и дефолианты. Ядовит.

SODIUM CHLORIDE = ХЛОРИД НАТРИЯ (или ХЛОРИСТЫЙ НАТРИЙ, или ПОВАРЕННАЯ СОЛЬ) – Sodium Chloride, NaCl is a common salt. Sodium chloride is used in large quantities as an electrolyte in application of direct dyes and reactive dyes. / Под Хлоридами понимаются химические соединения хлора с другими элементами. Хлориды металлов – кристаллы, соли соляной кислоты.

SODIUM DITHIONITE = ДИТИОНИТ НАТРИЯ (или ГИДРОСУЛЬФИТ НАТРИЯ) – Sodium Dithionite is a sodium hydrosulfite; dithionite is technically more correct. / Гидросульфит Натрия – это белый мелкозернистый порошок с сероватым оттенком. Химическая формула – $Na_2S_2O_4$ (в связи с этим другое название – Дитионит Натрия). Также в смеси обычно есть окись железа (Fe_2O_3) и другие не растворимые в воде вещества – чем меньше их массовая доля, тем выше, соответственно, качество гидросульфита натрия. К категории 'высший сорт' относятся те материалы, где доля самого гидросульфита натрия составляет как минимум 93%. Гидросульфит натрия применяется в химической, лёгкой промышленности (беление и крашение тканей), а также многих других отраслях. К примеру, в пищевой промышленности гидросульфит натрия используется как антиокислитель или консервант (порядковый номер – E222). Его часто добавляют в вина, идущие на вывоз (или экспорт) (то есть с длительным сроком хранения):- гидросульфит натрия помогает сохранить вкус и предотвратить их окисление. Также этот порошок применяют при консервировании фруктов – для борьбы с микробами и предотвращения потемнения. Есть множество технологий производства гидросульфита натрия. Для этих целей используется поваренная соль, едкий натр, серная кислота, биосульфит натрия, кальцинированная сода, цинковая пыль и этиловый спирт. Масштабы изготовления гидросульфита натрия в ведущих странах достигают 2–3 десятков тысяч тонн за год. Лидер в этой области – Япония, где гидросульфит натрия производят объёмами более 100 тысяч тонн в год. Гидросульфит натрия считается взрывобезопасным. Однако он пожароопасен и может самовоспламеняться в присутствии кислорода воздуха, если на него пролить воду (при этом происходит выделение серы, которая также затем возгорается). Потому при транспортировке гидросульфит натрия рекомендуется хранить в герметичной таре, лучше – в специальных герметичных барабанах для химических продуктов (толщиной не менее 0.5 мм), причём с дополнительной изоляцией полиэтиленом от попадания влаги. Также гидросульфит натрия обладает четвёртой степенью токсичности и при попадании внутрь организма в больших дозах может вызывать головокружение, вялость и тошноту. При случайном вдохе пыли с содержанием гидросульфита натрия требуется промыть водой глаза и слизистые, обеспечить человеку покой, свежий воздух, тепло. Если пыль гидросульфита натрия находилась в разряженном состоянии, в воздухе – обязательно сменить одежду. Гидросульфит натрия перевозится практически всеми видами закрытого транспорта, кроме воздушных. Наиболее частый способ – вагонные отправки. Гарантийный срок хранения гидросульфита натрия составляет около шести месяцев со дня производства.

SODIUM FORMALDEHYDE SULFOXYLATE = ФОРМАЛЬДЕГИД СУЛЬФОКСИЛАТ НАТРИЯ – Sodium Formaldehyde Sulfoxylate is a reducing agent used in discharge techniques and for stripping dye; Formosul and Rongalit C are trade names; designated in Colour Index as Reducing Agent 2. This chemical is useful for discharge on cellulose and silk, but not usually on wool. It requires alkaline conditions that may damage wool (alkaline conditions can also reduce the sheen of silk). It does not contain free formaldehyde. See also Zinc Formaldehyde Sulfoxylate. / Формальдегид Сульфоксилат Натрия. Щелочное (Alkaline). (Formosul) и Си. (Rongalit C). Смотрите также Формальдегид Сульфоксилат Цинка (Zinc Formaldehyde Sulfoxylate).

SODIUM HEXAMETAPHOSPHATE = ГЕКСАМЕТАФОСФАТ НАТРИЯ (или ГЕКСАМЕТАФОСФОРНОКИСЛЫЙ НАТРИЙ) – Sodium Hexametaphosphate, $Na_{(x+2)}P_xO_{(3x+1)}$, where x = 6 to 21; a sequestrant used to treat hard water; SHMP, often referred to in art dyeing literature as 'Metaphos'. Sodium hexametaphosphate softens water by sequestering calcium and magnesium, effectively making them unavailable to participate in other reactions. Typical use would be about 0.5 grams per liter of water. Calgon T is one trade name for sodium hexametaphosphate, though retail Calgon products contain other chemicals, and are not the preferred products for dyeing applications. / Гексаметафосфат Натрия.

SODIUM HYDROSULFITE = ГИДРОСУЛЬФИТ НАТРИЯ (или КИСЛЫЙ СЕРНИСТОКИСЛЫЙ НАТРИЙ) – Sodium Hydrosulfite, $Na_2S_2O_4$ is a reducing agent used in discharge techniques, dye stripping, and in vat dyeing; more properly called Sodium Dithionite; dyehouse term is 'Hydro' or 'Hydros'. For stripping, it is usually used in an alkaline solution at a temperature near the boiling point of water. This is the active ingredient in some of the 'whiteners' or 'dye removers' sold in small packages like the 'household' dyes in the grocery store. It produces a rather strong sulfurous smell. Sodium hydrosulfite is a flammable powder, and must be handled with care. Do not confuse this with sodium hydrosulfide, which is used with sulfur dyes. / Щелочное (Alkaline). Под Гидросульфитами или Бисульфитами понимаются кислые соли сернистой кислоты H_2SO_3.

SODIUM HYDROXIDE = ГИДРОКСИД НАТРИЯ (или ГИДРООКИСЬ НАТРИЯ, или ЕДКИЙ НАТР) – Sodium Hydroxide, NaOH is a strong base; commonly sold as beads or flakes, or as a 50% solution; also called Caustic Soda or Lye, often just called 'Caustic' in dyeing. Sodium hydroxide is used in some dyeing processes requiring very high pH. A solution of 4 grams per liter will have a pH of 13. It is common in vat dyeing, some reactive dye methods, and is used in mercerizing cotton. It is commonly used for industrial scouring of

cotton. Sodium hydroxide must be handled with great care, since it will cause severe skin burns. It should be dissolved by slowly adding it to stirred very cold water, since a great deal of heat is liberated as it dissolves. Never use aluminum vessels or tools with NaOH:- they will be corroded, and explosive hydrogen will be generated. Sodium hydroxide is deliquescent – extremely hygroscopic. / сильное основание (strong base). каустическая сода или едкий натр (caustic soda). шарики (beads).

SODIUM HYPOCHLORITE = ГИПОХЛОРИТ НАТРИЯ (или ХЛОРНОВАТИСТОКИСЛЫЙ НАТРИЙ) – Sodium Hypochlorite, NaOCl. Household type chlorine laundry bleach contains about 5% sodium hypochlorite as the active ingredient. Stronger solutions are available for industrial use. See also Bleach, and Chlorine. / Под Гипохлоритами понимаются соли хлорноватистой кислоты HClO. Гипохлориты – соли хлорноватистой кислоты HClO. Наибольшее значение имеют гипохлориты натрия NaClO и кальция $Ca(ClO)_2$, являющиеся сильными окислителями. Гипохлорит кальция известен под названием Белильной или Хлорной Извести. Гипохлориты применяются как отбеливающие средства в текстильной, бумажной, целлюлозной промышленности, как дегазатор ОВ, как стерилизующее средство, для дезинфекции питьевых и сточных вод и как источник кислорода.

SODIUM METABISULFITE = МЕТАБИСУЛЬФИТ НАТРИЯ (или XX) – Sodium Metabisulfite, $Na_2S_2O_5$ is commonly used to precipitate dissolved gold out of aqua regia and gold chloride solutions. Wine (and beer) makers use Sodium Metabisulfite to inhibit the growth of wild yeast and bacteria in the wine. It also works well as a sanitizer for wine making equipment. Dosage:- (i) Wild Yeast:- one quarter teaspoon per five gallons of must; and (ii) Sanitation:- two ounces to one gallon of water. Sodium metabisulfite is a white, slightly yellowish crystaline powder with a sulfur dioxide odor (rotten eggs), dissolving easily in water. When mixed with water or a strong acid solution, sodium metabisulfite releases sulfur dioxide (SO_2), a pungent, unpleasant smelling gas that can also cause breathing difficulties in some people. Released sulfur dioxide however makes the water a strong reducing agent. See also Sodium Bisulfite. / Сильная Кислота (Strong Acid). осадок (precipitate).

SODIUM M–NITROBENZENE SULFONATE = М–НИТРОБЕНЗИН СУЛЬФОНАТ НАТРИЯ (или НАТРИЕВАЯ СОЛЬ М–НИТРОБЕНЗОЛСУЛЬФОНОВОЙ КИСЛОТЫ) – Sodium M-Nitrobenzene Sulfonate, is often referred to by BASF's tradename Ludigol®. This chemical is a mild oxidizing agent that is sometimes used to protect dyes from degradation caused by reducing conditions that exist at high pH and high temperature, especially where air is excluded from the dyeing vessel. Such conditions are quite common in processes for some of the low-reactivity dyes, but very rare in processes for MX dyes, except in steam fixing. Recommended amounts for protecting dyes from reduction range from 1 to 10 grams per liter of dyebath. When used in printing it is sometimes called a Resist Salt. It is also used as an oxidizing agent for some vat dyes. / Бе.А.Эс.Эф. (BASF) Людиголь® (Ludigol®).

SODIUM PERBORATE = ПЕРБОРАТ НАТРИЯ – Sodium Perborate, $NaBO_3$ is the bleaching compound that is most commonly found in laundry detergents that contain 'color safe' bleach. Such detergents often contain special activators that make the perborate work more effectively at moderate temperatures. / Перборат Натрия – отбеливающий компонент, борется с пятнами от кофе, чая, травы. Недостатком Пербората Натрия является низкое содержание активного кислорода в 4-х водном продукте и нестабильность одноводного вещества, которая может приводить к его неконтролируемому разложению. Наиболее близким к заявляемому продукту по вещественному составу и используемым для синтеза реагентам является перборат кальция.

SODIUM PERCARBONATE = ПЕРКАРБОНАТ НАТРИЯ – Sodium Percarbonate is a dry chemical made by reacting sodium carbonate with hydrogen peroxide. Sodium percarbonate can be used as an alternative to hydrogen peroxide for oxidizing bleaching. It is considerably more expensive, but is safer to handle (relative to industrial-strength hydrogen peroxide). Oxi Clean® is a retail cleaning compound believed to be primarily sodium percarbonate. / Перкарбонат Натрия (пероксисольват карбоната натрия или ПКН) применяется в качестве отбеливающего реагента в текстильной, химической и других отраслях промышленности в виде индивидуального препарата или в композициях, а также в качестве отбеливающей добавки в составе синтетических моющих средств. Перкарбонат натрия относится к классу перекисных соединений. Производство перкарбоната натрия основано на взаимодействии перекиси водорода и карбоната натрия в присутствии стабилизирующих добавок с последующим выделением перкарбоната натрия, его грануляцией и сушкой. Этот продукт обладает рядом значительных преимуществ по сравнению с другими отбеливателями. Преимущества перкарбоната натрия перед перборатом натрия (ПБН):- (i) ПКН удаляет стойкие загрязнения – пятна от фруктов, соков, красного вина, чая и так далее; (ii) ПКН не пылит и не слеживается при хранении, поскольку имеет гранулированную выпускную форму; (iii) ПКН имеет более высокое содержание активного кислорода, что обеспечивает меньший расход активного компонента на единицу синтетического моющего средства (СМС); (iv) ПКН имеет лучшую растворимость (18 г в 100 г воды при 40 °С против 6 г), что обеспечивает меньшее время приготовления рабочего раствора; и (v) ПКН характеризуется более полным высвобождением активного кислорода в СМС (100% при 50 °С в течении 15 ч против 15% в ПБН), что обеспечивает более полное использование активного кислорода при отбеливании. Кроме того, соединения бора токсичны и отрицательно воздействуют на флору и фауну водоёмов, приводят к развитию сине-зелёных водорослей, пагубно влияют на здоровье беременных женщин, а при разложении перкарбоната натрия образуются вода, кислород и сода, практически не оказывающие отрицательного влияния на окружающую среду. Основными областями применения перкарбоната натрия являются:- (i) производство бытовых отбеливателей; и (ii) производство синтетических моющих средств (в качестве отбеливающего компонента). За рубежом к областям применения перкарбоната натрия также относятся:- (i) текстильная промышленность (отбеливание, аппретирование и расшлихтовка тканей и другое); (ii) косметическая и фармацевтическая промышленность (изготовление зубных паст, дезодорирующих составов, лосьонов, шампуней, мазей и другого); (iii) химическая промышленность (в качестве универсального окислителя); (iv) очистка твёрдых поверхностей пищевого, медицинского и прочего оборудования; и (v) производство дезинфицирующих составов. При этом большая часть производимого перкарбоната натрия используется в производстве синтетических моющих средств и бытовых отбеливателей, то есть основными потребителями являются заводы синтетических моющих средств и товаров бытовой химии.

SODIUM SILICATE = СИЛИКАТ НАТРИЯ (или КРЕМНЕКИСЛЫЙ НАТРИЙ) – Sodium Silicate, $Na_2Si_3O_7$ and similar compounds, usually as a solution in water. Sodium silicate is used as a stabilizer in hydrogen peroxide bleaching. It can also be used in direct application of reactive dyes to cellulose fibers. Here it is applied essentially full-strength after the dye is applied, acting as an alkali to cause the dye to fix to the fiber. Because it is a syrupy liquid, it makes the dye spread less than other postapplied alkalies. Care must be take to avoid making solutions of sodium silicate acidic, since this will result in a water-insoluble gel that is extremely difficult to remove. Sodium silicate solution is also called Water Glass. It can be very irritating to skin. / Щёлочь (Alkali).

SODIUM SULFATE = СУЛЬФАТ НАТРИЯ (или СЕРНОКИСЛЫЙ НАТРИЙ) – Sodium Sulfate is a Glauber's salt; Na_2SO_4. Sodium sulfate is used as an alternative to common salt (sodium chloride) in some dyeing processes, such as those involving MX turquoise where it is a simple electrolyte. When used with some acid dyes for wool, it may act as either an electrolyte to enhance exhaustion, or as a retarder to aid leveling, depending on conditions such as pH. It is also used as a diluent for many dyes. Sodium sulfate is often sold in anhydrous form. It will absorb water from the air, so it should be stored in tightly closed containers. In the dye industry, some use 'sodium sulfate' only to refer to the anhydrous form, and 'Glauber's salt' to refer to the decahydrate form ($Na_2SO_4 \cdot 10H_2O$). /

безводное (anhydrous). относится к форме десятиводного гидрата (decahydrate form). Эм.Экс. Туркуаз (в переводе с Французского языка – Бирюза или Бирюзовое; MX Turquoise). Глауберова Соль (по имени Немецкого химика Йохана Рудольфа Гляубэра (Johann Rudolph Glauber; 1604–1670)) то же, что Мирабилит.

SODIUM THIOSULFATE = ТИОСУЛЬФАТ НАТРИЯ (или ТИОСЕРНОКИСЛЫЙ НАТРИЙ) – Sodium Thiosulfate, $Na_2S_2O_3$, is a chemical used to neutralize chlorine in water for dye baths. The chlorine present in tap water can actually destroy small amounts of dye. This can be a problem, particularly when dyeing very pale shades where loss of a little dye can influence the final shade noticeably. Sodium thiosulfate is preferred for neutralizing chlorine for this application. Typical use would be about 0.15 grams per liter of bath. Sodium thiosulfate is the main ingredient in fixer (types sold as dry powder mixture) for black and white photographic processing. Most antichlor products for aquarium use are sodium thiosulfate. / Под Тиосульфатами понимаются соли тиосерной кислоты $H_2S_2O_3$ и алкилтиосерных кислот $RSSO_3H$, где R – алкил, аралкил. Наиболее важен тиосульфат натрия $Na_2S_2O_3$.

SOD PLANTING = ПОСАДКА С ЗАПАХИВАНИЕМ (или ДЕРНОВАЯ ПОСАДКА) – Sod Planting is a method of planting in sod with little or no tillage.

SOES = SMALL ORDER EXECUTION SYSTEM

SOFFEX = SWISS OPTIONS AND FINANCIAL FUTURES EXCHANGE

SOFT = МЯГКИЕ (или ЛЁГКИЕ) – Soft:- popular name given to traded commodities other then metals, e.g., Cocoa, Coffee, Cotton, Orange juice, sugar, etc. This term means certain soft commodities such as Cocoa, Coffee, Cotton, Orange juice, sugar, etc. / Популярное наименование, данное определённым торгуемым на биржах видам сырья, отличным от металлов, например, . Этот термин означает известные мягкие рода сырья, такие как Какао, Кофе, сахар, Хлопок и прочее.

SOFT = ОСЛАБЛЕННАЯ (или МЯГКАЯ) – A description of a price that is gradually weakening. In oil and gas industry, Soft is a term used to indicate lower than average, or lower than expected prices, usually in the context of crude or spot/rack prices. Also used to portray downward pressure, or a downward trend, in prices. The opposite of Firm.

SOFT ALLOCATION = ЛЁГКОЕ ВЫДЕЛЕНИЕ (или МЯГКОЕ РАЗМЕЩЕНИЕ) – Soft Allocation is the initial allocation of inventory to an order which will commit the inventory to the order but not specifically pull it from a certain lot.

SOFT COMMODITIES = МЯГКИЕ РОДА СЫРЬЯ – Soft Commodities are goods that are grown. Exchange-traded soft commodities include Cocoa, Coffee, Cotton, Orange juice, sugar, etc.

SOFT CURRENCY = МЯГКАЯ ВАЛЮТА (или ОГРАНИЧЕННО КОНВЕРТИРУЕМАЯ ВАЛЮТА) – Soft Currency is a currency which is not fully convertible to all currencies but only to some other soft currencies. Currency not freely convertible. Currency representing a less desirable performance on the Forex markets than other currencies. Soft currency countries tend to witness frequent currency devaluations, balance of payments difficulties or political instability. Also known as Weak Currency. The opposite of Hard Currency, or Strong Currency. / к засвидетельствованию (witness).

SOFTEN = МЯГКОЕ (или ЛЁГКОЕ) – Soften:- slowly declining market prices.

SOFTENER = УМЯГЧИТЕЛЬ (или МЯГЧИТЕЛЬ, или СМЯГЧИТЕЛЬ, или УМЯГЧАЮЩЕЕ СРЕДСТВО) – (1) Softener (fabric softener) is a chemical or chemical mixture intended to give fabric a soft hand. Softeners act primarily as lubricants for fibers, allowing them to slide over each other more easily, giving a softer feel. Some also help reduce static electric charge build up, and some are antimicrobial. Many softeners are surfactants, and they may be cationic, anionic or non-ionic. Household laundry softeners are often based on cationic surfactants. Softeners can interfere with dyeing, so they should be removed by scouring. Some, such as silicones, can be quite difficult to remove. Softener is a product designed to impart a soft mellowness to the fabric. Examples are glucose, glycerine, tallow, or any one of a number of quaternary ammonium compounds.

(2) Softener (water softener) is a chemical(s) added to water to prevent hardness ions from interfering with other solutes. Sodium hexametaphosphate (SHMP) is commonly used as a softener in dyeing. It will hold moderate amounts of hardness ions in solution. Soda ash will soften water, but it does it by formation of insoluble precipitates that can deposit on fabric or equipment, so SHMP is often added before soda ash to prevent this. Water softening systems which use common salt exchange hardness cations for sodium. Softener is a substance that reduces the hardness of water by removing or sequestering the calcium and magnesium ions. / Гексаметафосфат Натрия (Sodium Hexametaphosphate (SHMP)). осадок (precipitate). твёрдость (hardness).

(3) Softener is a substance used to reduce friction during mixing and processing when dry powders are added to polymers.

(4) Softener is a substance that is added to rubber and plastic compounds to facilitate the addition and dispersion of other solid compounding ingredients. It also enhances the processing properties. Softeners used as processing aids for the uncured rubber have also been referred to as Lubricants, Plasticizers, Tactifiers, and Dispersing Agents. Numerous materials are used as softeners, including vegetable and petroleum oils, waxes, and various plastics (coumarone-indene, etc). An important type is factice, which also provides some curring action when added to rubber. See also Adhesive Softener, and Factice. / Мягчители, нелетучие продукты, применяемые в производстве резины, пластмасс, лакокрасочных материалов. Смотрите также Пластификаторы.

SOFTENING POINT = ТОЧКА РАЗМЯГЧЕНИЯ – Softening Point is the temperature at which substances without a sharp melting point change from viscous to plastic flow.

SOFT FABRICS = МЯГКИЕ ТКАНИ – Soft Fabrics are the fabrics that tend to drape in soft folds and to cling instead of standing away from the figure or item being covered. Soft fabrics is usually used as the opposite of crisp fabrics. Single knits usually are considered soft fabrics.

SOFT FIBERS = МЯГКИЕ ВОЛОКНА – Soft Fibers are the flexible fibers of soft texture obtained from the inner bark of dicotyledonous plants. Soft fibers are fine enough to be made into fabrics and cordage. Examples are Flax, Hemp, Jute, Kenaf, and Ramie. See also Hard Fibers. / Образцами таких волокон являются Джут, Кенаф, Конопля (Пенька), Лён и Рами. Смотрите также Жёсткие Волокна (Hard Fibers). лубяное волокно (bast fiber).

SOFT LOAN = ЛЬГОТНЫЙ ЗАЙМ – Soft Loan:- this term refers to the no-interest loans granted to developing countries by the US International Development Association. A soft loan carries no interest (although there is a small annual service charge), is payable in 50 years, and has an amortization rate of 1% repayable annually for the 10 years following an initial 10-year grace period, followed by 3% repayable annually for the remaining 30 years. Soft Loan is a loan that carries an unsusally low rate of interest, often advanced as a form of foreign aid.

SOFT MARKET = ОСЛАБЛЕННЫЙ (или ПОДАТЛИВЫЙ, или МЯГКИЙ) РЫНОК – (1) Soft Market:- more potential sellers than buyers, which creates an environment where rapid price falls are likely. / Мягкий Рынок – рынок, характеризующийся превышением предложения над спросом. На мягком рынке ценных бумаг торговые операции ведутся неактивно, существует большой разрыв между котировками спроса и предложения, в ответ на достаточно незначительное расширение предложения происходит значительное снижение цен. Называется также Рынком Покупателя (Buyer's Market).

(2) Soft Market:- when the availability of some or all classes of insurance or reinsurances is high relative to demand for such insurance or reinsurance. Competition amongst insurers and reinsurers leads to downward pressure on premiums and to the availability of more extensive coverage terms. Compare hard market.

SOFT NAIL = МЯГКИЙ ГВОЗДЬ – Soft Nail is a pallet nail with a Morgan Impact Bend Angle Nail Tester (MIBANT) angle equal to or greater than 47 degrees. See also Pallet. / Моргэн.

SOFT RED WINTER WHEAT = МЯГКАЯ ОЗИМАЯ КРАСНОЗЁРНАЯ ПШЕНИЦА – Soft Red Winter Wheat is a low to medium protein Wheat with soft endosperm used to make cake flour, pastry flour and some self-rising flours (baking powder and salt added). Soft red winter Wheat is seeded in the fall. It is grown east of the Mississippi, with Ohio being the leading producer state followed by Arkansas, Illinois, and Missouri. Ohio Wheat is known for making higher-quality flour compared to flour coming from any other soft red winter wheat-producing state. Soft red winter Wheat is traded at the CBOT® under ticker symbol W. Contract size is 5 000 bushels quoted in US Cents per bushel. Delivery months include:- March (H), May (K), July (N), September (U) and December (Z). Contract is settled physically. Delivery grades include:- #2 Soft Red Winter at contract price, #1 Soft Red Winter at a 3 cent premium, other deliverable grades listed in Rule 14104. Soft Red Winter Wheat is all varieties of Soft Red Winter Wheat. There are no subclasses in this class. Soft Red Winter Wheat is seeded in the fall, has a low to medium protein content with soft endosperm, and is used to make cakes, pastries, flat breads, and crackers. It is grown east of the Mississippi and has no subclasses. Ohio is the leading producer of soft red winter Wheat followed by Arkansas, Illinois, and Missouri. Ohio Wheat is known for making higher-quality flour than that coming from any other soft red winter wheat-producing state. Total acreage is about 13.0 million acres. / СИБАТ® (CBOT®). Мягкая Озимая Краснозёрная Пшеница объединяет в себе все Селекционные Сорта Мягкой Озимой Краснозёрной Пшеницы. В этом классе Пшеницы отсутствуют подклассы.

SOFT ROT = МЯГКАЯ ГНИЛЬ (или МОКРАЯ ГНИЛЬ) – Soft Rot is not known to occur in living trees. It is important in degradation of wood in service. The best known feature is the curious cavities in the secondary wall, but they are not always present. / Пока что нет таких фактов, которые бы свидетельствовали о том, что мягкая гниль образовалась в живых деревьях.

SOFT SHELL = МЯГКАЯ ОБОЛОЧКА – Soft Shell:- soft shell fabrics combine the benefits of hard shell fabrics with a breathable, flexible, comfortable fabric. Stretch wovens with a Deluge® DWR (durable water repellent) treatment. / Дэлъюдьжь® Ди.ДаблЮ.Ар. (Deluge® DWR) – патентованная фирменная водоотталкивающая нестареющая влагозащита, не снижает своих свойств в течение всего срока эксплуатации изделия.

SOFT WATER = МЯГКАЯ ВОДА – Soft Water contains relatively low concentrations of salts (usually calcium and magnesium) that interfere with the formation of a lather with soap. Soft water from a treatment plant may contain sodium ions conferring a salty taste and making it unsuitable for irrigation. / .

SOFT WHITE WHEAT = МЯГКАЯ БЕЛОЗЁРНАЯ ПШЕНИЦА – Soft White Wheat is all soft endosperm white Wheat Varieties. This Class is divided into the following three Subclasses:- (i) Soft White Wheat is soft endosperm white Wheat Varieties which contain not more than 10 percent of white club Wheat; (ii) White Club Wheat is soft endosperm white club Wheat Varieties containing not more than 10 percent of other soft white Wheats; and (iii) Western White Wheat is soft White Wheat containing more than 10 percent of white club Wheat and more than 10 percent of other soft white Wheats. Soft White Wheat is used much the same way as Soft Red Wheat (for bakery products other than bread) and is grown mostly in the Pacific Northwest and to a lesser extent in California, Wisconsin, Michigan, and New York. Soft white Wheat has low protein and high yields. Subclasses are Soft White, White Club, and Western White Wheats. Total acreage is about 8.3 million acres. / эндосперм (endosperm). Мягкая Пшеница (Triticum Aestivum), Вид Пшеницы с неломким остистым или безостым, рыхлым, удлинённым колосом и голым зерном различной окраски (белой, жёлтой, красной). Вид гексаплоидный (содержит в соматических клетках 42 хромосомы), очень пластичный и самый распространённый; возделывается во всех земледельческих районах мира. Мягкая Пшеница – зимостойкая, засухоустойчивая и скороспелая. Известно более 250 Разновидностей этого Вида; из них наибольшие площади занимают Лютесценс, Эритроспермум, Мильтурум, Альбидум, Феррругинеум, Грекум.

SOFTWOOD = ДРЕВЕСИНА МЯГКИХ ПОРОД – Softwood is a cone bearing Tree Species, usually evergreen, with needles or scalelike leaves such as Pine, Spruce, Fir and Cedar. One of the botanical groups of trees that in most cases have needlelike or scalelike leaves. Softwood is a wood from coniferous or needle-bearing trees (not necessarily soft or low density). Also known as Conifers. / Виды (Species). Известна также как Хвойные (Conifers). Под Хвойными Породами понимаются деревья и кустарники с игловидными листьями – хвоей. К хвойным породам относятся Ель, Кедр, Лиственница, Пихта, Сосна и другие. Используют для получения древесины, живицы, в защитном лесоразведении, озеленении и другом. Плоды некоторых хвойных пород съедобны, например, кедровые орешки. Под Хвойными понимается Подкласс (Порядок) Голосеменных Растений. Главным образом Вечнозелёные Деревья и Кустарники, как правило, с игловидными (хвоя) или чешуйчатыми листьями и однополыми стробилами (шишками). Около 50 Родов, около 600 Видов. Многие хвойные (Ель, Кедр, Лиственница, Пихта, Сосна и другие) являются ценными лесообразующими породами.

SOI = STATEMENT OF INTENT

SOIL = ЗАГРЯЗНЕНИЕ – Soil:- caused by oil, grease or dirt. Often times originating from a dirty work area or machinery not properly cleaned. Finishing department defects, and namely – Trimming Defects. / вызывается попаданием масла, смазки или грязи. . Порок или дефект заключительной обработки, а именно – пороки .

SOIL = ПОЧВА – Soil is the biologically active, porous medium that has developed in the uppermost layer of the Earth's crust. Soil is one of the principal substrata of life on Earth, serving as a reservoir of water and nutrients, as a medium for the filtration and breakdown of injurious wastes, and as a participant in the cycling of carbon and other elements through the global ecosystem. It has evolved through weathering processes driven by biological, climatic, geologic, and topographic influences. Since the rise of agriculture and forestry in the 8th millennium BC, there has also arisen by necessity a practical awareness of soils and their management. In the XVIII and XIX centuries the Industrial Revolution brought increasing pressure on soil to produce raw materials demanded by commerce, while the development of quantitative science offered new opportunities for improved soil management. The study of soil as a separate scientific discipline began about the same time with systematic investigations of substances that enhance plant growth. This initial inquiry has expanded to an understanding of soils as complex, dynamic, biogeochemical systems that are vital to the life cycles

of terrestrial vegetation and soil-inhabiting organisms – and by extension to the human race as well. Soil is the loose surface material of the earth in which plants grow, in most cases consisting of disintegrated rock with an admixture of organic material (Soil Movement Position Paper). Soil is the unconsolidated mineral matter on the surface of the Earth that serves as a natural medium for growth of land plants. This has been subjected to and influenced by genetic environmental factors of parent material, climate (including moisture and temperature), macro- and microorganisms, and topography, all acting over a period of time and producing a product – soil – that differs from the material from which it is derived in many physical, chemical, biological, and morphological properties. / Под Почвой понимается природное образование, состоящее из генетически связанных горизонтов, формирующих в результате преобразования поверхностных слоёв литосферы под воздействием воды, воздуха и живых организмов; обладает плодородием. Твёрдая, жидкая (почвенный раствор), газообразная и живая (почвенная фауна и флора) части. Подразделяется на генетические типы, например, подзолистые (podzolic или podsolic), серые лесные, серозёмы, чернозёмы. Географическое распределение почв на равнинах подчинено общим законам широтной зональности, а в горах – вертикальной поясности. В сельском хозяйстве почва – основное средство производства. Почва, особое природное образование, обладающее рядом свойств, присущих живой и неживой природе; состоит из генетически связанных горизонтов (образуют почвенный профиль), возникающих в результате преобразования поверхностных слоёв литосферы под совместным воздействием воды, воздуха и организмов; характеризуется плодородием (смотрите Плодородие Почвы). Представление о почве как о самостоятельном природном теле с особыми свойствами, отличающими его от материнской (почвообразующей) породы, развивающемся в результате взаимодействия факторов почвообразования, было создано в последней четверти XIX века Русским геологом и почвоведом Василием Васильевичем Докучаевым (1846–1903) – основателем современного почвоведения. До этого почву обычно рассматривали в качестве одного из геологических образований. Плодородие почвы, то есть способность обеспечивать растения водой и пищей, позволяет ей участвовать в воспроизведении биомассы (смотрите также Биологическая Продуктивность). Природное плодородие имеет различный уровень, зависящий от состава и свойств почвы и факторов почвообразования. Под влиянием агротехнических, агрохимических и мелиоративных воздействий почва, являющаяся в сельском хозяйстве основным средством производства (смотрите Земля как средство производства), приобретает эффективное, или экономическое, плодородие, показателем которого служит урожайность сельскохозяйственных культур. Основные Факторы Почвообразования:- климат, материнская порода, растительный и животный мир, рельеф и геологический возраст территории, а также хозяйственная деятельность человека. Климат влияет на характер выветривания горных пород, воздействует на тепловой и водный режимы почвы, обусловливая проходящие в ней процессы и их интенсивность, и в значительной степени определяет растительный покров и животный мир. Материнская порода в процессе почвообразования превращается в почву. От её гранулометрического (механического) состава и структурных особенностей зависят физические свойства почвы – водо- и воздухопроницаемость, водоудерживающая способность и прочие, а следовательно, водный режим почвы, тепловой режим почвы, воздушный режим, скорость передвижения веществ в почве и другие. Минералогический состав материнской породы определяет минералогический и химический состав почвы и первоначальное содержание в ней элементов питания для растений. Растительность непосредственно воздействует на почву:- корни рыхлят и оструктуривают почвенную массу, извлекают из неё минеральные элементы. В естественных условиях минеральные и органические вещества поступают в почву и на её поверхность в виде корневого и наземного опада. Годовое количество опада изменяется примерно от 5–6 центнеров на гектар (ц/га) в пустынях и 10 ц/га в Арктических тундрах до 250 ц/га во влажных тропических лесах. Различен и качественный состав опада:- его зольность изменяется от 1 до 15%. В почве опад подвергается воздействию микрофлоры, минерализирующей до 80–90% его массы и участвующей в синтезе гумусовых веществ, которые образуются из продуктов распада и микробных метаболитов. Представители животного мира (главным образом Беспозвоночные, живущие в верхних горизонтах почвы и в растительных остатках на поверхности) в процессе жизнедеятельности значительно ускоряют разложение органических веществ и способствуют формированию органо-минеральных почвенных агрегатов, то есть структуры почвы. Основное влияние рельефа заключается в перераспределении по земной поверхности климатических (влаги, тепла и их соотношения) и других факторов формирования почвы. Время развития зрелого почвенного профиля для разных условий – от нескольких сотен до нескольких тысяч лет. Возраст территории вообще и почвы в частности, а также изменения условий почвообразования в процессе их развития оказывают существенное влияние на строение, свойства и состав почвы. При сходных географических условиях почвообразования почвы, имеющие неодинаковые возраст и историю развития, могут существенно различаться и принадлежать к разным классификационным группам. Хозяйственная деятельность человека влияет на некоторые факторы почвообразования, например, на растительность (вырубка леса, замена его травянистыми фитоценозами и другое), и непосредственно на почву путём её механической обработки (смотрите Обработка Почвы), мелиорации, внесения минеральных и органических удобрений и тому подобного. При соответствующем сочетании этих воздействий можно направленно изменять почвообразовательный процесс и свойства почвы. В связи с интенсификацией сельского хозяйства влияние человека на почвенные процессы непрерывно возрастает. Состав И Свойства Почвы:- почва состоит из твёрдой, жидкой, газообразной и живой частей. Соотношение их неодинаково не только в разных почвах, но и в различных горизонтах одной и той же почвы. Закономерно уменьшение содержания органических веществ и живых организмов от верхних горизонтов почвы к нижним и увеличение интенсивности преобразования компонентов материнской породы от нижних горизонтов к верхним. В твёрдой части преобладают минеральные вещества. Первичные минералы (кварц, полевые шпаты, роговые обманки, слюды и другие) вместе с обломками горных пород образуют крупные фракции; вторичные минералы (гидрослюды, монтмориллонит, каолинит и другие), формирующиеся в процессе выветривания, – более тонкие. Рыхлость сложения почвы обусловливается полидисперсностью состава её твёрдой части, включающей частицы разного размера (от коллоидов почвы, измеряемых сотыми долями микрона (мк), до обломков диаметром в несколько десятков сантиметров (см)). Основную массу почвы составляет обычно мелкозём – частицы менее 1 миллиметра (мм). Гранулометрический состав почвы определяется относительным содержанием в ней частиц различной величины, объединяемых в группы – гранулометрические фракции. В бывшем Союзе Советских Социалистических Республик (СССР) была принята следующая классификация почвенных частиц по размерам (Размер Частиц, мм – Наименование Фракции):- (i) > 3 мм – Камни; (ii) 3–1 мм - Гравий; (iii) 1–0.5 мм – Крупный Песок; (iv) 0.5–0.25 мм – Средний Песок; (v) 0.25–0.05 мм – Мелкий Песок; (vi) 0.05–0.01 мм – Крупная Пыль; (vii) 0.01–0.005 мм – Средняя Пыль; (viii) 0.005–0.001 мм – Мелкая Пыль; (ix) 0.001–0.000 5 мм – Грубый Ил; (x) 0.000 5–0.000 1 мм – Тонкий Ил; и (xi) < 0.000 1 мм – Коллоиды. В зависимости от соотношения физической глины (частиц мельче 0.01 мм) и физического песка (крупнее 0.01 мм) почвы по гранулометрическому составу разделяют на группы (разновидности):- песок рыхлый и связный, супесь, суглинок лёгкий и средний, глина лёгкая, средняя и тяжёлая. Более подробное деление проводят по преобладанию среди частиц гравия, песка, крупной пыли, пыли и ила. В СССР чаще применяли классификацию почв по гранулометрическому составу, предложенную Советским почвоведом Никодимом Антоновичем Качинским (1894–1976). Твёрдые частицы в естественном залегании заполняют не весь объём почвенной массы, а лишь некоторую его часть; другую часть составляют поры – промежутки различного размера и формы между частицами и их агрегатами. Суммарный объём пор называется Пористостью Почвы. Для большинства минеральных почв эта величина варьирует в пределах от 40 до 60%. В

органогенных (торфяных) почвах она возрастает до 90%, в заболоченных, оглеенных, минеральных – уменьшается до 27%. От пористости зависят водные свойства почвы (водопроницаемость, водоподъёмная способность, влагоёмкость) и плотность почвы. В порах находятся почвенный раствор и почвенный воздух. Соотношение их непрерывно меняется вследствие поступления в почву атмосферных осадков, иногда оросительных и грунтовых вод, а также расхода влаги – почвенного стока, испарения, десукции (отсасывание корнями растений) и другого. Освобождающееся от воды поровое пространство заполняется воздухом. Этими явлениями определяется воздушный и водный режимы почвы. Чем больше поры заполнены влагой, тем затруднительнее газовый обмен (особенно O_2 и CO_2) между почвой и атмосферой, тем медленнее протекают в почвенной массе процессы окисления и быстрее – процессы восстановления. В порах также обитают почвенные микроорганизмы. Плотность почвы (или объёмная масса) в ненарушенном сложении определяется пористостью и средней плотностью твёрдой фазы. Плотность минеральных почв от 1 до 1.6 грамма на кубический сантиметр (г/см^3), реже 1.8 г/см^3, заболоченных оглеенных – до 2 г/см^3, торфяных – 0.1–0.2 г/см^3. С дисперсностью сопряжена большая суммарная поверхность твёрдых частиц:- 3–5 квадратных метров на грамм (м^2/г) у песчаных почв, 30–150 м^2/г у супесчаных и суглинистых, до 300–400 м^2/г у глинистых. Благодаря этому почвенные частицы, особенно коллоидная и илистая фракции, обладают поверхностной энергией, которая проявляется в поглотительной способности почвы (смотрите также Почвенный Поглощающий Комплекс) и буферности почвы. Минералогический состав твёрдой части почвы во многом определяет её плодородие. Органических частиц (растительные остатки) содержится немного, и только торфяные почвы почти полностью состоят из них. В состав минеральных веществ входят:- Si, Al, Fe, K, N, Mg, Ca, P, S; значительно меньше содержится микроэлементов:- Cu, Mo, I, B, F, Pb и других (смотрите также Биогеохимические Провинции). Подавляющее большинство элементов находится в окисленной форме. Во многих почвах, преимущественно в почвах недостаточно увлажняемых территорий, содержится значительное количество $CaCO_3$ (особенно если почвы образовались на карбонатной породе), в почвах засушливых областей – $CaSO_4$ и другие более легко растворимые соли; почвы влажных тропических областей обогащены Fe и Al. Однако реализация этих общих закономерностей зависит от состава почвообразующих пород, возраста почвы, особенностей рельефа, климата и так далее. Например, на основных изверженных породах формируются почвы более богатые Al, Fe, щелочноземельными и щелочными металлами, а на породах кислого состава – Si. Во влажных тропиках на молодых корах выветривания почвы значительно беднее окислами железа и алюминия, чем на более древних, и по содержанию сходны с почвами умеренных широт. На крутых склонах, где эрозионные процессы весьма активны, состав твёрдой части почв незначительно отличается от состава почвообразующих пород. В засоленных почвах содержится много хлоридов и сульфатов (реже нитратов и бикарбонатов) кальция, магния, натрия, что связано с исходной засоленностью материнской породы, с поступлением этих солей из грунтовых вод или в результате почвообразования. В состав твёрдой части почвы входит органическое вещество, основная (80–90%) часть которого представлена сложным комплексом из гумусовых веществ, или Гумуса. Органическое вещество состоит также из соединений растительного, животного и микробного происхождения, содержащих клетчатку, лигнин, белки, сахара, смолы, жиры, дубильные вещества и тому подобные и промежуточные продукты их разложения. При разложении органических веществ в почвах содержащийся в них азот переходит в формы, доступные растениям. В естественных условиях они являются основным источником азотного питания растительных организмов. Многие органические вещества участвуют в создании органо-минеральных структурных отдельностей (комочков). Возникающая таким образом структура почвы во многом определяет её физические свойства, а также водный, воздушный и тепловой режимы. Органо-минеральные соединения представлены солями, глинисто-гумусовыми комплексами, комплексными и внутрикомплексными (хелаты) соединениями гумусовых кислот с рядом элементов (в их числе Al и Fe). Именно в этих формах последние перемещаются в почве. Жидкая часть, то есть Почвенный Раствор, – активный компонент почвы, осуществляющий перенос веществ внутри неё, вынос из почвы и снабжение растений водой и растворёнными элементами питания. Обычно содержит ионы, молекулы, коллоиды и более крупные частицы, превращаясь иногда в суспензию. Газообразная часть, или Почвенный Воздух, заполняет поры, не занятые водой. Количество и состав почвенного воздуха, в который входят N_2, O_2, CO_2, летучие органические соединения и прочее, не постоянны и определяются характером множества протекающих в почве химических, биохимических, биологических процессов. Например, количество CO_2 в почвенном воздухе существенно меняется в годовом и суточном циклах вследствие различной интенсивности выделения газа микроорганизмами и корнями растений. Газообмен между почвенным воздухом и атмосферой происходит преимущественно в результате диффузии CO_2 из почвы в атмосферу и O_2 в противоположном направлении. Живая часть почвы состоит из почвенных микроорганизмов (бактерии, грибы, актиномицеты, водоросли и другие) и представителей многих групп беспозвоночных животных – простейших, червей, моллюсков, насекомых и их личинок, роющих позвоночных и других (смотрите Почвенная Фауна). Активная роль живых организмов в формировании почвы определяет принадлежность её к биокосным природным телам – важнейшим компонентам биосферы. Процессы В Почве:- в процессе почвообразования материнская порода расчленяется на Почвенные Горизонты, которые образуют Почвенный Профиль. В поверхностных горизонтах накапливаются органическое вещество, азот и фосфор, обменные соединения алюминия, кальция, магния, калия, натрия; во многих случаях происходит потеря силикатных соединений (за исключением кремнезёма в форме кварца). Под влиянием факторов почвообразования в почве протекают разнообразные процессы, которые можно объединить в следующие основные группы:- (1) обмен веществами и энергией между почвой и другими природными телами; (2) процессы превращения веществ и энергии, происходящие в самом почвенном теле без перемещения веществ; (3) процессы передвижения веществ и энергии в почве (смотрите также Круговорот Веществ на Земле). К первой группе относят:- многосторонний обмен газами, влагой и твёрдыми частицами в системе атмосфера-почва-растительность (надземные органы); двусторонний обмен газами и влагой с растворёнными в ней веществами в системе почва-грунт (породы, залегающие под почвой, включая почвообразующую и подстилающую); обмен коротко- и длинноволновой радиацией в системе Солнце-растительность-почва-атмосфера-космическое пространство; многосторонний обмен тепловой энергией в системе атмосфера-растительность-почва-грунт; двусторонний обмен зольными веществами, соединениями азота, CO_2 и O_2 в системе почва-высшая растительность; преимущественно одностороннее поступление влаги из почвы в растения (через корни); одностороннее поступление в почву органического вещества, синтезированного высшими растениями, несущего в себе аккумулированную энергию. Вторая группа включает огромное количество весьма разнообразных процессов:- разложение органических соединений и синтез гумусовых веществ; синтез и распад микробной плазмы; образование и распад органо-минеральных соединений, то есть процессы, связанные с круговоротом углерода (разложение углеводов, дубильных веществ, лигнина и других); процессы, связанные с круговоротом азота, – аммонификация, нитрификация и денитрификация, фиксация атмосферного азота (смотрите Азотфиксация); разложение и превращение первичных и вторичных минералов и синтез вторичных; окисление и восстановление, особенно железа и марганца; замерзание и оттаивание почвенной влаги, её внутрипочвенное испарение, конденсация и так далее. Третья группа:- передвижение почвенного воздуха под влиянием меняющихся давления и температуры; диффузное передвижение газов и водяного пара, передвижение почвенного раствора под действием силы тяжести, капиллярных, сорбционных и осмотических сил; передвижение почвенной массы роющими животными, под влиянием давления корней и другие. Почвенные процессы протекают в тесной взаимосвязи и взаимозависимости, охватывая всю почвенную толщу или

сосредоточиваясь в отдельных частях. Происходят они в гравитационном поле Земли, имеют циклический характер, сопряжённый с цикличностью поступления на поверхность почвы радиационной энергии (суточные, годовые и многолетние циклы) и с биологической цикличностью живых организмов. Цикличность процессов не означает полного возврата почвы в исходное состояние. Результаты циклических процессов, происходящих в почвенной массе с самого начала формирования, и определяют становление, развитие и эволюцию почвы. Существо процессов, их интенсивность в разных объёмах почвы неодинаковы, большое влияние на них оказывает глубина от поверхности. Почва как открытая система связана также с другими природными системами (атмосферой, грунтом, живыми организмами) взаимным и многосторонним обменом веществ. Совокупности процессов формирования определённых почвенных горизонтов получили наименование элементарных почвенных процессов:- образование степного войлока, лесной подстилки, торфа (накопление органических остатков на поверхности почвы); гумусово-аккумулятивный процесс (накопление органо-минеральных соединений и зольных элементов в верхних горизонтах); засоление почвы (передвижение солей в растворённом состоянии с последующим выпадением из раствора); расселение (вынос растворённых солей в нижние горизонты или за пределы почвы); оглинивание, то есть превращение первичных минералов во вторичные глинистые минералы (разложение первичных минералов и синтез вторичных); иллювиальные процессы (растворение различных веществ в верхних горизонтах почвы, перемещение растворов в более глубокие горизонты с осаждением некоторых веществ и их аккумуляцией); лессиваж – передвижение под влиянием силы тяжести мельчайших твёрдых частиц в составе суспензии; оглеение (восстановление элементов с переменной валентностью, в первую очередь железа и марганца, и связанное с этим обесструктуривание почвенной массы), осолонцевание, осолодение, оподзоливание, ожелезнение, ферралитизация, педокриогенез и другие. Основные Типы Почв И Их Распространение:- изменчивость в пространстве и во времени факторов почвообразования, а следовательно, и процессов, происходивших в почвах в прошлом и совершающихся в настоящем, обусловливает большое разнообразие их в природе. До Докучаева почвы классифицировали по отдельным свойствам – химическому составу, гранулометрическому составу и другим. В основе современной генетической классификации почв лежит строение почвенного профиля, отражающее совокупность процессов становления, развития, эволюции почв и их режимы. Основная классификационная единица – Генетический Тип. Докучаевым выделялось 10 почвенных типов, в современных классификациях – более 100. Типы подразделяют на подтипы, роды, виды, разновидности, разряды и объединяют в классы, ряды, формации, генерации, семейства, ассоциации и тому подобное. Принцип объединения почвенных типов в более высокие единицы в различных классификациях неодинаков:- экологический – по условиям почвообразования, эволюционно-генетический (или историко-генетический) – по связям между группами почв, профильно-генетический – по строению почвенных профилей, их генезису и другому. Важной частью почвенной классификации является диагностика почв – система объективных признаков, позволяющих разделять их на всех таксономических уровнях классификации. Особое значение имеют диагностические признаки для определения типов и более низких таксономических единиц, так как на большинстве почвенных карт выделяют именно их ареалы. Большое практическое значение имеют прикладные (агропроизводственные, мелиоративные, лесоводственные и другие) группировки почв. Единая международная классификация почв не разработана. Создано значительное число национальных почвенных классификаций; некоторые из них (СССР, США, Франция) включают все почвы мира. Первая попытка создания мировой системы почв сделана ФАО–ЮНЕСКО (FAO–UNESCO; 1968–74) при составлении международной почвенной карты мира (Soil Map Of The World). Прилагаемая почвенная карта мира составлена на основе классификации почв, разработанной в СССР. Преобладающая часть суши занята сравнительно ограниченным числом почвенных групп, преимущественных типов (выделены на карте), которые относились Русскими геологами и почвоведами Василием Васильевичем Докучаевым (1846–1903) и Николаем Михайловичем Сибирцевым (1860–1900) к группе так называемых Зональных Почв, возникающих под влиянием типичного для каждой природной зоны почвообразования. Характер размещения зональных почв на поверхности суши обширными полосами – зонами, вытянутыми вдоль полос с близким атмосферным увлажнением (в областях с недостаточным увлажнением) и с одинаковой годовой суммой температур (в областях с достаточным и избыточным увлажнением), создаёт основную закономерность пространственного распределения почв на равнинных территориях – горизонтальную почвенную зональность (широтную или меридианальную). Например, на Восточно-Европейской равнине отчётливо выражены широтные зоны тундровых почв, подзолистых почв, серых лесных почв, чернозёмов, каштановых почв, бурых пустынно-степных почв. Ареалы подтипов зональных почв располагаются внутри зон также параллельными полосами, что позволяет выделить почвенные подзоны. Так, зона чернозёмов подразделяется на подзоны выщелоченных, типичных, обыкновенных и Южных чернозёмов, зона каштановых почв – на тёмно-каштановые, каштановые и светло-каштановые. В работах Советского учёного Иннокентия Петровича Герасимова (1905–1985) и других учёных были установлены закономерные изменения свойств почв внутри зон и подзон, связанные с изменениями климата и некоторых других биоклиматических условий. Это явление получило название провинциальности и фациальности и позволило выделить внутри зон и подзон провинции, а аналогичные провинции нескольких зон и подзон объединить в фации. Были выявлены различия рядов почвенных зон на разных континентах и крупных частях наиболее обширных континентов. Например, в Восточной части Азии с Севера на Юг сменяются зоны тундровых, мерзлотно-таёжных, подзолистых почв и подбуров, бурых лесных почв, коричневых почв сухих лесов и кустарников, желтозёмов, краснозёмов, красно-жёлтых ферралитных почв, а в центральной части (Западная Сибирь, Казахстан, Средняя Азия) – зоны тундровых почв, поверхностно-глеевых и подзолистых почв, чернозёмов, каштановых, бурых пустынно-степных, серо-бурых пустынных почв, серозёмов. Такие различия позволяют выделять почвенные области, каждая из которых характеризуется определённым рядом горизонтальных почвенных зон. В горных странах отчётливо выражена высотная поясность почв. В горах с недостаточным увлажнением смена вертикальных поясов обусловливается сменой степени увлажнения, а также экспозицией склонов (почвенный покров здесь приобретает экспозиционно-дифференцированный характер), а в горах с достаточным и избыточным увлажнением – изменением термических условий. Рассмотренные почвенно-географические закономерности, обусловленные главным образом биоклиматическими факторами, создают зонально-провинциальное строение почвенного покрова. Однако внутри зон, подзон и провинций почвенный покров неоднороден. В нём наблюдаются более или менее частые смены почв, связанные со сменой рельефа, почвообразующих пород, глубиной залегания грунтовых вод, то есть зависящие главным образом от литолого-геоморфологических факторов. Эти смены в разной степени генетически связанных ареалов почв, образующих определённый рисунок почвенного покрова, создают его структуру, все компоненты которой могут быть показаны лишь на крупномасштабных или детальных почвенных картах. Различные структуры почвенного покрова приурочены к определённым литолого-геоморфологическим и неотектоническим структурам, что отчётливо доказывает их тесную генетическую связь. Почва – один из природных компонентов, составляющих среду обитания человека. Нарушение почвенных процессов в результате неправильной эксплуатации почвенного покрова приводит к усиленной эрозии почвы, её засолению и заболачиванию. Принятые ‘Основы Земельного Законодательства Союза ССР И Союзных Республик’ (1968) предусматривали систему мер, направленных на повышение плодородия почв и охрану её от эрозии. О мероприятиях по предупреждению загрязнения почв смотрите в статье Санитарная Охрана Почвы.

SOIL AUGER = ПОЧВЕННЫЙ БУР – Soil Auger is a tool for taking soil samples.

SOIL BULK DENSITY = НАСЫПНАЯ ПЛОТНОСТЬ ПОЧВЫ – Soil Bulk Density is the mass of dry soil per unit volume, normally expressed in Megagrams per cubic meter or grams per cubic centimeter.

SOIL BURIAL TEST = ТЕСТ НА ЗАРЫВАНИЕ В ПОЧВУ – Soil Burial Test is a test of resistance of textile material to certain microorganisms present in soil. The samples are buried in soil for an extended period, then removed and measured for strength loss.

SOIL COMPACTION = УПЛОТНЕНИЕ ПОЧВЫ – When the soil is too moist the planter can smear the planting slot, which prevents normal root development. Damage occurs at a uniform depth. Under rain-grown conditions a plough-pan can restrict root development and in hot dry weather the plants may die. Soil Compaction is a compression of the soil resulting in reduced soil pore space (the spaces between soil particles), decreased movement of water and air into and within the soil, decreased soil water storage, and increased surface runoff and erosion. The use of heavy machinery during forest operations contributes to soil compaction. / сеялка точного высева (planter).

SOIL COMPACTION, SMEARING AND PLOUGHPANS = УПЛОТНЕНИЕ ПОЧВЫ, ЗАЛИПАНИЕ (или ЗАМАЗЫВАНИЕ) И УПЛОТНЕНИЕ ПОДПАХОТНОГО СЛОЯ ПОЧВЫ – Soil Compaction and Smearing occur when field operations such as picking or planting are completed over moist soil. Smearing of the seed slot during planting results in poor stand establishment and slow seedling growth. Seedling roots may grow horizontally along the bottom of the seed slot or may become twisted and contorted. When warm dry weather follows planting under wet conditions the smeared seed slot may dry out and the bed may crack open along the seed line. Further problems may occur if rain then washes soil-applied herbicides into the crack and directly into the root zone. Under certain conditions, when there are compacted areas beneath the plant line, some cotton plants grow 15–50 cm taller than other plants in the field. These larger plants feature a well developed shallow root system, few bolls and reddened stems and long branches, especially towards the top of the plant. Similar symptoms have been described as ‘acromania’ or ‘crazy top’ in the United States. Significant ploughpans may develop immediately below the zone of cultivation in fields used for rain-grown or dryland cropping. There may be sufficient soil moisture for seed germination and seedling growth but not enough to soften the ploughpan and allow the tap root to penetrate and grow into the sub-soil. The consequences are a poor stand with surviving plants unthrifty and featuring a nub root. / процесс коркообразования. Эти крупные растения отличаются хорошо развившейся поверхностной корневой системой, несколькими коробочками и багряными стеблями и длинными ветвями, особенно по направлению к вершине растения. Похожие симптомы описываются в Соединённых Штатах Америки как ‘акромания’ (‘acromania’) или ‘безумная верхушка’ (‘crazy top’). и позволить главному корню проникать и прорастать в подпочву или подпахотный слой. Последствиями являются скудные прорастания или насаждения выживающих растений. Под Прикатыванием понимается выравнивание и уплотнение поверхности предварительно вспаханной или разрыхлённой почвы полевыми катками. Применяют для более равномерной заделки семян, капиллярного поднятия влаги в верхний слой почвы, дружного появления всходов.

SOIL CRUSTING = ОБРАЗОВАНИЕ ПОЧВЕННОЙ КОРКИ – Soil Crusting:- some soil types are prone to crusting after rain. When this occurs soon after sowing then the germinating seedlings are unable to emerge and poor stand establishment results.

SOILED = ЗАПАЧКАННОЕ (или ЗАМАРАННОЕ, или МАРКОЕ) – Soiled:- may be caused by dirty containers or careless handling. Closure defects, and namely – Plastic Buttons. / Порок или дефект застёжки.

SOILED END = ЗАПАЧКАННАЯ ПРОДОЛЬНАЯ НИТЬ – Soiled Ends:- it is oily or soiled warp threads. Weaving Defect. Soiled Ends:- these are oily or soiled warp threads. Defect Name:- Soiled End. Defect Type:- warp lines, vertical lines. Fabric Type:- Bottomweights – Twill Derivatives. Description:- Soiled End:- This end apparently had grease spun into it during the spinning operation. Severity:- Major. See also Soiled Filling. / Уточина.

SOILED FILLING = ЗАПАЧКАННАЯ УТОЧИНА – (1) Defect Name:- Soiled Filling. Defect Type:- weft lines, horizontal lines. Fabric Type:- Shirting and Dress Goods – Chambray. Description:- Soiled Filling:- This description best suits the illustrated defect; however, this is package dyed filling and what appears as oily slubs actually is dye scum or crystallized dyestuff from the outside of the dye package. On a Sulzer loom, which feeds pick and pick from four dye packages simultaneously, this can continue as a general condition for a number of yards. Severity:- Major. See also Soiled End. (2) Defect Name:- Soiled Filling. Defect Type:- weft lines, horizontal lines. Fabric Type:- Shirting and Dress Goods – Plain Weave. Description:- Soiled Filling:- This defect is the result of a drop of dirty oil on a bobbin of filling. Severity:- Major.

SOILED FILLING/END = ЗАПАЧКАННАЯ УТОЧИНА/ПРОДОЛЬНАЯ НИТЬ – Soiled Filling/End:- dirty, oily looking spots on the warp or filling yarns or on package dyed yarn. Woven fabric defect. Self-descriptive. / пятна на пряжах основы или уточины или на . Порок или дефект ткачества.

SOILED GARMENTS = ЗАПАЧКАННЫЕ ШВЕЙНЫЕ ИЗДЕЛИЯ – Soiled Garments:- usually the result of excess oiling, poor housekeeping, improper handling or carelessness, sub-standard equipment. Machinery defects, and namely – Work Handling Equipment. / Порок или дефект от машинного оборудования.

SOILED YARN = ЗАПАЧКАННАЯ ПРЯЖА (или ЗАМАРАННАЯ ПРЯЖА, или ЗАГРЯЗНЁННАЯ ПРЯЖА) – Soiled Yarn is the individual yarn that discolored by dirt, oil or other contaminants. Note:- this defect is caused by the contamination of the yarn prior to, or occasionally during, knitting. / Загрязнённая Пряжа (soiled yarn):- порок пряжи в тканых полотнах, при котором пряжа изменила цвет из-за грязи, масел или других загрязнителей. Примечание:- этот порок вызван загрязнением пряжи до или во время процесса ткачества.

SOIL FERTILITY = ПЛОДОРОДИЕ ПОЧВЫ (или ПОЧВЕННОЕ ПЛОДОРОДИЕ) – Soil Fertility is the ability of the soil to supply nutrient elements in the amounts, forms, and proportions needed for maximum plant growth. / Под Плодородием Почвы понимается совокупность свойств почвы (содержание гумуса, доступных для растений питательных веществ, влаги и другого), обеспечивающая урожай сельскохозяйственных растений. Различают потенциальное (естественное) и эффективное (приобретённое под влиянием обработки, удобрений, мелиорации и тому подобного) плодородие почвы. При правильном использовании почвы её плодородие повышается. Плодородие Почвы, способность почвы обеспечивать растения усвояемыми питательными веществами, влагой и другим и давать урожай. Различают потенциальное (естественное) и эффективное плодородие почвы. Потенциальное (или Естественное) Плодородие Почвы определяется общим запасом в почве питательных веществ, влаги, а также другими условиями жизни растений. Эффективное (или Актуальное, Экономическое) Плодородие Почвы – возможность использования элементов плодородия растениями в данном году; зависит прежде всего от проведения всего комплекса агротехнических мероприятий. При большом потенциальном плодородии почвы эффективное может быть небольшим, и наоборот, при соответствующем уровне агротехники можно обеспечить высокое эффективное плодородие малоплодородных почв. Эффективное плодородие почвы – очень динамичное свойство почвы, способное быстро изменяться под влиянием природных условий и агротехнических приёмов. Важнейшие факторы плодородия почвы:- содержание необходимых для растений питательных веществ и их формы; наличие доступной для

растений влаги, уровень устойчивости влажности; хорошая аэрация почвы как важное условие развития корневых систем, а также жизнедеятельности микроорганизмов, обеспечивающих разложение органических и накопление питательных веществ в форме, усвояемой для высших растений; механических состав, структурное состояние и строение; содержание токсических веществ; реакция и другие. Сумма этих свойств определяет уровень культурного состояния почвы. Все элементы плодородия почвы взаимосвязаны. Плодородие почвы зависит от факторов почвообразования:- климата, почвообразующих пород, естественной и культурной растительности, рельефа, но особенно большое значение для уровня плодородия почвы имеет характер использования почвы. Главный приём регулирования запасов питательных веществ в почве, в особенности в доступных растениям подвижных формах, – внесение минеральных и органических удобрений. Существенное значение имеют введение в севообороты Бобовых культур и улучшение условий для жизнедеятельности азотобактера и других организмов, усваивающих азот из атмосферы. Устранение повышенной кислотности достигается известкованием почв, а повышенной щёлочности (солонцы) – гипсованием почв. Важное условие плодородия почвы – отсутствие в почве избыточного количества легкорастворимых солей, главным образом хлоридов и сульфатов натрия и отчасти магния, кальция и других катионов. Для устранения избытка солей применяют промывание почвы, а для предупреждения накопления солей – правильный поливной режим, дренаж и другое. Плодородие почвы сильно снижается при наличии в ней вредных химических соединений (закисных соединений железа, подвижных соединений алюминия), накапливающихся обычно в условиях застойного переувлажнения. Регулирование запасов влаги в почве достигается с помощью агротехнических и гидротехнических мероприятий (зяблевая вспашка, снегозадержание, ранневесеннее боронование, междурядная обработка посевов, орошение, осушение и другие). Наиболее высоким эффективным плодородием почвы характеризуются почвы, которые наряду с достаточным количеством влаги имеют хорошую аэрацию. Низкое плодородие почвы нередко зависит от наличия патогенных организмов. Устранение их химическими (стерилизация, внесение фунгицидов, нематоцидов и других) и агротехническими средствами (севооборот, обработка) резко повышает эффективное плодородие почвы. При правильном использовании почв их плодородие не только не снижается, но постоянно увеличивается (смотрите Земля как средство производства). История земледелия, рост урожайности сельскохозяйственных культур и продуктивности животноводства опровергают буржуазные мальтузианские и неомальтузианские теории, связанные с так называемым Законом Убывающего Плодородия Почвы (смотрите Мальтузианство, ‘Закон Убывающего Плодородия Почвы’). Классики Марксизма-Ленинизма вскрыли ненаучность этого закона и показали, что плодородие почвы постоянно изменяется и это зависит не только от естественных, но и от социально-экономических условий, которые в свою очередь определяют характер развития науки, техники и применение их достижений в сельском хозяйстве.

SOIL FUMIGATION = ФУМИГАЦИЯ ПОЧВЫ – Soil Fumigation is a method of soil treatment using chemicals wherein the pesticide, in gaseous form, is introduced into the soil by a soil injector; the soil or field position to be treated is first covered with a plastic sheet to prevent volatilization of the chemicals; the soil fumigant is highly toxic as it kills all forms of life – fungi, bacteria, nematodes, snails, and weeds. / .

SOIL HETEROGENEITY = ГЕТЕРОГЕННОСТЬ ПОЧВЫ (или НЕОДНОРОДНОСТЬ ПОЧВЫ, или РАЗНОРОДНОСТЬ ПОЧВЫ) – Soil Heterogeneity is the case where soil in a relatively small area varies greatly in texture, fertility, topography, moisture content, and drainage. Lowers the precision of results in ricefield experiments. / Под Гетерогенностью, от Греческого слова Héteros, означающее Другой или Иной, .

SOIL HORIZON = ПОЧВЕННЫЙ ГОРИЗОНТ – Soil Horizon is a soil layer with clear and relatively uniform character running roughly parallel to the soil surface. / свойство (character) . Под Почвенными Горизонтами понимаются слои, формирующиеся в результате естественного расчленения почвы в процессе её развития. Подразделяются на подгоризонты. Совокупность почвенных горизонтов образует почвенный профиль. Почвенные Горизонты, слои, формирующиеся в результате естественного расчленения почвы в процессе её образования; отсюда их другое название – Генетические Горизонты. Совокупность почвенных горизонтов образует Почвенный Профиль. Каждый почвенный горизонт более или менее однороден по механическому, минералогическому и химическому составу, физическим свойствам, структуре, окраске и другому; может подразделяться на подгоризонты. Почвенные горизонты обозначают буквенными символами:- A – перегнойно-аккумулятивный, часто ещё и элювиальный; B – иллювиальный, или метаморфический; C – материнская порода; подгоризонты, например, A_0 – лесная подстилка или степной войлок, A_1 – гумусовый, A_2 – подзолистый и так далее. На обрабатываемых почвах образуется пахотный горизонт $A_п$. Смотрите также Почва (Soil).

SOILING = ЗАПАЧКАННОСТЬ (или ЗАМАРАННОСТЬ) – Soiling:- results from incorrect oiling, improper cleaning of machine, improper belt guard or defective machine. Machinery defects, and namely – Sewing Machines and Attachments. Soiling is the staining or smudging of textile materials resulting from the deposit of dirt, oil undesirable dye, etc. / Порок или дефект от машинного оборудования.

SOILING MARKS = ОТМЕТИНЫ ОТ ЗАПАЧКАННОСТИ – Soiling Marks:- any type of dust in fabric. Finishing defect. / Порок или дефект заключительной отделки.

SOIL MICROBIOLOGY = МИКРОБИОЛОГИЯ ПОЧВ (или ПОЧВЕННАЯ МИКРОБИОЛОГИЯ) – Soil Microbiology is a subspecialization of soil science concerned with soil-inhabiting microorganisms and their relation to agriculture, including both plant and animal growth. / Под Микробиологией Почв, от Греческих слов Mikrós, означающее Малый, Bios, означающее Жизнь, и Lógos, означающее Слово или Учение, понимается .

SOIL MOISTURE = ВЛАЖНОСТЬ ПОЧВЫ (или ПОЧВЕННАЯ ВЛАГА) – Soil Moisture is a water contained in the soil, expressed as a percentage of weight of water per unit weight of dry soil or the percentage of volume of water per unit volume of bulk soil. Soil Moisture is the amount of water in the soil (wet weight minus dry weight). / Количество воды в почве (определяется как разность между весом влажной почвы и весом высушенной почвы).

SOIL ORGANIC MATTER = ОРГАНИЧЕСКОЕ ВЕЩЕСТВО ПОЧВЫ – Soil Organic Matter is the organic fraction of the soil:- includes plant and animal residues at various stages of decomposition, cells and tissues of soil organisms, and substances synthesized by the soil population.

SOIL PERMEABILITY = ПРОНИЦАЕМОСТЬ ПОЧВЫ – Soil Permeability is the ease with which gases, liquids, or plant roots penetrate or pass through a bulk mass of soil or a layer of soil. / корнями растения .

SOIL PH = ВОДОРОДНЫЙ ПОКАЗАТЕЛЬ ПОЧВЫ (или ПОЧВЕННЫЙ ПИ.ЭЙЧ.) – Soil Ph is a measure of the degree of acidity or alkalinity of a soil. A pH of 7.0 is neutral; below 7.0 is acidic, and above 7.0 is alkaline. / Щёлочность (Alkalinity). Щелочное (Alkaline). Водородный Показатель (pH) характеризует концентрацию (активность) ионов водорода в растворах; численно равен отрицательному десятичному логарифму концентрации (активности) водородных ионов (H^+), выраженной в молях на литр:- $pH = -lg(H^+)$. Водные растворы могут иметь pH от 1 до 14; в нейтральных растворах pH = 7, в кислых <7, в щелочных >7.

SOIL POPULATION = ПОПУЛЯЦИЯ ПОЧВЫ – Soil Population is all organisms living in the soil, including plants and animals. See also Population. / Под Популяцией Почвы, от позднелатинского слова Populatio, от Латинского слова Populus, означающее Народ или Население, понимается . Популяция, в генетике, экологии и эволюционном учении, совокупность особей одного вида, более или менее длительно занимающая определённое пространство и воспроизводящая себя в течение большого числа поколений; особи одной популяции имеют большую вероятность скрещиваться друг с другом, чем с особями других популяций; это связано с тем, что данная совокупность особей отделена от других таких же совокупностей особей той или иной степенью давления различных форм изоляции. Основной характеристикой популяции, определяющей её центральное положение как элементарной единицы эволюционного процесса, является её генетическое единство:- в пределах популяции в той или иной степени осуществляется Панмиксия. Вместе с тем особям, составляющим популяцию, присуща генетическая гетерогенность (в пределах единого генофонда популяции), определяющая приспособленность популяции к различным условиям среды обитания и создающая столь важный для эволюции резерв наследственной изменчивости. Вследствие генетической и морфофизиологической неравноценности особей, неоднородности окружающей среды популяция имеет сложную структуру:- особи различаются по полу и возрасту, принадлежности к разным, обычно перекрещивающимся поколениям, к разным фазам жизненного цикла, к тем или иным малоустойчивым группировкам внутри популяции (стадо, колония, семья и тому подобное). Биологический вид обычно представлен множеством взаимодействующих популяций. Число особей, входящих в популяцию, широко варьируя не только у разных видов, но и в пределах одного вида, всегда достаточно велико (обычно не менее нескольких сотен, однако у ряда видов может достигать сотен, тысяч, а может быть, и миллионов особей). Границы пространства, занятого популяцией, часто бывает трудно определить, так как они всегда динамичны, что обусловлено, например, колебаниями численности и плотности популяции (смотрите Волны Жизни). На популяционном уровне постоянно ощущается влияние всех других основных уровней организации жизни – молекулярно-генетического, организменного, биогеоценотического. Генетически детерминированные процессы клеточного метаболизма обусловливают в процессе индивидуального развития разную приспособленность отдельных особей к абиотическим и биотическим условиям среды обитания. Характер взаимоотношений между особями, в частности то место в установившейся внутри популяции иерархии, какое занимает данная особь, определяет важные свойства популяции. Изменение биогеоценотической среды влечёт за собой изменение генетического состава и структуры популяции, её численности и величины занимаемого ею пространства. В свою очередь, в процессе жизнедеятельности популяция воздействует на все уровни среды и, в частности, влияя на численность и структуру популяций других видов, служит фактором, обусловливающим динамику биогеоценоза. В пределах популяции (и при взаимодействии разных популяций) протекают процессы микроэволюции – основа эволюционного процесса в целом. Поэтому динамика генетического состава популяции, её численности и структуры, обмена веществ и энергии между популяцией и средой интенсивно изучаются популяционной генетикой, популяционной экологией, биогеоценологией, а ‘популяционное мышление’ необходимо во многих разделах общей биологии. Всестороннее изучение популяции (прежде всего, динамики численностей и обусловливающих её факторов) служит основой как рационального использования хозяйственно-полезных животных, так и мер борьбы с вредителями сельского хозяйства, переносчиками инфекционных заболеваний и так далее. Изучение генофондов природных популяций растений (сородичей культурных растений, древесных пород и тому подобного) – непременное условие успешного решения многих проблем селекции, интродукции, лесоведения. Наряду с природными популяциями изучаются лабораторные (экспериментально созданные) популяции, например, дрозофил, мышевидных грызунов, некоторых растений. В современной Англо-Американской литературе термин Популяция часто подменяется термином Дем (в Советской научной литературе Демом обычно обозначают внутрипопуляционные ‘семейные’ группировки). Термин Популяция употребляют также для обозначения отдельных обособленных групп домашних животных (породы, стада) и культурных растений (сорта, клоны, линии). В гистологии, медицине, микробиологии Популяцией называют однородные группы клеток в тканях многоклеточных организмов или в культуре клеток. Смотрите также Биология, Видообразование, Генетика, Эволюционное Учение.

SOIL PRODUCTIVITY = ПРОИЗВОДИТЕЛЬНОСТЬ ПОЧВЫ (или ПРОДУКТИВНОСТЬ ПОЧВЫ) – Soil Productivity is the capacity of the soil, in its normal environment, to produce a specified plant or sequence of plants under a specified system of management. It emphasizes the capacity of the soil to produce crops and is expressed in terms of yield.

SOIL PROFILE = ПОЧВЕННЫЙ ПРОФИЛЬ (или ПРОФИЛЬ ПОЧВЫ) – Soil Profile is a vertical section of the soil cutting through all its horizons and extending into the parent material. / горизонты и . Под Почвенным Профилем понимается совокупность почвенных горизонтов. Почвенный Профиль, вертикальный разрез почв от поверхности до материнской породы, состоящий из сформировавшихся в процессе почвообразования, генетически взаимосвязанных почвенных горизонтов и подгоризонтов. Мощность почвенный профиль от нескольких десятков сантиметров (см) до нескольких метров (м). Выделяют естественный почвенный профиль и в разной степени измененные деятельностью человека (освоенные, окультуренные, мелиорированные, культурные, преобразованные и другие). Различия в строении почвенного профиля, составе и свойствах его горизонтов – основа классификации почв. Каждый из почвенных типов, подтипов, родов и видов характеризуется определённым строением почвенного профиля, который отражает происходящие в почве процессы. Поэтому анализ почвенного профиля (сравнение состава и свойств горизонтов почвы) является основным методом, применяемым для изучения генезиса и плодородия почв, разработки приёмов их улучшения, а также составления почвенных карт и другого.

SOIL RELEASE FINISH = ЗАКЛЮЧИТЕЛЬНАЯ ОТДЕЛКА ПО ОТДАНИЮ ЗАПАЧКИВАНИЮ (или ЗАМАРЫВАНИЮ) – Soil Release:- a finish that has the purpose of increasing the absorbency of a fabric on durable press blends. The finish allows the stain to leave the fabric faster, increases the wicking action for improved comfort, and therefore imparts greater ease in cleaning. Some soil release finishes also provide resistance to soiling as well as ease of soil removal. Soil Release is a special finish applied to some man-made fiber fabrics in an attempt to overcome one of their disadvantages: the tendency to retain dirt, especially water-borne and/or oil-based stains, once it has penetrated the fibers. Polyester is one of the fibers that retains oil-based stains. / развод (или потёк (stain)).

SOIL SATURATION EXTRACT = ПОЧВЕННАЯ НАСЫЩЕННАЯ ВЫТЯЖКА (или ПОЧВЕННАЯ УПАРЕННАЯ ВЫТЯЖКА) – Soil Saturation Extract is the solution obtained through suction of soil saturated with water.

SOIL SCIENCE = ПОЧВОВЕДЕНИЕ (или НАУКА О ПОЧВЕ) – Soil Science is the science dealing with soils as a natural source on the surface of the Earth including soil formation, classification and mapping, and the physical, chemical, biological, and fertility properties of soils per se and these properties in relation to their management for crop production. / Под Почвоведением понимается наука о почве; изучает её происхождение, развитие, строение, состав, свойства (в том числе плодородие), географическое распространение и рациональное использование. Изучение почв началось в конце XVIII века. К середине XIX века появилось агрогеологическое направление почвоведения, рассматривающее почву как геологическое образование. Генетическое почвоведение, установившее понятие о почве как о естественном историческом теле, обладающем свойствами живой и неживой природы, создано в России в конце XIX века естествоиспытателем Василием Васильевичем Докучаевым (1846–1903). Агрономическое направление почвоведения (взаимоотношение почвы и растительности, почвенное плодородие)

развил Российский учёный Павел Андреевич Костычев (1845–95), географическое (сравнительный анализ почв профиля в связи с почвообразованием) – Российские учёные Николай Михайлович Сибирцев (1860–1900), Константин Дмитриевич Глинка (1867–1927) и другие. Основы коллоидной химии почв разработал в начале XX века Российский учёный Константин Каэтанович Гедройц (1872–1932). Позднее появилось биогеохимическое направление почвоведения, изучающее роль живых организмов в жизни почвы; выделились разделы почвоведения:- физическая химия, физика, минералогия, микробиология почв и другие. Почвоведение, наука о почве, её составе, свойствах, происхождении, развитии, географическом распространении, рациональном использовании. Относится к естественноисторическим наукам. Изучает почву как природное тело, средство производства и предмет труда. Важнейшие разделы:- генезис почв, геохимия, физическая, коллоидная и биологическая химия почв, биология, физика, гидрология, география почв. Научное изучение почв началось в конце XVIII века. На рубеже XVIII и XIX веков в Германии появилась гумусовая теория питания растений, предложенная Альбрэхьтом Даниэлем Та (Albrecht Daniel Thaer; 1752–1828) и повлекшая за собой глубокое исследование перегноя. Сменившая её в 1840-х теория минерального питания растений Юстуса Фрайхэ фон Либихя (Justus Freiherr von Liebig; 1803–1873) способствовала расширению химических исследований почвы и возникновению агрогеологического направления в почвоведении, которое (Немецкие учёные Фридрихь Альбэрт Фалю (Friedrich Albert Fallou; 1794–1877), Фердинанд Фрайхэ фон Рихьтхофэн (Ferdinand Freiherr von Richthofen; 1833–1905) и другие в конце XIX века) рассматривало почву только как геологическое образование, продукт выветривания, не принимая во внимание биологические процессы в ней. Поэтому оно не могло дать правильного представления о почве, хотя в разработке отдельных вопросов почвоведения (изучение минералогического, химического и гранулометрического состава) были достигнуты определённые успехи. Генетическое Почвоведение было создано в России во 2-й половине XIX века. Датой возникновения его считается 1883 – год опубликования Российским естествоиспытателем Василием Васильевичем Докучаевым (1846–1903) монографии ‘Русский Чернозём’, в которой сформулировано основное положение его теории:- почва – самостоятельное природное минерально-органическое тело, образовавшееся из поверхностных слоёв горной породы (от которой оно качественно отличается) в результате воздействия на них живых организмов (в том числе микроорганизмов) в определённых климатических условиях. Неотъемлемое свойство почвы – плодородие. Докучаев выдвинул и обосновал представление о факторах почвообразования – материнской горной породе, климате, растительности, рельефе, возрасте страны (впоследствии к ним была присоединена хозяйственная деятельность человека и другое) и показал необходимость изучения почвы с точки зрения её происхождения, в тесной связи с окружающими условиями – географическое направление в почвоведении. Большую роль в создании научного почвоведения сыграл Российский учёный Павел Андреевич Костычев (1845–95) – современник Докучаева, развивавший агрономическое направление (исследовал вопросы взаимоотношения почвы и растительности и почвенное плодородие), которое в дальнейшем продолжил Российский и Советский почвовед Василий Робертович Вильямс (1863–1939). Созданная Докучаевым наука о почве легла в основу разработанной системы мероприятий для борьбы с засухой, а также нашла применение при оценке земель. Ученики и последователи Докучаева – Николай Михайлович Сибирцев (1860–1900), Франц Юльевич Левинсон-Лессинг (1861–1939), Пётр Андреевич Земятченский (1856–1942), Георгий Николаевич Высоцкий (1865–1940), Владимир Иванович Вернадский (1863–1945), Константин Дмитриевич Глинка (1867–1927) и другие – много сделали для развития генетического почвоведения. В работах этих исследователей отразилось преимущественно географическое направление в почвоведении (сравнительный анализ строения почвенного профиля в его связи с факторами почвообразования). В начале XX века в почвоведении возникло новое направление, которое может быть названо химическим. Его творцом был Константин Каэтанович Гедройц (1872–1932), разработавший основы коллоидной химии почв. Исследование почвенных коллоидов послужило ключом к пониманию внутренней сущности разнообразных (физических, химических, биологических и других) процессов, лежащих в основе почвообразования и современной жизни почв. Создание в 1920-х Владимиром Ивановичем Вернадским биогеохимии привело к развитию в почвоведении биогеохимического направления – изучения роли живых организмов в жизни почвы и их роли в почвообразовании. В 1930-е возникают другие разделы почвоведения:- физическая химия, физика, минералогия, микробиология почв и другие. Руководящая роль в развитии почвоведения в этот период и в дальнейшем принадлежит Леониду Ивановичу Прасолову (1875–1954), Борису Борисовичу Полынову (1877–1952), Ивану Владимировичу Тюрину (1892–1962), Иннокентию Петровичу Герасимову (1905–1985), Ивану Николаевичу Антипову-Каратаеву (1888–1965), Виктору Абрамовичу Ковде (1904–1991), Евгении Николаевне Ивановой (1889–1973), Алексею Андреевичу Роде (1896–1979), Марии Михайловне Кононовой (1898–1979), Николаю Николаевичу Розову (1909–1986), Никодиму Антоновичу Качинскому (1894–1976), Сергею Владимировичу Зонну (1906–2002), Владимиру Родионовичу Волобуеву (1909–1987), Марии Альфредовне Глазовской (1912–2016), Дмитрию Гермогеновичу Виленскому (1892–1960), Евгению Николаевичу Мишустину (1901–1991) и другим. Синтез географического, химического и биогеохимического направлений в почвоведении привёл к современному пониманию почвы как природной системы, состоящей из 4 основных частей – твёрдой, жидкой, газообразной и живой, в которых непрерывно протекают процессы превращения и перемещения веществ и энергии и которые находятся в постоянном взаимодействии. Присутствие в почве живой части даёт возможность отнести её к биокосным телам биосферы. На этой основе совершенствуются учение о плодородии почвы, её классификация и диагностика. Основные задачи современного почвоведения:- дальнейшее исследование генезиса почв и, в первую очередь, динамики процессов, идущих в естественных и используемых в сельском хозяйстве почвах и связывающих между собой живую и неживую природу. Эти процессы наиболее широко изучаются в почвоведении, что определяет его большое значение в решении проблем охраны природы и рационального использования природных ресурсов. Учение Российского естествоиспытателя Василия Васильевича Докучаева оказало большое влияние на развитие почвоведения за рубежом. Важную роль в этом сыграли Международные конгрессы почвоведов, особенно 1-й и 2-й, состоявшиеся в 1927 в Соединённых Штатах Америки (США) и в 1930 в бывшем Союзе Советских Социалистических Республик (СССР) (10-й конгресс – в 1974 в СССР). Генетическое почвоведение было воспринято учёными всех стран и послужило основой для создания в 1930–40-е почвоведческих школ в США (Кётэс Флэтчё Марбэт (Curtis Fletcher Marbut; 1863–1935) и Ойгенэ Вольдэмар Хильгард (Eugene Woldemar Hilgard; 1833–1916)), Германии (Эмиль Раман (Emil Ramann; 1851–1926), Эйльхард Альфред Митчалихь (Eilhard Alfred Mitscherlich; 1874–1956)), Нидерландах (Давид Якобус Хисинк (David Jacobus Hissink; 1874–1956)), Великобритании (Сэр Эдвод Дьжон Расэл (Sir Edward John Russell; 1872–1965) и Сэр Вильэм Гями Ог (Sir William Gammie Ogg; 1891–1979)), Румынии (Георге Мунтеану Мургоч (Gheorghe Munteanu Murgoci; 1872–1925)), Югославии (Виктор Нойгебауа (или Нэугэбауэр; Viktor Neugebauer;) и Миховил Грачанин (Mihovil Gračanin; 1901–1981)), Швеции (Каль Улёф Там (Carl Olof Tamm; 1919–2007)) и других странах. В почвоведении широко используют полевые, экспедиционные и стационарные методы исследований, лабораторные методы (физический, физико-химический, химический, микроскопический, рентгенографический, радиоизотопный, спектроскопический и другие), сравнительно-географические и картографические методы. Почвоведение тесно связано с климатологией, геоморфологией, минералогией, петрографией, микробиологией, физиологией растений, химией, физикой и другими науками. Особо важное значение почвоведение имеет для сельского хозяйства, где оно помогает решать вопросы повышения плодородия почв, применения почвенных удобрений, проведения мелиораций (орошения, осушения, известкования, гипсования и другого), борьбы с эрозией почвы и тому подобным. Почвенные карты – необходимый

материал для разработки агрохимических, агротехнических и мелиоративных рекомендаций, для оценки земель и другого. Научные достижения почвоведения используются также при строительстве дорог, инженерных сооружений и тому подобного. В бывшем СССР исследования в области почвоведения возглавлял Почвенный Институт им. Василия Васильевича Докучаева и Институт Агрохимии и Почвоведения Академии Наук (ИАП АН) СССР (создан в 1970). Почвенные институты имелись почти во всех Союзных республиках, кафедры почвоведения – во многих университетах, во всех сельскохозяйственных и многих лесотехнических вузах. За рубежом исследования в области почвоведения проводили:- в США – научно-исследовательские учреждения Департамента Земледелия и Службы Охраны Почв, агрономические факультеты университетов; в Великобритании – Ротемстедская Опытная Станция и Почвенный Институт имени Маколея, в Федеративной Республике Германии (ФРГ) – институты почвоведения, в Швеции – Институт Лесного Хозяйства, во Франции – Институт Агрономических Исследований, Институт Биологического Почвоведения и другие; в бывших Германской Демократической Республике (ГДР), Польше, Чехословакии, Румынии, Болгарии, Венгрии организованы институты почвоведения. В СССР издавался журнал 'Почвоведение' (с 1899). Журналы, печатавшие работы по почвоведению, выходили во многих странах. Важнейшие из них:- 'Soil Science' (Bait., с 1916) и 'Soil Science Society of America. Proceedings' (Madison, с 1936) – в США:- 'Journal of Soil Science' (Edinburgh, с 1949) – в Великобритании; 'Zeitschrift für Pflanzenernaehrung und Bodenkunde' (Weinheim, с 1922) – в ГДР; 'Canadian Journal of Soil Science' (Ottawa, с 1921) – в Канаде; 'Indian Journal of Agricultural Science' (New Delhi, с 1931) – в Индии; 'Annales Agronomiques' (P., с 1875) – во Франции. Почвоведы СССР были объединены (с 1958) во Всесоюзное Общество Почвоведов, входившее в Международное Общество Почвоведов (возникло в 1924). Национальные общества почвоведов организованы в США, Канаде, Великобритании, ФРГ, ГДР, Франции, Румынии, Югославии, Чехословакии, Японии, Австралии, Индии, Новой Зеландии, Венесуэле, Аргентине и других странах.

SOIL SEPARATES = ФРАКЦИИ ПОЧВЫ (или ОТДЕЛЬНОСТИ ПОЧВЫ) – Soil Separates are groups of mineral particles separated on the basis of range in size. The principal separates are sand, silt, and clay.

SOIL STRUCTURE = СТРУКТУРА ПОЧВЫ (или СТРОЕНИЕ ПОЧВЫ) – Soil Structure is the combination or arrangement of individual soil particles into definable aggregates or peds which are characterized and classified according to size, shape, and degree of distinctness. / Под Структурой Почвы, от Латинского слова Structura, означающее Порядок или Расположение или Строение, понимается совокупность .

SOIL SUSPENDING AGENT = ГРЯЗЕСУСПЕНДИРУЮЩИЙ АГЕНТ – Soil Suspending Agents:- they aid in keeping soil suspended and dispersed in wash water. This action minimizes the settling or redepositing of soil on fabrics being laundered.

SOIL TEST = ИСПЫТАНИЕ ПОЧВЫ (или ПОЧВЕННЫЙ ТЕСТ, или АНАЛИЗ ПОЧВЫ, или ПОЧВЕННЫЙ АНАЛИЗ) – Soil Test is a chemical, physical, or microbiological operation which estimates the properties of the soil pertinent to the suitability of the soil to support plant growth. / Анализ Почвы, определение состава и свойств почвы. Проводят механический, химический, минералогический и микробиологический анализы. Результаты используют для составления почвенных карт, в том числе картограмм агрохимических. Механический (гранулометрический) анализ – количественное определение содержания в почве частиц разного диаметра. Проводят при помощи сит и пипеточным методом (используя зависимость между размерами частиц и скоростью оседания их в стоячей воде). В зависимости от содержания физической глины (частиц < 0.01 миллиметра (мм)) и физического песка (> 0.01 мм) почву по гранулометрическому (механическому) составу относят к той или иной разновидности (например, суглинок средний, супесь). Химическим анализом устанавливают химический состав и свойства почвы. Основные разделы его:- валовой, или элементный, анализ – позволяет выяснить общее содержание в почве C, N, Si, Al, Fe, Ca, Mg, P, S, K, Na, Mn, Ti и других элементов; анализ водной вытяжки (основа исследования засоленных почв) – даёт представление о содержании в почве водорастворимых веществ (сульфатов, хлоридов и карбонатов кальция, магния, натрия и других); определение поглотительной способности почвы; выявление обеспеченности почв питательными веществами – устанавливают количество легкорастворимых (подвижных), усваиваемых растениями соединений азота, фосфора, калия и других, по данным анализа определяют потребность полей в удобрениях. Большое внимание уделяют также изучению фракционного состава органических веществ почвы, форм соединений основных почвенных компонентов, в том числе микроэлементов. Различают полевые, экспедиционные и лабораторные химические анализы. Полевые анализы проводят упрощёнными методами, лабораторные – чаще инструментальными (спектроскопия, пламенная фотометрия, атомно-адсорбционные и другие). Минералогическим анализом определяют содержание в почве первичных и вторичных минералов с целью изучения её генезиса и физико-химических свойств. Распределение минералов по почвенному профилю исследуют методом шлифов, а их количественное соотношение и изменение в процессе почвообразования – иммерсионным методом. Илистую и коллоидную фракции исследуют термическим, рентгенографическим, электронографическим и другими методами. Для уточнения состава глинистых минералов прибегают к химическим методам:- делают валовой анализ и определяют ёмкость поглощения исследуемых фракций. Микробиологическим анализом устанавливают состав микрофлоры почвы для характеристики её биохимических свойств и биологической активности. Определяют количество (в тысячах на 1 грамм (г) сухой почвы) представителей основных групп почвенных микроорганизмов; Бактерий (отдельно азотобактера, нитрифицирующих и денитрифицирующих, аммонификаторов), Актиномицетов, Грибов, а также содержание почвенных водорослей, основных представителей простейших (Амёб и Инфузорий). Для получения достоверных результатов решающее значение имеет взятие образца в поле (в наиболее типичном месте) и правильное его хранение (в воздушно-сухом состоянии). Образцы для изучения генезиса почвы могут быть взяты из каждого горизонта и подгоризонта почвенного профиля или из нескольких точек поля, среднюю пробу из которых после перемешивания используют для исследования агрохимических свойств.

SOIL TEXTURE = ТЕКСТУРА ПОЧВЫ (или СЛОЖЕНИЕ ПОЧВЫ) – Soil Texture is the relative proportions of sand, silt, and clay particles in a soil. / Под Текстурой Почвы, от Латинского слова Textura, означающее Строение или Ткань, понимается преимущественная ориентация .

SOIL TILTH = ФИЗИЧЕСКАЯ СПЕЛОСТЬ ПОЧВЫ (или ПРИГОДНОСТЬ ПОЧВЫ К ОБРАБОТКЕ) – Soil Tilth is the quality of soil, keeps it from packing together. / Под Спелостью Почвы понимается состояние почвы, при котором её легко обрабатывать (физическая спелость почвы) или она готова к посеву и посадке (биологическая спелость почвы).

SOLAR RADIATION = СОЛНЕЧНАЯ РАДИАЦИЯ – Solar Radiation is the energy given off by the Sun. The Sun exerts an energy level of about 2 cal/cm^2 per minute on the Earth's surface. / Под Солнечной Радиацией понимаются электромагнитное и корпускулярное излучения Солнца. Электромагнитное излучение охватывает диапазон длин волн от Гамма-излучения до радиоволн, его энергетический максимум приходится на видимую часть спектра (0.46 мкм). Корпускулярная составляющая солнечной радиации состоит главным образом из протонов и электронов.

SOLAS = SAFETY OF LIFE AT SEA CONVENTION

SOLD–OUT MARKET = РАСПРОДАННЫЙ (или ПУСТОЙ, или ПЕРЕПРОДАННЫЙ) РЫНОК – Sold-Out Market:- when liquidation of a weakly-held position has been completed, and offerings become scarce, the market is said to be sold out. A down-trending market that is having repeated problems in extending the trend lower, especially when trading volume is drying up, is said to be 'sold-out'. This normally results in a corrective rally.

SOLE CROPPING = ЕДИНСТВЕННОЕ ВОЗДЕЛЫВАНИЕ – Sole Cropping is a growing one crop alone or in pure stand, either as a single crop or as a sequence of single crops within the year.

SOLE PROPRIETORSHIP = ИНДИВИДУАЛЬНОЕ ПРЕДПРИНИМАТЕЛЬСТВО – Sole Proprietorship is an unincorporated business owned and controlled by one person, ordinarily under a business name other than the owner's. Profits and losses flow through to the sole proprietor, who pays taxes on such profits as an individual. Any business that is owned and operated by a single individual. In the United States, a Sole Proprietorship is an unincorporated business with a sole owner in which the owner may be personally liable for business debts and claims against the business. A business owned by one individual.

SOLICITOR = СОЛИСИТОР – (1) A Solicitor is a legally qualified individual who has a general duty to advise their clients on matters of law in the United Kingdom. They are fully regulated by the Law Society. The company's principal solicitor or solicitors as reported in the annual report. In the United Kingdom and countries having a similar legal system the legal profession is divided into two kinds of lawyers:- the Solicitors who contact and advise clients, and barristers who argue cases in court (known as Advocates in Scotland). In cases where a trial is necessary a client has to hire a solicitor, who will advise him and then retain a barrister on his behalf. See also Barrister. In England and some other Commonwealth jurisdictions, a legal distinction is made between solicitors and barristers. A solicitor has exclusive privileges of giving oral or written legal advice. A barrister has exclusive privileges of preparing and conducting litigation in the courts. In Canada, the title barrister and solicitor is sometimes used even though there is no legal distinction between the advising and litigating roles. / Смотрите также Барристер (Barrister). В Англии и некоторых других юрисдикциях Содружества делается юридическое различие между солиситорами и барристерами. Солиситор, по сути, это адвокат низшего ранга с ограниченными полномочиями. В Соединённом Королевстве адвокат, ведущий дела в судах графств и подготавливающий материалы для барристеров. Выполняет также функции юрисконсульта (правоведа) в организациях и компаниях. Солиситоры (единственное число Solicitor), в Великобритании категория адвокатов, специализирующихся на самостоятельном ведении дел в магистратских судах графств и городов-графств и на подготовке материалов для барристеров – адвокатов более высокого ранга. Солиситоры выполняют также функции юрисконсультов в учреждениях, предприятиях, организациях, акционерных обществах. Солиситоры существуют с XIII века, с 1825 они объединены в Юридическое Общество (Law Society). Правовое положение солиситоров определено Актом о Солиситорах 1941. Кандидат в солиситоры должен 5 лет проработать у солиситора (при наличии университетского образования стажировка сокращается до 3 лет). Зачисление в солиситоры производится председателем Апелляционного Суда. Наличие в адвокатском корпусе Великобритании двух категорий адвокатов свидетельствует о консерватизме Английской судебной системы, социальной и профессиональной дифференциации адвокатуры, стремлении сохранить привилегии барристеров, дороговизне процесса.

(2) Solicitor is an employee of an insurance agent or agency who is empowered to sell insurance on behalf of a licensed agent, generally using only those insurers that the agency represents. A solicitor usually does not have binding authority, and the business that is generated by a solicitor usually is owned by the agent, not the solicitor.

SOLID = ТВЁРДОЕ ТЕЛО (или ТВЁРДОЕ) – Solid is any substance having a definite shape which it does not readily relinquish. More generally, any substance in which the force required to produce a deformation depends upon the magnitude of the deformation rather than upon the rate of deformation. / Под Твёрдым Телом понимается одно из четырёх агрегатных состояний вещества, отличающееся от других агрегатных состояний (жидкости, газов, плазмы) стабильностью формы и характером теплового движения атомов, совершающих малые колебания около положений равновесия. Наряду с кристаллическим состоянием твёрдого тела (смотрите Кристаллы) существует аморфное состояние, в том числе стеклообразное состояние. Кристаллы характеризуются дальним порядком в расположении атомов. В аморфных телах дальний порядок отсутствует (смотрите Ближний Порядок и Дальний Порядок). Согласно законам классической физики, применимым к большинству твёрдых тел, наинизшему энергетическому состоянию системы атомных частиц (атомов, ионов, молекул) соответствует периодическое расположение одинаковых групп частиц, то есть кристаллическая структура. Поэтому с термодинамической точки зрения аморфное состояние не является равновесным и с течением времени должно закристаллизоваться. Однако в обычных условиях это время может быть столь велико, что неравновесность не проявляется и аморфное тело практически устойчиво. Между кристаллическим твёрдым телом и жидкостью есть качественное различие (наличие у кристалла и отсутствие у жидкости дальнего порядка в расположении атомов). Между аморфным твёрдым телом и жидкостью различие только количественное:- аморфное твёрдое тело можно рассматривать как жидкость с очень большой вязкостью (которую часто можно считать бесконечно большой). Понятие Твёрдое Тело, как и понятие Жидкость, имеет характер идеализации (модельности), точнее было бы говорить о Твёрдотельных и Жидкостных свойствах конденсированной среды. Например, с точки зрения упругих свойств твёрдым следует считать тело с отличным от 0 статическим модулем сдвига θ (у жидкости $\theta = 0$). При рассмотрении пластических свойств твёрдым следует считать тело, необратимо деформируемое лишь при конечном надпороговом напряжении (у жидкостей, даже очень вязких, типа смол, пороговое напряжение необратимой деформации равно 0). Все вещества в природе затвердевают при атмосферном давлении и температуре $T > 0$ К, за исключением Гелия (He), который остаётся жидким при атмосферном давлении вплоть до $T = 0$ К. Для кристаллизации He необходимо давление 24 атм (при $T = 1.5$ К). Это уникальное свойство He находит объяснение в квантовой теории твёрдых тел и жидкостей (смотрите Гелий, и Квантовая Жидкость). При исследовании твёрдых растворов изотопов гелия (под давлением) обнаружено особое состояние вещества, занимающее промежуточное положение между кристаллом и квантовой жидкостью. Оно получило название Квантового Кристалла. У обычных кристаллов волновые свойства атомов приводят к существованию колебаний кристаллической решётки при $T = 0$ К, у квантовых жидкостей эти свойства полностью разрушают кристаллическую структуру, а у квантовых кристаллов волновые свойства атомов, сохраняя выделенность узлов кристаллической решётки, допускают их перемещение (с узла на узел). Твёрдое тело – основной материал, используемый человеком. От кремнёвых орудий неандертальца до современных машин и механизмов – во всех технических приспособлениях, созданных человеком, используются различные свойства твёрдого тела. Если на ранних ступенях развития цивилизации использовались механические свойства твёрдого тела, которые непосредственно ощутимы человеком (твёрдость, масса, пластичность, упругость, хрупкость и тому подобное), и твёрдое тело применялось лишь как конструкционный материал, то в современном обществе используется огромный арсенал физических свойств твёрдого тела (электрических, магнитных, тепловых и других), как правило, не доступных непосредственному человеческому восприятию и обнаруживаемых только при лабораторных исследованиях. Все свойства твёрдых тел могут быть поняты на основе знания его атомно-молекулярного строения, законов движения атомных (атомов, ионов, молекул) и субатомных (электронов, атомных ядер) частиц. Исследование свойств твёрдого тела и движения частиц в нём объединилось в большую область современной

физики – Физику Твёрдого Тела, развитие которой стимулируется потребностями практики, главным образом техники. Физика твёрдого тела обладает специфическими методами исследования, руководящими идеями, использует определённый (часто изощрённый) математический аппарат. Оставаясь частью физики, физика твёрдого тела выделилась в самостоятельную научную дисциплину. Это проявляется, например, в существовании большого числа специализированных научных журналов (в СССР Физика Твёрдого Тела; Физика Металлов И Металловедение; Физика И Техника Полупроводников и другие) и институтов (Институт Физики Твёрдого Тела Академии Наук Союза Советских Социалистических Республик (АН СССР) и другие). Приблизительно 1/2 физиков мира работает в области физики твёрдого тела и почти 1/2 всех научных физических публикаций относится к исследованию твёрдых тел. Квантовые Представления В Физике Твёрдого Тела:- объяснение свойств твёрдого тела возможно лишь на основе квантовой механики. Квантовая теория кристаллов разработана весьма подробно, квантовая теория аморфных тел – слабее. Одним из главных результатов квантового подхода к исследованию свойств кристаллического твёрдого тела явилась концепция квазичастиц. Энергию кристалла вблизи основного состояния можно представить в виде суммы элементарных возбуждений, суммы энергий отдельных квазичастиц. Это позволяет ввести понятие Газа Квазичастиц и для исследования тепловых, магнитных и других свойств твёрдого тела использовать методы квантовой физики газов. Макроскопические характеристики твёрдого тела при этом выражаются через характеристики квазичастиц (длина пробега, скорость, эффективная масса и тому подобное (смотрите ниже). Элементарные движения в аморфных телах значительно сложнее, чем в кристаллах. Поэтому не удаётся ввести наглядные понятия (аналогичные квазичастицам) для описания возбуждённых состояний аморфных тел, однако структура плотности этих состояний выяснена. Можно сформулировать несколько характерных особенностей твёрдых тел как физических объектов, состоящих из огромного (макроскопического) числа атомных частиц и электронов. (1) Атомы, молекулы и ионы – структурные единицы твёрдых тел, то есть энергия взаимодействия между ними мала по сравнению с энергией, которую надо затратить на разрушение самой структурной единицы (молекулы на атомы, атома на ион и электроны, атомного ядра на нуклоны). Однако энергия их взаимодействия велика по сравнению с энергией их теплового движения (в газах – обратное соотношение). В тех случаях, когда энергия теплового движения оказывается порядка или больше энергии взаимодействия между структурными единицами, в твёрдых телах происходит перестройка структуры (Фазовый Переход), приводящая к понижению свободной энергии системы (смотрите Термодинамика). (2) Согласно классическим законам, средняя энергия теплового движения частицы ≈ kT и энергия возбуждения твёрдого тела ≈ NkT, где N – число частиц, составляющих твёрдое тело. Уменьшение энергии твёрдого тела с понижением его температуры идёт быстрее, чем предусматривает классическая физика:- дискретный (квантовый) характер энергетического спектра твёрдого тела приводит к ‘вымораживанию’ движений при $T \to 0$ К, причём чем больше расстояние между уровнями энергии, тем при более высокой температуре ‘вымерзает’ соответствующее движение. Поэтому различные движения в твёрдом теле существенны при различных температурах. (3) В кристаллическом твёрдом теле возможны статические возбуждённые состояния:- частицы располагаются не совсем так, как им ‘положено’ из соображений минимума энергии. Неправильное расположение атома или его отсутствие (смотрите Дефекты В Кристаллах) приводят к большому повышению энергии взаимодействия атомов вблизи дефекта, однако в устойчивом состоянии неправильно расположенных атомов сравнительно мало. Аморфное тело, энергия которого больше, чем энергия соответствующего кристалла, как правило, устойчиво (метастабильно) из-за больших потенциальных барьеров (следствие ближнего порядка), отделяющих метастабильные положения атомов от стабильных. (4) Разнообразие сил, действующих между частицами, составляющими твёрдое тело, приводит к тому, что в кристаллах при определённых условиях могут проявляться свойства газов, жидкостей, плазмы. Например, ферромагнетик при $T = 0$ К – упорядоченная система ориентированных атомных магнитных моментов. При повышении температуры эта строгая ориентация нарушается тепловым движением, а при $T = T_c$ (Точка Кюри) полностью исчезает и твёрдое тело переходит в парамагнитное состояние. Величина T_c связана с энергией U_m взаимодействия между соседними магнитными моментами соотношением:- $kT_c \approx U_м$. При $T \geq T_c$ атомные магнитные моменты ведут себя, как Газ Магнитных Стрелок, например, магнитная восприимчивость твёрдого парамагнетика имеет ту же температурную зависимость, что и газообразного (смотрите ниже). Другой пример:- металл можно рассматривать как ионный остов, погруженный в электронную жидкость. Благодаря устойчивому положению ионов металл является твёрдым телом, но часть электронов в нём не связана с определёнными узлами кристаллической решётки, это – электроны проводимости. Их взаимодействие друг с другом сближает свойства совокупности электронов проводимости металлов со свойствами квантовой жидкости. В некоторых случаях (например, под воздействием электромагнитного поля высокой частоты, которая превышает частоту столкновений электронов) электронная жидкость в проводниках ведёт себя, как плазма (смотрите Плазма Твёрдых Тел). (5) Движения атомных частиц в твёрдых телах весьма разнообразны и проявляются в различных свойствах твёрдых тел. Все движения можно разбить на 3 типа:- (а) Диффузия Собственных или Чужеродных Атомов:- элементарный акт диффузии – флуктуационное перемещение атома из занятого им положения в соседнее – свободное. Как правило, время ‘оседлой’ жизни атома значительно больше, чем время перемещения – атом совершает редкие случайные скачки, вероятность которых возрастает с ростом температуры. Диффузионное перемещение – сравнительно редкий пример классического движения атомов в твёрдых телах. (б) Коллективные Движения Частиц, простейший пример которых – колебания кристаллической решётки. Энергия колеблющихся атомов приближённо равна сумме энергий отдельных колебаний. При высоких температурах средняя энергия каждого колебания ~ kT, при низких температурах она определяется формулой Планка и < кТ. Хотя в колебаниях решётки принимают участие все атомы твёрдого тела, они атомного масштаба (напомним:- средняя энергия поступательного движения частицы в классическом газе равна 3/2 kT). Другой пример:- электронное возбуждение атома, не локализуемое на определённом узле кристаллической решётки, а передающееся от узла к узлу. Энергия такого движения (оно может быть возбуждено при поглощении кванта света или при повышении температуры) порядка энергии возбуждения отдельного атома. Коллективные движения атомного масштаба имеют дискретную структуру. Например, энергия колебания атомов с частотой ω может быть равна $h\omega$, $2h\omega$, $3h\omega$ и так далее. Это позволяет каждому движению сопоставить квазичастицу. Квазичастицы, описывающие колебания атомов, называются Фононами. (в) При низких температурах (вблизи $T = 0$ К) атомные частицы в некоторых твёрдых телах (и в жидком Не) могут совершать движение, квантовое по своей природе, но макроскопическое по масштабу. Наиболее изучено движение электронов в сверхпроводниках и атомов в сверхтекучем Гелии. Характерная черта сверхпроводящего и сверхтекучего движения – строгая согласованность в поведении частиц, обусловленная взаимодействием между ними. Для ‘выхода из коллектива’ частица должна преодолеть некоторую энергию (энергетическая щель). Существование энергетической щели делает сверхпроводящее и сверхтекучее движение устойчивым (незатухающим) (смотрите Сверхпроводимость; и Сверхтекучесть). (6) Знание атомной структуры твёрдого тела и характера движения частиц в твёрдом теле (энергетический спектр) позволяет установить, какие квазичастицы ответственны за то или другое явление или свойство. Например, высокая электропроводность металлов обусловлена электронами проводимости, а теплопроводность – электронами проводимости и фононами; некоторые особенности поглощения света в диэлектриках – экситонами; ферромагнитный резонанс – магнонами и так далее. Отличие количественных характеристик различных движений позволяет отделить одно движение от другого. Например, из-за большого различия в массах скорость движения ионов в металлах и полупроводниках очень мала по сравнению со скоростью

электронов. Поэтому в некотором приближении (называемом Адиабатическим), рассматривая движение электронов, ионы можно считать неподвижными, а движение ионов определять усреднёнными (по быстрому движению) характеристиками электронов. Часто независимость различных типов движения твёрдых тел обусловлена малой энергией взаимодействия между степенями свободы различной природы. Например, в ферромагнетике колебания атомов и спиновые волны имеют энергию и скорость приблизительно одного масштаба, но связь между ними мала, потому что малы магнитострикционные силы (смотрите Магнитострикция). Однако в некоторых случаях имеет место резонансное взаимодействие между разнородными волновыми процессами, когда их частоты и длины волн совпадают. Это приводит к ‘перепутыванию’ движений; например, колебание атомов (звук) можно возбудить переменным магнитным полем, а звуковая волна может самопроизвольно превратиться в спиновую. (7) Все твёрдые тела при достаточном повышении температуры плавятся (или возгоняются). Подводимая к телу в процессе плавления теплота тратится на разрыв межатомных связей. Температура плавления Тпл, характеризующая силу связи атомных частиц в твёрдых телах, различна:- у молекулярного Водорода Тпл = –259.1 °C, у Вольфрама 3 410 ± 20 °C, а у графита более 4 000 °C. Исключение составляет твёрдый ^{3}He, который плавится под давлением при понижении температуры (смотрите Эффект Померанчука). При изменении внешних условий (давления, температуры, магнитного поля и так далее) в твёрдых телах происходят скачкообразные изменения структуры и свойств – фазовые переходы 1-го и 2-го рода. Наличие у твёрдых тел различных устойчивых кристаллических структур (модификаций) называется Полиморфизмом (например, графит и алмаз, белое и серое Олово). Переход из одной модификации в другую иногда происходит как фазовый переход 1-го рода, а иногда как переход 2-го рода. Примерами фазового перехода 2-го рода служат переход веществ из парамагнитного состояния в ферро- или антиферромагнитное, переход в сверхпроводящее состояние из нормального при отсутствии магнитного поля, упорядочение ряда сплавов, возникновение сегнетоэлектрических свойств у некоторых диэлектриков и другие. (8) В большинстве случаев при определённой температуре все степени свободы атомных частиц в твёрдых телах можно разделить на 2 категории. Для одних kT велико по сравнению с характерной энергией их взаимодействия $U_{вз}$, для других степеней свободы kT мало по сравнению с $U_{вз}$. Степени свободы, для которых $kT \geq U_{вз}$, могут быть описаны в терминах Газа Частиц (например, Газ Магнитных Стрелок при $T \geq T_c$); степени свободы, для которых $kT \geq U_{вз}$, находятся на низком уровне возбуждения, благодаря чему соответствующие им движения могут быть описаны путём введения квазичастиц, слабо взаимодействующих друг с другом. Таким образом, в большинстве случаев свойства твёрдых тел могут быть ‘сведены’ к свойствам газов – либо частиц, либо квазичастиц. Сильное взаимодействие при этом не ‘выпадает’, оно определяет структуру твёрдого тела (например, его кристаллической решётки) и свойства отдельной квазичастицы. Квазичастицы существуют не в свободном пространстве (как частицы в реальных газах), а в кристаллической решётке, структура которой отражается в свойствах квазичастиц. Вблизи точек фазового перехода 2-го рода такое ‘сведёние’ невозможно, так как движение атомных частиц твёрдых тел в этих условиях скоррелировано (на ‘языке’ квазичастиц это (означает, что нельзя пренебречь их взаимодействием). Корреляция носит особый (не силовой) характер:- вероятность коллективных движений частиц и квазичастиц столь же велика, сколь и их индивидуальных движений. Возрастание роли корреляции в движении частиц приводит к наблюдаемым эффектам:- возрастают теплоёмкость, магнитная восприимчивость и тому подобное. Вблизи фазового перехода 2-го рода твёрдое тело ведёт себя как система сильно взаимодействующих частиц (или квазичастиц), принципиально не сводимая к газу. Вблизи фазового перехода 2-го рода твёрдое тело может служить моделью значительно более сложных систем (например, ядерной материи, элементарных частиц в процессе их взаимодействия). Знание атомно-молекулярной структуры твёрдого тела, характера движения составляющих его частиц объясняет наблюдаемые явления и позволяет предсказывать ещё не открытые свойства твёрдых тел, а также целенаправленно изменять структуру твёрдых тел и синтезировать твёрдые тела с уникальным, набором свойств. Физика твёрдого тела разделилась на ряд областей, обособление которых происходит путём выделения либо объекта исследования (Физика Металлов, Физика Полупроводников, Физика Магнетиков и другие), либо метода исследования (рентгеновский структурный анализ, радиоспектроскопия твёрдого тела и тому подобное), либо определённых свойств твёрдого тела (механических, тепловых и так далее). Возможность обособления – следствие относительной независимости атомных движений в твёрдом теле. Атомно-Кристаллическая Структура Твёрдых Тел:- зависит от сил, действующих между атомными частицами. Изменяя среднее расстояние между атомами с помощью внешнего давления, можно существенно изменить вклад межатомных сил различной природы и благодаря этому – кристаллическую структуру твёрдого тела. Обнаружено большое число различных существующих при больших давлениях кристаллических модификаций, многие из которых отличаются по физическим свойствам. Например, Bi под давлением образует 3 сверхпроводящие модификации:- при 25 300 атм < ρ < 27 000 атм Bi II (T_c = 3.93 K); при 27 000 атм < ρ < 80 000 атм Bi III (T_c = 6.9 K); при 80 000 атм < ρ Bi IV (T_c = 7 K). Многие полупроводники под давлением переходят в металлическое состояние (Ge при ρ ≈ 120 000 атм становится металлом), а Yb (металл) под давлением превращается в полупроводник. Есть основания считать, что молекулярный водород под давлением в $2–3\cdot10^6$ атм превращается в металл. При чрезвычайно большом давлении (или плотности), когда объём, приходящийся на один атом, становится меньше обычного атомного размера, атомы теряют свою индивидуальность и вещество превращается в сильно сжатую электронноядерную плазму. Исследование такого состояния вещества важно, в частности, для понимания структуры звёзд. Атомная структура кристаллов экспериментально определяется методами рентгено-структурного анализа, магнитная структура ферромагнетиков и антиферромагнетиков (ориентация магнитных моментов атомов) – методами нейтронографии. Полное знание атомной структуры предполагает знание размеров элементарной ячейки кристалла и положения всех атомов внутри неё. Однако во многих случаях достаточно знать лишь элементы симметрии данного кристалла. При макроскопическом описании твёрдых тел (механических, электрических, тепловых, оптических свойств) кристаллы можно рассматривать как сплошную анизотропную среду, в которой симметричное расположение атомов приводит к эквивалентности направлений. Основу симметрии бесконечной кристаллической решётки составляет её пространственная периодичность – способность совмещаться с собой при параллельных переносах (Трансляциях) на определённые расстояния в определённых направлениях. Эквивалентные узлы кристаллической решётки, которые могут быть совмещены друг с другом путём трансляции, образуют Решётку Браве. Их существует 14 типов. По симметрии решётки Браве делятся на 7 кристаллических сингоний. Кроме того, кристаллическая решётка может обладать осями и плоскостями симметрии, зеркально-поворотными и винтовыми осями и плоскостями зеркального скольжения. Совокупность осей и плоскостей симметрии, определяющая симметрию физических свойств кристаллов, называется Кристаллическим Классом; их 32. Совокупность всех элементов симметрии кристаллической решётки называется её Пространственной Группой. Всего возможно 230 различных пространственных групп. Если учесть магнитные свойства атомов, составляющих кристаллическую решётку, то число возможных магнитных пространственных групп увеличится до 1 651 (смотрите Симметрия Кристаллов). Структура Реального Кристалла:- хотя монокристаллы большого размера в природе встречаются редко, они всё чаще используются в технике. Выращивают их искусственно (смотрите Синтетические Кристаллы). Применяемые на практике конструкционные материалы, как правило, – поликристаллы, состоящие из огромного числа мелких монокристаллов (кристаллических зёрен). Многие свойства твёрдых тел (например, пластичность, прочность) зависят от величины зёрен. При хаотической ориентации кристаллических зёрен поликристалл можно считать изотропным телом, хотя каждый кристалл в отдельности анизотропен. В

некоторых поликристаллах возникает анизотропия, связанная с условиями их кристаллизации и обработки (ориентированный рост, прокатка, ковка); она называется Текстурой. Границы зёрен нарушают строгую периодичность в расположении атомов в кристалле. Однако это – не единственные дефекты в кристаллах. Дефектами являются микроскопические включения (в частности, зародыши другой кристаллической модификации, пустоты и тому подобное), сама поверхность образца, чужеродные примесные атомы, вакансии, атомы в междоузлиях, дислокации и так далее. Наличие или отсутствие тех или других дефектов во многих случаях определяет так называемые Структурночувствительные Свойства твёрдых тел:- механические (прочность, пластичность), электропроводность, оптические и другие (смотрите ниже). Межатомные Связи:- по типам связей твёрдые тела делят на 5 классов, каждый из которых характеризуется своеобразным пространственным распределением электронов. (1) В Ионных Кристаллах (NaCl, KCl и других) основные силы, действующие между ионами, – силы электростатического притяжения. Распределение электронного заряда вблизи каждого иона близко к сферическому и слегка нарушается в области соприкосновения соседних ионов. (2) В Кристаллах С Ковалентной Связью валентные электроны обобществлены соседними атомами. Кристалл по существу представляет собой огромную молекулу. Этот тип характеризуется высокой электронной плотностью между ионами и резкой направленностью связей. Примеры кристаллов с ковалентной связью:- алмаз, Ge, Si. (3) У Большинства Металлов (например, щелочных) энергию связи обусловливают электроны проводимости; металл можно представлять как решётку из положительных ионов, погружённую в электронную жидкость (Металлическая Связь). У некоторых металлов (например, переходных) важна также ковалентная связь, осуществляемая электронами незаполненных внутренних оболочек. (4) В Молекулярных Кристаллах (например, в отвердевших инертных газах) молекулы связаны слабыми электростатическими силами (Силы Ван-дер-Ваальса), обусловленными взаимной поляризацией молекул. Для всех молекулярных кристаллов характерна слабая связь; они имеют низкую точку плавления и заметно сублимируют. В большинстве органических кристаллов молекулы связаны силами Ван-дер-Ваальса (смотрите Межмолекулярное Взаимодействие). (5) В Кристаллах С Водородными Связями каждый атом водорода связан силами притяжения одновременно с двумя другими атомами. Водородная связь – основная форма взаимодействия между молекулами воды. Водородная связь вместе с электростатическим притяжением дипольных моментов молекул H_2O определяет свойства воды и льда. Следует отметить, что классификация твёрдых тел по типам связи условна. Во многих веществах наблюдаются комбинации различных типов связи. Природа сил связи в твёрдых телах получила объяснение только после привлечения квантовой механики, хотя источником сил, действующих между атомными частицами, в твёрдых телах служат электростатическое притяжение и отталкивание. Образование из атомов и молекул устойчивых твёрдых тел показывает, что силы притяжения на расстояниях ~10^{-8} сантиметра (см) уравновешиваются силами отталкивания, быстро спадающими с расстоянием. Это даёт возможность в ряде случаев рассматривать атомные частицы как твёрдые шары и характеризовать их кристаллохимическими радиусами (смотрите Кристаллохимия). Для описания энергии U твёрдого тела как функции среднего расстояния r между частицами пользуются формулой Ленарда-Джонсона:- $U = (U_0 / (1 – n / m))[(a / r)^n – (n / m)(a / r)^m]$, в которой первое слагаемое описывает энергию притяжения, а второе – отталкивания; здесь a – среднее межатомное расстояние в нормальных условиях, n зависит от типа связи, например, в ионных кристаллах n = 1, а в молекулярных n = 6; m~9–11. Энергия имеет минимум, равный U_0 при r = a. Выражая r через удельный объём V ($r \sim V^{1/3}$), получаем уравнение состояния твёрдого тела – зависимость давления $\rho = –(dU / dV)$ от удельного объёма. Такой подход связывает экспериментально измеряемые величины (энергию связи, сжимаемость $\beta = –(1 / V)(dU / dV)$) и другие) друг с другом и с величинами, входящими в выражение для силы, действующей между частицами. Теоретические методы позволяют, исходя из ‘первых принципов’, рассчитать кристаллическую структуру, уравнение состояния, тепловые свойства твёрдых тел в широком интервале температур. Теоретические данные хорошо согласуются с экспериментом для ионных и молекулярных кристаллов. Для ковалентных кристаллов и металлов необходим учёт непарного характера сил, действующих между частицами.

SOLID DECK PALLET = ПОДДОН СО СПЛОШНЫМ НАСТИЛОМ – Solid Deck Pallet is a pallet constructed with no spacing between deckboards.

SOLID LOAD = СПЛОШНАЯ НАГРУЗКА (или СПЛОШНОЙ ГРУЗ) – Solid Load is a single, compact, rigid, homogeneous load, supported by all the blocks and/or stringers of the pallet. / Сплошной Груз:- отдельный, компактный, жёсткий, однородный груз, опирающийся на несущие элементы конструкции поддона.

SOLID–STATE POLYMERIZATION = ПОЛИМЕРИЗАЦИЯ В ТВЁРДОМ СОСТОЯНИИ – Solid-State Polymerization is a reaction of the active end-groups within a solid polymer. It may be intentional as in heating and drying nylon 66 to increase the final degree of polymerization; or it may be undesirable such as that which occurs in fibers under hightemperature conditions in tires that leads to increased degree of polymerization, cross-linking, and subsequent brittleness and loss of strength. / Найлан^{T3} (Nylon^{TM}).

SOLID WOOD PACKING MATERIALS = ТВЁРДЫЕ ДРЕВЕСНЫЕ УПАКОВОЧНЫЕ МАТЕРИАЛЫ – Solid Wood Packing Material (SWPM):- most wood packaging materials are covered by the new rule including wooden packaging materials such as pallets, crates, boxes, and pieces of wood used to support or brace cargo. These materials are currently referred to as Solid Wood Packing Material (SWPM), which is defined as ‘wood packing materials other than loose wood packing materials, used or for use with cargo to prevent damage, including, but not limited to, dunnage, crating, pallets, packing blocks, drums, cases, and skids’. See also Regulated Wood Packaging Material (RWPM).

SOLLERET = СОЛЁРЭ (или САЛЭРЭТ) – Solleret is a flexible steel shoe forming part of a medieval suit of armor. / Солёрэ (по-Французски) или Солерет – стальной ботинок в рыцарских доспехах.

SOLUBLE = РАСТВОРИМОЕ – Soluble:- capable of being dissolved, i.e. passing into solution.

SOLUBLE CONCENTRATE = РАСТВОРИМЫЙ КОНЦЕНТРАТ – Soluble Concentrate is a liquid formulation that forms a solution when added to water.

SOLUBLE GRANULE = РАСТВОРИМАЯ ГРАНУЛА – Soluble Granule is a dry granular formulation that forms a solution when added to water.

SOLUBLE ION = РАСТВОРИМЫЙ ИОН – Soluble Ion is the electrically charged form of an atom or group of atoms that exists in solution.

SOLUBLE POWDER = РАСТВОРИМЫЙ ПОРОШОК – Soluble Powder is a dry formulation that forms a solution when added to water.

SOLUTION = РАСТВОР – Solution is a homogeneous mixture formed by mixing a solid, liquid, or gaseous substance with a liquid or sometimes with a gas or solid. / Под Раствором понимается жидкая форма – однородная смесь твёрдого и жидкого веществ и какой-либо жидкости (растворителя).

SOLUTION–DYED = КРАШЕНОЕ В РАСТВОРЕ – Solution-Dyed:- a type of fiber dyeing in which colored pigments are injected into the spinning solution prior to the extrusion of the fiber through the spinneret. Fibers and yarns colored in this manner are color-fast to most destructive agents. See also Dyeing, and Mass-Colored. / Экструзия или Выдавливание (Extrusion).

SOLUTION DYEING = РАСТВОРЯЮЩЕЕ КРАШЕНИЕ (или КРАШЕНИЕ РАСТВОРОМ) – Solution Dyeing:- dyestuffs are added to the fibers or yarn prior to the tufting process. In solution dyeing, pigment is added to the molten polymer before extrusion into a colored filament. Thus, the filament is impregnated with the color pigment throughout. The only way to dye olefin is by solution dyeing. Commercial Nylon is also quite often solution-dyed. However, unless appropriate acid dye blockers are applied after carpet manufacturing, solution-dyed nylon can continue to accept acid dyes from food spills, coffee, colas, etc. Solution Dyeing:- adding dye to the chemical compound in the spinneret before extrusion. Also known as Dope Dyeing. Solution Dyeing, also known as Dope or Spun Dyeing, is the process of adding pigments or insoluble dyes to the spinning solution before the solution is extruded through the spinneret. Only manufactured fibers can be solution dyed. Solution dyeing is used for difficult-to-dye fibers such as olefin fibers, and for dyeing fibers for end uses that require excellent colorfastness properties. Because the color pigments become a part of the fiber, solution dyed materials have excellent colorfastness to light, washing, crocking (rubbing), perspiration, and bleach. Dyeing at the solution stage is more expensive since the equipment has to be cleaned thoroughly each time a different color is produced. Thus, the variety of colors and shades produced are limited. In addition, it is difficult to stock the inventory for each color. Decisions regarding color have to be made very early in the manufacturing process. Thus, this stage of dyeing is usually not used for apparel fabrics. Solution Dyeing:- the solution for man-made fiber is colored before making it into fiber. Dyestuff is put into ttre spinning solution and the color is locked in as the fiber is coagulated. Synonymous with Spun Dyeing and Dope Dyeing. See also Dope Dyeing, Dyeing, Mass-Colored, and Spun Dyeing. With Solution Dyed fiber, the color is added to the liquid polymer before it is extruded into yarn. Therefore, it is inherent in the fiber and there is no dye or water waste. Because the color is impregnated throughout the fiber, these materials have excellent UV resistance to color fade. Solution dyed fiber also has excellent abrasion, superior color consistency, superior crocking results, vibrant colors and superior everyday cleanability. Solution dyed yarns can be cleaned with a 4:1 bleach solution. KnollTextiles was one of the first contract textile companies to bring solution dyed fibers to the marketplace. Knoll, Inc headquartered in East Greenville, State of Pennsylvania (PA), the United States. Solution Pigmenting or Dope Dyeing:- dye is added to the solution before it is extruded through the spinnerets for making synthetic filaments. Solution Pigmenting or Dope Dyeing is a method applied for dyeing the synthetic fibers. Dye is added to the solution before it is extruded through the spinnerets for making synthetic filaments. This gives a colorfast fiber as the pigments are used which are the fastest known colors. / Найлан^{T3} (Nylon^{TM}). Экструзия или Выдавливание (Extrusion). протирание или притирка (rubbing). Растворяющее Пигментирование (Solution Pigmenting).

SOLVENCY = ПЛАТЁЖЕСПОСОБНОСТЬ – (1) Solvency:- sufficient assets and income. It is the primary responsibility of a state's insurance department is to monitor insurance companies licensed to transact business within their state and make certain that they remain solvent and have the ability to pay the claims of their policyholders.

(2) Solvency refers to the ability of an enterprise to pay its debts as they mature. For example, when a company carries a high level of long-term debt relative to assets, it has lower solvency. Information on long-term obligations, such as long-term debt and notes payable, in comparison to total assets and equity can be used to assess resources that will be needed to meet these fixed obligations, such as interest and principal payments. Ability of a borrower to meet maturing obligations as they become due. The opposite of Insolvency. / Способность заёмщика исполнять свои подлежащие погашению обязательства, когда это становится должным. В противоположность Неплатёжеспособности (Insolvency).

SOLVENCY = РАСТВОРЯЮЩАЯ СПОСОБНОСТЬ – Solvency is an ability of a fluid to dissolve inorganic materials and polymers, which is a function of aromaticity. / Растворяющая Способность – способность жидкости растворять неорганические материалы и полимеры, которая является функцией ароматичности.

SOLVENT = ПЛАТЁЖЕСПОСОБНЫЙ – Solvent:- able to meet all one's debts and obligations. / Способный удовлетворить все долги и обязательства перед своими кредиторами.

SOLVENT = СОЛЬВЕНТ (или РАСТВОРИТЕЛЬ) – Solvent is a material with a strong capability to dissolve a given substance. The most common petroleum solvents are mineral spirits, xylene, toluene, hexane, heptane, and naphthas. Aromatic-type solvents have the highest solvency for organic chemical materials, followed by naphthenes and paraffins. In most applications, the solvent disappears, usually by evaporation, after it has served its purpose. The evaporation rate of a solvent is very important in manufacture. Volatile liquids used in paint, stain, varnish, and lacquer coatings which give the coating workability and which, upon evaporation, allow the resin to harden. Solvents are added to the formula to help in dissolving some of the ingredients. Alcohols (part of this family) also adds an anti-freeze property so that the detergent may be shipped and stored in cold climates. Ethyl alcohol is the most common variety of alcohol in detergents and is also known as Grain Alcohol and Ethanol. / развод (или потёк (stain)). в краске, морилке, лаке/олифе, и лаковых покрытиях . Под Растворителями понимаются индивидуальные химические соединения или их смеси, способные переводить различные вещества в раствор. Подразделяются на неорганические (важнейший из них – вода) и органические. Среди последних свойствами растворителей обладают ароматические углеводороды, спирты, эфиры, хлорированные алифатические углеводороды и многие другие. Наиболее распространённые смеси органических веществ, используемые как растворитель, – бензин, скипидар, сольвент, уайт-спирит. Растворители применяют практически во всех отраслях промышленности, а также в сельском хозяйстве и в быту. Большинство органических растворителей – летучие, горючие, иногда токсичные жидкости, образующие с воздухом взрывоопасные смеси. При работе с такими растворителями необходимо соблюдать правила техники безопасности и противопожарной охраны. Под Растворителем понимается неорганическое (главным образом вода) или органическое (ацетон, бензол, спирты, хлороформ и другие) соединение, а также смесь (например, бензин), способное растворять различные вещества. Основные требования:- минимальная пожароопасность и токсичность, химическая инертность по отношению к растворяемому веществу, доступность и дешевизна. Растворители – индивидуальные химические соединения или смеси, способные растворять различные вещества, то есть образовывать с ними однородные системы переменного состава, состоящие из двух или большего числа компонентов (смотрите Растворы). Для систем жидкость–газ и жидкость–твёрдое вещество растворителем принято считать жидкий компонент; для системы жидкость–жидкость–компонент, находящийся в избытке. В принципе любое вещество может быть растворителем для какого-либо другого вещества. Однако на практике к растворителям относят только такие вещества, которые отвечают определённым требованиям. Например, растворители должны обладать хорошей, так называемой активной растворяющей способностью, быть достаточно химически инертными по отношению к растворяемому веществу и аппаратуре. Растворители, применяемые в промышленности, должны быть доступными и дешёвыми. В зависимости от отрасли промышленности к растворителям предъявляют различные другие требования, обусловленные особенностями производства. Так, для экстракции пригодны растворители, обладающие избирательной растворяющей способностью, для других процессов часто применяют так называемые Сочетающиеся Растворители, улучшающие взаимную растворимость, и так далее. Наиболее

употребительна химическая классификация, в соответствии с которой все растворители подразделяются на Неорганические и Органические. Самым распространённым неорганическим растворителем, применяемым для большого числа неорганических и органических соединений, является вода. К неорганическим растворителям относятся также:- жидкий аммиак – хороший растворитель для щелочных металлов, фосфора, серы, солей, аминов и других веществ; жидкий сернистый ангидрид – растворитель для многих органических и неорганических соединений, используемый, в частности, в промышленности для очистки нефтепродуктов; расплавленные металлы и соли и так далее. Большое значение имеют многочисленные органические растворители. Это прежде всего нефтяные растворители (в том числе углеводороды и их галогенопроизводные), спирты, простые и сложные эфиры, кетоны, нитросоединения. Органические растворители очень широко применяются в производстве пластмасс, лаков и красок, синтетических волокон, смол, клеев в резиновой промышленности, при экстракции растительных жиров, для химической чистки одежды; кроме того, их используют для очистки химических соединений перекристаллизацией, при хроматографическом разделении веществ, для создания определённой среды и так далее. Можно выделить группы растворителей в зависимости от других характеристик:- температуры кипения – Низкокипящие Растворители (например, этиловый спирт, метилацетат) и Высококипящие Растворители (например, ксилол); относительной скорости испарения – Быстроиспаряющиеся и Медленноиспаряющиеся (в качестве эталона часто берут скорость испарения бутилацетата); полярности – Неполярные (углеводороды, сероуглерод) и Полярные (например, вода, спирты, ацетон). Технические условия на растворители обычно содержат данные и по температуре вспышки, по пределам взрывоопасных концентраций паров в воздухе, по давлению пара при стандартных температурах, а также по растворяющей способности – для какого типа веществ можно использовать данный растворитель (для растворения масел и жиров, смол, красителей, каучуков натуральных и синтетических и тому подобных). В качестве растворителей распространены и смеси различных индивидуальных веществ, например, бензины, петролейный эфир, смеси спиртов и эфиров. К числу растворителей часто относят также Пластификаторы, служащие для улучшения механических и физических свойств каучуков, природных смол, полиамидов и многих других высокомолекулярных соединений. Почти все органические растворители физиологически активны. Некоторые из них – ароматические углеводороды, хлорпроизводные, амины, кетоны – при значительных концентрациях могут вызывать серьёзные отравления, другие приводят к различным кожным заболеваниям (дерматитам). Для многих промышленных органических растворителях разработаны технические условия по обеспечению как противопожарной безопасности при работе с ними, так и личной защиты от их физиологически вредных воздействий.

SOLVENT DYEING = КРАШЕНИЕ СОЛЬВЕНТОМ (или РАСТВОРИТЕЛЕМ) (или РАСТВОРЯЮЩЕЕ КРАШЕНИЕ) – Solvent Dyeing is the dyeing of synthetic textiles by using chlorinated hydrocarbon solvents (such as trichloroethylene or perchloroethylene) instead of water; used for nylons, polyesters, and acrylics. See also Dyeing. Solvent Dyeing is the substitution of organic liquid for water in the process of application and fixation of dyes on fibers. Solvent dyeing of textiles is not a new subject; the first patent was issued in Germany in 1980. Solvent Dyeing is a dyeing method based on solubility of a dye in some liquid other than water, although water may be present in the dyebath. / Найлан^{T3} (Nylon^{TM}).

SOLVENT EXTRACTION = ЭКСТРАКЦИЯ РАСТВОРИТЕЛЕМ (или ЭКСТРАГИРОВАНИЕ РАСТВОРИТЕЛЕМ) – Solvent Extraction is a refining process used to separate components (unsaturated hydrocarbons) from lube distillates in order to improve the oil's oxidation stability, viscosity index, and response to additives. The oil and the solvent extraction media are mixed in an extraction tower, resulting in the formation of two phases:- a heavy phase consisting of the undesirable unsaturates dissolved in the solvent. And a lighter phase consisting of a high quality oil with some solvent dissolved in it. The phases are separated and the solvent recovered from each by distillation. / Под Экстрагированием, от Датского слова Extraho, означающее Вытягиваю или Извлекаю, понимается то же, что Экстракция. Под Жидкостной Экстракцией понимается способ разделения и извлечения компонентов, смеси путём их перевода из одной жидкой фазы (например, водного раствора) в другую (обычно органическую), содержащую экстрагент. В промышленности осуществляется главным образом в противоточных аппаратах (экстракторах) непрерывного действия. Применяется в гидрометаллургии (например, для извлечения меди), для разделения редких и рассеянных элементов, в аналитической химии и другом.

SOLVENT EXTRACTION AND ELECTRO WINNING = ЭКСТРАКЦИЯ РАСТВОРИТЕЛЕМ И ЭЛЕКТРОВЫДЕЛЕНИЕ (или ЭКСТРАГИРОВАНИЕ РАСТВОРИТЕЛЕМ И ЭЛЕКТРОХИМИЧЕСКОЕ ИЗВЛЕЧЕНИЕ) – In mining industry, Solvent Extraction And Electro Winning (SX-EW) is a process for extracting metal from an ore and producing pure metal. First the metal is leached into solution; the resulting solution is then purified in the solvent extraction process; the solution is then treated in an electro chemical process (electro winning) to recover cathode copper. / В горной (горнодобывающей) промышленности, для восстановления катодной меди. Под Жидкостной Экстракцией понимается способ разделения и извлечения компонентов, смеси путём их перевода из одной жидкой фазы (например, водного раствора) в другую (обычно органическую), содержащую экстрагент. В промышленности осуществляется главным образом в противоточных аппаратах (экстракторах) непрерывного действия. Применяется в гидрометаллургии (например, для извлечения меди), для разделения редких и рассеянных элементов, в аналитической химии и другом. Под Электролизом понимается совокупность процессов электро-химического окисления-восстановления, происходящих на погружных и электролит электродах при прохождении электрического тока. Применяется для получения многих веществ (водорода, металлов, хлора и других), при нанесении металлических покрытий (гальваностегия), воспроизведении формы предметов (гальванопластика). Под Электролизом понимаются химические процессы, протекающие в электролите при прохождении через него постоянного электрического тока. При этом ионы электролита движутся к электродам:- положительно заряженные ионы (катионы) – к катоду, а отрицательно заряженные ионы (анионы) – к аноду. Качественные изменения состава электролита обусловливаются характером электродных процессов образования продуктов восстановления на катоде и продуктов окисления на аноде. Количественные изменения описываются законами Фарадея. На электролизе основное получение многих водорода, кислорода, металлов, хлора, щёлочей, некоторых органических веществ и других химических продуктов. Электролиз применяют при рафинировании металлов, полученных неэлектрохимическими методами; при нанесении защитных и декоративных металлических покрытий (гальваностегия); для воспроизведения формы какого-либо предмета (гальванопластика).

SOLVENT SPINNING = ПРЯДЕНИЕ ИЗ РАСТВОРА (или РАСТВОРЯЮЩЕЕ ПРЯДЕНИЕ) – In Solvent Spinning, plastics such as acrylics, cellulose acetate, and polyvinyl chloride are dissolved by certain solvents. The solution is forced through the spinneret and the filament then passes through a stream of hot air. The air aids in evaporating the solvents from the slender fibers. For economic reasons, these solvents must be recovered for use again. See also Dry Spinning, and Spinning. / ацетат целлюлозы или ацетилцеллюлоза (cellulose acetate).

SOM = SOIL ORGANIC MATTER

SOMA = SYSTEM OPEN MARKET ACCOUNT

SOMACLONAL VARIATION = СОМАКЛОНАЛЬНАЯ ВАРИАЦИЯ (или СОМАКЛОНАЛЬНАЯ ИЗМЕНЧИВОСТЬ) – Somaclonal Variation is an increase in genetic variability in plants regenerated from tissue culture. / Под Сомаклональной Изменчивостью, от Греческих слов Sōma, означающее Тело, и Klōn, означающее Ветвь или Отпрыск, понимается .

SOMALAC = SOCIÉTÉ D'AMÉNAGEMENT DE LA PLAINE DE MORONDAVA = REGIONAL DEVELOPMENT AUTHORITY FOR THE DEVELOPMENT OF THE PLAIN OF MORONDAVA

SOMATIC = СОМАТИЧЕСКОЕ – Somatic:- relating to or affecting the cell body. / Под Соматическим, от Греческого слова Sōma, означающее Тело, понимается .

SOMATIC CELL = СОМАТИЧЕСКАЯ КЛЕТКА – Somatic Cell is:- (1) a cell that is not destined to become a gamete, a 'body cell' whose genes will not be passed on to future generations. (2) The somatic cell divides to form tissues, etc. It is a body cell that has full chromosome content.

SOMATIC CELL HYBRIDIZATION = ГИБРИДИЗАЦИЯ СОМАТИЧЕСКИХ КЛЕТОК – Somatic Cell Hybridization is:- (1) the fusion of non-germ cells in cell culture under certain treatments and the formation of viable hybrid cells. (2) A breeding method that uses protoplast fusion to produce somatic hybrids between otherwise sexually compatible Species. / Под Гибридизацией, от Латинского слова Hibrida, означающее Помесь, понимается скрещивание разнородных в наследственном отношении организмов. Один из важнейших факторов эволюции биологических форм в природе. Применяют для получения хозяйственных ценных форм животных и растений. Скрещивание особей одного и того же Вида (различных Подвидов, Сортов, Пород или Линий) называется внутривидовой гибридизацией, а различных Видов или Родов – отдалённой гибридизацией.

SOMBRERO = СОМБРЭРО – Sombrero is a high-crowned hat of felt or straw with a very wide brim worn especially in the Southwest and Mexico. / Под Сомбрэро, от Испанского слова Sombrero, от Сомбра (Sombra), означающее Тень, понимается Испанская широкополая шляпа из соломы, мочала или пальмовых листьев, распространённая преимущественно в странах Латинской Америки, в частности в Мексике.

SOO = SERIES OF OPTION

SOP = STANDARD OPERATING PROCEDURE

SORI = СОРУСЫ – Sori is the plural of Sorus – a cluster of fruit dots in ferns. / Под Сорусом, от Греческого слова Sōrós, означающее Куча, понимается группа не сросшихся друг с другом спороносных органов – спорангиев, расположенная на нижней стороне листьев большинства Папоротников. Сорус, группа скученно расположенных органов размножения – спорангиев (например, у Папоротников, зооспорангиев – у Бурой Водоросли Ламинарии), оогониев (например, у Бурой Водоросли Диктиоты).

SORPTION BEHAVIOR = ПОВЕДЕНИЕ СОРБЦИИ – Sorption Behavior:- (Latin:- adsorbere – take up) Absorption or release of water vapor by a hygroscopic cargo until equilibrium is reached. / Под Сорбцией, от Латинского слова Sorbeo, означающее Поглощаю, понимается поглощение твёрдым телом или жидкостью какого-либо вещества из окружающей среды. Основные разновидности сорбции – абсорбция, адсорбция и хемосорбция. Поглощающее тело называют Сорбентом, поглощаемое – Сорбтивом (Сорбатом). Важнейшие твёрдые сорбенты, способные к регенерации и применяемые в технике, – активные угли, иониты, силикагель, цеолиты. Сорбция в гидрометаллургии – поглощение ценных компонентов (Au, Mo, U) из растворов или пульп при выщелачивании руд и концентратов.

SORPTION ISOTHERMS = ИЗОТЕРМЫ СОРБЦИИ – Sorption Isotherms are graphical representation of the sorption behavior of a substance at a specified temperature. / Под Изотермами, от Греческих слов Isos, означающее Одинаковый, Подобный или Равный, и Thérmē, означающее Тепло, понимаются линии, изображающие на диаграмме состояния равновесный изотермический процесс. Под Сорбцией, от Латинского слова Sorbeo, означающее Поглощаю, понимается поглощение твёрдым телом или жидкостью какого-либо вещества из окружающей среды. Основные разновидности сорбции – абсорбция, адсорбция и хемосорбция. Поглощающее тело называют Сорбентом, поглощаемое – Сорбтивом (Сорбатом). Важнейшие твёрдые сорбенты, способные к регенерации и применяемые в технике, – активные угли, иониты, силикагель, цеолиты. Сорбция в гидрометаллургии – поглощение ценных компонентов (Au, Mo, U) из растворов или пульп при выщелачивании руд и концентратов.

SORREL = ГНЕДОЕ (или ЖЕЛТОВАТО–КОРИЧНЕВОЕ, или КРАСНОВАТО–КОРИЧНЕВОЕ, или XX) – Sorrel:- a brownish orange to light brown.

SORTING = СОРТИРОВКА – Sorting is the process of separating a fleece into its various qualities according to diameter, length, color, strength, and other factors.

THE SORTINO RATIO = СООТНОШЕНИЕ СОРТИНО – The Sortino Ratio:- the purpose of risk management and subsequent risk measures is to avoid large downside risk, so a performance metric that punishes excessive positive returns while missing excessive downside risk is flawed. The Sortino ratio offers a better measure of risk. In many ways, the Sortino ratio is a better choice, especially when measuring and comparing the performance of managers whose programs exhibit positive skew in their return distributions. The Sortino ratio is a modification of the Sharpe ratio, using downside deviation rather than standard deviation as the measure of risk, i.e. only those returns falling below a userspecified target ('Desired Target Return') or required rate of return are considered risky. It is interesting to note that even Nobel laureate Harry Markowitz, when he developed Modern Portfolio Theory (MPT) in 1959, recognized that because only downside deviation is relevant to investors, using it to measure risk would be more appropriate than using standard deviation. However, he used variance (the square of standard deviation) in his MPT work because optimizations using downside deviation were computationally impractical at the time. In the early 1980s, Dr. Frank Sortino had undertaken research to come up with an improved measure for risk-adjusted returns. According to Sortino, it was Brian Rom's idea at Investment Technologies to call the new measure the Sortino ratio. The first reference to the ratio was in Financial Executive Magazine (August 1980) and the first calculation was published in a series of articles in the Journal of Risk Management (September 1981). The Sortino ratio, S, is defined as:- $S = (R - T) / TDD$; where:- R is the average period return; T is the target or required rate of return for the investment strategy under consideration (originally T was known as the Minimum Acceptable Return, or MAR. In his more recent work, MAR is now referred to as the Desired Target Return); TDD is the target downside deviation. The target downside deviation is defined as the root-mean-square, or RMS, of the deviations of the realized return's underperformance from the target return where all returns above the target return are treated as underperformance of 0. See also Sharpe Ratio, and Standard Deviation. The Sortino Ratio is a measure of risk-adjusted performance; uses the concept of a target rate of return both in expressing the return in the numerator and the risk in the denominator. Formula:- the Sortino Ratio = $[E(R_p) - R_{Target}] / TSSD$, where:- $E(R_p)$ is the expected return, or mean Return in practice, for portfolio p; R_{Target} is the user's target rate of return; and TSSD is the target semistandard deviation (or downside deviation). Example:- a portfolio

that earns 10% per year when the investor's target rate of return is 8% per year. The semistandard deviation based on returns relative to the target is 16% annualized. The Sortino ratio would be (10% – 8%) / 16% or 0.125. The Sortino Ratio:- a measure of risk-adjusted performance that tends to be used more in alternative investments than in traditional investments is the Sortino ratio. Unlike the Sharpe ratio, the Sortino ratio subtracts a benchmark return, rather than the riskless rate, from the asset's return in the numerator. Also, it uses downside standard deviation, rather than standard deviation, as the measure of risk in the denominator. Therefore, the Sortino ratio can be used for investments with skewed returns, especially those where the downside risk seems larger than the upside potential. As a semistandard deviation, the target semistandard deviation (TSSD) focuses on the downside deviations. As a target semistandard deviation, TSSD defines a downside deviation as the negative deviations relative to the target return rather than a mean return or zero. Thus, the Sortino ratio uses the concept of a target rate of return both in expressing the return in the numerator and the risk in the denominator. Even if the target return is set equal to the riskless rate, the Sortino ratio is not equal to the Sharpe ratio. Although they would share the same numerator, the denominator would be the same only for perfectly symmetrical distributions and where the mean return of the asset equaled the riskless rate. The point is that the emphasis of the Sortino ratio is the use of downside risk rather than the use of a target rate of return. To the extent that a return distribution is nonsymmetrical and that the investor is focused on downside risk, the Sortino ratio can be useful as a performance indicator. / Хэри Марковиц (Harry Markowitz). Доктор Фрэньк Эй.Сортино (Dr Frank A. Sortino). Брайэн Эм. Ром (Brian M. Rom). Смотрите также Соотношение Шарпа (Sharpe Ratio).

SOS = SOMALIAN SHILLING

SOU = STATEMENT OF USE

SOUK = СУК (или РЫНОК) – Souk is the local name for market used throughout the Arab world.

SOUND = ЗОНДИРОВАТЬ (или ИЗМЕРЯТЬ ГЛУБИНУ ЛОТОМ) – Sound (maritime term):- to measure the depth of the water with a lead. Also said of a whale when it dives to the bottom.

SOUND KNOT = ЗДОРОВЫЙ СУЧОК – Sound Knot is a knot that is solid across its face, at least as hard as the surrounding wood, and shows no indication of decay. / гниения или загнивания. Здоровым Сучком считается сучок, имеющий древесину без гнили.

SOUNDNESS = ДОБРОКАЧЕСТВЕННОСТЬ – Soundness refers to overall visual grain quality. Sound grain is reasonably well matured and reasonably free from kernels damaged by frost, mildew, bleaching, or weather. / Доброкачественное зерно является от зерновки (ядер), повреждённой морозом, .

SOUND OUT A PERSON = ЗОНДИРОВАТЬ ПЕРСОНУ (или ПРОЩУПАТЬ ЧЕЛОВЕКА) – Sound Out A Person (maritime term):- to obtain his reaction to something.

SOUND WOOL or SOUNDNESS = ПРАВИЛЬНАЯ (или КРЕПКАЯ, или ПРОЧНАЯ, или ЗДОРОВАЯ, или ДОБРОКАЧЕСТЕННАЯ, или НЕПОВРЕЖДЁННАЯ) ШЕРСТЬ или ДОБРОКАЧЕСТВЕННОСТЬ (или БЛАГОРОДСТВО) – Sound Wool or Soundness is a wool that has a strong staple. Wool buyers or graders test the soundness of the wool by holding a staple at either end and snapping their fingers across the middle of it.

SOURCE = ИСТОЧНИК – Source is an object that produces light or other radiant flux.

SOURCE NURSERY = ПИТОМНИК ИСТОЧНИК – Source Nursery is a breeding nursery where all genetic material including sources imparting cytoplasmic male sterility, genotypes with specific traits useful for hybrid breeding program, and elite Rice lines showing high general and specific combining ability are maintained for use in a hybrid breeding program.

SOURCES AND SINKS = ИСТОЧНИКИ И ВЛОЖЕНИЯ – Sources And Sinks:- sources are the origins or the injection end of a transmission transaction. Sinks are the destinations or the withdrawal end of a transaction.

SOURCES OF RESISTANCE = ИСТОЧНИКИ УСТОЙЧИВОСТИ (или ИСТОЧНИКИ РЕЗИСТЕНТНОСТИ) – Sources Of Resistance are:- (i) Varieties of resistance; and (ii) Varieties or breeding lines that have genes for resistance.

SOUR CRUDE OIL = СЕРНИСТАЯ НЕФТЬ – Sour Crude Oil:- industry terms which denote the relative degree of a given crude oil's sulfur content. Sour crude refers to those crudes with a comparatively high sulfur content, 0.5% by weight and above. See also Sweet Crude Oil. / Сернистая Нефть:- промышленный термин, используемый для обозначения относительной степени содержания серы в данной нефти. Сернистая нефть относится к тем нефтям, которые содержат сравнительно высокое количество серы, 0.5% к весу и более. Смотрите также Малосернистая Нефть (Sweet Crude Oil).

SOUR GAS = КИСЛЫЙ ГАЗ (или ВЫСОКОСЕРНИСТЫЙ ГАЗ) – Sour Gas is a natural gas found with a sufficiently high quantity of sulfur to require purifying prior to shipment or use. Sour Gas:- raw natural gas with a relatively high concentration of sulphur compounds, such as hydrogen sulphide. All natural gas containing more than one per cent hydrogen sulphide is considered sour. About 30 per cent of Canada's natural gas production is sour, most of it found in Alberta and northeastern British Columbia. / Сернистый Газ, SO_2, то же, что Сернистый Ангидрид.

SOURING = КИСЛОВКА – Souring is any treatment of textile materials in dilute acid. Its purpose is the neutralization of any alkali that is present. / Щёлочь (Alkali).

SOUTH ASIAN ASSOCIATION FOR REGIONAL COOPERATION = ЮЖНО–АЗИАТСКАЯ АССОЦИАЦИЯ ПО РЕГИОНАЛЬНОМУ СОТРУДНИЧЕСТВУ – The idea of regional cooperation in South Asia was first mooted in May 1980. The Foreign Secretaries of the seven countries met for the first time in Colombo in April 1981. The Committee of the Whole, which met in Colombo in August 1981, identified five broad areas for regional cooperation. New areas of cooperation were added in the following years. The Declaration on South Asian Regional Cooperation was adopted by the Foreign Ministers in 1983 in New Delhi. During the meeting, the Ministers also launched the Integrated Programme of Action (IPA) in nine agreed areas, namely, Agriculture; Rural Development; Telecommunications; Meteorology; Health and Population Activities; Transport; Postal Services; Science and Technology; and Sports, Arts and Culture. The South Asian Association for Regional Cooperation (SAARC) was established when its Charter was formally approved on 08 December 1985 by the Heads of State or Government of Bangladesh, Bhutan, India, Maldives, Nepal, Pakistan and Sri Lanka. Afghanistan became a member of SAARC during the Fourteenth SAARC Summit held in Delhi, India in April 2007. Until 2009 China, Japan, Republic of Korea, USA, Iran, Mauritius, Australia, Myanmar and the European Union have joined SAARC as Observers. SAARC provides a platform for the peoples of South Asia to work together in a spirit of friendship, trust and understanding. It aims to promote the welfare of the peoples of South Asia and to improve their quality of life through accelerated economic growth, social progress and cultural development in the region. Cooperation in SAARC is based on respect for the five principles of sovereign equality, territorial integrity, political independence, non-interference in internal affairs of the member states and mutual benefit. Regional cooperation is seen as a complement to the bilateral and multilateral relations of SAARC Member States. The SAARC Secretariat is based in Katmandu. It coordinates and monitors implementation of activities, prepares for and services meetings,

and serves as a channel of communication between the Association and its Member States as well as other regional organizations. The Secretariat is headed by the Secretary General, who is appointed from Member States in alphabetical order for a three-year term by the SAARC Council of Ministers. H.E. Dr. Sheel Kant Sharma of India is the current Secretary General of SAARC. The Secretary General is assisted by eight Directors on deputation from Member States. The Objectives of the Association as defined in the Charter are:- (i) to promote the welfare of the peoples of South Asia and to improve their quality of life; (ii) to accelerate economic growth, social progress and cultural development in the region and to provide all individuals the opportunity to live in dignity and to realize their full potentials; (iii) to promote and strengthen collective self-reliance among the countries of South Asia; (iv) to contribute to mutual trust, understanding and appreciation of one another's problems; (v) to promote active collaboration and mutual assistance in the economic, social, cultural, technical and scientific fields; (vi) to strengthen cooperation with other developing countries; (vii) to strengthen cooperation among themselves in international forums on matters of common interests; and (viii) to cooperate with international and regional organizations with similar aims and purposes. The South Asian Association for Regional Cooperation (SAARC) is made up of 7 members (Bangladesh, Bhutan, India, Maldives, Nepal, Pakistan and Sri Lanka) with the goal of promoting economic, social and cultural cooperation. Headquartered in Kathmandu, Nepal. The South Asian Association for Regional Cooperation (SAARC) was established when its Charter was formally adopted on 1985-December-08 by the Heads of State or Government of Bangladesh, Bhutan, India, Maldives, Nepal, Pakistan and Sri Lanka. SAARC provides a platform for the peoples of South Asia to work together in a spirit of friendship, trust and understanding. It aims to accelerate the process of economic and social development in Member States. In 2011:- 8 members (Afghanistan, Bangladesh, Bhutan, India, Maldives, Nepal, Pakistan and Sri Lanka). / Шарма (Sheel Kant Sharma). коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо). Ассоциация была сформирована решением глав государств и правительств семи государств, оформленного в виде Чартера (Charter), подписанного 08 Декабря 1985 в Даке, Бангладеш (Dhaka, Bangladesh).

SOUTHERN AFRICAN CUSTOMS UNION = ЮЖНО–АФРИКАНСКИЙ ТАМОЖЕННЫЙ СОЮЗ – As the world's oldest custom union, the Southern African Customs Union (SACU) dates back to 1889 Customs Union Convention between the British Colony of Cape of Good Hope and the Orange Free State Boer Republic. A new agreement, signed on 1910-June-29, was extended to the Union of South Africa and the British High Commission Territories (HCTs), i.e. Basutoland (Lesotho), Bechuanaland (Botswana), and Swaziland, South West Africa (Namibia) 'was a defacto member, since it was administered as part of South Africa' before it became a dejure member. The primary goal was to promote economic development through regional coordination of trade. The 1910 SACU Agreement which was in effect until 1969, created the following:- (i) a common external tariff (CET) on all goods imported into the Union from the rest of the world; a common pool of customs duties as per the total volume of external trade; and excise duties based on the total production and consumption of excisable goods; (ii) free movement of SACU manufactured products within SACU, without any duties or quantitative restrictions; and (iii) a revenue-sharing formula (RSF) for the distribution of customs and excise revenues collected by the union. As early as 1925, South Africa adopted import substitution industrialization (ISI) policies, backed by the common external tariffs on non-SACU products. These measures guaranteed a regional market for South African manufactures, while relegating the British High Commission Territories (HCTs) to producing primary commodities. Under apartheid, South Africa was the sole administrator of the common SACU revenue pool, setting SACU import duties and setting excise policy. With the structural issues of management and decision-making processes and the issues arising from the inequitable revenue sharing, the British High Commission Territories (HCTs) constantly called for a revision of the 1910 agreement. Negotiations to change the 1910 Agreement began after the HTCs gained their independence in the early 1960s, resulting in the 1969 Agreement. The 1969 SACU Agreement, Signed by the sovereign states of Botswana, Lesotho, and Swaziland (BLS) and South Africa, on 1969-December-11 provided two major changes:- (i) the inclusion of excise duties in the revenue pool; and (ii) a multiplier in the revenue sharing formula that enhanced BLS revenues annually by 42 percent. However, similar to the 1910 agreement, South Africa retained the sole decision-making power over customs and excise policies. It also retained open access to the BLS market, while the high common tariff raised barriers for Southern African neighbors' exports to SACU. These trade-diverting effects benefited South African manufacturers. Because of the 'absence of a joint decision-making' process, the BLS requested factoring compensation into the revenue sharing formula, in order to address the loss of fiscal discretion (From 1969 onwards), the BLS expressed their concern with the following three key issues:- (i) No joint decision making processes – Prior to 2002 SACU was administered on a part-time basis by annual meetings of the Customs Union Commission and there were no effective procedures to ensure compliance or resolve disputes. (ii) Revenue sharing formula – The issue of most concern in the 1969 Agreement was the Revenue Sharing Formula (RSF), which determined each country's share of the Common Revenue Pool. Following negotiations, the RSF was amended in 1976 to include a stabilization factor that ensured that the BLS received at least 17 percent, and at most 23 percent, of the value of their imports and excise duties. (iii) Question of external (outside SACU) trade – The BLS argued that South Africa consistently entered into preferential agreements which benefited only one of the five members. With the independence of Namibia in 1990 and the end of apartheid in South Africa in 1994, SACU members embarked on new negotiations in November 1994, which culminated in a new SACU agreement in 2002. The 2002 SACU Agreement addressed the following three outstanding issues:- (i) Joint decision making processes:- Article 3 established an independent Administrative Secretariat to oversee SACU with its headquarters in Windhoek, Namibia. Article 7 created several independent institutions including a Council of Ministers, a Customs Union Commission, Technical Liaison Committees, a SACU Tribunal and a SACU Tariff Board. These institutions are designed to enhance equal participation by member states. The 2002 Agreement also provides for policy coordination in agriculture, industry, competition, and unfair trade practices, and protection of infant industries. (ii) New Revenue Sharing Formula: Revision of the RSF to include a customs excise and development component. (iii) Question of external (outside SACU) trade: the need to develop strategies that enhance the political, economic, social, and cultural integration of the region without jeopardizing the economies of the smaller states. The Southern African Customs Union (SACU), established in 1910, includes Botswana, Lesotho, Namibia, South Africa and Swaziland. SACU provides for the free exchange of goods within the area, a common external tariff and sharing of custom revenues. External tariffs, excise duties and several rebate and refund provisions are the same for all SACU members. SACU's revenues are apportioned among its members according to a set formula. These funds constitute a significant contribution to each member's government revenues. Headquartered in Windhoek, Namibia. The Governments of the Republic of Botswana, Kingdom of Lesotho, Republic of Namibia, Republic of South Africa and Kingdom of Swaziland:- (i) acknowledging the positive role which the Southern African Customs Union (SACU) has played in the past one hundred years and the important role it can play in promoting regional integration and the economic development of all its Member States; (ii) mindful of the different levels of economic development of the SACU Member States and the need for their integration into the regional and global economy; (iii) recognising the challenges presented by developments at the regional and global level and the need to position SACU to respond to these; (iv) convinced that SACU can be a vehicle for deeper development integration both within itself and within the Southern African region; and hereby commit to the following:- Vision:- an economic community with equitable and sustainable development, dedicated to the welfare of its people for a common future. Mission:- (a) to serve as an engine for regional integration and development, industrial and economic diversification, the expansion of intra regional trade and investment, and global competitiveness; (b) to build economic policy coherence, harmonization and convergence to meet the development needs of the region; (c) to promote sustainable economic growth and development for employment creation and poverty reduction; (d) to serve as a building block of an ever closer community

among the peoples of Southern Africa; (e) to develop common policies and strategies for areas such as trade facilitation; effective customs controls; and competition; and (f) to develop effective, transparent and democratic institutions and processes. / Бичуанлэнд (Bechuanaland).

SOUTHERN AFRICAN DEVELOPMENT COMMUNITY = ЮЖНО–АФРИКАНСКОЕ СООБЩЕСТВО ПО РАЗВИТИЮ – The Southern African Development Community (SADC) started as Frontline States whose objective was political liberation of Southern Africa. SADC was preceded by the Southern African Development Coordination Conference (SADCC), which was formed in Lusaka, Zambia on 1980-April-01 with the adoption of the Lusaka Declaration (Southern Africa:- Towards Economic Liberation). The formation of SADCC was the culmination of a long process of consultations by the leaders of the then only majority ruled countries of Southern Africa, thus Angola, Botswana, Lesotho, Mozambique, Swaziland, United Republic of Tanzania and Zambia, working together as Frontline States. In May 1979 consultations were held between Ministers of Foreign Affairs and Ministers responsible for Economic Development in Gaborone, Botswana. Subsequently a meeting was held in Arusha, Tanzania in July 1979 which led to the establishment of SADCC. On 1992-August-17, at their Summit held in Windhoek, Namibia, the Heads of State and Government signed the SADC Treaty and Declaration that effectively transformed the Southern African Development Coordination Conference (SADCC) into the Southern African Development Community (SADC). The objective also shifted to include economic integration following the independence of the rest of the Southern African countries. Currently (in 2011) SADC has a membership of 15 Member States, namely; Angola, Botswana, Democratic Republic of Congo (DRC), Lesotho, Madagascar, Malawi, Mauritius, Mozambique, Namibia, Seychelles, South Africa, Swaziland, United Republic of Tanzania, Zambia and Zimbabwe. SADC's Vision is that of a common future, a future within a regional community that will ensure economic well-being, improvement of the standards of living and quality of life, freedom and social justice and peace and security for the people of Southern Africa. This shared vision is anchored on the common values and principles and the historical and cultural affinities that exist between the people of Southern Africa. The SADC Mission is to promote sustainable and equitable economic growth and socio-economic development through efficient productive systems, deeper co-operation and integration, good governance, and durable peace and security, so that the region emerges as a competitive and effective player in international relations and the world economy. Headquartered in Gaborone, Botswana. The origins of SADC lie in the 1960s and 1970s, when the leaders of majority-ruled countries and national liberation movements coordinated their political, diplomatic and military struggles to bring an end to colonial and white-minority rule in southern Africa. The immediate forerunner of the political and security cooperation leg of today's SADC was the informal Front Line States (FLS) grouping. It was formed in the mid-1970s. The Southern African Development Coordination Conference (SADCC) was the forerunner of the socio-economic cooperation leg of today's SADC. The adoption by nine majority-ruled Southern African countries of the Lusaka declaration on 1980-April-01 paved the way for the formal establishment of SADCC in July 1981. The membership of the FLS and SADCC sometimes differed. SADCC was transformed into SADC on 1992-August-17, with the adoption by the founding members of SADCC and newly independent Namibia of the Windhoek declaration and treaty establishing SADC. The 1992 SADC provided for both socio-economic cooperation and political and security cooperation. In reality, the FLS was dissolved only in 1994, after South Africa's first democratic elections. Subsequent efforts to place political and security cooperation on a firm institutional footing under SADC's umbrella failed. On 2001-August-14 the 1992 SADC treaty was amended. The amendment heralded the overhaul of the structures, policies and procedures of SADC, a process which is ongoing. One of the changes is that political and security cooperation is institutionalised in the Organ on Politics, Defence and Security (OPDS). One of the principal SADC bodies, it is subject to the oversight of the organization's supreme body, the Summit, which comprises the heads of state or government. The headquarters of SADC is in Gaborone, Botswana. SADC has 15 member states, namely:- Angola, Botswana, Democratic Republic of the Congo (since 1997-September-08), Lesotho, Madagascar (since 2005-August-18), Malawi, Mauritius (since 1995-August-28), Mozambique, Namibia (since 1990-March-31, since independence), the Seychelles (since 2007-August-15), South Africa (since 1994-August-30), Swaziland, Tanzania, Zambia, Zimbabwe. Seychelles had also previously been a member of SADC from 1997-September-08 1997 until 2004-July-01 2004. Southern African Development Community (SADC), originally (1979–92) Southern African Development Coordination Conference, is the regional organization of southern African countries that works to promote economic cooperation and integration among the member states and to preserve their economic independence. The member states are Angola, Botswana, Lesotho, Malawi, Mauritius, Mozambique, Namibia, South Africa, Swaziland, Tanzania, Zambia, and Zimbabwe. The first conference was held in 1979, on the eve of Zimbabwe's (Rhodesia's) independence under black majority rule. The SADC's activities are coordinated at annual conferences of the heads of government and of a council of ministers from all the member states. The SADC plans, coordinates, and finances various projects in agriculture and animal husbandry, energy, mining, disease control, telecommunications, and regional trade. The Southern African Development Co-ordination Conference, SADCC, the forerunner of the SADC, the Community, was established in April 1980 by Governments of the nine Southern African countries of Angola, Botswana, Lesotho, Malawi, Mozambique, Swaziland, Tanzania, Zambia and Zimbabwe. The formation of SADC was the culmination of a long process of consultations by the leaders of Southern Africa. Towards the end of the 1970's, it became clear to the leaders of the region that just having a national flag and a national anthem would not meet the needs of the people for improved living standards. Secondly, the positive experiences gained in working together in the group of Frontline States, to advance the political struggle, had to be translated into broader co-operation in pursuit of economic and social development. From 1977, active consultations were undertaken by representatives of the Frontline States, culminating in a meeting of Foreign Ministries of the Frontline States in Gaborone, in May 1979, which called for a meeting of ministers responsible for economic development. That meeting was subsequently convened in Arusha, Tanzania, in July 1979. The Arusha meeting led to the birth to the Southern African Development Co-ordination Conference a year later. The SADCC or the conference, was formed with four principal objectives, namely:- (i) to reduce Member States dependence, particularly, but not only, on apartheid South Africa; (ii) to implement programmes and projects with national and regional impact; (iii) to mobilise Member States' resources, in the quest for collective self-reliance; and (iv) to secure international understanding and support. These objectives were pursued with determination and vigour. Through SADCC, the founding fathers sought first to demonstrate the tangible benefits of working together, and to cultivate a climate of confidence and trust among member States. SADC has developed since then, to become a organization that has a Programme of Action, covering several broad economic and social sectors, namely, Energy, Tourism, Environment and Land Management, Water, Mining, Employment and Labor, Culture, Information and Sport and Transport and Communications. Other sectors are Finance and Investment, Human Resource Development, Food, Agriculture and Natural Resources, Legal Affairs and Health. Sectors are each co-ordinated by a Member State with some member states co-ordinating more than one sector. Over the past two years SADC has undertaken an exercise to restructure its institutions and a report on this was adopted by an Extra-Ordinary Summit on 2001-March-09 in Windhoek, Namibia. This restructuring was necessitated by the number of difficulties and constraints encountered in the process of moving the organization from a coordinating conference into a Community. These include:- (i) inadequate institutional reforms to enable the effective transformation from SADCC (Coordinating Conference) to SADC (the Community). Furthermore, the resource provision and the management system were not adequately addressed; (ii) the need to put in place appropriate mechanisms capable of translating the high degree of political commitment to shape the scope and scale of community building through regional integration. This implies delegating authority and strengthening the capacity for decision-making to the relevant agencies responsible for implementing the SADC agenda; (iii) lack of synergy between the objectives and strategies of the

Treaty on one hand and the existing SADC Programme of Action (SPA) and the institutional framework on the other. (iv) limited capacity to mobilize significant levels of the region's own resources for the implementation of its Programme; and (v) the external financial overdependence of the SADC Programme of Action (SPA) to the tune of more than 80 percent, which compromises the Programme's sustainability. Transformation from conference to community occurred in August 1992, when the Heads of State and Government of the Southern African Development Co-ordination Conference met in Windhoek, Namibia, to sign a Declaration and Treaty establishing the new SADC – the Southern African Development Community. The SADCC leaders had come to realise that although the co-ordination conference had served them well and had demonstrated the crucial need to cooperate in their development efforts, time had come to give the Organization a legal and more formal status. There was also a need to shift the focus of the organization from co-ordination of development projects to a more complex task of integrating the economies of member States. Hence the Treaty, which is the blueprint for building a Community of Southern African states. SADC and its member States are expected to act according to the following principles:- (i) sovereign equality of all member States; (ii) solidarity, peace and security; (iii) human rights, democracy, and the rule of law; (iv) equity, balance and mutual benefit; and (v) peaceful settlement of disputes. The objectives of SADC are to:- (i) achieve development and economic growth, alleviate poverty, enhance the standard and quality of life of the people of Southern Africa and support the socially disadvantaged through regional integration; (ii) evolve common political values, systems and institutions; (iii) promote and defend peace and security; (iv) promote self-sustaining development on the basis of collective self-reliance, and the interdependence of Member States; (v) achieve complementarity between national and regional strategies and programmes; (vi) promote and maximise productive employment and utilisation of resources of the Region; (vii) achieve sustainable utilisation of natural resources and effective protection of the environment; and (viii) Strengthen and consolidate the long standing historical, social and cultural affinities and links among the people of the Region. The ultimate objective of SADC, the Community is, therefore, to build a Region in which there will be a high degree of harmonisation and rationalisation to enable the pooling of resources to achieve collective self-reliance in order to improve the living standards of the people of the region. / , дальнюю связь и . коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо).

SOUTHERN BLOT/SOUTHERN TRANSFER = ЮЖНЫЙ БЛОТ/ЮЖНЫЙ ПЕРЕНОС – Southern Blot/Southern Transfer is a technique for the transfer of (denatured) DNA from an electrophoretic gel to a nitrocellulose membrane on which the DNA can be bound and hybridized to a single-stranded DNA probe. / (денатурированной) ДНК. Южный Блотинг – метод определения фрагмента ДНК, содержащего искомый ген, путём гибридизации разделённых электрофорезом фрагментов с радиоактивным зондом, например, радиоактивной к ДНК.

SOUTHERN HYBRIDIZATION = ЮЖНАЯ ГИБРИДИЗАЦИЯ – Southern Hybridization is a method employing gel separation of restricted DNA fragments, their blotting onto a membrane support, dissociation into single stranded DNA, and hybridization (reassociation) with a radio-labeled probe. / однонитевая или одноцепочечная ДНК, и . Южная Гибридизация – гибридизация с использованием южного блотинга (перенос ДНК с геля на фильтр). Под Гибридизацией, от Латинского слова Hibrida, означающее Помесь, понимается скрещивание разнородных в наследственном отношении организмов. Один из важнейших факторов эволюции биологических форм в природе. Применяют для получения хозяйственных ценных форм животных и растений. Скрещивание особей одного и того же Вида (различных Подвидов, Сортов, Пород или Линий) называется внутривидовой гибридизацией, а различных Видов или Родов – отдалённой гибридизацией.

SOUTHWESTER = ЗЮЙДВЕСТКА – Southwester (maritime term):- an oil-skin hat with broad rear brim. / Под Зюйдом, от Голландского слова Zuiden, понимается то же, что Юг.

SOU'WESTER = ЗЮЙДВЕСТКА (или НЕПРОМОКАЕМАЯ ШАПКА) – Sou'wester or Sou Wester is a waterproof hat with wide slanting brim longer in back than in front. A Sou Wester refers to a long raincoat usually warn at the sea or a kind of hat that is waterproof and whose edge is longer at the back than the front. Sou wester is usually worn by sailors because it helps prevent water even in storm time from going into your eyes or back. It is called a Sou Wester because it was formally imported from Switzerland. Sou Wester is a type of waterproof hat with wide slanting brim longer in back than in front. It is made of rubbery like fabric or simply vinyl bonded to fabric. A Sou Wester is a waterproof hat with a wide piece at the back to protect the neck that is worn especially by sailors. This term can also refer to a long oilskin coat worn especially at sea during stormy weather. A variant of this term is southwester, which could also mean a storm or gale blowing from the southwest. / Соувэстё (Sou'wester).

SOVEREIGN = СОВЕРЕН – British Sovereign gold bullion coins are nickel-size gold bullion coins that were struck worldwide at the height of the British Empire. First introduced in 1816, the British Gold Sovereign coins came to be the world's most widely distributed gold coins, a distribution which grew along with the British Empire to be minted in Pretoria, Bombay, Ottawa, Melbourne, Perth, and Sydney. Hundreds of millions of Sovereigns were struck at their peak of distribution in the late 1800s and early 1900s. A large supply of gold Sovereigns and continued hoarding and trade all over the world cause these nickel-sized gold coins to be available today at bullion pricing. These coins portray the reigning monarch (sovereign, hence the name) on one side, and Pestrucci's St George slaying the Dragon on the other. Sovereign is the British gold coin with face value of one pound sterling, a fineness of 916.6 and a fine gold content of 0.235 4 Troy ounces. The gold British Sovereign can trace its history to Henry VII (1485–1509) who issued the first 20-shilling gold coin in 1489. The minting of the British Sovereign was suspended shortly after James I ascended to the throne of England in 1603. More than 200 years later, gold Sovereigns were once again struck commencing with George III in 1817. In the XIX Century, the Master of the Mint commissioned his protégé, Royal Mint engraver Benedetto Pistrucci, to create the now classic image of St. George and the dragon for the reverse (back) of this coin. In 1890, then Chancellor of the Exchequer, George Goschen, declared:- 'Nothing, in my opinion, is more handsome than the St. George and Dragon'. From the time of Queen Victoria until Britain went off the gold standard, British Sovereigns were minted as circulating gold coins with the stated value of one pound. The obverse (front) of these gold British Sovereigns features the bust of the reigning king of the time. The bust is surrounded by words containing the name of the ruler followed by the words 'D.G. BRITT: OMN: REX F. D. IND: IMP:'. The reverse on each gold coin features a famous representation of St. George on horseback slaying a mythical dragon. The date and Mint Mark appear beneath St. George. Two Kings:- (i) Edward VII was born Albert Edward to Queen Victoria and Prince Albert. At just one month, he was invested with the titles of Prince of Wales and Earl of Chester. Renowned as a sportsman, he succeeded his mother as England's ruler in 1901, reigning until his death in 1910. Edward VII was known as the 'Peacemaker' for his ability to foster strong relations with other European countries. Both circulated and Brilliant Uncirculated versions of these British gold Sovereign coins are available. (ii) George V succeeded Edward VII to the throne in 1910. The first monarch of the now famous House of Windsor, George V shepherded his nation through World War I. Following World War I, George V warned his nation of the growing threat of Nazi Germany. He died in 1936. Both circulated and Brilliant Uncirculated versions of these gold British Sovereign coins are available. Two Queens:- (i) Queen Victoria was one of Britain's longest reigning monarchs, having ruled from 1837 until her death in 1901. Her reign became known as the Victorian Era, famous for the industrial revolution and significant expansion of the British Empire as well as society's strong emphasis on morality and family values. Both circulated and Brilliant Uncirculated versions of these gold British Sovereign coins are available. (ii) Queen Elizabeth II is the current reigning monarch of the United Kingdom. She ascended to the throne in 1952. Queen Elizabeth (then Princess Elizabeth) served in

World War II as a military truck driver with the rank of Second Subaltern (a junior officer). Queen Elizabeth celebrated her Golden Jubilee marking her 50th year as Queen in 2002. British Sovereigns of Queen Elizabeth II are available in Brilliant Uncirculated condition. Gross weight:- 7.988 1 g; gold content:- 0.235 4 Troy oz; composition:- 91.67% (22-Karat) Gold. Dates:- 1902–1910 (Edward VII); 1911–1917; 1925 (George V); 1839–1839; 1841–1874; 1879–1880; 1887–1896; 1898–1901 (Victoria); 1953; 1957; 1959; 1962–1968; 1974–1982; 2000–2006 (Elizabeth II). / Хэнри VII (Henry VII). Дьжеймз I (James I). Бэнэдэтто Пистручи (или Пистроксай) (Benedetto Pistrucci). Дьжодьж Гёшэн (George Goschen). Эдвод VII (Edward VII) Элбёт Эдвод (Albert Edward) Королева Виктория (Queen Victoria) и Принц Элбёт (Prince Albert). Король Дьжодьж V (George V). Королева Элизэбэс II (Queen Elizabeth II). Под Совереном (Sovereign) понимается Английская золотая монета, чеканившаяся с 1489 массой в 15.47 граммов (г) чистого золота. С установлением в Великобритании золотого стандарта в 1816 Соверен становится основной монетной единицей, равной по массе 1 Фунту Стерлингов (7.32 г чистого золота). В 1917 чеканка Соверенов для внутреннего обращения прекратилась, продолжаясь чеканиться только для продажи на международных рынках золота.

SOWING = ПОСЕВ – Sowing is the process of planting seeds. Plants which are usually sown:- among the major field crops, Oats, Wheat, and Rye are sowed, grasses and legumes are seeded, and Maize and Soybeans are planted. In planting, wider rows (generally 75 cm (30 in) or more) are used, and the intent is to have precise, even spacing between individual seeds in the row; various mechanisms have been devised to count out individual seeds at exact intervals. Difference between sowing and planting must not be forgotten. Sowing Depth:- in sowing, little if any soil is placed over the seeds. More precisely, seeds can be generally sown into the soil by maintaining a planting depth of about 2–3 times the size of the seed. Sowing Types and Patterns:- for hand sowing, several sowing types exist; these include:- (i) Flat Sowing; (ii) Ridge Sowing; and (iii) Wide Bed Sowing. Several patterns for sowing may be used together with these types; these include:- (i) Regular Rows; and (ii) Rows that are indented at the even rows (so that the seeds are placed in a crossed pattern). This method is much better, as more light may fall on the seedlings as they come out. Symmetrical grid pattern – using the quincunx pattern described in the The Garden of Cyrus. Types of Sowing:- (1) Hand Sowing:- hand sowing (or planting) is the process of casting handfuls of seed over prepared ground, or broadcasting (from which the technological term is derived). Usually, a drag, a swan-neck hoe or harrow is employed to incorporate the seed into the soil. Though labor-intensive for any but small areas, this method is still used in some situations. Practice is required to sow evenly and at the desired rate. A hand seeder can be used for sowing, though it is less of a help than it is for the smaller seeds of grasses and legumes. Hand sowing may be combined with pre-sowing in seed trays. This allows the plants to come to strength indoors during cold periods, e.g., spring in temperate countries. In agriculture, most seed is now sown using a seed drill, which offers greater precision; seed is sown evenly and at the desired rate. The drill also places the seed at a measured distance below the soil, so that less seed is required. The standard design uses a fluted feed metering system, which is volumetric in nature; individual seeds are not counted. Rows are typically about 10–30 cm apart, depending on the crop species and growing conditions. Several row opener types are used depending on soil type and local tradition. Grain drills are most often drawn by tractors, but can also be pulled by horses. Pickup trucks are sometimes used, since little draft is required. A seed rate of about 100 kg of seed per hectare (2 bushels per acre) is typical, though rates vary considerably depending on crop species, soil conditions, and farmer's preference. Excessive rates can cause the crop to lodge, while too thin a rate will result in poor utilisation of the land, competition with weeds and a reduction in the yield. (2) Open Field:- open-field planting refers to the form of sowing used historically in the agricultural context whereby fields are prepared generically and left open, as the name suggests, before being sown directly with seed. The seed is frequently left uncovered at the surface of the soil before germinating and therefore exposed to the prevailing climate and conditions like storms etc. This is in contrast to the seedbed method used more commonly in domestic gardening or more specific (modern) agricultural scenarios where the seed is applied beneath the soil surface and monitored and manually tended frequently to ensure more successful growth rates and better yields. Pre-treatment of seed and soil before sowing:- before sowing, certain seeds first require a treatment prior to the sowing process. This treatment may be seed scarification, stratification, seed soaking or seed cleaning with cold (or medium hot) water. Seed soaking is generally done by placing seeds in medium hot water for at least 24 to up to 48 hours. Seed cleaning is done especially with fruit (as the flesh of the fruit around the seed can quickly become prone to attack from insects or plagues. To clean the seed, usually seed rubbings with cloth/paper is performed, sometimes assisted with a seed washing. Seed washing is generally done by submerging cleansed seeds 20 minutes in 50 degree Celsius water. This (rather hot than moderately hot) water kills any organisms that may have survived on the skin of a seed. Especially with easily infected tropical fruit such as lychees and rambutans, seed washing with high temperature water is vital. In addition to the mentioned seed pretreatments, seed germination is also assisted when disease-free soil is used. Especially when trying to germinate difficult seed (e.g., certain tropical fruit), prior treatment of the soil (along with the usage of the most suitable soil; e.g., potting soil, prepared soil or other substrates) is vital. The two most used soil treatments are pasteurisation and sterilisation. Depending on the necessity, pasteurisation is to be preferred as this does not kill all organisms. Sterilisation can be done when trying to grow truly difficult crops. To pasteurise the soil, the soil is heated for 15 minutes in an oven of 120 °C. See also Seeding. / Посев – в растениеводстве, распределение семян в верхнем слое почвы для их прорастания; важнейший агротехнический приём при возделывании многих сельскохозяйственных культур. Способы посева выбирают с учётом требований сельскохозяйственных культур к площади питания, освещению, снабжению влагой, необходимости механизировать уход за посевами и прежде всего обработку междурядий. Разбросной Посев самый примитивный. Семена попадают на поверхность почвы и заделываются бороной на разную глубину, вследствие чего всходы появляются неодновременно. Рядовой Посев (междурядья 10–25 сантиметров (см), чаще 15 см) применяют при выращивании главным образом зерновых культур. Рядовая сеялка укладывает семена на дно бороздки и закрывает их рыхлым слоем почвы, что способствует дружному появлению всходов. Узкорядный Посев (междурядья 7–8 см) и Перекрёстный Посев зерновых, трав, Льна и другого более совершенны, чем рядовой, так как дают возможность размещать семена по площади более равномерно. Широкорядный Посев (междурядья более 25 см) применяют для пропашных культур (Кукурузы, Сахарной Свёклы, Подсолнечника, Гречихи, кормовых и столовых корнеплодов и других). При Ленточном Посеве (Моркови, Редиса и другого) широкие междурядья между лентами (группа рядов) чередуют с узкими между рядами. Гнездовым Посевом семена высевают по нескольку штук в каждую лунку (гнездо). Если гнёзда размещены по углам квадрата, то такой способ называется Квадратно-Гнездовым Посевом; при Квадратном Посеве в каждый угол квадрата высевают одно семя. При Пунктирном Посеве семена высевают по одному на заданном расстоянии одно от другого. В районах с малоснежными суровыми зимами для озимых культур применяют Бороздной Посев:- семена высевают на дно борозд, в них задерживается снег и предохраняет всходы от вымерзания. Гребневой Посев проводят по вершинам гребней, лучше прогреваемых солнцем; распространён в районах избыточного увлажнения и полярного земледелия. Посев проводят сеялками, иногда с самолёта, например, посев лесных культур. В зависимости от сроков различают Весенний Посев яровых культур, Осенний Посев – озимых культур, Летний Посев – для получения второго урожая, Подзимний Посев – для получения более ранних всходов. Для каждого растения существуют оптимальные сроки посева. В Европейской части бывшего СССР ранний посев яровых обеспечивал лучшее использование ими весенней влаги, питательных веществ и света. Дружный рост растений даёт возможность заглушить сорняки и снижает повреждаемость болезнями и вредителями. В Сибири и Северном Казахстане яровые культуры высевают позднее, так как при раннем посеве (например, зерновых) они сильнее страдают от Июньской засухи и сорняков. В республиках Средней Азии, в Азербайджане и других посев ранних яровых

(особенно Ячменя) возможен зимой (Февраль и даже Январь). Для поздних яровых культур срок сева определяют в зависимости от температуры почвы и воздуха. Срок сева озимых устанавливают с таким расчётом, чтобы до наступления заморозков всходы их могли достаточно развиться и окрепнуть:- в северных районах бывшего СССР – в Августе, на юге (Краснодарский Край, Крым и другие) – во 2-й декаде Сентября и заканчивают к началу Октября. Большое значение имеет сокращение продолжительности посева. Выращивание скороспелых и позднеспелых сортов одной и той же культуры позволяет без ущерба для урожая несколько растянуть сроки посева. Глубина Заделки семян зависит от биологических особенностей растений, механического состава почвы. В качестве общей закономерности установлено, что чем крупнее семена, тем глубже их нужно заделывать, например Кукурузу на 10–12 см, Зерновые колосовые на 4–6 см, Злаковые травы, махорку на 1–2 см. На тяжёлых суглинках и глинистых почвах семена заделывают мельче, чем на лёгких супесях и суглинках. Учитывают также влажность почвы:- семена не должны располагаться в сухом слое. Иногда глубину заделки приходится увеличивать, чтобы предохранить семена от птиц (Кукуруза, Горох) и выдувания. Норму Высева Семян устанавливают с учётом почвенно-климатических условий местности, хозяйственного назначения культуры, требований растений к площади питания, времени и способов посева, окультуренности почвы и другого. Подготовку к посеву начинают с заготовки и засыпки семян, проверки качества семенного материала на всхожесть, чистоту и тому подобное. В каждом хозяйстве составляют план посева, предусматривающий расстановку посевных агрегатов, сроки и порядок выполнения работ. При оценке качества посева проверяют своевременность его, равномерность глубины заделки семян, соблюдение норм высева, прямолинейность рядков и правильность квадратов. Посевом называют также поле, занятое сельскохозяйственной культурой.

SOWING DEPTH = ГЛУБИНА ЗАДЕЛКИ (или ГЛУБИНА ПОСЕВА) – Seed should be sown very shallow when planting into a dry loose seedbed as they tend to sink further into the soil when water is applied. Seedlings emerging from depth feature small cotyledons and poor vigour early in the season. / семядоли (cotyledons). В сельском хозяйстве под Посевом понимается заделка семян в верхние слои почвы для их прорастания. Способы:- квадратно-гнездовой, перекрёстный, разбросной, рядовой (ленточный, узкорядный, широкорядный) и другие. Посев проводится сеялками, иногда с самолёта. Глубина Заделки семян зависит от биологических особенностей растений, механического состава почвы. В качестве общей закономерности установлено, что чем крупнее семена, тем глубже их нужно заделывать, например, кукурузу на 10–12 сантиметров (см), Зерновые колосовые на 4–6 см, Злаковые травы, махорку на 1–2 см. На тяжёлых суглинках и глинистых почвах семена заделывают мельче, чем на лёгких супесях и суглинках. Учитывают также влажность почвы:- семена не должны располагаться в сухом слое. Иногда глубину заделки приходится увеличивать, чтобы предохранить семена от птиц (горох, кукуруза) и выдувания.

SOWING GUIDE = ПОСОБИЕ ПО СЕВУ – Sowing Guide is a structure consisting of intersecting strips of wood which form a network of square compartments. It is placed over the soil in a seedbox and seeds of test entries are placed in the compartments.

SOXS = SARBANES OXLEY ACT OF 2002

SOYBEAN LOOPER = СОЕБОБОВАЯ ПЯДЕНИЦА – Soybean Looper (Pseudoplusia Includens) is a light-green, defoliating caterpillar; migratory adults overwinter in the Southern United States or Caribbean basin and typically arrive in the Carolinas in late summer or fall.

SOYBEAN MEAL = ШРОТ ИЗ СОЕВЫХ БОБОВ – Soybean Meal is the product remaining after extracting most of the oil from whole soybeans. The oil may be removed by solvent extraction or by an expeller process in which the beans are heated and squeezed. The nutrient composition of the oil extracted Soybean meal 48 is shown in the table below. Soybean meal is high in protein and energy and is one of the most commonly used protein supplements in North America. It is a palatable feedstuff and may be used as the major protein supplement in rations for dairy cattle. Soybean Meal, the material remaining after solvent extraction of Soybean flakes, with a 50% Soy protein content, toasted (a misnomer because the heat treatment is with moist steam), and ground, in a hammer mill, provided the energy for the American revolution, beginning in the 1930s, of growing farm animals such as poultry and swine on an industrial scale; and more recently the aquaculture of catfish. Soybean Meal is the dominant protein supplement used in United States livestock and poultry feeds. Soy products are also used to make baby food, diet-food products, beer and ale, and noodles. Technical uses include adhesives, cleansing materials, polyesters, and other textiles. / Под Шротом, от Немецкого слова Schrot, означающее Мелкие Куски или Обрезки, понимаются отходы маслодельного производства, получаемые после экстракции жира из измельчённых масличных семян с помощью растворителей (бензин, дихлорэтан и другие). Шрот используется для кормления сельскохозяйственных животных.

SOYBEAN OIL = СОЕВОЕ МАСЛО (или МАСЛО ИЗ БОБОВ СОИ) – In processing Soybeans for oil extraction and subsequent soy flour production, selection of high quality, sound, clean, dehulled yellow Soybeans is very important. Soybeans having a dark colored seed coat, or even beans with a dark hilum will inadvertently leave dark specks in the flour, an undesirable factor when used in food products. All commercial Soybeans in the United States are yellow or yellow brown. To produce soybean oil, the Soybeans are cracked, adjusted for moisture content, rolled into flakes and solvent-extracted with commercial hexane. The oil is then refined, blended for different applications, and sometimes hydrogenated. Soybean oils, both liquid and partially hydrogenated, are exported abroad, sold as Vegetable Oil, or end up in a wide variety of processed foods. The remaining Soybean husks are used mainly as animal feed. Soybean Oil remains the most widely used edible oil in the United States, with consumption exceeding that of all other fats and oils combined. It is a major ingredient in cooking oil, margarine, mayonnaise, salad dressing, and shortening. Lecithin is a natural emulsifier derived from soybean oil and, without it, chocolate would separate from cocoa butter and spoil many sweet moments. Soybean Oil is widely used oil and is commonly called Vegetable Oil. Soybean oil is a very healthy food ingredient despite the bad publicity regarding fats and oils in general. Soybean oil does not contain much saturated fat. Saturated fat causes heart diseases and is mainly found in products from animal origin. Soybean oil is also used by the food industry in a variety of food products including salad dressings, sandwich spreads, margarine, bread, mayonnaise, non-dairy Coffee creamers and and snack foods. Soybean oil contains natural antioxidants which remain in the oil even after extraction. These antioxidants help to prevent the oxidative rancidity. Soybean oil is not only used in food products but is also used as renewable raw material to produce a variety of non-food products including bio diesel, including inks, plasticizers, crayons, paints and Soy candles. Soybean oil has normally a shelf life of 1 year but its better to store the soybean oil only a few months at room temperature. Soybean oil should be stored in a dry and dark place. It should be stored away from heat and if you want to keep soybean oil for longer periods it should be kept refrigerated. / Растительное или Жирное Растительное Масло относится к растительным жирам, поучаемым из семян или плодов растений отжимом или экстрагированием. Оно обладает плотностью 0.9–0.98 г/см^3, цвет от светло-жёлтого до тёмно-бурого. Бывают твёрдые, но чаще жидкие. Различают высыхающие растительные масла (конопляное, льняное), невысыхающие растительные масла (касторовое, кокосовое), и полувысыхающие (подсолнечное, хлопковое). Многие растительные масла являются важнейшими пищевыми продуктами. Основная питательная ценность растительных масел определяется высоким содержанием в них:- (i) стеринов (до 1 000 мг% в кукурузном, до 300 мг% в подсолнечном); (ii) токоферолов (100 мг% и более в соевом и кукурузном, до 60 мг% в подсолнечном); (iii) триглицеридов высших жирных кислот (до 80–90% в льняном, до 40–50% в подсолнечном); и

(iv) фосфатидов (до 3 000 мг% в соевом, до 1 400 мг% в подсолнечном). В технике растительные масла используются для производства лаков, мыл, олифы, топлива и других материалов. Соевое Масло, растительное жирное масло, получаемое из бобов Сои. В рафинированном виде применяется непосредственно в пищу и для производства маргарина. , доброкачественных, чистых, .

SOYBEAN PROTEIN FIBER = ВОЛОКНО ИЗ БЕЛКА СОЕБОБОВ (или БЕЛКОВОЕ ВОЛОКНО ИЗ БОБОВ СОИ) – Soybean Protein Fiber (SPF) is a new-typed healthy, comfortable and environmental textile fiber. It is the only renovated botanic protein fiber we can touch today. It is the sole nutritional 'Active Fiber' alive. You can feel its smoothness as children skin. Its moisture absorption, ventilation, draping and warmth cover the superiorities of all natural fibers. SPF has the softness and the smoothness of cashmere, but no harm to the nature. The raw material comes from Soybean, a plant massive in sourcing and rich in nutrition. SPF fabrics are resolvable in the earth back to the nature.

SOYBEANS = СОЕВЫЕ БОБЫ – The word Soy is derived from the Japanese word Shoyu (Soy sauce/Soya sauce). The Soybean (Glycine Max) is a Species of legume native to Eastern Asia. It is an annual plant that may vary in growth, habit, and height. It may grow prostrate, not growing higher than 20 cm (7.8 inches), or even stiffly erect up to 2 meters (6.5 feet) in height. The pods, stems, and leaves are covered with fine brown or gray pubescence. The leaves are trifoliate (sometimes with 5 leaflets), and the leaflets are 6–15 cm (2–6 inches) long and 2–7 cm (1–3 inches) broad. The leaves fall before the seeds are mature. The small, inconspicuous, self-fertile flowers are borne in the axil of the leaf and are white, pink or purple. The fruit is a hairy pod that grows in clusters of 3–5, with each pod 3–8 cm (1–3 inches) long and usually containing 2–4 (rarely more) seeds 5–11 mm in diameter. Beans are classed as pulses whereas Soybeans are classed as oilseeds. Soybeans are an important global crop, grown for oil and protein. The bulk of the crop is solvent extracted for vegetable oil and then defatted Soy meal is used for animal feed. A very small proportion of the crop is consumed directly for food by humans. Soybean products, however, appear in a large variety of processed foods. Soybeans are one of the 'biotech food' crops that are being genetically modified, and GMO (short for genetically modified organism) Soybeans are being used in an increasing number of products. Monsanto is the world's leader in genetically modified Soy for the commercial market. In 1995, Monsanto introduced Roundup Ready (RR) Soybeans that have had a copy of a gene from the bacterium, Agrobacterium sp. strain CP4, inserted, by means of a gene gun, into its genome that allows the transgenic plant to survive being sprayed by this non-selective, herbicide, glyphosate. Glyphosate, the active ingredient in Roundup, kills conventional Soybeans. Also known as Soya Beans in the United Kingdom. Soybeans belong to the Legume Family and are native to East Asia. They have been an important protein source in the Orient for millions of people for over five thousand years. Soybeans have been in the Western world since the XX century. Soybeans can be grown on a variety of soils and a wide range of climates, ranging form tropical Brazil to the snowy island Hokkaido in the north of Japan. As Soybeans mature in the pod, they ripen into a hard, dry bean. Although most Soybeans are yellow, there are also rare varieties which are black, brown or green. Soybeans futures are standardized, exchange-traded contracts in which the contract buyer agrees to take delivery, from the seller, a specific quantity of Soybeans (e.g., 5 000 bushels) at a predetermined price on a future delivery date. Soybeans Futures Exchanges:- You can trade Soybeans futures at Chicago Board of Trade (CBOT®) and Tokyo Grain Exchange (TGE). CBOT Soybeans futures prices are quoted in Dollars and cents per bushel and are traded in lot sizes of 5 000 bushels (136 metric tons). TGE Soybeans futures are traded in units of 50 tons and contract prices are quoted in Yen per metric ton. Consumers and producers of Soybeans can manage Soybeans price risk by purchasing and selling Soybeans futures. Soybeans producers can employ a short hedge to lock in a selling price for the Soybeans they produce while businesses that require Soybeans can utilize a long hedge to secure a purchase price for the commodity they need. Soybeans futures are also traded by speculators who assume the price risk that hedgers try to avoid in return for a chance to profit from favorable soybeans price movement. Speculators buy Soybeans futures when they believe that Soybeans prices will go up. Conversely, they will sell Soybeans futures when they think that Soybeans prices will fall. To buy or sell Soybeans futures, you need to open a trading account with a broker that handles futures trades. Most online brokerages out there only deal with stocks and stock options. Only a few such as E*TRADE Securities lets you trade futures and futures options as well. Xxxxx. Soybeans:- first introduced in Europe in the 1700s, the Soybean has become one of the most important beans in the world, securing a place for itself by providing oil and protein around the world. With applications as diversified as vegetable oil, animal feed and foodstuffs, it is no wonder that Soybeans have become staples in countries far from its original roots inEastern Asia. Fifty-five percent of the world's Soybean production occurs in the Americas. The US exports 37% of the world's Soybeans. Originally considered merely an industrial product before the 1920s, Soybeans rose to popularity for human consumption during World War II and have had a significant impact on US farming. In 2007, Soybeans brought in a total of USD26.8 billion. A sample commodity futures contract for Soybeans is shown in the following table:- Ticker Symbol:- (a) Open Outcry:- S (CBOT), and (b) Electronic:- ZIS (eCBOT); Contract Size:- 5 000 bushels; Deliverable Grades:- No. 2 Yellow at par, No.1 yellow at 6 cents per bushel over contract price and No.3 yellow at 6 cents per bushel under contract price; Contract Months:- March, May, July, August, September, and November; Trading Hours:- (a) CBOT Open Outcry:- Monday–Friday 09:30 am – 01:15 pm CST, and (b) eCBOT Electronic:- Sunday–Friday 06:31 pm – 06:00 am and 09:30 am – 01:15 pm CST; Last Trading Day:- the business day prior to the 15th calendar day of the contract month; Last Delivery Day:- second business day following the last trading day of the delivery month; Price Quote:- cents per bushel; Tick Size:- 0.25 cent/bu (USD12.50/contract); and Daily Price Limit (not applicable in electronic markets):- (a) 50 cents/bu (USD2 500/contract) above or below the previous day's settlement price, and (b) no limit in the spot month (limits are lifted beginning on First Position Day). Like every commodity, Soybeans have their own ticker symbol, contract value and margin requirements. To successfully trade a commodity, you must be aware of these key components and understand how to use them to calculate your potential profits and loss. For instance, if you buy or sell a Soybean futures contract, you will see a ticker tape handle that looks like this:- S8X @ 1 383'6. This is just like saying 'Soybean (S) 2008 (8) November (K) at USD13.8375 per bushel (1 383'6)'. A trader buys or sells a Soybean contract according to this type of quotation. Depending on the quoted price, the value of a commodities contract is based on the current price of the market multiplied by the actual value of the contract itself. In this instance, the Soybean contract is the equivalent of 5 000 bushels multiplied by our hypothetical price of 1 383'6, as in:- USD13.8375 x 5 000 bushels = USD69 187.5. Commodities are traded based on margin, and the margin changes based on market volatility and the current face value of the contract. To trade a Soybean contract on CBOT requires a margin of USD4 725, which is approximately 7% of the face value. Calculating a Change in Price:- because commodity contracts are customized, every price movement has its own distinct value. A one-cent move in a Soybean contract is equal to USD50. When determining the CBOT's Soybean profit and loss figures, you calculate the difference between the contract price and the exit price, and then multiply the difference by USD50. For example, if prices move from 1 383'6 to 1 350'6, you multiply the difference, which is 33, by USD50 to yield a contract value change of USD1 650. By other words:- (i) Soybean Contract Price (1 cent move = USD50); (ii) Sell one contract at 1 383'6; (iii) Buy one contract at 1 350'6; (iv) Total value 33 cents or USD 1 650. Soybean Exchanges:- Soybeans are traded in an open outcry format and electronically through the CME Group (Chicago Mercantile Exchange (CME), e-CBOT), the Brazilian Mercantile and Futures Exchange (BM&F), Mercado a Termino de Buenos Aires (MATba), Dalian Commodity Exchange (DCE), Kansai Commodities Exchange (KANEX), National Commodity and Derivatives Exchange (NCDEX) and the Tokyo Grain Exchange (TGE). Facts About Production:- the majority of the Soybean crop is allocated for vegetable oil and as animal feed. While tofu, soy milk and

other Soy products have been developed for human consumption, a small portion of the crop is actually allocated for foodstuffs. In 2008, US farmers set aside 74.8 million acres for Soybean plantings. In 2007, only 63.6 million acres (25.7 million hectares) were set aside for Soybeans. The yield from that crop produced 2.585 billion bushels (70.36 million metric tons) of Soybeans, and almost half of it, or 1.0 billion bushels (27.9 million metric tons) was exported. Ironically, China is the largest importer of US Soybeans, with Mexico coming in at a distant second. Considering Soybean byproducts, which are Soybean meal and Soybean oil, Mexico purchased USD439 million worth of Soybean meal and China purchased USD160 million worth of Soybean oil. Factors That Influence the Soybean's Price:- the price of soybeans is influenced by the following factors:- (i) The Soybean has two byproducts:- Soybean meal and Soybean oil. Each byproduct market enjoys its own supply and demand chain and a relationship with one another. Soybean trading uses a strategy called the Crush Spread, in which a trader purchases one contract of Soybeans (S) and sells one contract of Soybean oil (BO) and one contract of Soybean meal (SM). This is a way to diminish exposure to market forces and to create a hedge against supply and demand factors. (ii) One of the most controversial influences in the Soybean market is the concept of genetic modification or genetically modified organisms (GMO). Soybeans were modified to be resistant to herbicides by introducing genes taken from bacteria. Within a 10-year range from 1997–2007, the population of GMO soybeans increased from about 8% to 89%. While still a polarizing issue among consumers, GMO soybean crops have been tentatively accepted. (iii) The United States Department of Agriculture (USDA) releases several important reports on soybeans. Each year in March, the Prospective Plantings is released, detailing how many and which crops will be planted by farmers for the upcoming season. Every month thereafter, the USDA releases a monthly Crop Production report, which estimates the supply and demand for Soybeans. The final important report is the Grain Stocksreport, which is released four times a year and examines the supply of Soybeans and various other grains on a state-by-state basis and whether the soybeans are offsite or onsite. (iv) Brazil is the second largest producer of Soybeans behind the US. In 2005, Brazil produced 52.7 million metric tons, and is attempting to expand soybean cultivation further. However, the country faces opposition from various environment groups that dispute the soybean industry's encroachment on the Amazon rain forest and the overall deforestation of Brazil for profit. Conclusion:- the Soybean's price increases have a negative impact on other grains. Farmers only have so much arable land to plant crops. As a substitute good, it pushes corn and wheat aside, adversely affecting their supply and demand chains, which in turn significantly affects our global grain system. Global supplies are interdependent among countries, making all grains negatively interdependent because of the fight for limited resources. All of this leads to extreme fluctuations in the price and volatility of Soybeans – the perfect environment in which to trade. Xxxxx. How to Trade Soybean Commodity Futures:- Soybeans are used for everything from poultry feedstock to the creation of vegetable oil. There are different Soybean extracts you can trade on the commodities markets:- Soybeans themselves, Soybean oil, and Soybean meal. If you're interested in getting more background information on the Soybean industry, check out the following list:- (i) American Soybean Association; (ii) Iowa Soybean Association; (iii) Soy Protein Council; and (iv) Soy Stat Reference Guide. Soybeans:- Although most Soybeans are used for the extraction of Soybean oil (used as vegetable oil for culinary purposes) and Soybean meal (used primarily as an agricultural feedstock), whole Soybeans are also a tradable commodity. Soybeans are edible, and if you've ever gone to a sushi restaurant you might have been offered Soybeans as appetizers, under the Japanese name Edamame. The United States dominates the Soybean market, accounting for over 50 percent of total global production. Brazil is a distant second, with about 20 percent of the market. The crop in the United States begins in September, and the production of Soybeans is cyclical. The most direct way for you to trade Soybeans is through the Chicago Mercantile Exchange (CME) Soybean futures contract:- (i) Contract Ticker Symbol:- S; (ii) Electronic ticker (CME Globex):- ZS; (iii) Contract size:- 5 000 bushels; (iv) Underlying commodity:- Premium no. 1, no. 2, and no. 3 yellow Soybean bushels; (v) Price Fluctuation:- USD0.0025/bushel (USD12.50 per contract); (vi) Trading Hours:- 09:30 am to 01:15 pm Open Outcry, and 06:31 pm to 06:00 am Electronic (Chicago Time); (vii) Trading Months:- January, March, May, July, August, September, November. Soybean Oil:- Soybean oil is an extract of Soybeans that you and I know as vegetable oil. Soybean oil is the most widely used culinary oil in the United States and around the world, partly because of its healthy, nutritional characteristics. It contains about 85 percent unsaturated fat and very little saturated fat, which makes it appealing to health-conscious consumers. In addition to its gastronomic uses, Soybean oil is becoming an increasingly popular additive in alternative energy sources technology, such as bio-diesel. An increasing number of cars in the United States and abroad, for example, are being outfitted with engines that allow them to convert from regular diesel to Soybean oil during operation. Because of their economic fuel mileage and low environmental impact, these Soybean oil-enabled cars, known as Frybrids,are becoming more popular. Demand for Soybean oil has increased in recent years as demand for these cleaner-burning fuels increases and as the automotive technology is more able to accommodate the usage of such bio-diesels. According to the Commodity Research Bureau (CRB), production of Soybean oil increased from an average of 15 billion pounds in the mid-1990s to more than 22 billion pounds in 2003. If you want to trade Soybean oil, you need to go through the Chicago Board of Trade (CBOT), which offers the standard Soybean oil contract. Here is the contract information:- (i) Contract Ticker Symbol:- BO; (ii) Electronic Ticker (CME Globex):- ZL: (iii) Contract Size:- 60 000 pounds; (iv) Underlying Commodity:- Premium crude Soybean oil; (v) Price Fluctuation:- USD0.0001/pound (USD6.00 per contract); (vi) Trading Hours:- 09:30 am to 01:15 pm Open Outcry, and 06:31 pm to 06:00 am Electronic (Chicago Time); and (vii) Trading Months:- January, March, May, July, August, September, October, December. If you're wanting more info, take a look at the US National Oilseed Processors Association, an industry group. Soybean Meal:- Soybean meal, like Soybean oil, is an extract of Soybeans. Basically, whatever is left after Soybean oil is extracted from Soybeans can then be converted to Soybean meal. Soybean meal is a high protein, high energy-content food that is used primarily as a feedstock for cattle, hogs, and poultry. To invest in Soybean meal, you can trade the Soybean meal futures contract on the CME. Here is the information to help you get started trading this contract:- (i) Contract Ticker Symbol:- SM; (ii) Electronic Ticker (CME Globex):- ZM; (iii) Contract Size:- 100 Tons; (iv) Underlying Commodity:- 48% protein Soybean meal; (v) Price Fluctuation:- USD0.10/ton (USD10.00 per contract); (vi) Trading Hours:- 09:30 am to 01:15 pm Open Outcry, and 06:31 pm to 06:00 am Electronic (Chicago Time); and (vii) Trading Months:- January, March, May, July, August, September, October, December. / Эдамамэ (Edamame). Виды (Species). СИБАТ® (CBOT®). Монсэнто (Monsanto). Слово Соя (Soy) происходит от Японского слова Щойу (Shoyu) (Soy sauce/Soya sauce). Под Соей понимается Род Однолетних трав Семейства Бобовых. Несколько десятков Видов, во влажных тропиках Азии, Америки, Африки. Возделывается в основном Соя Культурная (Щетинистая) – зерновая, кормовая, масличная (до 37% масла) и сидеральная культура. Зерно сои (до 45% белка) используют для получения синтетических и искусственных пищевых продуктов. Соя (Glycine), Род Однолетних Травянистых Растений Семейства Бобовых, зерновая бобовая и масличная культура. 10 Видов во влажных тропиках и субтропиках Африки и Юго-Восточной Азии; в бывшем Союзе Советских Социалистических Республик (СССР) – 1 дикорастущий Вид (на Дальнем Востоке). Возделывают (с 5-го тысячелетия до Нашей Эры, в России с конца XIX века, родина – Китай) Обыкновенную или Культурную Сою (Glycine Max), во многих земледельческих районах мира. Обыкновенная Соя – свето-, влаголюбивое (переносит кратковременную засуху), теплолюбивое растение. Вегетационный период 75–200 суток. Опыляется перекрёстно. Лучшие почвы – чернозёмы, не выносит кислых, засолённых и заболоченных почв. Плоды – бобы. Соя даёт продовольствие (зерно, мука, масло, маргарин, соевые молоко и творог, кондитерские изделия), искусственное волокно, пластмассы, клей, лаки, краски, мыло, корма (зелёная масса, сено, жмых, шрот). Использую Сою и как сидерат. Зерно Сои – основное сырьё для производства синтетических и искусственных пищевых продуктов. Сою выращивают преимущественно на Дальнем Востоке, а также в

Украине, Северном Кавказе, Грузии и Молдавии. Сорта:- Салют 216, Амурская 41, Приморская 529, ВНИИМК 9186, Ласточка, Аркадия, Бельцкая 82, Кишинёвская 16 и другие. Лучшие предшественники – занятой пар, ранние Зерновые, многолетние травы. Благодаря азотфиксации Соя – ценный предшественник для пропашных и зерновых культур. Удобрения:- навоз 40 т/га и 45–60 кг/га P_2O_5 или 110–150 кг/га NPK. Высевают (в чистом виде или в смеси с Кукурузой и другими) в хорошо прогретую почву, широкорядным или ленточным способом; норма посева семян 35–140 кг/га, глубина – 4–7 см. Убирают прямым комбайнированием. Осваиваются интенсивные технологии возделывания Сои. Вредители – Люцерновая Совка, Соевая Зерновая Моль, Соевая Полосатая Блошка и другие; болезни – бактериоз, фузариоз, склеротиниоз и другие. Соя (Glycine), Род Травянистых Растений Семейства Бобовых. Несколько десятков Видов (по другим данным, 10 Видов), преимущественно в тропических странах с влажным климатом. Возделывают:- Сою Культурную, или Щетинистую (Glycine Hispida, или Glycine Max), – на всех континентах и Сою Яванскую (Glycine Javanica) – в Австралии как пастбищное растение. Из диких видов в СССР на Дальнем Востоке встречается Соя Уссурийская, или Дикая (Glycine Ussuriensis). Растения Сои прямостоячие, вьющиеся или ползучие. Листья перистые, тройчатые, реже с 5–6 листочками, с небольшими прилистниками. Цветки (белые, фиолетовые, красные) в пазушных кистевидных соцветиях, у некоторых видов цветки одиночные. Плод – боб, линейный или мечевидный. Семена округлые, продолговатые или сплюснутые. Соя Культурная подразделяется на 4 подвида:- Соя Корейская, Маньчжурская (к нему относятся почти все сорта, возделываемые в СССР), Китайская и Индийская. Предполагают, что она произошла от Сои Уссурийской. Однолетнее яровое растение со стержневой корневой системой, образует прямостоячий куст высотой 0.2–2 метра (м). Листья из 3–5 листочков, соцветие из 2–25 цветков. Боб от светлой до почти чёрной окраски, с 2–3 (реже 1 или 4) преимущественно светлыми семенами; 1 000 семян весит от 60 до 425 граммов (г). Светолюбива, влаголюбива, особенно после цветения (но может переносить кратковременную засуху). Хорошо произрастает на различных почвах, кроме кислых, заболоченных и солонцов. Потребляет много азота и фосфора. Соя Культурная – продовольственная, техническая, кормовая и сидеральная (смотрите Сидерация) культура. Зерно её содержит 24– 45% белка, 20–32% углеводов, 13–37% жира, витамины D_1, B, E и другое. Белок Сои близок по аминокислотному составу к животному белку. Зерно и недозрелые бобы употребляют в пищу, из соевой муки приготовляют молоко, творог, кондитерские изделия и другое, вводят её в комбикорма. Масло используют для производства маргарина и комбижира, рафинированное – в пищу. Зерно Сои – сырьё для многих видов промышленной продукции (искусственое волокно, пластмассы, клей, лаки, краски, мыло и другое), основное сырьё для производства синтетических и искусственных пищевых продуктов. Зелёную массу, сено, травяную муку, жмых и шрот скармливают скоту. Родина Культурной Сои – Китай, где её начали выращивать за 5 000 лет до Нашей Эры. Отсюда Соя распространилась в страны Южной и Юго-Восточной Азии. В Европу (Франция, Италия, Германия) завезена в конце XVIII века. В Соединённых Штатах Америки (США) её стали возделывать в XIX веке, на территории Европейской части России – с конца XIX века. Мировая посевная площадь Сои (миллонов гектаров (га)):- 16 в 1948–52; 28.3 в 1961–65; 35.8 в 1970 и 44.5 (в США 21.2, Китае 14.3) в 1974. Валовой сбор зерна 56.8 миллиона тонн (т) (в США 33.6, Китае 11.9), средний урожай зерна 12.8 центнеров с одного гектара (ц/га) (в 1974). В СССР в 1974 посевами Сои, преимущественно на Дальнем Востоке, а также на Украине, Северном Кавказе, в Грузии, Молдавии, было занято 850 000 га, валовой сбор зерна 375 000 т, средний урожай 4.41 ц/га (при соблюдении оптимальной технологии возделывания до 40 ц). Лучшие сорта:- Салют 216, Амурская 41, Приморская 529, ВНИИМК 9186 и другие. Сою возделывают в чистых посевах и в смеси с Кукурузой, Сорго (на зелёную массу, силос, сено). Удобрения:- навоз 40 тонн на гектар (т/га) и 45–60 килограммов на гектар (кг/га) P_2O_5 или 110–150 кг/га NPK. Применяют припосевное удобрение и подкормки. Способ посева широкорядный (междурядья 45 сантиметров (см)) или ленточный двухстрочный (51 см). Норма высева семян 35–140 кг/га, глубина заделки 4–7 см. Убирают Сою в фазу полной спелости зерна, зелёную массу – в период налива бобов. Вредители:- Люцерновая Совка, Соевая Зерновая Моль, Соевая Полосатая Блошка, Акациевая Огнёвка и другие; болезни:- бактериоз, фузариоз, склеротиниоз и другие.

SOYD METHOD = SUM–OF–THE–YEARS'–DIGITS METHOD

SP = SPECIE

SPA = SOCIETÀ PER AZIONI

SPACE–DYED = ПРОСТРАНСТВЕННО ОКРАШЕННОЕ – Space-Dyed:- a yarn or fiber that has been dyed at irregular intervals.

SPACE DYEING = ПРОСТРАНСТВЕННОЕ КРАШЕНИЕ – Space Dyeing is is a technique used to give yarn a unique, multi-colored effect. While a typical skein of yarn is the same color throughout, a skein of space dyed yarn is two or more different colors that typically repeat themselves throughout the length of the yarn. Space dyed yarn is sometimes referred to as Dip Dyed Yarn. The secret to space dyeing yarn involves the use of a special chemical called a Mordant. The purpose of a mordant is to help permanently fix the dye to the yarn after the space dyeing process. Since different colors of dye require different types of mordants, this makes it possible to dye the same skein of yarn many different colors. Space dyed yarn can be dyed in either coordinating or contrasting shades. Space dyeing yarn in coordinating colors, such as various neutral tones or assorted shades of blue, provides a subtle yet sophisticated look. Space dyed yarn in contrasting shades, such as yarn that is purple, red, and blue, offers a funkier feel. Spaced dyed yarn is most commonly used for knitting and crocheting. When space dyed yarn is made to make a knitted or crocheted item, the resulting project features uneven horizontal stripes that produce a collage-like effect. However, the size of the stripes in the finished piece depends on what size of yarn is used. As you might expect, thicker yarn produces thicker stripes. See also Dyeing. Space Dyeing:- several colors are printed along the yarn length to produce a tweed effect when tufted. Space Dyeing is a technique used to create lovely fabrics which shade from one color to another. Depending on the method used the fabrics can be softly muted or vibrant. General Background:- dyes are different to paints in that they react with the fabric fibers and create a chemical bond. To make this bond they need a fixative – washing soda or soda ash is used for cold water reactive dyes. Other dyes have different fixing agents. Health Warning:- dyes are chemicals and should be treated as such – do not inhale the powder, drink any of the liquids used or store where children could find and open them. Read all the instructions carefully before you start. Materials:- (i) 100% cotton fabric prewashed to remove any dressing; (ii) Procion MX reactive dyes (Dylon cold water dyes); (iii) Washing soda powder (look for one with no added bleach); (iv) Bottle to hold the dye solutions (Body Shop bottles are good – you can buy empty recycled ones); (v) Tubs and jars for the fabric dyeing containers:- ice cream cartons, mushroom cartons, etc; (vi) Cat litter tray to hold all the dye mixes (saves spillages); and (vii) Newspaper or plastic to protect working areas. For both methods:- (i) line a sink with damp fabric. Holding the containers, carefully mix approximately 1 teaspoon of dye powder in a small amount of lukewarm water. (If you are using a Dylon tin, sellotape the remainder closed and put into a plastic bag.) Mix to a paste and then add up to 100 ml of water. Wear a mask for this stage. The fabric in the sink is to catch any dye spillages. It can be added to the dye baths later. If your containers have tops, screw them on and put to one side. (ii) Mix 200 g of washing soda in a jug of boiling water. Stir until it is dissolved. Make up to 1 liter of solution by adding extra water. Method One:- to create soft muted colors:- (i) cut your fabric into pieces – fat quarter size works well. Soak in a bucket or sink of plain water for 15 minutes. (ii) Arrange fabrics in a container – you can make formal pleats or just scrunch it in. If you use jam jars just push half the fabric into the jar and leave the rest hanging out. (iii) Drip or spoon dye onto areas of the fabric. It helps to drip a different

color down each side of the jar. Then push more fabric in and drip more dye into the jar. (iv) Using rubber gloves, press the fabric down firmly until no white is showing. Add more dye if there are still white areas. Leave for at least 15 minutes and preferably longer. (v) Pour washing soda solution over the fabric, making sure all areas of fabric are in contact with the solution. You don't want the fabric swimming in solution, just damped by it. Leave for 45 minutes. It will not harm if it is left for longer – in fact the longer it is left the more time the dye has to bond to the fabric. (vi) Take the container to the sink and pour excess dye away. Fill the container with water, pull out the fabric and rinse very well. At this stage the dyes will still contaminate other fabrics so if you have a lovely yellow piece do not rinse with a dark blue piece or sections will go green. Keep rinsing until the water runs clear. Then rinse again in hot water, again until the water runs clear. Finally, put through a hot wash or rinse in the washing machine. Hang out to dry and iron when slightly damp. Method Two:- for bright vibrant colors:- (i) cut the fabric into pieces as before but this time soak in a bucket of washing soda solution. (ii) Continue as from step two above. The fact that the fabric already has the fixative means that as soon as the dyes hit the fabric they will start to bond with the fibers and you will get less color mixing. (iii) Leave the fabric in the dye solution as long as you can, for at least an hour. If you are impatient it is best to do this last thing at night and then leave overnight and rinse in the morning. Color Mixing Theory:- just mixing two colors will produce a fantastic range of colors. Blue and a pinky red make purple. Blue and yellow make green. Yellow and red make orange. If you are using three colors then be careful not to mess around too much or you will get muddy colors with no pure areas left – but this might be just what you wanted. If you use the same dye powders again you will create fabrics that tone with the ones you have made but they will not be identical. Subtle changes in temperature, water hardness and fabrics used will all affect the final result. Space Dyeing is used to produce yarns with multiple colors. Space Dyeing:- in this method, the yarn is dyed at intervals along its length. For these two procedures- knit-deknit method and OPI (OPI Products, Inc. headquartered in North Hollywood, State of California (CA), the United States) Space-Dye Applicator are adopted. In the first method, the yarn is knitted on either a circular or flat-bed knitting machine and the knitted cloth is then dyed and subsequently it is deknitted. Since the dye does not readily penetrate the areas of the yarn where it crosses itself, alternated dyed and undyed spaces appear. The OPI Space-Dye Applicator technique produces multi colored space- dyed yarns. The yarns are dyed intermittently as they run at very high speeds through spaced dyebaths. They are continuously subjected to shock waves produced by compressed air having supersonic velocities. Space Dyeing is the yarn-dyeing process in which each strand is dyed with more that one color at irregular intervals. Space dyeing produces an effect of unorganized design in subsequent fabric form. The two primary methods are knit-de-knit and warp printing. Space Dyeing is a method of dyeing yarn by dipping in dye or spotting in various places along the yarn. This causes different sections of the yarn to appear in different colors. The resulting fabric often has unusual, rainbow-like effects. / Оу.Пи.Ай. Продактс, Инк. (OPI Products, Inc.). жёсткость воды (water hardness). Крошэ, от Французского слова Crochet, означающее Крючок, .

SPACER FABRIC = ПРОСТРАНСТВЕННАЯ ТКАНЬ – Spacer Fabric:- two separate fabrics faces knitted independently and then connected by a separate spacer yarn. These fabrics can be produced on both circular and flat knitting machines. Spacer fabrics have the properties of good breathability, crush resistance, and a 3D appearance. / Эти ткани могут быть выработаны как на кругловязальных (circular knitting machines), так и на плосковязальных машинах (flat knitting machines).

SPACE SUIT = СКАФАНДР (или КОСМИЧЕСКИЙ КОСТЮМ) – Space Suit is a suit equipped with life supporting provisions to make life in space possible for its wearer. See also G Suit.

SPACING = РАЗМЕЩЕНИЕ (или ШАГ ПОСАДКИ, или МЕЖДУРЯДЬЕ) – Spacing is a distance of planting between hills and between rows. / Под Междурядьем понимается промежуток между рядами растений на поле, в саду и тому подобном. Почву в междурядье (шириной свыше 25 сантиметров) обрабатывают для её рыхления, уничтожения Сорняков, заделки удобрений и тому подобного.

SPAD = SOIL AND PLANT ANALYZER DEVELOPMENT

SPADIX = СПАДИКС (или ПОЧАТОК) – Spadix is a spicate inflorescence with congested, often tiny, flowers and a stout, often fleshy or succulent axis, often more or less surrounded by a spathe. Characteristic morphology of the family Araceae. / Початок – соцветие, имеющее колоски, с , часто мясистой или сочной осью (axis), часто более или менее . из семейства (family Araceae). Под Початком понимается соцветие с утолщённой главной осью, на которой расположены сидячие цветки, например, у Аронника. Початком часто называют соплодие Кукурузы. Початок (Spadix), колосовидное соцветие Растений с толстой, мясистой осью, на которой, часто очень тесно, расположены сидячие (без цветоножек) цветки, например, у Белокрыльника, Аронника, Аира. У основания початка часто имеется крупный, более или менее охватывающий его лист, нередко яркоокрашенный, служащий для защиты початка и привлечения Насекомых-опылителей. Иногда початок входит составной частью в сложные соцветия, например, у многих Пальм. В быту початком называют также соплодие Кукурузы. Початок:- особое колосовидное соцветие с утолщённой осью и мелкими сидячими цветками. Имеется у Ароидных и Пальм, у первых он окружён покрывалом и выглядит как простой прямостоячий орган, у вторых часто разветвлён.

SPAGE = S–PAGE = SEQUENTIAL POLYACRYLAMIDE GEL ELECTROPHORESIS

SPAGHETTI STRAPS = СТРОПЫ СПАГЭТТИ – Spaghetti Straps are the very narrow, tubular cloth straps.

SPAM = XX (или КОЛБАСНЫЙ ФАРШ) – Spam is any form of unsolicited communication sent in bulk. Most often spam is a commercial e-mail sent to a large number of addresses, but spam is also possible via instant messages, texts (SMS), social media and even voice mail. The practice of sending spam – called Spamming – is illegal in most jurisdictions. One of the most common means of spamming is to use botnets to send the spam.

SPAN® = THE STANDARD PORTFOLIO ANALYSIS OF RISK

SPAN = ПРОМЕЖУТОК (или ПРОЛЁТ) – Span is the distance between stringer or block supports. / расстояние между кронштейном рессоры и опорой блока.

SPAN = РАЗНОС ВАНТ (или ДЛИНА ВАНТ, или XX) – Span (maritime term):- a wire rope or line between davit heads. / Под Вантами, от Голландского слова Want, понимаются:- (1) снасти судового стоячего такелажа, раскрепляющие к бортам мачты и стеньги (смотрите Рангоут). (2) Гибкий растянутый элемент (растяжка), обычно в виде стального троса, для крепления висячих конструкций, радиомачт, антенн и другого.

SPANDEX FIBER = ВОЛОКНО СПЭНДЭКС (или ВОЛОКНО СПАНДЕКС) – Spandex Fiber is a manufactured fiber in which the fiber-forming substance is a long chain synthetic polymer composed of at least 85% of a segmented polyurethane. Characteristics:- Spandex is lighter in weight, more durable, and more supple than conventional elastic threads and has between two and three times their restraining power. Spandex is extruded in a multiplicity of fine filaments which immediately form a monofilament. It can be repeatedly stretched over 500% without breaking and still recover instantly to its original length. It does not suffer deterioration from oxidation as is the case with fine sizes of rubber thread, and it is not damaged by body oils, perspiration, lotions, or detergents. End Uses:- Spandex is used in foundation garments, bathing suits, hose, and webbings. The generic name used in the United States to

denote elastane fiber. A manufactured elastomeric fiber that can be repeatedly stretched over 500% without breaking, and will still recover to its original length. Also known as Polyurethane Fiber. Spandex Fiber and its Production Process:- spandex is a synthetic fiber that has an exceptional characteristic of elasticity due to which it is also known as Elastane. It is lightweight, soft, strong and very stretchable. In fact, spandex fiber was developed as an alternative to rubber but has a better quality than it. The name Lycra® has also come to be a synonymous of spandex. However, Lycra is the trademark brand but it has become so popular that all the varieties of spandex are popularly referred to as Lycra. Due to its durability and stretchability, spandex is mostly used to make sports wear and work wear, specially for factory workers. It wears like a second skin and for risk involved jobs like that of machine operators, Lycra clothing is like a boon. Characteristics of Spandex:- the most significant characteristic of spandex is its stretchability. It can be stretched to a great length and then also recovers its near to original shape. It can, in fact, be stretched to almost 500% of its length. It is lightweight, soft, smooth, supple and more durable and has higher retractive ability than rubber. As such, when spandex is used for making any clothing, it gives the best fit and comfort and also prevents bagging and sagging of the garment. It is also heat-settable which means that it facilitates transforming puckered fabrics into flat fabrics, or flat fabrics into permanent rounded shapes. Spandex fibers or fabrics can be easily dyed and they also resist damage by body oils, perspiration, lotions or detergents. These fabrics are also abrasion resistant. When spandex is sewn, the needle causes little or no damage from 'needle cutting' compared to the older types of elastic materials. The spandex fiber diameters range from 10 denier to 2 500 denier and can be found in both, clear and opaque lusters. Basic Principle for Making Spandex Fiber:- the US Federal Trade Commission (FTC) defines Spandex Fiber as a manufactured fiber in which the fiber forming substance is a long-chain synthetic polymer comprised of at least 85% of a segmented polyurethane. The polymer chain is a segmented block copolymer which contains long, randomly coiled, liquid, soft segments that move to a more linear, lower entropy, structure. The rigid segments act as 'virtual cross-links' that tie all the polymer chains together into an infinite network. The network thus formed, prevents the polymer chains from slipping past each other and taking on a permanent set or draw. When the stretching force is no longer applied, the linear, low entropy, soft segments move back to the original randomly coiled, higher entropy state, causing the fiber to recover its original shape and length. This segmented block copolymer is made in a multi-step proprietary process. It is extruded into a fiber as a monofilament threadline or for most products into a multiplicity of fine filaments that are coalesced shortly after they are formed into a single threadline. Materials Used for Spandex Fibers:- many raw materials are used to make the unique stretchable spandex fibers. They include prepolymers which produce the backbone of the fiber, stabilizers which protect the integrity of the polymer, and textile colorants to give attractive shades to the fibers and the spandex fabrics. Two kinds of prepolymers are reacted to produce the spandex fiber polymer back-bone- the flexible macroglycol and the rigid diisocyanate. Macro-glycol can be anything from among polyester, polyether, polycarbonate, polycaprolactone or some combination of these. These are long and flexible chain polymers having hydroxyl groups (–OH) on both ends, responsible for the stretching characteristic of spandex. The polymeric diisocyanate is a shorter and rigid chain polymer, having an isocyanate (–NCO) group on both ends. This molecule provides strength to the spandex fibers. Catalyst such as diazobicyclo octane is used to initiate reaction between the two types of prepolymers. Other low molecular weight amines are used to control the molecular weight of the fibers. Apart from the basic prepolymers, catalysts etc stabilizers, such as antioxidants, are added to protect the fibers from damaging sources like heat, light, atmospheric contaminants, and chlorine. Ultraviolet (UV) screeners such as hydroxybenzotriazoles are added to protect it against light degradation. Other stabilizers such as for preventing discoloration caused by atmospheric pollutants may also be used. As spandex is often used for making swim wear, antimildew additives are also added to it. Stabilizers added to the spandex fibers, are resistant to solvent exposure as this could have a damaging effect on the fiber. Dispersed and acid dyes are typically used for giving color to spandex fibers. However, special dyeing methods are adopted if the spandex fibers are interwoven with other fibers such as nylon fiber or polyester fiber. Manufacturing Process:- spandex fibers are manufactured in four different ways:- (i) melt extrusion, (ii) reaction spinning, (iii) solution dry spinning, and (iv) solution wet spinning. The initial step in all these methods is that of reacting monomers to produce a prepolymer. Prepolymer is then reacted further, in a variety of ways, and drawn out to produce a long fiber. The most commonly used method is the solution dry spinning that produces over 90% of the world's spandex fibers. First of all prepolymer is produced by mixing a macroglycol with a diisocyanate monomer. They are mixed in a reaction vessel and need the perfect conditions so that they may react to form a prepolymer. Ratio of the component materials is responsible for giving different characteristics to the fibers. As such the ratio is strictly controlled. The ideal ratio of glycol to diisocyanate may be 1:2. In the chain extension reaction, the prepolymer is reacted with an equal amount of diamine. It results in a solution which is diluted with a solvent to produce the spinning solution. The solvent makes the solution thinner which can be easily handled. It can then be pumped into the fiber production cell. In the fiber production cell, the polymer solution is pumped through a metal plate, called a Spinneret, which has small holes throughout its structure. The solution gets aligned in strands of liquid polymer. The strands passing through the cell, are heated in the presence of a nitrogen and solvent gas. The liquid polymer gets chemically reacted and forms into solid strands. A specific amount of the solid strands are bundled together to produce the desired thickness with the help of a compressed air device that twists the fibers together. As such, it can be said that each fiber of spandex is made up of many smaller individual fibers that join one another due to the natural stickiness of their surface. The fibers are finally treated with textile finishing chemicals that can be magnesium stearate or other polymer such as poly(dimethyl-siloxane). These finishes prevent the fibers from sticking together and help in the process of textile manufacturing. Fibers are then transferred through a series of rollers onto a spool. The windup speed of the entire process depends on the thickness of the fibers that can be anywhere from 300–500 mi (482.7–804.5 km) per minute. The spools with fiber, are put into final packaging and shipped to textile manufacturers or any other customers. The fibers here, may be blended with other fibers such as nylon or cotton fiber to produce the fabric that is used for clothing purposes. These fabrics can also be dyed in order to give a desired color to them. Applications of Spandex Fiber:- Spandex Fiber is mainly used to make such garments that require great comfort and fit. As such, they find applications in manufacturing of hosiery, swimsuits, aerobic or exercise wear, ski pants, golf jackets, disposable diaper, waist bands, bra straps and bra side panels etc. They are even great for making shaped garments like bra cups. Spandex fabrics are also used to make compression garments, such as surgical hose, support hose, bicycle pants, foundation garments etc. Spandex is a synthetic fiber known for its exceptional elasticity, strength, durability and resistance to water and oils. It is stronger and more durable than rubber, its major nonsynthetic competitor. Spandex is the generic name of man-made fibers derived from a chemical substance called Segmented Polyurethane (Resin). This man-made elastic fiber has a good deal of stretch and recovery for its weight. Spandex is used extensively in foundation garments and is much more comfortable than rubber because it is lighter in weight. Spandex is also found in some fabrics where stretch is considered desirable, such as in ski clothes. See also Polyurethane. Spandex is a manufactured elastomeric fiber that can be repeatedly stretched over 500% without breaking, and will still recover to its original length. This fiber is widely used in the manufacturing of garments to create elasticity. Spandex is a lightweight, synthetic fabric known for its strength, durability and resistance to water and oils. Spandex is also abrasion resistant. Spandex or Elastane is a synthetic fiber known for its exceptional elasticity. It is strong, but less durable than its major non-synthetic competitor, natural latex. It is a polyurethane-polyurea copolymer that was invented in 1959 by chemists C.L. Sandquist and Joseph Shivers at DuPont's Benger Laboratory in Waynesboro, Virginia. When first introduced, it revolutionized many areas of the clothing industry. The name 'Spandex' is an anagram of the word 'Expands'. It is the preferred name in North America; in continental Europe it is referred to by variants of 'Elastane', i.e. elasthanne (France), elastan (Germany), elastano (Spain and Portugal), elastam (Italy) and Elasthaan (Holland), and is known in the

UK, Ireland, Argentina, Australia and New Zealand primarily as Lycra®. Brand names for spandex include Lycra (made by Koch subsidiary Invista, previously a part of DuPont), Elaspan (also Invista), Acepora (Taekwang), Creora (Hyosung), ROICA and Dorlastan (Asahi Kasei), Linel (Fillattice), and ESPA (Toyobo). Spandex Fibers Production:- Spandex fibers are produced in four different ways:- melt extrusion, reaction spinning, solution dry spinning, and solution wet spinning. All of these methods include the initial step of reacting monomers to produce a prepolymer. Once the prepolymer is formed, it is reacted further in various ways and drawn out to make the fibers. The solution dry spinning method is used to produce over 94.5% of the world's spandex fibers. Solution Dry Dpinning:- Step 1:- the first step is to produce the prepolymer. This is done by mixing a macroglycol with a diisocyanate monomer. The two compounds are mixed in a reaction vessel to produce a prepolymer. A typical ratio of glycol to diisocyanate is 1:2. Step 2:- the prepolymer is further reacted with an equal amount of diamine. This reaction is known as Chain Extension Reaction. The resulting solution is diluted with a solvent (DMAc) to produce the spinning solution. The solvent helps make the solution thinner and more easily handled, and then it can be pumped into the fiber production cell. Step 3:- the spinning solution is pumped into a cylindrical spinning cell where it is cured and converted into fibers. In this cell, the polymer solution is forced through a metal plate called a Spinneret. This causes the solution to be aligned in strands of liquid polymer. As the strands pass through the cell, they are heated in the presence of a nitrogen and solvent gas. This process causes the liquid polymer to react chemically and form solid strands. Step 4:- as the fibers exit the cell, an amount of solid strands are bundled together to produce the desired thickness. Each fiber of spandex is made up of many smaller individual fibers that adhere to one another due to the natural stickiness of their surface. Step 5:- the resulting fibers are then treated with a finishing agent which can be magnesium stearate or another polymer. This treatment prevents the fibers' sticking together and aids in textile manufacture. The fibers are then transferred through a series of rollers onto a spool. Major Spandex Fiber Uses:- (1) apparel and clothing articles where stretch is desired, generally for comfort and fit, such as:- (i) activewear; (ii) athletic, aerobic, and exercise apparel; (iii) belts; (iv) bra straps and side panels; (v) competitive swimwear; (vi) cycling Jerseys and shorts; (vii) dance belts worn by male ballet dancers and others; (viii) gloves; (ix) hosiery; (x) leggings; (xi) netball bodysuits; (xii) orthopaedic braces; (xiii) rowing unisuits; (xiv) cross country race suits; (xv) ski pants; (xvi) skinny jeans; (xvii) slacks; (xviii) miniskirts; (xix) socks and tights; (xx) swimsuits/bathing suits; (xxi) underwear; (xxii) wetsuits; and (xxiii) zentai. (2) Compression garments such as:- (i) foundation garments; and (ii) motion capture suits. (3) Shaped garments such as:- (i) bra cups; (ii) support hose; (iii) surgical hose; (iv) superhero outfits; (v) women's volleyball shorts; and (vi) wrestling singlets. (4) Home furnishings, such as microbead pillows. For clothing, spandex is usually mixed with cotton or polyester, and accounts for a small percentage of the final fabric, which therefore retains most of the look and feel of the other fibers. In North America it is rare in men's clothing, but prevalent in women's. An estimated 80% of clothing sold in the United States contained spandex in 2010. Spandex:- clothing made of spandex, namely any of various elastic textile fibers made chiefly of polyurethane. Any of various elastic textile fibers made chiefly of polyurethane. Spandex is an synthetic elastic fiber of polyurethane. Lycra® (Invista, formerly Dupont) is a well-known brand of spandex. Spandex is found in fabrics either as bare fine filaments or covered with another fiber. Spandex can be dyed with disperse dyes and some acid dyes. Usually where bare filaments are used, they are quite inconspicuous even if they are not dyed to match the fabric. Spandex will withstand most preparation and dyeing processes without damage, but is damaged by chlorine bleach. / Найлан™ (Nylon™). Спэндэкс (Spandex) (Elastane). (C.L. Sandquist) и Дьжосэф Шивёз (Joseph Shivers) из Лаборатории ДюПо Бэнгё (DuPont's Benger Laboratory) в Waynesboro, Virginia. Экспэндз (Expands). Иластэйн (Elastane), то есть Илястан (Elasthanne; во Франции), Илястан (Elastan; в Германии), Эластано или Элащтано (Elastano; соответственно в Испании и Португалии), Элястан (Elastan; в Италии) и Илёстан (Elasthaan; в Голландии), и как Лайкра (Lycra®). (сделанное Кох (Koch) – дочерним предприятием Инвиста (Invista), а ранее часть ДюПо (DuPont)), Иласпэн или Иласпан Elaspan (также Инвиста (Invista)), Xxxxx Acepora (Taekwang), Xxxxx Creora (Hyosung), ROICA и (Асахи Касэй; Дорлэстэн Dorlastan (Асахи Касэй (Asahi Kasei)), Линэл или Лайнэл Linel (Филатис (Fillattice)), и И.Эс.Пи.Эй. (Тойобо) (ESPA (Toyobo)). Лайкра® Lycra® (Инвиста (Invista)), в бывшем ДюПо (Dupont). мононить (monofilament). Известно также как Полиуретановое Волокно (Polyurethane Fiber). хлорный отбеливатель (chlorine bleach). Спэндэкс – то же, что и Полиуретановые Волокна.

SPAN LENGTH = ДЛИНА УХВАТЫВАНИЯ (или МЕРНАЯ ДЛИНА) – (1) Span Length is the length at which a certain percentage of fibers from a given group would span when caught at random along their length. Span length is this 'extension distance' of fibers. The 2.5% Span Length corresponds to the classer's length. The 50% Span Length is that length which corresponds to half of the fibers caught at random along their length. The 66.7% Span Length is that length which corresponds to 2/3 of the fibers caught at random along their length. / Длина Ухватывания:- длина, при которой определённый процент волокон из данной группы мог бы быть измерен, когда случайно ухватываются вследствие своей длины. Длиной такого ухватывания является промежуток этой протяжённости волокон. Длина 2.5% ухватывания относится к длине классёра. Длина 50% ухватывания является той длиной, которая относится к половине волокон, случайно ухваченных вследствие своей длины. Длина 66.7% ухватывания является той длиной, которая относится к 2/3 волокон, случайно ухваченных вследствие своей длины.

(2) Span Length:- the minimum length attained by a specific percentage of the fibers in a test beard, corresponding to a determined percentage of the optical density of the beard. The first section of the length investigated, which is normally situated at a distance of 3.8 mm from the line of gripping of the comb, is taken as the reference base of 100% optical density.

SPANNER = ГАЕЧНЫЙ КЛЮЧ – Spanner (maritime term):- a tool for coupling hoses.

SPANS = SPATIAL ANALYSIS SYSTEMS

SPARE (IDLE) CAPACITY = ЗАПАСНАЯ (БЕЗДЕЙСТВУЮЩАЯ или РЕЗЕРВНАЯ) ЁМКОСТЬ – Spare (Idle) Capacity is the component of operating capacity that is not in operation and not under active repair, but capable of being placed in operation within 30 days; plus capacity not in operation but under active repair that can be completed within 90 days.

SPARE PART = ЗАПАСНАЯ ЧАСТЬ (или ЗАПЧАСТЬ) – Spare Part means an accessory, appurtenance, or part of an aircraft (except an aircraft engine or propeller), aircraft engine (except a propeller), propeller, or appliance, that is to be installed at a later time in an aircraft, aircraft engine, propeller, or appliance.

SPARK AND METAL DETECTOR = ИСКРО– И МЕТАЛЛОДЕТЕКТОР – Spark And Metal Detector:- modern fiber production without Metal Detectors is inconceivable today. They protect material and machines in the refinement chain from the cotton fiber to the nonwovens material. The only metal detector that can be directly integrated into the pneumatic conveying line without a probe tube examines the fibers in nonwovens plants for metallic particles. The short distance of less than 2 m between the sensor and the extremely fast mechanism increases ejection reliability. The difference in the airspeeds of heavy and light parts in the pneumatic conveying line has virtually no effect. This reduces ejection losses to a minimum. Needles, fragments of blades from the bale cutters and screws are among the metal contaminants that can be dangerous to production. Raw Cotton, which is fed to the blow room line, exhibits numerous impurities, which must be eliminated at an early stage in order to avoid negatively influencing the spinning process and creating quality loss in the yarn. Spark And Metal Detector:- most of the material in cotton spinning mill are combustible substances such as cotton, chemical fiber, etc. Furthermore, through the whole procedure of the blowing and carding line, the pipes

are sealed and large quantity of blower fans and dust filtering equipments are utilized. Because of the above situation, in case of fire alarm, large loss will happen. Not only will the material be lost, expensive machines will also be burned and damaged. The more important thing is that the production will be affected. In case that the blowing and carding line stops production because of fire alarm, it will affect the production operation of the whole spinning mill. The iron scraps directly mix into uniaxial, biaxial and other opening machine. So the beaters violently rub and strike with each other and that is the cause of fire alarm. The iron scraps mix into the blower with the fiber flow, the high speed flying blade of the blower fan strikes the iron scraps or iron scraps rub with turbo housing of the fan and then spark happens and finally fire alarm happens. The installing of spark and metal detector between the reciprocal bale plucker and other blower in the blowing and carding line pipes, the fire alarm that happens when beater of the bale plucker strikes and rubs can be prevented effectively. In the diverter of this product, the loss of the fiber wind pressure is very small. So it applies to various situations such as positive, negative and positive and negative pressure. It is the first barrier in the safety production in blowing and carding production line. Spark and metal detector is a new type of fireproofing equipment and is mainly used in the fireproofing of opening and picking process, dust filtering system in cotton spinning mill. Currently it is extensively applied in the blowing carding joint system. This machine is directly installed on the conduct tube of the opening and picking equipment. When the machine detects that there is fiber mixed in the pipe, it can give off acousto-optic alert and stop the relevant equipments and start the fire eliminating valve. Then discharge the fiber flow with fire into the fire extinguishing box. This type of spark diverter has high sensitivity and good reliability and can eliminate the fire before it develops and can serve the function of nipping in bud (in-combusting). When the beater of a bale plucker strikes metal material or the spindle end of the beater is tangled with fiber, spark may be caused, the spark can mix in the fiber and move in the conducting duct under the action of the wind. When the cotton fiber mixed with sparkle moves through the high sensitive infrared probe detecting area, the controlling program will immediately make the fire alarm with sound and light. Furthermore, while stopping the running of related equipments such as blower fan etc, the cotton flow with sparkle and combusting scraps are discharged into collect box to assure that the sparkle will not enter the next procedure and eliminate the hidden trouble of fire. / В прядильном производстве.

SPARK DETECTOR = ИСКРОДЕТЕКТОР (или ИСКРОГАСИТЕЛЬ) – Spark Detector:- Spark Detection and Extinguishment systems eliminate personnel injuries, equipment damage and loss of production from fires and explosions. The spark itself is not dangerous. Here's why:- For the creation of fires or explosions there must be three elements that are combined simultaneously:- a combustible material, oxygen and an ignition source. Removal of one of the elements will prevent a fire or explosion. Extraction systems and pneumatic conveyors increase the danger of fire. Once sparks and glowing embers are created, the pneumatic extraction system conveys this danger very quickly to other subsequent areas of the plant. The danger is when two of the three elements necessary for the creation of fires and explosions are transported, namely:- air and ignition sources (sparks). To protect such a system, all extraction ducts as well as the conveying duct to the material storage should be equipped with spark detection and extinguishment systems. The most important component of a spark detection and extinguishment system is the spark detector. To suit the different and often very severe applications, three different types of sensors are used. All three sensor types have highly sensitive electronics which detect even the smallest of glowing particles. In spinning process. / В прядильном производстве.

SPARKS = СВЕЧИ (или ИСКРЫ) – Sparks (maritime term):- the radio operator. / радист.

SPARK SPREAD = КУРСОВАЯ РАЗНИЦА В ОТНОШЕНИИ ВЫРАБОТКИ ЭЛЕКТРОЭНЕРГИИ (или СПРЭД НА ВЫРАБОТКУ ЭЛЕКТРОЭНЕРГИИ) – The Spark Spread is defined as the difference, at a particular location and at a particular point in time, between the fuel cost of generating a MWh of electricity and the price of electricity. The Spark Spread reflects the costs or anticipated costs of producing power from a specific facility. In other words, spark spread is the differential between the price of electricity and the price of natural gas or other fuel used to generate electricity, expressed in equivalent units. It can be used as a method of converting millions of British thermal units (Btus) to MegaWatt hours (MWh) and vice versa, and thus relates well to the electricity and natural gas futures contracts. The spread is simply the heat rate (a proxy for efficiency) of a specific generating unit or power system (the number of Btus needed to make one kiloWatt hour of electricity), multiplied by the cost of energy expressed as Dollars per British thermal units. For example, if it takes 10 000 Btus to make one kiloWatt hour of electricity, the formula can be simplified by multiplying the price per million Btus (MMBtu) by 10 to equate one MMBtu of natural gas to one MegaWatt hour of electricity. The usefulness of the spread evaluation is dependent on the market price for power which reflects the relationship of the supply and demand for power, not the efficiencies of the generating units. Other costs affecting the price of power using the spark spread evaluation include those of gas transportation, power transmission, plant operations and maintenance, and fixed costs. Because the electricity futures contract is specified in lots of 736 MegaWatt hours, and the natural gas futures contracts are specified in units of 10 000 million Btus, one power contract equates to 0.736 natural gas contracts. See also Gross Processing Margin. / Курсовая разница в отношении выработки электроэнергии или разница в ценах на выработку электроэнергии отражает расходы или предполагаемые расходы на производство электроэнергии какой-то конкретной установкой. Другими словами, разница в ценах на выработку электроэнергии – это разница между ценой электричества и ценой природного газа или любого другого топлива, используемого для генерации электричества, и выраженная в эквивалентных единицах измерения. Она может быть использована в качестве метода пересчёта миллионов Британской единицы теплоты (Б.е.т.) в МегаВатт-часы (МВтч) и наоборот, и поэтому служит хорошей взаимосвязью между фьючерсными контрактами на электричество и природный газ. Данная разница – это просто тепловой коэффициент (введённый для эффективности) какого-то конкретного генерирующего устройства или энергосистемы (количество Бет, требуемых для выработки одного килоВатт-часа электроэнергии), умноженный на стоимость энергоносителя, выраженную в Долларах за Британскую единицу теплоты. Например, если требуется 10 000 Бет для выработки одного килоВатт-часа электроэнергии, формула может быть упрощена до умножения цены за миллион Бет (МБет, в Англоязычном исполнении – MMBtu) на 10, чтобы приравнять один миллион Бет природного газа к одному МегаВатт-часу электроэнергии. Полезность расчёта этой разницы зависит от рыночной цены на электроэнергию, которая отражает взаимосвязь между спросом и предложением на электроэнергию, но не эффективность генерирующих устройств. Другие расходы, влияющие на цену электроэнергии при применении разницы в ценах на выработку электроэнергии, включают стоимость доставки газа, передачи электроэнергии, поддержание работоспособности газогенерирующей станции, и фиксированные затраты. Поскольку фьючерсные контракты на электричество имеют объём поставки 736 МегаВатт-часов каждый, а фьючерсные контракты на природный газ – 10 000 миллионов Бет, то один контракт на электричество приравнивается к 0.736 контракта на природный газ. Смотрите также Валовая Прибыль от Переработки (Gross Processing Margin).

SPAR PLATFORM = СПАРЕННАЯ ПЛАТФОРМА (или УСИЛЕННАЯ ПЛАТФОРМА) – Spar Platforms (Spars) consist of a large single vertical cylinder supporting a deck. These platforms have typical fixed platform topside, with a surface deck and drilling and production equipment. Spar platforms are moored using a system of lines anchored into the seafloor. Spars are used in water depths up to 5 500 feet, although existing technology can extend its use to water depths as great as 7 500 feet. Also known as Mini-Tension Leg Platform (Mini-TLP). See also Fixed Platform, Offshore Production Platform, and Tension Leg Platform. / В Соединённых Штатах

Америки. Известна также как Платформа с Укороченными Опорами (ПУО; Mini-Tension Leg Platform (Mini-TLP)). Смотрите также Стационарная Платформа (Fixed Platform), Морская Эксплуатационная Платформа (Offshore Production Platform), и Платформа С Растянутыми Опорами (Tension Leg Platform).

SPARRED = УКРЕПЛЁННЫЙ (или УСИЛЕННЫЙ) – A term Sparred describes a system of packing hollow-ware cargo whereby wooden supports hold the goods rigid during handling.

SPAT = СПЭТ (или КОРОТКИЕ ГЕТРЫ) – Spat is a cloth or leather gaiter covering the instep and ankle (short for spatterdash).

SPATHE = ОБЁРТКА (или ПОКРЫВАЛО) – Spathe is a large, often showy, solitary bract or pair of bracts ensheathing a spadix or other inflorescence on the same axis. Spathe is a large bract partially or wholly enclosing a group of flowers. / , в форме оболочки окружающие початок (spadix) или другое соцветие на такой же оси (axis). Покрывало:- термин обычно обозначает заметную брактею (прицветный лист), защищающую початок. У Ароидных (членов Семейства Агасеае, таких, как Филодендроны и Монстеры) оно листовидное, более или менее мясистое и часто ярко окрашенное. Иногда термин применяют к Пальмам (у них покрывало мясистое или деревянистое) и другим Растениям, например, плёнчатый чехол, окружающий бутон Нарцисса, является покрывалом.

SPATHULATE = ЛОПАТЧАТОЕ – Spathulate:- spoon-shaped. / Spat(h)ula – Пальмовая Ветвь.

SPATULATE LEAF = ЛОПАТЧАТЫЙ ЛИСТ – Spatulate Leaf:- oblong with the basal end narrowed and the apical end rounded, spoon-shaped, e.g., Myrica pensylvanica. Spatulate:- long and thin, broadening towards the tip, like a spatula. / О форме листа – Лапатчатое. как лопаточка.

SPC = STATISTICAL PROGRAMME COMMITTEE

SPDA = SINGLE–PREMIUM DEFERRED ANNUITY

SPDR = THE STANDARD AND POOR'S DEPOSITARY RECEIPT

SPEAK = СНОСИТЬСЯ (или ПЕРЕГОВАРИВАТЬСЯ) – Speak (maritime term):- to communicate with a vessel in sight.

SPEARPHISHING = ЛОВЛЯ РЫБЫ ОСТРОГОЙ (или ВЫУЖИВАНИЕ ПАРОЛЯ ОСТРОГОЙ) – Spearphishing is a modified form of a phishing attack, where the target – an individual or small group of people – are sent messages that appear to be from a trusted source, or on a subject of particular interest to the target, often determined via social engineering or collecting information from public sources about the target. These messages may contain links to fake web site to steal credentials for the actual, trusted web sites, or to convince the target to open attached documents, which then act as droppers for remote access Trojans, keyloggers, or other forms of malware used to further penetrate the target's computer(s) and network.

SPEC = SPECULATOR

SPECIAL 301 REPORT = СПЕЦИАЛЬНЫЙ 301 ОТЧЁТ – The Special 301 Report is prepared annually by the USTR under Section 182 as amended of the Trade Act of 1974. The Act states that the USTR must on an annual basis, by April of each year:- 'identify those foreign countries that deny adequate and effective protection of intellectual property rights, or deny fair and equitable markets access to United States persons that rely upon intellectual property protection, and those foreign countries identified under' this 'paragraph that are determined by the Trade Representative to be priority foreign countries'. The Act defines 'priority foreign countries' as 'those foreign countries that have the most onerous or egregious acts, policies, or practices that deny adequate and effective intellectual property rights, or deny fair and equitable market access to United States persons that rely upon intellectual property protection, whose acts, policies, or practices described in' this 'paragraph have the greatest adverse impact (actual or potential) on the relevant United States products, and that are not entering into good faith negotiations, or making significant progress in bilateral or multilateral negotiations to provide adequate and effective protection of intellectual property rights. The Uruguay Round Agreement Act furthermore states that countries may be identified under Special 301 'taking into account the history of intellectual property laws and practices of the foreign country, including any previous identifications' and 'the history of efforts of the United States, and the response of the foreign country, to achieve adequate and effective protection and enforcement of intellectual property rights'. It also states that compliance with the Agreement on Trade-Related Aspects of Intellectual Property Rights does not include a country from being identified as denying 'adequate and effective protection of intellectual property rights'.

SPECIAL ACCEPTANCE = ОСОБЫЙ АКЦЕПТ (или ОСОБОЕ ПРИНЯТИЕ) – In reinsurance, Special Acceptance is the facultative extension of a reinsurance treaty to embrace a risk not automatically included within its terms.

SPECIAL AND DIFFERENTIAL TREATMENT = ОСОБЫЙ И ДИФФЕРЕНЦИРОВАННЫЙ РЕЖИМ – Special And Differential Treatment:- the principle, enunciated in the Tokyo Declaration, that the Tokyo Round negotiations should seek to accord particular benefits to the exports of developing countries, consistent with their trade, financial and development needs. Among proposals for special or differential treatment are reduction or elimination of tariffs applied to exports of developing countries under the Generalized System of Preferences (GSP), expansion of product and country coverage of the GSP, accelerated implementation of tariff cuts agreed to in the Tokyo Round for developing country exports, substantial reduction or elimination of tariff escalation, special provisions for developing country exports in any new codes of conduct covering nontariff measures, assurance that any new multilateral safeguard system will contain special provisions for developing country exports, and the principle that developed countries will expect less than full reciprocity for trade concessions they grant developing countries.

SPECIAL BIN GRADE = ОСОБЫЙ БУНКЕРНЫЙ СОРТ – In a primary elevator, Special Bin Grain is held in a separate bin at the request of the owner. It is sometimes referred to as Identity-Preserved. In a terminal elevator, special bin grain is held by authority of the Canadian Grain Commission (CGC) in bins registered by bin numbers in the owner's name.

SPECIAL CARGO POLICY = СПЕЦИАЛЬНЫЙ ПОЛИС ПО ГРУЗУ – Special Cargo Policy is a stand-alone cargo policy covering a specific shipment for one voyage or trip. It is the complete policy and not subject to the terms and conditions of an open cargo policy, even if issued in conjunction with an open cargo policy. It is used when evidence of insurance is required, especially by a bank issuing a letter of credit. Insures a single specific cargo movement. Also known as Voyage Policy. / порядки и условия . Страхует от рисков одну конкретную перевозку груза. Известен также как Рейсовый Полис (Voyage Policy).

SPECIAL CLEANING = ОСОБАЯ ОЧИСТКА – Special Cleaning refers to any cleaning of grain in addition to the usual dockage assessment procedures. Special cleaning is used to improve the grade of the grain.

SPECIAL (COLLATERAL) = ОСОБОЕ (ОБЕСПЕЧЕНИЕ) – Special (Collateral):- securities that are highly sought after in the market by borrowers.

SPECIAL COMMODITIES CARRIER = ПЕРЕВОЗЧИК ОСОБЫХ РОДОВ СЫРЬЯ – Special Commodities Carrier is a common carrier trucking company that has authority to haul a special commodity; the sixteen special commodities include household goods, petroleum products, and hazardous materials.

SPECIAL COMMODITY WAREHOUSE = СКЛАД ДЛЯ ОСОБЫХ РОДОВ СЫРЬЯ – Special Commodity Warehouse is a warehouse that is used to store products requiring unique facilities, such as grain (elevator), liquid (tank), and tobacco (barn).

SPECIAL CROPS = ОСОБЫЕ СЕЛЬСКОХОЗЯЙСТВЕННЫЕ КУЛЬТУРЫ – In Canada, Special Crops are considered to be Beans, Buckwheat, chick Peas, Corn, Fababeans, Lentils, Mustard, Peas, Safflower, Soybeans, Sunflower, and Triticale. / В Канаде, среди особых сельскохозяйственных культур рассматриваются Бобы, Гречиха, Нут обыкновенный, Кукуруза, Бобовидные, Чечевица, Горчица, Горох, Сафлор, Соевые Бобы, Подсолнечник и Тритикале (пшенично-ржаные амфидиплоиды или ржано-пшеничные гибриды, формы Пшеницы, полученные при скрещивании её с Рожью).

SPECIAL CUSTOMS INVOICE = СПЕЦИАЛЬНЫЙ ТАМОЖЕННЫЙ СЧЁТ–ФАКТУРА (или ОСОБЫЙ ТАМОЖЕННЫЙ СЧЁТ–ФАКТУРА) – Special Customs Invoice is an official form usually required by US Customs if the rate of duty is based upon the value and the value of the shipment exceeds 500.00 Dollars. This document is usually prepared by the foreign exporter or his forwarder and is used by Customs in determining the value of the shipment. The exporter or his agent must attest to the authenticity of the data furnished. / Специальный Таможенный Счёт-Фактура является официальной формой, запрашиваемой обычно Таможней США в тех случаях, когда ставка пошлины базируется на стоимости, а стоимость грузовой партии превышает 500.00 Долларов. Этот документ обычно готовится иностранным экспортёром или его экспедитором и используется Таможней при определении стоимости грузовой партии. Экспортёр или его агент должен засвидетельствовать достоверность предоставленных данных.

SPECIAL DRAWING RIGHTS = СПЕЦИАЛЬНЫЕ ПРАВА ЗАИМСТВОВАНИЯ – Special Drawing Rights (SDRs) is the unit of payment and account of the International Monetary Fund through which its members can, if necessary, obtain loans to meet their international payment obligations. Type of international reserve asset created by the International Monetary Fund and allocated, on occasion, to the nations that are members of the IMF. Special Drawing Rights (SDR) is a type of international money created by the International Monetary Fund (IMF) and allocated to its member nations. SDRs are an international reserve asset, although they are only accounting entries (not actual coin or paper, and not backed by precious metal). Subject to certain conditions of the IMF, a nation that has a balance of payments deficit can use SDRs to settle debts to another nation or to the IMF. Special Drawing Rights (SDRs) are international reserve assets, created by the International Monetary Fund (IMF) and allocated to individual member nations. Within conditions set by the IMF, SDRs can be used by a nation with a deficit in its balance of international payments to settle debts with another nation or with the IMF. These are reserve assets created and distributed by decision of the members of the IMF. Participants accept an obligation, when designated by the IMF to do so, to provide convertible currency to another participant in exchange for SDRs equivalent to three times their own allocation. Only countries with a sufficiently strong balance of payments are so designated. SDRs may also be used in certain direct payments between participants in the scheme and for payments of various kinds to the IMF. Unit of account from the International Monetary Fund (IMF), i.e. used to express the amount of the limitations of a carrier's liability. Payment medium and reserve assets used internationally for transactions between central banks and issued by the International Monetary Fund (IMF) to its member nations. An SDR does not have the character of an actual currency unit but is primarily a neutral unit of account. At first SDRs were valued in relation to the value of gold, but have since been valued in relation to the member country's own currency. The value of the SDR was fixed daily on the basis of a basket of exchange rates on the London spot currency market. The currency basket was made up as follows:- USD (40% weighting), DEM (21%), JPY (17%), FRF (11%) and GBP (11%). A term, introduced in 1984, to facilitate exchange rating regarding limitation of liability under international law. The SDR replaced the 'gold franc' in such calculations, from November 1984. The value of the SDR varies daily, and is obtainable from the customary financial sources of information. Currency reserve instrument created by the International Monetary Fund (IMF) and made available to its member nations. Special Drawing Rights (SDRs) are a kind of international currency created in 1969 to replace gold as the principal means for clearing international transactions. Nations can pay off their balance of payments deficits with SDRs instead of gold or other currencies. SDRs were created to alleviate shortages of gold and reserve currencies in relation to world trade. Initially, the value of the SDR was based on the gold exchange value of the US Dollar (35 SDRs = 1 ounce of gold). In July 1974, the IMF tied the value of the SDR to a basket of 16 currencies of major trading member nations. Today, the value of the SDR fluctuates daily, along with other foreign exchange rates. See also International Monetary Fund. / Под Специальными Правами Заимствования (СПЗ (SDRs)) понимаются международные резервные кредитно-расчётные средства стран – членов Международного Валютного Фонда (МВФ), предназначенные для покрытия дефицитов их платёжных балансов. Созданы в 1970. Специальные Права Заимствования (СПЗ) (Special Drawing Rights (SDRs)):- сумма резервных платёжных средств страны в международной валютной системе; неофициальное название – 'бумажное золото'. Специальные Права Заимствования, впервые выпущенные Международным Валютным Фондом (МВФ) (International Monetary Fund (IMF)) в 1970, были разработаны для того, чтобы дополнить существующие резервы золота и конвертируемых (или твердых) валют, используемых для поддержания стабильности на международном валютном рынке. Например, если Министерство Финансов США видит, что цена Британского Фунта резко упала по отношению к Доллару США, оно может использовать свой запас Специальных Прав Заимствования для того, чтобы выкупить избыточные Фунты Стерлингов на международном валютном рынке, таким образом поднимая котировки оставшейся массы Фунтов Стерлингов. Нейтральная единица измерения стала необходимой в результате быстрого роста объёмов международной торговли в течение 1960-х. Международные кредитно-финансовые органы опасались, что два основных резервных средства платежа – золото и Доллары США – не смогут удовлетворить спрос на международную валюту, что вызовет непропорциональный рост курса Доллара США по отношению к другим резервным валютам. В тот момент, когда были введены Специальные Права Заимствования, цена золота была зафиксирована на уровне примерно 35 Долларов за унцию. МВФ выделяет каждой из более чем 140 стран – членов МВФ определённый объём СПЗ, пропорциональный её предполагаемой квоте в фонде. Расчёт этой квоты, в свою очередь, основан на валовом национальном продукте (ВНП) (gross national product (GNP)). Каждый член МВФ обязуется поддержать свои СПЗ всеми доходами и возможностями заимствования своего правительства и принимает их в обмен на золото или конвертируемые валюты. Первоначально стоимость одного СПЗ была зафиксирована на уровне 1 Доллара США или долларового эквивалента в иной конвертируемой валюте на 01 Января 1970. После того как правительства перешли к существующей в настоящее время системе плавающих обменных курсов (floating exchange rates), стоимость Специальных Прав Заимствования колеблется по отношению в 'корзине' основных валют. Все больше СПЗ используются для окончательной оплаты по международным расчётам. Этот процесс совпал с падением значения золота в качестве резервного средства платежа. Будучи внутренне равновесными по отношению к любой из валют, Специальные Права Заимствования используются для деноминации или в качестве расчётной единицы стоимости частных контрактов, международных соглашений и ценных бумаг на рынке Еврооблигаций (Eurobonds).

SPECIAL FUND = СПЕЦИАЛЬНЫЙ ФОНД – Investment fund exempt from certain legal requirements. Participation is restricted exclusively to investors proven to be peer professional players, e.g., insurance companies, pension funds. Special Funds:- type of

investment which, in contrast to retail funds, is not issued to the general public but offered to a limited group of investors. Special funds are tailored to the needs of certain institutional investors (not natural persons), for instance insurance companies, pension funds and social security organizations. / Инвестиционный Фонд, освобождённый от определённых юридических требований. Участие в таких фондах ограничено исключительно инвесторами, утверждёнными в разряд профессиональных игроков, например, страховыми компаниями, пенсионными фондами. Специальные Фонды в бюджетных и хозрасчётных организациях, целевые фонды денежных средств предприятий и организации, создаваемые за счёт их доходов и накоплений. Специальные фонды предназначаются для обеспечения и стимулирования развития производства, повышения его эффективности, а также для стимулирования определённых видов деятельности. Специальные фонды различаются по своему назначению и источникам формирования. В хозрасчётных предприятиях и организациях промышленности к специальным фондам относятся:- фонд материального поощрения, фонд социально-культурных мероприятий и жилищного строительства, фонд развития производства (смотрите Фонды Экономического Стимулирования). Кроме того, при определённых условиях на ряде предприятий образовывались:- фонд ширпотреба; фонд премирования по итогам социалистического соревнования; фонд освоения новой техники; фонд премирования за создание и внедрение новой техники и технологии, комплексной механизации и автоматизации; фонд премирования за поставку продукции на экспорт; фонд развития местной промышленности; фонд, образуемый за счёт прибыли от реализации новых видов товаров бытовой химии; фонд, образуемый за счёт прибыли от реализации новых видов товаров культурно-бытового назначения и хозяйственного обихода; фонд премирования за сбор, хранение, сдачу и отгрузку лома и отходов чёрных и цветных металлов; фонд премирования за экономию топлива, электрической и тепловой энергии и некоторые другие. В совхозах создавались:- фонд материального поощрения, фонд социально-культурных мероприятий и жилищного строительства, страховой фонд, фонд укрепления и расширения хозяйства, фонд премирования руководящих работников и специалистов. В колхозах специальные фонды включали:- резервный фонд, фонд материального поощрения колхозников и специалистов, фонд социального обеспечения и материальной помощи колхозникам; культурно-бытовой фонд. Источником специальных фондов в государственных предприятиях и организациях выступала прибыль (источником средств фонда развития производства также амортизационные отчисления и выручка от реализации ненужного имущества); в колхозах – главным образом чистый доход. В производственных, Всесоюзных и республиканских промышленных объединениях часть специальных фондов централизовалась. В бюджетных организациях специальные фонды включали:- фонд всеобуча общеобразовательных школ, расходуемый на оказание материальной помощи нуждающимся учащимся, предоставление бесплатного питания в школах и так далее; фонды премирования лиц, обнаруживших нарушения правил охоты, рыболовства и лесоиспользования, формирующиеся в соответствующих организациях за счёт отчислений в установленных размерах от сумм штрафов; фонд развития учреждения, создаваемый в научно-исследовательских учреждениях, предназначался для покрытия дополнительных расходов по их содержанию и оборудованию. К специальным фондам могли быть отнесены и специальные средства бюджетных учреждений и организаций (смотрите Внебюджетные Средства). Специальные фонды формировались в плановом порядке при выполнении предприятиями и организациями определённых количественных и качественных показателей, характеризующих эффективность производства и уровень хозяйствования. Порядок образования и использования специальных фондов и размеры отчислений в эти фонды устанавливались решениями Правительства бывшего Союза Советских Социалистических Республик (СССР).

SPECIAL FUNDS FOR RETIREMENT PROVISION = СПЕЦИАЛЬНЫЕ ФОНДЫ ПО ОБЕСПЕЧЕНИЮ УХОДА НА ПЕНСИЮ – Special Funds For Retirement Provision:- these funds are regulated by law and are subject to specific investment guidelines suited to the requirements of private provision for retirement. They offer a balanced portfolio inasmuch as they combine the advantages of investments in equities with investments in fixed-income instruments and real estate fund units. Special funds for retirement provision are governed by special conditions. Investments are mainly in securities backed by real assets. The equities portion is limited to a maximum of 75%; the portions invested in open-ended real estate funds and directly owned real estate are limited to a maximum of 30%. Revenues from special funds for retirement provision are not distributed, but have to be re-invested by the fund management company.

SPECIALIST = СПЕЦИАЛИСТ (или СВЕДУЩЕЕ ЛИЦО) – Specialist is a member of a securities exchange who is a market maker in one or more securities listed on the exchange floor to whom other members go when they wish to transact or leave an order. Specialists are expected to maintain a fair and orderly market in securities in which they make a market. A member of the New York Stock Exchange who has two primary functions. First, to maintain an orderly market in the securities assigned to the specialist. To do this, the specialist must, to a reasonable degree, buy or sell for their own account when there is a temporary disparity between supply and demand. Second, the specialist acts as a broker's broker. When commission brokers on the exchange floor receive a limit order, say, to buy at USD50.00 a stock then selling at USD60.00, they cannot wait at the post where the stock is traded to see if the price reaches the specified level. They leave the order with the specialist, who will try to execute it in the market if and when the stock declines to the specified price. At all times the specialists must put their customer's interests above their own. / Под Сведущим Лицом понимается лицо, обладающее специальными знаниями, то есть 'знаниями и навыками, приобретёнными путём специального обучения или опыта работы в области науки, техники, искусства, ремесла', которые используются указанными лицами в порядке и целях, которые установлены уголовно-процессуальным законом. Уже Устав Уголовного Судопроизводства 1864 закреплял, что 'сведущие люди приглашаются в таких случаях, когда для точного уразумения встречающегося в деле обстоятельства необходимы специальные сведения или опытность в науке, искусстве, ремесле, промысле или каком-либо занятии'. Ранее лиц, обладавших специальными знаниями, называли Сведущими Лицами, то есть лицами 'знающими'. Специалист – член биржи, который поддерживает справедливый и упорядоченный рынок по одному или более видам ценных бумаг. Специалист или уполномоченный биржевой брокер (specialist unit) выполняет две основные функции:- исполняет лимитные распоряжения (limit orders) от имени других членов биржи за часть комиссионных, которые взимает брокер на полу (floor broker), и покупает и продает – иногда в 'короткую' (selling short) – по собственному счёту биржевого брокера для корректировки спроса и предложения и таким образом предупреждает сильные колебания котировок акций. Согласно правилам биржи специалист не имеет права производить покупки за собственный счёт, когда в учётном журнале специалиста (specialist's book), в котором ведётся запись всех лимитных распоряжений по каждой ценовой категории в порядке их получения, есть неисполнимые распоряжения клиентов на те же ценные бумаги по той же цене. Биржевые цены должны удовлетворять строгим требованиям в отношении минимально необходимого капитала, прежде чем они получат разрешение вести операции на Нью Йоркской Фондовой Бирже (НЙФБ®; New York Stock Exchange (NYSE®)). НЙФБ® или Эн.Уай.Эс.И.® (NYSE®).

SPECIALIST NATURAL ENEMY = СПЕЦИАЛИЗИРУЮЩИЙСЯ ЕСТЕСТВЕННЫЙ (или ПРИРОДНЫЙ) ВРАГ – Specialist Natural Enemy is a predator which attacks only one (or a few) species. Specialist natural enemies are sometimes used as biological controls.

SPECIALIST PERFORMANCE EVALUATION QUESTIONNAIRE = ОПРОСНИК ОЦЕНИВАНИЯ ИСПОЛНИТЕЛЬНОСТИ СПЕЦИАЛИСТА – Surveys floor brokers quarterly to assess how well the specialists maintain the auction market; and how effectively they fulfill their dealer, agency, communication, and administrative functions. / коммуникация (communication, от Латинского слова Communicare, означающее Совещаться С Кем-Либо).
